STANDARD PROCEDURE

FLASH PROGRAMMING

NOTE: The wiTECH diagnostic application is the only recommended method for flashing ECUs.

NOTE: Help using the wiTECH diagnostic application for flashing an ECU is available by selecting "Help" then "Help Contents" at the top of the wiTECH diagnostic application window.

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

FOBIK PROGRAMMING

The Radio Frequency Hub (RF-Hub) may be programmed to recognize up to a total of eight FOBIKs. When replacing or adding a FOBIK, the integrated key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once an additional or new key has been cut, the RF-Hub must be programmed to recognize it as a valid FOBIK. When programming a FOBIK it may be necessary to have the vehicle PIN. Follow the instructions on the scan tool screen.

Programming

NOTE: All FOBICs that are to be used in this vehicle must remain on the front seat near the center console but behind the shifter.

NOTE: Do not put a Laptop or any wireless device (cell phone, audio device, etc.) on top of or near the center console. The RF Antenna is below the console.

1. Turn the ignition on.
2. With the scan tool select RFH.
3. Turn the ignition to the off/lock position. The ignition must be left off throughout this procedure on vehicles equipped with the RF-Hub.
4. With the scan tool select; "Misc. Functions" "Program Ignition FOBIKs".

NOTE: When programming a FOBIK, hold it near or on the center console top.

NOTE: When you are instructed to "Press the Unlock button" it is important that you do not hold the button. Press it One time quickly.

5. Press "Continue" and follow the instructions on the screen.

RF-HUB, BCM, PCM, FOBIK AND ELV REPLACEMENT AND PROGRAMMING ORDER GUIDE

Module	MODULE REPLACEMENT GUIDE (RF-HUB, BCM, PCM, FOBiK and ELV

RF-HUB INITIALIZATION - EXPORT WITH COLUMN LOCK MODULE

CAUTION: On vehicles equipped with the optional export premium Vehicle Theft System, when either the Radio Frequency Hub RF-Hub) or the shaft lock module (also known as Elektrische Lenksaulen Verriegelung/ELV or Electric Steering Column Lock/ESCL) is replaced with a new unit, the existing RF-Hub or ELV/ESCL MUST also be replaced with a new unit. In other words, any time either the RF-Hub or the ELV/ESCL is replaced with a new unit, BOTH the RF-Hub and the ELV/ESCL MUST be replaced with new units, WITHOUT EXCEPTION. Following replacement of BOTH the RF-Hub and the column lock module/ELV/ESCL, the two modules MUST be initialized using diagnostic scan tool routines in the EXACT SEQUENCE that follows. Failure to follow this sequence may result in BOTH the new RF-Hub and the new ELV/ESCL being rendered unusable, requiring BOTH units to be replaced a second time.

NOTE: Do not put a laptop or any wireless device (cell phones, audio devices etc.) near the top of the center console (the RKE antenna is located below the center console).

1. After both the RF-Hub and the ELV/ESCL have been replaced with new units, connect the diagnostic scan tool to the Data Link Connector (DLC).
2. Turn the ignition ON
3. Navigate to the RF-Hub in the ECU View of the diagnostic scan tool.
4. Turn the ignition OFF
5. Put all the FOBICs used in this vehicle on the front seat away from the console.
6. With the scan tool select: "Program ignition FOBIKs" in the Miscellaneous Functions menu and follow the instructions on the screen.

NOTE: When programming a FOBIK, have it in your hand resting on the console.

7. After all the FOBIKs have been programmed, run the "RF-Hub Replace" routine.
8. Turn the ignition on.
9. Run the ELV Replaced routine, also found under the Miscellaneous Functions menu item of the RF-Hub in the ECU View of the diagnostic scan tool.
10. Turn the ignition to the OFF position, wait 30 seconds, then cycle the ignition back to the ON/RUN position.
11. Verify that the ELV Locks the steering column when the ignition is turned off and Unlocks the

steering column when the ignition is turned On.

COMMUNICATION

DESCRIPTION

DESCRIPTION

The primary on-board communication network between microprocessor-based electronic control modules in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed (9.6 Kbps) serial link bus used to provide direct communication between a LIN master module and certain switch or sensor inputs.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-IHS, the CAN-C and the CAN-AT. The CAN-IHS and CAN-C systems provide on-board communication between all of the nodes that are connected to them. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps). The CAN-C is used typically for communications between more critical nodes, while the slower (125 Kbps). The CAN-IHS system is used for communications between less critical nodes.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle.

The BCM is located under the instrument panel to right of the glove box. The central CAN gateway or hub module integral to the BCM is connected to CAN-IHS and CAN-C buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them.

A third CAN bus on this vehicle is the CAN-AT (Audio and Telematics) Bus. The CTP Radio also known as the Telematics Gateway (TGW) transfers messages between the CAN-AT and CAN IHS buses. Examples of modules on the CAN-AT bus include the Amplifier, Integrated Center Stack (ICS) and the Hands Free Module (HFM). The TGW also stores DTCs for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send

and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed

OPERATION

OPERATION

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Body Control Module (BCM) to be a Central GateWay to process and transfer messages between the CAN C and CAN IHS buses. The BCM also stores Diagnostic Trouble Codes (DTCs) for certain bus network faults. A third CAN bus on this vehicle is the CAN-AT (Audio and Telematics) Bus. The CTP Radio also known as the Telematics Gateway (TGW) transfers messages between the CAN-AT and CAN IHS buses. Examples of modules on the CAN-AT bus include the Amplifier, Integrated Center Stack (ICS) and the Hands Free Module (HFM). The TGW also stores DTCs for certain bus network faults.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the

isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

NOTE: All measurement of termination resistance is done with the vehicle battery disconnected.

The communication protocol being used for the CAN data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the CAN bus system, providing near real-time communication (500 Kbps). CAN-IHS and CAN-AT communicate at (125 Kbps).

The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter (yard). While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire. Refer to the CAN Bus Voltages table.

CAN Bus Voltages (Normal Operation)								
CAN-C Bus Circuits	**Sleep**	**Recessive (Bus Idle)**	**Dominant (Bus Active)**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
CAN-IHS Bus Circuits	**Key-Off (Bus Asleep)**		**Key-On (Bus Active)**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (-)	0.0V		1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0.0 V		2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage.								

Total resistance of CAN networks can be measured with the battery disconnected. The average resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.

The CAN-IHS bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-IHS bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The BCM will keep either the CAN-IHS or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

In the CAN system, available options are configured into the BCM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The BCM also has two 64-bit registers, which track each of the **as-built** and **currently responding** nodes on the CAN-B and CAN-C buses. The BCM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

MODULE, A/C AND HEATER

DESCRIPTION

DESCRIPTION

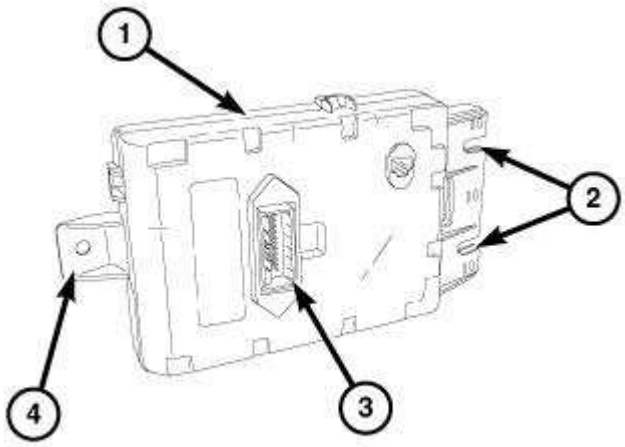

Fig. 1: A/C Heater Module, Mounting Tabs & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The A/C heater module (1) is a microprocessor designed to operate the heating and A/C system,

using the Controller Area Network (CAN) data bus. The A/C heater module has a plastic housing with one integral electrical connector receptacle (3) and three mounting tabs (2 and 4).

The A/C heater module is located on the air inlet housing, on the passenger side of the vehicle.

OPERATION

OPERATION

The A/C heater module utilizes integrated circuitry and information carried over the Controller Area Network (CAN) data bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C heater module allows it to control electronic functions and features of the heating and A/C system.

Some of the inputs received by the A/C heater module over the CAN bus are as follows:

- A/C Request
- Ambient Air Temperature
- Electric Back Light (EBL) Request
- Electrical System Voltage
- Engine Coolant Temperature
- Engine Speed
- Humidity, Windshield Glass Temperature and Dewpoint (ATC only)
- Refrigerant Pressure
- Vehicle Identification Number
- Vehicle Odometer

Some of the messages broadcasted by the A/C heater module on the CAN bus are as follows:

- A/C Clutch Engage
- Auto Headlamp Signal
- EBL Status

The A/C heater module receives the following information over hardwired circuits:

- Auto Headlamp Signal
- Evaporator Temperature
- Interior Air Temperature
- Left and Right Sun Load

The A/C heater module monitors and controls the following over hardwired circuits:

- Driver and Passenger Blend Door Positions

- Blower Motor Speed
- Mode Door Position
- Recirculation Door Position

The A/C heater module is diagnosed using a scan tool. Prior to replacing an A/C heater module, run the calibration procedure to verify that the concern is not an air door calibration issue. Refer to **STANDARD PROCEDURE** .

The A/C heater module cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Illustration shown with instrument panel removed from view for clarity.

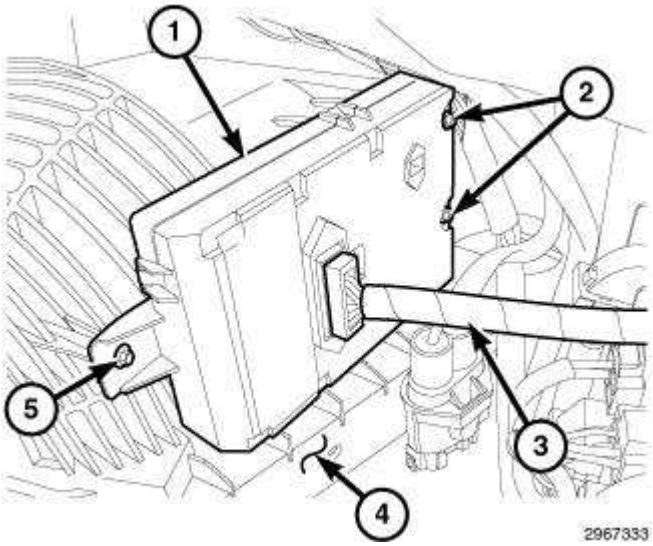

Fig. 2: Wire Harness Connector, A/C Heater Module & Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the right side instrument panel silencer panel. Refer to **PANEL, SILENCER,**

REMOVAL .

3. Remove the glove box and the glove box trim panel from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
4. Disconnect the wire harness connector (3) from the A/C heater module (1), located on the air inlet housing (4).

NOTE: It is not necessary to fully remove the two front A/C heater module retaining screws. The front A/C heater module retaining tabs are slotted to aid in module service.

5. Loosen the two screws (2) that secure the front of the A/C heater module to the air inlet housing.
6. Remove the one screw (5) that secures the rear of the A/C heater module to the air inlet housing.
7. Slide the A/C heater module rearward to disengage the module from the two front retaining screws and remove the module.

INSTALLATION

INSTALLATION

NOTE: Illustration shown with instrument panel removed from view for clarity.

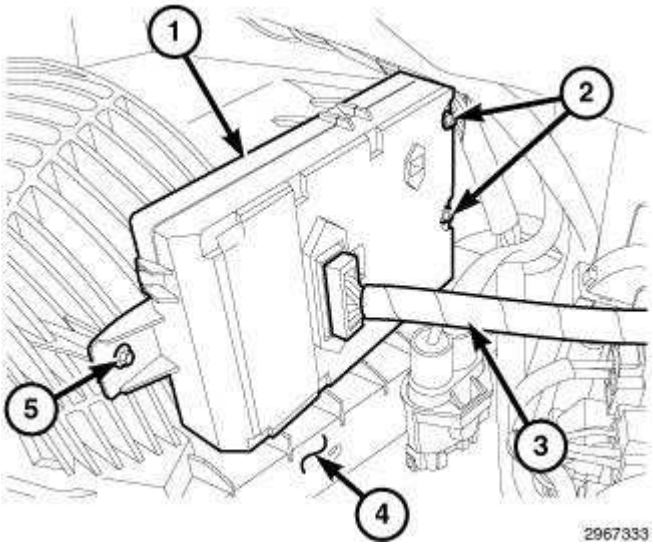

Fig. 3: Wire Harness Connector, A/C Heater Module & Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the A/C heater module (1) to the air inlet housing (4) and engage the module to the two front retaining screws (2).
2. Loosely install the screw (5) that secures the rear of the A/C heater module to the air inlet housing.

3. Tighten all the screws that secure the A/C heater module to the air inlet housing to 2 N.m (17 in. lbs.).
4. Connect the wire harness connector (3) to the A/C heater module.
5. Install the glove box trim panel and glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
6. Install the right side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

MODULE, ACTIVE DAMPING CONTROL

DESCRIPTION

DESCRIPTION

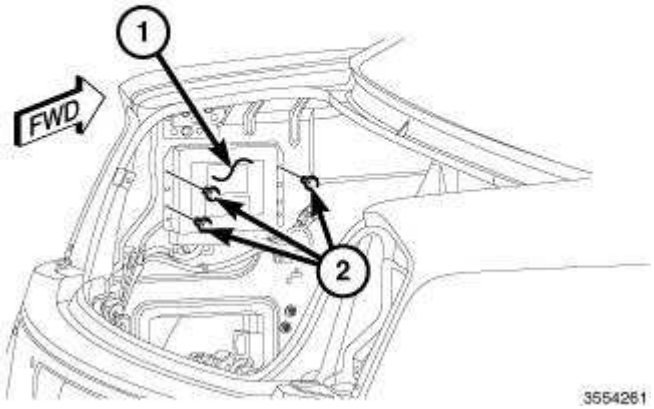

Fig. 4: ADCM & Three Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with Active Damping Suspension (ADS) have an Active Damping Control Module (ADCM). The ADCM (1) is located in the left side of the trunk and is retained by three mounting screws (2). The carpet on the left side of the trunk has to be repositioned to access the ADCM.

OPERATION

OPERATION

The Active Damping Control Module (ADCM) uses the CAN bus to communicate with multiple modules. The ADCM has the following inputs: Vehicle Speed, Steering Angle Sensor (SAS) position, Throttle Position Sensor (TPS), Active Damping System (ADS) input switch, and 3 ADS sensors. There are solenoid-controlled ADS valving units on each shock absorber assembly which are the

outputs for the ADCM.

The ADS input switch is a soft touch button on the radio display. When the ADS input switch is pressed with the key in the ON or RUN position, a signal is sent over the CAN bus to the ADCM and the Transmission Control Module (TCM) to change modes. The resulting change is indicated on the radio display.

The Active Damping Control Module (ADCM) controls the suspension and ride for the SRT version of this vehicle by adjusting the rebound and jounce of the shock assemblies using the above information and predetermined settings for maximum vehicle control. The shock absorbers are unique to the Active Damping System (ADS). Each shock absorber has a valving unit that is external, but still part of the shock absorber. Inside each valving unit are two solenoids that control the damping valves to alter the ride of the vehicle. The shocks are replaced as an assembly, they cannot be disassembled for repair.

The two front ADS sensors are mounted with one on each wheel well. The rear ADS sensor is mounted in the right rear wheel well on the shock tower. The ADCM is located in the left side of the trunk.

Two Mode ADS

Early build vehicles have a two mode Active Damping System (ADS), which consists of Auto and Sport Modes. The normal operating mode is Auto, and it is switched to and from Sport with the soft button on the radio display. When Sport is selected, ADS is activated and there is no change with the transmission programming.

Three Mode ADS

Later vehicles have a three mode Active Damping System (ADS), which consists of Auto, Sport, and Track modes. The normal operating mode is Auto, and it is switched to and from Sport or Track with the soft button on the radio display. If either Sport or Track is active during an ignition on-off-on cycle, the mode reverts to Sport. When Sport is selected, ADS is activated and there is no change with the transmission programming. When Track is selected, ADS and sport shifting in the trasmission are activated.

REMOVAL

REMOVAL

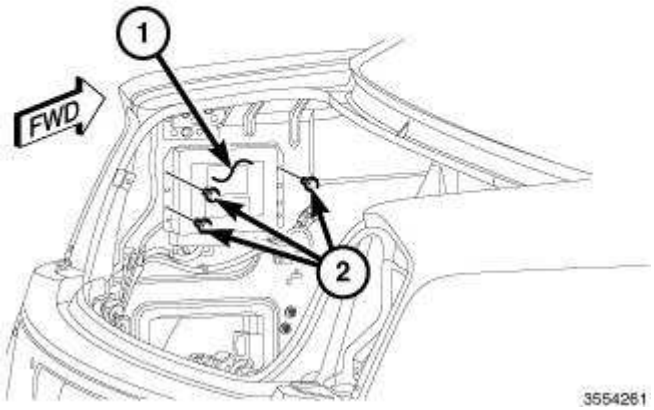

Fig. 5: ADCM & Three Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the left side inner trunk fasteners and position the carpet aside.
3. Disconnect the wire harness connectors and remove the three screws (2) from the Adaptive Damping Control Module (ADCM).
4. Release the integral latches that secure the ADCM (1) to the mounting bracket and slide the module upward to remove from the vehicle.

INSTALLATION

INSTALLATION

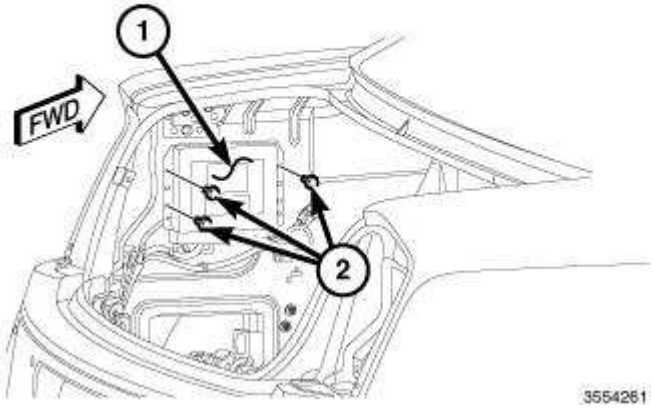

Fig. 6: ADCM & Three Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

1. Slide the Active Damping Control Module (ADCM) (1) into position making sure the latches secure the ADCM.
2. Install the retaining screws (2) and tighten to 9 N.m (80 in. lbs.).
3. Connect the wire harness connectors to the ADCM (1).
4. Position the carpet back in the original location and install the fasteners.
5. Connect the negative battery cable. Refer to **CABLES, BATTERY, INSTALLATION** .
6. Perform the ADCM Verification Test.

MODULE, ADAPTIVE FRONT LIGHTING SYSTEM

DESCRIPTION

DESCRIPTION

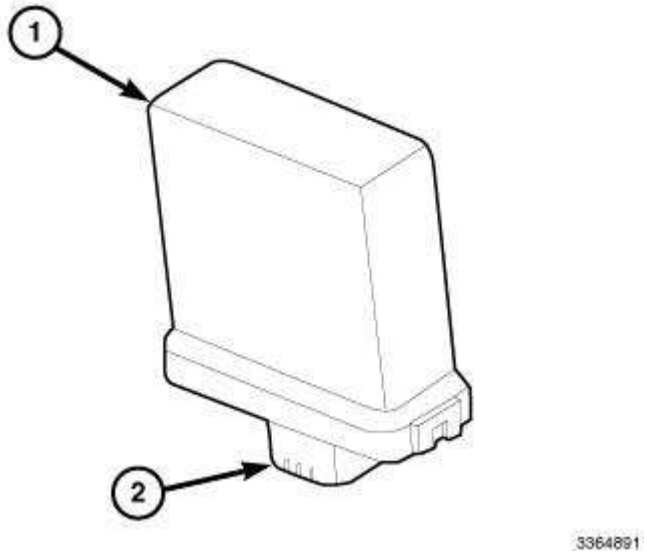

Fig. 7: AFLS Module & Integral Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Adaptive Front Lighting System (AFLS) (which includes the features formerly known as the headlamp leveling system required in some export markets) are also equipped with an AFLS module (1). The AFLS module is located on a bracket at the right front corner of the Power Distribution Center (PDC) located in the right front corner of the engine compartment.

This module works in conjunction with the front and rear axle (leveling) sensors, the headlamp leveling motors, the headlamp swiveling motors and electronic message inputs received over the Controller Area Network (CAN) data bus from other electronic modules in the vehicle. The module provides automatic headlamp beam aim adjustment to compensate for changes in vehicle height or direction caused by changes in vehicle loading, acceleration, deceleration, steering wheel angle and YAW rate.

The molded black plastic AFLS module housing has an integral latching mount that secures the unit

to a stamped metal blade-type bracket integral to the PDC bracket. Concealed within the housing is the circuitry of the module, which includes a microprocessor. The module is connected to the vehicle electrical system through an integral connector receptacle (2) by a take out and connector of the headlamp and dash wire harness.

The AFLS module cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced. The AFLS module is Flash programmable.

OPERATION

OPERATION

The microprocessor in the Adaptive Front Lighting System (AFLS) module contains the logic circuits and controls all of the features of the AFLS. The AFLS module also controls the functions previously performed by the Automatic Headlamp Leveling Module (AHLM). The AFLS module uses On-Board Diagnostics (OBD) and communicates with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. The AFLS module is also a Local Interface Network (LIN) master node and uses this method of communication to communicate with the two stepper motors within each right and left front lamp unit.

The AFLS module microprocessor continuously monitors electronic message inputs from the Body Control Module (BCM) (also known as the Common Body Controller/CBC), the Integrated Center Stack (ICS), the Steering Angle Sensor (SAS), the Steering Control Module (SCM) and the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, the Antilock Brake System/ABS module or the Electronic Stability Control/ESC module). The AFLS module also energizes or de-energizes the front and rear axle sensors as appropriate to monitor the vehicle height. When the axle sensors are energized, the AFLS module monitors and evaluates the Pulse Width Modulated (PWM) return signals from those sensors.

The AFLS module uses these inputs to determine steering wheel angle, vehicle speed, accelerator pedal position, vehicle yaw rate and ABS status. It then uses internal programming algorithms to compute the proper electronic message control outputs to provide over the LIN bus to the LIN slave headlamp leveling and headlamp swiveling stepper motors to adjust the headlamp beams vertically or horizontally as required. The AFLS module also continuously monitors return inputs from the leveling and swiveling motors to confirm stepper motor responsiveness as well as the proper positioning of the headlamp beams.

The AFLS module receives battery voltage on a fused ignition switch output (RUN) circuit, and is grounded at all times through a hard wired remote ground point. These connections allow the AFLS module to operate only when the ignition switch is in the ON position. The AFLS module also monitors all of the AFLS circuits and components, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects.

The hard wired circuits of the AFLS module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the AFLS module or the electronic controls or communication between modules and other devices that provide some features of the AFLS. The most reliable, efficient, and accurate means to diagnose the AFLS module or the electronic controls

and communication related to AFLS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AFLSM SYSTEM

The hard wired circuits to the Adaptive Front Lighting System Module (AFLSM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the AFLSM or the electronic controls and communication between modules and other devices that provide some features of the Adaptive Front Lighting System (AFLS). The most reliable, efficient, and accurate means to diagnose the AFLSM or the electronic controls and communication related to AFLS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

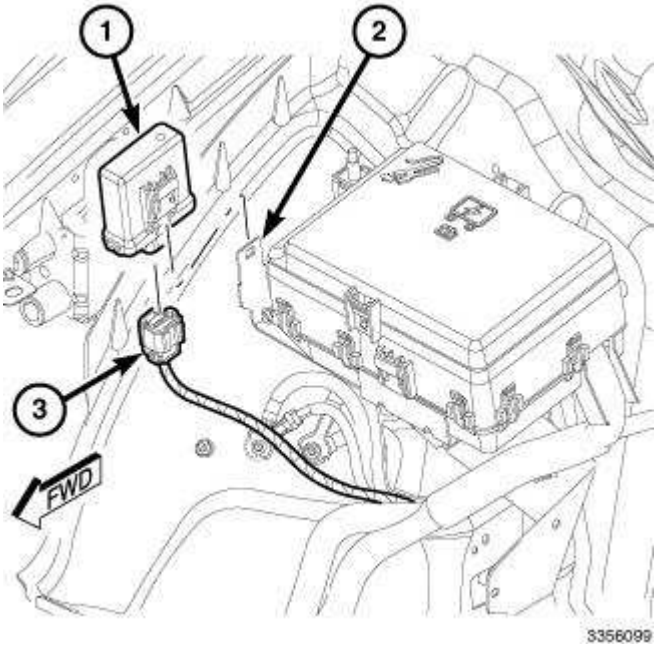

Fig. 8: (AFLS) Module, Blade-Type Mount & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the Adaptive Front Lighting System (AFLS) module (1) at the right front corner of the Power Distribution Center (PDC) in the right front corner of the engine compartment.

3. Release the AFLS module latch tab by pressing it toward the PDC.
4. While holding the AFLS module latch tab in the released position, pull the module upward to disengage it from the blade-type mount (2) integral to the right front corner of the PDC bracket.
5. Disconnect the headlamp and dash wire harness connector (3) from the AFLS module connector receptacle.
6. Remove the AFLS module from the vehicle.

INSTALLATION

INSTALLATION

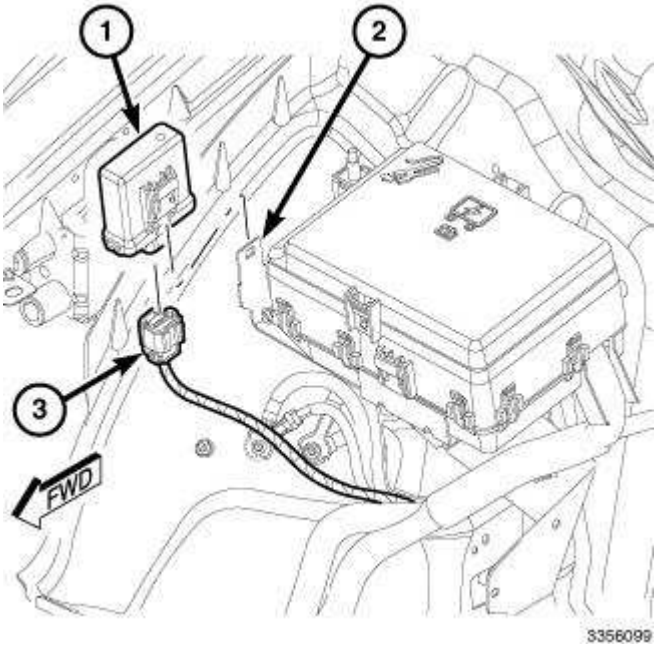

Fig. 9: (AFLS) Module, Blade-Type Mount & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the Adaptive Front Lighting System (AFLS) module (1) into the right front corner of the engine compartment.
2. Reconnect the headlamp and dash wire harness connector (3) to the AFLS module connector receptacle.
3. Align the AFLS module mount to the blade-type bracket (2) integral to the right front corner of the Power Distribution Center (PDC) bracket.
4. Push the AFLS module mount down over the bracket until the latch feature snaps into place.
5. Reconnect the battery negative cable.

NOTE: Whenever the Advanced Front Lighting System (AFLS) module is removed and reinstalled or replaced with a new unit, it is necessary for the AFLSM to be configured and calibrated to the vehicle using a calibration procedure. Follow the programming steps outlined in the diagnostic scan tool for the "AFLS

Module Calibrate" routine under "Miscellaneous Functions" for the "AFLS Module" menu item as appropriate.

MODULE, ANTI-LOCK BRAKE SYSTEM

DESCRIPTION

DESCRIPTION

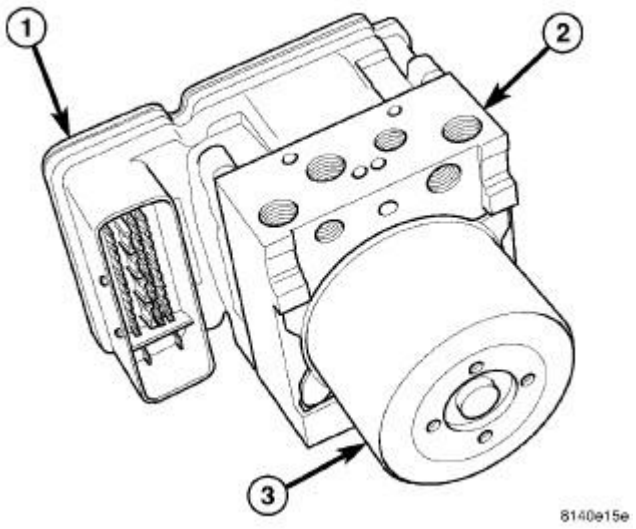

Fig. 10: Integrated Control Unit
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The Antilock Brake Module (ABM) is a microprocessor-based device which monitors the Antilock Brake System (ABS) during normal braking and controls it when the vehicle is in an ABS stop. The ABM also monitors the Electronic Stability Control (ESC).

The ABM (1) is mounted to the HCU (2) as part of the Integrated Control Unit (ICU). The ABM uses a 47-Way connector on the vehicle wiring harness. The power source for the ABM is through the ignition switch in the RUN or ON position. The ABM is on the CAN-C bus.

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

OPERATION

OPERATION

The primary functions of the Antilock Brake Module (ABM) are to:

- Monitor the Antilock Brake System (ABS) and Electronic Stability Program (ESP) for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in ABS or traction control mode.
- Modulates fluid pressure to the wheel brakes to control vehicle yaw rate in ESP mode.
- Store diagnostic information.
- Provide communication to the scan tool while in diagnostic mode.
- Illuminate the amber TCS/ESP indicator in the instrument cluster.

The ABM constantly monitors the ABS and ESP (if equipped) for proper operation. If the ABM detects a fault, it will turn on the amber TCS/ESP indicator and disable the ABS or ESP if so equipped. The normal base braking system will remain operational at that time.

The ABM continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the ABM commands the ABM solenoid coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The ABM continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

REMOVAL

REMOVAL

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

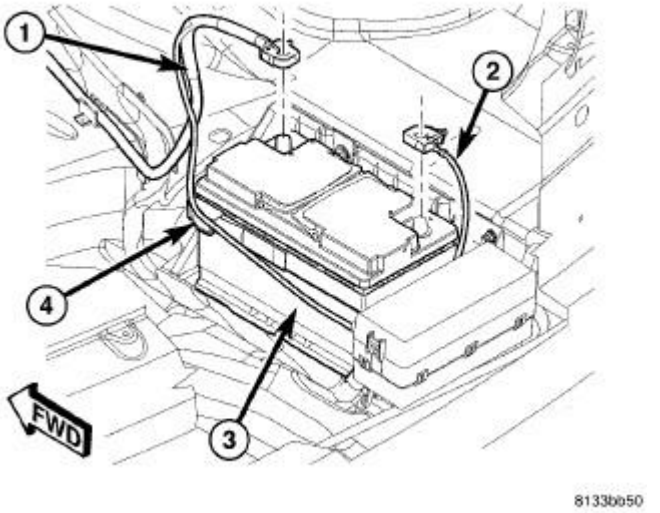

Fig. 11: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative (-) battery cable (2) from battery post and isolate.

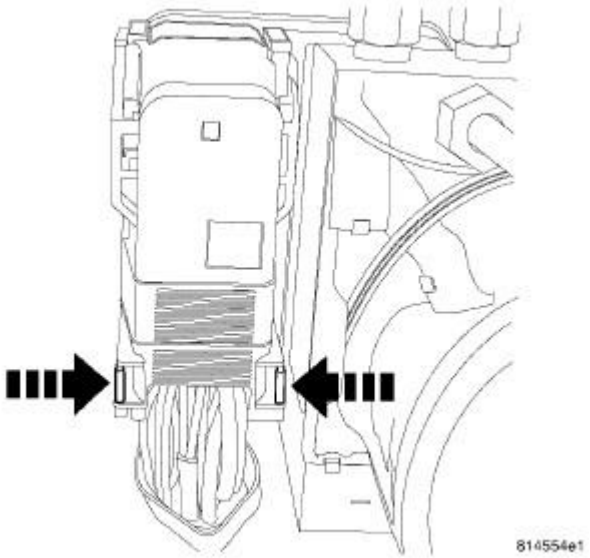

Fig. 12: ABM Connector Release Tabs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use this figure in the following step to release the ABM harness connector cover. It shows the location of the release tabs.

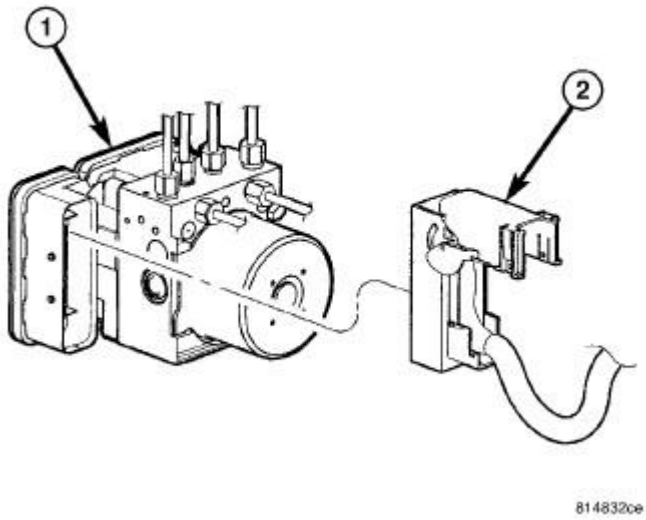

Fig. 13: Anti-Lock Brake Module Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect ABM harness connector from antilock brake module (ABM). To do so:
    1. Depress tabs on each side of connector cover, then
    2. Pull outward and upward on lower half of cover until it locks into position pointing straight outward (2). Connector can then be pulled straight outward off ABM (1).

NOTE: DO NOT remove any brake lines from the ICU fluid ports while performing the following steps. The ABM can be removed and installed without doing so.

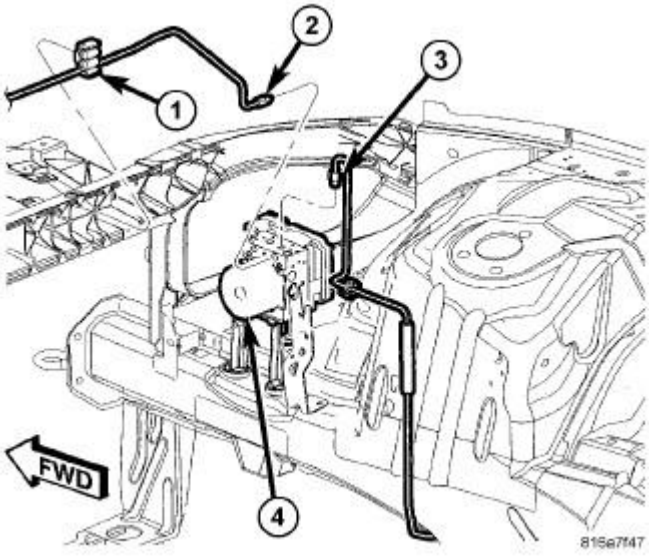

Fig. 14: Left Front And Right Front Brake Tubes AT ICU

Courtesy of CHRYSLER GROUP, LLC

3. Unclip all brake tubes from two routing clips (1) along upper radiator support.
4. Unclip right front brake tube (3) from routing clip on bracket below Fuse And Relay Center.

8. Slide ABM (1) off HCU (2).

INSTALLATION

INSTALLATION

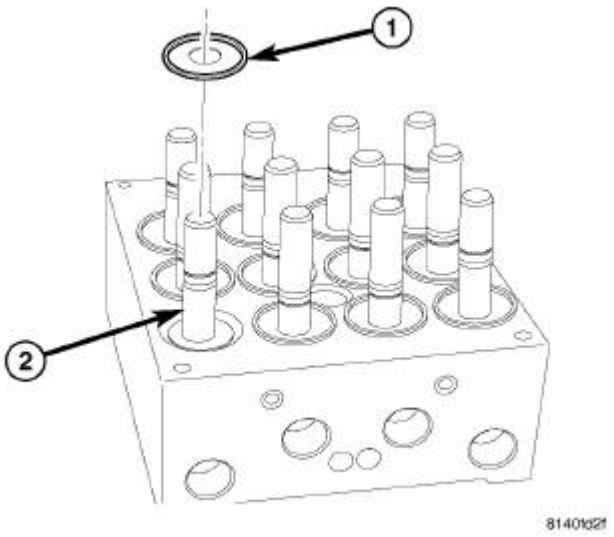

Fig. 19: Solenoid Valve Seal
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

1. Clean any debris off the mating surfaces of the HCU and ABM.
2. If the seals (1) on the solenoid valve stems (2) are not new, replace them all. Each of the solenoid valve stem seals must be new to keep out moisture and debris; **do not reuse solenoid valve stem seals** .

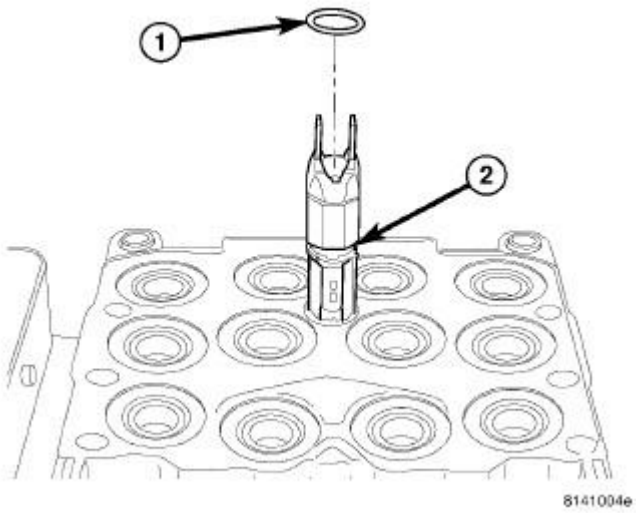

Fig. 20: Internal Pump Connector O-Ring
Courtesy of CHRYSLER GROUP, LLC

3. Replace the pump/motor connector O-ring (1) if it is not new. Be sure the O-ring is properly seated in the mounting groove (2).

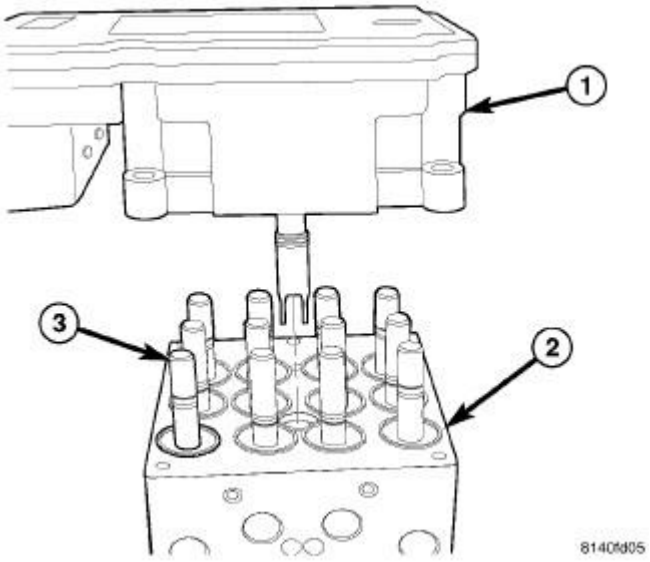

Fig. 21: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

4. Align components and install the ABM (1) on the HCU (2).

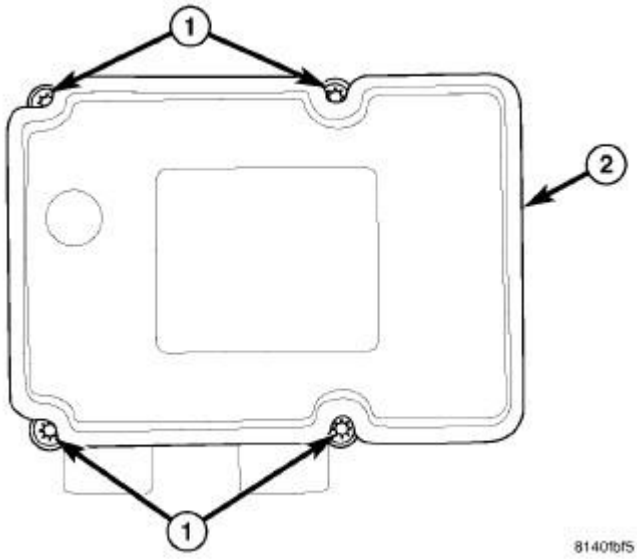

Fig. 22: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

5. Install the four screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2 N.m (17 in. lbs.).

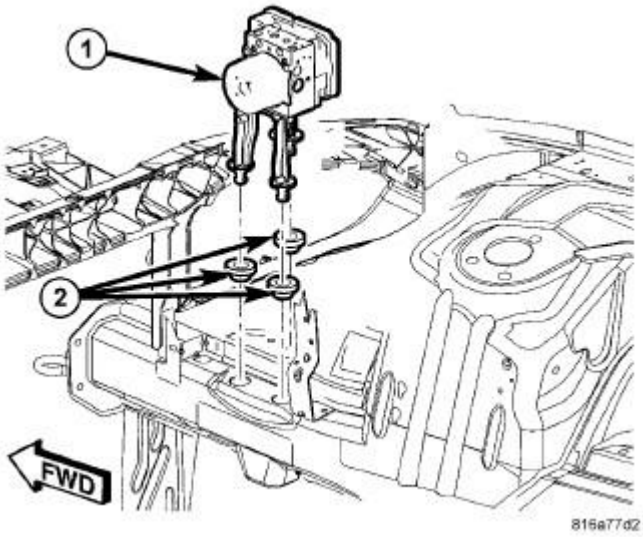

Fig. 23: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Position ICU (1) above mounting grommets (2) located in body side rail and press mounting bracket into place.

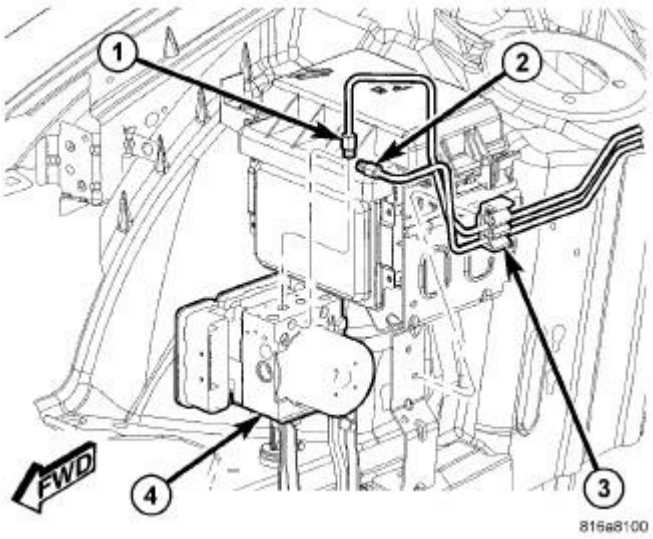

Fig. 24: Left Rear And Right Rear Brake Tubes AT ICU

Courtesy of CHRYSLER GROUP, LLC

8. Clip right front brake tube (3) to routing clip on bracket below Fuse And Relay Center.
9. Clip brake tubes to two routing clips (1) along upper radiator support.

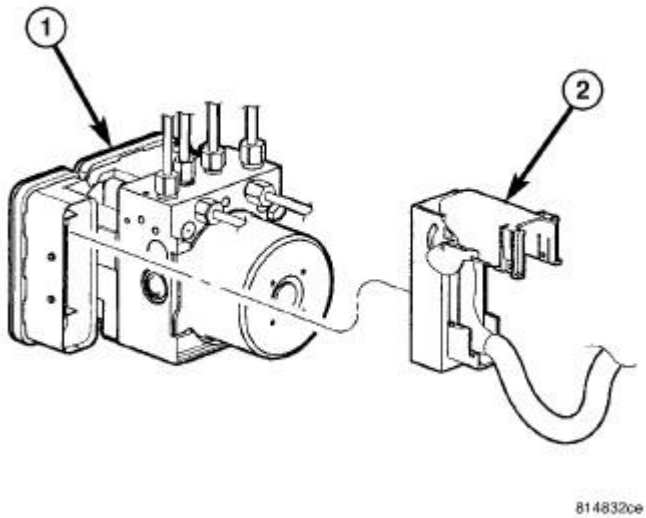

Fig. 26: Anti-Lock Brake Module Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before installing the ABM harness connector (2) on the ABM (1), be sure the seal is properly installed in the connector.

10. Insert ABM harness connector (2) into socket of ABM (1) and close cover, locking connector in place.

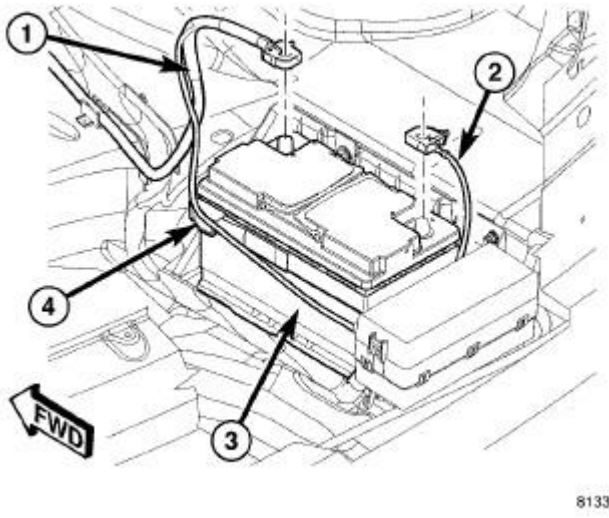

Fig. 27: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

11. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

12. Perform ABS Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

MODULE, BODY CONTROL

DESCRIPTION

DESCRIPTION

VEHICLE SYSTEMS SUPPORT

The electronic functions of the Body Control Module (BCM) supports or controls include the following:

- **Brake Fluid Level** - The continuously monitors the brake fluid level sensor through a hard-wired input to monitor the brake fluid level. the BCM transmits an electronic message over the Can data bus to Instrument Cluster (IC) to illuminate the Low Fluid indicator based on the input signal received from the fluid level sensor.
- **Enhanced Accident Response Support** - The BCM monitors an input from the Occupant Restraint Controller (ORC) and, following an airbag deployment, will immediately disable the power lock output, unlock all doors by activating the power unlock output, then enables the power lock output if the power lock switch input remains inactive for two seconds. The BCM also monitors an input from the Powertrain Control Module (PCM) to automatically turn ON the interior lighting after an airbag deployment event, 10 seconds after the vehicle speed is zero. The interior lighting remains illuminated until the ignition switch is turned to the OFF position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lighting Switch Support** - The BCM continuously monitors the headlamp switch position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the CAN data bus. The BCM reads and responds to this input by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal High Side Drivers (HSD)'s and by sending an electronic confirmation message back to the IC, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the multi-function switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the **A** (Automatic) position is selected, the BCM also monitors an electronic **ambient light level** message received over the CAN data bus from the Heater and Vehicle Air Conditioning (HVAC) control module based upon a hard wired input from the rain sensor to turn the exterior lighting ON and OFF automatically while the ignition switch is in the ON position.
- **Fuel Level Data Support** - The BCM provides a current source for and receives a hard-wired analog input from the fuel level sending unit located on the fuel pump module in the fuel tank. Based upon this input, the BCM uses electronic messaging to transmit this data over the CAN data bus for use by other electronic modules in the vehicle. The IC calculates the proper fuel gauge needle position and to control low fuel indicator operation based on these messages.
- **Hazard Lamp Circuit Control** - The BCM monitors an input from the hazard switch and receives a hard-wired analog input from the switch. The BCM reads and responds to this input

by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal High Side Drivers (HSD)'s and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the hazard light indicators as appropriate.

- **Headlamp Washer Control** - On vehicles equipped with headlamp washers, the BCM controls a relay in the Power distribution Center (PDC) based on electronic messages received over the Can data bus.
- **Ignition On and Ignition Accessory/On Relay Control** - The BCM monitors electronic **ignition switch status** messages received over the CAN bus from the RF hub and a hard-wired input from the ignition switch on the instrument panel, and provides high side driver outputs to control both the ignition ON and ignition ACCESSORY/ON relays in the Power Distribution Center (PDC) as appropriate.
- **Interior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn OFF all interior lamps if they remain ON after a timed interval of about eight minutes.
- **Interior Lighting Control** - The BCM monitors electronic messages and hard-wired inputs from the interior lighting switch, the door ajar switches, the liftgate ajar, and liftgate flip-up glass ajar switches (where applicable), the reading lamp switches and the RF hub to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-OFF and courtesy illumination DEFEAT features.
- **Local Interface Network Master Module** - The BCM is the master module for the LIN data bus. In this role it gathers information from the compass sensor, and the Intelligent Battery Sensor (IBS), then either acts on that information directly or places electronic messages on the CAN data bus for use by other modules
- **Power Inverter Support** - The BCM monitors a hard-wired input from the power inverter to determine the inverter status, then transmits electronic **inverter status** messages to other electronic modules in the vehicle over the CAN data bus.
- **Power Lock System Control** - The BCM monitors inputs from the power lock switches and the RF hub to provide control of the power lock motors through high side and low side driver outputs. This includes support for rolling door locks (also known as automatic door locks), automatic door unlock, and a door lock inhibit mode.
- **Remote Radio Switch Support** - The BCM receives electronic message inputs from the remote radio switches on the steering wheel over the CAN data bus, then provides electronic **radio request** messages over the CAN data bus to support the remote radio switch function.
- **Remote Start System Support** - The BCM receives electronic message inputs from the RF hub and then displays the appropriate remote start system textual reminder messages to the vehicle operator within the EVIC display.
- **Shipping Mode** - The new Chrysler Telematics Platform (CTP) vehicles no longer have a IOD fuse to use when transporting or storing for a long period of time. The BCM has a mode that takes the place of pulling the IOD fuse called **"Shipping Mode"** that is easily be enabled or disabled. Refer to **STANDARD PROCEDURE** .
- **Steering Wheel Switch Support** - The SCM receives electronic message inputs from the steering wheel switches on the steering wheel over the CAN data bus to control and configure many of the EVIC displays and functions.

- **Sunshade Control** - On LX models, an optional rear window sunshade is controlled by hard-wired signals received from the BCM. The BCM receives hard-wired signal from the rear sunshade switch or electronic Can bus messages received from the Integrated Center Stack (ICS) screen. The BCM then sends a hard-wired signal to the sunshade motor module to raise or lower the sunshade.
- **Vehicle Theft Security System Control** - The BCM monitors inputs from the door ajar switches, and the RF hub, on vehicles so equipped. The intrusion module provides electronic **horn** and **lighting request** messages to the BCM for the appropriate VTSS alarm output features.
- **Washer Fluid Level** - The continuously monitors the washer fluid level sensor through a hard-wired input to monitor washer fluid level. the BCM transmits an electronic message over the Can data bus to Instrument Cluster (IC) to illuminate the Low Fluid indicator based on the input signal received from the fluid level sensor.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

PROCEDURE

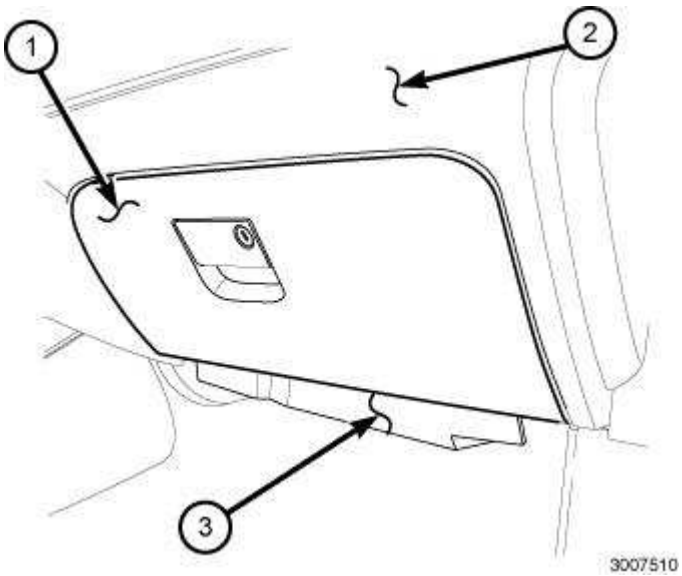

Fig. 28: Glove Box Assembly & Push Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box assembly (1). Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Remove the Instrument Panel (IP) lower hush panel (3).

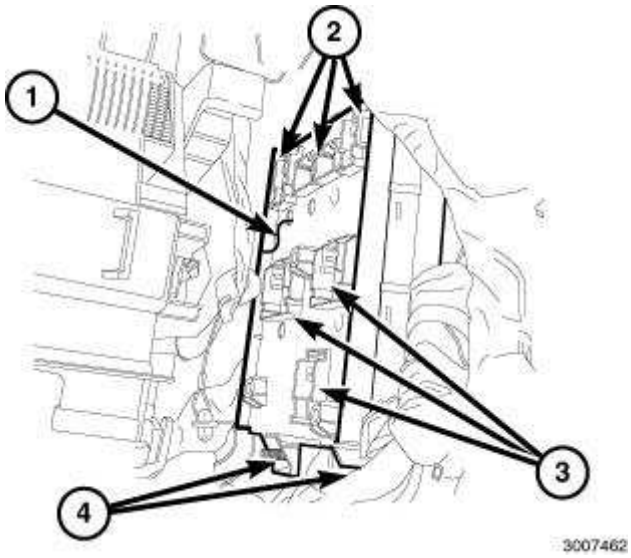

Fig. 29: Body Control Module (BCM), Receptacles & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connectors from the Body Control Module (BCM) (1) receptacles (2 and 3) as needed.
5. Remove the fasteners (4) that secure the module, two at the bottom, and one at the top.
6. Pull the module away from the side bulk head and down and remove the module.
7. Remove the BCM from the vehicle.

INSTALLATION

INSTALLATION

PROCEDURE

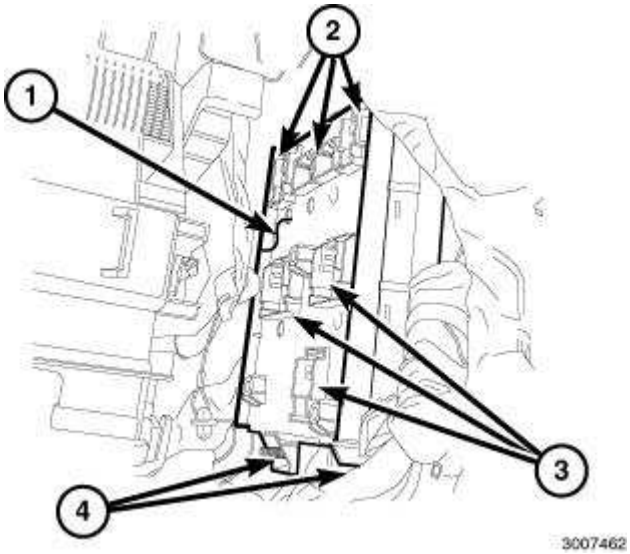

Fig. 30: Body Control Module (BCM), Receptacles & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the BCM in the vehicle.
2. Install the fasteners (4), two at the bottom, and one at the top, and tighten the securely.
3. Connect the electrical connectors to the Body Control Module (BCM) (1) receptacles (2 and 3) as needed.

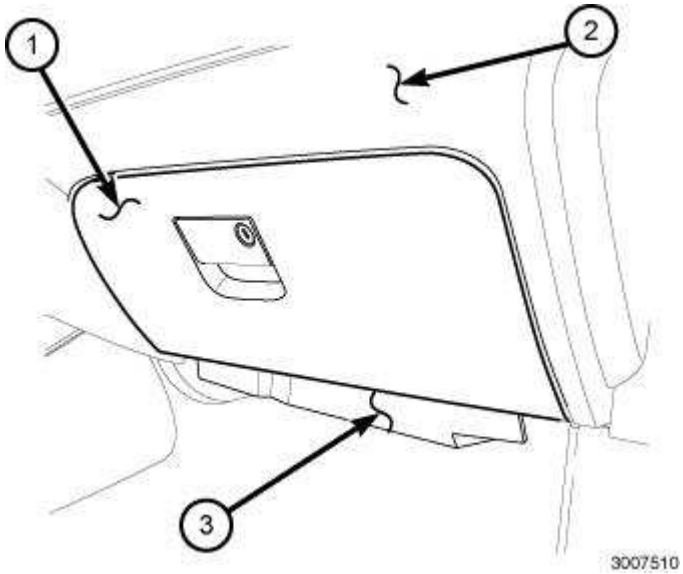

Fig. 31: Glove Box Assembly & Push Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the glove box assembly (1). Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
5. Install the lower hush panel (3) and install the two push-pin type retainers.
6. Connect the negative battery cable.

NOTE: **Program the BCM in accordance with the module replacement and programming guide. Refer to STANDARD PROCEDURE.**

MODULE, DOOR

DESCRIPTION

DESCRIPTION

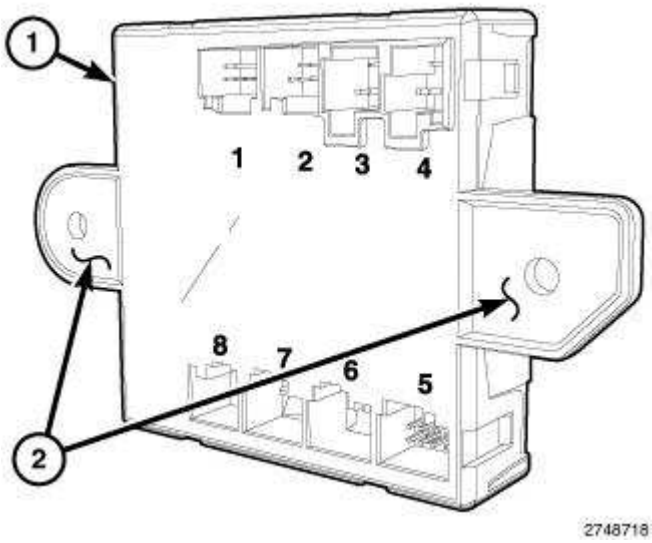

Fig. 32: Front Door Control Module
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with two electronic front door control modules (1) (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules), one each on both the driver and passenger front doors. Each door control module is concealed behind the front door trim panel where it is secured through two integral mounting tabs (2) to the door hardware module carrier by two screws. The front door control modules are located in the upper front corner of the front door hardware carriers, just below the mirror flag area of the front door.

Each door control module contains a microprocessor and is connected to the various switches on that door. In the case of the driver side module, it communicates with some switches over a Local Interface Network (LIN) data bus. Both the driver and passenger side module also receive various hard wired switch inputs and provide numerous hard wired outputs to various devices located on their respective doors. In addition, both front door control modules communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) Interior High Speed (IHS) data bus system.

Concealed and protected within the molded plastic door control module housing is the printed circuit board and the other electronic circuitry of the module. The front door control modules are connected to the vehicle electrical system through up to eight connector receptacles that are integral to the module housing.

A door control module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced. The door control module software is flash programmable.

OPERATION

OPERATION

The microprocessor-based electronic front door control modules (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules) contain logic circuits that monitor various hard wired low current, multiplexed inputs from the power window, power lock, power mirror and memory switches on their respective door. They also receive Controller Area Network (CAN) Interior High Speed (IHS) data bus electronic message-based external inputs from the opposing front door control module as well as from other electronic modules in the vehicle. The front door control modules also monitor hard wired power window motor Hall effect sensors and memory mirror position sensor inputs.

In addition, the front door control module on the driver side front door receives electronic message inputs from the driver side front door switch module over the Local Interface Network (LIN) data bus network. The program logic within the front door control module allows the microprocessor to prioritize all of these inputs and determine the tasks it needs to perform. These tasks are then completed either by controlling hard wired outputs to the various motors, actuators or lamps on its own or the rear doors, or by sending electronic message requests over the CAN-IHS bus to the appropriate electronic module in the vehicle.

The front door control modules are powered by a fused B(+) circuit and are grounded at all times so that they can operate regardless of the ignition switch position. Both driver and passenger door control modules provide active and stored Diagnostic Trouble Codes (DTC) through On-Board Diagnostics (OBD) and communicate with a diagnostic scan tool using the CAN data bus.

The hard wired inputs and outputs of the front door control module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the power window, power lock, memory, interior lighting or exterior lighting system features the front door control modules provide. The most reliable, efficient and accurate means to diagnose the front door control modules or the electronic controls and communication related to operation of these systems requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

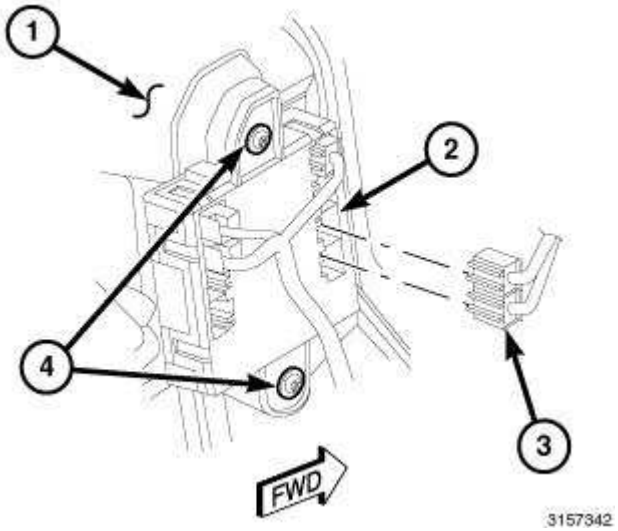

Fig. 33: Electrical Connectors, Door Control Module, Screws & Module Carrier
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the front door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect each of the electrical connectors (3) from the connector receptacles of the door control module (2).
4. Remove the two screws (4) that secure the door control module to the front door hardware module carrier (1).
5. Remove the door control module from the door hardware module carrier.

INSTALLATION

INSTALLATION

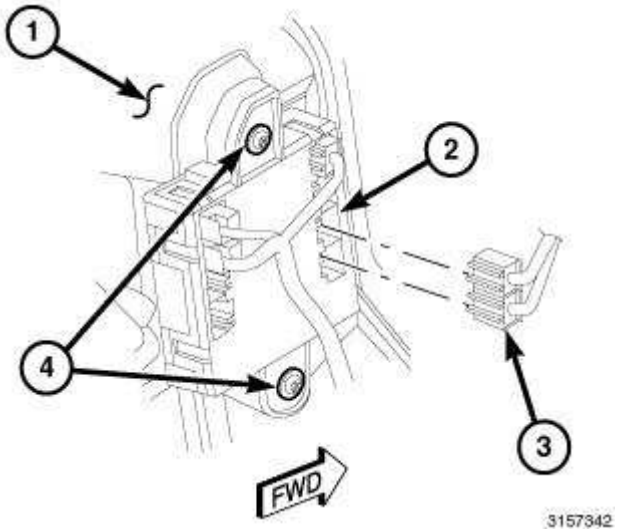

Fig. 34: Electrical Connectors, Door Control Module, Screws & Module Carrier
Courtesy of CHRYSLER GROUP, LLC

1. Position the door control module (2) to the front door hardware module carrier (1).
2. Install and tighten the two screws (4) that secure the door control module to the front door hardware module carrier. Tighten the screws securely.
3. Reconnect each of the electrical connectors (3) to the connector receptacles of the door control module.
4. Reinstall the trim panel to the inside of the front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.
6. The Clear/Relearn procedure should be performed following service of a door control module so that the module can learn the correct hard stops of the power window regulator. Refer to **STANDARD PROCEDURE** .

MODULE, DRIVETRAIN CONTROL

DESCRIPTION

DESCRIPTION

The Drivetrain Control Module (DTCM) controls the 4X4 transfer case shift functions via the actuation of a shift motor and utilizing the feedback of a mode sensor assembly. Communication is handled through the CAN bus. The user selectable transfer case modes include the following: 2WD, 4WD AUTO, 4WD LOCK, 4WD LOW, and Neutral (selections vary with the specific transfer case).

The DTCM is located in the drivers footwell, under the drivers foot rest.

OPERATION

OPERATION

During normal operation of an active transfer case the Drive Train Control Module (DTCM) control module learns and remembers the Clutch Engagement Point (Kiss Point), the position in the motor actuator's travel where torque begins to be transferred to the front wheels. The position is read out using the encoder as a 0 to 5 volt signal. This information is written into the module's EEPROM area at Ignition OFF. Over time the clutch pack wears and the Kiss Point changes in one direction (going from a lower voltage to a higher value).

POWER UP/DOWN

The DTCM will power up with an OFF/ON transition of the hard wired ignition switch input.

The DTCM will power down when the vehicle ignition switch transitions from ON to OFF, or there are no system requirements that dictate the controller to remain active

START-UP DIAGNOSTICS

When the DTCM is activated, the internal circuitry will undergo a diagnostic procedure. The controller will examine all inputs and outputs for short circuits to ground, short circuits to battery and open circuits and will also verify proper CPU and memory operation. If a fault is detected, a message will be sent out over the CAN C bus to the Cluster indicating that service is recommended.

After passing all diagnostic tests, the controller will receive and process inputs and produce the appropriate outputs. Proper monitoring of the controller inputs and outputs performance will continue.

INPUTS/OUTPUTS

The following are inputs to the DTCM:

- Transfer Case Mode Sensor Signal
- 1 Direct Battery Feed
- Ignition RUN Sense
- Sensor Ground
- Module Ground
- CAN C Bus

The following are outputs of the DTCM:

- Transfer Case Motor Brake Control
- 5V Sensor Supply
- Transfer Case Bi-directional Motor Control (A AND B)
- Switched B+ Solenoid Supply
- Transfer Case Motor Brake Control

TRANSFER CASE RANGE SELECT SWITCH INPUT (2WD, 4WD AUTO, 4WD LOCK, AND 4WD LOW SELECT SWITCH)

The transfer case range select switch is hardwired directly to the Cluster (CCN). The switch position is read by the CCN and is communicated to the TIPM (Gateway) via the CAN-B bus. The TIPM then rebroadcasts this information onto the CAN-C bus where the DTCM is a receiver.

The Cluster (CCN) will support circuitry which interfaces to the system's Transfer Case Range Select Switch, including a Transfer Case Range Select Switch voltage supply and a Transfer Case Range Select Switch input. The purpose of this circuitry is to determine the mode currently being requested by the operator via the resistance ladder network in the shifter assembly, where the Transfer Case Range Select Switch is packaged.

The NEUTRAL Select Switch Input will provide the operator with the ability to place the Transfer Case in Neutral. The Transfer Case Range Switch input will provide the operator with the ability to place the transfer case in 2WD, 4WD AUTO, 4WD LOCK, and 4WD LOW. The NEUTRAL Select Switch is a momentary pushpin switch; the Transfer Case Range Select Switch is a 4-position rotary contact

switch; both of these switches are provided through a resistor network for diagnostic purposes. The input will have an internal 1.0K +/- 1% pull-up resistor to 5V.

As the selected position in the switch varies and/or the NEUTRAL Switch is depressed or not, the resistance between the Cluster (CCN) voltage supply and Transfer Case Range Select Switches input will vary. Hardware, software, and calibrations within the Cluster will be provided that interpret the external resistance between the module's Transfer Case Range Select Switches voltage supply and Transfer Case Range Select Switches inputs as given in the table below:

NOTE: **There is no requirement for the DTCM to distinguish between a neutral request from the 4WD AUTO or the 4WD LOW position. Resistances in these ranges will be represented as a Neutral Switch Activation.**

TRANSFER CASE MODE SENSOR SIGNAL

The Transfer Case Mode Sensor Signal Input will provide the DTCM feedback about the position of the transfer case. The mode sensor is a linear analog position sensor with a 1.4K +/- 20% potentiometer and a 1 K +/- 20% wiper resistor that converts the motor shaft position into a multiplexed voltage. The mode sensor (on the active transfer case) is an active device where the sensor's current changes as the motor shaft position changes

TRANSFER CASE BI-DIRECTIONAL MOTOR CONTROL (A AND B)

This output will control a Bi-directional DC motor that controls a clutch pack in the Transfer Case that varies the torque transfer between the front and rear axles.

MODES OF OPERATION

NORMAL OPERATION

This mode is achieved by the ignition being switched in the RUN position, which powers up the 5V regulator and generates the appropriate RESET for the microprocessor. This mode also includes any required power-up system checks.

SHUT DOWN MODE

This mode is activated when the ignition switch turned to the off position. The DTCM will perform any required Shut Down tasks prior to turning off the 5V regulator.

LIMP-IN MODE

This mode is entered when the DTCM has detected an error condition that prevents the system from performing its required task. The DTCM operation will vary depending from modified operation to total system shut down based on the failure that has occurred.

REMOVAL

REMOVAL

1. To gain access to the Drive Train Contol Module (DTCM), remove the driver side foot rest. Refer to **FOOT REST, FLOOR, FRONT, REMOVAL** .

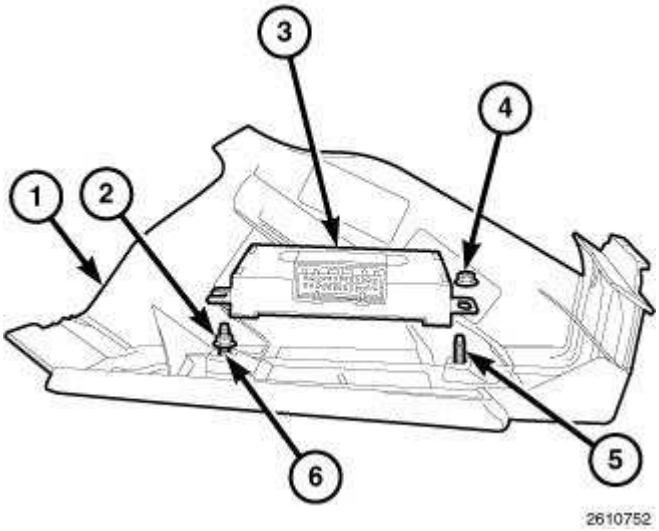

Fig. 35: Drive Train Control Module
Courtesy of CHRYSLER GROUP, LLC

2. Loosen the mounting nut (2) from mounting stud (6), remove mounting nut (4) from mounting stud (5).
3. Slide DTCM from mounting stud (6) and remove from drivers side foot rest (3).

INSTALLATION

INSTALLATION

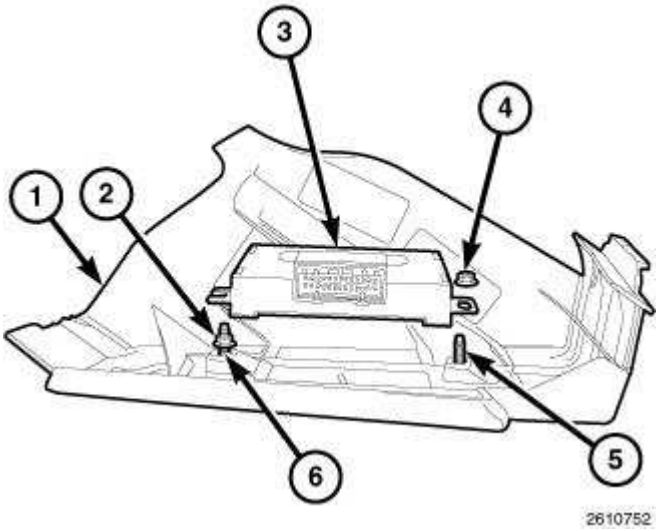

Fig. 36: Drive Train Control Module
Courtesy of CHRYSLER GROUP, LLC

1. Slide the Drive Train Control Module (3) on the mounting stud (6) and over mounting stud (5).
2. Intstall the mounting nuts (2 and 4). Tighten the nuts to 16 N.m (12 ft. lbs.).
3. Install the drivers side foot rest. Refer to **FOOT REST, FLOOR, FRONT, INSTALLATION** .

MODULE, ELECTRO-HYDRAULIC POWER STEERING

DESCRIPTION

DESCRIPTION

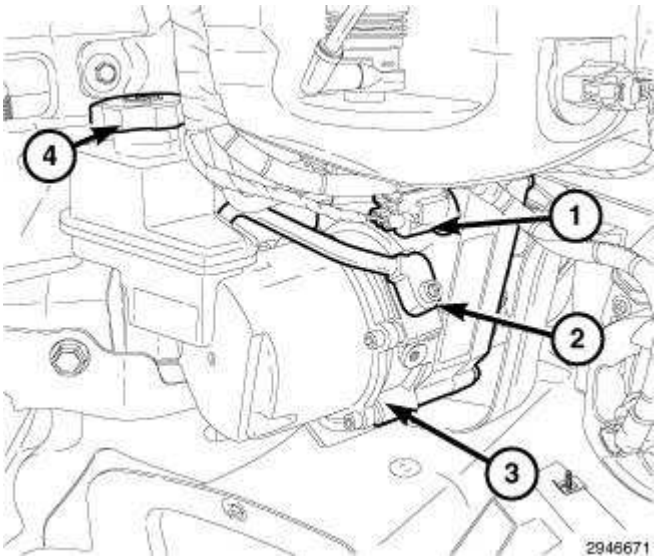

Fig. 37: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

CAUTION: There is an Electro Hydraulic Power Steering (EHPS) pump on Non-SRT vehicles which requires a different power steering fluid. Do not mix power steering fluid types. Damage may result to the power steering pump and system if any other fluid is used. The EHPS system uses fluid which meets material specification MS-11655 or equivalent. Do not overfill.

NOTE: There is no internal service of the Electro-Hydraulic Power Steering (EHPS) module. The EHPS module is integral to the EHPS pump (3). Replace the EHPS module as an assembly, including the brackets, and EHPS pump.

The EHPS pump is located in front of the right side tire and can be accessed by loosening and positioning aside the right front wheelhouse splash shield.

OPERATION

OPERATION

CAUTION: There is an Electro Hydraulic Power Steering (EHPS) pump on Non-SRT vehicles which requires a different power steering fluid. Do not mix power steering fluid types. Damage may result to the power steering pump and system if any other fluid is used. The EHPS system uses fluid which meets material specification MS-11655 or equivalent. Do not overfill.

Multiple modules work together to improve vehicle steering assist at different rates at different speeds. At slow speeds (parking maneuvers) more assist is available and at high speeds less assist is available. The EHPS module uses the CAN - C data bus for inputs and outputs of the information necessary for operation. The use of a scan tool is necessary for diagnostics. EHPS module faults are stored in a diagnostic program memory and are accessible with the scan tool. Faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are not erased if the battery is disconnected. For descriptions and procedures related to DTCs. Refer to **DIAGNOSIS AND TESTING** .

The Electro-Hydraulic Power Steering (EHPS) Pump assembly contains a control module, brushless electric motor, and hydraulic pump integrated into a single unit. The EHPS Pump draws power from the 12-Volt electrical system and provides the necessary flow and pressure to the steering gear to provide normal power steering. The output flow of the EHPS Pump is varied as a function of Steering Wheel Rate (received from SAS) and Vehicle Speed (received from ABS Module) in order to provide the optimum flow of power steering fluid to the steering gear under all operating conditions. The EHPS Pump will start to provide steering assist when the Vehicle speed message greater than 5 km/h (3 mph) is received on CAN C. If the Vehicle Speed message is missing at vehicle startup, the EHPS Pump will not operate. If the Vehicle Speed message is lost during operation the EHPS pump will use a default vehicle speed of 85 km/h (59 mph) to calculate desired flow and as a result, steering effort will no longer be speed sensitive. If the Steering Wheel Position message is lost the EHPS Pump will use a default steering wheel rate of 230°/sec to calculate desired flow and as a result, steering effort may be higher on evasive steering maneuvers. The EHPS pump will resume normal operation automatically once any missing message or out of range condition noted above is restored to normal.

REMOVAL

REMOVAL

NOTE: There is no internal service of the Electro-Hydraulic Power Steering (EHPS) module. The EHPS module is integral to the EHPS pump. Replace the EHPS module as an assembly, including the brackets, and EHPS pump.

For replacement of the EHPS module. Refer to **PUMP, REMOVAL** .

INSTALLATION

INSTALLATION

NOTE: There is no internal service of the Electro-Hydraulic Power Steering (EHPS) module. The EHPS module is integral to the EHPS pump. Replace the EHPS

module as an assembly, including the brackets, and EHPS pump.

For installation of the EHPS module. Refer to **PUMP, INSTALLATION** .

MODULE, ELECTRONIC SHIFT

DESCRIPTION

8HP45

The Electronic Shift Module (ESM) on the 8HP45 is part of the shifter assembly called the E-Shifter. For more information on the E-Shifter and FLOOR SHIFT, refer to **SHIFTER, TRANSMISSION, DESCRIPTION** and **SHIFTER, TRANSMISSION, OPERATION** .

NAG1

The Electronic Shift Module (ESM) on the NAG1 is part of the shifter assembly called the Shift Lever Assembly (SLA). For more information on the SLA, refer to **SHIFTER, TRANSMISSION, DESCRIPTION** and **SHIFTER, TRANSMISSION, OPERATION** .

MODULE, GLOW PLUG, 3.0L DIESEL [EXF]

DESCRIPTION

DESCRIPTION

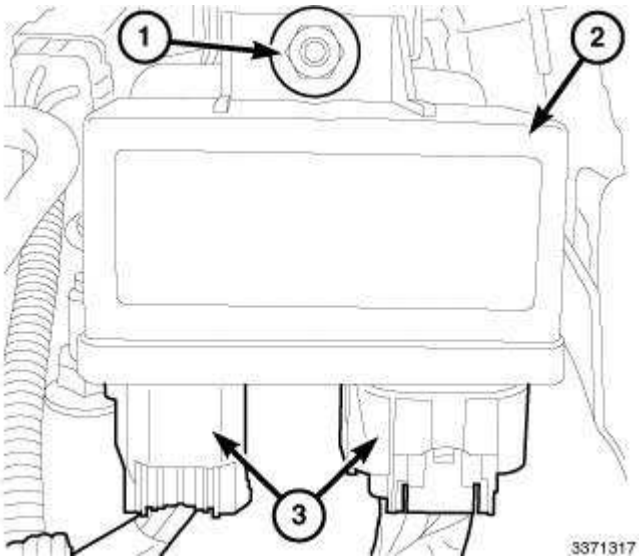

Fig. 38: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

The Glow Plug Module is located under the cowl panel cover behind the right front shock tower, and is attached to the strut tower support.

OPERATION

OPERATION

The Glow Plug Module is connected to a fused B(+) circuit and receives a path to ground at all times through the engine wiring harness. These connections allow it to remain functional regardless of the Electronic Ignition Switch (EIS) position. When the Powertrain Control Module (PCM) receives the On and Ignition Run signals from the EIS, it will send a signal through the LIN bus to actuate the Glow Plug Module for a period of time that depends on ambient air and engine coolant temperature.

The Glow Plug Module utilizes integrated relays and microprocessors to actuate the Glow Plugs based on input from the PCM. The Glow Plug Module has on-board diagnostic functions that will set powertrain DTCs, which will be transmitted to the PCM through the LIN bus. Because the Glow Plug Module uses microprocessors to control battery voltage to the Glow Plugs, conventional diagnostic methods will not always prove conclusive when diagnosing problems with the Glow Plug Module and related circuits. For proper diagnosis of the Glow Plug Module, the LIN data bus or electronic communication related to Glow Plug Module operation, a diagnostic scan tool is required. Refer to **COMMUNICATION, OPERATION**.

DIAGNOSIS AND TESTING

MODULE - GLOW PLUG

The Powertrain Control Module (PCM) actuates the glow plug module via the LIN bus. For glow plug module DTCs and related diagnostics, refer to appropriate Engine Electrical Diagnostics - Diesel.

REMOVAL

REMOVAL

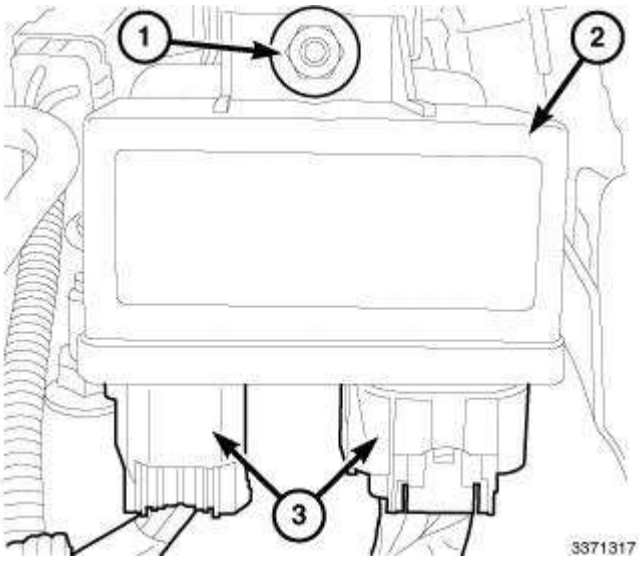

Fig. 39: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the cowl panel cover. Refer to **COVER, COWL PANEL, REMOVAL** .
3. Remove the nut (1) securing the glow plug module (2).
4. Pull up and disconnect the two glow plug wire harness connector (3).

INSTALLATION

INSTALLATION

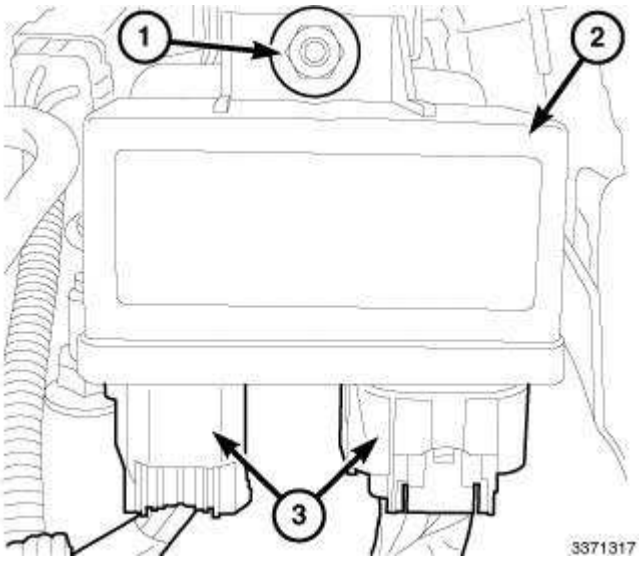

Fig. 40: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Connect the Glow Plug Module harness connector (3).
2. Install the glow plug module (2) and securely tighten the retaining nut (1).
3. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION** .
4. Connect the negative battery cable.

MODULE, HANDS FREE

DESCRIPTION

DESCRIPTION

The hands-free cellular system on this vehicle uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rearview mirror picks up vehicle

occupant's voices.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to a combine 10 phone and BTSA capable devices, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

The hands free module is located under the instrument panel to the left of the steering column mounted to the amplifier bracket.

OPERATION

OPERATION

STEERING WHEEL CONTROLS

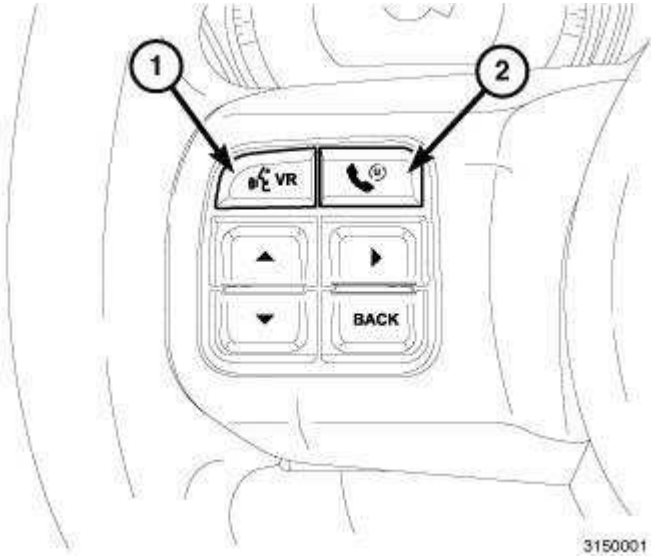

Fig. 41: Uconnect(TM) Phone Button & Uconnect(TM) Voice Command Button
Courtesy of CHRYSLER GROUP, LLC

The Uconnect™ Phone Button (2) is used to get into the phone mode and make calls, show recent, incoming, outgoing calls, view phonebook etc., When you press the button you will hear a BEEP. The beep is your signal to give a command.

The Uconnect™ Voice Command Button (1) is only used for "barge in" and when you are already in a call and you want to send Tones or make another call.

The Voice Command button (1) is also used to access the Voice Commands for the Uconnect™ Voice Command features if your vehicle is equipped. Please see the Uconnect™ Voice Command information for direction on how to use the button.

The Uconnect™ Phone is fully integrated with the vehicle's audio system. The volume of the

Uconnect™ Phone can be adjusted either from the radio volume control knob or from the steering wheel radio control (right switch), if so equipped.

Voice commands can be used to operate the Uconnect™ Phone and to navigate through the Uconnect™ Phone menu structure. Voice commands are required after most Uconnect™ Phone prompts.

UCONNECT TOUCH™ 4.3

The Uconnect™ Voice Command system allows you to control your AM, FM radio, satellite radio, disc player, SD Card, USB/iPod and Sirius Travel Link.

Uconnect™ Phone is a voice-activated, hands-free, invehicle communications system. Uconnect™ Phone allows you to dial a phone number with your mobile phone.

Uconnect Phone supports the following features:

Voice Activated features:

- Hands Free dialing via Voice ("Call John Smiths Mobile" or, "Dial 248 555-1212").
- Redialing last dialed numbers ("Redial").
- Calling Back the last incoming call number ("Call Back").
- View Call logs on screen ("Show incoming calls", "Show Outgoing calls", "Show missed Calls", "Show Recent Calls").
- Searching Contacts phone number ("Search for John Smith Mobile").

Screen Activated Features:

- Dialing via Keypad using touch screen.
- Viewing and Calling contacts from Phonebooks displayed on the touch screen.
- Setting Favorite Contact Phone numbers so the are easily accessible on the Main Phone screen.
- Viewing and Calling contacts from Recent Call logs.
- Listen to Music on your Bluetooth™ Device via the touch screen.
- Pairing up to 10 phones/audio devices for easy access to connect to them quickly.

UCONNECT TOUCH™ 8.4/8.4 NAV

The Uconnect™ Voice Command system allows you to control your AM, FM radio, satellite radio, disc player, SD Card, USB/iPod and Sirius Travel Link.

Uconnect Phone supports the following features:

Voice Activated Features:

- Hands Free dialing via Voice ("Call John Smiths Mobile" or, "Dial 248 555-1212").

- Hands Free text to speech listening of your incoming SMS messages.
- Hands Free text messaging ("Send a message to John Smiths Mobile").
- Redialing last dialed numbers ("Redial").
- Calling Back the last incoming call number ("Call Back").
- View Call logs on screen ("Show incoming calls", "Show Outgoing calls", "Show missed Calls", "Show Recent Calls").
- Searching Contacts phone number ("Search for John Smith Mobile").

Screen Activated Features:

- Dialing via Keypad using touch screen.
- Viewing and Calling contacts from Phonebooks displayed on the touch screen.
- Setting Favorite Contact Phone numbers so the are easily accessible on the Main Phone screen.
- Viewing and Calling contacts from Recent Call logs.
- Reviewing your recent Incoming SMS.
- Sending a text message via the touch screen.
- Listen to Music on your Bluetooth® Device via the touch screen.
- Pairing up to 10 phones/audio devices for easy access to connect to them quickly.

NOTE: Your phone must be capable of SMS messaging via Bluetooth™ for messaging features to work properly.

Your mobile phone's audio is transmitted through your vehicle's audio system; the system will automatically mute your radio when using the Uconnect™ Phone.

Two buttons on the rearview mirror, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

REMOVAL

REMOVAL

3. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

4. Connect the negative battery cable.

MODULE, HEATED SEAT

DESCRIPTION

DESCRIPTION

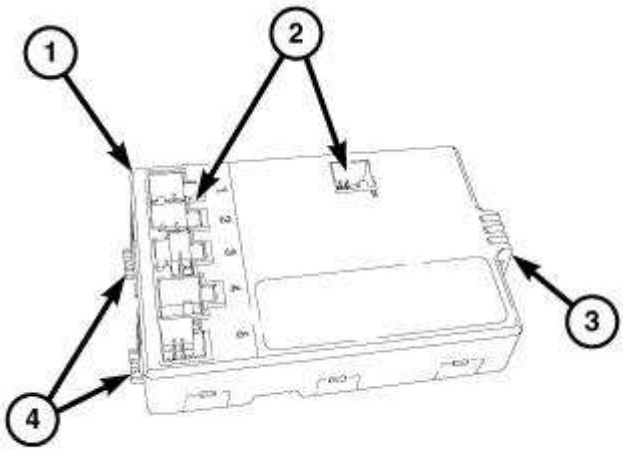

Fig. 46: Heated Seat Module (HSM), Electrical Connector Outlets & Tabs
Courtesy of CHRYSLER GROUP, LLC

The Heated Seat Module (HSM) (1), also know as the comfort seat wheel module, is a microprocessor designed to use the Controller Area Network (CAN) data bus messages from the U-Connect Touch™ screen module to operate the front heated seats, front vented seats, heated steering wheel and the rear heated seats, depending on how equipped.

When equipped with rear heated seats, the HSM receives request signals from the rear heated seat switches over hard-wired circuits.

The HSM has multiple electrical connector outlets (2) and three retaining tabs (3 and 4) that secure it to a bracket mounted to the underside of the front passenger seat.

OPERATION

OPERATION

The Heated Seat Module (HSM) controls the heated seat system, vented seat system and the heated steering wheel, depending on how equipped. The HSM is secured to a mounting bracket located under the front passenger seat. The HSM responds to heated and vented seat and heated steering wheel switch messages and ignition status inputs by controlling the 12 volt Direct Current (DC) output to the seat and steering wheel heating elements and front vented seat motors through integral solid-state relays.

When either of the front heated seat switches in the U-Connect Touch™ screen module are pressed, the module sends a message over the Controller Area Network (CAN) data bus to the HSM, signaling the HSM to energize the heating elements for the selected front seat. When equipped with rear heated seats, a request signal is sent to the HSM over a hard-wired circuit from the rear heated seat switch, to signal the HSM to supply power to the selected rear seat heating elements.

When either of the front vented seat switches in the U-Connect Touch™ screen module are pressed, the module sends a message over the CAN data bus to the HSM, signaling the HSM to operate the vented seat motors for the selected front seat.

When the heated steering wheel switch in the U-Connect Touch™ screen module is pressed, the module sends a message over the CAN data bus to the HSM, signaling the HSM to energize the heating element for the steering wheel.

The HSM energizes the integral solid-state relays that supply battery current to the heating elements. Heated seats turn off after 45 minutes of continuous operation. If high-level heating is selected, the control system will remain at the high level for 20 minutes and then drop to the low level. Normal heating cycle for the heated steering wheel is a minimum of 52 minutes.

The heated and vented seat and heated steering wheel system only operate when the ignition is in the Run position, and will turn off automatically whenever the ignition is set to any position other than Run.

The HSM is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** . The HSM will automatically turn off the heating seat and steering wheel elements if it detects an open or low short in a heating element circuit. The HSM will automatically turn off the vented seat motors if it detects an open or low short in a vented seat motor circuit.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

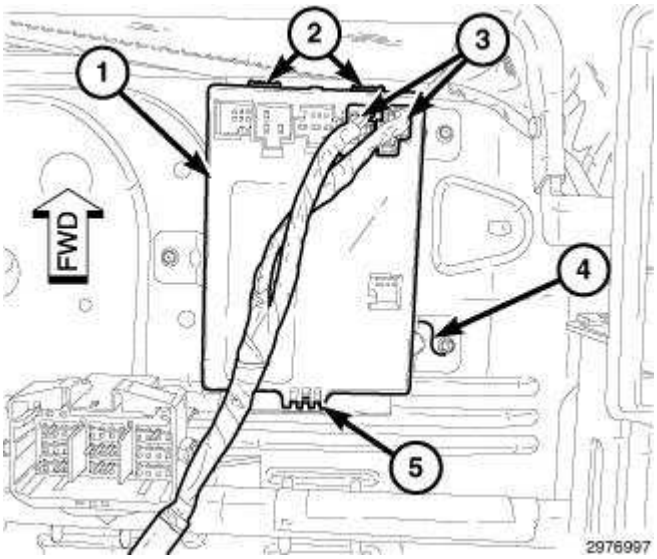

Fig. 47: Electrical Connectors, Heated Seat Module, Retaining Tab & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the fasteners that secure the front passenger seat to the body and tip the seat rearward to gain access to the underneath of the seat. Refer to **SEAT, FRONT, REMOVAL** .
3. Disconnect the electrical connectors (3) from the Heated Seat Module (HSM) (1).
4. Disengage the retaining tab (5) that secures the rear of the HSM to the bracket (4).
5. Disengage the two front retaining tabs (2) from the bracket and remove the HSM.

INSTALLATION

INSTALLATION

CAUTION: Properly align the Heated Seat Module (HSM) retaining tabs to the bracket, prior to engagement. Failure to follow these instructions may result in damage to the HSM.

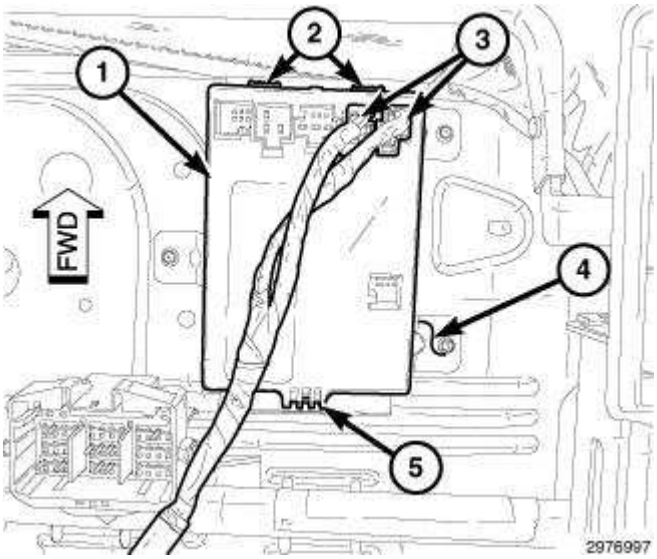

Fig. 48: Electrical Connectors, Heated Seat Module, Retaining Tab & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the Heated Seat Module (HSM) (1) to the bracket (4) and engage the two front retaining tabs (2). Make sure the front retaining tabs are correctly engaged to the bracket.
2. Engage the rear HSM retaining tab (5). Make sure the rear retaining tab is fully engaged to the bracket.
3. Connect the electrical connectors (3) to the HSM.
4. Install the seat. Refer to **SEAT, FRONT, INSTALLATION** .
5. Reconnect the negative battery cable.
6. Verify proper heated seat system operation.

MODULE, INTEGRATED CENTER STACK SCREEN

DESCRIPTION

DESCRIPTION

The LX only comes equipped with a 8.4 inch (Mid) Integrate Center Stack (ICS) Screen Modules. The ICS screen is located in the center of the instrument panel.

The 8.4 inch (mid) (1) is a full touch screen for audio system and HVAC operations.

OPERATION

OPERATION

The Integrated Center Stack (ICS) screen is the user interface for many functions and features in the vehicle.

When the user selects a function on the ICS screen, the touch sends a message to the Telematics Gateway Module and then to the bus to the module related to the users input. The module then makes the changes requested by the users input and sends a message back to reflect the change has been made.

The following features can be accessed through the ICS screen:

- All Radio functions including CD/DVD
- Media players
- Satellite Radio, if equipped
- GPS and navigation features, if equipped
- Heated seats, if equipped
- Climate controls
- Bluetooth functions, if equipped
- Personal convenience options
- Dealer Mode

REMOVAL

REMOVAL

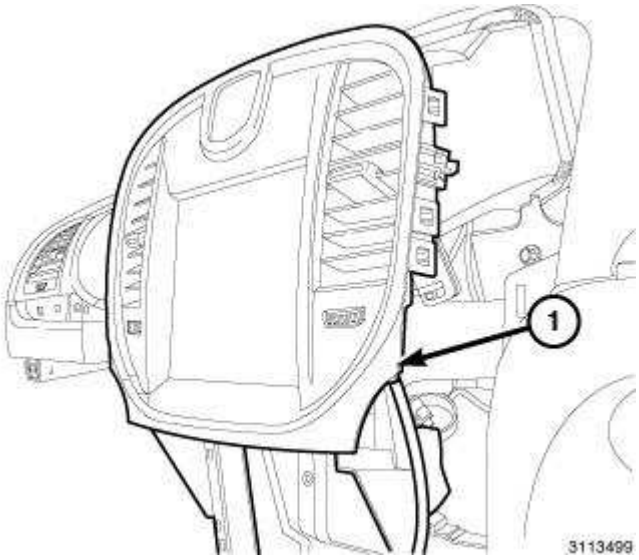

Fig. 49: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the instrument cluster bezel retainer (1) and remove the bezel (2). Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .

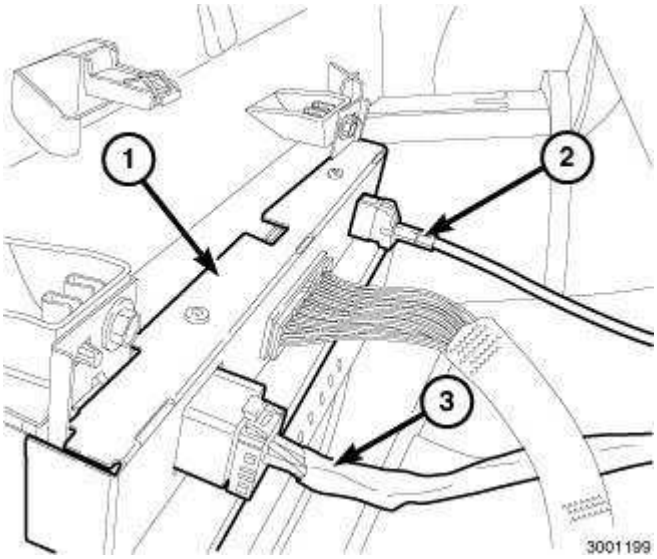

Fig. 50: Harness Connectors & Integrated Center Stack (ICS) Screen Module
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the harness connectors (2 & 3) from the rear of the Integrated Center Stack (ICS) screen module (1) to allow better access to the 40 - way connector.

CAUTION: Push the 40 way connector in before pushing on the locking clip. Failure to follow these instructions will damage or break the connector locking clip.

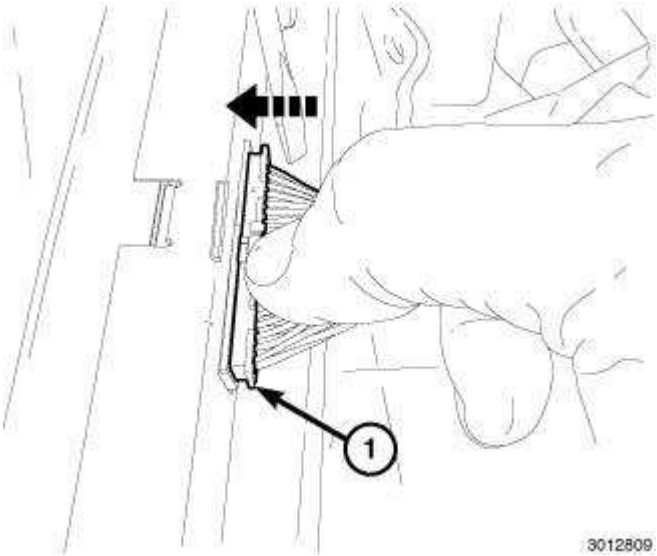

Fig. 51: 40 - Way Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: In the event that the locking tab breaks or is broken, do not replace the harness. The connector will still lock and the harness will still function as designed.

CAUTION: Never pull the connector out by the wires. Failure to follow these instructions will damage or break the wires and/or connector.

4. Push in on the 40 - way connector (1).

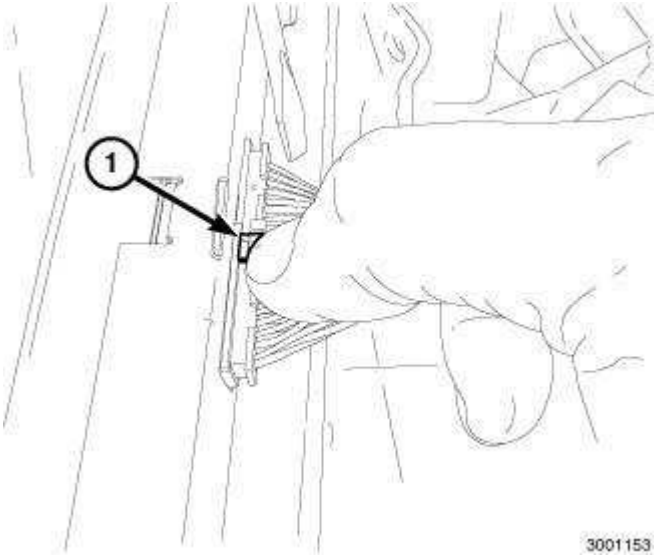

Fig. 52: Connector Release Lock
Courtesy of CHRYSLER GROUP, LLC

5. Gently push down on the connector release lock (1).

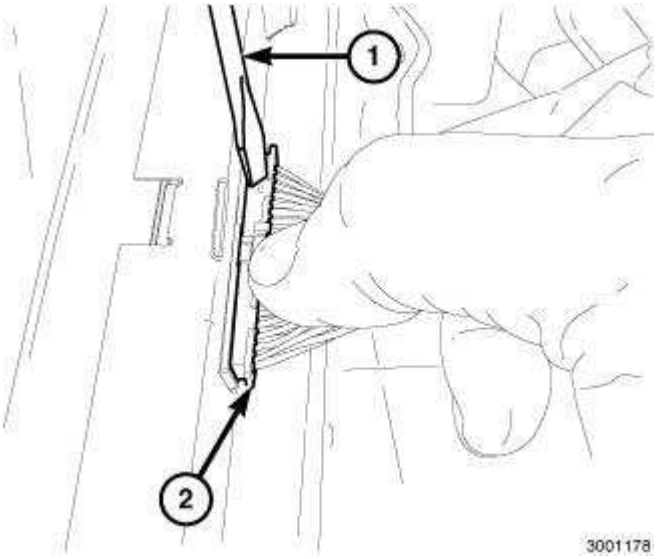

Fig. 53: Screw Driver & Connector
Courtesy of CHRYSLER GROUP, LLC

6. Using a pocket screw driver or a trim stick (special tool #C-4755, Trim Stick) or equivalent (1), gently pry on one side of the connector (2).

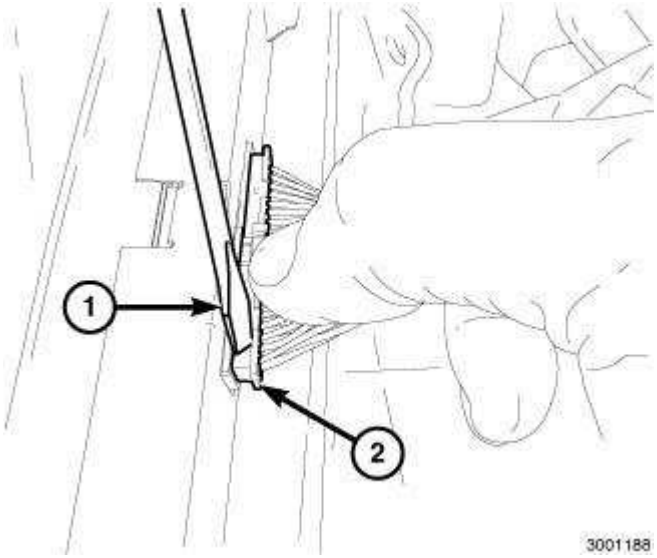

Fig. 54: Screw Driver & Connector
Courtesy of CHRYSLER GROUP, LLC

7. Using a pocket screw driver or a trim stick (special tool #C-4755, Trim Stick) or equivalent (1), gently pry on the other side of the connector (2).
8. Use steps 7 and 8 until the connector is out far enough to grab the connectors with your fingers.

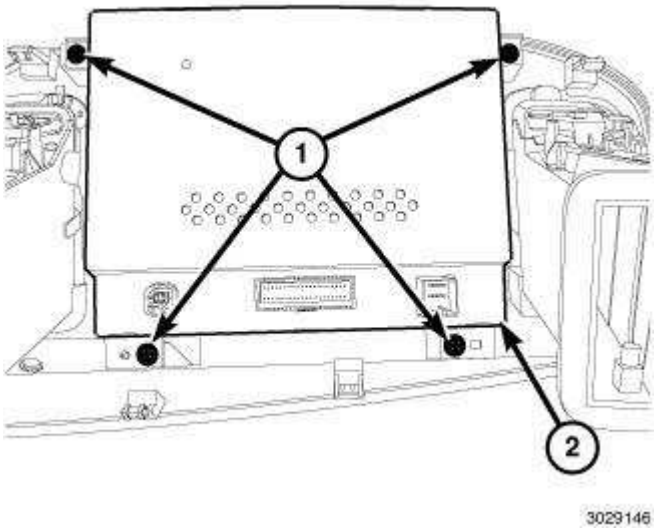

Fig. 55: Retainers
Courtesy of CHRYSLER GROUP, LLC

9. Remove the retainers (1) and remove the (ICS) screen module (2) from the instrument panel bezel.

INSTALLATION

INSTALLATION

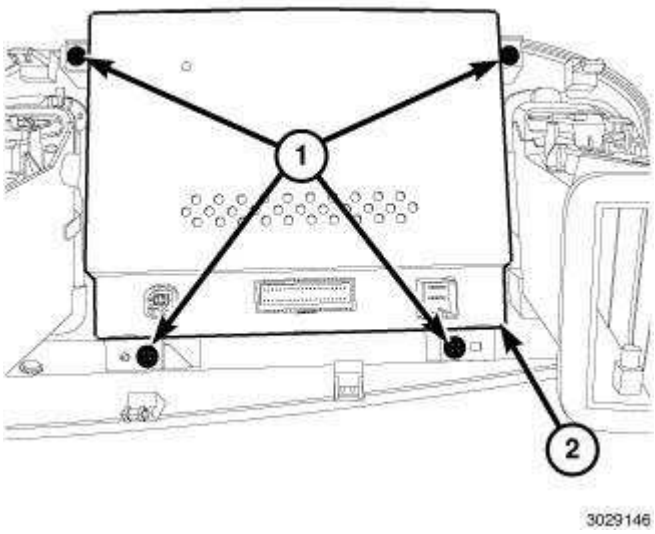

Fig. 56: Retainers
Courtesy of CHRYSLER GROUP, LLC

1. Position the (ICS) screen module (2) into the bezel and install the retainers (1).

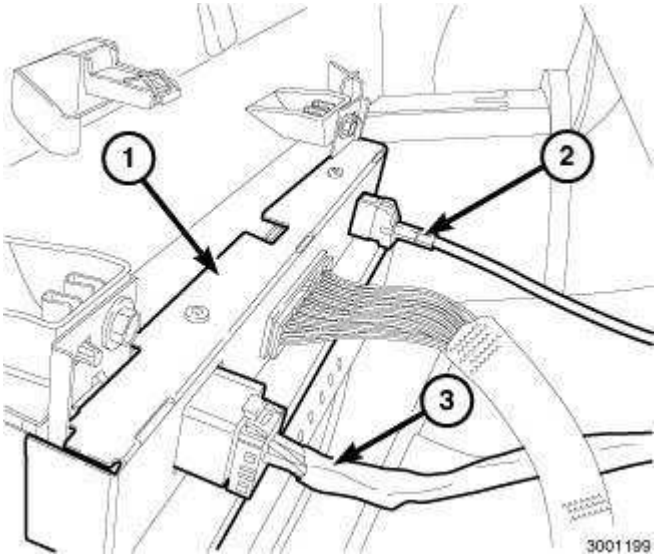

Fig. 57: Harness Connectors & Integrated Center Stack (ICS) Screen Module
Courtesy of CHRYSLER GROUP, LLC

2. Connect the harness connectors (2 & 3) to the rear of the Integrated Center Stack (ICS) screen module (1).

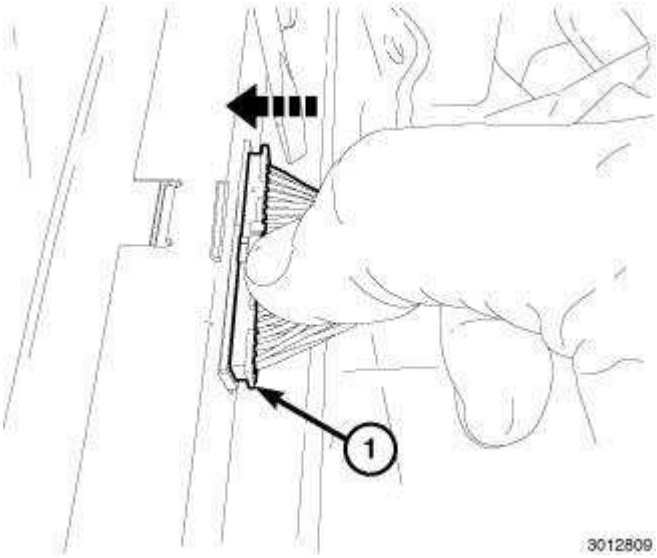

Fig. 58: 40 - Way Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: In the event that the locking tab breaks or is broken, do not replace the harness. The connector will still lock and the harness will still function as designed.

3. Carefully connect the 40 - way connector (1).

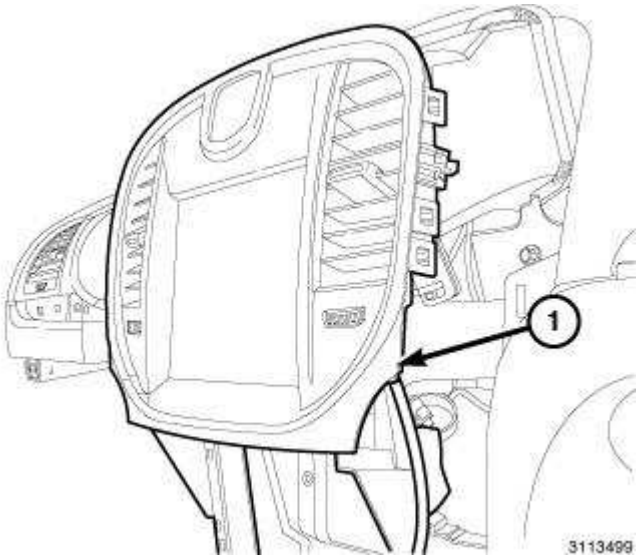

Fig. 59: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Install the instrument cluster center bezel (2). Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
5. Connect the negative battery cable.

MODULE, MEMORY

DESCRIPTION

DESCRIPTION

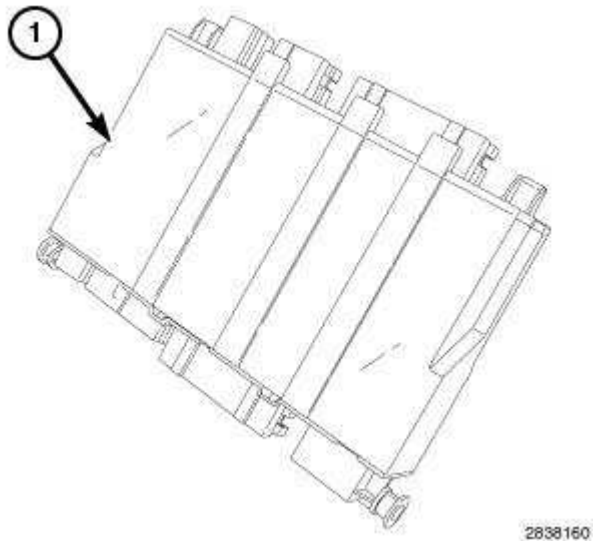

Fig. 60: seat
Courtesy of CHRYSLER GROUP, LLC

The Memory Seat Module (MSM) is located underneath the driver seat. It is used in conjunction with the other modules to recall the driver seat to one of two preset seat positions (horizontal, vertical, and recliner). The memory system is able to store and recall all driver side power seat positions, outside mirror positions, power tilt/telescopic steering column positions and power adjustable pedal position, as equipped. The memory seat system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twelve radio station presets (six AM and six FM), also for two drivers. The memory system will also store and recall the last station listened to for each driver, even if it is not one of the twelve preset stations.

The memory seat system will automatically recall the settings when a button of the memory switch located in the driver door trim panel is pressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if the "RKE Linked to Memory" feature is enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature.

OPERATION

OPERATION

The Memory Seat Module (MSM) receives battery current through a circuit breaker in the Power Distribution Center (PDC). The memory system remains operational, regardless of the ignition position. When the driver memory switch button or FOBIK transmitter button (when programmed) is

pushed, a signal is sent to the MSM over the Controller Area Network (CAN) data bus. The MSM is responsible for the 12 volt Direct Current (DC) feed and ground path to the power seat adjuster motors and to the other memory system components.

The MSM also receives hard-wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors, driver side view mirror motors, power adjustable steering column motors and power adjustable pedal motor, when equipped. The programmed software in the MSM allows it to know where the driver seat, mirror, steering column and pedals, as equipped, are located in there designed travel by a pulse count, generated from hall effect sensors. This way, when a memory seat switch is pressed the MSM will power these components until the correct preset location is achieved. The MSM will prevent the seat memory recall function from being initiated, if the transmission gear selector is not in the Park position. These inputs are monitored over the CAN bus by the MSM.

A memory setting is saved by pressing the "Set" button, then pressing either the memory "1" or "2" button within five seconds of pressing the "Set" button.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" FOBIK transmitter.

The MSM performs the following functions:

- Positions the driver power seat (fore/aft, up/down, tilt and recline positions).
- Sends the memory save or recall (number 1 or number 2) command over the CAN bus circuit to the other memory system components, radio station pre-sets and power mirror positions.
- Provides for the easy entry/exit feature.

When a memory button is pressed (number 1 or number 2) on the memory seat switch, it provides resistive signal to the MSM. The MSM will then position the driver seat to the pre-set location. When a FOBIK transmitter button is pressed, depending on which transmitter (number 1 or number 2), the WIN/SKIM receiver sends the recall request and FOBIK number (number 1 or number 2) data message. The FOBIK transmitter function depends on if the MSM is programmed to trigger the recall (linked FOBIKs).

A FOBIK is "linked" to a memory setting by pressing the "Set" button and then pressing either the memory "1" or "2" button within 5 seconds of pressing the set button, then by pressing the "lock" button on the selected FOBIK.

The memory seat system "Easy Entry and Exit" feature provides the driver with more room to enter or exit the vehicle. When the driver seat is in a memorized position, it will move rearward 55 millimeters (2.2 inches) or to the end of its travel, whichever occurs first, when the ignition is pressed to OFF. The seat will return to the pre-set position when the ignition is pressed to RUN.

The memory seat system "learns" the seat, mirror, column and pedal motors maximum end positions, when the motor reaches the limit of travel in any direction and stalls. Subsequently, movement will stop just short of that position to avoid extra stress on the motors and mechanisms. If the system learned a maximum position as a result of an obstruction, as for instance if a large object was placed on the floor behind the seat, the system can relearn the "true" maximum position through manually

operating the power seat after the obstruction is removed.

NOTE: **It is normal for the power accessories contained in the memory system to stop at the maximum "learned" position and then continue to the "true" maximum position when the control switch is released and then applied in the same direction a second time.**

Certain functions and features of the memory seat system rely upon resources shared with other electronic modules in the vehicle over the CAN bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware and component sensor current loads. At the same time, the memory seat system provides increased reliability, enhanced diagnostics and allows the addition of new feature capabilities.

NOTE: **Anytime a Memory Seat Module (MSM) or a driver power seat motor or seat track is replaced, the MSM must be cleared of all learned parameters using a scan tool and the Power Seat System Verification test must be performed.**

The use of a scan tool is needed for diagnosis of the MSM, CAN bus and other electronic modules. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

NOTE: **Anytime a Memory Seat Module (MSM) is replaced, the MSM must be cleared of all learned parameters using a scan tool, and the Power Seat System Verification test must be performed.**

NOTE: **Depending on how equipped, more memory seat module electrical connectors may be present than shown in the illustration.**

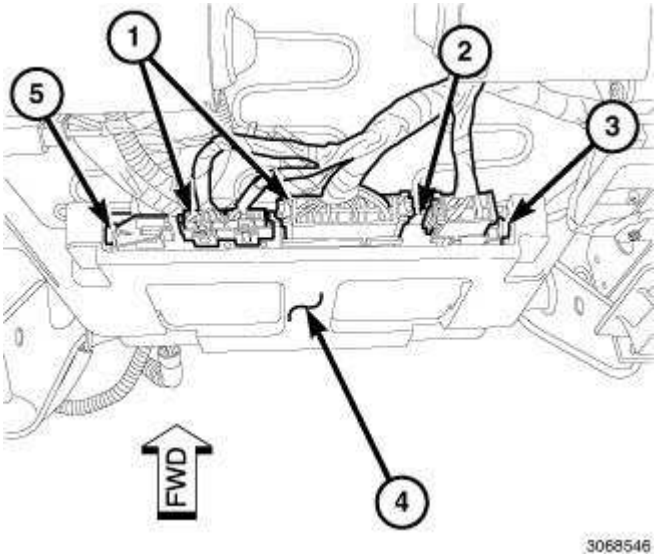

Fig. 61: Electrical Connectors, Memory Seat Module (MSM), MSM Retaining Tabs & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the fasteners that secure the driver seat to the body and tip the seat rearward to gain access to the underneath of the seat. Refer to **SEAT, FRONT, REMOVAL** .
3. Disconnect all the electrical connectors (1) from the front of the Memory Seat Module (MSM) (2).
4. Disengage the two front MSM retaining tabs (3 and 5) from the bracket (4) by carefully pushing up on the front of the MSM.
5. Disengage the two rear MSM retaining tabs from the bracket by carefully pulling the MSM forward.
6. Disconnect all electrical connectors from the rear of the MSM and remove the MSM.

INSTALLATION

INSTALLATION

NOTE: Depending on how equipped, more memory seat module electrical connectors may be present than shown in the illustration.

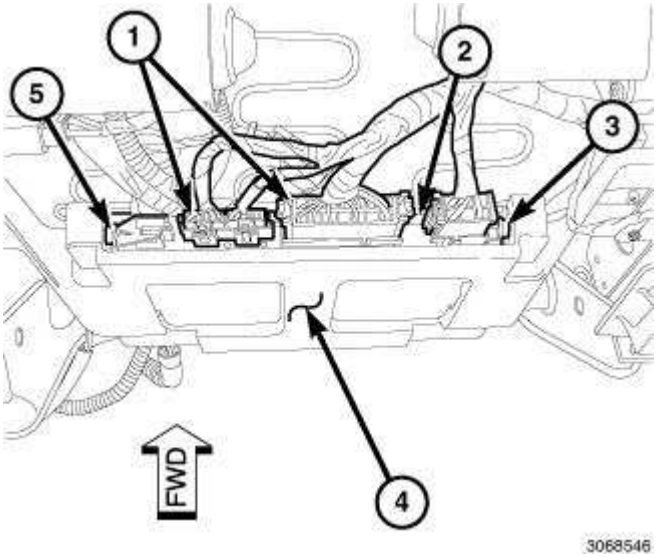

Fig. 62: Electrical Connectors, Memory Seat Module (MSM), MSM Retaining Tabs & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the Memory Seat Module (MSM) (2) to the bracket (4) and connect all electrical connectors to the rear of the MSM.

CAUTION: Properly align the Memory Seat Module (MSM) retaining tabs to the bracket, prior to engagement. Failure to follow these instructions may result damage to the MSM retaining tabs.

2. Install the MSM into the bracket and engage the two rear MSM retaining tabs to the bracket.
3. Engage the two front MSM retaining tabs (3 and 5) to the bracket by carefully pulling down on the front of the MSM.
4. Connect all the electrical connectors (1) to the front of the MSM.
5. Install the driver seat. Refer to **SEAT, FRONT, INSTALLATION** .
6. Reconnect the negative battery cable.

NOTE: Anytime a Memory Seat Module (MSM) is replaced, the MSM must be cleared of all learned parameters using a scan tool, and the Power Seat System Verification test must be performed.

7. Using a scan tool, select Clear All MSM Learned Parameters, found under the Memory Seat Module, Miscellaneous Functions tab.
8. Perform the Power Seat System Verification test. Refer to **STANDARD PROCEDURE** .
9. Verify proper memory seat system operation.

MODULE, POWERTRAIN CONTROL

DESCRIPTION

PCM

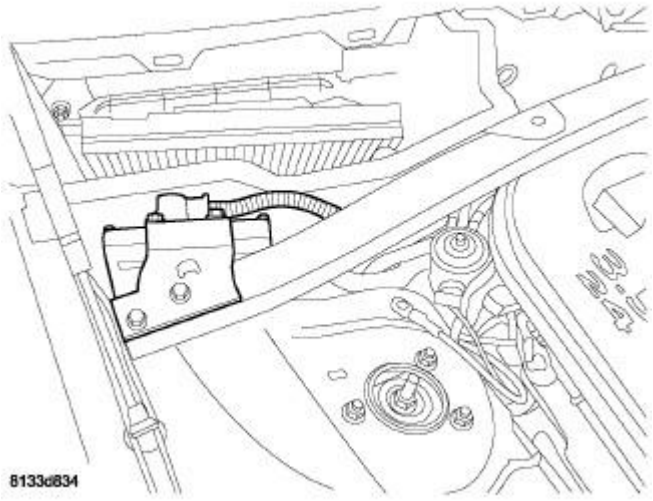

Fig. 63: PCM Location In Vehicle
Courtesy of CHRYSLER GROUP, LLC

The Powertrain Control Module (PCM) is located in the engine compartment. The PCM is referred to as NGC.

MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop** .

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O2S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O2S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O2S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensors (TPS) and pedal value sensors are monitored.

- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the O2S heater drivers (solid state devices) internal to the PCM. These drivers provide a PWM 0-12V signal to heat the O2S heater elements to optimize the O2S sensor signal output. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Direct Battery voltage
- Pedal Value Sensors (PVS)
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensors (TPS)
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within approximately 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay located in the IPM.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by actuating ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Direct Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor

- Manifold absolute pressure (MAP) sensor
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal)
- Pedal Value Sensors (PVS)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the electronic throttle control (ETC) motor and adjusts ignition timing accordingly.
- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.
- When the heating element has reached operating temperature located in the O2S, the PCM will begin monitoring O2 sensor output readings. The system will then leave the warm-up (open loop) mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the electronic throttle control (ETC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the A/C clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio.
- The PCM adjusts ignition timing by turning the ground path to the coils on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal)
- Vehicle speed

If the vehicle is under hard deceleration with the proper RPM and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

The PCM adjusts ignition timing by turning the ground path to the coils on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.

- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

STANDARD PROCEDURE

TCM QUICK LEARN - 42RLE ONLY (NON ABS)

The quick learn procedure requires the use of the appropriate scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 RPM
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60° and below 200°

TCM ADAPTATION - NAG1 ONLY

The adaptation procedure requires the use of the appropriate scan tool. This program allows the electronic transmission system to re-calibrate itself. This will provide the proper baseline transmission operation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Clutch Plate and/or Seal Replacement
- Electrohydraulic Unit Replacement or Recondition

1. With the scan tool, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings.

   NOTE: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.

2. Drive the vehicle until the transmission temperature is in the specified range.
3. Perform 4 to 5 coast downs from 5th to 4th gear and then 4th to 3rd gear.

   NOTE: For Upshift adaptation, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.

4. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times.
5. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever.
6. The TCM will store the adaptives every 10 minutes. After completion of the adaptation procedure make sure the vehicle stays running for at least 10 minutes.
7. It is possible to manually store the adaptives under the 10 minute time frame using the scan tool Store Adaptives procedure.

PCM/TCM REPROGRAMMING - GAS

And perform the PCM/TCM PROGRAMMING procedure. Refer to appropriate diagnostic information .

REMOVAL

DIESEL

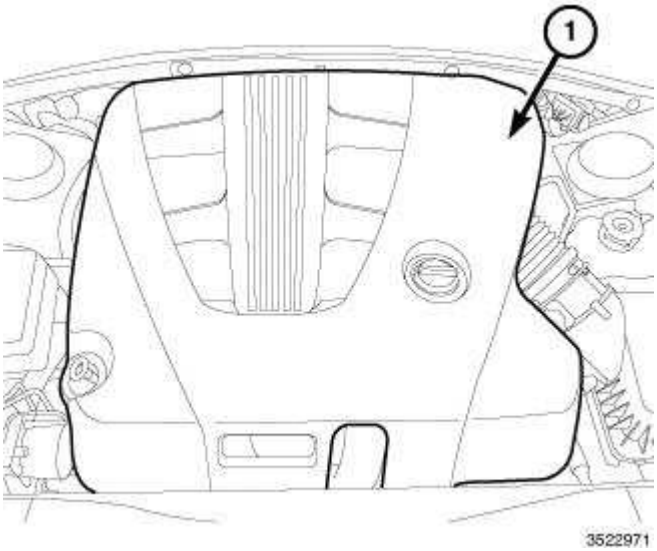

Fig. 64: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

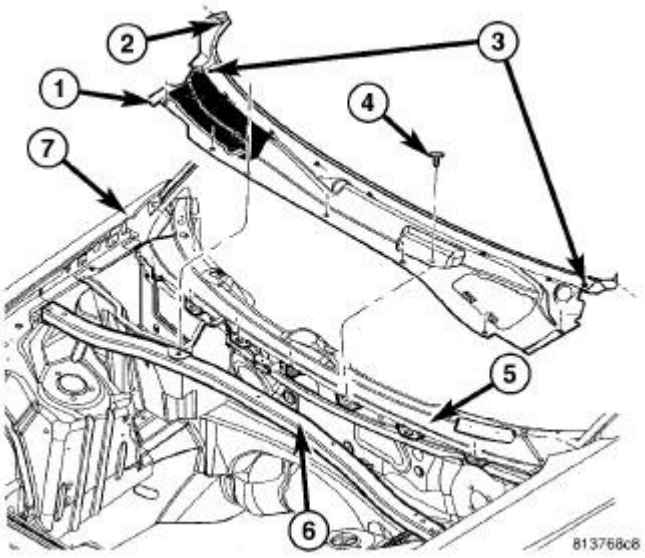

Fig. 65: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

3. Remove the wiper arm linkage. Refer to **LINKAGE, WIPER ARM, REMOVAL** .
4. Remove bolts and the strut support brace (6).

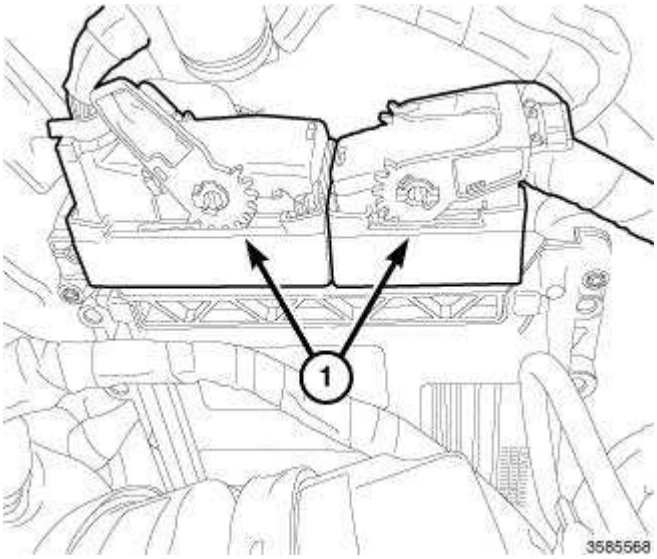

Fig. 66: Powertrain Control Module (PCM) Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the Powertrain Control Module (PCM) wire harness connector (1).

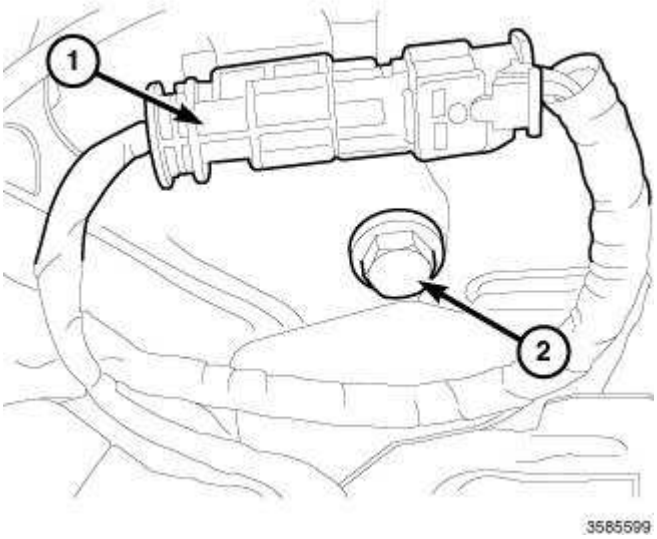

Fig. 67: Crash Sensor Wire Harness Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the crash sensor wire harness connector (1) from inner fender.
7. Remove bolt (2) and the PCM with mounting bracket.

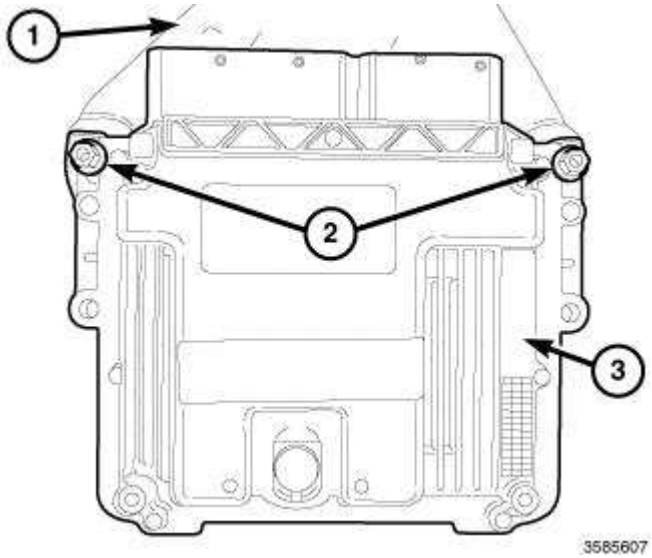

Fig. 68: Nuts, PCM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

8. Remove nuts (2) and the PCM (3) from mounting bracket (1).

GAS

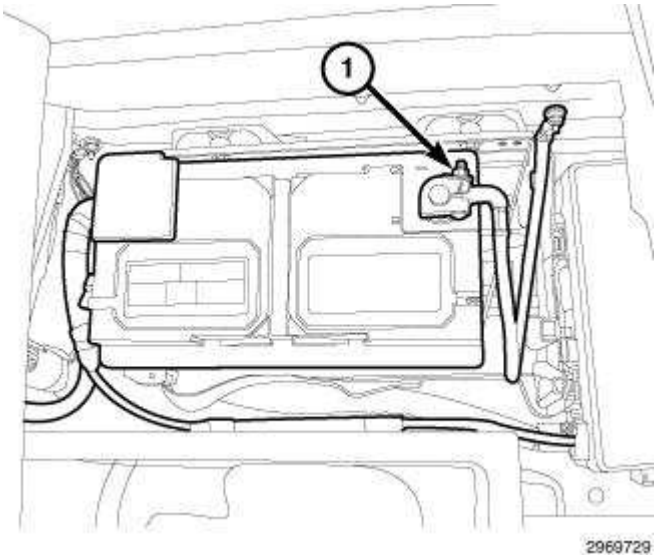

Fig. 69: Negative Battery Cable

1. Disconnect and isolate the negative battery cable (1).

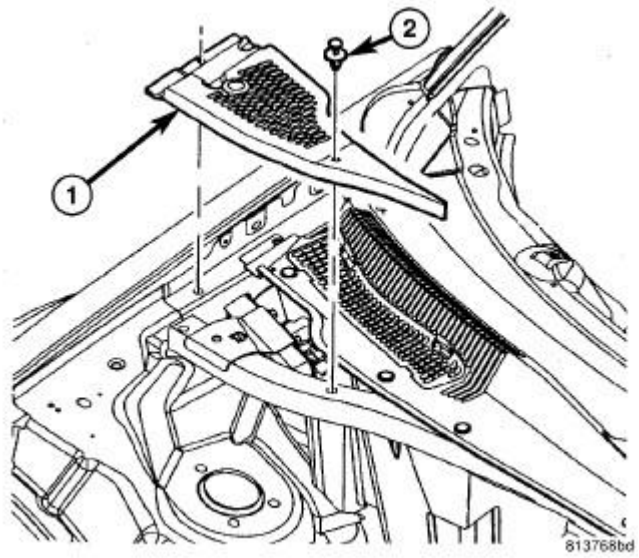

Fig. 70: Cowl Panel 1
Courtesy of CHRYSLER GROUP, LLC

2. Remove the two push pins (2) that secure the front cowl top panel (1) to the right rear corner of the engine compartment
3. Remove the front cowl top panel.

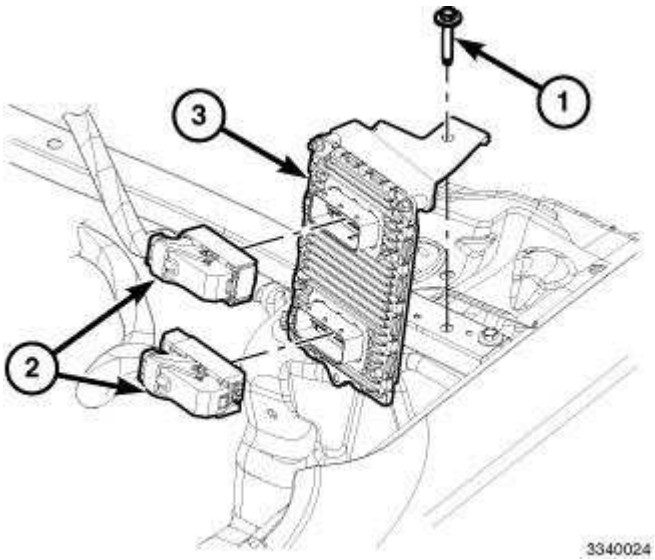

Fig. 71: Retaining Bolt, PCM Electrical Connectors & PCM
Courtesy of CHRYSLER GROUP, LLC

4. Remove the Powertrain Control Module (PCM) retaining bolt (1).
5. Disconnect the PCM electrical connectors (2).
6. Remove the PCM (3) from the vehicle.

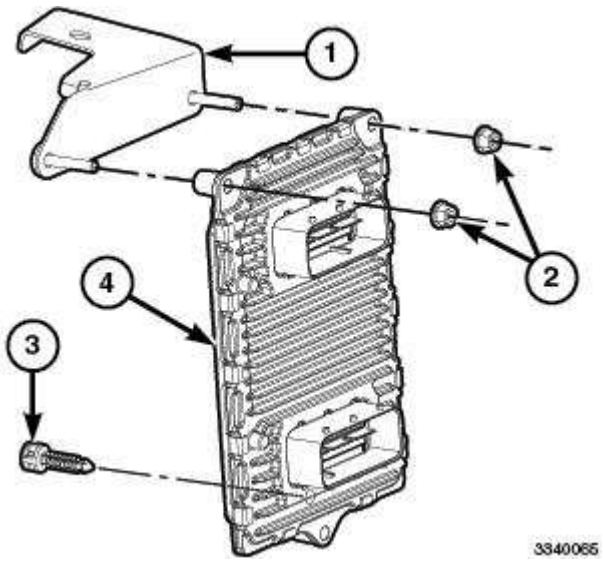

Fig. 72: NVH Rubber Bumper, PCM, Bracket & Nuts
Courtesy of CHRYSLER GROUP, LLC

7. If required, remove the NVH rubber bumper (3) from the PCM (4).
8. If required, remove the PCM mounting bracket (1) retaining nuts (2) and remove the bracket.

INSTALLATION

DIESEL

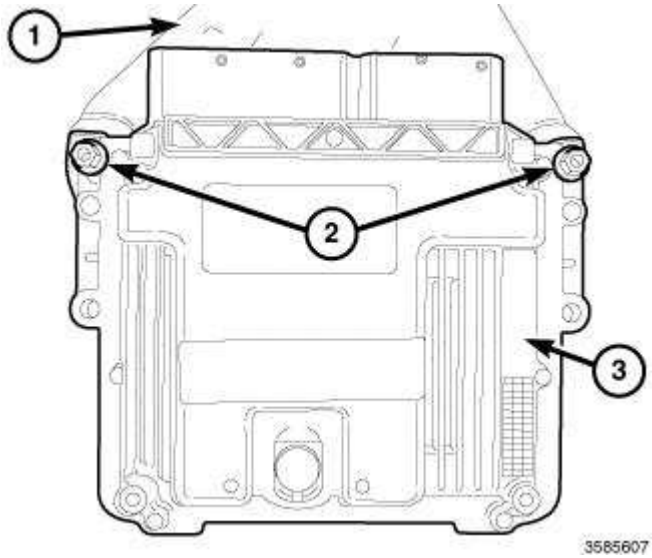

Fig. 73: Nuts, PCM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Install the Powertrain Control Module (PCM) (3) onto mounting bracket (1) and securely tighten the nuts (2).

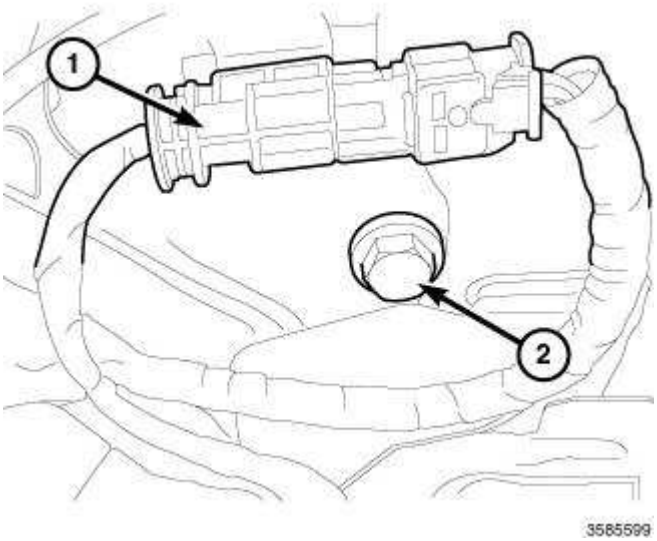

Fig. 74: Crash Sensor Wire Harness Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Install the PCM with mounting bracket and securely tighten the bolt (2).
3. Install the crash sensor wire harness connector (1) to the inner fender.

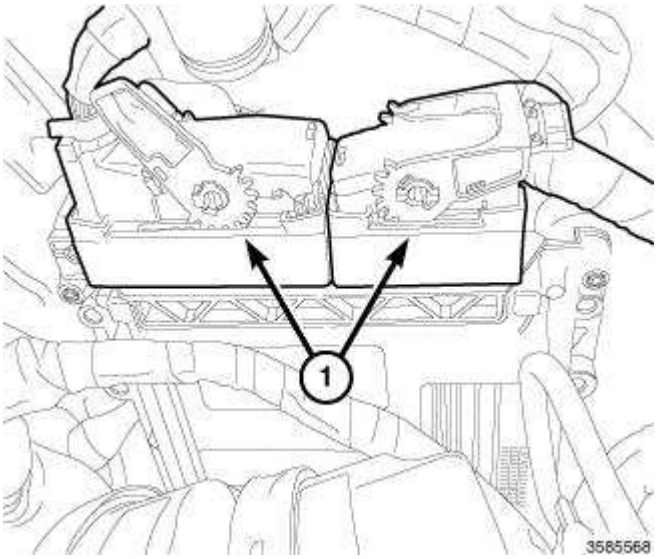

Fig. 75: Powertrain Control Module (PCM) Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Connect the PCM wire harness connector (1).

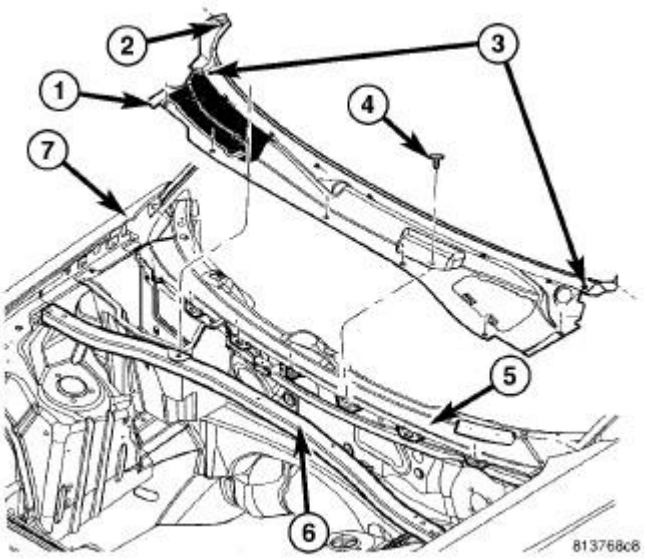

Fig. 76: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

5. Install the strut support brace (6). Tighten bolts to 38 N.m (28 ft. lbs.).
6. Install the wiper arm linkage. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .

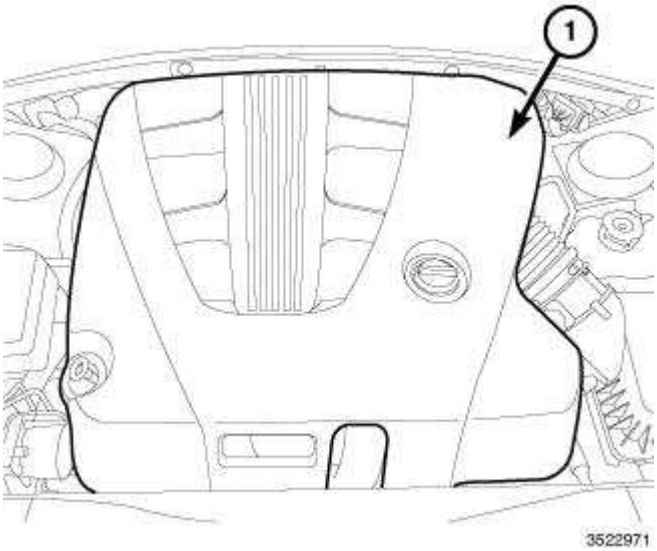

Fig. 77: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine cover (1).
8. Connect the negative battery cable.

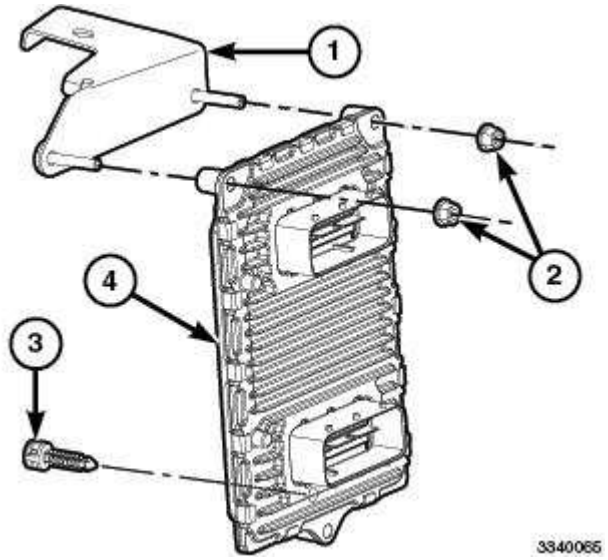

Fig. 78: NVH Rubber Bumper, PCM, Bracket & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, position the Powertrain Control Module (PCM) mounting bracket (1) onto the PCM (4), install the two retaining nuts (2) and tighten to 8 N.m (71 in. lbs.).
2. If removed, install the NVH rubber bumper (3) onto the PCM.

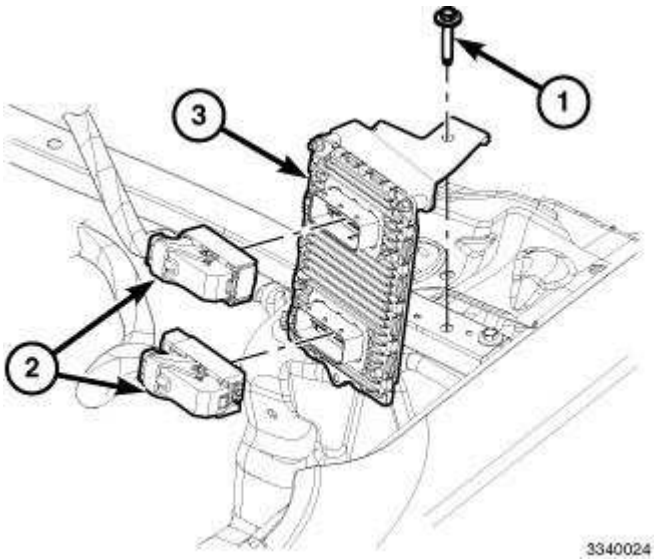

Fig. 79: Retaining Bolt, PCM Electrical Connectors & PCM
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to reconnecting the electrical connectors to the PCM, check the pins in the electrical connectors for misalignment and/or damage. Repair as necessary.

3. Position the PCM (3) into the vehicle.

4. Connect the PCM harness connectors (2).
5. Position the PCM bracket to the cross support, install the retaining bolt (1) and tighten to 16 N.m (12 ft. lbs.).

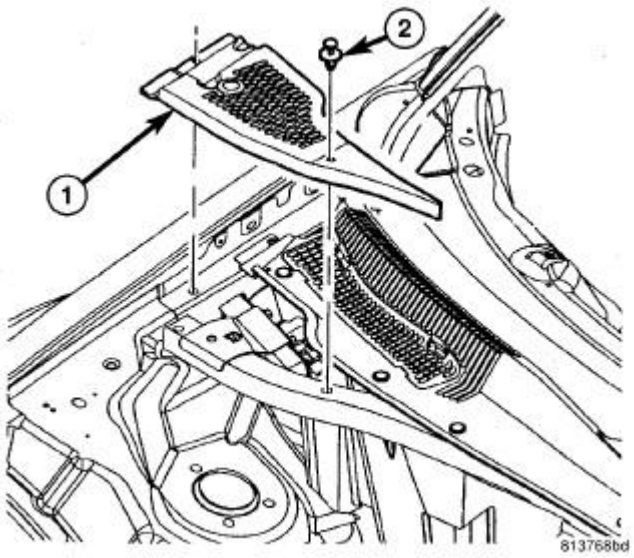

Fig. 80: Cowl Panel 1
Courtesy of CHRYSLER GROUP, LLC

6. Position the front cowl top panel (1) to the right rear corner of the engine compartment.
7. Install the two push-pins (2) that secure the front cowl top panel.

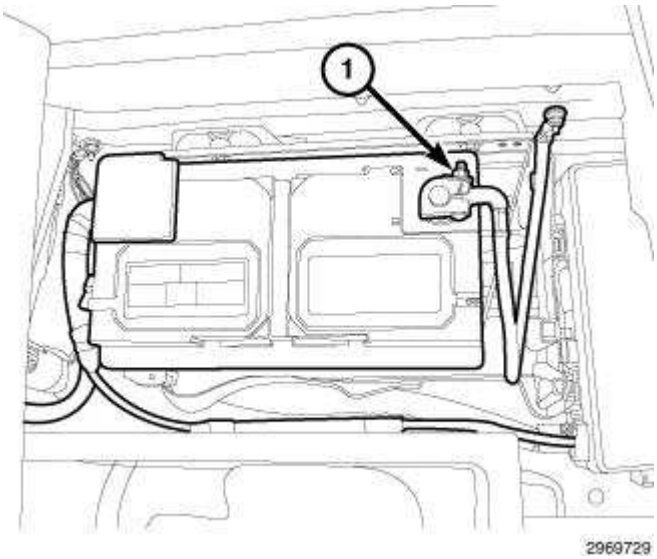

Fig. 81: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

8. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).

NOTE: **If a new PCM is installed, it must be programed with the original Vehicle Identification Number (VIN) and mileage. If this is not done, a Diagnostic Trouble Code (DTC) may set.**

NOTE: **If a new PCM is installed. Refer to STANDARD PROCEDURE.**

9. If a new PCM is being installed, use a scan tool and program the new PCM with the original VIN and vehicle mileage.

MODULE, RADIO FREQUENCY (RF HUB)

DESCRIPTION

DESCRIPTION

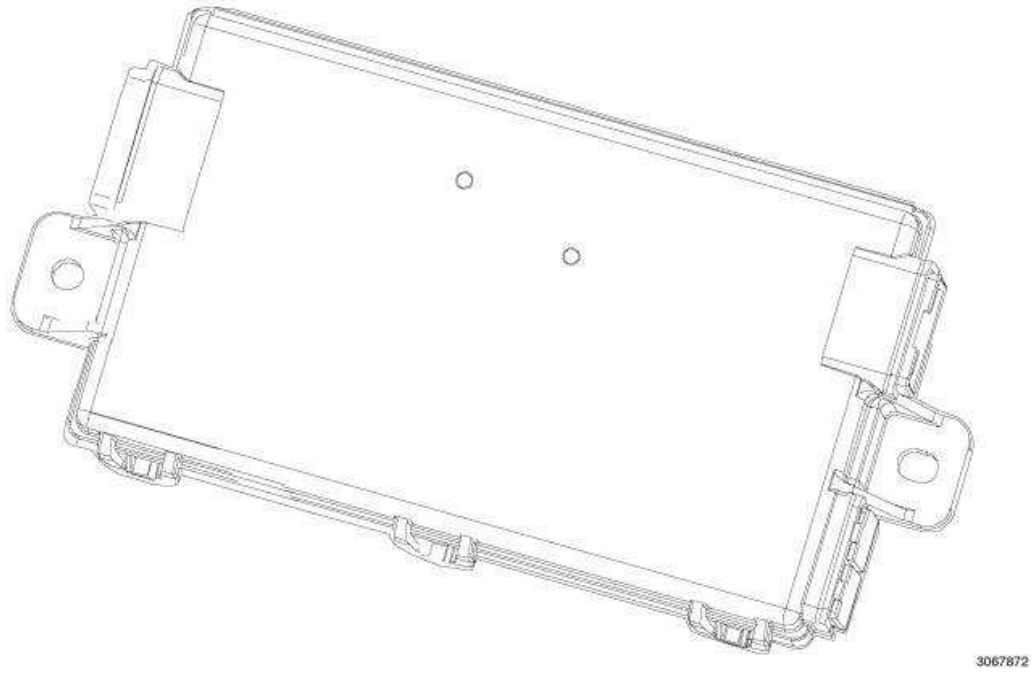

Fig. 82: RF Hub Module
Courtesy of CHRYSLER GROUP, LLC

The RF Hub is located on the rear center of the package shelf under the trim panel.

OPERATION

OPERATION

There are 5 other component categories that make up the new ignition system.

The components are:

- Radio Frequency (RF) HUB (1)
- LF Antennas (5)
- FOB (2, 4 for Police)
- Special Door Handles (2)
- Special Liftgate Handle (1)

This new ignition system operation begins when an owner approaches their vehicle with a FOB somewhere on their person or belongings, i.e., in their gym bag. When the owner touches the handle to pull the door open, door handle electronics signal the RF HUB with a "request to open". The RF HUB uses all of the 5 LF (low frequency) antennas to communicate with the FOB. Once located, the FOB's response is evaluated by the RF HUB to determine if the person pulling on the door handle is in fact the owner. This process completes 'FOB authentication'.

Once authentication is successfully completed, the RF HUB requests the Body Control Module (BCM) to unlock the affected door. Once the doors unlock, the owner is then free to continue pulling the door handle in an attempt to enter their vehicle. This process of opening the door without actively using a FOB or key is called 'passive entry'. The LD/LX trunk handle is outfitted with a passive entry switch, allowing the trunk to pop open when it's pressed after FOB authentication completes successfully.

After the vehicle's owner is buckled, the customer then pushes the KIN's SSB (Keyless Ignition Node's Start/Stop Button) while pushing the brake pedal as if braking while coming to a stoplight. (For manual transmission vehicles the clutch pedal is depressed instead of the brake pedal to initiate a start procedure). Before the vehicle is allowed to start, another 'FOB authentication' cycle must be completed. Once successfully completed, the RF HUB next sends the BCM the ignition switch position, which equates to a 'request to start' command. The process of starting a vehicle without the act of using a bladed key or FOB is called 'Keyless Go'.

The passive entry works when the FOB can be located outside the vehicle using the LF antennas. Keyless go operates when the RF HUB can locate the FOB inside the vehicle. Please refer to the owner's manual for more information on authentication zones.

After putting the vehicle into park, pushing the KIN's SSB allows the vehicle's engine to be shut off. In an emergency, pressing the SSB continuously for 2 seconds or repeatedly (one hit every 30-500msec) shuts off the engine.

REMOVAL

REMOVAL

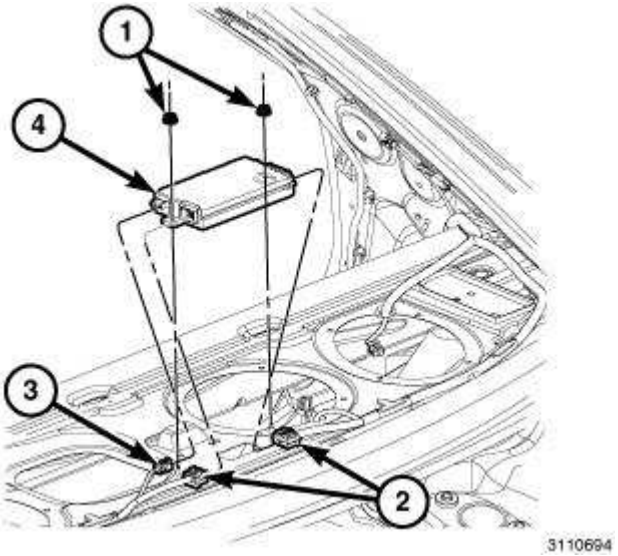

Fig. 83: RF Hub Retainers, Connectors & Remote Start Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the rear shelf cover. Refer to **PANEL, REAR SHELF, REMOVAL** .
3. Remove the RF Hub retainers (1).
4. Disconnect the electrical connectors (2).
5. If equipped, disconnect the remote start antenna (3).
6. Remove the RF Hub (4) from the vehicle.

INSTALLATION

INSTALLATION

NOTE: Replace and Program the module(s) per the RF-Hub, BCM, PCM FOBik and ELV Replacement and Programming Order Guide. Refer to STANDARD PROCEDURE.

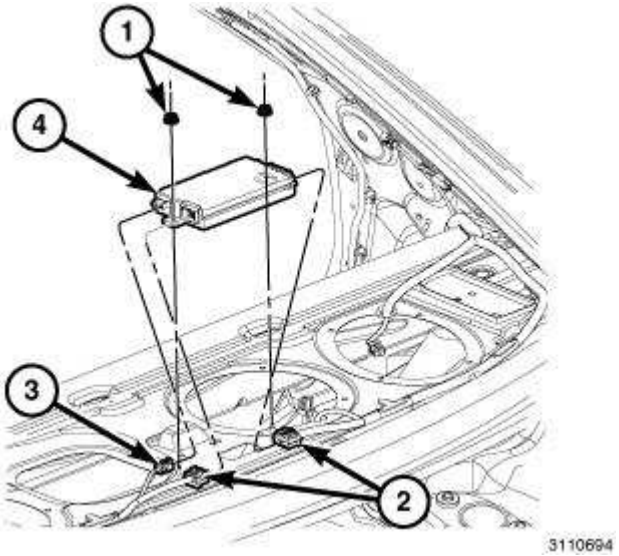

Fig. 84: RF Hub Retainers, Connectors & Remote Start Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Position into place and install the RF Hub (4) and retainers (1).
2. Connect the electrical connectors (2).
3. If equipped, connect the remote start antenna (3).
4. Install the rear shelf cover. Refer to **PANEL, REAR SHELF, INSTALLATION** .
5. Connect the Intelligent Battery Sensor (IBS) to the negative battery post.

NOTE: Program the RF-Hub. Refer to STANDARD PROCEDURE.

MODULE, STEERING COLUMN

DESCRIPTION

DESCRIPTION

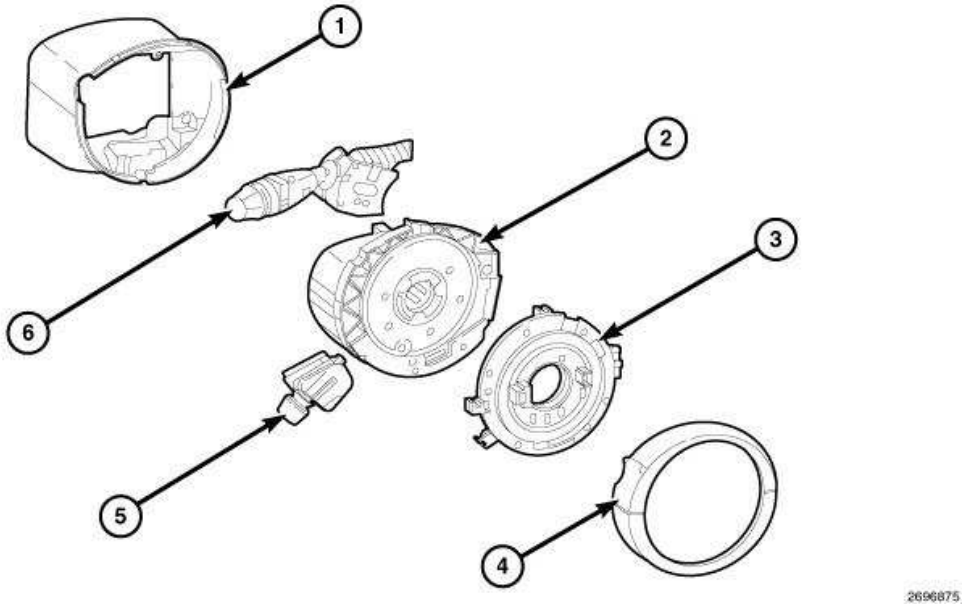

Fig. 85: Steering Column Shroud, Steering Angle Sensor (SAS), Clockspring, Telescope Switch & Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The Steering Control Module (SCM) for this vehicle is integral to the Steering Column Control Module (SCCM). The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the steering column shroud (1), the Steering Angle Sensor (SAS) (2), the clockspring (3), the multi-function switch (6), a steering column power tilt and telescope switch (5) for vehicles so equipped and a trim cover (4).

The SCCM is secured to the steering column by a unique mounting system using no external fasteners. The SCCM has two key stone features that snap into slots in the upper column jacket to secure the SCCM. In addition, a mechanical red indicator on the lower surface of the column shroud will be flush with the shroud surface when the SCCM is properly installed, but will stand proud of the shroud surface if the key stones are incompletely or improperly seated in the slots of the column jacket.

There are also unique lugs cast into the outer circumference of the steering wheel hub that must be engaged into slots within the inner circumference of the clockspring rotor hub to unlock and drive both the clockspring and the SAS, and the steering wheel must be tightened to specification to ensure proper clockspring and SAS function.

The SCCM includes an integral connector receptacle that faces toward the instrument panel and is connected to the vehicle electrical system through a single take out and connector of the instrument panel wire harness. The instrument panel wire harness take out has been intentionally provided with additional length to facilitate service removal and installation of the SCCM. However, following SCCM installation, this additional length must be pulled back and secured to the instrument panel structure to prevent the potential for undesirable rattling and buzzing noises while driving.

The SCM cannot be adjusted or repaired. If ineffective or damaged the entire SCCM unit must be

replaced.

OPERATION

OPERATION

The Steering Column Control Module (SCCM) includes an electronic circuit board, sometimes referred to as the Steering Control Module (SCM). The SCM is a Local Interface Network (LIN) bus master and a gateway for the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION**.

The microprocessor-based SCM provides power and ground to the multi-function and power tilt and telescope steering column switches of the SCCM, then utilizes integrated circuitry to monitor hard wired analog and digital return inputs from both of these switches. Except for the circuits for the optional heated steering wheel and the standard equipment Driver AirBag (DAB), which are pass-through circuits of the SCCM, the SCM also provides power and ground to all of the electronics carried on the steering wheel through a microprocessor contained in the right steering wheel switch, which is also a LIN slave.

The steering wheel-mounted electronics monitored by the SCM include the horn switch, the speed control switches, the remote radio switches, the hands-free communication switches and the Electronic Vehicle Information Center (EVIC) control switches, if the vehicle is so equipped. The LIN slave monitors the changing states of these switches through both hard wired analog and digital return inputs, then communicates those switch states to the SCM over the LIN bus. In response to those inputs, the internal circuitry of the SCM gateway then transmits electronic message outputs communicating all of the monitored switch state changes as well as SAS data to other electronic modules in the vehicle over the CAN bus.

A fixed connector receptacle of the SCCM connects the SCM to the vehicle electrical system through a single take out with connector from the instrument panel wire harness. The instrument panel wire harness take out has been intentionally provided with additional length to facilitate service removal and installation of the SCCM. However, following SCCM installation, this additional length must be pulled back and secured to the instrument panel structure to prevent the potential for undesirable rattling or buzzing noises while driving.

The SCM is connected to a fused B(+) circuit and receives a path to ground at all times. These connections allow it to remain functional regardless of the ignition switch position. Any input to the SCM that controls a vehicle system function that does not require that the ignition switch be in the ON position such as depressing the horn switch, prompts the SCM to wake up and transmit on the CAN data bus.

The service replacement SCCM is shipped with the clockspring pre-centered within the SCCM and with a plastic locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the steering wheel is installed on a steering column, clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black boxes of the clockspring tape are not visible in the inspection window, the entire SCCM must be replaced with a new unit. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Proper clockspring installation may also be confirmed by viewing the

Steering Angle Sensor (SAS) data using a diagnostic scan tool.

The hard wired circuits between components related to the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCCM, the SCM or the electronic controls or communication between modules and other devices that provide some features of the SCCM. The most reliable, efficient, and accurate means to diagnose the SCCM, the SCM or the electronic controls and communication related to SCCM or SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SCM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Steering Column Control Module (SCCM) and the Steering Control Module (SCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

REMOVAL

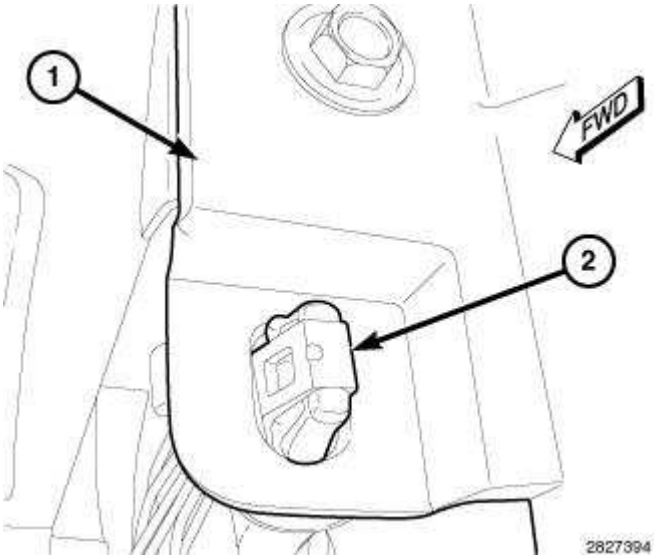

Fig. 86: Retainer Clip & Instrument Panel Base Trim
Courtesy of CHRYSLER GROUP, LLC

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit MUST be replaced with a new unit.

1. Place the front wheels in the straight ahead position.
2. Disconnect and isolate the battery negative cable.
3. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
4. Disconnect the steering wheel wire harness connectors from the upper Steering Column Control Module (SCCM) connector receptacles.
5. Remove the steering wheel from the upper steering column shaft. Refer to **WHEEL, STEERING, REMOVAL** .
6. Using a trim stick or another suitable wide flat-bladed tool, disengage the snap clips that secure the molded hard plastic outer edges of the steering column gap hider bezel to the instrument panel.
7. Pull the gap hider bezel up and away from the instrument panel far enough to access and

disengage the retainer clip (2) of the service length of the instrument panel wire harness SCCM take out that secures it to the instrument panel base trim (1) on the right side of the steering column opening.

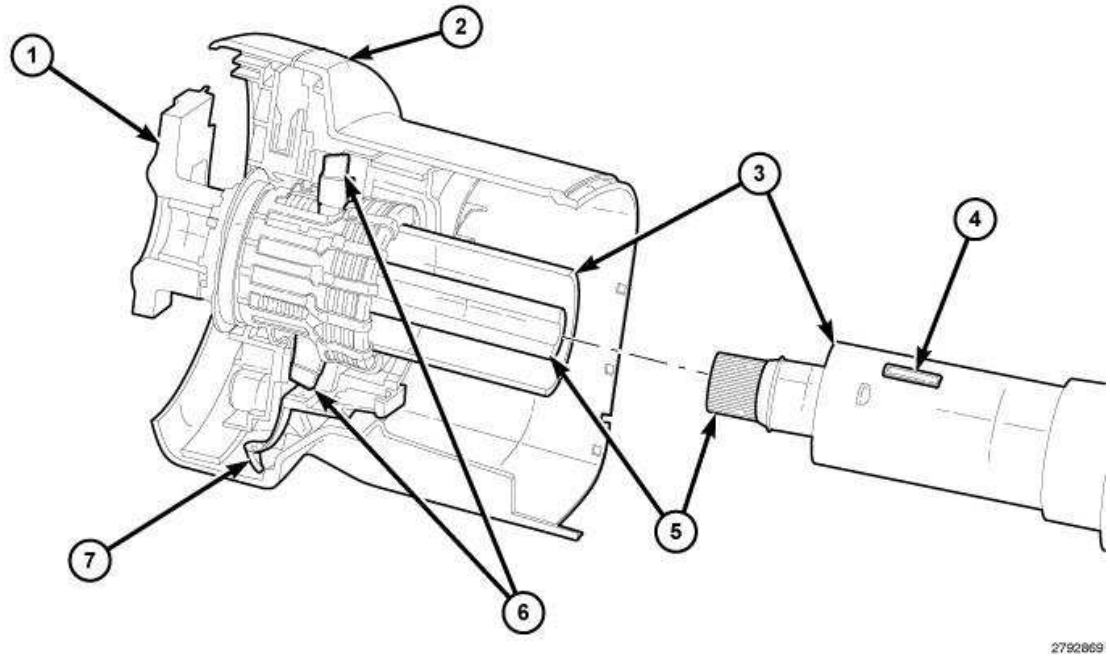

Fig. 87: SCCM Shroud, Lower Keystones, Slots & Steering Column Jacket
Courtesy of CHRYSLER GROUP, LLC

8. Firmly grasp each side of the SCCM shroud (2) on the edges nearest the instrument panel. Use a short, firm tug rearward on the shroud to disengage the spring-loaded upper and lower keystones (6) from the slots (4) in the top and bottom of the steering column jacket (3).
9. Pull the SCCM away from the top of the steering column far enough to reach through the back of the gap hider and shroud to access and disconnect the instrument panel wire harness connector from the lower SCCM connector receptacle.
10. Remove the SCCM from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit MUST be replaced with a new unit.

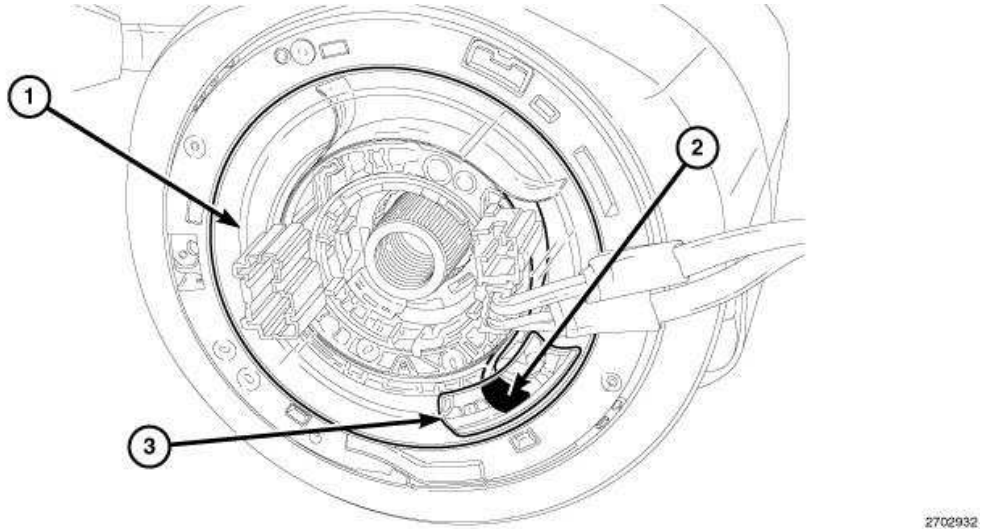

Fig. 88: Inspection Window, Clockspring Rotor & Black Squares
Courtesy of CHRYSLER GROUP, LLC

1. Before reinstalling a Steering Column Control Module (SCCM) onto a steering column, clockspring centering must be confirmed by viewing the inspection window (3) on the clockspring rotor (1). If the black squares (2) on the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the SCCM **MUST** be replaced with a new unit.

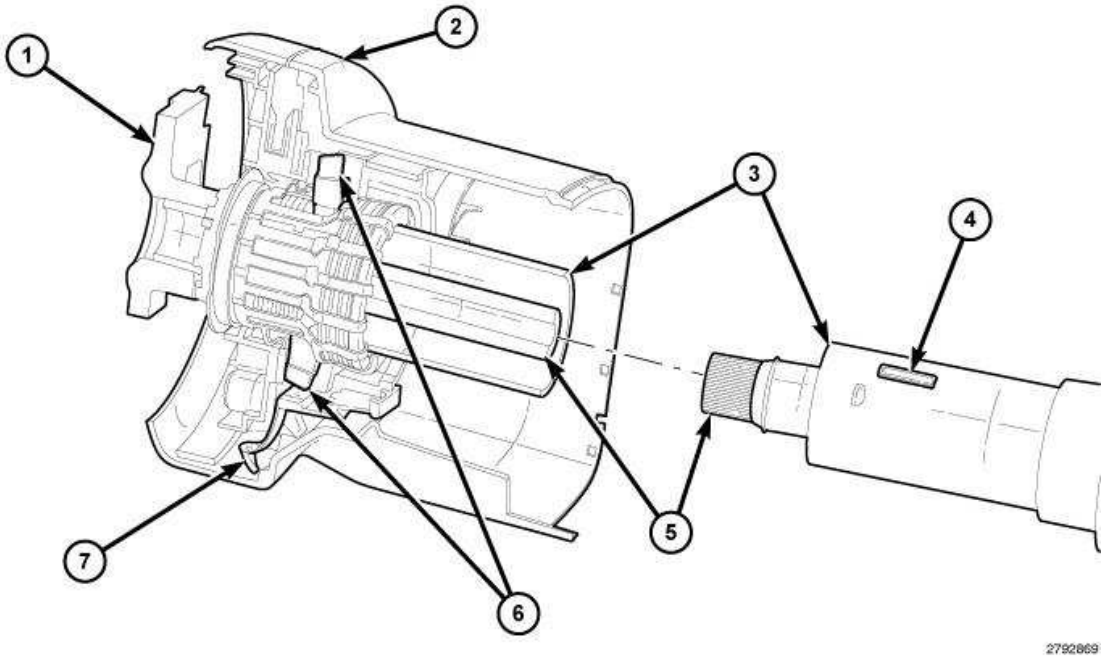

Fig. 89: SCCM Shroud, Lower Keystones, Slots & Steering Column Jacket
Courtesy of CHRYSLER GROUP, LLC

2. Be certain that the front wheels are still in the straight ahead position.
3. If a new SCCM is being installed, disengage the steering column gap hider from the lower edge of the used SCCM shroud and transfer it to the new one.
4. Position the SCCM close enough to the top of the steering column to reach through the back of the gap hider and shroud to reconnect the instrument panel wire harness connector SCCM take out to the lower SCCM connector receptacle.
5. Align the hub of the SCCM with the upper steering column shaft (5) and jacket (3).
6. Slide the SCCM over the top of the steering column jacket far enough for the spring-loaded upper and lower keystones (6) to engage the slots (4) in the top and bottom of the steering column jacket.
7. Confirm that the keystones are fully engaged in the column jacket slots by inspecting the round red indicator (7) visible on the lower surface of the SCCM shroud. The indicator should be flush with the shroud. If the indicator stands proud of the shroud, the keystones are **NOT** fully engaged. Carefully slide the SCCM slightly up and down, or rotate it slightly right and left as necessary for the keystones to snap into their slots and the indicator to become flush with the shroud.

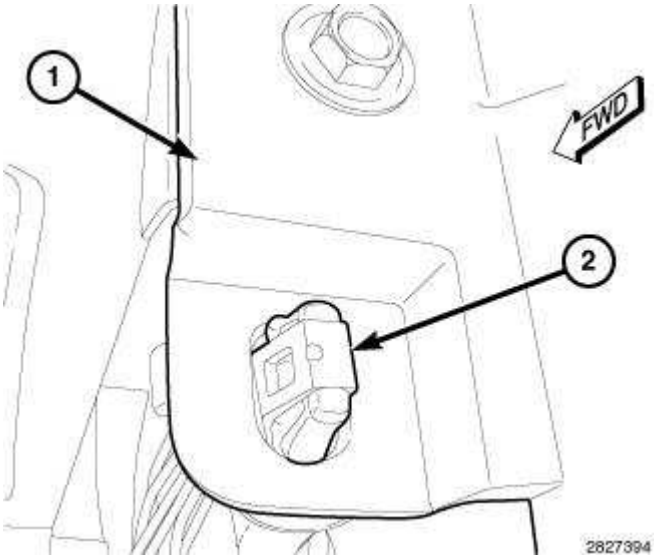

Fig. 90: Retainer Clip & Instrument Panel Base Trim
Courtesy of CHRYSLER GROUP, LLC

NOTE: The service length of the instrument panel wire harness take out for the SCCM MUST be pulled back out of the SCCM shroud and secured to the instrument panel base trim. Failure to properly accomplish this task will result in unsatisfactory buzzes, squeaks or rattles during vehicle operation.

8. Pull the gap hider bezel up and away from the instrument panel far enough to access and engage the retainer clip (2) of the service length of the instrument panel wire harness SCCM take out to the instrument panel base trim (1) on the right side of the steering column opening.
9. Align and engage the snap clips that secure the molded hard plastic steering column gap hider bezel to the instrument panel.
10. If a new SCCM is being installed, remove (break off) the red locking tab that secures the clockspring rotor to the clockspring case.
11. Reinstall the steering wheel onto the upper steering column shaft. Be certain to align and insert the rotational lugs on the steering wheel hub into the slots in the hub of the clockspring. Also, the steering wheel fastener **MUST** be tightened to the proper torque specification to ensure proper clockspring and Steering Angle Sensor (SAS) operation. Refer to **WHEEL, STEERING, INSTALLATION** .
12. Reconnect the steering wheel wire harness connectors to the upper SCCM connector receptacles.
13. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION** .
14. Reconnect the battery negative cable.

MODULE, TELEMATICS GATEWAY

DESCRIPTION

DESCRIPTION

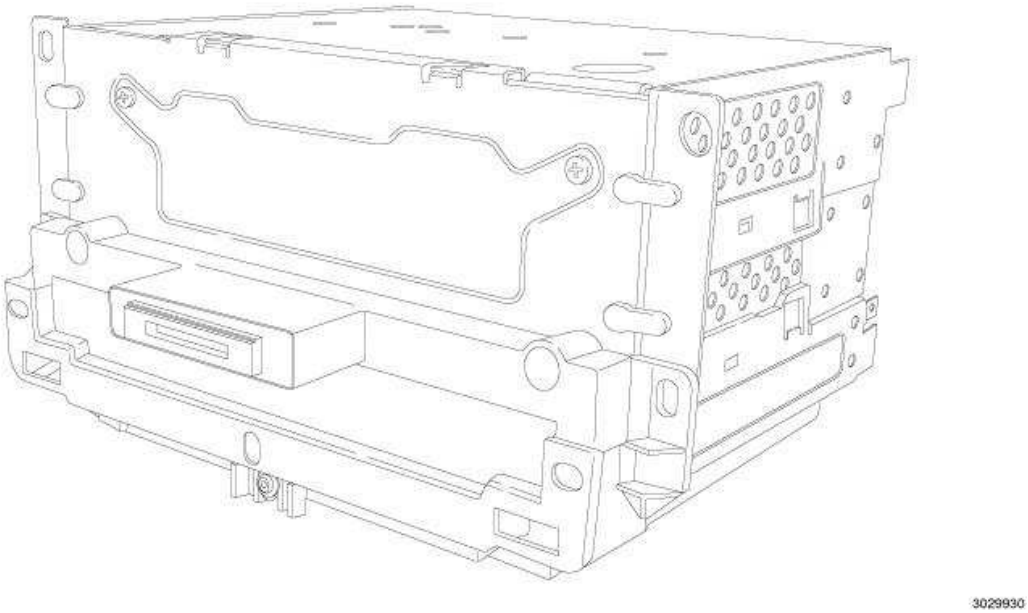

Fig. 91: Mid level Telematics Gateway Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mid level Telematics Gateway Module shown in illustration, Base level similar.

The Telematics Gateway Module (TGM) is located behind the switch bank assembly in the center of the instrument panel.

If repair or replacement of the TGM is required, the radio will require a four digit code for it to function.

There are two different levels of the TGM which are:

- Base - includes CD player.
- Mid - includes CD/DVD player and SD card reader.

OPERATION

OPERATION

The Telematics Gateway Module (TGM) is responsible for the displayed information on the Integrated Center Stack (ICS) Screen Module over the CAN-AT bus.

The user input from the ICS Screen Module sends the information over the CAN-AT to the TGM, the TGM then sends the command out to the CAN-I bus to the requested module. The requested module then makes the changes requested by the users input and sends a message back to the TGM, the TGM then send the message over the CAN-AT to the ICS to reflect the users input selection has

been activated and or changed.

The TGM is responsible for the following.

- Displaying information on the Integrated Center Stack (ICS) Screen Module.
- Passing user input to the correct module on the CAN bus.
- Turning the specific areas (buttons) on the screen usable for user interaction.
- CD/DVD operations
- SD card operations (Mid level only)

If the screen displays **"Shipping Mode"** . Refer to **STANDARD PROCEDURE** .

REMOVAL

REMOVAL

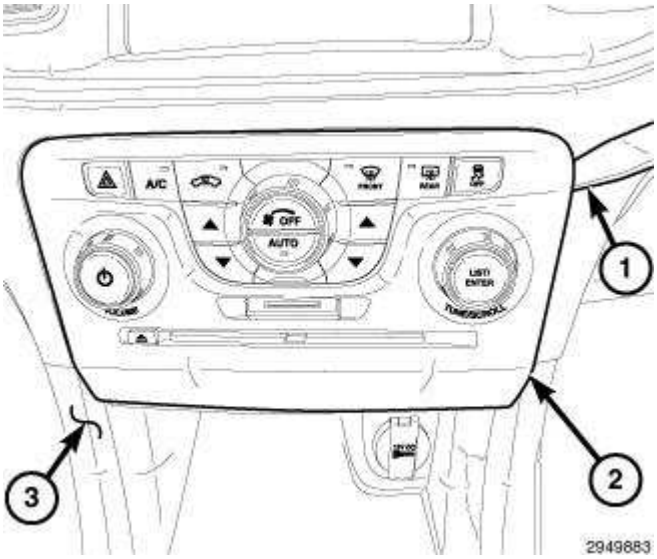

Fig. 92: Switch Bank
Courtesy of CHRYSLER GROUP, LLC

1. Perform a complete backup of user data. Refer to **STANDARD PROCEDURE** .
2. Disconnect the negative battery cable.
3. Before proceeding with the following repair procedure, review all warnings and cautions.
4. Remove the switch bank. Refer to **POD, SWITCH BANK, REMOVAL** .

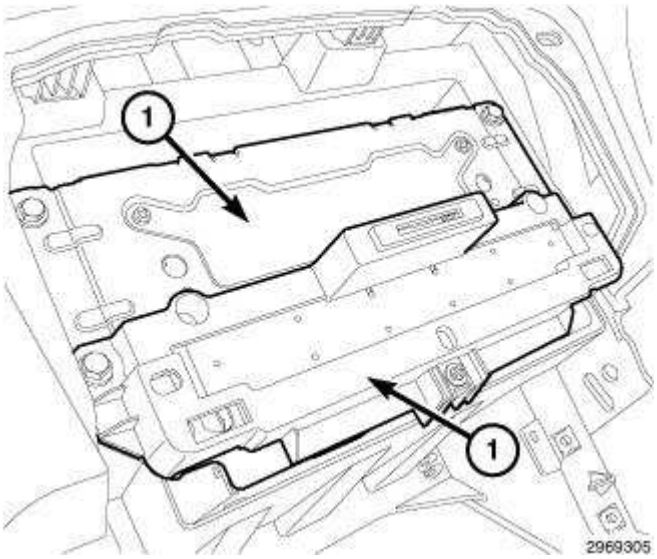

Fig. 93: Telematics Gateway Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove the Telematics Gateway Module (TGM) (1) retainers.

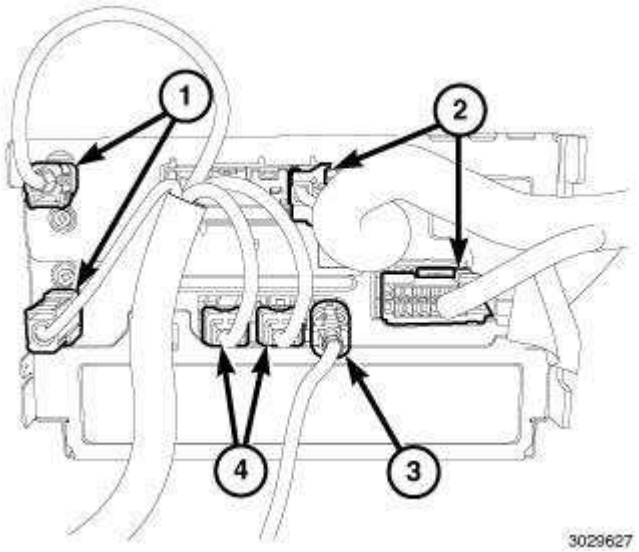

Fig. 94: Antenna(s), Video Cable, RF HUB, Wiring Connectors And UCI Cables
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

6. Pull the TGM out far enough to access the harness connectors.
7. If equipped, disconnect the antenna(s) (1), RF HUB and UCI cables (4), video cable (3) and wiring connectors (2) from the TGM.
8. Remove the TGM from the vehicle.

INSTALLATION

INSTALLATION

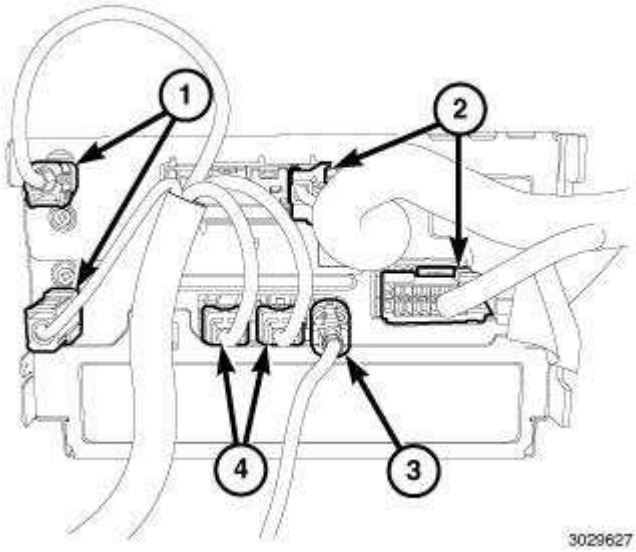

Fig. 95: Antenna(s), Video Cable, RF HUB, Wiring Connectors And UCI Cables
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mid level shown in illustration, base similar.

1. Position the Telematics Gateway Module (TGM) close to the instrument panel to connect the electrical connectors.
2. If equipped, connect the antenna(s) (1), RF HUB and UCI cables (4), video cable (3) and wiring connectors (2) to the TGM.

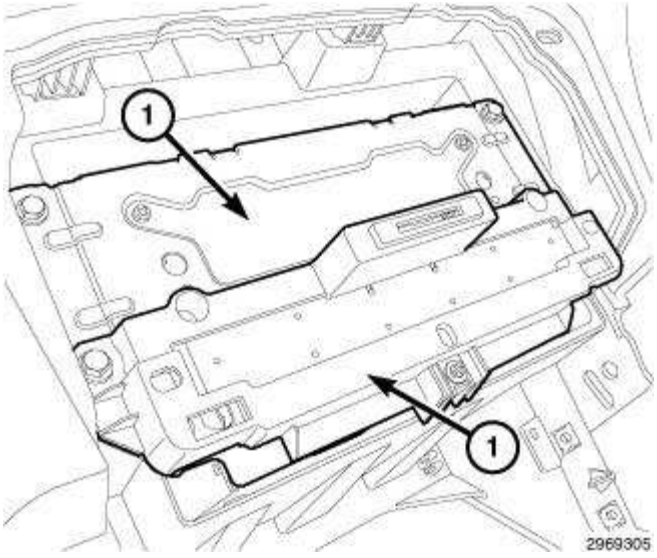

Fig. 96: Telematics Gateway Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Position the telematics gateway module into the instrument panel cavity and install the TGM (1) retainers. Tighten the fasteners securely.

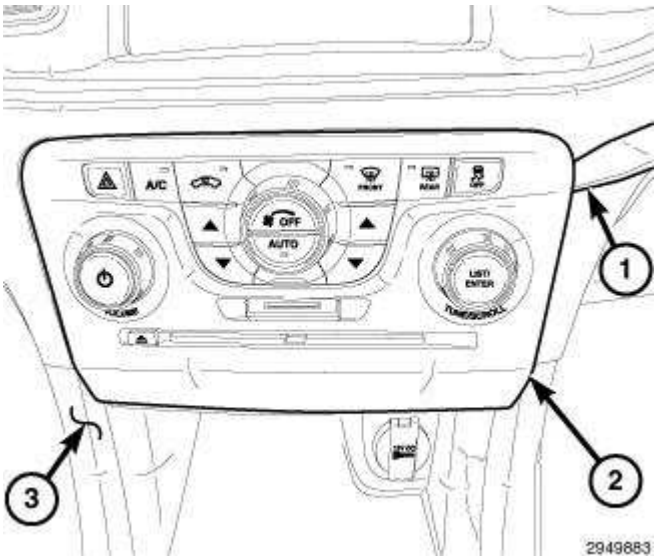

Fig. 97: Switch Bank
Courtesy of CHRYSLER GROUP, LLC

4. Install the switch bank (2). Refer to **POD, SWITCH BANK, INSTALLATION** .
5. Connect the negative battery cable.
6. Restore user data from backup. Refer to **STANDARD PROCEDURE** .

MODULE, TRANSMISSION CONTROL

DESCRIPTION

TRANSMISSION CONTROL MODULE - NAG1

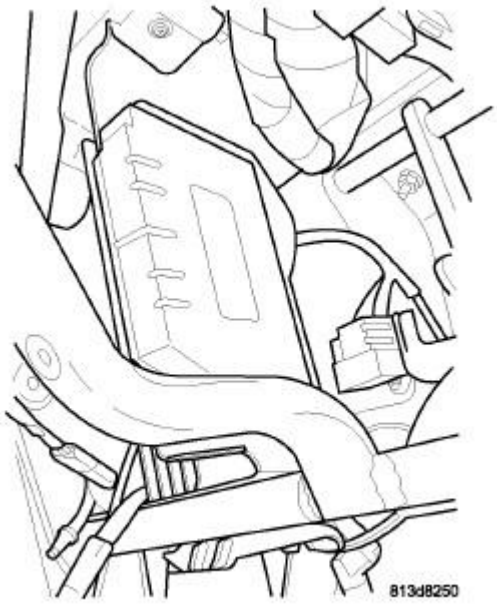

Fig. 98: TCM Location
Courtesy of CHRYSLER GROUP, LLC

The TCM is located under the left side of the instrument panel for left hand drive vehicles. For right hand drive vehicles, the TCM is located in the mirrored location under the right side of the instrument panel.

The electronic control system consists of various components providing inputs to the transmission control module (TCM). The TCM monitors transmission sensors, shift lever position, and bus messages to determine transmission shift strategy. After shift strategies are determined, the TCM controls the actuation of transmission solenoids, which controls the routing of hydraulic fluid within the transmission, by moving a sequence of four valves to make a shift occur.

The NAG1 electronic transmission has a fully adaptive control system. The system performs its functions based on continuous real-time sensor feedback information. In addition the TCM receives information from the PCM (engine management) and ABS (chassis systems) controllers over the CAN bus. The CAN bus is a high-speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 milliseconds. This means critical information can be shared between the transmission, engine, and ABS controllers. The CAN bus is a two wire bus with a CAN Bus (+) circuit and a CAN Bus (-) circuit. These circuits are twisted pairs in the harness to reduce the potential of radio and noise interference.

The transmission control system automatically adapts to changes in engine performance, vehicle speed, and transmission temperature variations to provide consistent shift quality. The control system ensures that clutch operation during up-shifting and downshifting is more responsive without increased harshness. The TCM activates the solenoid valves and moves valves in the valve body to achieve the necessary gear changes. The required pressure level is calculated from the load condition, engine speed. Vehicle speed (from ABS module) and transmission oil temperature,

matched to the torque to be transmitted. The TCM is located under the left side of the instrument panel for left hand drive vehicles. For right hand drive vehicles, the TCM is located in the mirrored location under the right side of the instrument panel.

TRANSMISSION CONTROL MODULE - 8HP45

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body includes the Transmission Control Module (TCM), all solenoids and sensors, and can be referred to as the Transmission Control Module Assembly (TCMA). The TCM is attached to the valve body between the transmission case and the valve body. If any component of the valve body **including the TCM** sensors or solenoids needs to be replaced, the complete TCMA (valve body) must be replaced. For further information of the TCMA. Refer to **VALVE BODY, DESCRIPTION** .

OPERATION

TRANSMISSION CONTROL MODULE - NAG1

The transmission control module (TCM) determines the current operating conditions of the vehicle and controls the shifting process for shift comfort and driving situations. It receives this operating data from sensors and broadcast messages from other modules.

The TCM uses inputs from several sensors that are directly hardwired to the controller and it uses several indirect inputs that are used to control shifts. This information is used to actuate the proper solenoids in the valve body to achieve the desired gear.

The shift lever assembly (SLA) has sensors that are monitored by the TCM to calculate shift lever position. The reverse light switch, an integral part of the SLA, controls the reverse light relay control circuit. The Brake/Transmission Shift Interlock (BTSI) solenoid and the park lockout solenoid (also part of the SLA) are controlled by the TCM.

The PCM and ABS broadcast messages over the controller area network (CAN) bus for use by the TCM. The TCM uses this information, with other inputs, to determine the transmission operating conditions.

The TCM:

- determines the momentary operating conditions of the vehicle.
- controls all shift processes.
- considers shift comfort and the driving situation.

The TCM controls the solenoid valves for modulating shift pressures and gear changes. Relative to

the torque being transmitted, the required pressures are calculated from load conditions, engine RPM, vehicle speed, and ATF temperature.

The following functions are contained in the TCM:

- Shift Program
- Downshift Safety
- Torque Converter Lock-Up Clutch.
- Adaptation.

The TCM continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into "Limp-In" or "default" mode. Some DTCs cause permanent Limp-In and others cause temporary Limp-In. The NAG1 defaults in the current gear position if a DTC is detected, then after a key cycle the transmission will go into Limp-in, which is mechanical 2nd gear. Some DTCs may allow the transmission to resume normal operation (recover) if the detected problem goes away. A permanent Limp-In DTC will recover when the key is cycled, but if the same DTC is detected for three key cycles the system will not recover and the DTC must be cleared from the TCM with the appropriate scan tool.

NOTE: **If the TCM has been replaced, the "TCM Adaptation Procedure" must be performed. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE.**

TCM SIGNALS

The TCM registers one part of the input signals by direct inputs, the other part by CAN bus. In addition to the direct control of the actuators, the TCM sends various output signals by CAN bus to other control modules.

SELECTOR LEVER POSITION

A series of sensors in the SLA inform the TCM of the position of the selector lever.

The TCM monitors the SLA for all shift lever positions through five position circuits. The SLA provides a low-current 12-volt signal to the TCM. The TCM compares the on/off signals to programmed combinations to determine the exact position of the shift lever.

ATF TEMPERATURE SENSOR

The ATF temperature sensor is a positive temperature co-efficient (PTC) thermistor. It measures the temperature of the transmission fluid and is a direct input signal for the TCM. The temperature of the ATF has an influence on the shifttime and resulting shift quality. As the temperature rises, resistance rises, and therefore, the probing voltage is decreasing. Because of its registration, the shifting process can be optimized in all temperature ranges.

The ATF temperature sensor is wired in series with the park/neutral contact. The temperature signal

is transmitted to the TCM only when the reed contact of the park/neutral contact is closed because the TCM only reads ATF temperature while in any forward gear, or REVERSE. When the transmission is in PARK or NEUTRAL, the TCM will substitute the engine temperature for the ATF temperature.

STARTER INTERLOCK

The TCM monitors a contact switch wired in series with the transmission temperature sensor to determine PARK and NEUTRAL positions. The contact switch is open in PARK and NEUTRAL. The TCM senses transmission temperature as high (switch supply voltage), confirming switch status as open. The TCM then broadcasts a message over CAN bus to confirm switch status. The PCM receives this information and allows operation of the starter circuit.

N2 AND N3 SPEED SENSORS

The N2 and N3 Input Speed Sensors are two Hall-effect speed sensors that are mounted internally in the transmission and are used by the TCM to calculate the transmission's input speed. Since the input speed cannot be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

CAN BUS INDIRECT INPUT SIGNALS

A 2.5-volt bias (operating voltage) is present on the CAN bus any time the ignition switch is in the RUN position. Both the TCM and the ABS apply this bias. On this vehicle, the CAN bus is used for module data exchange only. The indirect inputs used on the NAG1 electronic control system are:

- Wheel Speed Sensors.
- Transfer Case Switch Status.
- Brake Switch.
- Engine RPM.
- Engine Temperature.
- Cruise Control Status.
- Gear Limit Request.
- Throttle Position - 0% at idle, 100% at WOT. If open, TCM assumes idle (0% throttle opening).
- Odometer Mileage
- Maximum Effective Torque.
- Engine in Limp-In Mode/Mileage Where DTC Was Set.

BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI)

The BTSI solenoid prevents shifting out of the PARK position until the ignition key is in the RUN position and the brake pedal is pressed. The TCM controls the ground while the ignition switch supplies power to the BTSI solenoid. The PCM monitors the brake switch and broadcasts brake switch status messages over the CAN C bus. If the park brake is depressed and there is power (Run/Start) to SLA, the BTSI solenoid deactivates. The TCM monitors this for the SLA because the

SLA does not communicate on the CAN bus.

SHIFT SCHEDULES

The basic shift schedule includes up and downshifts for all five gears. The TCM adapts the shift program according to driving style, accelerator pedal position and deviation of vehicle speed. Influencing factors are:

- Road Conditions.
- Incline, Decline and Altitude.
- Trailer Operation, Loading.
- Engine Coolant Temperature.
- Cruise Control Operation.
- Sporty Driving Style.
- Low and High ATF Temperature.

Upshift To:	1-2	2-3	3-4	4-5
Activated By Solenoid:	1-2/4-5	2-3	3-4	1-2/4-5
Shift Point (at 35.2% of throttle)	29 km/h (18 mph)	48 km/h (30 mph)	68 km/h (42 mph)	85 km/h (53 mph)

Downshift From:	5-4	4-3	3-2	2-1
Activated By Solenoid:	1-2/4-5	3-4	2-3	1-2/4-5
Shift Point	55.7 km/h (34.61 mph)	40.5 km/h (25.17 mph)	24.4 km/h (15.16 mph)	15.1 km/h (9.38 mph)

DOWNSHIFT SAFETY

Selector lever downshifts are not performed if inadmissible high engine RPM is sensed.

ADAPTATION

To equalize tolerances and wear, an automatic adaptation takes place for:

- Shift Time.
- Clutch Filling Time.
- Clutch Filling Pressure.
- Torque Converter Lock-Up Control.

Adaptation data may be stored permanently and to some extent, can be diagnosed.

DRIVING STYLE ADAPTATION

The shift point is modified in steps based on the information from the inputs. The control module looks at inputs such as:

- vehicle acceleration and deceleration (calculated by the TCM).
- rate of change as well as the position of the throttle pedal (fuel injection information from the PCM).
- lateral acceleration (calculated by the TCM).
- gear change frequency (how often the shift occurs).

Based on how aggressive the driver is, the TCM moves up the shift so that the present gear is held a little longer before the next upshift. If the driving style is still aggressive, the shift point is modified up to ten steps. If the driving returns to normal, then the shift point modification also returns to the base position.

This adaptation has no memory. The adaptation to driving style is nothing more than a shift point modification meant to assist an aggressive driver. The shift points are adjusted for the moment and return to base position as soon as the inputs are controlled in a more normal manner.

CONTROLLER MODES OF OPERATION

PERMANENT LIMP-IN MODE

When the TCM determines there is a non-recoverable condition present that does not allow proper transmission operation, it places the transmission in permanent Limp-In Mode. When the condition occurs the TCM turns off all solenoids as well as the solenoid supply output circuit. If this occurs while the vehicle is moving, the transmission remains in the current gear position until the ignition is turned off or the shifter is placed in the "P" position. When the shifter has been placed in "P," the transmission only allows 2nd gear operation. If this occurs while the vehicle is not moving, the transmission only allows operation in 2nd gear.

TEMPORARY LIMP-IN MODE

This mode is the same as the permanent Limp-In Mode except if the condition is no longer present, the system resumes normal operation.

UNDER VOLTAGE LIMP-IN MODE

When the TCM detects that system voltage has dropped below 8.5 volts, it disables voltage-dependant diagnostics and places the transmission in the temporary Limp-In Mode. When the TCM senses that the voltage has risen above 9.0 volts, normal transmission operation is resumed.

HARDWARE ERROR MODE

When the TCM detects a major internal error, the transmission is placed in the permanent Limp-In Mode and ceases all communication over the CAN bus. When the TCM has entered this mode normal transmission operation does not resume until all DTCs are cleared from the TCM.

LOSS OF DRIVE

If the TCM detects a situation that has resulted or may result in a catastrophic engine or transmission problem, the transmission is placed in the neutral position. Improper Ratio, Input Sensor Overspeed or Engine Overspeed DTCs cause the loss of drive.

CONTROLLED LIMP-IN MODE

When a failure does not require the TCM to shut down the solenoid supply, but the failure is severe enough that the TCM places the transmission into a predefined gear, there are several shift performance concerns. For instance, if the transmission is slipping, the controller tries to place the transmission into 3rd gear and maintain 3rd gear for all forward drive conditions.

STANDARD PROCEDURE

TCM ADAPTATION - NAG1 ONLY

The adaptation procedure requires the use of the appropriate scan tool. This program allows the electronic transmission system to re-calibrate itself. This will provide the proper baseline transmission operation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Clutch Plate and/or Seal Replacement
- Electrohydraulic Unit Replacement or Recondition

1. With the scan tool, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings.

   NOTE: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.

2. Drive the vehicle until the transmission temperature is in the specified range.
3. Perform 4 to 5 coast downs from 5th to 4th gear and then 4th to 3rd gear.

   NOTE: For Upshift adaptation, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.

4. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times.
5. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever.
6. The TCM will store the adaptives every 10 minutes. After completion of the adaptation

procedure make sure the vehicle stays running for at least 10 minutes.

7. It is possible to manually store the adaptives under the 10 minute time frame using the scan tool Store Adaptives procedure.

TCM ADAPTATION - 8HP45

The 8HP45 transmission continuously self calibrates and learns shift points and clutch apply times. It is necessary to perform a drive cycle to provide the proper baseline transmission adaptation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Assembly (TCMA) Replacement
- Internal Transmission repairs.
- Torque Converter Replacement.

1. With the scan tool, clear any DTCs that may be set.
2. Drive the vehicle until the vehicle temperature is greater than 30°C (86°F).
3. After the vehicle has reached normal operating temperature, and with the scan tool, monitor actual gear state. Drive the vehicle normally with the accelerator pedal between 10% and 20% until 7th gear has been achieved, approximately 76 km/h (47 mph). After 7th gear has been achieved, coast down to 30 mph with no application of the brake or accelerator to allow a 6-5 shift. Brake the vehicle to a stop. Repeat this procedure 5 times.

RECEIVER, KEYLESS IGNITION NODE

DESCRIPTION

DESCRIPTION

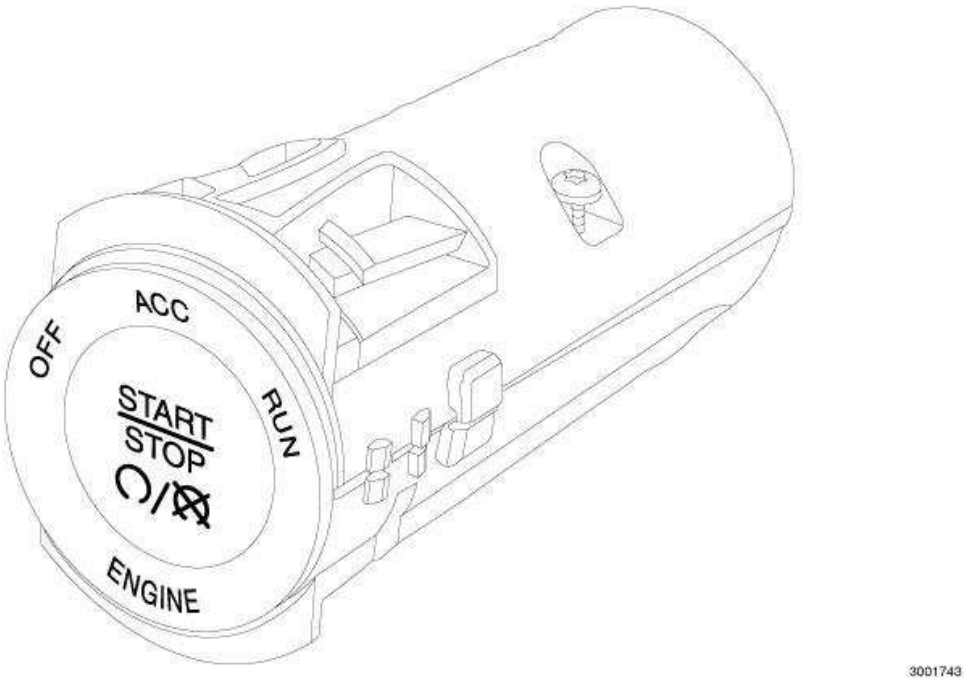

Fig. 99: Keyless Ignition Node (KIN)
Courtesy of CHRYSLER GROUP, LLC

Keyless Ignition Node (KIN) is part of the new ignition system.

The KIN module is located in the instrument panel to the left of the center stack.

OPERATION

OPERATION

There are 5 other component categories that make up the new ignition system.

The components are:

- Radio Frequency (RF) HUB (1)
- LF Antennas (5)
- FOB (2, 4 for Police)
- Special Door Handles (2)
- Special Liftgate Handle (1)

This new ignition system operation begins when an owner approaches their vehicle with a FOB somewhere on their person or belongings, i.e., in their gym bag. When the owner touches the handle to pull the door open, door handle electronics signal the RF HUB with a "request to open". The RF HUB uses all of the 5 LF (low frequency) antennas to communicate with the FOB. Once located, the FOB's response is evaluated by the RF HUB to determine if the person pulling on the door handle is in fact the owner. This process completes 'FOB authentication'.

Once authentication is successfully completed, the RF HUB requests the Body Control Module (BCM) to unlock the affected door. Once the doors unlock, the owner is then free to continue pulling the door handle in an attempt to enter their vehicle. This process of opening the door without actively using a FOB or key is called 'passive entry'. The LD/LX trunk handle is outfitted with a passive entry switch, allowing the trunk to pop open when it's pressed after FOB authentication completes successfully.

After the vehicle's owner is buckled, the customer then pushes the KIN's SSB (Keyless Ignition Node's Start/Stop Button) while pushing the brake pedal as if braking while coming to a stoplight. (For manual transmission vehicles the clutch pedal is depressed instead of the brake pedal to initiate a start procedure). Before the vehicle is allowed to start, another 'FOB authentication' cycle must be completed. Once successfully completed, the RF HUB next sends the BCM the ignition switch position, which equates to a 'request to start' command. The process of starting a vehicle without the act of using a bladed key or FOB is called 'Keyless Go'.

The passive entry works when the FOB can be located outside the vehicle using the LF antennas. Keyless go operates when the RF HUB can locate the FOB inside the vehicle. Please refer to the owner's manual for more information on authentication zones.

After putting the vehicle into park, pushing the KIN's SSB allows the vehicle's engine to be shut off. In an emergency, pressing the SSB continuously for 2 seconds or repeatedly (one hit every 30-500msec) shuts off the engine.

REMOVAL

REMOVAL

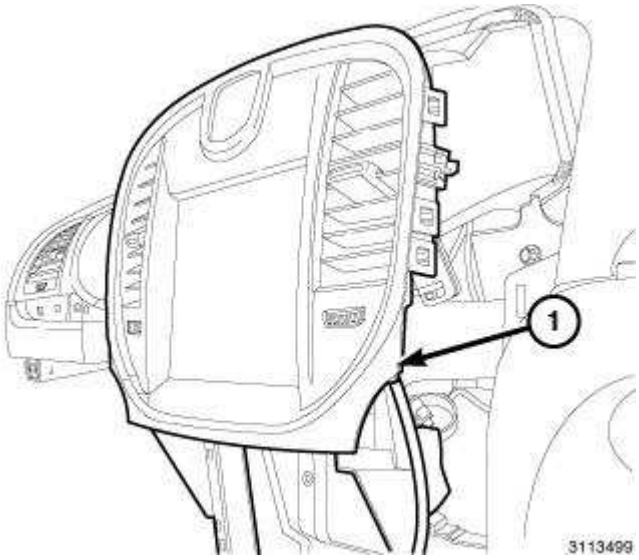

Fig. 100: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mid ICS shown in illustration, base similar.

1. Disconnect the negative battery cable.

2. Remove the instrument cluster bezel (1). Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
3. Reach through the Integrated Center Stack (ICS) screen opening and disconnect the Keyless Ignition Node (KIN) electrical connector.
4. Press on the three tabs (two on top and one on bottom) and push the KIN out the front of the instrument panel.

INSTALLATION

INSTALLATION

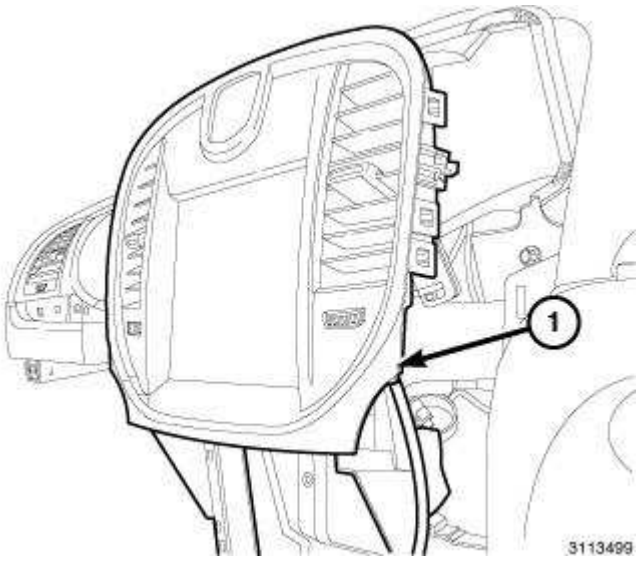

Fig. 101: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Push the Keyless Ignition Node (KIN) into the instrument panel until it snaps into place.
2. Reach through the Integrated Center Stack (ICS) screen opening and connect the KIN electrical connector.
3. Install the instrument cluster bezel (1). Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
4. Connect the negative battery cable.

SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL

DESCRIPTION

DESCRIPTION

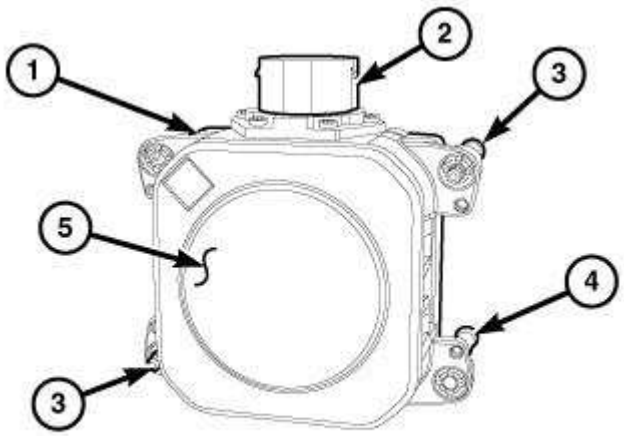

Fig. 102: Adaptive Speed Control Sensor, One Fixed Ball Stud, Two Adjustable Ball Studs & Radar Dome
Courtesy of CHRYSLER GROUP, LLC

The adaptive speed control sensor (1) (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) is located on a bracket secured near the right frame rail below the front bumper support member of the Front End Module (FEM) behind the front fascia. The stamped steel ACC sensor mounting bracket is secured by two screws to rivet nuts installed in the face of the bumper support member. This sensor is also the primary component of the Forward Collision Warning (FCW) feature of the Electronic Vehicle Information Center (EVIC).

One fixed ball stud (4) and two adjustable ball studs (3) secure the sensor housing through a snap fit into three molded plastic ball socket clips installed in the mounting bracket. The sensor pivots on the fixed ball stud while the two adjustable ball studs allow the sensor to be vertically aligned after installation using an ACC vertical alignment special tool and a 3.5 millimeter hex nut driver special tool. Horizontal alignment is performed electronically using a diagnostic scan tool during a ten minute drive at a steady, predetermined speed following completion of the vertical alignment.

The ACC sensor electronic circuitry is sealed and protected within a die cast aluminum housing. A molded plastic sensor bezel or mirror cover with a center clearance hole for the sensor lens snaps over the sensor and conceals a small square mirror in one corner of the sensor cover that is used for calibration purposes during the sensor manufacturing process. A molded plastic cover and a lens or radar dome (5) faces forward through an opening in the center of the front fascia lower airflow grille texture and right fog lamp bezel unit that is snapped into the opening.

The ACC sensor includes an applied connector receptacle (2) that is sealed and secured to the sensor housing with screws and faces downward when installed on the mounting bracket. The ACC sensor is connected to the vehicle electrical system through a single dedicated takeout and connector of the FEM wire harness.

The adjustable ball studs and the ACC sensor cannot be repaired. If ineffective or damaged the entire sensor unit must be replaced. The three plastic ball socket clips in the sensor mounting bracket must

also be replaced each time the ACC sensor is removed from and reinstalled onto the mounting bracket.

OPERATION

OPERATION

The microprocessor in the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or as the radar sensor or module) contains the logic circuits and controls many of the features of the adaptive speed control system. The ACC sensor receives battery voltage on a fused ignition switch output (run) circuit and is grounded at all times through a hard wired remote ground point. These connections allow the ACC sensor to operate only when the ignition switch is in the ON position. Likewise, the ACC sensor sleeps whenever the ignition switch is in any position except ON.

The ACC sensor is also a RAdio Detection And Ranging (RADAR) transceiver. The ACC sensor transmits electromagnetic signal bursts at an operating frequency of 77 gigahertz. Those signal bursts are scattered by any objects they strike within the 40 degree field of view of the transceiver, which changes the strength and frequency of the signal. The ACC sensor antenna receives and interprets the returned signals to detect any objects in the path of the vehicle as well as their speed and direction.

The ACC sensor receives electronic **speed control switch status** message inputs from the Steering Control Module (SCM) integral to the Steering Column Control Module (SCCM) over the Controller Area Network (CAN) data bus. The sensor also monitors electronic message inputs from the Powertrain Control Module (PCM), the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) and the Transmission Control Module (TCM).

The ACC sensor logic processes all of those inputs, then provides the appropriate electronic message outputs over the CAN data bus to the PCM, the TCM and the ABM to control and maintain the separation setting selected by the vehicle operator between the vehicle and any preceding vehicles. The ACC sensor also provides electronic message outputs to the instrument cluster and the Electronic Vehicle Information Center (EVIC) to invoke the Forward Collision Warning (FCW) features.

Among other features, the sensor also contains an electronic ambient temperature sensor and a heating element. When appropriate ambient temperatures are sensed, the heating element is energized by the sensor control circuitry to keep the sensor lens or radar dome clear of ice and snow accumulations that might otherwise blind the sensor to proper reception of returned signals.

The ACC sensor microprocessor continuously monitors all of its internal electronics to determine the sensor readiness. If the ACC sensor detects a monitored sensor fault, it sets and stores a Diagnostic Trouble Code (DTC). The ACC sensor uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the indicators and indications provided to the vehicle operator through the instrument cluster and the EVIC. The ACC sensor is also Flash programmable, allowing the sensor software to be updated using a diagnostic scan tool.

The hard wired inputs for the ACC sensor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACC sensor or the electronic controls or communication between other modules and devices that provide features of the adaptive speed control and FCW system features. The most reliable, efficient, and accurate means to diagnose the ACC sensor or the electronic controls and communication related to adaptive speed control or FCW system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ACC SYSTEM

The hard wired circuits to the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACC sensor or the electronic controls and communication between modules and other devices that provide some features of the adaptive speed control and Forward Collision Warning (FCW) systems. The most reliable, efficient, and accurate means to diagnose the ACC sensor or the electronic controls and communication related to adaptive speed control or FCW system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - ADAPTIVE SPEED CONTROL SENSOR ALIGNMENT

The adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) requires alignment whenever the ACC sensor is removed and reinstalled, whenever front end structural repairs are performed or whenever a Diagnostic Trouble Code (DTC) indicates ACC sensor adjustment is required. Sensor alignment consists of performing the mechanical vertical alignment described in the following procedure, followed by the electronic horizontal alignment that is performed with a diagnostic scan tool and the appropriate diagnostic information.

VEHICLE PREPARATION FOR SENSOR VERTICAL ALIGNMENT

1. Verify correct vehicle suspension height.
2. Repair or replace any ineffective, worn or damaged body components. Repair any loose or cracked fascia components that might interfere with the sensor field of view. The radar dome of the sensor module should be roughly centered in the opening of the fascia.
3. Verify proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody.

5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.

NOTE: The vehicle MUST be placed on a known level horizontal surface such as a wheel or frame alignment rack to achieve satisfactory sensor vertical alignment results.

6. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
7. Jounce the front and rear suspension three times by pushing downward on the front and rear bumpers and releasing.

SENSOR VERTICAL ALIGNMENT

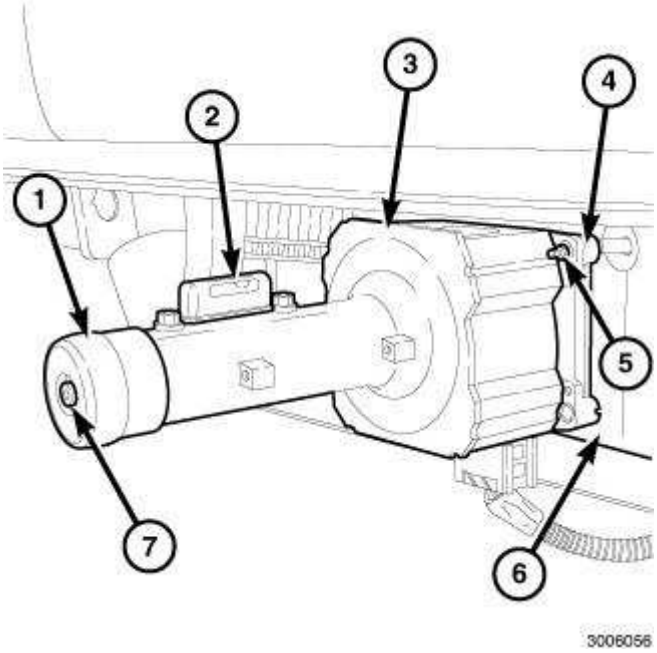

Fig. 103: Adaptive Speed Control Sensor, Bracket, Vertical Alignment Tool & Plunger
Courtesy of CHRYSLER GROUP, LLC

NOTE: The graphic shows Special Tool No. (special tool #10243-1, Fixture, Alignment, Accessory) installed on the adaptive speed control sensor with the front fascia removed for clarity; however, on EXPORT MARKET VEHICLES ONLY it is NOT necessary to remove the front fascia to install the special tool or to perform the following procedure.

1. The adaptive speed control sensor (4) (also known as the Adaptive Cruise Control/ACC sensor or module and the radar sensor or module) is located on a bracket (6) secured near the right frame rail on the underside of the front bumper support member of the Front End Module (FEM) behind the front fascia.
2. For domestic market vehicles only, remove the front fascia from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .
3. For domestic market vehicles only, working from behind the removed front fascia release the

latch features that secure the molded plastic ACC fascia closeout bezel to the fascia and remove the bezel from the right lower air intake opening.

4. For export market vehicles only, unsnap and remove the molded plastic ACC fascia closeout bezel from the right lower air intake opening of the front fascia to gain access to the ACC adjustment screws.
5. Unsnap and remove the smaller plastic bezel (mirror cover) from over the front of the sensor housing.
6. Using standard glass cleaner and a clean soft towel, remove any dirt or road salt from the convex molded dark plastic lens (radar dome) on the face of the sensor as well as from the suction cup of the vertical alignment tool (3) (Special Tool No. (special tool #10243-1, Fixture, Alignment, Accessory)).
7. Carefully slide the vertical alignment tool over the sensor housing until the suction cup rests against the lens of the sensor.

NOTE: It may take several attempts to get the suction cup of the special tool to fasten securely to the sensor. If necessary, lightly wet the suction cup with clean water to help improve adhesion.

8. Depress the plunger (1) of the vertical alignment tool to engage the suction cup and attach the special tool securely to the lens of the sensor.

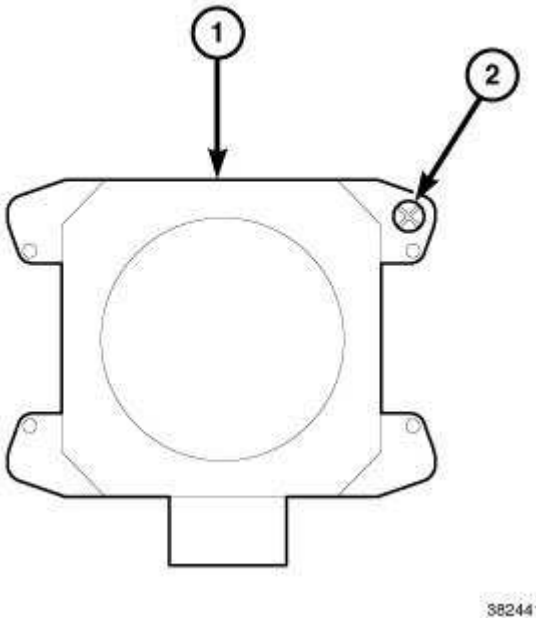

Fig. 104: Sensor & Ball Stud
Courtesy of CHRYSLER GROUP, LLC

9. Use the 3.5 millimeter hex nut driver (Special Tool No. (special tool #10243-2, Driver, Nut)) to rotate the vertical adjustment ball stud (2) that secures the sensor (1) to the mounting bracket as necessary to center the bubble of the spirit level between the two center marks on the vial of the level located on the top of the vertical alignment tool.

10. Depress the center release button of the special tool to release the suction cup from the sensor lens and remove the special tool from the sensor.
11. On domestic market vehicles only, reinstall the front fascia onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
12. Perform the ACC sensor horizontal alignment using a diagnostic scan tool and the appropriate diagnostic information.
13. Reinstall the smaller plastic bezel (mirror cover) onto the front of the sensor housing. Care must be taken to orient the bezel properly to ensure proper retention.
14. Reinstall the molded plastic ACC fascia closeout bezel into the right lower air intake opening of the front fascia.

REMOVAL

BRACKET

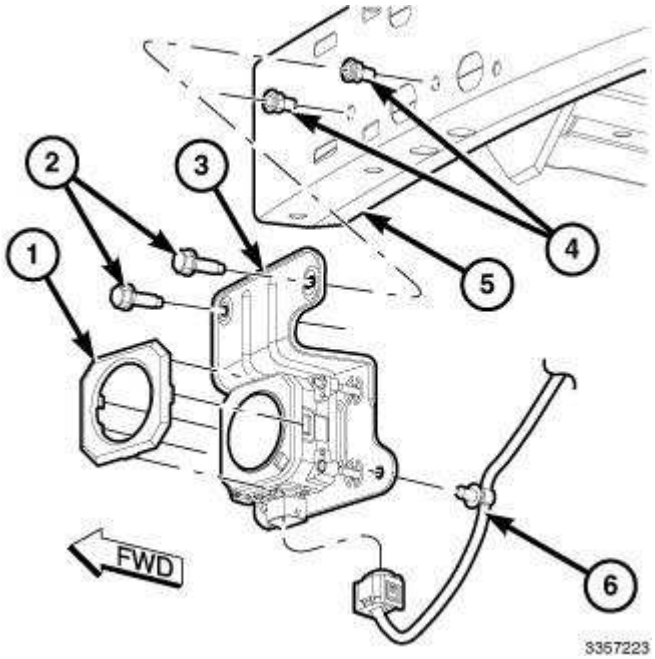

Fig. 105: Two Screws, Front Bumper Support Bar & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

1. Remove the adaptive speed control (also known as the Adaptive Cruise Control/ACC) sensor from the mounting bracket (3). Refer to **SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL, REMOVAL**.
2. Remove the two screws (2) that secure the bracket to the front bumper support bar (5).
3. Disengage the retainer that secures the Front End Module (FEM) wire harness (6) to the back of the bracket.
4. Remove the mounting bracket from the bumper support bar.

NOTE: The three molded plastic ball socket clips in the ACC sensor mounting

bracket MUST be removed, discarded and replaced with new ball socket clips any time the sensor is removed from the bracket.

5. Remove the three molded plastic ball socket clips from the back side of the ACC sensor mounting bracket and discard. The clips are removed by rotating them counterclockwise.

SENSOR

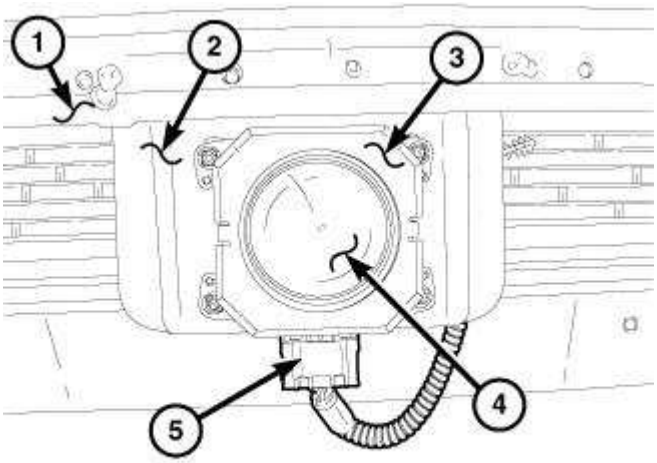

Fig. 106: Sensor Bezel (Mirror Cover) & Front Bumper Support Bar
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Remove the front fascia from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .
4. If equipped, unsnap and remove the sensor bezel (mirror cover) (3) from the face of the adaptive speed control (also known as Adaptive Cruise Control/ACC) sensor (4) located below the right side of the front bumper support bar (1).
5. Disconnect the Front End Module (FEM) wire harness connector (5) from the ACC sensor connector receptacle.
6. Firmly grasp the ACC sensor housing and pull it sharply forward from the sensor mounting bracket (2) until the one fixed and the two adjustable ball studs of the sensor unsnap from the three molded plastic ball socket clips in the bracket.
7. Remove the ACC sensor from the vehicle.

NOTE: The three molded plastic ball socket clips in the ACC sensor mounting bracket MUST be removed, discarded and replaced with new ball socket clips any time the sensor is removed from the bracket.

8. Remove the three molded plastic ball socket clips (5) from the back side of the ACC sensor mounting bracket and discard. The clips are removed by rotating them counterclockwise.

INSTALLATION

BRACKET

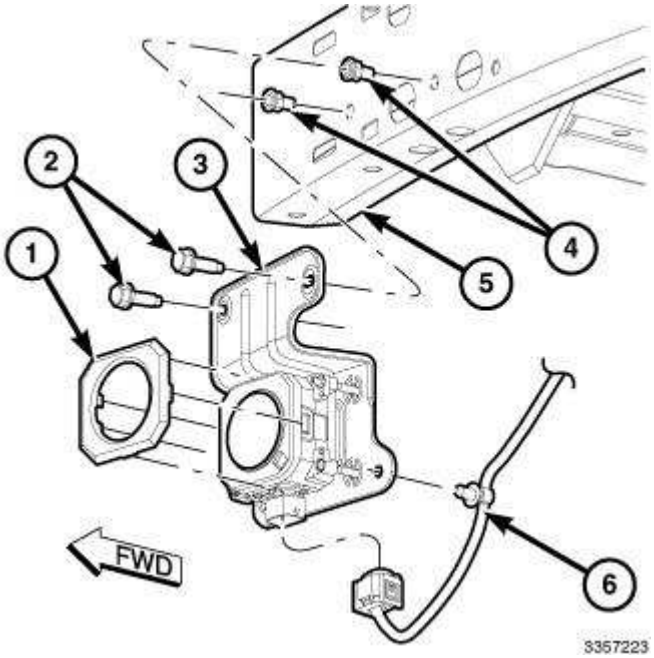

Fig. 107: Two Screws, Front Bumper Support Bar & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

NOTE: The molded plastic ball socket clips in the ACC sensor mounting bracket MUST be removed, discarded and replaced with new ball socket clips any time the sensor is removed from the bracket.

1. Check to be certain that the two rivet nuts (4) are properly installed and in good condition in the front bumper support bar (5).
2. Install three new molded plastic ball socket clips into the adaptive speed control (also known as Adaptive Cruise Control/ACC) sensor mounting bracket (3). The clips are installed from the back side of the bracket by rotating them clockwise.
3. Position the mounting bracket to the bumper support bar.
4. Engage the retainer that secures the Front End Module (FEM) wire harness (6) to the back of the bracket.
5. Starting with the outboard (round) mounting hole followed by the inboard (slotted) mounting hole, install and tighten the two screws (2) that secure the mounting bracket to the support bar. Tighten the screws securely.
6. Reinstall the ACC sensor onto the mounting bracket. Refer to **SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL, INSTALLATION**.

SENSOR

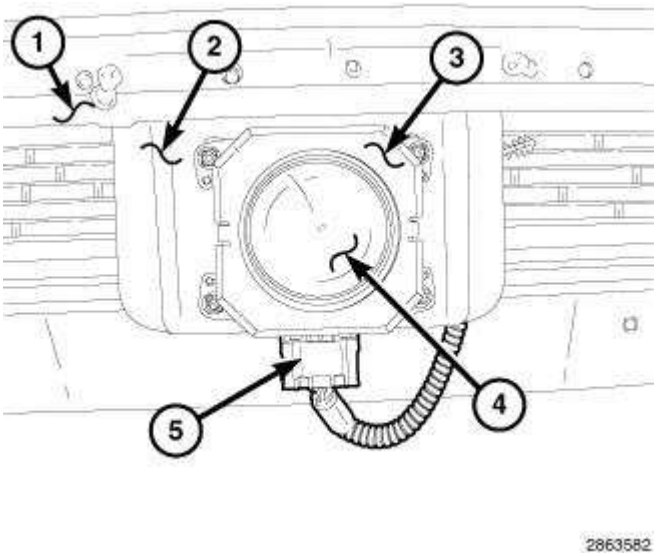

Fig. 108: Sensor Bezel (Mirror Cover) & Front Bumper Support Bar
Courtesy of CHRYSLER GROUP, LLC

NOTE: The molded plastic ball socket clips in the ACC sensor mounting bracket MUST be removed, discarded and replaced with new ball socket clips any time the sensor is removed from the bracket.

1. Install three new molded plastic ball socket clips into the adaptive speed control (also known as Adaptive Cruise Control/ACC) sensor mounting bracket (2) located below the right side of the front bumper support bar (1). The clips are installed from the back side of the bracket by rotating them clockwise.
2. Position the ACC sensor (4) to the mounting bracket.
3. Align the one fixed and the two adjustable ball studs of the sensor with the three plastic ball socket clips in the bracket.
4. Using hand pressure, press firmly and evenly on the face of the sensor until each of the ball studs snaps into the ball socket clips.
5. Reconnect the Front End Module (FEM) wire harness connector (5) to the ACC sensor connector receptacle.
6. If equipped, snap the sensor bezel (mirror cover) (3) over the face of the ACC sensor.
7. Check the ACC sensor vertical alignment. Refer to **SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL, STANDARD PROCEDURE**.
8. Reinstall the front fascia onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
9. Use a diagnostic scan tool and the appropriate diagnostic information to perform the horizontal sensor alignment procedure.

ENGINE

Cooling System - Chrysler 300

DESCRIPTION

DESCRIPTION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, coolant bottle is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Electric cooling fan
- Radiator
- A coolant recovery system
- Thermostat
- Water pump
- Radiator pressure cap
- Coolant
- Water pump
- Hoses and hose clamps

OPERATION

OPERATION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a source of hot coolant for heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

- When engine is cold the thermostat is closed. The cooling system has no flow through the radiator. The coolant flows through the engine, water pump, and heater.

- When engine is warm the thermostat is full open. On the gas engine coolant flows through the engine, radiator, heater, and water pump.

An optional factory installed maximum duty cooling package is available on most models. This package will provide additional cooling capacity for vehicles used under extreme conditions such as trailer towing in high ambient temperatures.

DIAGNOSIS AND TESTING

COOLING SYSTEM LEAKS

ULTRAVIOLET LIGHT METHOD

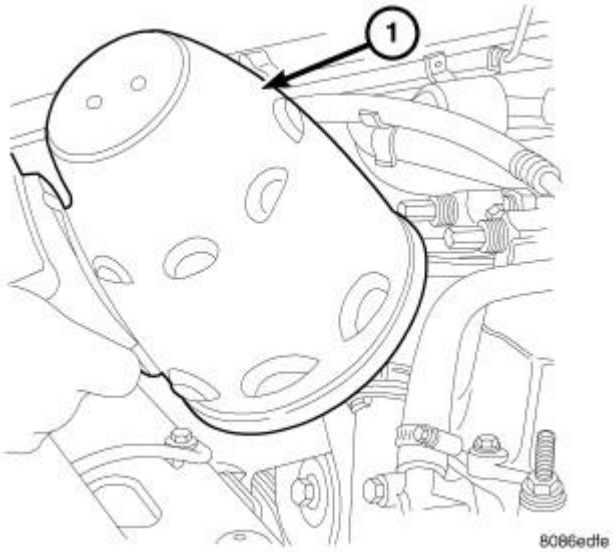

Fig. 1: Identifying Ultraviolet Light Method
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL BLACK LIGHT TOOL

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

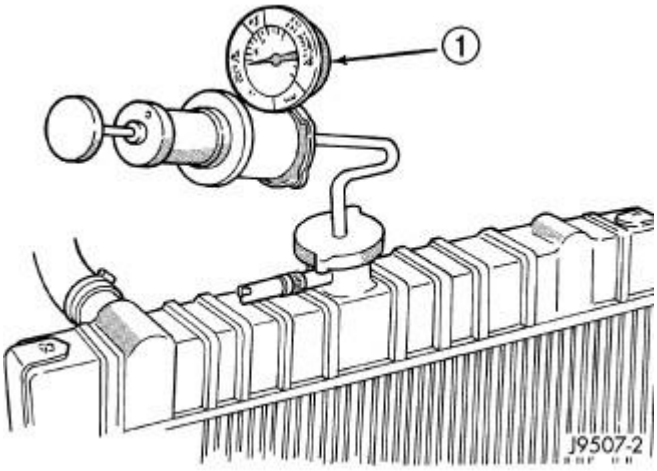

Fig. 2: Pressure Testing Cooling System - Typical - Gas
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL COOLING SYSTEM PRESSURE TESTER

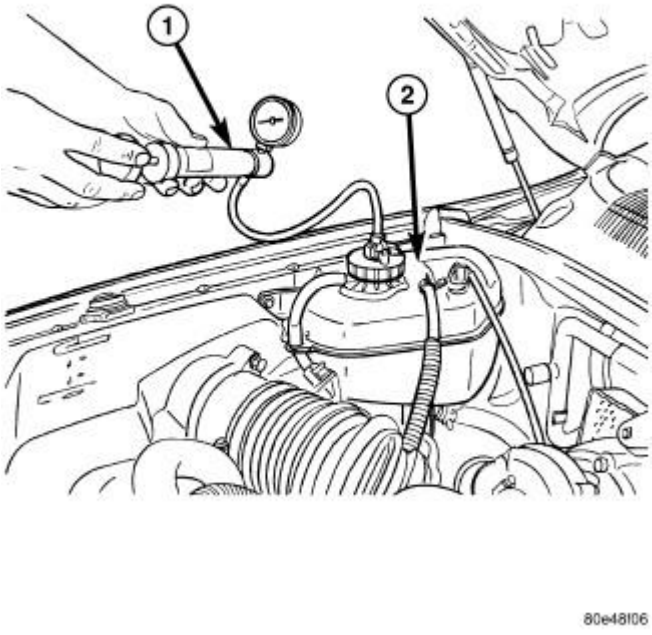

Fig. 3: Pressure Testing Cooling System - Typical - Diesel
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL COOLING SYSTEM PRESSURE TESTER

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

WARNING: Hot, pressurized coolant can cause injury by scalding.

Carefully remove radiator pressure cap from filler neck and check coolant level. Push down on cap to disengage it from stop tabs. Wipe inside of filler neck and examine lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on outside of filler neck. If cams are damaged, seating of pressure cap valve and tester seal will be affected.

Attach pressure tester ((special tool #7700, Tester, Cooling System) or an equivalent) to radiator filler neck.

Operate tester pump to apply 103.4 kPa (15 psi) pressure to system. If hoses enlarge excessively or bulges while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

Holds Steady: If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform **COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER** .

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect transmission dipstick for water globules and transmission fluid cooler for leakage.

WARNING: With radiator pressure tester tool installed on radiator, do not allow pressure to exceed 110 kPa (20 psi). Pressure will build up quickly if a combustion leak is present. To release pressure, rock tester from side to side. When removing tester, do not turn tester more than 1/2 turn if

system is under pressure.

Operate engine without pressure cap on radiator until thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

Drain sufficient coolant to allow thermostat removal. Refer to **THERMOSTAT, REMOVAL**. Remove accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.

Add coolant to radiator to bring level to within 6 mm (1/4 in) of top of thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 RPM while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such

as the following may be the cause:

- Prolonged idle
- Debris blocking the grill or cooling module
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed
- Trailer towing
- Steep grades
- Any accessory addition that fully or partially blocks the grille opening

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump, or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.

These charts are to be used as a quick-reference only. Refer to the group text for information.

COOLING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?	1. for On-Board Diagnostics and DTC information. Refer to **DESCRIPTION** . Replace thermostat if necessary.
	2. Is the temperature sending unit connected?	2. Check the temperature sensor connector. Repair connector if necessary.
	3. Is the temperature gauge operating OK?	3. Check gauge operation. Repair as necessary.
	4. Coolant level low in cold ambient temperatures accompanied with poor	4. Check coolant level in the coolant reserve/overflow tank and the radiator.

	heater performance.	Inspect system for leaks. Repair leaks as necessary.
	5. Improper operation of internal heater doors or heater controls.	5. Inspect heater and repair as necessary. Refer to **DIAGNOSIS AND TESTING** .
TEMPERATURE GAUGE READS HIGH OR THE COOLANT LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair.
	2. Is the temperature gauge reading correctly?	2. Check gauge. (Refer to **INSTRUMENT CLUSTER - SERVICE INFORMATION**). Repair as necessary.
	3. Is the temperature warning illuminating unnecessarily?	3. Check warning lamp operation. (Refer to **INSTRUMENT CLUSTER - SERVICE INFORMATION**). Repair as necessary.
	4. Coolant low in coolant reserve/overflow tank and radiator?	4. Check for coolant leaks and repair as necessary. Refer to **DIAGNOSIS AND TESTING**.
	5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.	5. Tighten cap
	6. Poor seals at the radiator cap.	6. (a) Check condition of cap and cap seals. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**.
		(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.

7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools	7. (a) Check condition of radiator cap and cap seals. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**.
	(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.
	(c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary.
	(d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.
8. Incorrect coolant concentration	8. Check coolant. for correct coolant/water mixture ratio. Refer to **COOLANT, DESCRIPTION**.
9. Coolant not flowing through system	9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.
10. Radiator or A/C condenser fins are dirty or clogged.	10. Remove insects and debris from radiator or A/C Condenser fins.
11. Radiator core is corroded or plugged.	11. Have radiator re-cored or replaced.
12. Aftermarket A/C installed without proper radiator.	12. Install proper radiator.
13. Fuel or ignition system problems.	13. Refer to **FUEL SYSTEM** for diagnosis.
14. Dragging brakes.	14. Check and correct as necessary.
15. Bug screen or cardboard is being used, reducing	15. Remove bug screen or cardboard.

	airflow.	
	16. Thermostat partially or completely shut.	16. Check thermostat operation and replaces necessary.
	17. Cylinder head gasket leaking.	17. Check for cylinder head gasket leaks. Refer to **DIAGNOSIS AND TESTING**. For repair. Refer to **CYLINDER HEAD, REMOVAL** or **CYLINDER HEAD, REMOVAL** or **CYLINDER HEAD, REMOVAL, 5.7L** or **CYLINDER HEAD, REMOVAL** .
	18. Cooling fan operation failure.	18. (a) Check for possible blow fuse. Replace as necessary.
		(b) Check for power at the fan. Repair as necessary.
		(c) Fan motor failure. Repair as necessary.
	19. Heater core leaking.	19. Check heater core for leaks. Refer to **CORE, HEATER, REMOVAL** . Repair as necessary.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly.	1. A normal condition. No correction is necessary.
	2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.	2. Check operation of gauge and repair if necessary. Refer to **INSTRUMENT CLUSTER - SERVICE INFORMATION** .
	3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running)	3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.
	4. Gauge reading high after re-starting a warmed up (hot) engine.	4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.

	5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	5. Check and correct coolant leaks. Refer to **DIAGNOSIS AND TESTING**.
	6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.	6. (a) Check for cylinder head gasket leaks. Refer to **DIAGNOSIS AND TESTING**.
		(b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.
	7. Water pump impeller loose on shaft.	7. Check water pump and replace as necessary.
	8. Loose accessory drive belt. (water pump slipping)	8. Refer to **BELT, SERPENTINE, DIAGNOSIS AND TESTING**. Check and correct as necessary.
	9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK	1. Pressure relief valve in radiator cap is defective.	1. Check condition of radiator cap and cap seals. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**. Replace cap as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. Refer to **DIAGNOSIS AND TESTING**.
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating.	1. Check reason for overheating and repair as necessary.
	2. Freeze point of coolant not correct. Mixture is too rich or too lean.	2. Check coolant concentration. and adjust ratio as required. Refer to **COOLANT, DESCRIPTION**.
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being	1. (a) Radiator cap relief valve stuck. Refer to **CAP, RADIATOR, DIAGNOSIS**

	relieved through coolant reserve/overflow system.	**AND TESTING**. Replace if necessary (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary.
		(c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary.
		(d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
INADEQUATE HEATER PERFORMANCE.	1.Thermostat failed in open position	1. Check thermostat operation and replaces necessary
	2. Has a Diagnostic trouble Code (DTC) been set?	2. for correct procedures and replace thermostat if necessary. Refer to **DESCRIPTION** .
	3. Coolant level low	3. Refer to **DIAGNOSIS AND TESTING**.
	4. Obstructions in heater hose/fittings	4. Remove heater hoses at both ends and check for obstructions
	5. Heater hose kinked	5. Locate kinked area and repair as necessary
	6. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.	6. If a slipping belt is detected. Refer to **BELT, SERPENTINE, REMOVAL**. If heater core obstruction is detected, for cooling system reverse flushing. Refer to **STANDARD PROCEDURE**.
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when	1. Occasional steam emitting from this area is normal. No repair is necessary.

AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. for coolant concentration information. Refer to **COOLANT, DESCRIPTION**. Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.
FAN RUNS ALL THE TIME	1. Fan control sensors inoperative.	1. Check for DTC's. Verify sensor readings.
	2. Fan control solenoid stuck "on".	2. Check fan operation speeds. Refer to fan speed operation table.
	3. Fan control solenoid harness damaged.	3. Check for DTC 1499. Repair as required.
	4. Transmission temperature too high.	4. Check for transmission over temp. DTC.
	5. Engine coolant temperature too high.	5. (a) Check coolant level. Correct level as required.
		(b) Thermostat stuck. Replace thermostat.
		(c) Water pump failed. Replace water pump.
		(d) Coolant flow restricted. Clean radiator.
		(e) Air flow over radiator obstructed. Remove obstruction.

STANDARD PROCEDURE

DRAINING

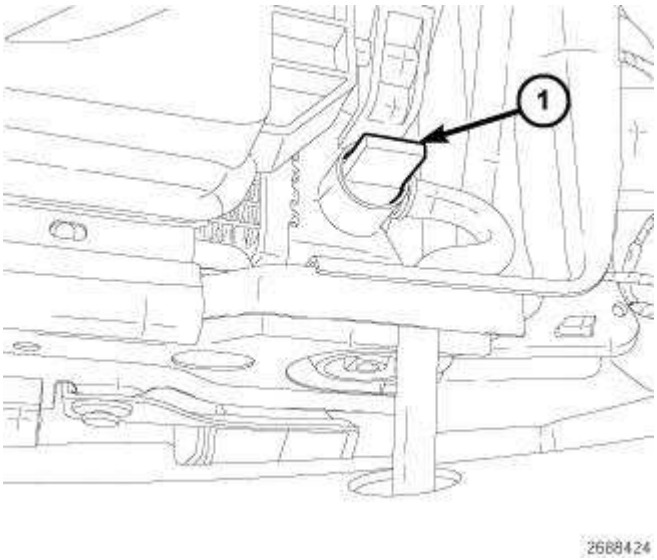

Fig. 4: Radiator Petcock
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

NOTE: Typical drain plug shown in illustration.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Remove radiator pressure cap.
2. Raise and secure vehicle.
3. If equipped, remove the underbody splash shield.
4. Loosen radiator petcock.
5. Drain coolant into a clean container.

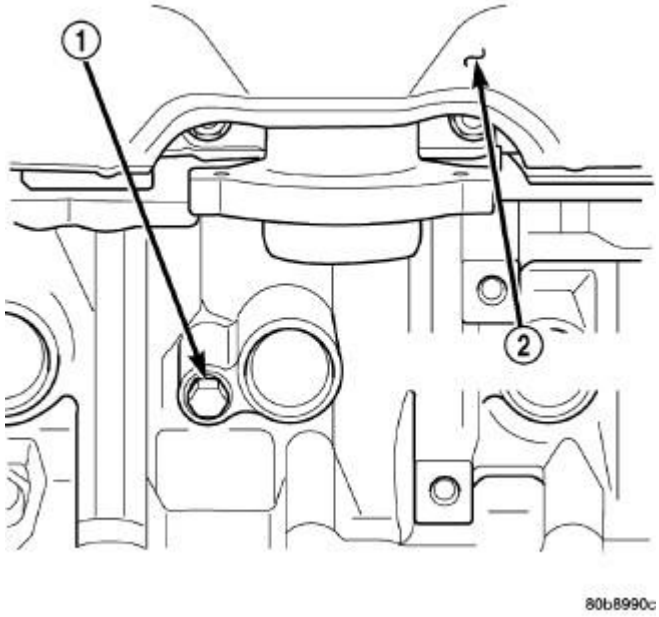

Fig. 5: Identifying Cylinder Block Drain Plugs
Courtesy of CHRYSLER GROUP, LLC

6. If necessary, to perform a complete coolant drain of the engine, remove the drain plug (1) from the engine block.

STANDARD PROCEDURE - COOLANT AIR EVACUATION

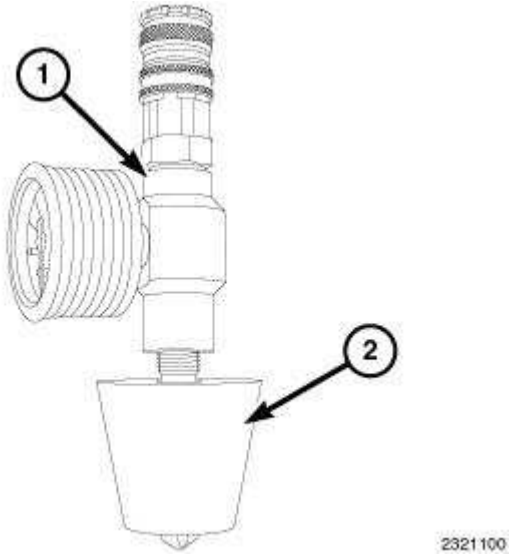

Fig. 6: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: **To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.**

WARNING: **ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.**

WARNING: **WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.**

NOTE: **The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.**

NOTE: **For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).**

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

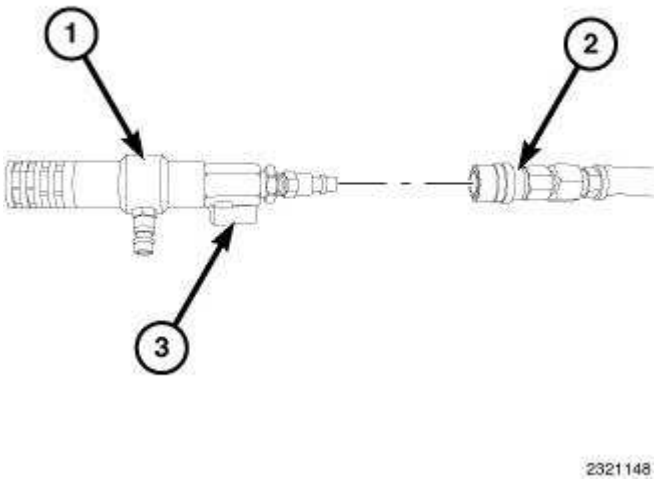

Fig. 7: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 PSI/5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

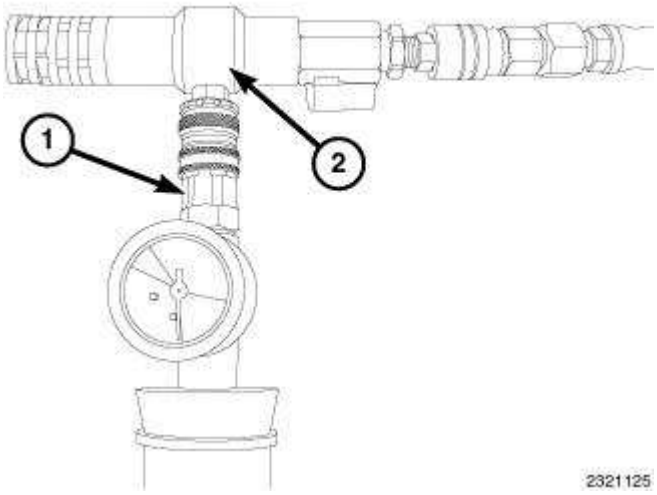

Fig. 8: Vacuum Generator/Venturi
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: **Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.**

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: **If a strong vacuum is being created in the system, it is normal to see the radiator hoses to collapse.**

9. Close the vacuum generator/venturi ball valve.

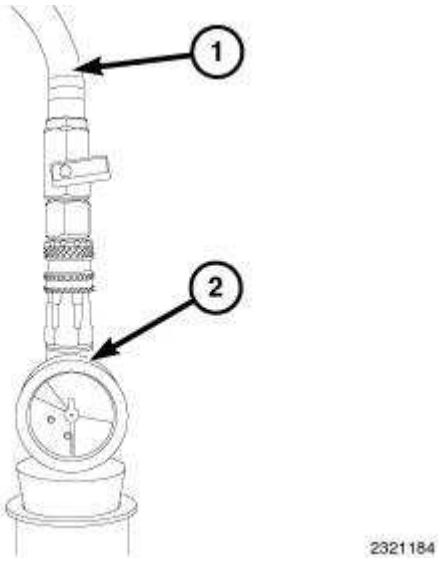

Fig. 9: Vacuum Generator/Venturi And Air Line
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE: **Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.**

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

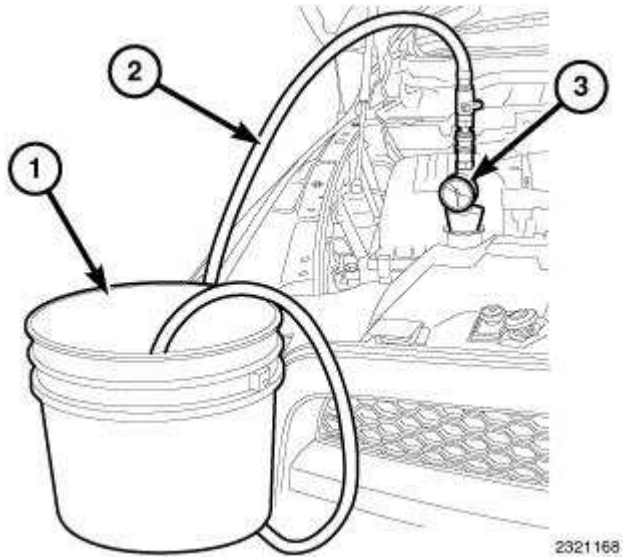

Fig. 10: Suction Hose Ball Valve
Courtesy of CHRYSLER GROUP, LLC

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

ADDING ADDITIONAL COOLANT

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and

replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

COOLANT LEVEL CHECK

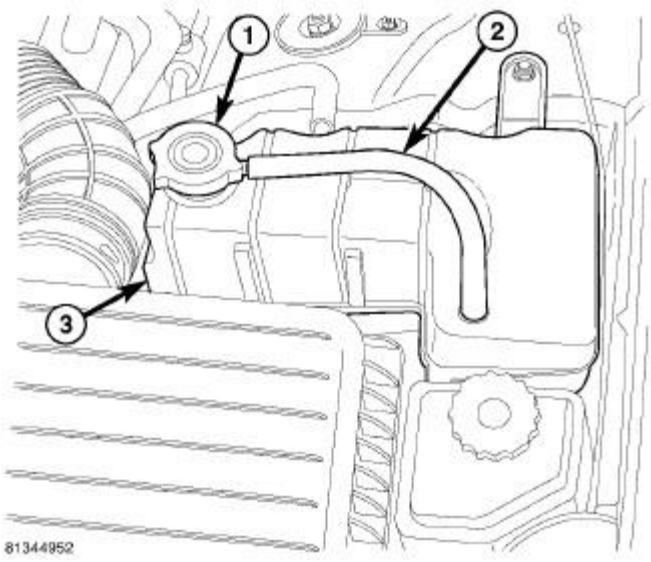

Fig. 11: Coolant Recovery Container
Courtesy of CHRYSLER GROUP, LLC

1 - COOLANT RECOVER CONTAINER PRESSURE CAP
2 - COOLANT RECOVERY CONTAINER
3 - ADD/FULL MARKS

NOTE: Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle (2).

The coolant reserve/overflow system provides a quick method for determining coolant level. With engine not running, the coolant level should be between MIN and MAX marks (3). If the coolant level is at or below the MIN mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark.

CLEANING/REVERSE FLUSHING

CLEANING

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain cooling system. Remove thermostat housing and thermostat. Install thermostat housing. Disconnect radiator upper hose from radiator and attach flushing gun to hose. Disconnect radiator lower hose from water pump and attach a lead-away hose to water pump inlet fitting.

CAUTION: On vehicles equipped with a heater water control valve, be sure heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering heater core.

Connect water supply hose and air supply hose to flushing gun. Allow engine to fill with water. When engine is filled, apply air in short blasts, allowing system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove lead away hose, flushing gun, water supply hose and air supply hose. Remove thermostat housing and install thermostat. Install thermostat housing with a replacement gasket. Refer to **REMOVAL** . Connect radiator hoses. Refill cooling system with correct antifreeze/water mixture. Refer to **ADDING ADDITIONAL COOLANT** .

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar® Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

ACCESSORY DRIVE

BELT, SERPENTINE

DESCRIPTION

DESCRIPTION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, coolant bottle is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Electric cooling fan
- Radiator
- A coolant recovery system
- Thermostat
- Water pump
- Radiator pressure cap
- Coolant
- Water pump
- Hoses and hose clamps

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

VISUAL DIAGNOSIS

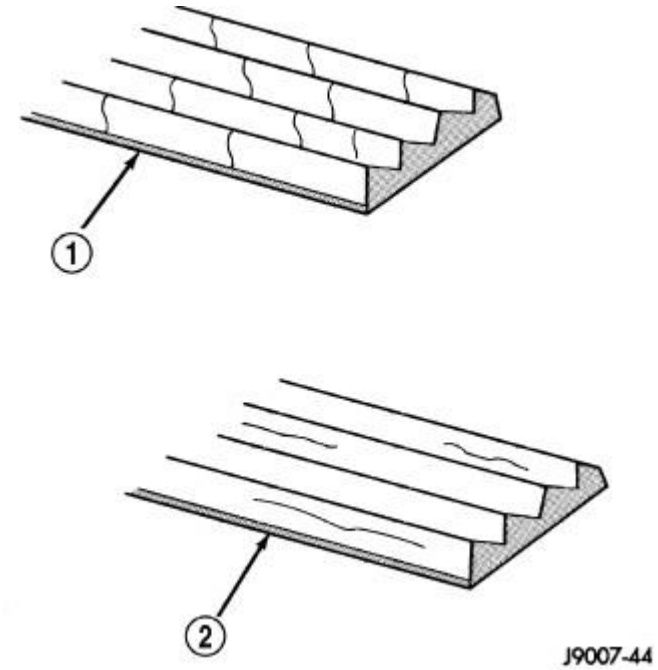

Fig. 12: Belt Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

1 - NORMAL CRACKS BELT OK
2 - NOT NORMAL CRACKS REPLACE BELT

When diagnosing serpentine accessory drive belts, small cracks (1) that run across the ribbed surface of the belt from rib to rib, are considered normal. These are not a reason to replace the belt. However, cracks (2) running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords, severe glazing or chunking.

Any belt with bumps, surface coming apart, or any other uneven indications along the flat surface of the belt must be remove and inspected and replaced if necessary.

for further belt diagnosis. Refer to **ACCESSORY DRIVE BELT DIAGNOSIS CHART**.

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt.
	2. Installation damage	2. Replace belt

RIB OR BELT WEAR	1. Pulley misaligned	1. Align pulley(s)
	2. Abrasive environment	2. Clean pulley(s). Replace belt if necessary
	3. Rusted pulley(s)	3. Clean rust from pulley(s)
	4. Sharp or jagged pulley groove tips	4. Replace pulley. Inspect belt.
	5. Belt rubber deteriorated	5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension	1. Inspect/Replace tensioner if necessary
	2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol)	2. Replace belt and clean pulleys
	3. Driven component bearing failure (seizure)	3. Replace faulty component or bearing
	4. Belt glazed or hardened from heat and excessive slippage	4. Replace belt.
LONGITUDINAL BELT CRACKING	1. Belt has mis-tracked from pulley groove	1. Replace belt
	2. Pulley groove tip has worn away rubber to tensile member	2. Replace belt
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Pulley(s) not within design tolerance	2. Replace pulley(s)
	3. Foreign object(s) in grooves	3. Remove foreign objects from grooves
	4. Pulley misalignment	4. Align component
	5. Belt cord line is broken	5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Incorrect belt tension	1. Replace Inspect/Replace tensioner if necessary
	2. Tensile member damaged during belt installation	2. Replace belt
	3. Severe misalignment	3. Align pulley(s)
	4. Bracket, pulley, or bearing failure	4. Replace defective component and belt
NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Bearing noise	2. Locate and repair
	3. Belt misalignment	3. Align belt/pulley(s)
	4. Belt to pulley mismatch	4. Install correct belt
	5. Driven component induced vibration	5. Locate defective driven component and repair

	6. Belt flat surface coming apart	6. Replace belt
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object	1. Correct rubbing condition
	2. Excessive heat causing woven fabric to age	2. Replace belt
	3. Tension sheeting splice has fractured	3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Belt contacting stationary object	2. Replace belt
	3. Pulley(s) out of tolerance	3. Replace pulley
	4. Insufficient adhesion between tensile member and rubber matrix	4. Replace belt

REMOVAL

3.6L

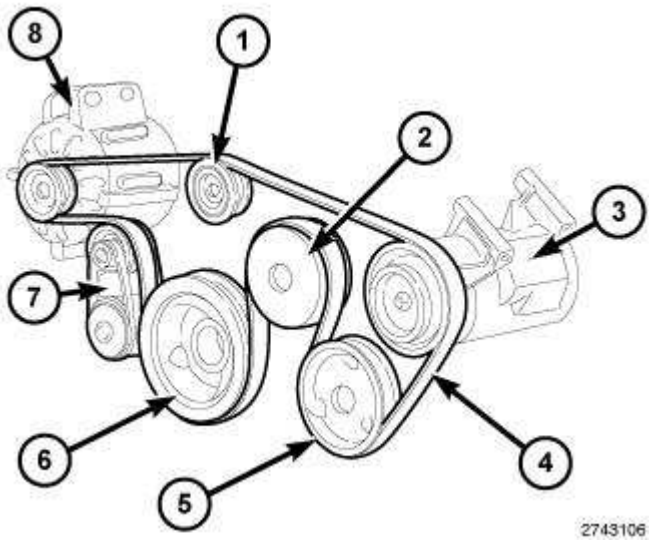

Fig. 13: Drive Belt Tensioners & Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner (7) until it contacts its stop. Remove belt (4), then slowly rotate the tensioner (7) into the freearm position.

3.6L ELECTRONIC POWER STEERING

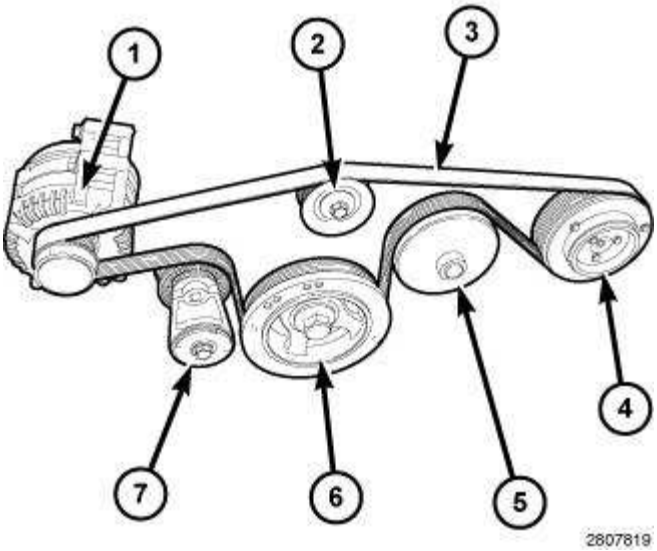

Fig. 14: New Belt, Idler Pulley, Tensioner Arm, Belt, Idler & Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Disconnect negative battery cable from battery.
2. Remove the air cleaner intake system.
3. Rotate belt tensioner (7) until it contacts its stop. Remove belt (3), then slowly rotate the tensioner (7) into the freearm position.

5.7L ELECTRONIC POWER STEERING

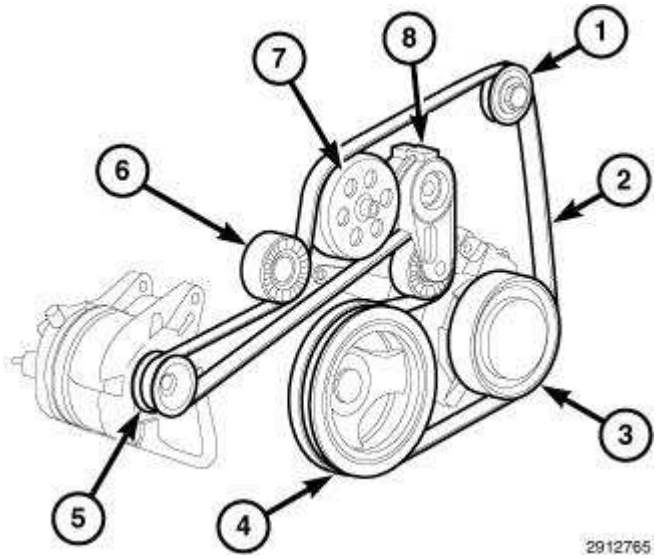

Fig. 15: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the air intake tube between intake manifold and air filter assembly.
3. Using a suitable square drive tool, release the belt tension by rotating the tensioner (8) clockwise. Rotate the belt tensioner (8) until the belt (2) can be removed from pulleys.
4. Remove the belt (2).
5. Gently release the tensioner (8).

3.0L

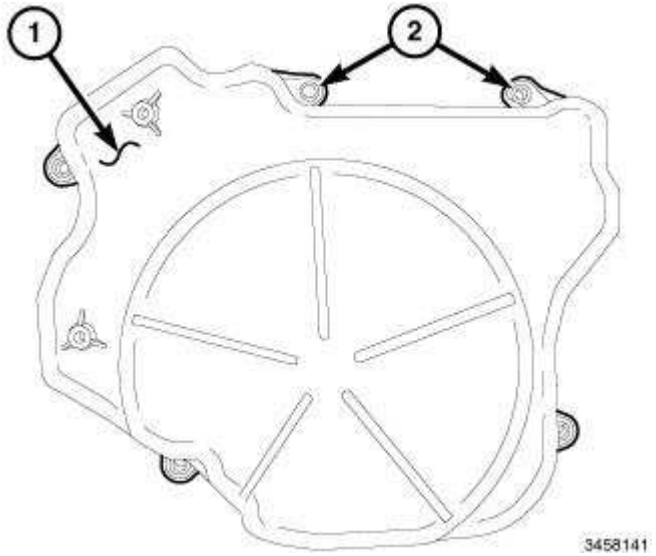

Fig. 16: Front Harmonic Vibration Dampener Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable from battery.
2. Remove the front harmonic vibration dampener cover (1).

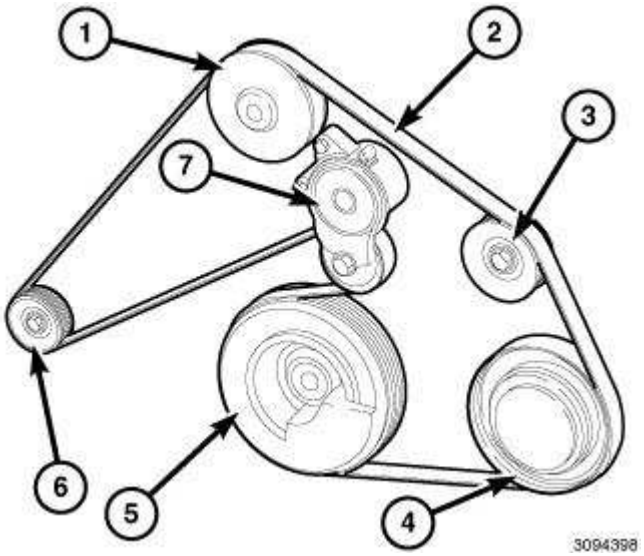

Fig. 17: Pulleys, Tensioner & Drive Belt Routing 3.0L
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

3. Rotate belt tensioner (7) until it contacts its stop. Remove belt (2), then slowly rotate the tensioner (7) into the freearm position.

INSTALLATION

3.6L

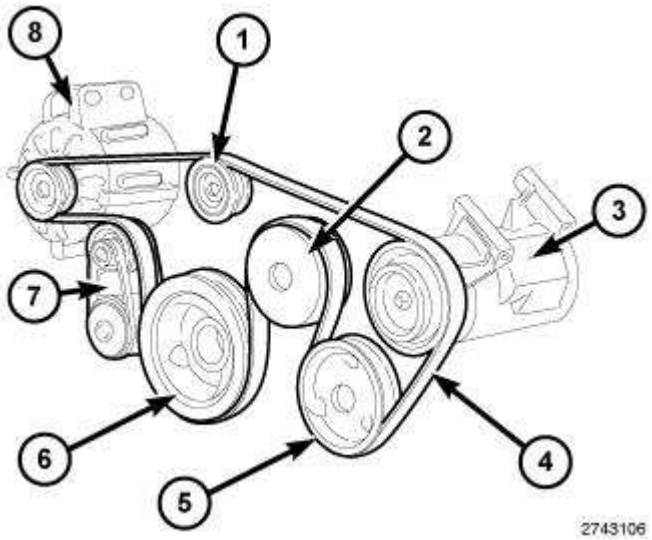

Fig. 18: Drive Belt Tensioners & Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt (4). Route the belt around all pulleys except the idler pulley (1). Rotate the tensioner arm (7) until it contacts its stop position. Route the belt (4) around the idler (1) and slowly let the tensioner (7) rotate into the belt. Make sure the belt (4) is seated onto all pulleys.

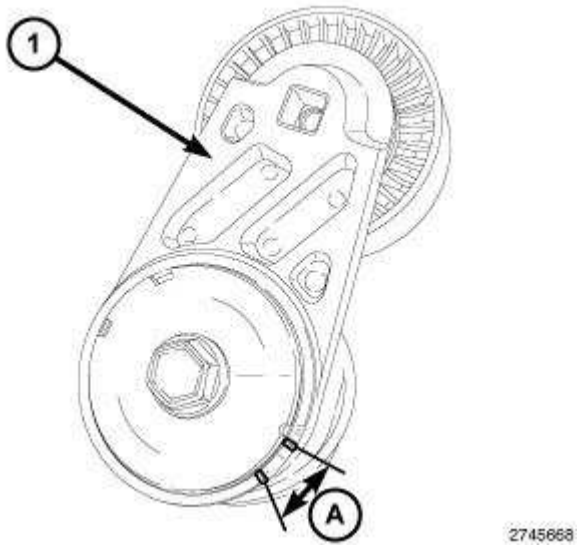

Fig. 19: Measurement A
Courtesy of CHRYSLER GROUP, LLC

3. With the drive belt installed, inspect the belt wear indicator. The gap between the tang and the housing stop (measurement A) must not exceed 24 mm (.94 inches).

3.6L ELECTRONIC POWER STEERING

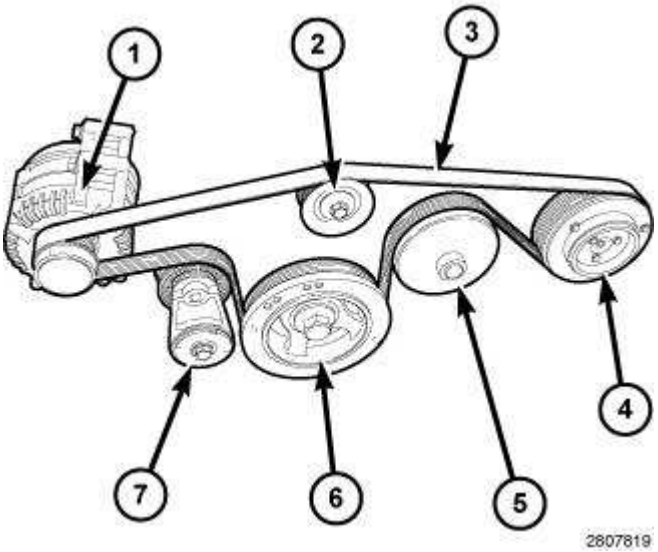

Fig. 20: New Belt, Idler Pulley, Tensioner Arm, Belt, Idler & Tensioner
Courtesy of CHRYSLER GROUP, LLC

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt (3). Route the belt around all pulleys except the idler pulley (2). Rotate the tensioner arm (7) until it contacts its stop position. Route the belt (3) around the idler (2) and slowly let the tensioner (7) rotate into the belt. Make sure the belt (3) is seated onto all pulleys.

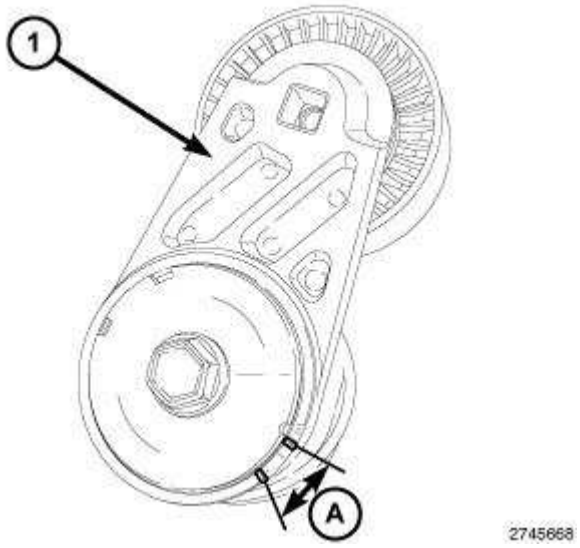

Fig. 21: Measurement A
Courtesy of CHRYSLER GROUP, LLC

3. With the drive belt installed, inspect the belt wear indicator. The gap between the tang and the housing stop (measurement A) must not exceed 24 mm (.94 inches).
4. Install the air cleaner intake system.

5.7L ELECTRONIC POWER STEERING

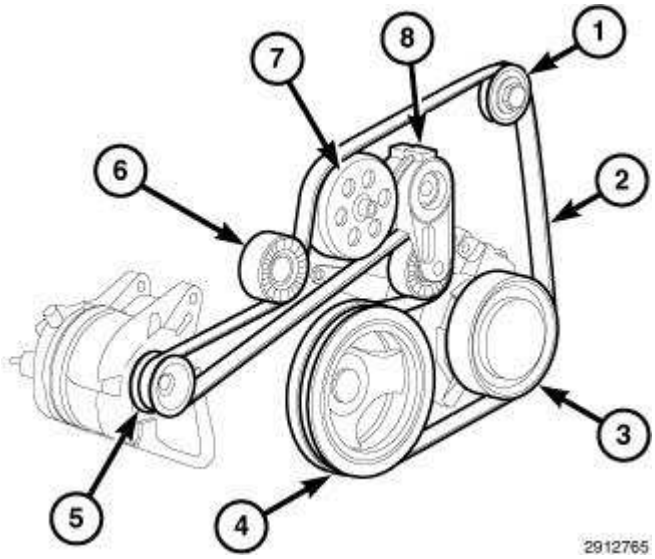

Fig. 22: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing accessory drive belt onto pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulleys.

1. Position the drive belt (2) over all pulleys except for the water pump pulley (7).
2. Rotate the tensioner (8) **clockwise** and slip the belt (2) over the water pump pulley (7).
3. Gently release tensioner (8).
4. Install the air intake tube between intake manifold and the air filter assembly.
5. Connect the negative battery cable.

3.0L

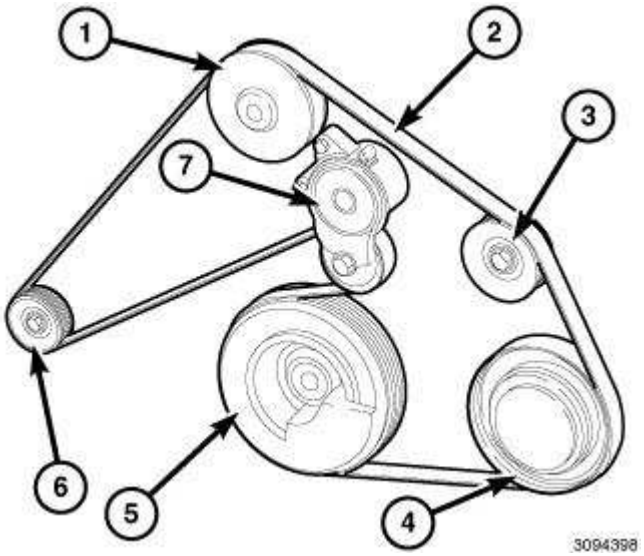

Fig. 23: Pulleys, Tensioner & Drive Belt Routing 3.0L
Courtesy of CHRYSLER GROUP, LLC

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt (2). Route the belt around all pulleys except the idler pulley (3). Rotate the tensioner arm (7) until it contacts its stop position. Route the belt (2) around the idler (3) and slowly let the tensioner (7) rotate into the belt. Make sure the belt (2) is seated onto all pulleys.

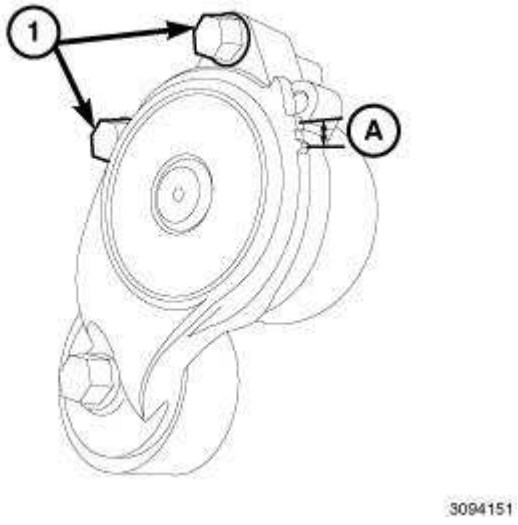

Fig. 24: Belt Wear Indicator (Measurement A)
Courtesy of CHRYSLER GROUP, LLC

3. With the drive belt installed, inspect the belt wear indicator. The gap between the tang and the housing stop (measurement A).

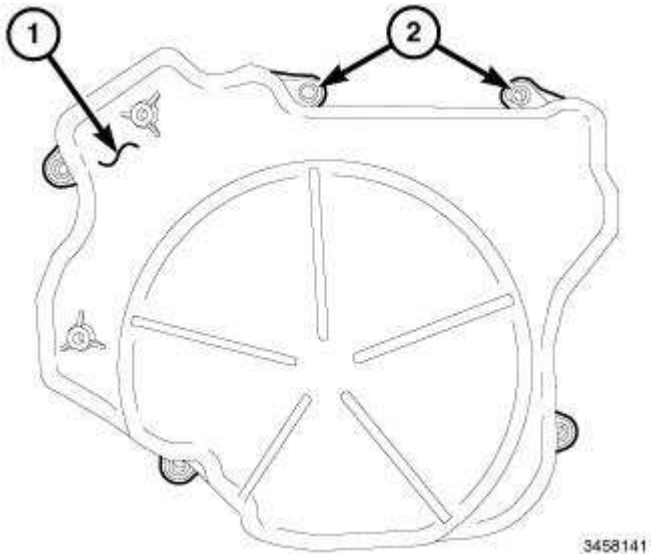

Fig. 25: Front Harmonic Vibration Dampener Cover
Courtesy of CHRYSLER GROUP, LLC

4. Install the harmonic vibration dampener cover (1). Tighten the bolts to 10 N.M (89 in. lbs.).
5. Connect the negative battery.

PULLEY, IDLER

REMOVAL

5.7/6.4L

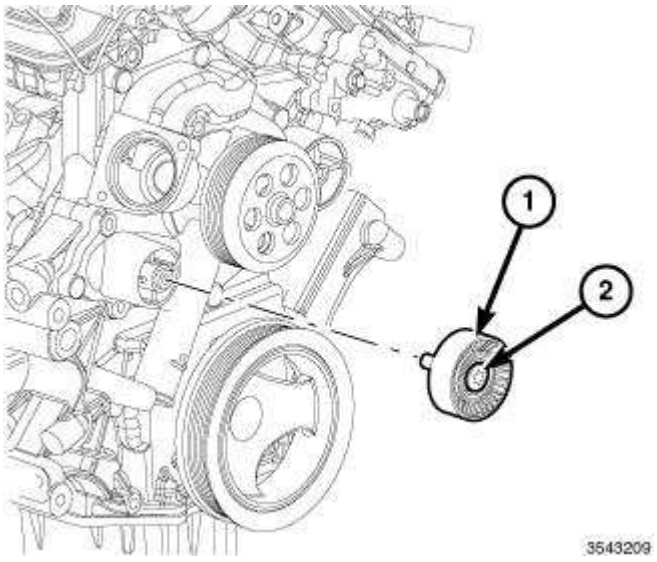

Fig. 26: Idler Pulley - 5.7L/6.4L Engine

Courtesy of CHRYSLER GROUP, LLC

1. Remove accessory drive belt. Refer to **TENSIONER, BELT, REMOVAL**.
2. Remove bolt (2) and idler pulley (1).

5.7L IDLER BRACKET

NOTE: The idler bracket takes the place of the power steering pump on the vehicles that use electronic power steering.

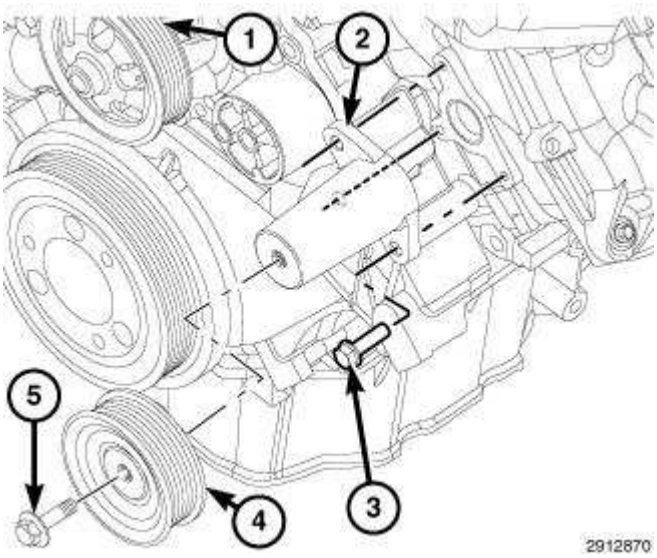

Fig. 27: Idler Pulley, Idler Bracket & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
2. Remove the idler pulley (4) from the idler bracket (2).
3. Remove the three mounting bolts (3) that hold the idler bracket (2) to the block.

3.6L

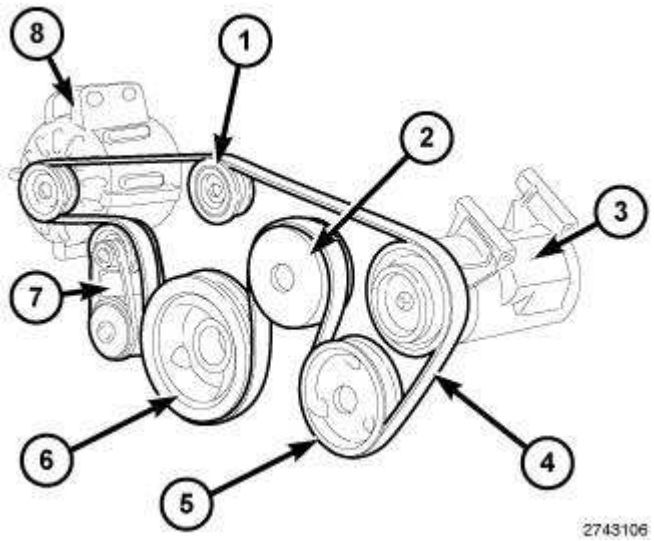

Fig. 28: Drive Belt Tensioners & Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Remove main drive belt (4). Refer to **BELT, SERPENTINE, REMOVAL**.
2. Remove the mounting bolt holding the idler pulley (1).

3.0L

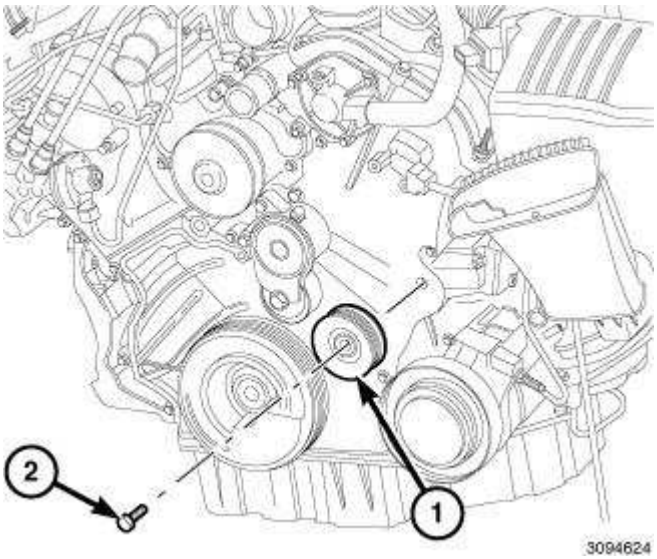

Fig. 29: Idler Pulley 3.0L
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
3. Remove the idler pulley.

INSTALLATION

5.7/6.4L

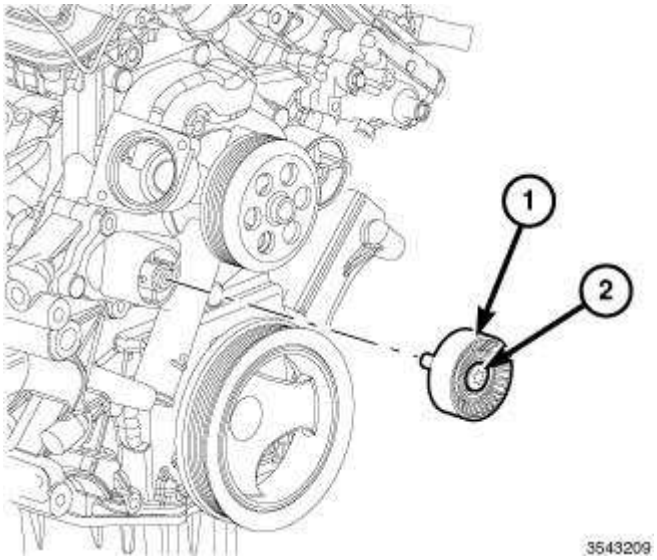

Fig. 30: IDLER PULLEY - 5.7L/6.4L ENGINE
Courtesy of CHRYSLER GROUP, LLC

1. Position idler pulley (1).
2. Tighten bolt (2) to 29 N.m (21 ft. lbs.).
3. Install accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

5.7L IDLER BRACKET

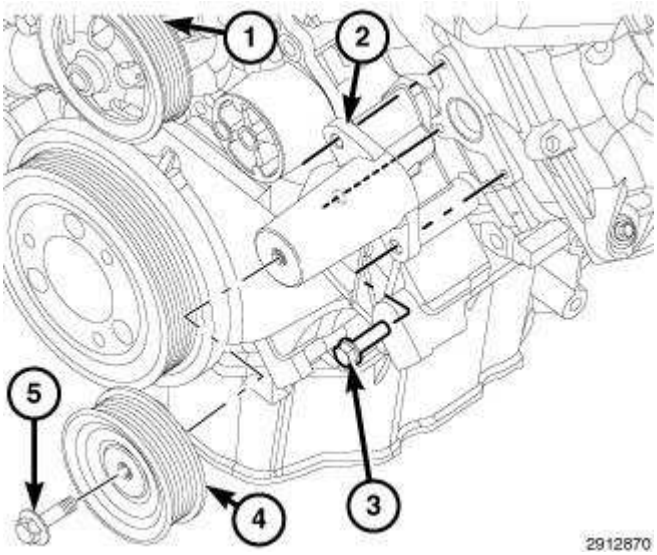

Fig. 31: Idler Pulley, Idler Bracket & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the idler bracket to the engine block. Install the three mounting bolts (3). Tighten bolts to 29 N.m (21 ft. lbs.).

2. Install the idler pulley (4). Tighten bolt (5) to 29 N.m (21 ft. lbs.).
3. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

3.6L

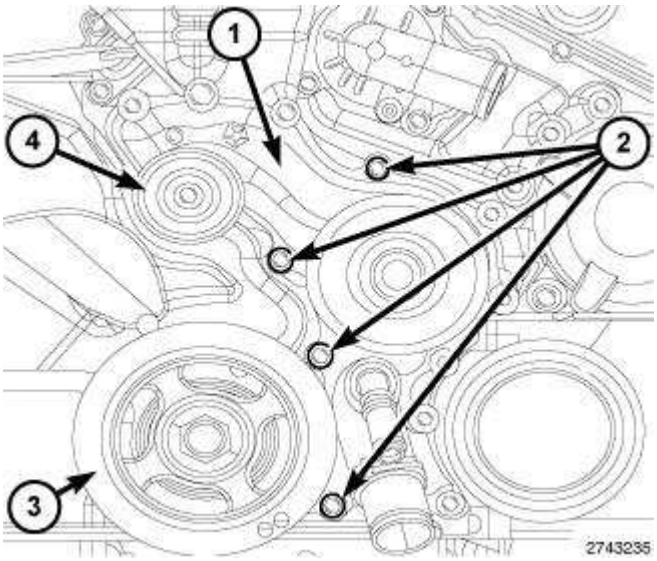

Fig. 32: Idler Pulley, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install bolt for idler pulley (4).
2. Install main drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

3.0L

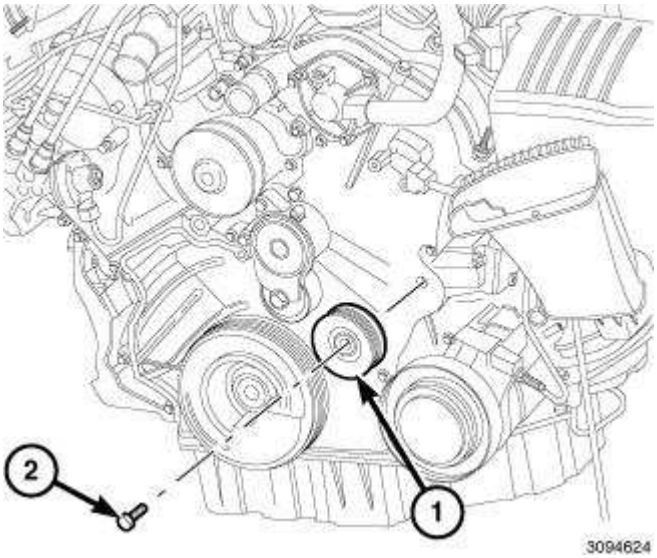

Fig. 33: Idler Pulley 3.0L
Courtesy of CHRYSLER GROUP, LLC

1. Position the pulley onto engine. Tighten bolt (2) to 54 N.m (40 ft. lbs.).
2. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
3. Connect the negative battery cable.

TENSIONER, BELT

DESCRIPTION

DESCRIPTION

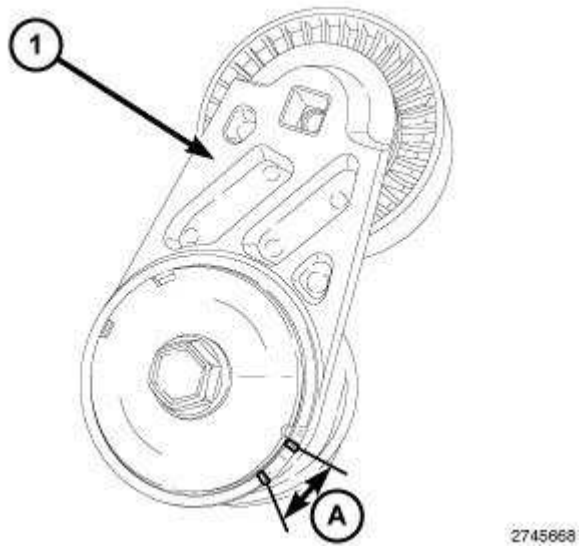

Fig. 34: Measurement A
Courtesy of CHRYSLER GROUP, LLC

Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension. All engines are equipped with an automatic belt tensioner. The tensioner maintains correct accessory drive belt tension at all times.

REMOVAL

3.6L

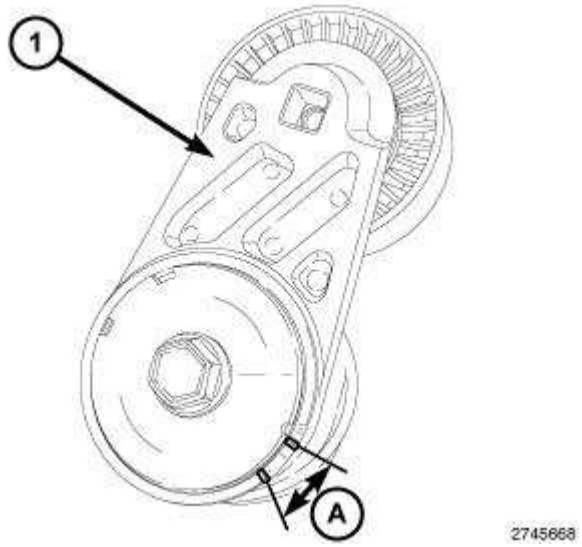

Fig. 35: Measurement A
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the air intake system. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove main drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
4. Remove tensioner assembly from engine front cover.

WARNING: Because of high spring tension, do not attempt to disassemble automatic tensioner. Unit is serviced as an assembly (except for pulley on tensioner).

5.7L

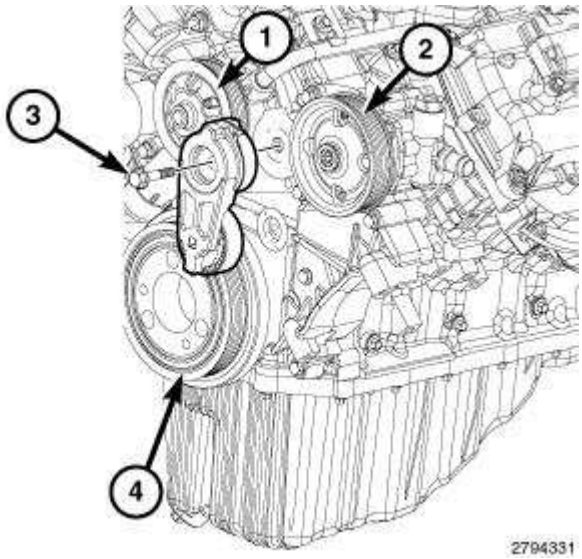

Fig. 36: Tensioner Assembly & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the air intake system. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove accessory drive belt Refer to **BELT, SERPENTINE, REMOVAL**.
4. Remove bolt (3) and tensioner assembly.

3.0L

WARNING: Because of high spring tension, do not attempt to disassemble automatic tensioner. Unit is serviced as an assembly (except for pulley on tensioner).

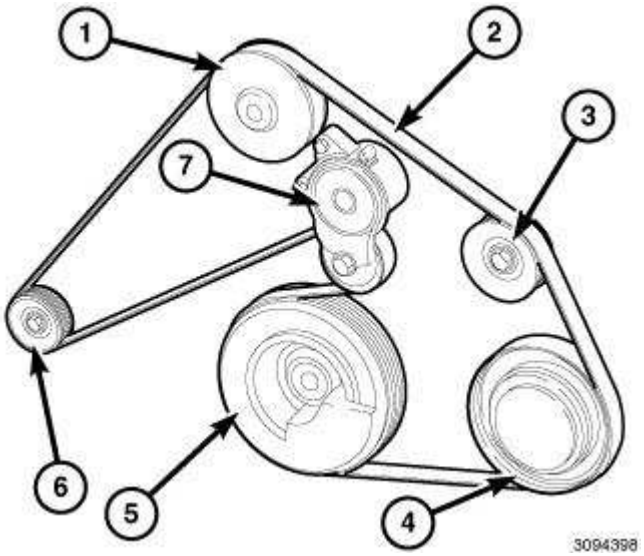

Fig. 37: Pulleys, Tensioner & Drive Belt Routing 3.0L
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the air intake system. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove main drive belt (2). Refer to **BELT, SERPENTINE, REMOVAL**.

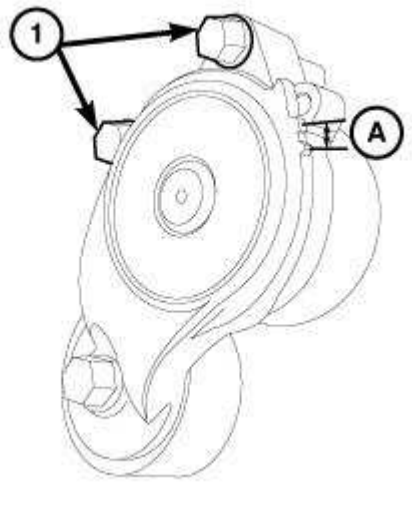

Fig. 38: Belt Wear Indicator (Measurement A)
Courtesy of CHRYSLER GROUP, LLC

4. Remove the belt tensioner assembly from the engine front cover.

INSTALLATION

3.6L

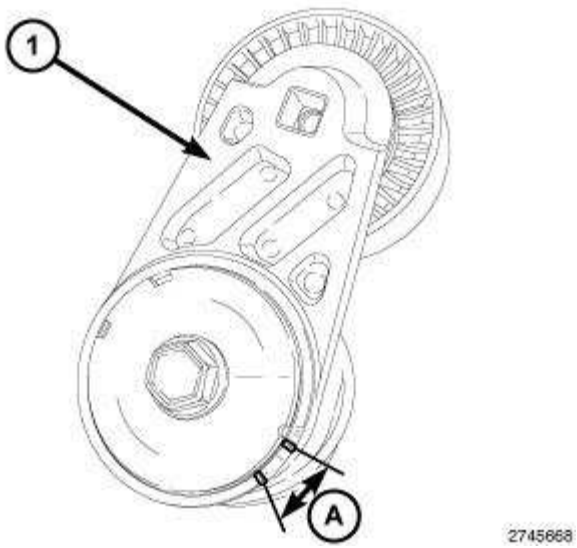

Fig. 39: Measurement A
Courtesy of CHRYSLER GROUP, LLC

1. An indexing slot is located on back of tensioner. Align this slot to the head of the bolt on the front cover. Install the mounting bolt. Tighten bolt to 41 N.m (30 ft. lbs.).
2. Install main drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
3. Check belt indexing marks.

4. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
5. Connect the negative battery.

5.7L

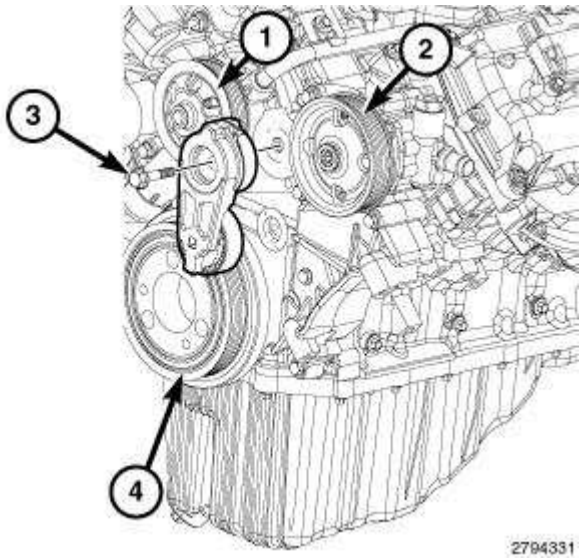

Fig. 40: Tensioner Assembly & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Align locator tang on tensioner with slot in front cover.
2. Install tensioner and mounting bolt (3) to front cover. Tighten bolt to 41 N.m (30 ft. lbs.).
3. Install accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
4. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
5. Connect the negative battery.

3.0L

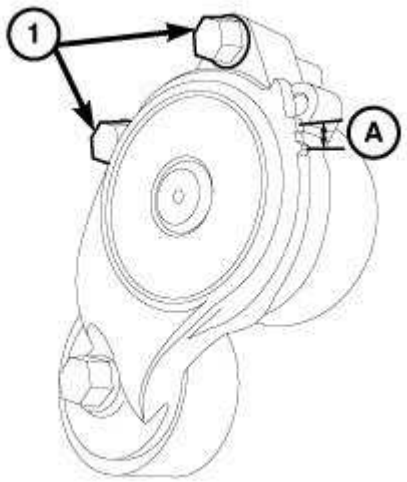

Fig. 41: Belt Wear Indicator (Measurement A)
Courtesy of CHRYSLER GROUP, LLC

1. Position the belt tensioner onto the front cover. Install the mounting bolt. Tighten bolts (1) to 41 N.m (30 ft. lbs.).
2. Install main drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
3. Check belt indexing marks.
4. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
5. Connect the negative battery.

ENGINE

BOTTLE, COOLANT RECOVERY

REMOVAL

REMOVAL

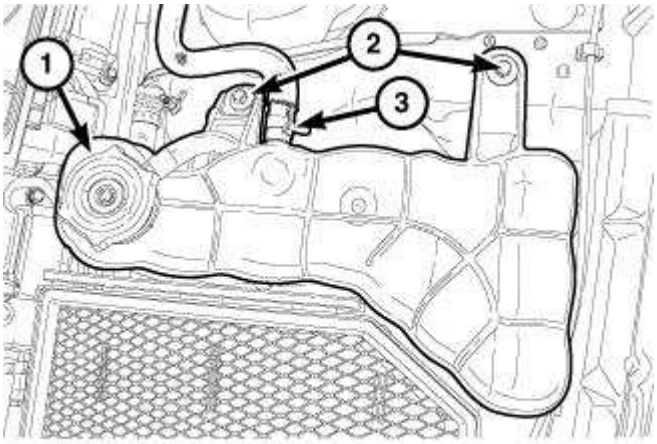

Fig. 42: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Partially drain cooling system using the draincock only. Refer to **STANDARD PROCEDURE**. Drain system below level of the coolant recovery pressure container.
2. Remove coolant recovery container pressure cap (1).
3. Remove and plug coolant recovery tube (3).
4. Remove mounting screws (2).
5. Pull the coolant recovery container away from the body.
6. Remove the coolant supply line from the coolant recovery container.
7. Remove coolant recovery container from vehicle.

INSTALLATION

INSTALLATION

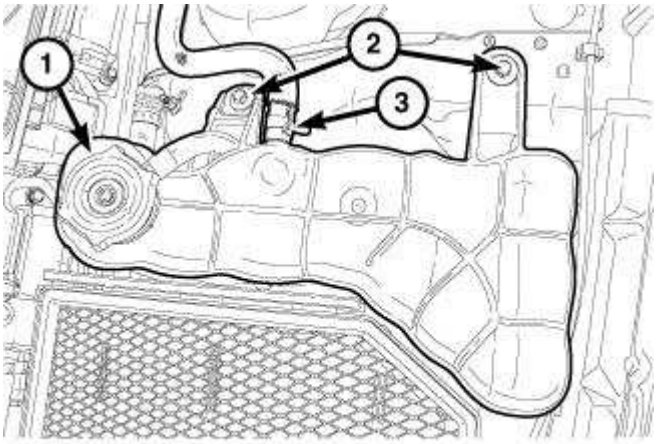

Fig. 43: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Install the lower supply line to the coolant recovery container (3)
2. Position the coolant recovery container.
3. Install mounting screws (2). Tighten to 10 N.m (89 in. lbs.).
4. Install the coolant recovery return tube (3).
5. Fill cooling system. Refer to **STANDARD PROCEDURE**.
6. Install coolant recovery container pressure cap (1).

CAP, RADIATOR

DESCRIPTION

DESCRIPTION

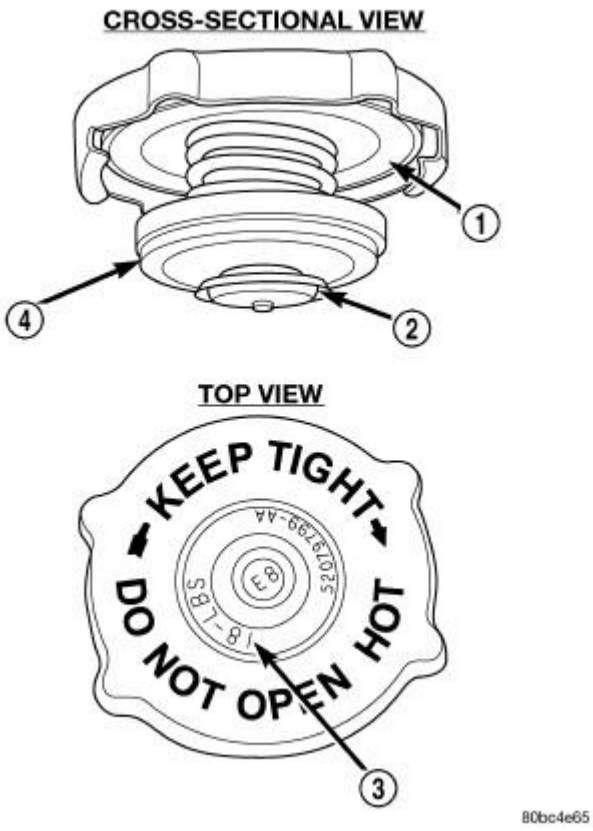

Fig. 44: Radiator Pressure Cap - Typical
Courtesy of CHRYSLER GROUP, LLC

All cooling systems are equipped with a pressure cap on the radiator. This cap releases pressure at some point within a range of 110-138 kPa (16-20 psi). The pressure relief point (in pounds) is engraved on top of the cap (3).

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve (4). This valve opens when system pressure reaches the release range of 110-138 kPa (16-20 psi).

A rubber gasket (2) seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

DIAGNOSIS AND TESTING

RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool (special tool #7700, Tester, Cooling System) (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 124 kPa (18 psi) and

hold pressure at a minimum of 110 kPa (186psi).

WARNING: The warning words "DO NOT OPEN HOT" on radiator pressure cap, are a safety precaution. When hot, pressure builds up in cooling system. To prevent scalding or injury, radiator cap should not be removed while system is hot and/or under pressure.

Do not remove radiator cap at any time **except** for the following purposes:

1. Check and adjust antifreeze freeze point.
2. Refill system with new antifreeze.
3. Conducting service procedures.
4. Checking for vacuum leaks.

WARNING: If vehicle has been run recently, wait at least 15 minutes before removing radiator cap. With a rag, squeeze radiator upper hose to check if system is under pressure. Place a rag over cap and without pushing cap down, rotate it counter-clockwise to first stop. Allow fluid to escape through the coolant reserve/overflow hose into reserve/overflow tank. Squeeze radiator upper hose to determine when pressure has been released. When coolant and steam stop being pushed into tank and system pressure drops, remove radiator cap completely.

RADIATOR PRESSURE CAP

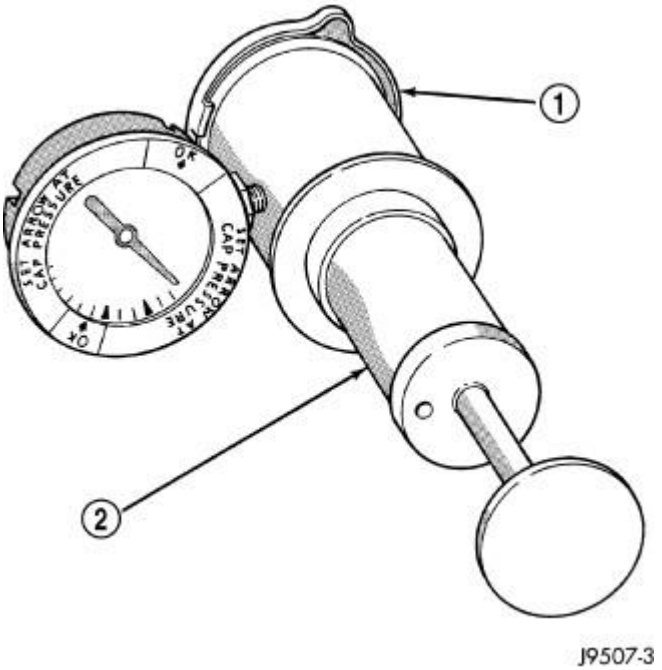

Fig. 45: Pressure Testing Radiator Pressure Cap-Typical
Courtesy of CHRYSLER GROUP, LLC

Remove cap (1) from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap (1) on pressure tester (special tool #7700, Tester, Cooling System) (2) or an equivalent.

Operate tester pump to bring pressure to 124 kPa (18 psi) on gauge. If pressure cap (1) fails to hold pressure of at least 110 kPa (16 psi) replace cap. Refer to the following **CAUTION** .

The pressure cap may test properly while positioned on tool (special tool #7700, Tester, Cooling System) (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

INSPECTION

INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

COOLANT

DESCRIPTION

DESCRIPTION

GAS ENGINES AND DIESEL ENGINES

WARNING: Antifreeze is an ethylene glycol based coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol based coolant properly, contact your government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan

when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (MS-9769), or the equivalent ethylene glycol based coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer Tool (special tool #8286, Refractometer) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid. Refer to **SPECIAL TOOLS**.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene

glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

FAN, COOLING

REMOVAL

3.6L SINGLE FAN

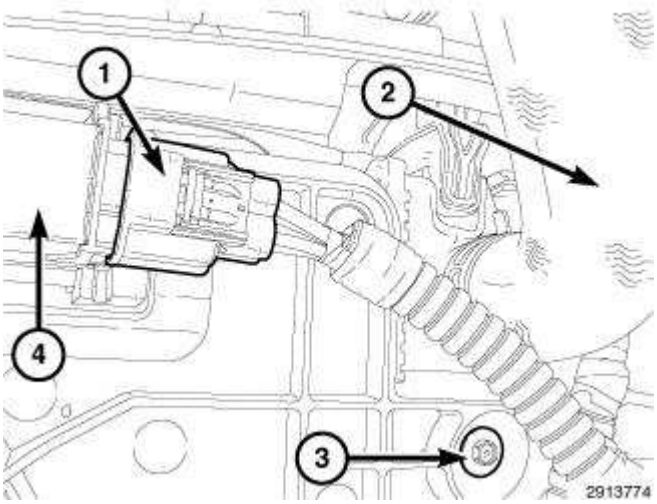

Fig. 46: Cooling Fan Electrical Connector & Upper Cooling Fan Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

1. Disconnect negative battery cable.
2. Remove the air filter housing assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Disconnect the cooling fan electrical connector (1).
4. Remove the upper cooling fan mounting bolts (3).
5. Remove the cooling fan assembly from the vehicle taking care not to damage the fins on the radiator.

5.7/6.4L SINGLE FAN

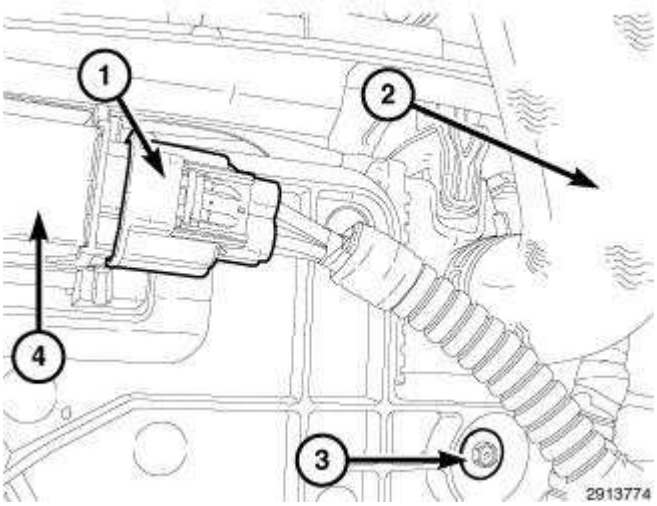

Fig. 47: Cooling Fan Electrical Connector & Upper Cooling Fan Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

1. Disconnect negative battery cable.
2. Remove the air filter housing assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Disconnect the cooling fan electrical connector (1).
4. Remove the upper cooling fan mounting bolts (3).

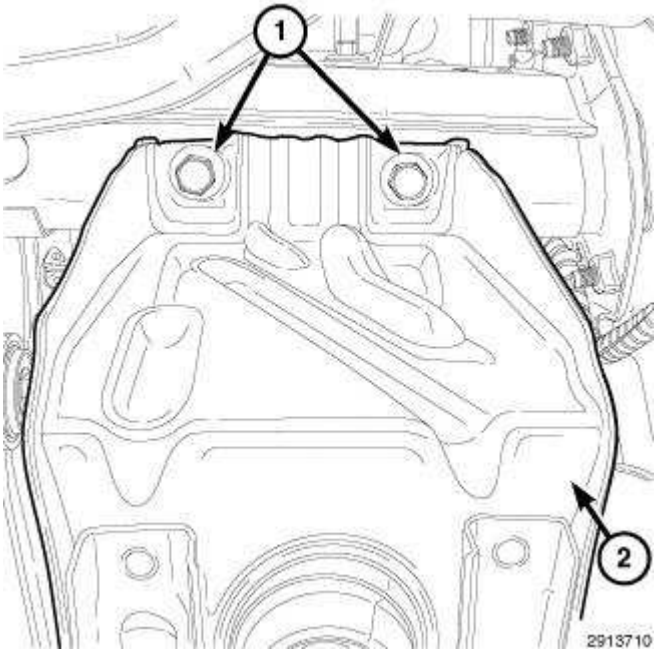

Fig. 48: Lower Radiator Core Support Bolts & Core Support
Courtesy of CHRYSLER GROUP, LLC

NOTE: The lower radiator support does not need to be removed. The bolts can be loosened so that the support can be positioned forward enough for the cooling fan to be removed from the bottom of the vehicle.

5. Raise vehicle.
6. If equipped, remove the lower engine belly pan.
7. **Loosen** the lower radiator core support bolts (1).

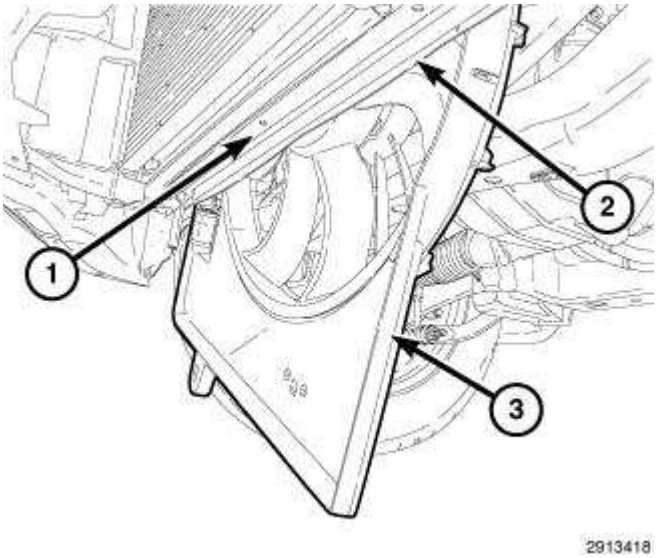

Fig. 49: Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

8. Remove the radiator cooling fan assembly (1) from the radiator by pushing up and away from the radiator mounts.
9. While moving the lower core support forward, slowly lower the left side of the cooling fan assembly from the bottom of the vehicle.
10. Remove the cooling fan assembly from the vehicle taking care not to damage the fins on the radiator.

3.6L DUAL FAN

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

1. Disconnect negative battery cable.
2. Remove the air filter housing assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .

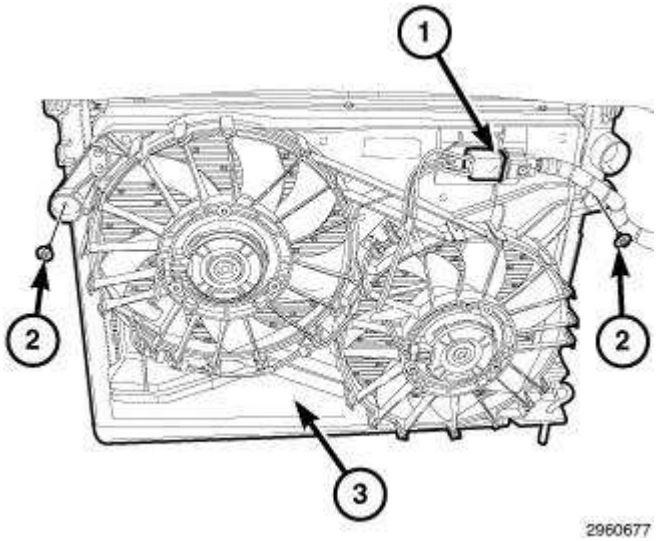

Fig. 50: Cooling Fan Electrical Connector, Cooling Fan Mounting Bolts & Radiator Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the cooling fan electrical connector (1).
4. Remove the cooling fan mounting bolts (2).
5. Using care. Remove the radiator cooling fan assembly (3) from vehicle.

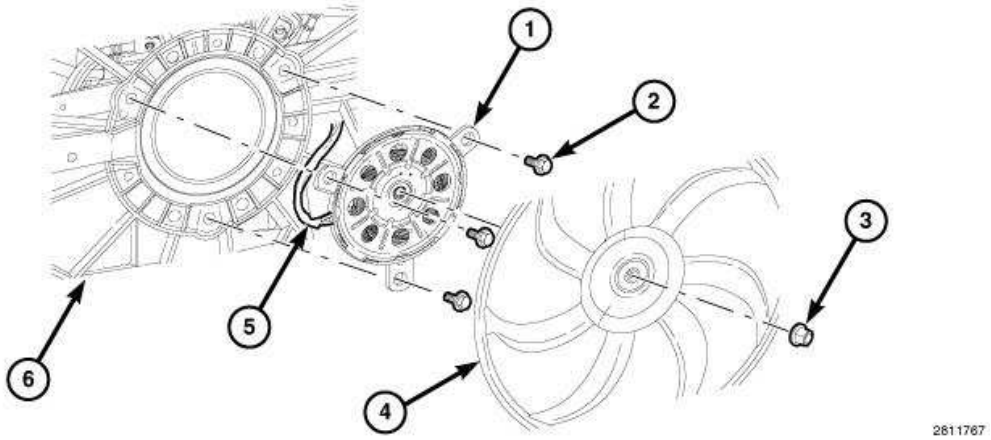

Fig. 51: Fan Motor Wiring Harness, Fan Shroud, Fan Blade & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Removing the fan motor wiring harness (5) from the fan shroud (6).
7. Remove the fan blade (4) from the fan motor.
8. Remove the bolts (2) that support the fan motor to the shroud.

5.7L DUAL FAN

1. Disconnect negative battery cable.
2. Remove the air filter housing assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Raise and support vehicle.
4. If equipped, remove the lower closeout panel.
5. Drain the coolant into a clean container. Refer to **STANDARD PROCEDURE**.
6. If equipped, install the lower closeout panel.
7. Lower vehicle.

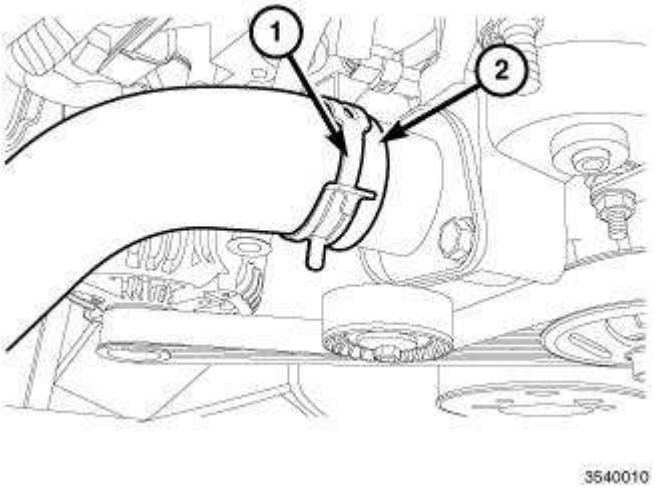

Fig. 52: Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

8. Remove the upper radiator hose (2).

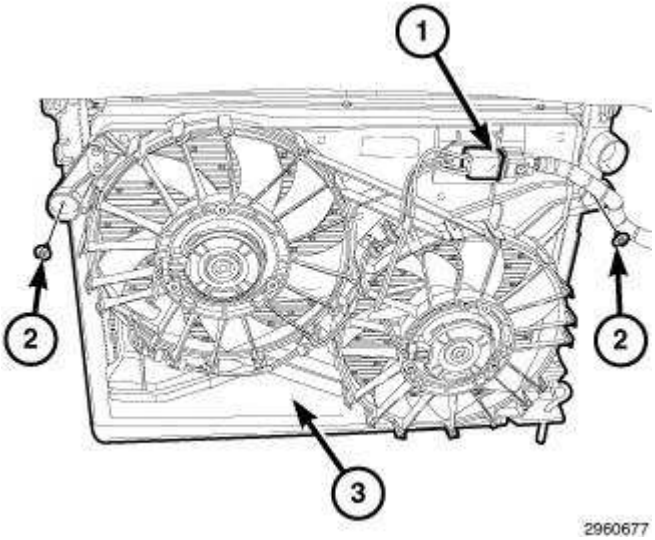

Fig. 53: Cooling Fan Electrical Connector, Cooling Fan Mounting Bolts & Radiator Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the cooling fan electrical connector (1).
10. Remove the cooling fan mounting bolts (2).
11. Using care. Remove the radiator cooling fan assembly (3) from vehicle.

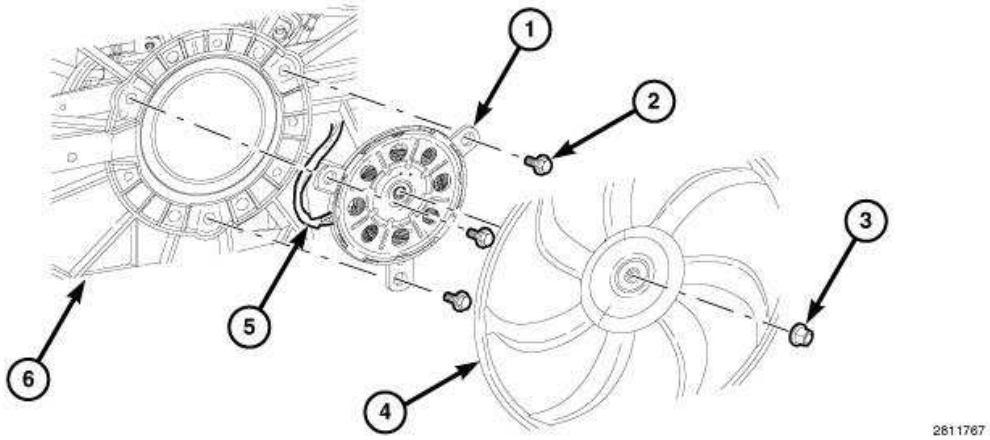

Fig. 54: Fan Motor Wiring Harness, Fan Shroud, Fan Blade & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Removing the fan motor wiring harness (5) from the fan shroud (6).
13. Remove the fan blade (4) from the fan motor.
14. Remove the bolts (2) that support the fan motor to the shroud.

6.4L DUAL FAN

1. Disconnect negative battery cable.
2. Remove the air filter housing assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .

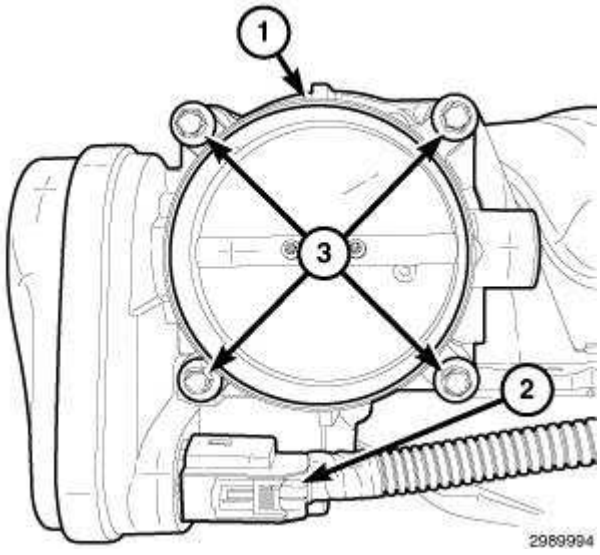

Fig. 55: Throttle Body, Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the throttle body (1). Refer to **THROTTLE BODY, REMOVAL** .

4. Raise and secure vehicle.
5. If equipped, remove the lower closeout panel.
6. Drain coolant into a clean container. Refer to **STANDARD PROCEDURE**.
7. Lower vehicle.

11. Remove the fan motor wiring harness (5) from the fan shroud (6).
12. Remove the fan blade (4) from the fan motor.
13. Remove the bolts (2) that secure the fan motor to the shroud.

INSTALLATION

3.6L SINGLE FAN

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from

the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

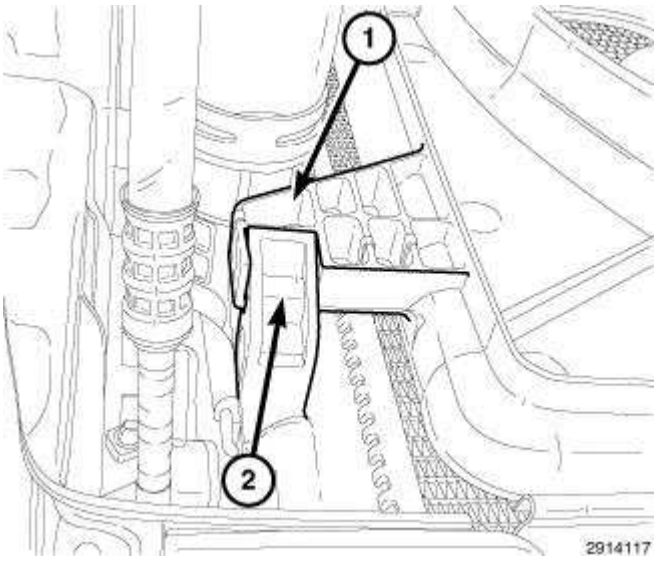

Fig. 65: Radiator Cooling Fan Assembly & Radiator Mounts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing the cooling fan assembly. Care must be used so that the fan shroud does not contact the radiator or the radiator fins. Damaged may cause leaking.

1. Position radiator cooling fan assembly (1) in vehicle.

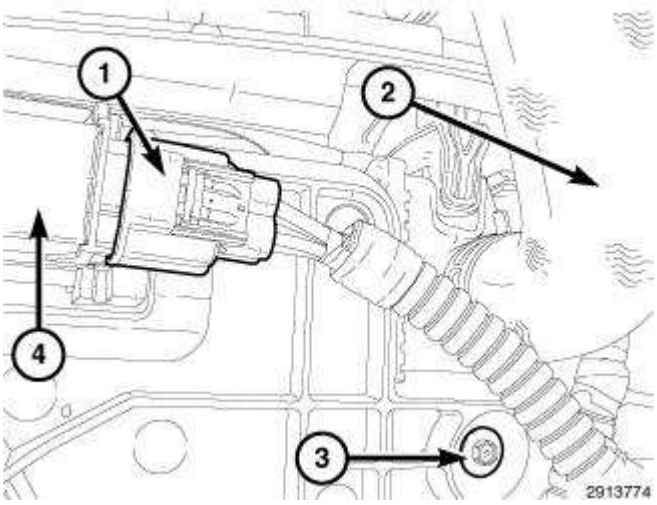

Fig. 66: Cooling Fan Electrical Connector & Upper Cooling Fan Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the cooling fan assembly mounting bolts (3). Tighten to 6 N.m (50 in. lbs.).

3. Connect cooling fan electrical connector (1).
4. Install the air filter housing. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
5. Connect the negative battery cable.
6. Operate engine until it reaches normal operating temperature. Check the fan for proper operation.

5.7/6.4L SINGLE FAN

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

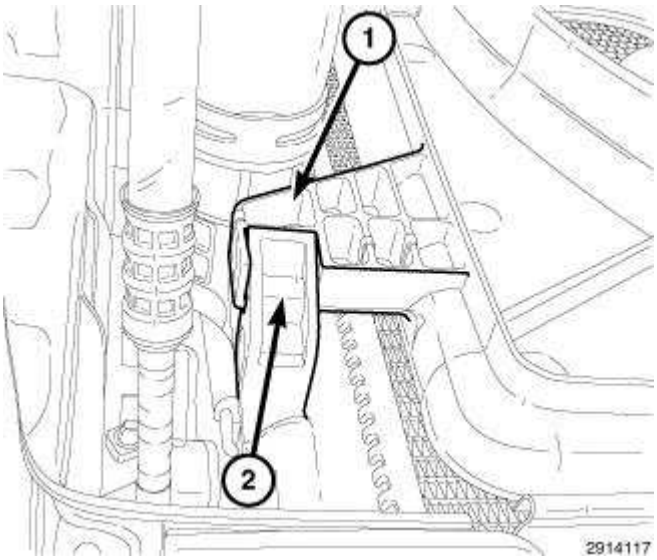

Fig. 67: Radiator Cooling Fan Assembly & Radiator Mounts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing the cooling fan assembly. Care must be used so that the fan shroud does not contact the radiator or the radiator fins. Damaged may cause leaking.

1. Position radiator cooling fan assembly (1) in vehicle.
2. Align the lower cooling fan assembly mounting tabs (1) with the radiator mounts (2).

9. Tighten the radiator lower support bolts (1) to 40 N.m (30 Ft. lbs.).
10. Install the lower engine covers.
11. Connect the cooling fan electrical connector.

12. Connect the negative battery cable.
13. Operate engine until it reaches normal operating temperature. Verify normal cooling fan operation.

HEATER, ENGINE BLOCK

DESCRIPTION

DESCRIPTION

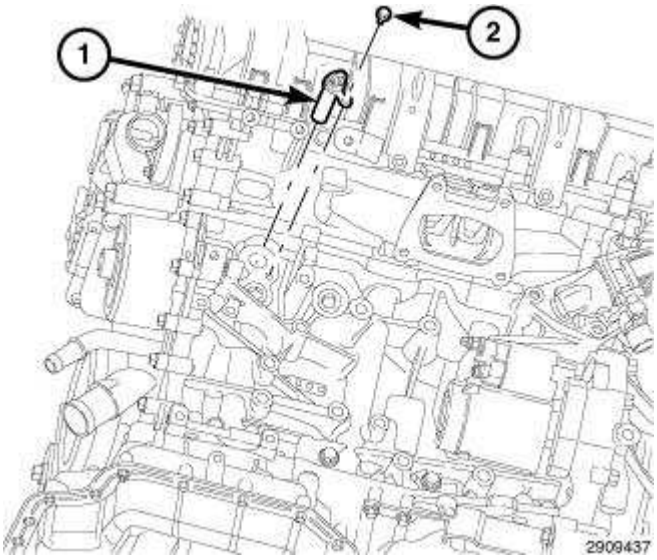

Fig. 87: 3.6L Engine Block Heater & Cylinder Block
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine block heater (1) is mounted in the cylinder block (2), near the front drivers side corner. The engine block heater (1) is a dry cylinder type design and is powered by 110 volt AC.

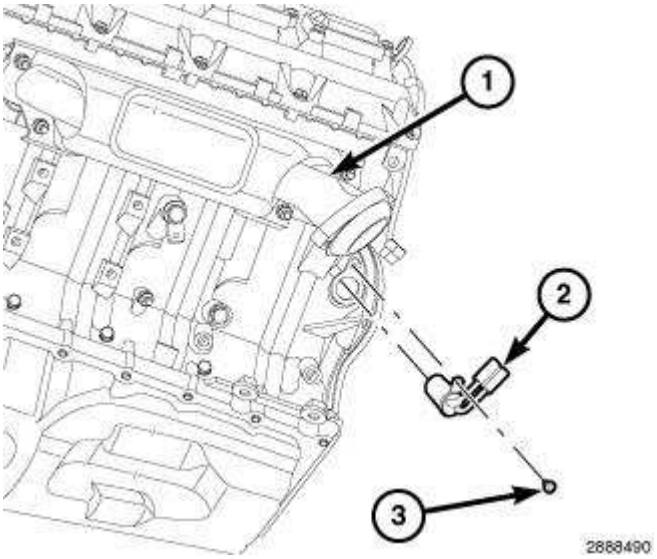

Fig. 88: PIA Bolt, Engine Block Heater Element & PIA Bolt
Courtesy of CHRYSLER GROUP, LLC

The 5.7L engine block heater (1) is mounted in the cylinder block, near the left rear corner. The engine block heater (1) is a dry cylinder type design and is powered by 110 volt AC.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

REMOVAL

3.6L

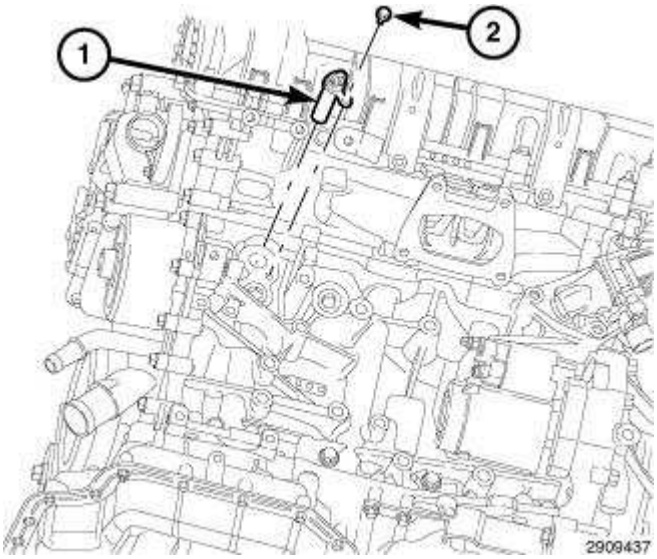

Fig. 89: 3.6L Engine Block Heater & Cylinder Block
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle on hoist.
2. Remove the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .
3. Detach power cord plug from block heater (1).
4. Remove block heater attaching screw located below heater terminals.
5. Remove block heater from cylinder block (2).

5.7L/6.4L

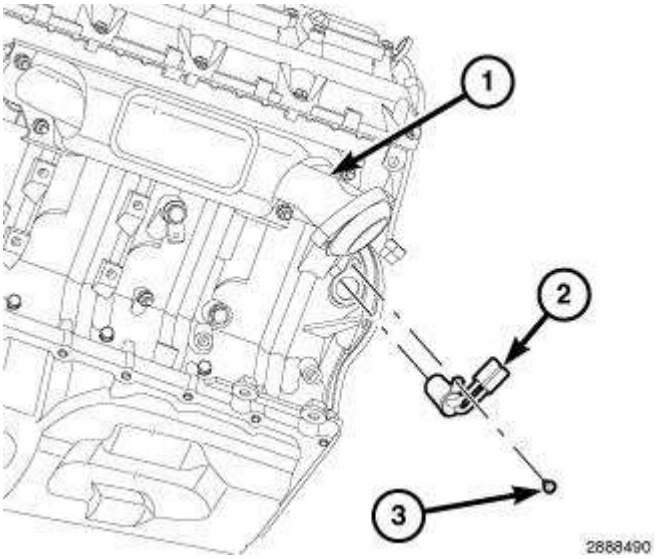

Fig. 90: PIA Bolt, Engine Block Heater Element & PIA Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the power cord from the block heater (1).
3. Remove the bolt (2) on the block heater (1). Remove the block heater assembly (1).

INSTALLATION

3.6L

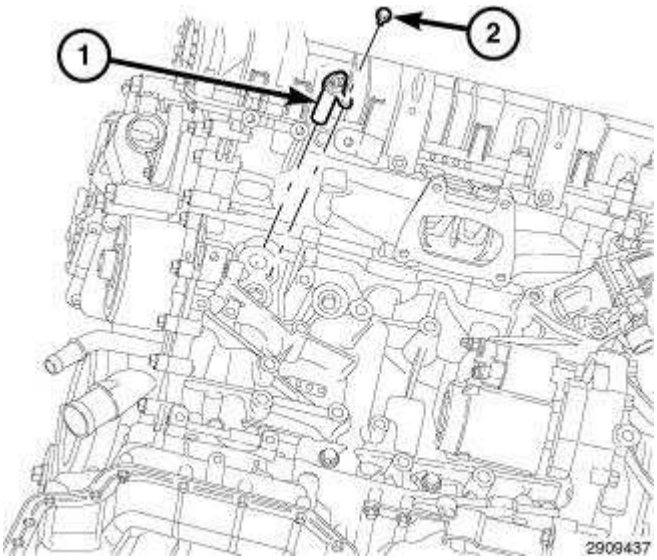

Fig. 91: 3.6L Engine Block Heater & Cylinder Block
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean cylinder block heater cavity.
2. Insert heater assembly (1) into block (2) with mounting hole is located below heater terminals.

3. Install mounting screw and tighten to 12 N.m (105 in. lbs.).

CAUTION: To prevent damage, the power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds.

4. Attach power cord to heater.
5. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .
6. Lower vehicle.

5.7L/6.4L

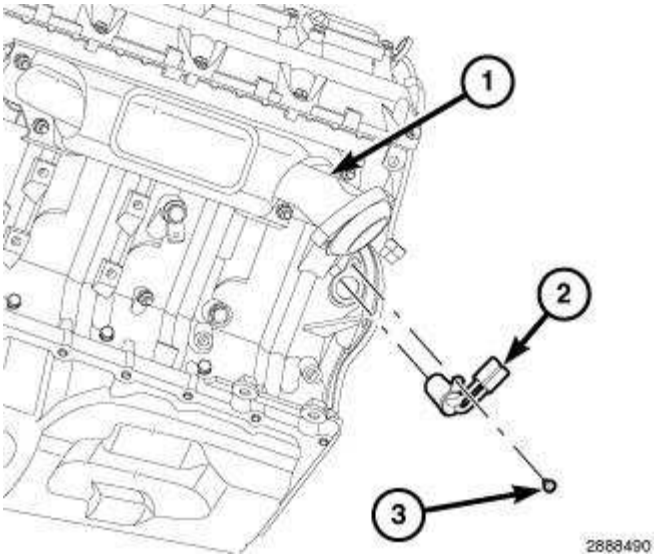

Fig. 92: PIA Bolt, Engine Block Heater Element & PIA Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean the cylinder block core hole and the block heater seat.
2. Insert the block heater assembly (1) into the block.
3. With the block heater fully seated, tighten bolt (1) to 12 N.m (106 in. lbs.).
4. If equipped, install lower engine cover.
5. Lower vehicle.

PUMP, WATER

DESCRIPTION

DESCRIPTION

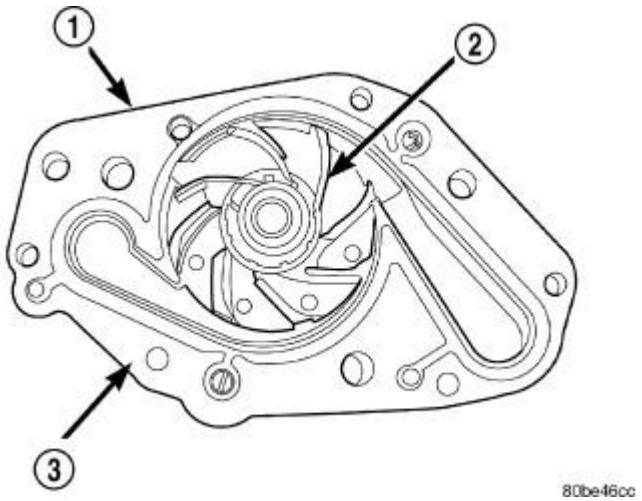

Fig. 93: Identifying Transmission Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

A centrifugal water pump (2) circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine main drive belt.

The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

The water pump (1) is mounted directly to the timing chain cover and is equipped with a non serviceable integral pulley.

STANDARD PROCEDURE

STANDARD PROCEDURE - COOLANT AIR EVACUATION

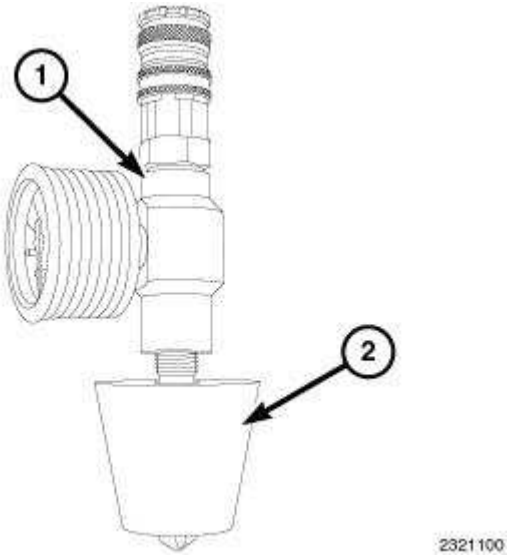

Fig. 94: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

WARNING: WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.

NOTE: The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.

NOTE: For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

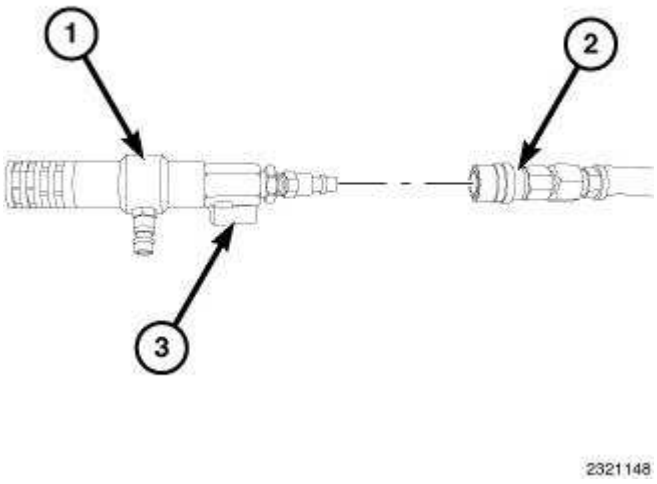

Fig. 95: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 PSI/5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

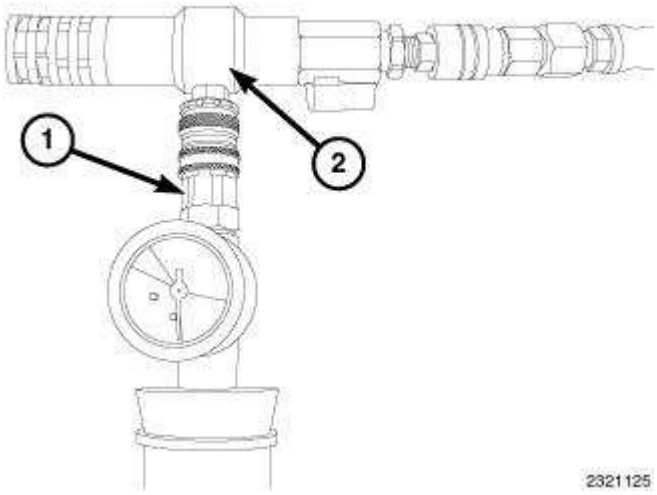

Fig. 96: Vacuum Generator/Venturi
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: **Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.**

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: **If a strong vacuum is being created in the system, it is normal to see the radiator hoses to collapse.**

9. Close the vacuum generator/venturi ball valve.

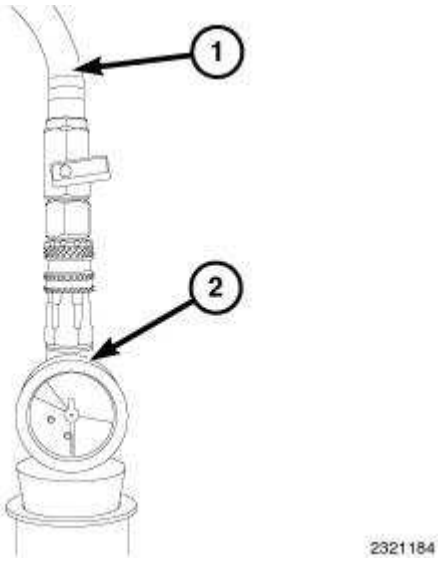

Fig. 97: Vacuum Generator/Venturi And Air Line
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE: **Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.**

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

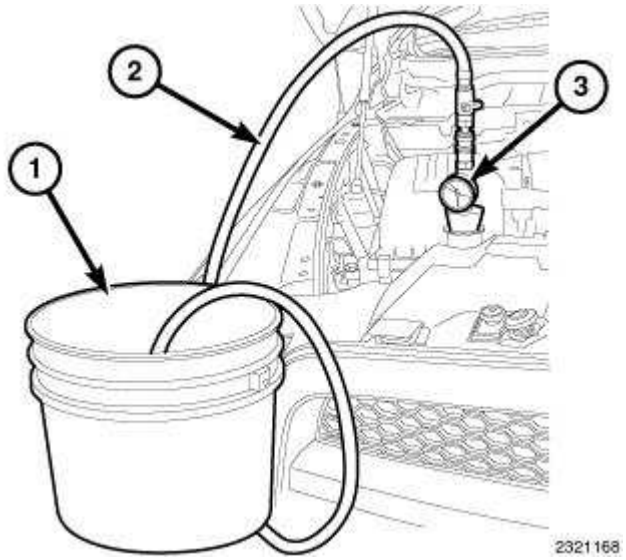

Fig. 98: Suction Hose Ball Valve
Courtesy of CHRYSLER GROUP, LLC

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

REMOVAL

3.6L

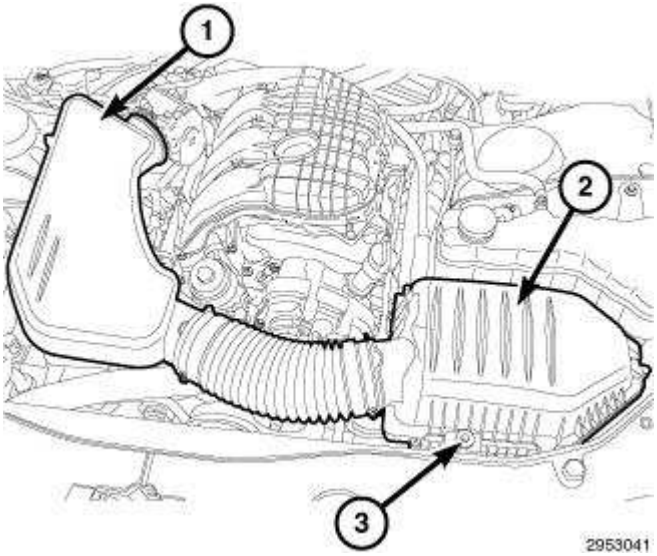

Fig. 99: Air Intake System And The Air Filter Box Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The water pump on 3.6L engines is bolted directly to the engine timing chain case cover.

1. Disconnect negative battery cable from battery.
2. Remove the air intake system and the air filter box cover (2) as an assembly.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

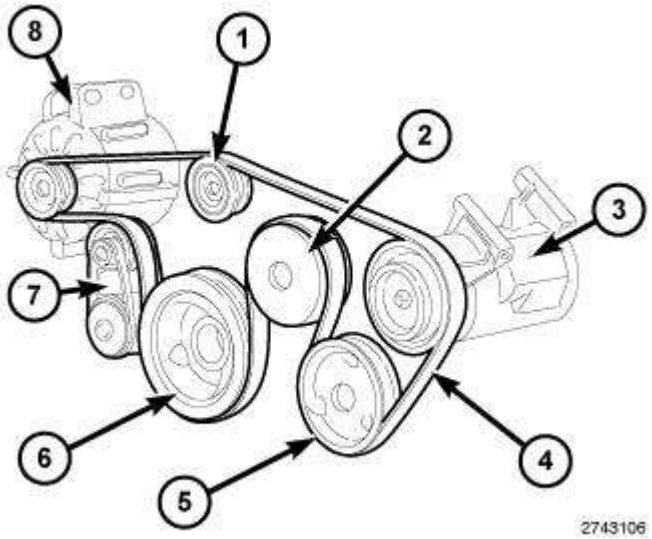

Fig. 100: Drive Belt Tensioners & Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.

WARNING: Constant tension hose clamps are used on most cooling system hoses. When removing or installing, use only tools designed for servicing this type of clamp. Always wear safety glasses when servicing constant tension clamps.

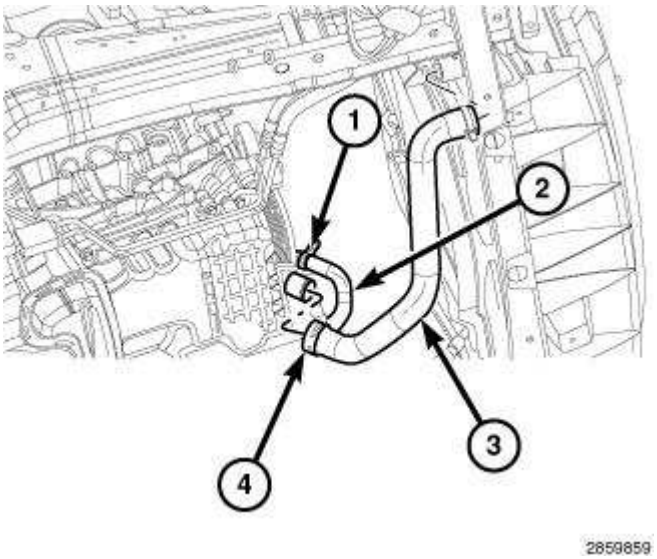

Fig. 101: Lower Heater Hose, Lower Radiator Hose & Tension Clamps
Courtesy of CHRYSLER GROUP, LLC

CAUTION: A number or letter is stamped into the tongue of constant tension clamps (4). If replacement is necessary, use only an original equipment clamp with matching number or letter.

5. Remove the lower heater hose (1) at the water pump and position aside.
6. Remove the lower radiator hose (3) from the water pump and position aside.

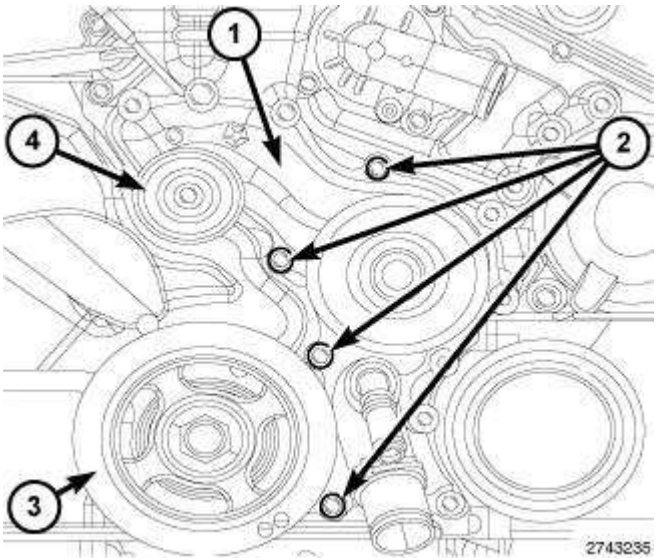

Fig. 102: Idler Pulley, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove idler pulley (4). Refer to **PULLEY, IDLER, REMOVAL**.
8. Remove the eleven water pump mounting bolts. Take notice to the four water pump bolts (2) that bolt directly to the timing cover.

CAUTION: Do not pry on the water pump at the timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

9. Remove water pump (1) and discard gasket.

5.7L/6.4L

1. Disconnect negative battery cable.
2. Remove the air intake assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove the resonator mounting bracket.
4. Remove cooling fan assembly. Refer to **FAN, COOLING, REMOVAL**.
5. Drain coolant into a clean container. Refer to **STANDARD PROCEDURE**.

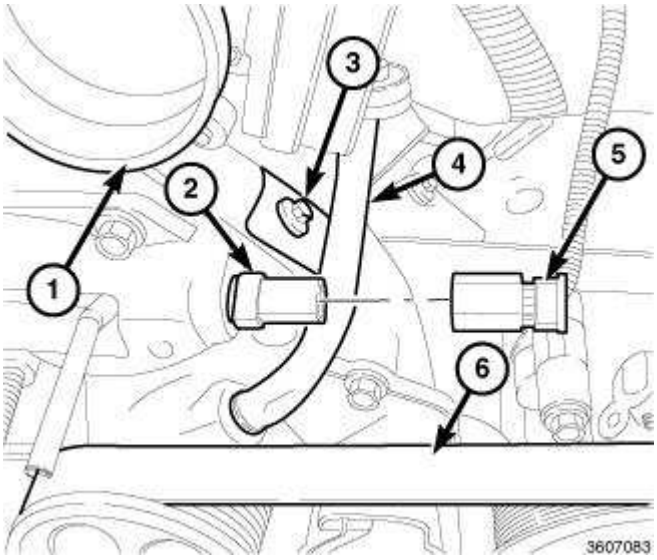

Fig. 103: Temperature Sensor, Connector, Metal Tube, Bolt & Drive Belt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the accessory drive belt (6). Refer to **BELT, SERPENTINE, REMOVAL**.
7. Remove the bolt (3) that secures the metal tube (4) to the engine.
8. Using care. Partially remove the metal bypass tube from the water pump.
9. Disconnect the temperature sensor (2) electrical connector (5)

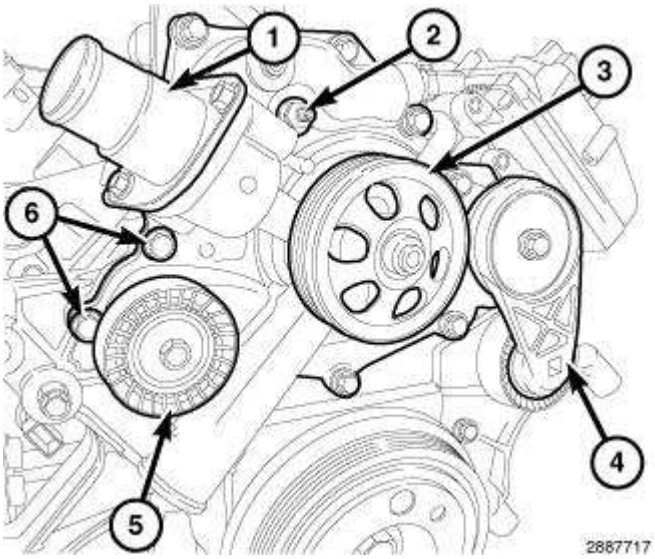

Fig. 104: Thermostat Housing, Water Pump, Belt Tensioner, & Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

10. Remove the upper radiator hose from the thermostat housing (1) and position aside.
11. Remove idler pulley (5).
12. Remove belt tensioner assembly (4). Refer to **TENSIONER, BELT, REMOVAL**.
13. Remove lower radiator hose from the water pump and position aside.
14. Remove the upper stud bolt (2).
15. Remove the water pump mounting bolts (6) and carefully remove pump (3) from the cover while removing the metal bypass tube.

3.0L DIESEL

1. Disconnect negative battery cable.
2. Remove the air intake assembly.
3. Drain coolant into a clean container. Refer to **STANDARD PROCEDURE**.

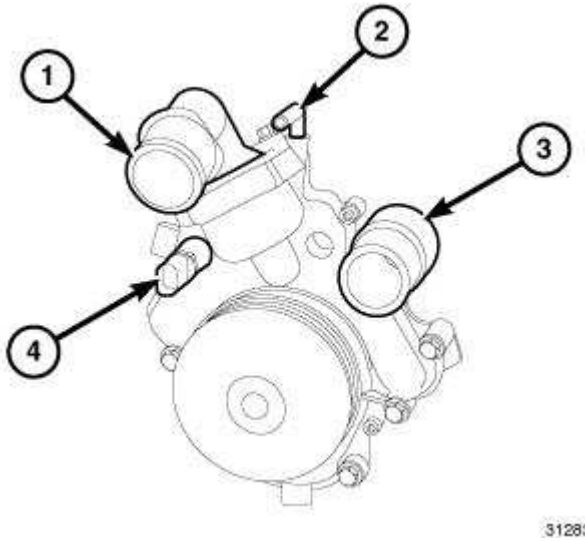

Fig. 105: Thermostat Housing, Purge Tube, Heater Supply Hose Fitting & Bypass Housing
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the temperature sensor (4) electrical connector.
5. Remove the upper radiator hose from the thermostat housing (1) and position aside.
6. Remove the coolant recovery bottle purge hose from purge tube (2).
7. Remove the lower radiator hose from the bypass housing (3) and position aside.

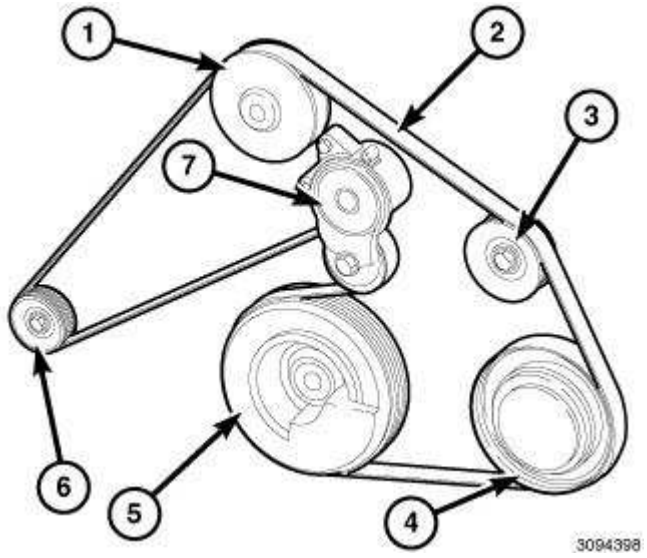

Fig. 106: Pulleys, Tensioner & Drive Belt Routing 3.0L
Courtesy of CHRYSLER GROUP, LLC

8. Remove belt tensioner assembly (7). Refer to **TENSIONER, BELT, REMOVAL**.
9. Remove the belt tensioner mounting bracket.

CAUTION: The fuel lines are a one time torque. If the fuel lines are removed. They would require replacing.

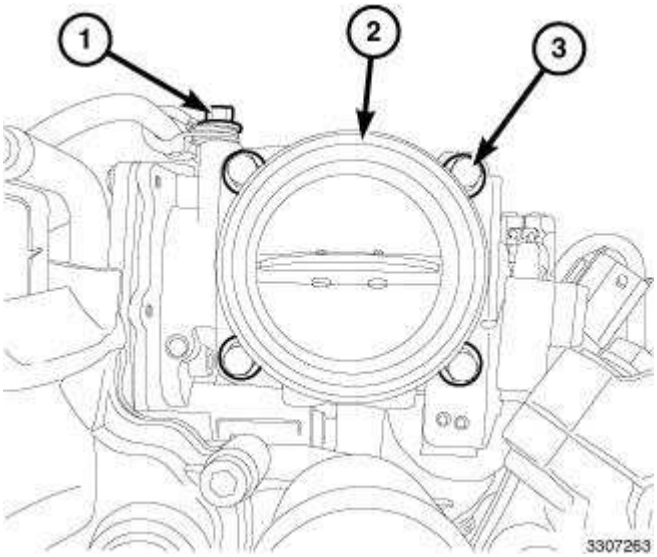

Fig. 107: (EGR) Air Flow Control Valve
Courtesy of CHRYSLER GROUP, LLC

10. Remove the EGR air control valve (2). Refer to **VALVE, EXHAUST GAS RECIRCULATION (EGR) AIRFLOW CONTROL, REMOVAL** .

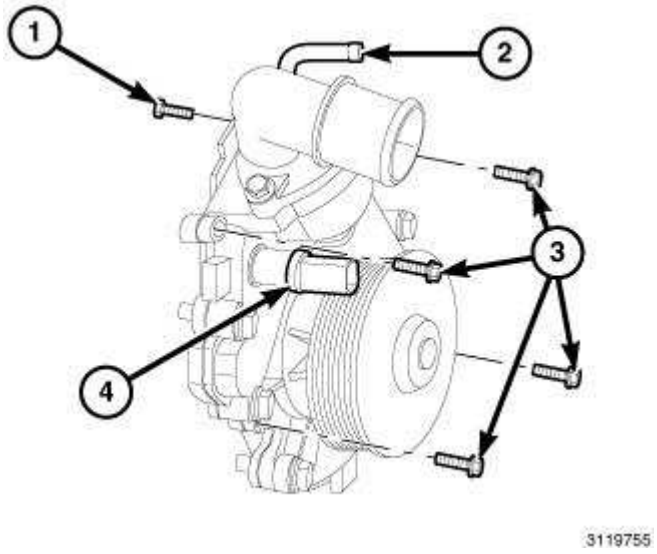

Fig. 108: Temperature Sensor & Torx Head Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Remove the temperature sensor (4).
12. Remove the four front torx head fasteners (3) and one upper rear torx head fasteners (1).

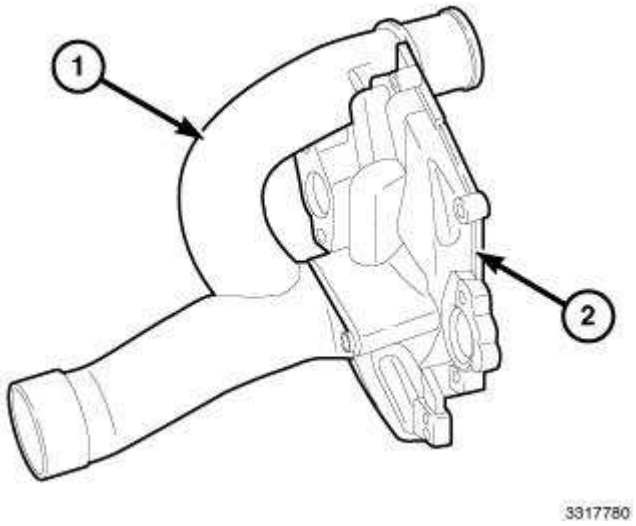

Fig. 109: Coolant Pipe
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is not necessary to remove the rear section of the water pump assembly (2).

CAUTION: Removal of the housing may cause the coolant pipe (1) to separate from under the intake assembly which can disturb the seal and may leak if not installed properly.

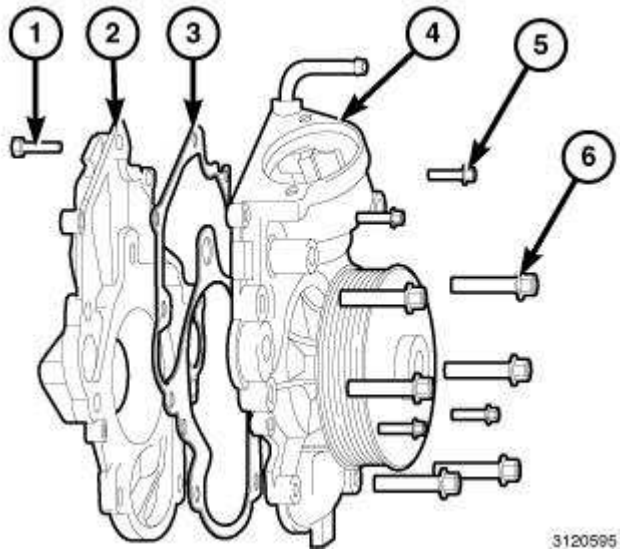

Fig. 110: Exploded View Of Water Pump
Courtesy of CHRYSLER GROUP, LLC

13. Remove the thermostat assembly.
14. Remove water pump mounting bolts (6).

15. Separated the water pump front housing (4) from the rear housing (2) and discard the gasket (3).

INSPECTION

5.7L/6.4L

1. Disconnect negative battery cable.
2. Remove the air intake assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove the resonator mounting bracket.
4. Remove cooling fan assembly. Refer to **FAN, COOLING, REMOVAL**.
5. Drain coolant into a clean container. Refer to **STANDARD PROCEDURE**.

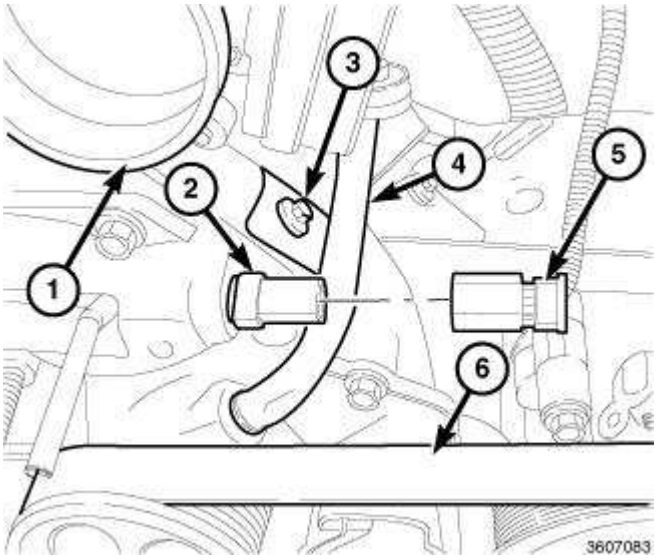

Fig. 111: Temperature Sensor, Connector, Metal Tube, Bolt & Drive Belt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the accessory drive belt (6). Refer to **BELT, SERPENTINE, REMOVAL**.
7. Remove the bolt (3) that secures the metal tube (4) to the engine.
8. Using care. Partially remove the metal bypass tube from the water pump.
9. Disconnect the temperature sensor (2) electrical connector (5)

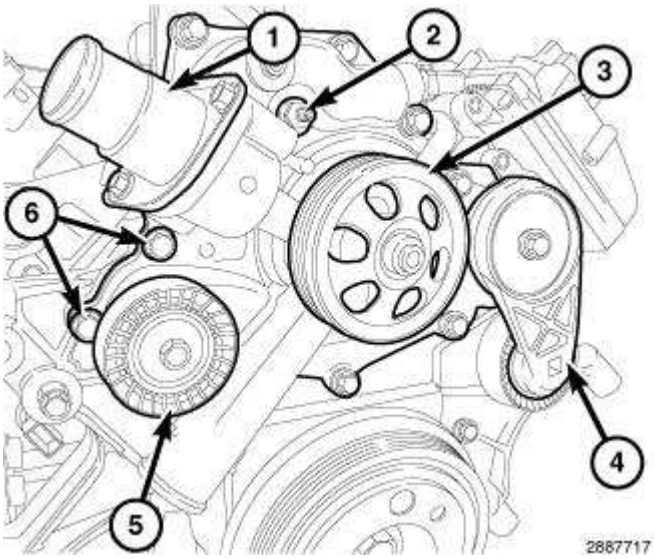

Fig. 112: Thermostat Housing, Water Pump, Belt Tensioner, & Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

10. Remove the upper radiator hose from the thermostat housing (1) and position aside.
11. Remove idler pulley (5).
12. Remove belt tensioner assembly (4). Refer to **TENSIONER, BELT, REMOVAL**.
13. Remove lower radiator hose from the water pump and position aside.
14. Remove the upper stud bolt (2).
15. Remove the water pump mounting bolts (6) and carefully remove pump (3) from the cover while removing the metal bypass tube.

INSTALLATION

3.6L

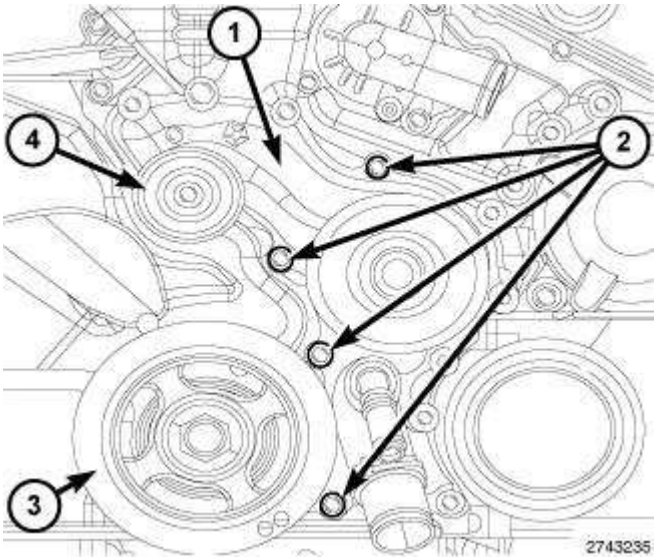

Fig. 113: Idler Pulley, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean mating surfaces.

NOTE: Take notice the lengths of the mounting bolts. Some M6 bolts mount directly to the timing cover (2).

2. Using a new gasket, position water pump (1) and hand tighten the M6 mounting bolts.
3. Hand tighten the idler pulley (4) bolt.
4. Hand tighten the upper M8 and M10 water pump to engine block mounting bolts.

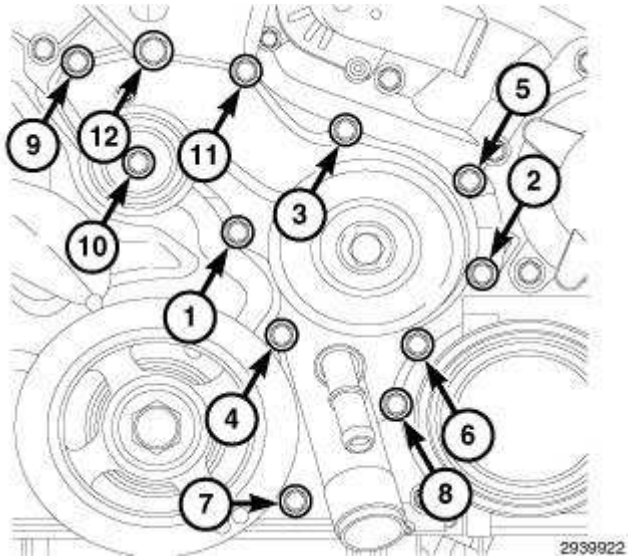

Fig. 114: Water Pump Fasteners Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Tightening the water pump fasteners in sequential order, will insure proper sealing surface.

5. Tighten the bolts 1 - 12 in the sequence shown in illustration. Tighten the bolts to their respective torque:
   - Tighten M6 mounting bolts to 12 N.m (9 ft. lbs.).
   - Tighten M8 bolts to 25 N.m (18 ft. lbs.).
   - Tighten M10 bolt to 55 N.m (41 ft. lbs.).
   - Repeat the tightening sequence until the proper torque has been met.
6. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.

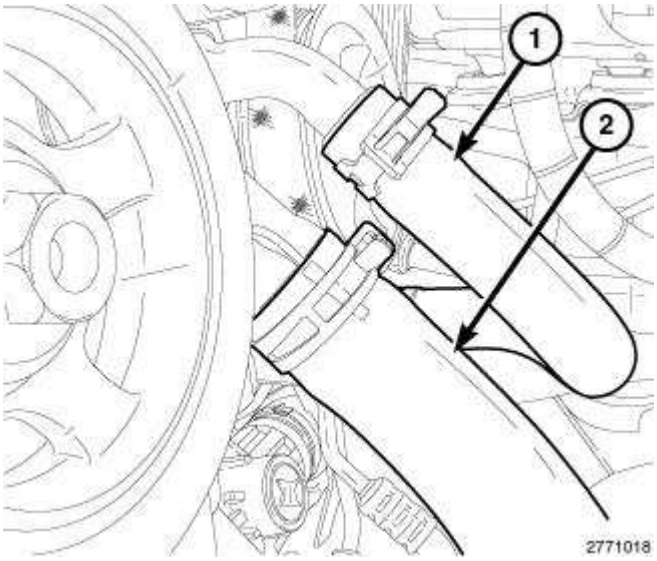

Fig. 115: Radiator Hose & Heater Hose
Courtesy of CHRYSLER GROUP, LLC

CAUTION: A number or letter is stamped into the tongue of constant tension clamps (4). If replacement is necessary, use only an original equipment clamp with matching number or letter.

7. Install the lower radiator hose (2).
8. Install the lower return heater hose (1).

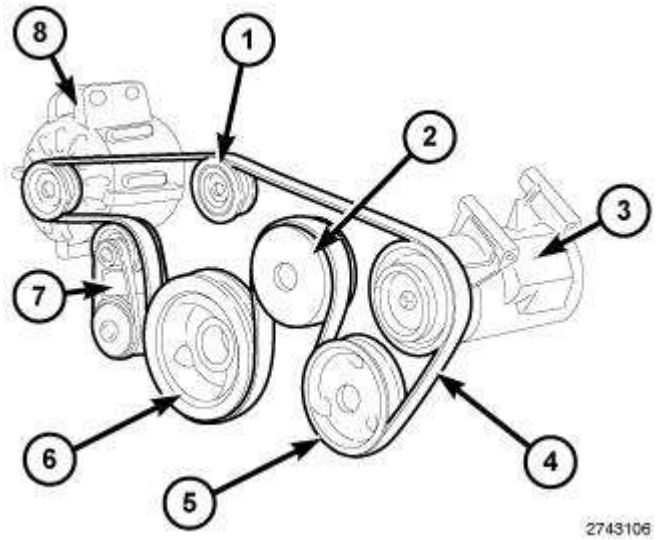

Fig. 116: Drive Belt Tensioners & Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump

rotating in wrong direction.

9. Install accessory drive belt (4). Refer to **BELT, SERPENTINE, INSTALLATION**.
10. Evacuate air and refill cooling system. Refer to **STANDARD PROCEDURE**.

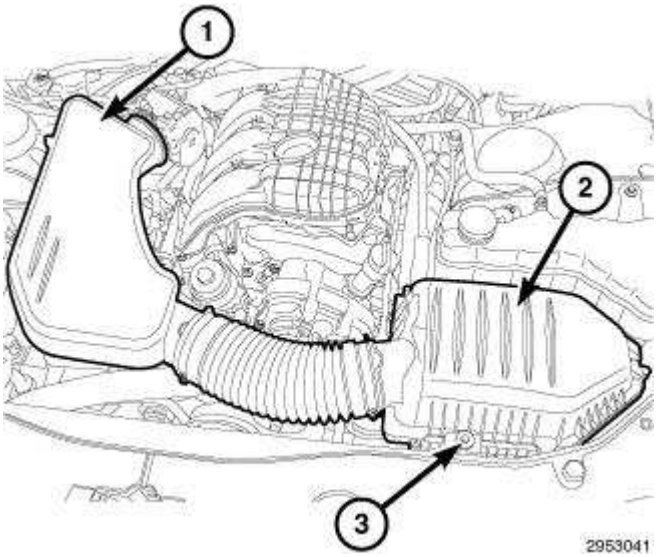

Fig. 117: Air Intake System And The Air Filter Box Cover
Courtesy of CHRYSLER GROUP, LLC

11. Install the air intake hose and resonator (1) assembly at the air filter housing.
12. Connect the intake air temperature sensor.
13. Connect negative battery cable.
14. Check the cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

5.7L/6.4L

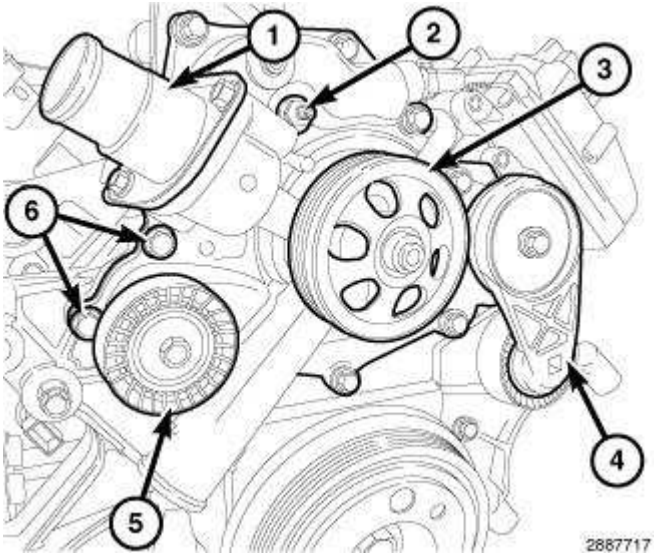

Fig. 118: Thermostat Housing, Water Pump, Belt Tensioner, & Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the mating surfaces of the timing chain cover and the waterpump.
2. Install the metal bypass tube while positioning the water pump (3) to the timing chain cover. Tighten mounting bolts (6) to 24 N.m (18 ft. lbs.).
3. Install the upper stud bolt (2). Tighten mounting bolts (6) to 24 N.m (18 ft. lbs.).
4. Install the lower radiator hose.
5. Install belt tensioner assembly (4). Refer to **TENSIONER, BELT, INSTALLATION**.
6. Install idler pulley (5).

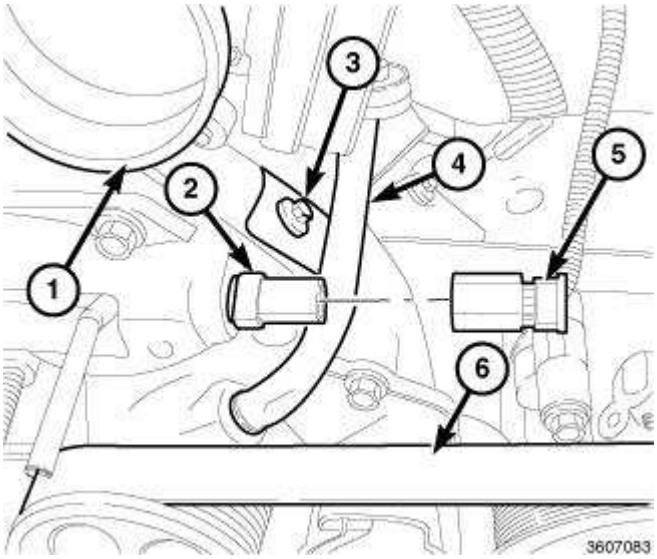

Fig. 119: Temperature Sensor, Connector, Metal Tube, Bolt & Drive Belt
Courtesy of CHRYSLER GROUP, LLC

7. Install upper metal heater tube. Tighten mounting bolts to 12 N.m (106 in. lbs.).
8. Connect the temperature sensor (2) electrical connector (5).
9. Install serpentine belt (6). Refer to **BELT, SERPENTINE, INSTALLATION**.
10. Install the resonator mounting bracket.
11. Install cooling fan assembly. Refer to **FAN, COOLING, INSTALLATION**.
12. Install the upper radiator hose to the thermostat housing (1).
13. Install the air intake assembly. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
14. Connect negative battery cable.
15. Evacuate air and refill cooling system. Refer to **STANDARD PROCEDURE**.
16. Check cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

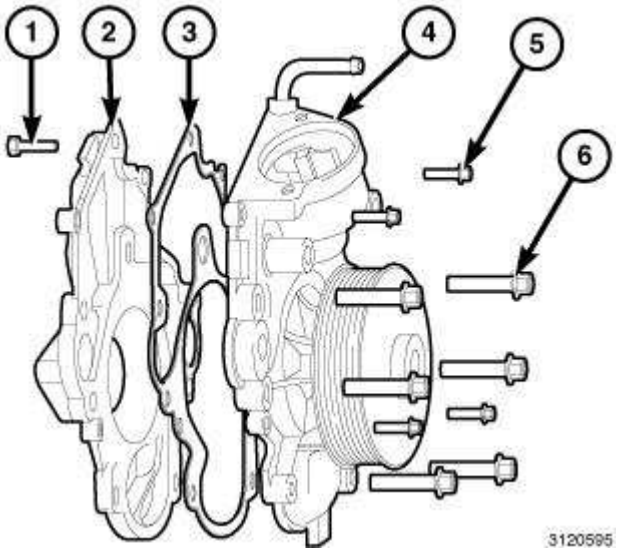

Fig. 120: Exploded View Of Water Pump
Courtesy of CHRYSLER GROUP, LLC

1. Clean mating surfaces. Install a new water pump gasket (3).
2. Install the water pump (4) onto the rear water pump housing (2). Loosely install the bolts (6).
3. Tighten front (5) and rear (1) fasteners to 11 N.m (97 in. lbs.).
4. Tighten mounting bolts (6) to 24 N.m (18 ft. lbs.).

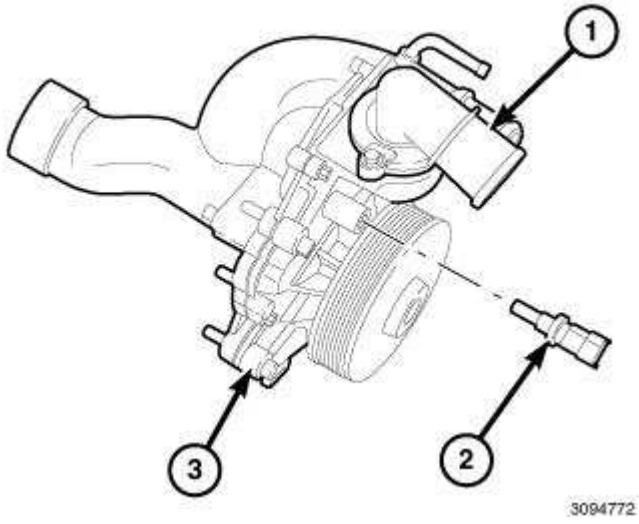

Fig. 121: Temperature Sensor & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the temperature sensor (2).
6. Install the thermostat housing assembly (1). Tighten to 11 N.m (97 in. lbs.)

7. Remove the lower engine cover.

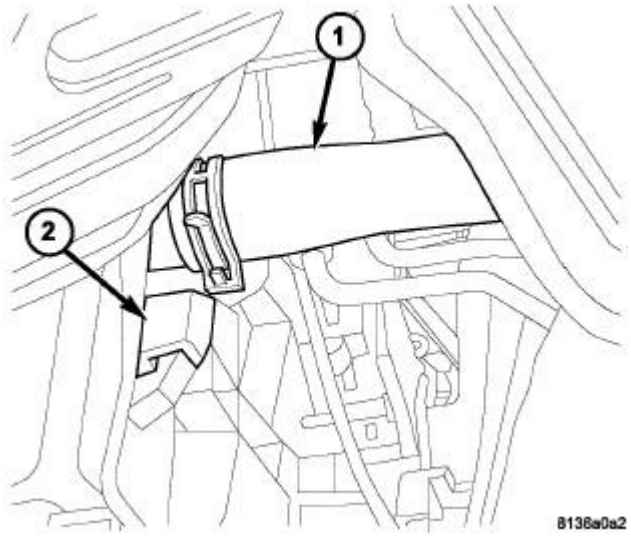

Fig. 128: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY

8. Remove lower radiator hose (1).
9. Lower vehicle.

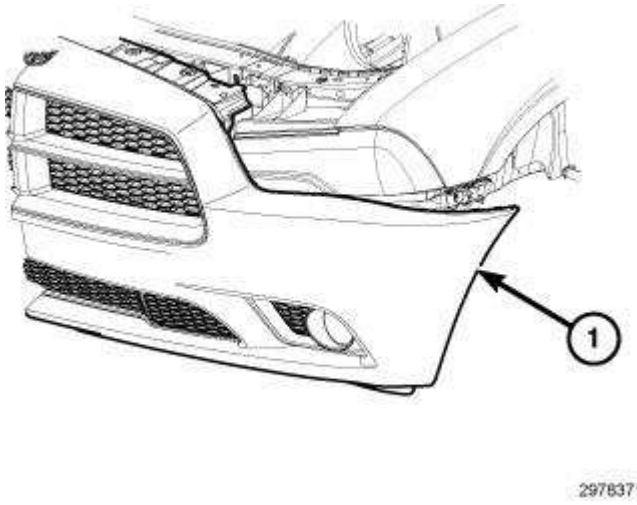

Fig. 129: Front Bumper Fascia
Courtesy of CHRYSLER GROUP, LLC

10. Remove the front bumper fascia. Refer to **FASCIA, FRONT, REMOVAL** .

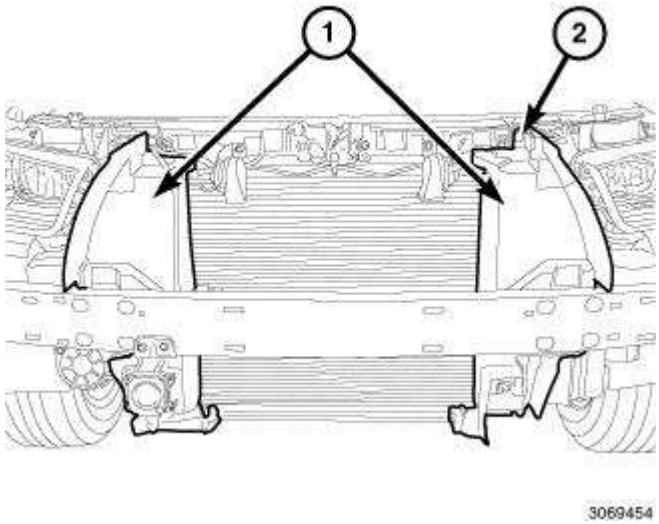

Fig. 130: Air Deflectors
Courtesy of CHRYSLER GROUP, LLC

11. Remove the air deflectors (1).

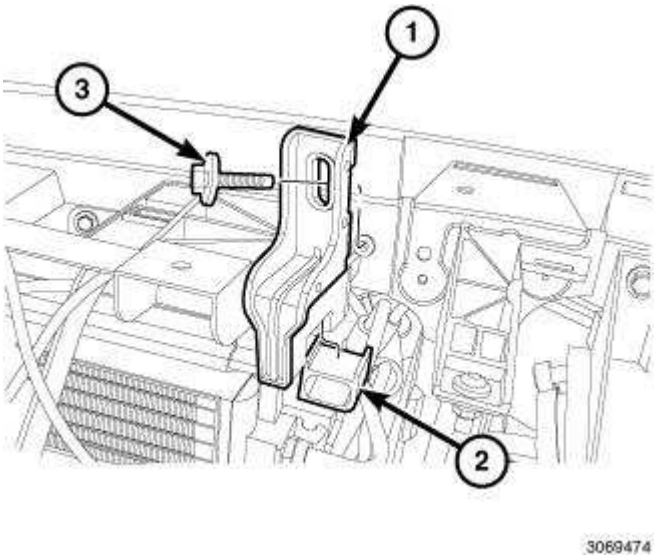

Fig. 131: Upper Radiator Mounting Brackets Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.

12. Remove upper radiator mounting brackets bolts (3).
13. Remove the upper radiator brackets (1) from the radiator supports (2)

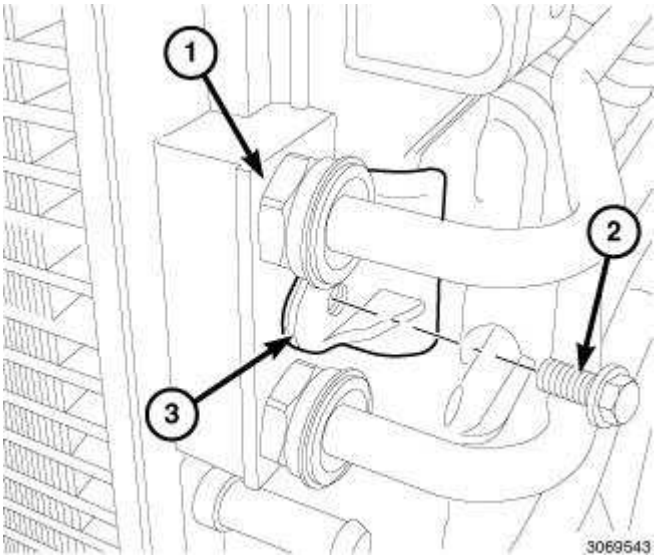

Fig. 132: Support Bolt
Courtesy of CHRYSLER GROUP, LLC

14. Remove the lower condenser mounting bolts.
15. Remove the support bolt (2) located between the cooler lines.
16. Using a suitable hanger. Support the condensor and remove the right side upper mounting bolt.

17. Separate condenser assembly from radiator.
18. Tilt radiator toward engine and remove radiator from vehicle.

5.7L/6.4L

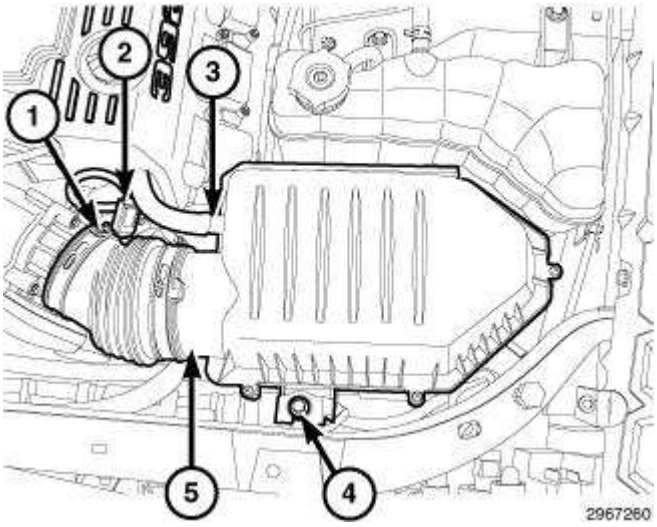

Fig. 133: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Remove the air intake assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Drain cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove upper radiator hose.
5. Raise vehicle.

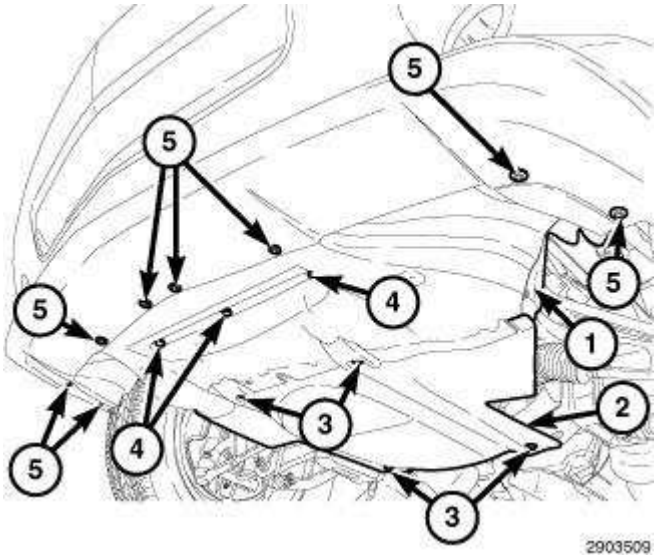

Fig. 134: Lower Engine Cover & Front Air Shield

Courtesy of CHRYSLER GROUP, LLC

9. Remove the front bumper fascia. Refer to **FASCIA, FRONT, REMOVAL** .
10. Lower vehicle.

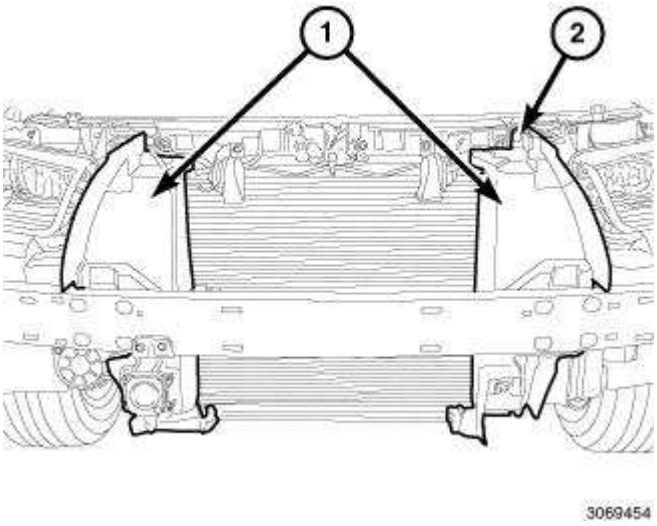

Fig. 138: Air Deflectors
Courtesy of CHRYSLER GROUP, LLC

11. Remove the air deflectors (1).

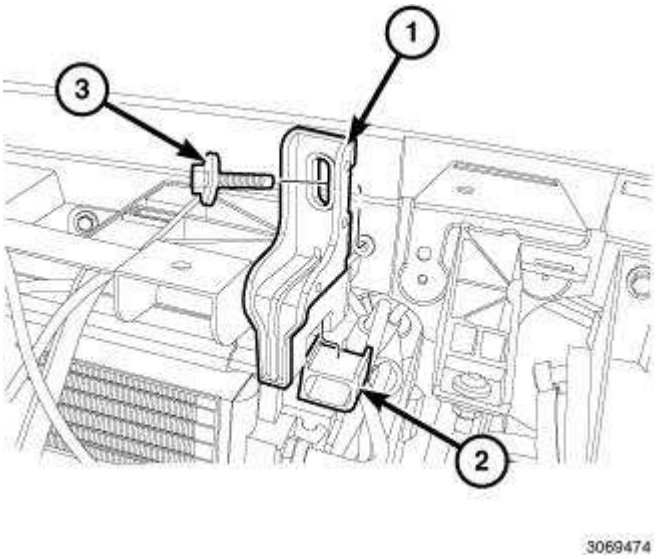

Fig. 139: Upper Radiator Mounting Brackets Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.

12. Remove upper radiator mounting brackets bolts (3).
13. Remove the upper radiator brackets (1) from the radiator supports (2)

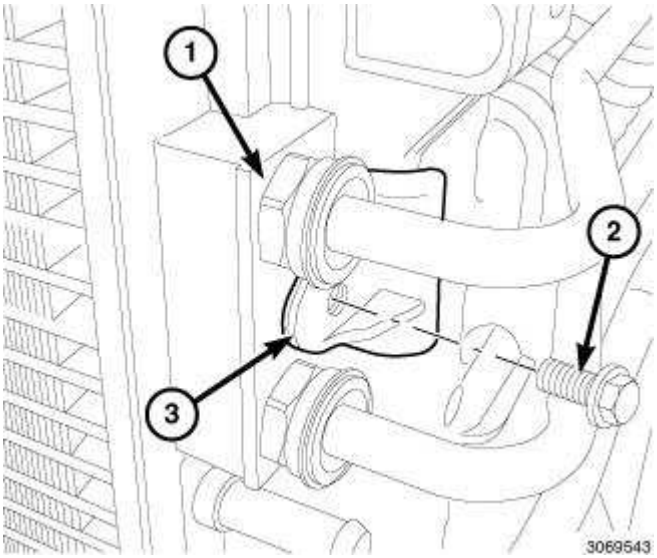

Fig. 140: Support Bolt
Courtesy of CHRYSLER GROUP, LLC

14. Remove the lower condenser mounting bolts.
15. Remove the support bolt (2) located between the cooler lines.
16. Using a suitable hanger. Support the condensor and remove the right side upper mounting bolt.

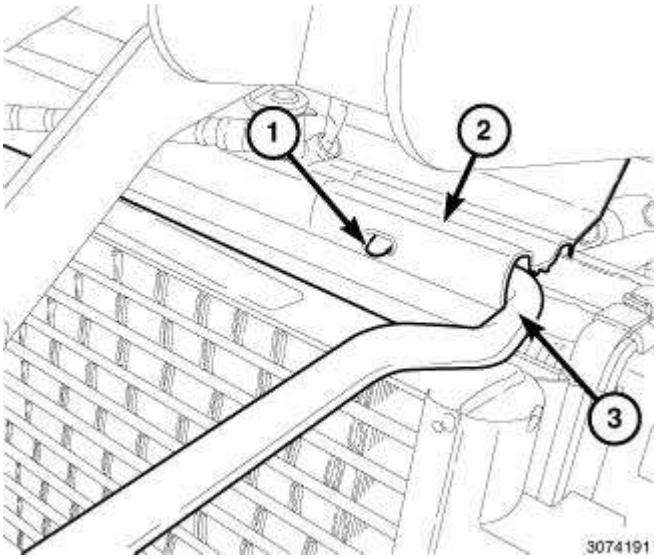

Fig. 141: Upper Shroud Cover, Pick & Clip
Courtesy of CHRYSLER GROUP, LLC

NOTE: To aid in removal. The upper shroud cover must be removed before the radiator. Leaving the cover on may cause the radiator to become jammed against the upper core support.

17. Carefully remove the upper shroud cover (2) by using a pick (3) to pull the cover retaining hole away from the clip (1) along the edge.

18. Tilt radiator toward engine for clearance from condensor.
19. Raise vehicle.

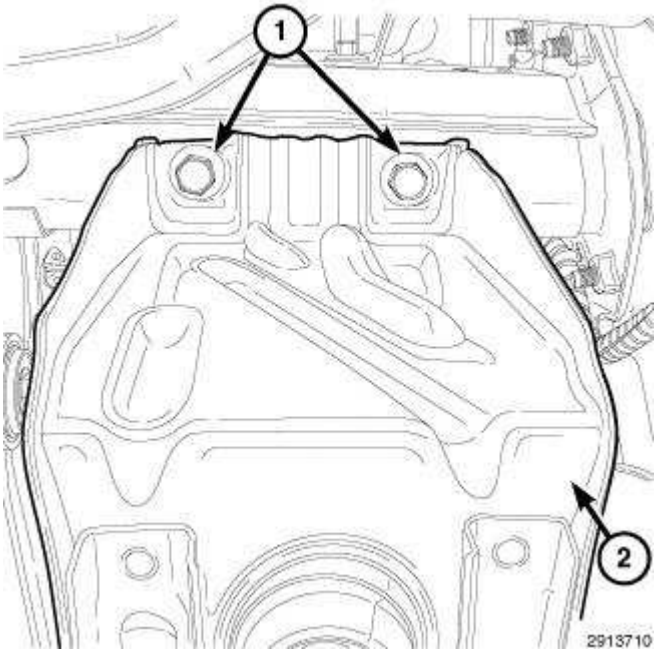

Fig. 142: Lower Radiator Core Support Bolts & Core Support
Courtesy of CHRYSLER GROUP, LLC

20. Using a suitable jack. Remove the lower radiator core support bolts (1).
21. Using care not to damage condensor or radiator fins. Lower the core support with the radiator.
22. Remove the radiator from the core support.

INSPECTION

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

3.6L

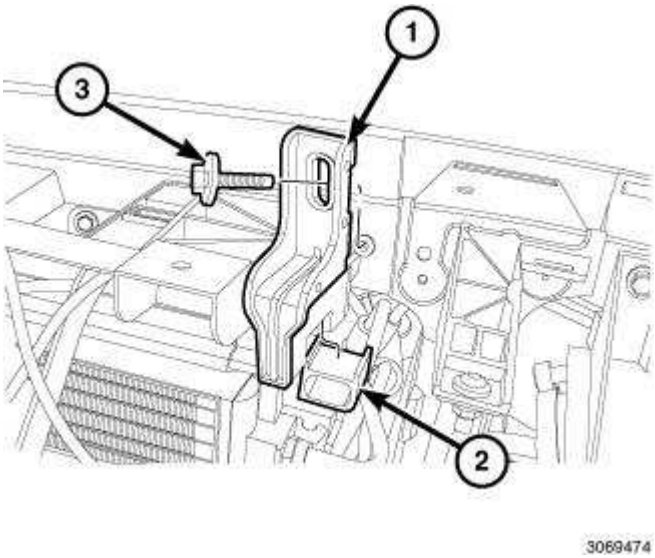

Fig. 143: Upper Radiator Mounting Brackets Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the radiator into engine compartment. Seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support.
2. Install the radiator mounting bracket (1) and bolts (2). Tighten to 12 N.m (106 in. lbs.).

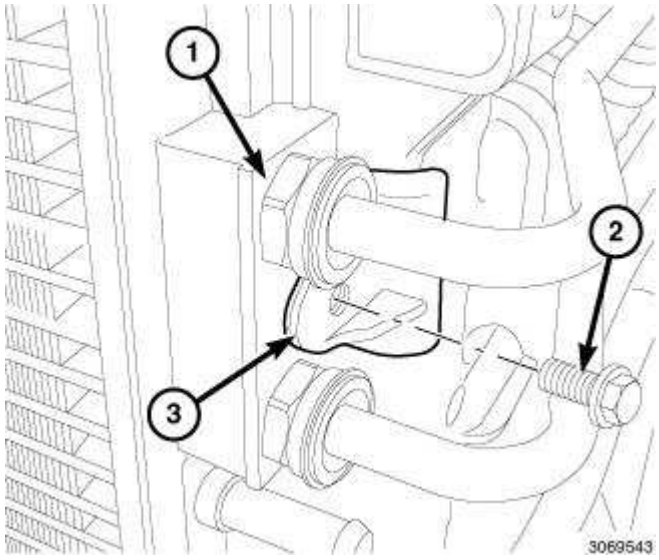

Fig. 144: Support Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Position the condenser on radiator and loosely install the support bolt.
4. Install upper and lower mounting bolt. Tighten bolts to 10 N.m (88 in. lbs.).
5. Tighten the support bolt to 10 N.m (88 in. lbs.).

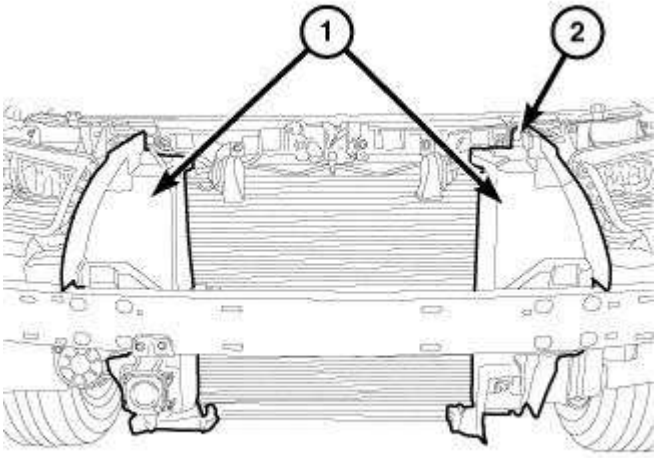

Fig. 145: Air Deflectors
Courtesy of CHRYSLER GROUP, LLC

6. Install the air deflectors (1).
7. Position the hood latch release cable (2) through the notch in deflector.

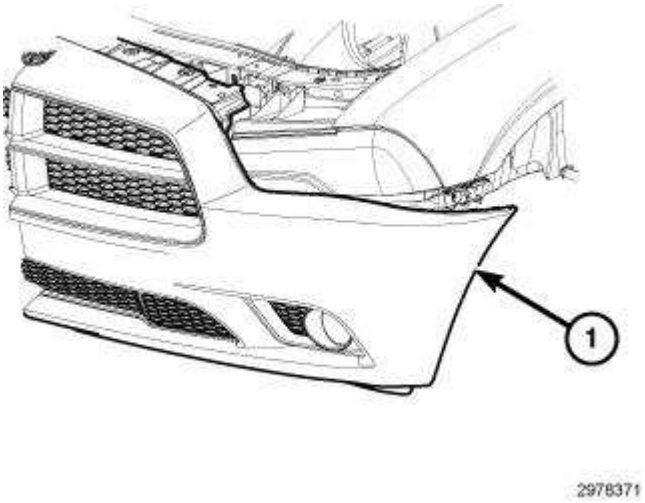

Fig. 146: Front Bumper Fascia
Courtesy of CHRYSLER GROUP, LLC

8. Install the front bumper fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
9. Raise the vehicle.

11. Position the condenser on radiator and loosely install the support bolt (3).
12. Install the condensors upper and lower mounting bolts. Tighten bolts to 10 N.m (88 in. lbs.).
13. Tighten the support bolt (3) to 10 N.m (88 in. lbs.).

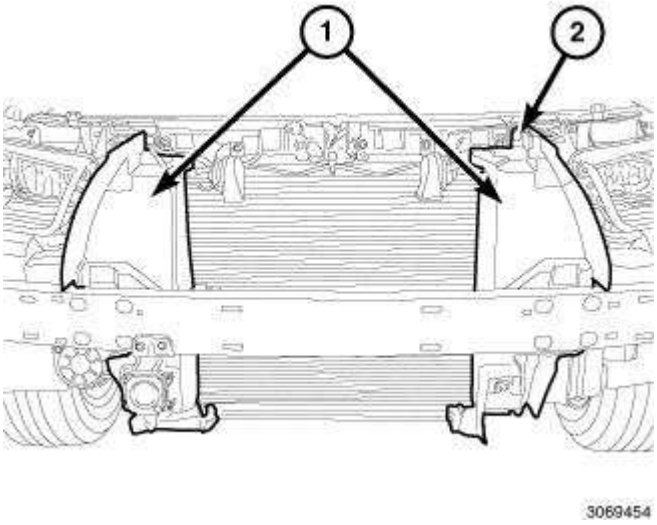

Fig. 156: Air Deflectors
Courtesy of CHRYSLER GROUP, LLC

14. Install the air deflectors (1).
15. Position the hood latch release cable (2) through the notch in deflector.

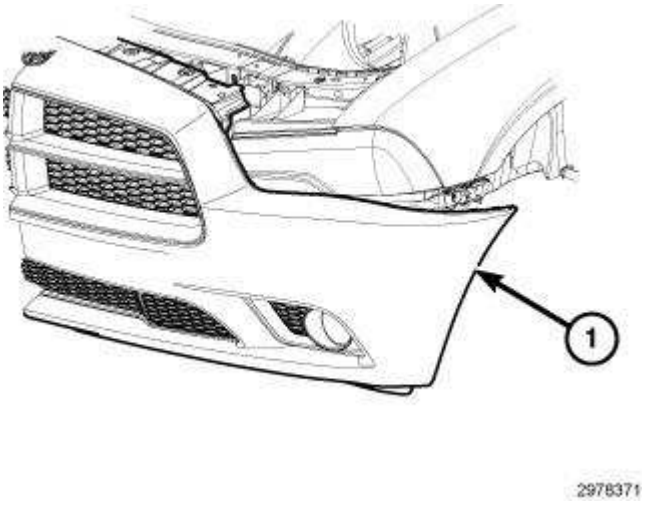

Fig. 157: Front Bumper Fascia
Courtesy of CHRYSLER GROUP, LLC

16. Install the front bumper fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
17. Install the upper radiator upper hose (2). Align hose so it does not interfere with the accessory drive belt or engine.
18. Connect the negative cable.

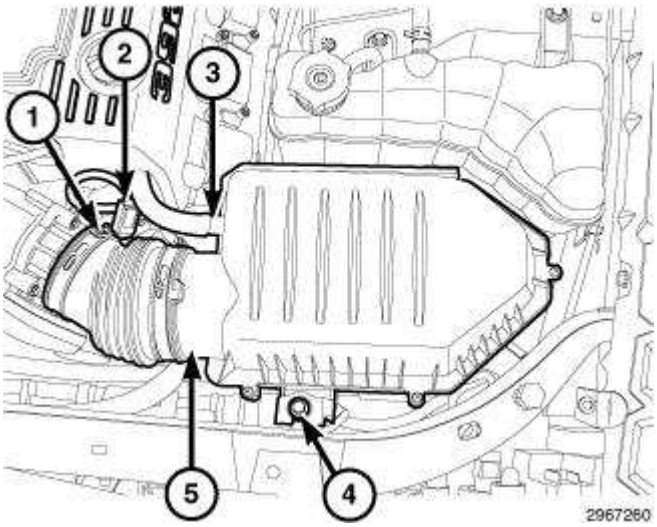

Fig. 158: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

19. Install the air intake assembly. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
20. Fill the cooling system with coolant. Refer to **STANDARD PROCEDURE**.
21. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission for the correct fluid levels.

SENSOR, COOLANT TEMPERATURE

REMOVAL

3.6L

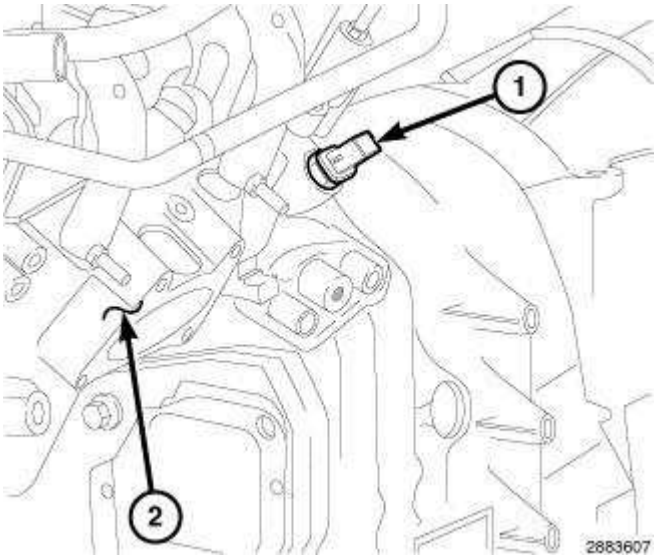

Fig. 159: Engine Coolant Temperature (ECT) Sensor
Courtesy of CHRYSLER GROUP, LLC

The Engine Coolant Temperature (ECT) sensor on the 3.6L engine is installed into a water jacket at rear of the cylinder head on the left side of the engine.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

NOTE: Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
2. Disconnect the electrical connector from the sensor.
3. Remove the sensor from the cylinder head.

5.7L/6.4L

The Engine Coolant Temperature (ECT) sensor is located on the upper portion of the water pump housing. It is installed into a water jacket inline with the thermostat.

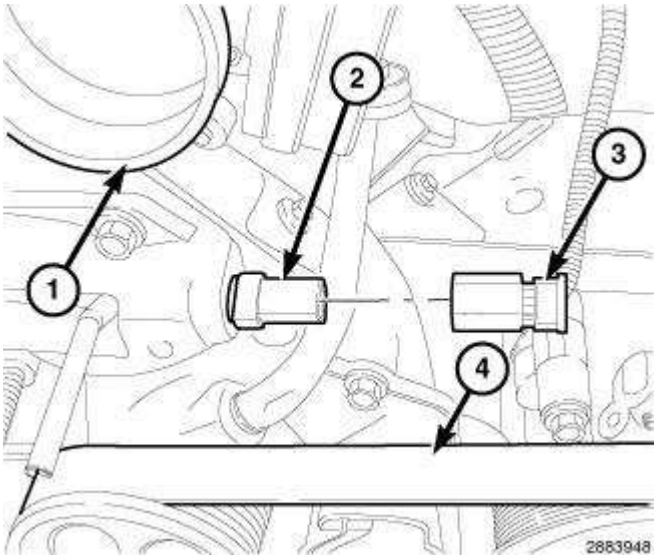

Fig. 160: Electrical Connector, Sensor & Water Pump Housing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Remove the air intake system. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .

NOTE: Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

2. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Disconnect electrical connector (3) from sensor (2).
4. Remove sensor from the water pump housing.

3.0L

The Engine Coolant Temperature (ECT) sensor is located on the upper portion of the water pump housing. It is installed into a water jacket inline with the thermostat.

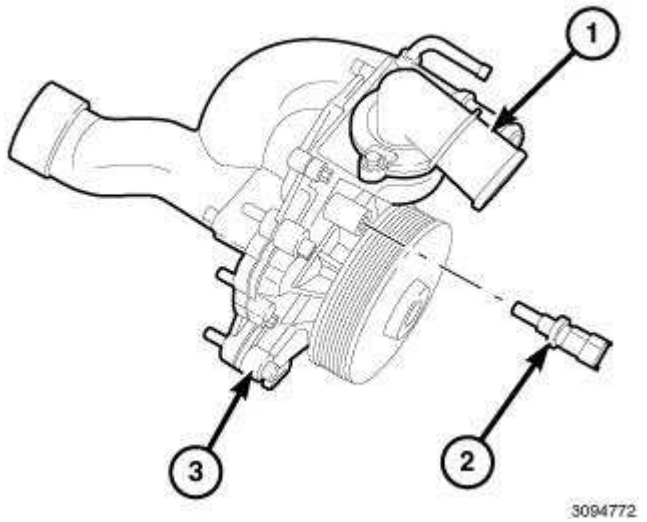

Fig. 161: Temperature Sensor & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Disconnect the negative battery cable.
2. Remove the air intake system.

NOTE: Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

3. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Disconnect electrical connector from sensor.
5. Remove sensor (2) from the water pump housing.

INSTALLATION

3.6L

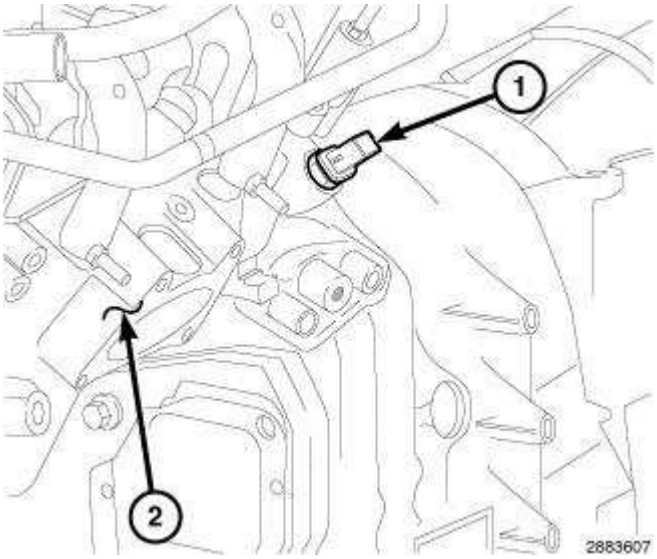

Fig. 162: Engine Coolant Temperature (ECT) Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPAR™ thread sealant with PFTE part number 04318034 to sensor threads.
2. Install sensor (1) to cylinder head.
3. Tighten sensor to 11 N.m (8 ft. lbs.) torque.
4. Connect electrical connector to sensor.
5. Replace any lost engine coolant. Refer to **STANDARD PROCEDURE**.

5.7L / 6.4L

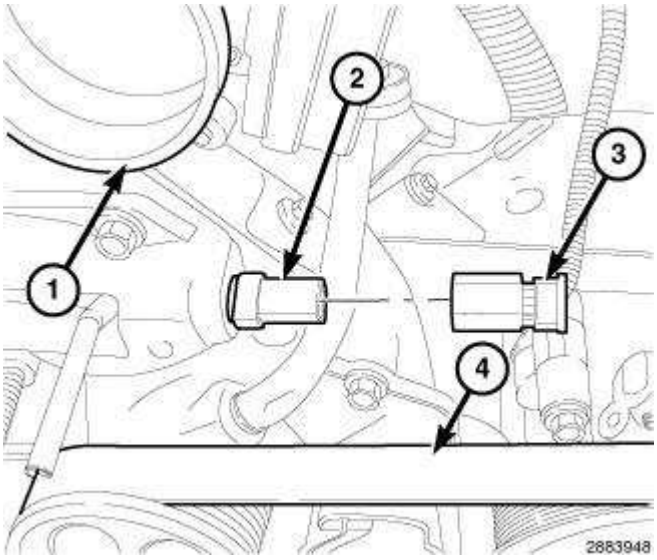

Fig. 163: Electrical Connector, Sensor & Water Pump Housing
Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPAR® thread sealant with PFTE to the sensor threads.

2. Install the coolant temperature sensor (2) into water pump housing.
3. Tighten the coolant temperature sensor to 11 N.m (8 ft. lbs.).
4. Connect the coolant temperature sensor electrical connector (3).
5. Install air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
6. Replace any lost engine coolant. Refer to **STANDARD PROCEDURE**.

3.0L

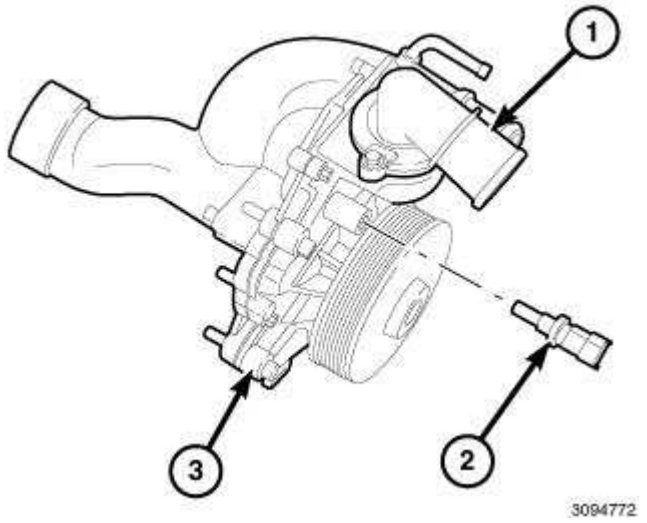

Fig. 164: Temperature Sensor & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPAR® thread sealant with PFTE to the sensor threads.
2. Install the coolant temperature sensor (2) into water pump housing (3).
3. Tighten the coolant temperature sensor to 11 N.m (8 ft. lbs.).
4. Connect the coolant temperature sensor electrical connector.
5. Install air intake system.
6. Replace any lost engine coolant. Refer to **STANDARD PROCEDURE**.

THERMOSTAT

DESCRIPTION

DESCRIPTION

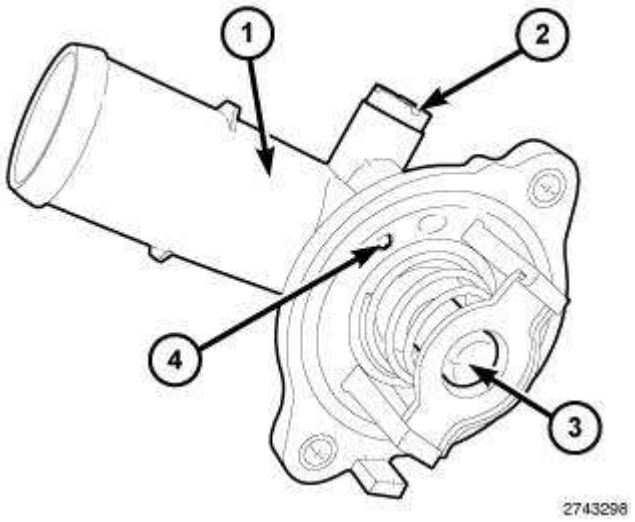

Fig. 165: Thermostat Is Part Of The Housing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

A pellet-type thermostat controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195°F (90°C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warm-up time, unreliable warm-up performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

The thermostat is part of the housing.

OPERATION

OPERATION

WARM-UP PHASE

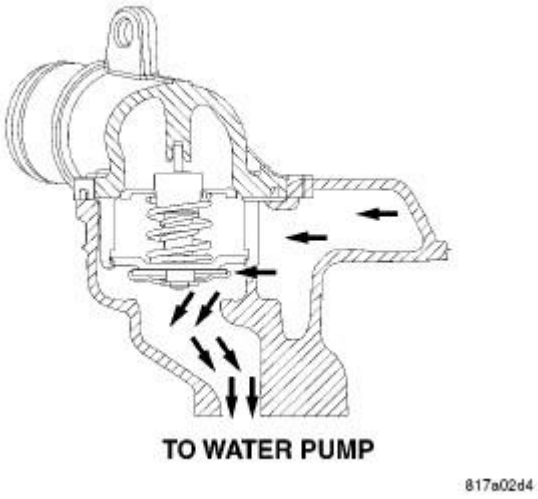

Fig. 166: Warm-Up Phase
Courtesy of CHRYSLER GROUP, LLC

Up to a coolant temperature of approximately 87° C (189° F), the main valve is closed and the bypass valve fully open. The flow through the radiator is interrupted and coolant flows through the bypass passage directly to the inlet side of the water pump.

PARTIAL-LOAD PHASE

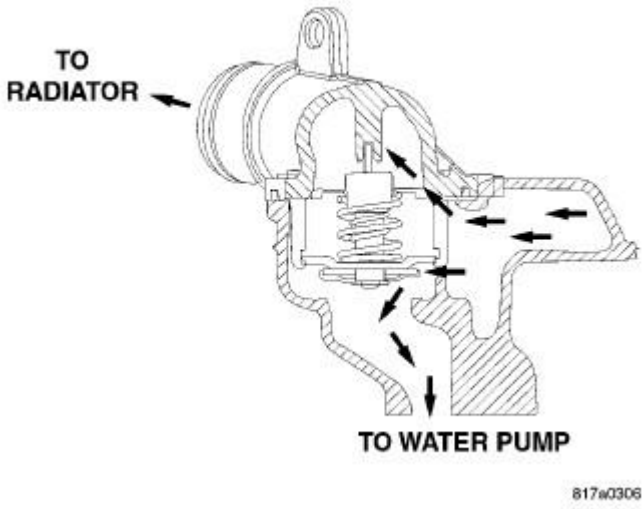

Fig. 167: Partial-Load Phase
Courtesy of CHRYSLER GROUP, LLC

The main valve begins to open at a coolant temperature of 86° C (189° F), and a small amount of coolant flows through the radiator. As the engine temperature increases, the main valve opens further

and the bypass valve gradually closes. More coolant flows through the radiator and less coolant flows through the bypass passage.

FULL-LOAD PHASE

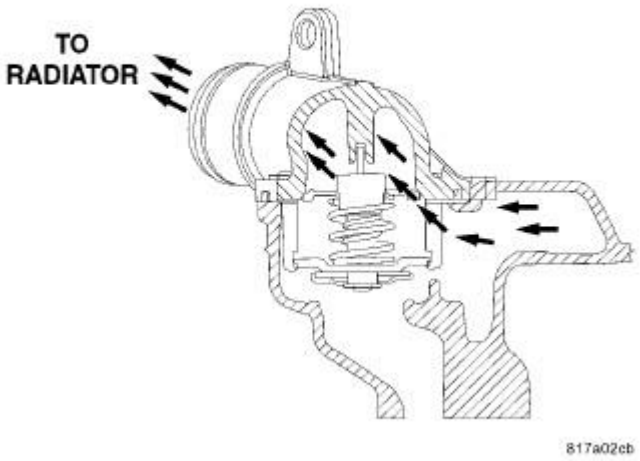

Fig. 168: Full-Load Phase
Courtesy of CHRYSLER GROUP, LLC

The main valve is fully open at a coolant temperature above 102° C (216° F). The bypass plate seals off the bypass passage. The entire quantity of coolant flows through the radiator.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE COOLANT THERMOSTAT

The thermostat is operated by a wax filled chamber (pellet) which is sealed. When heated coolant reaches a predetermined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

Thermostat diagnostics is included in powertrain control module's (PCM) programing for on-board diagnosis. The malfunction indicator light (MIL) will illuminate and a diagnostic trouble code (DTC) will be set when an "open too soon" condition occurs. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes. Refer to **DIAGNOSIS AND TESTING**. Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this .

REMOVAL

3.6L

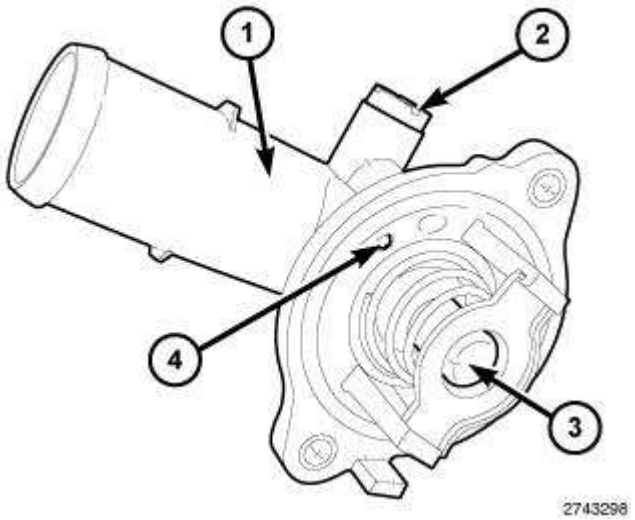

Fig. 169: Thermostat Is Part Of The Housing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

1. Disconnect negative battery cable at battery.
2. Remove the air intake assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Drain cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove upper radiator hose clamp and upper radiator hose at thermostat housing (1).
5. Remove thermostat housing mounting bolts, thermostat housing (1) and thermostat (3).

3.6L COOLANT CROSSOVER

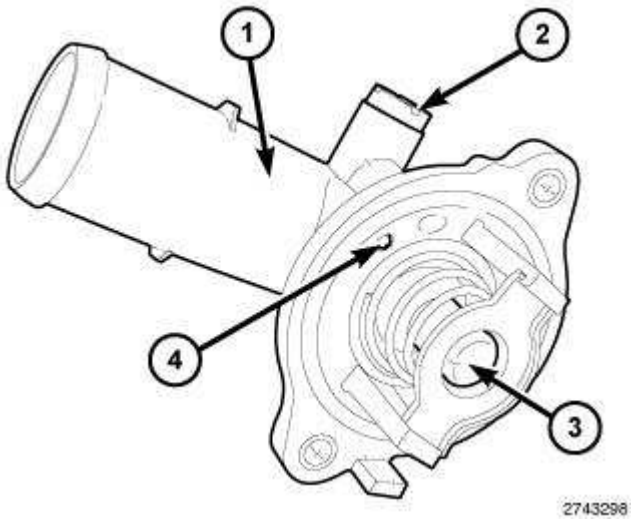

Fig. 170: Thermostat Is Part Of The Housing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the thermostat housing assembly. Refer to **THERMOSTAT, REMOVAL**.

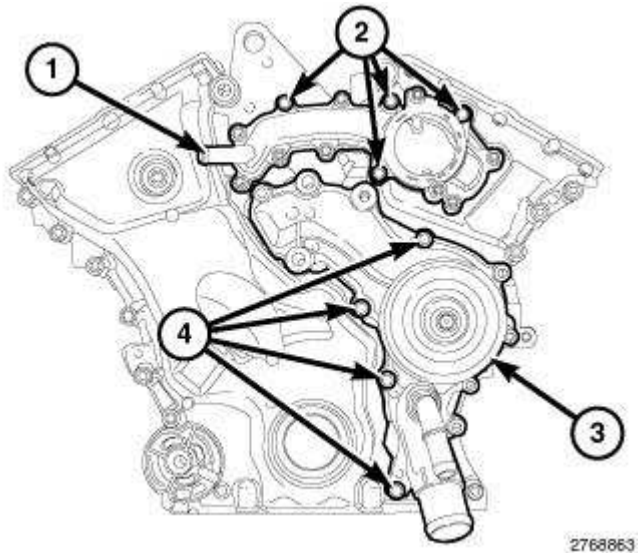

Fig. 171: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the Heater supply hose from the coolant crossover (1).
3. Remove the coolant crossover mounting bolts. Take notice to the four bolts (2) that bolt directly to the timing cover.
4. Remove the coolant crossover and discard Gaskets.

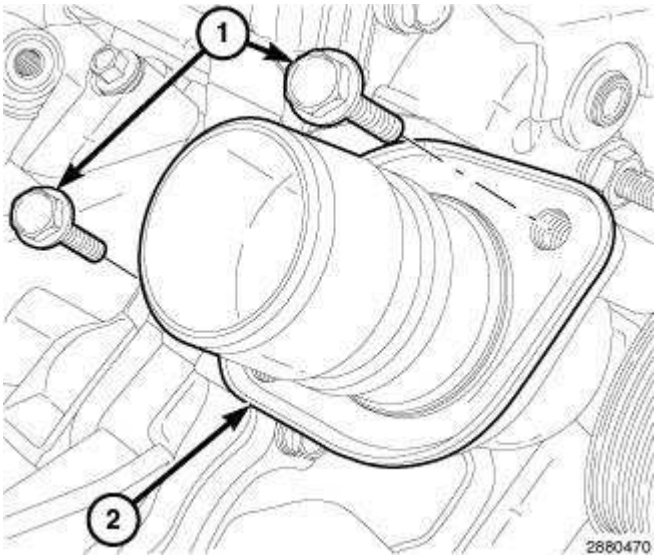

Fig. 172: Thermostat Housing & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen the radiator draincock with the cooling system hot and pressurized. Serious burns from the coolant can occur.

Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

If the thermostat is being replaced, be sure that the replacement is the specified thermostat for the vehicle model and engine type.

1. Disconnect the negative battery cable.
2. Remove the air intake system. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the upper radiator hose at the thermostat housing (2) and position aside.
5. Remove the thermostat housing mounting bolts (1), thermostat housing (2) and thermostat.

3.0L

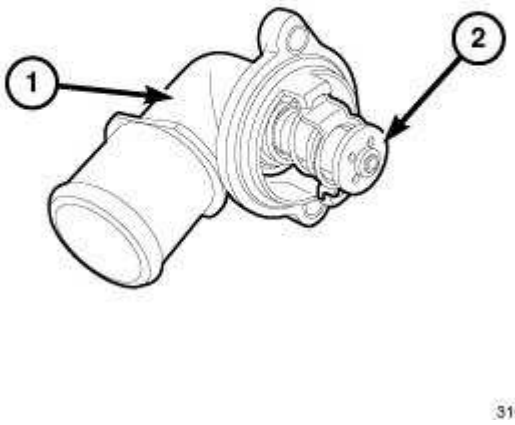

Fig. 173: Thermostat & Housing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

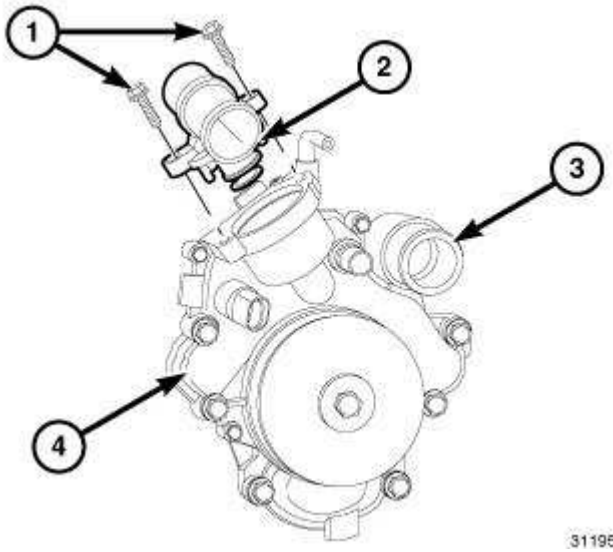

Fig. 174: Water Pump, Thermostat Housing & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable at battery.
2. Remove the air intake assembly. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Drain cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove upper radiator hose at the thermostat housing (1) and position aside.
5. Remove thermostat housing mounting bolts, thermostat housing (1) assembly.

INSTALLATION

3.6L

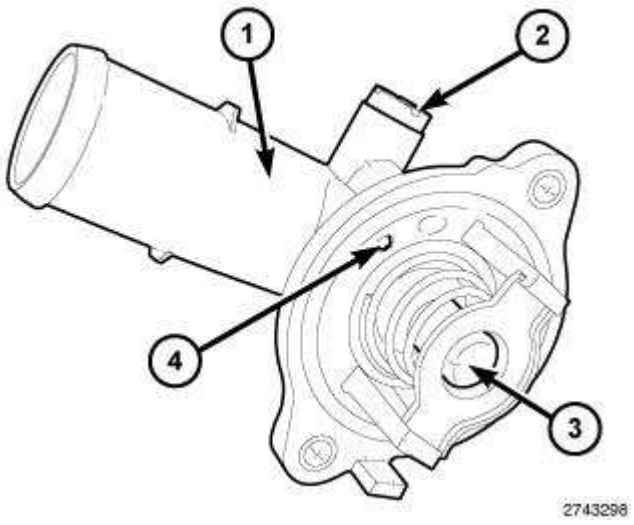

Fig. 175: Thermostat Is Part Of The Housing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

1. Clean mating areas of timing chain cover and thermostat housing (1).
2. Install a new gasket on to the thermostat housing.
3. Position thermostat housing (1) on the water crossover.
4. Install two thermostat housing bolts. Tighten bolts to 12 N.m (106 in. lbs.).
5. Install upper radiator hose on thermostat housing (1).
6. Fill cooling system. Refer to **STANDARD PROCEDURE**.
7. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .

8. Connect negative battery cable to battery.
9. Start and warm the engine. Check for leaks.

3.6L COOLANT CROSSOVER

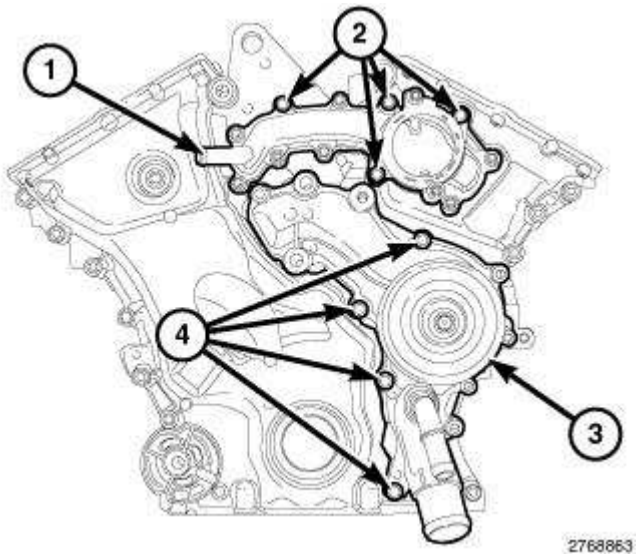

Fig. 176: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean gasket sealing surfaces.
2. Install new gasket onto the coolant crossover.

NOTE: The shorter M6 mounting bolts (2), bolt directly to the engine timing cover.

3. Hand tighten the M6 mounting bolts. Tighten the bolts in a criss cross pattern to 12 N.m (106 in. lbs.).
4. Install the heater supply hose to the coolant crossover (1).

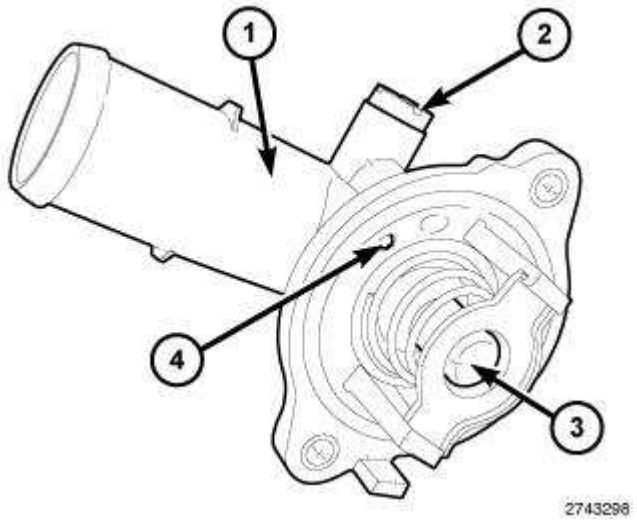

Fig. 177: Thermostat Is Part Of The Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the thermostat housing. Refer to **THERMOSTAT, INSTALLATION**.

5.7/6.4L

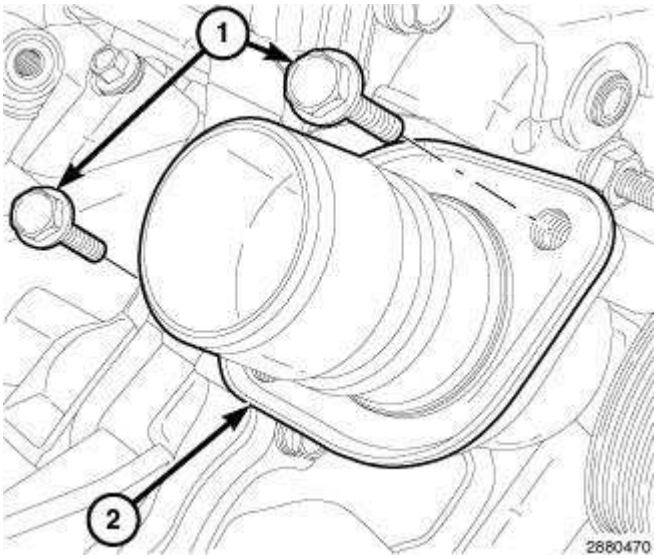

Fig. 178: Thermostat Housing & Mounting Bolts
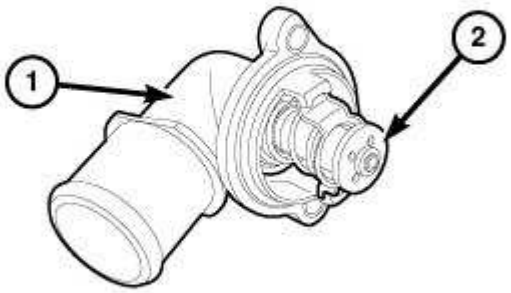
Courtesy of CHRYSLER GROUP, LLC

1. Position the thermostat and housing (2) on the front cover.
2. Install thermostat housing bolts (1). Tighten the bolts (1) to 13 N.m (115 in. lbs.).
3. Install the radiator hose onto the thermostat housing (2).
4. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
5. Connect negative battery cable.

6. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
7. Start and warm the engine. Check for leaks. Refer to **DIAGNOSIS AND TESTING**.

3.0L

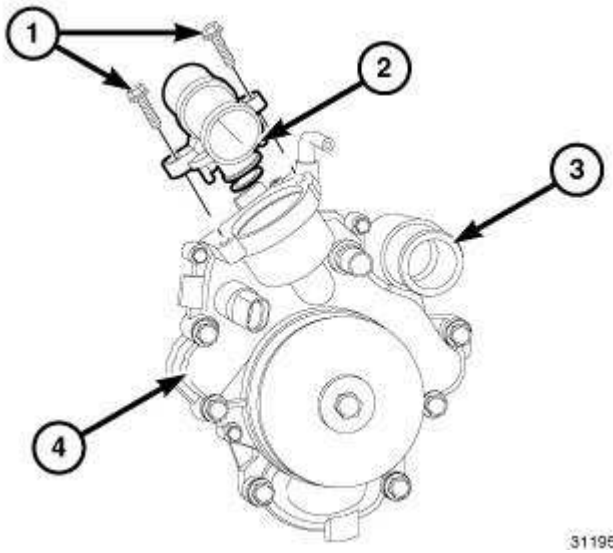


3104833

Fig. 179: Thermostat & Housing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

1. Install a new seal on to the thermostat housing.



3119520

Fig. 180: Water Pump, Thermostat Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position thermostat housing (2) onto the water pump.
3. Install two thermostat housing bolts (1). Tighten bolts to 11 N.m (97 in. lbs.).
4. Install upper radiator hose on thermostat housing (2).
5. Fill cooling system. Refer to **STANDARD PROCEDURE**.
6. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
7. Connect negative battery cable to battery.
8. Start and warm the engine. Check for leaks.

TUBE, HEATER HOSE, SUPPLY

REMOVAL

5.7L/6.4L

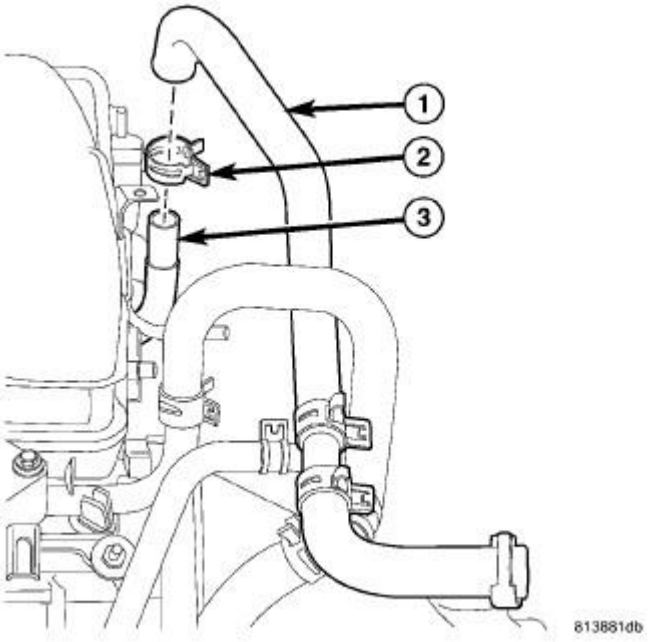


Fig. 181: Heater Supply Hose
Courtesy of CHRYSLER GROUP, LLC

1 - Heater Hose
2 - Clamp
3 - Tube

1. Disconnect negative battery cable.
2. Drain cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD, INTAKE, REMOVAL** .
4. Remove heater hoses from heater tubes.
5. Remove heater tube mounting bolts.
6. Remove heater tubes from water pump housing and remove from vehicle.

INSTALLATION

5.7L/6.4L

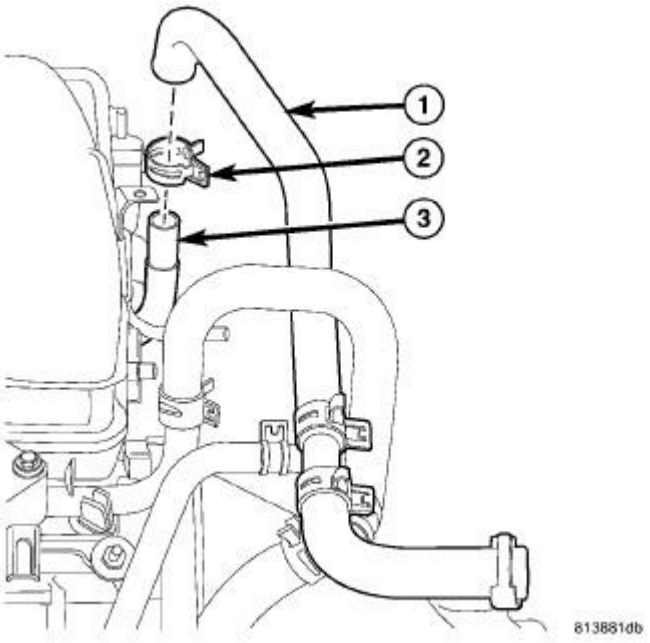

Fig. 182: Heater Supply Hose
Courtesy of CHRYSLER GROUP, LLC

1 - Heater Hose
2 - Clamp
3 - Tube

1. Position heater tubes into water pump housing.
2. Install mounting bolts. Tighten bolts to 10 N.m (88 in. lbs.).
3. Install heater hose onto heater tubes.
4. Install intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION, 5.7L** or **MANIFOLD, INTAKE, INSTALLATION** .

5. Connect negative battery cable.
6. Fill cooling system. Refer to **STANDARD PROCEDURE**.
7. Start vehicle and check for cooling system leaks.

TRANSMISSION

STANDARD PROCEDURE

STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/ASSEMBLY

DISCONNECT

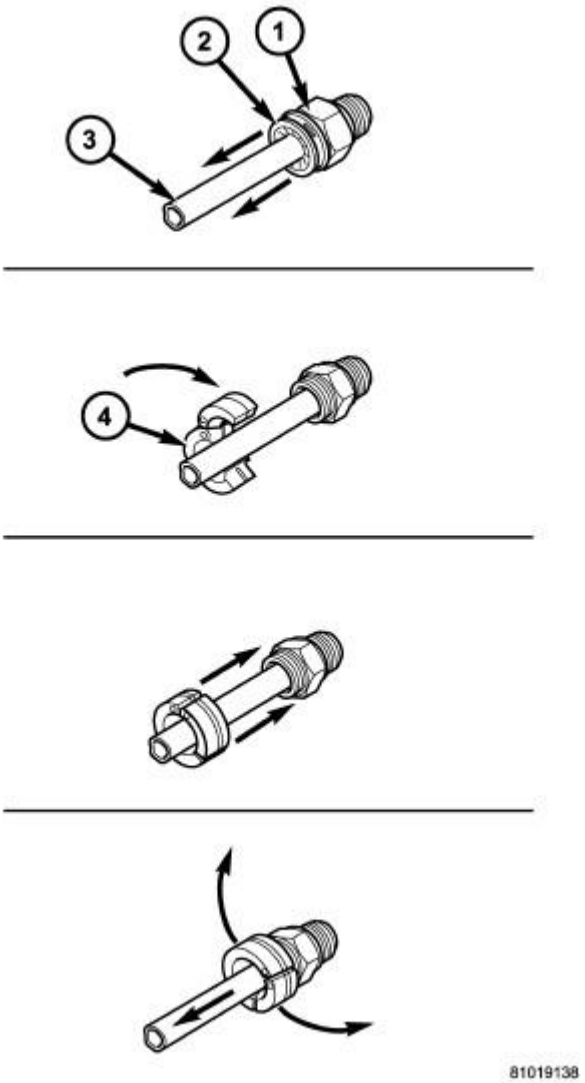

Fig. 183: Oil Cooler Line Quick Connect Fitting - Disassembly
Courtesy of CHRYSLER GROUP, LLC

1 - QUICK CONNECT FITTING
2 - DUST CAP
3 - OIL COOLER LINE
4 - SPECIAL TOOL 8875A

1. Remove dust cap by pulling it straight back off of quick connect fitting.
2. Place disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line) onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.

CONNECT

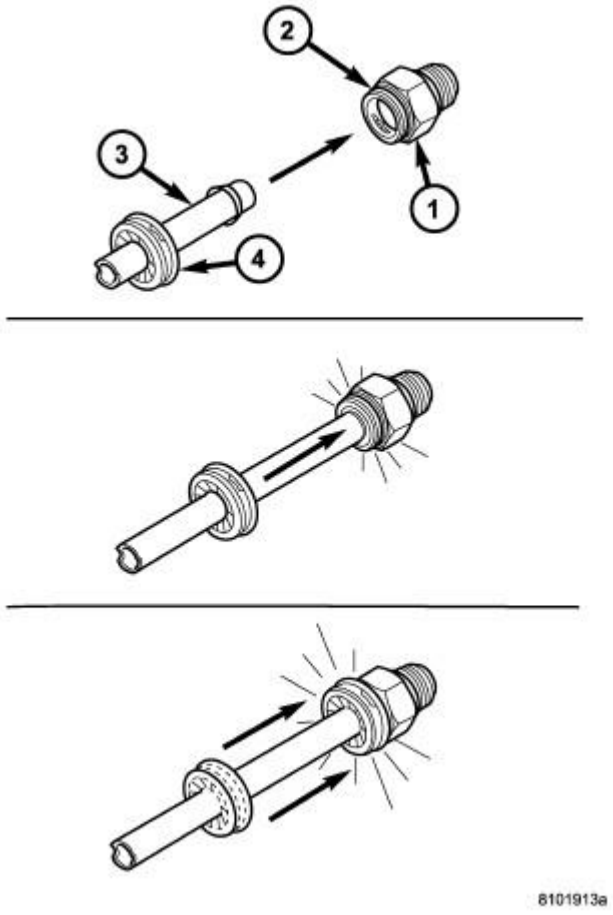

Fig. 184: Oil Cooler Line Quick Connect Fitting - Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - QUICK CONNECT FITTING
2 - CLIP
3 - OIL COOLER LINE
4 - DUST CAP

1. Align transmission cooler line with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a "click" is heard or felt.
3. Slide dust cap down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: If dust cap will not snap into place, repeat assembly step #2.

COOLER, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

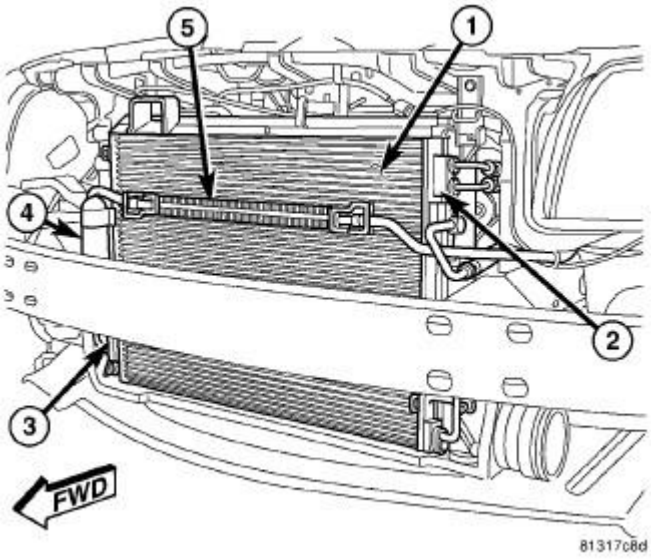

Fig. 185: Condenser-A/C Description
Courtesy of CHRYSLER GROUP, LLC

The automatic transmission cooler (2) is located in the front of the radiator and behind the front fascia and is combined with the A/C condenser. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler/A/C condenser assembly is equipped with quick connect fitting for the transmission oil cooler lines, a tapping block (3) for the receiver/drier (4) and mounting provisions for the power steering cooler (5).

The transmission oil cooler/AC condenser is service as an assembly. For removal and installation, refer to **CONDENSER, A/C, REMOVAL** or **CONDENSER, A/C, INSTALLATION** .

TUBES AND HOSES, TRANSMISSION OIL COOLER

REMOVAL

REMOVAL

1. Remove upper radiator closure panels
2. Using Release Tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove transmission cooler lines from transmission cooler. Refer to **STANDARD PROCEDURE**.
3. Raise vehicle on hoist.
4. Remove front transmission cooler lines from the thermal bypass valve block.
5. Remove rear transmission cooler lines from the thermal bypass valve block

6. Remove the transmission cooler lines from the transmission.

INSTALLATION

INSTALLATION

1. Install rear transmission cooler lines at transmission. Tighten fittings to 20 N.m (18 ft. lbs.).
2. Install rear transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).
3. Install front transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).
4. Install front transmission cooler lines into transmission cooler. Refer to **STANDARD PROCEDURE**.
5. Lower vehicle.
6. Check transmission fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .

VALVE, THERMO BYPASS

DESCRIPTION

DESCRIPTION

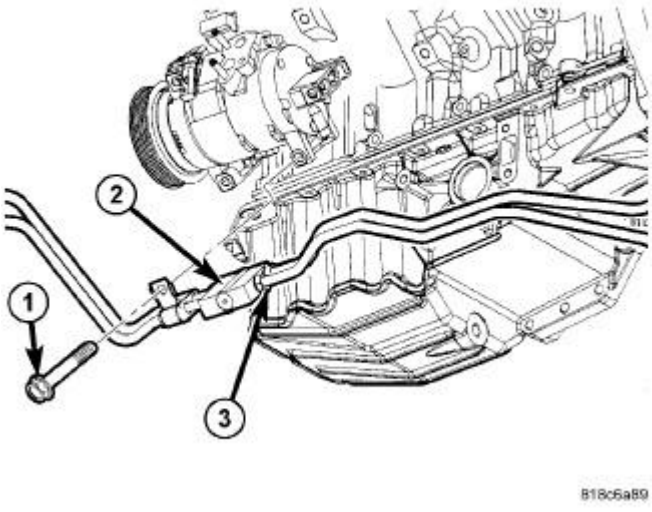

Fig. 186: Thermal Bypass Valve
Courtesy of CHRYSLER GROUP, LLC

The transmission thermal bypass valve is mounted on LH side of the engine at the A/C compressor.

OPERATION

OPERATION

The air-to-oil transmission cooler system has a thermal bypass valve assembly that controls fluid flow through the cooler. When the transmission fluid is cold (less then operating temperature), the fluid is routed through the cooler bypass valve without flowing through the transmission cooler. When the transmission fluid reaches operating temperatures 71°C (160°F) and above, the thermostat closes off the bypass and allowing fluid to flow through the transmission cooler. The thermal bypass valve is serviced as an assembly.

REMOVAL

REMOVAL

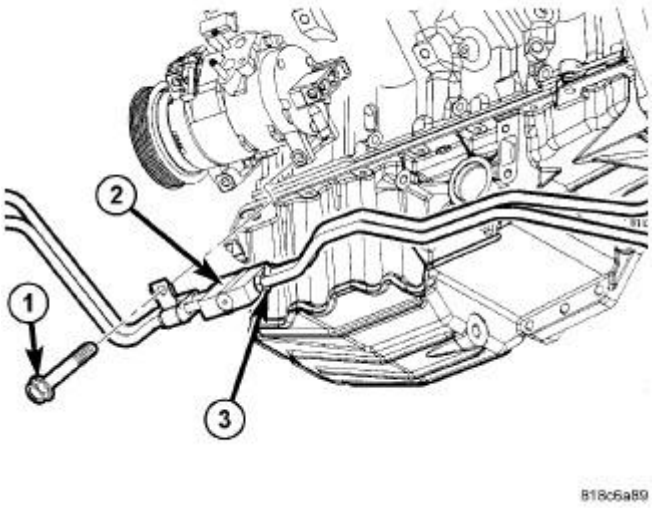

Fig. 187: Thermal Bypass Valve
Courtesy of CHRYSLER GROUP, LLC

1 - MOUNTING BOLT
2 - THERMAL BYPASS VALVE BLOCK
3 - COOLER LINE FITTING

1. Raise and support vehicle.
2. Remove front transmission cooler lines from the thermal bypass valve block (2).
3. Remove rear transmission cooler lines from the thermal bypass valve block (2).
4. Remove thermal bypass valve block (2).

INSTALLATION

INSTALLATION

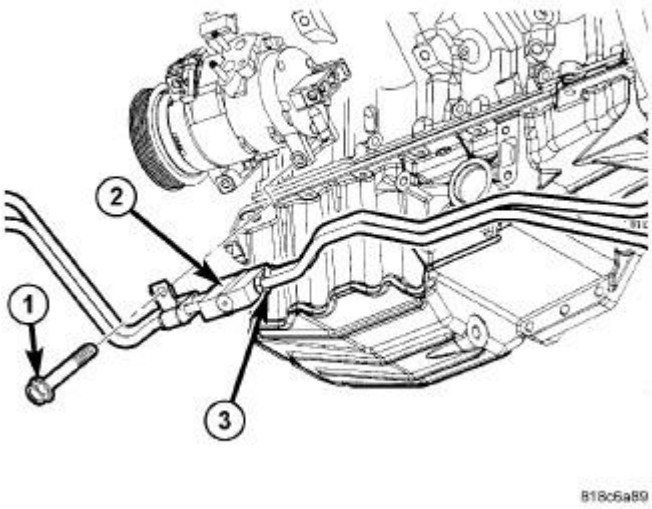

Fig. 188: Thermal Bypass Valve
Courtesy of CHRYSLER GROUP, LLC

1 - MOUNTING BOLT
2 - THERMAL BYPASS VALVE BLOCK
3 - COOLER LINE FITTING

1. Position thermal bypass valve. Install mounting bolt. Tighten mounting bolt to: 2.7L/5.7L/6.1L engine 50 N.m (37 ft. lbs.), 3.0L/3.5L engine 26 N.m (19 ft.lbs.).
2. Install rear transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).
3. Install front transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).

ENGINE

Exhaust System - Chrysler 300

DESCRIPTION

DESCRIPTION

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

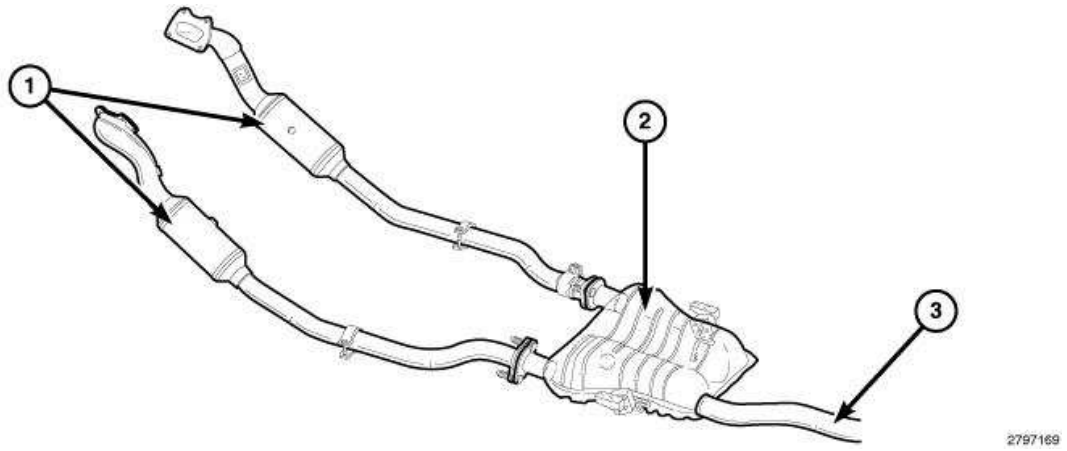

Fig. 1: Two Catalytic Converters & Single Muffler
Courtesy of CHRYSLER GROUP, LLC

The 3.6L converters are mounted to an integrated exhaust manifold. Refer to **3.6L** .

The 3.6L exhaust system uses two catalytic converters (1) located in the front exhaust pipe and a single muffler (2), with a single resonator/tailpipe assembly.

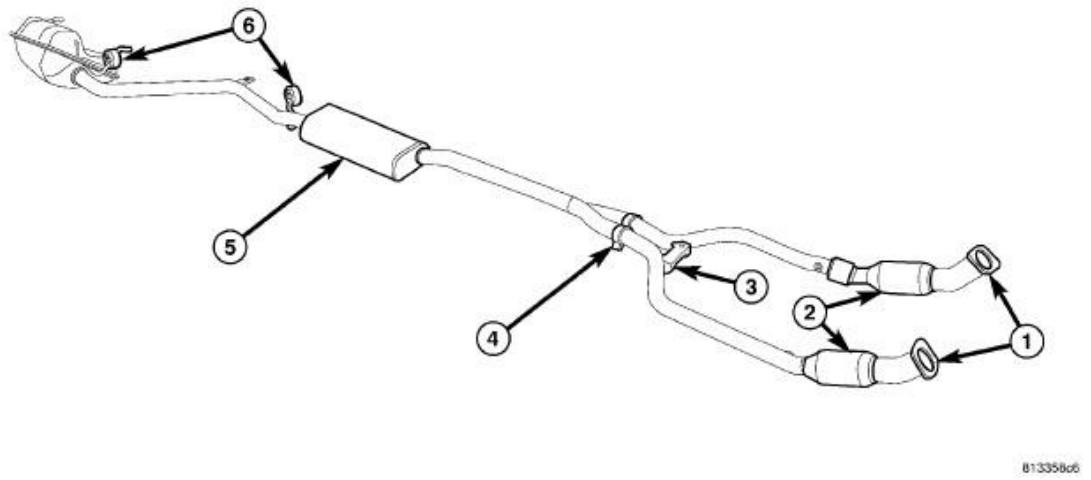

Fig. 2: Exhaust System - V6 Single System
Courtesy of CHRYSLER GROUP, LLC

The exhaust system consists of two front close coupled catalytic converters, a RH rear muffler and resonator assembly, and on vehicles equipped with dual exhaust, LH resonator and tailpipe assembly.

For the single exhaust systems, the RH muffler, resonator and tailpipe (4) are one single unit.

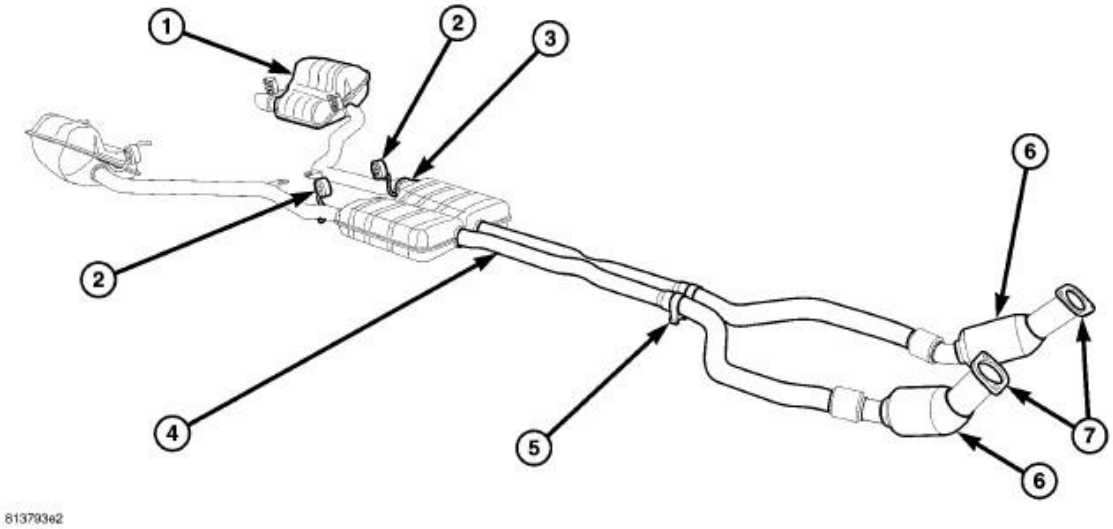

Fig. 3: Exhaust System - V8 Dual System
Courtesy of CHRYSLER GROUP, LLC

1 - LH REAR RESONATOR AND TAIL PIPE
2 - ISOLATOR
3 - BALL FLARE FLANGE 5.7L/6.4L
4 - RH REAR MUFFLER AND RESONATOR

5 - BAND CLAMPS
6 - CATALYTIC CONVERTER ASSEMBLY
7 - BALL FLANGE

On a 5.7L/6.4L, both catalytic converters attach directly to the exhaust manifold using studs and nuts.

The exhaust down pipes exit the converters and connect into the rear muffler and resonator (s).

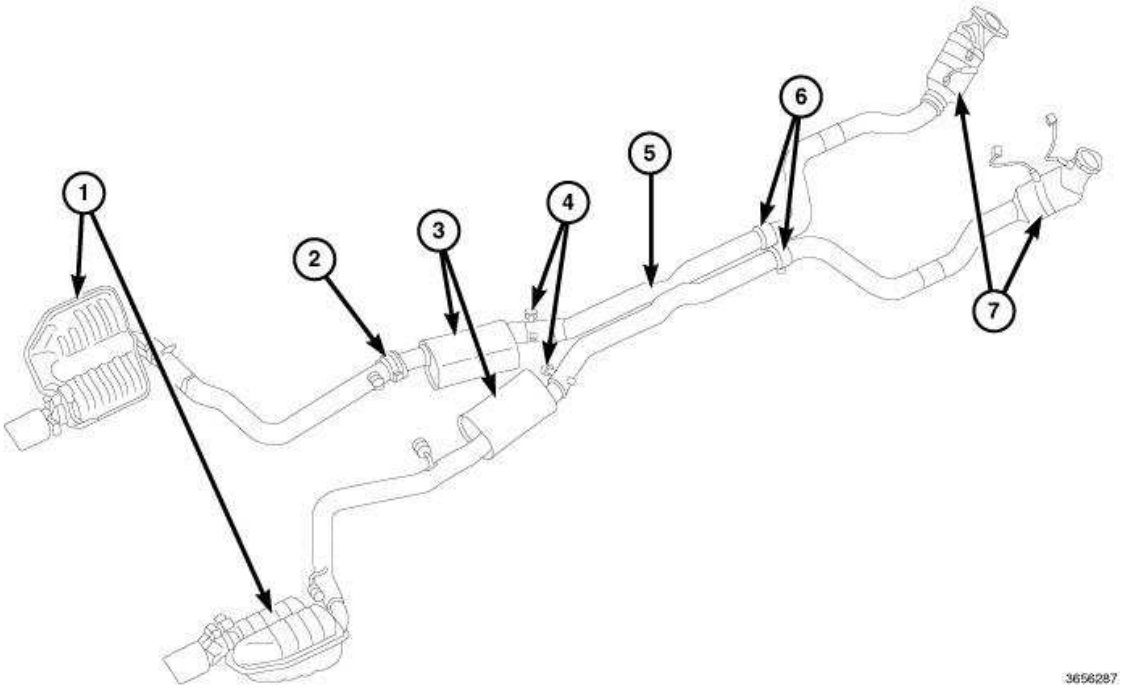

Fig. 4: Two Catalytic Converters, Dual Mufflers, Dual Resonator/Tailpipe Assembly, Active Exhaust Valve & Exhaust Pipes
Courtesy of CHRYSLER GROUP, LLC

Performance exhaust systems use two catalytic converters (7) located in the front exhaust pipe, and dual mufflers (3), a dual resonator/tailpipe assembly (1), and an active exhaust valve (4) located at the exhaust pipes (5).

The front exhaust pipe/catalytic converter assembly is a hydra-form thin wall air gap design. This design is used to reduce heat, noise and improve emissions. When replacement is required, use original equipment parts (or their equivalent).

The exhaust manifolds are equipped with ball flange outlets to assure a tight seal and strain free connections.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it may amplify objectionable noises originating from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or their equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

The exhaust system consists of exhaust manifold(s), exhaust pipe with active exhaust valves, differential pressure sensor, catalytic converter(s) with oxygen sensors, muffler and tailpipe.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE	1. Leaks at pipe joints.	1. Tighten flanges to specified torque at leaking joints. Refer to **SPECIFICATIONS**.
	2. Burned, rusted-out, or blown out muffler.	2. Replace muffler/tailpipe assembly. Refer to **MUFFLER, EXHAUST, REMOVAL**. Check exhaust system.
	3. Burned or rusted-out exhaust pipe.	Replace exhaust pipe.
	4. Exhaust pipe leaking at manifold flange.	4. Tighten connection attaching nuts. Refer to **SPECIFICATIONS**.
	5. Exhaust manifold cracked or broken.	5. Replace exhaust manifold. Refer to **MANIFOLD, EXHAUST, REMOVAL** or **MANIFOLD, EXHAUST, REMOVAL, 5.7L** or **MANIFOLD, EXHAUST, REMOVAL** .
	6. Leak between exhaust manifold and cylinder head.	6. Tighten exhaust manifold to cylinder head stud nuts or bolts. Refer to **SPECIFICATIONS** or **SPECIFICATIONS** or **SPECIFICATIONS** or **SPECIFICATIONS** .
	7. Restriction in muffler or tailpipe.	7. Remove restriction, if possible. Replace muffler or tailpipe, as necessary.
	8. Exhaust system contacting body or chassis.	8. Re-align exhaust system to clear surrounding components. 9. Clean spring and joints.

	9. Exhaust valve stuck open	Replace the exhaust pipe, as necessary.
LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten flanges. Refer to **SPECIFICATIONS**.
LACK OF POWER	1. Exhaust valve stuck closed	1. Clean spring and joints. Replace the exhaust pipe, as necessary.
	2. Restriction in muffler or tailpipe.	2. Remove restriction, if possible. Replace muffler or tailpipe, as necessary.
	3. Restriction in catalytic converter or diesel particulate filter.	3. Remove restriction, if possible. Replace catalytic converter or diesel particulate filter, as necessary.

ADJUSTMENTS

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

1. Loosen clamps and support brackets.
2. Align the exhaust system starting at the front, working rearward.
3. Tighten all clamps and brackets once alignment and clearances are achieved.

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Nut - Catalytic Converter to Ball Flange Snug fit	12	9	-
Nut - Catalytic Converter to Ball Flange	41	30	-
Band Clamp	50	36	-
Nut - Catalytic Converter to Support	55	40	-

Bracket			
Fasteners - Exhaust Support Bracket	25	18	-
Retainers - Heat Shield	10	7	98
Nuts - Tunnel Reinforcement	25	18	-
Fastener - Exhaust tips	30	22	-

INSPECTION

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

CONVERTER, CATALYTIC

DESCRIPTION

DESCRIPTION

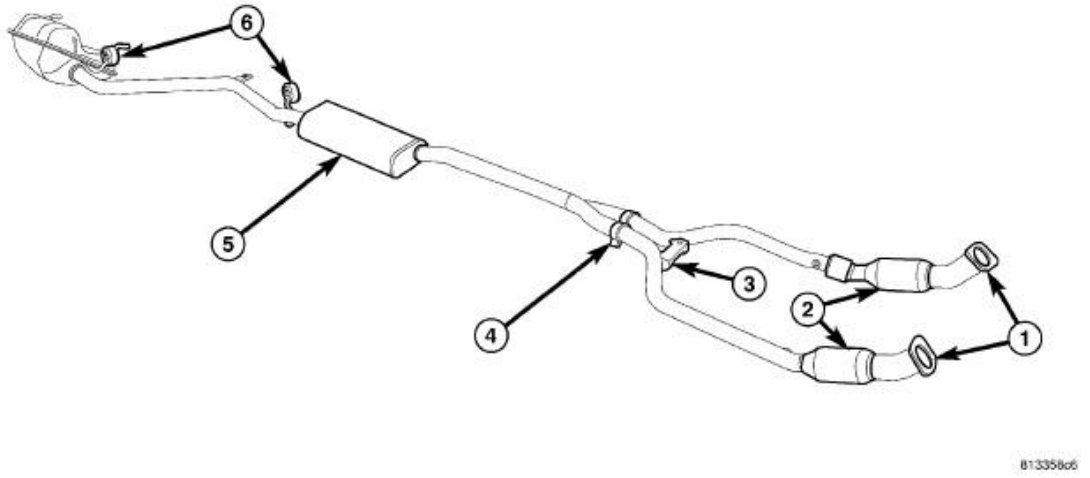

Fig. 5: Exhaust System - V6 Single System
Courtesy of CHRYSLER GROUP, LLC

The 5.7L close coupled, three-way catalytic converter inlets are connected to the exhaust manifolds by the use of ball flange (1). The left and right side converter outlet pipe connects to the exhaust system. The 5.7L is bolted to the exhaust header. The 3.6L bolts directly to the integrated exhaust manifold. Refer to **3.6L** .

REMOVAL

5.7L/6.4L

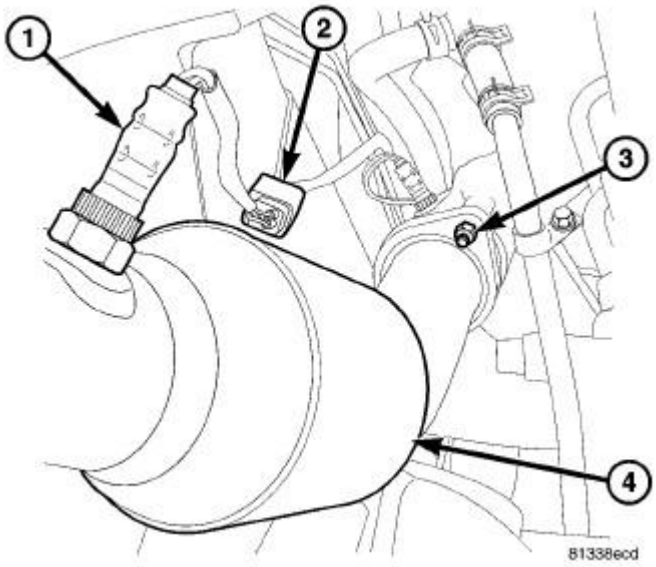

Fig. 6: LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

1 - OXYGEN SENSOR
2 - OXYGEN SENSOR CONNECTOR
3 - BALL FLANGE NUT
4 - LH CATALYTIC CONVERTER

CAUTION: When separating the catalytic converters from the manifolds, disconnect the oxygen sensor connectors. Allowing the catalytic converters hanging from the oxygen sensor wires damages the harness and/or sensors.

NOTE: Left side shown in illustration, right side similar.

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Saturate all exhaust bolts and nuts with Mopar® Rust Penetrant. Allow five minutes for penetration.
4. Disconnect the O2S sensor electrical connectors (2).
5. Remove the catalytic converter to manifold flange nuts (3) and separate the catalytic converters (4) from the exhaust manifolds.

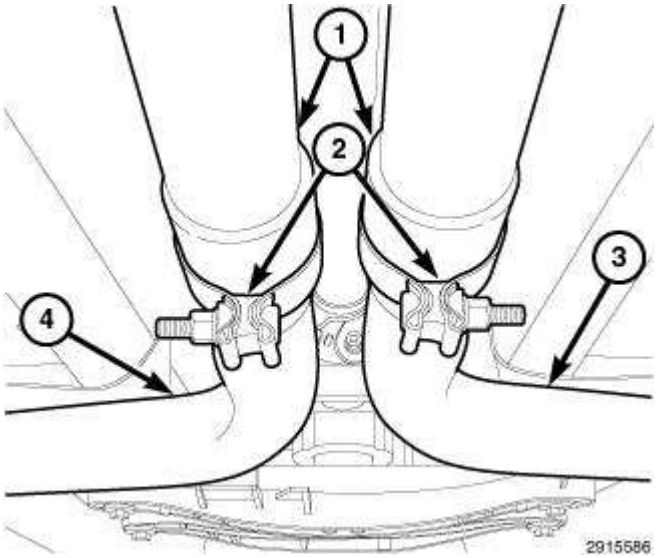

Fig. 7: View Of Exhaust Pipe Band Clamps, Resonator Assembly, And Catalytic Converters

6. Remove the front exhaust pipe band clamps (2) on the exhaust pipe/muffler and resonator assembly (1).
7. Separate the exhaust pipe/muffler and resonator assembly from the catalytic converters (3 and 4).
8. Remove the catalytic converters.

3.6L

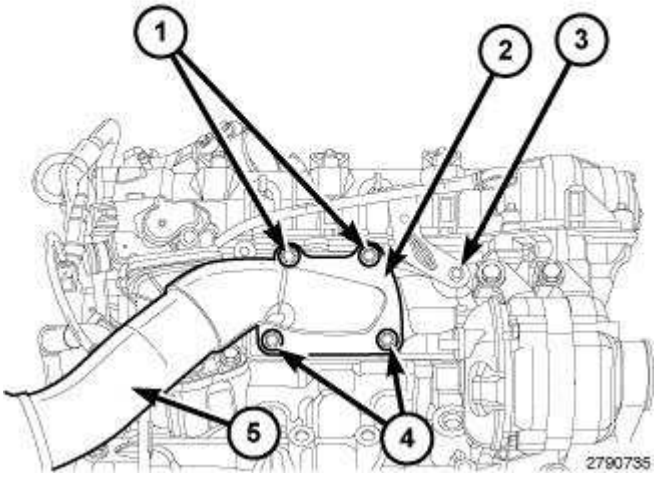

Fig. 8: Catalytic Flange Bolts, Reinforcement Brackets And Oxygen Sensor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

WARNING: If torches are used when servicing the exhaust system, do not allow any flame near the fuel lines or the fuel tank. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect negative battery cable.
2. Remove the engine cover.
3. Saturate the exhaust flange bolts with heat valve lubricant. Allow 5 minutes for penetration.
4. Remove the upper catalytic flange bolts (1).
5. Raise and support the vehicle.
6. If equipped, remove skid plate.
7. Remove the lower catalytic flange bolts (4).

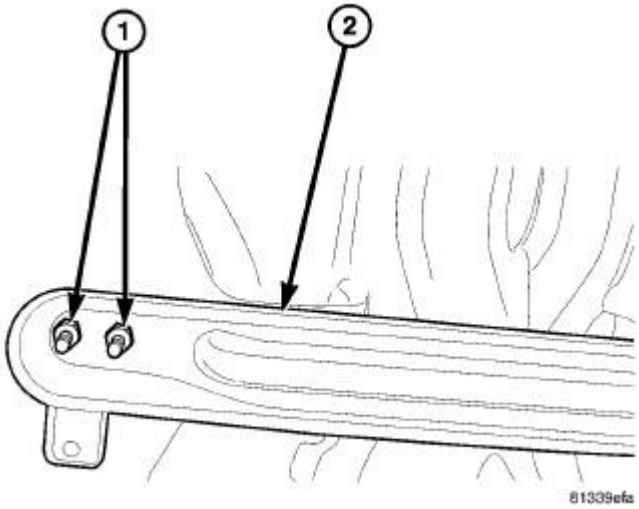

Fig. 9: Tunnel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

8. Remove tunnel reinforcement brackets (2).
9. Disconnect oxygen sensor (2) electrical connectors.

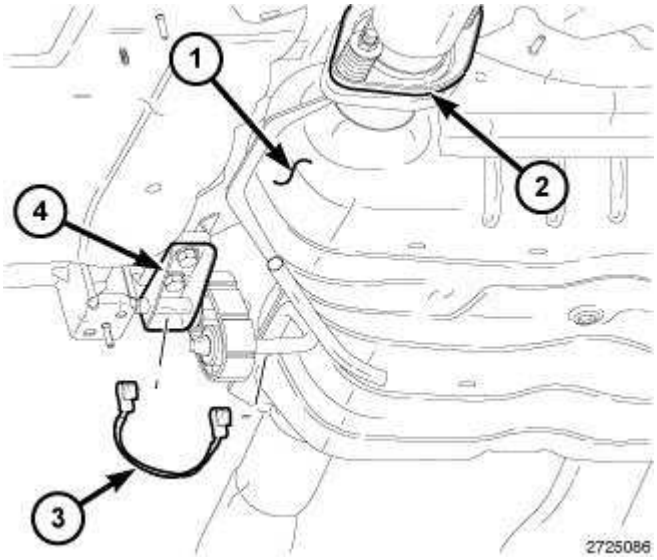

Fig. 10: Muffler Flange & Exhaust Pipe/Catalytic Converter Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Remove the nuts from the front exhaust pipe/catalytic converter assembly to the muffler flange (2).
11. Remove the front exhaust pipe/catalytic converter assembly (1) from the vehicle.

INSPECTION

INSPECTION

Check catalytic converter for a flow restriction. Exhaust System Restriction Check for procedure. Refer to **DIAGNOSIS AND TESTING**.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

INSTALLATION

5.7L/6.4L

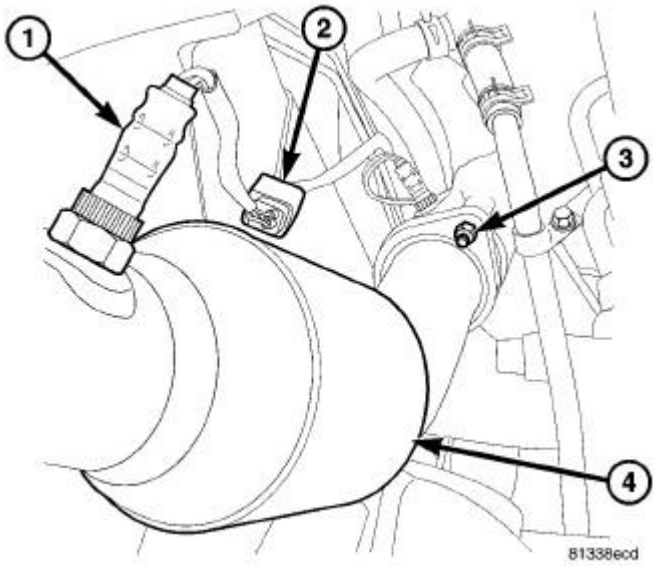

Fig. 11: LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

1 - OXYGEN SENSOR
2 - OXYGEN SENSOR CONNECTOR
3 - BALL FLANGE NUT
4 - LH CATALYTIC CONVERTER

NOTE: Left side shown in illustration, right side similar.

1. Position the catalytic converter (4) onto the exhaust manifold flange, install ball flange nuts (3) finger tight.
2. Connect the O2S sensor electrical connectors (2).

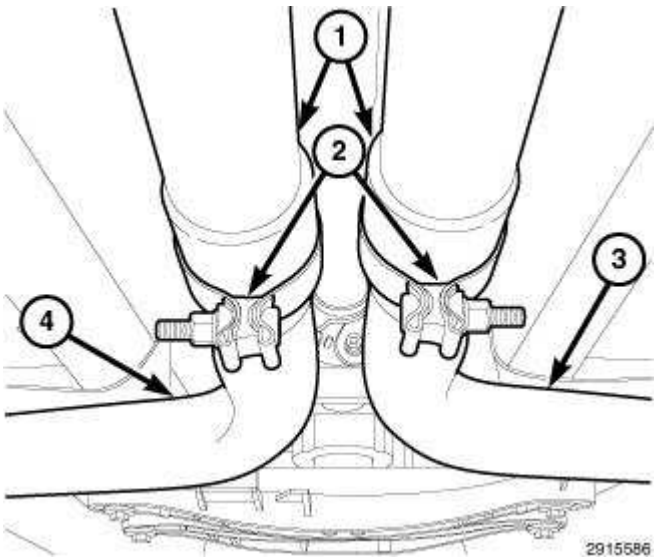

Fig. 12: View Of Exhaust Pipe Band Clamps, Resonator Assembly, And Catalytic Converters
Courtesy of CHRYSLER GROUP, LLC

3. Position the front exhaust pipe band clamps (2) on the exhaust pipe/muffler and resonator assembly (1).
4. Connect the exhaust pipe/muffler and resonator assembly into the catalytic converters (3, 4).
5. Tighten the exhaust manifold flange nuts to 41 N.m (30 ft. lbs.).
6. Tighten the band clamps to 61 N.m (45 ft. lbs.).
7. Lower the vehicle.
8. Connect the negative battery cable.
9. Start the engine and check for exhaust leaks.

3.6L

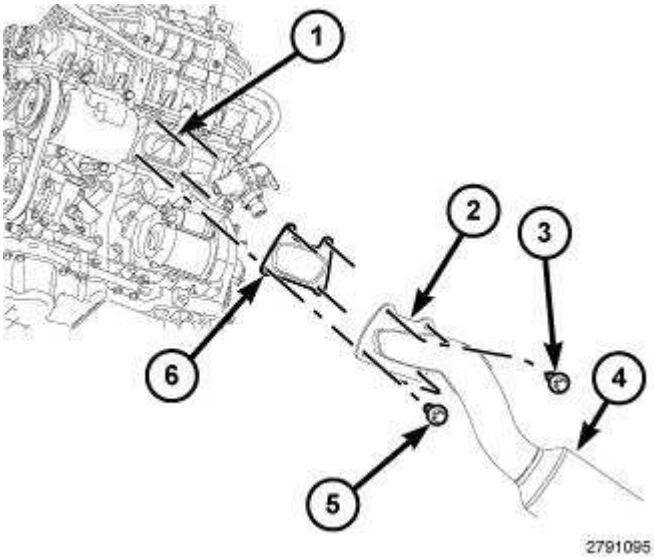

Fig. 13: Exhaust Gasket, Flange, Catalytic Converter Assemblies And Lower Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position new exhaust gasket (6) onto flange (1).
2. Position the front exhaust pipe/catalytic converter assemblies (4) into vehicle.
3. Install the lower bolts (5) at the front exhaust pipe/catalytic converter (4) assembly to exhaust manifold (1) flange. Do not tighten.
4. Lower vehicle.
5. Install the upper bolts at the front exhaust pipe/catalytic converter assemblies to exhaust manifold flanges. Tighten bolts to 23 N.m (17 ft. lbs.).
6. Raise vehicle.
7. Tighten lower flange bolts to 23 N.m (17 ft. lbs.).

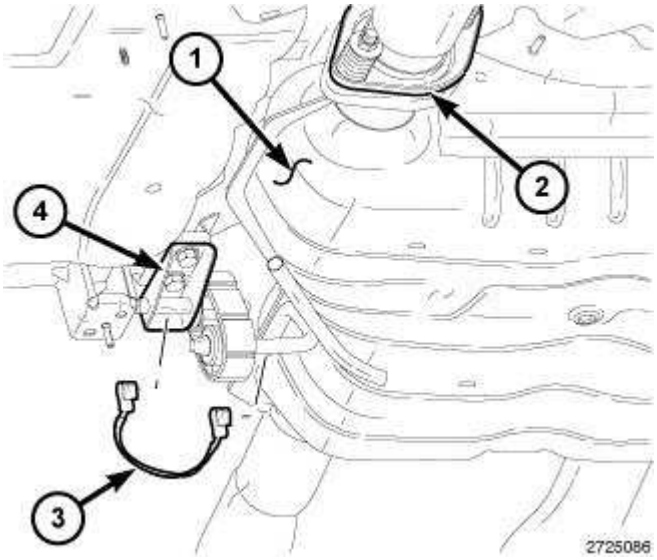

Fig. 14: Muffler Flange & Exhaust Pipe/Catalytic Converter Assembly
Courtesy of CHRYSLER GROUP, LLC

8. Position the exhaust system for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
9. Tighten the front exhaust pipe/catalytic converter assembly to muffler flange (2) nuts to 47 N.m (35 ft. lbs.) torque.

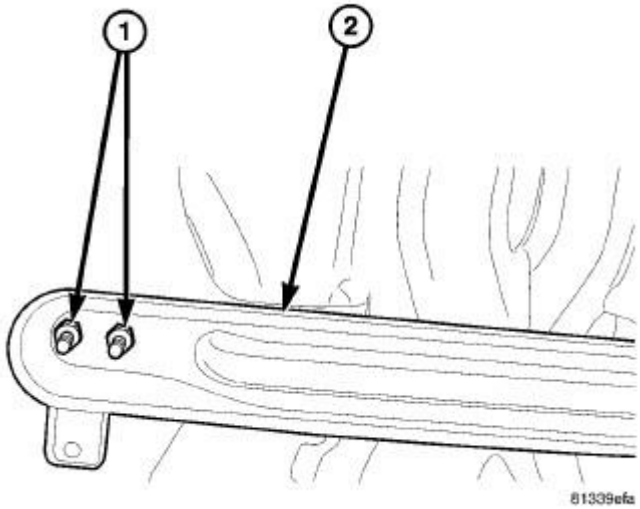

Fig. 15: Tunnel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

10. Connect oxygen sensor (2) electrical connectors.
11. Install tunnel reinforcement brackets (2). Tighten nuts (1) to 55 N.m (41 ft. lbs.).
12. If equipped, install skid plates.

13. Lower vehicle.
14. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.

FILTER, DIESEL PARTICULATE

DESCRIPTION

DESCRIPTION

A diesel particulate filter (DPF) is installed for exhaust gas after-treatment. The DPF filters, stores and burns particulate matter (soot) that is generated during the combustion process. The soot is oxidized to carbon dioxide CO2 at exhaust temperatures over 600° C (1, 112° F).

OPERATION

OPERATION

The oxidation catalysts raise the exhaust gas temperatures to regenerate the DPF, which is passive regeneration. If the passive regeneration cannot keep up with the build up of soot in the DPF, the ECM will actively regenerate the DPF to burn off the soot. Residue remains inside the DPF in the form of non burnable ash. Ash comes from the oils and other materials that are trapped in the oils and are present in the soot. Ash is not eliminated by the regeneration cycle. Excessive ash accumulation requires the replacement of the DPF. The DPF uses a silicon carbide wall-flow monolith with a platinum coating to trap particulates. The monolith contains a large number of square parallel channels, which run in the axial direction and are separated by thin porous walls. The channels are alternatively open at one end, but plugged at the other. The exhaust gases flow through the walls and escape through the pores in the wall material. Particulates, however, are too large to escape and are trapped in the monolith walls. The ECM starts the regeneration of the DPF if the soot load exceeds a performance map value. The ECM determines the load condition of the DPF based upon the exhaust gas pressure upstream and downstream of the DPF. A pressure differential sensor provides the pressure input to the ECM. During the regeneration process, the ECM raises the temperature in the DPF to burn off the soot accumulated. Under normal operation, the engine does not produce enough heat to oxidize the soot inside the DPF. This process requires temperatures above 550 °C (1, 022 ° F). After regeneration, the ECM reads the actual pressure difference at the DPF and compares it with a reference value. From this comparison, the ECM determines the ash quantity inside the DPF.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the engine cover.

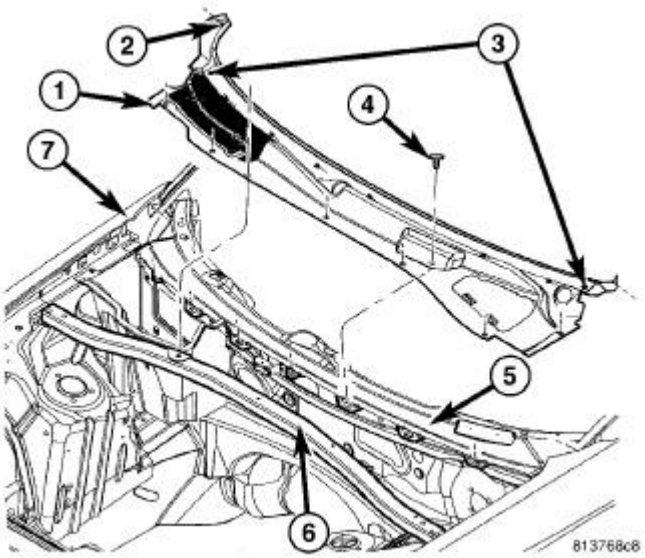

Fig. 16: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cowl assembly (1). Refer to **COVER, COWL PANEL, REMOVAL** .
4. Remove the heat shield.

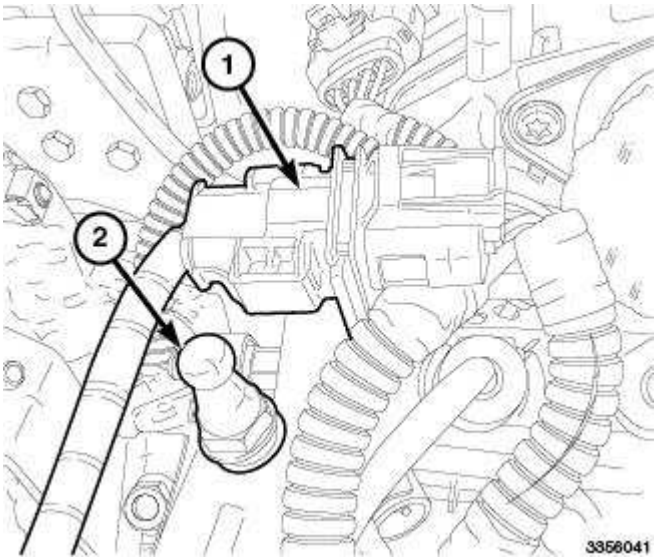

Fig. 17: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the electrical connectors (1) for the O2 sensor.
6. Remove the connectors from the transmission fill tube support bracket.
7. Remove the O2 sensor from the downpipe.
8. Remove the ball stud (2) that secures the transmission fill tube.

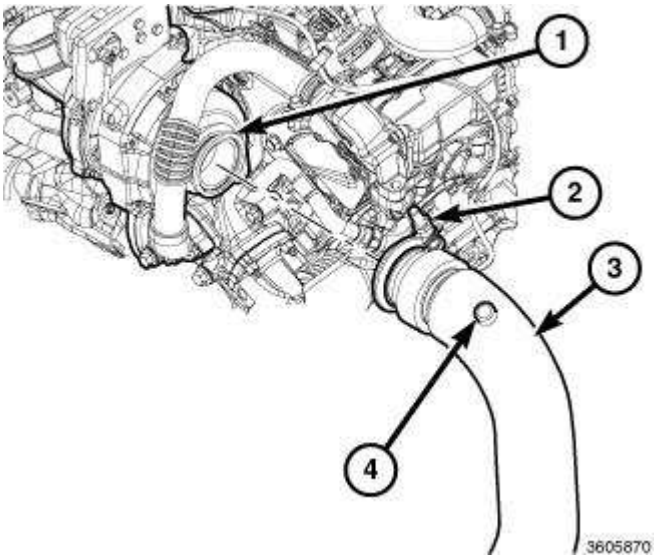

Fig. 18: Clamp, Downpipe & Turbocharger Flange
Courtesy of CHRYSLER GROUP, LLC

9. Loosen the clamp (2) and separate the downpipe (3) from the turbocharger flange (1).
10. Raise and support the vehicle.

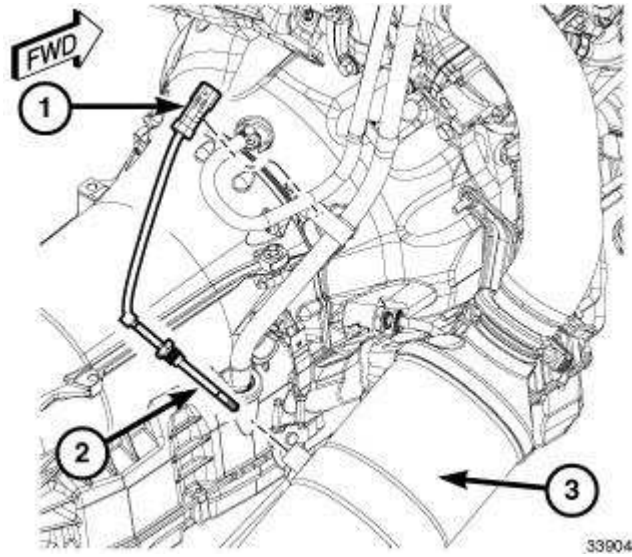

Fig. 19: Temperature Sensor, DPF & Connector
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the temperature sensor electrical connector (1).
12. Remove the temperature sensor (2).

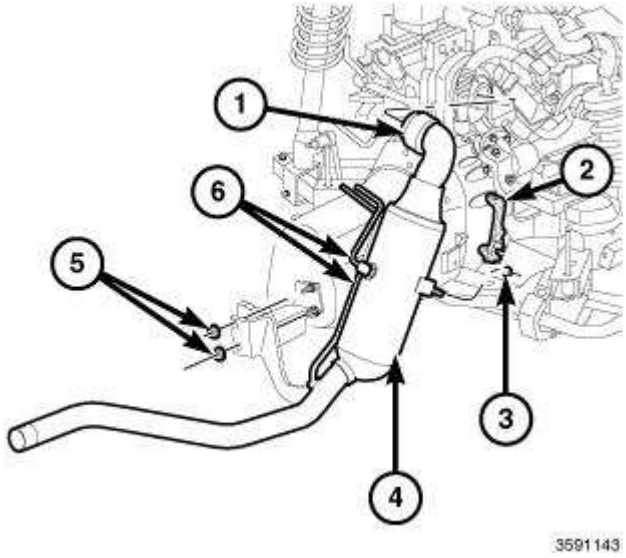

Fig. 20: Steel Lines, Nut, DPF & Rear Bracket Support Nuts
Courtesy of CHRYSLER GROUP, LLC

13. Separate the muffler/resonator from the DPF outlet pipe.
14. Disconnect the differential pressure hoses from the steel lines (6).
15. Remove the nut (3) the secures the DPF (4) to the transmission front steady rest bracket (2).
16. Remove the front steady rest bracket (2) from the transmission.
17. Remove the rear bracket support nuts (5) that secure the DPF outlet to the transmission.

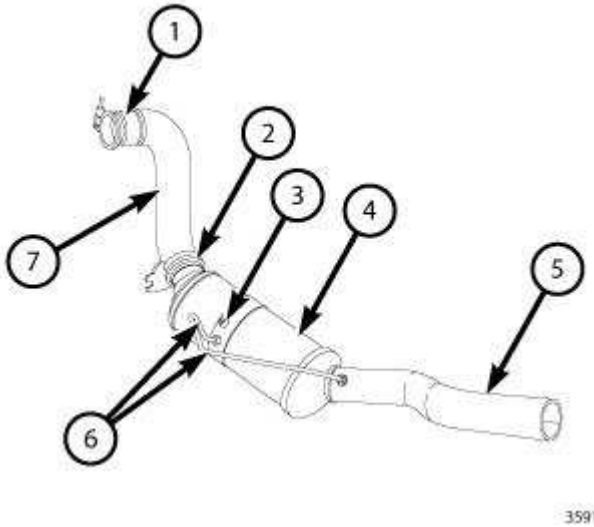

Fig. 21: DPF & Steel Differential Pressure Lines
Courtesy of CHRYSLER GROUP, LLC

18. Remove the DPF (4) from the vehicle.
19. Discard the steel gasket.
20. Remove the steel differential pressure lines (6).

INSTALLATION

INSTALLATION

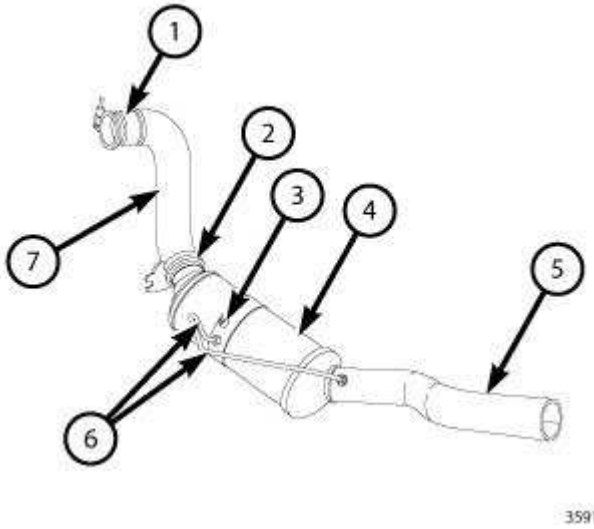

Fig. 22: DPF & Steel Differential Pressure Lines
Courtesy of CHRYSLER GROUP, LLC

1. Install the steel differential pressure lines (6).
2. Position the Diesel Particulate Filter (DPF) (4) into the vehicle.
3. Loosely install the DPF outlet pipe (5) into the muffler/resonator pipe.
4. Lower the vehicle.

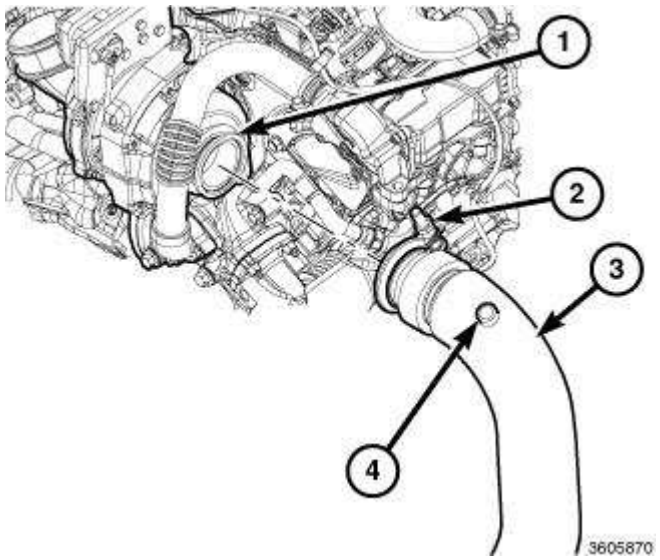

Fig. 23: Clamp, Downpipe & Turbocharger Flange
Courtesy of CHRYSLER GROUP, LLC

5. Position new steel gasket onto the downpipe (3).

6. Position the downpipe (3) to the turbocharger flange (1) and loosely tighten the clamp (2).
7. Raise and support the vehicle.

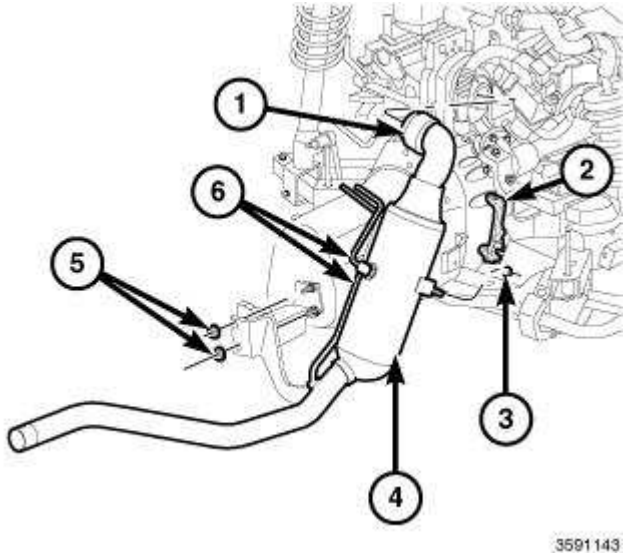

Fig. 24: Steel Lines, Nut, DPF & Rear Bracket Support Nuts
Courtesy of CHRYSLER GROUP, LLC

8. Install the front steady rest bracket (2) to the transmission. Tighten the nuts to 26 N.M (19 ft. lbs.).
9. Connect the differential pressure hoses to the steel lines (6).
10. Align the DPF to their respective mounts.
11. Tighten the front steady bracket retainer nut (3) for the DPF to 26 N.M (19 ft. lbs.).
12. Install the rear bracket support nuts (5). Tighten the nuts to 10 N.M (89 in. lbs.).
13. Tighten the muffler/resonator clamp.

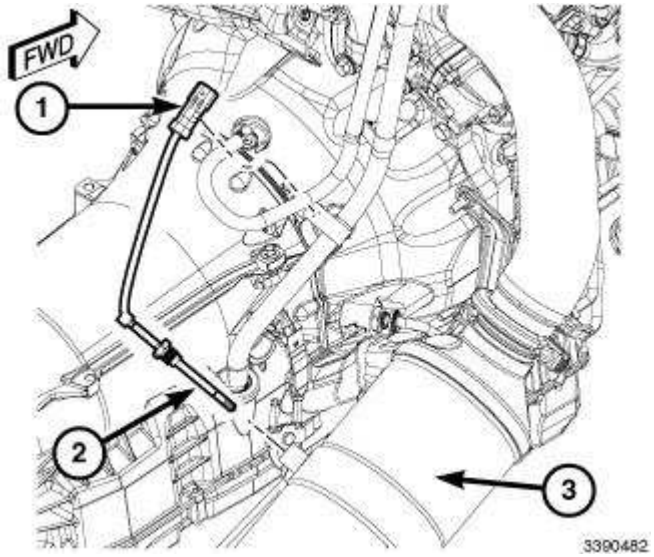

Fig. 25: Temperature Sensor, DPF & Connector

Courtesy of CHRYSLER GROUP, LLC

14. Install the temperature sensor (2).
15. Lower vehicle.

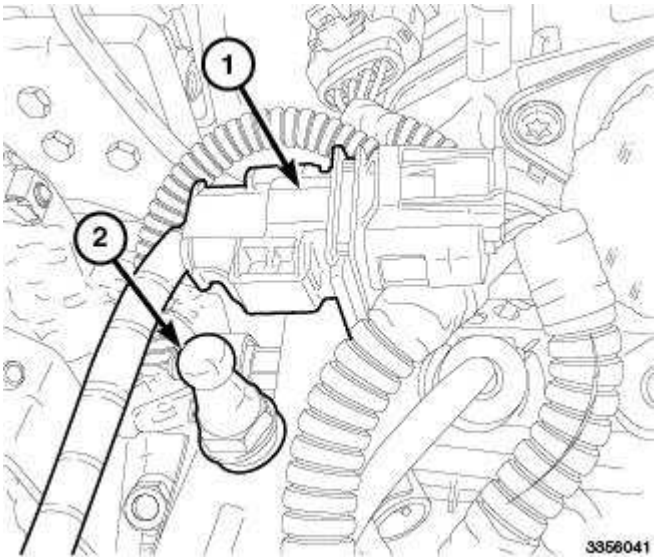

Fig. 26: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

16. Tighten the DPF to turbocharger outlet clamp (3) to 25 N.M (18 ft. lbs.).
17. Install the O2 sensor.
18. Reposition the transmission dipstick to the bracket and install the ball stud (2).
19. Connect the O2 sensor electrical connector (1) and mount it to the transmission fill tube support bracket.

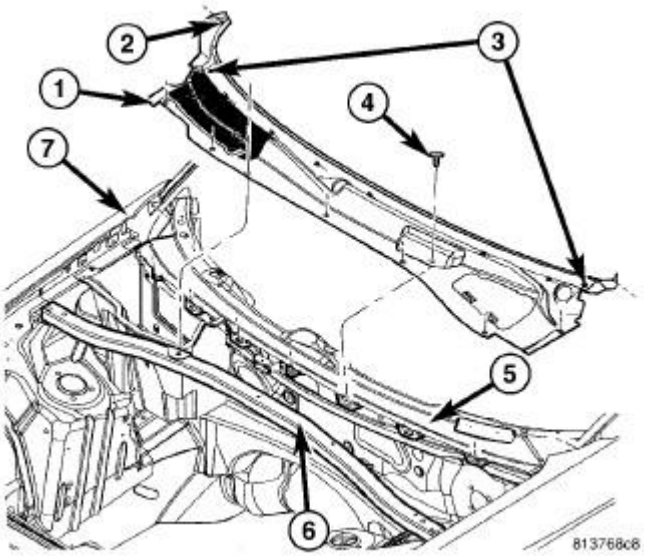

Fig. 27: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

20. Install the cowl assembly (1). Refer to **COVER, COWL PANEL, INSTALLATION** .
21. Install the engine cover.
22. Connect the negative battery cable.

MUFFLER, EXHAUST

DESCRIPTION

DESCRIPTION

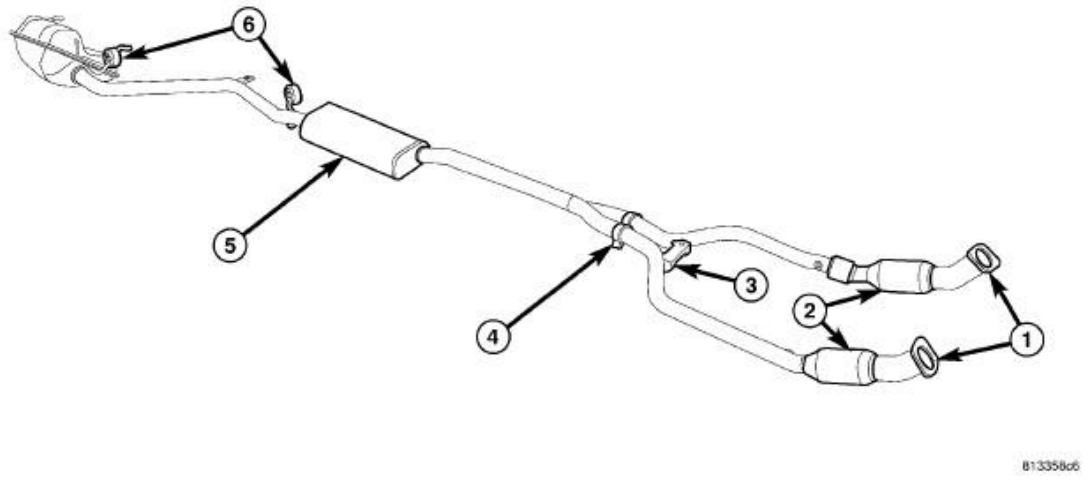

Fig. 28: Exhaust System - V6 Single System
Courtesy of CHRYSLER GROUP, LLC

The 3.6L exhaust pipe assembly consists of:

- Muffler and resonator assembly module (5)
- Isolators (6)

The muffler and resonator assembly is serviced as an assembly.

The 5.7L/6.4L RH muffler and tailpipe assembly consists of:

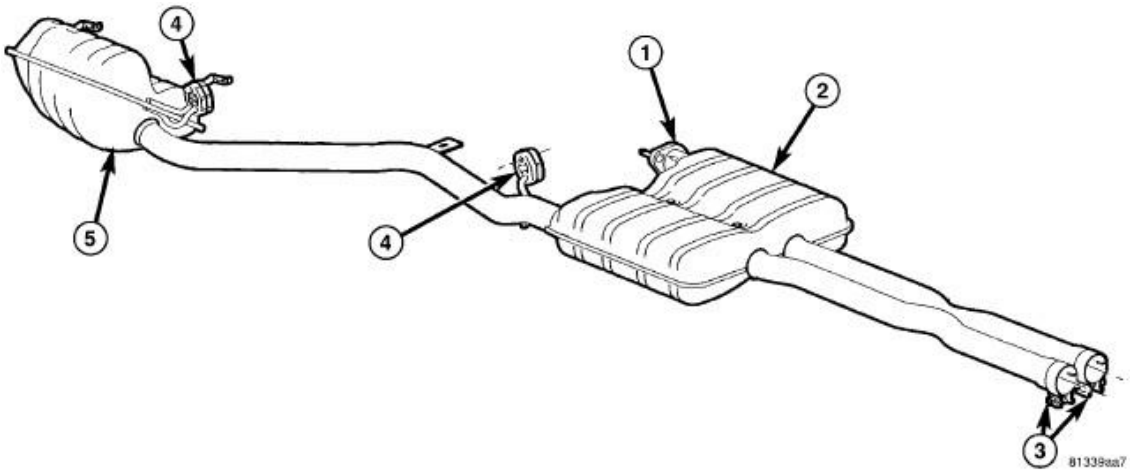

Fig. 29: Front Exhaust Pipe, Muffler And Resonator
Courtesy of CHRYSLER GROUP, LLC

- Front exhaust pipe and muffler (2) and resonator (5)
- Ball flange (1)
- Isolators (4)
- Band clamps (3)

The muffler and resonator assembly is serviced as an assembly.

REMOVAL

SINGLE MUFFLER

Courtesy of CHRYSLER GROUP, LLC

1 - BALL FLANGE
2 - MUFFLER AND TAIL PIPE ASSEMBLY
3 - BAND CLAMPS
4 - ISOLATOR
5 - RH REAR RESONATOR AND TAILPIPE ASSEMBLY

4. 3.6L/5.7L Engines - If equipped, remove the LH resonator and tailpipe assembly. Refer to **RESONATOR, EXHAUST, REMOVAL**.
5. Remove the isolators (4).
6. Remove the muffler and tailpipe assembly (5) by twisting/turning while pulling assembly out of catalytic converters.

DUAL MUFFLER

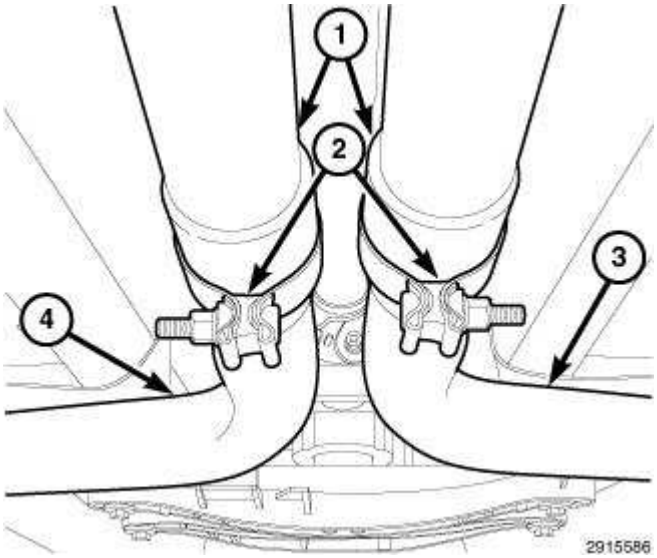

Fig. 33: View Of Exhaust Pipe Band Clamps, Resonator Assembly, And Catalytic Converters
Courtesy of CHRYSLER GROUP, LLC

1. Raise the vehicle.

CAUTION: Do not use any tools to remove the rubber isolators-remove by hand only. Soapy water or silicone based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum based lubricant on the isolators, as damage to the rubber material can occur.

2. Apply penetrating oil to band clamps.

3. Remove the catalytic converter to muffler and resonator clamps (2).

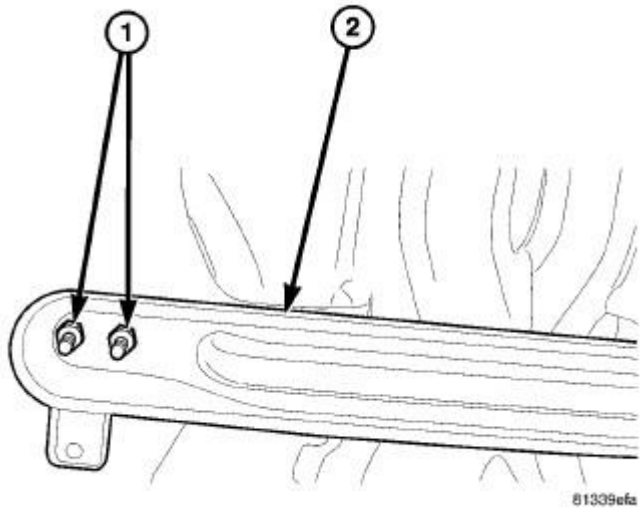

Fig. 34: Tunnel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1 - NUTS
2 - TUNNEL REINFORCEMENT

4. Remove the nuts (1) from the front and rear tunnel reinforcement brackets (2).

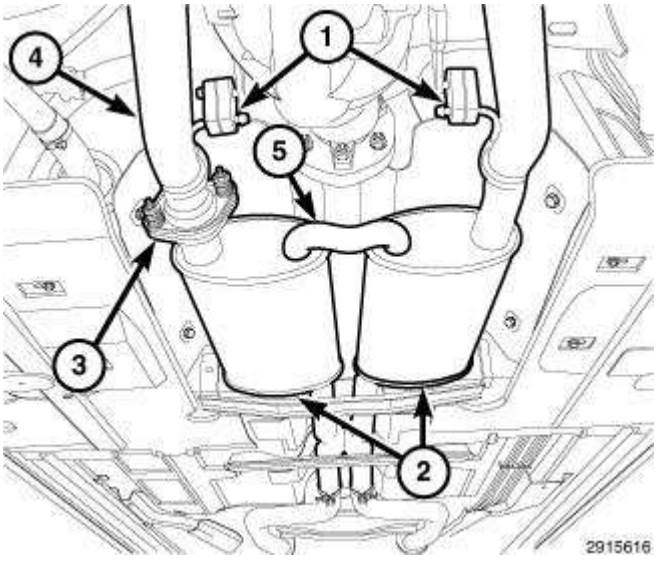

Fig. 35: Muffler/Tailpipe Assembly, Isolators, LH Resonator & Tailpipe Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right side resonator is part of the muffler assembly and must be

replaced with the mufflers if need replacing.

5. 5.7L Engines - If equipped, remove LH resonator and tailpipe assembly (4). Refer to **RESONATOR, EXHAUST, REMOVAL**.
6. Remove the isolators (1).
7. Remove the muffler and tailpipe assembly (2) by twisting/turning while pulling assembly out of catalytic converters.

INSTALLATION

SINGLE MUFFLER

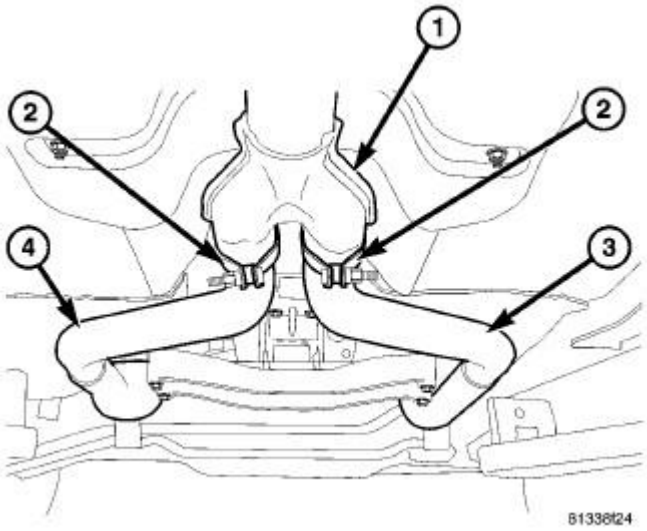

Fig. 36: Front Exhaust Pipe And Resonator Module Clamps
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT EXHAUST MODULE
2 - FRONT EXHAUST PIPE MODULE CLAMP
3 - RH CATALYTIC CONVERTER
4 - LH CATALYTIC CONVERTER

1. Position the front exhaust pipe module clamps (2) on exhaust pipe assembly.
2. Install the exhaust pipe assembly into catalytic converters (3 and 4).

NOTE: Isolators will have an approximately 10° forward angle when installed.

3. Install the isolators.

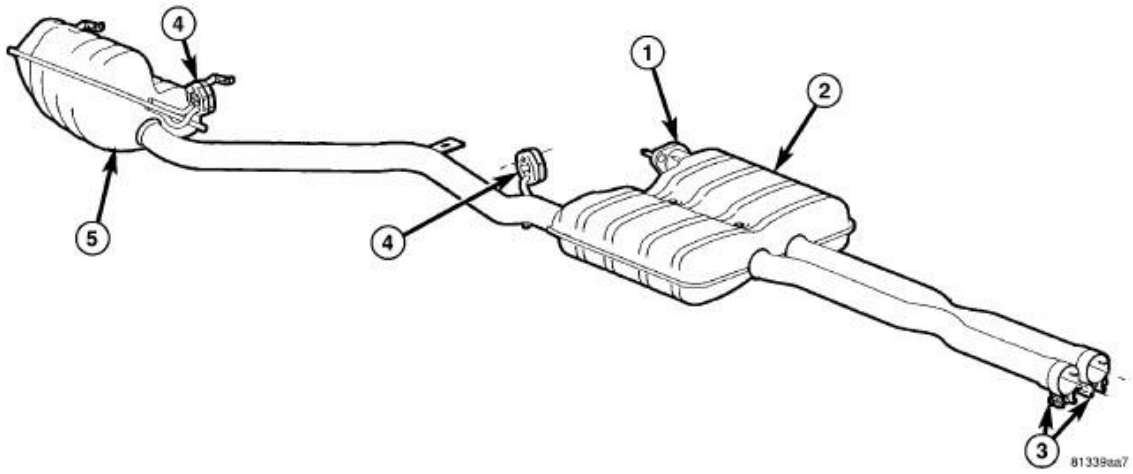

Fig. 37: Muffler And Resonator Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - BALL FLANGE
2 - MUFFLER AND RESONATOR ASSEMBLY
3 - BAND CLAMPS
4 - ISOLATOR
5 - RH REAR RESONATOR AND TAILPIPE ASSEMBLY

4. 3.6L/5.7L Engines - If equipped, install the LH rear resonator and tailpipe assembly. Refer to **RESONATOR, EXHAUST, INSTALLATION**.
5. Check for proper alignment and clearance to underbody and engine compartment components before tightening clamps.
6. Tighten band clamps to 61 N.m (45 ft. lbs.).

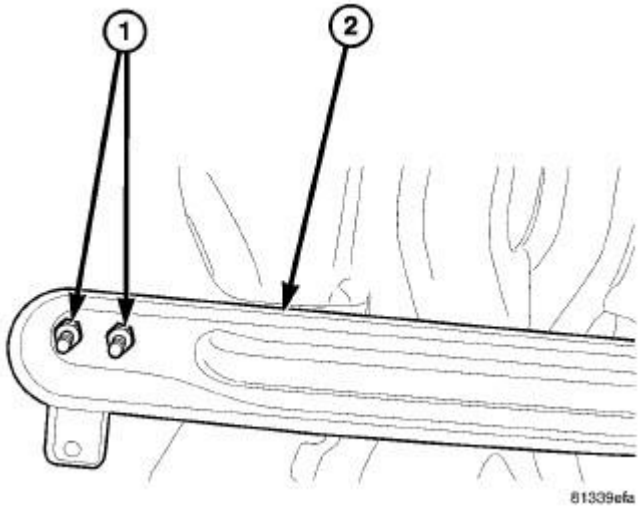

Fig. 38: Tunnel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1 - NUTS
2 - TUNNEL REINFORCEMENT

7. Install the tunnel reinforcement (2) and nuts (1). Tighten nuts to 25 N.m (215 in. lbs.)
8. Check the clearance between muffler and resonator assembly and the fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
9. Check the clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 -.78 in.).
10. The tailpipe should be centered in the rear fascia opening.
11. Adjust clearance as necessary.
12. Lower the vehicle.
13. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

DUAL MUFFLER

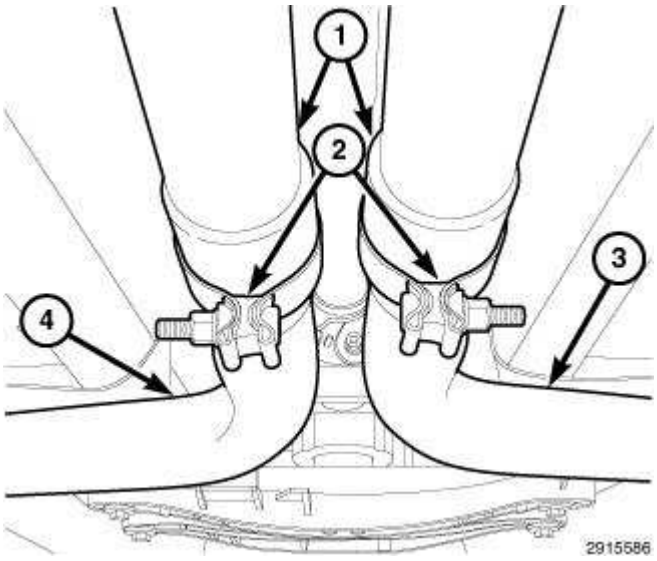

Fig. 39: View Of Exhaust Pipe Band Clamps, Resonator Assembly, And Catalytic Converters
Courtesy of CHRYSLER GROUP, LLC

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used.

1. Position the front exhaust pipe module clamps (2) on exhaust pipe assembly.
2. Install the exhaust pipe assembly into catalytic converters (3 and 4).

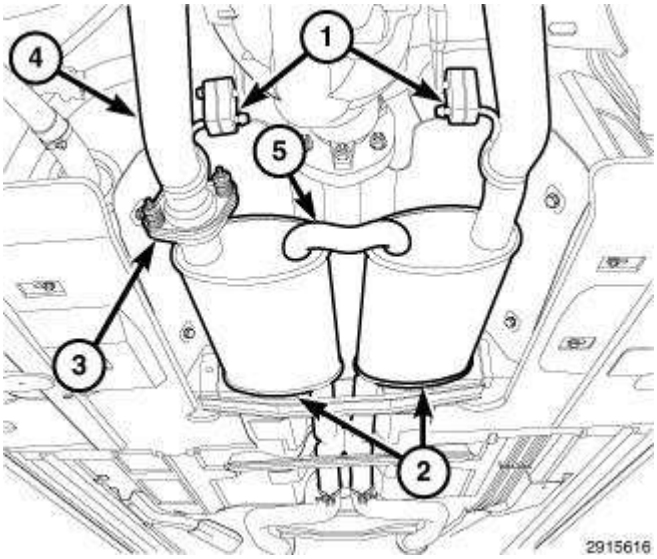

Fig. 40: Muffler/Tailpipe Assembly, Isolators, LH Resonator & Tailpipe Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Isolators will have an approximately 10° forward angle when installed.

3. Install the isolators (1).
4. 5.7L/6.4L Engines - If equipped, install LH rear resonator and tailpipe assembly. Refer to **RESONATOR, EXHAUST, INSTALLATION**.
5. Check for proper alignment and clearance to underbody and engine compartment components before tightening clamps.
6. Tighten the band clamps to 61 N.m (45 ft. lbs.).

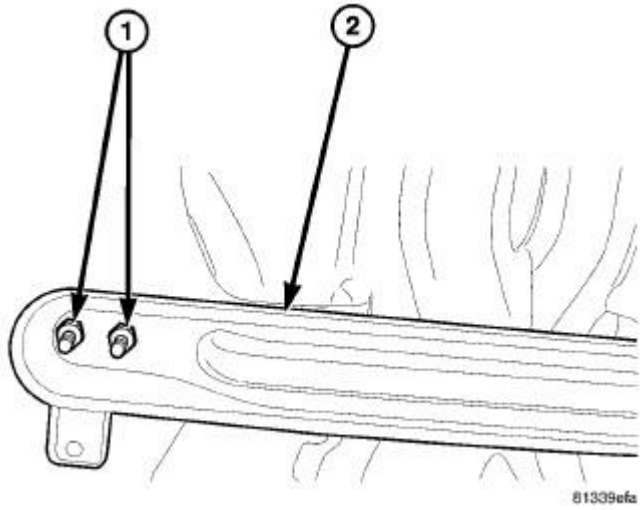

Fig. 41: Tunnel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1 - NUTS
2 - TUNNEL REINFORCEMENT

7. Install both tunnel reinforcement brackets (2) and nuts (1). Tighten nuts to 25 N.m (215 in. lbs.)
8. Check the clearance between muffler and resonator assembly and fuel tank. Clearance is 14mm (.55 in.) for V8 engine.
9. Check the clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 -.78 in.).
10. The tailpipe should be centered in the rear fascia opening.
11. Adjust clearance as necessary.
12. Lower the vehicle.
13. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

RESONATOR, EXHAUST

REMOVAL

SINGLE MUFFLER/RESONATOR

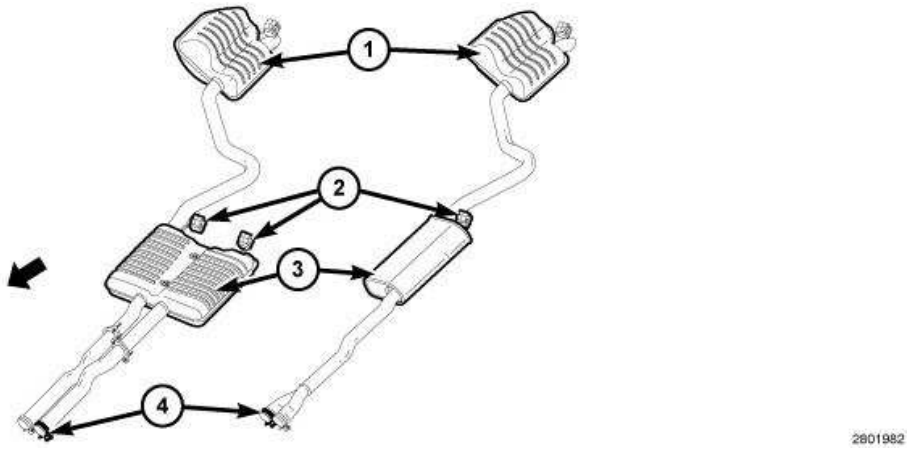

Fig. 42: Single Exhaust Systems, Muffler, Resonator And Tailpipe
Courtesy of CHRYSLER GROUP, LLC

NOTE: On single exhaust systems, the muffler, resonator and tailpipe (4) are one single unit.

1. Apply penetrating oil to band clamp nut and bolt (4).
2. Remove ground straps.
3. Support the exhaust system with a stand.
4. Remove the muffler/resonator assembly from the catalytic converter down pipes at the clamps (4).

CAUTION: Do not use any tools to remove the rubber isolators-remove by hand

only. Soapy water or silicone based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum based lubricant on the isolators, as damage to the rubber material can occur.

5. Remove the isolators (2).
6. Remove the muffler/resonator assembly.

DUAL MUFFLER/RESONATOR

3.6L

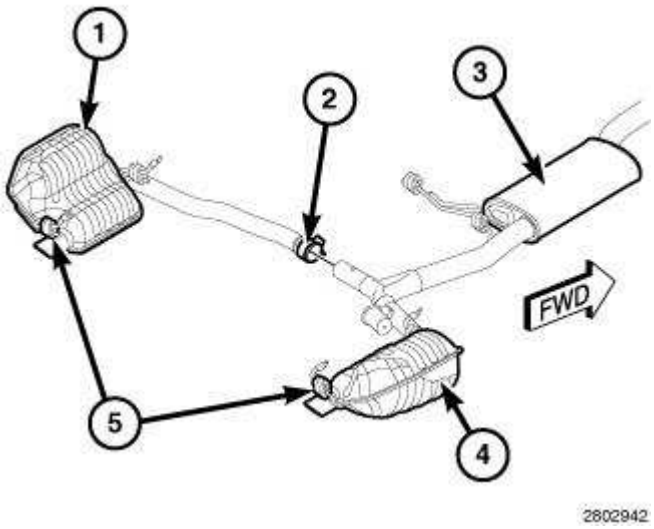

Fig. 43: Pipe Strap Clamp, Isolators And Tailpipe Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Raise the vehicle.
2. Loosen the pipe strap clamp (2) for the left side resonator pipe.
3. Remove the isolators (5) at the left side resonator.
4. Remove the left side resonator and tailpipe assembly (1).
5. Loosen the front strap clamps at the catalytic convertor down pipes.
6. Remove the isolator to the muffler/resonator assembly.
7. Remove the right side muffler/resonator assembly.

5.7L/6.4L

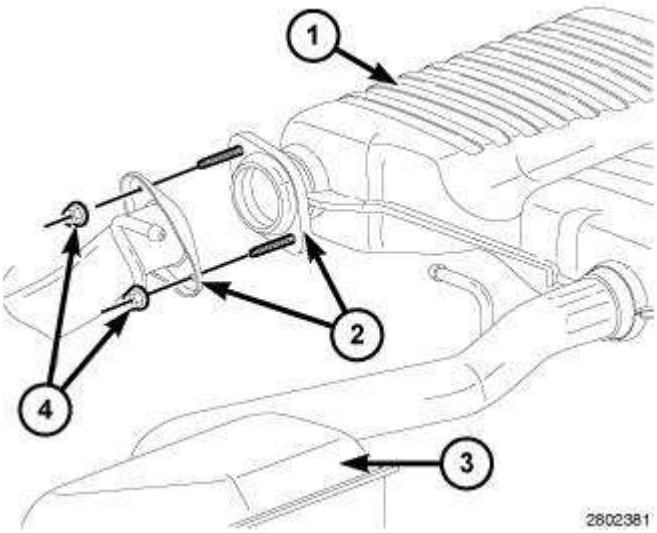

Fig. 44: Side Muffler Resonator Assembly, Flange And Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Raise the vehicle.
2. Remove the two mounting nuts (4) at the muffler flange (2).
3. Remove the isolators to the left side resonator.
4. Remove left side resonator/tailpipe assembly from the muffler flange (2).
5. Loosen the front strap clamps at the catalytic convertor down pipes.
6. Remove the isolators to the muffler/resonator assembly.
7. Remove the right side muffler/resonator (1) assembly.

INSTALLATION

SINGLE MUFFLER/RESONATOR

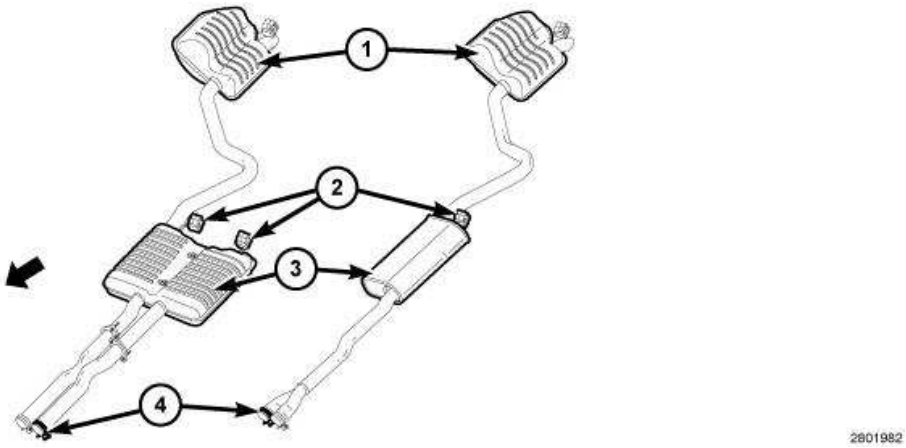

Fig. 45: Single Exhaust Systems, Muffler, Resonator And Tailpipe
Courtesy of CHRYSLER GROUP, LLC

NOTE: **NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.**

1. Position muffler/resonator assembly (2) onto the catalytic exhaust pipes.
2. Install support isolators.
3. Align muffler/resonator assembly to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them.
4. Tighten the exhaust clamps (4) to 50 N.m (37 ft. lbs.).
5. Connect the ground straps.
6. Lower vehicle.
7. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary

DUAL MUFFLER/RESONATOR

3.6L

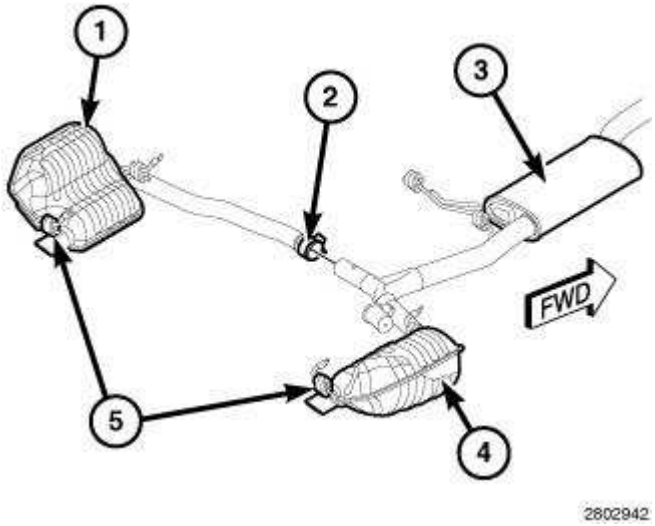

Fig. 46: Pipe Strap Clamp, Isolators And Tailpipe Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Place the muffler/resonator into position.
2. Install the isolators (5).
3. Place the left side resonator/tailpipe (1) assembly into position.
4. Install the isolators (5).
5. The tailpipe should be centered in the rear fascia opening.
6. Check the clearance between muffler and tailpipe assembly and the fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
7. Check the clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 -.78 in.).
8. Tighten the strap clamps (2) to 50 N.m (37 ft. lbs.).

9. Lower the vehicle.
10. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

5.7L/6.4L

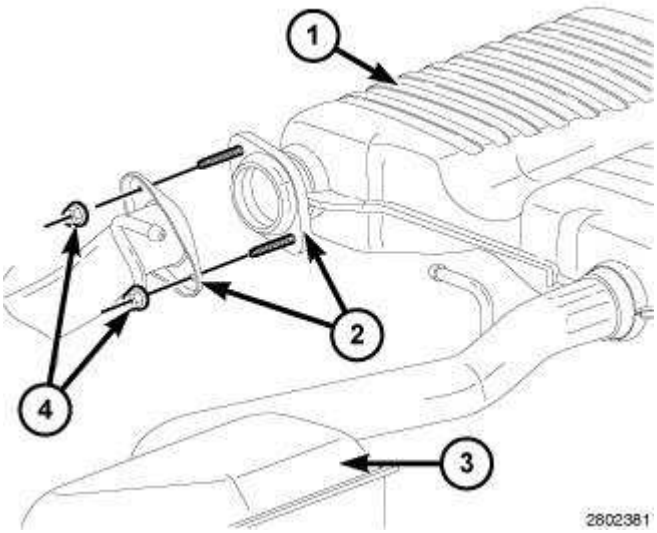

Fig. 47: Side Muffler Resonator Assembly, Flange And Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Place the muffler/resonator into position.
2. Install the isolators.
3. Place left side resonator/ tailpipe assembly into position.
4. Install the ball flange nuts (2). Tighten nuts finger tight.
5. Check the clearance between muffler and tailpipe assembly and the fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
6. Check the clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 -.78 in.).
7. The tailpipe should be centered in the rear fascia opening.
8. Tighten strap clamps (2) to 50 N.m (37 ft. lbs.).
9. Tighten ball flange nuts (2) to 30 N.m (22 ft. lbs.).
10. Lower the vehicle.
11. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

SENSOR, DIFFERENTIAL PRESSURE

DESCRIPTION

DIESEL

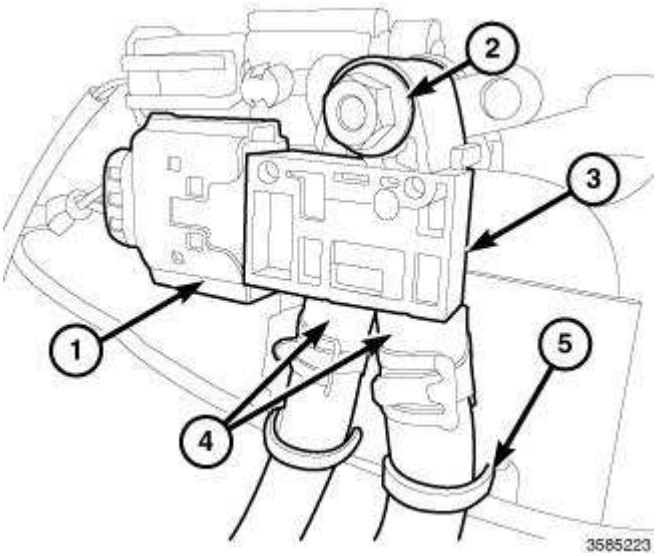

Fig. 48: Differential Pressure Sensor Wire Harness Connector, Zip Tie, Differential Pressure Sensor Hoses, Nut & Differential Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

The Exhaust Differential Pressure Sensor (3) is remotely mounted on the transmission housing. Two pressure tubes (4) measure pressure before and after the Diesel Particulate Filter (DPF)/Diesel Oxidation Catalyst (DOC). The sensor is critical for fail-safe of regeneration strategy, because it interprets high pressure drops as possible high soot loads.

6.4L

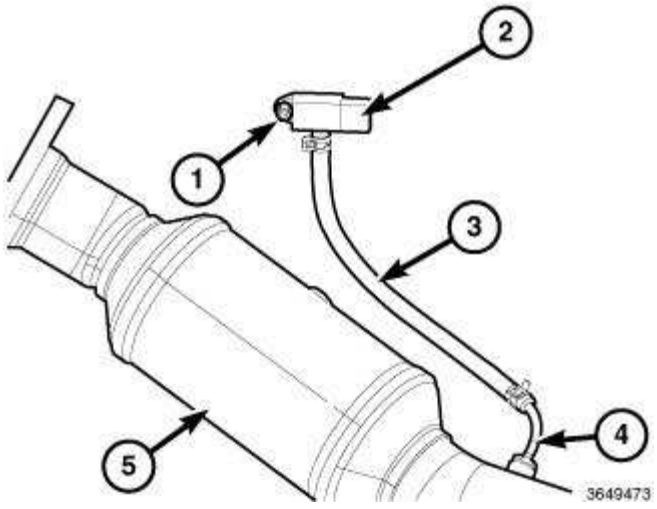

Fig. 49: Differential Pressure Sensor (DPS) Metal Tubing Fitting, DPS Electrical Connector, DPS Hose & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Exhaust Differential Pressure Sensor (2) is remotely mounted on the transmission housing. One pressure tube (3) measures back-pressure created by the valves located at the cold end of the

exhaust system. The sensor monitors the pressure in the exhaust system and determines if the valves are working properly for engine performance.

6.4L ACTIVE EXHAUST VALVE

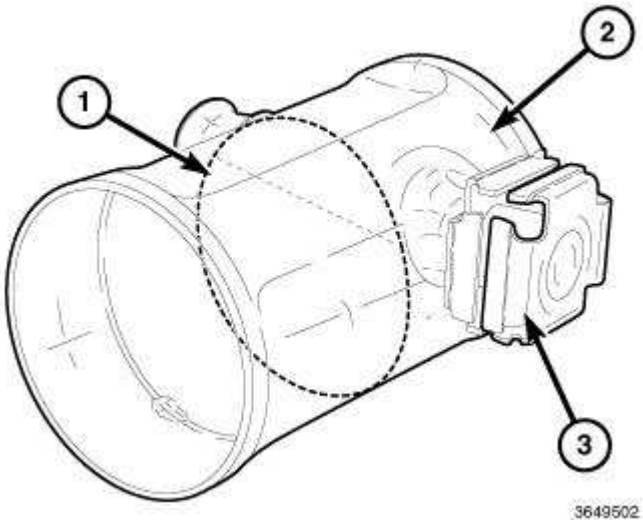

Fig. 50: Active Exhaust Valves (AEV), Valve & Spring Tension
Courtesy of CHRYSLER GROUP, LLC

The Active Exhaust Valves (AEV) (2) are located at the cold end of the exhaust pipe before the muffler, after the catalytic converters. The pressure created by the engine allows the valve (1) to over come the spring tension (3) and open for optimal engine performance. When the valve is closed. The back pressure created in the exhaust system assist in engine performance by:

- Increasing the fuel economy due to the increased use of MDS
- Increased use of the MDS from the AEV improvement
- No loss of vehicle performance
- Emissions remain the same.

The AEV is welded into the cold end of the exhaust pipe. If replacement of the valve is required. The exhaust pipe must be replaced. The AEV is non repairable.

REMOVAL

6.4L

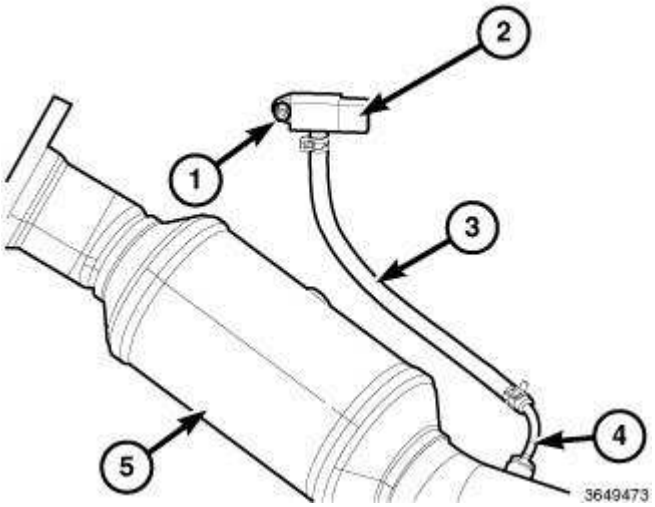

Fig. 51: Differential Pressure Sensor (DPS) Metal Tubing Fitting, DPS Electrical Connector, DPS Hose & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise and support vehicle.
3. If required, remove the Differential Pressure Sensor (DPS) metal tubing fitting (4).
4. Disconnect the DPS electrical connector (2).
5. Disconnect the DPS hose (3).
6. Remove the bolt (1) with the DPS.
7. Remove the DPS from the bracket.

DIESEL

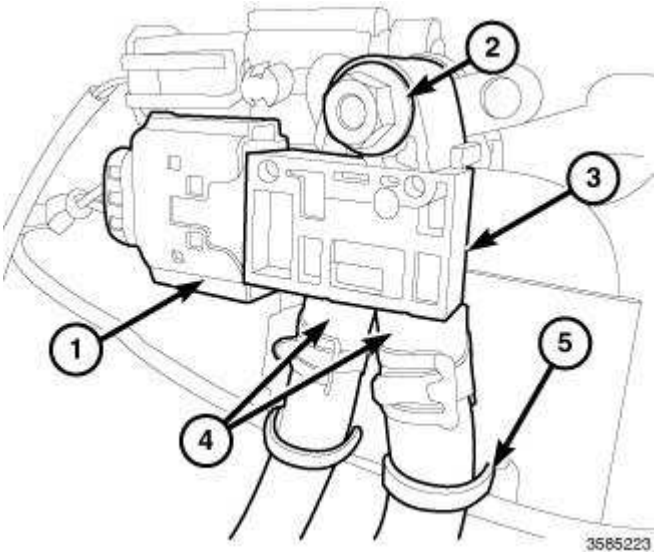

Fig. 52: Differential Pressure Sensor Wire Harness Connector, Zip Tie, Differential Pressure

Sensor Hoses, Nut & Differential Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Disconnect the differential pressure sensor wire harness connector (1).
4. Remove the zip tie (5) securing the differential pressure sensor hoses (4).
5. Disconnect the differential pressure sensor hoses (4).
6. Remove nut (2) and the differential pressure sensor (3).

INSTALLATION

6.4L

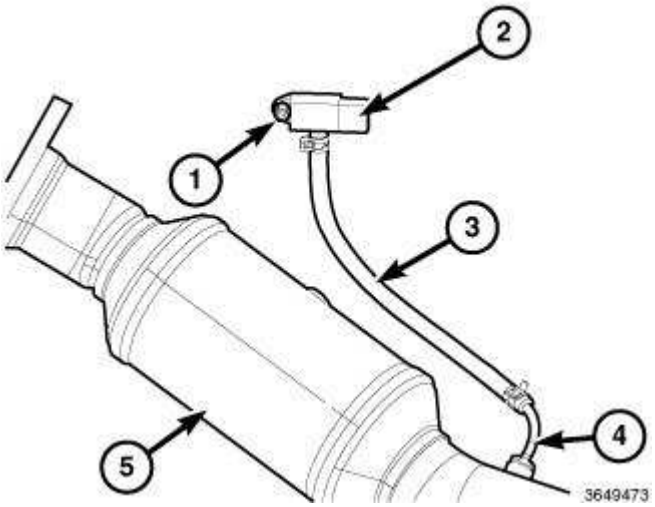

Fig. 53: Differential Pressure Sensor (DPS) Metal Tubing Fitting, DPS Electrical Connector, DPS Hose & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the Differential Pressure Sensor (DPS) metal tubing fitting (4).
2. Install the DPS (1) to the bracket.
3. Install the DPS and bracket in vehicle.
4. Connect the DPS hose.
5. Lower the vehicle.
6. Connect the negative battery cable.

DIESEL

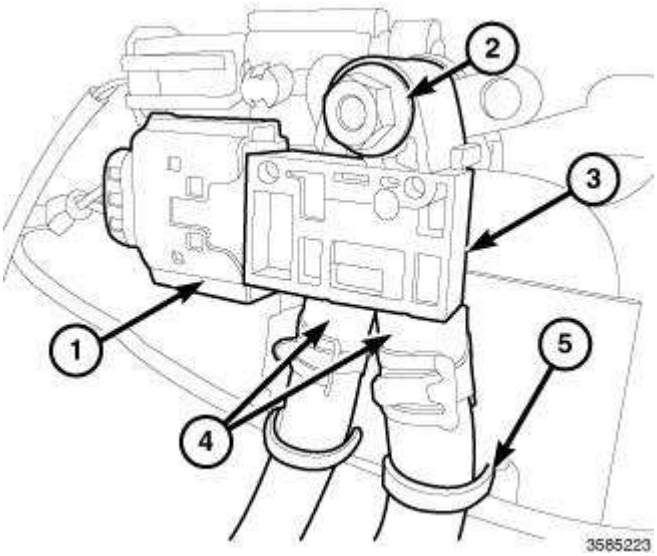

Fig. 54: Differential Pressure Sensor Wire Harness Connector, Zip Tie, Differential Pressure Sensor Hoses, Nut & Differential Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Install the differential pressure sensor (3) and securely tighten the nut (2) to 18 N.m (159 in. lbs.).

NOTE: Before installing, inspect both pressure hoses and make sure there is not any dip across the hoses. In cases where water is frozen, a dip across the hoses can cause condensation which can set a MIL.

2. Connect the differential pressure sensor hoses (4).
3. Install the zip tie (5) to secure the differential pressure sensor hoses (4).
4. Connect the differential pressure sensor wire harness connector (1).
5. Lower the vehicle.
6. Connect the negative battery cable.

SENSOR, EXHAUST TEMPERATURE

DESCRIPTION

DESCRIPTION

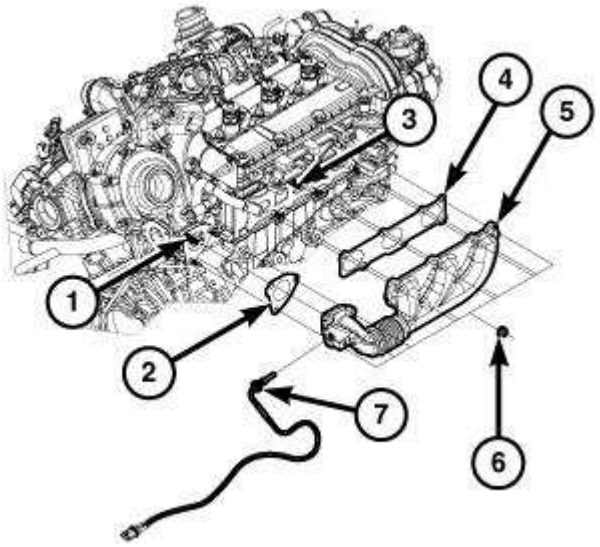

Fig. 55: Exhaust Manifold, Gaskets, Turbocharger, Cylinder Head & Fasteners
Courtesy of CHRYSLER GROUP, LLC

The Exhaust Gas Temperature Sensor (7) 1/1 is located the outlet of the Exhaust Manifold and is accessible from the top of the engine compartment. The Exhaust Gas Temperature Sensor 1/1 operates as a typical two wire 5-Volt sensor. It sends a signal to the Powertrain Control Module (PCM) indicating the temperature of the exhaust gases entering the Diesel Particulate Filter.

REMOVAL

EXHAUST TEMPERATURE SENSOR 1/1

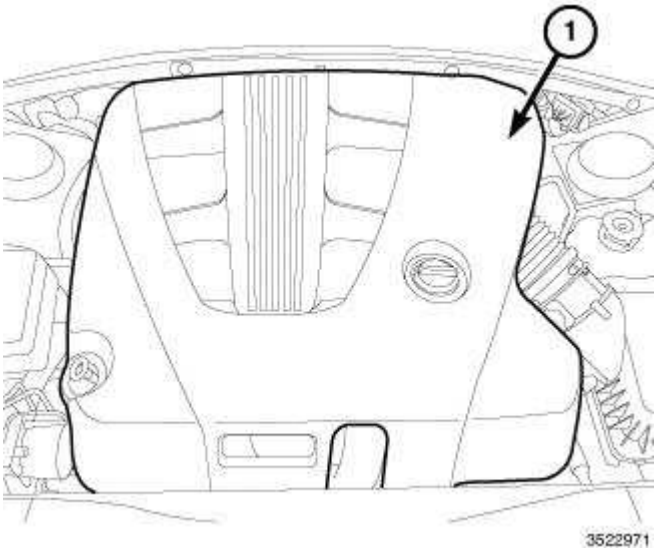

Fig. 56: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.

2. Remove the engine cover (1).
3. Remove the cowl extension and the side extensions. Refer to **COVER, COWL PANEL, REMOVAL** .

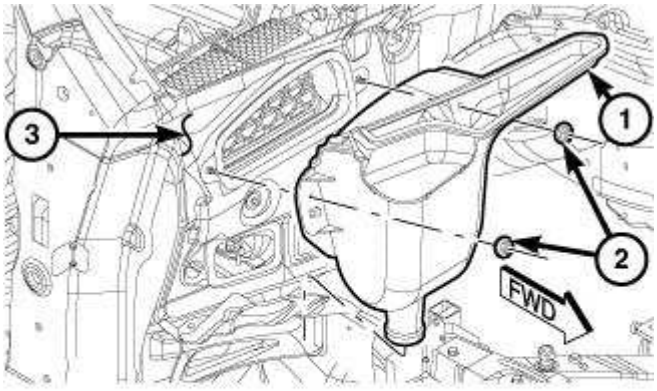

Fig. 57: Two Nuts, Air Inlet Duct & Dash Panel
Courtesy of CHRYSLER GROUP, LLC

4. Remove nuts and the HVAC air inlet housing (1).

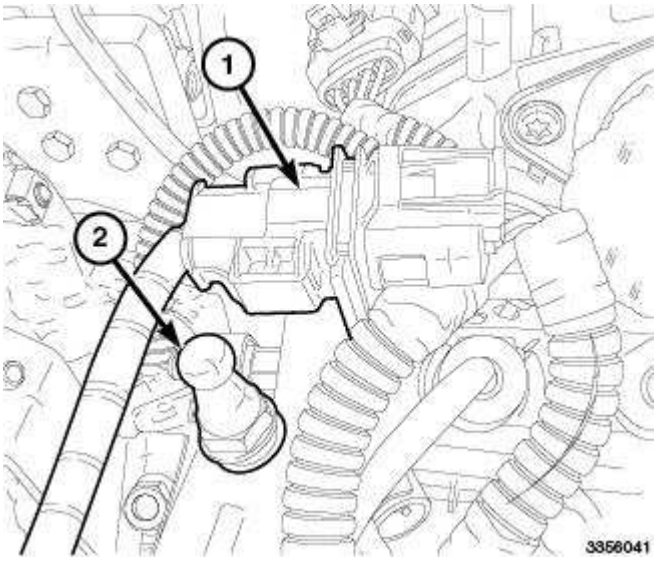

Fig. 58: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the oxygen sensor wire harness connector (1).
6. Disconnect the upstream exhaust temperature sensor wire harness connector.

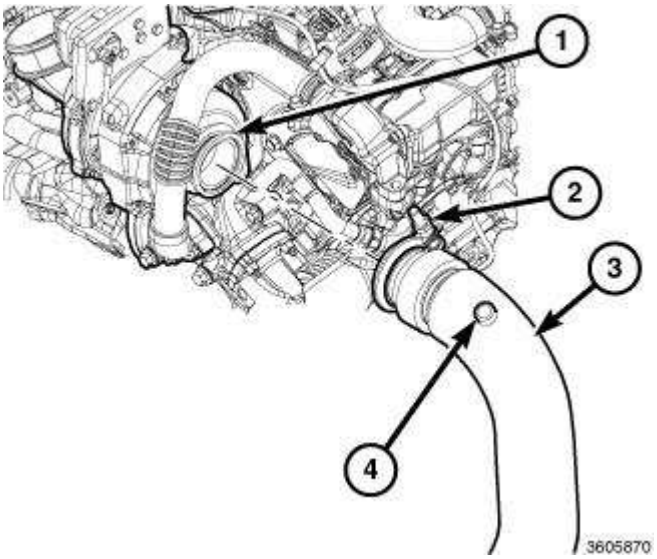

Fig. 59: Clamp, Downpipe & Turbocharger Flange
Courtesy of CHRYSLER GROUP, LLC

7. Loosen the clamp (2) and separate the Diesel Particulate Filter (DPF) from turbocharger.

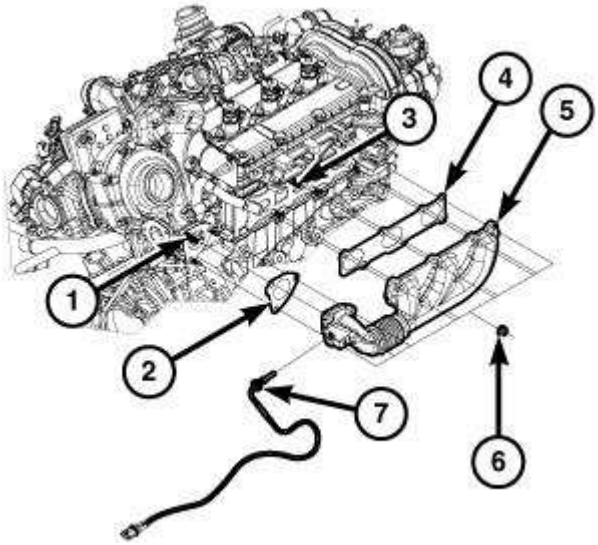

Fig. 60: Exhaust Manifold, Gaskets, Turbocharger, Cylinder Head & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Remove the exhaust temperature sensor (7).

EXHAUST TEMPERATURE SENSOR 1/2

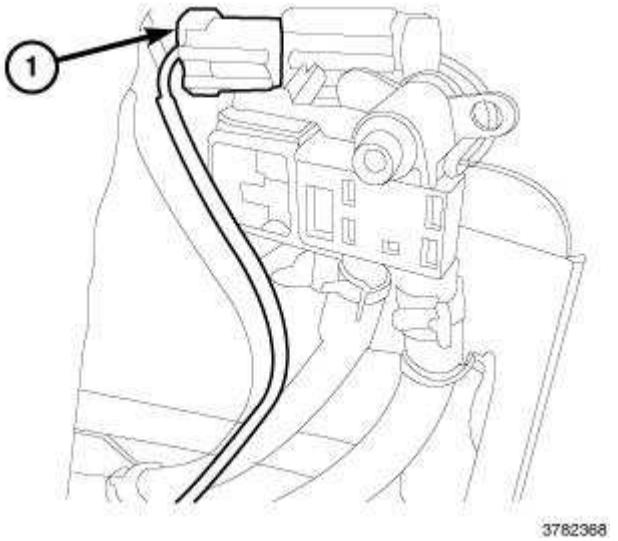

Fig. 61: Exhaust Temperature Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the transmission belly pan.
3. Disconnect the exhaust temperature sensor wire harness connector (1).

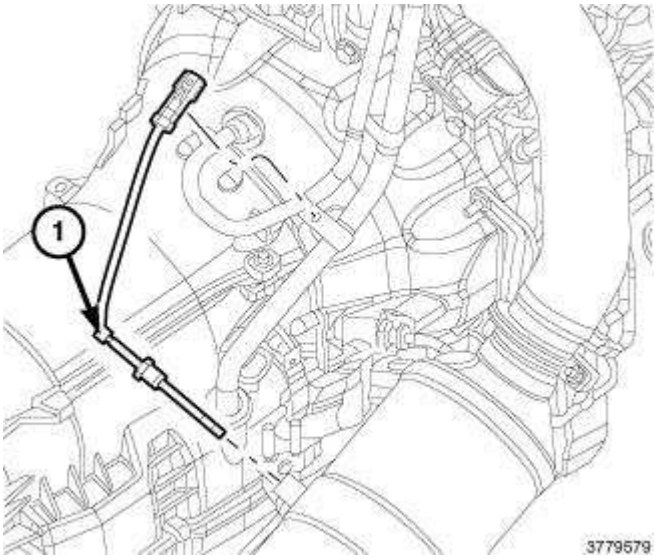

Fig. 62: Exhaust Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the exhaust temperature sensor (1).

INSTALLATION

EXHAUST TEMPERATURE SENSOR 1/1

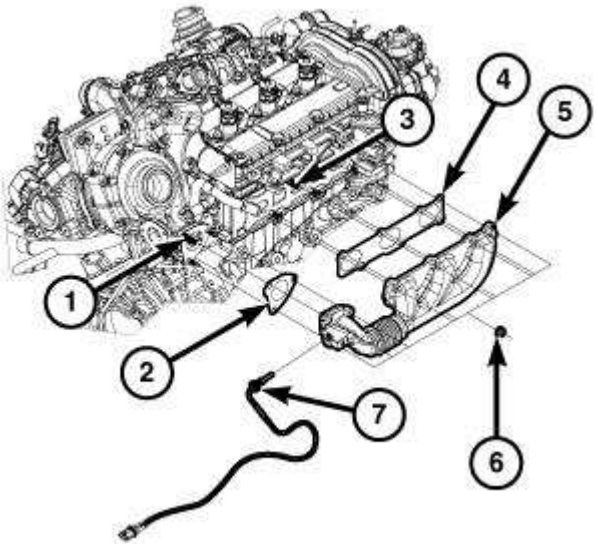

Fig. 63: Exhaust Manifold, Gaskets, Turbocharger, Cylinder Head & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install the exhaust temperature sensor (7) and tighten to 45 N.m (33 ft. lbs.).

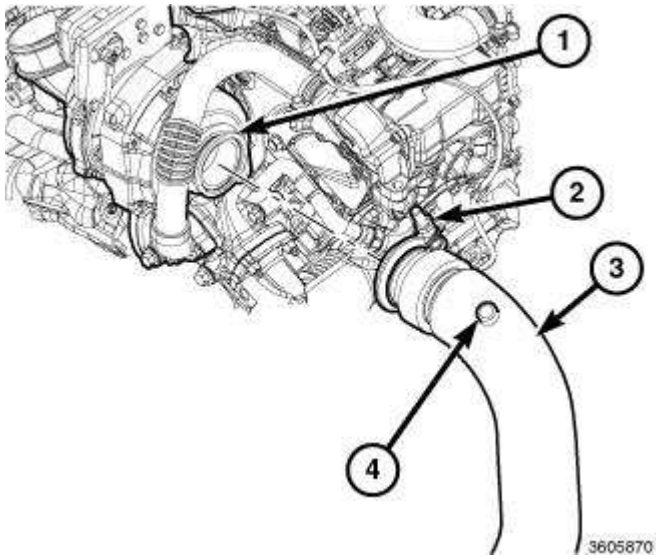

Fig. 64: Clamp, Downpipe & Turbocharger Flange
Courtesy of CHRYSLER GROUP, LLC

2. Align the Diesel Particulate Filter (DPF) pipe to the turbocharger. Tighten the clamp (2) to 25 N.m (18 ft. lbs.)

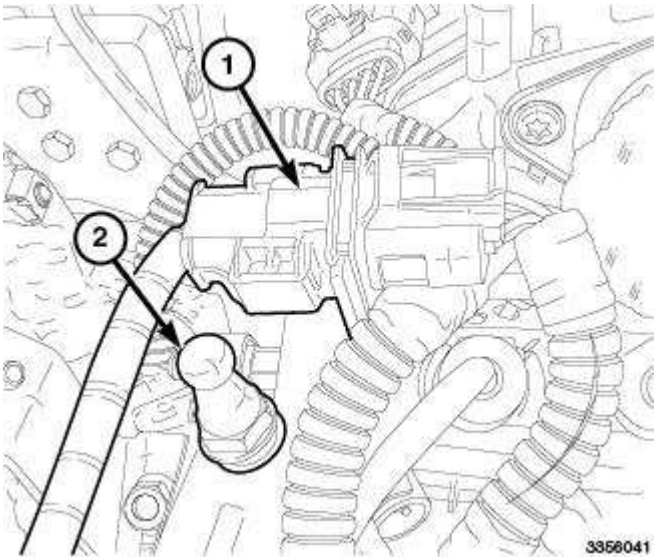

Fig. 65: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

3. Connect the upstream exhaust temperature sensor wire harness connector.
4. Connect the oxygen sensor wire harness connector (1).

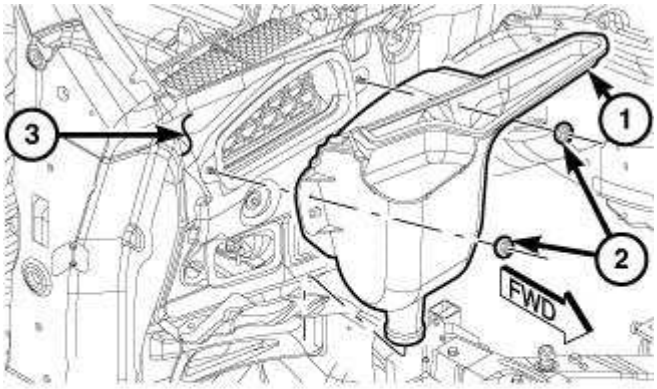

Fig. 66: Two Nuts, Air Inlet Duct & Dash Panel
Courtesy of CHRYSLER GROUP, LLC

5. Install the HVAC air inlet housing (1) and securely tighten nuts.
6. Install the cowl extension and the side extensions. Refer to **COVER, COWL PANEL, INSTALLATION** .

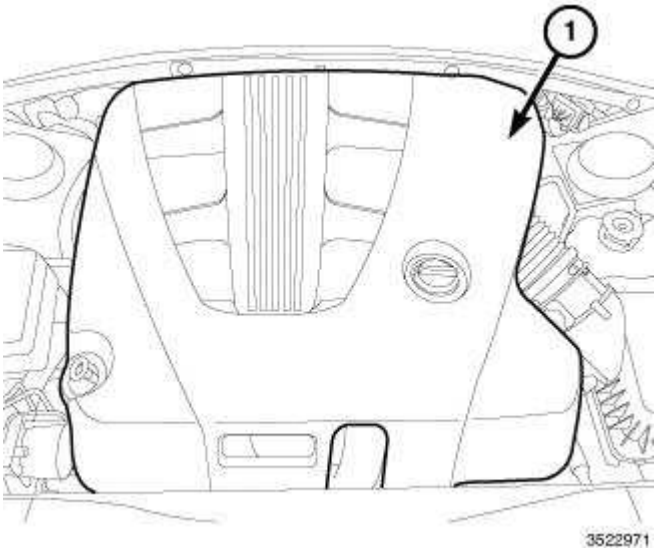

Fig. 67: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine cover (1).
8. Connect the negative battery cable.

EXHAUST TEMPERATURE SENSOR 1/2

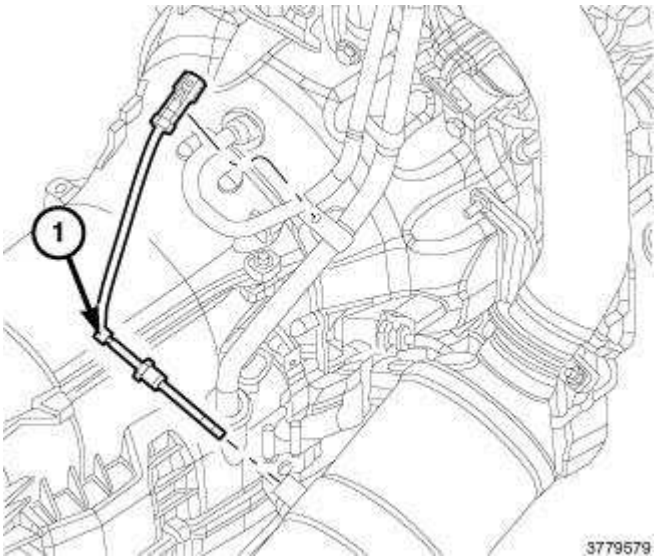

Fig. 68: Exhaust Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Install the exhaust temperature sensor (1) and tighten to 47 N.m (35 ft. lbs.).

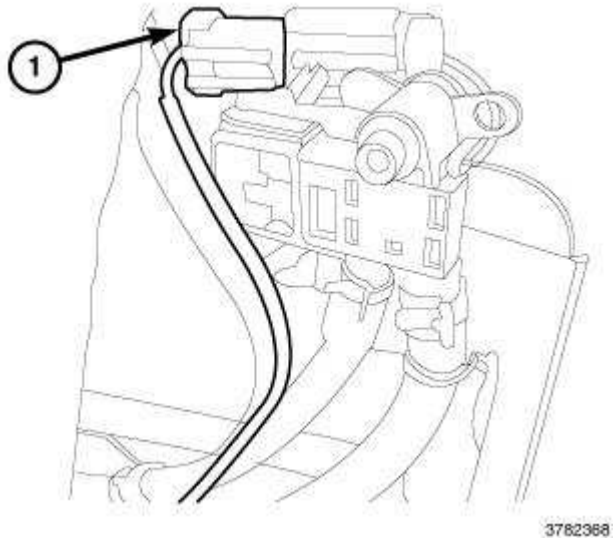

Fig. 69: Exhaust Temperature Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the exhaust temperature sensor wire harness connector (1).
3. Install the transmission belly pan.
4. Connect the negative battery cable.

SHIELD, HEAT

REMOVAL

REMOVAL

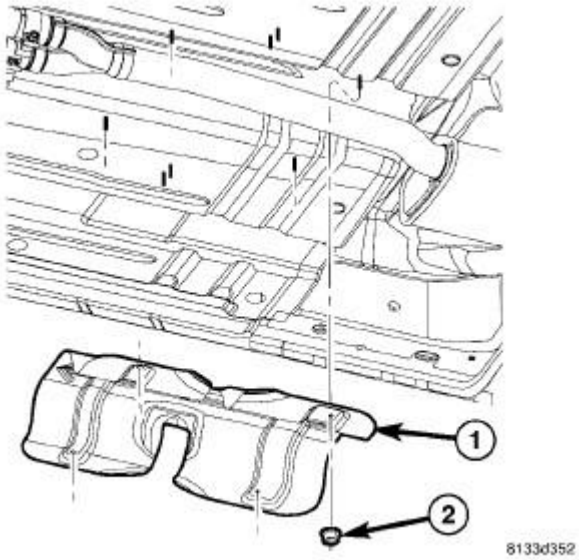

Fig. 70: Heat Shields

Courtesy of CHRYSLER GROUP, LLC

1 - HEAT SHIELD
2 - NUT

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Raise and secure the vehicle.
2. Remove the floor pan mid support bracket.
3. Remove the nuts (2).
4. Remove the heat shields (1).

INSTALLATION

INSTALLATION

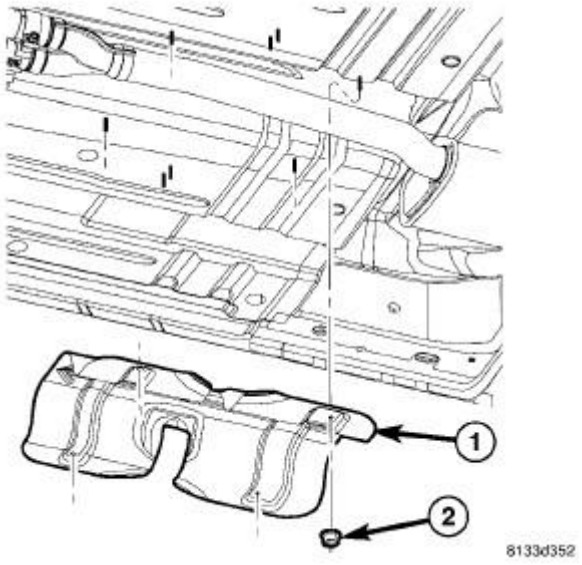

Fig. 71: Heat Shields
Courtesy of CHRYSLER GROUP, LLC

1 - HEAT SHIELD
2 - NUT

1. Position the heat shields (1).
2. Install the nuts (2). Tighten the nuts (2) to 10 N.m (98 in. lbs.).

3. Install the floor pan mid support bracket.
4. Lower the vehicle.

TAILPIPE, EXHAUST

REMOVAL

REMOVAL

NOTE: Assistance in removal is recommended. Never allow the muffler to hang from the isolators this may cause damage to either the isolators or the tailpipe/muffler assembly.

NOTE: Some exhaust systems are equipped with adjustable tail pipes and can be removed without removing the resonator assembly.

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. If equipped with adjustable tail pipes. Separate the tailpipe from the resonator outlet pipe.

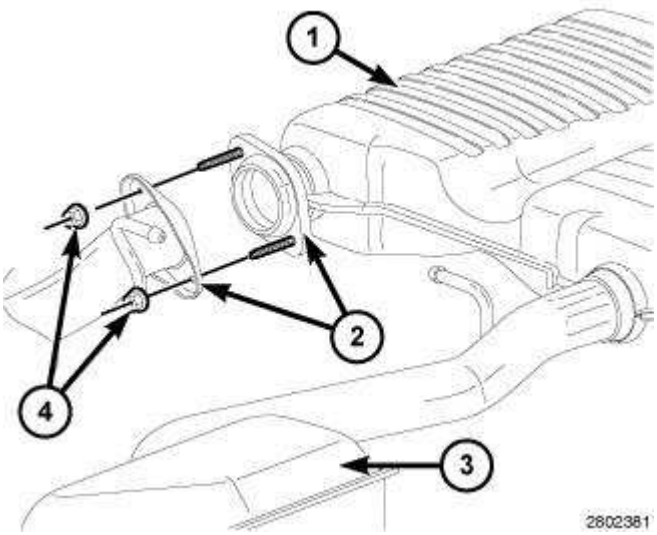

Fig. 72: Side Muffler Resonator Assembly, Flange And Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

4. If equipped with non adjustable tailpipes, separate the left side tailpipe/resonator at the flange (2).

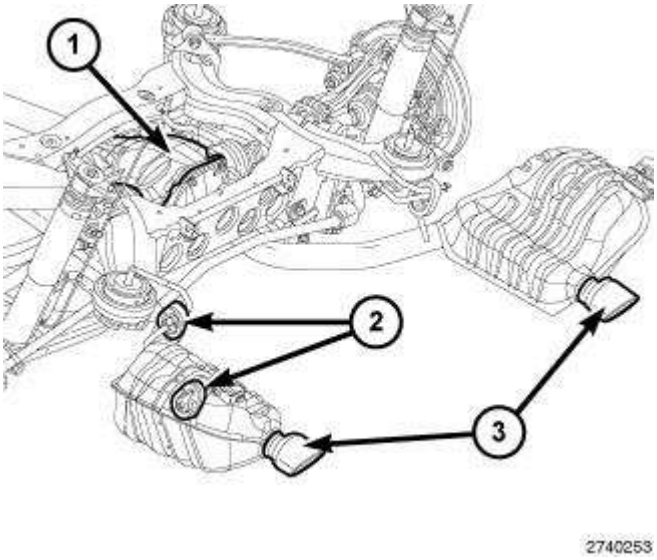

Fig. 73: Tailpipe/Muffler Assembly & Isolators
Courtesy of CHRYSLER GROUP, LLC

5. Remove the rear isolators (2).
6. Remove the tailpipe/resonator assembly.

WITH MUFFLER

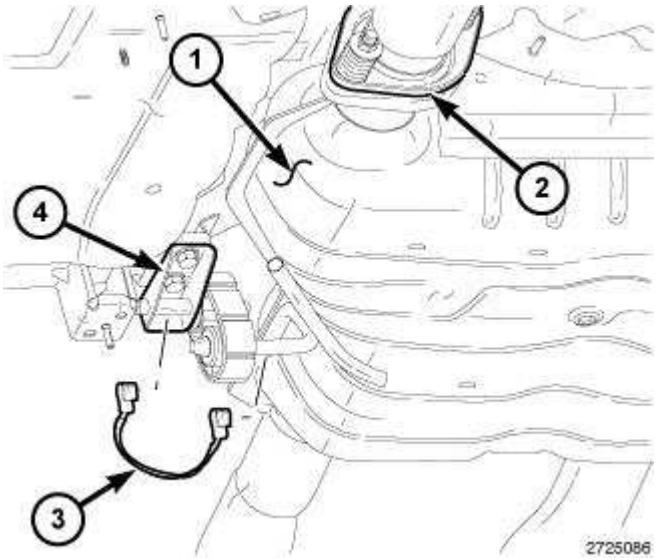

Fig. 74: Muffler Flange & Exhaust Pipe/Catalytic Converter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tailpipe/resonator to muffler assembly flange (2) nuts.
2. Remove tailpipe/resonator and muffler as an assembly from vehicle.

INSTALLATION

INSTALLATION

NOTE: Muffler installation is a two-man operation. Never allow the muffler to hang from the isolators. A helper is required so no damage will come to the isolators or to the tailpipe/muffler assembly.

NOTE: Some exhaust systems are equipped with adjustable tail pipes and can be removed without removing the resonator assembly.

1. If equipped with adjustable tail pipes. Install the tailpipe to the resonator outlet pipe and tighten clamp.

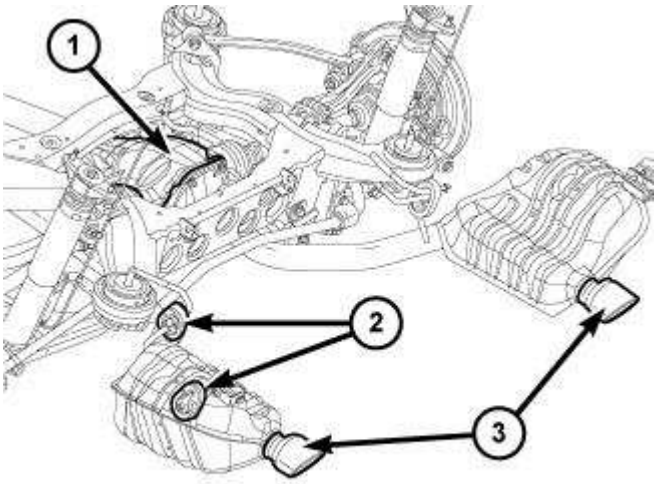

Fig. 75: Tailpipe/Muffler Assembly & Isolators
Courtesy of CHRYSLER GROUP, LLC

2. If equipped with non adjustable tailpipes, position the tailpipe/resonator (3) assembly in vehicle.
3. If equipped, install the left side tailpipe/resonator at the flange. Tighten the nuts to 28 N.M (21 ft. lbs.).
4. Install tailpipe/resonator insulators (2).
5. Install the tailpipe into the exhaust pipe.

WITH MUFFLER

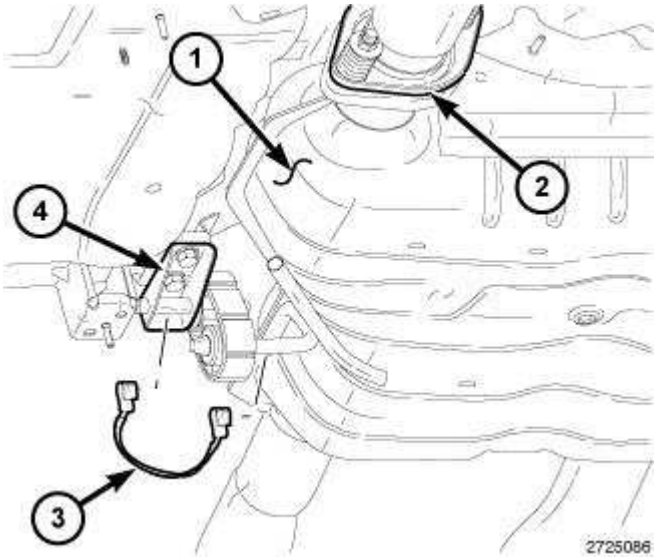

Fig. 76: Muffler Flange & Exhaust Pipe/Catalytic Converter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Install muffler insulators (4) and ground straps (3)
2. Align muffler (1) to the catalytic convertor pipe flange. Install and Tighten flange (2) nuts to 47 N.m (35 ft. lbs.).
3. Make sure the tailpipe/resonator assembly is correctly positioned and the properly aligned. The minimum clearance between components is 25mm (1 inch).
4. Lower the vehicle.
5. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

9031-1 - Bushing Removal Receiver (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-10 - Brace (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-11 - Clamp (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-12 - Brace (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-2 - Remover, Bushing (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-3 - Receiver, Bushing (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-4 - Installer, Bushing (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-5A - Remover, Bushing (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-6 - Receiver (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-7A - Installer, Bushing (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-8A - Receiver, Bushing (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9031-9 - Clamp (Originally Shipped In Kit Number(s) 9074, 9076, 9090, 9329-SUP, 9396, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)

9032-1 - Receiver, Bushing (Originally Shipped In Kit Number(s) 9076, 9090, 9090CC.)
9032-2 - Receiver, Bushing (Originally Shipped In Kit Number(s) 9076, 9090, 9090CC.)
9032-3 - Pusher, Bushing (Originally Shipped In Kit Number(s) 9076, 9090, 9090CC.)
9360 - Remover, Ball Joint (Originally Shipped In Kit Number(s) 9329, 9515, 9516, 9516-CAN, 9517, 9517-CAN, 9518, 9519, 9540, 9541.)
9520 - Remover/Installer, Bushing (Originally Shipped In Kit Number(s) 9329, 9329-SUP, 9515-SUP, 9516, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9520-1 - Installer Disc (Originally Shipped In Kit Number(s) 9329, 9329-SUP, 9515-SUP, 9516, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9520-2 - Installer, Bushing (Originally Shipped In Kit Number(s) 9329, 9329-SUP, 9515-SUP, 9516, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9520-3 - Remover, Bushing (Originally Shipped In Kit Number(s) 9329, 9329-SUP, 9515-SUP, 9516, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
9520-4 - Cup, Receiver (Originally Shipped In Kit Number(s) 9329, 9329-SUP, 9515-SUP, 9516, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP.)
C-4212F - Press, Ball Joint (Originally Shipped In Kit Number(s) 6745, 6880, 6881, MLR-C03.)

BUMPERS

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Front bumper bolts	28	21	-
Rear bumper bolts	28	21	-

BUMPER, FRONT

REMOVAL

REMOVAL

PEDESTRIAN PROTECTION REINFORCEMENT

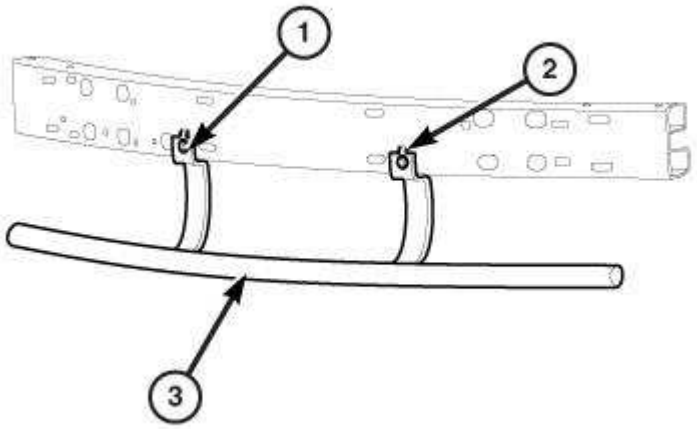

Fig. 1: Two Fasteners, Reinforcement & Hooks
Courtesy of CHRYSLER GROUP, LLC

NOTE: BUX vehicles only.

1. Remove the fascia assembly. Refer to **FASCIA, FRONT, REMOVAL**.
2. Remove the two fasteners (1) securing the pedestrain protection reinforcement (3) to the front bumper reinforcement.
3. Lift the pedestrain protection reinforcement (3) up and out to disengage the hooks (2) from the front bumper reinforcement.
4. Remove the pedestrain protection reinforcement (3).

BUMPER REINFORCEMENT

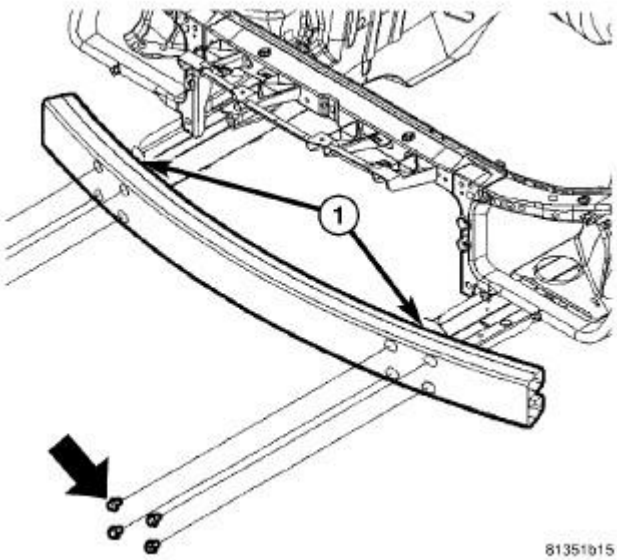

Fig. 2: Bumper
Courtesy of CHRYSLER GROUP, LLC

1. Remove fascia assembly. Refer to **FASCIA, FRONT, REMOVAL**.
2. Drill out the four spot welds (2 per side) between the bumper bracket and rail end cap (1).
3. Remove the eight screws (4 per side) and remove the bumper.

INSTALLATION

INSTALLATION

BUMPER REINFORCEMENT

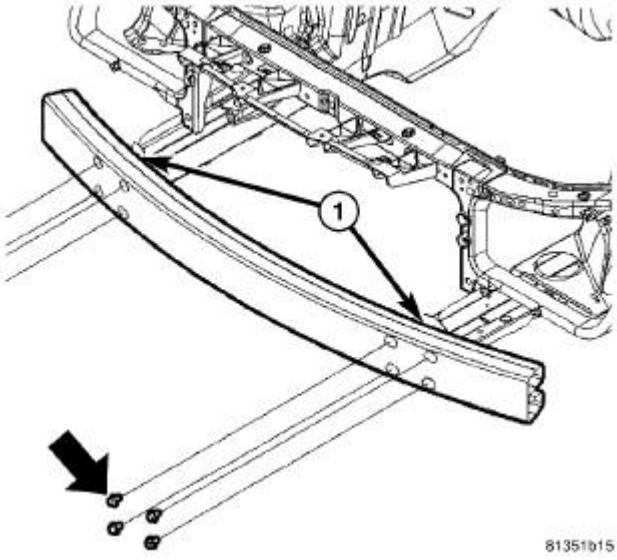

Fig. 3: Bumper

Courtesy of CHRYSLER GROUP, LLC

1. Position the bumper (1).

NOTE: It is not necessary to spot weld the bumper back into place.

2. Install the bolts and tighten to 28 N.m (21 ft. lbs.).
3. Install the fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

PEDESTRIAN PROTECTION REINFORCEMENT

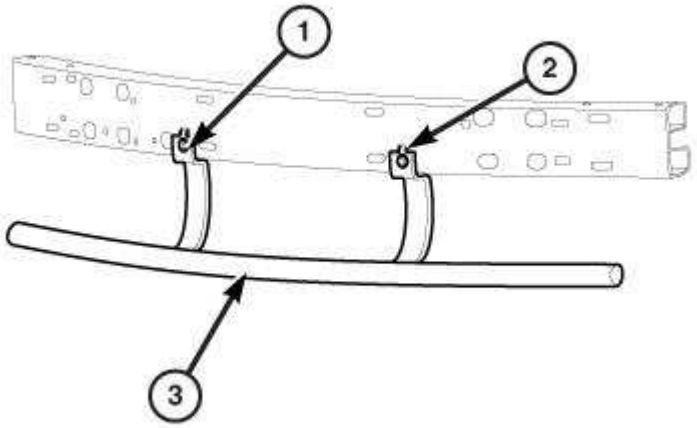

Fig. 4: Two Fasteners, Reinforcement & Hooks
Courtesy of CHRYSLER GROUP, LLC

NOTE: BUX vehicles only.

1. Position the pedestrain protection reinforcement (3) to the front bumper reinforcement by aligning and engaging the hook features (2).
2. Install the two fasteners (1) securing the pedestrain protection reinforcement (3) to the front bumper reinforcement. Tighten the fasteners to 9 N-m (80 in. lbs.).
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

BUMPER, REAR

REMOVAL

REMOVAL

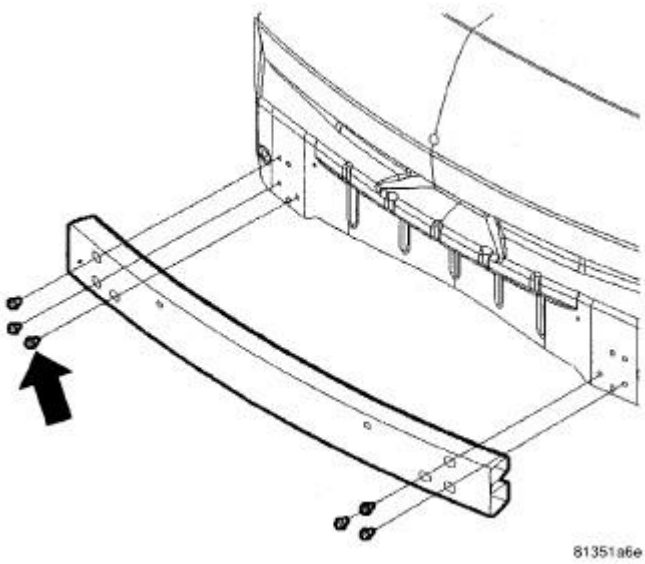

Fig. 5: Bumper
Courtesy of CHRYSLER GROUP, LLC

NOTE: 300 Shown in illustration. Magnum and Charger similar.

1. Remove the fascia assembly. Refer to **FASCIA, REAR, REMOVAL**.
2. Remove the six nuts and washers and remove the bumper.

INSTALLATION

INSTALLATION

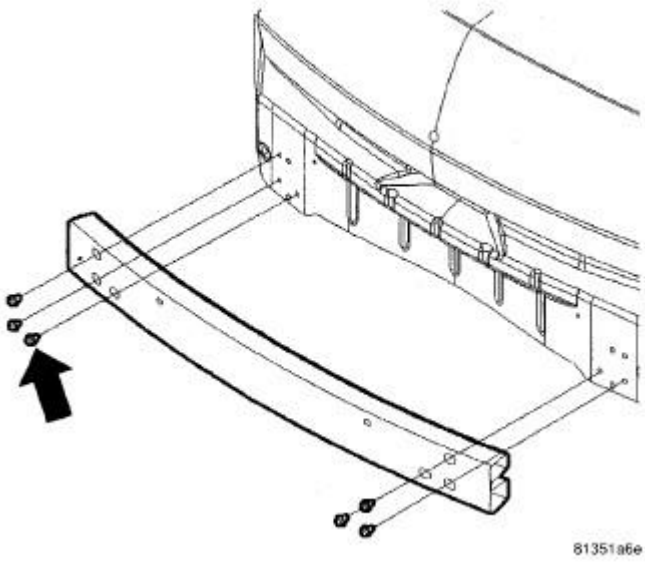

Fig. 6: Bumper

Courtesy of CHRYSLER GROUP, LLC

1. Position the bumper.
2. Install the nuts and washers and tighten to 28 N.m (21 ft. lbs.).
3. Install the fascia assembly. Refer to **FASCIA, REAR, INSTALLATION**.

FASCIA, FRONT

REMOVAL

REMOVAL

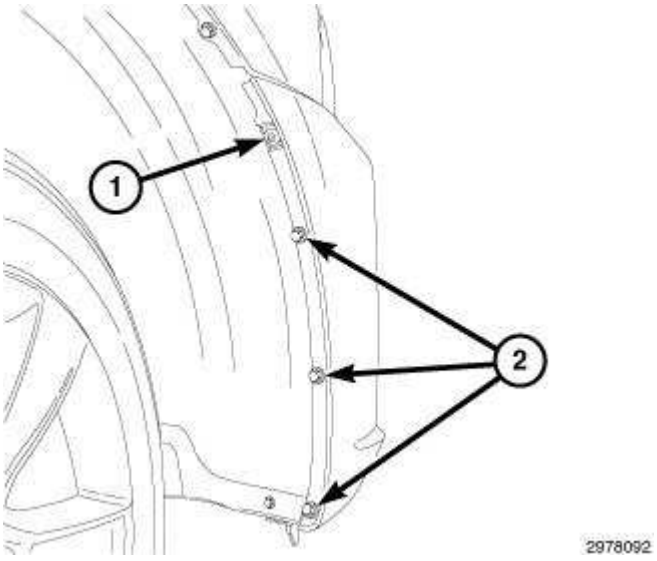

Fig. 7: Fastener & Three Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Base model shown in illustration, SRT models similar.

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove the fastener (1) that secure the front fascia assembly to the fender.
4. Remove the three fasteners (2) that secure each front wheel house splash shield to the front fascia assembly.
5. Repeat the removal steps for the opposite side.

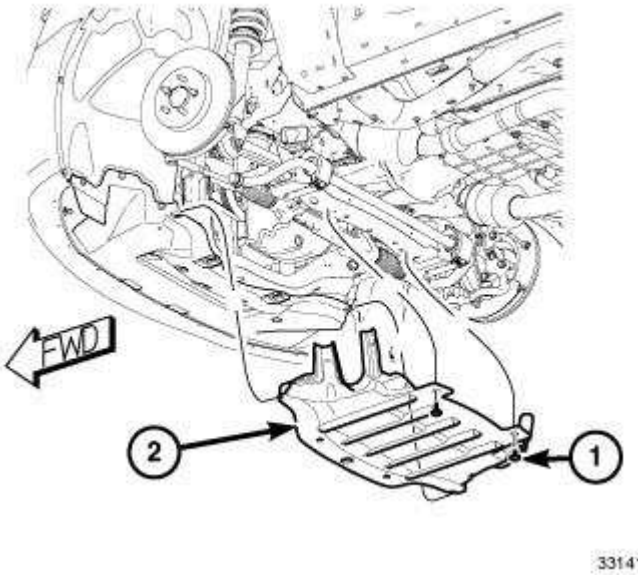

Fig. 8: Rear & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

6. Remove the rear belly pan (1). Refer to **BELLY PAN, REMOVAL**.

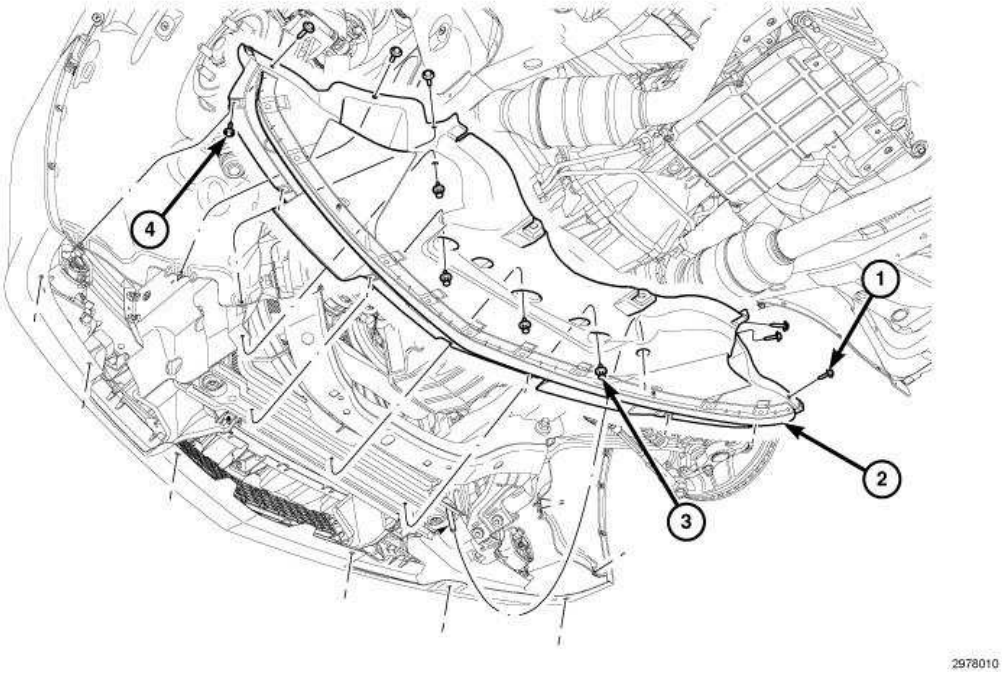

Fig. 9: Front Belly Pan
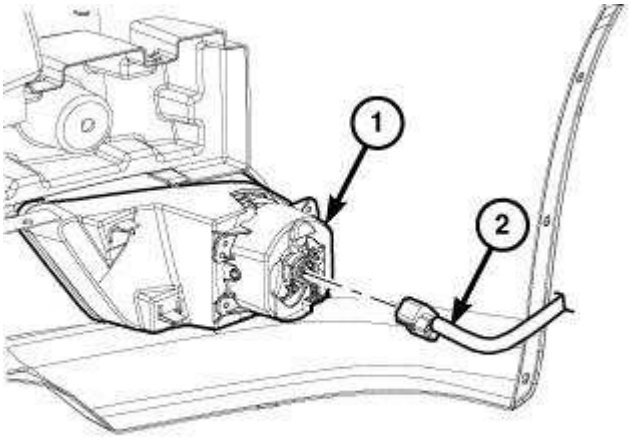
Courtesy of CHRYSLER GROUP, LLC

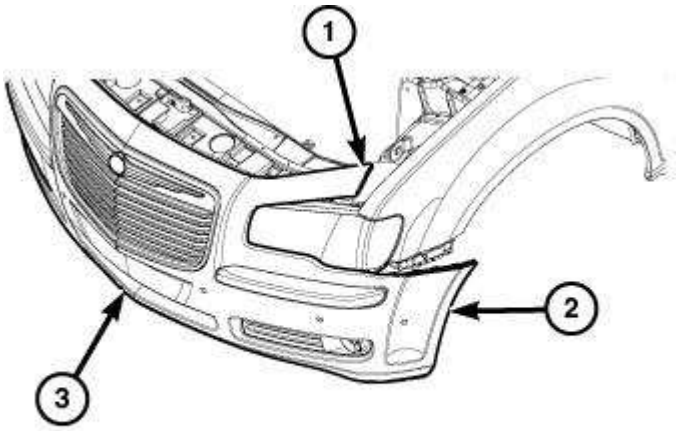
7. Remove the front belly pan (2). Refer to **BELLY PAN, REMOVAL**.



2978302

Fig. 10: Harness & Fog Lamps
Courtesy of CHRYSLER GROUP, LLC

8. If equipped, disconnect the harness (2) from the fog lamps (1). Repeat on the opposite side.



3314026

Fig. 11: Fascia At The Upper Fender & Fascia At The Wheel House Opening
Courtesy of CHRYSLER GROUP, LLC

9. Lower the vehicle.
10. Remove the upper radiator deflectors.
11. Pull out on the fascia at the upper fender to disengage the fascia (1) from the upper fender retaining bracket. Repeat on the opposite side.
12. Pull out on the fascia at the wheel house opening to disengage the fascia (2) from the fender retaining bracket. Repeat on the opposite side.

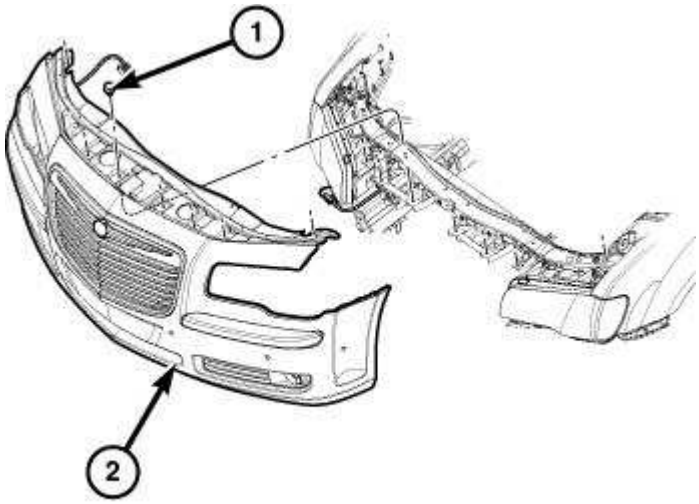


Fig. 12: Support Fasteners & Fascia
Courtesy of CHRYSLER GROUP, LLC

13. Remove the eight fascia to radiator support fasteners (1).
14. With the help of an assistant, remove the fascia (2) from the vehicle.

INSTALLATION

INSTALLATION

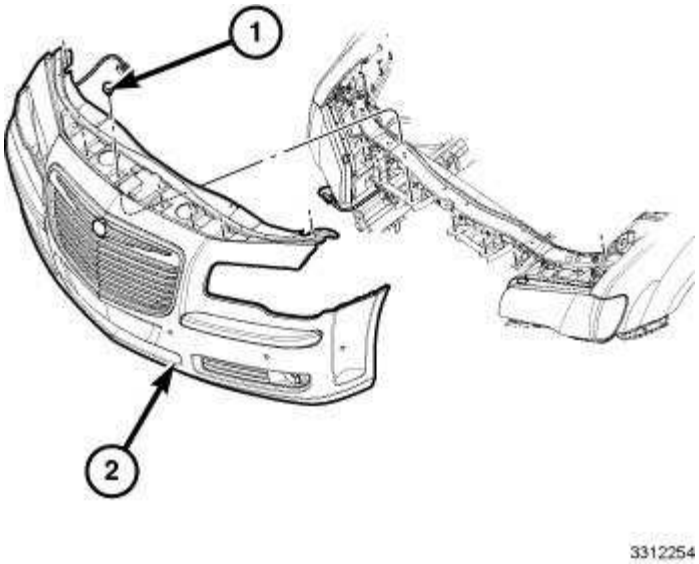

Fig. 13: Support Fasteners & Fascia
Courtesy of CHRYSLER GROUP, LLC

NOTE: Base model shown in illustration, SRT models similar.

1. With the help of an assistant, position the fascia (2) to the vehicle.

2. Install the eight fascia to radiator support fasteners (1).

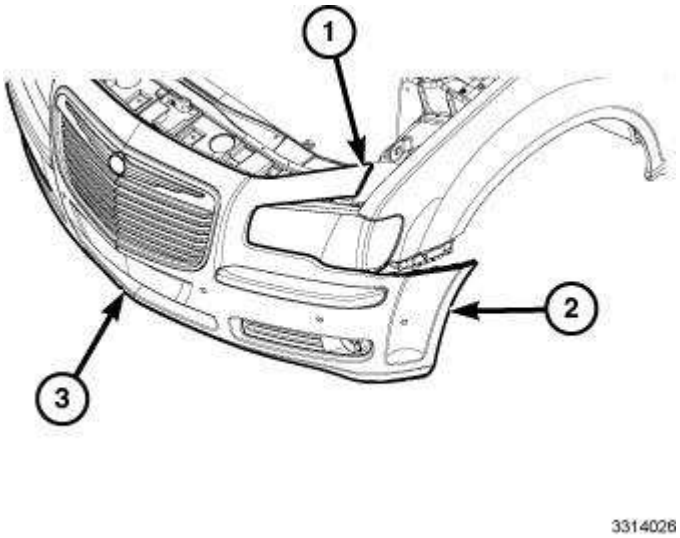

Fig. 14: Fascia At The Upper Fender & Fascia At The Wheel House Opening
Courtesy of CHRYSLER GROUP, LLC

3. Align the retaining tabs on the upper fascia (1) with the upper fender retaining bracket. Repeat on the opposite side.
4. Align the retaining tabs on the fascia (2) with the fender retaining bracket located between the bottom corner of the headlamp and the lower front corner of the fender. Repeat on the opposite side.
5. Once aligned, firmly hand tap the fascia (1, 2) to engage the retaining tabs.
6. Install the upper radiator deflectors.
7. Raise and support the vehicle.

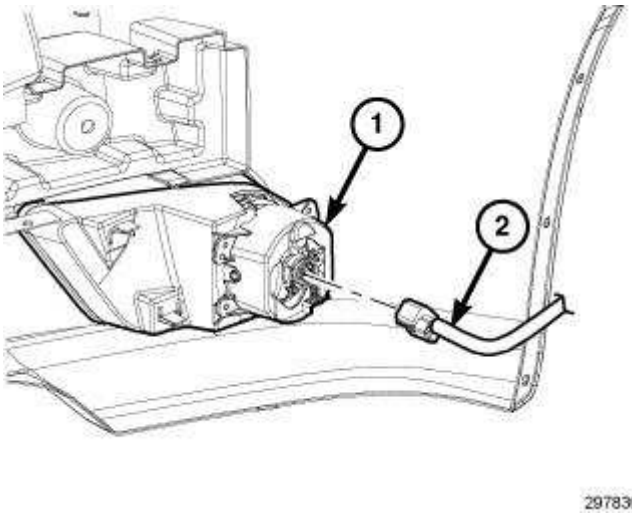

Fig. 15: Harness & Fog Lamps
Courtesy of CHRYSLER GROUP, LLC

8. If equipped, connect the harness (2) to the fog lamps (1).

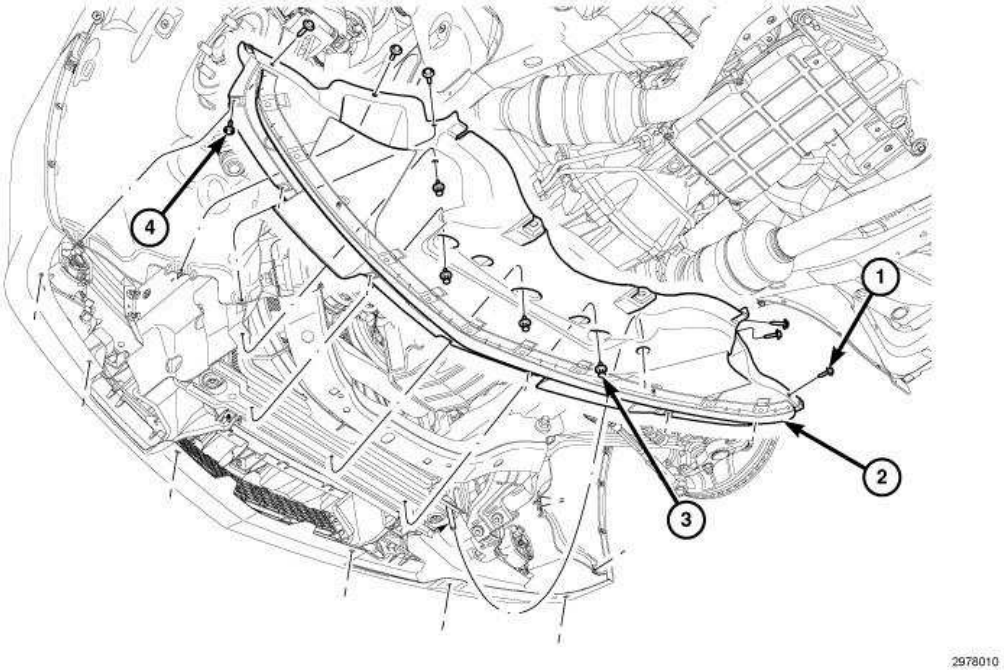

Fig. 16: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

9. Install the front belly pan (2). Refer to **BELLY PAN, INSTALLATION**.

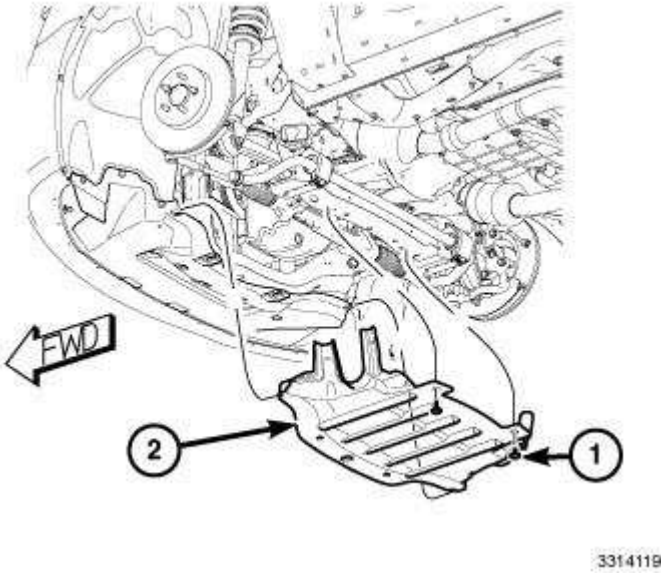

Fig. 17: Rear & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

10. Install the rear belly pan (2). Refer to **BELLY PAN, INSTALLATION**.

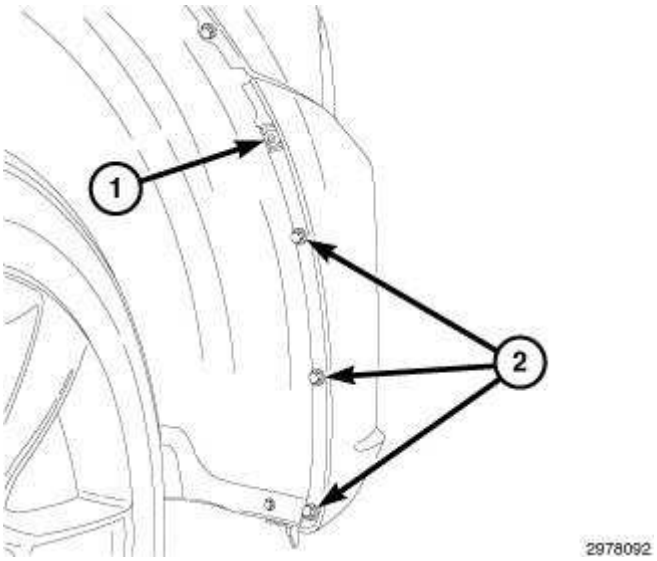

Fig. 18: Fastener & Three Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Install the three fasteners (2) that secure each front wheel house splash shield to the front fascia assembly.
12. Install the fastener (1) that secure the front fascia assembly to the fender. Tighten the fastener securely.
13. Lower the vehicle.
14. Connect the negative battery cable.

FASCIA, REAR

REMOVAL

REMOVAL

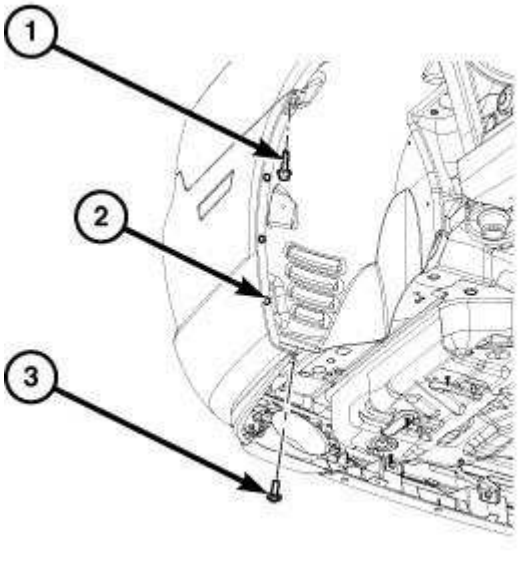

Fig. 19: Three Push-Pin Retainers & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Base model shown in illustration, SRT models similar.

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove the three push-pin retainers (2) that secure each rear wheel house splash shield to the rear fascia assembly.
4. Remove the fastener (1) that secures the rear fascia assembly to the rear quarter.
5. Remove the fastener (3) that secures the rear fascia assembly to the rear fascia support bracket.
6. Repeat the removal steps on the opposite side.

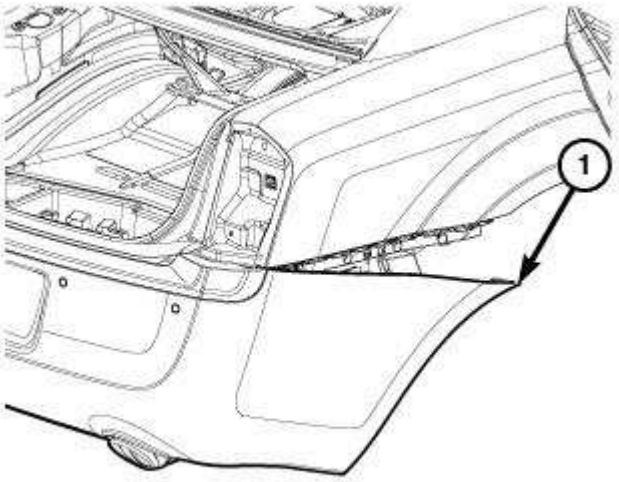

Fig. 20: Pull Out On The Fascia
Courtesy of CHRYSLER GROUP, LLC

7. Pull out on the fascia (2) at the wheel house opening to disengage the fascia from the retaining bracket. Repeat on the opposite side.

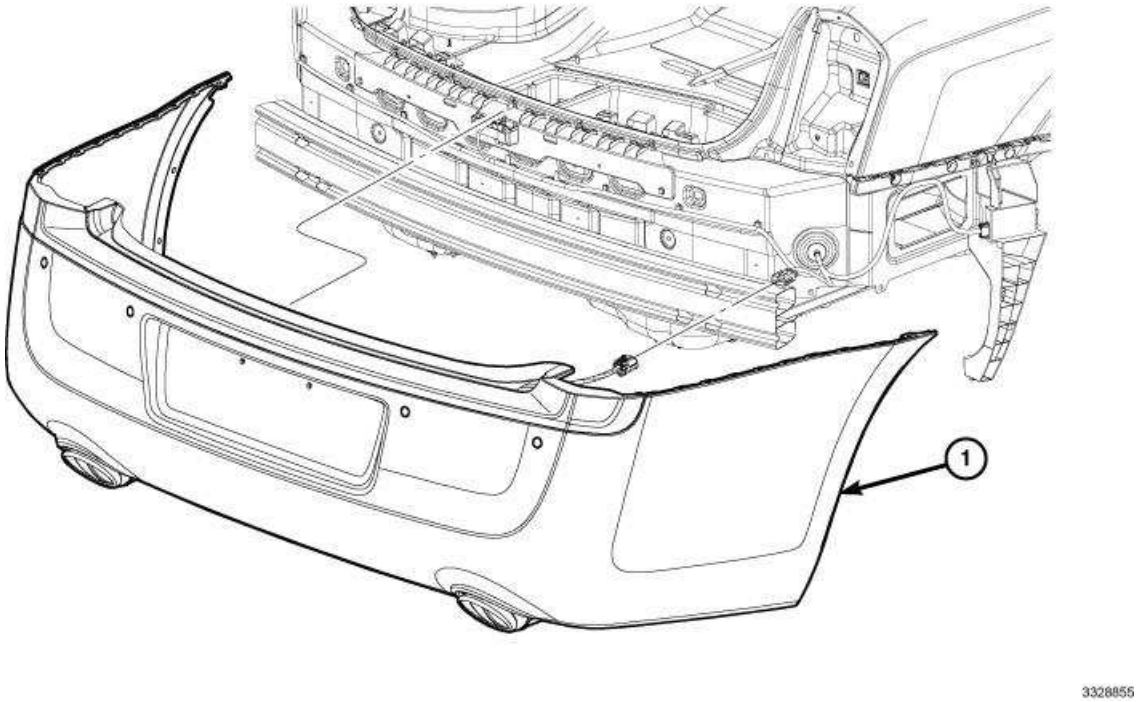

Fig. 21: Disengage The Fascia
Courtesy of CHRYSLER GROUP, LLC

8. With the help of an assistant, pull rearward to disengage the fascia (1) from the rear retaining

bracket.**Do not completely remove at this time.**

9. Disconnect the vehicle wiring harness.
10. With the help of an assistant, remove the fascia (1) from the vehicle.

INSTALLATION

INSTALLATION

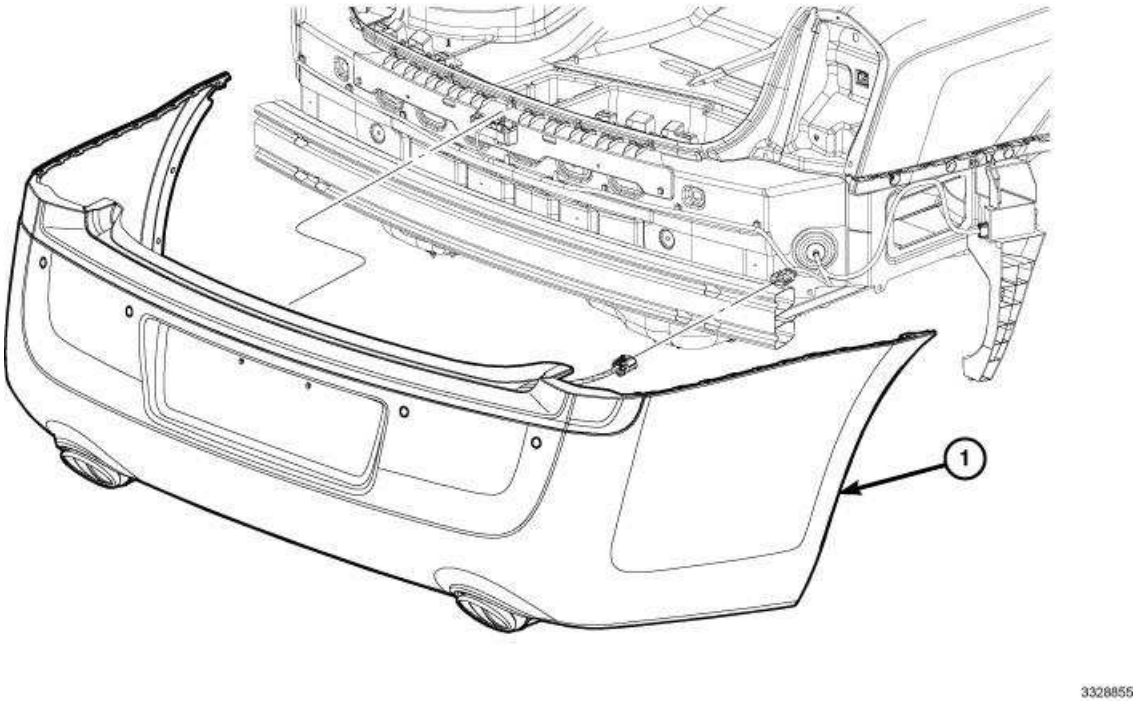

Fig. 22: Disengage The Fascia
Courtesy of CHRYSLER GROUP, LLC

NOTE: Base model shown in illustration, SRT models similar.

1. With the help of an assistant, position the fascia (2) to the vehicle.
2. Connect the vehicle wiring harness.
3. With the help of an assistant and using firm pressure, align and push forward to engage the fascia to the rear retaining bracket.

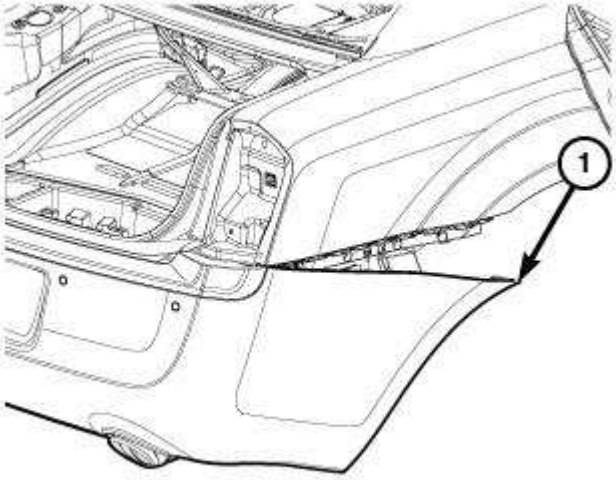

Fig. 23: Pull Out On The Fascia
Courtesy of CHRYSLER GROUP, LLC

4. Align the fascia (2) with the retaining bracket and using firm pressure push in to engage. Repeat on the opposite side.

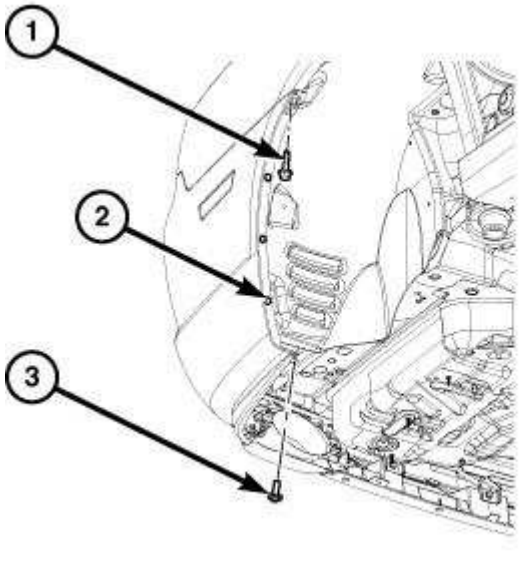

Fig. 24: Three Push-Pin Retainers & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the three push-pin retainers (2) that secure each rear wheel house splash shield to the rear fascia assembly. Repeat for opposite side.
6. Install the fastener (1) that secures the rear fascia assembly to the rear quarter. Tighten the fastener securely. Repeat for opposite side.

7. Install the fastener (3) that secures the rear fascia assembly to the rear fascia support bracket. Tighten the fastener securely. Repeat for opposite side.
8. Connect the negative battery cable.

FRAME

WARNING

USE OF HEAT DURING REPAIR

WARNING: Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- **avoid prolonged skin contact with petroleum or alcohol based**

cleaning solvents.

- **do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.**

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

RESTRAINT WARNINGS

WARNING: To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at

the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtain airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.**

WARNING: **To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

WARNING: **To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.**

WARNING: **To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these**

instructions may result in possible serious or fatal injury.

STANDARD PROCEDURE

STANDARD PROCEDURE - REAR FRAME RAIL REPLACEMENT

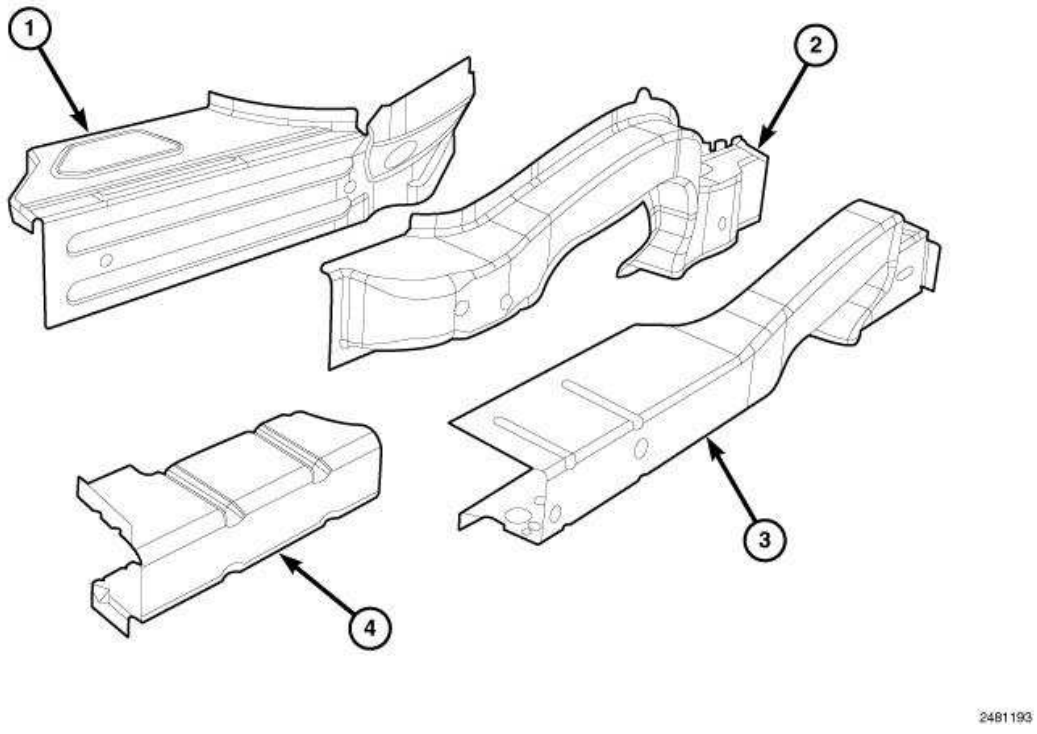

Fig. 25: Rail Terminology
Courtesy of CHRYSLER GROUP, LLC

1 - COVER PLATE
2 - RAIL, REAR, OUTER
3 - RAIL, REAR, INNER
4 - REINFORCEMENT, REAR RAIL INNER, REAR

"Rail, rear, outer" (2) - this portion of the rear rail assembly is not visible as it is gloved inside the "rail, rear, inner" (3) and the "cover plate, rear rail extension" (1). **This rail may not be sectioned!**

"Reinforcement, rear rail inner rear" (4) - welded inside of the "rail, rear, inner" (3) and extends from the end of that rail to the "panel, deck opening lower".

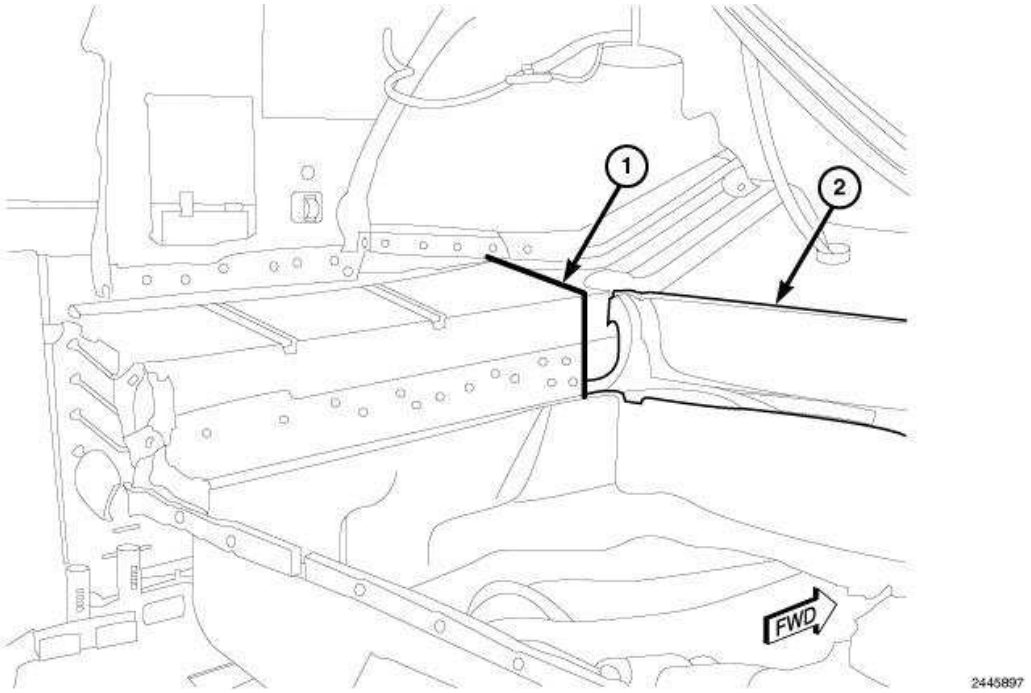

Fig. 26: Rear Inner Rail
Courtesy of CHRYSLER GROUP, LLC

"Rail, rear inner" may be sectioned at this location (1), greatly reducing vehicle disruption and repair costs.

This partial replacement procedure presumes that all damage to the "rail, rear inner" is aft of the crossmember (2).

Left side

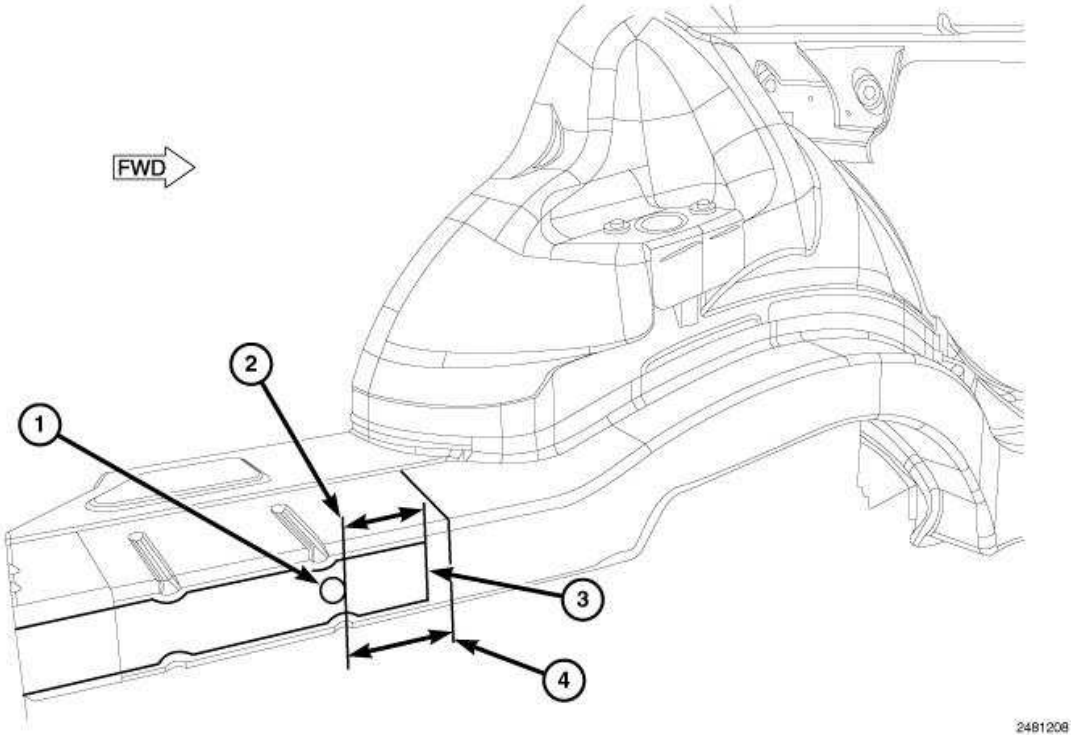

Fig. 27: Lx/Lc Left Rear Rail Cut Locations
Courtesy of CHRYSLER GROUP, LLC

1 - HOLE 2 - 100 mm (4 in.) 3 - REINFORCEMENT, REAR RAIL INNER, REAR 4 - CUT LOCATION 125 mm (5 in.)

The "Reinforcement, Rear Rail Inner, Rear" (3) ends 100 mm (4 in.) (2) forward of round hole (1) on inner face of "Rail, Rear Inner" - recommended cut location is 125 mm (5 in.) (4) from forward edge of the hole (1).

Right Side

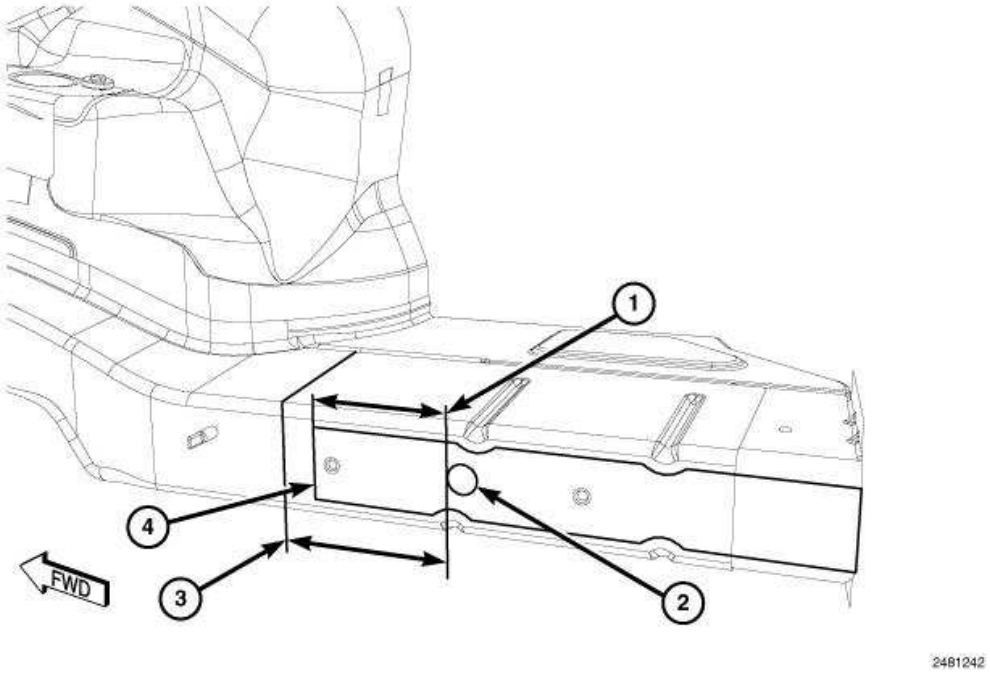

Fig. 28: Lx/Lc Right Rear Rail Cut Locations
Courtesy of CHRYSLER GROUP, LLC

1 - 125 mm (5 in.)
2 - HOLE
3 - CUT LOCATION 150 mm (6 in.)
4 - REINFORCEMENT, REAR RAIL INNER, REAR

The "Reinforcement, Rear Rail Inner Rear" (4) ends 125 mm (5 in.) (1) forward of round hole (2) on inner face of "rail, rear inner" - recommended cut location (3) is 150 mm (6 in.) from forward edge of hole (2).

The following procedure details key points of the repair. I-CAR training is presumed, and should be followed for best-practice repair procedures.

1. Mount the damaged vehicle onto a structural straightening bench and check/correct any body misalignment utilizing three dimensional measuring equipment.
2. Remove all components in area of repair allowing unimpeded access for cutting and welding operations.
3. Trunk floor should be removed if being replaced, or the necessary welds released and the weld flange bent inboard to provide access to the rail for the butt-joint.
4. Using the round hole in the "Rail, Rear, Inner" as a point of reference, measure 125 mm (5 in.) forward for the left rail, or 150 mm (6 in.) forward for the right rail, and scribe a vertical line on the rail.

5. With the vertical line just made as reference, cut off the damaged "Rail, Rear, Inner" taking care not to damage the "Rail, Rear, Outer", using a reciprocating saw or cut-off wheel, and remove the damaged portion.
6. Utilize the same measuring and cutting process above to remove the replacement portion from the service part.
7. Using a surface conditioning disk, remove all e-coat within 25 mm (1 in.) of the cut location and de-bur the cut edge.
8. If the "Rail, Rear, Outer" was damaged during the cutting operation, MIG-weld the damage and dress the weld.
9. Fabricate 19 mm (0.75 in.) weld backers from the damaged component, or the remains of the service part, and tack in place on the replacement rail section at the butt-joint location.
10. Position and clamp the replacement rail and confirm proper position with measuring equipment.
11. Weld the service part in position using a skip-stitch process.
12. Complete remaining repairs in the damaged area.
13. Clean and dress all welded areas.
14. Apply epoxy primer to the exterior of the rail at the repair location.
15. Apply quality body sealer to all areas previously sealed to duplicate the original appearance. Note that additional sealer may be applied to better protect the exterior exposed seams from road spray.
16. Refinish all exposed surfaces in trunk and on underbody using quality refinish materials.
17. Apply inner panel rust proofing, such as Mopar # 05093981AA, or equivalent, to the rail inner cavity areas in two applications with a 30-minute flash period between the applications. Pay particular attention to areas which have been welded.
18. Reassemble vehicle and complete repairs.

ADDITIONAL INFORMATION

Observe all cautions and warnings per the Chrysler service information. Refer to **FRAME, WARNING**.

Reference the Chrysler weld process chart. Refer to **FRAME, SPECIFICATIONS**.

Butt joint should be metal finished without thinning the base rail material or weldment. This is a cosmetic finishing process to disguise the repair and should have the surface coating (paint) duplicated as well.

Restore corrosion protection when complete with all welding operations.

TYPE OF ARC TRANSFER	Short Circuit		Short Circuit	Pulse	Short Circuit	

These Procedure Specifications are appropriate as of this publication. Procedures may be superceeded with new spec's at a later date.

Always process to the thinner material thickness (TMT)

All persons performing welding must be qualified to weld in all positions.

NOTE:

1. **Must remove Zinc Coating on both sides of metal at the weld zone.**
2. **MIG Braze welding process requires use of Pulse Arc® or STT® welding**

machine.

3. **Must use Lincoln® product since E 71T-11 product differs from other suppliers.**

SPECIFICATIONS

NOTE: Frame dimensions are listed in metric scale millimeter (mm). All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

FASTENER TORQUE

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Axle Flange Bolts	81	60	-
Ball Joint Nut	122	90	-
Caliper Guide Pins	31	23	-
Camber Link Bolt	85	63	-
Compression Link Bolt	85	63	-
Cushion Retainer Mounting Bolts	60	44	-
Engine Cradle bolts	185	136	-
Engine Mount Nuts	60	44	-
Front Suspension Crossmember Front Attaching Bolts	109	80	-
Front Suspension Crossmember Rear Attaching Bolts	102	75	-
Hub Nut	213	157	-
Outer Tie Rod End Nut	86	63	-
Radiator Support Crossmember Attaching Bolts	61	45	-
Rear Bumper Reinforcement Attaching Nuts	28	21	-
Rear Crossmember Mounting Bolts	180	133	-
Shock Absorber Lower Mounting Bolt	72	53	-

Shock Clevis Bracket to Lower Control Arm	174	128	-
Spring Link Bolt	108	80	-
SRT Rear Disc Brake Caliper Mounting Bolt	130	96	-
Stabilizer Link Ball Joint	81	60	-
Stabilizer Link Bolt	61	45	-
Standard Disc Brakes Guide Pins	31	23	-
Steering Gear Lower Mounting Bolt	142	105	-
Tension Link Bolt	85	63	-
Toe Link Cam Bolt Nut	108	80	-
Wheel Mounting Nuts	150	110	-

CROSSMEMBER, CRADLE, ENGINE

REMOVAL

REMOVAL

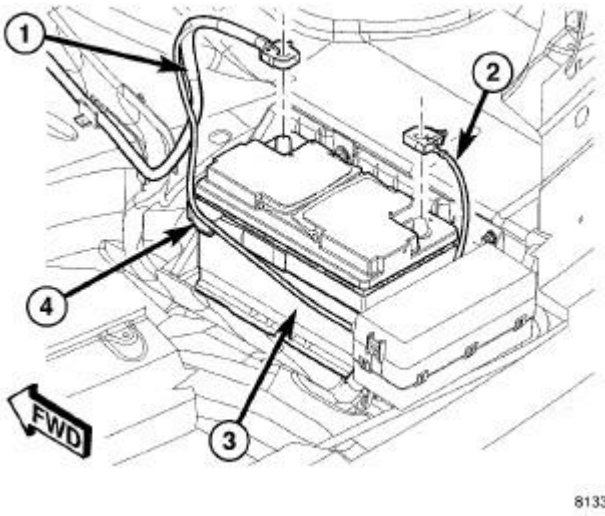

Fig. 31: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.

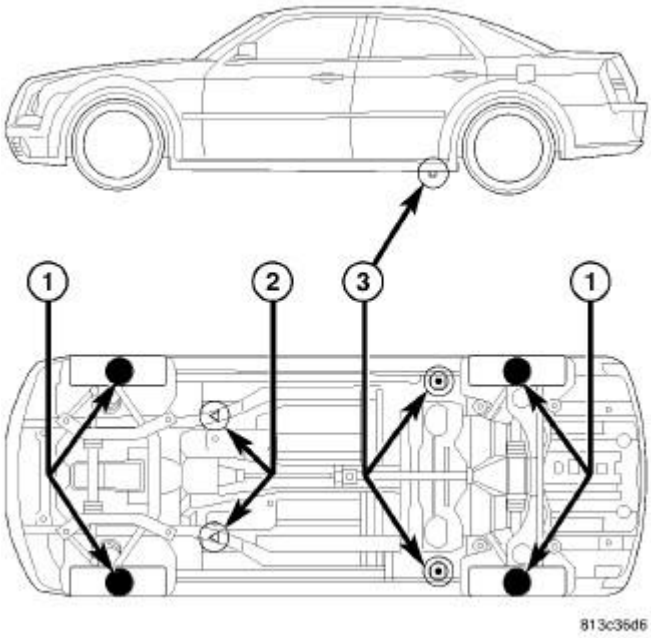

Fig. 32: Lifting Points
Courtesy of CHRYSLER GROUP, LLC

1 - DRIVE ON LIFT
2 - SAE HOISTING SYMBOLS
2 - FRAME CONTACT LIFT (SINGLE POST)
2 - CHASSIS LIFT (DUAL LIFT)
2 - OUTBOARD LIFT (DUAL LIFT)
2 - FLOOR JACK
3 - HOISTING PADS
3 - FRAME CONTACT LIFT (SINGLE POST)
3 - CHASSIS LIFT (DUAL LIFT)
3 - OUTBOARD LIFT (DUAL LIFT)
3 - FLOOR JACK

3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

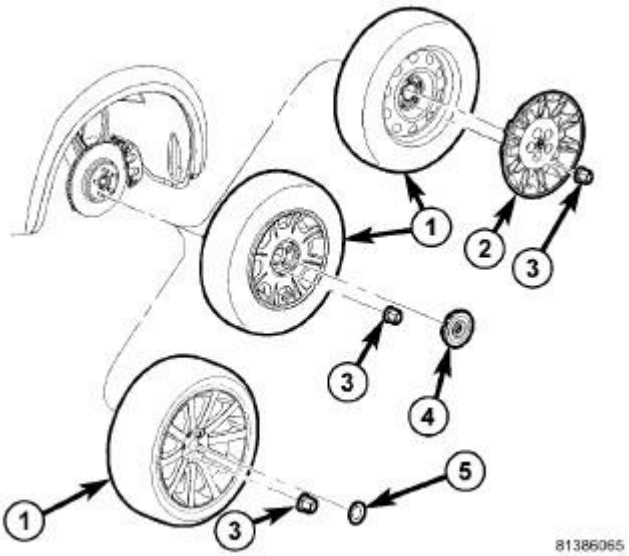

Fig. 33: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove the left and right front wheels (1). Refer to **REMOVAL** .

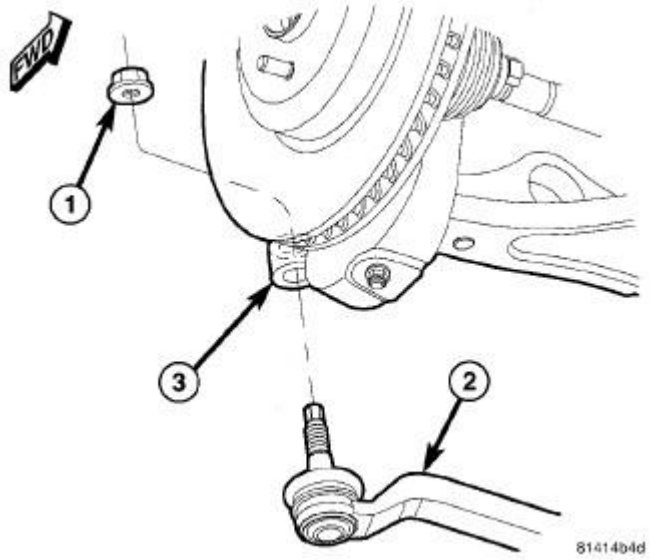

Fig. 34: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

5. Remove outer tie rod (2) end nut (1) at each knuckle (3).

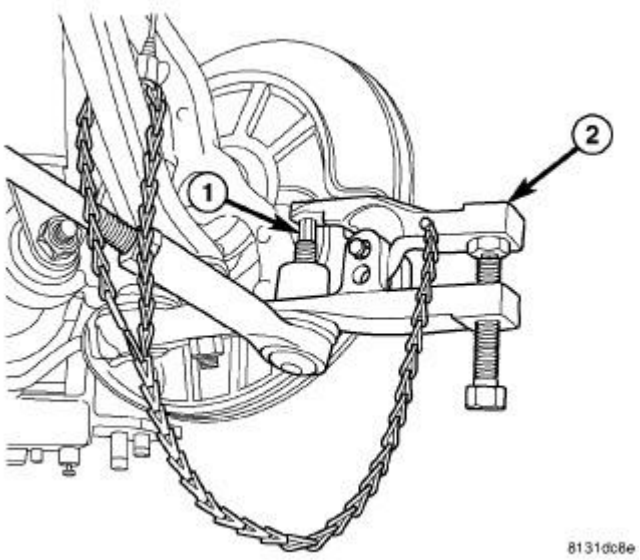

Fig. 35: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

6. Using, Special Tool (special tool #9360, Remover, Ball Joint) ball joint remover (2), separate outer tie rod (1) from each knuckle.

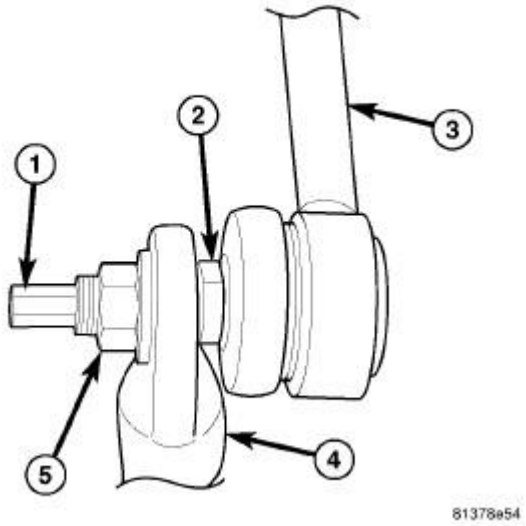

Fig. 36: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

7. On each side of vehicle, remove nut (5) fastening stabilizer link (3) to stabilizer bar (4). Slide link ball joint stem (1) from bar.

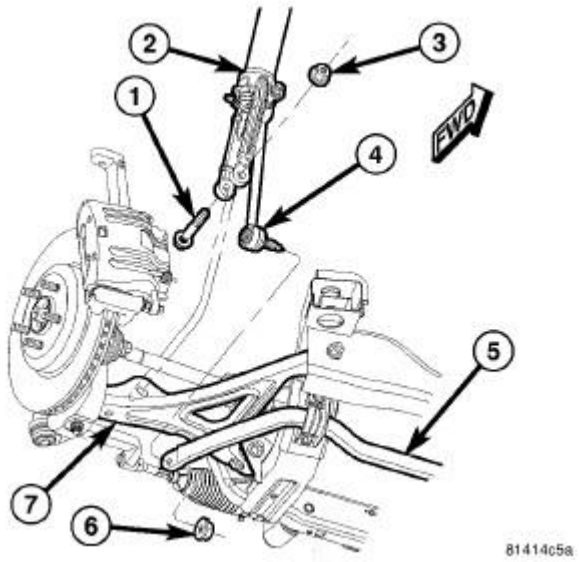

Fig. 37: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

8. Back off nut (3) from bolt (1) attaching shock clevis bracket (2) to lower control arm (7) until it is flush with end of bolt.
9. Using a brass drift punch, tap the bolt out of the clevis bracket until bolt serrations clear bracket.
10. Remove nut (3) and bolt (1) for clevis bracket and control arm.
11. Install engine support tool (special tool #8534B, Fixture, Driveline Support).
12. Remove upper airbox inlet tube.
13. Install left and right engine lift bracket to cylinder head.

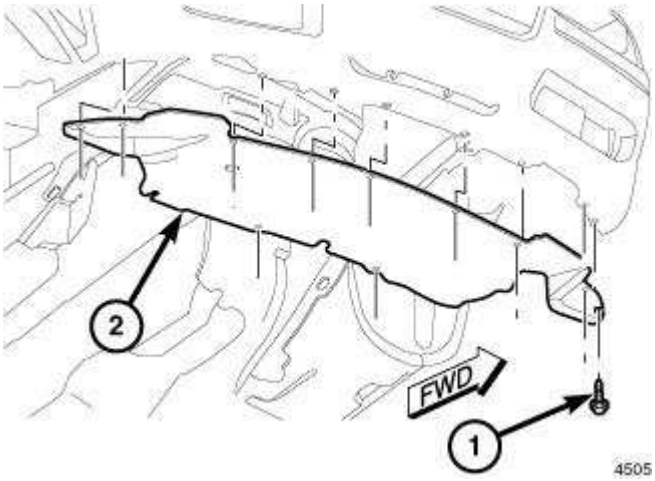

Fig. 38: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

14. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL**.

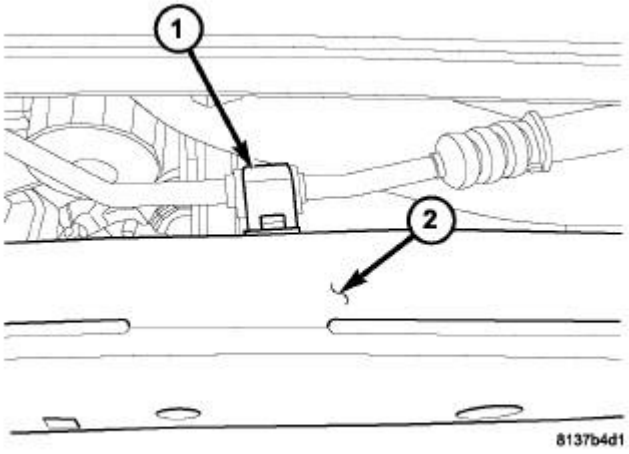

Fig. 39: Hose Mounting Bracket To Cradle
Courtesy of CHRYSLER GROUP, LLC

15. Remove two pressure line retainer bolts (1) from cradle (2).

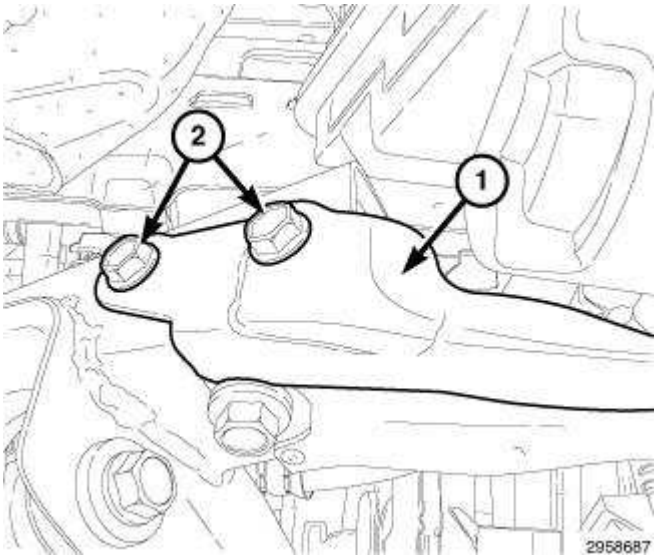

Fig. 40: Two Mounting Bolts & Electro Hydraulic Power Steering (EHPS) Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

16. Remove two mounting bolts (2) from the Electro Hydraulic Power Steering (EHPS) mounting bracket (1).

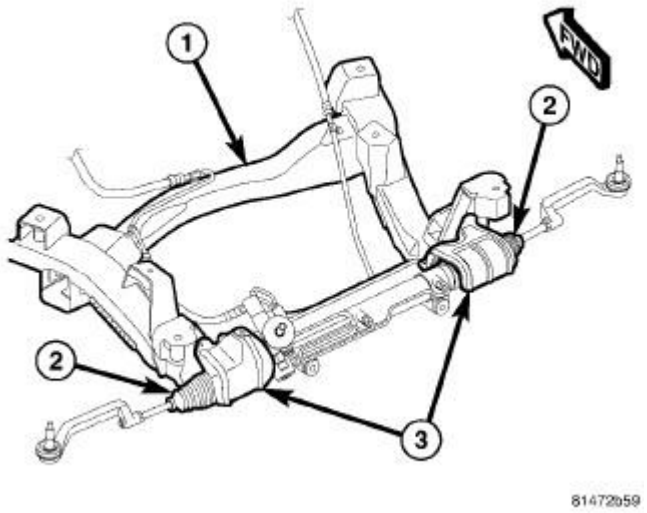

Fig. 41: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

17. Remove mounting screws, then heat shield (3) above each inner tie rod bellows (2).

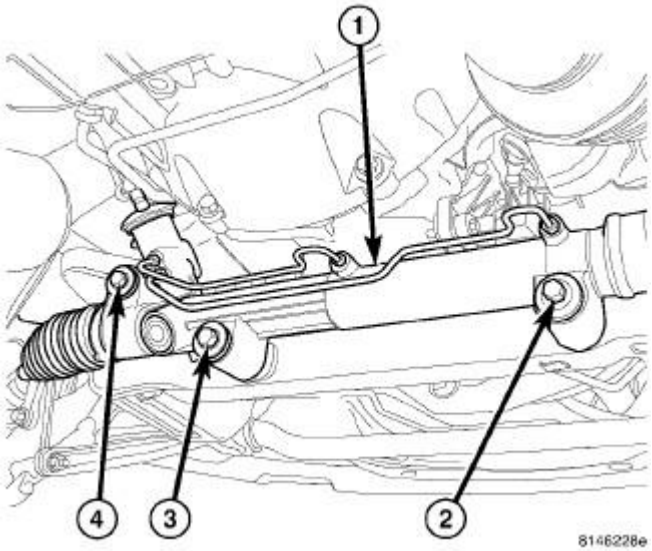

Fig. 42: Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Remove steering gear upper mounting bolt (4) and nut.
19. Remove steering gear lower mounting bolts (2 and 3).
20. Remove steering gear (1) and support from the exhaust system.

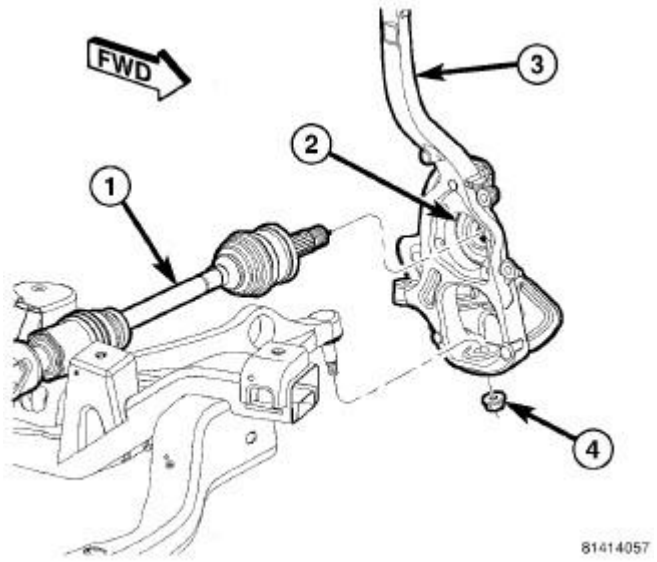

Fig. 43: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

21. Loosen nut (4) attaching lower control arm ball joint stud to knuckle (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

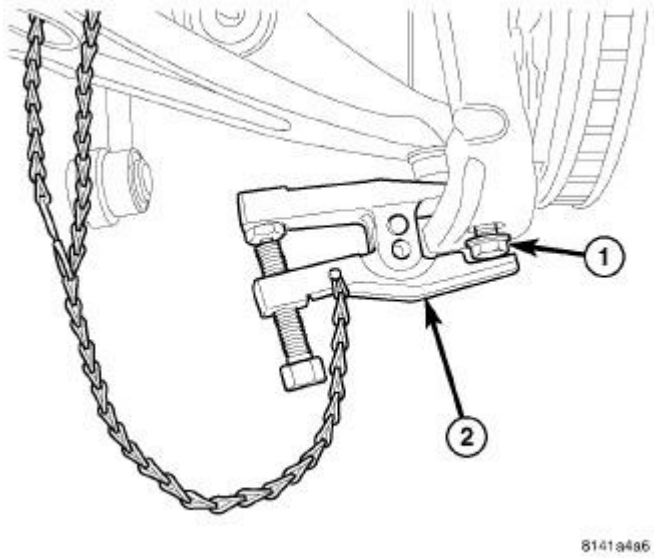

Fig. 44: Using Puller On Lower Ball Joint - AWD
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

22. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint) Ball Joint Removal tool, separate ball joint stud from knuckle.
23. Remove tool.
24. Remove left and right engine mount nut.
25. Remove nut (1) from end of ball joint stud.

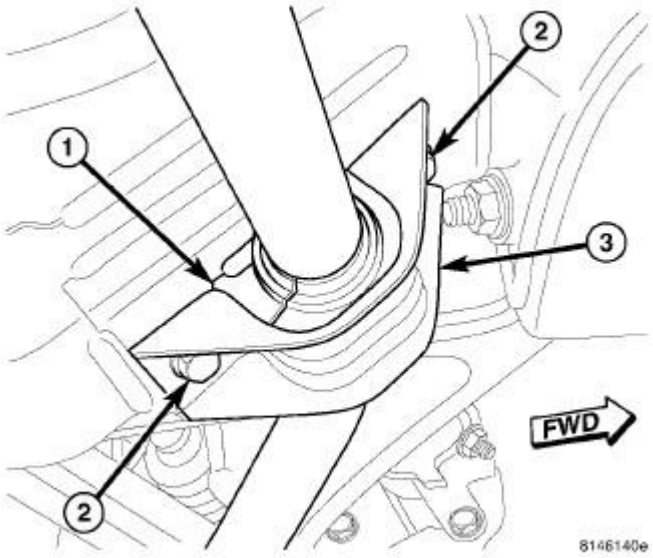

Fig. 45: Stabilizer Bar Bushing & Retainer
Courtesy of CHRYSLER GROUP, LLC

26. On each side of vehicle, remove bolts (2) fastening stabilizer bar isolator retainer (3) in place.
27. Remove stabilizer bar with isolators and retainers from vehicle.
28. Support the engine cradle (special tool (special tool #8534B, Fixture, Driveline Support) Engine Support Fixture) with a suitable lifting device.
29. Using a grease pencil or equivalent, mark the position of the engine cradle to aid installation.
30. Remove the four engine cradle bolts and lower the cradle.
31. Remove the control arms, if required.

INSTALLATION

INSTALLATION

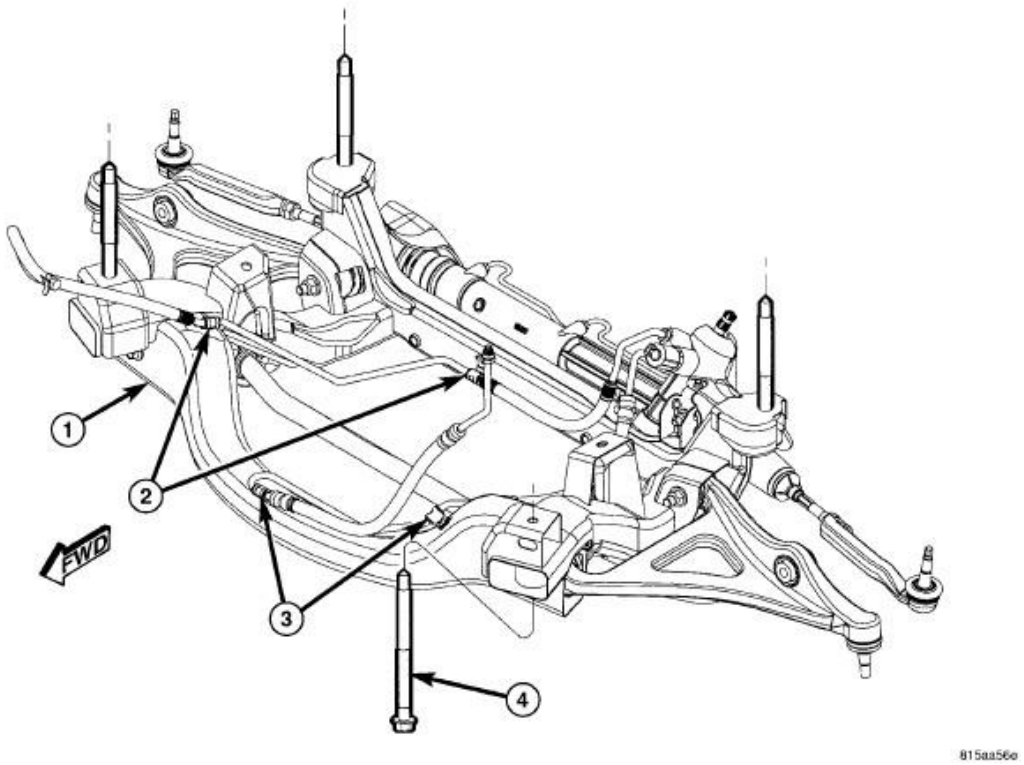

Fig. 46: Engine Cradle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Although AWD and RWD upper control arms are similar in appearance, they are not interchangeable.

1. Install control arms. Refer to **ARM, LOWER CONTROL, AWD, INSTALLATION** and **ARM, LOWER CONTROL, RWD, INSTALLATION** .
2. To aid installation, raise engine cradle to marked location.
3. Install four engine cradle bolts (4) and raise cradle. Tighten cradle bolts to 185 N.m (136 ft. lbs.).
4. Install stabilizer with isolators and retainers onto cradle. Refer to **STABILIZER BAR, FRONT, INSTALLATION** .

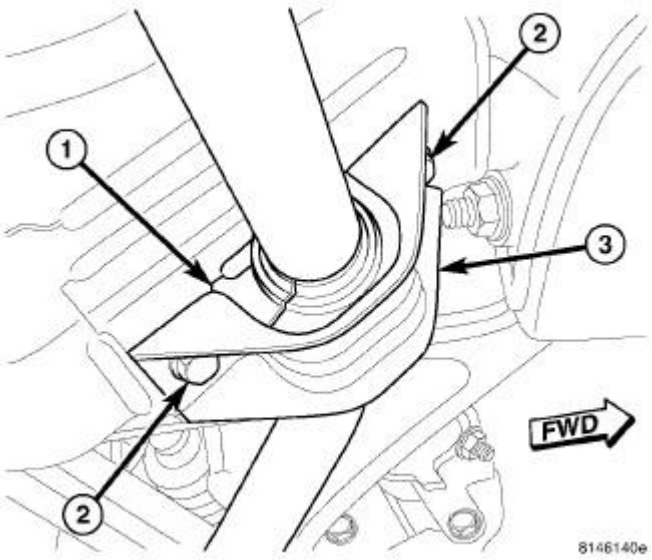

Fig. 47: Stabilizer Bar Bushing & Retainer
Courtesy of CHRYSLER GROUP, LLC

5. On each side of vehicle, install bolts (2) fastening stabilizer bar isolator retainer (3) in place. Tighten bolts to 60 N.m (44 ft. lbs.).

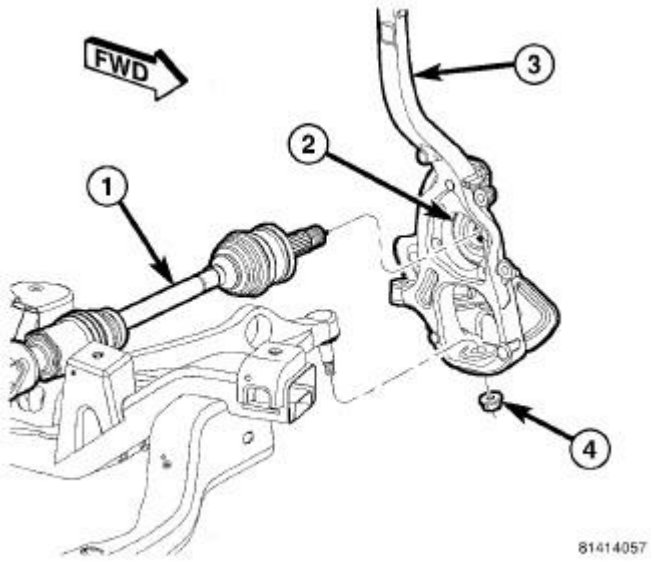

Fig. 48: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

6. Tighten engine mount nuts to 60 N.m (44 ft. lbs.).
7. Tighten left and right ball joint nut (4) to 122 N.m (90 ft. lbs.) attaching lower control arm ball joint stud to knuckle (3).

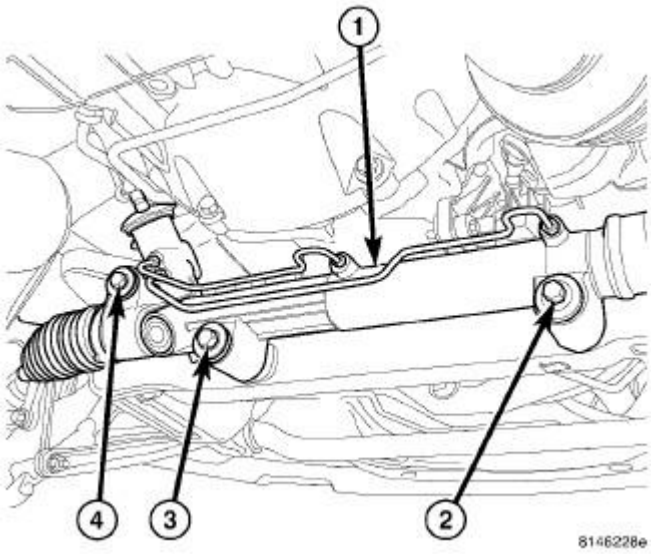

Fig. 49: Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install steering gear (1) and support from the exhaust system. Refer to **GEAR, INSTALLATION** .
9. Install steering gear lower mounting bolts (2 and 3). Tighten to 142 N.m (105 ft. lbs.).
10. Install steering gear upper mounting bolt (4) and nut.

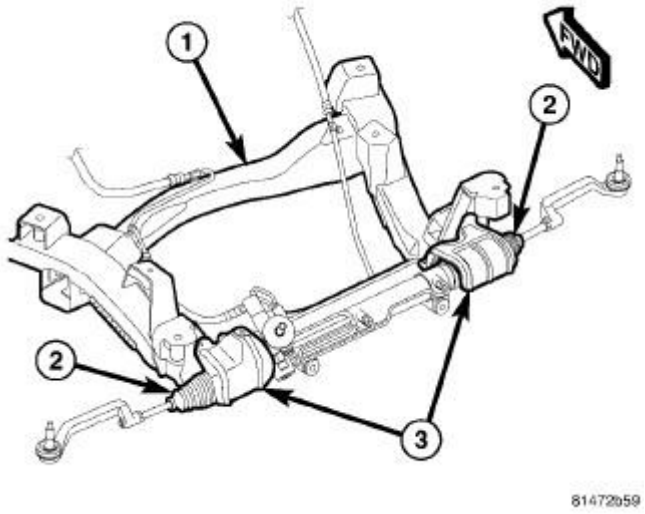

Fig. 50: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

11. Install heat shield (3) and mounting screws above each inner tie rod bellow.

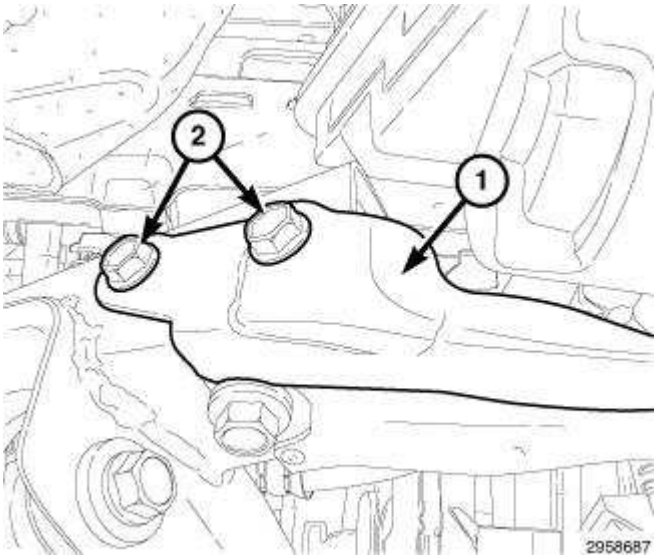

Fig. 51: Two Mounting Bolts & Electro Hydraulic Power Steering (EHPS) Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

12. Install Electro Hydraulic Power Steering (EHPS) pump bracket (1) mounting bolts (2) and tighten to 50 N.m (37 ft. lbs.).

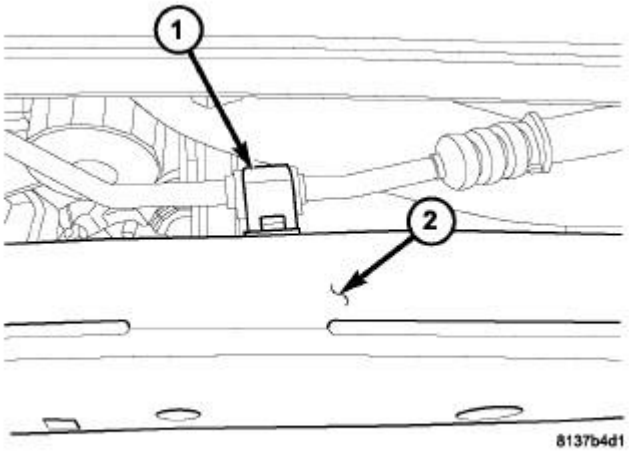

Fig. 52: Hose Mounting Bracket To Cradle
Courtesy of CHRYSLER GROUP, LLC

13. Install two pressure line retainer bolts (1) on cradle (2).

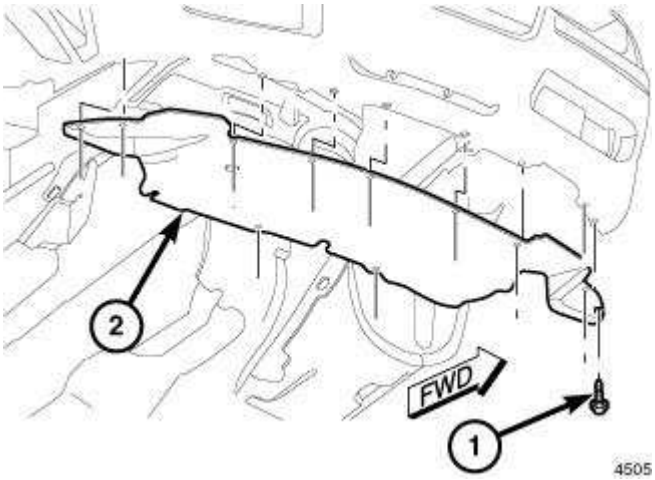

Fig. 53: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

14. Install front belly pan. Refer to **BELLY PAN, INSTALLATION**.

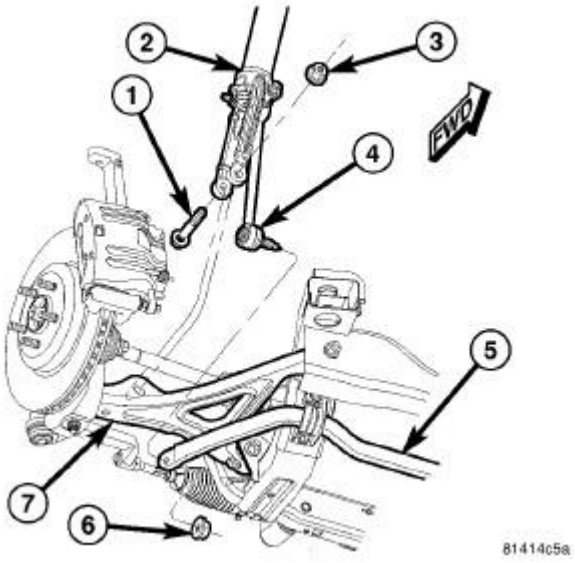

Fig. 54: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

15. Install nut (3) and bolt (1) attaching shock clevis bracket (2) to lower control arm (7). Tighten to 174 N.m (128 ft. lbs.).
16. On each side of vehicle, install nut (3) fastening stabilizer link (4) to stabilizer bar (5). Slide link ball joint stem on to bar. Tighten link nut to 81 N.m (60 ft. lbs.).

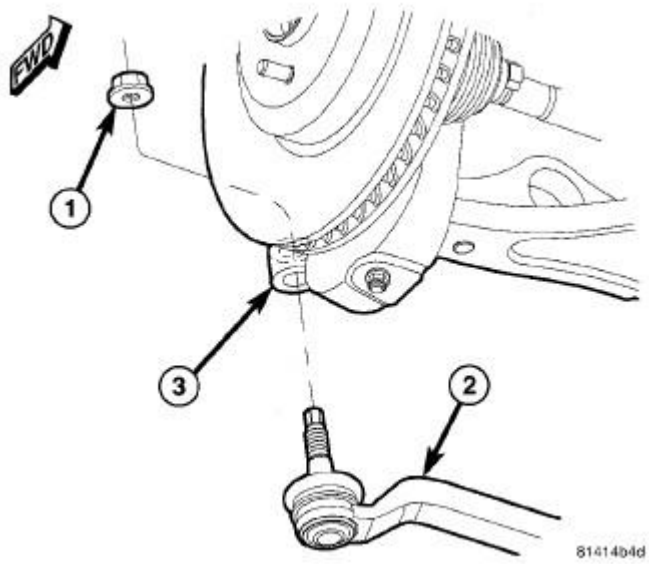

Fig. 55: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

17. Install outer tie rod (2) end nut (1) at each knuckle (3). Tighten end nut to 86 N.m (63 ft. lbs.).

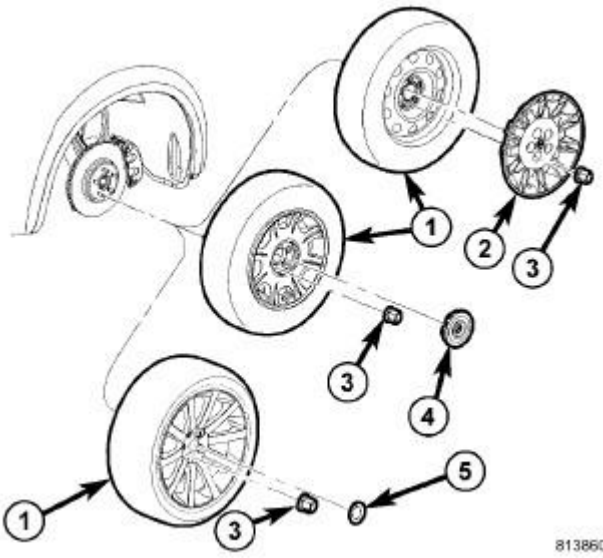

Fig. 56: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

18. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **INSTALLATION** .
19. Lower vehicle from hoist.
20. Install power steering fluid into pump reservoir. Refer to **FLUID, STANDARD PROCEDURE** .

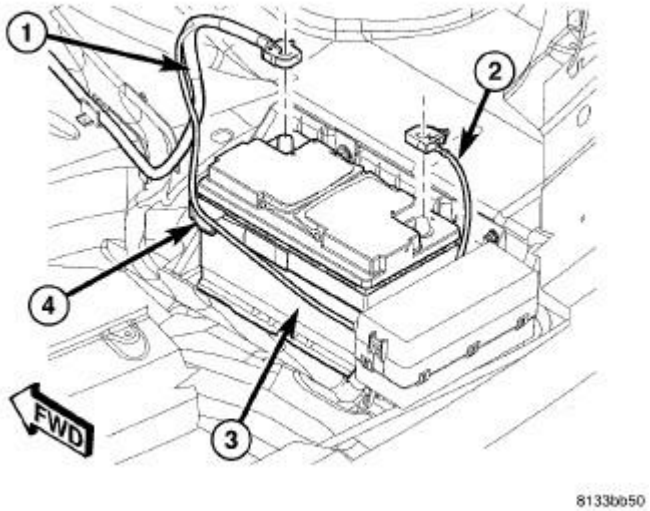

Fig. 57: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

21. Connect negative battery cable (2) to battery post.
22. Perform vehicle alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

CROSSMEMBER, REAR

REMOVAL

REMOVAL

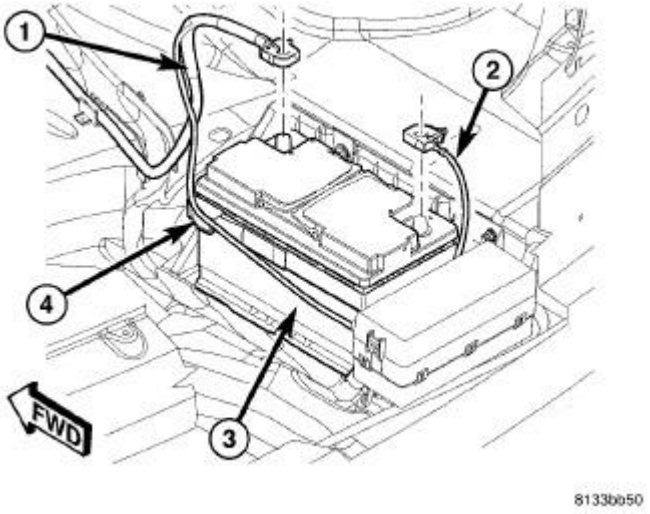

Fig. 58: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

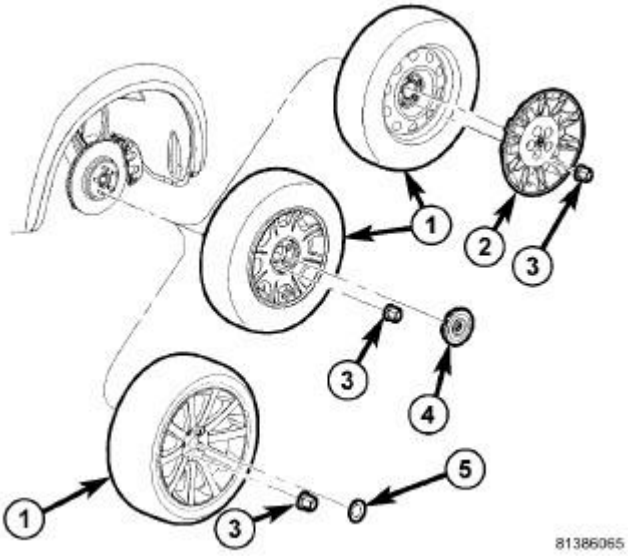

Fig. 59: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

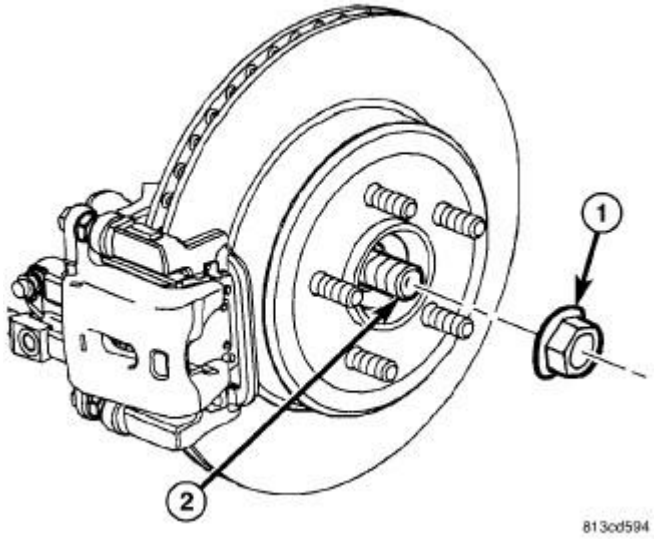

Fig. 60: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle rear, while a helper applies brakes to keep hub from rotating, remove

hub nut (1) from half shaft (2).

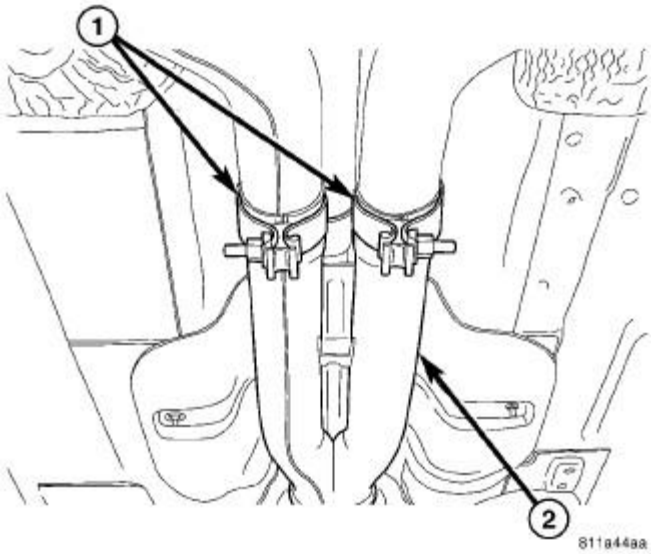

Fig. 61: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

5. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure).
6. Remove rear axle differential. Refer to **REMOVAL** or **REMOVAL** .
7. Slide each axle half shaft from hub and bearing and remove from vehicle.

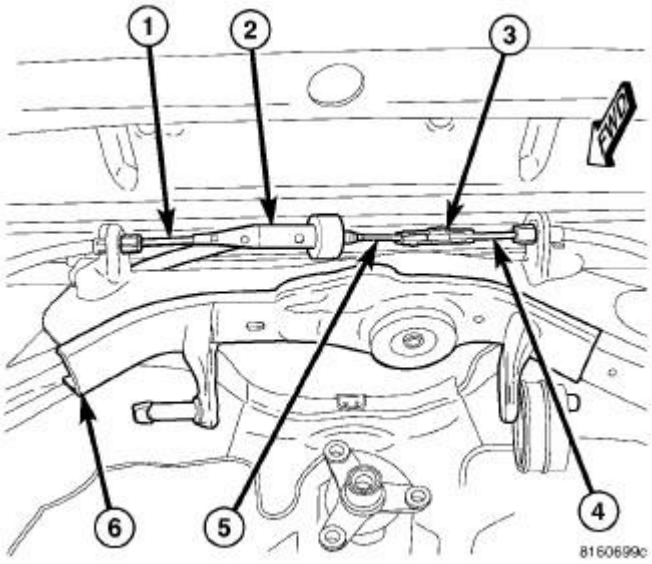

Fig. 62: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out

parking brake lever to service parking brake components.

8. Disconnect right rear parking brake cable (4) at connector (3) to front parking brake cable (5).
9. Disconnect left rear parking brake cable (1) at equalizer (2). **Leave equalizer on front cable.**

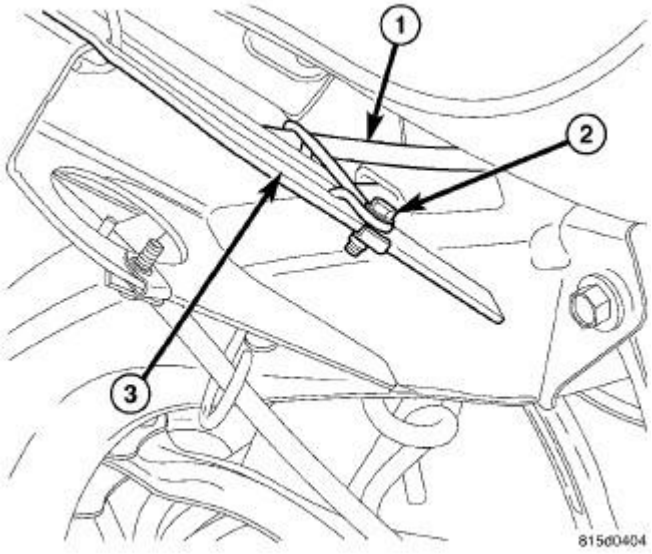

Fig. 63: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3). Remove J-nut from crossmember.

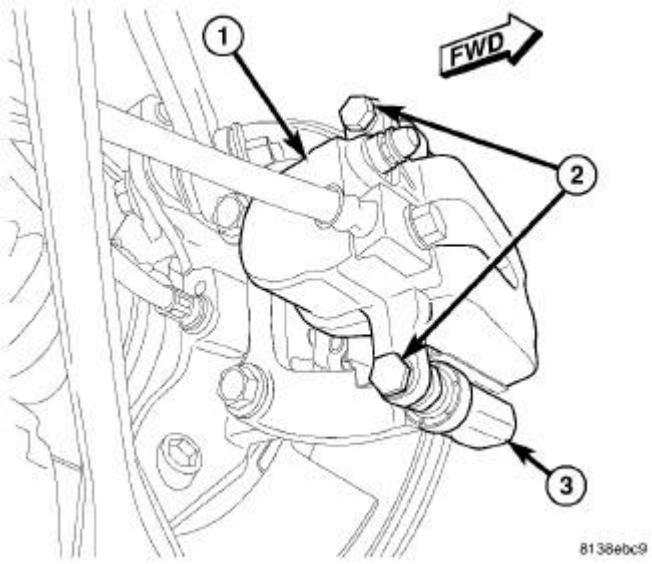

Fig. 64: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
    2. Remove brake caliper (1) from brake adapter (3) and pads.
    3. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

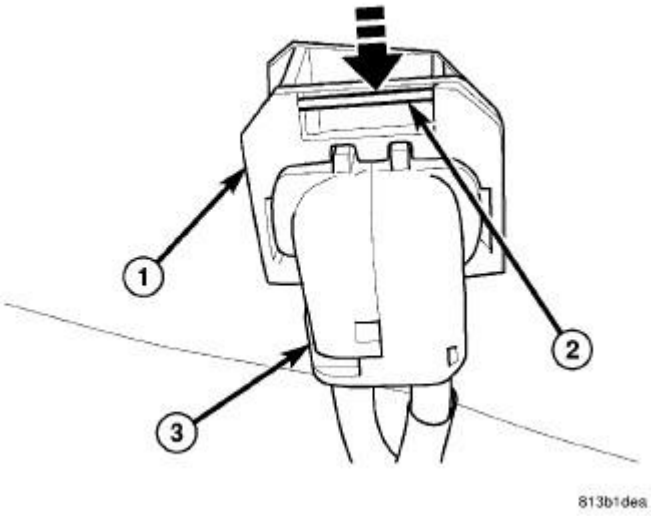

Fig. 65: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

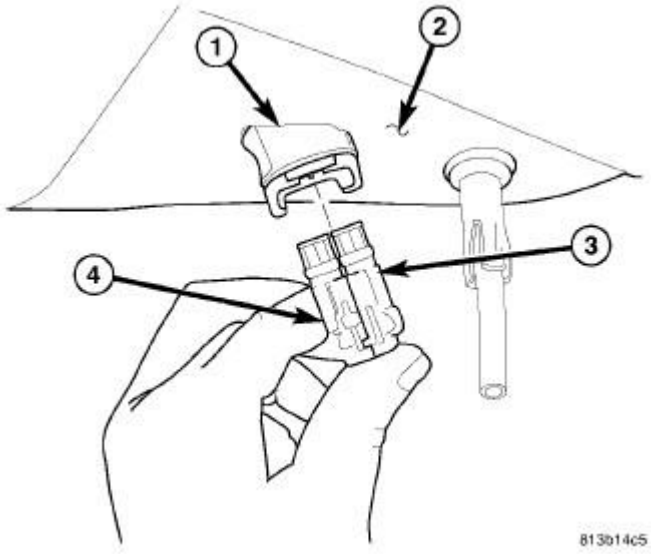

Fig. 66: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

12. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

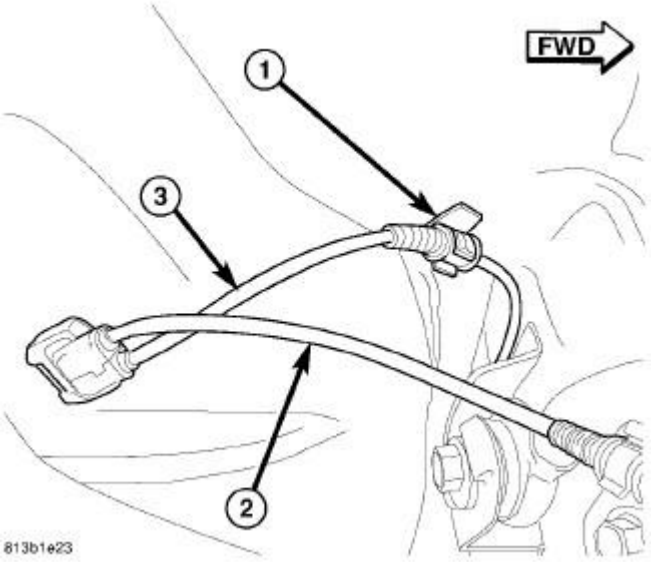

Fig. 67: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

13. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

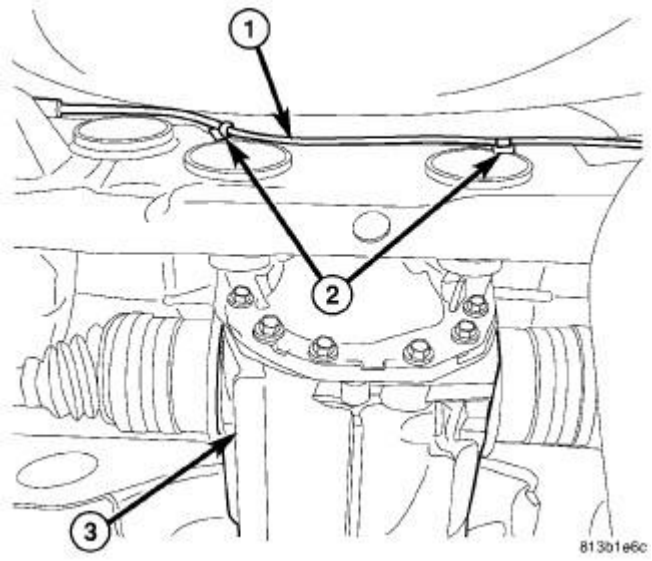

Fig. 68: Left Wheel Speed Sensor Routing Over Rear Differential
Courtesy of CHRYSLER GROUP, LLC

14. Unclip left sensor cable (1) from routing clips (2) along rear of crossmember near rear differential (3).

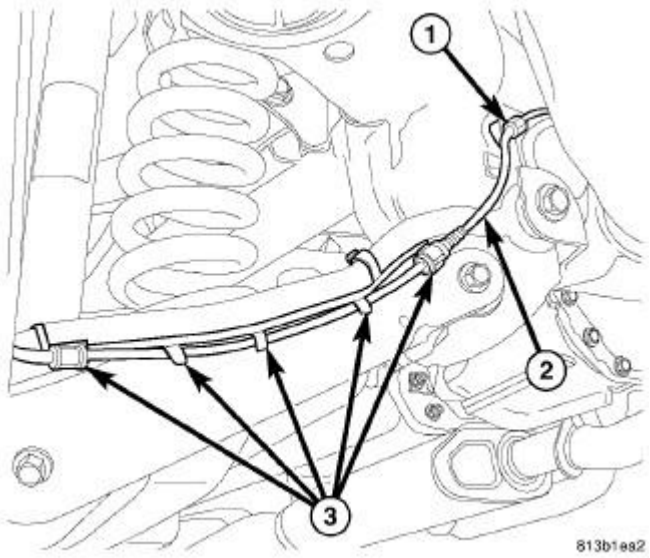

Fig. 69: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

15. Unclip left sensor cable (2) from routing clip (1) above toe link mount on rear crossmember.

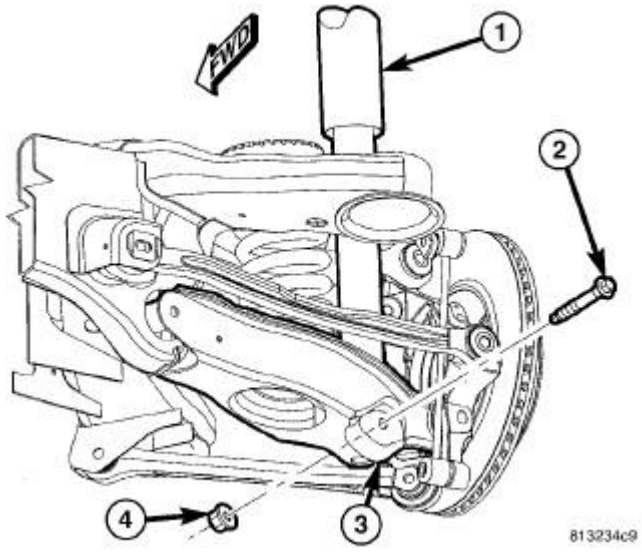

Fig. 70: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

16. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

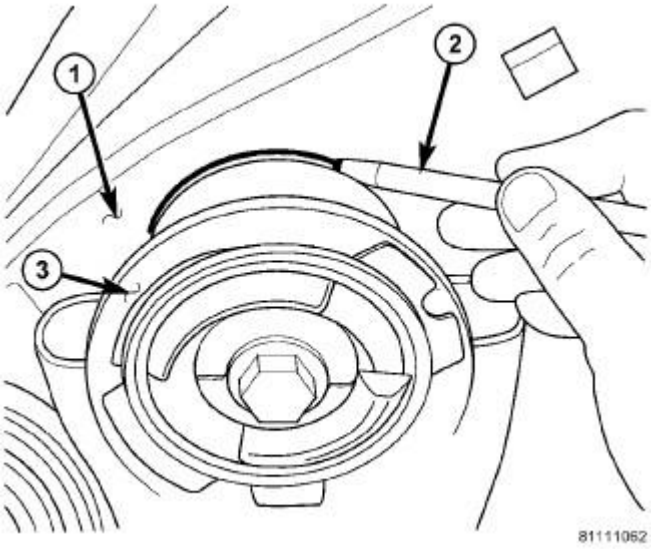

Fig. 71: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

17. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
18. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

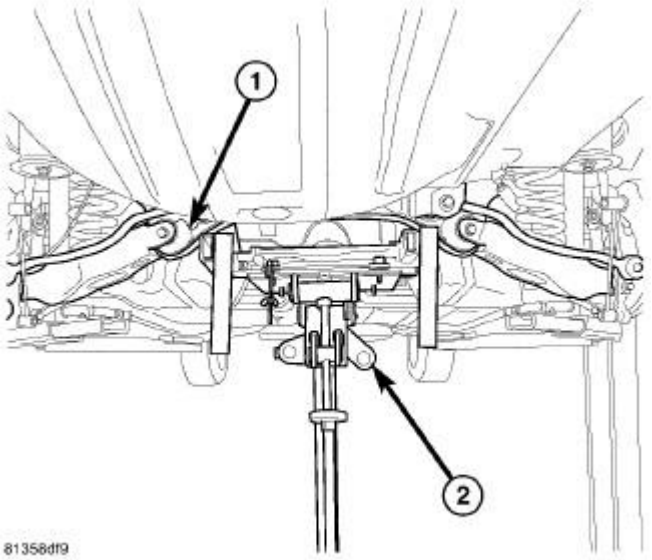

Fig. 72: Jack Positioned Beneath Crossmember

Courtesy of CHRYSLER GROUP, LLC

19. Position under-hoist utility jack or transmission jack (2) under center of rear crossmember (1). Raise jack head to contact crossmember and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 73: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

20. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .

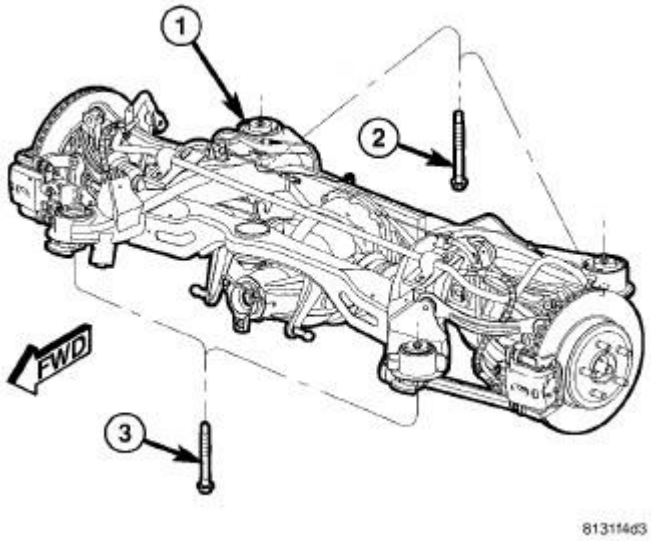

Fig. 74: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

21. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
22. **Slowly** lower crossmember using jack until crossmember is at a comfortable working level to access link and stabilizer bar fasteners.

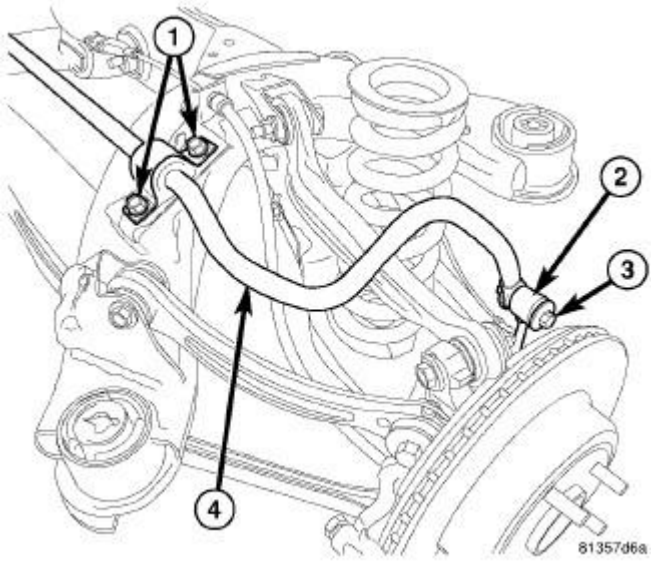

Fig. 75: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

23. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
24. Remove bolts (1) fastening each stabilizer bar cushion retainer to crossmember.
25. Remove stabilizer bar (4) with cushions and retainers.

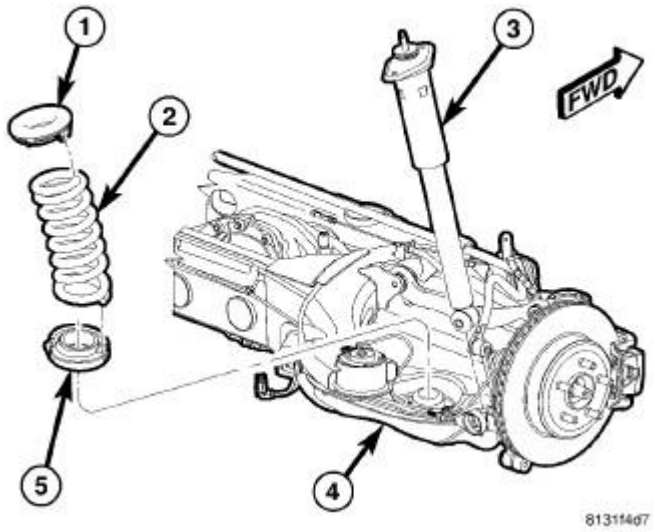

Fig. 76: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

26. Remove coil springs and isolators (1, 2 and 5) from spring links.

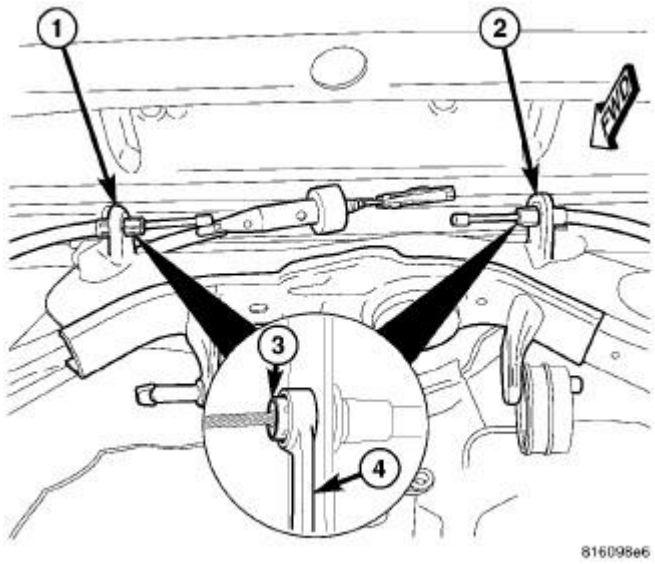

Fig. 77: Cables AT Crossmember Bracket
Courtesy of CHRYSLER GROUP, LLC

27. For each parking brake cable, place 13 mm 12-point box wrench (4) over cable strand and completely onto cable retainer (3) as shown at crossmember bracket (1 - left) (2 - right). It may be necessary to wiggle wrench around somewhat to collapse retainer fingers. With wrench in place, pull cable from bracket.

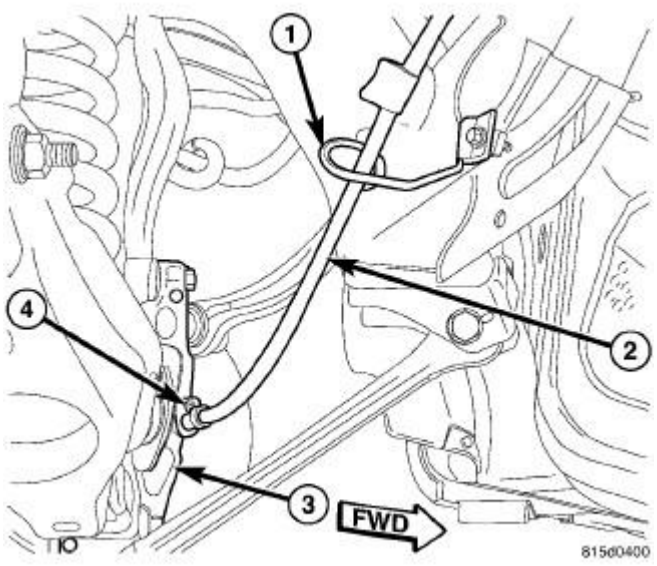

Fig. 78: Rear Cable Routing To Knuckle
Courtesy of CHRYSLER GROUP, LLC

28. On each side, remove screw fastening parking brake cable routing guide (1) to crossmember. Remove J-nuts from crossmember.

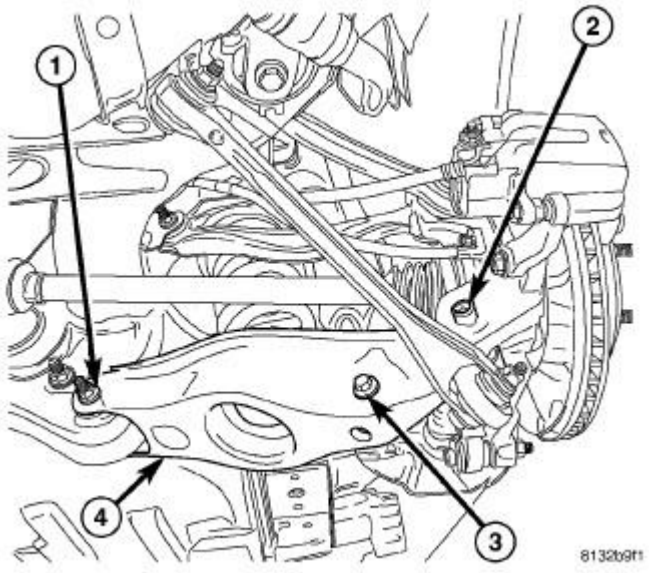

Fig. 79: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: For installation purposes, when removing fasteners for any rear suspension links, it is important to note which bolt fastens what component and in what direction it is installed in.

29. On each side of crossmember, remove bolt and nut (1) fastening spring link (4) to crossmember.

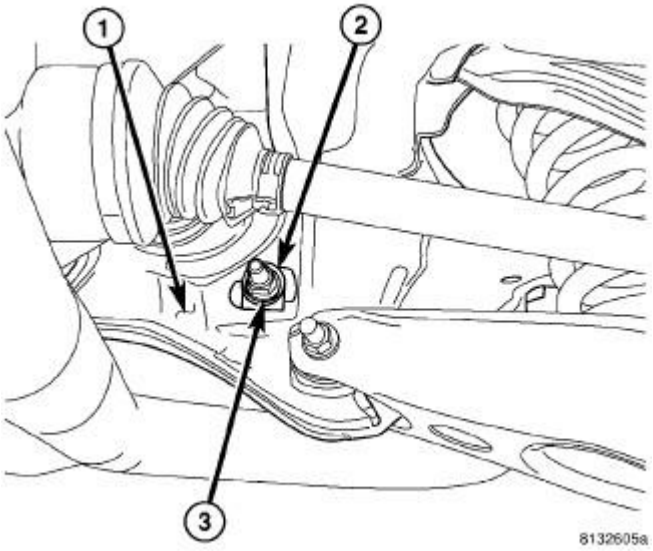

Fig. 80: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

30. On each side of crossmember, while holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

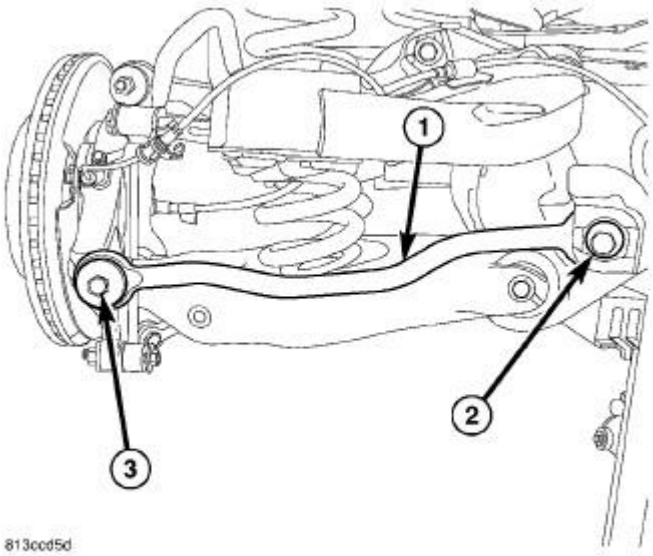

Fig. 81: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

31. On each side of crossmember, slide cam bolt (2) attaching toe link rearward, out of

crossmember and link (1).

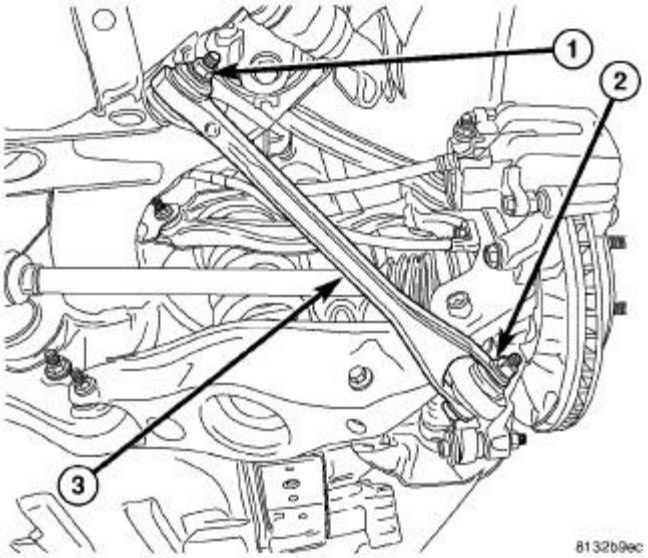

Fig. 82: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

32. On each side of crossmember, remove bolt and nut (1) mounting link (3) at crossmember.

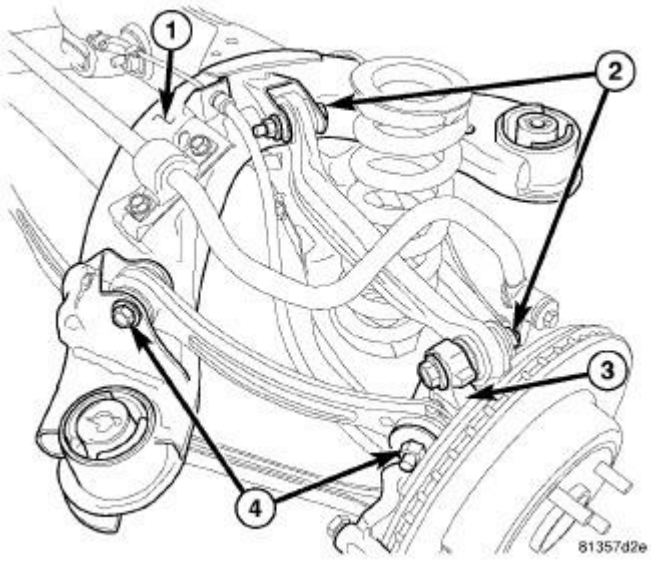

Fig. 83: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

33. On each side of crossmember, remove nut and bolt (4) mounting tension link to crossmember (1).
34. On each side of crossmember, remove nut and bolt (2) mounting camber link to crossmember

(1).

35. Carefully lift knuckle with links and parking brake cable attached from rear suspension crossmember.
36. Remove crossmember from jack.

INSTALLATION

INSTALLATION

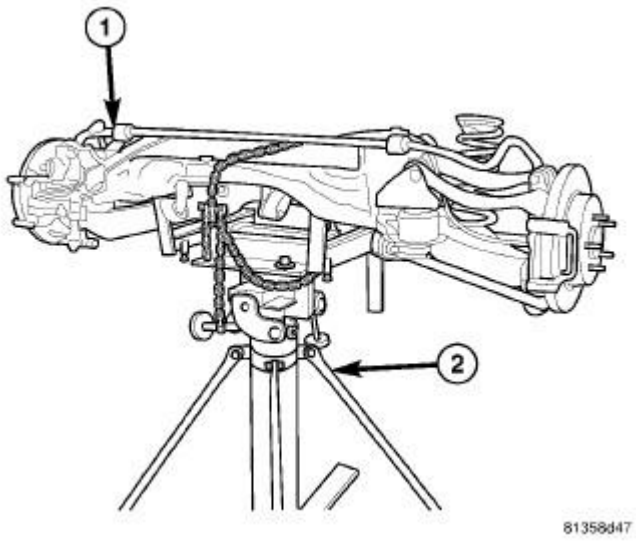

Fig. 84: Rear Crossmember Positioned On Jack
Courtesy of CHRYSLER GROUP, LLC

1. Install rear crossmember (1) on jack (2) head in same position in which it was removed and secure in place.

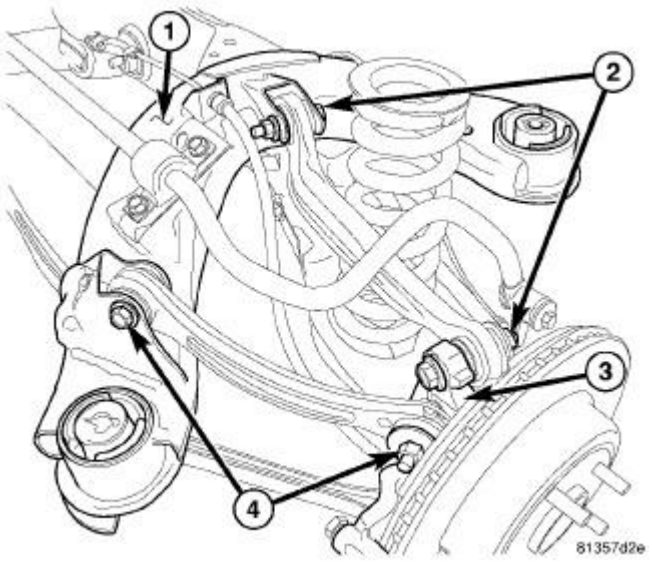

Fig. 85: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

2. Carefully place one side knuckle with links and parking brake cable attached as an assembly into mounted position on rear suspension crossmember. Install nut and bolt (2) mounting camber link to crossmember (1) to hold assembly in place. **Do not tighten at this time.**
3. Carefully place opposite side knuckle with links and parking brake cable attached as an assembly into mounted position on rear suspension crossmember. Install nut and bolt (2) mounting camber link to crossmember (1) to hold assembly in place. **Do not tighten at this time.**
4. On each side of crossmember, install nut and bolt (4) mounting each tension link to crossmember (1). **Do not tighten at this time.**

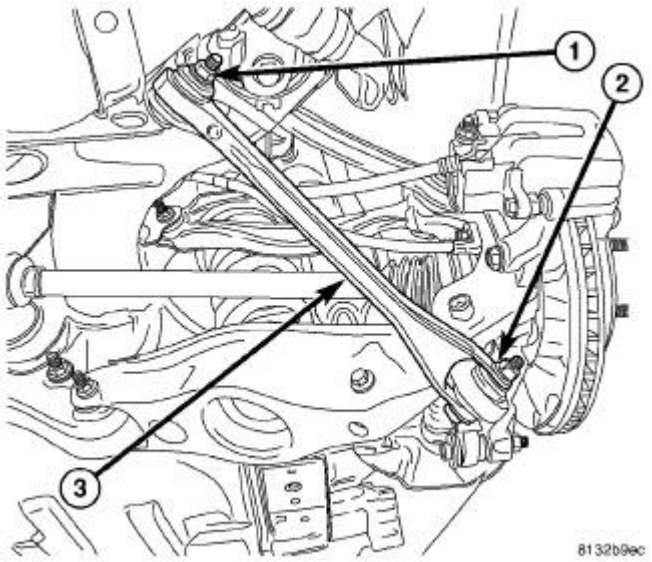

Fig. 86: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

5. On each side of crossmember, Install bolt and nut (1) mounting each compression link (3) at crossmember. **Do not tighten at this time.**

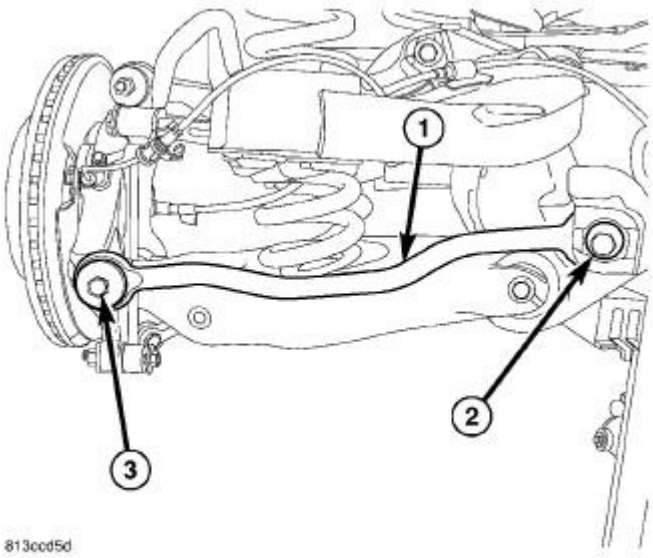

Fig. 87: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

6. On each side of crossmember, slide cam bolt (2) attaching toe link through crossmember and link (1) from rear.

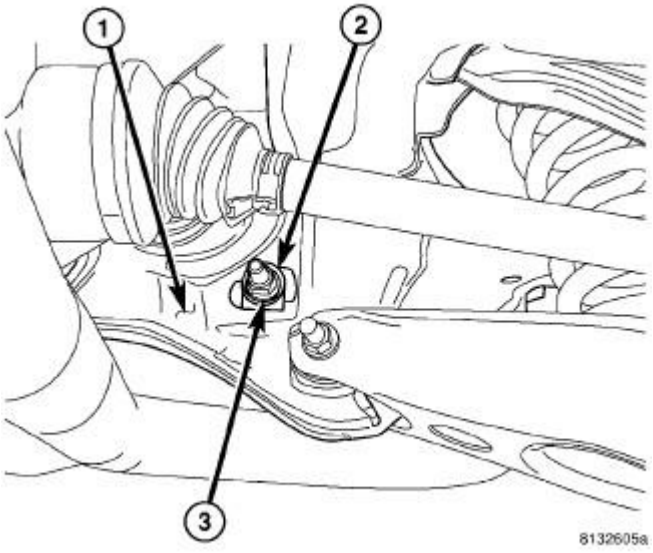

Fig. 88: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

7. On each side of crossmember, while holding toe adjustment cam bolt from rotating, install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten at this time.**

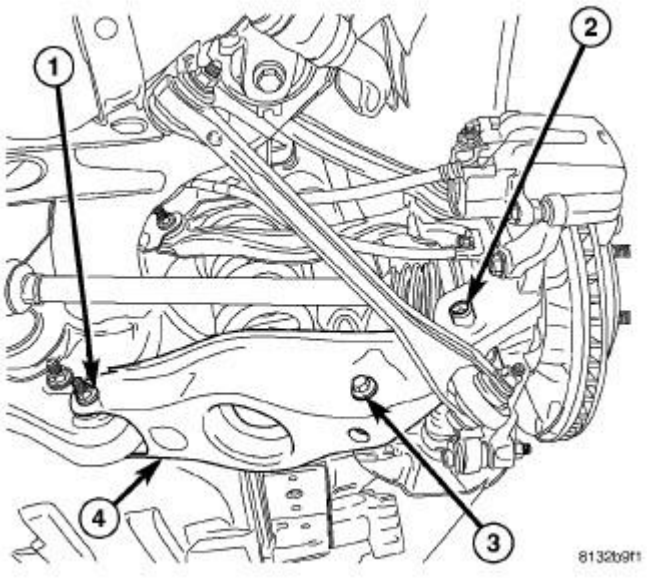

Fig. 89: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

8. On each side of crossmember, install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten at this time.**

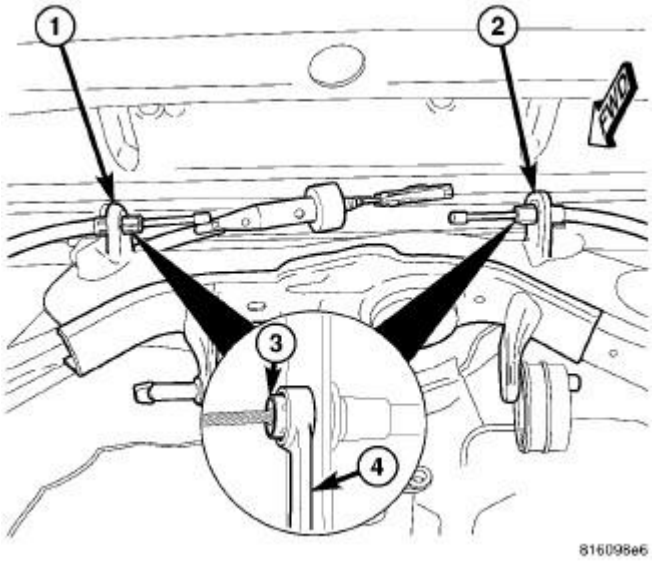

Fig. 90: Cables AT Crossmember Bracket
Courtesy of CHRYSLER GROUP, LLC

9. On each side of crossmember rear, guide leading end of rear parking brake through

crossmember bracket (1 - left) (2 - right) near equalizer and press cable housing retainer into bracket allowing retainer fingers to lock cable in place.

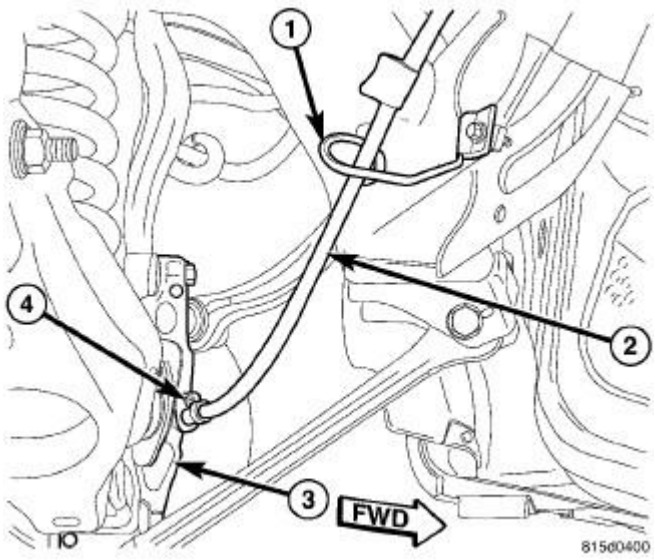

Fig. 91: Rear Cable Routing To Knuckle
Courtesy of CHRYSLER GROUP, LLC

10. On each side of crossmember rear, install J-nut for parking brake cable guide.
11. On each side, install screw fastening parking brake cable routing guide (1) to crossmember.

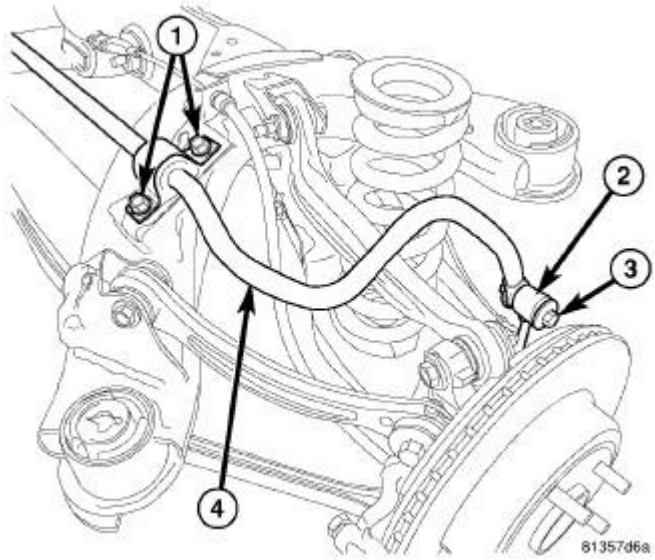

Fig. 92: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install stabilizer bar (4) with cushions and retainers on crossmember.

13. Install cushion retainer mounting bolts (1). **Do not tighten at this time.**
14. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer link (2). **Do not tighten at this time.**
15. Tighten cushion retainer mounting bolts (1) to 60 N.m (44 ft. lbs.).

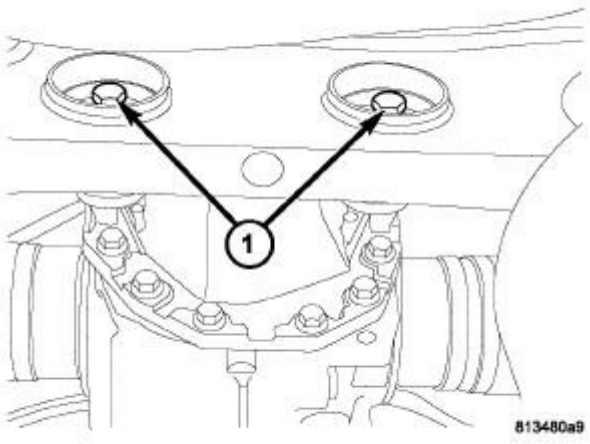

Fig. 93: Rear Axle-To-Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Differential mounting bolts (1) must be installed through bushings prior to crossmember installation in vehicle. Bolts cannot be inserted through bushings once crossmember is installed.

16. Transfer differential mounting bolts (1) from original crossmember differential mount bushings to bushings in replacement crossmember. Install bolts from rear. Be sure to insert bolts through correct mount bushings in crossmember depending on rear axle differential (198 mm axle differential shown in figure).

NOTE: Do not install coil springs on spring links at this time.

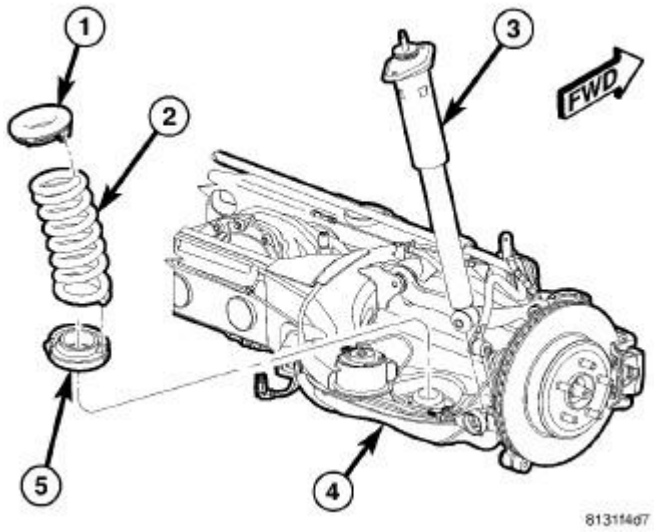

Fig. 94: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

17. Raise crossmember to body mounting points. As crossmember is raised, align shocks (3) with pockets in spring links. **Do not install bolts at this time.**

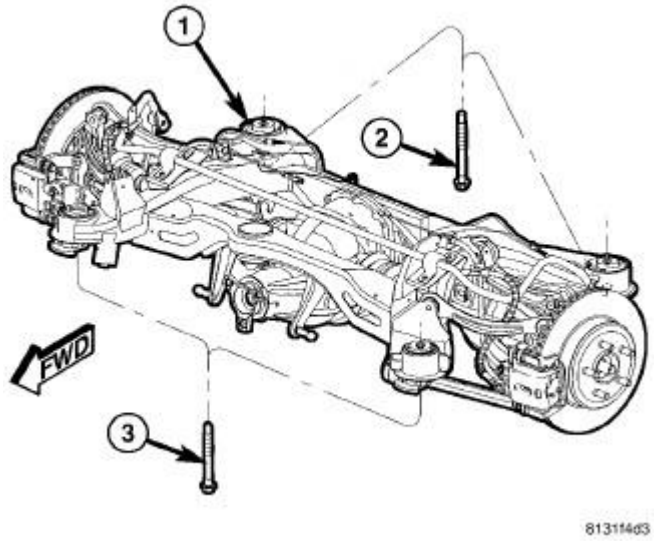

Fig. 95: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

18. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be

installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

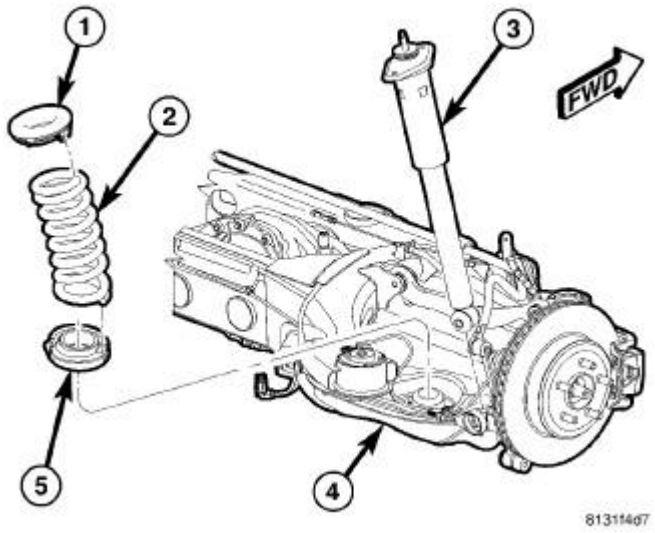

Fig. 96: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

19. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

20. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

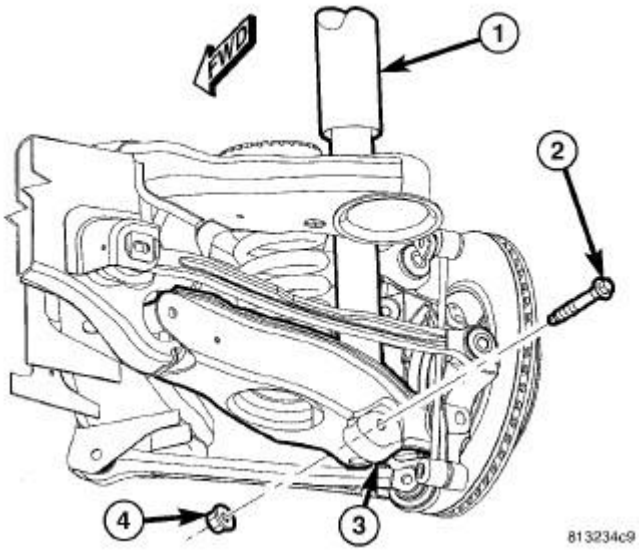

Fig. 97: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

21. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
22. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

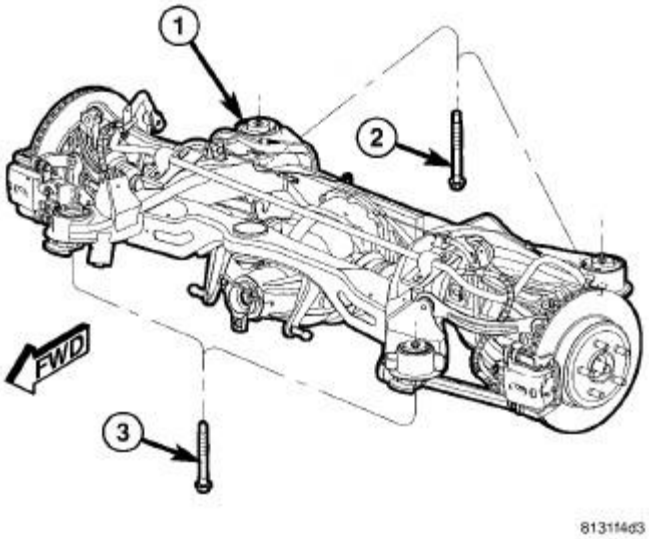

Fig. 98: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

23. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
24. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

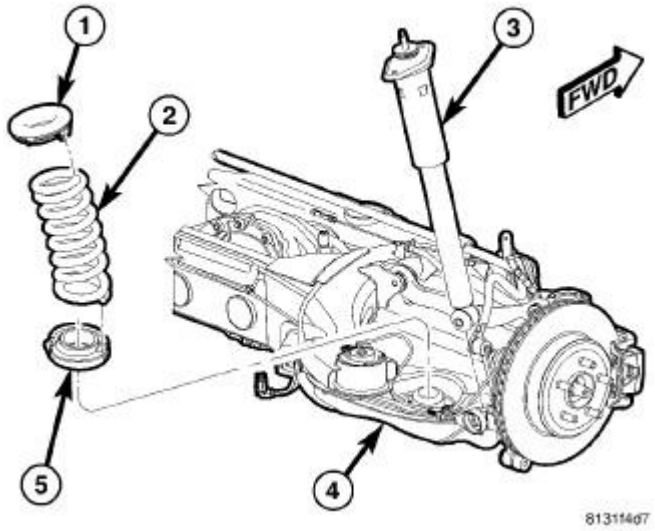

Fig. 99: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

25. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

26. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

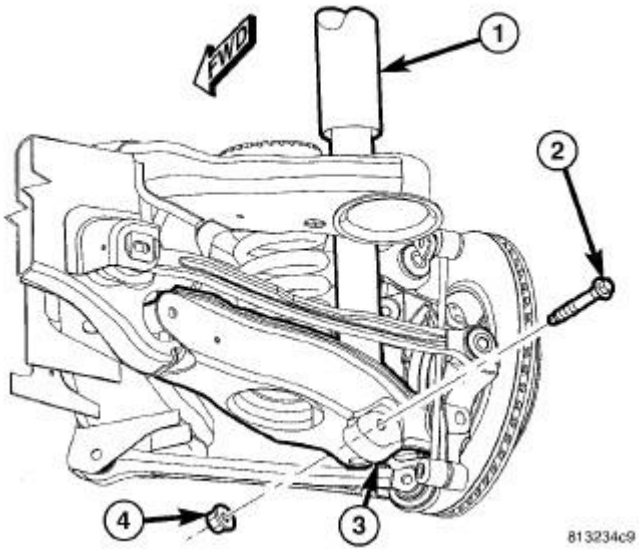

Fig. 100: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

27. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
28. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

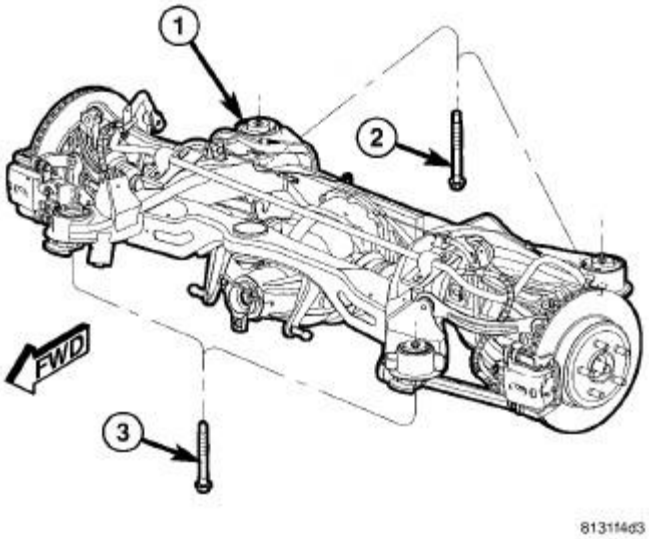

Fig. 101: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

29. Raise left side of crossmember (1) into mounted position. Install left side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

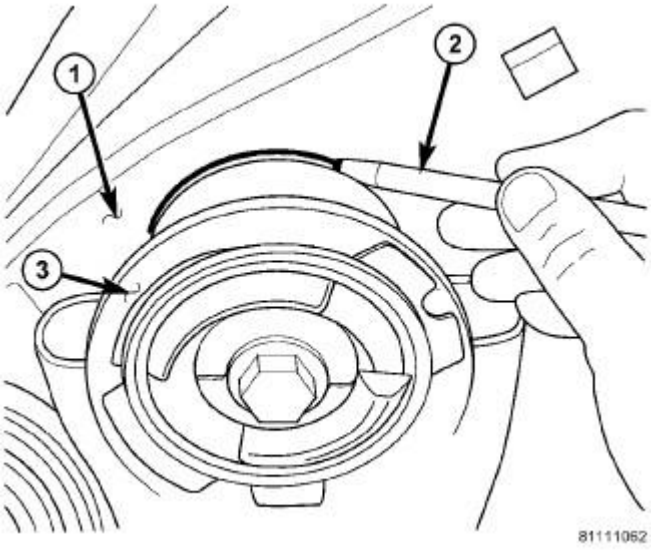

Fig. 102: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

30. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

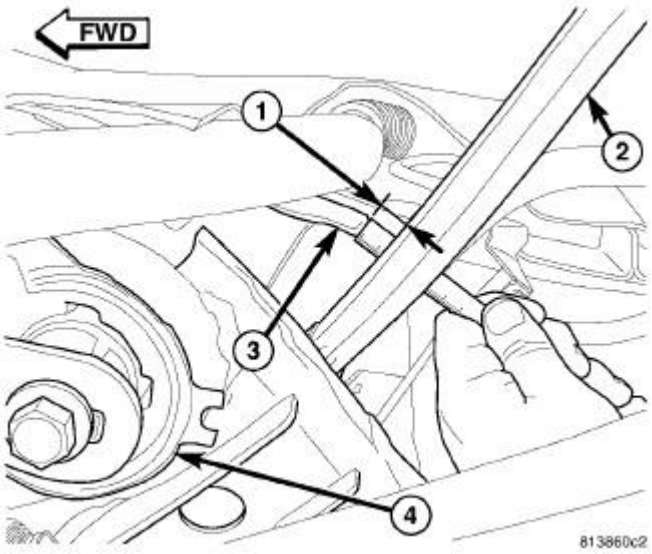

Fig. 103: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

31. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

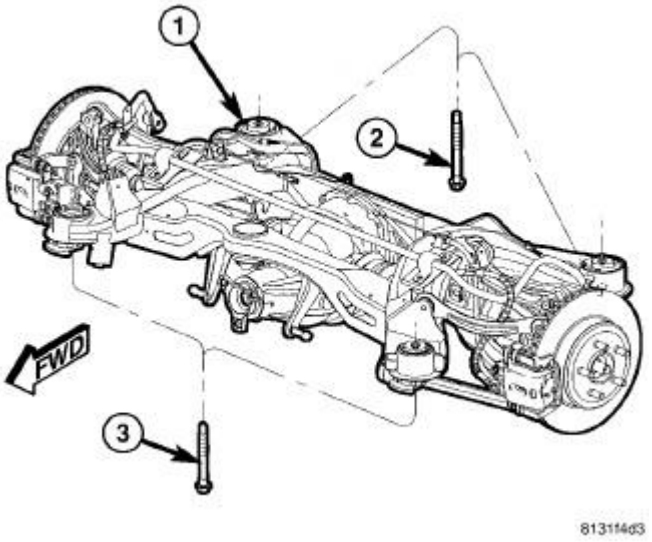

Fig. 104: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

32. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

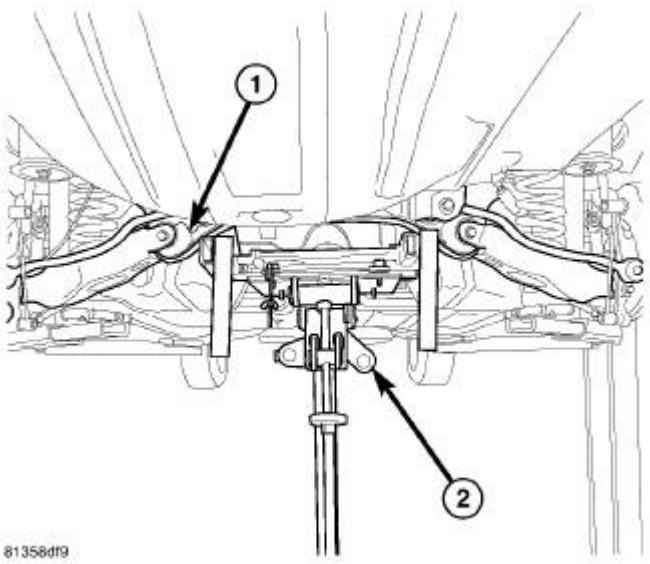

Fig. 105: Jack Positioned Beneath Crossmember
Courtesy of CHRYSLER GROUP, LLC

33. Remove jack (2) from under rear crossmember.

Fig. 106: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

34. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

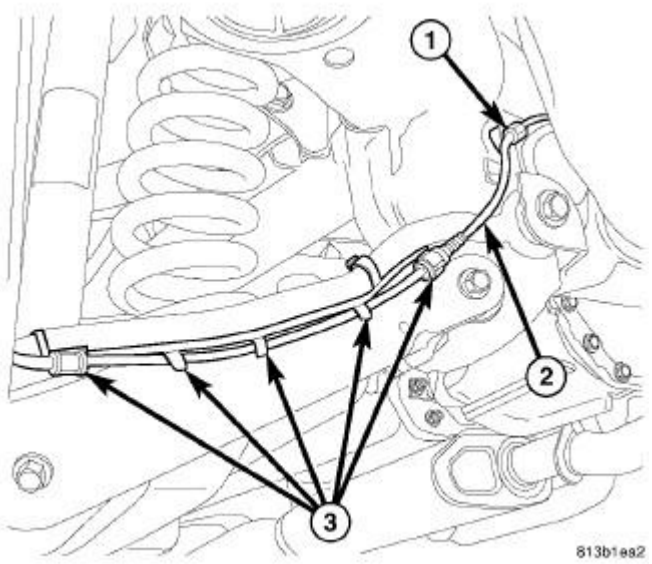

Fig. 107: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

35. Clip left rear wheel speed sensor cable (2) to routing clip (1) above toe link mount on rear crossmember.

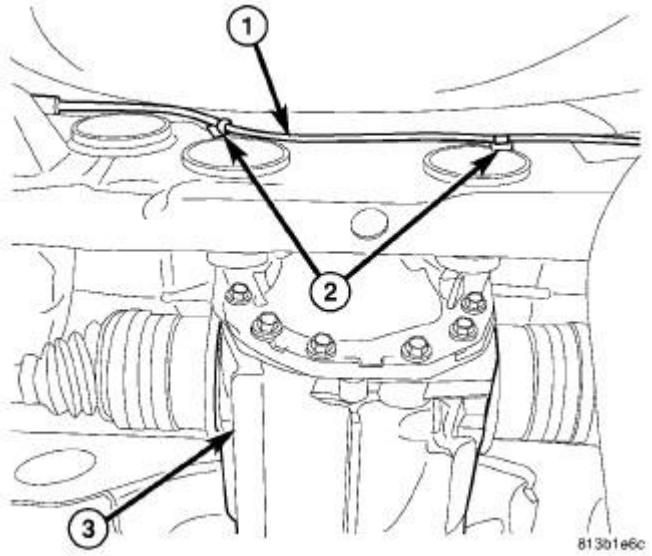

Fig. 108: Left Wheel Speed Sensor Routing Over Rear Differential
Courtesy of CHRYSLER GROUP, LLC

36. Clip left rear wheel speed sensor cable (1) to routing clips (2) along rear of crossmember near rear differential (3).

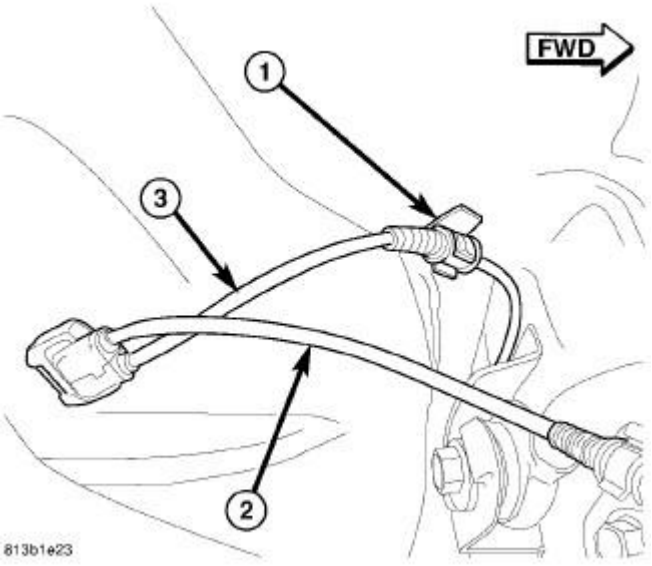

Fig. 109: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

37. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

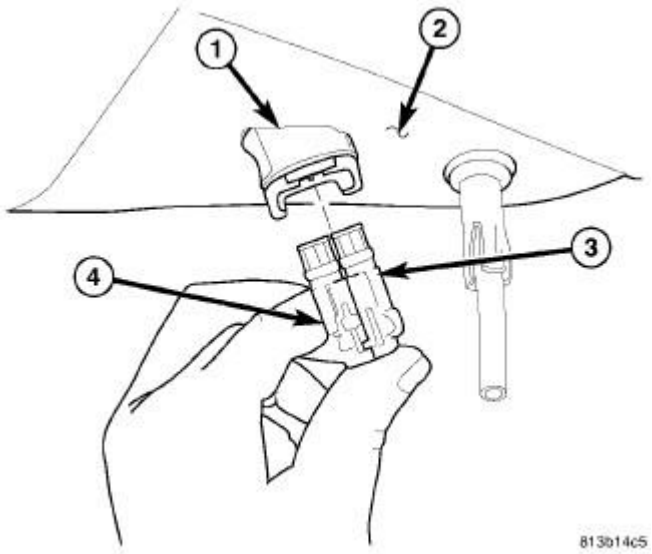

Fig. 110: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

38. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
39. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

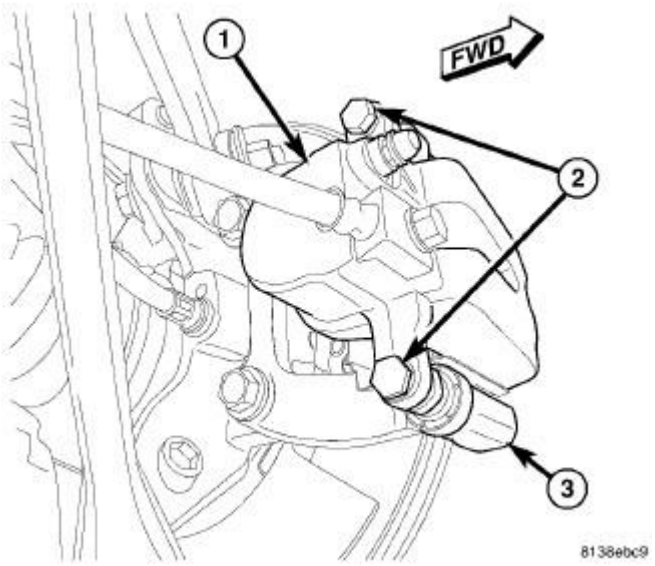

Fig. 111: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

40. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
    2. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

    3. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
    4. Make sure brake hose is properly routed and will not come in contact with suspension components.

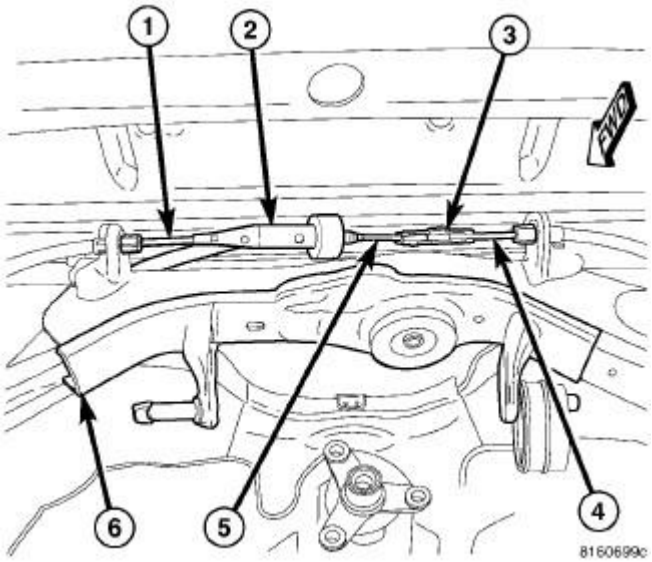

Fig. 112: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

41. Route front parking brake cable with equalizer above rear crossmember.

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

42. Connect left rear parking brake cable (1) to equalizer (2).
43. Connect right rear parking brake cable (4) to connector (3) already attached to front parking brake cable (5).

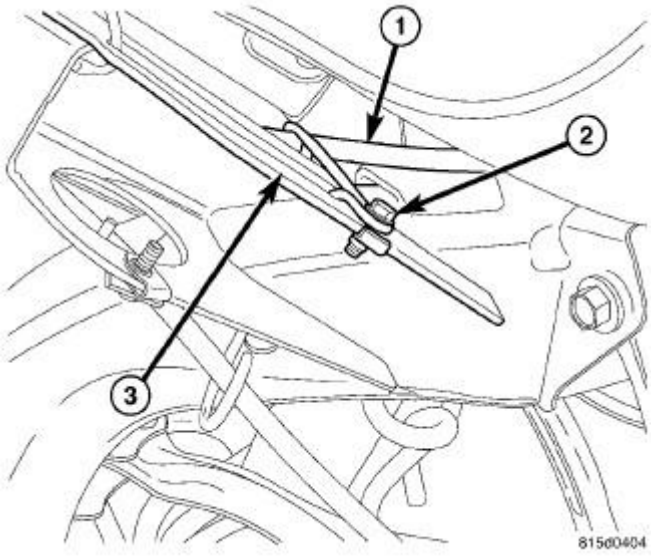

Fig. 113: Front Cable AT Left Front Of Crossmember

Courtesy of CHRYSLER GROUP, LLC

44. Install J-nut for mounting parking brake cable routing bracket to crossmember.
45. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

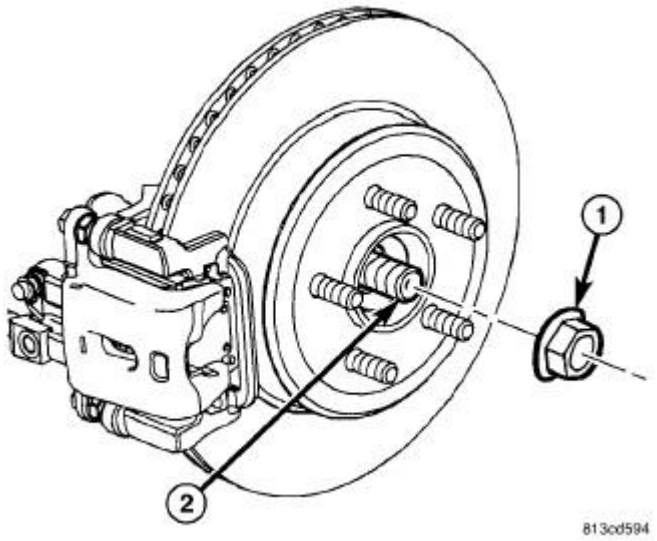

Fig. 114: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

46. On each side of vehicle, slide an axle half shaft (2) through hub and bearing and install hub nut (1). **Do not tighten hub nuts at this time.**
47. Install rear axle differential. Refer to **INSTALLATION** or **INSTALLATION** .
48. While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

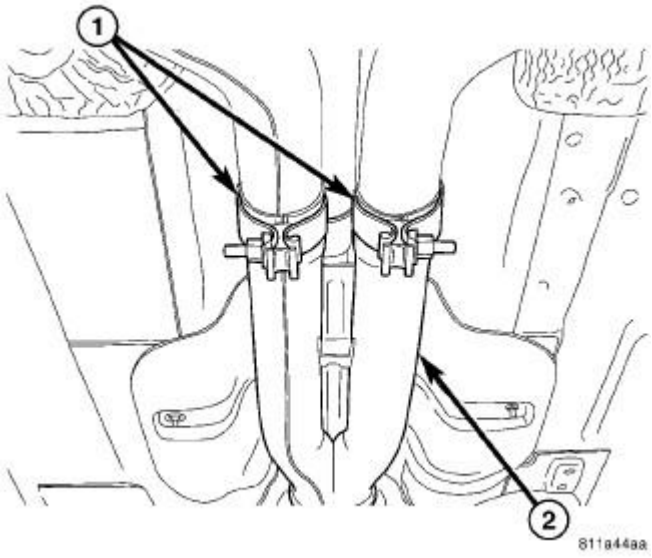

Fig. 115: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

49. Install rear exhaust system (2) (dual-outlet exhaust shown in figure).

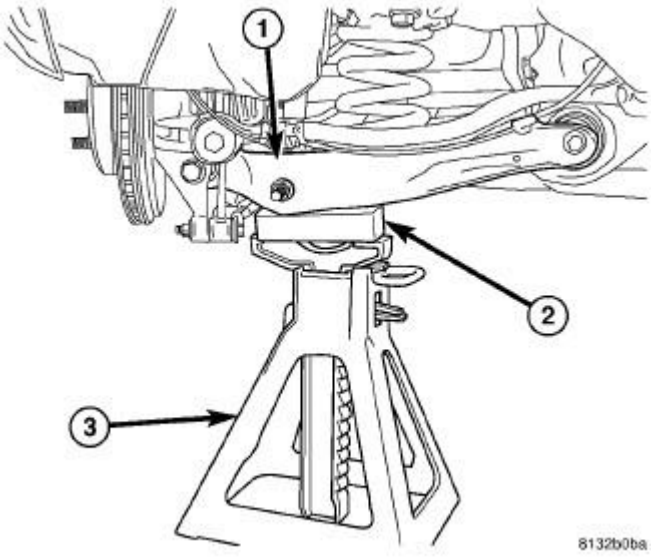

Fig. 116: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

50. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

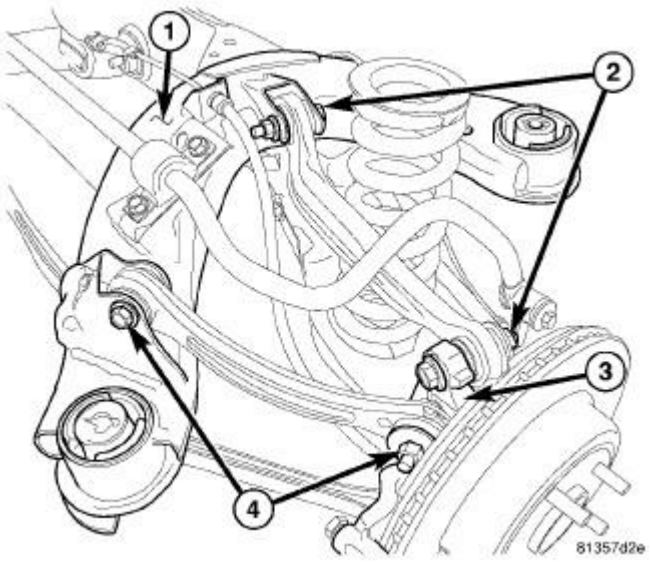

Fig. 117: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

51. Tighten camber link bolt (2) at crossmember to 85 N.m (63 ft. lbs.).
52. Tighten tension link bolt nut (2) at crossmember to 85 N.m (63 ft. lbs.).

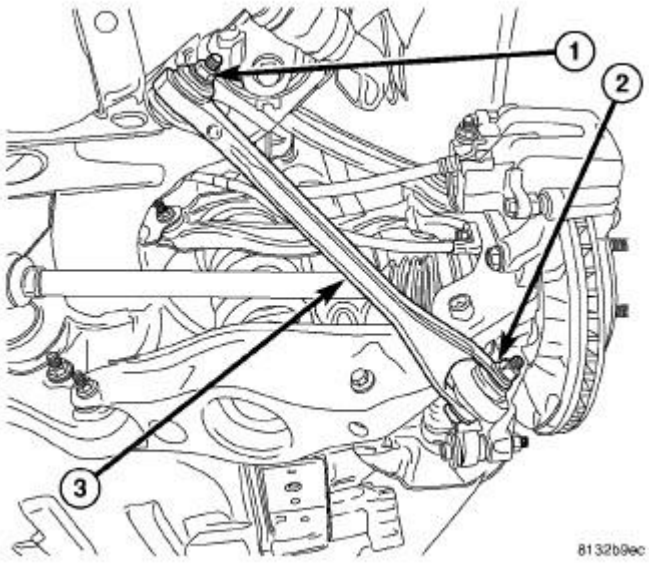

Fig. 118: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

53. Tighten compression link bolt (2) at crossmember to 85 N.m (63 ft. lbs.) torque.

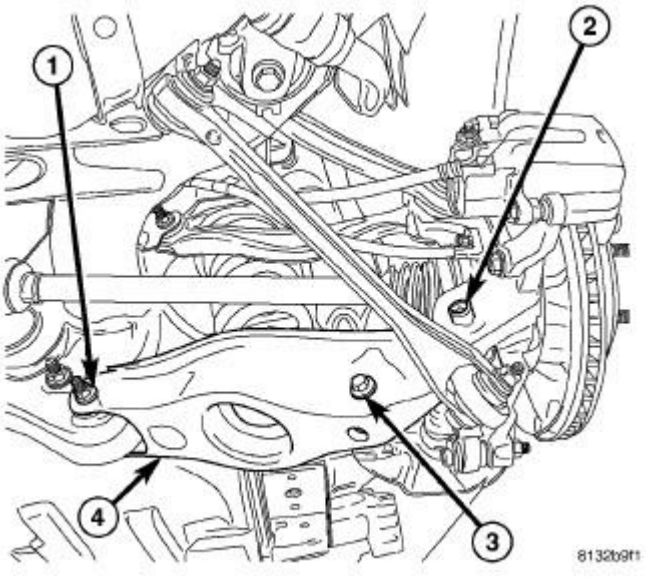

Fig. 119: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

54. Tighten spring link bolt (1) at crossmember to 108 N.m (80 ft. lbs.).

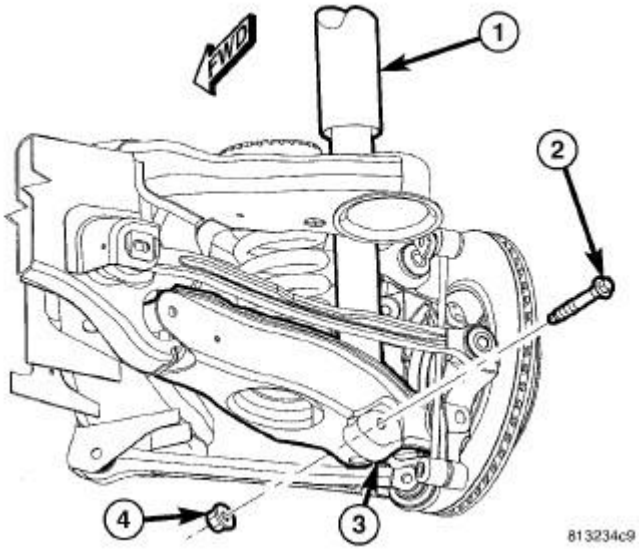

Fig. 120: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

55. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

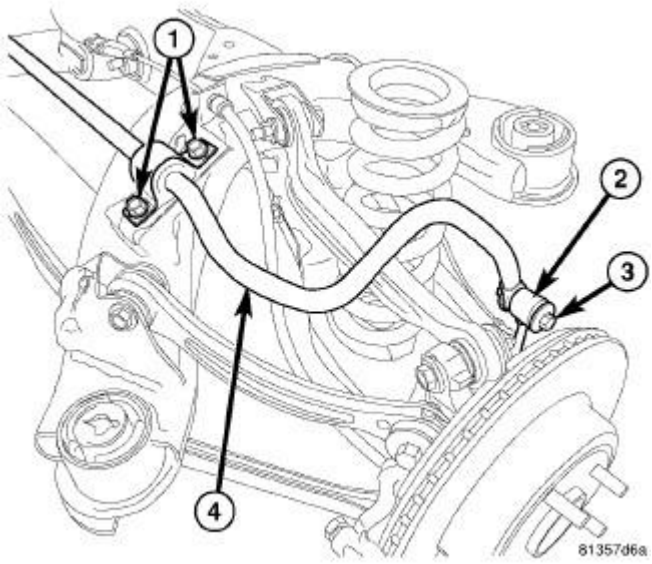

Fig. 121: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

56. Tighten stabilizer link bolts (3) to 61 N.m (45 ft. lbs.).

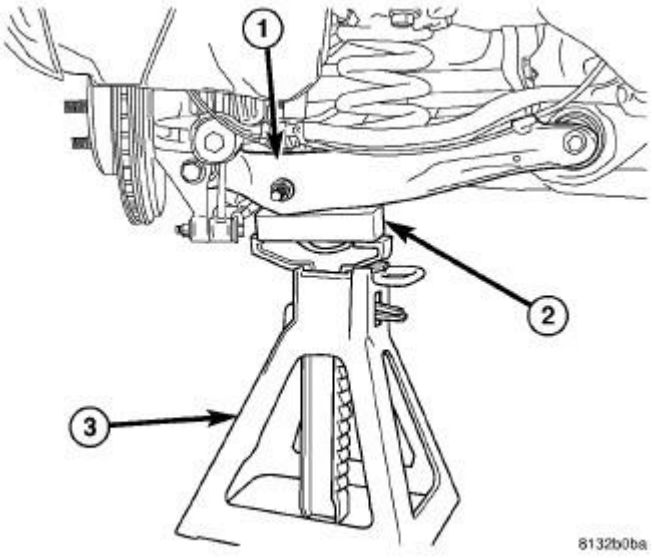

Fig. 122: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

57. Raise vehicle and remove jack stands (3).

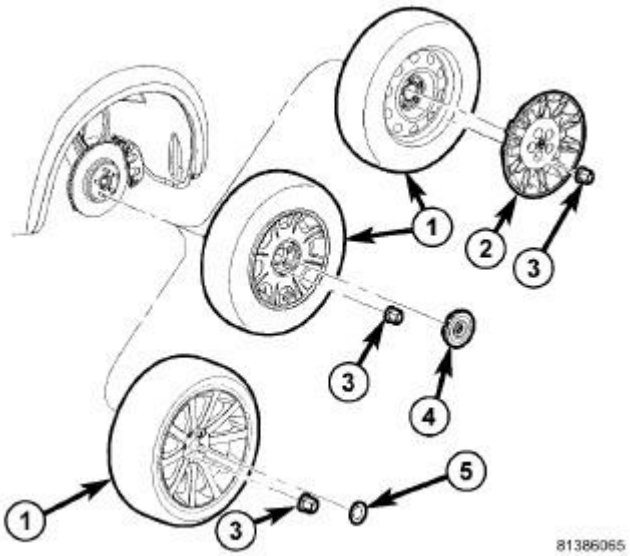

Fig. 123: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

58. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **INSTALLATION** .
59. Lower vehicle.

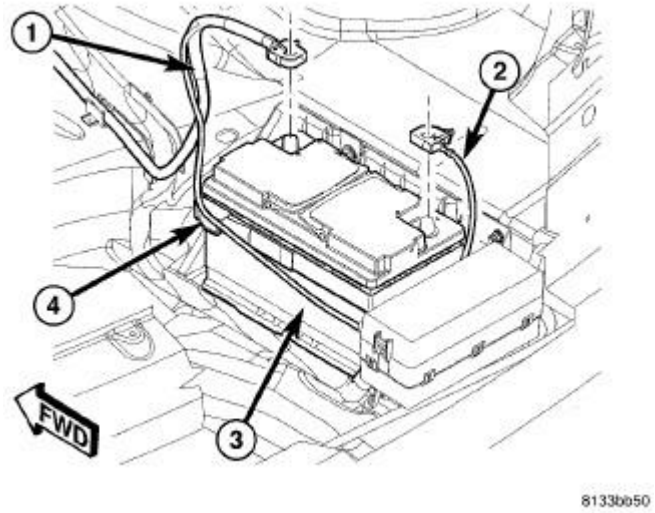

Fig. 124: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

60. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **STANDARD PROCEDURE** .
61. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving

vehicle.

62. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (). Refer to 31 and **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

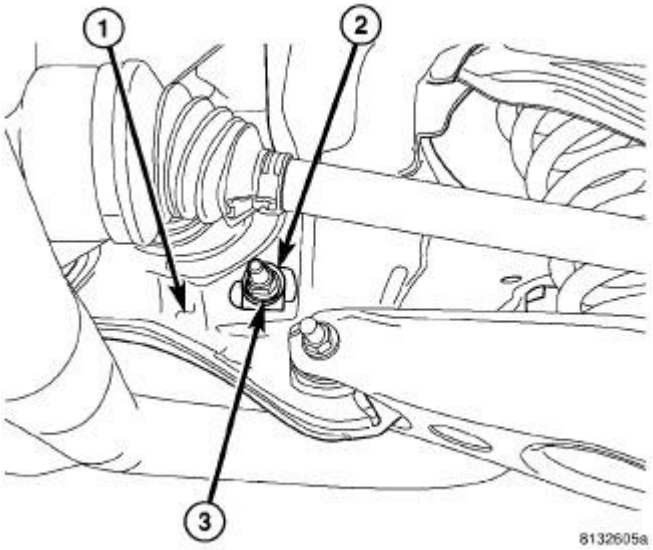

Fig. 125: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

63. On each side of crossmember, while holding cam bolt from turning, tighten toe link cam bolt nut (2) to 108 N.m (80 ft. lbs.) torque.

ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL

REMOVAL

REMOVAL

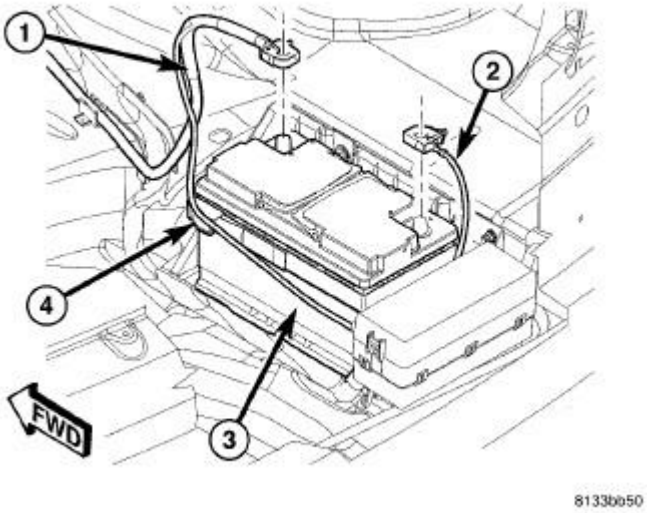

Fig. 126: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

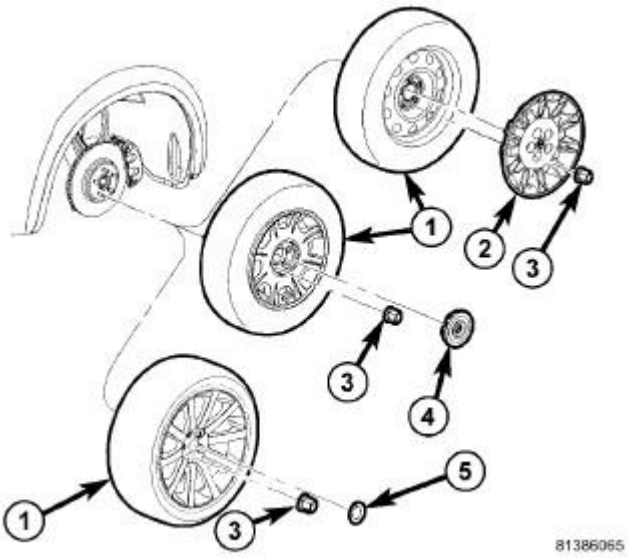

Fig. 127: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

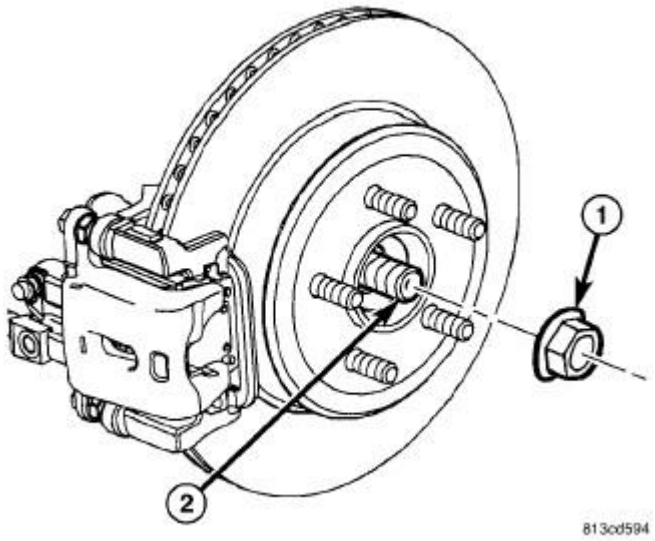

Fig. 128: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle rear, while a helper applies brakes to keep hub from rotating, remove hub nut (1) from half shaft (2).

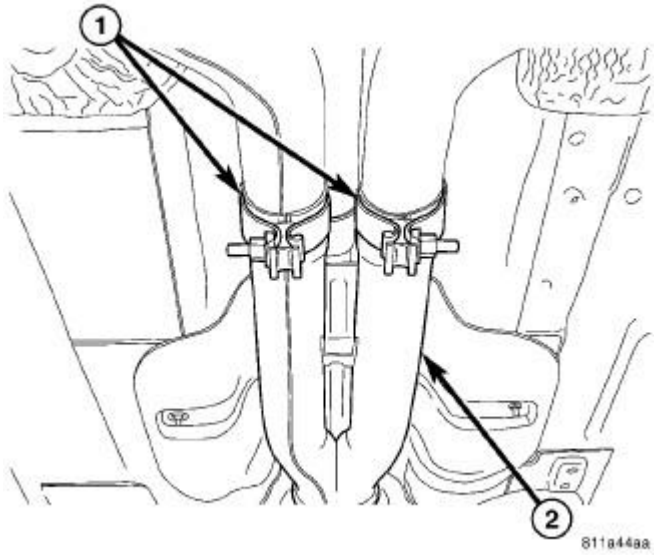

Fig. 129: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

5. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure).
6. Remove rear axle differential. Refer to **REMOVAL** .
7. Slide each axle half shaft from hub and bearing and remove from vehicle.

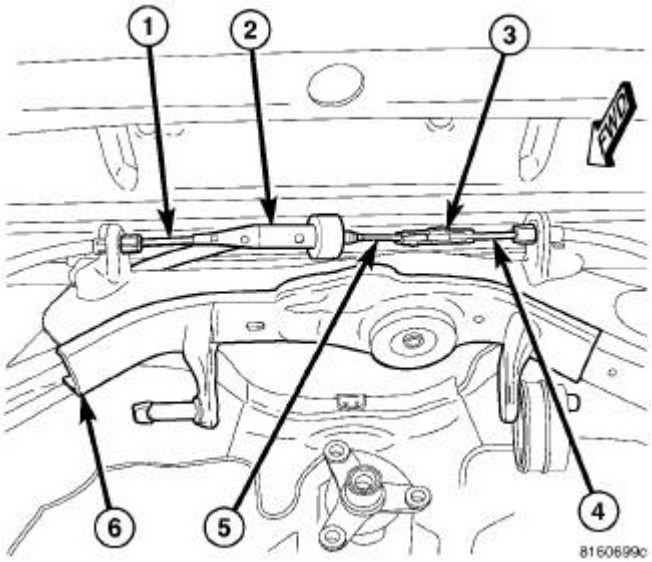

Fig. 130: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential.

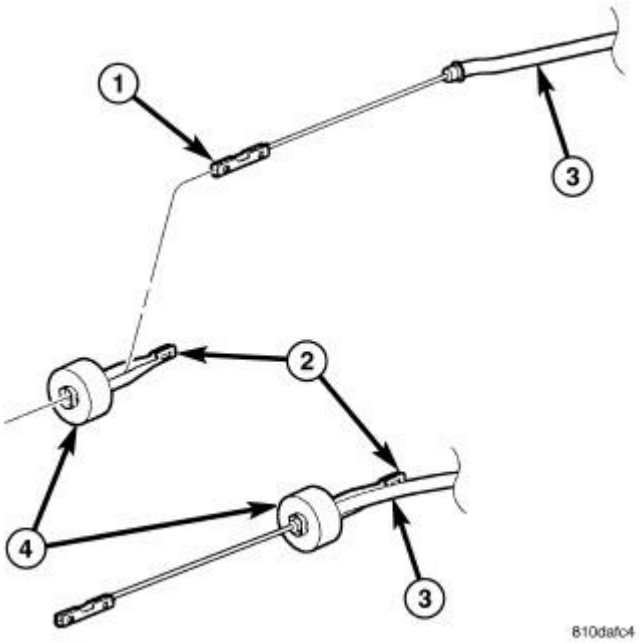

Fig. 131: Front Cable Installation Into Equalizer

Courtesy of CHRYSLER GROUP, LLC

9. Remove front parking brake cable (3) from equalizer (2).

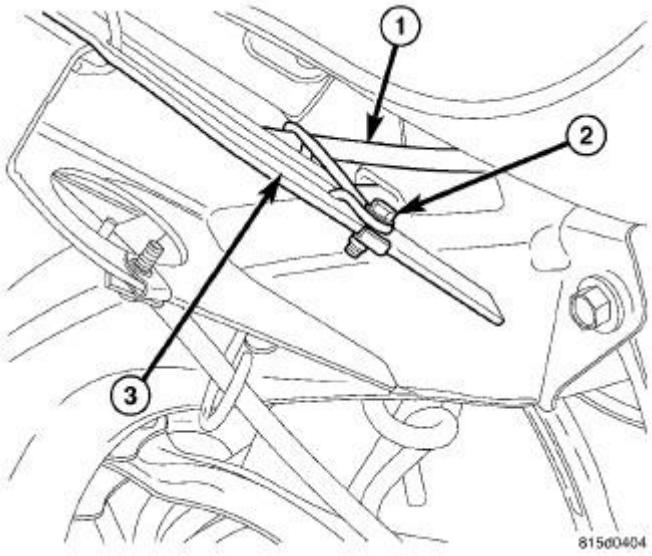

Fig. 132: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

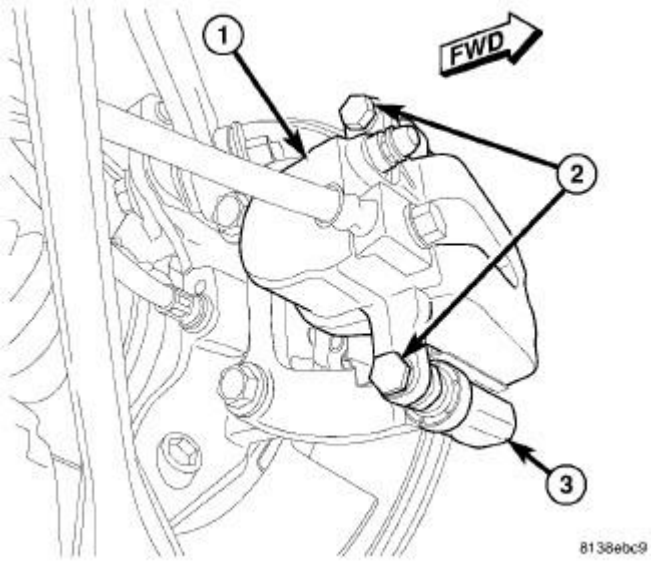

Fig. 133: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:

1. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
2. Remove brake caliper (1) from brake adapter (3) and pads.
3. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

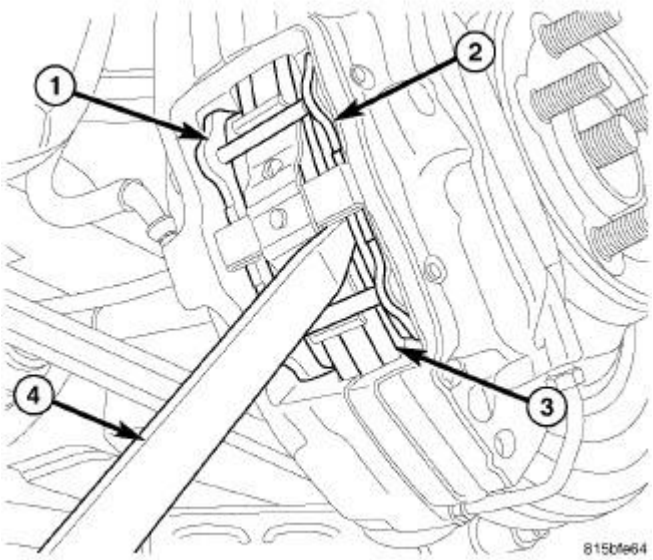

Fig. 134: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

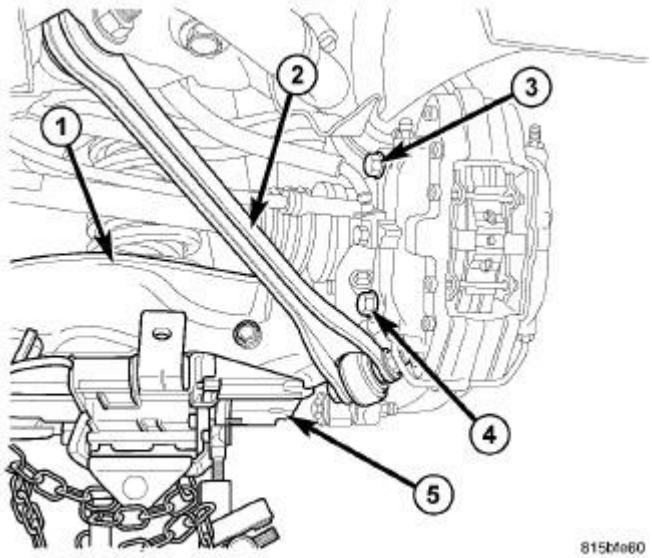

Fig. 135: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

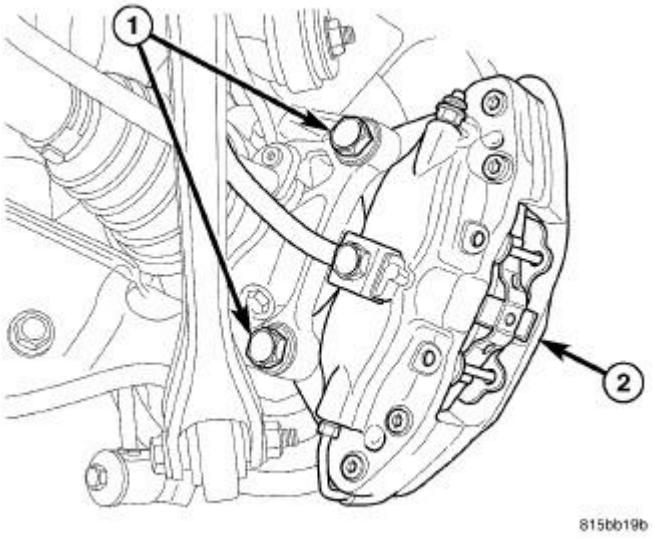

Fig. 136: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care

not to overextend brake hose when doing this.

17. If equipped with SRT8 disc brakes, remove jack from under spring link.

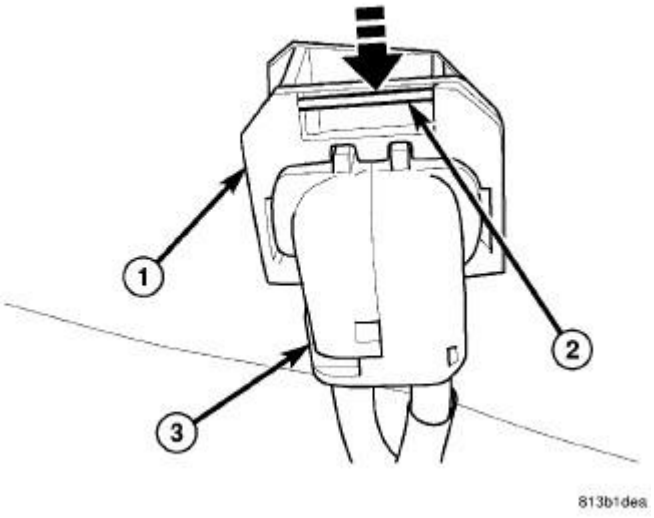

Fig. 137: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

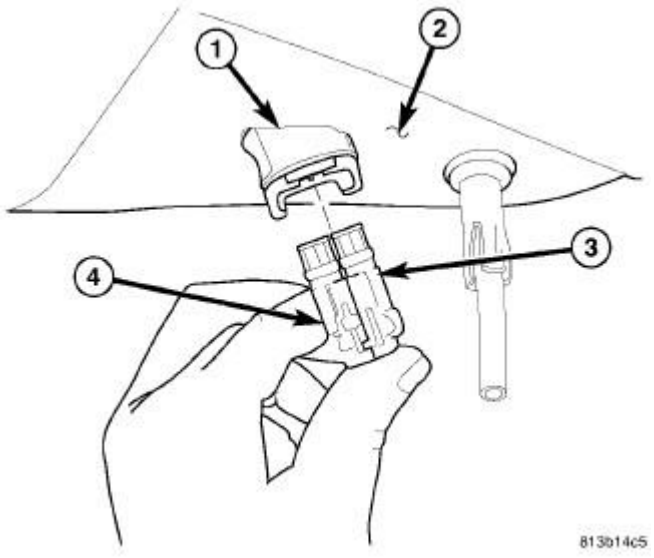

Fig. 138: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1)

located in luggage compartment floor pan (2).

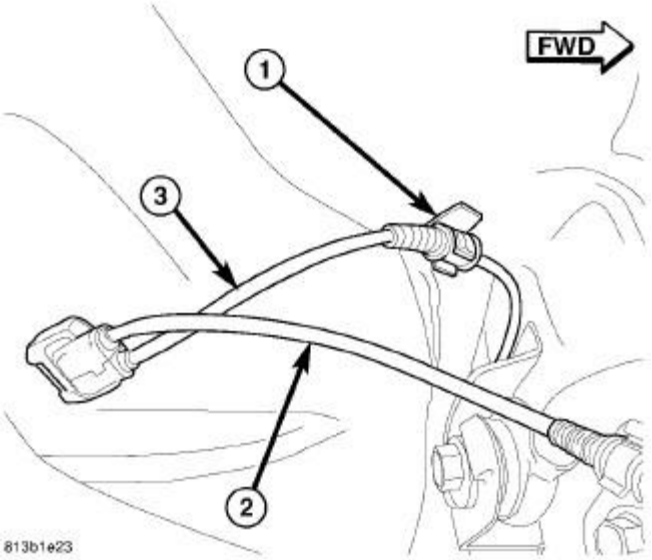

Fig. 139: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

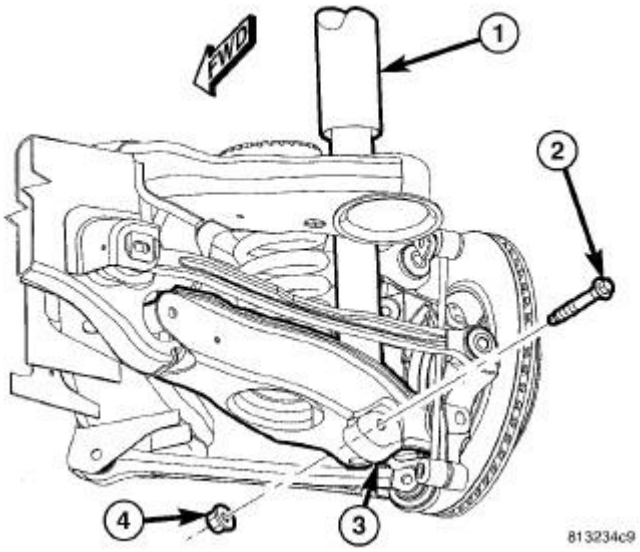

Fig. 140: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

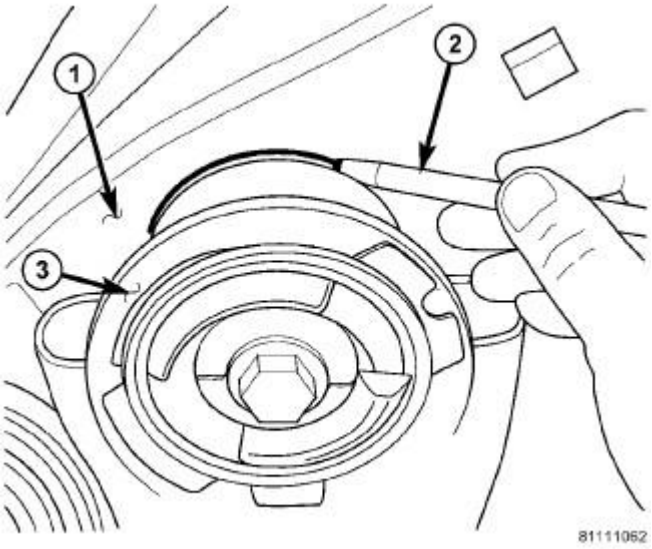

Fig. 141: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

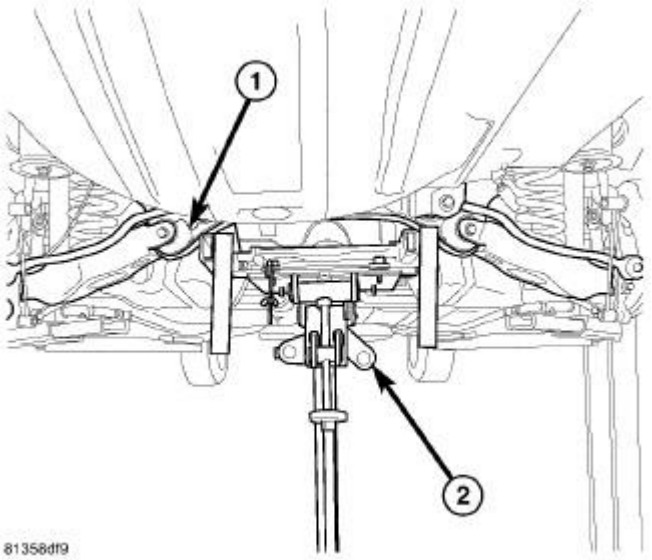

Fig. 142: Jack Positioned Beneath Crossmember

Courtesy of CHRYSLER GROUP, LLC

23. Position under-hoist utility jack or transmission jack (2) under center of rear crossmember (1). Raise jack head to contact crossmember and secure in place.

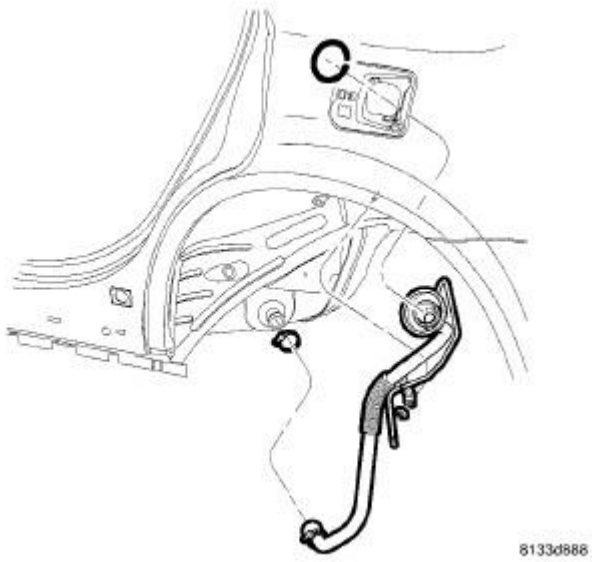

Fig. 143: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .

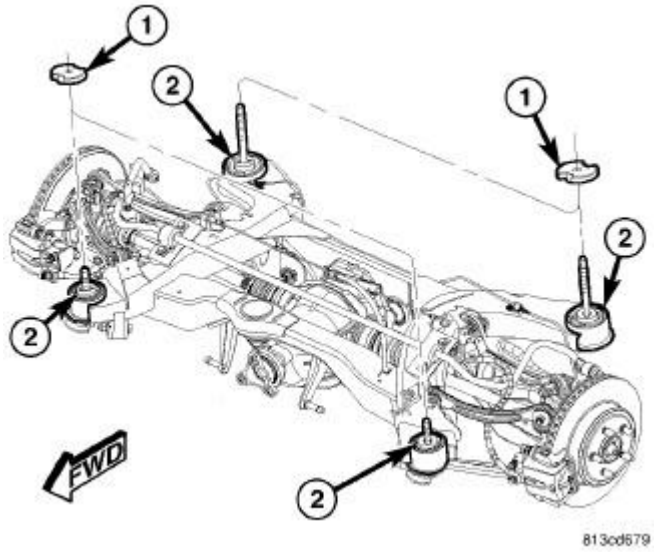

Fig. 144: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.**

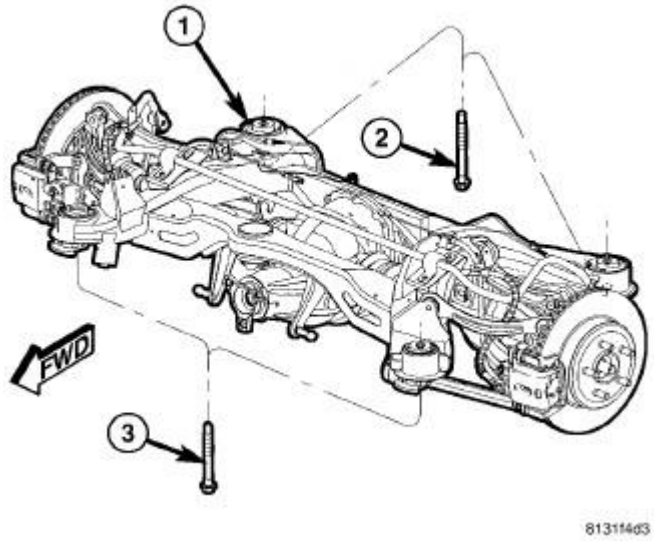

Fig. 145: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack until crossmember is at a comfortable working level.

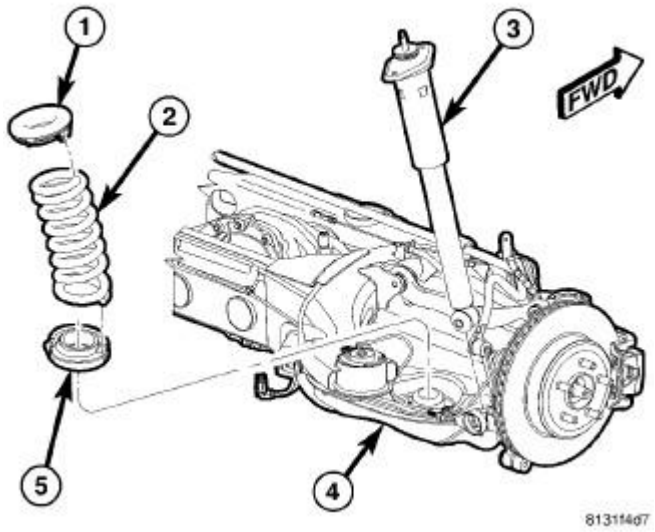

Fig. 146: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

27. Remove coil springs and isolators (1, 2 and 5) from spring links.

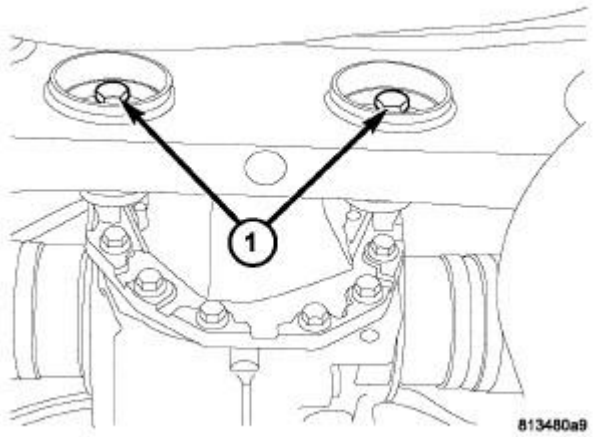

Fig. 147: Rear Axle-To-Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

28. Remove bolt (1) from bushing prior to removal.

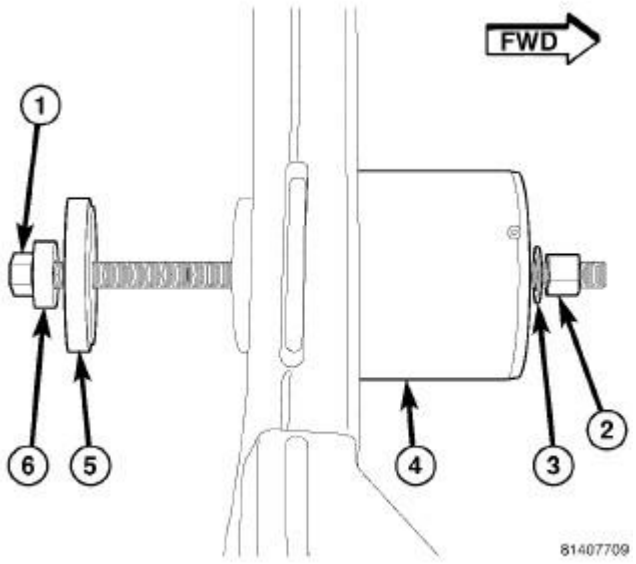

Fig. 148: Tools Assembled For Removal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using Special Tool (special tool #9520, Remover/Installer, Bushing), lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

NOTE: When installing Thrust Bearing (6), be sure to place hardened side toward Bolt head.

29. Assemble tools (See following list) over bushing as shown in illustration.
    - (1) Bolt
    - (2) Nut
    - (3) Washer
    - (4) Receiver (special tool #9520-4, Cup, Receiver)
    - (5) Remover (special tool #9520-3, Remover, Bushing)
    - (6) Thrust Bearing
30. While holding Nut (2) from rotating, **using hand tools** , tighten Bolt (1) until Remover (5) comes in contact with bushing and Receiver (4) sets squarely against crossmember.
31. Continue to tighten Bolt (1), pressing bushing out of crossmember.
32. Remove tools with bushing.

INSTALLATION

INSTALLATION

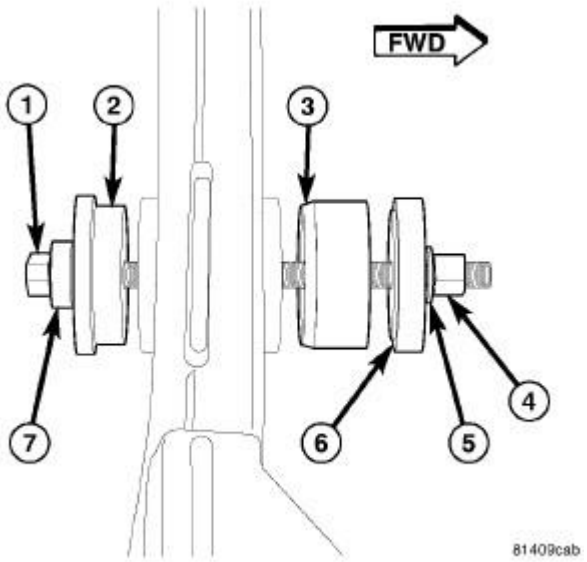

Fig. 149: Tools Assembled For Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is important that tapered end (3) of bushing be installed first into forward end of crossmember to ease installation.

NOTE: When installing Thrust Bearing (7), be sure to place hardened side toward Bolt head.

1. Insert tapered end of NEW bushing (3) into forward end of crossmember bushing bore.
2. Assemble tools (See following list) through crossmember and bushing as shown in illustration.
   - (1) Bolt
   - (2) Disc (special tool #9520-1, Installer Disc)
   - (3) Bushing
   - (4) Nut
   - (5) Washer
   - (6) Installer (special tool #9520-2, Installer, Bushing)
   - (7) Thrust Bearing
3. Insert Installer (6) into end of bushing and Disc (2) into opposite end of crossmember bushing bore.
4. While holding Nut (4) from rotating, tighten Bolt (1) **using hand tools** , pressing bushing into crossmember. Stop when Installer (6) bottoms against bushing bore.
5. Remove tools.

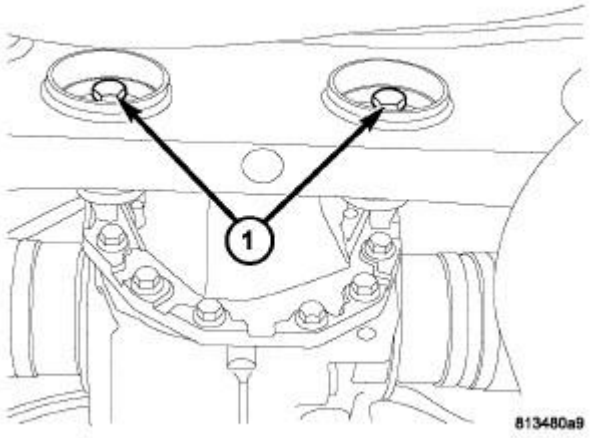

Fig. 150: Rear Axle-To-Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Differential mounting bolts (1) must be installed through bushings prior to crossmember installation in vehicle. Bolts cannot be inserted through bushings once crossmember is installed.

6. Insert differential mounting bolt (1) through mount bushing from rear (198 mm axle differential shown in figure. Other axles differ, but similar).

NOTE: Do not install coil springs on spring links at this time.

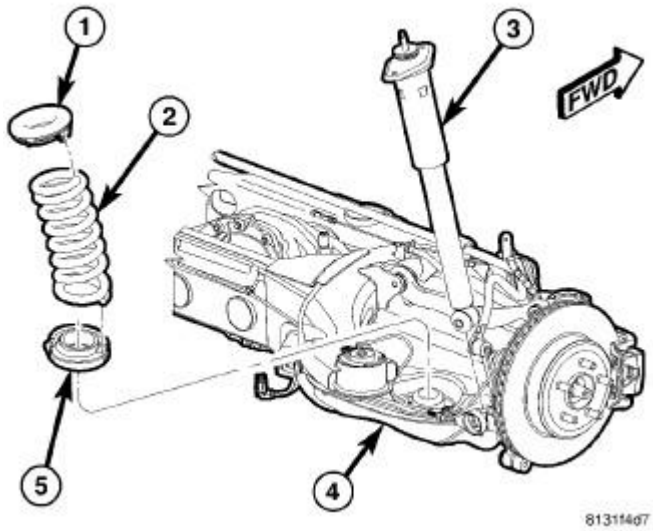

Fig. 151: Coil Spring And Shock Assy.

Courtesy of CHRYSLER GROUP, LLC

7. Raise crossmember to body mounting points. As crossmember is raised, align shocks (3) with pockets in spring links. **Do not install bolts at this time.**

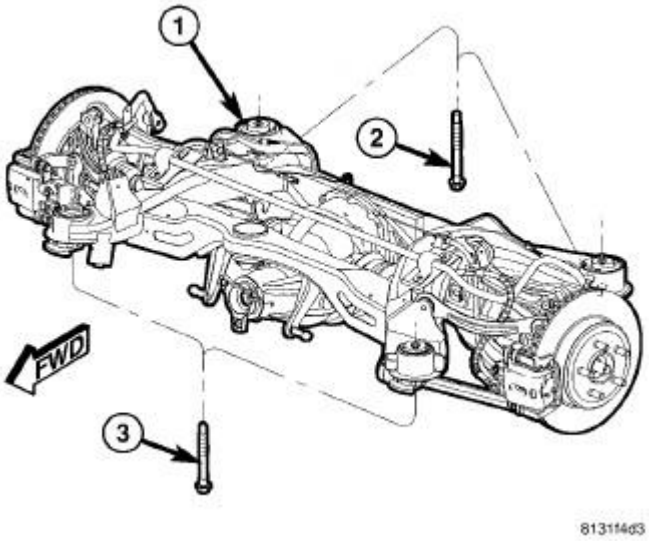

Fig. 152: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

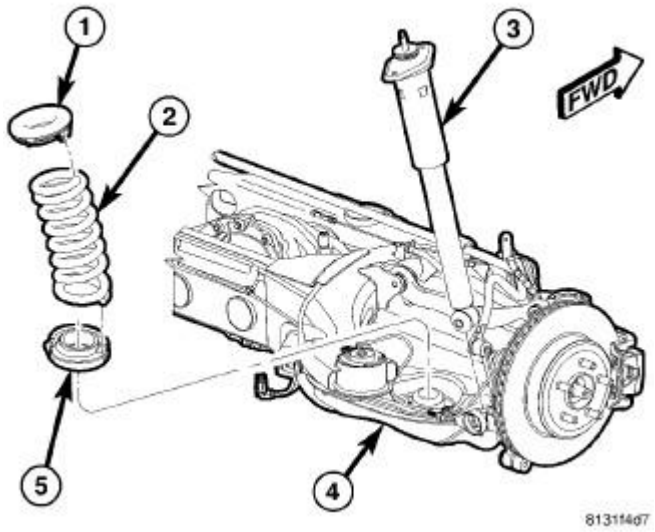

Fig. 153: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

9. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

10. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

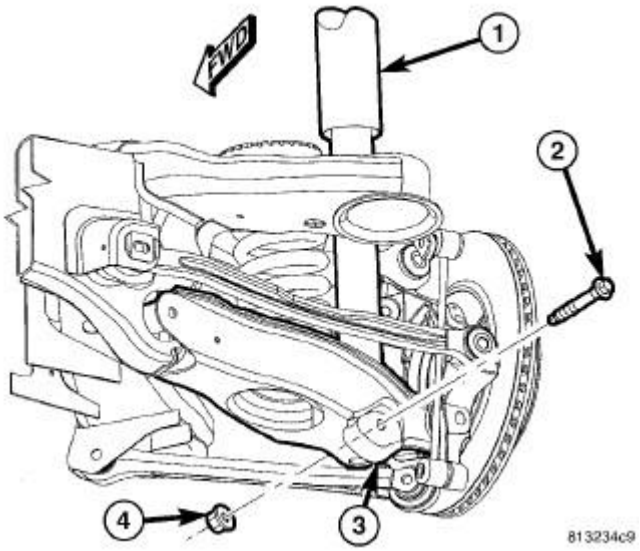

Fig. 154: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

11. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
12. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

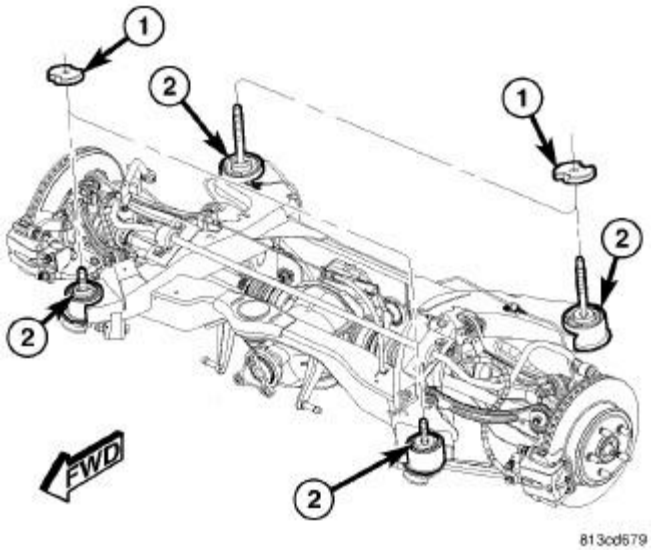

Fig. 155: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

13. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

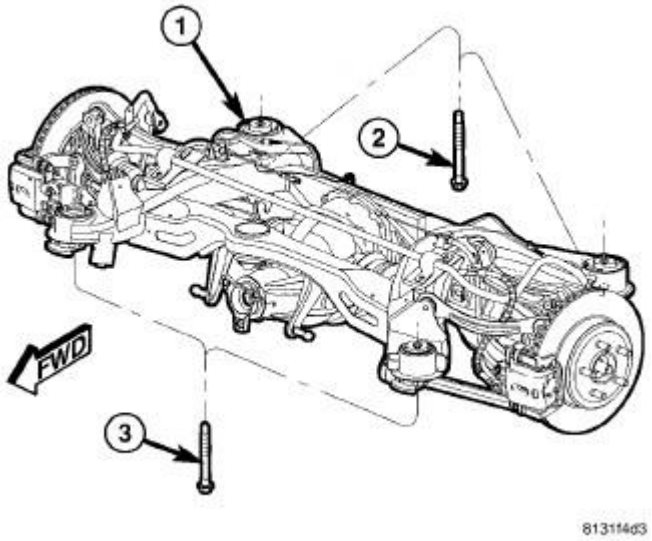

Fig. 156: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

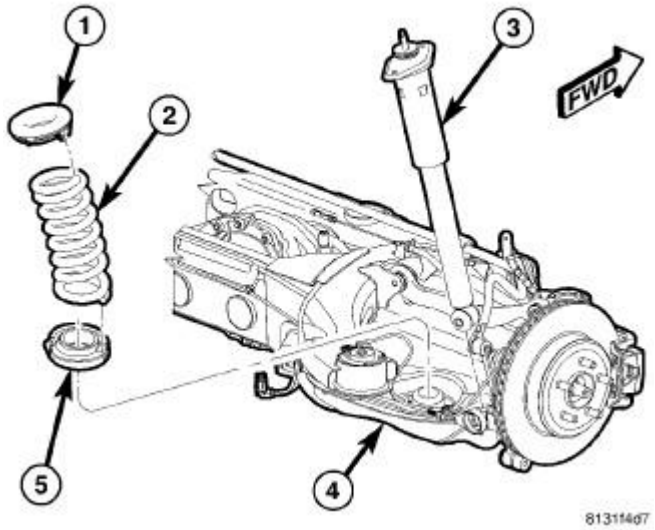

Fig. 157: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

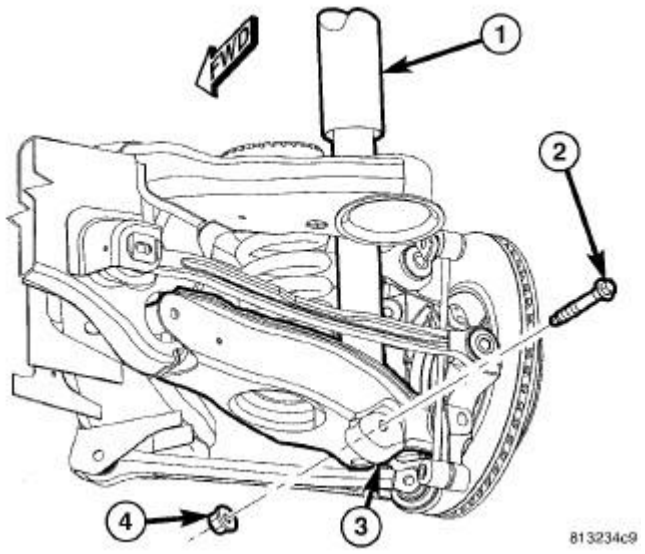

Fig. 158: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

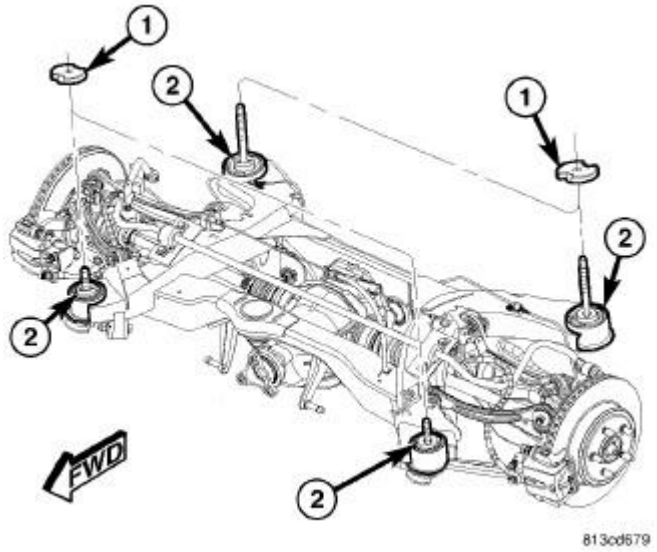

Fig. 159: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

20. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

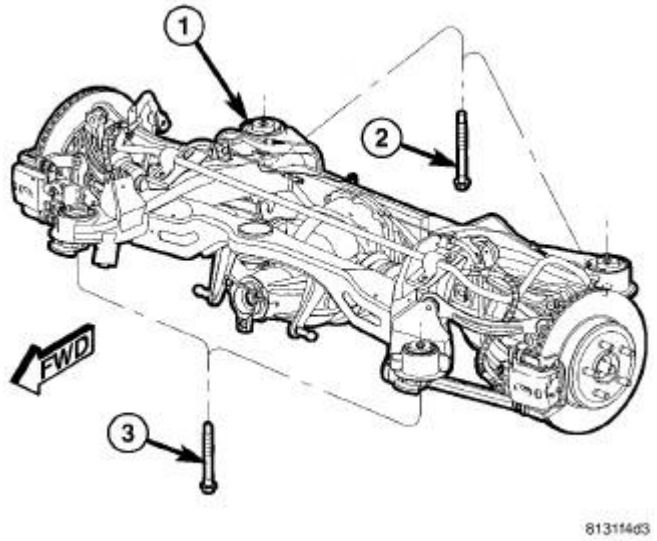

Fig. 160: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

21. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

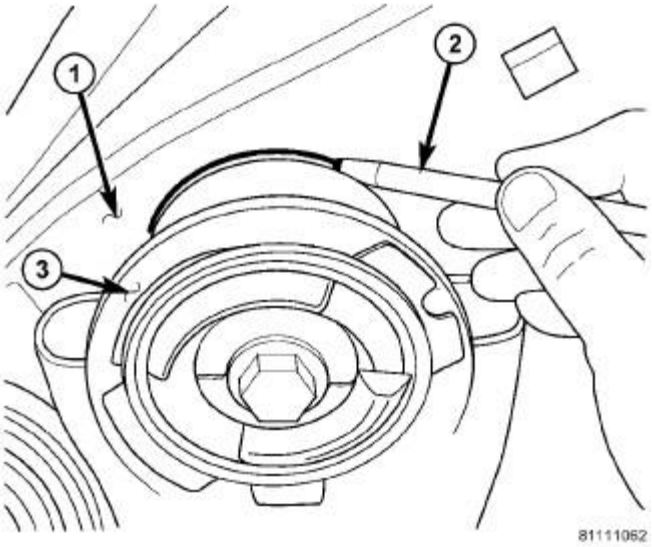

Fig. 161: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

22. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

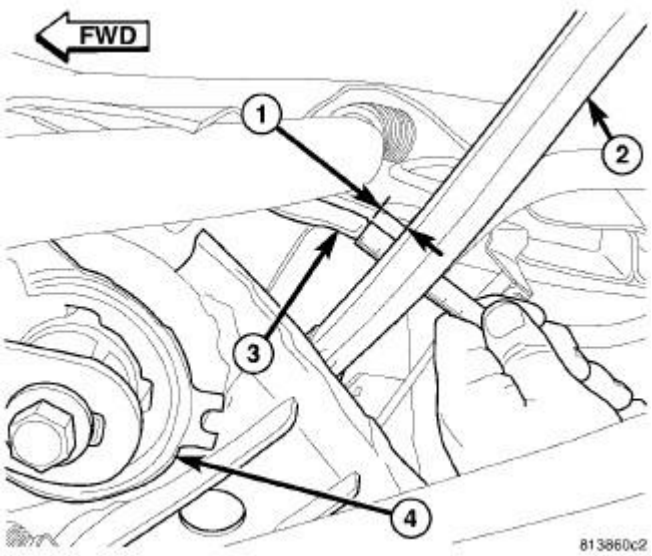

Fig. 162: Measuring Tension Link Clearance

Courtesy of CHRYSLER GROUP, LLC

23. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

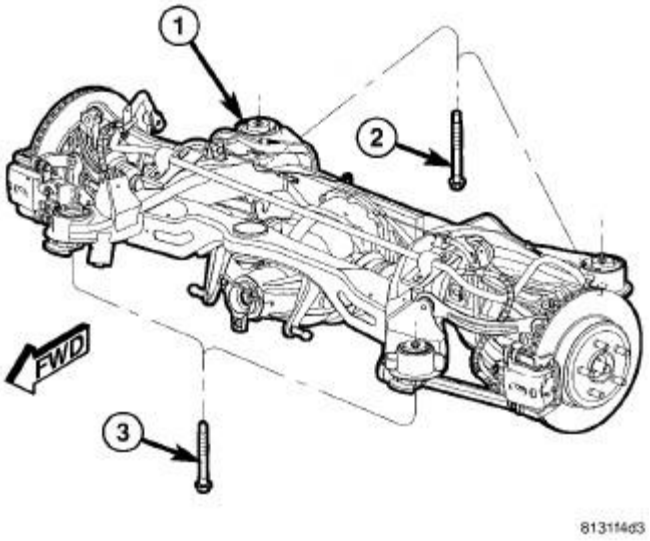

Fig. 163: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

24. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

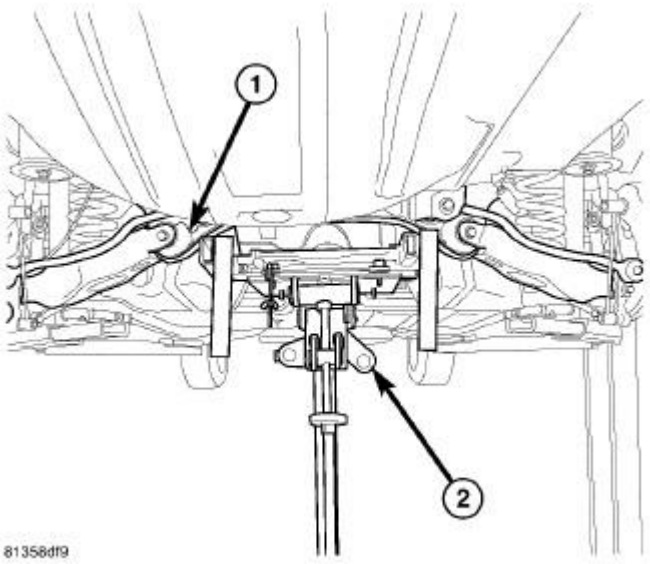

Fig. 164: Jack Positioned Beneath Crossmember
Courtesy of CHRYSLER GROUP, LLC

25. Remove jack (2) from under rear crossmember.

Fig. 165: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

26. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

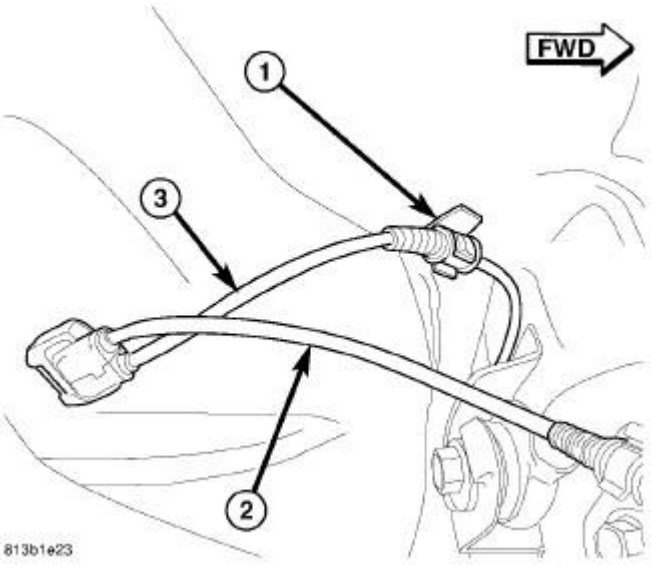

Fig. 166: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

27. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

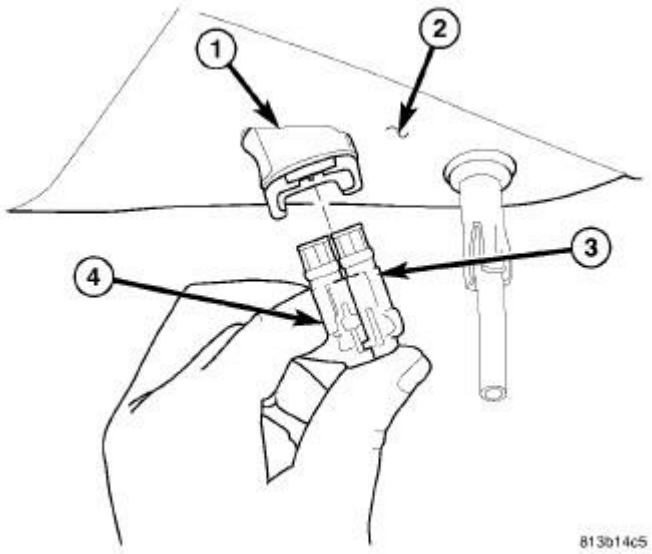

Fig. 167: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

28. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
29. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

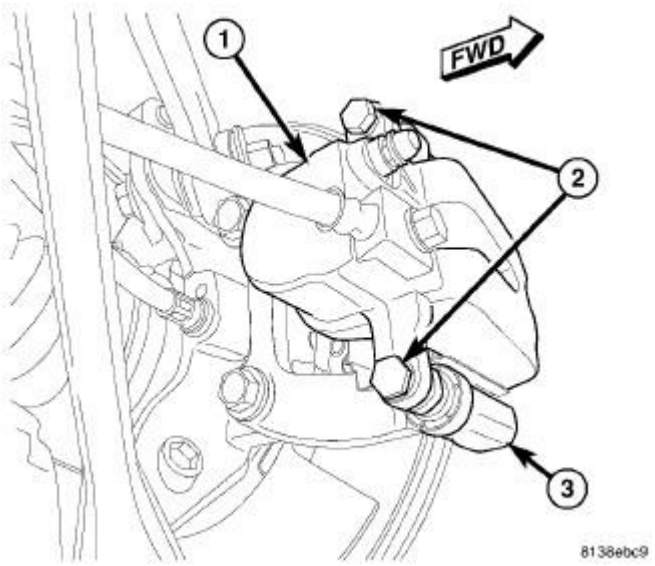

Fig. 168: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

30. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
    2. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
    3. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
    4. Make sure brake hose is properly routed and will not come in contact with suspension components.
31. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, FRONT MOUNT, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, REAR MOUNT, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, SPRING LINK, REMOVAL**.

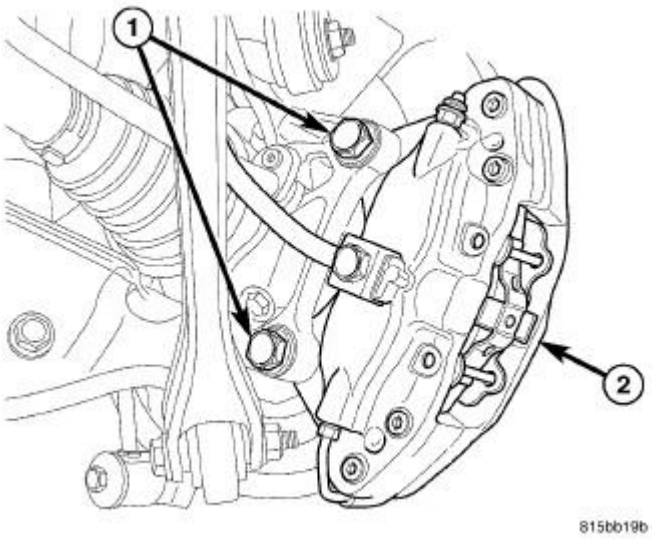

Fig. 169: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

32. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
33. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
34. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

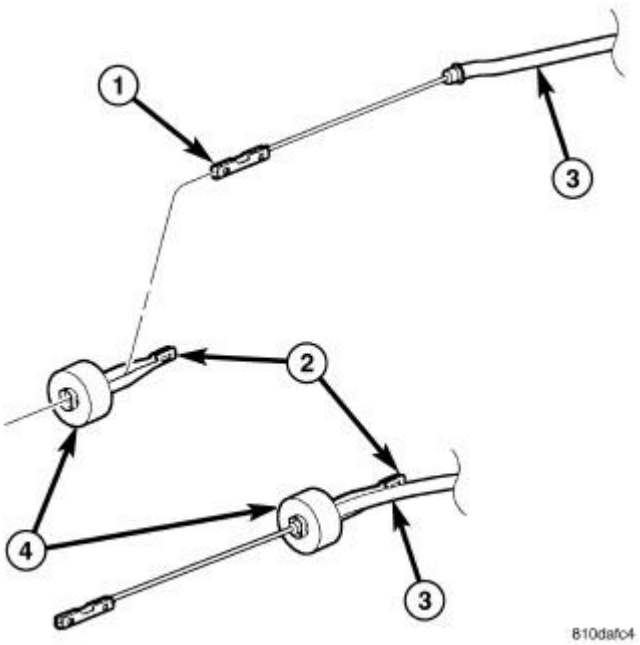

Fig. 170: Front Cable Installation Into Equalizer

Courtesy of CHRYSLER GROUP, LLC

35. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential (once installed).

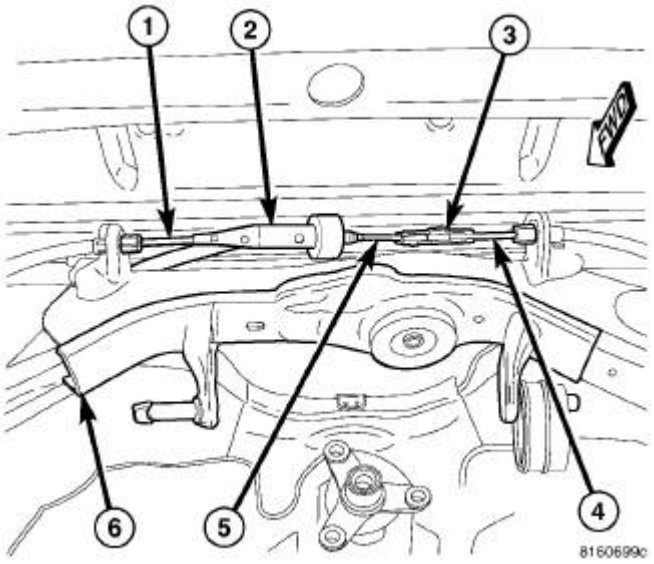

Fig. 171: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

36. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

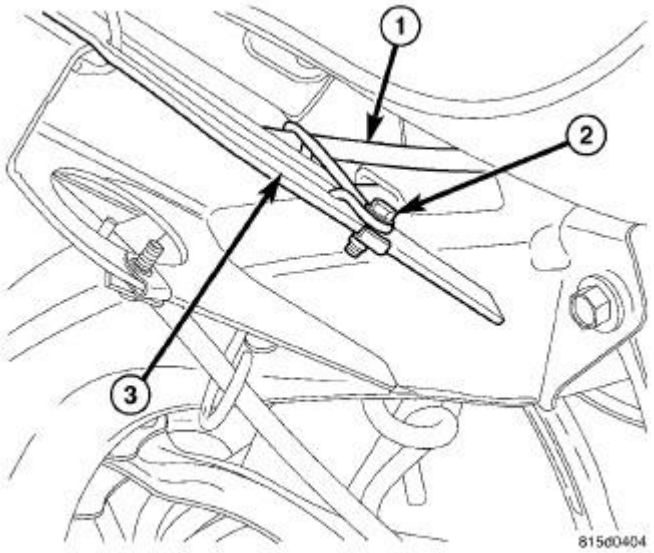

Fig. 172: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

37. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

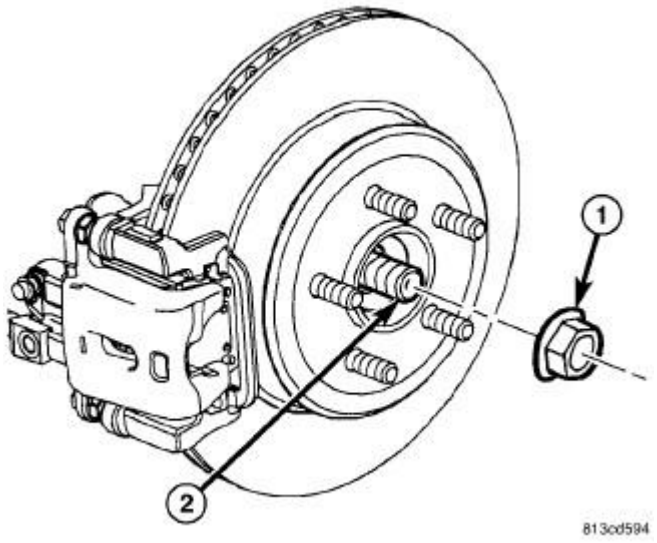

Fig. 173: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

38. On each side of vehicle, slide an axle half shaft (2) through hub and bearing and install hub nut (1). **Do not tighten hub nuts at this time.**
39. Install rear axle differential. Refer to **INSTALLATION** .
40. While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

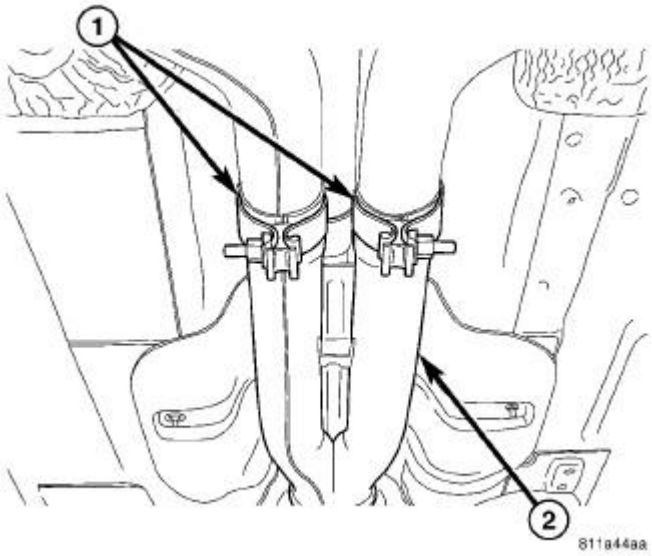

Fig. 174: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

41. Install rear exhaust system (2) (dual-outlet exhaust shown in figure).

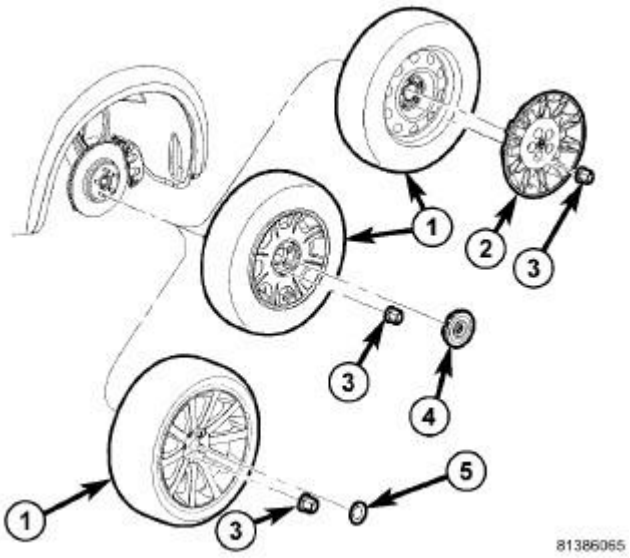

Fig. 175: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

42. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
43. Lower vehicle.

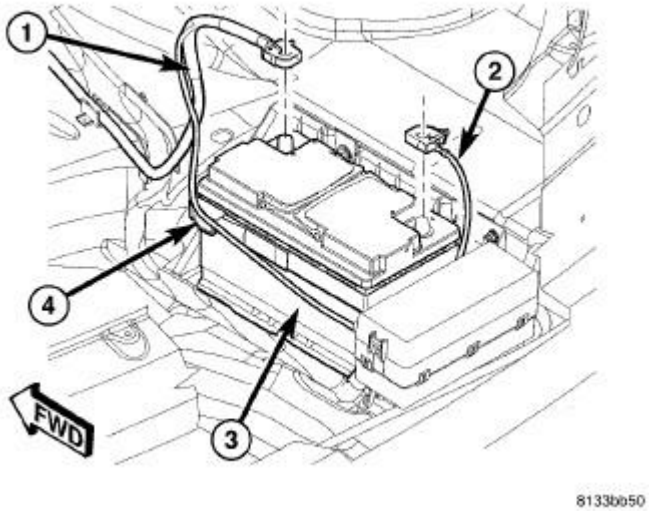

Fig. 176: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

44. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **STANDARD PROCEDURE** .
45. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
46. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

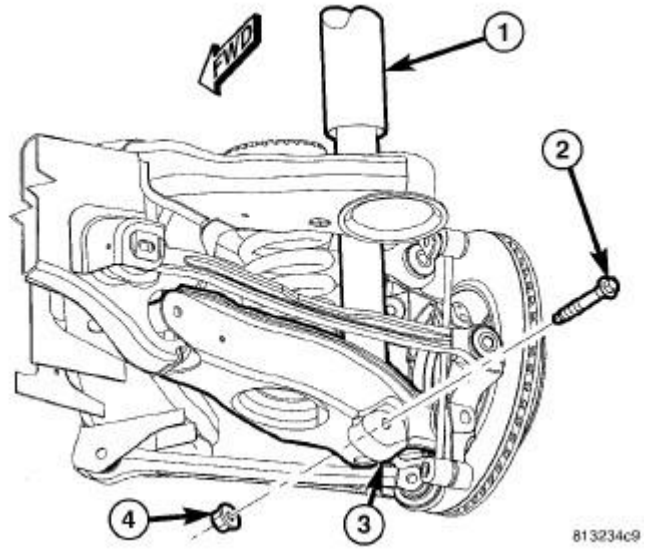

Fig. 177: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

47. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).
48. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (). Refer to 23 or **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

ISOLATOR, REAR CROSSMEMBER, FRONT MOUNT

REMOVAL

REMOVAL

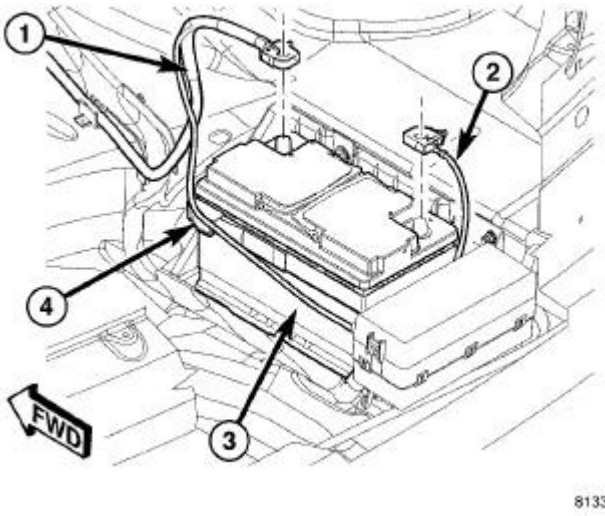

Fig. 178: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

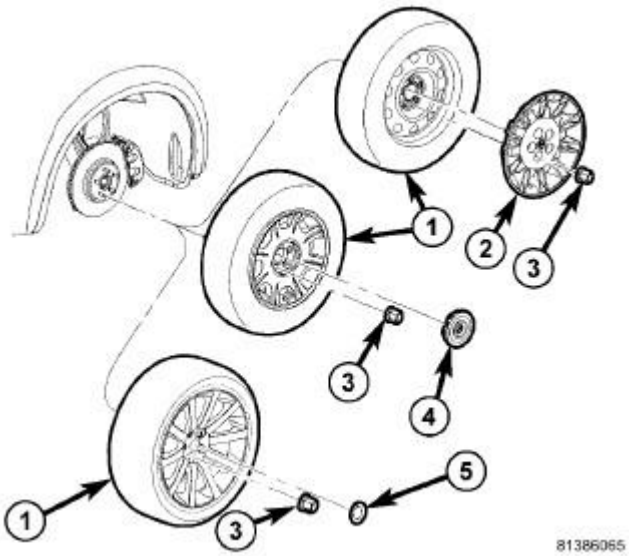

Fig. 179: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

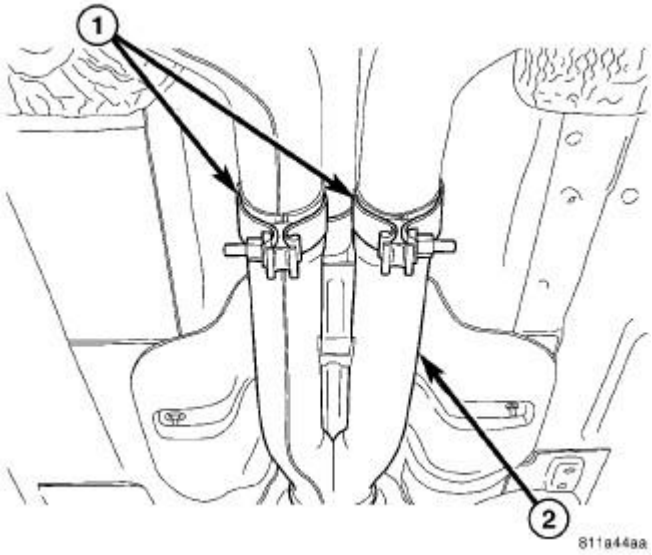

Fig. 180: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

4. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure).

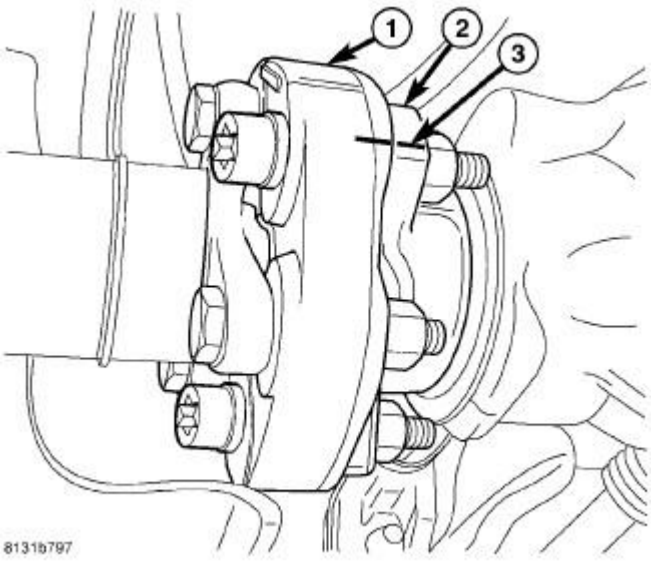

Fig. 181: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

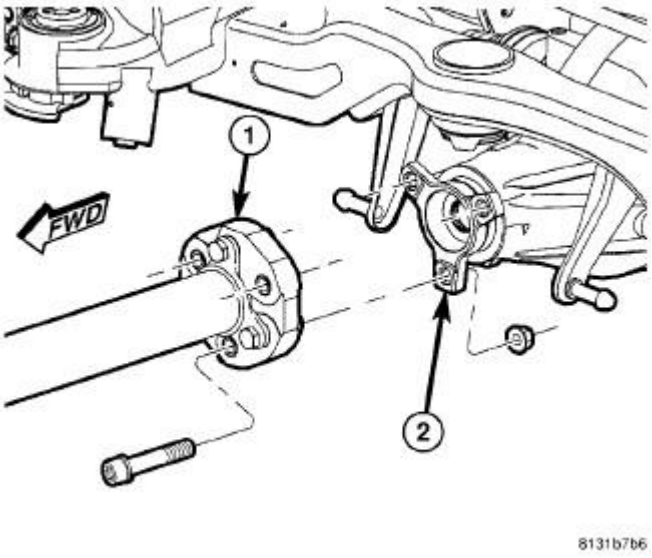

Fig. 182: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three (four if equipped with 215 MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

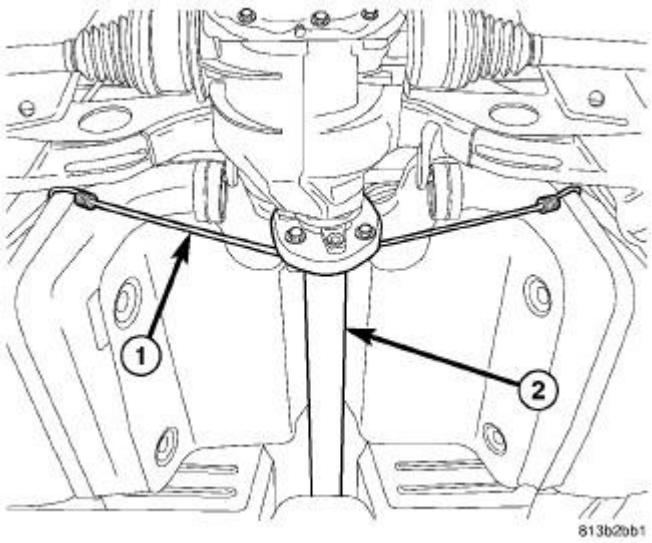

Fig. 183: Prop Shaft Support By Bungee Cord
Courtesy of CHRYSLER GROUP, LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown in illustration.

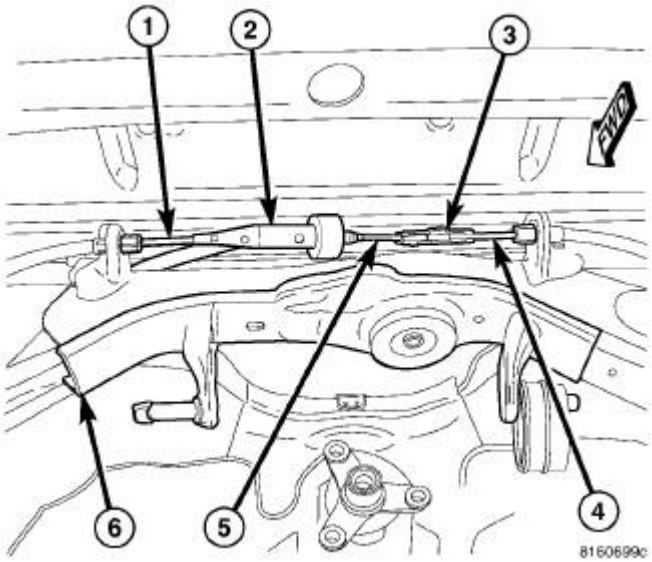

Fig. 184: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4)

above axle differential.

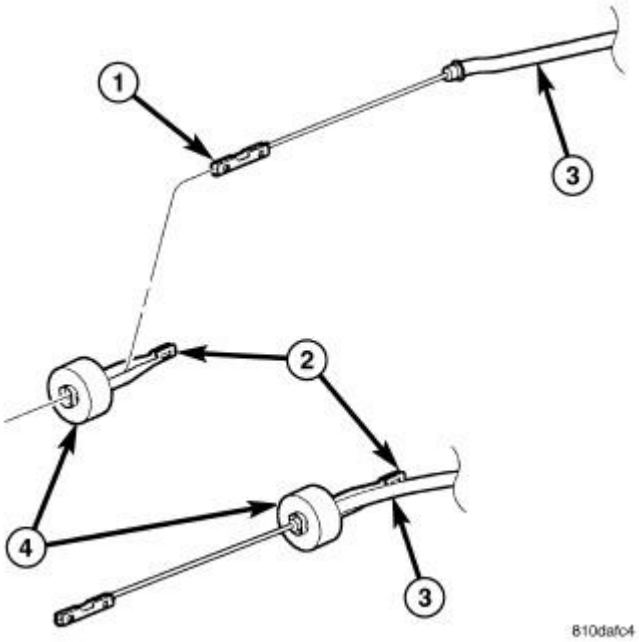

Fig. 185: Front Cable Installation Into Equalizer
Courtesy of CHRYSLER GROUP, LLC

9. Remove front parking brake cable (3) from equalizer (2).

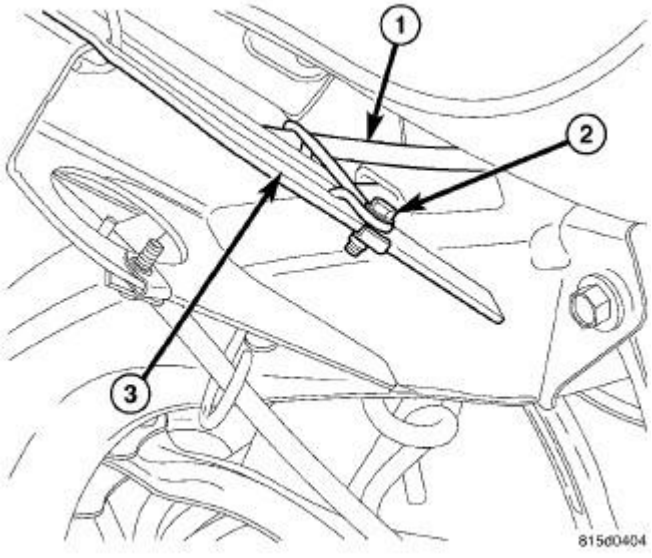

Fig. 186: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember

front flange (3).

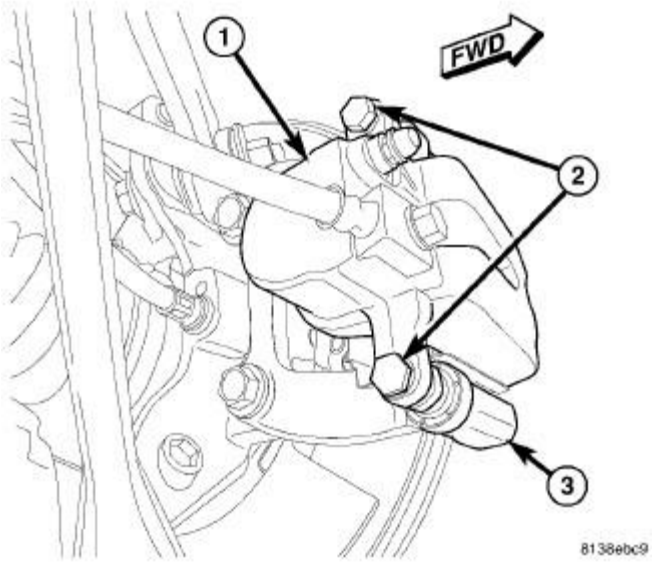

Fig. 187: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
    2. Remove brake caliper (1) from brake adapter (3) and pads.
    3. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

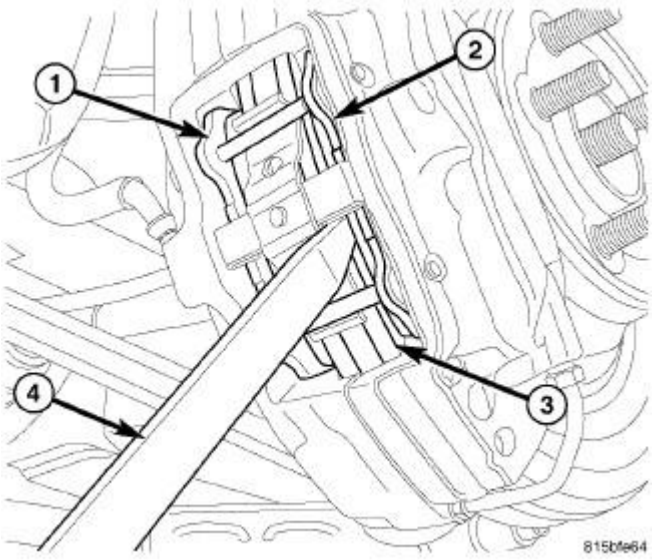

Fig. 188: Pushing Back Pistons In Bore

Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

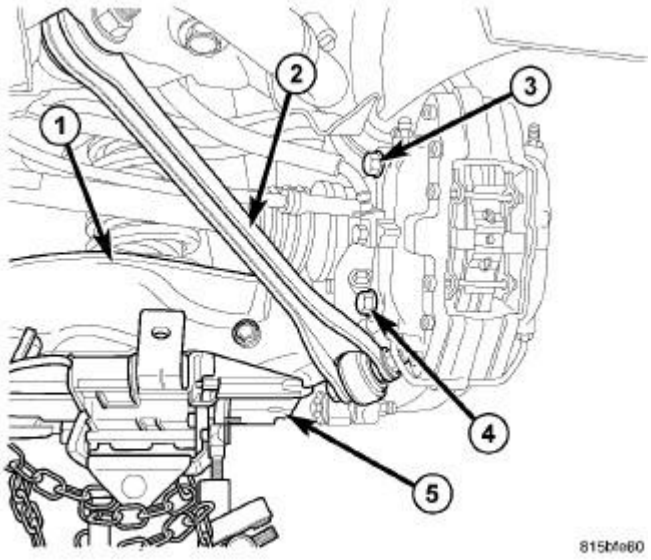

Fig. 189: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

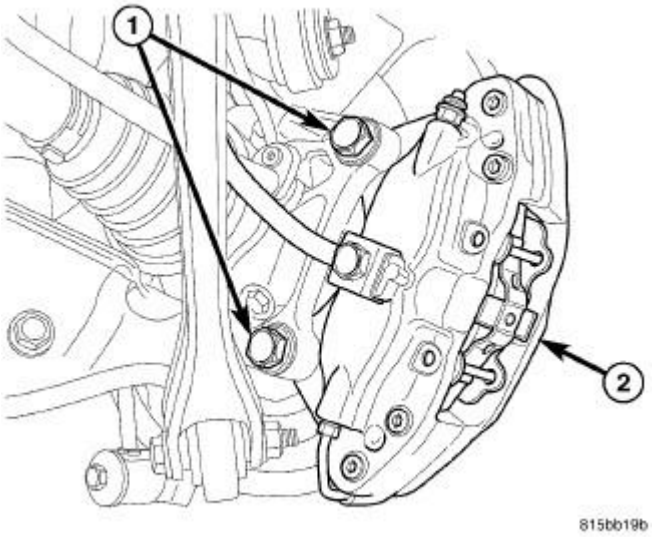

Fig. 190: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
17. If equipped with SRT8 disc brakes, remove jack from under spring link.

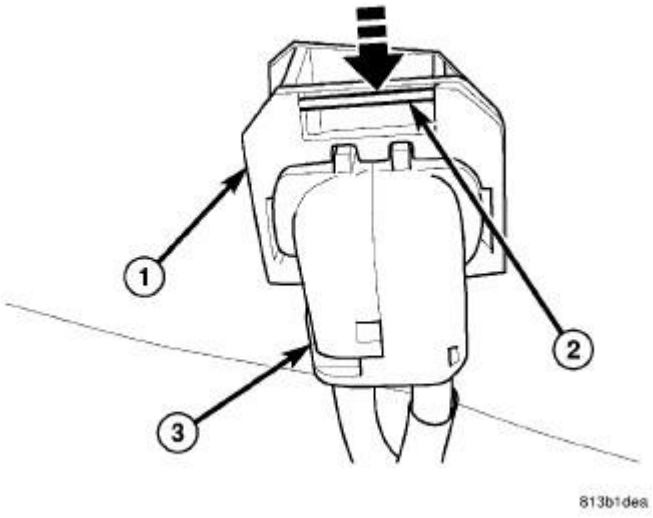

Fig. 191: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.**

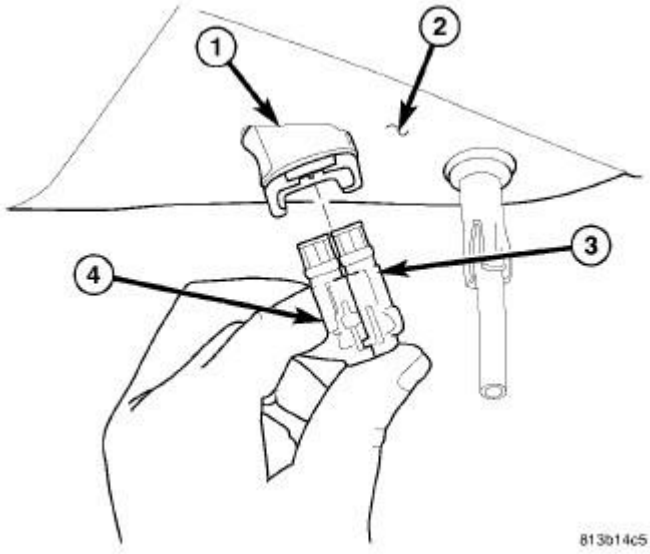

Fig. 192: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

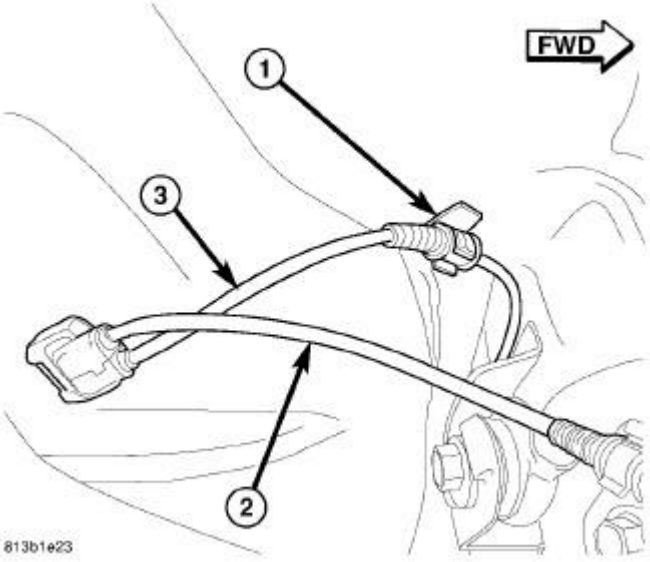

Fig. 193: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

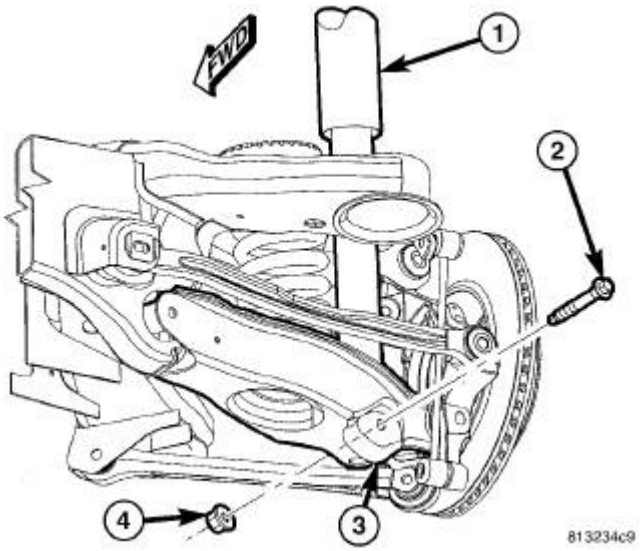

Fig. 194: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

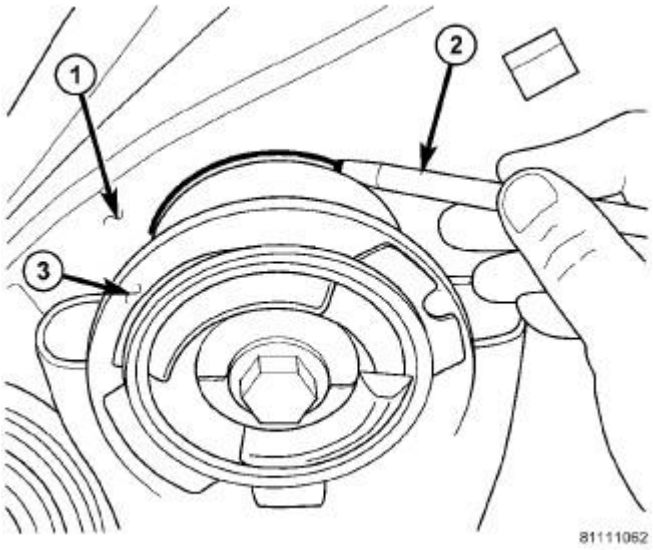

Fig. 195: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using

a marker or crayon. **Do not use a scratch awl to mark location.**

22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

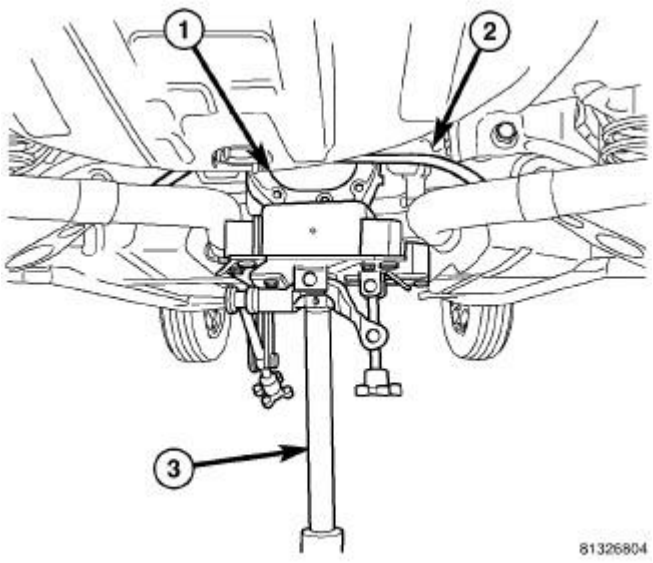

Fig. 196: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

23. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

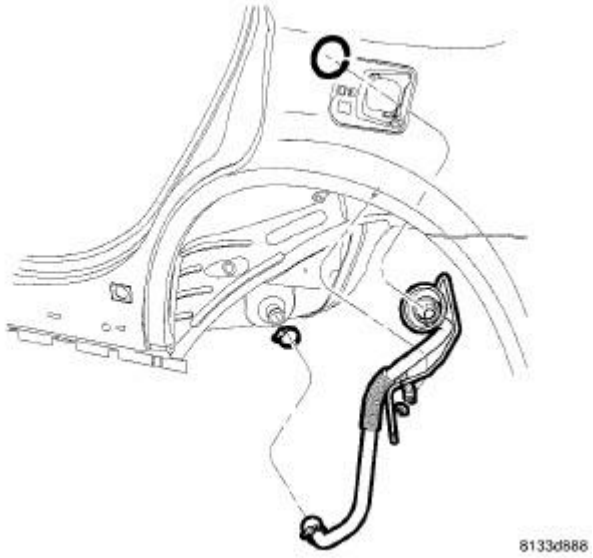

Fig. 197: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .

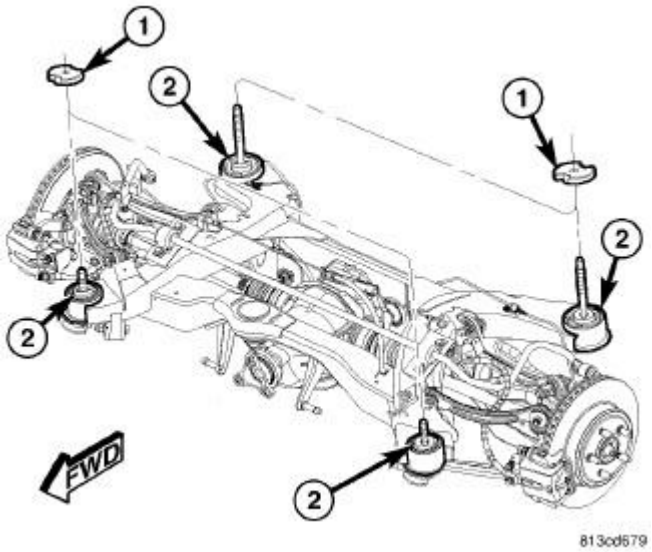

Fig. 198: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

NOTE: If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

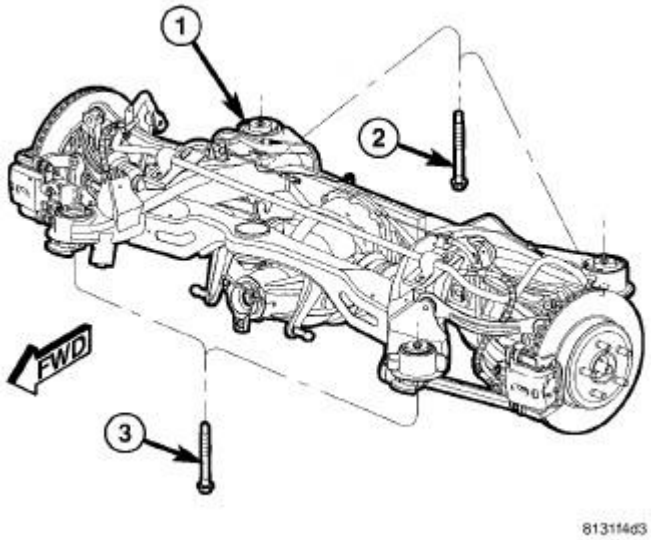

Fig. 199: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow propeller shaft removal from rear axle differential. **Do not lower jack any further than necessary.** Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.
27. Lower crossmember until crossmember is at a comfortable working level to access bushings. Support rear suspension assembly using jack stands to help stabilize assembly during bushing service.

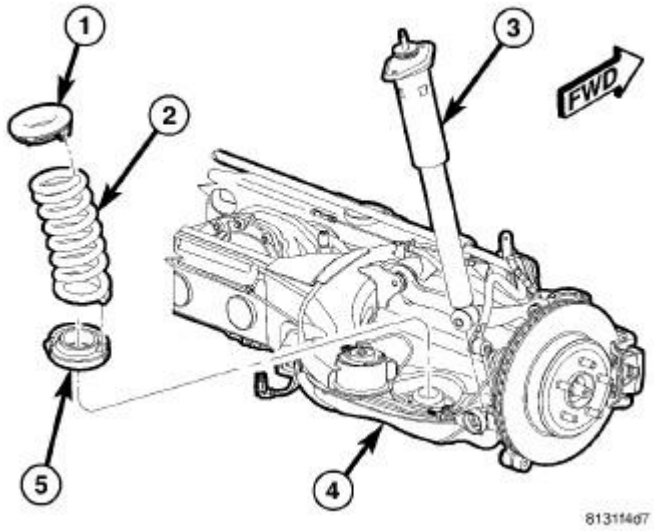

Fig. 200: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

28. Remove coil springs (2) with isolators (1 and 5) from spring links (4).

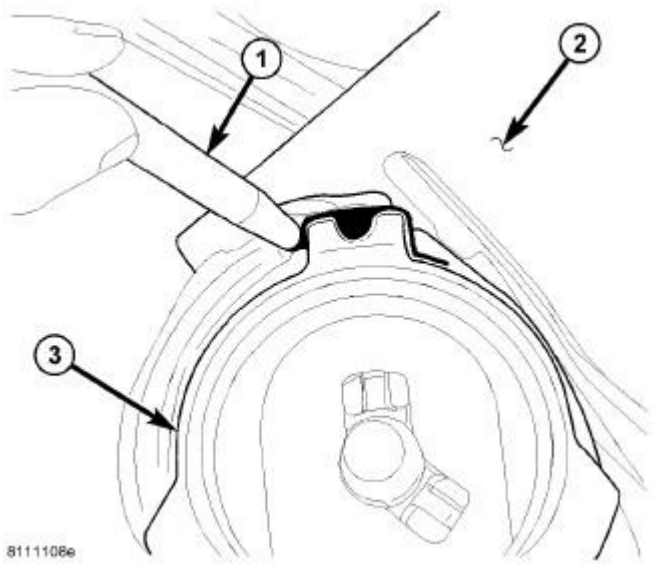

Fig. 201: Marking Location Of Front Bushing
Courtesy of CHRYSLER GROUP, LLC

1 - MARKER OR CRAYON
2 - CROSSMEMBER
3 - BUSHING CAN FLANGE

29. As an installation reference, carefully mark location of bushing requiring removal on crossmember (around bushing can flange) using a marker or crayon. **Do not use a scratch awl to mark location.**

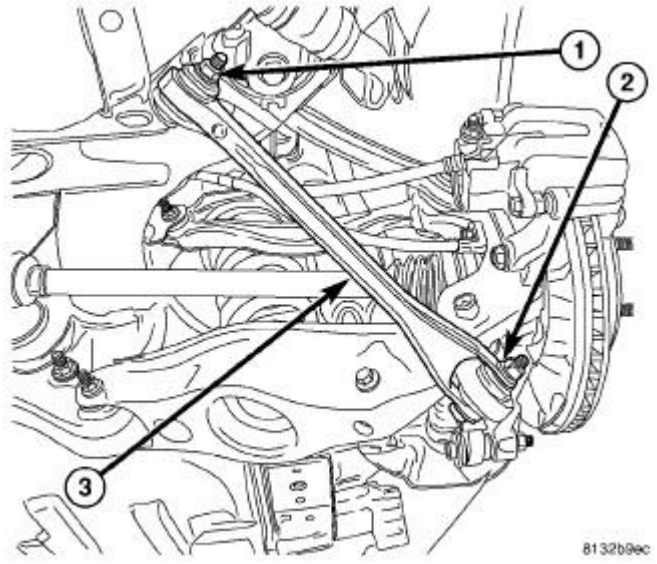

Fig. 202: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

30. Remove nut and bolt (1) fastening compression link (3) to crossmember.

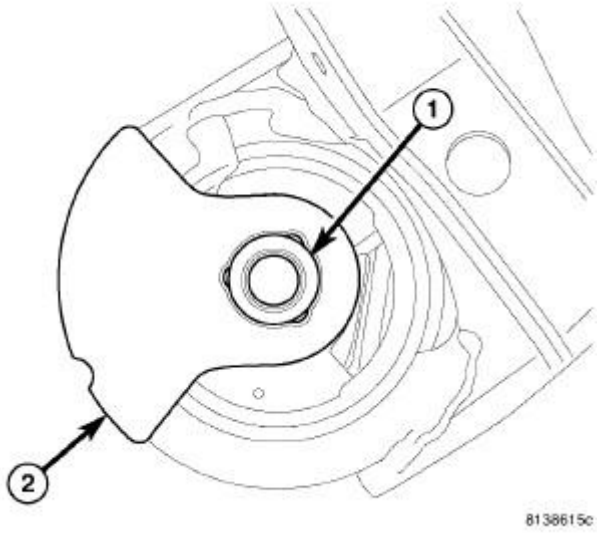

Fig. 203: Front Bushing Ear
Courtesy of CHRYSLER GROUP, LLC

31. Remove travel limiter (2) from bushing inner metal sleeve (1). To do so, use an appropriate grinding tool to remove inner metal sleeve material until limiter can be safely removed.

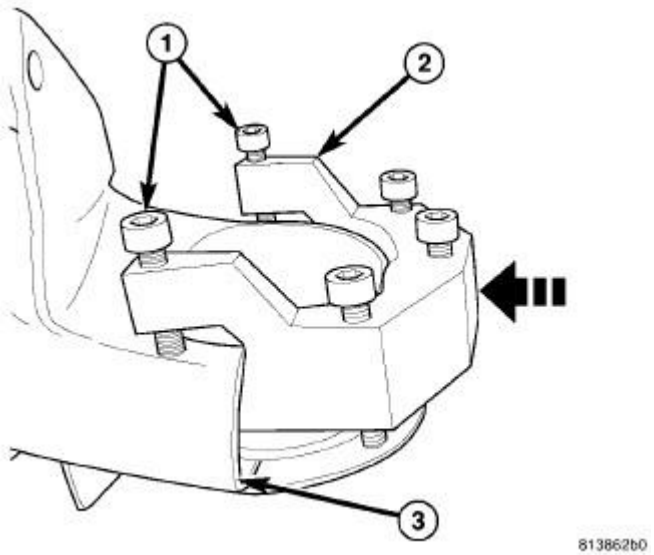

Fig. 204: Installing Support 9031-9
Courtesy of CHRYSLER GROUP, LLC

32. Slide Support (2), Special Tool (special tool #9031-9, Clamp), into end of crossmember (3) surrounding bushing bore as shown in illustration.

33. Snug set-screws (1) securing Support (2) to crossmember.

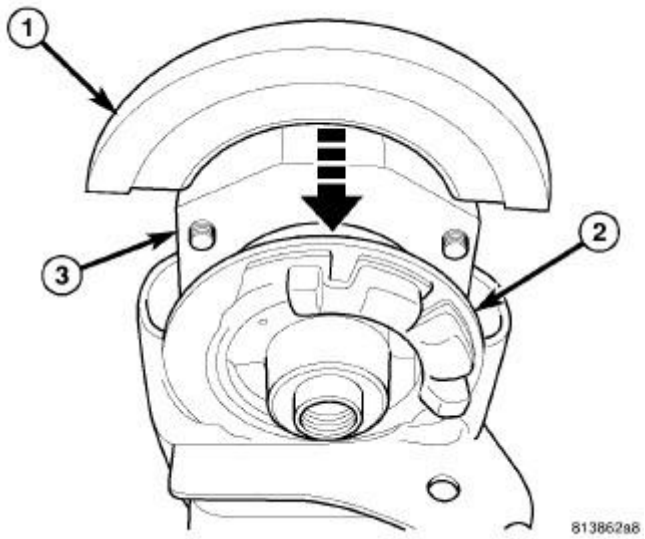

Fig. 205: Inserting Brace, Support & Bushing Bore Flange
Courtesy of CHRYSLER GROUP, LLC

34. Insert Brace (1), Special Tool (special tool #9031-10, Brace), between Support (special tool #9031-9, Clamp) (3) and bushing bore flange (2) matching step in Brace to bore flange.

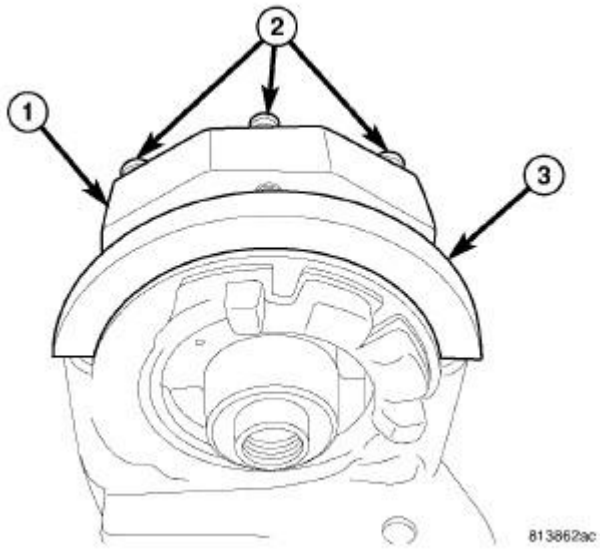

Fig. 206: Set-Screws & Brace
Courtesy of CHRYSLER GROUP, LLC

35. Snug set-screws (2) against Brace (special tool #9031-10, Brace). **Do not overtighten set-screws as they will distort and bend bushing bore flange.**

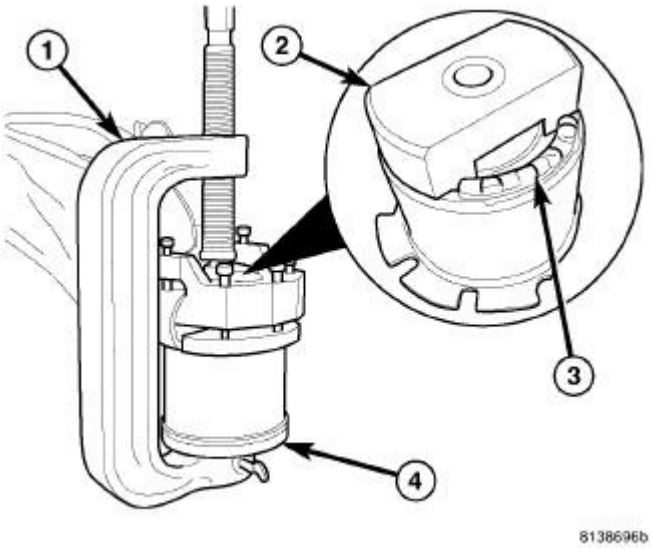

Fig. 207: Tools Positioned To Remove Front Bushing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using Press (1), Special Tool (special tool #C-4212F, Press, Ball Joint) Ball Joint Press Installer/Removal, lubricate screw-drive threads to provide ease of use and promote tool longevity.

36. Assemble tools (See following list) over bushing as shown in illustration. Ensure Remover lies between ridges (3) on bushing to properly contact bushing can.
    - (1) Press (special tool #C-4212F, Press, Ball Joint)
    - (2) Remover (special tool #9031-5A, Remover, Bushing)
    - (4) Receiver (special tool #9031-8A, Receiver, Bushing)
37. Tighten Press (1) screw-drive, pressing bushing out of crossmember.
38. Remove all tools.

INSTALLATION

INSTALLATION

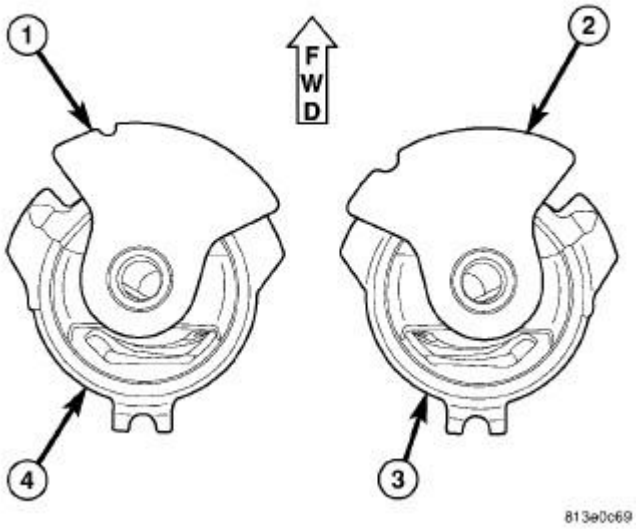

Fig. 208: Front Bushings - Left & Right
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Prior to bushing installation, inspect the bushing to make sure it is the correct side bushing for the job. Left side bushings have the travel limiter (1) tipped to the right in relationship to the bushing (4) can flange as shown in illustration. Right side bushings have the travel limiter (2) tipped to the left in relationship to the bushing (3) can flange as shown in illustration. Once installed, the travel limiters with face slightly outward from straight-ahead position.

CAUTION: It is very important that bushing be installed in same position as original to maintain vehicle ride quality and bushing longevity. That is why bushing, once installed, needs to closely match reference marks applied upon removal of original bushing.

1. Position bushing on crossmember bushing bore aligning bushing can flange with reference marks applied during removal.

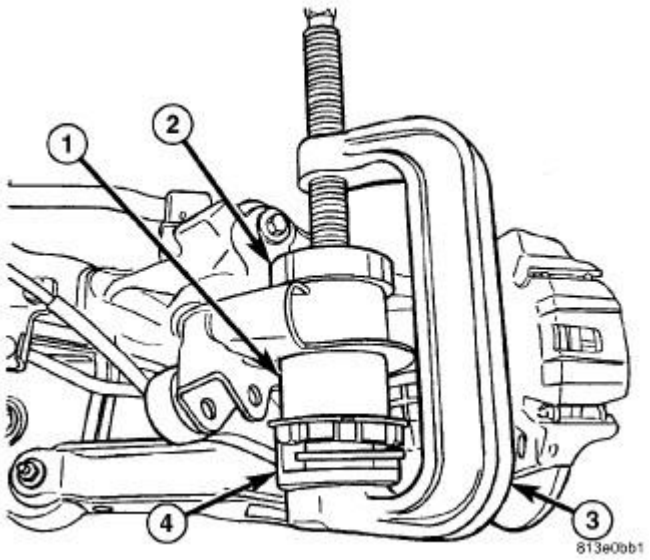

Fig. 209: Installing Front Bushing
Courtesy of CHRYSLER GROUP, LLC

2. Assemble tools (See following list) over bushing and crossmember as shown in illustration.
    - (2) Receiver (special tool #9031-6, Receiver)
    - (3) Press (special tool #C-4212F, Press, Ball Joint)
    - (4) Installer (special tool #9031-7A, Installer, Bushing)

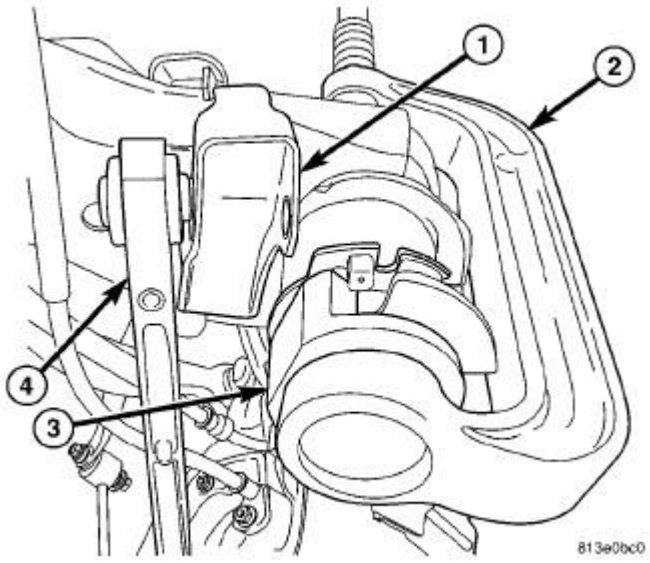

Fig. 210: Installer Positioned On Bushing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Ensure Installer (3), Special Tool (special tool #9031-7A, Installer, Bushing), is positioned that it will clear compression link bracket (1) while

bushing is being installed.

3. Tighten Press (2) screw-drive, pressing bushing into crossmember. Install bushing until bushing can flange contacts surface of crossmember.
4. Remove tools.
5. Verify bushing closely lines up with reference marks applied during removal.

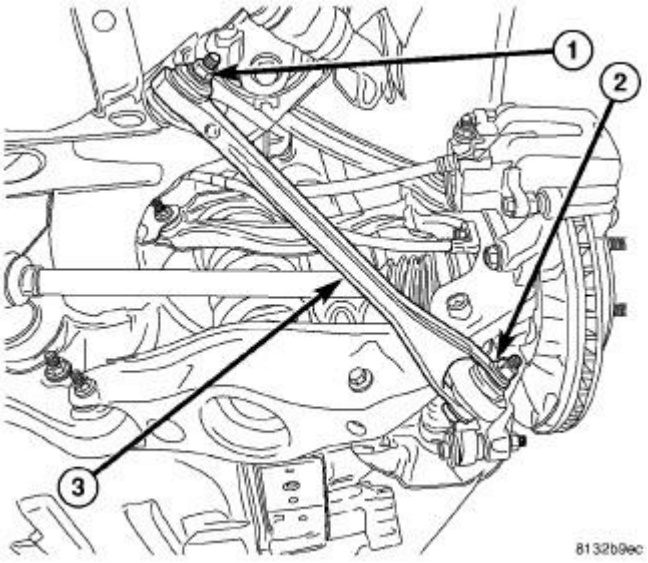

Fig. 211: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install bolt and nut as shown in illustration (1) fastening compression link (3) to crossmember. **Do not tighten bolt at this time.**

NOTE: Do not reinstall coil springs on spring links at this time. Install as directed in later steps.

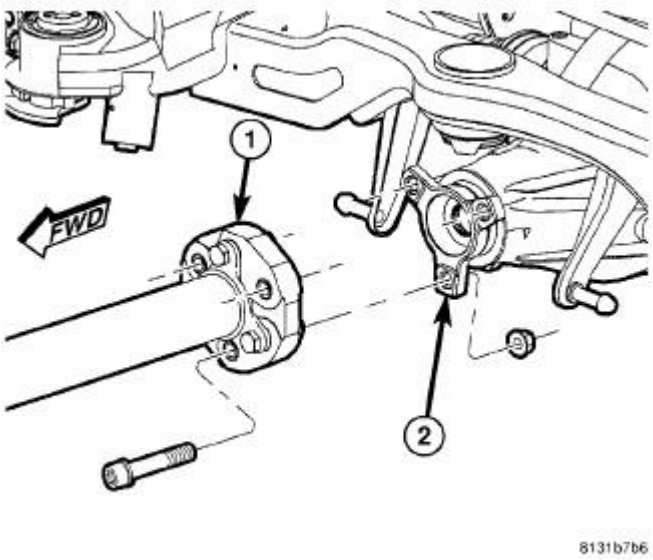

Fig. 212: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

7. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft (1) onto rear axle differential flange (2) and align shock absorbers with pockets in spring links.

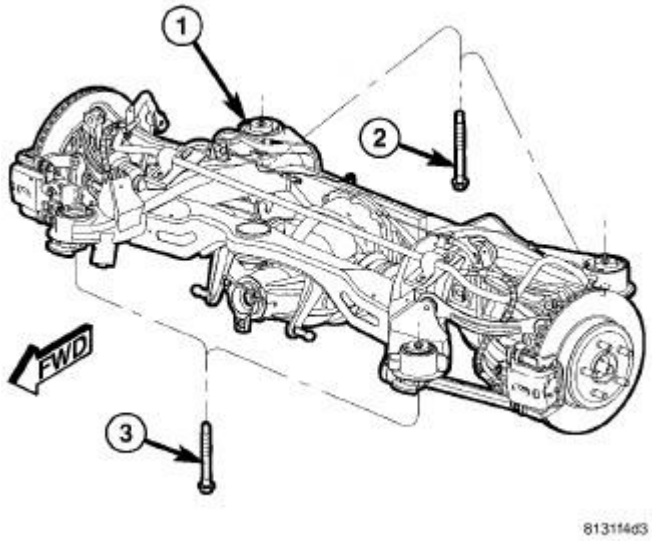

Fig. 213: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be

installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

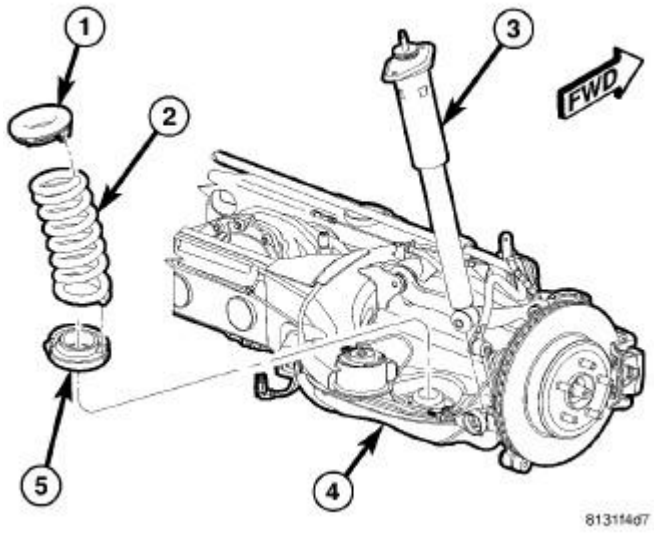

Fig. 214: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

9. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

10. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

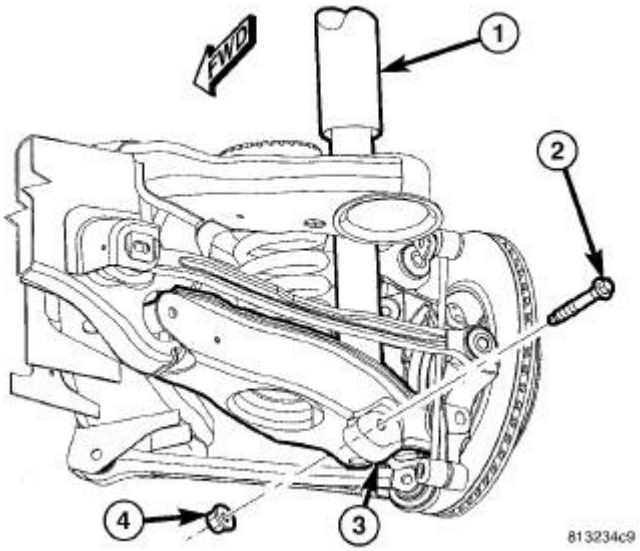

Fig. 215: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

11. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
12. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

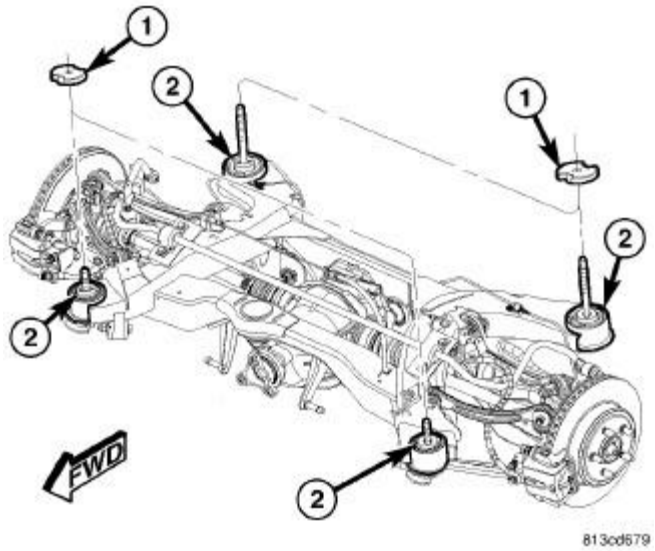

Fig. 216: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

13. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

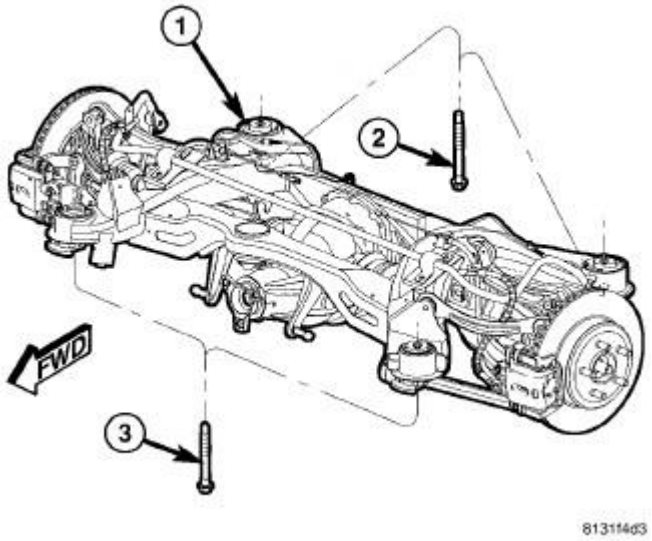

Fig. 217: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

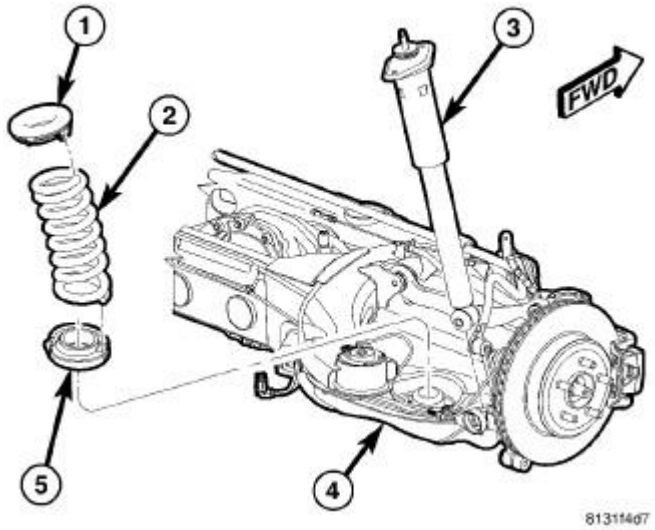

Fig. 218: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

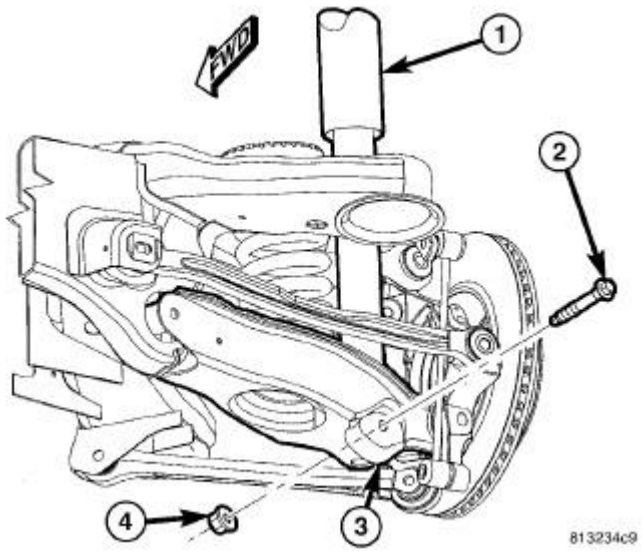

Fig. 219: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

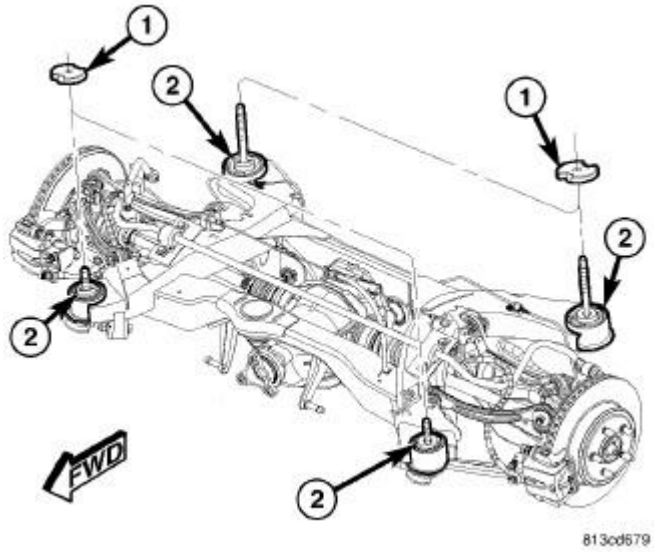

Fig. 220: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

20. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

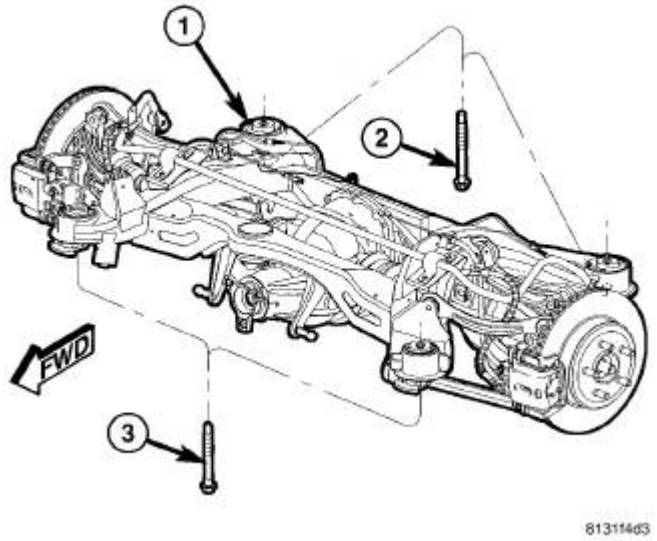

Fig. 221: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

21. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

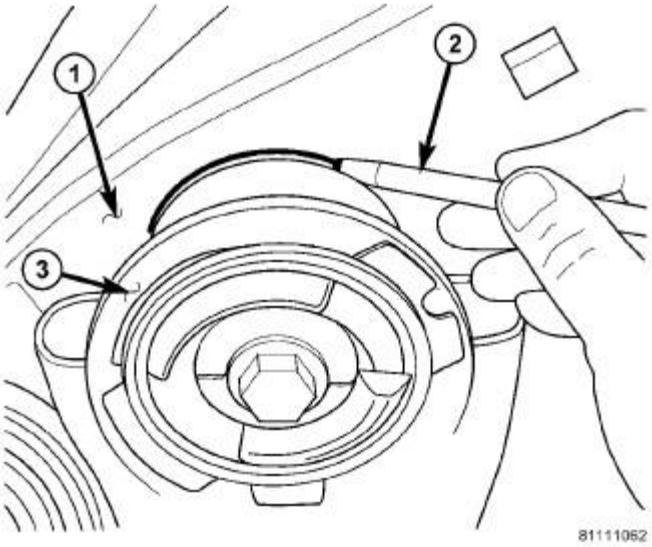

Fig. 222: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

22. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

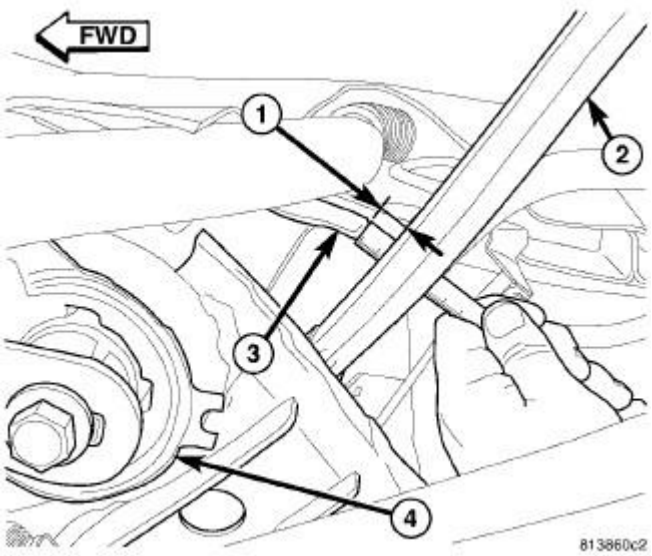

Fig. 223: Measuring Tension Link Clearance

Courtesy of CHRYSLER GROUP, LLC

23. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

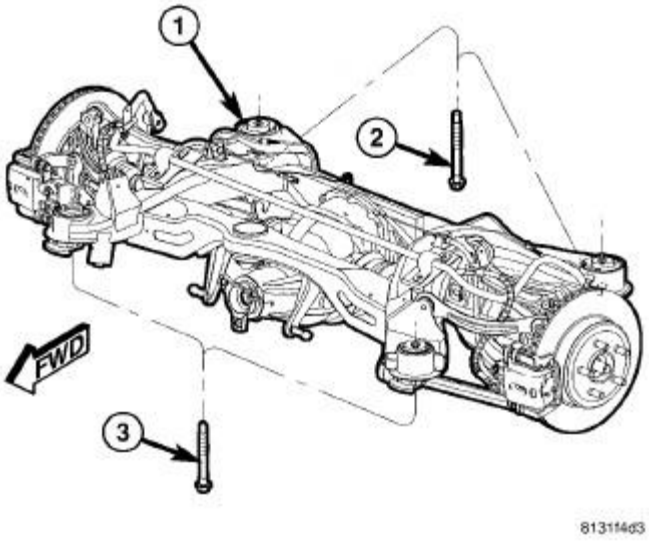

Fig. 224: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

24. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

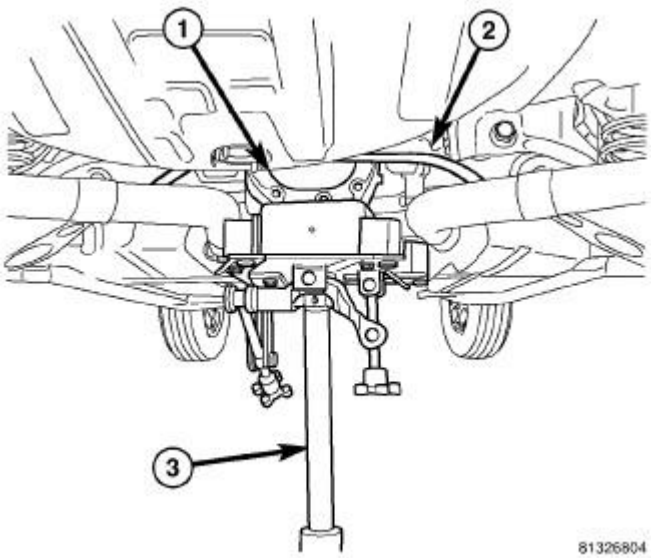

Fig. 225: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

25. Remove jack (3) from under rear axle differential.

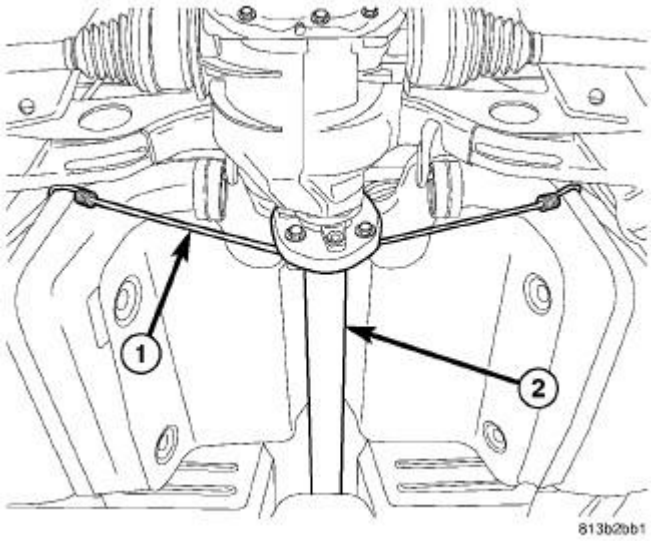

Fig. 226: Prop Shaft Support By Bungee Cord
Courtesy of CHRYSLER GROUP, LLC

26. Remove bungee cord (1) supporting propeller shaft (2).

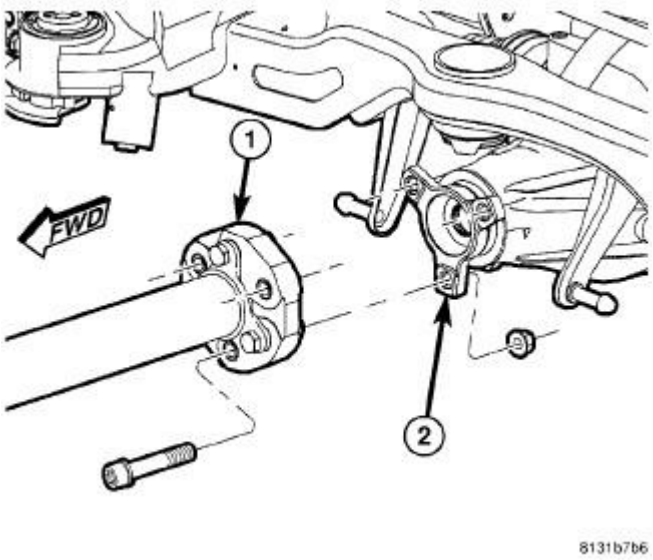

Fig. 227: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

27. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

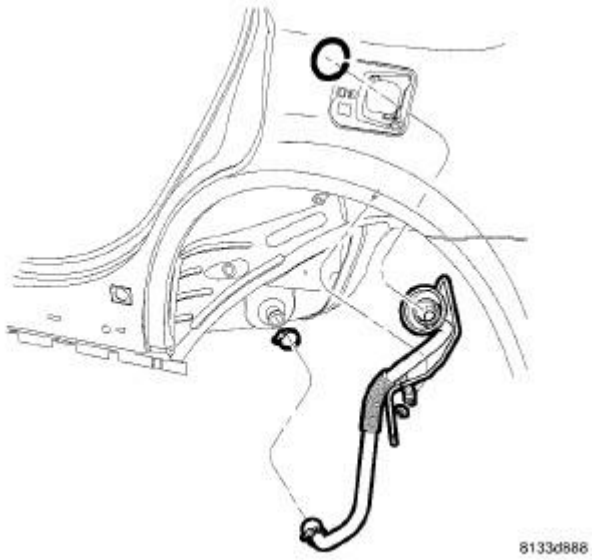

Fig. 228: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

28. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

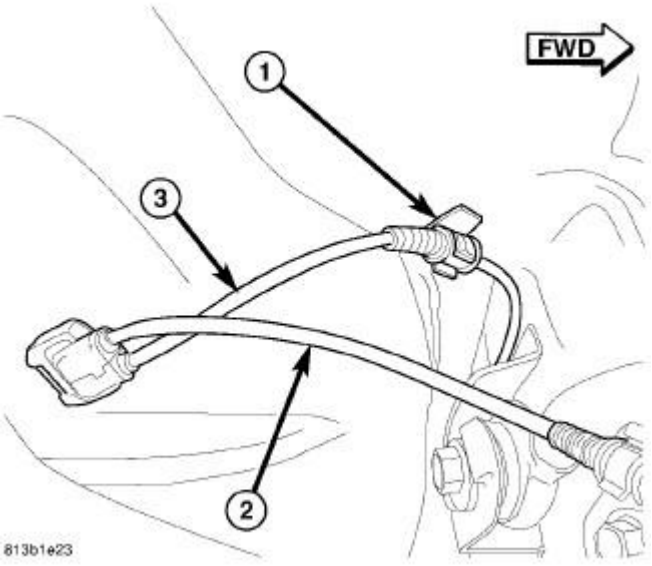

Fig. 229: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

29. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

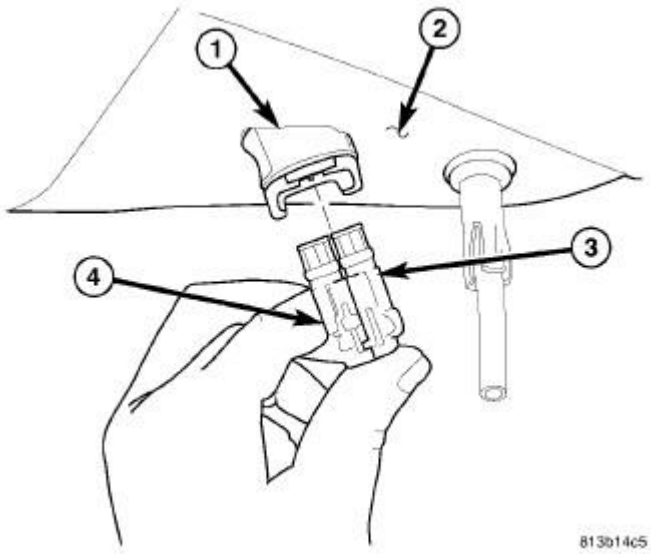

Fig. 230: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

30. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
31. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

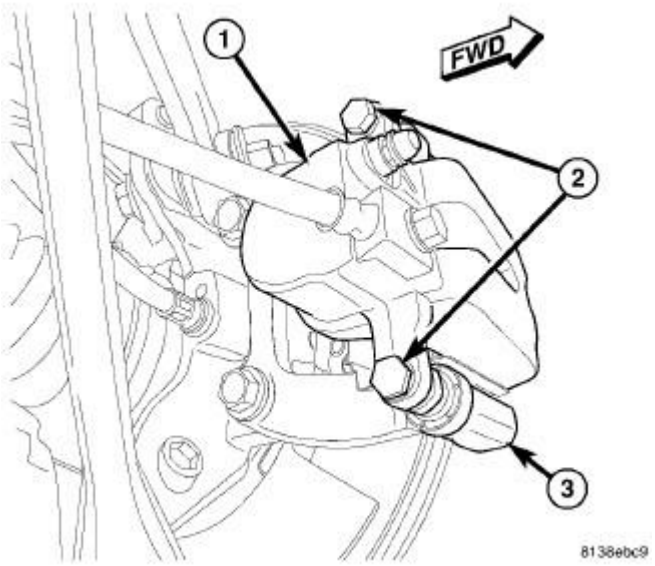

Fig. 231: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

32. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
    2. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).

    CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

    3. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
    4. Make sure brake hose is properly routed and will not come in contact with suspension components.
33. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, FRONT MOUNT, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, REAR MOUNT, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, SPRING LINK, REMOVAL**.

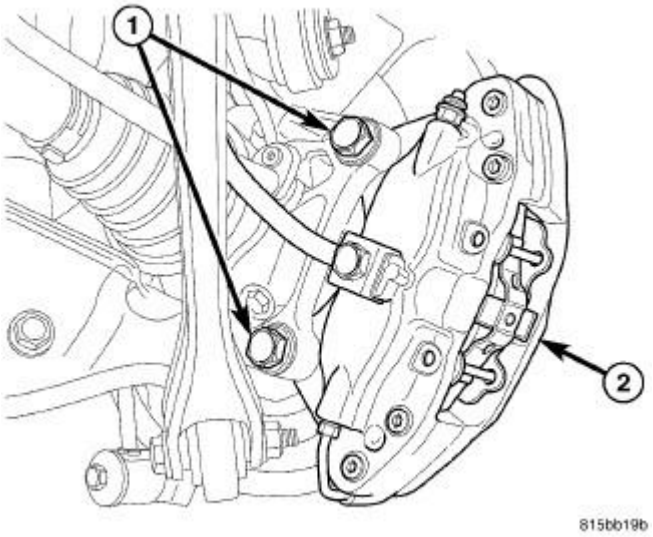

Fig. 232: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

34. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
35. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
36. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

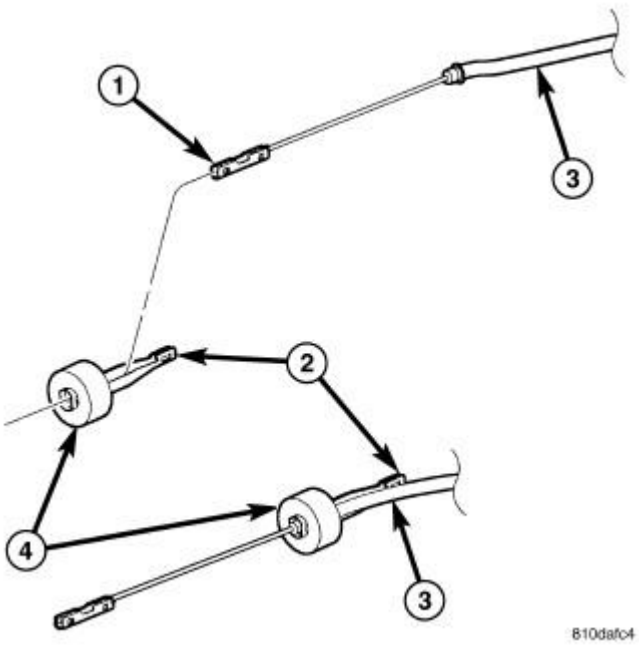

Fig. 233: Front Cable Installation Into Equalizer

Courtesy of CHRYSLER GROUP, LLC

37. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential (once installed).

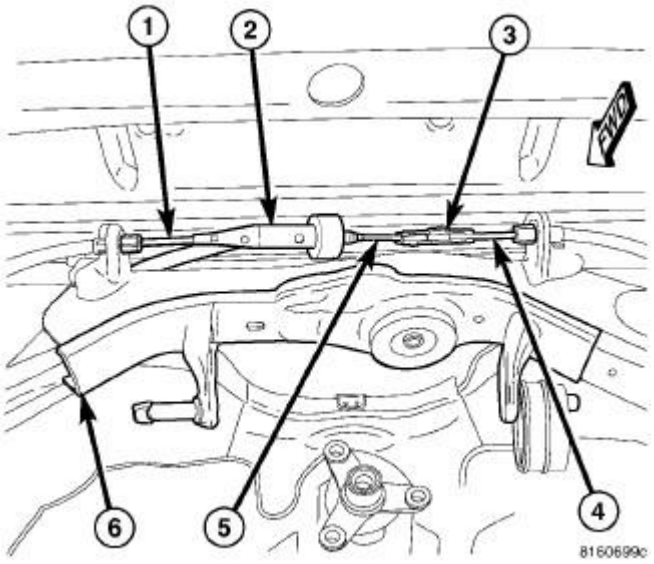

Fig. 234: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

38. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

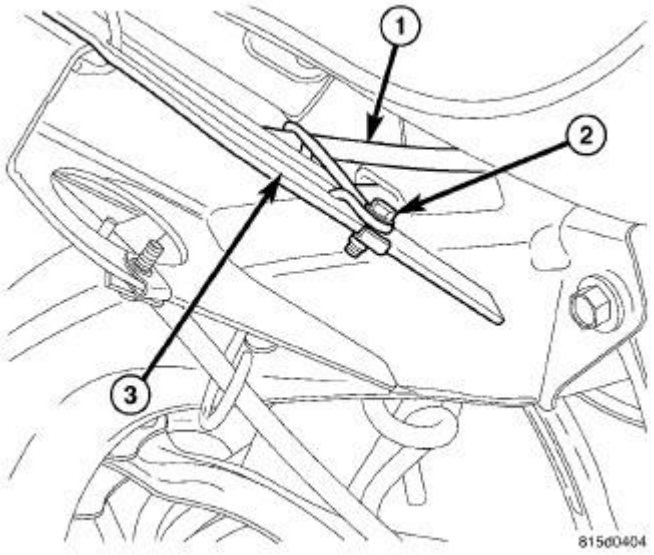

Fig. 235: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

39. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

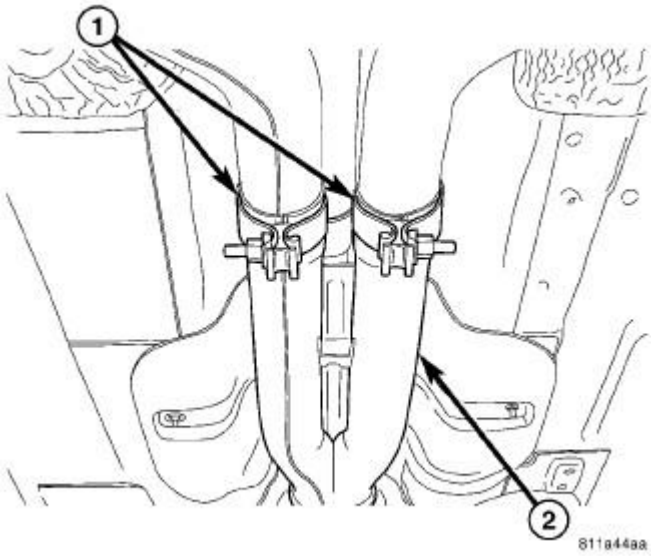

Fig. 236: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

40. Install rear exhaust system (2) (dual-outlet exhaust shown in figure).

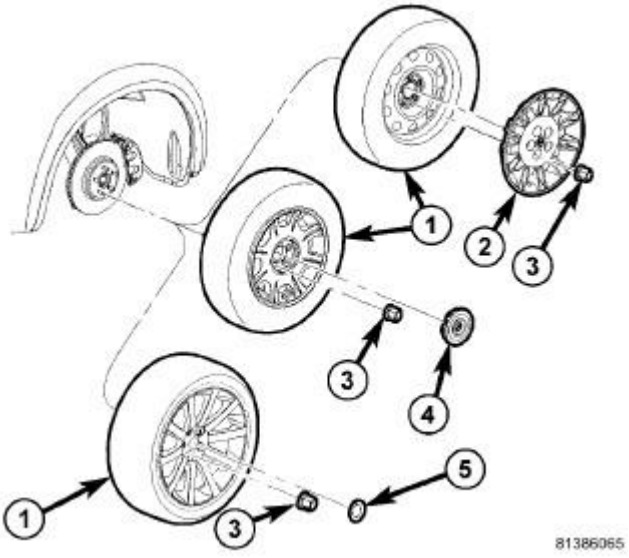

Fig. 237: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

41. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
42. Lower vehicle until rear wheels are just above floor level.
43. Apply parking brake lever. Release lever, then reapply.
44. Check to make sure rear wheels will not rotate with lever applied.
45. Lower vehicle.

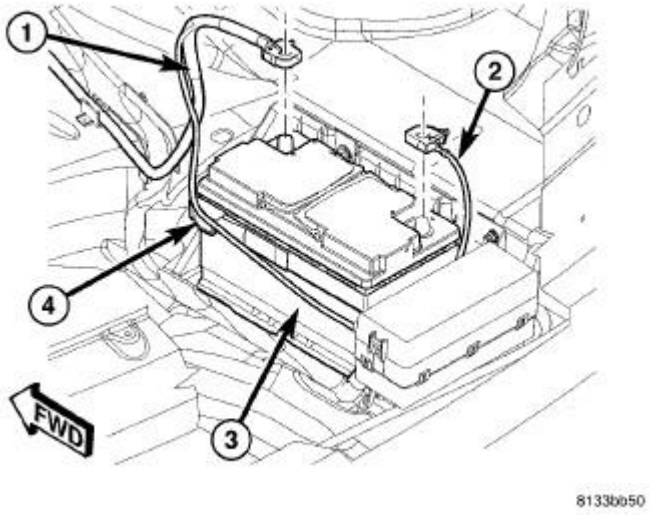

Fig. 238: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

46. Connect battery negative cable (2) to battery post.
47. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
48. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

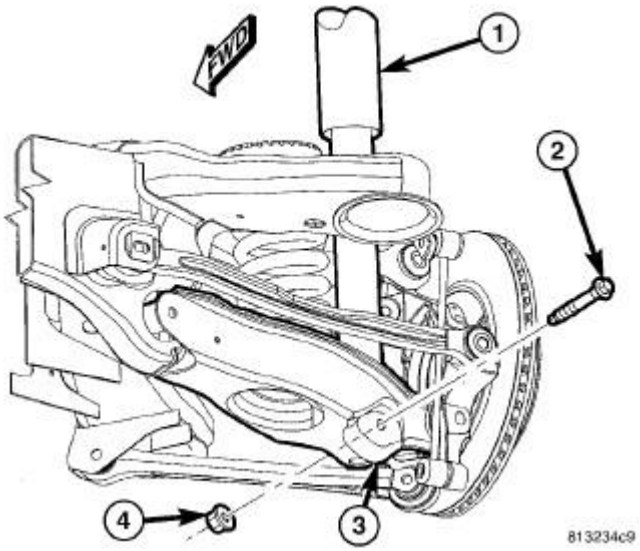

Fig. 239: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

49. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).

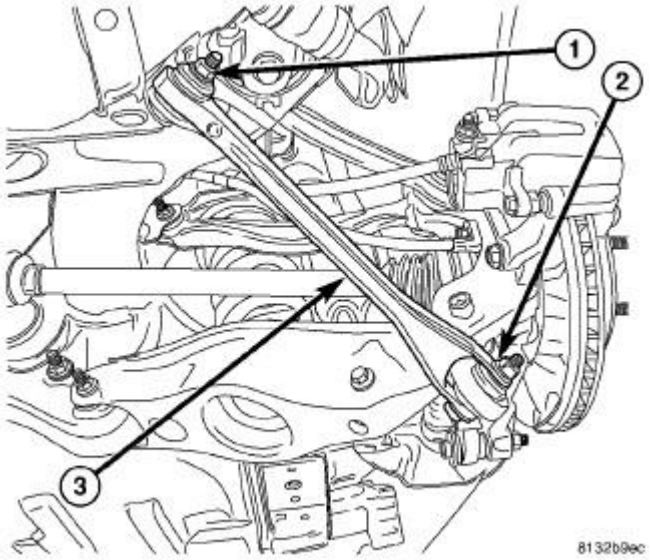

Fig. 240: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

50. Tighten compression link bolt and nut (1) at crossmember to 85 N.m (63 ft. lbs.).
51. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (). Refer to 23 and **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

ISOLATOR, REAR CROSSMEMBER, REAR MOUNT

REMOVAL

REMOVAL

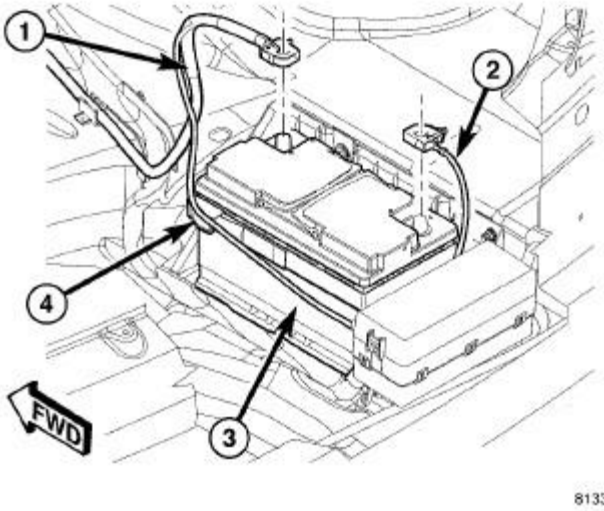

Fig. 241: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

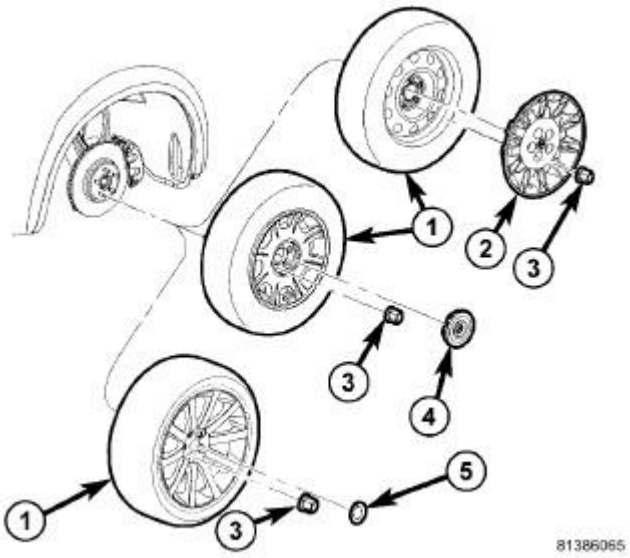

Fig. 242: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

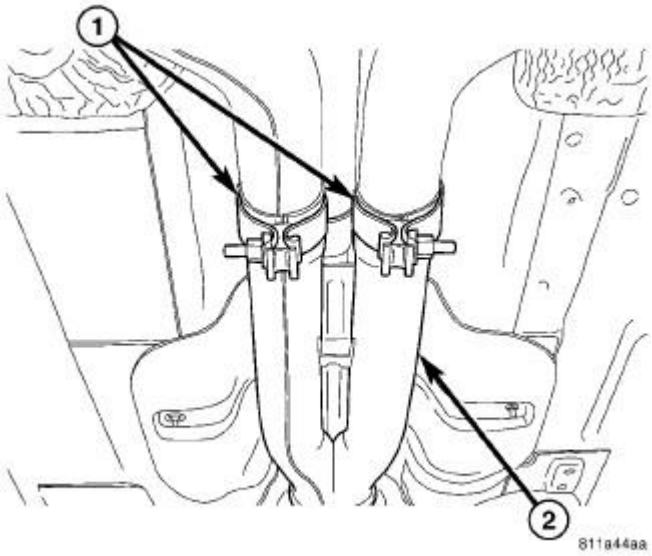

Fig. 243: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

4. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure).

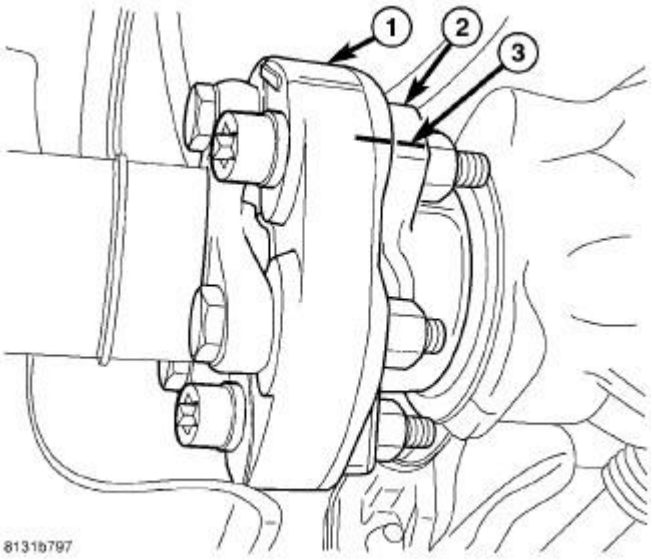

Fig. 244: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

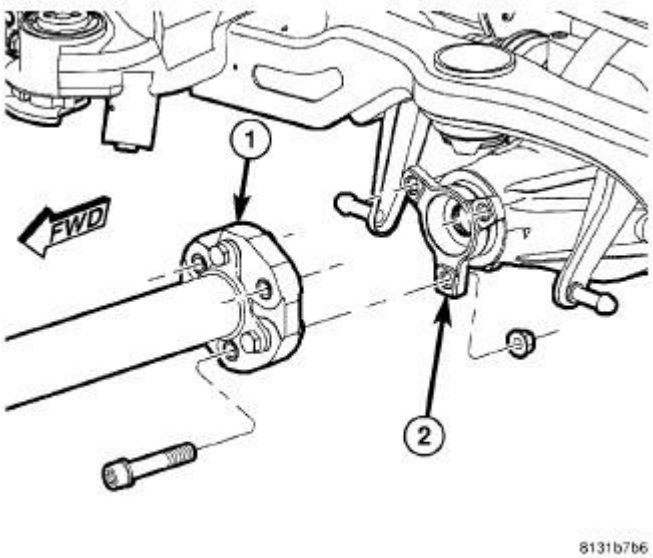

Fig. 245: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three (four if equipped with 215MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

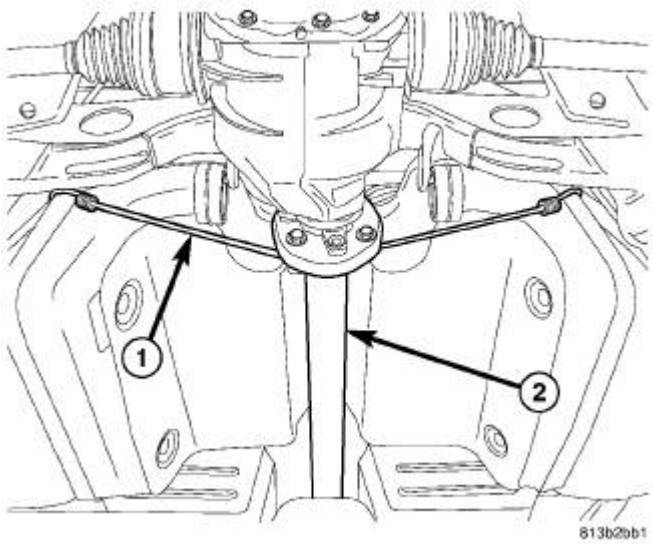

Fig. 246: Prop Shaft Support By Bungee Cord
Courtesy of CHRYSLER GROUP, LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown in illustration.

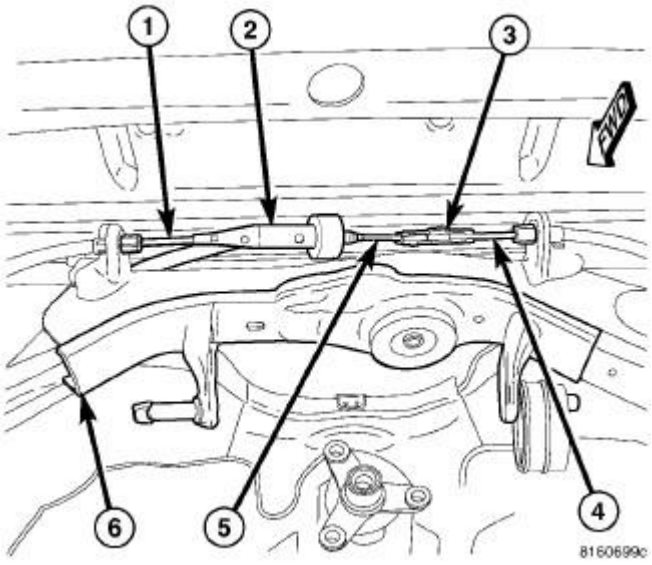

Fig. 247: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential.

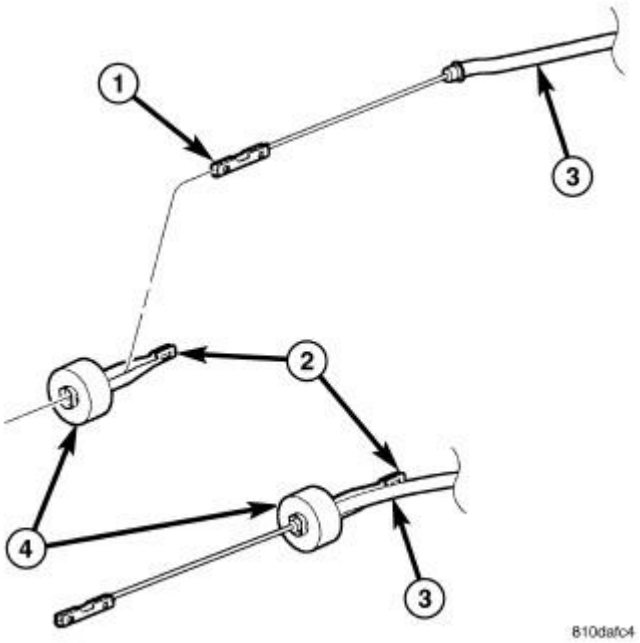

Fig. 248: Front Cable Installation Into Equalizer

Courtesy of CHRYSLER GROUP, LLC

9. Remove front parking brake cable (3) from equalizer (2).

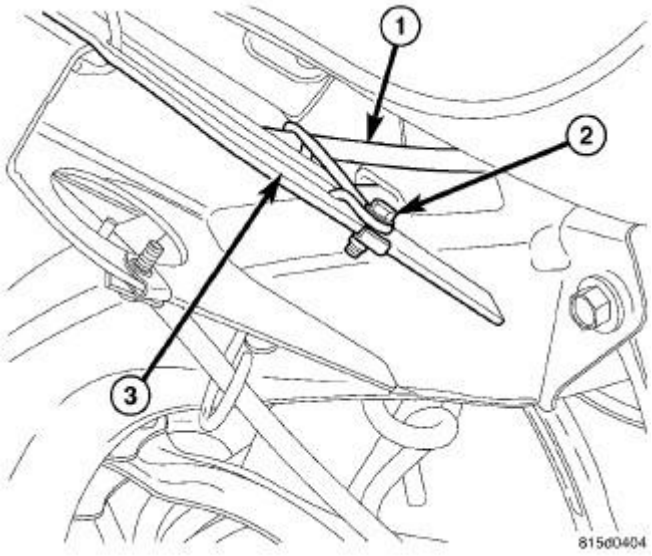

Fig. 249: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

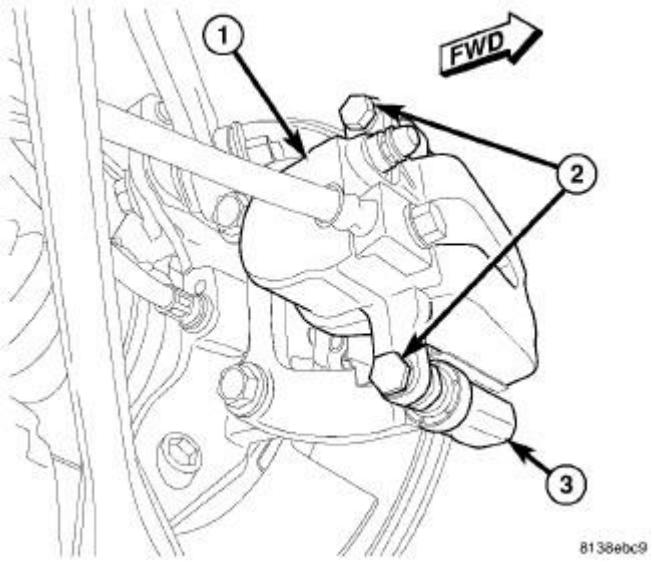

Fig. 250: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:

1. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
2. Remove brake caliper (1) from brake adapter (3) and pads.
3. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

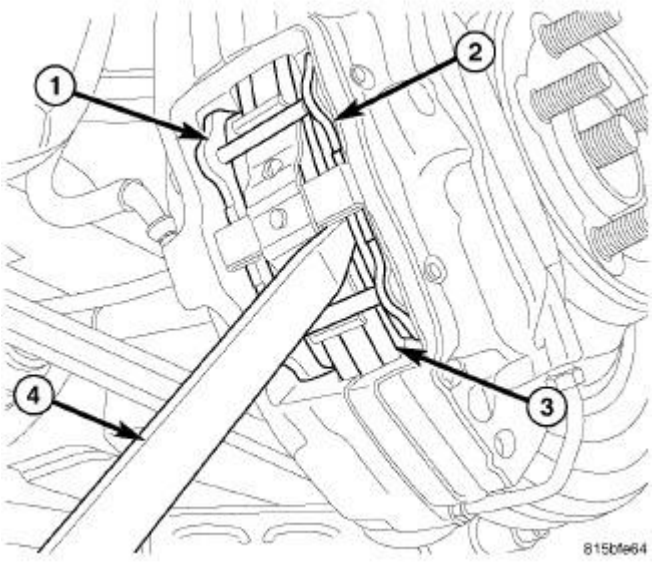

Fig. 251: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

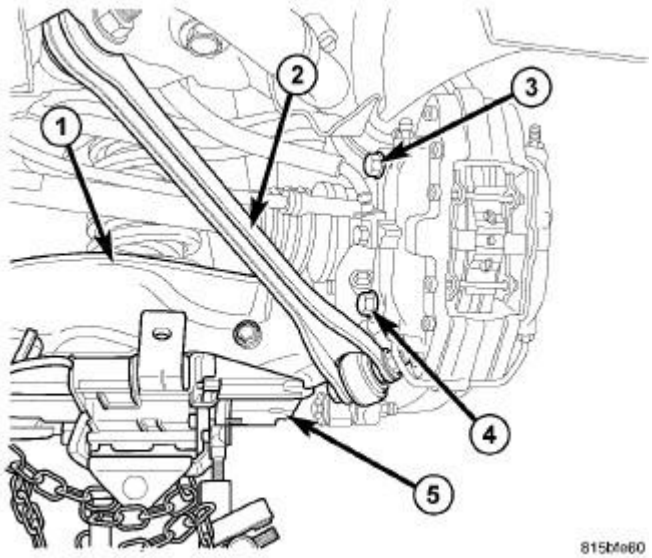

Fig. 252: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

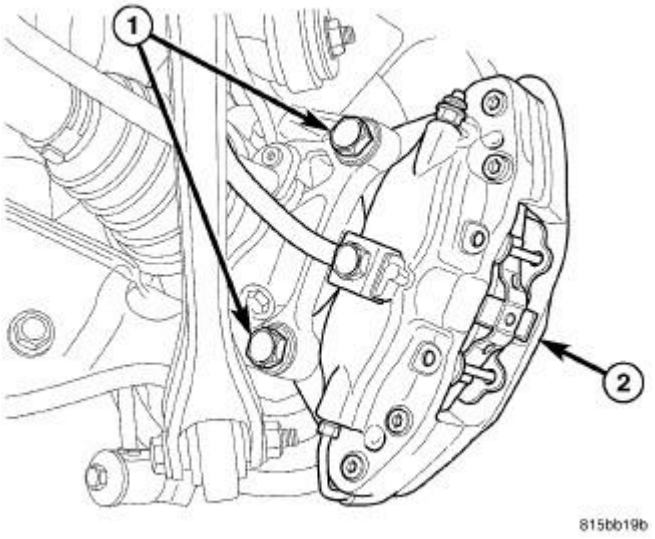

Fig. 253: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care

not to overextend brake hose when doing this.

17. If equipped with SRT8 disc brakes, remove jack from under spring link.

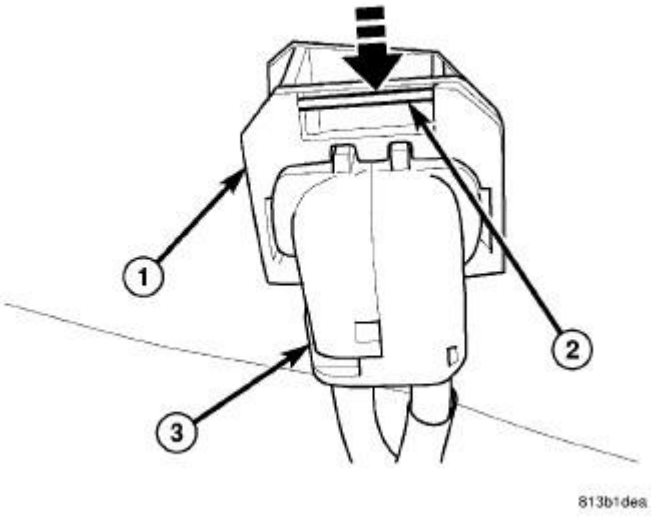

Fig. 254: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

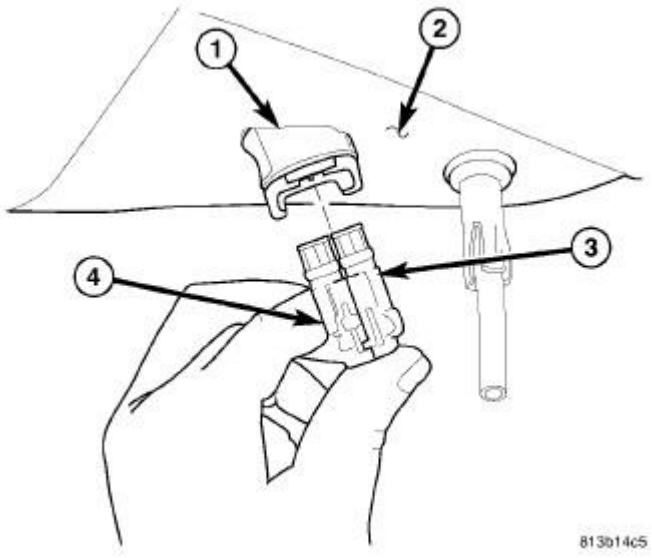

Fig. 255: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1)

located in luggage compartment floor pan (2).

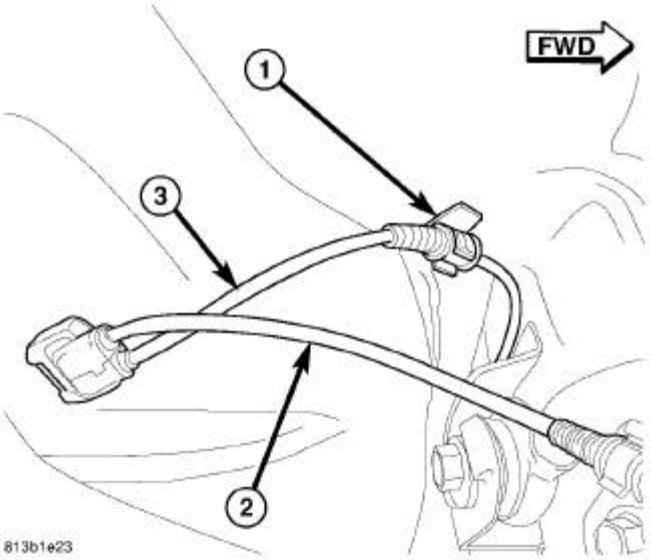

Fig. 256: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

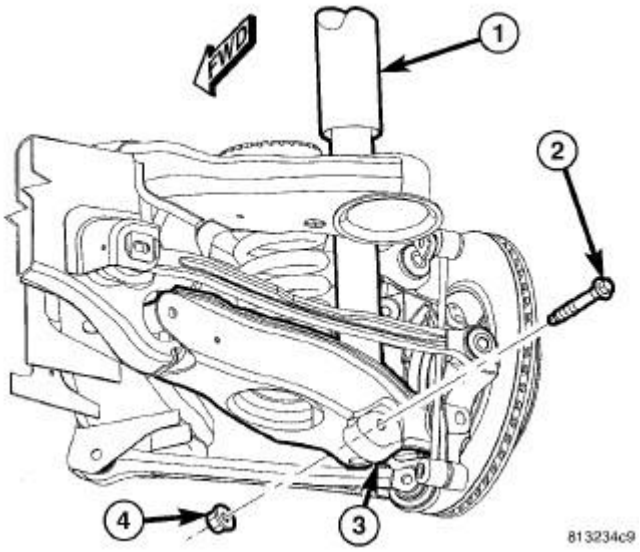

Fig. 257: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

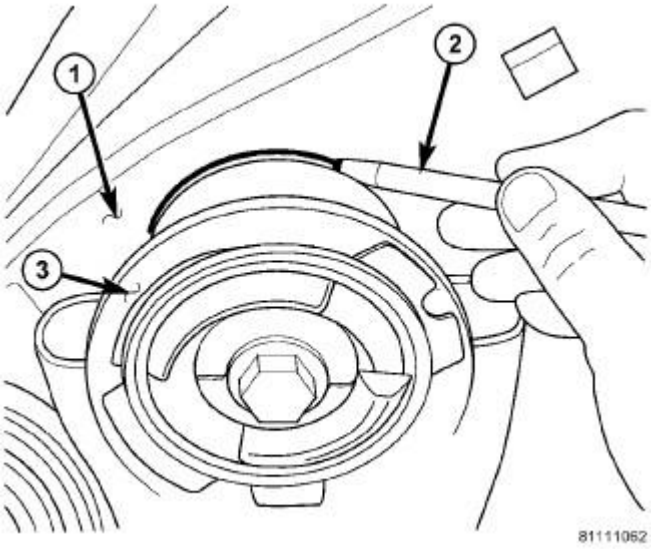

Fig. 258: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

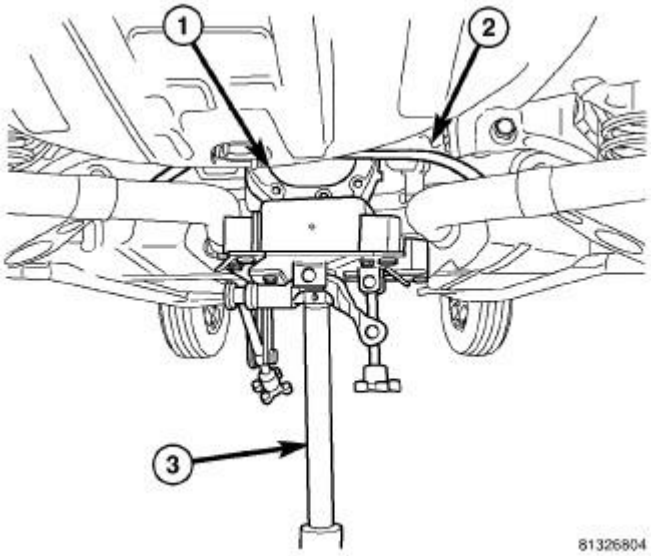

Fig. 259: Support Rear Suspension Using Jack

Courtesy of CHRYSLER GROUP, LLC

23. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

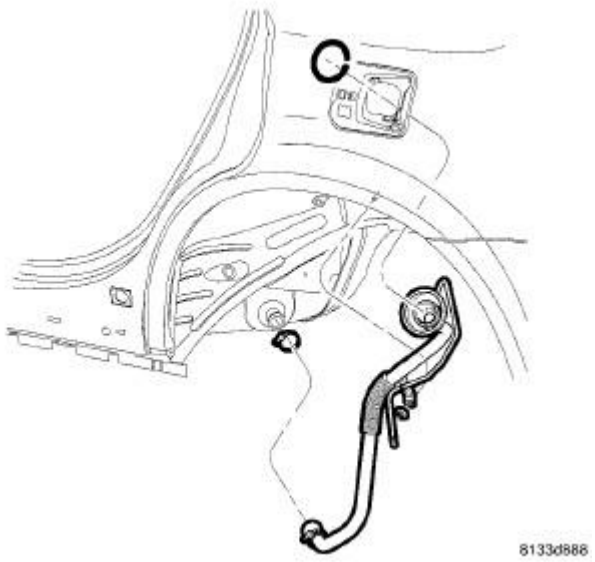

Fig. 260: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .

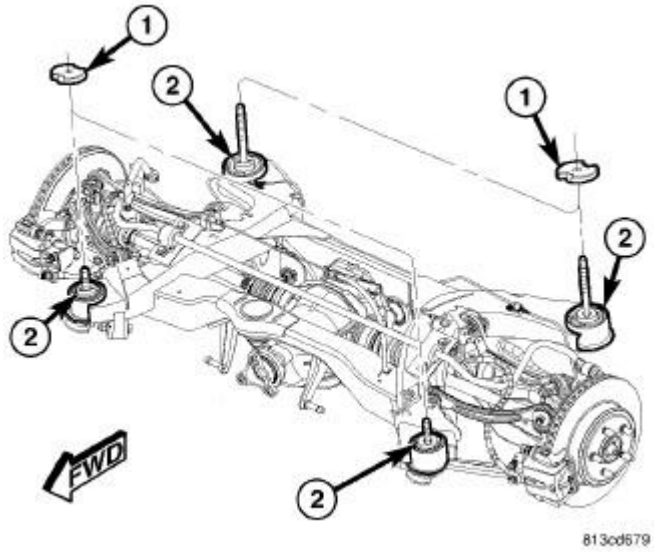

Fig. 261: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

NOTE: If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

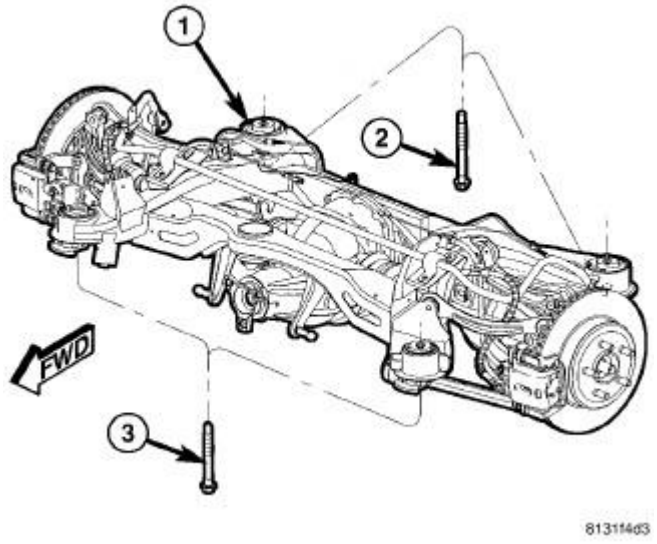

Fig. 262: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow propeller shaft removal from rear axle differential. **Do not lower jack any further than**

necessary. Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.

27. Lower crossmember until crossmember is at a comfortable working level to access bushings. Support rear suspension assembly using jack stands to help stabilize assembly during bushing service.

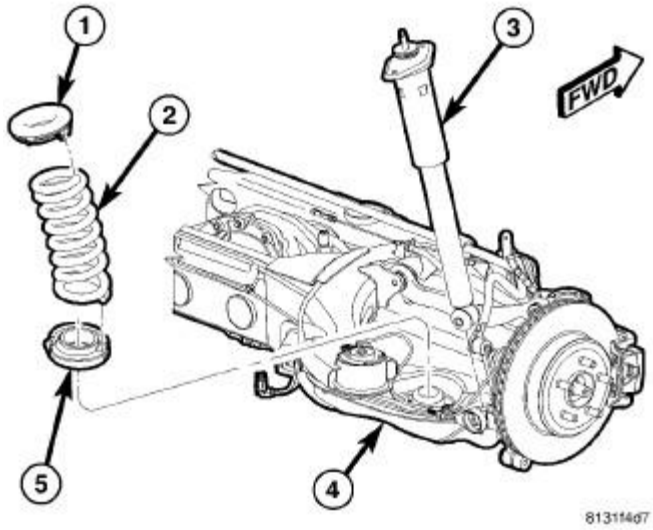

Fig. 263: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

28. Remove coil springs (2) with isolators (1 and 5) from spring links (4).

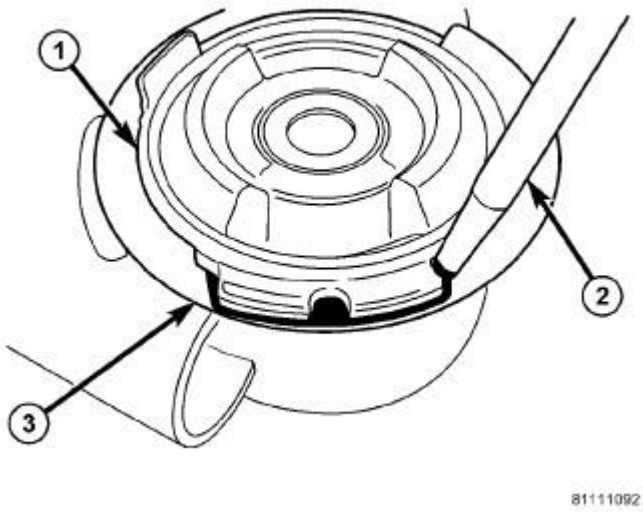

Fig. 264: Marking Location Of Rear Bushing
Courtesy of CHRYSLER GROUP, LLC

1 - BUSHING CAN FLANGE
2 - MARKER OR CRAYON
3 - CROSSMEMBER

29. As an installation reference, carefully mark location of bushing requiring removal on crossmember (around bushing can flange) using a marker or crayon. **Do not use a scratch awl to mark location.**

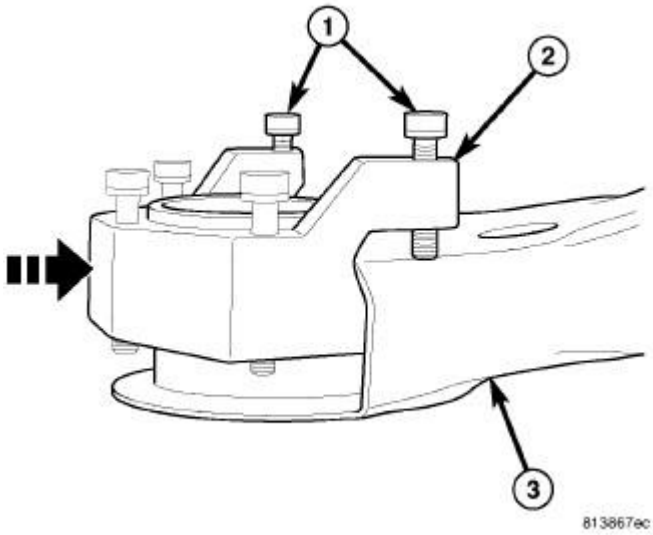

Fig. 265: Installing Support, Slide Support & Crossmember
Courtesy of CHRYSLER GROUP, LLC

30. Slide Support (2), Special Tool (special tool #9031-11, Clamp), into end of crossmember (3) surrounding bushing bore as shown in illustration.
31. Snug set-screws (1) securing Support (2) to crossmember.

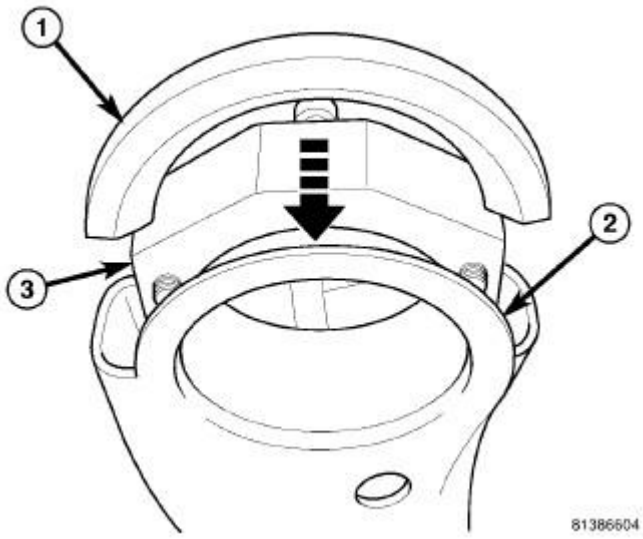

Fig. 266: Inserting Brace, Support & Bushing Bore Flange
Courtesy of CHRYSLER GROUP, LLC

32. Insert Brace (1), Special Tool (special tool #9031-12, Brace), between Support (special tool #9031-11, Clamp) (3) and bushing bore flange (2) matching angle cut in Brace to bore flange.

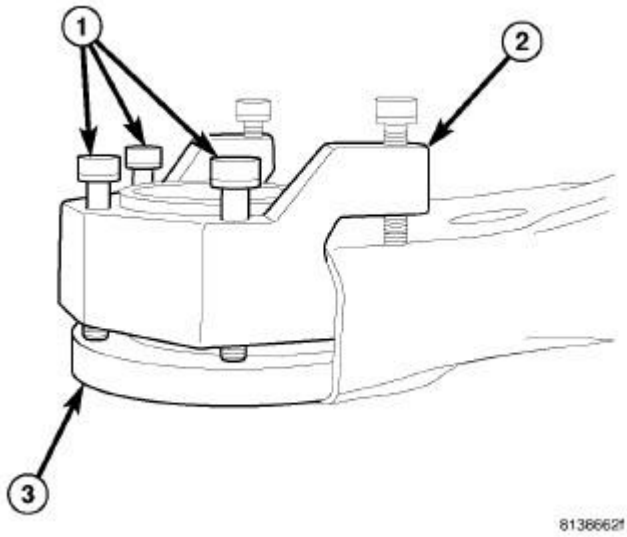

Fig. 267: Set-Screws & Brace
Courtesy of CHRYSLER GROUP, LLC

33. Snug set-screws (1) against Brace (special tool #9031-12, Brace). **Do not overtighten set-screws as they will distort and bend bushing bore flange.**

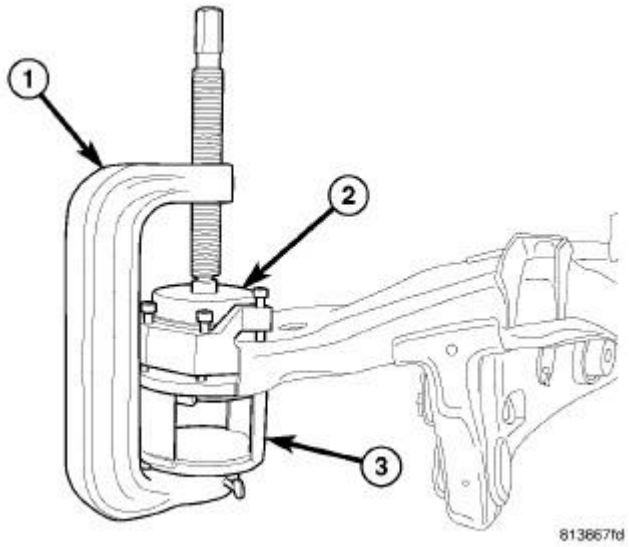

Fig. 268: Tools Positioned To Remove Rear Bushing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using Press (1), Special Tool (special tool #C-4212F, Press, Ball Joint), lubricate screw-drive threads to provide ease of use and promote tool longevity.

34. Assemble tools (See following list) over bushing as shown in illustration.
    - (1) Press (special tool #C-4212F, Press, Ball Joint)
    - (2) Remover (special tool #9031-2, Remover, Bushing)
    - (3) Receiver (special tool #9031-1, Bushing Removal Receiver)
35. Tighten Press (1) screw-drive, pressing bushing out of crossmember.
36. Remove all tools.

INSTALLATION

INSTALLATION

CAUTION: It is very important that bushing be installed in same position as original to maintain vehicle ride quality and bushing longevity. That is why bushing, once installed, needs to closely match reference marks applied upon removal of original bushing.

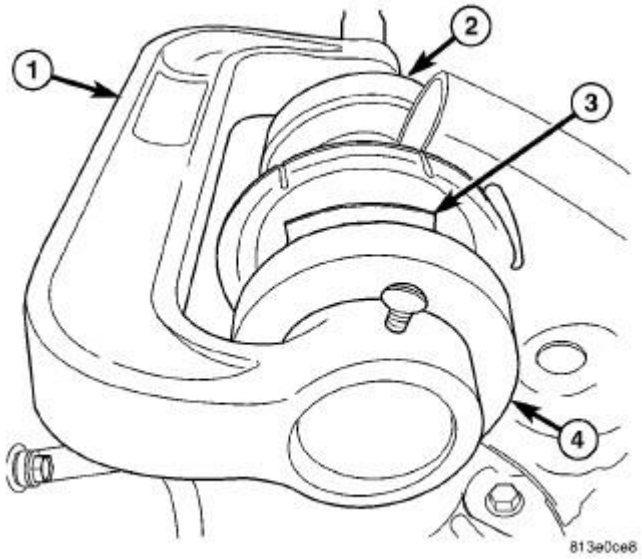

Fig. 269: Installing Rear Bushing
Courtesy of CHRYSLER GROUP, LLC

1. Position bushing on crossmember bushing bore aligning bushing can flange (3) with reference marks applied during removal.
2. Assemble tools (See following list) over bushing (3) and crossmember as shown in illustration.
   - (1) Press (special tool #C-4212F, Press, Ball Joint)
   - (2) Receiver (special tool #9031-3, Receiver, Bushing)
   - (4) Installer (special tool #9031-4, Installer, Bushing)
3. Tighten Press (1) screw-drive, pressing bushing into crossmember. Install bushing until bushing can flange contacts surface of crossmember.
4. Remove tools.
5. Verify bushing closely lines up with reference marks applied during removal.

NOTE: Do not reinstall coil springs on spring links at this time. Install as directed in later steps.

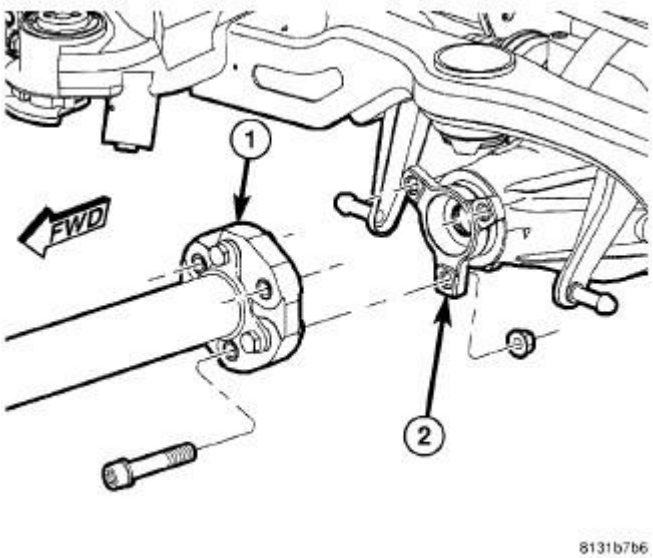

Fig. 270: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft (1) onto rear axle differential flange (2) and align shock absorbers with pockets in spring links.

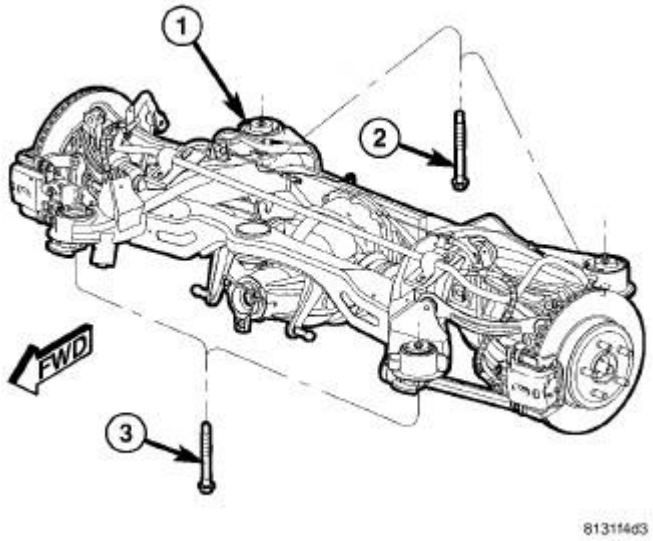

Fig. 271: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be

installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

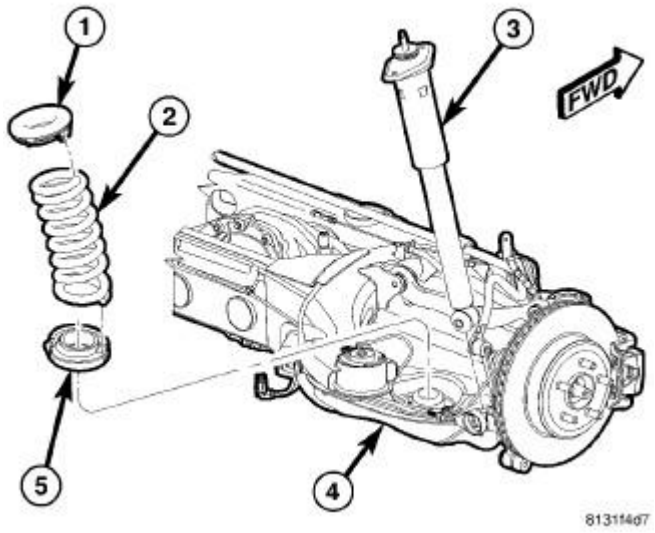

Fig. 272: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

8. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

9. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

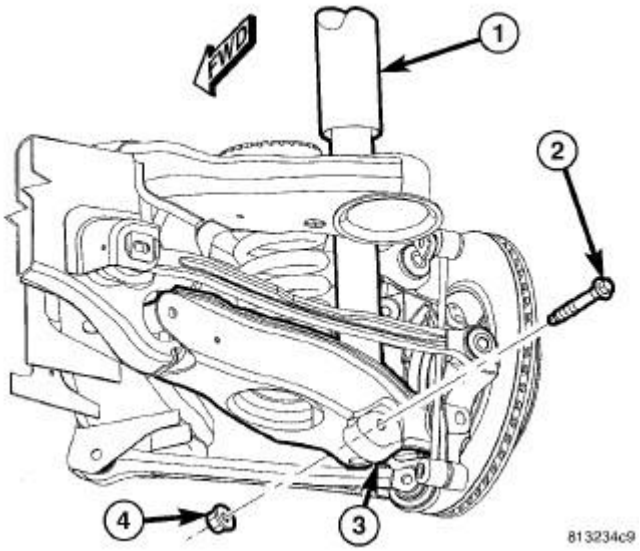

Fig. 273: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

10. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
11. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

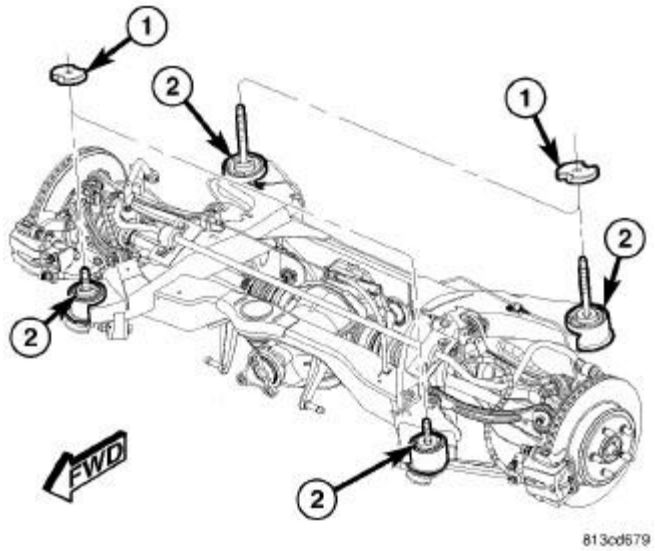

Fig. 274: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

12. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

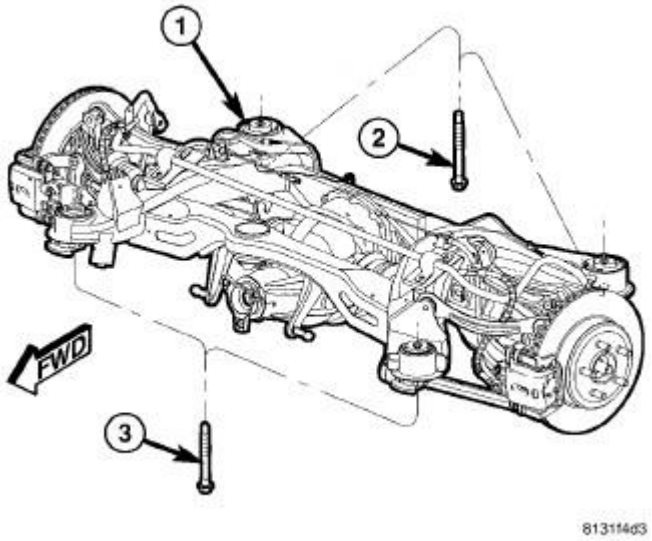

Fig. 275: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

13. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
14. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

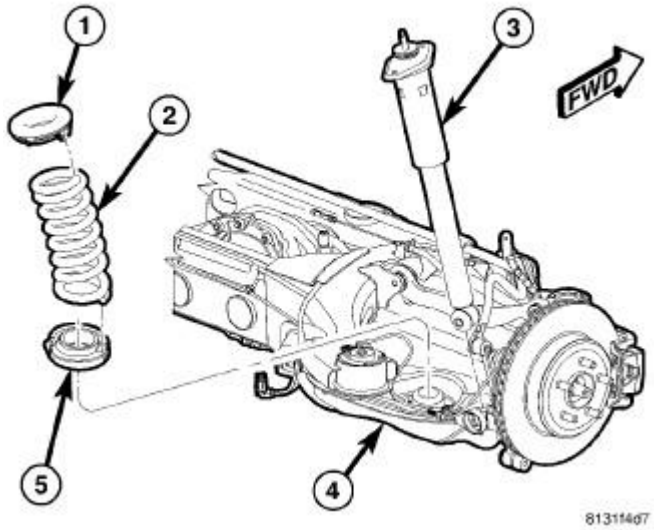

Fig. 276: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

15. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

16. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

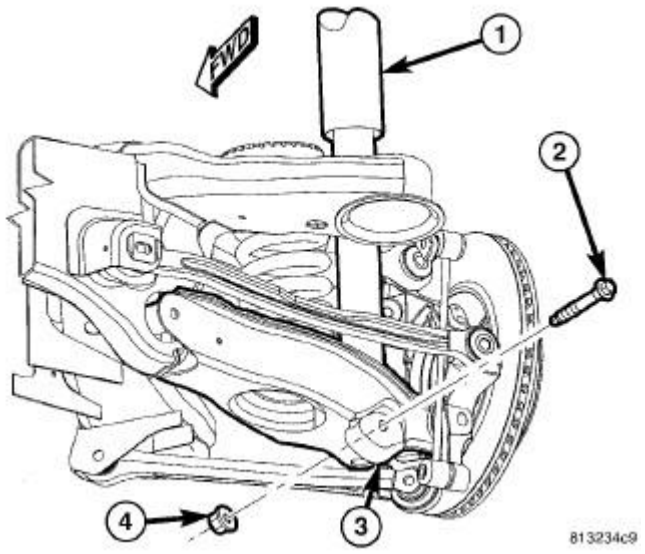

Fig. 277: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

17. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
18. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

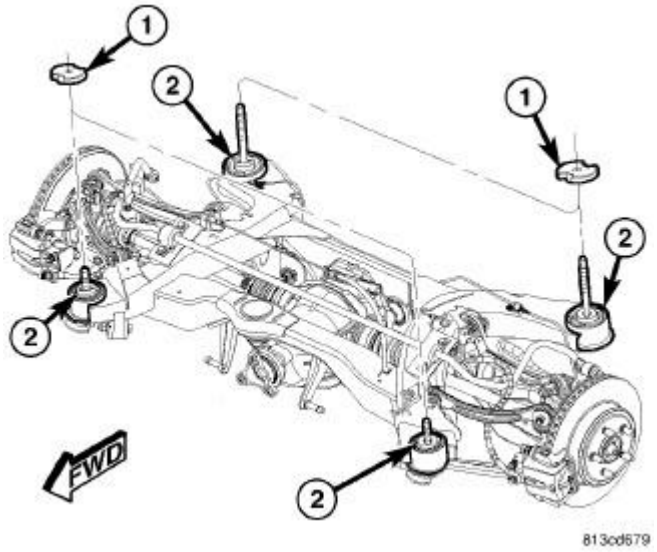

Fig. 278: AWD Crossmember Spacers
Courtesy of CHRYSLER GROUP, LLC

19. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

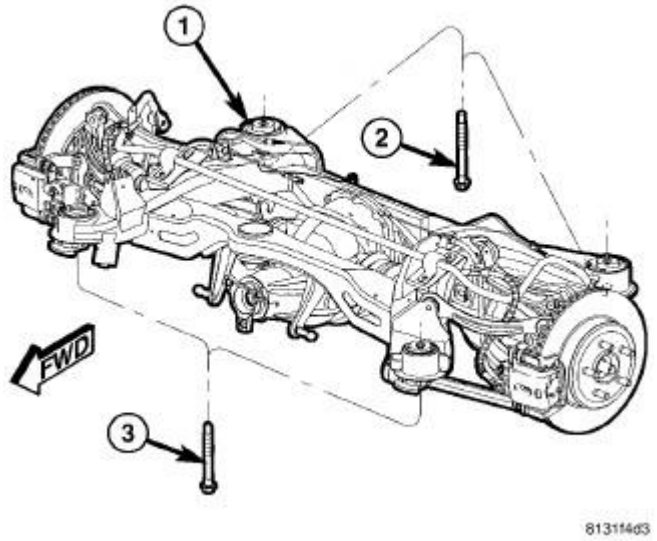

Fig. 279: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

20. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

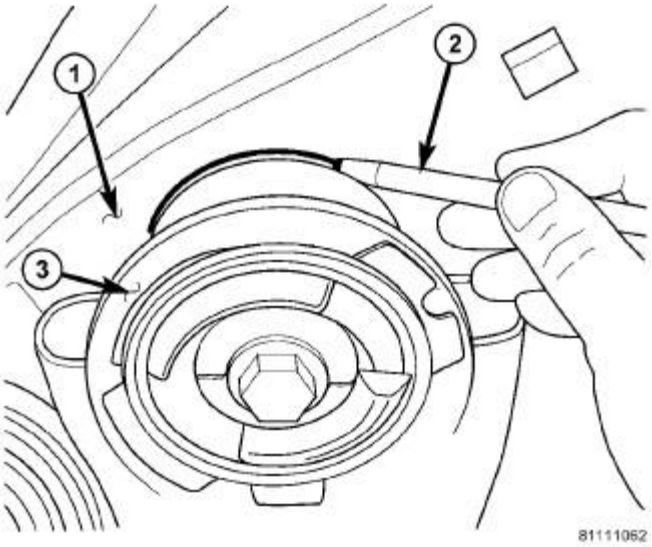

Fig. 280: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

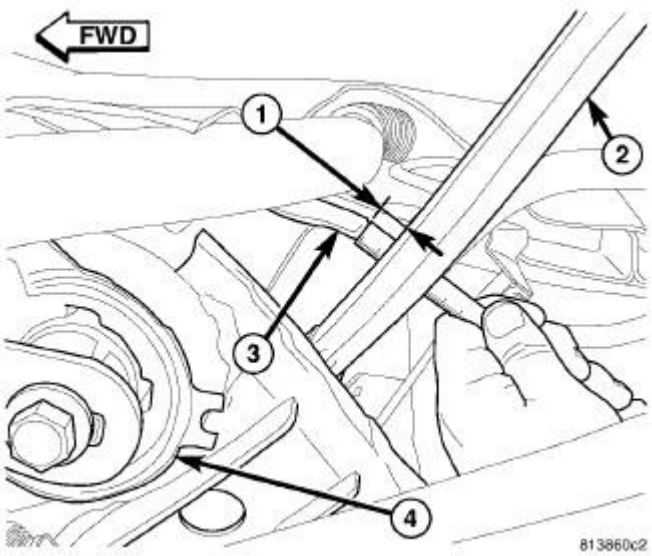

Fig. 281: Measuring Tension Link Clearance

Courtesy of CHRYSLER GROUP, LLC

22. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

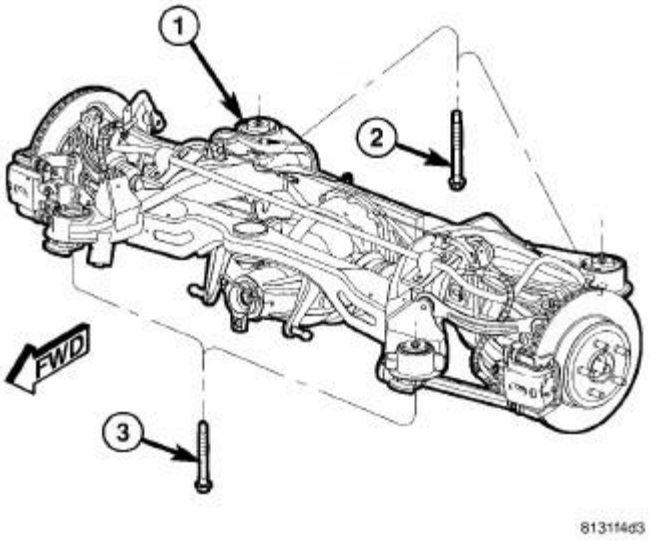

Fig. 282: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

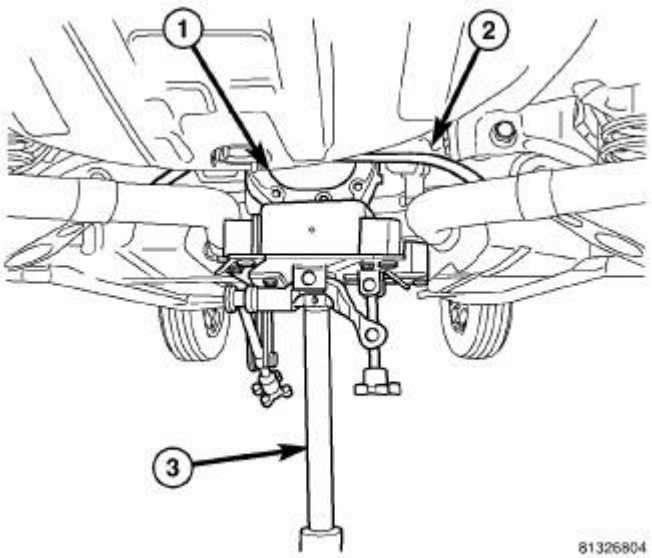

Fig. 283: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

24. Remove jack (3) from under rear axle differential.

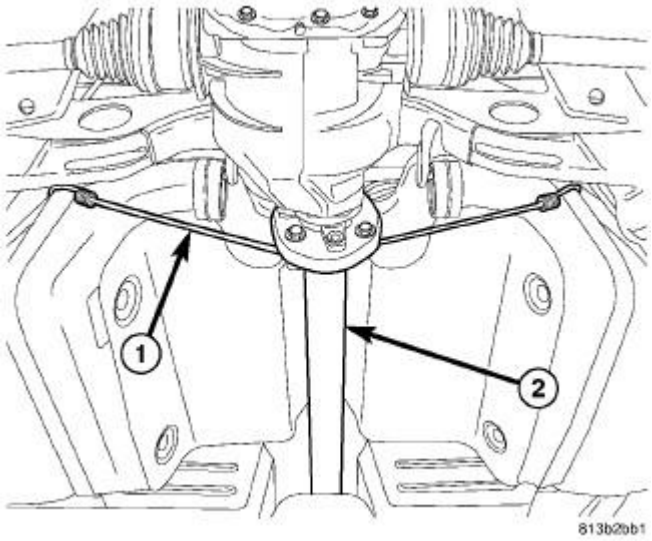

Fig. 284: Prop Shaft Support By Bungee Cord
Courtesy of CHRYSLER GROUP, LLC

25. Remove bungee cord (1) supporting propeller shaft (2).

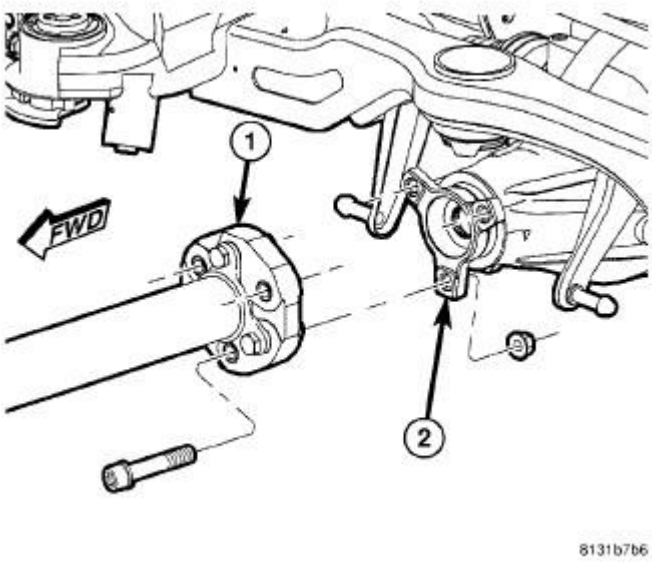

Fig. 285: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

26. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

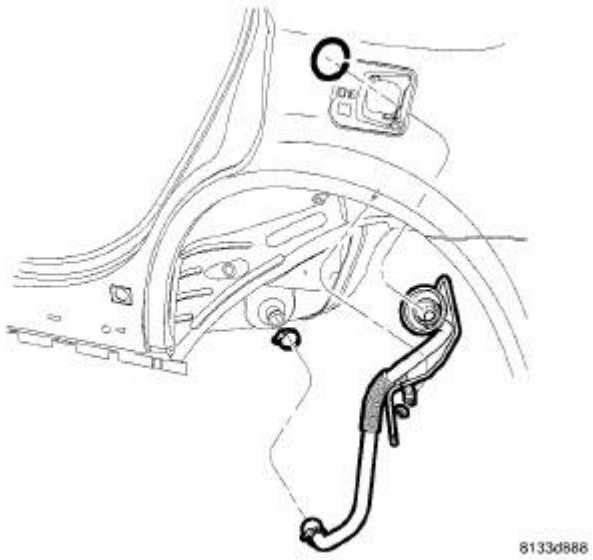

Fig. 286: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

27. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

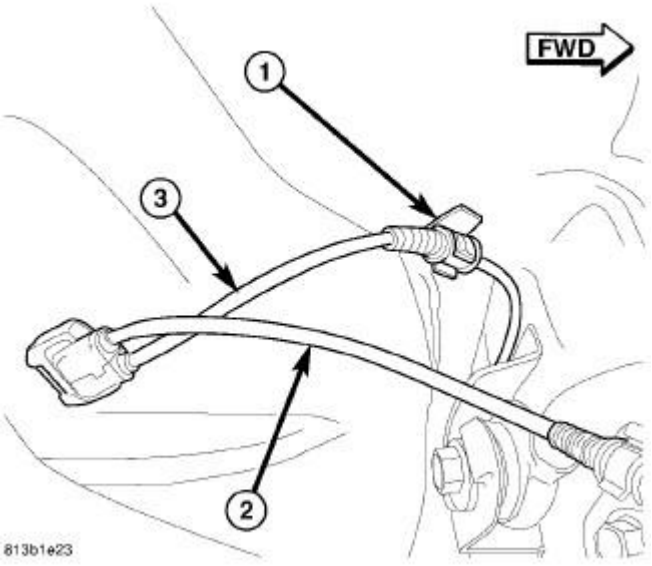

Fig. 287: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

28. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

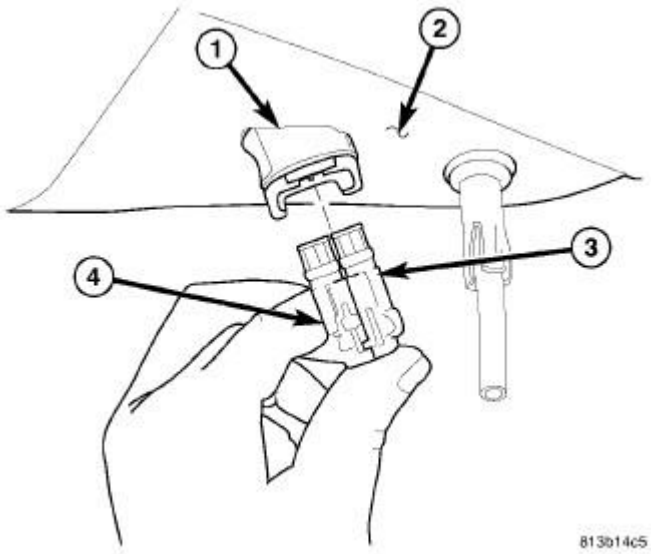

Fig. 288: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

29. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
30. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

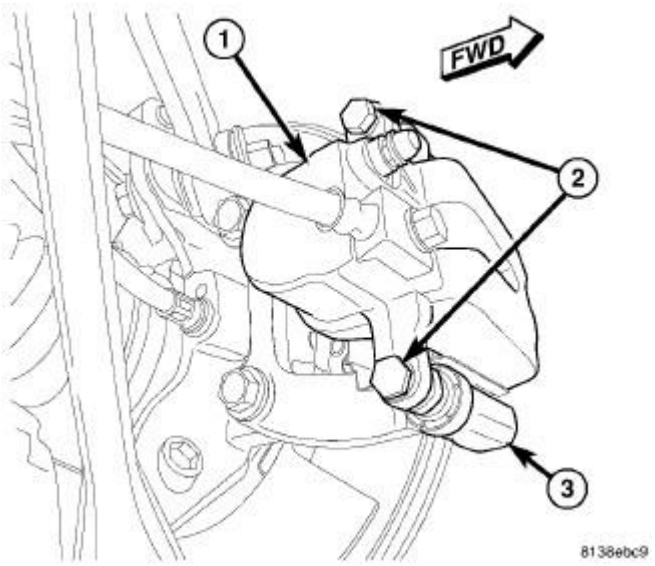

Fig. 289: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

31. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
    2. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).

       CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

    3. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
    4. Make sure brake hose is properly routed and will not come in contact with suspension components.
32. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, FRONT MOUNT, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, REAR MOUNT, REMOVAL** or **ISOLATOR, REAR CROSSMEMBER, SPRING LINK, REMOVAL**.

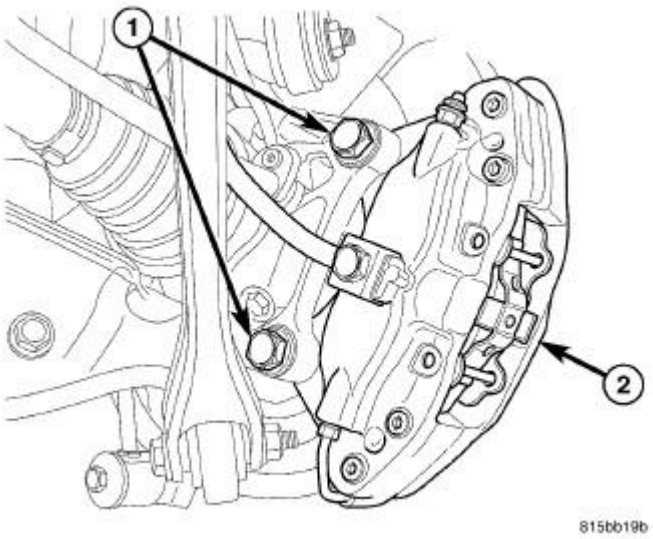

Fig. 290: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

33. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
34. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
35. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

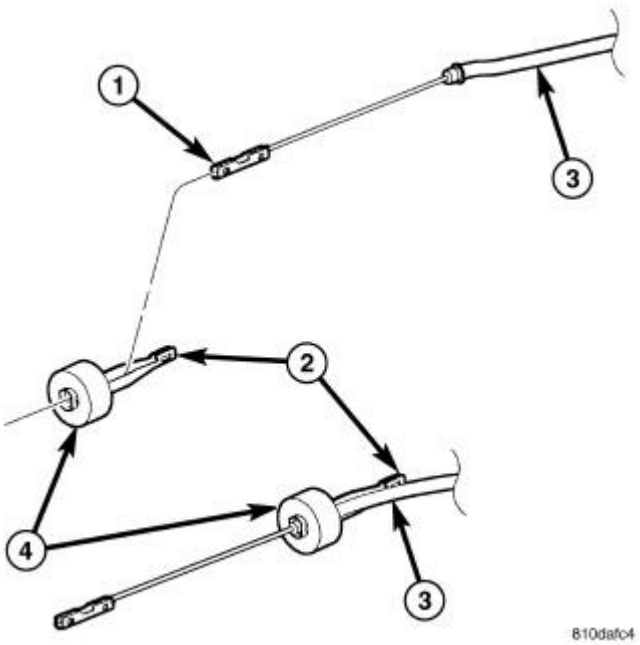

Fig. 291: Front Cable Installation Into Equalizer

Courtesy of CHRYSLER GROUP, LLC

36. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential (once installed).

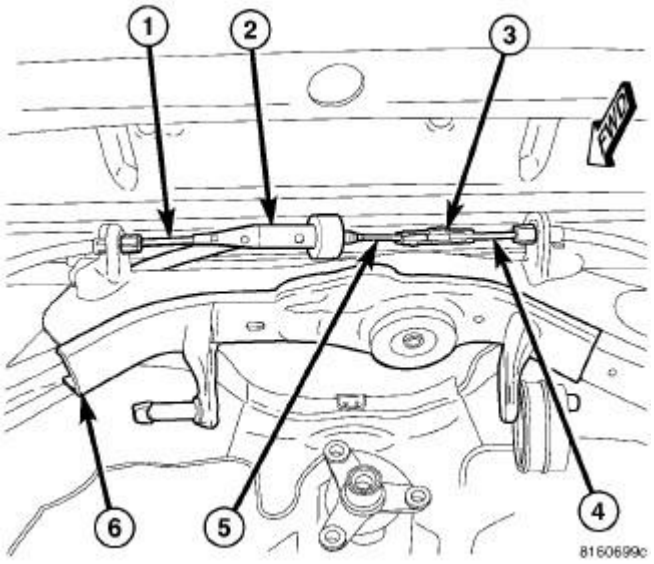

Fig. 292: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

37. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

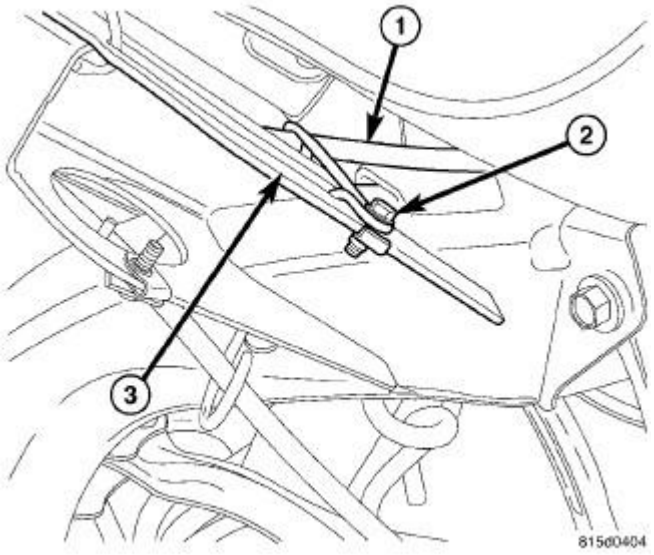

Fig. 293: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

38. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

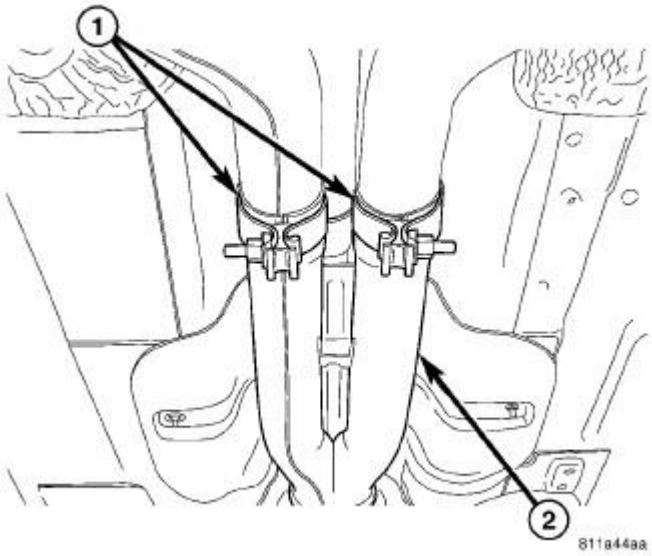

Fig. 294: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

39. Install rear exhaust system (2) (dual-outlet exhaust shown in figure).

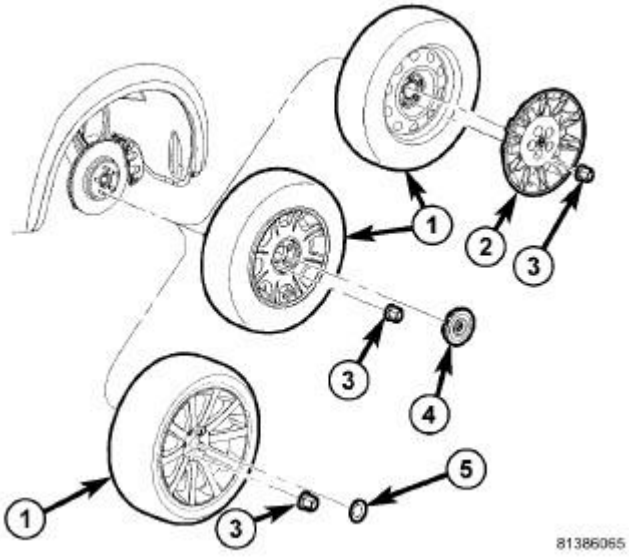

Fig. 295: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

40. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
41. Lower vehicle until rear wheels are just above floor level.
42. Apply parking brake lever. Release lever, then reapply.
43. Check to make sure rear wheels will not rotate with lever applied.
44. Lower vehicle.

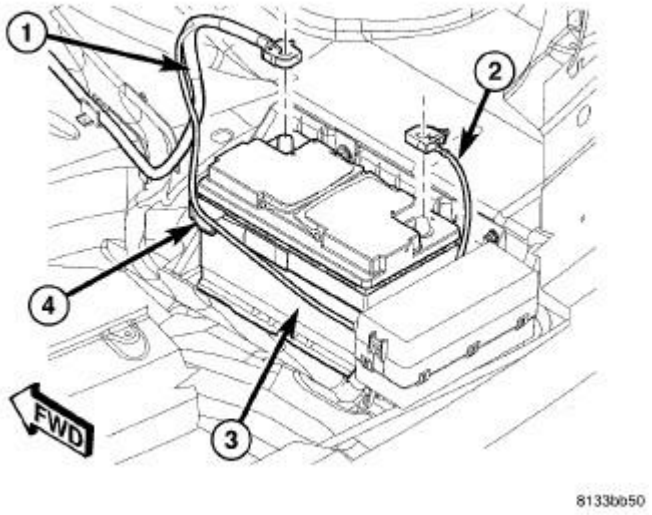

Fig. 296: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

45. Connect battery negative cable (2) to battery post.
46. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
47. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

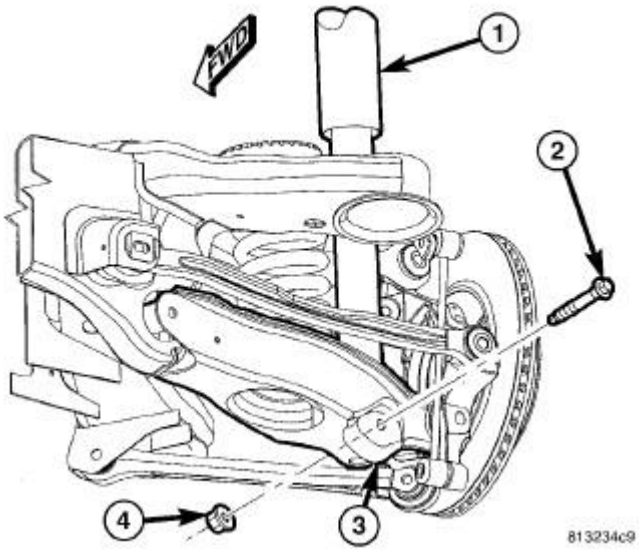

Fig. 297: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

48. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).
49. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (). Refer to 22 and **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

ISOLATOR, REAR CROSSMEMBER, SPRING LINK

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Access and remove rear spring on side of repair. Refer to **SPRING(S), REMOVAL** .

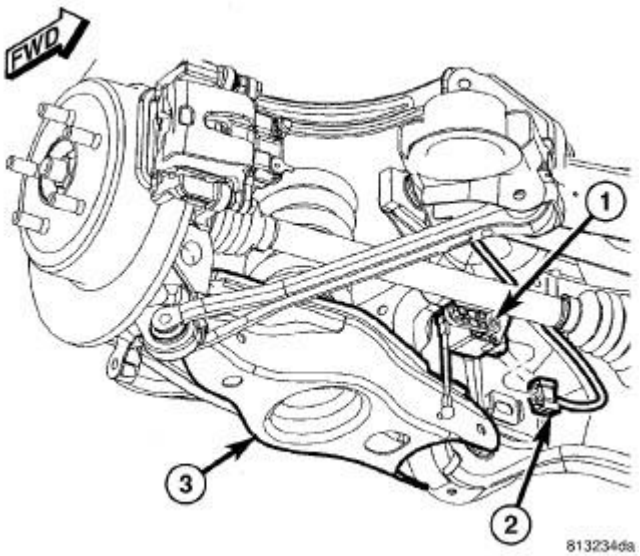

Fig. 298: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Export Only - If servicing right side bushing, disconnect headlamp leveling sensor (1) link at spring link (3).

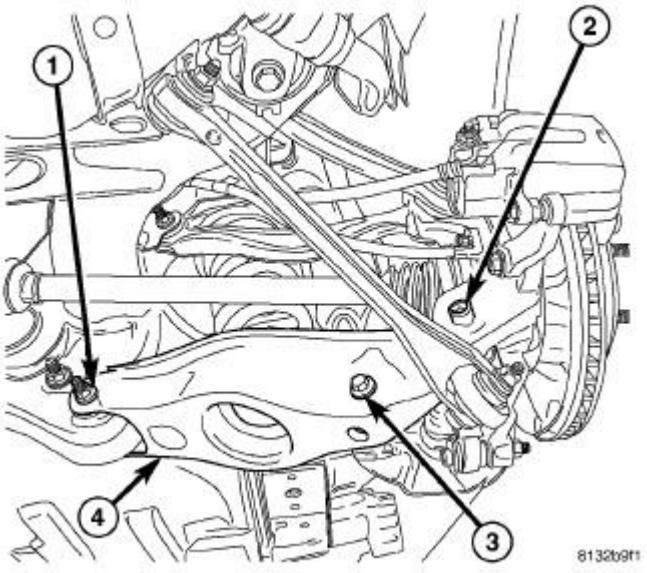

Fig. 299: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolt and nut (1) fastening spring link (4) to crossmember.
5. Position spring link downward, away from bushing in crossmember.

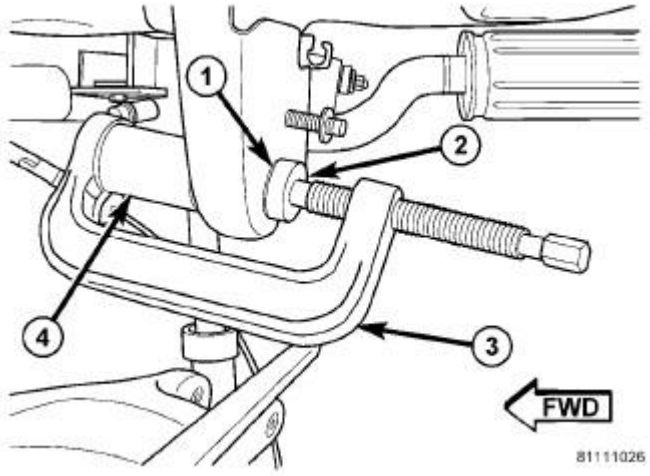

Fig. 300: Spring Link Bushing Removal
Courtesy of CHRYSLER GROUP, LLC

1 - BUSHING
2 - REMOVER 9032-2
3 - PRESS C-4212F
4 - RECEIVER 9032-1

NOTE: Prior to using Press (3), Special Tool (special tool #C-4212F, Press, Ball Joint), lubricate screw-drive threads to provide ease of use and promote tool longevity.

6. Assemble tools over bushing as shown (See list). Ensure Receiver, Special Tool (special tool #9032-1, Receiver, Bushing), sets against crossmember and not welds.
   - (2) Remover (special tool #9032-2, Receiver, Bushing)
   - (3) Press (special tool #C-4212F, Press, Ball Joint)
   - (4) Receiver (special tool #9032-1, Receiver, Bushing)
7. Tighten Press screw-drive, pressing bushing out of crossmember.

INSTALLATION

INSTALLATION

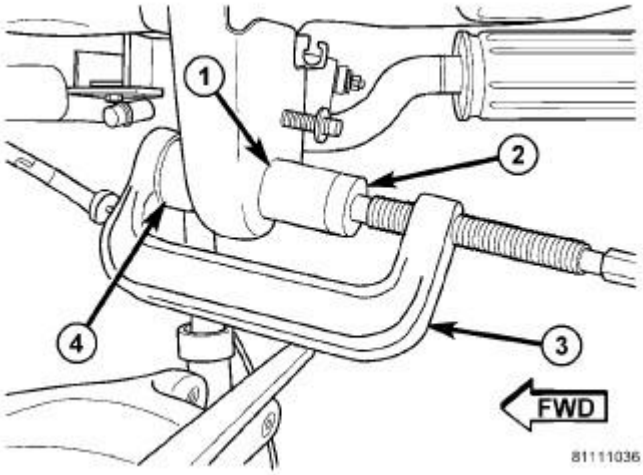

Fig. 301: Spring Link Bushing Installation
Courtesy of CHRYSLER GROUP, LLC

1 - BUSHING
2 - REMOVER/INSTALLER 9032-2
3 - PRESS C-4212F
4 - RECEIVER 9032-3

1. Position bushing (1) over rear of crossmember bushing bore.
2. Assemble tools over bushing and crossmember as shown (See list). Ensure Receiver, Special Tool (special tool #9032-3, Pusher, Bushing), is positioned to avoid welds on rear of crossmember bushing bore.
    - (2) Remover/Installer (special tool #9032-2, Receiver, Bushing)
    - (3) Press (special tool #C-4212F, Press, Ball Joint)
    - (4) Receiver (special tool #9032-3, Pusher, Bushing)
3. Tighten Press screw-drive, pressing bushing into crossmember. Install bushing until screw-drive stops, when bushing contacts Receiver on opposite side of crossmember.
4. Remove tools.

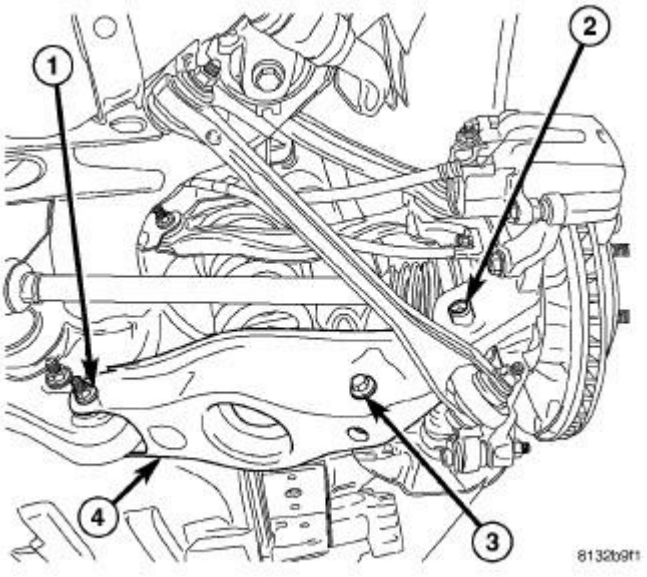

Fig. 302: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Swing spring link up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

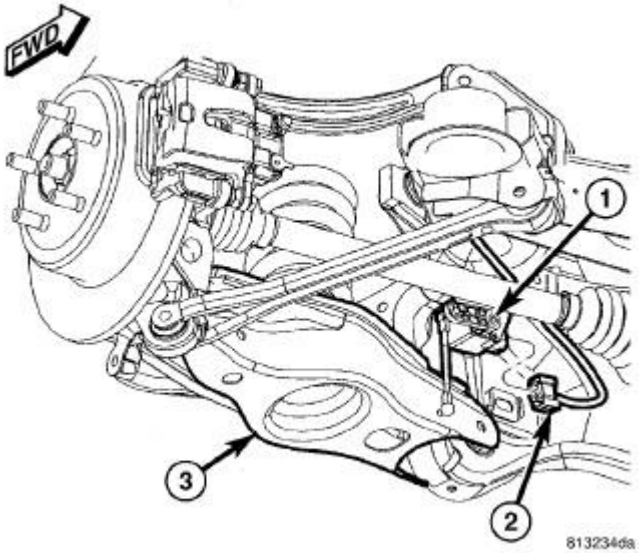

Fig. 303: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Export Only - If servicing right side bushing, connect headlamp leveling sensor (1) link at spring link (3).
7. Install rear spring as well as all components necessary to access it. Refer to **SPRING(S), INSTALLATION** .

8. Lower vehicle.
9. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.

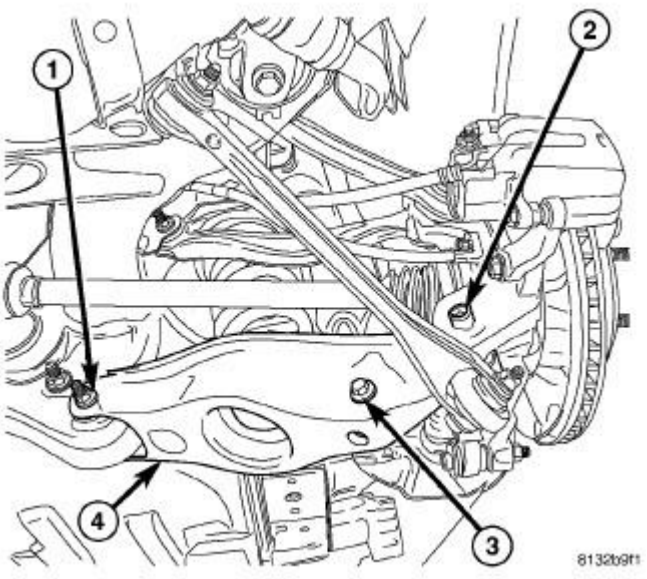

Fig. 304: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Tighten spring link bolt (1) at crossmember to 108 N.m (80 ft. lbs.).
11. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

UNDER BODY PROTECTION

BELLY PAN

REMOVAL

REMOVAL

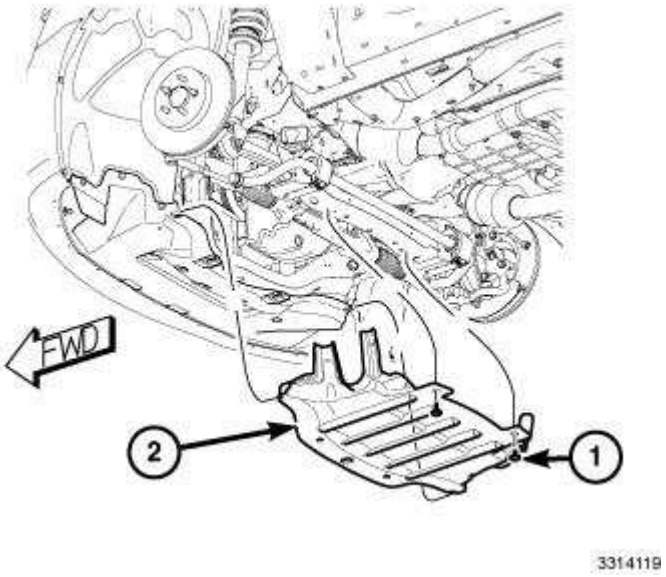

Fig. 305: Rear & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: Base model shown in illustration, SRT models similar.

1. Raise and support the vehicle.
2. Remove the four fasteners (1) that secure the rear belly pan (2) to the underside of the vehicle.
3. Pull the rear belly pan (2) rearward out of the from the front belly pan to remove from the vehicle.

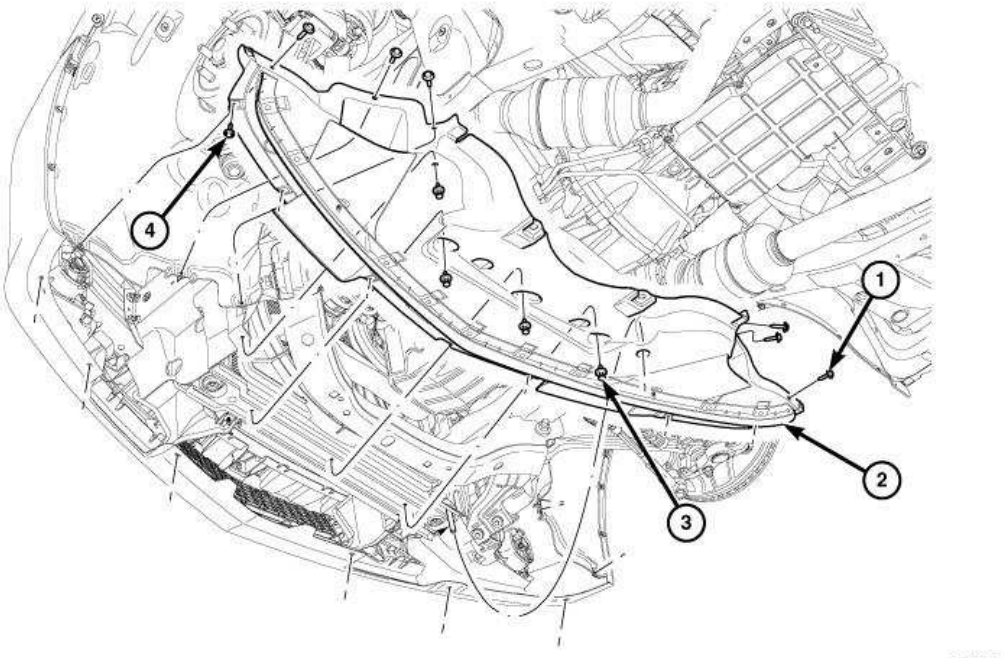

Fig. 306: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

4. Remove the six screws (4) that secure the front belly pan (2) to the underside of the vehicle's front fascia.
5. Remove the three screws (1) that secure the front belly pan (2) to the underside of the vehicle's wheelhouse inner. Repeat for the other side.
6. Remove the four push pin fasteners (3) that secure the front belly pan (2) to the underside of the vehicle's lower crossmember. Repeat for the other side.
7. Remove the front belly pan (2) from the underside of the vehicle.

INSTALLATION

INSTALLATION

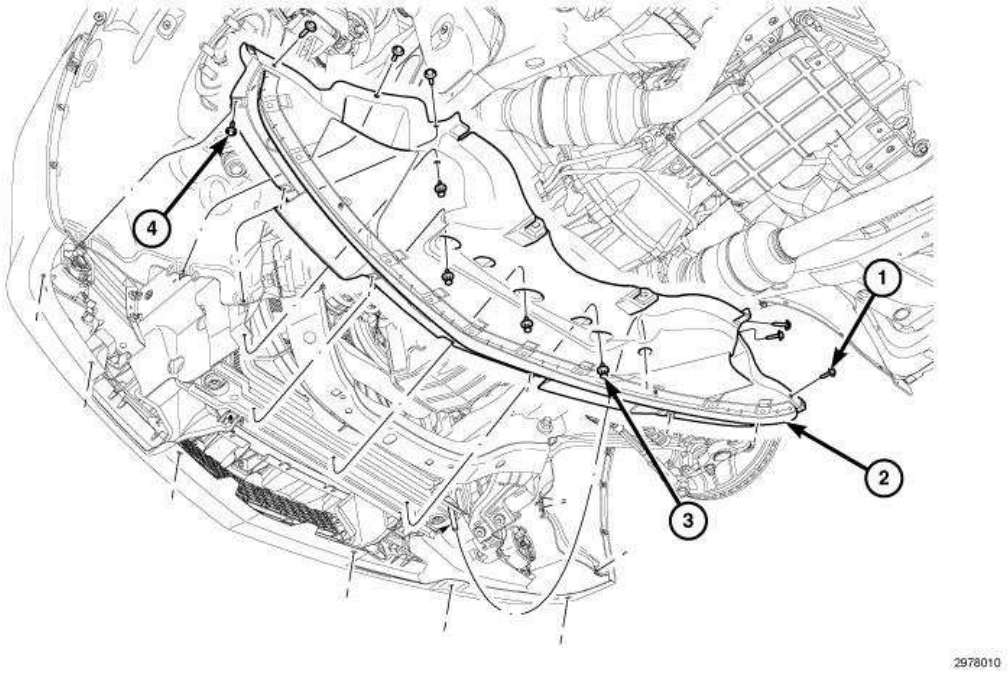

Fig. 307: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: Base model shown in illustration, SRT models similar.

1. Position the front belly pan (2) to the underside of the vehicle.
2. Install the four push pin fasteners (3) that secure the front belly pan (2) to the underside of the vehicle's lower crossmember.
3. Install the six screws (4) that secure the front belly pan (2) to the underside of the vehicle's front fascia.
4. Install the three screws (1) that secure the front belly pan (2) to the underside of the vehicle's

wheelhouse inner. Tighten the screws securely. Repeat for the other side.

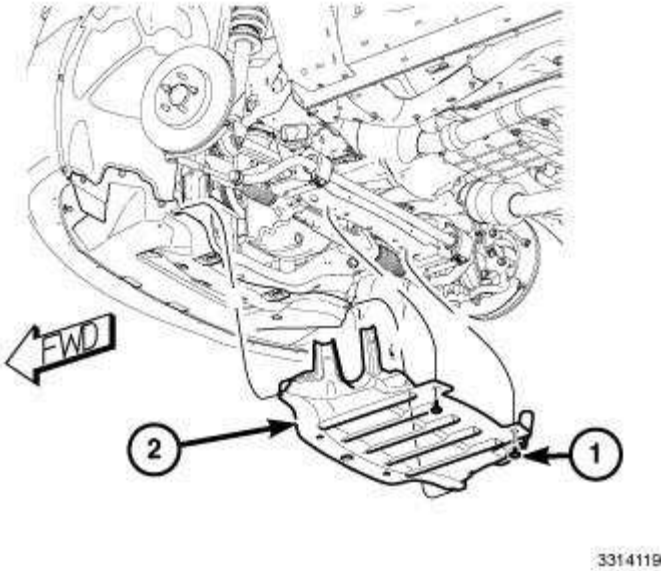

Fig. 308: Rear & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: During installation, ensure rear belly pan is shingled underneath front belly pan. Failure to do so may result in damage to belly pan.

5. Position the rear belly pan (2) to the underside of the vehicle and to the front fascia.
6. Install the fasteners (1) that secure the rear belly pan (2) to the underside of the vehicle. Tighten the fasteners securely.
7. Lower the vehicle.

SHIELD, UNDERBODY

REMOVAL

REMOVAL

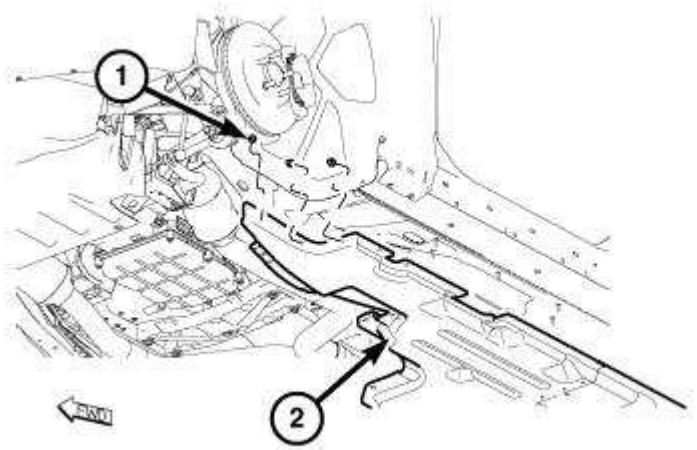

Fig. 309: Three Fasteners & Underbody Shield
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side typical.

1. Raise and support the vehicle.
2. Remove the three fasteners (1) that secure the underbody shield (2) to the front wheelhouse splash shield.

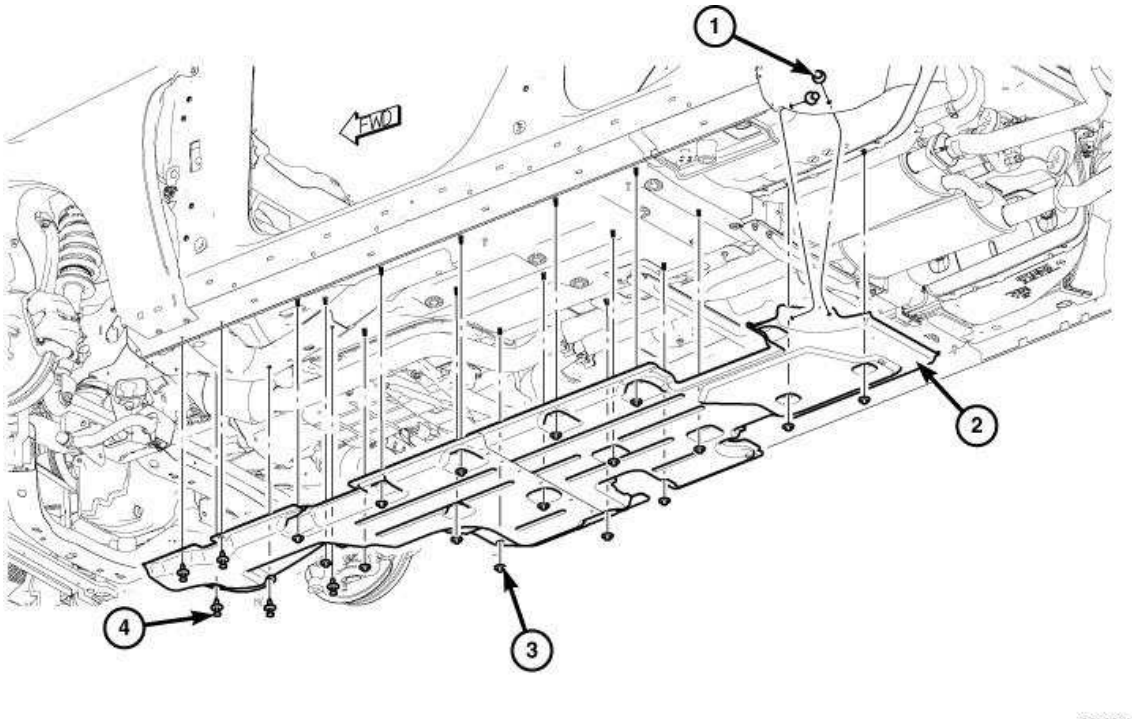

Fig. 310: Fasteners, Underbody Shield & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two fasteners (1) that secure the underbody shield (2) to the rear wheelhouse splash shield.
4. Remove the five fasteners (4) located near the front of the shield that secure the underbody shield (2) to the vehicle.
5. Remove the sixteen retaining nuts (3) that secure the underbody shield (1) to the vehicle underbody.
6. Remove the underbody shield from the vehicle.

INSTALLATION

INSTALLATION

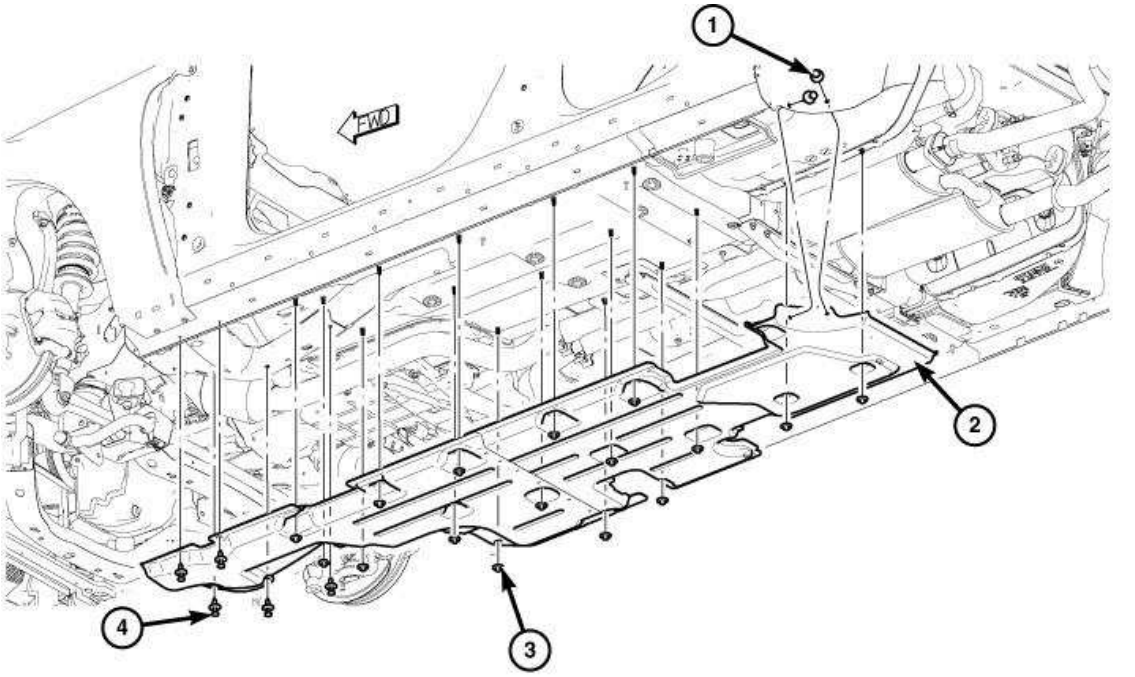

Fig. 311: Fasteners, Underbody Shield & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side typical.

1. Position the underbody shield (1) to the vehicle.
2. Install the sixteen retaining nuts (3) that secure the underbody shield (1) to the vehicle underbody. Tighten the nuts securely.
3. Install the five fasteners (4) located near the front of the shield that secure the underbody shield (2) to the vehicle.
4. Install the two fasteners (1) that secure the underbody shield (1) to the rear wheelhouse splash shield.

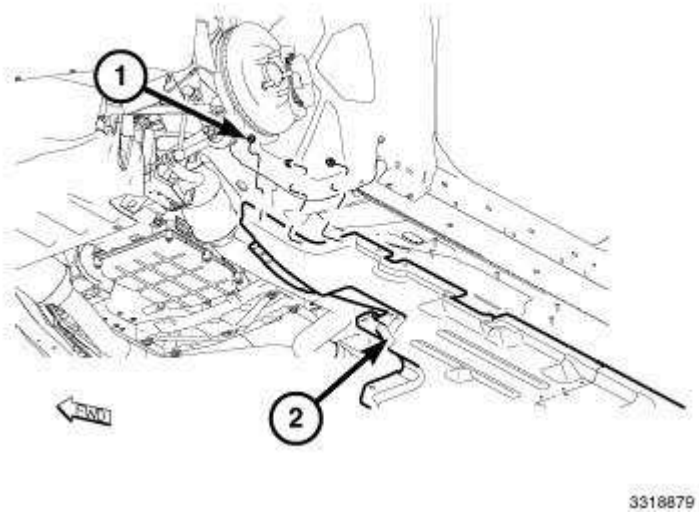

Fig. 312: Three Fasteners & Underbody Shield
Courtesy of CHRYSLER GROUP, LLC

5. Install the three fasteners (1) that secure the underbody shield (2) to the front wheelhouse splash shield. Tighten the fasteners securely.
6. Lower the vehicle.

SHIELD, REAR MOUNT

REMOVAL

REMOVAL

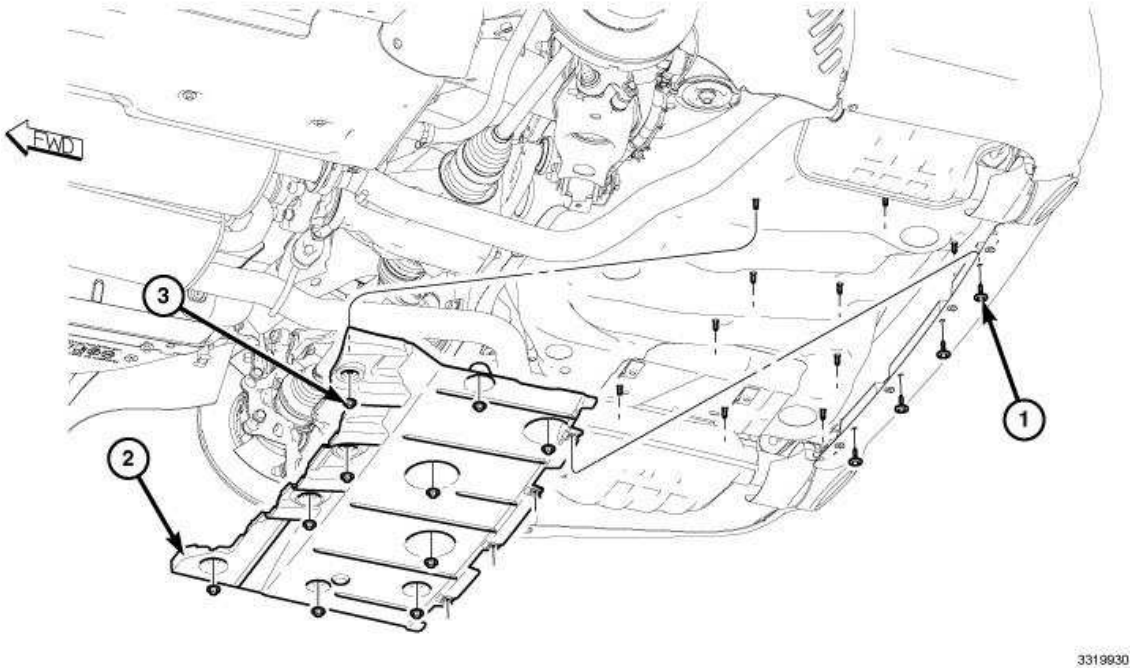

Fig. 313: Retaining Screws, Underbody Shield/Panel & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the four retaining screws (1) that secure the rear underbody shield/panel (2) to the rear fascia.
3. Remove the ten retaining nuts (3) that secure the rear underbody shield/panel (2) to the tire tub area located forward of the rear fascia.
4. Remove the rear underbody shield/panel (2) from the vehicle.

INSTALLATION

INSTALLATION

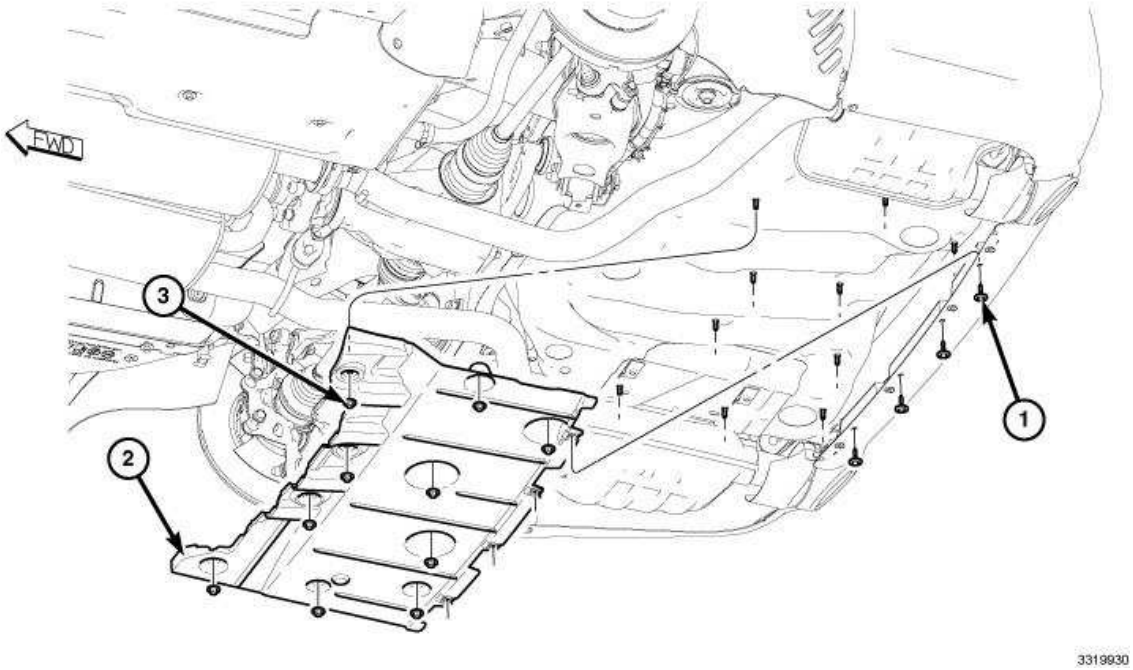

Fig. 314: Retaining Screws, Underbody Shield/Panel & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear underbody shield/panel (2) to the vehicle.
2. Install the ten retaining nuts (3) that secure the underbody shield (2) to the vehicle underbody. Tighten the nuts securely.
3. Install the four retaining screws (1) that secure the underbody shield (2) to the vehicle underbody. Tighten the nuts securely.
4. Lower the vehicle.

DRIVELINE/AXLES

Front Axle - Chrysler 300

DESCRIPTION

DESCRIPTION

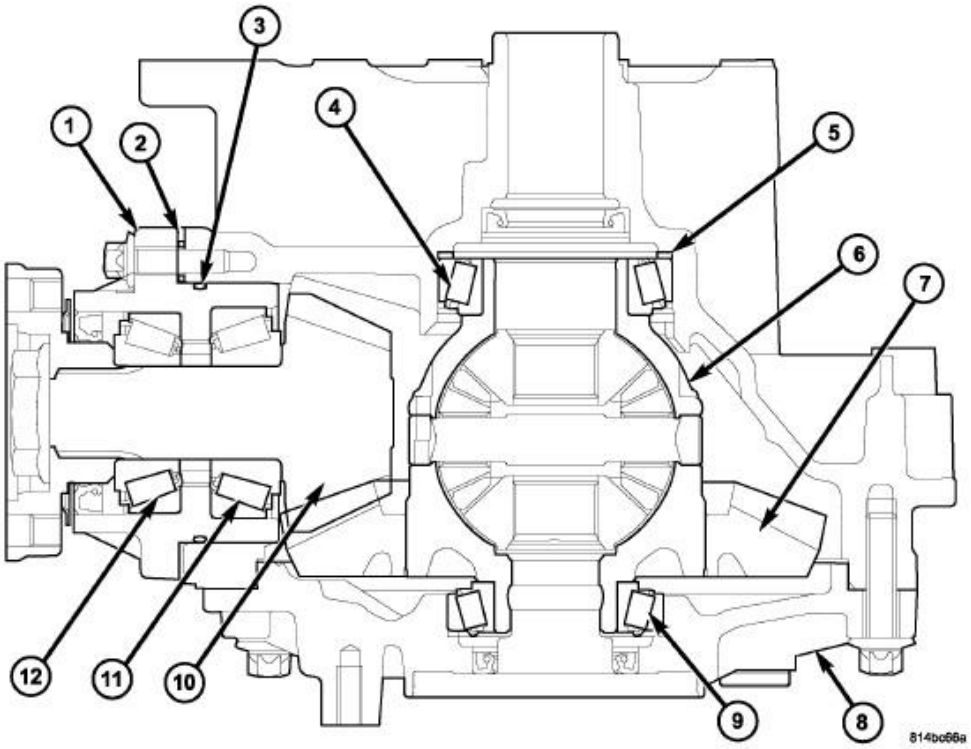

Fig. 1: Fia Axle Section View
Courtesy of CHRYSLER GROUP, LLC

1 - PINION HOUSING ASSEMBLY	7 - RING GEAR
2 - SHIM, PINION DEPTH	8 - COVER, AXLE
3 - O-RING SEAL, PINION HOUSING	9 - BEARING, DIFFERENTIAL SIDE (SMALL)
4 - BEARING, DIFFERENTIAL SIDE (LARGE)	10 - GEAR, PINION
5 - SHIM, SELECT	11 - BEARING, PINION HEAD
6 - DIFFERENTIAL ASSEMBLY	12 - BEARING, PINION TAIL

The 175MM FIA (Front Independent Aluminum). is an independent assembly with an aluminum housing and cast iron differential. The 175MM FIA uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select shims located on the outside of the differential bearing cups. Pinion height is set with a select shim sandwiched between the pinion housing assembly and the axle housing.

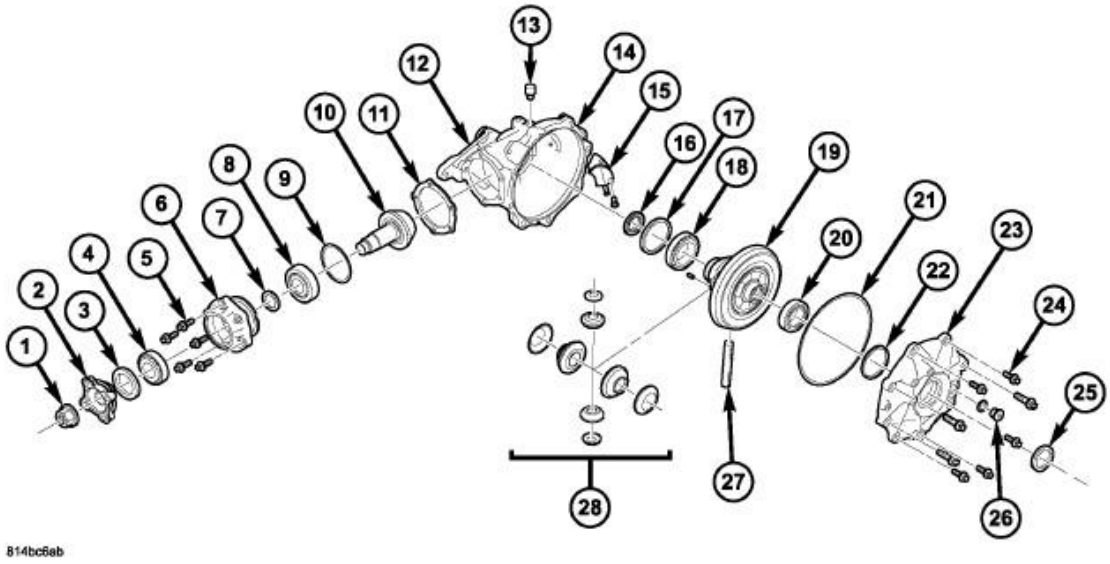

Fig. 2: 175mm Fia Front Axle Exploded View
Courtesy of CHRYSLER GROUP, LLC

1 - NUT, PINION FLANGE1	15 - BAFFLE, VENT
2 - FLANGE, PINION	16 - SEAL, AXLE
3 - SEAL, PINION	17 - SHIM, PRELOAD
4 - BEARING, PINION TAIL	18 - BEARING, DIFFERENTIAL SIDE
5 - BOLT, PINION HOUSING	19 - ASSEMBLY, RING GEAR/DIFFERENTIAL
6 - HOUSING, PINION	20 - BEARING, DIFFERENTIAL SIDE
7 - SPACER, SELECT	21 - SEAL, AXLE COVER O-RING
8 - BEARING, PINION HEAD	22 - SHIM, BEARING PRELOAD
9 - SEAL, PINION HOUSING O-RING	23 - COVER, AXLE HOUSING
10 - GEAR, PINION	24 - BOLT, AXLE HOUSING COVER
11 - SHIM, PINION DEPTH (SELECT)	25 - SEAL, AXLE
12 - HOUSING, AXLE	26 - PLUG, AXLE FILL
13 - VENT, HOUSING	27 - SHAFT, DIFFERENTIAL PINION
14 - HOUSING, AXLE	28 - SIDE GEAR ASSEMBLY

The 175MM FIA Axle is available only in All-Wheel Drive models, and only in a 3:07:1 ratio. Refer to **Fig. 2**.

ADJUSTMENTS

BEARING PRELOAD

PINION BEARING PRELOAD

NOTE: **Pinion bearing preload is controlled and adjusted by means of a select-thickness spacer sandwiched between the pinion head and tail bearing cones.**

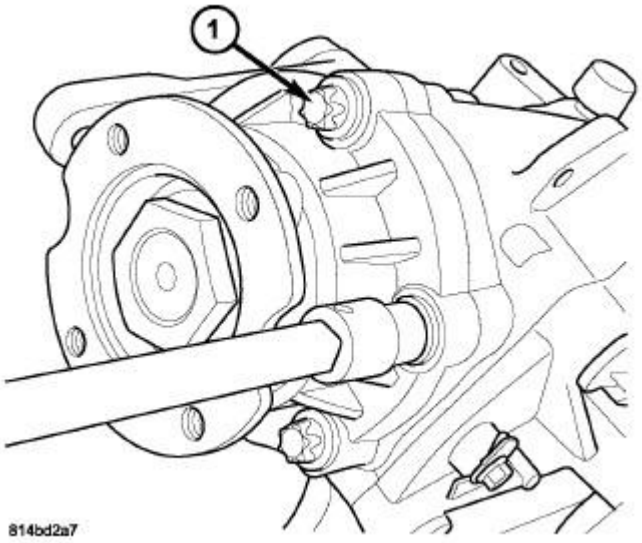

Fig. 3: Pinion Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove pinion housing bolts (1) and remove pinion housing assembly from axle housing. Refer to **Fig. 3**.

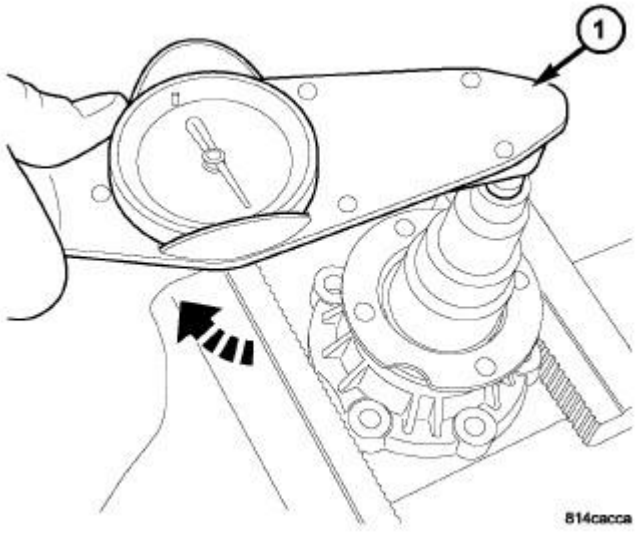

Fig. 4: Measuring Pinion Housing Assembly Turning Torque
Courtesy of CHRYSLER GROUP, LLC

2. Using a dial-type torque wrench (1), measure pinion housing rotating torque. Refer to **Fig. 4**.

Rotating torque should be within 130-260 N.m (12-23 in. lbs.). If rotating torque is below this range, disassemble pinion housing, measure and install a slightly thinner spacer (1), reassemble and reverify. If rotating torque is above this range, disassemble pinion housing, install a slightly thicker spacer, reassemble and re-verify rotating torque.

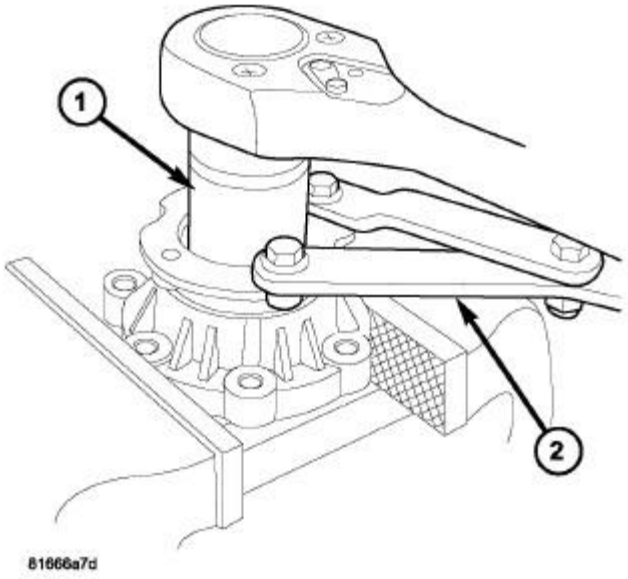

Fig. 5: Install Pinion Flange Nut/Vice
Courtesy of CHRYSLER GROUP, LLC

3. Using Spanner Wrench (special tool #6958, Wrench, Spanner) (2), remove pinion flange nut. Refer to **Fig. 5**.

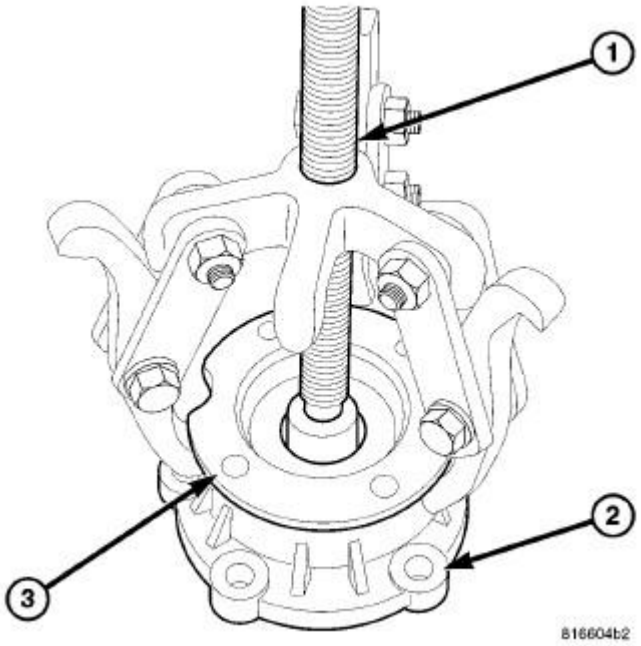

Fig. 6: Pinion Puller
Courtesy of CHRYSLER GROUP, LLC

4. Using Puller (special tool #1026, Puller) (1), remove pinion flange. Refer to **Fig. 6**.

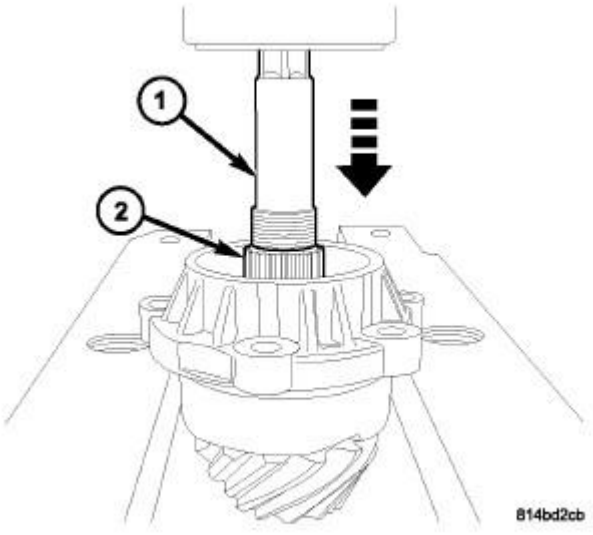

Fig. 7: Press Pinion Gear Out Of Housing
Courtesy of CHRYSLER GROUP, LLC

5. Press pinion gear (2) out of housing. Refer to **Fig. 7**.

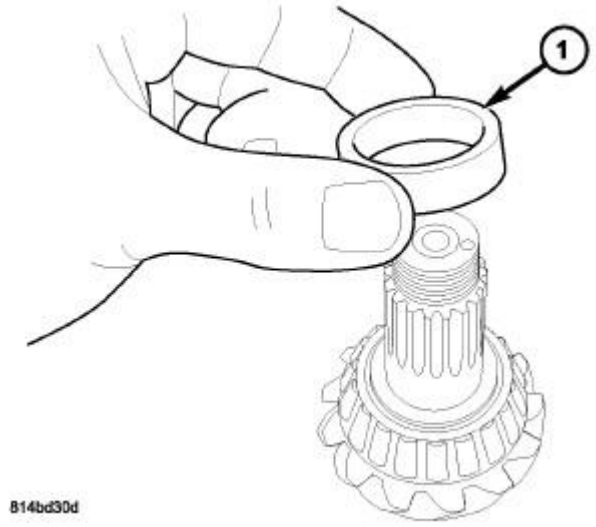

Fig. 8: Pinion Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

6. Remove pinion bearing preload spacer (1). Refer to **Fig. 8**.

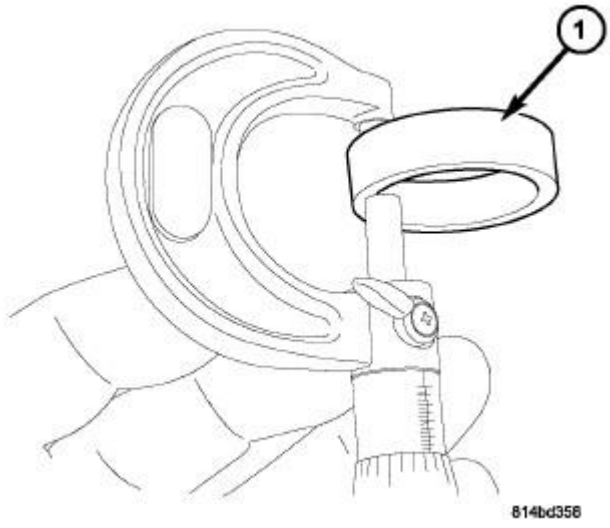

Fig. 9: Measure Pinion Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

7. Measure spacer (1) and correct per rotating torque measurement. Refer to **Fig. 9**.

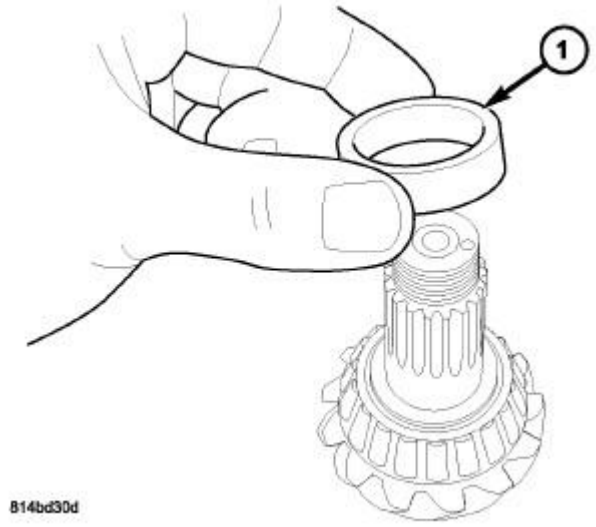

Fig. 10: Pinion Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

8. Install proper pinion bearing preload spacer (1). Refer to **Fig. 10**.

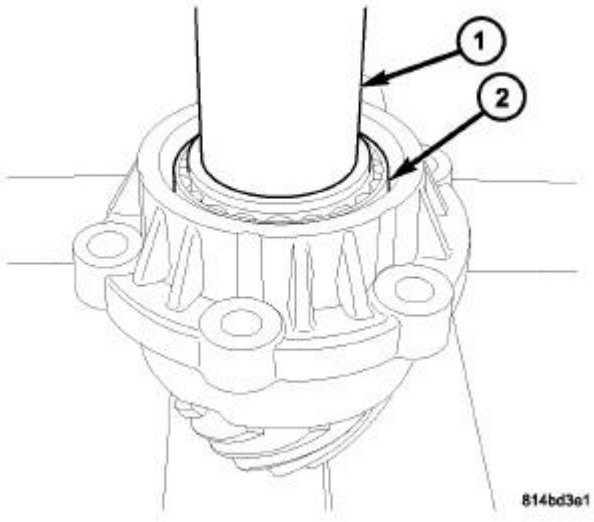

Fig. 11: Installing Pinion Tail Bearing Cone
Courtesy of CHRYSLER GROUP, LLC

9. Install pinion gear/bearing assembly to housing. Using Installer (special tool #L-4507, Installer, Bearing) (1), press pinion tail bearing (2) onto shaft until it bottoms. Refer to **Fig. 11**.

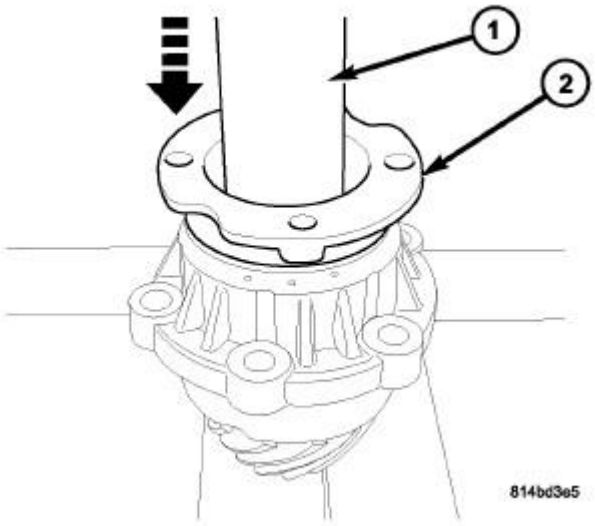

Fig. 12: Installing Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

10. Using Installer (special tool #L-4507, Installer, Bearing) (1), press on pinion flange (2). Refer to **Fig. 12**.

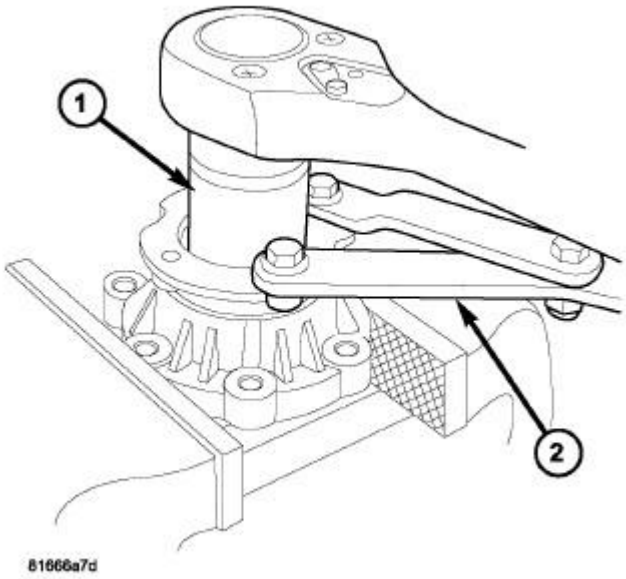

Fig. 13: Install Pinion Flange Nut/Vice
Courtesy of CHRYSLER GROUP, LLC

11. Install and torque (1) pinion flange nut to 475 N.m (350 ft. lbs.). Refer to **Fig. 13**

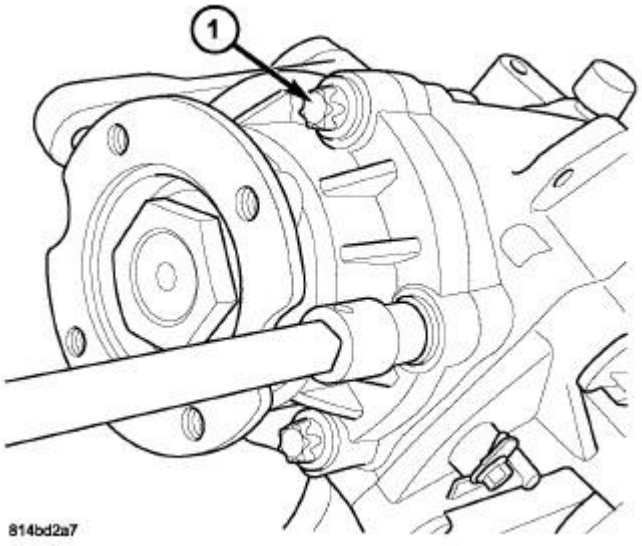

Fig. 14: Pinion Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install pinion housing assembly and depth shim to axle assembly.
13. Install and torque pinion housing-to-axle housing bolts (1) to 34 N.m (25 ft. lbs.). Refer to **Fig. 14**

DIFFERENTIAL SIDE BEARING PRELOAD

NOTE: Differential side bearing preload is controlled and adjusted by means of select-thickness shims sandwiched between the side bearing cups and the housing/cover.

NOTE: For accurate results, differential side bearing preload must only be measured when the pinion housing assembly is removed from the axle.

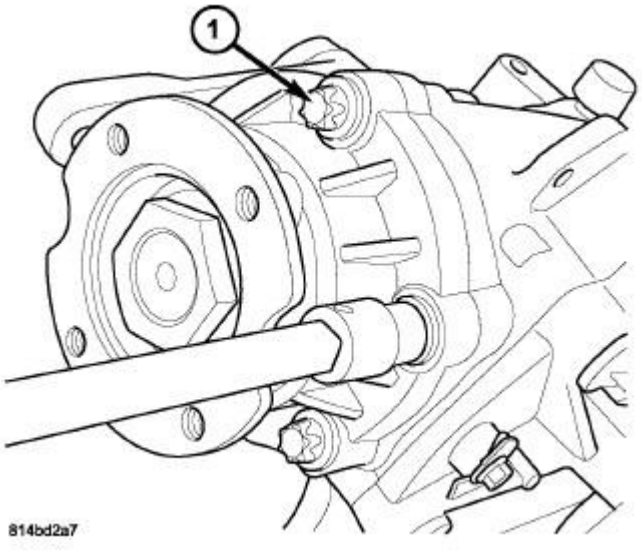

Fig. 15: Pinion Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove pinion housing-to-axle housing bolts (1). Refer to **Fig. 15**.

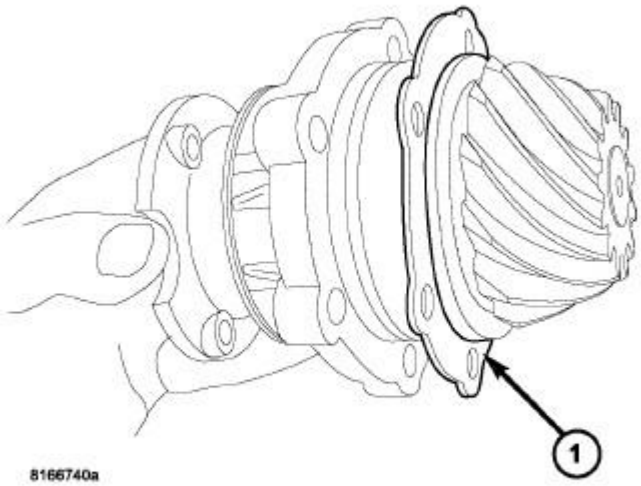

Fig. 16: Pinion Depth Shim
Courtesy of CHRYSLER GROUP, LLC

2. Remove pinion housing and depth shim (1) from axle assembly. Refer to **Fig. 16**.

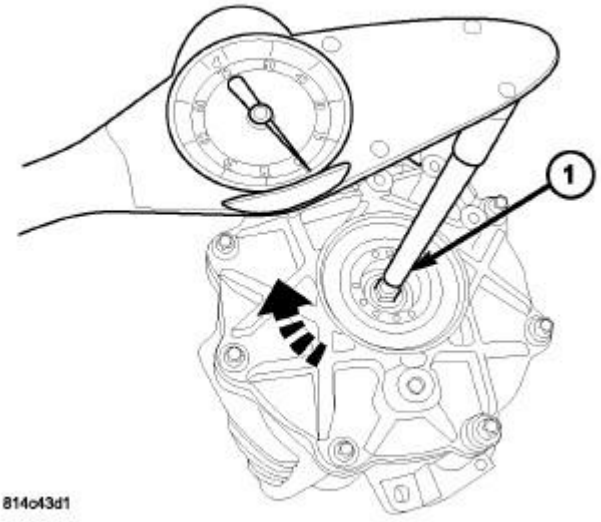

Fig. 17: Measure Differential Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

3. Install Torque Tool (special tool #C-4995A, Tool, Differential Bearing Torque) (1) to differential housing as shown in illustration. Refer to **Fig. 17**. Measure and record differential rotating torque. **Differential rotating torque should be within 190-260 N.m (17-23 in. lbs.).** If rotating torque is below this range, disassemble housing, measure and install slightly thicker preload shims (1). Add thickness equally to both sides. If rotating torque is above this range, disassemble housing, measure and install slightly thinner preload shims. Remove thickness equally from both sides.

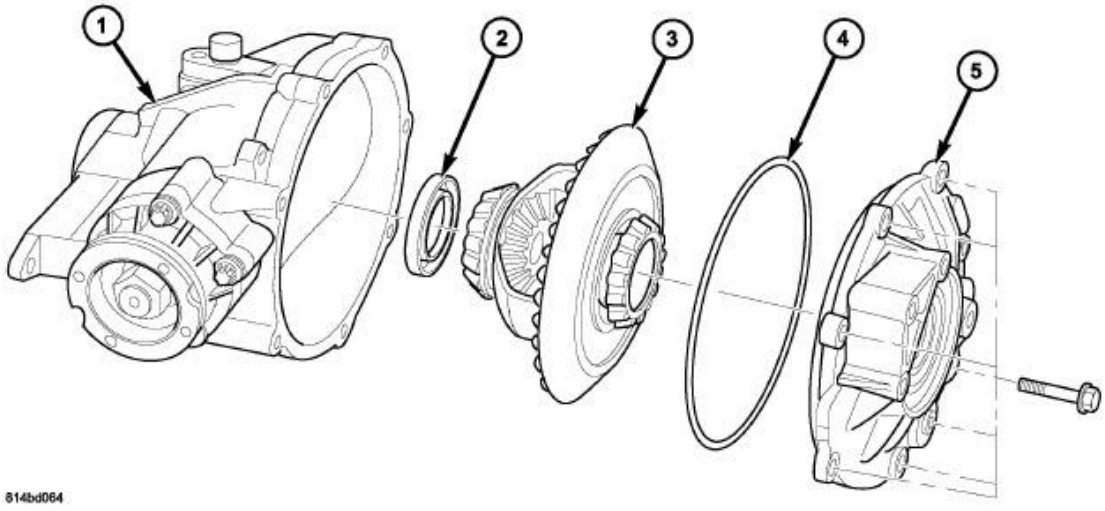

Fig. 18: Differential And Seal Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

4. Remove axle housing cover (5) and differential assembly (3). Refer to **Fig. 18**.

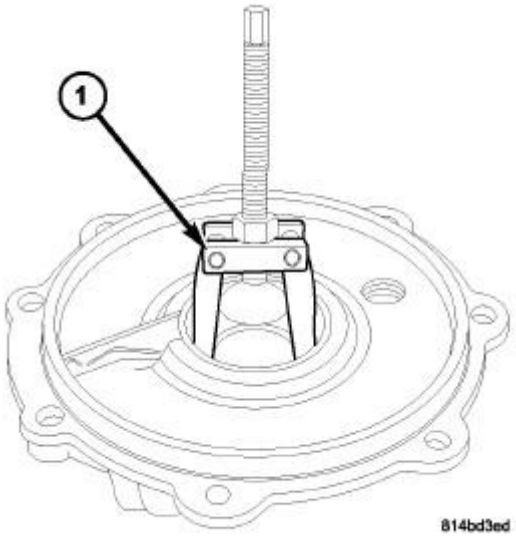

Fig. 19: Bearing Cup Remover
Courtesy of CHRYSLER GROUP, LLC

5. Remove differential side bearing cup from axle housing cover. Install Bearing Remover (special tool #6514, Remover, Bearing Cup) (1). Refer to **Fig. 19**.

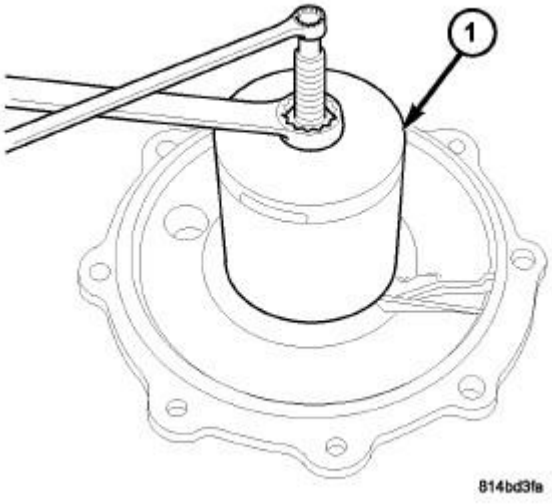

Fig. 20: Removing Differential Side Bearing Cup (Cover)
Courtesy of CHRYSLER GROUP, LLC

6. Remove differential side bearing cup with Bearing Remover (special tool #6514, Remover, Bearing Cup) (1). Refer to **Fig. 20**.

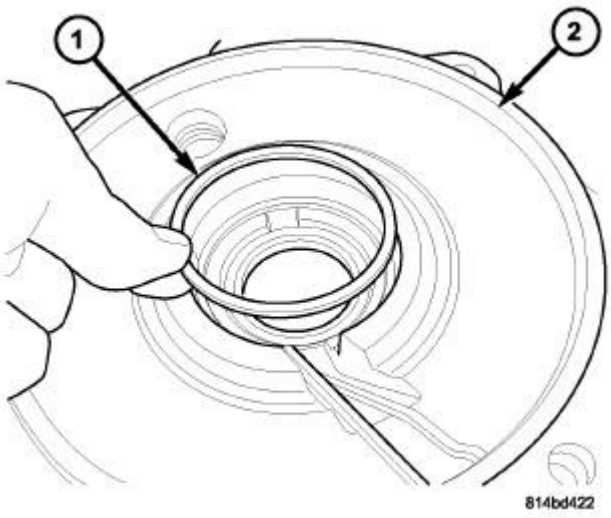

Fig. 21: Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

7. Remove side bearing preload shim (1). Refer to **Fig. 21**.

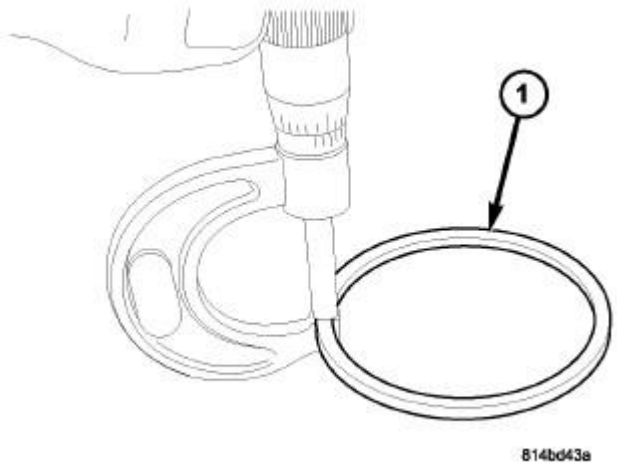

Fig. 22: Measure Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

8. Measure preload shim (1) to identify for replacement. Refer to **Fig. 22**.

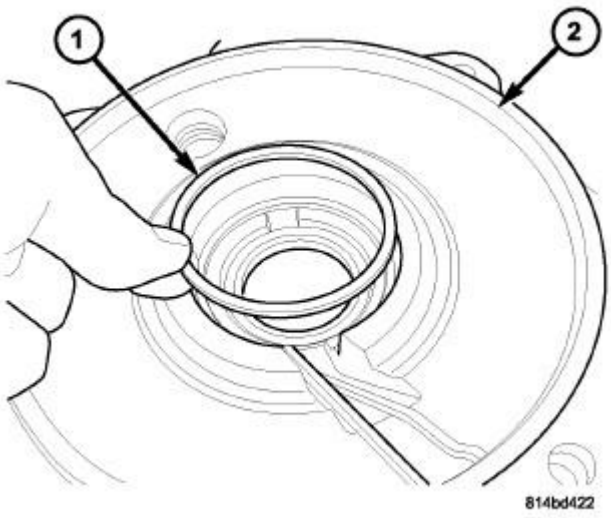

Fig. 23: Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

9. Install new differential side bearing preload shim (1) into axle housing cover (2). Refer to **Fig. 23**.

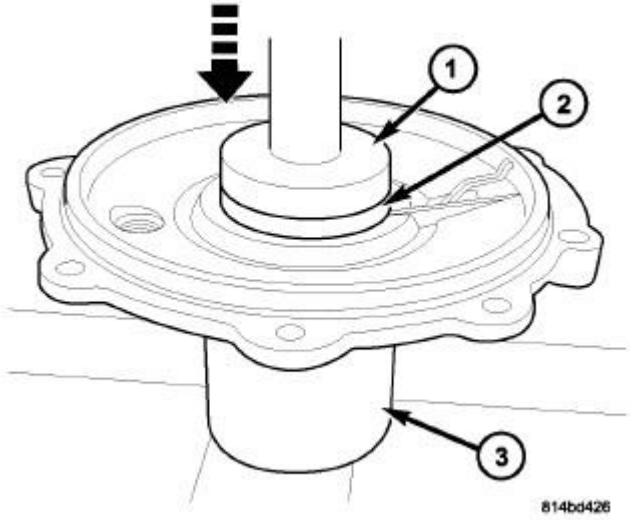

Fig. 24: Installing Side Bearing Cup (Cover)
Courtesy of CHRYSLER GROUP, LLC

10. Using Handle (special tool #C-4171, Driver Handle, Universal) and Installer (special tool #D-129, Installer, Bearing Cup) press new side bearing cup into cover until it bottoms. Use suitable cup (3) to support and protect cover.

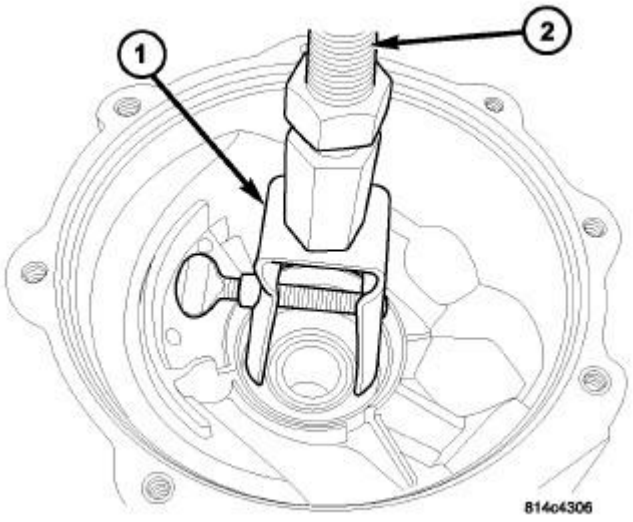

Fig. 25: Removing Inner Diff Side Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

11. Using Remover (special tool #9664, Remover, Bearing Cup) (1) and Slide Hammer (special tool #C-637, Slide Hammer, Universal) (2), remove differential side bearing (inboard) cup. Refer to **Fig. 25**.

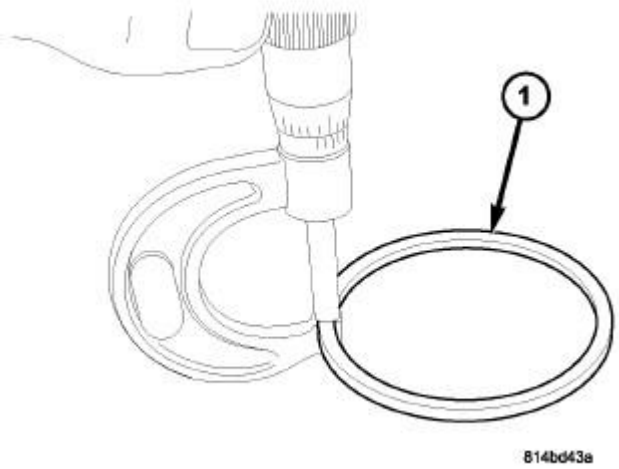

Fig. 26: Measure Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

12. Measure preload shim (1) to identify for replacement.
13. Install new differential side bearing preload shim (1) into axle housing. Refer to **Fig. 26**.
14. Using Handle (special tool #C-4171, Driver Handle, Universal) and Installer (special tool #D-

145, Installer, Bearing Cup), press differential side bearing cup into housing until it bottoms.

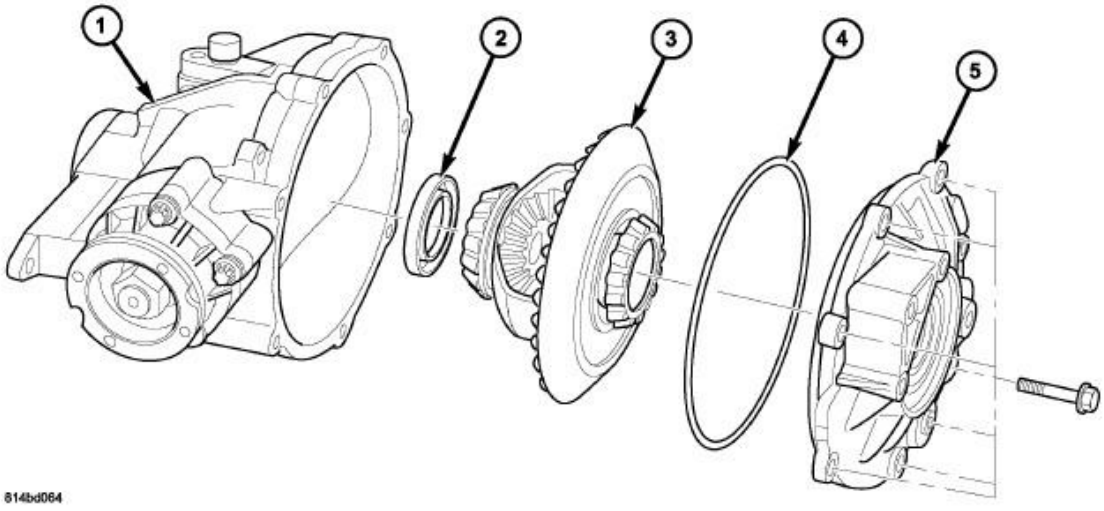

Fig. 27: Differential And Seal Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

15. Install differential/ring gear assembly (3), new cover o-ring seal (4), and cover (5). Refer to **Fig. 27**.
16. Install and torque cover-to-housing bolts to:
    - M10x40 - 65 N.m (48 ft. lbs.)
    - M8x25 - 34 N.m (25 ft. lbs.)

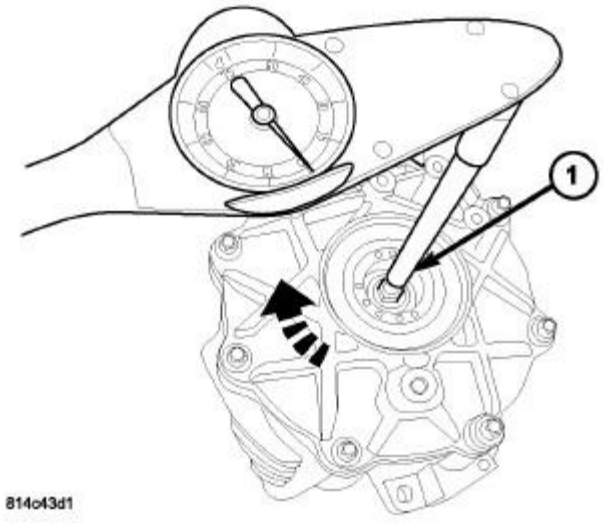

Fig. 28: Measure Differential Rotating Torque

Courtesy of CHRYSLER GROUP, LLC

17. Again verify rotating torque measurement (1). Refer to **Fig. 28**. Repeat adjustment procedure until proper rotating torque is obtained.

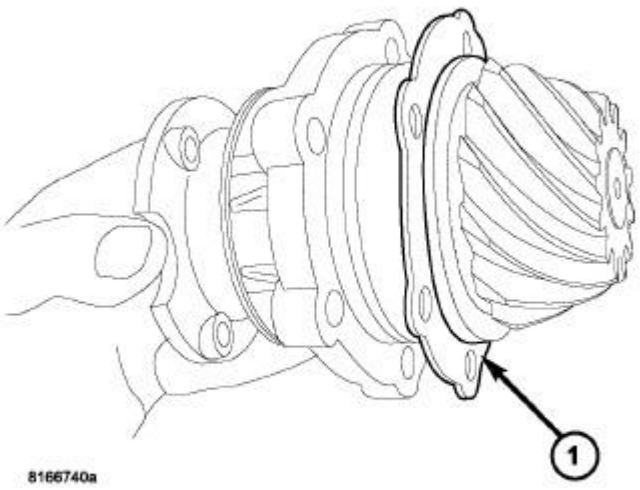

Fig. 29: Pinion Depth Shim
Courtesy of CHRYSLER GROUP, LLC

18. Install pinion housing assembly and depth shim (1). Refer to **Fig. 29**. Use new o-ring on housing.

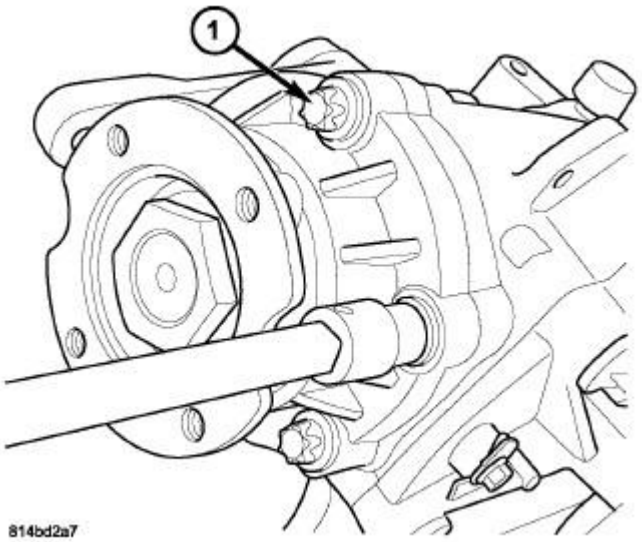

Fig. 30: Pinion Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Install and torque pinion housing-to-axle housing bolts (1) to 34 N.m (25 ft. lbs.). Refer to **Fig. 30**.

PINION DEPTH

PINION DEPTH VARIANCE

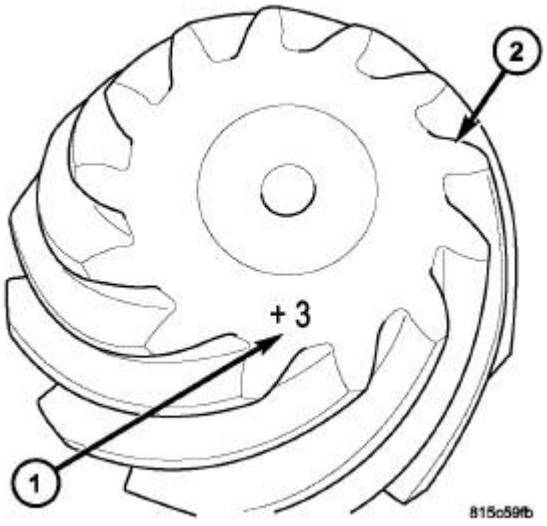

Fig. 31: Pinion Variance Marking
Courtesy of CHRYSLER GROUP, LLC

Identifying numbers for the ring gear and pinion are marked on the pinion (1). Refer to **Fig. 31**. A plus (+) number, minus (-) number or zero (0). The pinion depth variance/deviation (1) is the amount the depth varies from the standard depth setting of a pinion marked with a (0). The standard depth provides the best gear tooth contact pattern.

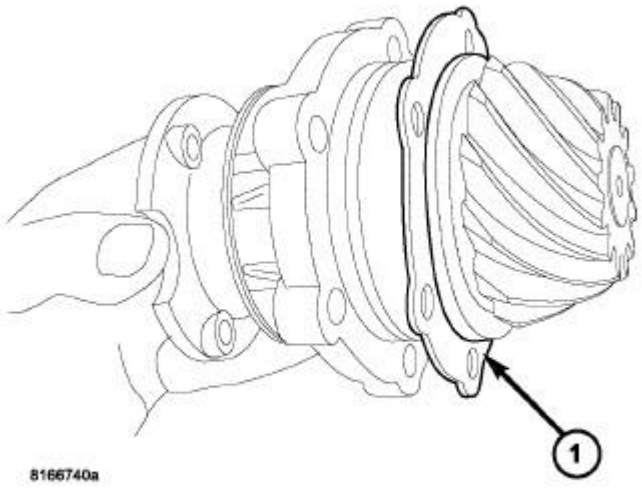

Fig. 32: Pinion Depth Shim
Courtesy of CHRYSLER GROUP, LLC

The pinion depth is set by selecting the shim (1) that fits between the pinion housing and the axle housing. Refer to **Fig. 32**.

PINION DEPTH MEASUREMENT

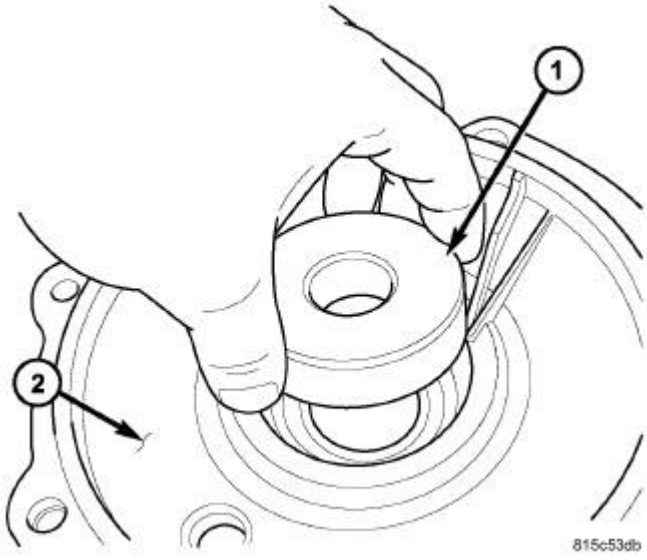

Fig. 33: Arbor Disc
Courtesy of CHRYSLER GROUP, LLC

1. Install arbor disc (special tool #9681-4, Disc, Arbor) (1) into differential cover (2). Refer to **Fig. 33**.

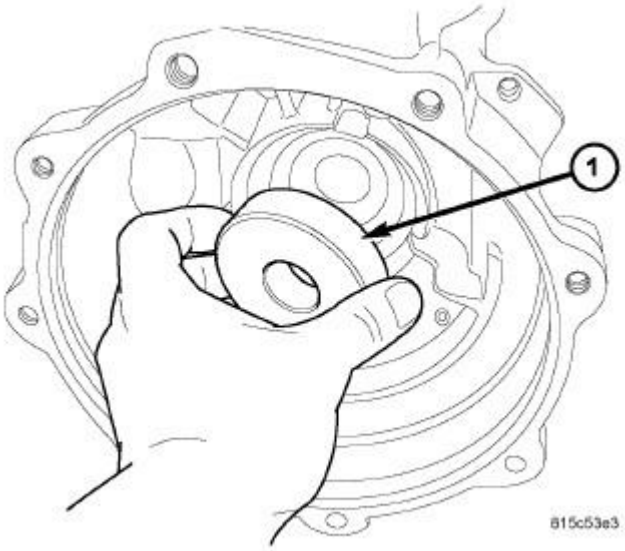

Fig. 34: Arbor Disc
Courtesy of CHRYSLER GROUP, LLC

2. Install arbor disc (special tool #9681-5, Disc, Arbor) (1) into differential case. Refer to **Fig. 34**.

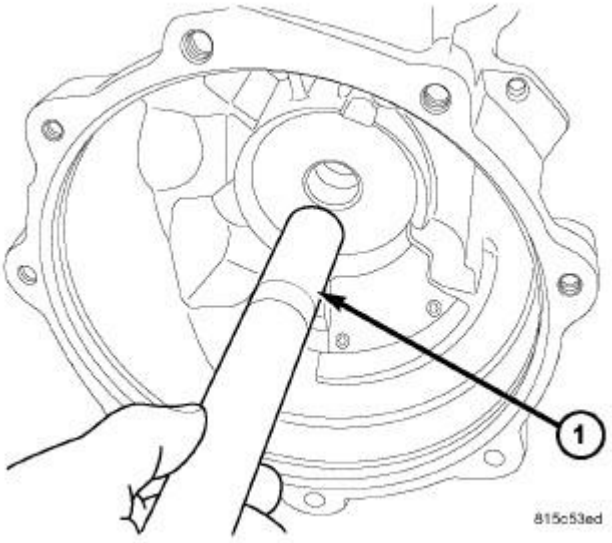

Fig. 35: Arbor Bar
Courtesy of CHRYSLER GROUP, LLC

3. Install arbor bar (special tool #D-115-3, Arbor) (1) into arbor disc (special tool #9681-5, Disc, Arbor).

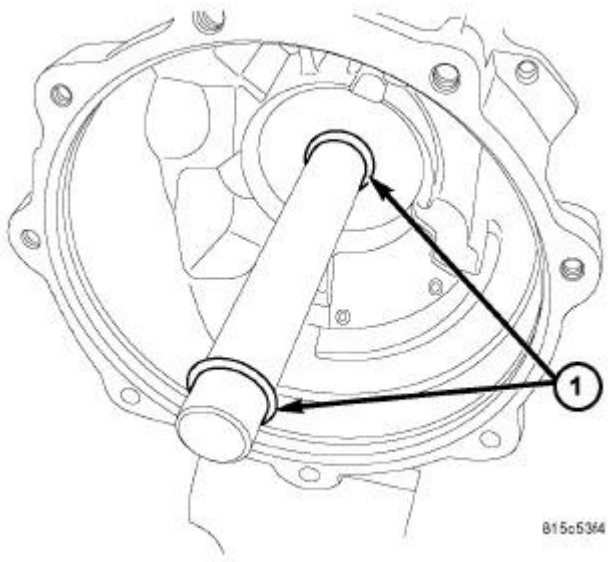

Fig. 36: Space O-Rings
Courtesy of CHRYSLER GROUP, LLC

4. Install O-rings (1) on arbor bar (special tool #D-115-3, Arbor). Refer to **Fig. 36**.

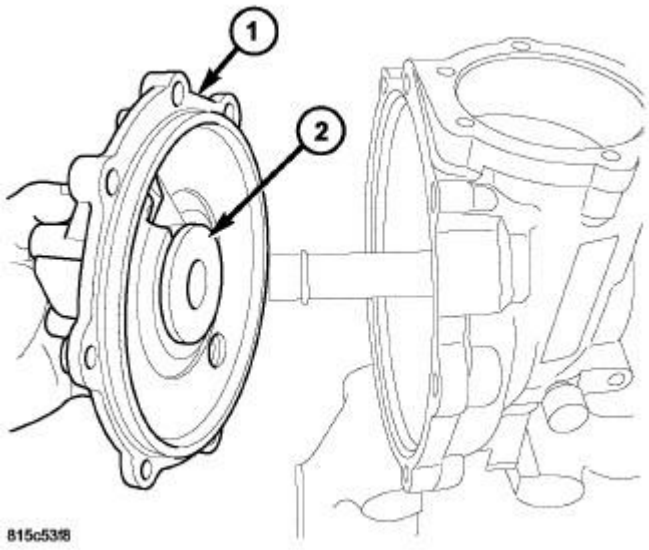

Fig. 37: Install Cover To Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install cover (1) to housing. Refer to **Fig. 37**.
6. Install and torque cover-to-housing bolts to:
    - M10x40 - 65 N.m (48 ft. lbs.)
    - M8x25 - 34 N.m (25 ft. lbs.)

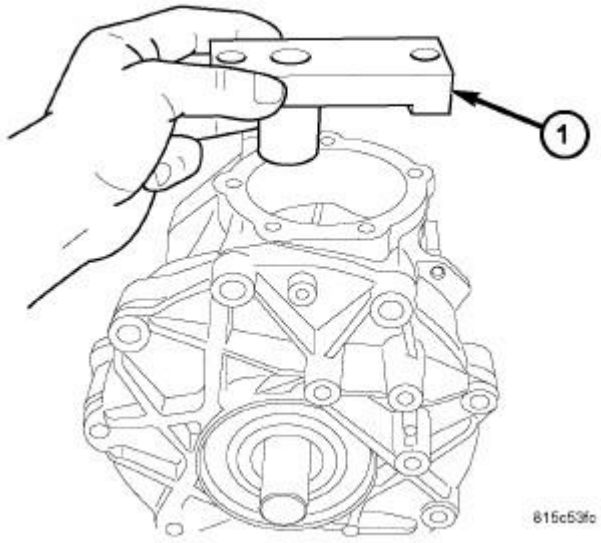

Fig. 38: Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure gauge plate surfaces are clean to insure an accurate reading

7. Install gauge plate (special tool #9681-2, Plate, Gage) (1) to pinion opening. Refer to **Fig. 38**.

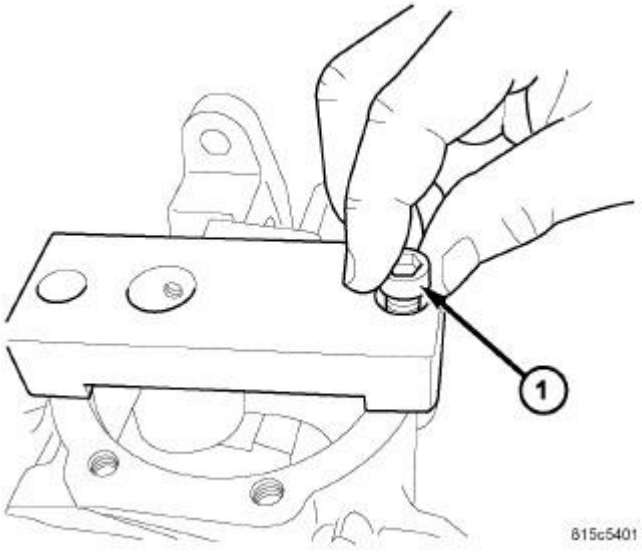

Fig. 39: Plate-To-Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install plate-to-housing bolts (1). Refer to **Fig. 39**.

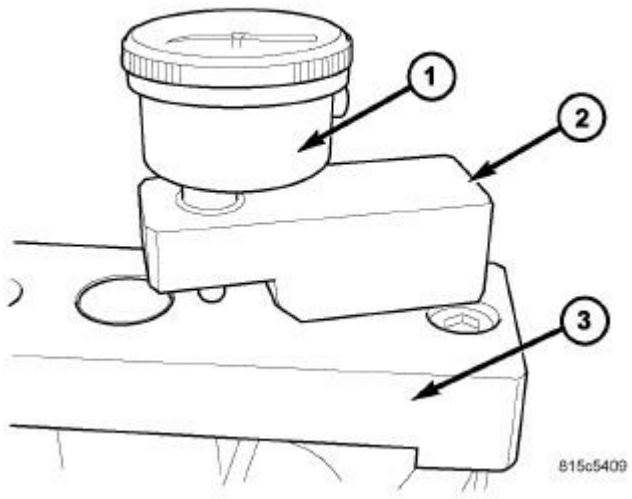

Fig. 40: Scooter Block & Dial Indicator On Gauge Plate
Courtesy of CHRYSLER GROUP, LLC

9. Install Scooter Block (2) and dial Indicator (1) on gauge plate (special tool #9681-2, Plate, Gage) (3). Refer to **Fig. 40**.

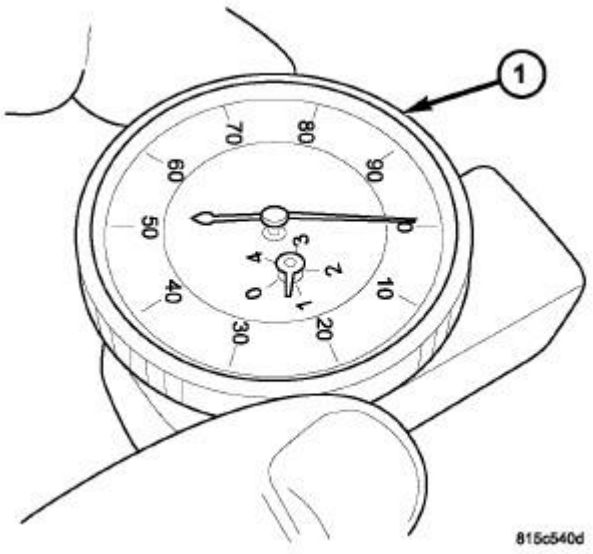

Fig. 41: Zero Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

10. Zero dial indicator (1). Refer to **Fig. 41**.

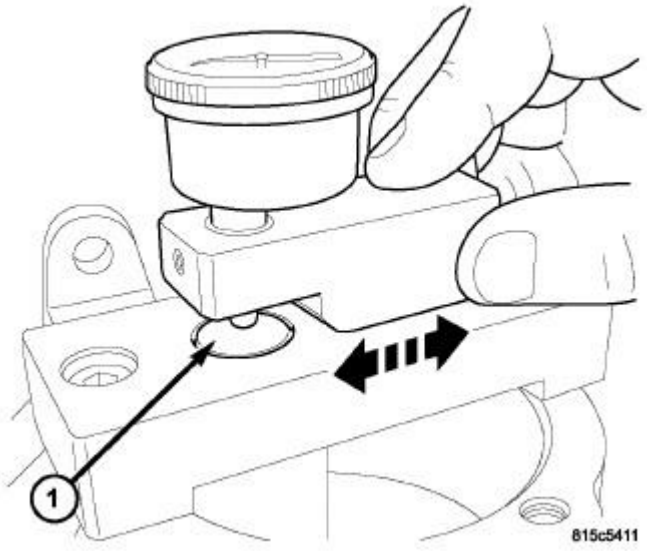

Fig. 42: Measure Gage Rod Protrusion
Courtesy of CHRYSLER GROUP, LLC

11. Take reading (1) with the dial indicator, measure gage rod protrusion. Refer to **Fig. 42**.
12. Record gage rod protrusion reading on the dial indicator. The dial indicator reading represents the amount that this particular assembly deviates from the design height.

PINION ASSEMBLY HEIGHT MEASUREMENT

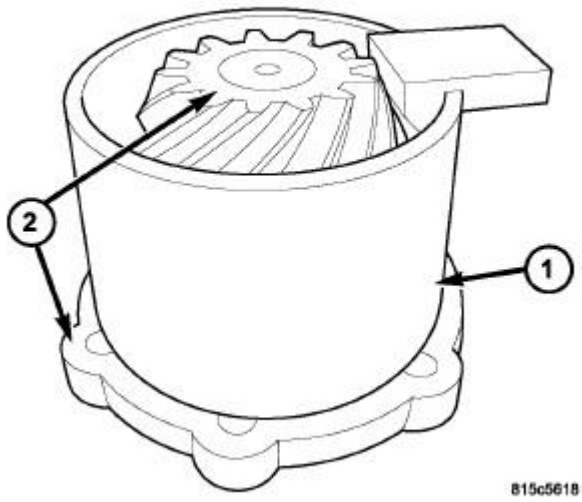

Fig. 43: Measuring Sleeve
Courtesy of CHRYSLER GROUP, LLC

1. Install measuring sleeve (special tool #9681-1, Gauge, Pinion Height) (1) over pinion assembly (2). Refer to **Fig. 43**.

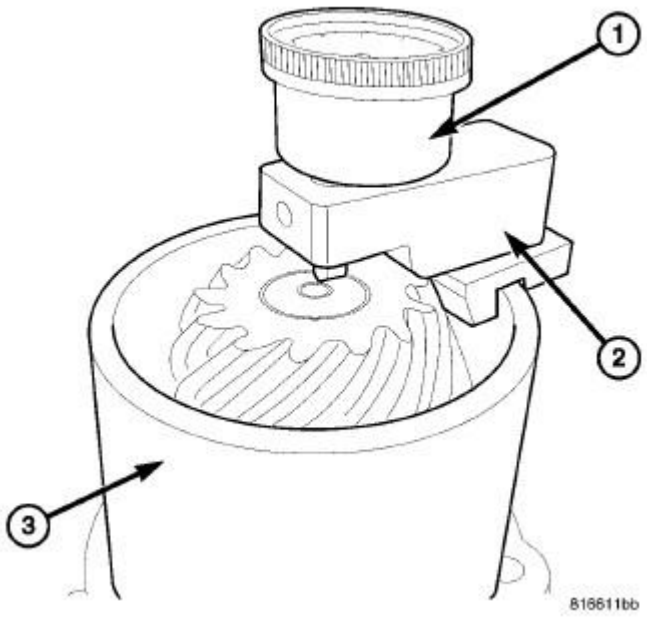

Fig. 44: Checking Pinion Height Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

2. Install Scooter Block (2) and dial Indicator on (1) measuring sleeve (special tool #9681-1, Gauge, Pinion Height) (3). Refer to **Fig. 44**.
3. Record reading on the dial indicator. The dial indicator reading represents the amount that this particular assembly deviates from the design height.

SHIM CALCULATION

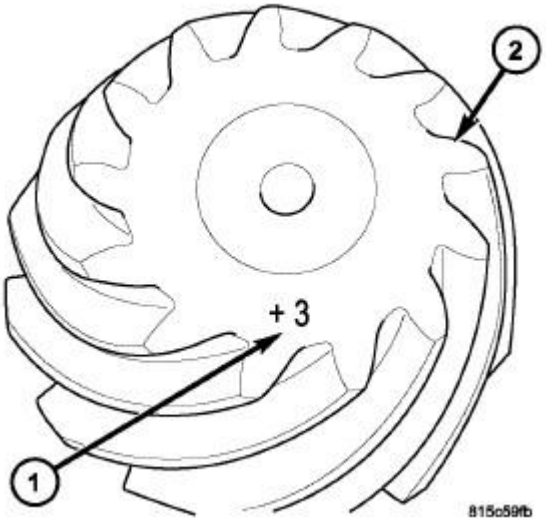

Fig. 45: Pinion Variance Marking

Courtesy of CHRYSLER GROUP, LLC

By adding the sum of the above readings you will be able to determine the correct shim needed.

Your base line shim will be 2.047 mm, add this to the pinion depth variance/deviation (1). Refer to **Fig. 45**. The variance/deviation marking on the pinion head in 0.01 mm increments. Therefore, for the graphic shown, 0.03 mm (0.0012 in.) would be added to the shim thickness.

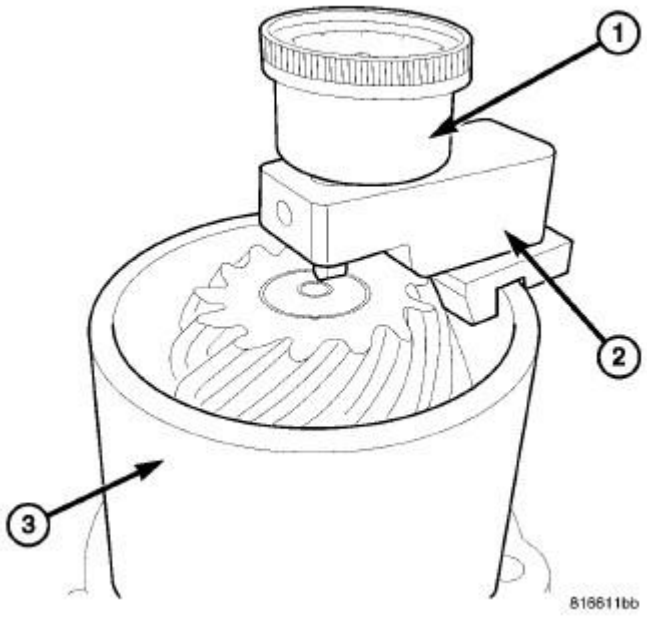

Fig. 46: Checking Pinion Height Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

Add your dial indicator reading measurement for pinion height (1). Refer to **Fig. 46**.

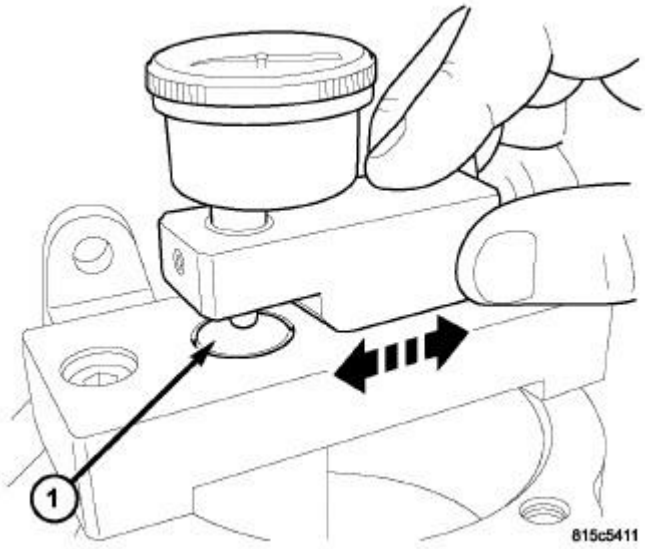

Fig. 47: Measure Gage Rod Protrusion
Courtesy of CHRYSLER GROUP, LLC

Add your gage rod protrusion measurement (1). Refer to **Fig. 47**.

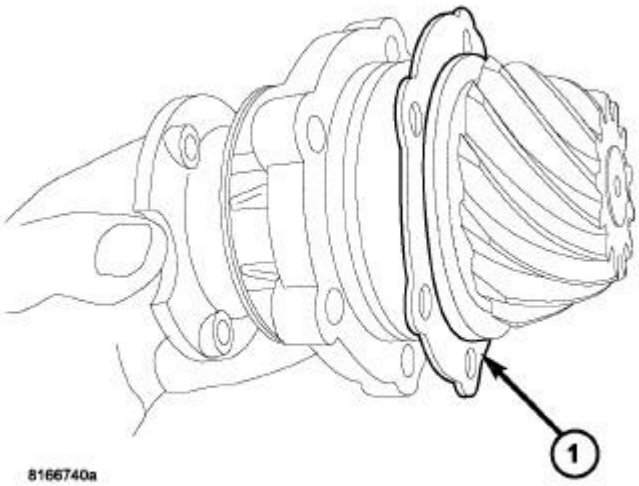

Fig. 48: Pinion Depth Shim
Courtesy of CHRYSLER GROUP, LLC

The sum of the above will be the shim size needed (1). Refer to **Fig. 48**.

MEASURING BACKLASH

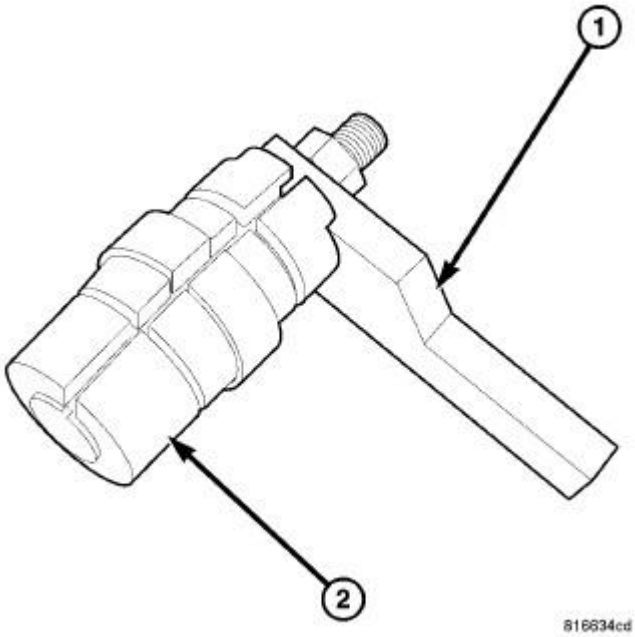

Fig. 49: Backlash Measuring Tool
Courtesy of CHRYSLER GROUP, LLC

1. Use Backlash Tool (special tool #9682, Backlash Measuring Tool) (1) to check backlash.

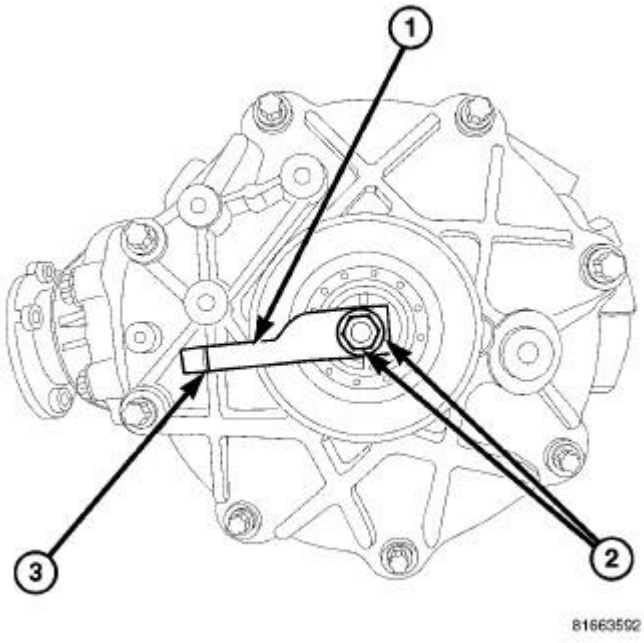

Fig. 50: Backlash Tool
Courtesy of CHRYSLER GROUP, LLC

2. Install Backlash Tool (special tool #9682, Backlash Measuring Tool) (1) into the side gear and tighten the lock down nut. Refer to **Fig. 50**.

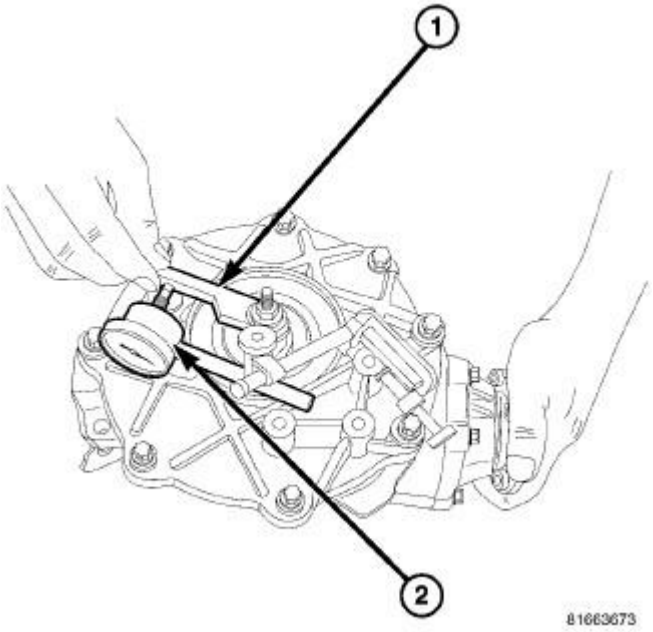

Fig. 51: Checking Backlash Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

3. Install Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2) to the differential cover and align the measuring tip of the Dial Indicator with the line on Backlash Tool (1). Refer to **Fig. 51**.
4. Zero the Dial Indicator.
5. While holding the pinion flange, rock the measuring arm back and forth stop - to - stop.
6. Record the reading on the Dial Indicator.
7. To bring backlash with in specifications, subtract from one side and add equal amount of cup shims to the other side of the differential case and the differential cover as needed. (1.34-2.98 mm (0.053-0.117 in.) Available in 0.04 mm (0.0015 in.) increments).

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Axle Ratio	3.07
Ring Gear Diameter	175 mm (6.9 in.)
Ring Gear Backlash	0.05-0.11 mm (0.002-0.004 in.)
Differential Torque-to-Rotate	190-260 N.cm (17-23 in. lbs.)
Pinion Housing Torque-to-Rotate	130-260 N.cm (12-23 in. lbs.)

Pinion Depth Shim Size	1.15-2.11mm (0.045-0.083 in.) Available in 0.04 mm (0.0015 in.) increments
Pinion Bearing Preload Spacer Size	9.60-10.59mm (0.378-0.417 in.) Available in 0.03 mm (0.001 in.) increments
Differential Bearing Preload Shim Size	1.31-2.51 mm (0.051-0.099 in.) Available in 0.04 mm (0.0015 in.) increments
Differential Backlash Shim Size	1.34-2.98 mm (0.053-0.117 in.) Available in 0.04 mm (0.0015 in.) increments

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Bolt, Axle Cover-to-Housing (M10x40)	65	48	-
Bolt, Axle Cover-to-Housing (M8x25)	34	25	-
Bolt, Axle Housing-to-Engine	65	48	-
Bolt, Intermediate Shaft-to-Engine	25	19	-
Bolt, Pinion Housing-to-Axle Housing	34	25	-
Nut, Pinion Flange	475	350	-
Plug, Axle Housing Fill	30	22	-
Bolts, Axle Assembly Support Bracket	28	21	-

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove both front halfshafts. Refer to **REMOVAL** and **REMOVAL** .
3. Remove front intermediate shaft assembly. Refer to **REMOVAL** or **REMOVAL** .
4. Remove front propeller shaft. Refer to **REMOVAL** .
5. Remove RH catalytic converter/exhaust pipe assembly. Refer to **CONVERTER, CATALYTIC, REMOVAL** .

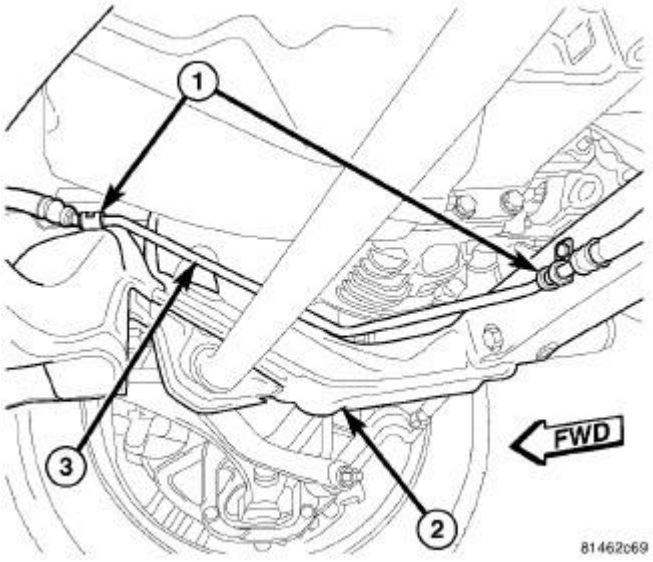

Fig. 52: Return Hose Routing Clips
Courtesy of CHRYSLER GROUP, LLC

6. Separate power steering return line (3) from cradle by unfastening clips (1). Refer to **Fig. 52**.

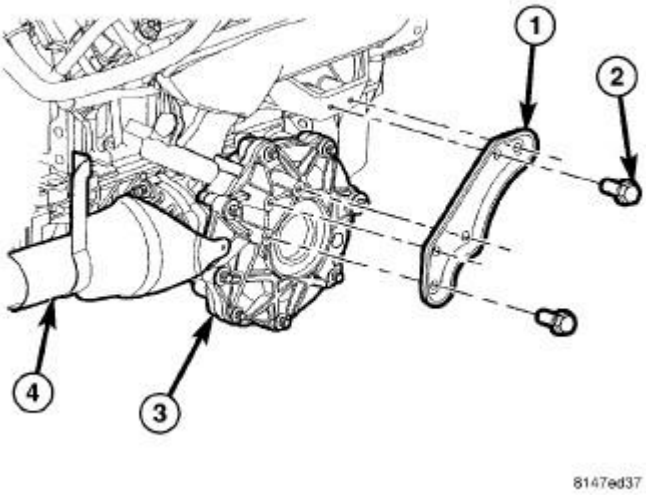

Fig. 53: Front Drive Axle Housing
Courtesy of CHRYSLER GROUP, LLC

7. Remove front axle housing support bracket (1). Refer to **Fig. 53**.

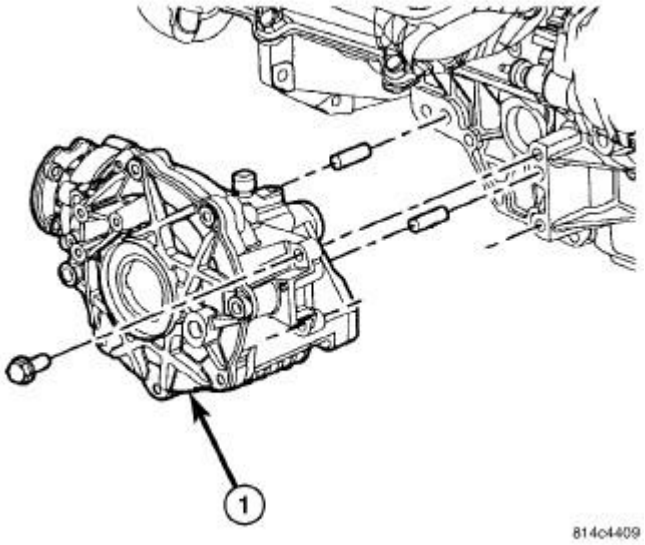

Fig. 54: Removing/Installing Front Axle
Courtesy of CHRYSLER GROUP, LLC

8. Remove seven front axle assembly-to-oil pan bolts. Remove axle assembly (1) from vehicle. Refer to **Fig. 54**.

DISASSEMBLY

DISASSEMBLY

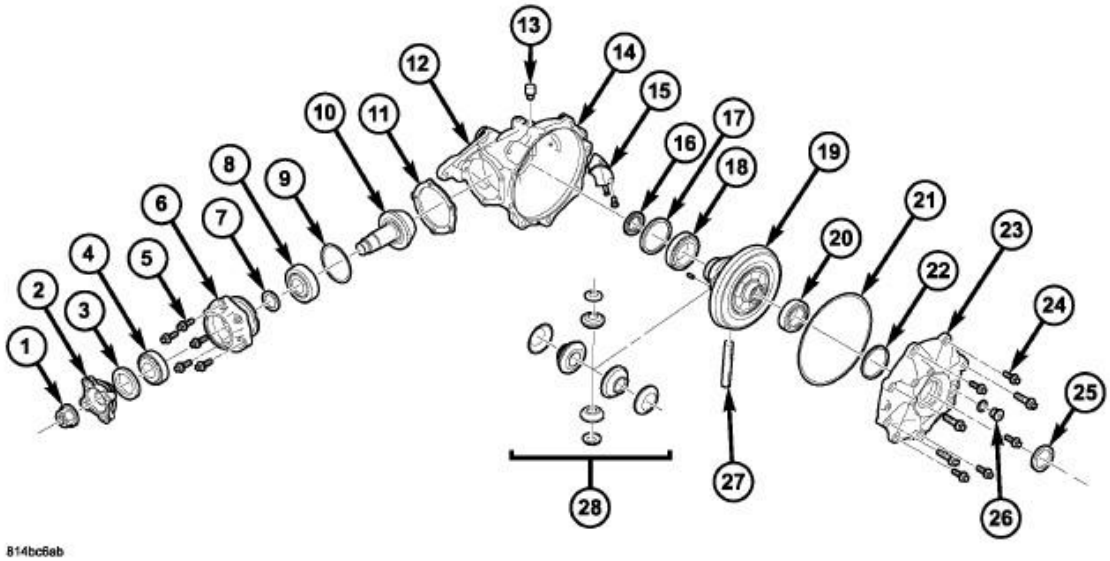

Fig. 55: 175mm Fia Front Axle Exploded View
Courtesy of CHRYSLER GROUP, LLC

1 - NUT, PINION FLANGE1	15 - BAFFLE, VENT
2 - FLANGE, PINION	16 - SEAL, AXLE
3 - SEAL, PINION	17 - SHIM, PRELOAD
4 - BEARING, PINION TAIL	18 - BEARING, DIFFERENTIAL SIDE
5 - BOLT, PINION HOUSING	19 - ASSEMBLY, RING GEAR/DIFFERENTIAL
6 - HOUSING, PINION	20 - BEARING, DIFFERENTIAL SIDE
7 - SPACER, SELECT	21 - SEAL, AXLE COVER O-RING
8 - BEARING, PINION HEAD	22 - SHIM, BEARING PRELOAD
9 - SEAL, PINION HOUSING O-RING	23 - COVER, AXLE HOUSING
10 - GEAR, PINION	24 - BOLT, AXLE HOUSING COVER
11 - SHIM, PINION DEPTH (SELECT)	25 - SEAL, AXLE
12 - HOUSING, AXLE	26 - PLUG, AXLE FILL
13 - VENT, HOUSING	27 - SHAFT, DIFFERENTIAL PINION
14 - HOUSING, AXLE	28 - SIDE GEAR ASSEMBLY

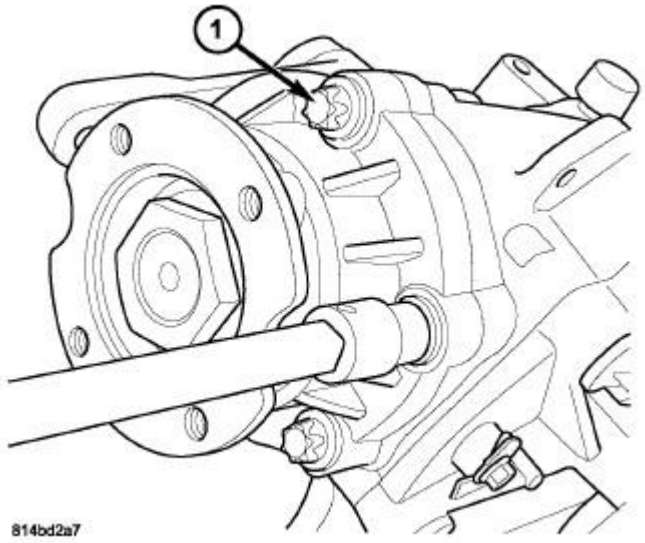

Fig. 56: Pinion Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove pinion housing assembly bolts (1).

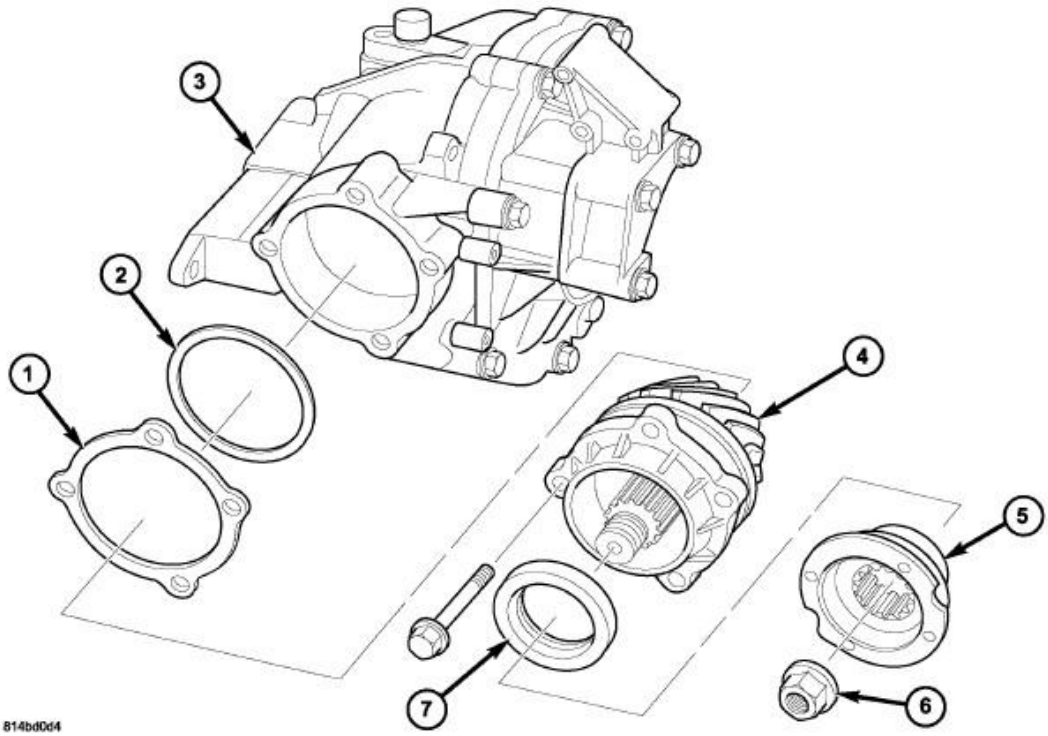

Fig. 57: Removing/Installing Pinion Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Remove pinion housing assembly (4). Refer to **Fig. 57**.

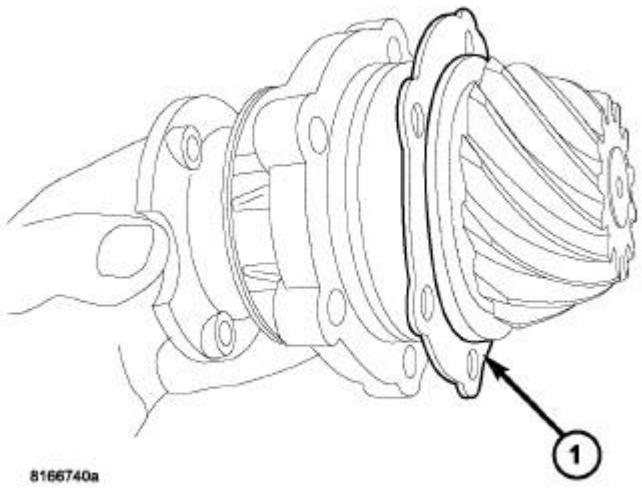

Fig. 58: Pinion Depth Shim

Courtesy of CHRYSLER GROUP, LLC

3. Remove pinion depth shim (1).

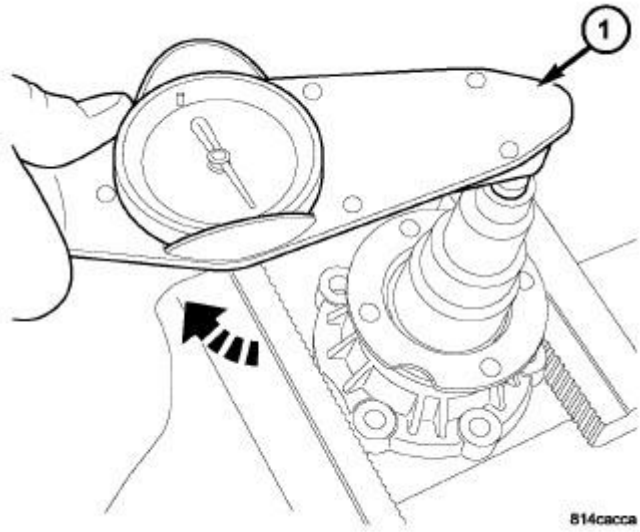

Fig. 59: Measuring Pinion Housing Assembly Turning Torque
Courtesy of CHRYSLER GROUP, LLC

4. Measure pinion housing assembly rotating torque (1). Rotating torque should be 130-250 N.cm (12-22 in. lbs.). If rotating torque is outside of this range, bearing replacement is required. Refer to Pinion Housing Disassembly.

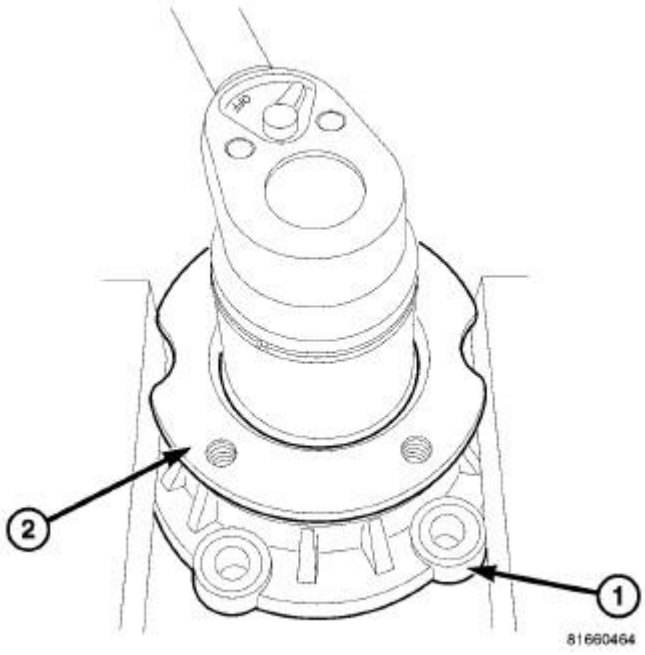

Fig. 60: Pinion In Vice
Courtesy of CHRYSLER GROUP, LLC

5. Remove pinion flange nut (1). Refer to **Fig. 60**.

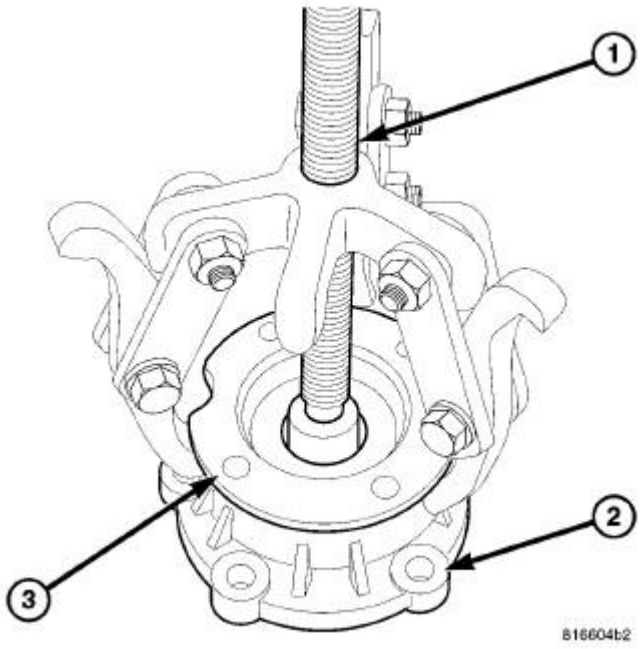

Fig. 61: Pinion Puller
Courtesy of CHRYSLER GROUP, LLC

6. Using puller (special tool #1026, Puller) (1), pull pinion flange from shaft. Refer to **Fig. 61**.

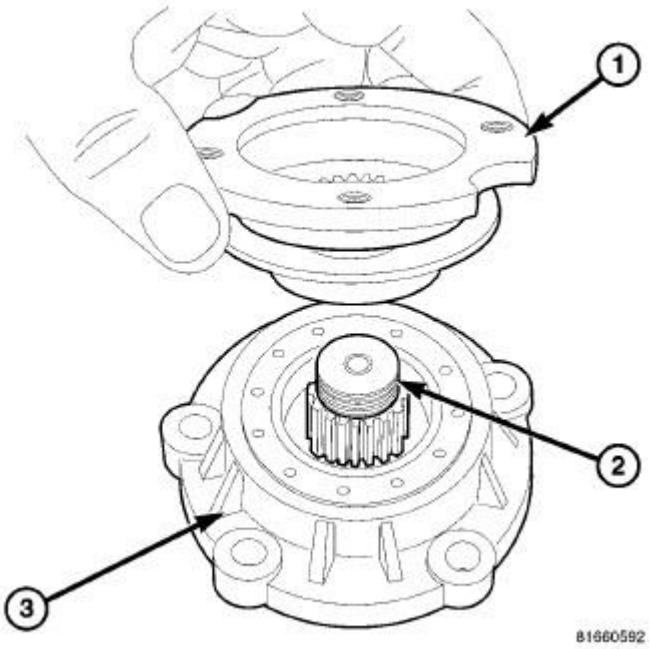

Fig. 62: Pinion Flange Remove/Install
Courtesy of CHRYSLER GROUP, LLC

7. Remove pinion flange (1). Refer to **Fig. 62**.

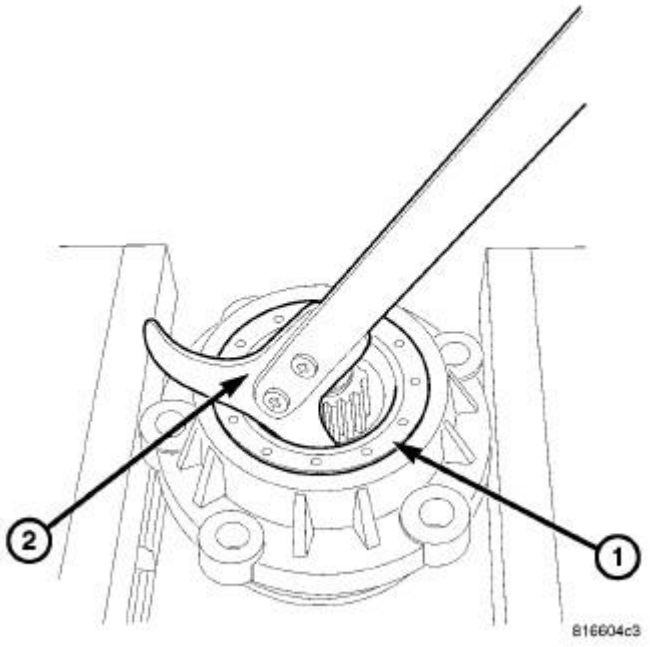

Fig. 63: Remove Pinion Seal/Tool
Courtesy of CHRYSLER GROUP, LLC

8. Using suitable tool, remove pinion seal (1).

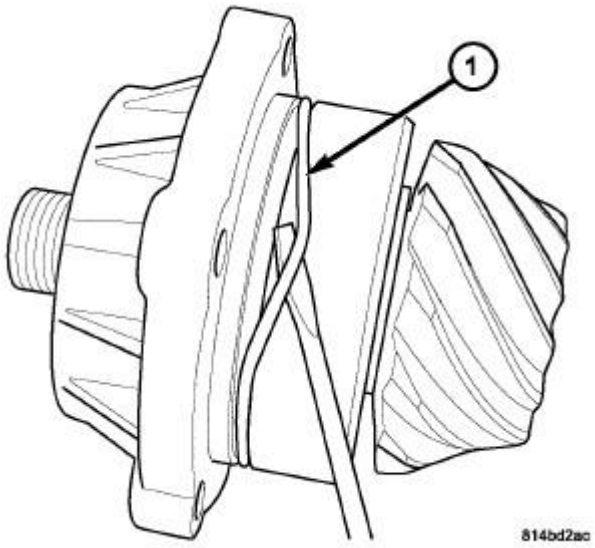

Fig. 64: Pinion Housing O-Ring
Courtesy of CHRYSLER GROUP, LLC

9. Remove pinion housing O-ring seal (1).

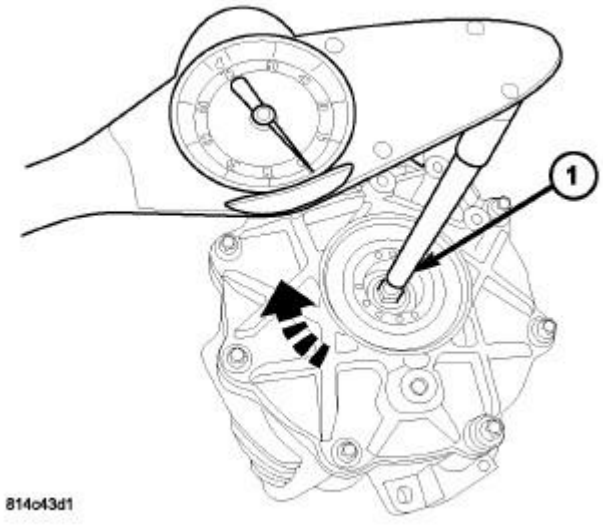

Fig. 65: Measure Differential Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

10. Measure differential rotating torque with Torque Tool C-4995A. Rotating torque should be within 190-250 N.cm (17-22 in. lbs). Measurements recorded out of this range require differential side bearing replacement and/or side bearing preload adjustment.

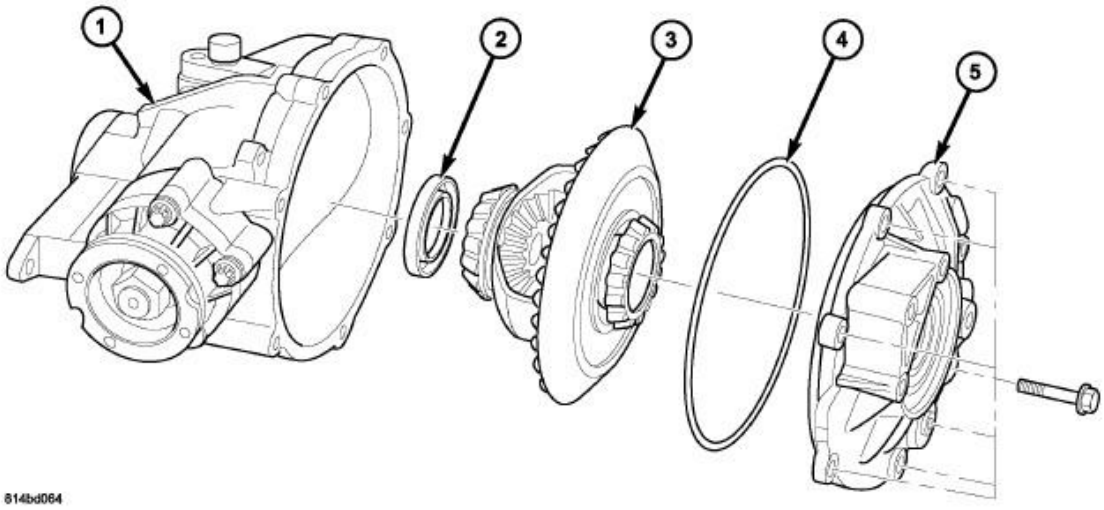

Fig. 66: Differential And Seal Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

11. Remove axle housing cover (5). Remove differential assembly (3) and inboard axle seal (2).

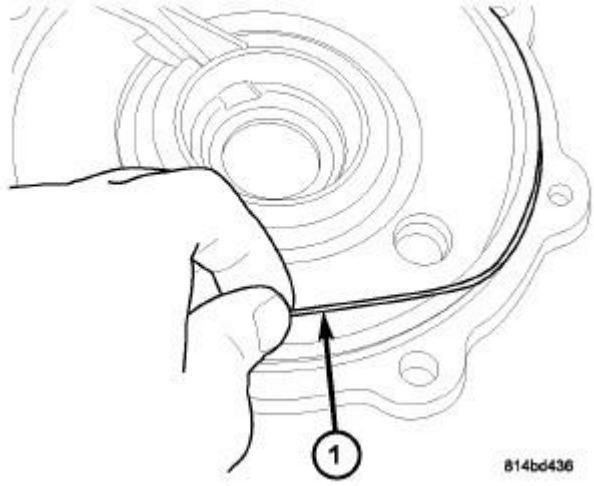

Fig. 67: Axle Housing Cover O-Ring
Courtesy of CHRYSLER GROUP, LLC

12. Remove axle housing cover o-ring (1).

PINION HOUSING DISASSEMBLY

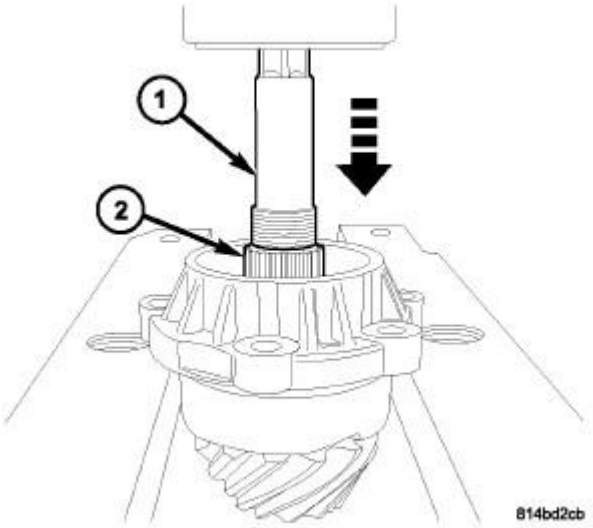

Fig. 68: Press Pinion Gear Out Of Housing
Courtesy of CHRYSLER GROUP, LLC

1. Press pinion gear/shaft (2) out of housing. Use suitable adapter (1) to protect end of shaft.

Fig. 69: Remove Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Remove pinion bearing (1). Refer to **Fig. 69**.

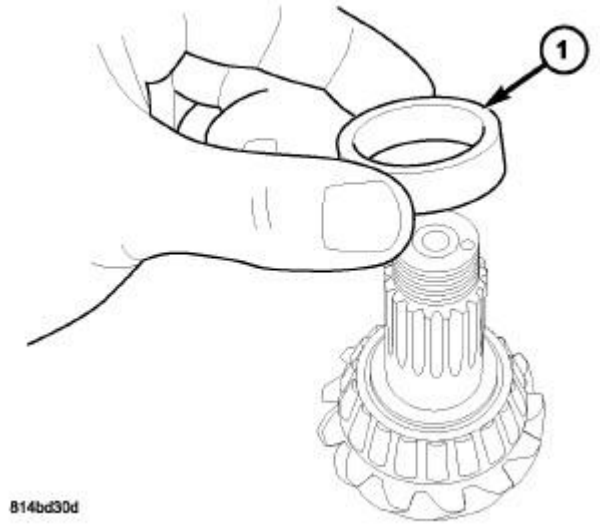

Fig. 70: Pinion Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

3. Remove pinion bearing spacer (1). Refer to **Fig. 70**.

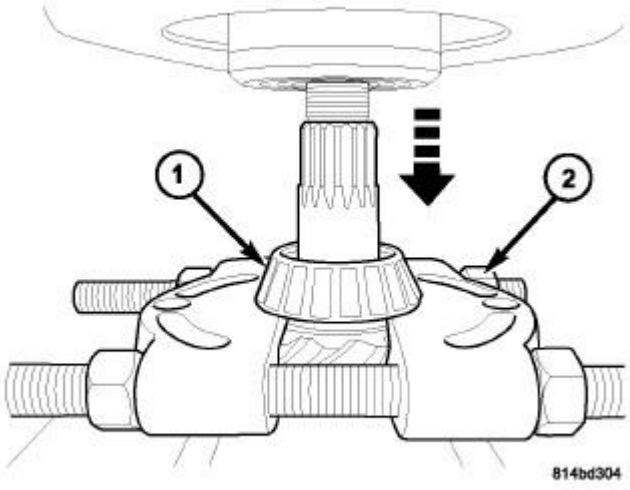

Fig. 71: Press Off Pinion Head Bearing
Courtesy of CHRYSLER GROUP, LLC

Using splitter (special tool #1130, Splitter, Bearing/Gear) or equivalent (2), press off pinion head bearing (1). Refer to **Fig. 71**.

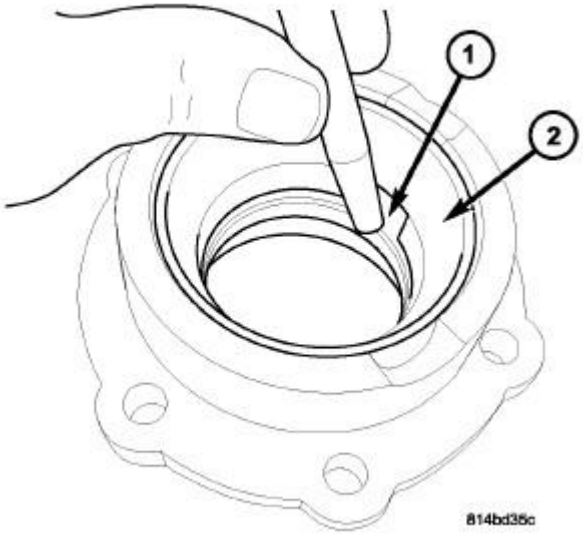

Fig. 72: Removing Pinion Tail Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable punch, remove pinion tail bearing cup (1). Refer to **Fig. 72**.

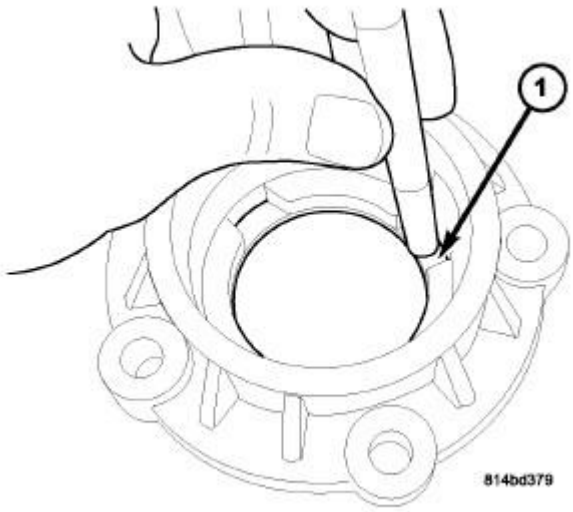

Fig. 73: Removing Pinion Head Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

5. Using suitable punch, remove pinion head bearing cup (1). Refer to **Fig. 73**.

DIFFERENTIAL DISASSEMBLY

NOTE: The differential ring gear is welded to the differential case and is not serviceable separately.

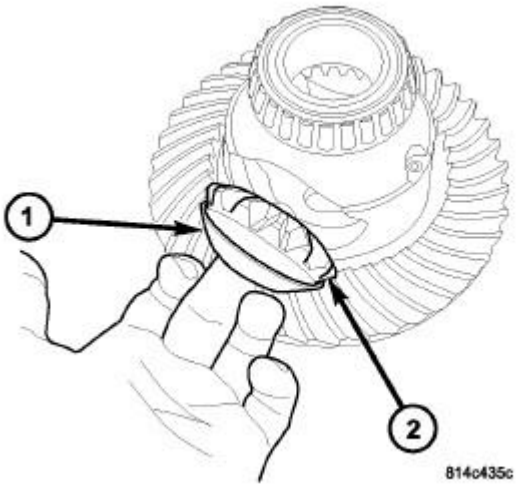

Fig. 74: Side Gear & Washer
Courtesy of CHRYSLER GROUP, LLC

1. Rotate differential side gears about case and remove side gears (2) and thrust washers (1). Refer to **Fig. 74**.

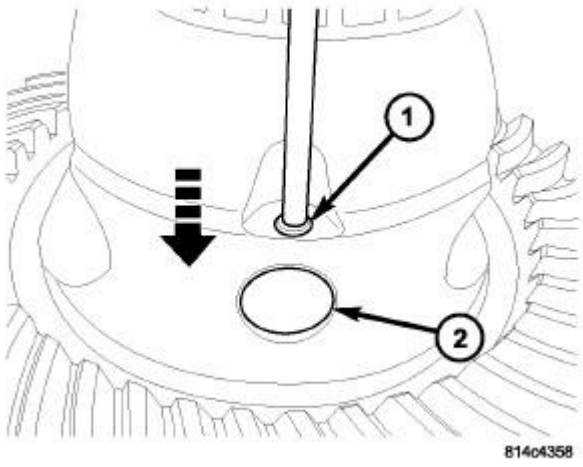

Fig. 75: Pinion Shaft Roll Pin
Courtesy of CHRYSLER GROUP, LLC

2. Using suitable punch, drive pinion shaft roll pin (1) into case until it bottoms.
3. Drive old roll pin from shaft and discard old pin.

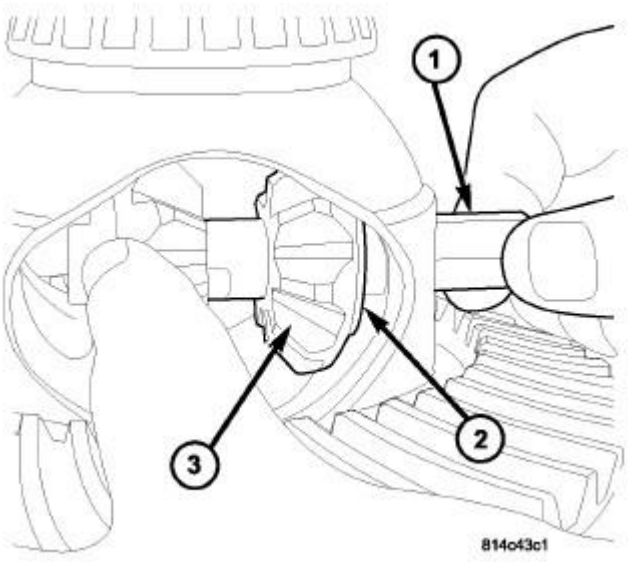

Fig. 76: Removing/Installing Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove pinion shaft (1), pinion gears (3) and thrust washers (2). Drive out and discard pinion shaft roll pin.

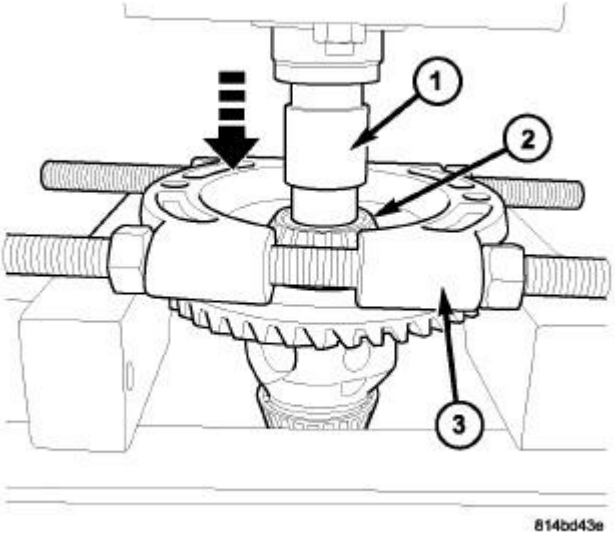

Fig. 77: Measure Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

5. Using Plug (special tool #9676, Adapter Plug) (1) and Bearing Splitter (special tool #1130, Splitter, Bearing/Gear) (3), press differential side bearing (2) off of ring gear side and discard.

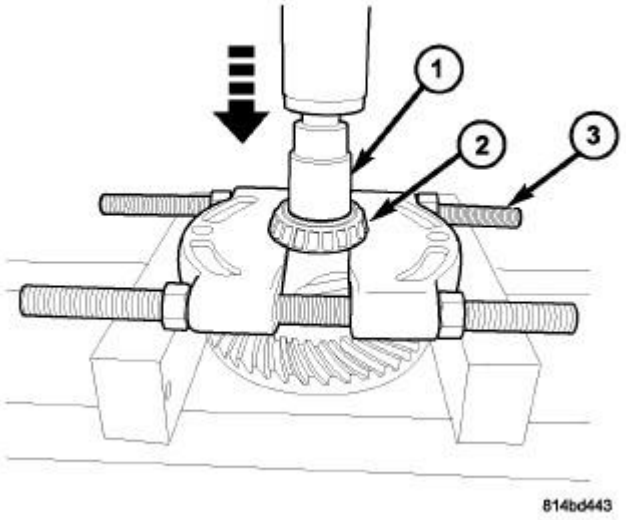

Fig. 78: Removing Side Bearing
Courtesy of CHRYSLER GROUP, LLC

6. Using Plug (special tool #9676, Adapter Plug) (1) and Bearing Splitter (special tool #1130, Splitter, Bearing/Gear) (3), press differential side bearing (2) off of opposite side and discard.

AXLE HOUSING

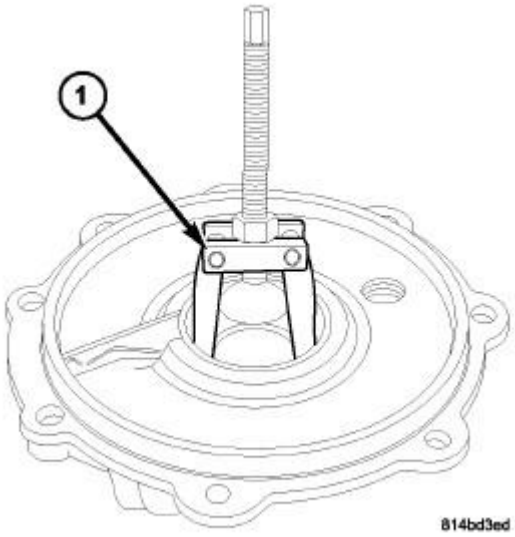

Fig. 79: Bearing Cup Remover
Courtesy of CHRYSLER GROUP, LLC

1. Remove differential side bearing cup from axle housing cover. Install Bearing Remover (special tool #6514, Remover, Bearing Cup) (1).

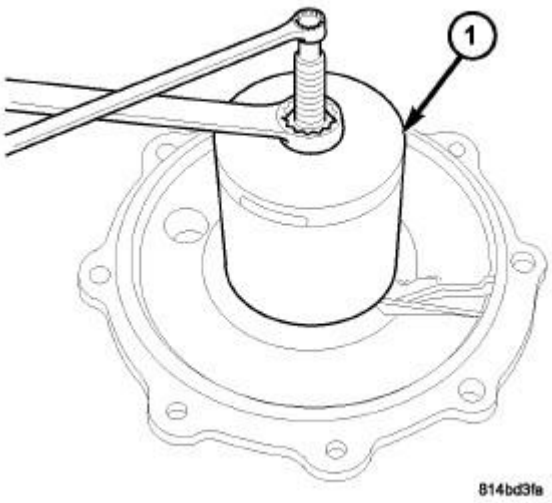

Fig. 80: Removing Differential Side Bearing Cup (Cover)
Courtesy of CHRYSLER GROUP, LLC

2. Remove differential side bearing cup with Bearing Remover (special tool #6514, Remover, Bearing Cup) (1).

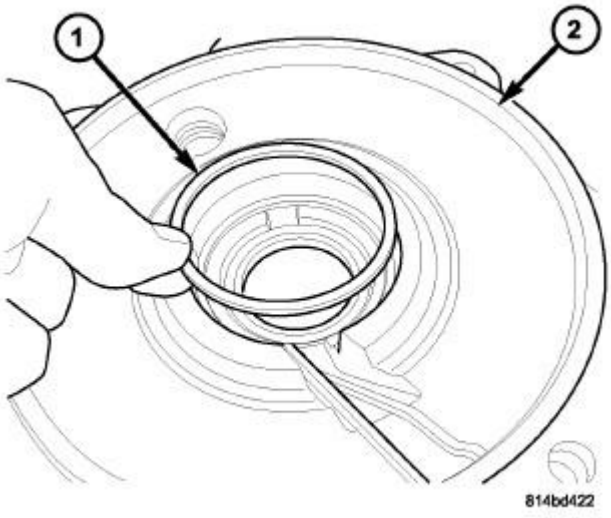

Fig. 81: Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

NOTE: Side bearing preload shims affect adjust differential bearing preload and ring gear backlash and must not be mixed up. Measure and tag side bearing preload shims upon removal.

3. Remove side bearing preload shim (1).

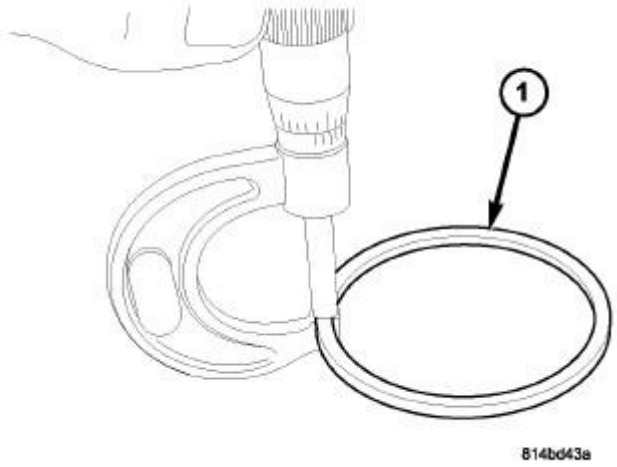

Fig. 82: Measure Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

4. Measure preload shim (1) to identify for replacement.

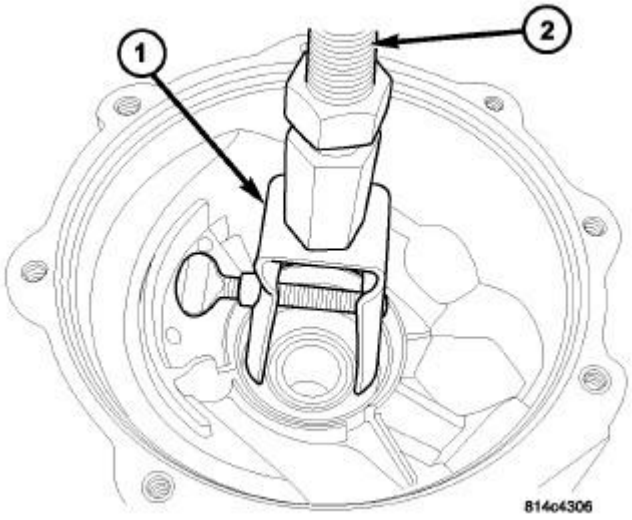

Fig. 83: Removing Inner Diff Side Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

5. Using Remover (special tool #9664, Remover, Bearing Cup) (1) and Slide Hammer (special tool #C-637, Slide Hammer, Universal) (2), remove and discard inboard differential side bearing cup.

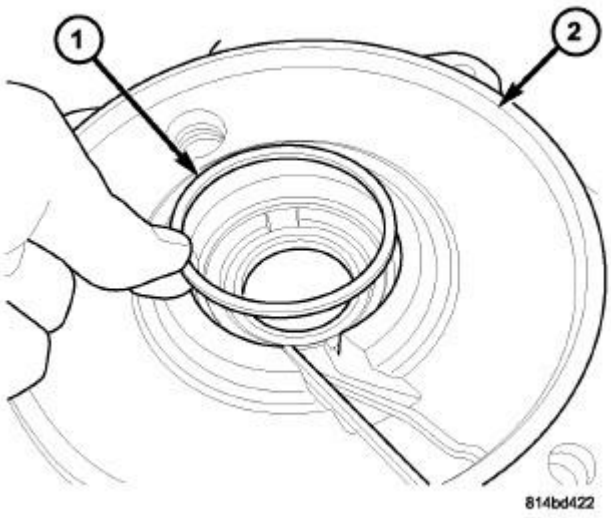

Fig. 84: Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

6. Remove side bearing preload shim from housing (1).

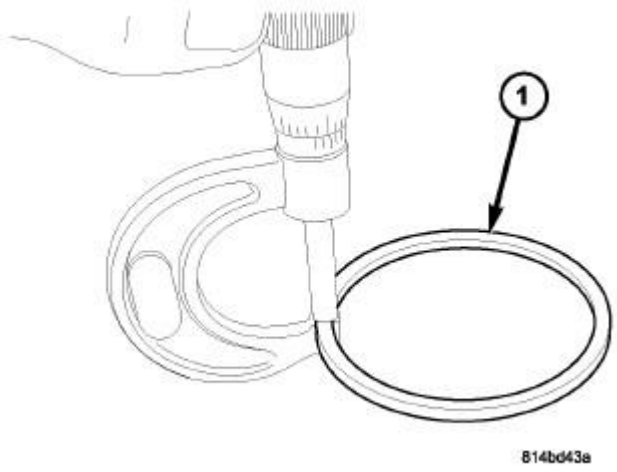

Fig. 85: Measure Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

7. Measure preload shim (1) to identify for replacement or installation.

ASSEMBLY

ASSEMBLY

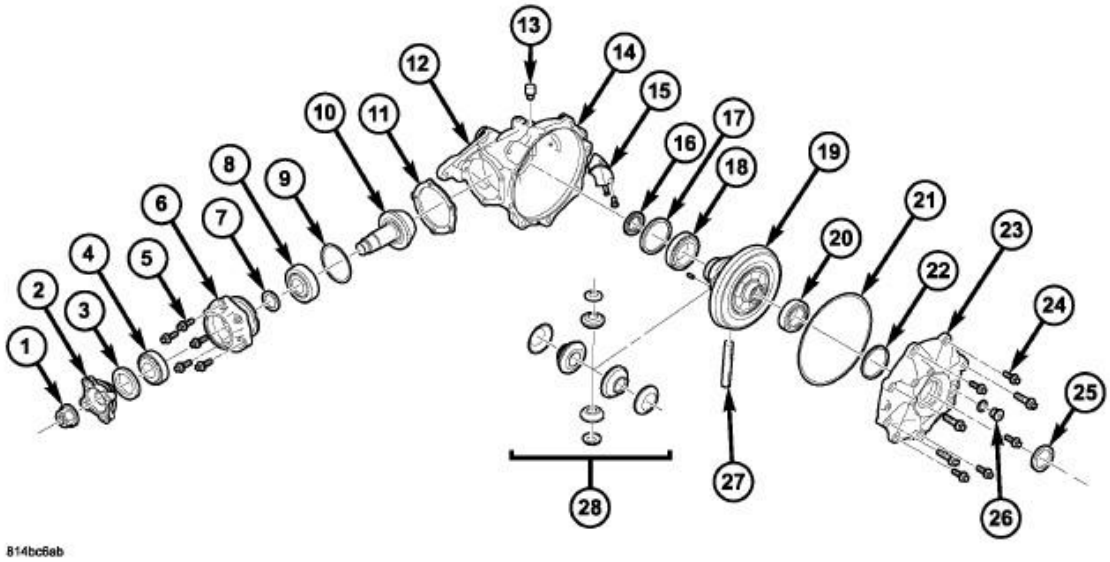

Fig. 86: Fia Front Axle Exploded View
Courtesy of CHRYSLER GROUP, LLC

1 - NUT, PINION FLANGE1	15 - BAFFLE, VENT
2 - FLANGE, PINION	16 - SEAL, AXLE
3 - SEAL, PINION	17 - SHIM, PRELOAD
4 - BEARING, PINION TAIL	18 - BEARING, DIFFERENTIAL SIDE
5 - BOLT, PINION HOUSING	19 - ASSEMBLY, RING GEAR/DIFFERENTIAL
6 - HOUSING, PINION	20 - BEARING, DIFFERENTIAL SIDE
7 - SPACER, SELECT	21 - SEAL, AXLE COVER O-RING
8 - BEARING, PINION HEAD	22 - SHIM, BEARING PRELOAD
9 - SEAL, PINION HOUSING O-RING	23 - COVER, AXLE HOUSING
10 - GEAR, PINION	24 - BOLT, AXLE HOUSING COVER
11 - SHIM, PINION DEPTH (SELECT)	25 - SEAL, AXLE
12 - HOUSING, AXLE	26 - PLUG, AXLE FILL
13 - VENT, HOUSING	27 - SHAFT, DIFFERENTIAL PINION
14 - HOUSING, AXLE	28 - SIDE GEAR ASSEMBLY

DIFFERENTIAL/RING GEAR ASSEMBLY

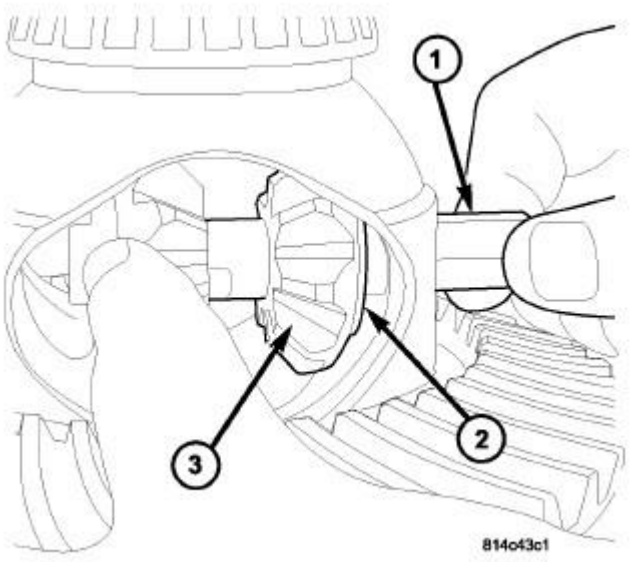

Fig. 87: Removing/Installing Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Install pinion shaft (1), pinion gears (3) and thrust washers (2). Refer to **Fig. 87**.

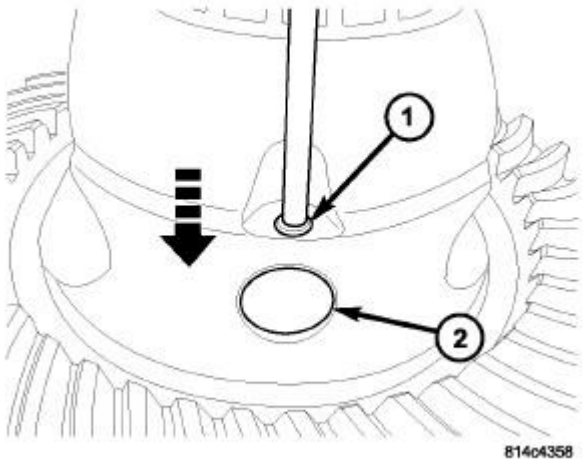

Fig. 88: Pinion Shaft Roll Pin
Courtesy of CHRYSLER GROUP, LLC

2. Using suitable punch, install **new** roll pin and install flush to differential case (1).

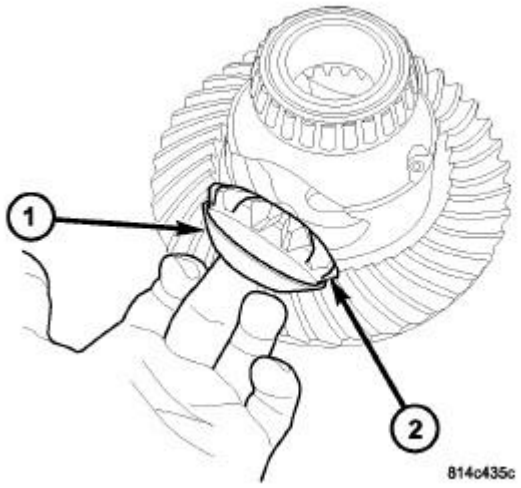

Fig. 89: Side Gear & Washer
Courtesy of CHRYSLER GROUP, LLC

3. Install differential side gears (2) and thrust washers (1). Rotate into position.

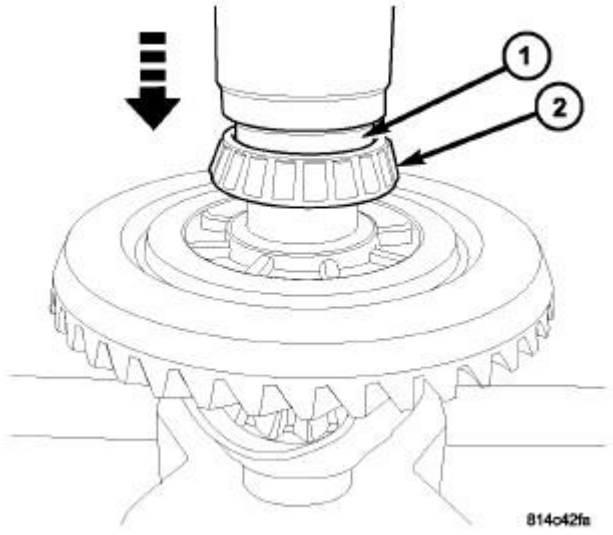

Fig. 90: Install Differential Side Bearing (Ring Gear Side)
Courtesy of CHRYSLER GROUP, LLC

4. Using Installer (special tool #9666, Installer, Bearing) (1), install **new** differential side bearing (ring gear side).

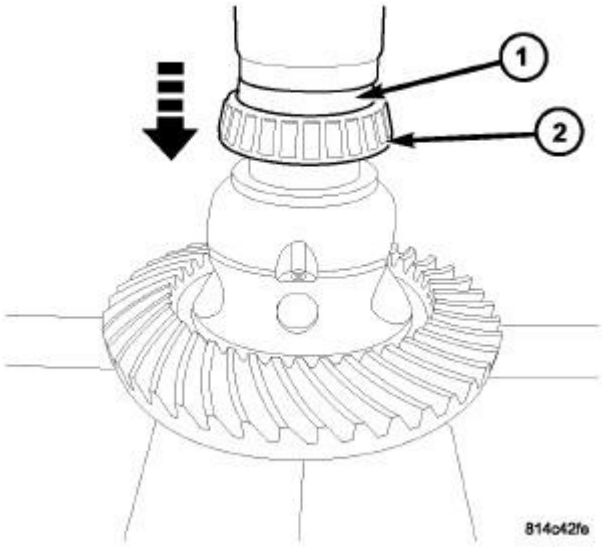

Fig. 91: Installing Differential Side Bearing (Ring Gear Side)
Courtesy of CHRYSLER GROUP, LLC

5. Using Installer (special tool #9665, Installer, Bearing) (1), install **new** differential side bearing (opposite side).

PINION HOUSING ASSEMBLY

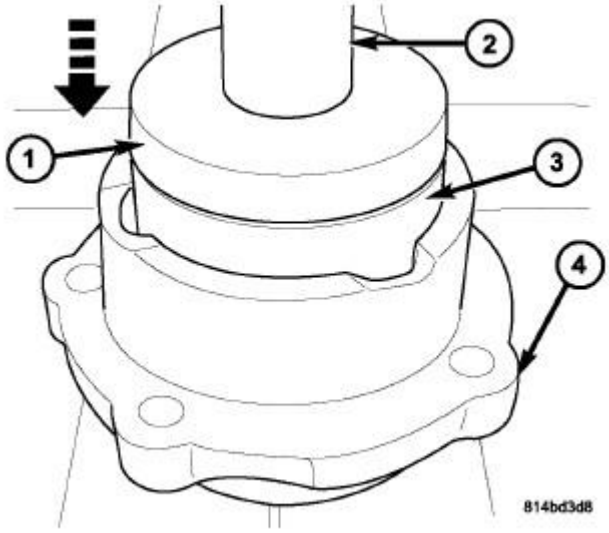

Fig. 92: Installing Pinion Head Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

1. Using Handle (special tool #C-4171, Driver Handle, Universal) (2) and Installer (special tool #D-129, Installer, Bearing Cup) (1), press **new** pinion head bearing cup (3) into pinion gear housing.

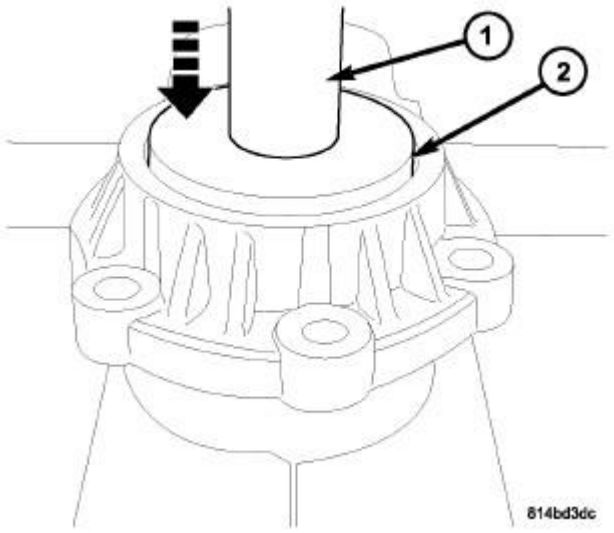

Fig. 93: Installing Pinion Tail Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

2. Using Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #D-130, Installer, Bearing Cup) (2), press new pinion tail bearing cup into pinion gear housing.

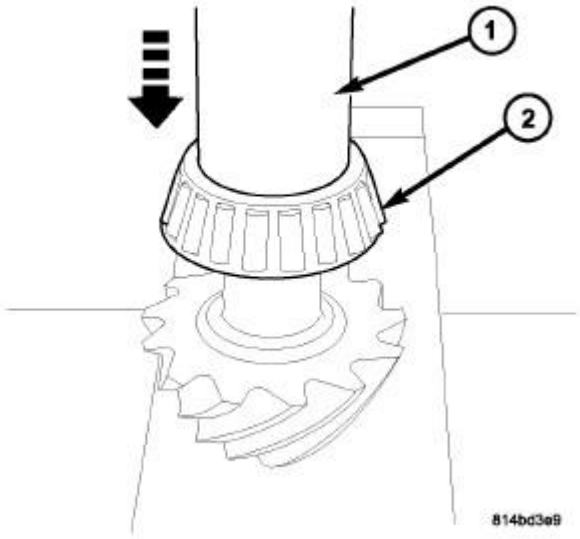

Fig. 94: Installing Pinion Head Bearing Cone
Courtesy of CHRYSLER GROUP, LLC

3. Using Installer (special tool #L-4507, Installer, Bearing), install **new** pinion head bearing.

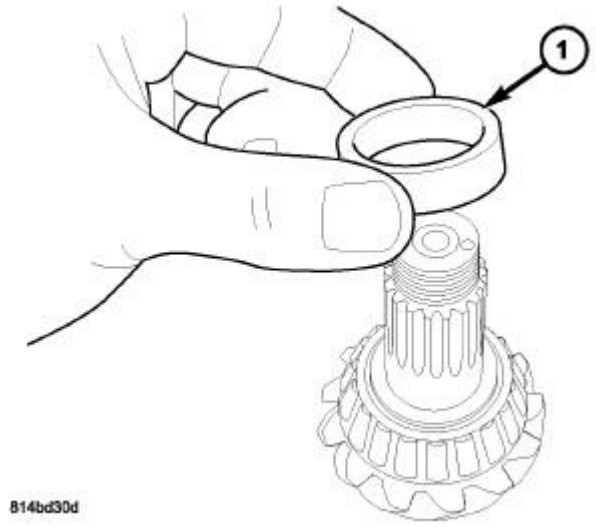

Fig. 95: Pinion Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

4. Install pinion bearing select spacer (1) removed upon disassembly. Spacer thickness will be measured/verified at end of assembly.

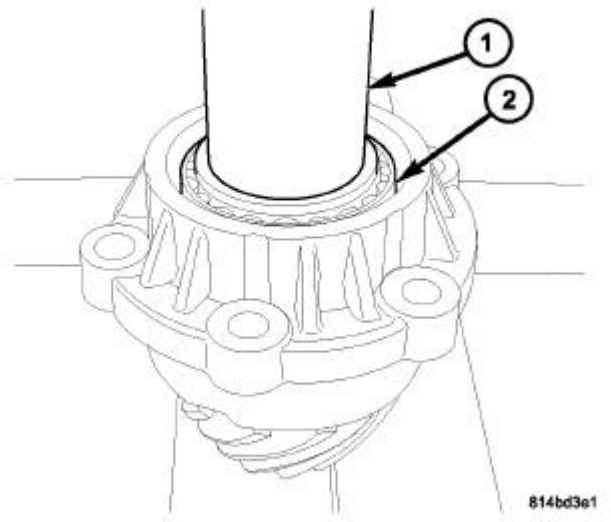

Fig. 96: Installing Pinion Tail Bearing Cone
Courtesy of CHRYSLER GROUP, LLC

5. Install pinion gear/bearing assembly into pinion housing. Using Installer (special tool #L-4507, Installer, Bearing) (1), press **new** pinion tail bearing (2) onto shaft.

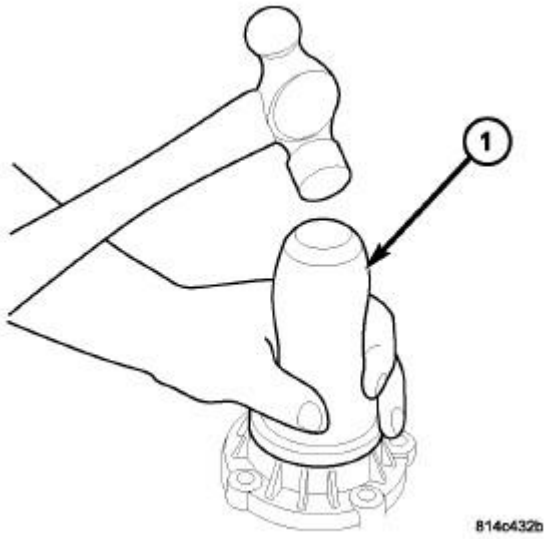

Fig. 97: Installing Pinion Flange Seal
Courtesy of CHRYSLER GROUP, LLC

6. Using Installer (special tool #9677, Installer, Seal) (1), install **new** pinion seal.

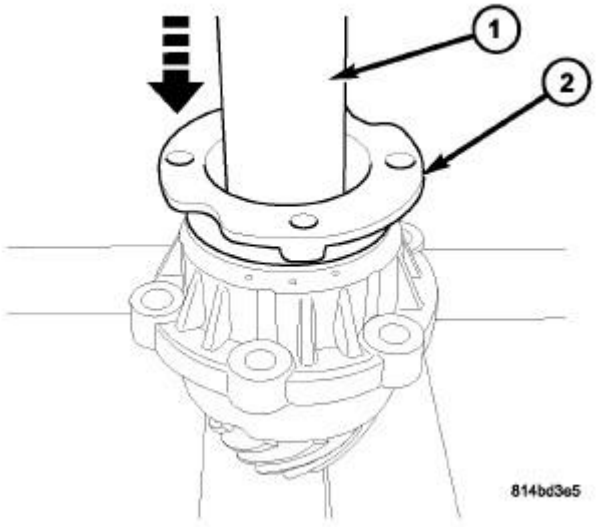

Fig. 98: Installing Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

7. Using Installer (special tool #L-4507, Installer, Bearing) (1), install pinion flange (2) until it bottoms.

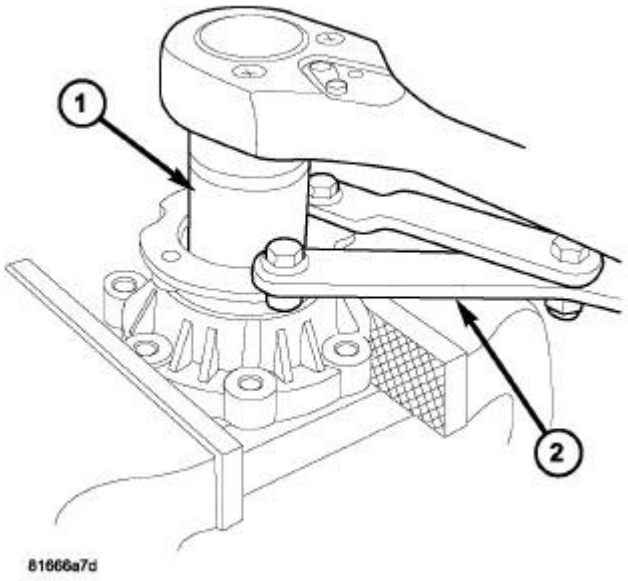

Fig. 99: Install Pinion Flange Nut/Vice
Courtesy of CHRYSLER GROUP, LLC

8. Using Spanner Wrench (special tool #6958, Wrench, Spanner) (2), install pinion flange nut and torque to 475 N.m (350 ft. lbs.). Refer to **Fig. 99**.

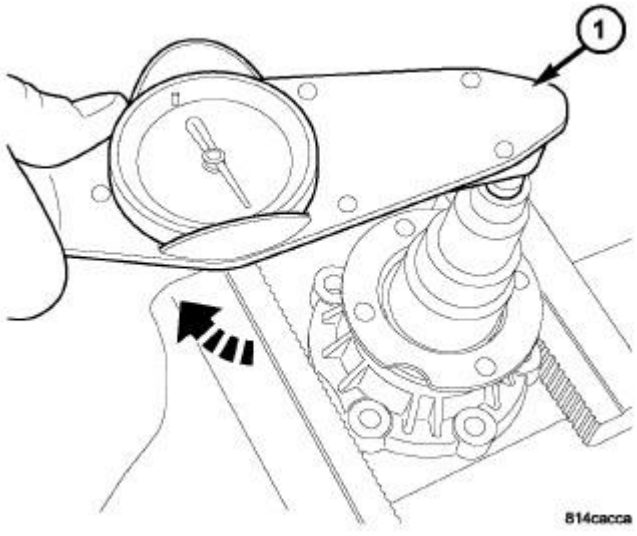

Fig. 100: Measuring Pinion Housing Assembly Turning Torque
Courtesy of CHRYSLER GROUP, LLC

9. Measure pinion housing assembly rotating torque (1). Rotating torque should be within 130-260 N.cm (12-23 in. lbs.).

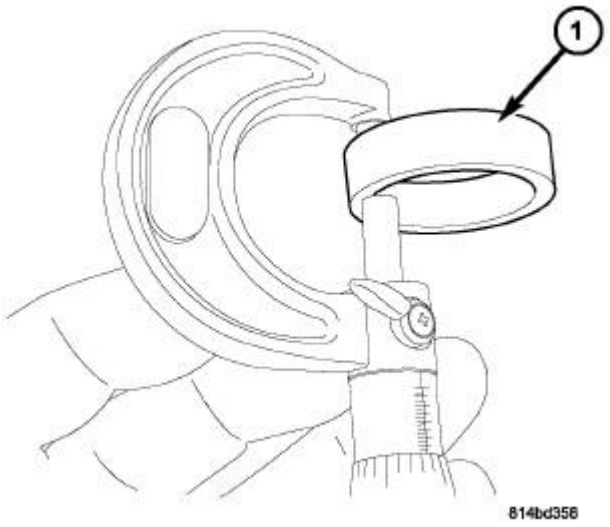

Fig. 101: Measure Pinion Bearing Spacer
Courtesy of CHRYSLER GROUP, LLC

10. If rotating torque is lower than this range, disassemble pinion housing, measure and install a slightly thinner spacer (1), reassemble and re-verify. If rotating torque is higher than this range, disassemble pinion housing, install a slightly thicker spacer, reassemble and re-verify rotating torque.
11. Select the pinion depth shim required for this axle assembly. Refer to **ADJUSTMENTS**.

AXLE HOUSING ASSEMBLY

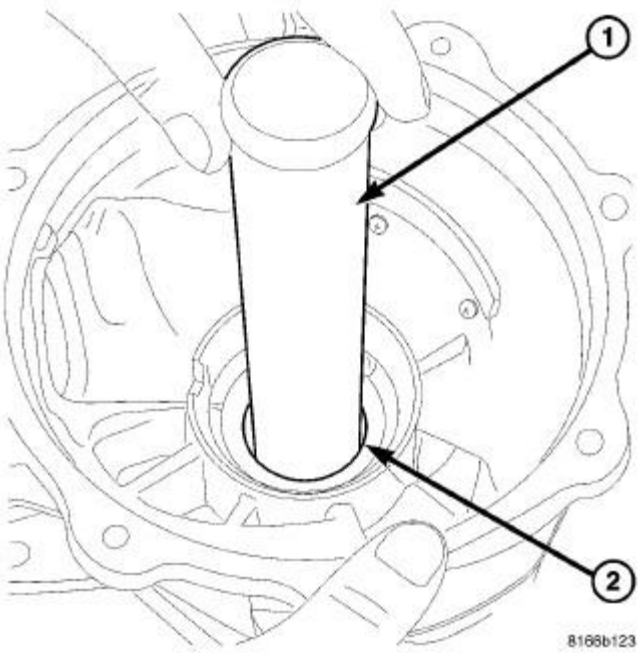

Fig. 102: Install Inner Differential Seal
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #L-4507, Installer, Bearing) (1), install new axle seal (inner) (2) into housing. Refer to **Fig. 102**.

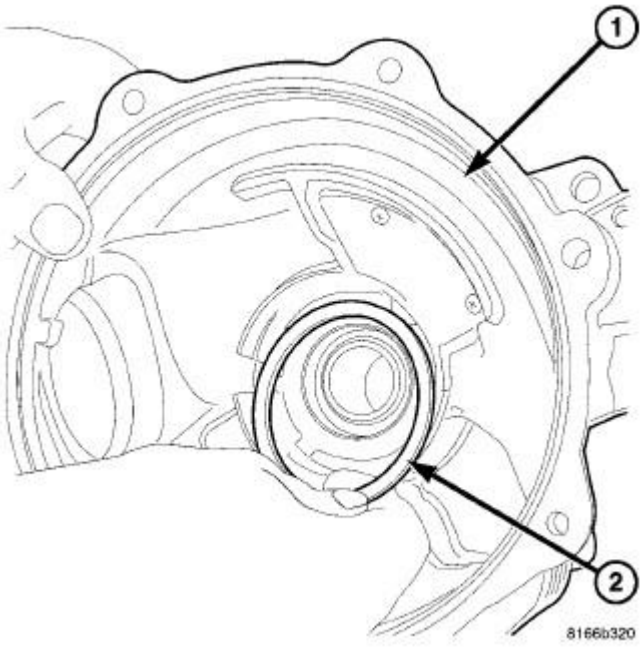

Fig. 103: Inner Differential Shim
Courtesy of CHRYSLER GROUP, LLC

2. Install side bearing preload shim (2) into axle housing (1).

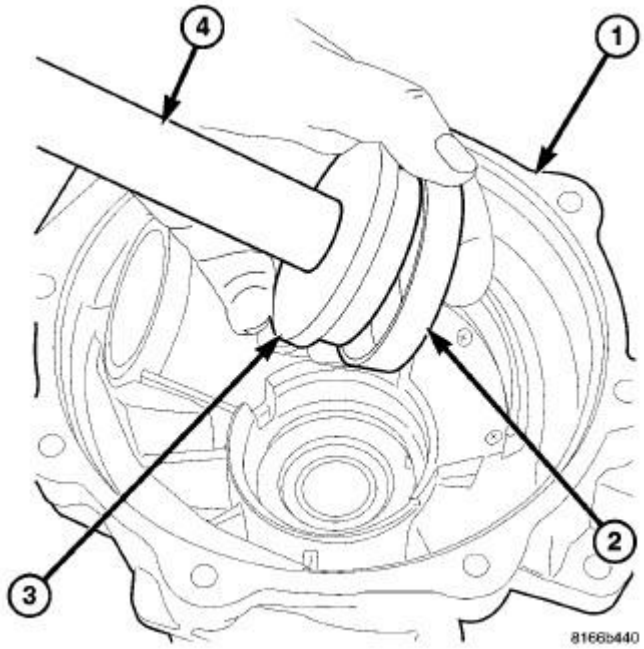

Fig. 104: Install Inner Diff Cup
Courtesy of CHRYSLER GROUP, LLC

3. Using Handle (special tool #C-4171, Driver Handle, Universal) (4) and Installer (special tool #D-145, Installer, Bearing Cup) (3) press new side bearing cup (2) into housing (1) until it bottoms.

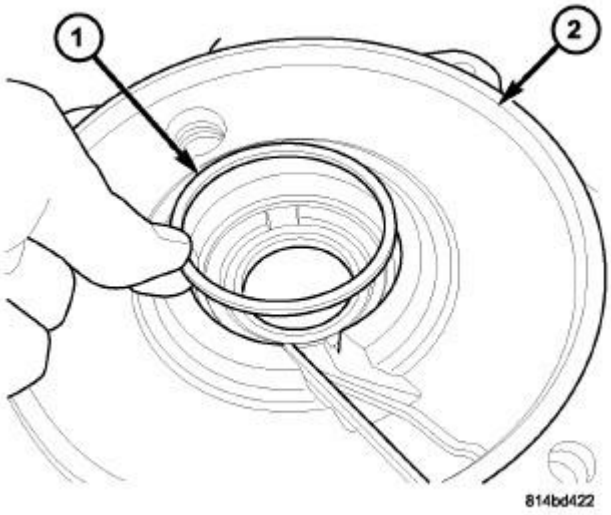

Fig. 105: Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

4. Install differential side bearing preload shim (1) into axle housing cover (2).

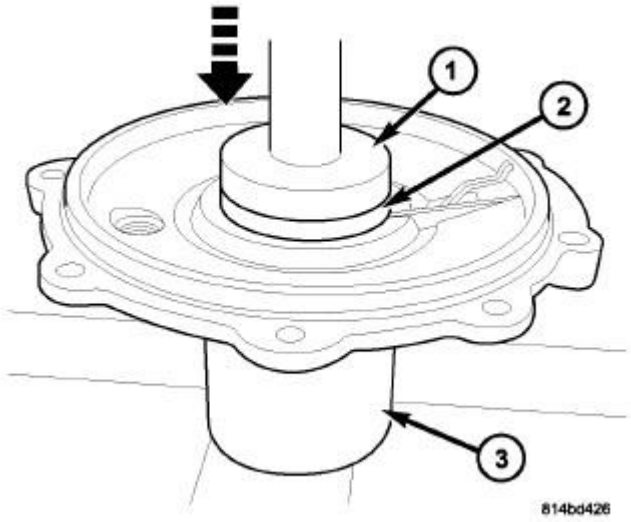

Fig. 106: Installing Side Bearing Cup (Cover)
Courtesy of CHRYSLER GROUP, LLC

5. Using Handle (special tool #C-4171, Driver Handle, Universal) and Installer (special tool #D-129, Installer, Bearing Cup) (1), press new side bearing cup into cover until it bottoms. Use suitable cup (3) to support and protect cover.

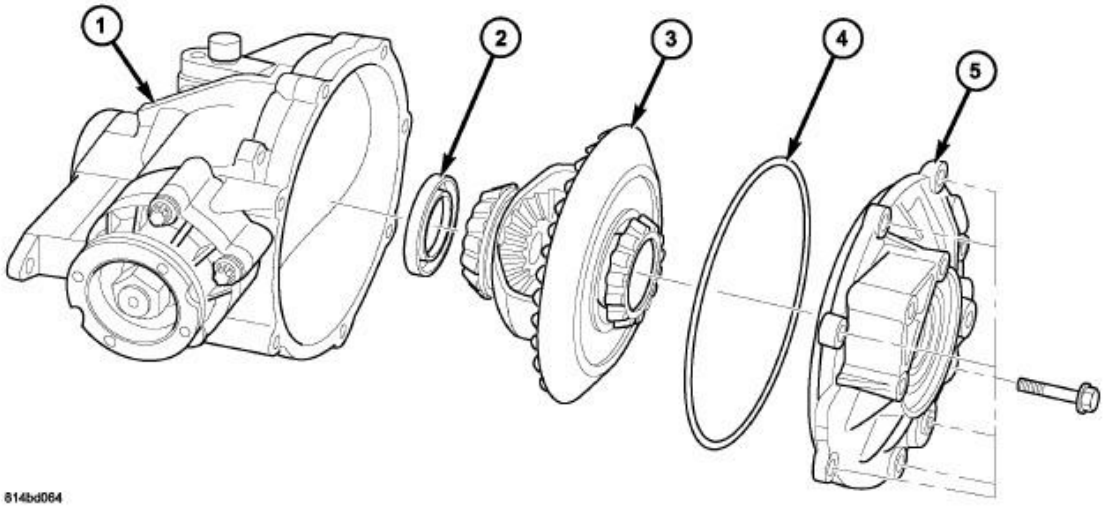

Fig. 107: Differential And Seal Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

6. Install differential/ring gear assembly (3), new cover o-ring seal (4), and cover (5).
7. Install and torque cover-to-housing bolts to:
   - M10x40 - 65 N.m (48 ft. lbs.)

- M8x25 - 34 N.m (25 ft. lbs.)

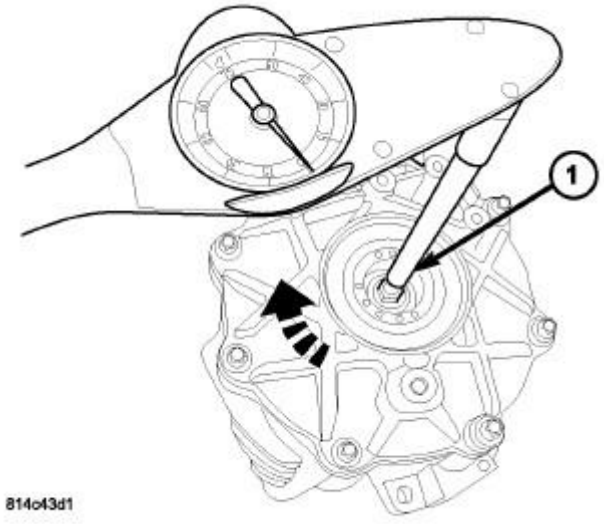

Fig. 108: Measure Differential Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

8. Using Torque Tool (special tool #C-4995A, Tool, Differential Bearing Torque) (1), measure differential side bearing rotating torque (preload). Rotating torque should be within 190-250 N.cm (17-22 in. lbs.).

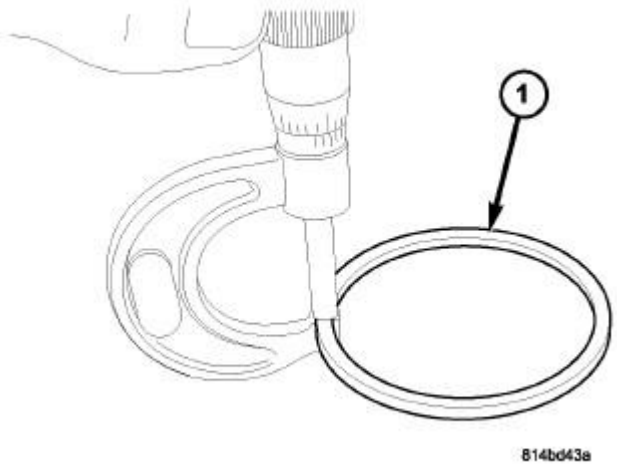

Fig. 109: Measure Side Bearing Preload Shim
Courtesy of CHRYSLER GROUP, LLC

9. If rotating torque is below this range, disassemble housing, measure and install slightly thicker

preload shims (1). Add thickness equally to both sides. If rotating torque is above this range, disassemble housing, measure and install slightly thinner preload shims. Remove thickness equally from both sides.

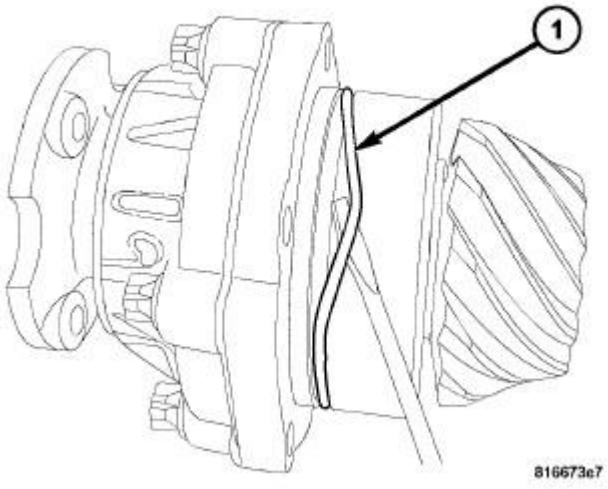

Fig. 110: N Pinion Housing O-Ring
Courtesy of CHRYSLER GROUP, LLC

10. Install new pinion housing o-ring seal (1). Refer to **Fig. 110**.

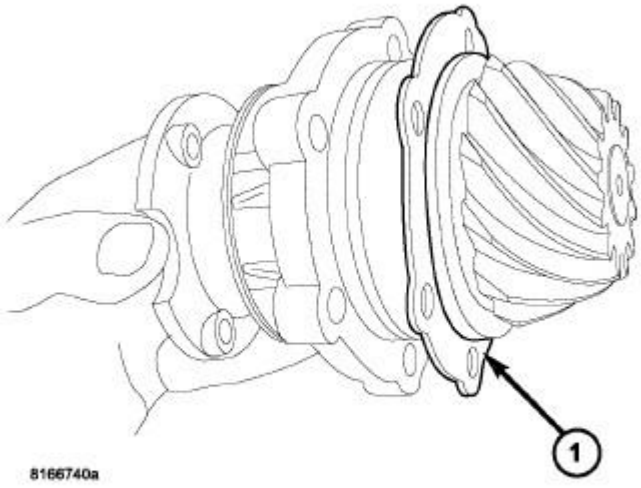

Fig. 111: Pinion Depth Shim
Courtesy of CHRYSLER GROUP, LLC

11. Install pinion housing assembly into axle housing with proper pinion depth shim (1). Refer to **Fig. 111** and **ADJUSTMENTS**.

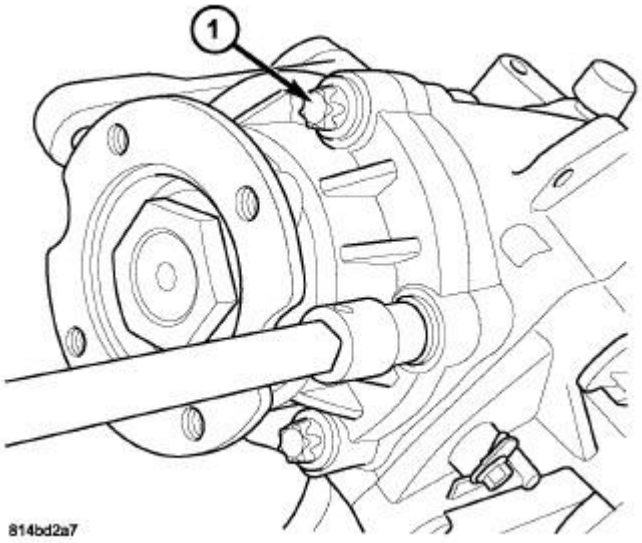

Fig. 112: Pinion Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install and torque pinion housing-to-axle housing bolts (1) to 34 N.m (25 ft. lbs.)
13. Measure and adjust ring gear backlash. Backlash should be within 0.05-0.11mm (0.002-0.004 in.). Refer to **ADJUSTMENTS**.

INSTALLATION

INSTALLATION

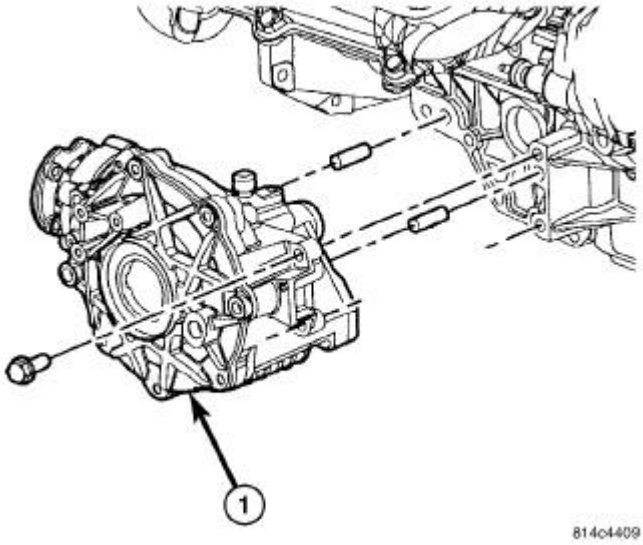

Fig. 113: Removing/Installing Front Axle
Courtesy of CHRYSLER GROUP, LLC

1. Install front axle assembly (1) into position. Refer to **Fig. 113**. Install and tighten axle housing-to-engine bolts to 65 N.m (48 ft. lbs.).

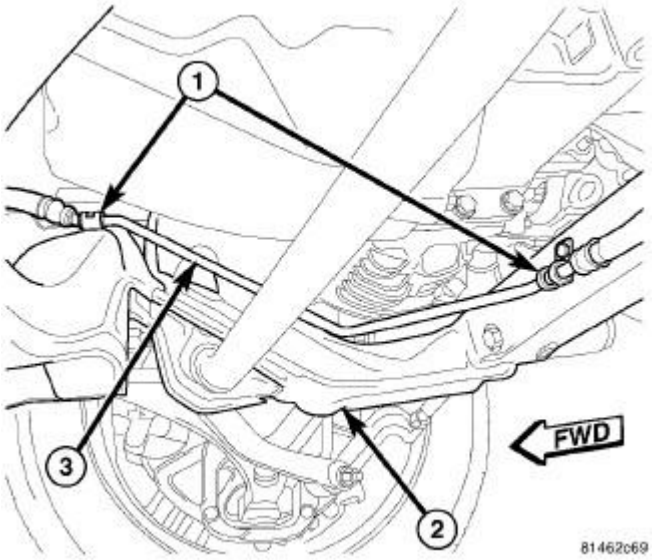

Fig. 114: Return Hose Routing Clips
Courtesy of CHRYSLER GROUP, LLC

2. Install power steering return line to cradle by fastening clips (1).

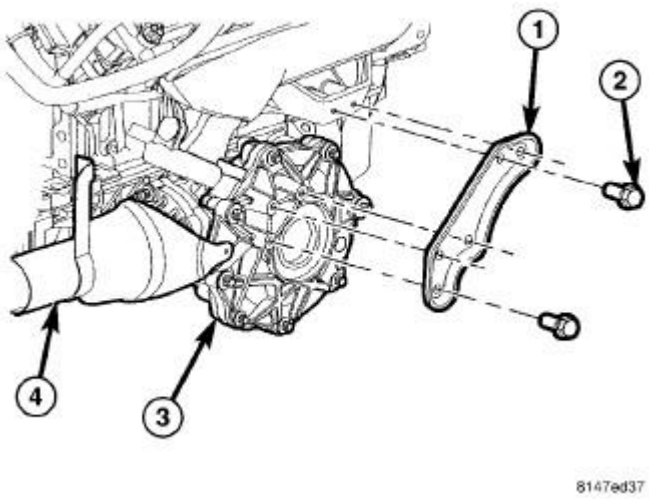

Fig. 115: Front Drive Axle Housing
Courtesy of CHRYSLER GROUP, LLC

3. Install axle assembly support bracket (1) and torque bolts to 28 N.m (21 ft. lbs.). Refer to **Fig. 115**.
4. Install RH catalytic converter/exhaust pipe assembly. Refer to **CONVERTER, CATALYTIC, INSTALLATION** .
5. Install front propeller shaft. Refer to **INSTALLATION** .
6. Install intermediate shaft. Refer to **REMOVAL** or **REMOVAL** .
7. Install both front halfshafts. Refer to **INSTALLATION** or **INSTALLATION** .

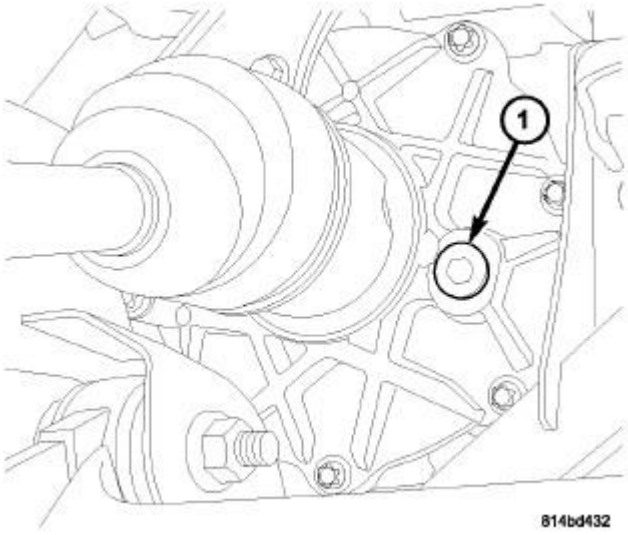

Fig. 116: Fluid Fill Plug Location
Courtesy of CHRYSLER GROUP, LLC

8. Fill axle with 600ml (0.64 qts.) of Mopar® 75W-90 Synthetic Gear Lubricant. Fluid level should be at or near bottom of fill hole. Torque fill plug (1) to 30 N.m (22 ft. lbs.). Refer to **Fig. 116**.
9. Lower vehicle.

SPECIAL TOOLS

SPECIAL TOOLS

	1026 - Puller (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC.) 1130 - Splitter, Bearing/Gear (Originally Shipped In Kit Number(s) 6745, 6947, 6949, 9202, 9202A-CAN, 9202CC, 9299.) 6514 - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 6546.) 6958 - Wrench, Spanner (Originally Shipped In Kit Number(s) 6947, 6949, 6966, 8204, 8204CC, 8667.) 9664 - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 9675, 9685, 9695.) 9665 - Installer, Bearing (Originally Shipped In Kit Number(s) 9675, 9685, 9695.) 9666 - Installer, Bearing (Originally Shipped In Kit Number(s) 9675, 9685, 9695.) 9676 - Adapter Plug (Originally Shipped In Kit Number(s) 9675, 9685, 9695.) 9677 - Installer, Seal (Originally Shipped In Kit Number(s) 9675, 9685, 9695.) 9681-1 - Gauge, Pinion Height (Originally Shipped In Kit Number(s) 9674.) 9681-2 - Plate, Gage (Originally Shipped In Kit Number(s) 9674.) 9681-4 - Disc, Arbor (Originally Shipped In Kit Number(s) 9674.) 9681-5 - Disc, Arbor (Originally Shipped In Kit Number(s) 9674.) 9682 - Backlash Measuring Tool (Originally Shipped In Kit Number(s) 9674.) DISCONNECT, FRONT AXLE

REMOVAL

FRONT AXLE DISCONNECT

1. Raise and support the vehicle.

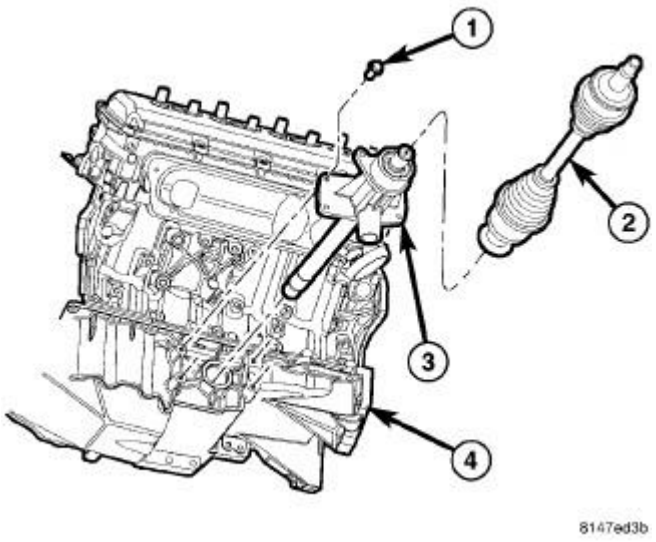

Fig. 117: Left Drive Axle & Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: The intermediate shaft is serviced only as a complete assembly.

2. Remove left halfshaft assembly (2). Refer to **REMOVAL** or **REMOVAL** .

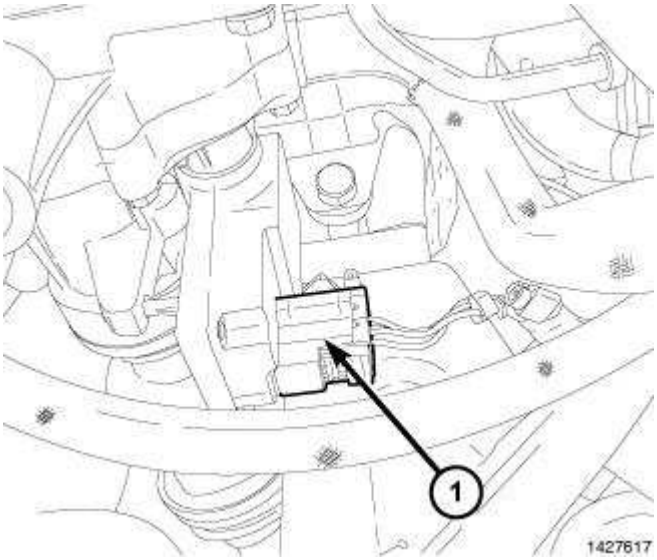

Fig. 118: Front Axle Disconnect Solenoid Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the front axle disconnect solenoid harness connector (1).

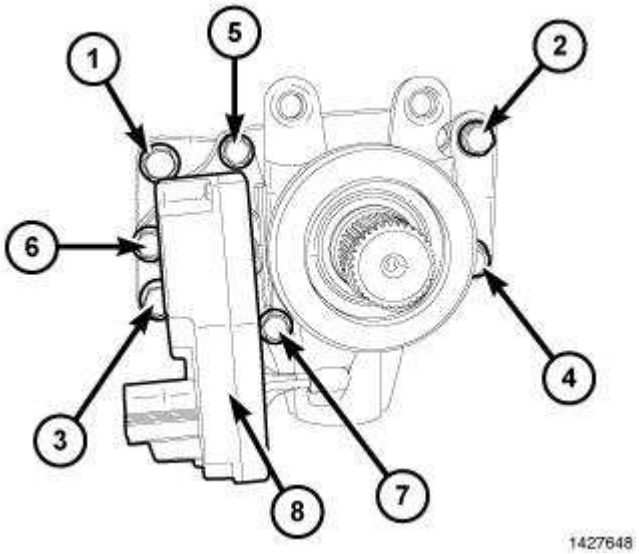

Fig. 119: Bolts From Front Axle Disconnect Solenoid
Courtesy of CHRYSLER GROUP, LLC

4. Remove the 3 bolts (5), (6), (7) from the front axle disconnect solenoid, and remove the front axle disconnect solenoid (8).

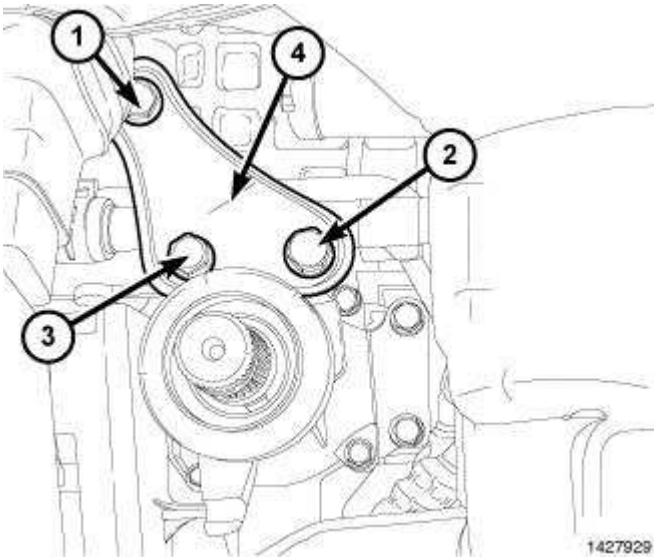

Fig. 120: Bolts From Front Axle Disconnect Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Remove the 3 bolts (1), (2), (3) from the front axle disconnect bracket, and remove the front axle disconnect bracket (4).

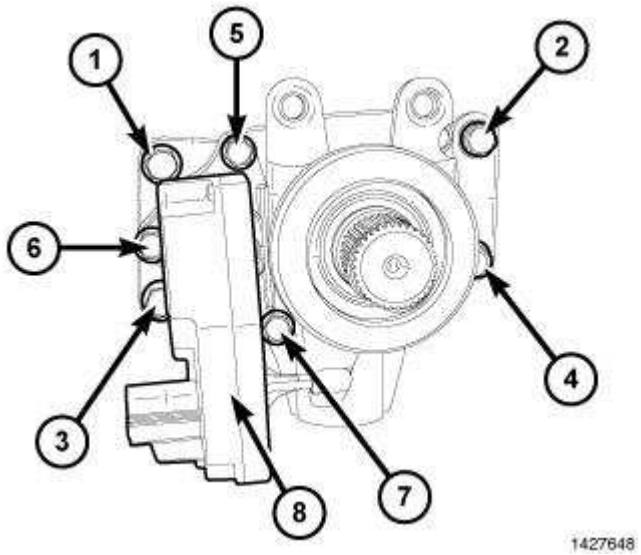

Fig. 121: Bolts From Front Axle Disconnect Solenoid
Courtesy of CHRYSLER GROUP, LLC

6. Remove four bolts (1) from the front axle disconnect (3) and remove it from the engine

FRONT AXLE DISCONNECT SOLENOID

1. Raise and support the vehicle.

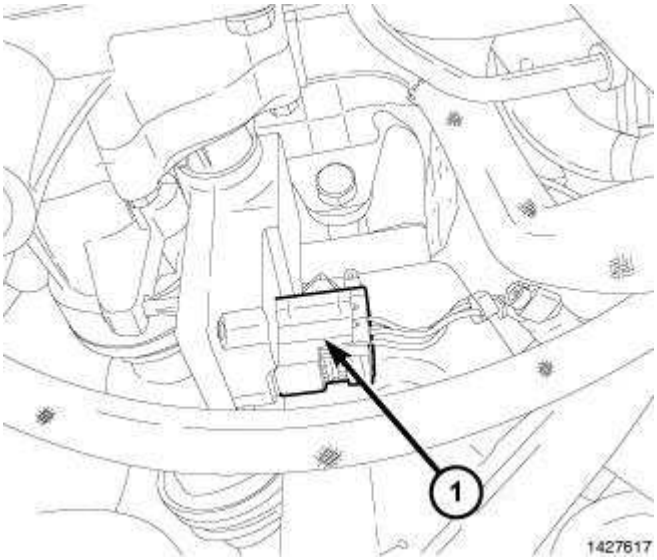

Fig. 122: Front Axle Disconnect Solenoid Harness Connector
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the front axle disconnect solenoid harness connector (1).

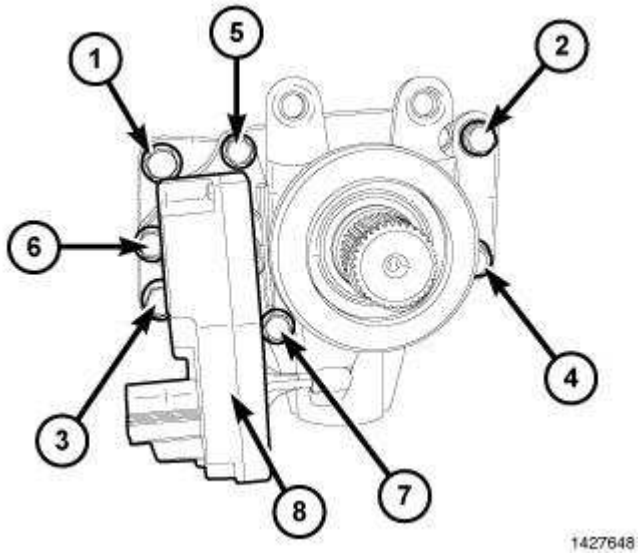

Fig. 123: Bolts From Front Axle Disconnect Solenoid
Courtesy of CHRYSLER GROUP, LLC

3. Remove the 3 bolts (5), (6), and (7) from the front axle disconnect solenoid (8).
4. Remove the front axle disconnect solenoid (8).

INSTALLATION

FRONT AXLE DISCONNECT

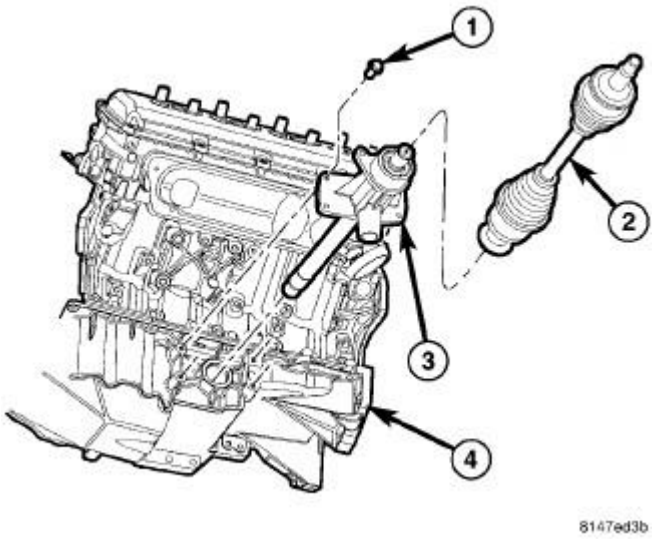

Fig. 124: Left Drive Axle & Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Install the front axle disconnect (3).
2. Install and torque the four front axle disconnect-to-oil pan bolts (1) to 25 N.m (18 ft. lbs.).

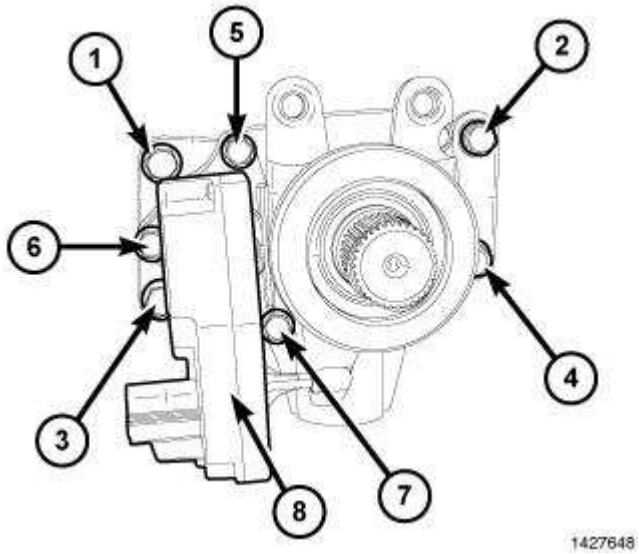

Fig. 125: Bolts From Front Axle Disconnect Solenoid
Courtesy of CHRYSLER GROUP, LLC

3. Install the front axle disconnect solenoid (8), and the 3 bolts (5), (6) and (7).

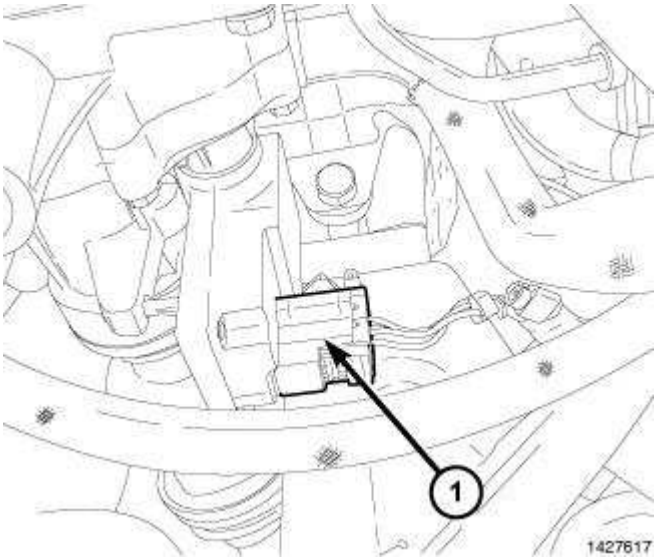

Fig. 126: Front Axle Disconnect Solenoid Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect the front axle disconnect solenoid harness connector (1).

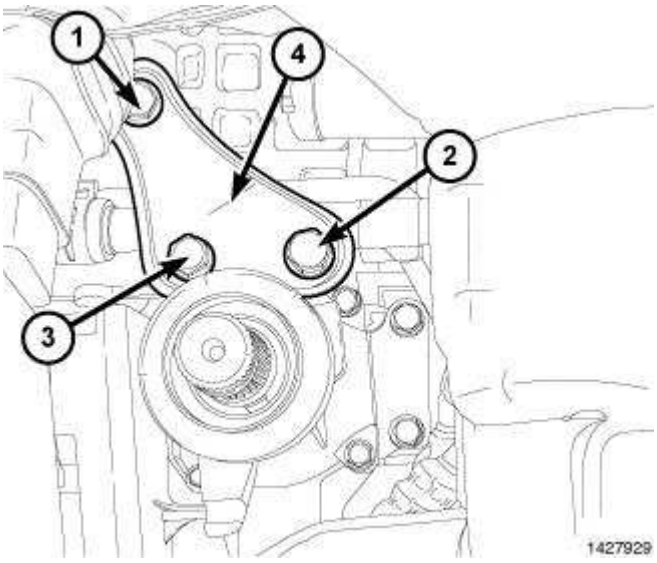

Fig. 127: Bolts From Front Axle Disconnect Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Install the front axle disconnect solenoid bracket (4), and the 3 bolts (1), (2), and (3).

FRONT AXLE DISCONNECT SOLENOID

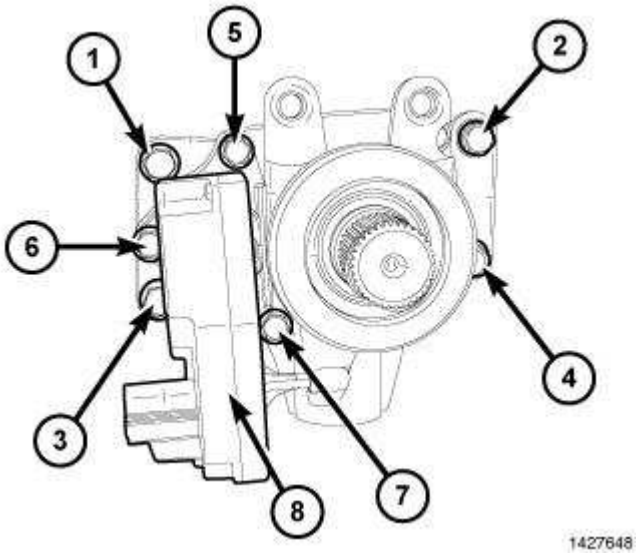

Fig. 128: Bolts From Front Axle Disconnect Solenoid
Courtesy of CHRYSLER GROUP, LLC

1. Install the front axle disconnect solenoid (8), and the 3 bolts (5), (6), (7).

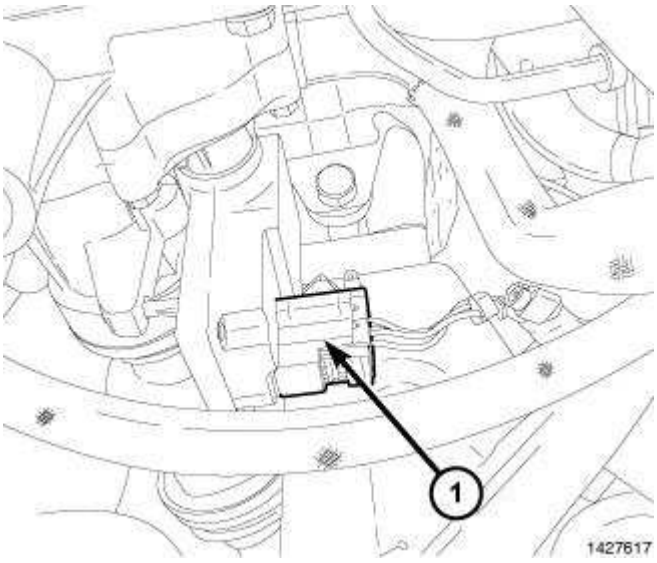

Fig. 129: Front Axle Disconnect Solenoid Harness Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the front axle disconnect harness connector (1).

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID FILL

NOTE: **The 175MM FIA Front Axle assembly is designed for 'fill for life' and is not manufactured with a fluid drain plug.**

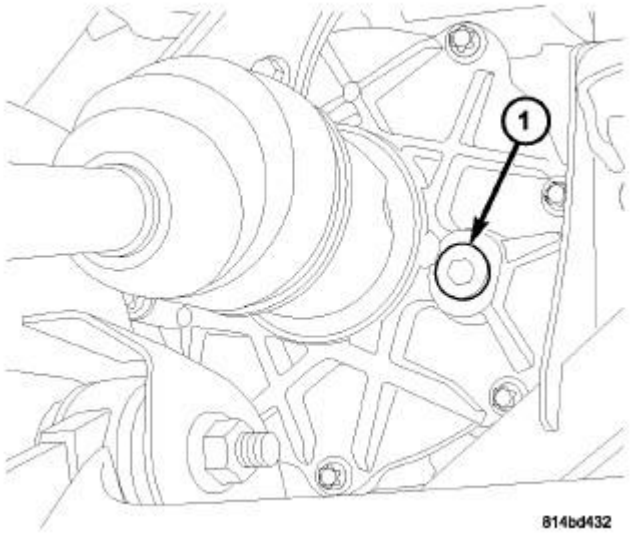

Fig. 130: Fluid Fill Plug Location
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove axle fill plug (1). Refer to **Fig. 130**.
3. Fill axle with 600ml (0.64 qts.) of Mopar® 75W-90 Synthetic Gear Lubricant. Fluid should be within 3/16" of bottom of fill hole.

SEAL, AXLE DRIVE SHAFT

REMOVAL

RIGHT AXLE SEAL

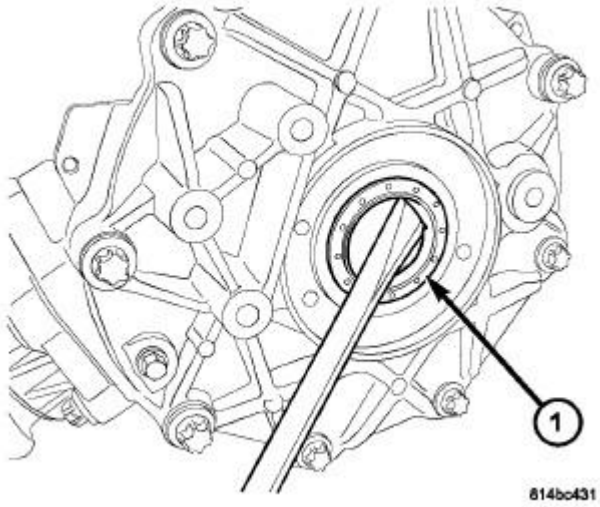

Fig. 131: Removing Axle Seal
Courtesy of CHRYSLER GROUP, LLC

1. Remove right halfshaft assembly. Refer to **REMOVAL** or **REMOVAL** .
2. Using suitable screwdriver, remove axle seal (1). Refer to **Fig. 131**.

LEFT AXLE SEAL

NOTE: Inboard (Left) axle seal replacement requires removal and disassembly of the axle assembly.

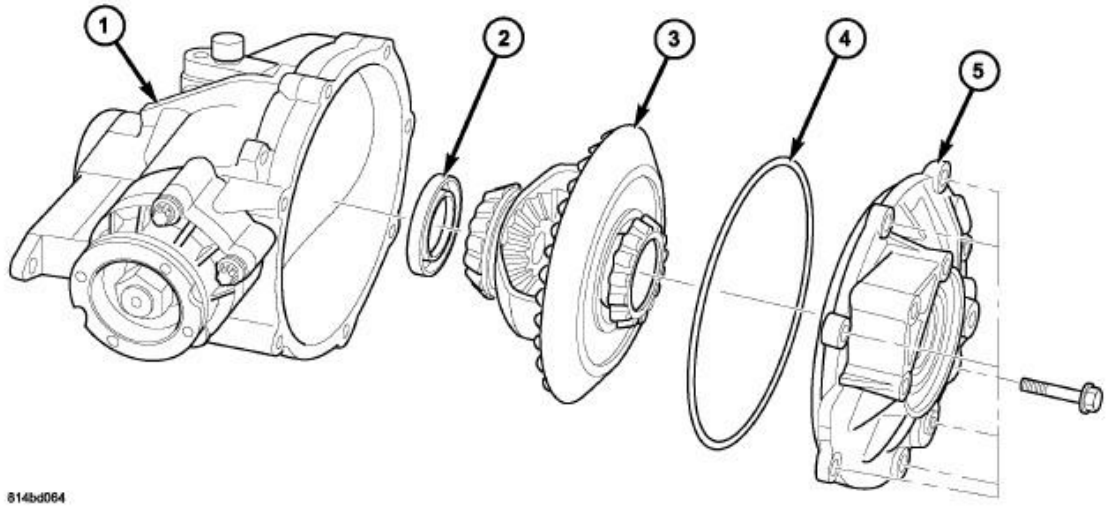

Fig. 132: Differential And Seal Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. Remove front axle assembly. Refer to **REMOVAL**.
2. Drain axle lubricant by turning housing on its side and draining out of left output bore.
3. Remove differential cover (5) and differential (3). Refer to **Fig. 132**. Remove and discard o-ring seal.
4. Using Remover (special tool #9664, Remover, Bearing Cup) and Slide Hammer (special tool #C-637, Slide Hammer, Universal), remove left axle seal.

INSTALLATION

RIGHT AXLE SEAL

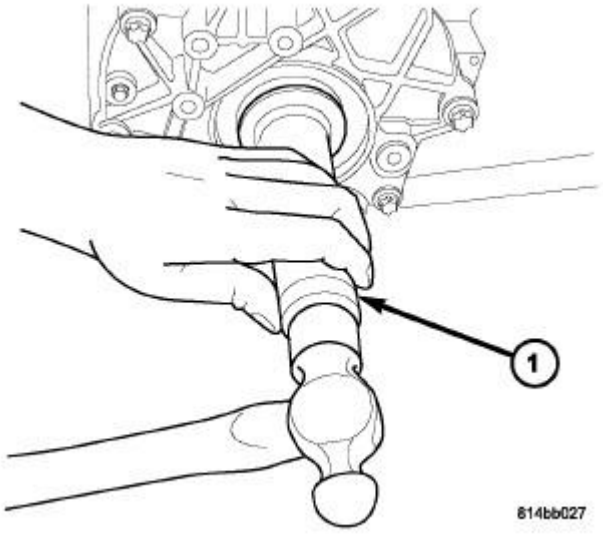

Fig. 133: Installing Axle Seal
Courtesy of CHRYSLER GROUP, LLC

1. Using Seal Installer C-4193A (1, install new axle shaft seal. Refer to **Fig. 133**.
2. Install right halfshaft assembly. Refer to **INSTALLATION** or **INSTALLATION** .

LEFT AXLE SEAL

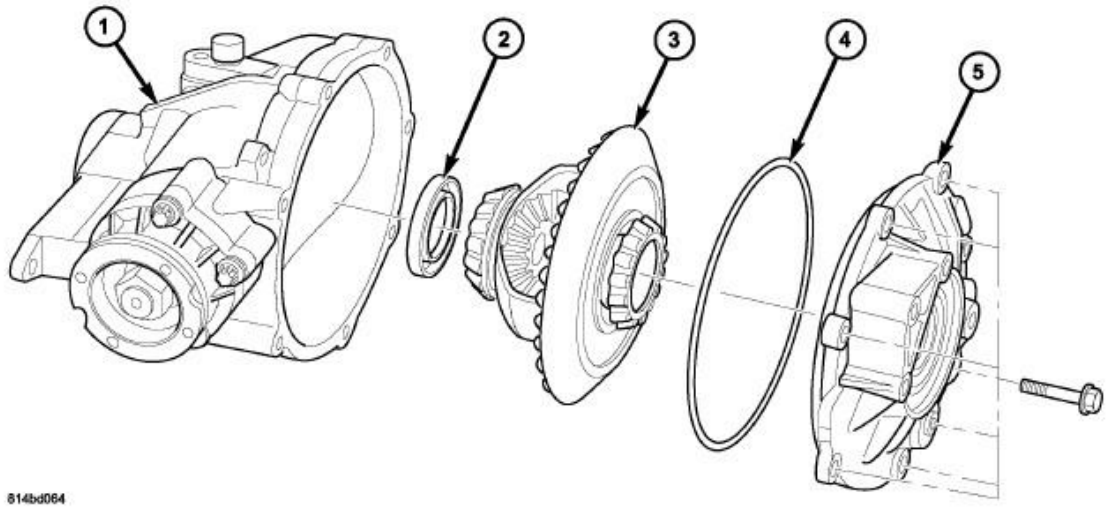

Fig. 134: Differential And Seal Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #L-4507, Installer, Bearing), install left (inboard) axle seal (2).
2. Install differential (3). Refer to **Fig. 134**. Install cover (5) with new o-ring seal (4).
3. Install and torque cover-to-housing bolts to:
    - M10x40 - 65 N.m (48 ft. lbs.)
    - M8x25 - 34 N.m (25 ft. lbs.)

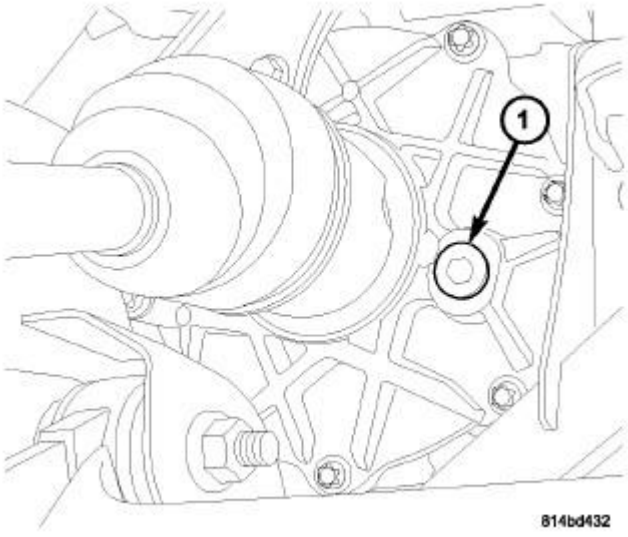

Fig. 135: Fluid Fill Plug Location
Courtesy of CHRYSLER GROUP, LLC

4. Install axle assembly into vehicle. Refer to **INSTALLATION**.
5. Fill axle (1) with 600ml (0. 64 qts.) Mopar® 75W-90 Synthetic Gear Lubricant. Refer to **Fig. 135**. Torque fill plug (1) to 30 N.m (22 ft. lbs.)

SEAL, PINION

REMOVAL

REMOVAL

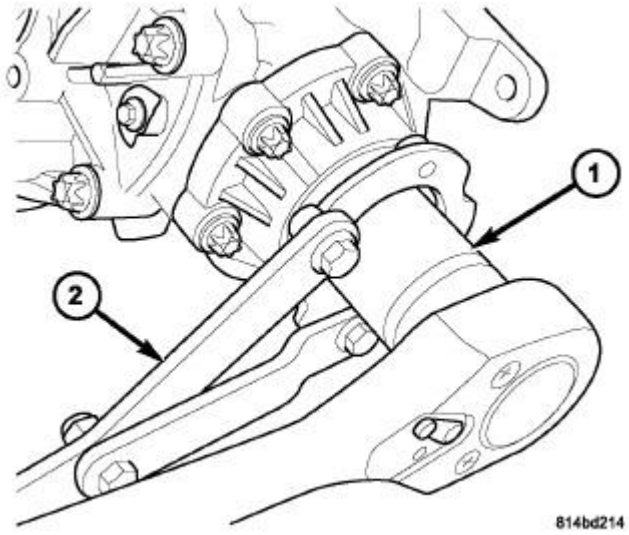

Fig. 136: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. Remove propeller shaft and heat shield. Refer to **REMOVAL** .
2. Using Spanner Wrench (special tool #6958, Wrench, Spanner) (2), remove pinion flange nut. Refer to **Fig. 136**.

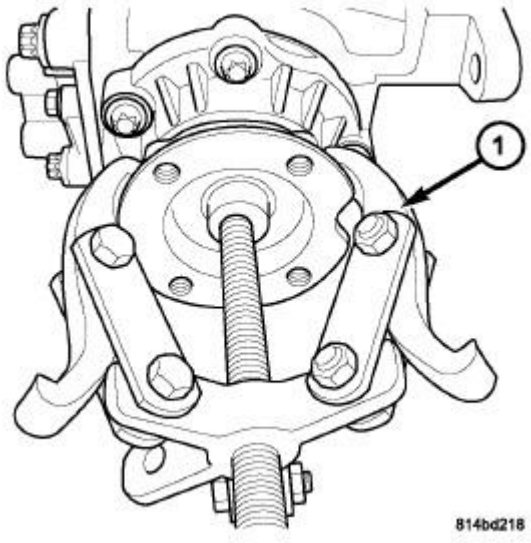

Fig. 137: Removing Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

3. Using Puller (special tool #1026, Puller) (1), remove pinion flange. Refer to **Fig. 137**.
4. Remove pinion flange seal with suitable screwdriver and discard.

INSTALLATION

INSTALLATION

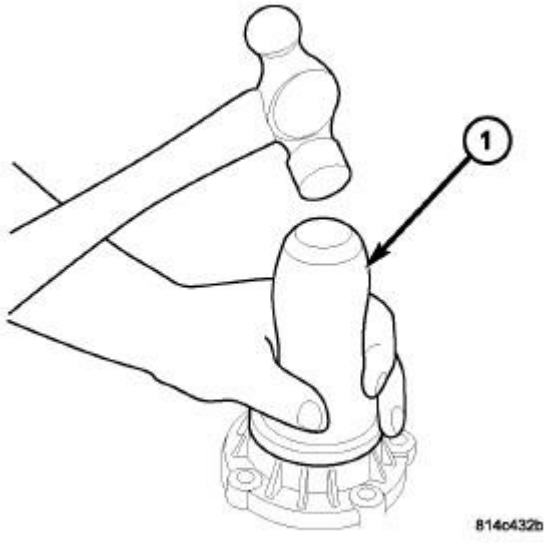

Fig. 138: Installing Pinion Flange Seal
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #9677, Installer, Seal) (1), install new pinion flange seal. Refer to

Fig. 138.

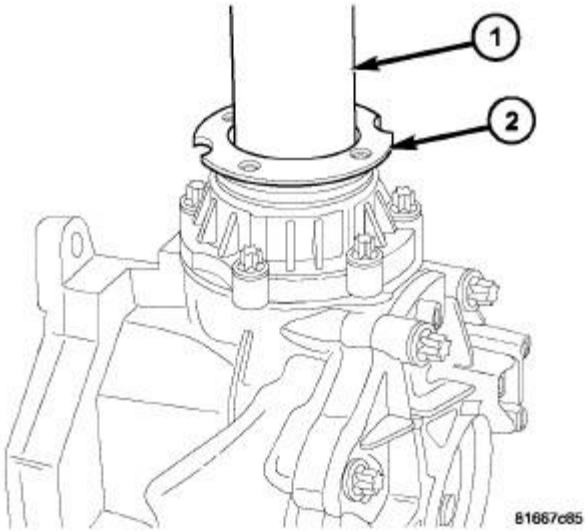

Fig. 139: Installing Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

1 - Installer
2 - Pinion Flange

2. Using Installer (special tool #L-4507, Installer, Bearing) (1), **lightly tap** pinion flange (2)onto shaft, just enough to start flange nut by hand. Refer to **Fig. 139**.

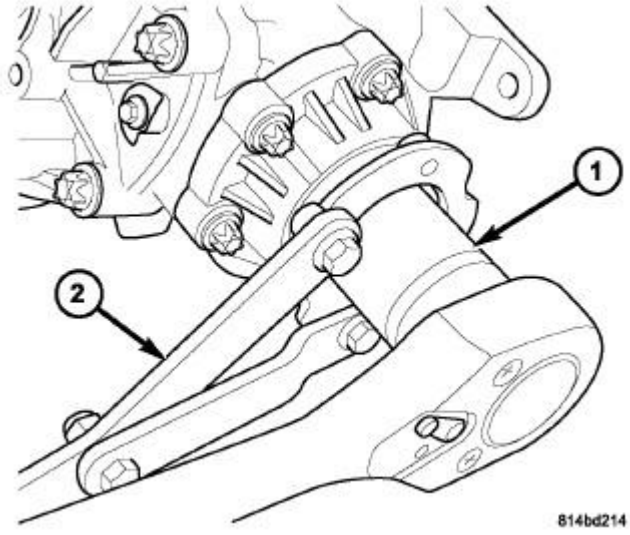

Fig. 140: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

3. Install pinion flange nut and torque to 475 N.m (350 ft. lbs.) (2). Refer to **Fig. 140**.
4. Install propeller shaft and heat shield. Refer to **INSTALLATION** .

DRIVELINE/AXLES

Front Half Shaft - Chrysler 300

DESCRIPTION

DESCRIPTION

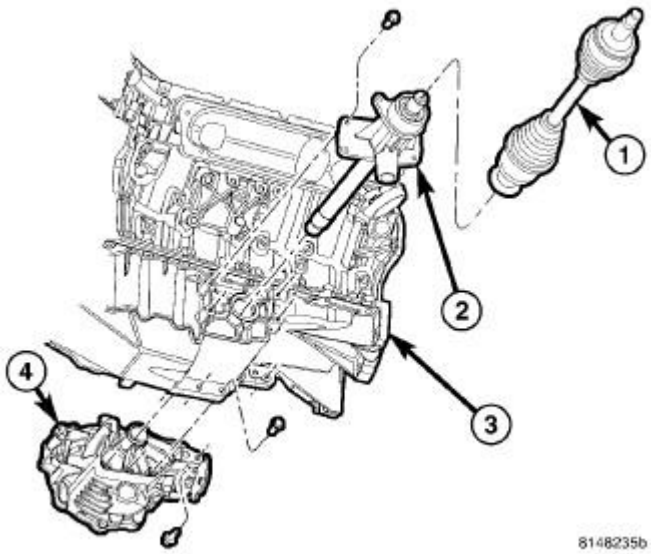

Fig. 1: Front Drive Axle Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LEFT HALFSHAFT ASSEMBLY
2 - INTERMEDIATE SHAFT ASSEMBLY
3 - ENGINE/OIL PAN
4 - FRONT AXLE ASSEMBLY

The inner joints of both half shaft assemblies are cross-groove joints. The outer joints of both assemblies are Rzeppa Joints. The cross-groove joints are true constant velocity (CV) joint assemblies, which allow for the changes in half shaft length through the jounce and rebound travel of the rear suspension.

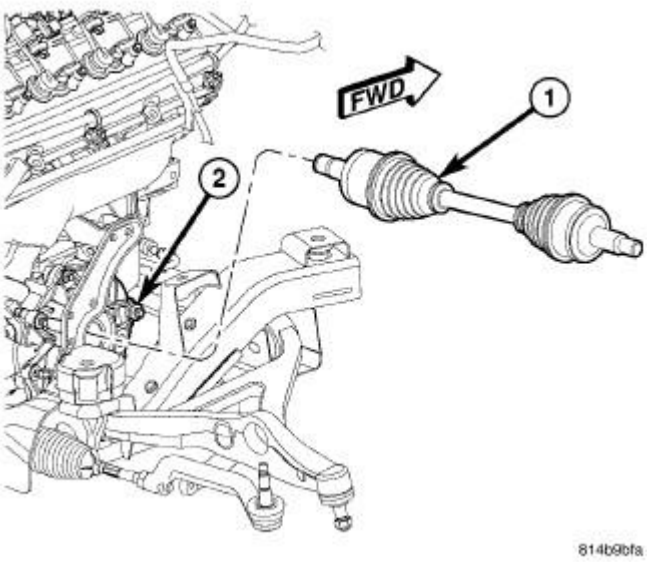

Fig. 2: Removing/Installing Right Halfshaft
Courtesy of CHRYSLER GROUP, LLC

1 - RIGHT HALFSHAFT ASSEMBLY
2 - FRONT AXLE ASSEMBLY

The inner cross-groove joint of the left halfshaft assembly is splined to the front axle disconnect and retained with a snap ring. The right halfshaft is splined to the front axle assembly and retained with a snap ring. The outer CV joint has a stub shaft that is splined into the wheel hub and retained by a steel hub nut.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HALF SHAFT

VEHICLE INSPECTION

1. Check for grease in the vicinity of both the inboard and outboard joints. This is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged outer CV or inner cross-groove joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- Damaged joint due to contamination caused by a torn seal boot on the inner or outer joint of the half shaft assembly.
- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft CV joint.
- A worn front axle disconnect shaft bearing (AWD Models).

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner cross-groove joint.
- A worn intermediate shaft bearing (AWD Models).
- Improper wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. Refer to **STANDARD PROCEDURE** .
- A worn intermediate shaft bearing (AWD Models).
- Improper tire and/or wheel runout due to a bent rim or damaged tire. Refer to **DIAGNOSIS AND TESTING** .

SPECIFICATIONS

REMOVAL

REMOVAL

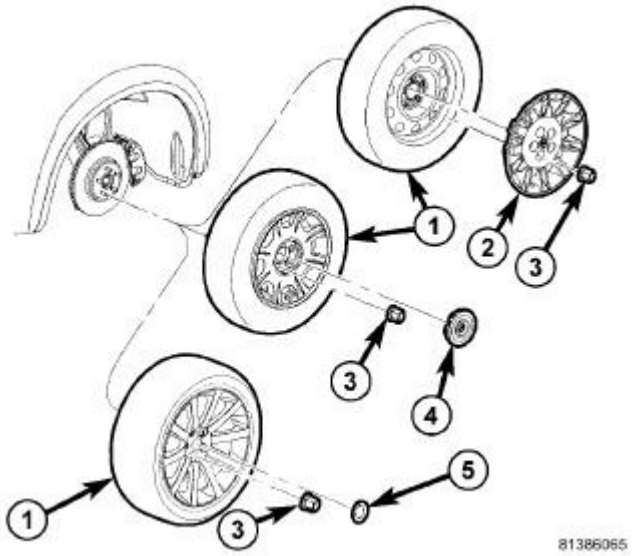

Fig. 3: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

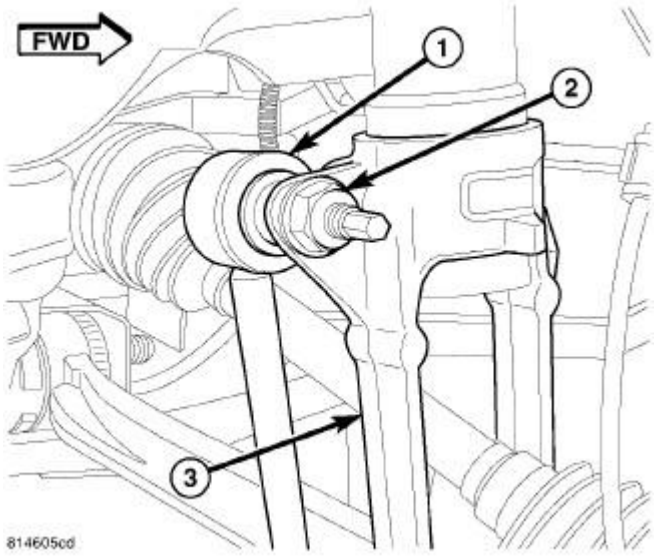

Fig. 4: Locating Stabilizer Link Attachment AT Shock Clevis

Courtesy of CHRYSLER GROUP, LLC

3. While holding link ball joint stem from rotating, remove nut (2) fastening stabilizer link (1) to shock clevis bracket (3). Slide link ball joint stem from clevis bracket.

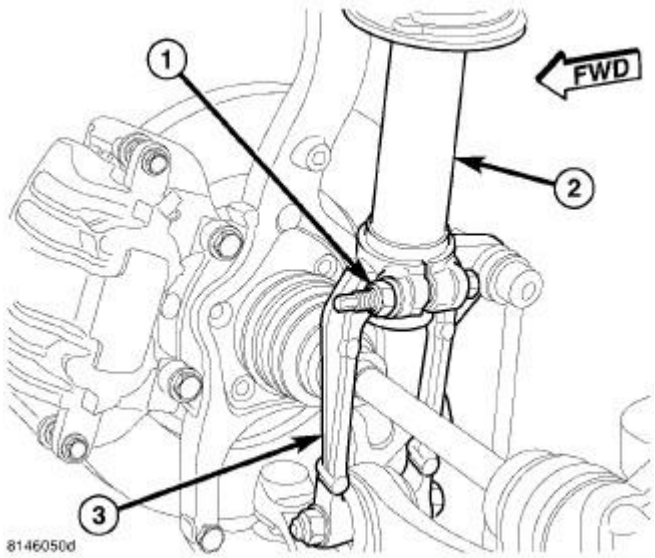

Fig. 5: Removing/Installing Shock Clevis Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove nut and pinch bolt (1) fastening clevis bracket (3) to bottom of shock assembly (2).

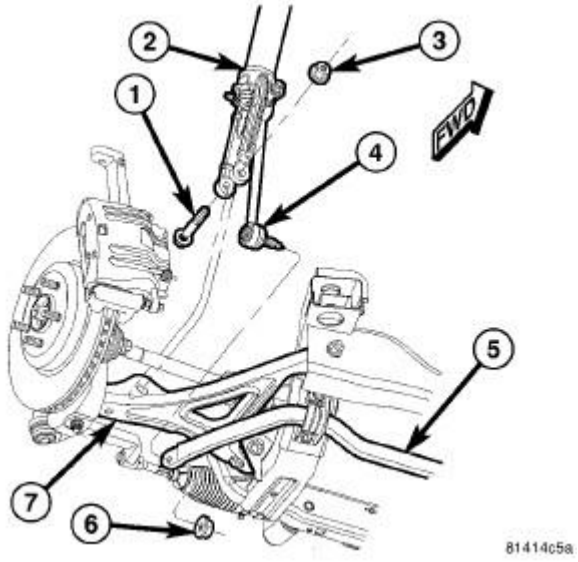

Fig. 6: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (3) and bolt (1) attaching shock clevis bracket (2) to lower control arm (7).

6. Pull lower end of clevis bracket outward away from lower control arm bushing, then slide it off shock assembly. It may be necessary to use an appropriate prying tool to spread clamp area of clevis bracket allowing removal from shock assembly.

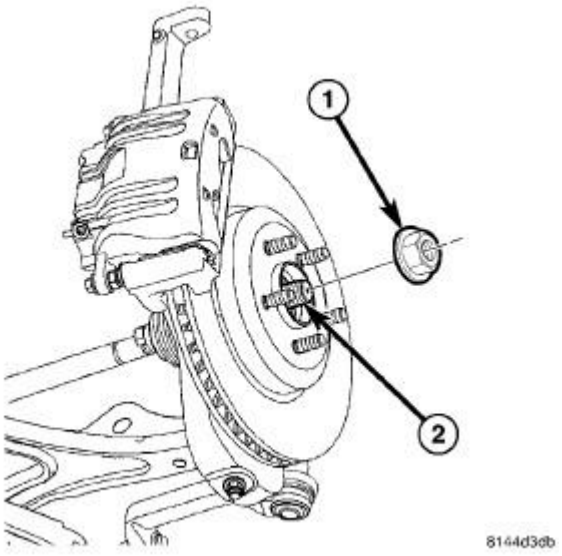

Fig. 7: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

7. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from axle half shaft (2).

NOTE: **In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before mounting bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.**

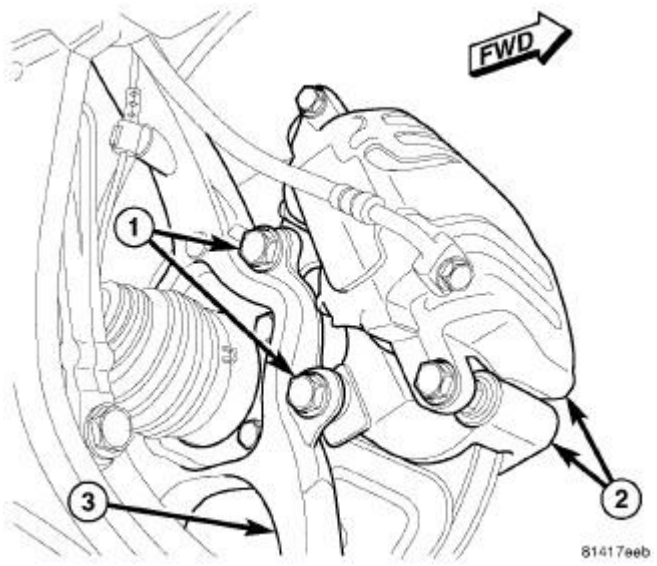

Fig. 8: Locating Front Caliper Bolts AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

8. Remove two bolts (1) securing disc brake caliper and adapter (2) to knuckle (3).
9. Remove disc brake caliper and adapter (2) from knuckle (3) as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

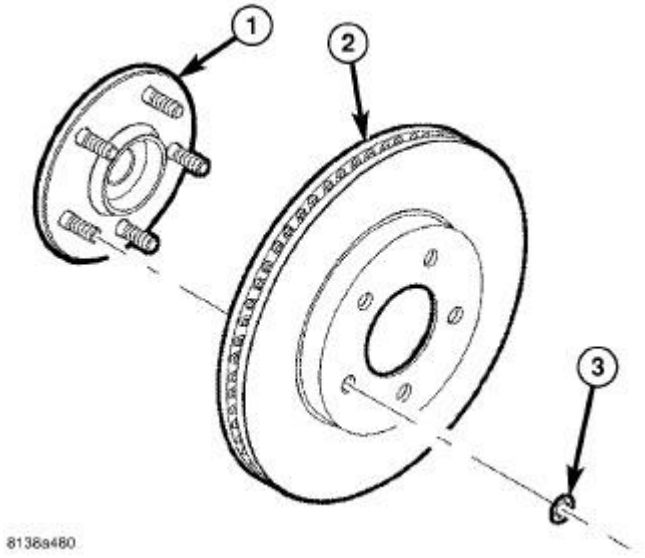

Fig. 9: Locating Clips Retaining Brake Rotor
Courtesy of CHRYSLER GROUP, LLC

10. Remove any clips (3) retaining brake rotor (2) to wheel studs.
11. Slide brake rotor (2) off hub and bearing (1).

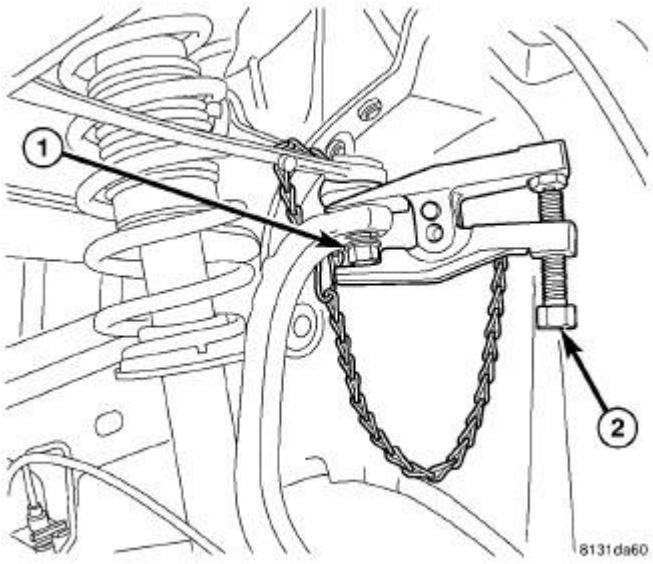

Fig. 10: Using Puller On Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller (special tool #9360, Remover, Ball Joint), into place past seal boot.

12. Using Puller (special tool #9360, Remover, Ball Joint) (2), separate upper ball joint stud (1) from knuckle.
13. Remove tool.
14. Remove nut (1) from end of upper ball joint stud.

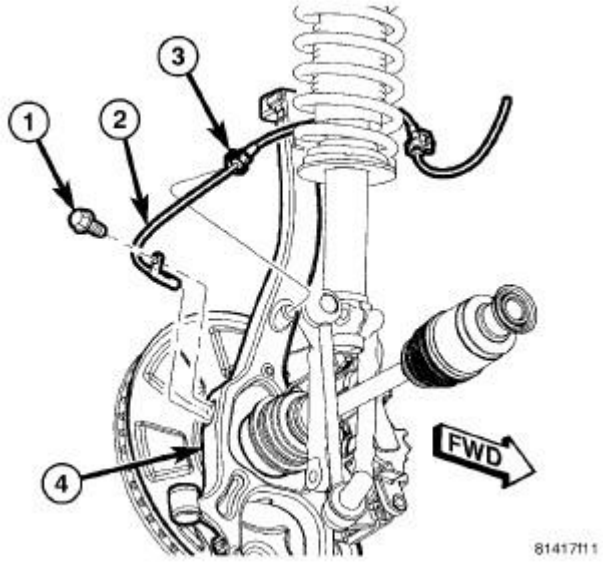

Fig. 11: Wheel Speed Sensor AT Front Knuckle - AWD

Courtesy of CHRYSLER GROUP, LLC

15. Remove clip (3) fastening wheel speed sensor (2) to knuckle (4).

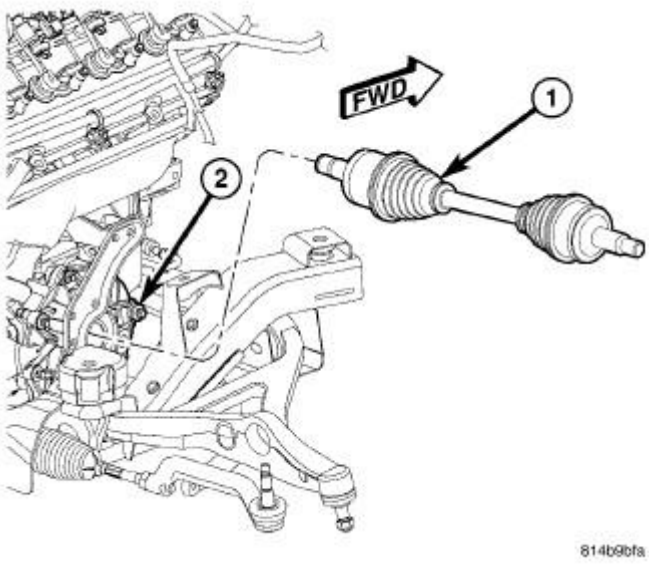

Fig. 12: Removing/Installing Right Halfshaft
Courtesy of CHRYSLER GROUP, LLC

16. Disengage right halfshaft (1) from axle and remove from vehicle.

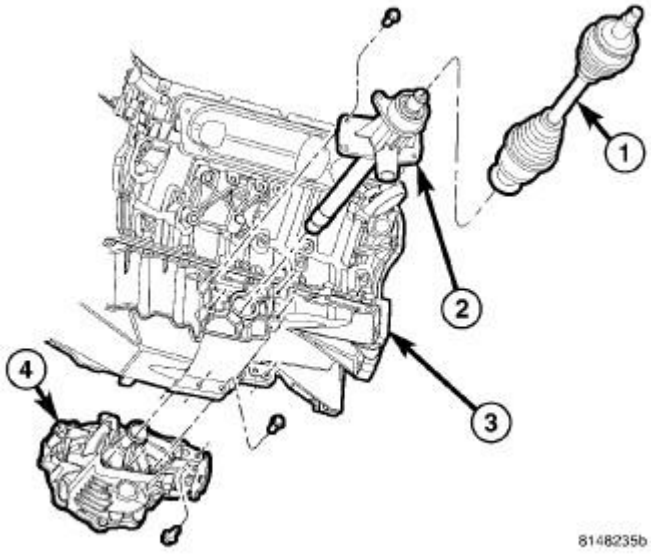

Fig. 13: Front Drive Axle Assembly
Courtesy of CHRYSLER GROUP, LLC

17. Remove left halfshaft (1) from vehicle.

INSTALLATION

INSTALLATION

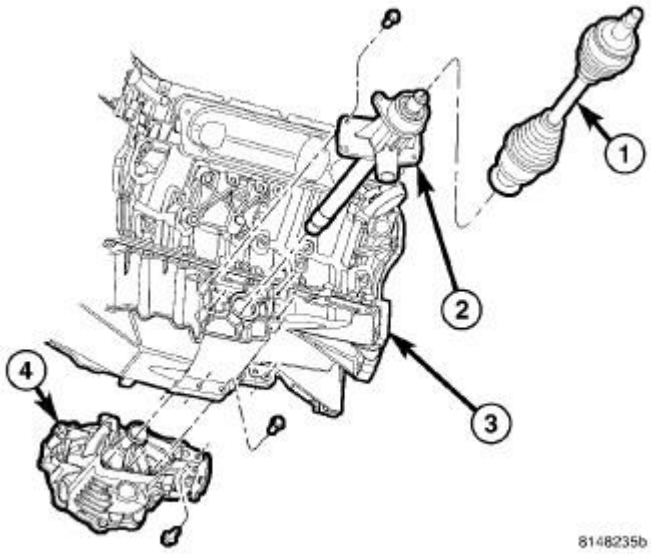

Fig. 14: Front Drive Axle Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Install left halfshaft assembly (1).

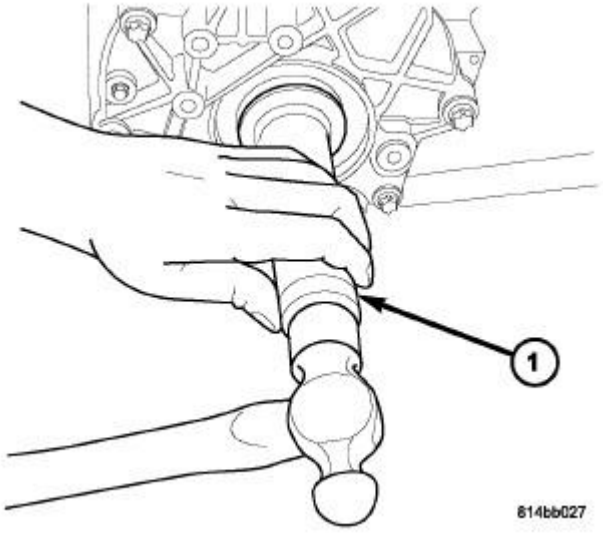

Fig. 15: Installing Axle Seal
Courtesy of CHRYSLER GROUP, LLC

2. Using Seal Installer C-4193A (1), install **new** axle seal.

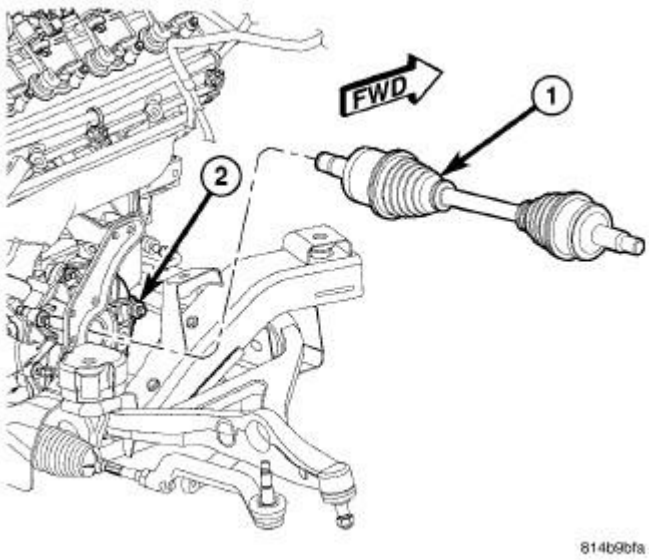

Fig. 16: Removing/Installing Right Halfshaft
Courtesy of CHRYSLER GROUP, LLC

3. Install right halfshaft assembly (1).

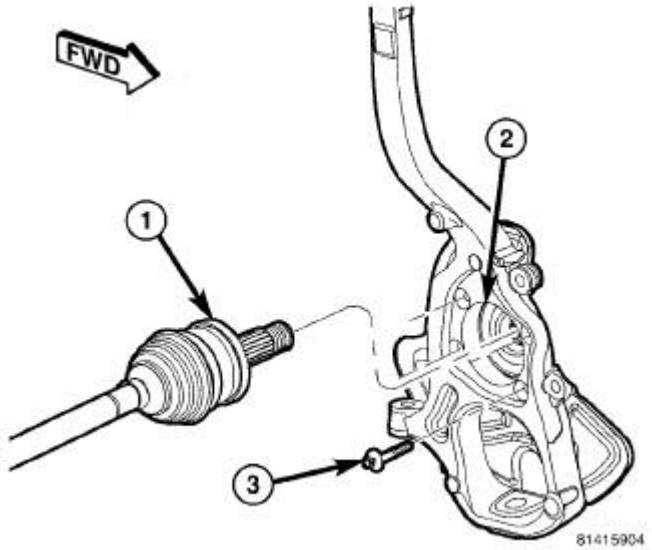

Fig. 17: Locating Halfshaft AT Hub/Bearing Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Install halfshaft (1) into hub/bearing assembly (2).

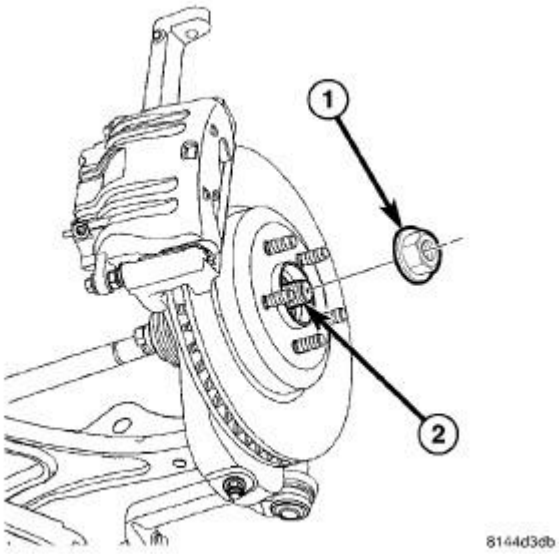

Fig. 18: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

5. Loosely install halfshaft hub nut (1), and do not tighten at this time.

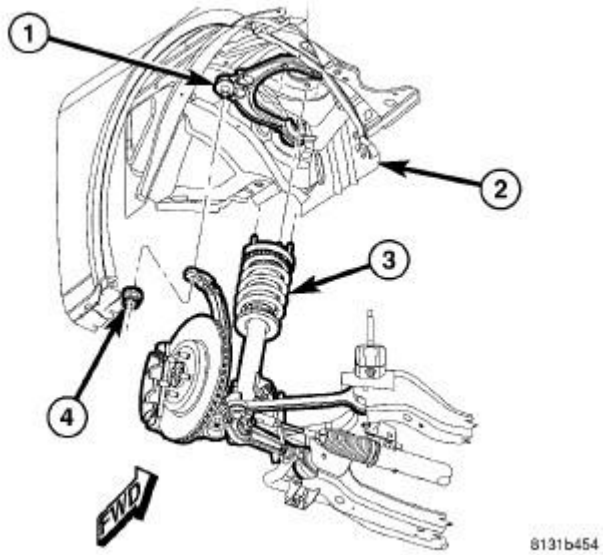

Fig. 19: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

6. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn) torque.

NOTE: **Inspect brake shoes (pads) before installation. Refer to HYDRAULIC/MECHANICAL .**

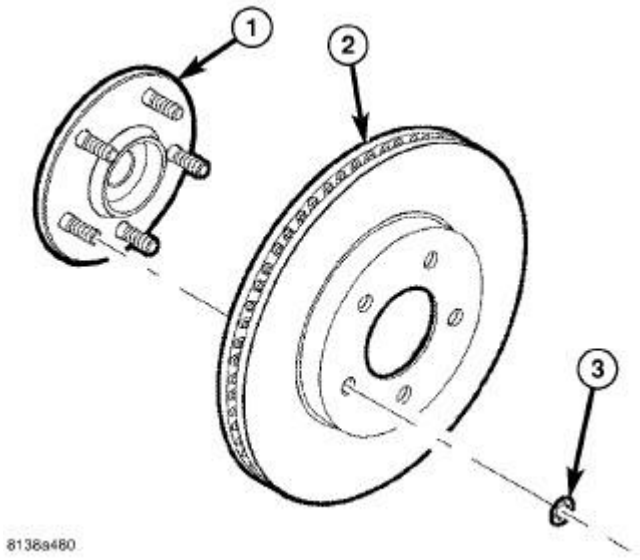

Fig. 20: Locating Clips Retaining Brake Rotor
Courtesy of CHRYSLER GROUP, LLC

7. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
8. Install brake rotor (2) over studs on hub and bearing.

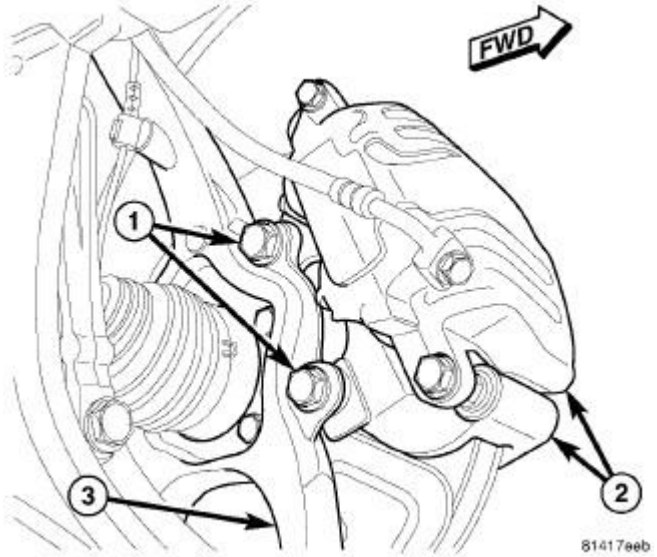

Fig. 21: Locating Front Caliper Bolts AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Install disc brake caliper and adapter assembly (2) over brake rotor.
10. Install mounting bolts (1) securing caliper adapter (2) to knuckle (3). Tighten bolts to 169 N.m (125 ft. lbs.) torque.

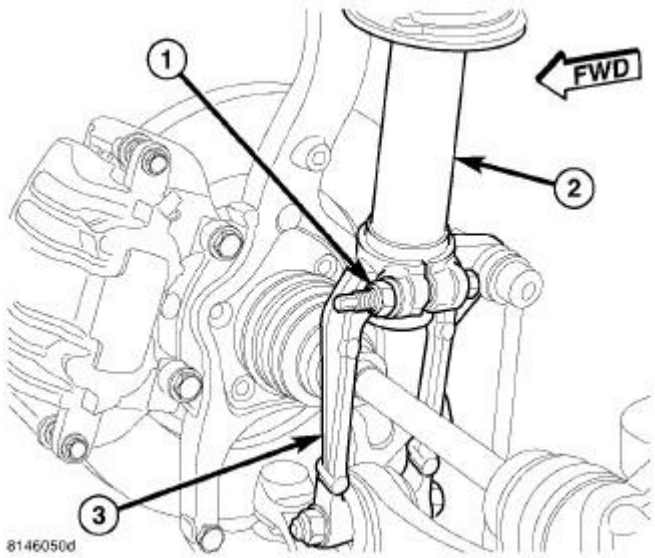

Fig. 22: Removing/Installing Shock Clevis Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Pull lower end of shock assembly outward, then slide clevis bracket (3) onto lower end. Slide clevis bracket onto shock assembly until bracket contacts collar on shock housing (2).
12. Install pinch bolt and nut (1) fastening clevis bracket (3) to bottom of shock assembly (2). Install pinch bolt from rear. **Do not tighten at this time.**

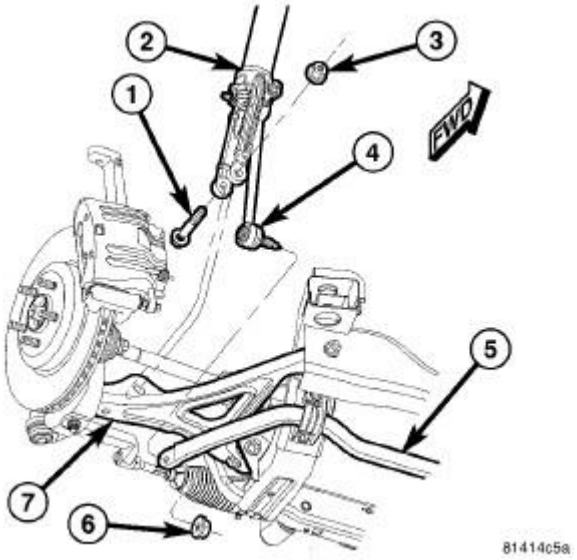

Fig. 23: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

13. Slide clevis bracket (2) over bushing mounted in lower control arm (7).
14. Install bolt (1) and nut (3) attaching shock clevis bracket (2) to lower control arm (7). **Do not tighten at this time.**

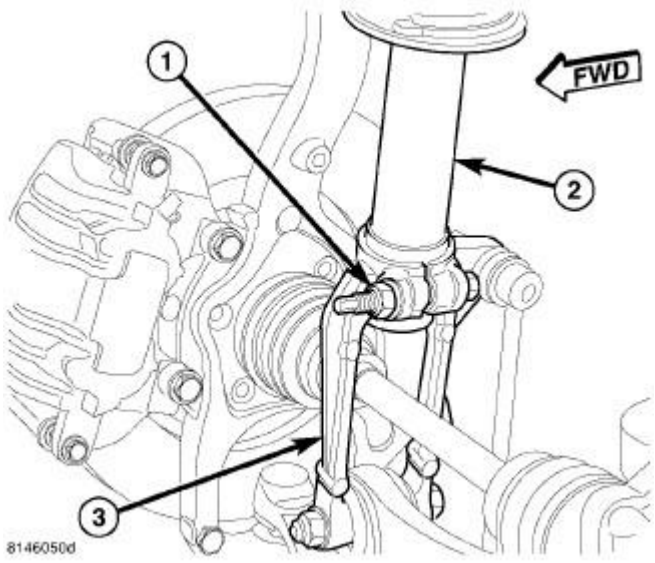

Fig. 24: Removing/Installing Shock Clevis Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

15. Tighten pinch bolt (1) attaching clevis bracket to shock assembly to 61 N.m (45 ft. lbs.) torque.

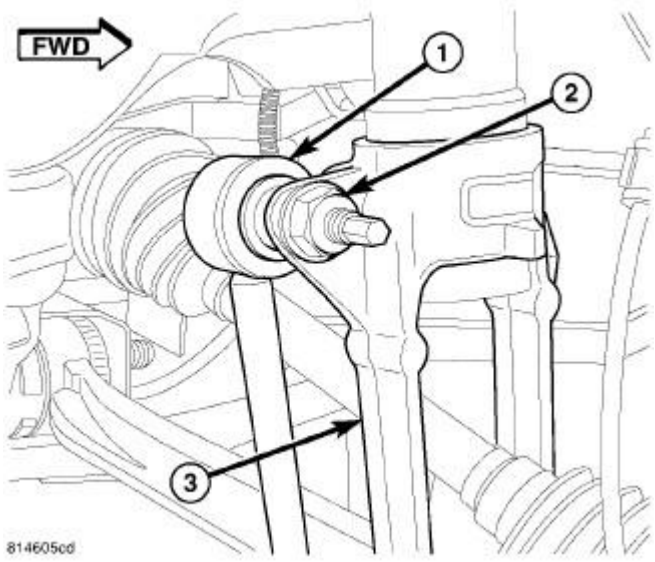

Fig. 25: Locating Stabilizer Link Attachment AT Shock Clevis
Courtesy of CHRYSLER GROUP, LLC

16. Slide stabilizer link ball joint stem into clevis bracket. Install nut (2) fastening link to clevis bracket (3). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 146 N.m (108 ft. lbs.) torque.

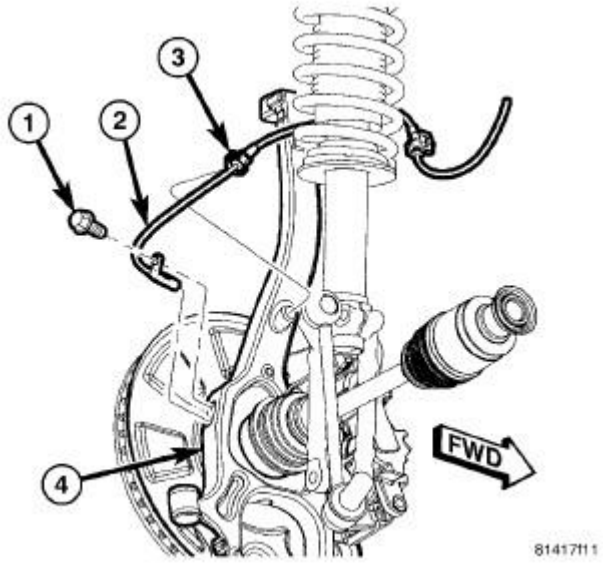

Fig. 26: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

17. Attach wheel speed sensor cable routing clip (3) at knuckle (4).

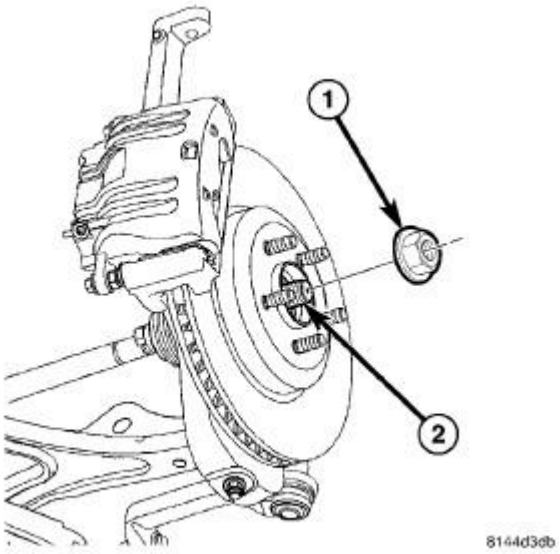

Fig. 27: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

18. Install hub nut (1) on end of axle half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.) torque.

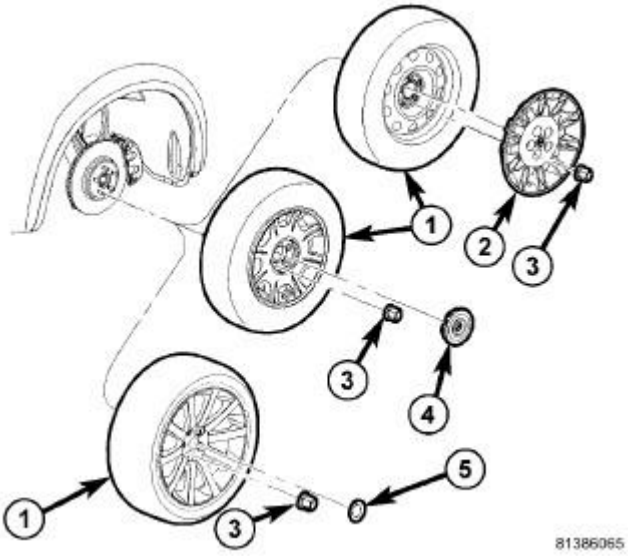

Fig. 28: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

19. Install tire and wheel assembly (1). Refer to **INSTALLATION** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) torque.
20. Lower vehicle.

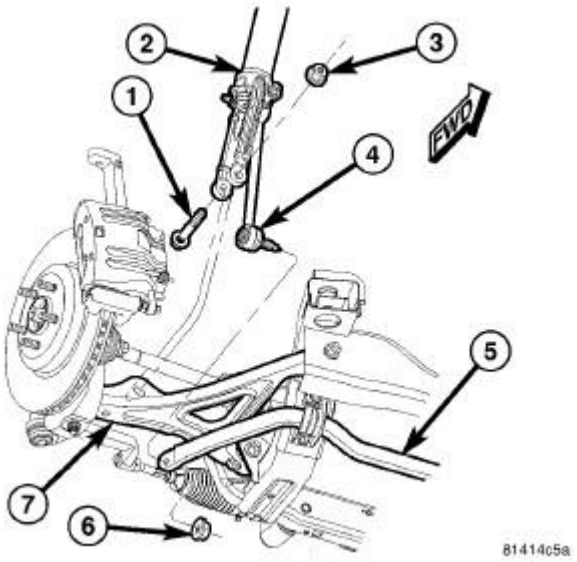

Fig. 29: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: When tightening lower shock clevis mounting bolt, do not attempt rotating bolt. Bolt shaft is serrated. Turn nut only.

21. Tighten lower shock clevis bracket bolt nut (3) to 174 N.m (128 ft. lbs.) torque.

SPECIAL TOOLS

SPECIAL TOOLS

	9360 - Remover, Ball Joint (Originally Shipped In Kit Number(s) 9329, 9515, 9516, 9516-CAN, 9517, 9517-CAN, 9518, 9519, 9540, 9541.) C-4975A - Installer, Axle Clamp

BOOT, DRIVE SHAFT, INNER

REMOVAL

REMOVAL

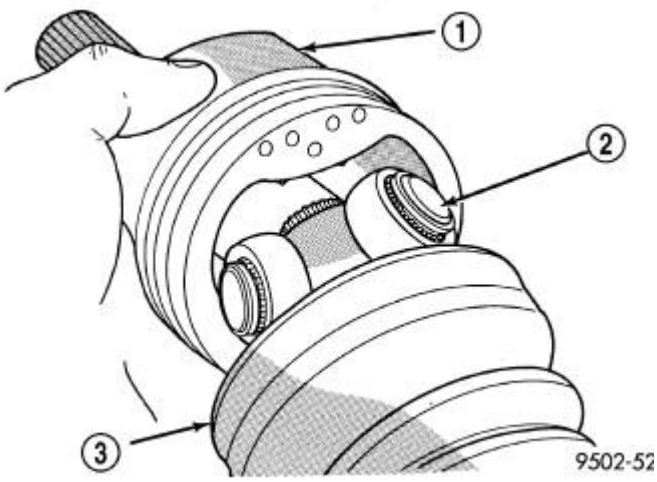

Fig. 30: Installing Tripod Housing On Spider Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove large boot clamp which retains inner tripod joint sealing boot to tripod joint housing and discard. Remove small clamp which retains inner tripod joint sealing boot to interconnecting shaft and discard. Remove the sealing boot (3) from the tripod housing and slide it down the interconnecting shaft.

   CAUTION: When removing the tripod joint housing from the spider assembly, hold the bearings in place on the spider trunnions to prevent the bearings from falling away.

2. Slide the tripod joint housing (1) off the spider assembly and the interconnecting shaft.

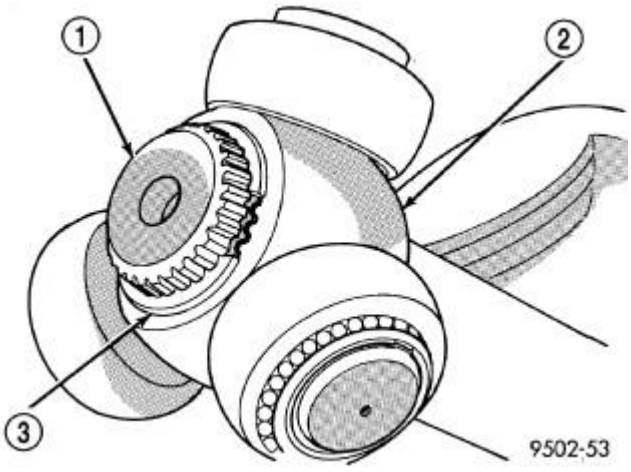

Fig. 31: Spider Assembly Retaining Snap Ring Installed
Courtesy of CHRYSLER GROUP, LLC

3. Remove snap ring (3) which retains spider assembly to interconnecting shaft (1). **Do not hit the outer tripod bearings in an attempt to remove spider assembly from interconnecting**

shaft.

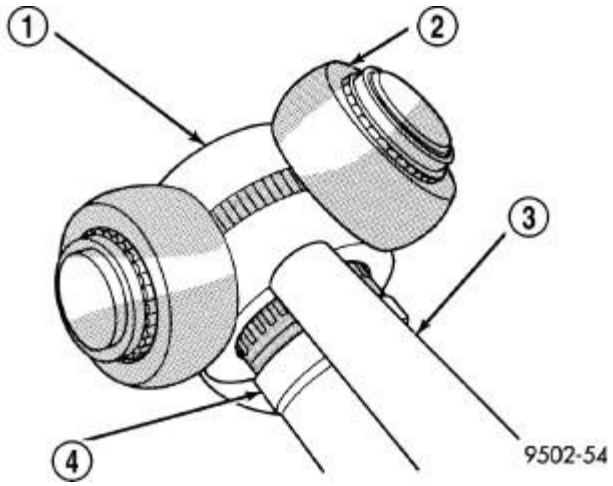

Fig. 32: Spider Assembly Removal From Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the spider assembly (1) from interconnecting shaft (4). If spider assembly will not come off interconnecting shaft by hand, it can be removed by tapping spider assembly with a brass drift (3).
5. Slide sealing boot off interconnecting shaft.
6. Thoroughly clean and inspect spider assembly, tripod joint housing, and interconnecting shaft for any signs of excessive wear. **If any parts show signs of excessive wear, the driveshaft assembly will require replacement. Component parts of these driveshaft assemblies are not serviceable.**

INSTALLATION

INSTALLATION

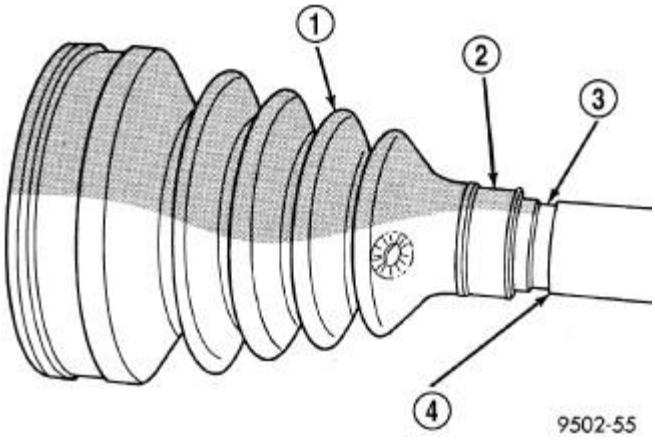

Fig. 33: Sealing Boot Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Slide inner tripod joint seal boot retaining clamp, onto interconnecting shaft. Then, slide the replacement inner tripod joint sealing boot (1) onto the interconnecting shaft. **Inner tripod joint seal boot MUST be positioned on interconnecting shaft, so the raised bead on the inside of the seal boot is in groove (3) on interconnecting shaft (4).**

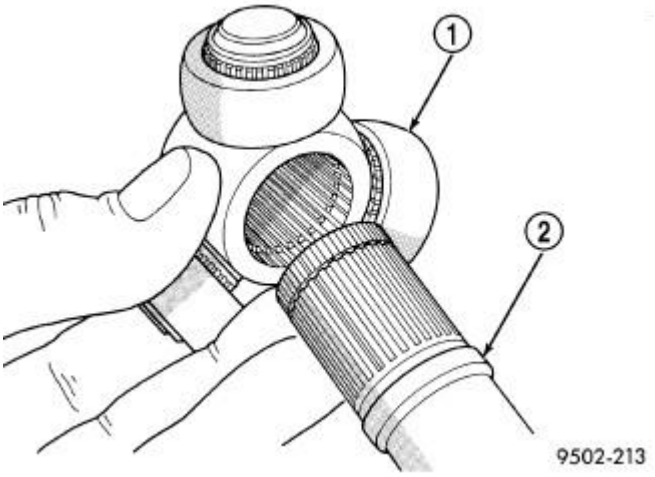

Fig. 34: Spider Assembly Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Install spider assembly (1) onto interconnecting shaft (2). Spider assembly must be installed on interconnecting shaft far enough to fully install spider retaining snap ring.

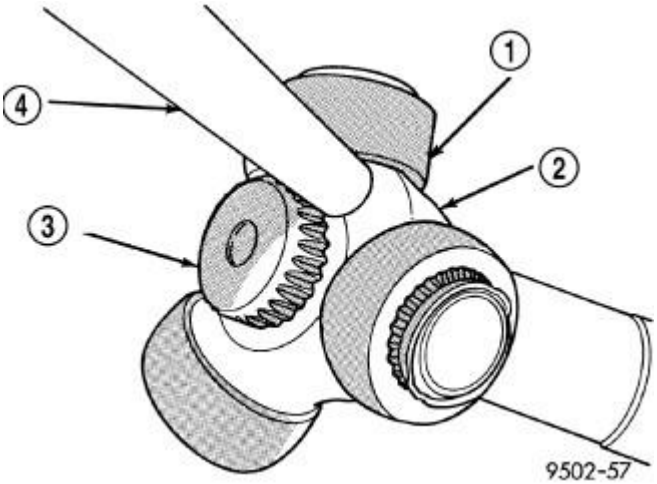

Fig. 35: Installing Spider Assembly On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

3. If spider assembly (2) will not fully install on interconnecting shaft by hand, it can be installed by tapping the spider body with a brass drift (4). **Do not hit the outer tripod bearings in an attempt to install spider assembly on interconnecting shaft.**

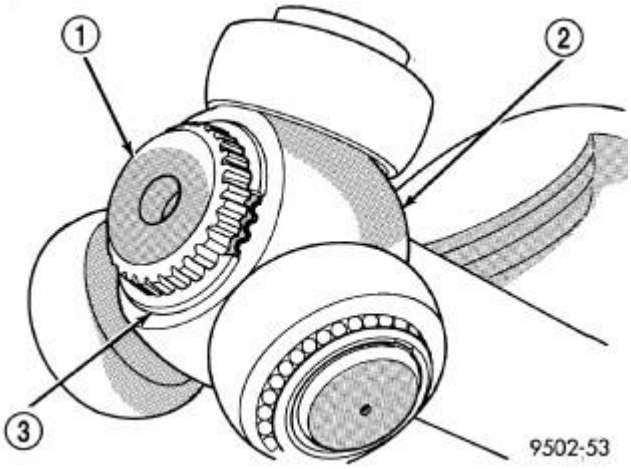

Fig. 36: Spider Assembly Retaining Snap Ring Installed
Courtesy of CHRYSLER GROUP, LLC

4. Install the spider assembly to interconnecting shaft retaining snap ring (3) into groove on end of interconnecting shaft. Be sure the snap ring is fully seated into groove on interconnecting shaft.

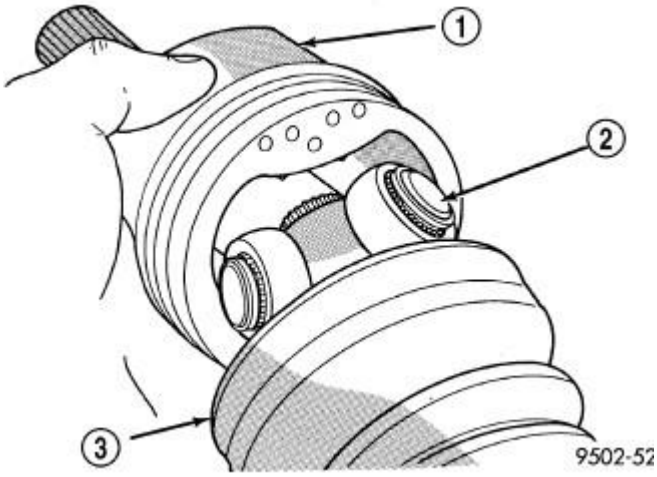

Fig. 37: Installing Tripod Housing On Spider Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Distribute 1/2 the amount of grease provided in the seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into tripod housing. Put the remaining amount into the sealing boot.
6. Align tripod housing (1) with spider assembly (2) and then slide tripod housing over spider assembly and interconnecting shaft.

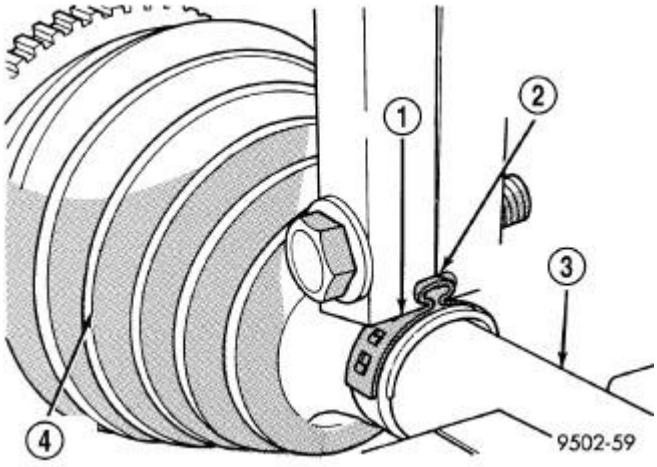

Fig. 38: Sealing Boot Retaining Clamp Installed
Courtesy of CHRYSLER GROUP, LLC

7. Install inner tripod joint seal boot to interconnecting shaft clamp evenly on sealing boot.
8. Clamp sealing boot (4) onto interconnecting shaft (3) using Crimping tool (special tool #C-4975A, Installer, Axle Clamp) and the following procedure. Place Crimping tool C-4975A over bridge of clamp. Tighten nut on Crimping tool (special tool #C-4975A, Installer, Axle Clamp) until jaws on tool (2) are closed completely together, face to face.

CAUTION: Seal must not be dimpled, stretched or out of shape in any way. If seal is NOT shaped correctly, equalize pressure in seal and shape it by hand.

9. Position sealing boot into the tripod housing retaining groove. Install seal boot retaining clamp evenly on sealing boot.

CAUTION: The following positioning procedure determines the correct air pressure inside the inner tripod joint assembly prior to clamping the sealing boot to inner tripod joint housing. If this procedure is not done prior to clamping sealing boot to tripod joint housing sealing boot durability can be adversely affected.

CAUTION: When venting the inner tripod joint assembly, use care so inner tripod sealing boot does not get punctured, or in any other way damaged. If sealing boot is punctured, or damaged in any way while being vented, the sealing boot can not be used.

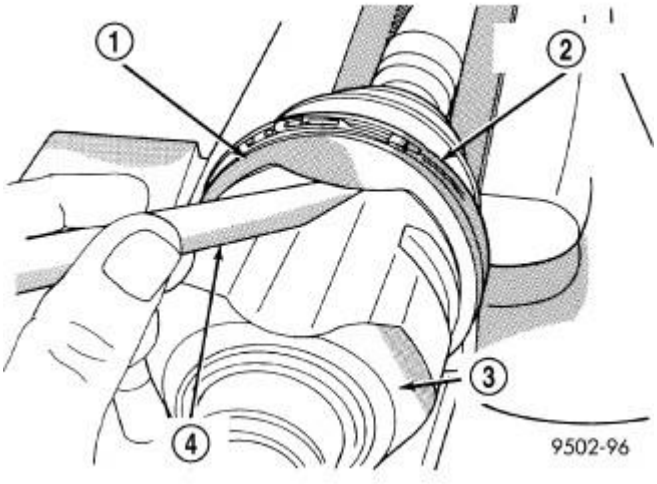

Fig. 39: Trim Stick Inserted For Venting Tripod Joint
Courtesy of CHRYSLER GROUP, LLC

10. Insert a trim stick (4) between the tripod joint (3) and the sealing boot (2) to vent inner tripod joint assembly. **When inserting trim stick between tripod housing and sealing boot ensure trim stick is held flat and firmly against the tripod housing. If this is not done damage to the sealing boot can occur.** If inner tripod joint has a Hytrel (hard plastic) sealing boot, be sure trim stick is inserted between soft rubber insert and tripod housing not the hard plastic sealing boot and soft rubber insert.

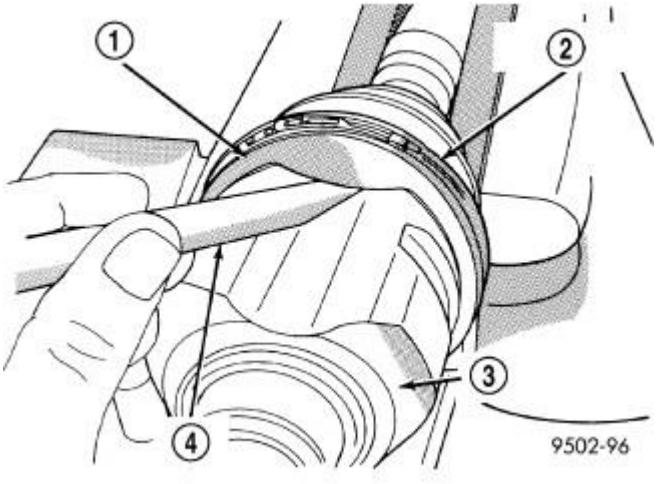

Fig. 40: Trim Stick Inserted For Venting Tripod Joint
Courtesy of CHRYSLER GROUP, LLC

11. With trim stick inserted between sealing boot and tripod joint housing, position the interconnecting shaft so it is at the center of its travel in the tripod joint housing. Remove the trim stick from between the sealing boot and the tripod joint housing. **This procedure will equalize the air pressure in the tripod joint, preventing premature sealing boot failure.**
12. Position trilobal boot to interface with the tripod housing. The lobes of the boot must be properly aligned with the recess's of the tripod housing.

13. Clamp tripod joint sealing boot to tripod joint, using required procedure for type of boot clamp application.

CRIMP TYPE BOOT CLAMP

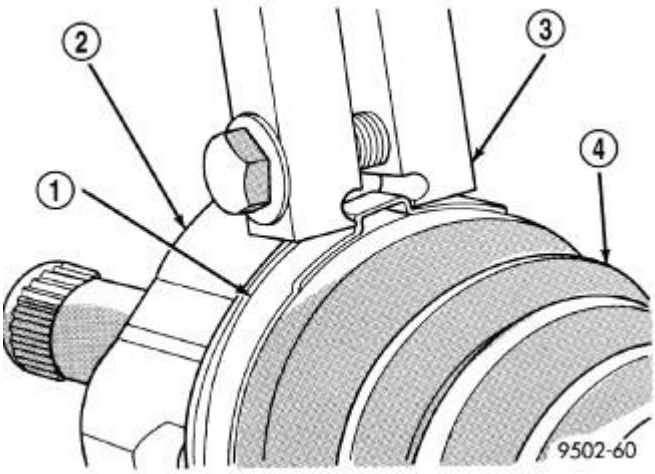

Fig. 41: Crimping Tool Installed On Sealing Boot Clamp
Courtesy of CHRYSLER GROUP, LLC

1. Clamp sealing boot onto tripod housing using Crimping tool (special tool #C-4975A, Installer, Axle Clamp) (3).
2. Place Crimping tool (special tool #C-4975A, Installer, Axle Clamp) over bridge of clamp.

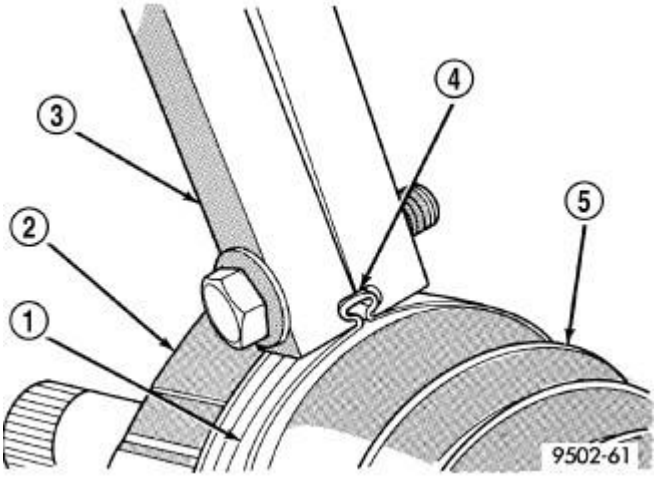

Fig. 42: Sealing Boot Retaining Clamp Installed
Courtesy of CHRYSLER GROUP, LLC

3. Tighten nut on Crimping tool (special tool #C-4975A, Installer, Axle Clamp) (3) until jaws on tool are closed completely together, face to face (4).

LATCHING TYPE BOOT CLAMP

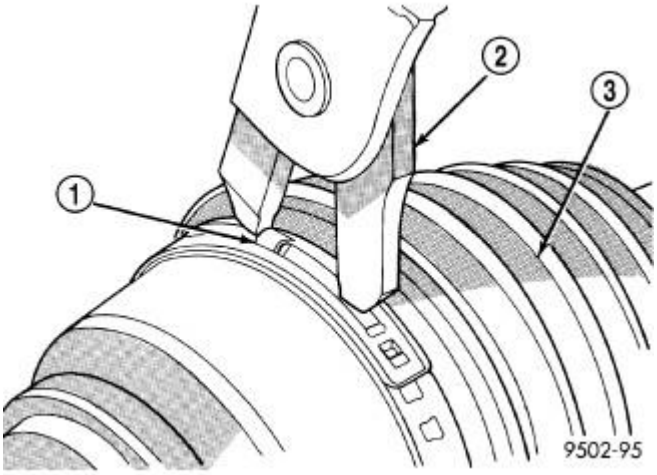

Fig. 43: Clamping Tool Installed On Sealing Boot Clamp
Courtesy of CHRYSLER GROUP, LLC

1. Clamp sealing boot (3) onto tripod housing using clamp locking tool, Snap-On YA3050 (2) or an equivalent.
2. Place prongs of clamp locking tool in the holes of the clamp (1).

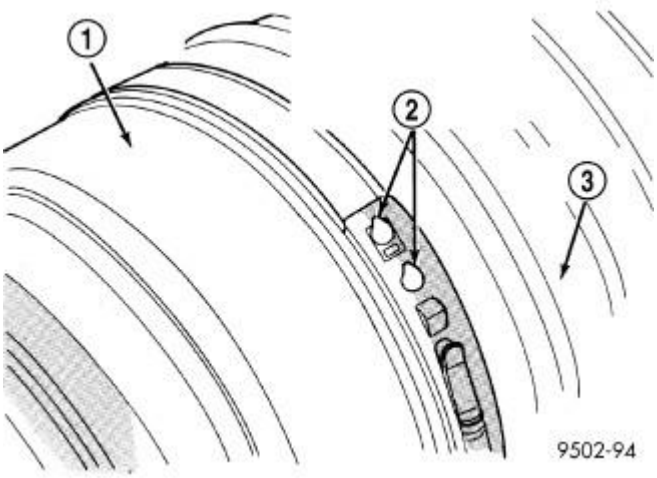

Fig. 44: Sealing Boot Clamp Correctly Installed
Courtesy of CHRYSLER GROUP, LLC

3. Squeeze tool together until top band of clamp is latched behind the two tabs on lower band of clamp (2).

BOOT, DRIVE SHAFT, OUTER

REMOVAL

REMOVAL

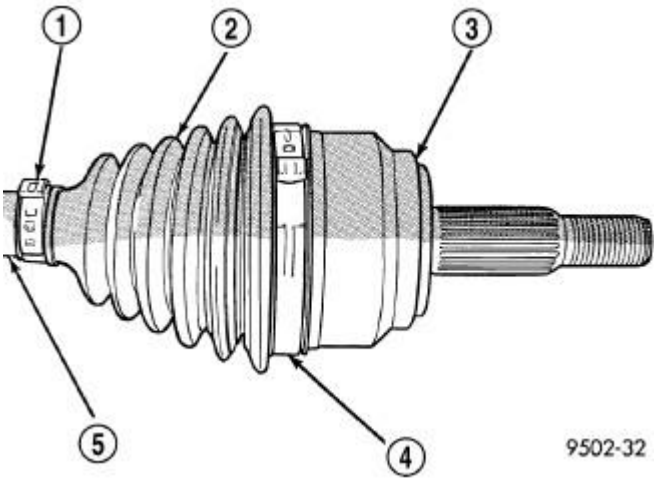

Fig. 45: Outer C/V Joint Seal Boot Clamps
Courtesy of CHRYSLER GROUP, LLC

1. Remove large boot clamp (4) retaining C/V joint sealing boot to C/V joint housing and discard. Remove small clamp (1) that retains outer C/V joint sealing boot to interconnecting shaft and discard. Remove sealing boot from outer C/V joint housing and slide it down interconnecting shaft.
2. Wipe away grease to expose outer C/V joint and interconnecting shaft.

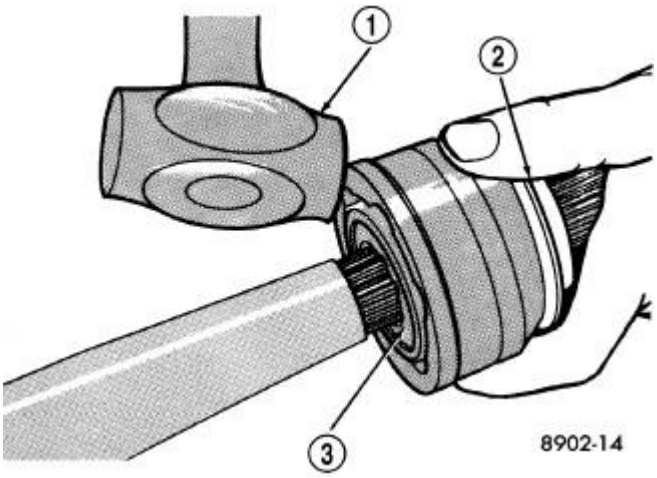

Fig. 46: Outer C/V Joint Removal From Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

3. Remove outer C/V joint from interconnecting shaft using the following procedure: Support interconnecting shaft in a vise **equipped with protective caps on jaws of vise to prevent damage to interconnecting shaft.** Then, using a **soft-faced hammer,** sharply hit the end of the C/V joint housing to dislodge housing from internal circlip on interconnecting shaft. Refer to **Fig. 46**. Then slide outer C/V joint off end of interconnecting shaft, joint may have to be tapped off shaft using a **soft-faced** hammer.

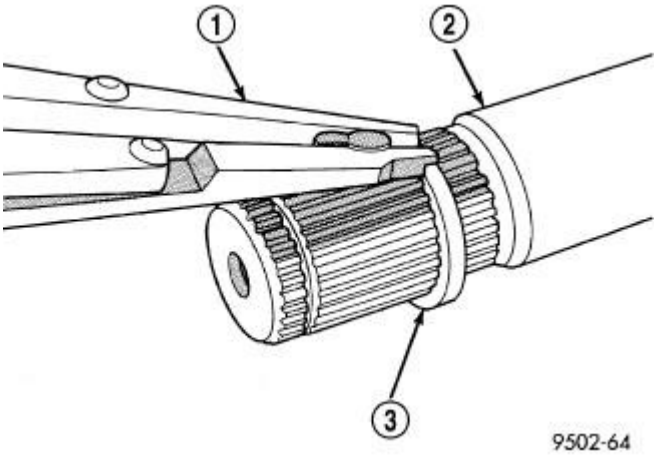

Fig. 47: Circlip Removal From Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove large circlip from the interconnecting shaft (3) before attempting to remove outer C/V joint sealing boot.
5. Slide failed sealing boot off interconnecting shaft.
6. Thoroughly clean and inspect outer C/V joint assembly and interconnecting joint for any signs of excessive wear. **If any parts show signs of excessive wear, the driveshaft assembly will require replacement. Component parts of these driveshaft assemblies are not serviceable.**

INSTALLATION

INSTALLATION

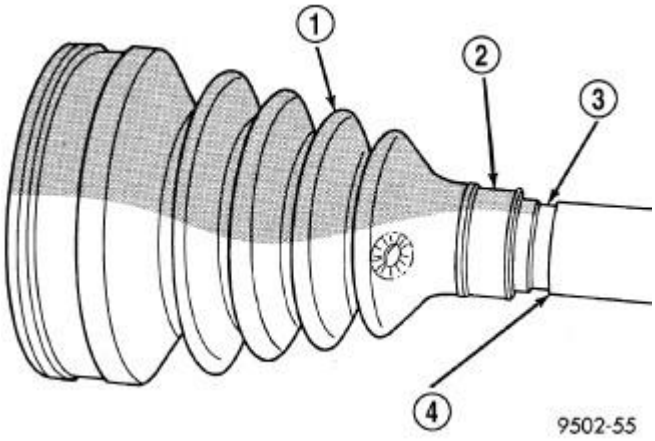

Fig. 48: Sealing Boot Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Slide new sealing boot (1) to interconnecting shaft retaining clamp onto interconnecting shaft. Slide the outer C/V joint assembly sealing boot onto the interconnecting shaft. **Seal boot MUST be positioned on interconnecting shaft so the raised bead on the inside of the seal boot**

is in groove on interconnecting shaft.

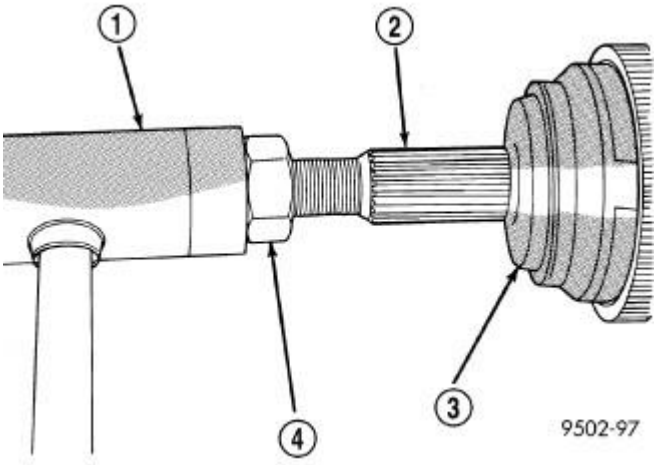

Fig. 49: Outer C/V Joint Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Align splines on interconnecting shaft with splines on cross of outer C/V joint assembly and start outer C/V joint onto interconnecting shaft.
3. Install outer C/V joint assembly onto interconnecting shaft by using a **soft-faced** hammer (1) and tapping end of stub axle (with nut installed) until outer C/V joint is fully seated on interconnecting shaft.

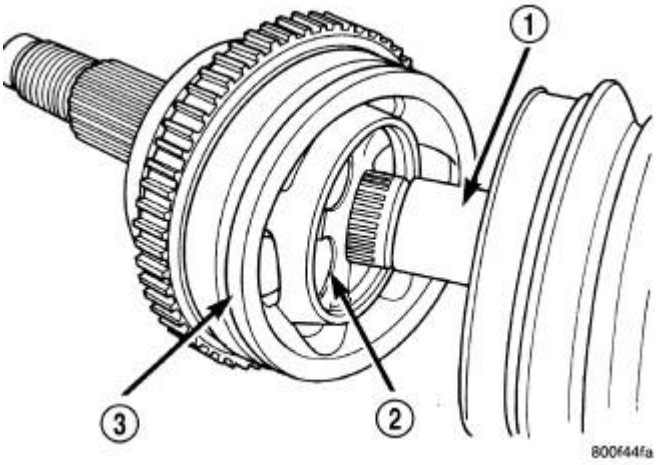

Fig. 50: Outer C/V Joint Correctly Installed On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Outer C/V joint assembly must be installed on interconnecting shaft until cross of outer C/V joint assembly is seated against circlip on interconnecting shaft (1).

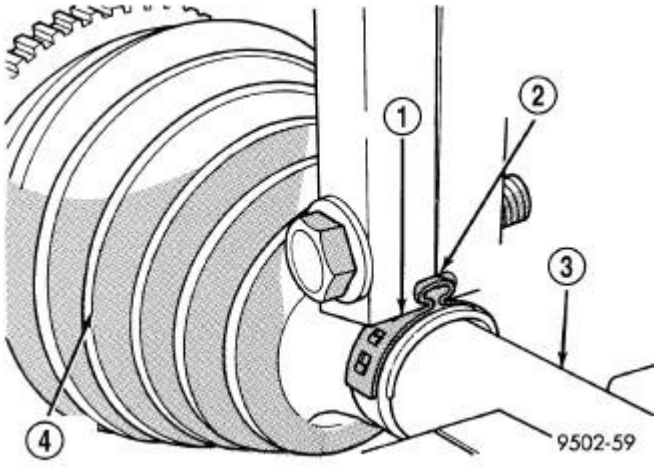

Fig. 51: Sealing Boot Retaining Clamp Installed
Courtesy of CHRYSLER GROUP, LLC

5. Distribute 1/2 the amount of grease provided in seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into outer C/V joint assembly housing. Put the remaining amount into the sealing boot.
6. Install outer C/V joint sealing boot to interconnecting shaft clamp evenly on sealing boot.
7. Clamp sealing boot onto interconnecting shaft using crimper (special tool #C-4975A, Installer, Axle Clamp) and the following procedure. Place crimping tool C-4975A over bridge of clamp. Tighten nut on crimping tool (special tool #C-4975A, Installer, Axle Clamp) until jaws on tool are closed completely together, face to face (2).

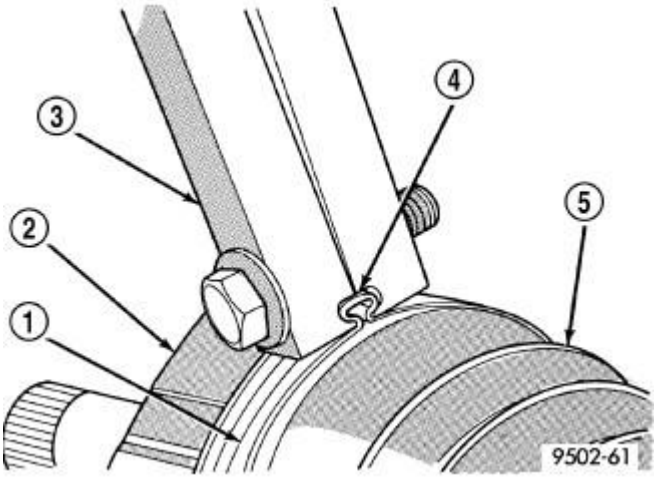

Fig. 52: Sealing Boot Retaining Clamp Installed
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Seal must not be dimpled, stretched, or out-of-shape in any way. If seal is NOT shaped correctly, equalize pressure in seal and shape it by hand.

8. Position outer C/V joint sealing boot into its retaining groove on outer C/V joint housing. Install sealing boot to outer C/V joint retaining clamp evenly on sealing boot.
9. Clamp sealing boot onto outer C/V joint housing using Crimper (special tool #C-4975A, Installer, Axle Clamp) (3) and the following procedure. Place crimping tool (special tool #C-4975A, Installer, Axle Clamp) over bridge of clamp. Tighten nut on crimping tool (special tool #C-4975A, Installer, Axle Clamp) until jaws on tool are closed completely together, face to face (2).

SUSPENSION

Front Suspension & Wheel Alignment - Chrysler 300

STANDARD PROCEDURE

STANDARD PROCEDURE - LUBRICATION

There are no serviceable lubrication points on the front or rear suspension. The ball joints are sealed-for-life and require no maintenance.

SPECIAL TOOLS

SPECIAL TOOLS

	9320 - Remover/Installer, Ball Joint (Originally Shipped In Kit Number(s) 9329, 9515, 9516, 9516-CAN, 9517, 9517-CAN, 9518, 9519, 9540, 9541.)
	9320-1 - Plate, Ball Joint Remover (Originally Shipped In Kit Number(s) 9329, 9515, 9516, 9516-CAN, 9517, 9517-CAN, 9518, 9519, 9540, 9541.)

FRONT

DESCRIPTION

NON SRT

The front suspension for both All-Wheel-Drive (AWD) and Non SRT Rear-Wheel-Drive (RWD)

vehicles is a long and short arm design.

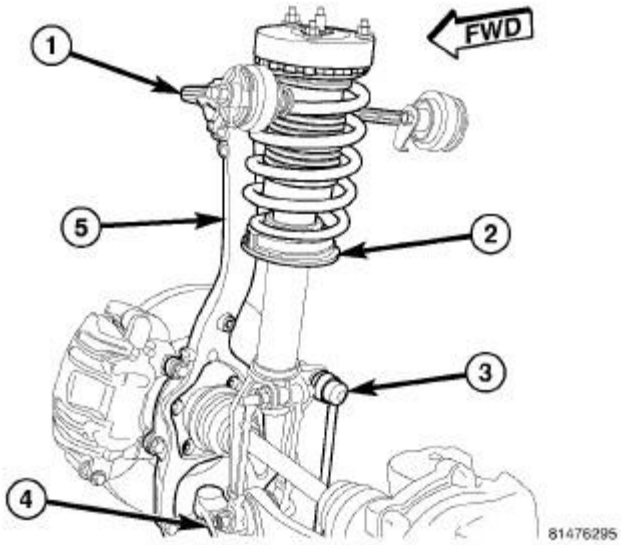

Fig. 1: Front Suspension - AWD
Courtesy of CHRYSLER GROUP, LLC

Each side of the AWD front suspension includes the following components:

- Hub And Bearing
- Knuckle (5)
- Lower Control Arm (4)
- Shock Assembly (2)
- Stabilizer Bar and Link (3)
- Upper Control Arm (1)

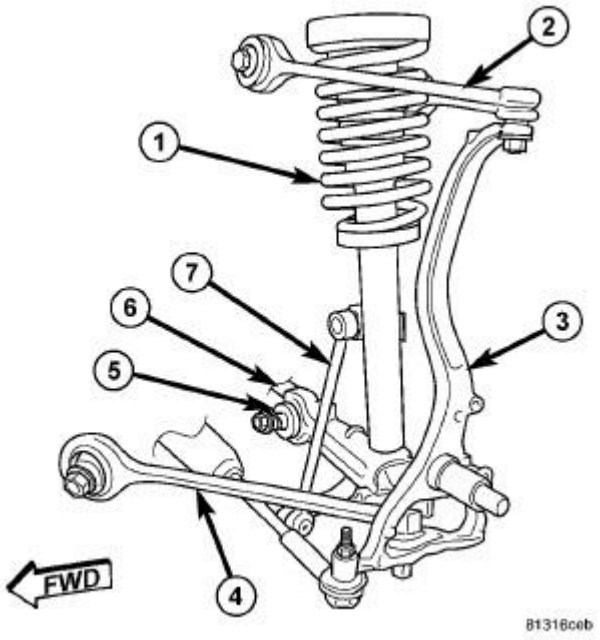

Fig. 2: Front Suspension
Courtesy of CHRYSLER GROUP, LLC

Each side of the Non SRT RWD front suspension includes the following components:

- Hub And Bearing
- Knuckle (3)
- Lower Control Arm (5)
- Shock Assembly (1)
- Stabilizer Bar and Link (7)
- Tension Strut (4)
- Upper Control Arm (2)

SRT

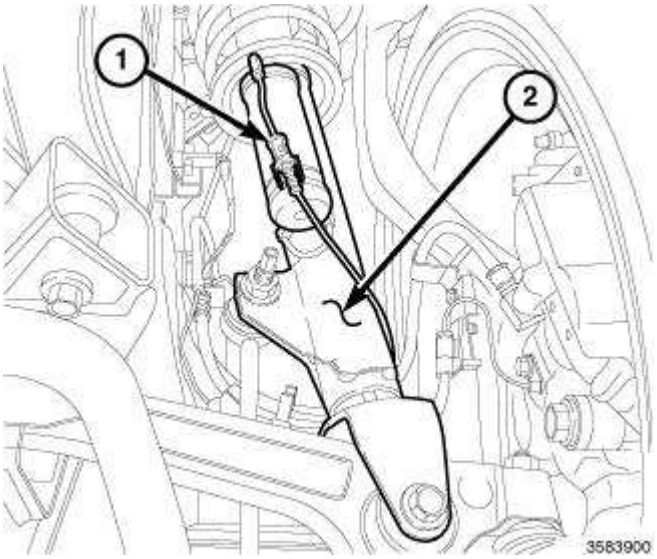

Fig. 3: Front Shock Assembly & Shock Solenoid Assembly
Courtesy of CHRYSLER GROUP, LLC

The SRT front suspension is part of an Active Damping System (ADS). The ADS includes unique shock absorbers, an Active Damping Control Module (ADCM), and three accelerometers that work together to modify the ride of the suspension over varying road conditions.

The Active Damping System (ADS) front shock assembly (2) is similar to a conventional coil over shock with the addition of a shock solenoid assembly (1) mounted on the side of its body with a three wire harness connector attached to it. The ADS shock assembly is serviced the same as a conventional shock absorber, with the addition of disconnecting the ADS harness connector from behind the splash shield.

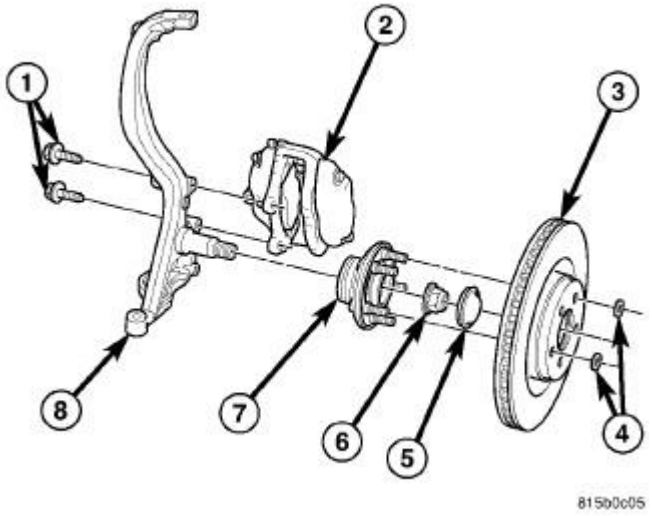

Fig. 4: Exploded View Of Front Disc Brakes - Srt-8
Courtesy of CHRYSLER GROUP, LLC

The SRT front suspension is similar to the standard front suspension but some components have been modified for unique ride, handling, and steering performance. Service of all front suspension components remain the same as the standard components. When components differ, be sure to use only SRT components on SRT vehicles.

The front knuckle (8) for the SRT is different from the standard knuckle. Although similar in appearance, the knuckle has been modified to accept the larger tire and wheel assembly. Also, the mounting bosses for the disc brake caliper have been moved downward to allow for mounting of the Brembo four-piston disc brake caliper (2).

The front stabilizer bar diameter has been increased for the SRT. It is serviced in the same manner as the standard bar.

REMOVAL

REMOVAL

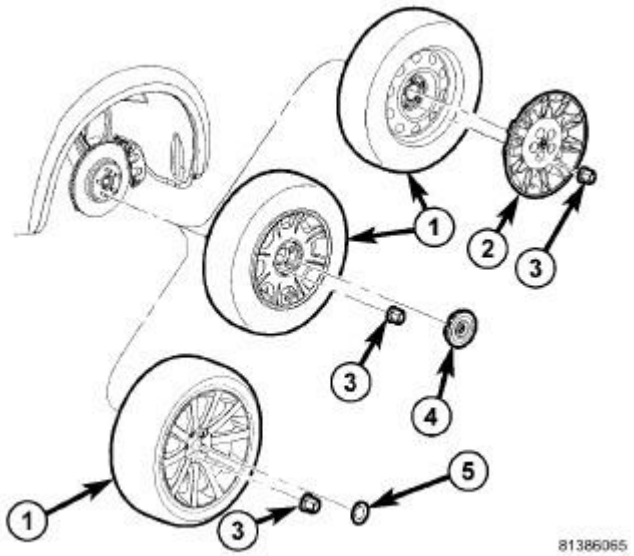

Fig. 5: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

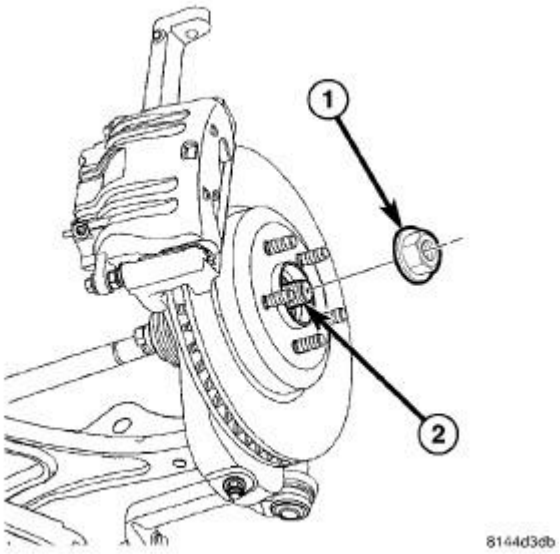

Fig. 6: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the axle half shaft (2).
4. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .

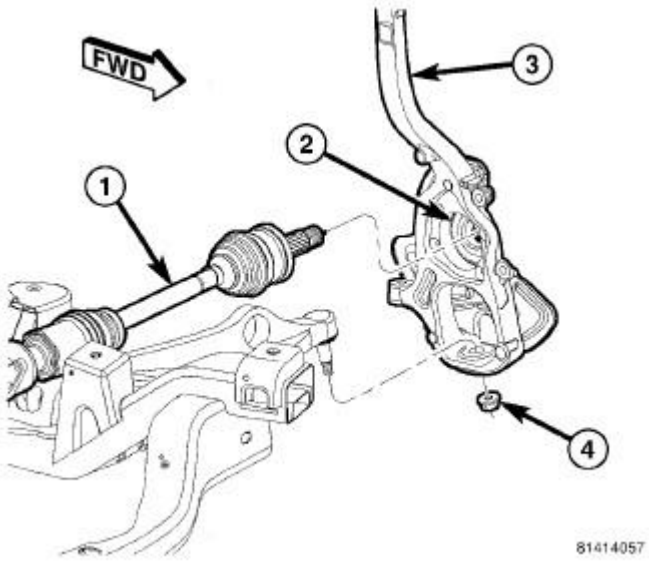

Fig. 7: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

5. Loosen nut (4) attaching lower control arm ball joint stud to knuckle (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

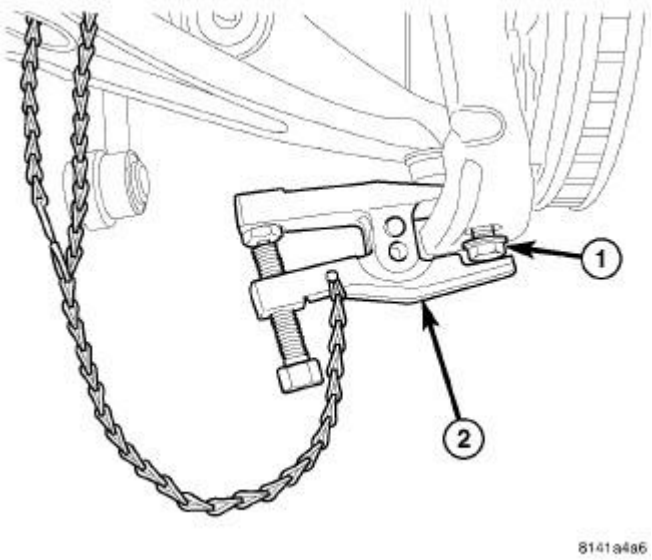

Fig. 8: Using Puller On Lower Ball Joint - AWD
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

6. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate ball joint stud from knuckle.
7. Remove tool.
8. Remove nut (1) from end of ball joint stud.

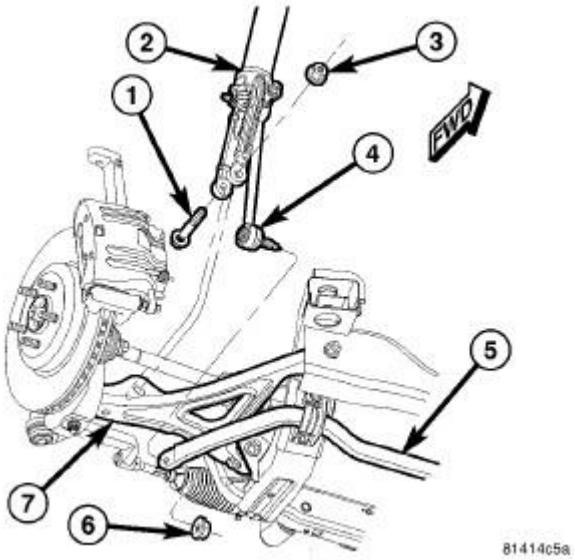

Fig. 9: Shock Attachment AT Lower Control Arm

Courtesy of CHRYSLER GROUP, LLC

9. Back off nut (3) from bolt (1) attaching shock clevis bracket (2) to lower control arm (7) until it is flush with end of bolt.
10. Using a brass drift punch, tap the bolt out of the clevis bracket until bolt serrations clear bracket.
11. Remove nut (3) and bolt (1) for clevis bracket and control arm.

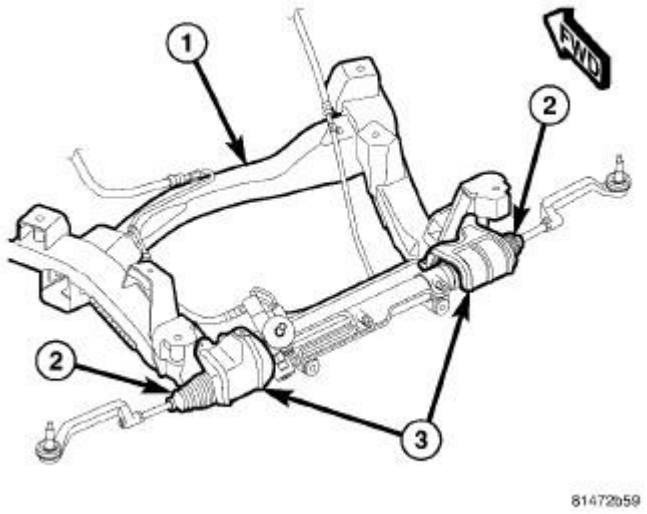

Fig. 10: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

12. Remove mounting screws, then heat shields (3) above both inner tie rod bellows (2).

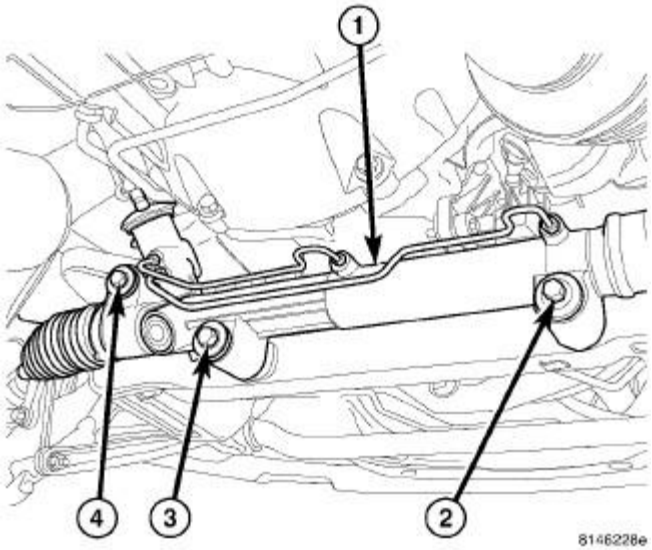

Fig. 11: Steering Gear Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

CAUTION: While steering gear bolts are removed, it important to avoid putting downward force on steering gear.

13. Remove steering gear mounting bolts as listed:
    1. Left side arm - Remove bolts (3) and (4). Loosen, but do not remove, bolt (2). It is important leave bolt (2) installed to avoid dropping gear too far, putting excessive force on steering coupling.
    2. Right side arm - Remove bolts (2) and (3). Loosen, but do not remove, bolt (4). It is important to leave bolt (4) installed to avoid dropping gear too far, putting excessive force on steering coupling.

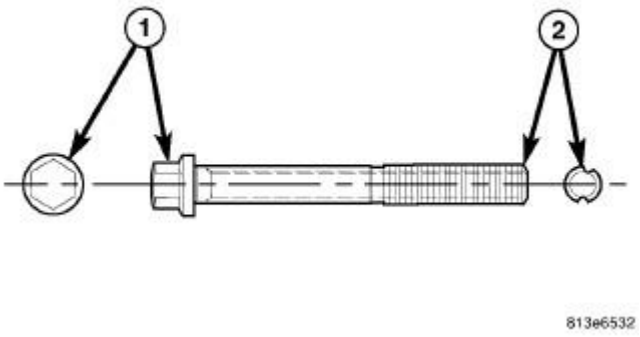

Fig. 12: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the lower control arm bolt at the engine cradle has a lengthwise grooved shaft (2), it is a special wheel alignment adjustment bolt and the bolt head (1) must not be rotated in the vehicle or damage to the bolt and engine cradle will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt positioning in engine cradle for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.

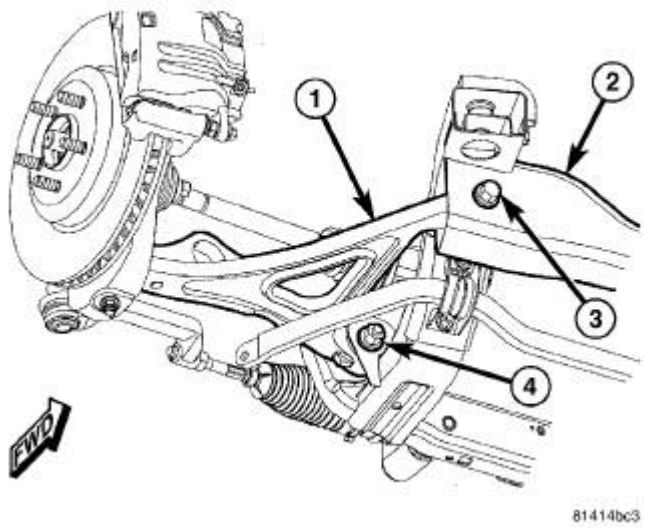

Fig. 13: Arm Attachment AT Crossmember
Courtesy of CHRYSLER GROUP, LLC

14. Remove bolt (3) and nut securing forward end of lower control arm (1) to engine cradle (2). If bolt has a lengthwise grooved shaft (see above note), remove bolt and nut by holding bolt stationary with a wrench, removing nut, then sliding bolt out of bushing and cradle while taking note of bolt positioning in engine cradle for reassembly purposes.
15. Remove bolt and nut (4) securing rearward end of lower control arm (1) to engine cradle (2). If bolt has a lengthwise grooved shaft (see above note), remove bolt and nut by holding bolt stationary with a wrench, removing nut, then sliding bolt out of bushing and cradle while taking note of bolt positioning in engine cradle for reassembly purposes.
16. Slide lower control arm (1) from engine cradle (2) and knuckle, and remove from vehicle.

INSTALLATION

INSTALLATION

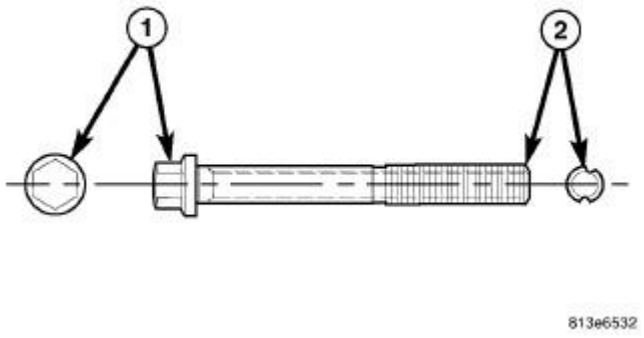

Fig. 14: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If installing a lower control arm engine cradle bolt that is a wheel alignment adjustment bolt (1) (identifying lengthwise grooved shaft (2)), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.**

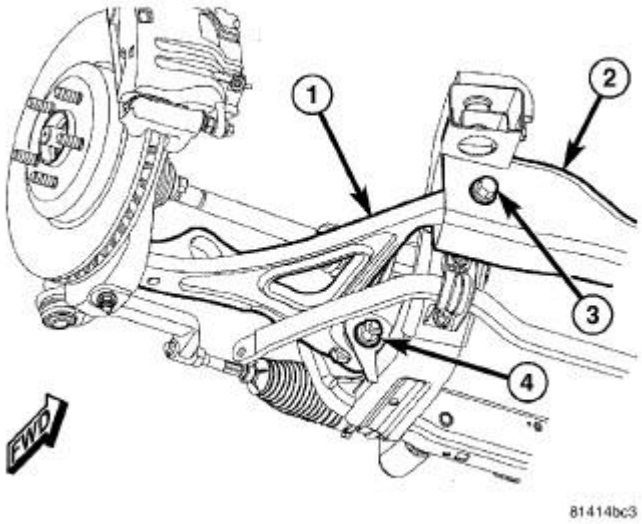

Fig. 15: Arm Attachment AT Crossmember
Courtesy of CHRYSLER GROUP, LLC

1. Slide lower control arm (1) into position in engine cradle (2) and place ball joint stem into mounting hole in knuckle.

   NOTE: **When installing lower control arm engine cradle bolts, it important to note that the forward bolt is installed front-to-rear and the rearward bolt is installed rear-to-front.**

2. Install lower control arm mounting bolts and nuts (3 and 4). **Do not tighten bolts at this time.**

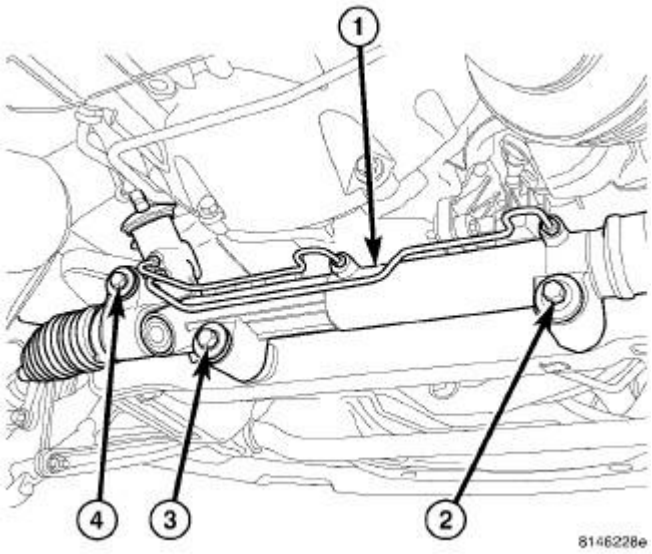

Fig. 16: Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Raise steering gear to mounted position and install lower mounting bolts (2 and 3). Install upper mounting bolt (4) and nut. Tighten all mounting bolts to 122 N.m (90 ft. lbs.).

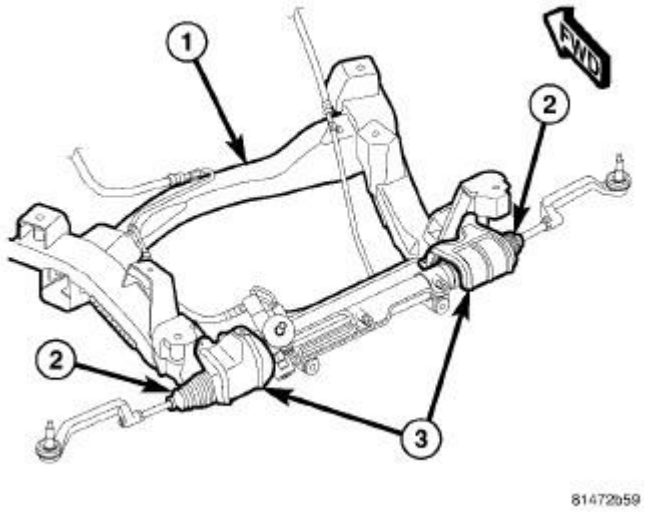

Fig. 17: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

4. Install heat shields (3) above both inner tie rod bellows (2). Tighten mounting screws to 7 N.m (62 in. lbs.).

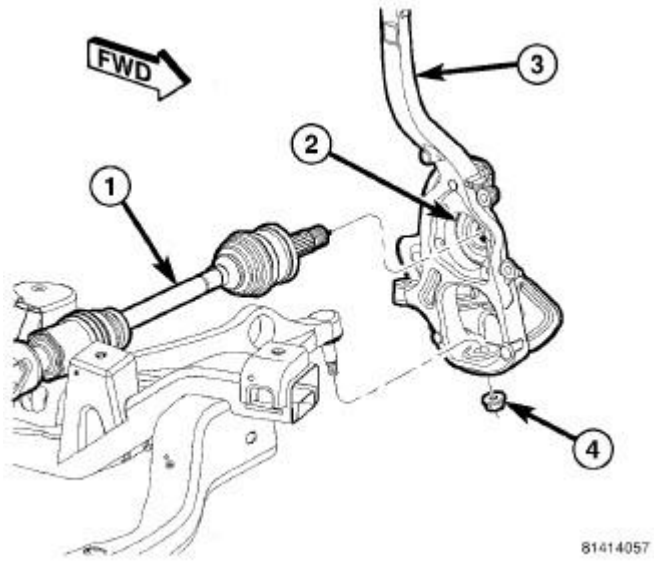

Fig. 18: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

5. Pull downward on control arm and guide ball joint stud into knuckle (3). Install NEW nut (4) on ball joint stud. Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

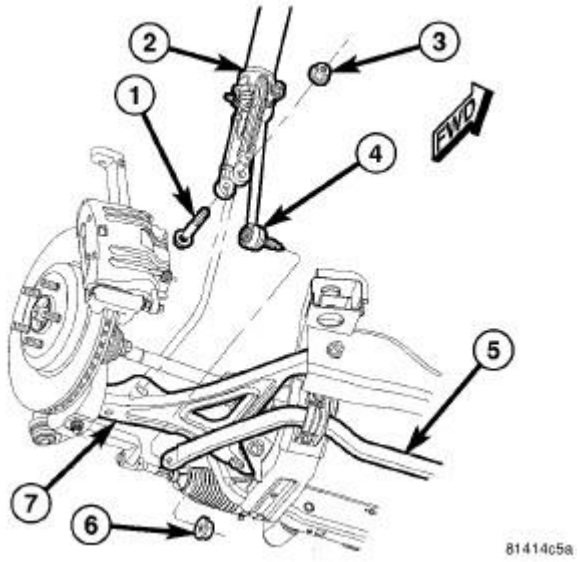

Fig. 19: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

6. Align shock clevis bracket (2) with lower control arm (7) bushing and install mounting bolt (1) and nut (3). **Do not tighten nut at this time.**

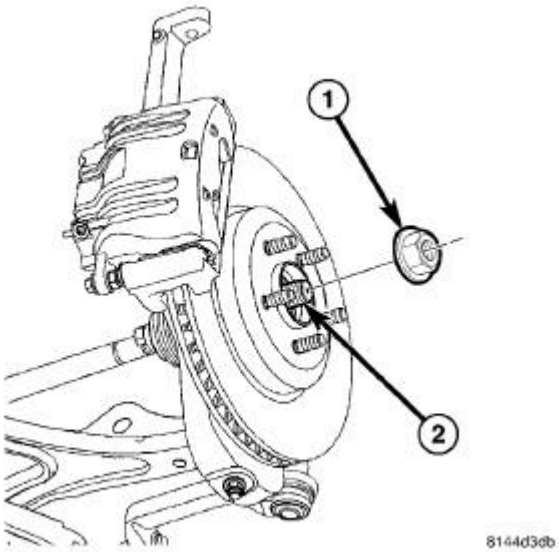

Fig. 20: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

7. Install hub nut (1) on end of axle half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

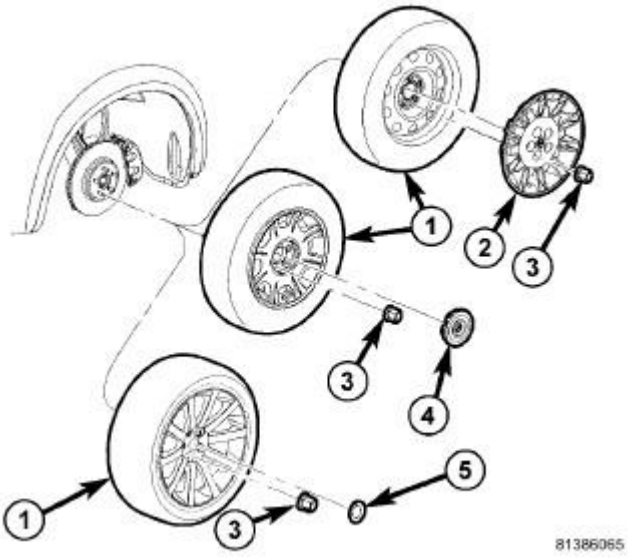

Fig. 21: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Install tire and wheel assembly (1). Refer to **INSTALLATION** .

9. Lower vehicle.
10. Position vehicle on an alignment rack/drive-on lift.

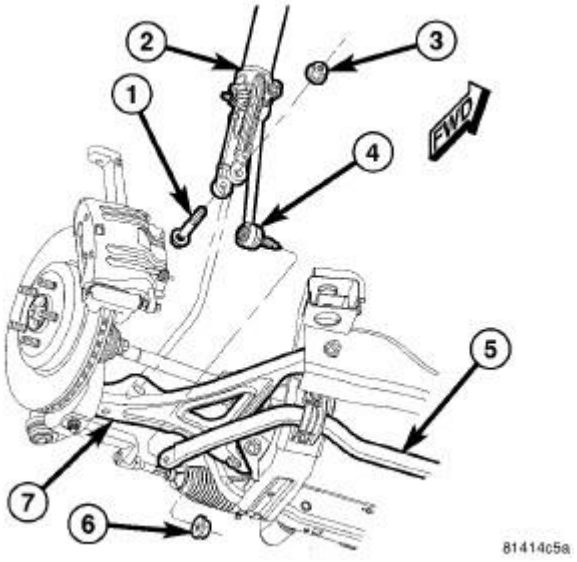

Fig. 22: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: When tightening lower shock clevis mounting bolt, do not attempt rotating bolt. Bolt shaft is serrated. Turn nut only.

11. Tighten lower shock clevis bracket bolt nut (3) to 174 N.m (128 ft. lbs.).
12. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

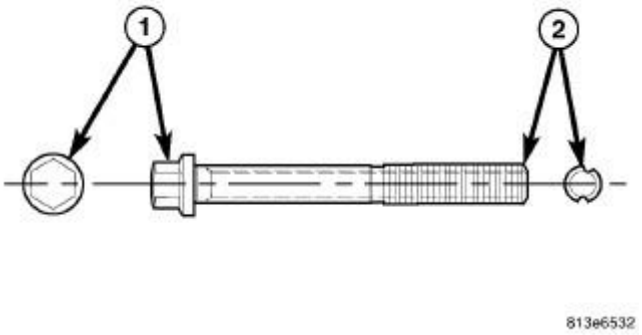

Fig. 23: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If lower control arm engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), be sure to only tighten nut. Do not rotate bolt or damage to cradle will occur.

13. Once camber is found to be within specifications, tighten lower control arm cradle bolt nuts to 176 N.m (130 ft. lbs.) while holding the bolts stationary.
14. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .

ARM, LOWER CONTROL, RWD

REMOVAL

REMOVAL

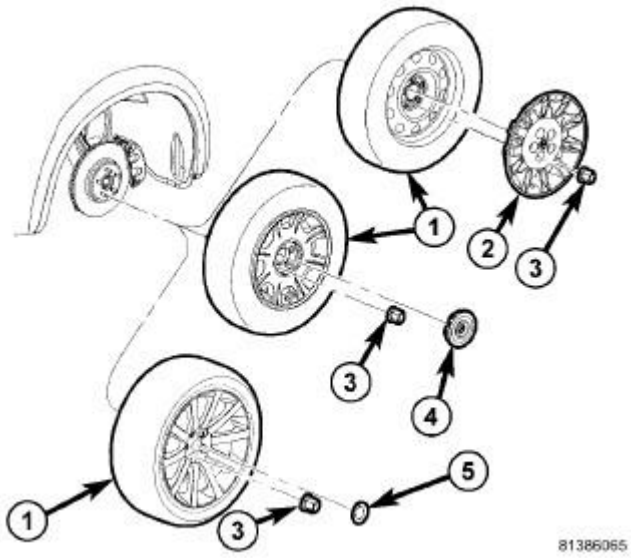

Fig. 24: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .

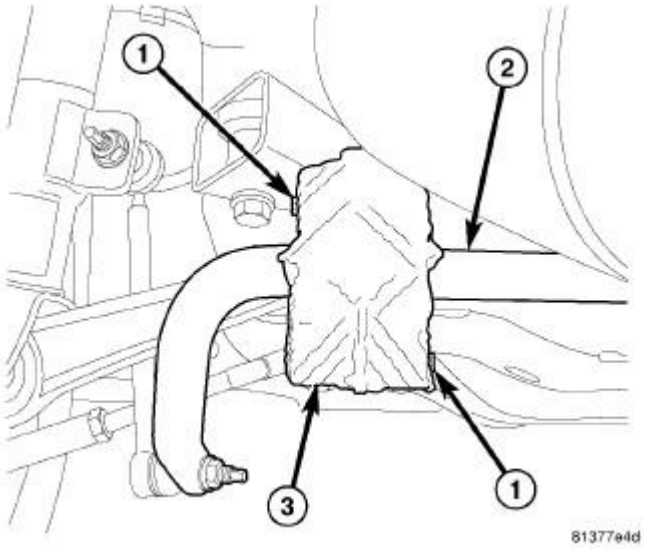

Fig. 25: Front Stabilizer Bar Heat Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove screws (1) fastening stabilizer bar heat shield (3) on side of control arm repair.

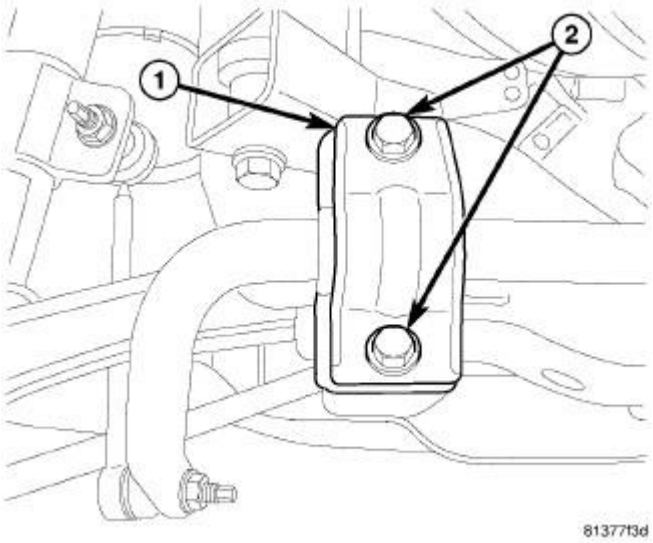

Fig. 26: Front Stabilizer Bar Bushing Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove bolts (2) fastening stabilizer bar bushing retainer (1) in place on side of control arm repair.

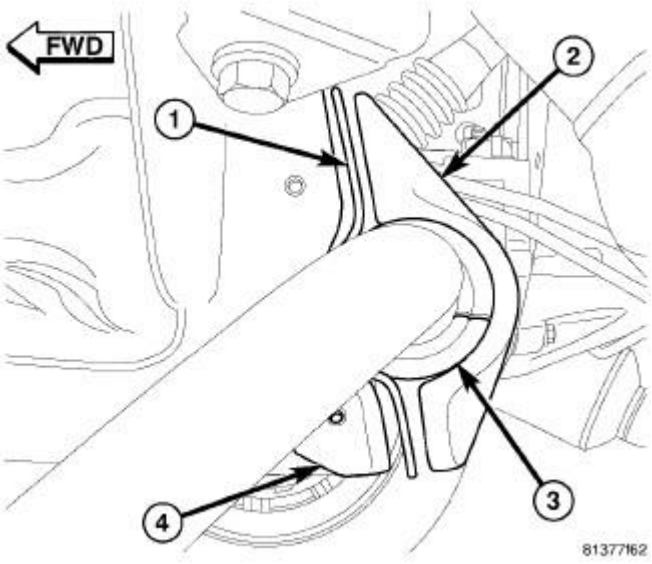

Fig. 27: Front Stabilizer Bar Bushing Retainer
Courtesy of CHRYSLER GROUP, LLC

6. Remove retainer halves (1) (2) from around stabilizer bar bushing (3).

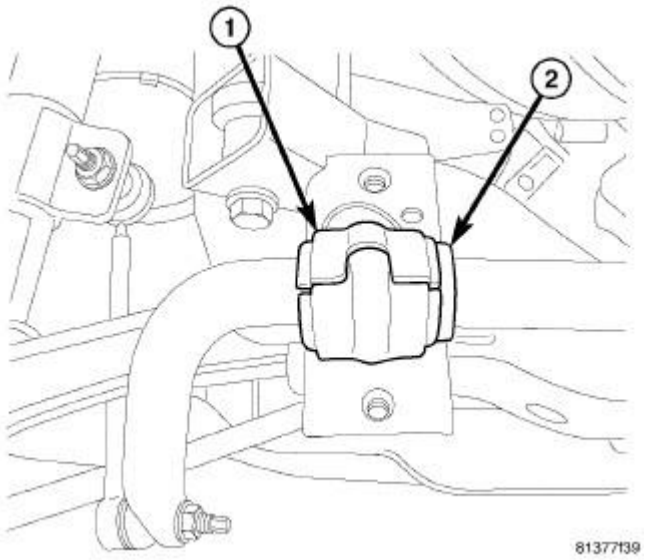

Fig. 28: Front Stabilizer Bar Bushing On Bar
Courtesy of CHRYSLER GROUP, LLC

7. Utilizing slit, remove bushing (1) from stabilizer bar (2).

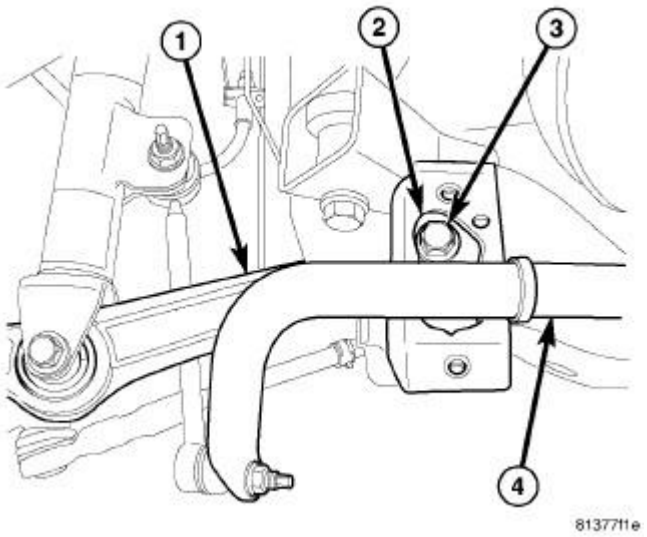

Fig. 29: Control Arm Cradle Bolt Head
Courtesy of CHRYSLER GROUP, LLC

NOTE: In the following step, the lower control arm cradle bolt (3) is accessed through the opening (2) created by removal of the bushing from the stabilizer bar (4).

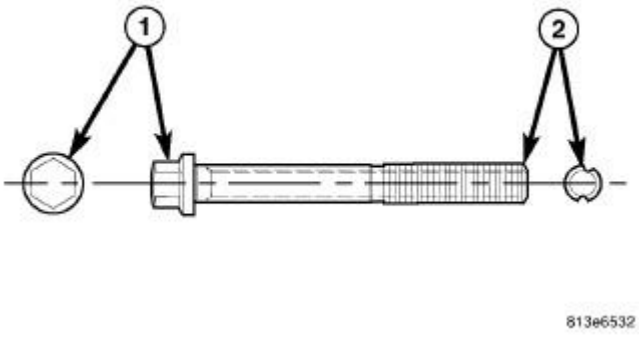

Fig. 30: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the lower control arm bolt at the engine cradle has a lengthwise grooved shaft (2), it is a special wheel alignment adjustment bolt and the bolt head (1) must not be rotated in the vehicle or damage to the bolt and engine cradle will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt positioning in engine cradle and control arm for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.

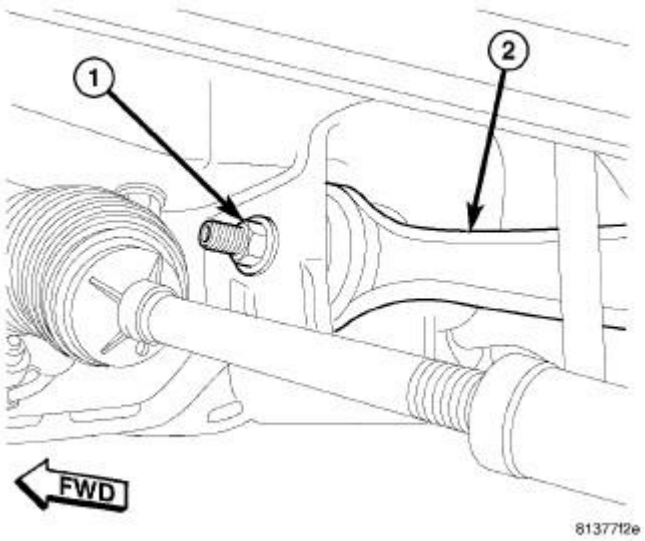

Fig. 31: Control Arm Cradle Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove bolt and nut (1) securing lower control arm (2) to engine cradle. If bolt has a lengthwise grooved shaft (see above note), remove bolt and nut by holding the bolt in place with a wrench, removing nut, then sliding bolt out of bushing and cradle while taking note of bolt positioning in lower control arm bushing for reassembly purposes.

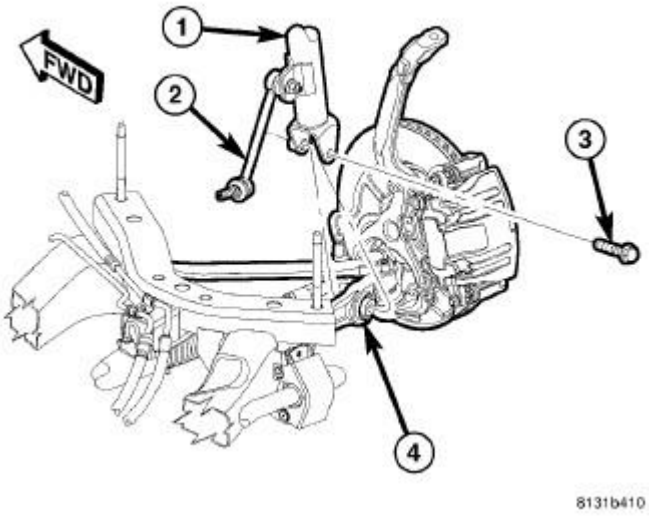

Fig. 32: Lower Shock Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt (3) securing shock assembly (1) to lower control arm (4).

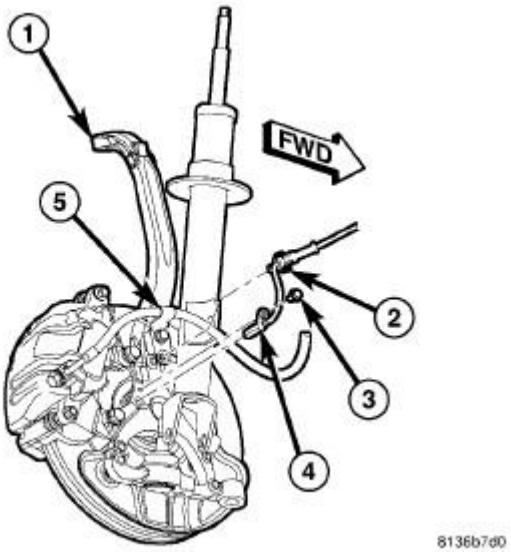

Fig. 33: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
11. Remove wheel speed sensor cable routing clip (2) from brake flex hose routing bracket (5).

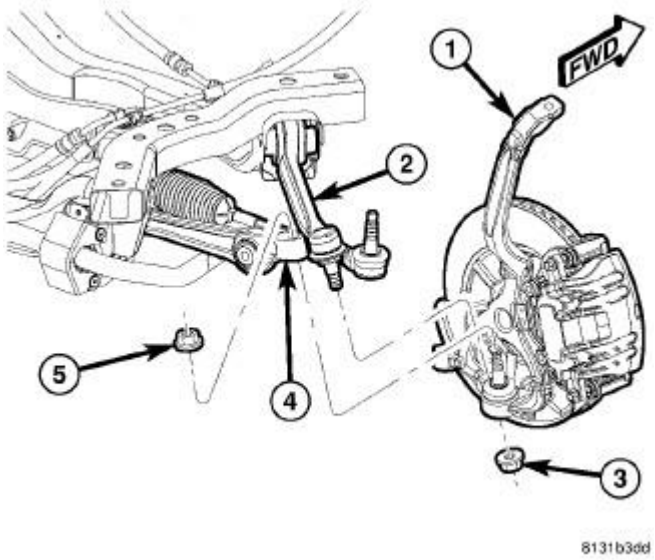

Fig. 34: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

12. Loosen nut (5) attaching ball joint stud to lower control arm (4). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

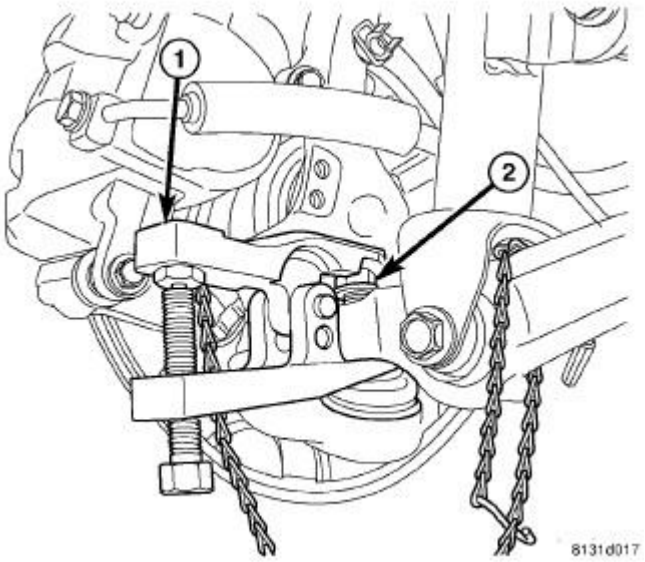

Fig. 35: Using Puller On LCA Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

13. Using Puller (1), Special Tool (special tool #9360, Remover, Ball Joint), separate ball joint stud (2) from lower control arm.

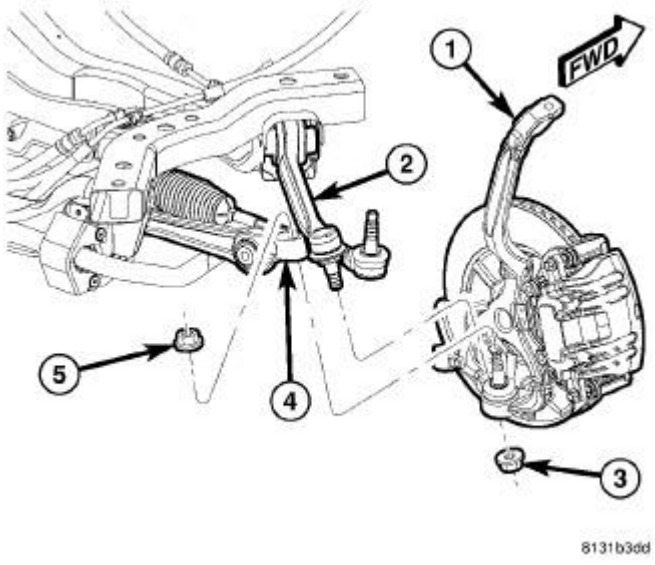

Fig. 36: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

14. Remove nut (5) from end of ball joint stud attaching lower control arm to knuckle.
15. Pry knuckle downward and slide ball joint stud out of lower control arm. Position knuckle outward, away from lower control arm.
16. Slide lower control arm out of engine cradle and remove from vehicle.

INSTALLATION

INSTALLATION

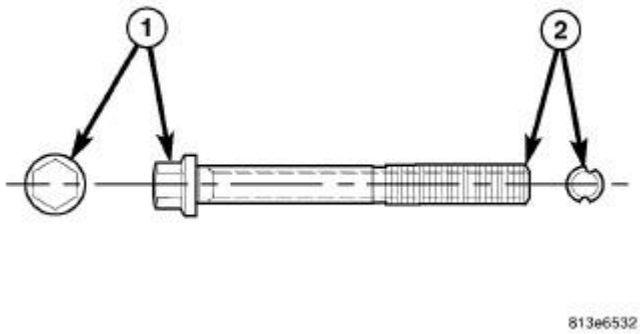

Fig. 37: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: If installing a lower control arm engine cradle bolt that is a wheel alignment adjustment bolt (1) (lengthwise grooved shaft (2)), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.

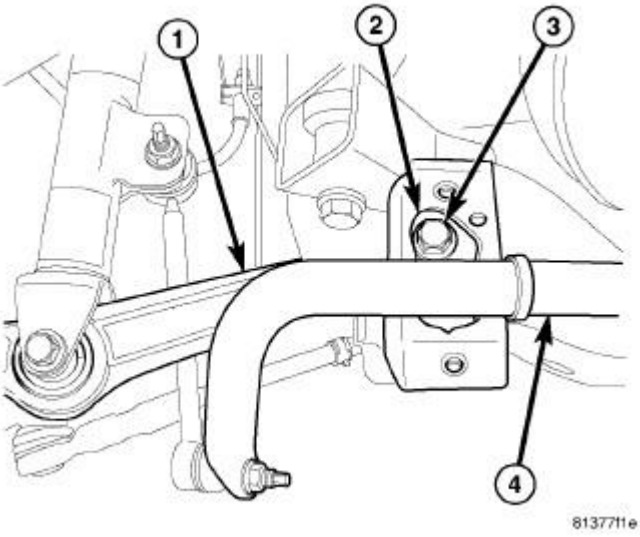

Fig. 38: Control Arm Cradle Bolt Head

Courtesy of CHRYSLER GROUP, LLC

1. Slide lower control arm (4) into position in engine cradle and install mounting bolt from rear.

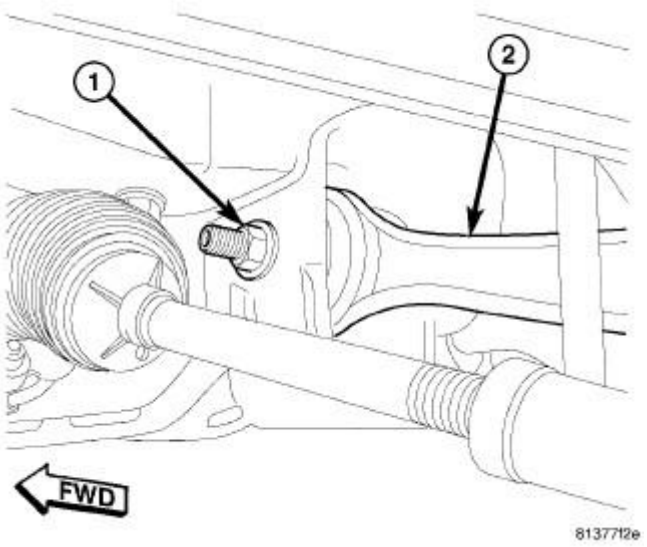

Fig. 39: Control Arm Cradle Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

2. Install nut (1) on lower control arm cradle bolt, but **do not tighten at this time** .

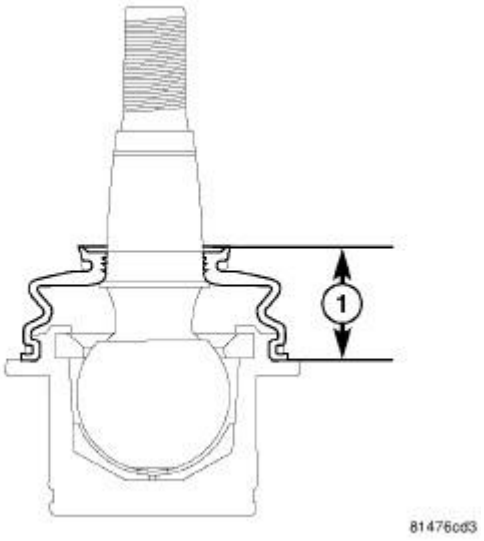

Fig. 40: Ball Joint Seal Boot Height
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before installing knuckle to lower control arm, measure height of ball

joint seal boot (1) mounted on knuckle. If seal boot height is above 25.5 mm, any air inside seal boot must be expelled. To do so, follow these steps.

a. **Tip ball joint stud completely to one side.**
b. **Using thumb and index finger, gently squeeze seal boot together at center expelling any air. Do not allow grease to be release.**
c. **Push down very top of seal boot.**
d. **Return ball joint stud to original "centered" position.**
e. **Measure ball joint seal boot height (1) making sure it is within specification.**
f. **Wipe any grease from ball joint stud.**

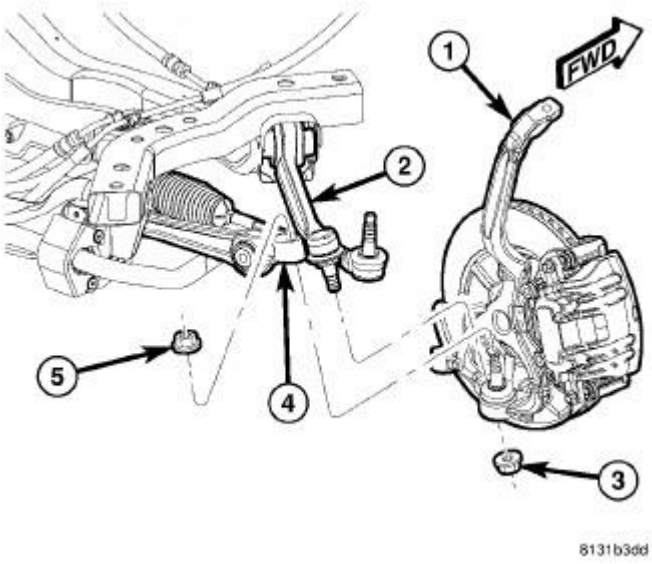

Fig. 41: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

3. Pull knuckle (1) downward and position lower control arm (4) over ball joint stud. Release knuckle, guiding stud into lower control arm. Install NEW nut (5) on ball joint stud attaching lower control arm (4) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

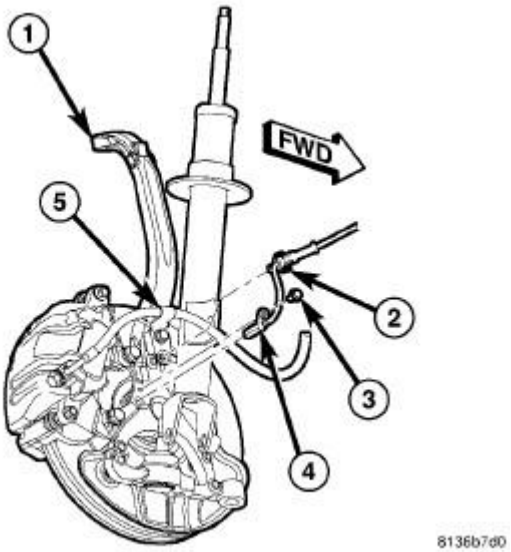

Fig. 42: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

4. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (95 in. lbs.).
5. Attach wheel speed sensor cable and routing clip (2) to brake flex hose routing bracket (5).

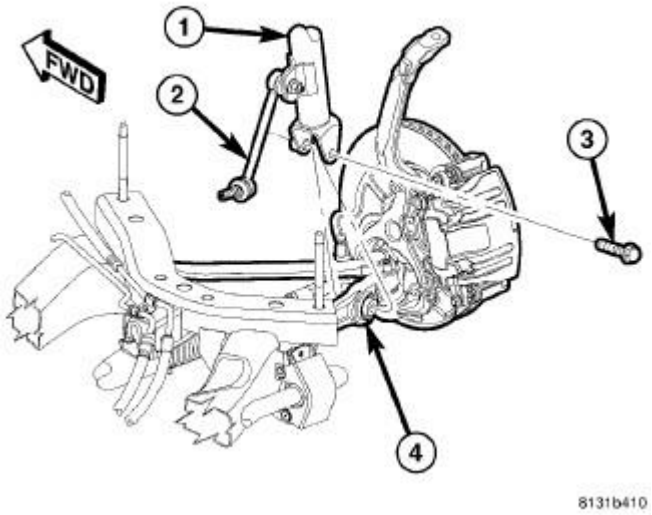

Fig. 43: Lower Shock Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install lower shock mounting bolt (3) attaching shock assembly (1) to lower control arm (4) **Do not tighten bolt at this time.**

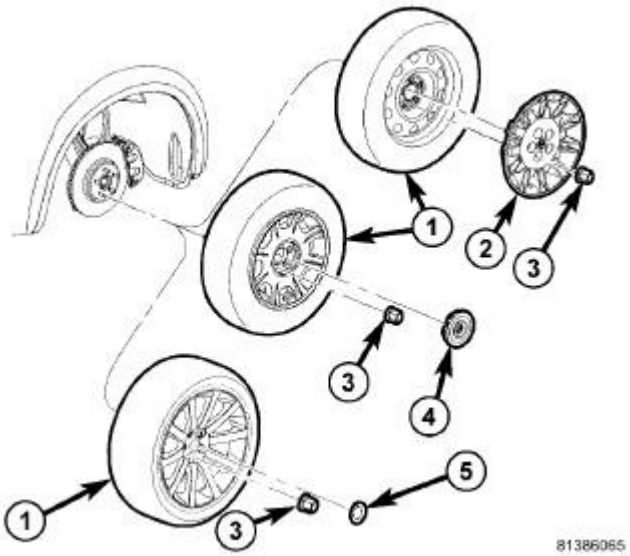

Fig. 44: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
8. Lower vehicle.

CAUTION: Because stabilizer bar is disconnected at cradle it is important to use extra care while moving vehicle to alignment rack/drive-on lift.

9. Position vehicle on an alignment rack/drive-on lift.
10. Tighten lower shock mounting bolt (3) to 174 N.m (128 ft. lbs.).

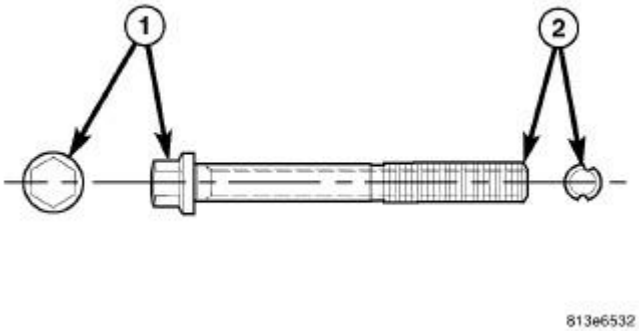

Fig. 45: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

CAUTION: If the control arm engine cradle bolt is a wheel alignment adjustment

bolt (lengthwise grooved shaft (2)), be sure to only tighten the nut. Do not rotate the bolt head (1) or damage to the bushing will occur.

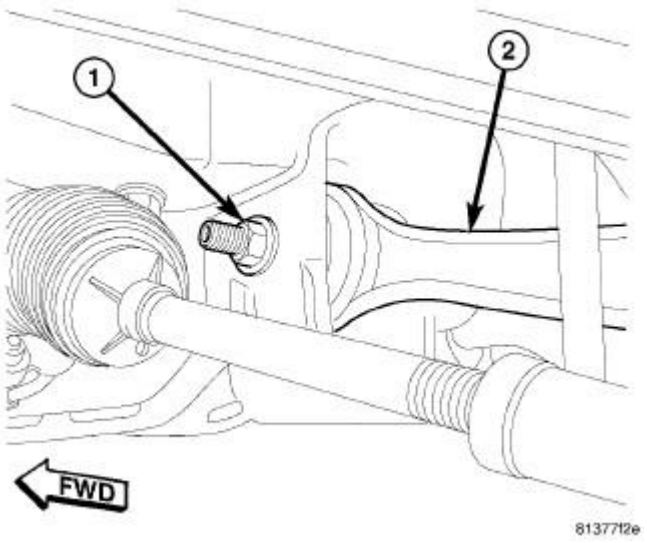

Fig. 46: Control Arm Cradle Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

12. Once camber is found to be within specifications, using a crowfoot wrench, tighten lower control arm cradle bolt nut (1) to 176 N.m (130 ft. lbs.) while holding the bolt stationary.

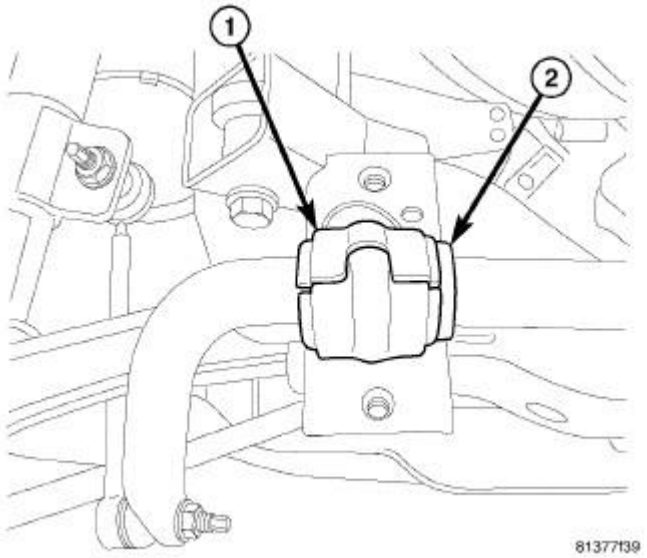

Fig. 47: Front Stabilizer Bar Bushing On Bar
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Because of stabilizer bushing outer shape, it is very important to

install bushings in position discussed in following step.

13. Utilizing slit in bushing, install stabilizer bar bushing (1) against locating collar on stabilizer bar (2) as shown in illustration. Make sure slit in bushing is positioned toward rear of vehicle.

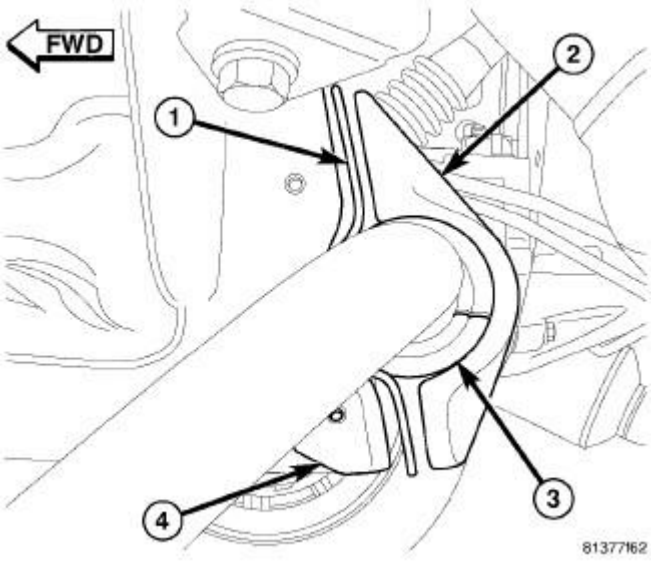

Fig. 48: Front Stabilizer Bar Bushing Retainer
Courtesy of CHRYSLER GROUP, LLC

14. Install stabilizer bar bushing retainer halves (1),(2) around bushing (3).

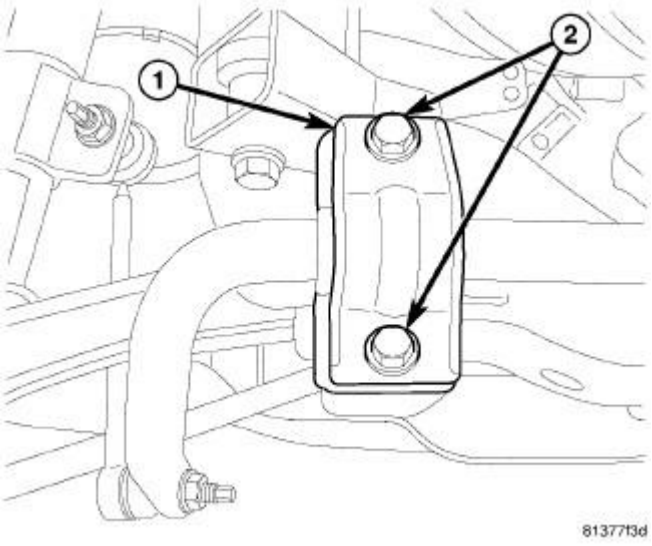

Fig. 49: Front Stabilizer Bar Bushing Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Install bolts (2) securing stabilizer bar bushing retainer halves (1) to cradle. Tighten bolts to 60 N.m (44 ft. lbs.).

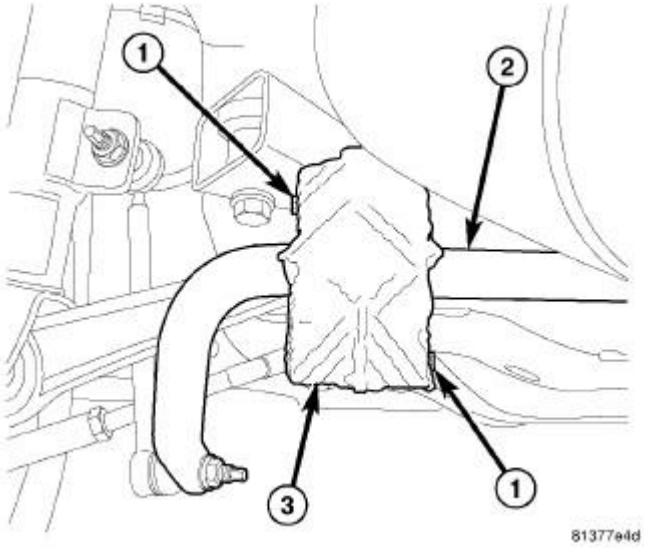

Fig. 50: Front Stabilizer Bar Heat Shield
Courtesy of CHRYSLER GROUP, LLC

16. Install stabilizer bar heat shield (3) over stabilizer bar bushing retainer. Install mounting screws (1).
17. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .

ARM, UPPER CONTROL

REMOVAL

REMOVAL

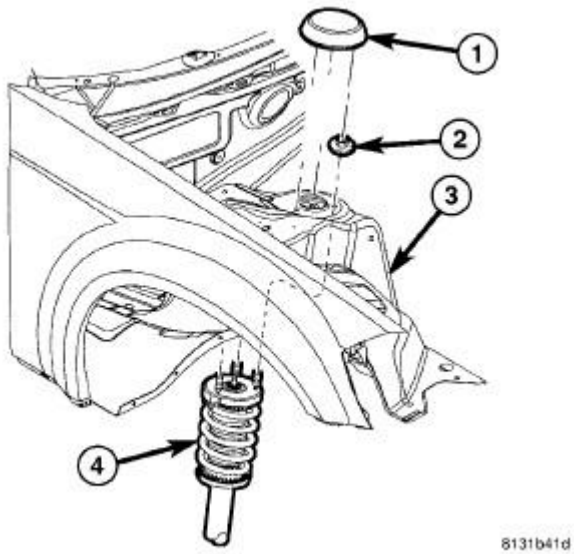

Fig. 51: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

1. If removing left upper control arm, remove and reposition coolant recovery container. Refer to **BOTTLE, COOLANT RECOVERY, REMOVAL** .
2. If removing right upper control arm, remove IPM from mount and reposition.
3. If equipped, remove front shock tower cap (1) from top of shock assembly (4).
4. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).

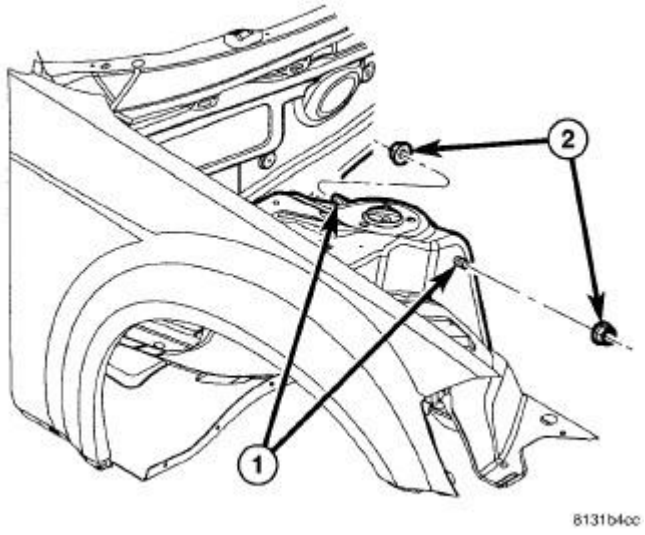

Fig. 52: Upper Control Arm Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

5. Remove nuts (2) from upper control arm mounting bolts (1).

6. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

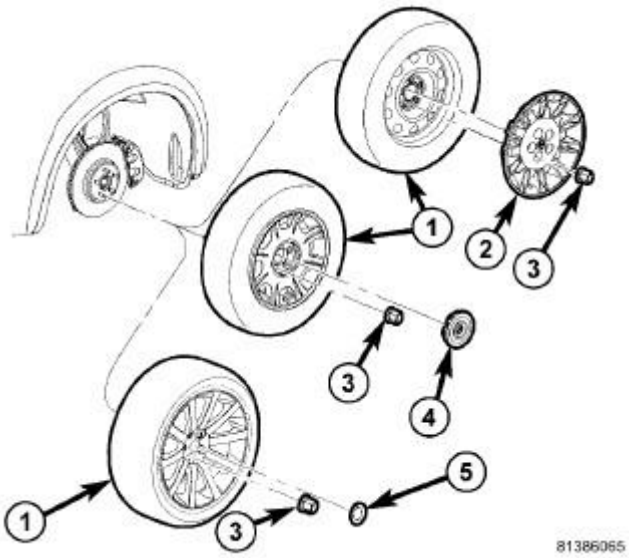

Fig. 53: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

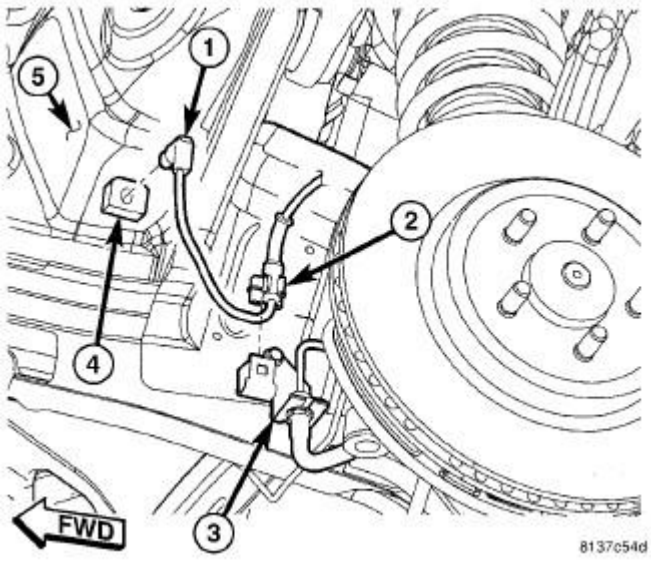

Fig. 54: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

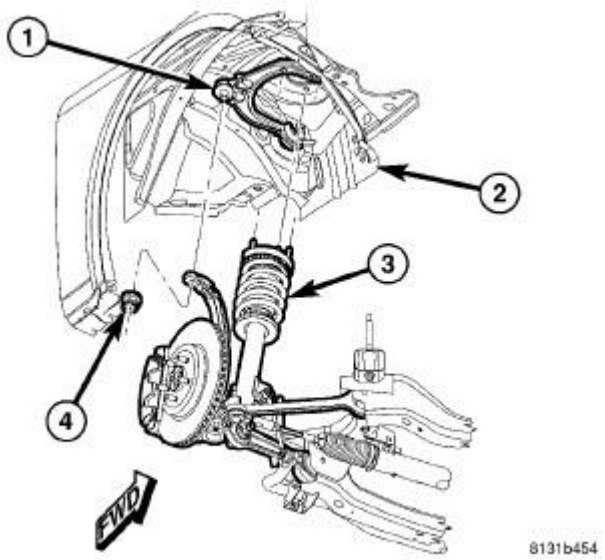

Fig. 55: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

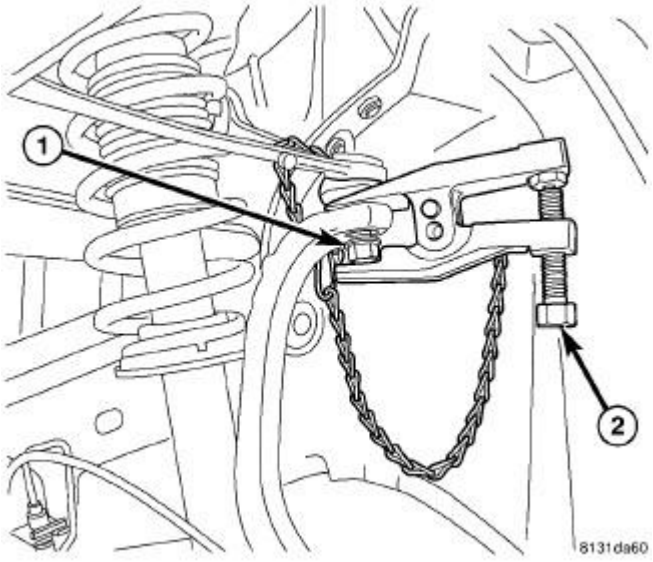

Fig. 56: Using Puller On Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

10. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate upper ball joint stud (1) from knuckle.

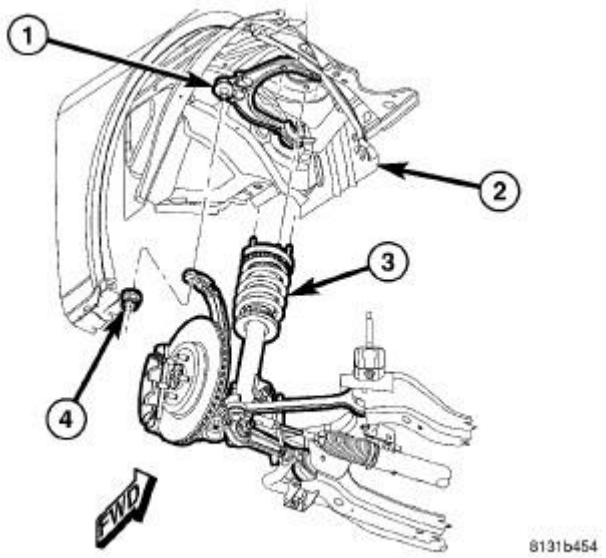

Fig. 57: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Remove nut (4) from end of upper ball joint stud (1).
12. Pull shock assembly (3) downward until studs clear shock tower (2), then pull it outward allowing access to upper control arm mounting bolts.

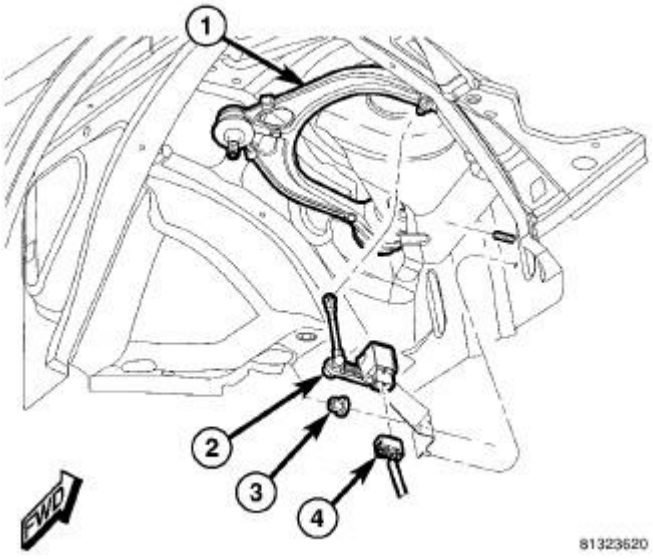

Fig. 58: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

13. Export Only - If servicing right upper control arm, disconnect headlamp leveling sensor (2) link at upper control arm (1).

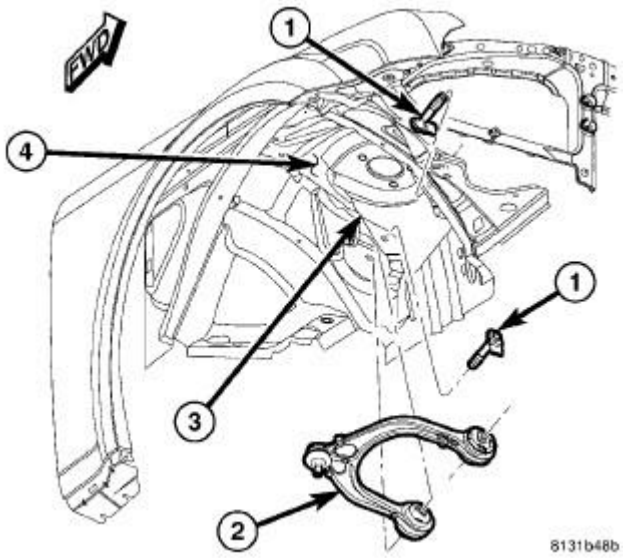

Fig. 59: Upper Control Arm Mounting
Courtesy of CHRYSLER GROUP, LLC

14. Remove upper control arm mounting (flag) bolts (1).
15. Remove upper control arm (2) from bracket (3) in shock tower (4).

INSTALLATION

INSTALLATION

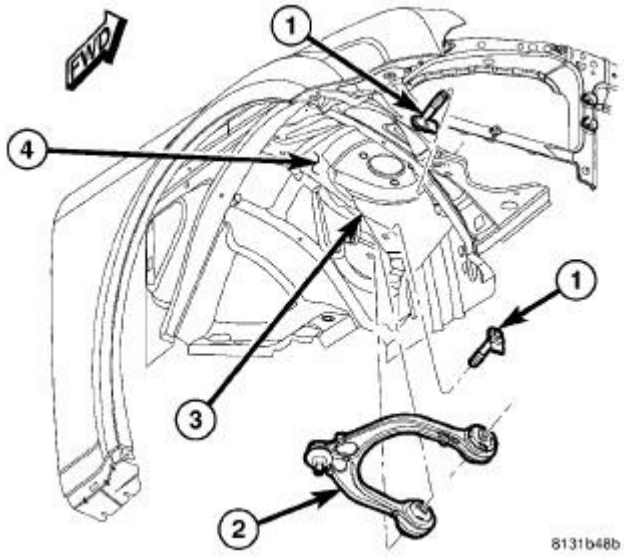

Fig. 60: Upper Control Arm Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: Although All-Wheel-Drive and Rear-Wheel-Drive upper control arms are similar in appearance, they are not interchangeable.

1. Slide upper control arm (2) into bracket (3) located in shock tower (4).
2. Install upper control arm mounting (flag) bolts (1) through bracket, arm and tower. Position flags on bolt heads outward, toward wheel opening.

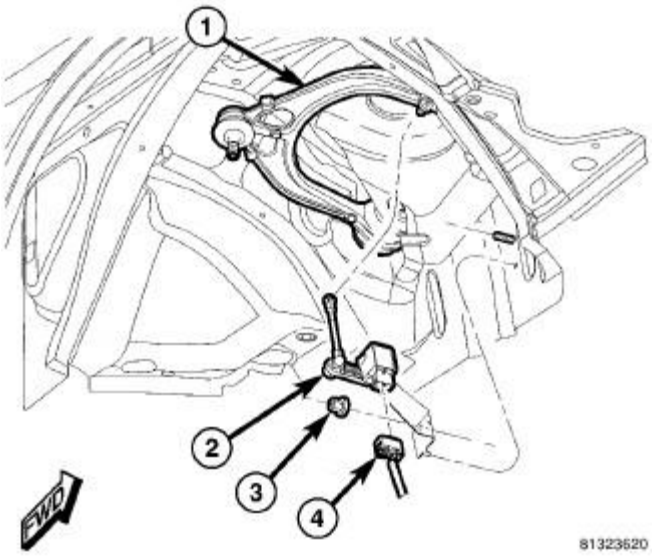

Fig. 61: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Export Only - If servicing right upper control arm, connect headlamp leveling sensor (2) link at upper control arm (1).

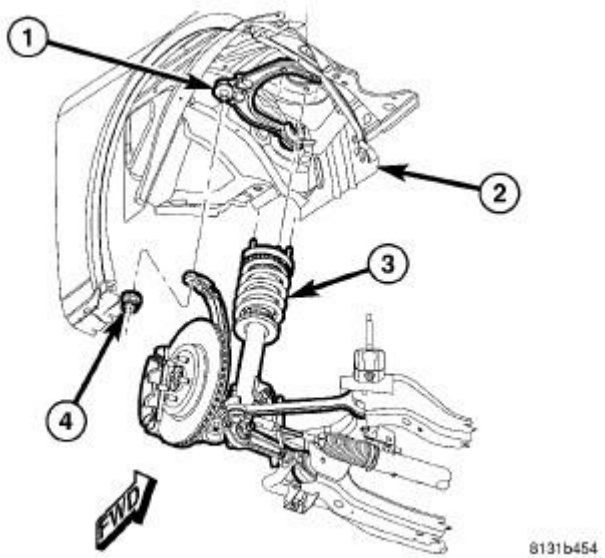

Fig. 62: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Move shock assembly (3) allowing studs to be inserted through shock tower (2) mounting holes.
5. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

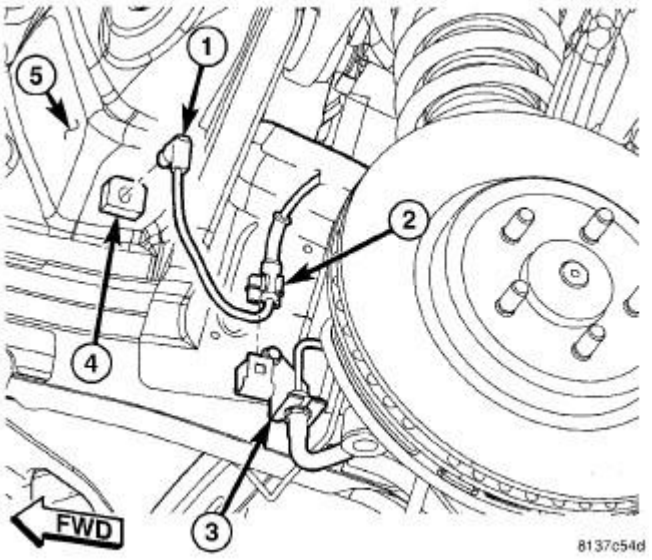

Fig. 63: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

6. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

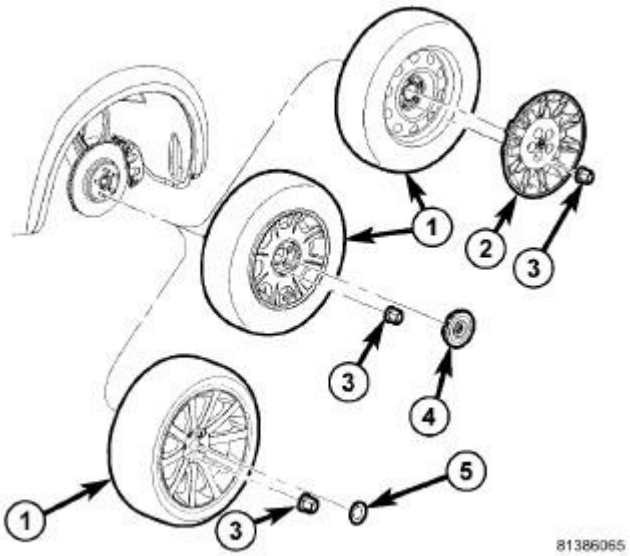

Fig. 64: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
8. Lower vehicle to curb position.

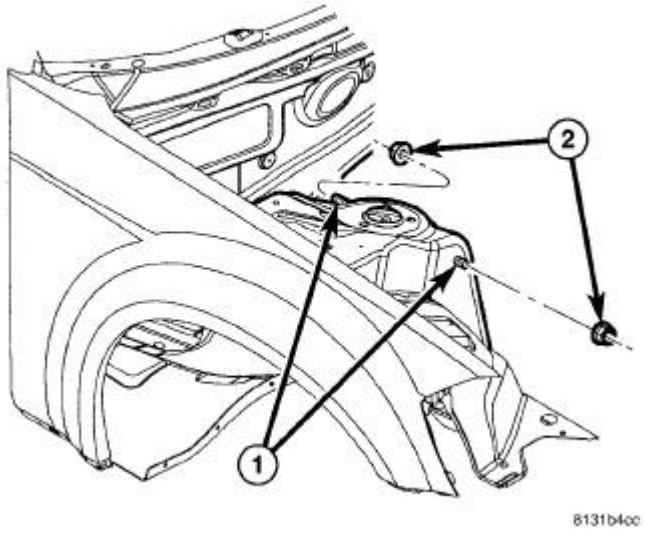

Fig. 65: Upper Control Arm Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

9. Install nuts (2) on upper control arm body mounting bolts (1). Tighten nuts to 75 N.m (55 ft. lbs.).

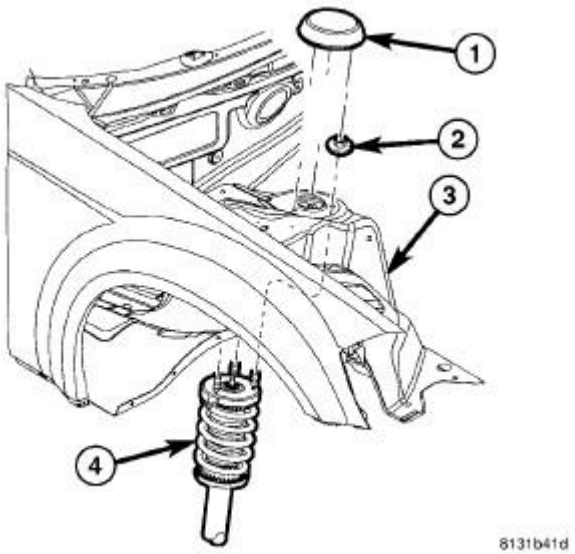

Fig. 66: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N.m (20 ft. lbs.).
11. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.
12. If installing left upper control arm, install coolant recovery container. Refer to **BOTTLE, COOLANT RECOVERY, INSTALLATION** .
13. If installing right upper control arm, install IPM.

BALL JOINT, SUSPENSION, LOWER

DESCRIPTION

DESCRIPTION

AWD

The ball joint for the lower control arm is pressed into the lower control arm. The ball joint is a "sealed for life" component and cannot be maintenance lubricated. The ball joint is lubricated for life at the time of assembly. **No attempt should be made to ever add any lubrication to these ball joints.**

Neither the ball joint, nor the seal boot for the lower control arm can be serviced as a separate component. They entire arm must be replaced if either are damaged.

RWD

There are two lower ball joints on the RWD version of this vehicle. One is for the lower control arm and the other for the tension strut. The ball joint for the lower control arm is pressed into the knuckle and the ball joint for the tension strut is part of the tension strut. The ball joints are both "sealed for

life" components and cannot be maintenance lubricated. These ball joints are lubricated for life at the time of assembly. **No attempt should be made to ever add any lubrication to these ball joints.**

The ball joint for the lower control arm is a ball joint and seal boot cartridge type and can be replaced as a separate component of the knuckle. The boot cannot be serviced separately. To service this ball joint. Refer to **KNUCKLE, STEERING, RWD, DISASSEMBLY**.

Neither the ball joint, nor the seal boot for the tension strut can be serviced as a separate component. They entire tension strut must be replaced if either are damaged.

The ball joint connection to the lower control arm and the ball joint connection at the knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a locking nut.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOWER BALL JOINT

1. Raise vehicle on a drive-on hoist.

   NOTE: If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.

2. Using a jack, lift the front end off the hoist and position a wooden block underneath lower control arm supporting that corner of the vehicles weight.
3. Remove tire and wheel assembly. Refer to **REMOVAL** .
4. Attach a dial indicator as follows:
   1. AWD Lower Control Arm - Attach a dial indicator to base of lower control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.
   2. RWD Tension Strut - Attach a dial indicator to base of tension strut, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.
   3. RWD Lower Control Arm - Attach a dial indicator to base of lower control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.

   NOTE: Use care when applying the load to the knuckle so as to not damage components of the suspension.

5. Insert a pry bar and rest it against lower control arm or tension strut (depending on which is being tested) and use lever principle to push knuckle upward until dial indicator no longer moves.

6. Record any ball joint movement. If movement in the lower control arm exceeds 1.5 mm (.059 in.), the ball joint is faulty.
7. If the lower ball joint for an All-Wheel-Drive vehicle needs replaced, the lower control arm needs to be replaced. Refer to **ARM, LOWER CONTROL, AWD, REMOVAL** and **ARM, LOWER CONTROL, RWD, REMOVAL**.
8. If the ball joint for the lower control arm on a Rear-Wheel-Drive vehicle needs replaced, it can be serviced separately. Refer to **KNUCKLE, STEERING, RWD, DISASSEMBLY**.
9. If the tension strut ball joint (RWD vehicle) needs replaced, the entire tension strut needs to be replaced. Refer to **STRUT, TENSION, REMOVAL**.

REMOVAL

REMOVAL

To service the lower ball joint for the lower control arm on rear-wheel-drive vehicles, the knuckle must be removed from the vehicle, then the ball joint can be removed. Refer to **KNUCKLE, STEERING, RWD, DISASSEMBLY** or **KNUCKLE, STEERING, AWD, REMOVAL** or **KNUCKLE, STEERING, RWD, REMOVAL**.

INSTALLATION

INSTALLATION

To install the ball joint for the lower control arm on rear-wheel-drive vehicles, refer to the following information. Refer to **KNUCKLE, STEERING, RWD, ASSEMBLY**.

BALL JOINT, SUSPENSION, UPPER

DESCRIPTION

DESCRIPTION

The upper ball joint is pressed into the upper control arm. The ball joint is a "sealed for life" component and cannot be maintenance lubricated. This ball joint is lubricated for life at the time of assembly. **No attempt should be made to ever add any lubrication to this ball joint.**

Neither the upper ball joint, nor the seal boot can be serviced as a separate component. The entire upper control arm must be replaced if either are damaged.

The ball joint connection at the knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a locking nut.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - UPPER BALL JOINT

1. Raise vehicle on a drive-on hoist.

NOTE: If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.

2. Using a jack, lift the front end off the hoist and position a wooden block underneath lower control arm supporting that corner of the vehicles weight.
3. Remove tire and wheel assembly. Refer to **REMOVAL** .
4. Attach a dial indicator to body of upper control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on end of knuckle near ball joint. Zero dial indicator.

NOTE: Use care when applying the load to the knuckle so as to not damage components of suspension.

5. Insert a pry bar and rest it against bottom of upper control arm and use lever principle to push arm upward until dial indicator no longer moves.
6. Record any ball joint movement. If movement in the control arm exceeds 1.5 mm (.059 in.), the ball joint is faulty.
7. If the ball joint needs replaced, the entire upper control arm needs to be replaced. Refer to **ARM, UPPER CONTROL, REMOVAL**.

HUB AND BEARING

DESCRIPTION

DESCRIPTION

The front wheel bearing and wheel hub of this vehicle are a one piece sealed unit or hub and bearing unit type assembly.

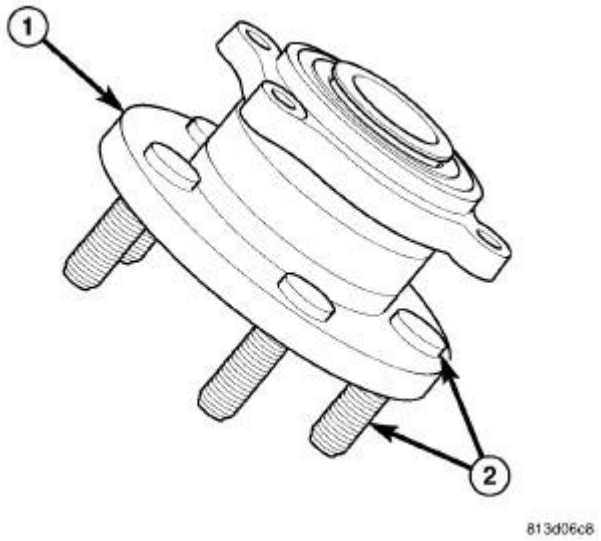

Fig. 67: Rear Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

On All-Wheel-Drive (AWD) vehicles, the hub and bearing (1) is mounted to the knuckle using four mounting bolts and to the axle half shaft using a retaining nut. The center of the AWD hub and bearing is splined to match the outer joint of the axle half shaft.

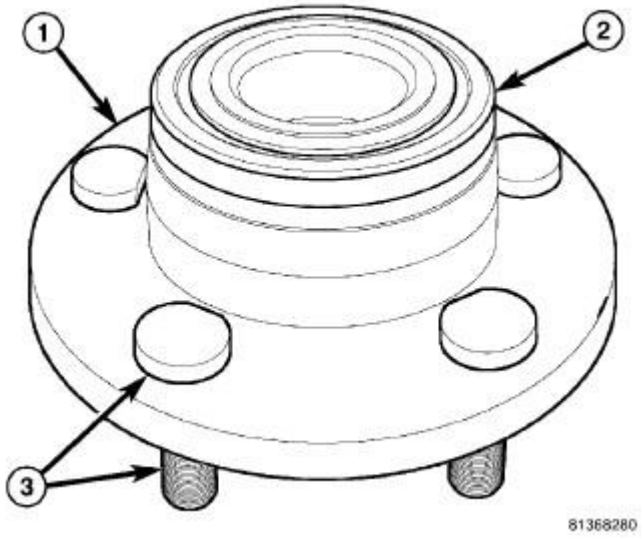

Fig. 68: Front Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

On Rear-Wheel-Drive (RWD) vehicles, the hub and bearing (1) is mounted to the center of the spindle using a retaining nut.

All front hub and bearings have five wheel mounting studs (3) on the hub flange for mounting the

wheel to the vehicle. The wheel mounting studs are the only replaceable components of the hub and bearing. Otherwise, the hub and bearing is serviced only as a complete assembly.

On RWD vehicles, a magnetic encoder (2) for the wheel speed sensor is pressed onto the hub and bearing. A magnetic encoder is not located on the AWD hub and bearing. It is pressed onto the axle half shaft outer joint.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING

NOTE: The hub and bearing is designed for the life of the vehicle and should require no maintenance.

With wheel and brake rotor removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

To diagnose a bent hub, measure hub runout. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING** .

REMOVAL

AWD

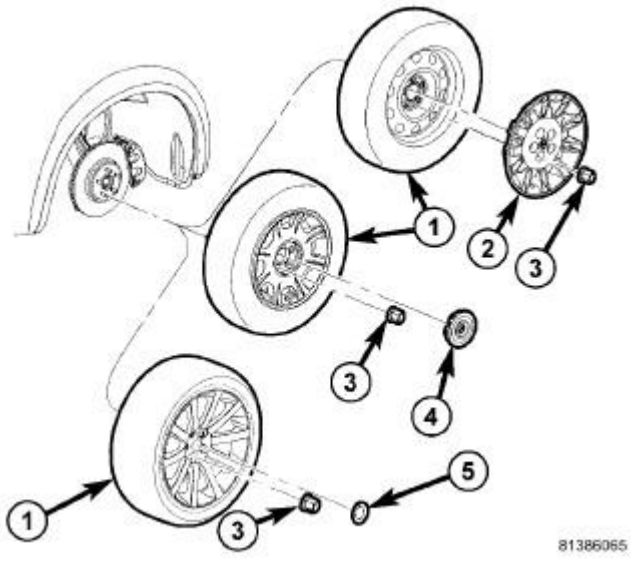

Fig. 69: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

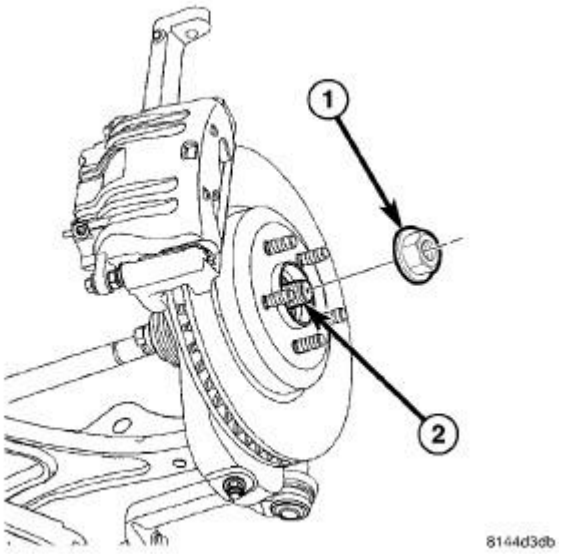

Fig. 70: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the axle half shaft (2).
4. Access and remove front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

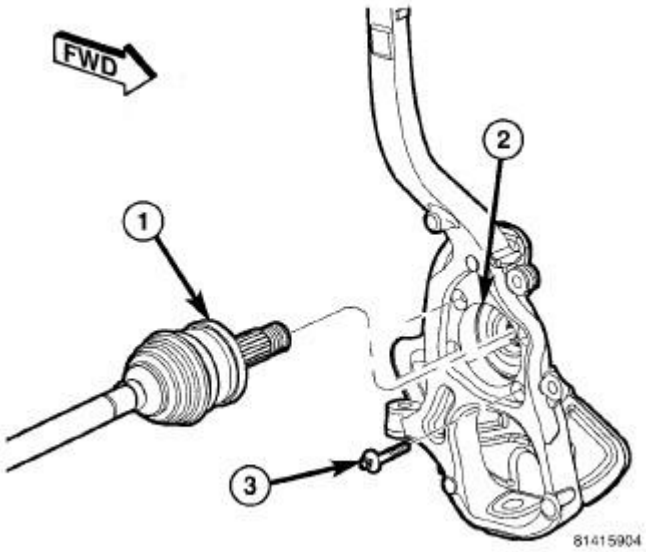

Fig. 71: Locating Halfshaft AT Hub/Bearing Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove four bolts (3) fastening hub and bearing (2) to knuckle.
6. Slide hub and bearing (2) off axle half shaft (1) and knuckle.

RWD

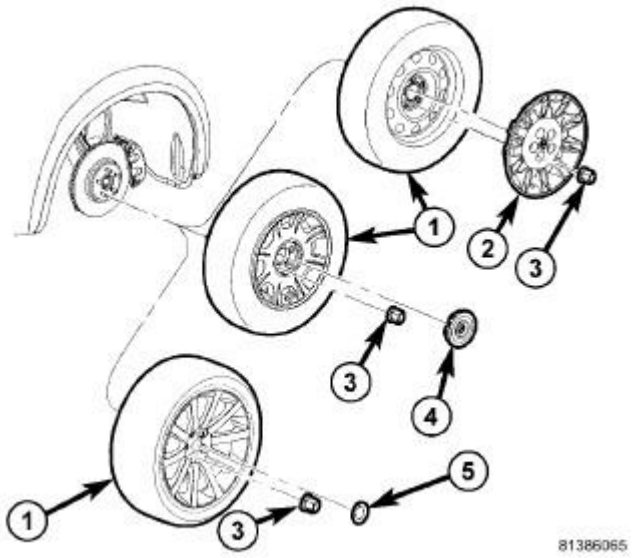

Fig. 72: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Access and remove front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

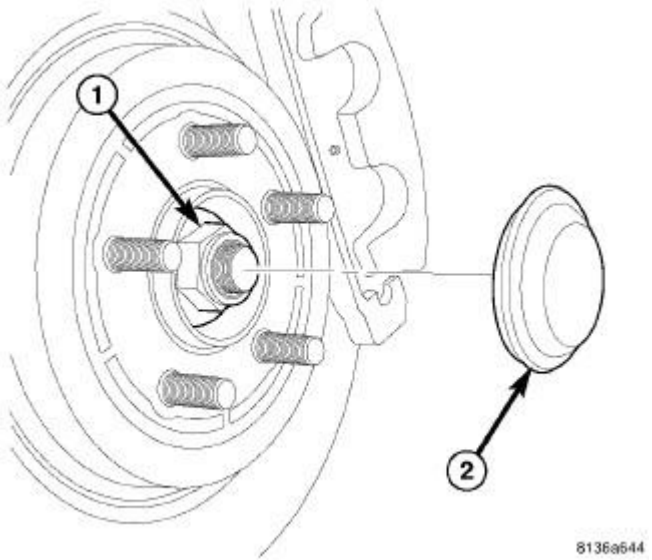

Fig. 73: Dust Cap & Hub Nut

Courtesy of CHRYSLER GROUP, LLC

4. Remove dust cap (2). When doing this, avoid damaging internal bore of hub to preserve seal integrity.
5. Remove hub nut (1).
6. Slide hub and bearing off knuckle spindle.

INSTALLATION

AWD

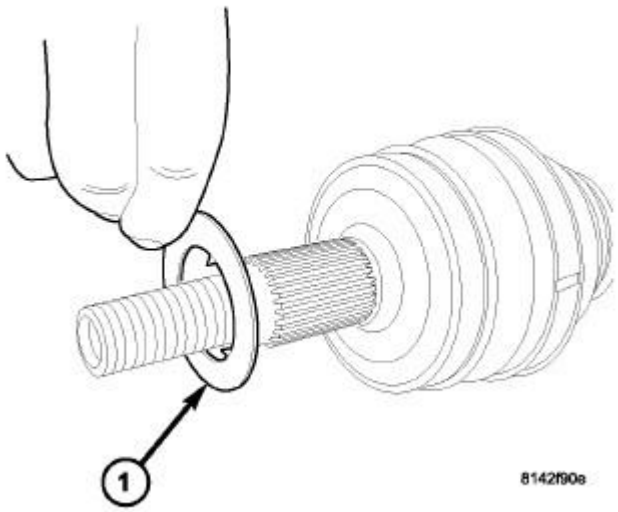

Fig. 74: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

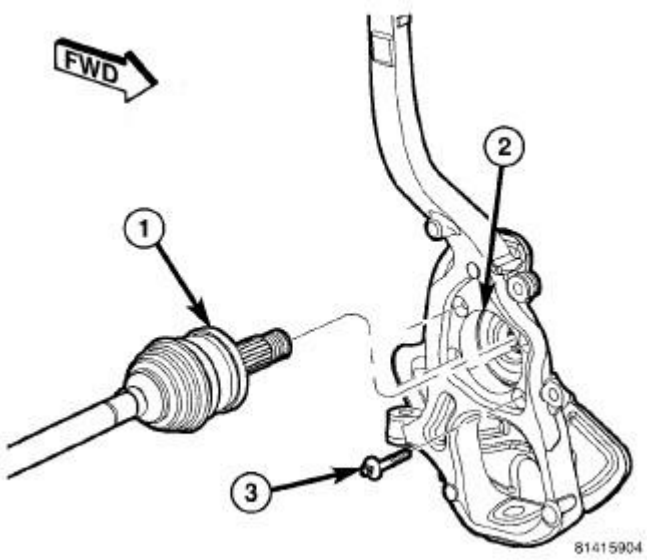

Fig. 75: Locating Halfshaft AT Hub/Bearing Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Slide hub and bearing (2) onto axle half shaft (1). Position hub and bearing onto knuckle, lining up mounting bolt holes.
2. Install four bolts (3) fastening hub and bearing in place. Tighten mounting bolts to 68 N.m (50 ft. lbs.).
3. Install brake rotor, then disc brake caliper and adapter assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .

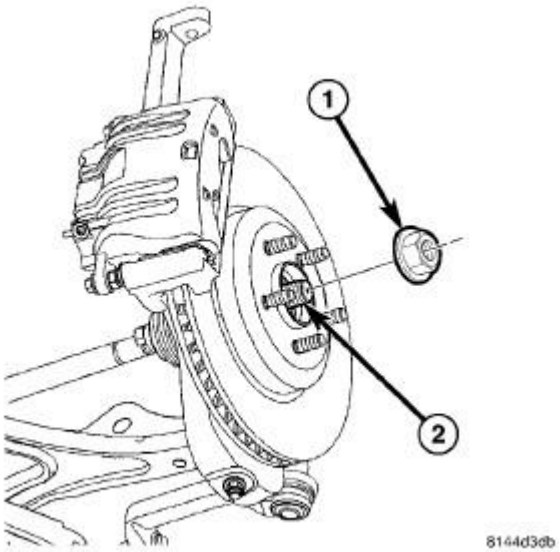

Fig. 76: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.**

4. Install hub nut (1) on end of axle half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

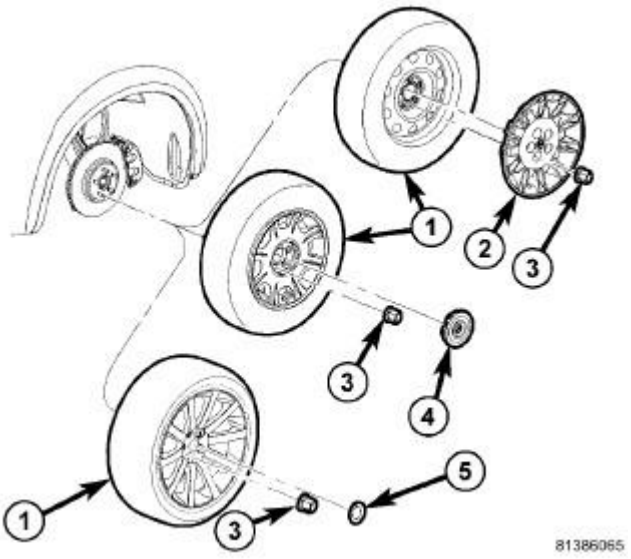

Fig. 77: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
6. Lower vehicle.

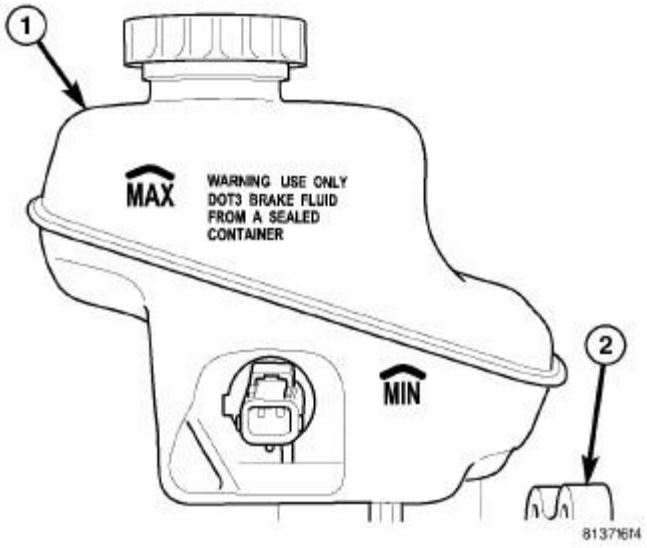

Fig. 78: Reservoir Fluid Level Markings

Courtesy of CHRYSLER GROUP, LLC

7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
8. Check and adjust brake fluid level in reservoir (1) as necessary.
9. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

RWD

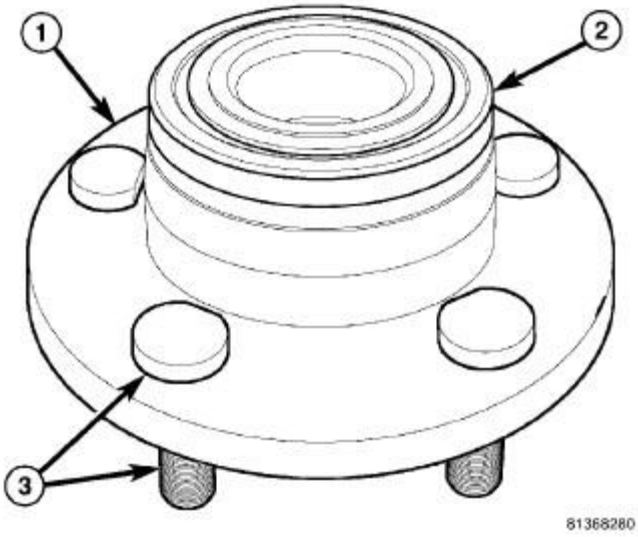

Fig. 79: Front Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to installation, inspect magnetic encoder (for wheel speed sensor) (2) for any damage and make sure any metal debris sticking to it is removed.

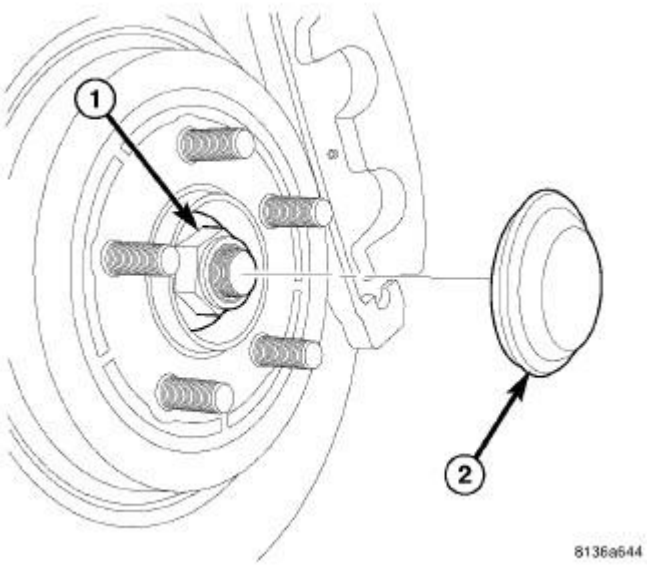

Fig. 80: Dust Cap & Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

1. Slide hub and bearing onto knuckle spindle.
2. Install hub nut (1) on end of spindle. Tighten hub nut to 213 N.m (152 ft. lbs.).
3. Install brake rotor, then disc brake caliper and adapter assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .

   NOTE: Install a new dust cap to preserve seal integrity.

4. Install NEW dust cap (2) on hub and bearing.

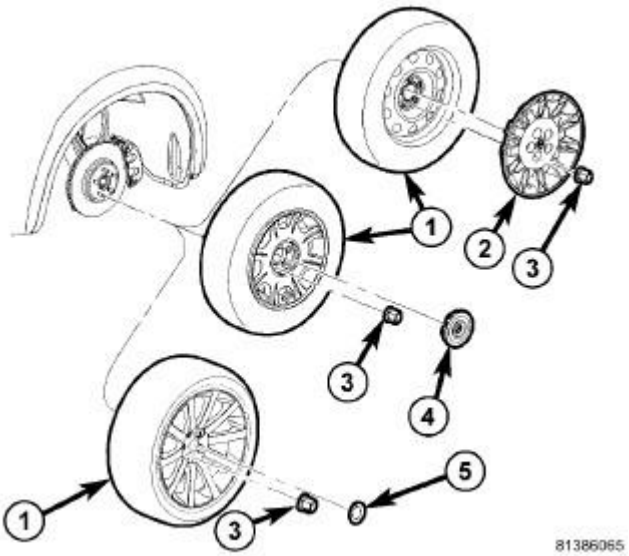

Fig. 81: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
6. Lower vehicle.

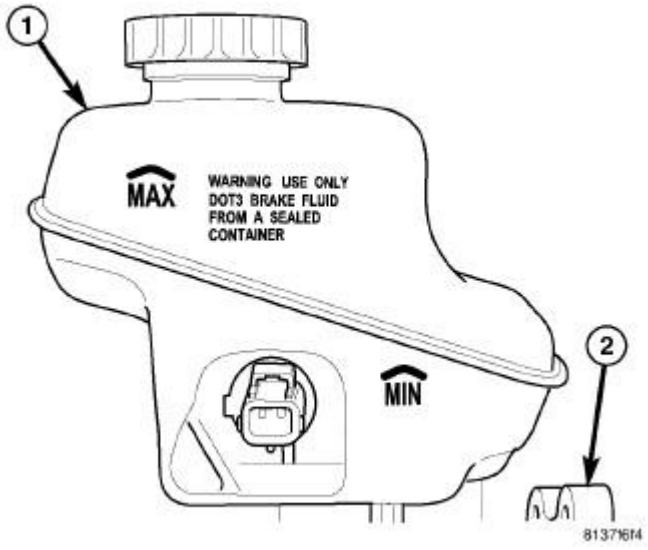

Fig. 82: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
8. Check and adjust brake fluid level in reservoir (1) as necessary.
9. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat

brake pads.

KNUCKLE, STEERING, AWD

REMOVAL

REMOVAL

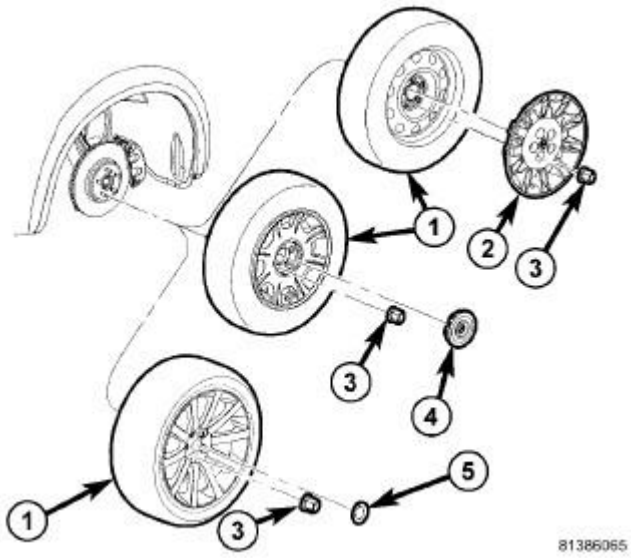

Fig. 83: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

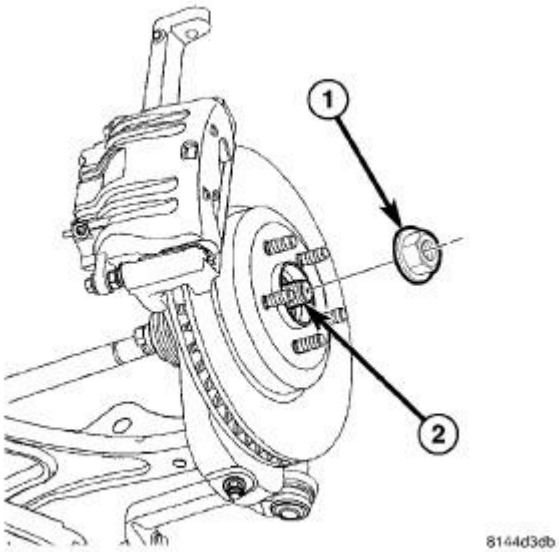

Fig. 84: Locating Axle Shaft Hub Nut
Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from axle half shaft (2).

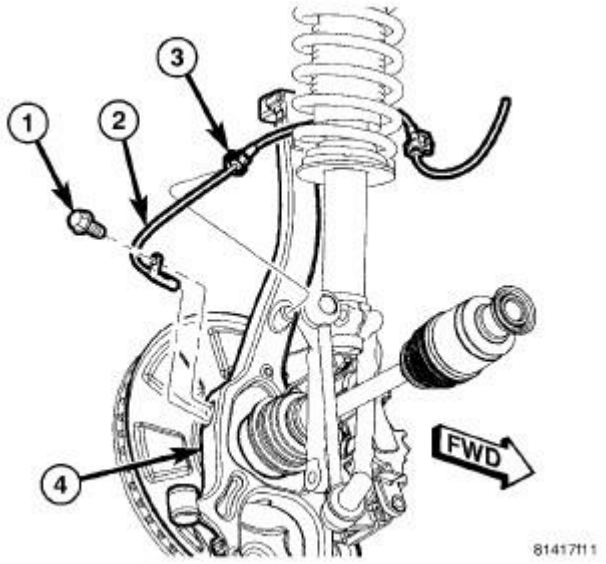

Fig. 85: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

4. Remove clip (3) fastening wheel speed sensor (2) to knuckle (4).
5. Remove screw (1) fastening wheel speed sensor (2) to knuckle (4). Pull sensor head (4) out of knuckle.
6. Access and remove front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

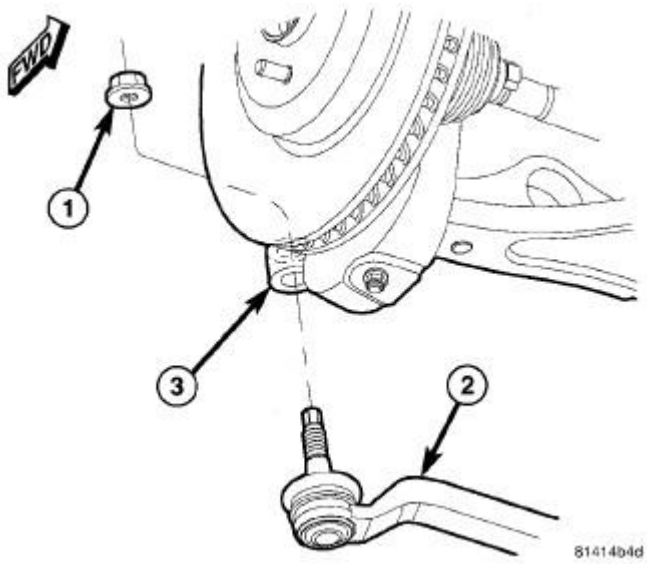

Fig. 86: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

7. Remove nut (1) from outer tie rod end (2) stud.

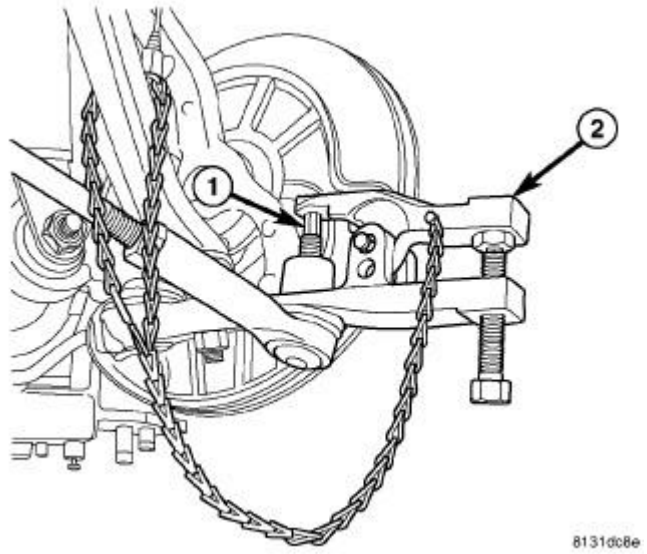

Fig. 87: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

8. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate tie rod stud (1) from knuckle.

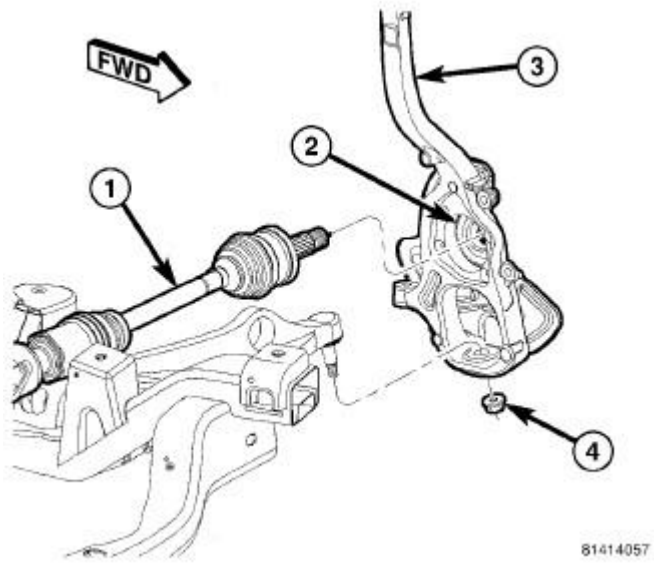

Fig. 88: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Loosen nut (4) attaching lower control arm ball joint stud to knuckle (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

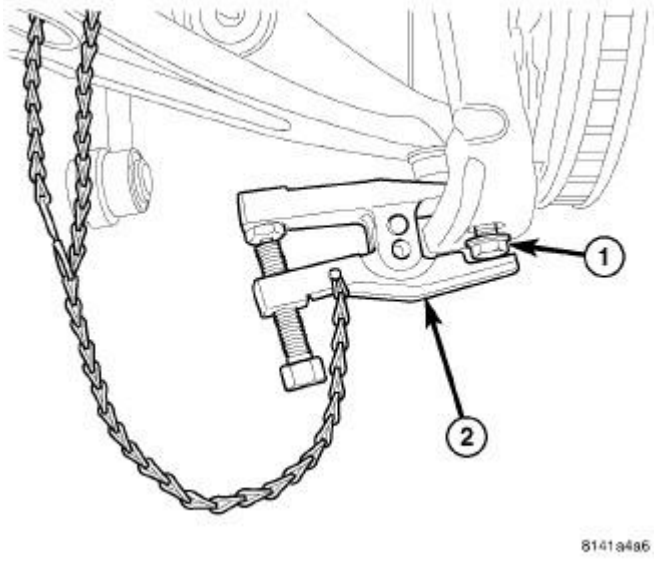

Fig. 89: Using Puller On Lower Ball Joint - AWD
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

10. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate ball joint stud from knuckle.
11. Remove tool.
12. Remove nut (1) from end of ball joint stud.

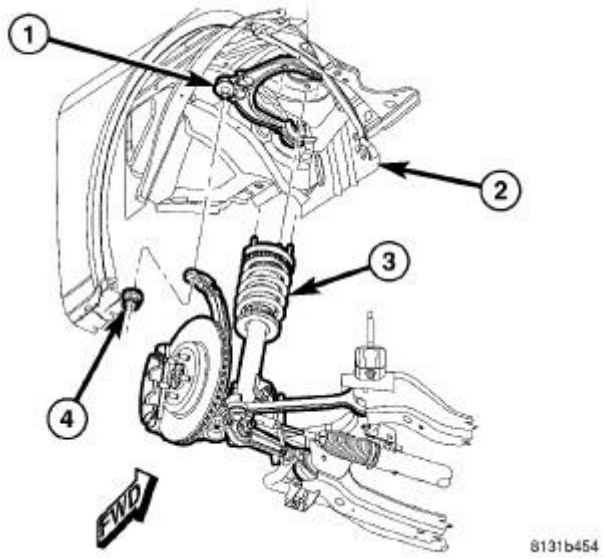

Fig. 90: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

13. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

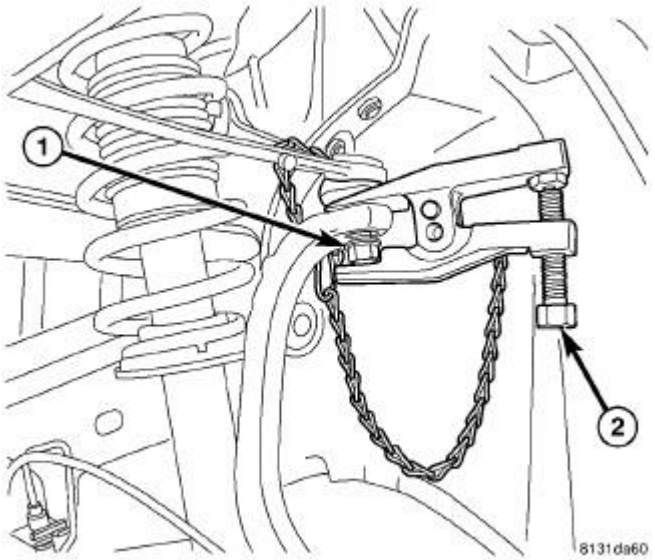

Fig. 91: Using Puller On Upper Ball Joint

Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

14. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate upper ball joint stud (1) from knuckle.
15. Remove tool.
16. Remove nut (1) from end of upper ball joint stud.

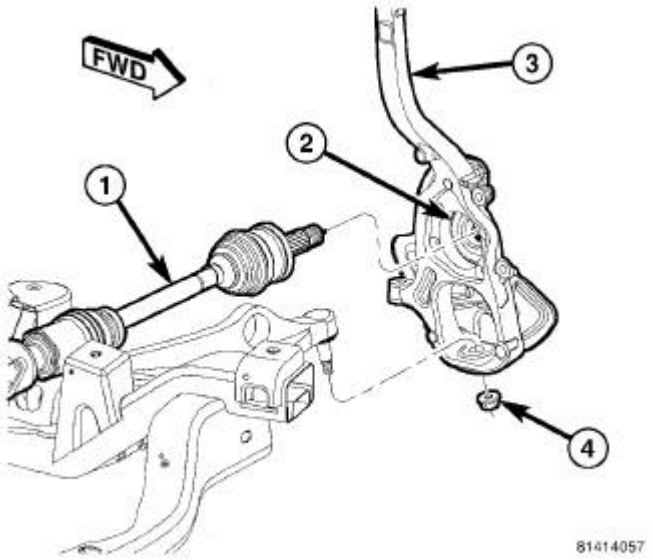

Fig. 92: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

17. Slide knuckle (3) off half shaft (1) and remove from vehicle.

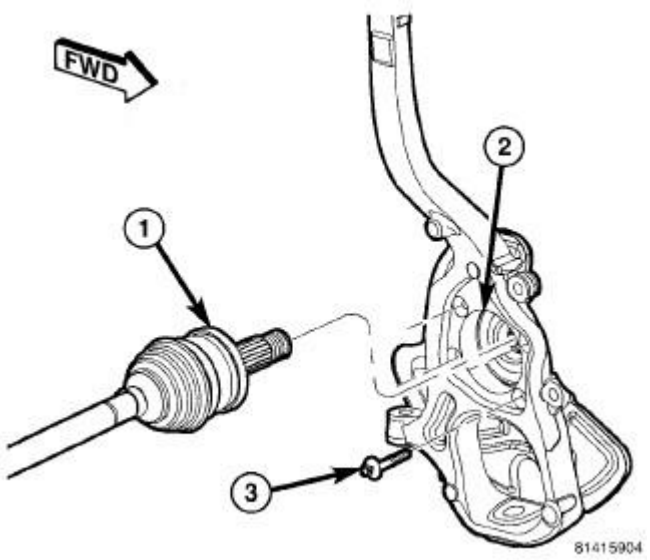

Fig. 93: Locating Halfshaft AT Hub/Bearing Assembly
Courtesy of CHRYSLER GROUP, LLC

18. If hub and bearing and dust shield need to be removed:
    1. Remove four bolts (3) fastening hub and bearing (2) to knuckle.
    2. Slide hub and bearing out of knuckle along with shield.

INSTALLATION

INSTALLATION

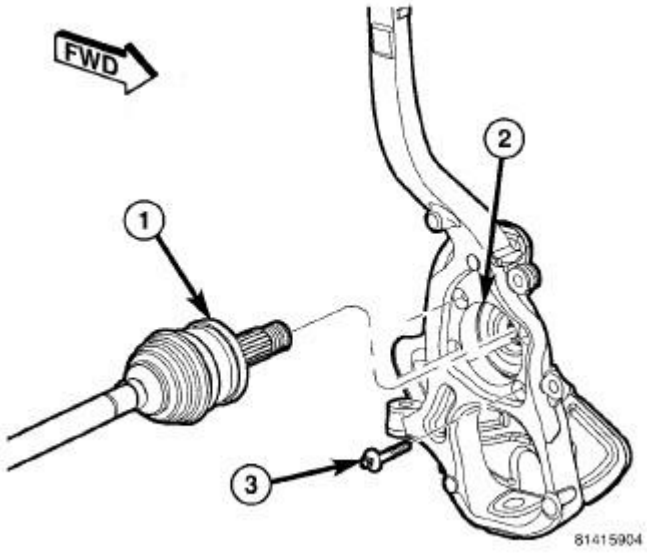

Fig. 94: Locating Halfshaft AT Hub/Bearing Assembly
Courtesy of CHRYSLER GROUP, LLC

1. If hub and bearing and dust shield needs to be installed on knuckle, perform following:
    1. Slide shield onto rear of hub and bearing.
    2. Slide hub and bearing into knuckle, lining up mounting holes in hub and bearing with those in shield and knuckle
    3. Install four bolts (3) fastening hub and bearing in place. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

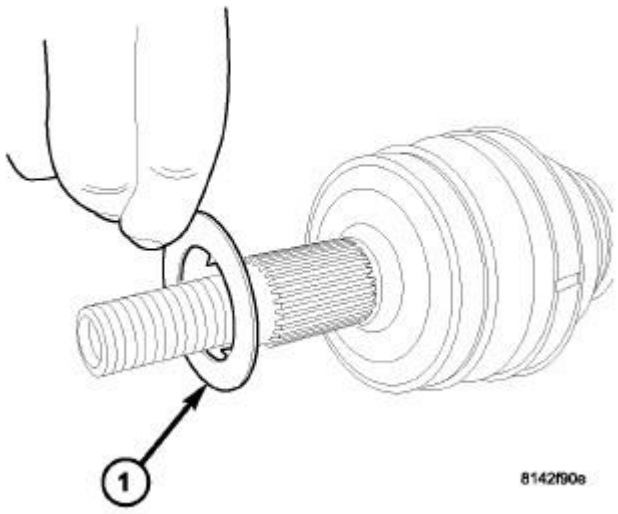

Fig. 95: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

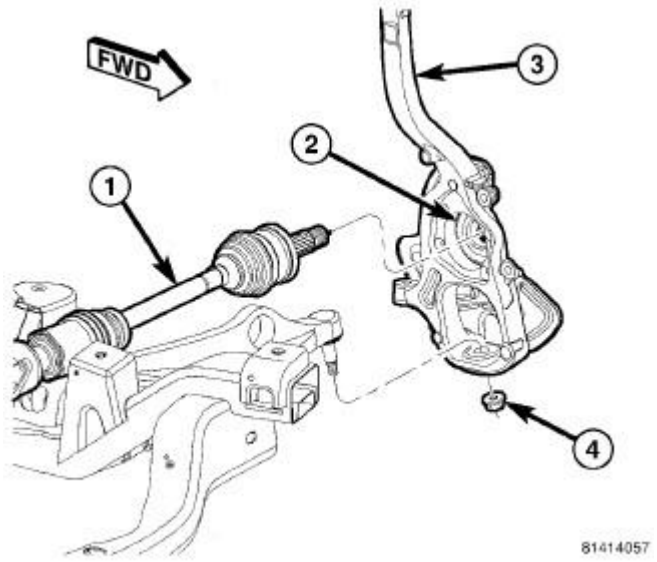

Fig. 96: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

2. Place knuckle (3) over lower ball joint stud and guide hub and bearing (2) onto axle half shaft (1).
3. Start NEW nut (4) on lower ball joint stud. **Do not tighten at this time.**

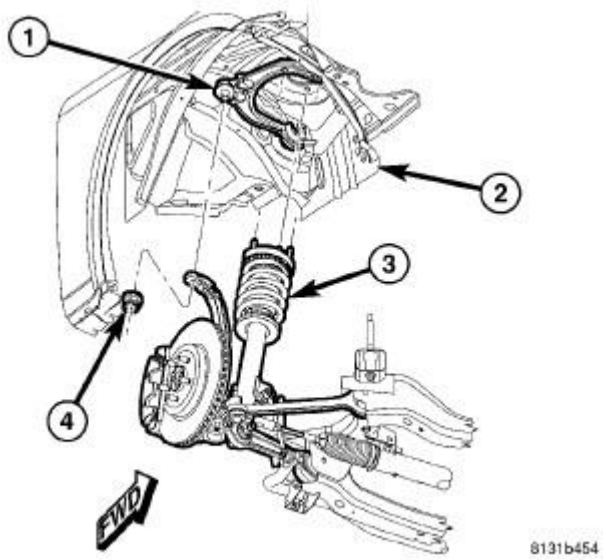

Fig. 97: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

4. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

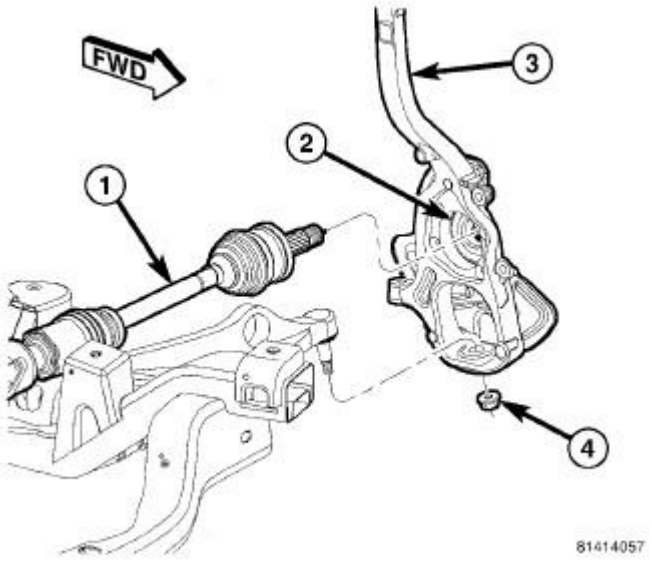

Fig. 98: Ball Joint & Axle Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

5. Tighten lower ball joint nut (4) by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

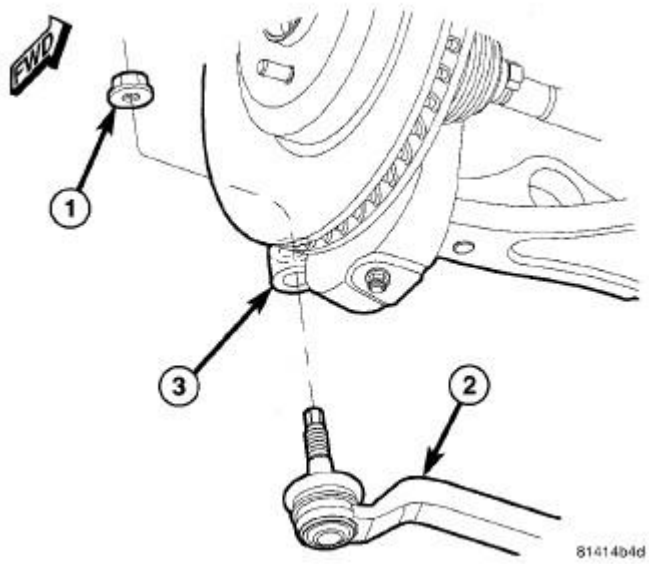

Fig. 99: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

6. Place outer tie rod stud through hole in knuckle (3) and install nut (1). Tighten nut by holding stud with a wrench while turning nut with another wrench. Tighten nut using crow foot wrench on torque wrench to 35 N.m + 90° turn (26 ft. lbs. + 90° turn).
7. Install brake rotor, then disc brake caliper and adapter assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .

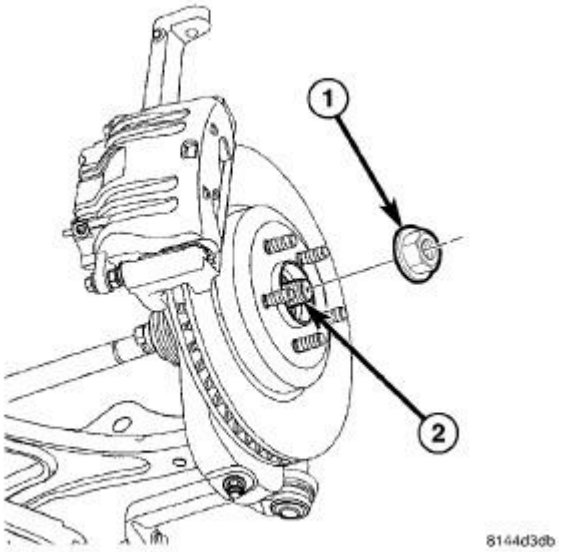

Fig. 100: Locating Axle Shaft Hub Nut

Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

8. Install hub nut (1) on end of axle half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

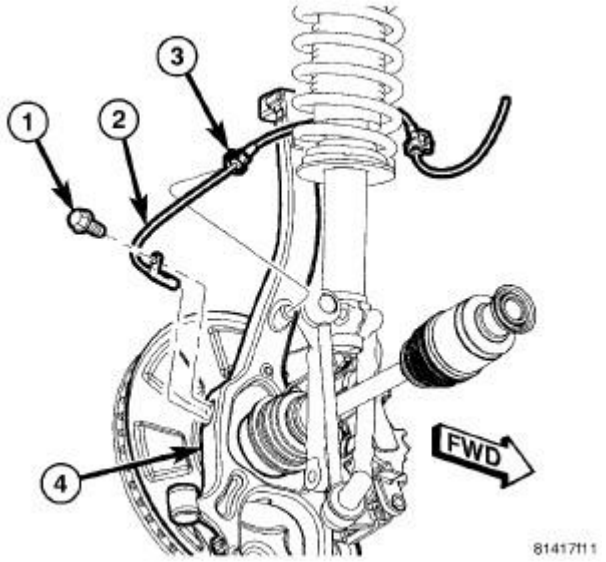

Fig. 101: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

9. Install wheel speed sensor (2) head into knuckle (4) and install mounting screw (1). Tighten screw to 11 N.m (95 in. lbs.).
10. Attach wheel speed sensor cable routing clip (3) at knuckle (4).

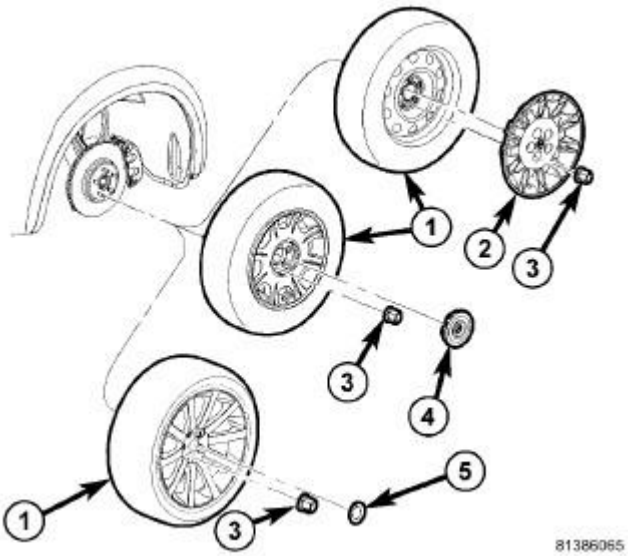

Fig. 102: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
12. Lower vehicle.

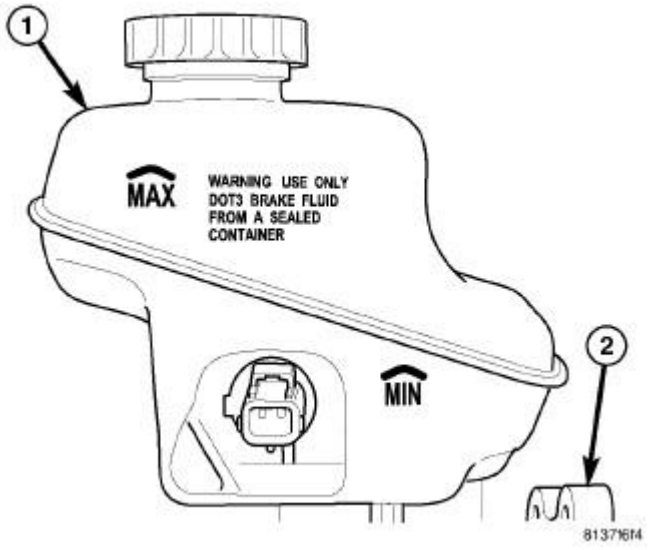

Fig. 103: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

13. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
14. Check and adjust brake fluid level in reservoir (1) as necessary.
15. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

KNUCKLE, STEERING, RWD

REMOVAL

REMOVAL

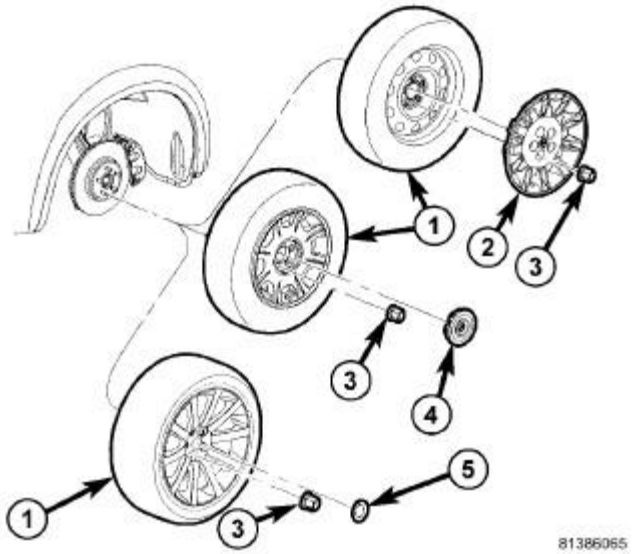

Fig. 104: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

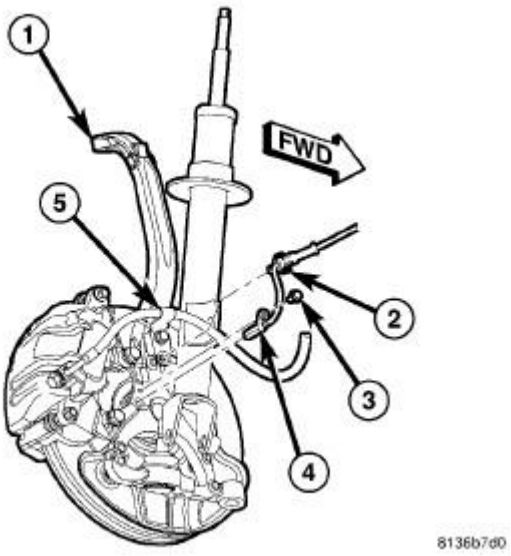

Fig. 105: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

3. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
4. Remove wheel speed sensor cable routing clip (2) from brake flex hose routing bracket (5).

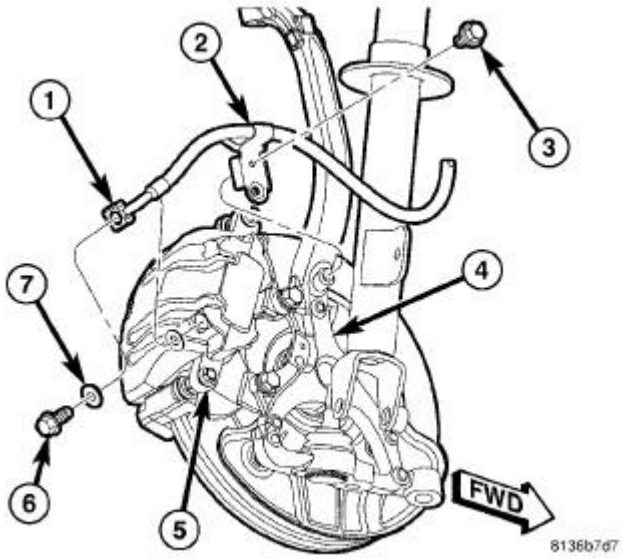

Fig. 106: Front Brake Flex Hose AT Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Remove screw (3) fastening brake flex hose routing bracket (2) to knuckle (4).
6. Access and remove front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

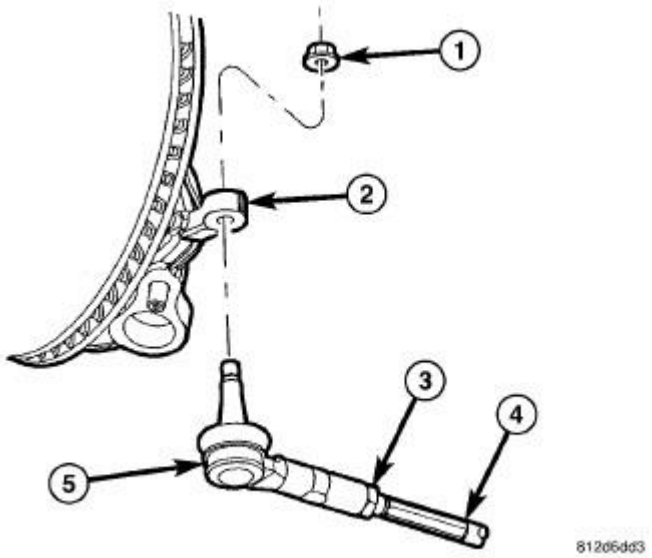

Fig. 107: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

7. Remove nut (1) from outer tie rod end stud.

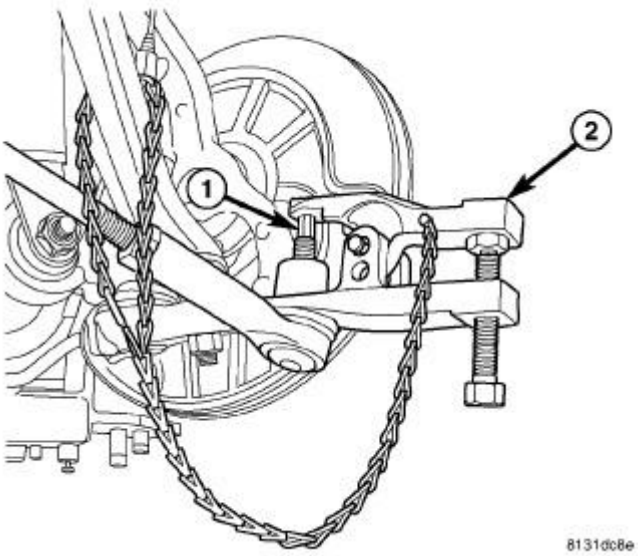

Fig. 108: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

8. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate tie rod stud (1) from knuckle.

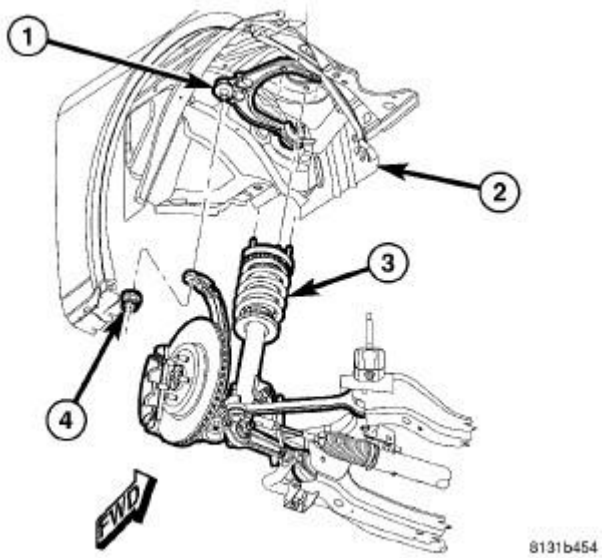

Fig. 109: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting**

while using Puller in next step.

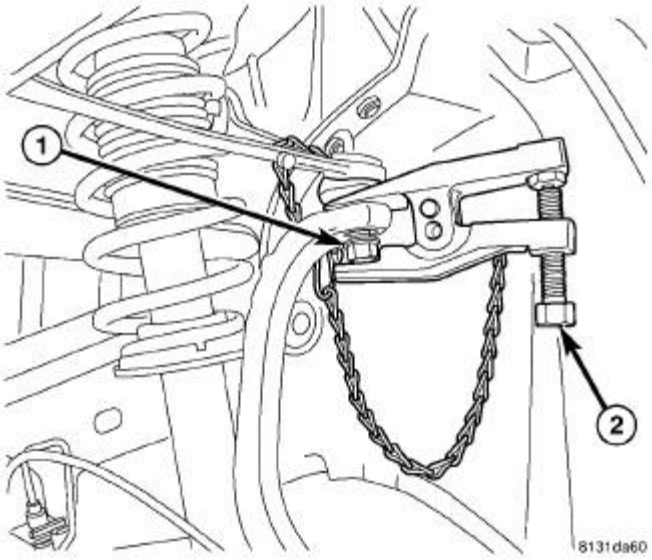

Fig. 110: Using Puller On Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

10. Using Puller (2), Special Tool (special tool #9360, Remover, Ball Joint), separate upper ball joint stud (1) from knuckle.

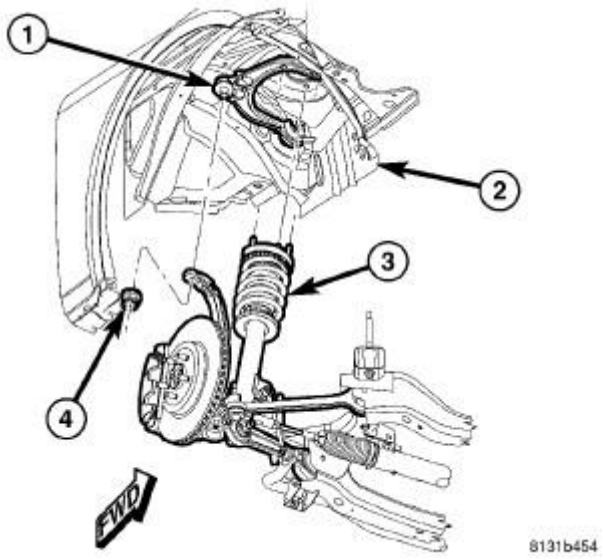

Fig. 111: View Of Upper Ball Joint, Spindle & Strut Mounting

Courtesy of CHRYSLER GROUP, LLC

11. Remove nut (4) from end of upper ball joint stud (1).

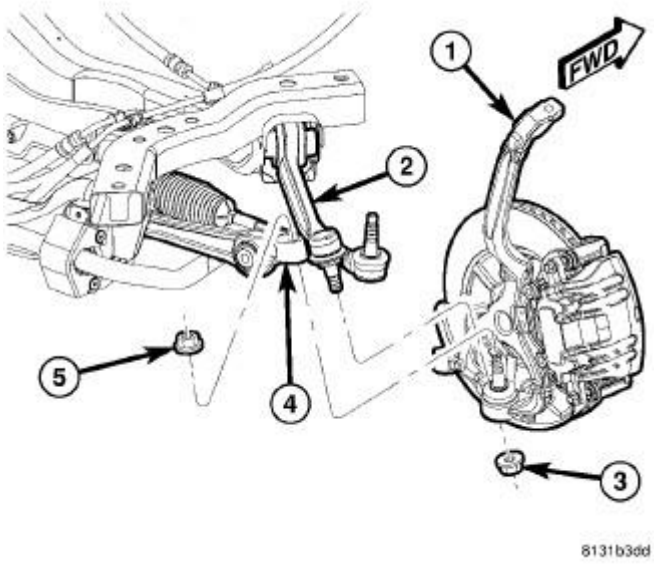

Fig. 112: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

12. Loosen nut (3) attaching tension strut (2) ball joint stud to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

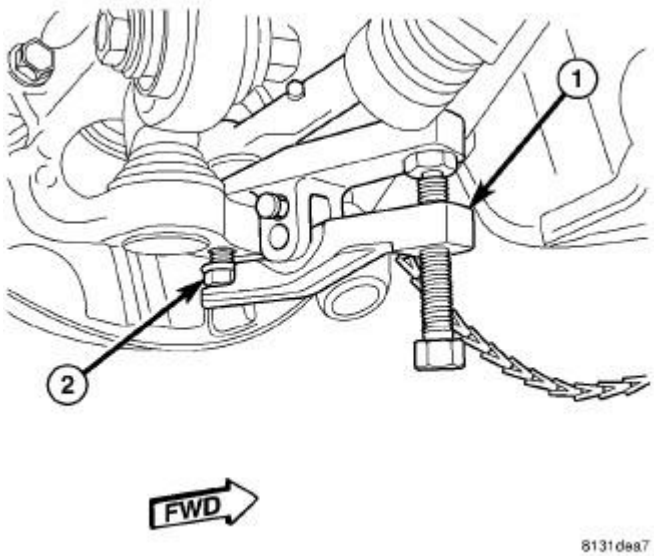

Fig. 113: Using Puller On Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

13. Using Puller (1), Special Tool (special tool #9360, Remover, Ball Joint), separate tension strut ball joint stud (2) from knuckle.

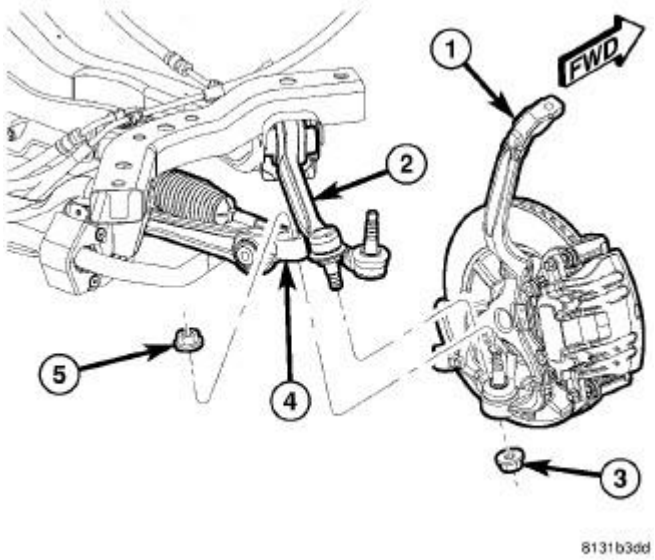

Fig. 114: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

14. Remove nut (3) from end of tension strut (2) ball joint stud.
15. Loosen nut (5) attaching ball joint stud to lower control arm (4). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

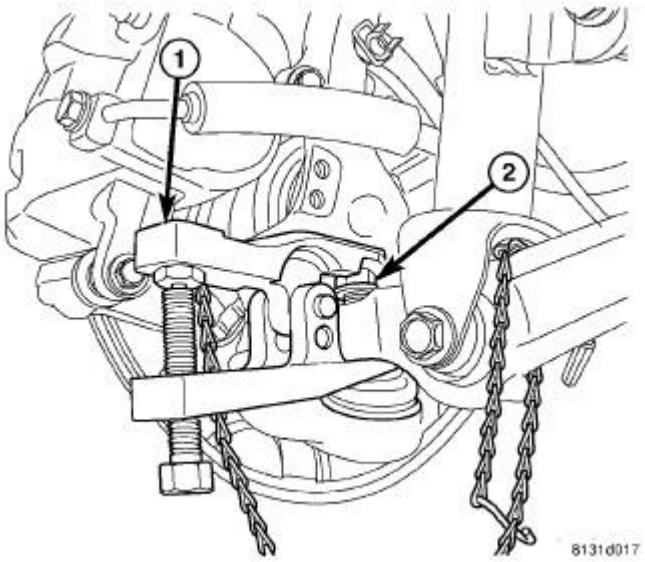

Fig. 115: Using Puller On LCA Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool (special tool #9360, Remover, Ball Joint), into place past seal boot.

16. Using Puller (1), Special Tool (special tool #9360, Remover, Ball Joint), separate ball joint stud (2) from lower control arm.

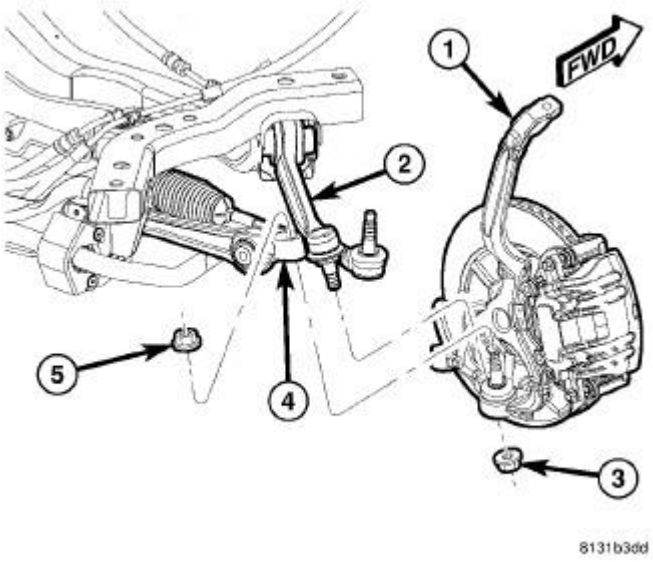

Fig. 116: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

17. Remove nut (5) from end of ball joint stud attaching lower control arm to knuckle.
18. Remove knuckle from vehicle.

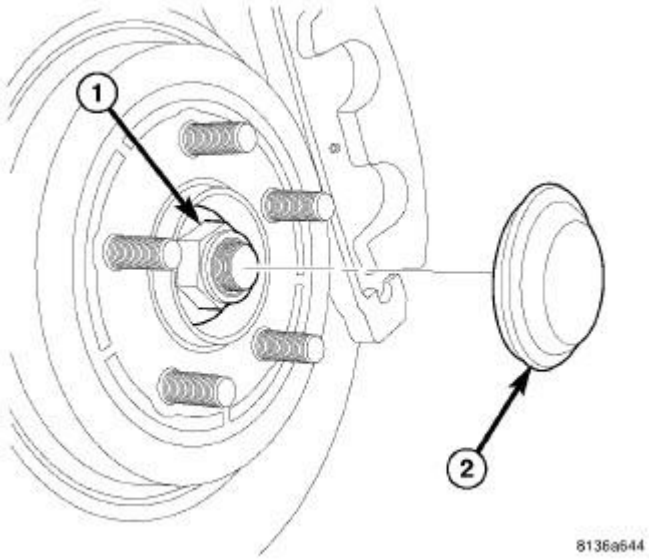

Fig. 117: Dust Cap & Hub Nut
Courtesy of CHRYSLER GROUP, LLC

19. If hub and bearing needs to be removed, perform the following:
    1. Remove dust cap (2). When doing this, avoid damaging internal bore of hub to preserve seal integrity.
    2. Remove hub nut (1).
    3. Slide hub and bearing off knuckle spindle.
20. If shield needs to be removed from knuckle, remove 3 mounting screws, then shield.
21. If lower control arm ball joint needs to be removed from knuckle. Refer to **KNUCKLE, STEERING, RWD, DISASSEMBLY**.

DISASSEMBLY

DISASSEMBLY

NOTE: To perform this procedure, it works best to mount Ball Joint Press (special tool #C-4212F, Press, Ball Joint) in a vise.

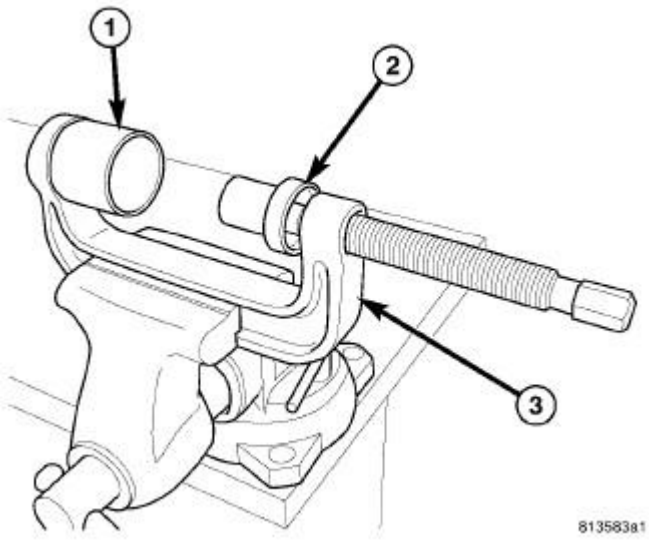

Fig. 118: Tools Assembled For Ball Joint Removal
Courtesy of CHRYSLER GROUP, LLC

1. Place Ball Joint Remover/Installer (special tool #9320, Remover/Installer, Ball Joint) (1) into cup area of Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (3) as shown in illustration and tighten set screw.
2. Place Ball Joint Remover/Installer (special tool #9320-3, Remover, Ball Joint) (2) onto end of screw-drive of Ball Joint Press (special tool #C-4212F, Press, Ball Joint) (3) as shown in illustration.

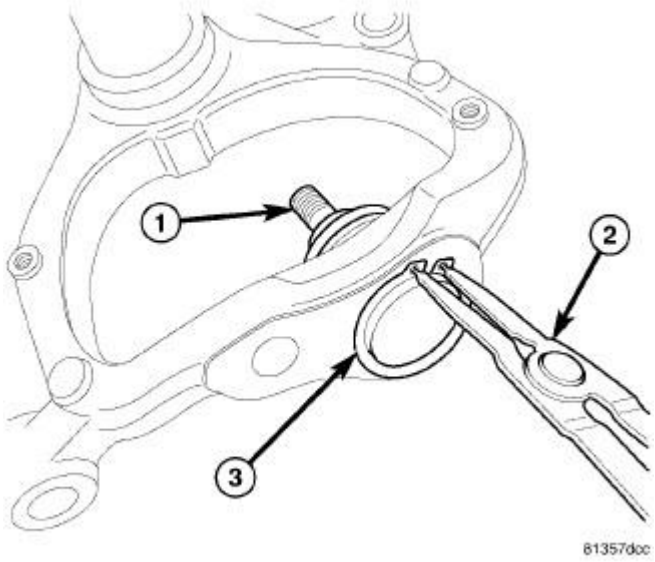

Fig. 119: Ball Joint Snap Ring
Courtesy of CHRYSLER GROUP, LLC

3. Using a pair of snap-ring pliers (2), remove snap-ring (3) from bottom of ball joint (1).

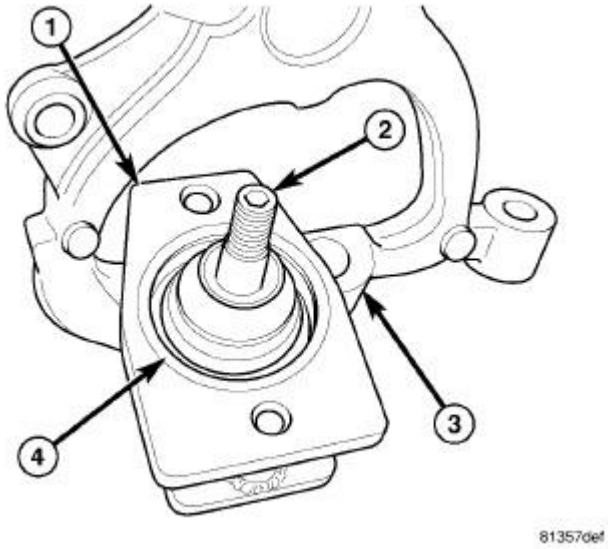

Fig. 120: Support Clamp Positioned Over Ball Joint
Courtesy of CHRYSLER GROUP, LLC

4. Install halves of Support Clamp (1), Ball Joint Remover/Installer (special tool #9320-1, Plate, Ball Joint Remover) (2) over ball joint (2) and around knuckle surface (3) as shown in illustration. Install and snug Support Clamp (1) screws from underside.

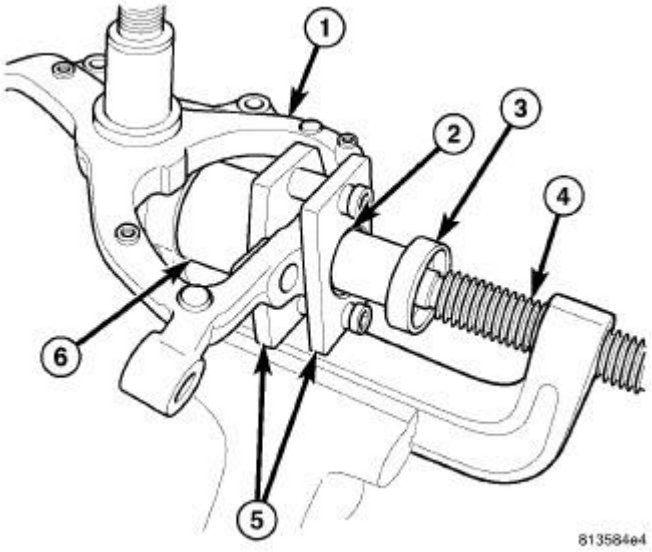

Fig. 121: Tools Positioned For Ball Joint Removal
Courtesy of CHRYSLER GROUP, LLC

5. Position knuckle (1) over tools guiding top of ball joint inside of Receiver (6), then hand tighten Press screw-drive (4) until Remover (3) comes into contact with bottom of ball joint (2).

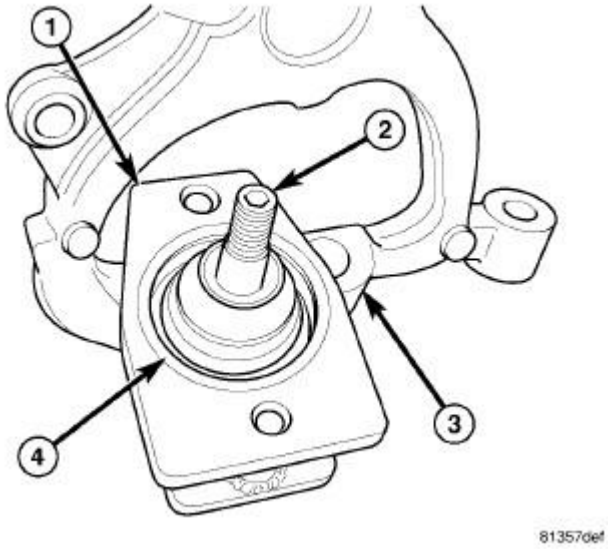

Fig. 122: Support Clamp Positioned Over Ball Joint
Courtesy of CHRYSLER GROUP, LLC

NOTE: When positioning knuckle over tools, make sure Receiver, Ball Joint Remover/Installer (special tool #9320-5, Receiver Cup), sets into recessed area (4) of Support Clamp, Ball Joint Remover/Installer (special tool #9320-1, Plate, Ball Joint Remover).

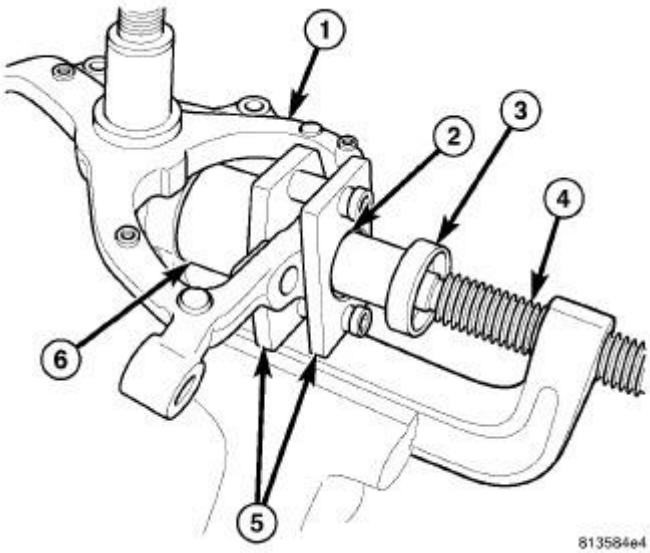

Fig. 123: Tools Positioned For Ball Joint Removal
Courtesy of CHRYSLER GROUP, LLC

6. Tighten Press screw-drive (4) forcing ball joint out of knuckle (1) and into Receiver (6).
7. Loosen screw-drive (4) and remove knuckle (1) from Press. Remove ball joint from Receiver (6).

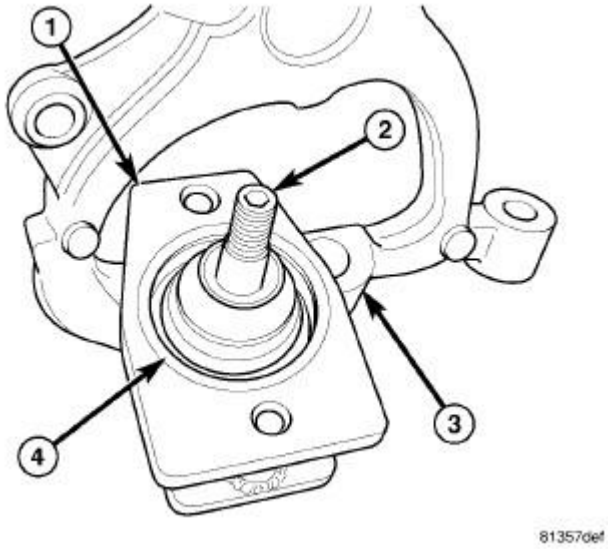

Fig. 124: Support Clamp Positioned Over Ball Joint
Courtesy of CHRYSLER GROUP, LLC

8. Remove Support Clamp (1) from knuckle (3).

ASSEMBLY

ASSEMBLY

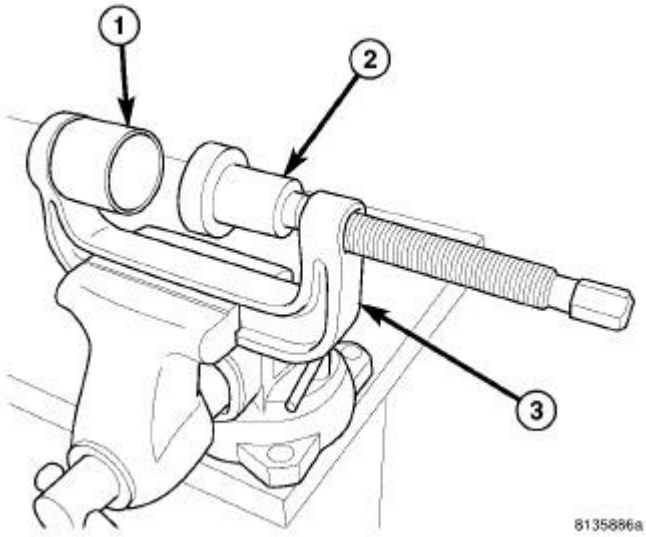

Fig. 125: Tools Assembled For Ball Joint Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: To perform this procedure it works best to mount Press (3), Special Tool (special tool #C-4212F, Press, Ball Joint), in a vise and hold the component in

your hands.

1. Place Installer (1), Special Tool (special tool #9320-4, Installer Cup), into cup area of Press (3), Special Tool (special tool #C-4212F, Press, Ball Joint), as shown in illustration and tighten set screw.
2. Place Remover (2), Special Tool (special tool #9320-3, Remover, Ball Joint), onto end of screw-drive of Press (3), Special Tool (special tool #C-4212F, Press, Ball Joint), as shown in illustration.

   Note: This is the reverse of how Remover is installed on screw-drive for removal.

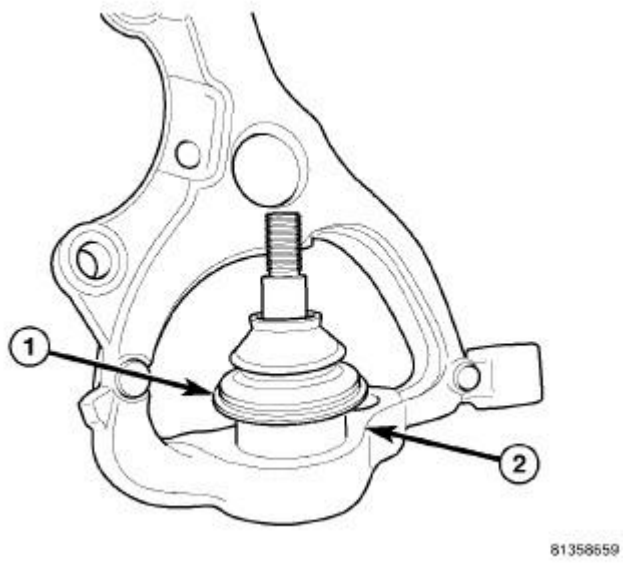

Fig. 126: Start Ball Joint In Knuckle
Courtesy of CHRYSLER GROUP, LLC

3. Start NEW ball joint (1) into bore of knuckle (2).

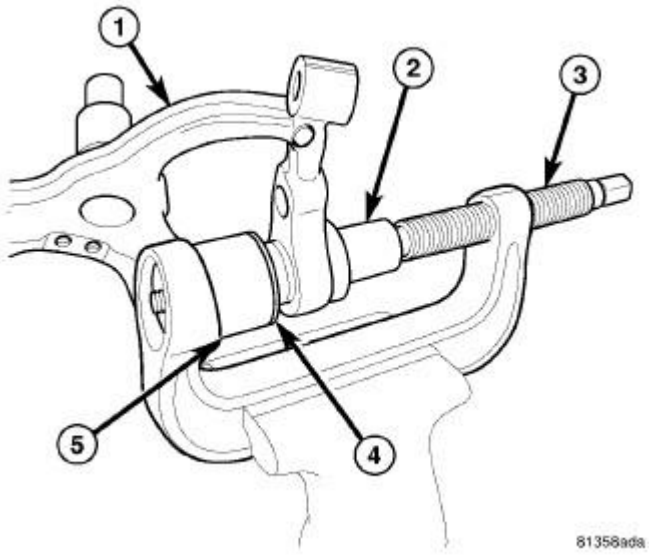

Fig. 127: Tools Positioned For Ball Joint Installation
Courtesy of CHRYSLER GROUP, LLC

4. Position knuckle (1) over tools guiding top of ball joint inside of Installer (5) until outside flange of ball joint (4) comes into contact with Installer, then hand tighten Press screw-drive (3) until Remover (2) comes into contact with bottom of knuckle (1).
5. Using hand tools, tighten screw-drive (3), pressing ball joint into knuckle until flange (4) comes to a stop against the knuckle.
6. Loosen screw-drive and remove knuckle from Press.

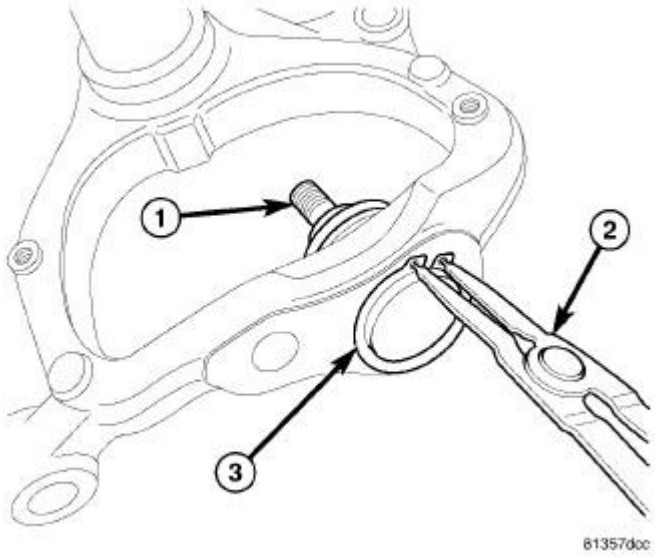

Fig. 128: Ball Joint Snap Ring
Courtesy of CHRYSLER GROUP, LLC

7. Install snap-ring (3) into groove on bottom of ball joint.
8. Inspect ball joint for proper fit. Make sure seal boot is uniform and wire rings are in place.
9. Install knuckle on vehicle. Refer to **KNUCKLE, STEERING, AWD, INSTALLATION** or **KNUCKLE, STEERING, RWD, INSTALLATION**.

INSTALLATION

INSTALLATION

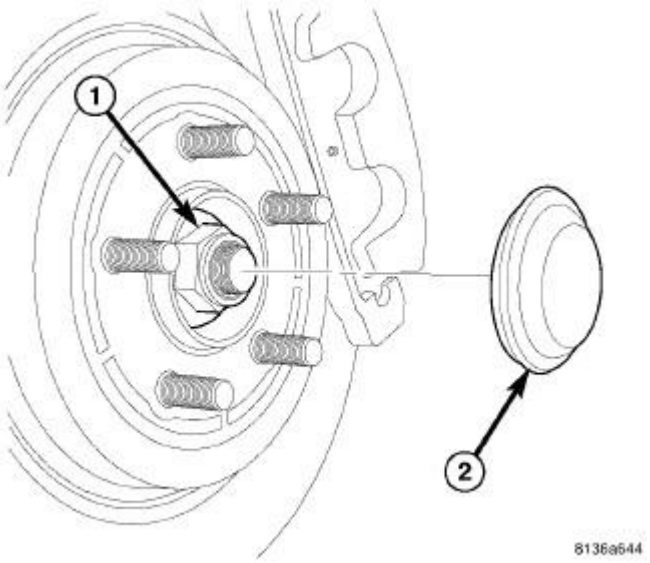

Fig. 129: Dust Cap & Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

1. If shield needs to be installed on knuckle, place shield in place and attach to knuckle using 3 screws. Tighten screws to 10 N.m (89 in. lbs.).
2. If hub and bearing needs to be installed on knuckle, perform the following:
    1. Slide hub and bearing onto knuckle spindle.
    2. Install hub nut (1) on end of spindle. Tighten hub nut to 213 N.m (152 ft. lbs.).
    3. Install NEW dust cap (2).

NOTE: Install a new dust cap to preserve seal integrity.

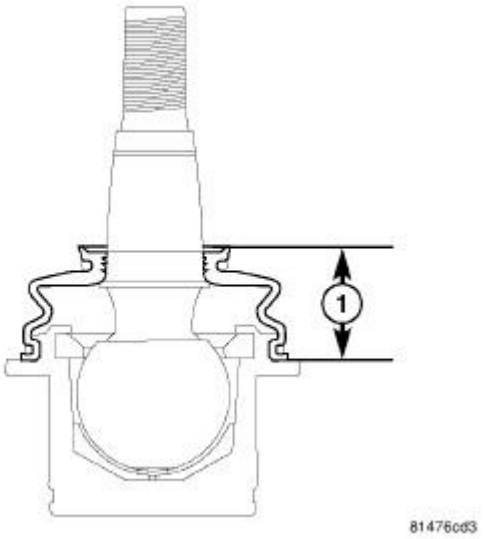

Fig. 130: Ball Joint Seal Boot Height
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before installing knuckle on lower control arm, measure height of ball joint seal boot (1) mounted on knuckle. If seal boot height is above 25.5 mm, any air inside seal boot must be expelled. To do so, follow these steps.

a. **Tip ball joint stud completely to one side.**
b. **Using thumb and index finger, gently squeeze seal boot together at center expelling any air. Do not allow grease to be release.**
c. **Push down very top of seal boot.**
d. **Return ball joint stud to original "centered" position.**
e. **Measure ball joint seal boot height (1) making sure it is within specification.**
f. **Wipe any grease from ball joint stud.**

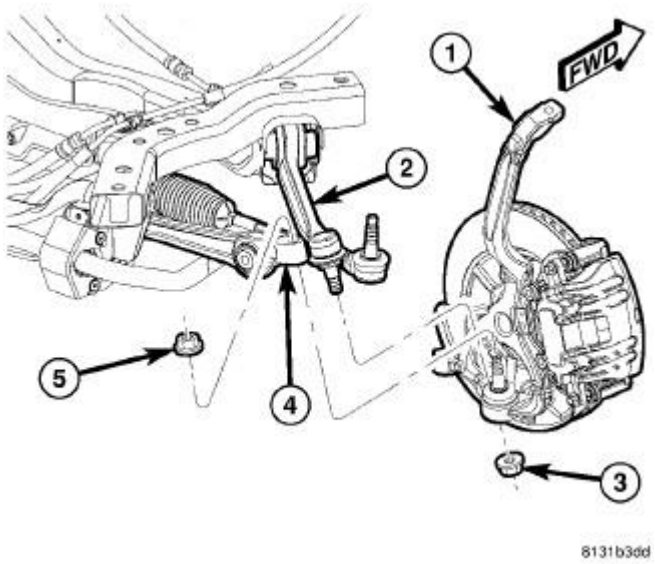

Fig. 131: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

3. Place knuckle (1) over lower ball joint studs on vehicle and loosely install NEW nuts by hand.

CAUTION: It is important to tighten nuts as described in following steps to avoid damaging ball stud joints.

4. Completely install NEW nut (5) on ball joint stud attaching lower control arm (4) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).
5. Completely install NEW nut (3) on ball joint stud attaching tension strut (2) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

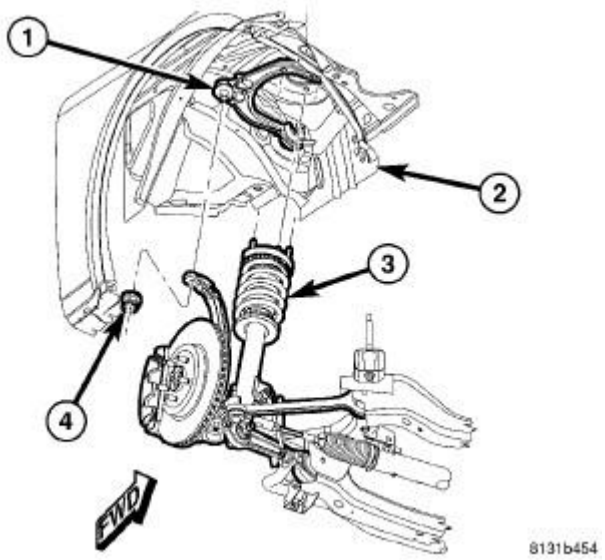

Fig. 132: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

6. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

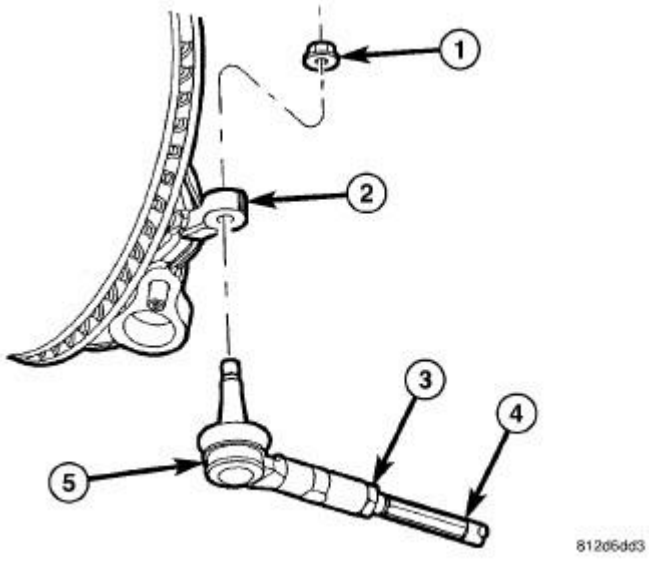

Fig. 133: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

7. Place outer tie rod stud through hole in knuckle (2) and install nut (1). Tighten nut by holding stud with a wrench while turning nut with another wrench. Tighten nut using crow foot wrench on torque wrench to 35 N.m + 90° turn (26 ft. lbs. + 90° turn).
8. Install brake rotor, then disc brake caliper and adapter assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .

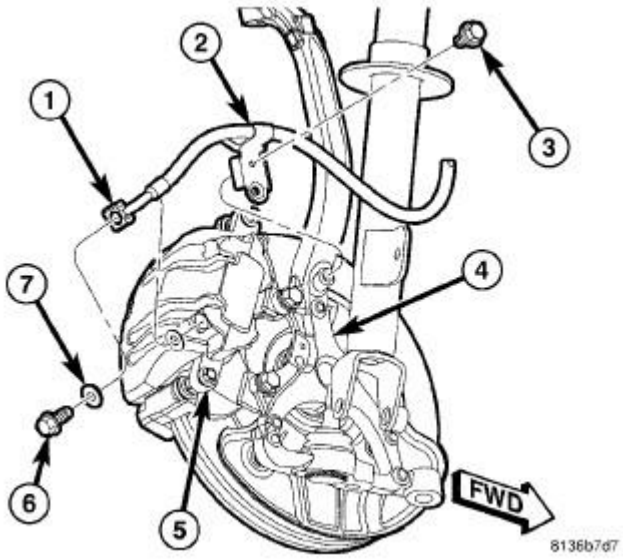

Fig. 134: Front Brake Flex Hose AT Caliper
Courtesy of CHRYSLER GROUP, LLC

9. Install screw (3) fastening brake flex hose routing bracket (2) to knuckle (4). Tighten screw to 12 N.m (106 in. lbs.).

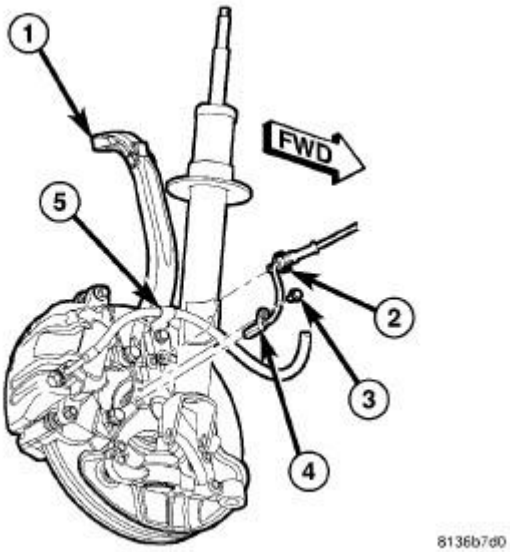

Fig. 135: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

10. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (95 in. lbs.).
11. Attach wheel speed sensor cable and routing clip (2) to brake flex hose routing bracket (5).

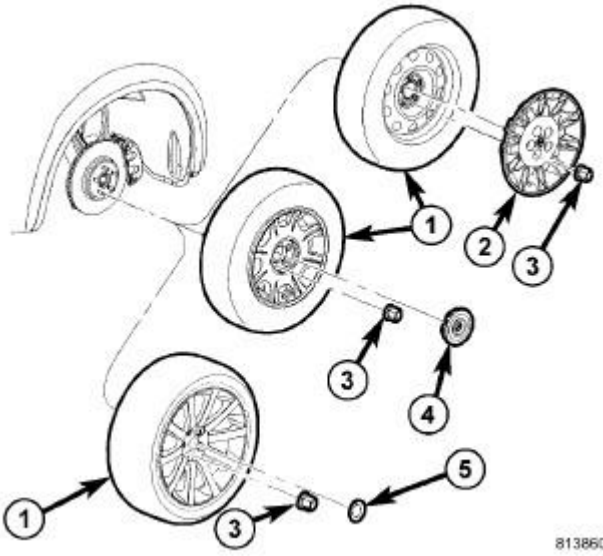

Fig. 136: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
13. Lower vehicle.

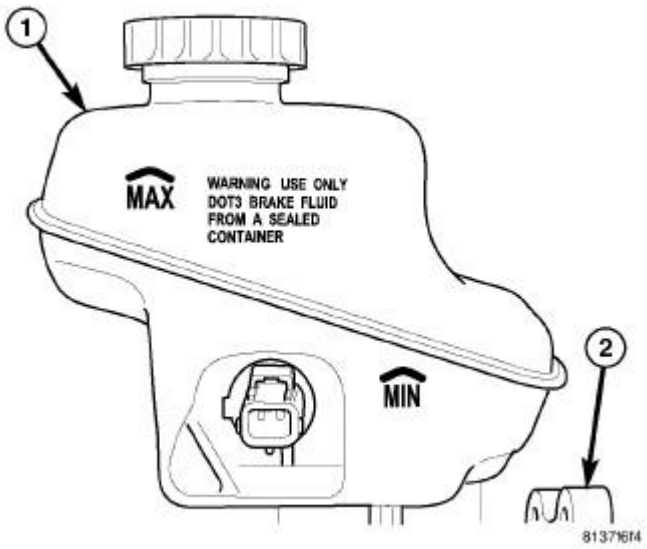

Fig. 137: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

14. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
15. Check and adjust brake fluid level in reservoir (1) as necessary.
16. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

SENSOR, ACTIVE DAMPING

DESCRIPTION

DESCRIPTION

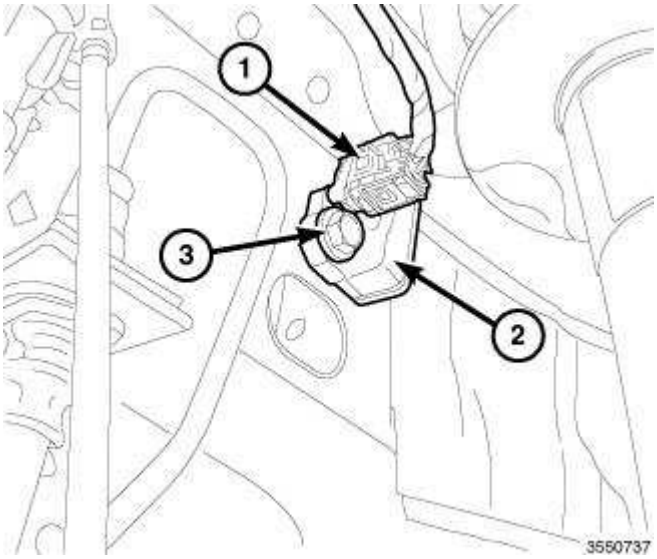

Fig. 138: Damping Sensors

Courtesy of CHRYSLER GROUP, LLC

NOTE: Right front sensor shown in illustration.

There are three active damping sensors (2). The front sensors are located in each front wheel well next to the brake line junction. The rear sensor is mounted in the right rear wheel well on the shock tower. The sensors are 3 wire, 5V reference sensors wired directly to the Active Damping Control Module (ADCM).

OPERATION

OPERATION

The Active Damping Control Module (ADCM) uses the CAN bus to communicate with multiple modules. The ADCM has the following inputs: Vehicle Speed, Steering Angle Sensor (SAS) position, Throttle Position Sensor (TPS), Active Damping System (ADS) Switch, and three active damping sensors.

There are two operating modes of the ADS, Auto and Sport. At each ignition key on cycle, the vehicle defaults to Auto mode. When Sport mode is selected, the suspension has unique handling characteristics.

The Active Damping Control Module (ADCM) controls the suspension and ride for the SRT version of this vehicle by adjusting the rebound and jounce of the shock assemblies using the above information and predetermined settings for maximum vehicle control. The shock absorbers are unique to the ADS. Each shock absorber has a valving unit that is external, but still part of the shock absorber. Inside each valving unit are two solenoids that control the damping valves to alter the ride of the vehicle. The shocks are replaced as an assembly, they cannot be disassembled for repair.

Additionally, there are three active damping sensors, two in the front of the vehicle and one in the rear. These sensors measure the plane of the vehicle.

REMOVAL

FRONT

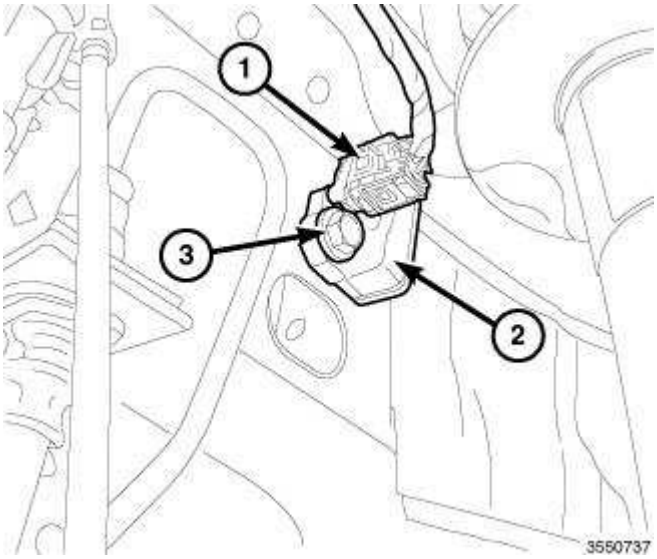

Fig. 139: Damping Sensors
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

1. Raise and support the vehicle.
2. Release the terminal locking tab and disconnect the wiring harness connector (1).
3. Remove the sensor retaining bolt (3) and remove the sensor (2) from the vehicle.

REAR

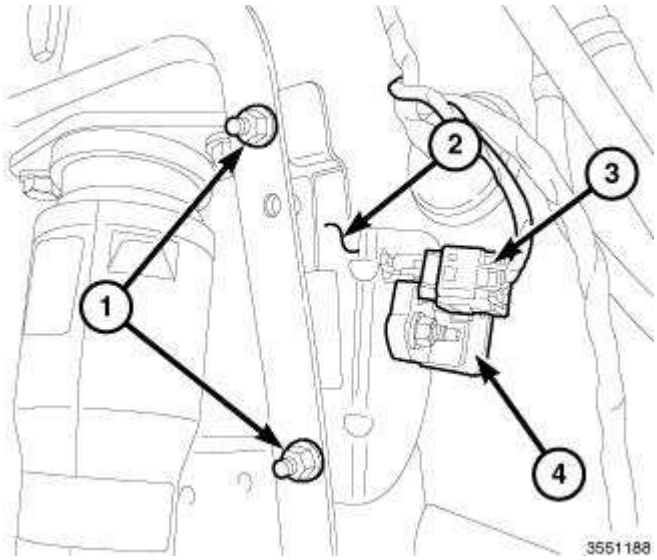

Fig. 140: Wiring Harness Connector, Two Mounting Nuts & ADS Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.

2. Release the terminal locking tab and disconnect the wiring harness connector (3) from the rear Active Damping Suspension (ADS) sensor (4).
3. Remove the two mounting nuts (1) securing the ADS bracket (2) to the shock tower.
4. Remove the bracket (2) from the vehicle with the ADS sensor attached.

INSTALLATION

FRONT

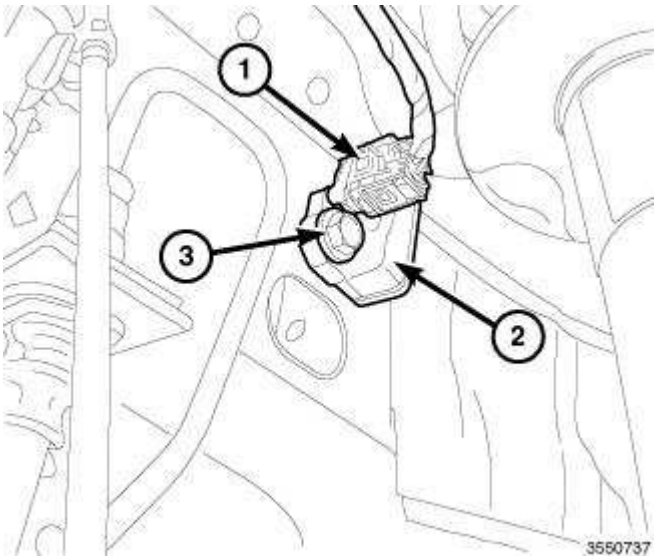

Fig. 141: Damping Sensors
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

1. Position the sensor (2), install the sensor retaining bolt (3) and tighten to 9 N.m (80 in. lbs.).
2. Connect the wiring harness connector (1) and seat the terminal locking tab.

REAR

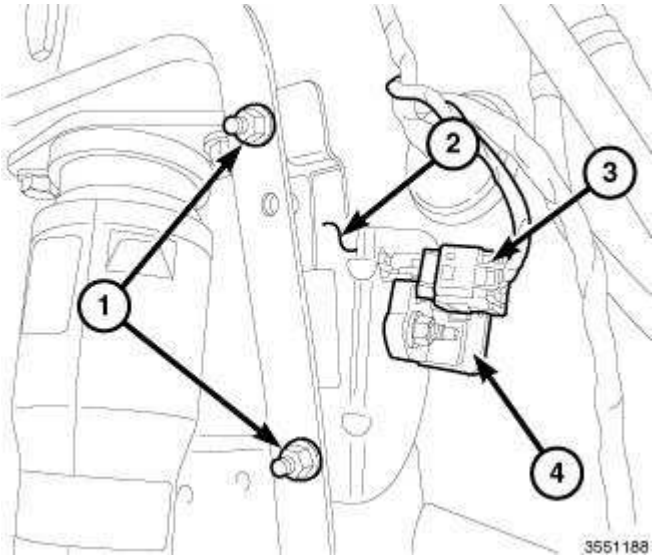

Fig. 142: Wiring Harness Connector, Two Mounting Nuts & ADS Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Install the bracket (2) and place the studs through the holes in the rear shock tower.
2. Install the mounting nuts (1) and tighten to 9 N.m (60 in. lbs.).
3. Connect the wiring harness connector (3) to the Active Damping Suspension (ADS) sensor (4) and seat the terminal locking tab.

SHOCK ABSORBER, SUSPENSION, COIL-OVER

REMOVAL

ALL-WHEEL-DRIVE

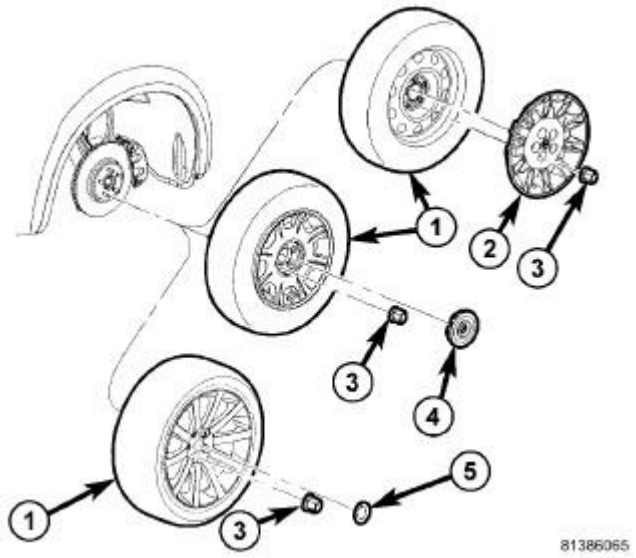

Fig. 143: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

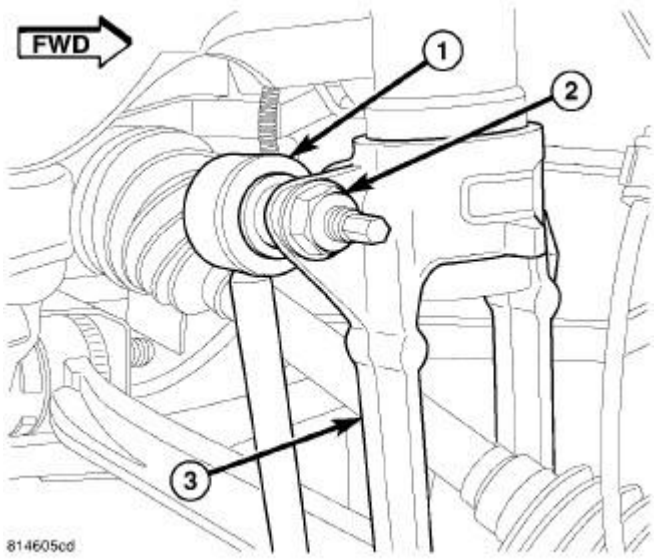

Fig. 144: Locating Stabilizer Link Attachment AT Shock Clevis
Courtesy of CHRYSLER GROUP, LLC

3. While holding link ball joint stem from rotating, remove nut (2) fastening stabilizer link (1) to shock clevis bracket (3). Slide link ball joint stem from clevis bracket.

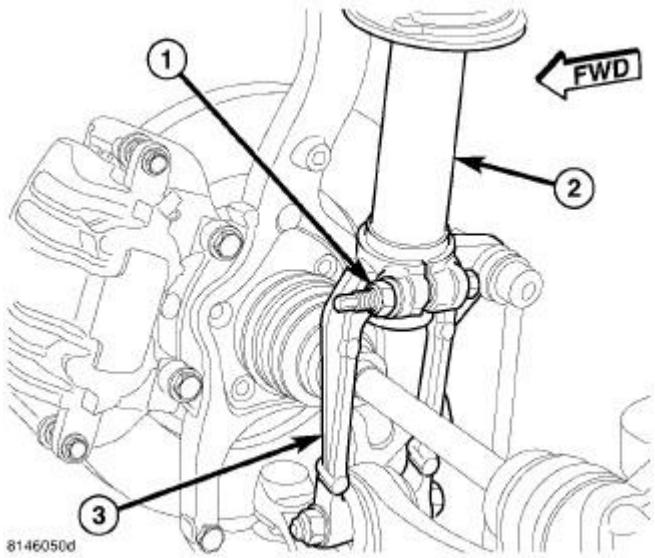

Fig. 145: Removing/Installing Shock Clevis Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove nut and pinch bolt (1) fastening clevis bracket (3) to bottom of shock assembly (2).

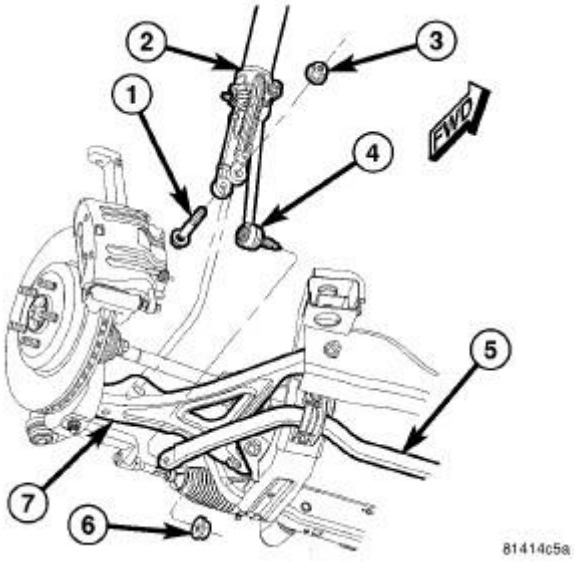

Fig. 146: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (3) and bolt (1) attaching shock clevis bracket (2) to lower control arm (7).
6. Pull lower end of clevis bracket outward away from lower control arm bushing, then slide it off shock assembly. It may be necessary to use an appropriate prying tool to spread clamp area of clevis bracket allowing removal from shock assembly.

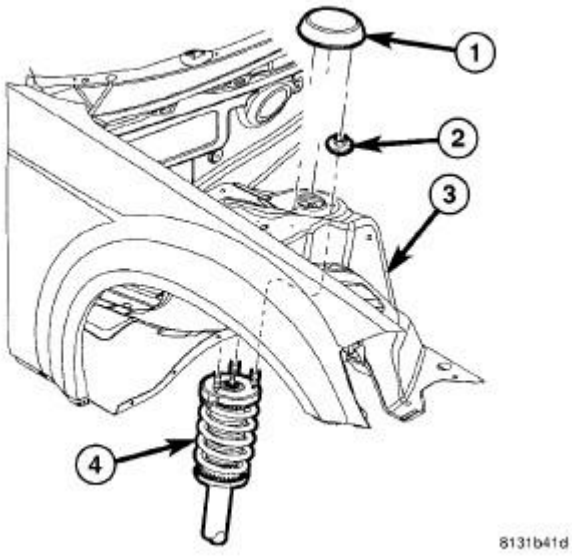

Fig. 147: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Lower vehicle just enough to access upper shock assembly mounting nuts (2).
8. If equipped, remove shock tower cap (1) from top of shock assembly (4).
9. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).
10. Remove shock assembly from vehicle.

REAR-WHEEL-DRIVE

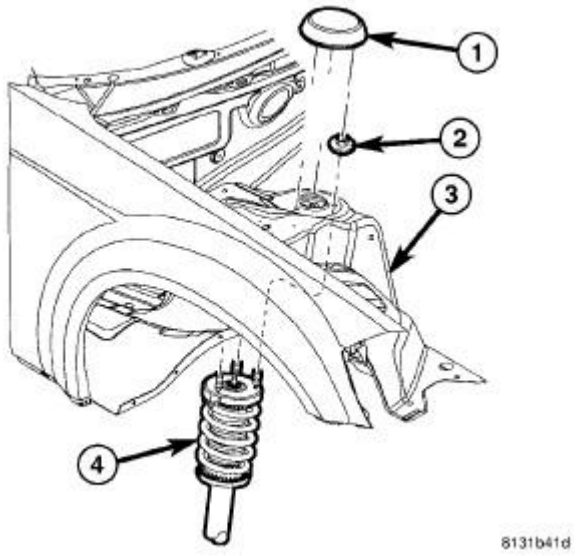

Fig. 148: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, remove front shock tower cap (1) from top of shock assembly (4).
2. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

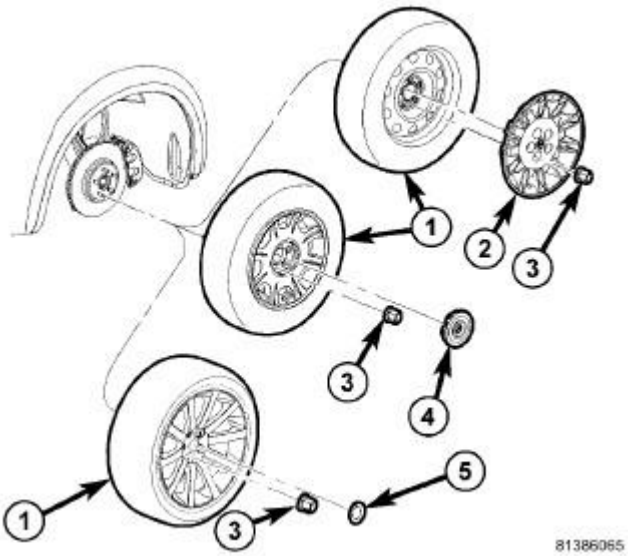

Fig. 149: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

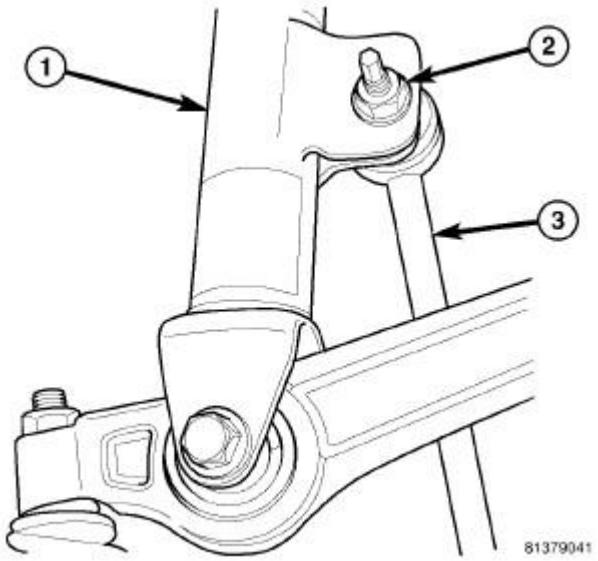

Fig. 150: Stabilizer Link AT Shock Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (2) fastening stabilizer link (3) to shock assembly (1). Slide link ball joint stem from shock assembly.

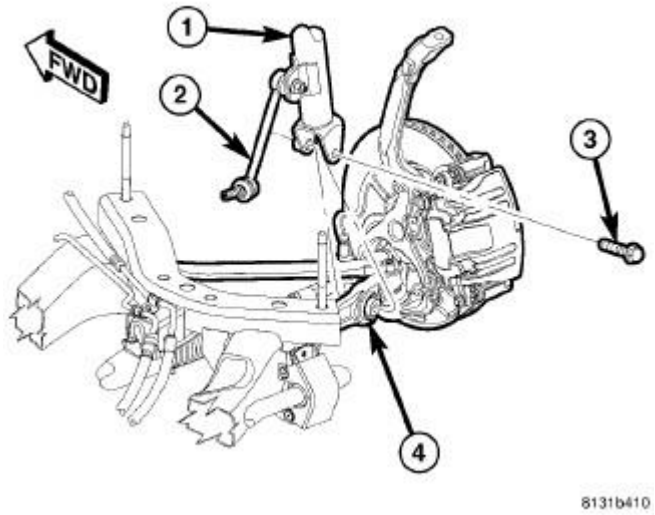

Fig. 151: Lower Shock Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove bolt (3) securing shock assembly (1) to lower control arm (4).

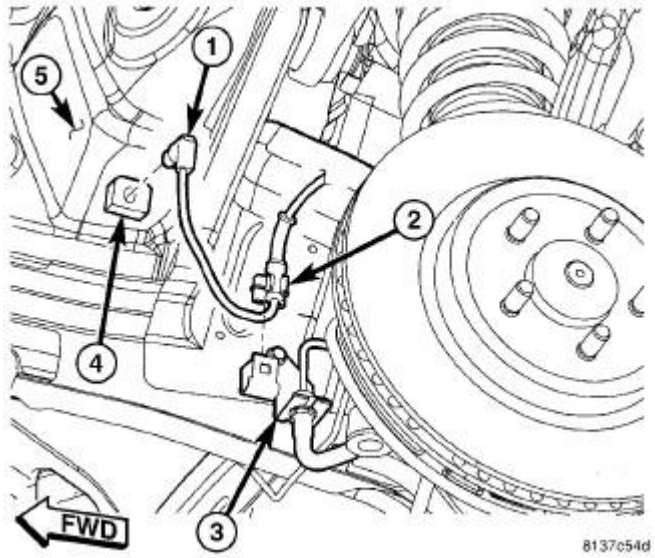

Fig. 152: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

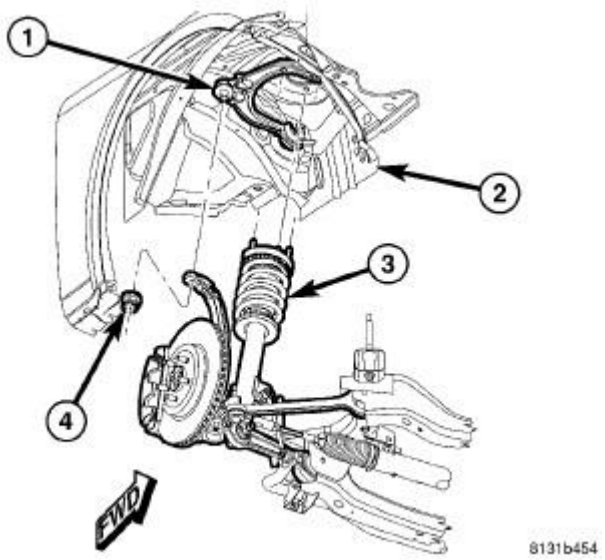

Fig. 153: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

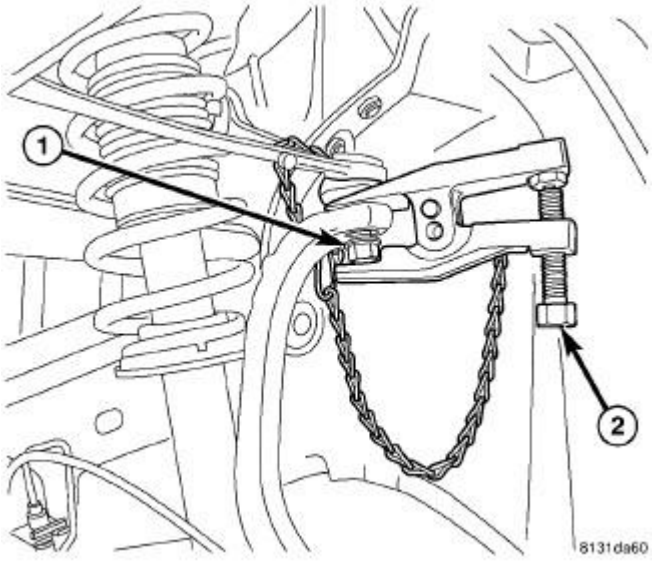

Fig. 154: Using Puller On Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding (special tool #9360, Remover, Ball Joint) into place past seal boot.

9. Using (special tool #9360, Remover, Ball Joint) (2), separate upper ball joint stud (1) from knuckle.

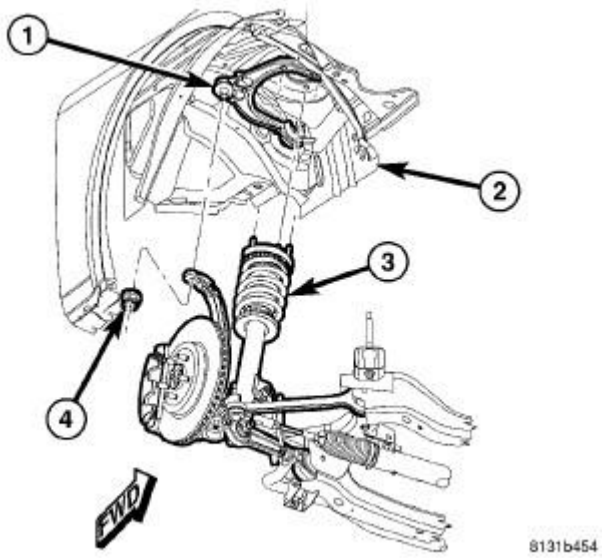

Fig. 155: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Remove nut (4) from end of upper ball joint stud (1).
11. Tip top of knuckle outward using care not to overextend brake flex hose.
12. Remove shock assembly from vehicle.

SRT

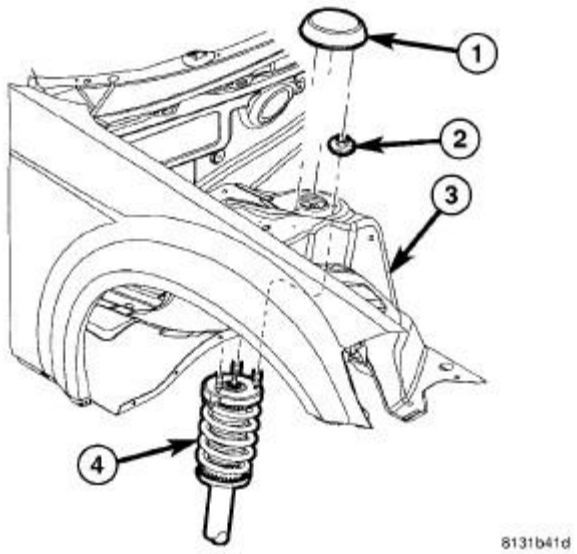

Fig. 156: Upper Shock Mounting

Courtesy of CHRYSLER GROUP, LLC

1. If equipped, remove front shock tower cap (1) from top of shock assembly (4).
2. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

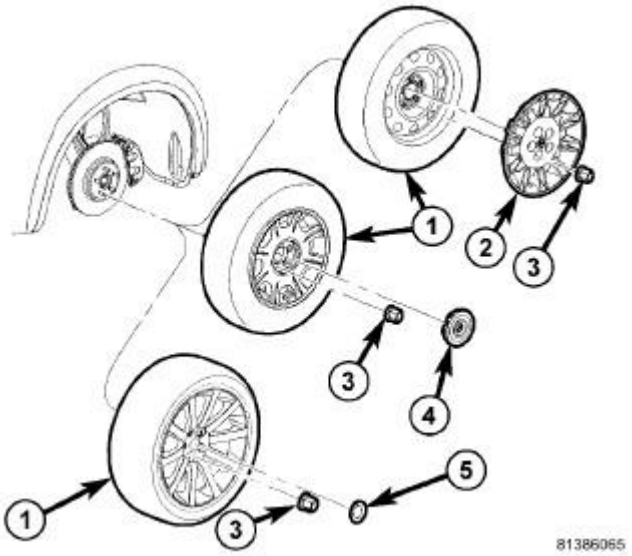

Fig. 157: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
5. Remove the right front splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

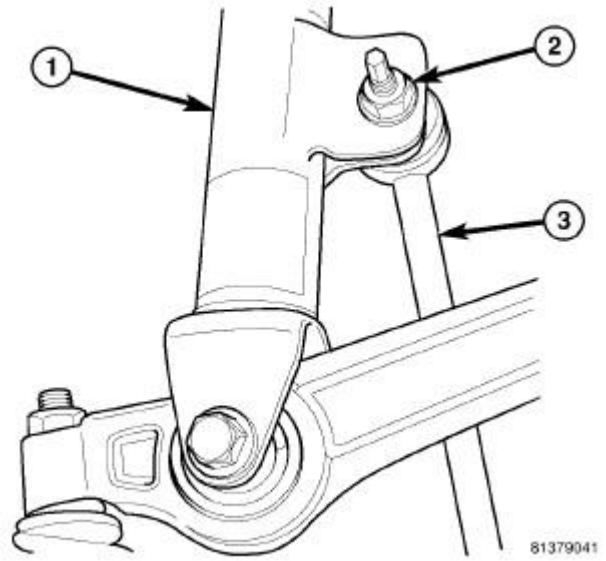

Fig. 158: Stabilizer Link AT Shock Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Remove nut (2) fastening stabilizer link (3) to shock assembly (1). Slide link ball joint stem from shock assembly.

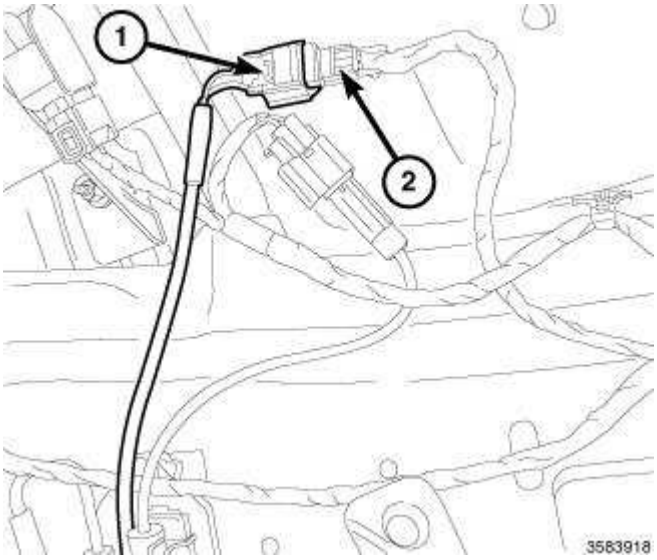

Fig. 159: ADS Shock Connector & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the Active Damping Suspension (ADS) shock connector (1) from the harness (2) on the wheel well.

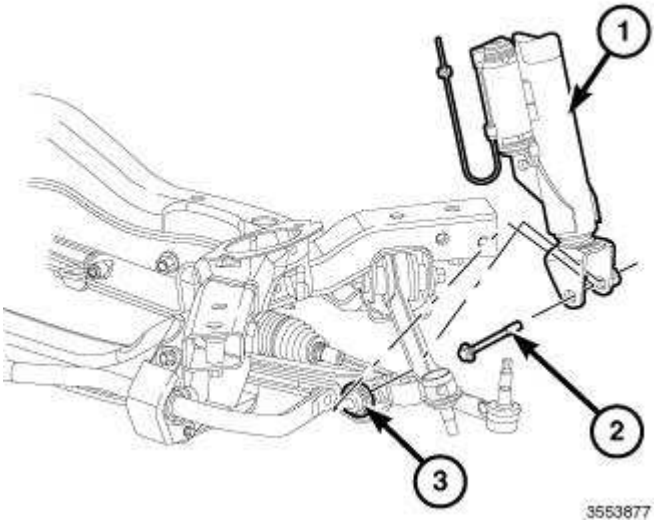

Fig. 160: Bolt, Shock Assembly & Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

8. Remove bolt (2) securing shock assembly (1) to lower control arm (3).

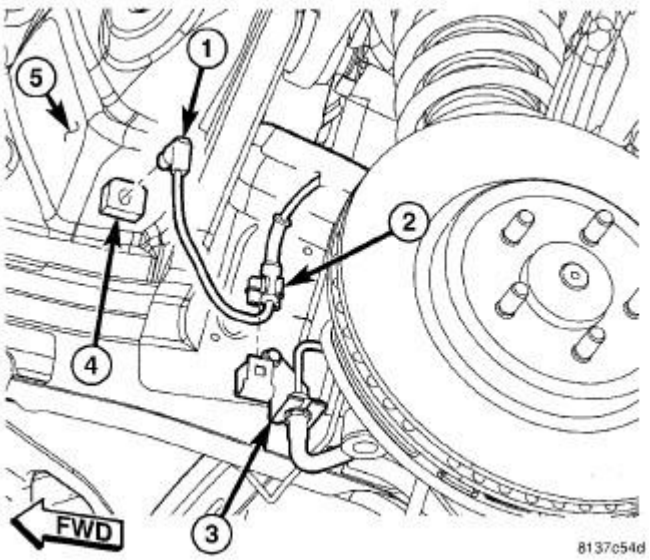

Fig. 161: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

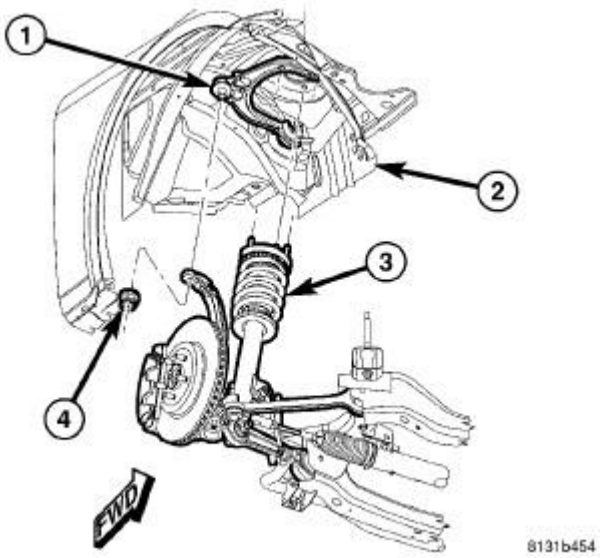

Fig. 162: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

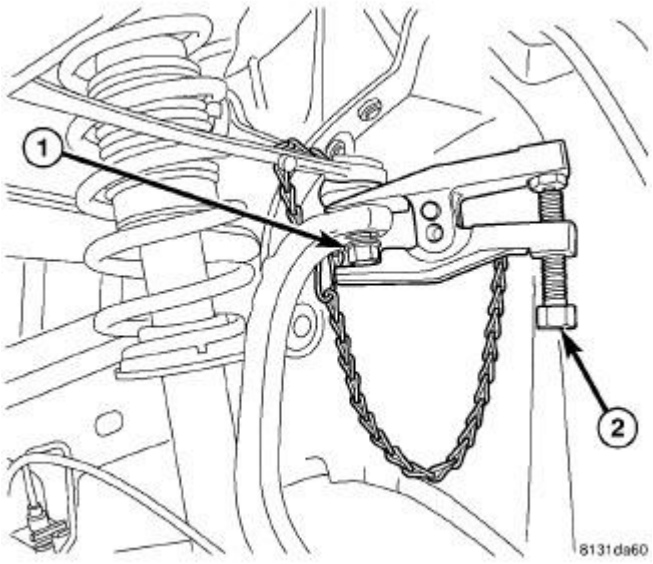

Fig. 163: Using Puller On Upper Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding (special tool #9360, Remover, Ball Joint) into place past seal boot.

11. Using (special tool #9360, Remover, Ball Joint)separate upper ball joint stud (1) from knuckle.

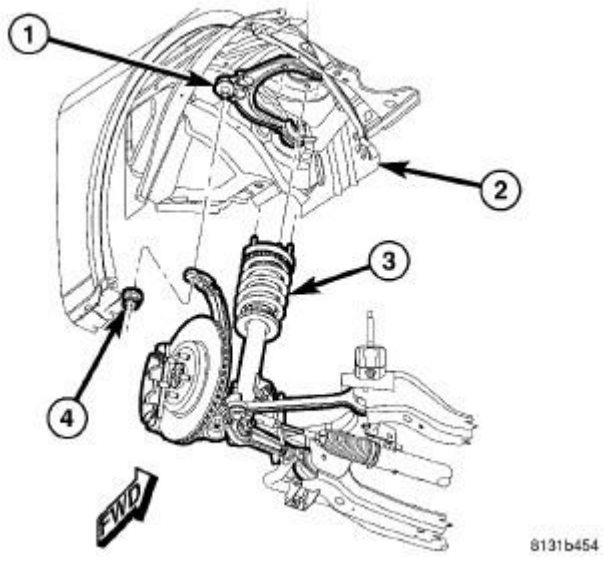

Fig. 164: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Remove nut (4) from end of upper ball joint stud (1).

13. Tip top of knuckle outward using care not to overextend bake flex hose.
14. Remove shock assembly from vehicle.

DISASSEMBLY

DISASSEMBLY

The shock assembly must be removed from vehicle for it to be disassembled and assembled.

For shock assembly disassembly and assembly, use of shock Spring Compressor, Pentastar Service Equipment (PSE) tool W-7200, or equivalent, is recommended to compress coil spring. Follow manufacturer's instructions closely.

WARNING: Do not remove shock shaft nut before coil spring is compressed. Coil spring is held under pressure and must be compressed, removing spring tension from upper and lower mounts, before shock removal.

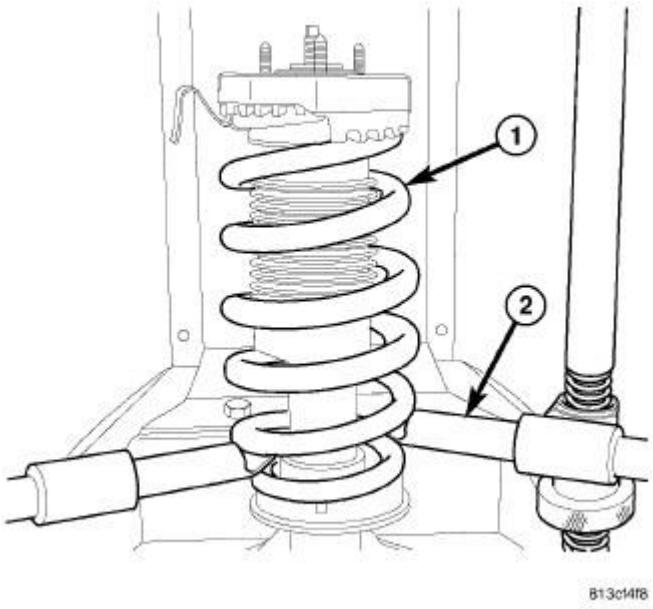

Fig. 165: Shock Assembly In Lower Hooks Of Tool
Courtesy of CHRYSLER GROUP, LLC

1. Position shock assembly coil spring (1) on hooks (2) of Compressor following manufacturers instructions. Install clamp securing shock to lower spring coil.

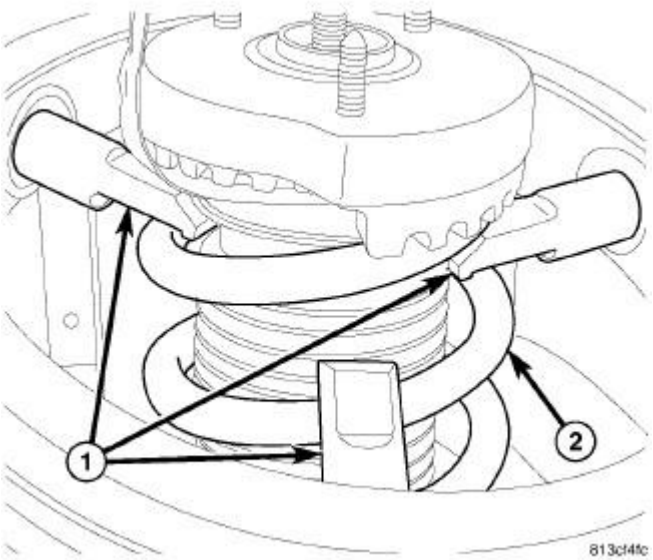

Fig. 166: Upper Hooks Positioned
Courtesy of CHRYSLER GROUP, LLC

2. Position Compressor upper hooks (1) on upper coil spring (2) following manufacturers instructions. To ease installation, rotate shock as necessary positioning shock in compressor so that upper spring coil ends (step in upper mount) at straight outward position from Compressor.
3. Compress coil spring until all spring tension is removed from upper mount.

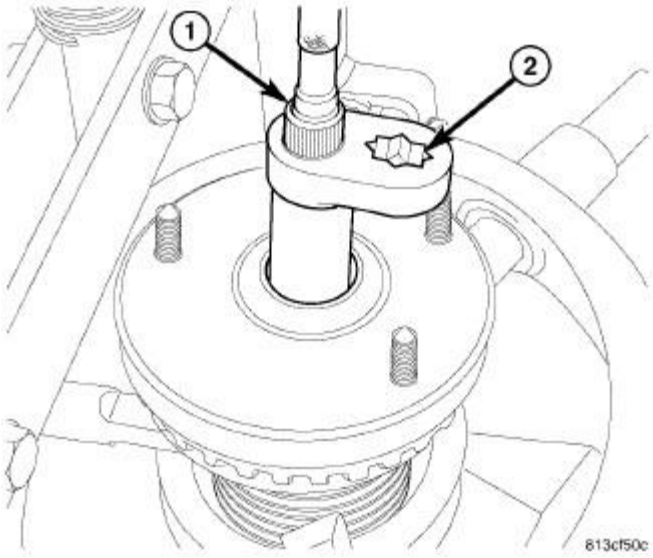

Fig. 167: Retaining Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

4. Position Wrench (2), Special Tool (special tool #9362, Wrench, Strut Nut), on shock shaft retaining nut. Next, insert 8 mm socket though Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, remove nut from shock shaft using Wrench.

5. Remove clamp from bottom of coil spring and remove shock and lower isolator out through bottom of coil spring.

NOTE: If upper mount or coil spring needs to be serviced, proceed with next step, otherwise, proceed with step 8.

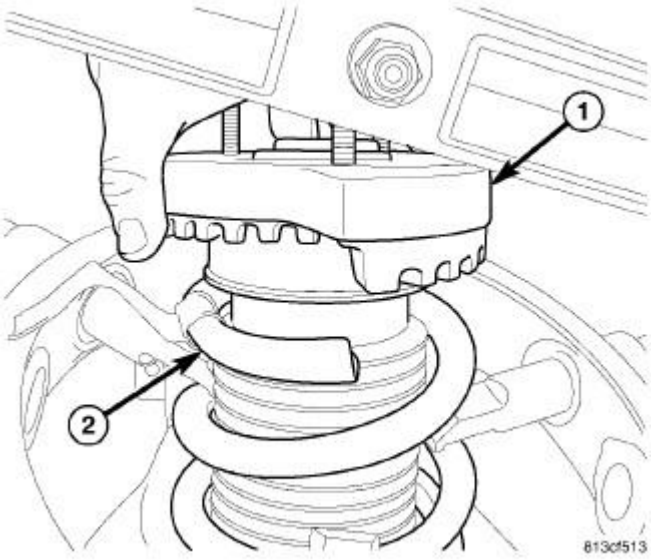

Fig. 168: Upper Mount Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

6. Remove upper mount (1) from shock shaft and coil spring.

NOTE: Prior to removing spring from compressor, note location of lower spring coil end in relationship to compressor to ease assembly of components later.

7. Back off Compressor drive, releasing tension from coil spring. Push back compressor upper hooks and remove coil spring from Compressor.

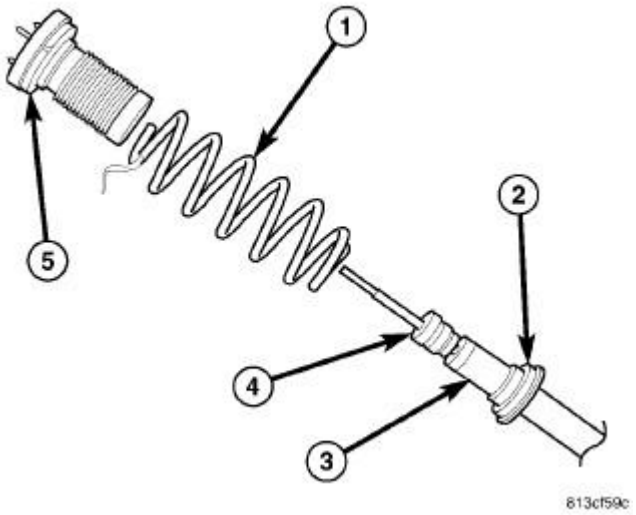

Fig. 169: Shock Assembly Exploded View
Courtesy of CHRYSLER GROUP, LLC

8. Remove jounce bumper (4) from shock shaft by pulling straight up and off.
9. Remove lower isolator (2) from shock body by pulling straight up and off shock shaft.
10. Inspect shock assembly components for following and replace as necessary:

- Inspect shock (3) for any condition of shaft binding over full stroke of shaft.
- Inspect upper mount (5) for cracks and distortion and its retaining studs for any sign of damage.
- Inspect upper spring isolator (5) for severe deterioration.
- Inspect lower spring isolator (2) for severe deterioration.
- Inspect dust shield for tears and deterioration.
- Inspect coil spring (1) for cracks in the coating and corrosion.
- Inspect jounce bumper (4) for cracks and signs of deterioration.

ASSEMBLY

ASSEMBLY

CAUTION: Use care not to damage coil spring coating during spring assembly. Damage to coating will jeopardize its corrosion protection.

NOTE: Left and right springs must not be interchanged.

NOTE: If coil spring has been removed from spring compressor, proceed with next step, otherwise, proceed with step 4.

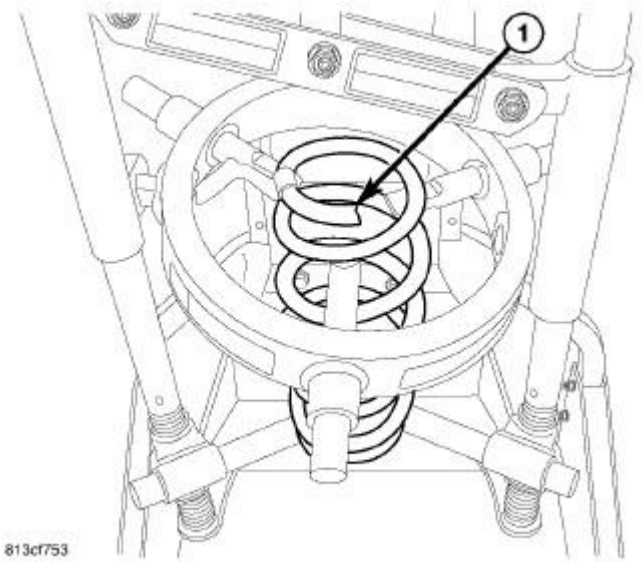

Fig. 170: Spring Positioned In Compressor
Courtesy of CHRYSLER GROUP, LLC

1. Place coil spring **(part number tag end upward)** in compressor lower hooks following manufacturers instructions. To ease shock reassembly, rotate coil spring around until upper coil (1) ends at straight outward position from Compressor. Proper orientation of spring to upper mount (once installed) is necessary.
2. Position compressor upper hooks over coil spring following manufacturers instructions.
3. Compress coil spring far enough to allow shock installation.

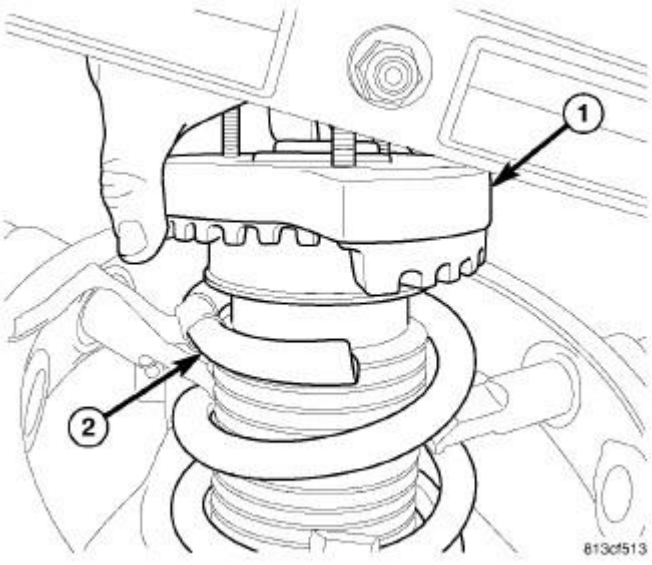

Fig. 171: Upper Mount Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

4. If separated, install upper mount (1) onto coil spring (2). Match step in upper isolator to end of spring coil.

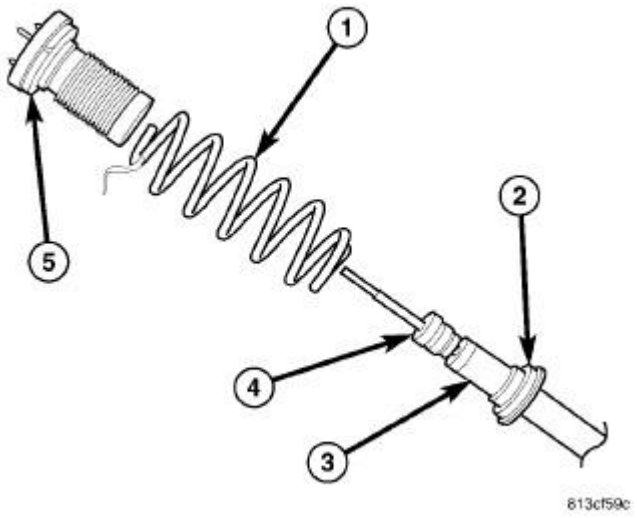

Fig. 172: Shock Assembly Exploded View
Courtesy of CHRYSLER GROUP, LLC

5. Install lower spring isolator (2) on shock body (3).
6. Install jounce bumper (4) on shock shaft, small end first.

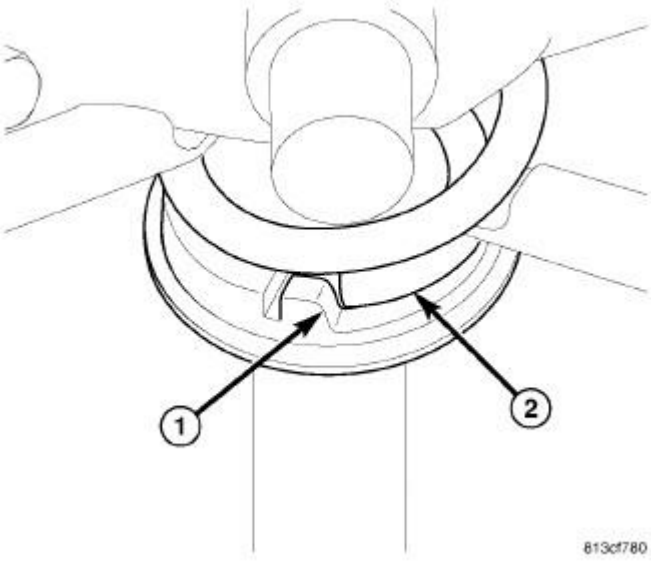

Fig. 173: Spring Positioned Against Lower Isolator
Courtesy of CHRYSLER GROUP, LLC

7. Install shock through bottom of coil spring until lower spring isolator (on shock) contacts lower

end of coil spring. Match step built into isolator (1) to lower coil end (2). Once in this position, stabilizer bar bracket, or clevis key on AWD models, should point straight inward toward Compressor body. If not, rotate isolator on shock body until alignment is achieved when isolator is correctly positioned with lower spring coil.

8. Install clamp to hold shock and coil spring together.

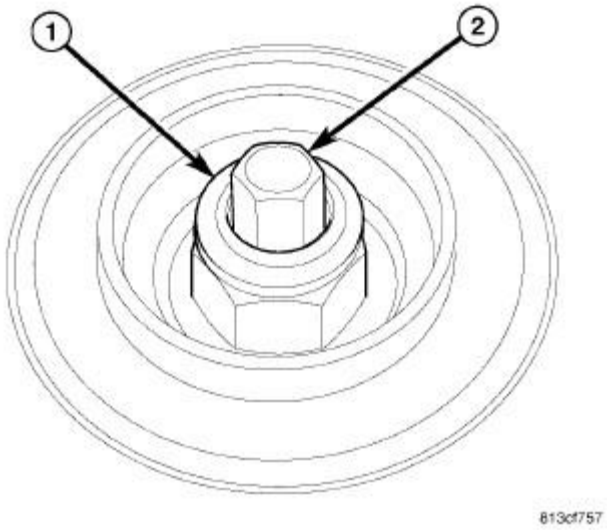

Fig. 174: Shock Rod Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install retaining nut (1) on shock shaft (2) as far as possible by hand. Make sure nut is installed far enough for 8 mm socket to grasp hex (2) on end of shaft for tightening.

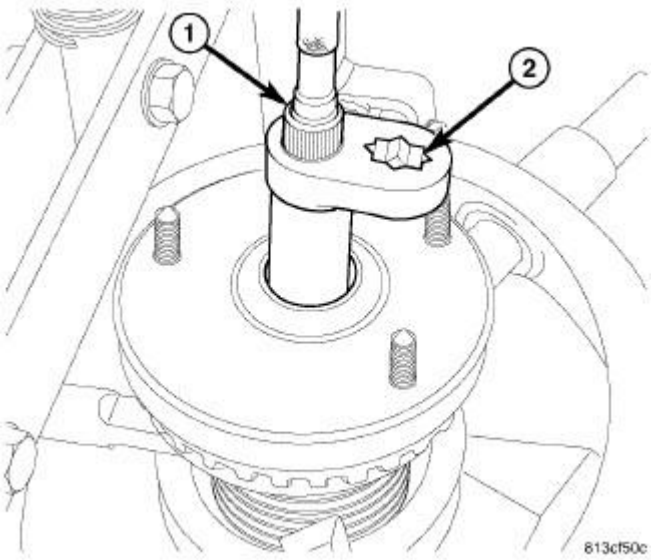

Fig. 175: Retaining Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

10. Install Wrench (on end of a torque wrench) (special tool #9362, Wrench, Strut Nut) on shock shaft retaining nut. Next, insert 8 mm socket though Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, tighten nut using Wrench to 90 N.m (66 ft. lbs.).
11. Slowly release tension from coil spring by backing off Compressor drive fully. As tension is relieved, make sure shock components are properly in place.
12. Remove clamp from lower end of coil spring and shock. Push back spring compressor upper and lower hooks, then remove shock assembly from spring compressor.
13. Install shock assembly on vehicle. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, INSTALLATION**.

INSTALLATION

ALL-WHEEL-DRIVE

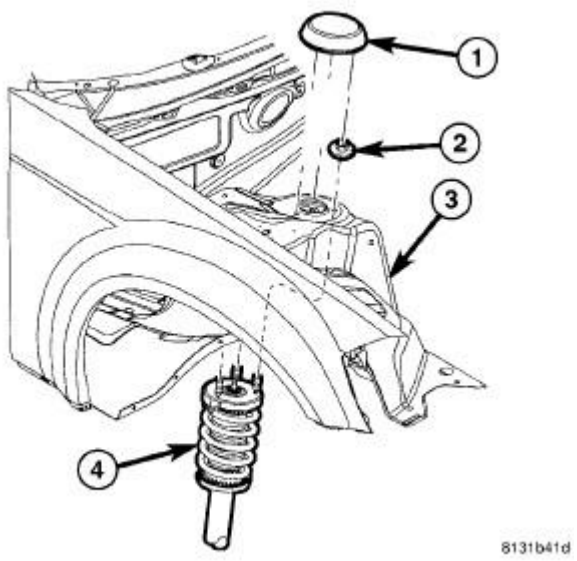

Fig. 176: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Guide shock assembly up into shock tower (3) and into mounting holes.
2. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N.m (20 ft. lbs.).
3. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.
4. Raise and support vehicle.

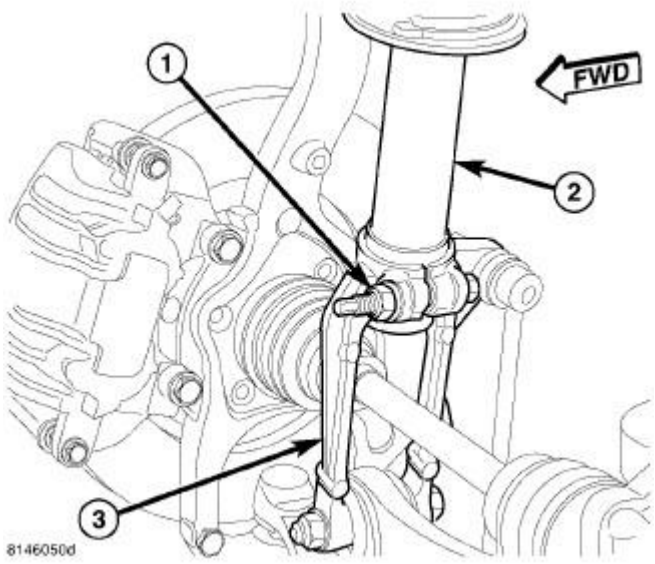

Fig. 177: Removing/Installing Shock Clevis Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Pull lower end of shock assembly outward, then slide clevis bracket (3) onto lower end. Slide clevis bracket onto shock assembly until bracket contacts collar on shock housing (2).
6. Install pinch bolt and nut (1) fastening clevis bracket (3) to bottom of shock assembly (2). Install pinch bolt from rear. **Do not tighten at this time.**

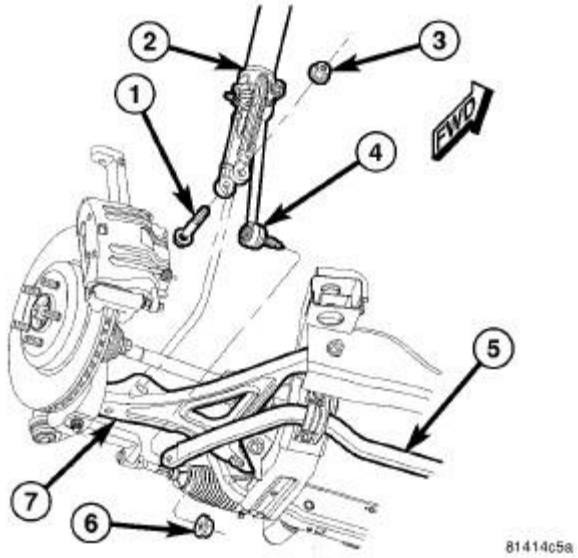

Fig. 178: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

7. Slide clevis bracket (2) over bushing mounted in lower control arm (7).
8. Install bolt (1) and nut (3) attaching shock clevis bracket (2) to lower control arm (7). **Do not**

tighten at this time.

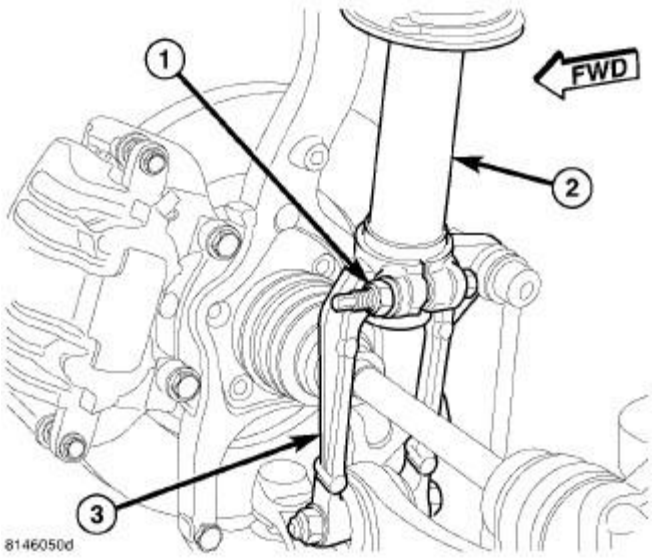

Fig. 179: Removing/Installing Shock Clevis Pinch Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Tighten pinch bolt (1) attaching clevis bracket to shock assembly to 61 N.m (45 ft. lbs.).

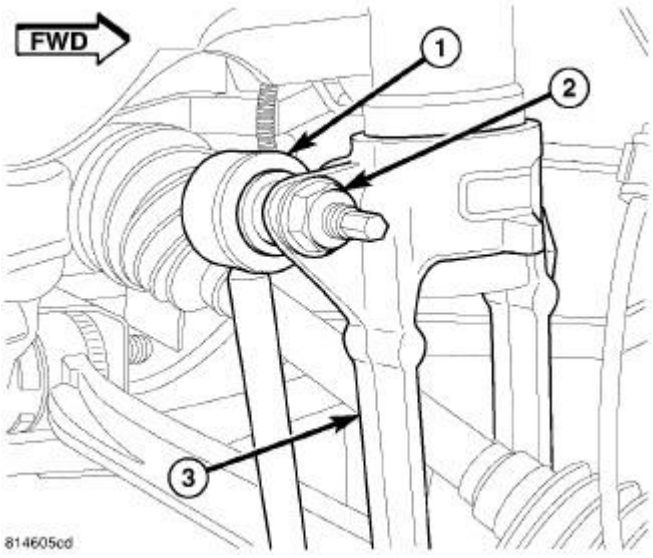

Fig. 180: Locating Stabilizer Link Attachment AT Shock Clevis
Courtesy of CHRYSLER GROUP, LLC

10. Slide stabilizer link ball joint stem into clevis bracket. Install nut (2) fastening link to clevis bracket (3). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 128 N.m (95 ft. lbs.).

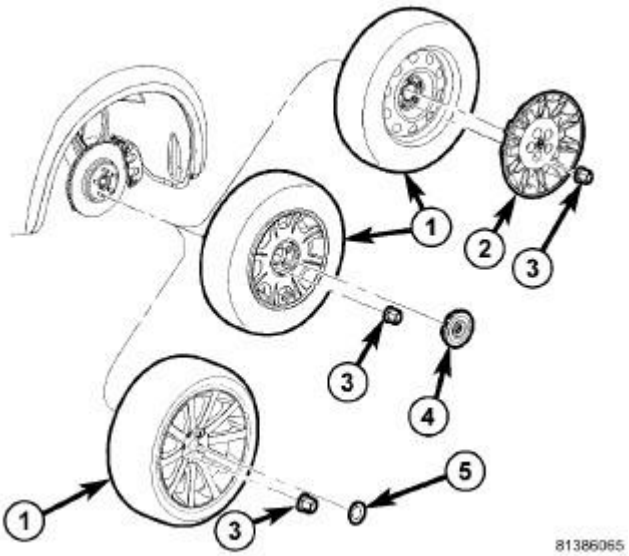

Fig. 181: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
12. Lower vehicle.

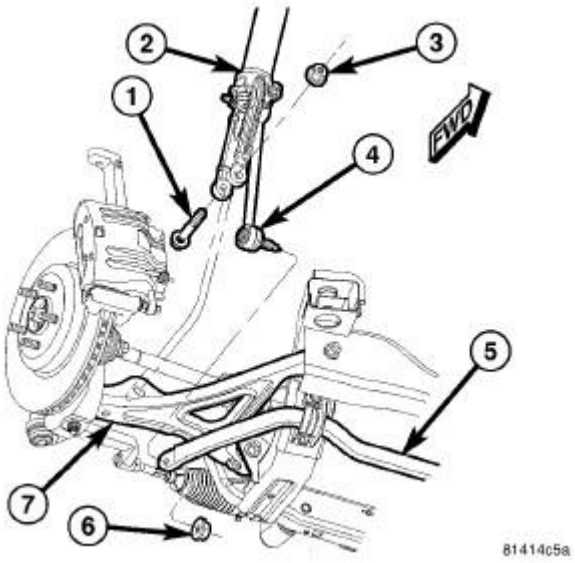

Fig. 182: Shock Attachment AT Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: When tightening lower shock clevis mounting bolt, do not attempt rotating bolt. Bolt shaft is serrated. Turn nut only.

13. Tighten lower shock clevis bracket bolt nut (3) to 174 N.m (128 ft. lbs.).

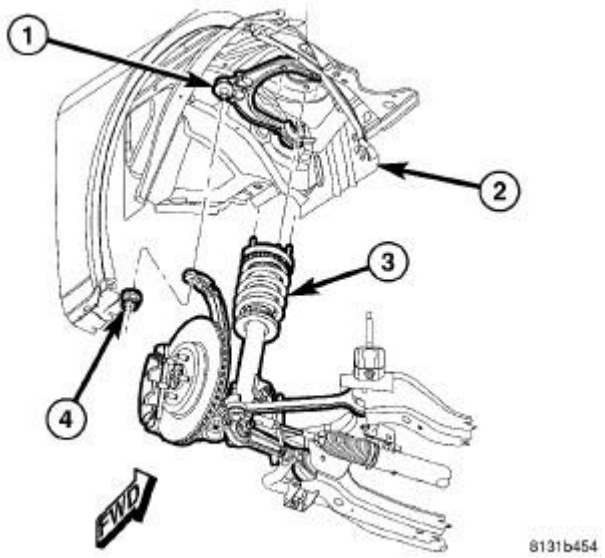

Fig. 183: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Place shock assembly into front suspension using reverse direction in which it was removed.

   CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

2. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

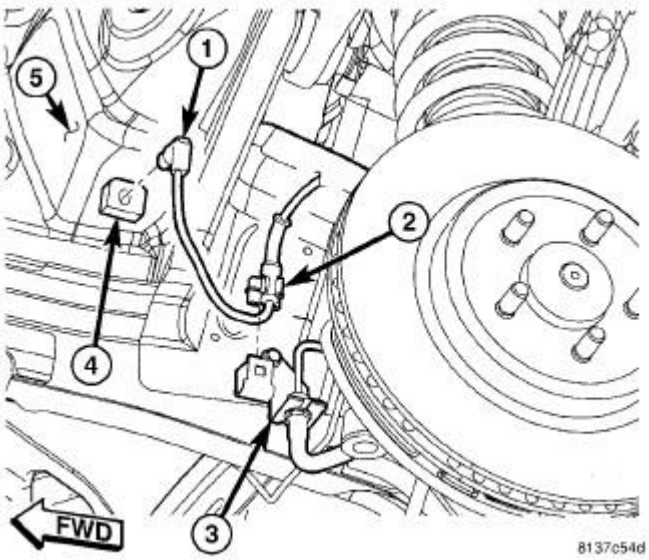

Fig. 184: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

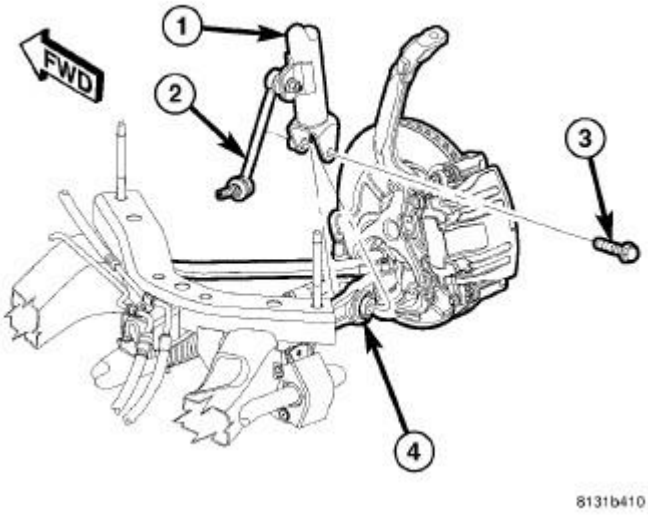

Fig. 185: Lower Shock Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt (3) attaching shock assembly (1) to lower control arm (4). **Do not tighten bolt at this time.**

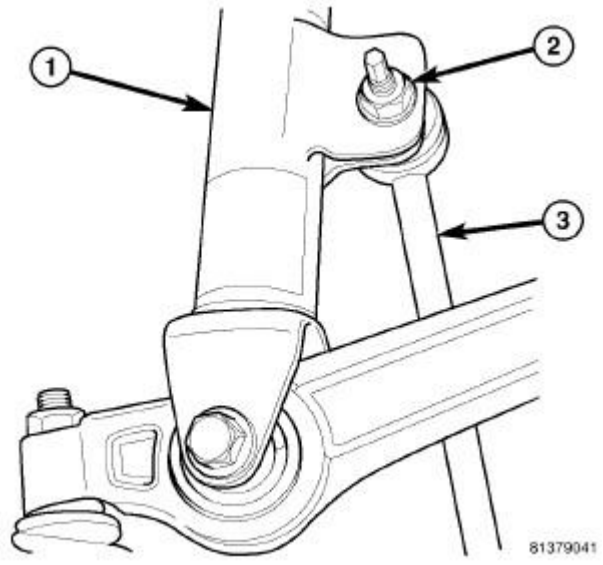

Fig. 186: Stabilizer Link AT Shock Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Slide stabilizer link (3) ball joint stem into shock assembly from front. Install nut fastening link (3) to shock assembly (1). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 128 N.m (95 ft. lbs.).

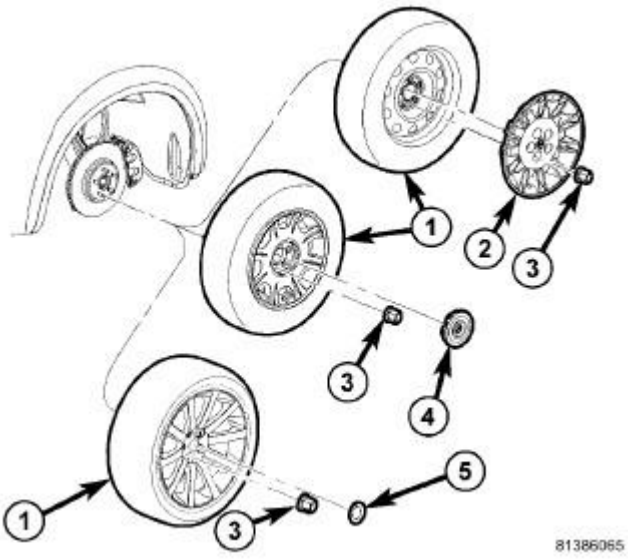

Fig. 187: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
7. Lower vehicle.

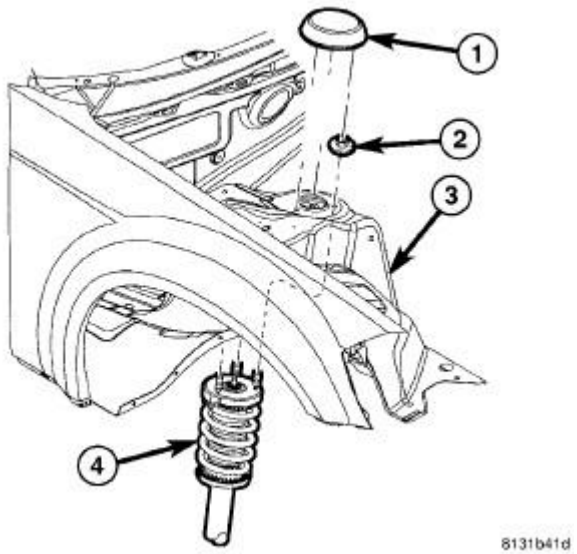

Fig. 188: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N.m (20 ft. lbs.).
9. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.

SRT

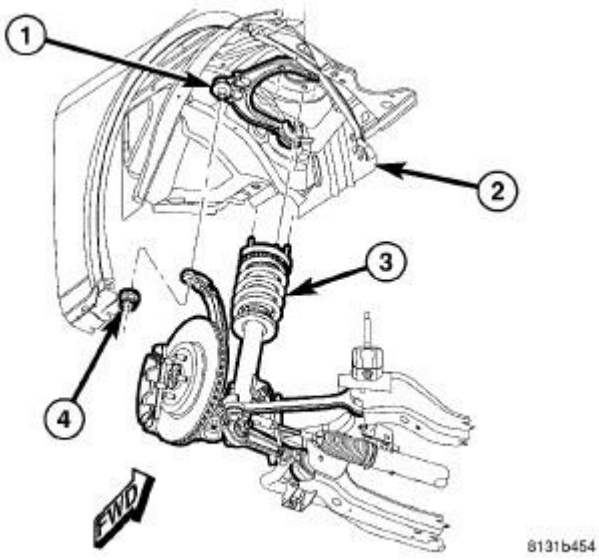

Fig. 189: View Of Upper Ball Joint, Spindle & Strut Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: If equipped with Active Damping System (ADS), position the shock solenoid

assembly on the side of the shock with the same orientation as when removed.

1. Place shock assembly into front suspension using reverse direction in which it was removed.

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

2. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

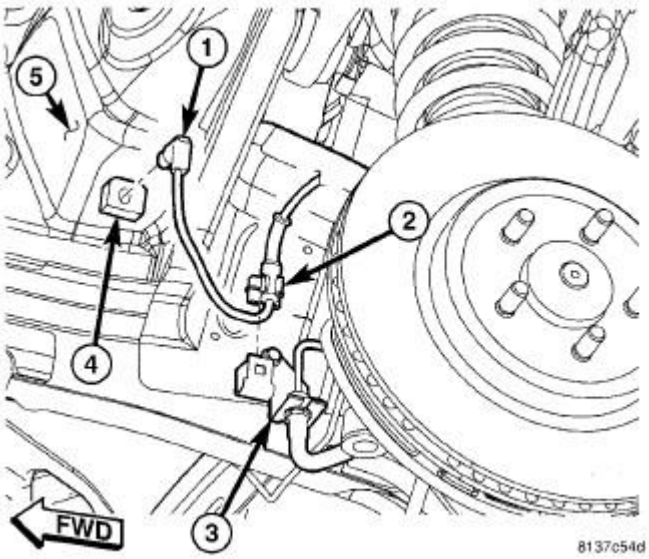

Fig. 190: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

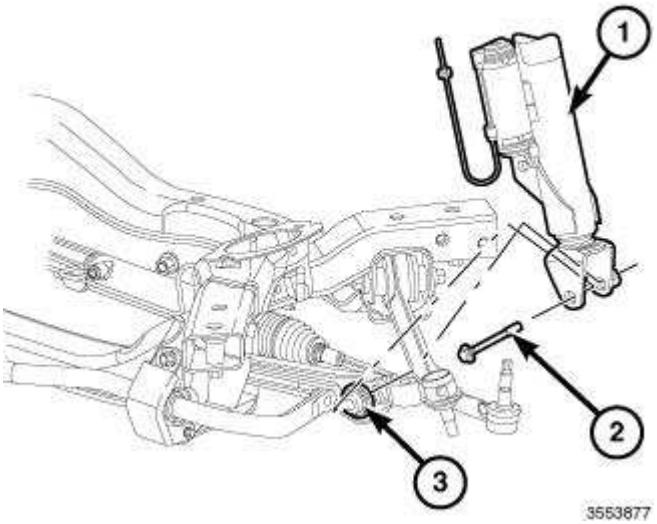

Fig. 191: Bolt, Shock Assembly & Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt (2) attaching shock assembly (1) to lower control arm (3). **Do not tighten bolt at this time.**

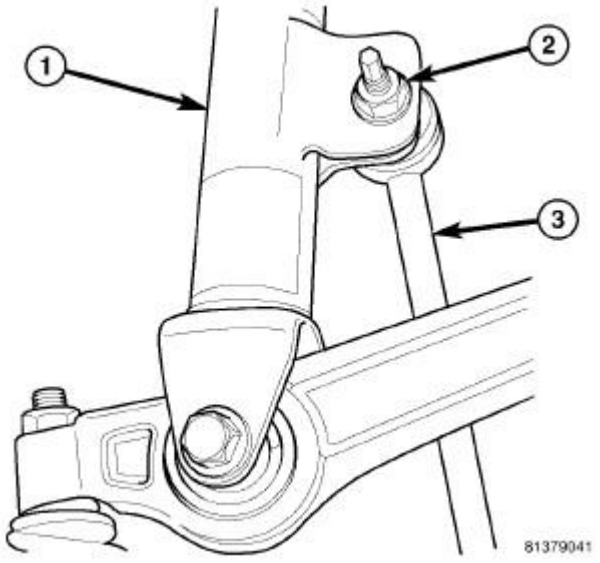

Fig. 192: Stabilizer Link AT Shock Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Slide stabilizer link (3) ball joint stem into shock assembly from front. Install nut fastening link (3) to shock assembly (1). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 128 N.m (95 ft. lbs.).

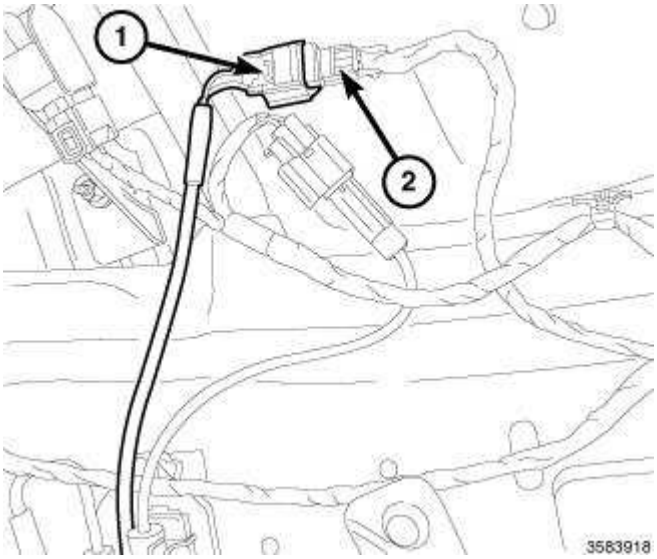

Fig. 193: ADS Shock Connector & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the ADS shock connector (1) to the vehicle wiring harness connector (2).
7. Install the splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** or **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .

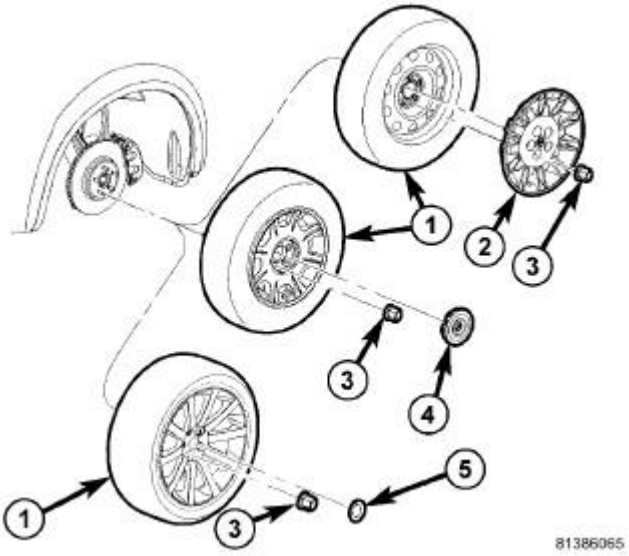

Fig. 194: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
9. Lower vehicle.

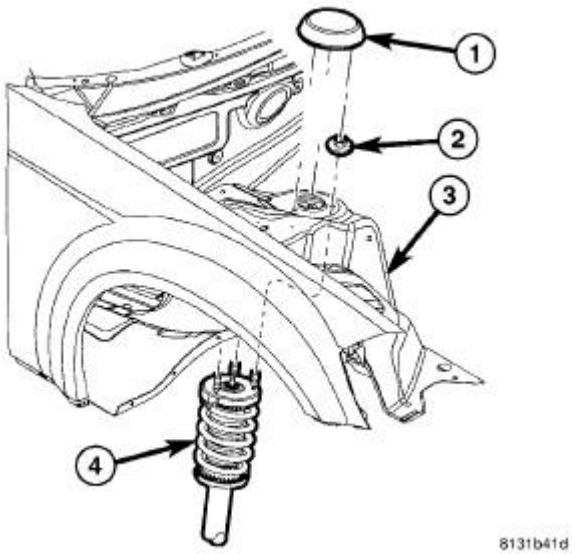

Fig. 195: Upper Shock Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N.m (20 ft. lbs.).
11. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.

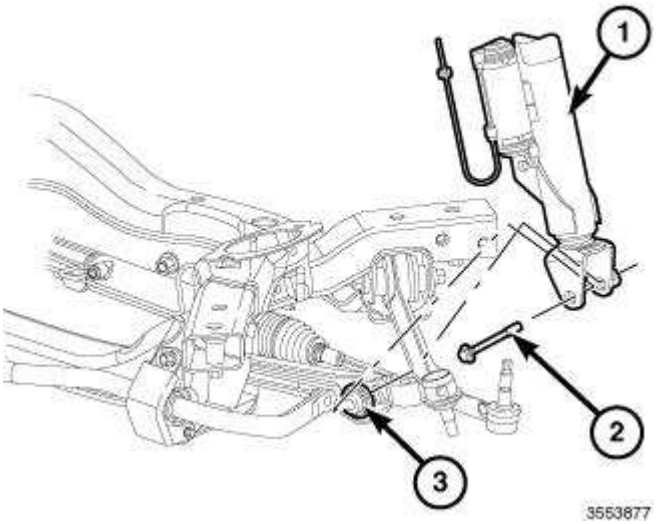

Fig. 196: Bolt, Shock Assembly & Lower Control Arm
Courtesy of CHRYSLER GROUP, LLC

12. Tighten lower shock clevis bracket bolt (2) to 174 N.m (128 ft. lbs.).

STABILIZER BAR, FRONT

REMOVAL

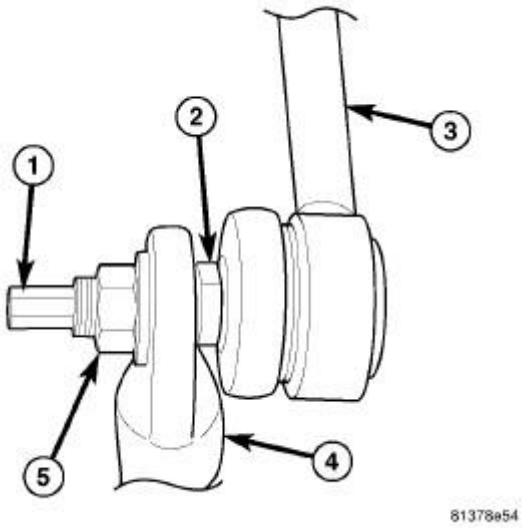

Fig. 197: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .
3. On each side of vehicle, remove nut (5) fastening stabilizer link (3) to stabilizer bar (4). Slide link ball joint stem (1) from bar.

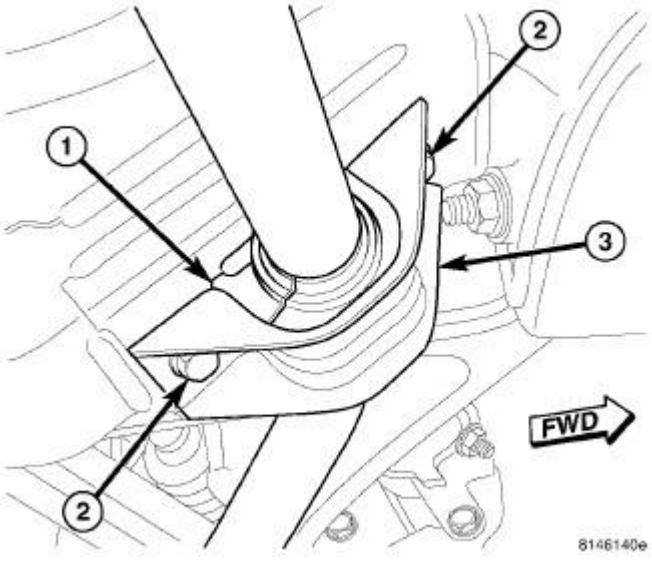

Fig. 198: Stabilizer Bar Bushing & Retainer
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle, remove bolts (2) fastening stabilizer bar isolator retainer (3) in place.
5. Remove stabilizer bar with isolators and retainers from vehicle.
6. On each side of bar, remove retainers (3) from around stabilizer bar isolators (1).
7. Utilizing slit, remove each isolator (1) from stabilizer bar (2).

REAR-WHEEL-DRIVE

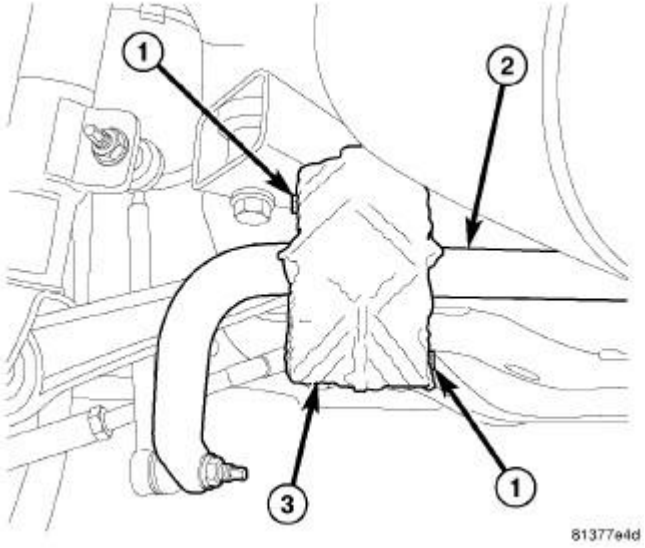

Fig. 199: Front Stabilizer Bar Heat Shield
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .
3. On each side of vehicle, remove screws (1) fastening stabilizer bar heat shield (3). Remove heat shield.

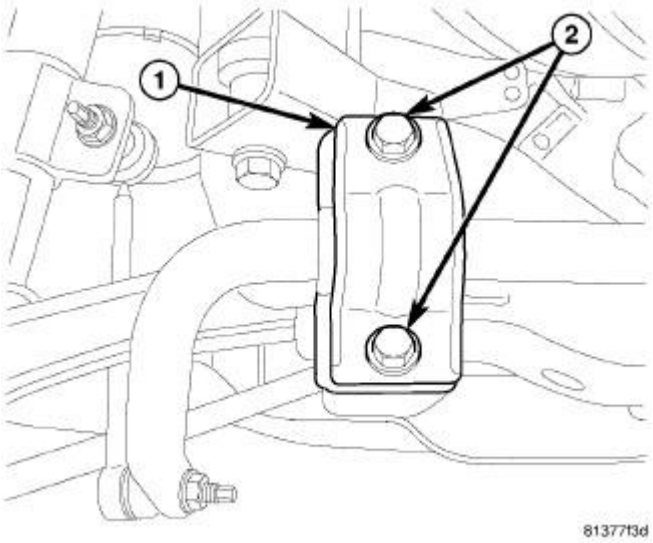

Fig. 200: Front Stabilizer Bar Bushing Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle, remove bolts (2) fastening stabilizer bar isolator retainer (1) in place.

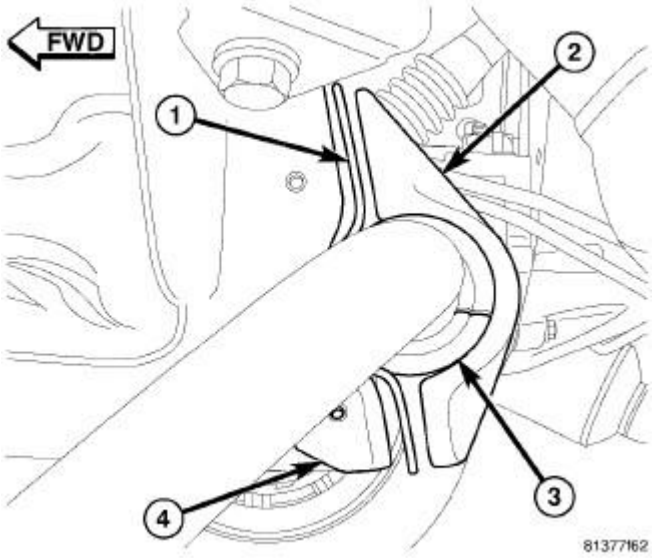

Fig. 201: Front Stabilizer Bar Bushing Retainer
Courtesy of CHRYSLER GROUP, LLC

5. On each side of vehicle, remove retainer halves (1) (2) from around stabilizer bar isolator (3).

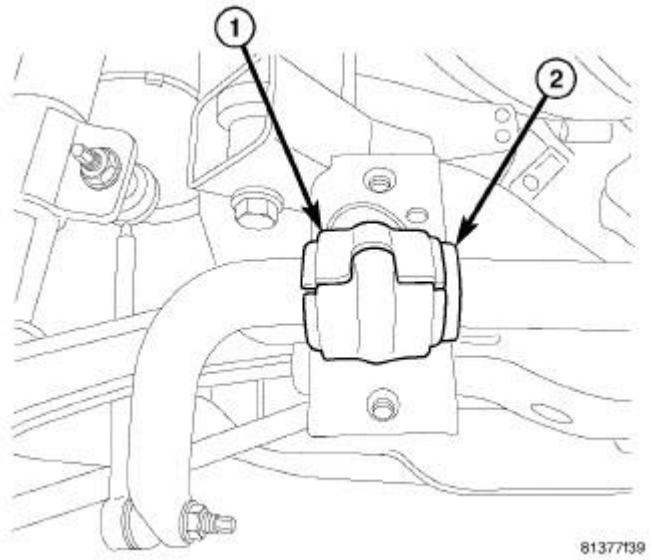

Fig. 202: Front Stabilizer Bar Bushing On Bar
Courtesy of CHRYSLER GROUP, LLC

6. Utilizing slit, remove each isolator (1) from stabilizer bar (2).

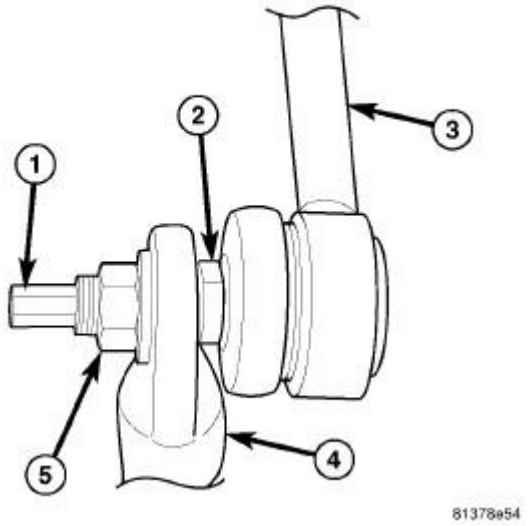

Fig. 203: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

7. On each side of vehicle, remove nut (5) fastening stabilizer link (3) to stabilizer bar (4). Slide link ball joint stem (1) from bar, then remove bar from vehicle.

INSTALLATION

ALL-WHEEL-DRIVE

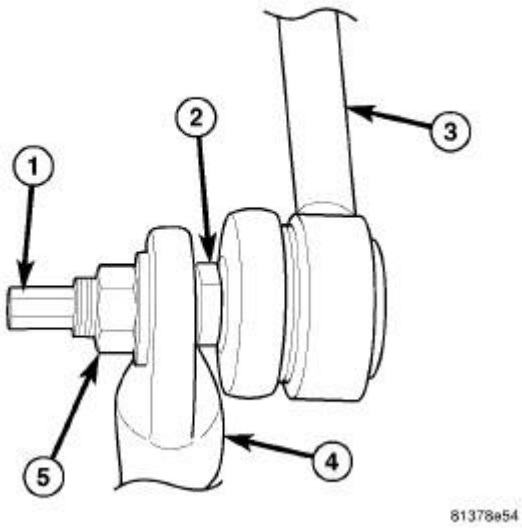

Fig. 204: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

1. Utilizing slit in isolator, install each stabilizer bar isolator on bar. Make sure slit in isolator is positioned toward rear of vehicle once installed on vehicle.
2. Install stabilizer bar isolator retainer over each isolator.

NOTE: When attaching stabilizer link to stabilizer bar, make sure link ball joint stem is pointed inboard toward engine cradle.

3. Install stabilizer bar ends (4) to each stabilizer link (3). Slide link ball joint stem (1) through mounting hole in bar. Loosely install nuts (5) at this time.

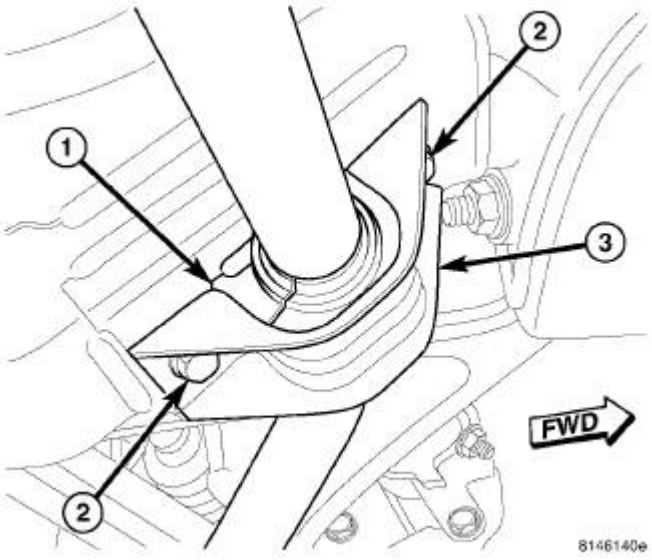

Fig. 205: Stabilizer Bar Bushing & Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Raise stabilizer bar to engine cradle, placing bushings (1) into mounted position.
5. Install bolts (2) securing each stabilizer bar isolator retainer (3) to cradle. Tighten bolts to 60 N.m (44 ft. lbs.).

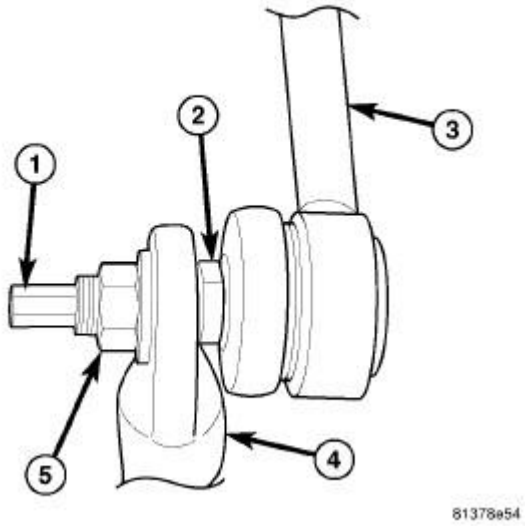

Fig. 206: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

6. While holding stem from rotating at hex (1) or flat (2) tighten stabilizer link nuts at each end of stabilizer bar (4) to 128 N.m (95 ft. lbs.).
7. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .
8. Lower vehicle.

REAR-WHEEL-DRIVE

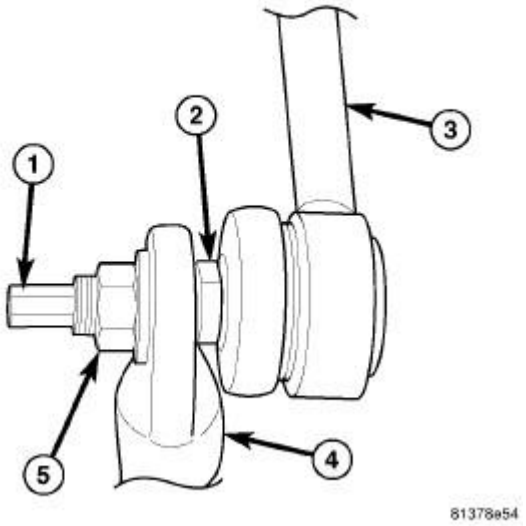

Fig. 207: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

NOTE: When attaching stabilizer link to stabilizer bar, make sure link ball joint stem is pointed inboard toward engine cradle.

1. On each side of vehicle, raise stabilizer bar (4) to stabilizer link (3) and slide link ball joint stem (1) through mounting hole in bar. Loosely install nut (5) at this time.

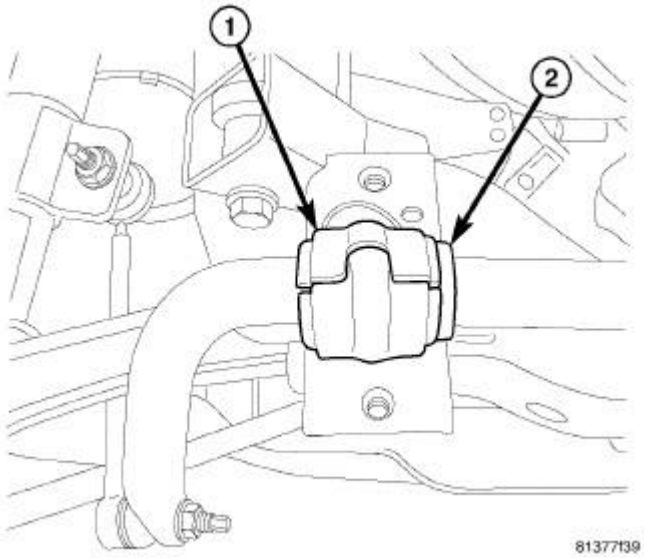

Fig. 208: Front Stabilizer Bar Bushing On Bar
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Because of stabilizer isolator outer shape, it is very important to

install isolators in position discussed in following step.

2. Utilizing slit in isolator, install each stabilizer bar isolator (1) on bar resting against locating collar (2) as shown in illustration. Make sure slit in isolator is positioned toward rear of vehicle.

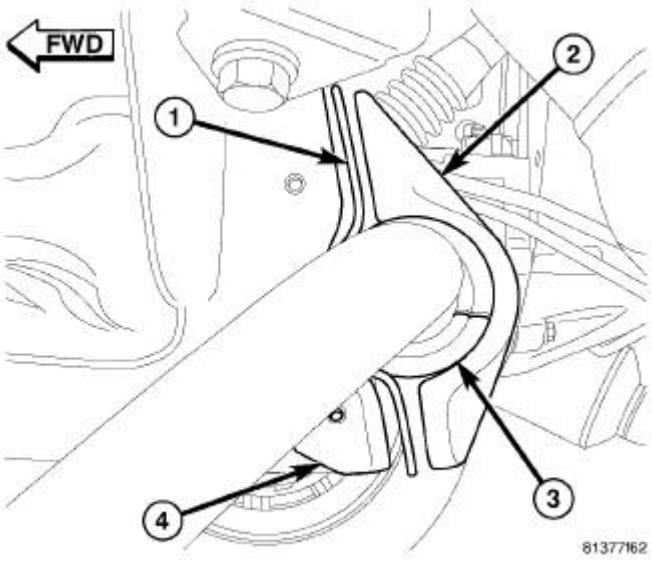

Fig. 209: Front Stabilizer Bar Bushing Retainer
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle, install stabilizer bar isolator retainer halves (1) (2) around isolator (3).

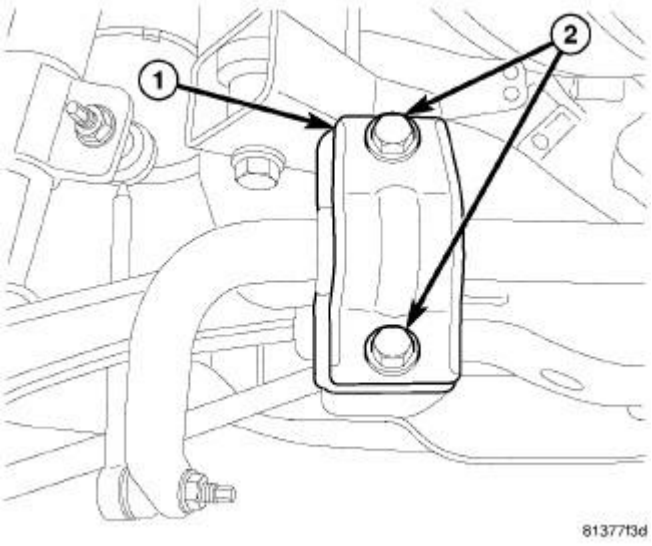

Fig. 210: Front Stabilizer Bar Bushing Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle, install bolts (2) securing stabilizer bar isolator retainer halves (1) to cradle. Tighten bolts to 60 N.m (44 ft. lbs.).

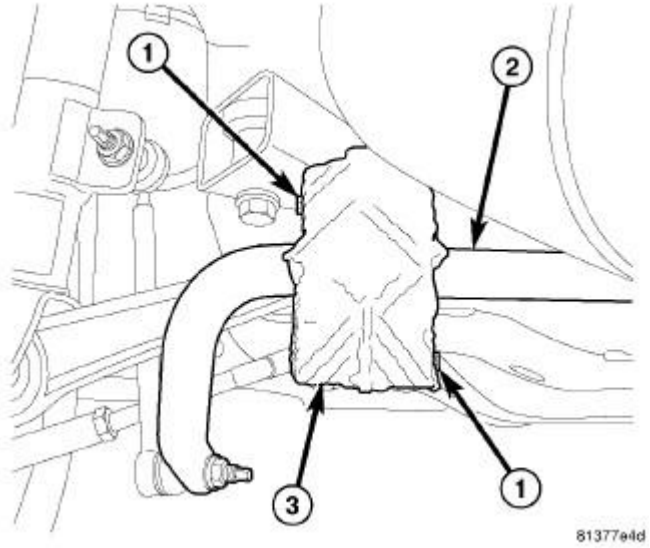

Fig. 211: Front Stabilizer Bar Heat Shield
Courtesy of CHRYSLER GROUP, LLC

5. On each side of vehicle, install stabilizer bar heat shield (3) over stabilizer bar isolator retainer. Install mounting screws (1).

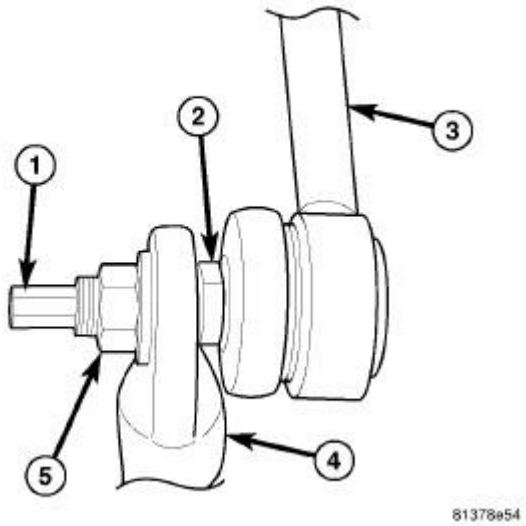

Fig. 212: Link Ball Joint AT Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

6. While holding stem from rotating at hex (1) or flat (2) tighten stabilizer link nuts at each end of

stabilizer bar (4) to 128 N.m (95 ft. lbs.)

7. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .
8. Lower vehicle.

STRUT, TENSION

REMOVAL

REMOVAL

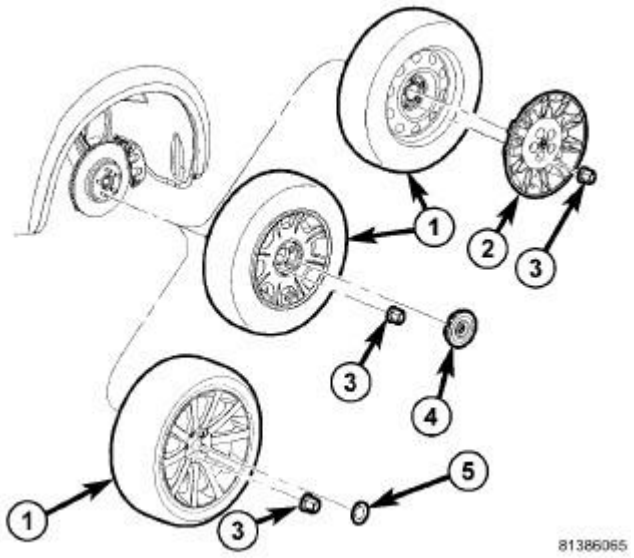

Fig. 213: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .

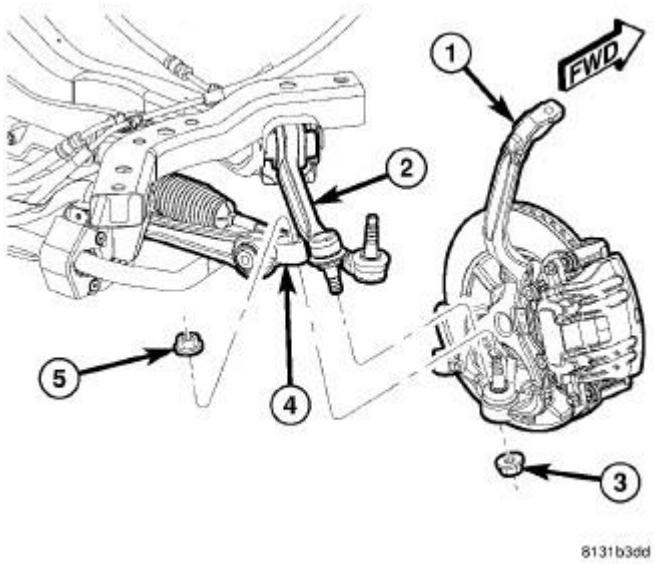

Fig. 214: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

4. Loosen nut (3) attaching tension strut (2) ball joint stud to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

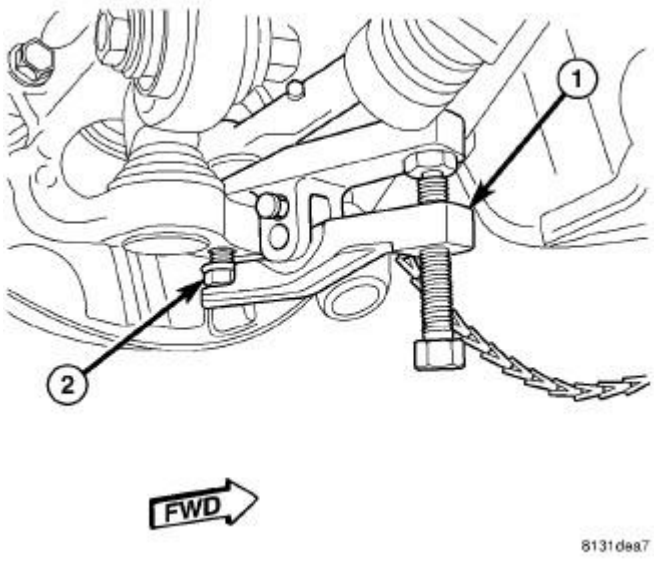

Fig. 215: Using Puller On Ball Joint
Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding (special tool #9360, Remover, Ball Joint) into place past seal boot.

5. Using (special tool #9360, Remover, Ball Joint) (1), separate tension strut ball joint stud (2) from knuckle.

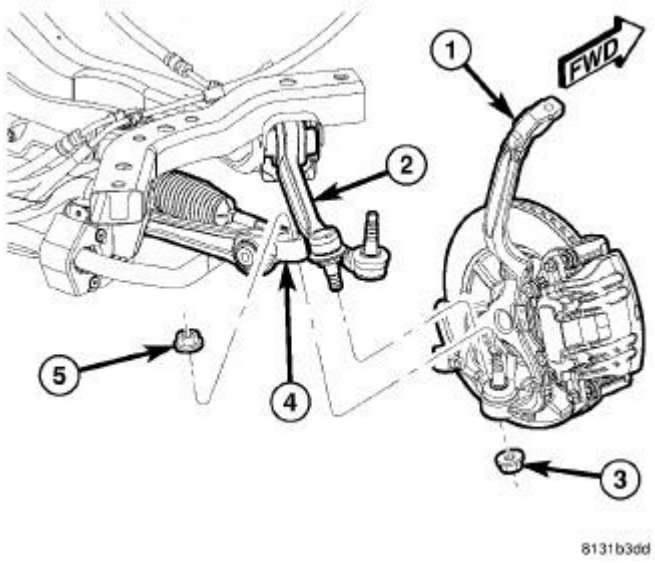

Fig. 216: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

6. Remove nut (3) from end of tension strut (2) ball joint stud.
7. Rotate knuckle outward and push ball joint upward, out of knuckle.

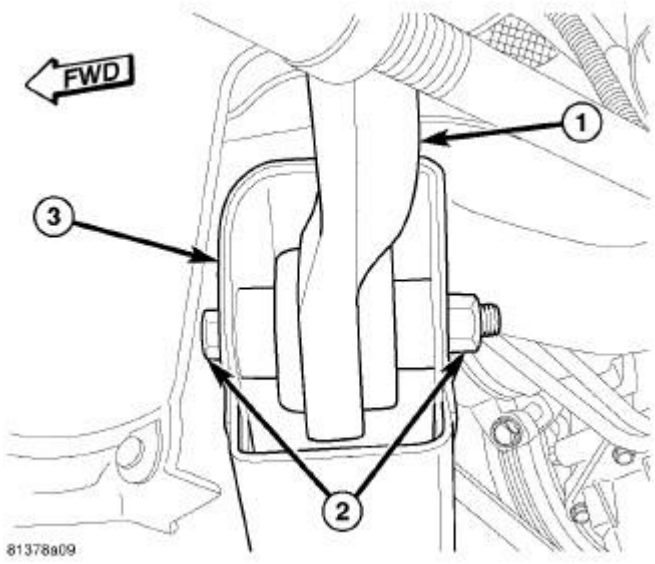

Fig. 217: Tension Strut Cradle Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove nut and bolt (2) securing tension strut (1) to engine cradle (3).

9. Slide tension strut out of cradle bracket and remove from vehicle.

INSTALLATION

INSTALLATION

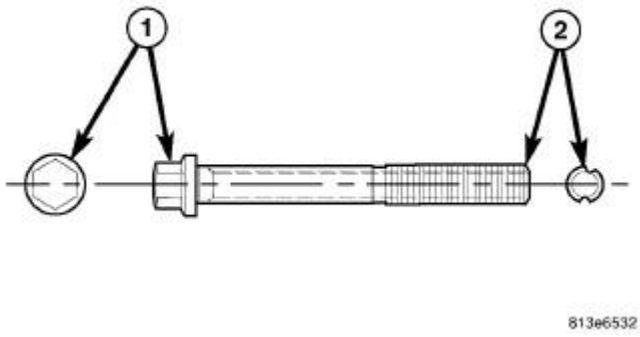

Fig. 218: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: If installing a tension strut engine cradle bolt that is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.

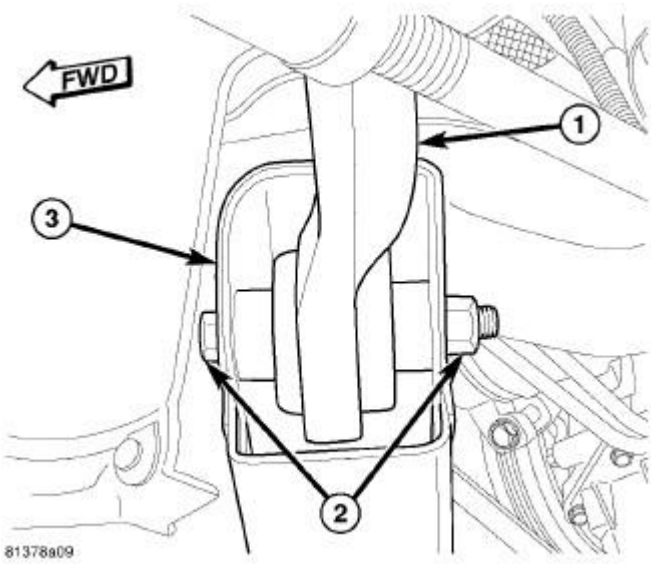

Fig. 219: Tension Strut Cradle Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fasteners for the tension strut must be tightened to specification with vehicle weight on wheels and at curb height. If it is tightened while on a vehicle

hoist, premature failure of the hydrobushing may occur.

1. Slide bushing end of tension strut (1) into cradle bracket (3).
2. Install mounting bolt (2) from front through cradle and bushing.
3. Install nut (2), but **do not tighten at this time** .

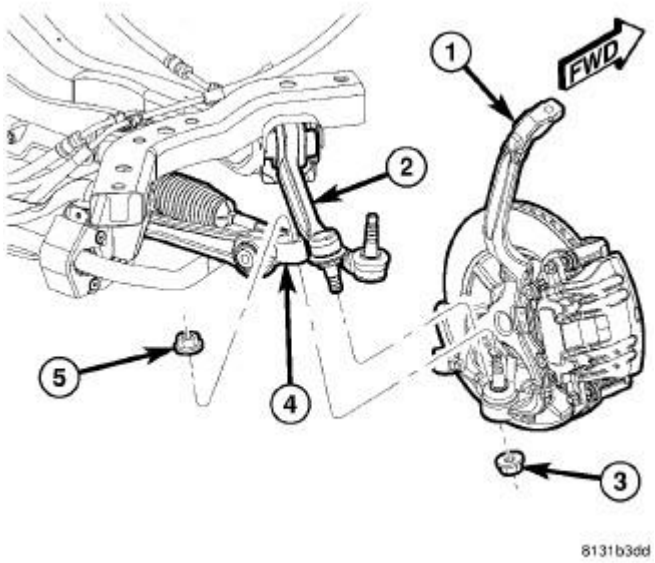

Fig. 220: Ball Joint, Spindle And Outer Tie Rod Attachment
Courtesy of CHRYSLER GROUP, LLC

4. Insert tension strut (2) ball joint stud downward, into knuckle hole.
5. Completely install NEW nut (3) on ball joint stud attaching tension strut (2) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

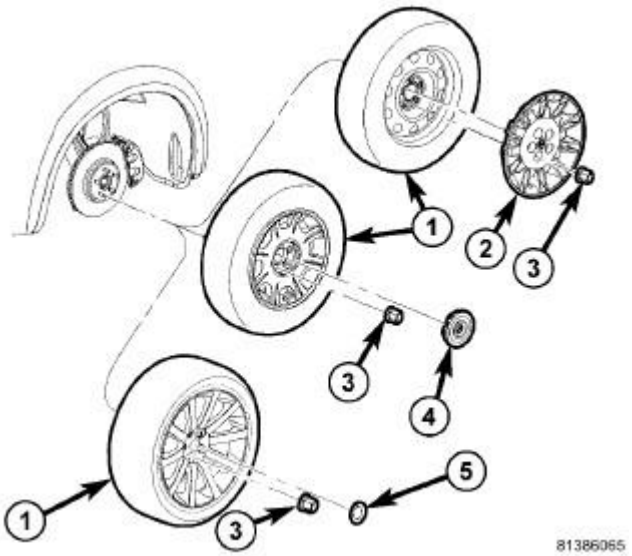

Fig. 221: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
7. Lower vehicle.
8. Position vehicle on an alignment rack/drive-on lift.

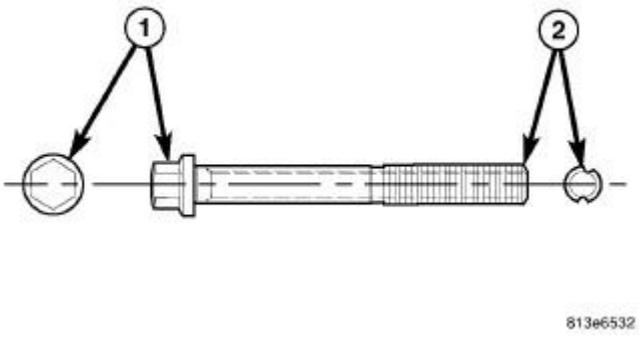

Fig. 222: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

CAUTION: If the tension strut engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), be sure to only tighten the nut. Do not rotate the bolt head (1) or damage to the bushing will occur.

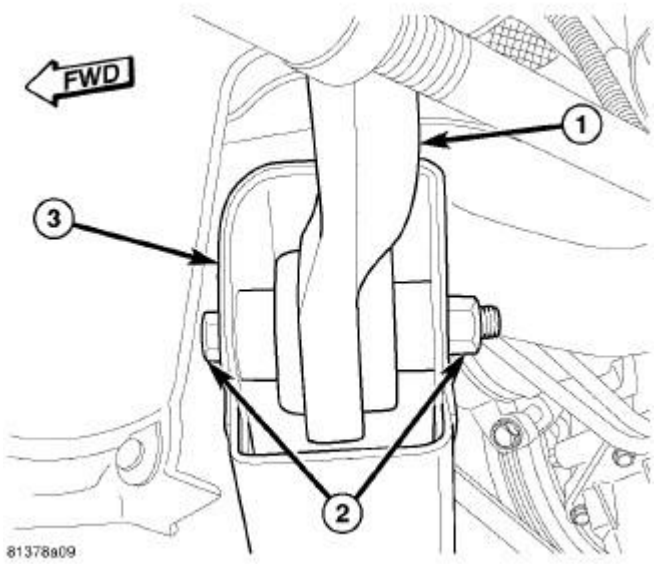

Fig. 223: Tension Strut Cradle Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

10. Once alignment is found to be within specifications, using a crowfoot wrench, tighten tension strut cradle bolt nut (2) to 176 N.m (130 ft. lbs.) while holding the bolt stationary.
11. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .

WHEEL ALIGNMENT

DIAGNOSIS AND TESTING

SUSPENSION AND STEERING

CONDITION	POSSIBLE CAUSES	CORRECTION
Front End Whine On Turns	1. Defective wheel bearing	1. Replace wheel bearing
	2. Incorrect wheel alignment	2. Check and reset wheel alignment
	3. Worn tires	3. Replace tires
Front End Growl Or Grinding On Turns	1. Defective wheel bearing	1. Replace wheel bearing
	2. Engine mount grounding	2. Check for motor mount hitting frame rail and reposition engine as required
	3. AWD - Worn or broken C/V joint	3. Replace C/V joint
	4. Loose wheel lug nuts	4. Verify wheel lug nut torque
	5. Incorrect wheel alignment	5. Check and reset wheel alignment
	6. Worn tires	6. Replace tires

Front End Clunk Or Snap On Turns	1. Loose lug nuts	1. Tighten wheel lug nuts to specifications
	2. Worn or loose tie rod	2. Tighten or replace tie rod end
	3. Worn or loose ball joint	3. Tighten or replace ball joint
	4. Worn/loose control arm bushing	4. Replace control arm or bushing
	5. Loose control arm fasteners	5. Tighten control arm fasteners to specified torque
	6. Loose stabilizer bar	6. Tighten stabilizer bar fasteners to specified torque
	7. Loose crossmember bolts	7. Tighten crossmember bolts to specified torque
Front End Whine With Vehicle Going Straight At A Constant Speed	1. Defective wheel bearing	1. Replace hub and bearing assembly
	2. Incorrect wheel alignment	2. Check and reset wheel alignment
	3. Worn tires	3. Replace tires
Front End Growl Or Grinding With Vehicle Going Straight At A Constant Speed	1. Engine mount grounding	1. Reposition engine/mount as required
Front End Clunk When Accelerating Or Decelerating	1. Worn or broken engine mount	1. Replace engine mount
	2. Loose lug nuts	2. Tighten wheel lug nuts to specified torque
	3. Worn or loose ball joint	3. Replace ball joint/control arm
	4. Worn or loose control arm bushing	4. Replace control arm or bushing
	5. Loose control arm fasteners	5. Tighten fasteners to specified torque
	6. Loose crossmember bolts	6. Tighten crossmember bolts to specified torque
	7. Worn tie rod end	7. Replace tie rod end
Road Wander	1. Incorrect tire pressure	1. Inflate tires to recommended pressure
	2. Incorrect front or rear wheel toe	2. Check and reset wheel toe
	3. Worn wheel bearing	3. Replace hub and bearing
	4. Worn control arm bushings	4. Replace control arm or bushing
	5. Excessive friction in steering gear	
		5. Replace steering gear
	6. Excessive friction in steering shaft coupling	6. Replace steering intermediate shaft/coupler

Lateral Pull	1. Unequal tire pressure	1. Inflate all tires to recommended pressure
	2. Radial tire lead	2. Perform lead correction procedure
	3. Incorrect front wheel camber	3. Check and reset front wheel camber
	4. Power steering gear imbalance	4. Replace power steering gear
	5. Wheel braking	5. Correct braking condition causing lateral pull
Excessive Steering Free Play	1. Incorrect Steering Gear Adjustment	1. Replace Steering Gear
	2. Worn or loose tie rod ends	2. Replace tie rod ends
	3. Loose steering gear mounting bolts	3. Tighten steering gear mounting bolts to specified torque
	4. Loose or worn steering shaft coupler	4. Replace steering intermediate shaft/coupler
Excessive Steering Effort	1. Low tire pressure	1. Inflate all tires to recommended pressure
	2. Lack of lubricant in steering gear	2. Replace steering gear
	3. Low power steering fluid level	3. Fill power steering fluid reservoir to correct level. Bleed as necessary
	4. Loose drive belt	4. Replace adjuster or drive belt
	5. Lack of lubricant in ball joints	5. Replace ball joints
	6. Steering gear malfunction	6. Replace steering gear
	7. Lack of lubricant in steering shaft coupler	7. Replace steering intermediate shaft/coupler

VEHICLE LEAD/PULL

To assure correct diagnosis, it is important to follow the steps outlined below in the order shown in illustration. Road test the vehicle before and after each step to verify that the lead condition has been corrected. When evaluating a vehicle, always drive the same road in both directions to get a feel for the effect of road crown and cross wind. A neutral vehicle will exhibit a small amount of drift on both right and left crowned roads (normal crown sensitivity). A vehicle with pronounced lead/pull may have one or more of the following conditions:

1. UNEQUAL TIRE PRESSURE. Adjust tire pressure to the pressure stated on door placard. Make sure the tire pressure is equal on all four tires and evaluate the car. Also verify that the tire size and type are correct and match each other. If the car still has a lead condition go to step (2).
2. TIRE CONICITY. Excessive tire conicity is one of the more frequent causes of vehicle lead. Cross-switch the front tires and evaluate the car. If the car still leads in the same direction or

gets worse, return the front tires to their original position, then go to step (3).

3. SUSPENSION ALIGNMENT. Check and record the wheel alignment settings. Non-symmetrical front caster or camber can sometimes cause a lead condition or can be used to fix a lead condition. Adjust the wheel alignment as necessary to preferred settings. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**. If the car still leads, go to step (4).
4. STEERING GEAR VALVE IMBALANCE. Steering gear valve imbalance can sometimes cause a vehicle lead. Although there is no quick test or measurement that can be performed to verify a good or bad steering gear valve, generally the steering efforts will feel much lighter in the lead direction and heavier in the opposite direction with an unbalanced valve. Replace the steering gear only as a "last resort" to solve the problem. To replace the steering gear. Refer to **GEAR, REMOVAL** .

STANDARD PROCEDURE

WHEEL ALIGNMENT

NOTE: If the vehicle is equipped with Adaptive Cruise Control (ACC), the ACC module must be realigned following any wheel alignment changes. Refer to SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL, STANDARD PROCEDURE .

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to ensure proper alignment.

1. Verify that the fuel tank is full of fuel. If the tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment angles.
2. The vehicle's passenger and luggage compartments should be free of any load that is not factory equipment.
3. Check the tires on the vehicle. All tires must be the same size and in good condition with approximately the same amount of tread wear. Inflate all the tires to the recommended air pressure.
4. Check the wheel and tire assemblies for excessive radial runout.
5. Inspect lower ball joints and all steering linkage for looseness, binding, wear or damage. Repair as necessary.
6. Check suspension fasteners for proper torque and tighten as necessary.
7. Inspect all suspension component rubber bushings for signs of wear or deterioration. Replace any faulty bushings or components before aligning the vehicle.
8. Check the vehicle's curb height to verify it is within specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

WHEEL ALIGNMENT SETUP

NOTE: Confirm the wheel alignment equipment is calibrated to the manufacturers requirements prior to attempting any wheel alignment.

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: **Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced (suspension compressed/released). Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.**

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
4. If front camber and caster are not within specifications, proceed to CAMBER AND CASTER below. If caster and camber are within specifications, proceed to TOE which can be found following CAMBER AND CASTER. Rear camber can be adjusted. Refer to CAMBER AND CASTER below. Rear caster is not adjustable. If found not to be within specifications, reinspect for damaged suspension or body components and replace as necessary. If rear toe is not within specifications, adjust rear toe before proceeding to adjust front toe.

CAMBER AND CASTER

Camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as NET BUILD. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications.

CAUTION: Do not attempt to adjust a vehicles wheel alignment by heating, bending or by performing any other modification to the vehicle's suspension components or body.

If individual front camber or caster is found not to meet alignment specifications, each can be adjusted by shifting the engine cradle if cross-camber and cross-caster are within specifications, or by using an available service adjustment bolt package. Always try to shift the cradle first **(if camber and caster are off slightly)** to correct the misalignment before installing an adjustment bolt package. If an adjustment bolt package installation is necessary, inspect the suspension components for any signs of damage or bending first. Refer to the following procedures for adjustments.

If individual rear camber is found not to meet alignment specifications, repair camber links are available in Plus or Minus One Millimeter (1 mm) lengths. A Plus or Minus 1 mm repair camber link will change camber approximately 0.5-0.7 degrees in the preferred direction. Before installing non-standard length camber links on a vehicle found to be outside the specifications, inspect the suspension components for any signs of damage or bending. To install either repair camber link.

Refer to **LINK, CAMBER, INSTALLATION** or **LINK, COMPRESSION, INSTALLATION** or **LINK, SPRING, INSTALLATION** or **LINK, TENSION, INSTALLATION** or **LINK, TOE, INSTALLATION** .

ADJUSTMENT BY SHIFTING CRADLE

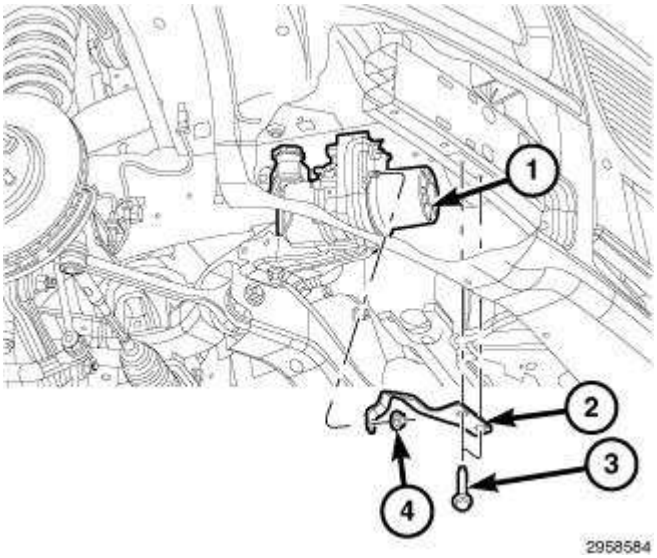

Fig. 224: EHPS Pump Bracket Retaining Nut & EHPS Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: This vehicle is equipped with an Electro Hydraulic Power Steering (EHPS) system. The bolts (3) for the EHPS front mounting bracket (2) must be loosened before shifting the cradle. After the cradle has been shifted and the cradle mounting fasteners have been tightened to the correct specification, tighten the EHPS mounting bracket bolts to the correct specification.

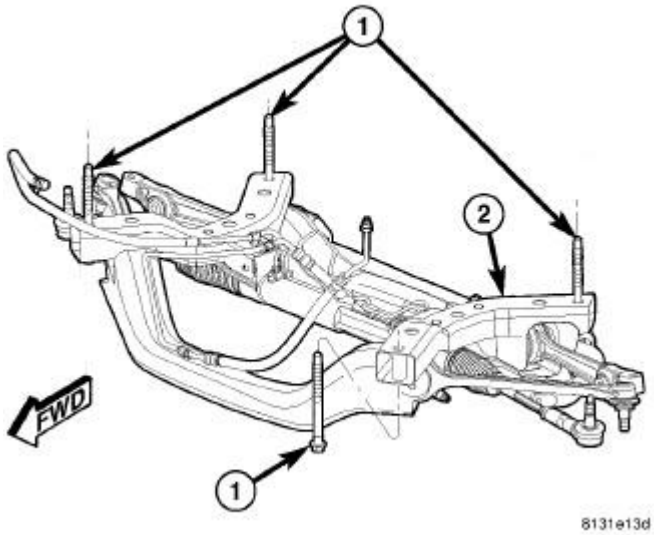

Fig. 225: Engine Cradle Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always use care when shifting cradle to avoid damaging other components on the vehicle.

1. Loosen the four bolts (1) fastening the engine cradle (2) to the frame just enough to allow movement of the cradle.
2. Shift cradle as necessary to bring camber or caster into specifications. When shifting cradle, use care not to move other angles (camber or caster) that are within specifications, out of specifications.
3. Tighten the four bolts (1) fastening the engine cradle (2) to the frame to specifications.
4. Jounce the rear, then front of the vehicle an equal amount of times.
5. Measure camber and caster. If camber and caster are within specifications, proceed to TOE. If camber or caster cannot be brought into specifications, perform the ADJUSTMENT BOLT PACKAGE INSTALLATION below.

ADJUSTMENT BOLT PACKAGE INSTALLATION - ALL-WHEEL-DRIVE (AWD)

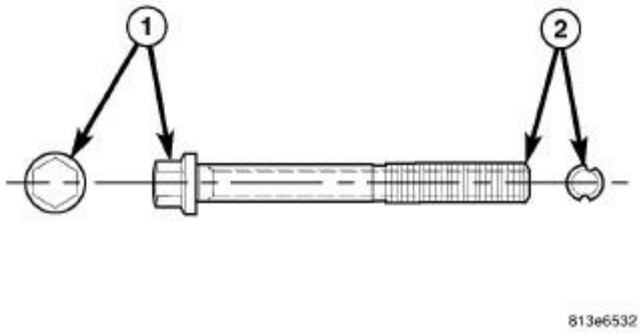

Fig. 226: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

The adjustment bolt package contains 2 special bolts (1). These bolts can be identified by the offset grooves cut into the thread section (2). These bolts are designed to replace the inboard mounting bolts of the lower control arm at the engine cradle. Each bolt allows approximately 0.3 degrees of movement. To adjust camber only, use both bolts, one at each leg of the control arm. To adjust caster only, use one bolt at the front leg only.

1. Raise the vehicle by the frame until the tires are not supporting the weight of the vehicle.
2. Remove the belly pan as necessary. Refer to **BELLY PAN, REMOVAL** .
3. Lower control arm rear bolt only:
    1. Remove the screws fastening the heat shields covering the steering gear inner tie rod boots. Remove the heat shields.
    2. Loosen (do not remove) the steering gear mounting bolt furthest from the side of

adjustment bolt installation.

3. Remove the two remaining steering gear mounting bolts and allow steering gear to relax on the side of adjustment bolt installation, giving access to the lower control arm rear mounting bolt.

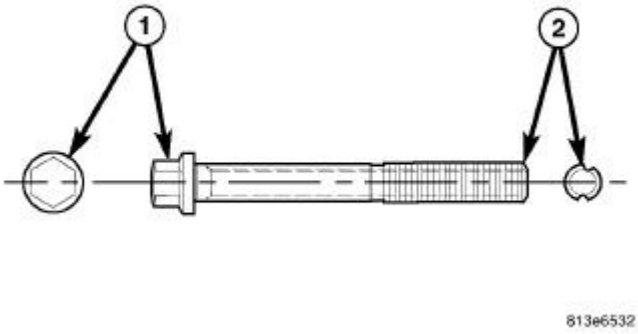

Fig. 227: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Wheel alignment adjustment bolts have offset grooves cut into the length of the bolt (2). If removing or installing lower control arm or tension strut mounting bolts that have these grooves, DO NOT ROTATE THE BOLT. To remove the bolt, hold the bolt head stationary and rotate the nut, then slide the bolt straight out of the bushing. This is necessary to avoid damaging the bat wings in the bushing inner metal or cradle.

4. Hold the head of the control arm or tension strut mounting bolt stationary and remove the nut. Slide the bolt straight out of the bushing and discard.

CAUTION: When installing an adjustment bolt, be sure to install it in the correct direction. Lower control arm rear mounting bolts must be installed from the rear-forward and lower control arm front mounting bolts must be installed from the front-rearward.

NOTE: The grooves on the adjustment bolts are off-center forcing the bolt to be installed in one of two ways depending on whether more positive or negative camber or caster is necessary. The Bolts must be rotated 180° to achieve either more positive or negative camber or caster. DO NOT force the adjustment bolt.

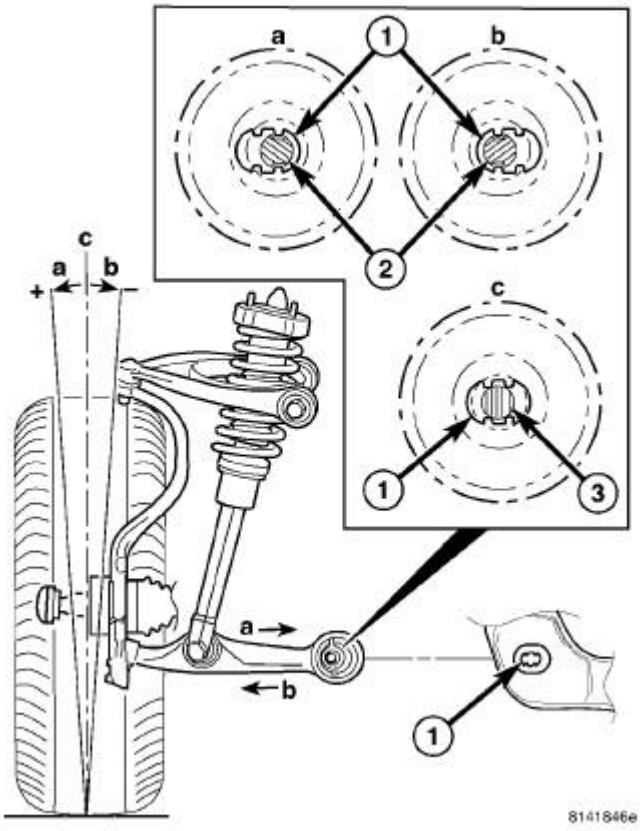

Fig. 228: Installing Camber Bolt - AWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the "bat wings" as shown in illustration (c).

5. Camber Adjustment - The adjustment bolts are designed to work in conjunction with "bat wing" holes that are formed into the engine cradle (1) allowing for lower control arm movement approximately 0.3° in either direction.
    - To achieve more positive camber, refer to (a) in the figure. Move the control arm in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and round hole in the bushing inner metal.
    - To achieve more negative camber, refer to (b) in the figure. Move the control arm in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and round hole in the bushing inner metal.

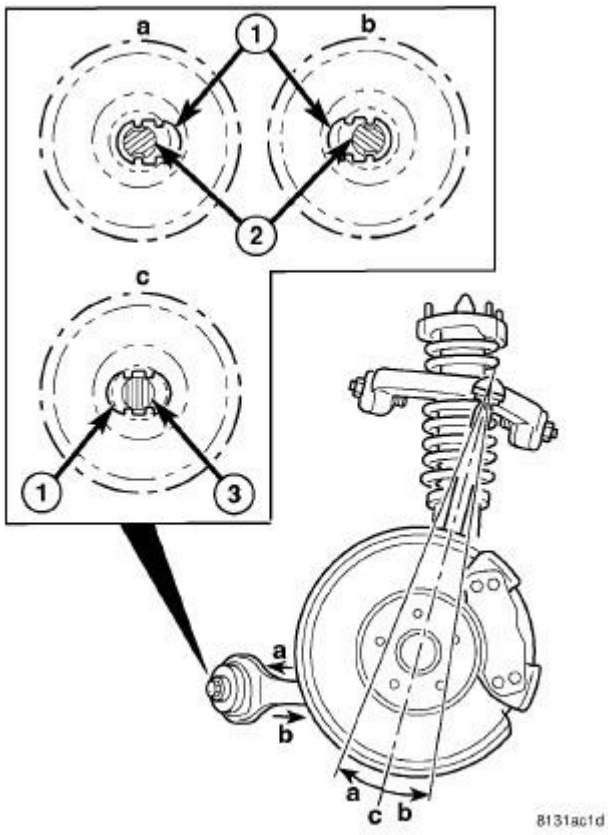

Fig. 229: Installing Caster Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the "bat wings" as shown in illustration (c).

6. Caster Adjustment - The adjustment bolts are designed to work in conjunction with "bat wings" that are formed into the engine cradle (1) allowing for lower control arm movement approximately 0.3° in either direction.
   - To achieve more positive caster, refer to (a) in the figure. Move the lower control arm in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and the round hole in the bushing inner metal.
   - To achieve more negative caster, refer to (b) in the figure. Move the lower control arm in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in engine cradle (1) and round hole in the bushing inner metal.
7. Start a NEW nut on the end of the mounting bolt by hand, then while holding the head of the bolt stationary, install the nut. **Do not tighten the nut at this time.**
8. Rear adjustment bolt only - Reinstall the steering gear and heat shields. Refer to **GEAR, INSTALLATION** .
9. Lower the vehicle to curb position. Jounce the rear, then the front of the vehicle an equal amount of times.

10. Using a crowfoot wrench, tighten the adjustment bolt **nut** to 176 N.m (130 ft. lbs.) while holding the bolt stationary. A socket on the end of a breaker bar works well for holding the rear bolt stationary with the steering gear is installed.
11. Measure camber and caster. If camber and caster are not within specifications, inspect the suspension components for any signs of damage or bending. If camber and caster (and cross-camber and cross-caster) are within specifications, proceed with TOE to check and adjust toe.
12. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .

TENSION STRUT CAMBER BOLT INSTALLATION - REAR-WHEEL-DRIVE (RWD)

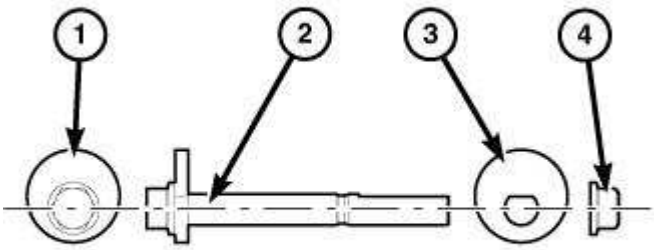

Fig. 230: Camber Bolt, Eccentric Washer & Eccentric Washer
Courtesy of CHRYSLER GROUP, LLC

Camber on rear wheel drive (RWD) vehicles can be adjusted by grinding out the tension strut mounting holes in the cradle and installing a camber bolt kit. The camber bolt (2) has an eccentric washer (1) built into the shoulder of the bolt head. There is an eccentric washer (3) that is keyed to a flat machined into the threads of the bolt. The keyed washer rotates in exactly the same way that the washer on the bolt head end rotates.

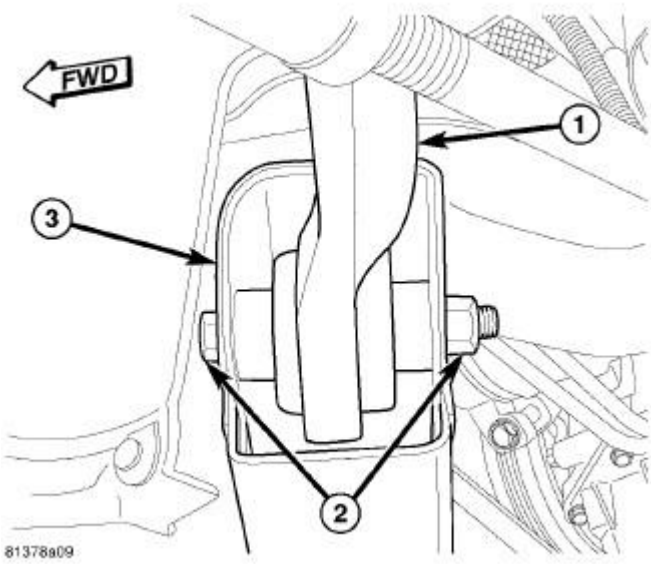

Fig. 231: Tension Strut Cradle Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the belly pan as necessary. Refer to **BELLY PAN, REMOVAL** .
3. Remove nut and bolt (2) securing tension strut (1) to engine cradle (3).
4. Slide tension strut out of cradle bracket and discard.

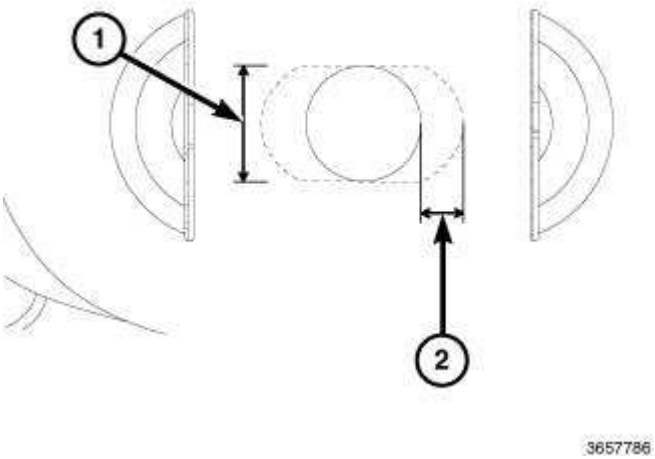

Fig. 232: Original Height
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove more than 5mm (0.2 in) (2) of material on either side of the existing mounting hole so that the strength of the tension strut mounting area is maintained. Also do not exceed the original height

(1) of the mounting hole.

NOTE: Grind out both the front and rear holes of the tension strut mounting area.

5. Grind out the area in the figure that is represented with dotted lines. Remove 5 mm (0.2 in) of material (2) from each side of the existing bolt hole. While cutting the material, maintain the original height (1) of the bolt hole.

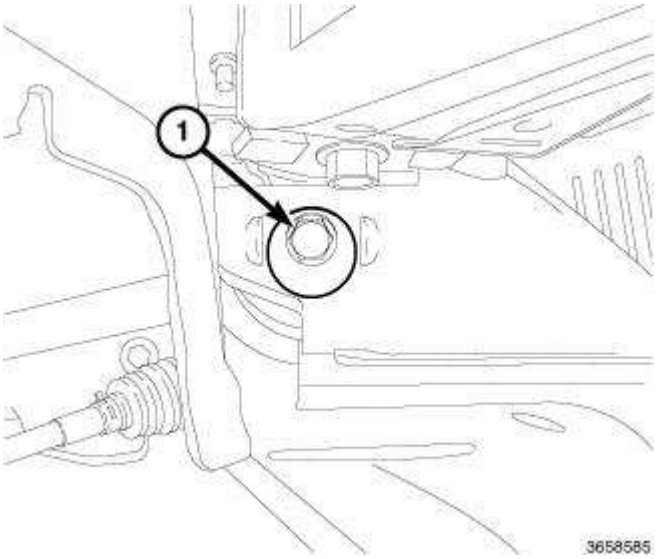

Fig. 233: Camber Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the camber bolt (1) into the front hole and install the eccentric washer on the bolt on the rear side of crossmember.
7. To adjust the camber, rotate the camber bolt (1) until the desired camber values are obtained.
8. Once the desired camber values are obtained, tighten the camber bolt (1) to 176 N.m (130 Ft. Lbs.).

TOE

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.

1. Center the steering wheel and lock in place using a steering wheel clamp.

NOTE: When performing the toe adjustment procedure, set rear toe to specifications before setting front toe.

2. If rear toe is not within specifications, perform the REAR TOE procedure below.
3. If front toe is not within specifications, perform the FRONT TOE procedure below.

4. Remove the steering wheel clamp.
5. Remove the alignment equipment.
6. Road test the vehicle to verify the steering wheel is straight and the vehicle does not wander or pull.

REAR TOE

NOTE: Perform the following procedure to each side of the vehicle as necessary.

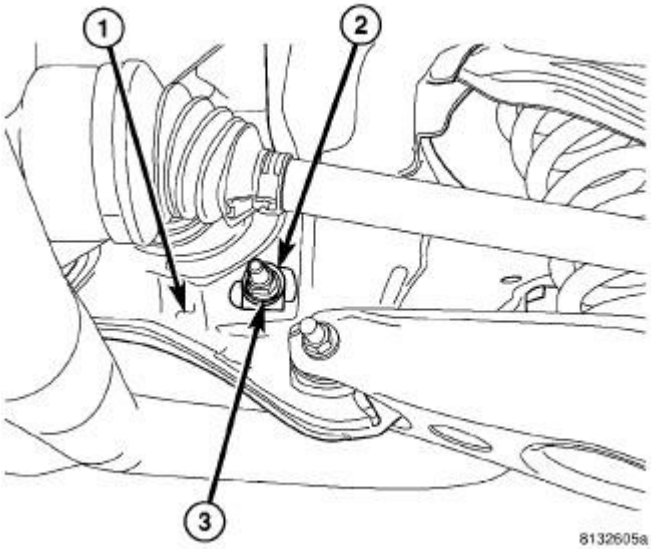

Fig. 234: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

1. Loosen the cam bolt nut securing the toe link to the rear crossmember (front of rear crossmember) just enough to rotate the cam bolt (1).

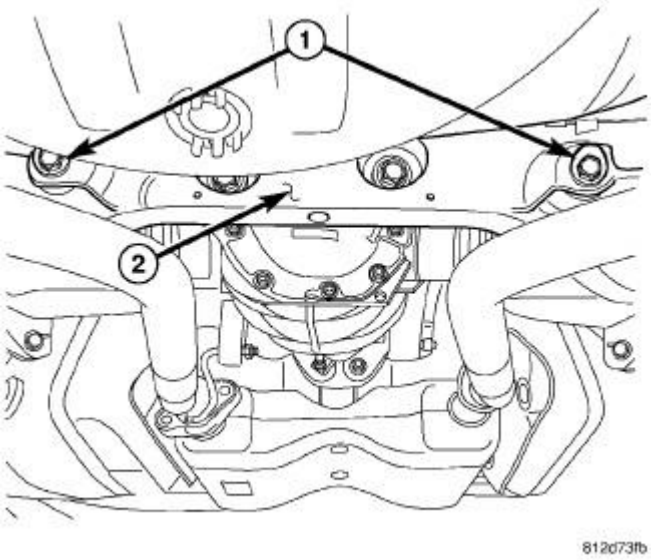

Fig. 235: Rear Toe Adjustment Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When adjusting rear toe, the eccentric lobes on the toe adjustment cam bolts and washers are not to be facing downward. The lobes should only be facing upward or up to 90° to one side or the other from the 12 O'clock position.

2. Rotate the cam bolt head on the opposite side (rear) of the crossmember in either direction until the preferred specification is obtained. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
3. While holding the cam bolt (1) from turning, tighten the cam bolt nut to specifications.
4. Adjust rear toe on opposite side of vehicle using above procedure as necessary.
5. Once rear toe is set, proceed to FRONT TOE to set the vehicle's front toe.

FRONT TOE

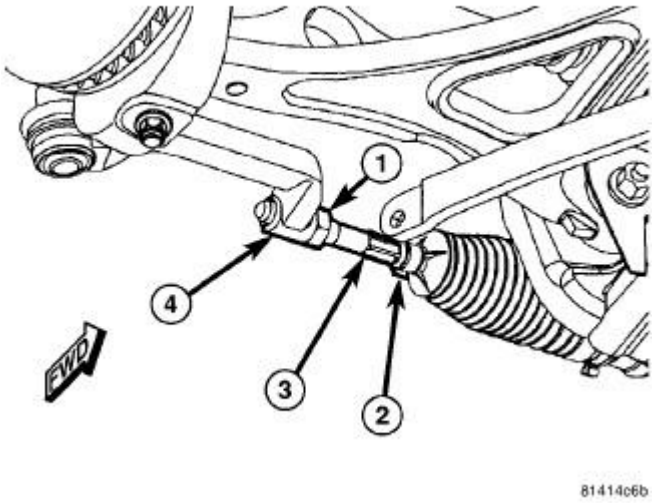

Fig. 236: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform the following procedure to each side of the vehicle as necessary.

CAUTION: Do not twist the inner tie rod-to-steering gear boots during front wheel Toe adjustment. Remove the boot clamps (2) at the inner tie rods and make sure the boots move freely on the inner tie rods.

1. AWD - Loosen the jam nut (1) at the inner-to-outer tie rod (3-4) connection.

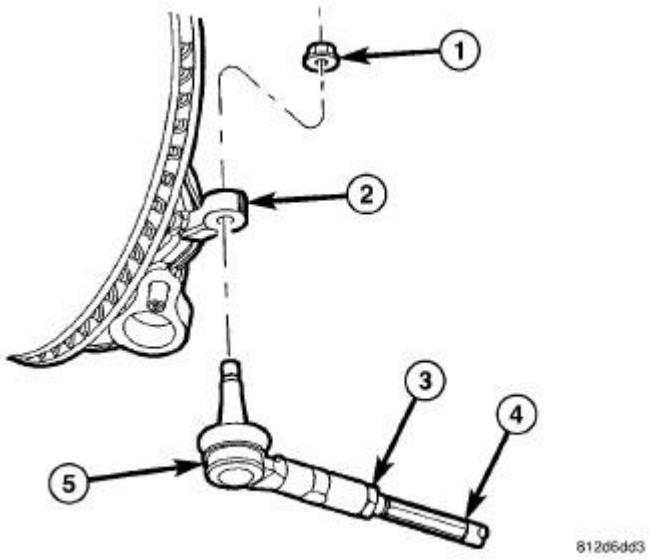

Fig. 237: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

2. RWD - Loosen the jam nut (3) at the inner-to-outer tie rod (4-5) connection.

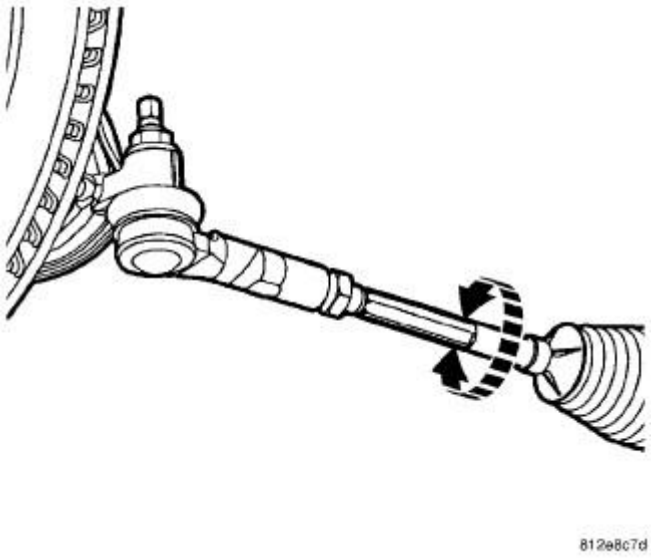

Fig. 238: Front Toe Adjustment
Courtesy of CHRYSLER GROUP, LLC

3. Grasp the inner tie rod at the hex and rotate as necessary to adjust front toe to the preferred toe specification. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.

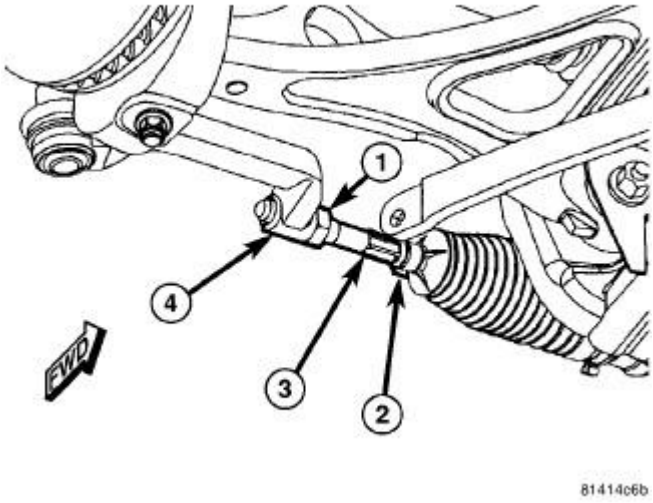

Fig. 239: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

4. AWD - Tighten the tie rod jam nut (3) to 75 N.m (55 ft. lbs.) using care not to lose adjustment.

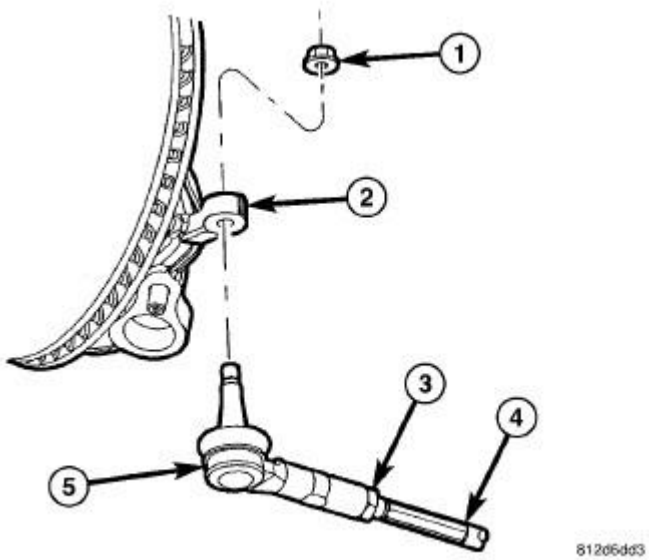

Fig. 240: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

5. RWD - Tighten the tie rod jam nut (3) to 75 N.m (55 ft. lbs.) using care not to lose adjustment.
6. Make sure the inner tie rod-to-steering gear boot is not twisted, then reinstall the boot clamp at the inner tie rod.
7. Adjust front toe on opposite side of vehicle using the above procedure as necessary.

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

NOTE: When measuring, the maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).

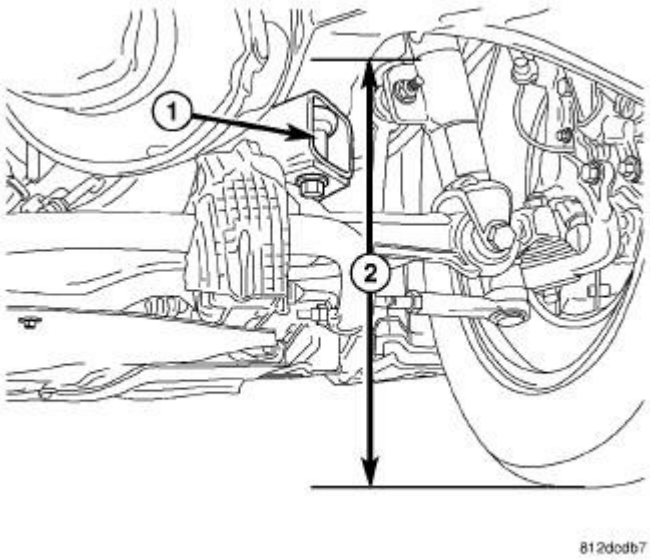

Fig. 241: Front Curb Height Measurement
Courtesy of CHRYSLER GROUP, LLC

1. Front - On each side of the vehicle, measure the distance (2) from the frame rail just behind the engine cradle rear mount (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.

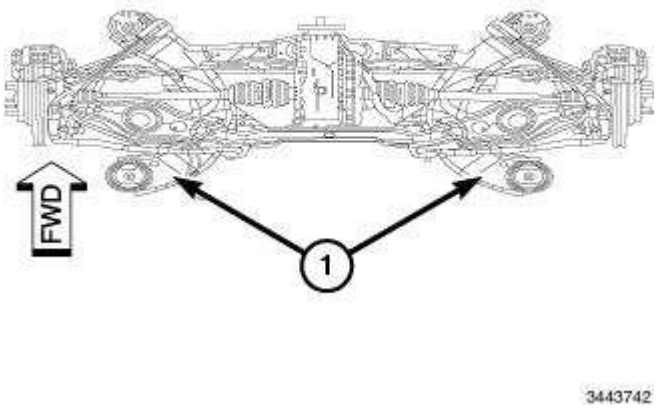

Fig. 242: Cradle Frame
Courtesy of CHRYSLER GROUP, LLC

2. Rear - On each side of the vehicle, measure the distance from the cradle frame (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.
3. Compare the measurements to the specifications listed in the following Curb Height

Specifications chart.

CURB HEIGHT SPECIFICATIONS

MODEL	FRONT	REAR
ALL-WHEEL-DRIVE	344 mm ± 12 mm 13.54 in. ± 0.47 in	367 mm ± 12 mm 14.45 in. ± 0.47 in.
REAR-WHEEL-DRIVE WITH 17 INCH WHEELS	317 mm ± 12 mm 12.48 in. ± 0.47 in	344 mm ± 12 mm 13.54 in. ± 0.47 in.
REAR-WHEEL-DRIVE WITH 18 INCH WHEELS	325 mm ± 12 mm 12.80 in. ± 0.47 in	352 mm ± 12 mm 13.86 in. ± 0.47 in.
REAR-WHEEL-DRIVE WITH 20 INCH WHEELS	331 mm ± 12 mm 13.03 in. ± 0.47 in	358 mm ± 12 mm 14.09 in. ± 0.47 in.

SPECIFICATIONS

WHEEL ALIGNMENT

NOTE: All specifications are given in degrees.

NOTE: All wheel alignments are to be set at curb height. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.

ALL-WHEEL-DRIVE

FRONT WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER - LEFT	0.00	-0.55° to +0.55°
CAMBER - RIGHT	-0.40°	-0.95° to +0.15°
CROSS-CAMBER (Maximum side-to-side difference)*(1)	+0.40°	-0.15° to +0.95°
CASTER - LEFT	+5.40°	+4.40° to +6.40°
CASTER - RIGHT	+5.40°	+4.40° to +6.40°
CROSS-CASTER* (1) (Maximum side-to-side difference)	0.00	-0.60° to +0.60°
TOE - TOTAL**(2)	+0.10°	-0.10° to +0.30°
Maximum side-to-side difference	0.00°	0.06°

Notes:

(1) * Cross Alignment values are determined by taking the left side value minus the right side value.

(2) ** TOTAL TOE is the sum of both left and right wheel toe settings. TOTAL TOE should be equally split between each wheel on the same axle to ensure the steering wheel is centered

after setting toe.

Positive toe is toe-in and negative toe is toe-out.

REAR WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER	-0.75°	-1.30° to -0.20°
CROSS-CAMBER (Maximum side-to-side difference)	0.00°	-0.80° to +0.80°

FUEL DELIVERY, DIESEL

STANDARD PROCEDURE

DIESEL FUEL SYSTEM CONTAMINATION

NOTE: Fuel system damage that was caused by incorrect or contaminated fuel that was introduced into the fuel system by the customer is not covered under warranty.

IF THE ENGINE WAS NOT STARTED AFTER INCORRECT OR CONTAMINATED FUEL WAS USED DURING REFUELING

If the fuel system has been contaminated (with gasoline, water, etc.) AND the engine WAS NOT STARTED, the following procedure must be followed:

1. Drain the fuel from the fuel tank. Refer to **DRAINING FUEL TANK - DIESEL** . Use an appropriate fuel container. Dispose of the contaminated fuel using the proper procedures.

   CAUTION: Dispose of petroleum based products in a manner consistent with all applicable Local, State, Federal, and Provincial regulations.

2. Remove the fuel tank. Refer to **TANK, FUEL, REMOVAL** or **TANK, FUEL, REMOVAL**.
3. Ensure the swirl pot indentation below the in the fuel tank electric fuel pump inlet is completely drained of any contaminated fuel.
4. Completely drain the low pressure fuel lines, and install a new fuel filter.
5. Install the fuel tank, and fill with clean diesel fuel.
6. Road test the vehicle to verify normal operation.

IF THE ENGINE WAS STARTED AFTER INCORRECT OR CONTAMINATED FUEL WAS USED DURING REFUELING

If the fuel system has been contaminated (with gasoline, water, etc.) AND the engine WAS STARTED, the following procedure must be followed:

1. Remove all fuel from the fuel tank. Refer to **DRAINING FUEL TANK - DIESEL** . Use an appropriate fuel container. Dispose of the contaminated fuel using the proper procedures.

   CAUTION: Dispose of petroleum based products in a manner consistent with all applicable Local, State, Federal, and Provincial regulations.

2. Remove the fuel tank. Refer to **TANK, FUEL, REMOVAL** or **TANK, FUEL, REMOVAL**.

3. Ensure the swirl pot indentation below the in the fuel tank electric fuel pump inlet is completely drained of any contaminated fuel.
4. Completely drain the low pressure fuel lines, and install a new fuel filter.
5. Install the fuel tank, and fill with clean diesel fuel.
6. Lift up on locking retaining tab to unlock the lock the fuel injector return line from injector
7. Disconnect the low pressure fuel injector return line T-Fitting from fuel injector.
8. Connect a clean hose to the T-Fitting orifice, and place the other end in a suitable clean container.
9. Turn the ignition ON, and collect the fuel escaping from the T-Fitting orifice in a clean container. Check the fuel sample for metal chips, dirt, or other foreign matter.
10. If any dirt or metal chips are present in the fuel sample, completely clean the high pressure side of the fuel injection system, then install new the fuel injectors, and the high pressure fuel pump.
11. If there are no metal chips or dirt present in the fuel sample, the fuel system is OK. Reconnect the T-Fitting orifice, and road test the vehicle to verify normal operation.

DRAINING FUEL TANK - DIESEL

CONVENTIONAL PROCEDURE

A one-way check valve is located within the fuel fill fitting on the fuel tank. Because of this valve, the tank cannot be drained the conventional way through the fuel fill opening. To drain the tank, the fuel pump module must be removed.

1. Disconnect the fuel supply line at the quick-connect fitting. Refer to **STANDARD PROCEDURE** .
2. Install the appropriate Fuel Line Adapters / Fitting from the (special tool #8978A, Decay Tool, Fuel). Route the opposite end of this hose to an diesel fuel draining station.

NOTE: Activation of the fuel pump module may time out and need to be restarted several times to completely drain the fuel tank.

3. Using a diagnostic scan tool, activate the fuel pump module until the fuel tank has been evacuated.

ALTERNATIVE PROCEDURE

NOTE: If the electric fuel pump is not operating, the fuel tank must be removed and drained through the fuel pump module opening of the fuel tank.

1. Disconnect the negative battery cable.
2. Remove fuel pump module. Refer to **MODULE, FUEL PUMP, REMOVAL** or **MODULE, FUEL PUMP, REMOVAL**.
3. After fuel pump module has been removed, drain fuel into an approved diesel fuel oil draining station.

High Pressure Fuel Tube support Bracket Bolt	11	-	97
High Pressure Fuel Tube Support Bracket Nut	11	-	97

FUEL SYSTEM PRESSURE - DIESEL

The correct fuel pressure from the in-tank electric fuel pump to the high pressure injection pump for this vehicle is 59 psi +/- 2 psi. The correct flow rate for the in-tank electric fuel pump is approximately 53 gph (200 lph) at an ambient temperature of 73° F (23° C) and a constant battery voltage of 13 volts DC.

FILTER, FUEL

REMOVAL

REMOVAL

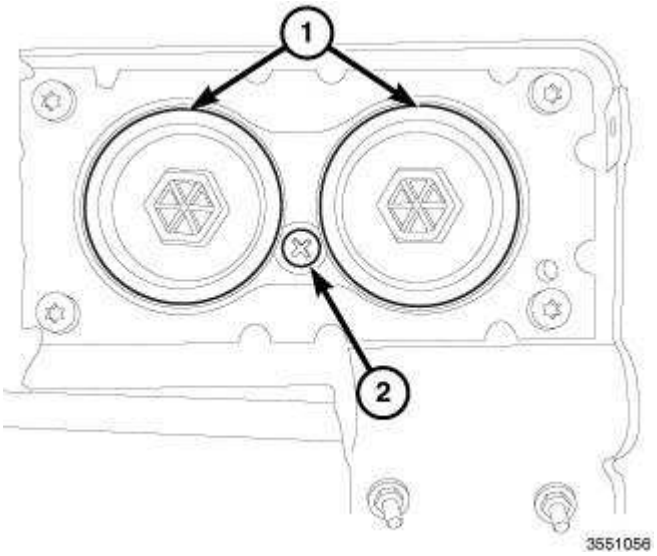

Fig. 1: Drain Plug & Filter Cover
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Loosen drain plug (2) and drain fuel filter/water separator into a suitable container.
3. Securely tighten drain plug (2).
4. Remove each filter cover (1) and the fuel filter.

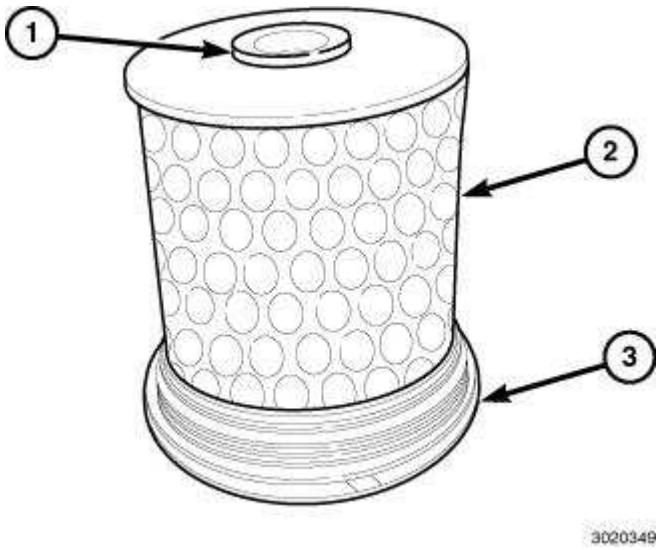

Fig. 2: Fuel Filter Cover & Fuel Filter
Courtesy of CHRYSLER GROUP, LLC

5. While holding the fuel filter cover (3), pull up on fuel filter (2) to separate from cover (3).

INSTALLATION

INSTALLATION

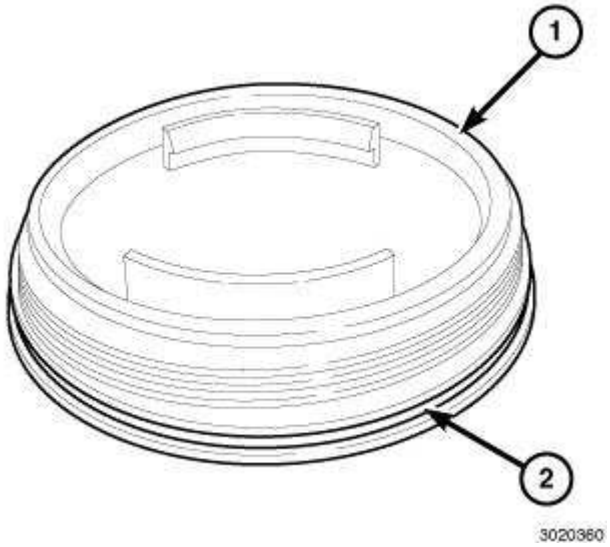

Fig. 3: New O-Ring Seal & Filter Covers
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate and install a new O-ring seal (2) onto filter covers (1).

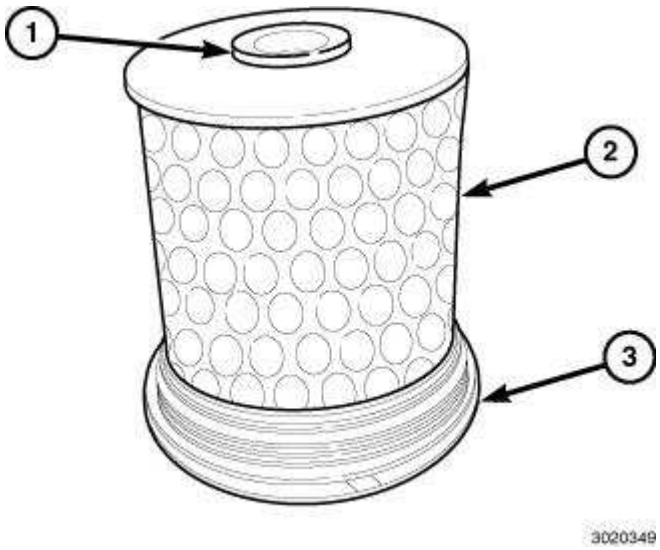

Fig. 4: Fuel Filter Cover & Fuel Filter
Courtesy of CHRYSLER GROUP, LLC

2. Position and push down on new fuel filters (2) to install filter onto cover (3).
3. Lubricate the rubber grommet seal (1) with clean diesel fluid.

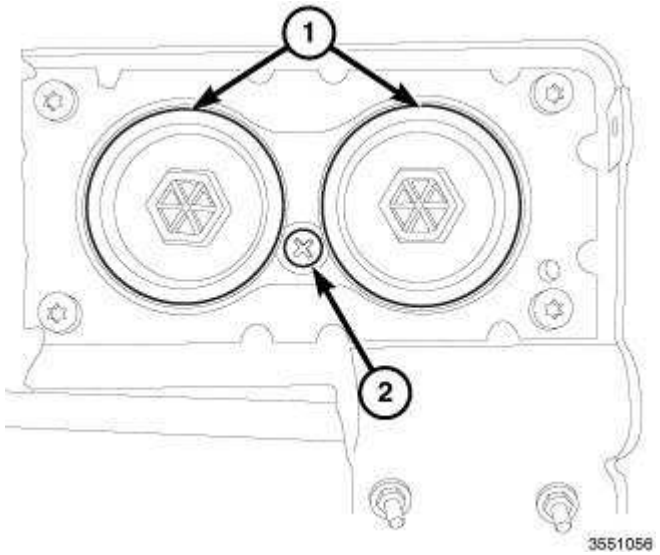

Fig. 5: Drain Plug & Filter Cover
Courtesy of CHRYSLER GROUP, LLC

4. Install the fuel filters. Tighten each cover (1) to 20 N.m (177 in. lbs.).
5. Lower the vehicle.
6. Start the vehicle and inspect for leaks.

FITTING, QUICK CONNECT

DESCRIPTION

DESCRIPTION

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type shown in illustration above. a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to **QUICK-CONNECT FITTINGS** for more information.

CAUTION: Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used. Refer to QUICK-CONNECT FITTINGS . This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips and latches) of Quick-Connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURE

QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal.

These are the quick-connect fittings:

- Redundant Latch Single Button Type Fitting
- Single Button Type Fitting
- Pinch Type Fitting
- Single Tab Type Fitting
- Two Tab Type Fitting
- Plastic Retainer Ring Type Fitting
- Latch Clip Type 1 Fitting
- Latch Clip Type 2 Fitting
- Wing Type Fitting

DISCONNECTING

CAUTION: Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

REDUNDANT LATCH SINGLE BUTTON TYPE FITTING:

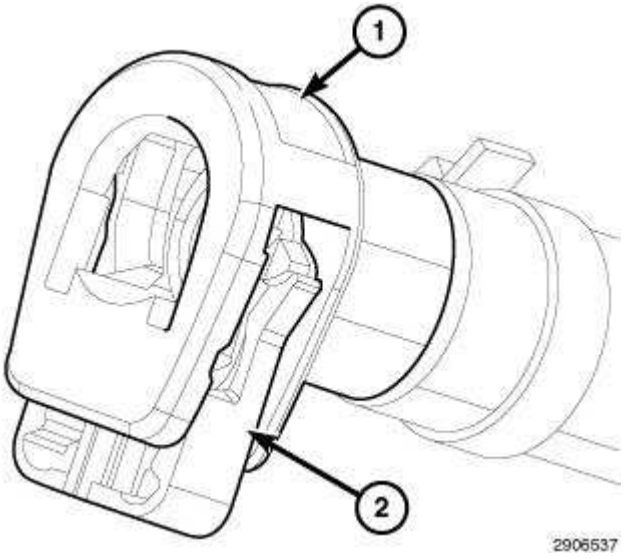

Fig. 6: Redundant Latch & Push Button
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting is equipped with a redundant latch (2) and a single push button (1) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

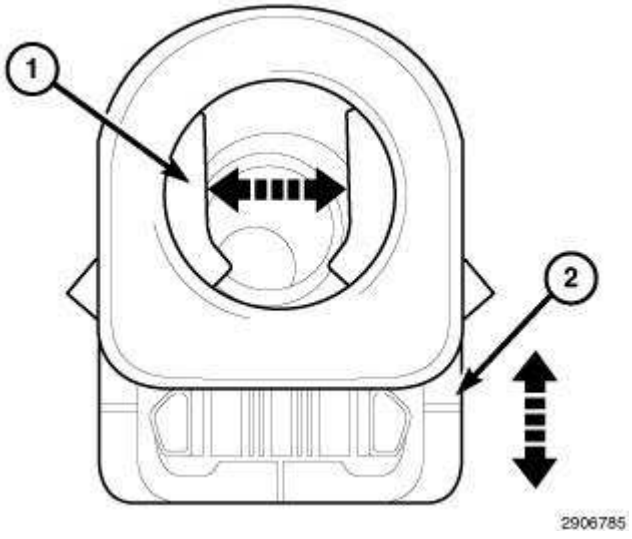

Fig. 7: Redundant Latch & Internal Latches

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

1. Pull the redundant latch (2) out away from the quick-connect fitting.
2. Press on the push button with your thumb, release the internal latches (1) and remove the quick-connect fitting from the fuel system component.

SINGLE BUTTON TYPE FITTING:

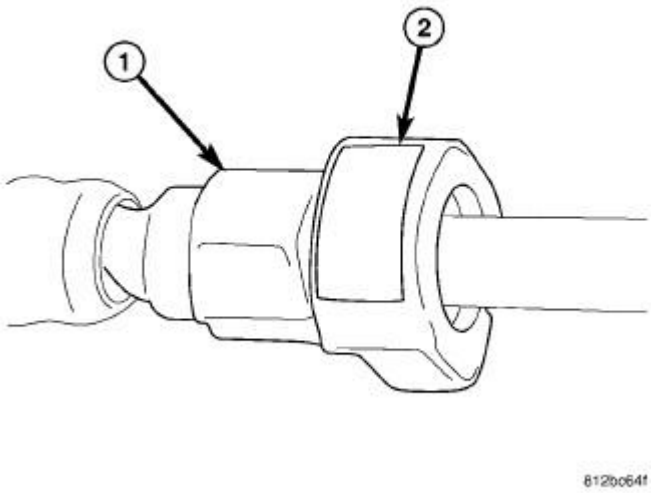

Fig. 8: Single Button Fitting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

This type of quick-connect fitting is equipped with a single push button (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

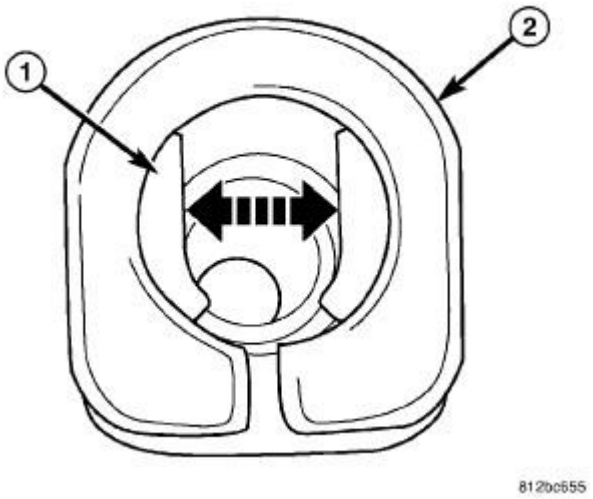

Fig. 9: Ouick-Connect Fitting Latches
Courtesy of CHRYSLER GROUP, LLC

1. Press on the push button with your thumb, release the internal latches (1).
2. Remove the quick-connect fitting from the fuel system component.

2 BUTTON TYPE FITTING

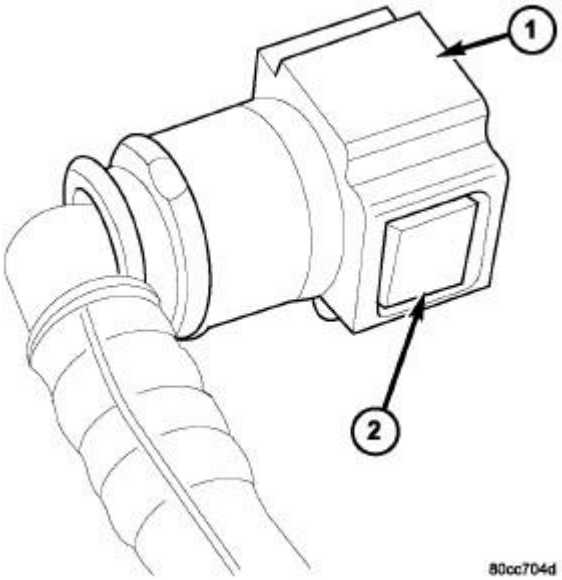

Fig. 10: View Of 2-Button Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two push buttons (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

1. Press on both push buttons with your thumb, release the internal latches.
2. While holding the two push buttons simultaneously, remove the quick-connect fitting from the fuel system component.

PINCH TYPE FITTING

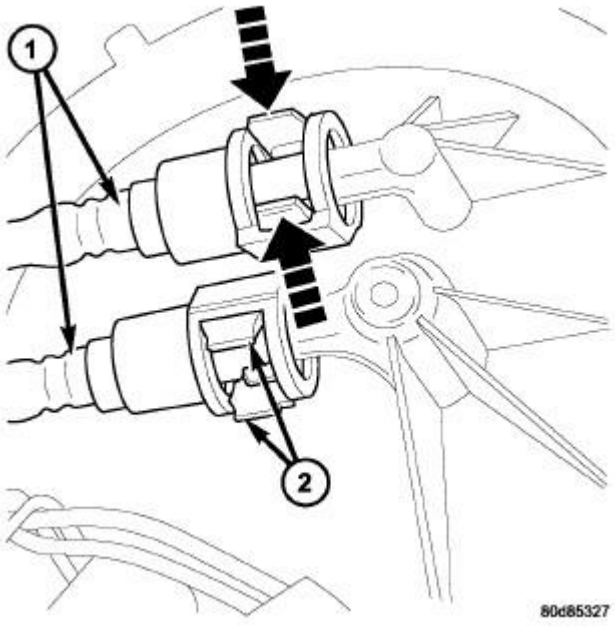

Fig. 11: View Of Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two finger tabs (2). Special tools are not required for removal.

1. Pinch both tabs (2) together and release the quick-connect fitting.
2. Remove the quick-connect fitting from the fuel system component.

SINGLE TAB TYPE FITTING

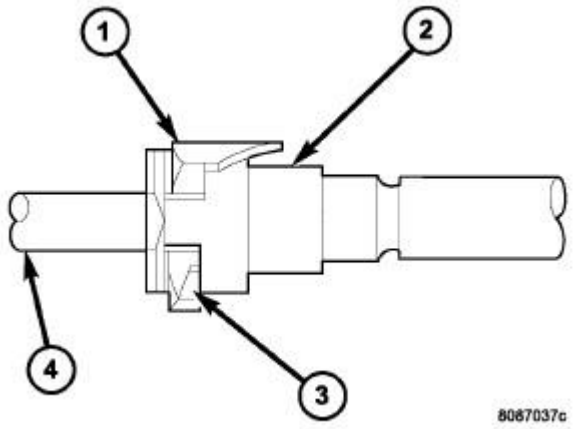

Fig. 12: View Of Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed the quick-connect fitting can be separated from the fuel system component. Special tools are not required for removal.

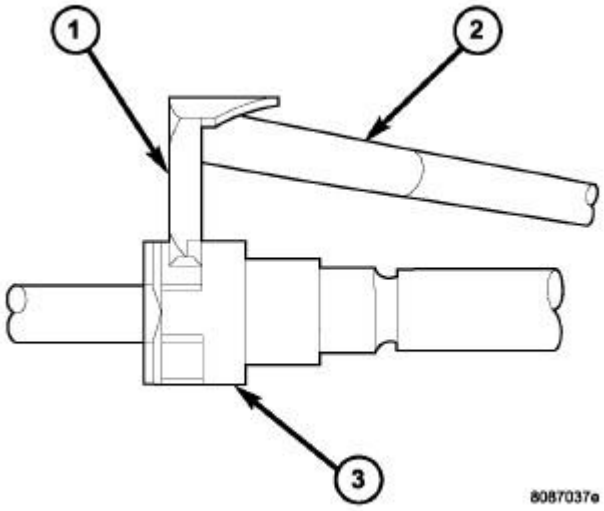

Fig. 13: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

1. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
2. While pressing the release tab on the side of the quick-connect fitting use a screwdriver (2) to pry up the pull tab.
3. Raise the pull tab until it separates from the quick-connect fitting.
4. Remove the quick-connect fitting from the fuel system component.

TWO TAB TYPE FITTING

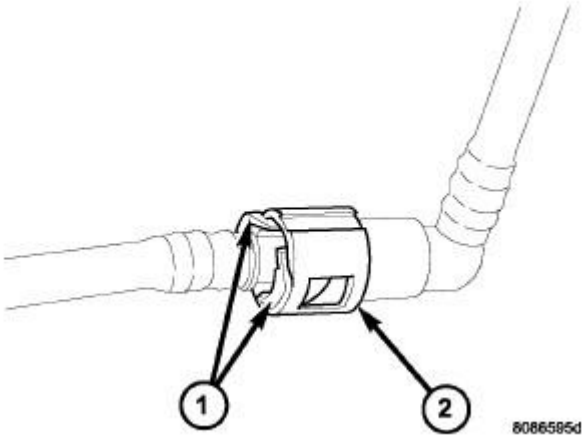

Fig. 14: Identifying Typical 2-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (2) is equipped with tabs located on both sides of the fitting (1). These tabs are integral to the fuel system component. The plastic tabs will remain on the component being serviced after the quick-connect fitting is removed. The O-ring and spacer will remain in the quick-connect fitting. Special tools are not required for removal.

1. Squeeze the plastic tabs (1) against the sides of component being serviced with your fingers.
2. Remove the quick-connect fitting from the fuel system component.

PLASTIC RETAINER RING TYPE FITTING

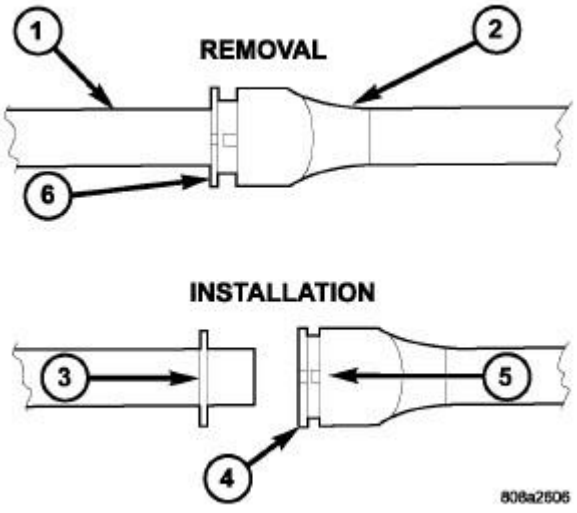

Fig. 15: Plastic Retainer Ring Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of fitting can be identified by the use of a round plastic retainer ring (4) usually black in color. Special tools are not required for removal.

NOTE: The round plastic retainer ring must be pressed squarely into the quick-connect fitting body. If this retainer is cocked during removal it will be difficult to disconnect the quick-connect fitting. Use an open-end wrench on the shoulder of the plastic retainer ring to aid in disconnection.

1. Firmly push the quick-connect fitting (5) towards the component being serviced while firmly pushing the round plastic retainer ring into the quick-connect fitting (6). With the round plastic ring depressed, remove the quick-connect fitting from the fuel system component.
2. After removal the plastic retainer ring will remain with the quick-connect fitting.

LATCH CLIP TYPE 1 FITTING

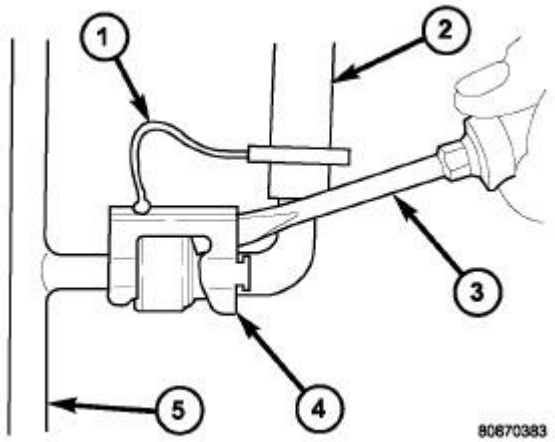

Fig. 16: Tethered, Latch Clip & Screwdriver
Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered (1) to fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Pry up on the latch clip (4) with a screwdriver (3).
2. Slide the latch clip away from the quick-connect fitting while lifting the screwdriver and position aside.

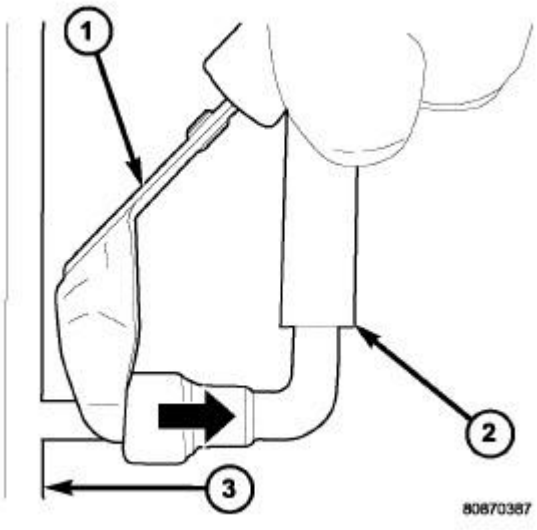

Fig. 17: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert the commercially available fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

4. With the commercially available fuel line removal tool (1) still inserted, remove the quick-connect fitting from the fuel system component.

LATCH CLIP TYPE 2 FITTING

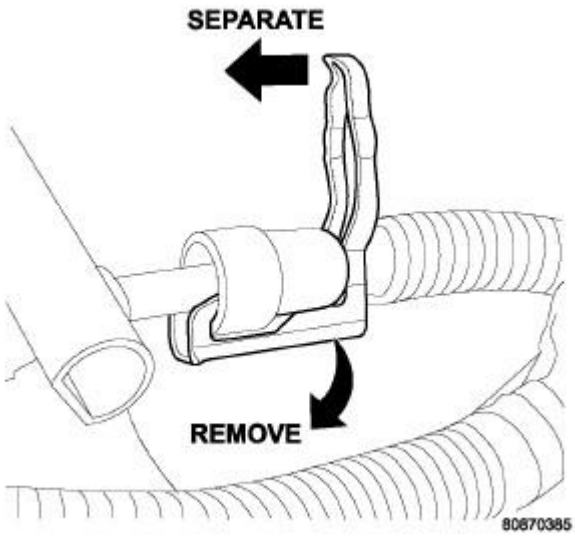

Fig. 18: Latch Clip

Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered to the fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after the latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Unlatch the small arms on the end of clip, swing away and separate from the fuel system component.
2. Slide the latch clip away from the quick-connect fitting while lifting with a screwdriver and position aside.

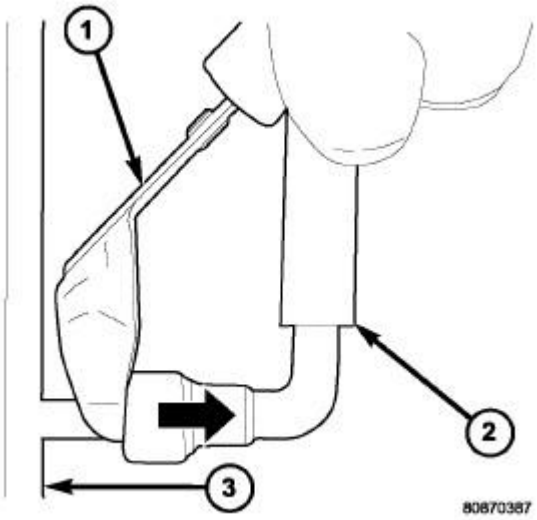

Fig. 19: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert the commercially available fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

4. With the commercially available fuel line removal tool (1) inserted, remove the quick-connect fitting from the fuel system component.

WING TYPE FITTING

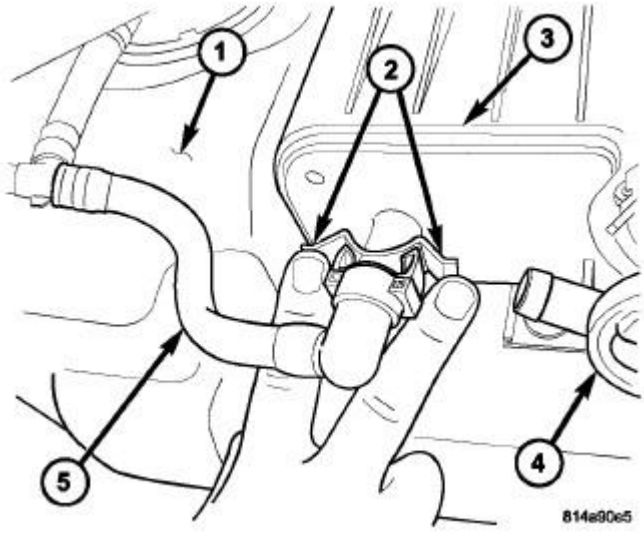

Fig. 20: EVAP Can. Vapor Hose
Courtesy of CHRYSLER GROUP, LLC

The wing type fitting is used on fuel system and emission components. The wing type fitting is most commonly used on the EVAP canister (3). Special tools are not required for removal.

1. Using two fingers, press both wings (2) and release the locking tabs.

   NOTE: After removal the locking tabs will remain with the quick-connect fitting.

2. While holding the wings, remove the quick-connect fitting from the fuel system component.

CONNECTING

1. Inspect the quick-connect fitting body and fuel system components for damage. Replace as necessary.
2. Prior to connecting any quick-connect fitting to components, check condition of fitting and components. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert the quick-connect fitting onto the fuel tube or fuel system component until the built-in stop on the fuel tube or component rests against the back of fitting.
4. Continue pushing until a click is felt.
5. If Equipped:
   - **Redundant Latch Single Button Type Fitting:** Push redundant latch until it locks into position in the quick-connect fitting.
   - **Single Tab Type Fitting:** Push new tab down until it locks into position in the quick-connect fitting.
   - **Latch Clip Type Fitting:** Install latch clip (snaps into position). **If latch clip will not snap into position, this indicates the quick-connect fitting is not properly installed onto fuel system component, recheck the connection.**

6. Verify a locked condition by firmly pulling on the quick-connect fitting connection of the fuel system component.

HEATER, FUEL

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the fuel filter/water separator assembly. Refer to **SEPARATOR AND FILTER, FUEL AND WATER, REMOVAL**.

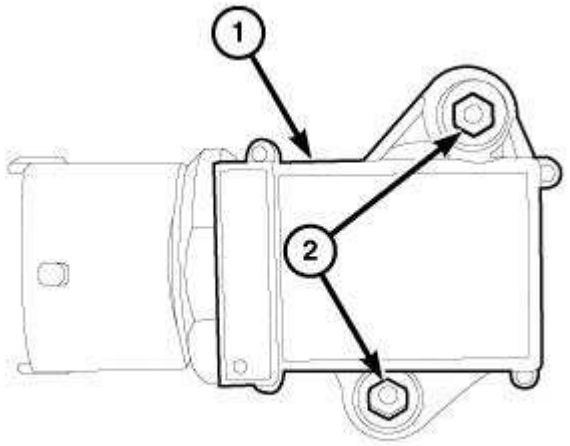

Fig. 21: Bolts & Fuel Heater/Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts (2), and the fuel heater/temperature sensor (1).
4. Remove and discard O-ring seal.

INSTALLATION

INSTALLATION

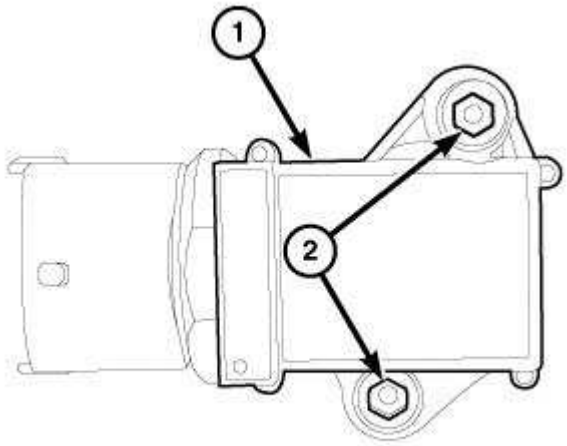

Fig. 22: Bolts & Fuel Heater/Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Clean the O-ring surface sealing area.

NOTE: Lubricate the O-ring seal with clean diesel fluid.

2. Using a new O-ring seal, install the fuel heater/temperature sensor (1). Tighten bolts (2) to 10 N.m (89 in. lbs.).
3. Install the fuel filter/water separator assembly. Refer to **SEPARATOR AND FILTER, FUEL AND WATER, INSTALLATION**.
4. Connect the negative battery cable.

MODULE, FUEL PUMP

REMOVAL

REMOVAL

MAIN FUEL PUMP MODULE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved

containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: If the electric fuel pump module is not operating or the fuel level sending unit is not operating and the fuel level cannot be determined, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle

1. Verify the fuel level is below 5/8 of a tank.
2. If required, perform the draining fuel tank procedure. Refer to **DRAINING FUEL TANK** .
3. Disconnect the negative battery cable.

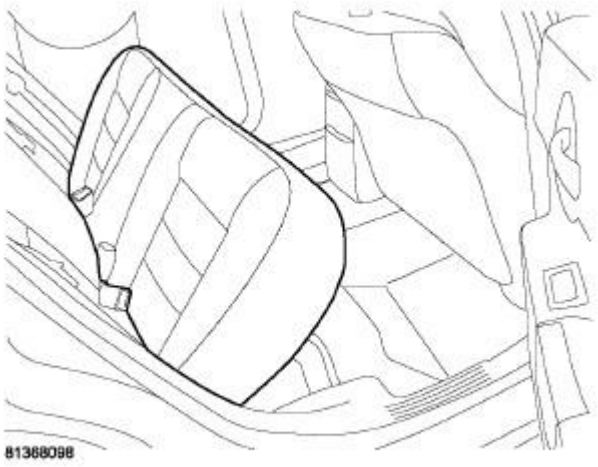

Fig. 23: Pulling Rear Seat Up
Courtesy of CHRYSLER GROUP, LLC

4. Push the rear lower seat cushion up and back and remove the seat cushion.

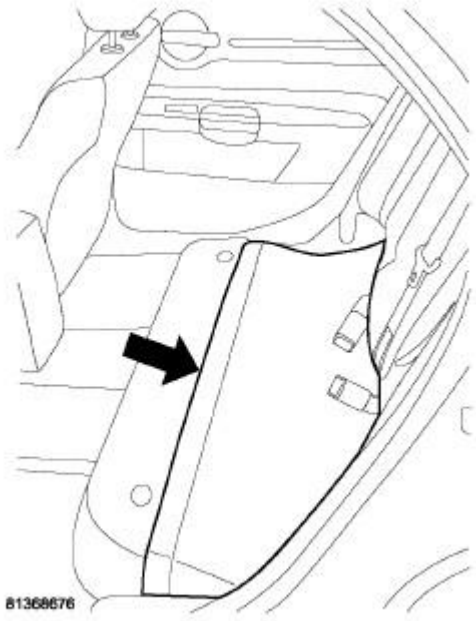

Fig. 24: Foam Pad Under Seat
Courtesy of CHRYSLER GROUP, LLC

5. Fold back the foam pad covering the fuel pump module plastic access covers.

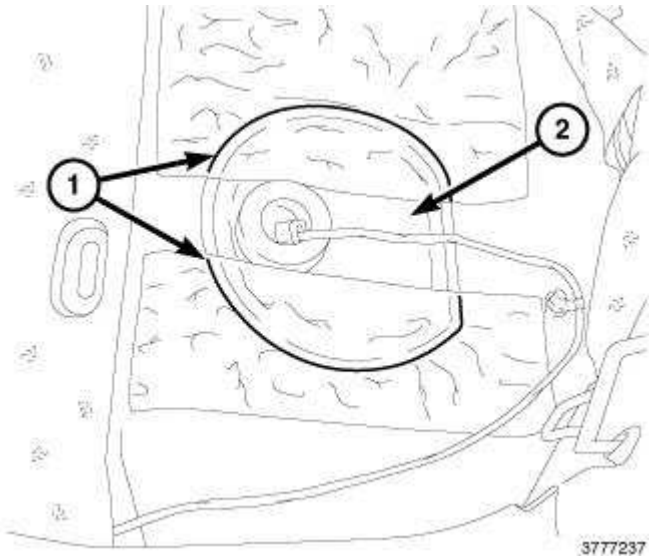

Fig. 25: Mastic Sound Deadener & Left Side Main Fuel Pump Module Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

6. Using a razor knife, cut the mastic sound deadener as shown in illustration (1).
7. Remove the left side main fuel pump module plastic access cover (2).

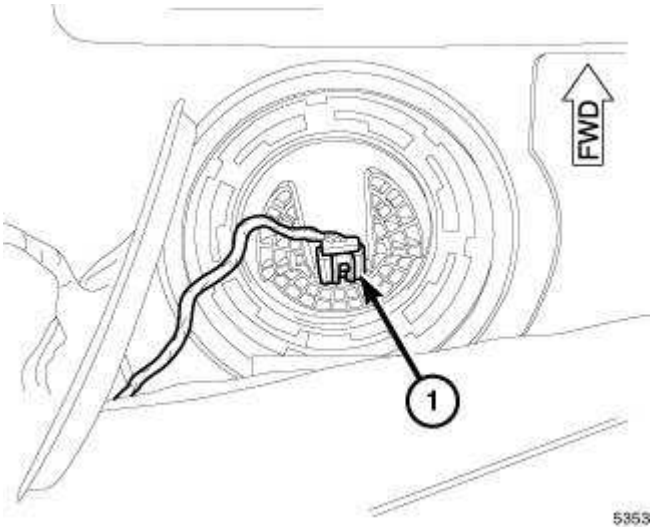

Fig. 26: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the electrical connector from the main fuel pump module.

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

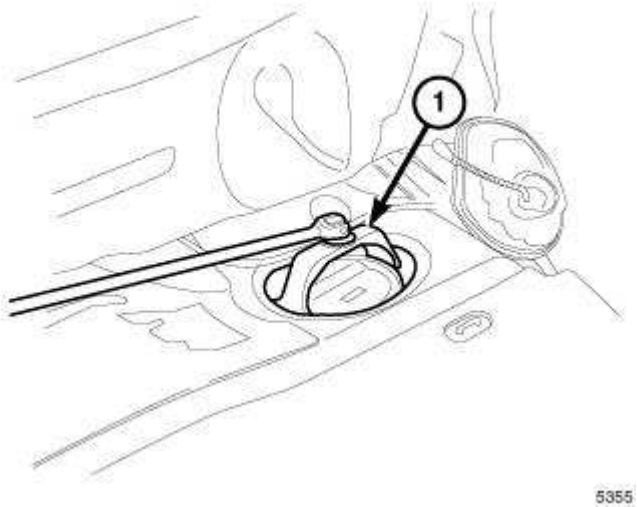

Fig. 27: Left Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

9. Mark the main fuel pump module orientation.
10. Position the (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the

outside edge of the lock ring.

11. Install a 1/2 inch drive breaker bar into the (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).

NOTE: The main fuel pump module will spring up slightly when the lock ring is removed.

12. Rotate the breaker bar counterclockwise and remove the lock ring.

CAUTION: Do not allow the float arm of the Main Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

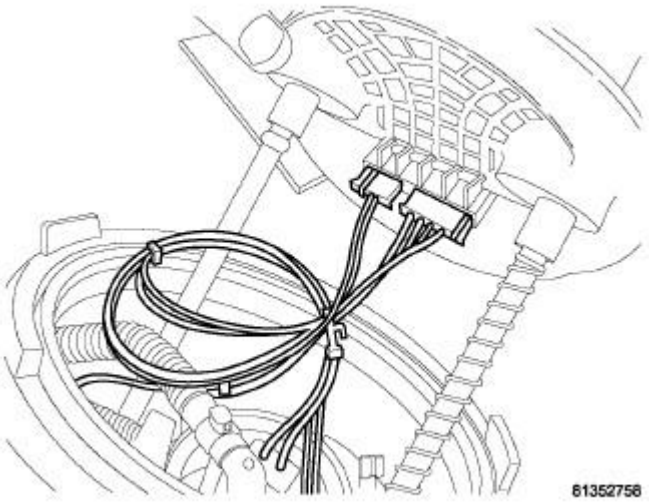

Fig. 28: Module Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

13. Raise and separate the top section from the bottom section of the main fuel pump module.
14. Disconnect the electrical connectors from under the top section of the main fuel pump module.
15. Remove the top section of the main fuel pump module from the vehicle.

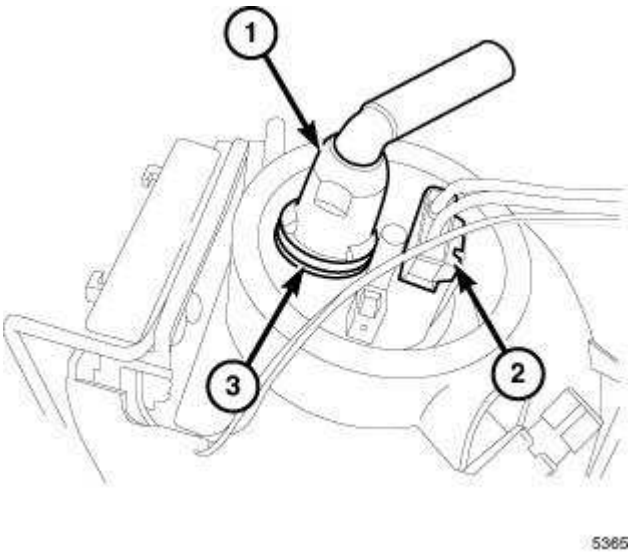

Fig. 29: Line Release
Courtesy of CHRYSLER GROUP, LLC

16. Press the quick connect release tab (3) and remove the fuel supply line (1) from the main fuel pump module.

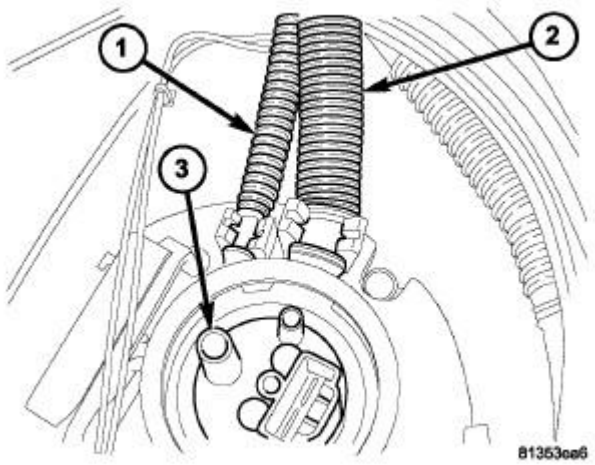

Fig. 30: Hose Connections Drivers Side
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the fuel return lines (1, 2) from the main fuel pump module.

NOTE: Do not spill fuel into the interior of the vehicle.

18. Carefully lift the bottom section of the main fuel pump module out of the fuel tank, tip the bottom section on its side and drain the remaining fuel from the bottom reservoir into the fuel tank and

remove from vehicle.

NOTE: Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.

19. Remove and discard the rubber O-ring seal.

AUXILIARY FUEL PUMP MODULE

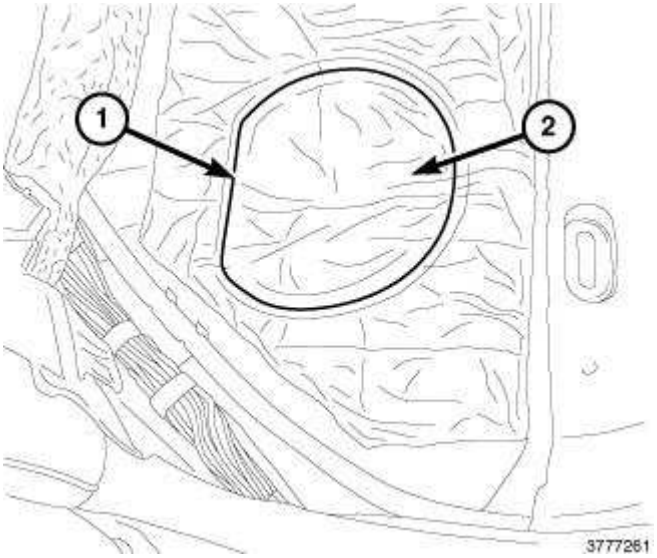

Fig. 31: Mastic Sound Deadener & Auxiliary Fuel Pump Module Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Main Fuel Pump Module must be removed for Auxiliary Fuel Pump Module removal.

1. Remove the main fuel pump module. Refer to **MAIN FUEL PUMP MODULE**.
2. Using a razor knife, cut the mastic sound deadener as shown in illustration (1).
3. Remove the auxiliary fuel pump module plastic access cover (2) from the floor pan.

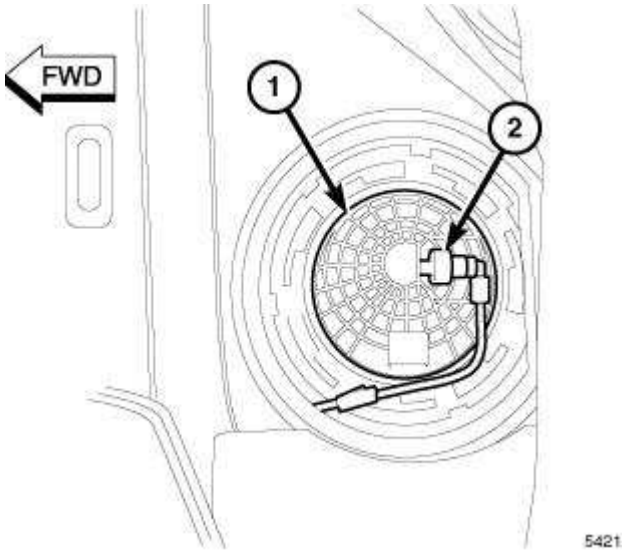

Fig. 32: Right Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

4. Disconnect the fuel supply line (2) from the auxiliary fuel pump module (1).
5. Mark the auxiliary fuel pump module orientation.

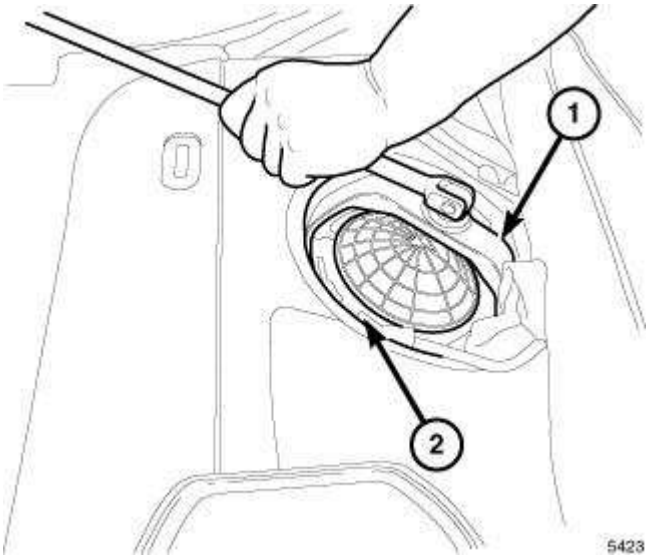

Fig. 33: Right Side Module
Courtesy of CHRYSLER GROUP, LLC

6. Position the (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
7. Install a 1/2 inch drive breaker bar into the (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).

8. Rotate the breaker bar counterclockwise and remove the lock ring (2).

CAUTION: Do not allow the float arm of the Auxiliary Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

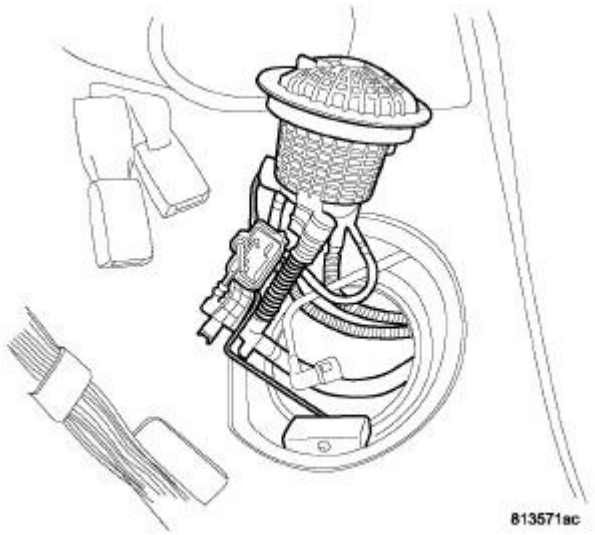

Fig. 34: Remove/Install Right Side Module
Courtesy of CHRYSLER GROUP, LLC

9. Lift the auxiliary fuel pump module up and out of fuel tank while guiding the fuel supply and return lines out from the left side of the fuel tank.

NOTE: Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.

10. Remove and discard the rubber O-ring seal.

INSTALLATION

INSTALLATION

MAIN FUEL PUMP MODULE

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: Do not allow the float arm of the Main Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

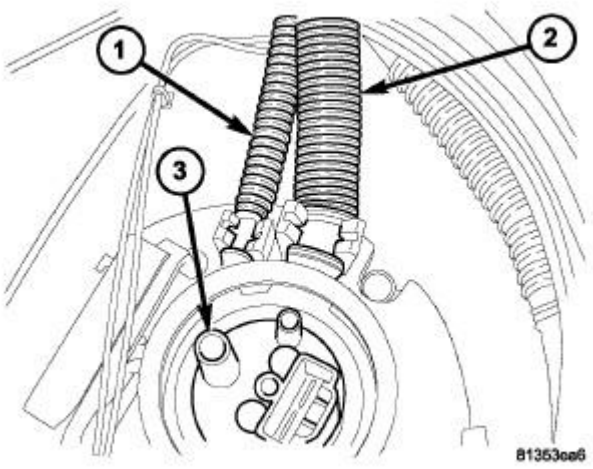

Fig. 35: Hose Connections Drivers Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Auxiliary Fuel Pump Module must be installed before the Main Fuel Pump Module.

1. If the auxiliary fuel pump module is removed. Refer to **AUXILIARY FUEL PUMP MODULE**.

   NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

2. Install a new rubber O-ring seal.
3. Using caution not to bend the float arm, lower the bottom section of the main fuel pump module into the fuel tank.
4. Connect the fuel return lines (1, 2) to the main fuel pump module.

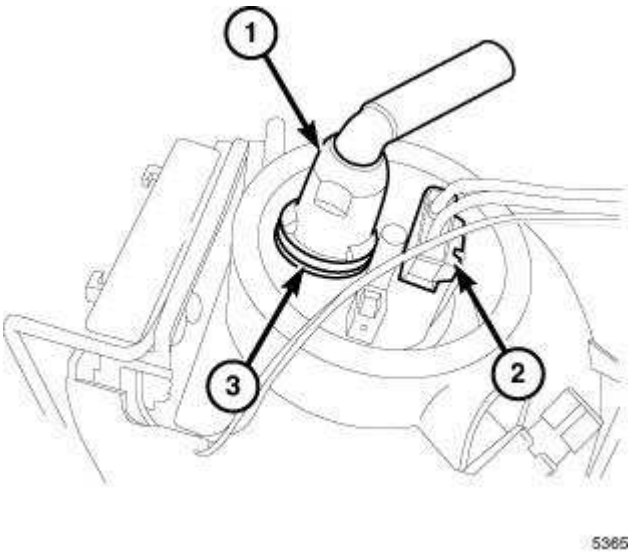

Fig. 36: Line Release
Courtesy of CHRYSLER GROUP, LLC

5. Connect the fuel supply line (1) to the main fuel pump module.

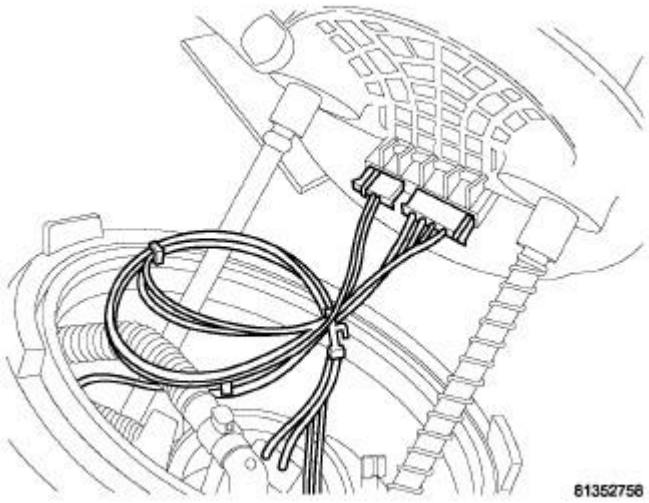

Fig. 37: Module Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Connect the electrical connectors at the top section of the main fuel pump module.
7. Join the upper section and lower section of the main fuel pump module together.
8. Position the main fuel pump module as noted during removal.

CAUTION: Verify the electrical wires are tucked away into the fuel tank so they don't get pinched between the top of the fuel pump module and the

rubber O-ring seal.

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.

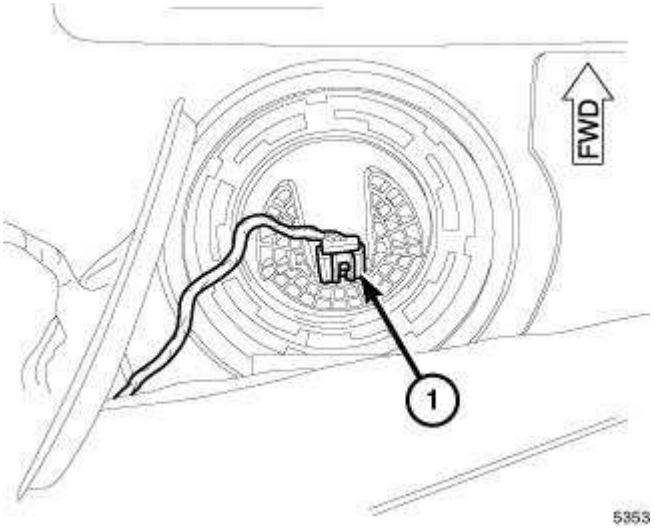

Fig. 38: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

9. Align the rubber O-ring seal and lower the main fuel pump module into position.
10. Verify the main fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

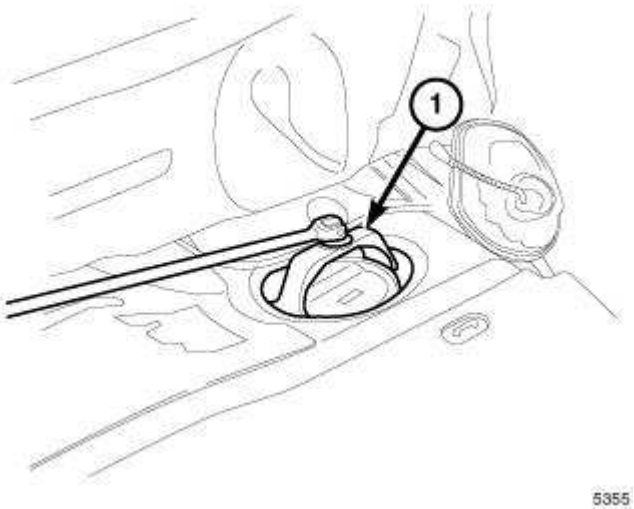

Fig. 39: Left Side Module
Courtesy of CHRYSLER GROUP, LLC

11. Position the lock ring over top of the main fuel pump module.
12. Position the (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring.
13. Install a 1/2 inch drive breaker bar into the (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
14. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

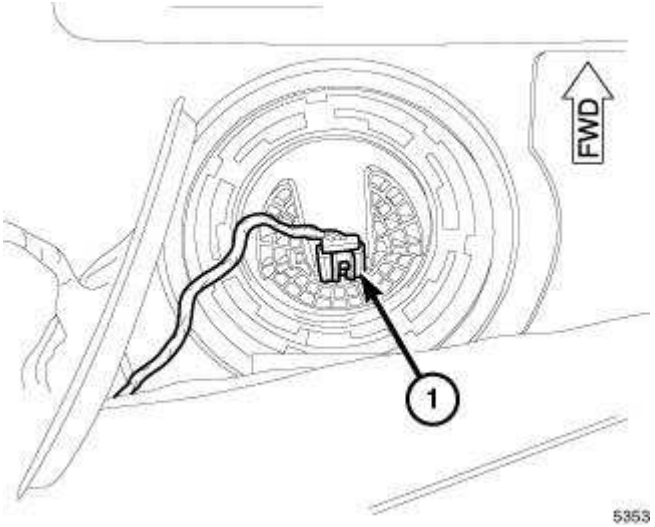

Fig. 40: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

15. Connect the electrical connector (1) to the main fuel pump module.
16. Fill the fuel tank and check for leaks around the rubber O-ring seal.

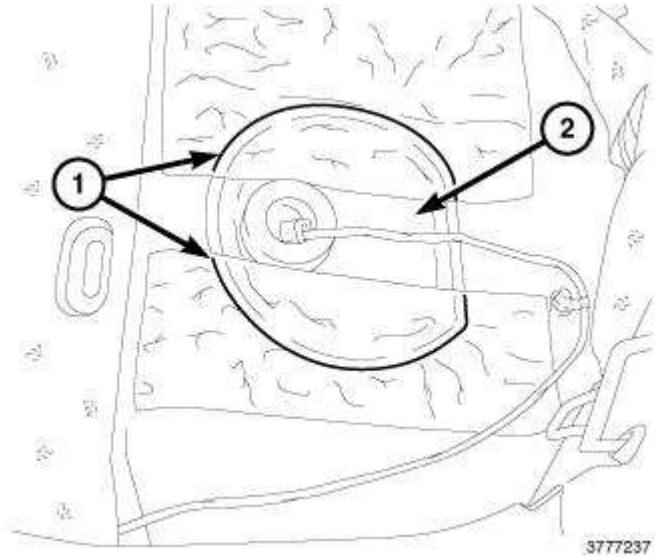

Fig. 41: Mastic Sound Deadener & Left Side Main Fuel Pump Module Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

17. Install the main fuel pump module plastic access cover (2).

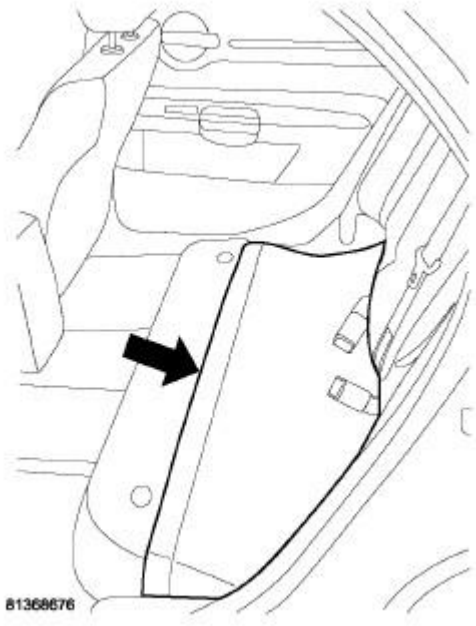

Fig. 42: Foam Pad Under Seat
Courtesy of CHRYSLER GROUP, LLC

18. Lower the foam pad covering back into place.

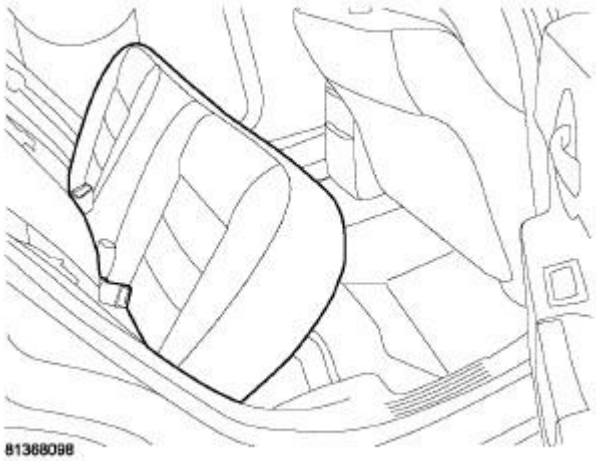

Fig. 43: Pulling Rear Seat Up
Courtesy of CHRYSLER GROUP, LLC

19. Push the rear lower seat cushion back and down and install the seat cushion.

20. Connect the negative battery cable.

AUXILIARY FUEL PUMP MODULE

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.

CAUTION: Do not allow the float arm of the Auxiliary Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

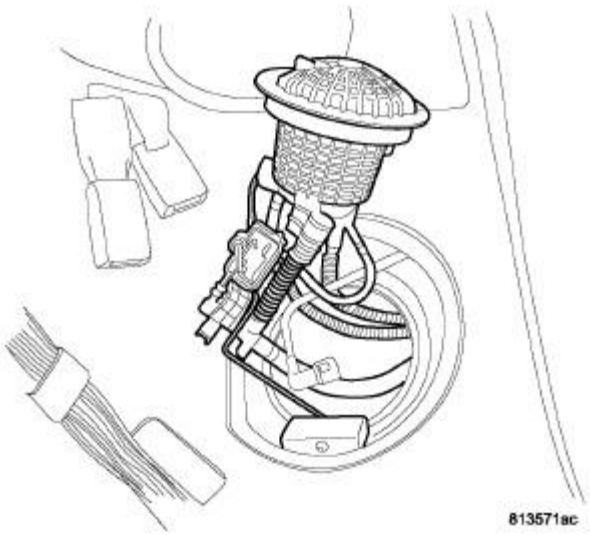

Fig. 44: Remove/Install Right Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

1. Install a new rubber O-ring seal.
2. Using caution not to bend the float arm, lower the auxiliary fuel pump module into the fuel tank while guiding the fuel return lines, fuel supply line and electrical connector over to the left side of the fuel tank.
3. Align the rubber O-ring seal and lower the auxiliary fuel pump module into position as noted during removal.
4. Position the lock ring over top of the auxiliary fuel pump module.
5. Verify the auxiliary fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

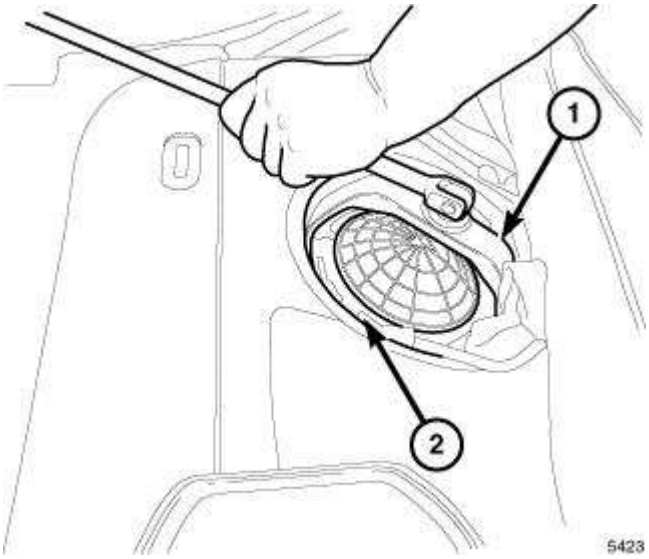

Fig. 45: Right Side Module
Courtesy of CHRYSLER GROUP, LLC

6. Position (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
7. Install a 1/2 inch drive breaker bar into the (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
8. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

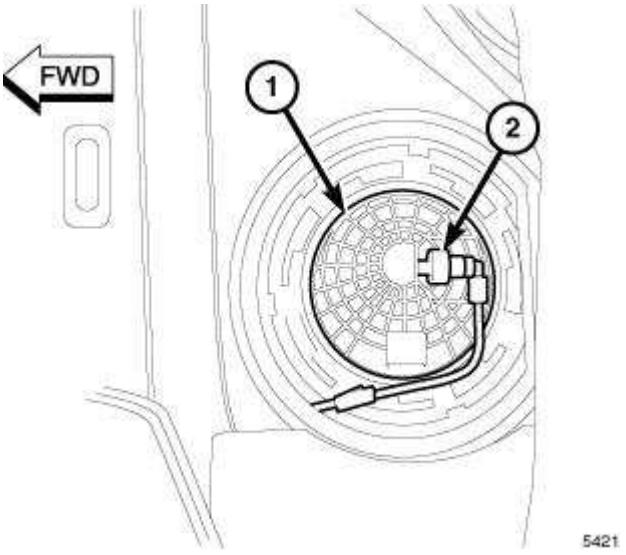

Fig. 46: Right Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

9. Connect the fuel supply line (2) to auxiliary fuel pump module (1).

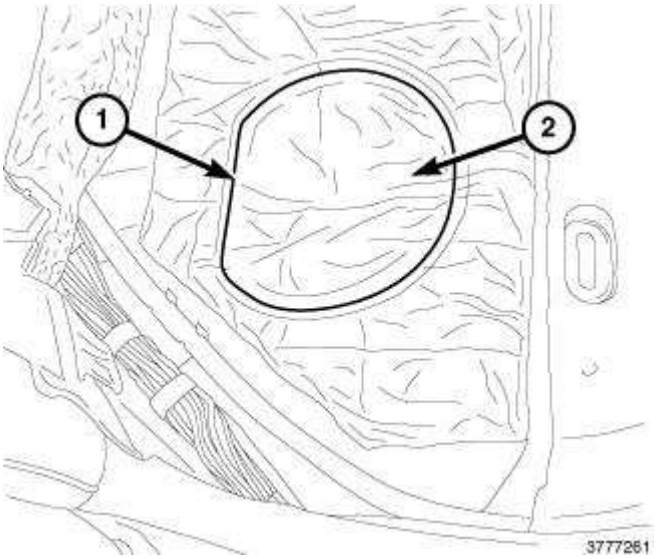

Fig. 47: Mastic Sound Deadener & Auxiliary Fuel Pump Module Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

10. Install the auxiliary fuel pump module plastic access cover (1).
11. Install the main fuel pump module. Refer to **MAIN FUEL PUMP MODULE**.

PUMP, FUEL INJECTION, HIGH PRESSURE

DESCRIPTION

DESCRIPTION

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

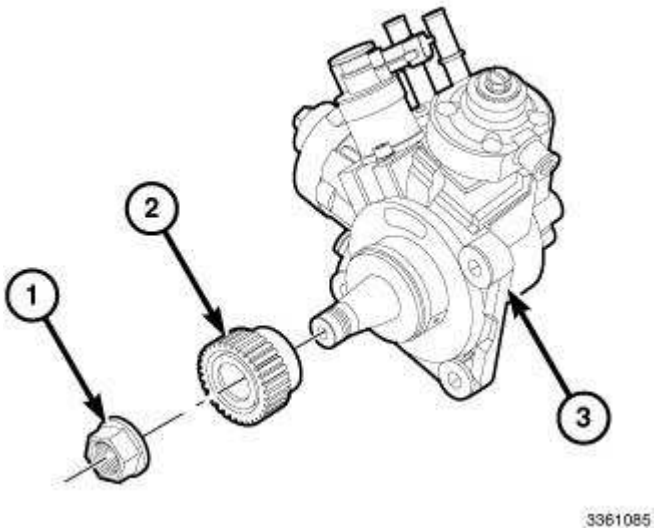

Fig. 48: High Pressure Pump, Gear & Nut
Courtesy of CHRYSLER GROUP, LLC

The high pressure pump (3) is mounted to the left rear of the cylinder head and there is a protection blocker plate attached to the front of the high pressure pump. The only serviceable part on the high pressure pump is the fuel quantity solenoid, the drive gear, and the O-ring seal. The high pressure pump must not be disassembled or opened. The high pressure pump has a screen filter that is not serviceable. If diagnosis has led you to believe that the filter is restricted of plugging up then the high pressure pump needs to be replaced.

OPERATION

OPERATION

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

CAUTION: Cranking the engine for an extended time without a fuel supply may damage the fuel injection pressure pump.

The High Pressure Delivery Pump (HPDP) supplies pressurized fuel between 200-1800 bar (2, 900 - 26, 106 psi) to the fuel rail and fuel injectors. The cascade valve, located inside the HPDP regulates the pressure in the low side and diverts some of the fuel entering for lubrication of the pump. The Powertrain Control Module (PCM) monitors high side fuel pressure via a fuel pressure sensor. Based on readings from the fuel pressure sensor, the PCM controls the output pressure of the pump using the Fuel Quantity Solenoid (FQS), which mounts to the HPDP.

NOTE: **The high pressure pump must not be disassembled or opened. The only serviceable items are the fuel quantity solenoid, the pump gear, and the O-ring seal.**

REMOVAL

REMOVAL

WARNING: **High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.**

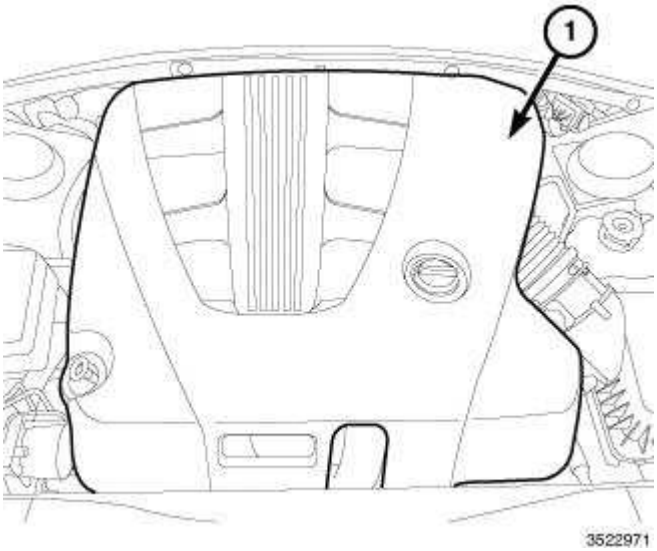

Fig. 49: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

14. Remove the EGR tube. Refer to **TUBE, EXHAUST GAS RECIRCULATION (EGR), REMOVAL** .
15. Remove nut (1) securing the fuel tube.
16. Remove bolt (3) securing the fuel tube.
17. Remove bolts (4) and the bracket (2) securing the fuel tubes.

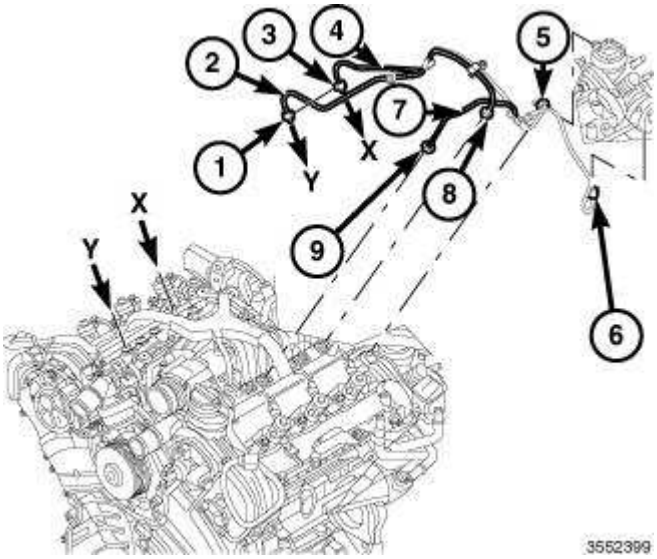

Fig. 58: High Pressure Fuel Crossover Tube, Left High Pressure Fuel Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

18. Loosen union nuts (1, 5) and remove the right high pressure fuel tube (2) and discard fuel tube.
19. Loosen union nuts (6, 9) and remove the left high pressure fuel tube (7) and discard fuel tube.

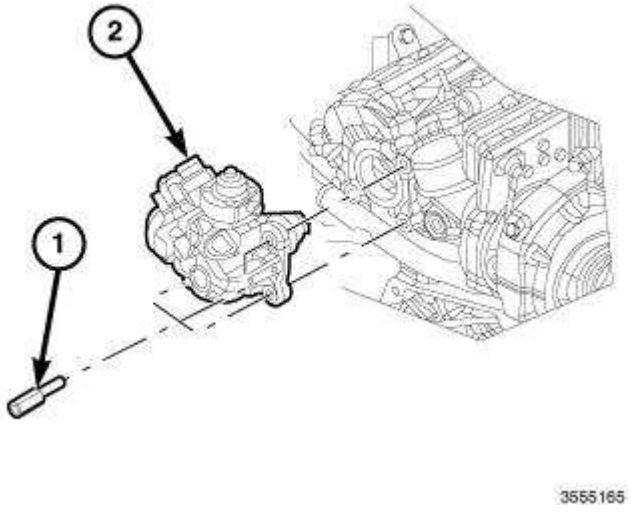

Fig. 59: Fuel Injection Pump
Courtesy of CHRYSLER GROUP, LLC

20. Remove the three bolts (1) and the high pressure pump (2).

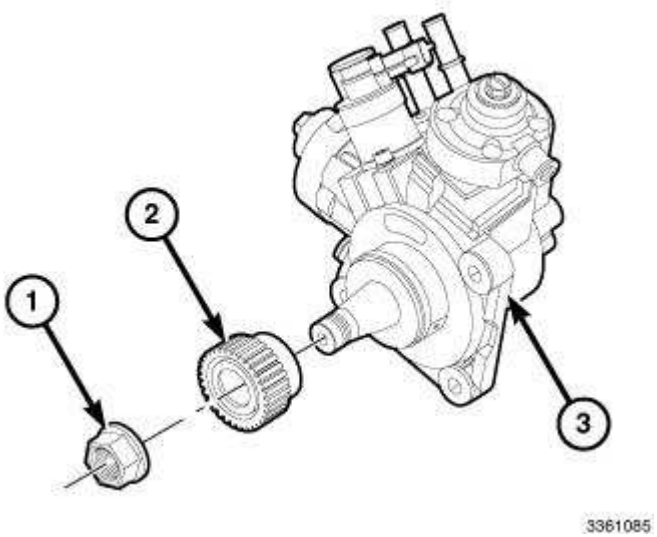

Fig. 60: High Pressure Pump, Gear & Nut
Courtesy of CHRYSLER GROUP, LLC

21. If necessary, remove nut (1) and gear (2) from the high pressure pump (3).

INSTALLATION

INSTALLATION

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

CAUTION: Do Not Force the high pressure pump into the right timing cover or attempt to seat it by drawing it in with the bolts. The pump gear must be properly aligned with the drive gear on the camshaft before the high pressure pump will seat on the cylinder head mounting surface. Failure to properly align drive gears will damage the high pressure pump or camshaft drive gear.

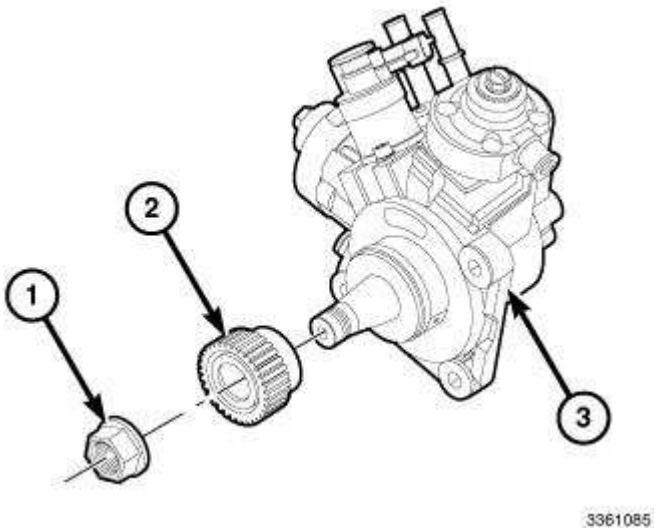

Fig. 61: High Pressure Pump, Gear & Nut
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the gear (2) and nut (1) onto the high pressure pump (3). Tighten nut (1) to 80 N.m (59 ft. lbs.).

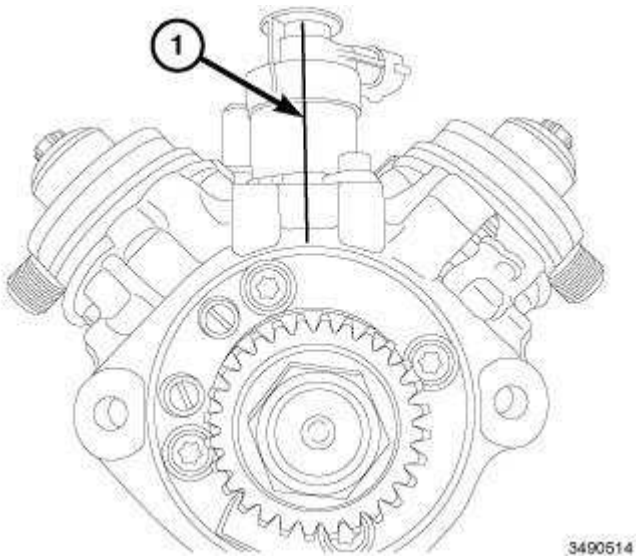

Fig. 62: Fuel Quantity Solenoid
Courtesy of CHRYSLER GROUP, LLC

2. Mark the center line on the fuel quantity solenoid (1) with a paint pan as making a reference to zero 0°.

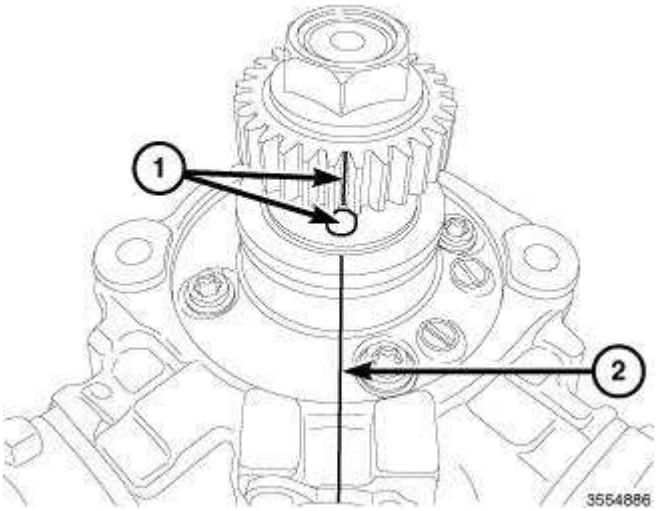

Fig. 63: Hole On The Gear & Reference Mark
Courtesy of CHRYSLER GROUP, LLC

3. Using a paint pen, mark the gear and the hole as a reference mark.
4. Rotate the pump shaft so the paint mark and hole on the gear (1) aligns with the 0° reference mark (2) on pump.

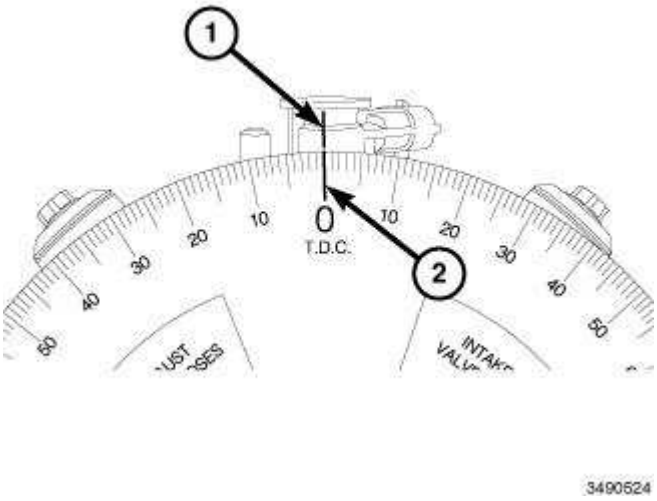

Fig. 64: Degree Wheel To Zero & Fuel Quantity Solenoid
Courtesy of CHRYSLER GROUP, LLC

5. Align the commercially available degree wheel to zero (2) with the center line on fuel quantity solenoid (1).

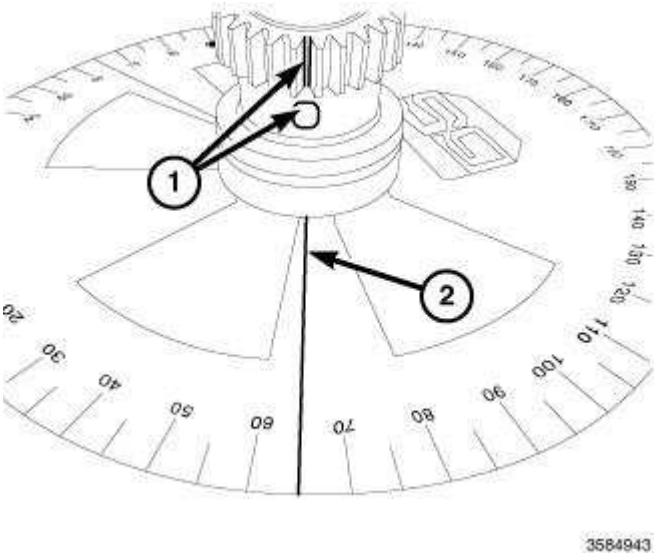

Fig. 65: Index Mark

30. Start engine and check for leaks.
31. Install the engine cover (1).

RAIL, FUEL

DESCRIPTION

DESCRIPTION

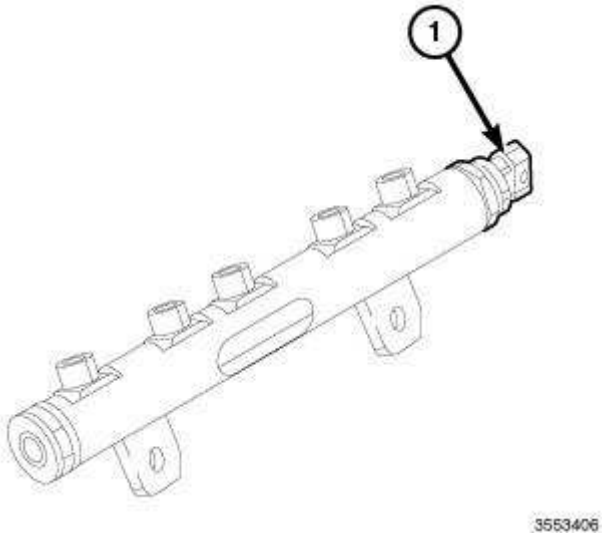

Fig. 81: High Pressure Pump
Courtesy of CHRYSLER GROUP, LLC

The high pressure pump supplies diesel fuel to the fuel rail which deliveries high pressure fuel to all injectors. A fuel rail pressure sensor, fuel rail pressure solenoid, and the return flow line are all combine to keep the fuel pressure in the fuel rail at the required pressure. The fuel rail is attached to the cylinder head.

OPERATION

OPERATION

The stored fuel volume inside the rail acts as a damper for pressure fluctuations which result because of pulsating supply and brief large extractions of fuel during injector firing. The rail primarily influences the atomization of fuel at the injector nozzle, and the accuracy of injected quantity during injection.

REMOVAL

LEFT FUEL RAIL

> **WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.**

1. Disconnect the negative battery cable.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD, INTAKE, REMOVAL** .

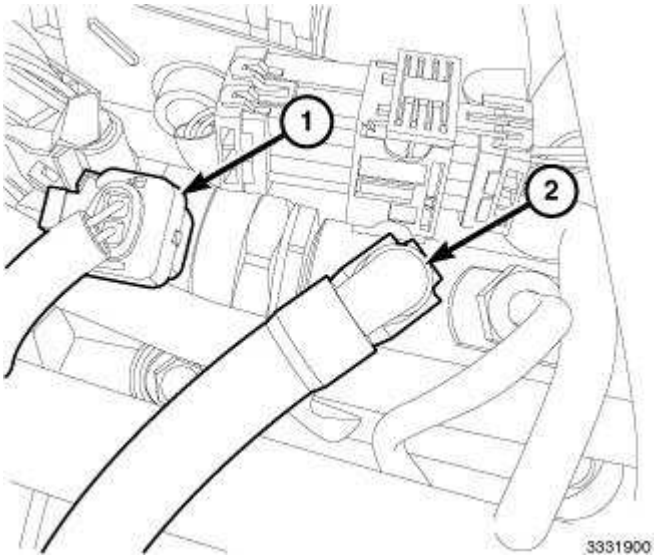

Fig. 82: Fuel Rail Return Line & Fuel Rail Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the fuel rail solenoid wire harness connector (1).
4. Disconnect the fuel rail return line (2) and position aside.
5. Remove the left bank high pressure fuel tubes. Refer to **TUBE(S), FUEL, REMOVAL**.

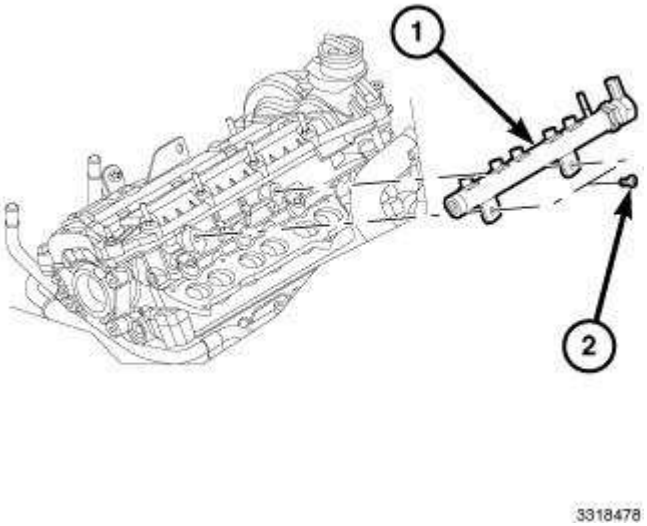

Fig. 83: Left Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove bolts (2) and the left fuel rail (1).

RIGHT FUEL RAIL

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel.

Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

1. Disconnect the negative battery cable.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD, INTAKE, REMOVAL** .

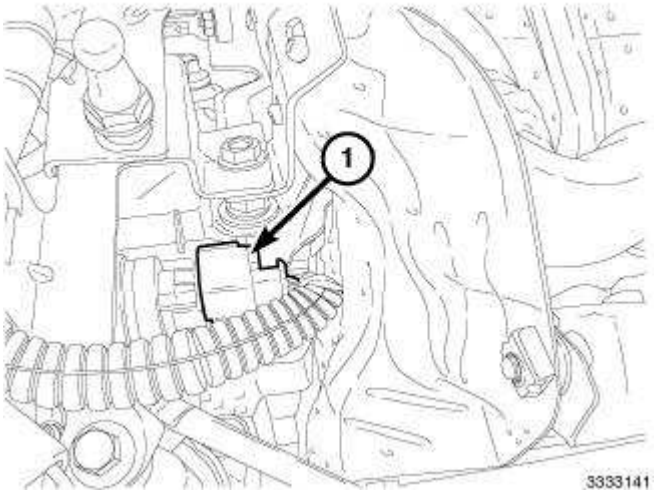

Fig. 84: Fuel Rail Pressure Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the fuel rail pressure sensor wire harness connector (1).

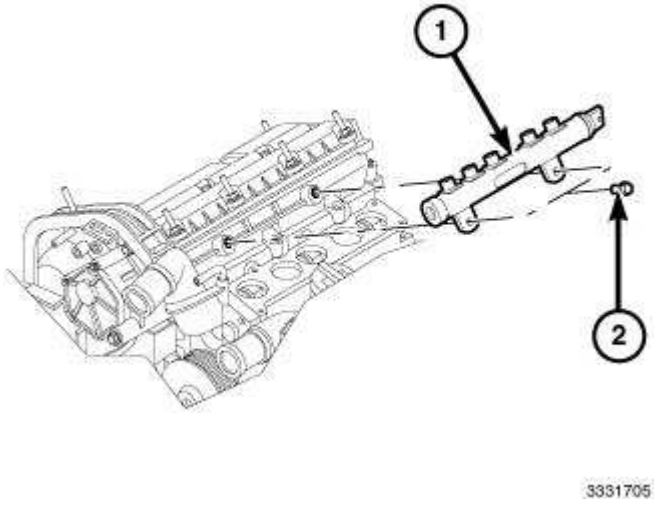

Fig. 85: Right Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the right bank high pressure fuel tubes. Refer to **TUBE(S), FUEL, REMOVAL**.
5. Remove bolts (2) the right fuel rail (1).

INSTALLATION

LEFT FUEL RAIL

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

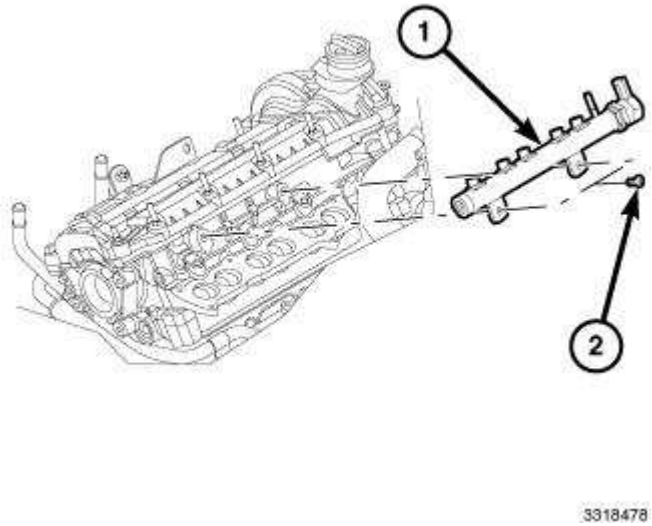

Fig. 86: Left Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the fuel rail (1). Tighten bolts (2) to 25 N.m (18 ft. lbs.).

NOTE: Fuel tubes must be replaced anytime they are removed.

2. Install the high pressure fuel rail tubes. Refer to **TUBE(S), FUEL, INSTALLATION**.

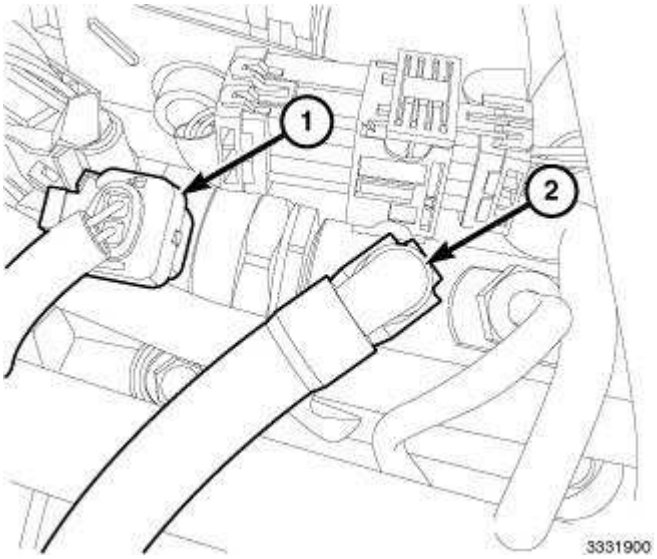

Fig. 87: Fuel Rail Return Line & Fuel Rail Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

3. Position fuel rail return line (2) and connect to fuel rail.
4. Connect the fuel rail pressure solenoid harness connector (1).
5. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION, 5.7L** or **MANIFOLD, INTAKE, INSTALLATION** .
6. Connect the negative battery cable.
7. Start engine and inspect for leaks.

RIGHT FUEL RAIL

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

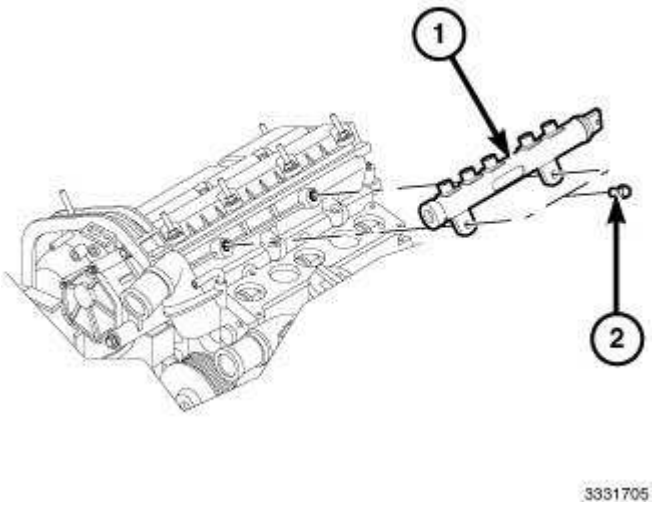

Fig. 88: Right Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the fuel rail (1). Tighten bolts (2) to 25 N.m (18 ft. lbs.).

   NOTE: Fuel tubes must be replaced anytime they are removed.

2. Install the high pressure fuel rail tubes. Refer to **TUBE(S), FUEL, INSTALLATION**.

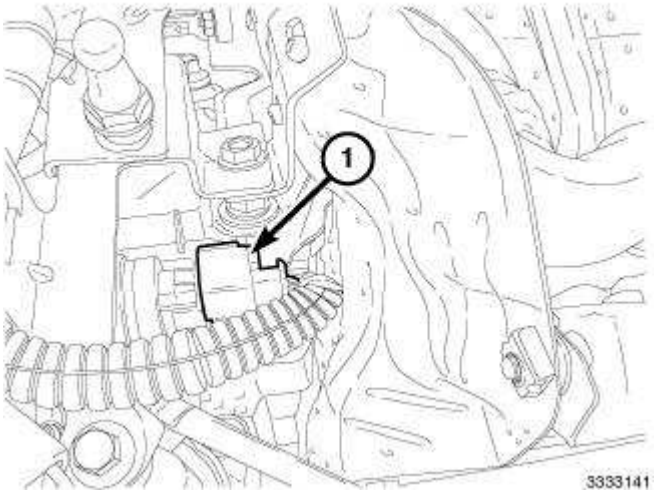

Fig. 89: Fuel Rail Pressure Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect the fuel rail pressure sensor wire harness connector (1).
4. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION, 5.7L** or **MANIFOLD, INTAKE, INSTALLATION** .

5. Connect the negative battery cable.
6. Start the engine and inspect for leaks.

REGULATOR, FUEL PRESSURE

DESCRIPTION

DESCRIPTION

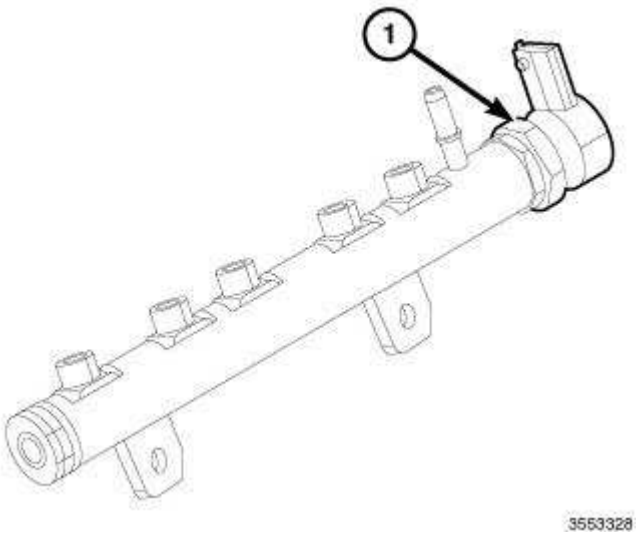

Fig. 90: Fuel Pressure Regulator
Courtesy of CHRYSLER GROUP, LLC

The fuel pressure regulator (1) is attached to the front of the left fuel rail. The fuel pressure regulator is not a serviceable item. In the event that the fuel pressure regulator fails, the fuel rail must be replaced. The fuel pressure regulator controls and maintains constant rail pressure with a control current transmitted by the Powertrain Control Module (PCM).

OPERATION

OPERATION

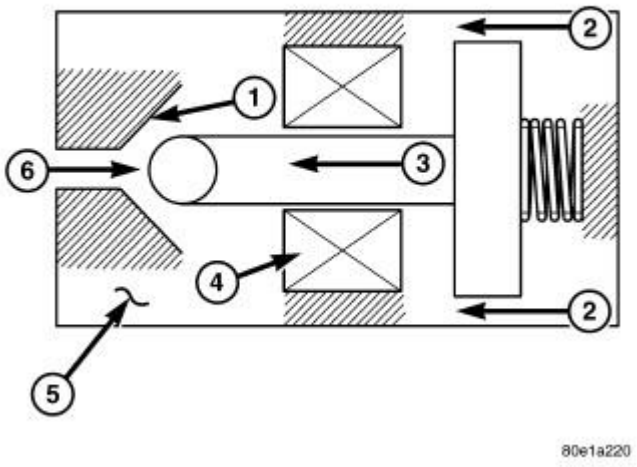

Fig. 91: Fuel Pressure Solenoid Operation
Courtesy of CHRYSLER GROUP, LLC

High pressure which is present in the fuel rail flows to the ball seat (1) of the solenoid (5). The specified pressure required by the system is built up in the rail by the fuel pressure regulator building up a magnetic force which corresponds to this specific pressure by means of a control current from the Powertrain Control Module (PCM). This magnetic force equals a certain outlet cross section at the ball seat of the solenoid. The rail pressure is altered as a result of the quantity of fuel which flows off. The current fuel pressure is signaled by the fuel pressure sensor to the (PCM). The controlled fuel flows back along the return fuel line, into the tank.

In a de-energized state, the fuel pressure solenoid is closed as the spring force (2) presses the ball into the ball seat. When driving, the fuel pressure solenoid is constantly open. When engine is started, the fuel pressure solenoid is held closed by magnetic force. When driving, the pressure of the fluid counteracts the magnetic force of the coil and the slight spring force.

REMOVAL

REMOVAL

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks.

Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

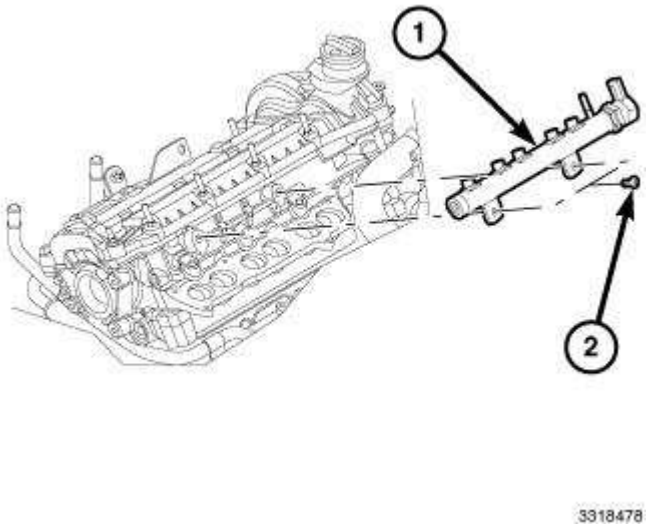

Fig. 92: Left Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fuel pressure regulator is not a serviceable item. If diagnosis has lead you to replace the fuel pressure regulator, then a new fuel rail must to be installed.

1. Disconnect the negative battery cable.
2. Remove the left fuel rail (1). Refer to **RAIL, FUEL, INSTALLATION** or **RAIL, FUEL, INSTALLATION**.

INSTALLATION

INSTALLATION

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

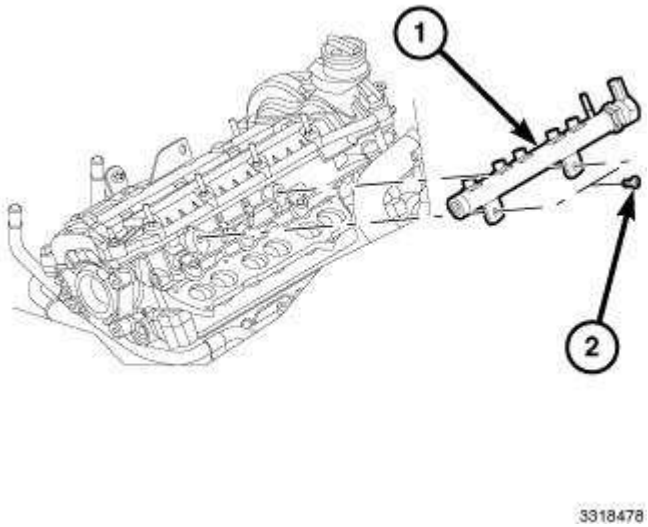

Fig. 93: Left Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the left fuel rail (1). Refer to **RAIL, FUEL, INSTALLATION** or **RAIL, FUEL, INSTALLATION**.
2. Connect the negative battery cable.

SENDING UNIT AND SENSOR, FUEL LEVEL

DESCRIPTION

FUEL LEVEL SENDING UNIT AND SENSOR

The fuel level sending units and sensors are integrated with both the main fuel pump module and the auxiliary fuel pump module and are not serviced separately. The appropriate fuel pump module must be replace if either fuel level sending unit is to be replaced.

For fuel pump module removal. Refer to **MODULE, FUEL PUMP, REMOVAL** or **MODULE, FUEL PUMP, REMOVAL**.

SENSOR, FUEL PRESSURE

DESCRIPTION

DESCRIPTION

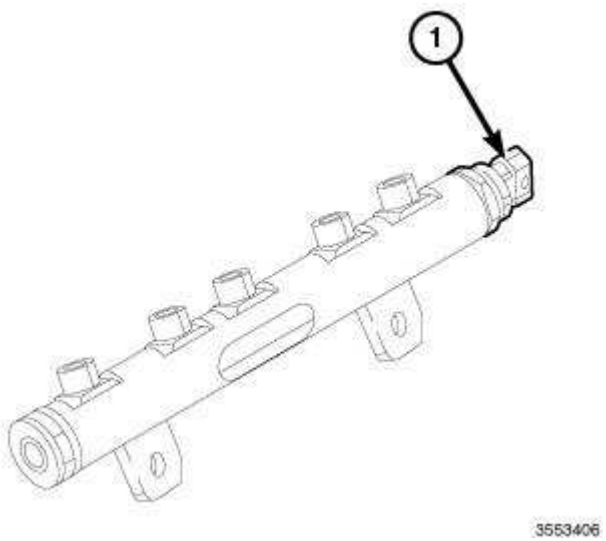

Fig. 94: High Pressure Pump
Courtesy of CHRYSLER GROUP, LLC

The fuel rail pressure sensor screws into the right fuel rail at the back of the engine. The Powertrain Control Module (PCM) uses this sensor to monitor the fuel rail pressure. The fuel rail pressure sensor is not a serviceable item, if diagnosis has led you to replace the fuel rail pressure sensor then the complete fuel rail has to be replaced.

OPERATION

OPERATION

The fuel rail pressure sensor measures the current fuel rail pressure and supplies an appropriate voltage signal to the Powertrain Control Module (PCM).

REMOVAL

REMOVAL

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or

fatal injury.

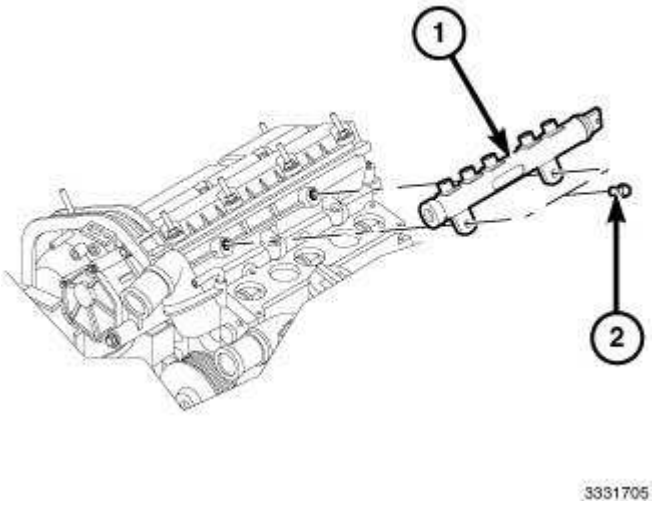

Fig. 95: Right Fuel Rail & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fuel rail pressure sensor is not a serviceable item. If diagnosis has lead you to replace the fuel rail pressure sensor, then a new fuel rail must to be installed.

1. Disconnect the negative battery cable.
2. Remove the right fuel rail (1). Refer to **RAIL, FUEL, REMOVAL** or **RAIL, FUEL, REMOVAL**.

INSTALLATION

INSTALLATION

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

Courtesy of CHRYSLER GROUP, LLC

1. Install the right fuel rail (1). Refer to **RAIL, FUEL, INSTALLATION** or **RAIL, FUEL, INSTALLATION**.
2. Connect the negative battery cable.

SENSOR, FUEL TEMPERATURE

REMOVAL

REMOVAL

The fuel temperature sensor is a combination fuel heater/temperature sensor. Refer to **HEATER, FUEL, REMOVAL**.

SENSOR, WATER IN FUEL

DESCRIPTION

DESCRIPTION

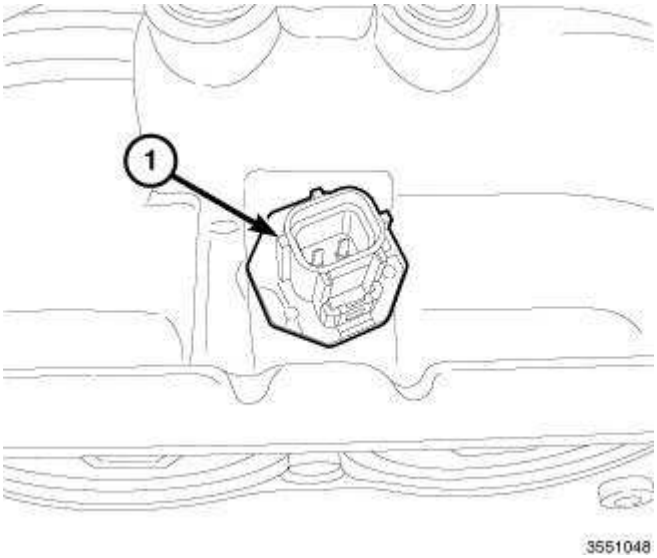

Fig. 97: Fuel (WIF) Sensor
Courtesy of CHRYSLER GROUP, LLC

The Water In Fuel (WIF) sensor (1) is located in the fuel filter housing. The WIF sensor (1) detects the presence of water in the fuel. If water is present in the fuel, a signal is sent to the Powertrain Control Module (PCM) and the PCM signals the instrument cluster, over the CAN bus, to illuminate the water in fuel warning.

OPERATION

OPERATION

The non-dielectric properties of the water allow the sensors probes to close the electronic circuit when water is present in the system. When diesel fuel is present in the system, its dielectric (does not conduct electricity well) properties do not allow any electrical contact between the probes. A 12V power signal is always present in order to illuminate the indicator on the instrument cluster.

REMOVAL

REMOVAL

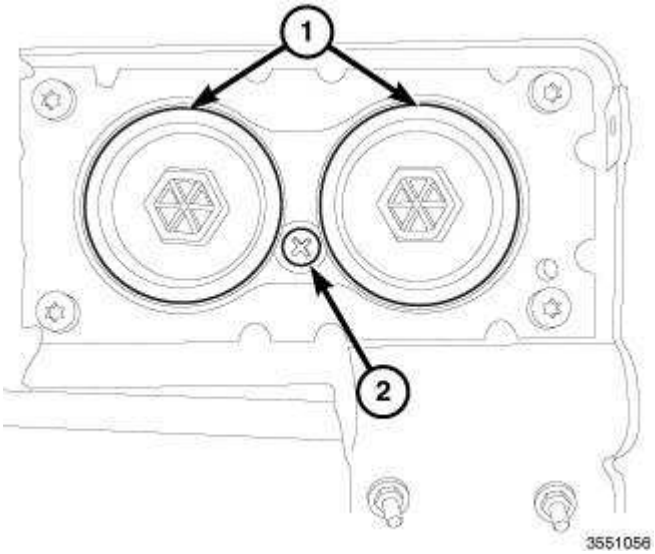

Fig. 98: Drain Plug & Filter Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove any dirt and debris around the fuel filter assembly using a suitable solvent or compressed air. Area around the fuel filter assembly must be clean and dry.

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Loosen drain plug (2) and drain fuel filter/water separator into a suitable container.
4. Securely tighten drain plug (2).

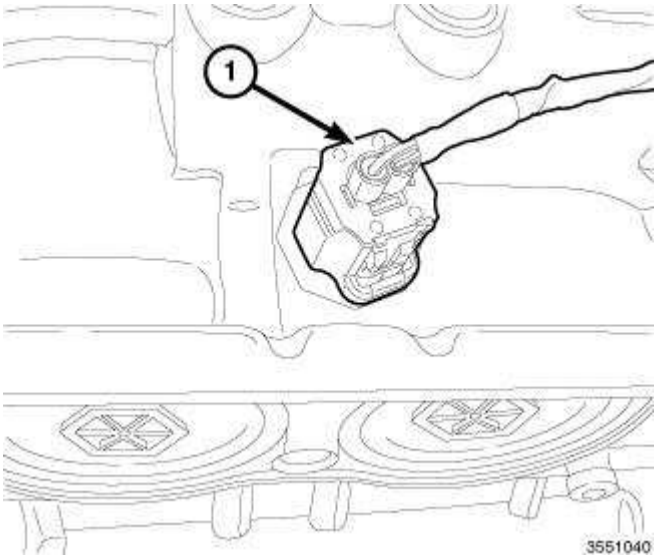

Fig. 99: Water In Fuel (WIF) Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the Water In Fuel (WIF) sensor wire harness connector (1).

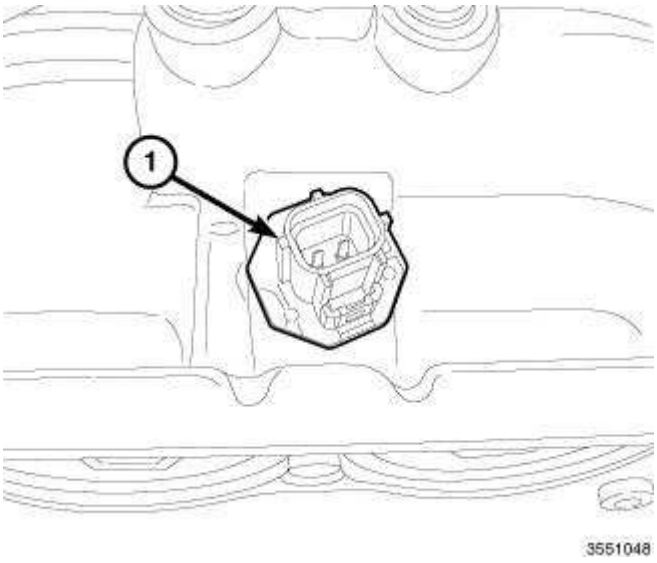

Fig. 100: Fuel (WIF) Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the water in fuel sensor (5).
7. Remove and discard O-ring seal.

INSTALLATION

INSTALLATION

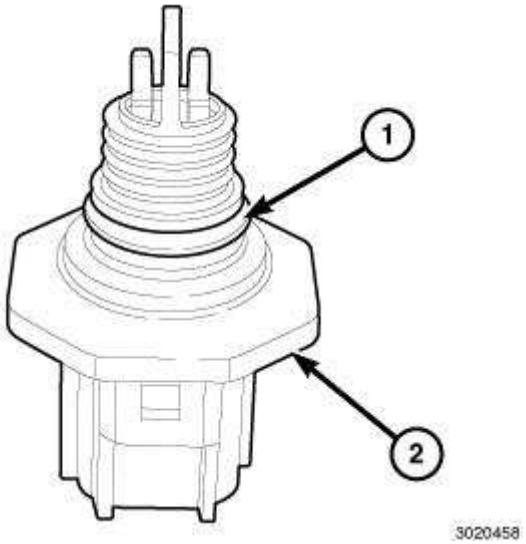

Fig. 101: O-Ring Seal & Water In Fuel Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Clean the O-ring sealing area of housing.

NOTE: Lubricate the O-ring seal with clean diesel fluid.

2. Install a new O-ring seal (1) onto Water in Fuel (WIF) sensor (2).

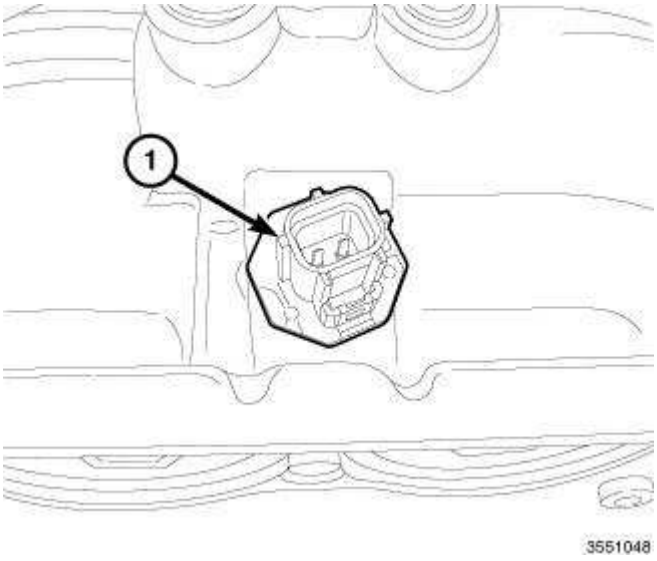

Fig. 102: Fuel (WIF) Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Install the WIF sensor (1) and securely tighten sensor.

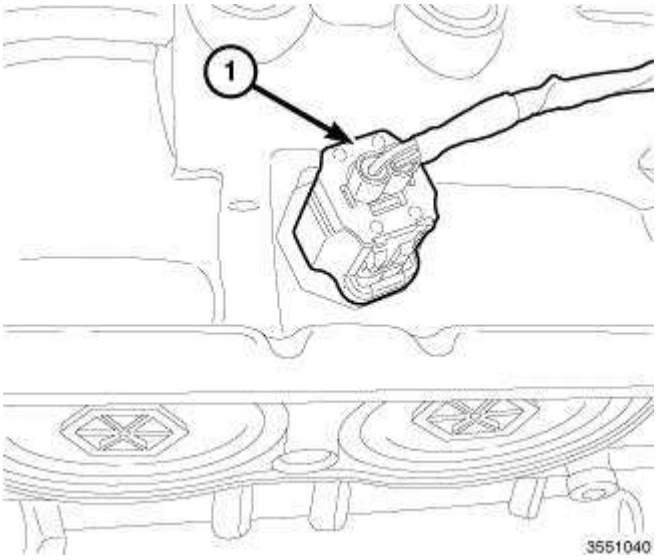

Fig. 103: Water In Fuel (WIF) Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect the Water In Fuel (WIF) sensor wire harness connector (1).
5. Lower the vehicle.
6. Connect the negative battery cable.

SEPARATOR AND FILTER, FUEL AND WATER

DESCRIPTION

DESCRIPTION

The fuel filter/water separator housing is located on the left side of the vehicle in front of the fuel tank. The filter has the task of cleaning the fuel before it is fed to the high-pressure system and ultimately to the injector nozzles.

1. The fuel filter/water separator housing incorporates the following components:
    - Two 5 micron fuel filter element.
    - Water separator
    - Drain plug
    - Water In Fuel sensor (WIF)
    - Fuel heater/temperature sensor

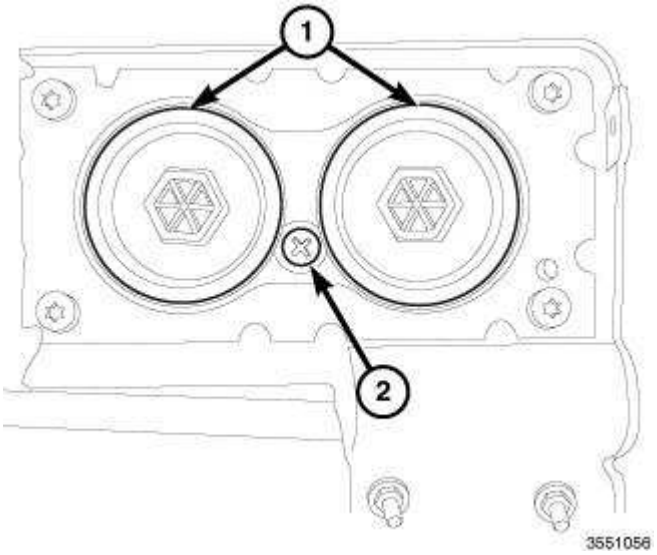

Fig. 104: Drain Plug & Filter Cover
Courtesy of CHRYSLER GROUP, LLC

Fuel filtering is critical in common-rail systems. Small amounts of impurities may damage the precision mechanical components over time. Water entering the injection system can also lead to damage. Servicing the fuel filters (1) is done from the bottom of the fuel filter/water separator housing.

A water reservoir is located at the bottom of the filter to collect any water contained in the fuel. A drain plug (2) is located on the bottom of the filter housing. The filter housing should be drained if a Water-in-Fuel message is displayed in the instrument cluster. Water is drained by removing the drain plug.

REMOVAL

REMOVAL

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

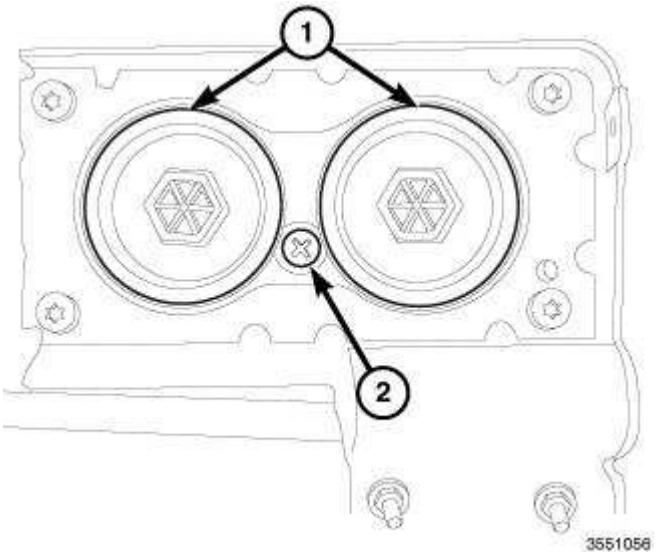

Fig. 105: Drain Plug & Filter Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Loosen drain plug (2) and drain fuel filter/water separator into a suitable container.
4. Securely tighten drain plug (2).

7. Make sure fuel filter drain port (2) is closed.
8. Lower the vehicle.
9. Connect the negative battery cable.
10. Start the engine and inspect for leaks.

SOLENOID, FUEL QUANTITY

DESCRIPTION

DESCRIPTION

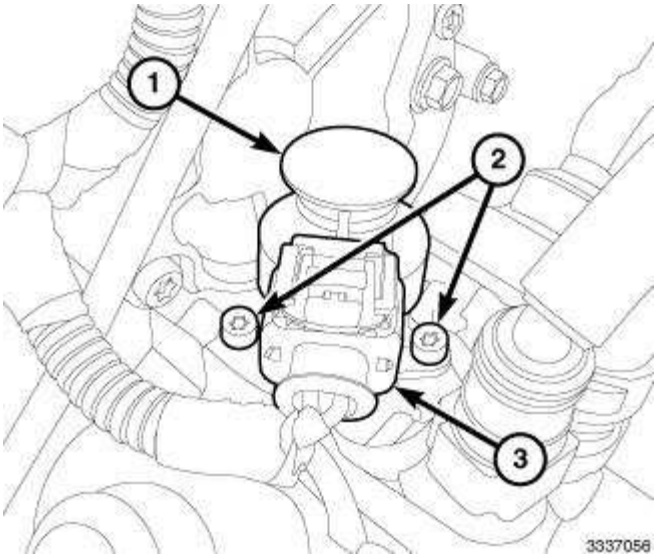

Fig. 115: Fuel Quantity Solenoid, Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

The fuel quantity solenoid is located in the top of the high pressure pump. The solenoid is pulse width modulated by the Powertrain Control Module (PCM) and meters the amount of fuel that flows into the high pressure elements inside of the high pressure pump. The solenoid is also inactive during the first 30 seconds to allow maximum fuel pressure to the fuel rail during start up.

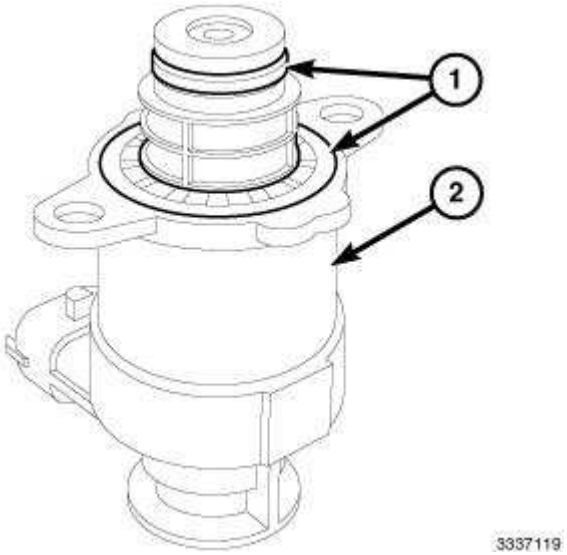

Fig. 116: Fuel Quantity Sensor & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. The fuel quantity solenoid incorporates a screen filter (1) that may require periodic cleaning. In the invent that screen filter gets dirty or restricted driveability issues and or fault codes may occur.

OPERATION

OPERATION

The fuel quantity solenoid is a pulse width modulated valve that controls the amount of fuel sent or delayed to the high pressure pump elements inside of the high pressure pump. The Powertrain Control Module (PCM) determines the fuel pressure set point based on engine sensor inputs. If the actual fuel rail pressure is too low, the PCM commands the solenoid to allow more fuel to flow to the high pressure pump. This minimizes the difference between the actual fuel rail pressure reading and the set point. The PCM will also operate the solenoid, delaying fuel if the fuel rail pressure becomes to high.

The fuel quantity solenoid is commanded open by the PCM to allow the high pressure pump to build maximum pressure 1800 bar (26, 106 psi) the solenoid also has fuel tank heat protection function that meters the exact amount of fuel to prevent excess heated fuel from returning to the fuel tank.

REMOVAL

REMOVAL

> **WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.**

1. Disconnect the negative battery cable.
2. Remove the cowl panel cover. Refer to **COVER, COWL PANEL, REMOVAL** .
3. Remove bolts and the strut tower support.

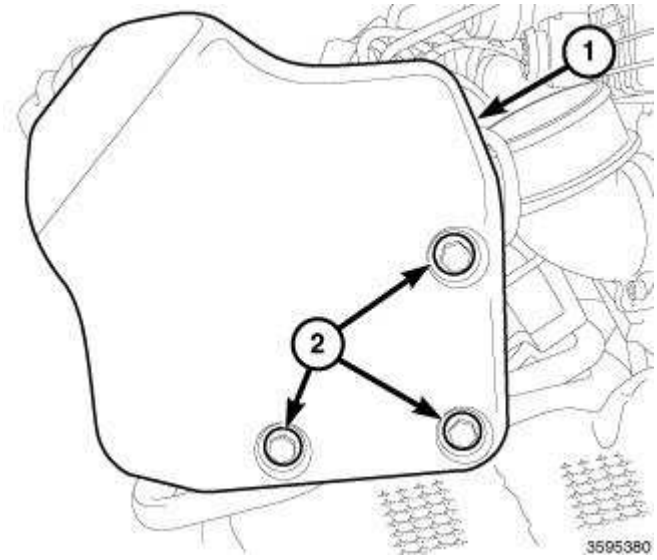

Fig. 117: High Pressure Pump Blocker & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (2) and the high pressure pump blocker shield (1).

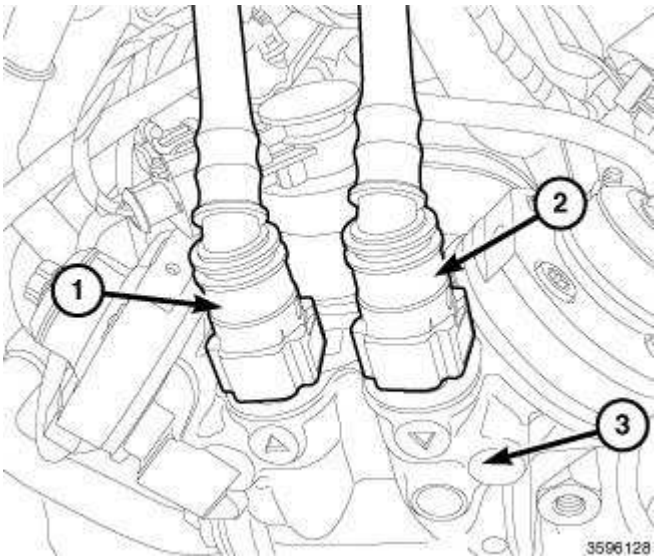

Fig. 118: Low Pressure Supply & Return
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the low pressure supply (2) and return (1) lines from high pressure pump. Refer to **FITTING, QUICK CONNECT** .

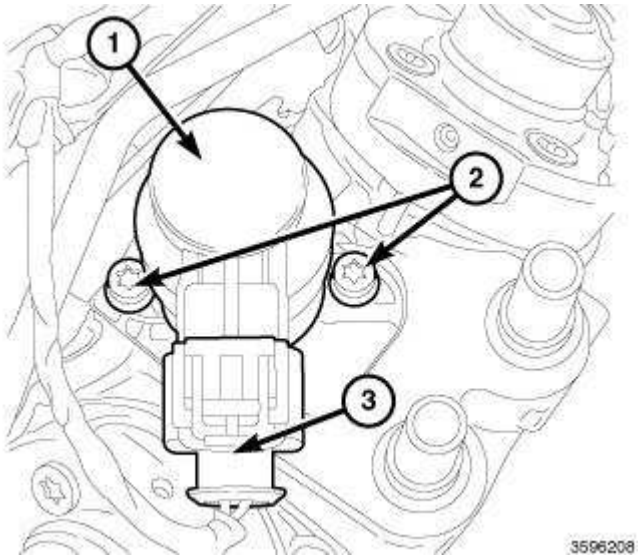

Fig. 119: Fuel Quantity Solenoid Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the fuel quantity solenoid wiring harness connector (3).
7. Clean the surrounding area of the fuel quantity solenoid.
8. Remove fasteners (2) and the fuel quantity solenoid (1).

INSTALLATION

INSTALLATION

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

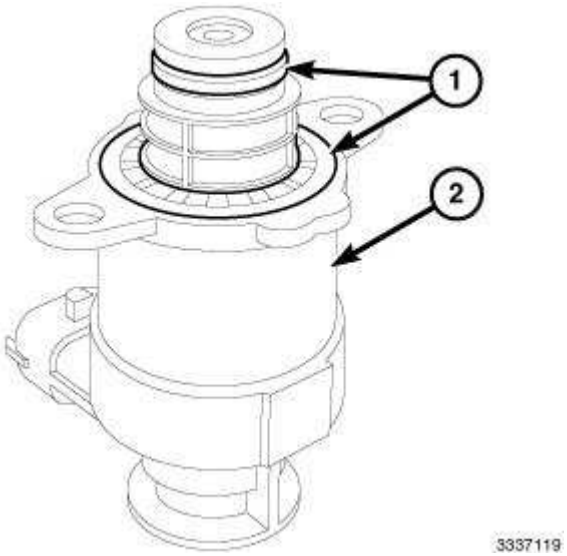

Fig. 120: Fuel Quantity Sensor & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Clean the sealing surfaces.
2. Inspect the fuel quantity solenoid screen filter (1) and clean as necessary.
3. Install new O-ring seals (1) onto the fuel quantity sensor (2).

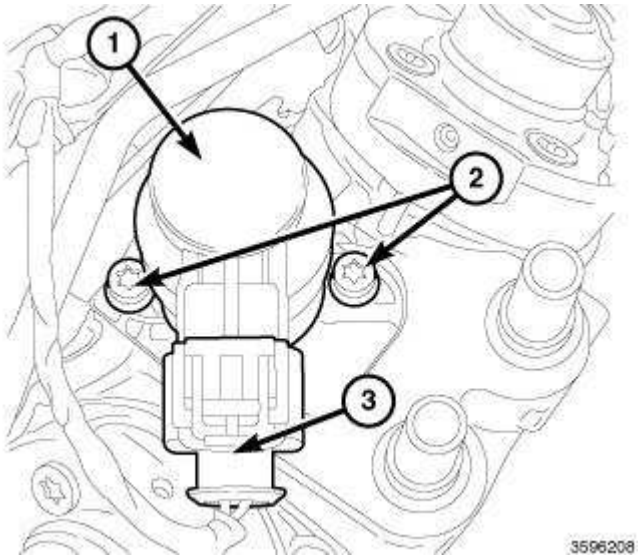

Fig. 121: Fuel Quantity Solenoid Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Install the fuel quantity solenoid (1) and securely tighten fasteners (2).
5. Connect the fuel quantity solenoid wiring harness connector (3).

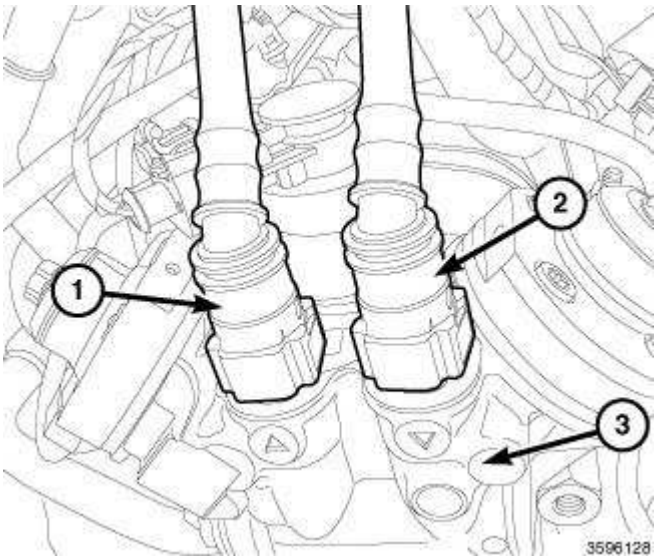

Fig. 122: Low Pressure Supply & Return
Courtesy of CHRYSLER GROUP, LLC

6. Connect the low pressure supply (2) and return (1) lines from high pressure pump.

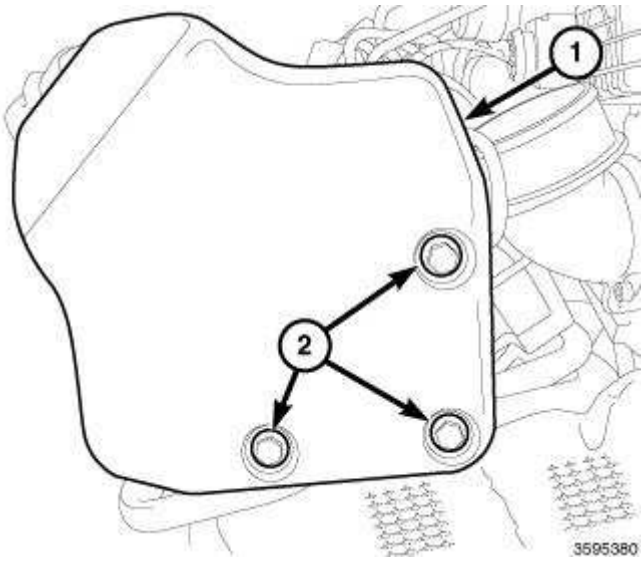

Fig. 123: High Pressure Pump Blocker & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the high pressure pump blocker shield (1). Tighten bolts (2) to 25 N.m (18 ft. lbs.).
8. Install the strut tower support and securely tighten bolts.
9. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION** .
10. Connect the negative battery cable.
11. Start the engine and inspect for leaks.

TANK, FUEL

REMOVAL

REMOVAL

1. Perform the draining fuel tank procedure. Refer to **DRAINING FUEL TANK** .
2. Disconnect the negative battery cable.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the left rear tire.

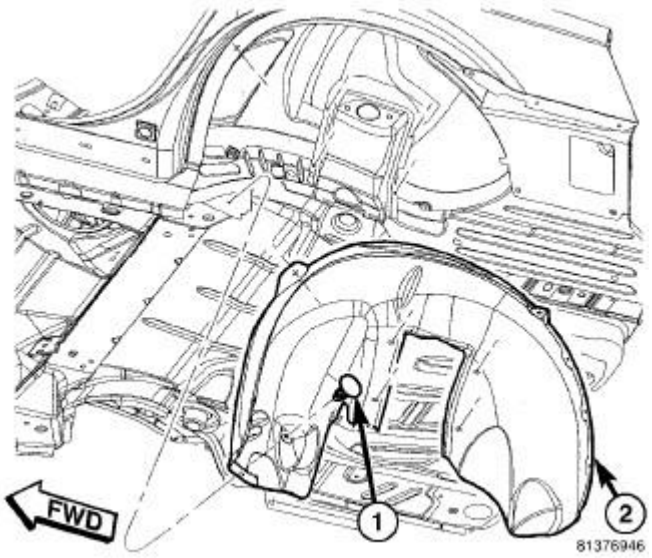

Fig. 124: Removing/Installing Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

5. Remove the push-pins (1) that secure the rear wheelhouse shield to the body.
6. Remove the left rear wheelhouse splash shield (2).

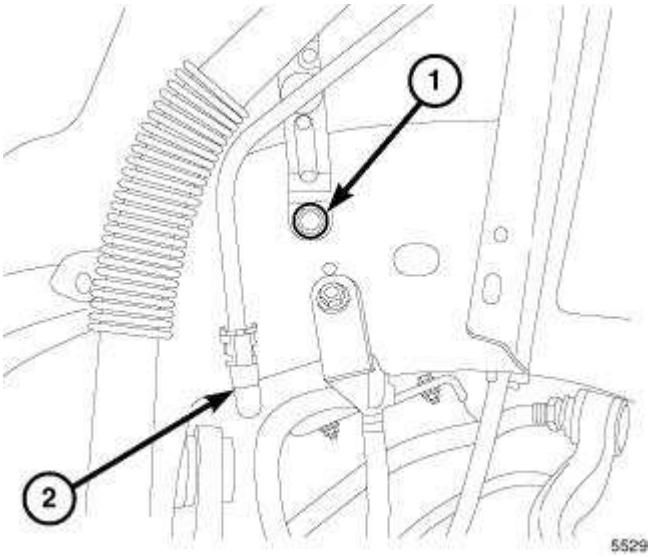

Fig. 125: Filler Tube Mounting Screw
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the fuel filler tube ORVR vent line (2).
8. Remove the fuel filler tube retaining bolt (1).

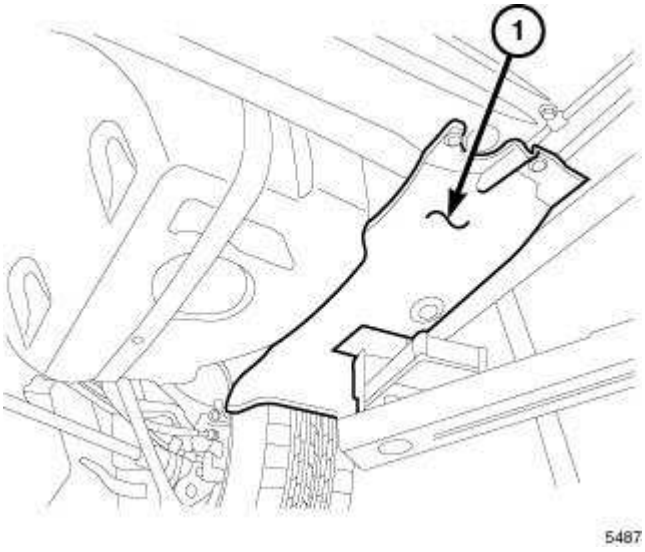

Fig. 126: Splash Shield DR Side
Courtesy of CHRYSLER GROUP, LLC

9. Remove the left under body splash shield (1).

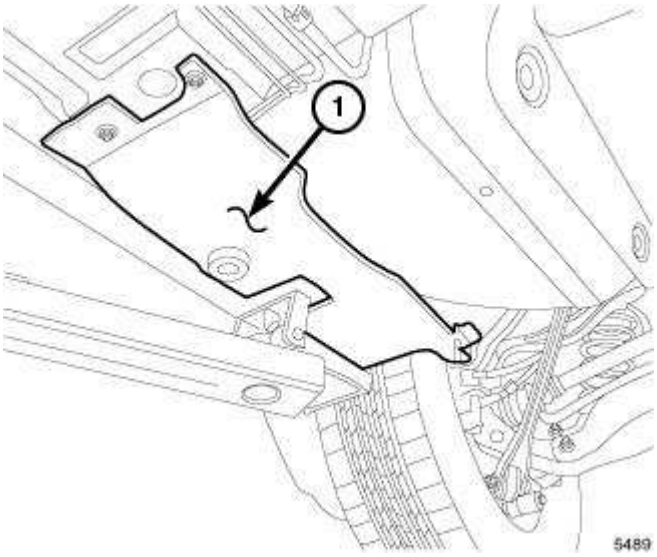

Fig. 127: Splash Shield PASS Side

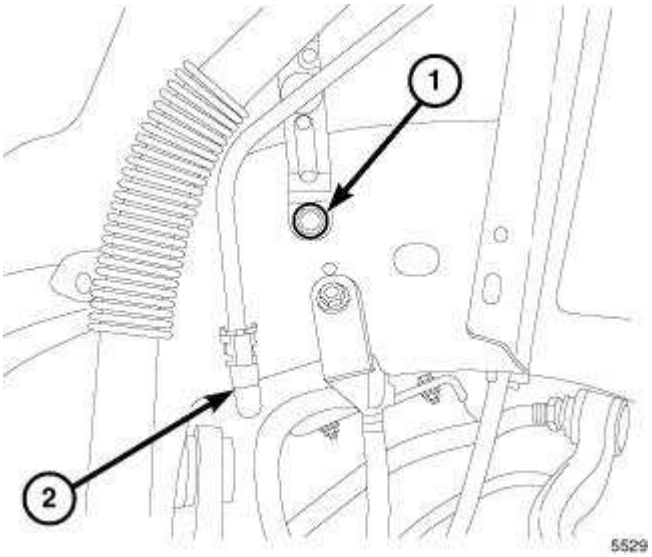

Fig. 149: Filler Tube Mounting Screw
Courtesy of CHRYSLER GROUP, LLC

16. Connect the ORVR vent line (2).
17. Install the fuel filler tube retaining bolt (1) and tighten to 7 N.m (62 in. lbs.).

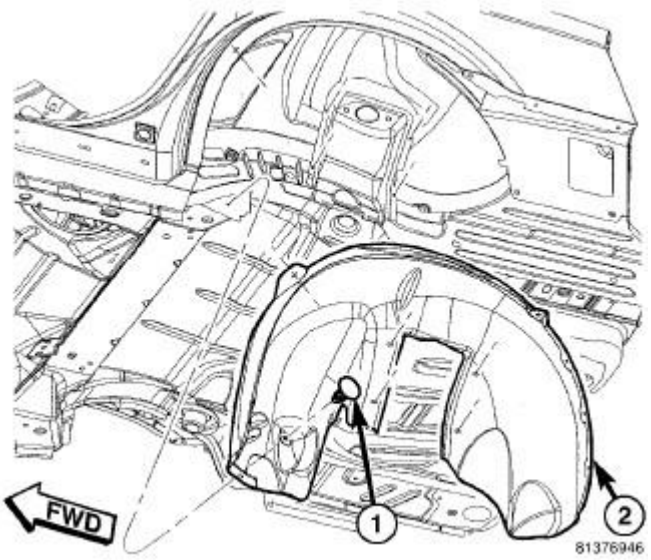

Fig. 150: Removing/Installing Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

18. Position the left rear wheelhouse splash shield (2).
19. Install the push-pins (1) that secure the rear wheelhouse shield to the body.
20. Install the left rear tire.
21. Lower the vehicle.
22. Fill the fuel tank.
23. Connect the negative battery cable.
24. Use the scan tool to pressurize the fuel system and check for leaks.

TUBE(S), FUEL

REMOVAL

FUEL TUBES

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

10. Remove the fuel injector return line (1) from the main low pressure return line (2).

INSTALLATION

FUEL TUBES

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 186 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

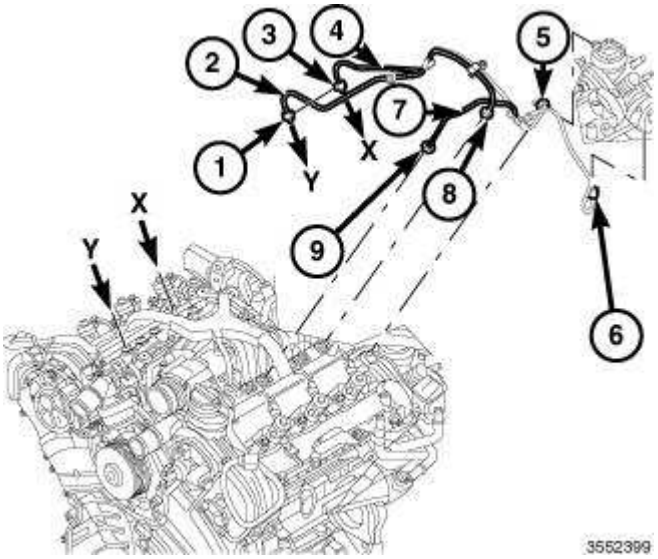

Fig. 165: High Pressure Fuel Crossover Tube, Left High Pressure Fuel Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Fuel tubes are a one time only use and must be replaced anytime they have been removed.

1. Install the new left high pressure fuel tube (7) and tighten union nuts (6, 9) finger tight.
2. Install the new high pressure fuel crossover tube (4) and tighten union nuts (3, 8) finger tight.
3. Install the new right high pressure fuel tube (2) and tighten union nuts (1, 6) finger tight.

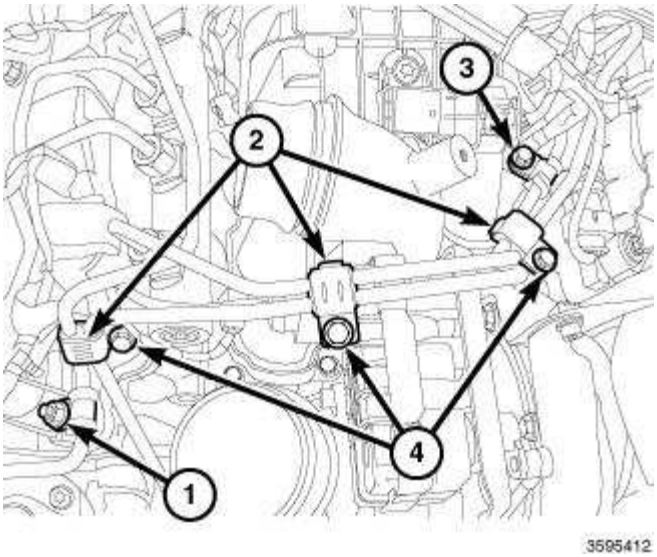

Fig. 166: Fuel Tube Securing Bolts & Bracket
Courtesy of CHRYSLER GROUP, LLC

4. Install the bracket (2) securing the fuel tubes. Tighten bolts (4) to 11 N.m (97 in. lbs.).
5. Install bolt (3) securing the right fuel tube and tighten to 11 N.m (97 in. lbs.).

6. Install nut (1) securing the left fuel tube and tighten to 11 N.m (97 in. lbs.).

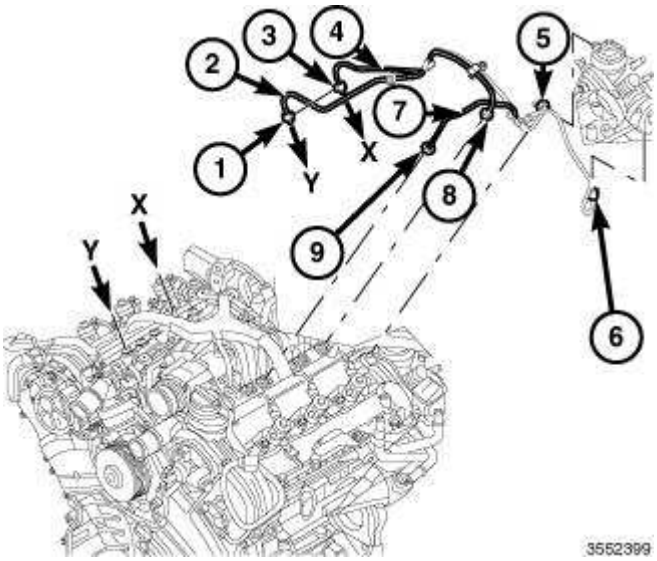

Fig. 167: High Pressure Fuel Crossover Tube, Left High Pressure Fuel Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the union nuts as follows:
   - Tighten union nut (1, 3, 8, 9) to 5 N.m (44 in. lbs.) plus an additional 75 degrees turn.
   - Tighten union nut (5 and 6) to 11 N.m (97 in. lbs.) plus an additional 75 degrees turn.

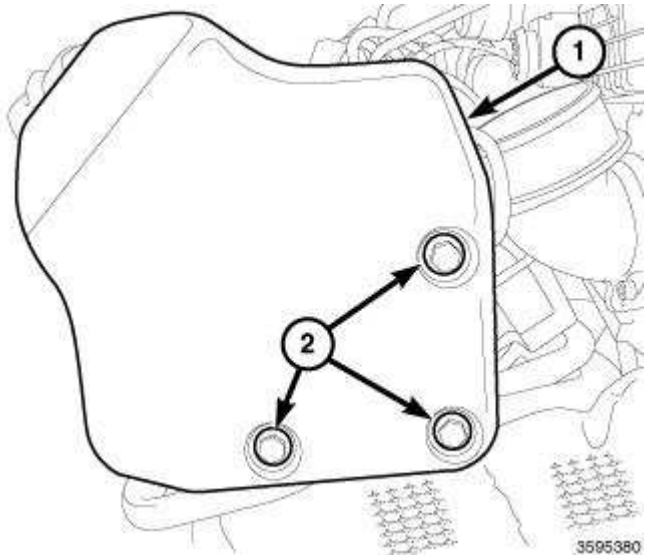

Fig. 168: High Pressure Pump Blocker & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the fuel pump blocker (1). Tighten bolts (2) to 25 N.m (18 ft. lbs.).

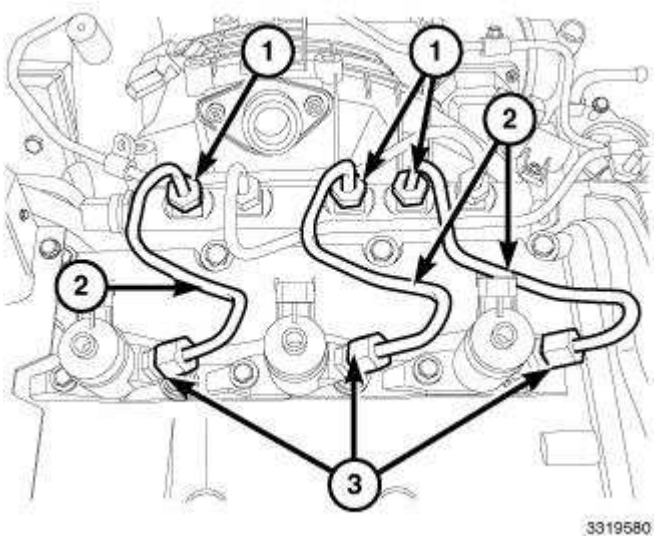

Fig. 169: Right Side Fuel Tubes & Union Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Fuel tubes are a one time only use and must be replaced anytime they have been removed.**

9. Remove the protective caps from the fuel injectors and fuel rail.
10. Install the new right side fuel tubes (2) and tighten union nuts (1, 3) finger tight:
    - Tighten union nut (1) to 5 N.m (44 in. lbs.) plus an additional 75 degrees turn.
    - Tighten union nut (3) to 11 N.m (97 in. lbs.) plus an additional 75 degrees turn.
11. Install the EGR tube. Refer to **TUBE, EXHAUST GAS RECIRCULATION (EGR), INSTALLATION** .

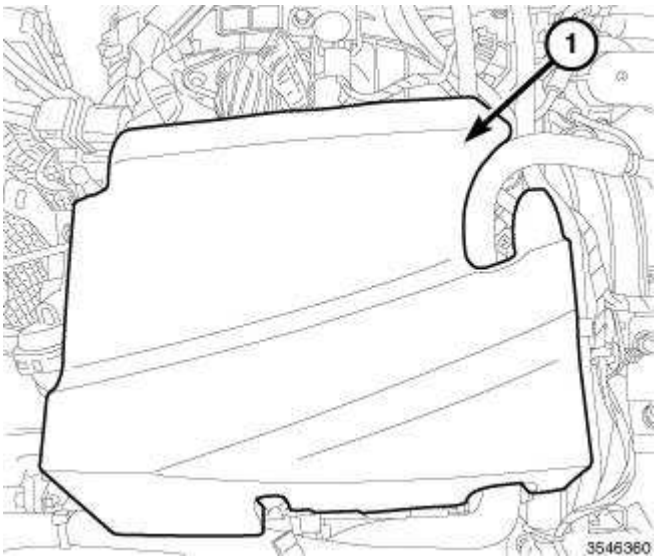

Fig. 170: Right Side Fuel Injector Silencer
Courtesy of CHRYSLER GROUP, LLC

12. Install the right side fuel injector silencer (1).

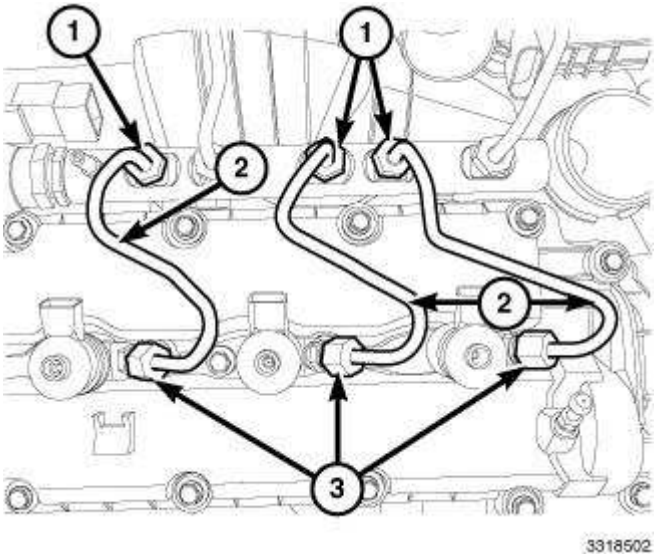

Fig. 171: Left Side Fuel Tubes & Union Nuts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the protective caps from the fuel injectors and fuel rail.
14. Install new left side fuel tubes (2) and tighten union nuts (1 and 3) finger tight.
    - Tighten union nut (1) to 5 N.m (44 in. lbs.) plus an additional 75 degrees turn.
    - Tighten union nut (3) to 11 N.m (97 in. lbs.) plus an additional 75 degrees turn.

18. Connect the negative battery cable.
19. Start engine, allow to warm, turn engine off and inspect for leaks.
20. Install the engine cover (1).

FUEL INJECTOR RETURN LINES

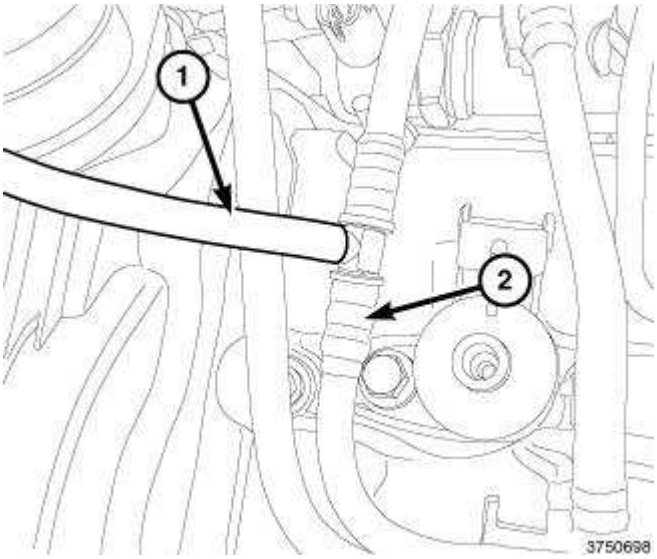

Fig. 175: Fuel Injector Return Line & Main Low Pressure Return Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: The one-way check valves on the fuel injector lines are not serviceable and should not be taken apart. If the one-way check valve is bad then a new fuel injector return line will need to be installed.

1. Inspect the fuel injector return line for cracks and inspect the O-ring seals for damage. Replace the fuel injector return line if a problem exists.
2. Install the fuel injector return line (1) to the main low pressure return line (2).

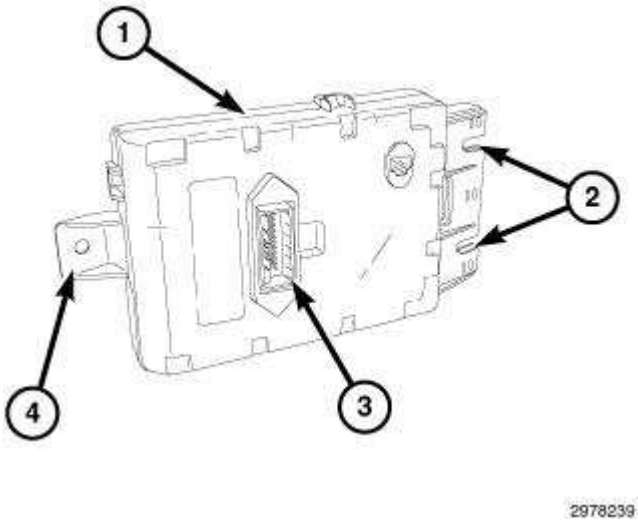

Fig. 176: Fuel Injector, Return Hose, Retaining Tab & Connector

Courtesy of CHRYSLER GROUP, LLC

3. Slide the fuel filler tube hose clamp into position and tighten.

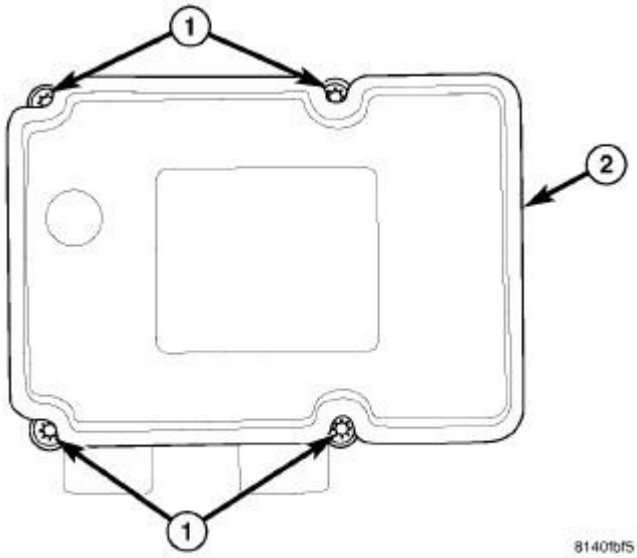

Fig. 192: Filler Tube Mounting Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the fuel filler tube retaining nut (1) and tighten to 12 N.m (106 in. lbs.).
5. Connect the fuel filler tube ORVR vent line (2).

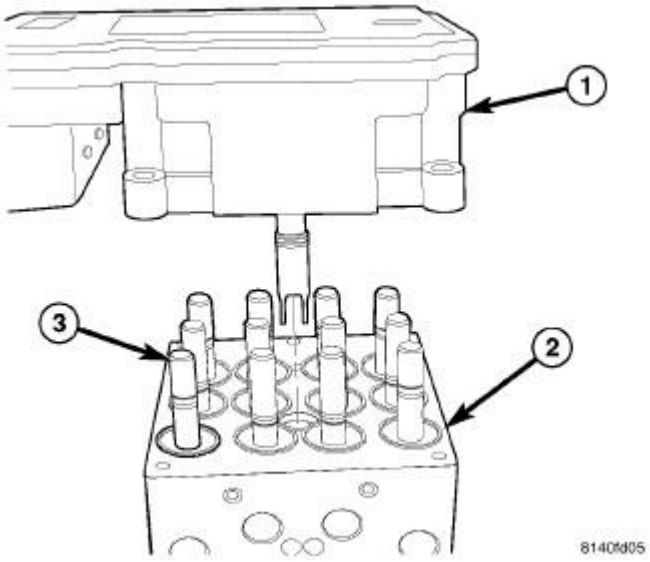

Fig. 193: Splash Shield DR Side
Courtesy of CHRYSLER GROUP, LLC

6. Install the underbody splash shield (1).

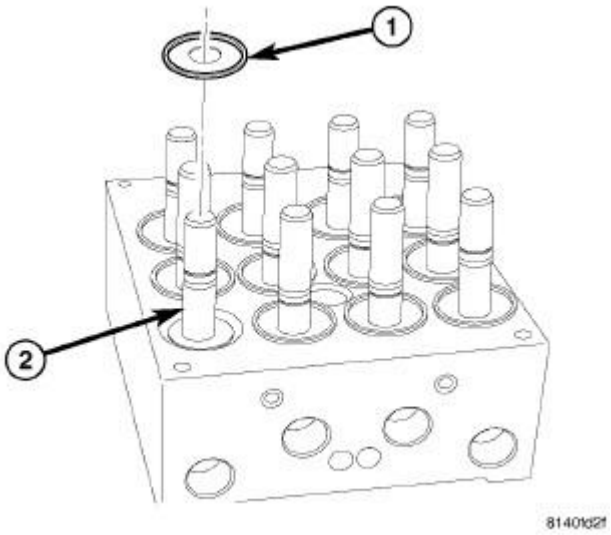

Fig. 194: Removing/Installing Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

7. Position the rear wheelhouse splash shield (2) to the body and install the push-pins (1).
8. Install the left rear tire.
9. Lower the vehicle.

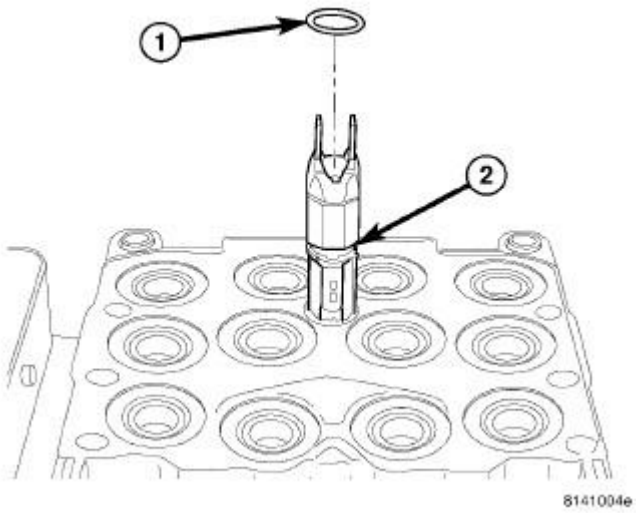

Fig. 195: Filler Tube Rubber AT Body Opening
Courtesy of CHRYSLER GROUP, LLC

10. Align the fuel filler tube rubber seal to the fuel filler housing.
11. Pull the fuel filler rubber seal through the fuel filler housing opening.
12. Verify the sheet metal of the fuel filler housing is in the groove of the rubber seal.

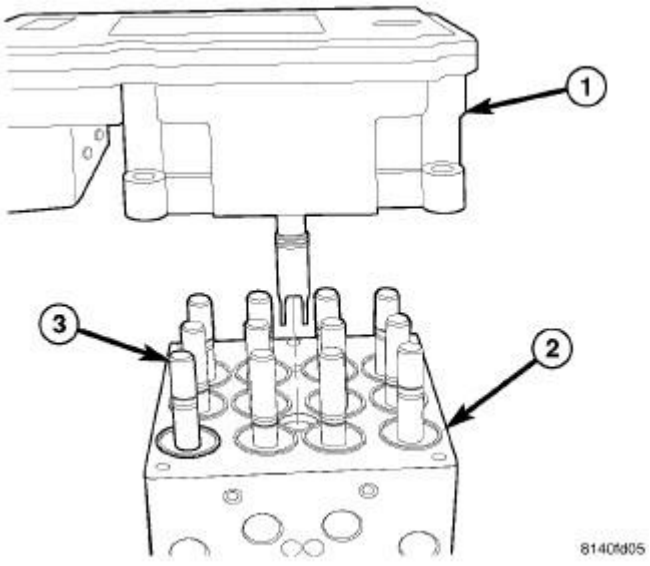

Fig. 196: Metal Wire Retaining Wire
Courtesy of CHRYSLER GROUP, LLC

13. Start the metal retaining wire (1) into the groove on the inside of the filler tube rubber seal.
14. Work the retaining wire around the fuel filler tube rubber seal until the fuel filler tube is locked into position.

15. Connect the negative battery cable.
16. Fill the fuel tank and check for leaks.

FUEL INJECTION, DIESEL

OPERATION

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

STANDARD PROCEDURE

INJECTOR QUANTITY ADJUSTMENT

The injector quantity adjustment, or classification of injectors describes the quantity, or fuel delivery characteristic of the injector. This will make it possible to match the Powertrain Control Module (PCM) fuel delivery strategy to the mechanical characteristics of the injector within a more narrowly graduated range. Injector classification can only be performed with a scantool.

The fuel injectors used in this vehicle have a seven digit alphanumeric code, which allows the PCM to determine the fuel quantity characteristic of each injector.

When carrying out service procedures where the injectors are removed from the cylinder head, it is important to observe the original locations of each individual injector, as installing an original injector in the wrong location, vehicle driveability and smoking concerns could result.

If an injector(s) is replaced, or if there is any concern that an injector may not be installed in its original location, the injector quantity adjustment procedure must be performed with the scan tool in order to program the quantity classification (seven digit alphanumeric code) to the corresponding cylinder in the engine control module.

INJECTOR CLASSIFICATION PROCEDURE

NOTE: **The engine must not be running for this procedure.**

NOTE: **If installing a new injector, make a note of the seven digit alphanumeric code. You will need to enter it into the scan tool during the Injector Quantity Adjustment procedure.**

NOTE: **Before performing this procedure, if the PCM has been replaced, or if any injector has been installed anywhere but its original location, make a note of the seven digit alphanumeric codes and the physical location of each injector. You will need to enter them into the scan tool during the Injector Quantity Adjustment procedure.**

1. Turn ignition switch "ON".
2. Using a scantool, select PCM View, then MISCELLANEOUS FUNCTIONS.
3. Select Injector Quantity Adjustment, then NEXT.
4. If the PCM was replaced, the Injector EEPROM Location procedure must be performed. Select YES, then NEXT, and follow the directions on the scan tool. Otherwise, go to step 5.
5. Select the injector(s) that has been replaced, access the keyboard function, and type the seven digit alphanumeric code next to the cylinder number that corresponds to the physical location where the injector has been installed.
6. Click NEXT. The scan tool will prompt to turn the ignition switch off for 12 seconds.
7. Repeat step 5 and 6 for any other injectors that are new, or have been moved from their original location. Once injectors are classified, cycle ignition to complete.
8. Once the seven digit alphanumeric codes for all injectors have been entered into the PCM, cycle ignition to complete the procedure.

INJECTOR(S), FUEL

DESCRIPTION

DESCRIPTION - FUEL INJECTORS

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This may be as high as 1800 bar (26, 106 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the fuel system.

Three electronically controlled fuel injectors are located on top of each cylinder bank. The injectors generate a fine fuel atomization at injection pressures of up to 1, 800 bar (26, 106 psi). Each injector is held in place by a tensioning claw and retaining bolt. A copper seal ring is located on the injector tip to seal off the injector to the combustion chamber. When servicing the injectors, always replace the copper seal ring and inspect the seal in the cylinder head cover. Lubricate the body of the injector with Mopar® 05012249AA - Nickel Antisieze Compound, or Molikote Anti-Fretting Paste (MB part number A001-989-42-51-10).

OPERATION

OPERATION

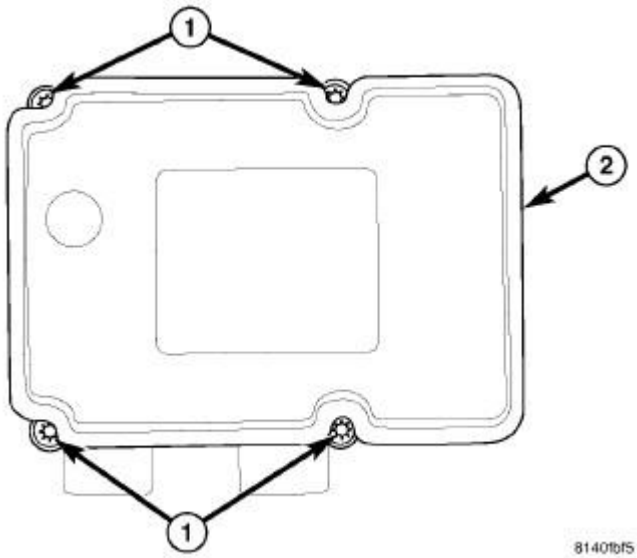

Fig. 197: "Z" Port (Inlet), "A" Port (Outlet)
Courtesy of CHRYSLER GROUP, LLC

The injector receives a single high pressure supply which, once inside the injector, is distributed in two distinct flows. One mainly supplies the nozzle and the other controls the pressure rod. Both of these flows also contribute to the lubrication of the injector's moving parts, thanks to consistent seepage present in an injection system that operates at such a high pressure. There is also recirculation, which is necessary to dissipate the diesel used to operate the pilot valve for channelling the seepage. The temperature of the diesel recirculated by the injector can reach very high levels 100 °C (212 °F). The recirculation systems must therefore be equipped with pipes that can withstand these temperatures. In order to better understand its operation, the injector may be considered as comprising two parts:

- 1. The actuator/nozzle, comprising the jet and pressure rod-pin assembly.
- 2. The control solenoid, comprising the solenoid and valve.

The volume inside the pilot valve and immediately above the actuator is known as the control capacity, and carries out a vital role in the operation of the injector. It is permanently supplied with diesel via a "Z" port (inlet) (4). The diesel flows out from this reservoir through a second "A" port (outlet) (2), whose opening is controlled by the control solenoid valve. The diesel contained in the control reservoir exerts a pressure that can be modulated and which acts upon the upper surface of the pressure rod, whose area is AC; the force acting on this area therefore depends on the pressure within the control volume.

The actuator/nozzle comprises a jet with 7 openings at the end, for the output of diesel, and a pressure rod-pin assembly. The jet is supplied with pressurized diesel when the pressure rod-pin assembly is in the raised position. This is raised by an imbalance between the opposing forces acting

on the assembly. There are three forces acting on the pressure rod-pin system:

- Spring force Fe exerted in the closing direction and created by the spring which acts on the pin; this force guarantees the seal of the nozzle when the line pressure drops to zero, avoiding the formation of drops of fuel in the cylinder.
- Force FC which also acts in the closing direction; this is caused by the pressure of the diesel present in the control volume. This pressure acts on the upper area of the pressure rod.
- Force FA exerted in the opening direction, created by the pressure of the fuel present in the supply volume and acting on the area of the circular crown marked out on the outside by the sliding diameter of the pin in the jet and on the inside by the sealing diameter of the conical housing.

The equilibrium of the pressure rod-pin assembly depends on the balance between these three forces; when the injector is not energized, the pressures in the supply and control volumes are identical and equal to the line pressure provided by the rail. In this condition: FC + Fe > FA.

REMOVAL

LEFT BANK

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1800 bar (26, 206 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury.

10. If injector can't be removed by hand, install the (special tool #VM.10358, Remover, Fuel Injector) (1) to remove the fuel injector (2). Discard lower sealing washer and place a protective cap over the nozzle.

CLEANING

CLEANING FUEL INJECTORS

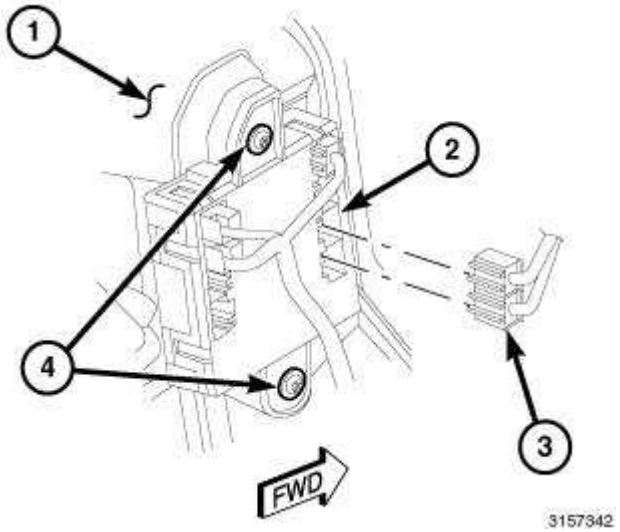

Fig. 209: Fuel Injector & Sealing Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before cleaning the injector recesses, seal the injector holes in the injector recesses with the appropriate pin to prevent debris from falling into the recesses and entering the motor.

1. Using a lint-free rag, wipe the cylinder head around the fuel injector.
2. Wipe out injector recesses with a lint-free cloth, then clean with the (special tool #9717, Brush, Injector Bore).
3. Clean the bottom of the cylinder recess with a round brush.
4. Blow out the recess and clean again with a lint-free cloth and cover over.
5. Perform these steps for each injector recess.

NOTE: DO NOT clean the tip of the injector with a wire brush. Use a lint-free cloth.

6. Clean injector body (1) with a wire brush.
7. Clean injector tips with a lint-free cloth.

NOTE: Do Not apply antiseize lubricant to the injector nozzle, apply only to the injector body.

8. Grease injector body with antiseize lubricant.

NOTE: Always replace the seals that seal off the injectors at the cylinder head to the combustion chamber.

INSTALLATION

LEFT BANK

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

NOTE: Any time a new injector is installed, or if an existing injector is installed in any location other than its original location, the injector quantity adjustment procedure must be performed. Refer to FUEL INJECTION, DIESEL, STANDARD PROCEDURE.

NOTE: DO NOT use a brush to clean around the injector nozzle. DO NOT lubricate area around injector nozzle. The injector may become restricted with debris.

NOTE: Be sure a new copper washer/seal is installed on end of injector and the old seal is removed, before installing in cylinder head.

NOTE: No force should be used in installing the fuel injector. Do not apply any pressure to the electrical connector or the fuel return port during the installation process.

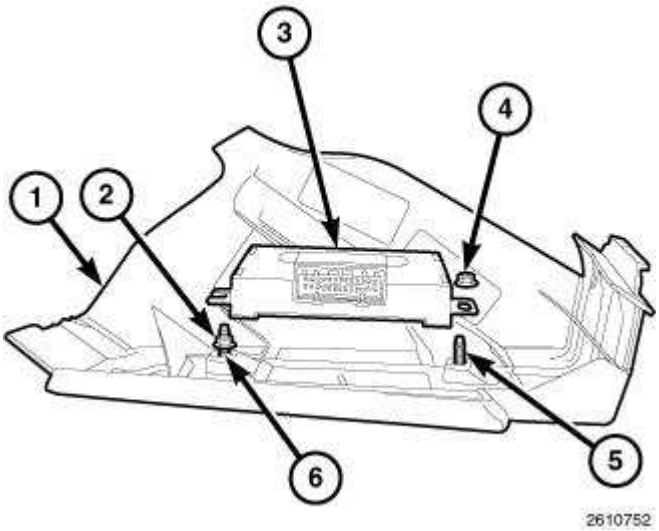

Fig. 210: Fuel Injector Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean injectors and injector bore. Refer to **INJECTOR(S), FUEL, CLEANING**.
2. Lubricate the new fuel injector seal (1) with clean engine oil, diesel fuel, or all purpose white grease.

3. Install a new fuel injector seal (1) in the cylinder head cover (2).

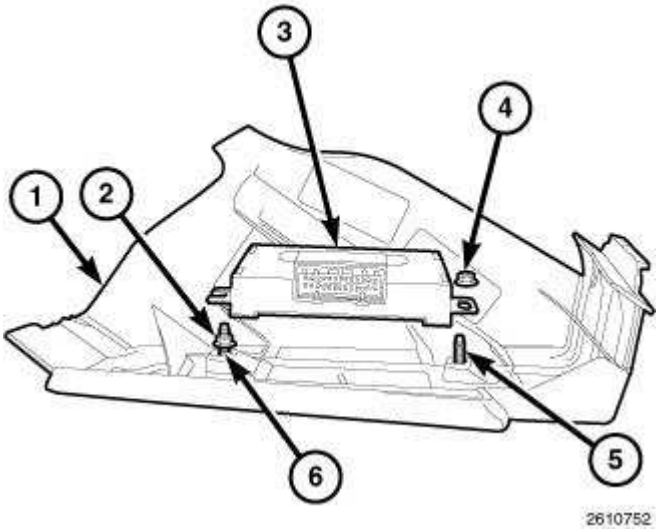

Fig. 211: Fuel Injector & Sealing Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do Not apply any lubricant to the fuel injector nozzle. Care must be taken not to restrict the discharge orifices in the nozzle.

4. Lubricate the fuel injector body with Mopar® White Lithium Grease.
5. Install a new sealing washer (2) onto the fuel injector (1).

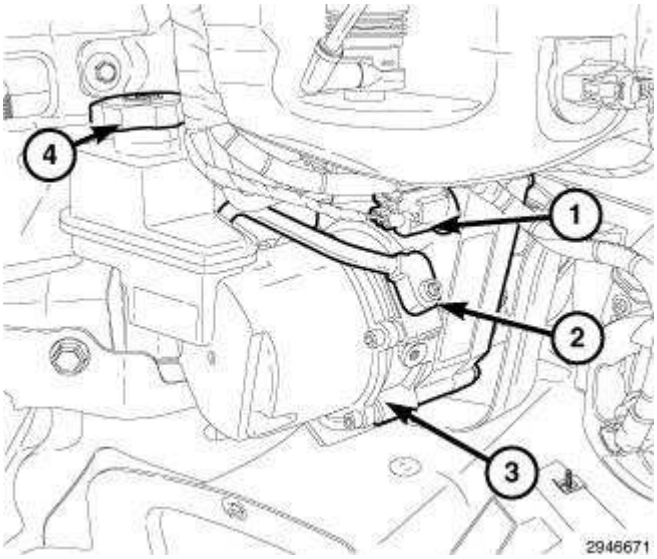

Fig. 212: Fuel Injector, Hold Down Bolt, Washer & Retaining Claw

SENSOR, ACCELERATOR PEDAL POSITION

DESCRIPTION

DESCRIPTION

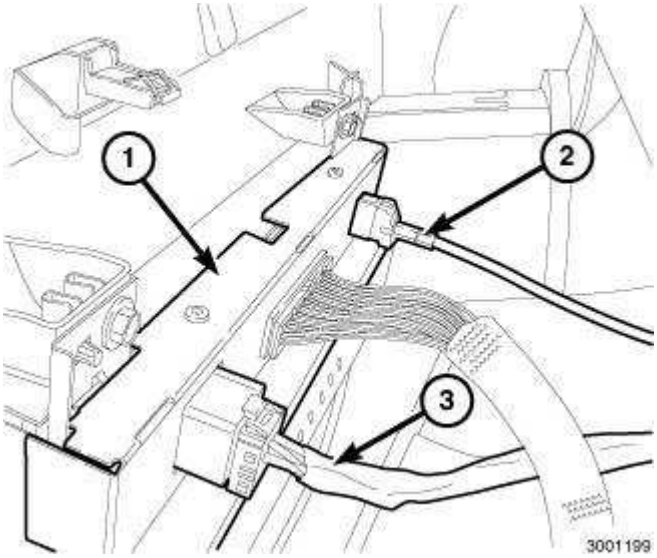

Fig. 225: Accelerator Pedal Position Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - ACCELERATOR PEDAL POSITION SENSOR (APPS)
2 - ACCELERATOR PEDAL ASSEMBLY

The accelerator pedal position sensor (1) is located on the accelerator pedal assembly (2). The driver supplies the torque requirements for the engine by operating the accelerator pedal in accordance with the desired speed or acceleration. The pedal sensor converts the mechanical operation of the pedal into an electrical signal and sends the information to the Powertrain Control Module (PCM). The PCM adjusts the quantity of the fuel that is injected into the engine.

The accelerator pedal position sensor (1) is serviced as an assembly with the accelerator pedal assembly (2).

REMOVAL

REMOVAL

1 - HARNESS CONNECTOR
2 - FASTENERS
3 - ACCELERATOR PEDAL ASSEMBLY

1. Install the accelerator pedal assembly (3). Tighten nuts (2) to 34 N.m (25 ft. lbs.).
2. Connect the APPS wire harness connector (1).
3. Install the drivers lower dash board close out panel.
4. Connect the negative battery cable.

SENSOR, AIR TEMPERATURE, NUMBER 2

DESCRIPTION

DESCRIPTION

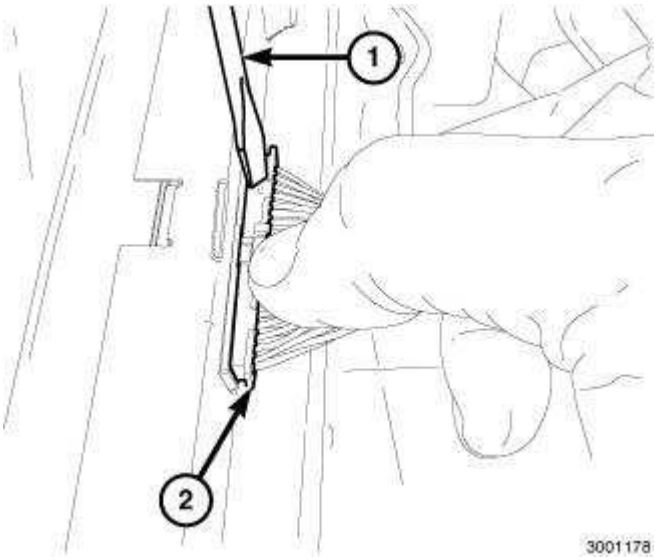

Fig. 228: Intake Air Temperature Sensor/Boost Pressure Sensor, Fastener & Connector
Courtesy of CHRYSLER GROUP, LLC

The Intake Air Temperature (IAT) sensor 2 (2) is combined with the Boost Pressure sensor is a mounted on the top of the intake manifold.

OPERATION

OPERATION

The Intake Air Temperature (IAT) sensor 2 operates as a typical two wire sensor and is used to monitor the temperature of the air in the Intake Manifold. It receives a 5-Volt signal on the (K48) Intake Air Temperature Sensor 2 Signal circuit and shares the (K690) ground circuit with the Boost Pressure Sensor.

REMOVAL

REMOVAL

1. The Intake Air Temperature (IAT) sensor 2 (2) is incorporated with the boost pressure sensor. For installation, refer to **SENSOR, BOOST PRESSURE, INSTALLATION**.

SENSOR, BOOST PRESSURE

DESCRIPTION

DESCRIPTION

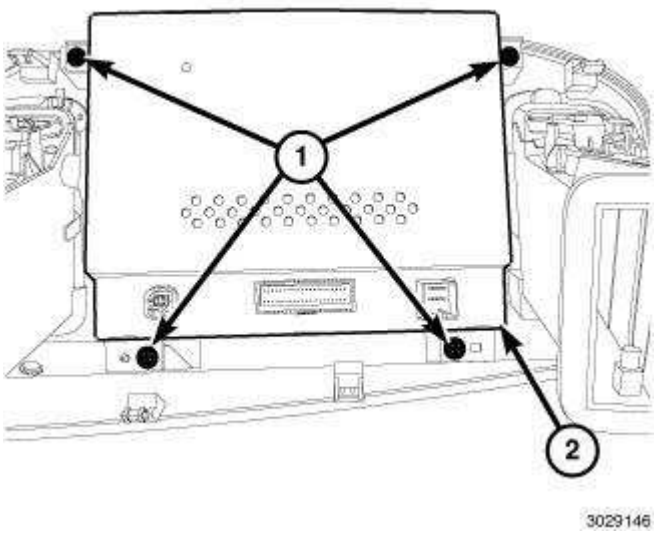

Fig. 231: Intake Air Temperature Sensor/Boost Pressure Sensor, Fastener & Connector
Courtesy of CHRYSLER GROUP, LLC

The Boost Pressure Sensor (2) is combined with the Intake Air Temperature (IAT) Sensor 2 is a mounted on the top of the intake manifold.

OPERATION

OPERATION

The Boost Pressure Sensor operates as a typical three wire sensor. It is used to measure the pressure of the air entering the Turbocharger. It receives a 5-Volt feed on the (K668) Boost Pressure Sensor 5-Volt Supply circuit and shares the (K690) ground circuit with the Intake Air Temperature Sensor. The Powertrain Control Module (PCM) receives a signal from the sensor via the (K37) Boost Pressure Sensor Signal circuit.

DIAGNOSIS AND TESTING

BOOST PRESSURE SENSOR

If the boost pressure sensor fails, the PCM records a DTC into memory and continues to operate the engine in one of the three limp-in modes. When the PCM is operating in this mode, a loss of power will be present, as if the turbocharger was not operating. The best method for diagnosing faults with the boost pressure sensor is with the scan tool. Refer to the Diesel Powertrain Diagnostic information.

REMOVAL

REMOVAL

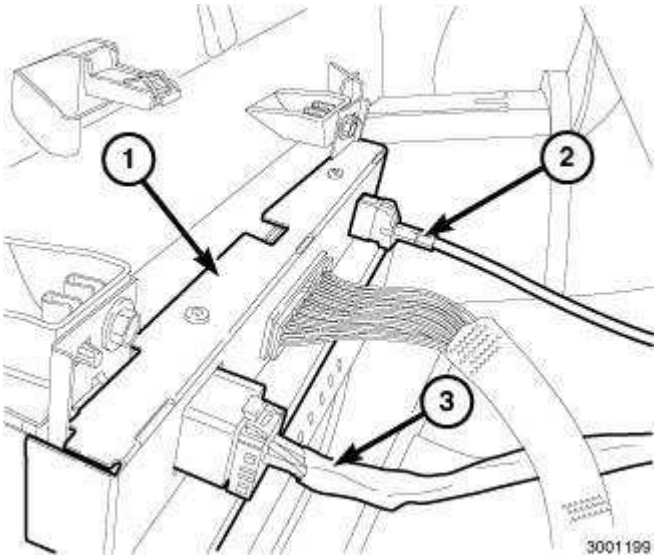

Fig. 232: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

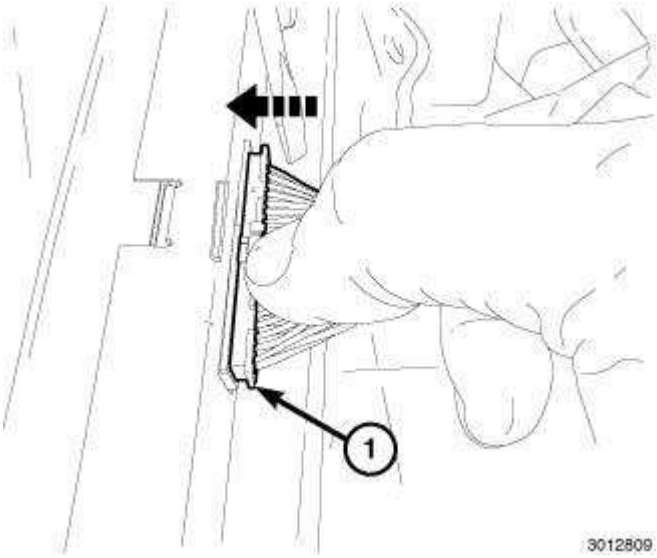

Fig. 233: Intake Air Temperature Sensor/Boost Pressure Sensor, Fastener & Connector

SENSOR, CAMSHAFT POSITION

DESCRIPTION

DESCRIPTION

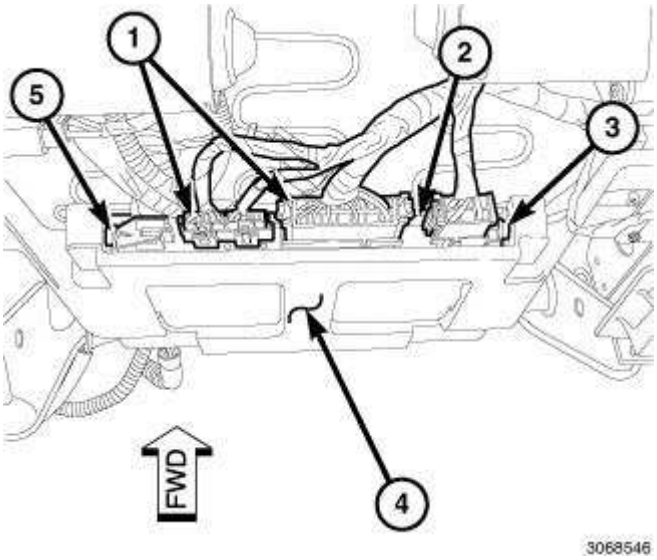

Fig. 236: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensor is mounted on the left upper timing cover. The hall effect sensor supplies a signal to the Powertrain Control Module (PCM). The PCM uses the signals sent by the CMP and the Crankshaft Position (CKP) sensor to determine injection timing.

OPERATION

OPERATION

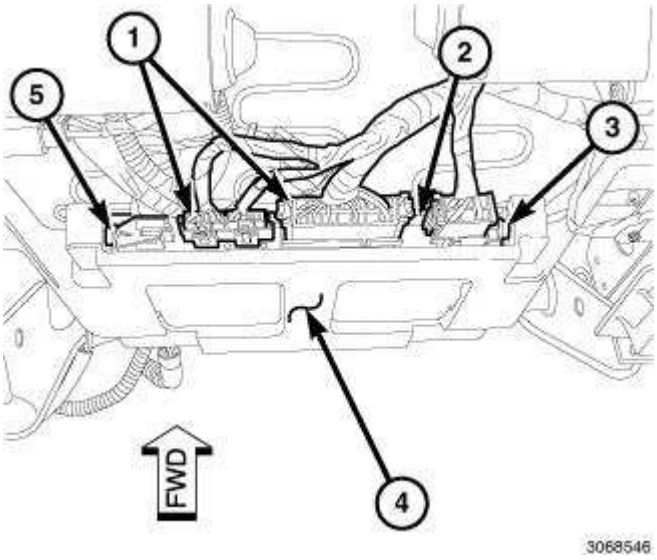

Fig. 237: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The signal circuit of the camshaft sensor has a voltage of approximately 5V. The camshaft has a

reluctor wheel bolted to the front of left exhaust camshaft, the camshaft signal is approximately 0V. This 0V to 5V signal is used by the Powertrain Control Module (PCM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start.

REMOVAL

REMOVAL

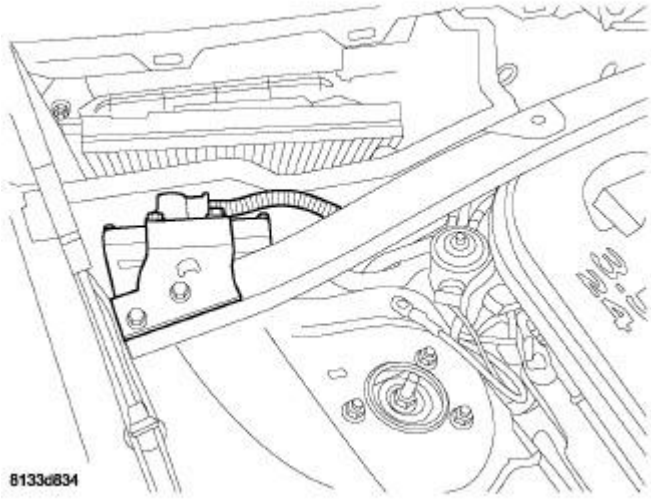

Fig. 238: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Disconnect Camshaft Position (CMP) sensor wire harness connector (3).
3. Remove bolt (1) and the CMP sensor (2).

INSTALLATION

INSTALLATION

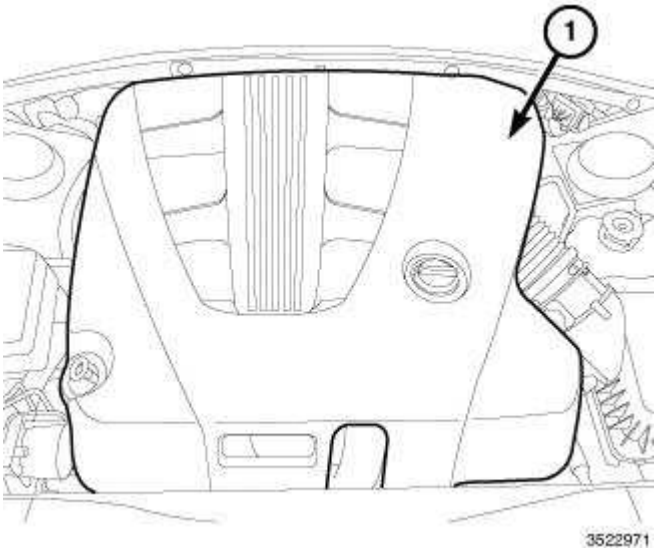

Fig. 239: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install Camshaft Position (CMP) sensor (2). Tighten bolt (1) to 8 N.m (71 in. lbs.).
2. Connect the CMP wire harness connector (3).
3. Connect the negative battery cable.

SENSOR, CRANKSHAFT POSITION

DESCRIPTION

DESCRIPTION

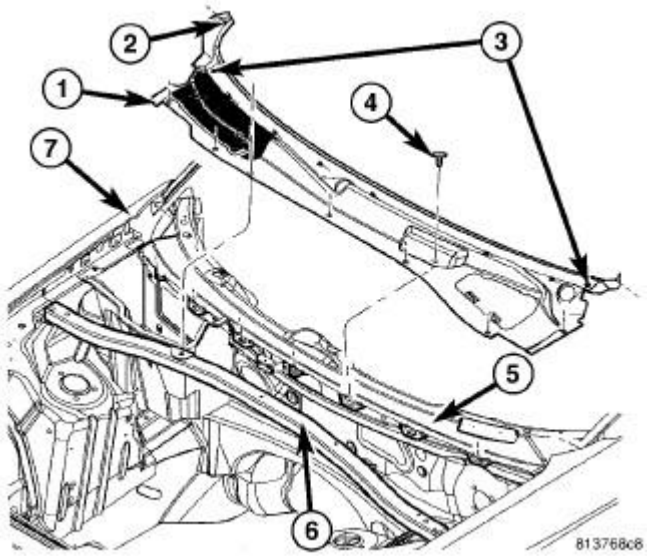

Fig. 240: Crankshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Crankshaft Position (CKP) sensor (2) is located at the rear of the engine below the crankshaft. The sensor detects the crankshaft position through a (hall effect) by means of missing segments on the tone wheel behind flex plate. The powertrain Control Module (PCM) detects TDC position of cylinder 1 by means of the signal supplied by the sensor. Injection timing is synchronized by means of the camshaft signal and the crankshaft signal. This sensor is used to detect engine speed.

OPERATION

OPERATION

The crankshaft position and engine speed are detected through a (hall effect) signal. The distance between the Crankshaft Position (CKP) sensor and the gaps of the tone wheel is fixed by the installation position.

When the crankshaft rotates, an alternating voltage is generated in the crankshaft position sensor by the gaps of the tone wheel located behind the flex plate.

In this case, the metal portion of the tone wheel generates a positive voltage pulse and the gap in the tone wheel a negative voltage pulse. The distance from the positive to the negative voltage peak equals the length of the gap.

REMOVAL

REMOVAL

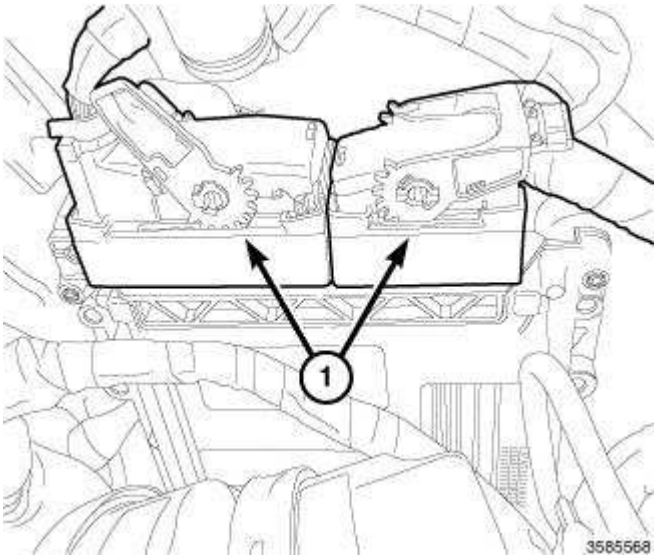

Fig. 241: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
3. Remove the transmission belly pan.
4. Disconnect the Crankshaft Position Sensor (CKP) wiring harness connector (1).

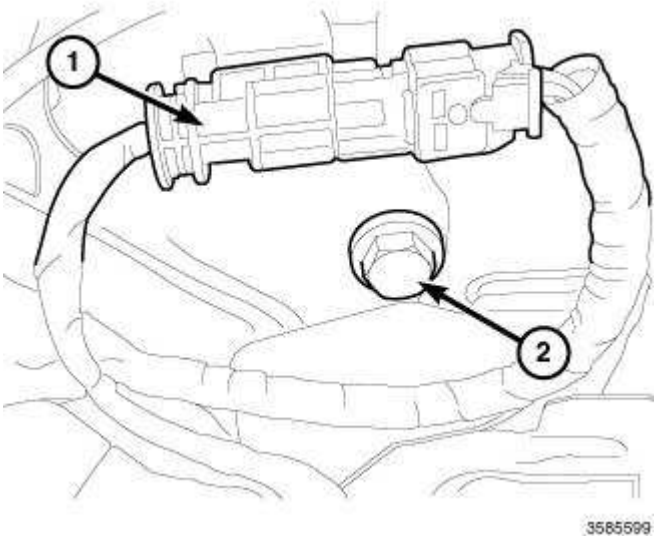

Fig. 242: Rear Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two bolts (4) from the rear engine mount isolator.
6. Using a suitable transmission jack, positioned under the transmission oil pan, raise the transmission to gain enough clearance to remove the CKP cover.

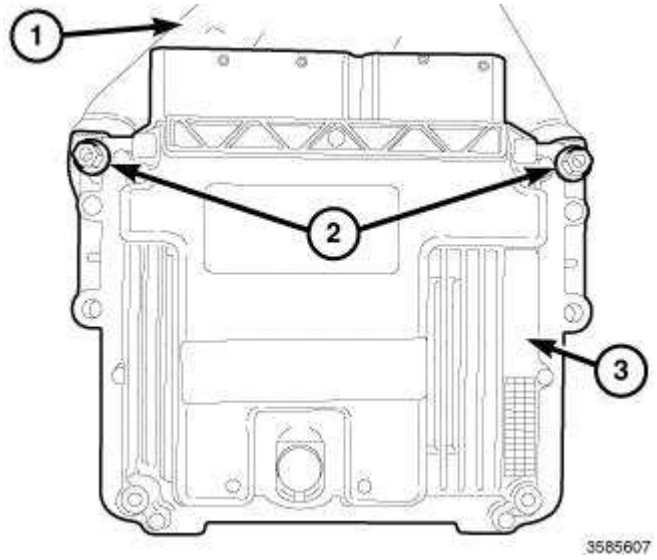

Fig. 243: CKP Sensor, Seal & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (1) and the CKP cover.

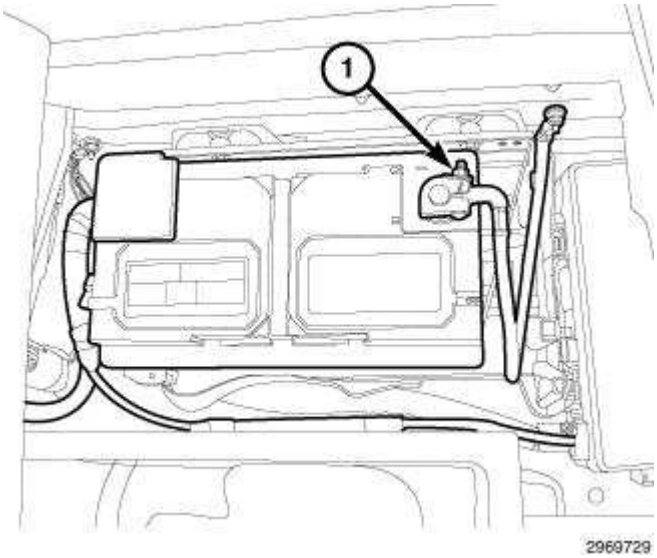

Fig. 244: Access Hole, Bolt & CKP Sensor
Courtesy of CHRYSLER GROUP, LLC

8. Using the access hole shown in illustration, remove bolt (3) and the CKP sensor (2).

INSTALLATION

INSTALLATION

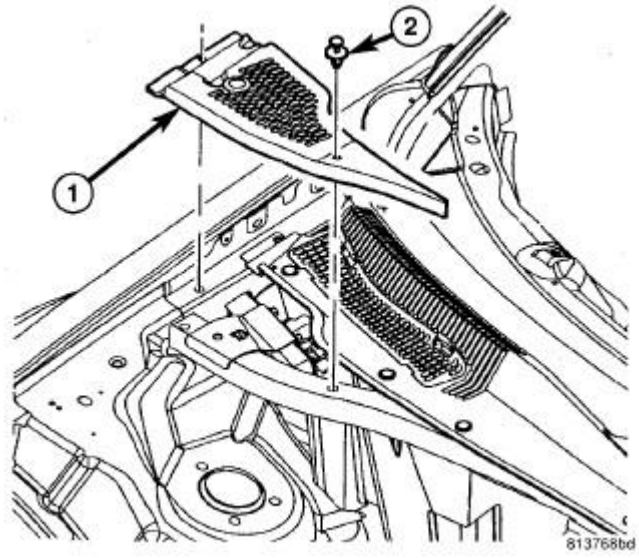

Fig. 245: Access Hole, Bolt & CKP Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Clean the area and bore around Crankshaft Position (CKP) sensor.
2. Install the CKP sensor (2). Tighten bolt (3) to 6 N.m (53 in. lbs.).

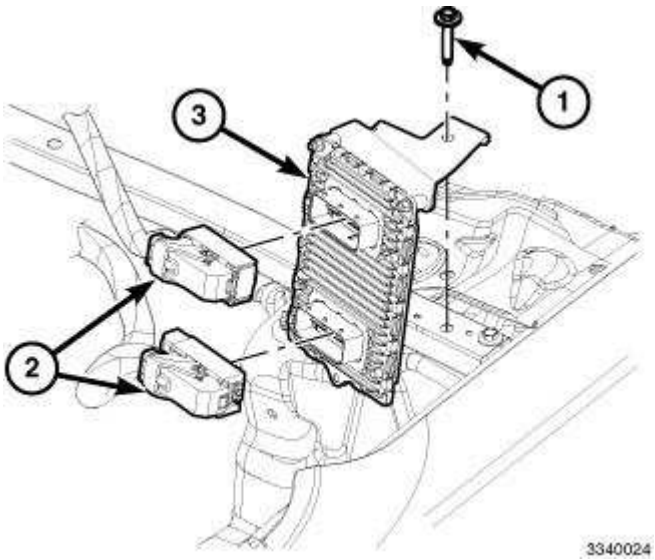

Fig. 246: CKP Sensor, Seal & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Install the CKP sensor cover. Tighten bolts (1) to 8 N.m (71 in. lbs.).

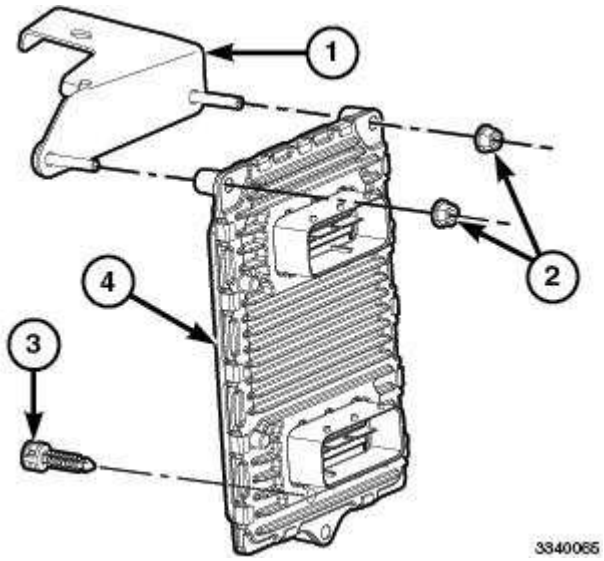

Fig. 247: Rear Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Lower the transmission jack so the weight is resting on the isolator.
5. Install the rear engine mount isolator bolts (4) and tighten to 61 N.m (45 ft. lbs.).

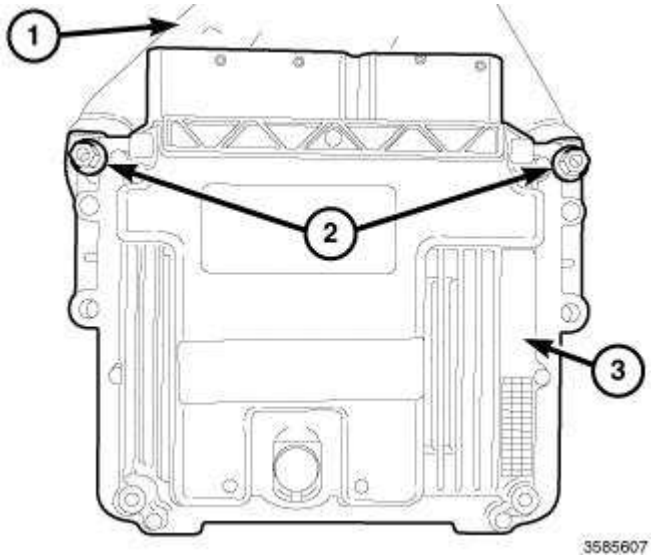

Fig. 248: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the CKP wire harness connector (1).
7. Install the transmission belly pan.
8. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
9. Connect the negative battery cable.

SENSOR, MASS AIRFLOW (MAF)

DESCRIPTION

DESCRIPTION

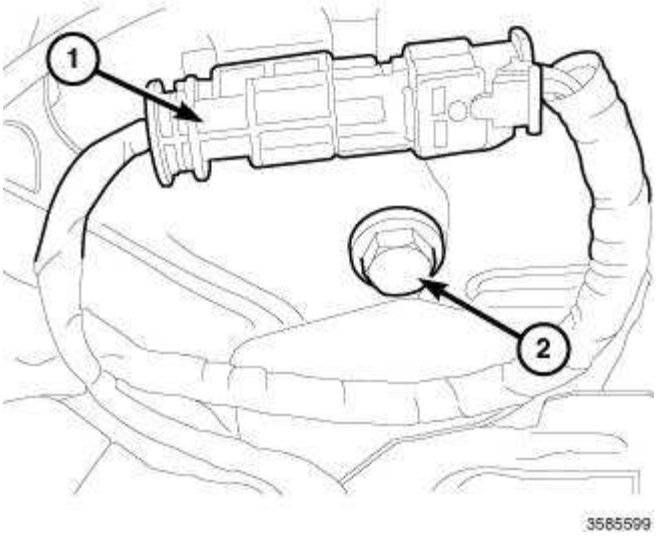

Fig. 249: Mass Air Flow Sensor, Air Cleaner Housing Cover & Screws
Courtesy of CHRYSLER GROUP, LLC

The Mass Air Flow (MAF) sensor (3) is located in the air intake port between the air filter and the turbocharger. The MAF sensor is a hot film thermal flowmeter with an Integrated Temperature sensor which detects the intake air temperature. The sensor is designed for recording load on combustion engines with diesel fuel injection and has a cylinder size in accordance with the required air flow rate.

OPERATION

OPERATION

The Powertrain Control Module (PCM) uses the Mass Air Flow (MAF) sensor to measure air density. The temperature resistor located at the front of the MAF sensor measures the temperature of the inlet air. By varying the voltage, the electronic circuit regulates the temperature of the heating resistor in the rear so that it is 320° F (160°C) higher than the temperature of the intake air. The temperature at the heating resistor is measured by a sensor resistor in-between.

Because the incoming air has a cooling effect, the greater the amount of air that flows in, then the higher the voltage of the heating resistor. The heating resistor is therefore a measure of mass of air flowing past. If a temperature change occurs as a result of a increase or reduction of air flow, the PCM corrects the voltage at the heating resistor until the temperature difference is again achieved. This control voltage is use by the PCM as a unit measure for metered air mass.

REMOVAL

REMOVAL

FUEL DELIVERY, GAS

STANDARD PROCEDURE

FUEL SYSTEM PRESSURE RELEASE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

1. Remove the fuel pump relay from the Power Distribution Center (PDC). Refer to **FUSE LOCATIONS AND TYPES, SPECIFICATIONS** . A relay location label can also be found on the underside of the PDC cover.
2. Start and run the engine until it stalls.
3. Attempt restarting engine until it will no longer run.
4. Turn ignition key to the OFF position.
5. Return fuel pump relay to the Power Distribution Center (PDC).

NOTE: After servicing the fuel system, one or more Diagnostic Trouble Codes (DTC's) may have been stored in the Powertrain Control Module (PCM) memory due to disconnecting the fuel pump module circuit. A diagnostic scan tool must be used to erase a DTC.

DRAINING FUEL TANK

CONVENTIONAL PROCEDURE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel

will spill into the interior of the vehicle.

CAUTION: If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

NOTE: Due to a one-way check valve installed into the fuel fill fitting at the tank, the tank cannot be drained at the fuel filler tube.

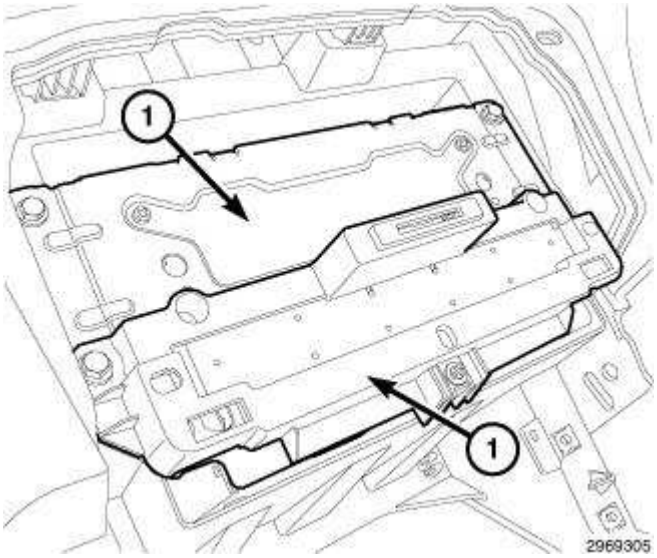

Fig. 268: Fuel Supply Line
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the fuel supply line (2) from the fuel rail. Refer to **STANDARD PROCEDURE** .

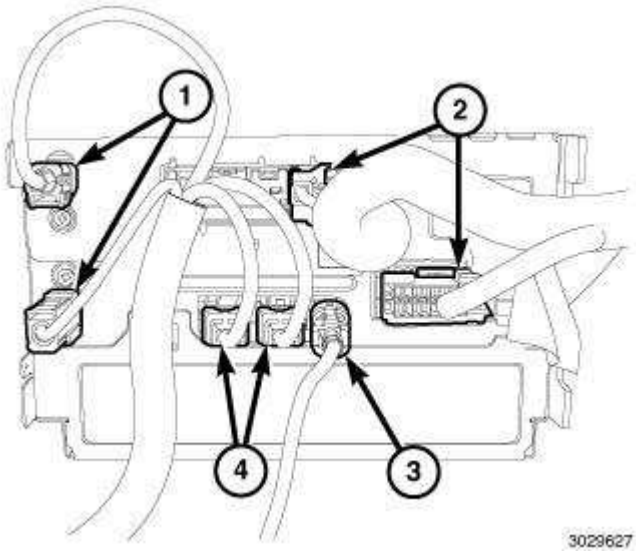

Fig. 269: Fuel Line Adapters
Courtesy of CHRYSLER GROUP, LLC

NOTE: Tool number 8978-2 is used on 5/16" fuel lines while tool number 8531-1 is used on 3/8" fuel lines.

3. Install the appropriate fuel line adapter fitting from the (special tool #8978A, Decay Tool, Fuel) to the fuel supply line. Route the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.

NOTE: Due to a built in time out feature of the diagnostic scan tool, the fuel pump may need to be reactivated several times before the fuel tank evacuation is complete.

4. Using a diagnostic scan tool, activate the fuel pump until the fuel tank has been evacuated.

ALTERNATIVE PROCEDURE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: The fuel level of the vehicle must be below 5/8 of a tank before using the "Alternative Procedure". If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

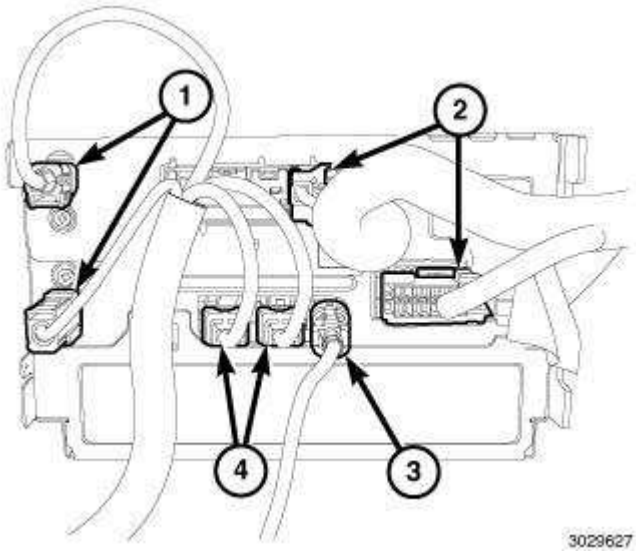

Fig. 270: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
3. Disconnect the negative battery cable (1).

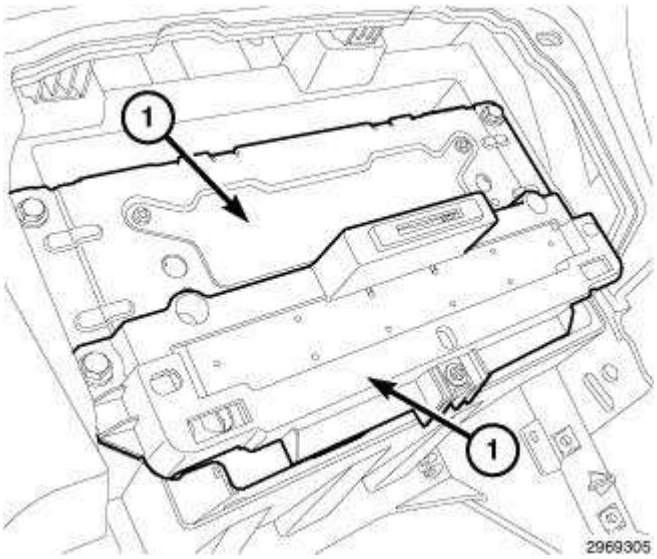

Fig. 271: Pulling Rear Seat Up
Courtesy of CHRYSLER GROUP, LLC

4. Push the rear lower seat cushion up and back and remove the seat cushion.

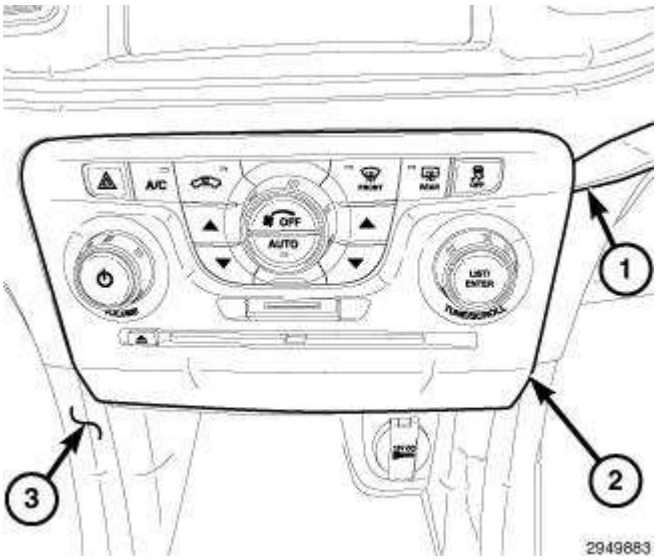

Fig. 272: Foam Pad Under Seat
Courtesy of CHRYSLER GROUP, LLC

5. Fold back the foam pad covering the fuel pump module plastic access covers.

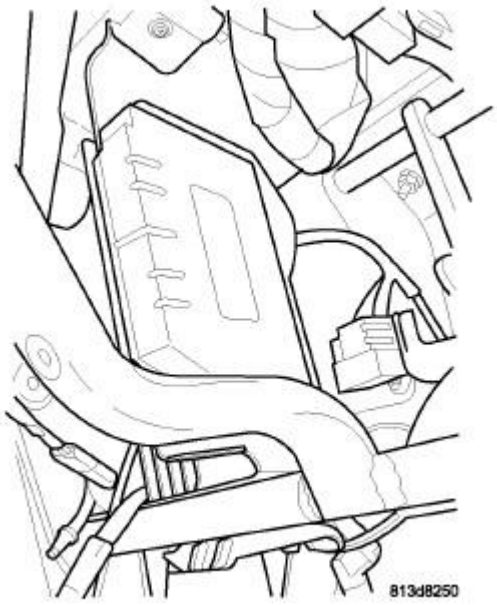

Fig. 273: Locating Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

6. Remove the left side fuel pump module plastic access cover.

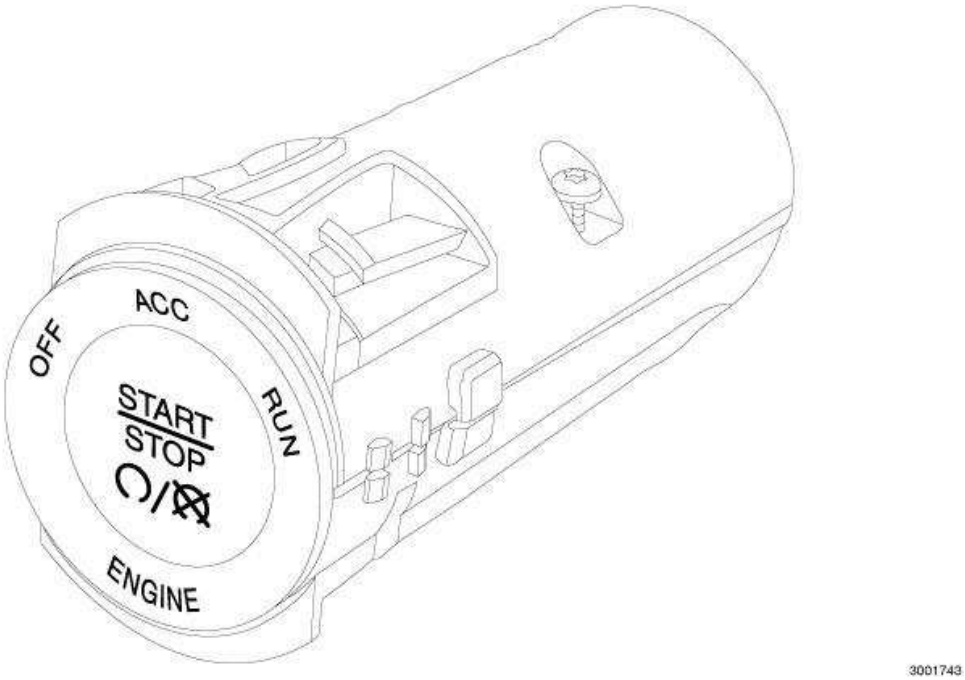

Fig. 274: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the electrical connector from the fuel pump module.

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

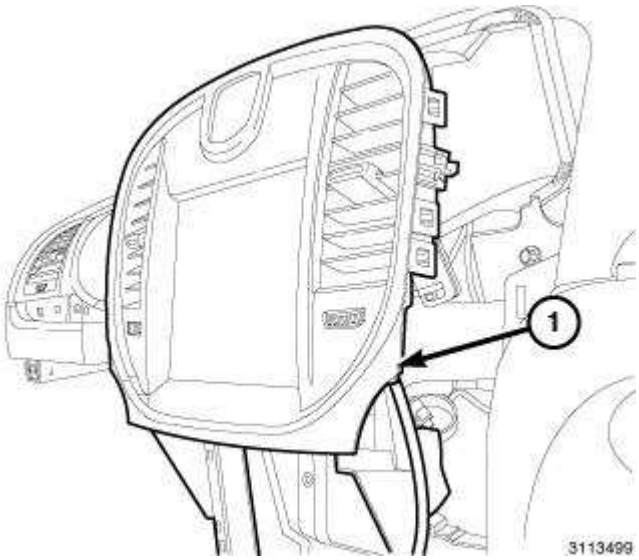

Fig. 275: Left Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

8. Mark the fuel pump module orientation.
9. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring.
10. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (1).
11. Rotate the breaker bar counterclockwise and remove the lock ring.

CAUTION: Do not spill fuel into the interior of the vehicle.

CAUTION: The lower reservoir of the fuel pump module must be drained before removal or fuel can spill into the interior of the vehicle.

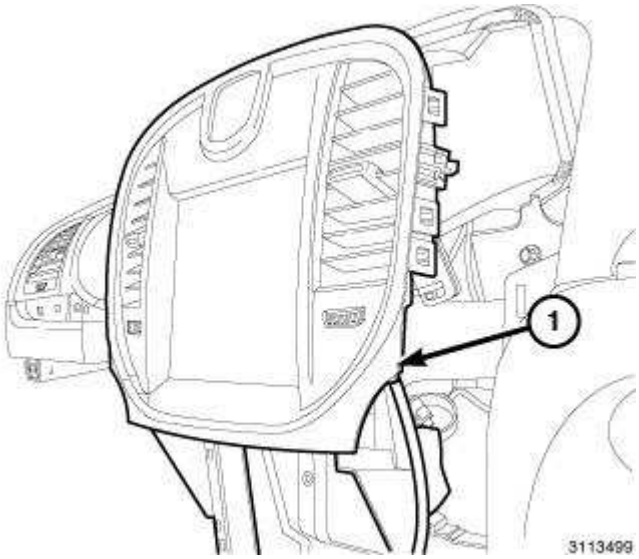

Fig. 276: Draining Left Side
Courtesy of CHRYSLER GROUP, LLC

12. Lift the fuel pump module up enough to push a 3/8 inch hose into the fuel tank.
13. Attach the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.
14. Using the gas caddy, evacuate the left side of the fuel tank.

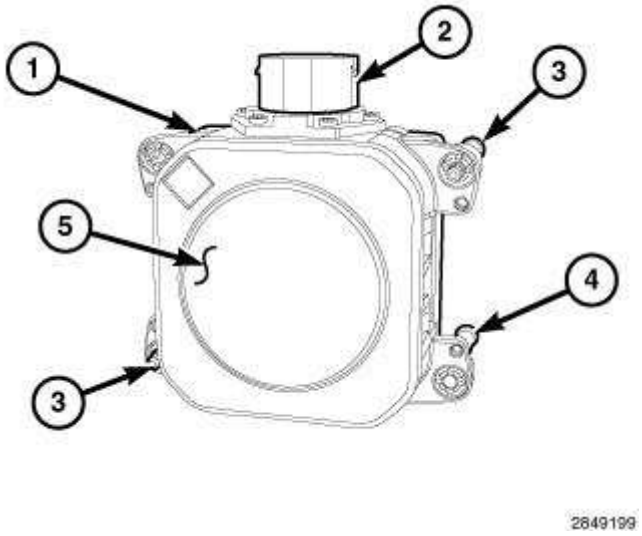

Fig. 277: Access Cover Right Side Module
Courtesy of CHRYSLER GROUP, LLC

15. Remove the right side auxiliary fuel pump module plastic access cover (1).

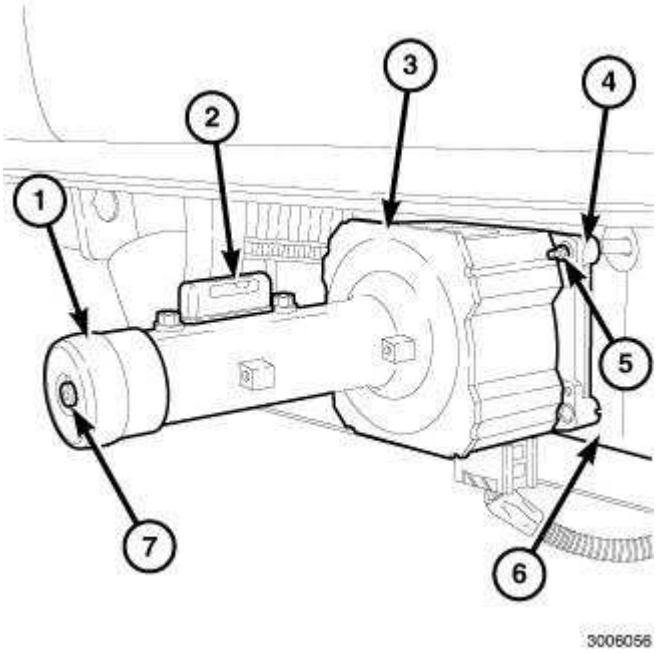

Fig. 278: Right Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the fuel supply line (2) at the auxiliary fuel pump module (1).

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

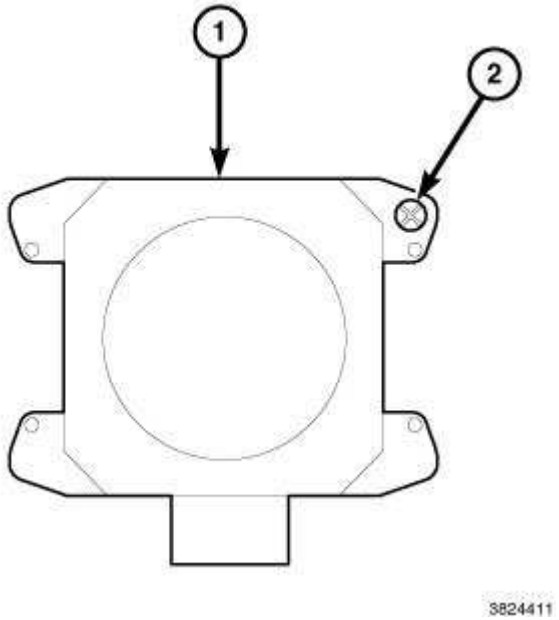

Fig. 279: Right Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the auxiliary fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

17. Mark the auxiliary fuel pump module orientation.
18. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
19. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
20. Rotate the breaker bar counterclockwise and remove the lock ring.

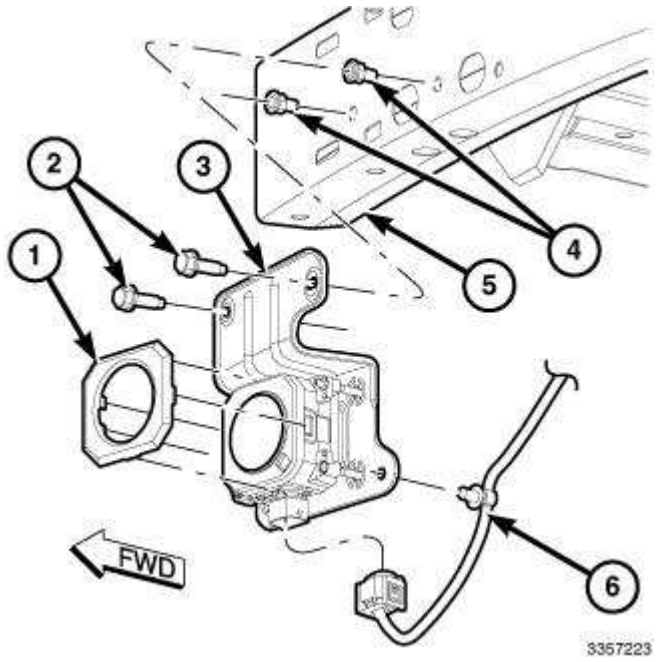

Fig. 280: Draining Right Side
Courtesy of CHRYSLER GROUP, LLC

21. Lift the auxiliary fuel pump module up enough to push a 3/8 inch hose (1) into the fuel tank.
22. Attach the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.
23. Using the gas caddy, evacuate the right side of the fuel tank.

FITTING, QUICK CONNECT

STANDARD PROCEDURE

QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. Some quick-connect fittings require the use of a special tool for disconnection and removal.

These are the quick-connect fittings:

- Redundant Latch Single Button Type Fitting
- Single Button Type Fitting
- Pinch Type Fitting
- Single Tab Type Fitting
- Two Tab Type Fitting
- Plastic Retainer Ring Type Fitting
- Latch Clip Type 1 Fitting
- Latch Clip Type 2 Fitting
- Wing Type Fitting

DISCONNECTING

WARNING: The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system

pressure must be released. Refer to FUEL SYSTEM PRESSURE RELEASE .

CAUTION: Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used. Refer to QUICK-CONNECT FITTINGS . This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

REDUNDANT LATCH SINGLE BUTTON TYPE FITTING:

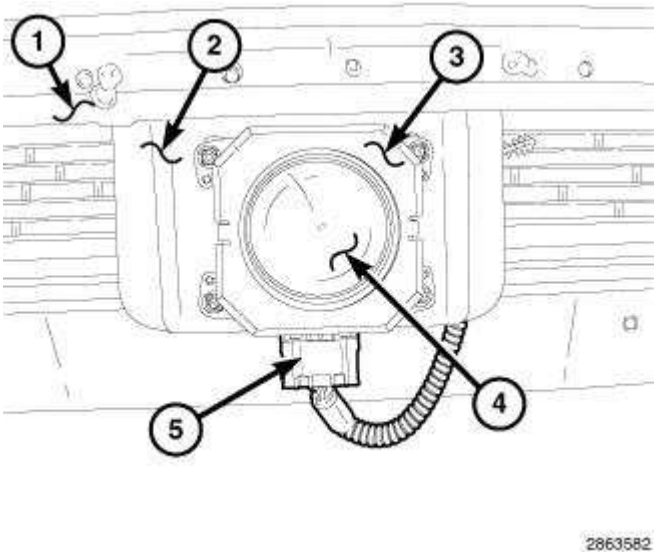

Fig. 281: Redundant Latch & Push Button
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting is equipped with a redundant latch (2) and a single push button (1) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

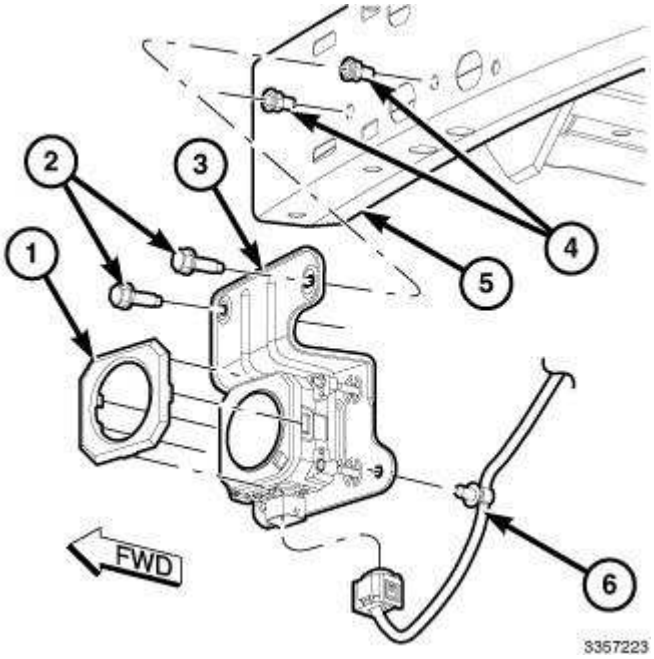

Fig. 282: Redundant Latch & Internal Latches
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

1. Pull the redundant latch (2) out away from the quick-connect fitting.
2. Press on the push button with your thumb, release the internal latches (1) and remove the quick-connect fitting from the fuel system component.

SINGLE BUTTON TYPE FITTING:

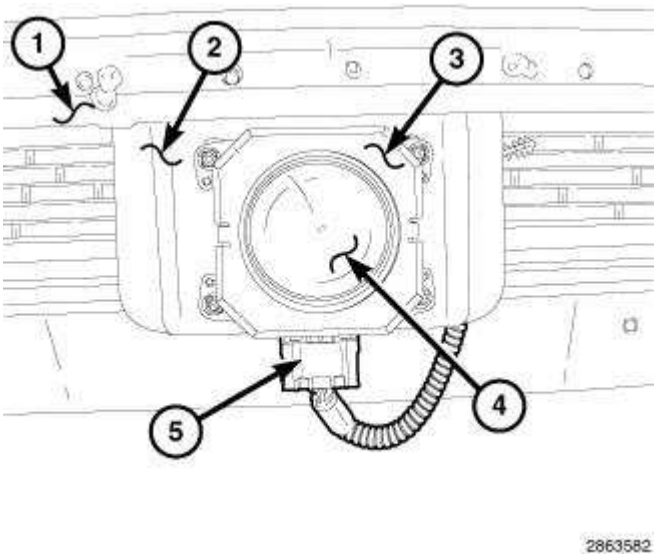

Fig. 283: Single Button Fitting

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

This type of quick-connect fitting is equipped with a single push button (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

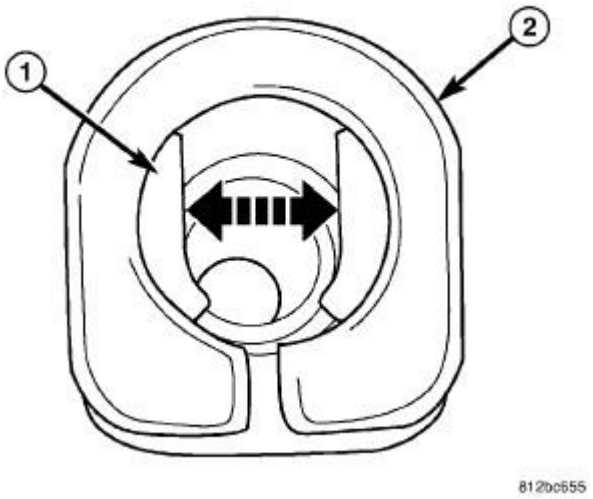

Fig. 284: Ouick-Connect Fitting Latches
Courtesy of CHRYSLER GROUP, LLC

1. Press on the push button with your thumb, release the internal latches (1).
2. Remove the quick-connect fitting from the fuel system component.

2 BUTTON TYPE FITTING

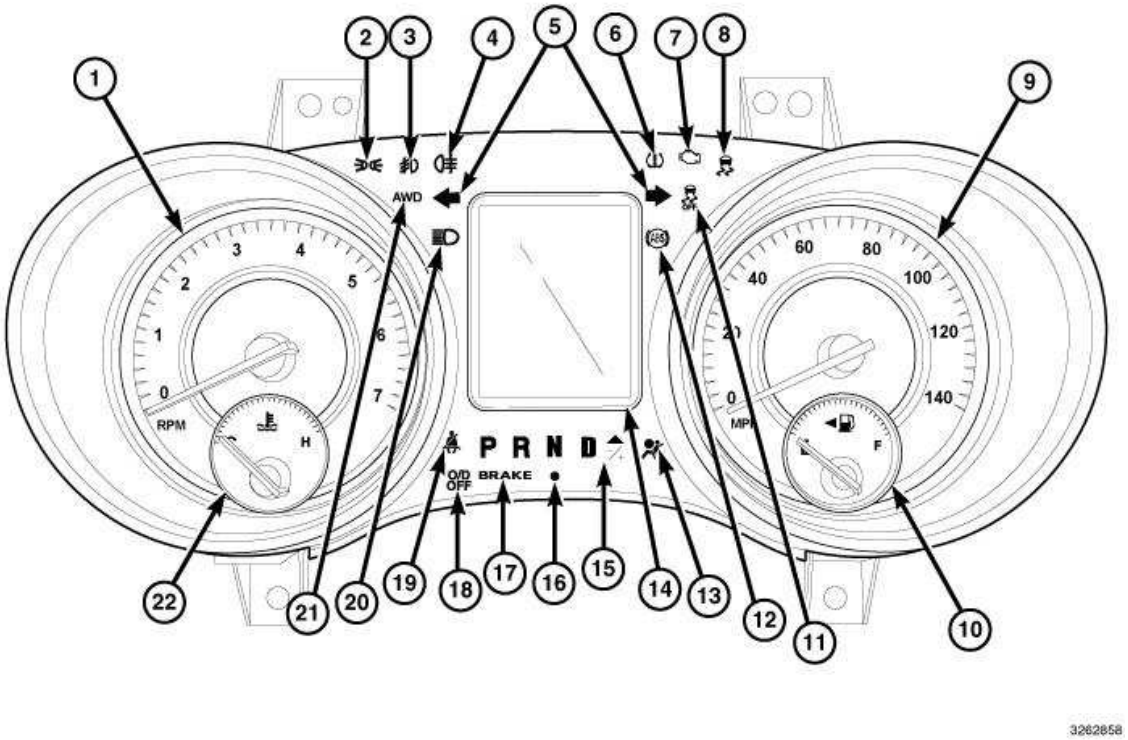

Fig. 285: View Of 2-Button Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two push buttons (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

1. Press on both push buttons with your thumb, release the internal latches.
2. While holding the two push buttons simultaneously, remove the quick-connect fitting from the fuel system component.

PINCH TYPE FITTING

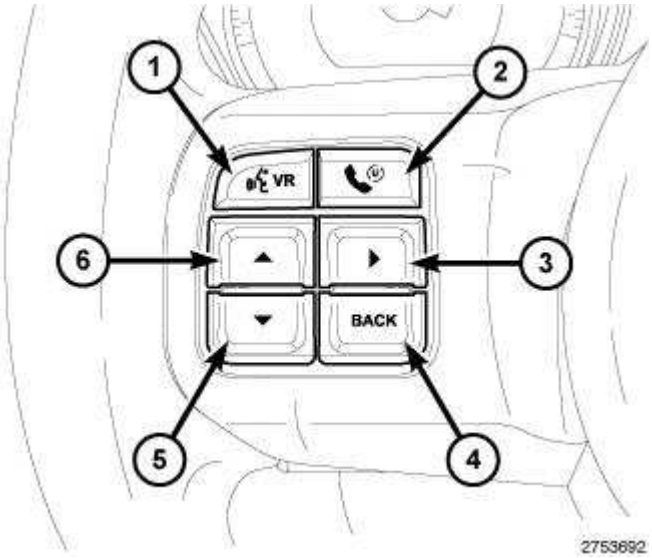

Fig. 286: View Of Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two finger tabs (2). Special tools are not required for removal.

1. Pinch both tabs (2) together and release the quick-connect fitting.
2. Remove the quick-connect fitting from the fuel system component.

SINGLE TAB TYPE FITTING

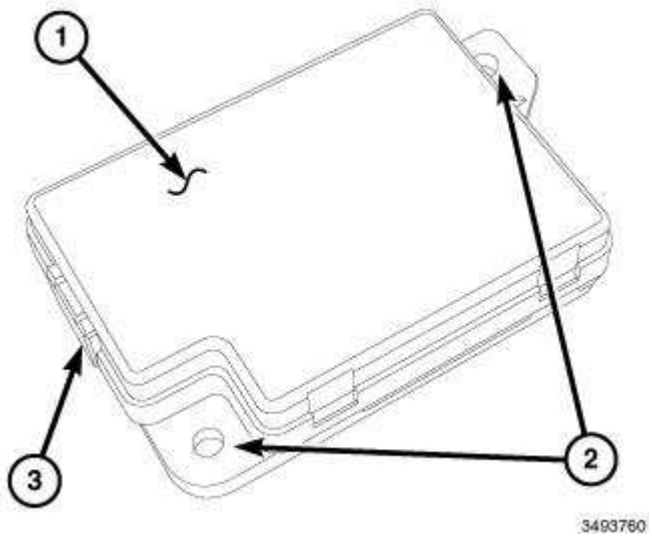

Fig. 287: View Of Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed the quick-connect fitting can be separated from the fuel system component. Special

tools are not required for removal.

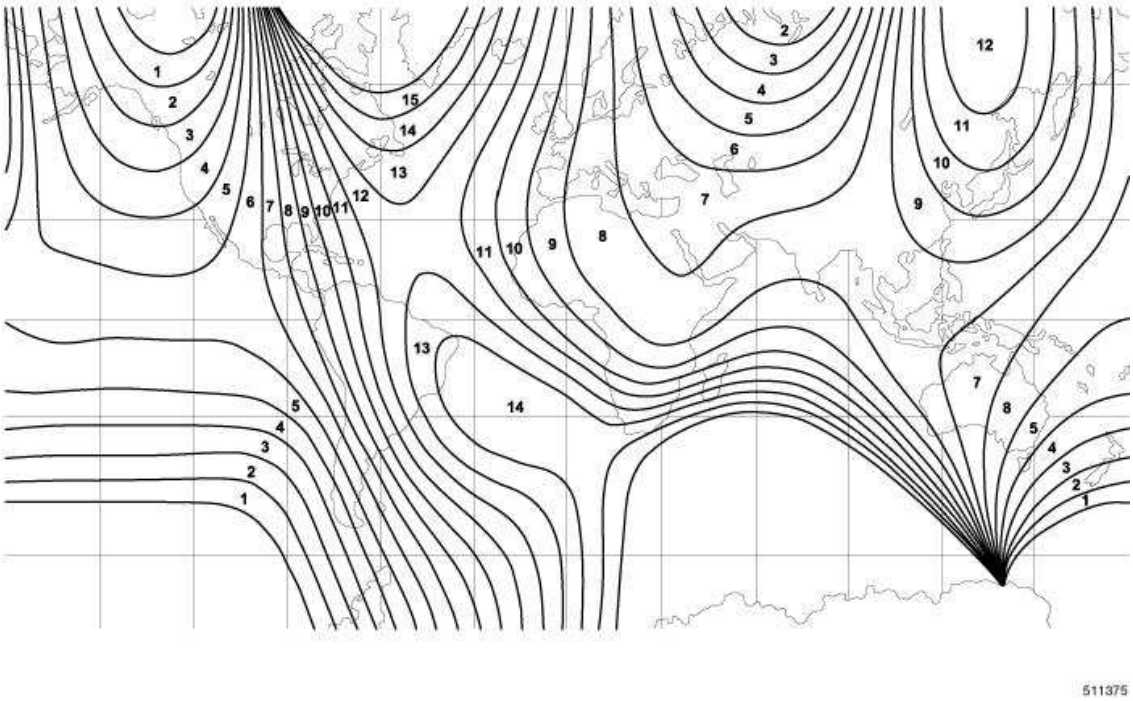

Fig. 288: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

1. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
2. While pressing the release tab on the side of the quick-connect fitting use a screwdriver (2) to pry up the pull tab.
3. Raise the pull tab until it separates from the quick-connect fitting.
4. Remove the quick-connect fitting from the fuel system component.

TWO TAB TYPE FITTING

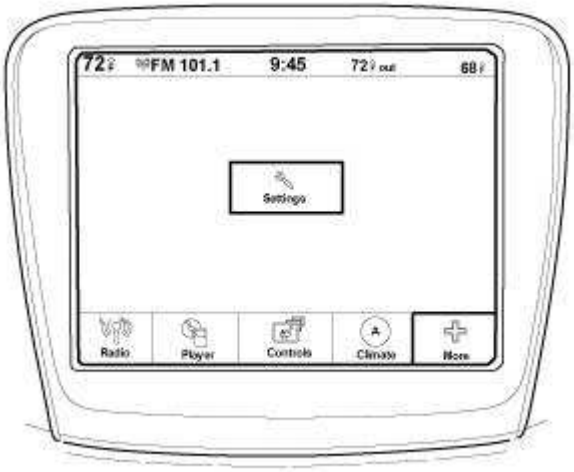

Fig. 289: Identifying Typical 2-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (2) is equipped with tabs located on both sides of the fitting (1). These tabs are integral to the fuel system component. The plastic tabs will remain on the component being serviced after the quick-connect fitting is removed. The O-ring and spacer will remain in the quick-connect fitting. Special tools are not required for removal.

1. Squeeze the plastic tabs (1) against the sides of component being serviced with your fingers.
2. Remove the quick-connect fitting from the fuel system component.

PLASTIC RETAINER RING TYPE FITTING

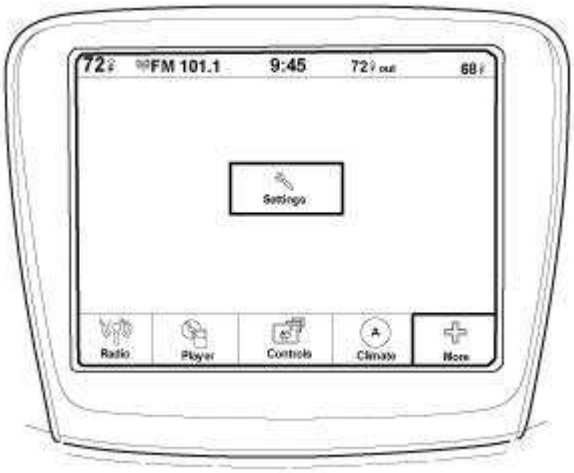

Fig. 290: Plastic Retainer Ring Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of fitting can be identified by the use of a round plastic retainer ring (4) usually black in color. Special tools are not required for removal.

NOTE: The round plastic retainer ring must be pressed squarely into the quick-connect fitting body. If this retainer is cocked during removal it will be difficult to disconnect the quick-connect fitting. Use an open-end wrench on the shoulder of the plastic retainer ring to aid in disconnection.

1. Firmly push the quick-connect fitting (5) towards the component being serviced while firmly pushing the round plastic retainer ring into the quick-connect fitting (6). With the round plastic ring depressed, remove the quick-connect fitting from the fuel system component.
2. After removal the plastic retainer ring will remain with the quick-connect fitting.

LATCH CLIP TYPE 1 FITTING

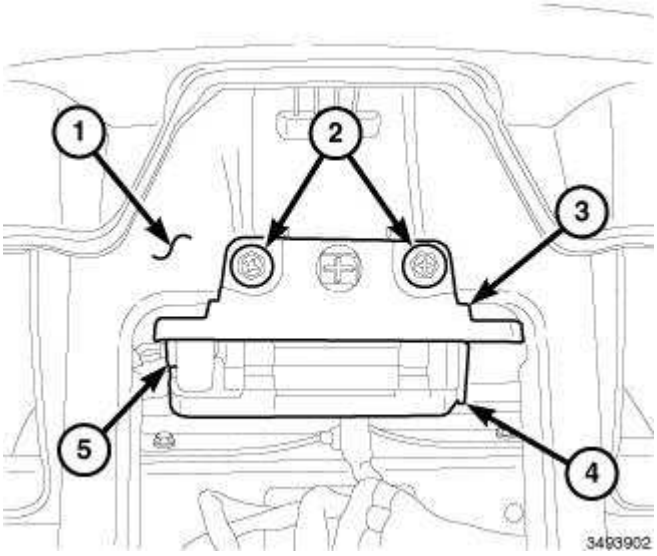

Fig. 291: Tethered, Latch Clip & Screwdriver
Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered (1) to fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Pry up on the latch clip (4) with a screwdriver (3).
2. Slide the latch clip away from the quick-connect fitting while lifting the screwdriver and position aside.

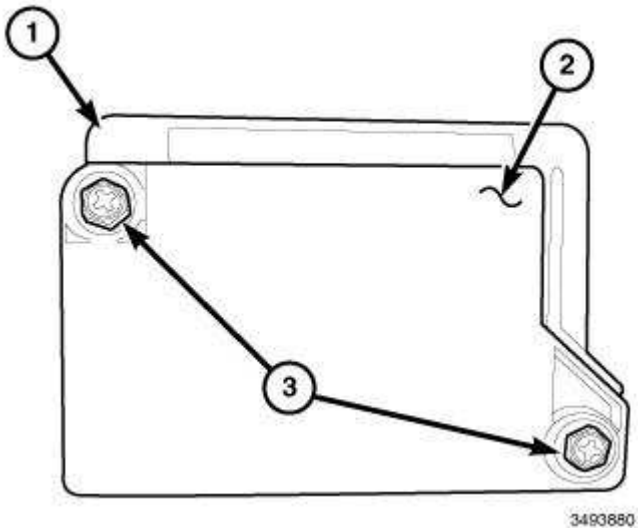

Fig. 292: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert an appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

4. With the special tool still inserted, remove the quick-connect fitting from the fuel system component.

LATCH CLIP TYPE 2 FITTING

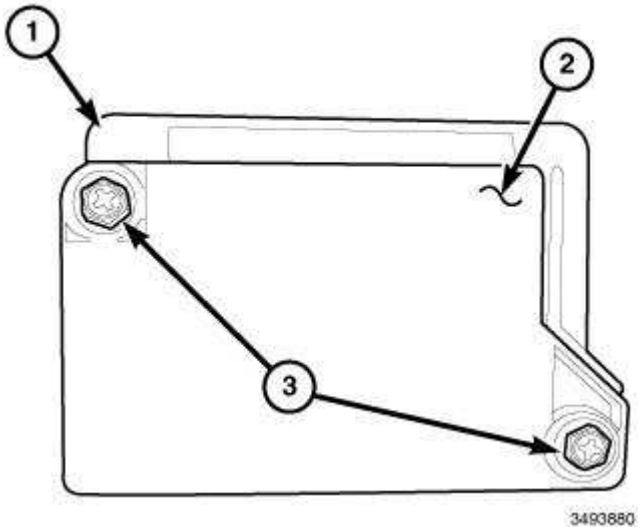

Fig. 293: Latch Clip
Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered to the fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after the latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Unlatch the small arms on the end of clip, swing away and separate from the fuel system component.
2. Slide the latch clip away from the quick-connect fitting while lifting with a screwdriver and position aside.

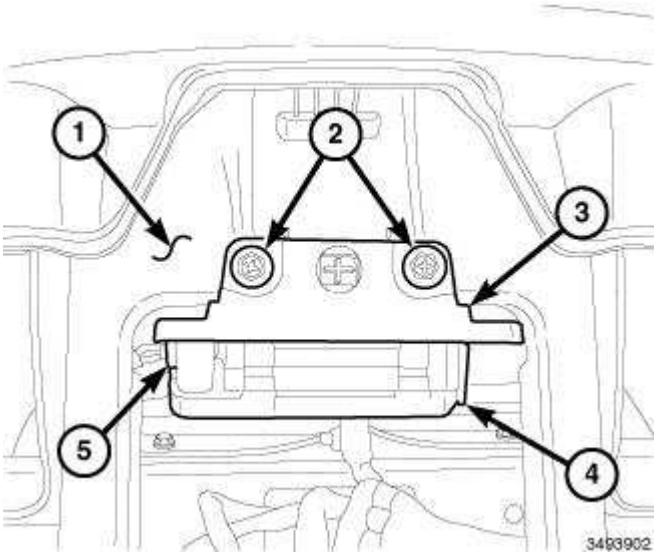

Fig. 294: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert an appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

4. With the special tool still inserted, remove the quick-connect fitting from the fuel system component.

WING TYPE FITTING

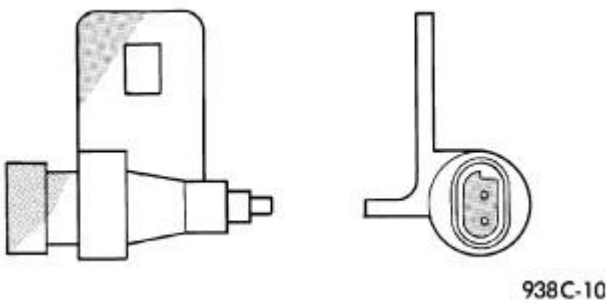

Fig. 295: EVAP Can. Vapor Hose
Courtesy of CHRYSLER GROUP, LLC

The wing type fitting is used on fuel system and emission components. The wing type fitting is most commonly used on the EVAP canister (3). Special tools are not required for removal.

1. Using two fingers, press both wings (2) and release the locking tabs.

   NOTE: After removal the locking tabs will remain with the quick-connect fitting.

2. While holding the wings, remove the quick-connect fitting from the fuel system component.

CONNECTING

1. Inspect the quick-connect fitting body and fuel system components for damage. Replace as necessary.
2. Prior to connecting any quick-connect fitting to components, check condition of fitting and components. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert the quick-connect fitting onto the fuel tube or fuel system component until the built-in stop on the fuel tube or component rests against the back of fitting.
4. Continue pushing until a click is felt.
5. If Equipped:
   - **Redundant Latch Single Button Type Fitting:** Push redundant latch until it locks into position in the quick-connect fitting.
   - **Single Tab Type Fitting:** Push new tab down until it locks into position in the quick-connect fitting.
   - **Latch Clip Type Fitting:** Install latch clip (snaps into position). **If latch clip will not snap into position, this indicates the quick-connect fitting is not properly installed onto fuel system component, recheck the connection.**
6. Verify a locked condition by firmly pulling on the quick-connect fitting connection of the fuel system component.

MODULE, FUEL PUMP

DESCRIPTION

DESCRIPTION

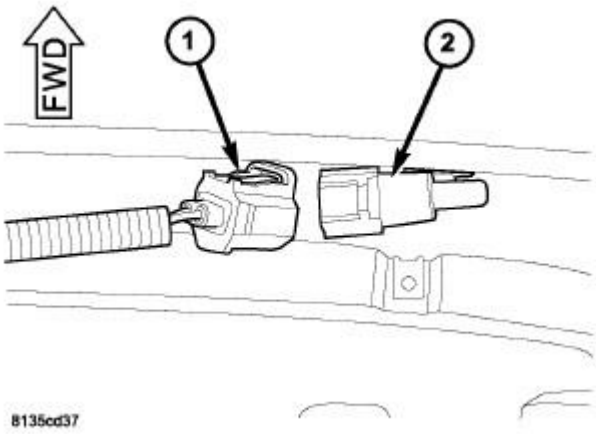

Fig. 296: Main Fuel Pump Module & Auxiliary Fuel Pump Module
Courtesy of CHRYSLER GROUP, LLC

This vehicle uses a saddle type tank that has a reservoir on both sides of the rear drive shaft. The main fuel pump module (2) is located on the left side of the vehicle and is a high flow fuel pump specifically designed for the 6.4L HEMI Engine. The auxiliary fuel pump module (1) is located the right side of the vehicle. The fuel outlet or fuel supply line is on the auxiliary fuel pump module (right side) and supplies fuel to the engine. The electrical connector is on the main fuel pump module (left side) and controls both modules. The fuel pressure regulator is integrated into the auxiliary fuel pump module and is not a serviceable component.

Both modules have fuel level sending cards. The fuel level sending cards are not serviceable components. There are 3 hoses that connect the main and auxiliary fuel pump modules together, one is the fuel supply line the other two are fuel return lines. These lines are removed from the main fuel pump module when servicing either unit. One fuel filter is used and is located at the bottom of the main fuel pump module and is designed for extended life. A separate frame mounted fuel filter is not used with any engine. The fuel filter is not a serviceable component.

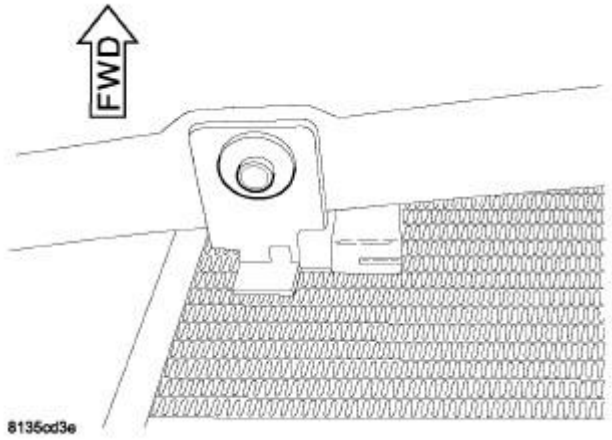

Fig. 297: Electrical Connector And Fuel Level Sending Card

Right side auxiliary fuel pump module with the fuel supply fitting (1), fuel return lines (2), fuel supply line (3), fuel pressure regulator (4) and fuel level sending card (5).

OPERATION

OPERATION

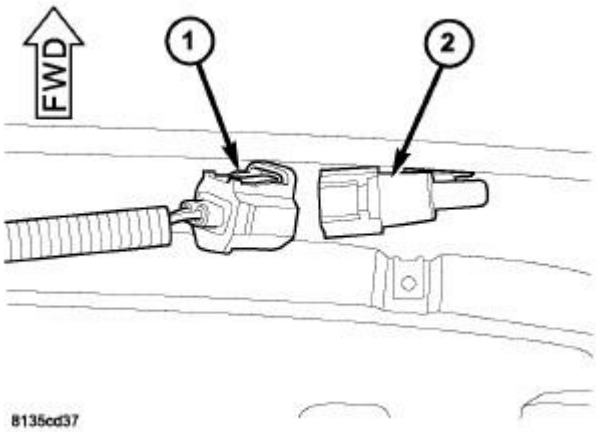

Fig. 299: Fuel System
Courtesy of CHRYSLER GROUP, LLC

The way the fuel pumps work is as follows, fuel enters the reservoir of the main fuel pump module

(driver side). The main fuel pump module (2) pumps the fuel through the filter to the auxiliary fuel pump module (1) (passenger side) through a supply line inside the fuel tank. The fuel pressure regulator inside the auxiliary fuel pump module regulates the pressure at 58 psi and sends fuel to the engine. All unused fuel that is not sent to the engine is fed through a venturi at the bottom of the auxiliary fuel pump module. This creates a low pressure siphoning effect and draws fuel from the passenger side of the tank and transfers it to the drivers side tank via siphon hose inside the tank. While the vehicle is running the fuel in the passenger side of tank is continuously transferred to the drivers side. Fuel will continue to fill the drivers side tank till it reaches the bridge section and then starts to spill over to the passenger side.

Both main and auxiliary fuel pumps have fuel level sender cards and the reading of these senders are averaged out to give us the fuel gauge reading. When diagnosing a fuel level sender concern, the passenger side reading should never be higher than the drivers side reading. However it is possible, depending on fuel level and driving habit before diagnosing, to spill fuel over to the passenger side that might indeed show a lower resistance value than the driver side.

The fuel gauge gives an indication to the vehicle operator the level of fuel in the fuel tank. This fuel gauge is controlled by the instrument cluster circuit board based upon cluster programming and a hard wired inputs received by the cluster from the fuel level sending units integrated into the fuel pump modules.

The instrument cluster continually monitors both fuel pump sender cards to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING** . The fuel gauge is serviced as a unit with the instrument cluster.

The technician needs to order the correct part when replacing the main fuel pump module, auxiliary fuel pump module and/or fuel tank as all are replaced individually.

REMOVAL

REMOVAL

MAIN FUEL PUMP MODULE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from

contact with fuel.

CAUTION: If the electric fuel pump module is not operating or the fuel level sending unit is not operating and the fuel level cannot be determined, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle

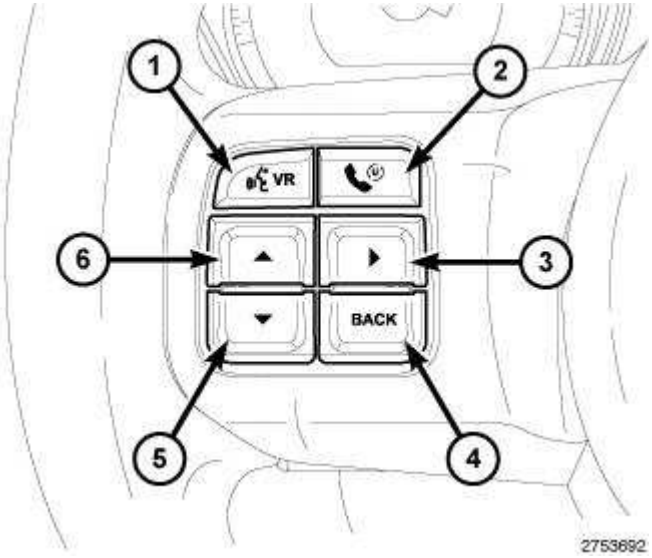

Fig. 300: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
3. If required, perform the draining fuel tank procedure. Refer to **DRAINING FUEL TANK** .
4. Disconnect the negative battery cable.

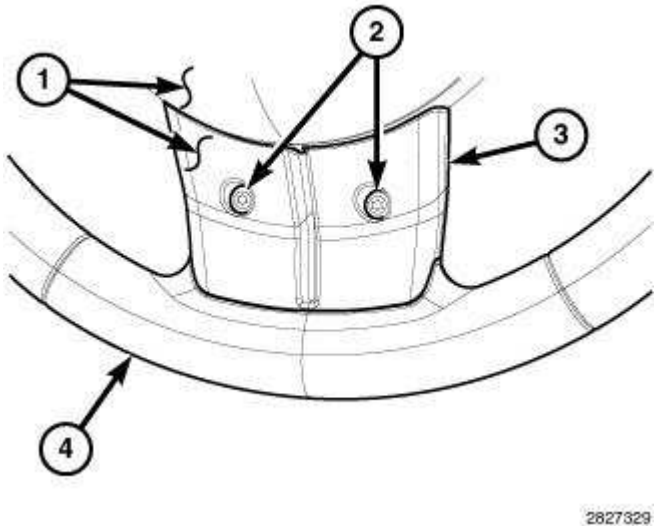

Fig. 301: Pulling Rear Seat Up
Courtesy of CHRYSLER GROUP, LLC

5. Push the rear lower seat cushion up and back and remove the seat cushion.

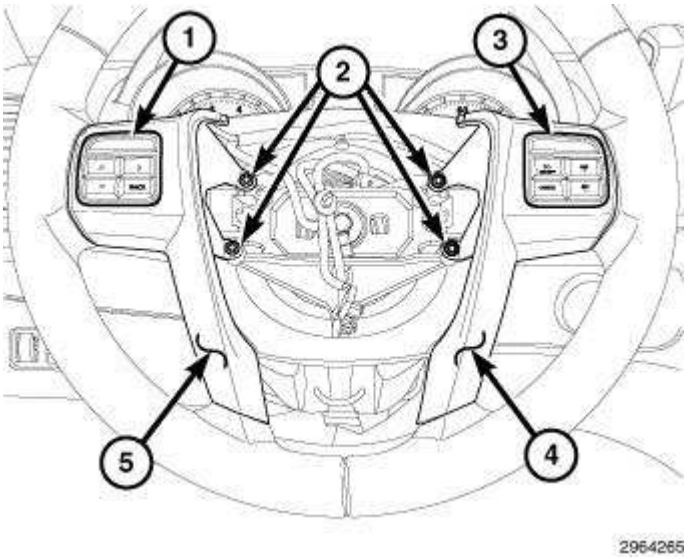

Fig. 302: Foam Pad Under Seat
Courtesy of CHRYSLER GROUP, LLC

6. Fold back the foam pad covering the fuel pump module plastic access covers.

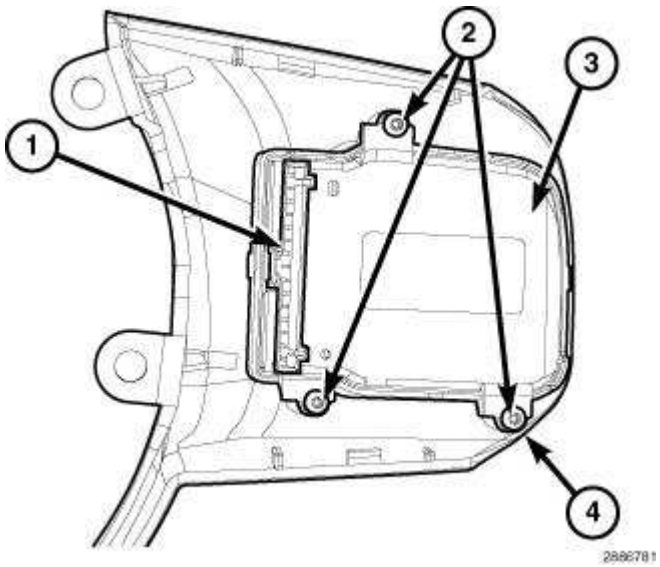

Fig. 303: Locating Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

7. Remove the left side main fuel pump module plastic access cover.

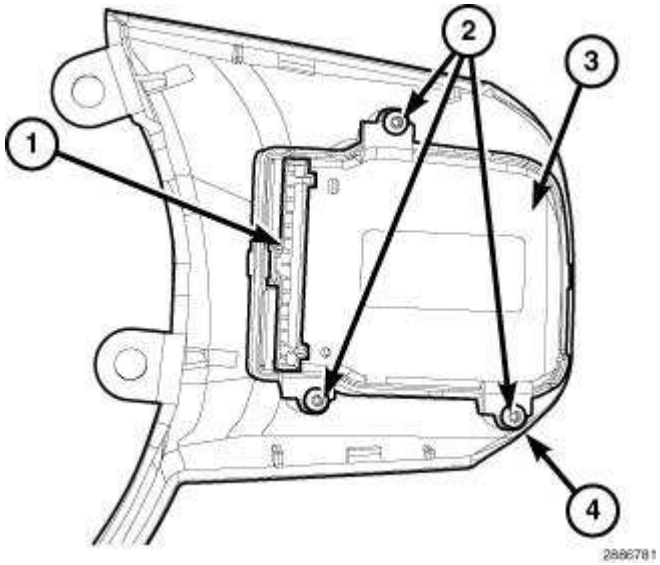

Fig. 304: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the electrical connector from the main fuel pump module.

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

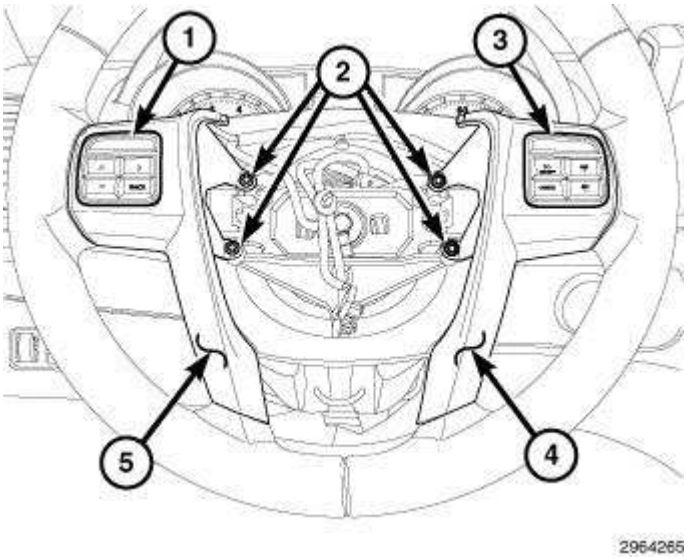

Fig. 305: Left Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

9. Mark the main fuel pump module orientation.
10. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring.
11. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).

NOTE: The main fuel pump module will spring up slightly when the lock ring is removed.

12. Rotate the breaker bar counterclockwise and remove the lock ring.

CAUTION: Do not allow the float arm of the Main Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

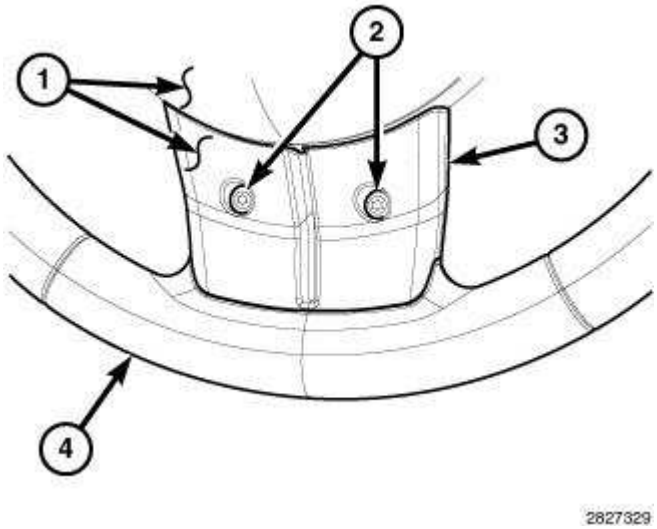

Fig. 306: Module Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

13. Raise and separate the top section from the bottom section of the main fuel pump module.
14. Disconnect the electrical connectors from under the top section of the main fuel pump module.
15. Remove the top section of the main fuel pump module from the vehicle.

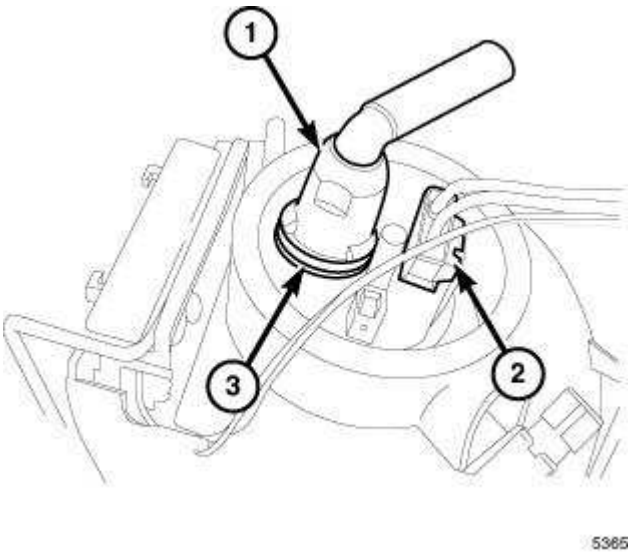

Fig. 307: Line Release
Courtesy of CHRYSLER GROUP, LLC

16. Press the quick connect release tab (3) and remove the fuel supply line (1) from the main fuel pump module.

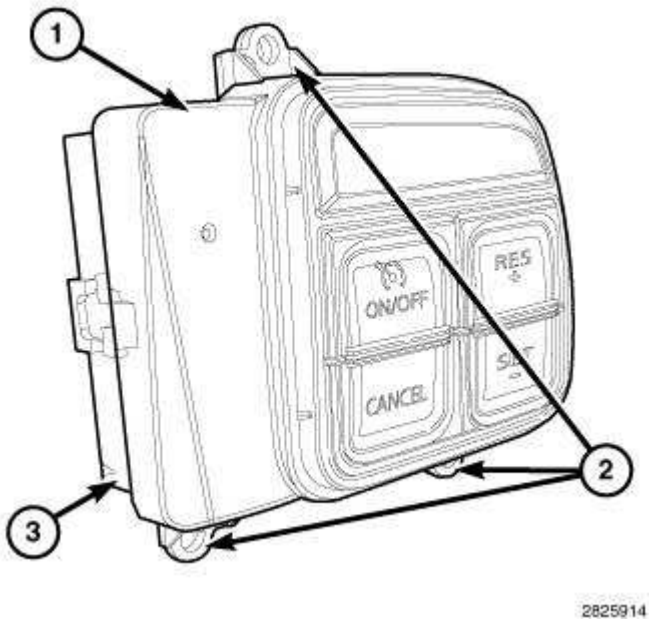

Fig. 308: Hose Connections Drivers Side
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the fuel return lines (1, 2) from the main fuel pump module.

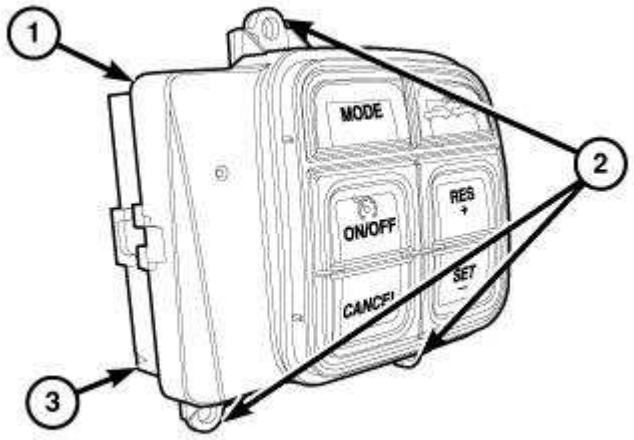
    NOTE: Do not spill fuel into the interior of the vehicle.

18. Carefully lift the bottom section of the main fuel pump module out of the fuel tank, tip the bottom section on its side and drain the remaining fuel from the bottom reservoir into the fuel tank and remove from vehicle.

    NOTE: Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.

19. Remove and discard the rubber O-ring seal.

AUXILIARY FUEL PUMP MODULE

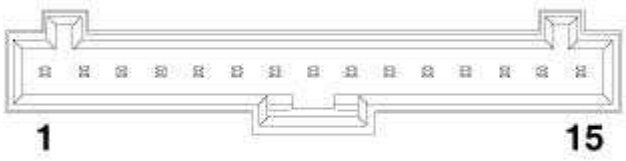


2826408

Fig. 309: Access Cover Right Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Main Fuel Pump Module must be removed for Auxiliary Fuel Pump Module removal.

1. Remove the main fuel pump module. Refer to **MAIN FUEL PUMP MODULE**.
2. Remove the auxiliary fuel pump module plastic access cover (1) from the floor pan.



2827003

Fig. 310: Right Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

3. Disconnect the fuel supply line (2) from the auxiliary fuel pump module (1).
4. Mark the auxiliary fuel pump module orientation.

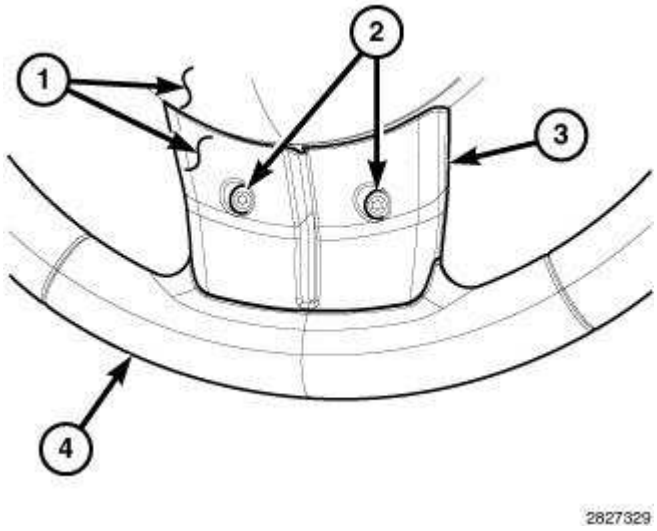


Fig. 311: Right Side Module
Courtesy of CHRYSLER GROUP, LLC

5. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
6. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
7. Rotate the breaker bar counterclockwise and remove the lock ring (2).

CAUTION: Do not allow the float arm of the Auxiliary Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

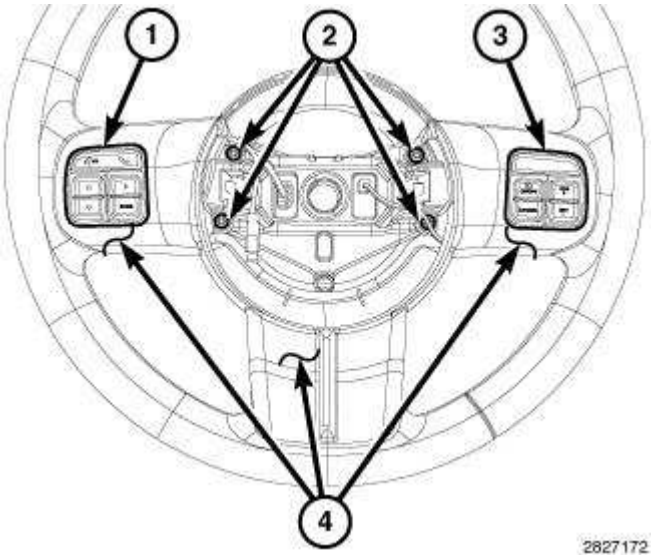

Fig. 312: Remove/Install Right Side Module
Courtesy of CHRYSLER GROUP, LLC

8. Lift the auxiliary fuel pump module up and out of fuel tank while guiding the fuel supply and return lines out from the left side of the fuel tank.

NOTE: Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.

9. Remove and discard the rubber O-ring seal.

INSTALLATION

INSTALLATION

MAIN FUEL PUMP MODULE

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: Do not allow the float arm of the Main Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

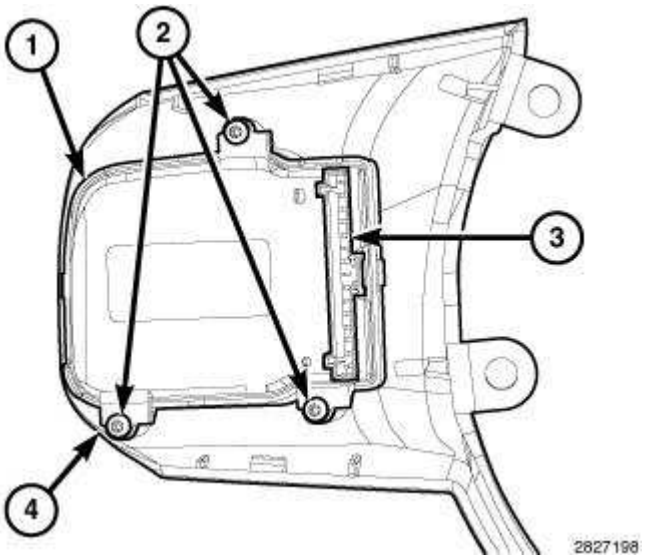

Fig. 313: Hose Connections Drivers Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Auxiliary Fuel Pump Module must be installed before the Main Fuel Pump Module.

1. If the auxiliary fuel pump module is removed. Refer to **AUXILIARY FUEL PUMP MODULE**.

   NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

2. Install a new rubber O-ring seal.
3. Using caution not to bend the float arm, lower the bottom section of the main fuel pump module into the fuel tank.
4. Connect the fuel return lines (1, 2) to the main fuel pump module.

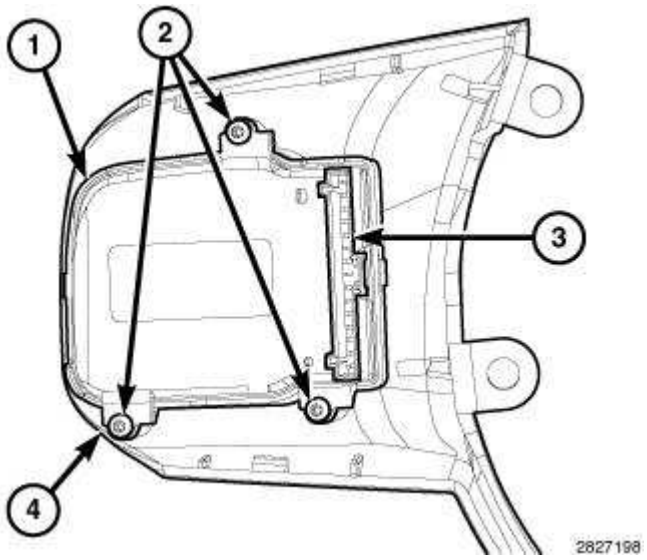

Fig. 314: Line Release
Courtesy of CHRYSLER GROUP, LLC

5. Connect the fuel supply line (1) to the main fuel pump module.

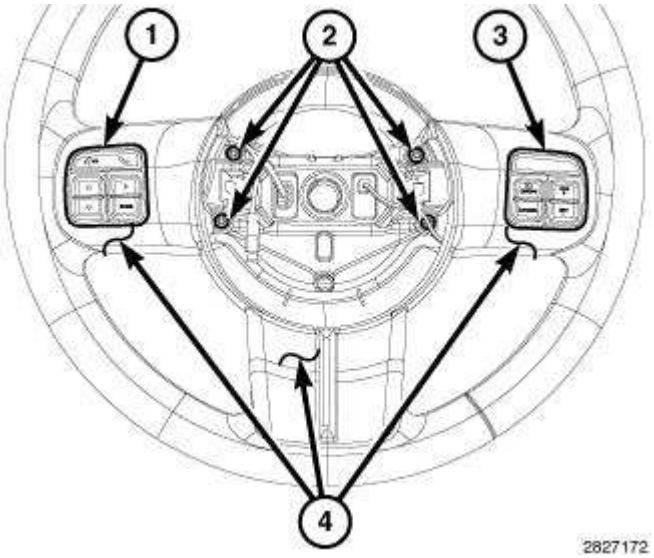

Fig. 315: Module Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Connect the electrical connectors at the top section of the main fuel pump module.
7. Join the upper section and lower section of the main fuel pump module together.
8. Position the main fuel pump module as noted during removal.

CAUTION: Verify the electrical wires are tucked away into the fuel tank so they don't get pinched between the top of the fuel pump module and the rubber O-ring seal.

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.

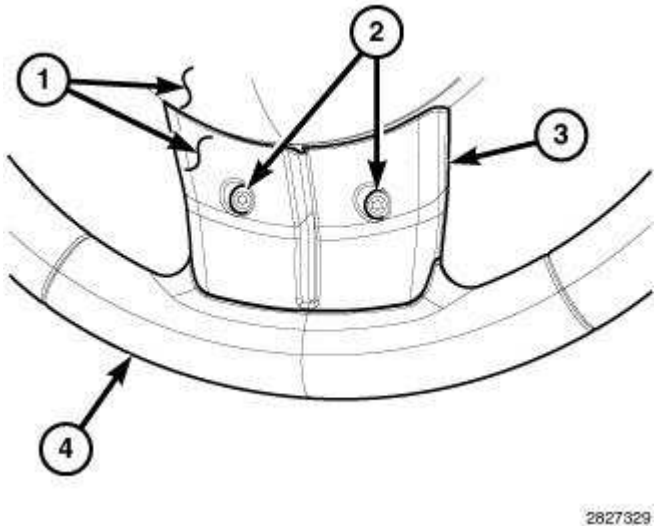

Fig. 316: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

9. Align the rubber O-ring seal and lower the main fuel pump module into position.
10. Verify the main fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

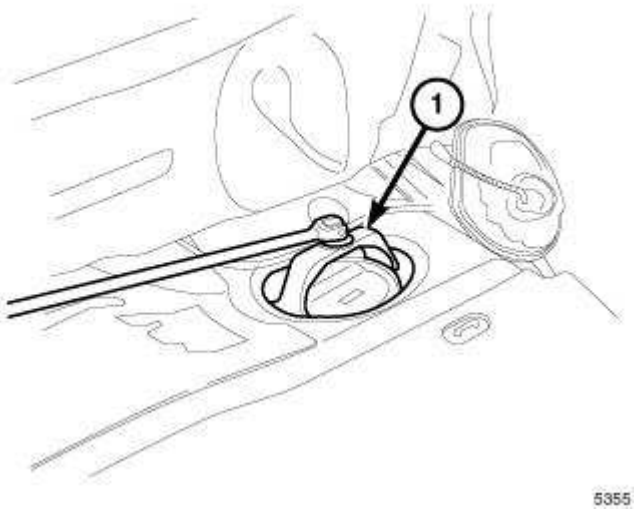

Fig. 317: Left Side Module
Courtesy of CHRYSLER GROUP, LLC

11. Position the lock ring over top of the main fuel pump module.

12. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring.
13. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
14. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

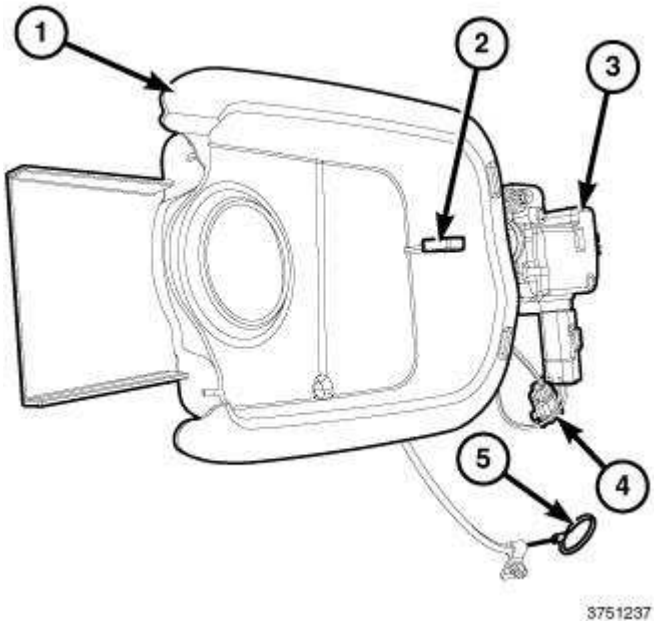

Fig. 318: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

15. Connect the electrical connector (1) to the main fuel pump module.
16. Fill the fuel tank and check for leaks around the rubber O-ring seal.

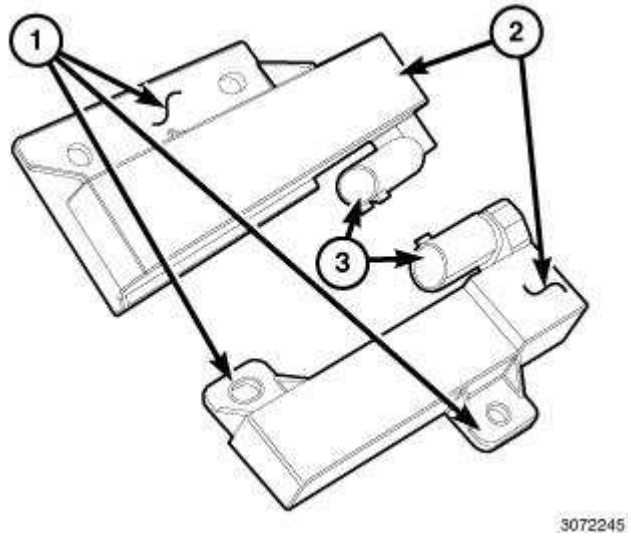

Fig. 319: Locating Plastic Access Cover

Courtesy of CHRYSLER GROUP, LLC

17. Install the main fuel pump module plastic access cover.

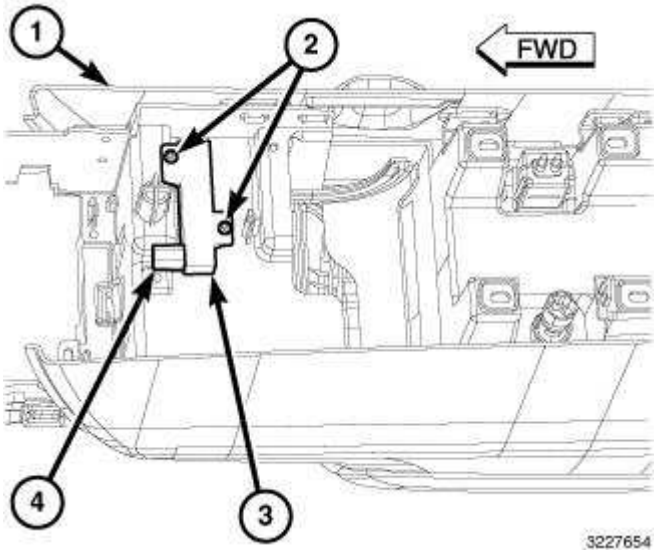

Fig. 320: Foam Pad Under Seat
Courtesy of CHRYSLER GROUP, LLC

18. Lower the foam pad covering back into place.

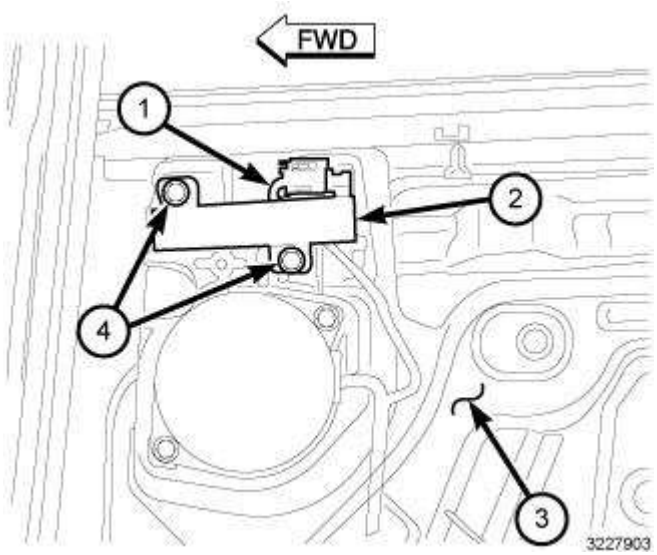

Fig. 321: Pulling Rear Seat Up
Courtesy of CHRYSLER GROUP, LLC

19. Push the rear lower seat cushion back and down and install the seat cushion.

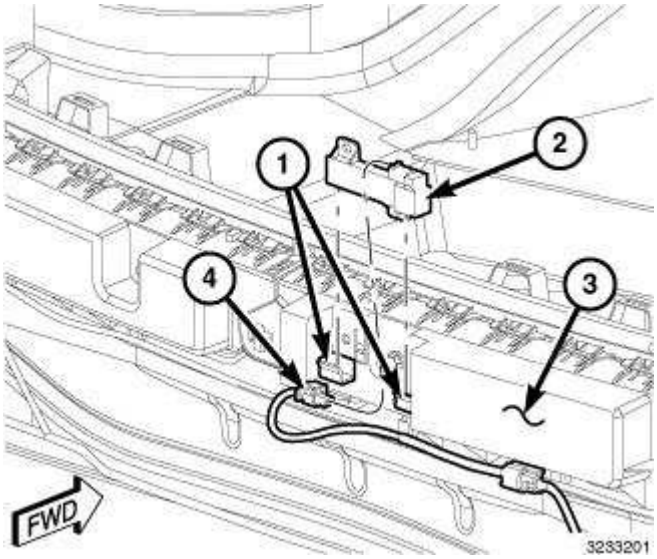

Fig. 322: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

20. Connect the negative battery cable.

AUXILIARY FUEL PUMP MODULE

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.

CAUTION: Do not allow the float arm of the Auxiliary Fuel Pump Module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

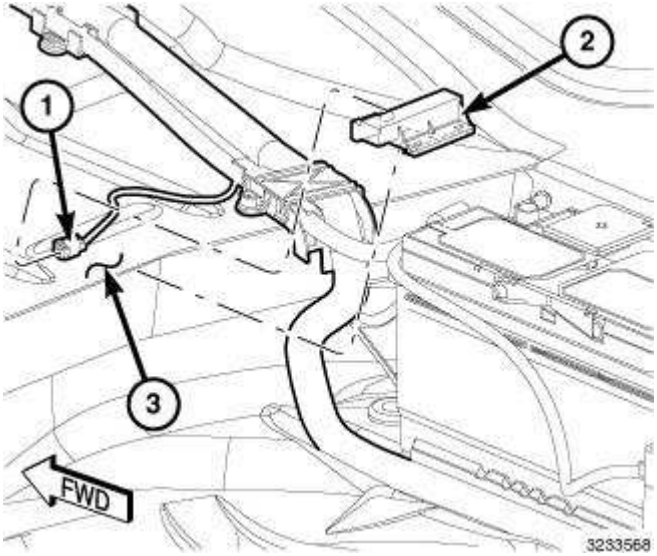

Fig. 323: Remove/Install Right Side Module

Courtesy of CHRYSLER GROUP, LLC

NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

1. Install a new rubber O-ring seal.
2. Using caution not to bend the float arm, lower the auxiliary fuel pump module into the fuel tank while guiding the fuel return lines, fuel supply line and electrical connector over to the left side of the fuel tank.
3. Align the rubber O-ring seal and lower the auxiliary fuel pump module into position as noted during removal.
4. Position the lock ring over top of the auxiliary fuel pump module.
5. Verify the auxiliary fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

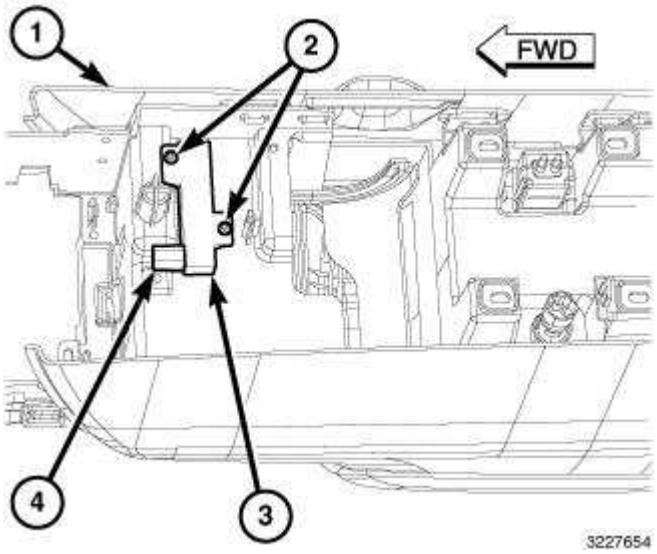

Fig. 324: Right Side Module
Courtesy of CHRYSLER GROUP, LLC

6. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
7. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
8. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

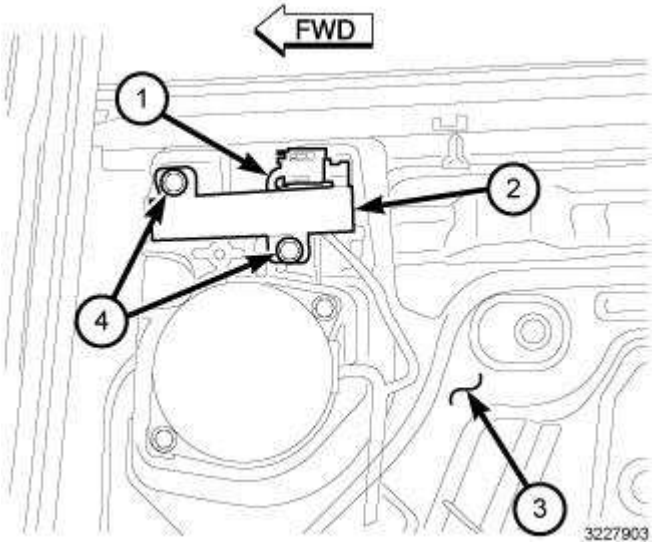

Fig. 325: Right Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

9. Connect the fuel supply line (2) to auxiliary fuel pump module (1).

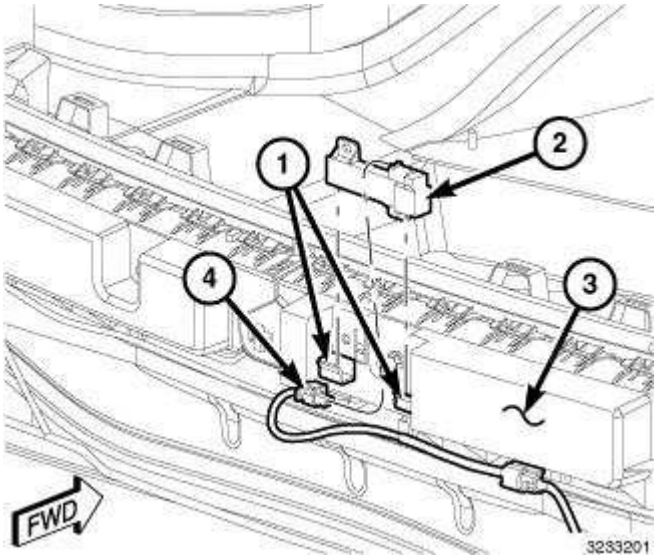

Fig. 326: Access Cover Right Side Module
Courtesy of CHRYSLER GROUP, LLC

10. Install the auxiliary fuel pump module plastic access cover (1).
11. Install the main fuel pump module, see. Refer to **MAIN FUEL PUMP MODULE**.

RAIL, FUEL

REMOVAL

3.6L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

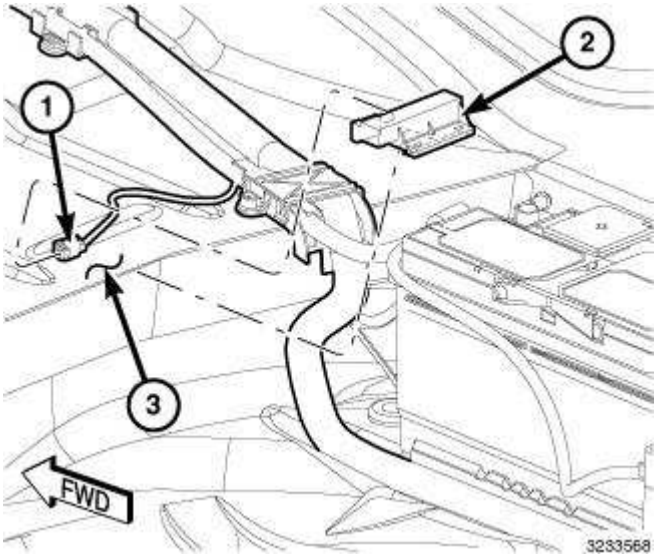

Fig. 327: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable (1).

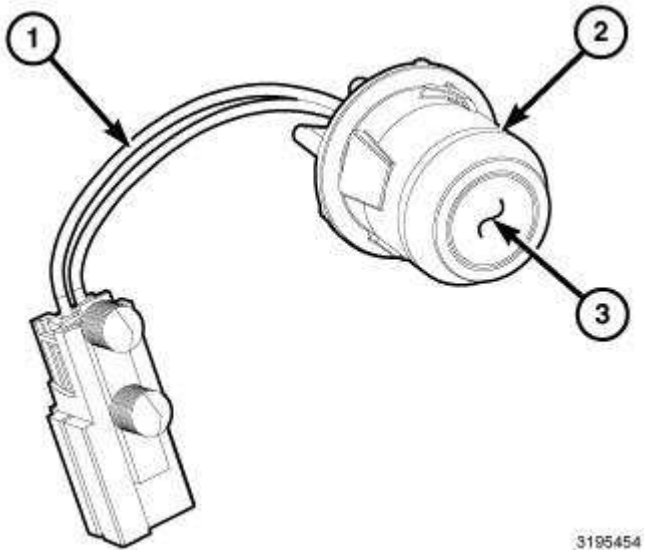

Fig. 328: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

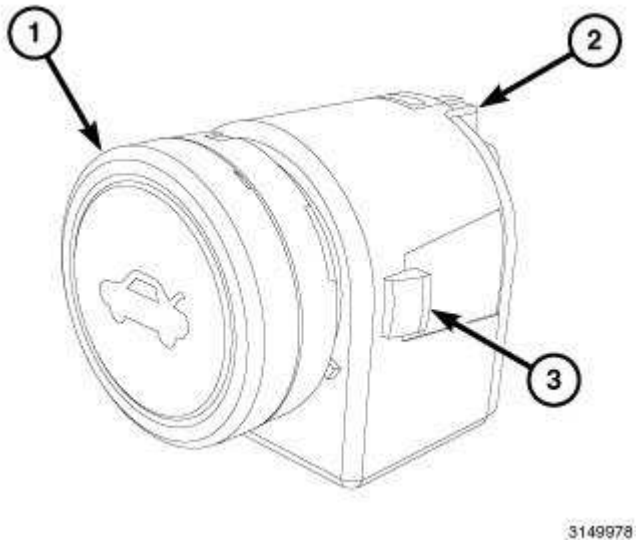

Fig. 329: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).

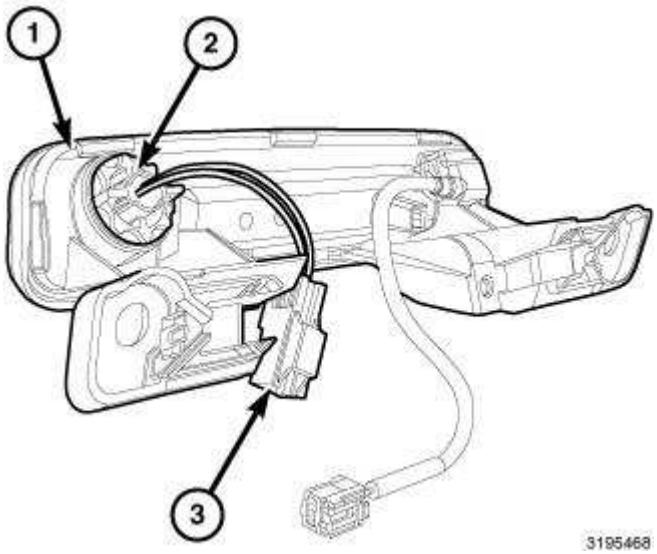

Fig. 330: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD,**

INTAKE, REMOVAL .

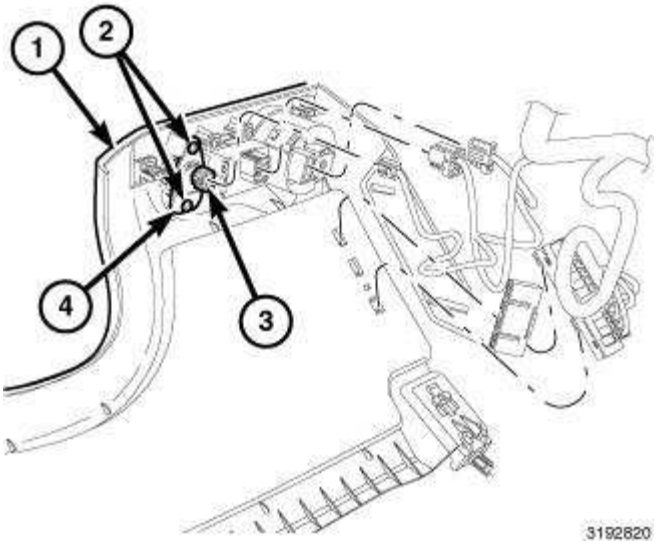

Fig. 331: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the insulator (2) from the left cylinder head cover.

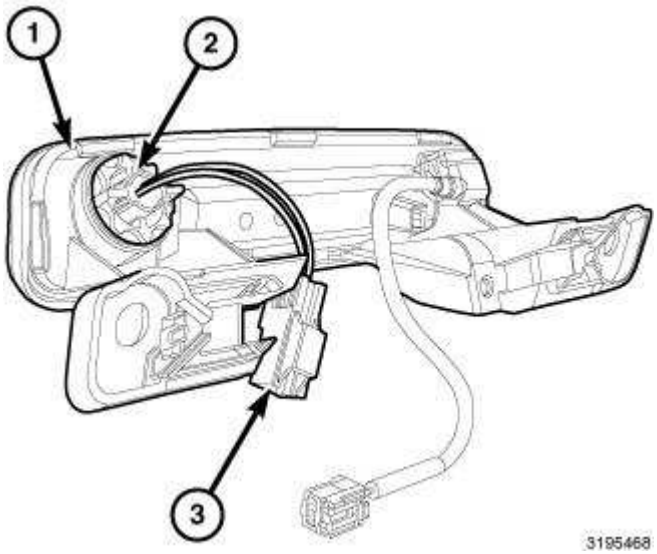

Fig. 332: Fuel Supply Hose & Fuel Injector Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the fuel injector electrical connectors (2).
12. Disconnect the fuel supply hose (1) from the fuel rail. Refer to **FITTING, QUICK CONNECT** .

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connector tube. Due to the design of this tube, it does not use any clamps. Never attempt to

install a clamping device of any kind on the tube. When removing the fuel rail assembly for any reason, be careful not to bend or kink the tube.

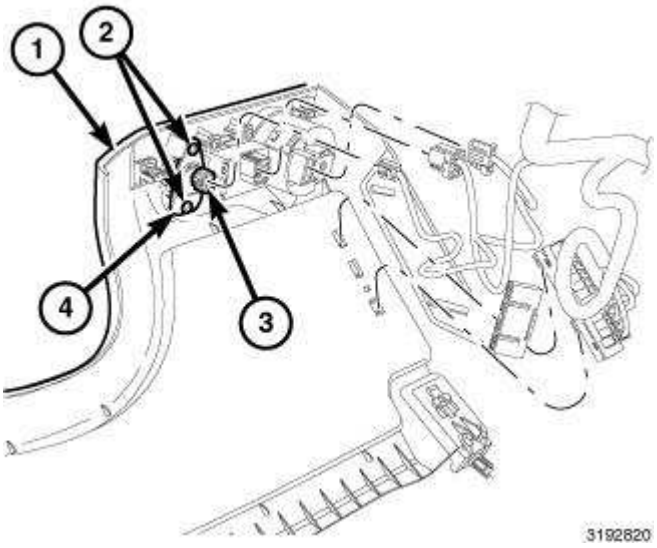

Fig. 333: Fuel Rail & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the fuel rail (2) four retaining bolts (1).
14. Lift the fuel rail and the fuel injectors from the lower intake manifold.

CAUTION: When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.

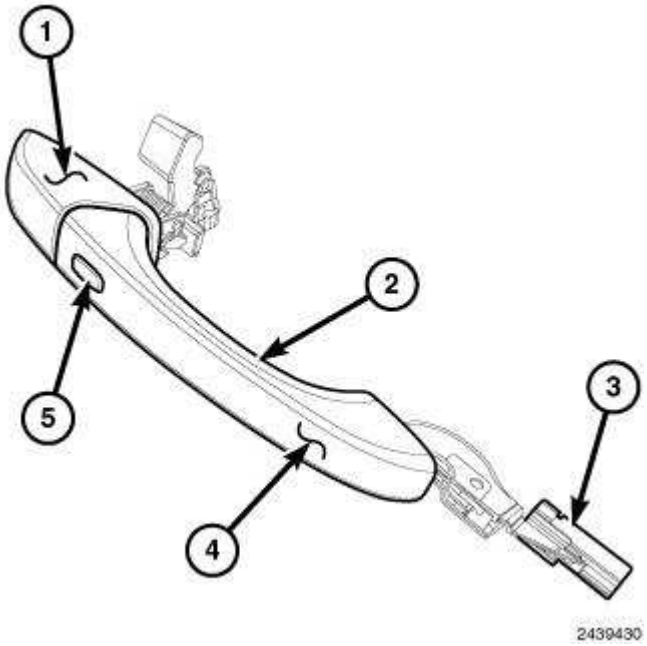

Fig. 334: Fuel Injectors
Courtesy of CHRYSLER GROUP, LLC

15. If required, remove any remaining fuel injectors (1) from the lower intake manifold.

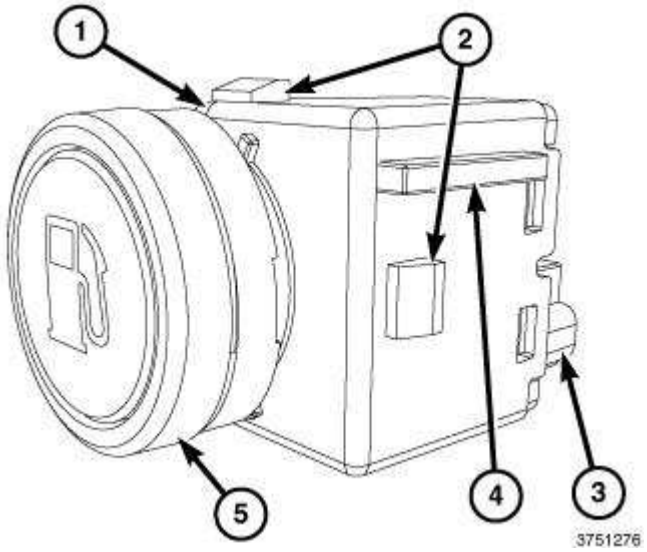

Fig. 335: Fuel Injectors & The Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 2 fuel injector removal shown in illustration, all other fuel injectors similar.

16. If required, remove any remaining fuel injectors (1) from the fuel rail (2).

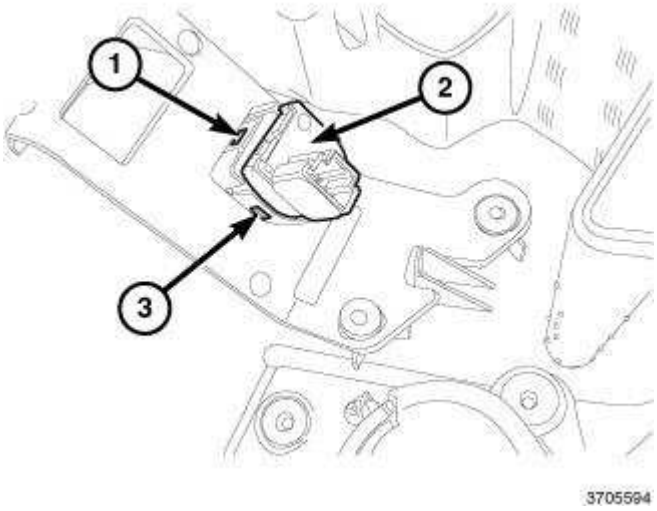

Fig. 336: O-ring Seals
Courtesy of CHRYSLER GROUP, LLC

17. Remove and discard all fuel injector O-ring seals (1).

5.7L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.

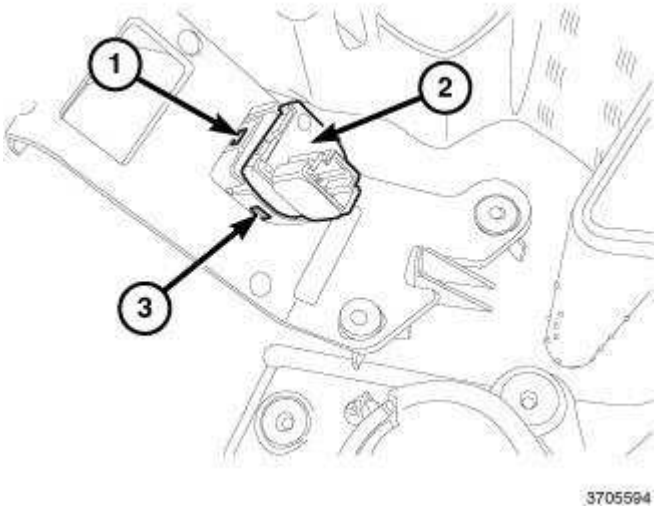

Fig. 337: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the negative battery cable.
3. Remove fuel tank filler cap.

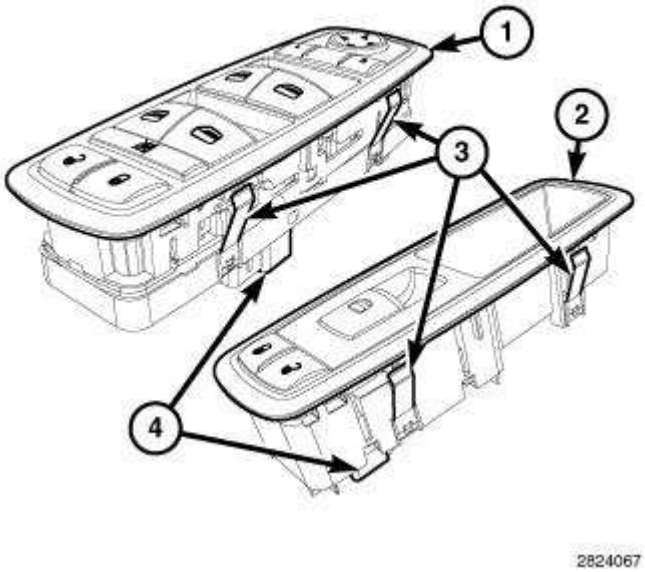

Fig. 338: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

4. Remove the engine cover (2).

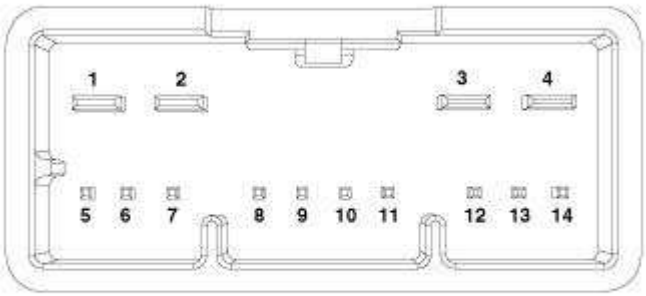

Fig. 339: Intake Air Temperature (IAT) Sensor, Air Cleaner Housing, Resonator Retaining Bolt & Hose Clamp
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the electrical connector at the Intake Air Temperature (IAT) sensor (1).
6. Loosen the hose clamp at the air cleaner housing (2).
7. Remove the resonator retaining bolt (3).
8. Loosen the hose clamp at the throttle body (4) and remove the resonator.
9. Disconnect electrical connectors at all 8 fuel injectors. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove the connector (3) from the injector.
10. Disconnect throttle body electrical connectors.

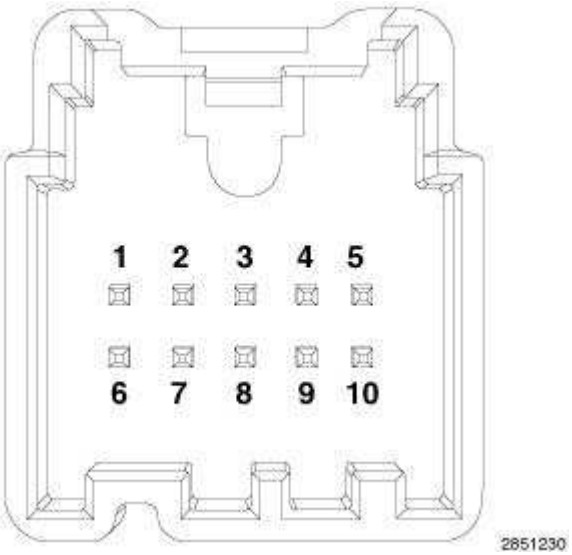

Fig. 340: Fuel Rail Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the fuel supply line at the fuel rail. Refer to **QUICK-CONNECT FITTINGS** .
12. Disconnect the PCV hose.
13. Using the sequence shown in illustration, remove the four fuel rail retaining bolts.
14. Gently rock and lift the left side fuel rail until the fuel injectors just start to clear the machined holes in the intake manifold.
15. Gently rock and lift the right side fuel rail until the fuel injectors just start to clear the machined holes in the intake manifold. Repeat this procedure (left/right) until all injectors have cleared the machined holes.
16. Remove the fuel rail (with injectors attached) from the engine.
17. If the fuel injectors are to be removed. Refer to **INJECTOR(S), FUEL, REMOVAL** or **INJECTOR (S), FUEL, REMOVAL**.

6.4L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.

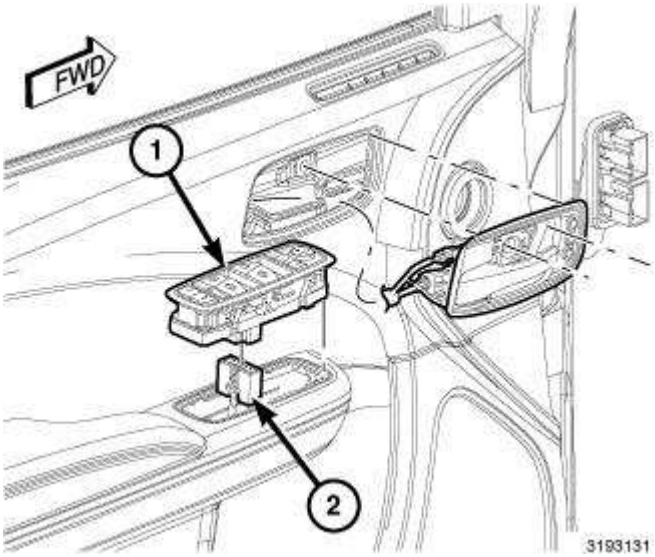

Fig. 341: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

2. Disconnect the negative battery cable.
3. Remove fuel tank filler cap.

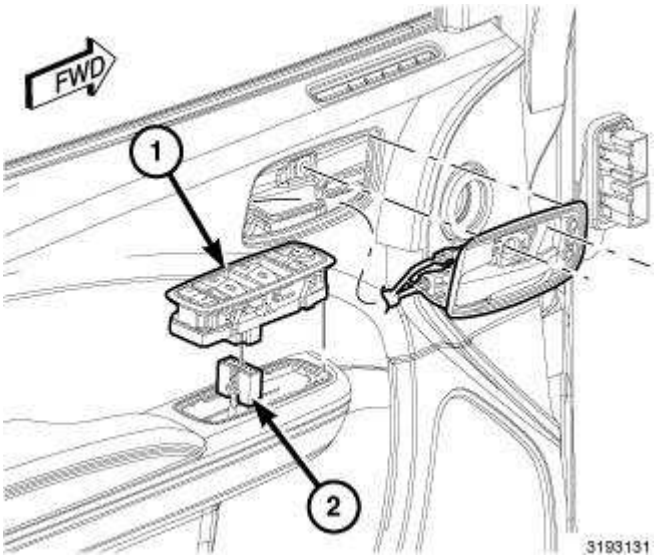

Fig. 342: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

4. Remove the engine cover (2).

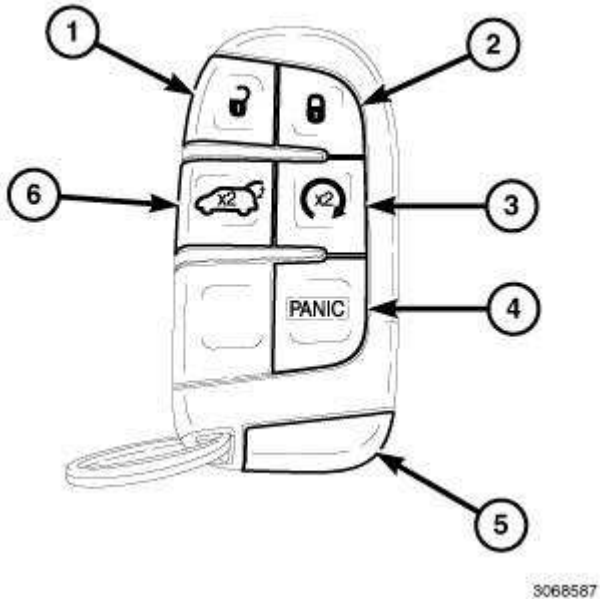

Fig. 343: Intake Air Temperature (IAT) Sensor, Air Cleaner Housing & Duct
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the electrical connector at the Intake Air Temperature (IAT) sensor (4).
6. Loosen the hose clamp at the air cleaner housing (2).

7. Loosen the hose clamp at the throttle body (2) and remove the duct (3).

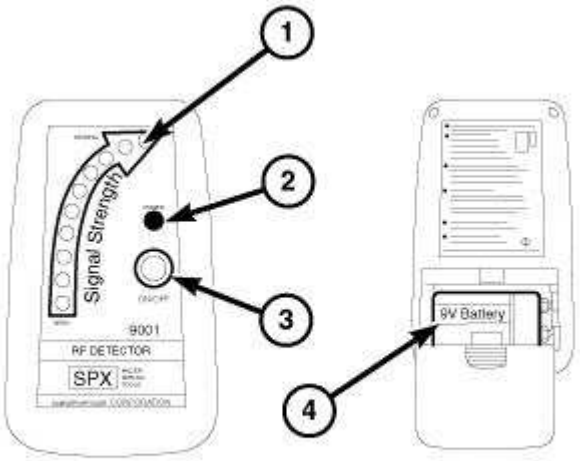

Fig. 344: Throttle Body, Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect throttle body electrical connector (2).

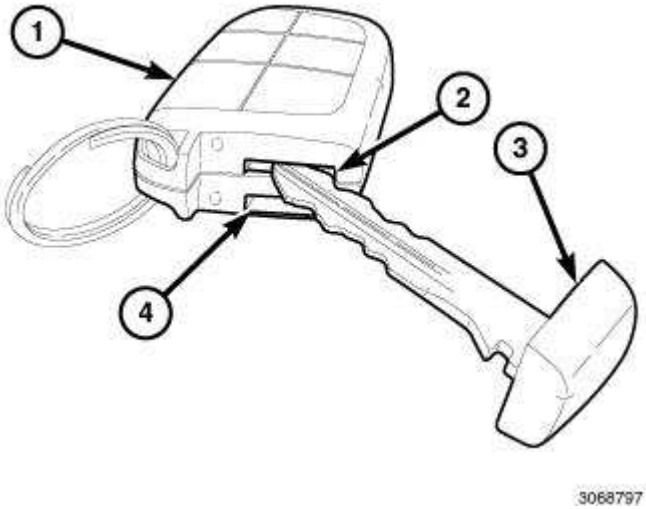

Fig. 345: Fuel Rail Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect electrical connectors at all 8 fuel injectors. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove the connector (3) from the injector.

10. Disconnect the fuel supply line at the fuel rail. Refer to **FITTING, QUICK CONNECT** .
11. Disconnect the PCV hose.
12. Using the sequence shown in illustration, remove the four fuel rail retaining bolts.
13. Gently rock and lift the left side fuel rail until the fuel injectors just start to clear the machined holes in the intake manifold.
14. Gently rock and lift the right side fuel rail until the fuel injectors just start to clear the machined holes in the intake manifold. Repeat this procedure (left/right) until all injectors have cleared the machined holes.
15. Remove the fuel rail (with injectors attached) from the engine.
16. If the fuel injectors are to be removed. Refer to **INJECTOR(S), FUEL, REMOVAL** or **INJECTOR (S), FUEL, REMOVAL**.

INSTALLATION

3.6L

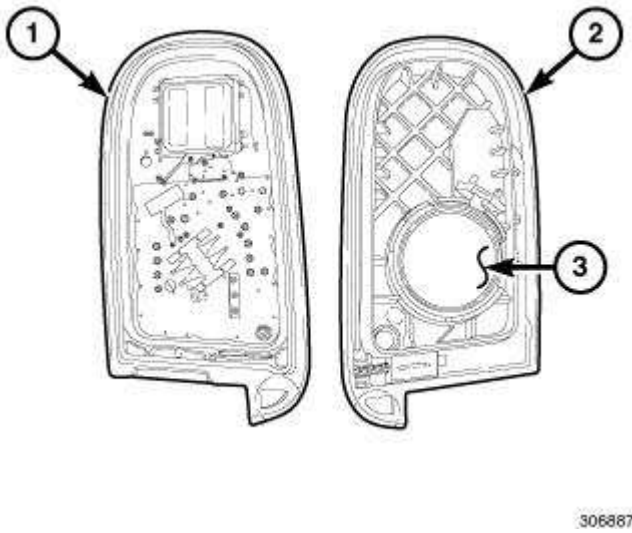

Fig. 346: O-ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Lightly lubricate the new O-ring seals (1) with clean engine oil and position the seals onto the fuel injector (2).

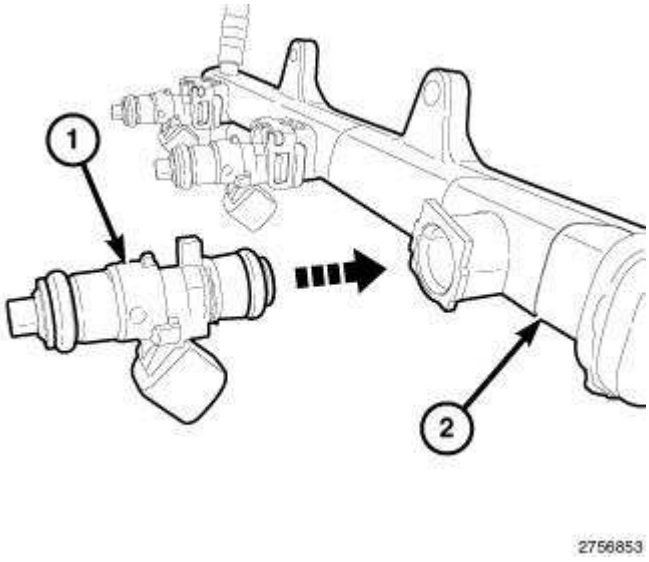

Fig. 347: O-ring Seals & Fuel Injector
Courtesy of CHRYSLER GROUP, LLC

2. Install the six fuel injectors into the fuel rail.

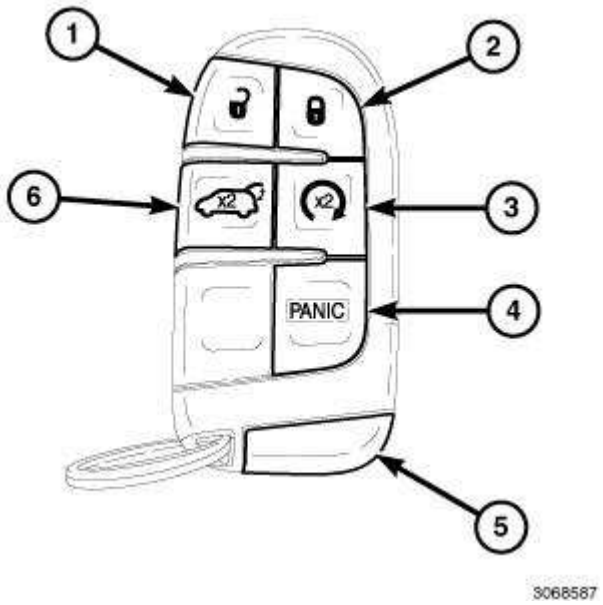

Fig. 348: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Clean out the fuel injector bores in the lower intake manifold.
4. Position the fuel rail (1) onto the lower intake manifold, install the four retaining bolts and using the sequence shown in illustration, tighten to 7 N.m (62 in. lbs.).

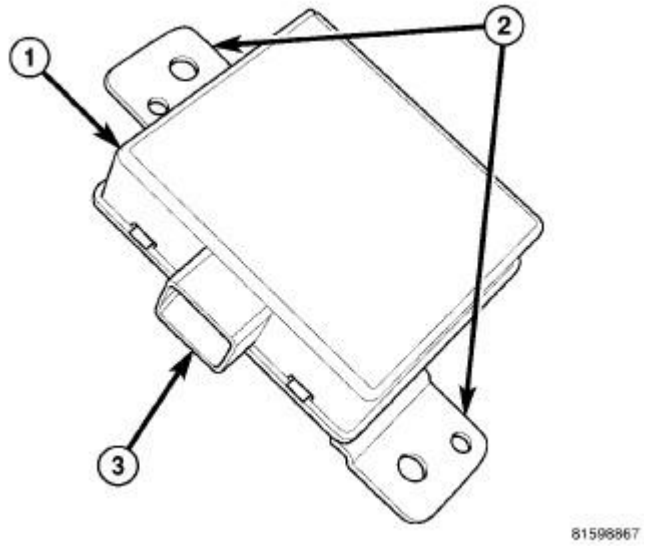

Fig. 349: Fuel Supply Hose & Fuel Injector Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Connect the fuel injector electrical connectors (2).
6. Connect the fuel supply hose to the fuel rail (1). Refer to **FITTING, QUICK CONNECT** .

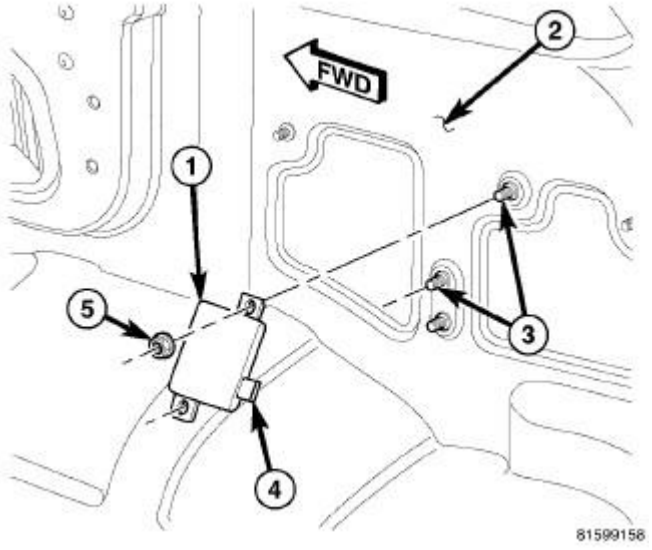

Fig. 350: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

7. Install the insulator (2) to the two alignment posts (3) on top of the left cylinder head cover.

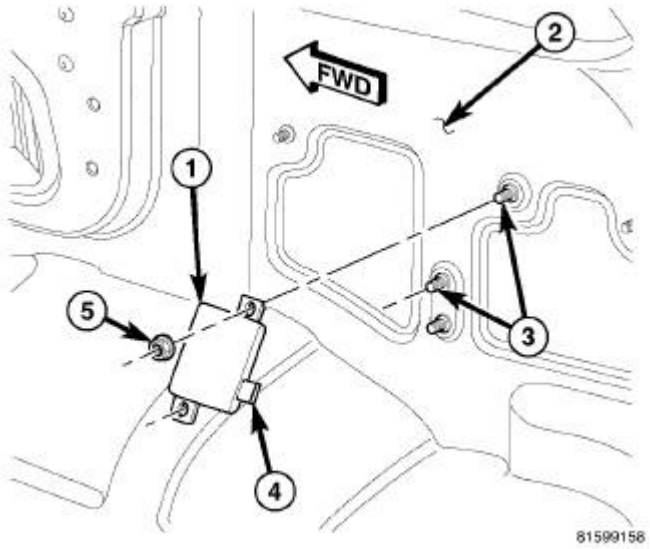

Fig. 351: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. Install the upper intake manifold (1) and support brackets. Refer to **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION, 5.7L** or **MANIFOLD, INTAKE, INSTALLATION** .

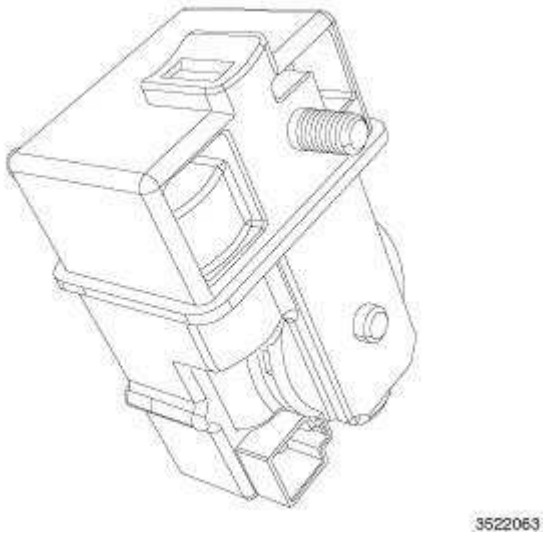

Fig. 352: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

9. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
10. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
11. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).

12. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
13. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

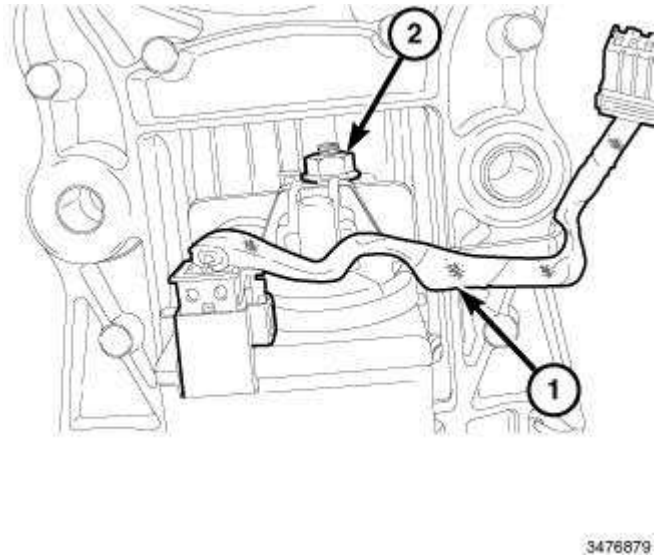

Fig. 353: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

14. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

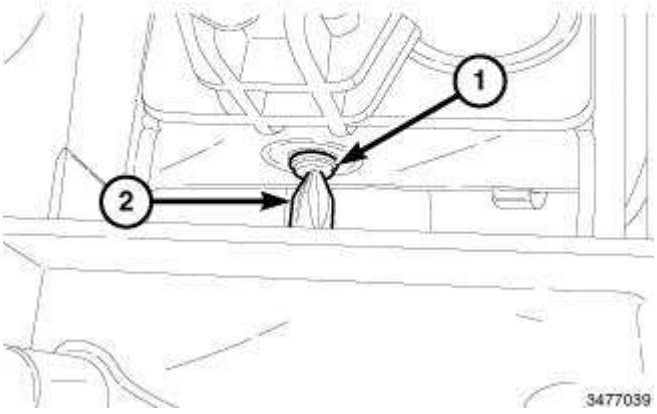

Fig. 354: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

15. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
16. Start the engine and check for leaks.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.

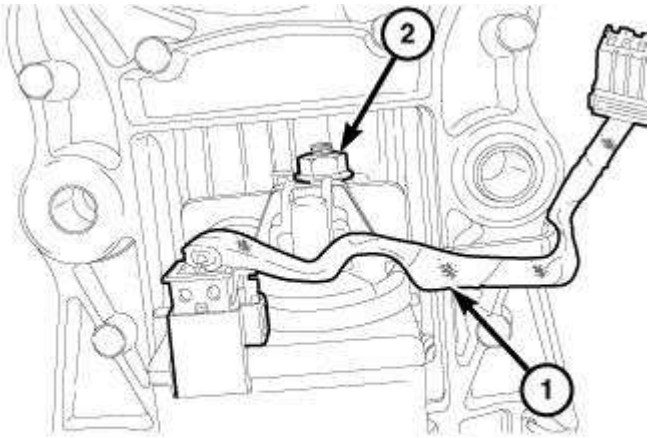

Fig. 355: Fuel Injector O-Rings, Fuel Rail/Fuel Injector Assembly & Four Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fuel injector O-rings may be used again, provided no cuts, tears, or deformation have occurred.

1. If removed, install the fuel injectors onto the fuel rail. Refer to **INJECTOR(S), FUEL, INSTALLATION** or **INJECTOR(S), FUEL, INSTALLATION**.
2. Inspect the fuel injector O-rings (3) and replace if necessary.
3. Clean out the fuel injector machined bores in the intake manifold.
4. Apply a small amount of engine oil to each fuel injector O-ring (3).

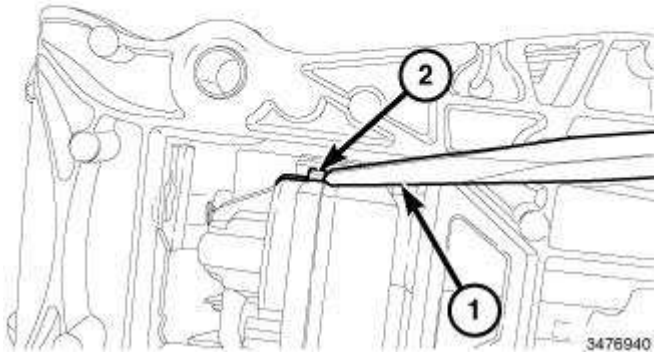

Fig. 356: Fuel Rail Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Position fuel rail/fuel injector assembly (1) into the machined fuel injector bores of the intake manifold.
6. Guide each injector into the intake manifold using care not to tear the fuel injector O-rings.
7. Push the right fuel rail down until the fuel injectors have bottomed on shoulders.
8. Push the left fuel rail down until the injectors have bottomed on shoulders.
9. Using the sequence shown in illustration, install the four fuel rail retaining bolts (2) and tighten to 11 N.m (8 ft. lbs.).
10. Connect the fuel line (1) to the fuel rail. Refer to **STANDARD PROCEDURE** .
11. Connect the fuel injector electrical connectors.
12. Connect the PCV hose.

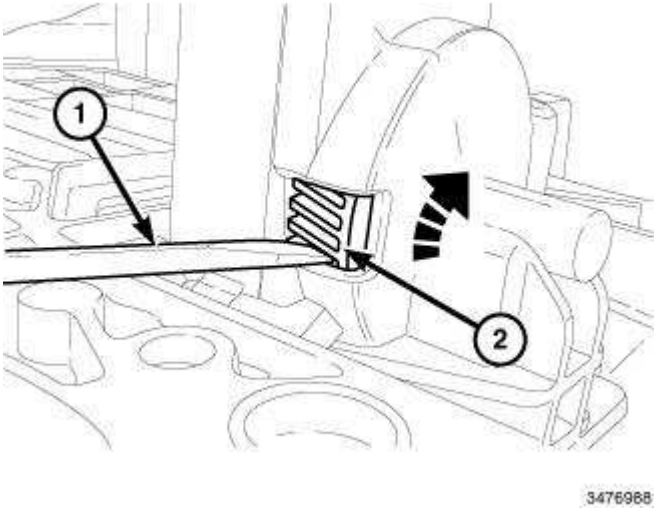

Fig. 357: Intake Air Temperature (IAT) Sensor, Air Cleaner Housing, Resonator Retaining

Bolt & Hose Clamp
Courtesy of CHRYSLER GROUP, LLC

13. Position the resonator onto the throttle body and air cleaner housing.
14. Tighten the hose clamp at the throttle body (4) to 5 N.m (45 in. lbs.).
15. Install the resonator retaining bolt (3) and tighten to 5 N.m (45 in. lbs.).
16. Tighten the hose clamp at the air cleaner housing (2) to 5 N.m (45 in. lbs.).
17. Connect the electrical connector at the Intake Air Temperature (IAT) sensor (1).

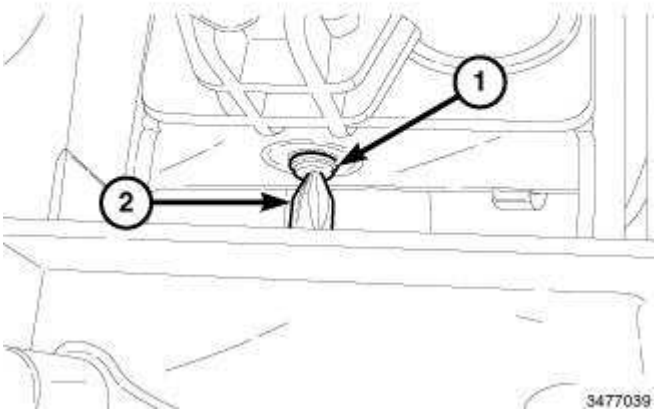

Fig. 358: Oil Fill Cap & Engine Cover
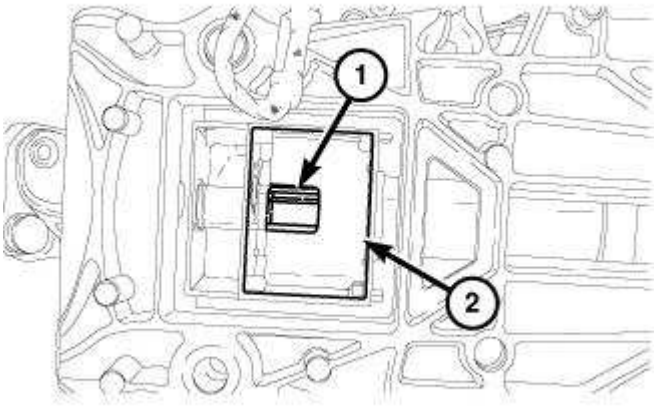
Courtesy of CHRYSLER GROUP, LLC

18. Install the engine cover (2).
19. Start the engine and check for leaks.

6.4L

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.

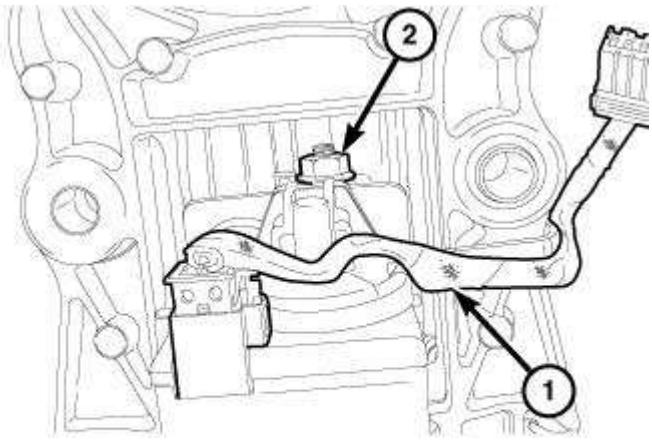


3477108

Fig. 359: Fuel Injector O-Rings, Fuel Rail/Fuel Injector Assembly & Four Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fuel injector O-rings may be used again, provided no cuts, tears, or deformation have occurred.

1. If removed, install the fuel injectors onto the fuel rail. Refer to **INJECTOR(S), FUEL, INSTALLATION** or **INJECTOR(S), FUEL, INSTALLATION**.
2. Inspect the fuel injector O-rings (3) and replace if necessary.
3. Clean out the fuel injector machined bores in the intake manifold.
4. Apply a small amount of engine oil to each fuel injector O-ring (3).



3476879

Fig. 360: Fuel Rail Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Position fuel rail/fuel injector assembly (1) into the machined fuel injector bores of the intake manifold.
6. Guide each injector into the intake manifold using care not to tear the fuel injector O-rings.
7. Push the right fuel rail down until the fuel injectors have bottomed on shoulders.
8. Push the left fuel rail down until the injectors have bottomed on shoulders.
9. Using the sequence shown in illustration, install the four fuel rail retaining bolts (2) and tighten to 11 N.m (8 ft. lbs.).
10. Connect the fuel line (1) to the fuel rail. Refer to **STANDARD PROCEDURE** .
11. Connect the fuel injector electrical connectors.
12. Connect the PCV hose.

17. Install the engine cover (2).
18. Connect the negative battery cable.
19. Start the engine and check for leaks.

REGULATOR, FUEL PRESSURE

DESCRIPTION

DESCRIPTION

The fuel pressure regulator is integrated with the auxiliary fuel pump module and is not serviced separately. The auxiliary fuel pump module must be replace if the fuel pressure regulator is to be replaced.

For auxiliary fuel pump module removal. Refer to **MODULE, FUEL PUMP, REMOVAL** or **MODULE, FUEL PUMP, REMOVAL**.

SENDING UNIT AND SENSOR, FUEL LEVEL

DESCRIPTION

DESCRIPTION

The fuel level sending units and sensors are integrated with both the main fuel pump module and the auxiliary fuel pump module and are not serviced separately. The appropriate fuel pump module must be replace if either fuel level sending unit is to be replaced.

For fuel pump module removal. Refer to **MODULE, FUEL PUMP, REMOVAL** or **MODULE, FUEL PUMP, REMOVAL**.

TANK, FUEL

REMOVAL

REMOVAL

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

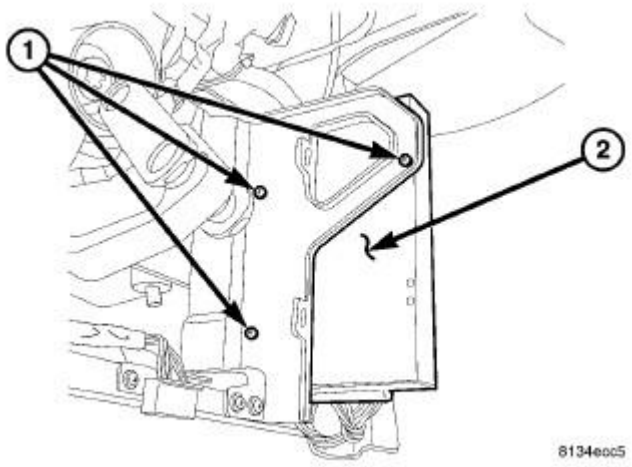

Fig. 364: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Perform the draining fuel tank procedure. Refer to **DRAINING FUEL TANK** .
3. Disconnect the negative battery cable (1).
4. Raise and support the vehicle.
5. Remove the left rear tire.

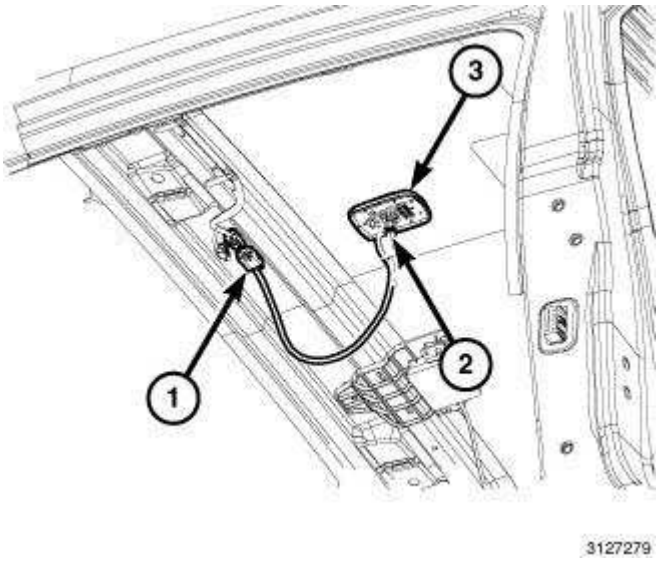

Fig. 365: Removing/Installing Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

6. Remove the push-pins (1) that secure the rear wheelhouse shield to the body.
7. Remove the left rear wheelhouse splash shield (2).

14. Connect the negative battery cable (1).
15. Fill the fuel tank and check for leaks.

FUEL INJECTION, GAS

OPERATION

INJECTION SYSTEM

All engines used in this information have a sequential Multi-Port Electronic Fuel Injection system. The

MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide-Open-Throttle

- Ignition switch OFF

Within these modes of operation, there are two different types of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP operation the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP operation, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP operation the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35°F (1.7°C).
    - If the coolant is over 35°F (1.7°C) the PCM will wait 38 seconds.
    - If the coolant is over 50°F (10°C) the PCM will wait 15 seconds.
    - If the coolant is over 167°F (75°C) the PCM will wait 3 seconds.
    - For other temperatures the PCM will interpolate the correct waiting time.
2. O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

OPEN LOOP operation is used for engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle. Under most conditions, acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** occur in CLOSED LOOP operation.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero RPM), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch

pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch status

- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)

- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to **ON-BOARD DIAGNOSTICS**).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure

- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to **ON-BOARD DIAGNOSTICS** .
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.

- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

FUEL CORRECTION OR ADAPTIVE MEMORIES

OPERATION

SHORT TERM

Short Term Adaptive or Short Term Fuel Trim (STFT) is an immediate correction to fuel injector pulse width. During Closed Loop operation, Short Term Adaptive makes immediate adjustments to fuel delivery in direct response to the signal from the upstream O2 sensor. The PCM infers air/fuel ratio by monitoring oxygen content measured by the upstream O2 stream sensor.

This is an immediate response to the O2 sensor signal that is not switching or is consistently high or low. If the upstream oxygen sensor voltage is not consistently switching between 2.5 and 3.5 volts, the PCM knows that the base pulse width calculation needs to be modified by adjusting the injector pulse width until the correct O2 sensor voltage is achieved. The need to adjust the injector pulse width may be a result of vehicle operating conditions, engine wear, fuel quality, etc. The maximum range of authority for Short Term Adaptive is ±33%. Short Term Adaptive values are not stores when the ignition is off.

LONG TERM

The main function of Long Term Adaptive is to make fuel corrections that permit Short Term Adaptive to hover around zero. In order to maintain correct emissions throughout all operating ranges of the engines, a cell structure based on engine RPM and load (MAP) is used.

There are 26 cells used for the NGC. Two of the cells are used only during idle, as determined by throttle position and park/neutral switch input. The other cells each represent a given off-idle manifold pressure and RPM range.

After the vehicle has reached full operating temperature, short term correction factors will update Long Term Adaptive Memory cells based on vehicle load (RPM/MAP) to allow the Short Term Adaptive value to be brought back to near zero. Once this correction factor is updated in the memory, it will be used by the PCM under all operating conditions, open loop and closed loop. However, the values stored in the Long-term are updated only after the vehicle has entered long-term closed loop at full operating temperature. This is done to prevent any transition temperature or start-up compensation form corrupting long term fuel correction.

Long Term and Short Term Adaptive can each change the pulse width by as much as ±33% for a maximum total correction of ±66% from base pulse width calculation. Long Term Adaptive values are

used during both Open Loop and Closed Loop operation.

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .

SPECIFICATIONS

INJECTOR(S), FUEL

REMOVAL

3.6L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

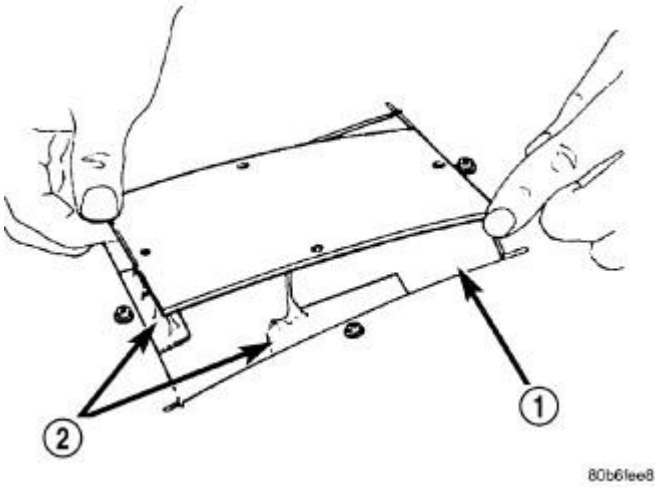

Fig. 408: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable (1).

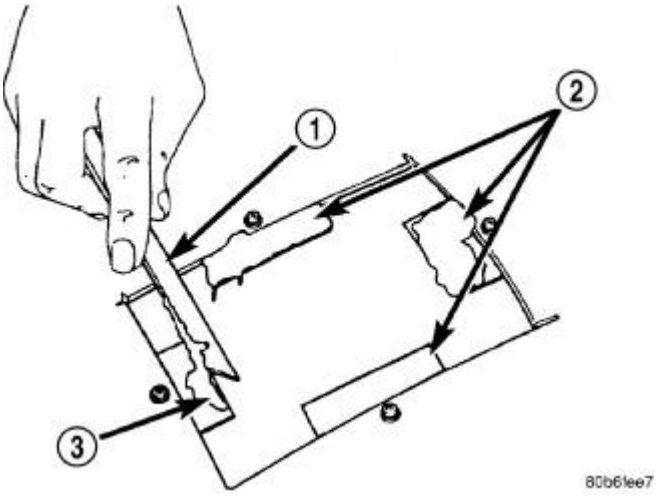

Fig. 409: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

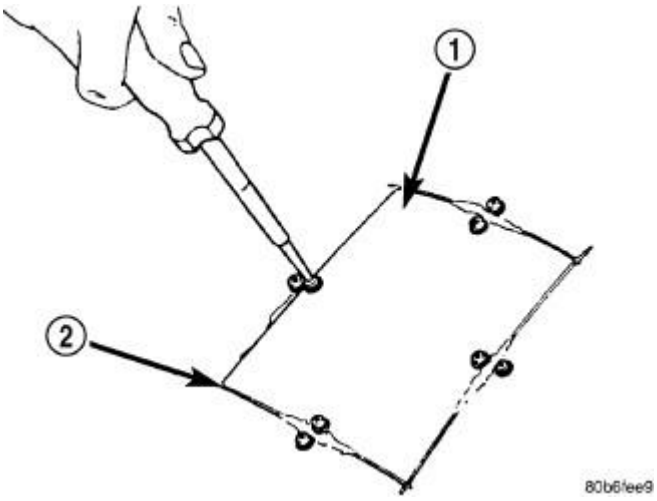

Fig. 410: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).

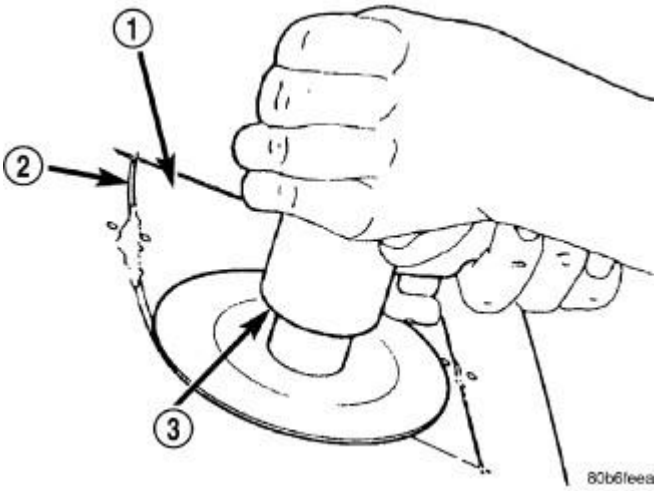

Fig. 411: Fuel Rail & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.

9. Remove the upper intake manifold and fuel rail (2). Refer to **RAIL, FUEL, REMOVAL** or **RAIL,**

FUEL, REMOVAL.

NOTE: Number 2 fuel injector removal shown in illustration, all other fuel injectors similar.

11. Remove the fuel injectors (1) from the lower intake manifold.

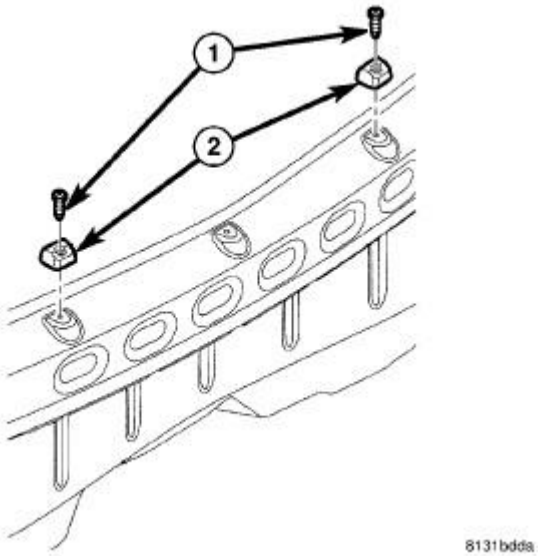

Fig. 414: O-ring Seals
Courtesy of CHRYSLER GROUP, LLC

12. Remove and discard all fuel injector O-ring seals (1).

5.7L

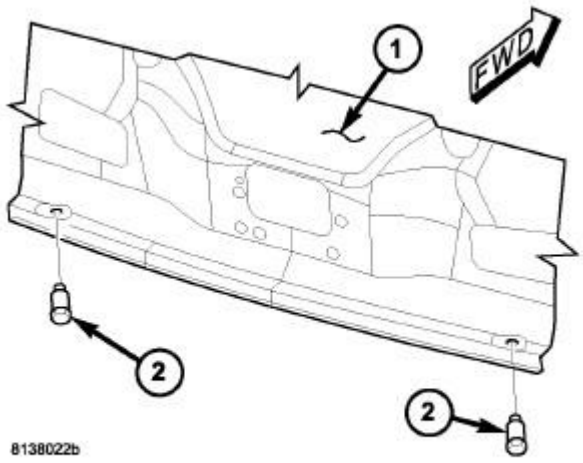

Fig. 415: Fuel Injector O-Rings, Fuel Rail/Fuel Injector Assembly & Four Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel injector(s), fuel system pressure must be released.

NOTE: To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Remove the fuel rail assembly (1). Refer to **RAIL, FUEL, REMOVAL** or **RAIL, FUEL, REMOVAL**.
3. Remove the fuel injector retaining clip(s) (2) from the fuel rail (1).
4. Remove the injector(s) from the fuel rail assembly.

INSTALLATION

3.6L

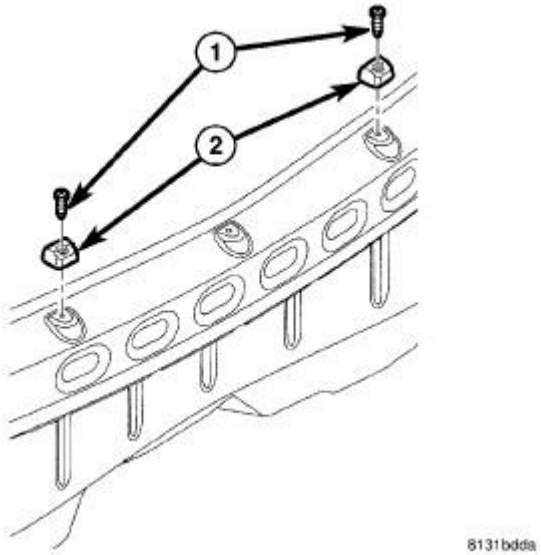

Fig. 416: O-ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Lightly lubricate the new O-ring seals (1) with clean engine oil and position the seals onto the fuel injector (2).

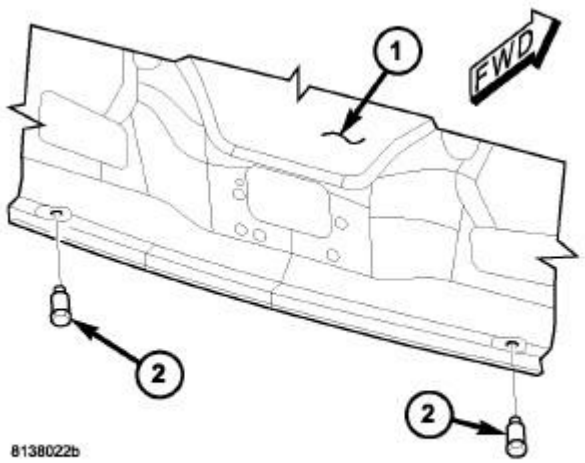

Fig. 417: O-ring Seals & Fuel Injector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 2 fuel injector installation shown in illustration, all other fuel injectors similar.

2. Install the fuel injectors (1) into the fuel rail (2).

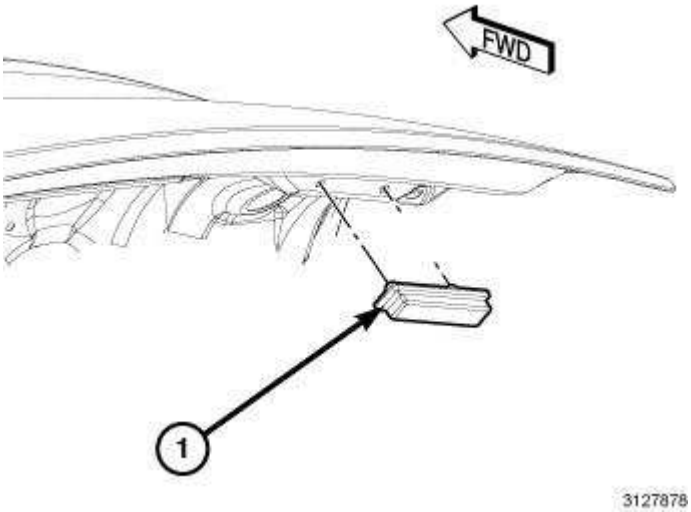

Fig. 418: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Install the fuel rail and upper intake manifold. Refer to **RAIL, FUEL, INSTALLATION** or **RAIL, FUEL, INSTALLATION**.

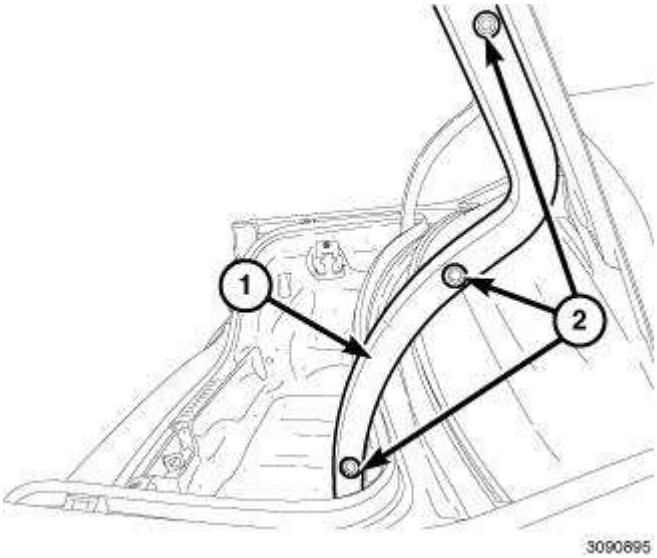

Fig. 419: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
5. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
6. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
7. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
8. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

10. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
11. Start the engine and check for leaks.

5.7L

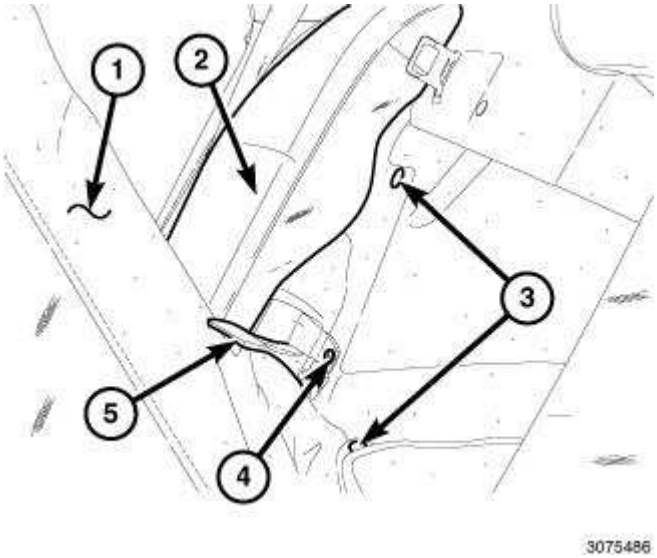

Fig. 422: Fuel Injector O-Rings, Fuel Rail/Fuel Injector Assembly & Four Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Right side shown in illustration, left side similar.**

NOTE: **The fuel injector O-rings may be used again, provided no cuts, tears, or deformation have occurred.**

1. Inspect the fuel injector O-rings (3) and replace if necessary.
2. Apply a small amount of engine oil to each fuel injector O-rings.
3. Install the fuel injector(s) into the fuel rail and install the retaining clip(s) (2).
4. Install the fuel rail assembly (1) Refer to **RAIL, FUEL, INSTALLATION** or **RAIL, FUEL, INSTALLATION**.
5. Start the engine and check for leaks.

PEDAL, ACCELERATOR

REMOVAL

REMOVAL

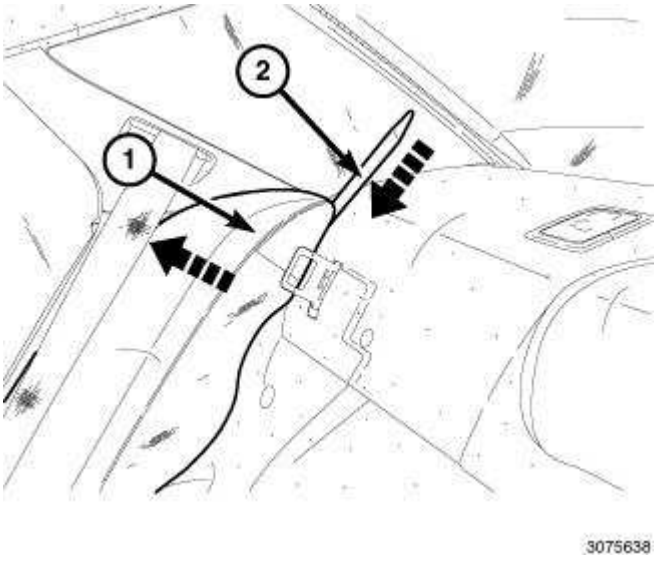

Fig. 423: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).

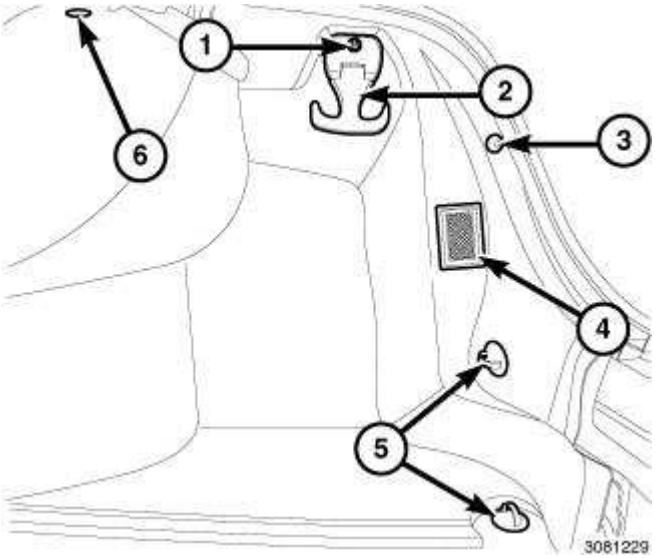

Fig. 424: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

2. If equipped with adjustable pedals, remove the adjuster cable (1) at accelerator pedal adjuster motor (2).

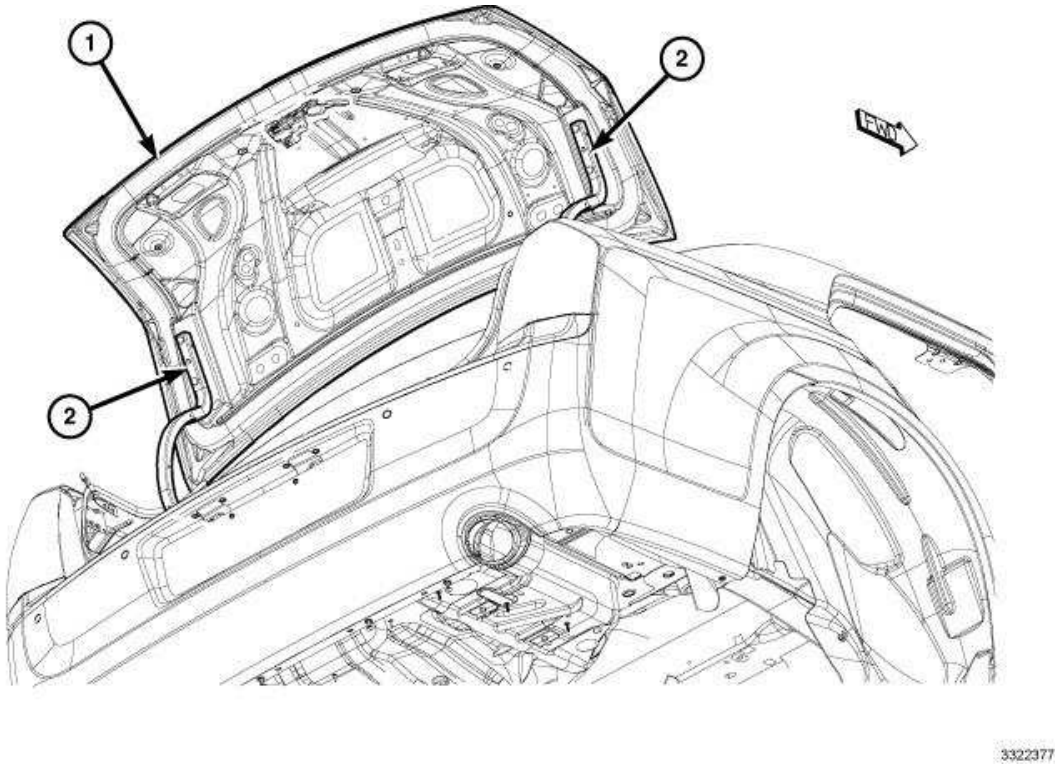

Fig. 425: Accelerator Pedal Adjuster Motor & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not attempt to separate or remove the Accelerator Pedal Position

Sensor (APPS) from the accelerator pedal assembly. The APPS and the accelerator pedal is replaced as an assembly. If the sensor is removed from the pedal, the electronic calibration may be destroyed.

3. Disconnect the electrical connector at the accelerator pedal adjuster motor (1).
4. Disconnect both electrical connectors at the APPS (2).

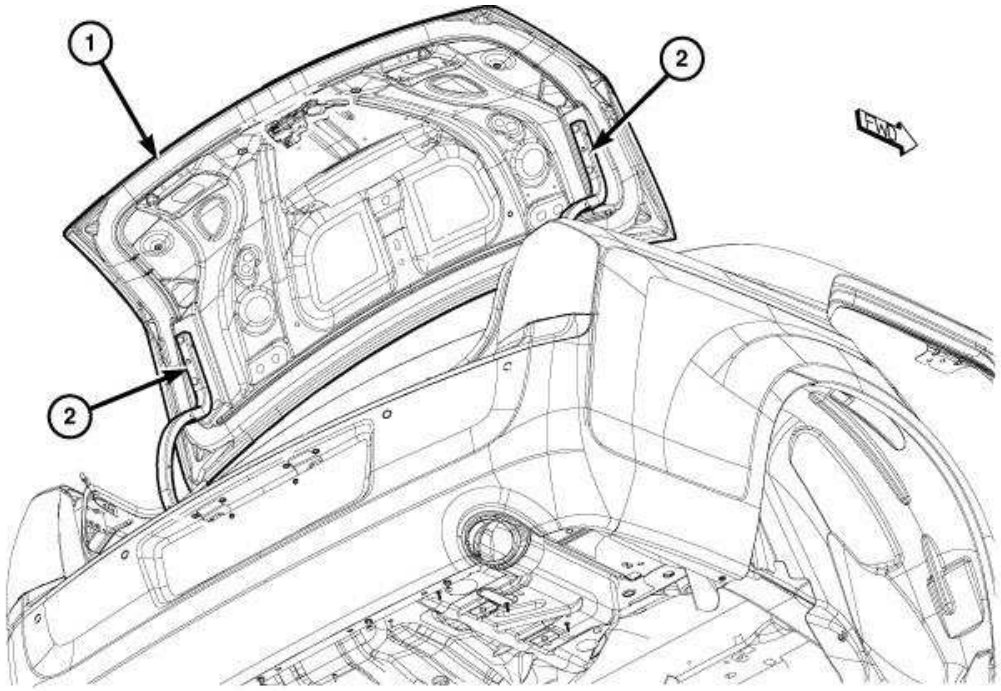

Fig. 426: 3 Retaining Nuts & Pedal Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove the pedal assembly 3 retaining nuts (2, 3).
6. Remove the pedal assembly (1).

INSTALLATION

INSTALLATION

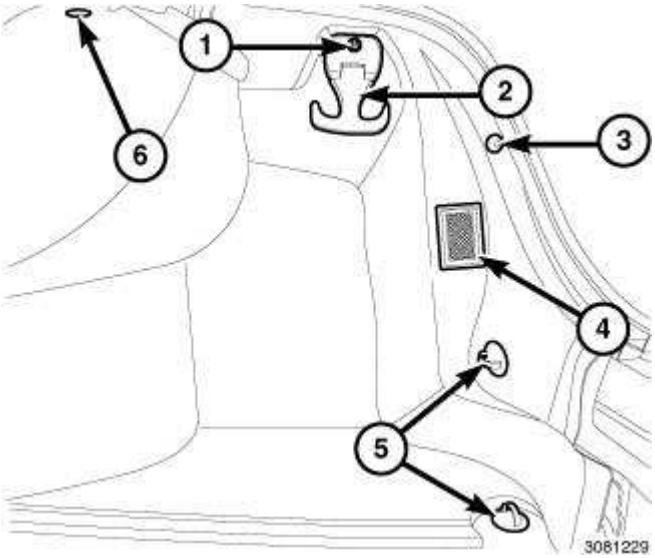

Fig. 427: 3 Retaining Nuts & Pedal Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the pedal assembly (1) to the mounting studs.
2. Install the pedal assembly 3 retaining nuts (2, 3) and tighten to 34 N.m (25 ft. lbs.).

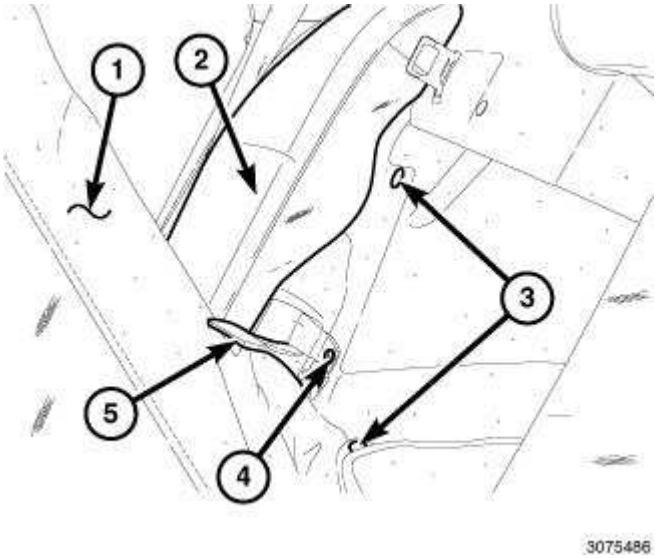

Fig. 428: Accelerator Pedal Adjuster Motor & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Connect both electrical connectors at the APPS (2).
4. Connect the electrical connector at the accelerator pedal adjuster motor (1).

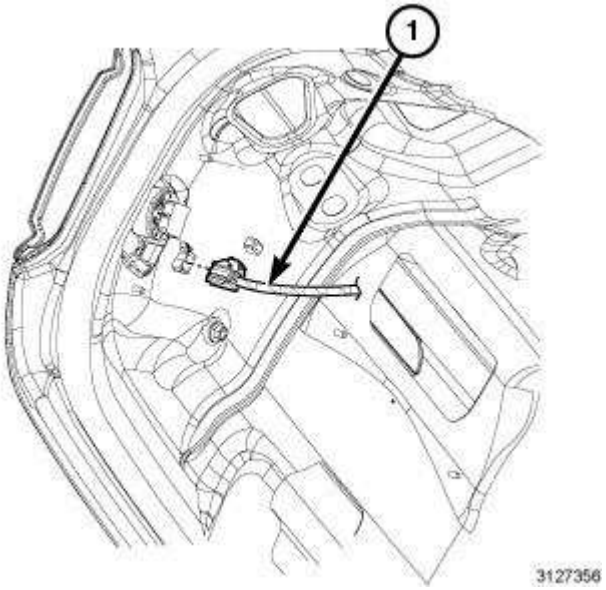

Fig. 429: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

5. Connect the negative battery cable (1).

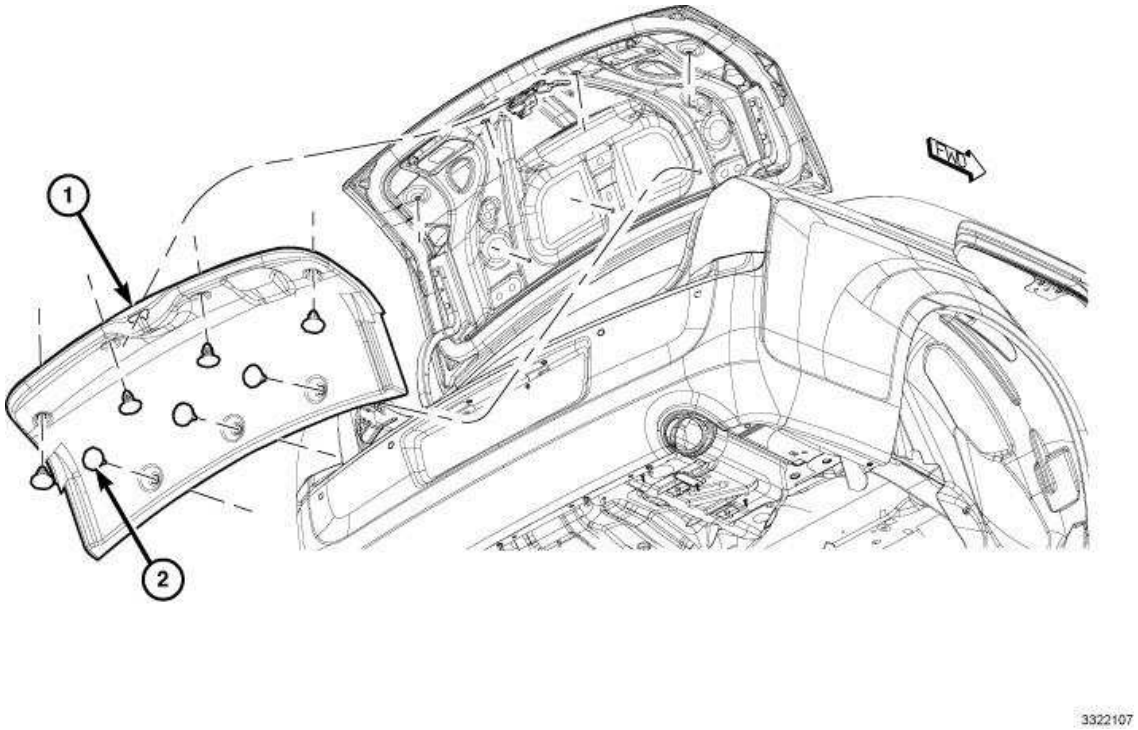

Fig. 430: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

6. If equipped with adjustable pedals, synchronize the accelerator pedal to the brake pedal and then connect the adjuster cable (1) to the accelerator pedal adjuster motor (2). Refer to **PEDAL (S), BRAKE AND/OR ACCELERATOR, INSTALLATION** or **PEDAL(S), BRAKE AND/OR**

ACCELERATOR, ADJUSTABLE, INSTALLATION .

SENSOR, AIR TEMPERATURE, INLET

REMOVAL

3.6L

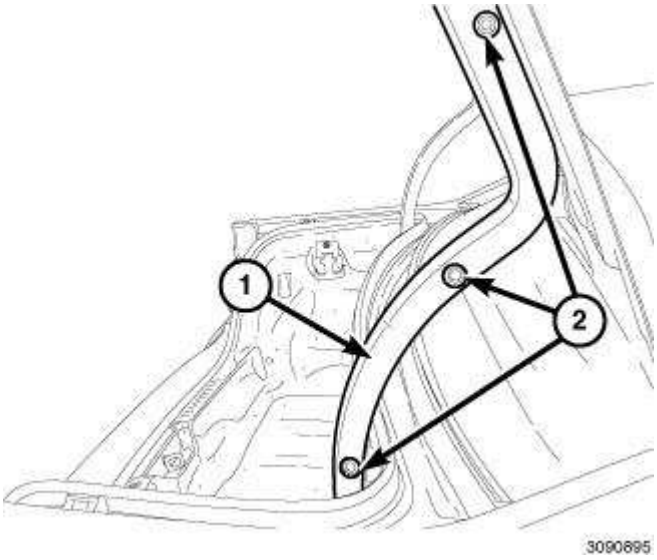

Fig. 431: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

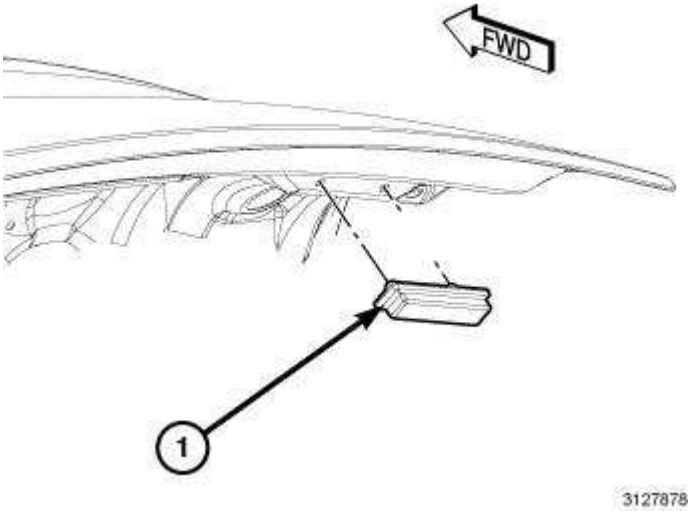

Fig. 432: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

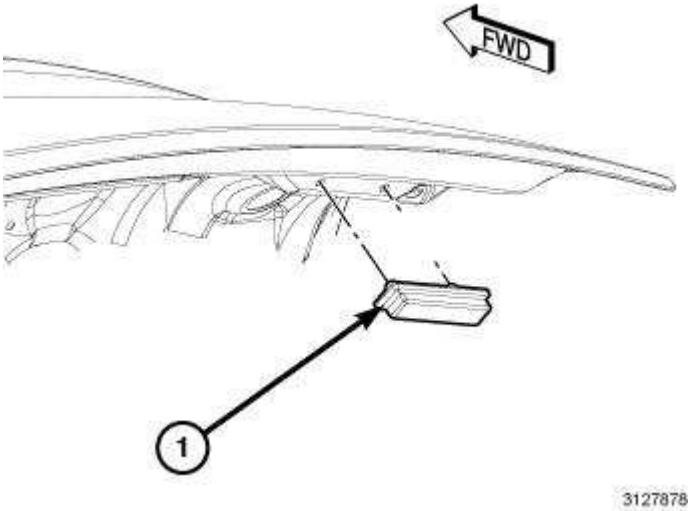

Fig. 433: Inlet Air Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.

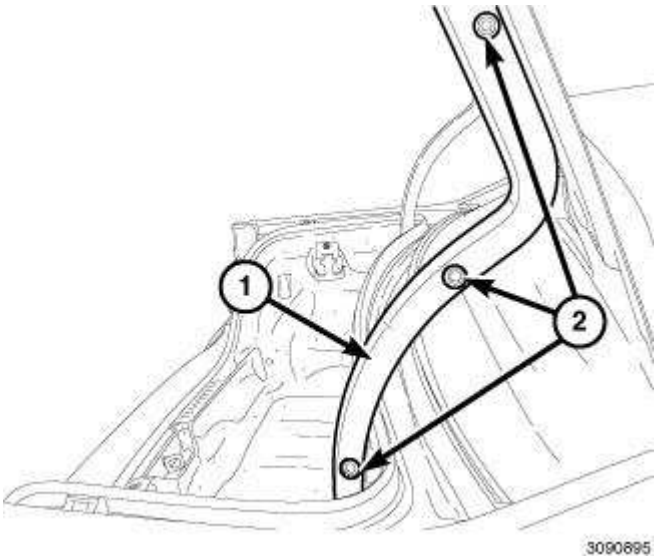

Fig. 434: View Of IAT Sensor Tab/O-Ring - 3.7L/4.7L/5.7L
Courtesy of CHRYSLER GROUP, LLC

4. Clean any dirt from the air inlet tube at the IAT sensor base.
5. Gently lift the small plastic release tab (3), rotate the sensor about 1/4 turn counterclockwise and remove the sensor from the inlet air hose.
6. The IAT sensor O-ring (2) can be reused if not damaged.

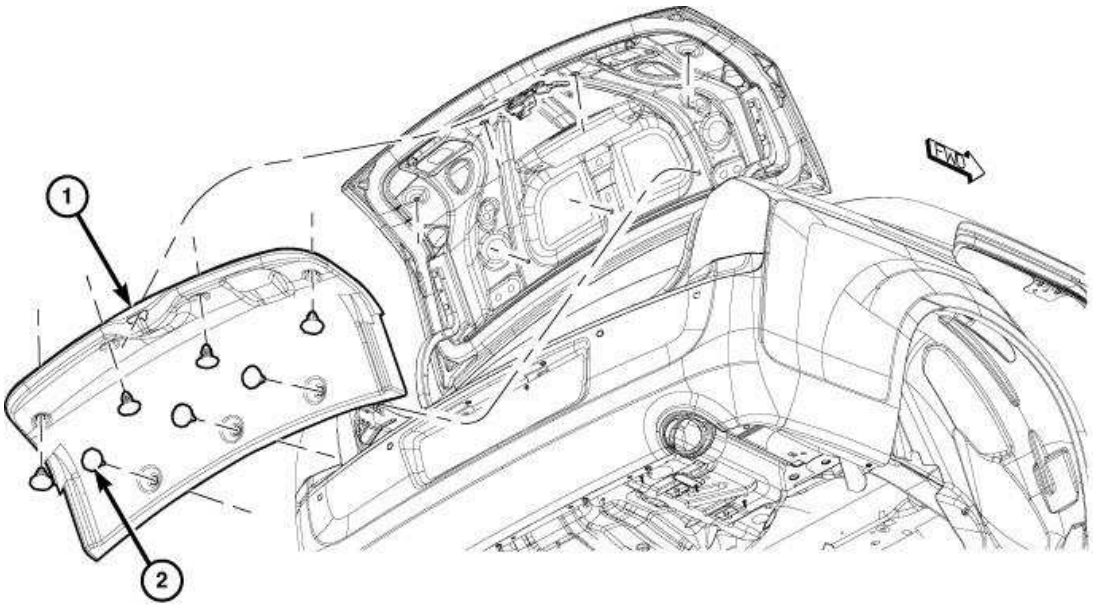

Fig. 435: Sensor Location
Courtesy of CHRYSLER GROUP, LLC

The Inlet Manifold Air Temperature (IAT) sensor is installed into the rubber air intake hose near front of throttle body.

1. Disconnect electrical connector from IAT sensor.
2. Clean dirt from sensor base.
3. Pull sensor from rubber hose.

INSTALLATION

3.6L

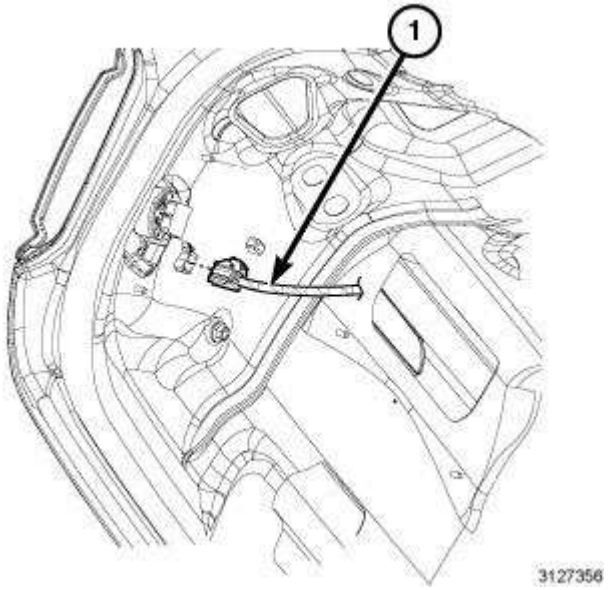

Fig. 436: View Of IAT Sensor Tab/O-Ring - 3.7L/4.7L/5.7L
Courtesy of CHRYSLER GROUP, LLC

1. The Inlet Air Temperature (IAT) sensor O-ring seal (2) can be reused if not damaged.
2. Clean the IAT sensor mounting hole in the air inlet hose.
3. Install the IAT sensor into the air inlet hose and rotate clockwise until the release tab (3) engages.

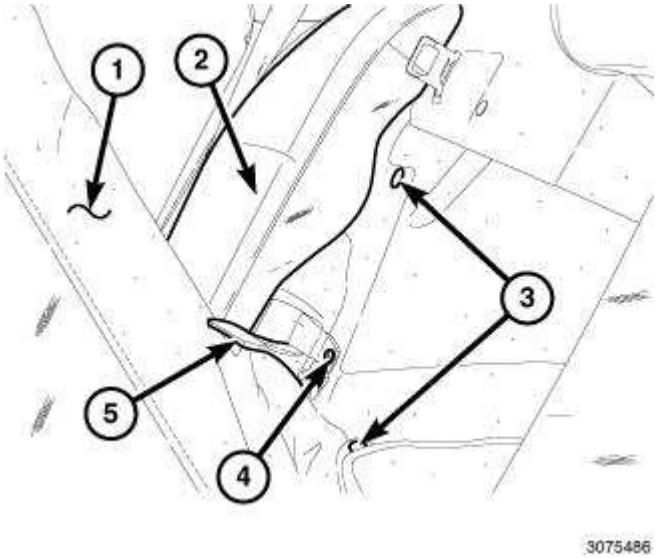

Fig. 437: Inlet Air Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Install the electrical connector (1) to the IAT sensor.

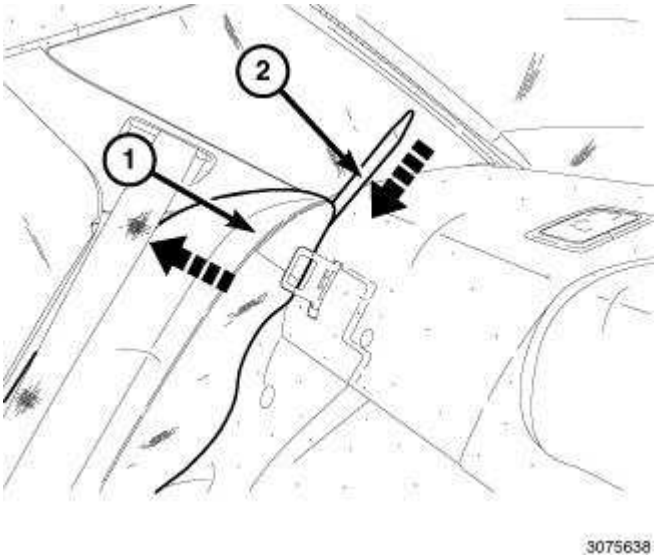

Fig. 438: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

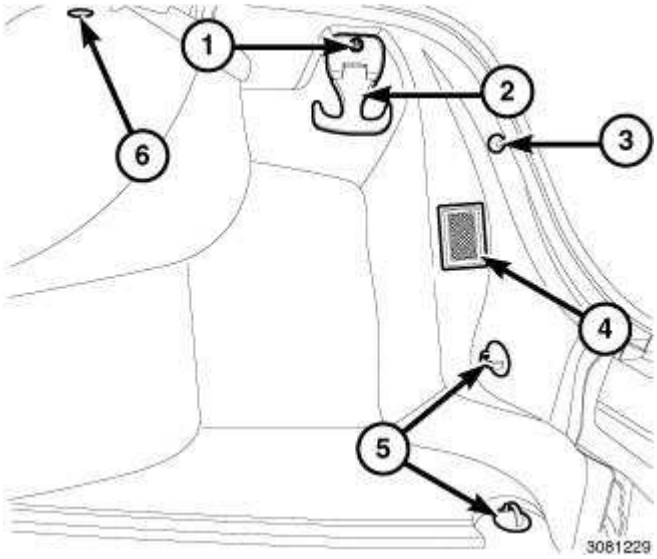

Fig. 439: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

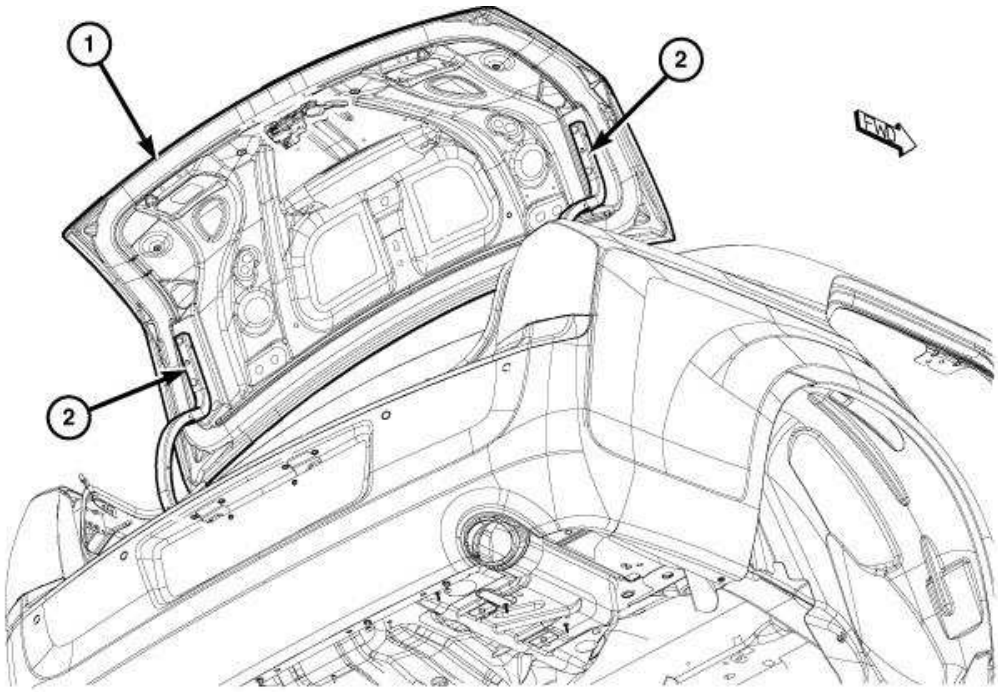

Fig. 440: Sensor Orientation
Courtesy of CHRYSLER GROUP, LLC

1. Press sensor into rubber air hose.
2. Rotate sensor into position as shown in illustration. **For proper system operation, sensor must be positioned as shown in illustration.**

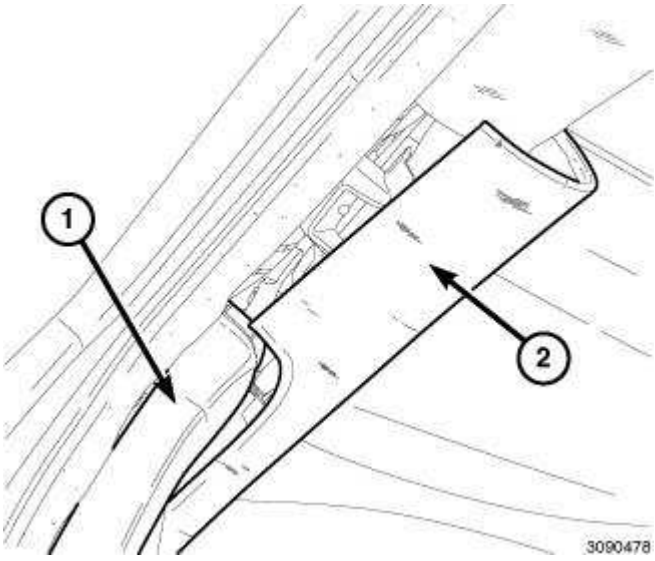

Fig. 441: Sensor Location

3. Connect electrical connector to sensor.

SENSOR, CRANKSHAFT POSITION

DESCRIPTION

DESCRIPTION

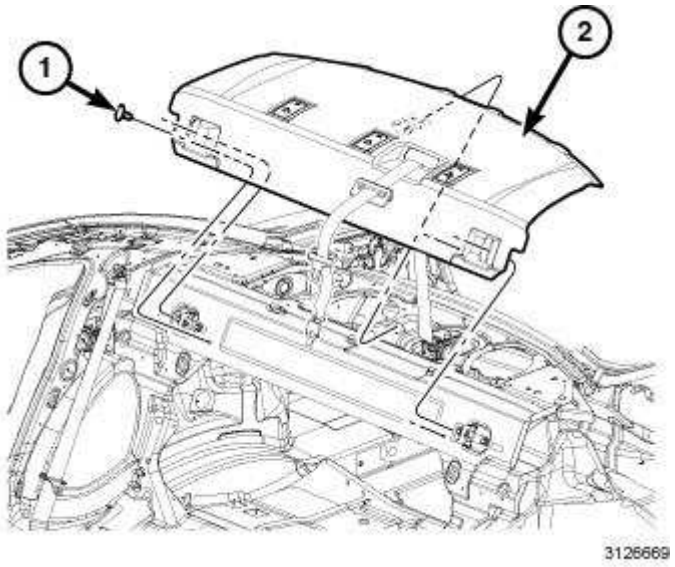

Fig. 442: Crankshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Crankshaft Position (CKP) sensor (1) is a hall effect device combined with an internal magnet.

The CKP sensor is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

OPERATION

OPERATION

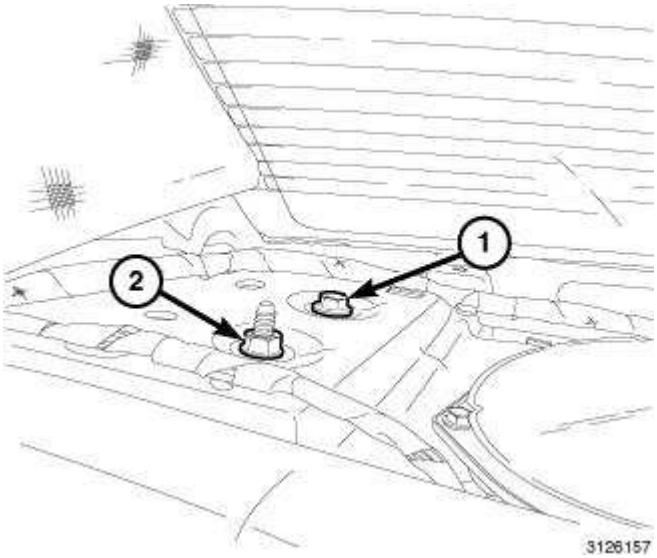

Fig. 443: Identifying Crankshaft Position Sensor And Tone Wheel (3.7L V-6)
Courtesy of CHRYSLER GROUP, LLC

The engine speed and crankshaft position are provided through the CKP (Crankshaft Position) sensor (3). The sensor generates pulses which sends an input signal to the Powertrain Control Module (PCM). The PCM interprets the sensor input signal to determine the crankshaft position. The PCM then uses this information, along with other inputs, to determine injector sequence and ignition timing.

A tonewheel (targetwheel) is bolted to the engine crankshaft (1). This tonewheel has notches (2) on the outer edge.

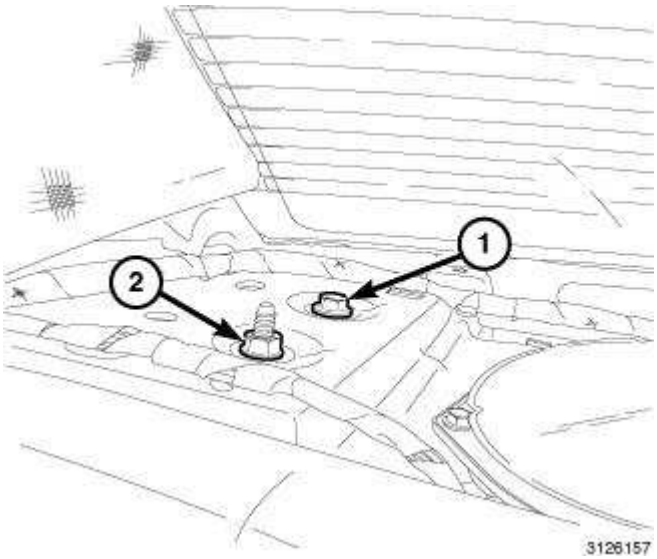

Fig. 444: Crankshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The sensor (1) is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

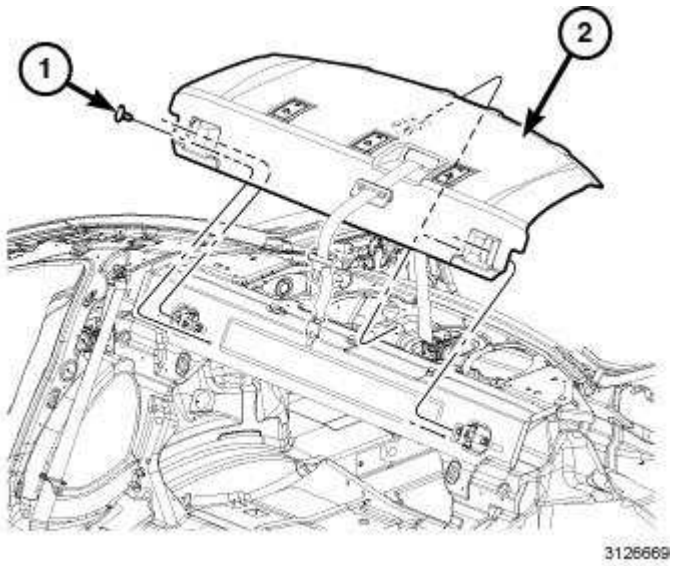

Fig. 445: Crankshaft Position Sensor Operation & Notches - 5.7L
Courtesy of CHRYSLER GROUP, LLC

The notches (3) cause a pulse to be generated when they pass under the sensor. The generated pulses are the input signal to the PCM.

REMOVAL

3.6L

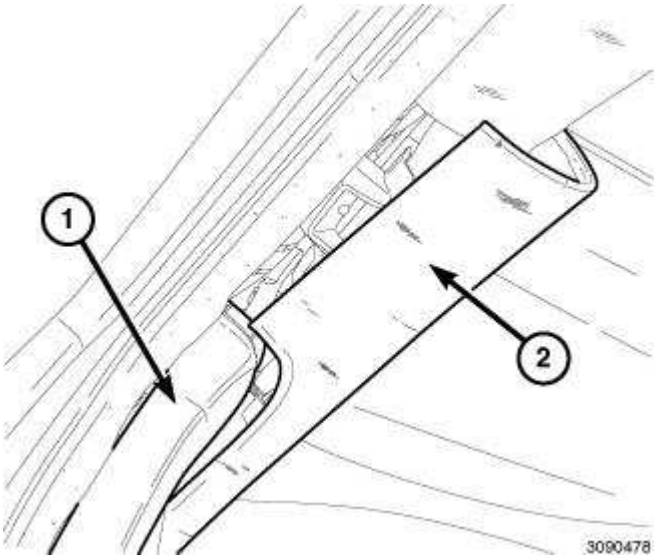

Fig. 446: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

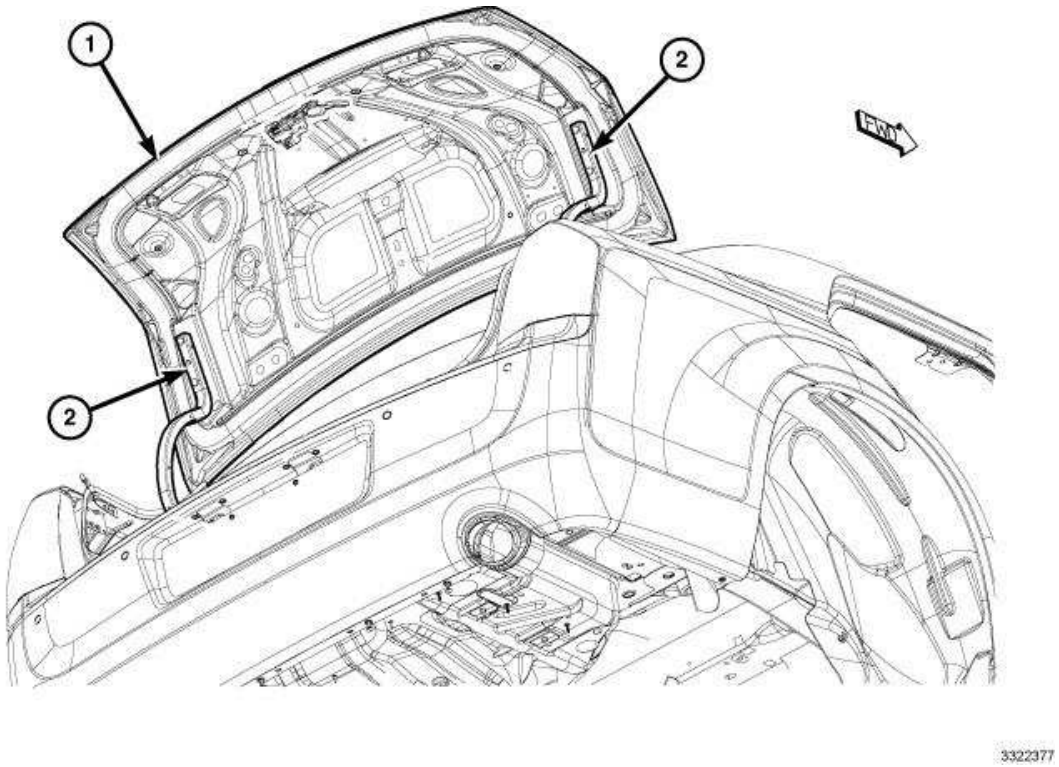

Fig. 447: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the belly pan retainers (1) and remove the belly pan.

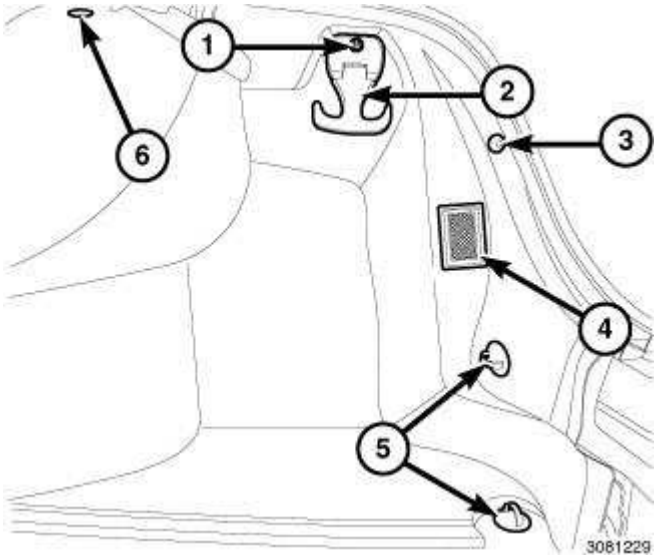

Fig. 448: Heat Shield
Courtesy of CHRYSLER GROUP, LLC

The crankshaft position (CKP) sensor is mounted into the right rear side of the cylinder block.

4. Push back the heat shield (1) from the crankshaft position (CKP) sensor.

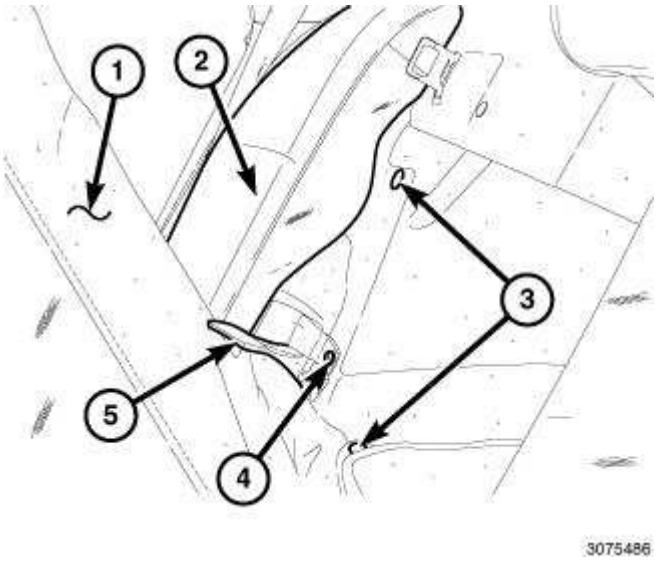

Fig. 449: Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the electrical connector (1) from the crankshaft position (CKP) sensor.

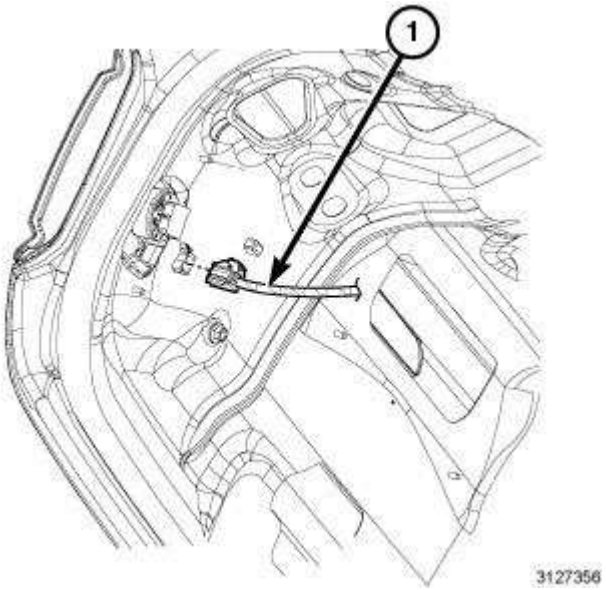

Fig. 450: Sensor Mounting Bolt & Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the sensor mounting bolt (2).
7. Carefully twist the sensor (1) from the cylinder block.

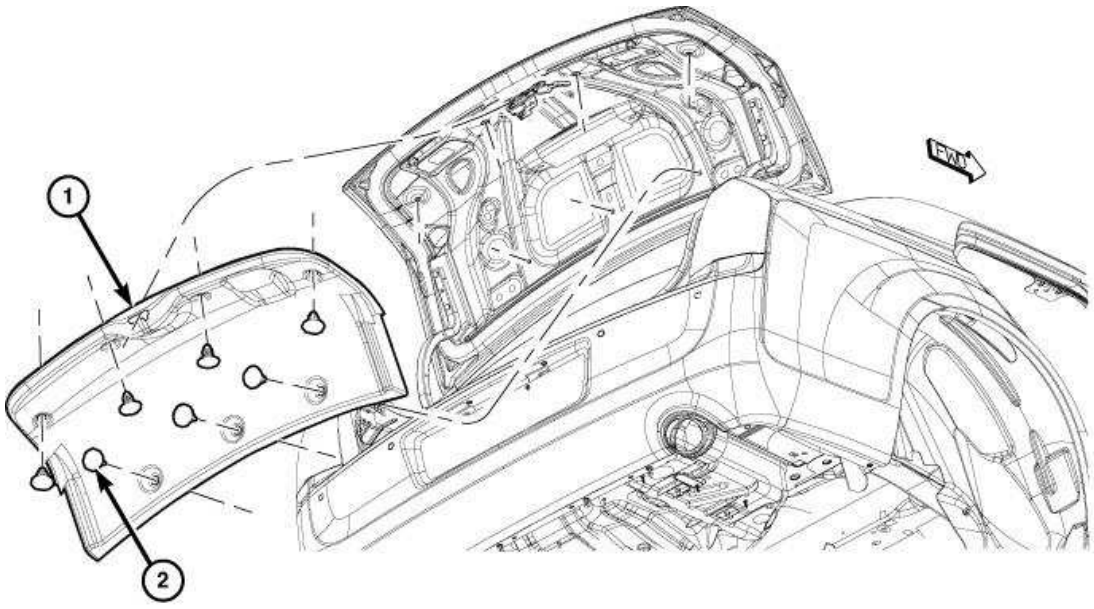

Fig. 451: O-Ring
Courtesy of CHRYSLER GROUP, LLC

8. The CKP sensor O-ring (1) can be reused if not damaged.

5.7L

The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block (1). It is positioned and bolted into a machined hole in the engine block.

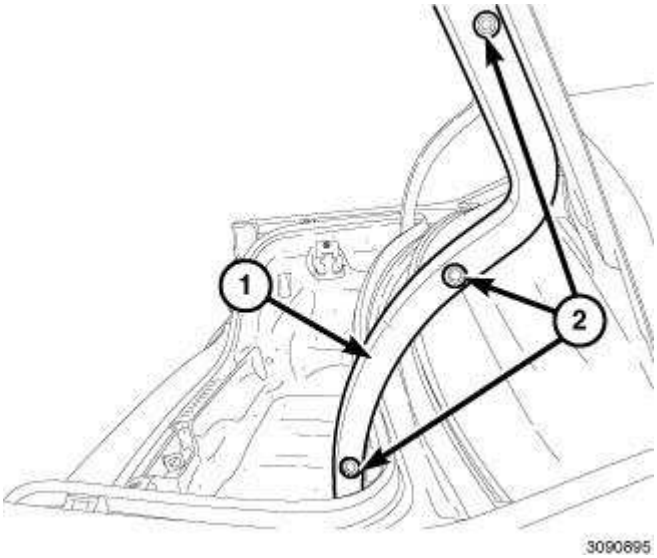

Fig. 452: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the starter motor Refer to **STARTER, REMOVAL** .
4. Disconnect the CKP sensor electrical connector (1).

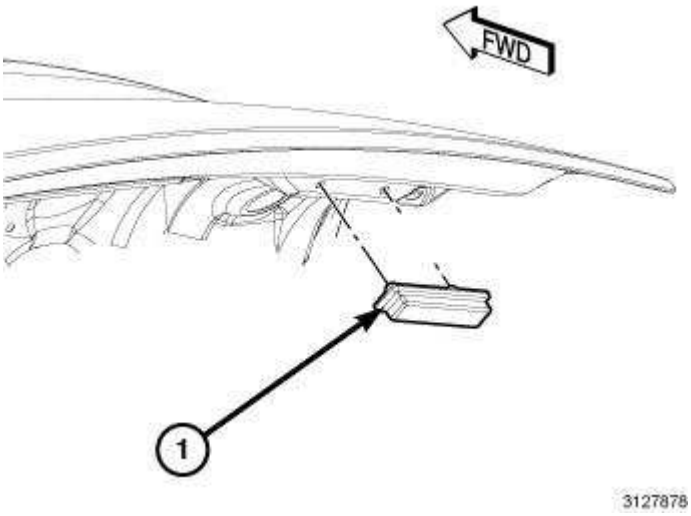

Fig. 453: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the CKP sensor mounting bolt (1).
6. Using a slight twisting motion, remove the CKP sensor from the engine block.

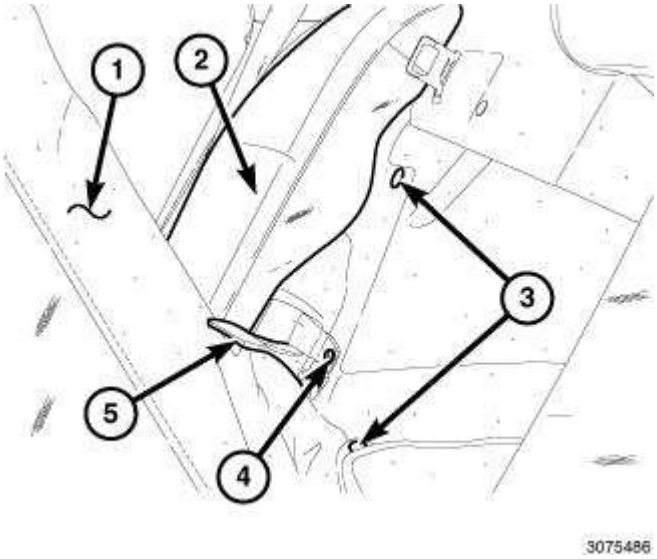

Fig. 454: Crankshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Check the condition of the sensor O-ring (1) and replace if necessary.

INSTALLATION

3.6L

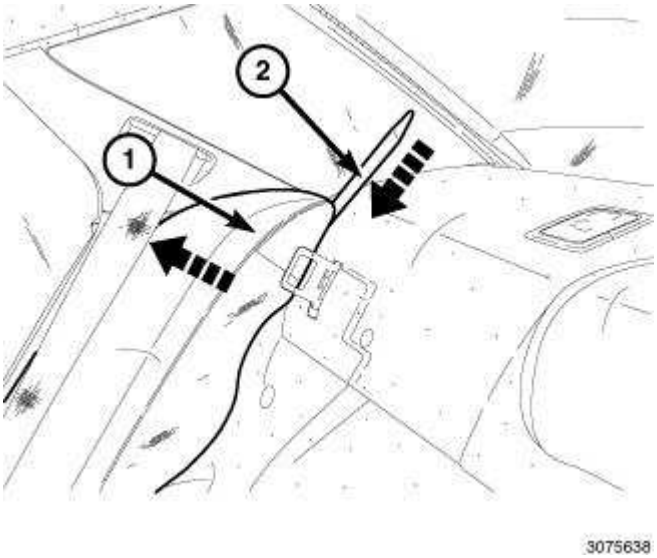

Fig. 455: O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. The crankshaft position (CKP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the sensor O-ring (1).

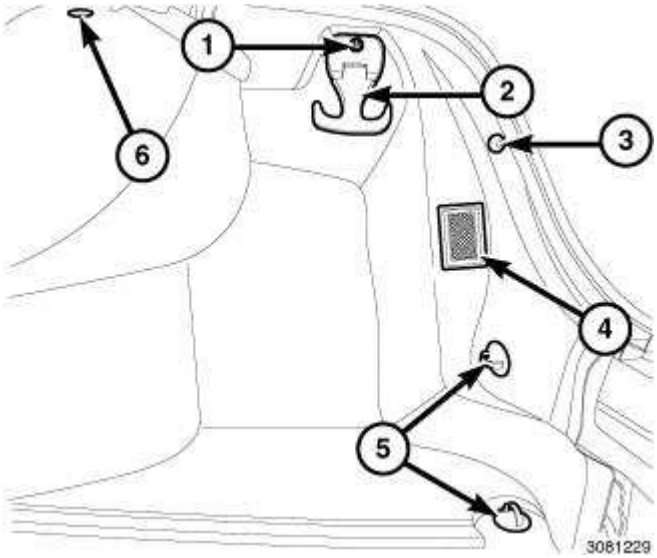

Fig. 456: Sensor Mounting Bolt & Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Clean out the CKP sensor mounting bolt hole in the engine block.
4. Install the sensor (1) into the engine block with a slight rocking and twisting motion.

CAUTION: Before tightening the CKP sensor mounting bolt, be sure the sensor is completely flush to the cylinder block. If the CKP sensor is not flush, damage to the sensor mounting tang may result.

5. Install the mounting bolt (2) and tighten to 12 N.m (9 ft. lbs.).

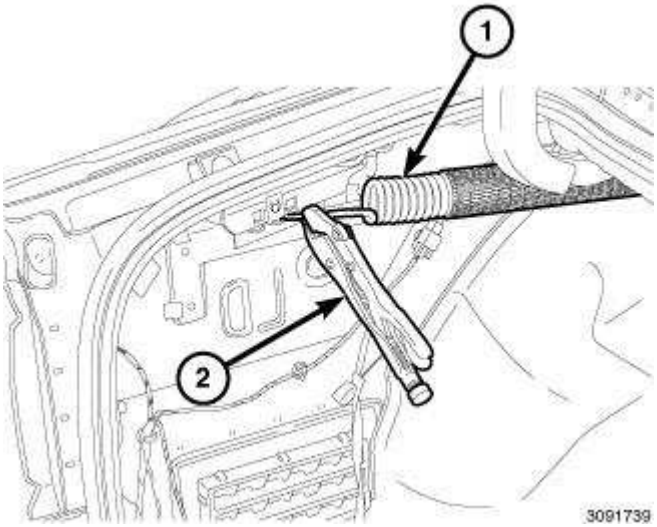

Fig. 457: Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the CKP sensor electrical connector (1).

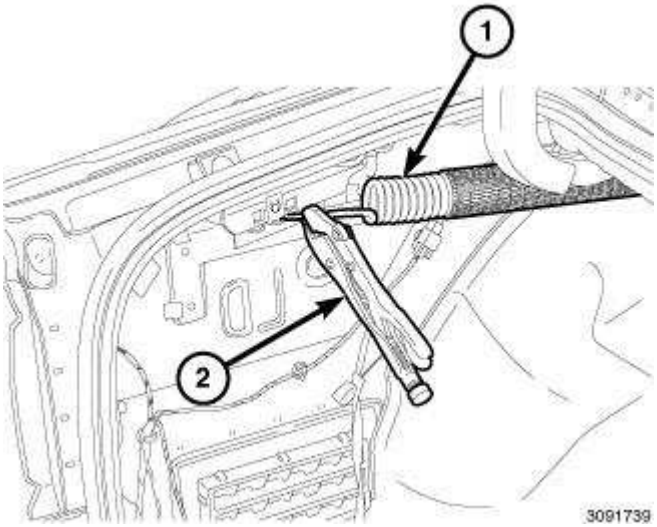

Fig. 458: Heat Shield
Courtesy of CHRYSLER GROUP, LLC

7. Position the heat shield (1) over the CKP sensor.

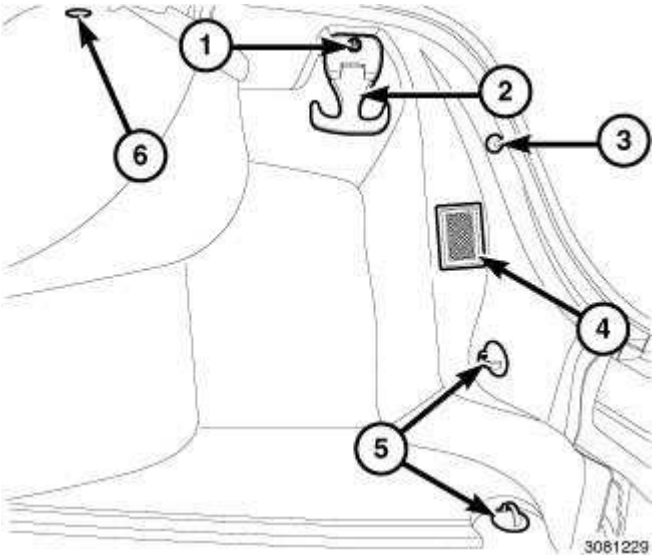

Fig. 459: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Position the belly pan and install the retainers (1).
9. Lower the vehicle.

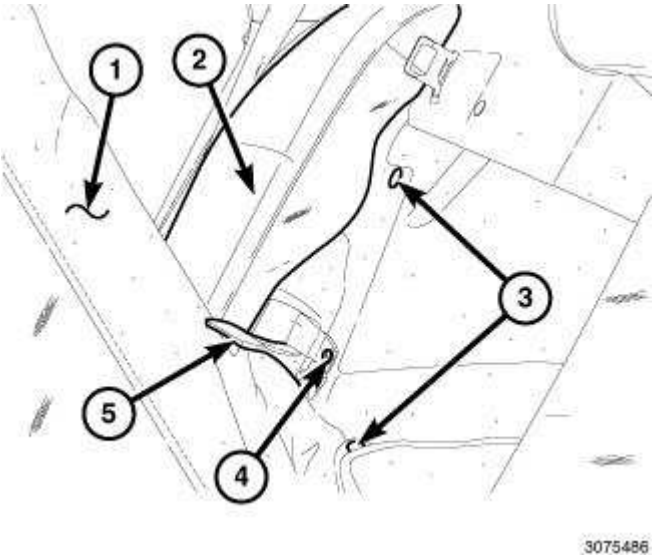

Fig. 460: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

10. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

5.7L

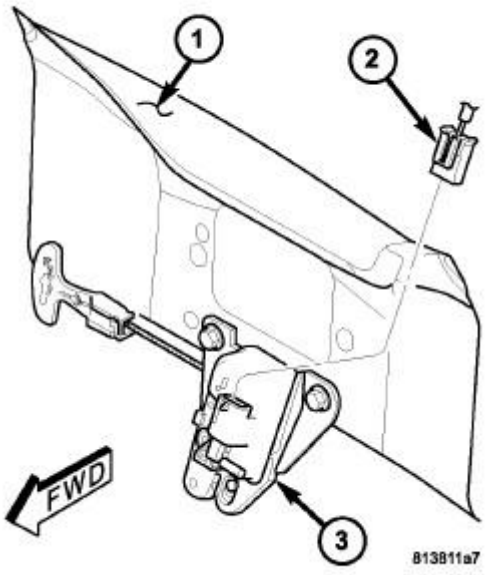

Fig. 461: Crankshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing the Crankshaft Position (CKP) sensor, check the condition of the sensor O-ring (1) and replace if necessary.

1. Clean the machined hole in the engine block.
2. Apply a small amount of engine oil to the CKP sensor O-ring (1).
3. Install the CKP sensor into the engine block with a slight twisting motion.

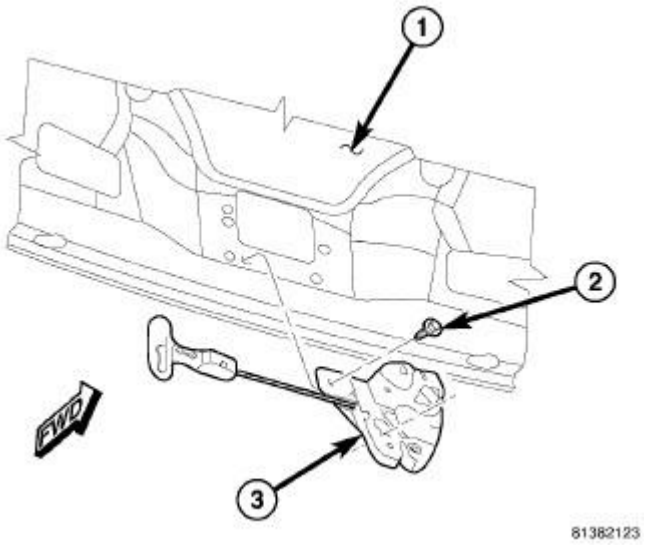

Fig. 462: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before tightening the CKP sensor mounting bolt (1), be sure the sensor is completely flush to the cylinder block. If sensor is not flush, damage to the sensor mounting tang may result.

4. Install the CKP sensor mounting bolt (1) and tighten to 12 N.m (9 ft. lbs.).

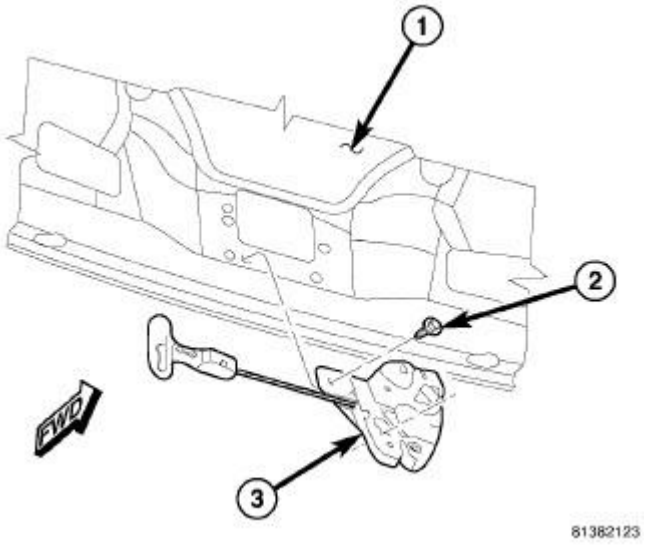

Fig. 463: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

5. Connect the CKP sensor electrical connector (1).

6. Install the starter motor. Refer to **STARTER, INSTALLATION** .
7. Lower the vehicle.
8. Install the negative battery cable.

SENSOR, MANIFOLD AIR PRESSURE (MAP)

REMOVAL

3.6L

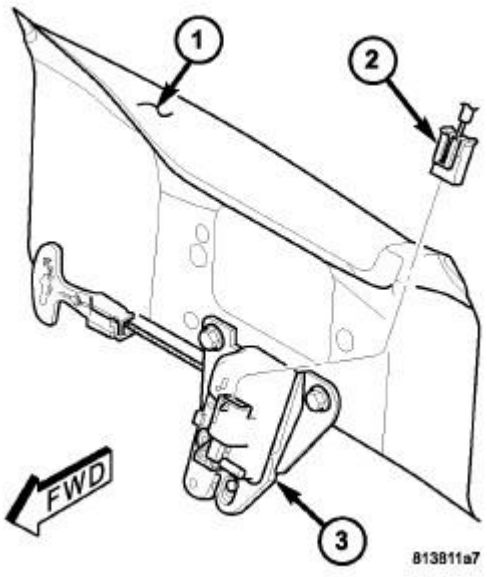

Fig. 464: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

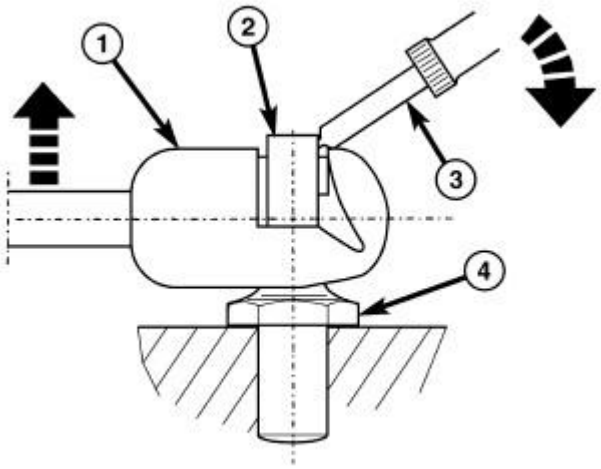

Fig. 465: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

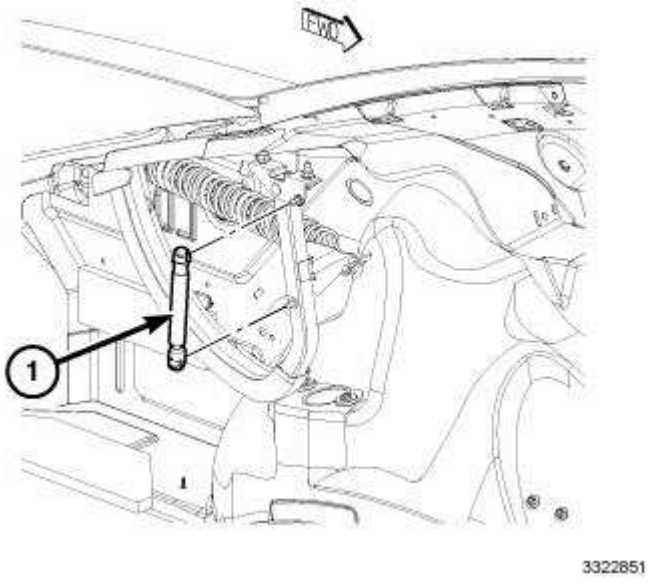

Fig. 466: MAP Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

3. Unlock and disconnect the electrical connector (1) from the MAP sensor.

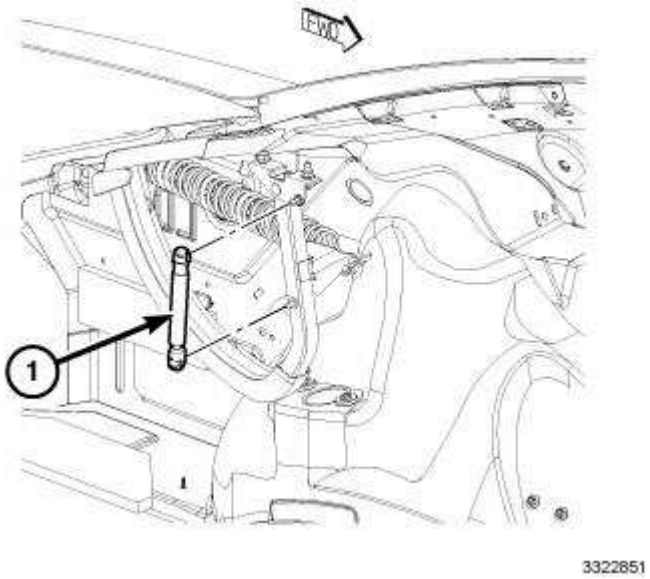

Fig. 467: Removing MAP Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Rotate the MAP sensor 1/4 turn counterclockwise and pull the sensor straight up and out of the upper intake manifold.

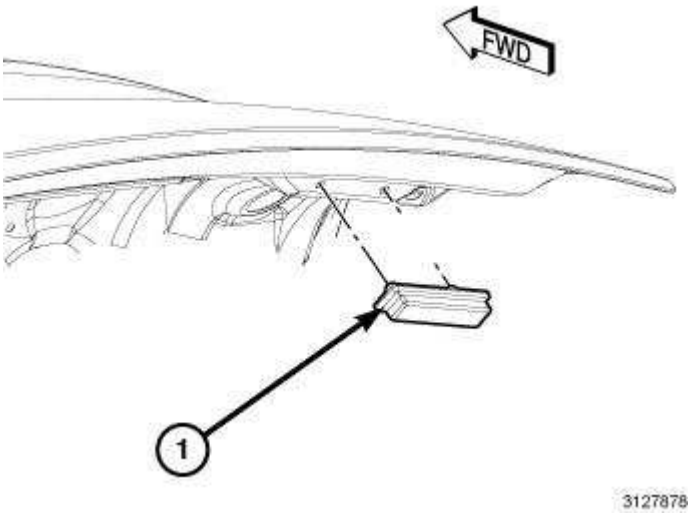

Fig. 468: O-Ring
Courtesy of CHRYSLER GROUP, LLC

5. The MAP sensor O-ring (1) can be reused if not damaged.

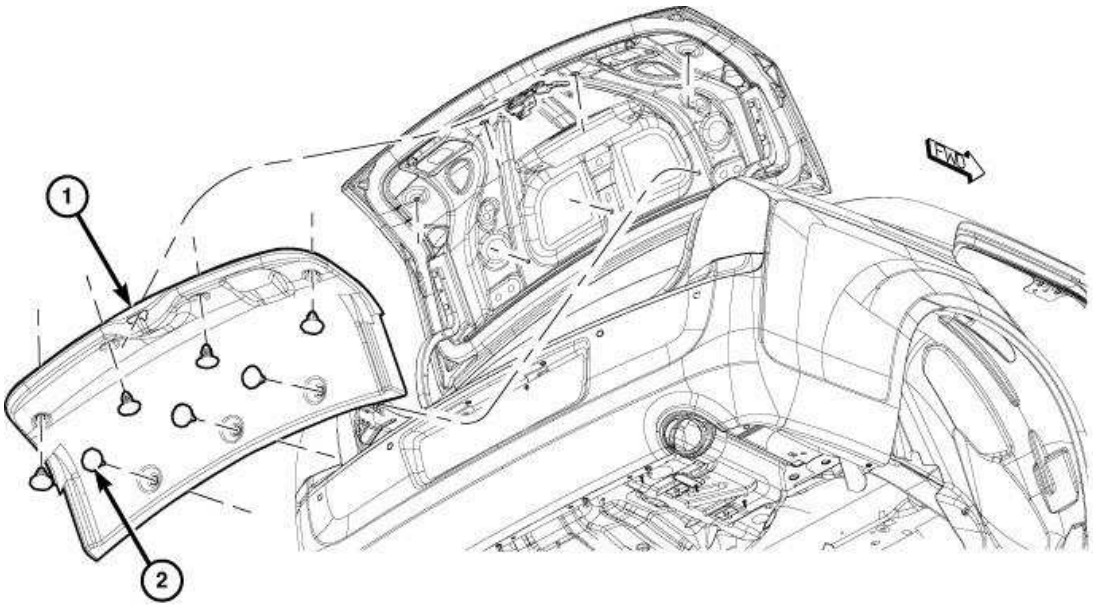

Fig. 469: MAP Sensor Location - 5.7L
Courtesy of CHRYSLER GROUP, LLC

The Manifold Absolute Pressure (MAP) sensor (3) is mounted into the top/rear of the intake manifold (4) near the cowl/hood seal (1).

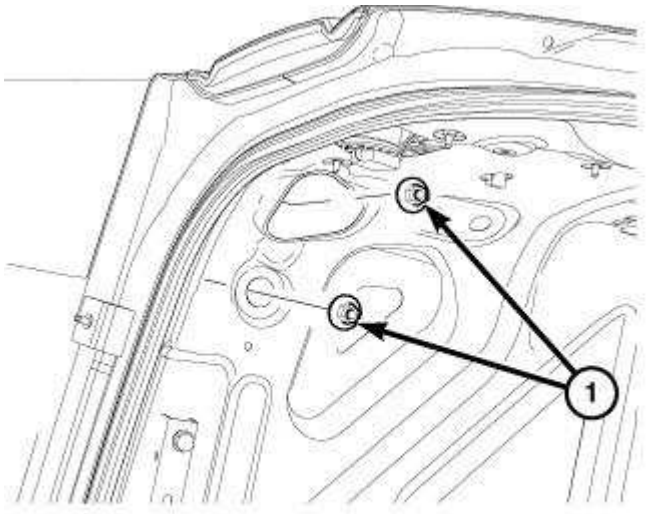

Fig. 470: 5.7L MAP Sensor R/I
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect electrical connector at sensor by sliding release lock out (1). Press down on lock tab

(2) for removal.

2. Rotate sensor 1/4 turn counter-clockwise for removal.
3. Check condition of sensor o-ring.

INSTALLATION

3.6L

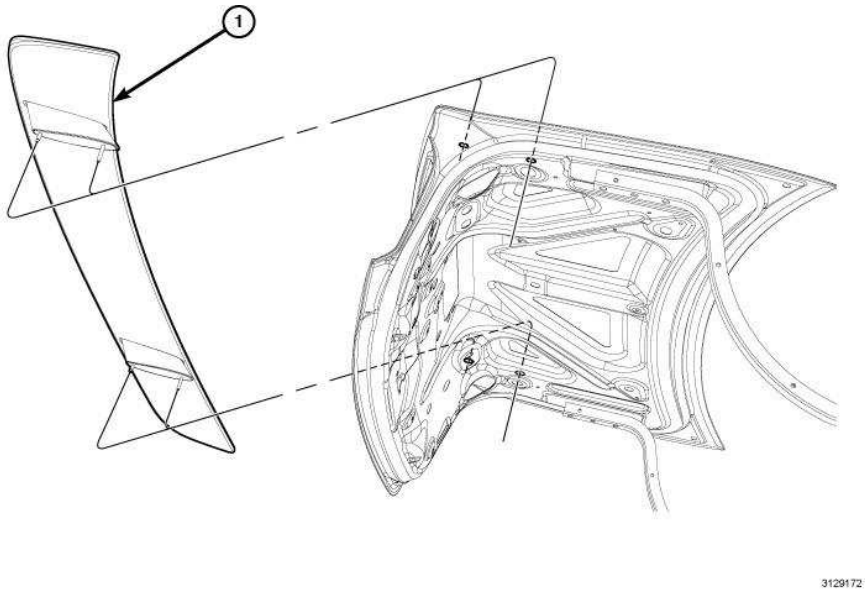

Fig. 471: O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. The manifold air pressure (MAP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the sensor O-ring (1).

Courtesy of CHRYSLER GROUP, LLC

5. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

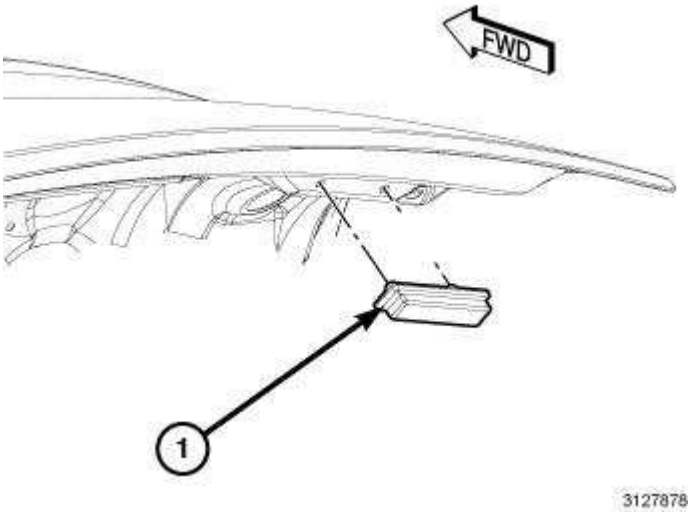

Fig. 475: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

5.7L

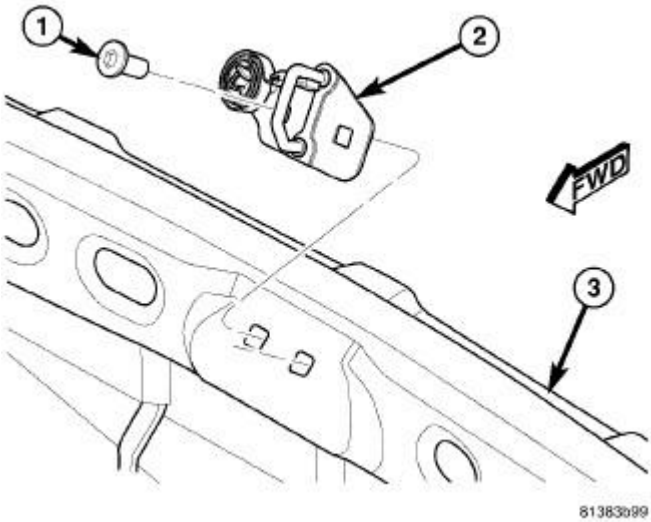

Fig. 476: MAP Sensor Location - 5.7L
Courtesy of CHRYSLER GROUP, LLC

1. Clean MAP sensor mounting hole at intake manifold.

2. Check MAP sensor o-ring seal for cuts or tears.
3. Position sensor (3) into intake manifold.
4. Rotate sensor 1/4 turn clockwise for installation.
5. Connect electrical connector (2) to sensor (3).

SENSOR, OXYGEN

REMOVAL

3.6L

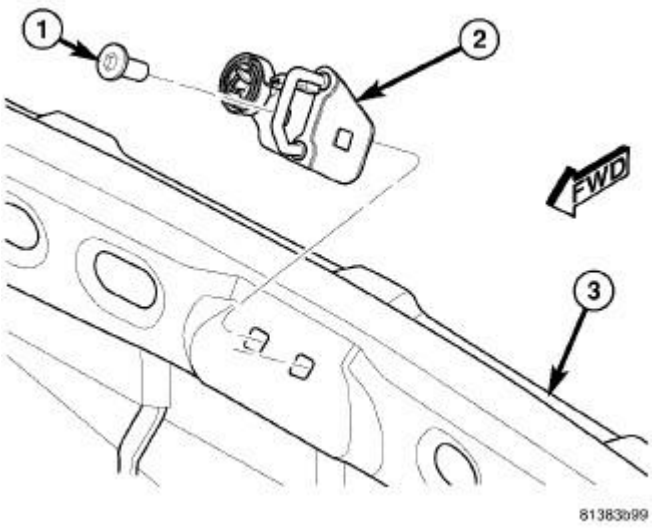

Fig. 477: Right Upstream/Downstream Oxygen Sensors & Left Upstream/Downstream Oxygen Sensors
Courtesy of CHRYSLER GROUP, LLC

The engine is equipped with four heated oxygen sensors:

- The right upstream oxygen sensor (1) is referred to as the 1/1 sensor.
- The right downstream oxygen sensor (2) is referred to as the 1/2 sensor.
- The left upstream oxygen sensor (4) is referred to as the 2/1 sensor.
- The left downstream oxygen sensor (3) is referred to as the 2/2 sensor.

WARNING: The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

3. Disconnect the heated oxygen sensor electrical connector.
4. Remove the oxygen sensor.
5. Clean the exhaust pipe threads using an appropriate tap.

5.7L

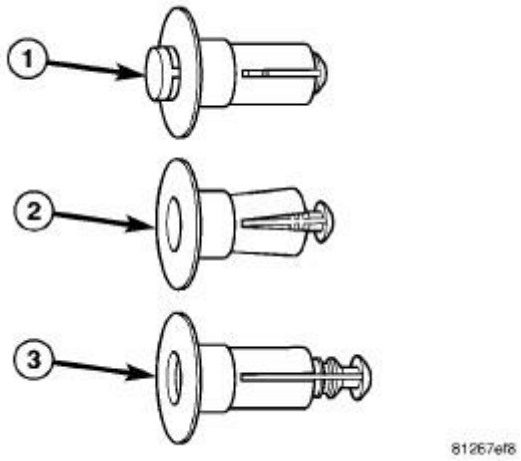

Fig. 478: O2S Sensors
Courtesy of CHRYSLER GROUP, LLC

UPSTREAM O2S SENSORS

1. Raise and support the vehicle.

WARNING: The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

2. Disconnect the O2S sensors (1, 2) electrical connectors.
3. Remove the left catalytic converter heat shield.
4. Using the appropriate oxygen sensor removal/installation tool, remove the O2S sensors.
5. Clean the threads in the exhaust pipes using an appropriate tap.

DOWNSTREAM O2S SENSORS

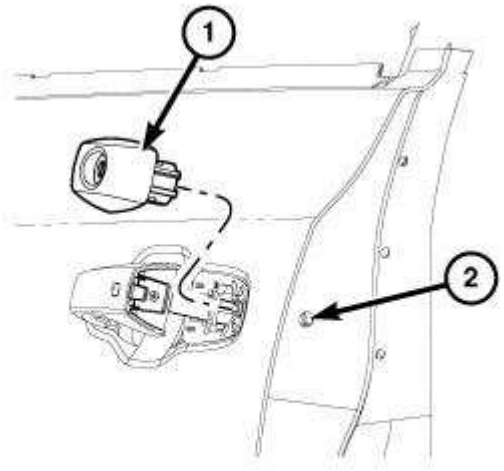
1. Raise and support the vehicle.
2. Support the transmission with a safety stand or suitable jack, remove the crossmember retaining bolts and slightly lower the transmission to gain access to the O2S sensor electrical connectors.

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

3. Disconnect the O2S sensors (3, 4) electrical connectors.
4. Using the appropriate oxygen sensor removal/installation tool, remove the O2S sensors.
5. Clean the threads in the catalytic converters using an appropriate tap.

INSTALLATION

3.6L



3328990

Fig. 479: Right Upstream/Downstream Oxygen Sensors & Left Upstream/Downstream Oxygen Sensors
Courtesy of CHRYSLER GROUP, LLC

The engine is equipped with four heated oxygen sensors:

- The right upstream oxygen sensor (1) is referred to as the 1/1 sensor.
- The right downstream oxygen sensor (2) is referred to as the 1/2 sensor.
- The left upstream oxygen sensor (4) is referred to as the 2/1 sensor.
- The left downstream oxygen sensor (3) is referred to as the 2/2 sensor.

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound

such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**

2. Install the oxygen sensor and tighten to 50 N.m (37 ft. lbs.).

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.

3. Connect the heated oxygen sensor electrical connector.
4. Lower the vehicle.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

5.7L

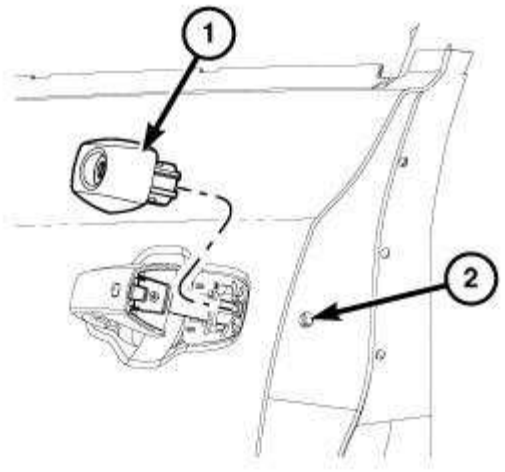


Fig. 480: O2S Sensors
Courtesy of CHRYSLER GROUP, LLC

DOWNSTREAM O2S SENSORS

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **Do not add any additional anti-seize compound to threads of a new oxygen sensor.**

1. Using the appropriate oxygen sensor removal/installation tool, install the O2S sensors (3, 4) and tighten to 41 N.m (30 ft. lbs.).
2. Connect the O2S sensors electrical connectors.
3. Raise the transmission and install the crossmember to frame bolts and tighten to 68 N.m (50 ft. lbs.), remove the safety stand or jack.
4. Lower the vehicle.

UPSTREAM O2S SENSORS

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **Do not add any additional anti-seize compound to threads of a new oxygen sensor.**

1. Using the appropriate oxygen sensor removal/installation tool, install the O2S sensors (1, 2) and tighten to 41 N.m (30 ft. lbs.).
2. Install the left catalytic converter heat shield.
3. Connect the O2S sensors electrical connectors.
4. Lower the vehicle.

SOLENOID, SHORT RUNNER VALVE

OPERATION

OPERATION

The SRV system operates under WOT conditions above 5000 RPM to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the solenoid. If the spike is not present, the PCM sets the DTC.

REMOVAL

REMOVAL - 5.7L

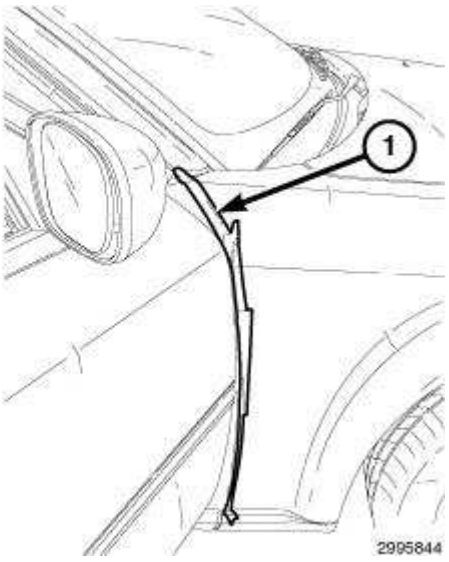

Fig. 481: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).

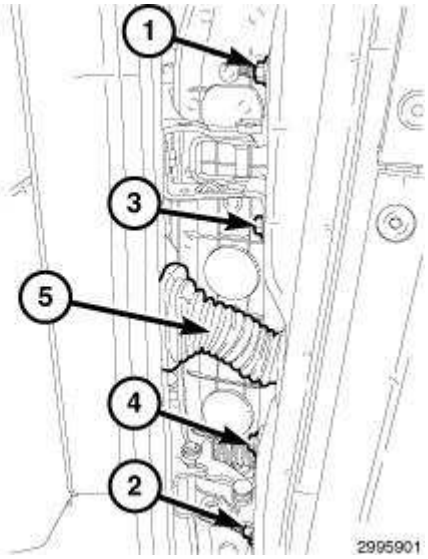

Fig. 482: Intake Manifold Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Remove the intake manifold and throttle body as an assembly Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD, INTAKE, REMOVAL** .

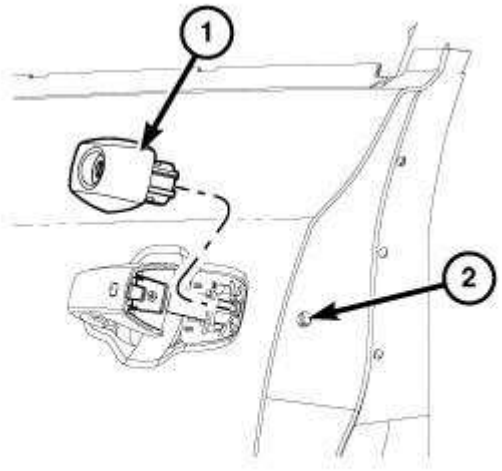
3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

CAUTION: Never have the ignition key in the ON position when checking the throttle body shaft for a binding condition. This may set DTC's.



3328990

Fig. 492: Electrical Connector, Electronic Throttle Control (ETC), Clip & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the electrical connector (1) from the Electronic Throttle Control (ETC) (2) and unfasten the ETC harness from the clip (4) on the throttle body.
9. Remove four throttle body mounting bolts (3).
10. Remove the throttle body from the upper intake manifold.
11. Check the condition of the throttle body-to-intake manifold seal. The seal can be reused if not damaged.

5.7L

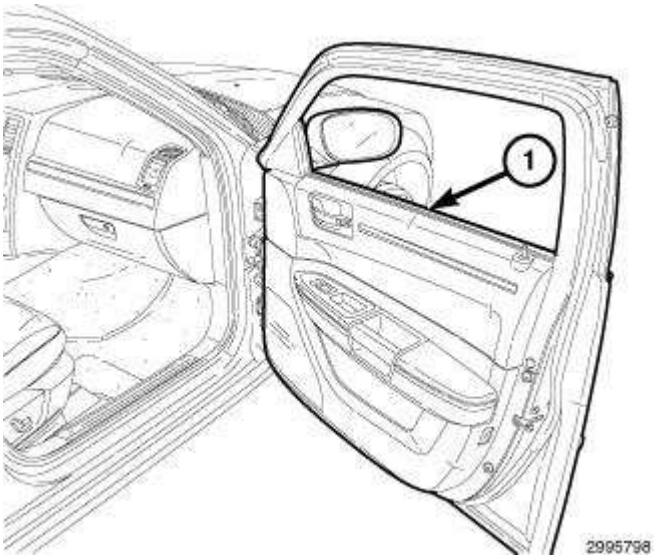


Fig. 493: Removing/Installing Throttle Body - 5.7L
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

1. Remove rubber air duct at front of throttle body.
2. Disconnect electrical connector (3) at throttle body (1).
3. Remove four throttle body mounting bolts (2).
4. Remove throttle body from intake manifold.

5. Check condition of throttle body o-ring (2) at front of intake manifold (1).

INSTALLATION

3.6L

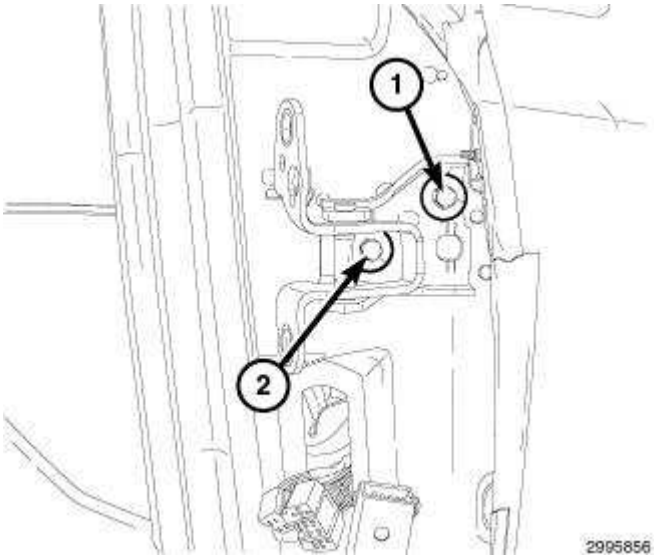

Fig. 495: Throttle Body-To-Intake Manifold Seal
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of the throttle body-to-intake manifold seal (1). The seal can be reused if not damaged.
2. Clean the mating surfaces of the throttle body and intake manifold.

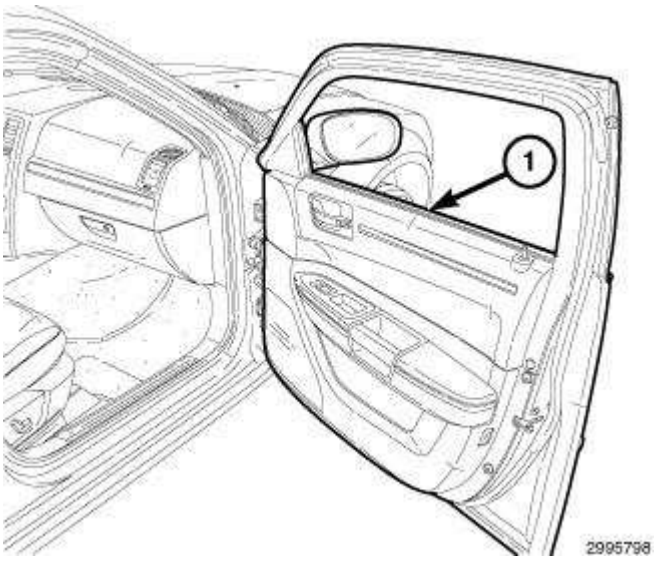

Fig. 496: Electrical Connector, Electronic Throttle Control (ETC), Clip & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Position the throttle body (2) to the intake manifold.
4. Install the throttle body mounting bolts (3) and tighten in a crisscross pattern sequence to 6 N.m

(53 in. lbs.).

5. Connect the electrical connector (1) to the Electronic Throttle Control (ETC) (2) and secure the ETC harness to the clip (4) on the throttle body.

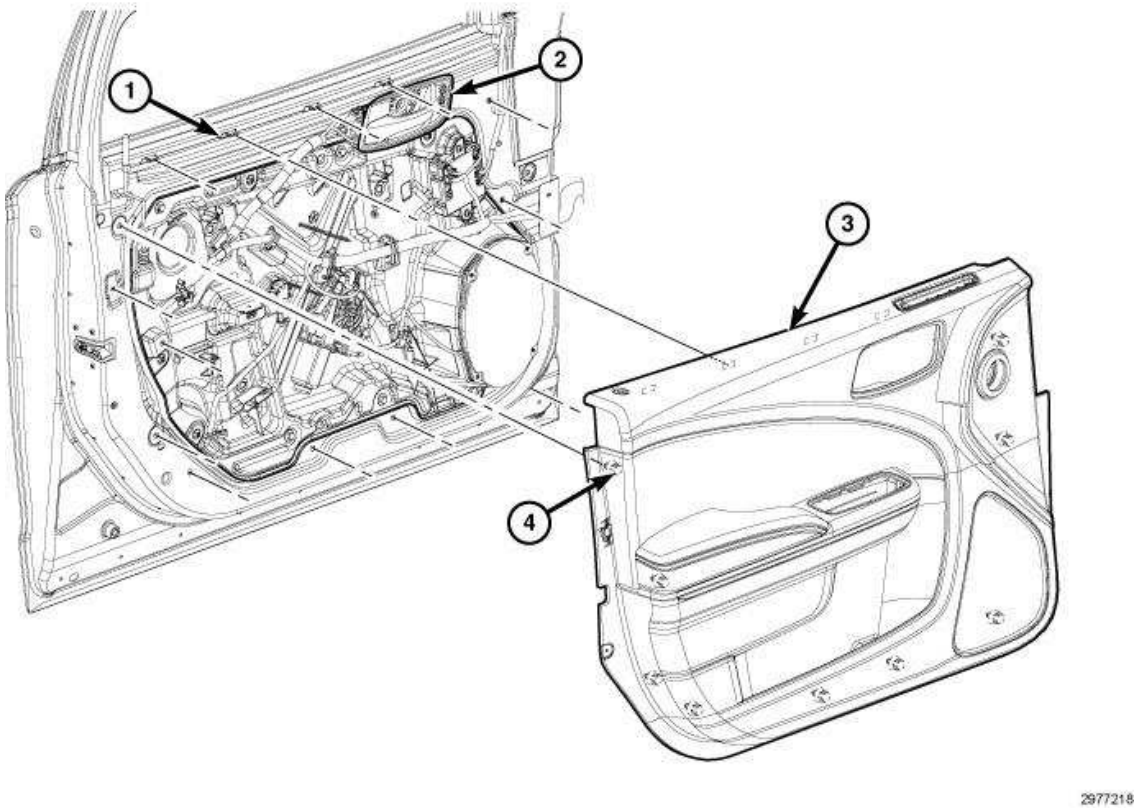

Fig. 497: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
7. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
8. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
9. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
10. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

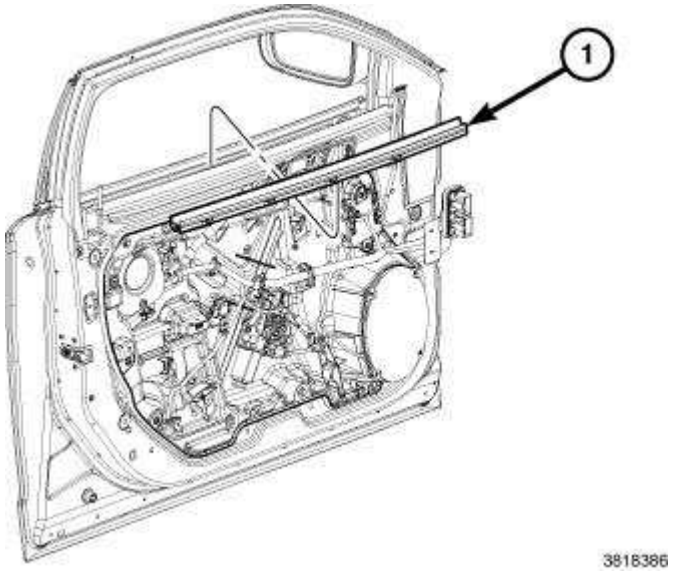

Fig. 498: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

11. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

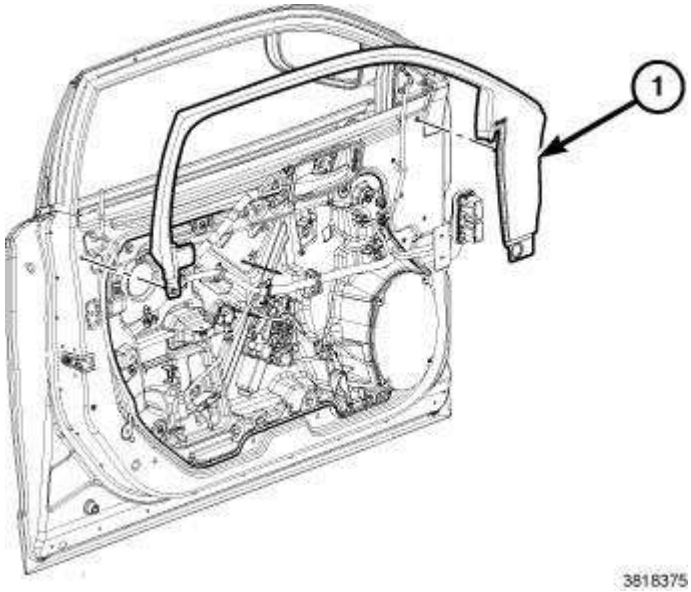

Fig. 499: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

12. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

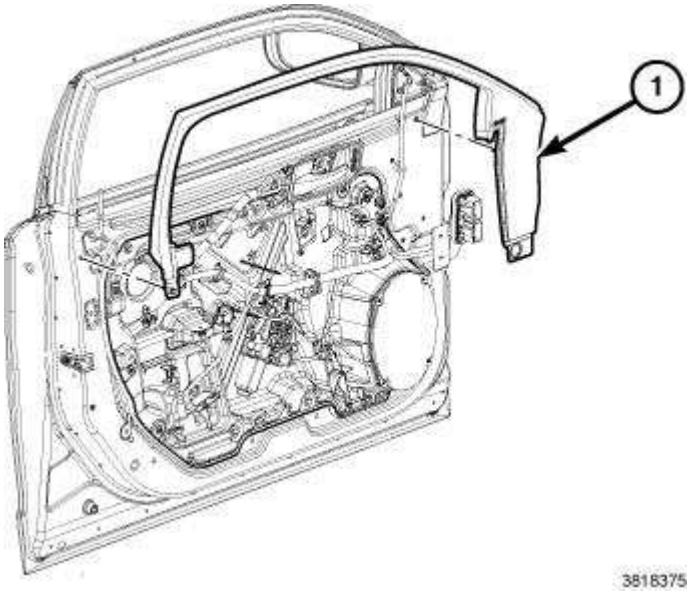

Fig. 500: Locating Throttle Body O-Ring AT Intake Manifold - 5.7L
Courtesy of CHRYSLER GROUP, LLC

1. Clean and check condition of throttle body-to-intake manifold o-ring (2).
2. Clean mating surfaces of throttle body and intake manifold (1).

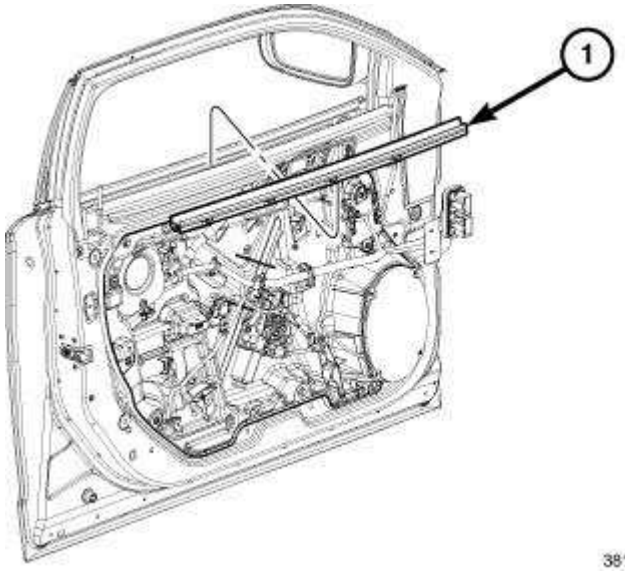

Fig. 501: Removing/Installing Throttle Body - 5.7L
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
4. Install and tighten four mounting bolts (2). Refer to **TORQUE** .

5. Install electrical connector (3).
6. Install rubber air hose to throttle body.
7. A Scan Tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not performed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

VALVE, SHORT RUNNER

DESCRIPTION

DESCRIPTION

The intake manifold features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold.

The SRV system operates under Wide Open Throttle conditions to maximize engine performance. When activated by the PCM, the SRV actuates a mechanical linkage to redirect the intake air flow to eight short runners. The PCM looks for a signal feedback when the actuator is activated. If the signal feedback is not present, the PCM sets the DTC.

REMOVAL

REMOVAL

ACCESSORIES AND EQUIPMENT

Heated/Cooled Accessories - Service Information - Chrysler 300

DESCRIPTION

HEATED/COOLED CUPHOLDER

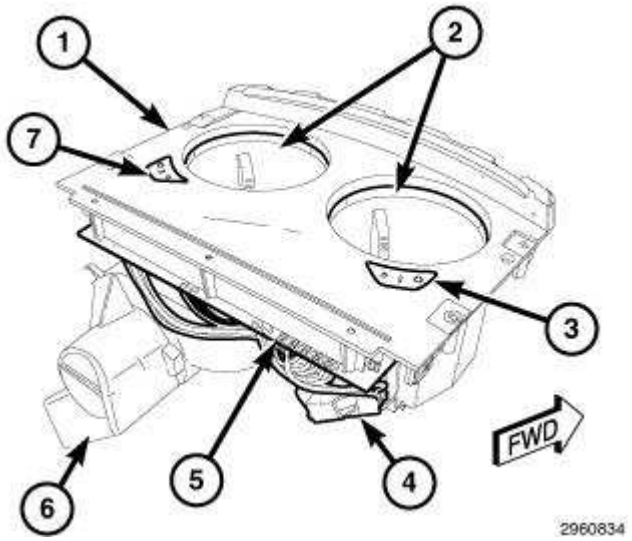

Fig. 1: Heated And Cooled Cupholder Assembly
Courtesy of CHRYSLER GROUP, LLC

The heated and cooled cupholder assembly (1) is located in the center console, when equipped. The two heated and cooled cupholders (2) can heat the container placed within them to 60° C (140° F) or cool the container to near 1.6° C (35° F). Each heated and cooled cupholder has a Positive Temperature Coefficient (PTC) ceramic element attached to an aluminum cylinder, that forms the side of the cupholder. A circuit board (5) with a heat sink controls the unit's function, and the wiring connector (4) connects it to a lead of the center console wire harness. The integral ventilation duct (6) helps dissipate the heat from within the cupholder assembly. The each cupholder is controlled through a switch (3 and 7). The Light Emitting Diodes (LEDs) in each switch, illuminate blue to indicate when the cupholder is set to cool, or red when set to heat.

HEATED STEERING WHEEL

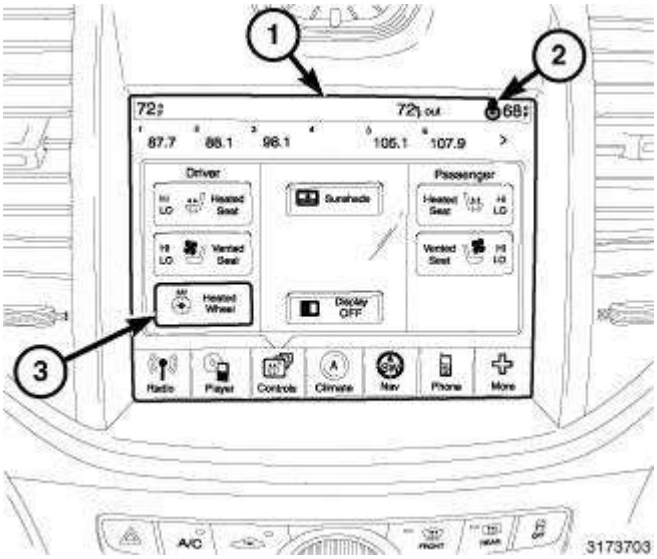

Fig. 2: U-Connect Touch(TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The heated steering wheel system is designed to enhance the thermal comfort of the driver by heating the steering wheel, when desired. The steering wheel heating element is made of copper wire and is sandwiched between the leather and the substrate material of the steering wheel. A vehicle with a heated steering wheel can easily be identified by the heated steering wheel switch (3) located in the U-Connect Touch ™ screen module (1), at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates and an International Standards Organization (ISO) symbol (2) appears in the top corner of the U-Connect Touch ™ screen module.

The heated steering wheel system consists of the following major components

- **Heated Steering Wheel Switch** - Refer to **SWITCH, HEATED STEERING WHEEL, DESCRIPTION**.
- **Heated Seat Module (HSM)** - (also know as the comfort seat wheel module). Refer to **MODULE, HEATED SEAT, DESCRIPTION** .
- **Heated Steering Wheel** - Refer to **OPERATION**.

VENTED SEATS

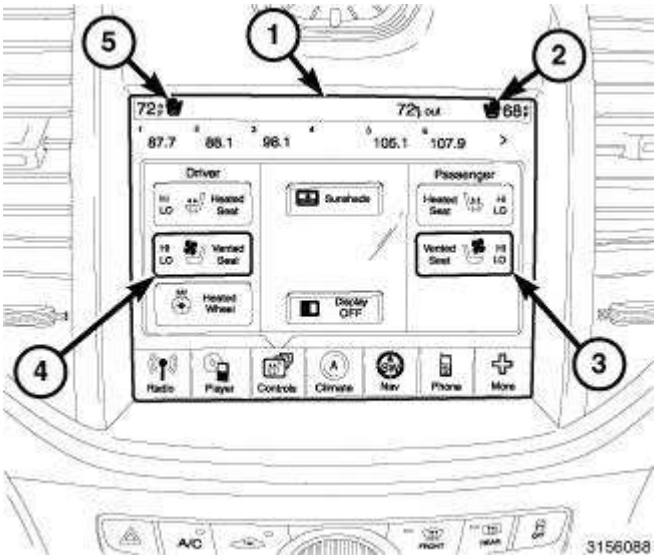

Fig. 3: U-Connect Touch(TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the driver and front seat occupant, when desired. Occupant comfort is achieved by pulling air from the outside of the seating surfaces into the seat back and cushion of the seat. Vehicles with the optional vented seat system can be visually identified by the two vented seat switches (3 and 4) located in the U-Connect Touch™ screen module (1), in the center of the instrument panel. The vented seat system allows a ventilated seat occupant to select from two different levels of seat venting (HI and LO).

The vented seat system consist of the following major components:

- **Vented Seat Motors** - Four vented seat motors are used per vehicle. Two vented seat motors for each front seat, one for the seat back cushion and the other for the seat bottom cushion. Refer to **MOTOR, VENTED SEAT, DESCRIPTION**.
- **Vented Seat Pads** - Four vented seat pads are used per vehicle. Two vented seat pads for each front seat, one on the seat back cushion and the other on the seat bottom cushion.
- **Vented Seat Switches** - Two vented seat switches are used per vehicle, one for each front seat. The vented seat switches are integral to the U-Connect Touch™ screen module and communicate over the Controller Area Network (CAN) data bus. Refer to **SWITCH, VENTED SEAT, DESCRIPTION**.
- **Heated Seat Module** - One Heated Seat Module (HSM) is used per vehicle. The HSM is mounted under the front passenger seat and contains the control logic and software for the vented seat system. The HSM communicates over the CAN data bus. Refer to **MODULE, HEATED SEAT, DESCRIPTION** .

OPERATION

HEATED/COOLED CUPHOLDER

When the ignition is in the Run position, battery voltage is supplied through a fuse to the heated and

cooled cupholder assembly circuit board. The two heated and cooled cupholders can heat up to 60° C (140° F) or cool to near 1.6° C (35° F). When a cupholder is on, either the red or blue Light Emitting Diode (LED) in the cupholder switch illuminates to indicate which function is operating. The blue LED illuminates when a cupholder is set to cool, and red illuminates when set to heat.

A Positive Temperature Coefficient (PTC) ceramic element provides the temperature change in each of the cupholders. Direct Current (DC) either heats or cools the PTC ceramic element, depending on which way current is applied through the element. Each PTC ceramic element is attached to an aluminum cylinder that forms the side of a cupholder. The PTC material used in each heated and cooled cupholder has the unique property of very low resistance to electric current. This allows them to change temperature rapidly and to transfer heat quickly. The PTC ceramic elements are self-regulating. As a PTC ceramic element reaches the desired temperature, the resistance increases dramatically, preventing an excessive temperature. The desired temperature is determined by the chemical makeup of the ceramic material. The aluminum cylinders distribute and transfer the heat from the relatively small PTC elements to the beverage containers. In addition, a heat sink is used to increase heat transfer area.

A special mug is included with the heated and cooled cupholder to increase its effectiveness. The lower section of the mug is aluminum and fits closely within the cupholder to maximize the heat transfer potential. The upper section of the mug is insulated to keep the contents at the desired temperature.

The heated and cooled cupholder assembly cannot be adjusted or repaired and must be replaced if inoperative or damaged.

HEATED STEERING WHEEL

Operation of the steering wheel heating element is controlled by the Heated Seat Module (HSM), also know as the comfort seat wheel module. A temperature sensor is integrated into the steering wheel heating element that sends the temperature of the steering wheel to the HSM, which adjusts the temperature of the steering wheel heating element accordingly. The normal heating cycle of the steering wheel will last a minimum of 52 minutes, unless the switch is pressed again. The heated steering wheel system will automatically shut off if the heating element reaches a temperature greater than 50° C (122° F), or if a fault is detected. If for any reason a fault in the heated steering wheel system becomes present, a Diagnostic Trouble Code (DTC) will set.

The heated steering wheel system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The steering wheel heating element is not serviced separately from the steering wheel and if inoperative or damaged, the entire steering wheel assembly must be replaced. Refer to **WHEEL, STEERING, REMOVAL** .

VENTED SEATS

The vented seat assemblies are located internally to both front seats. The driver and front passenger vented seats are turned on and off by two separate switches located in the U-Connect Touch™

screen module. The vented seats will only operate when the engine is running, and will always stay off unless a vented seat switch is pressed. The vented seats are controlled by the Heated Seat Module (HSM), also know as the comfort seat wheel module. The HSM provides variable analog voltages that drive two 12 volt Direct Current (DC) motors. One motor is located in the seat back and the other motor is mounted to the seat bottom pan. Each press of a vented seat switch will cause the vented seat fan to change speeds from off to HI, HI to LO and LO to off. Both vented seats operate separately from each other and will not operate at the same time as the heated seats.

The vented seat system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED AND COOLED CUPHOLDER

NOTE: **NOTE: The heated and cooled cupholder has a low and high voltage cut-off feature that turns the cupholder off if vehicle voltage falls below 9.8 volts, or if voltage goes above 16.2 volts. Be certain to check the vehicle electrical system for proper operation anytime the heated and cooled cupholder appears inoperative.**

NOTE: **See Wiring Information for complete circuit schematics and connector pin-out details.**

The heated and cooled cupholders only operate when the ignition is in RUN. The heated and cooled cupholders have a low and high voltage cut-off feature that turns the cupholders off if vehicle voltage falls below 9.8 volts, or if voltage goes above 16.2 volts. Before any testing of the heated and cooled cupholder assembly is attempted, the battery should be fully charged and the charging system checked for proper operation. Refer to **BATTERY, STANDARD PROCEDURE** and **DIAGNOSIS AND TESTING** .

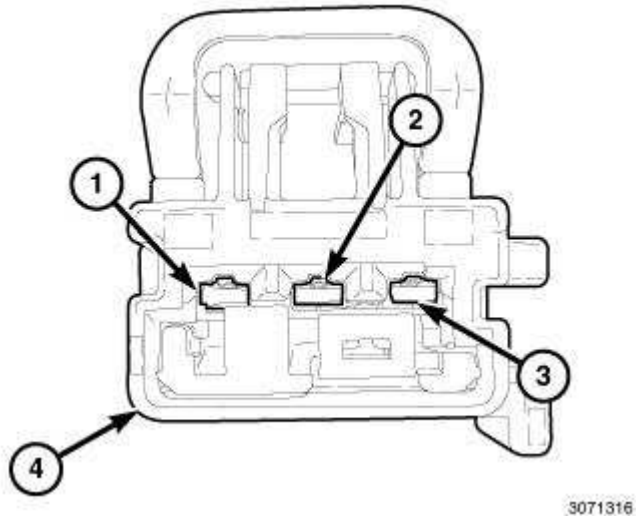

Fig. 4: Fuses & Power Distribution Center (PDC)

Courtesy of CHRYSLER GROUP, LLC

1. Check the ignition run fuse in the Power Distribution Center (PDC). If the fuse is OK, proceed to Step 2. If the fuse is not OK, see Wiring Information, repair the shorted circuit and replace the fuse.
2. Remove the heated and cooled cupholder assembly to gain access to the vehicle wire harness connector (4) for the cupholder. Refer to **CUPHOLDER, HEATED/COOLED, REMOVAL**.
3. Using a Digital Voltage and Ohm Meter (DVOM), with the ignition in RUN, check pin 1 for battery voltage. If OK, go to Step 4. If not OK, see Wiring Information and repair the vehicle wiring as required.
4. Using a DVOM, with the vehicle lights on, check pin 2 for battery voltage. If OK, go to Step 5. If not OK, see Wiring Information and repair the vehicle wiring as required.
5. Using a DVOM, check pin 3 for a good ground. If OK, replace the heated and cooled cupholder assembly. Refer to **CUPHOLDER, HEATED/COOLED, REMOVAL**. If not OK, see Wiring Information and repair the vehicle wiring as required.

HEATED STEERING WHEEL

NOTE: Vehicles equipped with the heated steering wheel option utilize a low voltage cut-off feature. This feature turns off power to the heated steering wheel anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated steering wheel appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, move the steering wheel around while testing continuity. also wiggle the heated steering wheel wire harness and electrical connectors while testing continuity.

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Before testing any individual components in the heated steering wheel system, check the following:

- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), U-Connect Touch ™ screen module and the Telematics Gateway (TGW). If any DTCs are found, repair as necessary (Refer to appropriate Diagnostics for more information).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated steering wheel system.
- If there are no DTCs and the heated steering wheel system functions properly, but the heated

steering wheel indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

VENTILATED SEATS

NOTE: Vehicles equipped with the ventilated seat option utilize a low voltage cut-off feature. This feature turns off power to the ventilated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the ventilated seat system appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around within the seat while testing continuity. also wiggle the ventilated seat wire harness and electrical connectors while testing continuity.

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Before testing any individual components in the ventilated seat system, check the following:

- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), U-Connect Touch ™ screen module and the Telematics Gateway (TGW). If any DTCs are found, repair as necessary (Refer to appropriate DTC-Based Diagnostics for more information).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the front vented seat system.
- If there are no DTCs and the front vented seat system functions properly, but a vented seat indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

CUPHOLDER, HEATED/COOLED

REMOVAL

REMOVAL

NOTE: Take the proper precautions to protect the center floor console from cosmetic damage.

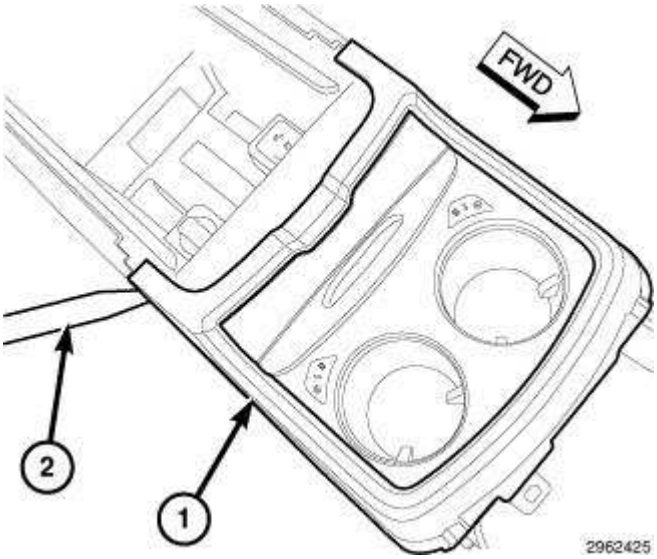

Fig. 5: Center Console Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the shifter bezel from the center floor console. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Using Trim Stick (special tool #C-4755, Trim Stick) (2) or equivalent, carefully disengage the retaining clips that secure the center console bezel (1) to the center floor console and remove the bezel.

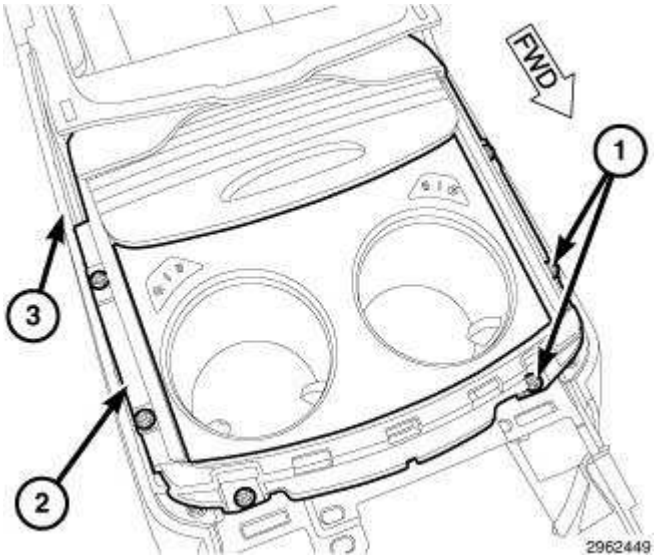

Fig. 6: Screws, Shade Door & Center Floor Console
Courtesy of CHRYSLER GROUP, LLC

4. Remove the six screws (1) that secure the shade door (2) to the center floor console (3) and remove the door.

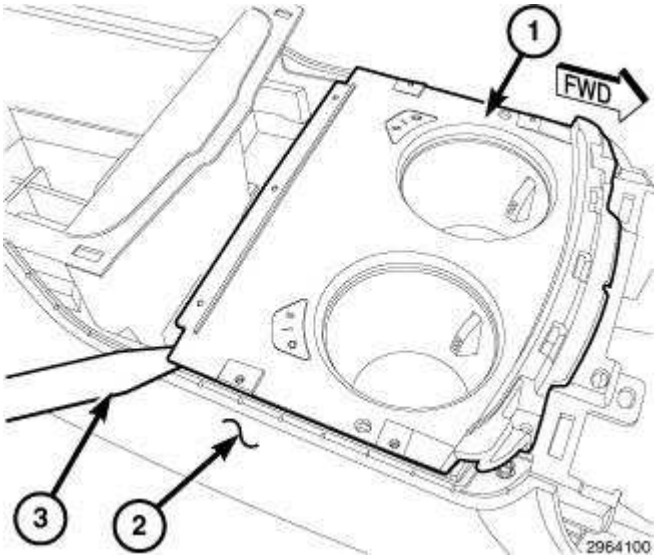

Fig. 7: Shade Door
Courtesy of CHRYSLER GROUP, LLC

5. Using Trim Stick (special tool #C-4755, Trim Stick) (3) or equivalent, carefully disengage the retaining clips that secure the heated/cooled cupholder assembly (1) to the center floor console (2).

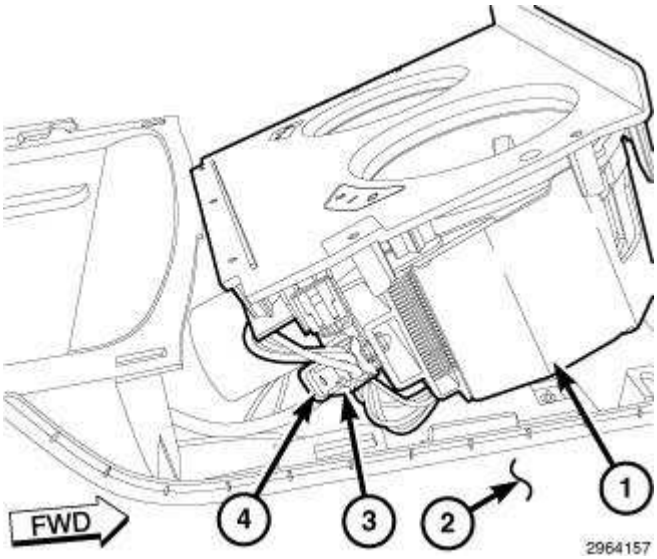

Fig. 8: Heated/Cooled Cupholder Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the console wire harness (4) from the cupholder connector (3) and remove the heated/cooled cupholder assembly (1) from the center floor console (2).

INSTALLATION

INSTALLATION

NOTE: **Take the proper precautions to protect the center floor console from cosmetic damage.**

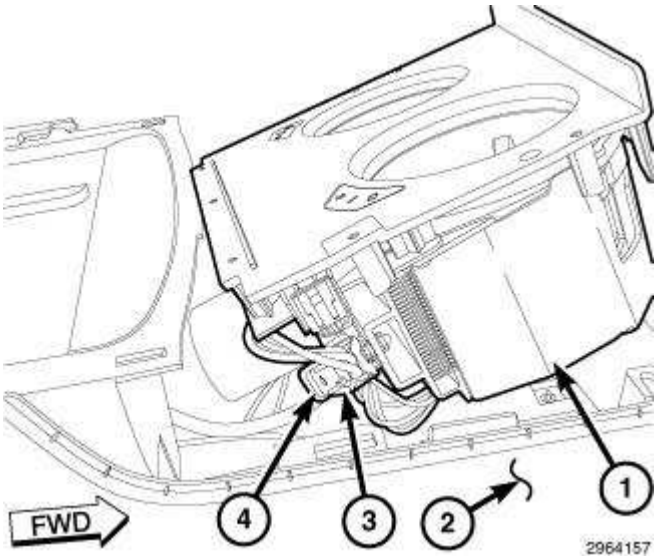

Fig. 9: Heated/Cooled Cupholder Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the heated/cooled cupholder assembly (1) to the center floor console and (2) connect the console wire harness (4) to the cupholder connector (3).

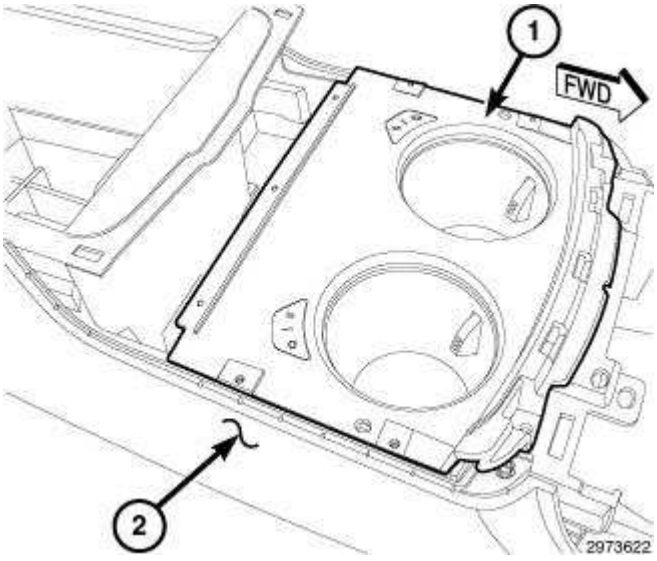

Fig. 10: Heated/Cooled Cupholder Assembly & Center Floor Console
Courtesy of CHRYSLER GROUP, LLC

2. Engage the retaining clips that secure the heated/cooled cupholder assembly (1) to the center floor console (2).

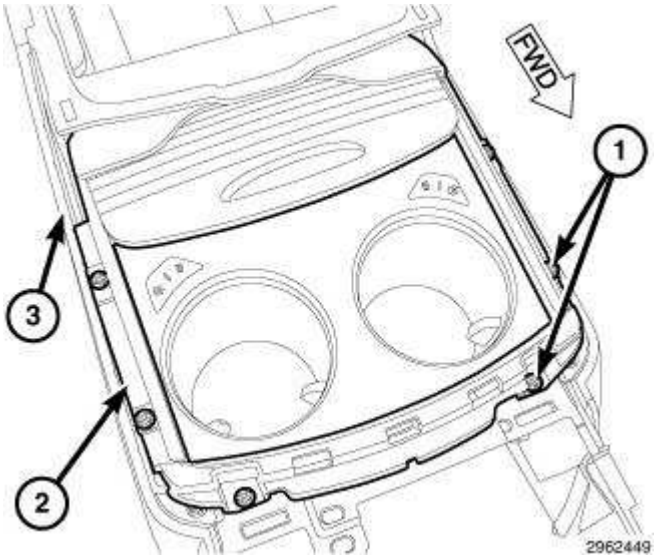

Fig. 11: Screws, Shade Door & Center Floor Console
Courtesy of CHRYSLER GROUP, LLC

3. Install the six screws (1) that secure the shade door (2) to the center floor console (3). Tighten the screws to 2 N.m (17 in. lbs.).

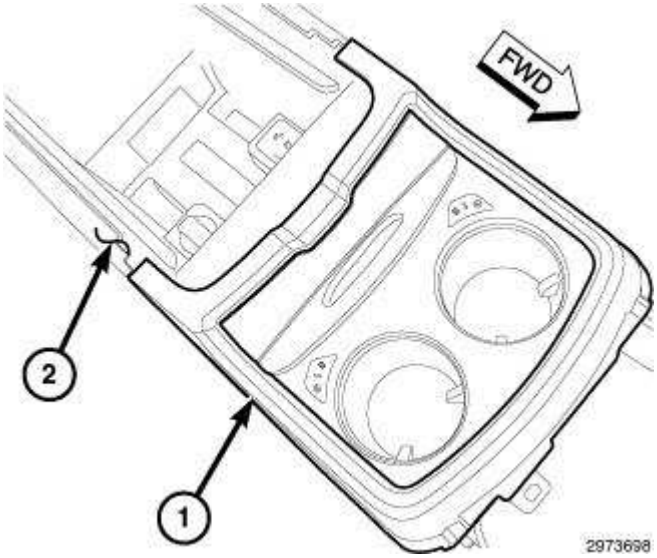

Fig. 12: Center Console Bezel & Center Floor Console
Courtesy of CHRYSLER GROUP, LLC

4. Position the center console bezel (1) to the center floor console (2) and engage the retaining clips. Make sure the retaining clips are fully engaged.
5. Install the shifter bezel to the center floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .
6. Reconnect the negative battery cable.
7. Verify proper heated/cooled cupholder operation.

MOTOR, VENTED SEAT

DESCRIPTION

DESCRIPTION

NOTE: Seat bottom motor shown in illustration. Seat back motor similar.

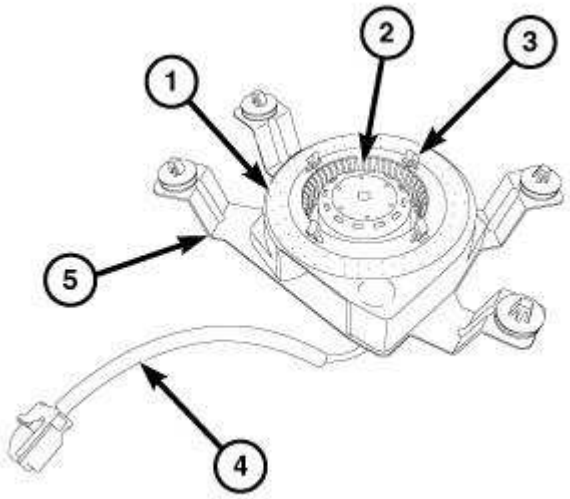

Fig. 13: Vented Seat Motors, Integral Fan Blade, Wire Lead And Connector & Metal Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

When equipped, each front seat has two vented seat motors (1). One motor is mounted to the seat back frame and the second motor is mounted to the seat bottom pan. Each vented seat motor is attached to a vented seat pad.

Each vented seat motor consists of a 12 volt Direct Current (DC) motor with an integral fan blade (2) and a wire lead and connector (4). Each vented seat motor is attached to a metal mounting bracket (5) and has four plastic tabs (3) that secure the motor to the vented pad.

OPERATION

OPERATION

The vented seat motors will only operate with the engine running and will not operate at the same time as the heated seats. The vented seat motors are controlled by the Heated Seat Module (HSM), also know as the comfort seat wheel module. The HSM provides the vented seat motors with variable analog voltages giving the motors two selectable speeds. These speeds are selected by the driver and/or front passenger by pressing the vented seat switches, located in the U-Connect Touch™ screen module. Switching the vented seats on while the heated seats are already operating will disable the heating of the seat and start the venting of the seat. Both front vented seats work independently from each other, so that the driver and front passenger can choose there own settings

for individual comfort preferences.

The vented seat system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The vented seat motor located in the seat bottom pan cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **MOTOR, VENTED SEAT, REMOVAL**.

The vented seat motor located in the seat back frame cannot be adjusted or repaired and the entire seat back frame must be replaced if the motor is inoperative or damaged. Refer to **COVER, SEAT BACK, FRONT, REMOVAL** .

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The vented seat motor located in the seat back frame cannot be serviced separately. The entire seat back frame must be replaced if the vented seat back motor is inoperative or damaged. Refer to COVER, SEAT BACK, FRONT, REMOVAL .

NOTE: On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Refer to MODULE, OCCUPANT RESTRAINT CONTROLLER, DESCRIPTION .

NOTE: Driver seat shown in illustrations. Passenger seat similar.

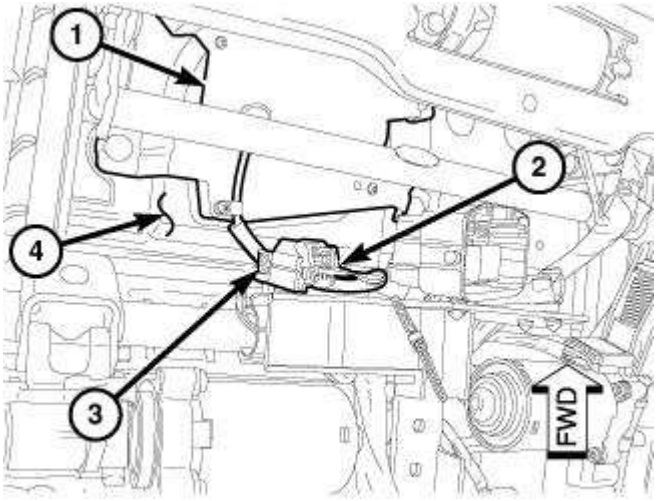

Fig. 14: Electrical Connectors & Vented Seat Motor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat and place it on a workbench. Refer to **SEAT, FRONT, REMOVAL** .
3. When servicing the driver seat, remove the memory seat module and bracket. Refer to **MODULE, MEMORY, REMOVAL** .
4. When servicing the passenger seat, remove the heated seat module and bracket. Refer to **MODULE, HEATED SEAT, REMOVAL** .
5. Disconnect the electrical connectors (2 and 3) for the vented seat motor (1), located on the seat bottom pan (4).

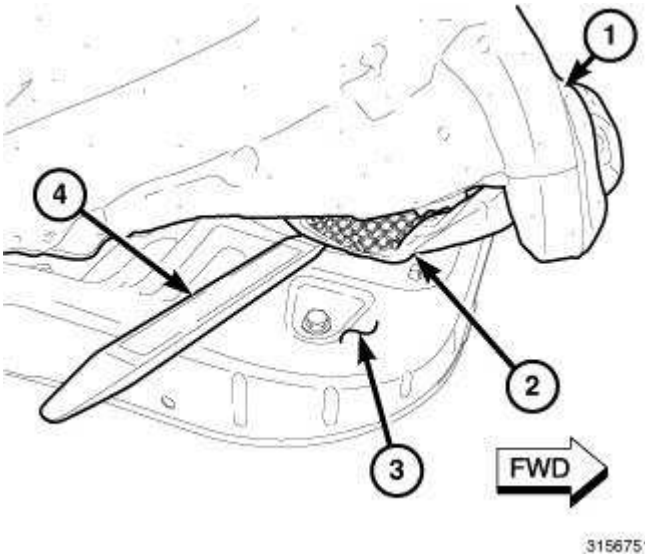

Fig. 15: Seat Bottom Pan, Trim Stick & Seat Bottom Cushion And Cover
Courtesy of CHRYSLER GROUP, LLC

6. Partially remove the seat bottom cushion and cover (1) from the seat bottom pan (3) to gain access to the vented seat motor. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** or **COVER, SEAT CUSHION, SECOND ROW, REMOVAL** .
7. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (4), carefully disengage the four retaining tabs that secure the vented seat pad (2) to the vented seat motor.

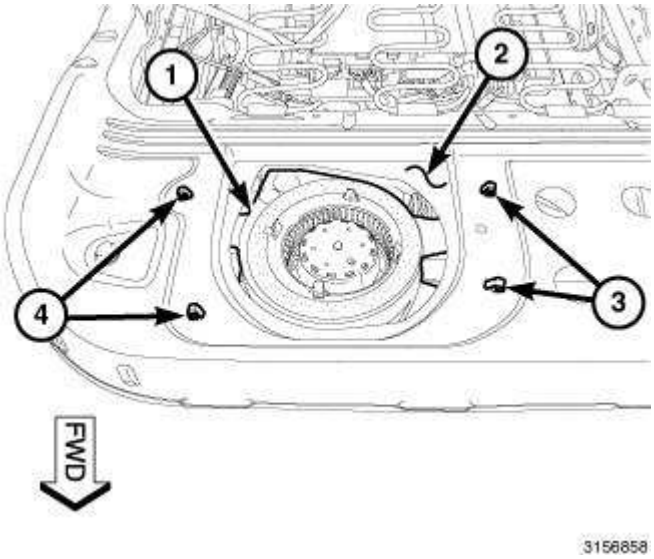

Fig. 16: Seat Bottom Pan, Vented Seat Motor & Four Plastic Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with seat cushion and cover removed from view for clarity. It is not necessary to completely remove the seat bottom cushion and cover from the seat bottom pan to service the vented seat motor.

8. Disengage the four plastic retainers (3 and 4) that secure the vented seat motor (1) to the seat bottom pan (2).
9. Remove the vented seat motor from underneath the seat bottom pan.

INSTALLATION

INSTALLATION

NOTE: On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Refer to MODULE, OCCUPANT RESTRAINT CONTROLLER, DESCRIPTION .

NOTE: Driver seat shown in illustrations. Passenger seat similar.

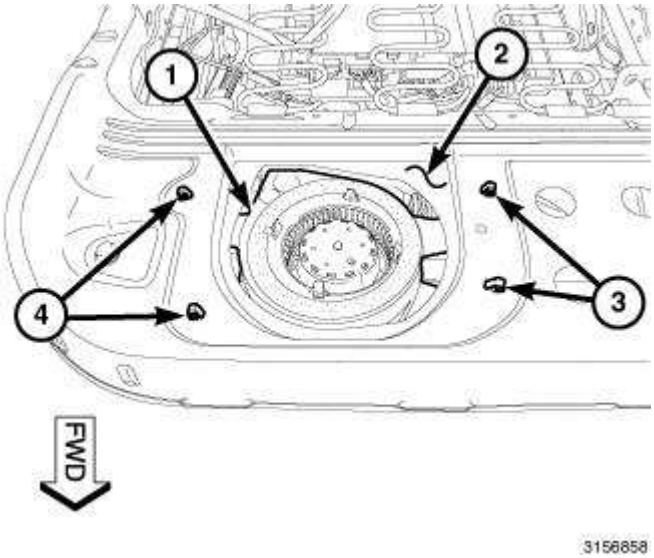

Fig. 17: Seat Bottom Pan, Vented Seat Motor & Four Plastic Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with seat cushion and cover removed from view for clarity. It is not necessary to completely remove the seat bottom cushion and cover from the seat bottom pan to service the vented seat motor.

1. Position the vented seat motor (1) underneath the seat bottom pan (2) and engage the four plastic retainers (3 and 4) to the pan. Be sure the retainers are fully engaged.

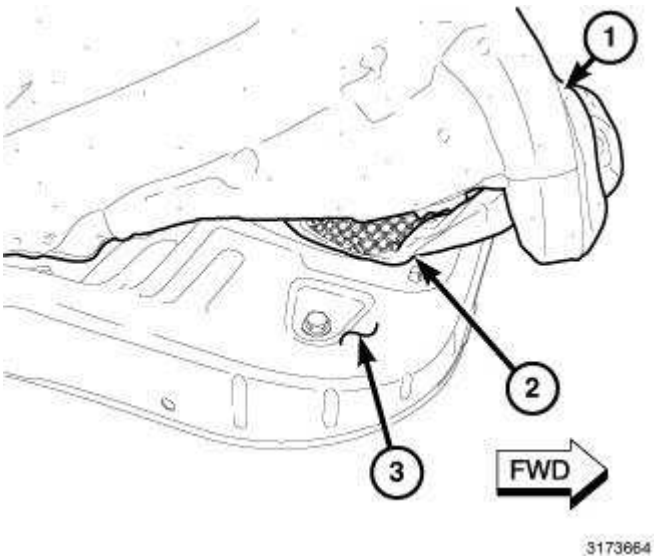

Fig. 18: Seat Bottom Pan, Vented Seat Motor Four Plastic Retainers
Courtesy of CHRYSLER GROUP, LLC

2. Connect the vented seat pad (2) to the vented seat motor and engage the four retaining tabs that secure the pad to the motor. Be sure the retaining tabs are fully engaged.
3. Install the seat bottom cushion and cover (1) onto the seat bottom pan (3). Refer to **COVER,**

SEAT CUSHION, FRONT, INSTALLATION or **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION** .

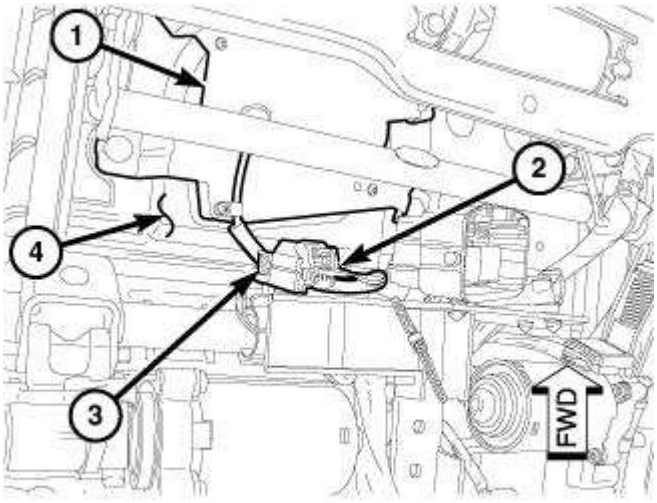

Fig. 19: Electrical Connectors & Vented Seat Motor
Courtesy of CHRYSLER GROUP, LLC

4. Connect the electrical connectors (2 and 3) for the vented seat motor (1), located under the seat bottom pan (4).
5. When servicing the driver seat, install the memory seat module and bracket. Refer to **MODULE, MEMORY, INSTALLATION** .
6. When servicing the passenger seat, install the heated seat module and bracket. Refer to **MODULE, HEATED SEAT, INSTALLATION** .
7. Install the seat. Refer to **SEAT, FRONT, INSTALLATION** .
8. Reconnect the negative battery cable.
9. Verify proper vented seat system operation.

SWITCH, HEATED STEERING WHEEL

DESCRIPTION

DESCRIPTION

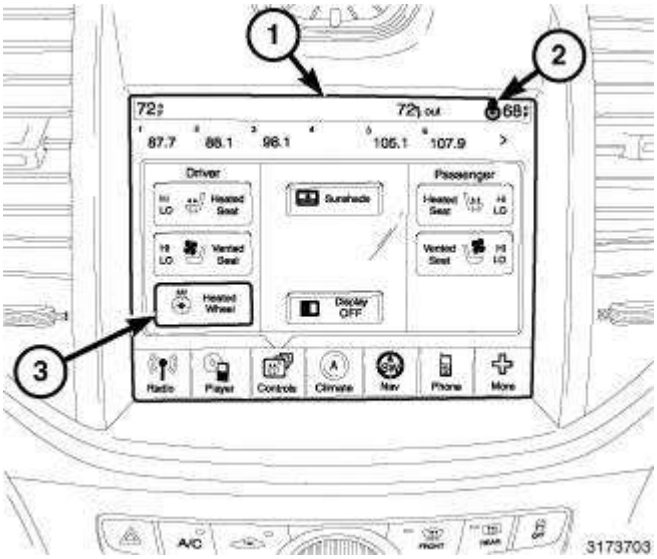

Fig. 20: U-Connect Touch(TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The switch (3) for the optional heated steering wheel is located in the U-Connect Touch ™ screen module (1), at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates and an International Standards Organization (ISO) symbol (2) appears at the top of the U-Connect Touch ™ screen module.

OPERATION

OPERATION

The heated steering wheel switch allows the driver to turn on and off the heated steering wheel. The heated steering wheel will remain off until the driver presses the switch. Once the switch is pressed, the switch will illuminate and an International Standards Organization (ISO) symbol appears in to top corner of the U-Connect Touch™ screen module, indicating that the heating element in the steering wheel is operating. Pressing the switch while the heated steering wheel is on, will turn the heating steering wheel off.

The heated steering wheel switch also functions as a visual indicator for a fault with the heated steering wheel system. When the heated steering wheel switch is pressed and a fault is present in the heated steering wheel system, the switch will illuminate for two seconds and then immediately turn off.

The heated steering wheel switch is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The heated steering wheel switch located in the U-Connect Touch™ screen module cannot be adjusted or repaired. If a heated steering wheel switch or indicator lamp is inoperative or damaged, the entire U-Connect Touch™ screen module must be replaced (Refer to appropriate service information).

SWITCH, VENTED SEAT

DESCRIPTION

DESCRIPTION

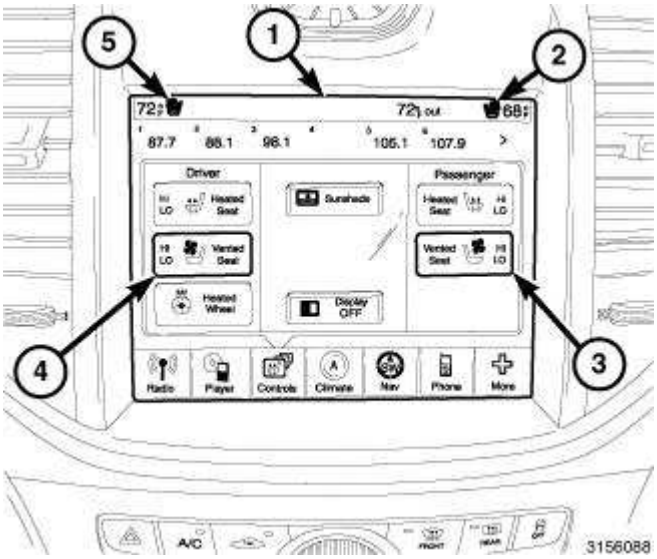

Fig. 21: U-Connect Touch(TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The switches (3 and 4) for the optional front vented seat system are located in the U-Connect Touch ™ screen module (1), at the center of the instrument panel. The vented seat system allows the driver and front seat passenger to select from two different speed of electrical seat ventilation (HI and LO). When the vented seat switches are pressed on, each switch illuminates either HI or LO, and an International Standards Organization (ISO) symbol (2 and 5) appears at the top of the U-Connect Touch ™ screen module. Pressing a vented seat switch once will select HI. Pressing the same switch a second time will select LO. Pressing the switch a third time will turn the ventilating function of the seat off.

OPERATION

OPERATION

When either of the front vented seat switches located in the U-Connect Touch ™ screen module are pressed with the engine running, a request signal is sent to the Heated Seat Module (HSM) (also know as the comfort seat wheel module), over the Controller Area Network (CAN) data bus. The HSM then provides variable analog voltages that drive the two 12 volt Direct Current (DC) motors, located in each front ventilated seat. There are three settings for each vented seat; off, HI and LO. Pressing a vented seat switch once will select HI. Pressing the same switch a second time will select LO. Pressing the switch a third time will shut the vented seat motors off.

The vented seat system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The individual front vented seat switches located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a front vented seat switch or indicator is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

ACCESSORIES AND EQUIPMENT

Heated Glass - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

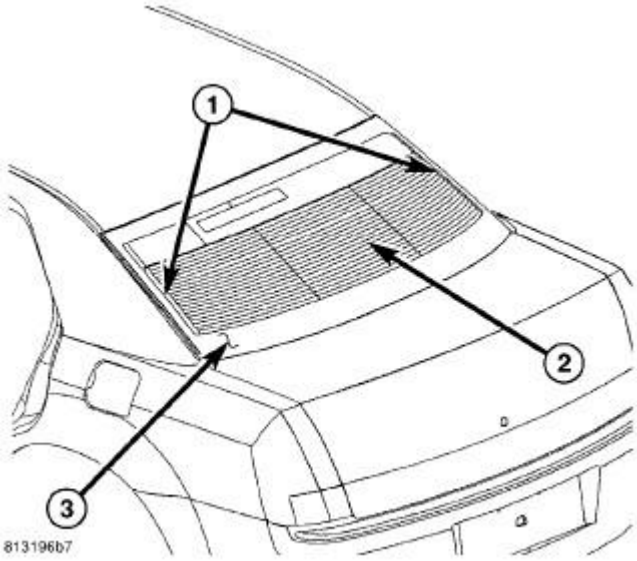

Fig. 1: Grid-EBL Description 48
Courtesy of CHRYSLER GROUP, LLC

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned On or Off by a switch and timing circuit integral to the A/C-heater control located at the center of the instrument panel.

Circuit protection is provided by two cartridge fuses located in the power distribution center (PDC). One fuse is for the heated rear window grid circuit and the other fuse is for the heated outside mirror grid circuit, when equipped.

OPERATION

OPERATION

The rear window defogger (Electric Back Light) (EBL) system is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the A/C heater module energizes the EBL relay in the Power Distribution Center (PDC), and fused battery current is directed to the rear window defogger grid lines, and to the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An indicator lamp in the switchbank illuminates when the EBL system is on. The A/C heater module contains the EBL system control circuitry, including the timer logic.

NOTE: The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is set to any position other than Run, or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. Refer to **GRID, DEFOGGER, REAR, STANDARD PROCEDURE**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC BACKLIGHT (EBL) SYSTEM

NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear glass heating grid lines.

NOTE: See Wiring Information for circuit descriptions and diagrams of the rear window defogger system.

Operation of the rear window defogger (Electric Back Light (EBL)) system can be confirmed by the following:

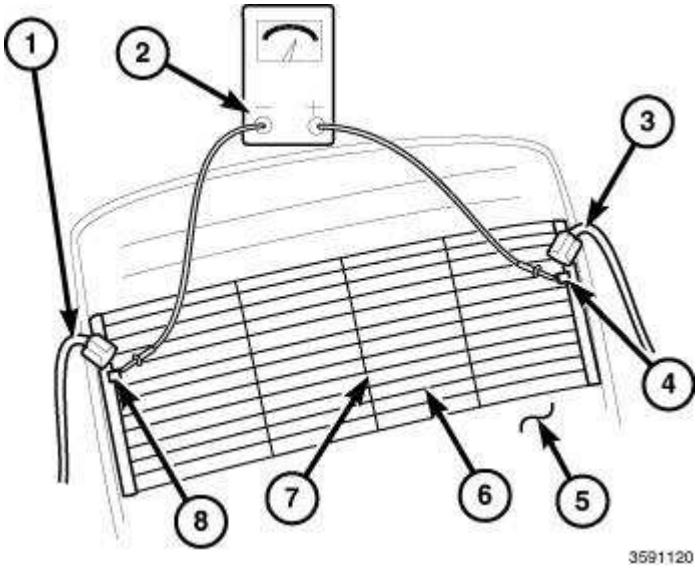

Fig. 2: Rear Window Glass Grid Test
Courtesy of CHRYSLER GROUP, LLC

1. Use a scan tool and check for Diagnostic Trouble Codes (DTCs) related to the U-Connect Touch ™ screen module, Telematics Gateway (TGW) or the A/C heater module. If no DTCs are found, go to 2. If any DTCs are found, repair as required, then proceed to 2.
2. With the ignition in the Run position, press a rear window defogger switch to on.
3. Rear window defogger operation can be checked by feeling the rear window glass (5), or the heated outside rear view mirror glass, when equipped with heated mirrors. After three to four minutes of operation, a distinct difference in temperature should be detected between the clear glass area and the heated glass area, or the heated mirror glass.
4. If a temperature difference is not detected, use a 12 volt Direct Current (DC) voltmeter and contact the rear glass heating grid terminal A (8) with the negative lead, and terminal B (4) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
    - Confirm the ignition is in the Run position.
    - Confirm the rear window defogger switch is on.
    - Check the EBL fuse in the Power Distribution Center (PDC). The fuse must be tight in its receptacle and its electrical connections must be secure.
    - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the heating grid and the EBL relay in the PDC.
    - Confirm the EBL ground wire (1) is connected to the heating grid negative terminal and that there is continuity to ground.
5. Visually inspect the bus bars, horizontal defogger grid lines (6) and vertical defogger grid lines (7) for damage which could cause an open circuit condition. If a broken grid line or bus bar is found, repair as required. Refer to **GRID, DEFOGGER, REAR, STANDARD PROCEDURE**.
6. If the EBL system operation has been verified but the rear window defogger indicator lamp in the switchbank does not illuminate, replace the entire switchbank pod. Refer to **POD, SWITCH BANK, REMOVAL** .

GRID, DEFOGGER, REAR

STANDARD PROCEDURE

STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

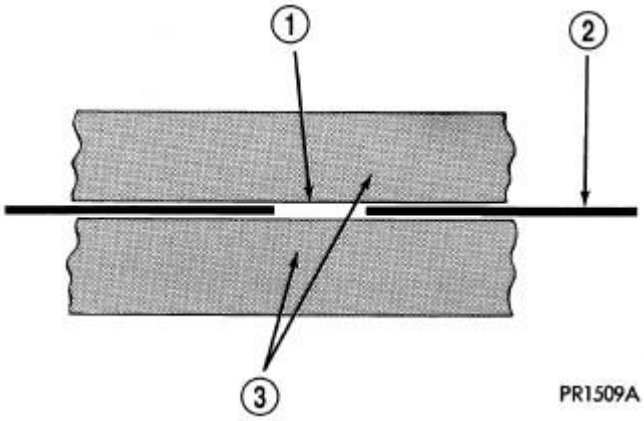

Fig. 3: Grid Line Repair - Typical
Courtesy of CHRYSLER GROUP, LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.

6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

RELAY, DEFOGGER, REAR

DESCRIPTION

DESCRIPTION

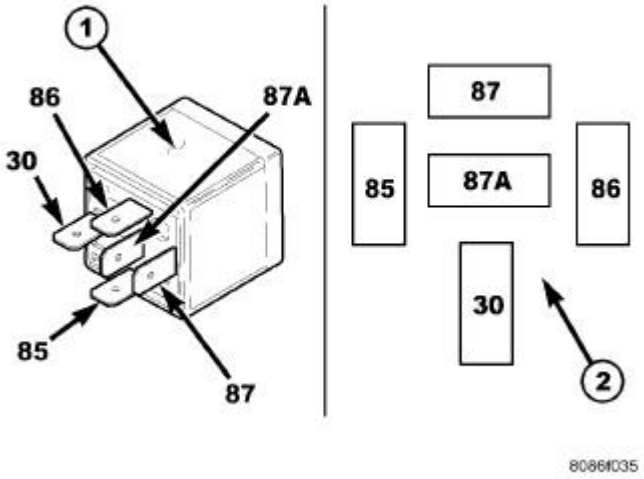

Fig. 4: EBL Relay
Courtesy of CHRYSLER GROUP, LLC

The relay (1) for the rear window defogger system, also known as the Electric Back Light (EBL), is an International Standards Organization (ISO) type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is a electromechanical device that switches battery current through a fuse in the Power Distribution Center (PDC) to the rear window defogger grid and to the heated outside rear view

mirrors, when equipped.

The EBL relay is located in the PDC, in the luggage compartment, near the spare tire.

REMOVAL

REMOVAL

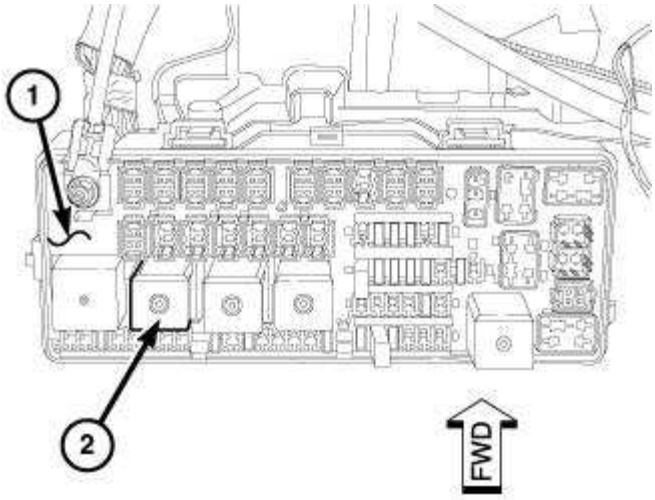

Fig. 5: Power Distribution Center (PDC) And EBL Relay
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the Power Distribution Center (PDC) (1), located in the luggage compartment, near the spare tire.
3. Remove the EBL relay (2) from the PDC.

INSTALLATION

INSTALLATION

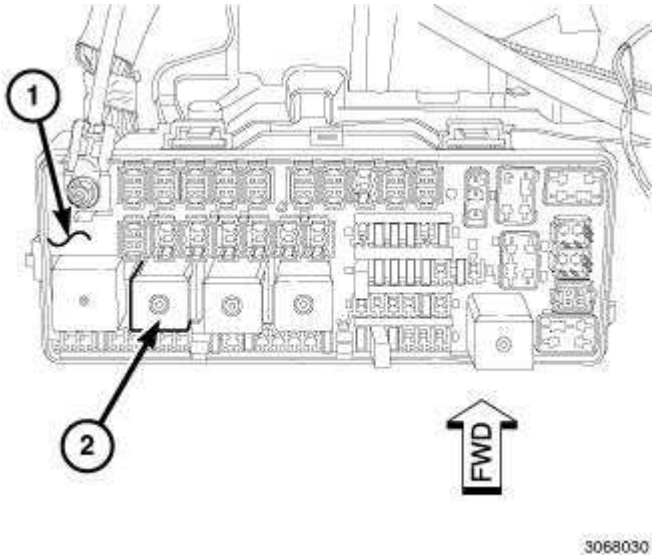

Fig. 6: Power Distribution Center (PDC) And EBL Relay
Courtesy of CHRYSLER GROUP, LLC

1. Position the EBL relay (2) into the proper receptacle of the Power Distribution Center (PDC) (1).
2. Align the EBL relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.

SWITCH, DEFOGGER, REAR

DESCRIPTION

DESCRIPTION

NOTE: Automatic Temperature Control (ATC) shown in illustration. Manual Temperature Control (MTC) similar.

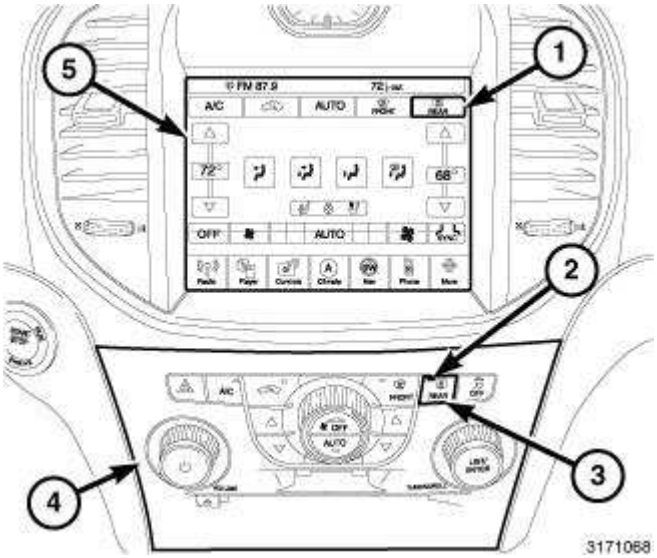

Fig. 7: Identifying U-Connect Touch Defogger, EBL System And Switchbank Indicator Lamp
Courtesy of CHRYSLER GROUP, LLC

The controls (1 and 3) for the rear window defogger, also know as the Electric Back Light (EBL) system, are located in the switchbank (4) and in the U-Connect Touch ™ screen module (5), at the center of the instrument panel. An amber indicator lamp (2) in the switchbank illuminates when the EBL system is on.

OPERATION

OPERATION

The rear window defogger (Electric Back Light) (EBL) system is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the A/C heater module energizes the EBL relay in the Power Distribution Center (PDC) and fused battery current is directed to the rear window defogger grid lines and the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An amber indicator lamp in the switchbank illuminates when the EBL system is on. The A/C heater module contains the EBL system control circuitry, including the timer logic.

NOTE: The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is turned to any position other than run, or by manually pressing the rear window defogger switch a second time.

The individual rear window defogger switch located in the switchbank cannot be adjusted or repaired.

If a rear window defogger switch or indicator lamp is inoperative or damaged, the entire switchbank must be replaced. Refer to **POD, SWITCH BANK, REMOVAL** .

The individual rear window defogger switch located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a rear window defogger switch is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

ACCESSORIES AND EQUIPMENT

Heated Seats - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

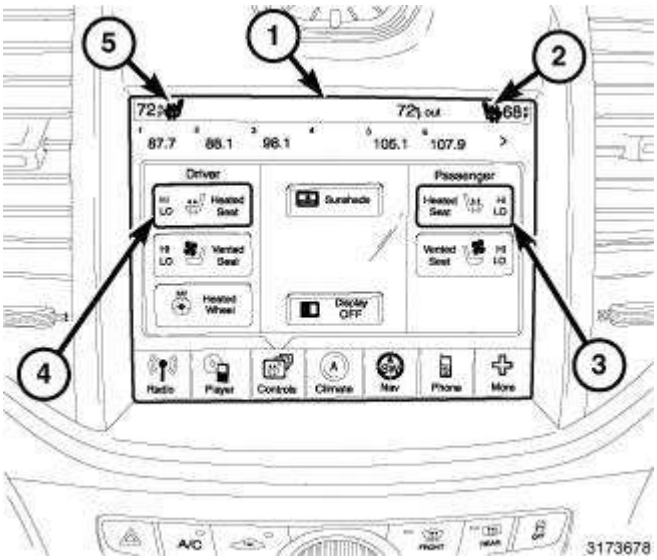

Fig. 1: U-Connect Touch(TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

Vehicles with the optional heated seat system can be visually identified by the two heated seat switches (3 and 4) located in the U-Connect Touch™ screen module (1), in the center of the instrument panel. The heated seat system allows a heated seat occupant to select from two different levels of electrical seat heating (HI and LO).

The heated seat system includes the following major components:

- **Heated Seat Switches** - Up to four heated seat switches are used per vehicle, one for each front heated seat and one for each rear heated seat, when equipped. Both front switches are integral to the U-Connect Touch™ screen module and communicate over the Controller Area Network (CAN) data bus. Refer to **SWITCH, HEATED SEAT, DESCRIPTION**. Both rear heated seat switches are hard-wired to the HSM .
- **Heated Seat Module** - One Heated Seat Module (HSM) is used per vehicle. The HSM is mounted under the front passenger seat and contains the control logic and software for the heated seat system. The HSM communicates over the CAN data bus. Refer to **MODULE, HEATED SEAT, DESCRIPTION** .
- **Heated Seat Elements** - Up to eight heated seat elements are used per vehicle. Two heated seat elements for each heated seat, one on the seat back cushion and the other on the seat bottom cushion. The heated seat elements are hard-wired to the HSM. Refer to **PAD, HEATER, DESCRIPTION**.

OPERATION

OPERATION

The heated seat system operates on battery current received through a fused ignition Run circuit, so that the system will only operate when the engine is running. If the engine is turned off with a heated seat on, the heated seat system will turn off and remain off, until the engine is restarted and a heated seat switch is pressed to on again.

A Heated Seat Module (HSM) is used to control the heated seat system. The HSM is mounted under the front passenger seat. The HSM responds to heated seat switch messages and ignition status inputs by controlling the 12 volt Direct Current (DC) output to the seat heating elements through integral solid-state relays and hard-wired circuits.

When either of the front heated seat switches in the U-Connect Touch™ screen module are pressed, the module sends a message over the Controller Area Network (CAN) data bus, signaling the HSM to energize the heating elements for the selected front heated seat.

If equipped, when a rear heated seat switch in the floor console are pressed, the switch sends a resistive signal to the HSM over hard-wired circuits, signaling the HSM to energize the heating elements for the selected rear heated seat.

The HSM energizes the integral solid-state relays that supply battery current to the heating elements. When high-temperature level heating is initially selected, the HSM provides a boosted high-heat level during the first four minutes of operation. After the first four minutes have passed, the HSM then drops the heat output to the normal high-temperature level for the next 26 minutes of operation. During high-temperature level operation, the HI indicator illuminates in the switch. After 30 minutes of high-temperature level heating, the HSM automatically lowers the heat level to low. At that time, the LO indicator illuminates. Operation on the low-temperature level setting will automatically turn off after 30 minutes.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

NOTE: **Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. also wiggle the heated seat wire harness and electrical connectors while testing continuity.**

NOTE: **For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the heated seat system, check the following:

- Check to see if the concern is isolated to only one seat. Operate the other heated seat.
- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), U-Connect Touch ™ screen module and the Telematics Gateway (TGW). If any DTCs are found, repair as necessary (Refer to appropriate diagnostic information).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat system.
- If there are no DTCs and the front heated seat system functions properly, but a heated seat switch indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).
- If there are no DTCs and the rear heated seat system functions properly, but one or both of the indicator lamps in a rear heated seat switch do not illuminate, check the rear heated switch circuits and repair as necessary. See Wiring information. If the wiring is OK, replace the inoperative second row heated seat switch. Refer to **SWITCH, HEATED SEAT, REMOVAL**.

PAD, HEATER

DESCRIPTION

DESCRIPTION

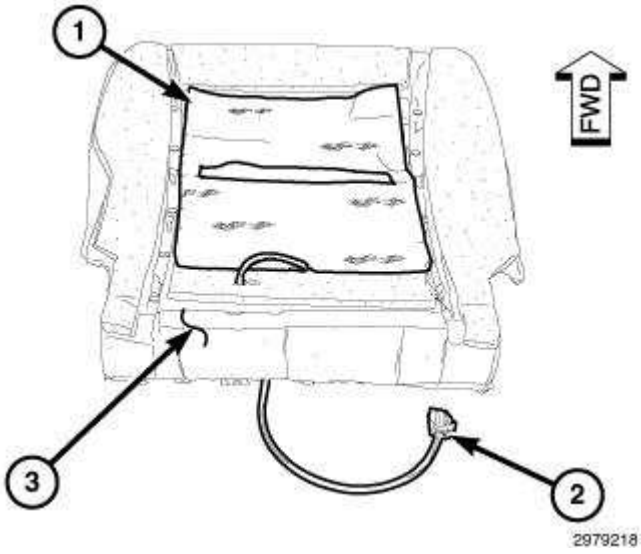

Fig. 2: One Heating Element, Wire Lead And Connector & Seat Bottom Cushion

Courtesy of CHRYSLER GROUP, LLC

NOTE: Front seat shown in illustration. Back seat similar.

Vehicles equipped with the optional heated seat system have up to four heated seats. One heating element (1) is used for each seat bottom cushion (3) and another heating element is used for each seat back cushion.

All of the heated seat elements consist of multiple heating circuits operating in parallel throughout the element and a wire lead and connector (2). The heated seat elements are captured between the seat trim cover and the seat cushion. If a malfunction occurs in one or more of the individual circuits, the remaining operational circuits will continue to provide heat.

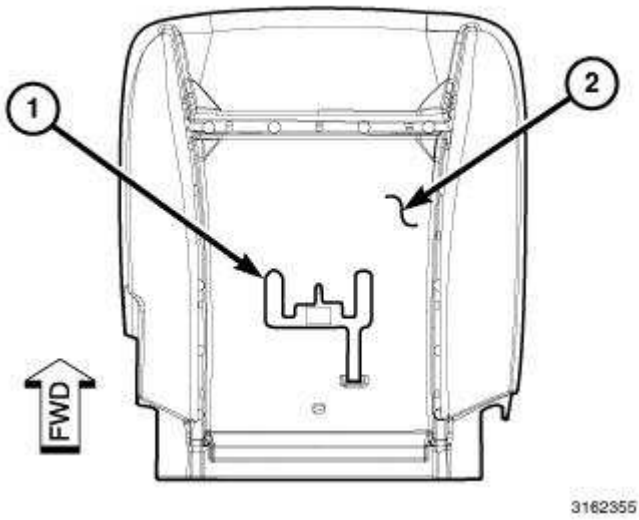

Fig. 3: One heating Element & Wire Lead And Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical Occupant Detection Sensor (ODS) shown in illustration.

All models have an Occupant Detection Sensor (ODS) (1) mounted directly to the front passenger seat bottom cushion (2). This sensor provides information to the Occupant Restraint Controller (ORC) used for control of the passenger belt alert feature. Refer to **SENSOR, OCCUPANT DETECTION, DESCRIPTION** .

If the ODS is removed from the seat bottom cushion, it must be replaced with a new ODS unit. Refer to **SENSOR, OCCUPANT DETECTION, REMOVAL** .

OPERATION

OPERATION

Battery current is directed to each heated seat element by the Heated Seat Module (HSM). The HMS

will energize the heated seat elements when the heated seat switch is pressed.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperse some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the seat cushion covers, warming the seat covers and its occupant.

The heated seat elements cannot be repaired and if damaged or inoperative must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

NOTE: The wire harness connectors for the heating elements are located under the seat.

NOTE: When testing the heated seat elements for resistance, be certain to sit in the seat in question and move around the heating elements within the seat while testing. Moving the heating elements will help eliminate the possibility of an intermittent open in the element, which would only be evident in a certain position.

1. Locate and disconnect the seat heating element electrical connectors as necessary.
2. Check the resistance between the circuits leading in and out of the suspect heated seat element. The resistance should be between the specifications listed in the following Heated Seat Element Resistance chart. If OK, refer to **DIAGNOSIS AND TESTING**. If not OK, replace the inoperative heated seat element. Refer to **PAD, HEATER, REMOVAL**.

HEATED SEAT ELEMENT RESISTANCE

Location and Type	Acceptable Resistance Value
Front Seat Bottom Cushion - Heated only	9.0 - 5.1 ohms
Front Seat Back Cushion - Heated only	7.8 - 5.2 ohms
Front Seat Bottom Cushion - Heated and Vented	7.9 - 5.3 ohms
Front Seat Back Cushion - Heated and Vented	8.5 - 5.6 ohms
Rear Seat Bottom Cushion - Heated only	9.9 - 6.6 ohms
Rear Seat Back Cushion - Heated only	9.0 - 6.0 ohms

REMOVAL

FRONT SEAT

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC).

NOTE: Seat bottom cushion shown in illustration. Seat back cushion similar.

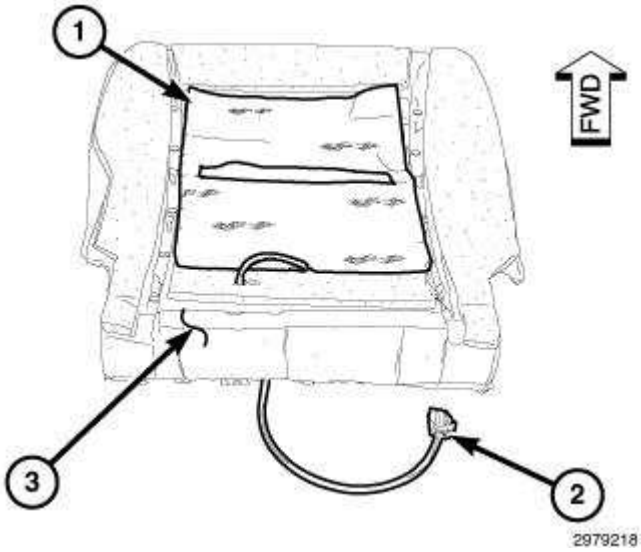

Fig. 4: One Heating Element, Wire Lead And Connector & Seat Bottom Cushion
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate front seat bottom or front seat back cushion and place it on a workbench (Refer to **SEATS**).
3. Remove the cover from the cushion (3) (Refer to **SEATS**).
4. Make note of the installed location of the heated seat element (1) on the cushion.
5. Route the wire lead and connector (2) out through the opening in the cushion.
6. Remove the heated seat element from the foam cushion by carefully peeling the element away from the cushion. Be careful not to remove excessive foam from the cushion.

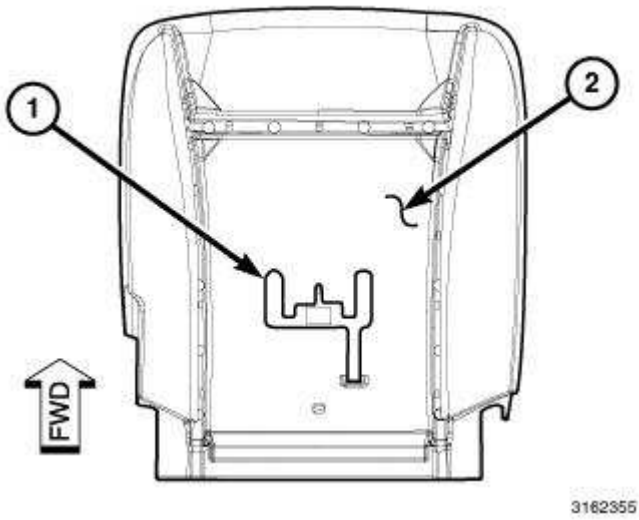

Fig. 5: One heating Element & Wire Lead And Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical Occupant Detection Sensor (ODS) shown in illustration.

7. When servicing the front passenger seat, if required, remove the Occupant Detection Sensor (ODS) (1) from the seat bottom cushion (2) and discard the sensor. Refer to **SENSOR, OCCUPANT DETECTION, REMOVAL** .

REAR SEAT

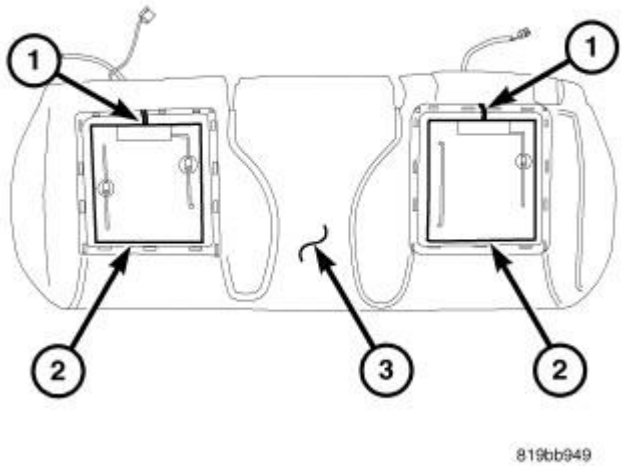

Fig. 6: Heated Rear Seat Elements
Courtesy of CHRYSLER GROUP, LLC

NOTE: Seat bottom cushion shown in illustration. Seat back cushion similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate rear seat bottom or rear seat back cushion and place it on a workbench (Refer to **SEATS**).
3. Remove the cover from the cushion (3) (Refer to **SEATS**).
4. Make note of the installed location of the heated seat element (2) on the cushion being serviced.
5. Route the wire lead and connector (1) out through the opening in the cushion.
6. Remove the heated seat element from the foam cushion by carefully peeling the element away from the cushion. Be careful not to remove excessive foam from the cushion.

INSTALLATION

FRONT SEAT

CAUTION: During heated seat element replacement, be careful not to fold or crease the new heating element. Folds or creases will cause premature heated seat element failure.

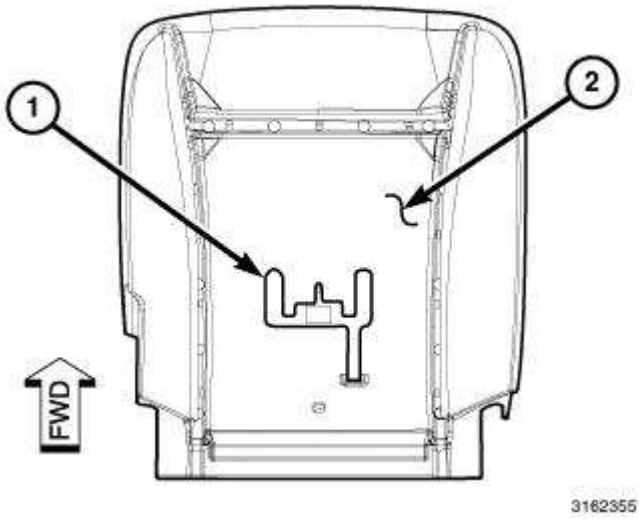

Fig. 7: One heating Element & Wire Lead And Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical Occupant Detection Sensor (ODS) shown in illustration.

1. When servicing the front passenger seat, if required, install a new Occupant Detection Sensor (ODS) (1) onto the seat bottom cushion (2). Refer to **SENSOR, OCCUPANT DETECTION, INSTALLATION** .

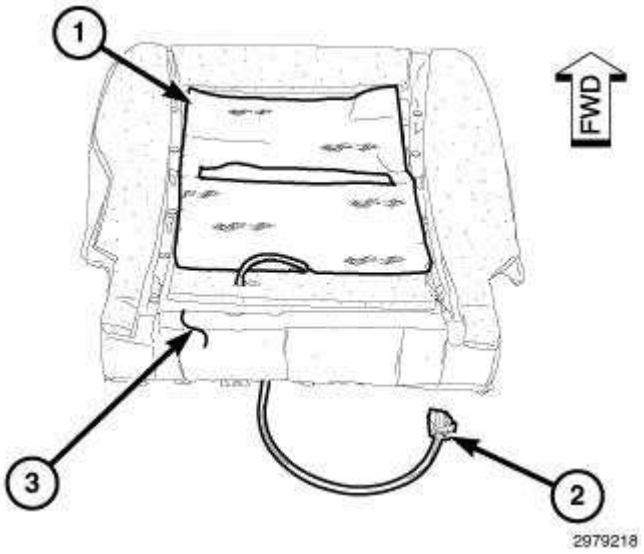

Fig. 8: One Heating Element, Wire Lead And Connector & Seat Bottom Cushion
Courtesy of CHRYSLER GROUP, LLC

NOTE: Seat bottom cushion shown in illustration. Seat back cushion similar.

2. Peel off the adhesive backing from the replacement heated seat element (1).
3. Position the heated seat element onto the foam cushion (3) directly where the original heater element was located. There will be adhesive marks on the cushion outlining the factory installed location.
4. Firmly press the heated seat element onto the foam cushion. Make sure the adhesive is fully adhered to the cushion. Be careful not to fold or crease the new heating element.
5. Route the wire lead and connector (2) through the opening in the cushion.
6. Install the seat bottom or seat back cover onto the cushion (Refer to **SEATS**).

NOTE: Make certain the heated seat element wire harness, airbag harness and ODS harness (when equipped) is correctly routed. Any excess wire should be securely placed between the rear of the bottom cushion and the rear seat cover flap.

7. Install the seat bottom or seat back cushion (Refer to **SEATS**).
8. Install the seat. Refer to **SEAT, FRONT, INSTALLATION** .
9. Reconnect the negative battery cable.
10. Verify proper front heated seat system operation.

REAR SEAT

CAUTION: During heated seat element replacement, be careful not to fold or crease the new heating element. Folds or creases will cause premature heated seat element failure.

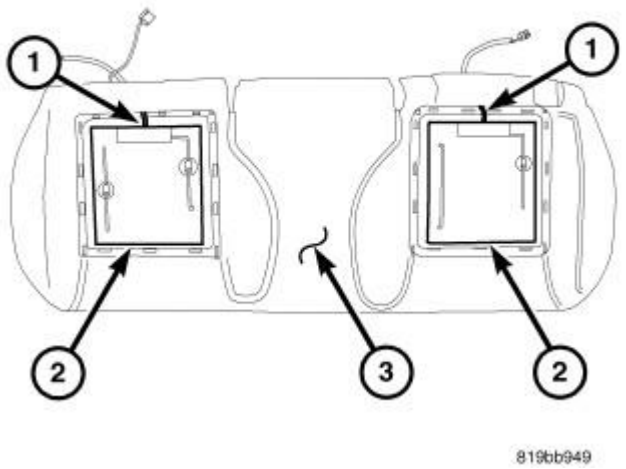

Fig. 9: Heated Rear Seat Elements
Courtesy of CHRYSLER GROUP, LLC

NOTE: Seat bottom cushion shown in illustration. Seat back cushion similar.

1. Peel off the adhesive backing from the replacement heated seat element (2).
2. Position the heated seat element onto the foam cushion (3) directly where the original heater element was located. There will be adhesive marks on the cushion outlining the factory installed location.
3. Firmly press the heated seat element onto the foam cushion. Make sure the adhesive is fully adhered to the cushion. Be careful not to fold or crease the new heating element.
4. Route the wire lead and connector (1) through the opening in the cushion.
5. Install the seat bottom or seat back cover onto the cushion (Refer to **SEATS**).
6. Install the rear seat bottom or rear seat back cushion (Refer to **SEATS**).
7. Reconnect the negative battery cable.
8. Verify proper rear heated seat system operation.

SWITCH, HEATED SEAT

DESCRIPTION

FRONT

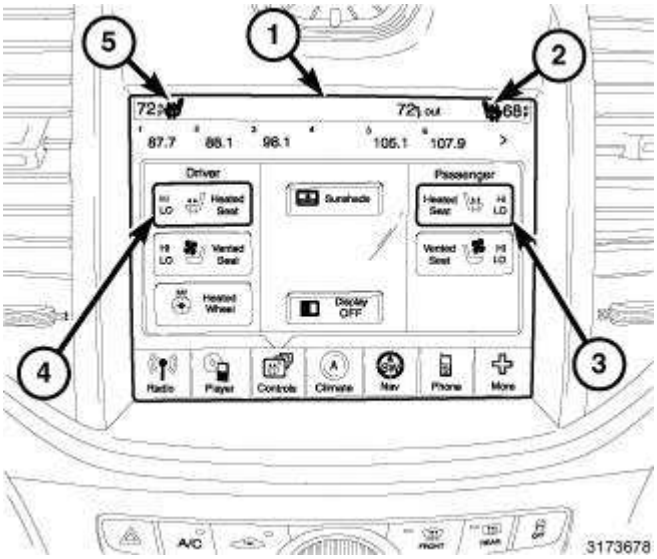

Fig. 10: U-Connect Touch(TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The switches (3 and 4) for the optional front heated seat system are located in the U-Connect Touch ™ screen module (1), at the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO). When the heated seat switches are pressed on, each heated seat switch illuminates either HI or LO, and an International Standards Organization (ISO) symbol (2 and 5) appears at the top of the U-Connect Touch ™ screen module.

REAR

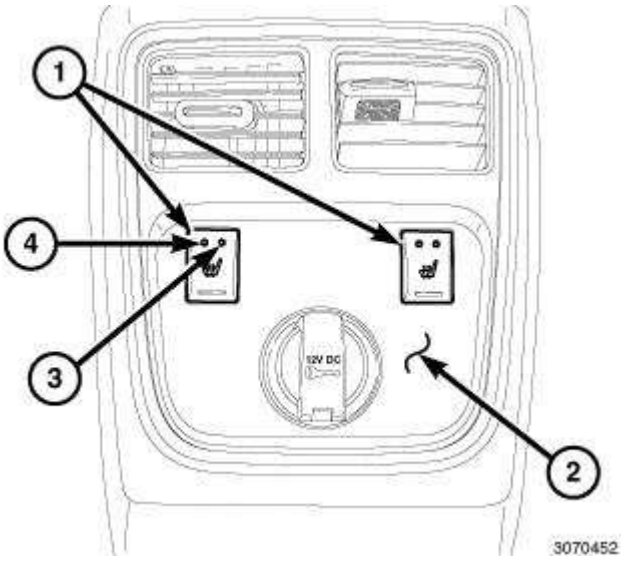

Fig. 11: Rear Heated Seat Switches
Courtesy of CHRYSLER GROUP, LLC

The rear heated seat switches (1) are momentary contact push button type switches that are mounted at the rear of the center floor console (2). These switches allow the rear seat passengers to

select from two different levels of electrical seat heating (high and low). Amber Light Emitting Diodes (LEDS) (3 and 4) in each switch indicate the level of heat in use: Two LEDs illuminate for high, one for low, and none for off. Pressing a heated seat switch once will select high level heating. Pressing the same switch a second time will select low level heating. Pressing the switch a third time will shut the heating elements in the seat off.

OPERATION

FRONT

When either of the front heated seat switches located in the U-Connect Touch ™ screen module are pressed with the engine running, a signal is sent to the Heated Seat Module (HSM) (also know as the comfort seat wheel module) over the Controller Area Network (CAN) data bus, signaling the module to energize the heating elements for the selected seat. Indicator lamps illuminate for each heated seat switch and indicate the level of heat in use (HI or LO). Pressing a heated seat switch once will select high-level heating and pressing the same switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The HSM energizes the integral solid-state relays that supply battery current to the heating elements. When high-temperature level heating is initially selected, the HSM provides a boosted high-heat level during the first four minutes of operation. After the first four minutes have passed, the HSM then drops the heat output to the normal high-temperature level for the next 26 minutes of operation. During high-temperature level operation, the HI indicator illuminates in the switch. After 30 minutes of high-temperature level heating, the HSM automatically lowers the heat level to low. At that time, the LO indicator illuminates. Operation on the low-temperature level setting will automatically turn off after 30 minutes.

The individual front heated seat switches located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a front heated seat switch or indicator is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

REAR

The two rear heated seat switches are momentary, push button-type switches, that provide a hard-wired resistance signal to the Heated Seat Module (HSM) (also know as the comfort seat wheel module), signaling it to energize the heating elements for the selected seat. Light Emitting Diodes (LED) in each switch indicate the level of heat in use. The rear seat switch LEDs are controlled by the HSM.

The rear heated seat switches are diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The rear heated seat switches cannot be adjusted or repaired and if a switch or its LEDs are damaged or inoperative, the entire switch must be replaced.

REMOVAL

REMOVAL

NOTE: **Take the proper precautions to protect the face of the floor console panel from cosmetic damage while performing this procedure.**

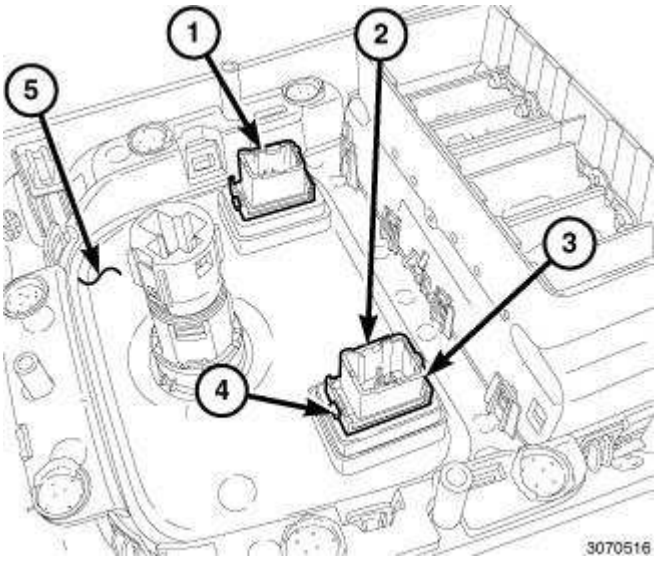

Fig. 12: Trim Panel, Retaining Tabs & Heated Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the trim panel (5) from the back of the floor console using Trim Stick (special tool #C-4755, Trim Stick) or equivalent. Disconnect any necessary electrical connectors and place the trim panel on a workbench.
3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, gently disengage the two retaining tabs (3 and 4) that secure each 2nd row heated switch (1 and 2) to the back of the floor console rear trim panel.
4. Remove the 2nd row heated switches, as necessary, from the floor console rear trim panel.

INSTALLATION

INSTALLATION

NOTE: **Take the proper precautions to protect the face of the floor console panel from cosmetic damage while performing this procedure.**

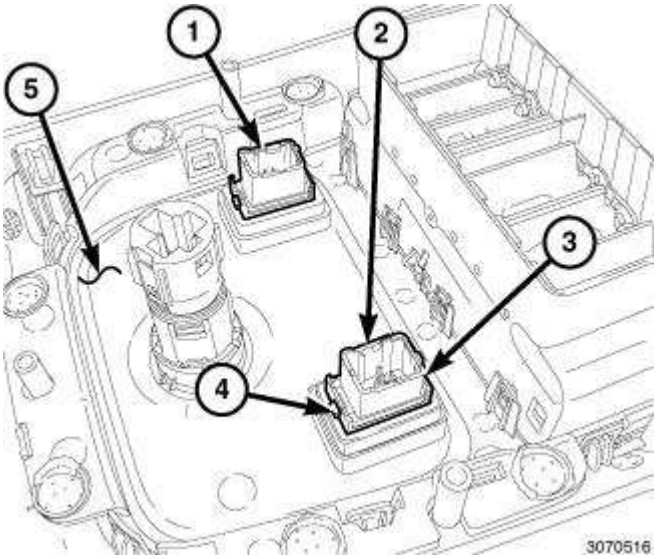

Fig. 13: Trim Panel, Retaining Tabs & Heated Switch
Courtesy of CHRYSLER GROUP, LLC

1. Align the tabs on each 2nd row heated seat switch (1 and 2) with the openings in the floor console rear trim panel (5) and install the switches, as necessary. Push the switches firmly into the trim panel until the two retaining tabs (3 and 4) are fully engaged.
2. Install the trim panel onto the back of the center floor console. Be sure to connect any necessary electrical connectors and properly align the console ducts.
3. Reconnect the negative battery cable.
4. Verify proper 2nd row heated seat system operation.

ACCESSORIES AND EQUIPMENT

Horn System - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

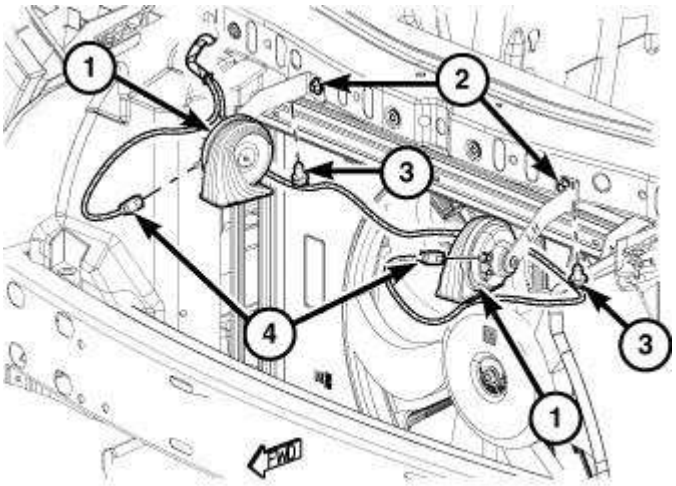

Fig. 1: Identifying Push-Pin Retainer, Harness, Mounting Fastener And Horn
Courtesy of CHRYSLER GROUP, LLC

The dual-note horn system features two electromagnetic horn units. The horn system includes the following major components:

- **Horns** - The two horns are located behind the grille below a trim cover.
- **Horn Switch** - The horn switch is located beneath the driver airbag.

OPERATION

DIAGNOSIS AND TESTING - HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Power Distribution Center (PDC).

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component

diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

NOTE: The horn switch pads are only serviced as an assembly with the airbag mounting bracket.

1. Position the airbag mounting bracket (3).
2. Press down to compress the springs and install the four e-clip retainers (3), securing bracket (2) to the airbag.
3. Position the airbag assembly (1) and connect the electrical connectors.
4. Install the driver side airbag assembly. Refer to **AIR BAG, DRIVER, INSTALLATION** .
5. Connect the battery negative cable.

HVAC

Heating And Air Conditioning - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

A Manual Temperature Control (MTC) or an Automatic Temperature Control (ATC) Dual Zone heating and A/C system is available on this vehicle.

To maintain the performance level of the Heating, Ventilation and Air Conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. See **ENGINE COOLING SYSTEM** for more information before opening or attempting any service to the engine cooling system.

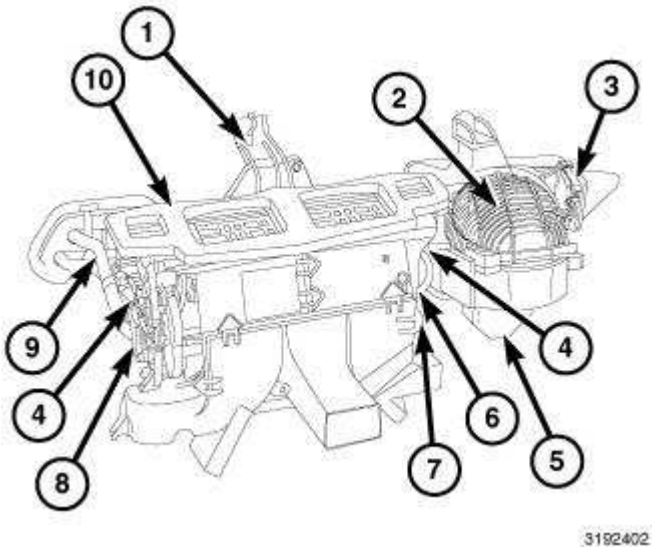

Fig. 1: Housing-HVAC Description
Courtesy of CHRYSLER GROUP, LLC

All vehicles are equipped with a common front Dual Zone HVAC housing (1). The heating and A/C system combines heating, ventilating and A/C capabilities into a single unit mounted within the passenger compartment, behind the instrument panel. The HVAC housing includes:

- Recirculation-air door and actuator (2)
- A/C heater module (3)
- Blend-air doors and actuators (4)
- Blower motor (5)

- Blower motor power module (6)
- Evaporator temperature sensor (7)
- Mode-air doors and actuator (8)
- Heater core (9)
- A/C evaporator (10)

NOTE: **An electric positive temperature coefficient (PTC) heater is used on vehicles when equipped with the 3.0L diesel engine. The PTC heater unit compensates for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core. Refer to UNIT, HEATER, DESCRIPTION.**

Based upon the system and selected mode, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC housing and the floor outlets are located on the bottom of the HVAC housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlets** - Two large defroster outlets are located near the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - Two front side window demister outlets, one located on each front door, near the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and one located on each side of the touch screen interface, at the center of the instrument panel.
- **Floor Outlets** - There are four floor outlets, one located above each front footwell and one located under each front seat.
- **Console Outlets** - There are two console outlets located at the back of the center floor console, facing the rear of the vehicle.

OPERATION

OPERATION

The heating and A/C systems used in this vehicle are blend-air type systems. In a blend air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core. In the Dual Zone system, separate blend-air doors are used to provide completely independent side-to-side temperature control of the discharge air. The temperature controls determine the discharge air temperatures by operating the blend door actuators, which move the blend-air doors. This design allows almost immediate control of output air temperatures.

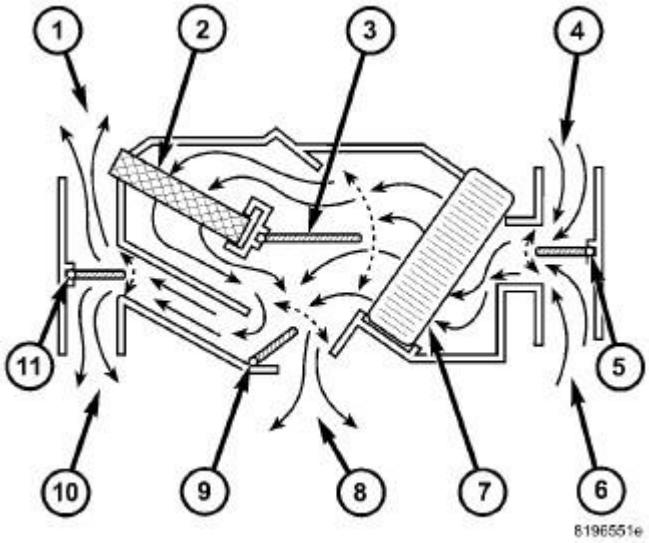

Fig. 2: Blend Air System Schematic
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical blend air system shown in illustration.

The heating and A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the Heating, Ventilation and Air Conditioning (HVAC) housing and passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air doors (3) with the temperature controls on the switchbank or the U-Connect Touch ™ screen module. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode controls on the switchbank or the U-Connect Touch ™ screen module. The temperature and mode controls use electrical actuators to operated the air doors.

The velocity of the air flow out of the outlets can be manually or automatically adjusted, depending on the system. using the blower motor control on the switchbank or the U-Connect Touch ™ screen module.

The fresh air intake can be shut off by pressing the Recirculation button on the switchbank or the U-Connect Touch ™ screen module. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6).

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the switchbank or the U-Connect Touch ™ screen module. The A/C compressor will automatically engage based on humidity sensor readings to help prevent windshield fogging.

The defroster outlets receive airflow from the HVAC housing through the molded plastic defroster duct, which is secured to the top of the HVAC housing. The airflow from the defroster duct is directed

by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts, which are secured to the instrument panel support. The airflow from the side window demister outlets is directed by fixed vanes and cannot be adjusted. The demisters operate when the mode control is set in any Floor to Defrost position.

The instrument panel outlets receive airflow from the HVAC housing through a molded plastic center panel duct and two end panel ducts. The two end panel ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct or shut off the flow of air leaving the outlets.

The front and rear floor outlets receive airflow from the HVAC housing through the front and rear floor ducts which are secured to each side of the HVAC housing. The rear seat ducts direct airflow beneath the carpet to the outlets located near the front of each rear seat foot well. None of the floor outlets can be adjusted.

NOTE: **It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.**

The A/C system is designed for use of non-CFC, R-134a refrigerant and uses an A/C expansion valve (TXV) to meter the flow of refrigerant to the A/C evaporator. To maintain minimum evaporator temperature and prevent evaporator freezing, an evaporator temperature sensor input is supplied to the A/C heater module. In turn, the Powertrain Control Module (PCM) cycles the A/C clutch on and off as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the Heating, Ventilation and Air Conditioning (HVAC) housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the

passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: The use of an A/C recycling/charging station for purposes of determining the actual charge level of an A/C system is not recommend. Service recycling/charging stations do not reflect the correct amount of refrigerant charge in the A/C system after a single "reclaim" cycle. Tests have shown that it can take two or more "reclaim" cycles to remove all of the refrigerant charge, depending on the equipment being used. Use only the following procedure for determining the proper charge level.

NOTE: The A/C Cooldown test which can be initiated on the MTC or ATC system is not a valid test to determine A/C performance. It is intended to be only used at the assembly plant and should not be used at a dealer or repair facility. Use only the following procedure to check A/C performance.

1. Make sure the following conditions are met in the area where this test is to be performed:
   - Maximum ambient temperature: 43.3°C (110°F)
   - Minimum ambient temperature: 15.5°C (60°F)
   - Maximum relative humidity: 90%
   - Minimum relative humidity: 20%
2. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the Controller Area Network (CAN) data bus, Telematics Gateway (TGW), A/C heater module, Body Control Module (BCM) and Powertrain Control Module (PCM). If no DTCs are found, go to Step 3. If any DTCs

are found, repair as required, then proceed to Step 3.

3. Operate the heating and A/C system under the following conditions.
   - Engine at normal operating temperature
   - Engine at normal idle speed
   - No sun-load in the cabin of the vehicle
   - Vehicle doors and windows closed
   - Transmission in Park or Neutral with the park brake On.
   - A/C heater controls set to Recirculation mode, full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see **A/C SYSTEM DIAGNOSIS** table
   - All panel outlet vanes open and positioned straight rearward

   NOTE: If the following step is not performed, the results of this test will not be accurate.

4. Using a scan tool, operate the engine cooling fans at high speed.
5. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes or a minimum of five minutes.

   NOTE: This procedure requires you to know what the temperature and relative humidity is in your location at the time of the test. This information can be obtained from multiple sources, such as the internet or local news media.

6. With the A/C clutch engaged, compare the observed panel outlet air temperature along with the ambient temperature of the work area and the relative humidity to the Maximum Panel Outlet Temperature chart.
7. If the air outlet temperature fails to meet the specifications shown in the Maximum Panel Outlet Temperature chart, see **A/C SYSTEM DIAGNOSIS** table.

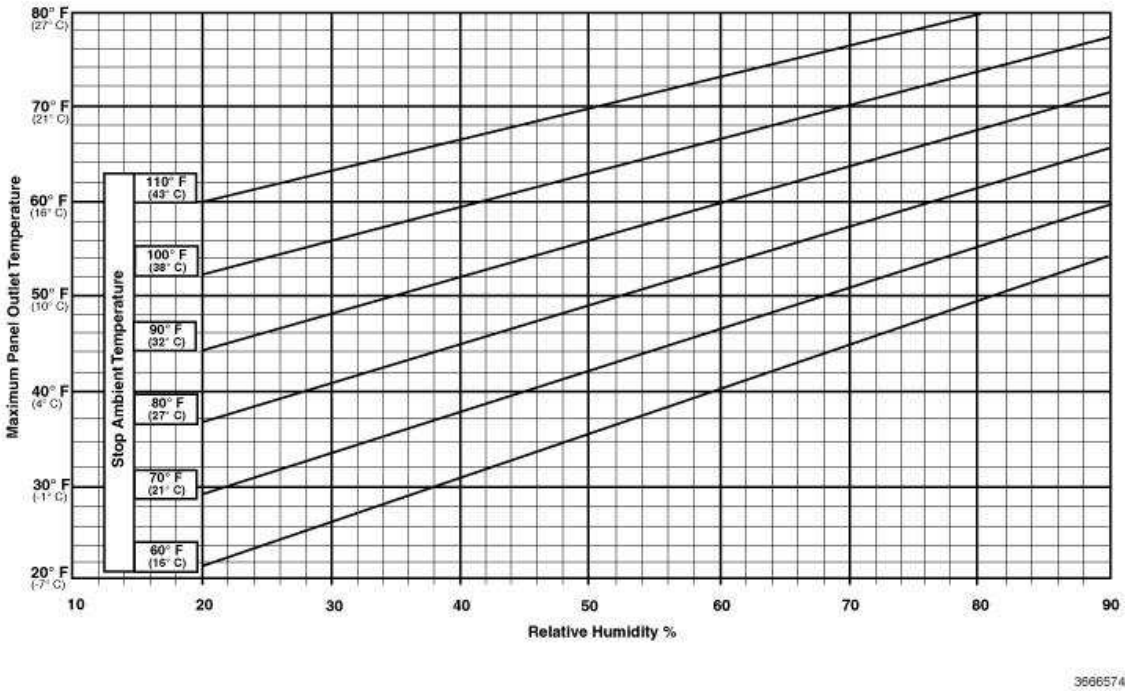

Fig. 3: Maximum Panel Outlet Temperature
Courtesy of CHRYSLER GROUP, LLC

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See **REFRIGERANT SYSTEM LEAKS** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the A/C clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See **REFRIGERANT SYSTEM LEAKS** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Open fuse.	2. See Wiring Information. Check the fuses in the Totally Integrated Power Module (TIPM) and the Rear Power Distribution Center (PDC). Repair the shorted circuit or component and replace the fuse(s), if required.
	3. Inoperative A/C clutch.	3. See **COMPRESSOR, A/C** . Test the A/C clutch and coil and replace, if required.
	4. Improperly installed or inoperative evaporator temperature sensor.	4. See **SENSOR, EVAPORATOR TEMPERATURE** . Test the sensor and replace, if required.

	5. Inoperative A/C pressure transducer.	5. See **TRANSDUCER, A/C PRESSURE** Test the sensor and replace, if required.
	6. Inoperative control module, CAN bus or wiring.	6. See the appropriate Electrical Diagnostic Procedures for testing of the modules and CAN bus, and see Wiring Information for compressor control circuit repair, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See **REFRIGERANT OIL LEVEL** . Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator(s) improperly installed or inoperative.	2. See **ACTUATOR, BLEND DOOR** . Inspect the actuator(s) for proper operation and replace, if required.
	3. Blend-air door(s) inoperative or sealing improperly.	3. See **HOUSING, HVAC** . Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See **REFRIGERANT SYSTEM LEAKS** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See **EVAPORATOR, A/C** . Replace the restricted A/C evaporator, if required.
	3. Inoperative A/C compressor.	3. See **COMPRESSOR, A/C** . Replace the A/C compressor, if required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. See **CONDENSER, A/C** . Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the A/C receiver/drier is restricted.	2. See **DRIER, A/C RECEIVER** . Replace the restricted A/C receiver/drier, if required.
	3. Inoperative radiator cooling fan.	3. See **ENGINE COOLING SYSTEM** . Test the radiator cooling fan and replace, if required.
	4. Refrigerant system overcharged.	4. See **REFRIGERANT SYSTEM CHARGE** . Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if

		required.
	5. Air in the refrigerant system.	5. See **REFRIGERANT SYSTEM LEAKS** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. See **ENGINE COOLING SYSTEM** . Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. See **ENGINE COOLING SYSTEM** . Inspect the accessory drive belt condition and tension. Repair as required.
	2. Inoperative A/C expansion valve.	2. See **VALVE, A/C EXPANSION** . Replace the valve, if required.
	3. Inoperative A/C compressor.	3. See **COMPRESSOR, A/C** . Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See **LINE, A/C DISCHARGE**, **LINE, A/C SUCTION** and **LINE, A/C DISCHARGE** . Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See **VALVE, A/C EXPANSION** . Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See **CONDENSER, A/C** . Replace the restricted A/C condenser, if required.

HEATER PERFORMANCE

See **ENGINE COOLING SYSTEM** before performing the following tests. Check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Perform the A/C System Performance Test, which is found within the HVAC System Test. Refer to **STANDARD PROCEDURE** . If any Diagnostic Trouble Codes (DTCs) are found, repair as necessary (Refer to appropriate diagnostic information).

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Air Temperature	16° C (60° F)	21° C (70° F)	27° C (80° F)	32° C (90° F)
Minimum Heater System Air Outlet Temperature	52° C (125° F)	56° C (133° F)	59° C (139° F)	62° C (144° F)

See **ENGINE COOLING SYSTEM** if the heater outlet air temperature is below the minimum specification. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Inoperative water pump
- Inoperative thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing
- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake
- Obstructed heater system outlets
- Inoperative engine thermostat
- Inoperative blower motor system
- Inoperative A/C heater control or module
- Inoperative blend door actuator(s)
- Inoperative, obstructed or improperly installed blend-air door(s)

TEMPERATURE CONTROL

If the air outlet temperature cannot be adjusted with the temperature controls, the following may require service:

- Inoperative switchbank, U-Connect Touch ™ screen module or A/C heater module.
- Inoperative blend door actuator(s).

- Inoperative, obstructed or improperly installed blend-air door.
- Inoperative related wiring harness or connectors.

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C EVAPORATOR CLEANING

Some vehicle operators may experience a musty odor from the A/C system, primarily at start up in hot and humid climates. This odor may be the result of microbial growth on the cooling coil. During normal A/C system operation, condensation forms in and around the A/C cooling coil. When airborne pollutants mix with this condensation, bacteria and fungi growth begins and odor may result.

If the vehicle operator experiences a musty odor when operating the A/C system, perform the following procedure.

> **WARNING: Always use eye protection, rubber gloves and protective clothing when performing the following procedure. Avoid continuous breathing of vapors from evaporator coil cleaning and sealing fluids. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.**

1. On models equipped with a particulate air filter, remove the filter and inspect for dirt and debris. Refer to **FILTER, PARTICULATE AIR, REMOVAL**. Discard the used particulate filter if required.
2. Remove the cowl panel cover (refer to **PANEL, COWL TRIM** for more information).
3. Clean any dirt and debris that may be present at the HVAC fresh air inlet screen and at the top of the cowl panel.
4. Install the cowl panel cover.
5. Raise and support the vehicle.
6. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may be blocking the drain and repair as necessary.
7. Once drain operation has been verified;
   - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
   - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or plug and temporarily cap or plug the drain tube.
8. Lower the vehicle.
9. Place a protective cover over the front passenger side floor and seat area.
10. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
11. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
12. Clean any dirt and debris that may be present inside the HVAC blower motor housing and all readily accessible areas inside the HVAC housing. If necessary, use a vacuum with a small

flexible hose, and take caution not to damage the evaporator core fins.

13. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely coat the entire surface of A/C evaporator with three bottles of Mopar® Cooling Coil Cleaner through the blower motor and power module or resistor openings. Be sure to use all of the coil cleaner in each container.
14. Allow the vehicle to sit for 30 minutes.
15. Raise and support the vehicle.

WARNING: Excess cooling coil cleaner will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil cleaning fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

16. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil cleaner to drain from the HVAC housing.
17. Lower the vehicle.
18. Refill the three empty coil cleaner bottles with clean tap water.
19. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely rinse the entire surface of A/C evaporator with the three bottles of clean tap water through the blower motor and power module openings. Be sure to use all of the water in each container.
20. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
21. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
22. Disconnect the wire harness connector from the A/C compressor to disable compressor operation. Refer to **COMPRESSOR, A/C, REMOVAL**.
23. Start the engine
24. Adjust all the windows so they are open approximately 8 mm (0.5 in.).
25. Set the A/C heater controls to the following:
    - air distribution to Panel and Recirculation mode
    - temperature to full heat
26. Allow the vehicle to run for 20 minutes.
27. Turn the engine off.
28. Raise and support the vehicle.
29. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may have blocked the drain during evaporator coil cleaning and repair as necessary.
30. Once drain operation has been verified;
    - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
    - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic

cap or plug and temporarily cap or plug the drain tube.

31. Lower the vehicle.
32. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
33. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
34. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely coat the entire surface of A/C evaporator with one bottle of Mopar® Cooling Coil Coating through the blower motor and power module openings. Be sure to use all of the coil coating in the container.

NOTE: Be sure to thoroughly clean out the spray delivery tool with warm water once coil coating is complete to prevent damage to the tool.

35. Refill the empty bottles with clean warm tap water and completely rinse out the PSE Flex Spray Delivery Tool 534-62637, or equivalent.
36. Allow the vehicle to sit for 30 minutes.
37. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
38. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
39. Raise and support the vehicle.

WARNING: Excess cooling coil coating will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil sealing fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

40. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil coating to drain from the HVAC housing.
41. Lower the vehicle.
42. Start the engine
43. Adjust all the windows so they are open approximately 8 mm (0.5 in.).
44. Set the A/C heater controls to the following:
    - air distribution to Panel and Recirculation mode
    - temperature to full heat
45. Allow the vehicle to run for 20 minutes.
46. Turn vehicle off.
47. Remove protective cover from front passenger side floor and seat area.
48. On models equipped with a particulate air filter, install the filter. Refer to **FILTER, PARTICULATE AIR, INSTALLATION**.
49. Connect the wire harness connector to the A/C compressor. Refer to **COMPRESSOR, A/C,**

INSTALLATION.

50. Verify proper heating and A/C system operation.

CONTROLS

ACTUATOR, BLEND DOOR

DESCRIPTION

DESCRIPTION

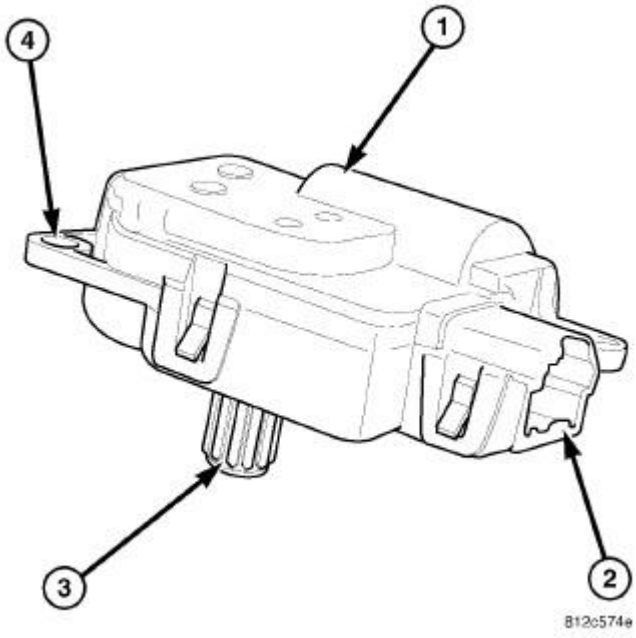

Fig. 4: Identifying Actuator Components

Courtesy of CHRYSLER GROUP, LLC

The two blend door actuators (1) for the Dual Zone heating and A/C system are reversible, 12 volt Direct Current (DC) servo motors. One blend door actuator is located on each side the of air distribution housing.

The blend door actuators are contained within a black molded plastic case with an integral wire connector receptacle (2). An output shaft with splines (3) connect each blend door actuator to the respective blend door linkage. Three integral mounting tabs (4) allow each actuator to be secured to the air distribution housing.

The blend door actuators do not require mechanical indexing to the blend door linkage, as they are electronically calibrated by the A/C heater module. The heating and A/C system must be recalibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The blend door actuators are interchangeable with each other, and with the actuators for the recirculation and mode-air doors.

OPERATION

OPERATION

The two blend door actuators are connected to the A/C heater module through the vehicle electrical system by dedicated two-wire lead and connectors of the HVAC wire harness. The blend door actuators can move the blend-air doors in two directions. When the A/C heater module pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C heater module reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction.

When the A/C heater module makes the voltage to both connections high or both connections low, the blend-air doors stops and will not move. The A/C heater module uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuators and the blend-air doors. The A/C heater module learns the blend-air doors stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the blend door actuator circuits.

The blend door actuators are diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blend door actuators cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for

the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

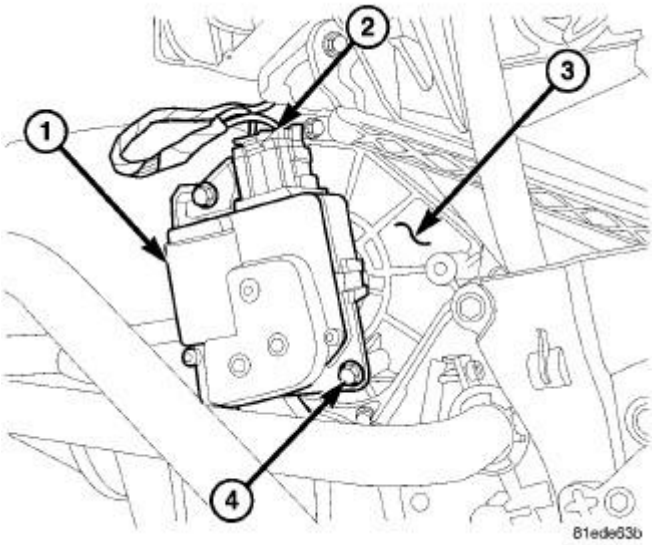

Fig. 5: Actuator-Blend Door-Single/Dual Driver
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the left side instrument panel silencer. Refer to **PANEL, SILENCER, REMOVAL** .
3. Remove the two screws (4) that secure the blend door actuator (12) to the left side of the HVAC air distribution housing (3).
4. Remove the blend door actuator from the air distribution housing and disconnect the HVAC wire harness connector (2) and remove the actuator from the vehicle.

RIGHT SIDE

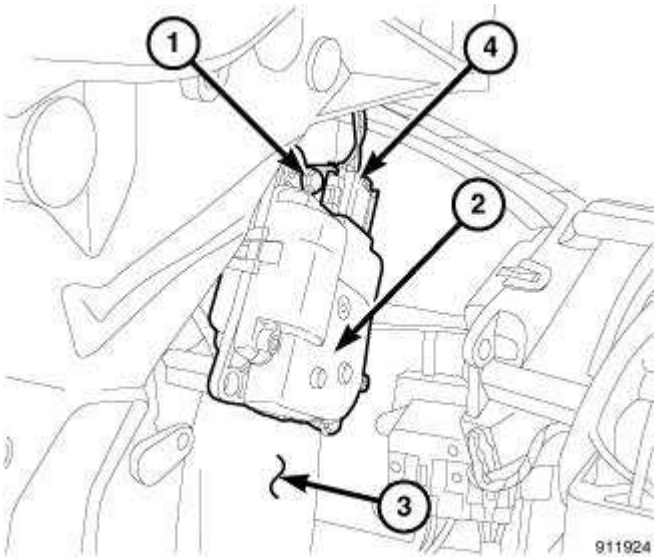

Fig. 6: Actuator-Blend Door-Dual Passenger
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the right side instrument panel silencer. Refer to **PANEL, SILENCER, REMOVAL** .
3. Remove the glove box and the glove box trim panel from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
4. Remove the two screws (1) that secure the blend door actuator (4) to the right side of the HVAC air distribution housing (3).
5. Remove the blend door actuator from the air distribution housing and disconnect the HVAC wire harness connector (2) and remove the actuator from the vehicle.

INSTALLATION

INSTALLATION

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

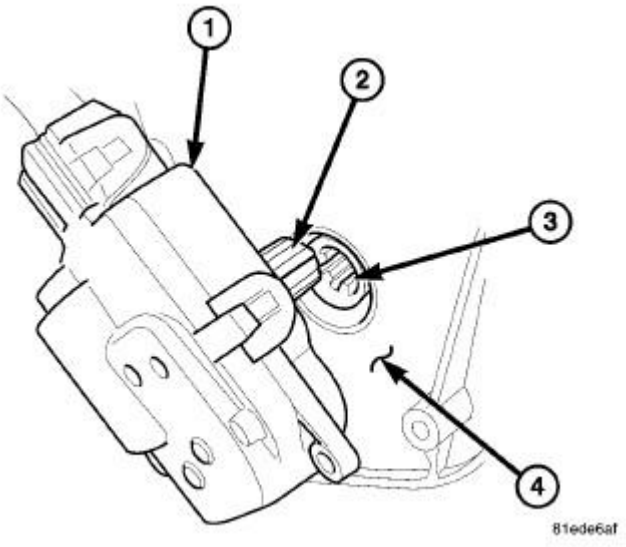

Fig. 7: Actuator-Blend Door-Lf Align
Courtesy of CHRYSLER GROUP, LLC

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the left side of the HVAC air distribution housing (4). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (2) with those on the blend door cam (3).

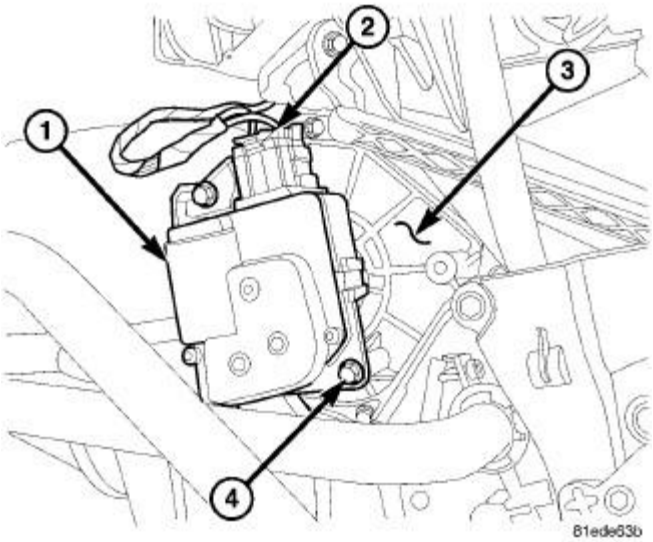

Fig. 8: Actuator-Blend Door-Single/Dual Driver
Courtesy of CHRYSLER GROUP, LLC

3. Install the two screws (4) that secure the blend door actuator (1) to the air distribution housing (3). Tighten the screws to 2 N.m (17 in. lbs.).

4. Connect the HVAC wire harness connector (2) to the blend door actuator.
5. Install the left side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

RIGHT SIDE

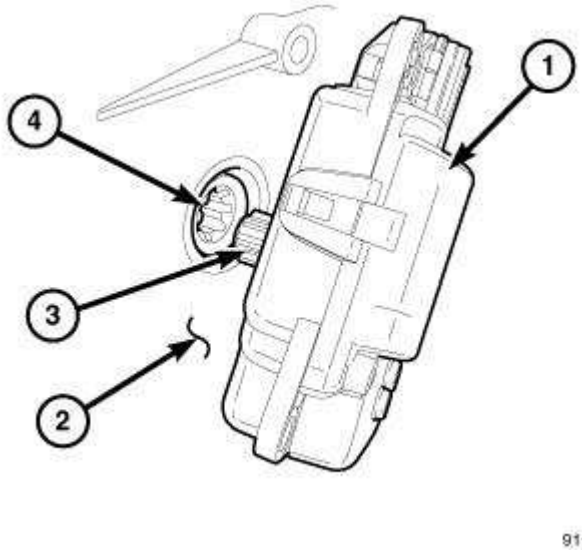

Fig. 9: Actuator-Blend Door
Courtesy of CHRYSLER GROUP, LLC

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the right side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the blend door cam (4).

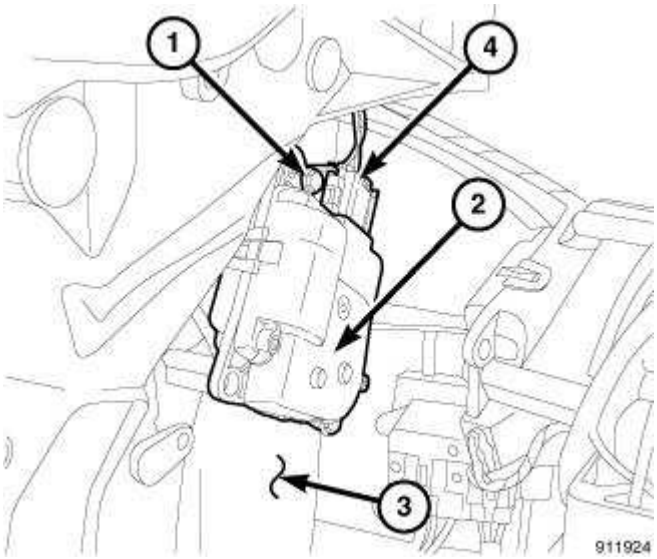

Fig. 10: Actuator-Blend Door-Dual Passenger
Courtesy of CHRYSLER GROUP, LLC

3. Install the screws (1) that secure the blend door actuator (4) to the air distribution housing (3). Tighten the screws to 2 N.m (17 in. lbs.).
4. Connect the HVAC wire harness connector (2) to the blend door actuator.
5. Install the glove box trim panel and glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
6. Install the right side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, MODE DOOR

DESCRIPTION

DESCRIPTION

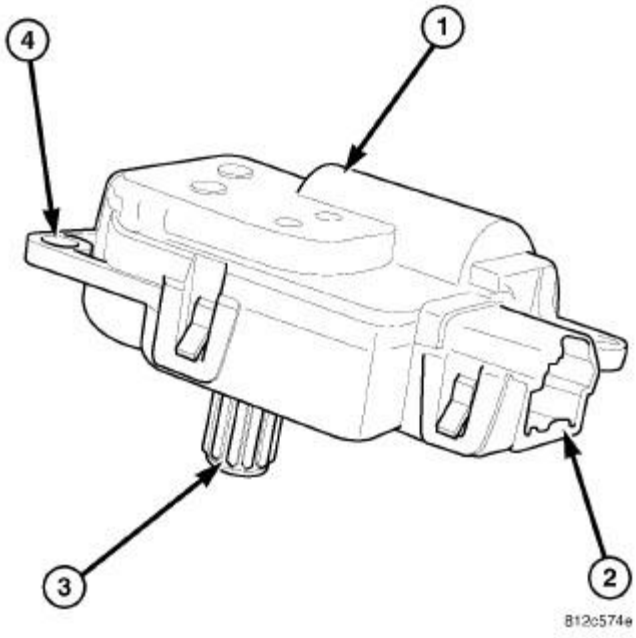

Fig. 11: Identifying Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The mode door actuator (1) for the Dual Zone heating and A/C system is a reversible, 12 volt Direct Current (DC) servo motor, which is mechanically connected to the mode-air doors. The mode door actuator is located on the driver side end of the air distribution housing

The mode door actuator is contained within a black molded plastic case with an integral wire connector receptacle (2). An output shaft with splines (3) connect it to mode door linkage and integral

mounting tabs (4) allow the actuator to be secured to the air distribution housing.

The mode door actuator does not require mechanical indexing to the mode door linkage, as it is electronically calibrated by the A/C heater module. The heating and A/C system must be recalibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The mode door actuator is interchangeable with the actuators for the recirculation and blend-air doors.

OPERATION

OPERATION

The mode door actuator is connected to the A/C heater module through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness.

The mode door actuator can move the floor, defrost/demist and the panel-air doors in two directions. When the A/C heater module pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the A/C heater module reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction.

When the A/C heater module makes the voltage to both connections high or both connections low, the mode-air doors stop and will not move. The A/C heater module uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air doors. The A/C heater module learns the mode-air doors stop position during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the mode door actuator circuits.

The mode door actuator is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The mode door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

3. Install the screws (4) that secure the mode door actuator (2) to the bracket (3). Tighten the screws to 2 N.m (17 in. lbs.).
4. Connect the HVAC wire harness connector (1) to the mode door actuator.
5. On LHD models, install the knee blocker. Refer to **AIR BAG, KNEE BLOCKER, INSTALLATION** .
6. Install the left side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, RECIRCULATION DOOR

DESCRIPTION

DESCRIPTION

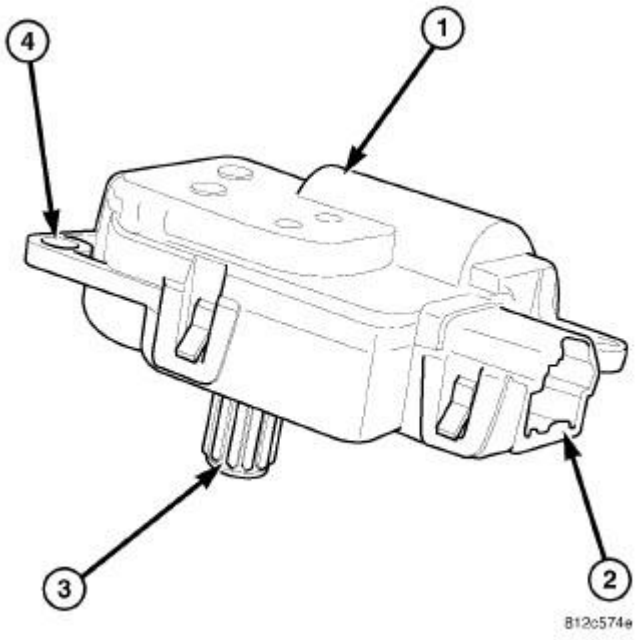

Fig. 15: Identifying Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The recirculation door actuator (1) for the Dual Zone heating and A/C system is a reversible, 12 volt Direct Current (DC) servo motor, which is directly connected to the pivot shaft of the recirculation-air door. The recirculation door actuator is located on the left side of the air inlet housing.

The recirculation door actuator is contained within a black molded plastic case with an integral wire connector receptacle (2). An output shaft with splines (3) connect it to recirculation door shaft and integral mounting tabs (4) allow the actuator to be secured to the air inlet housing.

The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C heater module. The heating and A/C system must be recalibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The recirculation door actuator is interchangeable with the actuators for the blend and mode air doors.

OPERATION

OPERATION

The recirculation door actuator is connected to the A/C heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness.

The recirculation door actuator can move the recirculation-air door in two directions. When the A/C heater module pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C heater module reverses the

polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. When the A/C heater module makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.

The A/C heater module uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C heater module learns the recirculation-air door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the recirculation door actuator circuits.

The recirculation door actuator is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The recirculation door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

3. Install the two screws (4) that secure the recirculation door actuator (1) to the air inlet housing (2). Tighten the screws to 2 N.m (17 in. lbs.).
4. Connect the HVAC wire harness connector (3) to the recirculation door actuator.
5. Install the glove box trim panel and glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
6. Install the right side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

CONTROL, A/C AND HEATER

DESCRIPTION

DESCRIPTION

A Manual Temperature Control (MTC) and an Automatic Temperature Control (ATC) Dual Zone heating and A/C system are available for this vehicle. The Dual Zone heating and A/C system allows both the driver and the front seat passenger the ability to individually regulate air temperature for their side of the vehicle. All controls are identified by International Standards Organization (ISO) graphic symbols.

The ATC heating and A/C system can automatically adjust the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain occupant comfort, even under changing outside weather conditions, and offers several manual override features, such as, fan speed, airflow distribution, defrost and recirculation modes.

Both heating and A/C systems provide the vehicle occupants with a number of options to help control

climate and comfort within the vehicle (Refer to the Owner's Manual for more information on the features of the heating and A/C system).

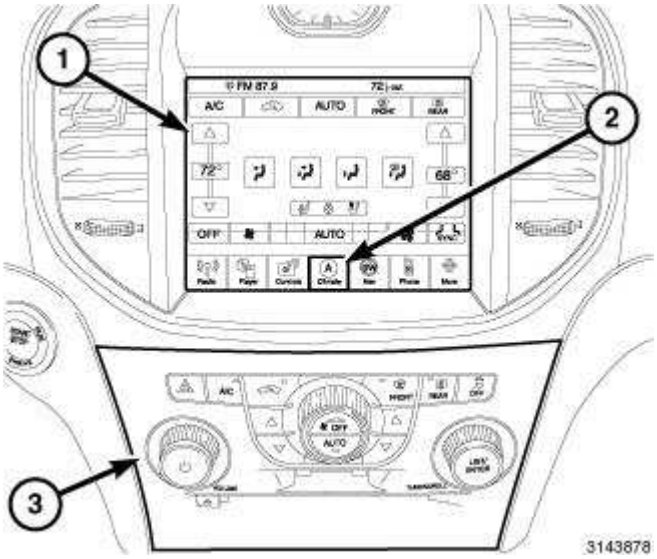

Fig. 19: A/C Systems Are Located In The U-Connect Touch (TM) Screen Module, Climate Tab & Switchbank
Courtesy of CHRYSLER GROUP, LLC

NOTE: Automatic Temperature Control (ATC) shown in illustration. Manual Temperature Control (MTC) similar.

The controls for both of the Dual Zone heating and A/C systems are located in the U-Connect Touch ™ screen module (1), under the Climate tab (2), and on the switchbank (3) at the center of the instrument panel.

OPERATION

AUTOMATIC TEMPERATURE CONTROL (ATC)

Each of the A/C heater controls in the front switchbank are resistor type controls. When a button is pushed, or a knob is turned, the switchbank sends a resistive signal over hard-wired circuits to the U-Connect Touch ™ screen module. The controls in the U-Connect Touch ™ screen module mimic the action selected on the switchbank. The U-Connect Touch ™ screen module communicates the heater and A/C control request signals to the A/C heater module.

The A/C heater module is a dedicated microprocessor that automatically drives the electrically operated air-door actuators for the Dual Zone Automatic Temperature Control (ATC) heating and A/C systems. The ATC A/C heater module obtains sun load, in-car temperature and evaporator temperature information through hard-wired circuits, and occupant heating and A/C settings and other required vehicle information over the Controller Area Network (CAN) data bus. Refer to **MODULE, A/C AND HEATER, OPERATION** .

The Dual Zone ATC heating and A/C system is diagnosed using a scan tool. Refer to **DIAGNOSIS**

AND TESTING .

Prior to replacing an A/C heater control or A/C heater module, check for any Diagnostic Trouble Codes (DTCs) related to the heating and A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **STANDARD PROCEDURE** .

The individual A/C heater controls located in the switchbank cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire switchbank pod must be replaced. Refer to **POD, SWITCH BANK, REMOVAL** .

The individual A/C heater controls located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

MANUAL TEMPERATURE CONTROL (MTC)

Each of the A/C heater controls in the front switchbank are resistor type controls. When a button is pushed, or a knob is turned, the switchbank sends a resistive signal over hard-wired circuits to the U-Connect Touch ™ screen module. The controls in the U-Connect Touch ™ screen module mimic the action selected on the switchbank. The U-Connect Touch ™ screen module communicates the heater and A/C control request signals to the A/C heater module.

The A/C heater module is a dedicated microprocessor for the Dual Zone Manual Temperature Control (MTC) heating and A/C system. The MTC A/C heater module obtains evaporator temperature information through hard-wired circuits, and occupant heating and A/C settings and other required vehicle information over the Controller Area Network (CAN) data bus. Refer to **MODULE, A/C AND HEATER, OPERATION** .

The Dual Zone MTC heating and A/C system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

Prior to replacing an A/C heater control or A/C heater module, check for any Diagnostic Trouble Codes (DTCs) related to the heating and A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **STANDARD PROCEDURE** .

The individual A/C heater controls located in the switchbank cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire switchbank pod must be replaced. Refer to **POD, SWITCH BANK, REMOVAL** .

The individual A/C heater controls located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

MODULE, POWER, BLOWER MOTOR

DESCRIPTION

DESCRIPTION

NOTE: Automatic Temperature Control (ATC) shown in illustration. Manual Temperature Control (MTC) similar.

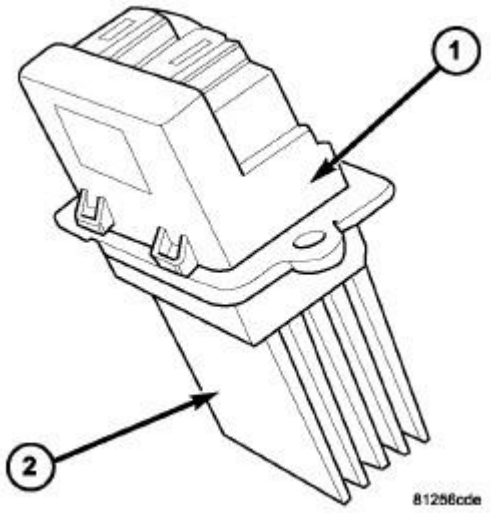

Fig. 20: Integral Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

Both the Automatic Temperature Control (ATC) and Manual Temperature Control (MTC) heating and A/C systems use a blower motor power module to control the blower motor speed.

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic mounting plate with two integral connector receptacles (1). Concealed behind the mounting plate is the power module electronic circuitry and a large finned heat sink (2).

The blower motor power module is accessed for service by removing the glove box.

OPERATION

OPERATION

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the HVAC wire harness. A second lead and connector of the wire harness is connected to the blower motor.

On the Automatic Temperature Control (ATC) system, the blower motor power module allows the microprocessor-based A/C heater module to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming.

On the Manual Temperature Control (ATC) system, the blower motor power module allows the A/C-

heater module to provide an infinite amount of blower motor speeds throughout its operating range, based upon blower switch input.

Both the ATC and MTC systems use a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blower motor power module cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution may result in possible serious injury.

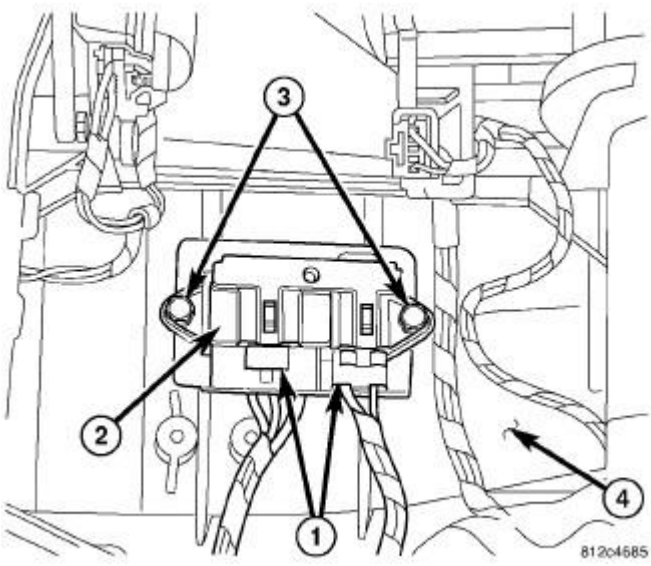

Fig. 21: Removing/Installing Blower Motor Power Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Disconnect the two wire harness connectors (1) from the blower motor power module (2).
4. Remove the two screws (3) that secure the blower motor power module to the HVAC housing (4) and remove the power module.

INSTALLATION

INSTALLATION

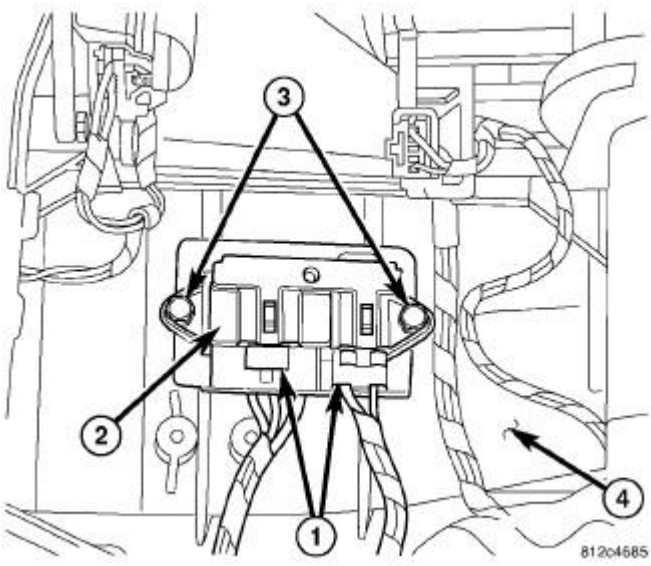

Fig. 22: Removing/Installing Blower Motor Power Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the blower motor power module (2) into the HVAC housing (4).
2. Install the two screws (3) that secure the blower motor power module to the HVAC housing. Tighten the screws to 2 N.m (17 in. lbs.).
3. Connect the two wire harness connectors (1) to the blower motor power module.
4. Install the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
5. Reconnect the negative battery cable.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

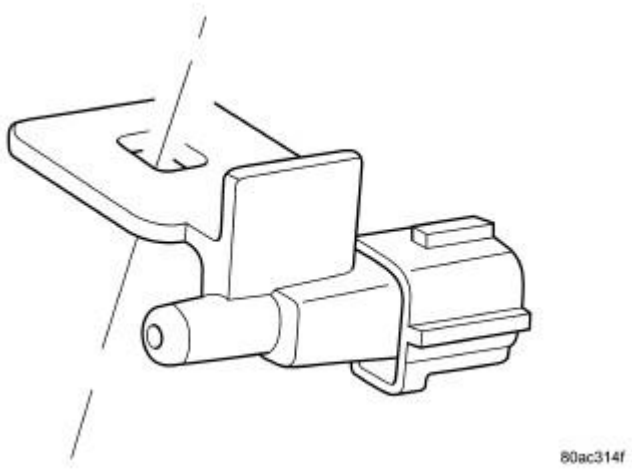

Fig. 23: Identifying Ambient Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The ATC system uses the sensor data to maintain optimum cabin temperature levels. The ambient air temperature sensor is mounted to the front bumper beam.

OPERATION

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the Automatic Temperature Control (ATC) A/C heater module, Powertrain Control Module (PCM) and other vehicle control modules.

The ambient air temperature sensor is diagnosed using a scan tool (Refer to appropriate diagnostic information).

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .

SENSOR, EVAPORATOR TEMPERATURE

DESCRIPTION

DESCRIPTION

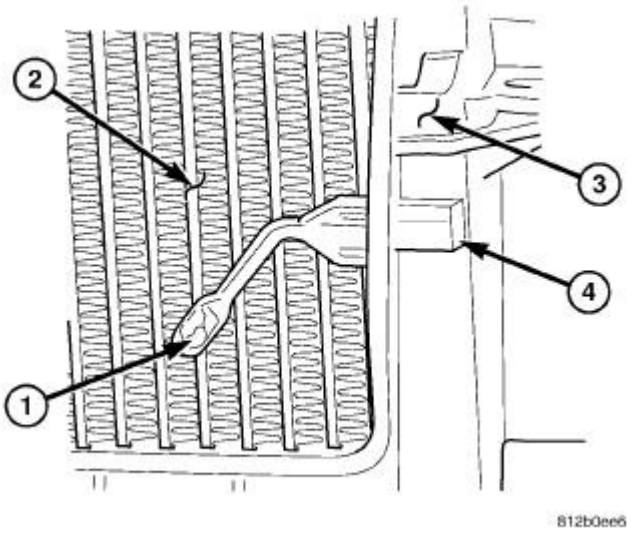

Fig. 24: Sensor-Evaporator Temperature
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the HVAC wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

OPERATION

OPERATION

The evaporator temperature sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and supplies an input signal to the A/C heater module. The A/C heater module uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C heater module through sensor ground circuit and a 5 volt Direct Current (DC) reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C heater module uses the monitored voltage reading as an indication of evaporator temperature. The A/C heater module is programmed to respond to this input by requesting the Powertrain Control Module (PCM) to cycle the A/C clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

The evaporator temperature sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

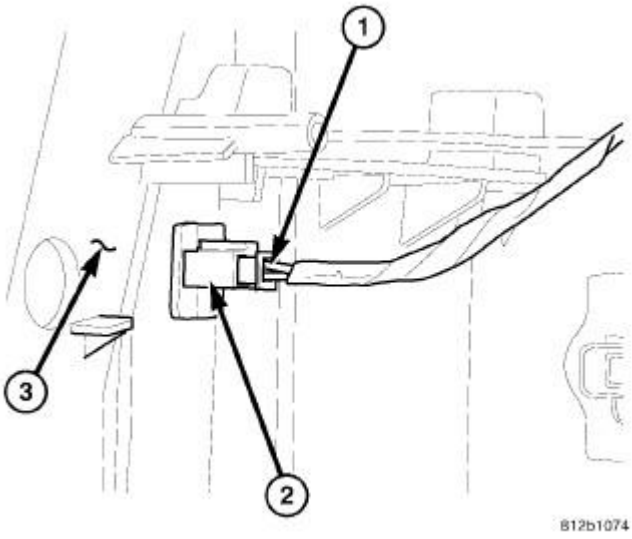

Fig. 25: Sensor-Evaporator Temperature
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the right side instrument panel silencer. Refer to **PANEL, SILENCER, REMOVAL** .
3. Remove the glove box and the glove box trim panel from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
4. Disconnect the HVAC wire harness connector (1) from the evaporator temperature sensor (2) located on the HVAC housing (3) and remove the sensor.

INSTALLATION

INSTALLATION

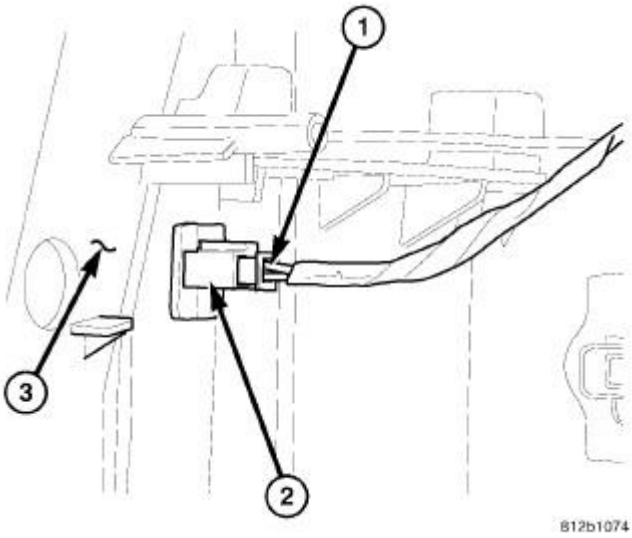

Fig. 26: Sensor-Evaporator Temperature
Courtesy of CHRYSLER GROUP, LLC

1. Install the evaporator temperature sensor (2) into HVAC housing (3).
2. Connect the HVAC wire harness connector (1) to the evaporator temperature sensor.
3. Install the glove box trim panel and glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
4. Install the right side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
5. Reconnect the negative battery cable.

SENSOR, HUMIDITY

DESCRIPTION

DESCRIPTION

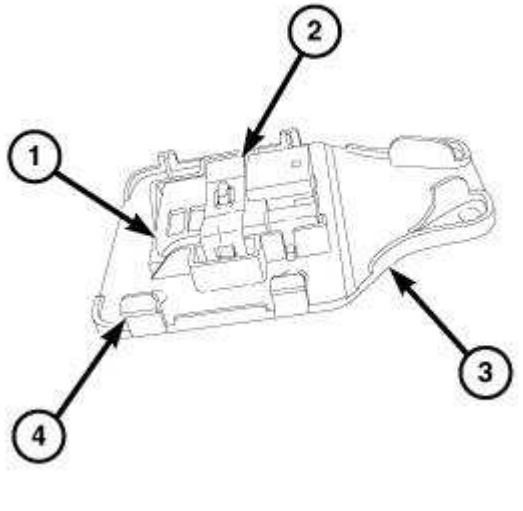

Fig. 27: Humidity Sensor, Bracket, Retaining Clip & Plastic Tabs
Courtesy of CHRYSLER GROUP, LLC

A humidity sensor (1) is used on Automatic Temperature Control (ATC) models to detect humidity levels inside the vehicle to optimize the dehumidifying effect of the A/C system. The humidity sensor is attached to a plastic bracket (3) by a metal retaining clip (2). The sensor bracket is attached to the inside of the windshield by an adhesive. A cover is attached to the sensor bracket by four plastic tabs (4). The humidity sensor is connected to the Body Control Module (BCM) by a dedicated three wire lead and connector that protrudes out from under the front of the headliner.

CAUTION: Use care when servicing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

The humidity sensor can be serviced without the use of any special tools.

OPERATION

OPERATION

The humidity sensor detects humidity, dew point and windshield glass temperature, and sends this information to the Body Control Module (BCM) over a Local Interconnect Network (LIN) data bus connection. The BCM then broadcasts the message over the Controller Area Network (CAN) data bus to the A/C heater module. The A/C heater module automatically adjusts A/C clutch operation, amount of recirculated air, blower motor speeds and outlet modes to prevent fogging on the inside of the windshield glass. If the humidity sensor message is not received by the A/C heater module, a Diagnostic Trouble Code (DTC) will set. The information the A/C heater module receives from the humidity sensor can be viewed using a scan tool.

The humidity sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The humidity sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

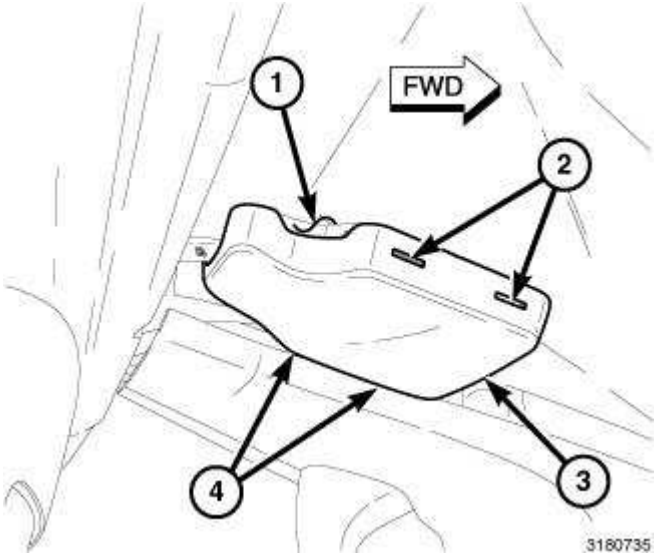

Fig. 28: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable

   CAUTION: Use care when removing the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

2. Carefully disengage the four retaining tabs (2 and 4) that secure the cover (3) to the humidity sensor bracket (1) by pressing in on the right side of the cover, while rocking the left side of the cover off the bracket.

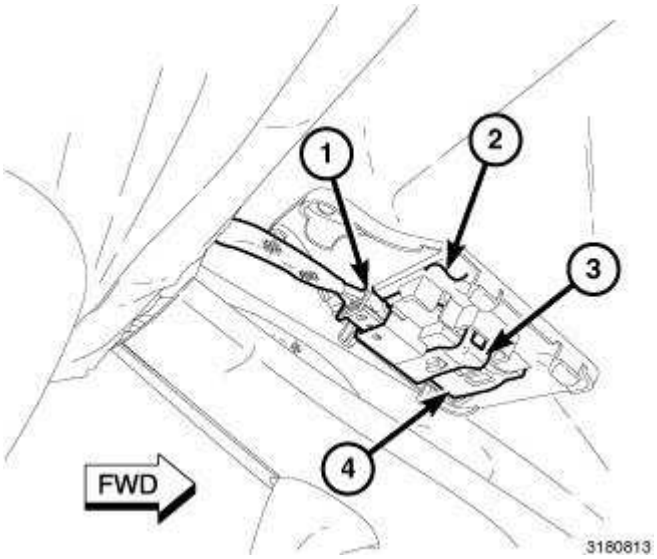

Fig. 29: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when removing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Using a small screwdriver or similar tool, carefully disengage the metal retaining clip (3) from the sensor bracket (2) and remove the humidity sensor (4) and the clip as an assembly.
4. Disconnect the wire harness connector (1) from the humidity sensor.
5. If the humidity sensor bracket is damaged and cannot be reused, replace the windshield. Refer to **WINDSHIELD, REMOVAL** .

INSTALLATION

INSTALLATION

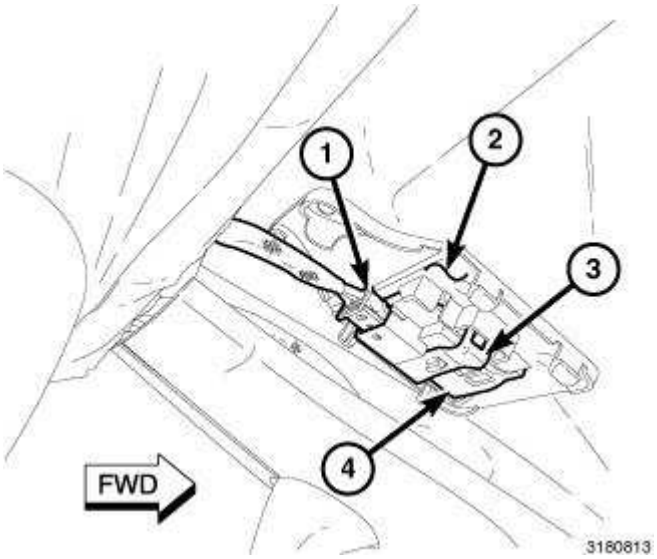

Fig. 30: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

1. If the humidity sensor bracket (1) is damaged and cannot be reused, install a new windshield. Refer to **WINDSHIELD, INSTALLATION** .
2. Connect the wire harness connector (1) to the humidity sensor (4).

CAUTION: Use care when installing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Position the humidity sensor to the sensor bracket (2) and engage the metal retaining clip (3) to the bracket. Make sure both sides of the retaining clip are fully engaged to the bracket.

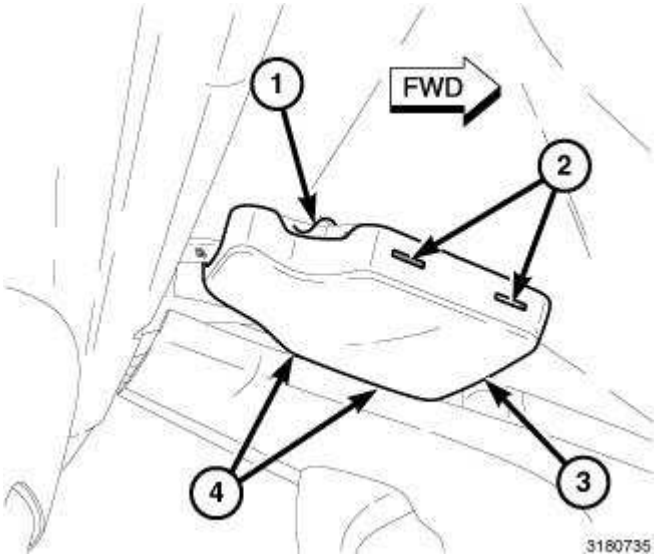

Fig. 31: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when install the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

4. Carefully install the humidity sensor cover (3) onto the sensor bracket (1). Make sure the four retaining tabs (2 and 4) are fully engaged to the bracket
5. Reconnect the negative battery cable.

SENSOR, SUN

DESCRIPTION

DESCRIPTION

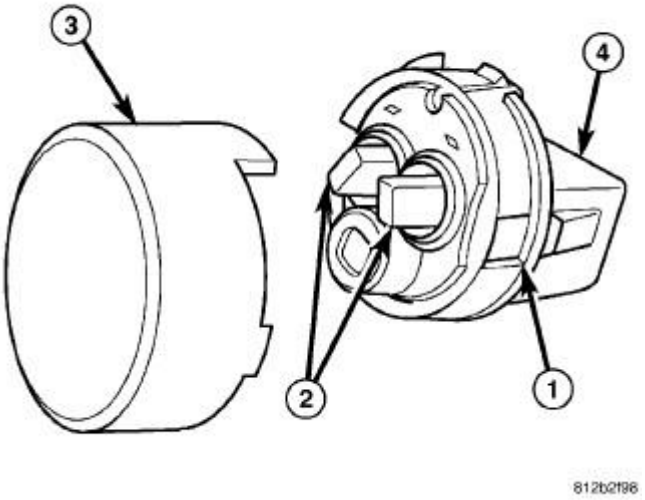

Fig. 32: Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical sun sensor assembly shown in illustration.

The Automatic Temperature Control (ATC) heating-A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates two sun sensors (2) within a molded plastic case with a clear lens (3), that protrudes through the center of the defroster grille. The wire harness receptacle (4) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

OPERATION

OPERATION

The Automatic Temperature Control (ATC) Dual Zone heating and A/C system uses two sun sensors to balance the system in response to side-to-side variations of sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the A/C heater module to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control, if equipped.

The sun sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The sun sensor assembly cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUN SENSOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, check for the following:

- Any items laying on top of the instrument panel are not covering the sun sensor.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Confirm that the windshield wipers are properly adjusted.
- Confirm that the sun sensor is properly installed. Refer to **SENSOR, SUN, INSTALLATION**.
- Confirm that the defroster grille is properly installed. Refer to **GRILLE, DEFROSTER, INSTALLATION** .

The A/C heater module continually monitors the sun sensor circuits and will store Diagnostic Trouble Codes (DTCs) for any problem it detects. The sun sensor can be tested in the vehicle with a scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in an accidental airbag deployment and possible serious or fatal injury.

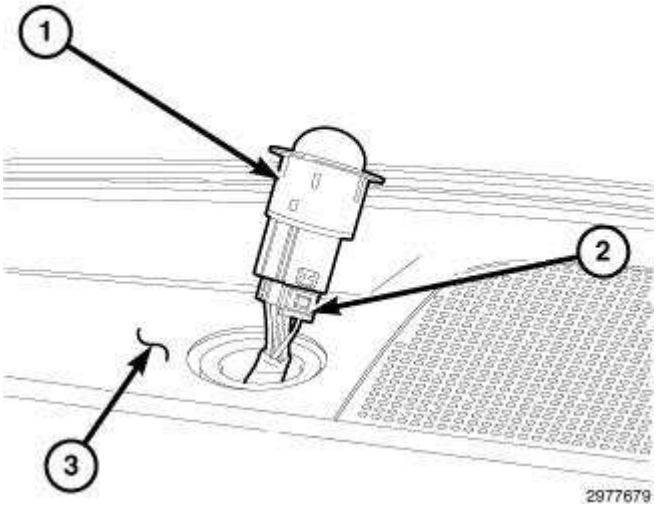

Fig. 33: Sun Sensor, Panel & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a small flat bladed tool, gently pry the sun sensor (1) out of the top of the instrument panel (3).
3. Disconnect the wire harness connector (2) and remove the sensor.

INSTALLATION

INSTALLATION

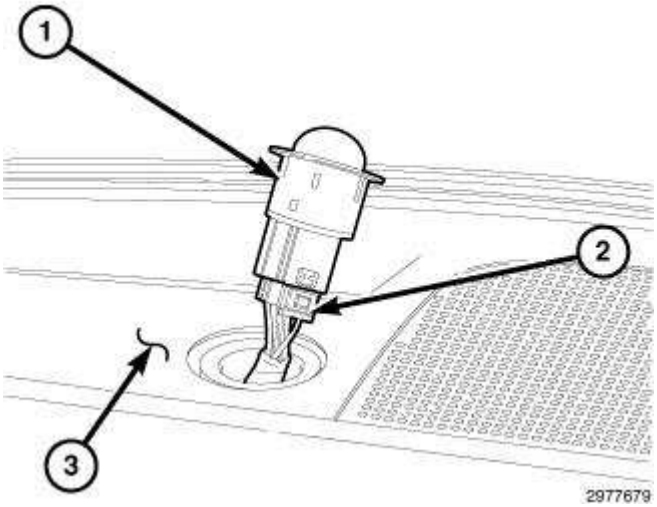

Fig. 34: Sun Sensor, Panel & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the sun sensor (1) near the instrument panel (3).
2. Connect the wiring harness connector (2) to the sun sensor.
3. Align the tab on the sun sensor with the slot in the opening of the instrument panel and gently push the sensor into the instrument panel. Make sure the sensor is fully engaged and lies flat in the instrument panel.
4. Reconnect the negative battery cable.

SENSOR, TEMPERATURE, IN-CAR

DESCRIPTION

DESCRIPTION

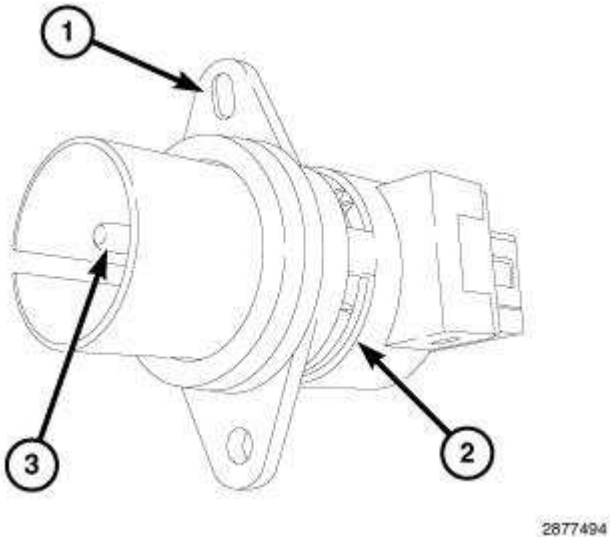

Fig. 35: In-Car Temperature Sensor, Aspirator Motor & Thermistor
Courtesy of CHRYSLER GROUP, LLC

The in-car temperature sensor (1) is used in the Automatic Temperature Control (ATC) heating and A/C system only. The in-car temperature sensor consists of an aspirator motor (2) and a temperature thermistor (3). The in-car temperature sensor sends a resistance signal to the ATC A/C heater module and is attached to the instrument panel, below the steering column.

OPERATION

OPERATION

Air is drawn from the passenger compartment by the aspirator motor and flows over the temperature thermistor. The thermistor changes resistance with air temperature. The A/C heater module for the Automatic Temperature Control (ATC) system receives the resistance signal over hard-wired circuits and calculates the temperature of the air in the passenger compartment. The ATC system then automatically makes adjustments to maintain the optimum passenger compartment comfort.

The in-car temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING -

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the in-car temperature sensor and the A/C heater module. If any DTCs are found, repair as necessary. Refer to **DIAGNOSIS AND TESTING** . If no DTCs are found, perform the two following tests. Replace the in-car temperature sensor if the sensor fails either test.

IN-CAR TEMPERATURE SENSOR

ASPIRATOR MOTOR TEST

The in-car temperature sensor uses an aspirator motor to draw air from the passenger compartment and flow the air over the temperature thermistor. Test the motor as follows.

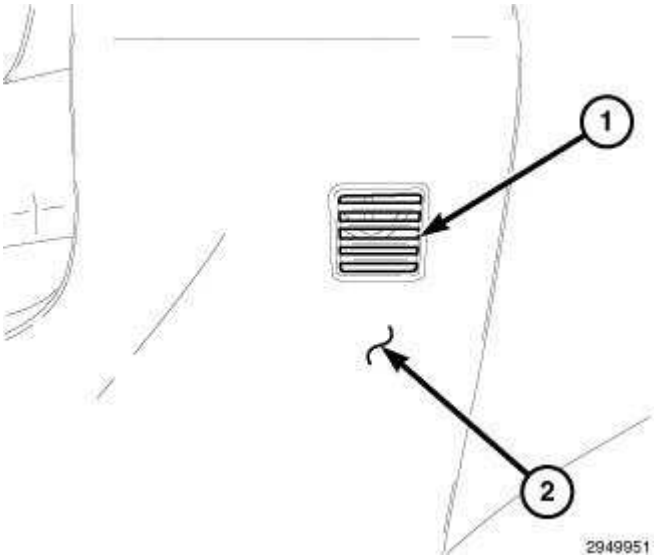

Fig. 36: Opening Grille & Opening Cover
Courtesy of CHRYSLER GROUP, LLC

1. Place the ignition in the Run position.
2. Place a small piece of newspaper in front of the aspirator motor opening grille (1), located on the steering column opening cover (2). If the paper sticks to the grille, the aspirator motor is operating properly. The piece of paper should be only large enough to cover the opening.
3. If the paper does not stick to the grille, check the in-car temperature sensor electrical connections and wiring. If connections and wiring are OK, replace the in-car temperature sensor.

TEMPERATURE THERMISTOR TEST

The in-car temperature sensor uses a temperature thermistor to provide resistance values that correlate with temperature change. Test the thermistor as follows.

1. Remove the in-car temperature sensor and place it on a workbench. Refer to **SENSOR, TEMPERATURE, IN-CAR, REMOVAL**.
2. Note the current ambient air temperature of the work area.
3. Use an ohm meter and check the resistance between pins 1 and 2 of the in-car temperature sensor. Compare the temperature of the work area to the found resistance value. The resistance should be within specifications as listed in the Resistance and Temperature chart. If not OK, replace the in-car temperature sensor.

RESISTANCE AND TEMPERATURE

Air Temperature Range	Low Resistance Range (kohm)	High Resistance Range (kohm)
-21° to -15°C (-5° to 5°F)	292 ± 1.0	223 ± 0.9
-14° to -9°C (6° to 15°F)	198 ± 0.9	161 ± 0.8
-8° to -4°C (16° to 25°F)	144 ± 0.8	123 ± 0.8

-3° to 1°C (26° to 35°F)	111 ± 0.7	95 ± 0.7
2 to 7°C (36° to 45°F)	86 ± 0.7	70 ± 0.6
8 to 12°C (46° to 55°F)	64 ± 0.6	55 ± 0.5
13° to 18°C (56° to 65°F)	51 ± 0.5	42 ± 0.4
19° to 23°C (66° to 75°F)	39 ± 0.4	33 ± 0.3
24° to 29°C (76° to 85°F)	31 ± 0.3	26 ± 0.3
30° to 35°C (86° to 95°F)	24 ± 0.3	20 ± 0.3
36° to 40°C (96° to 105°F)	18 ± 0.3	16 ± 0.3
41° to 46°C (106° to 115°F)	15 ± 0.3	13 ± 0.3

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.

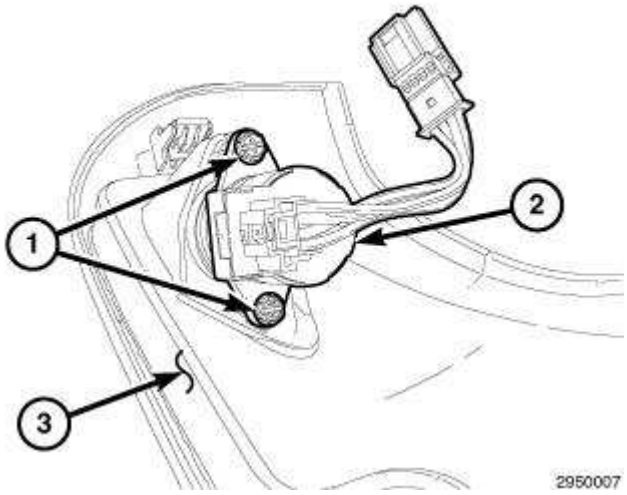

Fig. 37: Two Screws & In-Car Temperature Sensor

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column opening cover (3) and place it on a workbench. Refer to **COVER,**

STEERING COLUMN OPENING, REMOVAL .

3. Remove the two screws (1) that secure the in-car temperature sensor (2) to the steering column opening cover and remove the sensor.

INSTALLATION

INSTALLATION

NOTE: Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.

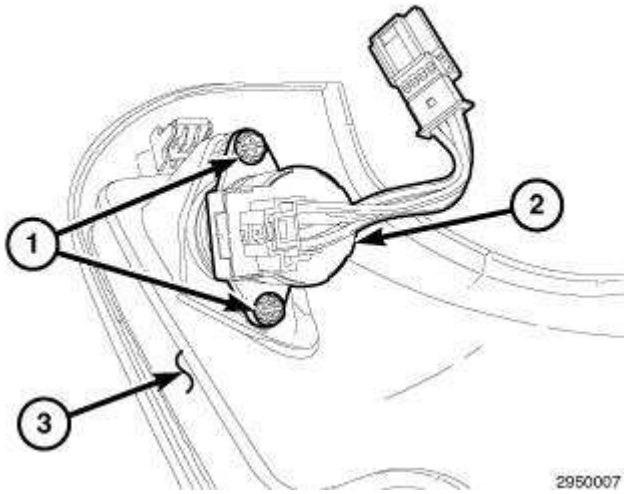

Fig. 38: Two Screws & In-Car Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Position the in-car temperature sensor (2) onto the steering column opening cover (3).
2. Install the two screws (1) that secure the in-car temperature sensor to the steering column opening cover. Tighten the screws securely.
3. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
4. Reconnect the negative battery cable.

TRANSDUCER, A/C PRESSURE

DESCRIPTION

DESCRIPTION

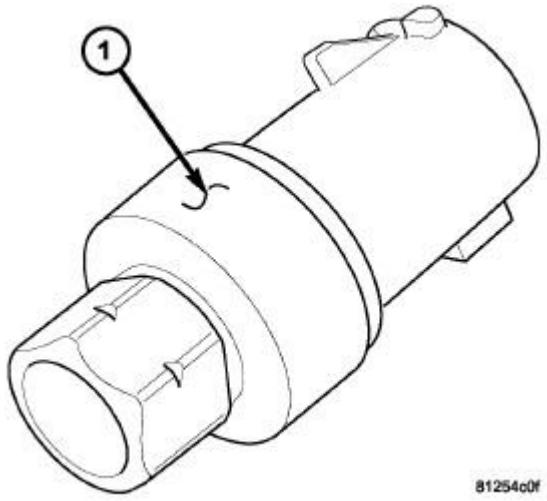

Fig. 39: A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C liquid line. A rubber O-ring seals the connection between the A/C pressure transducer and the liquid line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C liquid line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the liquid line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The Powertrain Control Module (PCM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM is programmed to respond to the A/C pressure transducer and other sensor inputs and control the operation of the A/C clutch and the radiator cooling fan, to help optimize A/C system performance, and to protect the A/C system from damage. The PCM will disengage the A/C clutch when high side pressure rises above 3082 kPa (447 psi) and reengage the clutch when high side pressure drops below 2937 kPa (426 psi). The A/C pressure transducer will also disengage the A/C clutch if the high side pressure drops below 110 kPa (16 psi) and will reengage the clutch when the high side pressure rises above 221 kPa (32 psi). If the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan. The A/C pressure transducer input to the PCM will also prevent the A/C clutch from engaging when ambient temperatures are below about 4.5° C (40° F) due to the pressure/temperature relationship of the

refrigerant.

The A/C pressure transducer is tested using a scan tool. Refer to appropriate diagnostic information .

The A/C pressure transducer cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

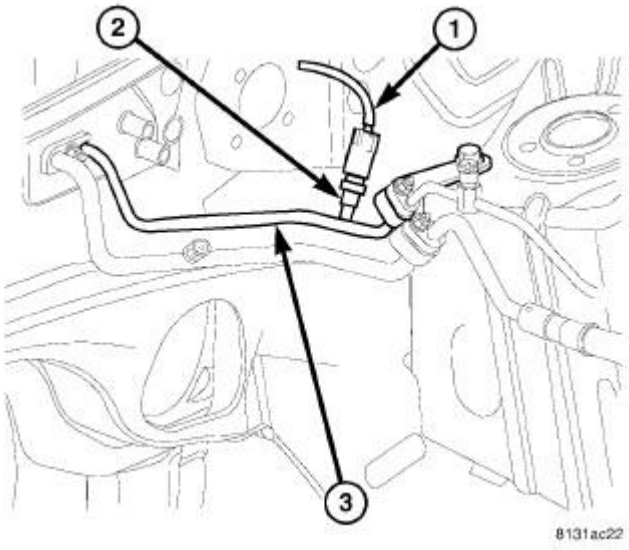

Fig. 40: Removing/Installing A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2).
3. Remove the A/C pressure transducer from the A/C liquid line (3) and remove and discard the O-ring seal.

INSTALLATION

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

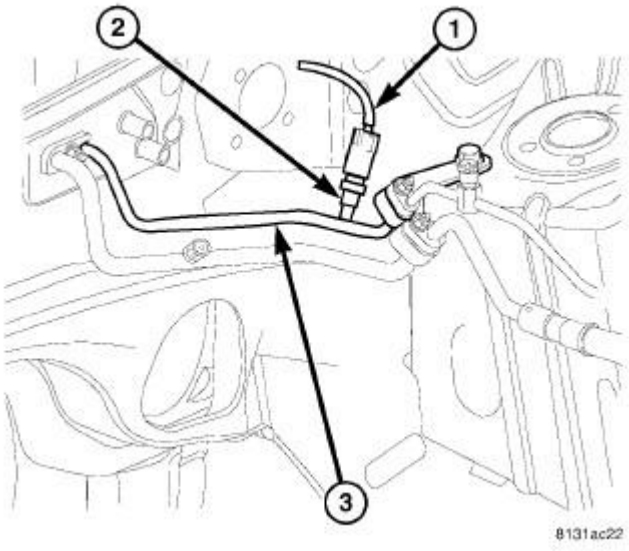

Fig. 41: Removing/Installing A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the liquid line fitting.
2. Install the A/C pressure transducer (2) onto the A/C liquid line (3). Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT, DEFROSTER

REMOVAL

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

1. Position the passenger side instrument panel duct and demister duct assembly (4) into the instrument panel.
2. Install the passenger side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
3. Install the four screws that secure the passenger side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N.m (20 in. lbs.).
4. Position the driver side instrument panel duct and demister duct assembly (3) into the instrument panel.
5. Install the driver side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
6. Install the four screws that secure the driver side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N.m (20 in. lbs.).

7. Install the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2). Tighten the screw to 2.2 N.m (20 in. lbs.).
8. Install the instrument panel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .

FILTER, PARTICULATE AIR

DESCRIPTION

DESCRIPTION

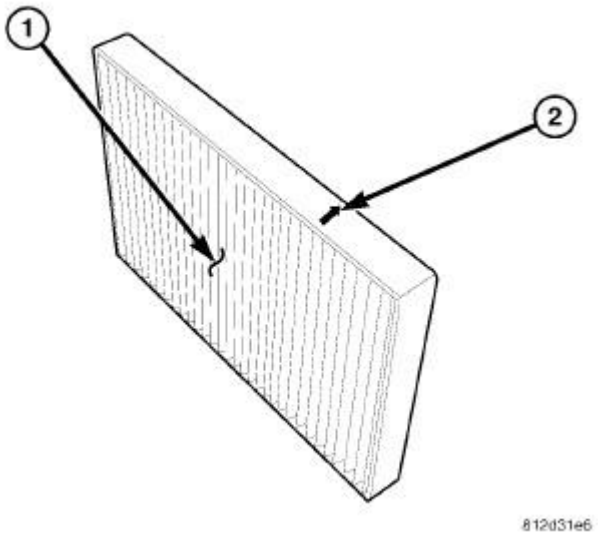

Fig. 54: Filter-Particulate Air Description
Courtesy of CHRYSLER GROUP, LLC

All models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC housing. The filter is mounted in the engine compartment, inside of the fresh air inlet housing of the heating-A/C system.

The filter should be replaced at least every 24, 000 km (15, 000 miles) or each year and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow (2) to indicate air flow direction through the filter.

REMOVAL

REMOVAL

NOTE: LHD model shown in illustrations. RHD model similar.

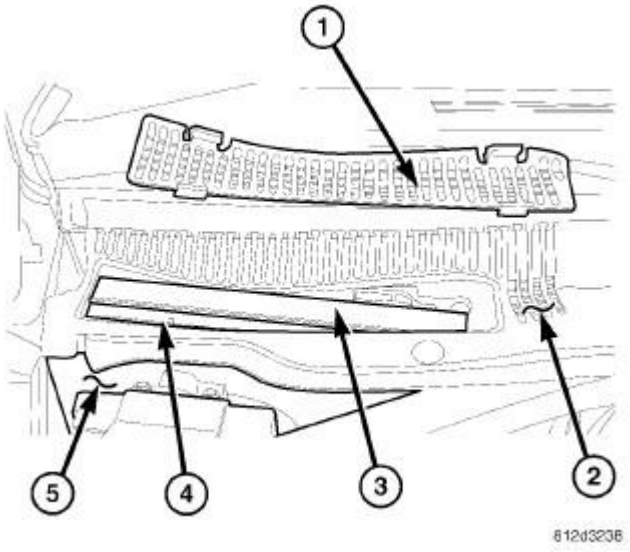

Fig. 55: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

1. Remove the air inlet grille (1) from the wiper module screen (2) located near the dash panel in the engine compartment.
2. Open the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5).

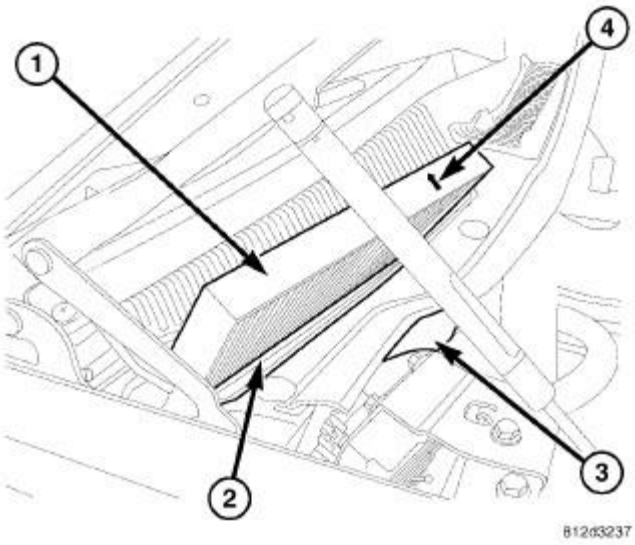

Fig. 56: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: To aid in reinstallation, note the installed position of the particulate air filter prior to removal of the filter.

3. Remove the particulate air filter (1) from the particulate air filter housing (2) located inside of the dash panel plenum (3). Note the direction of air flow indicated by an arrow (4) on the filter.

INSTALLATION

INSTALLATION

NOTE: The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

NOTE: LHD model shown in illustrations. RHD model similar.

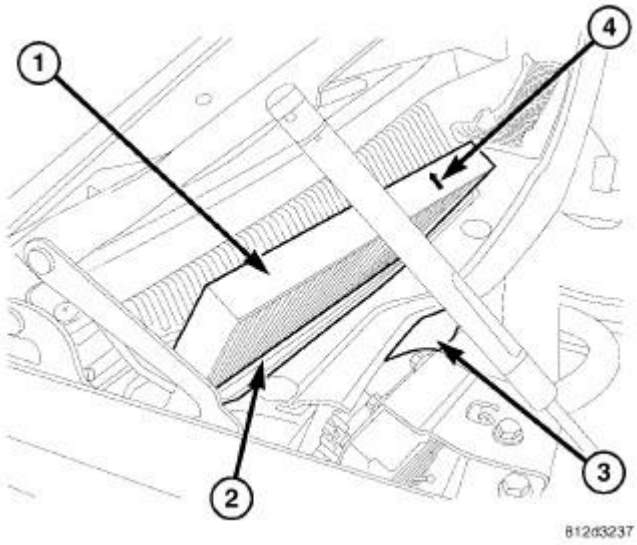

Fig. 57: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

1. Install the particulate air filter (1) into the particulate air filter housing (2) located inside of the dash panel plenum (3). Insert the particulate air filter down directly into the filter housing with the arrow (4) on the filter pointing to the rear of the vehicle. The particulate air filter is held in place by friction between the filter element and the filter housing, so no fasteners are required.

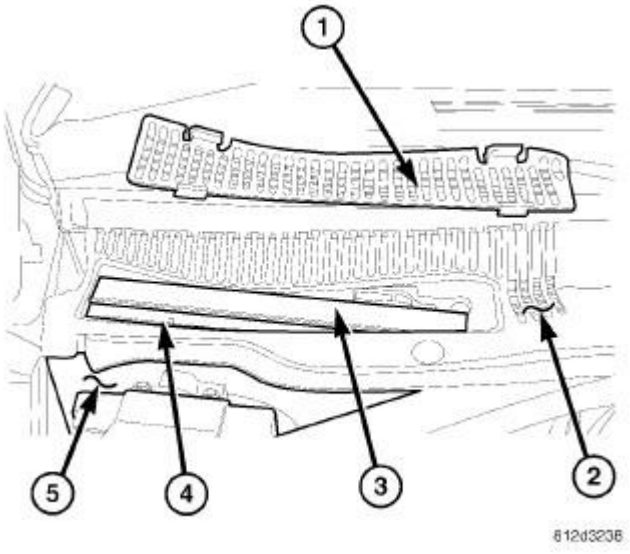

Fig. 58: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

2. Close the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5).
3. Install the air inlet grille (1) onto the wiper module screen (2).

HOUSING, HVAC

REMOVAL

HOUSING-AIR DISTRIBUTION

WARNING: Refer to the applicable Warnings and Cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

NOTE: **LHD model shown in illustrations. RHD model similar.**

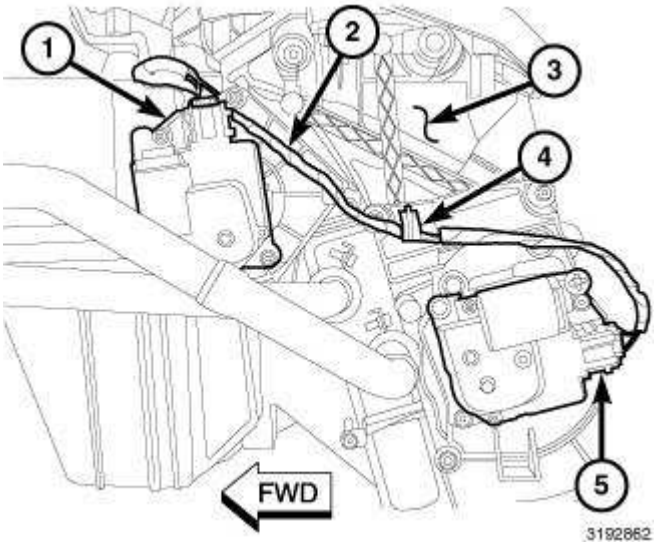

Fig. 59: HVAC Wire Harness, Mode Door Actuator, Blend Door Actuator & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the HVAC housing assembly and place it on a suitable workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Disconnect the HVAC wire harness (2) from the mode door actuator (5) and the blend door actuator (1), located on the left side of the air distribution housing (3).
3. Disengage the HVAC wire harness from the retaining tab (4).

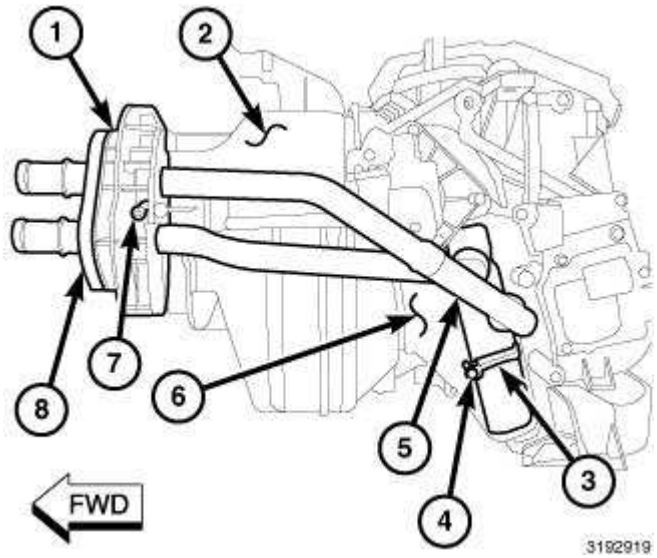

Fig. 60: Screw, Flange, HVAC Housing, Retaining Screw, Bracket, Housing
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (7) that secure the flange (1) to the front of the HVAC housing (2) and

remove the flange.

5. Remove the reatining screw (4) that secures the heater core bracket (3) to the driver side of the air distribution housing (6) and remove the bracket.
6. Disengage the heater core tubes from the foam seal (8) and carefully pull the heater core (5) straight out of the side of the air distribution housing.

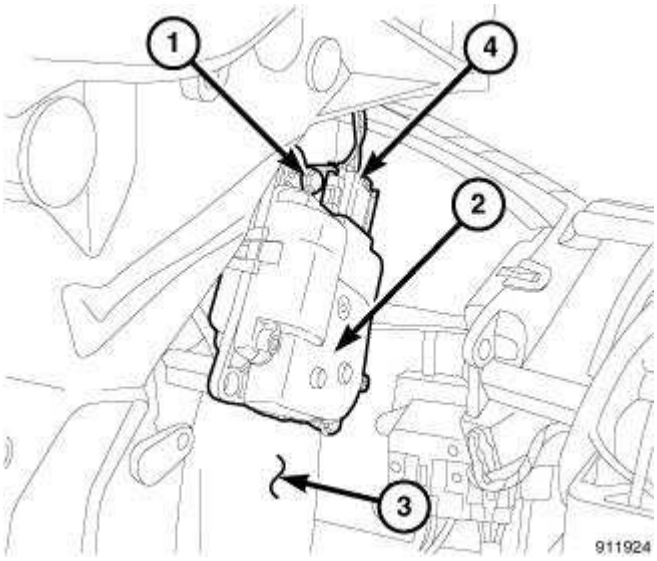

Fig. 61: Actuator-Blend Door-Dual Passenger

7. Disconnect the HVAC wire harness (4) from the blend door actuator (2) located on the passenger side of the air distribution housing (3).

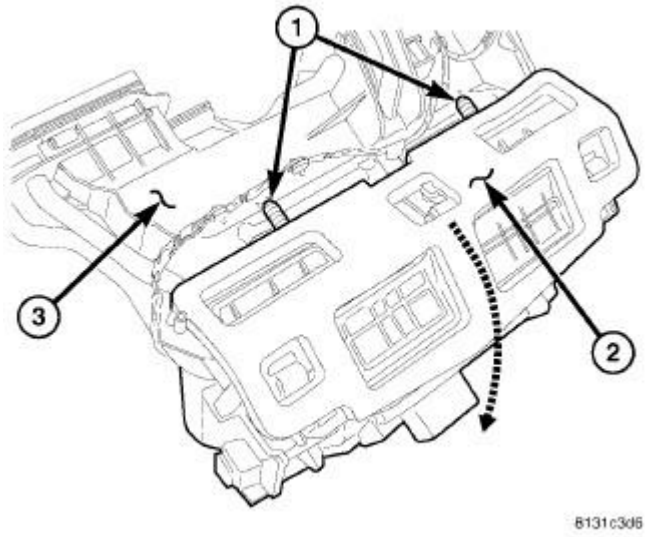

Fig. 62: Removing Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

8. Remove the two screws (1) and disengage the two tabs that secure the top of the air distribution housing (2) to the HVAC housing (3).
9. Tilt the top of the air distribution housing downward and disengage the two tab-and-slot type retainers, located at the bottom of the housing.
10. If required, disassemble the air distribution housing. Refer to **HOUSING, HVAC, DISASSEMBLY**.

HOUSING-AIR INLET

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal inury.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model shown in illustration. RHD model similar.

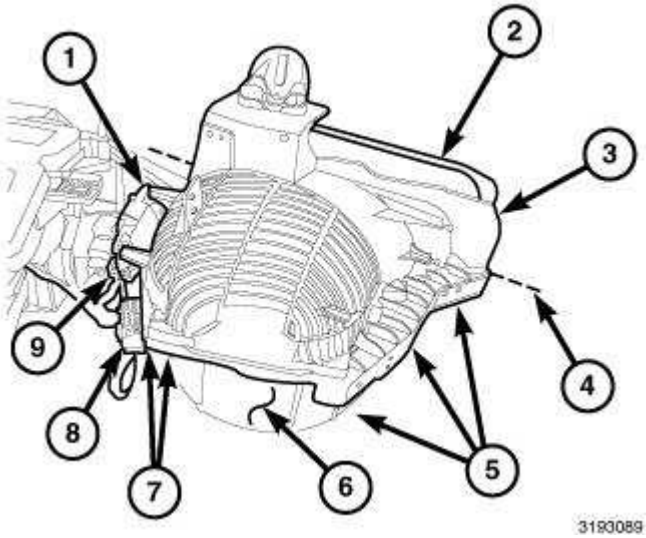

Fig. 63: Wire Harness Connector, Door Actuator, Wire Harness Connector & Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the A/C heater module. Refer to **MODULE, A/C AND HEATER, REMOVAL** .
3. Disconnect the HVAC wire harness connector (9) from the recirculation door actuator (1).
4. Disengage the HVAC wire harness connector (8) from the air inlet housing (3).
5. Carefully cut the foam seal (2) along the parting line (4) of the air inlet housing. If the seal is deformed or damaged, it must be replaced.
6. Remove the five screws (5 and 7) that secure the air inlet housing to HVAC housing (6).
7. Remove the air inlet housing from the HVAC housing.
8. If required, disassemble the air inlet housing. Refer to **HOUSING, HVAC, DISASSEMBLY**.

HOUSING-FRESH AIR INLET

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: The fresh air inlet housing must be removed from the vehicle for removal of the HVAC housing.

NOTE: LHD model shown in illustrations. RHD model similar.

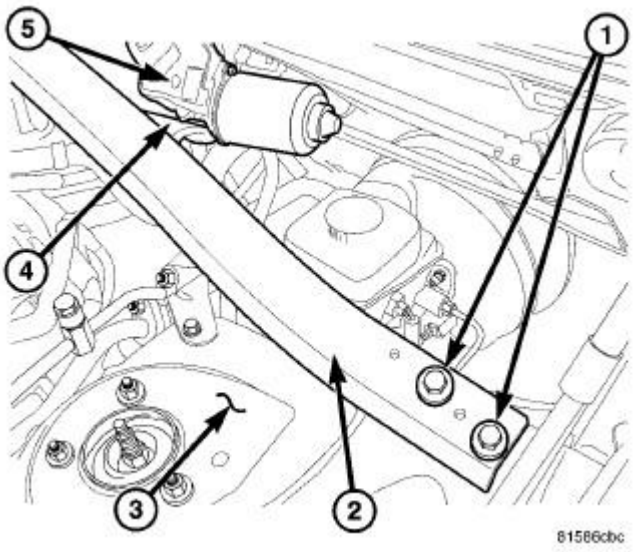

Fig. 64: Strut Support- Driver Side
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

2. Remove the cowl top panel from the dash panel. Refer to **COVER, COWL PANEL, REMOVAL** .
3. Remove the two bolts (1) that secure the strut support (2) to the driver side strut tower (3).
4. Disengage the wiper motor (5) from the bracket (4) located on the strut support.

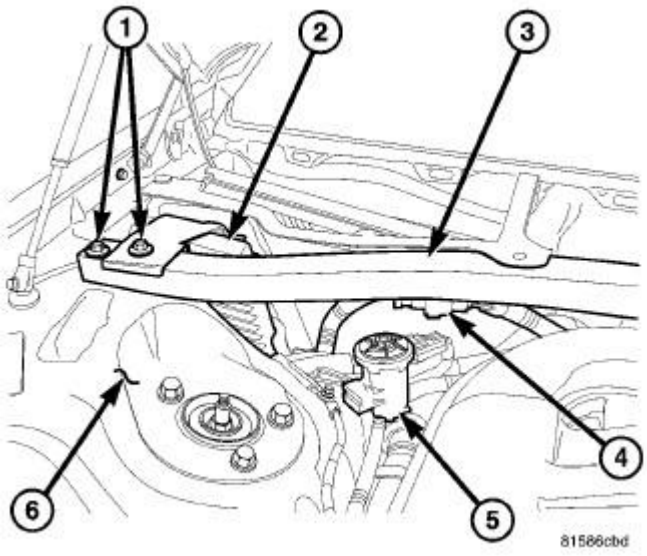

Fig. 65: Strut Support- Passenger Side
Courtesy of CHRYSLER GROUP, LLC

5. Disengage the retainer that secures the wire harness (4) to the bottom of the strut support (3).
6. On LHD models, remove the purge solenoid (5) from its mounting bracket and position the solenoid out of the way.
7. Remove the two bolts (1) that secure the strut support to the passenger side strut tower (6) and remove the support from the engine compartment.
8. Position the powertrain control module (PCM) or the engine control module (ECM) (2) (depending on engine application) out of the way.

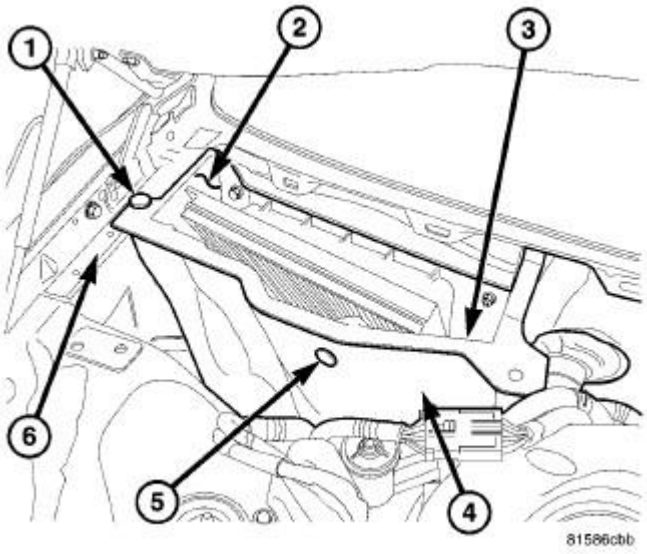

Fig. 66: Push Pins-Fresh Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

9. Remove the push-pin retainer (1) that secures the fresh air inlet housing (2) to the passenger side inner fender (6).
10. Disengage the wire harness retainer (3) from inside the bottom of the fresh air inlet housing, if equipped.
11. Remove the push-pin retainer (5) that secures the insulator (4) to the front of the fresh air inlet housing and position the insulator out of the way.

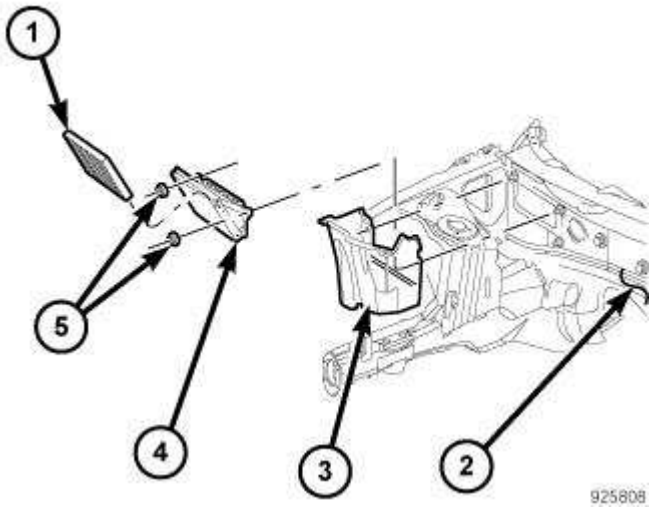

Fig. 67: 06 Fresh Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

12. Remove the two nuts (5) that secure the fresh air inlet housing (3), particulate air filter (1) and filter housing (4) to the dash panel (2).

13. Remove the fresh air inlet housing, particulate air filter and filter housing as an assembly from the dash panel.

HOUSING-HVAC ASSEMBLY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown in illustrations. RHD model similar.

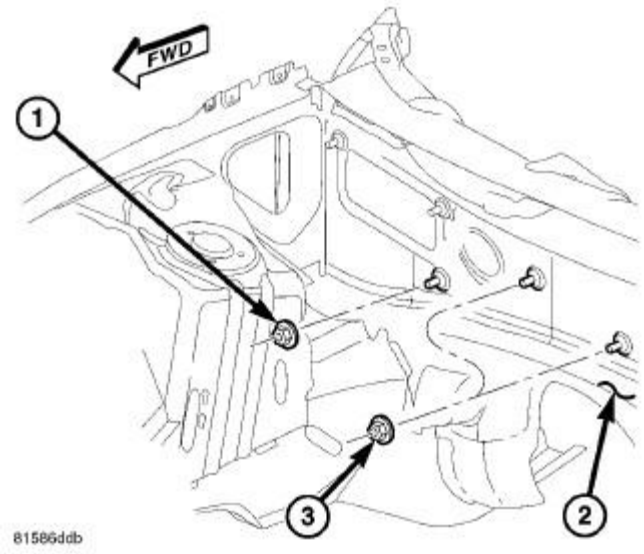

Fig. 68: Remove/Install Housing-HVAC-Exterior
Courtesy of CHRYSLER GROUP, LLC

1. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

2. Drain the engine cooling system. Refer to **STANDARD PROCEDURE** .
3. Disconnect and isolate the negative battery cable.
4. Remove the fresh air inlet housing from the dash panel. Refer to **HOUSING, HVAC, REMOVAL**.
5. Disconnect the A/C liquid line and the A/C suction line from the A/C evaporator. Refer to **LINE, A/C LIQUID, REMOVAL**.
6. Disconnect the heater hoses from the heater core tubes.
7. Remove the three nuts (1 and 3) that secure the HVAC housing to the engine compartment side of the dash panel (2).

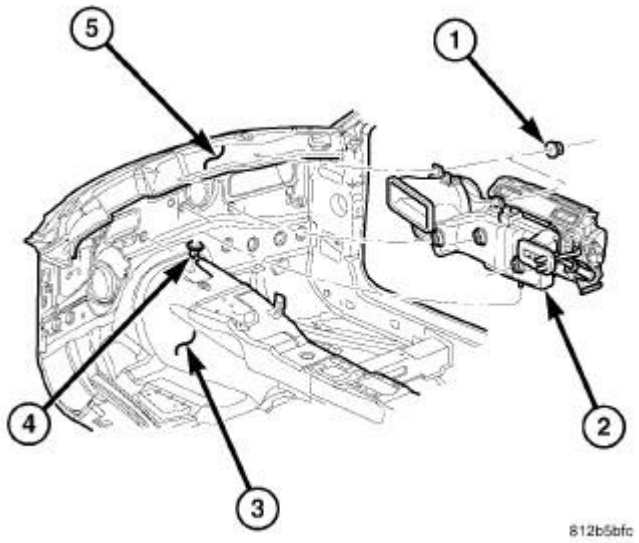

Fig. 69: Housing-Hvac-Interior
Courtesy of CHRYSLER GROUP, LLC

8. Remove the instrument panel from the passenger compartment. Refer to **PANEL, INSTRUMENT, REMOVAL** .
9. Disconnect the floor console duct. Refer to **DUCT, FLOOR CONSOLE, REMOVAL**.
10. Disconnect the rear floor distribution ducts. Refer to **DUCT, FLOOR DISTRIBUTION, REMOVAL**.
11. Remove the defroster ducts. Refer to **DUCT, DEFROSTER, REMOVAL**.
12. Remove the two nuts (1) that secure the HVAC housing (2) to the passenger compartment side of the dash panel (5).
13. Pull the HVAC housing assembly rearward so that the mounting studs clear the dash panel.
14. Lift the HVAC housing assembly upwards so that the condensate drain tube clears the grommet (4) in the floor panel (3) and remove the HVAC housing assembly from the passenger compartment.
15. If required, disassemble the HVAC housing assembly. Refer to **HOUSING, HVAC, DISASSEMBLY**.

DISASSEMBLY

HOUSING-AIR DISTRIBUTION

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

NOTE: LHD model shown in illustration. RHD model similar.

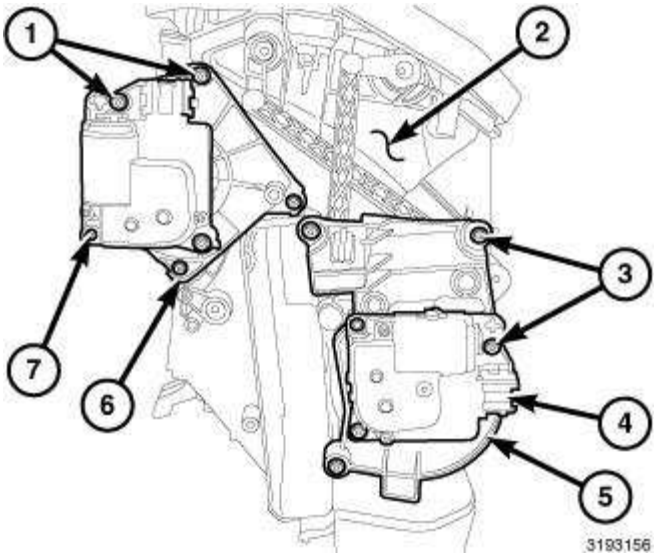

Fig. 70: Screws, Blend Door Actuator & Actuator Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Remove the air distribution housing (2) from the HVAC housing and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. On models equipped with the 3.0L diesel engine, remove the electric Positive Temperature Coefficient (PTC) heater from the air distribution housing. Refer to **UNIT, HEATER, REMOVAL**.
3. Remove the screws (1) that secure the blend door actuator (7) and the blend door actuator bracket (6) to the left side of the air distribution housing and remove the actuator and bracket.
4. Remove the screws (3) that secure the mode door actuator (4) and the mode door actuator bracket (5) to the air distribution housing and remove the actuator and bracket.

14. Carefully cut the foam seal (1) along the parting line (2) of the two halves of the air distribution housing (3). If the seal is deformed or damaged, it must be replaced.
15. Remove the screws (4) that secure the two halves of the air distribution housing together.

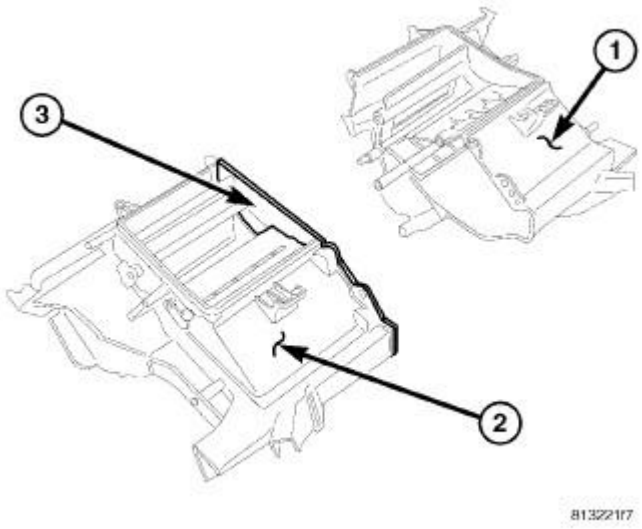

Fig. 76: Removing/Installing Partition Air Housing
Courtesy of CHRYSLER GROUP, LLC

16. Carefully separate the left half of the air distribution housing (1) from the right half of the housing

(2).

17. Remove the center partition (3).

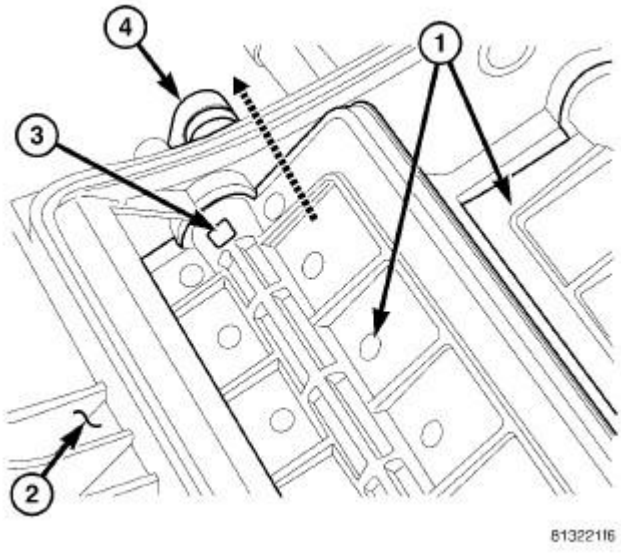

Fig. 77: Removing Air Doors From Air Housing
Courtesy of CHRYSLER GROUP, LLC

18. To remove the air doors (1) from the air distribution housing (2), first carefully push down on the tab (3) of the air door lever (4) located in the pivot shaft of the air door being removed.

NOTE: If the seal on the air door is deformed or damaged, the air door must be replaced.

19. Gently pull the air door lever out of the pivot shaft and remove the air door(s) from the air distribution housing as required.

HOUSING-AIR INLET

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model shown in illustration. RHD model similar.

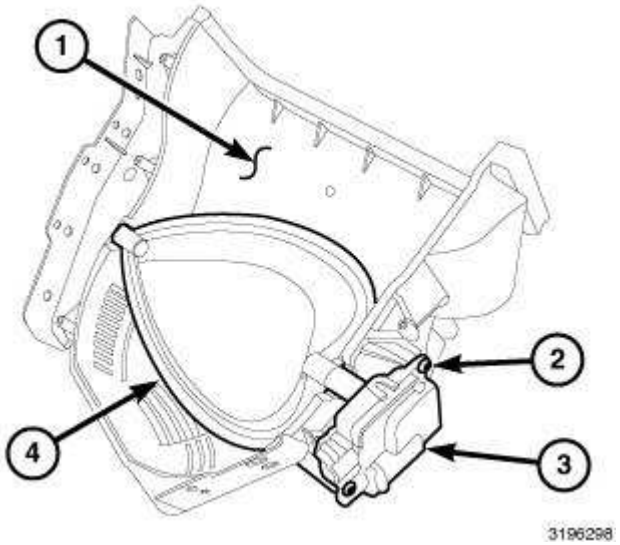

Fig. 78: Air Inlet Housing, Two Screws, Door Actuator & Recirculation-Air Door
Courtesy of CHRYSLER GROUP, LLC

1. Remove the air inlet housing (1) from the HVAC housing and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the two screws (2) that secure the recirculation door actuator (3) to the air inlet housing and remove the actuator.
3. Remove the recirculation-air door (4) from the air inlet housing.

HOUSING-HVAC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown in illustration. RHD model similar.

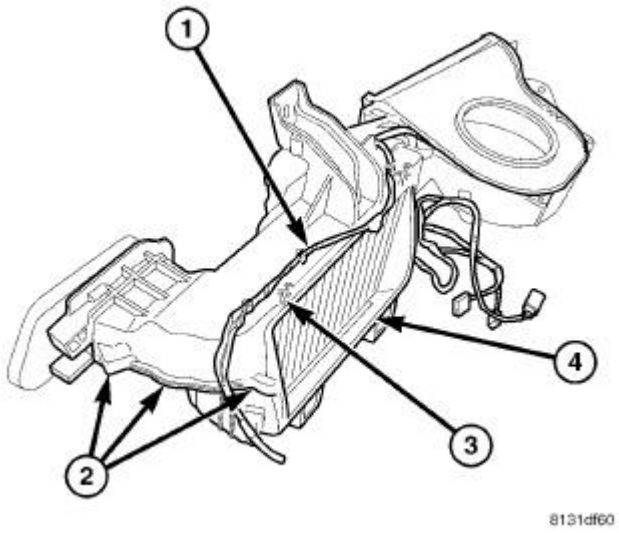

Fig. 79: Locating HVAC Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the air inlet housing. Refer to **HOUSING, HVAC, REMOVAL**.
3. Remove the air distribution housing. Refer to **HOUSING, HVAC, REMOVAL**.
4. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
5. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
6. Remove the evaporator temperature sensor. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL**.
7. Remove the HVAC wiring harness (1).
8. Remove the ten screws (2) that secure the upper half of the HVAC housing (3) to the lower half of the HVAC housing (4) and remove the upper housing.

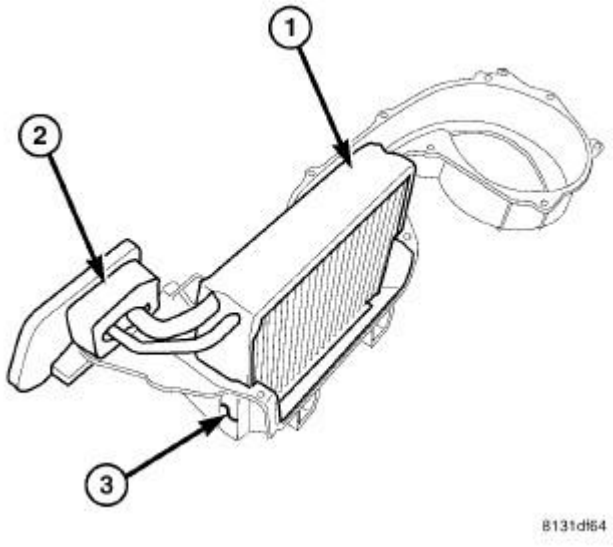

Fig. 80: Removing/Installing A/C Evaporator
Courtesy of CHRYSLER GROUP, LLC

9. Carefully lift the A/C evaporator (1) and foam seal (2) out of the lower half of the HVAC housing (3).

NOTE: If the foam seal at the front of the HVAC housing is deformed or damaged, the seal must be replaced.

10. If required, remove the A/C expansion valve, tapping block and foam seal from the A/C evaporator. Refer to **VALVE, A/C EXPANSION, REMOVAL**.

ASSEMBLY

HOUSING-AIR DISTRIBUTION

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

NOTE: LHD model shown in illustration. RHD model similar.

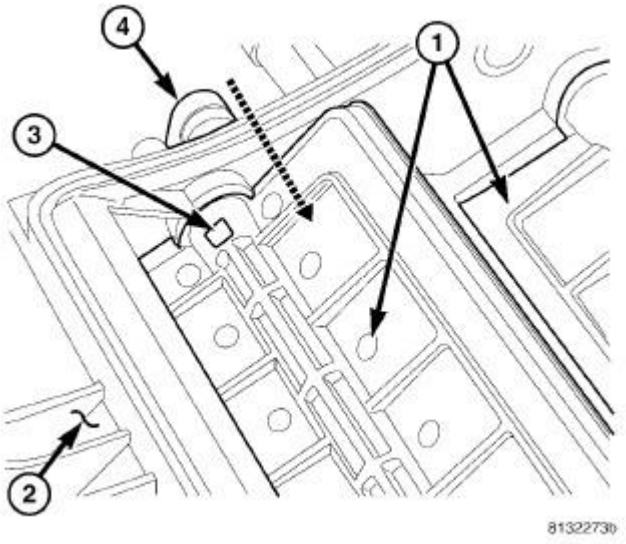

Fig. 81: Installing Air Housing-Air Doors
Courtesy of CHRYSLER GROUP, LLC

1. Install the air door(s) (1) into the air distribution housing (2) as required. Align the air door with the pivot shaft hole in the housing.
2. Align and install the air door lever (4) into the pivot shaft of the air door. Make sure that the tab (3) on the door lever is securely engaged to the pivot shaft.

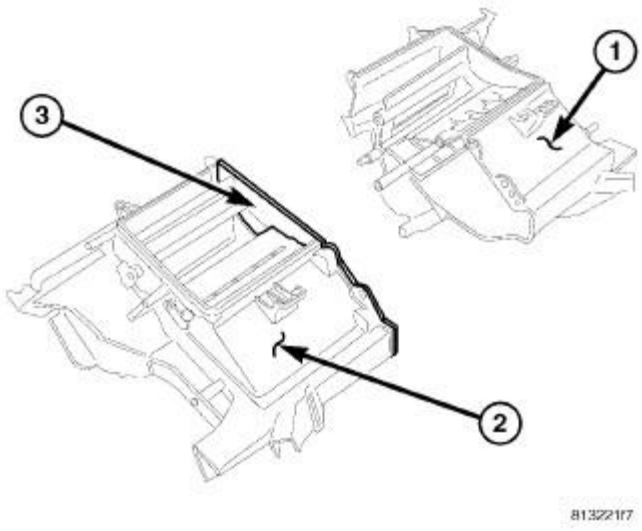

Fig. 82: Removing/Installing Partition Air Housing
Courtesy of CHRYSLER GROUP, LLC

3. Align the air door pivot shafts with the pivot holes in the center partition (3) and install the partition onto the left half of the air distribution housing (1).

4. Align the air door pivot shafts to each other and carefully install the left half of the air distribution housing to the right half of the housing (2).

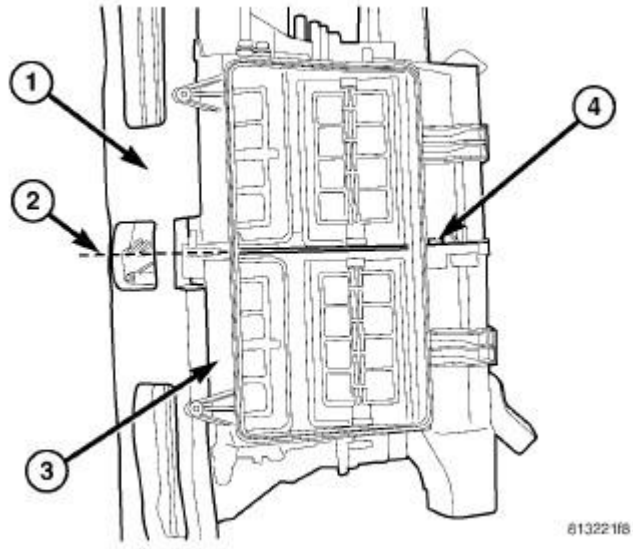

Fig. 83: Removing/Installing Air Housing-Seal & Screws
Courtesy of CHRYSLER GROUP, LLC

5. Install the screws (4) that secure the two halves of the air distribution housing (3) together. Tighten the screws to 2.2 N.m (20 in. lbs.).
6. Inspect the foam seal (1), especially at the parting line (2). If the seal is deformed or damaged, it must be replaced.

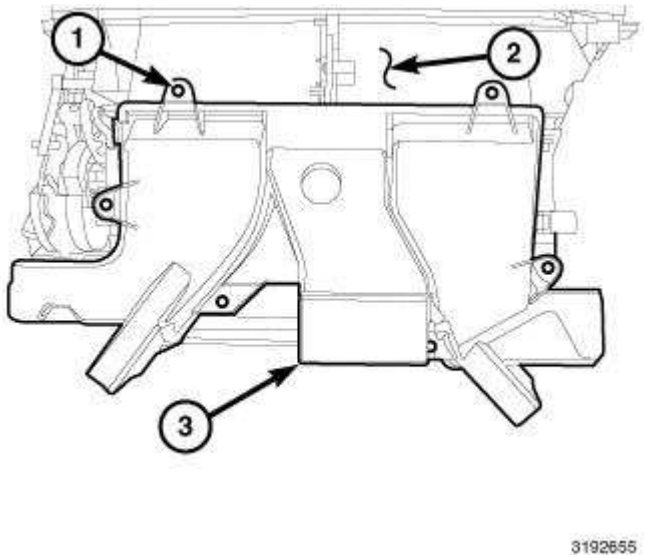

Fig. 84: Six Screws, Front Floor Distribution Duct & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

7. Position the floor distribution duct (3) onto the air distribution housing (2).

8. Install the six screws (1) that secure the floor distribution duct to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).

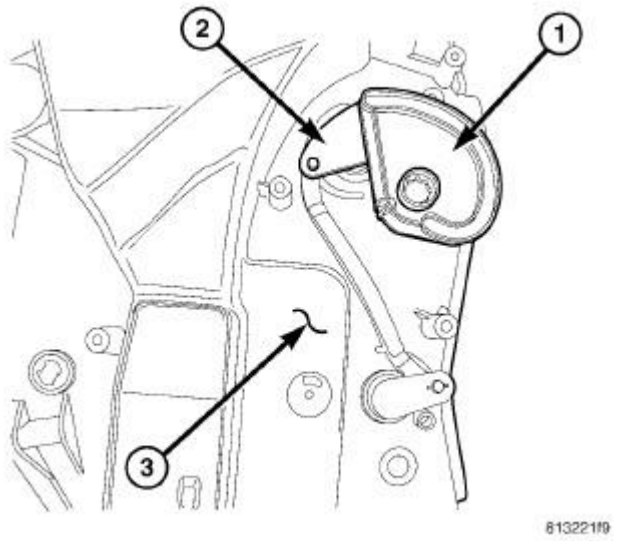

Fig. 85: Removing/Installing Air Housing-Blend Actuator Cam-RH
Courtesy of CHRYSLER GROUP, LLC

9. Install the blend door cam (1) onto the blend door lever (2) and the pivot shaft located on the right side of the air distribution housing (3).

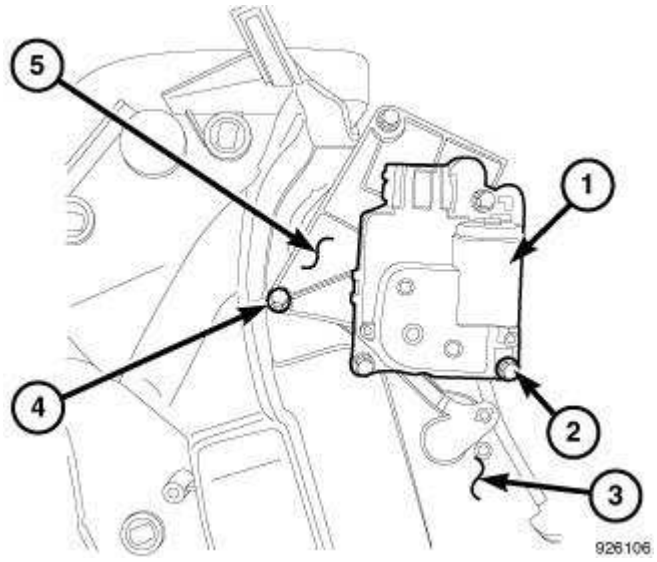

Fig. 86: Air Housing-Blend Actuator And Bracket-RH
Courtesy of CHRYSLER GROUP, LLC

10. Install the blend door actuator mounting bracket (5) onto the right side of the air distribution housing (3).

11. Install the screws (4) that secure the blend door actuator mounting bracket to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
12. Install the blend door actuator (1) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door cam. Refer to **ACTUATOR, BLEND DOOR, INSTALLATION**.
13. Install the screws (2) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).

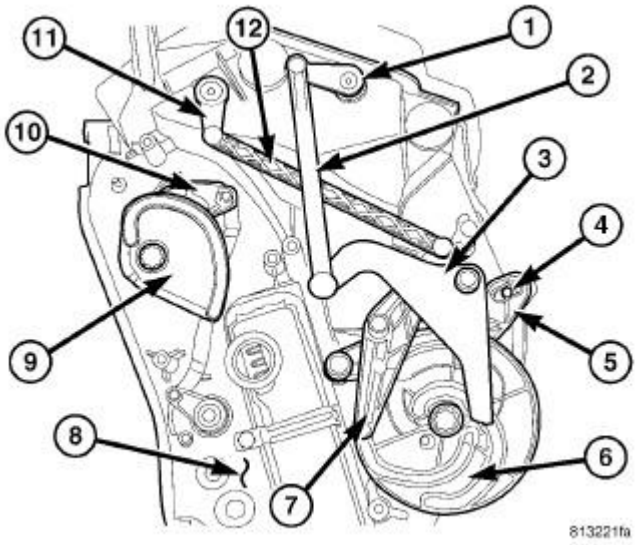

Fig. 87: Removing/Installing LH Actuator Linkages Air Housing
Courtesy of CHRYSLER GROUP, LLC

14. Install the blend door cam (9) onto the blend door lever (10) and the pivot shaft located on the left side of the air distribution housing (8).
15. Install the floor door linkage (5) onto the floor door lever (4) and the pivot shaft on air distribution housing.

NOTE: Align the guide pin on the floor door linkage with the guides on the mode door cam during installation of the floor door linkage.

16. Install the mode door cam (6) onto the pivot shaft on air distribution housing.
17. Connect the defrost/demister door linkage rod (12) onto the defrost/demister door lever (11).

NOTE: Align the guide pin on the defrost/demister linkage with the guides on the mode door cam during installation of the defrost/demister linkage.

18. Install the defrost/demister linkage (7) onto the pivot shaft on air distribution housing.
19. Connect the instrument panel door linkage rod (2) onto the instrument panel door lever (1).

NOTE: **Align the guide pin on the instrument panel linkage with the guides on the mode door cam during installation of the instrument panel linkage.**

20. Install the instrument panel linkage (3) onto the pivot shaft on air distribution housing.

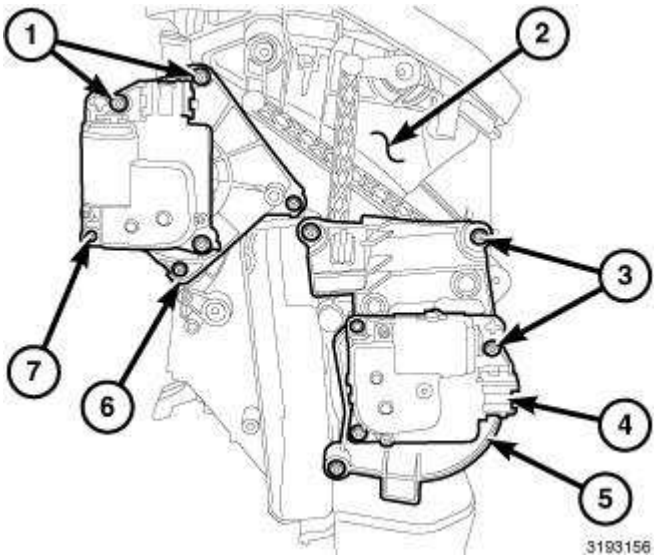

Fig. 88: Screws, Blend Door Actuator & Actuator Bracket
Courtesy of CHRYSLER GROUP, LLC

21. Position the blend door actuator mounting bracket (6) and the mode door actuator mounting bracket (5) onto the left side of the air distribution housing (2).
22. Install the screws (1 and 3) that secure the mounting brackets to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
23. Install the blend door actuator (7) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door cam. Refer to **ACTUATOR, BLEND DOOR, INSTALLATION**.
24. Install the mode door actuator (4) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the mode door cam. Refer to **ACTUATOR, MODE DOOR, INSTALLATION**.
25. Install the screws (1 and 3) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
26. On models equipped with the 3.0L diesel engine, install the electric Positive Temperature Coefficient (PTC) heater. Refer to **UNIT, HEATER, INSTALLATION**.
27. Install the air distribution housing. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-AIR INLET

NOTE: **The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

NOTE: **LHD model shown in illustration. RHD model similar.**

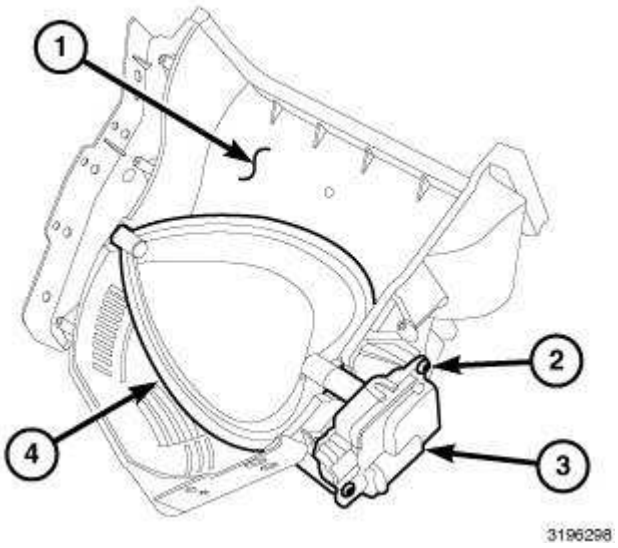

Fig. 89: Air Inlet Housing, Two Screws, Door Actuator & Recirculation-Air Door
Courtesy of CHRYSLER GROUP, LLC

1. Position the recirculation-air door (4) into the air inlet housing (1).

CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the air inlet housing.

2. Install the recirculation door actuator (3) onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the recirculation door pivot shaft. Refer to **ACTUATOR, RECIRCULATION DOOR, INSTALLATION**.
3. Install the two screws (2) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 2 N.m (17 in. lbs.).
4. Install the air inlet housing. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-HVAC

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

NOTE: **LHD model shown in illustration. RHD model similar.**

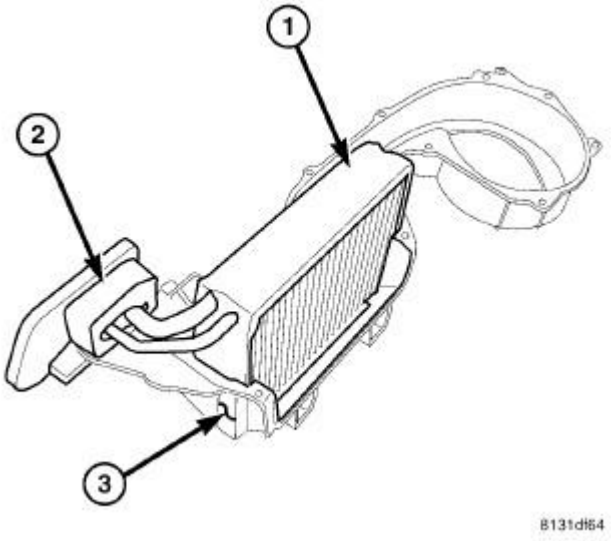

Fig. 90: Removing/Installing A/C Evaporator
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the foam seal (2), tapping block and A/C expansion valve onto the A/C evaporator (1). Refer to **VALVE, A/C EXPANSION, INSTALLATION**.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.

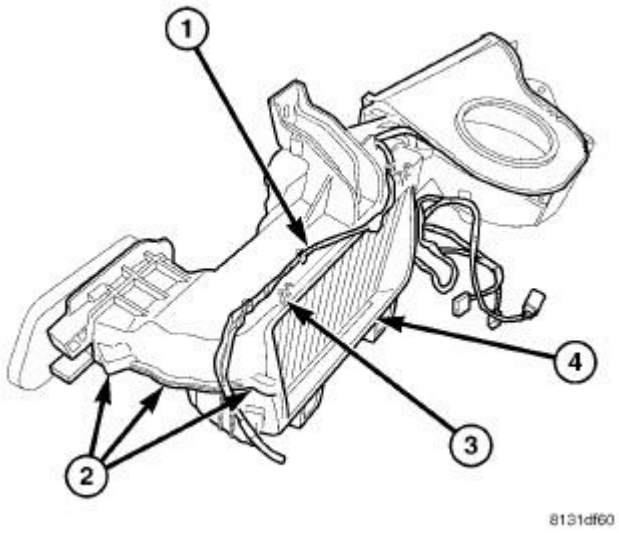

Fig. 91: Locating HVAC Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

3. Install the upper half of the HVAC housing (3) onto the lower half of the HVAC housing (4).
4. Install the ten screws (2) that secure the two halves of the HVAC housing together. Tighten the screws to 2.2 N.m (20 in lbs.).
5. Install the HVAC wiring harness (1). Make sure the harness is routed through all wiring retainers.
6. Install the evaporator temperature sensor. Refer to **SENSOR, EVAPORATOR TEMPERATURE, INSTALLATION**.
7. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
8. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
9. Install the air inlet housing. Refer to **HOUSING, HVAC, INSTALLATION**.
10. Install the air distribution housing. Refer to **HOUSING, HVAC, INSTALLATION**.

NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

11. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

INSTALLATION

HOUSING-AIR DISTRIBUTION

NOTE: **LHD model shown in illustrations. RHD model similar.**

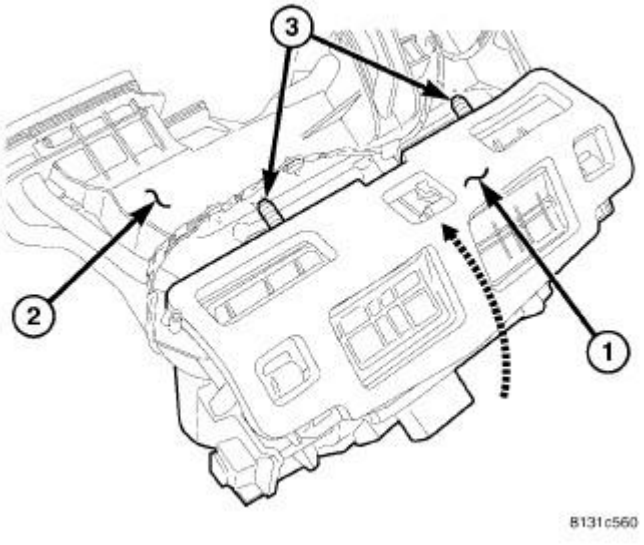

Fig. 92: Installing Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the air distribution housing onto the rear of the HVAC housing (2) by inserting the tabs on the bottom of the distribution housing into the slots located on the bottom of the HVAC housing and tipping the distribution housing upward until it is properly aligned with the HVAC housing.
2. Install the two screws (3) that secure the air distribution housing to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).

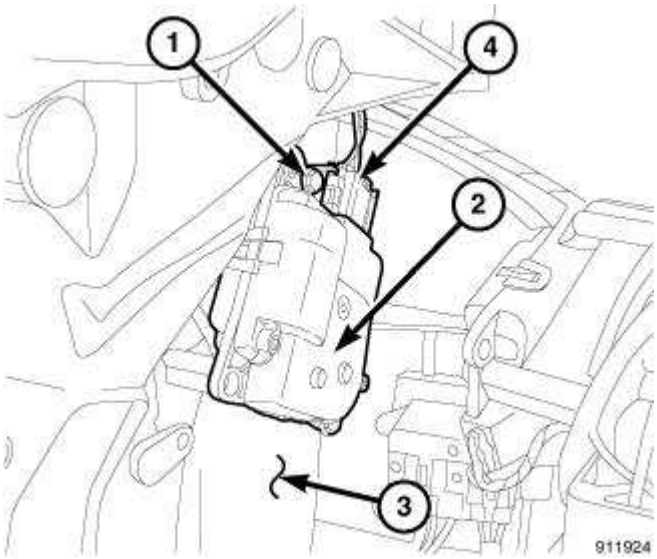

Fig. 93: Actuator-Blend Door-Dual Passenger
Courtesy of CHRYSLER GROUP, LLC

3. Connect the HVAC wire harness (4) to the blend door actuator (2) located on the passenger side of the air distribution housing (3).

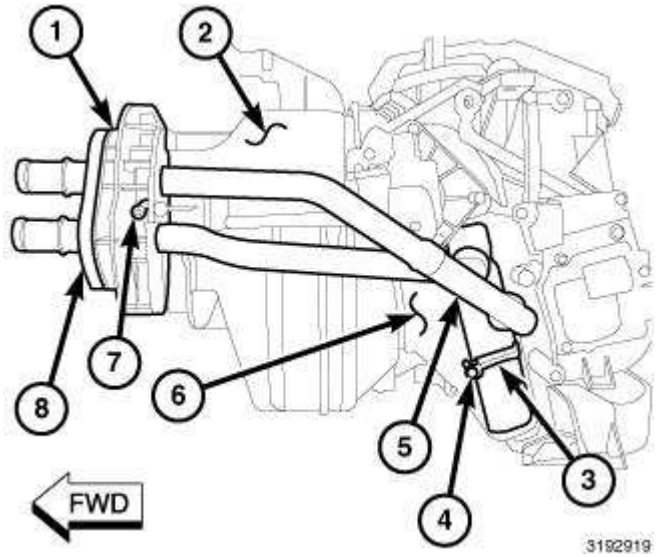

Fig. 94: Screw, Flange, HVAC Housing, Retaining Screw, Bracket, Housing
Courtesy of CHRYSLER GROUP, LLC

4. Install the heater core (5) into the driver side of the air distribution housing (6) and engage the heater core tubes to the foam seal (8).
5. Install heater core bracket (3) and retaining screw (4). Tighten the screw to 2.2 N.m (20 in. lbs.).
6. Install the flange (1) over the heater core tubes and onto the HVAC housing (2).
7. Install the screw (7) that secure the flange to the front of the HVAC housing. Tighten the screw to 2.2 N.m (20 in. lbs.).

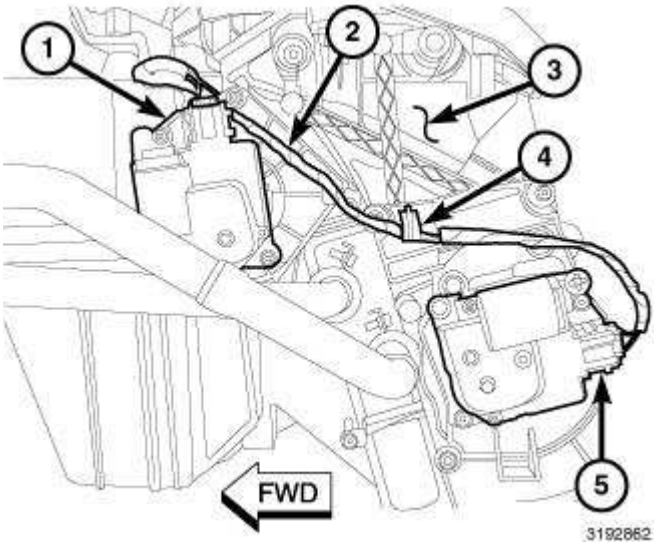

Fig. 95: HVAC Wire Harness, Mode Door Actuator, Blend Door Actuator & Air Distribution Housing

Courtesy of CHRYSLER GROUP, LLC

8. Connect the HVAC wire harness (2) to the mode door actuator (5) and the blend door actuator (1), located on the driver side of the air distribution housing (3).
9. Engage the HVAC wire harness to the retaining tab (4).
10. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-AIR INLET

NOTE: LHD model shown in illustration. RHD model similar.

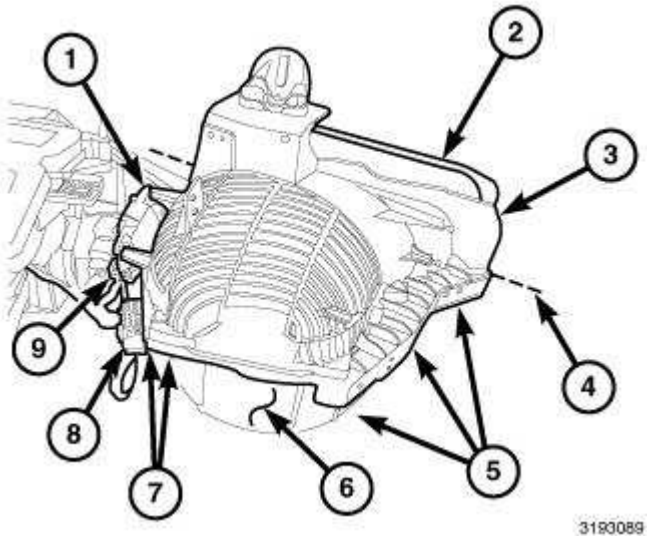

Fig. 96: Wire Harness Connector, Door Actuator, Wire Harness Connector & Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the air inlet housing (3) onto the HVAC housing (6).

CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the top of the HVAC housing.

2. Install the five screws (5 and 7) that secure the air inlet housing to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).
3. Inspect the foam seal (2), especially along the parting line (4). If the seal is deformed or damaged, it must be replaced.
4. Connect the HVAC wire harness connector (9) to the recirculation door actuator (1).
5. Engage the HVAC wire harness connector (8) to the air inlet housing.
6. Install the A/C heater module. Refer to **MODULE, A/C AND HEATER, INSTALLATION** .
7. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-FRESH AIR INLET

NOTE: **The fresh air inlet housing must be removed from the vehicle for removal of the HVAC housing.**

NOTE: **LHD model shown in illustrations. RHD model similar.**

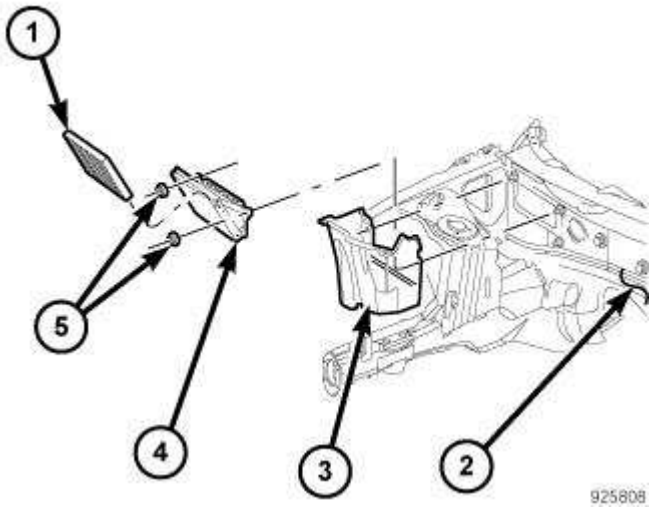

Fig. 97: 06 Fresh Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the fresh air inlet housing (3), particulate air filter (1) and filter housing (4) as an assembly onto the engine compartment side of the dash panel (2).
2. Install the two nuts (5) that secure the fresh air inlet housing and filter housing to the dash panel. Tighten the nuts to 7 N.m (62 in. lbs.).

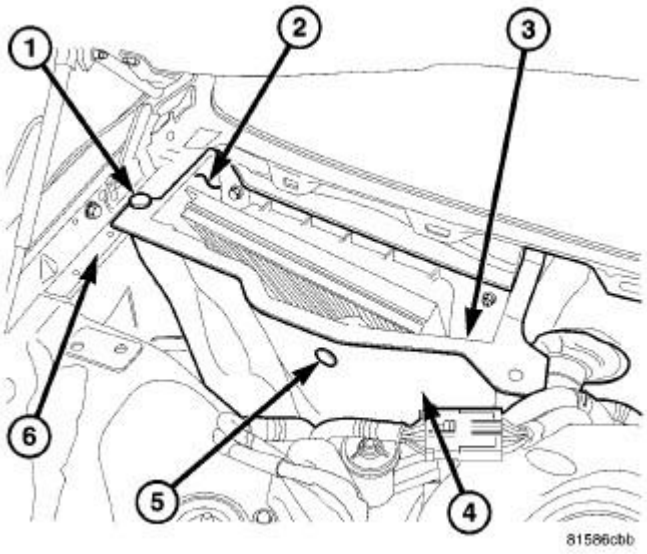

Fig. 98: Push Pins-Fresh Air Inlet Housing

Courtesy of CHRYSLER GROUP, LLC

3. Position the insulator (4) into its installed location and install the push-pin retainer (5) that secures the insulator to the front of the fresh air inlet housing (2).
4. Install the push-pin retainer (1) that secures the fresh air inlet housing to the right inner fender (6).
5. Reach under the fresh air inlet housing and install the wire harness retainer (3) into the bottom of the air inlet housing, if equipped.

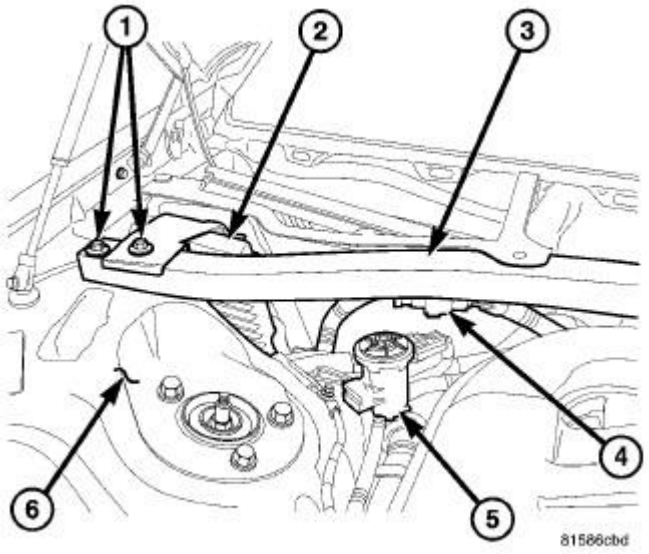

Fig. 99: Strut Support- Passenger Side
Courtesy of CHRYSLER GROUP, LLC

6. Position the powertrain control module (PCM) or the engine control module (ECM) (2) (depending on engine application) into its installed location.
7. Position the strut support (3) into the engine compartment and loosely install the two bolts (1) that secure the strut support and the ECM/PCM to the passenger side strut tower (6).
8. On LHD models, install the purge solenoid (5) onto its mounting bracket located on the right strut tower.
9. Engage the retainer that secures the wire harness (4) to the bottom of the strut support.

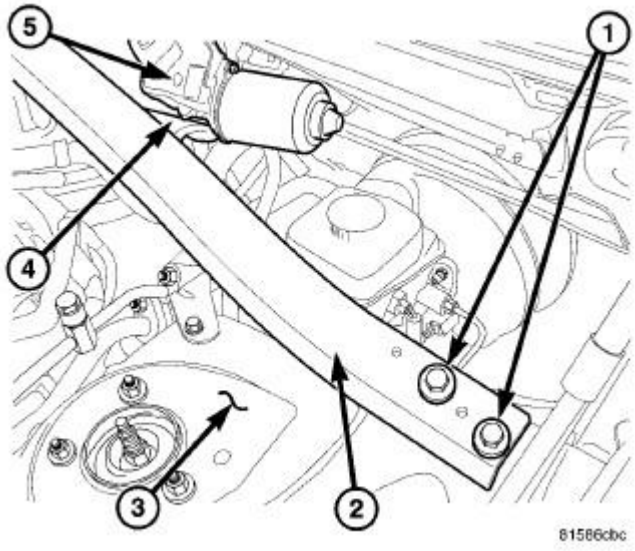

Fig. 100: Strut Support- Driver Side
Courtesy of CHRYSLER GROUP, LLC

10. Engage the wiper motor (5) to the bracket (4) located on the strut support (2).
11. Position the strut support to the driver side strut tower and loosely install the two bolts (1) that secure the support to the tower.
12. Tighten all four bolts that secure the strut support to 38 N.m (28 ft. lbs.).
13. Install the cowl top panel onto the dash panel. Refer to **COVER, COWL PANEL, INSTALLATION** .
14. Reconnect the negative battery cable.

HOUSING-HVAC ASSEMBLY

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown in illustrations. RHD model similar.

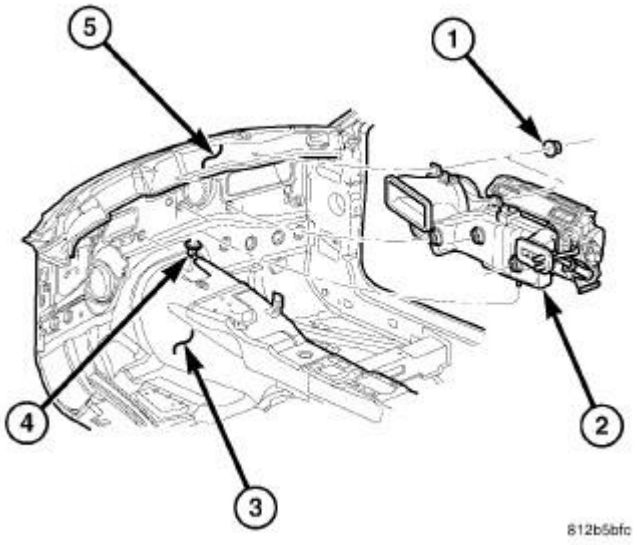

Fig. 101: Housing-Hvac-Interior
Courtesy of CHRYSLER GROUP, LLC

1. Position the HVAC housing (2) into the passenger compartment with the mounting studs in their proper locations in the dash panel (5) and the condensate drain tube into the grommet (4) on the floor panel (3).
2. Install the two nuts (1) that secure the HVAC housing to the passenger compartment side of the dash panel. Tighten the nuts to 3 N.m (26 in. lbs.).
3. Install the defroster ducts. Refer to **DUCT, DEFROSTER, INSTALLATION**.
4. Connect the floor distribution ducts. Refer to **DUCT, FLOOR DISTRIBUTION, INSTALLATION**.
5. Connect the floor console duct. Refer to **DUCT, FLOOR CONSOLE, INSTALLATION**.
6. Install the instrument panel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .

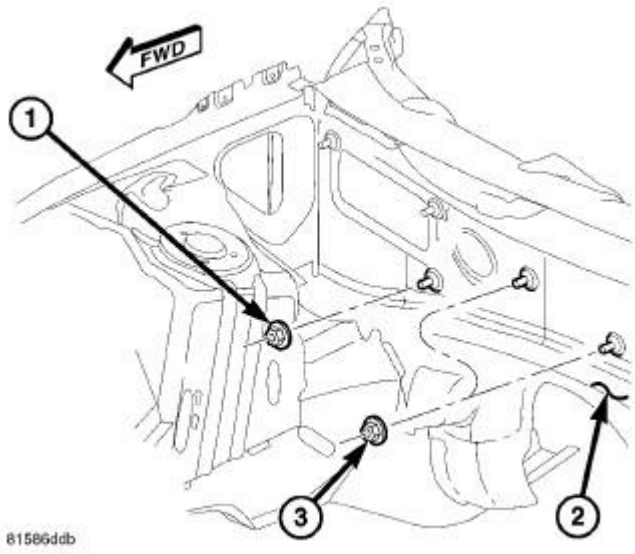

Fig. 102: Remove/Install Housing-HVAC-Exterior
Courtesy of CHRYSLER GROUP, LLC

7. Install the three nuts (1 and 3) that secure the HVAC housing to the engine compartment side of the dash panel (2). Tighten the nuts to 7 N.m (62 in. lbs.).
8. Connect the heater hoses to the heater core tubes.
9. Connect the A/C suction line and A/C liquid line to the A/C evaporator. Refer to **LINE, A/C LIQUID, INSTALLATION**.
10. Install the fresh air inlet housing to the engine compartment side of the dash panel. Refer to **HOUSING, HVAC, INSTALLATION**.
11. Reconnect the negative battery cable.
12. If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .
13. Refill the engine cooling system. Refer to **STANDARD PROCEDURE** .
14. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
15. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
16. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

MOTOR, BLOWER

DESCRIPTION

DESCRIPTION

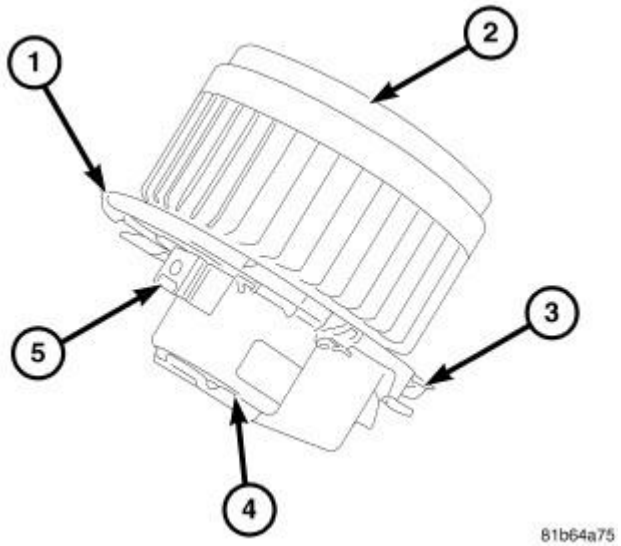

Fig. 103: Blower Motor
Courtesy of CHRYSLER GROUP, LLC

The blower motor is mounted to the bottom of the HVAC housing, on the passenger side of the vehicle. The blower motor assembly is a squirrel type blower cage (2) connected to a 12 volt Direct Current (DC) motor, located within a plastic housing (4). The blower motor has an integral wire

harness bracket (1), three mounting provisions (3) and a wire connector receptacle (5).

The blower motor can be accessed for service from underneath the instrument panel.

OPERATION

OPERATION

The blower motor controls the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

Both the Manual Temperature Control (MTC) and the Automatic Temperature Control (ATC) heating and A/C system use an electronic blower motor power module to control blower motor speed. The power module uses a Pulse Width Modulated (PWM) input from the A/C heater module and a feedback signal from the blower motor to regulate the blower motor ground path. On both systems, the blower motor receives battery current through a relay in the Power Distribution Center (PDC) whenever the ignition is in the Run position.

The blower motor control system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blower motor and wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: See Wiring Information for circuit descriptions and diagrams.

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative A/C heater module
- Inoperative blower motor
- Inoperative blower motor power module
- Inoperative blower motor relay

- Inoperative blower motor switch
- Inoperative blower motor wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor on and off. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heating and A/C system. If the noise goes away, possible causes include:

- Deformed or damaged blower wheel
- Foreign material in blower wheel
- Foreign material in the HVAC housing
- Foreign material on fresh air inlet screen
- Improper blower motor mounting
- Worn blower motor bearings or brushes

VIBRATION

Possible causes of blower motor vibration include:

- Deformed or damaged blower wheel
- Foreign material in blower wheel
- Improper blower motor mounting
- Worn blower motor bearings

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: LHD model shown in illustration. RHD model similar.

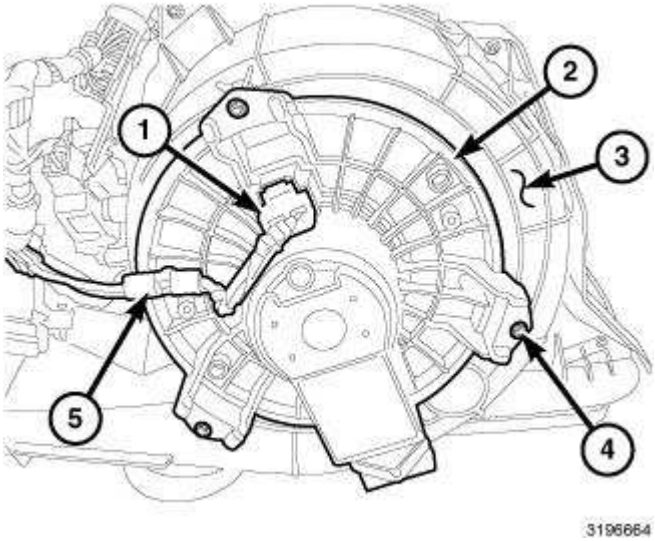

Fig. 104: Wire Harness Connector, Blower Motor, Wire Harness Retainer, Three Screws & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side instrument panel silencer. Refer to **PANEL, SILENCER, REMOVAL** .
3. Disengage the wire harness connector (1) from the blower motor (2).
4. Disengage the wire harness retainer (5).
5. Remove the three screws (4) that secure the blower motor to the HVAC housing (3) and remove the blower motor.

INSTALLATION

INSTALLATION

NOTE: LHD model shown in illustration. RHD model similar.

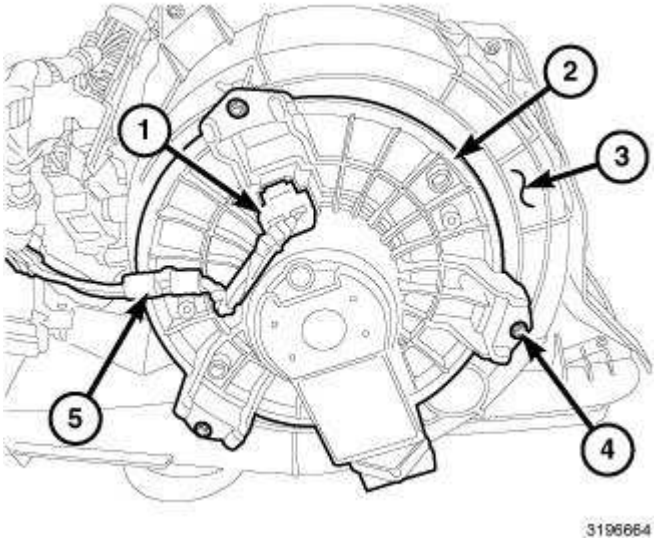

Fig. 105: Wire Harness Connector, Blower Motor, Wire Harness Retainer, Three Screws & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the blower motor (2) into the HVAC housing (3).
2. Install the three screws (4) that secure the blower motor to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor and engage the wire harness retainer (5).
4. Install the passenger side instrument panel silencer. Refer to **PANEL, SILENCER, INSTALLATION** .
5. Reconnect the negative battery cable.

OUTLET, AIR

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

CENTER OUTLETS

NOTE: Take the proper precautions to protect the face of center bezel from cosmetic damage while performing this procedure.

NOTE: Passenger side shown in illustration. Driver side similar.

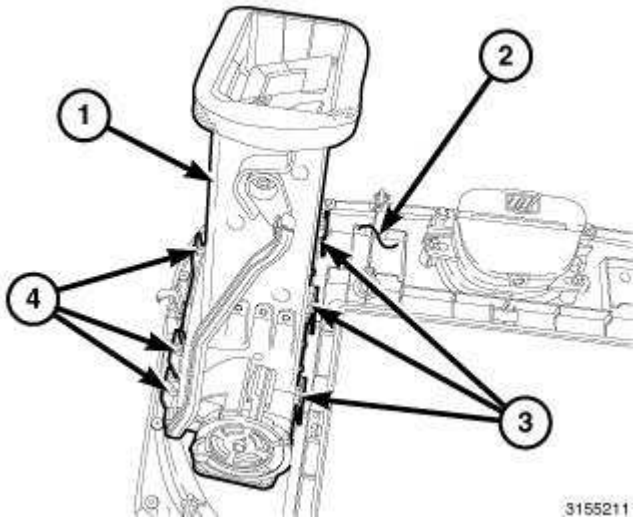

Fig. 106: Center Bezel, Six Retaining Tabs & Each Air Outlet
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (2) from the instrument panel and place it on a workbench. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .

   NOTE: If the foam seal on an air outlet is deformed or damaged, the seal must be replaced.

3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, disengage the six retaining tabs (3 and 4) that secure each air outlet (1) to the center bezel and remove the outlets as required.

OUTBOARD OUTLETS

NOTE: Passenger side shown in illustration. Driver side similar.

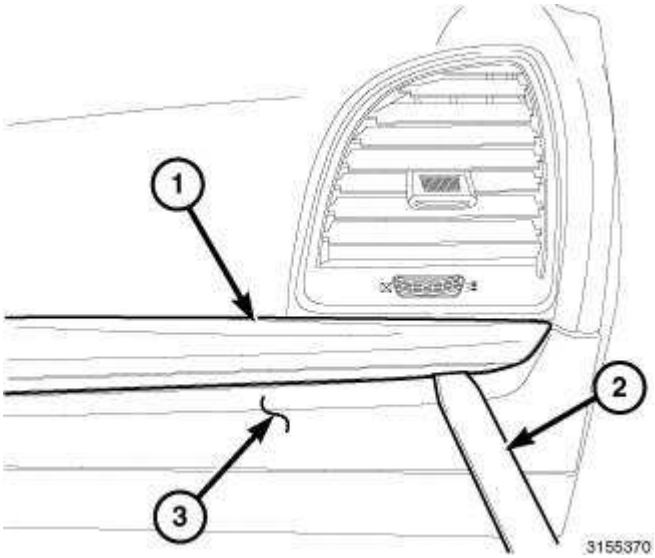

Fig. 107: Trim Stick, Trim Panel Insert & Instrument Panel Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (2), disengage the retaining tabs that secure the trim panel insert (1) to the instrument panel cover (3) and remove the insert.

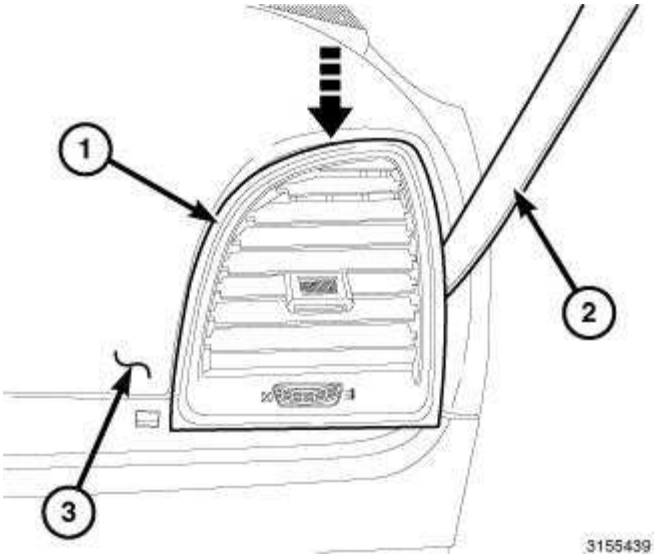

Fig. 108: Instrument Panel Air Outlet, Trim Stick & Instrument Panel Cover
Courtesy of CHRYSLER GROUP, LLC

3. Carefully pull the instrument panel air outlet (1) downward.
4. Using Trim Stick (special tool #C-4755, Trim Stick) (2) or equivalent, disengage the three retaining tabs that secure the outboard side of the air outlet to the instrument panel cover (3).

NOTE: If the foam seal on an air outlet is deformed or damaged, the seal must be

replaced.

5. With Trim Stick (special tool #C-4755, Trim Stick) or equivalent still in place as shown in illustration, wiggle and rotate the air outlet to disengage the inboard side of the outlet from the instrument panel cover and remove the outlet.

FLOOR CONSOLE OUTLETS

NOTE: Take the proper precautions to protect the face of the floor console rear trim panel from cosmetic damage while performing this procedure.

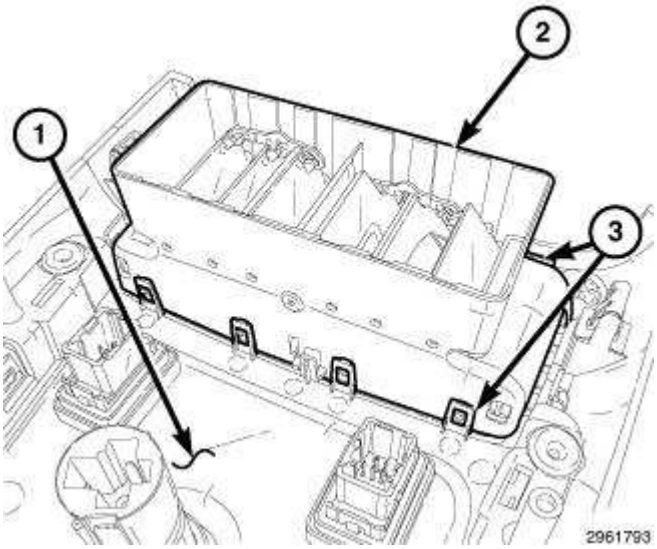

Fig. 109: Trim Panel, Retaining Tabs & Air Outlet
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the trim panel (1) from the back of the floor console and place it on a workbench. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs (3) that secure the air outlet (2) to the trim panel and remove the outlet.

INSTALLATION

INSTALLATION

CENTER OUTLETS

NOTE: Take the proper precautions to protect the face of center bezel from cosmetic damage while performing this procedure.

NOTE: Passenger side shown in illustration. Driver side similar.

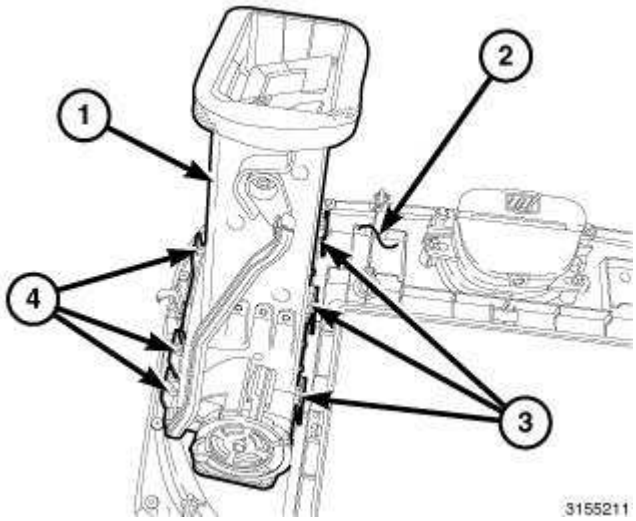

Fig. 110: Center Bezel, Six Retaining Tabs & Each Air Outlet
Courtesy of CHRYSLER GROUP, LLC

1. Position each air outlet (1) to the instrument panel center bezel (2).
2. Engage the six retaining tabs (3 and 4) that secure each air outlet to the center bezel. Make sure the retaining tabs are fully engaged.

NOTE: Make sure that the air outlets are properly aligned to the ducts within the instrument panel and that the foam seals on the outlets are properly installed.

3. Install the center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
4. Reconnect the negative battery cable.

OUTBOARD OUTLETS

NOTE: Passenger side shown in illustration. Driver side similar.

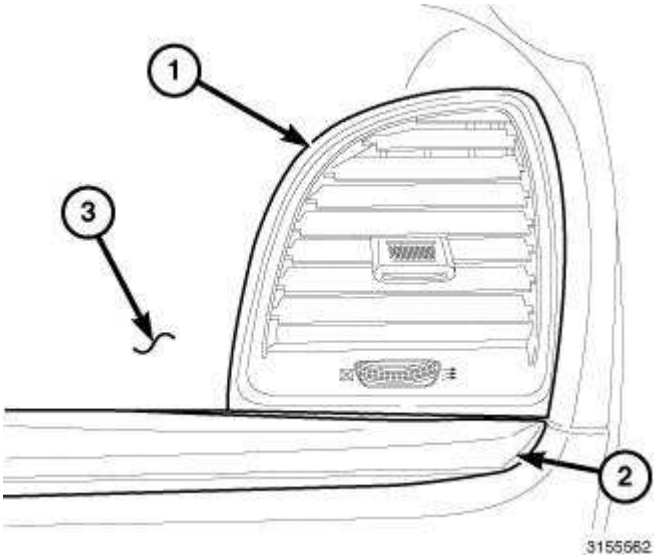

Fig. 111: Air Outlet, Air Outlet & Trim Insert
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure that the air outlet is properly aligned to the duct within the instrument panel and that the foam seal on the outlet is properly installed.

1. Position the air outlet (1) into the instrument panel and connect it to the duct.
2. Engage the retaining tabs that secure the air outlet to the instrument panel cover (3). Make sure the retaining tabs are fully engaged.
3. Install the trim insert (2) onto the instrument panel cover and engage the retaining tabs. Make sure the retaining tabs are fully engaged.
4. Reconnect the negative battery cable.

FLOOR CONSOLE OUTLETS

NOTE: Take the proper precautions to protect the face of the floor console rear trim panel from cosmetic damage while performing this procedure.

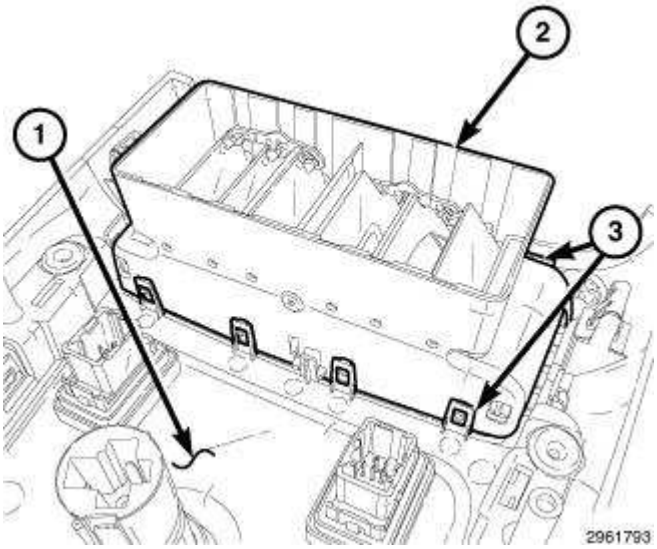

Fig. 112: Trim Panel, Retaining Tabs & Air Outlet
Courtesy of CHRYSLER GROUP, LLC

1. Position the air outlet (2) onto the floor console trim panel (1).
2. Engage the retaining tabs (3) that secure the air outlet to the trim panel. Make sure the retaining tabs are fully engaged to the outlet.

NOTE: Make sure that the air outlet is properly aligned to the duct within the floor console and that the foam seal on the duct is properly installed.

3. Install the trim panel (1) onto the back of the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .
4. Reconnect the negative battery cable.

PLUMBING

WARNING

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kPa (21 psi). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. Chrysler LLC recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent

leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage

and possible serious or fatal injury.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C system refrigerant charge is empty or low, a leak in the A/C system is likely. When searching for a refrigerant leak in the A/C system, use an electronic leak detector and refrigerant leak detection dye with an Ultra Violet (UV) light that is designed for R-134a refrigerant. It is important to use only high-quality refrigerant leak detection equipment to properly locate refrigerant system leaks, such as the equipment listed in the teamPSE Service Equipment Catalog. Use only Chrysler approved R-134a leak detection dye, available through Mopar®.

1. Visually inspect all A/C lines, A/C fittings and A/C components under the hood for an oily residue. Oil residue can be an indicator of a leak location.
2. Connect a high-quality manifold gauge set or refrigerant recovery machine to the A/C system and determine if the static A/C system pressure is above or below 345 kPa (50 psi). Refer to **PLUMBING, STANDARD PROCEDURE**. If static A/C system pressure is less than 345 kPa (50 psi), proceed to **SYSTEM EMPTY**. If static A/C system pressure is greater than 345 kPa (50 psi), go to **SYSTEM LOW**.

REFRIGERANT SYSTEM LEAKS

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -8 kPa (-26 in. Hg) or greater vacuum) for at least 30 minutes. Refer to **PLUMBING, STANDARD PROCEDURE**.

CAUTION: Use only Chrysler LLC approved R-134a leak detection dye. It is important to use only high-quality refrigerant leak detection equipment. Small leaks may not be found using low-budget equipment. Failure to follow these instructions may result in an incomplete diagnosis and possible remaining refrigerant leaks.

2. Prepare an R-134a dye injector with a Chrysler approved R-134a leak detection dye.
3. Prepare the vehicle specific amount of R-134a refrigerant. Refer to **REFRIGERANT, SPECIFICATIONS**.

NOTE: Anytime an R-134a leak detection dye has been added to the refrigerant system, a label indicating that dye has been added should be placed on the vehicle in plain view, for other technicians.

4. Dispense the leak detection dye and the correct amount of R-134a refrigerant into the

evacuated refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

5. Proceed to **LEAK TEST**.

SYSTEM LOW

CAUTION: Use only Chrysler LLC approved R-134a leak detection dye. It is important to use only high-quality refrigerant leak detection equipment. Small leaks may not be found using low-budget equipment. Failure to follow these instructions may result in an incomplete diagnosis and possible remaining refrigerant leaks.

1. Prepare an R-134a dye injector with a Chrysler approved R-134a leak detection dye.

NOTE: Anytime an R-134a leak detection dye has been added to the refrigerant system, a label indicating that dye has been added should be placed on the vehicle in plain view, for other technicians.

2. Dispense the leak detection dye and 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Proceed to **LEAK TEST**.

LEAK TEST

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating and A/C system with the engine at idle under the following conditions for at least 15 minutes.
   - Doors or windows open
   - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
   - Front A/C and heater controls set to outside air, full cool, panel mode, high blower and A/C compressor engaged
   - If equipped, rear A/C and heater controls set to full cool and high blower.
3. Shut the vehicle off and wait at least 5 minutes.

CAUTION: Use it is important to use only a high-quality Ultra Violet (UV) light when searching for a leak in the refrigerant system. Small leaks may not be found using budget equipment. Failure to follow these instructions may result in an incomplete diagnosis and possible remaining refrigerant leaks.

4. Begin searching for leaks using a high quality UV light to detect the fluorescent R-134a leak detection dye. Inspect all connections, plumbing fittings, brazed joints, hoses, hose crimps, service ports, compressor housing, pressure relief valve and A/C condenser for dye. Inspect the evaporator drain tube and condensate for presence of dye, which indicates a leak from the A/C evaporator.

WARNING: Use extreme care when working around a running engine. Keep hands and fingers clear of the radiator fan, accessory drive belt and all other moving components. Keep away when wearing loose clothing, jewelry or long hair that is not properly secured. Underhood components may become hot to the touch. Be careful not to come into contact with hot engine, A/C and engine cooling system components. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Use only an electronic leak detector designed for R-134a refrigerant. It is important to use only high-quality refrigerant leak detection equipment. Small leaks may not be found using budget equipment. Failure to follow these instructions may result in an incomplete diagnosis and possible remaining refrigerant leaks.

5. If a leak is not found with the R-134a detection dye, use a high-quality electronic R-134a leak detector and insert it into the evaporator drain tube, and into the instrument panel air outlets, to check for evaporator leaks. Check the evaporator tubes at the A/C expansion valve, for leaks not visible behind the valve. Check around the front of the A/C compressor, for compressor shaft seal leaks. Check between the A/C condenser and radiator for condenser leaks not previously visible.

STANDARD PROCEDURE

REFRIGERANT SYSTEM RECOVERY

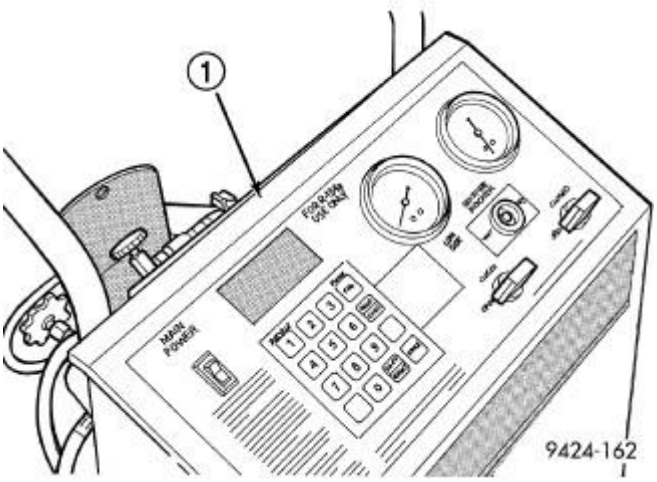

Fig. 113: Identifying Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

The R-134a refrigerant must be recovered from the A/C system prior to performing any repairs that require disconnection of an A/C refrigerant line.

When recovering the A/C refrigerant system, use an R-134a refrigerant recovery/recycling/charging

station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE: A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

RECOVERY PROCEDURE

WARNING: Review safety precautions and warnings before performing this procedure. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. If use of aftermarket A/C system sealant is suspected, the A/C system should be tested for sealant prior to refrigerant system recovery. See the operating instructions supplied by the equipment manufacturer for proper use and care of this equipment.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. Recover the A/C refrigerant system following the operating instructions supplied by the recovery/recycling/charging station manufacturer.
4. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.

5. Reinstall the caps onto the refrigerant system service ports.

REFRIGERANT SYSTEM EVACUATE

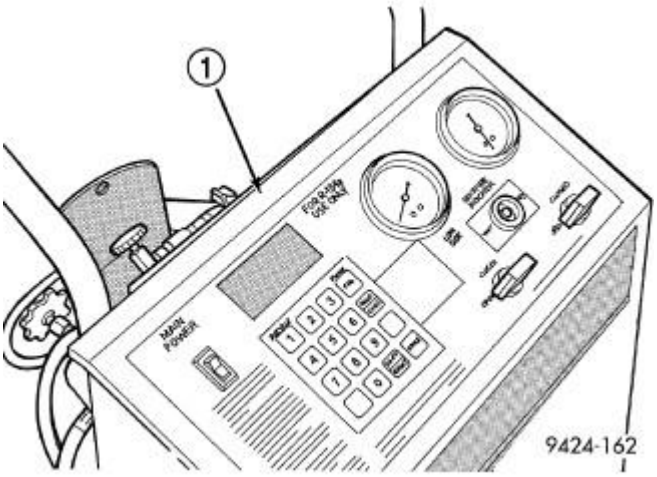

Fig. 114: Identifying Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-134a refrigerant.

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-134a refrigerant recovery/recycling/charging station with a vacuum pump (1) that meets SAE standard J2788, or an R-134a compatible manifold gauge set and a stand-alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

EVACUATION PROCEDURE

WARNING: Review safety precautions and warnings before performing this procedure. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging

the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: **When connecting service equipment couplers to refrigerant line service ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.**

2. Connect an R-134a refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard J2788 to the refrigerant system, or an R-134a compatible manifold gauge set and a stand-alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Reinstall the caps onto the refrigerant system service ports.

REFRIGERANT SYSTEM CHARGE

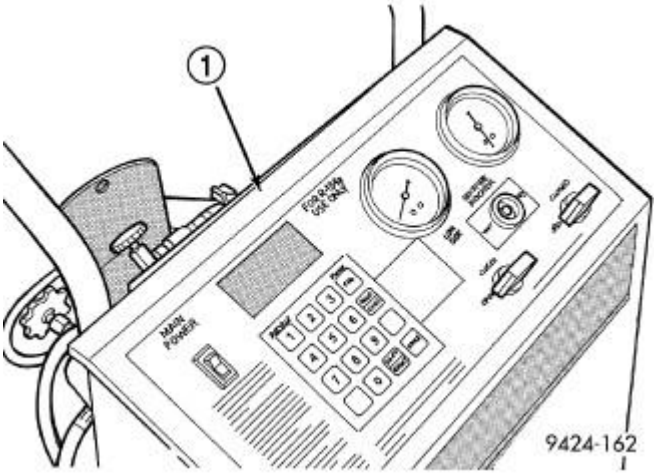

Fig. 115: Identifying Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

After all A/C refrigerant system repairs have been completed and the refrigerant system has been evacuated, the A/C system can be recharged with R-134a refrigerant.

When charging the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

WARNING: Review safety precautions and warnings before performing this procedure. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

NOTE: A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.

4. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. Refer to **REFRIGERANT, SPECIFICATIONS**. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
5. Open both the low and high side valves, then open the charge valve to allow the heated refrigerant to flow into the refrigerant system.
6. When the transfer of refrigerant has stopped, close the valves.

WARNING: Take care not to open the high side (high pressure) valve while performing Step 7. Failure to follow these instructions may result in possible serious or fatal injury.

7. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
   a. Open all of the windows in the vehicle.
   b. Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.

c. Run the engine at a steady high idle (about 1400 RPM).
d. If the A/C compressor does not operate, test the compressor control circuits and repair as required.
e. Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
f. When the transfer of refrigerant has stopped, close the valves.

8. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

COMPRESSOR, A/C

DESCRIPTION

A/C CLUTCH

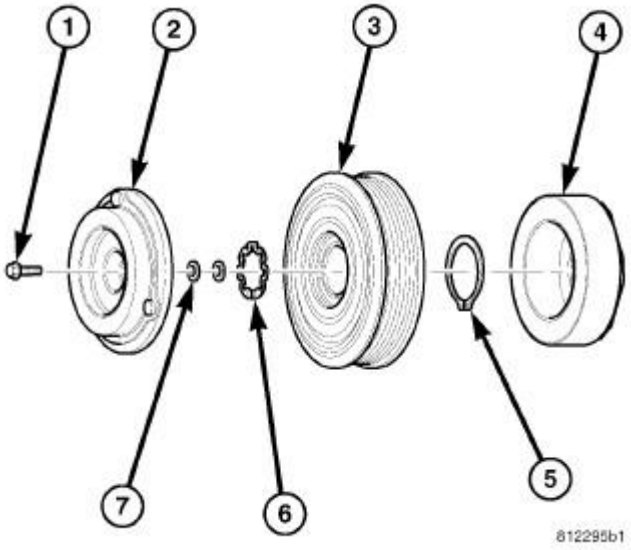

Fig. 116: A/C Compressor Clutch Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C clutch assembly shown in illustration.

The A/C compressor clutch assembly consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).

A/C COMPRESSOR

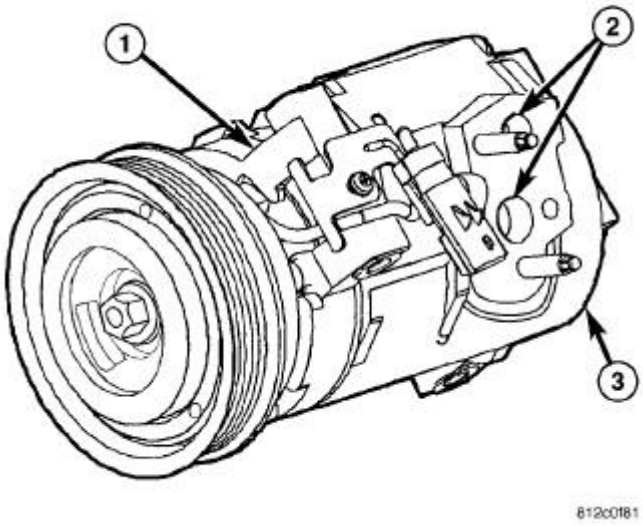

Fig. 117: Discharge Ports & Compressor Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor shown in illustration.

Models equipped with the 3.6L engine, use a Visteon RS-18 A/C compressor. Models equipped with the 3.0L, 5.7L and 6.4L engine, use a Denso 10SRE18 A/C compressor.

Both A/C compressors have a fixed displacement of 180 cubic centimeters (11 cubic inches) and have the suction and discharge ports (2) located on the compressor cylinder head (3), along with a label identifying the use of R-134a refrigerant.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head at the rear of the A/C compressor. Refer to **COMPRESSOR, A/C, DESCRIPTION**. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

A/C CLUTCH

The A/C clutch components provide the means to engage and disengage the A/C compressor from the moving engine accessory drive belt. A/C clutch engagement is controlled by the Powertrain Control Module (PCM). When the PCM energizes the electromagnetic A/C clutch coil, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C clutch components cannot be repaired and must be replaced if inoperative or damaged.

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The A/C compressor cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. Refer to **DRIER, A/C RECEIVER, REMOVAL**.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve should not open when the A/C system is operating correctly. If the high pressure relief valve vents refrigerant, there is most likely a problem within the A/C refrigerant system. The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. If the high pressure relief valve vents refrigerant, see the A/C System Diagnosis chart. Refer to **DIAGNOSIS AND TESTING**.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

A/C CLUTCH COIL

The A/C clutch coil electrical circuit is controlled by the Powertrain Control Module (PCM), through a relay in the Power Distribution Center (PDC). See Wiring Information for complete HVAC wiring diagrams. Begin testing of a suspected A/C clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the A/C heater module, Body Control Module (BCM), PCM and PDC. If no DTCs are found, go to 2. If any DTCs are found, repair as required.
2. Check the A/C clutch fuse in the PDC. If OK, go to 3. If not OK, repair the shorted circuit and replace the fuse.
3. If the A/C clutch still will not engage, verify the refrigerant charge level by conducting the A/C Performance test. Refer to **DIAGNOSIS AND TESTING**. If the refrigerant charge level is OK, go to **COIL RESISTANCE TEST** and **COIL CURRENT DRAW TEST**. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch coil connector.
3. Use an ohm meter and Back Probe Tool (special tool #6801, Terminal Probe) and measure the resistance of the A/C clutch coil at the coil connector terminals.
4. See **A/C CLUTCH COIL SPECIFICATIONS** for acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).
    1. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
    2. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **BATTERY, DIAGNOSIS AND TESTING** .
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the A/C clutch coil feed terminal using Back Probe Tool (special tool #6801, Terminal Probe). Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the A/C clutch coil.
3. With the A/C heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C clutch should engage immediately and the clutch coil supply voltage should be within two volts of the battery voltage. If the clutch coil supply voltage is OK, go to5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. See **A/C CLUTCH COIL SPECIFICATIONS** table for acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
    1. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
    2. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH COIL SPECIFICATIONS

Application	Coil Resistance	Coil Current Draw
3.0L/5.7L/6.4L Engines	3.3 - 3.5 ohms	3.2 amps Max @ 12V ± 0.5V @ 21° C (70° F)
3.6L Engine	3.0 - 4.0 ohms	3.1 - 4.0 amps @ 12V ± 0.5V @ 21° C (70° F)

A/C SYSTEM NOISE TESTING

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. Refer to **COMPRESSOR, A/C, INSTALLATION**.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises.
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**. and **PLUMBING, STANDARD PROCEDURE**.
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL**.

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C CLUTCH PLATE INSPECTION

NOTE: **The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.**

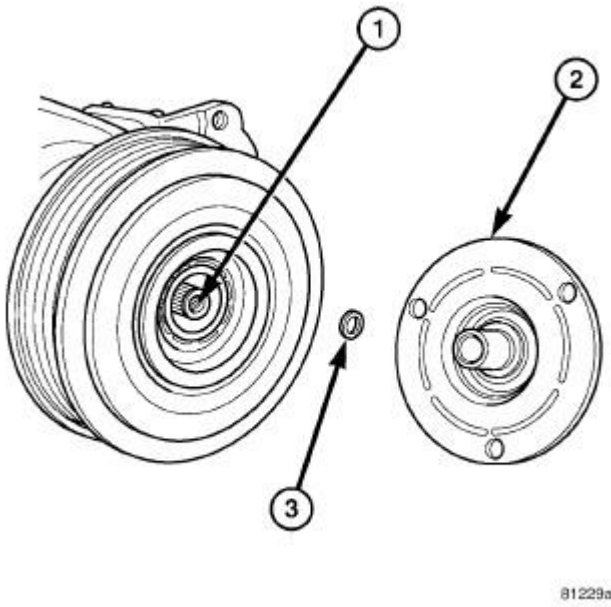

Fig. 118: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if excessive wear or scoring is found.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. The pulley and clutch plate should be replaced if bearing roughness or excessive leakage is found.

REMOVAL

A/C CLUTCH

NOTE: **The compressor clutch assembly can be serviced with the refrigerant system fully-charged and with the A/C compressor installed on the engine.**

NOTE: **Typical A/C compressor and clutch assembly shown in illustrations.**

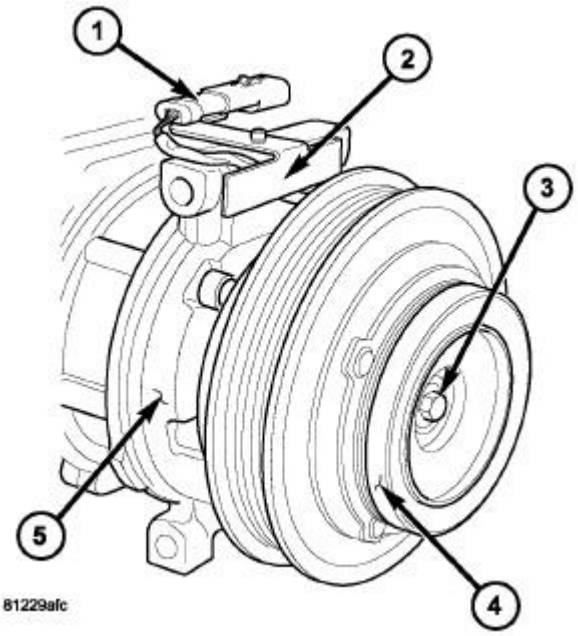

Fig. 119: Locating A/C Compressor Shaft Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. On 5.7L and 6.4L engine equipped models, remove the air intake hose and the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove the radiator fan and shroud assembly. Refer to **FAN, COOLING, REMOVAL** .
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).

   NOTE: Some models (depending on engine application) may require the A/C compressor to be removed from its installed location to gain access to the compressor shaft bolt and/or pulley and field coil snap rings. However, the refrigerant system can still remain fully charged.

6. Carefully remove the A/C clutch coil connector and wire lead from the connector bracket (2).
7. Remove the compressor shaft bolt (3). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (4) from rotating during bolt removal.

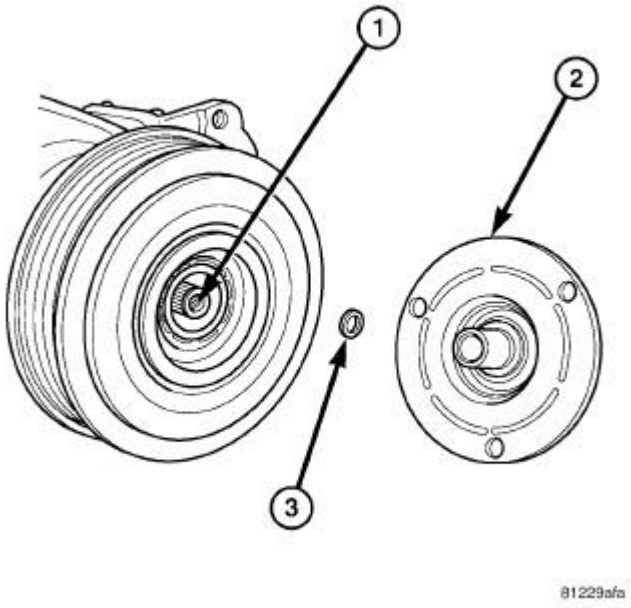

Fig. 120: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

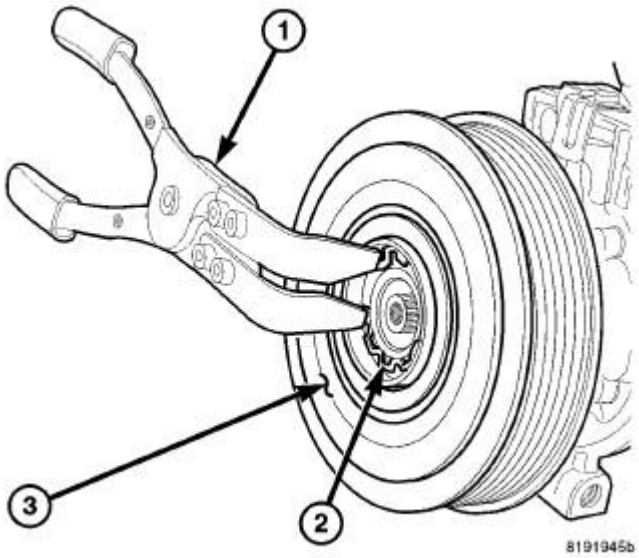

Fig. 121: Clutch Pulley & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

9. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor and remove the pulley and bearing assembly.

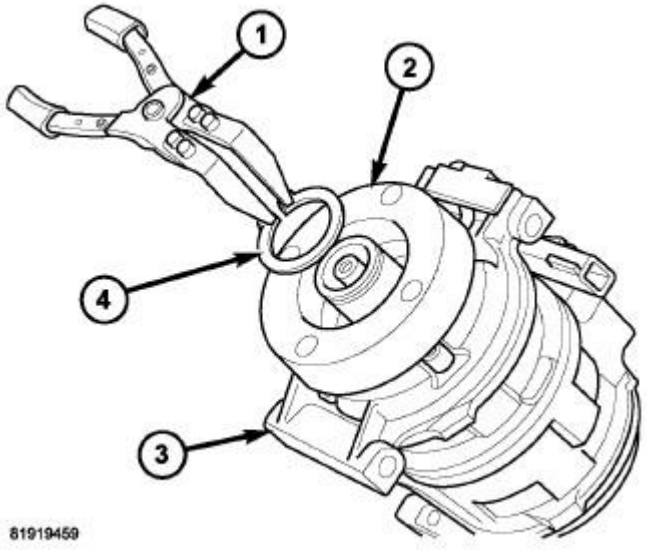

Fig. 122: Clutch Coil And Snap Ring
Courtesy of CHRYSLER GROUP, LLC

10. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, remove the snap ring (4) that secures the A/C clutch coil (2) to the front of the A/C compressor (3) and remove the coil.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and.PLUMBING, CAUTION. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor. Refer to DRIER, A/C RECEIVER, REMOVAL.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

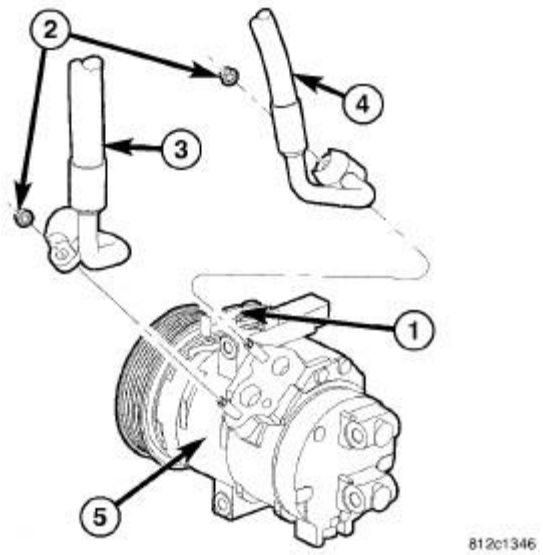

Fig. 123: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines show.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Disconnect the mass air flow sensor wire harness connector and remove the engine air cleaner housing.
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C

compressor (5).

6. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the seals.
7. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

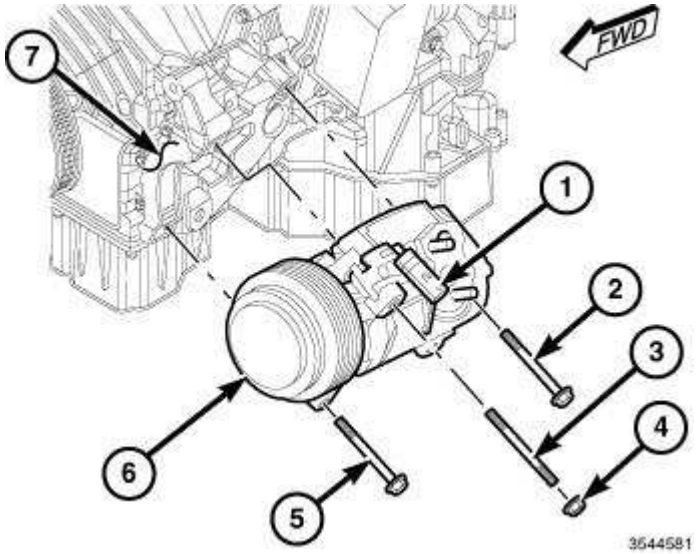

Fig. 124: bolts, A/C Clutch Electrical Connector, A/C Compressor & Bracket
Courtesy of CHRYSLER GROUP, LLC

8. Raise and support the vehicle.
9. Remove the front belly pan.
10. Remove the bolts (2 and 5) that secure the A/C compressor (6) to the A/C compressor bracket (7).
11. Lower the vehicle.
12. Disconnect the engine wire harness from the A/C clutch electrical connector (1).
13. Support the A/C compressor, remove the nut (4) and stud (3) that secures the A/C compressor to the bracket and remove the compressor.

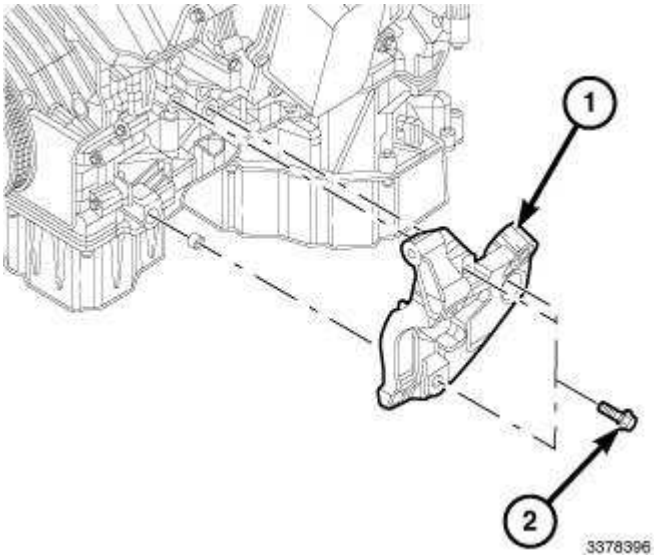

Fig. 125: A/C Compressor Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. If required, remove the bolts (2) that secure the A/C compressor bracket (1) to the engine and remove the bracket.

3.6L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

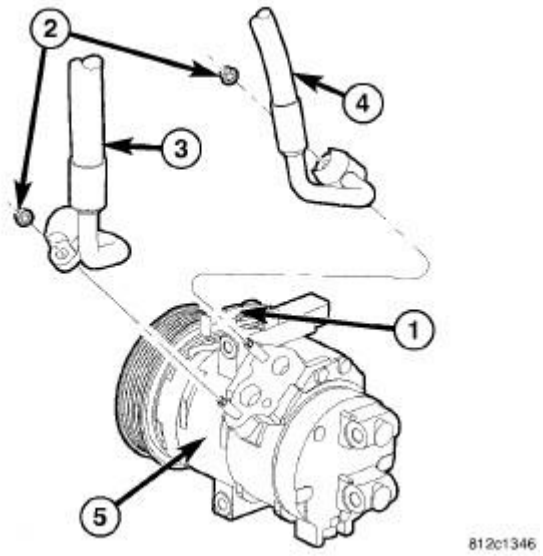

Fig. 126: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines show.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. Disconnect the engine wire harness from the A/C clutch connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

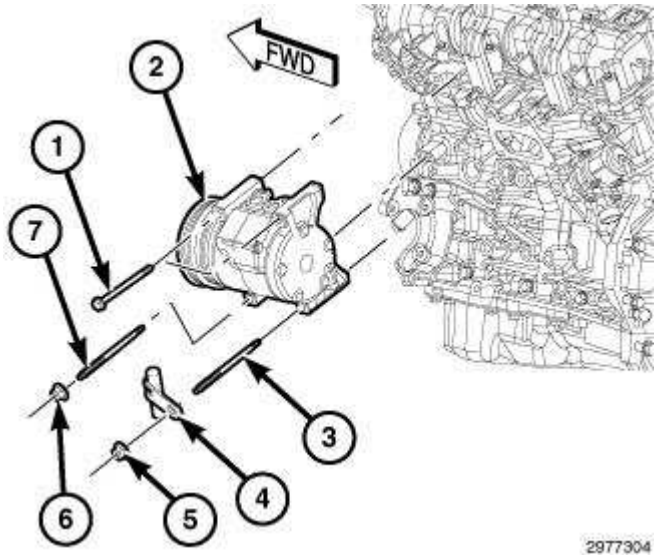

Fig. 127: Two Nuts, Two Studs, Bracket & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL** .
10. Remove the two nuts (5 and 6) and two studs (3 and 7).

CAUTION: Use care not to deform or damage the heater tube and bracket when servicing the A/C compressor.

11. Carefully position the heater tube and bracket (4) out of the way.
12. Support the A/C compressor and remove the two bolts (1).
13. Remove the A/C compressor from the engine compartment.

5.7L/6.4L ENGINES

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and. Refer to PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor. Refer to DRIER, A/C RECEIVER, REMOVAL.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

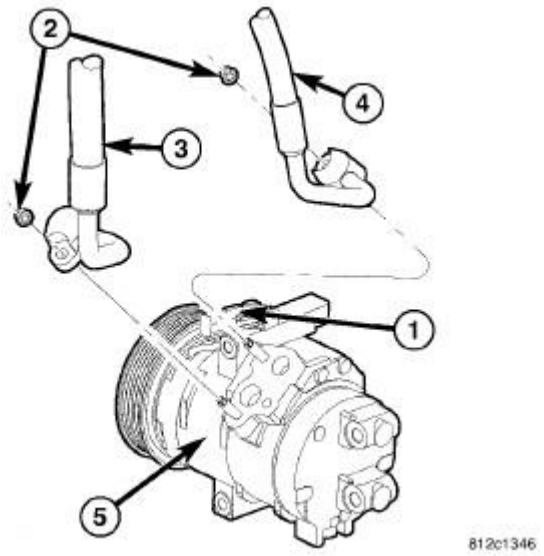

Fig. 128: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing.
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. On SRT models, position the power steering pump and reservoir out of the way. Refer to **RESERVOIR, POWER STEERING PUMP, REMOVAL** .
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Disconnect the engine wire harness from the A/C clutch connector (1).
9. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

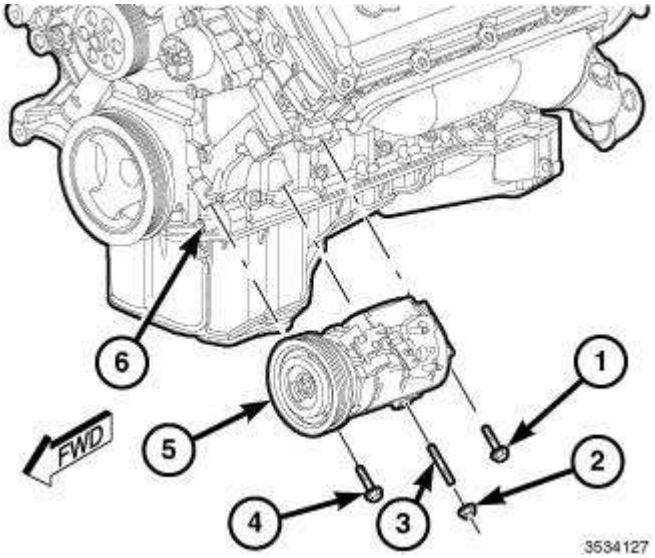

Fig. 129: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

10. Remove the front belly pan.
11. Remove the two bolts (1 and 4) that secure the A/C compressor (5) to the engine (6).
12. Support the A/C compressor and remove the nut (2) and stud (3).
13. Remove the A/C compressor from the engine compartment.

INSTALLATION

A/C CLUTCH

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

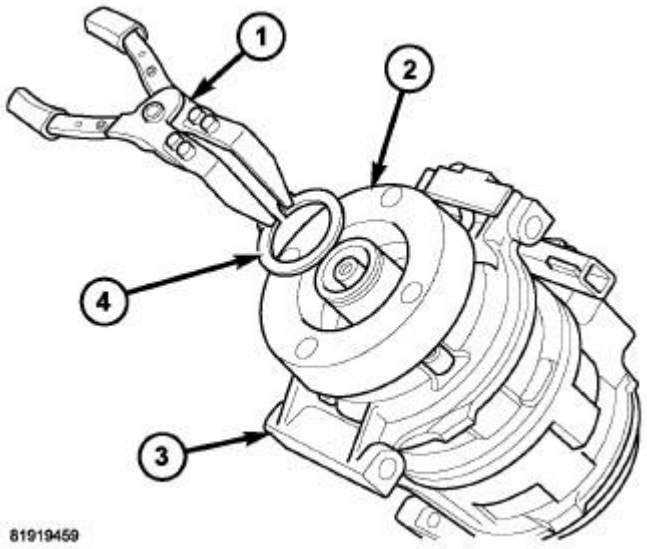

Fig. 130: Clutch Coil And Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1. Align the dowel pin on the back of the A/C clutch coil (2) with the hole in the front of the A/C compressor (3) and position the coil onto the compressor. Be certain that the A/C clutch coil wire lead is properly routed so that it is not pinched between the compressor housing and the coil.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the A/C clutch coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the coil dowel pin location on the A/C compressor.

2. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, install the snap ring (4) that secures the A/C clutch coil to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.

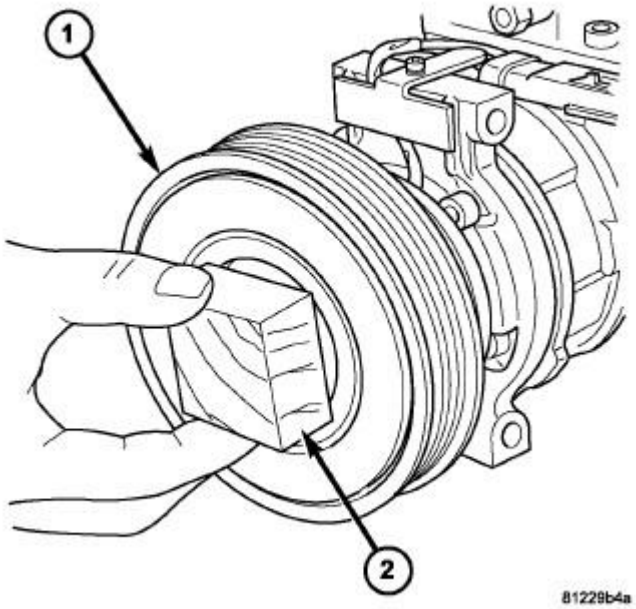

Fig. 131: Identifying Pulley & Bearing Assembly
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Be certain to position the A/C clutch coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.

3. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

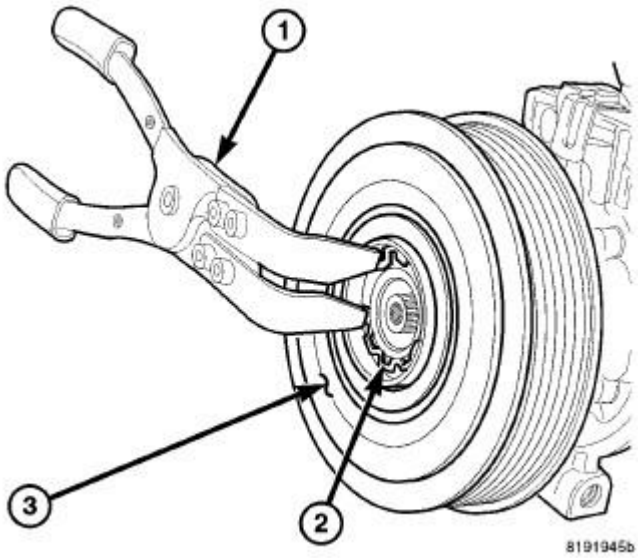

Fig. 132: Clutch Pulley & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

4. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

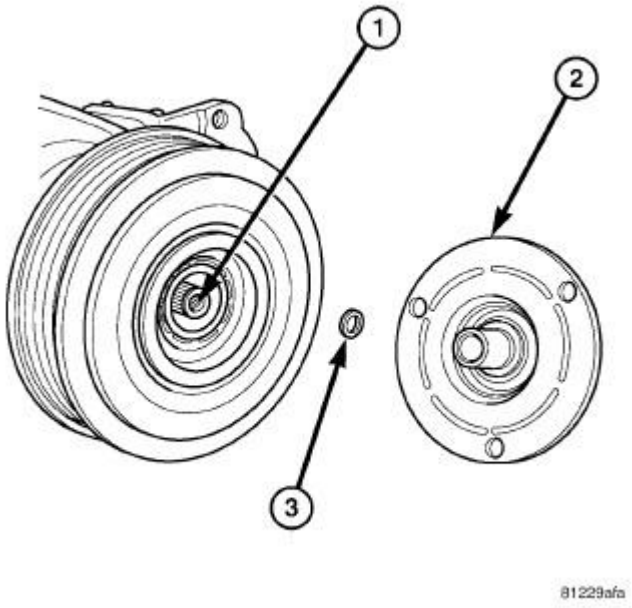

Fig. 133: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

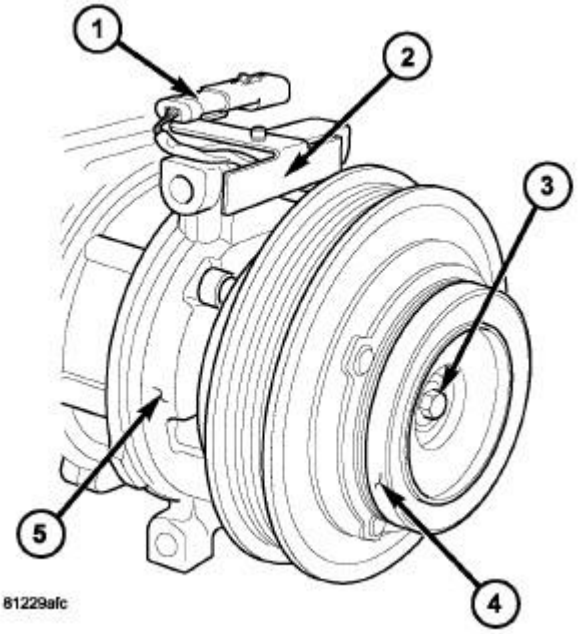

Fig. 134: Locating A/C Compressor Shaft Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the clutch plate (4) onto the front of the A/C compressor (5).
7. Install the compressor shaft bolt (3). Tighten the bolt to 19 N.m (168 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to measure the air gap.

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.35 - 0.60 mm (0.014 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION: Be certain that the A/C clutch coil wire lead is routed so that it is not pinched between the compressor housing and the coil connector bracket.

9. Carefully route the A/C clutch coil wire lead behind the connector bracket (2).
10. Install the A/C clutch coil connector (1) onto the connector bracket.
11. Connect the engine wire harness to the A/C clutch coil connector.
12. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
13. Install the radiator fan and shroud assembly. Refer to **FAN, COOLING, INSTALLATION** .
14. On 5.7L and 6.4L engine equipped models, install the air cleaner housing and air intake hose. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
15. Reconnect the negative battery cable.
16. Verify proper A/C clutch operation.

3.0L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can

cause serious damage to the replacement A/C compressor. Refer to DRIER, A/C RECEIVER, REMOVAL.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

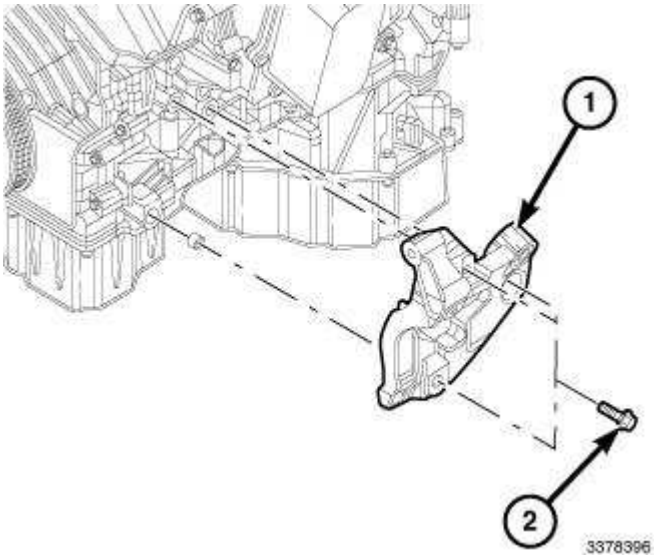

Fig. 135: A/C Compressor Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the A/C compressor bracket (1) and retaining bolts (2). Tighten the bolts 45 N.m (33 ft. lbs.).

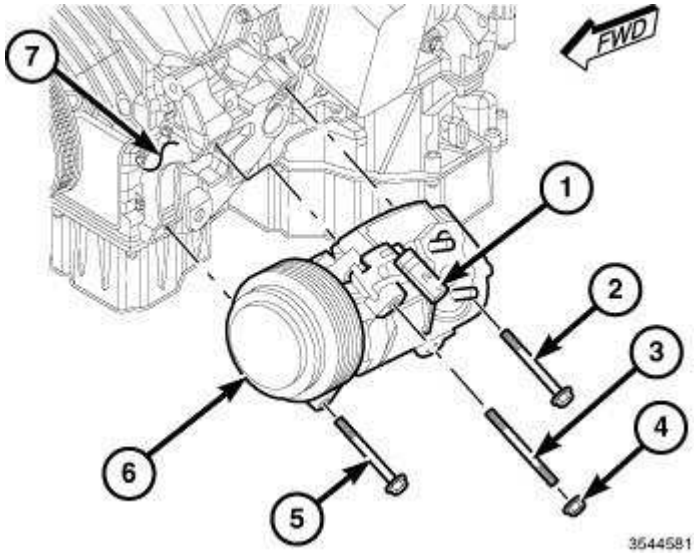

Fig. 136: bolts, A/C Clutch Electrical Connector, A/C Compressor & Bracket
Courtesy of CHRYSLER GROUP, LLC

2. If the A/C compressor (6) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C compressor to the A/C compressor bracket (7) and install the stud (3). Tighten the stud to 10 N.m (89 in. lbs.).
4. Install and hand tighten the nut (4) that secures the A/C compressor to the bracket.
5. Raise and support the vehicle.
6. Install and hand tighten the two bolts (2 and 5) that secure A/C compressor to the bracket.
7. Tighten the two bolts to 28 N.m (21 ft. lbs.) using the following sequence:
   - Bolt at rear of compressor.
   - Bolt at front of compressor.
8. Install the belly pan.
9. Lower the vehicle.
10. Tighten the nut at the front of the A/C compressor to 28 N.m (21 ft. lbs.).
11. Connect the engine wire harness to the A/C clutch electrical connector (1).

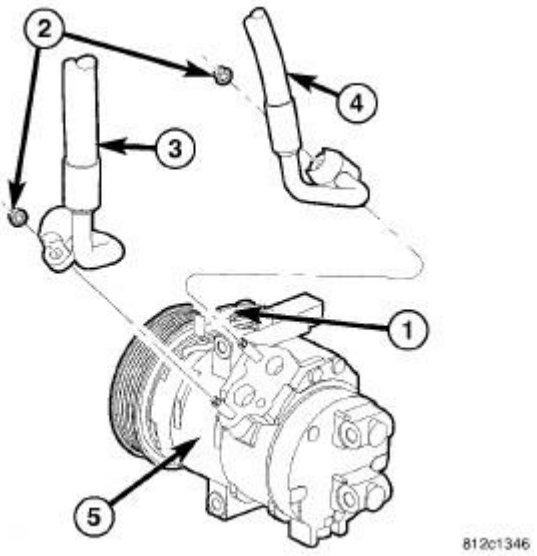

Fig. 137: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines show.

12. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
13. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
14. Connect the suction and discharge lines onto the A/C compressor (5).
15. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N.m (17 ft. lbs.).

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor. Refer to DRIER, A/C RECEIVER, REMOVAL.

16. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
17. Install the engine air cleaner housing and connect the wire harness to the mass air flow sensor.
18. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
19. Install the engine trim cover.
20. Reconnect the negative battery cable.

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

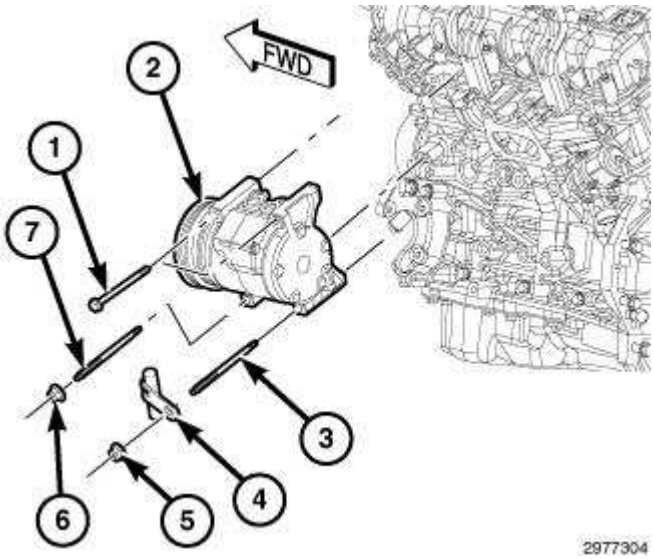

Fig. 138: Two Nuts, Two Studs, Bracket & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor to the engine and install the two studs (3 and 7). Tighten the studs to 10 N.m (89 in. lbs.).

3. Loosely install the two bolts (1)
4. Reposition the heater tube and bracket (4) and loosely install the two nuts (5 and 6).
5. Tighten the bolts and nuts to 28 N.m (21 ft. lbs.) using the following sequence:
    - Bolt at front of compressor.
    - Nut at front of compressor.
    - Bolt at rear of compressor.
    - Nut at rear of compressor.
6. Install the front belly pan. Refer to **BELLY PAN, INSTALLATION** .

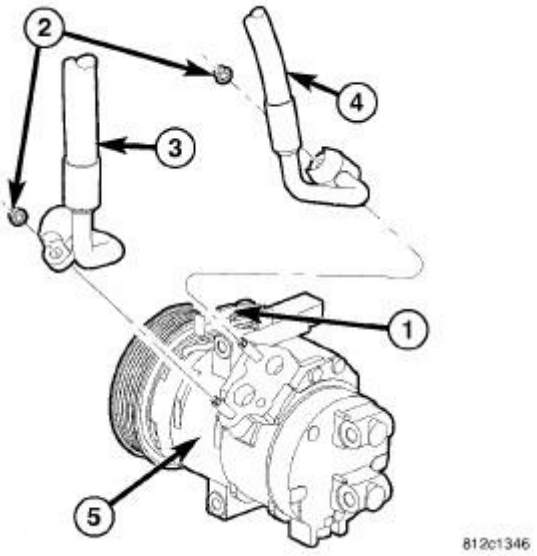

Fig. 139: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines show.

7. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
8. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the suction and discharge lines onto the A/C compressor (5).
10. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N.m (17 ft. lbs.).
11. Connect the engine wire harness to the A/C clutch connector (1).
12. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
13. Replace the A/C receiver/drier if the A/C compressor is being replaced due to an internal failure. Refer to **DRIER, A/C RECEIVER, REMOVAL**.

14. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
15. Reconnect the negative battery cable.
16. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

5.7L/6.4L ENGINES

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor. Refer to DRIER, A/C RECEIVER, REMOVAL.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

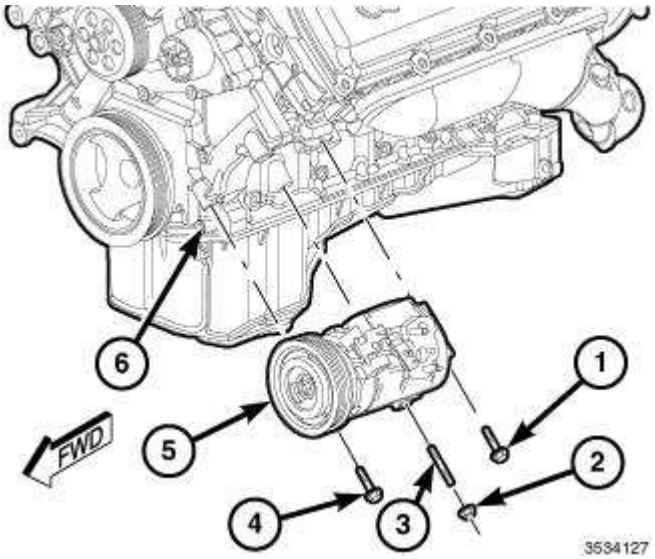

Fig. 140: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

1. If the A/C compressor (5) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor to the engine (6) and install the stud (3). Tighten the stud to 10 N.m (89 in. lbs.).
3. Loosely install the two bolts (1 and 4) and one nut (2) that secure the A/C compressor to the engine.
4. Tighten the nut and bolts to 28 N.m (21 ft. lbs.) using the following sequence:
    - Nut at front of compressor.
    - Bolt at front of compressor.
    - Bolt at rear of compressor.
5. Install the front belly pan.

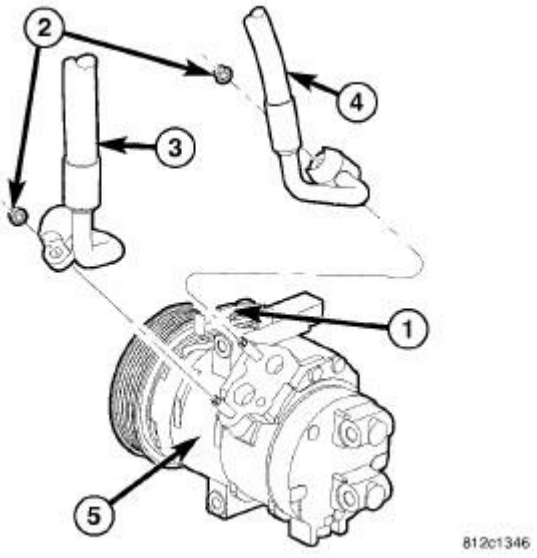

Fig. 141: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

6. Connect the engine wire harness to the A/C clutch connector (1).
7. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
8. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C

compressor in the vehicle.

9. Connect the A/C suction and discharge lines onto the A/C compressor (5).
10. Install the nuts (2) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N.m (17 ft. lbs.).

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor. Refer to DRIER, A/C RECEIVER, REMOVAL.

11. On SRT models, reposition the power steering pump and reservoir. Refer to **RESERVOIR, POWER STEERING PUMP, INSTALLATION** .
12. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
13. Install the air cleaner housing.
14. Reconnect the negative battery cable.
15. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

CONDENSER, A/C

DESCRIPTION

DESCRIPTION

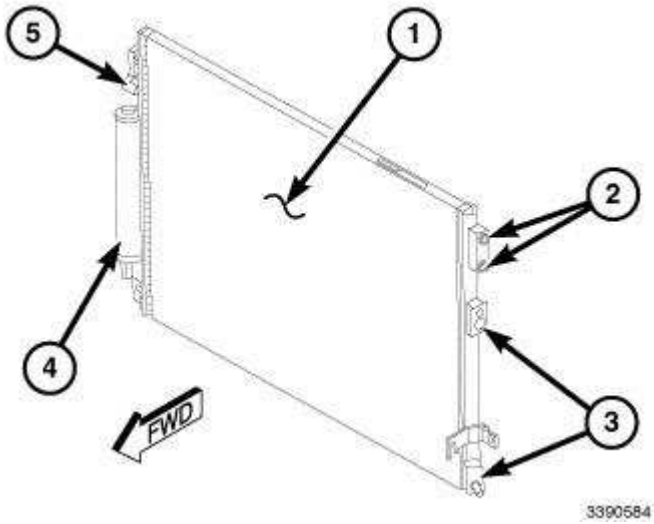

Fig. 142: A/C Condenser, A/C Refrigerant Lines, Receiver/Drier, Brackets & Integral Automatic Transmission Cooler
Courtesy of CHRYSLER GROUP, LLC

The A/C condenser (1) is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the

refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with tapping blocks for the A/C refrigerant lines (3) and for the receiver/drier (4), mounting brackets (5) and fittings for the integral automatic transmission cooler (2).

OPERATION

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C condenser has no serviceable parts. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is disconnected from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

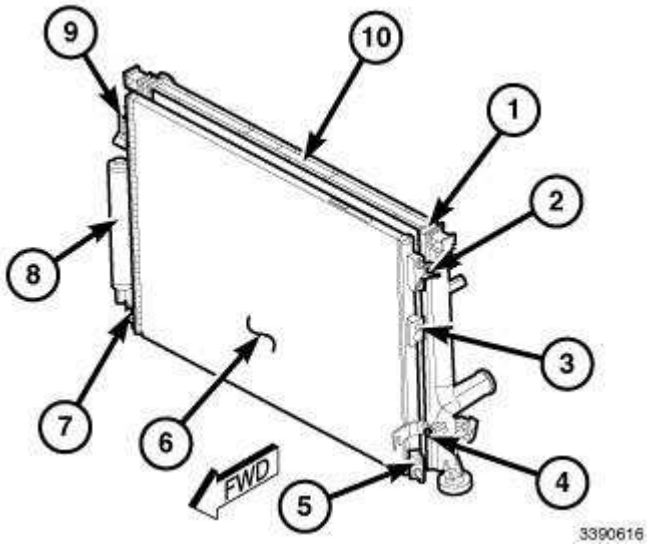

Fig. 143: Transmission Cooler Ports, Refrigerant Line Fittings, Four Bolts, Secure A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with A/C condenser and radiator removed from vehicle for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
4. Disconnect the automatic transmission cooler lines from the automatic transmission cooler ports (1) and install plugs in the cooler ports.
5. If equipped with 3.0L diesel engine, remove the charge air cooler. Refer to **COOLER AND HOSES, CHARGE AIR, REMOVAL** .
6. Disconnect the A/C discharge line and A/C liquid line from refrigerant line fittings (3 and 5). Refer to **LINE, A/C LIQUID, REMOVAL** and **LINE, A/C DISCHARGE, REMOVAL**.
7. Install plugs in, or tape over, the opened refrigerant line fittings and condenser ports.
8. Remove the four bolts (2, 4, 7 and 9) that secure A/C condenser (6) to the radiator (10).
9. Carefully tilt the bottom of the A/C condenser forward and lower the condenser out of the vehicle.
10. If required, place the A/C condenser onto a workbench and remove the A/C receiver/drier (8). Refer to **DRIER, A/C RECEIVER, REMOVAL**.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C

refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets may result in a refrigerant system leak.

NOTE: Be certain that each of the radiator and condenser air seals are installed in their proper locations. These air seals are required for the A/C and engine cooling systems to perform as designed.

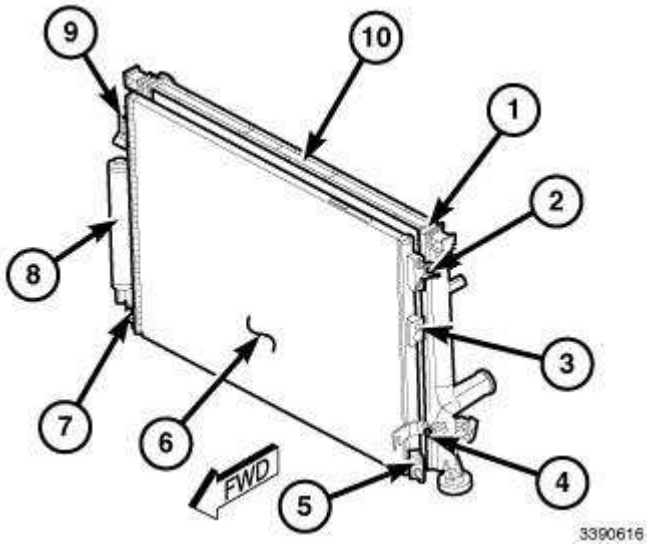

Fig. 144: Transmission Cooler Ports, Refrigerant Line Fittings, Four Bolts, Secure A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with A/C condenser and radiator removed from vehicle for clarity.

1. If required, install the A/C receiver/drier (8) onto the A/C condenser (6). Refer to **DRIER, A/C RECEIVER, INSTALLATION**.

2. Carefully position the A/C condenser to the radiator (10).
3. Install the four bolts (2, 4, 7 and 9) that secure the A/C condenser to the radiator. Tighten the bolts to 5 N.m (44 in. lbs.).
4. Remove the tape or plugs from the opened refrigerant line fittings and condenser ports.
5. Connect the A/C discharge line and the A/C liquid line to the refrigerant line tapping blocks (3 and 5). Refer to **LINE, A/C DISCHARGE, INSTALLATION** and **LINE, A/C LIQUID, INSTALLATION**.
6. If equipped with 3.0L diesel engine, install the charge air cooler. Refer to **COOLER AND HOSES, CHARGE AIR, INSTALLATION** .
7. Remove the plugs and connect the automatic transmission cooler lines to the cooler ports (1).
8. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
11. If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Check the automatic transmission fluid level and fill as required.

CORE, HEATER

DESCRIPTION

DESCRIPTION

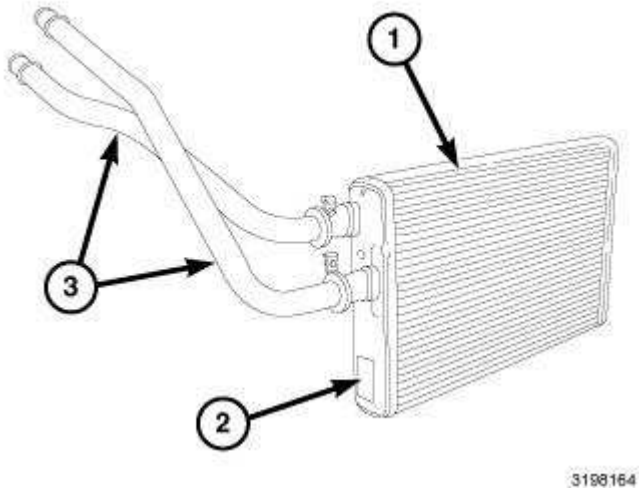

Fig. 145: Heater Core, Tubes & Tank
Courtesy of CHRYSLER GROUP, LLC

The heater core (1) is mounted into the left side of the air distribution housing, which is located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes with fins. The heater core is positioned within the air distribution housing so that only the selected amount of air entering the housing passes through the heater core, before being distributed through the heating and A/C system ducts and outlets. One end of the heater core has a tank (2) that includes fittings for the heater core tubes (3) and O-ring seals.

The heater core be serviced without removing the HVAC housing from the vehicle.

OPERATION

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and must be replaced if restricted, leaking or damaged.

REMOVAL

REMOVAL

WARNING: Refer to the applicable Warnings and Cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: LHD model shown in illustration. RHD model similar.

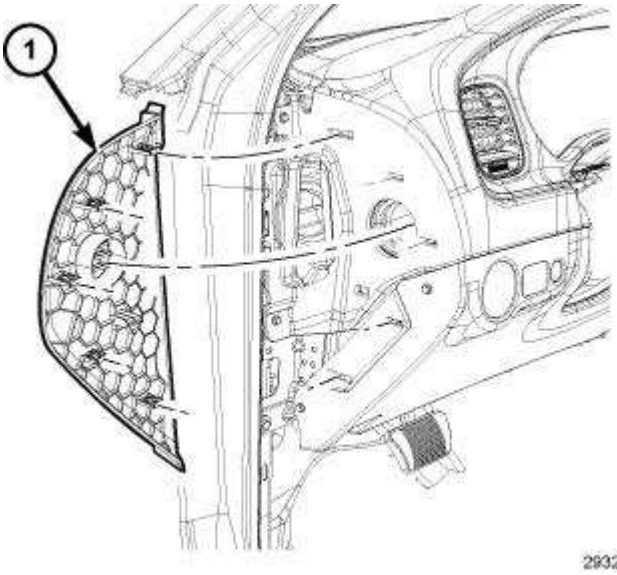

Fig. 146: End Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration. Right side similar.

1. Disconnect and isolate the negative battery cable.
2. Drain the engine cooling system. Refer to **STANDARD PROCEDURE** .
3. Remove the left and right side instrument panel silencers. Refer to **PANEL, SILENCER, REMOVAL** .
4. Using (special tool #C-4755, Trim Stick) or equivalent, remove the left and right side instrument panel end caps (1).

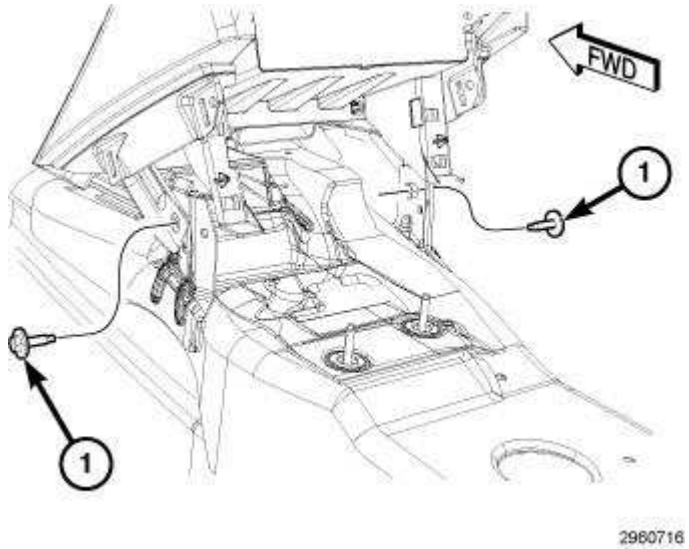

Fig. 147: Floor Pan Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the steering column. Refer to **COLUMN, REMOVAL** .
6. Remove the center floor console. Refer to **CONSOLE, FLOOR, REMOVAL** .
7. Remove the two bolts (1) that secure the center of the instrument panel to the floor pan.

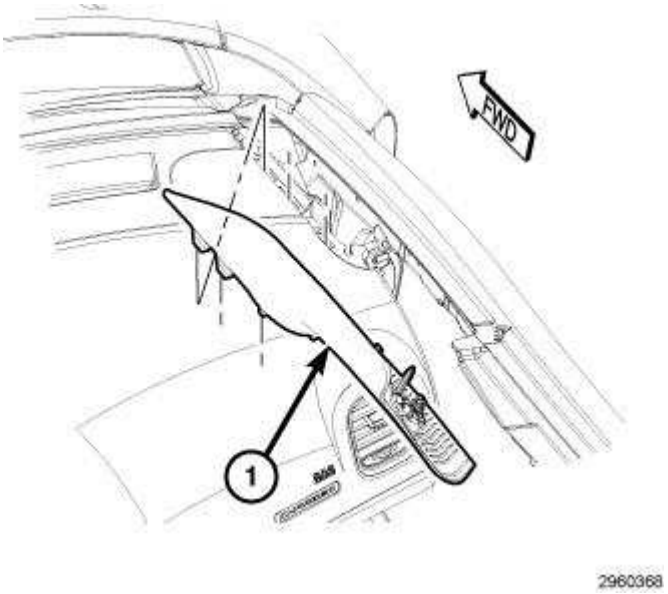

Fig. 148: A-Pillar Trim Panels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration. Right side similar.

8. Remove the left and right side A-pillar trim panels (1). Refer to **PANEL, A-PILLAR TRIM, REMOVAL** .

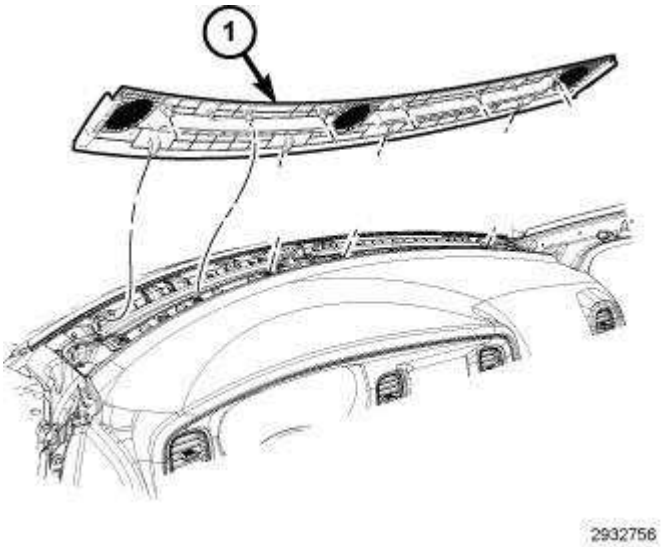

Fig. 149: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

9. Using (special tool #C-4755, Trim Stick) or equivalent, remove the defroster grille (1).

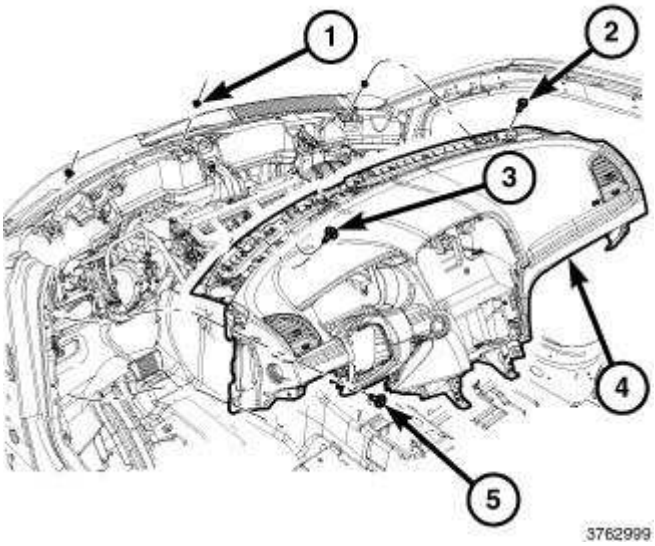

Fig. 150: Defroster Grille, Screws, Instrument Panel, Two Bolts & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the three screws (2) that secure the top of the instrument panel (4) to the spring nuts (1).
11. Remove the two bolts (3) that secure the top of the instrument panel to the cowl panel.
12. Remove the two bolts (5) that secure the left and right side of the instrument panel to the body.
13. Disengage the retaining tabs that secure the left and right side of the instrument panel to the body.

NOTE: Make sure to leave the right side door open when repositioning the left side of the instrument panel.

14. For clearance, carefully position the left side of the instrument panel rearward approximately 50 mm (2 in.).

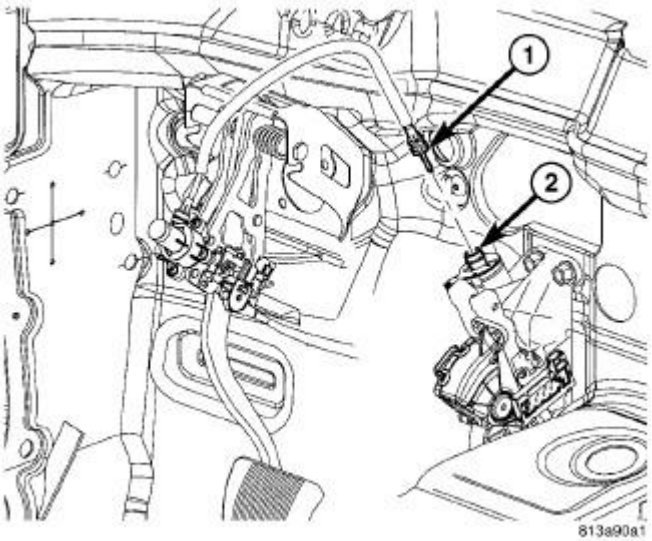

Fig. 151: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

15. When equipped with power adjustable pedals, disconnect the adjuster cable (1) from the accelerator pedal adjuster motor (2) and position the cable out of the way.

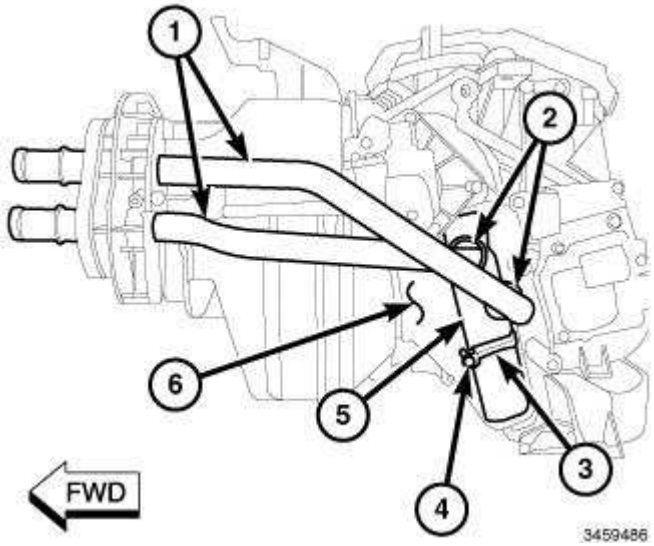

Fig. 152: Two Clamps, Heater Core Tubes, Heater Core, Screw, Heater Core Bracket & HVAC Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Take proper precautions to protect the carpeting and interior trim from engine coolant. Have absorbent toweling readily available to clean up any spills.

NOTE: **If required, use your fingers to rotate the clamps to gain access to the clamp retaining screws.**

16. Remove the two clamps (2) that secure the heater core tubes (1) to the heater core (5).
17. Disconnect the heater core tubes from the heater core and position the tubes out of the way.
18. Remove and discard the heater core tube O-ring seals and install plugs in, or tape over, the opened tubes and heater core ports.
19. Remove the retaining screw (4) that secures the heater core bracket (3) to the driver side of the HVAC air distribution housing (6) and remove the bracket.

NOTE: **If the foam seal around the heater core is deformed or damaged, it must be replaced.**

20. Carefully pull the heater core straight out of the air distribution housing.

INSTALLATION

INSTALLATION

NOTE: **LHD model shown in illustration. RHD model similar.**

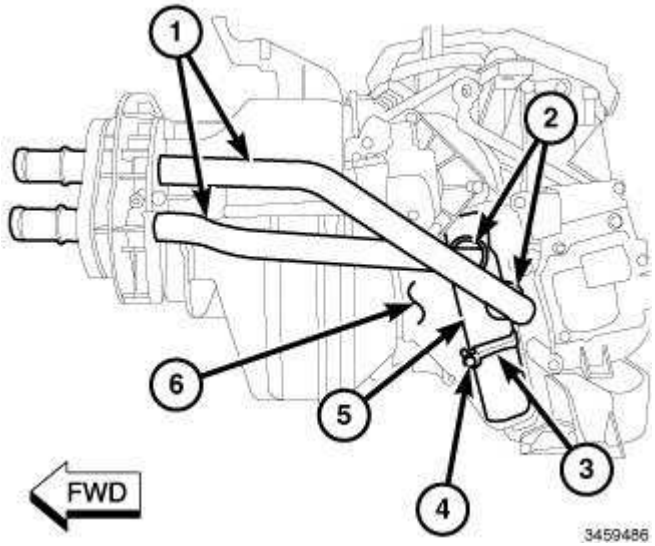

Fig. 153: Two Clamps, Heater Core Tubes, Heater Core, Screw, Heater Core Bracket & HVAC Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

1. Carefully install the heater core (5) into the driver side of the HVAC air distribution housing (6).
2. Install the heater core bracket (3) and retaining screw (4). Tighten the screw to 2.2 N.m (20 in. lbs.).
3. Remove the tape or plugs from the heater core tubes (1) and the heater core ports.
4. Lubricate new O-ring seals with clean engine coolant and install them onto the heater core

tubes. Use only the specified O-ring seals as they are made of a special material for the engine cooling system.

5. Connect the heater core tubes to the heater core.
6. Install the two clamps (2) that secure the heater core tubes to the heater core. Tighten the screws on the clamps to 1.7 N.m (15 in. lbs.).

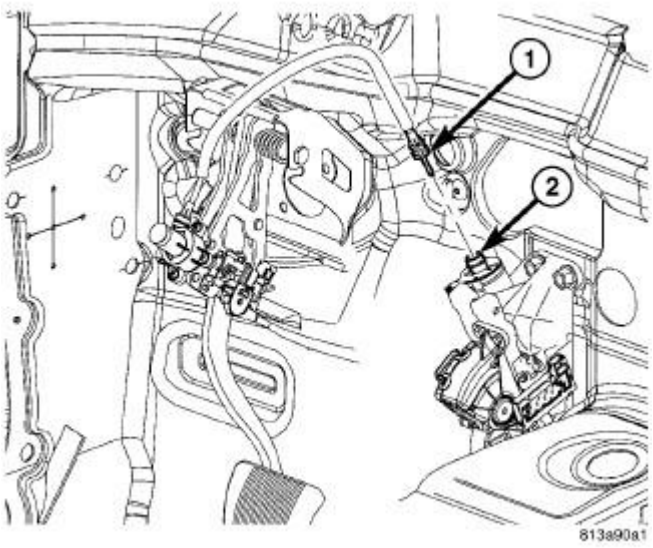

Fig. 154: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

7. When equipped with power adjustable pedals, reconnect the adjuster cable (1) to the accelerator pedal adjuster motor (2).

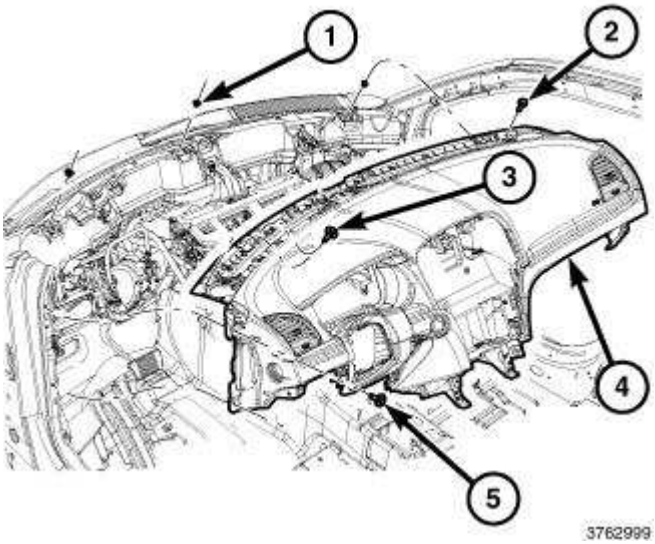

Fig. 155: Defroster Grille, Screws, Instrument Panel, Two Bolts & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Carefully reposition the instrument panel (4) and engage the retaining tabs that secure the left and right side of the instrument panel to the body.
9. Install the two bolts (5) that secure the left and right side of the instrument panel to the body. Tighten the bolts to 16 N.m (12 ft. lbs.).
10. Install the three screws (2) that secure the top of the instrument panel to the spring nuts (1). Tighten the screws securely.
11. Install the two bolts (3) that secure the top of the instrument panel to the cowl panel. Tighten the bolts to 21 N.m (15 ft. lbs.).

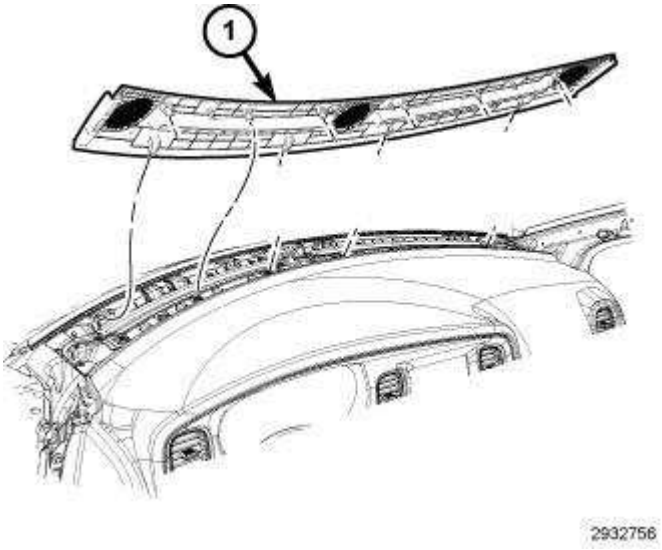

Fig. 156: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

12. Install the defroster grille (1). Make sure the retaining tabs are fully engaged.

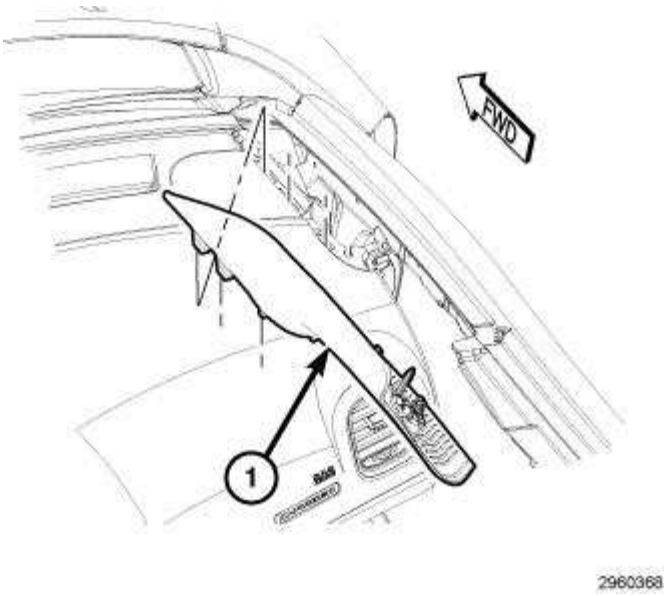

Fig. 157: A-Pillar Trim Panels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration. Right side similar.

13. Install the left and right side A-pillar trim panels (1). Refer to **PANEL, A-PILLAR TRIM, INSTALLATION** .

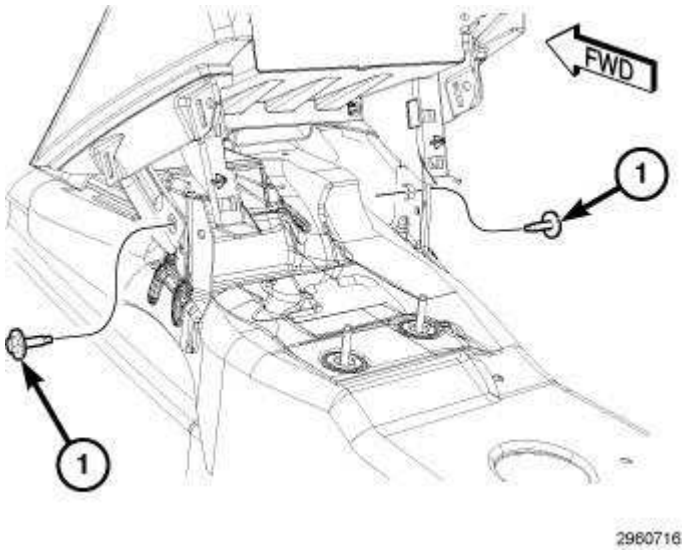

Fig. 158: Floor Pan Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Install the two bolts (1) that secure the center of the instrument panel to the floor pan. Tighten the bolts to 16 N.m (12 ft. lbs.).

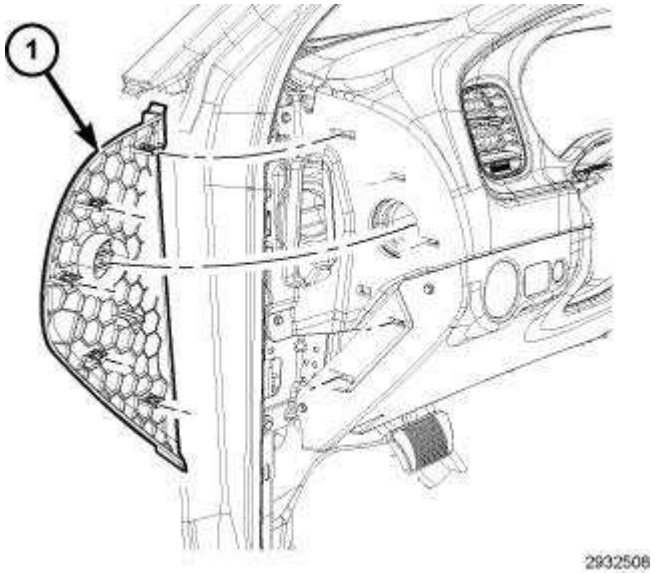

Fig. 159: End Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration. Right side similar.

15. Install the center floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .
16. Install the steering column. Refer to **COLUMN, INSTALLATION** .
17. Install the left and right side instrument panel end caps (1). Make sure the retaining tabs are fully engaged.
18. Install the left and right side instrument panel silencers. Refer to **PANEL, SILENCER, INSTALLATION** .
19. Reconnect the negative battery cable.
20. If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .
21. Refill the engine cooling system. Refer to **STANDARD PROCEDURE** .

CORE, SERVICE PORT VALVE

DESCRIPTION

DESCRIPTION

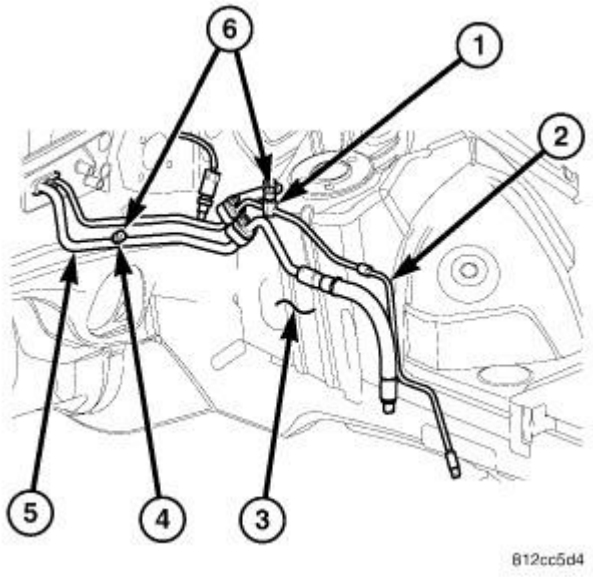

Fig. 160: Refrigerant System Service Ports Description
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The high side service port (1) is located on the liquid line (2) near the left shock tower (3). The low side service port (4) is located on the suction line (5) near the left shock tower. Both the high side and low side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap (6) installed over it from the factory. The service port caps are serviceable items.

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

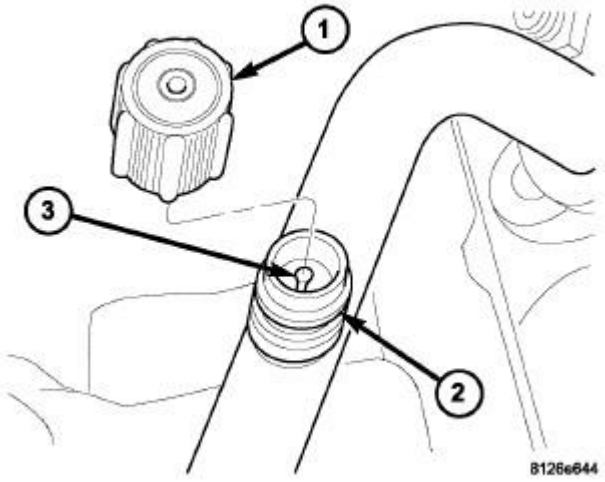

Fig. 161: Identifying A/C Service Port Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C service port shown in illustration.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.

4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

INSTALLATION

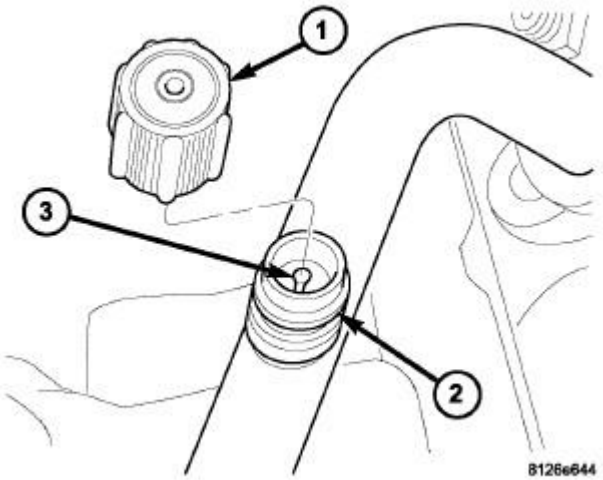

Fig. 162: Identifying A/C Service Port Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C service port shown in illustration.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: Damage may result to a service port valve core if the valve core is not fully seated in the A/C service port. Such damage can result in a loss of refrigerant.

3. Install and tighten the valve core into the service port(s) using a Schrader type valve core tool.
4. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

5. Install the protective cap (1) onto the service port.

DRIER, A/C RECEIVER

DESCRIPTION

DESCRIPTION

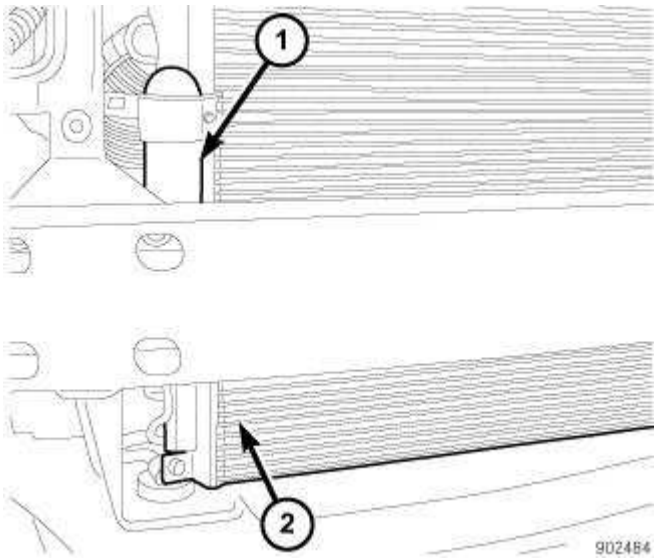

Fig. 163: Receiver/Drier Description
Courtesy of CHRYSLER GROUP, LLC

The receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The receiver/drier is installed on the high-side of the A/C system and is connected directly to the right end of the A/C condenser. The receiver/drier can be easily serviced by removing the front fascia.

OPERATION

OPERATION

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C receiver/drier has no serviceable parts except for the O-ring seals, gaskets and the high side service port valve and cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever

the A/C receiver/drier is removed.

The A/C receiver/drier cannot be repaired and must be replaced if leaking or damaged, or if an internal failure of the A/C compressor has occurred.

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

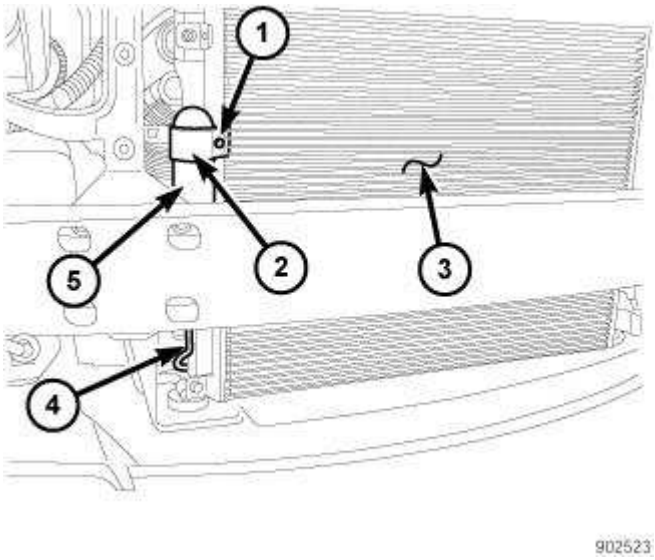

Fig. 164: Receiver/Drier
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
4. Remove the screw (1) that secures the receiver/drier mounting bracket (2) to the right end of the A/C condenser (3).
5. Remove the bolt (4) that secures the receiver/drier (5) to the A/C condenser.
6. Disconnect the receiver/drier from the A/C condenser and remove and discard the dual-plane seal.
7. Install plugs in, or tape over the opened receiver/drier fitting and the condenser ports.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level prevents the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: If only the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

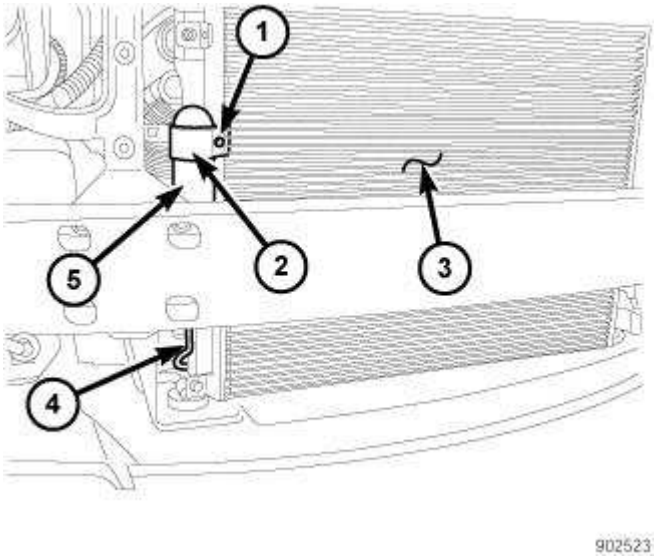

Fig. 165: Receiver/Drier
Courtesy of CHRYSLER GROUP, LLC

1. Position the receiver/drier (5) into the engine compartment.
2. Remove the tape or plugs from the receiver/drier fitting and the ports of the A/C condenser (3).
3. Lubricate a new dual-plane seal with clean refrigerant oil and install it onto the receiver/drier

fitting. Use only the specified seal, as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

4. Connect the receiver/drier to the right end of the A/C condenser.
5. Install the bolt (4) that secures the receiver/drier to the A/C condenser. Tighten the bolt to 22 N.m (16 ft. lbs.).
6. Install the receiver/drier mounting bracket (2) onto the A/C condenser.
7. Install the screw (1) securing the receiver/drier mounting bracket onto the A/C condenser. Tighten the screw to to 5 N.m (44 in. lbs.).
8. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
11. If the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

EVAPORATOR, A/C

DESCRIPTION

DESCRIPTION

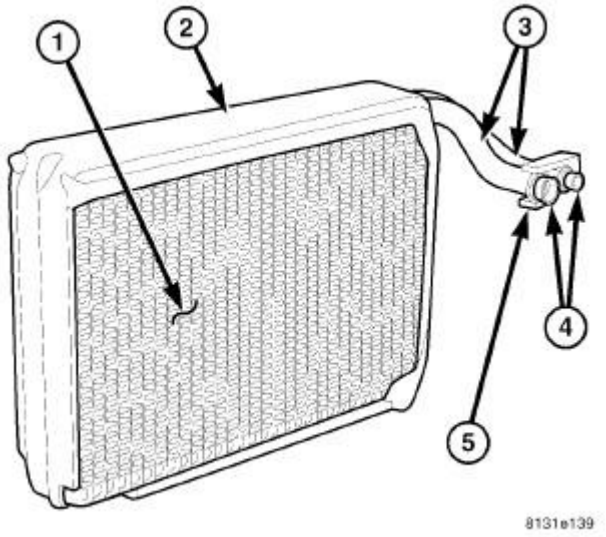

Fig. 166: Evaporator-A/C Description
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C evaporator (1) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator and its insulator (2) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) and a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

OPERATION

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: LHD model shown in illustration. RHD model similar.

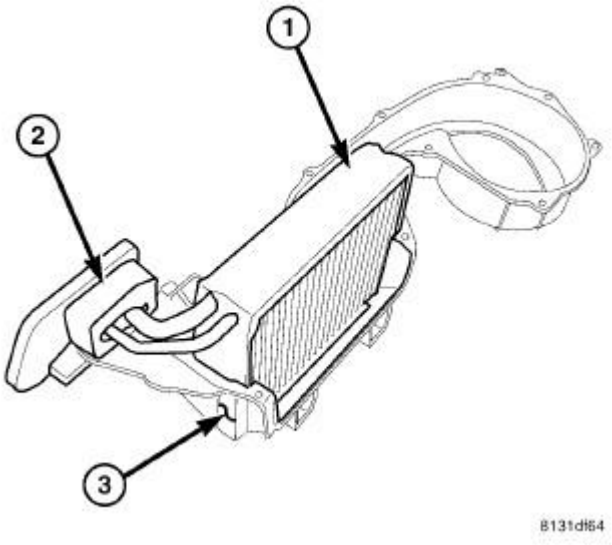

Fig. 167: Removing/Installing A/C Evaporator
Courtesy of CHRYSLER GROUP, LLC

1. Remove the HVAC housing assembly. Refer to **HOUSING, HVAC, REMOVAL**.
2. Disassemble the HVAC housing as necessary to access the A/C evaporator (1). Refer to **HOUSING, HVAC, DISASSEMBLY**.
3. Carefully lift the A/C evaporator and the foam seal (2) out of the lower half of the HVAC housing (3).

NOTE: If the foam seal at the front of the HVAC housing is deformed or damaged, the seal must be replaced.

4. Remove the A/C expansion valve, tapping block and foam seal from the A/C evaporator. Refer to **VALVE, A/C EXPANSION, REMOVAL**.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: **If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

NOTE: **LHD model shown in illustration. RHD model similar.**

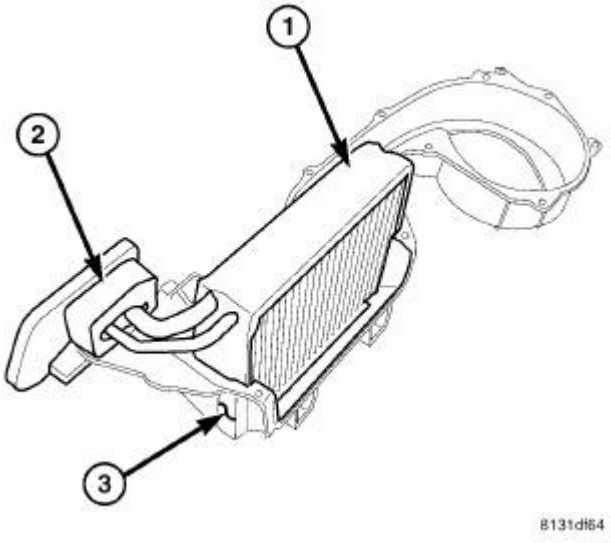

Fig. 168: Removing/Installing A/C Evaporator
Courtesy of CHRYSLER GROUP, LLC

1. Install the foam seal (2), tapping block and A/C expansion valve onto the A/C evaporator (1). Refer to **VALVE, A/C EXPANSION, INSTALLATION**.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.
3. Assemble the HVAC housing. Refer to **HOUSING, HVAC, ASSEMBLY**.

   NOTE: **If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

LINE, A/C DISCHARGE

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

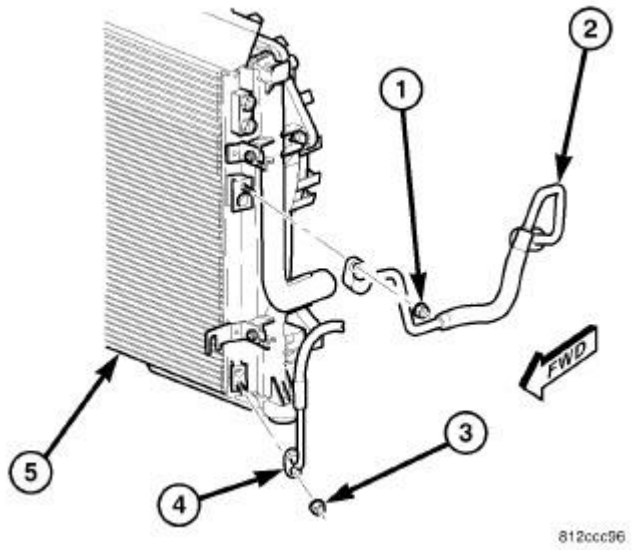

Fig. 169: Removing/Installing A/C Lines AT Condenser
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** and **BODY, AIR CLEANER, REMOVAL** and **BODY, AIR CLEANER, REMOVAL, 5.7L** and **BODY, AIR CLEANER, REMOVAL** .
4. Reach through the headlamp opening in the upper radiator support and remove the nut (1) that secures the A/C discharge line (2) to the A/C condenser (5).
5. Disconnect the A/C discharge line from the A/C condenser and remove and discard the dual plane seal.
6. Install plugs in, or tape over the discharge line fitting and condenser inlet port.

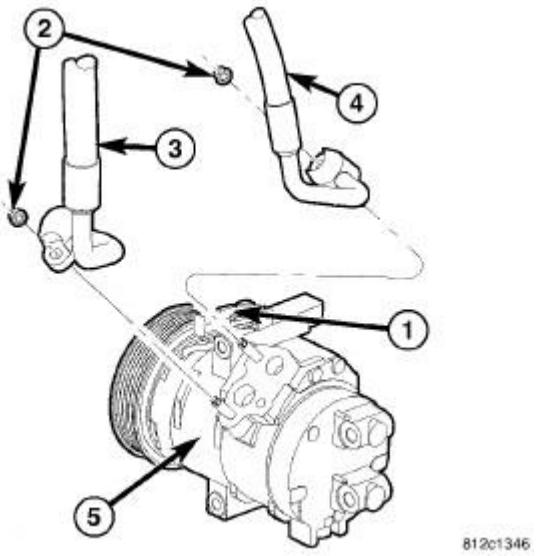

Fig. 170: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

7. Remove the nut (2) that secures the A/C discharge line (4) to the A/C compressor (5).
8. Disconnect the A/C discharge line from the A/C compressor and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened refrigerant line fitting and the compressor port.
10. Remove the A/C discharge line from the engine compartment.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

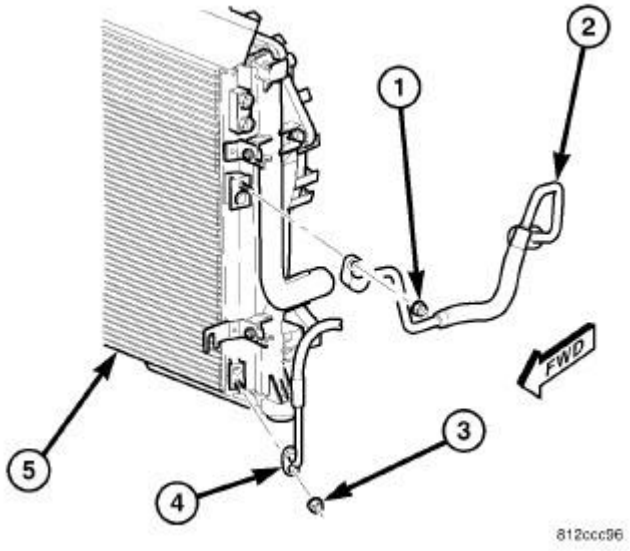

Fig. 171: Removing/Installing A/C Lines AT Condenser
Courtesy of CHRYSLER GROUP, LLC

1. Position the A/C discharge line (2) into the engine compartment.
2. Remove the tape or plugs from the opened discharge line fitting and the inlet port on the A/C condenser (5).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge line onto the A/C condenser.
5. Reach through the headlamp opening in the upper radiator support and install the nut (1) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22 N.m (16 ft. lbs.).

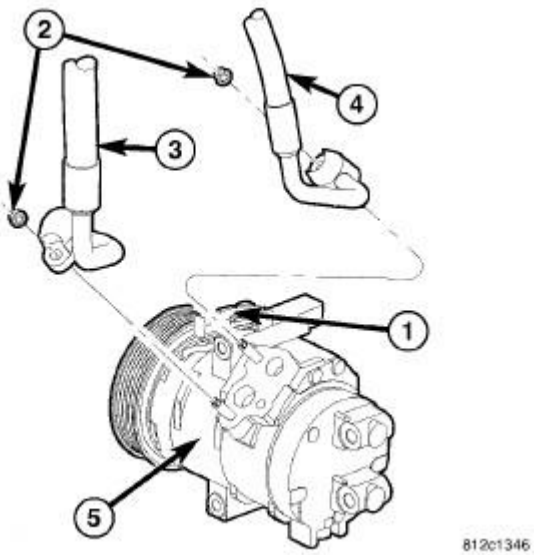

Fig. 172: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

6. Remove the tape or plugs from the opened fitting on the A/C discharge line (4) and the outlet port on the A/C compressor (5).
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C discharge line onto the A/C compressor.
9. Install the nut (2) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 23 N.m (17 ft. lbs.).
10. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** and **BODY, AIR CLEANER, INSTALLATION** and **BODY, AIR CLEANER, INSTALLATION, 5.7L** and **BODY, AIR CLEANER, INSTALLATION** .
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

LINE, A/C LIQUID

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The A/C liquid line is serviced in two sections. The rear section of the liquid line is serviced as an assembly with the rear section of the A/C suction line.

FRONT SECTION

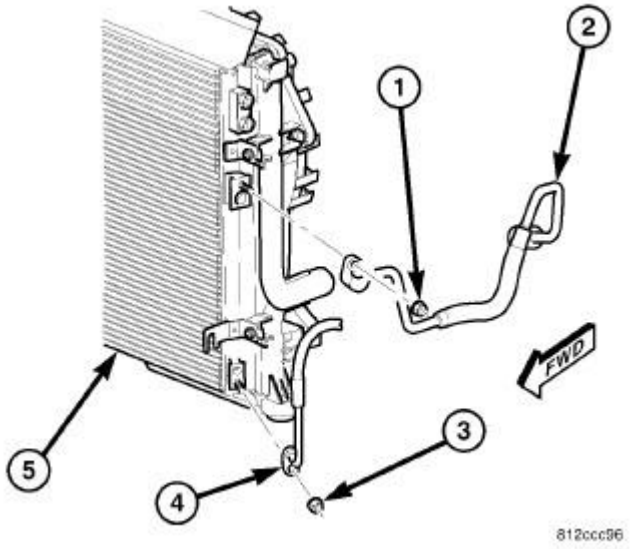

Fig. 173: Removing/Installing A/C Lines AT Condenser
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
4. Raise and support the vehicle.
5. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL** .
6. Remove the nut (3) that secures the front section of the A/C liquid line (4) to the A/C condenser (5).
7. Disconnect the A/C liquid line from the A/C condenser and remove and discard the dual plane seal.
8. Install plugs in, or tape over the opened liquid line fitting and condenser outlet port.

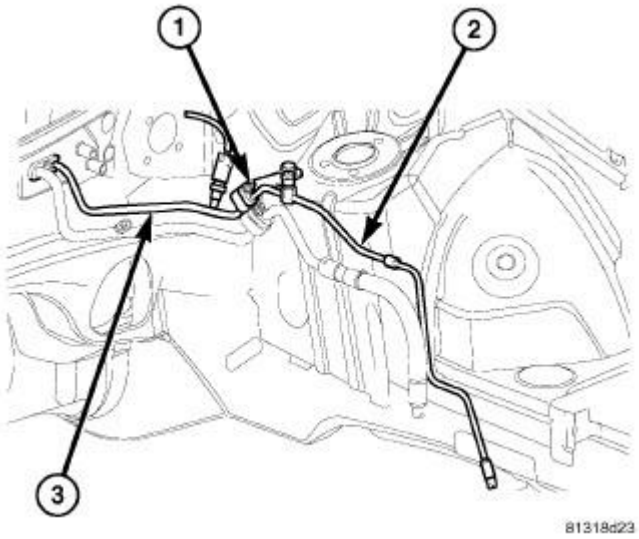

Fig. 174: Removing/Installing A/C Liquid Front Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

9. Lower the vehicle.
10. Remove the nut (1) that secures the front section of the A/C liquid line (2) to the rear section of the liquid line (3).
11. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
12. Install plugs in, or tape over the opened liquid line fittings.
13. Remove the front section of the A/C liquid line from the engine compartment.

REAR SECTION

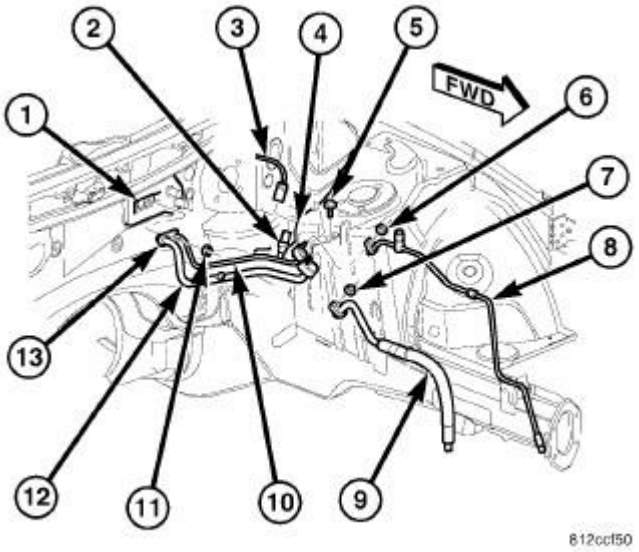

Fig. 175: Removing/Installing Rear A/C Liquid/Suction Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. On LHD models, remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
4. Remove the nut (6) that secures the front section of the A/C liquid line (8) to the rear section of the liquid line (10).
5. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened liquid line fittings.
7. Remove the nut (7) that secures the front section of the A/C suction line (9) to the rear section of the suction line (12).
8. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened suction line fittings.
10. Disconnect the wire harness (3) from the A/C pressure transducer (2).
11. Remove the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4).
12. Remove the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve (1).
13. Disconnect the rear section of the A/C liquid and suction lines from the A/C expansion valve.

14. Remove the dual plane seal from the suction and liquid line fittings and discard.
15. Install plugs in, or tape over the opened suction and liquid line fittings and the expansion valve ports.
16. Remove the rear section of the A/C liquid and suction lines as an assembly from the engine compartment.
17. If required, remove the A/C pressure transducer from the rear section of the A/C liquid line. Refer to **TRANSDUCER, A/C PRESSURE, REMOVAL**.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: The A/C liquid line is serviced in two sections. The rear section of the liquid line is serviced as an assembly with the rear section of the A/C suction line.

FRONT SECTION

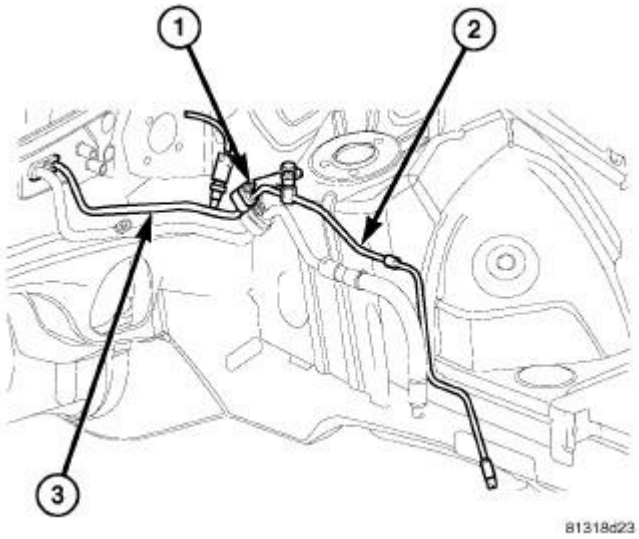

Fig. 176: Removing/Installing A/C Liquid Front Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the front section of the liquid line (2) into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
5. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line. Tighten the nut to 22 N.m (16 ft. lbs.).

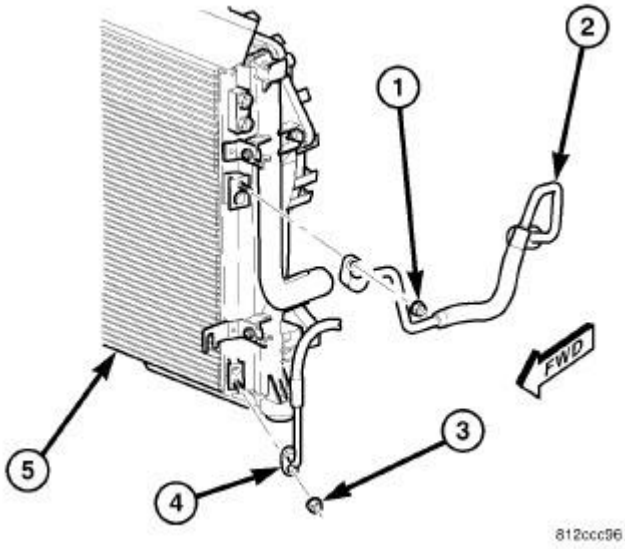

Fig. 177: Removing/Installing A/C Lines AT Condenser
Courtesy of CHRYSLER GROUP, LLC

6. Raise and support the vehicle.
7. Remove the tape or plugs from the fitting on the front section of the A/C liquid line (4) and the outlet port of the A/C condenser (5).
8. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C liquid line to the A/C condenser.
10. Install the nut (3) that secures the front section of the A/C liquid line to the A/C condenser. Tighten the nut to 22 N.m (16 ft. lbs.).
11. Install the front belly pan. Refer to **BELLY PAN, INSTALLATION** .
12. Lower the vehicle.
13. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
14. Reconnect the negative battery cable.
15. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
16. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
17. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

REAR SECTION

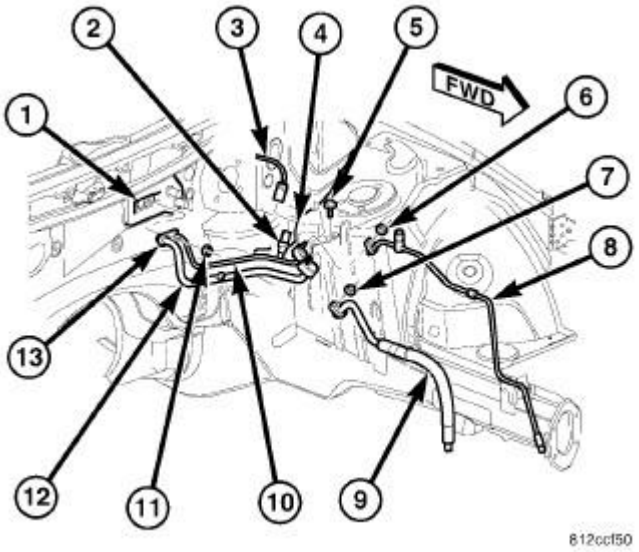

Fig. 178: Removing/Installing Rear A/C Liquid/Suction Line

NOTE: LHD model shown in illustration. RHD model similar.

1. If removed, install the A/C pressure transducer (2) onto the A/C liquid line (10). Refer to **TRANSDUCER, A/C PRESSURE, INSTALLATION**.
2. Position the rear section of the A/C liquid line (10) and the rear section of the A/C suction line (12) as an assembly into the engine compartment.
3. Remove the tape or plugs from the suction and liquid line fittings and the ports in the A/C expansion valve (1).
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the rear section of the A/C liquid and suction lines to the A/C expansion valve.
6. Install the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
7. Install the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4). Tighten the bolt to 11 N.m (97 in. lbs.).
8. Connect the wire harness (3) to the A/C pressure transducer.
9. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line (8) to the rear section of the A/C liquid line.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
12. Install the nut (6) that secures the front section of the A/C liquid line to the rear section of the

A/C liquid line. Tighten the nut to 22 N.m (16 ft. lbs.).

13. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line (9) to the rear section of the A/C suction line.
14. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
16. Install the nut (7) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N.m (16 ft. lbs.).
17. Install the air cleaner housing (refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL**).
18. Reconnect the negative battery cable.
19. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
20. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
21. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

LINE, A/C SUCTION

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The A/C suction line is serviced in two sections. The rear section of the suction line is serviced as an assembly with the rear section of the A/C liquid line.

FRONT SECTION

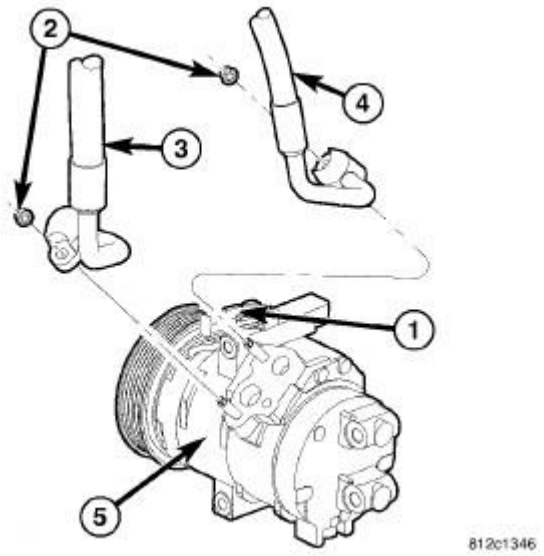

Fig. 179: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
4. Remove the nut (2) that secures the front section of the A/C suction line (3) to the A/C compressor (5).
5. Disconnect the A/C suction line from the A/C compressor and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened suction line fitting and compressor inlet port.

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
4. Remove the nut (7) that secures the front section of the A/C suction line (9) to the rear section of the suction line (12).
5. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened suction line fittings.
7. Remove the nut (6) that secures the front section of the A/C liquid line (8) to the rear section of the liquid line (10).
8. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened liquid line fittings.
10. Disconnect the wire harness (3) from the A/C pressure transducer (2).
11. Remove the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4).
12. Remove the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve (1).
13. Disconnect the rear section of the A/C suction and liquid lines from the A/C expansion valve.

14. Remove the dual plane seal from the suction and liquid line fittings and discard.
15. Install plugs in, or tape over the opened suction and liquid line fittings and the expansion valve ports.
16. Remove the rear section of the A/C suction and liquid lines as an assembly from the engine compartment.
17. If required, remove the A/C pressure transducer from the rear section of the A/C liquid line. Refer to **TRANSDUCER, A/C PRESSURE, REMOVAL**.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: The A/C suction line is serviced in two sections. The rear section of the suction line is serviced as an assembly with the rear section of the A/C liquid line.

FRONT SECTION

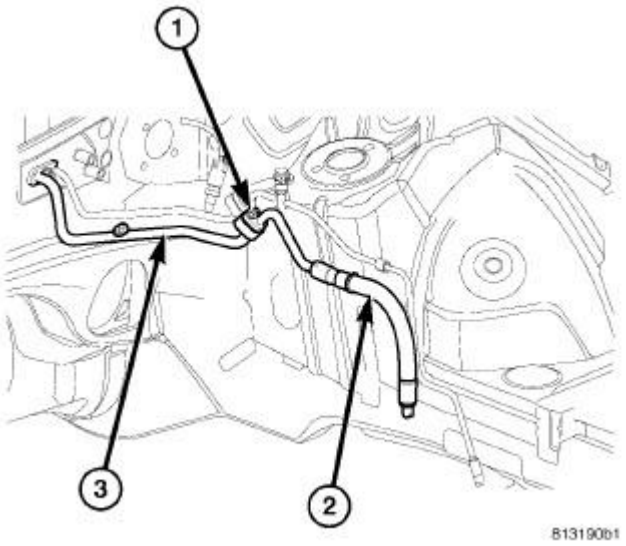

Fig. 182: Removing/Installing A/C Suction Front Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the front section of the A/C suction line (2) into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
5. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N.m (16 ft. lbs.).

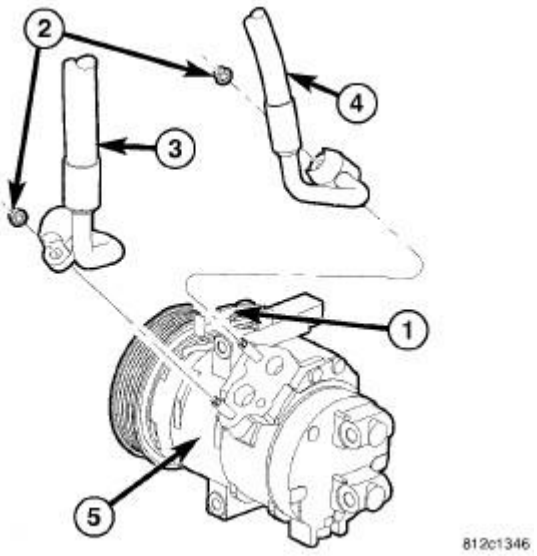

Fig. 183: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

6. Remove the tape or plugs from the fitting on the front section of the A/C suction line (3) and the inlet port of the A/C compressor (5).
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Connect the A/C suction line to the A/C compressor.
9. Install the nut (2) that secures the front section of the A/C suction line to the A/C compressor. Tighten the nut to 23 N.m (17 ft. lbs.).
10. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

REAR SECTION

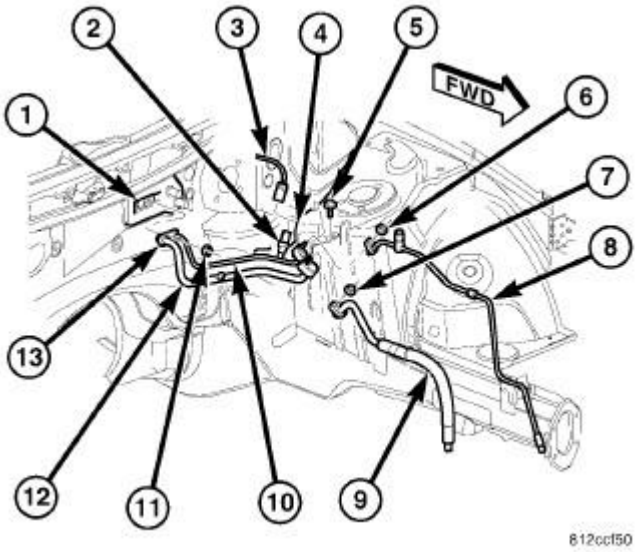

Fig. 184: Removing/Installing Rear A/C Liquid/Suction Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. If removed, install the A/C pressure transducer (2) onto the A/C liquid line (10). Refer to **TRANSDUCER, A/C PRESSURE, INSTALLATION**.
2. Position the rear section of the A/C suction line (12) and the rear section of the A/C liquid line (10) as an assembly into the engine compartment.
3. Remove the tape or plugs from the suction and liquid line fittings and the ports in the A/C expansion valve (1).
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the rear section of the A/C liquid and suction lines to the A/C expansion valve.
6. Install the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
7. Install the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4). Tighten the bolt to 11 N.m (97 in. lbs.).
8. Connect the wire harness (3) to the A/C pressure transducer.
9. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line (8) to the rear section of the A/C liquid line.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
12. Install the nut (6) that secures the front section of the A/C liquid line to the rear section of the

A/C liquid line. Tighten the nut to 22 N.m (16 ft. lbs.).

13. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line (9) to the rear section of the A/C suction line.
14. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
16. Install the nut (7) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N.m (16 ft. lbs.).
17. Install the air cleaner housing (refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION**).
18. Reconnect the negative battery cable.
19. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
20. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
21. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

OIL, REFRIGERANT

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The refrigerant oil in the A/C system is unique depending on the A/C compressor used. Use only PAG oils that are designed to work with the refrigerant type and A/C compressor in the vehicle. Always refer to the A/C Underhood Specification Label for the correct oil designation. The refrigerant oil container should be kept tightly capped until it is ready for use, and then tightly recapped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: **Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.**

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C condenser, A/C evaporator or A/C receiver/drier is replaced. See **REFRIGERANT OIL CAPACITIES** chart.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. See the **COMPRESSOR OIL DRAIN PROCEDURE**.

REFRIGERANT OIL TYPE

A/C Compressor	Oil Type
Denso 10SRE18 - 3.0L/5.7L/6.4L Engines	* Use only ND-8 PAG oil
Visteon RS-18 - 3.6L Engine	* Use only VC-46 PAG oil

* Always use the type of PAG oil listed for the model being serviced. See A/C Underhood Specification Label located in the engine compartment. Do not mix different types of PAG oils.

REFRIGERANT OIL CAPACITIES

COMPONENT	ml.	oz.
Total System Fill	180	6.1
A/C Condenser	30	1.0
A/C Evaporator	60	2.0
A/C Receiver/drier	30	1.0
A/C Compressor	Drain and measure the oil from the old compressor (See Compressor Oil Drain Procedure below)	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.

3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type specified for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. Refer to **COMPRESSOR, A/C, INSTALLATION**.

VALVE, A/C EXPANSION

DESCRIPTION

DESCRIPTION

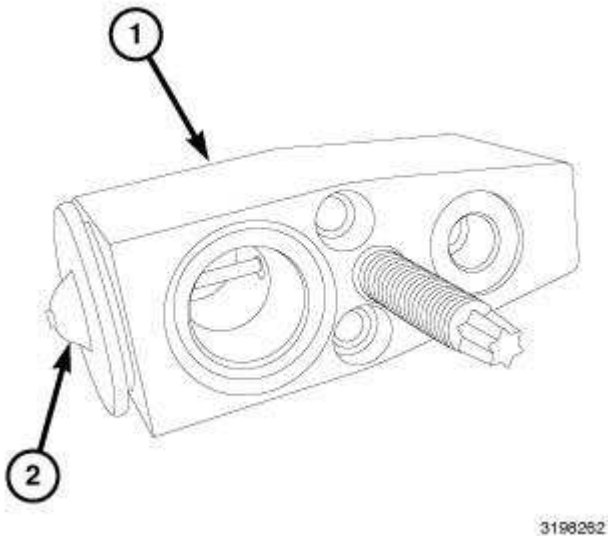

Fig. 185: H-valve Type Body & Thermal Sensor
Courtesy of CHRYSLER GROUP, LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1), with an integral thermal sensor (2). The A/C expansion valve is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

OPERATION

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the A/C liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - A/C EXPANSION VALVE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO^2 is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO^2 is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85°F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Verify the refrigerant system charge level by conducting the A/C Performance Test. Refer to **DIAGNOSIS AND TESTING**.
3. Close all doors, windows and vents to the passenger compartment.
4. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.

5. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
6. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to 7. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO^2 or personal injury can result.

7. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO^2 or another suitable super-cold material. **Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to 8. If not OK, replace the inoperative A/C expansion valve. Refer to **VALVE, A/C EXPANSION, REMOVAL**.
8. Allow the A/C expansion valve to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve. Refer to **VALVE, A/C EXPANSION, REMOVAL**.

REMOVAL

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. Refer to PLUMBING, WARNING and PLUMBING, CAUTION. Failure to follow these instructions may result in serious or fatal injury.

NOTE: LHD model shown in illustration. RHD model similar.

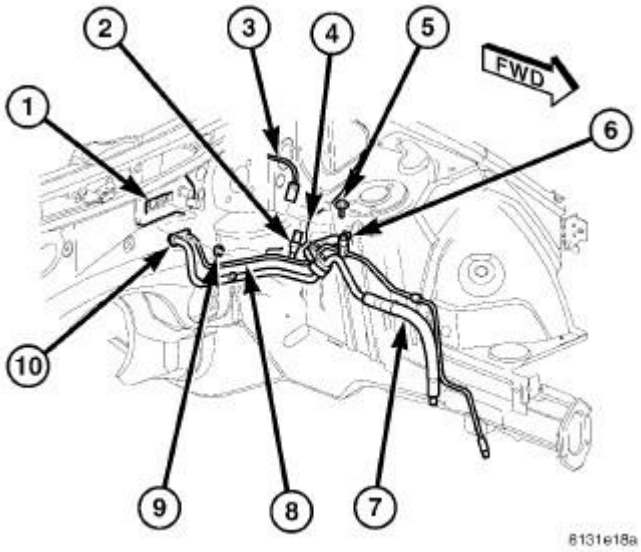

Fig. 186: Removing/Installing A/C Expansion Valve Refrigerant Lines
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the bolt (5) that secures the refrigerant line mounting bracket (6) to the left front shock tower (4).
4. Remove the nut (9) that secures the refrigerant line tapping block (10) to the A/C expansion valve (1).
5. Disconnect the wire harness (3) from the A/C pressure transducer (2) to help allow access to the A/C expansion valve.
6. Disconnect the A/C suction line (7) and the A/C liquid line (8) from the A/C expansion valve and position the refrigerant lines out of the way.
7. Remove the seal from the suction and liquid line fittings and discard.
8. Install plugs in, or tape over the opened suction and liquid line fittings.

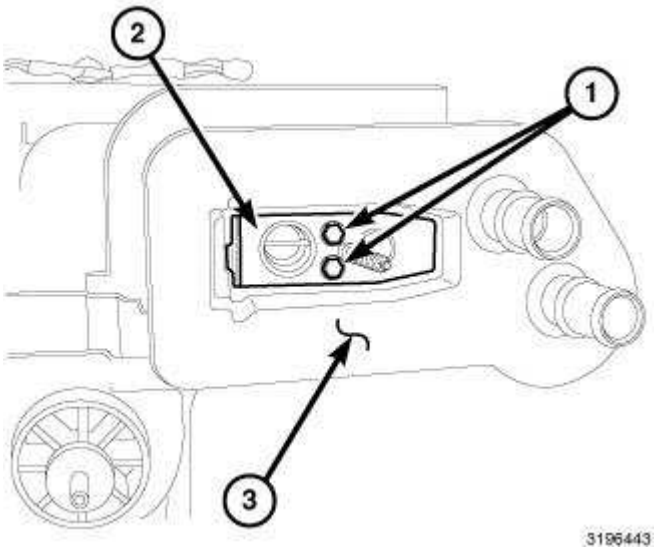

Fig. 187: Valve-A/C Expansion
Courtesy of CHRYSLER GROUP, LLC

9. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block located within the seal (3).
10. Remove the A/C expansion valve from the evaporator tube tapping block.
11. Remove the O-ring seals from the evaporator tube fittings and discard.
12. Install plugs in, or tape over the opened evaporator tube fittings.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustration. RHD model similar.

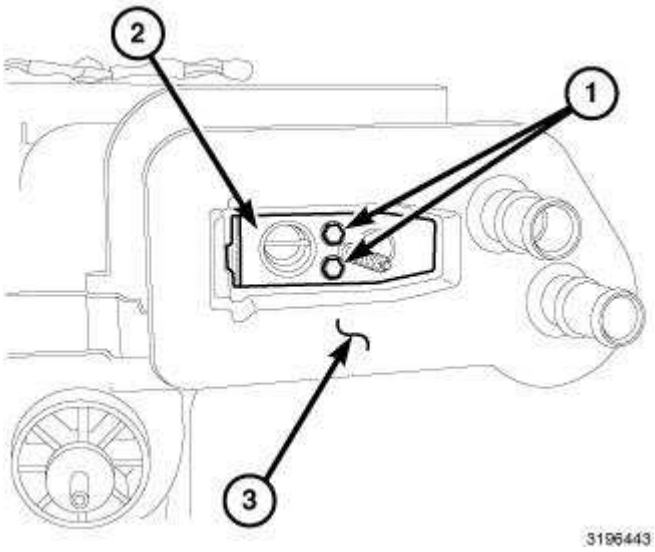

Fig. 188: Valve-A/C Expansion
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the evaporator tube fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block.
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N.m (97 in. lbs.).

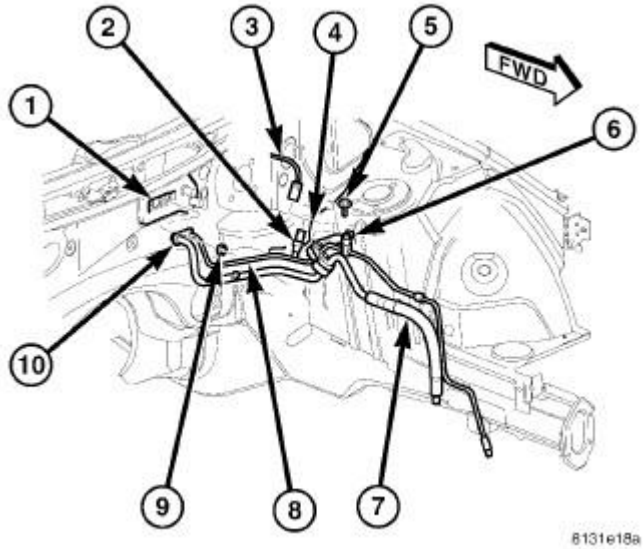

Fig. 189: Removing/Installing A/C Expansion Valve Refrigerant Lines
Courtesy of CHRYSLER GROUP, LLC

5. Remove the tape or plugs from the suction and liquid line fittings.
6. Lubricate a new seal with clean refrigerant oil and install onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C suction line (7) and the A/C liquid line (8) to the A/C expansion valve (1).
8. Install the nut (9) that secures the refrigerant line tapping block (10) to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
9. Install the bolt (5) that secures the refrigerant line mounting bracket (6) to the left front shock tower (4). Tighten the bolt to 11 N.m (97 in. lbs.).
10. Connect the wire harness (3) to the A/C pressure transducer (2).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

CABIN HEATER

RELAY, HEATER UNIT

DESCRIPTION

DESCRIPTION

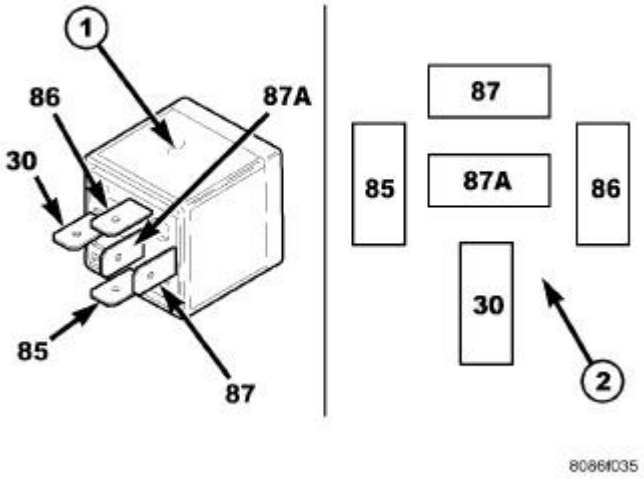

Fig. 190: EBL Relay
Courtesy of CHRYSLER GROUP, LLC

Three relays (1) are used for the electric Positive Temperature Coefficient (PTC) heater unit. The relays are International Standards Organization (ISO) type relay. Relays conforming to the ISO

specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit as determined by the Powertrain Control Module (PCM).

The three PTC relays are located in the diesel accessory fuse/relay block in the engine compartment.

REMOVAL

REMOVAL

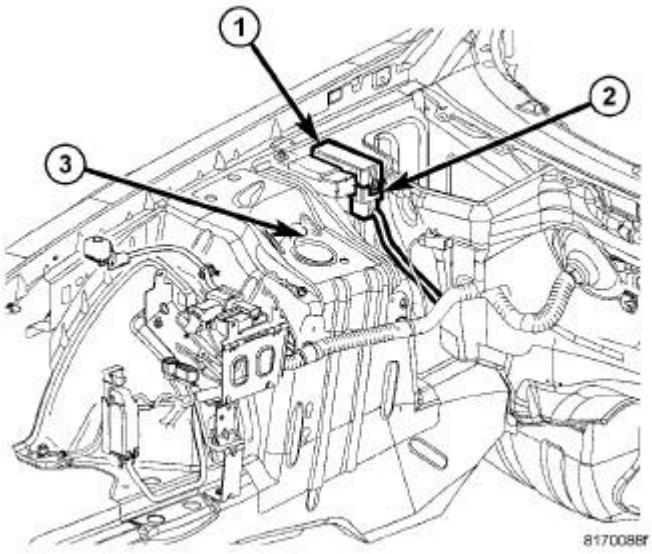

Fig. 191: Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Open the cover (1) of the diesel accessory fuse/relay block (2) located in the engine compartment behind the right side shock tower (3).
3. Remove the positive temperature coefficient (PTC) relays as necessary from the fuse/relay block.

INSTALLATION

INSTALLATION

NOTE: LHD model shown in illustration. RHD model similar.

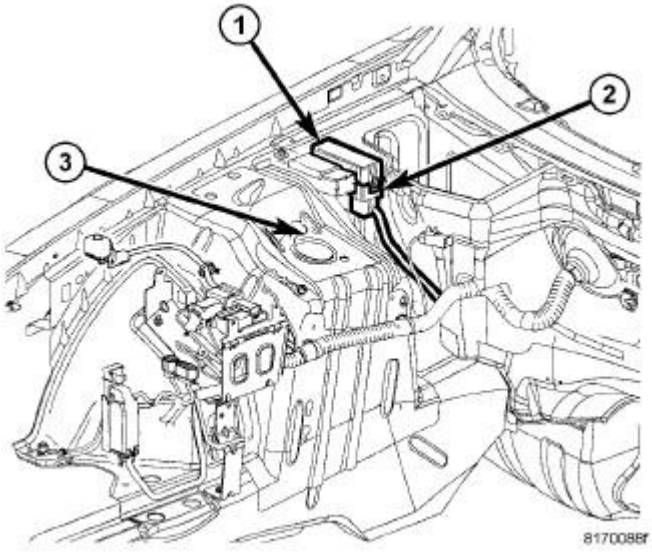

Fig. 192: Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER GROUP, LLC

1. Position the positive temperature coefficient (PTC) relays as necessary into the proper receptacle of the diesel accessory fuse/relay block (2) located behind the right side shock tower (3).
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.
3. Close the cover (1) of the diesel accessory fuse/relay block.
4. Reconnect the negative battery cable.

UNIT, HEATER

DESCRIPTION

DESCRIPTION

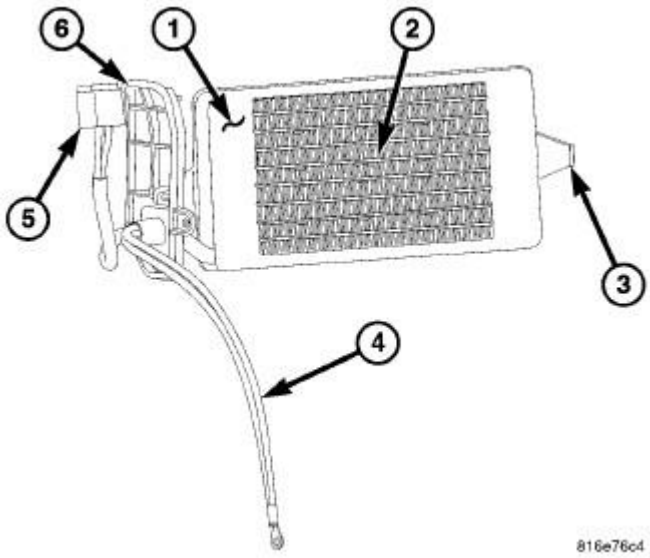

Fig. 193: PTC Heater Unit
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

An electric Positive Temperature Coefficient (PTC) heater unit (1) is used in vehicles equipped with the 3.0L diesel engine. The PTC heater unit aids in passenger compartment heating by compensating for the slower warm up rate of the diesel engine.

The PTC heater unit is located in the HVAC air distribution housing, downstream of the heater core and is controlled by the Powertrain Control Module (PCM) through three relays.

The PTC heater consists of three heating elements with fins (2) that transfer the heat to the conditioned air flowing within the air distribution housing and a retaining feature (3) that is molded onto end of the PTC heater unit to support the heater unit inside the air distribution housing. The PTC heater unit is connected to the vehicle electrical system by a ground strap (4) and a plastic wire connector with three terminals (5) which is connected to the headlamp and dash wire harness. If service of the PTC heater unit is required, a plastic mounting plate (6) is provided with the replacement heater unit.

The PTC heater unit can be accessed for service from underneath the instrument panel.

OPERATION

OPERATION

The Positive Temperature Coefficient (PTC) heater unit dissipates 1 kW of electrical power through 3 heating bars. The Powertrain Control Module (PCM) controls the three relays for the PTC heater unit. The PTC heater unit is split into three "banks". Control logic calls for all PTC heaters to be on all of the time, however, due to limitations in electrical power some of the elements may be turned off occasionally based on alternator load. This allows for lower in-rush current and optimum battery

charging. Electrical power output is between 900-1050 W.

The control system for the PTC heater unit is diagnosed using a scan tool. Prior to replacing a PTC heater unit, check for any diagnostic trouble codes (DTCs) related to the PCM and heating and A/C system. Initiate the Actuator Calibration function to verify that the concern is not a heating and A/C system calibration issue. Refer to **STANDARD PROCEDURE** .

The PTC heater unit cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

POSITIVE TEMPERATURE COEFFICIENT (PTC) HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury

NOTE: See Wiring Information for circuit descriptions and diagrams. Wiring Information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Prior to replacing the Positive Temperature Coefficient (PTC) heater unit, check the fuses located in the two diesel accessory fuse blocks and check for any Diagnostic Trouble Codes (DTCs) related to the Powertrain Control Module (PCM) and the heating and A/C system and repair as necessary. Initiate the Actuator Calibration function to verify that the concern is not a heating and A/C system calibration issue. Refer to **STANDARD PROCEDURE** .

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the PTC heater unit. Refer to **UNIT, HEATER, REMOVAL**.
3. Using an ohmmeter, check for continuity between each of the terminals of the PTC wire lead connector and the PTC heater ground strap. In each case there should be continuity. If OK, verify the PTC ground strap has a good connection to the body and/or repair the wire harness circuits between the PTC heater unit, Power Distribution Center (PDC) and the PCM. If NOT OK, replace the PTC heater unit.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

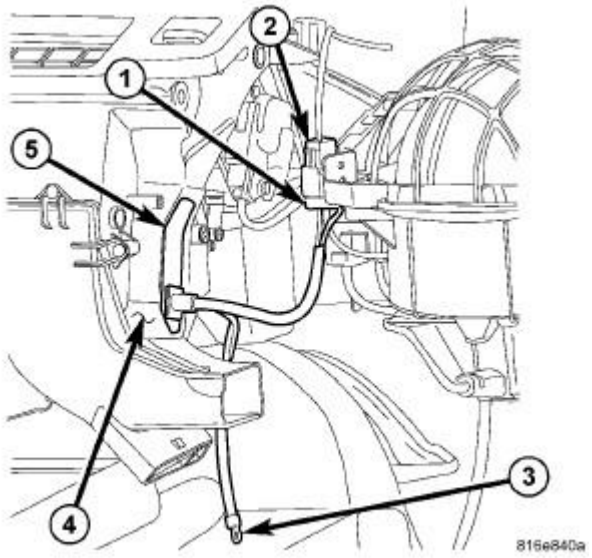

Fig. 194: PTC Heater Unit Removal
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box bin from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Disconnect the wire harness connector (1) of the positive temperature coefficient (PTC) heater unit from the headlamp and dash wire harness lead (2).
4. Remove the PTC ground strap (3) from the body.

WARNING: Use care when cutting the air distribution housing to remove the PTC heater unit. Failure to take proper precautions may result in possible serious injury.

CAUTION: Use a sharp utility knife or a hot knife to cut the air distribution housing around the PTC heater unit. Do not use a saw of any kind or damage to the air distribution housing will result.

5. Carefully cut the passenger side of the air distribution housing (4) around the PTC heater unit following the cut line (5) molded into the side of the housing.
6. Remove the PTC heater unit from the air distribution housing by pulling it straight out of the housing.

INSTALLATION

INSTALLATION

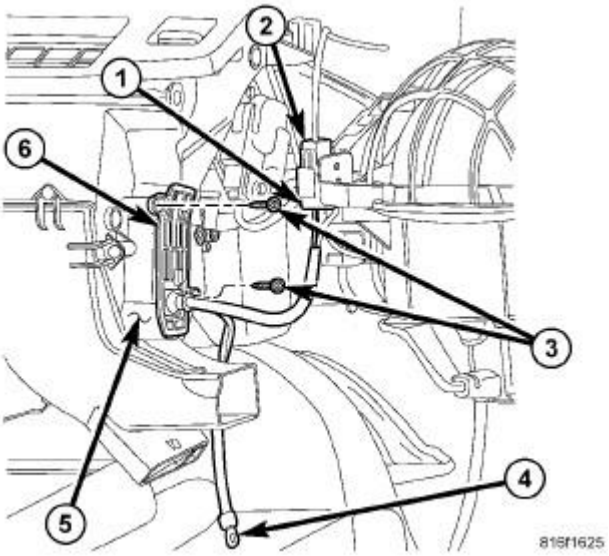

Fig. 195: PTC Heater Unit Install
Courtesy of CHRYSLER GROUP, LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the positive temperature coefficient (PTC) heater unit and adapter plate (6) into the passenger side of the air distribution housing (5). Make sure to engage the end of the heater unit into the molded locator area in the driver side of the air distribution housing and make sure that the rubber wiring grommet is fully engage over the adapter plate.
2. Install the two screws (3) that secure the PTC heater unit to the air distribution housing. Tighten the screws to 2.2 N.m (20 in. lbs.).
3. Install the PTC ground strap (4). Tighten the retainer securely to ensure a good ground.
4. Connect the PTC wire harness connector (1) to the headlamp and dash wire harness lead (2).
5. Install the glove box bin. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
6. Reconnect the negative battery cable.

ENGINE

Ignition System - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as coil on plug. The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensors. The coil on plug ignition system utilizes an ignition coil for every cylinder. The ignition coils are mounted directly over the each spark plug.

OPERATION

OPERATION

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate square wave pulses that are inputs to the Powertrain Control Module (PCM). The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft AND camshaft position.

CAPACITOR, IGNITION

REMOVAL

3.6L

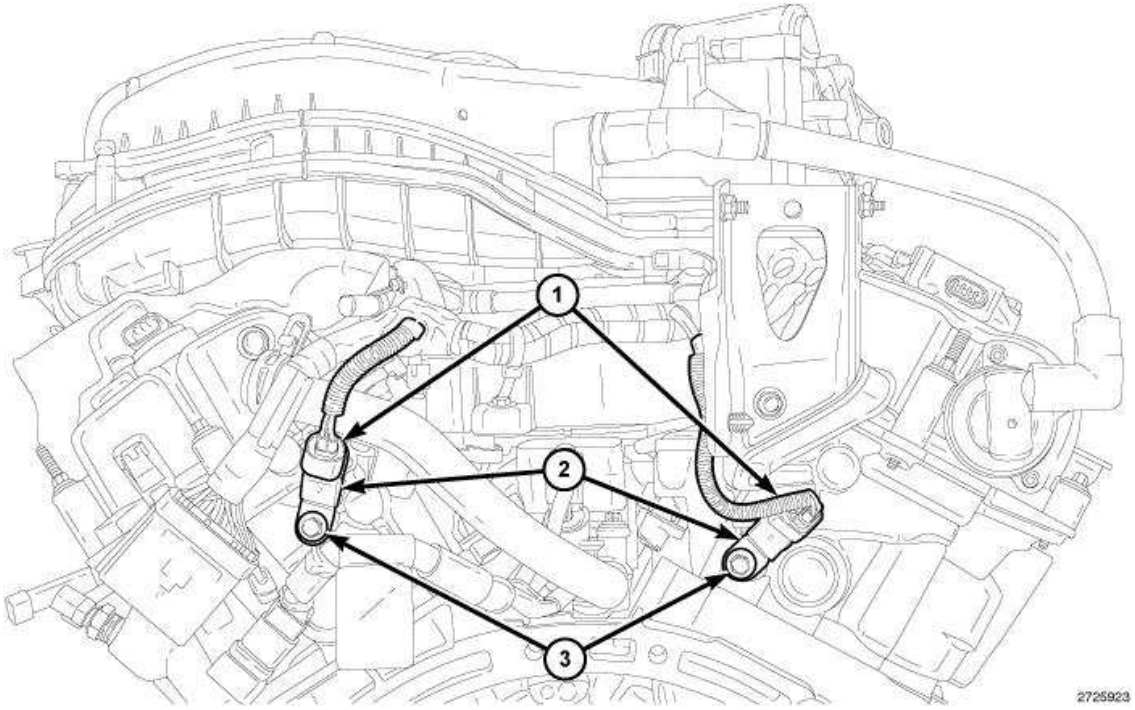

Fig. 3: Electrical Connector, Mounting Bolt & Ignition Capacitor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the electrical connector (1).
3. Remove the mounting bolt (3) and the ignition capacitor (2).

5.7L / 6.4L

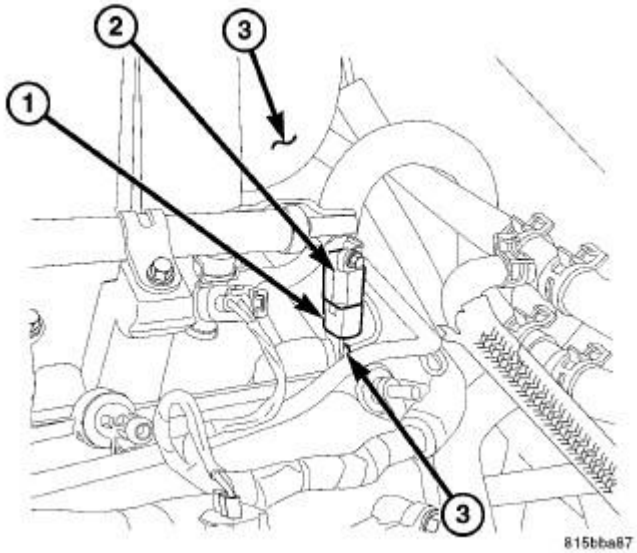

Fig. 4: Capacitor - 6.1L
Courtesy of CHRYSLER GROUP, LLC

The ignition capacitor (2) is attached at the left rear corner of the intake manifold (3).

1. Disconnect and isolate the negative battery cable.
2. Remove the electrical connector (1).
3. Remove the retaining bolt and remove capacitor (2).

INSTALLATION

3.6L

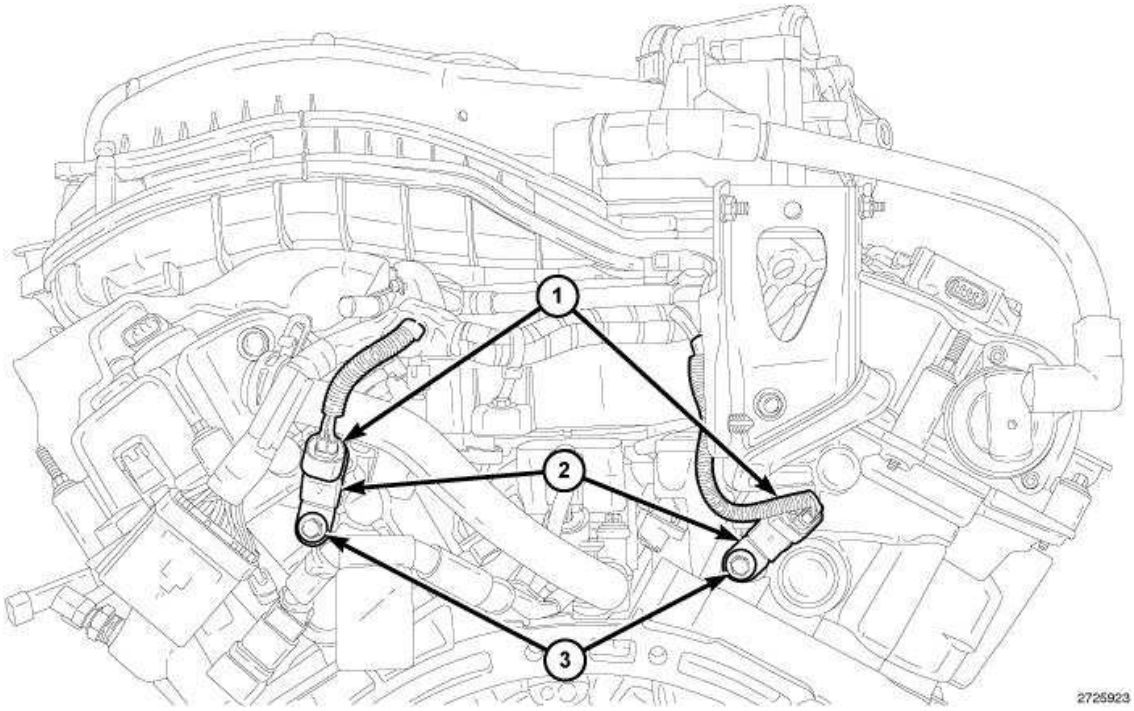

Fig. 5: Electrical Connector, Mounting Bolt & Ignition Capacitor
Courtesy of CHRYSLER GROUP, LLC

1. Install the ignition coil capacitor (2) and bolt (3). Tighten the bolt to 10 N.m (89 in. lbs.).
2. Connect the electrical connector (1).
3. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

5.7L / 6.4L

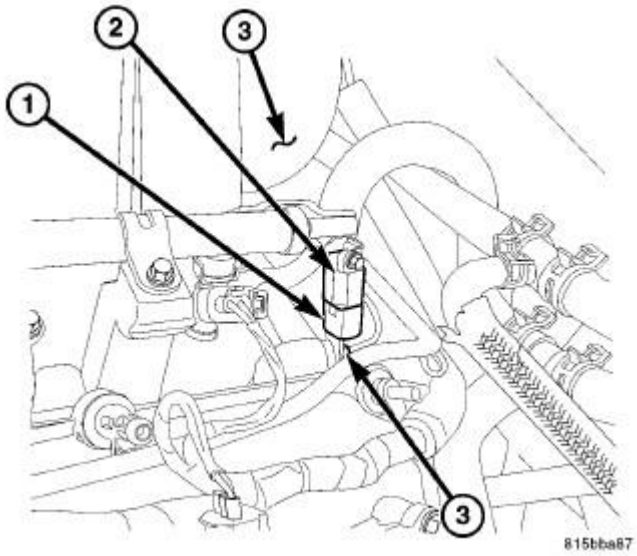

Fig. 6: Capacitor - 6.1L
Courtesy of CHRYSLER GROUP, LLC

1. Position the ignition capacitor (2) at the left rear corner of intake manifold (3).
2. Install the retaining bolt.
3. Install the electrical connector (1).
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

COIL, IGNITION

REMOVAL

3.6L

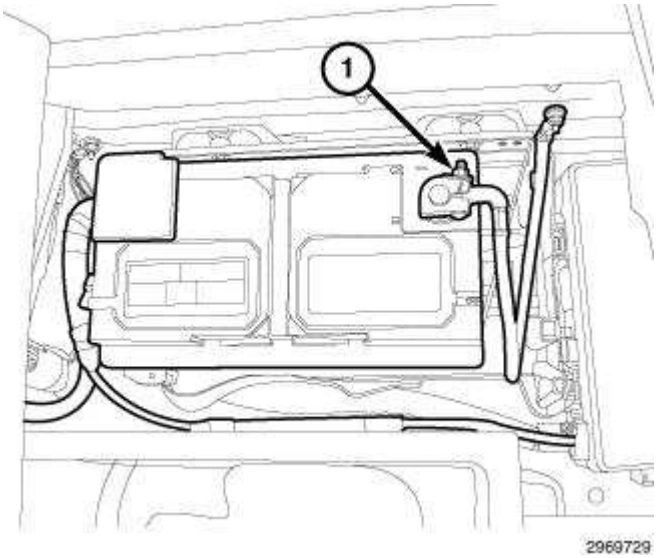

Fig. 7: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

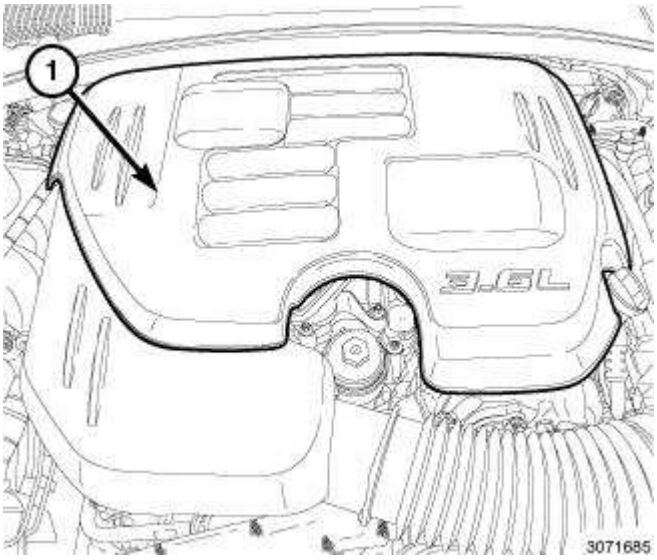

Fig. 8: Engine Cover

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

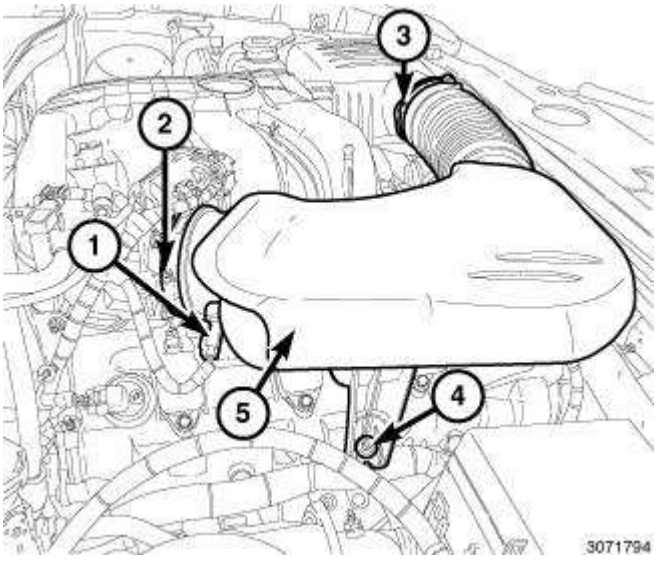

Fig. 9: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. If removing the ignition coils from cylinders 1, 3 or 5 on the right side of the engine, first remove the air inlet hose (5). Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER,**

REMOVAL or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .

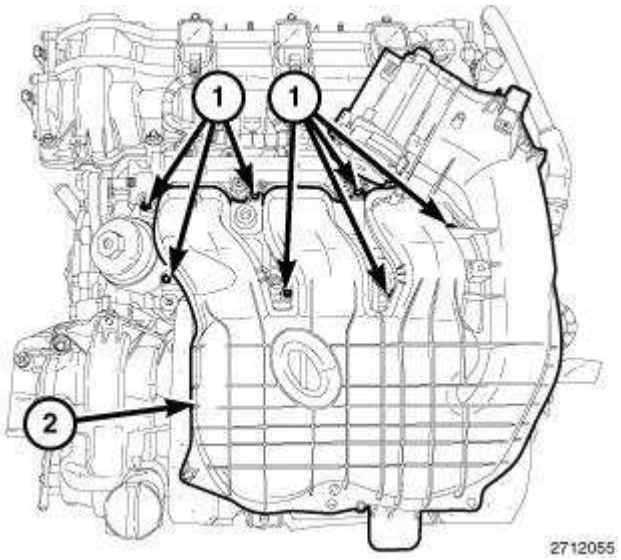

Fig. 10: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. If removing the ignition coils from cylinders 2, 4 or 6 on the left side of the engine, first remove the air inlet hose, upper intake manifold (2) and insulator. Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD, INTAKE, REMOVAL** .

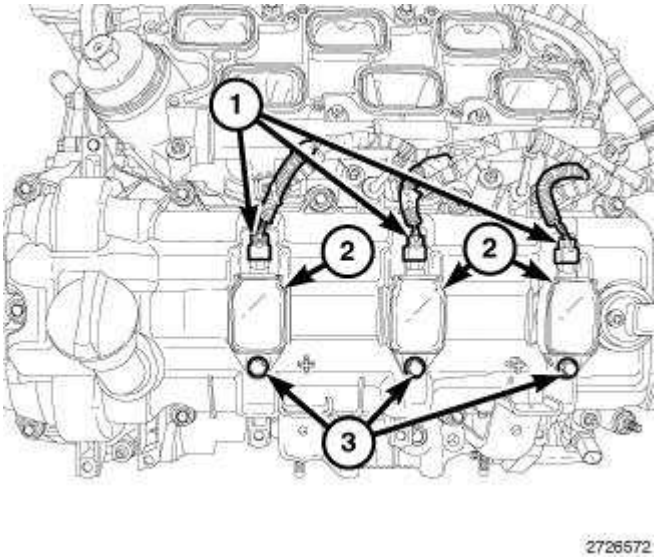

Fig. 11: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

5. Unlock and disconnect the electrical connector (1) from the ignition coil.
6. Remove the ignition coil retaining bolt (3).
7. Pull the ignition coil (2) from cylinder head cover opening with a slight twisting action.

5.7L / 6.4L

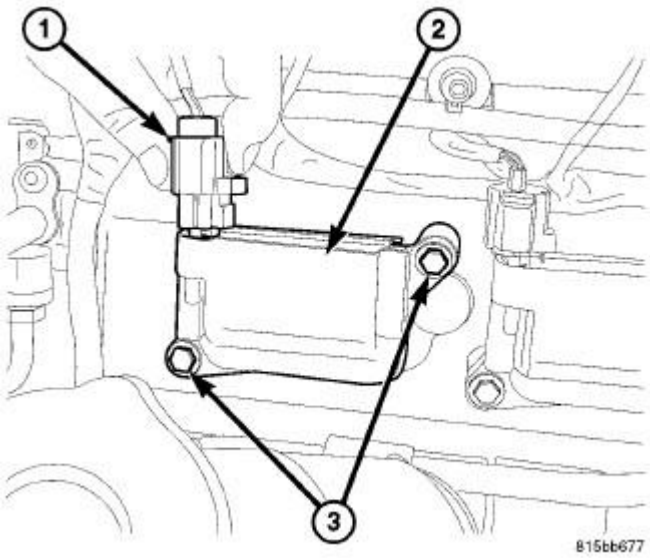

Fig. 12: Ignition Coil Mounting Bolts - 5.7L/6.1L
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the electrical connector (1) from the coil.
3. Remove the two coil retaining bolts (3).

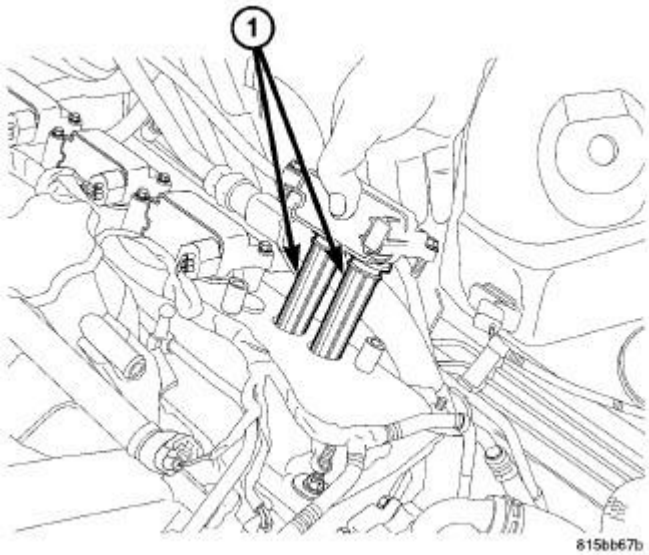

Fig. 13: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

4. Using a slight rocking motion, carefully lift coil (1) from the cylinder head opening.

INSTALLATION

3.6L

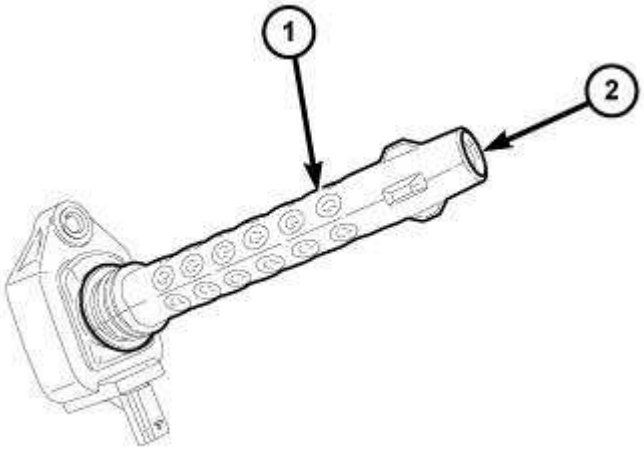

Fig. 14: Ignition Coil Rubber Boot & Opening Of The Boot
Courtesy of CHRYSLER GROUP, LLC

1. Using compressed air, blow out any dirt or contaminants from around the top of spark plug.
2. Check the condition of the ignition coil rubber boot (1). Inspect the opening of the boot (2) for any debris, tears or rips. Carefully remove any debris with a lint free cloth.

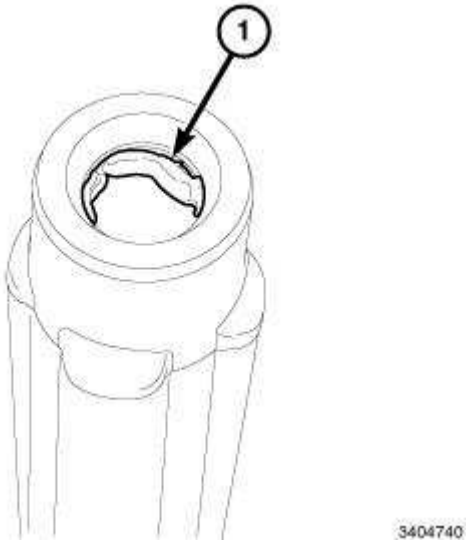

Fig. 15: Fluostar 2LF Lubricant
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not apply a silicone based grease such as Mopar® Dielectric Grease to the ignition coil rubber boot. The silicone based grease will absorb into the boot causing it to stick and tear.

3. Place a small, 360° bead of Fluostar 2LF lubricant (1) along the inside opening of the coil boot approximately 1 to 2 mm from the chamfer edge but not on the chamfered surface.

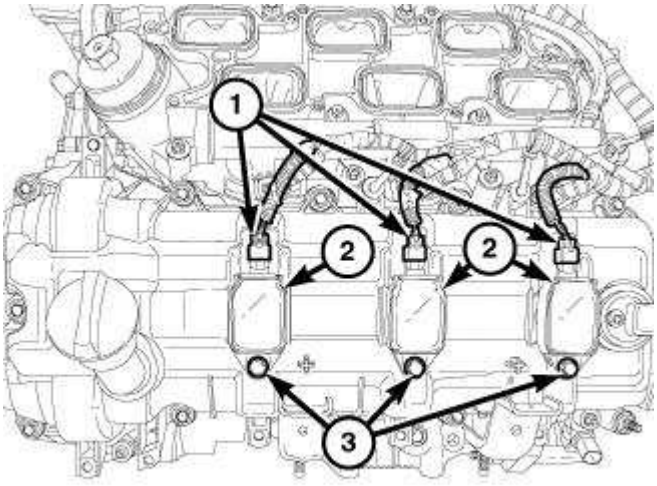

Fig. 16: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH ignition coils are shown in illustration, the RH ignition coils are similar.

4. Position the ignition coil (2) into the cylinder head cover opening. Using a twisting action, push the ignition coil onto the spark plug.
5. Install the ignition coil mounting bolt (3) and tighten to 8 N.m (71 in.lbs).
6. Connect and lock the electrical connector (1) to the ignition coil (2).

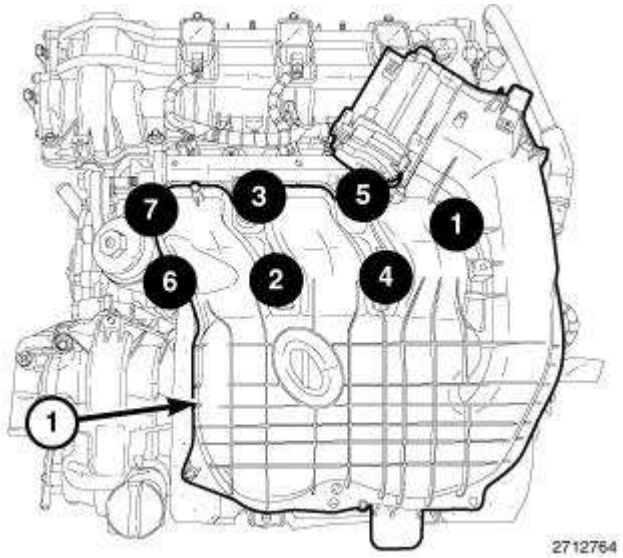

Fig. 17: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. If removed, install the insulator, upper intake manifold (1) and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION, 5.7L** or **MANIFOLD, INTAKE, INSTALLATION** .
8. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

5.7L / 6.4L

Courtesy of CHRYSLER GROUP, LLC

1. Before installing coil(s), apply dielectric grease to the inside of spark plug boots (1).

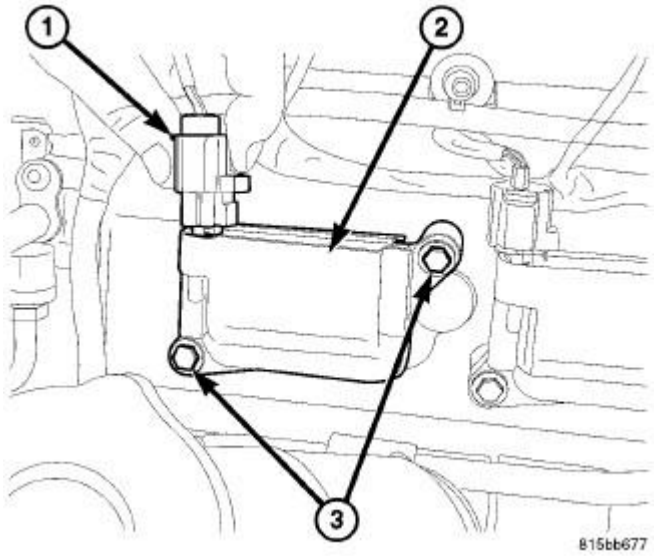

Fig. 19: Ignition Coil Mounting Bolts - 5.7L/6.1L
Courtesy of CHRYSLER GROUP, LLC

2. Position the ignition coil into cylinder head and push both spark plug boots onto each spark plug.
3. Install the two coil mounting bolts (3) and tighten to 12 N.m (106 in. lbs.).
4. Connect the electrical connector (1) to the coil and lock connector.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

PLUG, GLOW, 3.0L DIESEL

DESCRIPTION

DESCRIPTION

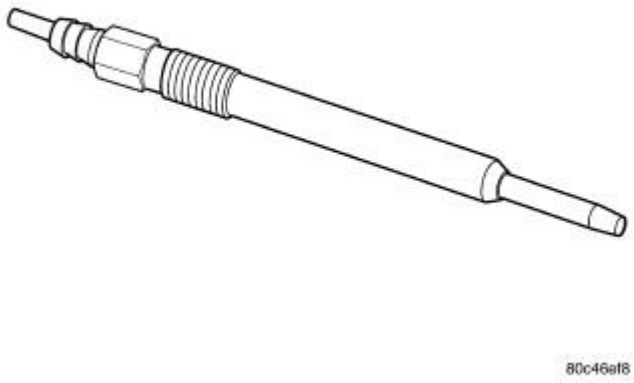

Fig. 20: Glow Plug

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The glow plugs operate on a 5-volt system. The glow plugs DO NOT tolerate any over voltage. Full battery voltage will destroy the glow plug immediately. DO NOT test the glow plugs with a 12V source as damage will occur to the glow plug.

CAUTION:

- **Never bend, bump or knock the fast metallic glow plugs.**
- **Fast metallic glow plugs must not be handled loose in a container. Store, handle, and transport them only in original boxes.**
- **If there is any doubt about the proper condition of a glow plug, do not reuse it.**
- **Do not clean the glow plugs with abrasive or aggressive media.**
- **Avoid dipping the glow plug into fluids.**
- **Read Diagnostic Trouble Codes (DTCs). If a glow plug problem is indicated, do not start the engine.**

CAUTION: Disregarding these instructions may cause severe engine damage.

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder. Each glow plug is threaded into the side of the cylinder head below the fuel rail.

OPERATION

OPERATION

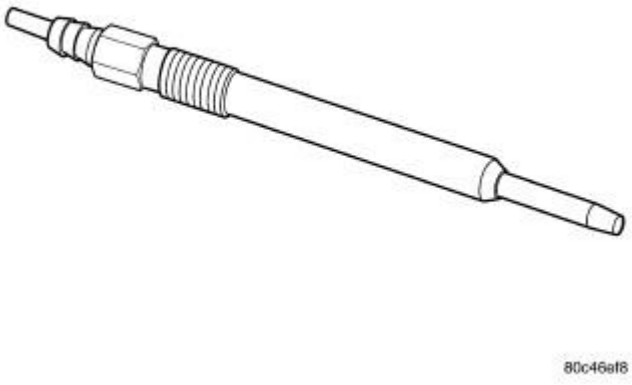

Fig. 21: Glow Plug
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The glow plugs operate on a 5-volt system. DO NOT test the glow plugs with a 12 V source as damage will occur to the glow plug(s).

The Powertrain Control Module (PCM) monitors various engine sensors. When the ignition key is turned to the ON position, the PCM sends a signal to the glow plug module (relay) to turn on, and cycle, the glow plugs for a predetermined amount of time, plus illuminate the glow plug light in the instrument panel. Once activated, the element inside of the core of the glow plug begins to glow. If there is a fault with the glow plug system, the PCM will store a fault code.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

CAUTION: DO NOT attempt to start the engine until the glow plug system tests correctly.

CAUTION: Do not apply 12 V battery voltage to the glow plug. Damage the glow plug, engine, or personal injury may result.

NOTE: To ensure a good contact of the measurement connections the contacts have to be free of oil, dirt or corrosion.

1. Measure the electrical resistance of each glow plug while it is still installed in the cylinder head. Resistance should be between 0.2 E 5? between the electrical connector point on the glow plug and the cylinder head. The ground contact on the DVOM must be as close as possible to the point where the glow plug contacts the cylinder head to avoid erratic resistance measurements.
2. If the resistance is out of tolerance, remove the glow plug from the cylinder head and check the resistance again.
3. Dismantled state: measure between connection side (connector/thread) and housing.
4. Engine mounted state: measure between connection side (connector/thread) and engine mass.
5. Resistance value:
   - Resistance > 5 ?: open circuit failure.
   - Resistance < 200 m?: short circuit failure.
   - 200 m? < Resistance < 5 ?: glow plug OK.
6. Use the actuator test function of the scan tool to test the glow plug module and glow plug lamp. The glow plug module's on-board diagnostic tests will automatically check the electrical condition of the entire glow plug system.
7. After the scan tool glow plug actuator test function is complete, if MIL is OFF and no glow plug DTCs are present, testing is complete and the engine can be started.
8. If MIL is still ON, check the harness connectors of glow plugs, repair any loose or damaged connections, and run the glow plug actuator test again.
9. If MIL is still ON, check the electrical connectors of glow plugs and power up the glow plugs

again.

SENSOR, CAMSHAFT POSITION

DESCRIPTION

DESCRIPTION

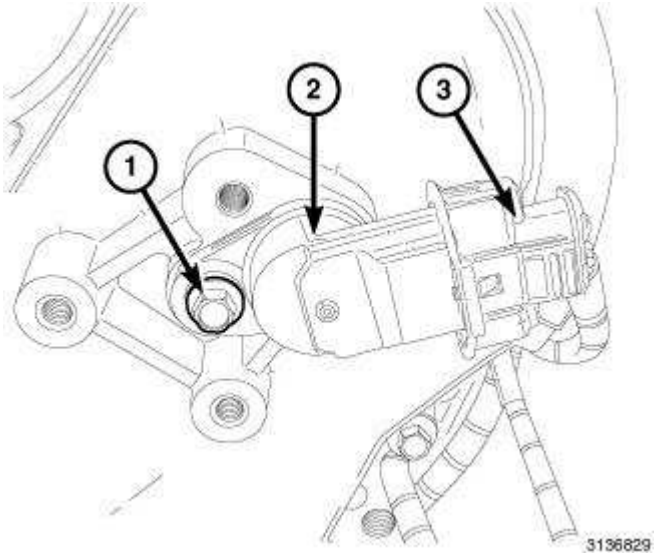

Fig. 28: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensor is mounted on the left upper timing cover. The hall effect sensor supplies a signal to the Powertrain Control Module (PCM). The PCM uses the signals sent by the CMP and the Crankshaft Position (CKP) sensor to determine injection timing.

3.6L

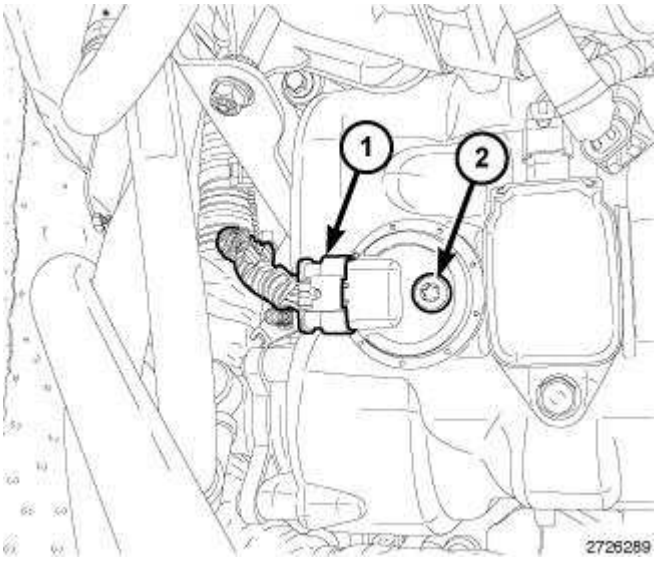

Fig. 29: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

The two Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers. The sensors are bolted to the cylinder head and utilize a radial lip seal where they protrude through the covers. The attaching bolt (2) has an O-ring seal and is captured in the sensor.

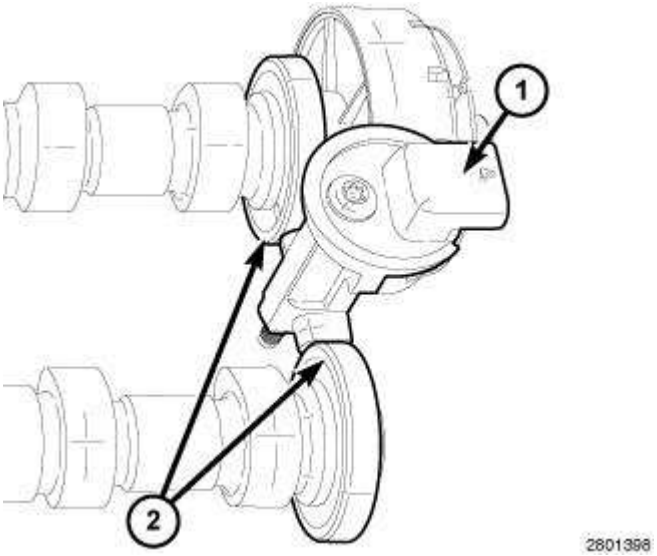

Fig. 30: Camshaft Position Sensors (CMP) Sensors & Encoded Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

The Camshaft Position Sensors (CMP) sensors (1) are dual read, single element hall effect sensors mounted between the magnetic encoded timing wheels (2). The magnetic timing wheels are used because of their small diameter allowing for a compact cylinder head design.

5.7L/6.4L

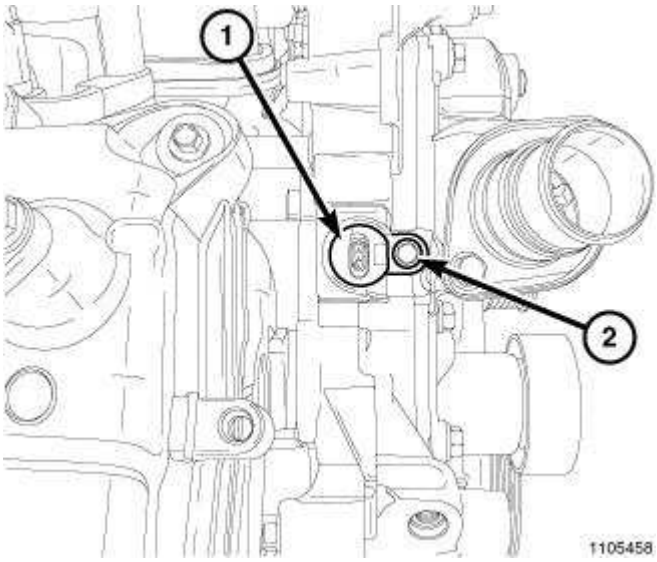

Fig. 31: Camshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position Sensor (CMP) (1) is located in the timing cover near the thermostat housing.

OPERATION

OPERATION

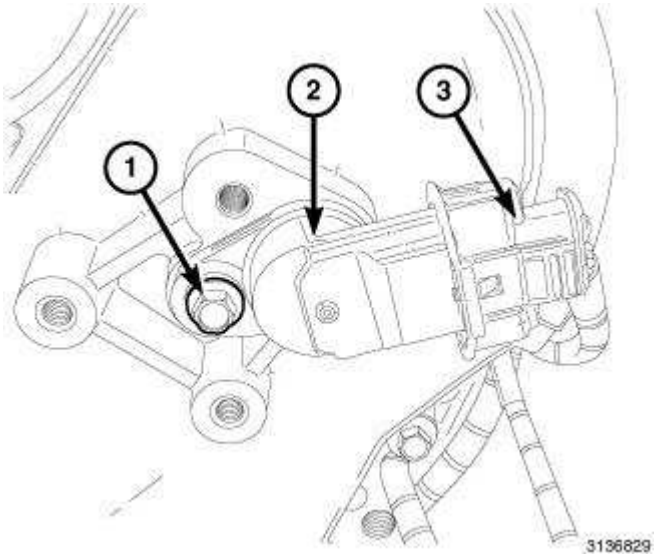

Fig. 32: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The signal circuit of the camshaft sensor has a voltage of approximately 5V. The camshaft has a reluctor wheel bolted to the front of left exhaust camshaft, the camshaft signal is approximately 0V. This 0V to 5V signal is used by the Powertrain Control Module (PCM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start.

3.6L

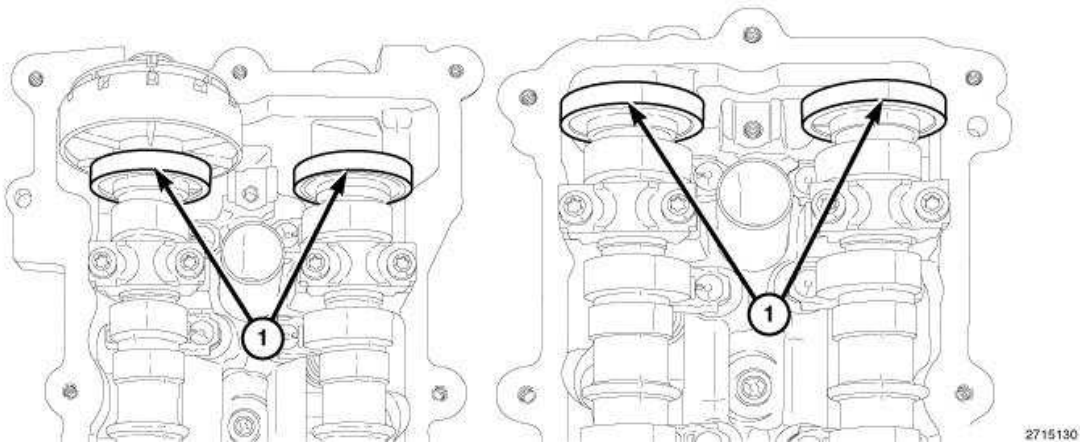

Fig. 33: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

The 3.6 liter engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have two pressed on magnetic timing wheels (1) that are magnetically encoded.

The Camshaft Position Sensors (CMP) are mounted between the timing wheels (1).

5.7L/6.4L

The CMP sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders. The sensor generates electrical pulses. These pulses (signals) are sent to the Powertrain Control Module (PCM). The PCM will then determine crankshaft position from both the camshaft position sensor and crankshaft position sensor.

The tonewheel is located at the front of the camshaft. As the tonewheel rotates, notches pass through the sync signal generator.

When the cam gear is rotating, the sensor will detect the notches. Input voltage from the sensor to the PCM will then switch from a low (approximately 0.3 volts) to a high (approximately 5 volts). When the sensor detects a notch has passed, the input voltage switches back low to approximately 0.3 volts.

REMOVAL

REMOVAL

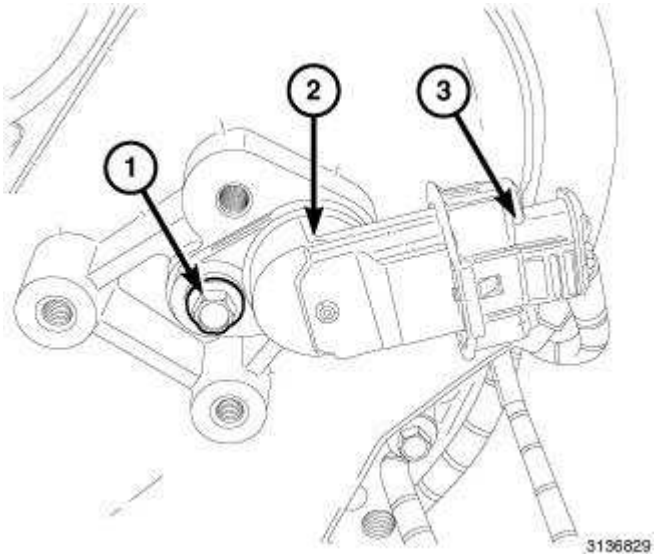

Fig. 34: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Disconnect Camshaft Position (CMP) sensor wire harness connector (3).
3. Remove bolt (1) and the CMP sensor (2).

3.6L

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

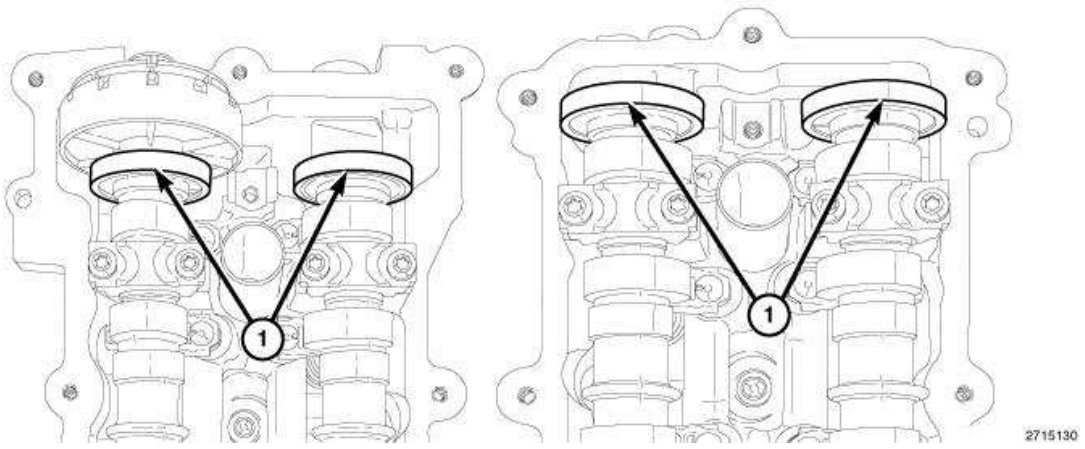

Fig. 35: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

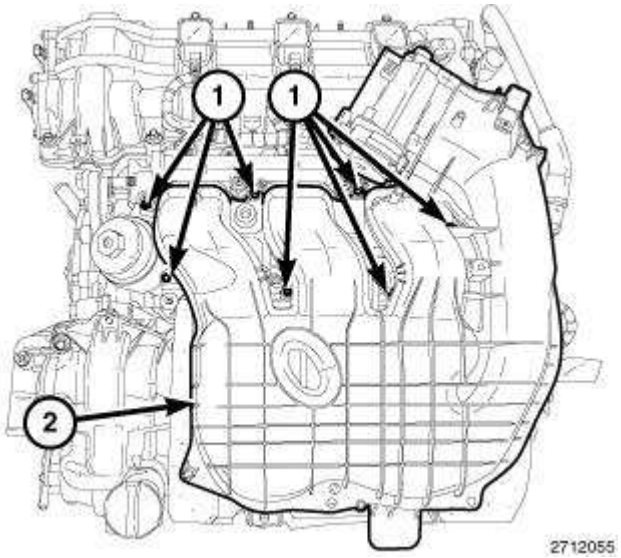

Fig. 36: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers and are

bolted to the cylinder head.

1. Disconnect and isolate the negative battery cable.
2. If removing the left CMP sensor, first remove the air inlet hose and upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL** or **MANIFOLD, INTAKE, REMOVAL, 5.7L** or **MANIFOLD, INTAKE, REMOVAL** .

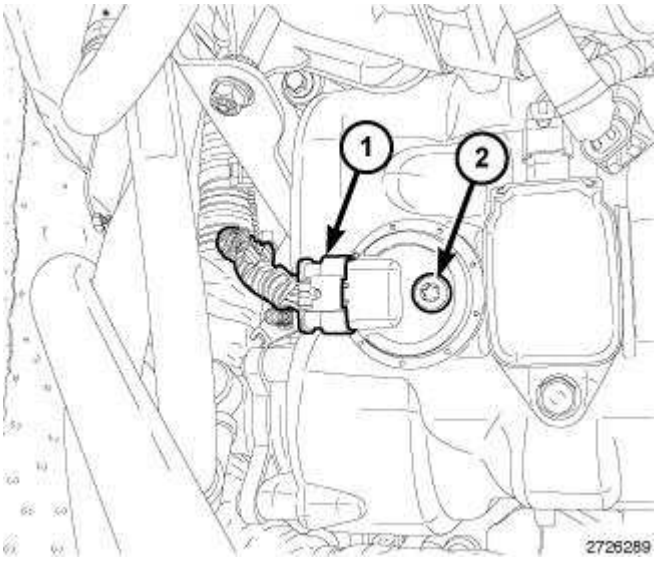

Fig. 37: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right CMP sensor is shown in illustration, the left CMP sensor is similar. If removing both right and left CMP sensors, mark the sensors so they can be installed in their original locations.

3. Disconnect the electrical connector (1) from the CMP sensor.
4. Loosen the sensor mounting bolt (2).

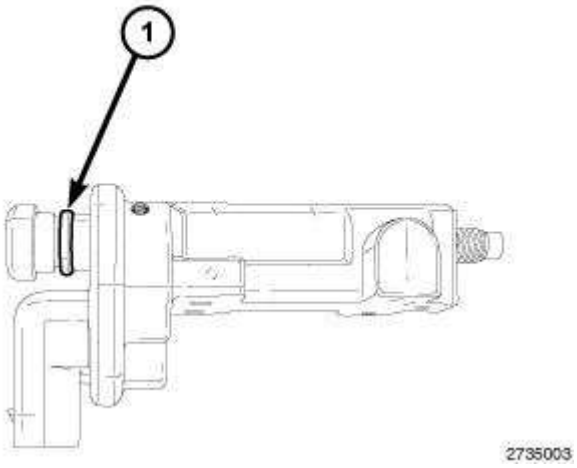

Fig. 38: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

5. Pull the sensor and mounting bolt from the cylinder head cover.
6. The O-ring seal (1) can be reused if not damaged.

5.7L / 6.4L

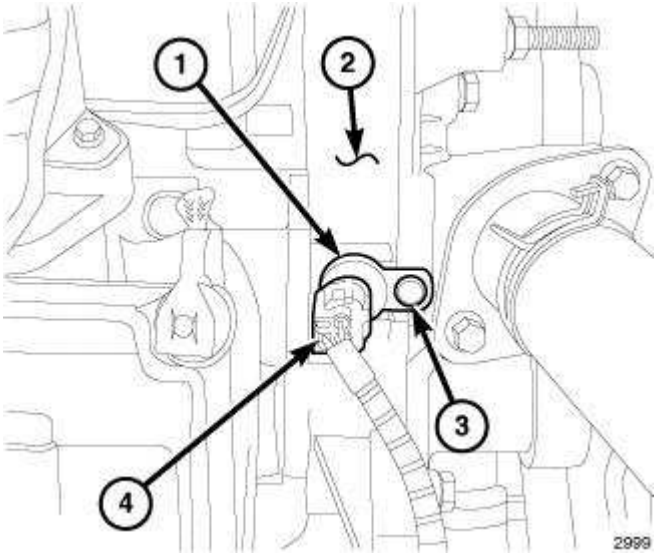

Fig. 39: Camshaft Position Sensor-5.7L
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the electrical connector (4) at the Camshaft Position (CMP) sensor (1).
3. Remove the CMP sensor mounting bolt (3).
4. Using a slight rotating motion, carefully remove the CMP sensor from the timing cover (2).

5. Check the condition of the sensor O-ring.

INSTALLATION

INSTALLATION

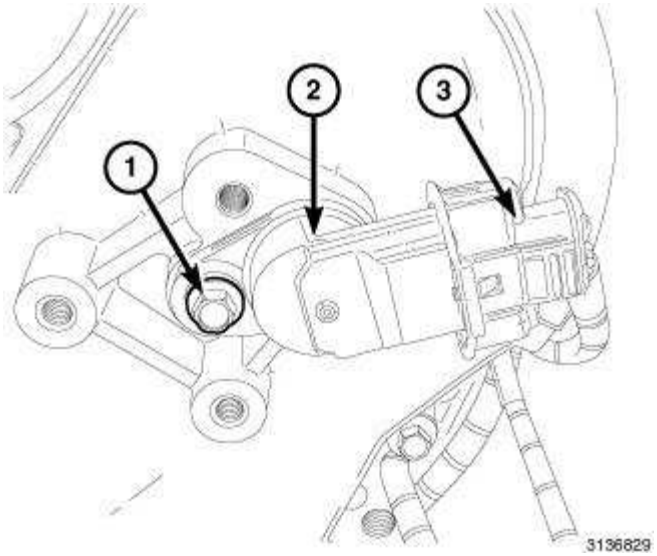

Fig. 40: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install Camshaft Position (CMP) sensor (2). Tighten bolt (1) to 8 N.m (71 in. lbs.).
2. Connect the CMP wire harness connector (3).
3. Connect the negative battery cable.

3.6L

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

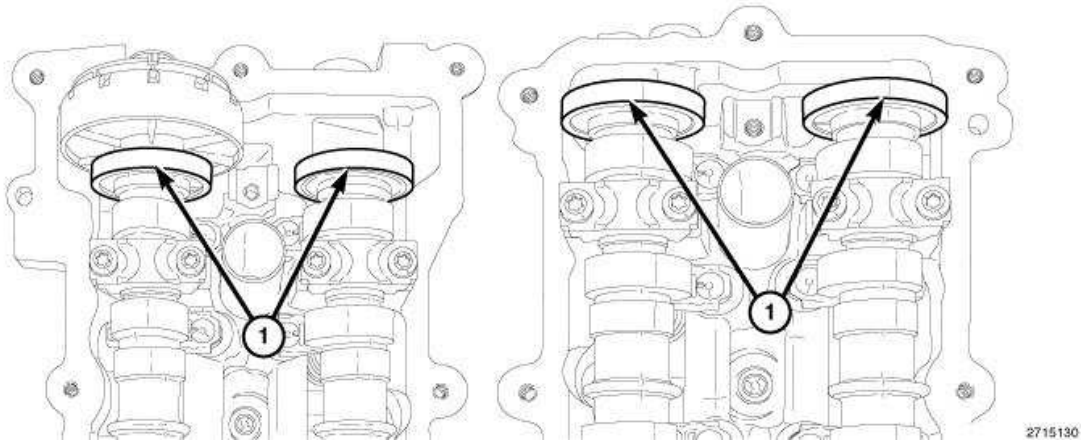

Fig. 41: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

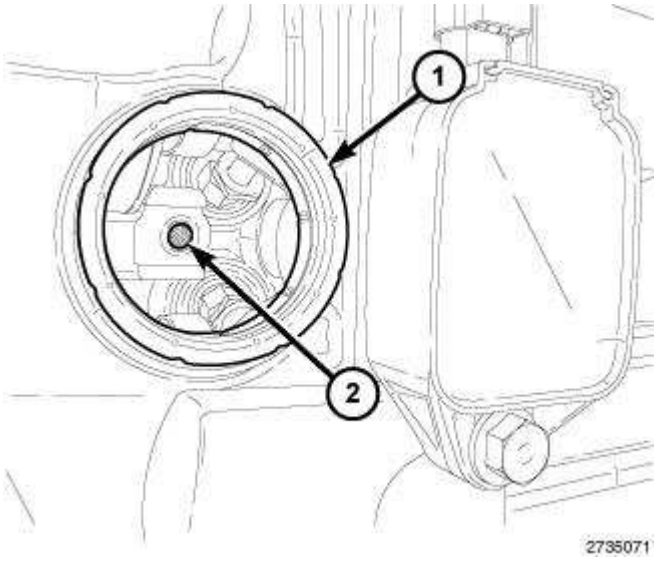

Fig. 42: CMP Sensor Seal & Mounting Bolt Hole
Courtesy of CHRYSLER GROUP, LLC

1. Clean out the camshaft position (CMP) sensor mounting bolt hole (2) in cylinder head.
2. The CMP sensor seal (1) can be reused if not damaged.

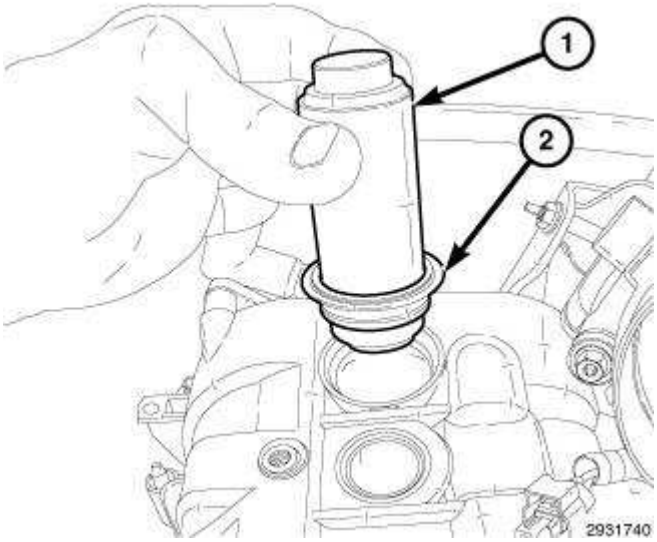

Fig. 43: Installing CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

3. If required, install a new CMP sensor seal (2) in the cylinder head cover:
   - Lubricate the CMP sensor seal inner and outer diameters with clean engine oil.
   - Place the CMP sensor seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/ Spark Plug Tube Seal) (1).
   - Push the seal into the cylinder head cover until the base of the seal is seated.
   - Remove the tool.

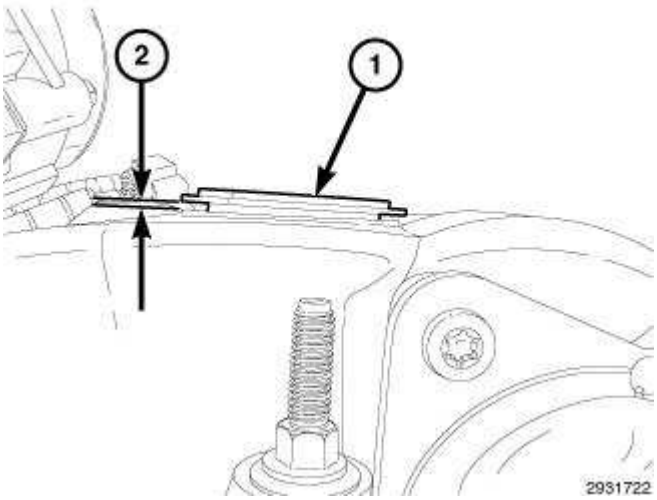

Fig. 44: Gap & CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: A properly installed CMP sensor seal (1) will have a 1.5 - 2.0 mm (0.06 - 0.08 in.) gap (2) between the cylinder head cover and the seal upper flange.

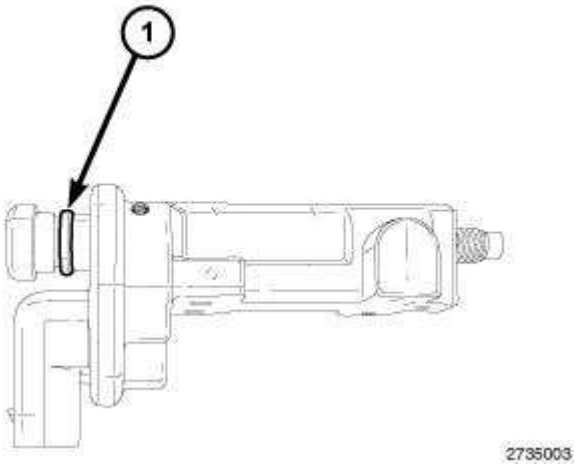

Fig. 45: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

4. The sensor mounting bolt O-ring (1) can be reused if not damaged.
5. Apply a small amount of engine oil to the sensor mounting bolt O-ring (1).

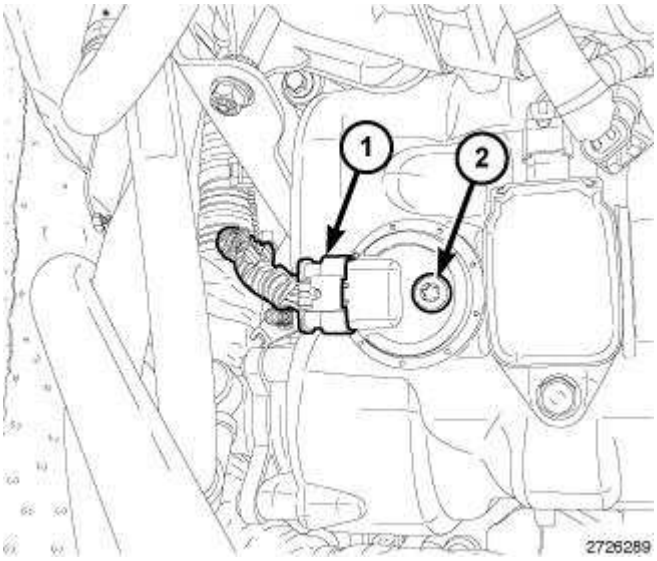

Fig. 46: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right CMP sensor is shown in illustration, the left CMP sensor is similar. If both right and left CMP sensors where removed, install them into their original locations.

6. Install the CMP sensor to the cylinder head. Tighten the mounting bolt (2) to 9 N.m (80 in. lbs.).
7. Connect the electrical connector (1) to the sensor.

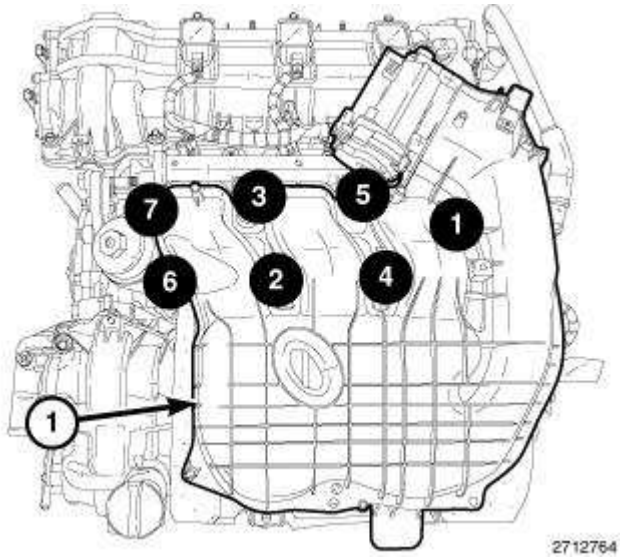

Fig. 47: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. If required, install the upper intake manifold (1) and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION** or **MANIFOLD, INTAKE, INSTALLATION, 5.7L** or **MANIFOLD, INTAKE, INSTALLATION** .
9. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

5.7L / 6.4L

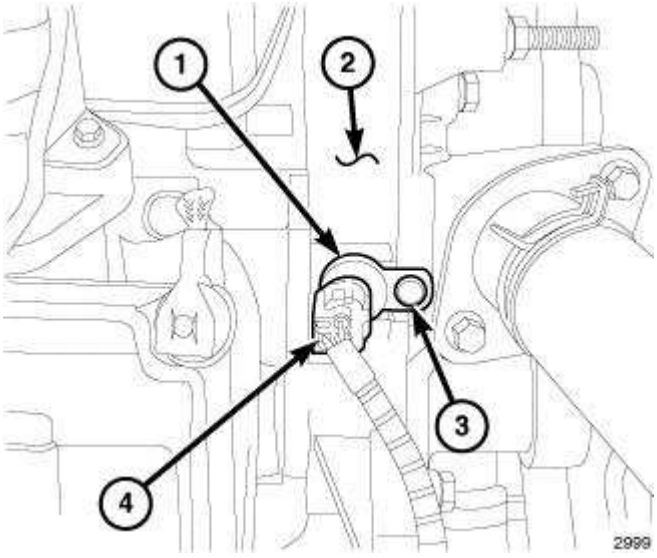

Fig. 48: Camshaft Position Sensor-5.7L

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Install the Camshaft Position (CMP) sensor using a slight rotating motion (side to side). Make sure the CMP sensor is fully seated. Do not drive the CMP sensor into the bore with the mounting screw. This may cause the CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

1. Using a slight rotating motion, carefully install the CMP sensor (1) into the timing cover (2).

CAUTION: Before tightening the sensor mounting bolt, be sure the sensor is completely flush to the timing cover. If the sensor is not flush, damage to the sensor mounting tang may result.

2. Install the CMP mounting bolt (3) and tighten to 12 N.m (9 ft. lbs.).
3. Connect the electrical connector (4) to the CMP sensor.
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SENSOR, KNOCK

DESCRIPTION

3.6L

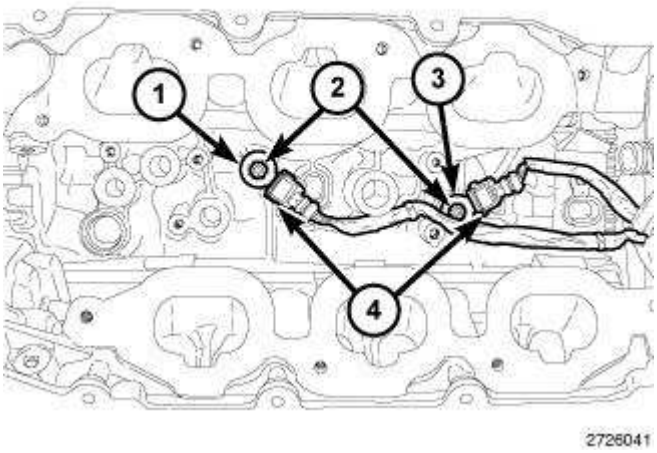

Fig. 49: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward knock sensor (1) is known to the Powertrain Control Module (PCM) as Knock Sensor 1. The rear knock sensor (3) is known to the PCM as Knock Sensor 2.

The 3.6L engine uses two knock sensors (1, 3) and are bolted to the cylinder block under the intake manifold.

5.7L / 6.4L

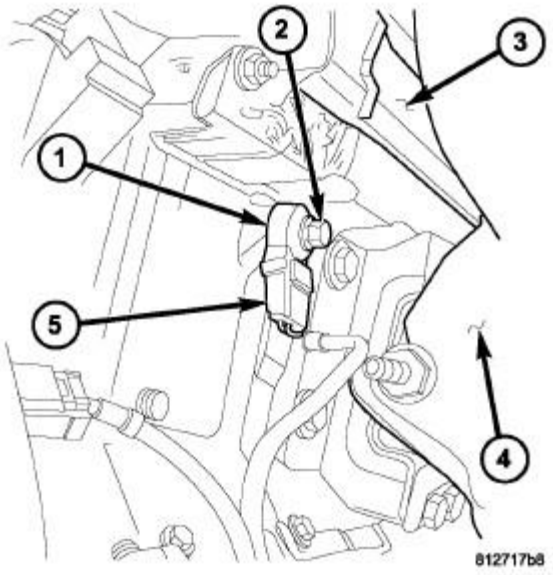

Fig. 50: Locating Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

The 5.7L and 6.4L engines use two knock sensors (1) and are bolted to each side of the cylinder block (outside) under each exhaust manifold (3).

OPERATION

OPERATION

When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric crystal which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as RPM is above the minimum RPM) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.

REMOVAL

3.6L

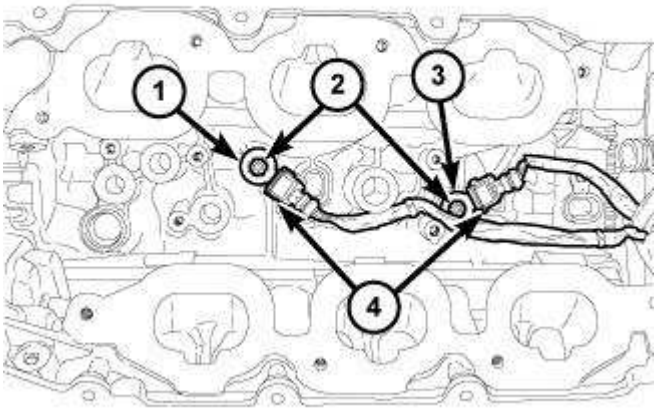

Fig. 51: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

4. Remove the air cleaner housing assembly, upper and lower intake manifolds and the oil filter housing. Refer to **HOUSING, OIL FILTER, REMOVAL** or **HOUSING, OIL FILTER, REMOVAL** .
5. Remove the knock sensor electrical connector (4).

NOTE: **There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.**

6. Remove the retaining bolt (2) and knock sensor 1 (1) or knock sensor 2 (3).

5.7L / 6.4L

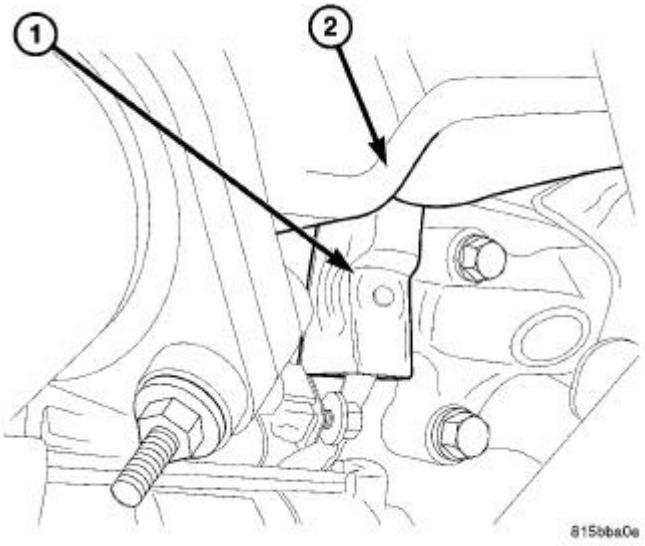

Fig. 52: Knock Sensor Heat Shield - 6.1L
Courtesy of CHRYSLER GROUP, LLC

Two knock sensors are used. Each sensor is bolted to the outside of cylinder block below the exhaust manifold.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the heat shield (1) from knock sensor (shield snaps onto sensor).

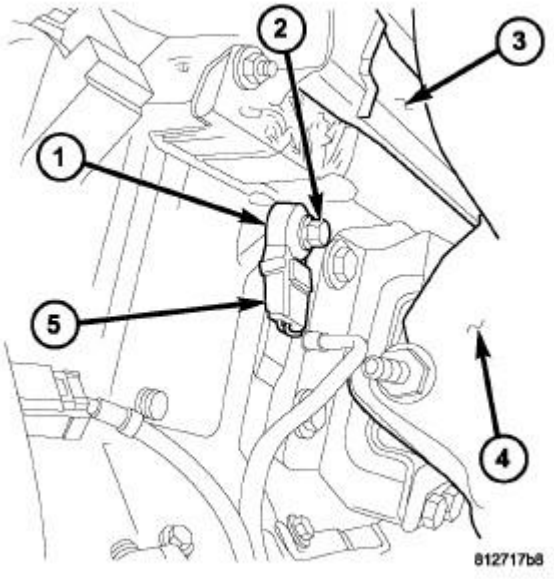

Fig. 53: Locating Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the knock sensor electrical connector (5).

NOTE: Note the foam strip on the knock sensor retaining bolt threads. This foam is only used to retain the bolts to the knock sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

5. Remove the knock sensor retaining bolt (2).
6. Remove the knock sensor from the cylinder block.

INSTALLATION

3.6L

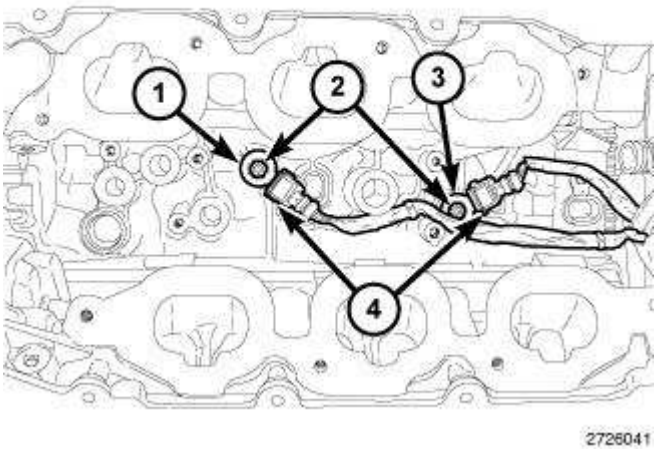

Fig. 54: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Thoroughly clean the knock sensor mounting holes.

   NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque specification for the knock sensor bolt is less than the typical 8 mm bolt.

   NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install knock sensor 1 (1) or knock sensor 2 (3) and retaining bolt (2). Tighten the retaining bolt to 22 N.m (16 ft. lbs.).
3. Connect the electrical connector (4).
4. Install the oil filter housing, upper and lower intake manifolds and air cleaner housing assembly. Refer to **HOUSING, OIL FILTER, INSTALLATION** or **HOUSING, OIL FILTER, INSTALLATION** .
5. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **LUBRICATION** or **LUBRICATION** or **LUBRICATION** or **LUBRICATION** .
6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
7. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
8. Operate the engine until it reaches normal operating temperature. Check cooling system for

correct fluid level. Refer to **STANDARD PROCEDURE** .

5.7L / 6.4L

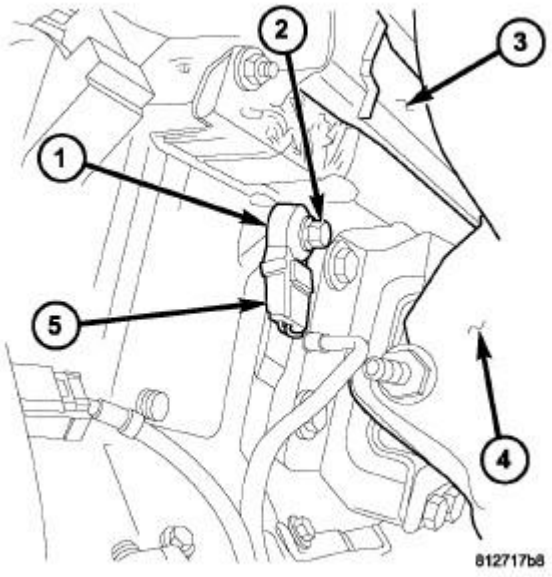

Fig. 55: Locating Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Over or under tightening the knock sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control.

1. Position the knock sensor (1) onto cylinder block.

NOTE: The foam strip used on bolt threads is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install the retaining bolt and tighten (2) to 20 N.m (15 ft. lbs.).
3. Connect the electrical connector (5) to the knock sensor.

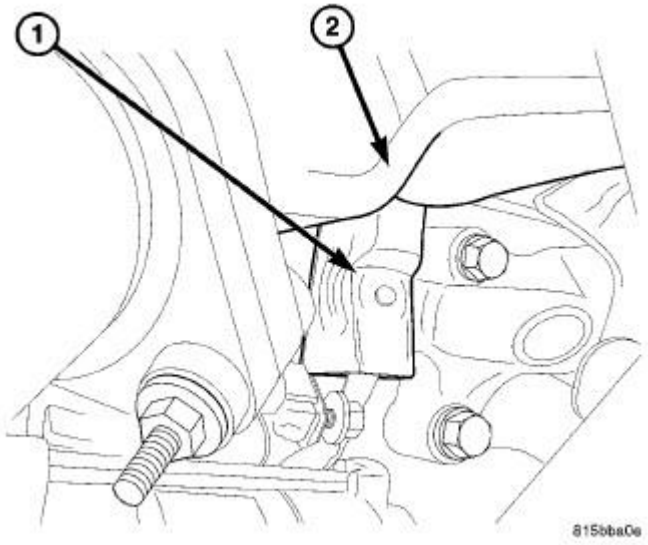

Fig. 56: Knock Sensor Heat Shield - 6.1L
Courtesy of CHRYSLER GROUP, LLC

4. Snap the heat shield (1) onto the knock sensor.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SOLENOID, VARIABLE VALVE TIMING

DESCRIPTION

DESCRIPTION

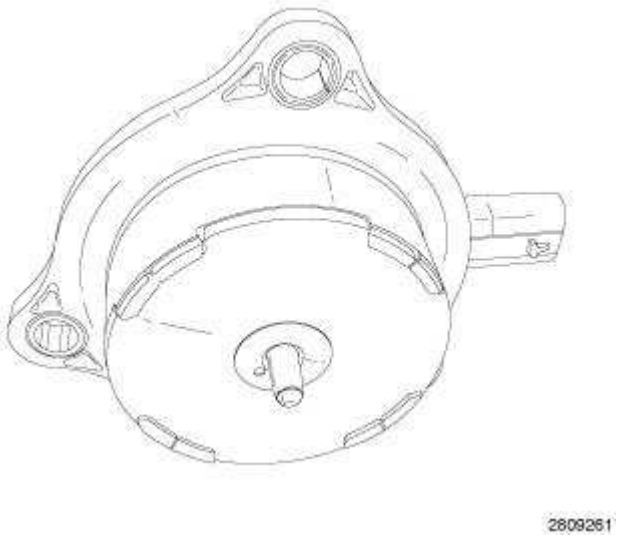

Fig. 57: Variable Valve Timing Solenoid
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four VVT solenoids are located on the front of the cylinder head covers. The pintle should move freely within the solenoid body. Do not attempt to disassemble the solenoids, they are not serviceable. The solenoids are identical but should be installed in the same location as removed.

OPERATION

OPERATION

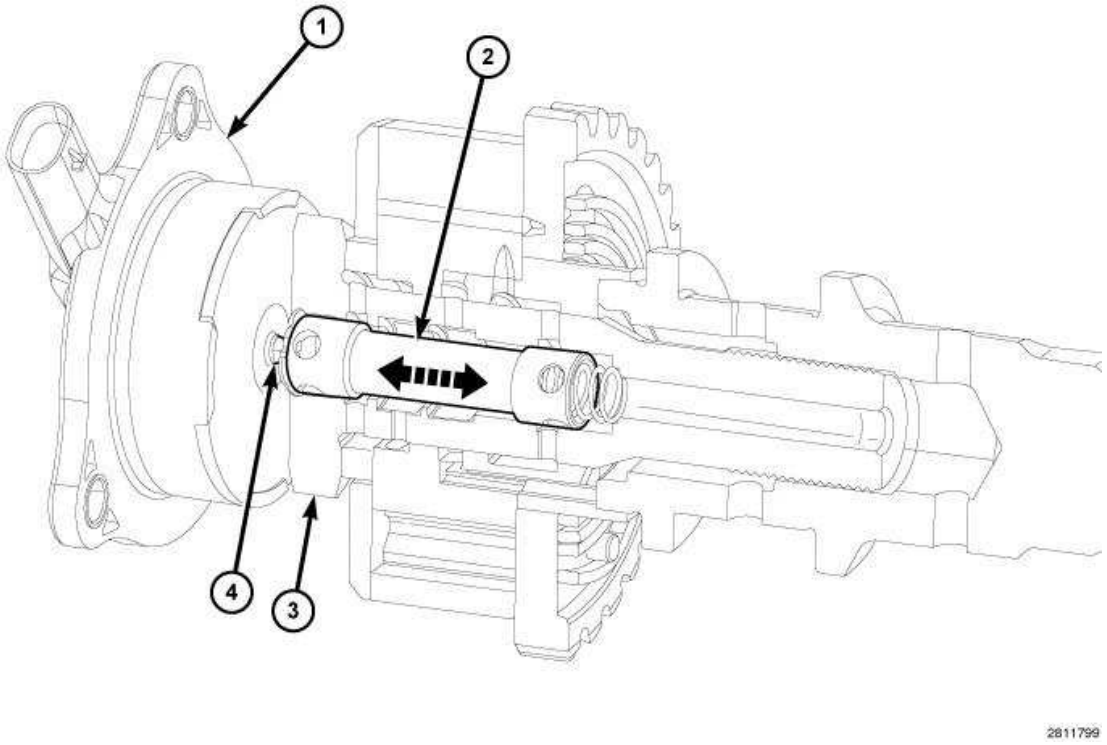

Fig. 58: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, OPERATION** .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

REMOVAL

3. Install the variable valve timing solenoid mounting bolts (3) and tighten to 4 N.m (35 in. lbs.).
4. Connect the electrical connector (1) to the variable valve timing solenoid.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SPARK PLUG

DESCRIPTION

DESCRIPTION

CAUTION: Cleaning platinum plugs may damage the platinum center electrode or the thin platinum pad.

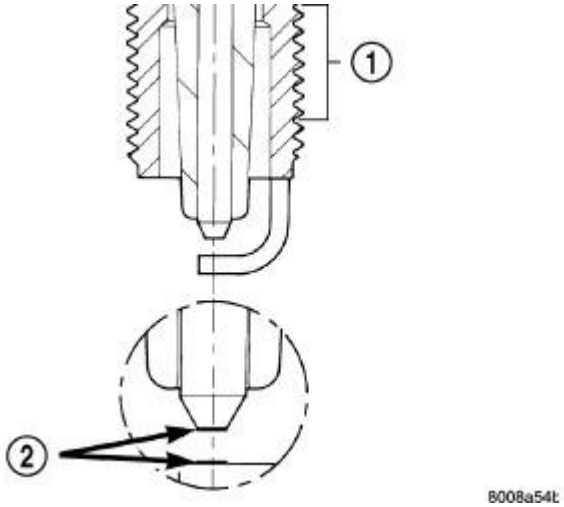

Fig. 75: Platinum Pads
Courtesy of CHRYSLER GROUP, LLC

1 - APPLY ANTI-SEIZE COMPOUND HERE ONLY
2 - PLATINUM SPARK SURFACE

The spark plugs are platinum resistor design. They have resistance values of 3, 500 to 20, 000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications. Refer to **SPECIFICATIONS**.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

When the spark plugs use a single or double platinum tips, they have a recommended service life of 100, 000 miles for normal driving conditions per schedule A in this information. The spark plugs have a recommended service life of 75, 000 miles for severe driving conditions per schedule B in this information. A thin platinum pad (2) is welded to both or just the center electrode end(s). Extreme care must be used to prevent spark plug cross threading, incorrect gapping and ceramic insulator damage during plug removal and installation.

Mopar® Nickel-Graphite Anti-Seize compound is applied to the thread area (1) to prevent damage to the spark plug during removal and installation.

REMOVAL

3.6L

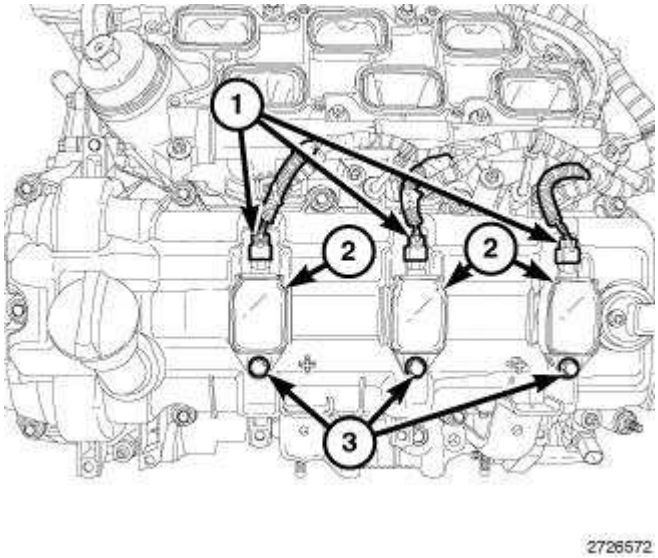

Fig. 76: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

1. Remove the ignition coil (2). Refer to **COIL, IGNITION, REMOVAL**.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

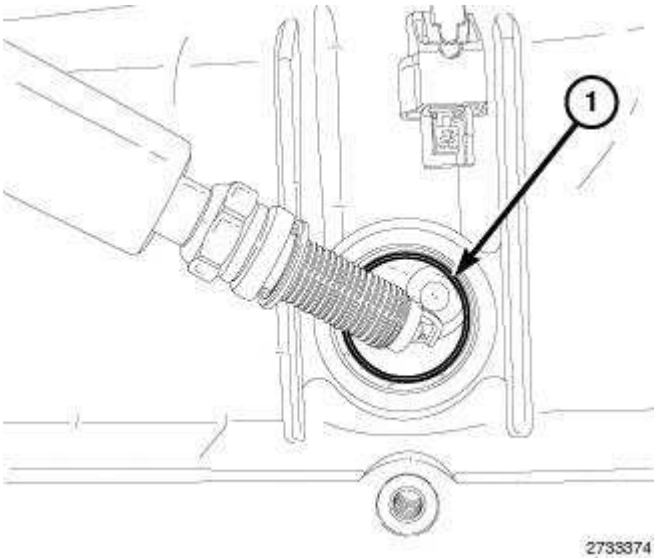

Fig. 77: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

2. Prior to removing the spark plug, spray compressed air into the cylinder head opening. This will

help prevent foreign material from entering combustion chamber.

3. Remove the spark plug from the cylinder head using a quality thin wall socket with a rubber or foam insert.
4. Inspect the spark plug condition.

5.7L / 6.4L

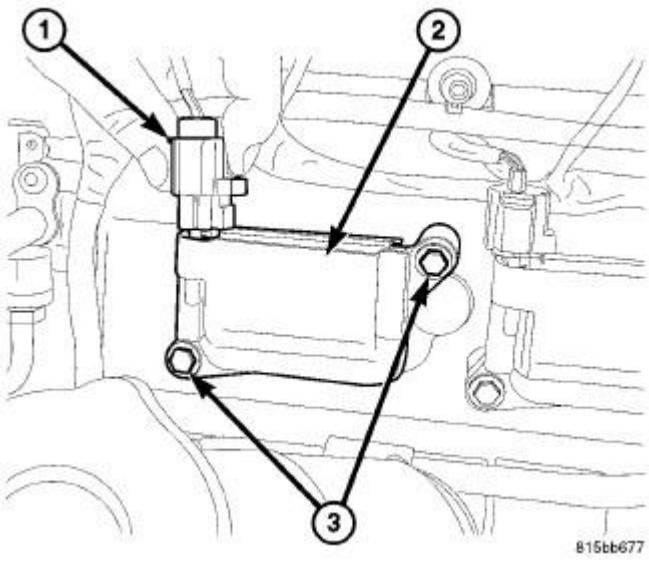

Fig. 78: Ignition Coil Mounting Bolts - 5.7L/6.1L
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the coil electrical connector (1).
3. Remove the coil mounting bolts (3).

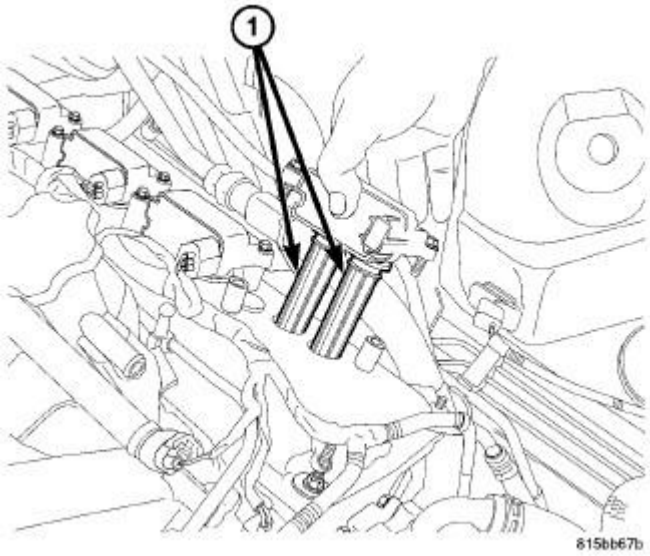

Fig. 79: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

4. Carefully lift coil from the cylinder head opening with a slight rocking motion.

CAUTION: Prior to removing the spark plugs, use compressed air to remove any accumulated dirt and debris. If dirt and debris enter the engine, this may cause internal engine damage.

5. Remove the spark plug(s) from the cylinder head using a quality deep well socket with a rubber or foam insert.

INSTALLATION

3.6L

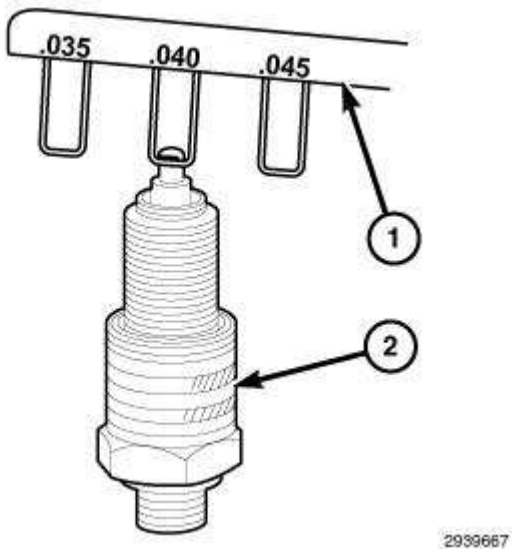

Fig. 80: Gap Gauging Tool
Courtesy of CHRYSLER GROUP, LLC

1. Check and adjust the spark plug gap with a gap gauging tool (1). Refer to **SPECIFICATIONS**.

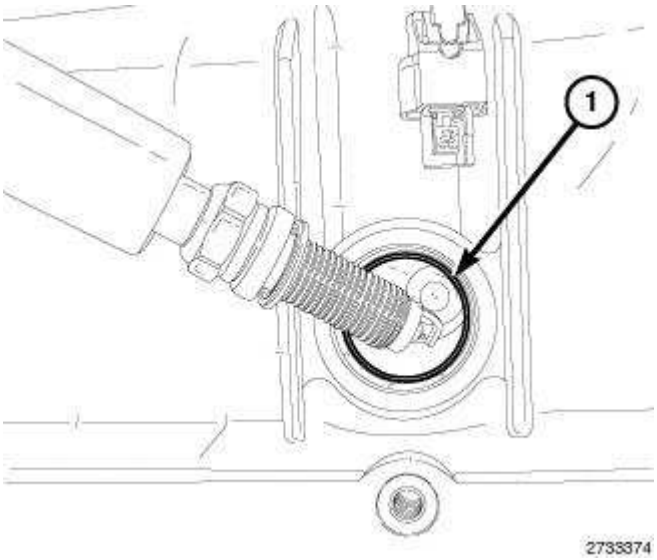

Fig. 81: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

3. Tighten the spark plugs to 17.5 N.m (13 ft. lbs.).

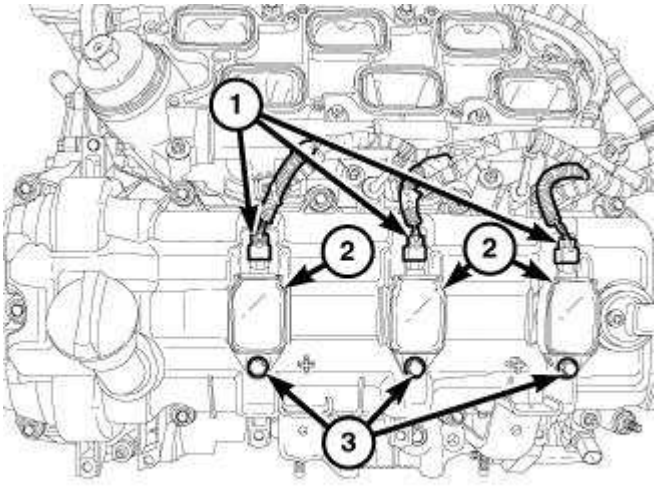

Fig. 82: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

4. Install the ignition coil (2). Refer to **COIL, IGNITION, INSTALLATION**.

5.7L / 6.4L

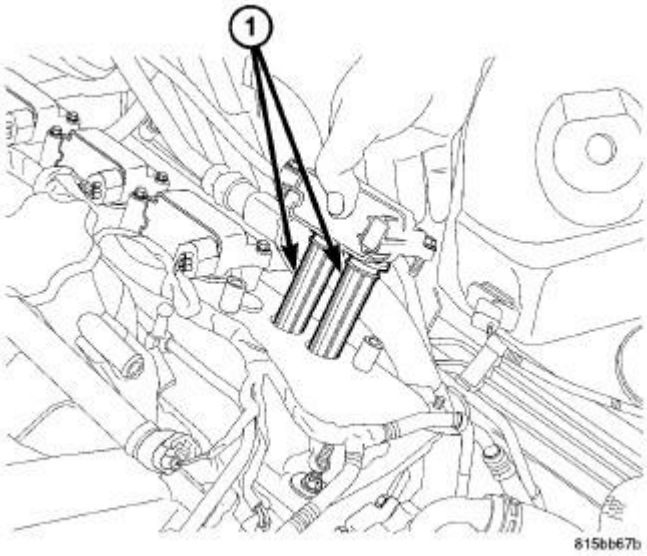

Fig. 83: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

1. To avoid cross threading, start the spark plug(s) into the cylinder head by hand.
2. Tighten the spark plugs as follows:
   - 5.7L - 25 - 30 N.m (18.5 - 22 ft. lbs.)
   - 6.4L - 10 - 20 N.m (7.5 - 15 ft. lbs.)
3. Apply dielectric grease to the inside of spark plug boots (1).
4. Position the ignition coil into the cylinder head and push both spark plug boots onto each spark plug.

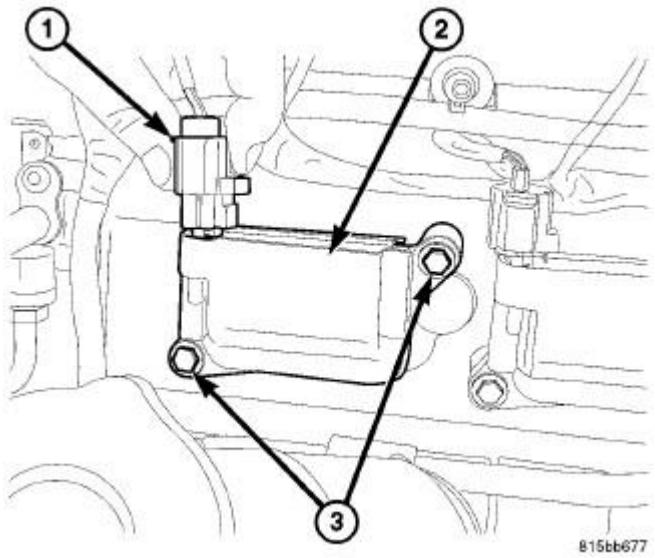

Fig. 84: Ignition Coil Mounting Bolts - 5.7L/6.1L
Courtesy of CHRYSLER GROUP, LLC

5. Install the ignition coil retaining bolts (3) and tighten to 12 N.m (9 ft. lbs.).
6. Connect the ignition coil electrical connector (1).
7. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SWITCH, IGNITION

DESCRIPTION

DESCRIPTION

For more information on the ignition system. Refer to **RECEIVER, KEYLESS IGNITION NODE, DESCRIPTION** or **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

ACCESSORIES AND EQUIPMENT

Instrument Cluster - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

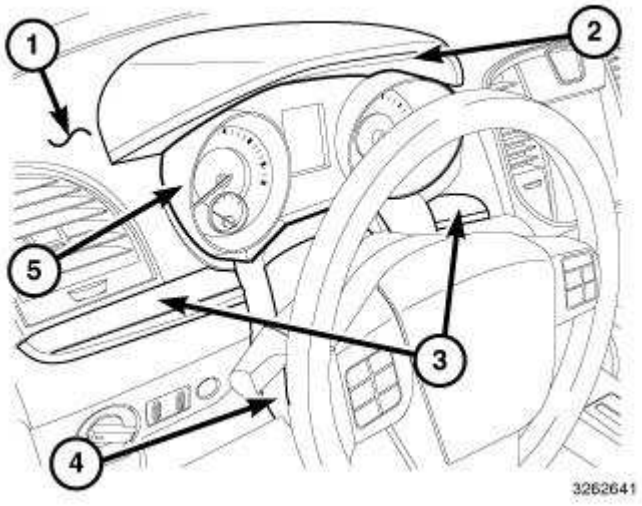

Fig. 1: Instrument Cluster (IC)
Courtesy of CHRYSLER GROUP, LLC

The instrument cluster (IC) (5) (also known as the Instrument Panel Cluster/IPC) for this vehicle is located directly in front of the driver, above the steering column opening. The mounts and the electrical connections, are concealed within the instrument panel behind various trim panels and the cluster itself. The IC contains various indicators, analog gauges, an electronic display unit and an integrated circuit board. The electronic display unit displays odometer information and several indicators, some of which are model dependent.

The optional Electronic Vehicle Information Center (EVIC) makes use of the IC electronic display unit. The EVIC feature provides display options of the outside ambient temperature, compass headings, average fuel economy, elapsed time, numerous textual warning messages, reminder indicators and certain diagnostic information.

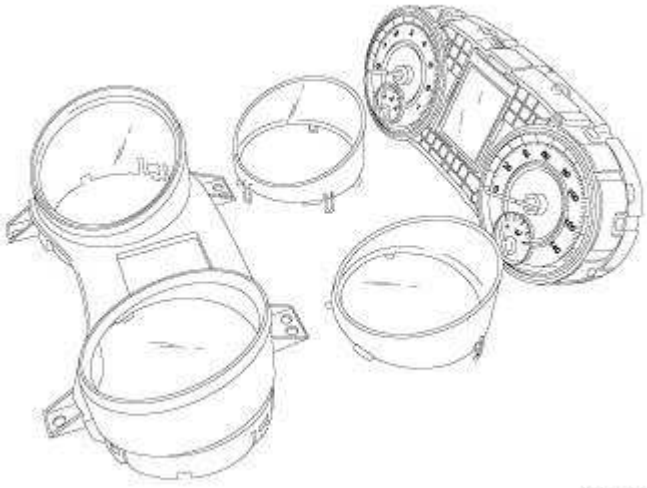

Fig. 2: Gauges, Indicators, Electronic Display Unit, Electronic Circuit Board And Housing
Courtesy of CHRYSLER GROUP, LLC

The IC has several serviced components. The gauges, indicators, electronic display unit, electronic circuit board and housing are only serviced as an assembly and cannot be adjusted or repaired. If a gauge, an LED unit, the electronic display unit, the electronic circuit board, the circuit board hardware, the cluster overlay or the cluster housing is damaged or ineffective, the entire IC unit must be replaced. The cluster lens, hood and mask are available for separate service replacement.

ELECTRONIC DISPLAY UNIT

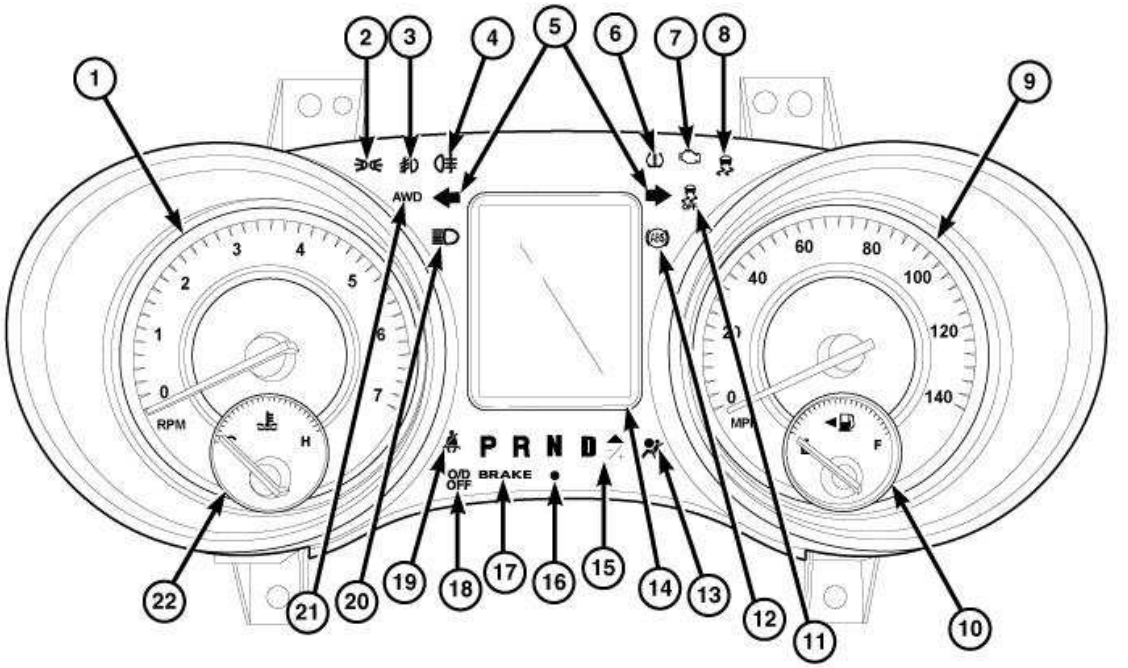

Fig. 3: Identifying Electronic Vehicle Information Center (EVIC) Components
Courtesy of CHRYSLER GROUP, LLC

The IC includes an electronic display unit (14). The electronic display unit is soldered to the electronic circuit board, and is visible through a window with a smoked lens between the tachometer on the left and speedometer on the right. The dark lens prevents it from being clearly visible when it is not illuminated.

The odometer information is displayed within the electronic display unit. The odometer information is stored in the IC memory. This information can be increased when the proper inputs are provided, but the information cannot be decreased. The odometer can display values up to 999, 999 kilometers (999, 999 miles). The odometer latches at these values, and will not roll over to zero.

The odometer display does not show leading zeroes, does not have a decimal point and will not show values less than a full unit (kilometer or mile). The unit of measure (**km** or **miles**) for the odometer display is shown in the electronic display in the same color and at the same lighting level as the odometer values. The unit of measure for the odometer can be selected using the customer programmable features function of the Integrated Center Stack (ICS) screen module. The odometer has a RENTAL CAR mode, which will illuminate the odometer information in the display whenever either front door is opened while the ignition switch status is OFF or ACCESSORY.

During daylight hours (exterior lamps are OFF) the electronic display unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the electronic display unit lighting level is adjusted with the other cluster general illumination lamps using the panel lamps dimmer function of the interior lighting dimmer control. However, a PARADE mode position of the dimmer control allows the display to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

Dual trip odometer (Trip A and Trip B) capability is standard equipment on this vehicle. Both trip odometers appear within the electronic display unit. The trip odometer information is also stored in the IC memory. Each trip odometer can display values up to 16099.9 kilometers (9999.9 miles). Each trip odometer will roll over to zero independently when it accumulates these values. The trip odometer minimum value is **0.0** (miles or kilometers) and does have a decimal point to show values of tenths of a full unit (miles or kilometers).

The unit of measure (**km** or **miles**) for the trip odometer display is shown next to the **Trip A** or **Trip B** text in the display in the same color and at the same lighting level as the trip odometer values. The unit of measure for the trip odometer can also be selected using the customer programmable features function of the ICS screen module.

VEHICLE SYSTEMS SUPPORT

AUDIBLE WARNINGS

The IC electronic circuit board is equipped with a piezoelectric speaker and programming that allows it to provide various audible alerts to the vehicle operator. These alerts include single chime tones and continuous slow or fast tones. An IC can also produce audible clicks that are used to emulate the sound of a conventional turn signal or hazard warning flasher.

FUEL LEVEL DATA

The IC receives a message from the Body Control Module (BCM) over the Control Area Network (CAN) data bus. The IC uses this information to calculate the proper fuel gauge needle position and to control low fuel indicator operation.

VEHICLE WARNING MESSAGES

When the appropriate conditions exist, messages such as **DOOR** (door ajar), **LoCOOL** (low engine coolant), **LoWASH** (low washer fluid), **ESC OFF** (Electronic Stability Control/ESC in partial off mode), **NoBUS** (data bus communication fault), or **CHANGE OIL** displays in the electronic display unit.

CHANGE OIL MESSAGE

This vehicle is equipped with an engine oil change indicator system. The **CHANGE OIL** message flashes in place of the instrument cluster odometer for approximately 12 seconds after a single chime has sounded to indicate the next scheduled oil change interval has been attained. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message continues to display each time the ignition switch status transitions to ON. To turn off the message temporarily, press and release the trip odometer push button on the instrument cluster. To reset the oil change indicator system, (after performing the scheduled maintenance) perform the following procedure:

1. Set the ignition switch to the ON status. (Do not start the engine).
2. Fully press the accelerator pedal slowly three times within 10 seconds.
3. Set the ignition switch to the LOCK status.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure

ELECTRONIC VEHICLE INFORMATION CENTER DISPLAY

The optional Electronic Vehicle Information Center (EVIC) system conveniently allows the driver to select a variety of useful information by pressing the EVIC push button controls, which are located within the EVIC switch pod located on the front of the left horizontal steering wheel spoke. The EVIC display menu options include:

- **Compass display**
- **Outside temperature display**
- **System status display**
- **Trip computer functions**
- **Vehicle information warning message displays**
- **Economy mode (ECO) display**

OPERATION

OPERATION

The microprocessor-based IC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. The Vehicle Theft Alarm (VTA) lamp input is hard wired, the remaining are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

The IC may also produce audible warnings for other electronic modules in the vehicle based upon electronic tone request messages received over the CAN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The IC circuitry operates on battery current received through a non-switched fused B(+) circuit and on battery current received through a fused ignition switch output (run-start) circuit. This arrangement allows the IC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The circuitry is grounded through a ground circuit of the instrument panel wire harness.

The IC also has a self-diagnostic test capability that tests each of the CAN bus message-controlled functions of the cluster. This test illuminates the appropriate indicators, positions the gauge needles at several predetermined calibration points across the gauge faces, and illuminates all segments of the Electronic Vehicle Information Center (EVIC). The EVIC will display the hardware/software version, and the CAN Vehicle Maintenance Monitor (VMM) used in the IC. Refer to **DIAGNOSIS AND TESTING**.

LIQUID CRYSTAL DISPLAY

The LCD display unit is an integrated part, and soldered to the IC electronic circuit board. With the ignition switch in the Off or Accessory positions, the LCD display is activated when the driver door is opened (Rental Car mode), and deactivated when the driver door is closed. Otherwise, the display units are active when the ignition switch is in the ON or START positions, and inactive when the ignition switch is in the OFF or ACCESSORY positions.

The IC LCD display unit has several display capabilities. The LCD unit displays odometer, trip odometer, engine hours, gear selector indication (PRNDL) for models with an automatic transmission, several warning or reminder indications, and various diagnostics information when certain fault conditions exist. Steering wheel mounted switches are used to control some of the display modes of the LCD. for more information. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION** .

CLUSTER ILLUMINATION

Instrument cluster illumination is supplied by several LED lamps controlled by the IC, and are illuminated at 100% intensity anytime the ignition switch is in the ON or RUN position. The illumination intensity of these lamps can be adjusted only when the vehicle park lamps are on by rotating the dimming control ring (down to dim, up to brighten). The IC monitors a CAN bus input from

the Body Control Module (BCM) to determine illumination intensity.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If all of the Instrument Cluster (IC) gauges, and indicators are ineffective, be certain to check the IC fused B(+) fuse and the IC fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard-wired gauge or indicator is ineffective, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) data bus message-controlled gauge or indicator is ineffective, perform the self-diagnostic Test.

CAUTION: Instrument clusters used in this vehicle automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus and through certain hard-wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN and the certified odometer values embedded into cluster memory, but will otherwise be automatically configured for compatibility

with the features and optional equipment in the vehicle in which they are initially installed.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the cruise indicator, the electronic throttle control indicator, the tow/haul indicator, the service four-wheel drive indicator, the four-wheel drive low indicator, the four-wheel drive lock indicator, the transmission over-temp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

SELF TEST

The diagnostic self test will put the IC into its self-diagnostic mode. In this mode the IC can perform a diagnostic test that will confirm that the circuitry, the gauges, and the indicators are capable of operating as designed. During the test the IC circuitry will position each of the gauge needles at various calibration points, illuminate each of the segments in the Liquid Crystal Display (LCD) unit, and turn all of the indicators ON and OFF again.

Successful completion of the self test will confirm that the IC is operational. However, there may still be a problem with the Controller Area Network (CAN) data bus or Local Interface Network (LIN) data bus, the Engine Control Module (ECM), the Body Control Module (BCM), the Controller Antilock Brake (CAB), the All-Wheel Drive Control Module (AWDCM), the Occupant Restraint Controller (ORC), the compass module, the Keyless Ignition Node (KIN), or the inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the OFF position.
2. Depress the Electronic Vehicle Information Center (EVIC) menu **Down Scrolling** switch button.
3. While still holding the scroll switch button depressed, turn the ignition switch to the ON position, but do not start the engine.
4. Release the switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the LCD unit, and perform a bulb check of each operational LED indicator. The LCD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a LCD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The self test is now complete. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The self test will be aborted if the ignition switch is turned to the OFF position, or if an electronic **vehicle speed** message indicating that the vehicle is moving is received over the CAN data bus during the test.

7. Go back to repeat the test, if necessary. Refer to 1.

STANDARD PROCEDURE

STANDARD PROCEDURE - ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or "BeltAlert®" feature that is enabled when the vehicle is shipped from the factory. This BeltAlert® feature provides extended, and modified visual seatbelt indicator, and audible chime warning responses to an unbuckled driver, or front passenger seat belt. For front passenger seats equipped with the BeltAlert® feature, the warning system may be triggered when an animal or heavy object is on the front passenger seat, or when the seat is folded flat (if equipped). The beltminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool. The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully.

1. With the ignition switch in any position except On or Start, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except On or Start to toggle the BeltAlert® feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: If replacing the cluster, take note of the mileage before disconnecting the battery, so the replacement cluster can be programmed with the correct mileage.

CLUSTER ASSEMBLY

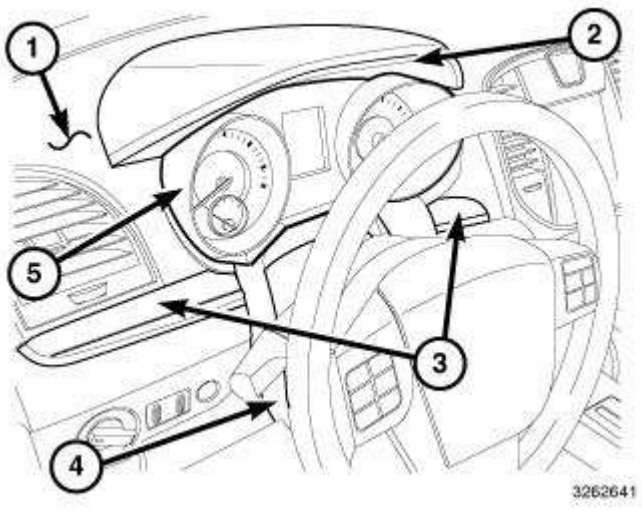

Fig. 4: Instrument Cluster (IC)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Pull the instrument panel upper hood (2) toward the driver seat to release the clips, and separate the hood from the instrument panel.
3. Using a trim stick, remove the two small trim panels (3) on both sides of the steering column opening.
4. Remove the steering column cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
5. Release the clips, and position aside the steering column opening seal (4) to gain access to the instrument cluster fasteners.

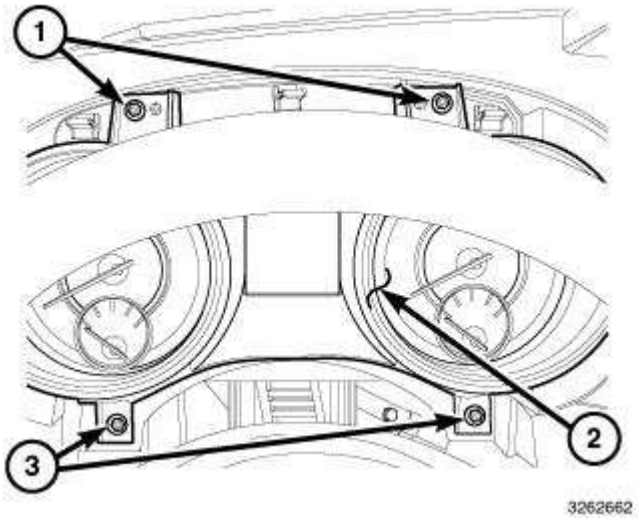

Fig. 5: Upper/Lower, Fasteners & Cluster
Courtesy of CHRYSLER GROUP, LLC

6. Remove the upper (1) and lower (3) fasteners securing the cluster (2) to the instrument panel.
7. Tilt the cluster forward, and disconnect the cluster electrical connector.
8. Remove cluster from instrument panel.

CLUSTER LENS, HOOD, AND MASK

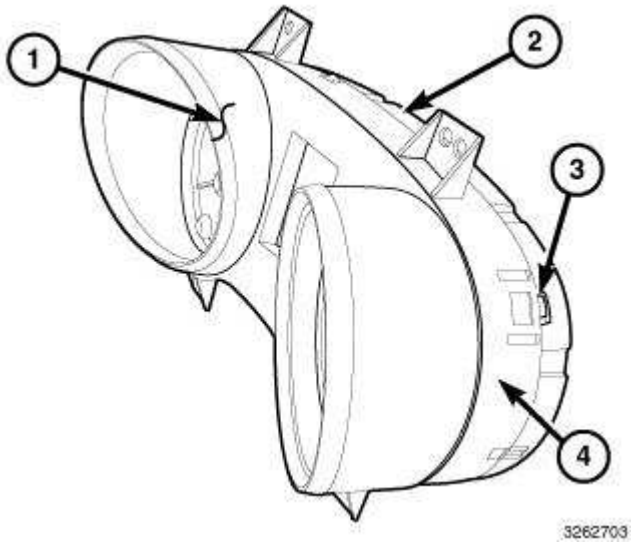

Fig. 6: Instrument Cluster Assembly, Latches, Mask Assembly & Instrument Cluster Body
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument cluster assembly (1) from the instrument panel. Refer to 1.
3. Working around the perimeter disengage the latches (3), and remove the instrument cluster lens, hood, and mask assembly (4).
4. Remove the lens, hood, and mask assembly from the instrument cluster body (2).
5. Working around the perimeter of the left or right inner hood assemblies, disengage each of the latches that secure the panels to the cluster body.

INSTALLATION

INSTALLATION

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

CLUSTER ASSEMBLY

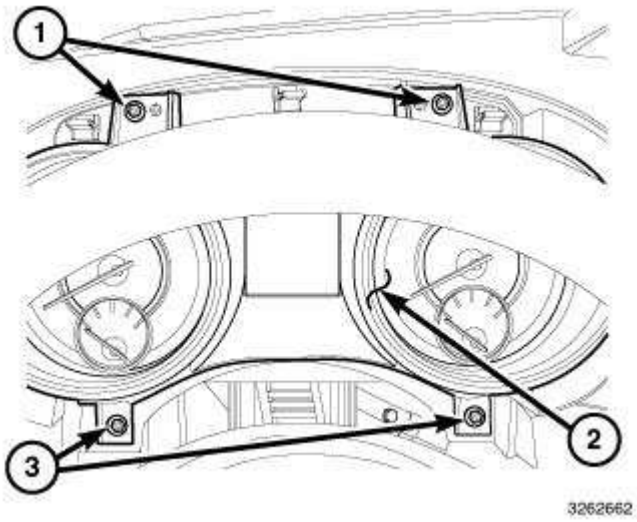

Fig. 7: Upper/Lower, Fasteners & Cluster
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the cluster has been replaced, the replacement cluster should be programmed with the correct mileage. Verify the correct mileage via WiTech/Scan Tool.

1. Position cluster into instrument panel opening.
2. Connect the cluster electrical connector.
3. Tilt the cluster forward, install and tighten the upper and lower fasteners (1 and 3).

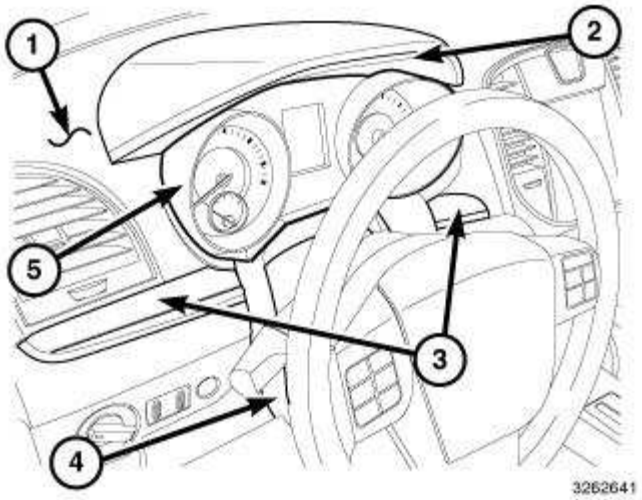

Fig. 8: Instrument Cluster (IC)
Courtesy of CHRYSLER GROUP, LLC

4. Position the steering column opening seal (4), and press into place.
5. Install the steering column cover. Refer to **COVER, STEERING COLUMN OPENING,**

INSTALLATION .

6. Install the two small instrument panel trim panels (3).
7. Position the upper hood (2) on the instrument panel, and press into place engaging the clips that secure the hood.
8. Connect the battery negative cable.

CLUSTER LENS, HOOD AND MASK

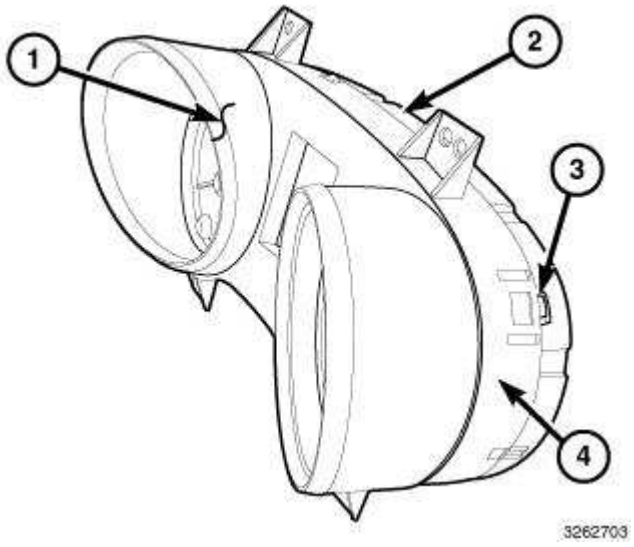

Fig. 9: Instrument Cluster Assembly, Latches, Mask Assembly & Instrument Cluster Body
Courtesy of CHRYSLER GROUP, LLC

1. Working around the perimeter of the left or right cluster lens, and hood assembly engage each of the latches that secure the unit to the cluster assembly.
2. Working around the perimeter of the lens, hood, and mask assembly engage each of the latches that secure the unit to the cluster assembly.
3. Install the cluster assembly into the instrument panel. Refer to 1.

GAUGE PACK, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION

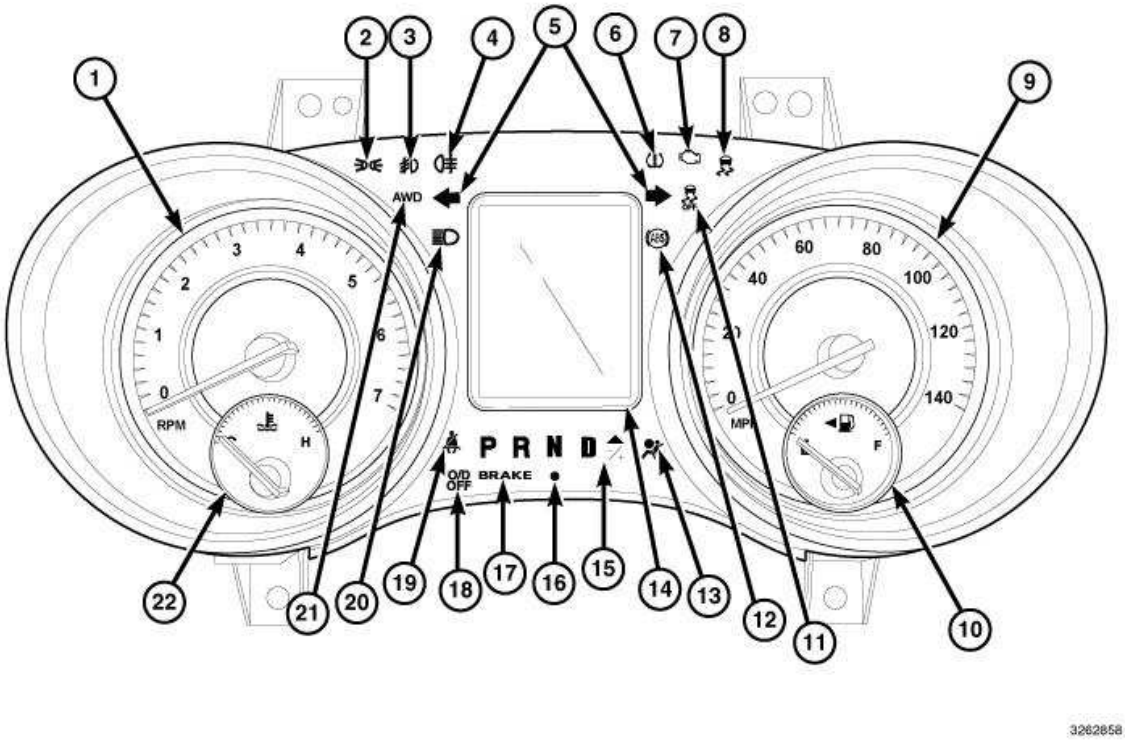

Fig. 10: Identifying Electronic Vehicle Information Center (EVIC) Components
Courtesy of CHRYSLER GROUP, LLC

The Instrument Cluster (IC) for this vehicle houses 4 analog gauges standard on all models, and has provisions for up to 29 International Control and Display Symbol icon indicators, that are all controlled by the IC electronic circuitry. Refer to **INDICATORS, INSTRUMENT CLUSTER, DESCRIPTION**. The gauge graphics are silver against a black field except for a single red graduation at the high end of the gauge scale, on both the engine temperature, and fuel level gauges; and several red graduations at the high end of the gauge scale on the tachometer; that designate the red line area. When illuminated by the cluster illumination lighting, the silver text and graphics as well as the red graphics still appear the same, the red gauge needles have internal optical illumination. Gauge illumination is provided by dimmer controlled Light Emitting Diode (LED) units soldered onto the IC circuit board. The Gauge set and indicators shown in illustration above are an integrated part of the cluster, therefore are only serviced as a unit. The instrument cluster lens and the hood and mask unit are the only components of the instrument cluster assembly that can be serviced separately.

The instrument cluster includes the following analog gauges:

- **Engine Temperature Gauge (22)**
- **Fuel Gauge (10)**
- **Speedometer (9)**
- **Tachometer (1)**

ENGINE TEMPERATURE

The standard equipment engine temperature gauge is located on the left side of the instrument cluster with in the tachometer. The gauge consists of a movable gauge needle or pointer controlled by the IC circuitry and a fixed 90 degree gauge scale on the IC overlay that reads from **C** (or Cold) to **H** . An International Control and Display Symbol icon for **Engine Coolant Temperature** is located on the gauge face, near the low end of the scale. For more information, refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** .

FUEL LEVEL

A fuel gauge is standard equipment on all instrument clusters. This gauge is located on the right side of the instrument cluster, within the speedometer. Similar to the engine temperature gauge, the fuel level gauge consists of a movable gauge needle or pointer controlled by the IC circuitry and a fixed 90 degree gauge scale on the cluster overlay that reads from **E** (or Empty) to **F** (or Full). The International Control and Display Symbol icon for **Fuel** is located on the gauge face, in the center of the scale. An arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay next to the **Fuel** icon on the gauge to provide the driver with a reminder as to the location of the fuel filler access. For more information, refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** .

SPEEDOMETER

Standard equipment on all instrument clusters, the speedometer is located to the left of center in the instrument cluster, next to the tachometer and engine temperature gauge. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 185 degree primary scale on the gauge dial face that reads left-to-right either from **0** to **140** or **160** MPH, or from **0** to **230** km/h, depending upon the model.

Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. Text appearing on the cluster overlay above the hub of the speedometer needle and below the primary scale abbreviates the unit of measure for the primary scale (either **MPH** or **km/h**), and text above the hub of the speedometer needle and below the secondary scale indicates the unit of measure for that scale.

TACHOMETER

The standard equipment tachometer is located to the right of center in the instrument cluster, next to the speedometer and fuel gauge. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 185 degree scale on the gauge dial face that reads left-to-right either from **0** to **7** . The text **RPM X 1000** imprinted on the cluster overlay directly above the hub of the tachometer needle identifies that each number on the tachometer scale is to be multiplied by 1000 RPM.

OPERATION

OPERATION

GAUGES

All gauges receive battery current through the Instrument Cluster (IC) circuitry only when the ignition switch is in the ON or START positions. With the ignition switch in the OFF position battery current is not supplied to any gauges, and the IC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the ON or START positions.

All of the IC gauges are driven by stepper motors. Two fixed electromagnetic coils are located within each gauge. These coils are wrapped at right angles to each other around a movable permanent magnet. The movable magnet is suspended within the coils on one end of a pivot shaft, while the gauge needle is attached to the other end of the shaft. One of the coils has a fixed current flowing through it to maintain a constant magnetic field strength. Current flow through the second coil changes, which causes changes in its magnetic field strength. The current flowing through the second coil is changed by the IC circuitry in response to messages received over the CAN data bus. The gauge needle moves as the movable permanent magnet aligns itself to the changing magnetic fields created around it by the electromagnets.

ENGINE COOLANT TEMPERATURE GAUGE

This gauge is controlled by the IC circuit board based upon programming and electronic messages received from the Powertrain Control Module (PCM) over the CAN data bus.

The engine coolant temperature gauge is a stepper motor design gauge that receives battery current on the instrument IC electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The IC is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The IC circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the IC receives a message from the PCM indicating the engine coolant temperature is between the low end of normal [about 54° C (130° F)] and the high end of normal [about 127° C (260° F)], the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature Low Message** - Each time the IC receives a message from the PCM indicating the engine coolant temperature is below the low end of normal [about 54° C (130° F)], the gauge needle is held at the "C" increment at low end of the gauge scale. The gauge needle remains at the low end of the gauge scale until the IC receives a message from the PCM indicating that the engine temperature is above about 54° C (130° F), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Engine Temperature High Message** - Each time the IC receives a message from the PCM indicating the engine coolant temperature is above about 127° C (260° F), the gauge needle is moved into the red zone on the gauge scale, the engine temperature indicator is illuminated, and a single chime tone is sounded. The gauge needle remains in the red zone and the engine temperature indicator remains illuminated until the IC receives a message from the PCM indicating that the engine temperature is below about 127° C (260° F), or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.
- **Communication Error** - If the IC fails to receive an engine temperature message, it will hold

the gauge needle at the last indication for about five seconds or until the ignition switch is turned to the Off position, whichever occurs first. After five seconds, the IC will move the gauge needle to the low end of the gauge scale.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the IC. For further diagnosis of the engine coolant temperature gauge or the IC circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING**. If the IC turns on the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service. The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

FUEL GAUGE

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the IC circuit board based upon programming and a hard wired input received from the fuel level sending unit on the fuel pump module in the fuel tank.

The fuel gauge is a stepper motor design gauge that receives battery current on the IC electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The IC is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The IC circuitry controls the gauge needle position and provides the following features:

- **Fuel Level Sending Unit Input** - The IC provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the sense input voltage. The IC programming applies an algorithm to calculate the proper fuel gauge needle position based upon the fuel level sense input, then moves the gauge needle to the proper relative position on the gauge scale. This algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the IC.
- **Less Than Ten Percent Tank Full Input** The LX is equipped with two tank sizes : an 18 gallon and a 19 gallon. This is a saddle type tank with a sending unit on each side. The sending units are hard-wired to the IC. The IC will average the sending unit voltages and provide the proper gauge positioning. Each time the fuel level sense input to the IC indicates the fuel tank is about ten percent full or less for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to about the one-eighth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about thirteen percent full for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the IC receives a fuel level sense input that indicates

the fuel level in the fuel tank is less than the Empty gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the IC is a short circuit.

- **More Than Full Stop Input** - Each time the IC receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the Full gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the IC is an open circuit.

The IC continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The IC then sends the proper fuel level messages to other electronic modules in the vehicle over the CAN data bus. For further diagnosis of the fuel gauge or the IC circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING**. The fuel gauge is serviced as a unit with the instrument cluster.

SPEEDOMETER

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the IC circuit board based upon programming and electronic messages received from the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM is provided the vehicle speed information across the CAN data bus by either the PCM, the ESP module or the ABS module.

The IC circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message** - Each time the IC receives a vehicle speed message from the BCM, it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The IC will receive a new vehicle speed message and reposition the gauge pointer accordingly about every 50 milliseconds. The gauge needle will continually be positioned at the relative vehicle speed position on the gauge scale until the vehicle stops moving, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the IC fails to receive a speedometer message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.

The PCM continually monitors the vehicle speed sensor to determine the vehicle road speed. The PCM then sends the proper vehicle speed messages to the IC. For further diagnosis of the speedometer or the IC circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING**. The speedometer is serviced as a unit with the instrument cluster.

TACHOMETER

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the IC circuit board based upon programming and electronic messages received from the PCM over the CAN data bus.

The tachometer is a stepper motor design gauge that receives battery current on the IC electronic

circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The IC is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The IC circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message** - Each time the IC receives an engine speed message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The IC will receive a new engine speed message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the IC fails to receive an engine speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.

The PCM continually monitors the crankshaft position sensor to determine the engine speed. The PCM then sends the proper engine speed messages to the IC. For further diagnosis of the tachometer or the IC circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING**. The tachometer is serviced as a unit with the instrument cluster.

The gauges are diagnosed using the IC self-diagnostic test. Refer to **DIAGNOSIS AND TESTING**. Proper testing of the CAN data bus and the electronic data bus message inputs to the IC that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

INDICATORS, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION

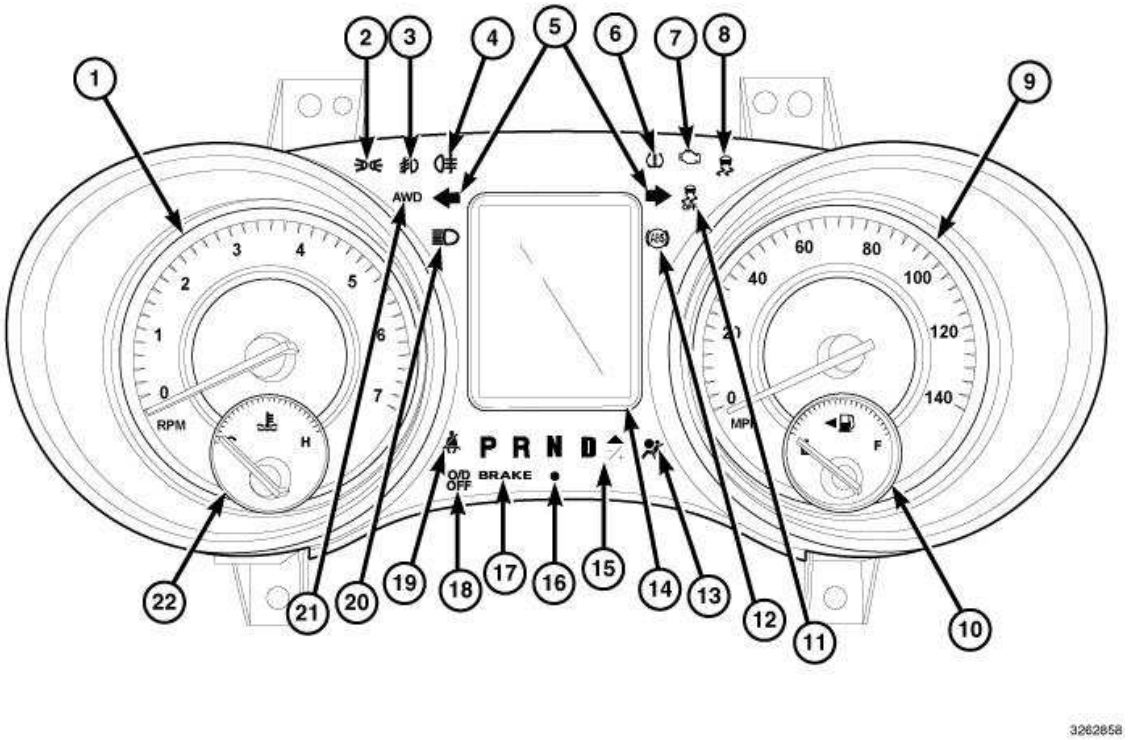

Fig. 11: Identifying Electronic Vehicle Information Center (EVIC) Components
Courtesy of CHRYSLER GROUP, LLC

The Instrument Cluster (IC) for this vehicle has provisions for up to 29 International Control and Display Symbol icon indicators and 4 analog gauges, that are all controlled by the IC electronic circuitry and standard on all models. Refer to **GAUGE PACK, INSTRUMENT CLUSTER, DESCRIPTION**. Some of the indicators are automatically configured when the IC is connected to the vehicle's electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each IC may have provisions for indicators to support every available option, the configurable indicators will not function in vehicles that do not have the equipment that an indicator supports.

Each indicator in the IC, except those located within a VFD unit, is illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the electronic circuit board. IC illumination is accomplished by several dimmable LED units, which illuminate each of the gauge dial faces for visibility when the exterior lighting is turned ON. These LED units as well as the IC assembly are serviced only as a complete unit with the instrument cluster and, if damaged or ineffective, the entire instrument cluster assembly must be replaced. The IC lens and the hood and mask unit are the only components of the IC assembly that can be serviced separately.

The IC includes provisions for the following indicators:

- **Airbag Indicator (13)**
- **Ajar Indicators (14)** - in the EVIC display
- **Antilock Brake System (ABS) Indicator (12)**

- **All Wheel Drive (AWD) Indicator (21)**
- **Brake Indicator (18)** - text only for U.S. market, icon only for markets outside U.S.
- **Change Oil Indicator** - textual message in odometer / EVIC display
- **Charging Indicator (14)** - in the EVIC display
- **Cruise Indicator (14)** - in the EVIC display
- **Electronic Stability Control (ESC) System Activation Indicator (8)**
- **Electronic Throttle Control (ETC) Indicator (14)** - in the EVIC display
- **Engine Coolant Temperature Indicator (14)** - in the EVIC display
- **Front Fog Lamp Indicator (3)** - with optional front fog lamps only
- **Fuel Saver Indicator- ECOnomizer (ECO) (14)** - in the EVIC display
- **Gas Cap Indicator (14)** - in the EVIC display
- **Gear Selector Indicator (15)**
- **High Beam Indicator (20)**
- **Low Fuel Indicator (14)** - in the EVIC display
- **Low Oil Pressure Indicator (14)** - in the EVIC display
- **Malfunction Indicator Lamp (MIL) (7)** - only on domestic market vehicles
- **No Bus Indicator** - in the EVIC display
- **Seat Belt Indicator (19)**
- **Security Indicator (16)**
- **Tire Pressure Monitor (TPM) Indicator (6)**
- **Electronic Stability Control (ESC) OFF Indicator (11)**
- **Turn Signal (Right and Left) Indicators (5)**

The IC also includes the following Liquid Crystal Display (LCD) units :

- **Electronic Vehicle Information Center (EVIC) Display** . Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .

For more information on the International Control and Display Symbol icons. Refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** .

OPERATION

OPERATION

Indicators are located in various locations within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and are all connected to the electronic circuit board. All of the indicators are completely controlled by the IC. The various indicators are controlled by different strategies; some receive fused ignition output from the IC circuitry and have a switched ground, while others are grounded through the IC circuitry and have a switched battery feed. However, most are controlled by (CAN) or Local Interface Network (LIN) data bus messages from other electronic modules in the vehicle while others are controlled by a combination of hard wired inputs, electronic

messaging and IC programming. If the IC loses CAN data bus communication, the IC circuitry will automatically turn ON the Malfunction Indicator Lamp (MIL) until CAN data bus communication is restored.

In addition, certain indicators in this IC are automatically or self-configured. This feature allows the configurable indicators to be enabled by the IC circuitry for compatibility with certain optional equipment. These indicators are enabled or disabled by an electronic **configuration** message sent to the IC by the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM defaults for the Antilock Brake System (ABS) and the airbag indicators is enabled. These configuration settings must be programmatically disabled in the BCM using a diagnostic scan tool for vehicles that do not have this equipment. The automatically or self-configured indicators remain latent in the IC at all times and will be active only when the IC receives the appropriate CAN or LIN bus message inputs for that optional system or equipment.

The hard wired indicator inputs may be diagnosed using conventional diagnostic tools and procedures. However, the IC circuitry and electronic CAN or LIN data bus message controlled indicators are diagnosed using the self-diagnostic IC **Self Test** . for more information, refer to **DIAGNOSIS AND TESTING**. Proper testing of the CAN or LIN data bus and the electronic data bus message inputs to the IC that control each indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Below are brief explanations of the indicators available on this vehicle. More detailed information may be available elsewhere in this service information covering the system or component that control or influence the illumination of that indicator.

AIRBAG INDICATOR

The airbag indicator gives an indication to the vehicle operator when the airbag system, or a circuit or component of the system is ineffective. The airbag indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the Occupant Restraint Controller (ORC) over the CAN data bus. The IC will illuminate the airbag indicator for about six seconds as a bulb test each time the ignition switch status transitions to ON.

The airbag indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the airbag indicator for the following reasons:

- **Airbag Indicator Lamp-On Message** - Each time the IC receives an electronic **airbag indicator lamp-ON** message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about 12 seconds or until the IC receives a lamp-OFF message from the ORC, whichever is longer. This indicator will also be extinguished when the ignition switch status transitions to OFF.
- **Communication Error** - If the IC receives no lamp-ON or lamp-OFF messages from the ORC for 10 consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the IC receives a single lamp-OFF message from the ORC.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper lamp-ON or lamp-OFF message to the IC. If the ORC sends a lamp-ON message after the bulb test, it indicates that the ORC has detected a system malfunction or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a DTC for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the IC airbag indicator circuit, the IC sends a message notifying the ORC of the condition, then the IC and the ORC will each store a DTC.

For proper diagnosis of the airbag system, the ORC, the IC, the CAN data bus or the electronic communication related to airbag indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AJAR INDICATORS

The ajar indicators give an indication to the vehicle operator that one or more of the passenger compartment doors or the deck lid may be open or not completely latched. These indicators are controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the Body Control Module (BCM) over the CAN data bus. The BCM monitors hard-wired inputs from the door and deck lid ajar switches.

The ajar indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused B(+) circuit. Therefore, the ajar indications can occur regardless of the ignition switch position. The IC will turn ON an ajar indicator for the following reasons:

- **Ajar Indicator Lamp-On Message** - Each time the IC receives an electronic **door ajar indicator lamp-on** or **deck lid ajar indicator lamp-on** message from the BCM indicating that a door or the deck lid or a combination of these is open or not completely latched, the appropriate ajar textual message and icons will be illuminated. If the IC detects a vehicle speed input greater than zero (kilometers or miles-per-hour) while the ignition switch status is ON or START, the ajar indication will be accompanied by a single chime tone. When the ignition switch status is anything except ON or START, any and all ajar indications will time out after about five minutes.

The ajar switches on the door and deck lid latch mechanisms provide hard-wired ground inputs to the BCM circuitry through the ajar switch sense circuits whenever a door or the deck lid is open or not completely latched. The BCM continually monitors the door and deck lid ajar switches to determine the status of the doors and deck lid, then sends the proper electronic **ajar indicator lamp-on** or **lamp-off** message to the IC.

The hard wired ajar switch inputs to the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the BCM, the IC, the CAN data bus or the electronic communication related to ajar indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ANTILOCK BRAKE SYSTEM INDICATOR

The Antilock Brake System (ABS) indicator gives an indication to the vehicle operator when the ABS

system, or a circuit or component of the system is ineffective. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the cluster from the CAB over the CAN data bus. The IC will illuminate the ABS indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The ABS indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the ABS indicator for the following reasons:

- **ABS Indicator Lamp-On Message** - Each time the IC receives an electronic **ABS indicator lamp-ON** message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.
- **Communication Error** - If the IC receives no lamp-ON or lamp-OFF messages from the CAB for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated until the IC receives a valid message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.
- **ABS Diagnostic Test** - The ABS indicator is blinked ON and OFF by lamp-ON and lamp-OFF messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON or lamp-OFF message to the IC. If the CAB sends a lamp-ON message after the bulb test, it indicates that the CAB has detected a system malfunction or that the ABS system has become ineffective. The CAB will store a DTC for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the IC ABS indicator circuit, the IC sends a message notifying the CAB of the condition, then the IC and the CAB will each store a DTC and the IC will flash the brake indicator ON and OFF as a backup to notify the vehicle operator.

For proper diagnosis of the anti-lock brake system, the CAB, the IC, the CAN data bus or the electronic communication related to ABS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

BRAKE/PARK BRAKE INDICATOR

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition or when the brake fluid level switch is disconnected. The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the CAB or the Body Control Module (BCM) over the CAN data bus. The BCM monitors the hard wired input from the park brake switch. The IC will illuminate the brake indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The brake indicator LED is completely controlled by the IC logic circuit, and that logic will only allow

this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the brake indicator for the following reasons:

- **Brake Indicator Lamp-On Message** - Each time the IC receives an electronic **brake indicator lamp-ON** message from the CAB, the brake indicator will be illuminated. The CAB may also send lamp-ON messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the IC receives a lamp-OFF message from the CAB or until the ignition switch status transitions to OFF, whichever occurs first.
- **Low Brake Fluid Textual Warning Message** - When the CAB detects a low brake fluid level input from the brake fluid level switch, it will send an electronic **textual warning request** message requesting the IC display a textual warning message. Each time the IC receives this message from the CAB, a **LOW BRAKE FLUID LEVEL** textual message will appear within the IC electronic display to accompany brake indicator illumination. This message indicates that the CAB has detected a low brake fluid level condition in the brake master cylinder or that there is a problem in the brake fluid level switch or circuits.
- **Park Brake Switch Input** - Each time the IC receives an electronic **brake indicator lamp-FLASH** message from the BCM, the brake indicator will be flashed ON and OFF. While the ignition switch status is ON, the BCM monitors the park brake switch through the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released). The indicator continues to flash until the park brake switch sense input to the BCM is an open circuit (park brake switch open = park brake fully released), or until the ignition switch status transitions to OFF, whichever occurs first.
- **Antilock Brake System (ABS) Indicator Backup** - If the IC detects a fault in the ABS indicator circuit it will send a message indicating the fault to the CAB, then flash the brake indicator ON and OFF. The IC will continue to flash the brake indicator until the ABS indicator circuit fault is resolved, or until the ignition switch status transitions to OFF, whichever occurs first.

The park brake switch on the park brake lever mechanism provides a hard-wired ground input to the BCM circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The CAB continually monitors the ABS system circuits and sensors, including the brake fluid level switch on the brake master cylinder reservoir, to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON, lamp-OFF or lamp-FLASH message to the IC. If the CAB sends a lamp-ON message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction or that the ABS system has become ineffective. The CAB will store a DTC for any malfunction it detects.

The hard wired park brake switch input to the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the brake fluid level switch, the ABS, the BCM, the CAB, the IC, the CAN data bus or the electronic communication related to brake indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHANGE OIL INDICATOR

The change oil indicator gives an indication to the vehicle operator when a duty-cycle algorithm

contained within the software of the PCM determines that a recommended oil change interval has been attained. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the PCM.

The change oil indicator function of the IC electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the change oil indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the change oil indicator for the following reasons:

- **Change Oil Indicator Lamp-On Message** - Each time the ignition switch status transitions to ON and the IC receives an electronic **change oil indicator lamp-ON** message from the PCM indicating that a duty-cycle based recommended oil change interval has been attained, the change oil indicator will be illuminated for about ten seconds, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.
- **Change Oil Indicator Reset Procedure** - Once an engine oil change has been completed, the PCM duty cycle counters can be reset using the following procedure. Set the ignition switch status to ON, but DO NOT start the engine. Slowly depress and release the accelerator pedal fully three times within ten seconds. The IC will display a textual **OIL CHANGE RESET** message. Set the ignition switch status to OFF. If the change oil indicator illuminates the next time the engine is started, repeat this procedure.

The PCM continually monitors numerous sensor inputs to determine the duty-cycles to which the engine is being subjected. A pre-programmed algorithm within the PCM then determines when to send the proper lamp-ON or lamp-OFF message to the IC.

For proper diagnosis of the change oil indicator, the PCM, the IC, the CAN data bus or the electronic communication related to change oil indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHARGING INDICATOR

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus. The IC will illuminate the charge indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The charging indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the charging indicator for the following reasons:

- **Voltage Low Message** - Each time the IC receives an electronic **system voltage** message from the PCM indicating the voltage is low (less than about 11.5 volts is a charge fail condition),

the charging indicator will be illuminated. The indicator remains illuminated until the IC receives a message from the PCM indicating the voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch status transitions to OFF, whichever occurs first.

- **Voltage High Message** - Each time the IC receives an electronic **system voltage** message from the PCM indicating the voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the IC receives a message from the PCM indicating the voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper messages to the IC. If the IC turns ON the charging indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service.

For proper diagnosis of the charging system, the PCM, the IC, the CAN data bus or the electronic communication related to charging indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHECK GAUGES INDICATOR

The check gauges indicator gives an indication to the vehicle operator when the engine coolant temperature gauge indicates the coolant temperature is high or critical. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the PCM.

The check gauges indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the check gauges indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the check gauges indicator for the following reasons:

- **Engine Temperature High or Critical Message** - Each time the IC receives an electronic **engine coolant temperature** message from the PCM indicating the temperature is high or critical the engine coolant temperature gauge needle is moved to the appropriate position at the high end of the gauge scale, the check gauges textual warning is displayed, and a single chime tone is sounded. The check gauges textual warning remains illuminated until the IC receives a message from the PCM indicating that the temperature is below the high end of normal, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the check gauges textual warning is cycled OFF and then ON again by the appropriate temperature messages from the PCM.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper messages to the IC. If the IC turns on the check gauges indicator due to a high or critical engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the IC, the CAN data bus or

the electronic communication related to check gauges indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CRUISE INDICATOR

The cruise indicator gives the vehicle operator an indication when the speed control system is ON, regardless of whether the speed control is engaged. This indicator is controlled by the IC circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus.

The cruise indicator LED is completely controlled by the IC logic circuit, and that logic only allows this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED is always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the cruise indicator for the following reasons:

- **Cruise Indicator Lamp-On Message** - Each time the IC receives an electronic **cruise indicator lamp-on** message from the PCM indicating the speed control system is ON, the cruise indicator is illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the PCM, or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the speed control switches to determine the appropriate outputs to control the vehicle speed. The PCM then sends the proper lamp-on or lamp-off message to the IC.

For proper diagnosis of the speed control switches, the PCM, the IC, the CAN data bus or the electronic communication related to cruise indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ELECTRONIC THROTTLE CONTROL INDICATOR

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system, or a circuit or component of the system is ineffective. The ETC indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus. The IC will illuminate the ETC indicator for about fifteen seconds as a bulb test each time the ignition switch status transitions to ON.

The ETC indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the ETC indicator for the following reasons:

- **ETC Indicator Lamp-On Message** - Each time the IC receives an electronic **ETC indicator lamp-ON** message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about 12 seconds or until the IC receives a lamp-OFF message from the PCM, whichever is longer. If the indicator is illuminated solid with

the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service. The indicator will be extinguished when the ignition switch status transitions to OFF.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the IC. If the PCM sends a lamp-ON message after the bulb test, it indicates that the PCM has detected an ETC system malfunction or that the ETC system is ineffective. The PCM will store a DTC for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the IC ETC indicator circuit, the IC sends a message notifying the PCM of the condition, then the IC and the PCM will each store a DTC.

For proper diagnosis of the ETC system, the PCM, the IC, the CAN data bus or the electronic communication related to ETC indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE INDICATOR

The engine temperature indicator gives an indication to the vehicle operator when the engine temperature gauge reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received from the PCM over the CAN data bus. The IC will illuminate the engine temperature indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The engine temperature indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The engine temperature indicator will also be turned ON for the following reasons:

- **Engine Temperature High Message** - Each time the IC receives a message from the PCM indicating the engine coolant temperature is high, the engine temperature indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until a message from the PCM indicating that the engine coolant temperature is below the high end of normal is received, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the IC. If the IC turns on the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

ELECTRONIC STABILITY CONTROL INDICATOR

The Electronic Stability Control (ESC) indicator gives an indication to the vehicle operator when the ESC has been activated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the CAB and the Final Drive Control Module (FDCM) over the CAN data bus. The IC will illuminate the ESC/BAS indicator for about four seconds as a bulb test each time the ignition switch status transitions to ON.

The ESC indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the ESC/BAS indicator for the following reasons:

- **ESC Indicator Lamp-On Message** - Each time the IC receives an electronic **ESC/ indicator lamp-ON** message from the CAB indicating that the ESC system has been activated, the ESC indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.
- **ESC Off Textual Message** - Each time the IC receives an electronic **ESC OFF indicator lamp-ON** message from the CAB indicating that the ESC system has been manually disabled, an **ESC OFF** textual message will appear within the IC electronic display unit. The **ESC OFF** textual message remains displayed until the IC receives a lamp-OFF message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.
- **ESC Textual Warning Message** - When the CAB or FDCM detects certain monitored fault conditions, it will send electronic messages requesting the IC display a textual warning message. Each time the IC receives an electronic **ESC textual warning request** message from the CAB or FDCM, a **WARNING! LIMIT SPEED** textual message will appear within the IC electronic display unit to accompany an ESC indicator that is illuminated solid. This message indicates that the CAB or FDCM has detected a problem in one of the ESC system circuits or components.

The CAB and FDCM continually monitor the ESC circuits and sensors to decide whether the system is in good operating condition. The CAB or FDCM then sends the proper lamp-ON or lamp-OFF message to the IC.

For proper diagnosis of the ESC/BAS system, the CAB, the FDCM, the IC, the CAN data bus or the electronic communication related to the ESC/BAS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FRONT FOG LAMP INDICATOR

The front fog lamp indicator gives an indication to the vehicle operator whenever the front fog lamps are illuminated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the BCM over the CAN data bus.

The front fog lamp indicator LED is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only

illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the front fog lamp indicator for the following reasons:

- **Front Fog Indicator Lamp-On Message** - Each time the IC receives an electronic **front fog indicator lamp-ON** message from the BCM indicating the front fog lamps are turned ON, the front fog lamp indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the BCM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The BCM continually monitors a hard wired input from the exterior lighting switch to determine the appropriate outputs to the front fog lamps. The BCM activates or deactivates the front fog lamps then sends the proper lamp-ON or lamp-OFF message to the IC to control the front fog lamp indicator.

For proper diagnosis of the front fog lamp system, the BCM, the IC, the CAN data bus or the electronic communication related to front fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

GAS CAP INDICATOR

The gas cap indicator gives an indication to the vehicle operator when there is a gross leak detected in the on-board fuel vapor recovery system. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the PCM.

The gas cap indicator function of the IC electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the gas cap indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the gas cap indicator for the following reasons:

- **Gas Cap Indicator Lamp-On Message** - Each time the IC receives an electronic **gas cap indicator lamp-ON** message from the PCM indicating there is a gross leak in the vapor recovery system, the gas cap indicator will be displayed. The indicator remains displayed until the IC receives a lamp-OFF message from the PCM, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.

NOTE: **If the On-Board Diagnostic (OBD) system in the vehicle determines that the fuel filler cap is loose, improperly installed or damaged, a gas cap ICON will be displayed in the electronic display unit. In this instance, verify that the gas cap is properly installed and tightened before proceeding with any further diagnosis.**

The PCM continually monitors the on board vapor recovery system to determine whether there are air leaks in the system. The PCM then sends the proper lamp-ON or lamp-OFF message to the IC. If the IC turns ON the gas cap indicator due to a monitored gross leak in the vapor recovery system, it may indicate that the gas cap has been removed or is improperly installed.

For proper diagnosis of the on board vapor recovery system, the PCM, the IC, the CAN data bus or the electronic communication related to gas cap indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

HIGH BEAM INDICATOR

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received from the BCM over the CAN data bus.

The high beam indicator LED is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the high beam indicator for the following reasons:

- **High Beam Indicator Lamp-On Message** - Each time the IC receives an electronic **high beam indicator lamp-ON** message from the BCM or the Automatic High Beam Module (AHBM) (also known as SmartBeam® on vehicles so equipped) the high beam indicator will be illuminated. The high beam indicator remains illuminated until the IC receives a lamp-OFF message from the BCM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The BCM continually monitors electronic messages from the Steering Angle Sensor (SAS) based upon the status of the beam select switch and the AHBM to determine the proper headlamp beam control. The BCM activates or deactivates the headlamp high beams then sends the proper lamp-ON or lamp-OFF message back to the IC.

For proper diagnosis of the SAS, the AHBM, the BCM, the IC, the CAN data bus or the electronic communication related to high beam indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW COOLANT INDICATOR

The low coolant indicator gives an indication to the vehicle operator when the diesel engine coolant level is low. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the PCM.

The low coolant indicator function of the IC electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the low coolant indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the low coolant indicator for the following reasons:

- **Low Coolant Indicator Lamp-On Message** - Each time the IC receives an electronic **low coolant indicator lamp-ON** message from the PCM indicating the engine coolant level is low, the low coolant textual warning and icon are illuminated and a single chime tone is sounded. The low coolant textual warning and icon remain illuminated until the IC receives a lamp-OFF

message from the PCM, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the textual warning and icon are cycled OFF and then ON again by the appropriate messages from the PCM.

The PCM continually monitors the engine coolant level switch on the coolant bottle to determine the level of the engine coolant. The PCM then sends the proper lamp-ON or lamp-OFF message to the IC. If the IC turns ON the coolant low indicator and icon due to a low coolant level, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant level switch, the PCM, the IC, the CAN data bus or the electronic communication related to low coolant indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW FUEL INDICATOR

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the IC circuit board based upon programming and a hard wired input received by the IC from the fuel level sending unit on the fuel pump module in the fuel tank. The IC will illuminate the low fuel indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The low fuel indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the low fuel indicator for the following reasons:

- **Less Than 11 Percent Tank Full Input** - The BCM provides a constant current source to the fuel level sending unit, and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls, and decreases as the fuel level rises causing changes in the sense input voltage. Each time the fuel level sense input to the BCM indicates the fuel tank is about 11 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the BCM sends an electronic message to the IC. Then the IC moves the gauge needle to the appropriate position on the gauge scale; the low fuel indicator is illuminated and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about 14 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the IC receives a fuel level message from the BCM that indicates the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the BCM is a short circuit.
- **More Than Full Stop Input** - Each time the IC receives a fuel level message from the BCM that

indicates the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the BCM is an open circuit.

The BCM continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The BCM then sends the proper electronic **fuel level** message to IC and other electronic modules in the vehicle over the CAN data bus. The BCM will store a DTC for any fault detected in the fuel level sense circuit.

For proper diagnosis of the fuel tank sending unit, the BCM, the IC, and the CAN data bus or the electronic communication related to low fuel indicator operation or fuel level data processing, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW OIL PRESSURE INDICATOR

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus.

The low oil pressure indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message** - Each time the IC receives an electronic **engine oil pressure** message from the PCM indicating the pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or flashing until the IC receives a message from the PCM indicating that the pressure is above about 6.9 kPa (1 psi), or until the ignition switch status transitions to OFF, whichever occurs first. The IC will only turn the indicator ON in response to low engine oil pressure if the engine speed is greater than zero.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper messages to the IC. If the IC turns ON the indicator after the bulb test, it may indicate that the engine or the engine oiling system requires service.

For proper diagnosis of the engine oil pressure sensor, the PCM, the IC, the CAN data bus or the electronic communication related to low oil pressure indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW TIRE PRESSURE INDICATOR

The Tire Pressure Monitor (TPM) indicator gives an indication to the vehicle operator of the status of the TPM system. This indicator is controlled by a transistor on the IC circuit board based upon

programming and electronic messages received by the IC from the Tire Pressure Module (TPM) (also known as the CORAX module) over the CAN data bus. The IC will illuminate the TPM indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The TPM indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the TPM indicator for the following reasons:

- **TPM Indicator Lamp-On Message** - Each time the IC receives an electronic **TPM indicator lamp-ON** message from the TPM, the TPM indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the TPM message. The indicator remains illuminated until the IC receives a lamp-OFF message from the TPM, or until the ignition switch status transitions to OFF position, whichever occurs first.
- **TPM Textual Warning Message** - When the TPM detects certain monitored fault conditions, it will send electronic messages requesting the IC display a textual warning message. Each time the IC receives an electronic **textual warning request** message from the TPM, a **SERVICE TIRE PRESS. SYSTEM** textual message will appear within the electronic display unit to accompany a flashing TPM indicator or to replace the TPM **TIRE LOW PRESSURE** textual message. This message indicates that the TPM has detected a problem in one of the TPM system components.
- **TPM Low Pressure Message** - On vehicles equipped with the optional premium version of the TPM system, each time the IC receives an electronic **low pressure** message from the TPM, a **LEFT FRONT** , **RIGHT FRONT** , **LEFT REAR** or **RIGHT REAR LOW PRESSURE** textual message will appear within the IC electronic display unit to accompany a solid TPM indicator. If the vehicle is equipped with a full-sized matching spare tire and wheel assembly, an electronic **spare low pressure** message from the TPM to the IC will cause a **SPARE LOW PRESSURE** textual message to appear in the electronic display unit, but the TPM indicator will not illuminate. This message indicates that the TPM has received a low tire pressure input from the tire pressure sensor in the identified location on the vehicle. The premium TPM system is not offered in markets where rear fog lamps are an available option.
- **Communication Error** - If the IC receives no TPM lamp-ON or lamp-OFF messages from the TPM for six consecutive seconds, the TPM indicator is illuminated by the IC. The indicator remains controlled and illuminated by the IC until a valid lamp-ON or lamp-OFF message is received from the TPM.

The TPM performs a self-test each time the ignition switch status transitions to ON to decide whether the TPM system is in good operating condition and whether the tire inflation pressures are too high or too low. The TPM then sends the proper lamp-ON or lamp-OFF message to the IC. If the IC turns ON the TPM indicator after the bulb test, it indicates that the inflation pressure of a tire is too low or that a malfunction has occurred and the TPM system is ineffective.

For proper diagnosis of the TPM system, the TPM, the IC, the CAN data bus or the electronic communication related to TPM indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

MALFUNCTION INDICATOR LAMP

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the PCM has recorded a DTC for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus. The IC will illuminate the MIL indicator for about fifteen seconds as a bulb test each time the ignition switch status transitions to ON.

The MIL LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the MIL for the following reasons:

- **MIL Lamp-On Message** - Each time the IC receives an electronic **MIL lamp-ON** message from the PCM, the indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. For some DTCs, if a problem does not recur, the PCM will send a lamp-OFF message automatically. Other DTCs may require that a fault be repaired and the PCM be reset before a lamp-OFF message will be sent. For more information on the PCM, and the DTC set and reset parameters. Refer to **OPERATION** .
- **Communication Error** - If the IC receives no lamp-ON or lamp-OFF messages from the PCM for 10 consecutive message cycles, the MIL is illuminated by the IC to indicate a loss of bus communication. The indicator remains controlled and illuminated by the IC until a valid message is received from the PCM.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the IC. If the IC turns ON the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems require service.

For proper diagnosis of the fuel and emissions systems, the PCM, the IC, the CAN data bus or the electronic communication related to MIL operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

NO BUS INDICATOR

The no bus indicator gives an indication to the vehicle operator when the IC detects a loss of electronic communication over the CAN data bus. This indicator is controlled by the IC logic circuit based upon programming and electronic messages not being received over the CAN data bus from the BCM.

The no bus indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the no bus indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the no bus indicator for the following reasons:

- **No Electronic Communication Messages** - Each time the ignition switch is turned to the ON position and the IC does not receive electronic communication messages over the CAN data bus, the no bus indicator is illuminated. The indicator remains illuminated until CAN bus communication is restored or until the ignition switch status transitions to OFF, whichever occurs first.

The IC continually monitors the CAN data bus to determine the status of many sensors and systems throughout the vehicle. If the IC detects the loss of CAN bus communication it illuminates the no bus indicator to alert the vehicle operator that it cannot provide accurate displays and outputs.

For proper diagnosis of the IC, the CAN data bus or the electronic communication related to no bus indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

POSITION LAMP INDICATOR

The position lamp indicator gives an indication to the vehicle operator whenever the position lamps are illuminated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the BCM over the CAN data bus.

The position lamp indicator LED is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the position lamp indicator for the following reasons:

- **Position Lamp Indicator Lamp-On Message** - Each time the IC receives an electronic **position lamp indicator lamp-ON** message from the BCM indicating the position lamps are turned ON, the position lamp indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the BCM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The BCM continually monitors a hard wired input from the exterior lighting switch to determine the appropriate outputs to the park lamps. The BCM activates or deactivates the park lamps then sends the proper lamp-ON or lamp-OFF message to the IC to control the position lamp indicator.

For proper diagnosis of the position lamp system, the BCM, the IC, the CAN data bus or the electronic communication related to position lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

REAR FOG LAMP INDICATOR

The rear fog lamp indicator gives an indication to the vehicle operator whenever the rear fog lamps are illuminated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the BCM over the CAN data bus.

The rear fog lamp indicator LED is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+)

circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the rear fog lamp indicator for the following reasons:

- **Rear Fog Indicator Lamp-On Message** - Each time the IC receives an electronic **rear fog indicator lamp-ON** message from the BCM indicating that the rear fog lamps are turned ON, the rear fog lamp indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the BCM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The BCM continually monitors a hard wired input from the exterior lighting switch to determine the appropriate outputs to the rear fog lamps. The BCM activates or deactivates the rear fog lamps then sends the proper lamp-ON or lamp-OFF message to the IC to control the rear fog lamp indicator.

For proper diagnosis of the rear fog lamp system, the BCM, the IC, the CAN data bus or the electronic communication related to rear fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

REMOTE START INDICATOR

The remote start indicator gives an indication to the vehicle operator of the remote start system status. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the BCM and the Radio Frequency Hub (RF Hub).

The remote start indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, the remote start indications can be illuminated regardless of the ignition switch status. The IC will turn ON the remote start indicator for the following reasons:

- **Remote Start Active Messages** - Each time the IC receives an electronic **remote start active** message from the BCM, the **REMOTE START ACTIVE - PUSH START BUTTON** textual message is displayed. The message is displayed while the current remote start event remains active (about 15 minutes), until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to ON, whichever occurs first.
- **Remote Start Abort Messages** - Each time the IC receives a combination of electronic **remote start abort** and **door ajar** , **hood ajar** , **liftgate ajar** or **low fuel** messages from the BCM the **REMOTE START ABORTED** and appropriate **DOOR AJAR** , **HOOD AJAR** , **LIFTGATE AJAR** or **FUEL LOW** textual messages are displayed. The messages are displayed while the current remote start event remains active (about 15 minutes), until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to ON, whichever occurs first.
- **Remote Start Disabled Messages** - Each time the IC receives an electronic **remote start disabled** message from the BCM the **REMOTE START DISABLED - START VEHICLE TO RESET** textual message is displayed. The message is displayed while the current remote start event remains active (about 15 minutes), until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to START, whichever

occurs first.

The BCM continually monitors the remote start system inputs and the RF Hub to determine the proper outputs to the remote start components. The BCM then sends the proper lamp-ON or lamp-OFF message to the IC.

For proper diagnosis of the remote start system, the RF hub, the BCM, the IC, the CAN data bus or the electronic communication related to remote start indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SEAT BELT INDICATOR

The seat belt indicator gives an indication to the vehicle operator of the status of the driver side front seat belt (export market vehicles) or driver and passenger front seat belts (domestic market vehicles). This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received over the CAN data bus from the ORC.

The seat belt indicator also includes a programmable enhanced seat belt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This BELTMINDER feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seat belt indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the seat belt indicator for the following reasons:

- **Seat Belt Reminder Function** - Each time the IC receives a battery current input on the fused ignition switch (run-start) circuit, the indicator will be illuminated as a seat belt reminder for about six seconds, or until the ignition switch status transitions to OFF, whichever occurs first. This reminder function will occur regardless of the status of the seat belt switch input to the ORC.
- **Front Seat Belt Not Buckled - Beltminder Active** - Following the seat belt reminder function, each time the IC receives an electronic **seat belt indicator lamp-On** message from the ORC while the ignition switch status is START or ON, the indicator will be illuminated. In addition, if the front seat belt remains unbuckled about 18 to 25 seconds after the conclusion of the seat belt reminder function with the vehicle speed greater than about 8 kilometers-per-hour (5 miles-per-hour), the seat belt indicator will begin to cycle between flashing ON and OFF for 3 seconds, then lighting solid for 2 seconds. The seat belt indicator will continue to cycle between flashing and solid illumination for 13 complete cycles, until the seat belt switch sense inputs to the ORC are closed circuits (seat belt switch closed = seat belt buckled), or until the ignition switch status transitions to OFF, whichever occurs first.
- **Front Seat Belt Not Buckled - Beltminder Inactive** - Following the seat belt reminder function, each time the IC receives an electronic **seat belt indicator lamp-On** message from the ORC while the ignition switch status is START or ON, the indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the ORC or until the ignition

switch status transitions to OFF, whichever occurs first.

Each seat belt switch is connected in series between source current and a sense circuit from the ORC. The ORC continually monitors the seat belt switch circuits then sends the proper lamp-on or lamp-off messages to the IC. The seat belt switch inputs to the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the ORC, the IC, the CAN data bus or the electronic communication related to seat belt indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SECURITY INDICATOR

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On vehicles equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. This indicator is controlled by a transistor on the IC circuit board based upon a hard wired input to the IC from the BCM and electronic messages received by the BCM from the RF hub over the CAN data bus. The BCM will illuminate the security indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The security indicator LED is completely controlled by the BCM logic circuit, and that logic will allow this indicator to operate whenever the BCM receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the BCM. Depending upon the programmed condition the indicator can be illuminated solid, flashed at a slow rate (0.5 Hertz, 12.5 percent duty cycle), or flashed at a fast rate (1 Hertz, 50 percent duty cycle). The IC will turn ON the security indicator for the following reasons:

- **VTSS Indication** - During the 16 second VTSS arming function, the BCM will flash the security indicator ON and OFF repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the BCM flashes the security indicator ON and OFF continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the BCM will flash the security indicator at a steady, slow rate for about 30 seconds after the VTSS is disarmed.
- **SKIS Indicator Lamp-On Message** - Each time the BCM receives an electronic **SKIS indicator lamp-ON** message from the RF hub, the security indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the RF hub message. The indicator remains illuminated solid or continues to flash until the BCM receives a lamp-OFF message from the RF hub, or until the ignition switch status transitions to OFF, whichever occurs first. For more information on the SKIS and the security indicator control parameters. Refer to **OPERATION** .
- **SKIS Textual Message** - When the RF hub detects certain monitored conditions or is placed in the programming mode it will send electronic messages requesting the IC display textual messages, and the appropriate textual message or combination of messages is illuminated in the electronic display unit. **PROGRAMMING ACTIVE** , **NEW KEY PROGRAMMED** , **REMOTE KEY BATTERY LOW** and **SERVICE SECURITY KEY** messages appear individually, while a **KEY NOT PROGRAMMED** message is followed by either a **DAMAGED KEY** , **INVALID KEY** or

EXCEEDED KEY PROGRAM LIMIT message and an **INVALID KEY** message is followed by a **TRY ALTERNATE KEY** message. The textual messages related to key programming are active only on vehicles sold in markets where customer programming is an available feature of the SKIS.

- **Communication Error** - If the BCM receives no lamp-ON or lamp-OFF messages from the RF hub for 10 consecutive message cycles, the security indicator is illuminated by the BCM. The indicator remains controlled and illuminated by the BCM until a valid lamp-ON or lamp-OFF message is received from the RF hub.

The BCM circuitry controls the security indicator whenever the ignition switch status is OFF and the VTSS is arming, armed, or alarming. Whenever the ignition switch status is ON or START, RF hub performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present within the vehicle. The RF hub then sends the proper lamp-ON or lamp-OFF message to the BCM. If the BCM flashes the security indicator when the ignition switch transitions to ON, or turns ON the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is ineffective.

For proper diagnosis of the VTSS, the SKIS, the BCM, the RF hub, the IC, the CAN data bus or the electronic communication related to security indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SERVICE COLUMN LOCK INDICATOR

The service column lock indicator gives an indication to the vehicle operator when the RF hub has recorded a DTC for a steering column shaft lock module circuit or component malfunction. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the RF hub over the CAN data bus.

The service column lock indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the service column lock indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the service column lock indicator for the following reasons:

- **Service Column Lock Indicator Lamp-On Message** - Each time the IC receives an electronic **service column lock indicator lamp-ON** message from the RF hub, the service column lock indicator will be illuminated. The indicator remains illuminated for about five seconds, until the IC receives a lamp-OFF message from the RF hub, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.

The RF hub continually monitors the steering column shaft lock module circuits and components to determine the condition of the system. The RF hub then sends the proper lamp-ON or lamp-OFF message to the IC.

For proper diagnosis of the shaft lock module, the RF hub, the IC, the CAN data bus or the electronic communication related to service column lock indicator operation a diagnostic scan tool is required.

Refer to the appropriate diagnostic information.

TRACTION CONTROL INDICATOR

The traction control indicator gives an indication to the vehicle operator when the Electronic Stability Control (ESC) / Traction Control System (TCS) has been activated. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the CAB over the CAN data bus. The IC will illuminate the traction control indicator for about four seconds as a bulb test each time the ignition switch status transitions to ON.

The traction control indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch status is anything except ON or START. The indicator only illuminates when it is provided a path to ground by the IC circuitry. The IC will turn ON the traction control indicator for the following reasons:

- **Traction Control Indicator Lamp-On Message** - Each time the IC receives an electronic **traction control indicator lamp-ON** message from the CAB indicating that the ESC/TCS has been activated, the traction control indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the CAB message. The indicator remains illuminated solid or continues to flash until the IC receives a lamp-OFF message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.

The CAB continually monitors the traction control switch to determine the proper outputs to the components of the Antilock Brake System (ABS). The CAB then sends the proper lamp-ON or lamp-OFF message to the IC.

For proper diagnosis of the traction control switch, the ESC/TCS, the CAB, the IC, the CAN data bus or the electronic communication related to traction control indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRANSMISSION TEMPERATURE INDICATOR

The transmission over-temperature indicator gives an indication to the vehicle operator when the transmission fluid temperature is excessive, which may lead to accelerated transmission component wear or failure. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the TCM.

The transmission over-temperature indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the transmission over-temperature indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the transmission over-temperature indicator for the following reasons:

- **Trans Over-Temp Indicator Lamp-On Message** - Each time the IC receives an electronic **trans over-temp indicator lamp-ON** message from the TCM indicating that the fluid temperature is too high, the transmission over-temperature indicator will be illuminated and a

single chime tone is sounded. The indicator remains illuminated for about five seconds, until the IC receives a lamp-OFF message from the TCM, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the indicator is cycled OFF and then ON again by the appropriate lamp-ON and lamp-OFF messages from the TCM.

The TCM continually monitors the transmission temperature sensor to determine the transmission operating condition. The TCM then sends the proper lamp-ON or lamp-OFF message to the IC. If the IC illuminates the transmission over-temperature indicator due to a high transmission oil temperature condition, it may indicate that the transmission or the transmission cooling system are being overloaded or that they require service.

For proper diagnosis of the transmission temperature sensor, the TCM, the IC, the CAN data bus or the electronic communication related to transmission over-temperature indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TURN SIGNAL INDICATORS

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on the IC cluster electronic circuit board based upon cluster programming and electronic messages received from the BCM over the CAN data bus.

Each turn signal indicator Light Emitting Diode (LED) unit is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the turn signal indicators for the following reasons:

- **Turn Signal Indicator Lamp-On Message** - Each time the IC receives an electronic **right** or **left turn signal indicator lamp-On** message from the BCM over the CAN data bus, the appropriate turn signal indicator will be flashed on and off. The BCM messages to the IC also control the flash rate of the turn signal indicators, as well as the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional turn signal flasher. The turn signal indicators continue to flash on and off until the IC receives a lamp-OFF message from the BCM, or until the ignition switch status transitions to OFF, whichever occurs first.
- **Hazard Warning Indicator Lamp-On Message** - Each time the IC receives an electronic **hazard warning indicator lamp-On** message from the BCM over the CAN data bus, both turn signal indicators will be flashed on and off. The BCM messages to the IC also control the flash rate of the turn signal indicators, as well as the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The turn signal indicators continue to flash on and off until the IC receives a lamp-OFF message from the BCM.
- **Turn Signal-On Textual Warning Message** - When the BCM detects that a turn signal has

been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour) a **TURN SIGNAL ON** textual message and flashing right or left turn signal icon will appear within the IC electronic display unit and a chime tone will be sounded.

- **Lamp Out Mode** - If the BCM detects an ineffective turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message to the IC. The IC then increases the flash rate of the turn signal indicators and the click rate of the electromechanical relay to provide an indication of the problem to the vehicle operator.

The IC continually monitors electronic messages from the BCM to determine the proper turn signal and hazard warning indicator operation.

For proper diagnosis of the turn signal and hazard warning system, the multi-function switch, the BCM, the IC, the CAN data bus or the electronic communication related to turn signal indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WAIT-TO-START INDICATOR

The wait-to-start indicator gives an indication to the vehicle operator when the diesel engine is too cool for efficient and reliable engine starting, and the engine glow plugs are energized in their preheat operating mode. This indicator is controlled by the IC logic circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus.

The wait-to-start indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the wait-to-start indicator for the following reasons:

- **Wait-To-Start Indicator Lamp-On Message** - Each time the IC receives an electronic **wait-to-start indicator lamp-ON** message from the PCM indicating that the air temperature is too cool for efficient and reliable engine starting and the glow plugs are energized in their preheat mode, the wait-to-start indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the PCM, until the PCM detects that the engine is running, or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the glow plug control circuits to determine when they are energized in their preheat operating mode. The PCM then sends the proper lamp-ON or lamp-OFF message to the IC. For proper diagnosis of the wait-to-start indicator, the PCM, the IC, the CAN data bus or the electronic communication related to wait-to-start indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WASHER FLUID INDICATOR

The washer fluid indicator gives an indication to the vehicle operator that the fluid level in the washer reservoir is low. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received from the BCM over the CAN data bus.

The washer fluid indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the washer fluid indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the washer fluid indicator for the following reasons:

- **Washer Fluid Indicator Lamp-On Message** - Each time the IC receives an electronic **washer fluid indicator lamp-ON** message from the BCM indicating that a low washer fluid condition has been detected for 60 consecutive seconds, the washer fluid indicator is illuminated and a single chime tone is sounded. The indicator remains illuminated until the IC receives lamp-OFF messages for 60 consecutive seconds from the BCM, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the washer fluid indicator is cycled OFF and then ON again by the appropriate lamp-ON and lamp-OFF messages from the BCM.

The BCM continually monitors the washer fluid level switch in the washer reservoir to determine the level of the washer fluid. The BCM then sends the proper lamp-ON or lamp-OFF message to the IC.

For proper diagnosis of the washer fluid level switch, the BCM, the IC, the CAN data bus or the electronic communication related to washer fluid indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WATER-IN-FUEL INDICATOR

The water-in-fuel indicator gives an indication to the vehicle operator when there is excessive water in the fuel system. This indicator is controlled by the IC based upon programming and electronic messages received from the PCM over the Controller Area Network (CAN) data bus.

The water-in-fuel indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch status is anything except ON or START. The icon only illuminates when it is provided a path to ground by the IC transistor. Each time the ignition switch status transitions to ON the water-in-fuel indicator is illuminated for about two seconds as a bulb test. The water-in-fuel indicator will be turned ON for the following reasons:

- **Water-In-Fuel Indicator Lamp-On Message** - Each time the IC receives an electronic **water-in-fuel lamp-ON** message from the PCM indicating that there is excessive water in the diesel fuel system, the water-in-fuel indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the PCM, or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the water-in-fuel sensor to determine whether there is excessive water in the diesel fuel system. The PCM then sends the proper lamp-ON or lamp-OFF message to the IC. For proper diagnosis of the water-in-fuel operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

POD, SWITCH BANK

DESCRIPTION

DESCRIPTION

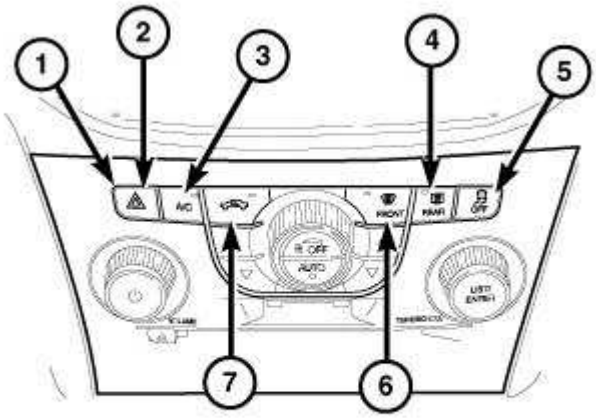

Fig. 12: Accessory Switch Bank Module (ASBM), Hazard Warning/A/C On/Off Switch, Stability Control
Courtesy of CHRYSLER GROUP, LLC

The Accessory Switch Bank Module (ASBM) (1) for this vehicle is located in the center stack area of the instrument panel. The accessory switch back, the a/c and heater controls, and the radio hard controls are a complete unit and only serviced as such. This switches vary from a single momentary push button switch, to momentary push button switches; depending on the equipment or systems they support. The unit includes the following switches:

- **Hazard Warning Switch (2)**
- **A/C On/Off switch (3)**
- **Rear Defroster On/Off switch (4)**
- **Electronic Stability Control Off (5)**
- **Windshield defroster On/Off switch (6)**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the switch bank cannot be repaired and are not serviced individually. If any component

within the switch bank is ineffective or damaged, the complete assembly must be replaced.

OPERATION

OPERATION

For information covering details of operation for the individual switches or indicator contained within the instrument panel switch bank, refer to the specific service information covering the system to which that switch or indicator belongs.

- **Air Conditioning control Switches** (all models) - Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .
- **Front and Rear Defroster Control switches** (all models) - Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .
- **Electronic Stability Control (ESC) On/Off** - Refer to **DESCRIPTION** .
- **Hazard Switch** (all models) - Refer to **SWITCH, HAZARD WARNING, DESCRIPTION** .

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

SWITCH-BANK AND BEZEL ASSEMBLY

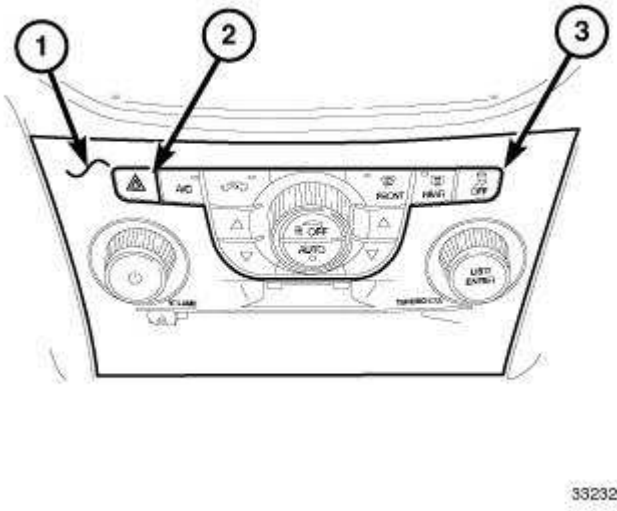

Fig. 13: Guide Pins & Switch-Bank Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

CAUTION: Use care when removing or installing the cubby bin, not to damage or distort the guide pins (4) on either side.

2. Using a trim stick, pry the switch-bank panel (1) away from the IP, and release the clips that secure the switch-bank to the IP.

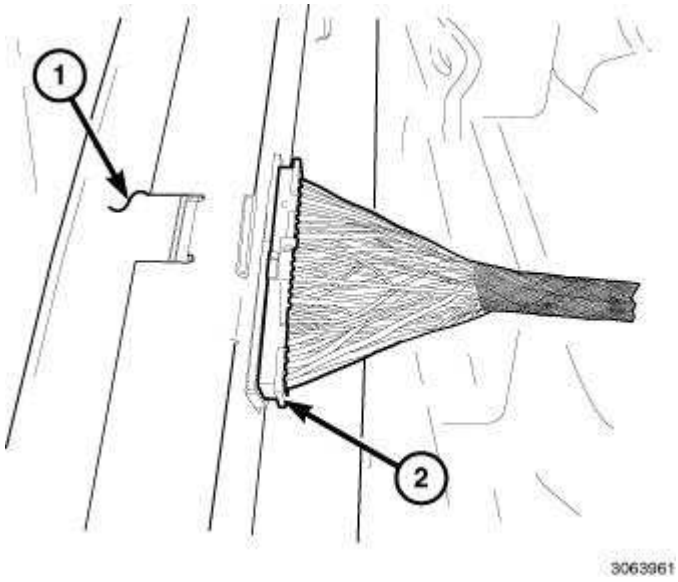

Fig. 14: Switch-Bank Panel & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (2) from the back of the switch-bank assembly (1). Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, REMOVAL** .
4. Remove the switch-bank assembly from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

SWITCH-BANK AND BEZEL ASSEMBLY

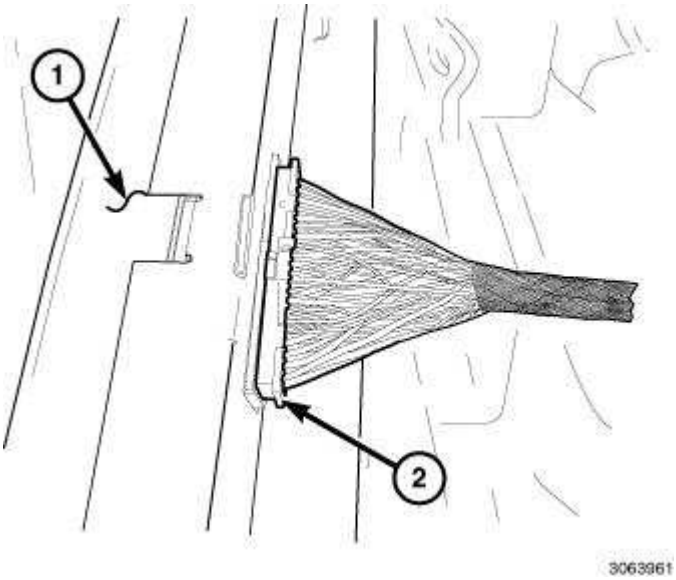

Fig. 15: Switch-Bank Panel & Electrical Connector
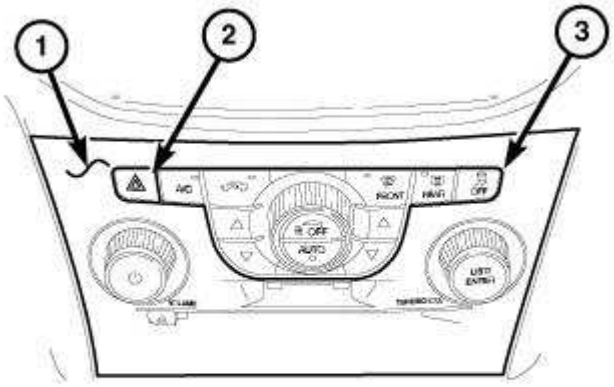
Courtesy of CHRYSLER GROUP, LLC

1. Position the switch-bank assembly in place.
2. Connect the electrical connector (2) to the back of the switch-bank assembly (1).



3323204

Fig. 16: Guide Pins & Switch-Bank Panel
Courtesy of CHRYSLER GROUP, LLC

3. Position the switch-bank panel (1) in the IP and press firmly to engage the clips, securing the switch-bank to the IP.
4. Connect the negative battery cable.

ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Interior - Service Information - Chrysler 300

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. Refer to SPECIFICATIONS. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The interior lighting system for this vehicle includes both incandescent and Light Emitting Diode (LED) unit lighting on several separate circuits. The lamps in the interior lighting system include:

- **Center Floor Console Cup Holder Lamps** - The cup holders in the center floor console include a standard equipment light pipe around their inside perimeter illuminated by LED lamp units to assist visibility at night. These lamps are controlled by the panel lamps dimmer circuit and illuminate whenever the exterior lighting is turned ON.
- **Center Floor Console Forward Storage Bin Lamp** - The forward storage bin in the center floor console on some models is illuminated by an LED lamp unit located in the overhead console to assist visibility at night. This lamp is controlled by the exterior lighting circuit and illuminates whenever the exterior lighting is turned ON.
- **Center Floor Console Universal Serial Bus Connector Lamp** - The Universal Serial Bus (USB) connector in the center floor console on some models includes an LED lamp unit to assist visibility at night. This lamp is controlled by the courtesy lamp circuit and illuminates whenever the interior courtesy lamps are turned ON.
- **Door Entry And Exit Lamps** - Door entry and exit lamps (also known as puddle lamps) on some models include an incandescent lamp unit on the underside of each door trim panel that illuminate the ground outside the opened doors to assist visibility at night. These lamps are controlled by the courtesy lamps circuit and illuminate whenever the interior courtesy lamps are turned ON.
- **Door Inside Handle Lamps** - Door inside latch release handle pockets on models with the ambient lighting package include an LED lamp unit to assist visibility at night. These lamps are controlled by both the ambient lamps dimmer circuit and the courtesy lamps circuit. These lamps are illuminated whenever the ambient lighting or the courtesy lighting is turned ON, and

are dimmable only when the ambient lighting is turned ON while the exterior lighting is also turned ON.

- **Door Map Pocket Lamps** - Door trim panel map pockets on models with the ambient lighting package include an LED lamp unit to assist visibility at night. These lamps are controlled by both the ambient lamps dimmer circuit and the courtesy lamps circuit. These lamps are illuminated whenever the ambient lighting or the courtesy lighting is turned ON, and are dimmable only when the ambient lighting is turned ON while the exterior lighting is also turned ON.
- **Front Dome Lamps** - Front seat driver side and passenger side incandescent dome lamps are located behind a lens shared with the LED map/reading lamps in the overhead console. The dome lamps are controlled by the courtesy lamp circuit and by independent lens-actuated switches.
- **Front Map/Reading Lamps** - Front seat driver side and passenger side LED map/reading lamps are located behind a lens shared with the incandescent dome lamps in the overhead console. The map/reading lamps are controlled by the courtesy lamp circuit and by independent push button switches in the overhead console.
- **Glove Box Lamp** - A standard glove box lamp with an integral plunger-actuated switch is located at the upper outboard corner of the instrument panel lower glove box opening and illuminates whenever the glove box door is opened.
- **Instrument Panel Courtesy Lamps** - Vehicles equipped with the optional instrument panel courtesy lamps have two LED lamp units mounted to the closeout panel located under each side of the instrument panel. These lamps are controlled by the courtesy lamps circuit and illuminate whenever the interior courtesy lamps are turned ON.
- **Rear Map/Reading Lamps** - Optional rear seat incandescent map/reading lamps are located behind a lens integral to the grab handle unit located on each roof side rail above the rear door openings. The map/reading lamps are controlled by the courtesy lamp circuit and by independent lens-actuated switches.
- **Trunk Lamps** - Standard trunk lamps are located in the right and left trunk trim panels and are activated automatically whenever the deck lid is opened to illuminate the trunk of the vehicle.
- **Vanity Lamps** - Optional single-intensity vanity lamps are located on both sides of a covered mirror on both the right and left sun visors. These lamps are controlled by an integral vanity mirror cover-actuated switch.

Most controls on the instrument panel and elsewhere in the interior of the vehicle are illuminated by the panel lamps dimmer circuit for night visibility. All have miniature incandescent bulbs, Light-Emitting Diode (LED) units or a combination of the two lighting types that are soldered to internal circuit boards and are not serviceable.

Other components of the interior lighting system for this vehicle include:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Deck Lid Ajar Switch** - A deck lid ajar switch is integral to the latch mechanism of the deck lid.
- **Dimmer Module** - A dimmer module is located on the left side of the instrument panel, below

and outboard of the steering column just inboard from the headlamp switch. The dimmer module features a vertical thumbwheel for selecting the panel lamps dimming level, a PARADE mode to illuminate all Vacuum Fluorescent Display (VFD) units at full brightness for visibility when driving in daylight with the exterior lighting turned ON. There are also detent positions to turn ON all interior courtesy lighting, and a DEFEAT position that overrides door ajar switch control of interior lighting. On vehicles equipped with the ambient lighting option the dimmer module includes a second thumbwheel dedicated to the ambient lighting, which allows the selection of the ambient lighting dimming level while the exterior lighting is turned ON and includes a detent position that turns the ambient lighting OFF.

- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door.
- **Door Module** - An electronic door control module (also known as the Driver Door Module/DDM or Passenger Door Module/PDM) is concealed behind the front door trim panel where it is secured through two integral mounting tabs to the inner door panel. Refer to **MODULE, DOOR, DESCRIPTION** .
- **Trunk Ajar Switch** - A trunk ajar switch is integral to the deck lid latch mechanism.

Hard wired circuitry connects the interior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the interior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The lamps of the interior lighting system can be divided into general classifications based upon the circuit that controls their operation: The courtesy lamp circuit, the reading lamps circuit and the panel lamps dimmer circuit. In vehicles equipped with the optional ambient lighting package, the ambient lights are actually controlled by the courtesy lamp circuit as well as by dedicated ambient lighting outputs based upon an input from the ambient lighting thumbwheel of the dimmer module. Following are paragraphs that briefly describe the operation of the courtesy lamps, reading lamps and panel lamps dimmer interior lighting circuits.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that

provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

COURTESY LAMP CIRCUIT

Depending upon the selected vehicle options, the courtesy lamp circuit may include either the dome or map and reading lamps located in the overhead console near the windshield, the map and reading lamp integral to the grab handle above each rear door opening, the trunk lamp located in the left trunk trim panel, the glove box lamp in the top of the glove box opening in the instrument panel and the vanity lamps located in the sun visors.

The lamps in the courtesy lamp circuit are provided with a path to ground at all times. The Body Control Module (BCM) (also known as the Common Body Controller/CBC) controls the output of battery voltage for the courtesy lamps in this circuit based upon hard wired inputs from the dimmer module and electronic message inputs from the ignition switch (also known as the Keyless Ignition Node/KIN) and the Radio Frequency (RF) Hub.

After all of the ajar switch inputs to the BCM transition to open, the BCM will keep the courtesy lamps illuminated for about 30 seconds, then fade the lamps to OFF (theater dimming) over about 3 seconds. The BCM also provides courtesy lamp operation based upon a resistor multiplexed input from the interior lighting thumbwheel of the dimmer module, and provides an Illuminated Entry feature in response to certain electronic **ignition switch status** message inputs received from the KIN, the RF Hub and the Occupant Restraint Controller (ORC) over the CAN data bus. A courtesy lamp DEFEAT mode input based upon a resistor multiplexed input from the interior lighting thumbwheel of the dimmer module thumbwheel will cause the BCM to override normal courtesy lamp operation.

The BCM provides a battery saver (load shedding) feature for all courtesy lamps, which will automatically turn these lamps OFF if they are left ON for more than about 10 minutes after the electronic **ignition switch status** message transitions to OFF. If any courtesy lamp input is received subsequent to a 10 minute load shed and prior to a new ignition cycle, the courtesy lamps will turn OFF after 90 seconds.

AMBIENT LIGHTING

Vehicles equipped with the ambient lighting option have a second, dedicated ambient lighting thumbwheel located in the dimmer module. This thumbwheel controls the Light Emitting Diode (LED) units in the inside door latch release handle pockets and the door map pockets. The ambient lighting can be turned ON at full brightness or OFF using the ambient lighting thumbwheel. When the exterior lighting is turned ON, the ambient lighting can be dimmed using the ambient lighting thumbwheel. The ambient lighting is also controlled by the courtesy lamp circuit and will be turned ON at full brightness whenever the other courtesy lamps are turned ON, regardless of the ambient lighting thumbwheel setting.

The ambient lighting thumbwheel provides a resistor multiplexed input to the BCM. The BCM controls the front door ambient lighting using electronic messages sent to the door modules (also known as the Driver Door Module/DDM and Passenger Door Module/PDM) over the CAN data bus. The door

modules then regulate the voltage output to the front door ambient lighting LED units accordingly. The BCM provides direct hard wired outputs to control the rear door ambient lighting LED units.

READING LAMP CIRCUIT

For those lamps on the courtesy lamp circuit with independent switching such as the map and reading lamps, the optional vanity lamps and the glove box lamp, the BCM also provides a battery voltage output to those switches through a separate reading lamp circuit. The BCM provides a battery saver (load shedding) feature for the reading lamp circuit as well as the courtesy lamp circuit, which will automatically turn these lamps OFF if they are left ON for more than about 10 minutes after the electronic **ignition switch status** message transitions to OFF. If any reading lamp input is received subsequent to a 10 minute load shed and prior to a new ignition cycle, the courtesy lamps will turn OFF after 90 seconds.

PANEL LAMPS DIMMER CIRCUIT

The panel lamps dimmer circuit actually includes several circuits. These circuits control the back lighting illumination and dimming level of the headlamp switch, the dimmer module, the automatic transmission gear selector bezel lamp as well as the center floor console cup holder lamps. All lamps in the panel lamps dimmer circuits are provided a path to ground at all times through a hard wired ground circuit. These lamps are illuminated by a 12-volt Pulse Width Modulated (PWM) output of the BCM or the door control modules (also known as the Driver Door Module/DDM or Passenger Door Module/PDM) through several panel lamps dimmer circuits.

This shared PWM output synchronizes the selected illumination intensity level of all the lamps in the panel lamps dimmer circuits. The BCM uses hard wired resistor multiplexed inputs from the rotary exterior lighting control knob of the headlamp switch to determine when the exterior lighting is turned ON and from the thumbwheel of the dimmer module to determine the dimming level selection. Then the BCM provides the appropriate PWM outputs through the panel lamps dimmer circuits as well as electronic **dimming level** messages over the CAN data bus to other electronic modules in the vehicle.

The Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and the Integrated Center Stack (ICS) use the electronic **dimming level** messages to control the illumination intensity of their own back lighting, controls and display units. In addition, when the interior lighting thumbwheel of the dimmer module is moved to the PARADE (or funeral) mode detent position, all of the electronic display units are illuminated at their full intensity levels for increased visibility when the vehicle is driven during daylight hours with the exterior lighting turned ON. The PARADE mode has no effect on the illumination intensity of incandescent panel lamps.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTERIOR LIGHTING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the interior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The hard wired circuits between components related to the operation of the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ACRONYMS USED IN THE FOLLOWING SERVICE INFORMATION	
Body Control Module	BCM
Light-Emitting Diode	LED

COURTESY AND READING LAMP CIRCUITS

CONDITION	POSSIBLE CAUSES	CORRECTION
A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT ILLUMINATE	1. Ineffective or missing bulb (except LED lamps).	1. Test and replace the courtesy lamp bulb if required.
	2. Ineffective lamp switch.	2. Test and replace a dome lamp switch, dome/reading lamp switch, glove box lamp switch or vanity lamp switch if required.
	3. Ineffective ground circuit.	3. Test and repair the open ground circuit if required.
	4. Ineffective feed circuit.	4. Test and repair the open feed

		circuit if required.
ALL LAMPS IN THE COURTESY LAMP CIRCUIT DO NOT ILLUMINATE	1. Courtesy DEFEAT feature turned ON.	1. Turn courtesy DEFEAT feature OFF.
	2. Ineffective ground circuit.	2. Test and repair the open ground circuit if required.
	3. Ineffective or missing fuse.	3. Test and replace the fuse if required.
	4. Ineffective courtesy lamp control circuit.	4. Test and repair the courtesy lamp control circuit if required.
	5. Ineffective dimmer module.	5. Test and replace the dimmer module if required.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT EXTINGUISH	1. Ineffective lamp switch.	1. Test and replace a dome/reading lamp switch, glove box lamp switch or vanity lamp switch if required.
ALL LAMPS IN THE COURTESY LAMP CIRCUIT DO NOT EXTINGUISH	1. Ineffective ajar switch.	1. Test and replace a door ajar or liftgate ajar switch if required.
	2. Ineffective ajar switch sense circuit.	2. Test and repair the shorted ajar switch sense circuit if required.
	3. Ineffective dimmer module.	3. Test and replace the dimmer module if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.

PANEL LAMPS DIMMER CIRCUIT

NOTE: **As part of the exterior lighting failsafe feature, upon ignition ON all of the panel lamps dimmer circuit lamps will illuminate at full intensity and the exterior park lamps and headlamp low beams will illuminate regardless of the multi-function switch control knob and stalk positions if the Steering Control Module (SCM) cannot detect an input from the multi-function switch, or if there is a loss of data bus communication.**

CONDITION	POSSIBLE CAUSES	CORRECTION
A SINGLE LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb or Light Emitting Diode (LED) unit.	1. Test and replace the lamp bulb or LED unit if required.
	2. Ineffective ground circuit.	2. Test and repair the open lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair the open lamp feed circuit if required.

A SINGLE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair the shorted lamp feed circuit if required.
ALL LAMPS DO NOT ILLUMINATE	1. Ineffective ground circuit.	1. Test and repair the open lamp ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair the open lamp feed circuit if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
ALL LAMPS ILLUMINATE AT FULL INTENSITY AT IGNITION ON	1. Ineffective dimmer module.	1. Test and replace the dimmer module if required.
	2. Ineffective IC inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further IC diagnosis.
	3. Loss of data bus communication.	3. Use a diagnostic scan tool to test the data bus. Refer to the appropriate diagnostic information.

LAMP, COURTESY, CUPHOLDER

REMOVAL

REMOVAL

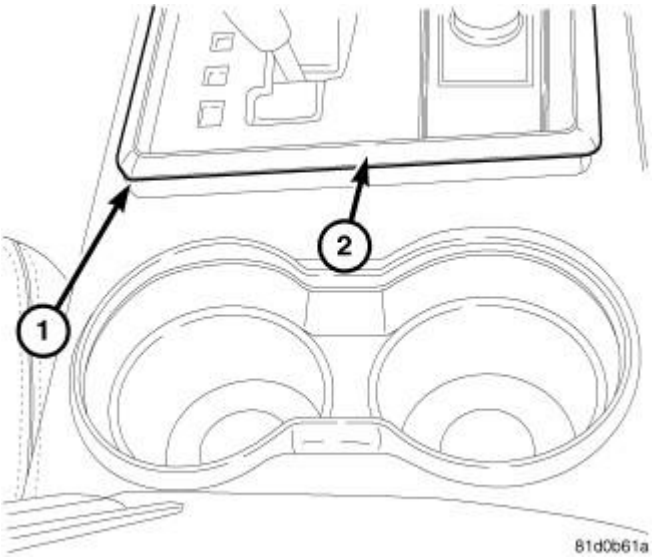

Fig. 1: Identifying Shifter Trim Ring
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the battery negative cable.
2. Place the shifter into the neutral position.
3. Insert a trim stick or equivalent at (1) and gently pry to remove the shifter trim ring (2).

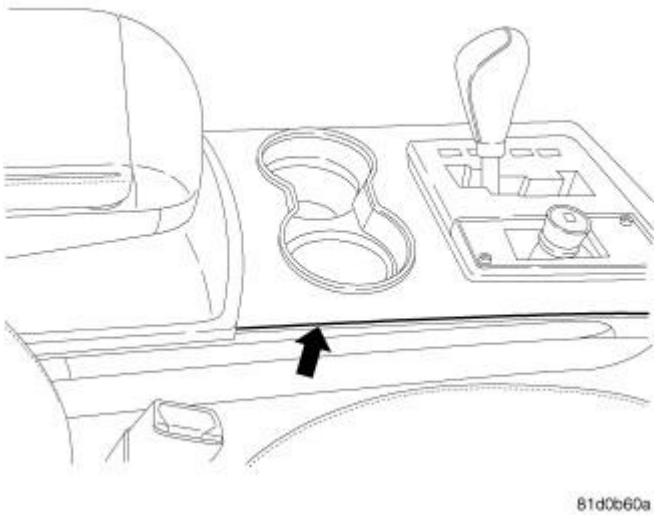

Fig. 2: Identifying Shifter Trim Ring
Courtesy of CHRYSLER GROUP, LLC

4. Insert a trim stick or equivalent at point (1) and gently pry to remove console trim from the center console.

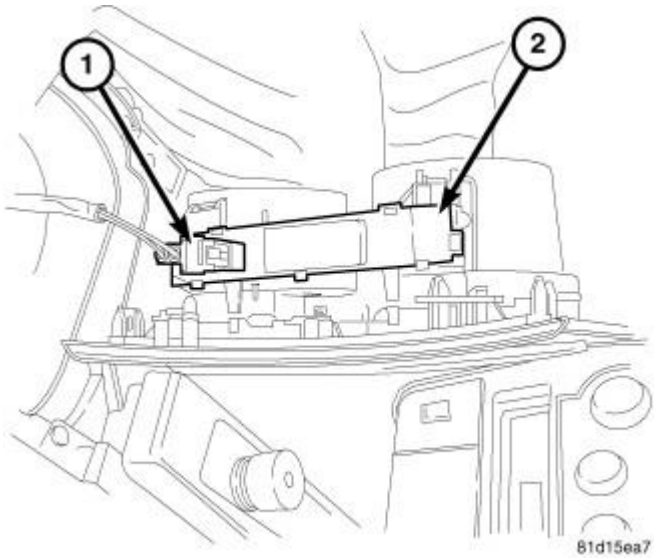

Fig. 3: Identifying Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the electrical connector (1) from the LED lamp unit (2).
6. Remove the LED lamp (2) from the center console by flexing the lock tabs on the unit.

INSTALLATION

INSTALLATION

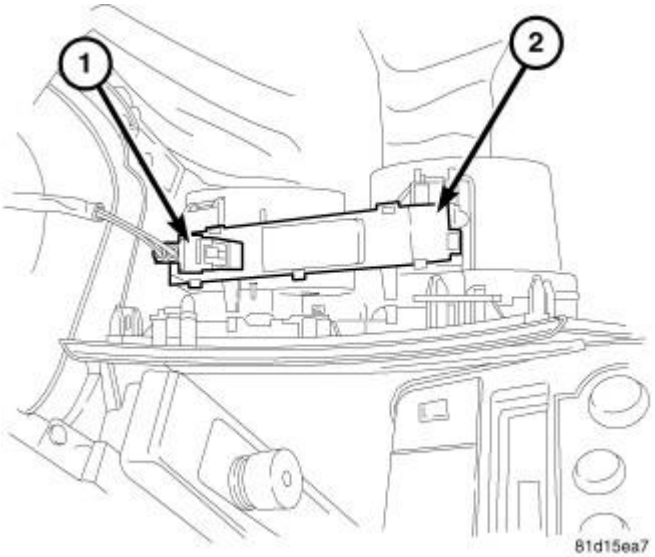

Fig. 4: Identifying Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install the LED lamp (2) into the center console trim by flexing the lock tabs.
2. Connect the electrical connector (1) to the lamp unit.

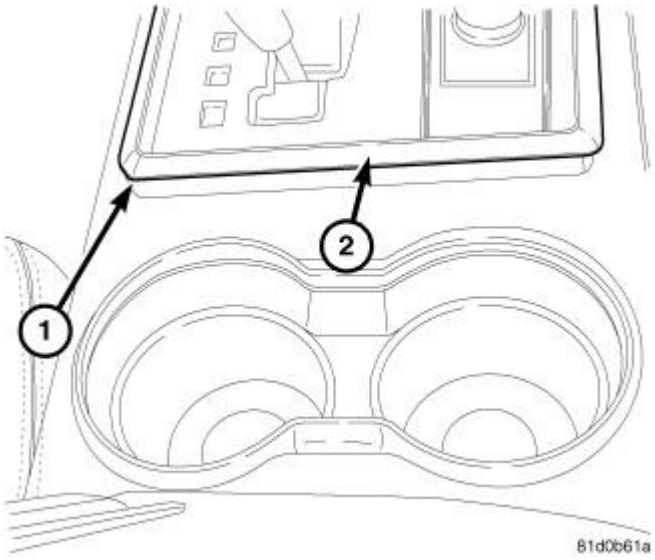

Fig. 5: Identifying Shifter Trim Ring
Courtesy of CHRYSLER GROUP, LLC

3. Install the console trim (1) to the center console.
4. Install the shifter trim ring (2) to the console
5. Connect the negative battery cable.

LAMP, DOME

REMOVAL

BULB - FRONT

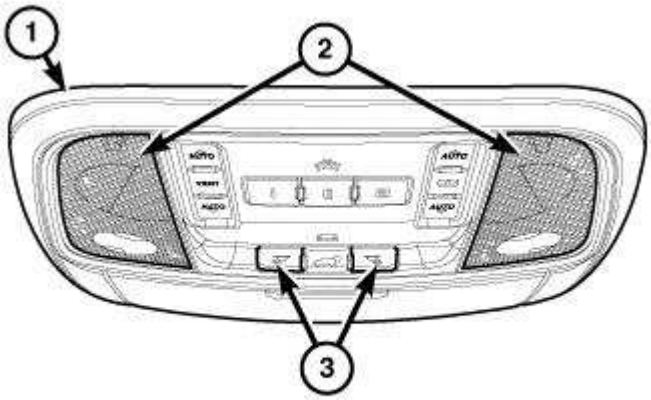

Fig. 6: Overhead Console, Lenses & Switches
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front dome and the front map/reading lamps are integral to the overhead console (1) in the headliner near the windshield. Both the incandescent dome lamps and the Light Emitting Diode (LED) map/reading lamps share the same two lenses (2) in the overhead console. Both the dome lamps and the map/reading lamps are turned ON and OFF by the door ajar switches or by the interior lighting thumbwheel of the headlamp switch. The front dome lamps can be turned ON independently by depressing the lamp lenses, while the front map/reading lamps are turned ON or OFF independently by the two map/reading lamp push button switches (3). The incandescent dome lamp bulbs are serviceable; however, the LED map/reading lamps as well as all of the switches, lamp housings, lenses and wiring are serviced only as a unit with the overhead console assembly.

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner, but do not disconnect it. Refer to **CONSOLE, OVERHEAD, REMOVAL** .

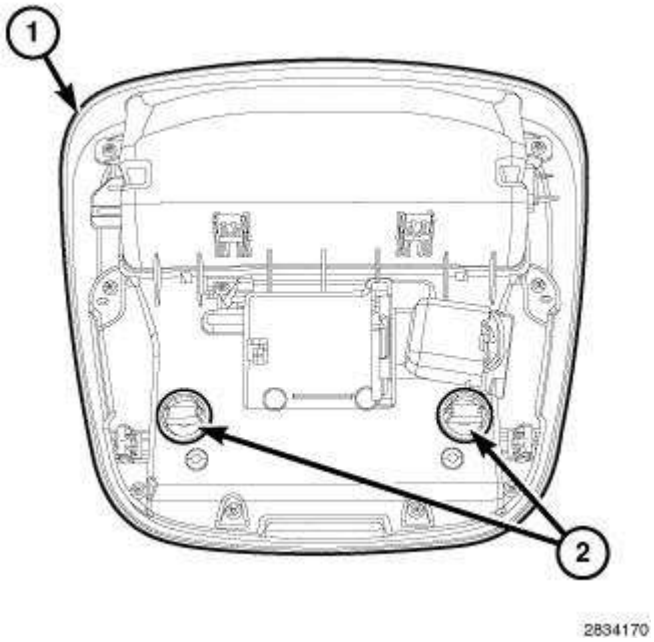

Fig. 7: Console & Bulb Holder Unit
Courtesy of CHRYSLER GROUP, LLC

3. Reach above the top of the over head console (1) to access and rotate the bulb and bulb holder unit (2) counterclockwise about 30 degrees to unlock it from the keyed opening in the lamp housing.
4. Pull the bulb holder and bulb straight out of the housing.

BULB - REAR

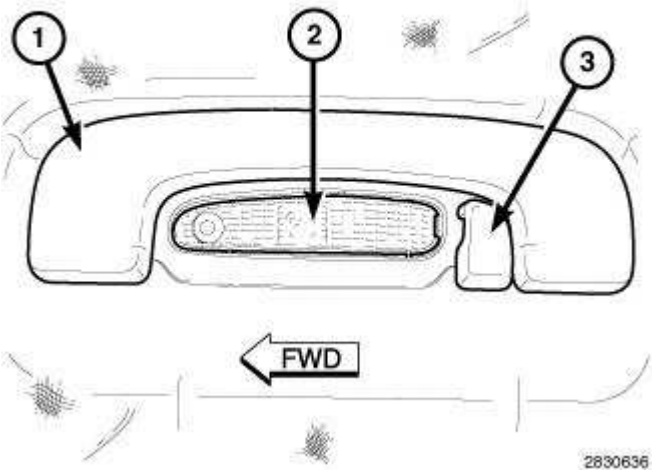

Fig. 8: Grab Handle & Reading Lamp Lens
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The rear dome/reading lamps are integral to the grab handle (1) in the headliner on the inner roof side rail over each outboard rear seating position. The lamp housing, switch and wiring are serviced only as a unit with the grab handle assembly.**

1. Disconnect and isolate the battery negative cable.
2. Using a small thin-bladed screwdriver, gently pry the forward end of the reading lamp lens (2) away from the grab handle far enough to unsnap it from the lamp housing.
3. Pull the front end of the lens outward far enough to disengage the larger rear lens tab from the lamp housing.

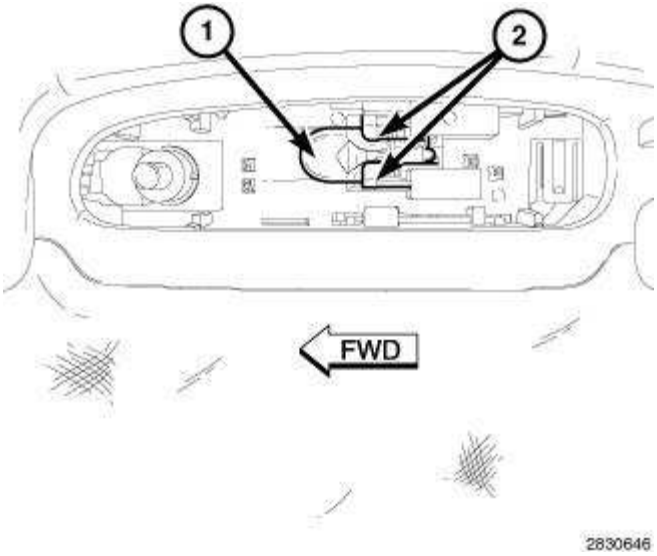

Fig. 9: Bulb & Bulb Holders
Courtesy of CHRYSLER GROUP, LLC

4. Pull the base of the bulb (1) straight forward out of the bulb holders (2) within the lamp housing.

INSTALLATION

BULB - FRONT

CAUTION: **Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.**

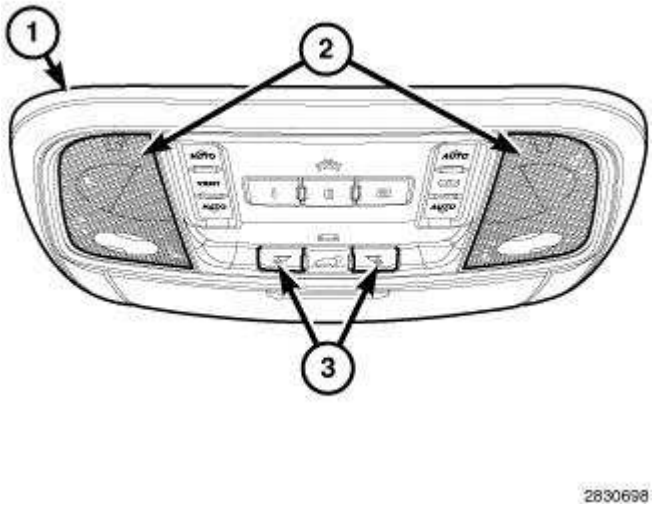

Fig. 10: Overhead Console, Lenses & Switches
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The front dome and the front map/reading lamps are integral to the overhead console (1) in the headliner near the windshield. Both the incandescent dome lamps and the Light Emitting Diode (LED) map/reading lamps share the same two lenses (2) in the overhead console. Both the dome lamps and the map/reading lamps are turned ON and OFF by the door ajar switches or by the interior lighting thumbwheel of the headlamp switch. The front dome lamps can be turned ON independently by depressing the lamp lenses, while the front map/reading lamps are turned ON or OFF independently by the two map/reading lamp push button switches (3). The incandescent dome lamp bulbs are serviceable; however, the LED map/reading lamps as well as all of the switches, lamp housings, lenses and wiring are serviced only as a unit with the overhead console assembly.**

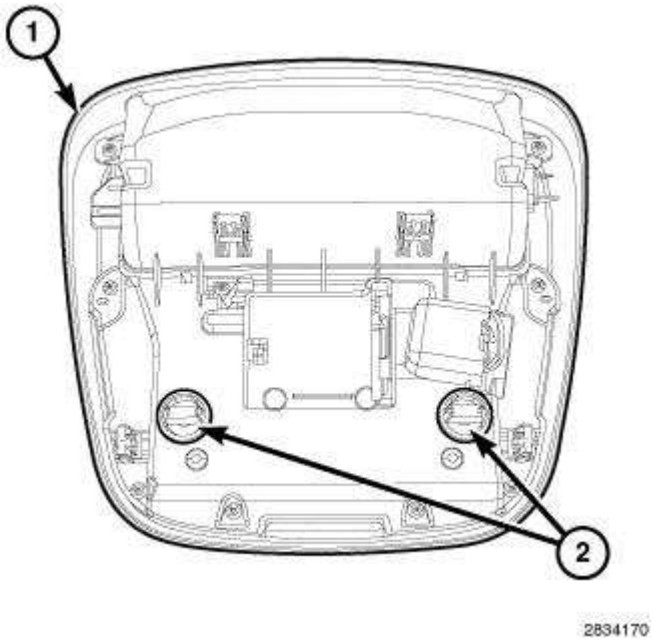

Fig. 11: Console & Bulb Holder Unit
Courtesy of CHRYSLER GROUP, LLC

1. Reach above the top of the overhead console (1) to align and insert the bulb and bulb holder unit (2) into the keyed opening of the overhead console lamp housing until the bulb holder is firmly seated.
2. Rotate the bulb and bulb holder unit clockwise about 30 degrees to lock it into place.
3. Reinstall the overhead console onto the headliner. Refer to **CONSOLE, OVERHEAD, INSTALLATION** .
4. Reconnect the battery negative cable.

BULB - REAR

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

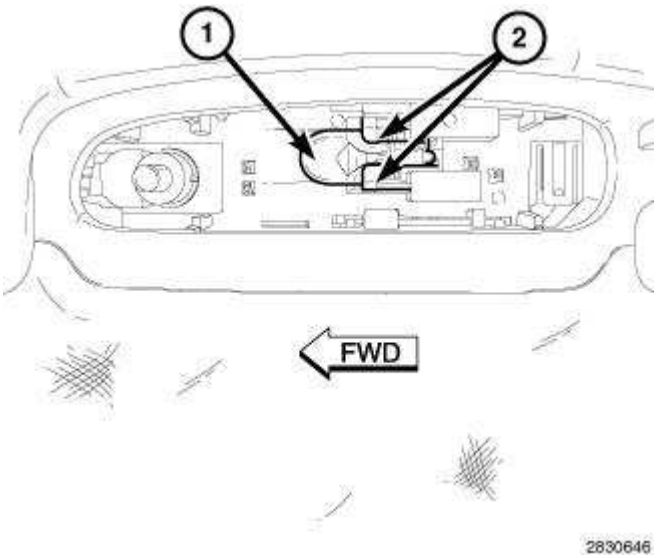

Fig. 12: Bulb & Bulb Holders
Courtesy of CHRYSLER GROUP, LLC

NOTE: The rear dome/reading lamps are integral to the grab handle in the headliner on the inner roof side rail over each outboard rear seating position. The lamp housing, switch and wiring are serviced only as a unit with the grab handle assembly.

1. Align the base of the bulb (1) with the bulb holders (2) within the rear reading lamp housing.
2. Push the bulb straight rearward into the bulb holders until the base is fully seated.

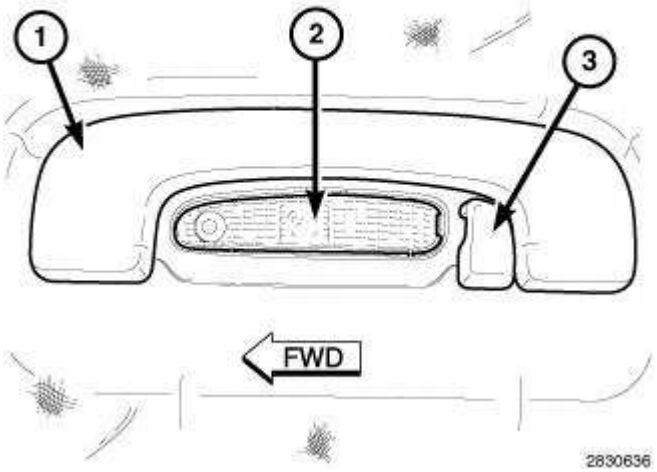

Fig. 13: Grab Handle & Reading Lamp Lens
Courtesy of CHRYSLER GROUP, LLC

3. Insert the large tab on the rearward end of the lamp lens (2) into the rear end of the lamp housing.

4. Using hand pressure, push the small tab at the front of the lens rearward and inward towards the lamp housing until it snaps into place.
5. Reconnect the battery negative cable.

LAMP, ENTRY AND EXIT

REMOVAL

BULB

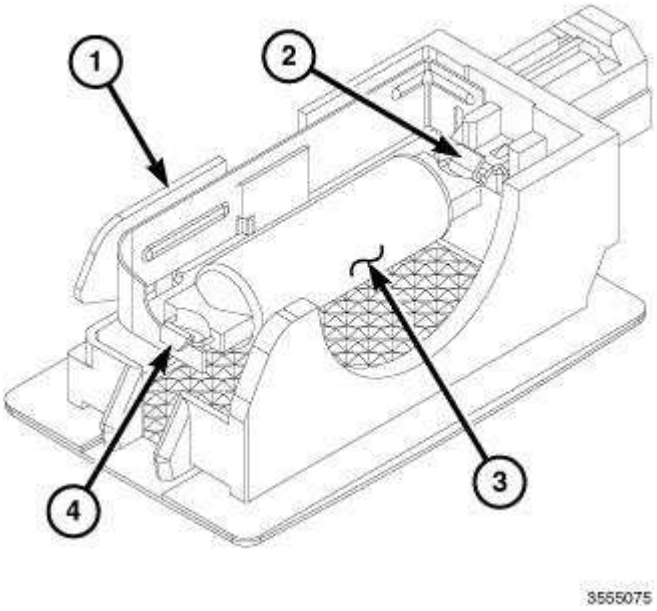

Fig. 14: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the entry and exit lamp unit (1) (also known as the puddle lamp) from the bottom of the front or rear door trim panel. Refer to **LAMP, ENTRY AND EXIT, REMOVAL**.
3. Gently press the movable bulb holder (4) and the bulb (3) towards the fixed bulb holder (2) far enough to disengage the wire loop terminal of the bulb from the hook of the fixed bulb holder.
4. Disengage the wire loop terminal of the bulb from the hook on the movable bulb holder.
5. Remove the bulb from the lamp.

LAMP

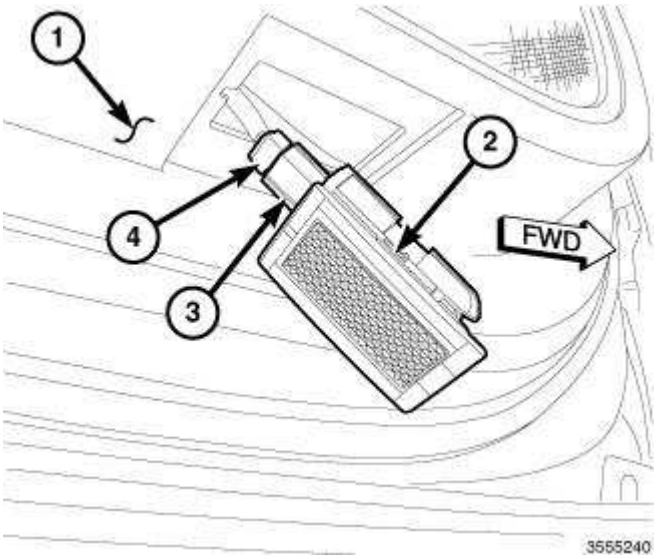

Fig. 15: Rear Door Trim Panel, Lens, Door Wire Harness Connector & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable flat wide-bladed tool, gently pry the forward (notched) edge of the entry and exit lamp (also known as the puddle lamp) lens (2) down from the mounting hole in the lower horizontal surface of the front or rear door trim panel (1).
3. Disconnect the door wire harness connector (4) from the connector receptacle (3) integral to the lamp housing.
4. Remove the lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

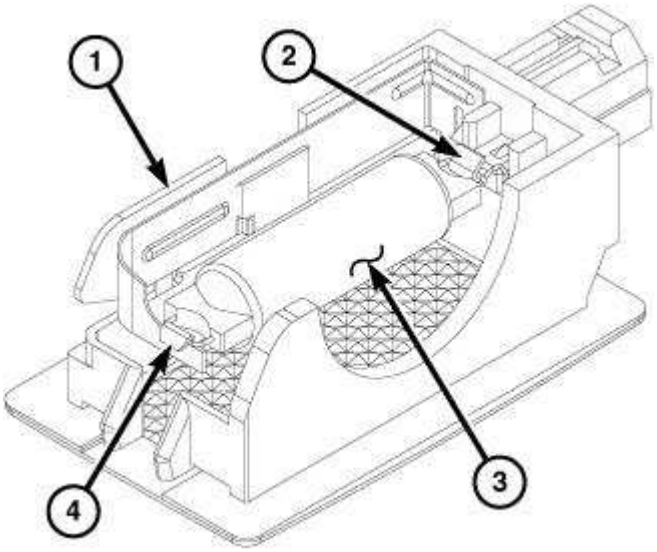

Fig. 16: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Engage the wire loop terminal on one end of the bulb (3) over the hook on the movable bulb holder (4).
2. Gently press the movable bulb holder and bulb towards the fixed bulb holder (2) far enough to engage the wire loop terminal over the hook on the fixed bulb holder, then release the movable bulb holder.
3. Reinstall the entry and exit lamp unit (1) (also known as the puddle lamp) into the bottom of the front or rear door trim panel. Refer to **LAMP, ENTRY AND EXIT, INSTALLATION**.
4. Reconnect the battery negative cable.

LAMP

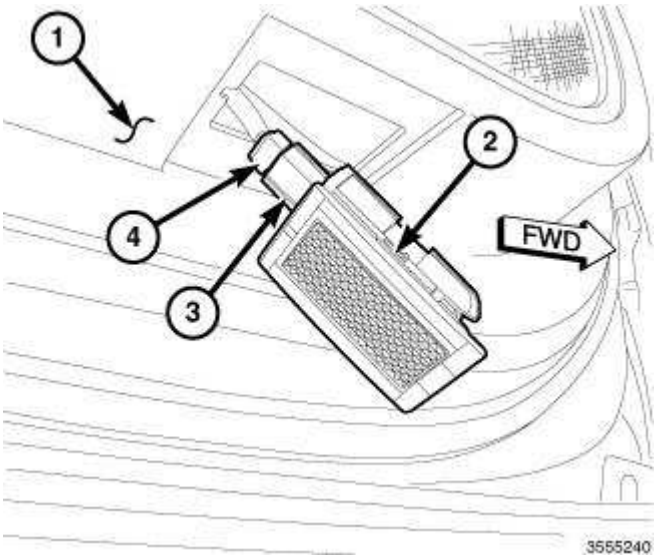

Fig. 17: Rear Door Trim Panel, Lens, Door Wire Harness Connector & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the entry and exit lamp (also known as the puddle lamp) to the mounting hole in the lower horizontal surface of the front or rear door trim panel (1).
2. Reconnect the door wire harness connector (4) to the connector receptacle (3) integral to the lamp housing.
3. Insert the connector end of the lamp into the rearward end of the mounting hole in the door trim panel far enough to engage the fixed retention tabs with the edge of the mounting hole.
4. Using hand pressure, press the front (notched) edge of the lamp lens (2) upward until the movable retention tabs snap into place and the lens is just proud of the trim panel.
5. Reconnect the battery negative cable.

LAMP, TRANSMISSION RANGE INDICATOR

REMOVAL

REMOVAL

1. Disconnect the battery negative cable.
2. Remove shift console trim ring and shift console trim panel. Refer to **CONSOLE, FLOOR, REMOVAL** .

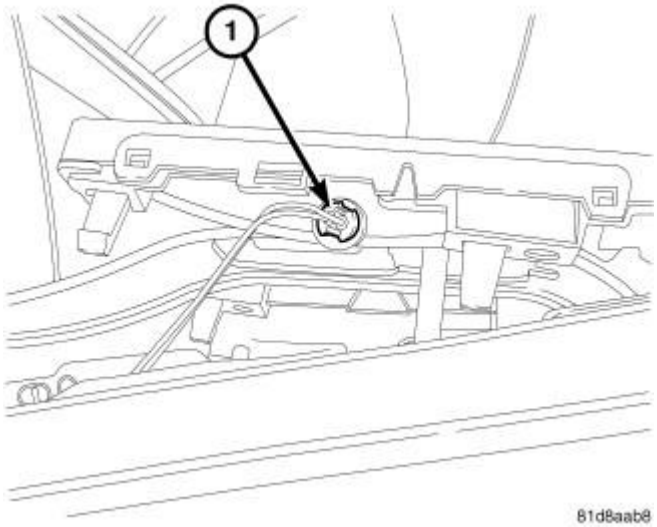

Fig. 18: Identifying Bulb Socket
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick or equivalent, gently pry up the shifter bezel lock tabs.
4. Grasp the bulb socket (1) and turn counter clockwise to remove from the shifter assembly.
5. Pull the bulb from the bulb socket.

INSTALLATION

INSTALLATION

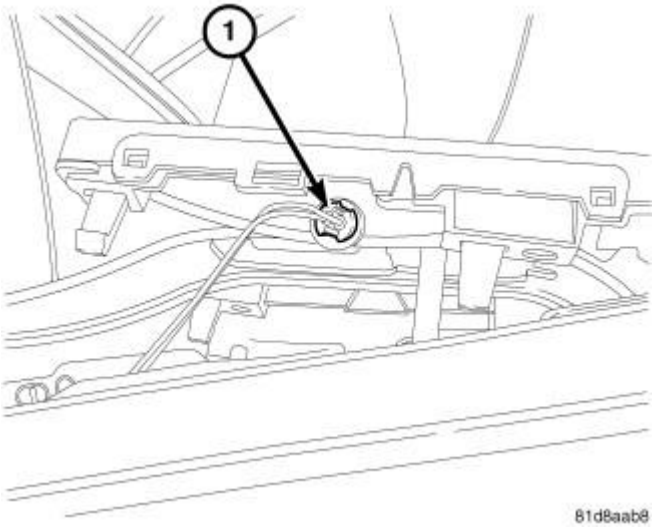

Fig. 19: Identifying Bulb Socket
Courtesy of CHRYSLER GROUP, LLC

1. Insert new bulb into bulb socket.
2. Install socket into shifter assembly.

3. Snap shifter assembly back into the center console.
4. Install shifter console trim panel and shift console trim ring. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Connect battery negative cable.

LAMP, TRUNK

REMOVAL

BULB

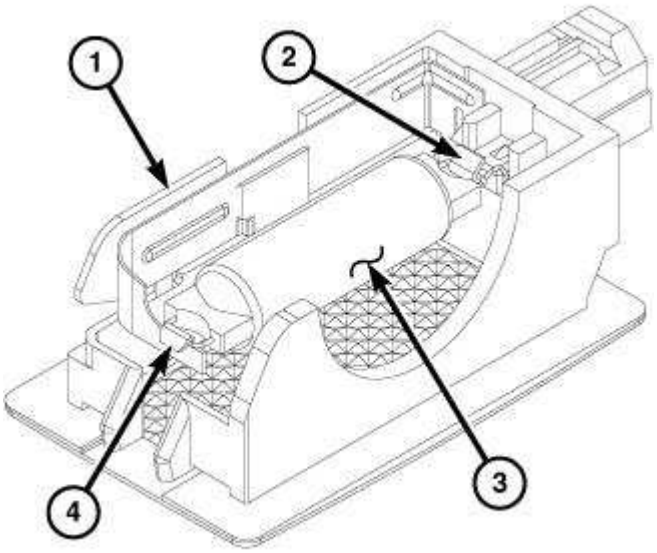

Fig. 20: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trunk lamp unit (1) from the right or left trunk trim panel. Refer to **LAMP, TRUNK, REMOVAL**.
3. Gently press the movable bulb holder (4) and the bulb (3) towards the fixed bulb holder (2) far enough to disengage the wire loop terminal of the bulb from the hook of the fixed bulb holder.
4. Disengage the wire loop terminal of the bulb from the hook on the movable bulb holder.
5. Remove the bulb from the lamp.

LAMP

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable flat wide-bladed tool, gently pry the upper (notched) edge of the trunk lamp lens (4) out from the mounting hole (1) in the right or left trunk side trim panel.
3. Disconnect the body wire harness connector (2) from the connector receptacle (3) integral to the lamp housing.
4. Remove the lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

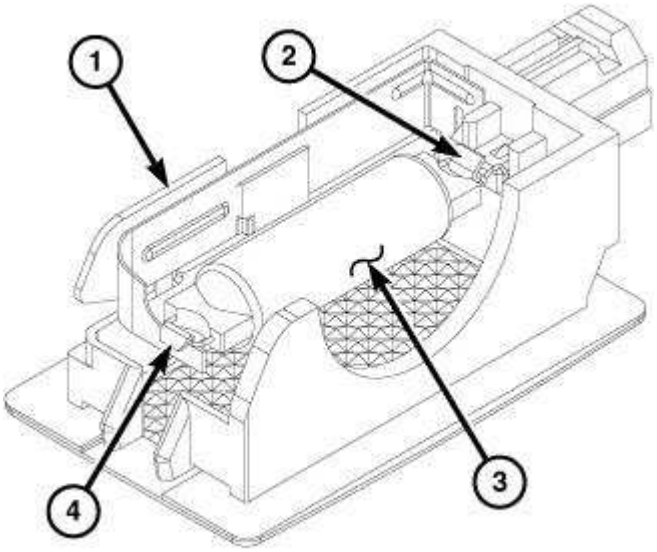

Fig. 22: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Engage the wire loop terminal on one end of the bulb (3) over the hook on the movable bulb holder (4).
2. Gently press the movable bulb holder and bulb towards the fixed bulb holder (2) far enough to engage the wire loop terminal over the hook on the fixed bulb holder, then release the movable bulb holder.
3. Reinstall the trunk lamp unit (1) into the right or left trunk trim panel. Refer to **LAMP, TRUNK, INSTALLATION**.
4. Reconnect the battery negative cable.

LAMP

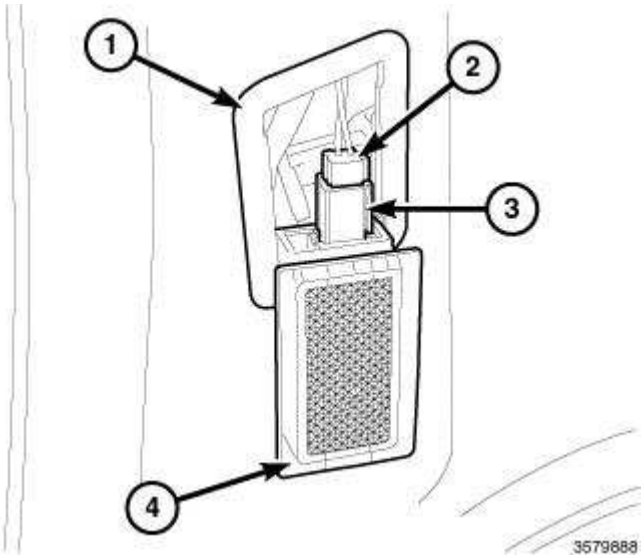

Fig. 23: Trunk Lamp Lens, Connector Receptacle & Mounting Hole
Courtesy of CHRYSLER GROUP, LLC

1. Position the trunk lamp to the mounting hole (1) in the right or left trunk side trim panel.
2. Reconnect the body wire harness connector (2) to the connector receptacle (3) integral to the lamp housing.
3. Insert the connector end of the lamp into the lower end of the mounting hole in the trunk side trim panel far enough to engage the fixed retention tabs with the edge of the mounting hole.
4. Using hand pressure, press the upper (notched) edge of the lamp lens (4) into the mounting hole until the movable retention tabs snap into place and the lens is just proud of the trim panel.
5. Reconnect the battery negative cable.

LAMP, VANITY

REMOVAL

REMOVAL

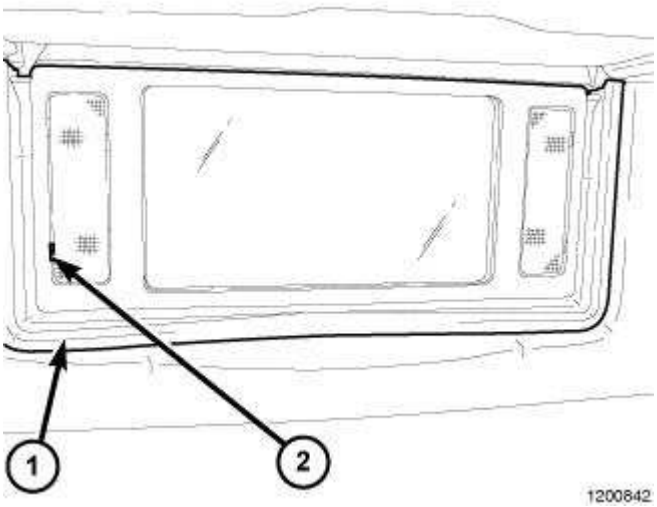

Fig. 24: Vanity Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: Vehicles equipped with optional vanity lamps have a single lamp at each side of the covered mirror that is integral to each sun visor. Each lamp is independently controlled by an integral switch that is automatically actuated by the mirror cover. The lamp housings, the switch, the mirror and the mirror cover are serviced only as a unit with the sun visor. The bulb types and service procedures are identical for each of these lamp bulbs.

1. Disconnect and isolate the battery negative cable.
2. Insert a small flat-bladed screwdriver on either side near the top or the bottom between the vanity lamp lens (2) and the lamp housing of the sun visor (1).
3. Carefully pry the lens outward until it unsnaps from the lamp housing.

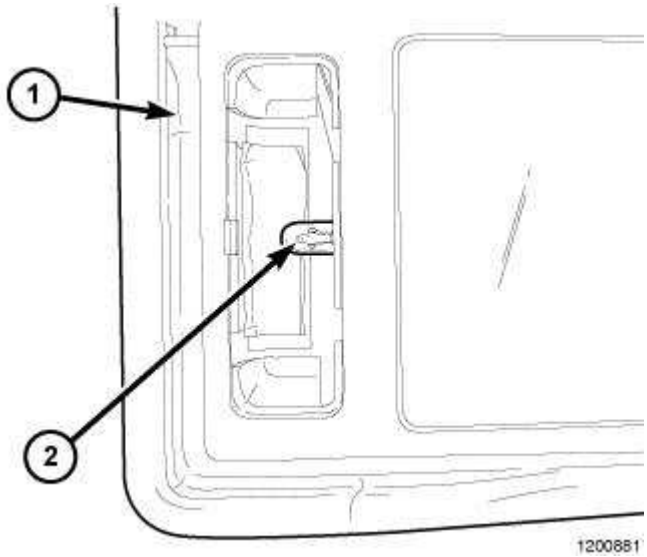

Fig. 25: Vanity Lamp Bulb
Courtesy of CHRYSLER GROUP, LLC

4. Using small needle-nose pliers, carefully grasp the bulb (2) and pull the base out of the lamp socket.

INSTALLATION

INSTALLATION

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

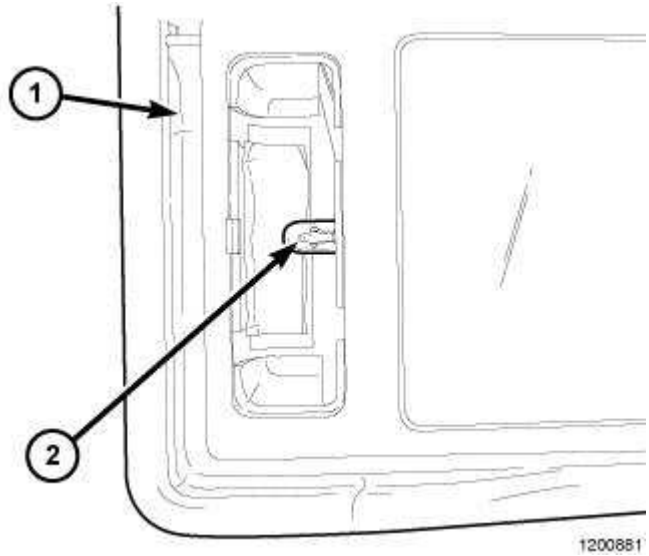

Fig. 26: Vanity Lamp Bulb
Courtesy of CHRYSLER GROUP, LLC

NOTE: Vehicles equipped with optional vanity lamps have a single lamp at each side of the covered mirror that is integral to each sun visor. Each lamp is independently controlled by an integral switch that is automatically actuated by the mirror cover. The lamp housings, the switch, the mirror and the mirror cover are serviced only as a unit with the sun visor. The bulb types and service procedures are identical for each of these lamp bulbs.

1. Using small needle-nose pliers, carefully grasp the vanity lamp bulb (2) and align the base of the bulb with the socket in the lamp housing of the sun visor (1).
2. Push the bulb straight into the socket until the base is fully seated.

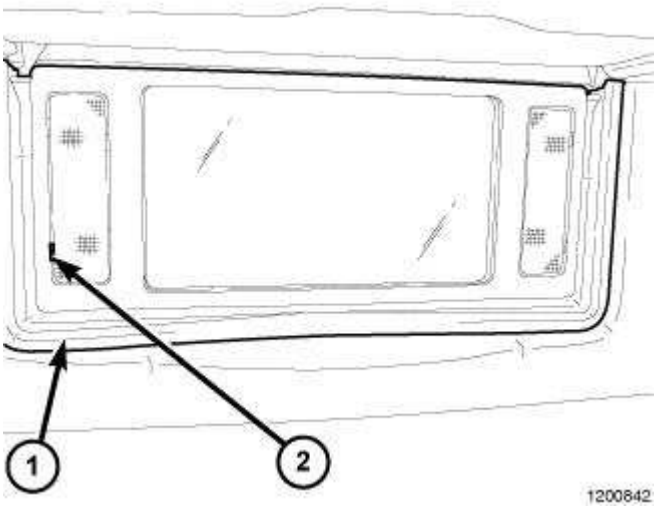

Fig. 27: Vanity Lamp
Courtesy of CHRYSLER GROUP, LLC

3. Insert one tab on the top or the bottom of the lens (2) into the appropriate slot at the top or bottom of the lamp housing.
4. Flex the lens far enough to engage the loose tab into its slot in the lamp housing.
5. Reconnect the battery negative cable.

SWITCH AND LAMP, GLOVE BOX

REMOVAL

BULB

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

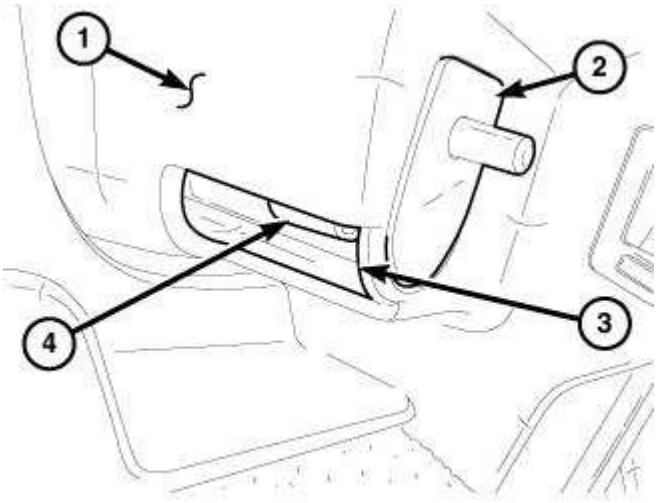

Fig. 28: Window, Instrument Panel Glove Box Housing, Access The Bulb & Switch Unit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the glove box.
3. Reach through the window (3) in the instrument panel glove box housing (1) to access the bulb (4) on the lower side of the glove box lamp and switch unit (2).
4. Pull the base of the bulb straight out of the bulb holder and out through the window.

LAMP/SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

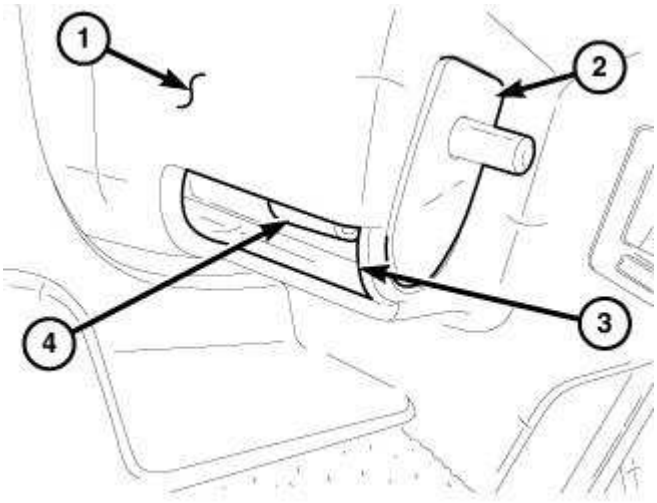

Fig. 29: Window, Instrument Panel Glove Box Housing, Access The Bulb & Switch Unit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the glove box.
3. Reach through the window (3) in the instrument panel glove box housing (1) to access and depress the latch feature on either side of the glove box lamp and switch unit (2).
4. While holding the retaining latch depressed, push the glove box lamp and switch unit out through the mounting hole in the face of the instrument panel glove box housing.
5. Disconnect the wire harness connector from the glove box lamp and switch.
6. Remove the lamp and switch unit from the instrument panel.

INSTALLATION

BULB

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Courtesy of CHRYSLER GROUP, LLC

1. Reach through the window (3) in the instrument panel glove box housing (1) to align the base of the bulb (4) with the bulb holder on the lower side of the glove box lamp and switch unit (2).
2. Push the bulb straight into the bulb holder until the base is firmly seated.
3. Close the glove box.
4. Reconnect the battery negative cable.

LAMP/SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

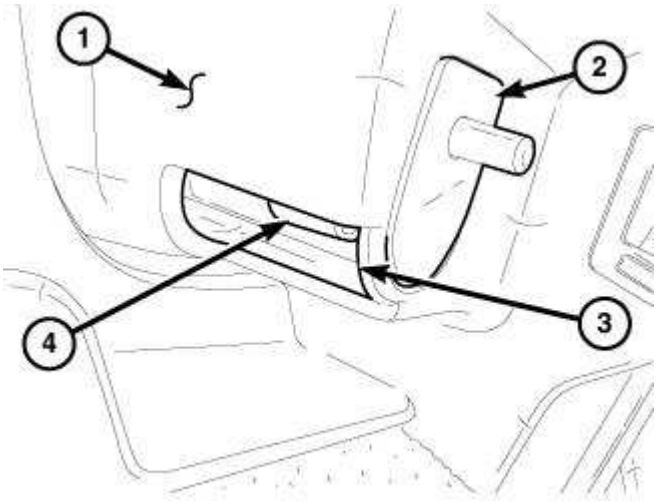

Fig. 31: Window, Instrument Panel Glove Box Housing, Access The Bulb & Switch Unit
Courtesy of CHRYSLER GROUP, LLC

1. Position the glove box lamp and switch unit (2) to the instrument panel glove box housing (1).
2. Reconnect the wire harness connector to the lamp and switch unit.
3. Feed the wire harness back through the switch mounting hole.
4. Align the lamp and switch unit with the mounting hole in the instrument panel glove box housing.
5. Using hand pressure, push the lamp and switch unit firmly and evenly into the mounting hole until it is fully seated.
6. Close the glove box.
7. Reconnect the battery negative cable.

SWITCH, DIMMER

DESCRIPTION

DESCRIPTION

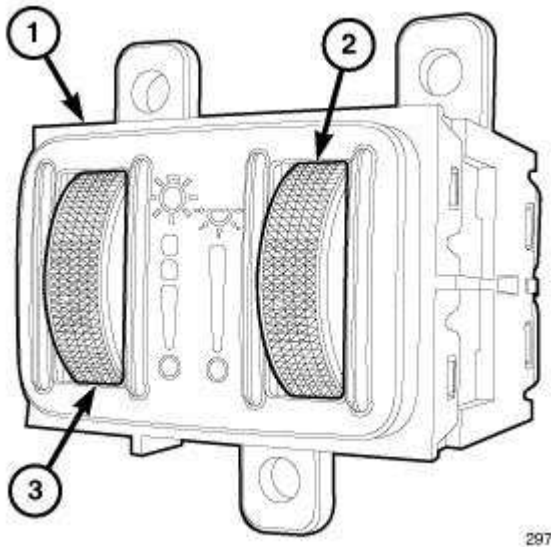

Fig. 32: Dimmer Module, Thumbwheel & Second Thumbwheel
Courtesy of CHRYSLER GROUP, LLC

This vehicle has a separate dimmer module (1) that is located on the instrument panel, in a mounting hole inboard of the headlamp switch mounting hole, outboard of the steering column. The standard dimmer module features a single thumbwheel (3) for panel lamps dimming and interior lighting control. There are also two optional switches with a second thumbwheel (2). The second thumbwheel is used for ambient (also known as halo) lighting control in vehicles with the ambient lighting option, or for headlamp leveling control in vehicles manufactured for certain markets where headlamp leveling is required.

The dimmer module is constructed of molded plastic. The thumbwheel is molded plastic and knurled around its circumference to ease operator control. The dimmer module face plate is labeled with graphics and International Control and Display Symbol icons to clearly identify the functions of the thumbwheel or optional thumbwheels.

The dimmer module housing is secured within the mounting hole of the instrument panel by three screws, two on the top and one on the bottom. The back of the dimmer module housing has an integral connector receptacle containing terminal pins that connect the module to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. Panel dimmer controlled Light Emitting Diode (LED) units soldered to the circuit board within the module provide back lighting for visibility at night, but are not serviceable.

The dimmer module cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The dimmer module uses a single resistor multiplexed output for each switch thumbwheel to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) on a multifunction switch

MUX return circuit. It then provides outputs to the BCM on a panel lamps dimmer signal circuit to control panel dimmer and interior lighting functions, or on a dimmer environmental lighting circuit to control ambient (halo) lighting functions.

On vehicles equipped with a remote manual headlamp leveling system, the dimming module also receives a battery voltage input on a park/tail/running lamps feed circuit whenever the exterior lighting is turned ON. It then provides outputs to the BCM on a headlamp leveling switch to module signal circuit to control the headlamp leveling function.

The dimmer module illumination circuit receives a path to ground at all times through an instrument panel ground circuit. The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the dimmer module.

The dimmer module operates as follows:

- **Ambient (Halo) Lighting Control** - On vehicles so equipped, the right thumbwheel on the dimmer module is rotated to the ambient DEFEAT or one of the six ambient dimmer detent positions to control the ambient (halo) lighting level. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the dimmer environmental lighting circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the liftgate courtesy feeds driver circuit.
- **Headlamp Leveling Control** - On vehicles so equipped, the right thumbwheel on the dimmer module is rotated to the 0, 1 or 2 detent positions to provide the appropriate resistor multiplexed output to the BCM over the headlamp leveling switch to module signal circuit. The BCM reads and responds to this input by providing the appropriate control outputs to the headlamp leveling motors.
- **Interior Lighting Control** - The left thumbwheel on the dimmer module is rotated to the dome DEFEAT, dome ON, PARADE mode, or one of the six panel dimmer detent positions to control the interior courtesy/dome and panel lamps. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the panel lamps dimmer signal circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the courtesy lamps, panel lamps and reading lamps driver circuits, and by sending appropriate electronic **dimming level** messages to other electronic modules over the CAN data bus.

The dimmer module as well as the hard wired inputs and outputs of the module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - DIMMER SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate

the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

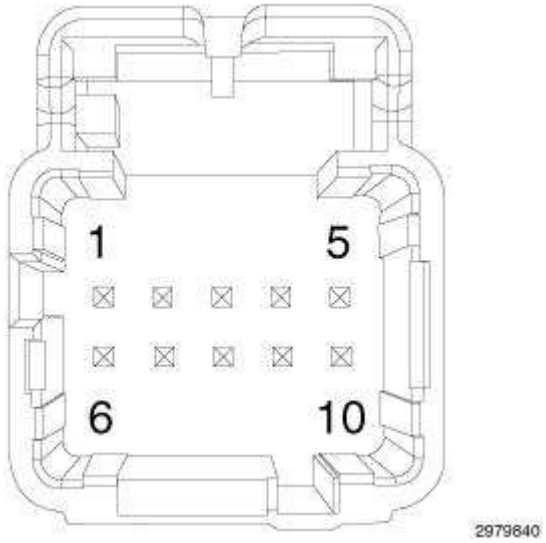

Fig. 33: Dimmer Switch
Courtesy of CHRYSLER GROUP, LLC

1. Remove the dimmer module from the instrument panel. Refer to **SWITCH, DIMMER, REMOVAL**.
2. Disconnect the instrument panel wire harness connector from the back of the dimmer module.
3. Using an ohmmeter, test the resistance between the terminals of the module as shown in the Dimmer Module Tests table.

DIMMER MODULE TESTS	
SWITCH POSITION (PINS)	**RESISTANCE RANGE (OHMS)**
DOME DEFEAT (1 and 4)	8645 - 9555
PANEL DIMMER 1 (1 and 4)	2565 - 2835
PANEL DIMMER 2 (1 and 4)	1140 - 1260
PANEL DIMMER 3 (1 and 4)	646 - 714
PANEL DIMMER 4 (1 and 4)	417.78 - 426.22
PANEL DIMMER 5 (1 and 4)	256.5 - 283.5
PANEL DIMMER 6 (1 and 4)	180.18 - 183.82

PARADE MODE (1 and 4)	135.63 - 138.37
DOME ON (1 and 4)	172.26 - 175.74
AMBIENT DOME DEFEAT (1 and 5)	8645 - 9555
AMBIENT DIMMER 1 (1 and 5)	2565 - 2835
AMBIENT DIMMER 2 (1 and 5)	1140 - 1260
AMBIENT DIMMER 3 (1 and 5)	646 - 714
AMBIENT DIMMER 4 (1 and 5)	417.78 - 426.22
AMBIENT DIMMER 5 (1 and 5)	256.5 - 283.5
AMBIENT DIMMER 6 (1 and 5)	494.01 - 503.99
HEADLAMP LEVELING 0 (7 and 8)	172.26 - 175.74
HEADLAMP LEVELING 1 (7 and 8)	198 - 202
HEADLAMP LEVELING 2 (7 and 8)	575.19 - 586.81
SWITCH ILLUMINATION (2 and 3)	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 3 TO PLUS (+), CONNECT PIN 2 TO MINUS (-) - LEDs SHOULD BARELY GLOW

4. If the module fails any of the tests, replace the ineffective dimmer module as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

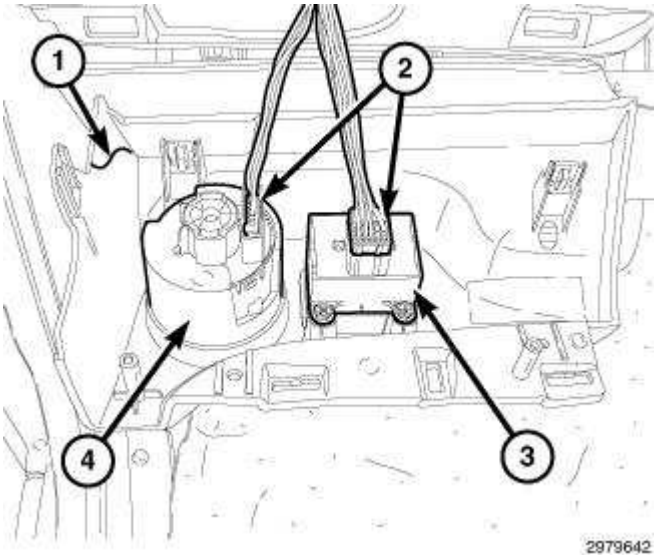

Fig. 34: Trim Molding, Wire Harness Connector & Dimmer Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, gently and evenly pry around the perimeter of the instrument panel trim molding outboard of the steering column to unsnap the molding from the instrument panel.
3. Pull the trim molding (1) away from the instrument panel far enough to access and disconnect the instrument panel wire harness connector (2) from the dimmer module (3) connector receptacle.
4. Remove the three screws that secure the dimmer module to the back of the instrument panel trim molding.
5. Remove the dimmer module from the trim molding.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

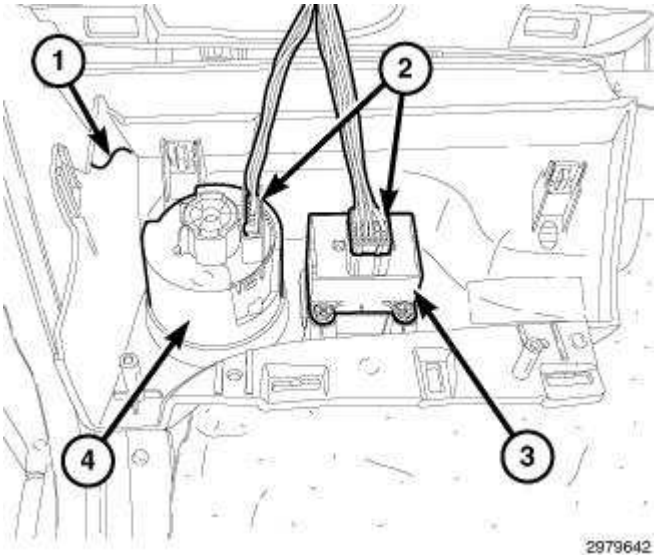

Fig. 35: Trim Molding, Wire Harness Connector & Dimmer Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the dimmer module (3) onto the back of the driver side outboard instrument panel trim molding (1).
2. Install and tighten the three screws that secure the dimmer module to the trim molding. Tighten the screws securely.
3. Reconnect the instrument panel wire harness connector (2) to the dimmer module connector receptacle.
4. Align the snap clips on the back of the trim molding with the receptacles in the instrument panel outboard of the steering column. Using hand pressure, press firmly and evenly on the bezel until the clips snap into place.
5. Reconnect the battery negative cable.

SWITCH, DOOR AJAR

DESCRIPTION

DOOR

This vehicle has four door ajar switches, one for each door. Each switch is concealed within and integral to its respective door latch unit. The switches are momentary leaf contact-type micro switch units that are actuated by the mechanisms internal to the door latch. An integral connector receptacle on each door latch connects the door ajar switch and the power lock motor to the vehicle electrical system through its respective door wire harness.

The door ajar switches cannot be adjusted or repaired and, if ineffective or damaged, the door latch unit must be replaced.

DECK LID

A deck lid ajar switch is standard equipment on this vehicle. The switch is concealed within and integral to the deck lid latch unit. The switch is a momentary leaf contact-type micro switch unit that is actuated by the deck lid latch mechanism. An integral connector receptacle on the deck lid latch connects the deck lid ajar switch to the vehicle electrical system through the body wire harness.

The deck lid ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the deck lid latch unit must be replaced. Refer to **LATCH, REMOVAL** .

OPERATION

DOOR

The door ajar switches are actuated by the mechanisms internal to the door latch. When a door is closed and properly latched, its door ajar switch is an open circuit. When a door is open or only partially latched, the door ajar switch is a closed circuit. The door ajar switches are hard wired in series between a body ground and the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM reads the hard wired door ajar switch inputs through internal pull-ups, then uses these inputs to control many electronic functions and features of the vehicle. The BCM also sends electronic **door ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The door ajar switches as well as the hard wired inputs and outputs of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DECK LID

The deck lid ajar switch is actuated by the deck lid latch mechanism. When the deck lid is closed and properly latched, the deck lid ajar switch is an open circuit. When the deck lid is open or only partially latched, the deck lid ajar switch is a closed circuit. The deck lid ajar switch is hard wired in series between a body ground and the Body Control Module (BCM) (also known as the Common Body Controller). The BCM reads the hard wired liftgate ajar switch input through an internal pull-up, then uses this input to control many electronic functions and features of the vehicle. The BCM also sends electronic **deck lid ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The deck lid ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Exterior - Service Information - Chrysler 300

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. Refer to SPECIFICATIONS . In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The exterior lighting system for this model includes the following exterior lamp units:

- **Center High Mounted Stop Lamp** - A Center High Mounted Stop Lamp (CHMSL) is centered

near the top of the vertical surface of the deck lid at the rear of the vehicle.

- **Front Fog Lamps** - Vehicles equipped with this option have a front fog lamp unit mounted near each outboard end of the front fascia, below the front lamp units.
- **Front Lamp Units** - Standard equipment includes a bi-functional, single filament halogen front lamp unit. A bi-functional High Intensity Discharge (HID) front lamp unit is optional. The Adaptive Front Lighting System (AFLS) is included when the vehicle is equipped with the optional HID front lamp unit. The front lamp units are mounted at the front of each front fender panel at the outboard side of the grille opening.
- **License Plate Lamp** - Two standard rear license plate lamp units are mounted to the rear fascia, just above the license plate tub formation.
- **Outside Mirror Lamps** - The outside rear view mirrors are available with signal lamps and approach lamps. The signal lamps incorporate three amber Light Emitting Diode (LED) units behind a clear lens located on the lower, forward-facing outer cap of each mirror head. The outside mirror signal lamps also function as repeater lamps in vehicles manufactured for sale in certain export markets where they are required. The signal lamps are serviced only as a unit with the outside rear view mirror assembly. The approach lamps are used on vehicles equipped with the Passive Entry (PE) system and incorporate an LED unit located behind the outer edge of each outside rear view mirror glass and are serviced only as a unit with the mirror glass and case assembly.
- **Rear Lamp Units** - A rear lamp unit is mounted to the rear of each quarter panel on either side of the deck lid opening.
- **Rear Fog Lamps** - In certain export markets where they are required, two rear fog lamps are integral to the rear lamp units.

These exterior lighting lamps and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Automatic headlamps are standard equipment on this vehicle. The headlamp switch includes an **A** (Automatic) position and an automatic headlamp sensor senses ambient light levels. The automatic headlamp sensor is integral to the sun load sensor located on the top of the instrument panel. When the **A** position of the headlamp switch is selected, the headlamps are turned ON and OFF automatically as ambient light levels dictate.
- **Adaptive Front Lighting System** - Vehicles equipped with the High Intensity Discharge (HID) front lamp units include the Adaptive Front Lighting System (AFLS). AFLS includes an electronic AFLS module mounted to the right of the Power Distribution Center (PDC) in the engine compartment. The AFLS module monitors vehicle braking, steering and suspension system inputs then automatically adjusts the aim of the headlamp beams up and down or right and left as appropriate using leveling and swiveling stepper motors integral to both front lamp units for improved visibility when driving at night.
- **Backup Lamps** - The backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to each rear lamp unit.
- **Brake Lamps** - The brake (or stop) lamps include multiple Light-Emitting Diode (LED) units, a reflector and a red lens that are integral to each rear lamp unit, and the red lens and multiple LED units of the CHMSL.
- **Daytime Running Lamps** - Multiple Light-Emitting Diode (LED) units in a light strip integral to

each front lamp unit are illuminated when appropriate to serve as the Daytime Running Lamps (DRL).

- **Exterior Lamp Fail-Safe Operation** - The Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and the Body Control Module (BCM) (also known as the Common Body Controller/CBC) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected input from either the headlamp switch or the multi-function switch, no communication from the Steering Control Module (SCM) or Steering Angle Sensor (SAS) or when the Controller Area Network (CAN) data bus is inoperative.
- **Exterior Lamp Load Shedding** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) provides a battery saver feature which will automatically turn OFF all exterior lamps that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Lamps** - The optional front fog lamps include the bulb, reflector and projector lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, Light Emitting Diode (LED) units and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamp Delay** - When this feature is enabled the low or high beam headlamps remain illuminated for a programmable delay interval of 0 (disabled), 30, 60 or 90 seconds after the ignition switch has been turned to the OFF position. This feature is customer programmable using the Electronic Vehicle Information Center (EVIC) switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS).
- **Headlamps** - Two headlamp systems are available on this vehicle for domestic markets. The standard halogen headlamp system includes a bi-functional single filament halogen bulb in each front lamp unit for low or high beam headlamps. The optional HID headlamp system includes a bi-functional single HID lighting element/igniter unit for low or high beam headlamps. In either halogen or HID form, an electric solenoid motor and mechanism internal to the front lamp unit closes a shutter for low beams and opens the shutter for high beams. HID headlamps are standard equipment for all vehicles manufactured for export markets. The HID front lamp units each include an electronic ballast module. Both headlamp systems also include an adjustable reflector and clear lens integral to each front lamp unit.
- **Headlamps With Wipers** - When this feature is enabled and the **AUTO** position of the headlamp switch is selected, the headlamps are turned ON automatically whenever the windshield wipers are turned ON; and, if the headlamps were turned ON automatically when the wipers were turned ON and the appropriate ambient light conditions exist, they will also turn OFF automatically when the wipers are turned OFF. This feature is customer programmable using the Electronic Vehicle Information Center (EVIC) switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS).
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Park Lamps** - The front park lamps include the amber bulbs, the reflectors and the clear lenses of each park lamp and the multiple Light Emitting Diode (LED) units and amber lens of each front side marker lamp integral to each front lamp unit. The rear tail lamps include the multiple LED units, a reflector and a red lens integral to both the rear lamp units, the multiple LED units

and red lens of each rear side marker lamp integral to each rear lamp unit as well as the bulbs and clear lenses of each license plate lamp unit.

- **Rear Fog Lamps** - Rear fog lamps are available only in certain export markets where they are required equipment. The rear fog lamps include the multiple Light Emitting Diode (LED) units a red lens and a reflector that are integral to each rear lamp unit.
- **SmartBeam® Automatic Headlamps** - Vehicles equipped with the optional SmartBeam® automatic (auto high) headlamp option include a unique digital light-sensing imager camera integral to the electrochromic inside rear view mirror and programming that allows it to detect light levels, their color and their source within the path ahead of the vehicle. When SmartBeam® is enabled, the **A** (Automatic) position of the headlamp switch is selected, the high beam position of the headlamp dimmer switch is selected and the ambient light conditions are appropriate, the headlamp high beams are turned ON and OFF automatically as needed.
- **Turn Signal Lamps** - The front turn signal lamps include an amber bulb, a reflector, and a clear lens that are integral to each front lamp unit. On vehicles equipped with the optional outside mirror signal lamps, there are several amber Light-Emitting Diode (LED) units and a clear lens integral to each mirror signal lamp that are also activated by the turn signal circuits for the same side of the vehicle. For domestic markets the rear turn signal lamps include the multiple LED units, a reflector and a red lens integral to each rear lamp unit. For export markets the rear turn signal lamps include an amber bulb, a reflector and a clear lens integral to each rear lamp unit.

Other components of the exterior lighting system for this vehicle include:

- **Adaptive Front Lighting System Module** - An Adaptive Front Lighting System (AFLS) module is located on the right side of the Power Distribution Center (PDC) in the engine compartment. Refer to **MODULE, ADAPTIVE FRONT LIGHTING SYSTEM, DESCRIPTION** .
- **Axle Sensors** - Vehicles equipped with HID headlamps have an axle sensor for both the front and the rear axles, which monitor the suspension height of the vehicle.
- **Backup Lamp Switch** - A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the electronic automatic transmission performs the backup lamp switch function for this vehicle.
- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Brake Lamp Switch** - A lever-actuated brake pedal position sensor serves as the brake lamp switch in this vehicle. The brake pedal position sensor is located on the brake pedal support bracket under the instrument panel and is actuated by a pin on the brake pedal arm when the brake pedal is depressed.
- **Controller Antilock Brake** - A Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM or the Antilock Brake System/ABS module) is located in the engine compartment below the brake master cylinder. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Electronic Ballast Module** - Vehicles equipped with the HID headlamps have an electronic ballast module secured to the underside of each front lamp unit. Each module controls the HID lighting element/igniter within the front lamp unit to which it is mounted.
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the instrument

panel switch bank in the lower vehicle feature controls module (also known as the Integrated Center Stack/ICS) located in the center stack area of the instrument panel.

- **Headlamp Leveling And Swiveling Motors** - A headlamp leveling stepper motor and a headlamp swiveling stepper motor is located within each front lamp unit housing of vehicles manufactured with HID headlamps.
- **Headlamp Switch** - A rotary knob-actuated headlamp switch is located in the headlamp switch bezel of the instrument panel. The headlamp switch is used to select the park lamps, headlamps or fog lamps.
- **Instrument Cluster** - The Instrument Cluster (IC) is also known as the Common Instrument Cluster (CIC) in this vehicle. The IC is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .
- **Instrument Panel Switch Bank** - The instrument panel switch bank contains the hazard switch. The switch bank is located in the lower vehicle feature controls module (also known as the Integrated Center Stack/ICS) located in the center stack area of the instrument panel. Refer to **POD, SWITCH BANK, DESCRIPTION** .
- **Multi-Function Switch** - The multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn).
- **Park Brake Switch** - A park brake switch is located on the park brake mechanism located on the driver side cowl side inner panel below the instrument panel.
- **SmartBeam® Module** - The SmartBeam® automatic high beam digital imaging camera and system logic circuitry is integral to the electrochromic inside rear view mirror on the inside of the windshield.
- **Steering Control Module** - The Steering Control Module (SCM) is located within the Steering Column Control Module (SCCM) on the top of the steering column, just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Turn Signal Cancel Cam** - The turn signal cancel cam is integral to the clockspring. The turn signal cancel cam provides automatic turn signal cancellation as the steering wheel is rotated back to its centered position following a vehicle turning maneuver.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting

systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ADAPTIVE FRONT LIGHTING SYSTEM

The Adaptive Front Lighting System (AFLS) module monitors hard wired inputs from the front and rear axle (leveling) sensors. The AFLS module also monitors electronic message inputs from the Body Control Module (BCM) (also known as the Common Body Controller/CBC), the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, Antilock Brake System/ABS module or the Electronic Stability Control/ESC module) the Powertrain Control Module (PCM), the Steering Angle Sensor (SAS) and the Steering Control Module (SCM) received over the Controller Area Network (CAN) data bus.

The AFLS module is programmed to use these inputs and, as a Local Interface Network (LIN) master node, respond by providing electronic message outputs over a Local Interface Network (LIN) data bus connection to the leveling and swiveling stepper motors within each High Intensity Discharge (HID) front lamp unit. The four stepper motors, which are each a LIN slave node, respond by adjusting the aim of the headlamp beams up, down, right or left as commanded. The stepper motors then provide a confirmation reply over the LIN bus to the AFLS module indicating the current beam position.

AUTOMATIC HEADLAMPS

The automatic headlamp system includes the headlamp switch, the Body Control Module (BCM) (also known as the Common Body Controller/CBC), the air conditioner - heater control unit and the sun load sensor on the top of the instrument panel.

The sun load sensor provides an ambient light level input to the A/C - heater control whenever the ignition switch is in the ON position. The A/C - heater control responds to this input by sending the appropriate electronic **light level** messages to the BCM over the Controller Area Network (CAN) data bus. When the **AUTO** (Automatic) position is selected with the headlamp switch, the BCM receives a hard wired multiplex input from the headlamp switch. The BCM also receives electronic messages over the CAN data bus from the PCM indicating the engine is running.

The BCM responds to these input conditions by automatically controlling a Pulse-Width Modulated (PWM) voltage output to the selected headlamp bulbs or lighting elements through the right and left low or high beam driver circuits to illuminate the headlamps. The BCM also remembers which beams (low or high) were selected when the headlamps were last turned OFF, and energizes those beams and lamps again the next time it turns the headlamps ON.

BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured to the body sheet metal within the passenger compartment. The Powertrain Control Module (PCM) continually monitors a hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the appropriate electronic **transmission gear selector status** messages to other electronic modules over the CAN data bus. Whenever the ignition switch is in the ON position and the Body Control Module (BCM) (also known as the Common Body Controller/CBC) receives an electronic message indicating the status of the transmission gear selector is REVERSE, it provides a battery voltage output to the backup lamps on the backup lamp control output circuit.

BRAKE LAMPS

The brake (or stop) lamps and the Center High Mounted Stop Lamp (CHMSL) each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal within the passenger compartment. The Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, the Antilock Brake System/ABS module or the Electronic Stability Control/ESC module) monitors a hard wired input from the brake pedal position sensor, which is actuated by movement of the brake pedal arm. When the CAB receives an input from the brake pedal position sensor indicating movement of the brake pedal arm, it responds by sending the appropriate electronic **brake lamp switch** status message to the BCM over the CAN data bus. The BCM then controls brake lamp and CHMSL illumination through High Side Drivers (HSD) on the left and right stop lamp control circuits. The brake lamp function of the trailer tow wiring is also controlled by an output from the BCM based upon the electronic **brake lamp switch** status messages received from the CAB.

DAYTIME RUNNING LAMPS

Vehicles equipped with this option or manufactured for sale in Canada illuminate multiple Light-Emitting Diode (LED) units in both front lamp units when the engine is running, the parking brake is released and the exterior lamps are turned OFF. The BCM must be programmed appropriately for this feature to be enabled. Once enabled, anytime the BCM receives electronic messages over the CAN data bus from the PCM indicating the engine is running, a hard wired multiplex input from the headlamp switch indicating the status of the headlamp switch is OFF and a hard wired input from the park brake switch indicating that the parking brake is released, the BCM provides an output to the appropriate LED units to produce illumination. If a turn signal is activated while the DRL units are active, the DRL for the same side of the vehicle as the indicated turn is extinguished until the turn signal is cancelled to permit clear signal visibility.

FRONT FOG LAMPS

Vehicles equipped with optional front fog lamps include a front fog lamp switch integral to the headlamp switch on the instrument panel. The front fog lamps have a path to ground at all times through their connection to the headlamp and dash wire harness and a takeout with an eyelet terminal that is secured to the body sheet metal. The BCM monitors a hard wired multiplex input from the headlamp switch to determine whether the fog lamps are selected.

When the BCM input from the headlamp switch indicates the fog lamps are selected, it controls front fog lamp operation by providing a battery voltage output to the fog lamps through the right and left front fog lamp control circuits. The BCM also sends the appropriate electronic messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to illuminate or extinguish the front fog lamp indicator. The BCM will automatically de-energize the front fog lamps any time the headlamp high beams are selected, except on vehicles manufactured for certain export markets.

The BCM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position, if there is a charging system failure, or if the electrical system voltage falls below about 11.75 volts for more than about 30 seconds.

Each front fog lamp includes an integral adjustment screw to be used for static aiming of the fog lamp beams.

HAZARD WARNING LAMPS

The hazard warning system includes the IC, the BCM and the hazard switch in the instrument panel switch bank of the Integrated Center Stack (ICS) module located in the center stack area of the instrument panel. The hazard switch provides a hard wired input to the BCM. When the BCM receives an input from the hazard switch, it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the front and rear, right and left turn signal control circuits.

The BCM also sends the appropriate electronic messages to the IC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical hazard warning flasher.

HEADLAMPS

The headlamp system includes the IC, the BCM, the headlamp switch on the instrument panel, the Steering Column Module (SCM) and the multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The BCM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The BCM monitors a hard wired multiplex input to determine the status of the headlamp switch on the instrument panel, while the SCM monitors a hard wired multiplex input from the multi-function switch to determine whether the headlamp high or low beams are selected. The SCM sends the appropriate **headlamp beam select switch status** messages to the BCM over the CAN data bus. The BCM responds to these input conditions by controlling an output to the headlamp shutter solenoid to activate the appropriate headlamp beam output level. The BCM also sends the appropriate electronic messages to the IC to control the illumination of the high beam indicator.

When the optical horn feature is selected, the low beams will shut OFF about 200 milliseconds after

the high beams are activated. The BCM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The BCM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position.

The SCM provides a fail-safe feature for the headlamps, which will cause the BCM to turn the low beam headlamps ON automatically if there is no input available from the multi-function switch. The BCM provides a fail-safe feature for the headlamps, which will turn the low beam headlamps ON automatically if there is no input available from the headlamp switch. The BCM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

Each headlamp includes integral adjustment screws to be used for static aiming of the headlamps.

HEADLAMP TIME DELAY

The headlamp time delay feature includes the headlamp switch and the BCM. This feature is customer programmable using the Electronic Vehicle Information Center (EVIC) switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS). If the headlamp switch is in the **AUTO** (Automatic) position when the ignition switch is moved from the ON position to any position except ON, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp time delay interval. The default delay interval is 90 seconds, but can be reprogrammed by the customer using the EVIC switches.

MIRROR APPROACH LAMPS

The approach lamps integral to the outside rear view mirrors on vehicles equipped with the Passive Entry (PE) system are controlled by the interior courtesy lamp circuit. Refer to **OPERATION** .

MIRROR SIGNAL LAMPS

The signal lamps integral to the outside rear view mirrors on vehicles so equipped are controlled by the turn signal circuits.

PARK LAMPS

The park lamps system includes the headlamp switch on the instrument panel and the BCM. The front park lamp bulbs and LED unit marker lamps each have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear park/tail lamp and side marker LED units and the license plate lamp bulbs each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal.

The BCM monitors a hard wired multiplex input from the headlamp switch. The BCM responds to this input by controlling a battery voltage output to the appropriate lamps and bulbs through high side drivers on the front and rear, right and left lamp driver and control circuits.

The BCM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The BCM also provides a fail-safe feature for the park lamps, which will turn the park lamps and low beam headlamps ON automatically if there is no input available from the headlamp switch. The BCM also provides a fail-safe feature for the park lamps that will turn the park lamps and low beam headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

SMARTBEAM® SYSTEM

The optional SmartBeam® (auto high beam) system includes the SmartBeam® module with digital imager camera and electronic circuitry integral to the electrochromic inside rear view mirror, the SCM, the BCM, the IC, the headlamp switch and the multi-function switch. First, the **Auto High Beams** option must be enabled using the customer programmable features function of the EVIC. Then the **AUTO** (Automatic) position must be selected using the rotary knob of the headlamp switch, the headlamp beam selector switch must be in the high beam position and the appropriate ambient light conditions must be present. Finally, the vehicle speed must be greater than 32 kilometers-per-hour (20 miles-per-hour).

Once all of these prerequisites have been met, the SmartBeam® camera and its circuitry within the electrochromic mirror automatically sends the appropriate electronic **headlamp beam select switch status** messages to the BCM over the Local Interface Network (LIN) data bus. The BCM then responds to these messages by providing an output to the headlamp bulbs or the lighting elements through the right and left low and high beam feed circuits to illuminate the headlamps. The BCM also sends the appropriate electronic messages back to the IC to control the illumination of the high beam indicator.

The SCM continues to monitor the multi-function switch, and will send the appropriate electronic messages to the BCM, which relays these messages to the SmartBeam® circuitry in the inside rear view mirror to manually invoke the beam select switch momentary optical horn (flash-to-pass) feature or, when a detent switch position is selected to override SmartBeam® operation.

TURN SIGNAL LAMPS

The turn signal lamps system includes the multi-function switch on the steering column, the SCM, the IC and the BCM. The front turn signal lamp bulbs each have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear turn signal LED units have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal.

The SCM monitors a hard wired multiplex input from the multi-function switch to determine the status of the turn signal switch, then sends the appropriate electronic **turn signal switch status** messages to the BCM over the CAN data bus. The BCM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps through high side drivers on the appropriate front and rear, right or left turn signal control circuits. The BCM also sends the appropriate electronic messages to the IC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto

the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical turn signal flasher.

The BCM also provides a Turn Signal ON warning that will send a **turn signal ON warning** request message to the IC over the CAN bus that causes the IC to generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per-hour). The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXTERIOR LIGHTING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.
