WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain or seat (pelvic and thorax) airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtains or seat airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain and seat airbags

will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System

(SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

OCCUPANT RESTRAINT SYSTEM

An occupant restraint system is standard factory-installed safety equipment on this vehicle. Available occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening and adjusting a seat belt; while passive restraints require no action by the vehicle occupants to be employed.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the rear seating. These upper anchors are integral to the rear shelf panel. Two lower anchors are also provided for each outboard rear seating position. The lower anchors are integral to an isofix cross member welded to the center floor panel beneath the rear seat. These lower anchors are accessed from the front of the rear seat where the seat back meets the seat cushion.
- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing lower B-pillar mounted inertia latch-type emergency locking retractors, height-adjustable upper B-pillar mounted turning loops, a traveling lower seat belt anchor secured to the outboard side of the seat frame, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The passenger side front seat belt retractor is switchable to an automatic locking retractor for compatibility with child seats. The driver and passenger side front seat belt buckles each include an integral seat belt switch that detects whether the front seat belts have been fastened.
- **Rear Seat Belts** - All three rear seating positions are equipped with three-point seat belt systems. The outboard seating position belts employ C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops and fixed

lower seat belt anchors secured to the lower C-pillar. The center position retractor is secured to the rear shelf panel and the fixed lower center seat belt anchor is secured to the floor panel. All three rear seat belts have fixed end-release seat belt buckles secured to the floor panel, a double buckle unit on the right side and a single buckle unit on the left side. Both outboard second row seat belt retractors are switchable to an automatic locking retractor for compatibility with child seats.

PASSIVE RESTRAINTS

Fig. 1: SRS Logo
Courtesy of CHRYSLER GROUP, LLC

The passive restraints available for this vehicle include the following:

- **Active Head Restraints** - Inertia-based Active Head Restraints (AHR) are standard equipment for both front seating positions in this vehicle.
- **Dual Front Airbags** - Multistage driver and front passenger airbags are standard in this model. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) from four to six seconds as a bulb test each time the ignition switch is turned to the ON position. Pyrotechnic-type seat belt tensioners are also integral for the driver and passenger front seat belts of all airbag equipped vehicles to work in conjunction with the dual front and side curtain airbags.
- **Knee Blocker Airbag** - The front airbag system also includes a knee blocker airbag (also known as a Knee AirBag/KAB or an Inflatable Knee Blocker/IKB) that is located just below the steering column, behind the instrument panel steering column opening cover. This airbag is also a passive, inflatable, SRS component and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the steering column opening cover on the instrument panel just beneath the steering column.
- **Seat Airbags** - Front seat integrated pelvic and thorax airbags are standard equipment in all

markets. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.

- **Side Curtain Airbags** - Side curtain airbags are standard equipment for this vehicle when it is also equipped with dual front airbags. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a molded identification trim button with the **SRS - AIRBAG** logo located on the top of each B-pillar upper trim panel near the headliner.

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Head Restraints** - On vehicles with this equipment, one Active Head Restraint (AHR) is located atop each front seat back unit.
- **Airbag Indicator** - The airbag indicator is integral to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Driver Airbag** - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of each vertical member of the headlamp mounting cross member structural support.
- **Knee Blocker Airbag** - This vehicle is equipped with a knee blocker airbag (also known as the Knee AirBag/KAB or Inflatable Knee Blocker/IKB) feature. The knee blocker airbag is mounted behind the instrument panel steering column opening cover in addition to the static driver knee blocker.
- **Occupant Detection Sensor** - An Occupant Detection Sensor (ODS) is located on the top of the seat cushion of the passenger side front seat in domestic market vehicles.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) is located on a mount on the floor panel transmission tunnel forward of the transmission gear selector, and is concealed below the instrument panel.
- **Passenger Airbag** - The passenger airbag is located in the instrument panel, beneath the passenger airbag door on the top of the instrument panel above the glove box on the passenger side of the vehicle.
- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.
- **Seat Airbag** - A seat (also known as pelvic and thorax) airbag unit is secured to each outboard front seat back frame, where it is concealed beneath the seat back trim cover and foam.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractor and both front seat buckle units on vehicles equipped with dual front airbags. The seat belt retractor and

tensioner units are secured to each lower inner B-pillar and are concealed behind the lower B-pillar trim. The seat belt buckle tensioner units are located on the inboard rear corner of each front seat cushion frame.

- **Seat Track Position Sensor** - Certain vehicles may include a seat track position sensor that may be located on the inboard side of one of the seat adjuster tracks on both the driver and the passenger front seats.
- **Side Curtain Airbag** - A standard equipment side curtain airbag is secured to each inside roof side rail above the headliner, and extends from the A-pillar to just beyond the C-pillar.
- **Side Impact Sensor** - Six side impact sensors are standard equipment on vehicles equipped with side curtain airbags, three on each side of the vehicle. One pressure-type sensor is located on each right and left side front door hardware module carrier, while one acceleration-type sensor is located on each B-pillar and C-pillar. These sensors are each concealed behind the adjacent interior trim components.

The ORC and the IC each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

PEDESTRIAN PROTECTION SYSTEM

An Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) is factory-installed safety equipment, which is available only in vehicles manufactured for certain export markets. The EPP system includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Hood Hinge Actuators** - The two pyrotechnic EPP active hood hinge actuators are each secured by a screw within a mounting plate located on each of the two active hood hinges, which are located near each rear corner of the hood panel.
- **Active Hood Hinges** - The active hood hinges have several features and components not found on a conventional hood hinge. In addition to a mounting plate for a pyrotechnic actuator and a reset spring, each active hood hinge includes a mid-strap joined to the hood bracket by a pivot pin at the forward end and a shear rivet at the rearward end. An up-stop pin near the center of the hood bracket fits within a slotted hole near the center of the mid-strap. Refer to **HINGE, HOOD** for hood hinge removal and installation procedures.
- **Front Energy Absorber Foam Material** - The front energy absorber foam material is

sandwiched between the front bumper area of the front fascia and the front bumper support beam. Refer to **FASCIA, FRONT** for front fascia removal and installation procedures.

- **Impact Sensors** - The EPP system includes three dedicated acceleration-type impact sensors to support the EPP feature. The impact sensors are each mounted by a screw to a receptacle with a U-nut located on the back of the front fascia. One sensor and bracket is located near each end just above the bumper support beam, and one is located near the center just below the bumper support beam. The impact sensors and the sensor mounting provisions are concealed behind the front fascia.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) also serves as the Electronic Pedestrian Protection Module (EPPM) in this vehicle. The ORC is located on a mount on the floor panel transmission tunnel near the dash panel just forward of the center instrument panel support.
- **Pedestrian Bar** - A static, tubular metal pedestrian bar (also known as a leg catcher) is concealed just behind the lower end of the front fascia. The pedestrian bar is suspended at each side from the lower end of a stamped metal bracket that is secured at the top near the same brackets that support each end of the front bumper support beam. Refer to **FRAME AND BUMPERS** for the pedestrian bar removal and installation procedures.

The ORC and the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the EPP electronic components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the EPP components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OCCUPANT RESTRAINT SYSTEM

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as Supplemental Restraint System (SRS) components because

they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components. In addition, each front seat occupant must have their Active Head Restraint (AHR) unit properly adjusted in order to obtain its maximum safety benefit.

The SRS electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) illuminates from four to six seconds as a bulb test each time the ignition switch is turned to the ON or START positions. Following the bulb test, the airbag indicator is turned ON or OFF by the ORC to indicate the status of the SRS. If the airbag indicator comes ON at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the acceleration-type impact sensors, or by a pressure wave within a front door as measured by the pressure-type impact sensor. When an impact is severe enough, the microprocessor in the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions.

The front seat belt retractor and buckle tensioners, the knee blocker airbag (also known as the Knee AirBag/KAB or Inflatable Knee Blocker/IKB) are provided with a deployment signal by the ORC in conjunction with the front airbags. The side curtain airbags and the seat airbags (also known as pelvic and thorax airbags) are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle. The ORC also contains a rollover sensor. Should the vehicle roll over and not cause any acceleration-type or pressure-type impact sensor to signal the need for a deployment, the rollover sensor in the ORC will deploy the side curtain air bags, the seat air bags and, under certain conditions, will also actuate the seat belt buckle and retractor tensioners.

During a frontal vehicle impact, the static knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The static knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the IC to turn ON the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

PEDESTRIAN PROTECTION SYSTEM

In the event of a frontal vehicle impact, the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) components are designed and intended to enhance the protection for pedestrians from the hard components found just beneath the hood of the vehicle within the engine compartment. The EPP system has three acceleration-type impact sensors located in the front bumper area of the vehicle, a microcontroller-based Occupant Restraint Controller (ORC) located within the passenger compartment of the vehicle that also serves as the EPP system controller and an active hood hinge with a pyrotechnic-type actuator at each rear corner of the hood panel.

The impact sensors continually transmit sensor data to the ORC that give an indication of the forces of gravity (G force) upon the sensors. The ORC also receives electronic message inputs over the Controller Area Network (CAN) data bus indicating the ignition status, vehicle speed and ambient temperature. If the vehicle has a collision, the ORC uses algorithms to analyze all of the input data to determine whether to deploy the hood. If the algorithm makes a deployment decision and that the vehicle speed is between 22 kilometers-per-hour (14 miles-per-hour) and 52 kilometers-per-hour (32 miles-per-hour), then the ORC will send electrical signals to deploy the actuators on the active hood hinges.

When the micro gas generator in each actuator is energized, it produces a large quantity of expanding gas. The expanding gas moves a piston within the actuator that pushes upward against the hood bracket of the active hood hinge. The force of the actuator on the hinge bracket creates a lever action that shears a rivet between the hood bracket and the mid-strap of both hood hinges, allowing the actuators to lift the rear of the hood at the hinges. Lifting the rear of the hood in this manner provides additional clearance between the hood and the hard components found within the engine compartment.

Each active hood hinge functions normally during routine opening and closing of the hood. However, upon active hood hinge deployment the rear of the hood is lifted to a predetermined height, which is controlled by an up-stop pin on the hinge bracket that is engaged within a slotted hole in the mid-strap

of each hinge.

During a frontal pedestrian impact, the purpose of the pedestrian bar (also known as the leg catcher) that supports the lower front fascia is to reduce the severity of leg injuries and to position the pedestrian onto the hood of the vehicle rather than onto the pavement. These goals are both intended to reduce the severity and debilitating nature of potential pedestrian injuries. It should be noted that the pedestrian bar **must** be inspected and replaced if visually damaged following **any** frontal vehicle impact, regardless of whether or how the active hood is deployed.

The EPP system electrical circuits are continuously monitored and controlled by the ORC microcontroller. If the ORC detects a problem it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic request message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to illuminate the airbag indicator. The airbag indicator may be turned ON or OFF by the ORC to indicate a problem in either the Supplemental Restraint System (SRS) or the EPP system electrical circuits.

The hard wired circuits between components related to the EPP system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the EPP system or the electronic controls or communication between other modules and devices that provide inputs to the ORC. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to EPP system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUPPLEMENTAL RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool

along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

PEDESTRIAN PROTECTION SYSTEM

The hard wired circuits between modules and components related to the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the EPP system or the electronic controls or communication between other modules and devices that provide features of the EPP system. The most reliable, efficient, and accurate means to diagnose the EPP system or the electronic controls and communication related to EPP system operation, as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the EPP system may require the use of the Supplemental Restraint System (SRS) Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-

deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SERVICE AFTER A PEDESTRIAN PROTECTION DEPLOYMENT

COMPONENT REPLACEMENT AND INSPECTION REQUIREMENTS

There are two types of Electronic Pedestrian Protection (EPP) system deployments that may occur: pedestrian and non-pedestrian. Following either type of deployment, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will display a **SERVICE ACTIVE HOOD** message and the airbag indicator will be illuminated. To make sure continued system integrity, certain components must be replaced or inspected following a deployment based upon the deployment type.

PEDESTRIAN DEPLOYMENT

The following components **must** be replaced following a pedestrian deployment:

- Right and left EPP hood hinge actuators
- Right and left active hood hinges
- Hood panel

The following components **must** be closely inspected, then replaced if any damage is visually evident

following a pedestrian deployment:

- EPP impact sensors
- EPP impact sensor wiring
- Front bumper energy absorber foam material (inspect for compression, cracks and any other signs of deformation or deterioration)
- Front bumper support beam (reinforcement)
- Front fascia
- Front fascia brackets
- Hood latch/secondary catch unit
- Hood latch striker
- Pedestrian bar (see **NOTE**)

NOTE: **The pedestrian bar MUST be inspected and replaced if visually damaged following ANY frontal vehicle impact, regardless of whether the active hood is deployed or how the impact occurred.**

NON-PEDESTRIAN DEPLOYMENT

The following components **must** be replaced following a non-pedestrian deployment:

- Right and left EPP hood hinge actuators
- Right and left active hood hinges

The following components **must** be closely inspected, then replaced if any damage is visually evident following a non-pedestrian deployment:

- EPP impact sensors
- EPP impact sensor wiring
- Front bumper energy absorber foam material (inspect for compression, cracks and any other signs of deformation or deterioration)
- Front bumper support beam (reinforcement)
- Front fascia
- Front fascia brackets
- Hood latch/secondary catch unit
- Hood latch striker
- Hood panel
- Pedestrian bar (see **NOTE 2**)

NOTE:

1. **In order to guarantee continued Electronic Pedestrian Protection (EPP) system integrity, the hood panel MUST be replaced following three EPP deployments, regardless of how the active hood is deployed or the results**

of any visual inspection.

2. **The pedestrian bar MUST be inspected and replaced if visually damaged following ANY frontal vehicle impact, regardless of whether the active hood is deployed or how the impact occurred.**

ACTIVE HOOD HINGE RESET PROCEDURE

If the vehicle remains otherwise safely operable following an EPP deployment, a customer reset position for the active hood hinges is provided to restore adequate forward visibility to drive the vehicle to the nearest dealer for service. Proceed as follows to engage the deployed active hood hinges in the reset position:

1. Push downward on one rear corner of the hood panel.

   NOTE: The initial 15 millimeters (0.60 inch) of travel will require significant effort, up to 300 Newtons (68 pounds) of force. After the initial travel, the deployed EPP actuators will vent and the required force to push the hood downward will be reduced.

2. Continue pushing the hood downward until the active hinge reset mechanism engages. The **C** shaped reset spring on the hinge mid-strap will come into contact with the hood bracket and the resistance will increase. Provide an additional downward force (a soft bump downward) on the hood to cause the reset spring to compress, then snap into the detent notch in the hood bracket. The rear edge of the hood will be raised about 5 millimeters (0.20 inch) higher than the fender when the active hood hinge is in the reset position.
3. Repeat Steps 1 and 2 on the opposite rear corner of the hood panel.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, the following guidelines MUST be observed.

- **Following ANY major vehicle impact damage in the vicinity of an impact sensor or the ORC** - It is critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), front impact sensors and side impact sensors located within the proximity of the impact damage be closely inspected and restored to their original conditions. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.
- **If an active head restraint is deployed** - An inertia-based Active Head Restraint (AHR) unit that is undamaged following a deployment automatically resets itself. These units are designed with the intention of reuse.
- **If the driver airbag is deployed** - If the driver airbag has been deployed, the steering wheel, the clockspring and the complete steering column with lower steering column coupler must also be replaced.

- **If the knee blocker airbag is deployed** - If the knee blocker airbag (also known as the Knee AirBag/KAB or Inflatable Knee Blocker/IKB) has been deployed, the instrument panel steering column opening cover must also be replaced.
- **If the passenger airbag is deployed** - If the passenger airbag has been deployed, the instrument panel top pad must also be replaced.
- **If a seat airbag is deployed** - If a seat (pelvic and thorax) airbag has been deployed, the seat back frame, the seat back foam and the seat back trim cover on the same side of the vehicle as the deployed airbag must also be replaced.
- **If a seat belt tensioner is deployed** - The seat belt tensioners are deployed in conjunction with the front airbags, but can also be deployed with seat (pelvic and thorax) or side curtain airbags. The seat belt tensioners must be replaced if either front airbag has been deployed, and must be inspected if either seat or side curtain airbag has been deployed.
- **If a side curtain airbag is deployed** - If a side curtain airbag has been deployed, the headliner as well as the upper A, B and the C-pillar trim on the same side of the vehicle as the deployed airbag must also be replaced. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a side curtain airbag deployment.

The components identified with the deployed SRS components in the preceding list are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

SQUIB CIRCUIT WIRING REPAIRS

In addition to the preceding guidelines, be aware that the heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to the connected wiring (squib circuits) and connector insulators. There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner. This connection method typically requires no additional wiring repair following a deployment.

However, the second connection method involves a wire harness takeout and connector insulator that are connected directly to the airbag or tensioner initiator or squib. These direct-connect type take outs and connector insulators **MUST** be repaired following an airbag or seat belt tensioner deployment using the approved Supplemental Restraint System Wiring Repairs procedure. Refer to **STANDARD PROCEDURE**.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The driver and passenger airbags in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment

event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Turn the ignition switch to the ON position.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **Airbag Squib Status** table to determine the status of both driver and passenger airbag squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	**CONDITIONS**	**SQUIB STATUS**
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other	Both Squib 1 and 2 were used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	**AND** Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

NOTE: **If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.**

CLEANUP PROCEDURE

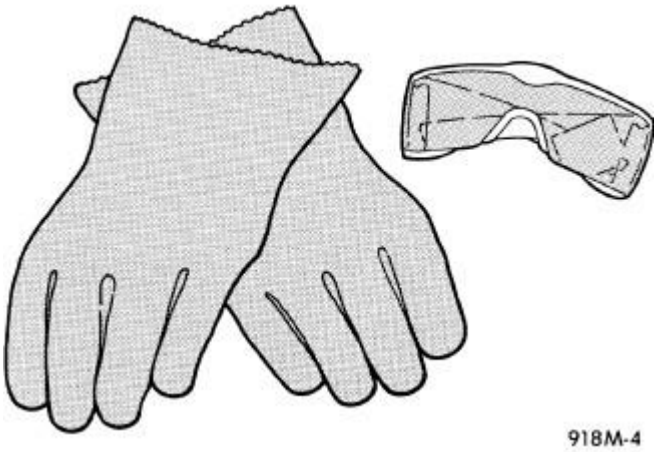

Fig. 2: Safety Glasses & Rubber Gloves
Courtesy of CHRYSLER GROUP, LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: **To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

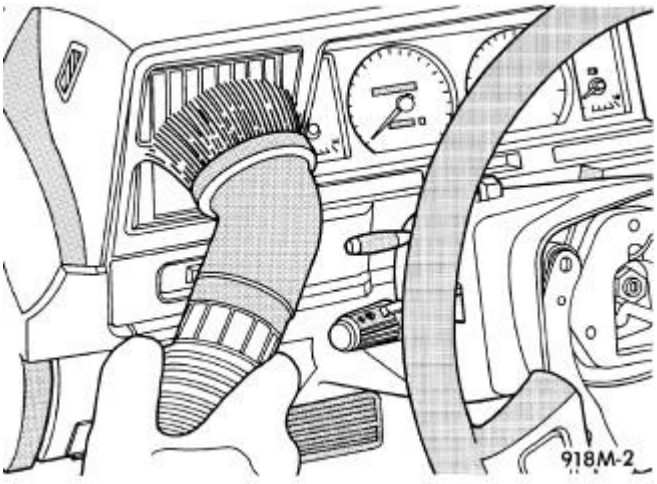

Fig. 3: Vacuum Cleaner
Courtesy of CHRYSLER GROUP, LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to AIRBAG SQUIB STATUS heading within this information. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the

recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp).

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring diagram for the original wire gauge size.

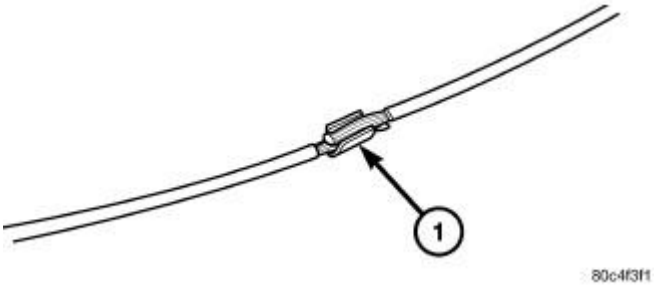

Fig. 4: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

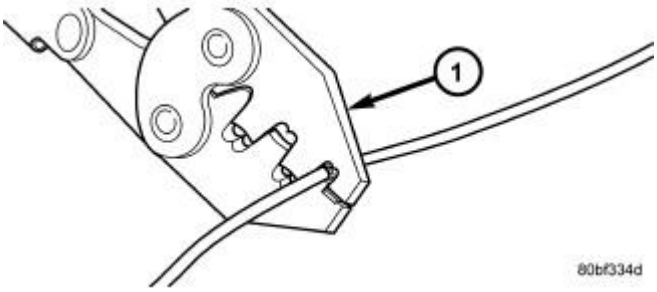

Fig. 5: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

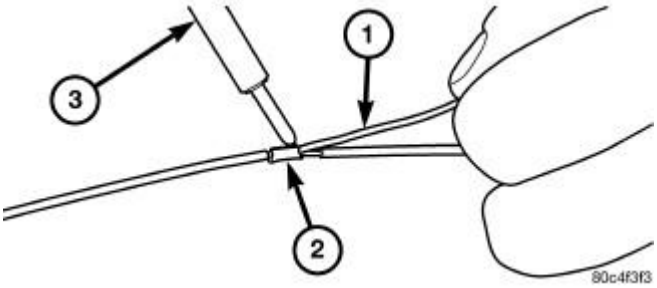

Fig. 6: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

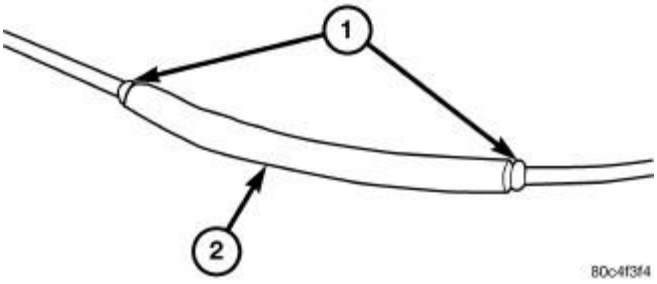

Fig. 7: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of

the tubing.

SUPPLEMENTAL RESTRAINTS VERIFICATION TEST

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the service or replacement of any SRS component. Refer to the appropriate diagnostic procedures.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. During the following test, the battery negative cable remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover and outboard of the steering column.
3. Turn the ignition switch to the ON position and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in 5 or6, refer to the appropriate diagnostic information.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to9.
9. Turn the ignition switch to the OFF position for about 15 seconds, and then back to the ON position. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays ON, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

ACTUATOR, ELECTRONIC PEDESTRIAN PROTECTION HOOD HINGE

DESCRIPTION

DESCRIPTION

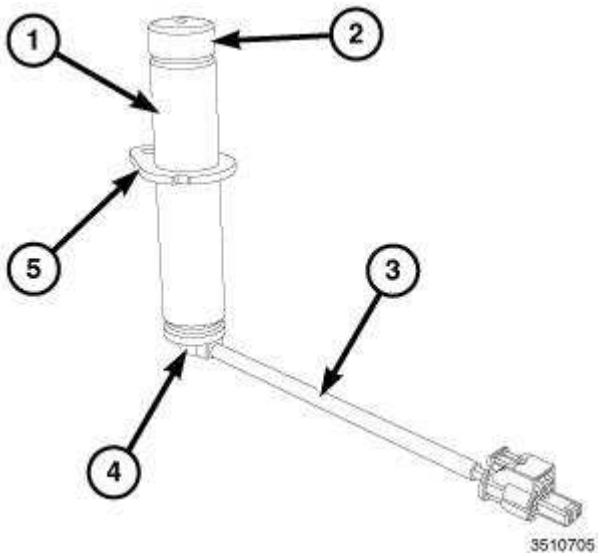

Fig. 8: Integral Bracket, Tubular Metal Housing, Metal Piston, Gas Generator & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

Active hood hinge actuators are found only in vehicles equipped with the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or Active Hood System), which is available only in vehicles manufactured for certain export markets. An EPP active hood hinge actuator is located on each hinge. The actuators are secured by a self-tapping screw through an integral bracket (5) to a mounting plate integral to the lower bracket on each active hood hinge.

The actuator consists primarily of a tubular metal housing (1) containing a metal piston (2) with a molded plastic cap and a small pyrotechnically activated gas generator (4). The actuators are controlled by the Occupant Restraint Controller (ORC). An actuator pigtail wire (3) and connector insulator are routed to a dedicated take out of the headlamp and dash wire harness and connected to the vehicle electrical system by a keyed and latching molded plastic connector insulator to ensure a secure connection.

The EPP active hood hinge actuators cannot be repaired and, if ineffective or damaged, the entire actuator unit must be replaced. The actuators are not intended for reuse and must be replaced following any EPP system deployment.

OPERATION

OPERATION

The Electronic Pedestrian Protection (EPP) active hood hinge actuators are deployed by a signal generated by the Occupant Restraint Controller (ORC) through the right and left hood actuator line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the actuators, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

The gas generator is installed in one end of a steel cylinder tube where the piston is sealed to the inside circumference of the tube. As the gas expands, it pushes the piston up the tube, where it

actuates the leveraging mechanism of the active hood hinge that cuts the hinge shear rivet and raises the rear edge of the hood panel.

Raising the hood panel following a frontal impact of the vehicle creates additional clearance between the hood and the hard components within the engine compartment. This clearance helps to reduce the severity of injuries that a pedestrian might experience in these situations as a result of harmful contact with those hard parts found just beneath the hood panel within the engine compartment.

The ORC monitors the condition of the active hood hinge actuators through circuit resistance, and will register a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC will then request illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC). Proper diagnosis of the active hood hinge actuator gas generator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Electronic Pedestrian Protection (EPP) system active hood hinge actuator. If the actuator is ineffective or damaged, but not deployed, it should be handled in the same manner as is used when handling non-deployed supplemental restraints. Review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the actuator has been deployed, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. .

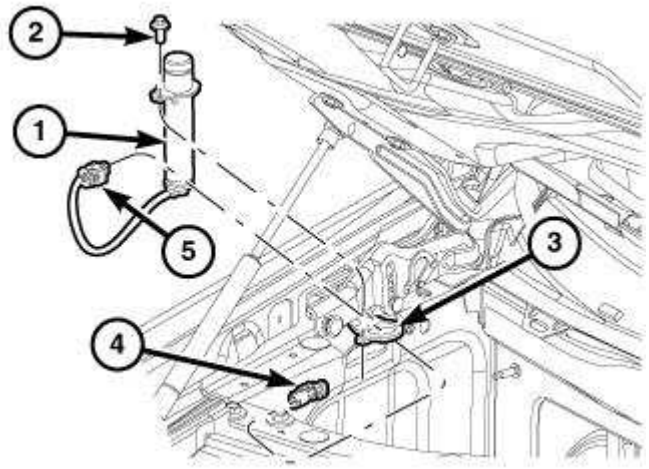

Fig. 9: Pigtail Wire Connector, Electronic Pedestrian Protection (EPP) Active Hood Hinge Actuator & Dash Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. With the ignition switch in the OFF position, disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Disconnect the pigtail wire connector (5) of the Electronic Pedestrian Protection (EPP) active hood hinge actuator (1) from the headlamp and dash wire harness connector (4).
3. Remove the screw (2) that secures the actuator bracket to the mount (3) on the hood hinge lower bracket.
4. Remove the actuator from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Electronic Pedestrian Protection (EPP) system active hood hinge actuator. If the actuator is ineffective or damaged, but not deployed, it should be handled in the same manner as is used when handling non-deployed supplemental restraints. Review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the actuator has been

deployed, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. .

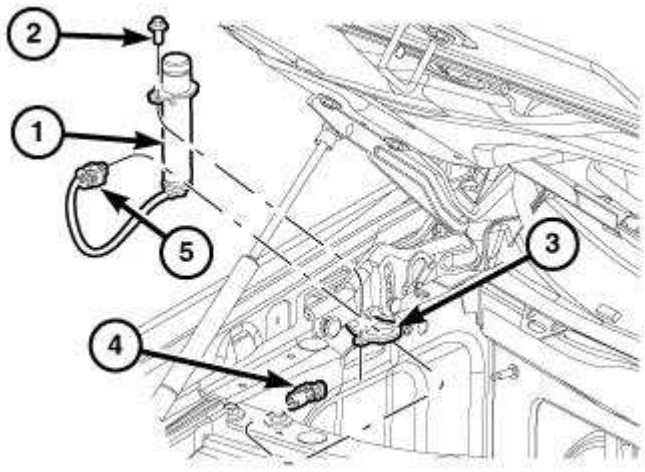

Fig. 10: Pigtail Wire Connector, Electronic Pedestrian Protection (EPP) Active Hood Hinge Actuator & Dash Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Guide the pigtail wire and connector (5) of the Electronic Pedestrian Protection (EPP) active hood hinge actuator (1) through the mount (3) on the hood hinge lower bracket while positioning the actuator to the hinge.
2. Align the hole in the actuator bracket with the hole in the hinge mount.
3. Install and tighten the screw (2) that secures the actuator to the hinge. Tighten the screw to 7.9 N.m (70 in. lbs.).
4. Reconnect the pigtail wire connector of the actuator to the headlamp and dash wire harness connector (4).
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any EPP system component. Refer to **STANDARD PROCEDURE**.

ADJUSTER, SEAT BELT TURNING LOOP, FRONT

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners.

Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

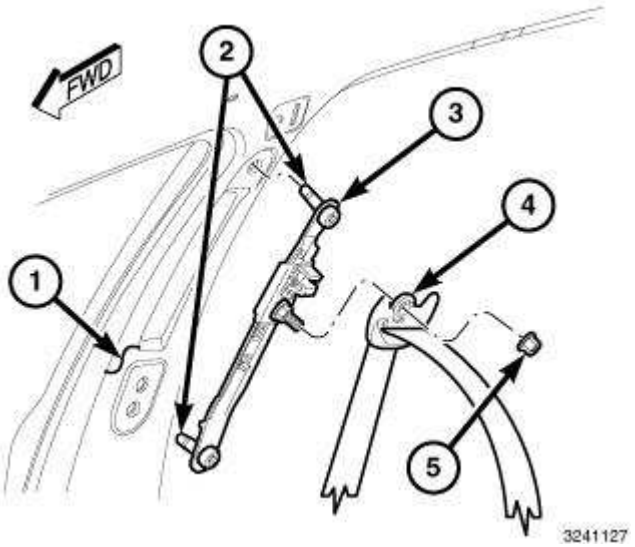

Fig. 11: Nut, Seat Belt Turning Loop, Height Adjuster & Two Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
2. Remove the nut (5) that secures the seat belt turning loop (4) to the stud on the height adjuster (3).
3. Remove the seat belt turning loop from the height adjuster.
4. Remove the two screws (2) that secure the height adjuster to the upper inner B-pillar.
5. Remove the seat belt turning loop adjuster from the B-pillar.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate.

Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

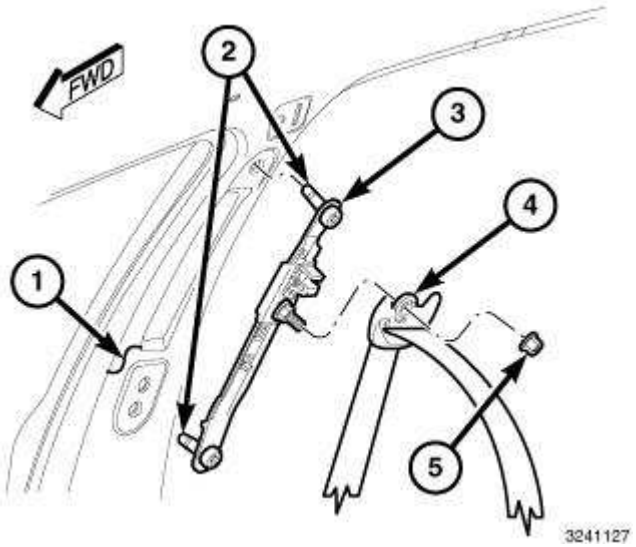

Fig. 12: Nut, Seat Belt Turning Loop, Height Adjuster & Two Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt turning loop height adjuster (3) to the inside of the upper inner B-pillar (1).
2. Install and tighten the two screws (2) that secure the adjuster to the B-pillar. Tighten the screws to 45 N.m (33 ft. lbs.).
3. Position the seat belt turning loop (4) onto the stud of the height adjuster on the B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
4. Install and tighten the nut (5) that secures the turning loop to the height adjuster. Tighten the nut to 45 N.m (33 ft. lbs.).
5. Reinstall the trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

Fig. 13: Except SRT
Courtesy of CHRYSLER GROUP, LLC

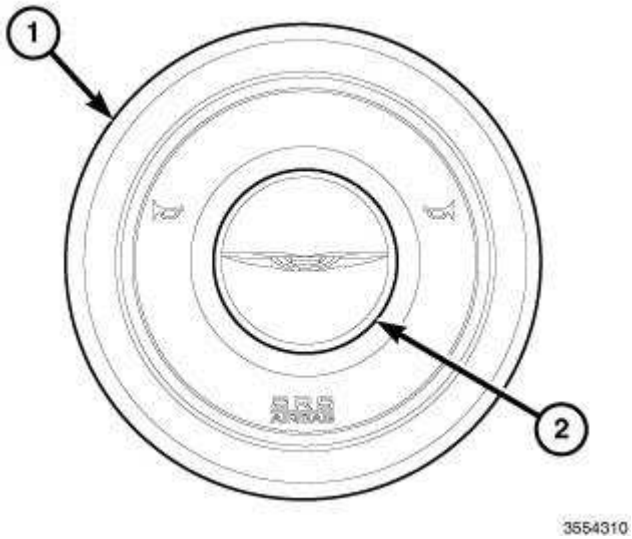

Fig. 14: SRT
Courtesy of CHRYSLER GROUP, LLC

The injection molded, thermoplastic driver airbag protective trim cover (1) is the most visible part of the Driver AirBag (DAB). The DAB is located in the center of the steering wheel, where it is secured with screws to the floating horn switch within the hub cavity of the three-spoke steering wheel. An injection molded, bright emblem with the Chrysler logo (2) is applied to the center of the trim cover.

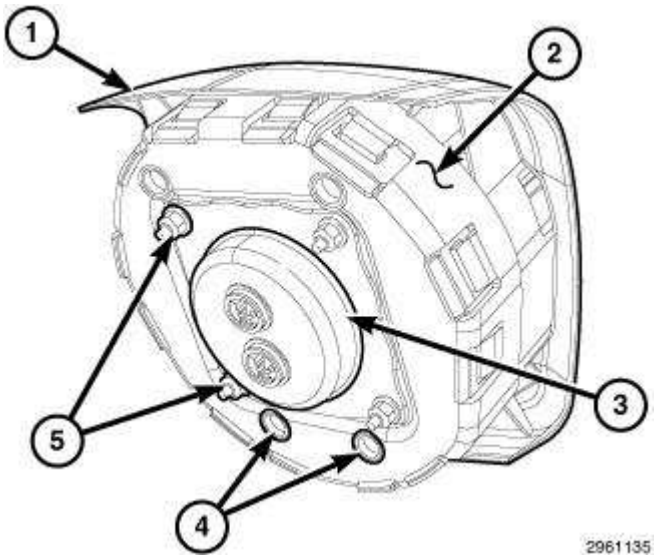

Fig. 15: Except SRT
Courtesy of CHRYSLER GROUP, LLC

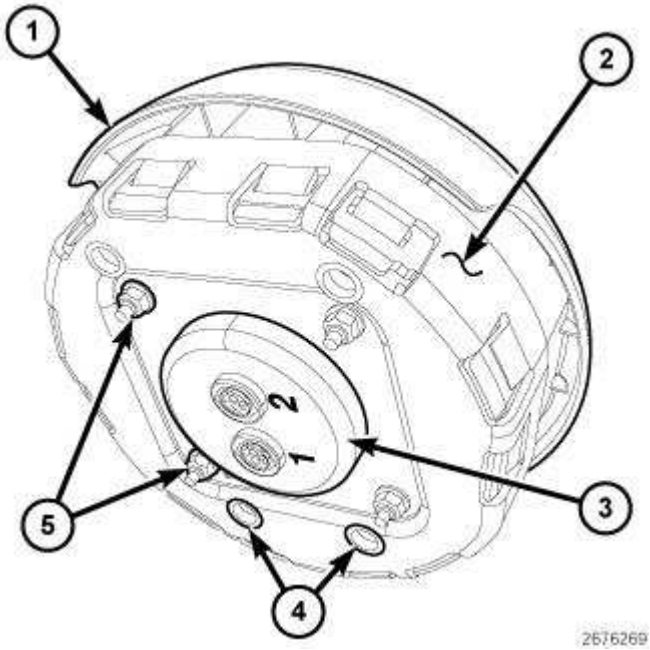

Fig. 16: SRT
Courtesy of CHRYSLER GROUP, LLC

Concealed beneath the DAB trim cover (1) are the folded airbag cushion, the airbag housing (2), the airbag inflator (3) and the retainers (5) that secure the inflator to the housing. The airbag cushion, housing and inflator are secured within an integral receptacle molded into the back of the trim cover. Except for SRT models, the vertical walls of this receptacle have numerous integral window features that are engaged by numerous hook features that are bent outward around the perimeter of the DAB housing. On SRT models, the vertical walls of this receptacle have numerous integral window features that are engaged by numerous tab features that are bent inward around the perimeter of the DAB housing. Once the SRT trim cover is fully seated in the housing, it can only be removed by

cutting it off, and will have to be replaced with a new trim cover. The DAB housing also has four well nuts (4) which are used to secure the floating horn switch to the back of the housing.

The DAB used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying 67 centimeter (26.5 inch) diameter fabric airbag cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the stamped metal airbag housing using four flanged hex nuts. Two keyed and color-coded connector receptacles on the DAB inflator connect the two inflator initiators to the vehicle electrical system through two jacketed, two-wire pigtail harnesses from the clockspring.

The DAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The DAB trim cover and the floating horn switch are available for individual service replacement.

OPERATION

OPERATION

The multistage Driver AirBag (DAB) is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the DAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the DAB housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the DAB trim cover will split at predetermined breakout lines, then fold back out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to a Supplemental Restraint System (SRS) fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. Refer to **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned during a deployment is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these

actions, contact a physician.

Proper diagnosis of the DAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

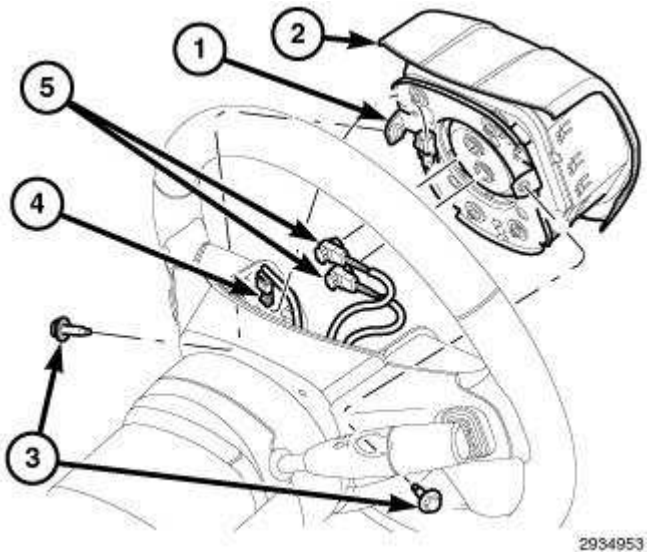

Fig. 17: Two Screws, Floating Horn Switch & Driver Airbag
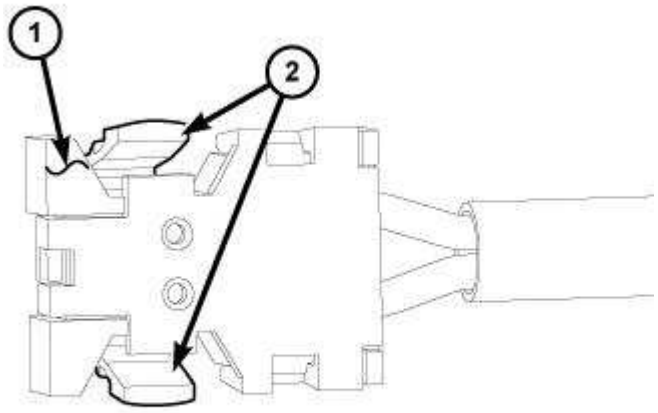
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Working through the access holes in each side of the steering wheel rear trim cover, remove the two screws (3) that secure the floating horn switch (1) and Driver AirBag (DAB) (2) unit to the steering wheel armature.
3. Pull the DAB and floating horn switch unit away from the steering wheel far enough to access the electrical connections (3 and 4) at the back of the airbag housing and switch unit.
4. Disconnect the steering wheel wire harness connector (4) from the floating horn switch connector on the back of the switch.

CAUTION: Do not pull on the clockspring pigtail wires or pry on the connector insulators to disengage them from the Driver AirBag (DAB) inflator initiator connector receptacles. Improper removal of these pigtail wires and their connector insulators can result in damage to the airbag circuits or the connector insulators.



2128307

Fig. 18: Airbag Pigtail Wire Connector Insulators & Integral Latches
Courtesy of CHRYSLER GROUP, LLC

5. The clockspring DAB pigtail wire connector insulators (1) are secured by integral latches (2) to the airbag inflator connector receptacles, which are located on the back of the DAB housing. Pinch both latches firmly, then pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
6. Remove the driver airbag from the steering wheel.
7. If the driver airbag has been deployed, the clockspring and the steering column must be replaced.

DISASSEMBLY

DISASSEMBLY

EXCEPT SRT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit.

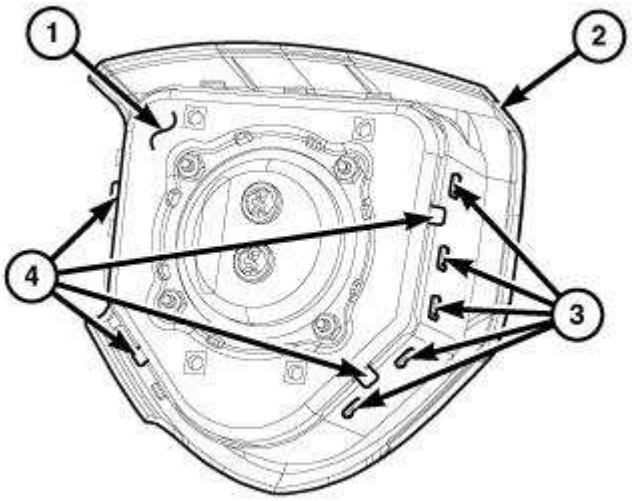


Fig. 19: Trim Cover, Thirteen Hooks, Airbag Housing & Tab
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
3. Place the driver airbag on a suitable clean and dry work surface with the trim cover (2) facing down. If the trim cover will be reused, be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures.
4. Disengage each of the thirteen hooks (3) of the airbag housing (1) from the thirteen windows in the vertical walls of the trim cover receptacle, one wall at a time. Start by disengaging the upper wall, then do each of the two side walls, and finish with the lower wall. To disengage the hooks, use hand pressure to push outward on the upper edge of the receptacle wall far enough to clear the locating tab (4) on the airbag housing, at the same time push the adjacent edge of the airbag housing firmly and evenly downward into the trim cover receptacle.
5. With all of the hooks disengaged, lift the housing, inflator, and cushion as a unit from the receptacle on the back of the driver airbag trim cover.

SRT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper

precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit. The trim cover will be irreparably damaged if it is removed from the DAB housing and MUST be replaced with a new trim cover.

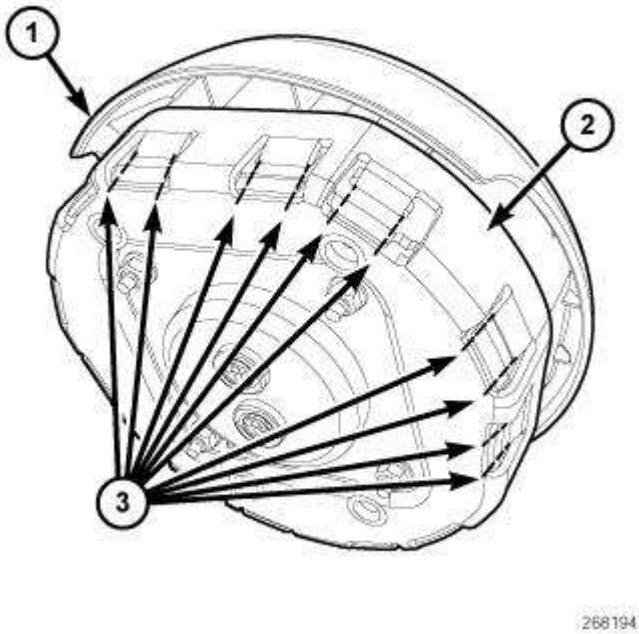

Fig. 20: Twelve Trim Cover, Cut Lines & Airbag Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
3. Place the DAB on a suitable clean and dry work surface.
4. Using a sharp utility knife, carefully cut through the lower edge of each of the twelve trim cover (1) windows at the cut lines (3) on each side of the twelve inward pointing hooks of the airbag housing (2). Use extreme care to prevent any scraps from entering and becoming lost within the airbag housing or cushion.
5. With all of the windows cut open, separate the remainder of the trim cover from the DAB housing by pulling it away from the top of the housing around the perimeter. Discard the removed trim cover.

ASSEMBLY

ASSEMBLY

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: **The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit.**

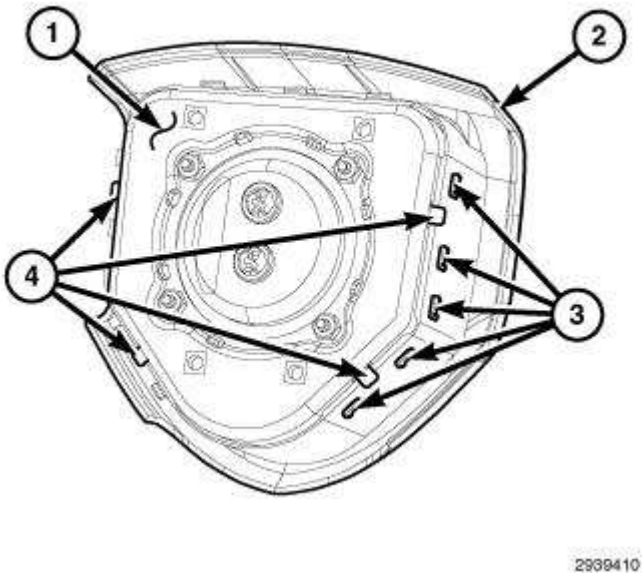

Fig. 21: Trim Cover, Thirteen Hooks, Airbag Housing & Tab
Courtesy of CHRYSLER GROUP, LLC

1. Place the driver airbag trim cover (2) on a suitable clean and dry work surface with the receptacle facing up. Be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures.
2. Position the driver airbag housing (1), inflator, and cushion as a unit over the trim cover receptacle.
3. Using hand pressure, push the airbag housing firmly and evenly down into the trim cover receptacle far enough that the hooks (3) of the housing are aligned with the windows in the vertical walls of the receptacle.
4. Work around the perimeter of the unit engaging each of the thirteen hooks on the driver airbag housing through the thirteen windows in the walls of the trim cover receptacle.
5. After the driver airbag has been assembled, try pulling the trim cover and the airbag housing away from each other. This action will fully seat the edges of the windows into the cradles of the hooks and the vertical walls of the receptacle beneath the locating tabs (4) of the housing.

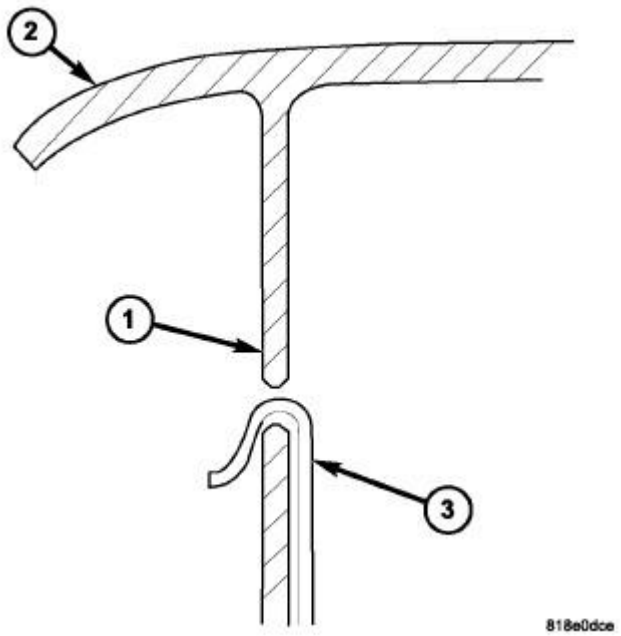

Fig. 22: Airbag Blocking Tab & Housing Hook

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped

between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit. The trim cover will be irreparably damaged if it is removed from the DAB housing and MUST be replaced with a new trim cover.

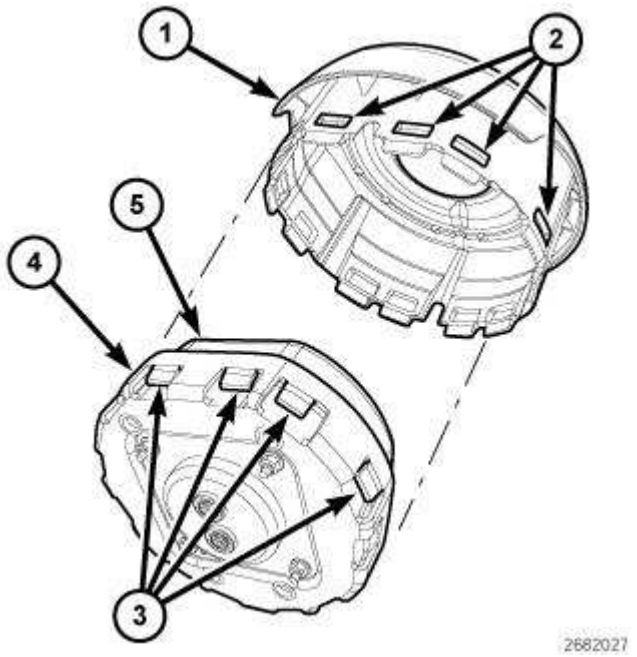

Fig. 23: Driver AirBag Housing, Cushion, DAB Trim Cover, Pointing Hooks & Twelve Windows
Courtesy of CHRYSLER GROUP, LLC

1. Place the Driver AirBag housing (4) on a suitable clean and dry work surface with the cushion (5) facing up.
2. Position the DAB trim cover (1) over the housing. Be certain that the twelve windows (2) of the trim cover are aligned with the twelve inward pointing hooks (3) of the airbag housing. All of the trim cover windows will align with all of the housing hooks correctly only in one position.
3. Insert the edges of the trim cover between the airbag cushion and the airbag housing. Be certain that the trim cover and housing are still properly aligned.
4. Using hand pressure, push the trim cover firmly and evenly down into the housing far enough that each of the inward pointing hooks of the housing is engage through a window in the trim

cover.

5. Inspect around the entire perimeter of the unit being certain each of the twelve hooks on the DAB housing is engaged through the appropriate window in the trim cover.
6. After the DAB has been assembled, try pulling the perimeters of the trim cover and the airbag housing away from each other. This action will fully seat the housing hooks into the trim cover windows.
7. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION**.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the driver airbag trim cover must never be painted. Replacement airbags are serviced with trim covers in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

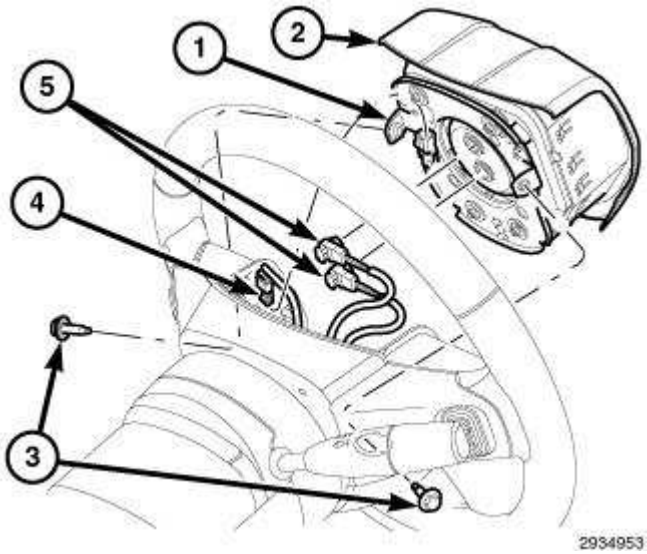

Fig. 24: Two Screws, Floating Horn Switch & Driver Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the Driver AirBag (DAB) (2) and floating horn switch (1) unit close enough to the steering wheel to reconnect the electrical connections to the back of the airbag housing.
2. Reconnect the steering wheel wire harness connector (4) to the floating horn switch connector on the back of the switch.
3. Reconnect the wire connectors (5) to the airbag inflator connector receptacles by pressing straight in on the connector insulator. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
4. Carefully position the DAB and floating horn switch unit into the steering wheel hub. Be certain that none of the steering wheel wiring is pinched between the airbag housing or the horn switch and the steering wheel armature.
5. Working through the access holes in each side of the steering wheel rear trim cover, install and tighten the two screws (3) that secure the floating horn switch and DAB unit to the steering wheel armature. Tighten the screws to 13 N.m (10 ft. lbs.).
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, KNEE BLOCKER

DESCRIPTION

DESCRIPTION

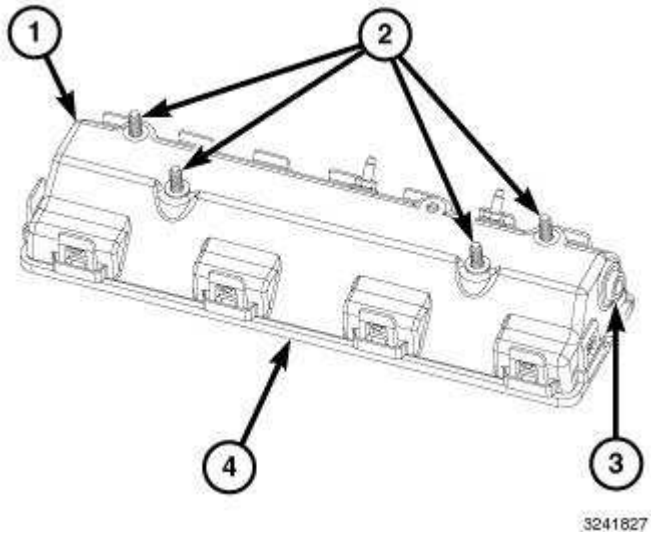

Fig. 25: Airbag Housing, Four Studs, Plastic Protective Cover & Inflator Initiator
Courtesy of CHRYSLER GROUP, LLC

A knee blocker airbag (also known as the Knee AirBag/KAB or the Inflatable Knee Blocker/IKB) is used on vehicles manufactured for domestic markets. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. Vehicles with this equipment may be readily identified by the **SRS - AIRBAG** logo located on the upper outboard corner of the instrument panel steering column opening cover.

The knee blocker airbag is concealed behind the steering column opening cover below the steering column on the driver side lower instrument panel. Located behind the steering column opening cover, the stamped metal airbag housing (1) is secured by four studs (2) with nuts to the stamped metal lower instrument panel reinforcement of the instrument panel support structure. A molded plastic protective cover (4) is secured over the folded airbag cushion by several hook formations stamped into the airbag housing that are engaged through window openings in tabs integral to the outer perimeter of the cover.

The airbag housing contains the airbag inflator and a heat shield. The airbag inflator is a single-initiator, non-azide hybrid-type unit that is secured to the housing by two studs with nuts and sealed within the airbag housing. The airbag is connected to the vehicle electrical system through a dedicated take out and connector insulator of the instrument panel wire harness that connects directly to the inflator initiator (3).

The knee blocker airbag cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the airbag is deployed, the knee blocker and the steering column opening cover must also be replaced.

OPERATION

OPERATION

The knee blocker airbag (also known as the Knee AirBag/KAB or the Inflatable Knee Blocker/IKB) is

deployed by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through a knee blocker line 1 and line 2 (or squib) circuits to the initiator in the airbag inflator. The hybrid-type inflator assembly for the airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemical pellets burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the knee blocker airbag protective cover will split at predetermined tear seam lines concealed on the underside of the cover, then fold open and out of the way.

The cushion protects the lower extremities of the vehicle operator and helps to keep the seat occupant properly positioned for the Driver AirBag (DAB) deployment during a frontal impact collision. Following an airbag deployment, the knee blocker airbag cushion quickly deflates by venting the inert gas through the loose weave of the fabric used to construct the instrument panel side of the airbag cushion, and the deflated cushion hangs down loosely from the lower instrument panel.

Proper diagnosis of the knee blocker airbag inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged Inflatable Knee Blocker (IKB) airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the IKB airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

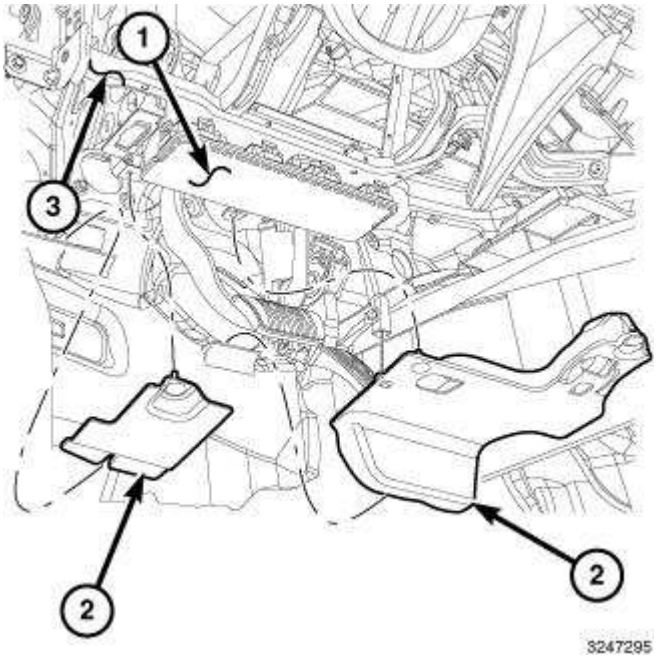

Fig. 26: Panels, Instrument Panel Lower Reinforcement & Knee AirBag (KAB) Cover

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the close out panels (2) from under the driver side of the instrument panel lower reinforcement (3) and surrounding the Knee AirBag (KAB) cover (1) and housing.
3. Remove the steering column opening cover from the instrument panel. Refer to **COVER, INSTRUMENT PANEL, REMOVAL** .

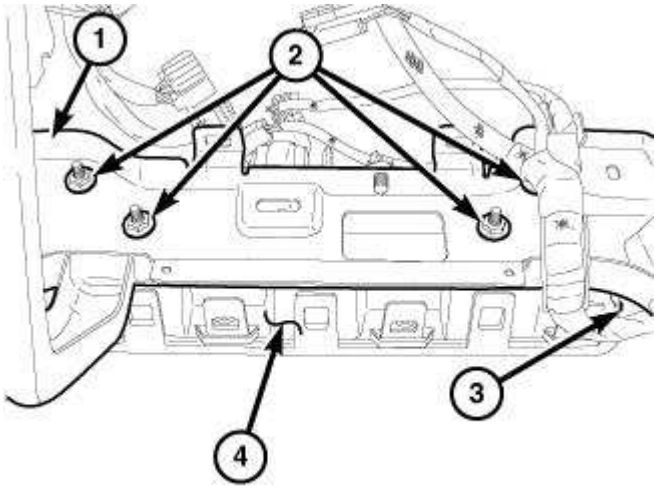

Fig. 27: Four Nuts, Studs, Wire Harness Connection & Instrument Panel Lower Reinforcement
Courtesy of CHRYSLER GROUP, LLC

4. Remove the four nuts (2) that secure the studs of the KAB (4) to the instrument panel lower reinforcement (1).
5. Rotate the outboard end of the KAB downward so that the instrument panel wire harness connection (3) to the KAB inflator faces upward.
6. Disconnect the electrical connection that is secured by integral latches to the KAB inflator initiator connector receptacle on the inboard end of the KAB housing. Depress the latches on each side of the connector insulator and pull the insulator straight out from the inflator initiator to disconnect it from the connector receptacle.
7. Remove the KAB from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Inflatable Knee Blocker (IKB) airbag, or becoming entrapped between the IKB airbag cushion and the IKB cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Inflatable Knee Blocker (IKB) airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the IKB airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

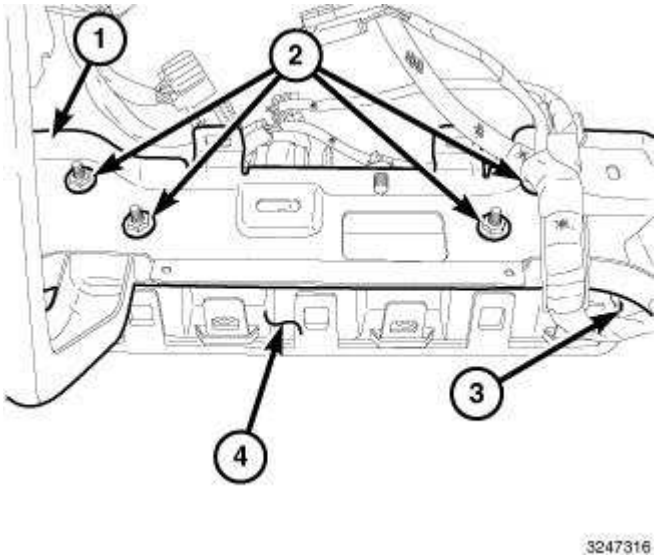

Fig. 28: Four Nuts, Studs, Wire Harness Connection & Instrument Panel Lower Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1. Position the Knee AirBag (KAB) (4) below the steering column opening of the instrument panel in a vertical orientation with the airbag inflator initiator connector receptacle (3) facing upward.
2. Reconnect the connector insulator of the instrument panel wire harness take out for the KAB to the airbag inflator initiator connector receptacle by pressing straight in on the connector. You can be certain that the connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
3. Carefully position the KAB to the instrument panel lower reinforcement (1).
4. Install and tighten the four nuts that secure the studs of the KAB to the instrument panel lower reinforcement. Tighten the nuts to 6 N.m (53 in. lbs.).
5. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, INSTRUMENT PANEL, INSTALLATION** .

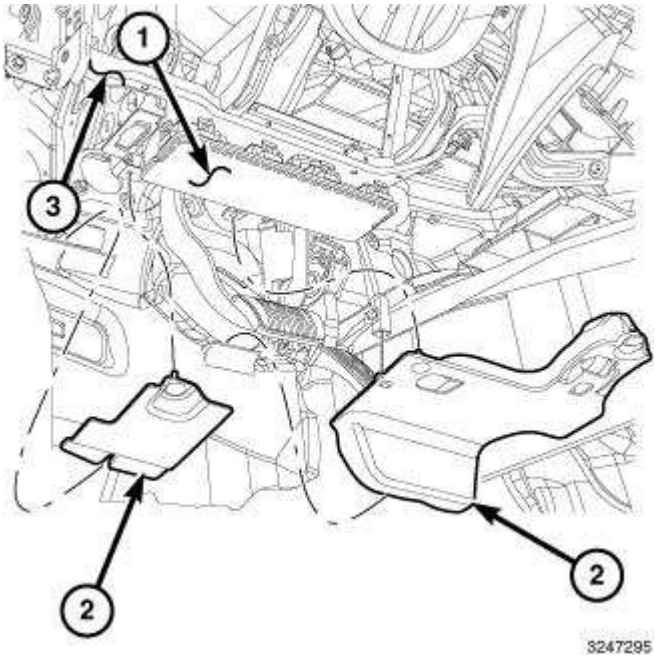

Fig. 29: Panels, Instrument Panel Lower Reinforcement & Knee AirBag (KAB) Cover
Courtesy of CHRYSLER GROUP, LLC

6. Reinstall the close out panels (2) under the driver side of the instrument panel lower reinforcement (3) and surrounding the KAB cover (1) and housing.
7. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

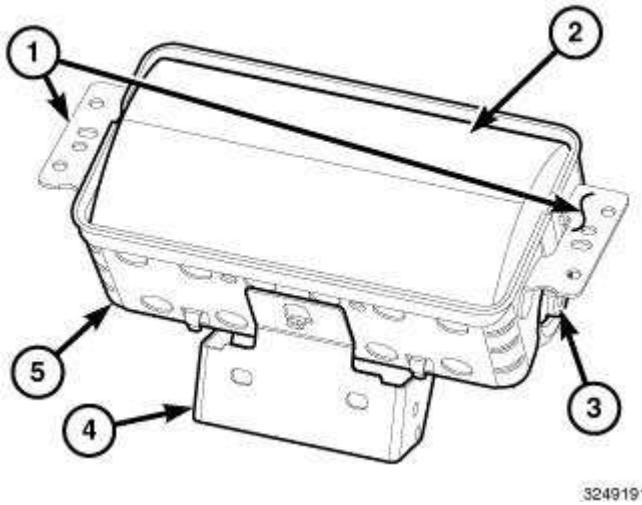

Fig. 30: Upper Bracket, Lower Mounting Bracket, Welded Metal Housing & Airbag Cushion
Courtesy of CHRYSLER GROUP, LLC

The horizontal surface of the instrument panel top pad above the glove box is the most visible part of the Passenger AirBag (PAB). The seamless PAB door is integral to the top of the instrument panel cover above the glove box opening on the instrument panel in front of the front seat passenger seating position. Located below the PAB door area of the instrument panel cover, the PAB retainer or chute is secured to the underside of the instrument panel cover substrate.

The retainer defines the PAB door breakout area of the cover and serves as the receptacle for the PAB cushion and housing. Two U-nuts on each side of the retainer secure the two screws that mount each upper bracket (1) of the PAB housing to the substrate. The PAB is also secured by two screws through a stamped lower mounting bracket (4) to the instrument panel support structure or armature.

The PAB unit used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. The PAB unit consists of a stamped and welded metal housing (5), the airbag cushion (2), and the airbag inflator. The airbag housing contains the airbag inflator and the folded airbag cushion. A rectangular fabric cushion is used.

The passenger airbag used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The PAB unit consists passenger airbag consists of a stamped and welded metal housing, the airbag cushion, the airbag inflator, and a stamped metal airbag cushion retainer plate that is secured to the airbag housing.

The airbag housing contains the airbag inflator and the folded airbag cushion. The airbag inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. A dedicated takeout with keyed and color coded connector insulators directly connects the two inflator initiators (3) to the vehicle electrical system through the instrument panel wire harness. A rectangular fabric cushion is used.

The PAB cannot be repaired and must be replaced if deployed, ineffective or in any way damaged. The PAB door and retainer are serviced only as a unit with the instrument panel cover. If the PAB is deployed, the instrument panel cover must also be replaced.

OPERATION

OPERATION

The multistage Passenger AirBag (PAB) is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the PAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the PAB can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag cushion will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn, ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the cushion, causing the cushion to inflate. As the cushion inflates, the PAB door area of the instrument panel cover will split at predetermined tear seam lines concealed on the underside of the cover, then the door will pivot up over the top of the instrument panel and out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas through vent holes within the fabric used to construct the back (windshield side) of the cushion.

Typically, both initiators are used during a PAB deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. Refer to **STANDARD PROCEDURE**.

Proper diagnosis of the PAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the passenger airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

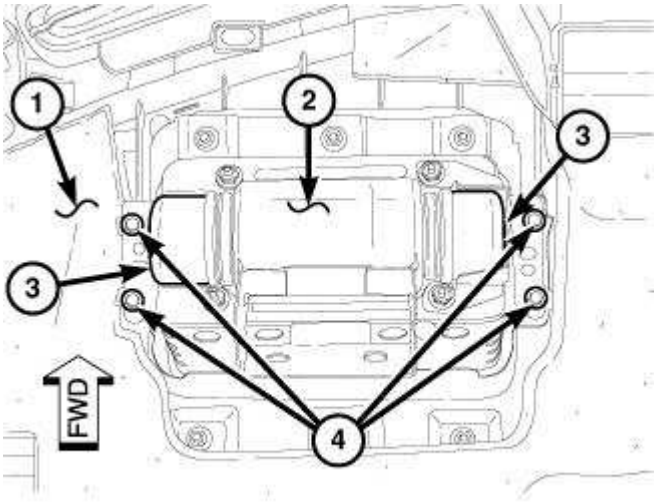

Fig. 31: Two PAB Initiators, Passenger AirBag (PAB), Instrument Panel Cover & Four Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Reach through the instrument panel glove box opening to access and remove the two screws that secure the PAB lower bracket to the instrument panel structural support.
4. Reach through the instrument panel glove box opening to access and disconnect the two instrument panel wire harness connectors from the two PAB initiators (3), one at each side of the PAB inflator canister.
5. Remove the Passenger AirBag (PAB) (2) and instrument panel cover (1) as a unit from the instrument panel support structure or armature. Refer to **COVER, INSTRUMENT PANEL, REMOVAL** .
6. Place the instrument panel cover and passenger airbag unit on a suitable work surface with the top of the cover facing down. If the cover will be reused, be certain to take the proper

precautions to prevent the cover from receiving cosmetic damage during the following procedures.

7. Remove the four screws (4) that secure the two upper airbag mounting brackets to the U-nuts on each side of the PAB retainer or chute (2) on the underside of the instrument panel cover.
8. Remove the PAB from the instrument panel cover.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the instrument panel top pad must never be painted. Replacement top pads are serviced in the original colors. Paint may change the way in which the material of the top pad responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the passenger airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

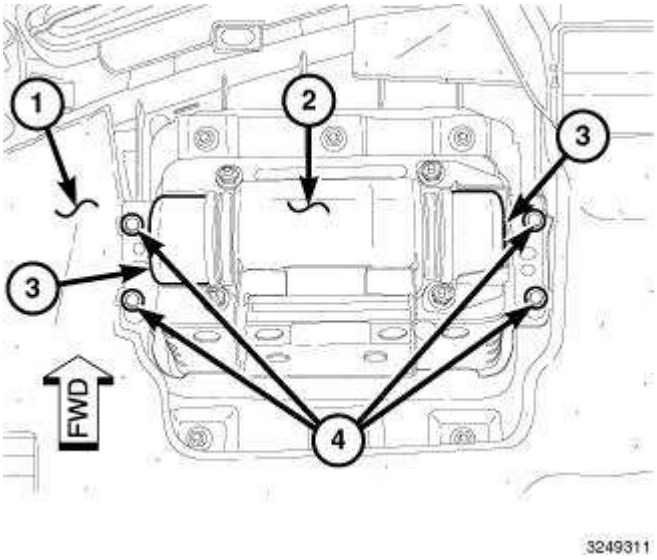

Fig. 32: Two PAB Initiators, Passenger AirBag (PAB), Instrument Panel Cover & Four Screws
Courtesy of CHRYSLER GROUP, LLC

1. Place the instrument panel cover (1) on a suitable work surface with the receptacle of the Passenger AirBag (PAB) retainer or chute facing up. Be certain to take the proper precautions to prevent the cover from receiving cosmetic damage during the following procedures.
2. Carefully position the PAB housing into the airbag retainer receptacle.
3. Install and tighten the four screws that secure the PAB upper mounting brackets to the U-nuts on the retainer. Tighten the screws to 2.8 N.m (25 in. lbs.).
4. Reinstall the PAB and instrument panel cover onto the instrument panel structural support or armature as a unit. Refer to **COVER, INSTRUMENT PANEL, INSTALLATION** .
5. Reach through the instrument panel glove box opening to access and reconnect the two instrument panel wire harness connectors to the two PAB initiators (3), one at each side of the PAB inflator canister. Be certain the connectors are each fully engaged and locked.
6. Reach through the instrument panel glove box opening to install and tighten the two screws that secure the PAB lower bracket to the instrument panel structural support. Tighten the screws to 11.6 N.m (103 in. lbs.).
7. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
8. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SEAT

DESCRIPTION

DESCRIPTION

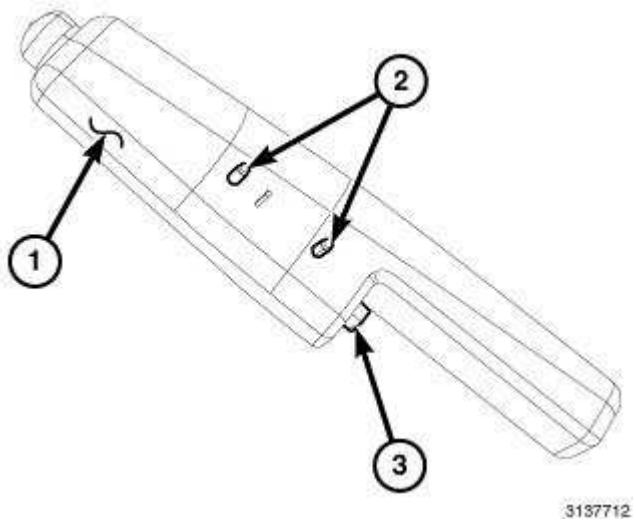

Fig. 33: Seat AirBags (SAB), Two Studs & Inflator Initiator
Courtesy of CHRYSLER GROUP, LLC

Seat AirBags (SAB) (1) (also known as thorax or pelvic airbags) are standard equipment on this model. These airbags are completely concealed beneath the seat back trim cover on the upper outboard sides of both front seat backs. The airbags are inserted into a molded thermoplastic chute on the outside of the seat back frame, then secured to the frame by nuts on two studs (2) on the SAB bracket on the inboard side of the inflator. The SAB is connected to the vehicle electrical system through a dedicated jumper wire harness with a connector insulator that connects directly to the inflator initiator (3). The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the initiator.

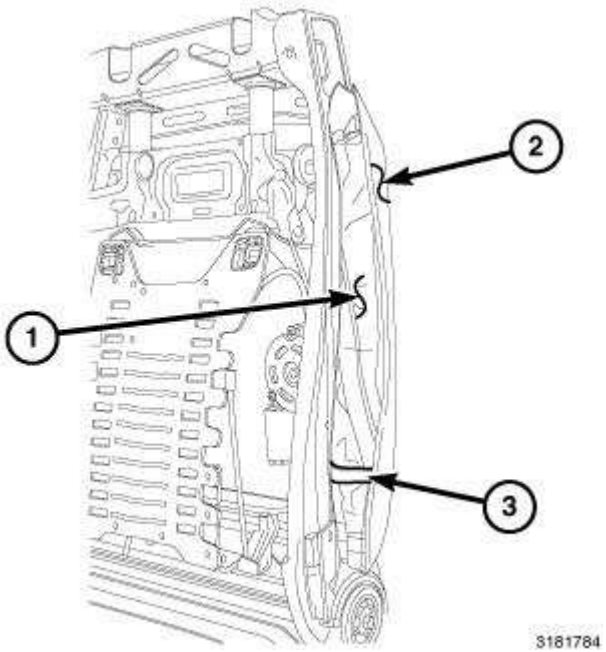

Fig. 34: Folded SAB Cushion, Chute & Fabric Strap
Courtesy of CHRYSLER GROUP, LLC

The folded SAB cushion (1) is contained within and protected by the chute (2). The cushion is constructed of a coated nylon fabric. The folded SAB cushion is tied to the airbag inflator with a fabric strap (3). The inflator consists of the airbag inflator and a high pressure cylinder filled with inert gas. The airbag inflator is a single-initiator, hybrid-type unit that is secured to the SAB bracket.

The SAB cannot be repaired, and must be replaced if deployed, ineffective, or in any way damaged. If the SAB is deployed the thermoplastic chute, the seat back frame, the seat back foam, the seat back trim cover and the seat airbag jumper wire harness must also be replaced.

OPERATION

OPERATION

Each Seat AirBag (SAB) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right SAB line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected so that all of the released gas is directed into the folded SAB cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric retainer strap and the thermoplastic chute will direct the expanding cushion through the outboard side of the seat back trim cover and into the area between the outboard side of the front seat and the front door to protect the front seat occupant during a side impact collision or a vehicle rollover incident.

Following the deployment, the SAB cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the outboard side of the front seat back.

Proper diagnosis of the SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front and back of the front seat back frame (2). Refer to **COVER, SEAT BACK, FRONT, REMOVAL** .
5. Remove the two nuts (3) that secure the Seat AirBag (SAB) and thermoplastic chute (1) to the outboard side of the seat back frame.

CAUTION: Do not pull on the Seat AirBag (SAB) jumper wire harness take out or pry on the connector insulator to disengage the connector from the

SAB inflator connector receptacle. Improper removal of this take out and its connector insulator can result in damage to the airbag circuits or the connector insulator.

6. Disengage the two SAB studs from the seat back frame and remove the SAB and chute from the seat back as a unit.

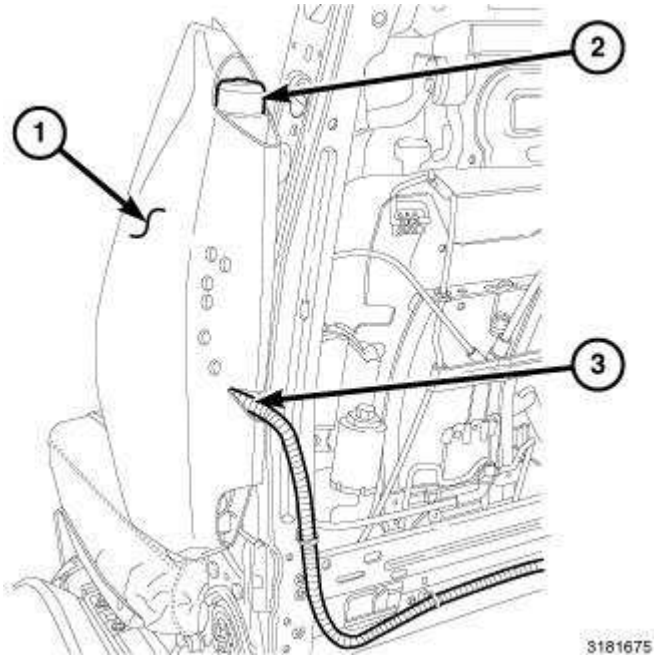

Fig. 36: SAB From The Chute, SAB Jumper Wire Harness & SAB Inflator
Courtesy of CHRYSLER GROUP, LLC

7. Disengage the SAB from the chute (1) to access and disconnect the SAB jumper wire harness (3) connector from the base of the SAB inflator (2). Pull the connector insulator straight out from the inflator to disconnect it from the connector receptacle.
8. Disengage the SAB jumper wire harness from the opening in the back of the chute.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: **The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .**

CAUTION: The Seat AirBag (SAB) must be installed into the nylon pouch integral to the front seat back trim cover before the SAB or the trim cover are installed on the front seat back frame. Failure to do so will adversely affect the function of the SAB system.

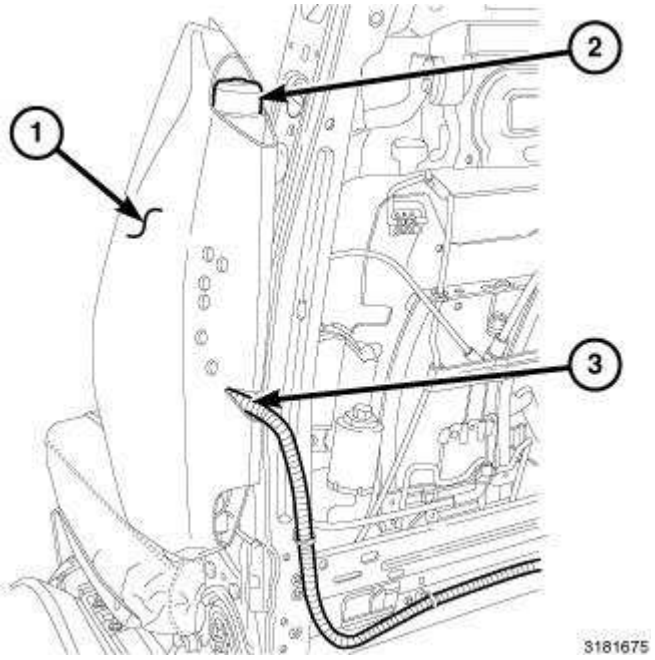

Fig. 37: SAB From The Chute, SAB Jumper Wire Harness & SAB Inflator
Courtesy of CHRYSLER GROUP, LLC

1. Engage the SAB jumper wire harness (3) through the opening in the back of the thermoplastic chute (1).
2. Reconnect the seat jumper wire harness connector to the connector receptacle at the base of the SAB inflator. Be certain that the connector latches and lock are fully engaged.
3. Carefully slide the Seat AirBag (SAB) and inflator (2) into the chute and engage the two SAB studs through the holes provided in the chute. Be certain not to tear or damage the chute.

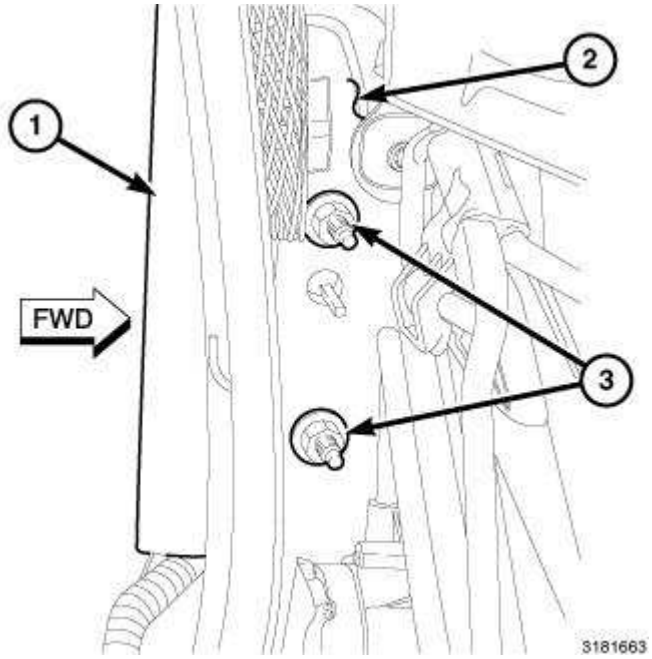

Fig. 38: Front Seat Back Frame, Two Nuts & Seat AirBag (SAB) And Thermoplastic Chute
Courtesy of CHRYSLER GROUP, LLC

4. Position the SAB and chute (1) as a unit to the outboard side of the seat back frame (2) and insert the SAB mounting studs through the mounting holes in the frame.
5. Install and tighten the two nuts (3) that secure the SAB to the outboard side of the seat back frame. Tighten the nuts to 8 N.m (71 in. lbs.).

CAUTION: Be certain that all of the trim is properly reinstalled on the front seat back frame. Failure to do so will adversely affect the function of the Seat AirBag (SAB) system.

6. Reinstall the trim onto the front and back of the front seat back frame. Refer to **COVER, SEAT BACK, FRONT, INSTALLATION** .
7. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
8. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

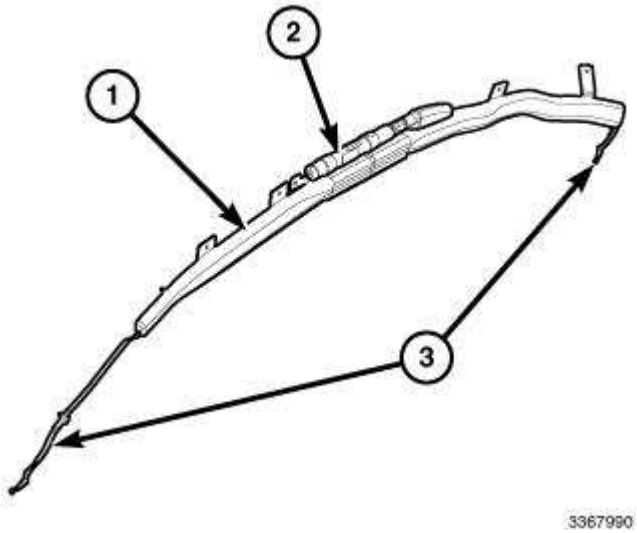

Fig. 39: Side AirBag Inflatable Curtains (SABIC), Tether & Hybrid-Type Inflator
Courtesy of CHRYSLER GROUP, LLC

Side AirBag Inflatable Curtains (SABIC) (1) are standard factory-installed equipment for this vehicle. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. The SABIC system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision or a vehicle rollover incident. Each SABIC cushion provides full coverage of the side glass on the same side of the vehicle as the monitored impact.

Each vehicle is equipped with two individually controlled SABIC units. These SABIC units are concealed and mounted above the headliner where they are each secured to one of the roof side rails. Each folded airbag cushion is contained within a fabric wrap and extruded plastic channels that extend along the roof rail from the A-pillar at the front of the vehicle to the C-pillar at the rear of the vehicle.

A long tether (3) extends down the A-pillar from the front of the SABIC cushion, while a shorter tether extends back to over the C-pillar. The end of each tether is secured to a slot in the sheet metal with a metal T-hook, while an additional plastic push-in fastener secures the T-hook within the slot in the sheet metal of the pillar. A molded airbag support bracket is snapped into the roof rail above the C-pillar.

The hybrid-type inflator (2) for each SABIC is secured to the roof rail above the B-pillar and the front door opening, and is connected to the airbag cushion by a long tubular manifold. The inflator bracket and the extruded cushion channel are secured with both plastic push-in fasteners and a snap-in fastener to the roof rail. The inflator is initially hung from the roof rail by the snap-in fastener, then the push-in fasteners secure the body of the airbag cushion to the roof rail and the support bracket. Finally, the entire assembly is secured with five screws to the roof rail and the airbag support bracket.

The airbag inflator is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness near the top of the B-pillar. The body wire harness connects the SABIC unit to the Occupant Restraint Controller (ORC).

The SABIC units cannot be adjusted or repaired and must be replaced if deployed, ineffective, or in any way damaged. Once a SABIC has been deployed, the complete SABIC unit, the headliner, the upper A, B, and C-pillar trim as well as all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each Side AirBag Inflatable Curtain (SABIC) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through the left or right SABIC line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded airbag cushion, causing the cushion to inflate. As the cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision or a vehicle rollover incident. The cushion features large chambers that inflate adjacent to the head of each front and rear seat occupant.

The front and rear tethers keep the SABIC cushion taut to the side of the vehicle. In addition, ramps integral to the side trim of the interior and integral to the SABIC modules themselves guide the cushion into the proper deployment position. Following the deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and the deflated cushion hangs down loosely from the roof rail.

Proper diagnosis of the SABIC inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There

may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

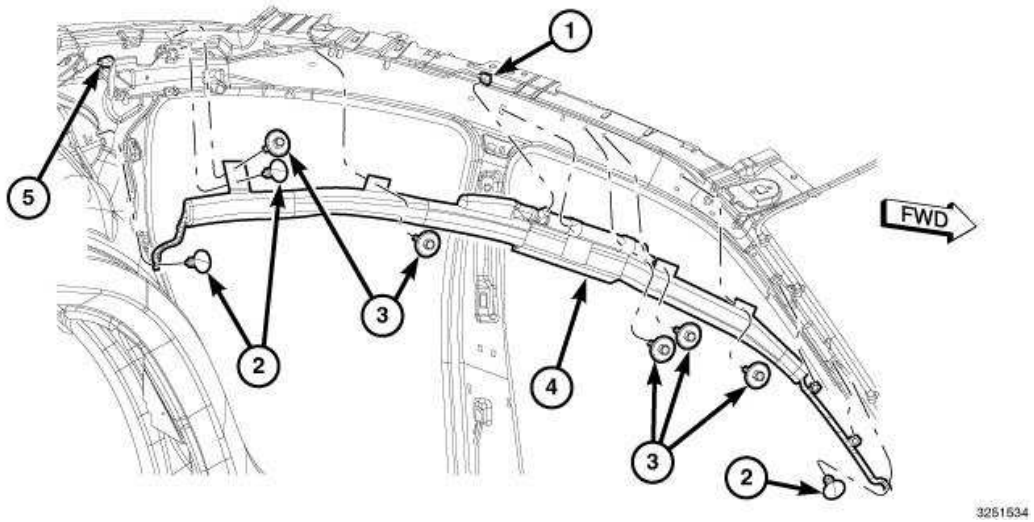

Fig. 40: Wire Harness Connector, Side Air Bag Inflatable Curtain (SABIC), Five Screws & Airbag Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the headliner from the vehicle. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the body wire harness connector (1) for the Side Air Bag Inflatable Curtain (SABIC) (4) from the connector receptacle on the inflator on the inner roof rail above the B-pillar.
4. Remove the five screws (3) that secure the SABIC to the inner roof rail and the airbag support bracket (5).
5. Disengage the plastic push-in fasteners (2), then the T-hook that secures the end of each front and rear SABIC tether in the slots in the inner A-pillar and C-pillar sheet metal.

6. Disengage the remaining plastic push-in fasteners that secure the SABIC to the A-pillar, the inner roof rail and the airbag support bracket at the top of the C-pillar.
7. Grasp the SABIC inflator firmly and pull it away sharply to disengage the snap-in fastener from the inner roof rail above the B-pillar.
8. Remove the SABIC from the vehicle as a unit.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

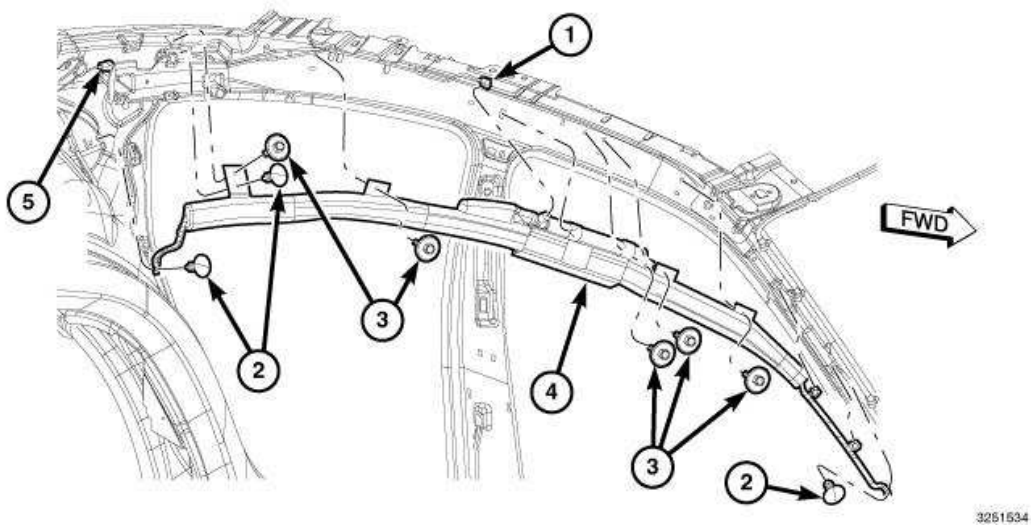

Fig. 41: Wire Harness Connector, Side Air Bag Inflatable Curtain (SABIC), Five Screws & Airbag Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the box nuts and the airbag support bracket (5) for the Side Air Bag Inflatable Curtain (SABIC) (4) are properly installed in the inner roof rail and that they are in good condition.
2. Position the SABIC into the vehicle as a unit.
3. Align the snap-in fastener on the back of the SABIC inflator with the hole in the inner roof rail above the B-pillar and push on the inflator firmly and evenly to snap it into place.
4. Engage the plastic push-in fasteners (2) that secure the airbag cushion to the inner roof rail and the airbag support bracket behind the inflator and the B-pillar.
5. Engage the T-hook that secures the end of each front and rear SABIC tether into the slots in their respective inner A-pillar or C-pillar sheet metal.
6. Engage the plastic push-in fasteners that secure the SABIC front tether to the holes in the inner A-pillar.
7. Engage the plastic push-in fasteners (2) that secure the front and rear SABIC tether T-hooks in their inner A-pillar or C-pillar slots.
8. Install and tighten the five screws (3) that secure the SABIC to the inner roof rail and the airbag support bracket. Tighten the screws to 9 N.m (80 in. lbs.).
9. Reconnect the body wire harness connector (1) to the SABIC inflator connector receptacle.
10. Reinstall the headliner into the vehicle. Refer to **HEADLINER, INSTALLATION** .
11. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

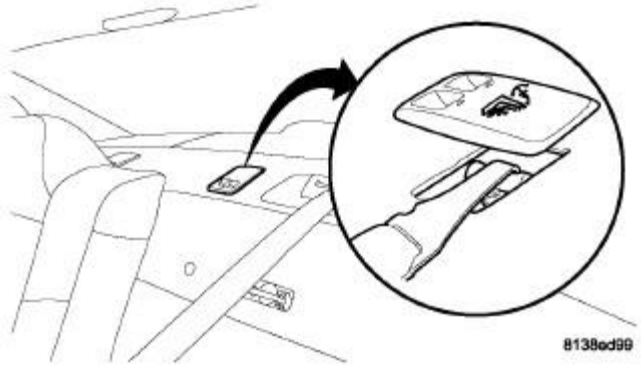

Fig. 42: Lower Anchor & Tether
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system for domestic markets. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seats in these vehicles are equipped with a fixed-position child restraint upper tether anchor for both the center and the two outboard seating positions, and child restraint lower anchors (also known as ISOFIX anchors) for the two outboard seating positions only. Vehicles manufactured for export markets are not equipped with the upper tether anchors, but do have the ISOFIX lower anchors.

The three upper tether anchors are integral to the rear shelf panel. These anchors are each constructed of heavy-gauge steel reinforcement brackets integral to the rear shelf panel and are concealed beneath individual trim cover and bezel units that are integral to the rear shelf trim panel. These upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the rear shelf panel. The upper tether anchor trim covers and bezels are serviced as a unit with the rear shelf trim panel.

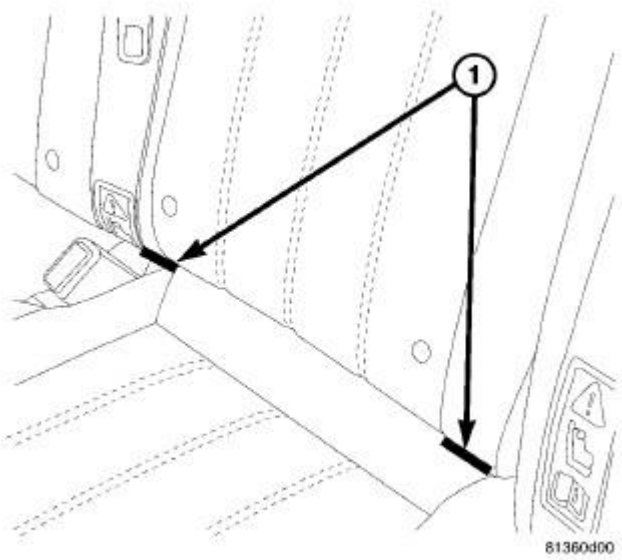

Fig. 43: Lower Anchors
Courtesy of CHRYSLER GROUP, LLC

The lower anchors for all vehicles are integral to an ISOFIX cross member that is permanently mounted to the center floor panel beneath the rear seat cushion. These anchors are constructed from heavy-gauge round steel bar stock that is formed into a U-shape, then securely welded at each end to the cross member.

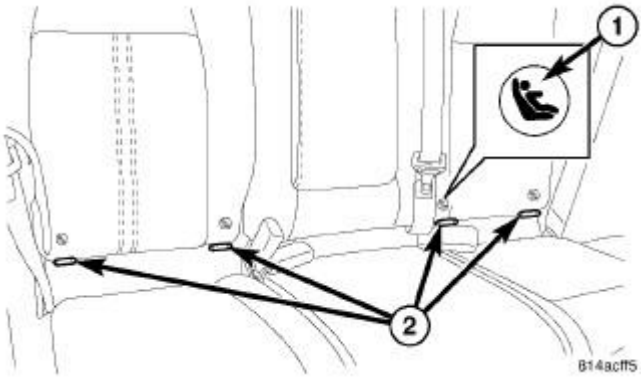

Fig. 44: Identifying Rear Seat Lower Anchors & Markers With An Imprinted Child Seat Icon
Courtesy of CHRYSLER GROUP, LLC

The rear seat lower anchors (2) are each accessed from the front of their respective seats, at each side where the seat back meets the seat cushion. Round markers (1) with an imprinted child seat icon help identify the anchor locations as they may be otherwise difficult to see with the seat back in the upright position. These lower anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the isofix cross member of the center floor panel.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles,

mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

OPERATION

OPERATION

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. The rear seats in this vehicle have two pairs of anchor provisions for installing a LATCH-compatible child seat. A single seat may be mounted in the center seating position, or one in each outboard seating position.

With LATCH, child seats are secured by direct attachment to the vehicle structure, rather than by the seat belts. With LATCH-compatible child seats, lower (also known as ISOFIX) anchors attach to the seat structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

Three upper tether anchors are integral to the rear shelf panel to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap. Vehicles manufactured for export markets are equipped with only the ISOFIX lower anchors, and have no upper tether anchor provisions.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

BUCKLE, SEAT BELT

REMOVAL

FRONT SEAT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in

accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle also includes a seat belt tensioner. If the front seat belt buckle is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

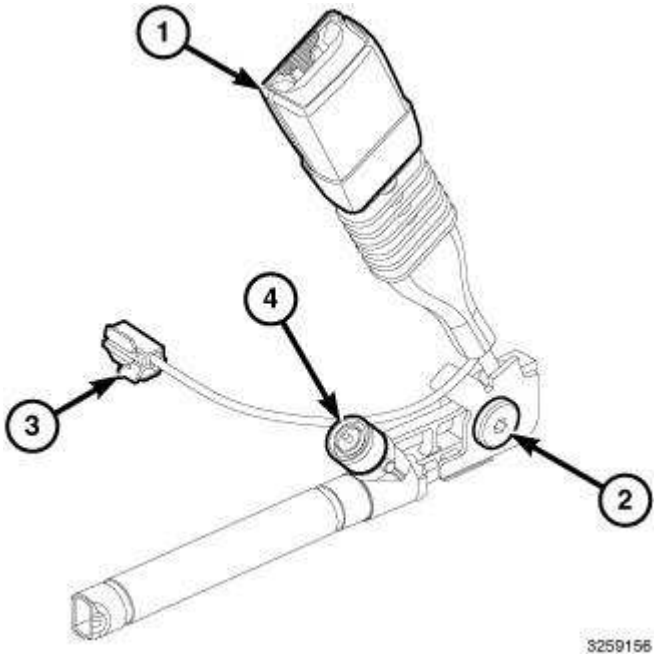

Fig. 45: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
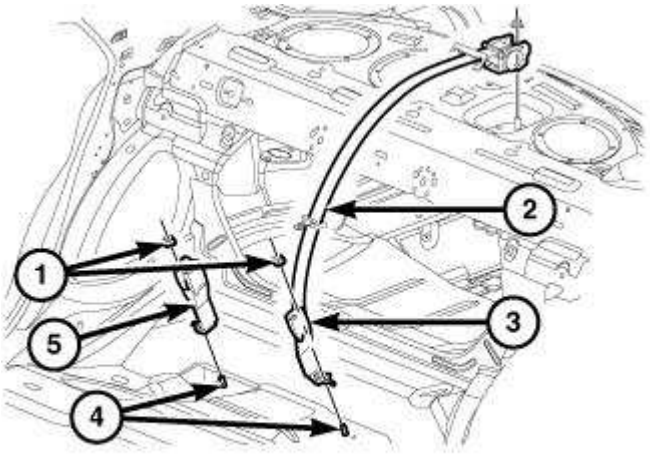
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat for easiest access to the seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Disconnect the seat wire harness connector from the seat belt tensioner initiator (4).
5. Disconnect the seat belt switch pigtail wire connector (3) from the seat wire harness connector.
6. Remove the screw (2) that secures the front seat belt buckle lower anchor to the bracket at the back of the seat cushion frame.
7. Remove the buckle and tensioner (1) from the front seat as a unit.

REAR SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.



3253891

Fig. 46: Center Rear Seating Position Buckles, Left Outboard Rear Seating Position Buckle & Center Rear Seating Position Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right outboard and center rear seating position buckles (5) are serviced

only as a unit. The left outboard rear seating position buckle (3) is integral to the center rear seating position seat belt and retractor (2) lower anchor. Refer to RETRACTOR, SEAT BELT, REMOVAL.

1. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, REMOVAL** .
2. Remove the nut (1) that secures the anchor plate of the right outboard and center rear seating position buckles (5) to the stud (4) on the center floor panel.
3. Remove the buckle unit from the vehicle.

INSTALLATION

FRONT SEAT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle also includes a seat belt tensioner. If the front seat belt buckle is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

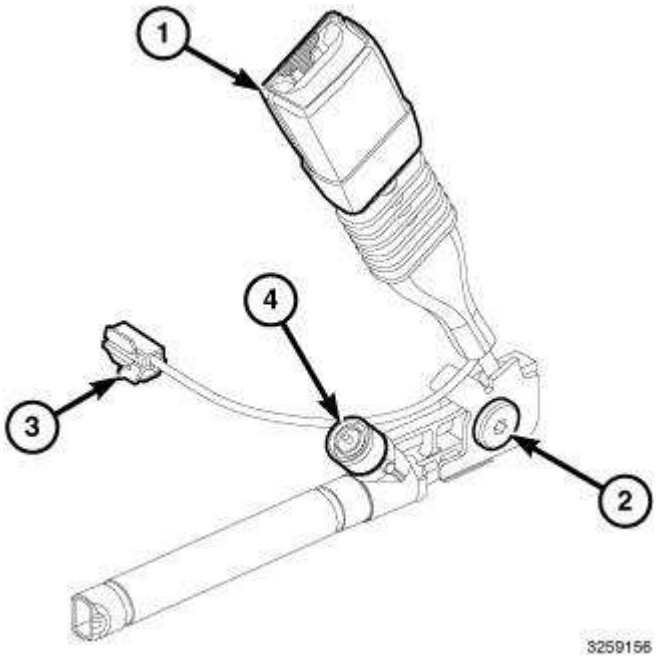


Fig. 47: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
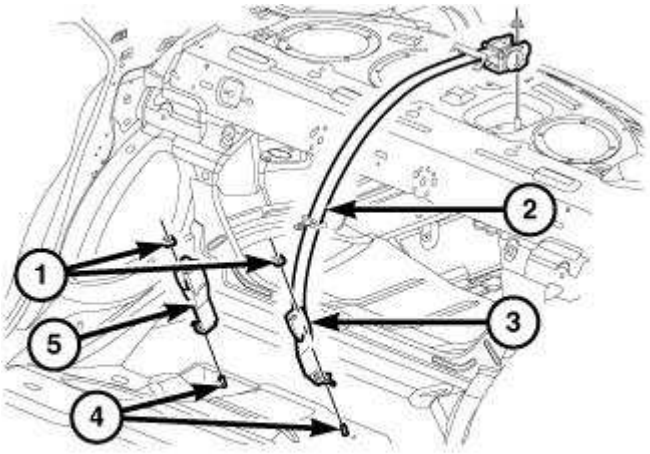
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt buckle and tensioner (1) lower anchor to the bracket at the back of the seat cushion frame.
2. Install and tighten the screw (2) that secures the lower anchor to the seat cushion frame. Tighten the screw to 39 N.m (29 ft. lbs.).
3. Reconnect the seat belt switch pigtail wire connector (3) to the seat wire harness connector.
4. Reconnect the seat wire harness connector to the seat belt tensioner initiator (4).
5. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and

unused replacement parts listed in the Chrysler Mopar® Parts Catalog.



3253891

Fig. 48: Center Rear Seating Position Buckles, Left Outboard Rear Seating Position Buckle & Center Rear Seating Position Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right outboard and center rear seating position buckles (5) are serviced only as a unit. The left outboard rear seating position buckle (3) is integral to the center rear seating position seat belt and retractor (2) lower anchor. Refer to RETRACTOR, SEAT BELT, INSTALLATION.

1. Position the anchor plate of the right outboard and center rear seating position buckles (5) onto the stud (4) on the center floor panel. Be certain to engage the anti-rotation tab of the anchor plate into the clearance hole in the floor panel.
2. Install and tighten the nut (1) that secures buckle anchor plate to the floor. Tighten the nut to 40 N.m (30 ft. lbs.).
3. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** .

CLOCKSPRING

DESCRIPTION

DESCRIPTION

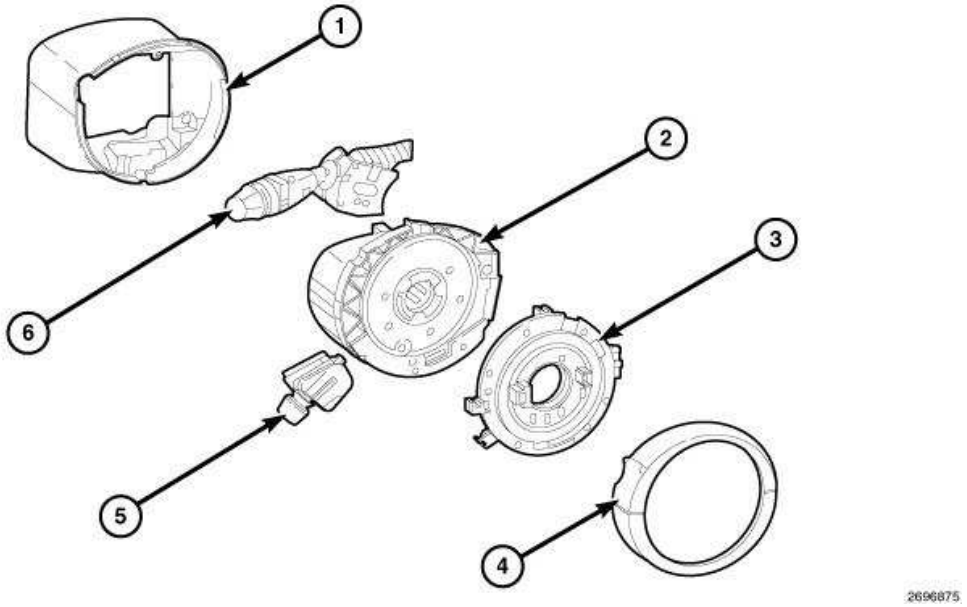


Fig. 49: Steering Column Shroud, Steering Angle Sensor (SAS), Clockspring, Telescope Switch & Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The clockspring (3) for this vehicle is integral to the Steering Column Control Module (SCCM). The clockspring includes an integral, internal turn signal cancel cam. The SCCM is secured near the top of the steering column below the steering wheel. In addition to the clockspring the SCCM includes the steering column shroud (1), the Steering Angle Sensor (SAS) (2), the multi-function switch (6), a power adjustable steering column tilt and telescope switch (5) for vehicles so equipped and a trim cover (4).

Within the plastic clockspring case is a spool-like molded clear plastic rotor with an exposed hub. The upper surface of the rotor hub has a large center hole, two short pigtail wires with connectors, and two connector receptacles that face toward the steering wheel. The inner surface of the clockspring rotor hub has keyway features that are engaged by lug features on the outer circumference of the steering wheel hub. These interlocking features allow the steering wheel to drive the clockspring and SAS and also unlock the clockspring rotor when the steering wheel has been properly installed.

The SCCM includes an integral connector receptacle that faces toward the instrument panel and is connected to the vehicle electrical system through a single takeout and connector of the instrument panel wire harness. The instrument panel wire harness take out has been intentionally provided with additional length to facilitate service removal and installation of the SCCM. However, following SCCM installation, this additional length must be pulled back and secured to the instrument panel structure to prevent undesirable noises while driving.

Wound around the rotor spool within the clockspring case are long ribbon-like tapes that consist of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tapes terminate at the connector receptacle that faces the instrument panel, while the inner end of the tapes terminate at the pigtail wires and connector receptacles on the hub of the clockspring rotor that face the steering wheel. The outer surface of the rotor spool hub within the clockspring case also has the integral lobes of the turn signal cancel cam.

The clear plastic clockspring rotor has an outer band that has a translucent or frosted appearance except for a small, clear inspection window area in the lower right quadrant. The clockspring tape has several black squares that are only visible through the clear inspection window when the clockspring is properly centered. If these squares are not visible through the inspection window, clockspring centering has been compromised and the entire SCCM must be replaced with a new unit.

The service replacement SCCM is shipped with the clockspring pre-centered and with a red molded plastic locking tab installed. The locking tab secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed after the SCCM is installed on the steering column and before the steering wheel can be installed. The clockspring cannot be repaired. If the clockspring is ineffective, damaged, if clockspring centering is compromised or if the Driver AirBag (DAB) has been deployed the entire SCCM unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

OPERATION

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and certain electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the driver airbag, the horn switch, the speed control switch, the remote radio switches, the hands-free communication switches and the Electronic Vehicle Information Center (EVIC) control switches, if the vehicle is so equipped.

The clockspring is integral to the Steering Column Control Module (SCCM) positioned and secured near the top of the steering column. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** . The turn signal cancel cam is integral to the rim of the clockspring rotor hub spool within the clockspring case so it also moves with the rotation of the steering wheel. Two short, sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the Driver AirBag (DAB), while a steering wheel wire harness connected to the connector receptacles on the upper surface of the clockspring rotor completes circuits for the various steering wheel-mounted switches and the heated steering wheel, if the vehicle is so equipped.

Like the clockspring in a timepiece, the clockspring tape and conductors have travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits.

However, if the steering shaft is disconnected from the steering gear the clockspring rotor spool can change position relative to other movable steering components. Clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, clockspring centering has been compromised and the entire SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** .

Service replacement clocksprings are shipped pre-centered within the SCCM and with a plastic

locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the SCCM is installed on a steering column, clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, the SCCM must be replaced with a new unit. Proper clockspring installation may also be confirmed by viewing the Steering Angle Sensor (SAS) data using a diagnostic scan tool.

The hard wired clockspring circuits to the SCCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCCM, the Steering Control Module (SCM) or the electronic controls or communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

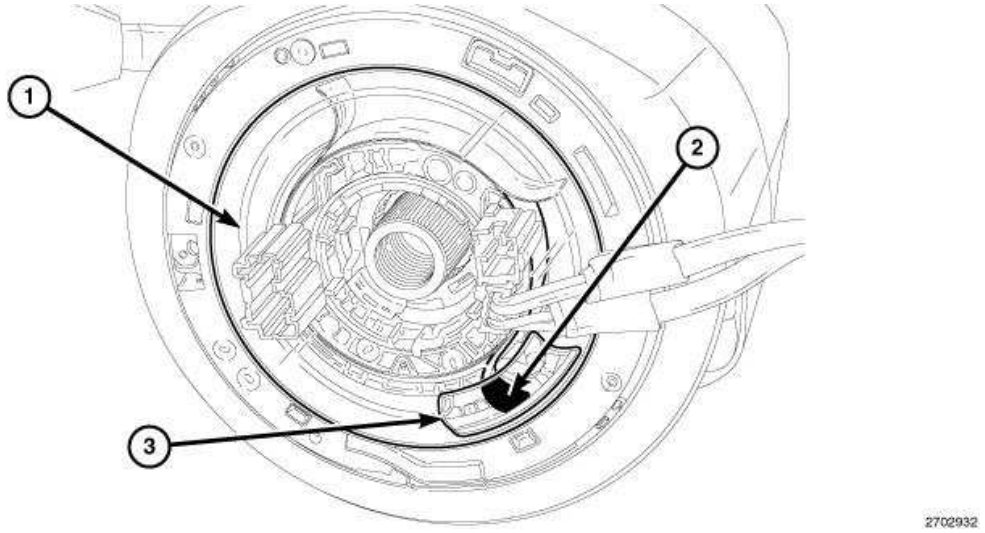

Fig. 50: Inspection Window, Clockspring Rotor & Black Squares
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always turn the steering wheel until the front wheels are in the straight-

ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit MUST be replaced with a new unit.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the steering shaft is disconnected from the steering gear, the clockspring rotor spool can change position relative to the fixed steering components.

Clockspring centering must always be confirmed by viewing the inspection window (3) on the clockspring rotor (1). If the black squares (2) on the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** .

The service replacement SCCM is shipped with the clockspring pre-centered and with a red plastic locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the SCCM is installed on a steering column, clockspring centering must be confirmed by viewing the black squares on the clockspring tape through the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** . Proper clockspring installation may also be confirmed by viewing the Steering Angle Sensor (SAS) data using a diagnostic scan tool.

MODULE, OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

DESCRIPTION

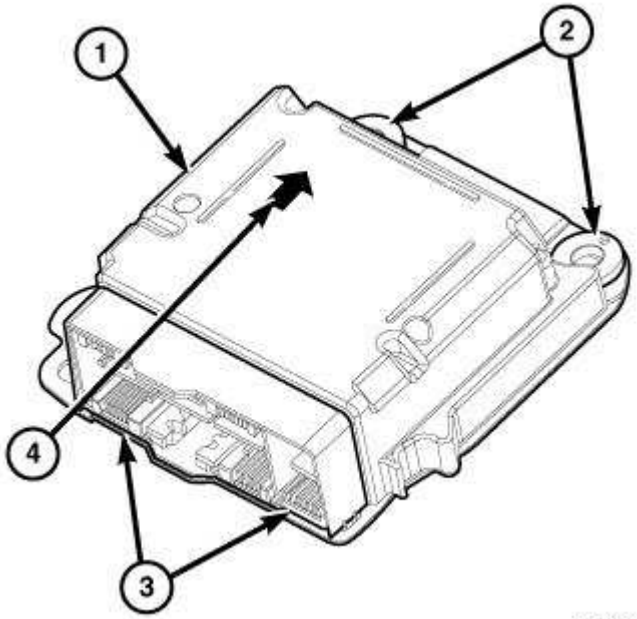

Fig. 51: Occupant Restraint Controller (ORC), Arrow, Integral Mounting Flanges & Electrical Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

The Occupant Restraint Controller (ORC) (1) is secured by three screws to a stamped steel mounting bracket on the top of the floor panel transmission tunnel near the dash panel and beneath the instrument panel center support in the passenger compartment of the vehicle. Concealed within a hollow in the center of the ORC housing is the electronic circuitry of the ORC which includes a microprocessor, an electronic impact sensor, an electronic safing sensor and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing to enclose and protect the internal electronic circuitry and components.

An arrow (4) printed on the label on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has integral mounting flanges (2) on the right and left front and the left rear corner. The stamped metal cover plate has two integral locating pins on its lower surface. Two molded plastic electrical connector receptacles (3) exit the rearward facing side of the ORC housing. These receptacles connect the ORC to the vehicle electrical system through two dedicated take outs and connectors, one from the instrument panel wire harness and the second from the body wire harness.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. In addition, there are unique versions of the ORC for vehicles with or without certain optional Supplemental Restraint System (SRS) components. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced.

PEDESTRIAN PROTECTION SYSTEM

The Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) is available only in vehicles manufactured for certain export markets. In vehicles so

equipped, a unique version of the ORC also serves as the EPP system control module.

OPERATION

OPERATION

The microprocessor in the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microprocessor continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the IC over the CAN data bus to turn ON the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits; a fused ignition switch output (run) circuit through a fuse in the Body Control Module (BCM) (also known as the Common Body Controller/CBC) and a fused ignition switch output (run-start) circuit through a second fuse in the BCM. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness that is secured by a ground screw to the body sheet metal. These connections allow the ORC to be operational whenever the ignition switch is in the START or ON positions.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact.

Various sensors within the ORC are continuously monitored by the ORC logic. These internal sensors, along with several external impact sensor inputs allow the ORC to determine both the severity of an impact and to verify the necessity for deployment of any SRS components. Two remote front impact sensors are located on the back of the right and left vertical members of the radiator support near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors inputs from an internal rollover sensor, seat track position sensors, seat belt switches and six additional remote side impact sensors located on the left and right front door module carriers, on the right and left lower B-pillars and on the right and left C-pillars near the belt line to control deployment of the side curtain airbag units and seat (also known as pelvic and thorax) airbags. On vehicles so equipped, the ORC also uses the passenger side seat belt switch input along

with an input from the Occupant Detection Sensor (ODS) in the passenger front seat cushion to support the passenger belt alert feature, and will send electronic messages to the IC to illuminate the seat belt indicator when appropriate.

The impact sensors within the ORC are electronic accelerometer sensors that provide an additional logic input to the ORC microprocessor. These sensors are used to verify the need for a SRS component deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the SRS components to deploy. On vehicles equipped with side curtain airbags or seat airbags, a separate impact sensor within the ORC provides confirmation to the ORC microprocessor of side impact forces. This separate sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microprocessor determine when the deceleration rate as signaled by the impact sensors indicate an impact that is severe enough to require SRS protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and, if the vehicle is so equipped, the seat airbags and either side curtain airbag unit.

The hard wired SRS inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PEDESTRIAN PROTECTION SYSTEM

In vehicles so equipped, a microcontroller within the ORC also contains the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) logic circuits. The EPP system logic of the ORC continuously monitors the three dedicated EPP acceleration-type electronic impact sensors located behind the front bumper area of the fascia at the front of the vehicle. The impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors electronic **ignition status** , **vehicle speed** and **ambient temperature** message inputs received from other electronic modules over the CAN data bus. The EPP system logic of the ORC uses a pre-programmed decision algorithm to analyze all of these inputs, which allows the ORC to determine both the type and severity of an impact.

When the deceleration rate as signaled by the impact sensors indicate an impact that requires the deployment of the pyrotechnic EPP actuator located on each active hood hinge at the rear corners of the hood panel and all other programmed conditions are met, the ORC sends the proper electrical signals to deploy the actuators. As a safing function, the ORC requires confirming sensor inputs from at least two of the three EPP impact sensors before it will issue a deployment signal.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the active hood hinge actuators for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup EPP system protection in case there is a loss of battery current supply to the ORC during an impact event.

An Event Data Recorder (EDR) within the ORC stores EPP near-deployment event records. The ORC microcontroller continuously monitors all of the EPP system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it logs an active DTC. The ORC also stores a DTC after it has been resolved. When the ORC has logged a DTC, it sends electronic request messages over the CAN data bus to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to turn ON the airbag indicator.

The hard wired EPP inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls or communication between other modules and devices that provide features of the EPP system. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to EPP system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant

Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

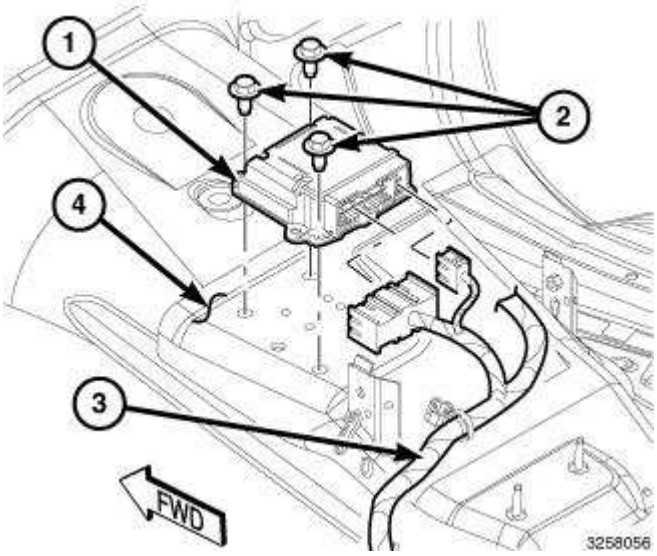

Fig. 52: Floor Panel Transmission Tunnel, Instrument Panel And Body Wire Harness, Three Screws & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the center console from the top of the floor panel transmission tunnel (4). Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Remove the console floor duct from the floor panel transmission tunnel. Refer to **DUCT, FLOOR CONSOLE, REMOVAL** .

   NOTE: If equipped with a cable-type floor shifter, it is not necessary to disconnect the shift cable from the shifter.

4. If equipped with a floor shifter:
   1. Disconnect the wire harness connectors from the shifter.
   2. Remove the four nuts that secure the shifter to the weld studs on the floor panel transmission tunnel.
   3. Remove the shifter from the transmission tunnel. If it is a cable-type shifter, carefully position the shifter and cable out of the way over the right side of the transmission tunnel.
5. Remove the switch bank and bezel from the instrument panel center stack. Refer to **POD, SWITCH BANK, REMOVAL** .

6. Remove the Telematics Gateway Module (TGM) from the instrument panel center stack. Refer to **MODULE, TELEMATICS GATEWAY, REMOVAL** .
7. Disconnect the instrument panel and body wire harness (3) connectors from the Occupant Restraint Controller (ORC) (1) connector receptacles located on the rearward facing side of the module.
8. Reach through the instrument panel center stack openings to access and cut the sound deadening material along the right side of the ORC.
9. Reach around and behind the left side of the instrument panel center stack support structure to access and cut the sound deadening material along the forward-facing side of the ORC.
10. Pull the sound deadening material over the left side of the ORC far enough to access the mounting provisions.
11. Remove the three screws (2) that secure the ORC to the top of the floor panel transmission tunnel.
12. Remove the ORC from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be

scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

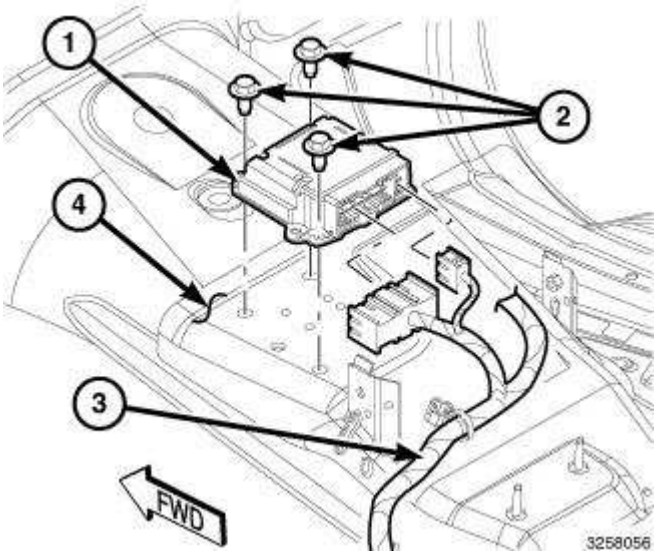

Fig. 53: Floor Panel Transmission Tunnel, Instrument Panel And Body Wire Harness, Three Screws & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the Occupant Restraint Controller (ORC) (1) onto the floor panel transmission tunnel (4). When the ORC is correctly positioned, the orientation arrow on the ORC label will be pointed forward in the vehicle.
2. Install and tighten the three screws (2) that secure the ORC to the floor panel transmission tunnel. Tighten the screws to 8 N.m (71 in. lbs.).
3. Restore the flap of sound deadening material that was cut during the removal procedure over and around the ORC.
4. Reconnect the instrument panel and body wire harness (3) connectors to the ORC connector receptacles located on the rearward facing side of the module. Be certain that the latches and the locks on both connectors are each fully engaged.
5. Reinstall the Telematics Gateway Module (TGM) into the instrument panel center stack. Refer to **MODULE, TELEMATICS GATEWAY, INSTALLATION** .
6. Reinstall the switch bank and bezel into the instrument panel center stack. Refer to **POD, SWITCH BANK, INSTALLATION** .
7. If equipped with a floor shifter:
    1. Position the shifter over the four weld studs on the top of the floor panel transmission tunnel.
    2. Install and tighten the four nuts that secure the shifter to the weld studs on the floor panel transmission tunnel. Tighten the nuts securely.
    3. Reconnect the wire harness connectors to the shifter.
8. Reinstall the console floor duct onto the floor panel transmission tunnel. Refer to **DUCT,**

FLOOR CONSOLE, INSTALLATION .

9. Reinstall the center console onto the top of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION** .
10. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

RESTRAINT, ACTIVE HEAD

DESCRIPTION

DESCRIPTION

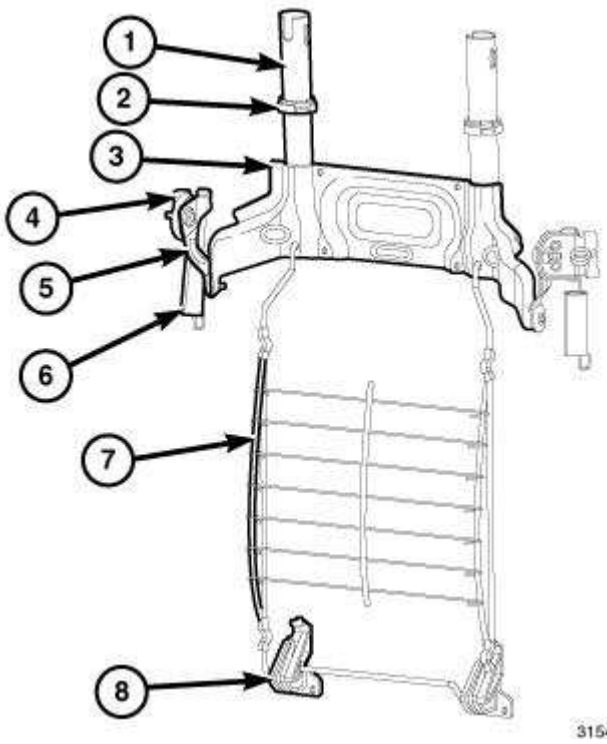

Fig. 54: Steel Headrest Guide Tubes, Fulcrum Bushing, Brackets, Steel Pivot Link, Spring & Static Lumbar Assembly
Courtesy of CHRYSLER GROUP, LLC

Active Head Restraint (AHR) units are standard equipment for both front seating positions in this vehicle. On vehicles so equipped, one inertia-activated AHR unit is located atop each front seat back. Outwardly, an inertia-activated AHR appears the same as a non-active head restraint. The mechanical components that articulate the inertia-activated AHR headrest pad are all concealed within the front seat back frame assembly.

At the top of the seat back frame are two stamped steel headrest guide tubes (1). The guide tubes are each inserted through a molded plastic fulcrum bushing (2) installed in the upper seat back frame member and are permanently fixed to a movable stamped steel armature bracket (3) located just

below the upper frame member near the top of the seat back. The armature bracket is secured to a stamped steel pivot link (5) at each side that pivots on a screw threaded into a mounting bracket (4) welded to each side member of the seat back frame. The pivot links are each have a spring (6) attached to a lever opposite the armature bracket attachment that is anchored to the seat back frame side member below, which provides the spring-loaded return action of the inertia mechanism.

The upper end of the static lumbar assembly (7) is secured at each side to the base of the armature bracket. Each side of the lower end of the lumbar assembly is engaged in a ramp bracket (8) riveted to the lower seat back frame member. The optional power lumbar assembly (not shown) is secured to the armature bracket at the top and the ramp brackets at the bottom in an identical manner as the standard equipment static lumbar assembly.

The inertia-activated AHR linkage cannot be repaired. If damaged or ineffective, it must be replaced as a unit with a new seat back frame unit. However, following an AHR deployment if no physical damage to the unit has occurred, unlike many other Supplemental Restraint System (SRS) components, the spring-loaded inertia-activated AHR linkage will reset itself for reuse.

OPERATION

OPERATION

The inertia-activated Active Head Restraint (AHR) units are deployed and reset automatically by the mechanism contained within each front seat back assembly. During a rear impact, inertia drives the seat occupant rearward into the seat back, loading the seat lumbar assembly. The ramp brackets at the base of the lumbar assembly translate this rearward travel into a vertical motion. The vertical motion of the lumbar assembly is then transmitted to the armature bracket.

Through the rotation of the pivot links at each side of the armature bracket, the vertical motion of the lumbar assembly is converted to a slightly forward and upward arc of the armature bracket, headrest guide tubes and headrest that is designed to reduce the space between the back of the head of the seat occupant and the head restraint pad. Closing this space catches the head of the seat occupant during a low speed rear impact collision event and is important in reducing or eliminating potentially debilitating cervical (also known as whiplash) injuries.

Unless damaged, following the rear impact, the return spring on the pivot link at each side of the armature bracket returns the mechanical components within the seat back and the headrest to their non-loaded positions.

RETRACTOR, SEAT BELT

DESCRIPTION

DESCRIPTION

Both front seating position seat belts are equipped with a Constant Force Retractor (CFR), while the seat belt retractors used in all seating positions include an inertia-type, Emergency Locking Retractor (ELR) mechanism as standard equipment. However, the ELR for all seating positions except the

driver side front are mechanically switchable from an ELR to an Automatic Locking Retractor (ALR).

The CFR, ELR and ALR features are all integral to the seat belt retractor unit mechanism that is concealed beneath a molded plastic cover located on one side of the retractor spool. The CFR, ELR and ALR features cannot be adjusted or repaired and, if ineffective or damaged, the entire seat belt and retractor must be replaced as a unit.

OPERATION

OPERATION

The Constant Force Retractors (CFR) used for both front seating positions provide a constant force load-limiting feature. This load-limiting feature helps to limit the maximum force on the belt webbing to help absorb the energy of the upper torso during an impact event. The CFR feature also helps to offset any extreme torso loading that might occur as the seat belt webbing is automatically retracted by deployment of the belt tensioners in conjunction with a front airbag deployment.

The primary function of the switchable Emergency Locking Retractor (ELR) to Automatic Locking Retractor (ALR) feature is to securely accommodate an infant or child booster seat in any seating position of the vehicle except the driver side front seat without the need for a self-cinching seat belt tip half latch plate unit or another supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type ELR in situations where the minimum inertia locking threshold has not been achieved.

The locked mode of the ALR is engaged and the retractor is switched from operating as a standard inertia-type ELR by first buckling the combination lap and shoulder belt buckle. Then all of the shoulder belt webbing is pulled out from the retractor. Once all of the belt webbing is extracted from the retractor spool, the retractor will automatically become engaged in the pre-locked ALR mode and will make a light, audible clicking or ratcheting sound as the shoulder belt is allowed to retract onto the spool to provide an audible confirmation that the ALR mode is engaged. Once the ALR mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard ELR (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted back onto the retractor spool. The ELR mode is confirmed by the absence of the light, audible clicking or ratcheting sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load threshold is sensed, or until the retractor is again switched to the ALR mode.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

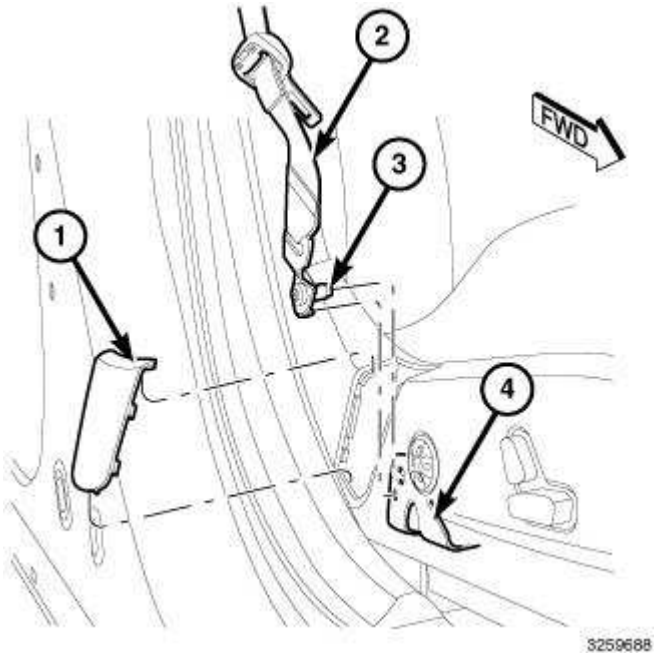

Fig. 55: Front Seat Belt Lower Anchor Cover, Screw, Seat Belt & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the front seat to its most forward position for easiest access to the front seat belt lower anchor cover (1) and the B-pillar trim.
2. Grasp the upper edge of the lower anchor cover and pull it carefully upward and outward to unsnap it from the front seat cushion outboard side shield.
3. Remove the screw (3) that secures the seat belt (2) lower anchor to the bracket (4) on the outboard side of the front seat cushion frame.
4. Remove the trim from the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .

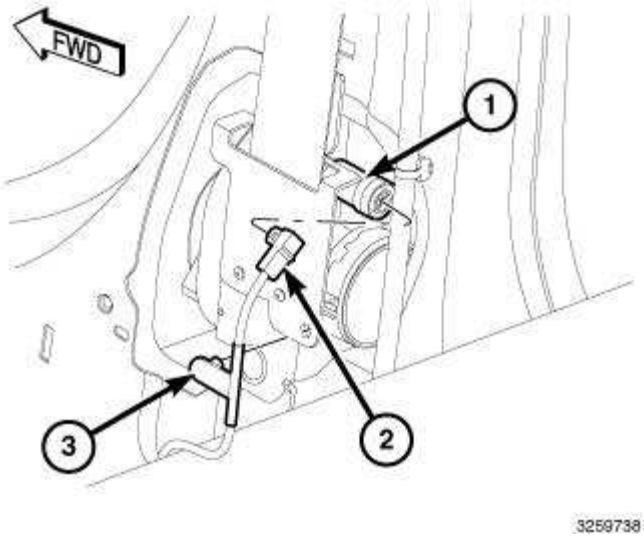

Fig. 56: Body Wire Harness Retainer, Yellow Connector & Seat Belt Tensioner Initiator
Courtesy of CHRYSLER GROUP, LLC

5. Disengage the body wire harness retainer (3) from the retractor bracket.
6. Disconnect the yellow connector (2) of the body wire harness from the seat belt tensioner initiator (1) on the retractor.

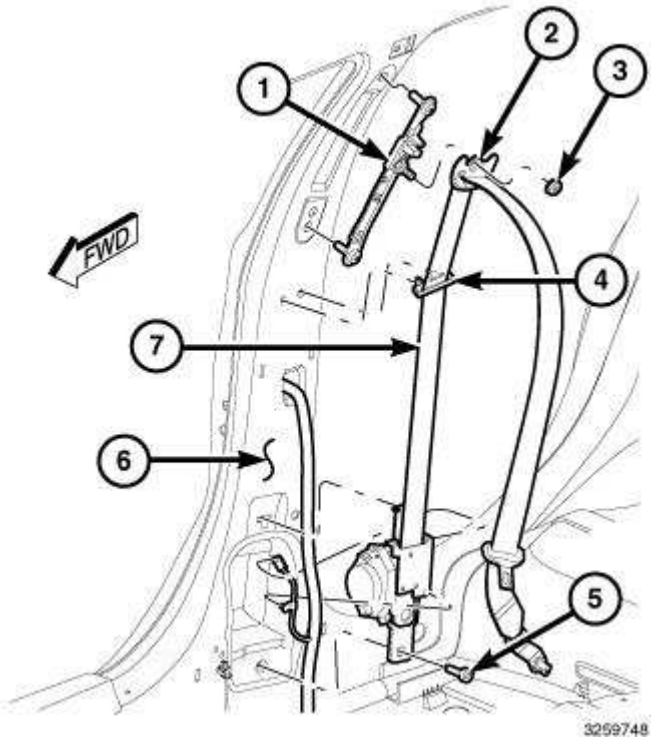

Fig. 57: Nut, Seat Belt Turning Loop, Belt Web Guide, Inner B-Pillar, Front Seat Belt, Screw & Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

7. Remove the nut (3) that secures the seat belt turning loop (2) to the stud of the height adjuster (1) on the upper inner B-pillar.
8. Remove the seat belt turning loop from the height adjuster.
9. Disengage the two clips that secure the belt web guide (4) to the holes in the inner B-pillar (6).
10. Remove the screw (5) that secures the retractor bracket to the base of the inner B-pillar.
11. Disengage the T-tab on the upper retractor bracket from the T-slot in the inner B-pillar.
12. Remove the front seat belt (7) and retractor from the vehicle as a unit.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate.

Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

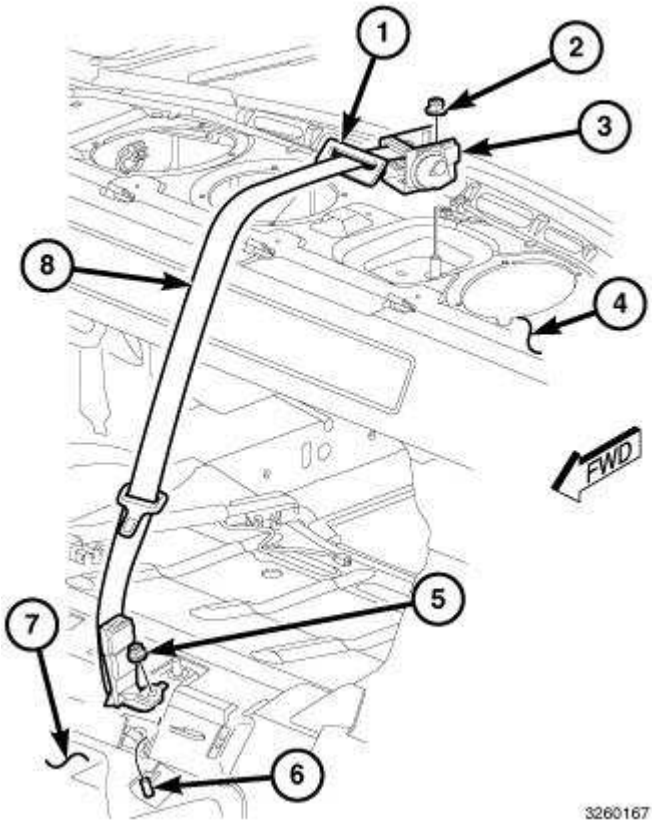

Fig. 58: Nut, Rear Center Seat Belt, Stud, Center Floor Panel, Seat Belt Trim Cover & Rear Shelf Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left outboard rear seating position buckle is integral to the center rear seating position seat belt and retractor lower anchor.

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, REMOVAL** .
3. Remove the nut (5) that secures the rear center seat belt (8) lower anchor and the left outboard seating position buckle anchor to the stud (6) on the center floor panel (7).
4. Remove the seat belt and buckle anchors from the stud.
5. Disengage the seat belt trim cover (1) from the rear shelf panel trim opening.
6. Remove the trim from the rear shelf panel (4). Refer to **PANEL, REAR SHELF, REMOVAL** .

7. Remove the nut (2) that secures the retractor (3) to the stud on the rear shelf panel.
8. Lift the retractor from the stud and disengage the T-tab on the retractor bracket from the T-slot in the rear shelf panel.
9. Remove the seat belt (8) and retractor from the vehicle as a unit.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

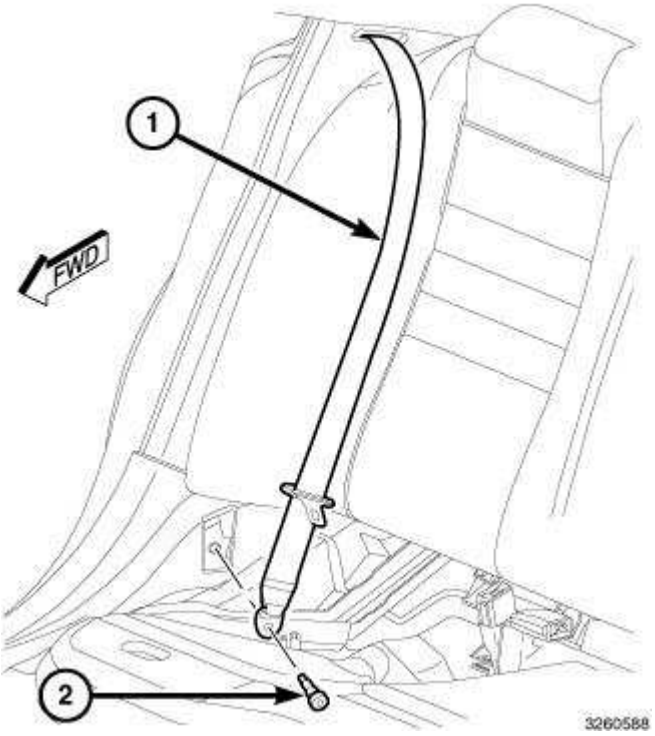

Fig. 59: Screw & Rear Outboard Seat Belt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, SECOND**

ROW, REMOVAL .

3. Remove the screw (2) that secures the rear outboard seat belt (1) to the lower inner C-pillar.

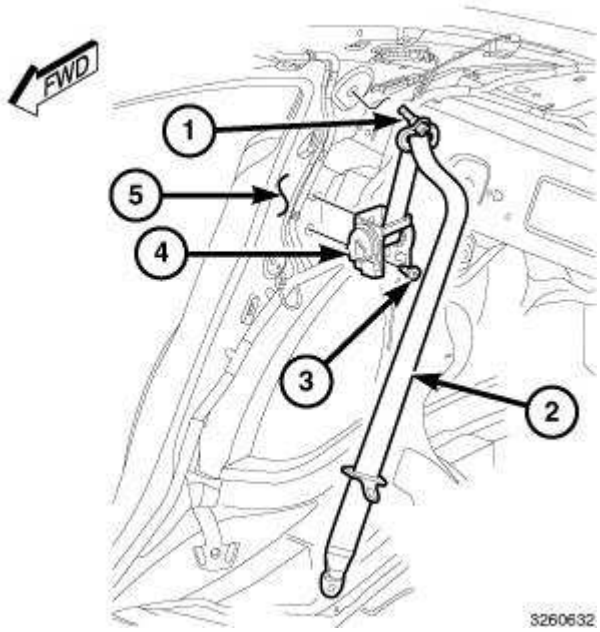

Fig. 60: Seat Belt Webbing, Screw, Seat Belt, Upper C-pillar & Retractor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the trim from the inside of the upper C-pillar (5). Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
5. Disengage the seat belt webbing (2) and lower anchor from the seat belt opening in the upper C-pillar trim.
6. Remove the screw (1) that secures the seat belt turning loop to the upper inner C-pillar.
7. Remove the seat belt turning loop from the upper inner C-pillar.
8. Remove the screw (3) that secures the retractor (4) to the inner C-pillar.
9. Disengage the retractor T-tab from the T-slot in the inner C-pillar.
10. Remove the rear outboard seat belt and retractor from the inner C-pillar as a unit.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper

precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

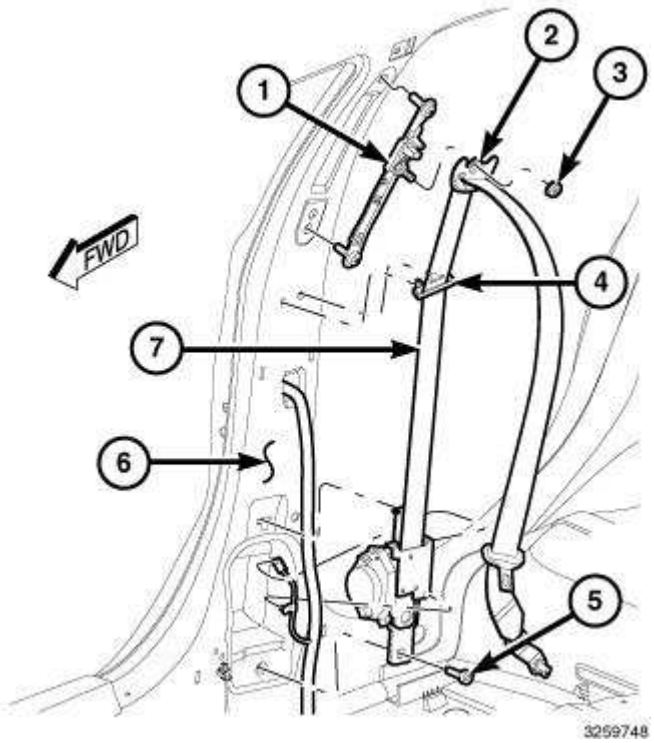

Fig. 61: Nut, Seat Belt Turning Loop, Belt Web Guide, Inner B-Pillar, Front Seat Belt, Screw & Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt (7) and retractor into the vehicle as a unit.
2. Engage the T-tab on the upper retractor bracket into the T-slot in the inner B-pillar (6).
3. Install and tighten the screw (5) that secures the retractor bracket to the base of the inner B-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
4. Position the belt web guide (4) to the holes in the inner B-pillar and use hand pressure to press it firmly and evenly until the two clips that secure it snap into place. Be certain that the seat belt webbing between the retractor and the web guide is not twisted.
5. Position the seat belt turning loop (2) onto the stud of the height adjuster (1) on the upper inner B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
6. Install and tighten the nut (3) that secures the turning loop to the height adjuster. Tighten the nut to 45 N.m (33 ft. lbs.).

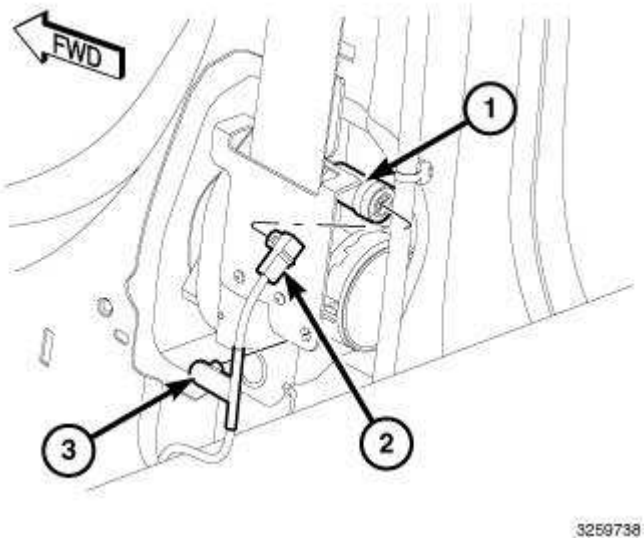

Fig. 62: Body Wire Harness Retainer, Yellow Connector & Seat Belt Tensioner Initiator
Courtesy of CHRYSLER GROUP, LLC

7. Reconnect the yellow connector (2) of the body wire harness to the seat belt tensioner initiator (1) on the retractor.
8. Engage the body wire harness retainer (3) to the retractor bracket.
9. Reinstall the trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

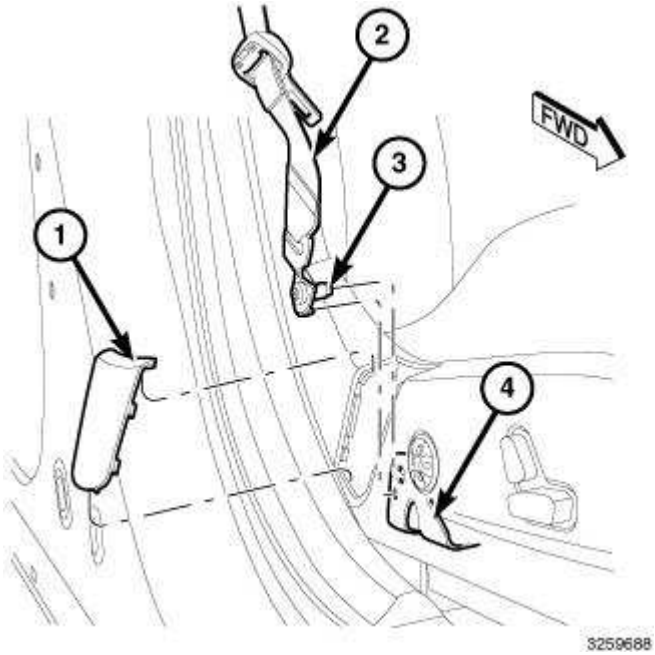

Fig. 63: Front Seat Belt Lower Anchor Cover, Screw, Seat Belt & Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Position the seat belt lower anchor (2) to the mounting bracket (4) on the outboard side of the

front seat cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.

11. Install and tighten the screw (3) that secures the lower anchor to the seat. Tighten the screw to 45 N.m (33 ft. lbs.).
12. Reinstall the lower anchor cover (1) onto the front seat cushion outboard side shield by seating the integral lower tab of the cover into position, then pushing inward using care to avoid breaking any of the cover tabs.
13. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

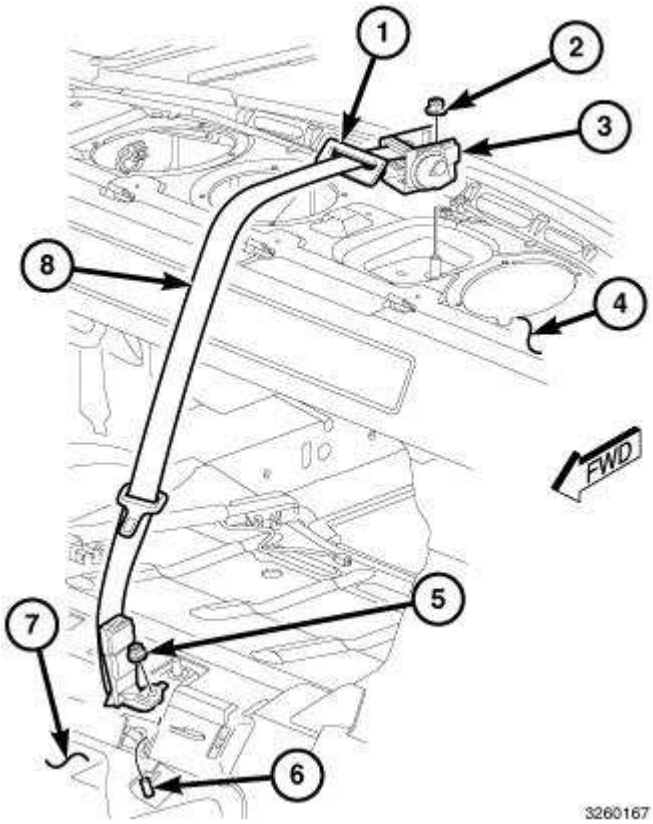

Fig. 64: Nut, Rear Center Seat Belt, Stud, Center Floor Panel, Seat Belt Trim Cover & Rear Shelf Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left outboard rear seating position buckle is integral to the center rear seating position seat belt and retractor lower anchor.

1. Position the center rear seat belt (8) and retractor (3) to the rear shelf panel (4) as a unit.
2. Engage the T-tab on the retractor bracket into the T-slot in the rear shelf panel and lower the retractor over the stud on the rear shelf panel.
3. Install and tighten the nut (2) that secures the retractor to the stud. Tighten the nut to 50 N.m (37 ft. lbs.).
4. Reinstall the trim onto the rear shelf panel. Refer to **PANEL, REAR SHELF, INSTALLATION** .
5. Engage the seat belt trim cover (1) into the rear shelf panel trim opening. Be certain the belt webbing is not twisted between the retractor and the trim cover.
6. Position the rear center seat belt and left outboard seating position buckle anchors over the stud (6) on the center floor panel (7).
7. Install and tighten the nut (5) that secures the seat belt and buckle anchors to the stud. Tighten the nut to 50 N.m (37 ft. lbs.).
8. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION** .

9. Reconnect the battery negative cable.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

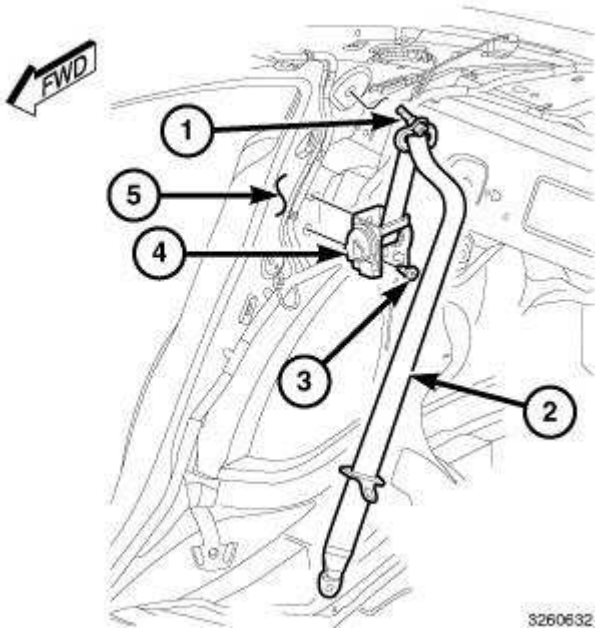

Fig. 65: Seat Belt Webbing, Screw, Seat Belt, Upper C-pillar & Retractor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear outboard seat belt (2) and retractor (4) to the inner C-pillar (5) as a unit.
2. Engage the T-tab on the retractor bracket into the T-slot in the inner C-pillar.
3. Install and tighten the screw (3) that secures the retractor to the inner C-pillar. Tighten the screw to 32 N.m (24 ft. lbs.).
4. Position the seat belt turning loop to the inner C-pillar. Be certain the seat belt webbing between the retractor and the turning loop is not twisted.
5. Install and tighten the screw (1) that secures the seat belt turning loop to the inner C-pillar. Tighten the screw to 32 N.m (24 ft. lbs.).

6. Insert the seat belt webbing and lower anchor through the seat belt opening in the upper C-pillar trim.
7. Reinstall the trim onto the upper inner C-pillar. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .

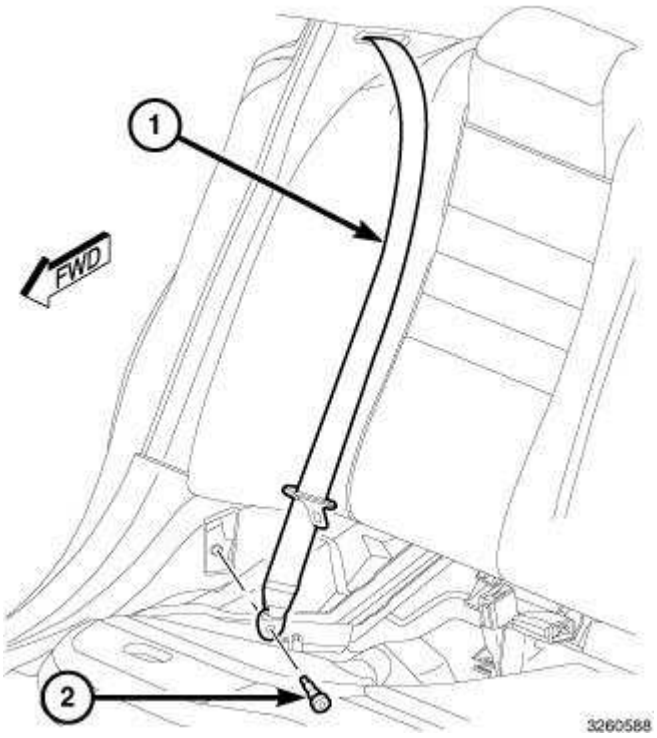

Fig. 66: Screw & Rear Outboard Seat Belt
Courtesy of CHRYSLER GROUP, LLC

8. Position the rear outboard seat belt (1) lower anchor to the lower inner C-pillar. Be certain the seat belt webbing between the turning loop and the lower anchor is not twisted.
9. Install and tighten the screw (2) that secures the seat belt lower anchor to the lower inner C-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
10. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION** .
11. Reconnect the battery negative cable.

SENSOR, IMPACT

DESCRIPTION

ELECTRONIC PEDESTRIAN PROTECTION

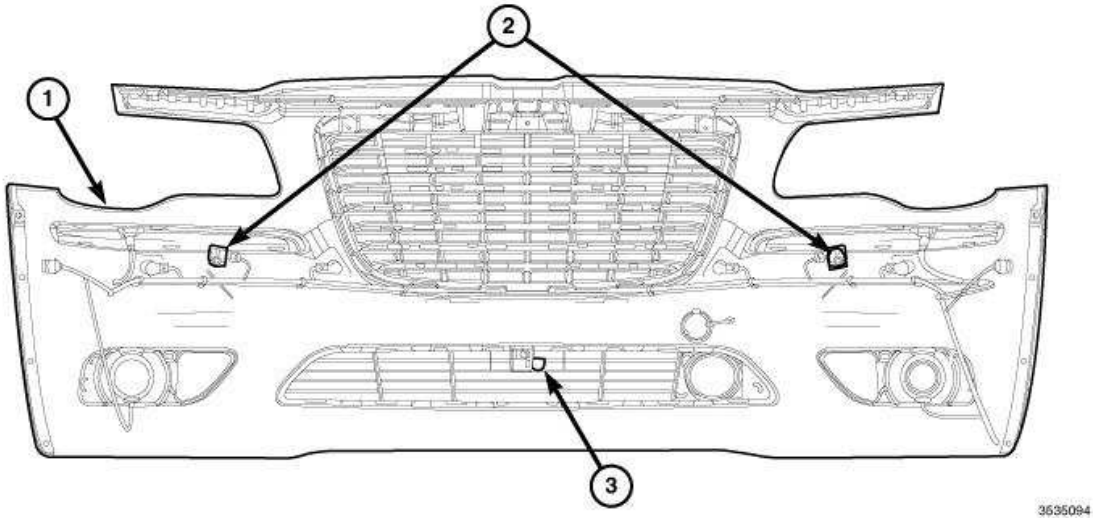

Fig. 67: Electronic Pedestrian Protection (EPP) Impact Sensors & Front Fascia
Courtesy of CHRYSLER GROUP, LLC

Electronic Pedestrian Protection (EPP) impact sensors (2 & 3) are found only in vehicles equipped with the EPP system (also known as the PedPro or Active Hood System), which is available only in vehicles manufactured for certain export markets. These sensors are mounted at the front of the vehicle to provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the pyrotechnic EPP active hood hinge actuators located on each hinge at the rear corners of the hood panel.

The EPP impact sensors are satellite acceleration-type sensors that are mounted to the back of the front fascia (1) in the front bumper area of the vehicle. The two outboard sensors are each secured by a screw to a U-nut within dedicated molded brackets integral to the back of the front fascia above the front bumper support beam. The center sensor is secured by a screw to a U-nut within a molded dedicated bracket integral to the back of the front fascia below the front bumper support beam. The sensors and the front bumper support beam are concealed behind the front fascia.

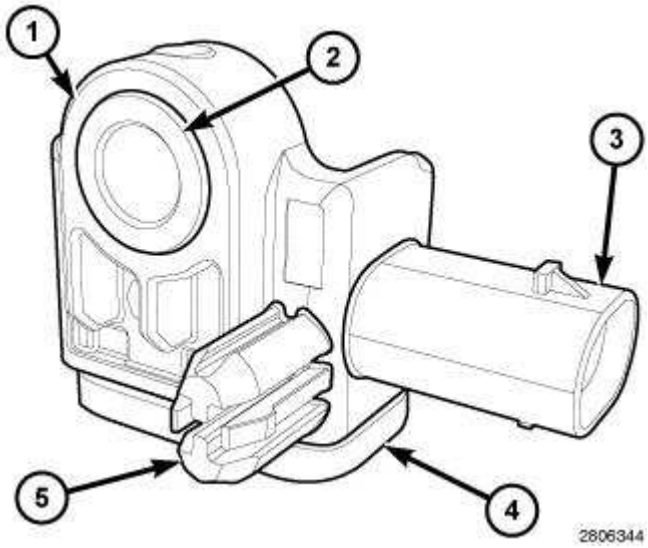

Fig. 68: Satellite Acceleration-Type Impact Sensors, Integral Connector Receptacle, Metal Sleeve & Molded Cover
Courtesy of CHRYSLER GROUP, LLC

Each sensor housing (1) has an integral connector receptacle (3), an integral locator pin with two latch features (5) and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the cavity and a molded cover (4) is laser welded over the cavity to seal and protect the internal electronic circuitry and components.

The EPP impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the headlamp and dash wire harness. These acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OCCUPANT RESTRAINT

Remote or satellite impact sensors are mounted in various strategic locations of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, seat airbags and the seat belt pretensioners. Two types of sensors are used in this vehicle. They are the acceleration-type and the pressure-type, which are described in further detail in the following paragraphs.

ACCELERATION TYPE

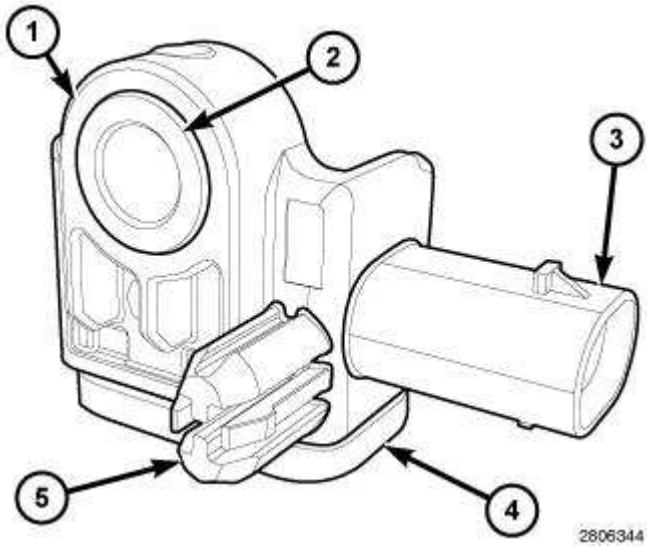

Fig. 69: Satellite Acceleration-Type Impact Sensors, Integral Connector Receptacle, Metal Sleeve & Molded Cover
Courtesy of CHRYSLER GROUP, LLC

Remote or satellite acceleration-type impact sensors (1) are mounted in various locations in the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the ORC to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, the seat belt pretensioners and the seat (also known as pelvic and thorax) airbags.

Although the front and side acceleration-type impact sensors are similar in appearance and construction, they may not be interchangeable. The front impact sensors may monitor acceleration forces on a different axis than those monitored by the side impact sensors. Each sensor is secured with a single screw to its mounting location. The front sensors are located on the back of each vertical support member of the headlamp mounting cross member between the cooling module and the front lamp unit. A side sensor is located near the base of each inner B-pillar and near the belt line of each C-pillar and concealed behind the interior trim.

Each sensor housing has an integral connector receptacle (3), an integral locator pin with two latch features (5), and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the cavity and a molded cover (4) is laser welded over the cavity to seal and protect the internal electronic circuitry and components.

The front impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the headlamp and dash wire harness, while the side impact sensors are connected through dedicated take outs and connectors of the body wire harness.

The acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

PRESSURE TYPE

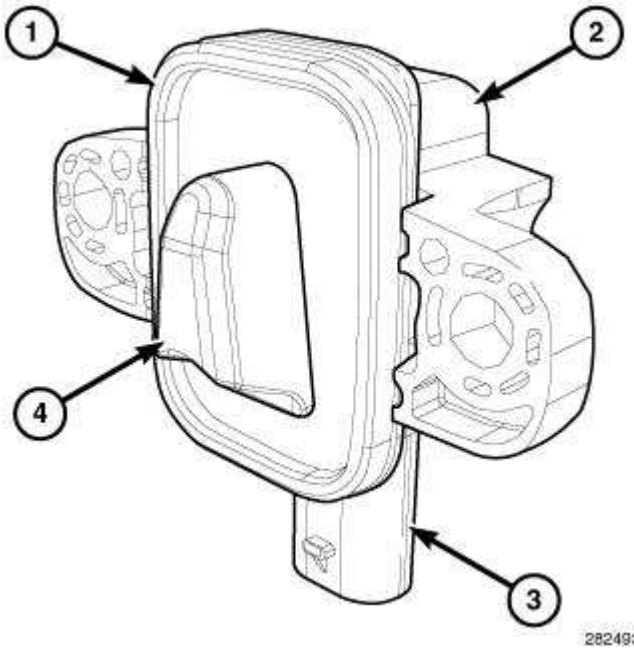

Fig. 70: Sensors, Resilient Gasket, Connector Receptacle & Water Shield
Courtesy of CHRYSLER GROUP, LLC

Two pressure-type front door side impact sensors (2) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws and is sealed by a resilient gasket (1) to the front door hardware module carrier on the front door inner panel. The sensors are concealed behind the front door trim panel within the passenger compartment.

The right and left front door side impact sensors are identical in construction and calibration. The impact sensor housing has an integral connector receptacle (3), two integral mounting tabs, and an integral hood-like water shield (4). The water shield extends through a hole in the front door module carrier into the interior of the door cavity and protects the sensor orifice from contamination. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor, which includes an electronic communication chip and the pressure sensor.

The housing cavity is filled with a potting material to seal and protect the internal electronic circuitry and components. A label on the sensor has a directional arrow and the word **down** imprinted upon it to provide verification of the correct sensor orientation in the vehicle. The pressure-type side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness.

These pressure-type front door side impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION

ELECTRONIC PEDESTRIAN PROTECTION

The acceleration-type Electronic Pedestrian Protection (EPP) impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the EPP system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) then sends electronic messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to control the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through the dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the acceleration-type EPP impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the EPP system. The most reliable, efficient, and accurate means to diagnose the impact sensors or the electronic controls and communication related to acceleration-type EPP impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OCCUPANT RESTRAINT

ACCELERATION-TYPE

The acceleration-type impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the acceleration-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PRESSURE-TYPE

The pressure-type front door side impact sensors recognize a side impact in the front door area by monitoring changes in pressure within the front door cavity. A sudden pressure wave is created as the door collapses during an impact event. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the current in the sensor plus circuit.

The hard wired circuits between the pressure-type front door side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the pressure-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

ELECTRONIC PEDESTRIAN PROTECTION

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Electronic Pedestrian Protection (EPP) system impact sensor, as it can damage the impact sensor or affect its calibration. The EPP impact sensor enables the system to deploy the EPP system active hood hinge actuators. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper EPP active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged

Electronic Pedestrian Protection (EPP) system impact sensor. Whether the EPP system has been deployed or the vehicle has had a front end collision without EPP system deployment, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.

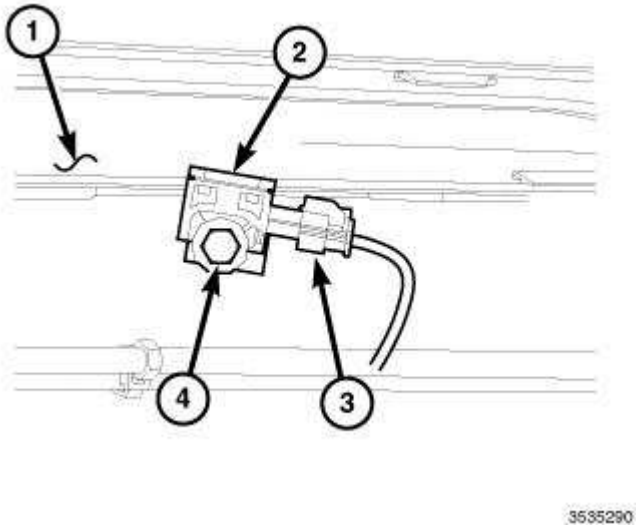

Fig. 71: Outboard Sensors
Courtesy of CHRYSLER GROUP, LLC

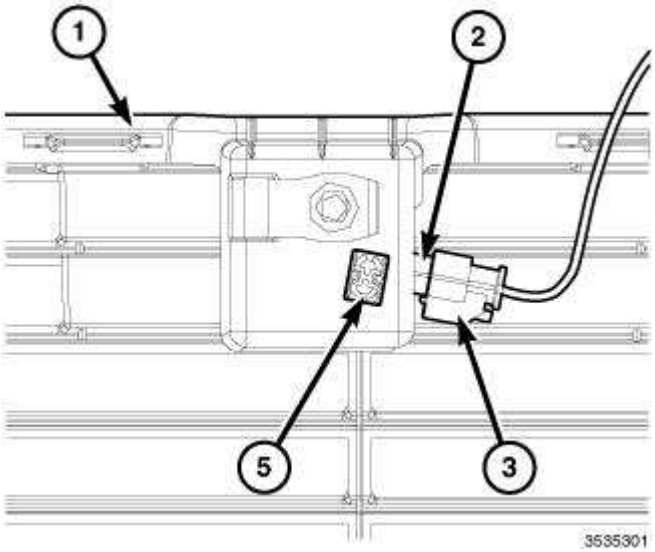

Fig. 72: Center Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the front fascia (1) from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .
3. Disconnect the front fascia wire harness connector (3) from the Electronic Pedestrian Protection

(EPP) center or outboard impact sensor (2) connector receptacle.

4. Remove the screw (4) that secures the EPP impact sensor to the U-nut within the molded bracket integral to the back of the fascia.
5. Disengage the latch features of the integral locator pin (5) on the EPP impact sensor from the locator hole in the fascia bracket.
6. Remove the EPP impact sensor from the front fascia.

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

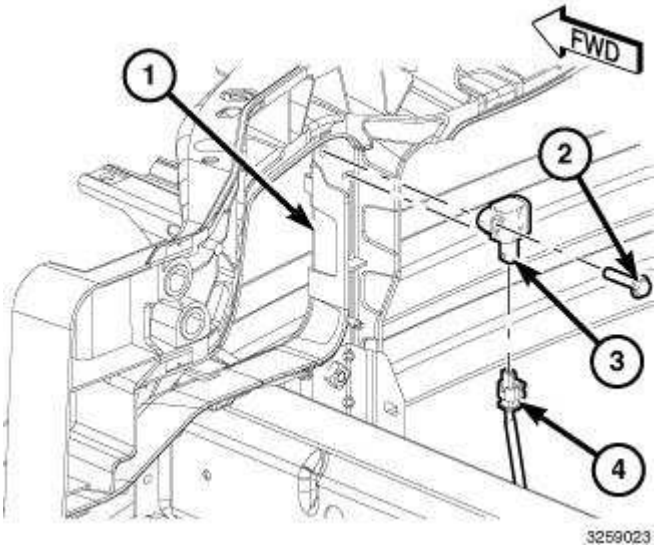

Fig. 73: Front End Module (FEM) Structural Support, Wire Harness Connector, Screw & Left Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. For the left hand side only, remove the fastener that secures the engine air cleaner assembly to the Front End Module (FEM) structural support (1) and move the air cleaner assembly far enough to access the impact sensor connector and fastener on the back of the vertical support member between the cooling module and the front lamp unit opening.
3. Disconnect the headlamp and dash wire harness connector (4) from the right or left front impact sensor (3) connector receptacle.
4. Remove the screw (2) that secures the sensor to the back of the FEM vertical support member.
5. Disengage the locating pin integral to the sensor from the locating hole in the FEM vertical support member.
6. Remove the right or left front impact sensor from the vehicle.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

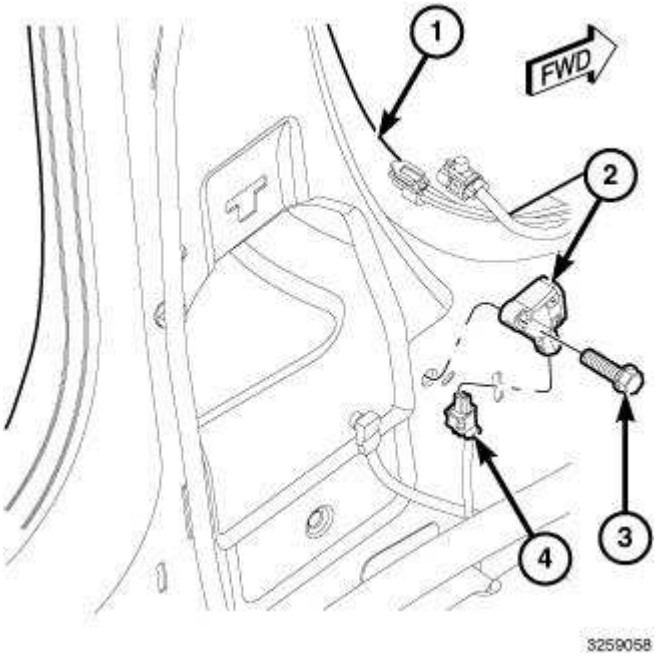

Fig. 74: Lower B-pillar, Body Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the lower B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
4. Disconnect the body wire harness connector (4) from the side impact sensor (2) connector receptacle.
5. Remove the screw (3) that secures the sensor to the lower B-pillar.
6. Gently pry the sensor away from the inner B-pillar far enough to disengage the latch features of the locator pin from the locator hole.
7. Remove the sensor from the inner B-pillar.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

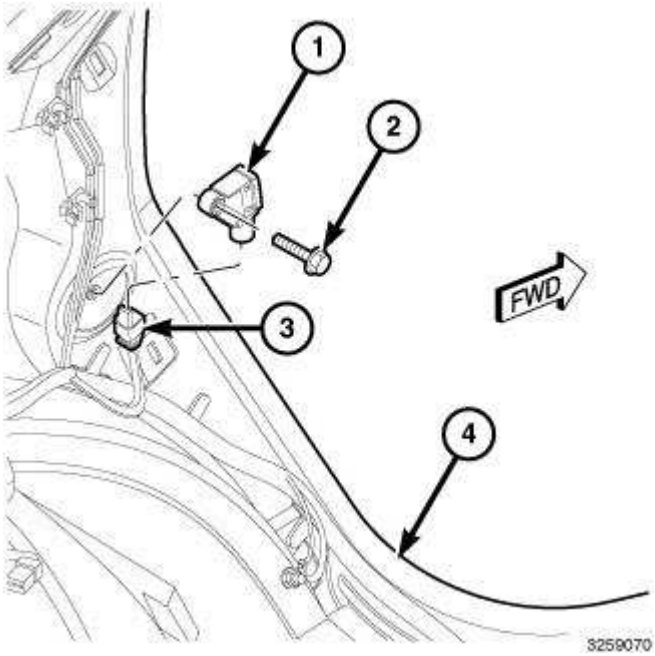

Fig. 75: Lower C-pillar, Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the lower C-pillar (4). Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
3. Disconnect the body wire harness connector (3) from the side impact sensor (1) connector receptacle.
4. Remove the screw (2) that secures the sensor to the inner C-pillar.
5. Gently pry the sensor away from the inner C-pillar far enough to disengage the latch features of the locator pin from the locator hole.
6. Remove the sensor from the inner C-pillar.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

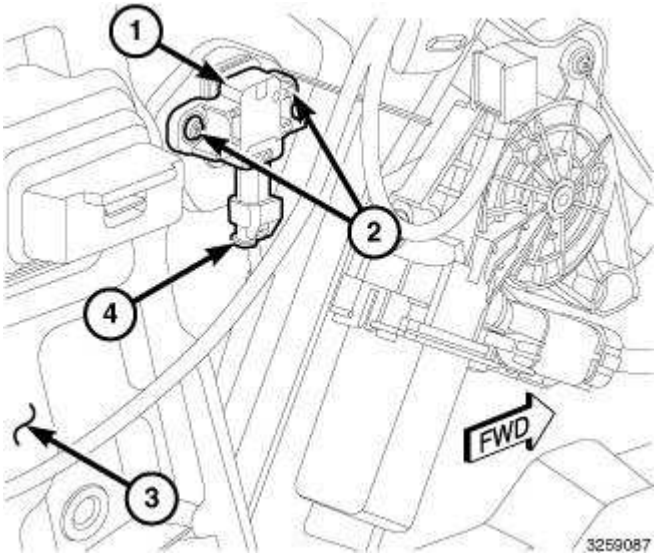

Fig. 76: Front Door Wire Harness Connector, Side Impact Sensor, Two Screws & Front Door Hardware Module Carrier Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim panel from the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect the front door wire harness connector (4) from the side impact sensor (1) connector receptacle.
4. Remove the two screws (2) that secure the side impact sensor to the front door hardware module carrier panel (3).
5. Remove the side impact sensor from the vehicle.

INSTALLATION

ELECTRONIC PEDESTRIAN PROTECTION

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Electronic Pedestrian Protection (EPP) system impact sensor, as it can damage the impact sensor or affect its calibration. The EPP impact sensor enables the system to deploy the EPP system active hood hinge actuators. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper EPP active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Electronic Pedestrian Protection (EPP) system impact sensor. Whether the EPP system has been deployed or the vehicle has had a front end collision without EPP system deployment, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.

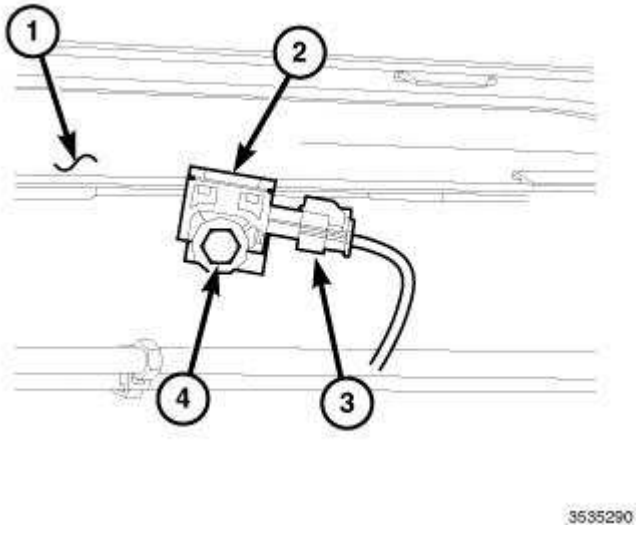

Fig. 77: Outboard Sensors
Courtesy of CHRYSLER GROUP, LLC

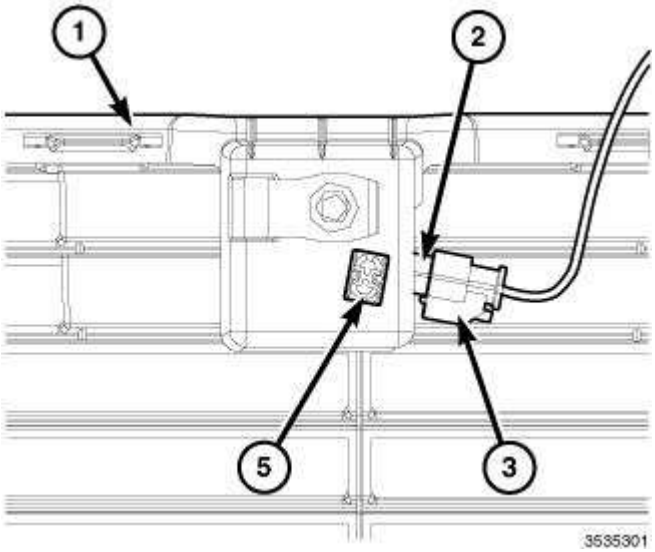

Fig. 78: Center Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Carefully inspect the U-nut for the center or outboard Electronic Pedestrian Protection (EPP) impact sensor to be certain it is good condition and is properly installed in the molded bracket integral to the back of the front fascia (1).
2. Carefully position the EPP impact sensor (2) to the molded bracket. Be certain that the latches of the anti-rotation pin on the back of the sensor are engaged in the clearance hole of the bracket.
3. Install and tighten the screw (4) that secures the sensor to the U-nut in the molded bracket. Tighten the screw to 8 N.m (70 in. lbs.).
4. Reconnect the front fascia wire harness connector (3) to the EPP impact sensor connector receptacle.
5. Reinstall the front fascia onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any EPP system component. Refer to **STANDARD PROCEDURE**.

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact

sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

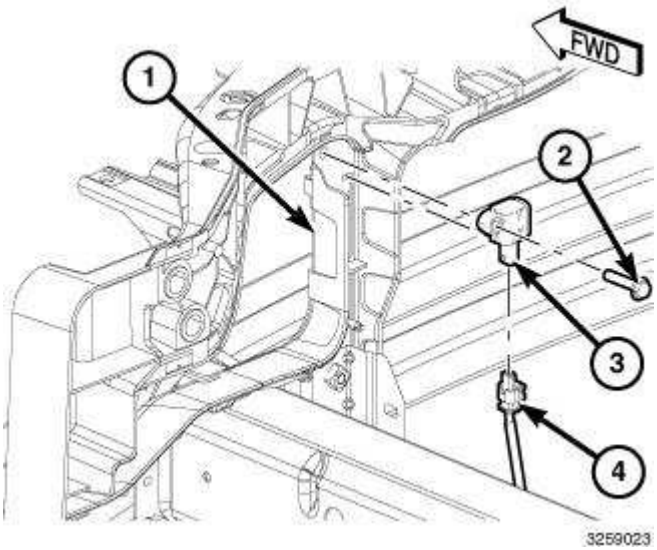

Fig. 79: Front End Module (FEM) Structural Support, Wire Harness Connector, Screw & Left Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the right or left front impact sensor (3) to the back of the Front End Module (FEM) vertical support member (1) between the cooling module and the front lamp unit opening.
2. Be certain to engage the locating pin integral to the sensor into the locating hole in the FEM vertical support member.
3. Install and tighten the screw (2) that secures the sensor to the FEM vertical support member. Tighten the screw to 11 N.m (97 in. lbs.).
4. Reconnect the headlamp and dash wire harness connector (4) to the sensor connector receptacle.
5. For the left hand side only, position the engine air cleaner assembly to the FEM structural support and reinstall the fastener that secures the air cleaner assembly.
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

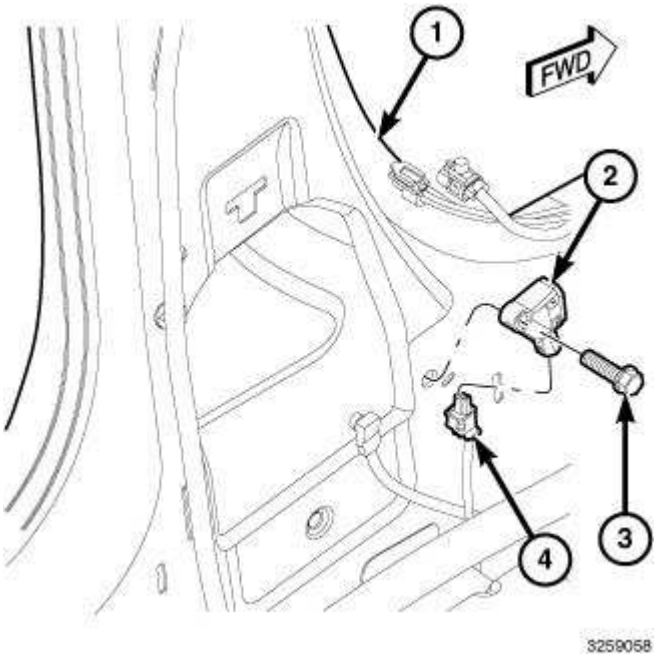

Fig. 80: Lower B-pillar, Body Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (2) onto the inner B-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner B-pillar.
2. Install and tighten the screw (3) that secures the sensor to the inner B-pillar. Tighten the screw to 11 N.m (97 in. lbs.).
3. Reconnect the body wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the lower trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS

component. Refer to **STANDARD PROCEDURE**.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

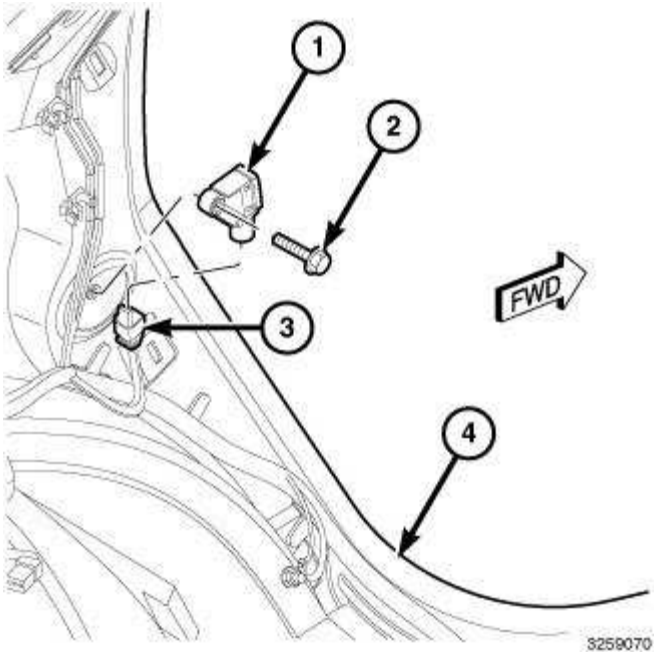

Fig. 81: Lower C-pillar, Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (1) onto the inner C-pillar (4). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner C-pillar.
2. Install and tighten the screw (2) that secures the sensor to the inner C-pillar. Tighten the screw to 11 N.m (97 in. lbs.).

3. Reconnect the body wire harness connector (3) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the C-pillar. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

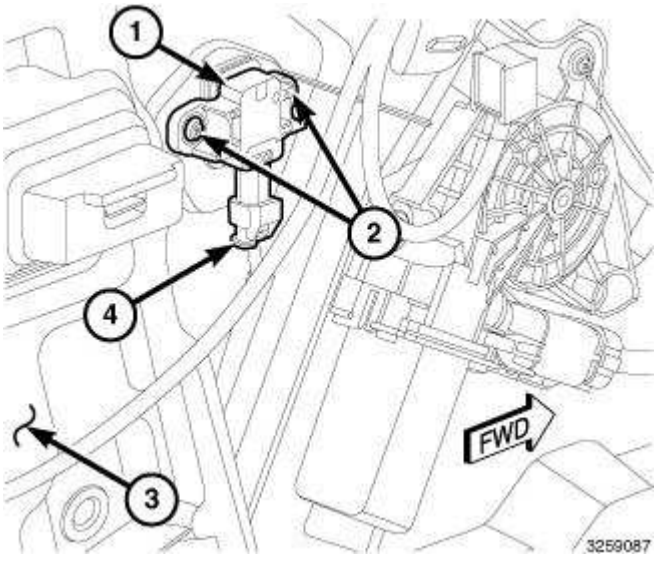

Fig. 82: Front Door Wire Harness Connector, Side Impact Sensor, Two Screws & Front Door Hardware Module Carrier Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain that the gasket between the pressure-type side impact sensor and the front door hardware module carrier panel is in good condition and positioned on the back of the sensor. There MUST be a good seal between the sensor and the hardware module carrier panel for the sensor to operate properly. If the gasket is in poor condition, replace the sensor.**

1. Position the side impact sensor (1) to the right or left front door hardware module carrier panel (3). When the sensor is correctly positioned, the sensor connector receptacle will be pointed toward the bottom of the door.
2. Install and tighten the two screws (2) that secure the side impact sensor to the door hardware module carrier panel. Tighten the screws to 2.4 N.m (21 in. lbs.).
3. Reconnect the front door wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the trim panel onto the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SENSOR, OCCUPANT DETECTION

DESCRIPTION

DESCRIPTION

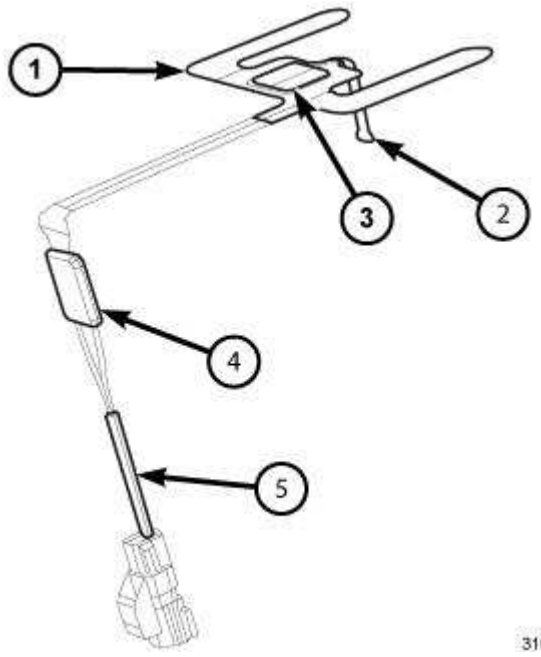

Fig. 83: Plastic Sensor Mat, Locator Tab, Adhesive Patch, Adhesive Block & Connector
Courtesy of CHRYSLER GROUP, LLC

An Occupant Detection Sensor (ODS) is located directly below the passenger side front seat cushion

trim cover. This sensor provides information to the Occupant Restraint Controller (ORC) used for control of the passenger belt alert feature.

The ODS consists of a flexible clear plastic sensor mat (1) containing several resistive membrane, force sensing resistor cells that is secured by either a locator tab (2) and an adhesive patch (3) or by just the adhesive patch to the top surface of the seat cushion foam. The locator tab is still present, but is not used on ventilated seat applications. The adhesive patches on either ODS are a one time only material and cannot be reactivated or reused if removed.

A short, two-conductor pigtail wire and connector (5) connect the sensor to the vehicle electrical system through a dedicated take out and connector of the seat wire harness. A hot melt adhesive block (4) encapsulates and protects the connections between the electrical conductors in the tail of the sensor mat and the pigtail wires as well as a diagnostic resistor.

The ODS cannot be adjusted or repaired, and must be replaced if damaged or ineffective.

OPERATION

OPERATION

The Occupant Detection Sensor (ODS) acts as a simple switch to detect loads placed upon the passenger side front seat cushion. The sensor circuits are connected to and monitored by the Occupant Restraint Controller (ORC) whenever the ignition switch is in the ON position. The ORC uses an algorithm logic in monitoring the changing states of the sensor input to determine whether the seat cushion load is static or dynamic.

The ORC microprocessor continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system status and readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC). However, because the ODS input is only used for control of the passenger belt alert feature, which has no effect on SRS component features or functions, the airbag indicator is **NOT** illuminated in response to a detected ODS circuit fault.

The ODS receives source current and a clean ground through dedicated sensor plus and minus circuits from the ORC. The ORC then sends the appropriate sensor status information to the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which uses this information as an additional logic input used for control of the seat belt indicator and the passenger belt alert feature in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC).

The hard wired circuits between the ODS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ODS or the electronic controls and communication between other modules and devices that provide some features of the passenger belt alert feature. The most reliable, efficient, and accurate means to diagnose the ODS or the electronic controls and communication related to passenger belt alert feature operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

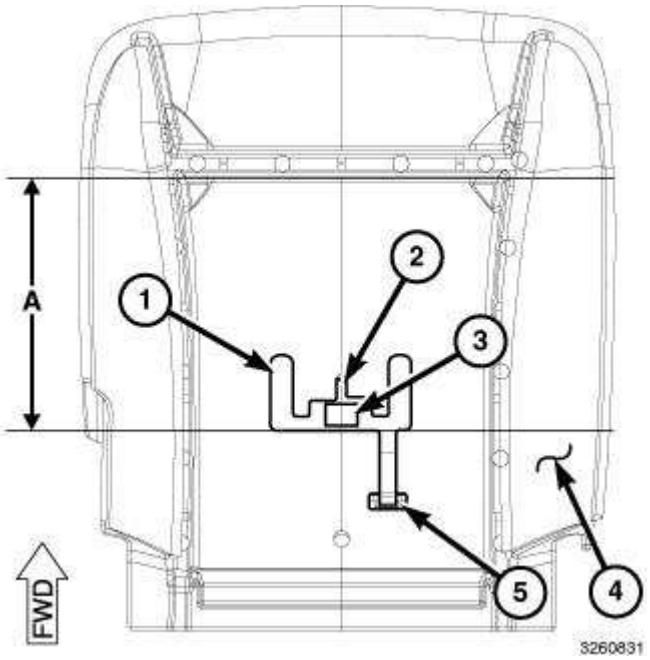

Fig. 84: Occupant Detection Sensor (ODS), Clearance Hole, Seat Cushion Foam, Locator Hole & Adhesive Patch
Courtesy of CHRYSLER GROUP, LLC

1. Position the passenger side front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the passenger side front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front seat cushion foam and frame. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** .
5. If the vehicle is so equipped, remove the heater mat from the seat cushion foam. Refer to **PAD, HEATER, REMOVAL** .
6. Reach under the back of the front seat cushion frame to access and disconnect the Occupant Detection Sensor (ODS) (1) pigtail wire connector from the seat wire harness.
7. Disengage the ODS hot melt block and pigtail wire from the clearance hole (5) near the back of

the seat cushion foam (4).

8. Except on vehicles with the ventilated seat option, disengage the ODS locator tab from the locator hole (2) near the center of the seat cushion foam.
9. Disengage the adhesive patch (3) of the ODS from the top surface of the seat cushion foam.
10. Remove the ODS from the seat cushion.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: When handling a new Occupant Detection Sensor (ODS), it should never be bent, creased, torn, cut or abraded. The ODS should not be handled with or come into contact with hard or sharp-edged tools or objects. Do not allow the ODS to drop more than 2 meters (6.5 feet). Prior to installation, do not sit on, stand on or place boxes, tools or any other foreign object on the ODS. If the ODS adhesive patches become inadvertently adhered to any seat materials or foreign objects prior to proper positioning on the seat cushion, the ODS must be scrapped and replaced with a new unit. Do not modify the seat foam or trim materials of a seat that contains an ODS. Failure to observe these cautions may result in an inoperative ODS, or an ODS that provides inaccurate inputs to the Occupant Restraint Controller (ORC).

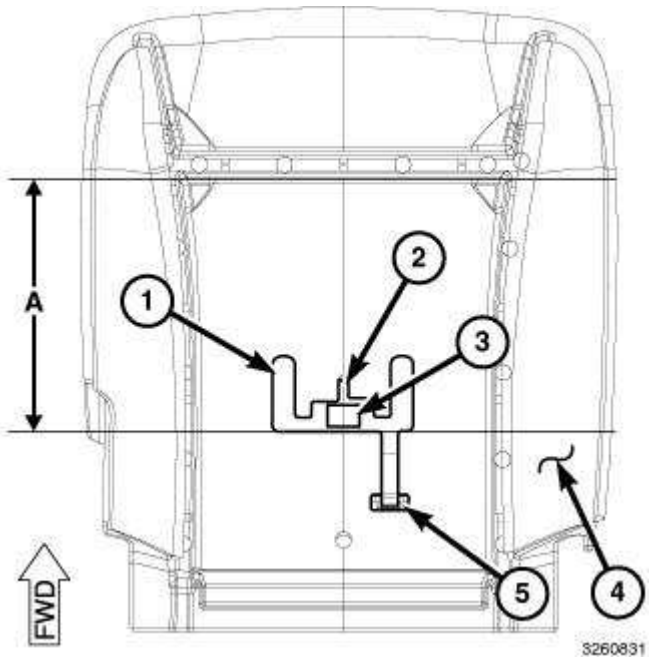

Fig. 85: Occupant Detection Sensor (ODS), Clearance Hole, Seat Cushion Foam, Locator Hole & Adhesive Patch
Courtesy of CHRYSLER GROUP, LLC

1. Except on vehicles equipped with the ventilated seat option, insert the locator tab of the Occupant Detection Sensor (ODS) mat (1) into the locator hole (2) near the center of the seat cushion foam (4) and push the tab all the way through the foam. On vehicles with the ventilated seat option, leave the locator tab flat on the seat cushion and pointed forward in the vehicle.
2. Position the sensor mat on the seat cushion with the two mat sensor cell branches aligned with the sides of the seat and the rear edge of the mat positioned 124 millimeters (4.88 inches) (Distance A) rearward from the back edge of the forward crimp channel in the seat cushion foam.

CAUTION: The adhesive used to secure the ODS to the seat is heat activated and requires that both the adhesive and the material it is applied to be ideally between 21° and 38° C (between 70° and 100° F). Application of the ODS to surfaces below 10° C (50° F) is not recommended as the adhesive becomes too firm to readily adhere. Do not touch or allow the adhesive patches to contact any foreign materials with the release paper removed. Do not attempt to add adhesive materials to the ODS.

3. Peel the release paper off of the adhesive patch (3) on the underside of the ODS mat.
4. Apply hand pressure (0.8 bar or 12 psi) over the adhesive patch of the ODS mat for at least four seconds to activate and adhere the adhesive to the seat cushion foam.
5. Route the ODS pigtail wires through the clearance hole (5) near the back of the seat cushion foam and insert the hot melt block into the recess.
6. Reach under the back of the front seat cushion frame to access, route and reconnect the ODS

pigtail wire and connector to the seat wire harness.

7. If the vehicle is so equipped, reinstall the heater mat onto the seat cushion foam. Refer to **PAD, HEATER, INSTALLATION** .
8. Reinstall the trim onto the front seat cushion foam and frame. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** .
9. Reinstall the passenger side front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
10. Reconnect the battery negative cable.

SENSOR, SEAT TRACK POSITION

DESCRIPTION

DESCRIPTION

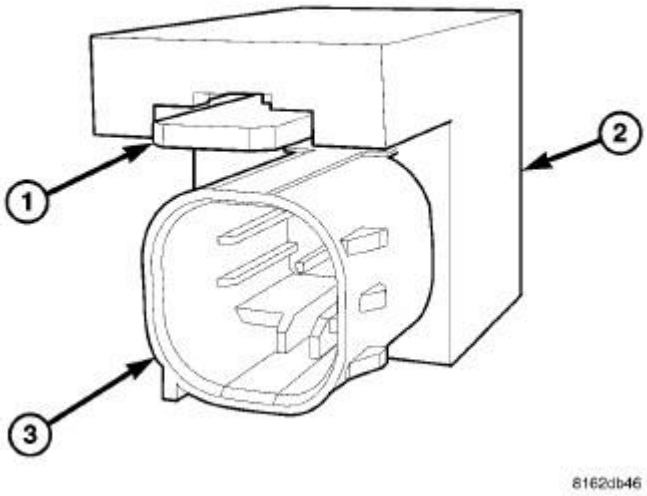

Fig. 86: Identifying Seat Track Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Seat Track Position Sensor (STPS) (2) is a Hall Effect-type sensor used on some vehicles. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing.

The sensor housing has a mounting slot containing an integral latch feature (1) and slides and latches onto a stamped metal blade-type bracket located on the inboard side of one of the upper seat adjuster tracks near the rear of the driver side or passenger side front seat. A molded connector receptacle (3) integral to the sensor housing is connected to the vehicle electrical system through a connector and take out of the front seat wire harness beneath the front seat cushion frame.

The STPS cannot be adjusted or repaired and, if ineffective or damaged, the entire sensor must be

replaced.

OPERATION

OPERATION

The seat track position sensor is designed to provide a seat position data input to the Occupant Restraint Controller (ORC) indicating whether the driver or passenger side front seat is in a full forward or a not full forward position. The ORC uses this data as an additional logic input for use in determining the appropriate deployment force to be used when deploying the multistage driver or passenger airbag.

The seat track position sensor receives a nominal five volt supply from the ORC. The sensor communicates the seat position by modulating the voltage returned to the ORC on a sensor data circuit. The ORC also monitors the condition of the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC sends messages over the CAN data bus to control the illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC).

The hard wired circuits between the seat track position sensor and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the seat track position sensor or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the seat track position sensor or the electronic controls and communication related to seat track position sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

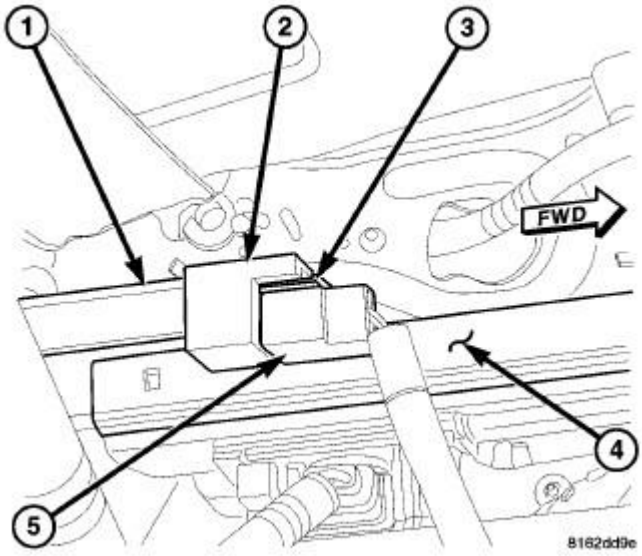

Fig. 87: Seat Track Position Sensor On Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the rear edge of the front seat cushion to access the seat track position sensor (2) on a bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Using a small screwdriver, hold the latch feature (3) depressed while sliding the connector end of the sensor off of the bracket.
4. Disconnect the seat wire harness connector (5) from the sensor connector receptacle.
5. Remove the sensor from under the front seat.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

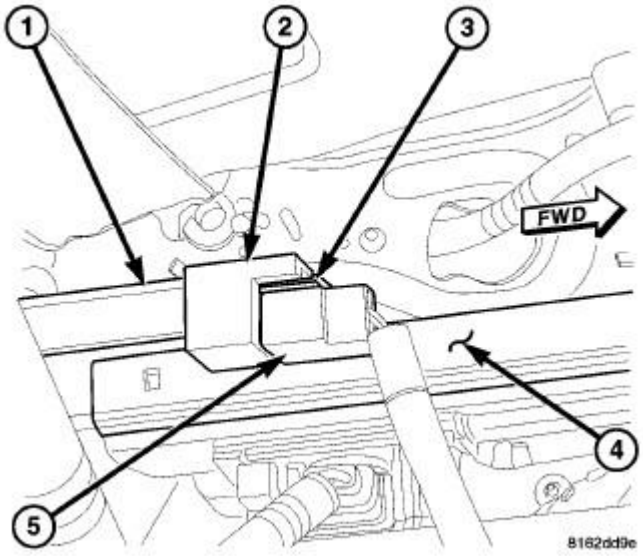

Fig. 88: Seat Track Position Sensor On Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the rear edge of the front seat cushion to reconnect the seat wire harness connector (5) to the seat track position sensor (2) connector receptacle. Be certain that the latch on the connector is fully engaged.
2. Align the open end of the sensor mounting slot to the blade of the sensor bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Push the sensor firmly onto the bracket until the latch feature (3) snaps into place with an audible click.
4. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SWITCH, SEAT BELT

DESCRIPTION

DESCRIPTION

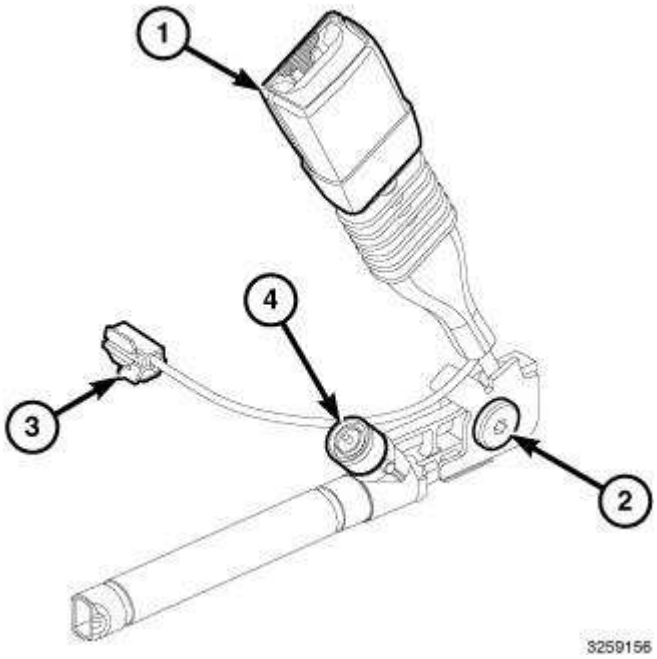

Fig. 89: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

The driver and passenger side front seat belt switches for this vehicle are actually Hall Effect-type sensors. These sensors consist of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that is integral to each front seat belt buckle (1). The front seat belt buckles are located on a molded plastic scabbard and secured by a screw (2) to the inboard side of each front seat cushion frame so that the buckles travel with the seat.

The front seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire and connector (3) on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness. A one kilohm diagnostic resistor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

The seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced.

OPERATION

OPERATION

The front seat belt switches are designed to control a hard wired sense input to the Occupant Restraint Controller (ORC). A spring-loaded slide with a small window-like opening is integral to the buckle latch mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and the window of the slide exposes the Hall Effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced current as an output to the ORC. When the seat belt is unbuckled, the spring-loaded slide moves upward and shields the IC from the field of the permanent magnet, causing

the output current from the seat belt switch to be reduced.

The seat belt switches receive a supply of current from the ORC, and the ORC senses the status of the front seat belt switches through its connection to the seat wire harness. The ORC provides electronic **seat belt switch status** messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus. The IC uses these messages as an additional logic input for control of the seat belt indicator. The ORC monitors the condition of the seat belt switch circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between the seat belt switches and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switches or the electronic controls or communication between other modules and devices that provide some features of the seat belt reminder system. The most reliable, efficient, and accurate means to diagnose the seat belt switches or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

TENSIONER, SEAT BELT

DESCRIPTION

DESCRIPTION

In vehicles manufactured for domestic markets, the front seat belt incorporates dual tensioners: one integral to the retractor, and one integral to the buckle.

RETRACTOR TENSIONER

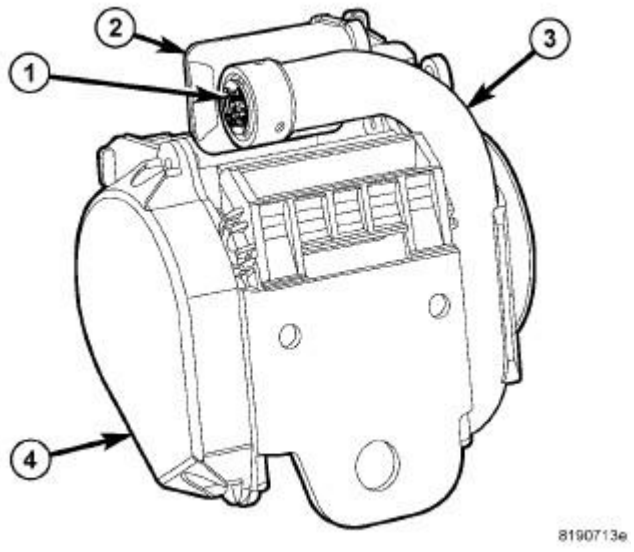

Fig. 90: Seat Belt Tensioner
Courtesy of CHRYSLER GROUP, LLC

Seat belt retractor tensioners supplement the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt and retractor units (4), which are secured to the inner B-pillar on the right and left sides of the vehicle. The retractor is concealed beneath the molded plastic inner B-pillar trim. The seat belt tensioner consists primarily of a sprocket/pinion, a steel tube (3), a cast metal housing, numerous steel balls, a stamped metal ball trap (2), a torsion bar and a small pyrotechnically activated gas generator with a connector receptacle (1).

All of these components are located on one side of the retractor spool on the outside of the retractor housing except for the torsion bar, which serves as the spindle upon which the retractor spool rides. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through a dedicated take outs of the body wire harness by keyed and latching yellow molded plastic connector insulator to ensure a secure connection.

The retractor tensioners cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the seat belt tensioners have also been deployed. The seat belt tensioners are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication that the seat belt tensioner has been deployed and requires replacement. Refer to **RETRACTOR, SEAT BELT, REMOVAL**.

BUCKLE TENSIONER

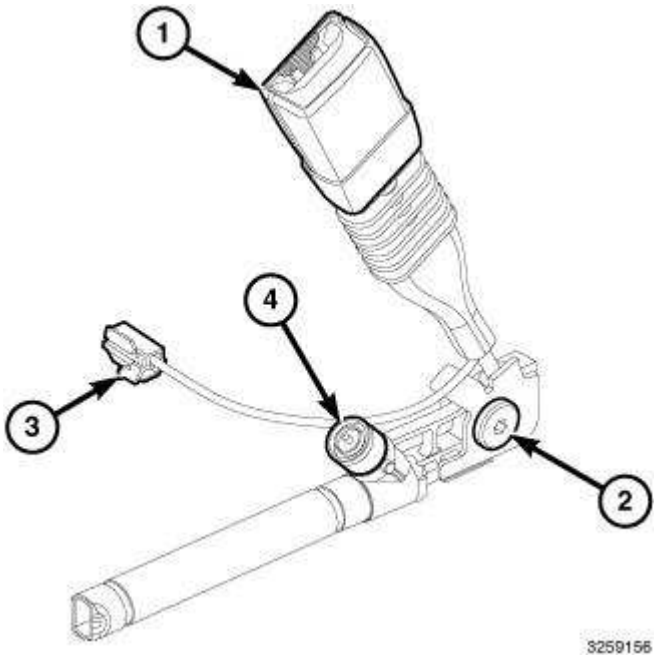

Fig. 91: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

A seat belt buckle tensioner supplements the dual front airbags for domestic market versions of this vehicle. This tensioner is integral to the front seat belt buckle unit, which is secured by a large screw to the outside of the inboard seat cushion frame of the front seat. The buckle tensioner consists

primarily of a buckle (1), a molded plastic scabbard, a cable and piston, a cable guide and bracket, a metal cylinder tube and a small pyrotechnically activated gas generator (4).

The buckle tensioner is controlled by the Occupant Restraint Controller (ORC) and is connected to the vehicle electrical system through a dedicated take out of the seat wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The buckle tensioner has a single pigtail harness (3) for the integral seat belt switch.

The buckle tensioner cannot be repaired and, if ineffective or damaged, the entire front seat belt buckle unit must be replaced. If the front airbags have been deployed, the buckle tensioners have also been deployed. The buckle tensioners are not intended for reuse and must be replaced following any front airbag deployment. Refer to **BUCKLE, SEAT BELT, REMOVAL**.

OPERATION

OPERATION

The seat belt tensioners are deployed in conjunction with the dual front airbags by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

On the retractor tensioner, the gas generator is installed in one end of a steel tube that contains numerous steel balls. As the gas expands, it pushes the steel balls through the tube into a cast metal housing, where a ball guide directs the balls into engagement with the teeth of a sprocket that is geared to one end of the retractor spool. As the balls drive past the sprocket, the sprocket turns and drives the seat belt retractor spool causing the slack to be removed from the front seat belts. The ball trap captures the balls as they leave the sprocket and are expelled from the housing.

On the buckle tensioner, the gas generator is installed in one end of the tubular metal piston housing, which contains a piston secured to one end of a cable. The cable is routed around an integral guide to the buckle, which is secured to the opposite end of the cable. As the gas expands, it pushes the piston and the cable through the tube and pulls the buckle downward, causing the slack to be removed from the front seat belt.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seats might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel or windshield. The seat belt retractor also has a torsion bar mechanism that is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the seat belt tensioner gas generator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate

Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

BRAKES

Antilock Brake System (ABS) - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

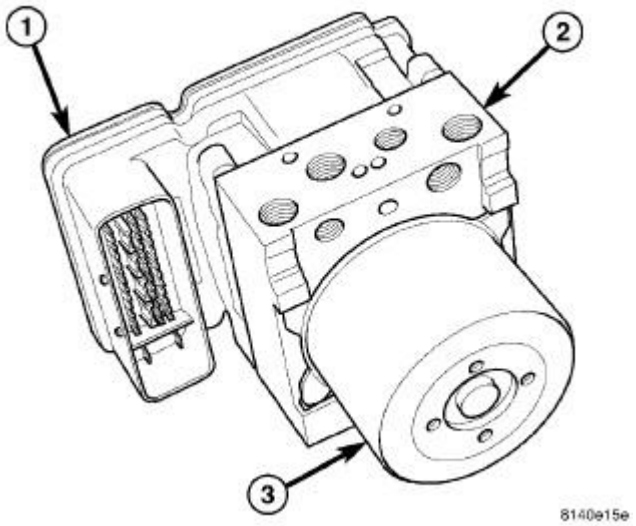

Fig. 1: Integrated Control Unit
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

This vehicle uses an electronic brake control system designated MK25e. This system includes ABS (Antilock Brake System), TCS (Traction Control System), BAS (Brake Assist System), EVBP (Electronic Variable Brake Proportioning) and ESC (Electronic Stability Control). All of these systems work together to enhance vehicle stability and control in various driving conditions and are commonly referred to as ESC.

This system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Includes Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (1)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)
- Dynamics Sensor - Includes a yaw rate sensor and a lateral accelerometer.
- Steering Angle Sensor (SAS) - The SAS is part of the Steering Column Control Module

(SCCM).

- Brake Pressure Sensor - The brake pressure sensor is located in the HCU and is not serviceable separate from the HCU.

ABS

The purpose of the Antilock Brake System (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

ALL-SPEED TRACTION CONTROL

The traction control system (TCS) is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

With rear-wheel drive, All-Speed Traction Control is effective up to 85 mph (137 km/h); with AWD, All-Speed Traction Control is effective up to 45 mph (72 km/h), which is common among competitive AWD vehicles with traction control.

ELECTRONIC STABILITY CONTROL

The Electronic Stability Control (ESC) enhances control and stability of the vehicle under various driving conditions. ESC corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESC uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESC applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition.

- Oversteer - When the vehicle is turning more that appropriate for the steering wheel position.
- Understeer - When the vehicle is turning less than appropriate for the steering wheel position.

The "ESC/TCS" indicator light located in the instrument cluster starts to flash as soon as the tires lose traction and the ESC system becomes active. The "ESC/TCS" indicator light also flashes when TCS is active.

The ESC can be turned off by using the ESC Off switch. When the ESC Off switch is depressed, it does not completely turn the system off. The ESC system shuts off engine management but retains brake activations for yaw control.

BRAKE ASSIST SYSTEM

The Brake Assist System (BAS) is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the

rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the antilock brake system (ABS). Applying the brakes very quickly results in the best BAS assistance.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Electronic Variable Brake Proportioning (EVBP) is used to balance front-to-rear braking in place of a traditional rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

OPERATION

OPERATION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a front/rear split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3-5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the

highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3-4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber

ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

ELECTRONIC STABILITY CONTROL

To determine whether the car is responding properly to cornering commands, ESC uses steering

wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESC operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESC system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the electronic shuttle valve.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

STANDARD PROCEDURE

STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

NOTE: During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add Mopar® DOT 3 brake fluid as required.

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under

the lower steering column cover to the left of the steering column.

3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

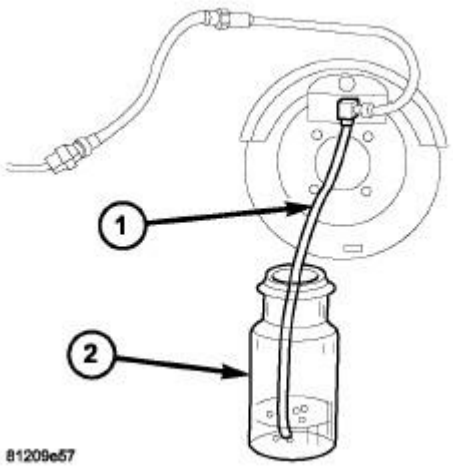

Fig. 2: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

WARNING: When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.

NOTE: Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

4. Bleed the base brake system. Refer to **STANDARD PROCEDURE** .
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

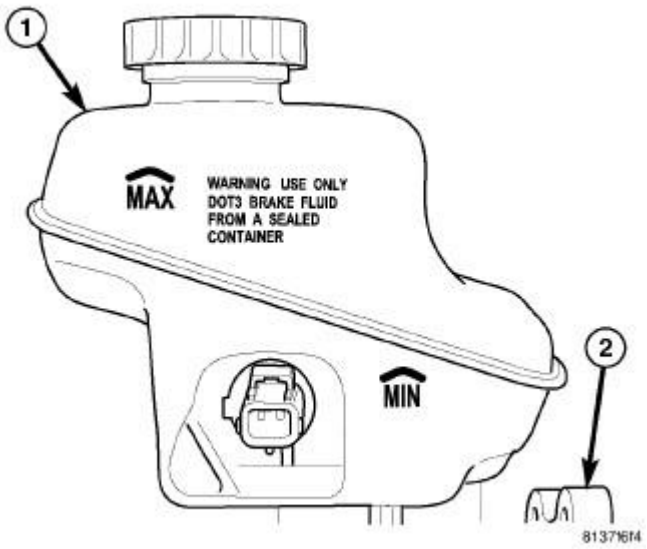

Fig. 3: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

7. Fill the master cylinder fluid reservoir (1) to the MAX level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

TORQUE

For ABS fastener torque specifications, see Brake Fastener Torque. Refer to **SPECIFICATIONS** .

ELECTRICAL

SENSOR, DYNAMICS

DESCRIPTION

DESCRIPTION

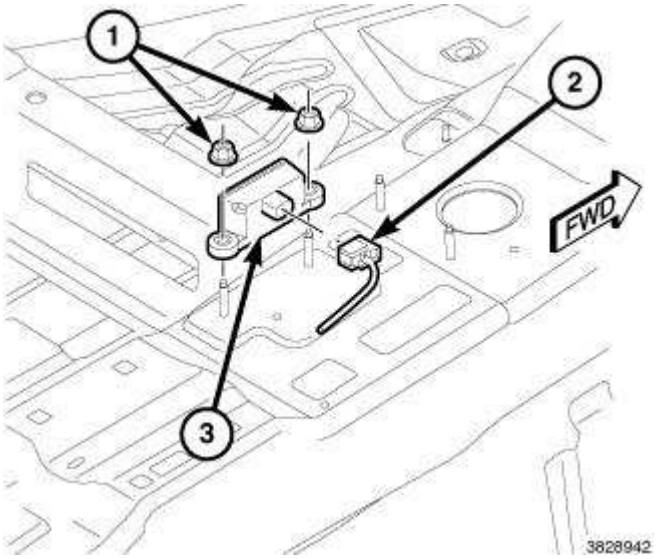

Fig. 4: Dynamics Sensor
Courtesy of CHRYSLER GROUP, LLC

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (3). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

REMOVAL

REMOVAL

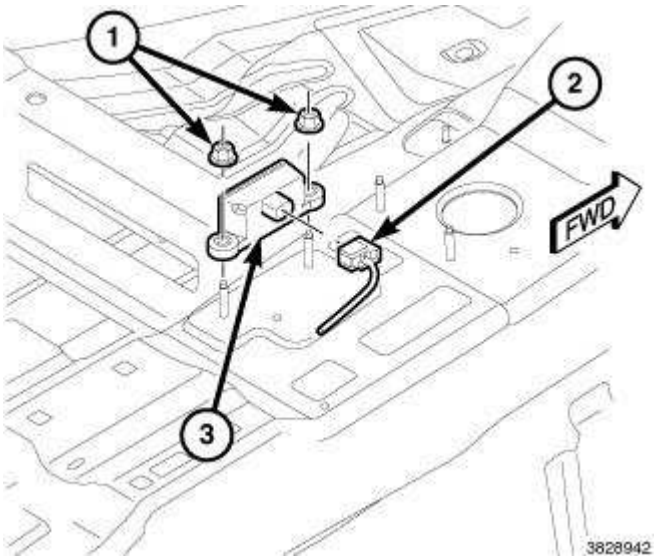

Fig. 5: Dynamics Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable from battery post.
2. Remove floor console. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Disconnect wiring harness (2) connector at sensor (3).
4. Remove nuts (1) mounting sensor (3) to floor pan tunnel.
5. Remove dynamics sensor (3) from vehicle.

INSTALLATION

INSTALLATION

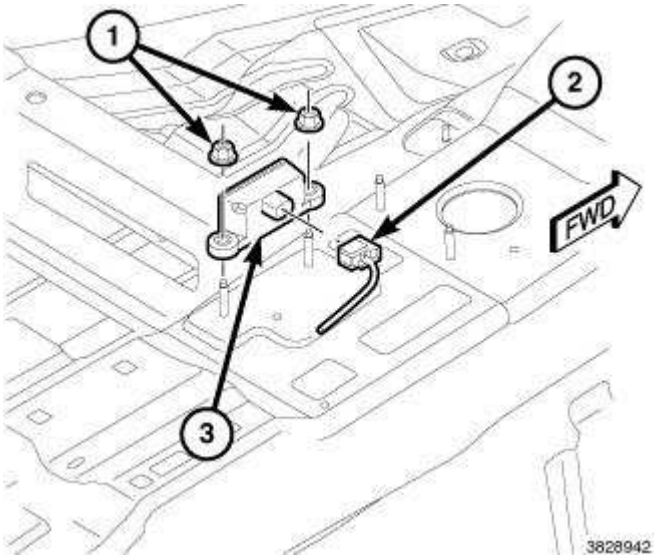

Fig. 6: Dynamics Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Install dynamics sensor (3) over studs mounted to floor pan tunnel.
2. Install mounting nuts (1) and tighten to 7 N.m (62 in. lbs.).
3. Connect wiring harness (2) connector to sensor (3).
4. Install floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Connect battery negative cable to battery post. It is important that this is performed properly.
6. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, STEERING WHEEL ANGLE

REMOVAL

REMOVAL

The steering angle sensor is serviced as an assembly with the steering column control module (SCCM). Refer to **MODULE, STEERING COLUMN, REMOVAL** .

INSTALLATION

INSTALLATION

The steering angle sensor is serviced as an assembly with the steering column control module (SCCM). Refer to **MODULE, STEERING COLUMN, INSTALLATION** .

SENSOR, WHEEL SPEED, FRONT

DESCRIPTION

DESCRIPTION

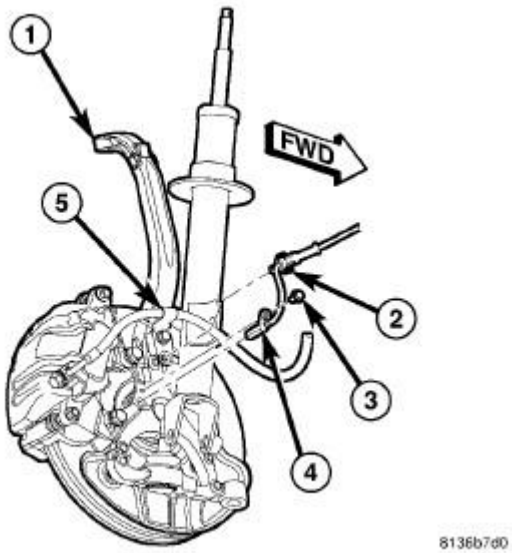

Fig. 7: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

One wheel speed sensor is mounted to each knuckle. The wheel speed sensor, using a tone wheel attached to the hub and bearing (RWD) or front half shaft (AWD) as a trigger mechanism, communicates with the Antilock Brake Module, informing it of that wheel's speed.

The head of the front wheel speed sensor used on Rear-Wheel-Drive (RWD) vehicles mounts to the inside of the knuckle.

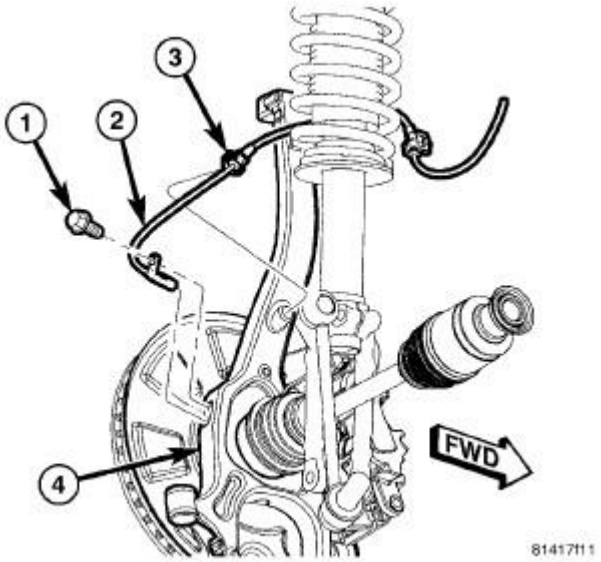

Fig. 8: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

The head of the front wheel speed sensor used on All-Wheel-Drive (AWD) vehicles mounts to the rear of the knuckle.

Vehicles without antilock brakes are equipped with one front wheel speed sensor. It is attached to the right front knuckle and is used to provide wheel speed sense to various vehicle systems.

REMOVAL

ALL-WHEEL-DRIVE

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

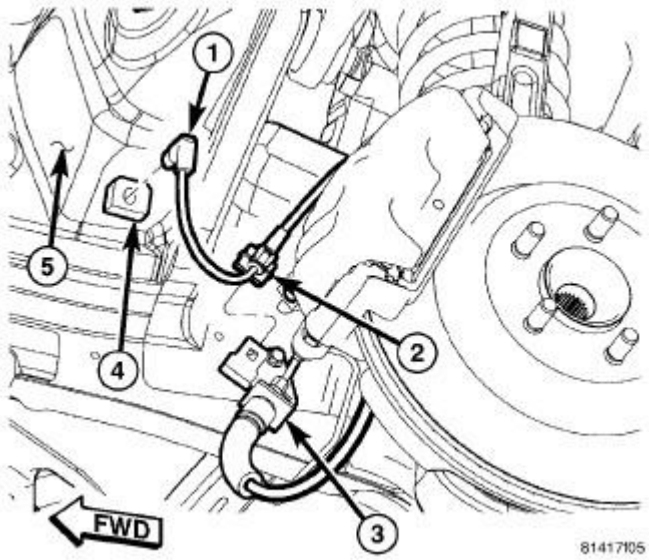

Fig. 9: Wheel Speed Sensor AT Body - AWD
Courtesy of CHRYSLER GROUP, LLC

2. Remove sensor cable routing clip (2) from brake hose bracket (3).

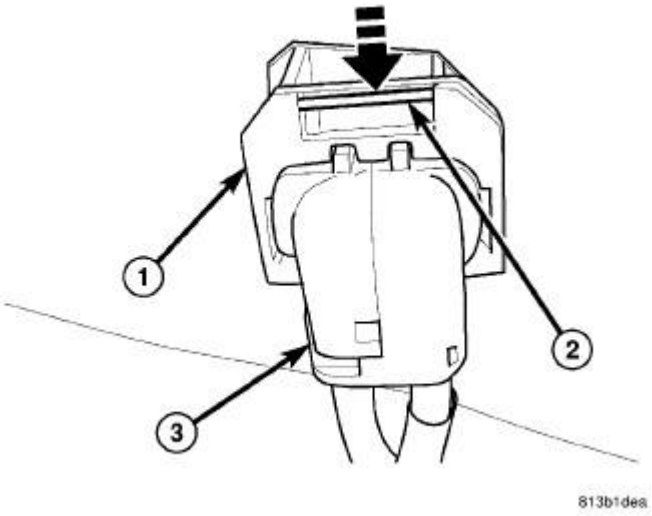

Fig. 10: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor connector (3) outward.

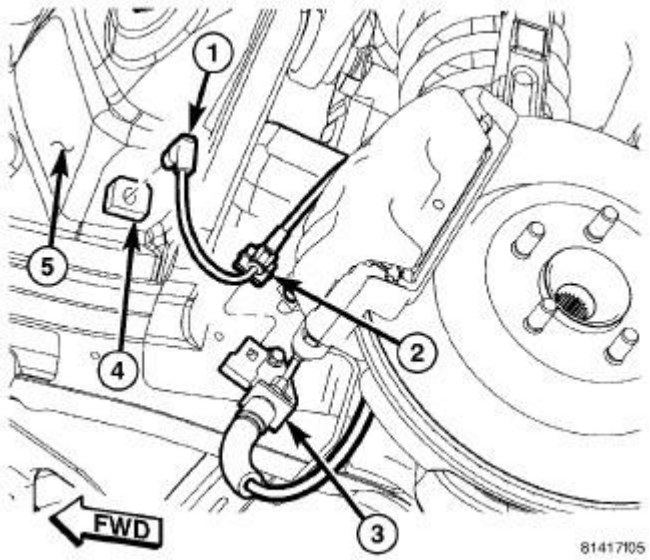

Fig. 11: Wheel Speed Sensor AT Body - AWD
Courtesy of CHRYSLER GROUP, LLC

3. Remove sensor connector (1) from body wiring harness connector (4).

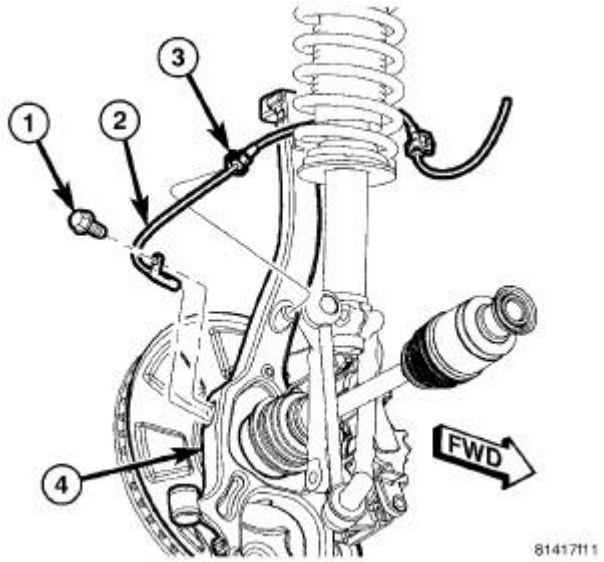

Fig. 12: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (1) fastening wheel speed sensor (2) to knuckle (4). Pull sensor head out of knuckle.
5. Remove wheel speed sensor cable routing clip (3) from knuckle (4).
6. Remove wheel speed sensor (2).

REAR-WHEEL-DRIVE

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

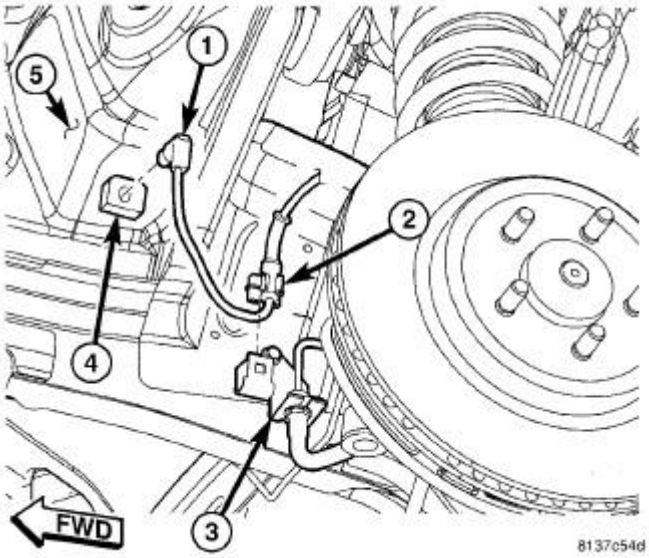

Fig. 13: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

2. Remove sensor cable routing clip (2) from brake hose bracket (3).

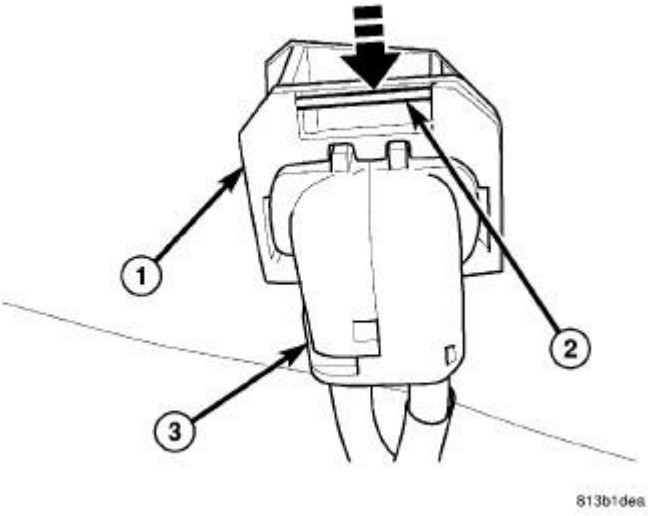

Fig. 14: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor

connector (3) outward.

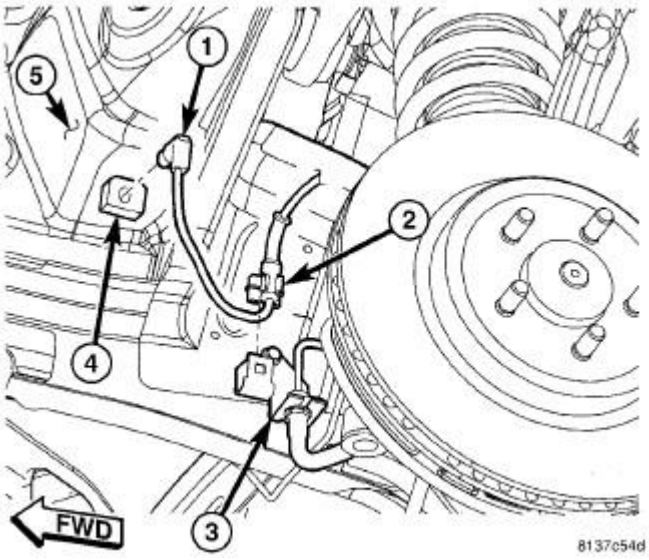

Fig. 15: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Remove sensor connector (1) from body wiring harness connector (4).

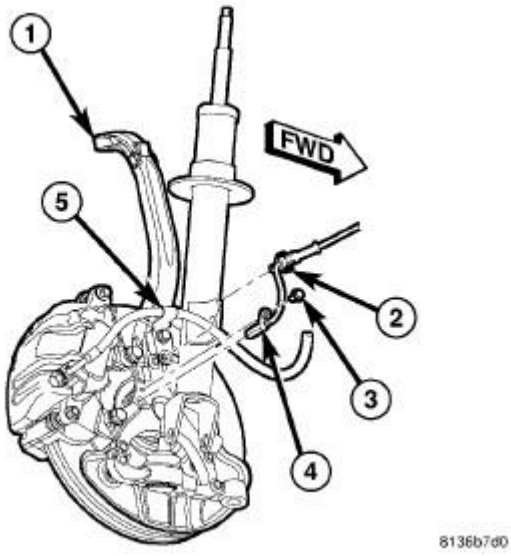

Fig. 16: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
5. Remove wheel speed sensor cable routing clip (2) from brake hose routing bracket (5).

INSTALLATION

ALL-WHEEL-DRIVE

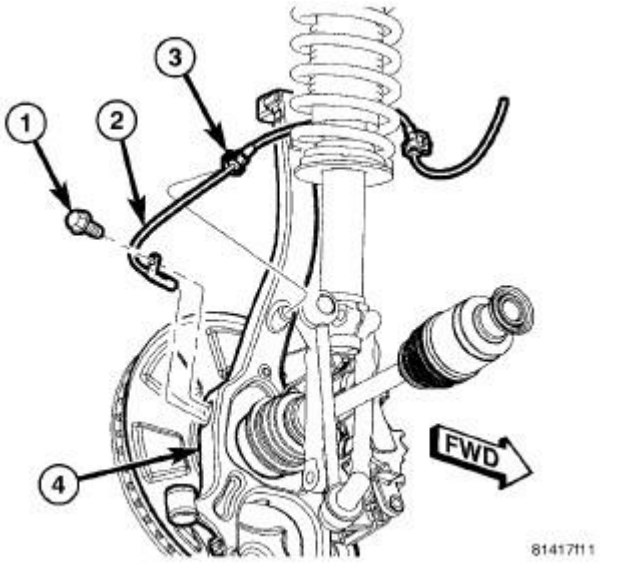

Fig. 17: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

1. Install wheel speed sensor (2) head into knuckle (4) and install mounting screw (1). Tighten screw to 11 N.m (97 in. lbs.).
2. Attach wheel speed sensor cable and routing clip (3) to knuckle (4).

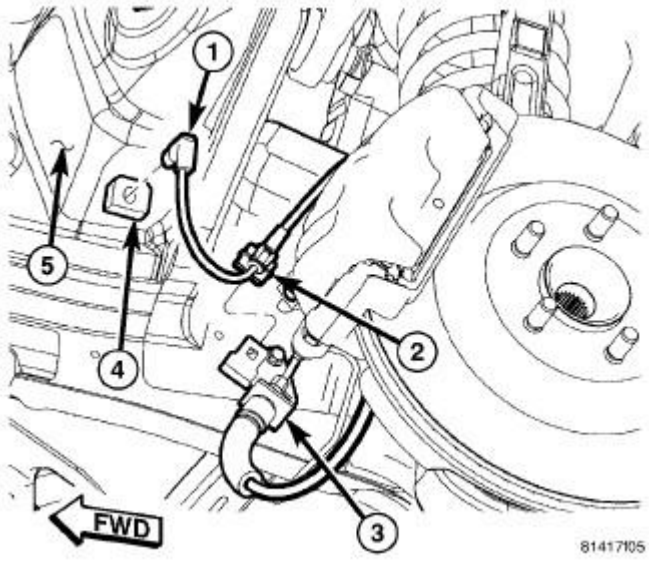

Fig. 18: Wheel Speed Sensor AT Body - AWD
Courtesy of CHRYSLER GROUP, LLC

3. Attach sensor cable routing clip (2) to brake hose bracket (3).
4. Connect sensor connector (1) to body wiring harness connector (4). When installing connector, make sure retaining clip on body connector is properly in place and sensor connect cannot be pulled out.
5. Lower vehicle.
6. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

REAR-WHEEL-DRIVE

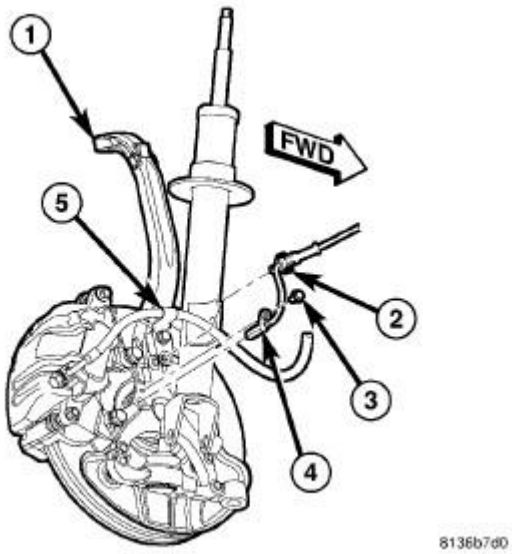

Fig. 19: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (97 in. lbs.).
2. Attach wheel speed sensor cable and routing clip (2) to brake hose routing bracket (5).

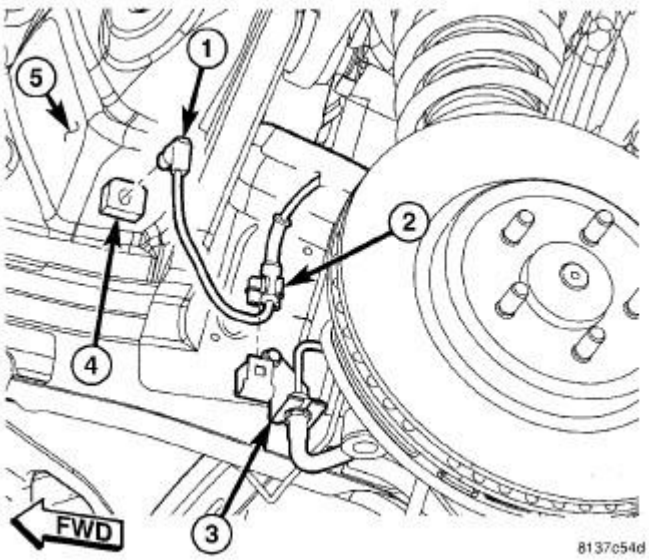

Fig. 20: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Attach sensor cable routing clip (2) to brake hose bracket (3).
4. Connect sensor connector (1) to body wiring harness connector (4). When installing connector, make sure retaining clip on body connector is properly in place and sensor connect cannot be pulled out.
5. Lower vehicle.
6. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, WHEEL SPEED, REAR

DESCRIPTION

DESCRIPTION

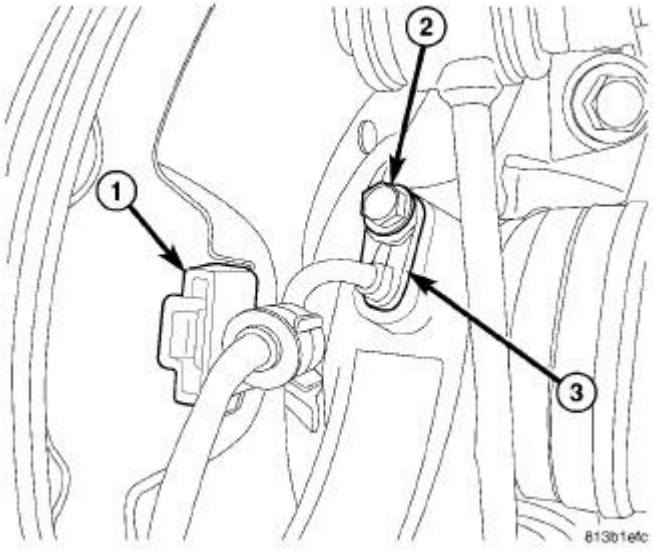

Fig. 21: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

One wheel speed sensor (3) is mounted to the rear of each rear knuckle. The wheel speed sensor, using a tone wheel attached to the rear axle half shaft as a trigger mechanism, communicates with the Antilock Brake Module, informing it of that wheel's speed.

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

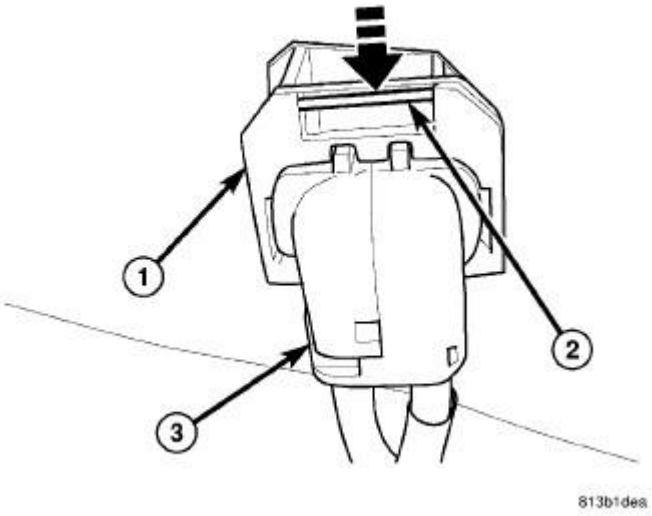

Fig. 22: Releasing Wheel Speed Sensor Connector

Courtesy of CHRYSLER GROUP, LLC

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor connector (3) outward.

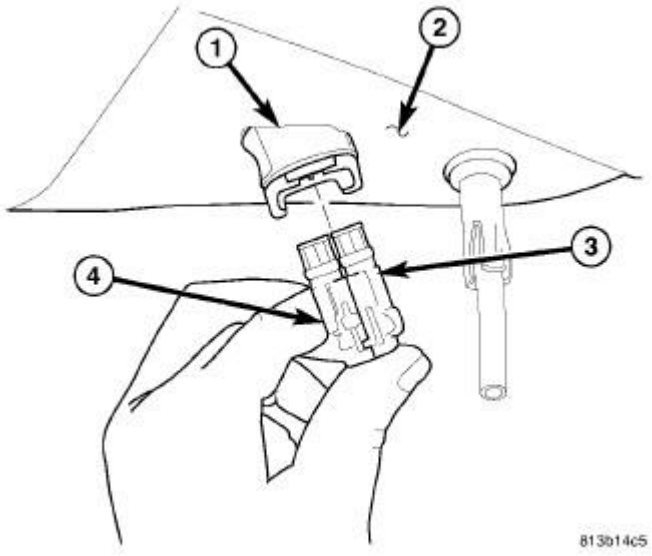

Fig. 23: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

2. Remove sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).
3. Separate left sensor connector (4) from right sensor connector (3).

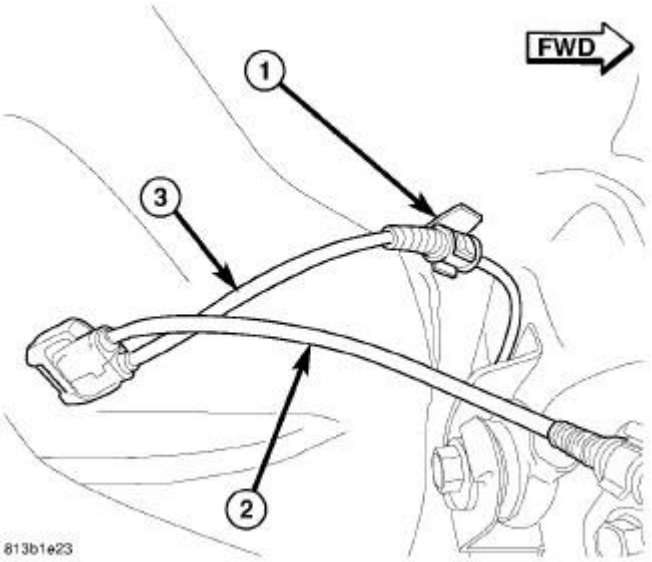

Fig. 24: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

4. If removing left sensor, unclip sensor cable (3) from routing clip near body connector (1).

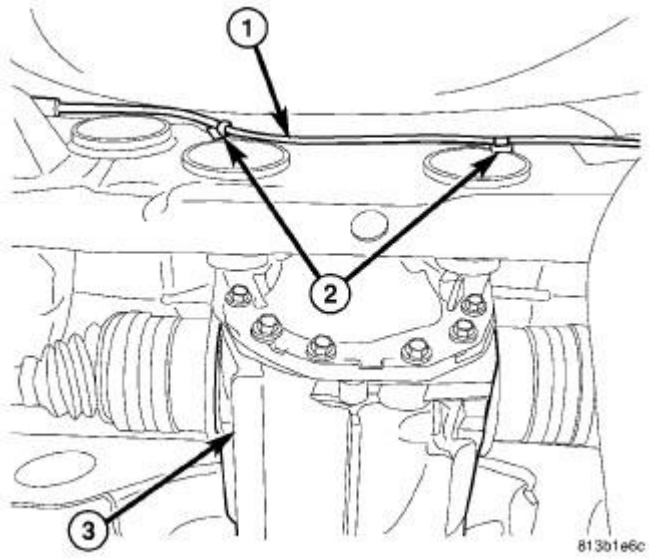

Fig. 25: Left Wheel Speed Sensor Routing Over Rear Differential
Courtesy of CHRYSLER GROUP, LLC

5. If removing left sensor, unclip sensor cable (1) from routing clips (2) along rear of crossmember near rear differential (3).

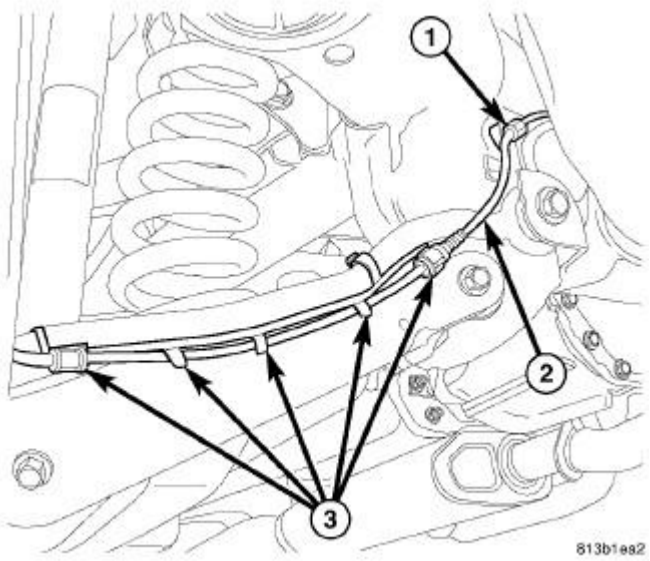

Fig. 26: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

6. If removing left sensor, unclip sensor cable (2) from routing clip (1) above toe link mount on rear crossmember.
7. Unclip sensor cable (2) from routing clips (3) along toe link.

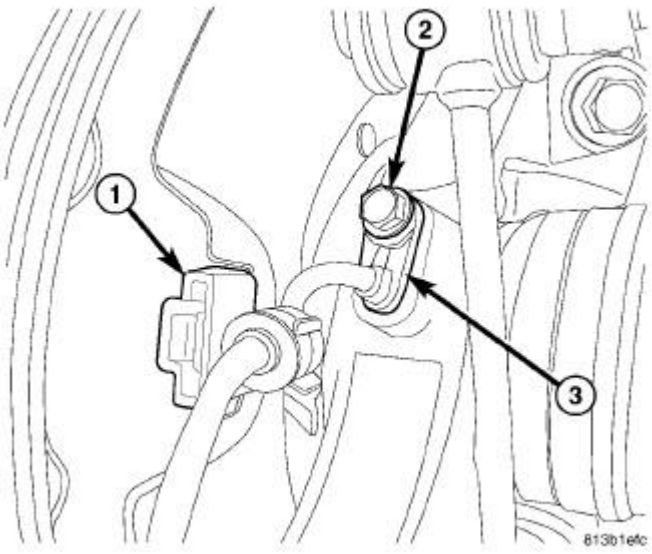

Fig. 27: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

8. Unclip sensor cable at rear brake rotor shield (1).
9. Remove screw (2) fastening sensor head (3) to rear knuckle.
10. Remove wheel speed sensor.

INSTALLATION

INSTALLATION

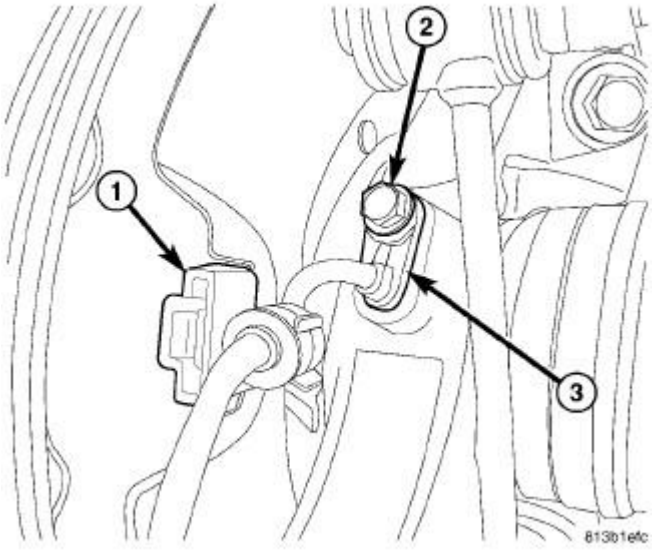

Fig. 28: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
2. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
3. Install sensor cable at rear brake rotor shield (1).

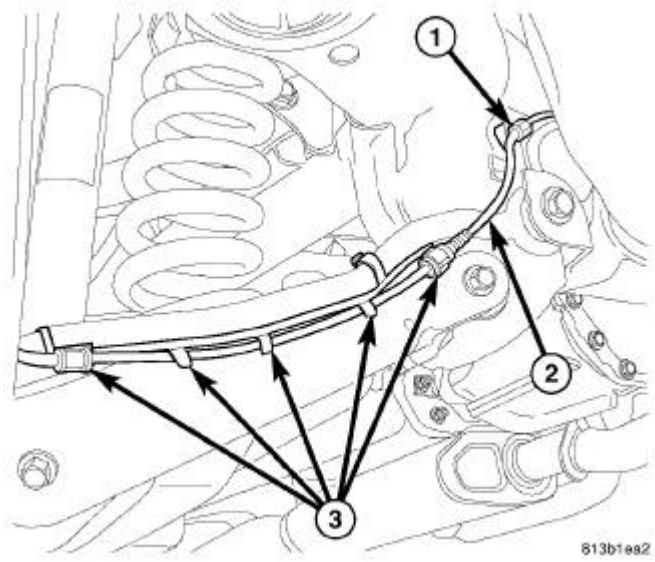

Fig. 29: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

4. Clip sensor cable (2) to routing clips (3) along toe link.
5. If installing left sensor, clip sensor cable (2) to routing clip (1) above toe link mount on rear crossmember.

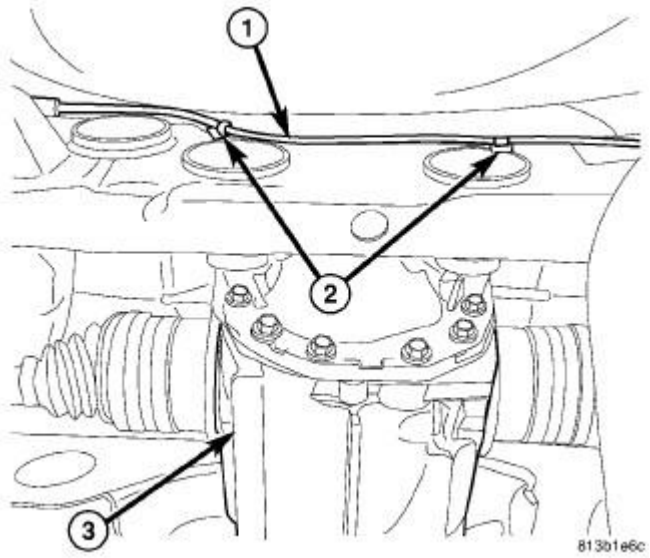

Fig. 30: Left Wheel Speed Sensor Routing Over Rear Differential
Courtesy of CHRYSLER GROUP, LLC

6. If installing left sensor, clip sensor cable (1) to routing clips (2) along rear of crossmember near rear differential (3).

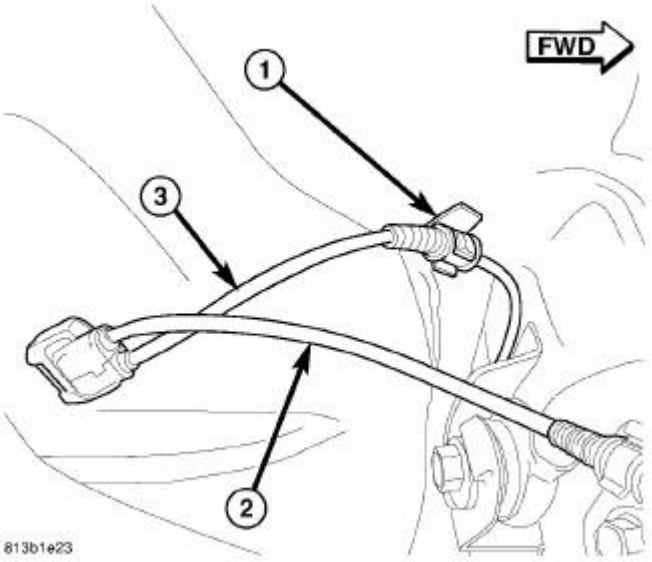

Fig. 31: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

7. If installing left sensor, clip sensor cable (3) to routing clip near body connector (1).

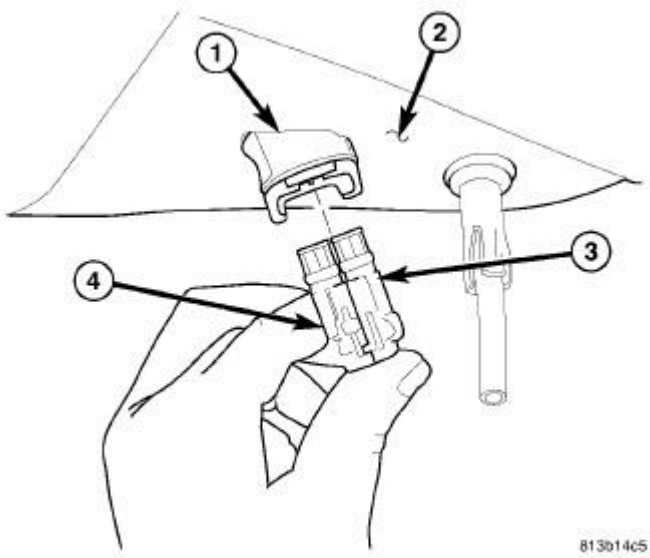

Fig. 32: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

8. Match left sensor connector (4) to right sensor connector (3) to make one connector.
9. Insert sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.
10. Lower vehicle.
11. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)

DESCRIPTION

DESCRIPTION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC Off Switch is located in the Instrument Panel Switch Pod in the center of the instrument panel. The ESC Off switch turns the Electronic Stability Control off whenever the switch is depressed. Depressing the switch a second time turns the ESC back on. The switch resets itself each time the ignition is cycled.

When the ESC Off switch is depressed and released, turning ESC off, it does not completely turn the system off. The ESC system reduces torque management to a lesser amount, but ESC function can still occur if the system perceives the need.

The ESC Off switch is serviced as part of the Instrument Panel Switch Pod.

REMOVAL

REMOVAL

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC Off switch is serviced as part of the Instrument Panel Switch Pod. Refer to **POD, SWITCH BANK, REMOVAL** .

INSTALLATION

INSTALLATION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC Off switch is serviced as part of the Instrument Panel Switch Pod. Refer to **POD, SWITCH BANK, INSTALLATION** .

HYDRAULIC/MECHANICAL

HYDRAULIC CONTROL UNIT (HCU)

REMOVAL

REMOVAL

To remove the HCU, the ICU must be removed and disassembled. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL**.). Refer to **INTEGRATED CONTROL UNIT (ICU), DISASSEMBLY**.

INSTALLATION

INSTALLATION

To install the HCU, assemble and install the ICU. Refer to **INTEGRATED CONTROL UNIT (ICU), ASSEMBLY** & **INTEGRATED CONTROL UNIT (ICU), INSTALLATION**.

INTEGRATED CONTROL UNIT (ICU)

DESCRIPTION

DESCRIPTION

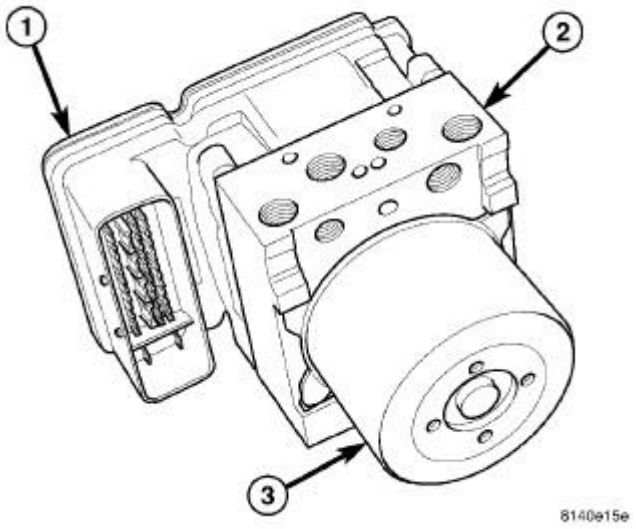

Fig. 33: Integrated Control Unit
Courtesy of CHRYSLER GROUP, LLC

The Hydraulic Control Unit (HCU) (2) and the Antilock Brake Module (ABM) (1) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU).

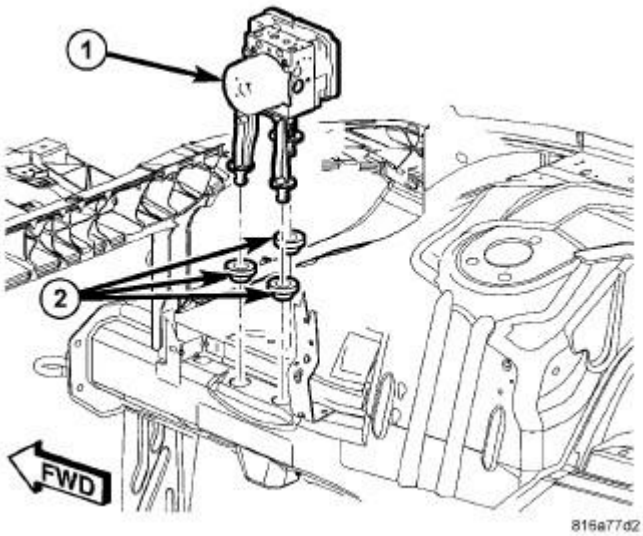

Fig. 34: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

The ICU (1) is located in the engine compartment, mounted to a bracket that is attached to the right side rail through the use of isolation grommets (2).

The ABS with traction control ICU consists of the following components: the ABM, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), two traction control solenoid valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The replaceable components of the ICU are the HCU and the ABM. No attempt should be made to service any components of the HCU or ABM. For replacement of the ABM. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

For additional information on the ABM. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .

REMOVAL

REMOVAL

NOTE: Before proceeding. Refer to CAUTION & WARNING .

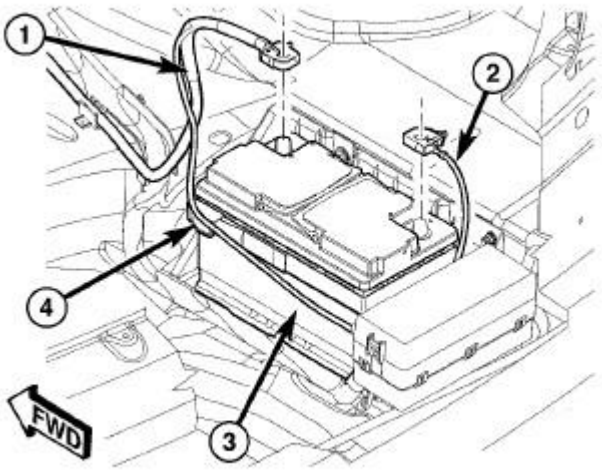

Fig. 35: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

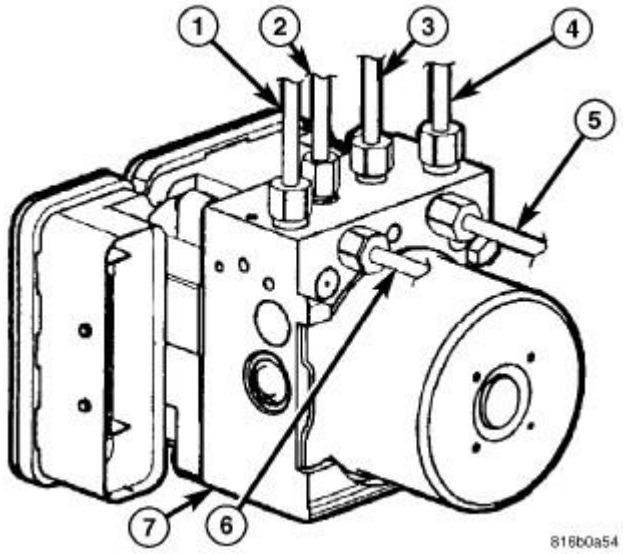

Fig. 36: Brake Tubes AT ICU - Mk25e
Courtesy of CHRYSLER GROUP, LLC

3. Remove primary (4) and secondary (1) brake tubes (from master cylinder) at hydraulic control unit (7).
4. Remove remaining brake tubes (2, 3, 5, 6) at hydraulic control unit (7).

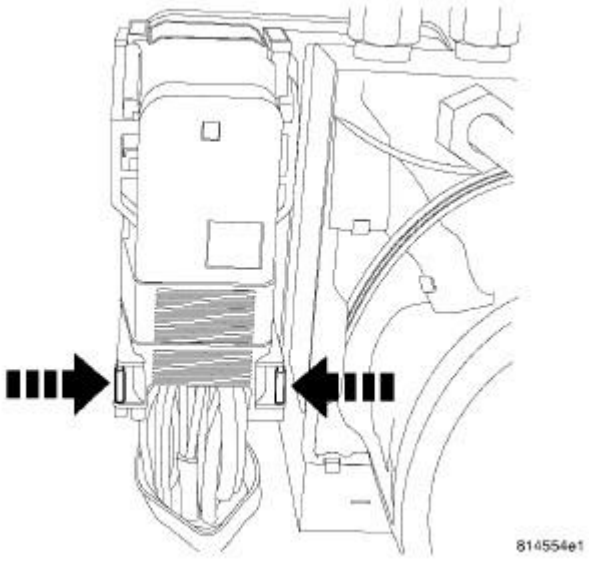

Fig. 37: ABM Connector Release Tabs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use this figure in the following step to release the ABM harness connector cover. It shows the location of the release tabs.

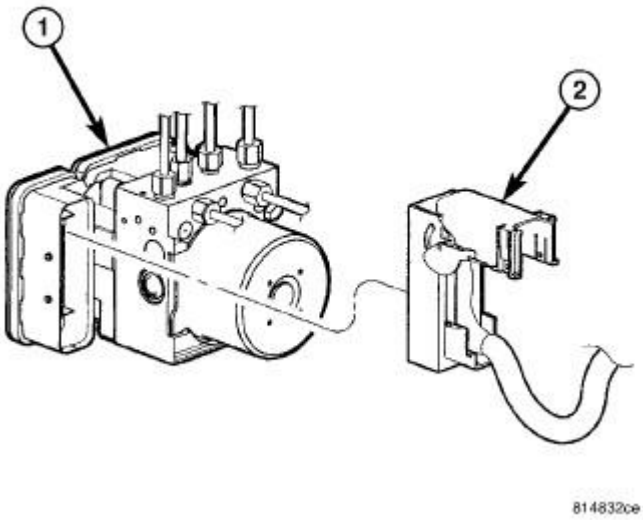

Fig. 38: Anti-Lock Brake Module Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect ABM harness connector from antilock brake module (ABM). To do so:
    1. Depress tabs on each side of connector cover, then
    2. Pull outward and upward on lower half of cover until it locks into position pointing straight outward (2). Connector can then be pulled straight outward off ABM (1).

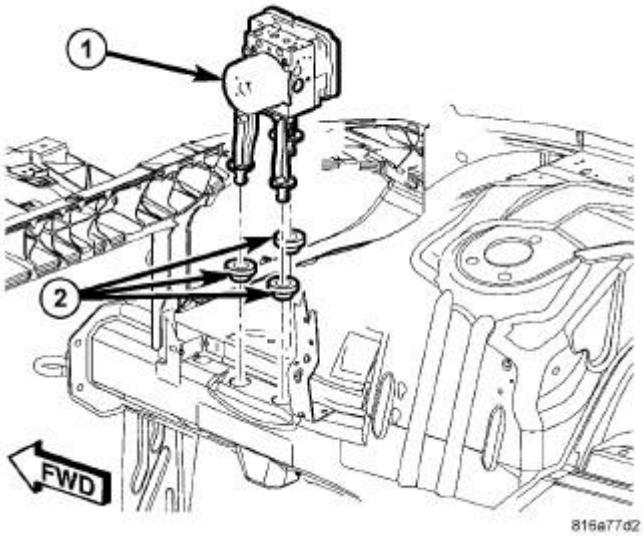

Fig. 39: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Pull up on unit (1) and remove from mounting grommets (2) in body side rail.

DISASSEMBLY

DISASSEMBLY

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

1. Remove two screws attaching the mounting bracket to the HCU. Remove the bracket.

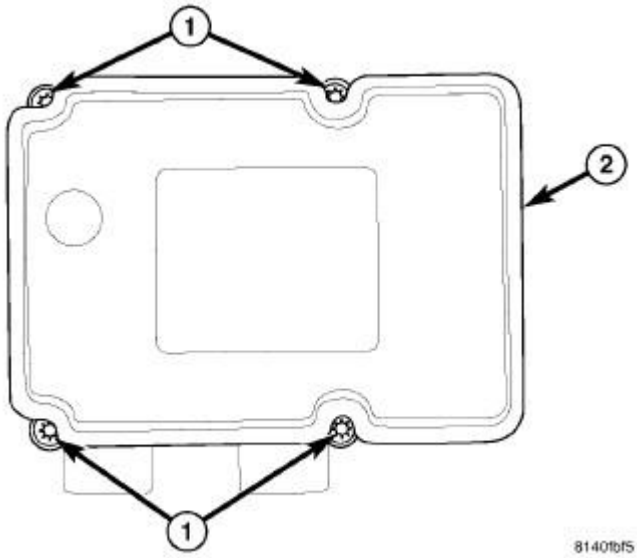

Fig. 40: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

2. Remove four screws (1) attaching ABM (2) to HCU.

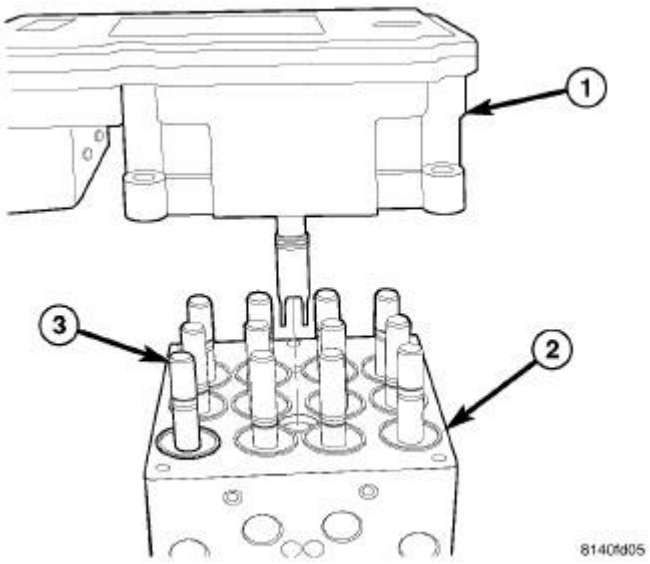

Fig. 41: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

3. Separate ABM (1) from HCU (2).

ASSEMBLY

ASSEMBLY

1. Clean any debris off the mating surfaces of the HCU and ABM.

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

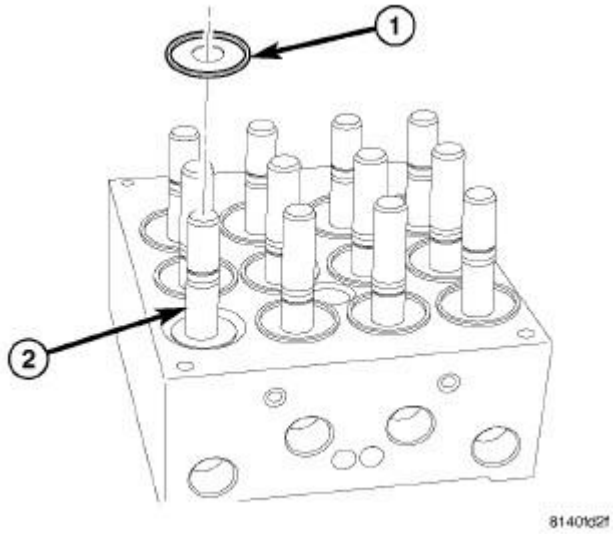

Fig. 42: Solenoid Valve Seal
Courtesy of CHRYSLER GROUP, LLC

2. If the seals (1) on the solenoid valve stems (2) are not new, replace them all. Each of the solenoid valve stem seals must be new to keep out moisture and debris; **do not reuse solenoid valve stem seals** .

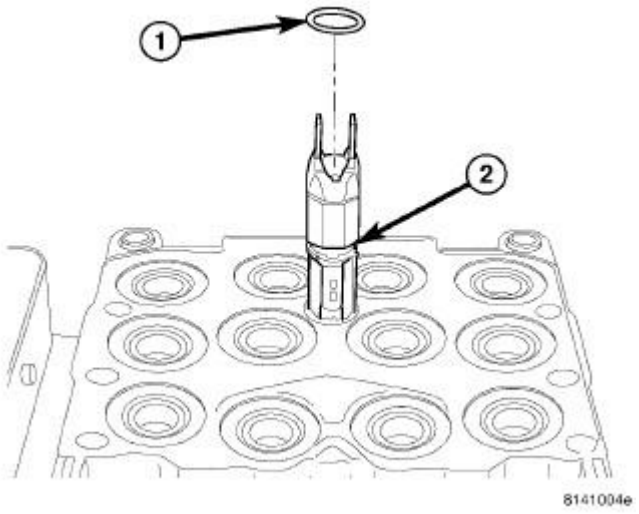

Fig. 43: Internal Pump Connector O-Ring
Courtesy of CHRYSLER GROUP, LLC

3. Replace the pump/motor connector O-ring (1) if it is not new. Be sure the O-ring is properly seated in the mounting groove (2).

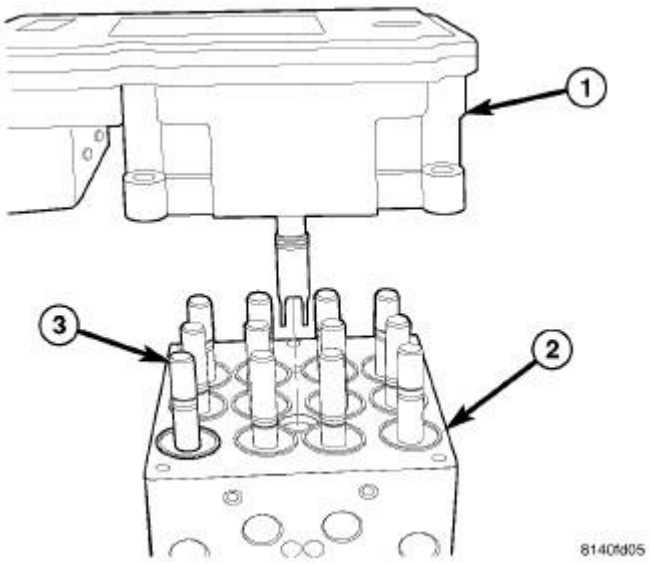

Fig. 44: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

4. Align components and install the ABM (1) on the HCU (2).

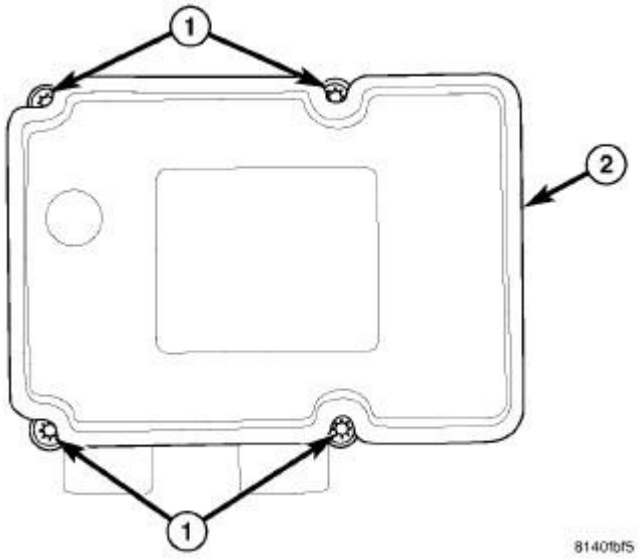

Fig. 45: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

5. Install the four screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2 N.m (17 in. lbs.).
6. Attach the mounting bracket to the HCU. Install two mounting bracket attaching screws and tighten to 11 N.m (97 in. lbs.).
7. Install the ICU in the vehicle. Refer to **INTEGRATED CONTROL UNIT (ICU), INSTALLATION**.

INSTALLATION

INSTALLATION

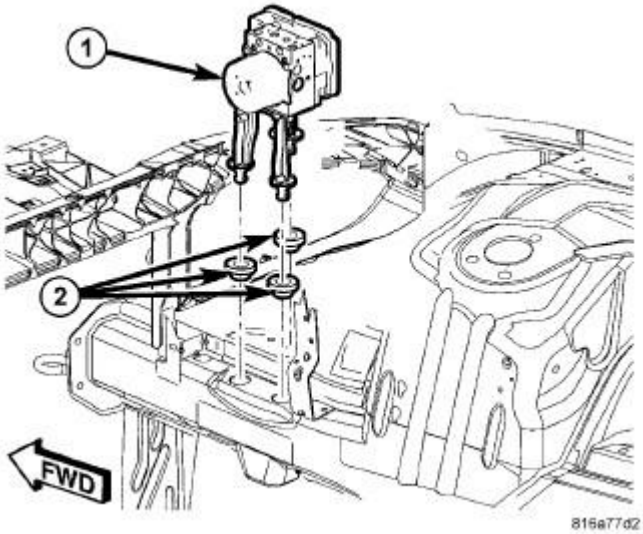

Fig. 46: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install unit (1), pushing mounting bracket down into mounting grommets (2) located in body side rail.

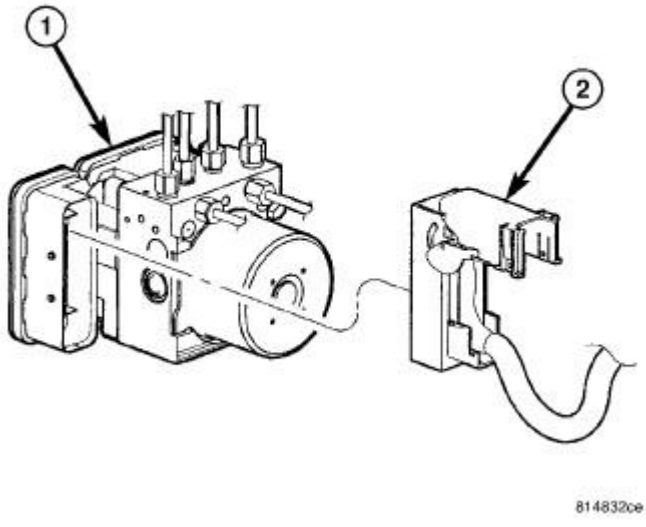

Fig. 47: Anti-Lock Brake Module Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before installing the ABM harness connector (2) on the ABM (1), be

sure the seal is properly installed in the connector.

2. Insert ABM harness connector (2) into socket of ABM (1) and close cover, locking connector in place.

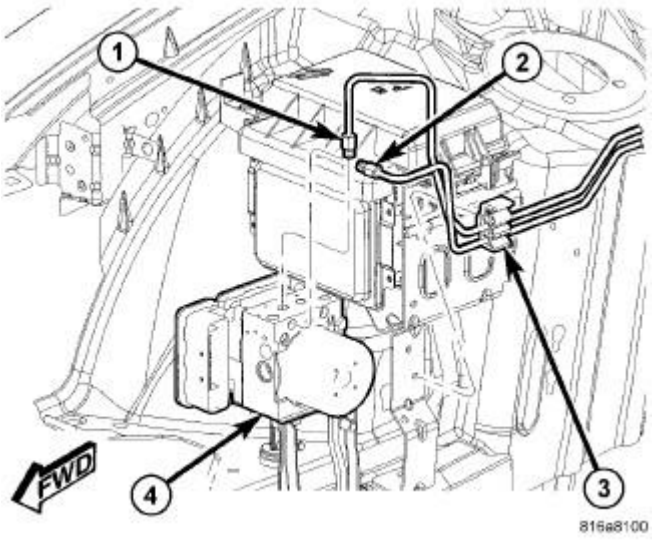

Fig. 48: Left Rear And Right Rear Brake Tubes AT ICU
Courtesy of CHRYSLER GROUP, LLC

3. Install left (2) and right (1) rear brake tubes at hydraulic control unit (4). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

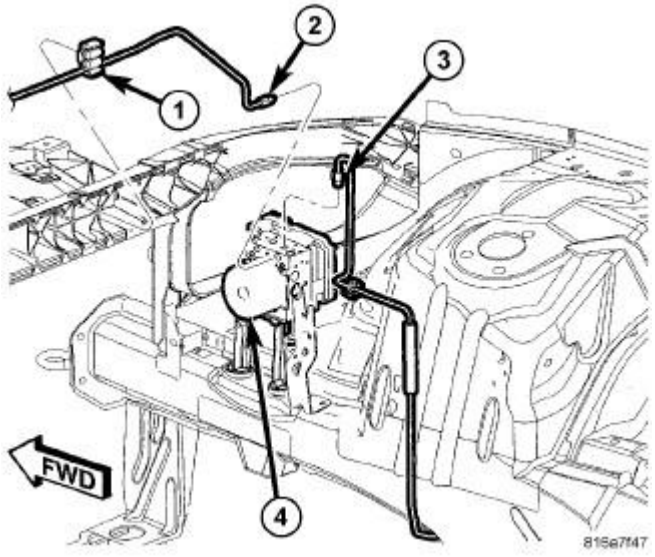

Fig. 49: Left Front And Right Front Brake Tubes AT ICU
Courtesy of CHRYSLER GROUP, LLC

4. Install left (2) and right (3) brake tubes at hydraulic control unit (4). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

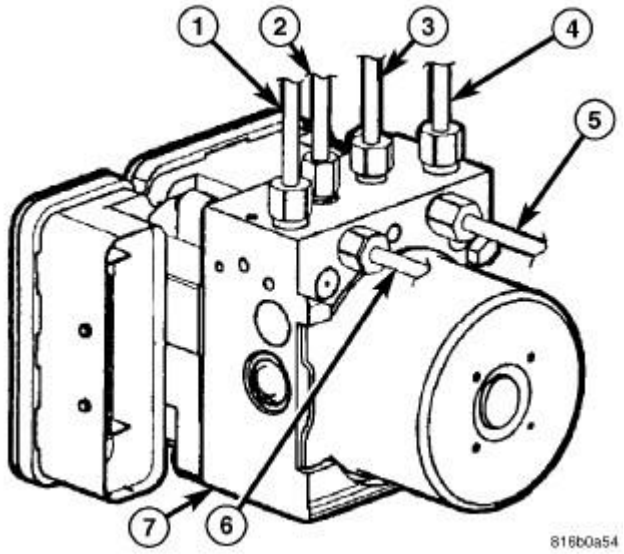

Fig. 50: Brake Tubes AT ICU - Mk25e
Courtesy of CHRYSLER GROUP, LLC

5. Install primary (4) and secondary (1) brake tubes at hydraulic control unit (7). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.
6. Remove brake pedal holding tool.

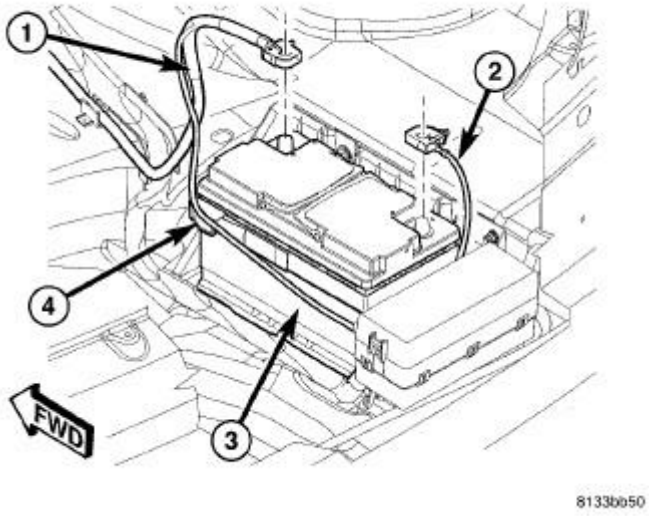

Fig. 51: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

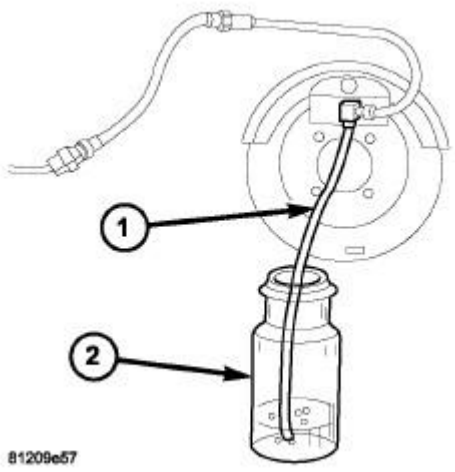

Fig. 52: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

8. Fill and bleed (1) base brake hydraulic system and ABS. Refer to **STANDARD PROCEDURE** .
9. Perform Diagnostic Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

ACCESSORIES AND EQUIPMENT

Audio And Video - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

The audio system includes the following components:

- ISC Screen Module
- Telematics Gateway Module (TGM)
- Antenna (AM/FM and Satellite Audio and navigation)
- Power amplifier (with premium speaker system only)
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Satellite Receiver (integrated within the TGM)
- Speakers

OPERATION

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Power Distribution Center (PDC) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with the use of scan tool. Check for any Diagnostic Trouble Codes (DTCs) RADIO. If there are any DTCs, perform the appropriate diagnostic procedure(s) before proceeding.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

AUDIO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
TELEMATICS GATEWAY (TGW) INOPERATIVE	1. Fuse inoperative.	Check TGW fuses in the rear PDC. Replace fuses, if required.
	2. Open Wiring.	Perform the "No Response From Radio" test. Refer to **DIAGNOSIS AND TESTING** .
NO AUDIO - BUT TGW LIGHTS UP	1. Antenna problem.	Perform the "Poor or No AM/FM Audio Reception" test. Refer to **DIAGNOSIS AND TESTING** .
	2. TGW or Amplifier (if equipped) connector damaged.	Check for loose or corroded TGW or Amplifier connector. Repair, as required.
	3. Wiring damaged.	Check for shorted or open wires. Repair wiring as required.
	4. TGW or Amplifier (if equipped) ground damaged.	Check for continuity between TGW or Amplifier and a known good ground. There should be continuity. Repair ground as required.
	5. Amplifier (if equipped) inoperative.	Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .
	6. Speakers inoperative.	or if equipped. Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .
NO DISPLAY FROM THE INTEGRATED CENTER STACK (ICS) SCREEN	1. Fuse inoperative.	Check the TGW and ICS fuses in the Junction Block. Replace fuses, if required.
	2. TGW and ICS connectors	Check for loose or corroded

	damaged.	TGW and ICS connectors. Check Repair as required.
	3. Wiring damaged.	Check for battery voltage at TGW and ICS connectors. Repair wiring as required.
	4. Low Voltage Differential Signal (LVDS) Video Cable open or connectors damaged.	Check for loose or poor LVDS cable connections between the TGW and ICS connectors. Check and repair as required.
	5. TGW and ICS ground circuit damaged.	Check for continuity between TGW and ICS and a known good ground. There should be continuity. Repair ground as required.
	6. TGW or ICS inoperative.	Check "No Response from TGW". Refer to **DIAGNOSIS AND TESTING** . Check "No Response from ICS" Refer to **DIAGNOSIS AND TESTING** .
POOR AM/FM RADIO RECEPTION	1. Antenna inoperative	Perform the "Poor or No AM/FM Audio Reception" test. Refer to **DIAGNOSIS AND TESTING** .
	2. TGW ground damaged.	Check for continuity between TGW chassis and a known good ground. There should be continuity. Repair ground as required.
	3. TGW inoperative.	Refer to **DIAGNOSIS AND TESTING** . or **DIAGNOSIS AND TESTING** .
	4. Faulty rear window antenna (grid).	Verify that the rear antenna grid is functioning properly. Repair as necessary. Refer to **MAST, ANTENNA, DIAGNOSIS AND TESTING**.
POOR SDAR AUDIO RECEPTION	1. SDAR Antenna Inoperative.	Perform the "Poor or No Satellite Audio Reception" test. Refer to **DIAGNOSIS AND TESTING** .
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	Inspect door trim panel and correct as necessary. Replace any missing fasteners.
	2. Water shield loose or misaligned.	Inspect water shield and adjust as required.

	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	Remove items from door trim panel. Ensure that vibration is no longer present.
	4. Alternator whine.	Check charging system.
	5. Noise when the rear window defogger is on.	Check for an open grid line in the EBL.
NO MEMORY	1. Fuse inoperative.	Check fuse in rear PDC. Replace fuse, if required.
	2. Radio connector damaged.	Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	Check for battery voltage at radio connector. Repair wiring, if required.
	4. Ground damaged.	Check for continuity between the radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Not communication with the Memory Seat Module (MSMD).	Check for DTCs in the MSMD. Refer to **DIAGNOSIS AND TESTING** .
NO COMPACT DISC OPERATION	1. CD damaged.	Insert known good CD and test operation. Avoid the use of "home made" CD's with adhesive labels. The labels may cause disc to become jammed in the radio.
	2. Foreign material on CD.	Clean CD and test operation.
	3. Condensation on CD or optics.	Allow temperature of vehicle interior to stabilize and test operation.
	4. Radio inoperative.	Exchange or replace radio, if required.

STANDARD PROCEDURE

STANDARD PROCEDURE - USER DATA BACKUP

The mid line ICS with the 8.4 in screen has the option to back up user data. The base model system does not have this option.

Plug in a USB stick into the Universal Customer Interface (UCI) USB port. In "Dealership Menu" then "Copy User Data" this will copy personalization settings to a USB stick. Upon replacing the Telematic Gate Way (TGW) Module return back to the Dealer Menu and select "Restore User Data" to replace

the user's personal settings.

AMPLIFIER

DESCRIPTION

DESCRIPTION

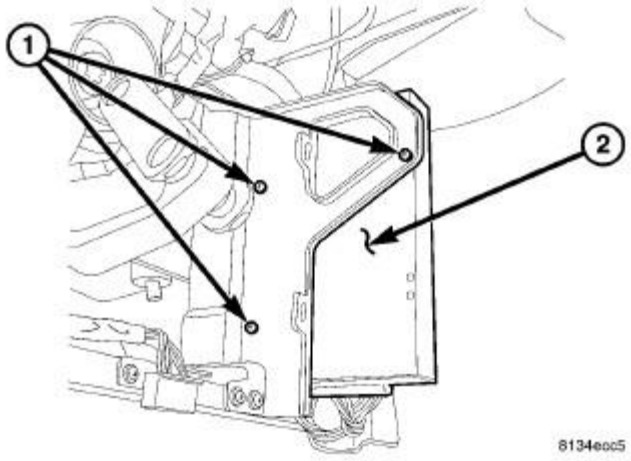

Fig. 1: Amplifier
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hands Free Module removed for clarity.

The amplifier is mounted to the left of the steering column under the instrument panel.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AMPLIFIER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

The amplifier unit should be checked if there is no sound output noted from the speakers. For diagnosis of the power amplifier. Refer to **SPEAKER, DIAGNOSIS AND TESTING**.

REMOVAL

REMOVAL

1. Disconnect and isolate battery negative cable.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN**

OPENING, REMOVAL .

3. Remove the Hands Free Module (HFM). Refer to **MODULE, HANDS FREE, REMOVAL** .
4. Disconnect the amplifier electrical connectors.
5. Loosen the mounting fasteners.
6. Remove the amplifier (2).

INSTALLATION

INSTALLATION

1. Install the amplifier.
2. Tighten the amplifier mounting retainers.
3. Connect the amplifier electrical connectors.
4. Install the Hands Free Module (HFM). Refer to **MODULE, HANDS FREE, INSTALLATION** .
5. Install the steering column cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
6. Connect the negative battery cable.

ANTENNA, SATELLITE, AUDIO

DESCRIPTION

DESCRIPTION

On vehicles equipped with satellite audio, a combined antenna for satellite and navigation is used. For removal and installation. Refer to **ANTENNA, SATELLITE, AUDIO, REMOVAL** and **ANTENNA, SATELLITE, AUDIO, INSTALLATION**.

For information on diagnosing the antenna and cables, using the (special tool #9977-6, Kit, Radio Antenna Diagnostic) perform the "Poor or No Satellite Audio Reception" test. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

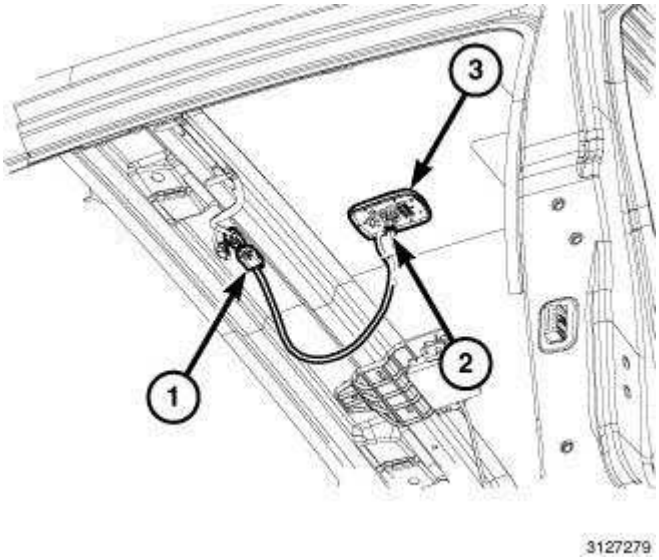

Fig. 2: Antenna Electrical Connectors, Mounting Fastener And Antenna
Courtesy of CHRYSLER GROUP, LLC

NOTE: This operation will require the necessity of two technicians.

1. Disconnect and isolate the negative battery cable.

CAUTION: Be extremely careful not to pull too hard on the headliner which could cause it to buckle. Support it if it starts to drop.

2. Lower the headliner. Refer to **HEADLINER, REMOVAL** .
3. Once the headliner is loose, move the front seats forward and lower the front seat backs and rest the headliner on top of the seats.
4. Disconnect the antenna electrical connectors from the antenna (1).
5. Remove the mounting fastener (2).
6. From inside the vehicle and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna (3).

INSTALLATION

INSTALLATION

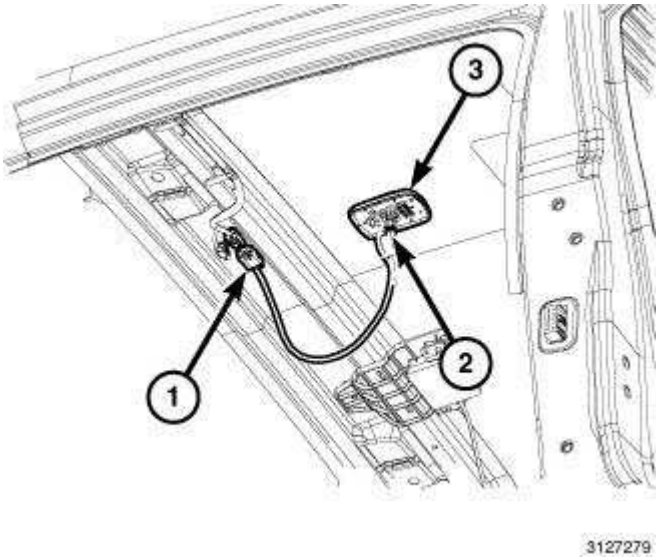

Fig. 3: Antenna Electrical Connectors, Mounting Fastener And Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Insert the antenna harness through the hole in the roof panel. Press the antenna (3) into position until both the retainers engage into position.
2. Install and tighten the mounting fastener (2). Tighten to 9 N.m (80 in. lbs.).
3. Connect the antenna harness to the connectors on the antenna (1).
4. Install the headliner. Refer to **HEADLINER, INSTALLATION** .
5. Connect the negative battery cable.

CABLE, ANTENNA, AUDIO

DESCRIPTION

DESCRIPTION

The AM/FM coaxial antenna cables run from the radio to the Antenna Module which is mounted in the right C-Pillar.

There are two coaxial cables that run in series. The first cable runs from the back of the radio through the instrument panel harness and to the in-line white fakra connector that is behind the glove box and secured to the blower housing. The second coaxial runs from the in-line connector, down the right floor, with the body harness, and up the C-Pillar to the Antenna Module.

For Export Vehicles, the cables run the same but down the LEFT side of the vehicle.

For more information on testing the coaxial cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic) and perform the "Poor or No AM/FM Audio Reception. Refer to **DIAGNOSIS AND TESTING** .

CABLE, ANTENNA, SATELLITE

DESCRIPTION

DESCRIPTION

The Satellite coaxial antenna cables run from the radio to the Satellite Antenna which is mounted on the roof.

There are two coaxial cables that run in series. The first cable runs from the back of the radio through the instrument panel harness to the in-line white fakra connector that is behind the glove box and secured to the blower housing. The second coaxial runs from the in-line connector, down the right floor with the body harness. The cable then runs up the C-Pillar and across to the center of the rear roof support and connects with the antenna yellow fakra connector.

For Export Vehicles, the cables run the same but down the LEFT side of the vehicle.

For more information on testing the coaxial cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic) and perform the "Poor or No Satellite Audio Reception. Refer to **DIAGNOSIS AND TESTING** .

CAMERA

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable from the IBS.
2. Remove the Center High Mounted Stop Lamp (CHMSL). Refer to **LAMP, CENTER HIGH MOUNTED STOP, REMOVAL** .
3. Remove the camera retainers and remove the backup camera from the CHMSL.

INSTALLATION

INSTALLATION

1. Install the camera and retainers to the Center High Mounted Stop Lamp (CHMSL).
2. Install the CHMSL. Refer to **LAMP, CENTER HIGH MOUNTED STOP, INSTALLATION** .
3. Connect the negative battery cable to the IBS.

COMPONENTS, RADIO NOISE SUPPRESSION

DESCRIPTION

DESCRIPTION

Radio noise suppression devices are installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of "buzzing," "hissing," "popping," "clicking," "crackling," and/or "whirring" sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder heads. The other is secured to the frame.

OPERATION

OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

REMOVAL

REMOVAL

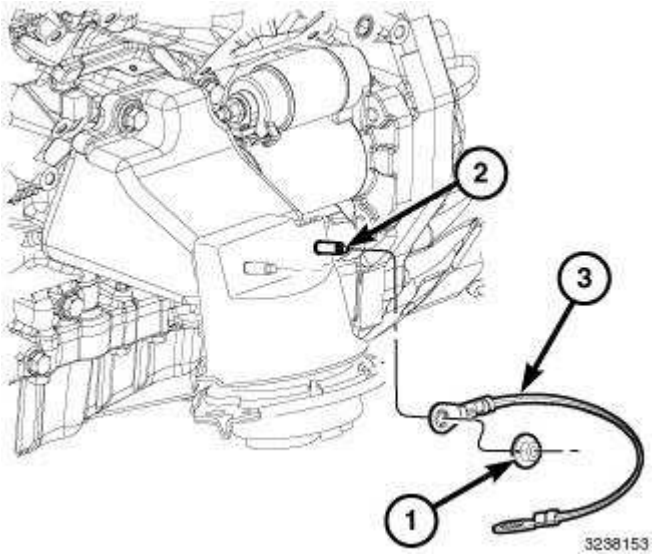

Fig. 4: Suppression Retainer And Driver Side Engine Mount Stud
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood.
2. Remove the radio noise suppression retainer (1) from the driver side engine mount stud (2).
3. Remove the radio noise suppression retainer from the body side of the strap.
4. Remove the radio noise suppression strap from the vehicle.

INSTALLATION

INSTALLATION

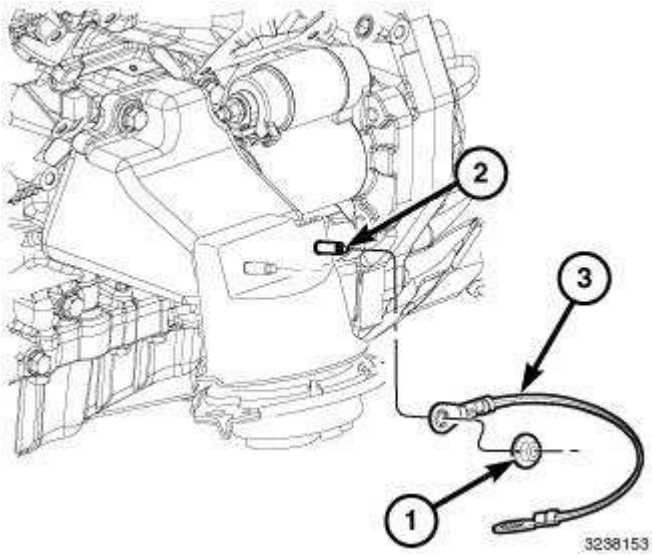

Fig. 5: Suppression Retainer And Driver Side Engine Mount Stud
Courtesy of CHRYSLER GROUP, LLC

1. Position the radio noise suppression strap (3) on the driver side engine mount stud (2).
2. Install the radio noise suppression strap retainer (1) to the engine mount stud (2).
3. Install the radio noise suppression strap to the body.
4. Install the radio noise suppression strap retainer to the body.
5. Close the hood.

MAST, ANTENNA

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR GLASS INTEGRAL ANTENNA

The antenna grid pattern is located above the EBL grid.

For circuit descriptions and diagrams, refer to the appropriate wiring information. To detect breaks in the integral antenna elements, the following procedure is required:

1. Disconnect the antenna module connector from the antenna pigtail on the glass or at the Antenna Module connector. Refer to **MODULE, RADIO ANTENNA, REMOVAL**.
2. Using an ohmmeter, connect one lead to the disconnected module connector and with the other lead check each end of the grid pattern, on the opposite side of the glass, for continuity.

   NOTE: The resistance should be below 2.4 Ohms on each line.

3. Measure the resistance of each line. The resistance should be exactly the same for each line.
4. If the resistance is not exactly the same for each line, check for a crack(s) in the grid. They may be hard to find as all the lines are tied together.
5. Even if the resistance is the same for all lines, do a very close visual inspection of the grid.
6. A break in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit or equivalent.

MODULE, RADIO ANTENNA

DESCRIPTION

DESCRIPTION

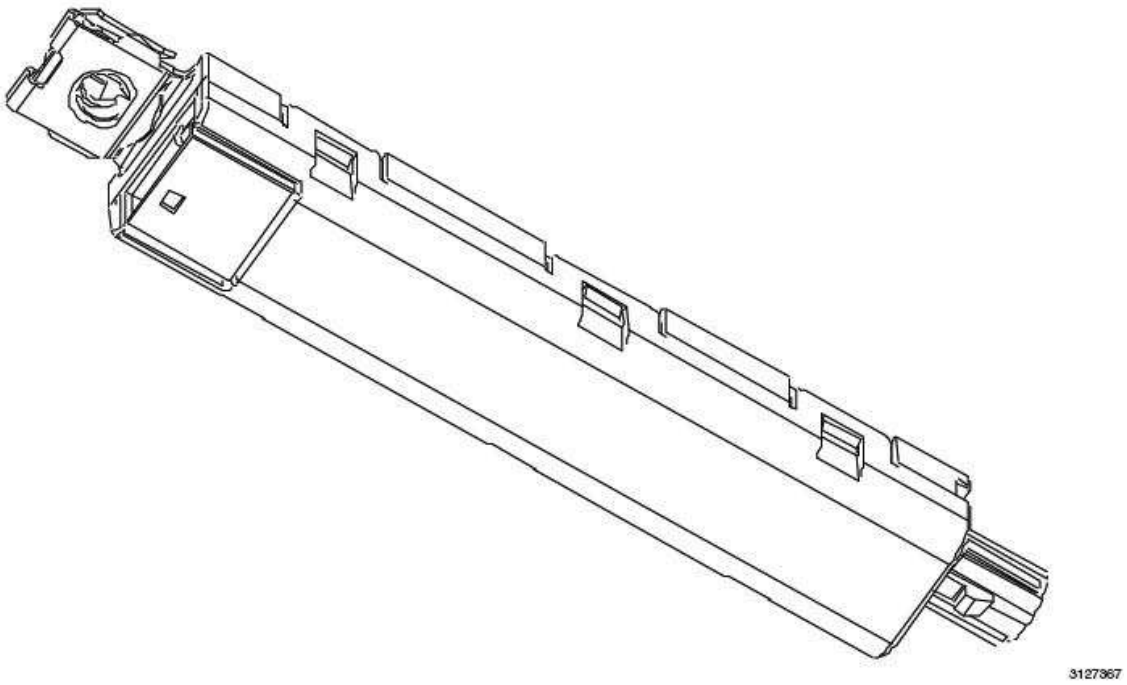

Fig. 6: View Of Antenna Module
Courtesy of CHRYSLER GROUP, LLC

The antenna module is an electronic circuit component designed to capture and enhance RF (Radio Frequency) signals in both the AM and FM broadcast bands. The antenna module is mounted to the right C-pillar. The module is grounded through the mounting bracket and fastener. The module has a one wire electrical connector that connects to the integral radio antenna grid located on the rear window. There is also a coax cable connector coming from the radio. The radio supplies a nine volt supply to the module, through the coax cable.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ANTENNA MODULE

1. Turn the ignition off.
2. Remove the right C-Pillar upper trim. Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .

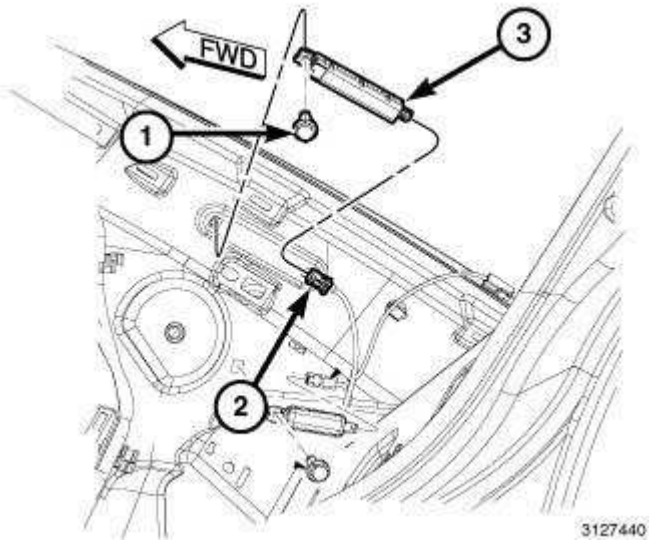

Fig. 7: Antenna Cable, Mounting Fasteners And Antenna Module
Courtesy of CHRYSLER GROUP, LLC

3. Check the antenna connections (2) to the antenna module (3) and to the antenna grid. If they are all right, continue. If they are not all right, clean and tighten the connections and re-test the audio.
4. Disconnect the antenna module white AM/ FM audio fakra connector (2) and connect the (special tool #9977-6-FM, Antenna) to the harness connector.
5. Place the magnetic antenna on the roof of the vehicle.
6. Drive the vehicle outside to a clear un-obstructed overhead view.
7. Turn the radio on and try several AM and FM stations.

- **Audio Improved - Check the antenna grid and repair if necessary. Refer to MAST, ANTENNA, DIAGNOSIS AND TESTING. If the grid checks good, replace the antenna module.**

- **Audio Did Not Improve - Check the radio and cables. or perform the Poor Or No AM/FM Audio Reception test. Refer to MAST, ANTENNA, DIAGNOSIS AND TESTING & DIAGNOSIS AND TESTING .**

REMOVAL

REMOVAL

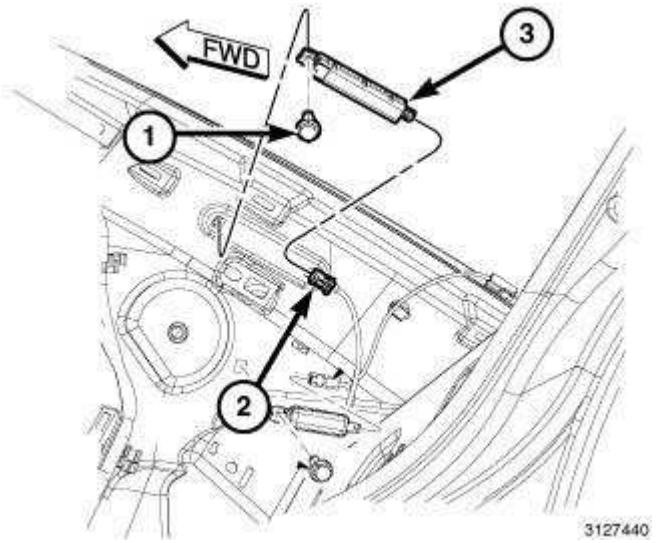

Fig. 8: Antenna Cable, Mounting Fasteners And Antenna Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the C-pillar upper trim.
3. Disconnect the antenna cable (2).
4. Remove the mounting fasteners (1) and antenna module (3).

INSTALLATION

INSTALLATION

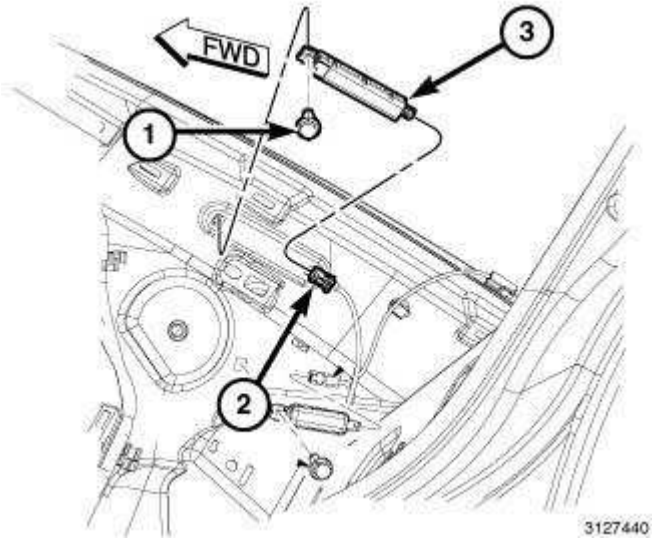

Fig. 9: Antenna Cable, Mounting Fasteners And Antenna Module
Courtesy of CHRYSLER GROUP, LLC

1. Position module into place.

2. Install and tighten mounting fasteners (1).
3. Connect the antenna module (2).
4. Install the C-pillar upper trim.
5. Connect battery negative cable.

RADIO

DESCRIPTION

DESCRIPTION

The radio features have been incorporated into the Telematics Gateway Module. Interaction with the radio features is done through the ISC screen module and switch bank located in the center stack of the instrument panel. For more information, refer to **MODULE, TELEMATICS GATEWAY, DESCRIPTION** and **POD, SWITCH BANK, DESCRIPTION** .

RADIO ANTI-THEFT CODE PROCEDURE

For the vehicles that are equipped with power net or NTG4 radios. If the TGM or the radio have been removed or replaced. A four digit security code is required in order for the radio to function:

1. The key must be in the "RUN" position.
2. Press the "ON/VOL" control button.
3. The word "CODE" or " Please enter Anti-Theft Code" will appear on the display.
4. Enter the 4-digit code by pressing the corresponding preset buttons in sequence.

NOTE: **If three consecutive attempts are made to enter an invalid anti-theft code the radio will enter a 'WAIT' state. While in this state the radio display will read 'WAIT'. To exit the 'WAIT' state the radio must remain powered with the ignition in the run position for a continuous 30 minutes (the vehicle may be driven during this time). After exiting the 'WAIT' state the radio will again display 'CODE' and a valid anti-theft code may be entered.**

SPEAKER

DESCRIPTION

BASE

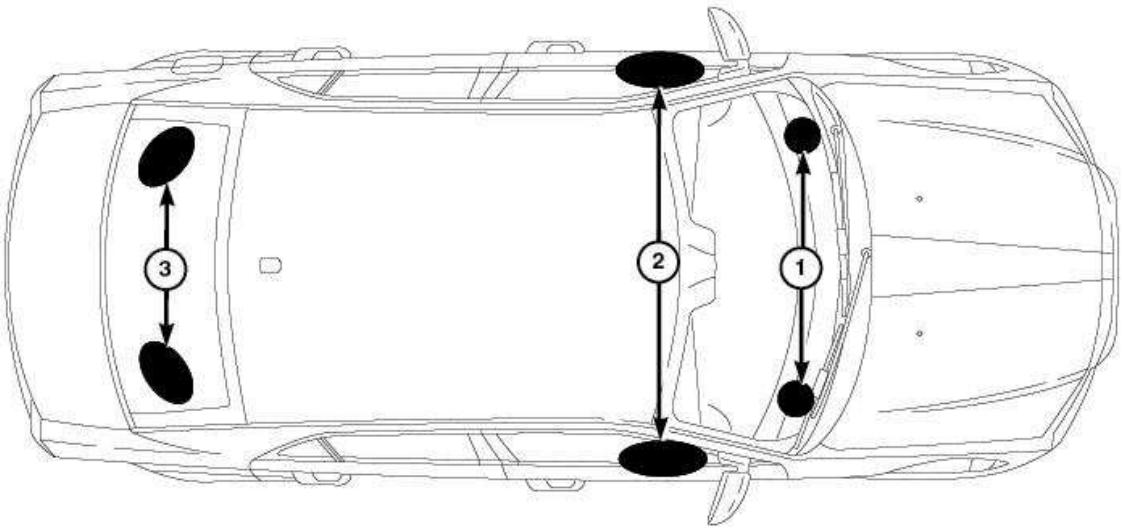

Fig. 10: Six Speakers
Courtesy of CHRYSLER GROUP, LLC

The base speaker system includes six speakers.

- Two 8.89 centimeter (3.5 inch) diameter midrange tweeters located in the instrument panel (1).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located in each front door (2).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf (3).

PREMIUM 1

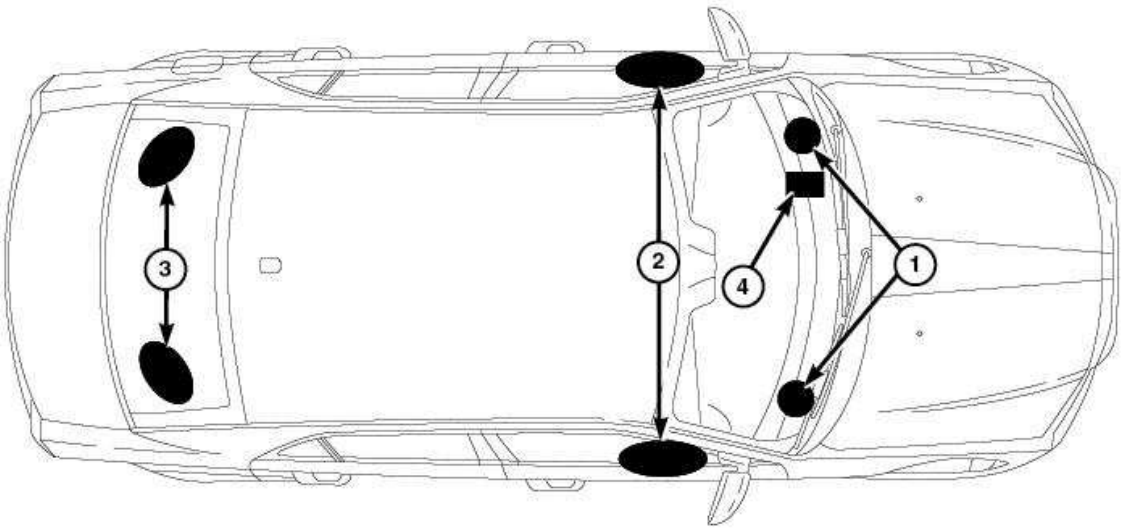

Fig. 11: Six Speakers And Amplifier
Courtesy of CHRYSLER GROUP, LLC

The premium 1 audio system includes six speakers and a amplifier.

- Two 8.89 centimeter (3.5 inch) diameter midrange tweeters located in the instrument panel (1).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located in each front door (3).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf (3).
- 8 channel 276 watts amplifier located under the instrument panel to the left of the steering column (4).

PREMIUM 2

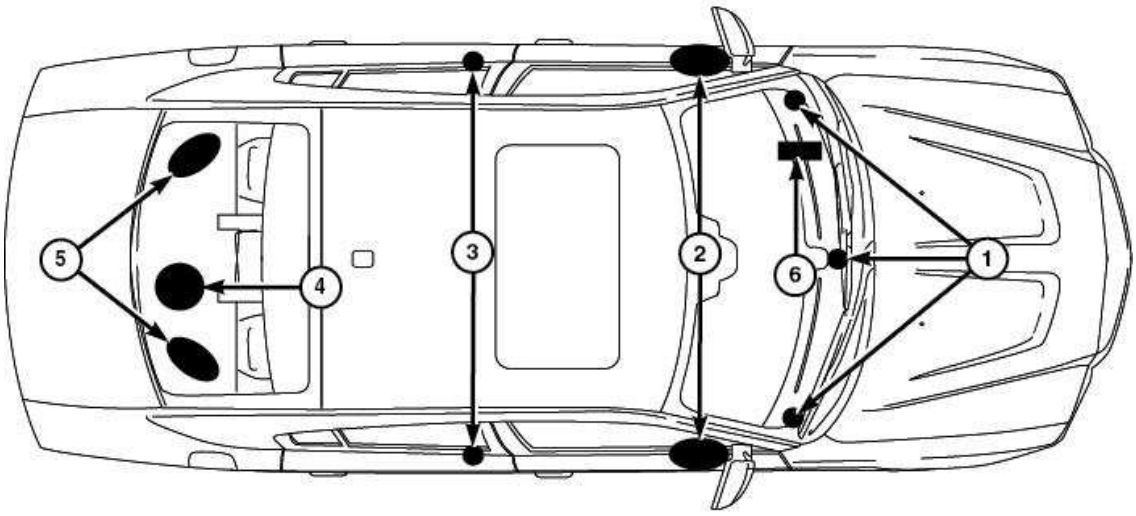

Fig. 12: Nine Speakers And A Amplifier
Courtesy of CHRYSLER GROUP, LLC

The audio system includes nine speakers and a amplifier.

- Three 8.89 centimeter (3.5 inch) diameter midrange tweeters located in the instrument panel (1).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker is located in each front door (2).
- Two 8.89 centimeter (3.5 inch) diameter midrange tweeters located in each rear door (3).
- One 20.32 centimeter (8 inch) DVC subwoofer (4).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf (5).
- 12 channel 506 watts amplifier located under the instrument panel to the left of the steering column (6).

SRT

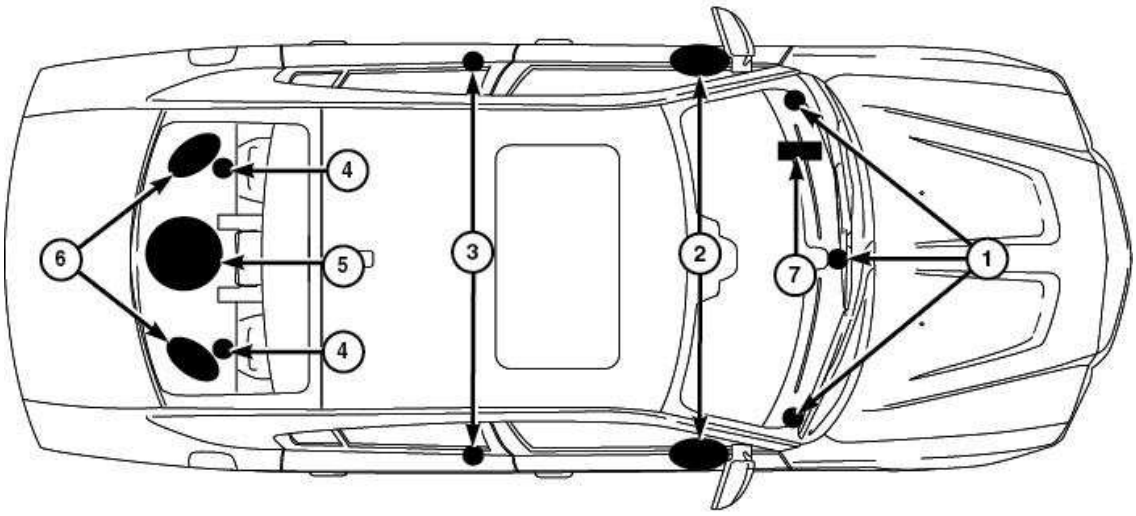

Fig. 13: Eleven Speakers And An Amplifier
Courtesy of CHRYSLER GROUP, LLC

The SRT audio system includes eleven speakers and an amplifier.

- Three - 8.89 centimeter (3.5 inch) diameter midrange tweeters located in the instrument panel (1).
- Two - 15.2 X 23 centimeter (6 X 9 inch) diameter speaker is located in each front door (2).
- Two - 8.89 centimeter (3.5 inch) diameter midrange tweeters located in each rear door (3).
- Two - 8.89 centimeter (3.5 inch) diameter midrange tweeters located on each side of the rear shelf (4).
- One - 25.4 centimeter (10 inch) DVC subwoofer (5).
- Two - 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf (6).
- One - 12 channel 1000 watts amplifier located under the instrument panel to the left of the steering column (7).

BEATS™ BY DR. DRE™

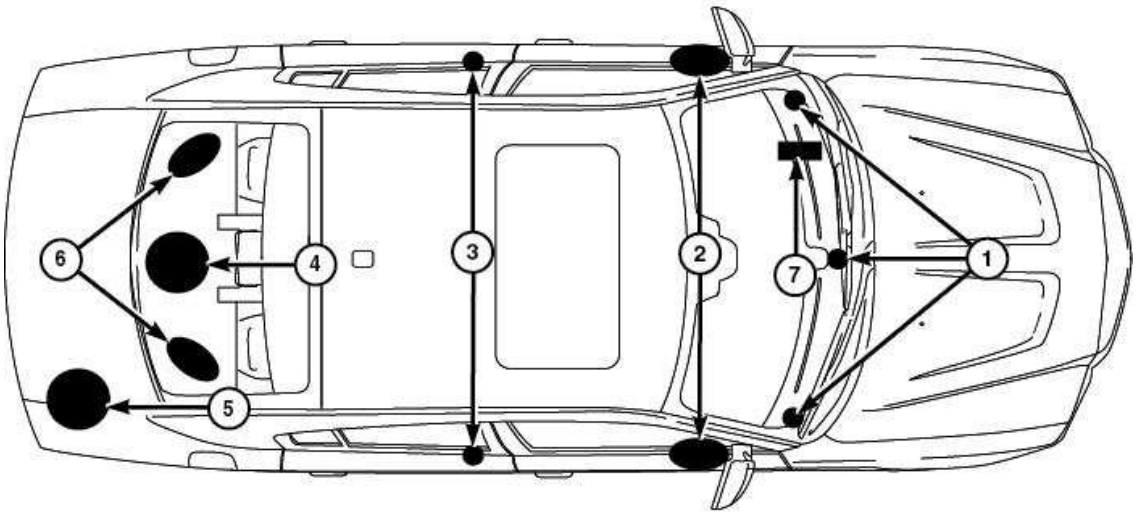

Fig. 14: Eleven Speakers And A Amplifier
Courtesy of CHRYSLER GROUP, LLC

The BEATS™ BY DR. DRE™ audio system includes eleven speakers and a amplifier

- Three 8.89 centimeter (3.5 inch) diameter midrange tweeters located in the instrument panel (1).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker is located in each front door (2).
- Two 8.89 centimeter (3.5 inch) diameter midrange tweeters located in each rear door (3).
- One 20.32 centimeter (8 inch) DVC subwoofer in the rear shelf (4).
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf (6).
- One 20.32 centimeter (8 inch) DVC subwoofer in the right rear quarter panel in the trunk (5).
- 12 channel 552 watts amplifier located under the instrument panel to the left of the steering column (7).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

1. If all speakers are inoperative, check the TGM fuses in the rear power distribution center. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the rear power distribution center. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.
5. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

REMOVAL

INSTRUMENT PANEL

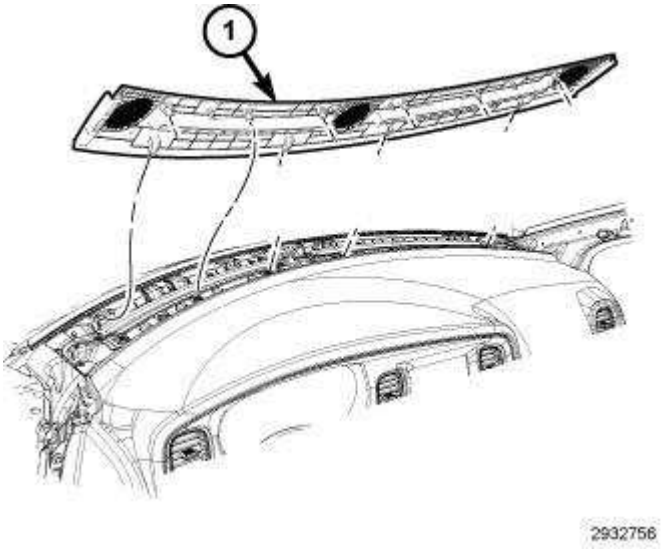

Fig. 15: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the defroster grille (1). Refer to **GRILLE, DEFROSTER, REMOVAL** .
3. Remove the speaker mounting retainers.
4. Disconnect the electrical connector and remove the speaker.

FRONT DOOR

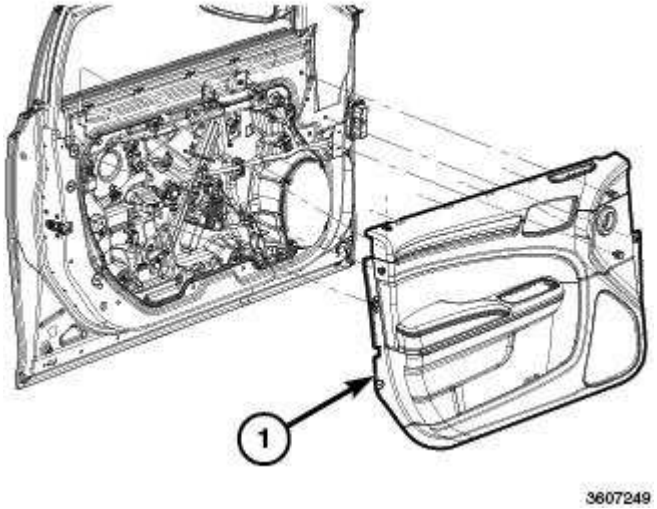

Fig. 16: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the IBS/negative battery cable assembly to the negative battery post.
2. Remove the door trim panel (1). Refer to **PANEL, DOOR TRIM, REMOVAL** .

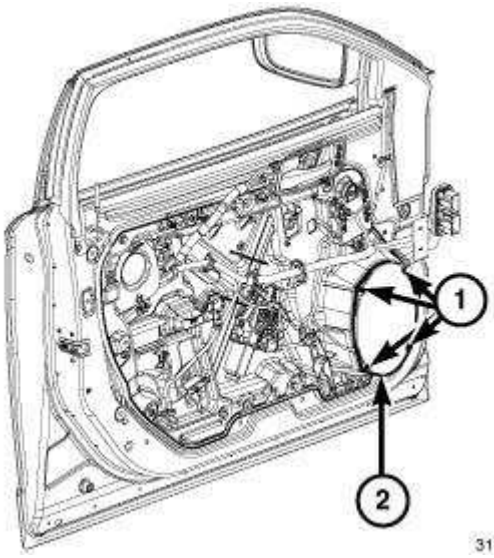

Fig. 17: Speaker Retainers & Speaker (Front Door)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the speaker retainers (1).

NOTE: Hold the speaker while disconnecting the speaker electrical connector.

4. Disconnect the speaker electrical connector from the speaker (2).
5. Remove the speaker from the door.

REAR DOOR

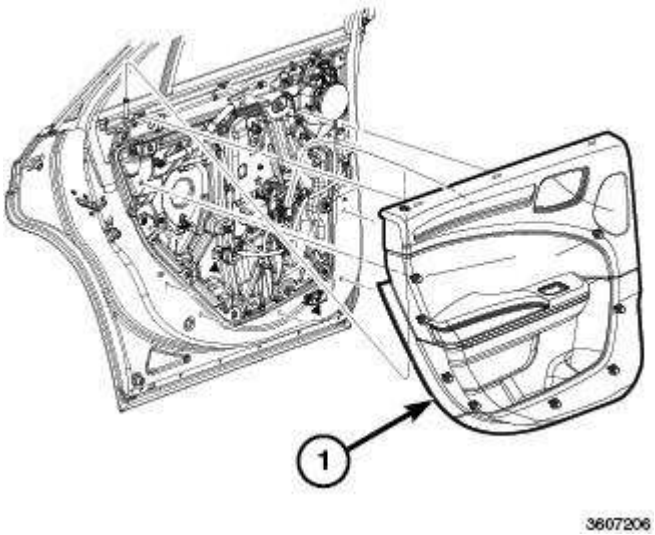

Fig. 18: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the IBS/negative battery cable assembly from the negative battery post.

2. Remove the door trim panel (1). Refer to **PANEL, REAR DOOR TRIM, REMOVAL** .

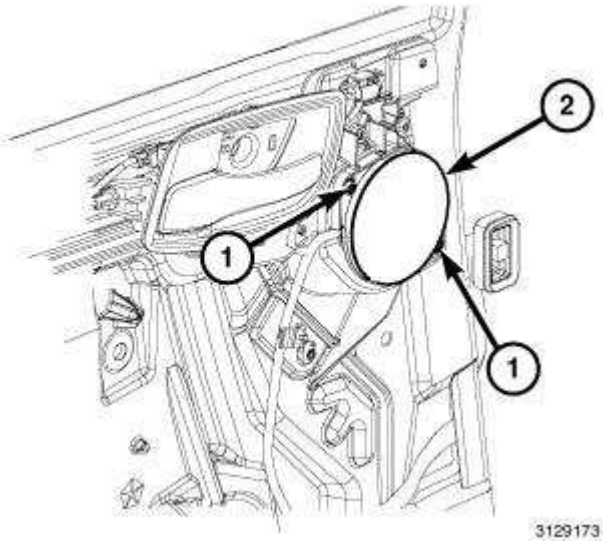

Fig. 19: Speaker Retainers & Speaker (Rear Door)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the speaker retainers (1).
4. Disconnect the speaker electrical connector and remove the speaker (2).

REAR SHELF

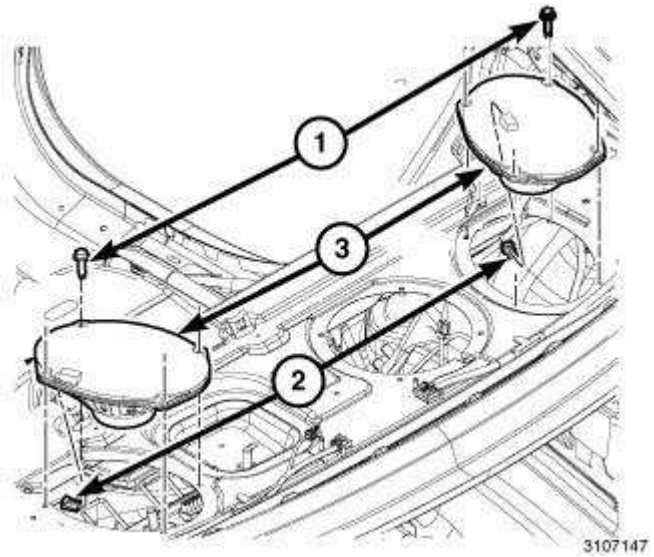

Fig. 20: Speaker Retainers, Speaker Electrical Connector & Rear Shelf Speakers
Courtesy of CHRYSLER GROUP, LLC

NOTE: 6X9" shown in illustration, 6.5" and 3.5" Unity speaker similar.

1. Disconnect the negative battery cable.
2. Remove the rear shelf cover. Refer to **PANEL, REAR SHELF, REMOVAL** .
3. Remove the speaker retainers (1).
4. Disconnect the speaker electrical connector (2).
5. Remove the rear shelf speakers (3).

SUBWOOFER - REAR SHELF

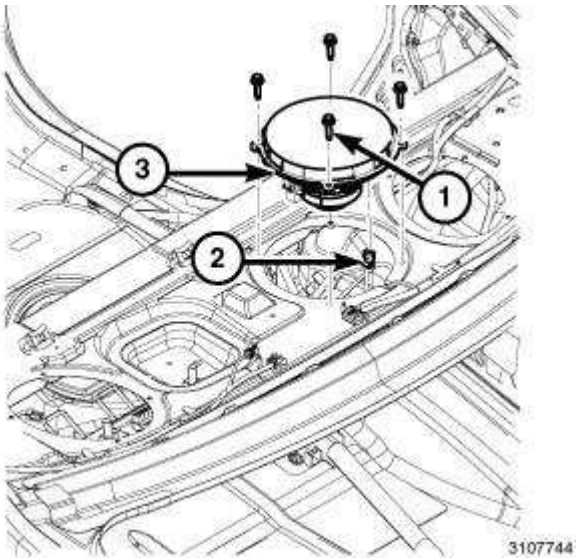

Fig. 21: Subwoofer, Retainers & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the rear shelf cover. Refer to **PANEL, REAR SHELF, REMOVAL** .
3. Remove the subwoofer retainers (1).
4. Disconnect the subwoofer electrical connector (2).
5. Remove the subwoofer (3).

SUBWOOFER - BEATS™ BY DR. DRE™

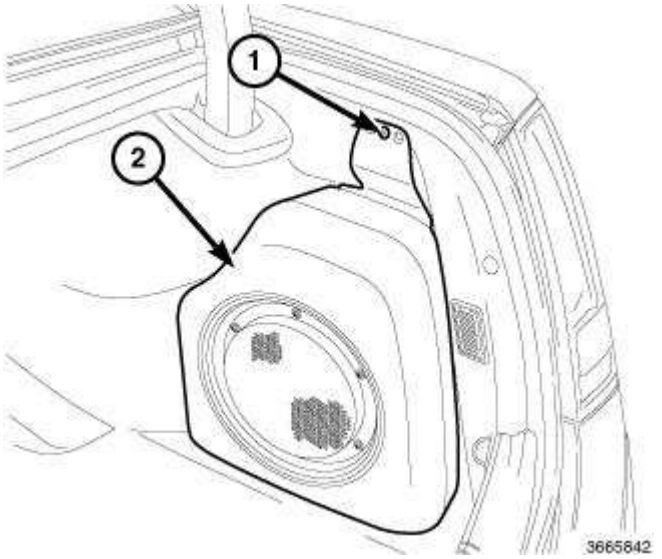

Fig. 22: Subwoofer Mounting Retainer & Vehicle
Courtesy of CHRYSLER GROUP, LLC

1. Open the trunk lid.
2. Disconnect the negative battery cable.
3. Remove the subwoofer mounting retainer (1).
4. Disconnect the subwoofer electrical connector.
5. Remove the subwoofer from the vehicle (2).

INSTALLATION

INSTRUMENT PANEL

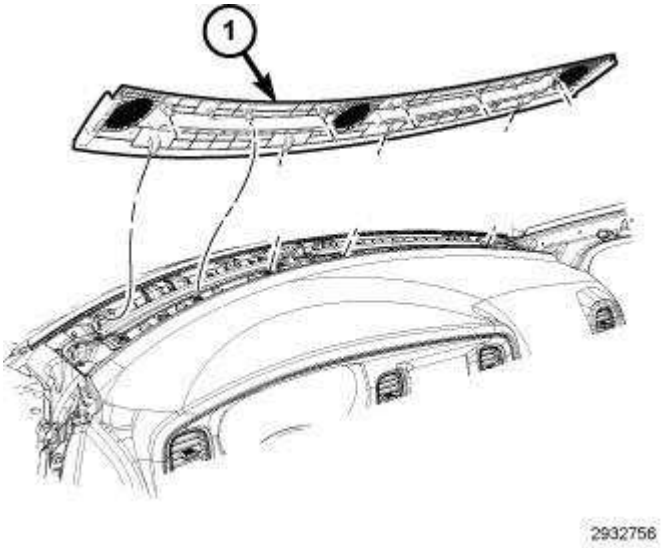

Fig. 23: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector to the speaker and position into the instrument panel.
2. Install the speaker mounting retainers.
3. Install the defroster grille (1). Refer to **GRILLE, DEFROSTER, INSTALLATION** .
4. Connect the negative battery cable.

FRONT DOOR

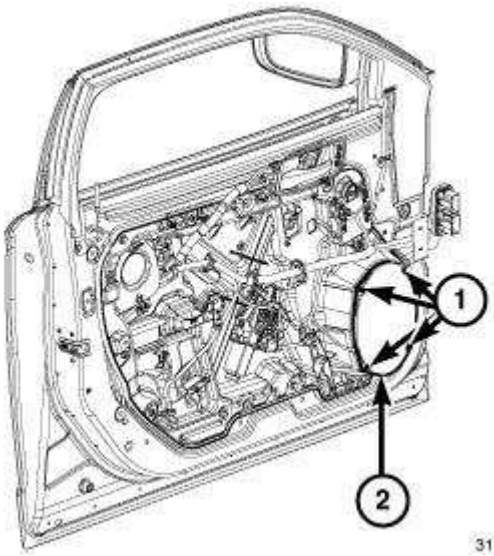

Fig. 24: Speaker Retainers & Speaker (Front Door)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hold the speaker while connecting the speaker electrical connector.

1. Connect the speaker electrical connector to the speaker.
2. Position the speaker (2) into the door and install the retainers (1).

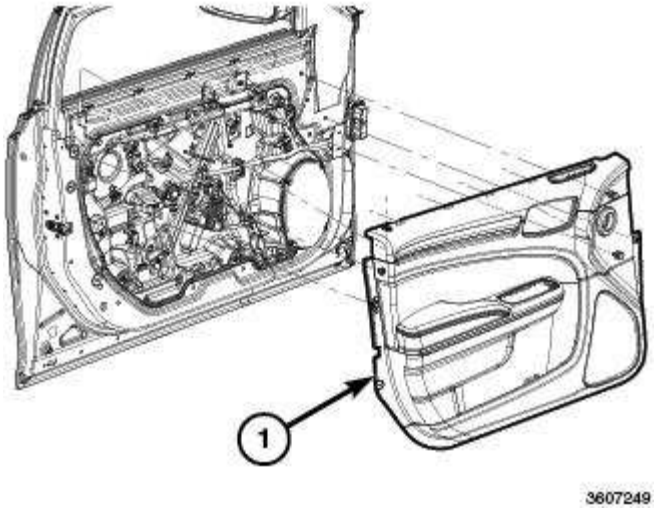

Fig. 25: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

3. Install the door trim panel (1). Refer to **PANEL, DOOR TRIM, INSTALLATION** .
4. Connect the IBS/negative battery cable assembly to the negative battery post.

REAR DOORS

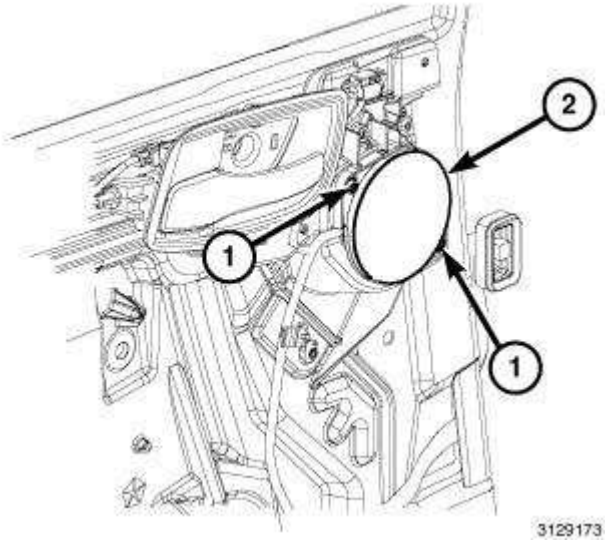

Fig. 26: Speaker Retainers & Speaker (Rear Door)
Courtesy of CHRYSLER GROUP, LLC

1. Connect the speaker electrical connector.
2. Position the speaker (2) into the door and install the speaker retainers (1).

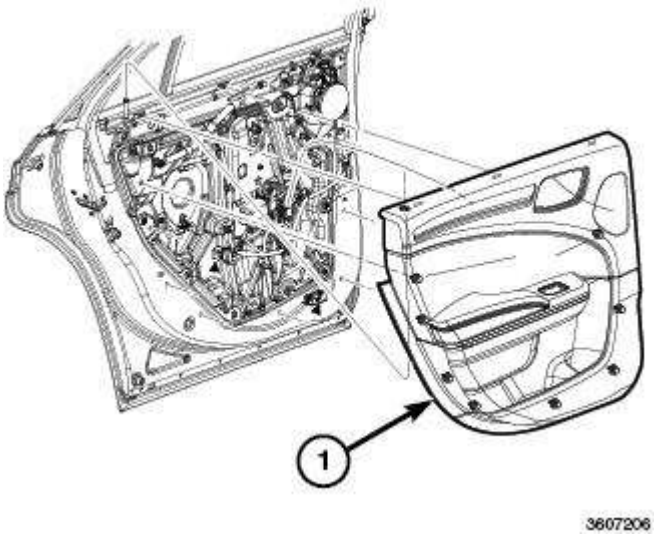

Fig. 27: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

3. Install the door trim panel (1). Refer to **PANEL, REAR DOOR TRIM, INSTALLATION** .
4. Connect the IBS/negative battery cable assembly to the negative battery post.

REAR SHELF

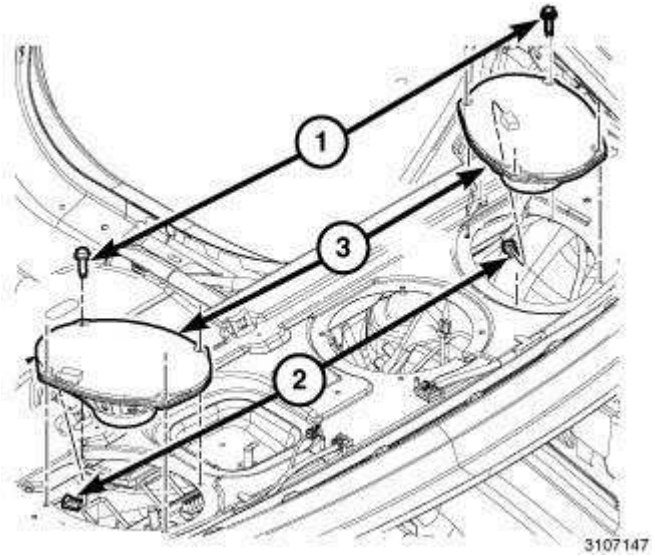

Fig. 28: Speaker Retainers, Speaker Electrical Connector & Rear Shelf Speakers
Courtesy of CHRYSLER GROUP, LLC

NOTE: 6X9" shown in illustration, 6.5" and 3.5" Unity speaker similar.

1. Connect the speaker electrical connector (2).
2. Position speaker (3) into the rear shelf.
3. Install the speaker retainers (1).
4. Install the rear shelf cover. Refer to **PANEL, REAR SHELF, INSTALLATION** .
5. Connect the negative battery cable.

SUBWOOFER - REAR SHELF

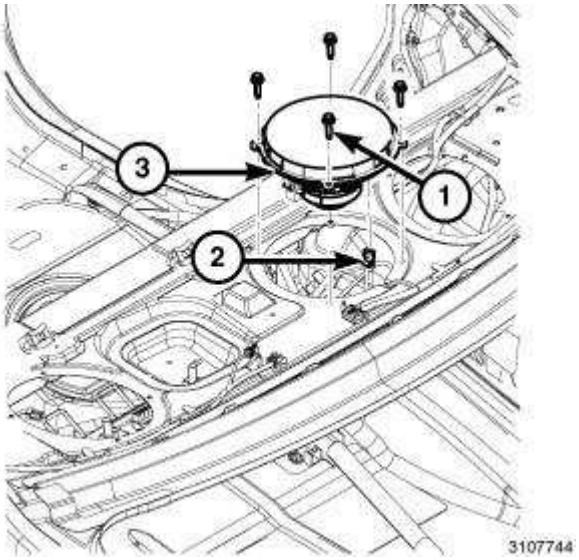

Fig. 29: Subwoofer, Retainers & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the subwoofer electrical connector (2).
2. Position the subwoofer (3) into the rear shelf.
3. Install the subwoofer retainers (1).
4. Install the rear shelf cover. Refer to **PANEL, REAR SHELF, INSTALLATION** .
5. Connect the negative battery cable.

SUBWOOFER - BEATS™ BY DR. DRE™

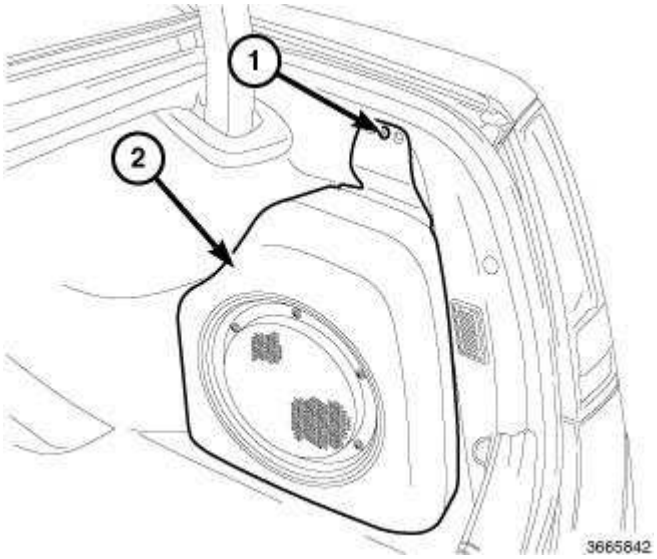

Fig. 30: Subwoofer Mounting Retainer & Vehicle
Courtesy of CHRYSLER GROUP, LLC

1. Position the subwoofer (2) to the right side of the truck area and connect the subwoofer

electrical connector.

2. Install the subwoofer mounting retainer (1).
3. Connect the negative battery cable.
4. Close the trunk lid.

SWITCH, REMOTE RADIO

DESCRIPTION

REMOTE RADIO SWITCH WITHOUT PADDLE SHIFT

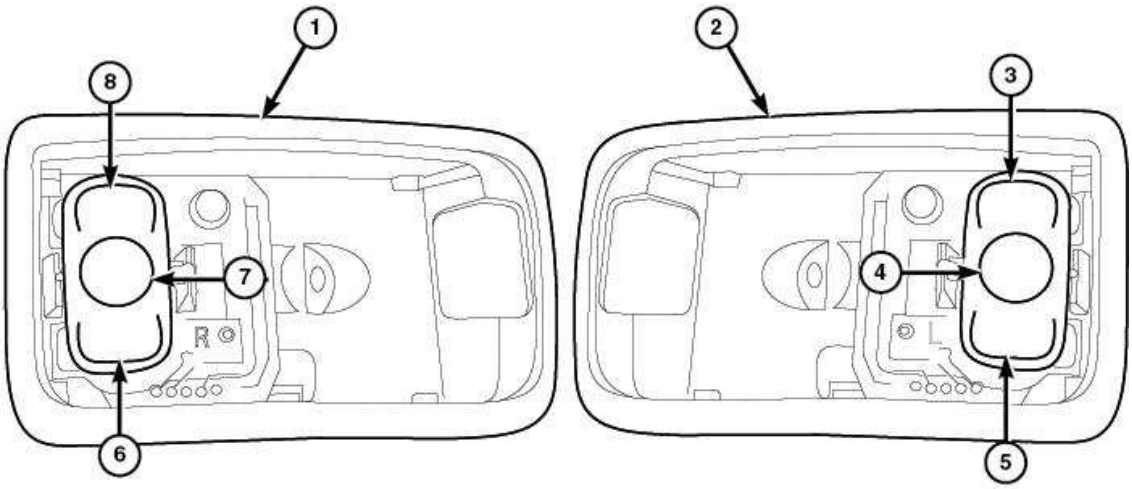

Fig. 31: Remote Radio Switches
Courtesy of CHRYSLER GROUP, LLC

The remote radio switches are mounted to the back of the steering wheel. Each switch consists of a remote radio switch and a paddle shift switch.

The right switch (1) consists of the following functions:

- Volume "UP" (8)
- Mode (7)
- Volume "DOWN" (6)

The left switch (2) consists of the following functions:

- Seek "UP" (3)
- Preset (4)
- Seek "DOWN" (5)

For information on the operation of the remote radio and paddle shift switches. Refer to **SWITCH, REMOTE RADIO, OPERATION**.

REMOTE RADIO SWITCH WITH PADDLE SHIFT

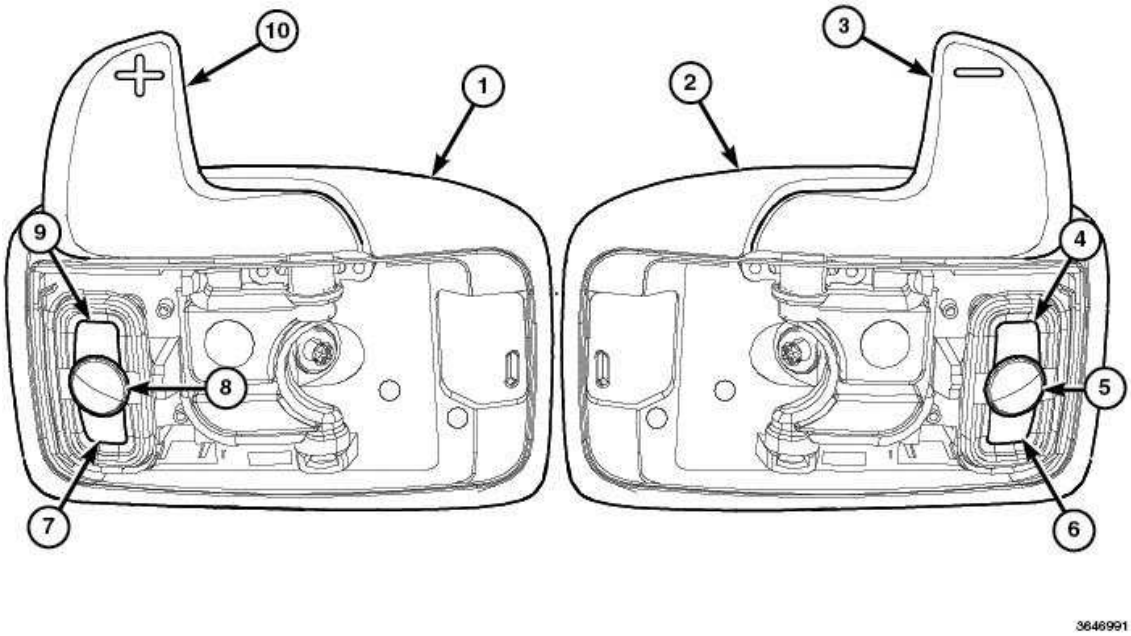

Fig. 32: Remote Radio Switches
Courtesy of CHRYSLER GROUP, LLC

The remote radio switches are mounted to the back of the steering wheel. Each switch consists of a remote radio switch and a paddle shift switch.

The right switch (1) consists of the following functions:

- Upshift switch (paddle shift) (10)
- Volume "UP" (9)
- Mode (8)
- Volume "DOWN" (7)

The left switch (2) consists of the following functions:

- Downshift switch (paddle shift) (3)
- Seek "UP" (4)

- Preset (5)
- Seek "DOWN" (6)

For information on the operation of the remote radio and paddle shift switches. Refer to **SWITCH, REMOTE RADIO, OPERATION**.

OPERATION

REMOTE RADIO SWITCH WITHOUT PADDLE SHIFT

The six switches (back of steering wheel spokes) in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the right steering wheel switch (speed control switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The right steering wheel switch (speed control switch) senses the status of the switches by reading the voltage drop of the signal circuit.

When the right steering wheel switch (speed control switch) senses an input (voltage drop) from any one of the remote radio switches, it communicates the switch status message to the Steering Column Control Module (SCCM) via the LIN Bus (through the clockspring). The SCCM then broadcasts switch status information over the CAN Bus to the audio system. The electronic circuitry within the audio system is programmed to respond to these remote radio switch status messages by adjusting the audio settings as requested.

For the removal procedure. Refer to **SWITCH, REMOTE RADIO, REMOVAL**.

REMOTE RADIO SWITCH WITH PADDLE SHIFT

REMOTE RADIO SWITCHES

The six switches (back of steering wheel spokes) in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the right steering wheel switch (speed control switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The right steering wheel switch (speed control switch) senses the status of the switches by reading the voltage drop of the signal circuit.

When the right steering wheel switch (speed control switch) senses an input (voltage drop) from any one of the remote radio switches, it communicates the switch status message to the Steering Column Control Module (SCCM) via the LIN Bus (through the clockspring). The SCCM then broadcasts switch status information over the CAN Bus to the audio system. The electronic circuitry within the audio system is programmed to respond to these remote radio switch status messages by adjusting the audio settings as requested.

PADDLE SHIFTERS

The paddle shifters in the two remote radio switch units are normally open, resistor multiplexed

momentary switches that are hard wired to the right steering wheel switch (speed control switch). The right steering wheel switch (speed control switch) provides a five volt signal and return circuit to the switches. Both switches share the signal and return circuits. The right steering wheel switch (speed control switch) senses the status of the switches by reading the voltage drop of the signal circuit.

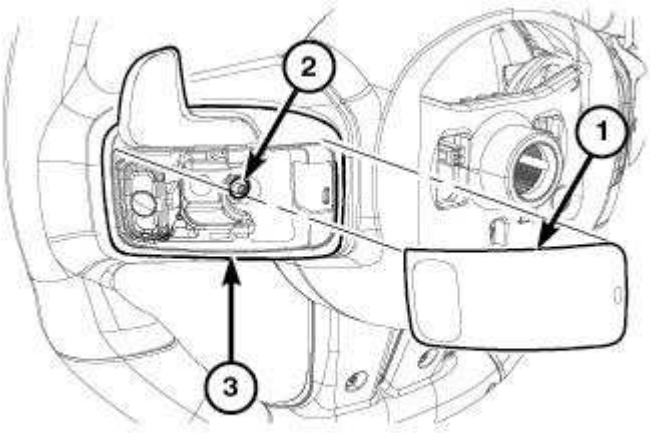
When the right steering wheel switch (speed control switch) senses an input (voltage drop) from any one of the paddle shifters, it communicates the switch status message to the steering column control module (SCCM) via the LIN Bus (through the clockspring). The SCCM then broadcasts switch status information over the CAN Bus to the transmission control module (TCM) communicating driver request for transmission upshift or downshift.

For the removal procedure. Refer to **SWITCH, REMOTE RADIO, REMOVAL**.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the IBS/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.



3648319

Fig. 33: Paddle Shift Unit Cover, Paddle Shift Unit Retainer & Paddle Shift Unit
Courtesy of CHRYSLER GROUP, LLC

NOTE: With paddle shift shown in illustration, without paddle shift similar.

1. Disconnect the IBS/negative battery cable assembly from the negative battery post.
2. From the back of the steering wheel, remove the remote radio switch with paddle shift unit cover (1).
3. Remove the remote radio switch with paddle shift unit retainer (2).
4. Gently remove the remote radio switch with paddle shift unit (3) from the steering wheel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the IBS/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Courtesy of CHRYSLER GROUP, LLC

NOTE: With paddle shift shown in illustration, without paddle shift similar.

NOTE: Verify that the remote radio switch with paddle shift unit connector lines up with steering wheel connector before fully seating switch.

1. Install the remote radio switch with paddle shift unit to the back of the steering wheel.
2. Install the remote radio switch with paddle shift unit retainer (2).

Tighten retainer to 1.22 N.m (11 in. lbs.).

3. Install the remote radio switch with paddle shift unit cover (1), be sure that the cover is snapped securely in place.
4. Connect the IBS/negative battery cable assembly to the negative battery post.

AUTOMATIC TRANSMISSION

8HP45 - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

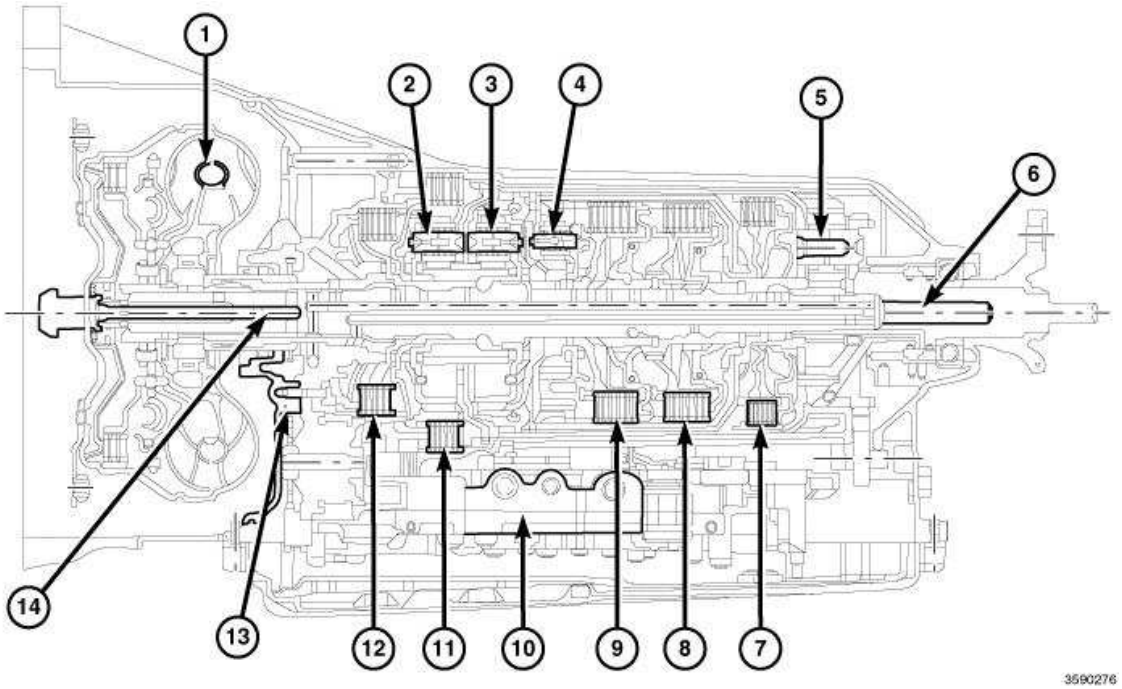

Fig. 1: 8HP45 Automatic Transmission
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER	8 - C CLUTCH
2 -P1 PLANETARY	9 - E CLUTCH
3 - P2 PLANETARY	10 - VALVE BODY
4 - P3 PLANETARY	11 - B CLUTCH
5 - P4 PLANETARY	12 - A CLUTCH
6 - OUTPUT SHAFT	13 - OIL PUMP
7 - D CLUTCH	14 - INPUT SHAFT

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

The transmission case is a single-piece unit. The starter pocket, cooler line fittings, and manual park

release lever are located on the driver's side of the case. The electrical connector and oil fill plug are located on the passenger side of the case. The two-wheel drive model uses a flanged output shaft connection. The all-wheel drive model uses a sealed, externally-splined output shaft to form a dry connection between the adapter plate and the Borg Warner 44-40 transfer case.

TRANSMISSION IDENTIFICATION

Two bar code labels are applied to the transmission case. The label on the driver's side rear of the case contains the Chrysler component tracking number on the top and the Chrysler part number on the bottom.

TRANSMISSION GEAR RATIOS

The gear ratios for the 8HP45 automatic transmission are as follows:

GEAR	RATIO
1ST	4.69:1
2ND	3.13:1
3RD	2.10:1
4TH	1.67:1
5TH	1.28:1
6TH	1.00:1
7TH	0.84:1
8TH	0.67:1
REVERSE	3.30:1

OPERATION

OPERATION

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

The 8HP45 is an electronic eight-speed automatic transmission. The Transmission Control Module Assembly (TCMA), which is integrated into the valve body, provides fully synchronized clutch-to-clutch shifting through four planetary gear sets. The TCMA includes a mounting plate that holds the Transmission Control Module (TCM) and a molded wiring harness for connection to various transmission sensors and solenoids. The valve body assembly contains all the sensors and solenoids required for operation, completely inside the transmission. Eight speeds allow the engine to maintain its optimal RPM range, increasing fuel economy and performance.

Transmission control is performed by the TCM based on hard-wired and CAN bus signals from

sensors and modules. The TCM receives driveability data from the Powertrain Control Module (PCM) and other modules over the CAN-C bus. It also receives shift lever position information from the electronic shifter over a dedicated transmission CAN bus. The TCM processes this input data and controls operation of the torque converter clutch, park lock system, solenoid valves, and pressure regulating valve.

The input and output speed sensors are Hall-effect sensors that measure shaft rotational speed. The input speed sensor is located at the top, near the center, of the of the TCMA and reads input shaft speed from the magnetic ring on the P2 carrier. The output speed sensor is located at the back of the TCMA and reads output shaft speed from the P4 carrier

FILTER SERVICE

The 8HP45 has a conventional fluid sump design, however, the filter is integrated into the oil pan resulting in a lower profile for improved vehicle packaging. The oil pan gasket is reusable providing it is not damaged during removal.

FLUID CHECK AND FILL

A fluid fill tube and indicator are not provided. All work is performed under the vehicle while raised on a hoist. In the event of a transmission shift quality concern, a fluid leak, or in conjunction with a transmission repair, the transmission fluid level must be validated and topped off as necessary. The procedure involves the use of a scan tool to monitor transmission fluid temperature. Specific service procedures are necessary to check and fill the transmission with fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

CLUTCHES

The 8HP45 transmission uses two multi-plate holding clutches (A and B) and three multi-plate driving (rotating) clutches (C, D, and E). Gear shifts from one - eight and eight - one are synchronous shifts, meaning one of the clutches must continue to transmit torque at lower pressure until the other clutch is able to accept the input torque.

Clutches A and B are holding clutches. Clutch A is applied by hydraulic pressure and released by a return spring, similar to the driving clutches. Clutch B operation is unique because it has fluid chambers on both sides of the apply piston, and therefore it is applied and released hydraulically. Regulation of fluid pressure on each side of the piston allows precise positioning of clutch B for apply, release, and controlled slip conditions.

Clutches C, D, and E operate in a similar manner. Regulated pressure is available at the clutch C shift solenoid and the clutch valve. When the shift solenoid is de-energized, fluid flows through the shift solenoid and applies pressure to the clutch valve. During the shift, pressure moves the clutch valve, which begins to apply the clutch. Pressure from the holding valve regulates the opening of the clutch valve, softening the shift. Above a set threshold, the holding valve seats and allows the clutch valve to open completely.

EMERGENCY RUNNING FUNCTION - LIMP IN MODE

In the event of a complete transmission electrical failure (loss of power to the TCM), the transmission enters default limp-in mode. When the TCM loses power, all solenoids are de-energized. Maximum pressure locks the transmission in 6th gear, and a diagnostic trouble code (DTC) is stored in memory. If the vehicle is in a forward gear range when the fault occurs, the transmission defaults to 6th gear.

If the vehicle is in park, reverse, or neutral, or if the engine is turned off when the fault occurs, the transmission will remain in park because the park lock release system cannot release the parking pawl. No hydraulic pressure is supplied to the driving clutches. In this situation, the manual park release lever must be used to disengage the park pawl.

The limp-in function remains active until the DTC is rectified or the stored DTC is erased with the appropriate scan tool.

OIL PUMP OPERATION

The oil pump is located just behind the torque converter, between the pump housing and cover assemblies. The torque converter drives the pump assembly using a chain and sprockets. The oil pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports, allowing it to produce the fluid volume necessary for all operating conditions. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to be returned to the pump. This reduces cavitation and noise. A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

POWERFLOW COMPONENTS

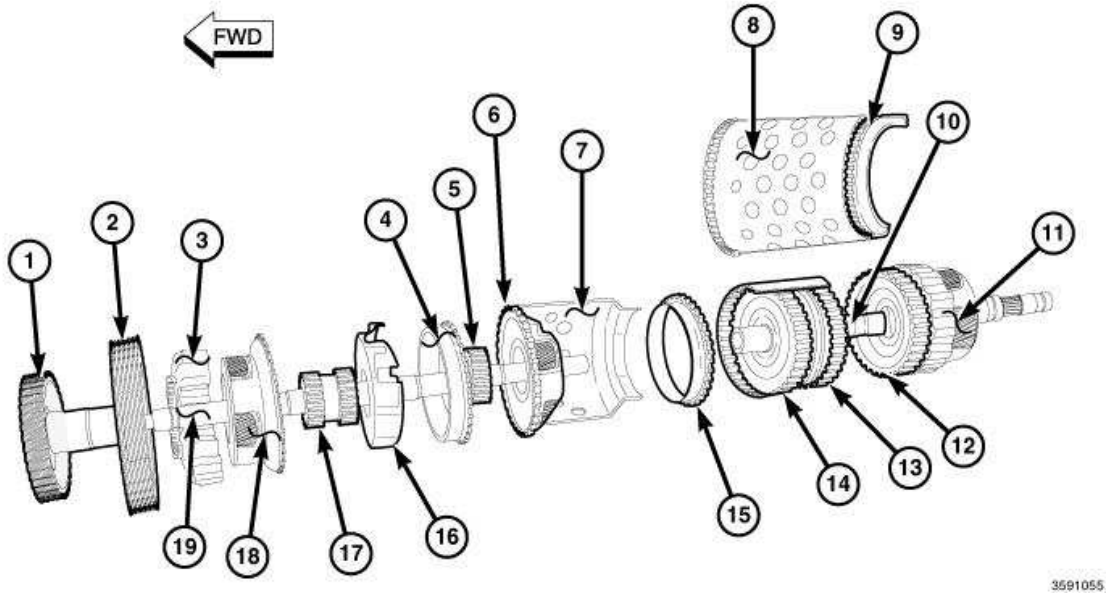

Fig. 2: Powerflow Components
Courtesy of CHRYSLER GROUP, LLC

1- A CLUTCH	11 - P4 CARRIER
2 - B CLUTCH	12 - D CLUTCH
3 - P1 ANNULUS (PARTIAL CUTAWAY)	13 - C CLUTCH
4 - P2 ANNULUS	14 - E CLUTCH
5 - P3 SUN GEAR	15 - P3 ANNULUS
6 - P3 CARRIER	16 - P2 CARRIER
7 - D CLUTCH DRUM (PARTIAL CUTAWAY)	17 - P1/P2 SUN GEAR
8 - P4 ANNULUS DRUM (PARTIAL CUTAWAY)	18 - P1 CARRIER
9 - P4 ANNULUS (PARTIAL CUTAWAY)	19 - INPUT SHAFT

10 - P4 SUN GEAR/D CLUTCH RETAINER (PARTIAL CUTAWAY)	

Use this POWER FLOW COMPONENTS graphic and chart to identify the individual components of the specific gear powerflow explanations below:

FIRST GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) and clutch B (2) holds the P1 annulus (3). Because two members of the same gear set are held, the entire P1 gear set is stationary. The stationary P1 carrier (18) is connected to the P4 annulus (9), locking the annulus. The input shaft (19) drives the C clutch (13), and the C clutch (13) drives the P4 sun gear (10). The P4 sun gear (10) drives the P4 carrier (11), whose pinions walk around the held P4 annulus (9).

SECOND GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) and clutch B (2) holds the P1 annulus (3). As with 1st gear, the entire P1 gear set is stationary. The stationary P1 carrier (18) is connected to the P4 annulus (9), locking the annulus. The input shaft (19) drives the P2 carrier (16). The P2 carrier (16) drives the P2 annulus (4). The P2 annulus (4) drives the E clutch (14) through the P3 sun gear (5) connection. The E clutch (14) then drives the P4 sun gear (10). The P4 sun gear (10) drives the P4 carrier (11), whose pinions walk around the held P4 annulus (9).

THIRD GEAR POWERFLOW

Clutch B (2) holds the P1 (3) annulus. The input shaft (19) drives the C clutch (12), which drives the P4 annulus (9). The C clutch (12) also drives the E clutch (14), which drives the P2 annulus (4). Because the P2 carrier (16) and the P2 annulus (4) are both driven at input shaft speed, the P2 gear set is locked at input shaft speed. The P1/P2 sun gear (17) drives the P1 carrier (18), and the P1 carrier drives the P4 annulus (9).

FOURTH GEAR POWERFLOW

Clutch B (2) holds the P1 annulus (3). With the E (14) and D (12) clutches applied, all components of the P3 and P4 gear sets are locked together to rotate at the same speed. The input shaft (19) drives the P2 carrier (16) which drives the P1/P2 sun gear (17). The P1/P2 sun gear drives the P1 carrier (18). The P1 carrier drives the P4 gear set through the P4 annulus (9).

FIFTH GEAR POWERFLOW

Clutch B (2) holds the P1 annulus (3). The input shaft (19) always drives the P2 carrier (16). Because the C clutch (13) is applied, the P3 annulus (15) and P4 sun gear (10) are also driven at input shaft speed. The D clutch (12) is applied to connect the P3 carrier (6) with the P4 carrier (11). The P2 carrier (16) drives the P1/P2 sun gear (17), which drives the P1 carrier (18). The P1 carrier walks around the held P1 annulus (3) and drives the P4 annulus (9). Gear reduction is achieved between the P4 sun gear (10) rotating at input shaft speed and the P4 annulus (9) rotating at a reduced speed.

SIXTH GEAR POWERFLOW

Clutch C (13) drives the P3 annulus (15) at input shaft speed and E clutch (14) drives the P3 sun gear (5) at input shaft speed. Because two components of the same gear set are driven at the same speed, the entire gear set is locked in rotation. The D clutch (12) connects the P3 carrier (6) to the P4 carrier (11) and the output shaft.

SEVENTH GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) stationary. The input shaft drives the P2 carrier which drives the P2 annulus, increasing the speed of the P3 sun gear (5) and creating overdrive. The C clutch (13) drives the P3 annulus (15) at input shaft speed. The P3 sun gear (5) spins at a faster speed than the P3 annulus (15) and the P3 carrier (6) is the output of the gear set. This results in a reduction that offsets the overdrive of the P2 gear set. The D clutch (12) connects the P3 carrier (6) to the P4 carrier (11) and the output shaft.

EIGHTH GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) stationary. As with 7th gear, the P2 gear set creates an overdrive ratio. However, the E clutch (14) is now applied, which locks together the P3 gear set and eliminates any torque multiplication from the P3 gear set. The overdrive created by P2 is transferred by the D clutch (7) to the output shaft.

REVERSE GEAR POWERFLOW

Clutches A (1) and B (2) hold the P1 gear set to hold the P1/P2 sun gear (17). The input shaft drives the P2 carrier, which produces an overdrive ratio from the P2 gear set, driving the P3 sun gear (5) in engine direction. The P3 carrier (6) is connected to the output shaft by the D clutch (12). This holds the carrier, reversing the direction and multiplying torque. The P3 annulus (15) is connected to the P4 sun gear (10), which drives the P4 gear set opposite of engine direction and multiplies torque again.

DIAGNOSIS AND TESTING

CLUTCH AIR PRESSURE TESTS

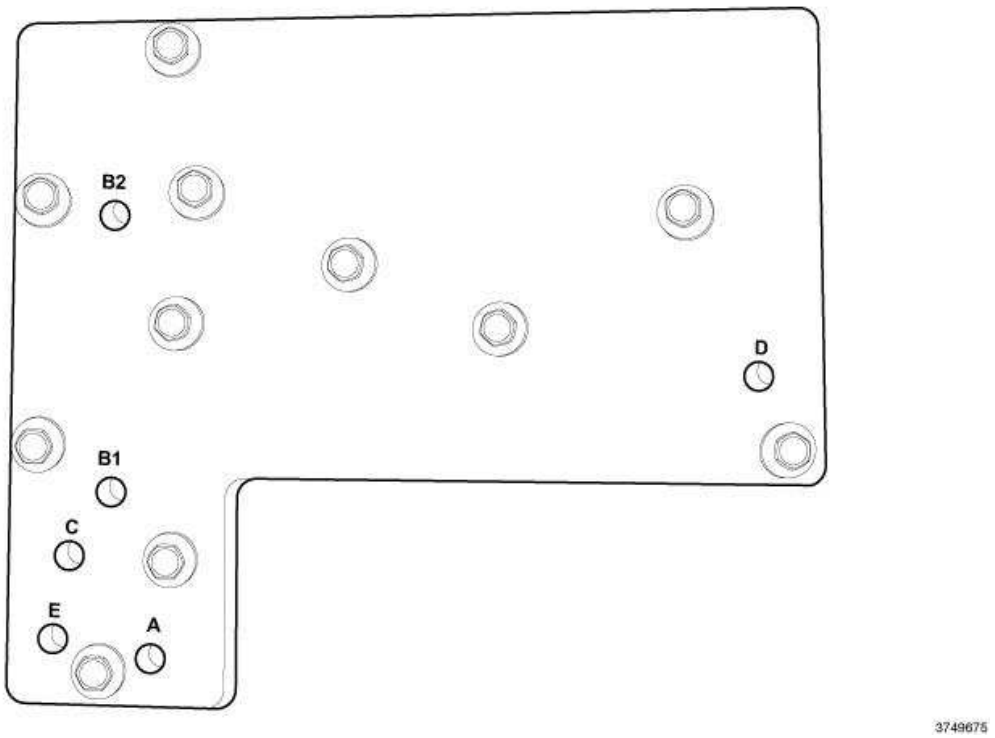

Fig. 3: Clutch Pressure Test
Courtesy of CHRYSLER GROUP, LLC

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure using (special tool #10383, Plate, Clutch Pressure Test).

The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 5-8 bar (73-116 psi).

Remove the oil pan and the valve body. Install (special tool #10383, Plate, Clutch Pressure Test) and tighten bolts to 6 N.m (50 in. lbs.). When testing is finished install valve body and tighten **new** bolts to 8 N.m (71 in. lbs.). Install the oil pan bolts and tighten to 10 N.m (89 in. lbs.). Fill the transmission. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

A CLUTCH

Apply air pressure to the feed hole located on the test plate marked **A** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

B1 CLUTCH FUNCTION

Apply air pressure to the feed hole located on the test plate marked **B1** , listen for an audible thud. The piston should not return to its starting position when the air pressure is removed. An audible hiss

may be heard when testing this clutch as the seal is designed to allow fluid/air to pass.

B2 CLUTCH FUNCTION

Apply air pressure to the feed hole located on the test plate marked **B2** , listen for an audible thud. The piston should return to the beginning B1 starting position and should not return to its starting position when the air pressure is removed. An audible hiss may be heard when testing this clutch as the seal is designed to allow fluid/air to pass.

C CLUTCH

Apply air pressure to the feed hole located on the test plate marked **C** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

D CLUTCH

Apply air pressure to the feed hole located on the test plate marked **D** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

E CLUTCH

Apply air pressure to the feed hole located on the test plate marked **E** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

DIAGNOAIS AND TESTING - AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.
- Transfer case performance (if equipped).

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid

level, fluid condition, and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

DIAGNOSIS AND TESTING - PRELIMINARY

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Road test and note how transmission upshifts, downshifts, and engages.
3. Check fluid level and condition.

VEHICLE IS DISABLED

1. Check for transmission fault codes using the appropriate scan tool.
2. Check for cracked, leaking cooler lines.
3. Check fluid level and condition.
4. With the transmission in the Park position, attempt to rotate drive shaft(s) to ensure transmission output shaft coupler/flange is secure.
5. Check the transfer case operation (if equipped).
6. Raise and support vehicle on safety stands, start engine with transmission in the Park position and allow to idle for several minutes, shift transmission into gear, and note following:
    1. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
    2. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
7. Check the TCMA, Wiring, Valve body, and Solenoids (Utilize fault codes to diagnose if available).

DIAGNOSIS AND TESTING - ROAD TESTING

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

Before road testing, be sure the fluid level has been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

REMOVAL

REMOVAL

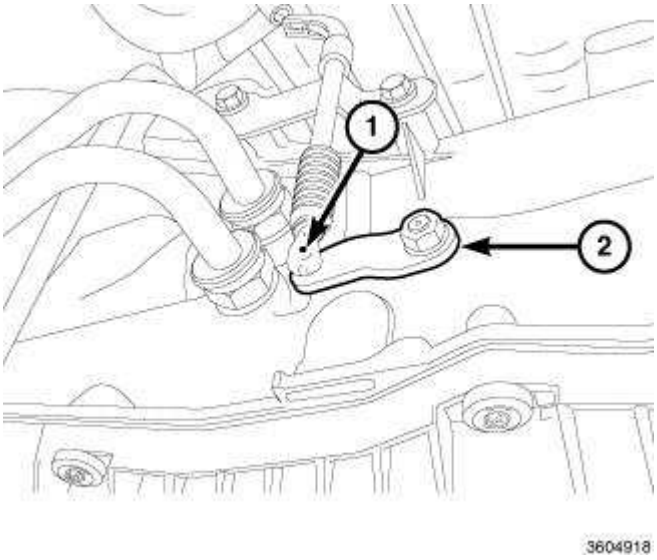

Fig. 4: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Disconnect the right and left bank up stream oxygen sensors.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the complete exhaust system.
5. **For AWD only** , remove the transfer case. Refer to **REMOVAL** .
6. **For RWD only** , remove the rear propeller shaft. Refer to **REMOVAL** .
7. Remove the starter from the transmission and set aside. Refer to **STARTER, REMOVAL** .
8. Disconnect the manual park release cable (1) from the lever (2).

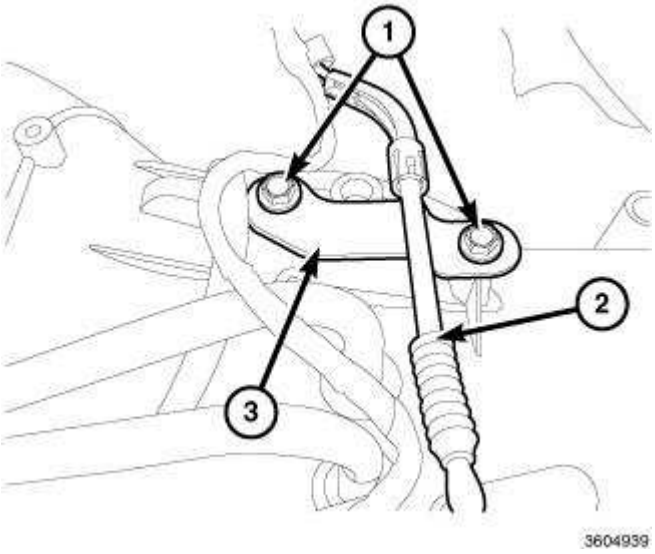

Fig. 5: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (1) from the manual park release cable bracket (3) and set the bracket/cable (2, 3) aside.

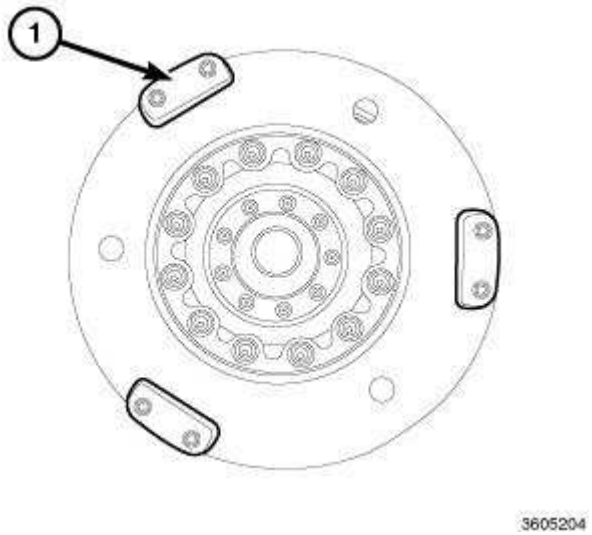

Fig. 6: Two Bolts
Courtesy of CHRYSLER GROUP, LLC

10. The converter is attached with three sets of two bolts (1) 120° apart as shown in illustration.

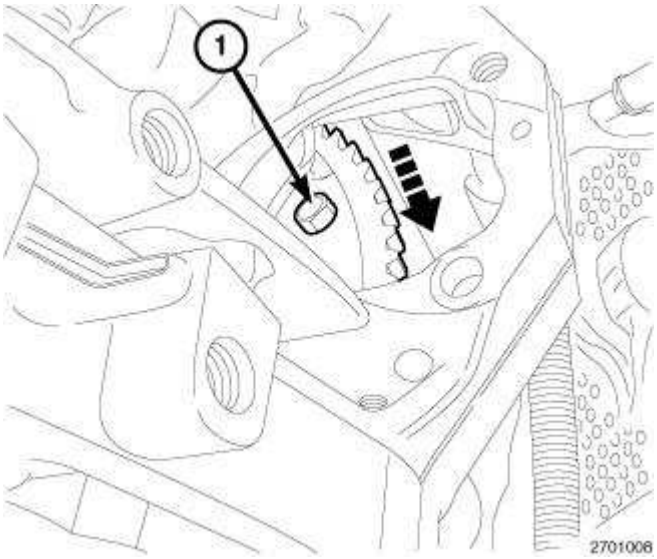

Fig. 7: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the crankshaft in a clockwise direction for access, and through the starter opening, remove the six converter bolts (1).

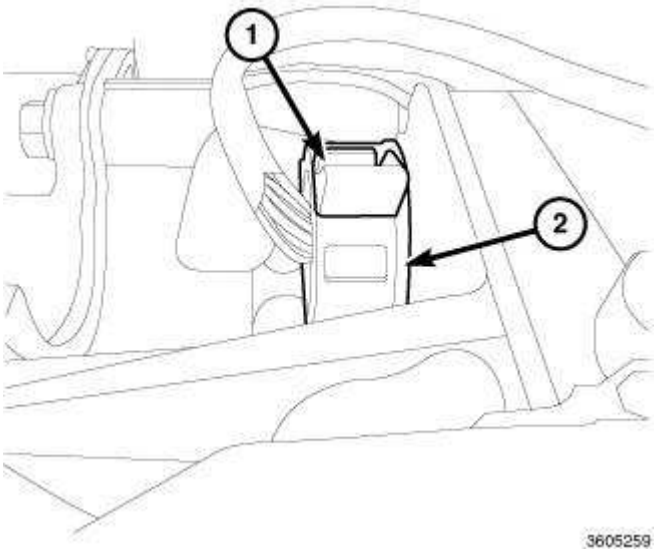

Fig. 8: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

12. Turn the locking mechanism lock (1) of the adapter plug connector (2) counter-clockwise to release the lock.

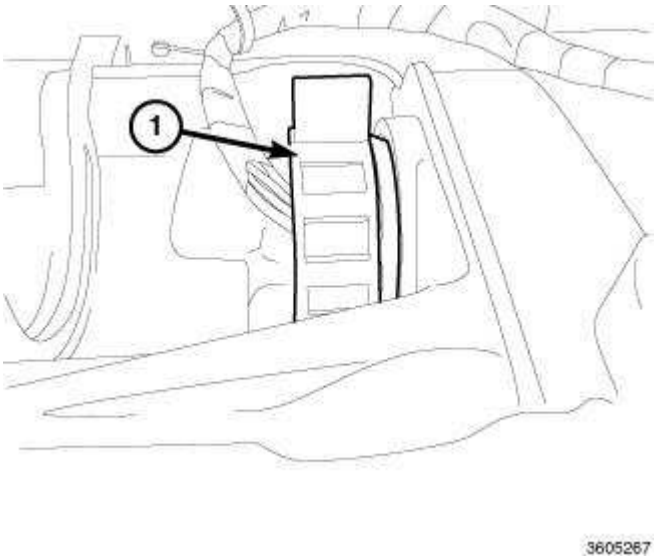

Fig. 9: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

13. Remove the adapter plug connector (1) from the transmission.

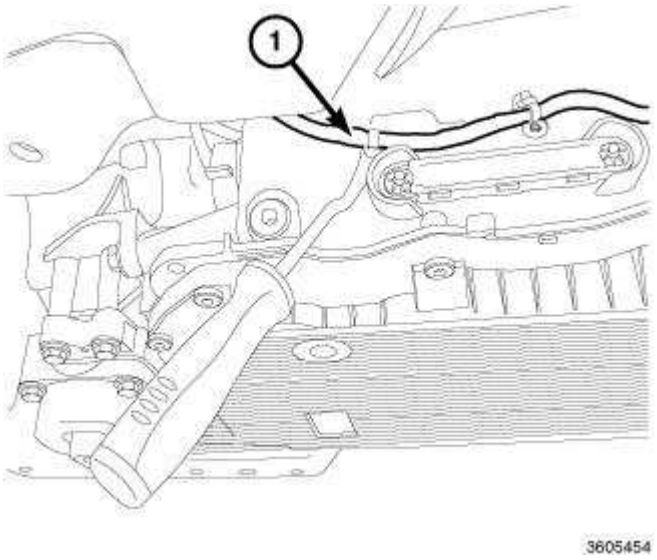

Fig. 10: Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

14. Disconnect the wiring harness (1) from the transmission case.

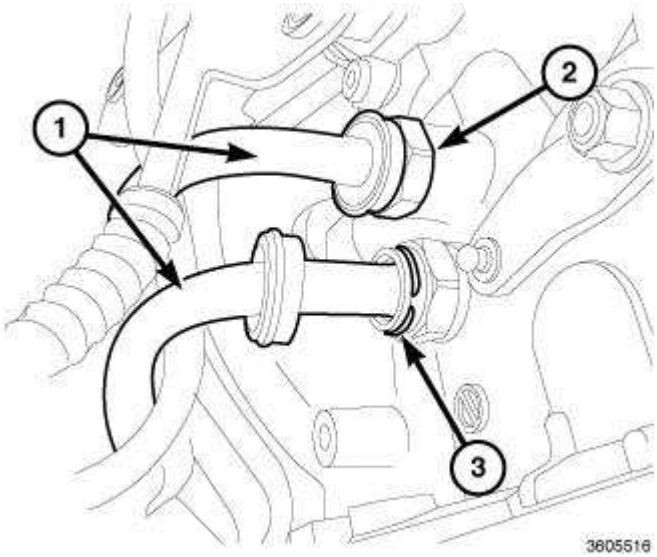

Fig. 11: Transmission Fluid Cooler Lines, Clips & Fittings
Courtesy of CHRYSLER GROUP, LLC

15. Disconnect the transmission fluid cooler lines (1) at the fittings (2) by removing the clips (3).

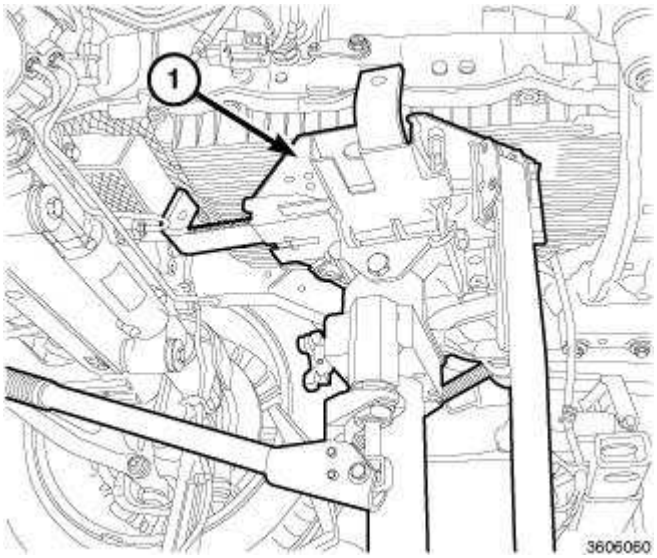

Fig. 12: Service Jack
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.

16. Raise the transmission slightly with a service jack (1) to relieve load on the crossmember.

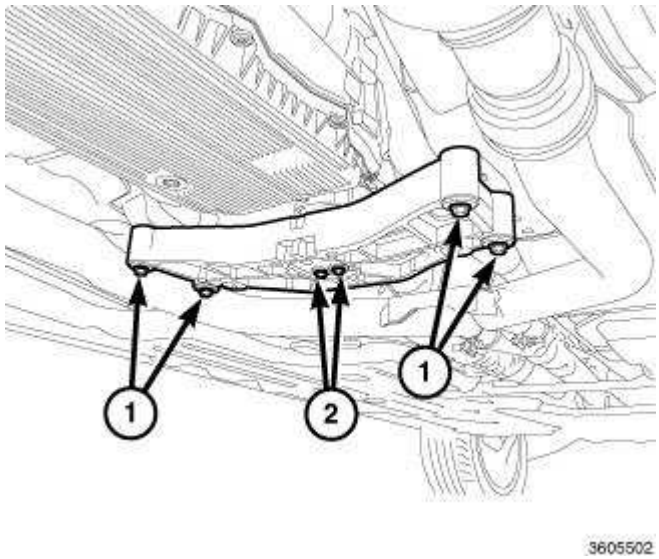

Fig. 13: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove the bolts attaching the crossmember (1) to frame and remove the crossmember.
18. Remove the bolts (2) securing the rear support and cushion to the cross member and remove.

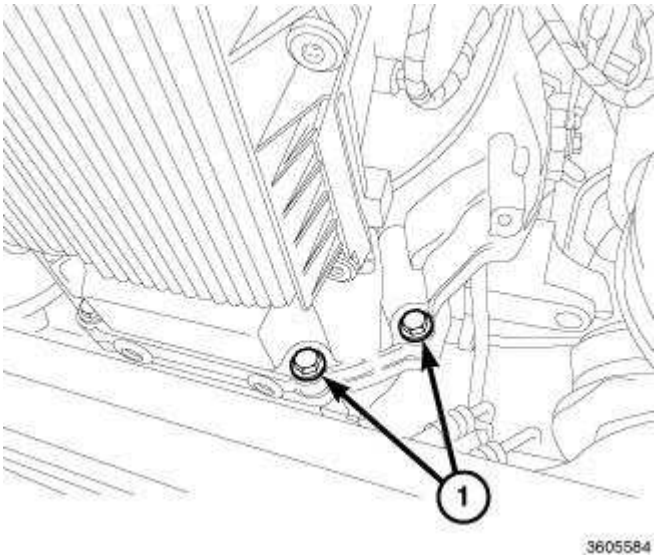

Fig. 14: Bell Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Remove the bell housing bolts (1) on the RH side.

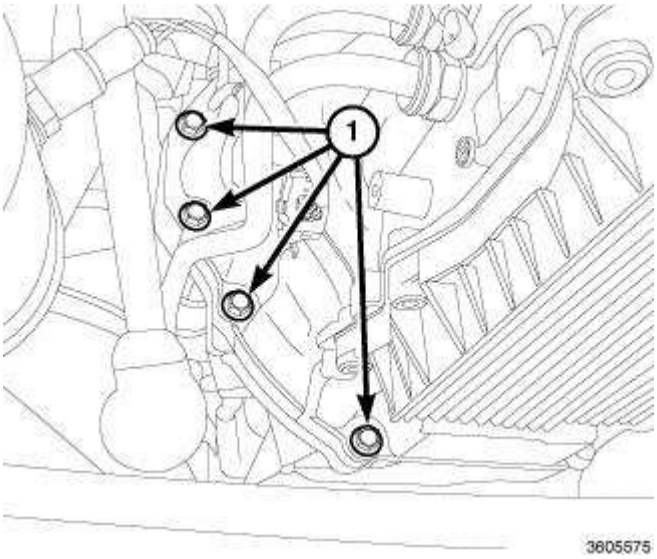

Fig. 15: Bell Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

20. Remove the bell housing bolts (1) on the LH side.

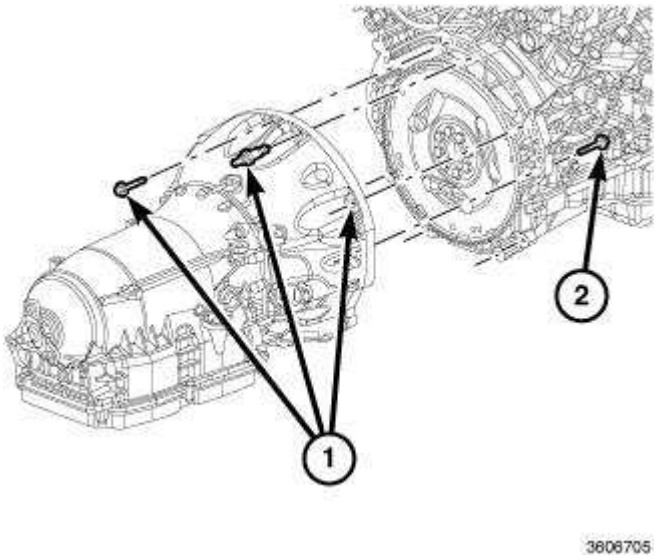

Fig. 16: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD shown in illustration, AWD similar.

21. Remove all remaining bell housing bolts (1, 2) securing the transmission to the engine block.
22. Hold the torque converter in place during transmission removal.
23. Lower the transmission and remove the assembly from the vehicle.

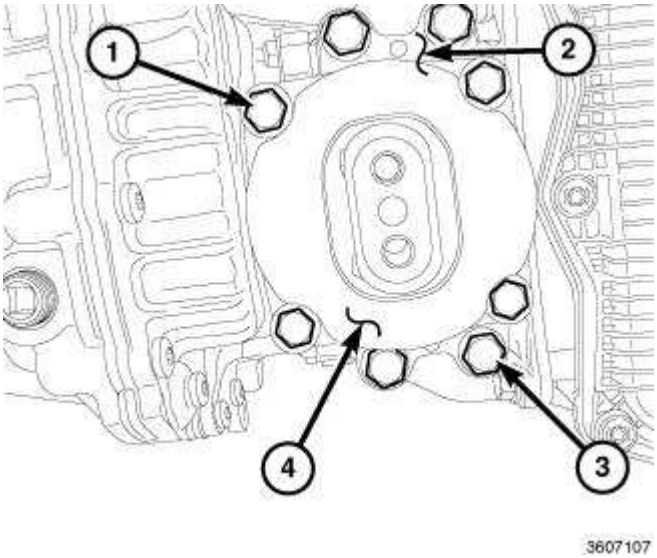

Fig. 17: Four Rear Transmission Mount Bolts, Rear Transmission Mount, Adapter Bracket Bolts & Adapter
Courtesy of CHRYSLER GROUP, LLC

24. **For AWD only** , remove the four rear transmission mount bolts (1) and rear transmission mount (4) from the transmission.

25. **For AWD only** , remove the adapter bracket bolts (3) and the adapter (2) from the transmission.

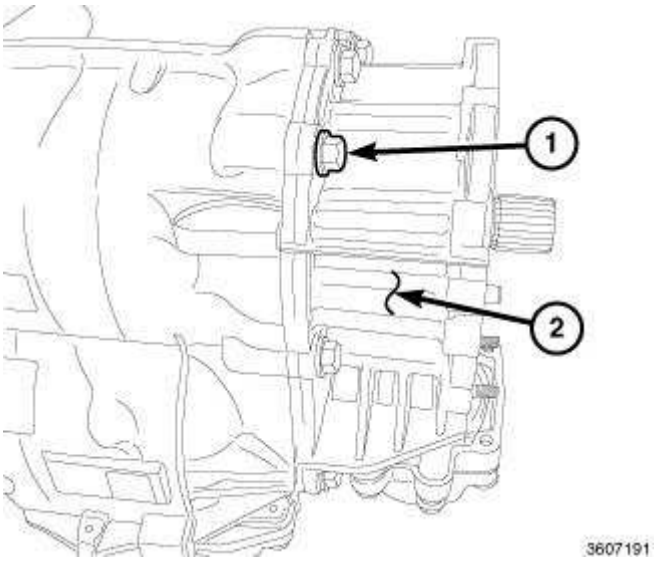

Fig. 18: Seven Extension Housing Bolts & Extension Housing
Courtesy of CHRYSLER GROUP, LLC

26. **For AWD only** , remove the seven extension housing bolts (1) and remove the extension housing (2).

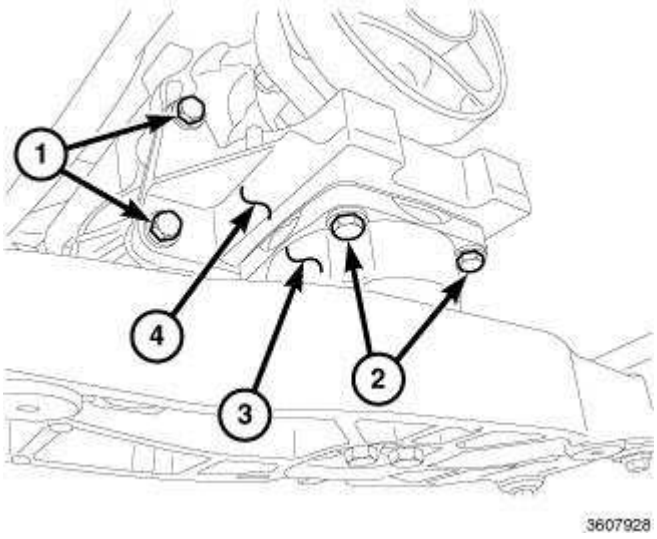

Fig. 19: Four Transmission Mount Bolts & Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

27. **For RWD only** , remove the four transmission mount bolts (2) and the transmission mount (3).
28. **For RWD only** , remove the four adapter bracket bolts (1) and the adapter bracket (4).

DISASSEMBLY

DISASSEMBLY

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to appropriate diagnostic information .

NOTE: Tag all clutch pack assemblies, as they are removed, for reassembly identification.

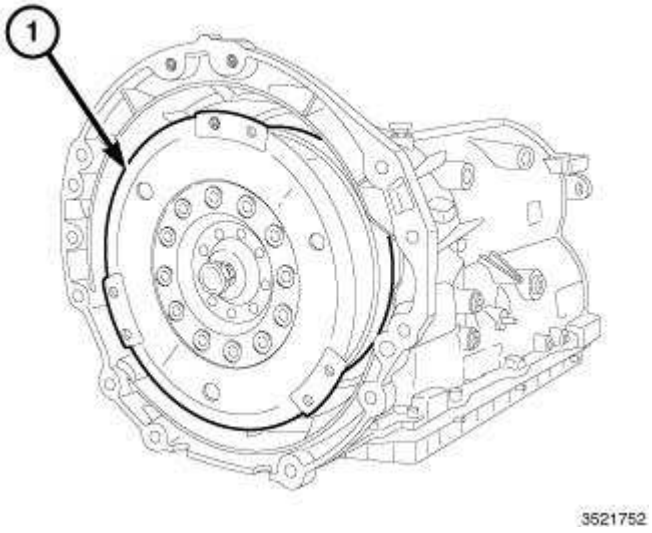

Fig. 20: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD Shown in illustration, AWD similar.

1. Remove the torque converter (1).

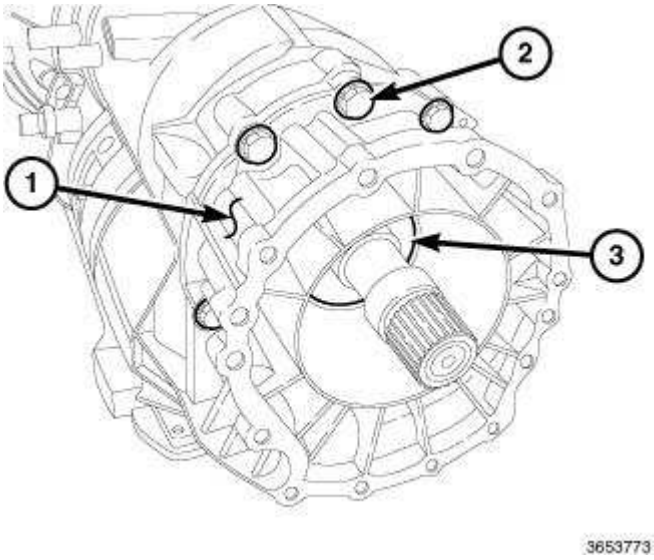

Fig. 21: AWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: AWD only.

2. Remove the seven transmission housing extension bolts (2) and remove the housing (1).
3. Remove the transmission rear oil seal (3) with a suitable slide hammer and screw.

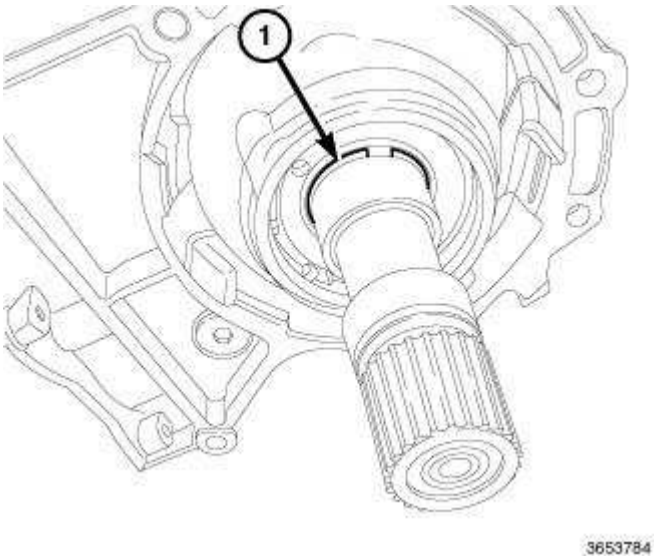

Fig. 22: AWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: AWD only.

4. Remove the input shaft snap ring (1) and washer.

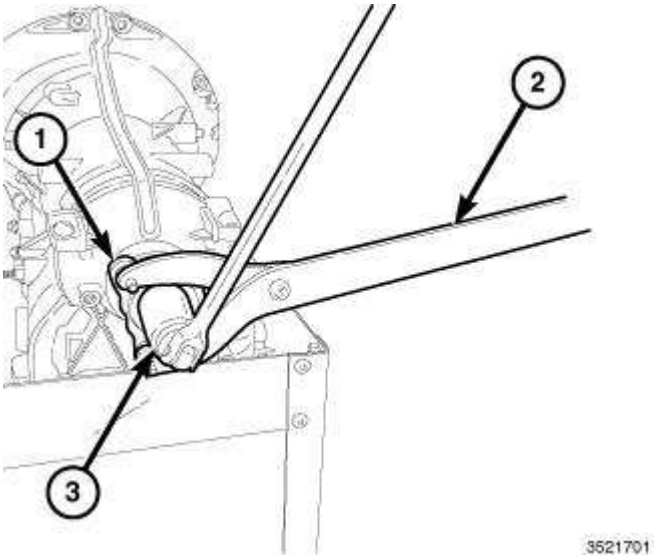

Fig. 23: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD only.

5. Using a suitable punch, remove the staking from the propeller shaft flange nut, and loosen the nut about 1 thread using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1).

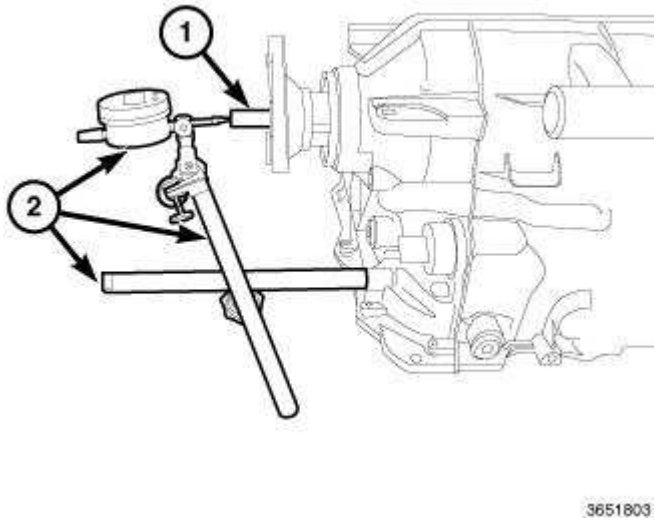

Fig. 24: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD shown in illustration, AWD similar.

NOTE: End play specification is between 0.11 - 0.42 mm (0.0043 - 0.0165 in.). If

end play is outside this range, a different selectable end play shim must be used during assembly.

6. Measure the output shaft (1) end play as follows:
    1. Attach a dial indicator (2) and position the plunger against the end of the output shaft (1).
    2. Zero the dial indicator (2).
    3. Move the output shaft (1) in and out, and record the maximum travel for assembly reference.

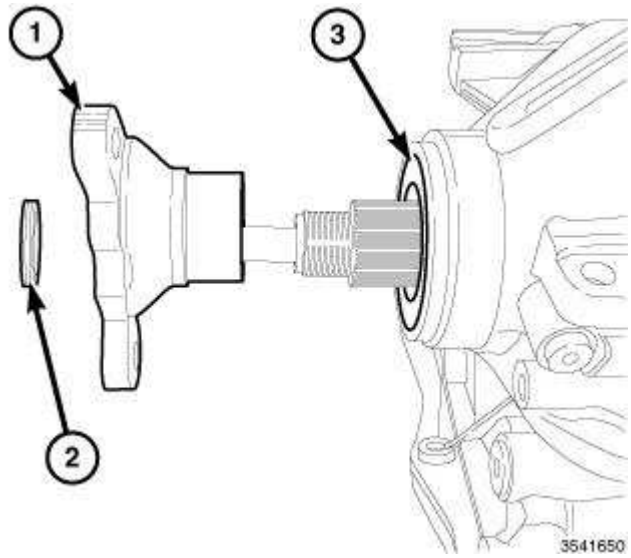

Fig. 25: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD only.

7. Finish removing the propeller shaft flange nut.
8. Remove the propeller shaft flange (1).
9. Remove the transmission rear dust seal (2).
10. Remove the transmission rear oil seal (3) with a suitable slide hammer and screw.
11. Remove the transmission output shaft washer.

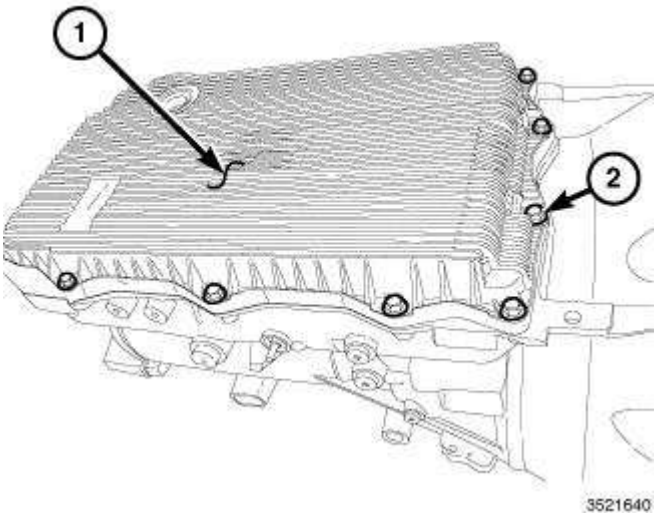

Fig. 26: Thirteen Oil Pan Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the thirteen oil pan retaining bolts (2).

NOTE: Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.

13. Carefully detach the oil pan (1) and gasket.

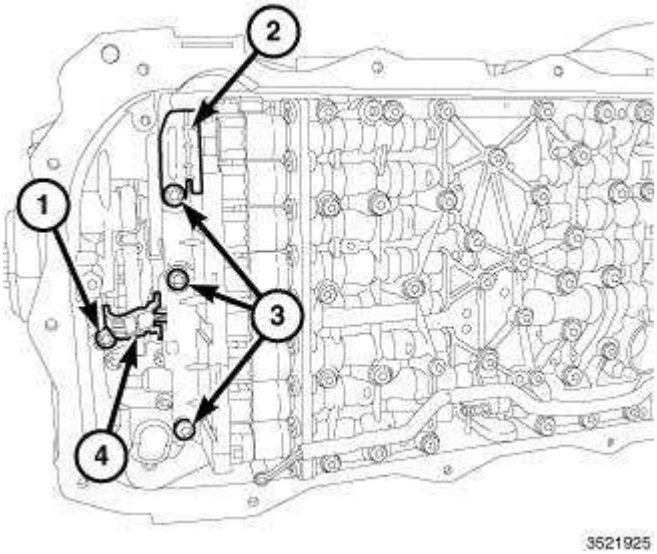

Fig. 27: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Remove the valve body assembly end retainer bolts (3).
15. Lift the electrical connector lock (2) to release the internal harness end from inside the transmission for valve body assembly removal.
16. Remove the sensor retaining bolt (1) and pull the sensor (4) loose from the case.

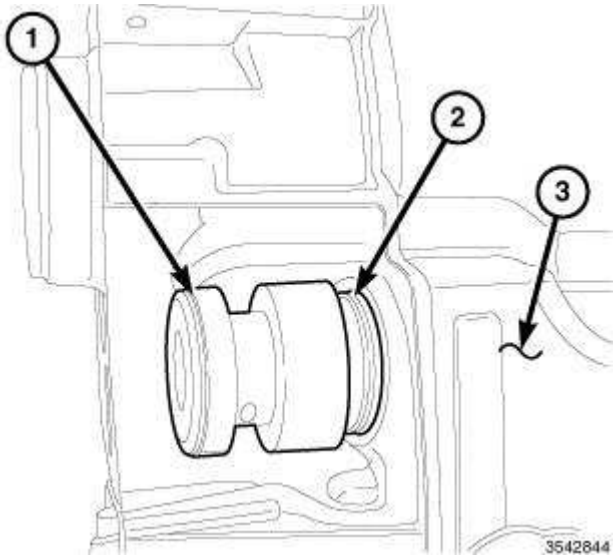

Fig. 28: Remover/Installer, Guide Sleeve
Courtesy of CHRYSLER GROUP, LLC

17. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully pull the electrical harness insulator (2) straight out from the transmission case (3).

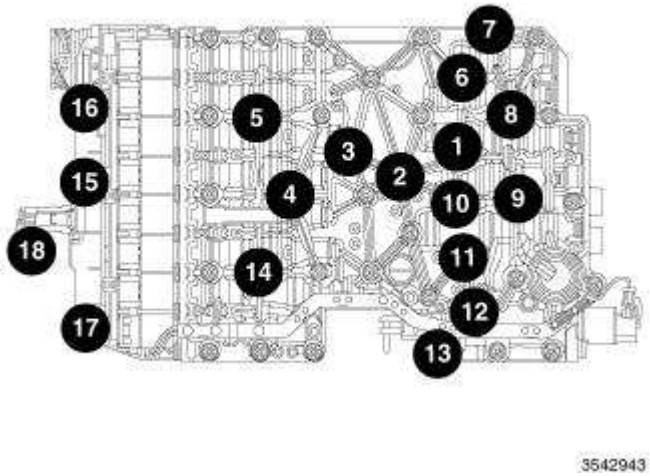

Fig. 29: Valve Body Assembly Retaining Bolts 1-14
Courtesy of CHRYSLER GROUP, LLC

18. Remove valve body assembly retaining bolts 1-14 (15-18 are already removed).
19. Carefully lift the valve body assembly from the transmission.

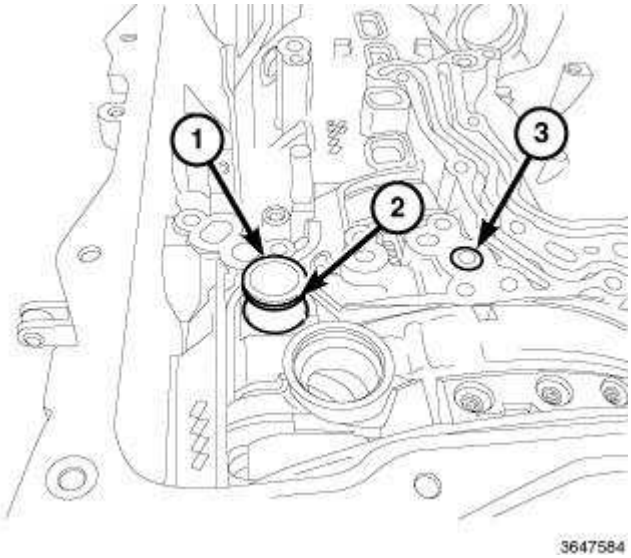

Fig. 30: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fluid port (1) may be in the transmission or the valve body assembly.

20. Pull the fluid port (1) from the transmission or valve body assembly.
21. Remove the two O-rings (2).
22. Remove the compression seal (3) from the transmission.

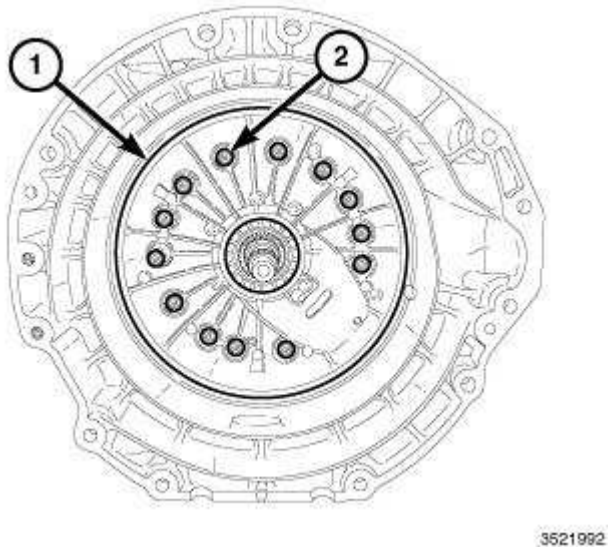

Fig. 31: Thirteen Oil Pump Housing Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Remove the thirteen oil pump housing retaining bolts (2).

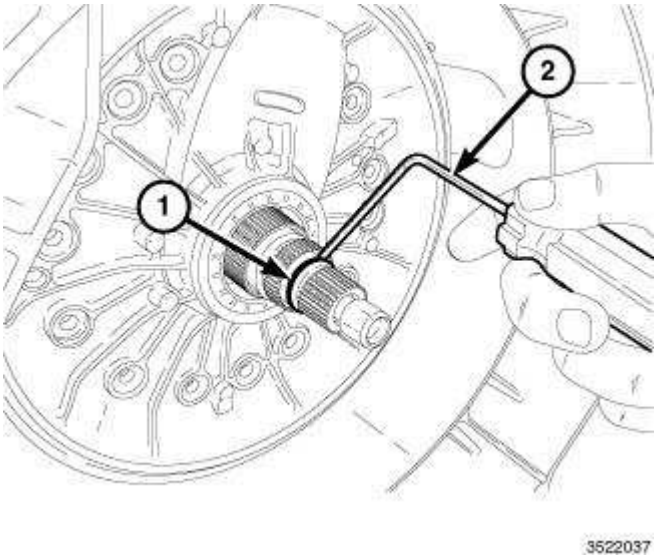

Fig. 32: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

24. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.

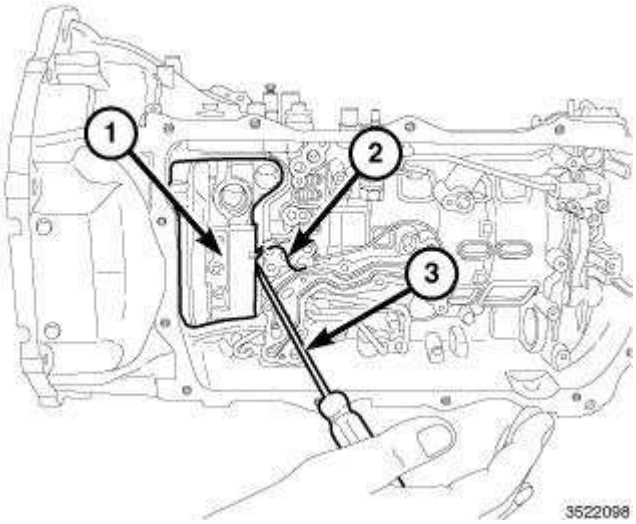

Fig. 33: Oil Pump Housing, Case & Small Flat Blade Screwdriver
Courtesy of CHRYSLER GROUP, LLC

25. Carefully pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver (3) or equivalent through the case opening.
26. From the front of the transmission, remove the oil pump housing.

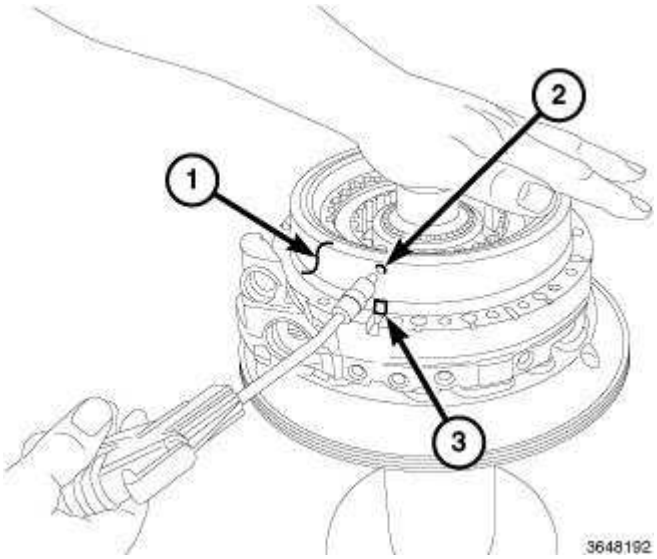

Fig. 34: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply air pressure slowly because oil may spray when B-piston releases from the assembly.

27. With one hand above B-piston (1), carefully apply air pressure into the hole (2) directly above the B-piston alignment tab (3) to remove B-piston (1) from the assembly.

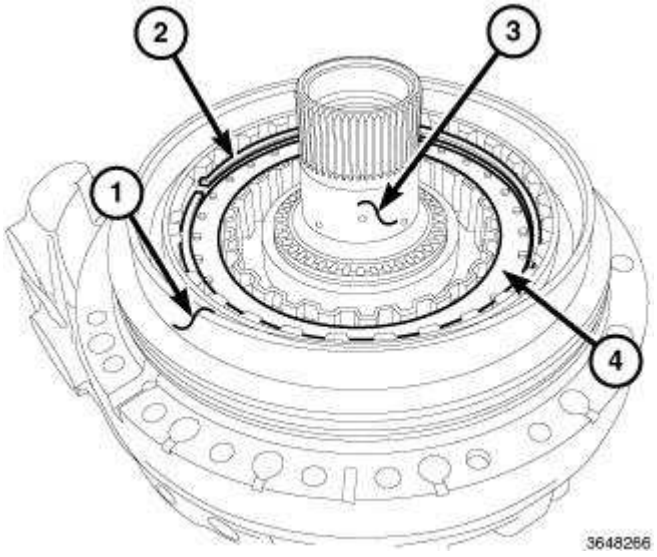

Fig. 35: Outer Ring, Snap Ring & Spacers
Courtesy of CHRYSLER GROUP, LLC

28. Remove the outer ring (1) (under B-piston).
29. Remove the snap ring (2).
30. Remove the clutches and spacers (4).

31. Remove the hub (3).

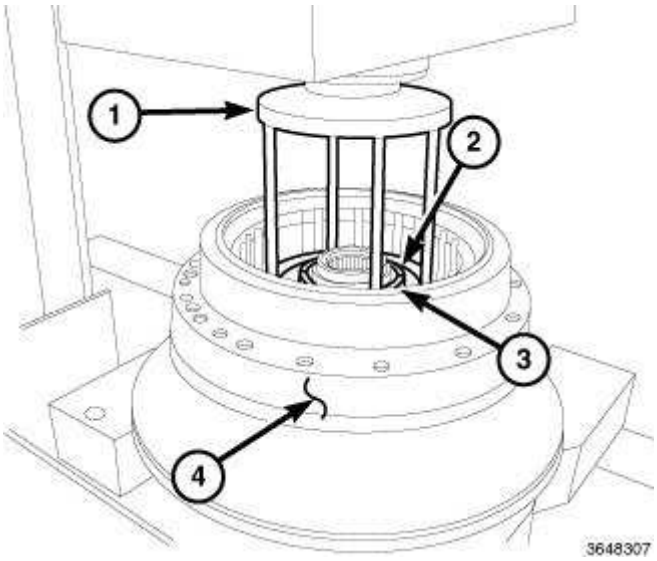

Fig. 36: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

32. Position the oil pump housing assembly (4) in a suitable arbor press.
33. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and remove the two halves of the split retainer ring (2, 3).

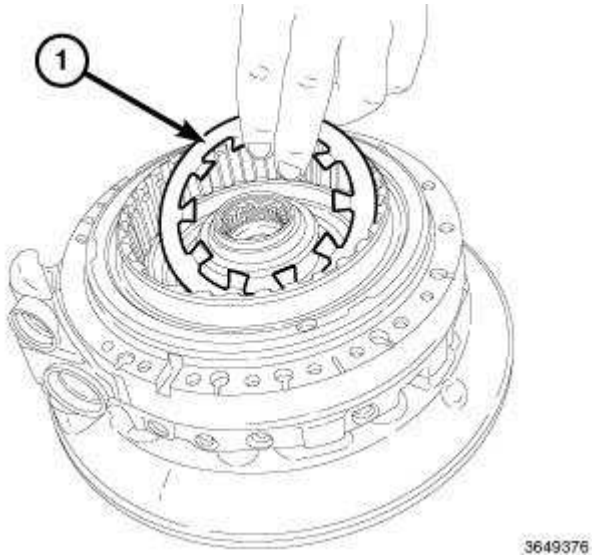

Fig. 37: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

34. Remove the piston retaining ring and piston below it.

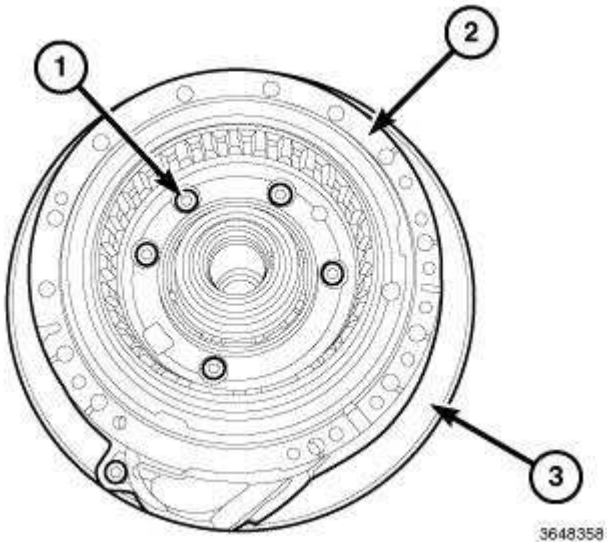

Fig. 38: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

35. Remove the six bolts (1) and separate the oil pump housing (2) from the oil pump cover (3).

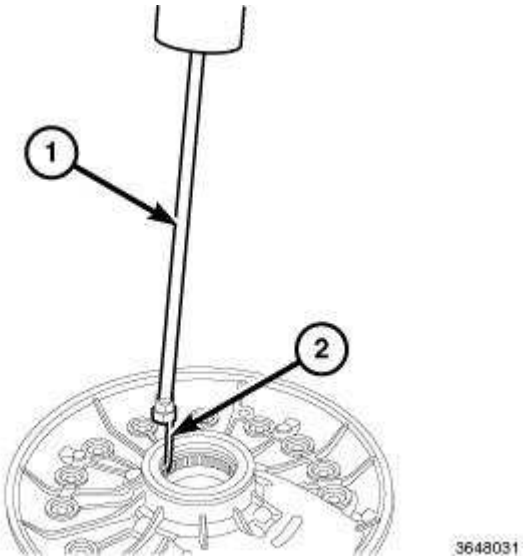

Fig. 39: Remover, Seal & Slide Hammers
Courtesy of CHRYSLER GROUP, LLC

36. Using (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the oil seal from the front pump cover.
37. Remove the outer lip seal from the front pump cover.

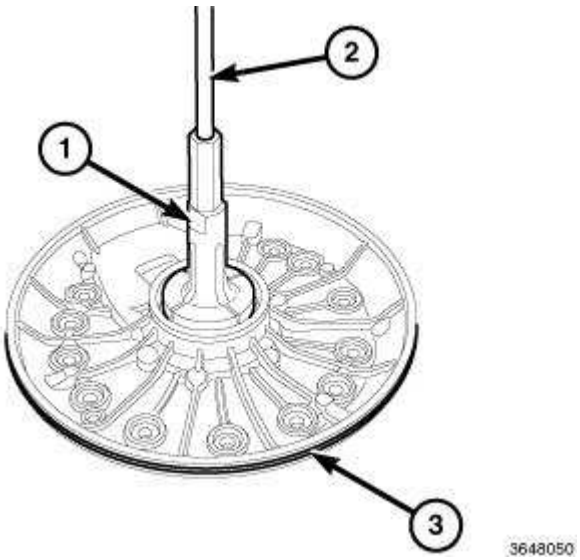

Fig. 40: Remover, Bearing Cup & Slide Hammers
Courtesy of CHRYSLER GROUP, LLC

38. Remove the snap ring.
39. Using (special tool #6787A, Remover, Bearing Cup) (1) and (special tool #C-3752, Slide Hammers) (2) remove the needle bearing from the front cover (3).
40. Remove the snap ring.
41. Using (special tool #9585, Remover, Bearing Cup) and (special tool #C-637, Slide Hammer, Universal) remove the needle bearing.

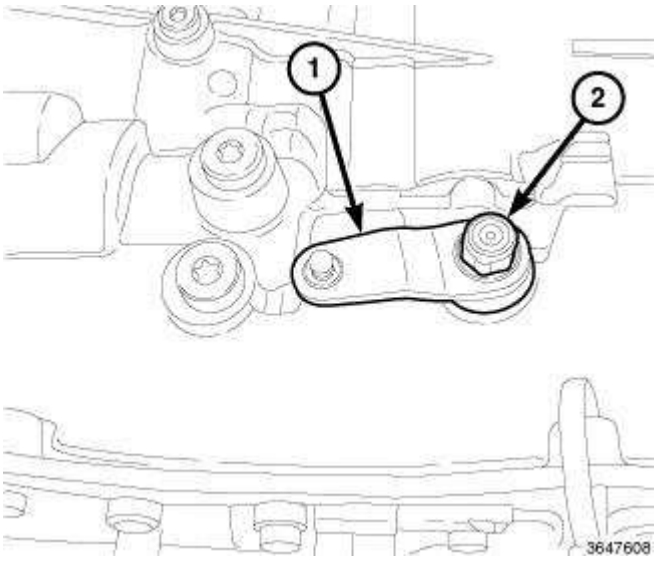

Fig. 41: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

42. Remove the manual park release lever retaining nut (2) and remove the lever (1).

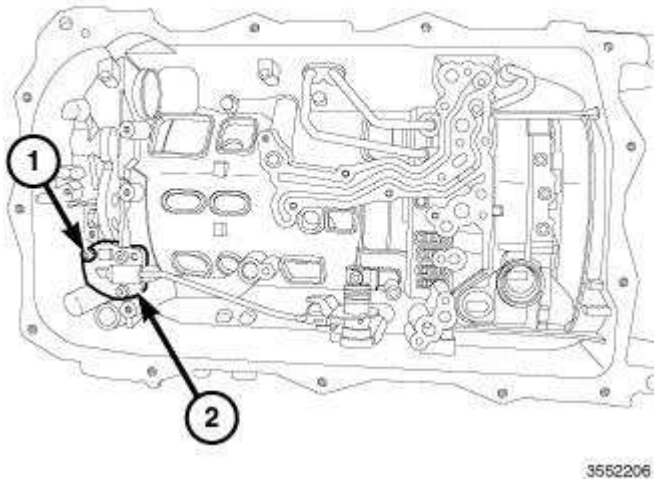

Fig. 42: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

43. Remove the three park pawl lock rod guide plate retaining screws (1) and remove the plate (2).

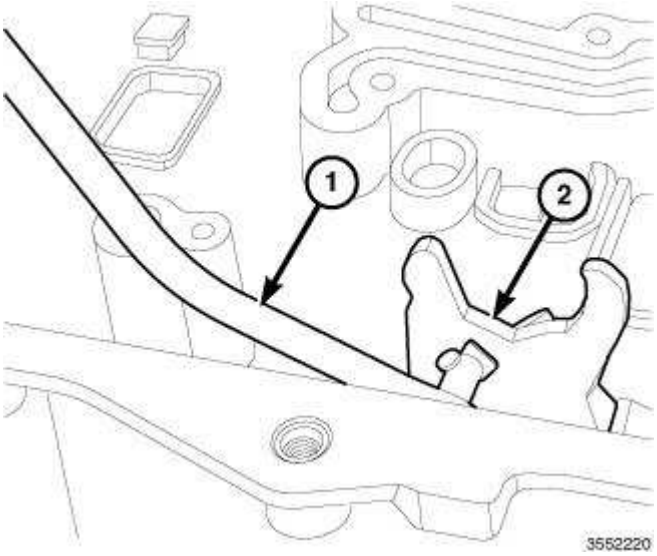

Fig. 43: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

44. Remove the park pawl lock rod (1) from the fork (2).

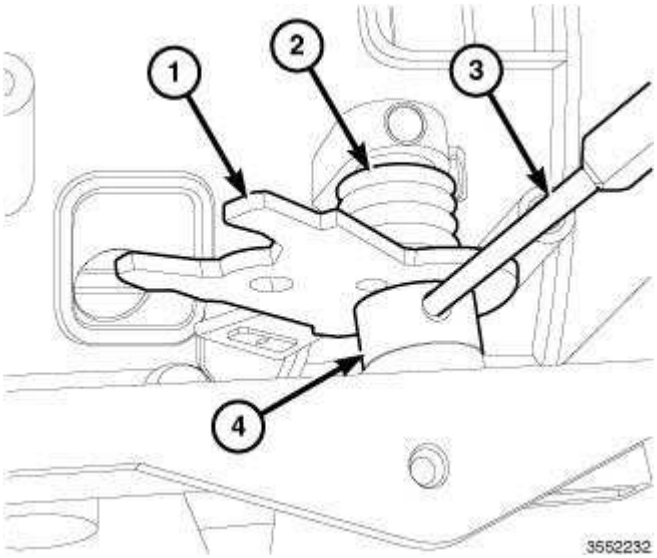

Fig. 44: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

NOTE: Pay attention to the spring position for installation.

45. Remove the roll pin from the selector shaft (4) using a suitable pin punch (3).
46. Remove the shaft (4), spring (2) and fork (1) from the case.
47. Remove the selector shaft seal using a small screwdriver or equivalent.

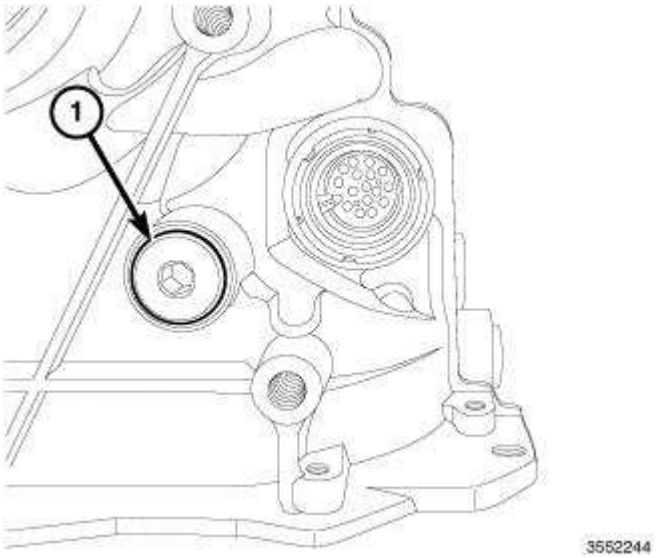

Fig. 45: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

48. Remove the park pawl shaft plug (1) from the rear of the case.

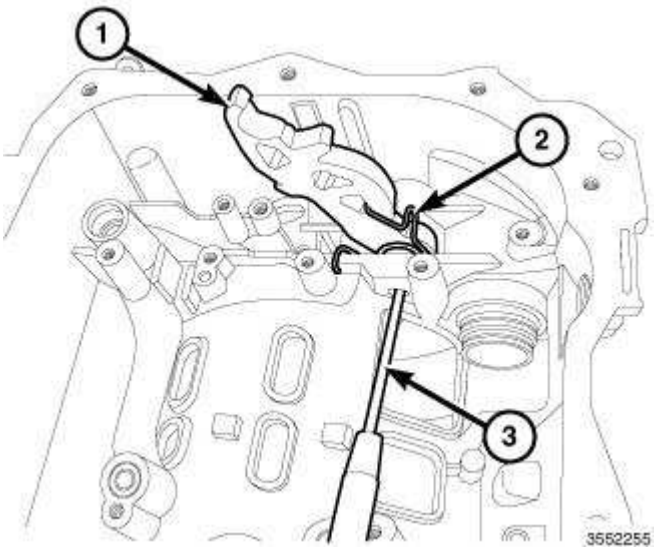

Fig. 46: Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Pay attention to the spring position for installation.

49. Remove the park pawl shaft using a suitable pin punch (3), remove the park pawl (1) and spring (2).

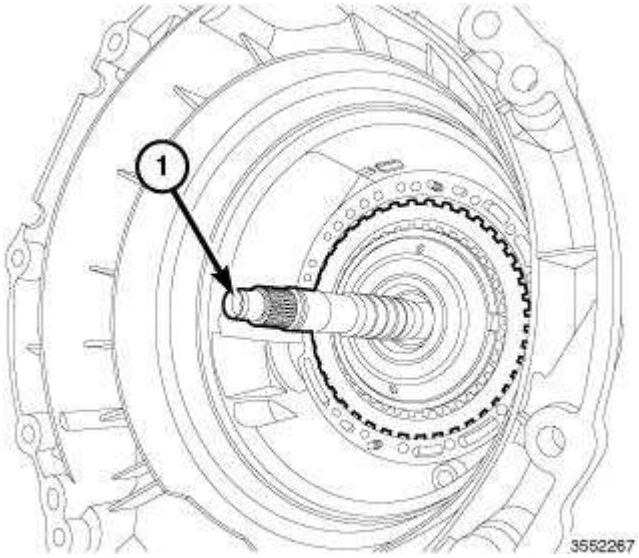

Fig. 47: P4 Annulus Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

50. Remove the input/output shaft and P4 annulus drum assembly (1) from the case.

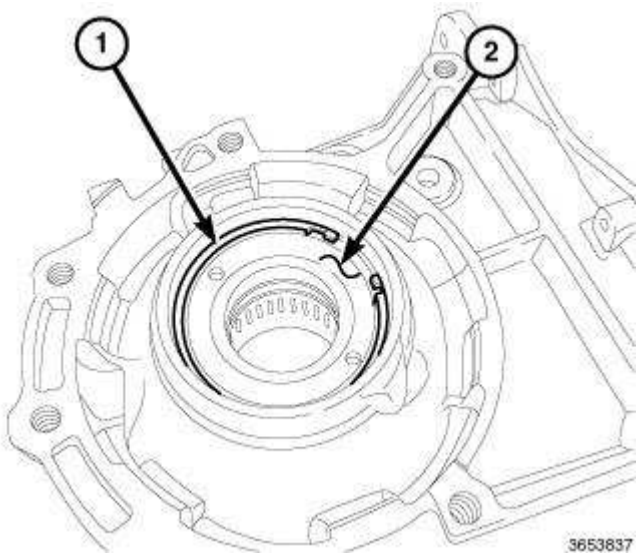

Fig. 48: Outer Bearing Snap Ring & Outer Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: AWD shown in illustration, RWD similar. The AWD bearing is a needle bearing and the RWD is a ball bearing.

51. Remove the outer bearing snap ring (1), and the outer needle bearing (2) (AWD) or outer ball bearing (RWD).

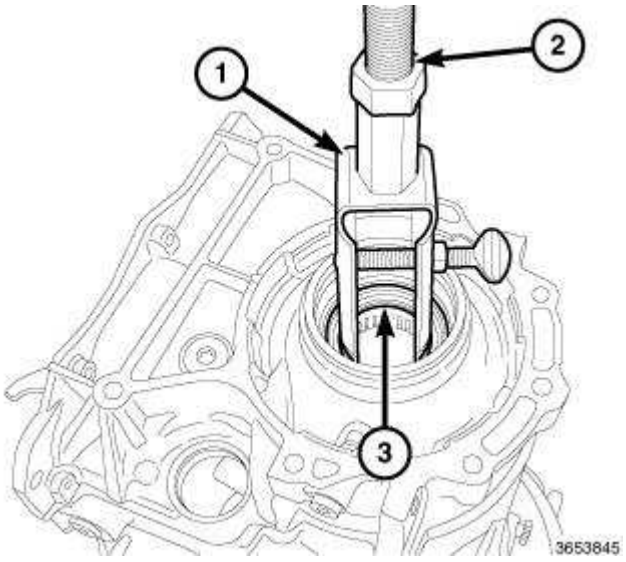

Fig. 49: Bearing Cup, Slide Hammer, Universal & Oil Dam
Courtesy of CHRYSLER GROUP, LLC

NOTE: AWD shown in illustration, RWD similar.

52. Remove the oil dam snap ring.

53. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2), remove the oil dam (3).

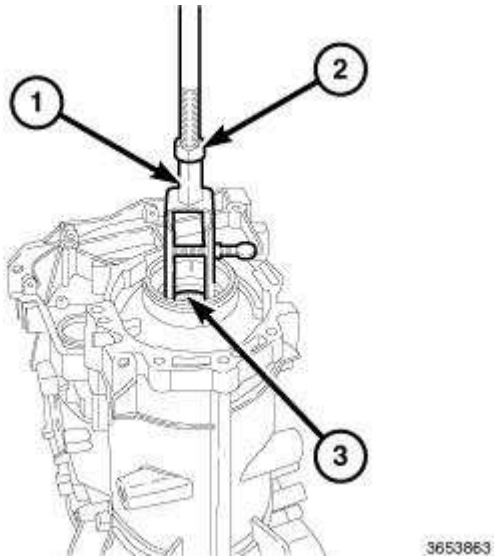

Fig. 50: Bearing Cup & Slide Hammer, Universal
Courtesy of CHRYSLER GROUP, LLC

NOTE: AWD shown in illustration, RWD similar.

54. Remove the output shaft inner needle bearing snap ring.
55. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2), remove the inner needle bearing (3).

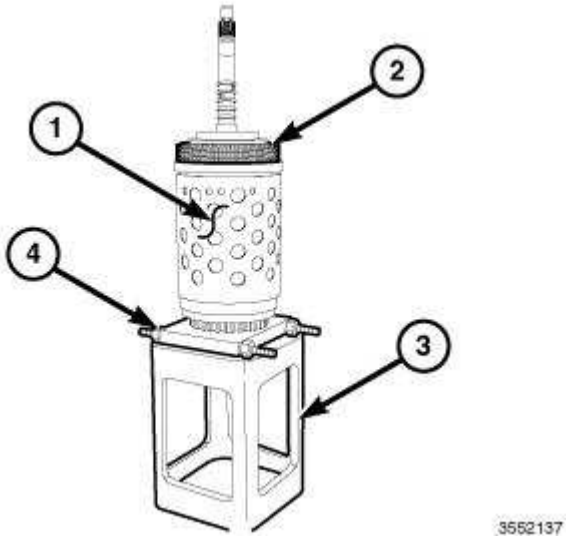

Fig. 51: P4 Annulus Drum Assembly, Assembly, Press Fixture & Splitter, Bearing/Gear
Courtesy of CHRYSLER GROUP, LLC

56. Position the input/output shaft and P4 annulus drum assembly (1) on (special tool #8925-3,

Assembly, Press Fixture) (3) and (special tool #1130, Splitter, Bearing/Gear) (4).

57. Remove the clutch pack (2).

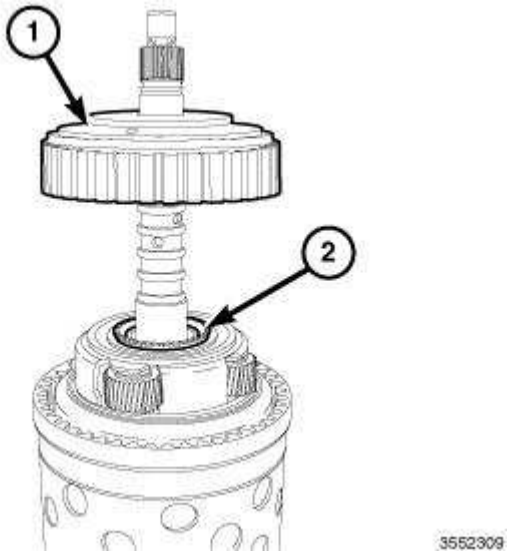

Fig. 52: P1 Annulus/B Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

58. Remove the O-ring and 5 squared O-rings.
59. Remove the P1 annulus/B clutch hub assembly (1) from the P4 annulus drum.

NOTE: The washer may stick to the bottom of the P1 annulus/B clutch hub assembly (1).

60. Remove the selectable shim from the P1 annulus/B clutch hub.
61. Remove the needle bearing and holding plate (2) from the P1 planetary carrier.

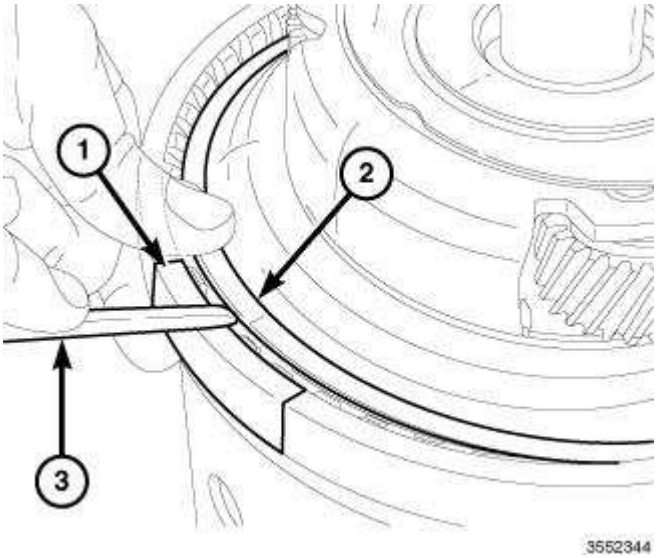

Fig. 53: Suitable Tool & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.

62. Position the (special tool #10378, Rings, Support) (1) on the P4 annulus drum assembly to protect the drum.

NOTE: Pry the snap ring from the opposite side of the snap ring openings to release.

NOTE: When the snap ring is removed the internal clutch drum may drop slightly.

63. Using a suitable tool (3), release the snap ring (2) by prying in and up from the opposite side of the snap ring openings.

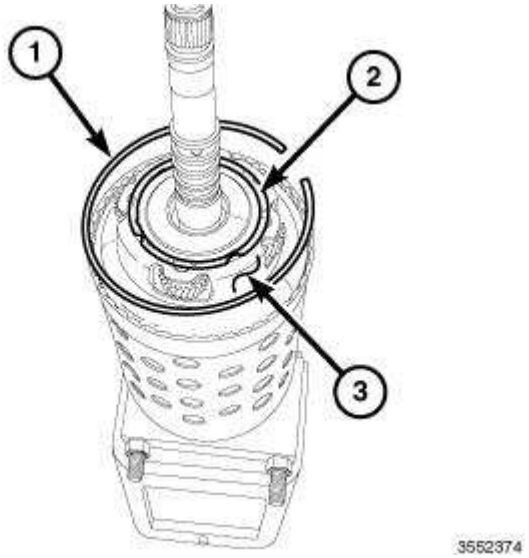

Fig. 54: P1 Planetary Carrier & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

64. Remove the P1 planetary carrier (3).
65. Remove P1/P2 sun gear from the bottom of the P1 planetary carrier (3).

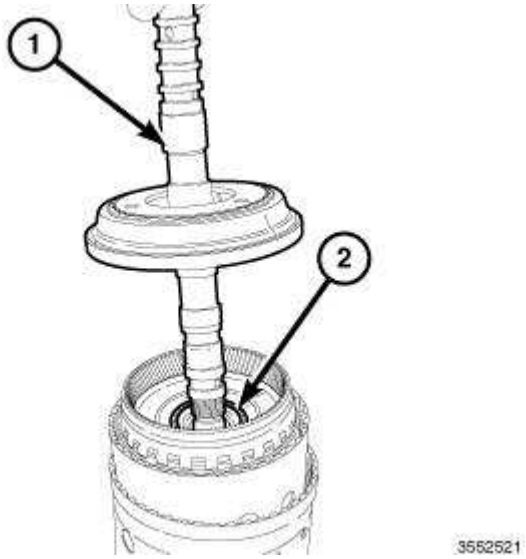

Fig. 55: P2 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

66. Remove the input shaft with P2 planetary carrier (1) from the drum assembly.
67. Remove the needle bearing (2) and washer.

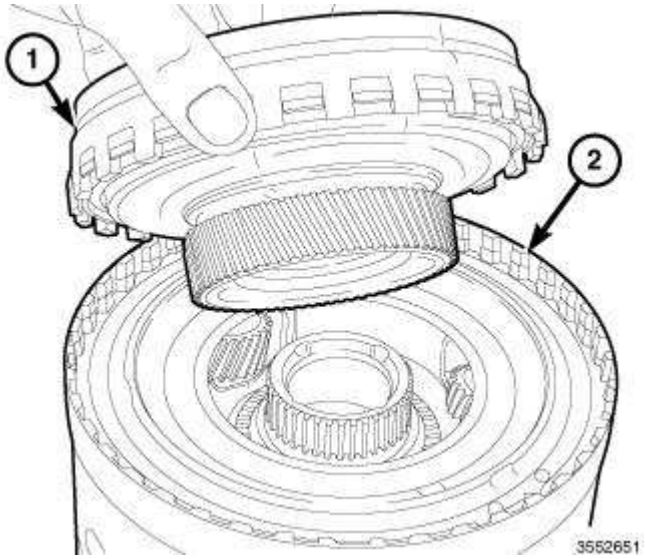

Fig. 56: P2 Annulus/P3 Sun Gear
Courtesy of CHRYSLER GROUP, LLC

68. Remove the P2 annulus/P3 sun gear (1) from the drum assembly (2).

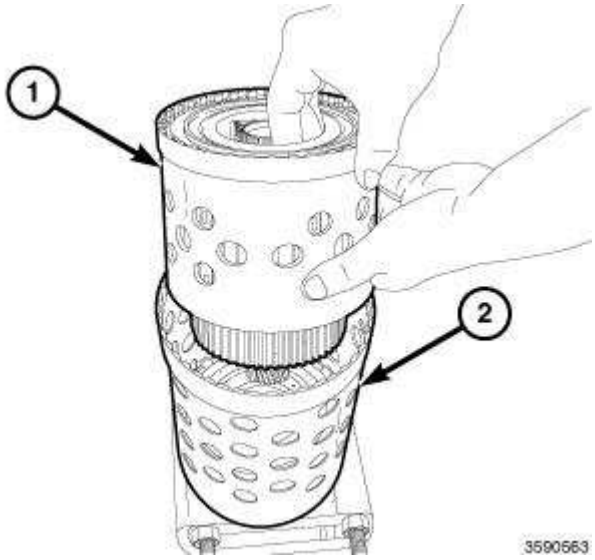

Fig. 57: D Clutch Drum & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

69. Remove the D clutch drum (1) from the P4 annulus drum (2).

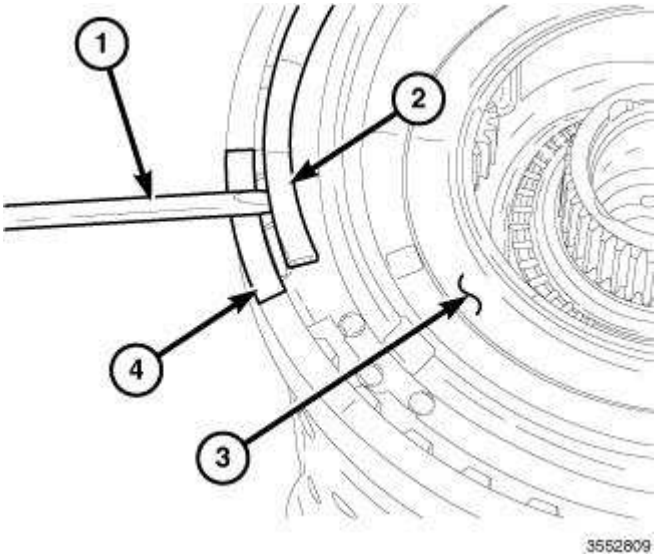

Fig. 58: Rings, Support, Suitable Tool & P3 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

NOTE: The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.

70. Position the (special tool #10378, Rings, Support) (4) on the P4 annulus drum assembly to protect the drum.
71. Using a suitable tool (1), release and remove the snap ring (2).
72. Remove the P3 planetary carrier (3).

73. Remove the needle bearing from the planetary carrier.

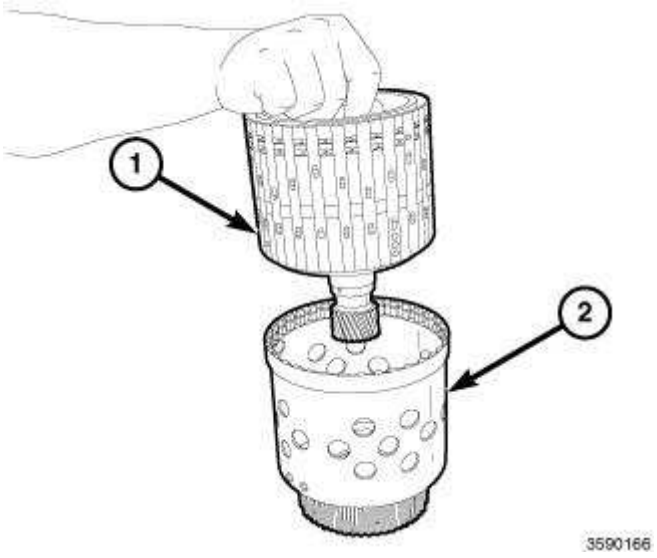

Fig. 59: P4 Sun Gear/C/E Clutch Retainer & D Clutch Drum
Courtesy of CHRYSLER GROUP, LLC

74. Remove the P4 sun gear/C/E clutch retainer (1) from the D clutch drum (2).

Fig. 60: Snap Ring & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

75. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).

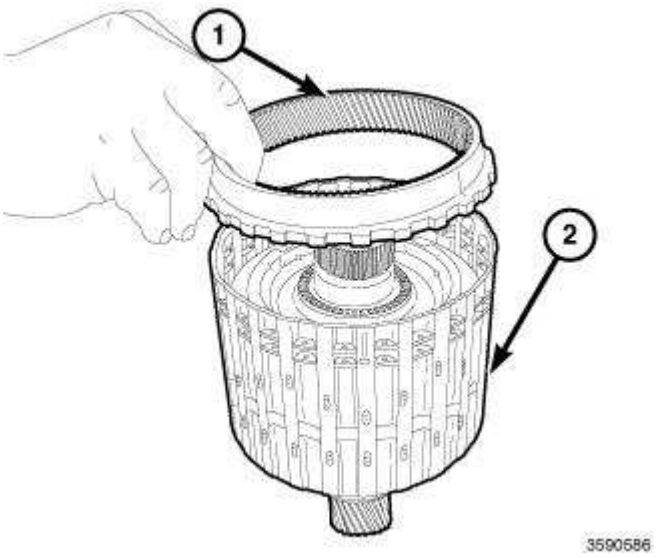

Fig. 61: P3 Annulus & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

76. Remove the P3 annulus (1) from the P4 sun gear/C/E clutch retainer (2).

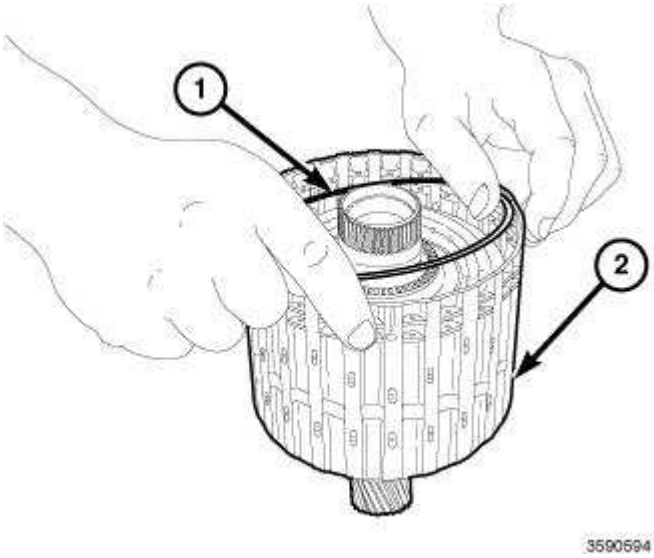

Fig. 62: Snap Ring & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

77. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).

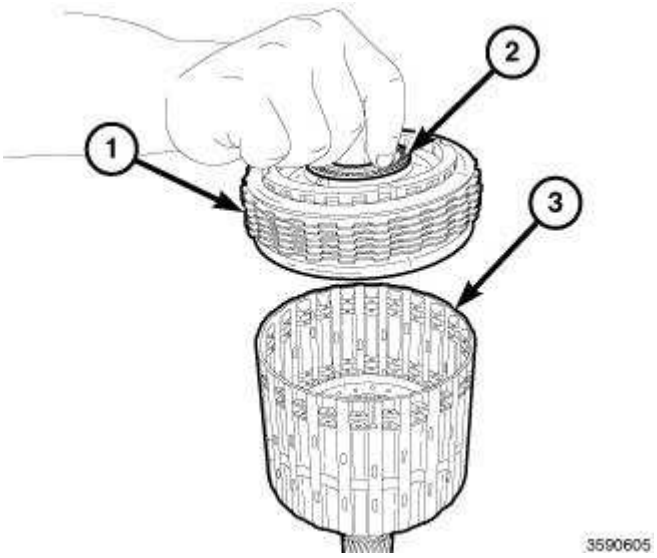

Fig. 63: E Clutch & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

78. Remove the E clutch (1) from the P4 sun gear/C/E clutch retainer (3).
79. Remove the needle bearing (2) from the E clutch (1).

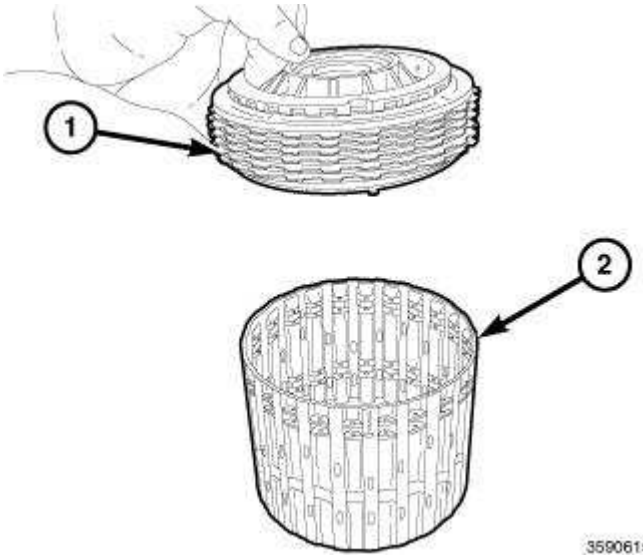

Fig. 64: C Clutch & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

80. Remove the C clutch (1) from the P4 sun gear/C/E clutch retainer (2).
81. Remove the bearing from top and bottom of C clutch (1).

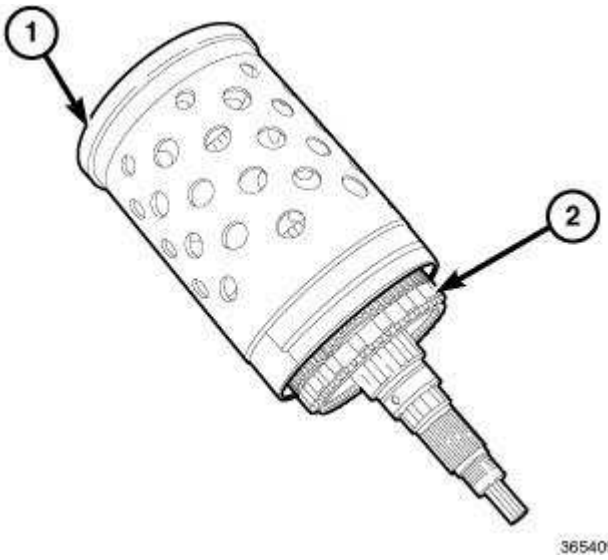

Fig. 65: P4 Planetary Carrier/Output Shaft & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

82. Remove the P4 planetary carrier/output shaft (2) from the P4 annulus drum (1).

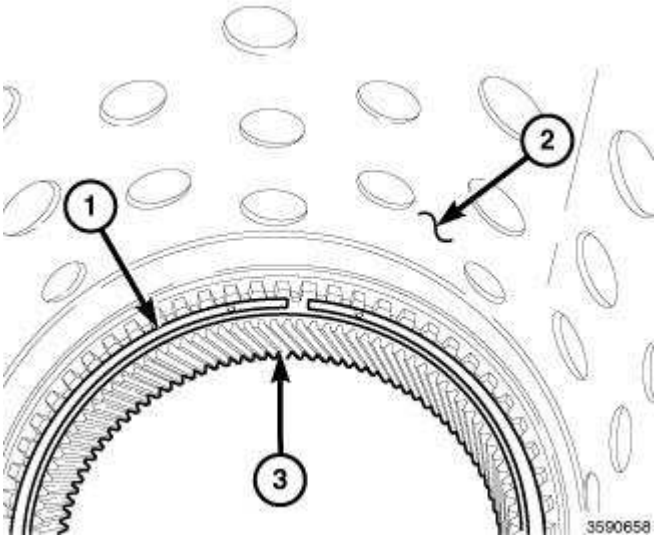

Fig. 66: Snap Ring & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

83. Remove the snap ring (1) from the P4 annulus drum (2).
84. Remove the P4 annulus (3) from the P4 annulus drum (2).

CLEANING

CLEANING

CAUTION: A unique transmission fluid has been developed for the 8HP45

transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with the appropriate automatic transmission fluid only during overhaul and assembly.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Flush the case bores and fluid passages thoroughly with approved transmission fluid. Dry the case and all fluid passages with compressed air. Be sure that all fluid passages are clear.

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to appropriate diagnostic information .**

11. Install the P4 sun gear/C/E clutch retainer (1) into the D clutch drum (2).

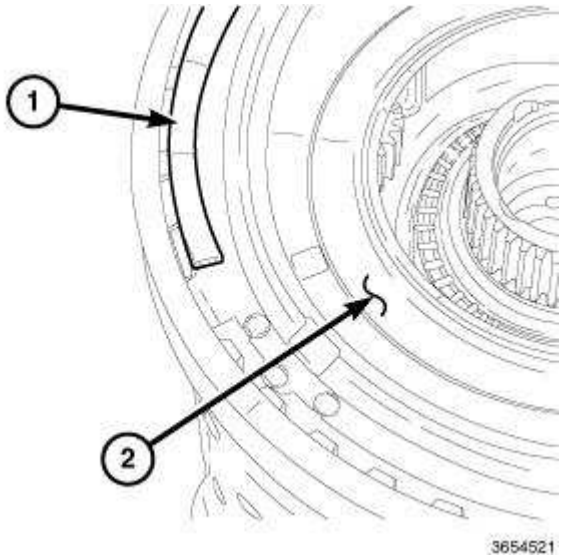

Fig. 75: P3 Planetary Carrier & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

12. Install the needle bearing onto the planetary carrier.
13. Install the P3 planetary carrier (2) in the D clutch drum.
14. Install the snap ring (1).

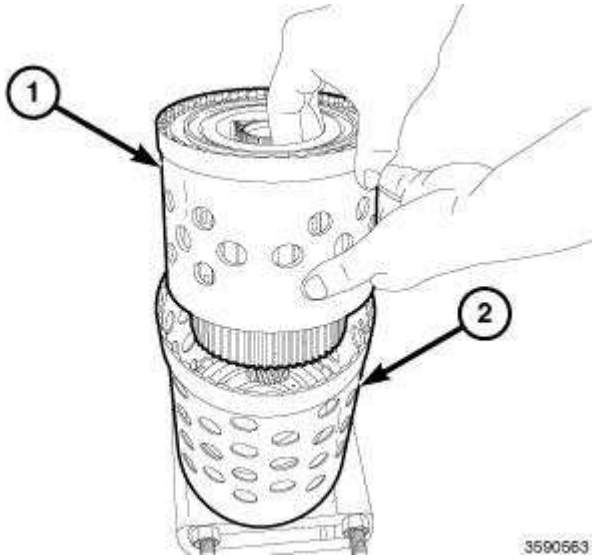

Fig. 76: D Clutch Drum & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

15. Install the D clutch drum (1) into the P4 annulus drum (2).

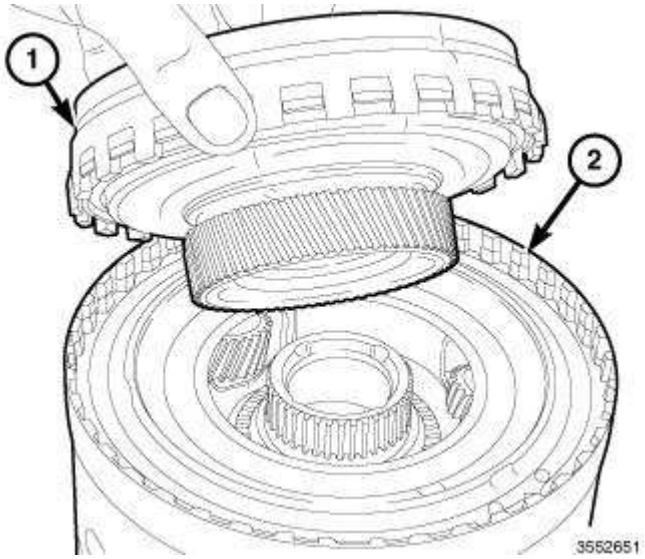

Fig. 77: P2 Annulus/P3 Sun Gear
Courtesy of CHRYSLER GROUP, LLC

16. Install the P2 annulus\P3 sun gear (1) onto the drum assembly (2).

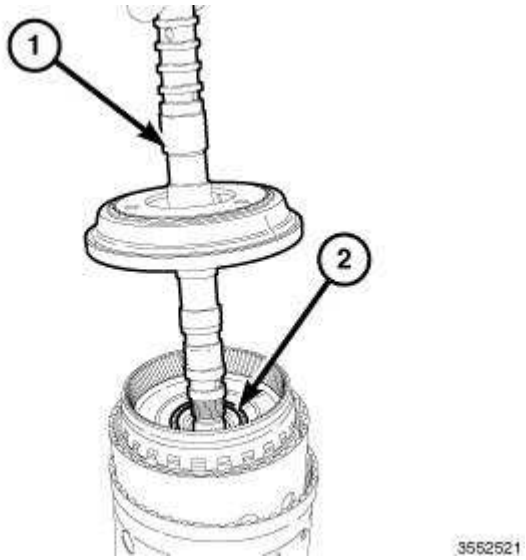

Fig. 78: P2 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

17. Install the needle bearing (2) and washer.
18. Install the input shaft with P2 planetary carrier (1) into the drum assembly.

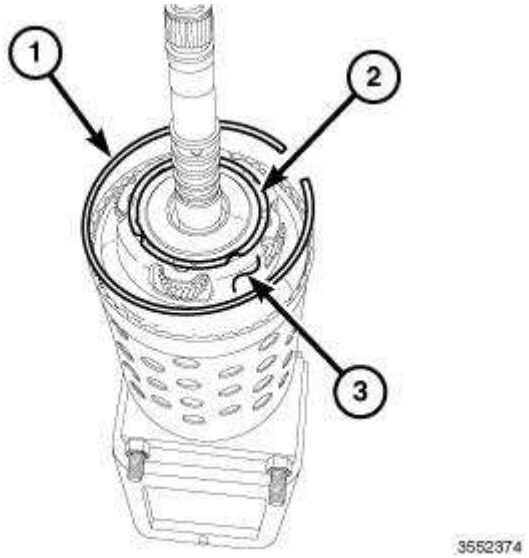

Fig. 79: P1 Planetary Carrier & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

19. Install P1/P2 sun gear into the bottom of the P1 planetary carrier (3).
20. Install the P1 planetary carrier (3).
21. Install the snap ring (1).

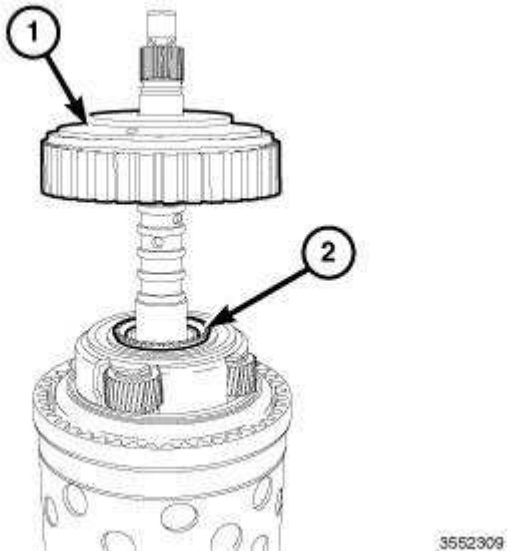

Fig. 80: P1 Annulus/B Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

22. Install the needle bearing and holding plate (2) onto the P1 planetary carrier.
23. Install the selectable shim to the P1 annulus/B clutch hub.
24. Install the P1 annulus\B clutch hub assembly (1) onto the P4 annulus drum.
25. Install the O-ring and five squared O-rings.

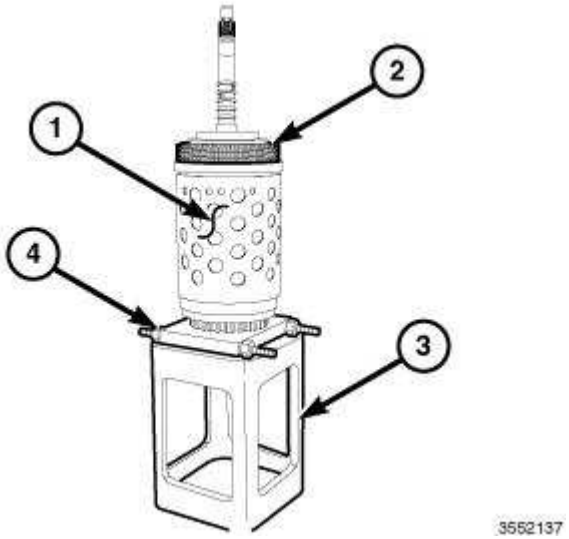

Fig. 81: P4 Annulus Drum Assembly, Assembly, Press Fixture & Splitter, Bearing/Gear
Courtesy of CHRYSLER GROUP, LLC

26. Install the clutch pack (2).

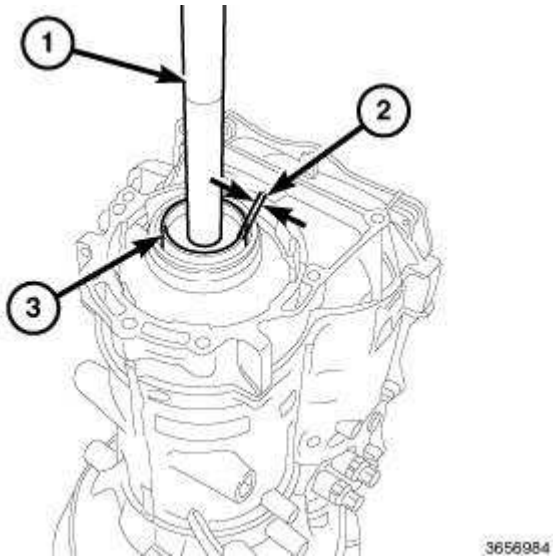

Fig. 82: Output Needle Bearing/Rear Oil Dam, Thick Walled Side & Driver Handle, Universal
Courtesy of CHRYSLER GROUP, LLC

NOTE: The (special tool #10373, Installer, Output Needle Bearing/Rear Oil Dam) (3) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the output shaft inner needle bearing, use the thick walled side (2) of the tool against the bearing.

27. Using (special tool #10373, Installer, Output Needle Bearing/Rear Oil Dam) (3) and (special tool #C-4171, Driver Handle, Universal) (1), install the output shaft inner needle bearing.

28. Install the snap ring.

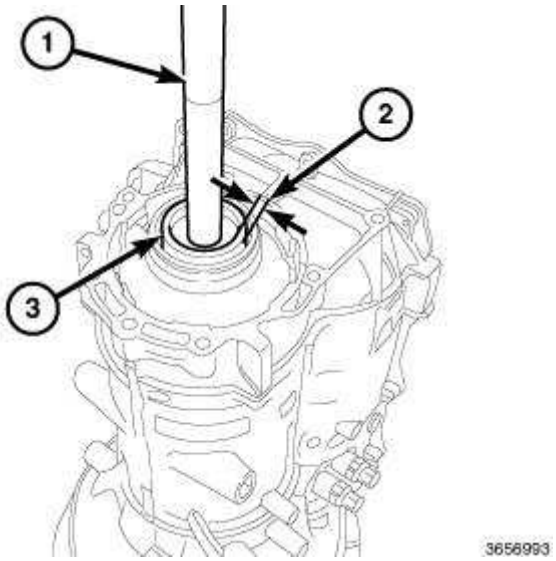

Fig. 83: Output Needle Bearing/Rear Oil Dam, Thin Walled Side & Driver Handle, Universal
Courtesy of CHRYSLER GROUP, LLC

NOTE: The (special tool #10373, Installer, Output Needle Bearing/Rear Oil Dam) (3) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the oil dam, use the thin walled side (2) of the tool against the oil dam.

29. Using (special tool #10373, Installer, Output Needle Bearing/Rear Oil Dam) (3) and (special tool #C-4171, Driver Handle, Universal) (1), install the oil dam.
30. Install the snap ring.

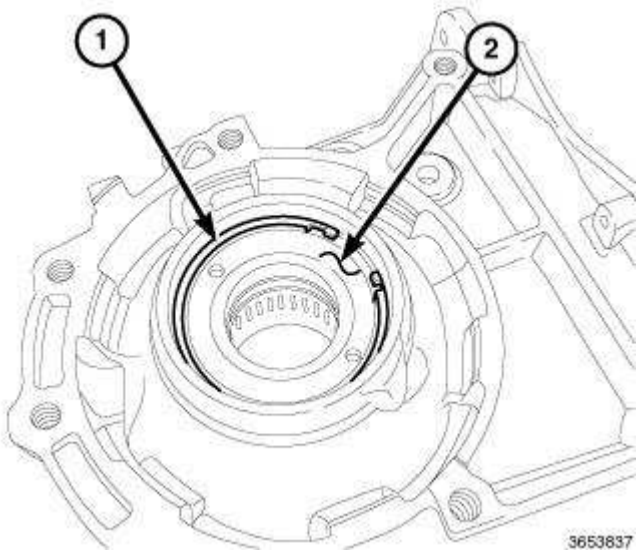

Fig. 84: Outer Bearing Snap Ring & Outer Needle Bearing

Courtesy of CHRYSLER GROUP, LLC

31. Install the needle bearing (AWD) or ball bearing (RWD).
32. Install the snap ring (1).

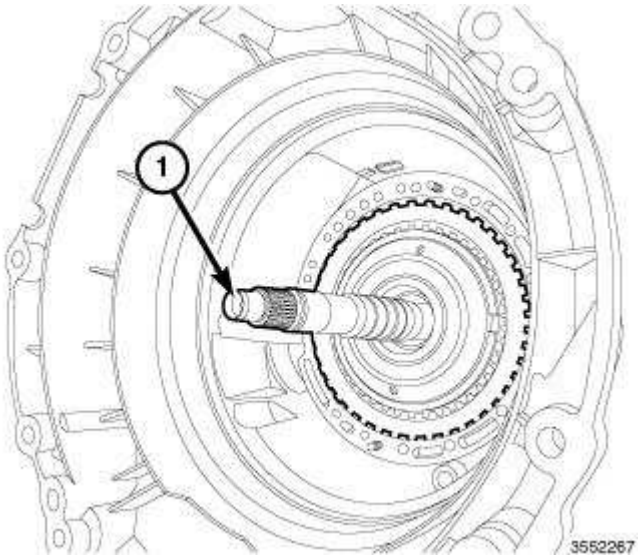

Fig. 85: P4 Annulus Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

33. Install the input/output shaft and P4 annulus drum assembly (1) into the case.

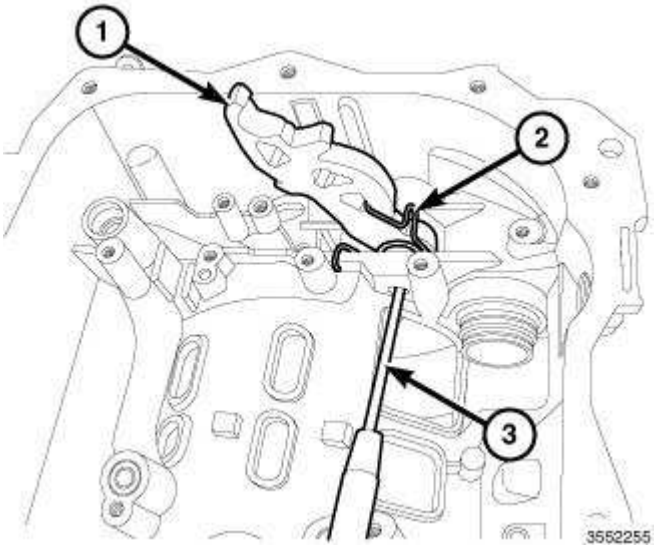

Fig. 86: Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

34. From outside the transmission case, install the park pawl shaft and install the park pawl (1) and spring (2).

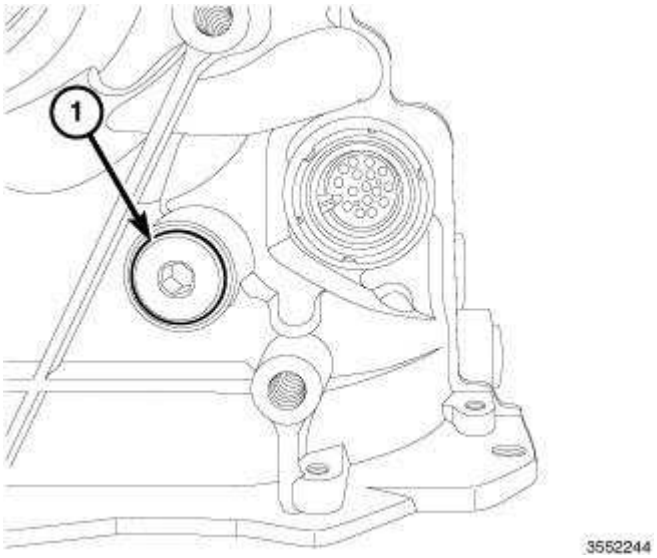

Fig. 87: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

35. Install the park pawl shaft plug (1) into the rear of the case and tighten to 35 N.m (26 ft. lb.).

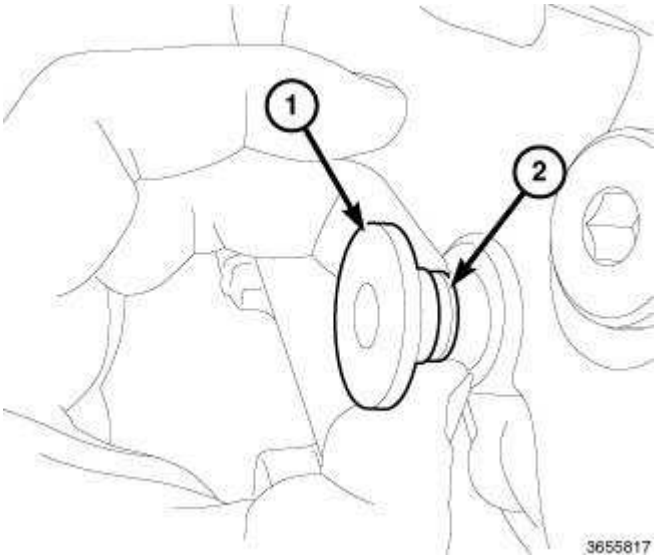

Fig. 88: Spacer & Selector Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

36. Using (special tool #6936, Spacer) (1), install the selector shaft seal (2).

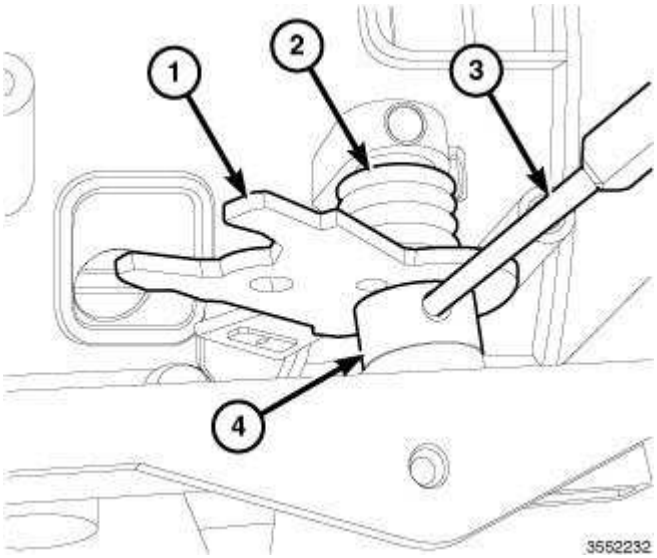

Fig. 89: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

37. Install the shaft (4), spring (2), and fork (1) into the case.
38. Install the roll pin into the selector shaft (4) using a suitable pin punch (3).

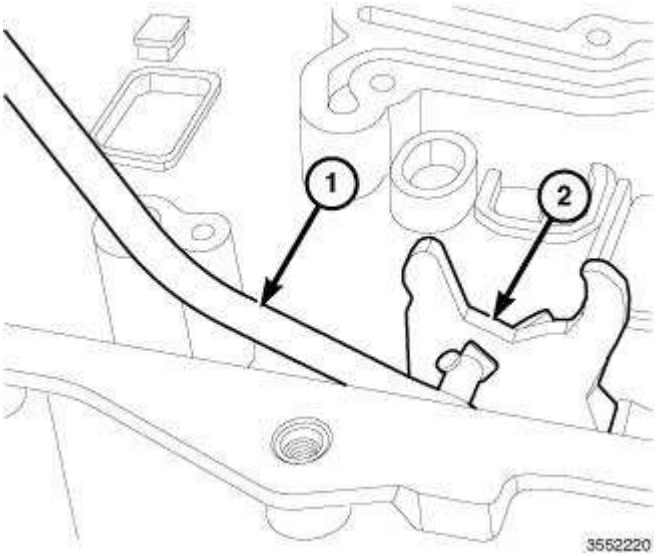

Fig. 90: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

39. Install the park pawl lock rod (1) onto the fork (2).

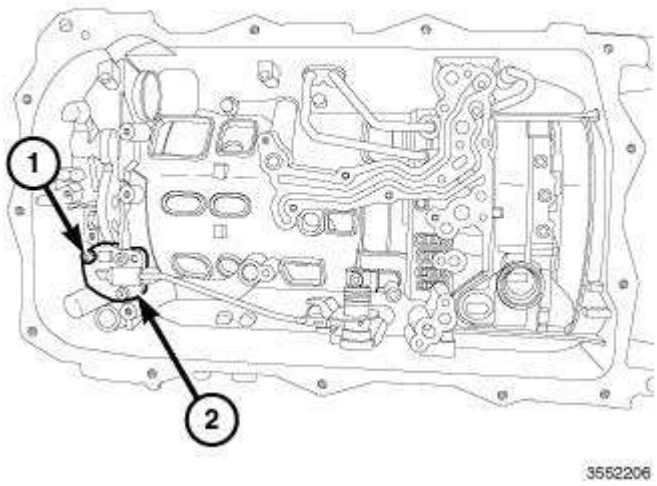

Fig. 91: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

40. Position the park pawl lock rod guide plate (2), install the three park pawl lock rod guide plate retaining screws (1) and tighten to 10 N.m (89 in. lb.).

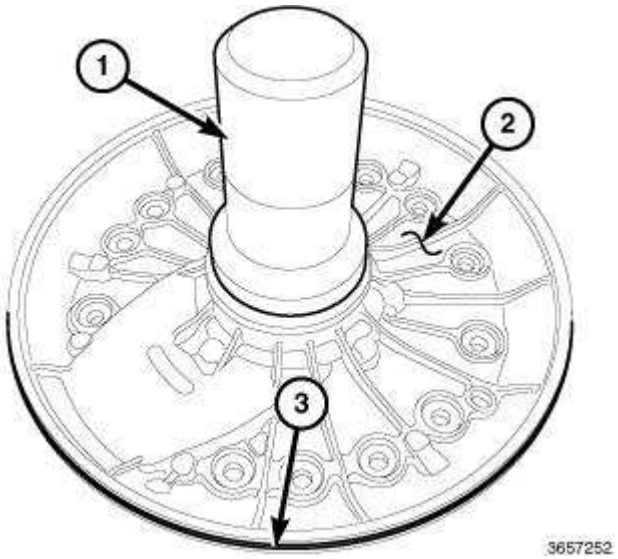

Fig. 92: Oil Pump Cover Lip Seal & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

41. Install the oil pump cover lip seal (3) on the oil pump cover (2).
42. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) (1), install the input shaft seal in the oil pump cover (2).

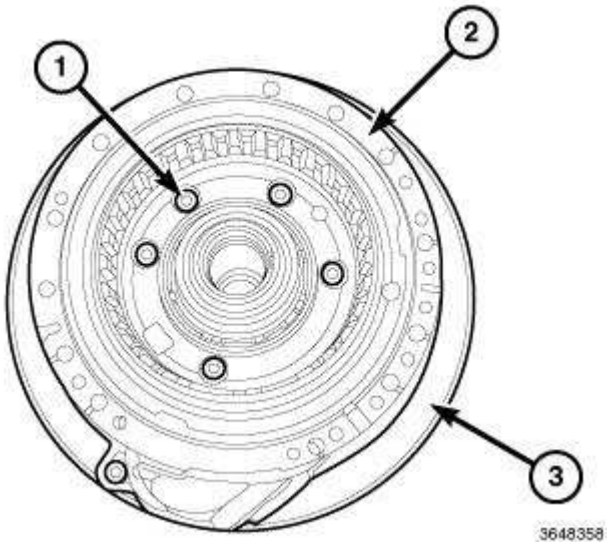

Fig. 93: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

43. Position the oil pump housing (2) and oil pump cover (3) together.
44. Install the five bolts (1) and tighten to 5 N.m (44 in. lb.) plus 45°.

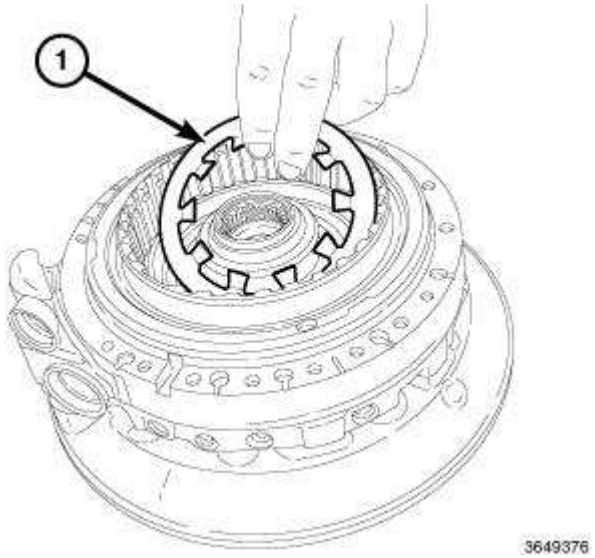

Fig. 94: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

45. Insert the piston and the retaining ring (1) into the housing.

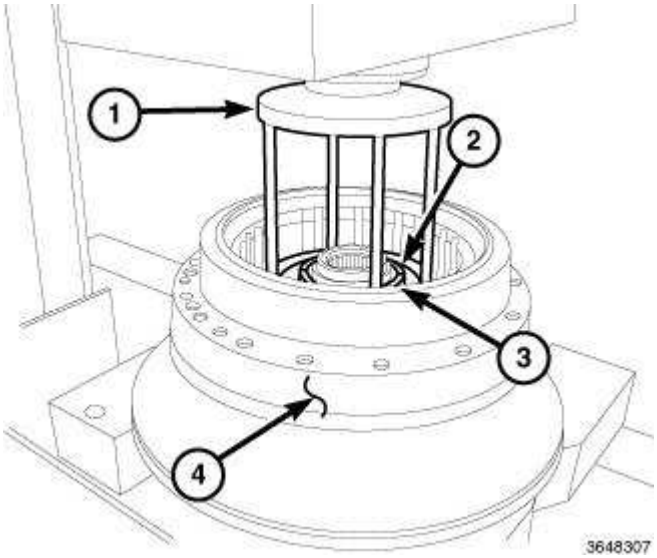

Fig. 95: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

46. Position the oil pump housing assembly (4) in a suitable arbor press.
47. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).

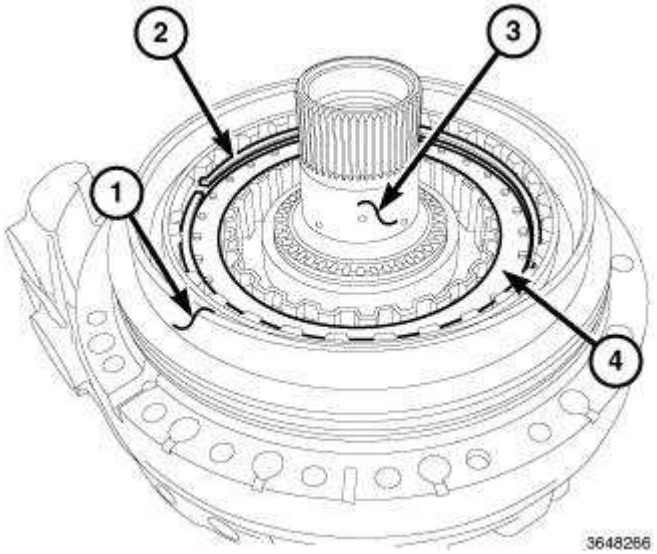

Fig. 96: Outer Ring, Snap Ring & Spacers
Courtesy of CHRYSLER GROUP, LLC

48. Install the hub (3).
49. Install the clutches and spacers (4).
50. Install the snap ring (2).
51. Install the outer ring (1) (below B-piston).

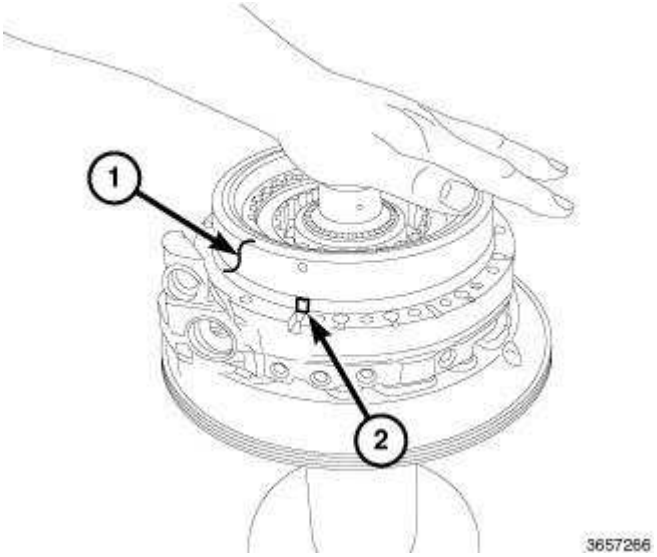

Fig. 97: B-Piston Alignment Tab & B-Piston
Courtesy of CHRYSLER GROUP, LLC

52. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.

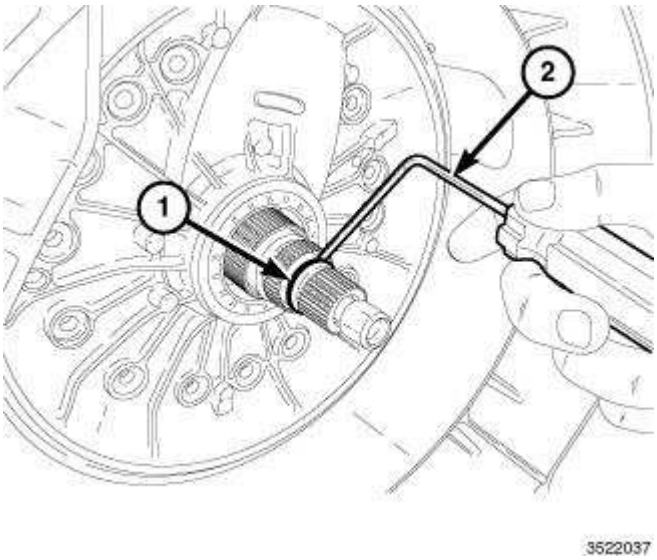

Fig. 98: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

53. Carefully position the oil pump housing assembly into the case.
54. Install the **new** input shaft O-ring.

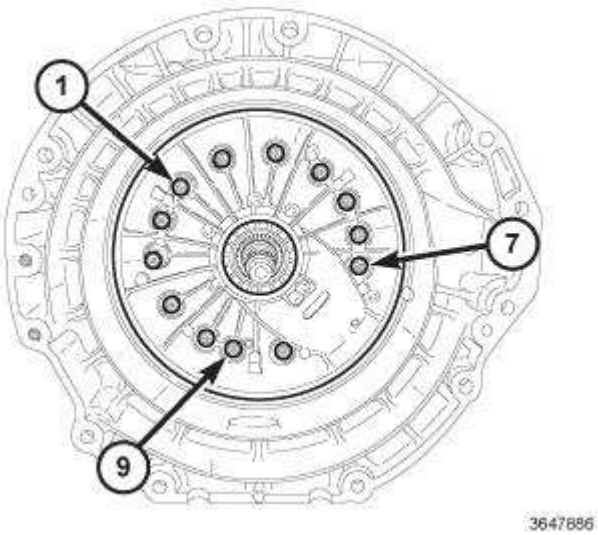

Fig. 99: Pre Tighten Bolts One, Seven And Nine
Courtesy of CHRYSLER GROUP, LLC

55. Install the thirteen oil pump cover retaining bolts and tighten the oil pump cover as follows:
    1. In order to seat the oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    2. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    3. Working in a clockwise pattern, beginning with number one, tighten an additional 90°.

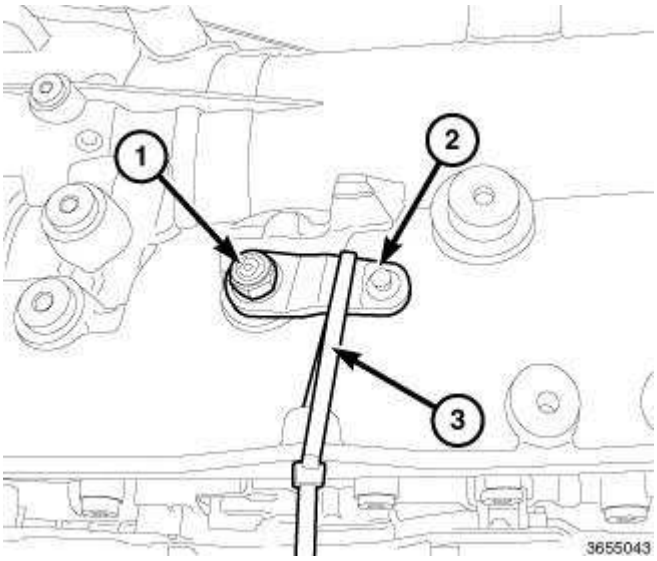

Fig. 100: Manual Park Release Lever & Nut & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual park release lever (2) can be reversed to release tension and ease the installation of the valve body assembly.

56. Temporarily install the manual park release lever (2) to release tension on the shift fork as follows:
    1. Install the manual shift shaft lever (2) 180 degrees offset from its original position.
    2. Install the nut (1) and hand tighten.
    3. Turn the manual park release lever (2) and using a tie strap (3), secure the lever (2) into position so the park release fork is in the same position as it was before valve body assembly removal.

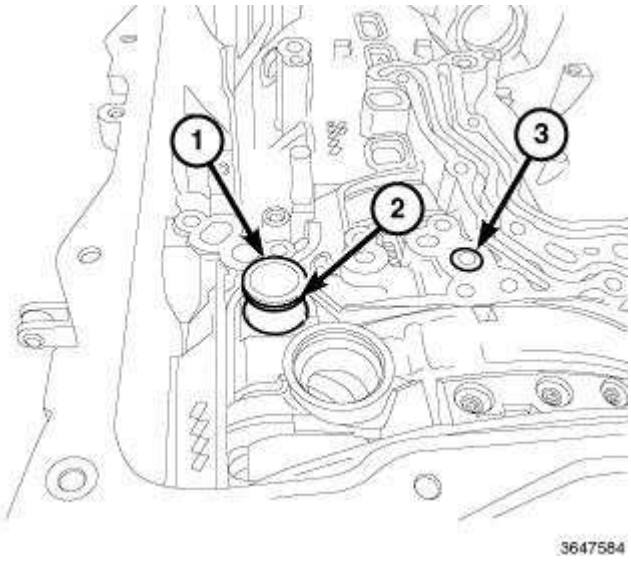

Fig. 101: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

57. Install a new compression seal (3) into the transmission case.
58. Install the fluid port (1) with **new** O-rings to the transmission case.

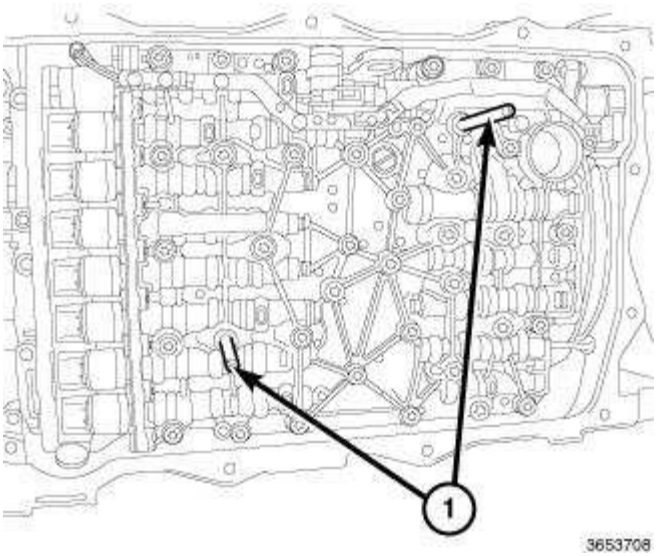

Fig. 102: Pins, Valve Body Alignment & Valve Body Alignment Pins

Courtesy of CHRYSLER GROUP, LLC

59. Install the (special tool #10379, Pins, Valve Body Alignment) (1) in the transmission case as guides for the valve body assembly.

    NOTE: Make sure the shift fork lines up properly.

60. Using the valve body alignment pins (1) to guide, position the valve body assembly to the transmission.

    NOTE: After several bolts have been hand tightened, remove the guide pins (1).

61. Install the fourteen valve body assembly retaining bolts and hand tighten.

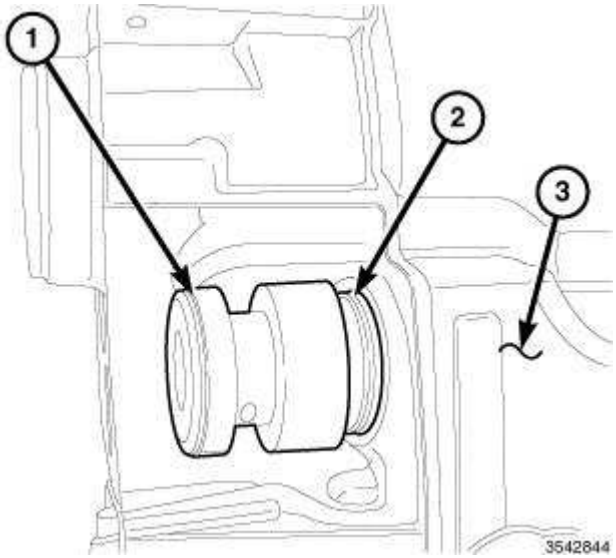

Fig. 103: Remover/Installer, Guide Sleeve
Courtesy of CHRYSLER GROUP, LLC

62. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully install the electrical harness insulator (2) into the transmission case (3).

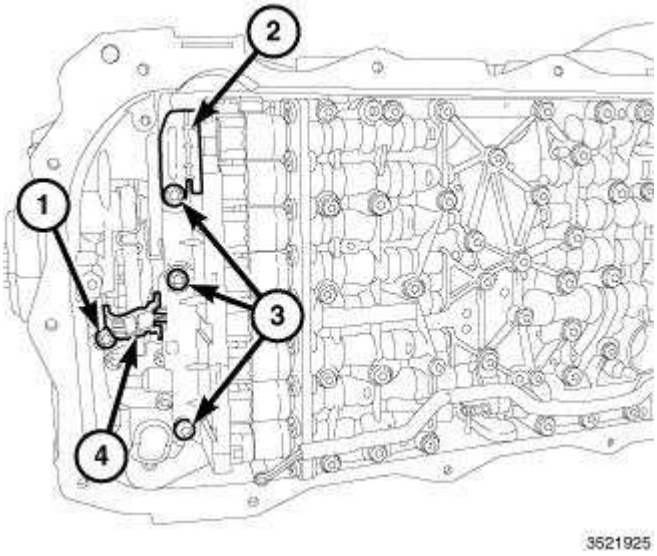

Fig. 104: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

63. Install the sensor (4) and the sensor retaining bolt (1) and hand tighten.
64. Latch the electrical connector insulator lock (2) by pushing in.
65. Install the valve body assembly end retainer bolts (3) and hand tighten.

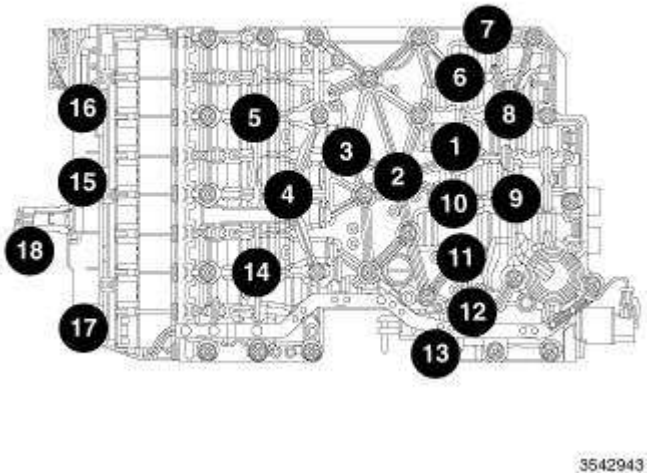

Fig. 105: Valve Body Assembly Retaining Bolts 1-14
Courtesy of CHRYSLER GROUP, LLC

66. Tighten the valve body assembly retaining bolts 1-18 in the sequence shown in illustration to 8 N.m (71 in. lbs.).

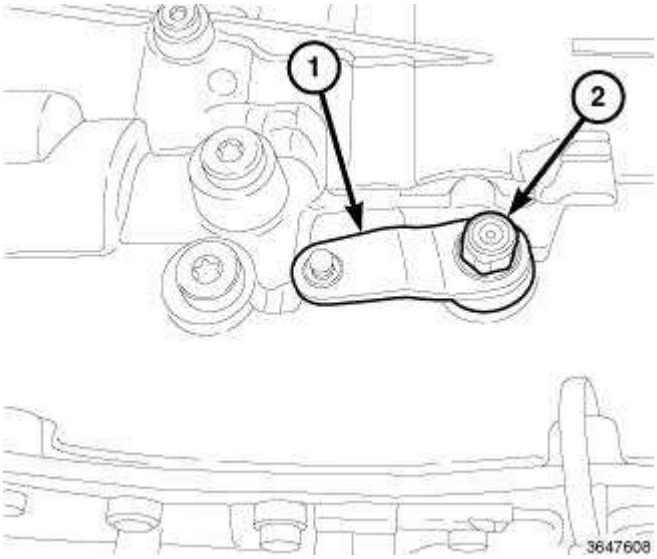

Fig. 106: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

67. Remove the tie strap and return the manual release lever (1) to the original position.
68. Install the nut (2) and tighten to 10 N.m (89 in. lbs.).

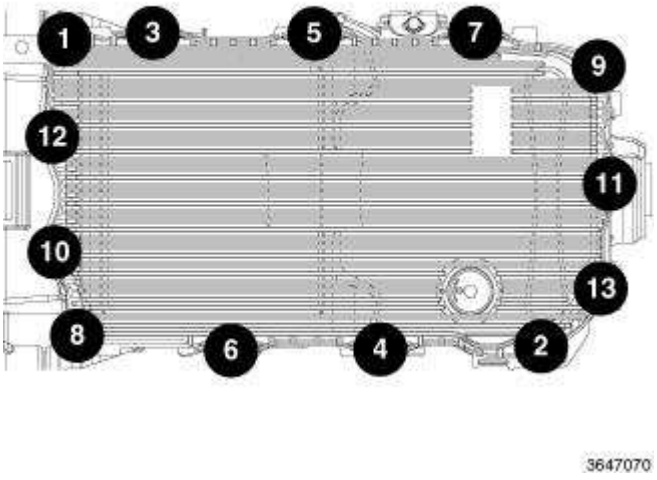

Fig. 107: Oil Pan Retaining Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

69. Position the oil pan and gasket.
70. Install the thirteen oil pan retaining bolts and using the sequence shown in illustration and tighten to 10 N.m (89 in. lbs.).

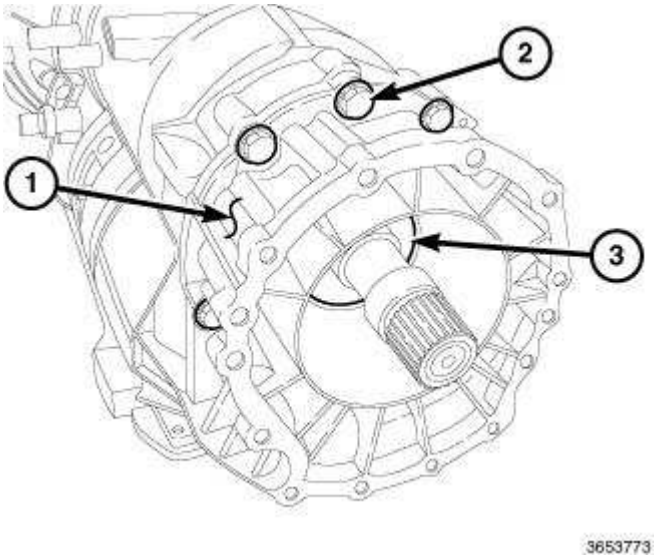

Fig. 108: AWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: AWD only.

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

71. Position the new output shaft seal (3) over the output shaft and against the transmission case.
72. Using (special tool #8481, Installer, Gear) install the output shaft seal.
73. Position the extension housing.
74. Install the seven transmission housing extension bolts (2) and tighten to 27 N.m (20 ft. lbs.).

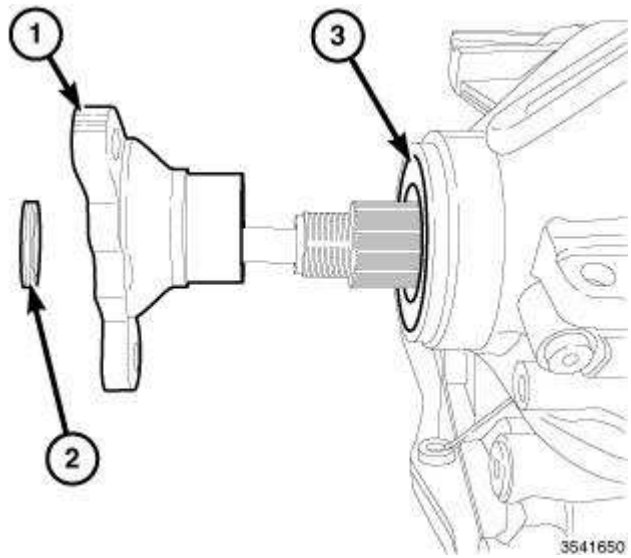

Fig. 109: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD only.

75. Install the transmission output shaft washer.

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

76. Position the new output shaft seal (3) over the output shaft and against the transmission case.
77. Using (special tool #8481, Installer, Gear) install the output shaft seal.
78. Install the transmission rear dust seal (2).
79. Install the propeller shaft flange (1).

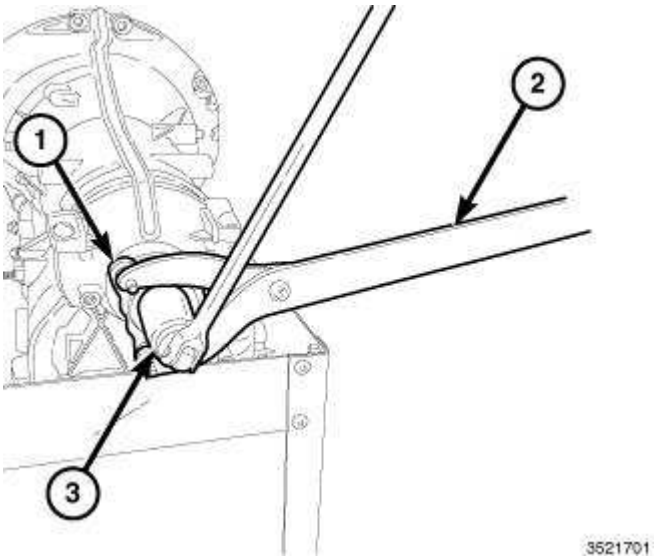

Fig. 110: RWD
Courtesy of CHRYSLER GROUP, LLC

80. Install the **new** propeller shaft flange nut and washer using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1). Tighten to 60 N.m (44 Ft. lbs.).
81. Stake the nut.

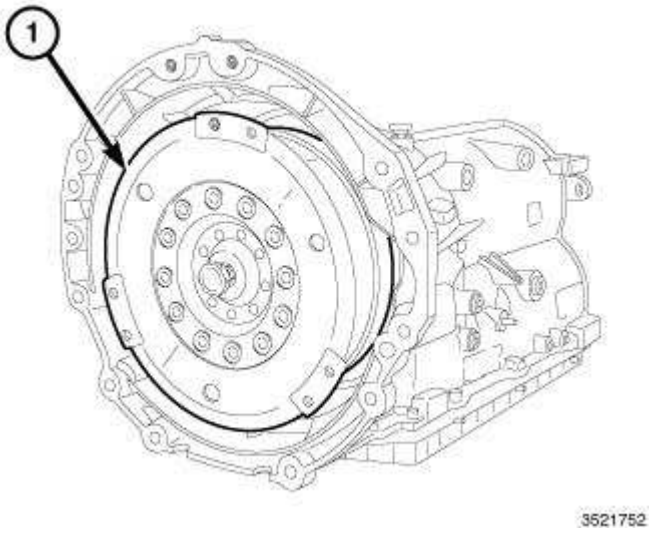

Fig. 111: RWD
Courtesy of CHRYSLER GROUP, LLC

82. Install the torque converter (1). Refer to **TORQUE CONVERTER, INSTALLATION**.
83. Before installing the transmission in the vehicle, pre-fill the transmission as outlined in FILL TRANSMISSION AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

CAUTION: When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.

NOTE: Make sure that the transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.

1. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.

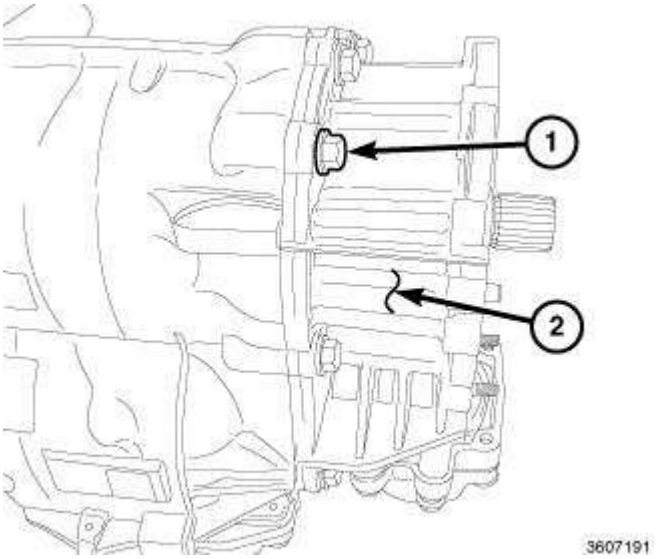

Fig. 112: Seven Extension Housing Bolts & Extension Housing
Courtesy of CHRYSLER GROUP, LLC

2. **For AWD only** , position the extension housing (2), install the seven bolts (1) and tighten to 27 N.m (20 ft. lbs.).

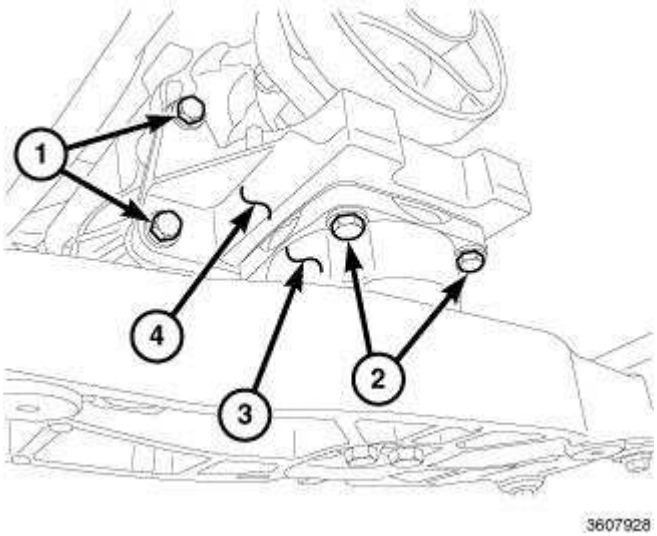

Fig. 113: Four Transmission Mount Bolts & Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

3. **For RWD only** , position the adapter bracket (4), install the adapter bracket bolts (1) and tighten to 33 N.m (24 ft. lbs.).
4. **For RWD only** , position the rear transmission mount (3), install the transmission mount bolts (2) and tighten to 33 N.m (24 ft. lbs.).

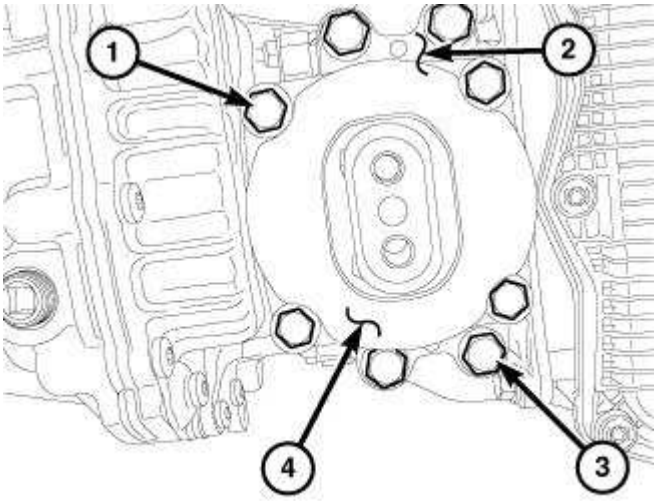

Fig. 114: Four Rear Transmission Mount Bolts, Rear Transmission Mount, Adapter Bracket Bolts & Adapter
Courtesy of CHRYSLER GROUP, LLC

5. **For AWD only** , position the adapter bracket (2), install the adapter bracket bolts (3) and tighten to 33 N.m (24 ft. lbs.).
6. **For AWD only** , position the rear transmission mount (4), install the rear transmission mount bolts (1) and tighten to 33 N.m (24 ft. lbs.).

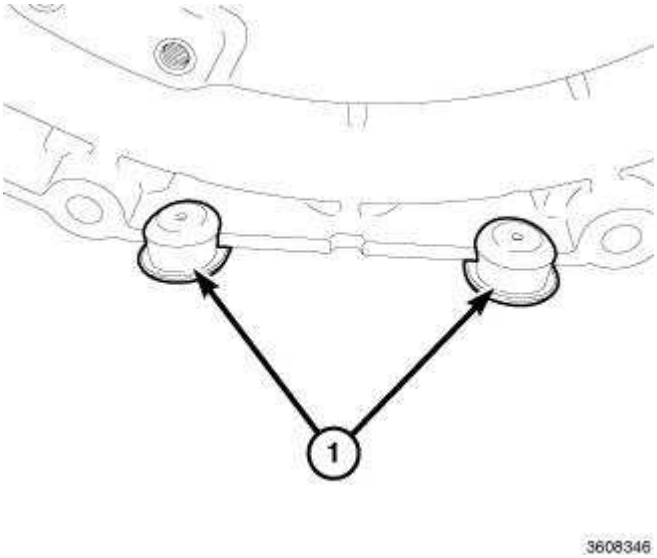

Fig. 115: Rubber Access Plugs
Courtesy of CHRYSLER GROUP, LLC

7. Verify that the rubber access plugs (1) are installed in the front of the transmission.

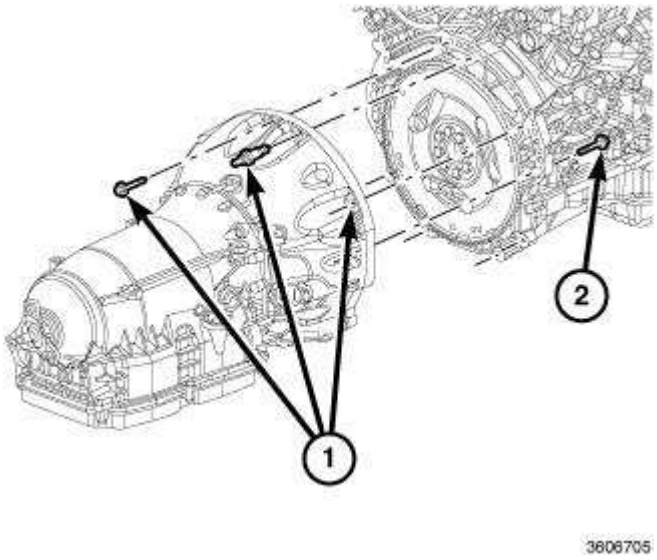

Fig. 116: RWD
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hold torque converter in place during transmission installation.

8. Position the transmission to the vehicle.
9. Install the upper bell housing bolts (1, 2) securing the bell housing to the engine block. Do not tighten at this time.

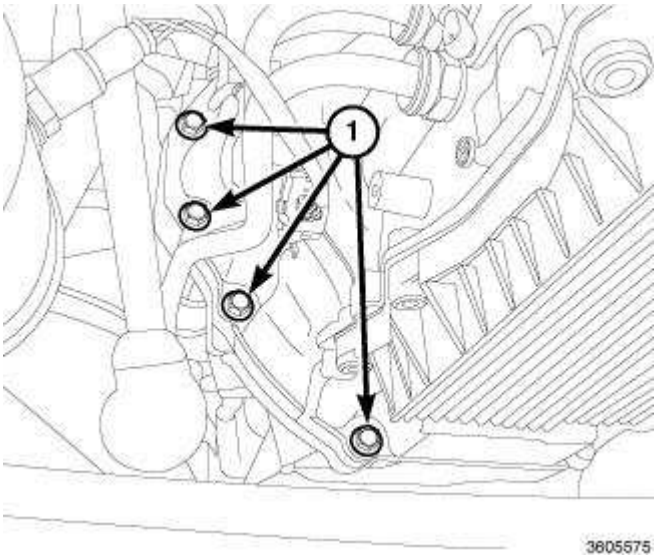

Fig. 117: Bell Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the LH bell housing bolts (1). Do not tighten at this time.

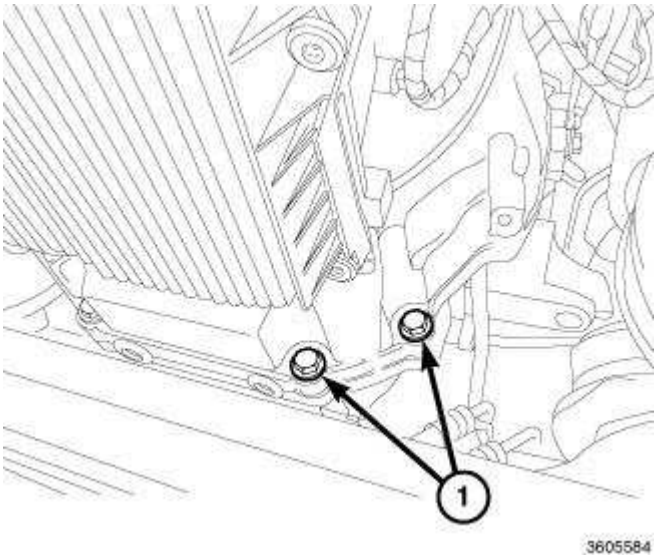

Fig. 118: Bell Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the RH bell housing bolts (1). Tighten **all** the bell housing bolts to 55 N.m (41 ft. lbs.)

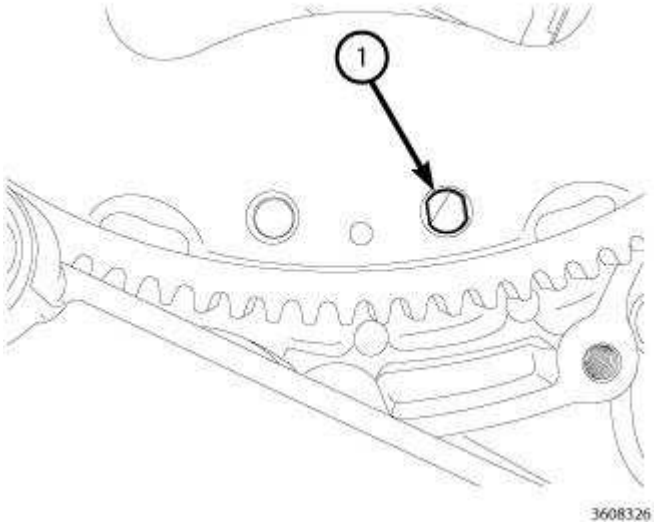

Fig. 119: Alignment Hole
Courtesy of CHRYSLER GROUP, LLC

12. Rotate crankshaft in clockwise direction to line up the alignment hole (1) in the flex plate, then start the first bolt.

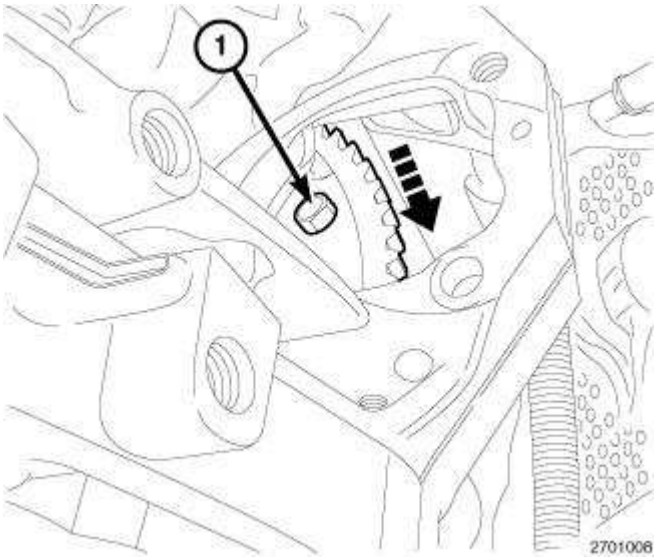

Fig. 120: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

13. Rotate crankshaft in clockwise direction until converter bolts (1) are accessible. There are three sets of two bolts 120° apart. Install the remaining bolts and tighten to 42 N.m (31 ft. lbs.).

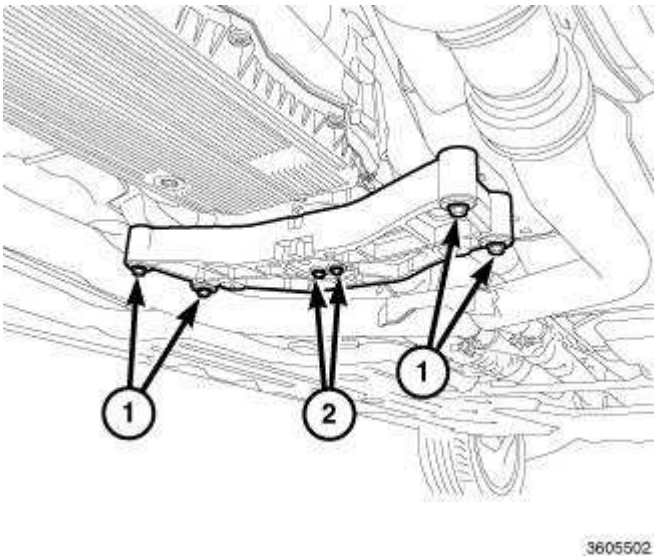

Fig. 121: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Position the crossmember, install the bolts (1) to the frame and tighten to 65 N.m (48 ft. lbs.).
15. Install the bolts (2) securing rear support and cushion to the cross member and tighten to 65 N.m (48 ft. lbs.).

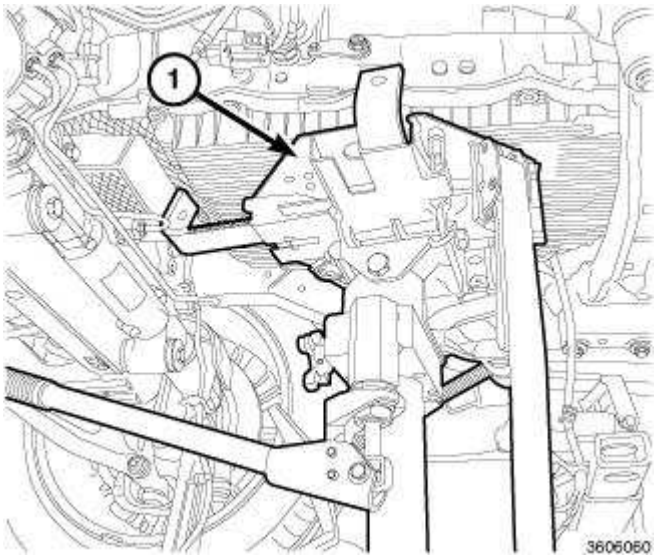

Fig. 122: Service Jack
Courtesy of CHRYSLER GROUP, LLC

16. Remove the transmission jack (1).

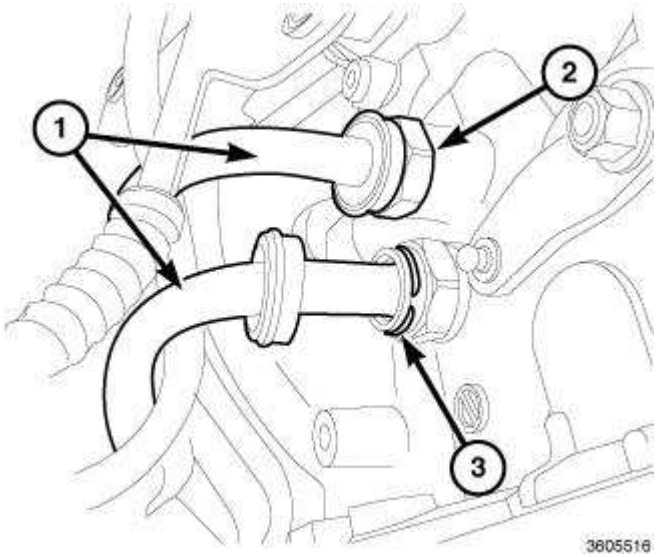

Fig. 123: Transmission Fluid Cooler Lines, Clips & Fittings
Courtesy of CHRYSLER GROUP, LLC

17. Connect transmission fluid cooler lines (1) at transmission fittings (2) and install the clips (3).

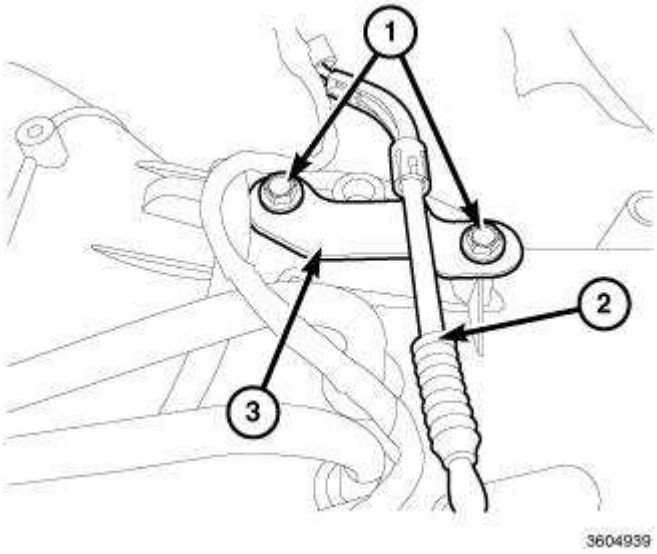

Fig. 124: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

18. Position the manual park release cable bracket/cable (2, 3), install the bolts (1) and tighten to 20 N.m (15 ft. lbs.).

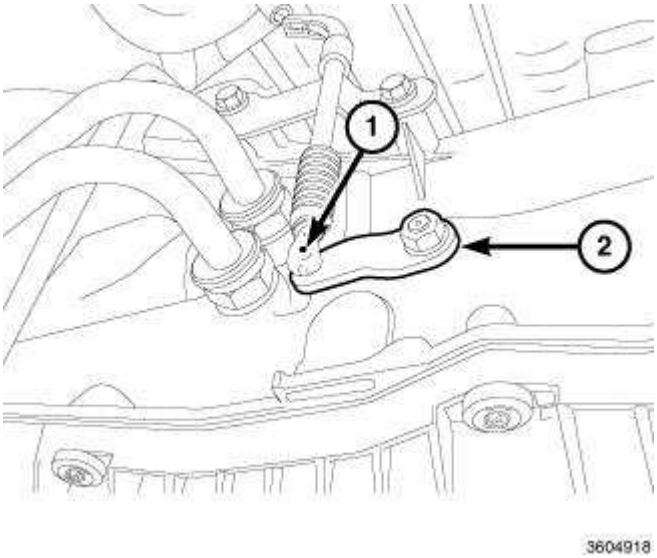

Fig. 125: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

19. Connect the parking pawl release cable (1) to the lever (2).
20. Connect the negative battery cable.
21. Connect the right and left bank up stream oxygen sensors.
22. Install the complete exhaust system.
23. Install the transfer case if equipped. Refer to **INSTALLATION** .
24. Install the rear propeller shaft (RWD). Refer to **INSTALLATION** .

25. Install the starter. Refer to **STARTER, INSTALLATION** .

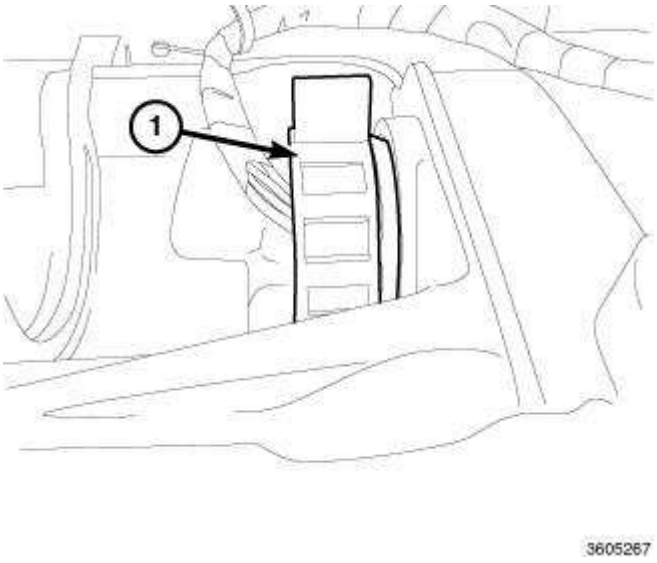

Fig. 126: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

26. Connect the adapter plug connector (1) to the transmission.

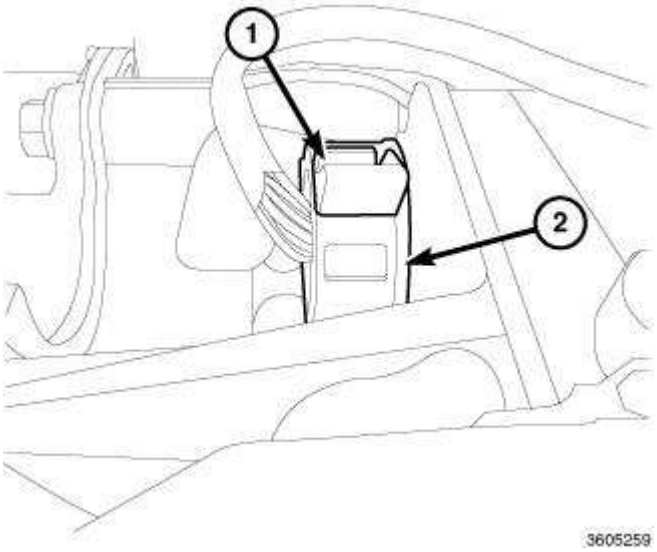

Fig. 127: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

27. Turn the locking mechanism lock (1) of the adapter plug connector (2) clockwise to secure.
28. Perform the STANDARD PROCREDURE - TRANSMISSION FILL AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

C-4171 - Driver Handle, Universal (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.) C-637 - Slide Hammer, Universal (Originally Shipped In Kit Number(s) 9202.)

CABLE, MANUAL PARK RELEASE

OPERATION

OPERATION

The 8HP45 utilizes a fully electronic shifter mechanism with no physical connections to the transmission such as shifter linkage or cables. Due to this design the park function of the

transmission is performed using electronic inputs and hydraulic pressure to hold to parking pawl lever in the disengaged position while moving. Once in park this hydraulic pressure is reduced which allows the lever to engage the parking pawl which in turn keeps the vehicle from rolling forward or rearward.

Should the vehicle or any component of the E-Shifter lose power or communication the parking pawl will be engaged and the vehicle cannot be moved. To move the vehicle there is a manual park release mechanism that will allow first responders to disengage the parking pawl and allow the vehicle to be moved further facilitating vehicle recovery such as towing or moving the vehicle to allow jump starting.

REMOVAL

REMOVAL

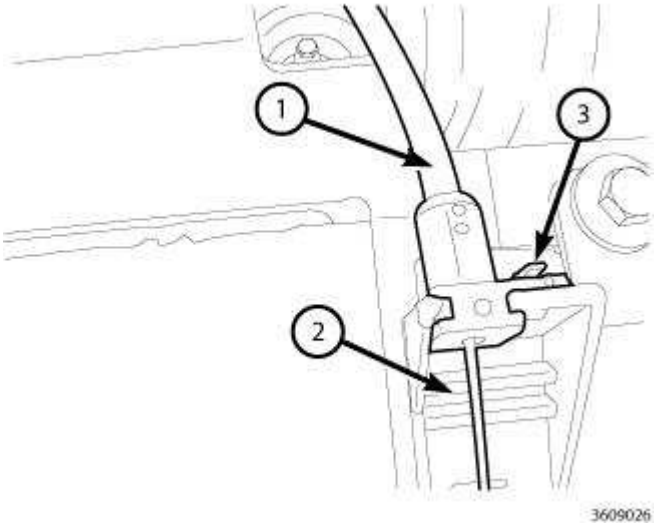

Fig. 128: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the shifter bezel.
3. Disconnect the cable (1) from the housing (2), while holding the release tab (3) open.
4. Disconnect the cable from the lever.
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

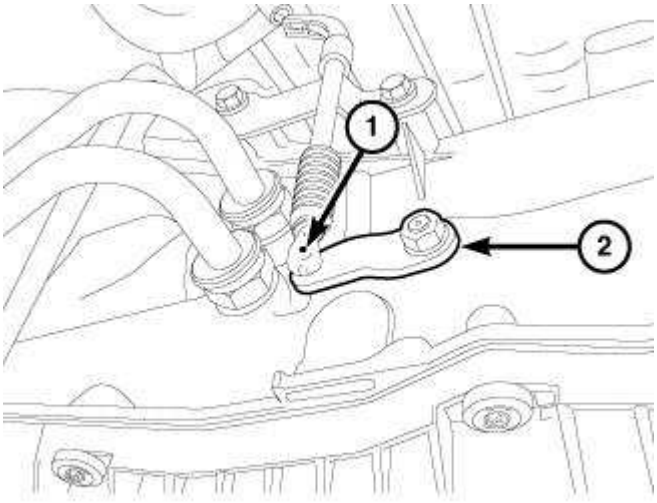

Fig. 129: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

6. Using a flat bladed tool, disconnect the cable (1) from the transmission lever (2).

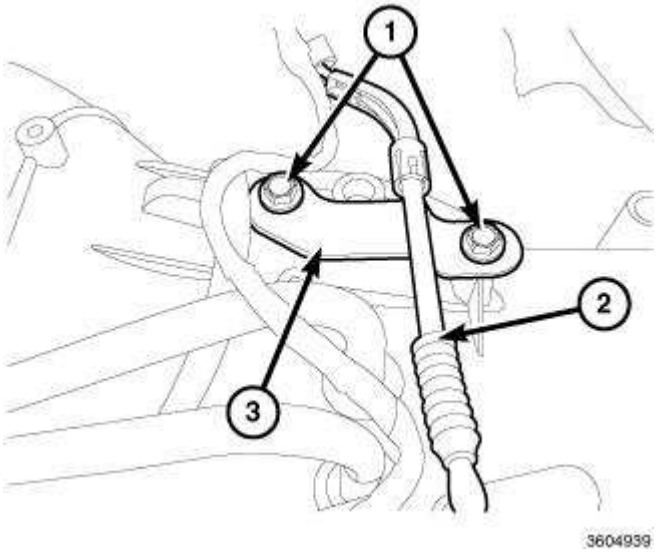

Fig. 130: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

7. Remove the cable retention bracket bolts (1) and remove the cable (2) from the vehicle.

INSTALLATION

INSTALLATION

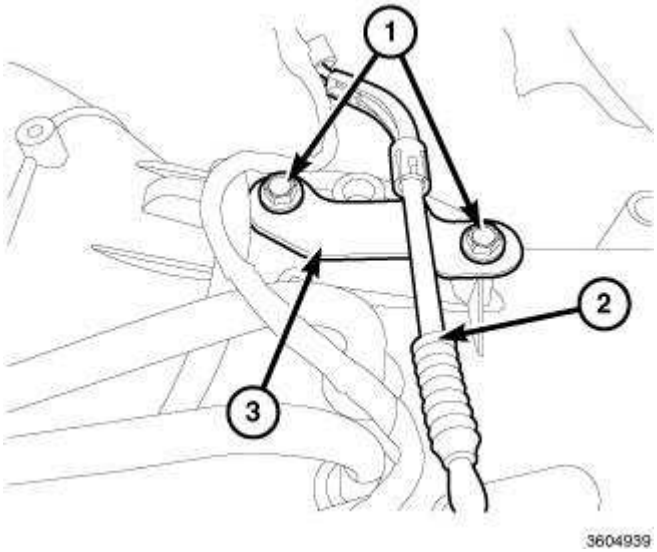

Fig. 131: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

1. Install the cable (2) to the vehicle. Install the cable retention bracket bolts (1) and tighten to 20 N.m (15 ft. lbs.).

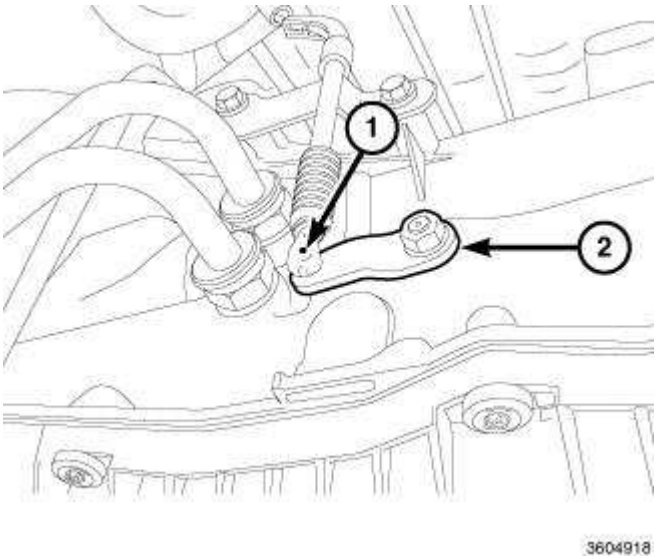

Fig. 132: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

2. Connect the cable (1) to the transmission lever (2).
3. Lower the vehicle.

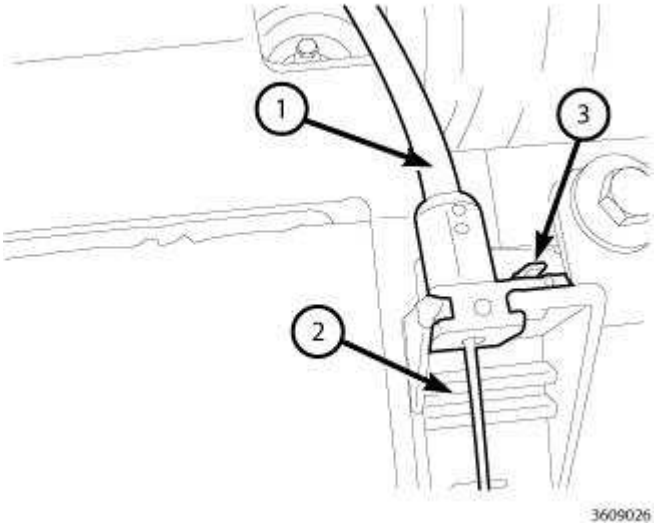

Fig. 133: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

4. Connect the cable end (2) to the lever.
5. Connect the cable (1) to the housing.
6. Install the shifter bezel.
7. Connect the negative battery cable.

FLUID AND FILTER

DESCRIPTION

DESCRIPTION

FILTER SERVICE

The 8HP45 has a conventional fluid sump design, however, the filter is integrated into the oil pan resulting in a lower profile for improved vehicle packaging. The oil pan gasket is reusable providing it is not damaged during removal.

STANDARD PROCEDURE

STANDARD PROCEDURE - CHECK OIL LEVEL

To properly check and fill the transmission, perform the following procedure:

WARNING: There is a risk of accident from vehicle starting off by itself when engine running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

1. Raise and support the vehicle **on a level hoist** . Refer to **HOISTING, STANDARD PROCEDURE** .
2. Start the engine.
3. Using a scan tool or the vehicle information center, verify that the transmission fluid temperature is below 30°C (86°F).
4. Disable traction control (ESC).
5. Remove the fill plug from the right rear of the transmission case.
6. Add transmission fluid until it trickles from the fill opening.
7. Install the fill plug.
8. Lower the vehicle for access to inside of the vehicle, leaving the tires at least 8 inches off the ground.
9. With the brakes applied, place the transmission in Reverse and hold for 5 seconds.
10. Place the transmission in Drive and hold for 5 seconds.
11. Release the brakes, slowly accelerate to 2nd gear and hold for 5 seconds.
12. Apply the brakes and place the transmission in Neutral.
13. Raise the engine speed to 2000 RPM for 5 seconds.
14. Return the engine to idle and place the transmission in Park.

NOTE: A full transmission will have fluid at the fill hole with the transmission between 30°C (86°F) and 50°C (122°F). Do not over fill.

15. Remove the fill plug and allow excess fluid to drain from fill hole or add fluid as necessary.
16. Install the fill plug.
17. Using a scan tool, clear any DTCs.

STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS .

To properly fill the transmission after an in vehicle service or overhaul, perform the following procedure:

NOTE: **If the transmission cooler was replaced, add an additional 0.7L (0.72 qts) of transmission fluid.**

1. **If the transmission was overhauled** , prior to installing in the vehicle, tip the transmission on it side, remove the oil fill plug on the right rear side of the case and install 9L (9.5 qts) of transmission fluid. Install the fill plug. After installing the transmission, perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
2. **If an in vehicle service was performed** , raise and support the vehicle **on a level hoist** , remove the oil fill plug on the right rear side of the case and install transmission fluid until it drips from the fill hole. Refer to **HOISTING, STANDARD PROCEDURE** . Install the fill plug and perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

STANDARD PROCEDURE - FLUID/FILTER SERVICE

NOTE: **The oil pan and filter are an integrated assembly that cannot be serviced separately.**

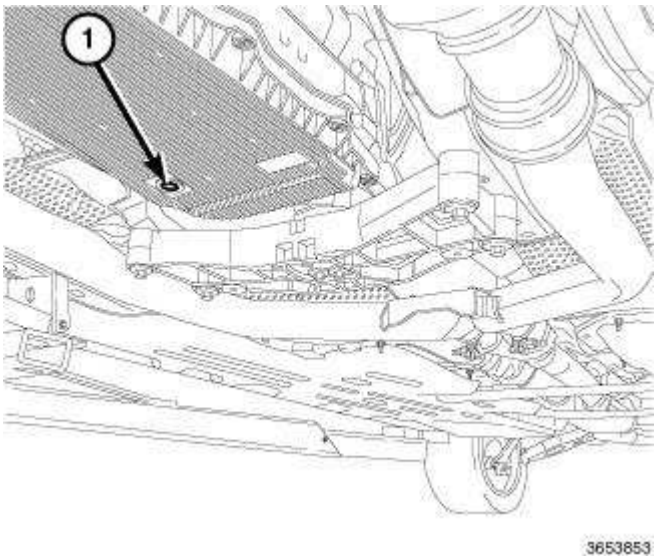

Fig. 134: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

1. Raise the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the transmission oil pan plug and allow the transmission to drain.

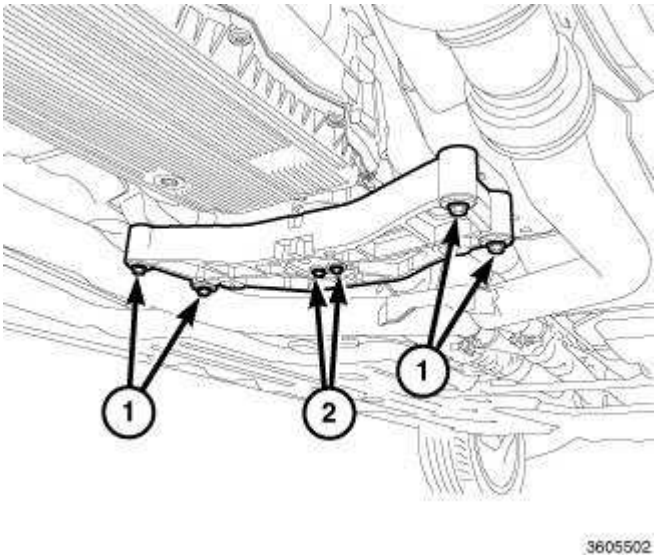

Fig. 135: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Support the transmission with a suitable stand.
4. Remove the bolts (2) securing rear support and cushion to the crossmember.
5. Remove the bolts attaching the crossmember (1) and remove the crossmember.

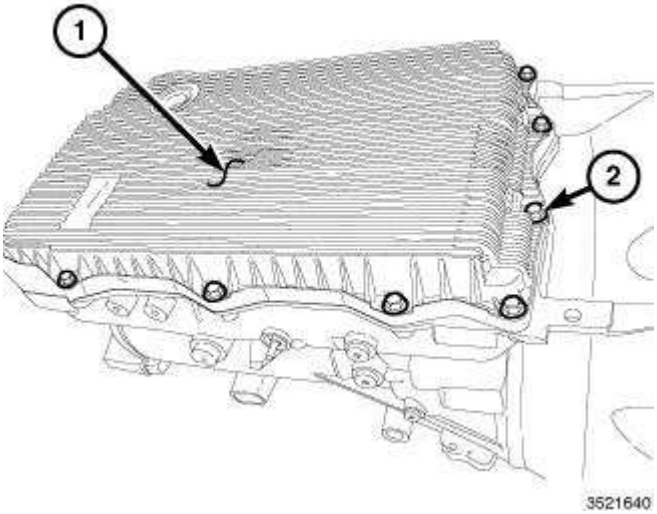

Fig. 136: Thirteen Oil Pan Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.

6. Remove the 13 oil pan retaining bolts (2).
7. Remove the oil pan (1) and gasket. If the pan is being removed for contamination concerns discard the pan.

8. Install the **new** oil pan (1) and gasket.

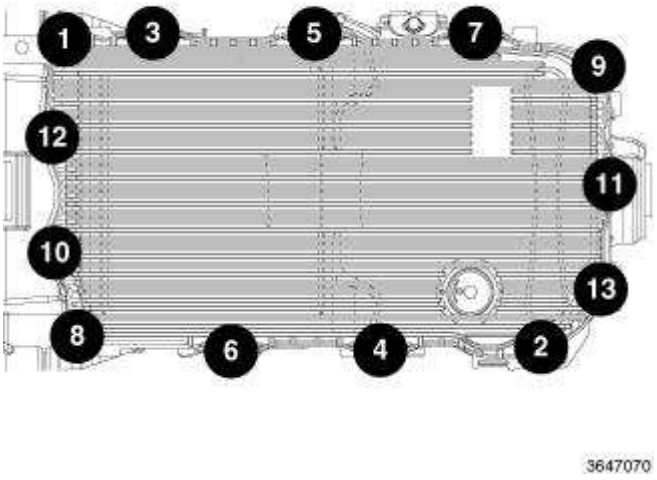

Fig. 137: Oil Pan Retaining Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

9. Install the 13 oil pan retaining bolts and tighten to 10 N.m (89 in. lbs.) using the sequence given.

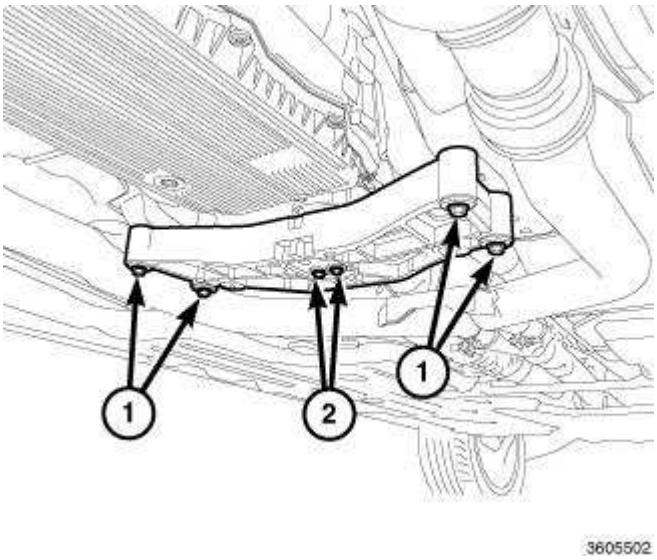

Fig. 138: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install bolts attaching crossmember (1) to body and Install cross member. Tighten the fasteners to 65 N.m (48 ft. lbs.)
11. Install bolts (2) securing rear support and cushion to the cross member and Install. Tighten the fasteners to 65 N.m (48 ft. lbs.)

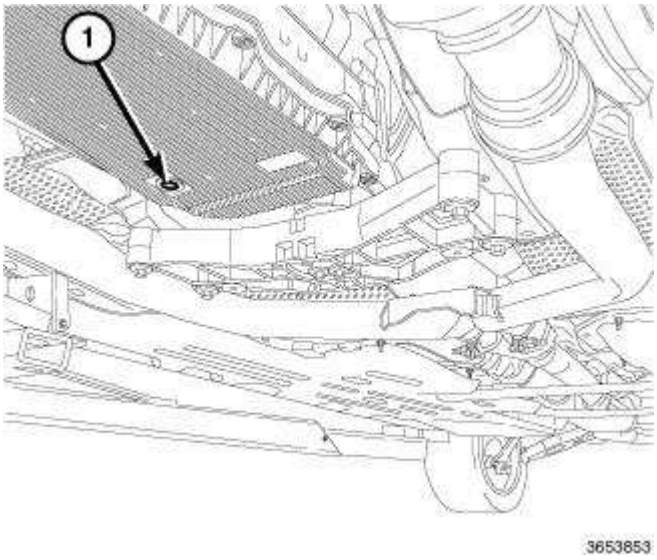

Fig. 139: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

12. Inspect and adjust the fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
13. Lower the vehicle.

LEVER, MANUAL PARK RELEASE

REMOVAL

REMOVAL

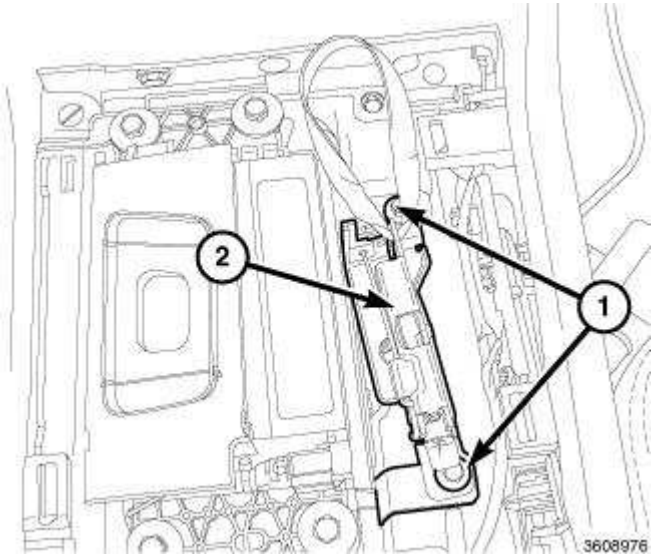

Fig. 140: Bolts & Lever Mechanism
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.

2. Remove the shifter bezel.
3. Remove the bolts (1) securing the lever mechanism (2) to the mounting bracket.

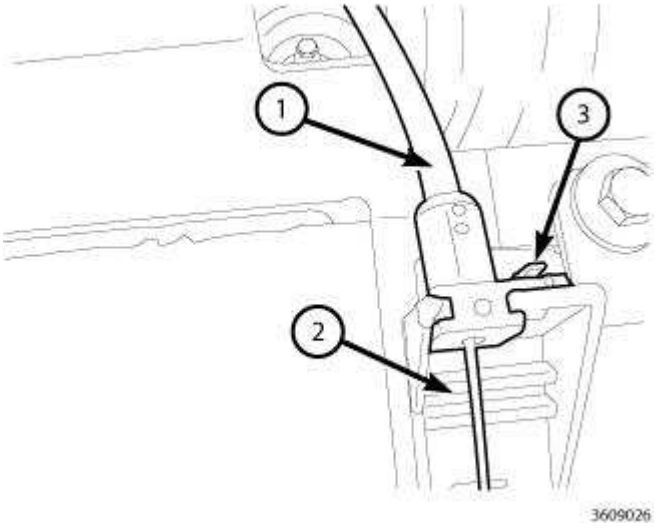

Fig. 141: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the cable (1) from the housing (2), while holding the release tab (3) open.
5. Remove the cable from the lever and remove the lever from the vehicle.

INSTALLATION

INSTALLATION

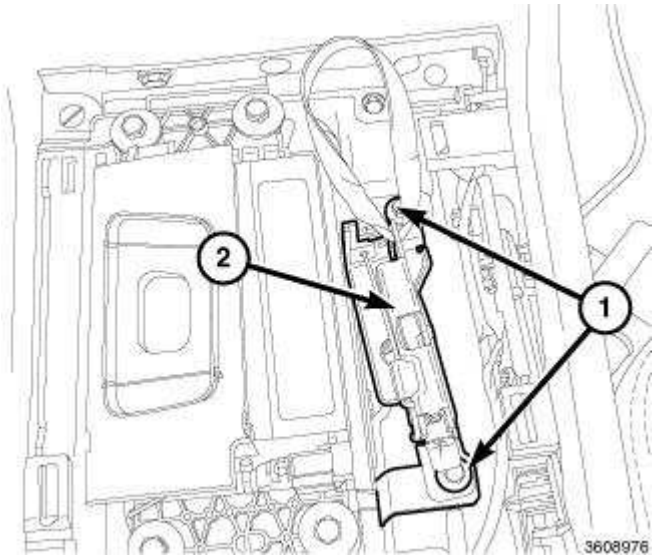

Fig. 142: Bolts & Lever Mechanism
Courtesy of CHRYSLER GROUP, LLC

1. Connect the cable to the lever.
2. Install the bolts (1) securing the lever mechanism (2) to the air ducting and tighten to 10 N.m (89 in. lb.).

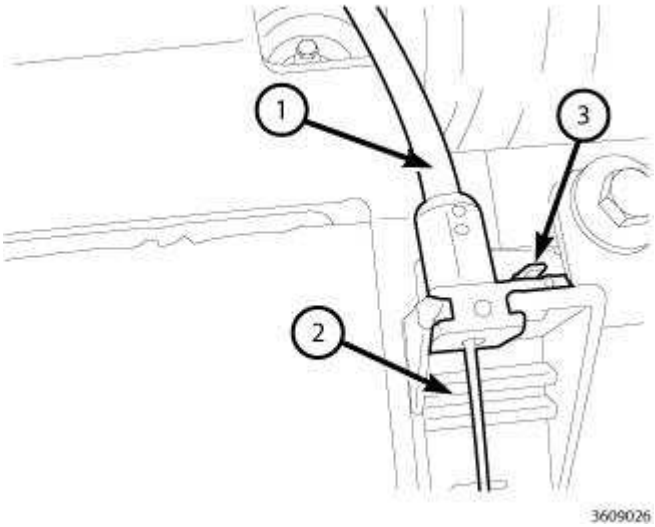

Fig. 143: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

3. Connect the cable to the housing.
4. Install the shifter bezel.
5. Connect the negative battery cable.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

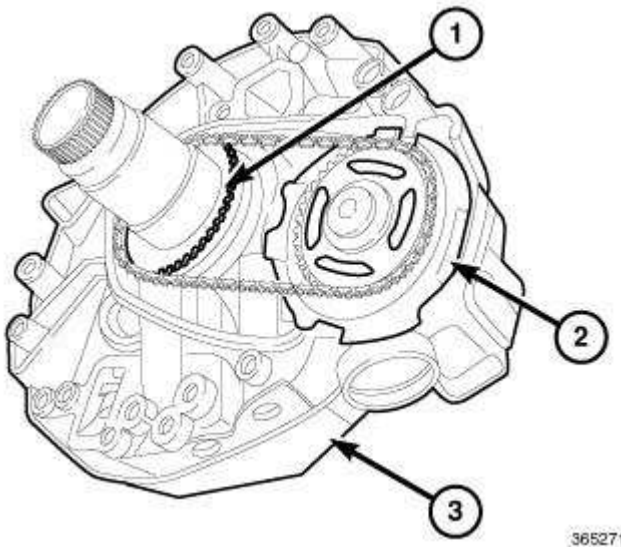

Fig. 144: Transmission Oil Pump & Chain And Sprocket
Courtesy of CHRYSLER GROUP, LLC

The transmission oil pump (2) is driven by a chain and sprocket (1). The oil pump is located just behind the torque converter, inside of the pump housing (3). The pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports. The pump provides necessary lubrication and cooling throughout all phases of transmission operation.

OPERATION

OPERATION

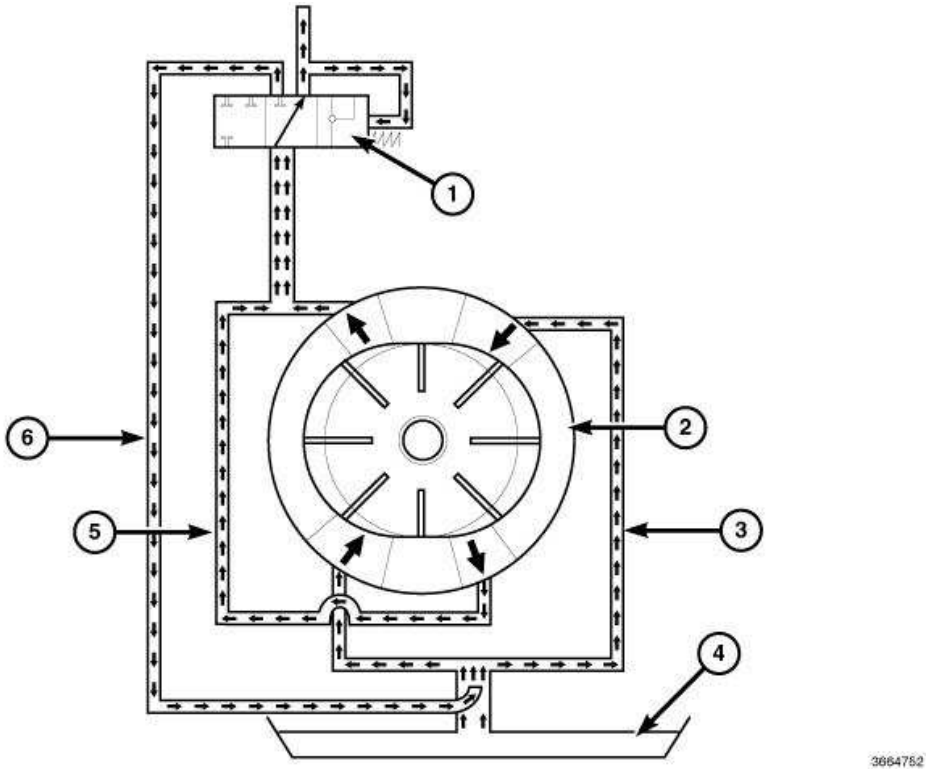

Fig. 145: System Pressure Valve, Sump Pump Pressure, Pipe Intake Pipe Return Of Redundant Oil
Courtesy of CHRYSLER GROUP, LLC

1- SYSTEM PRESSURE VALVE	4 - SUMP
2 - PUMP	5 - PRESSURE PIPE
3 - INTAKE PIPE	6 - RETURN OF REDUNDANT OIL

The transmission oil pump is driven by a chain and sprocket. The oil pump has two intake ports and two exhaust ports. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to return to the pump. This reduces cavitation and noise.

REMOVAL

REMOVAL

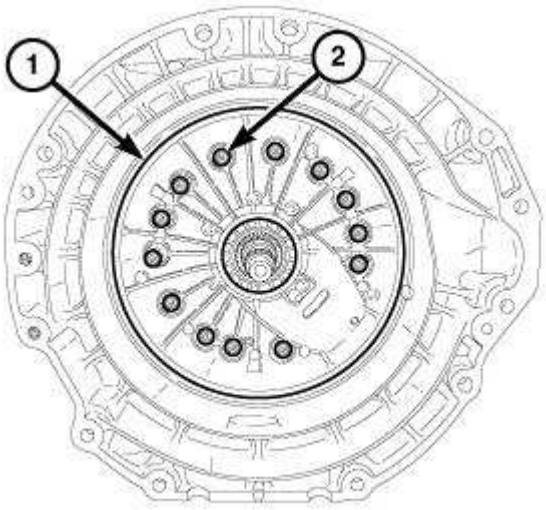

Fig. 146: Thirteen Oil Pump Housing Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL**.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
3. Remove the thirteen oil pump assembly to case bolts (2).

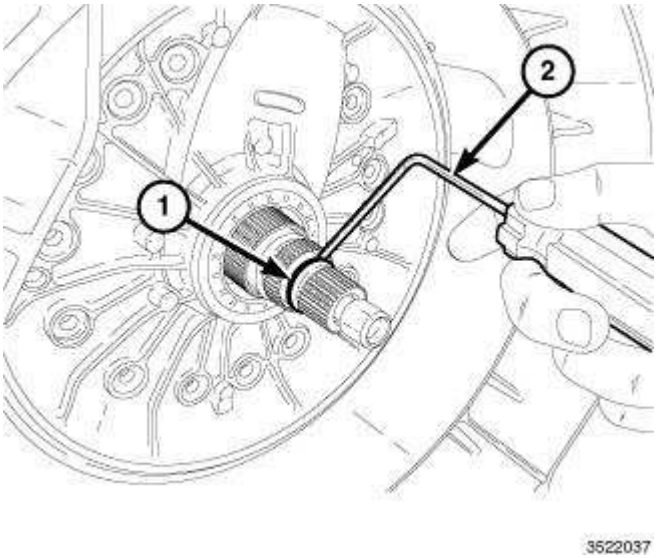

Fig. 147: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

4. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.

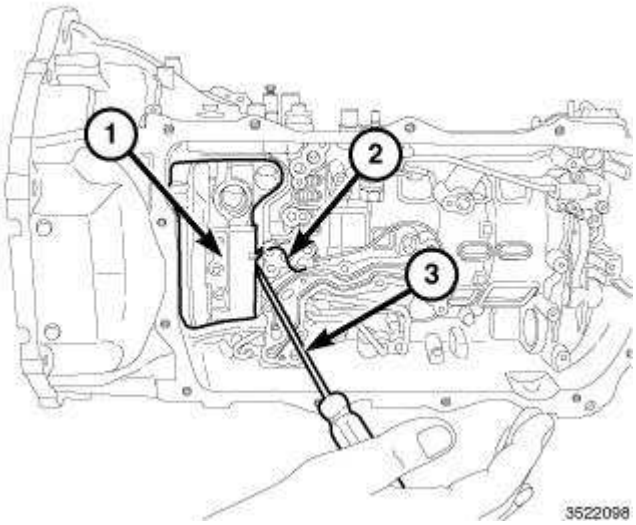

Fig. 148: Oil Pump Housing, Case & Small Flat Blade Screwdriver
Courtesy of CHRYSLER GROUP, LLC

5. Carefully pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver (3) or equivalent through the case opening.
6. From the front of the transmission, remove the oil pump housing.

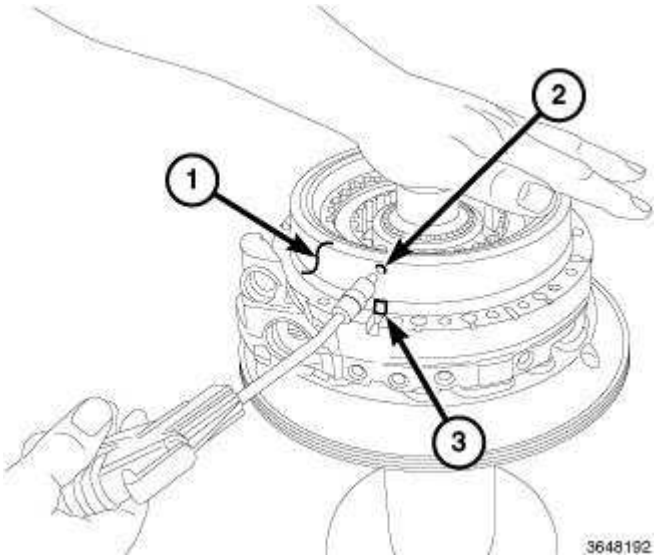

Fig. 149: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply air pressure slowly, oil may spray when B-piston releases from the assembly.

7. With one hand above B-piston (1), carefully apply air pressure into the hole directly above the B-piston alignment tab (3) to remove B-piston (2) from the assembly.

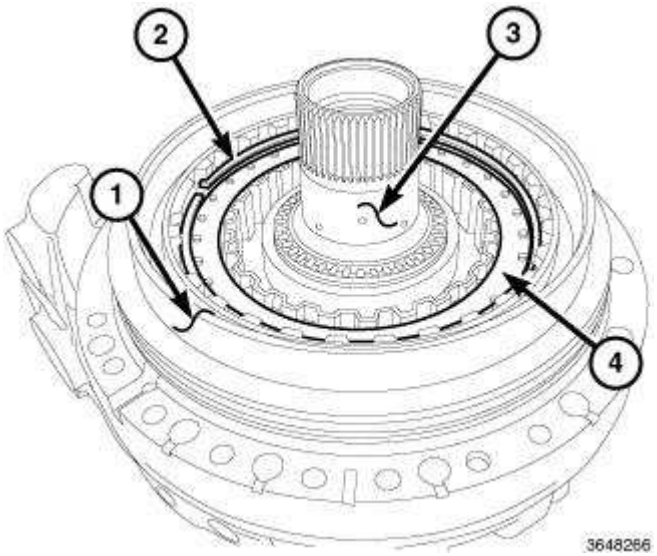

Fig. 150: Outer Ring, Snap Ring & Spacers

6. Install the hub (3).
7. Install the clutches and spacers (4).
8. Install the snap ring (2).
9. Install the outer ring (1) (inside B-piston).
10. Install the B-piston.

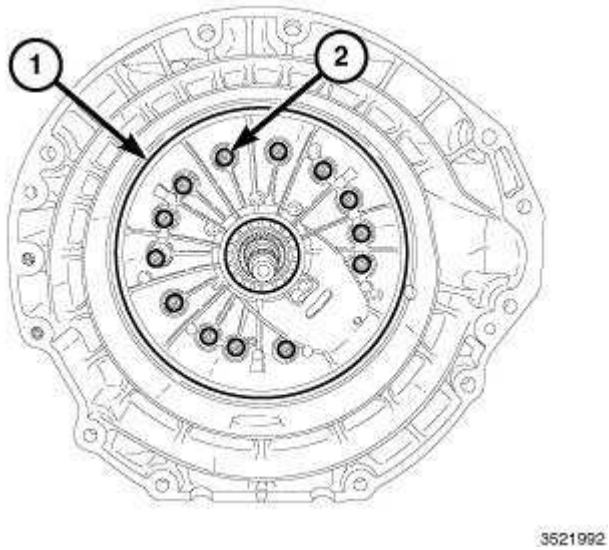

Fig. 161: Thirteen Oil Pump Housing Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the 13 **new** oil pump cover retaining bolts (2) and tighten the oil pump cover as follows:
    1. In order to seat the oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).

2. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
3. Working in a clockwise pattern, beginning with number one, tighten an additional 90°.

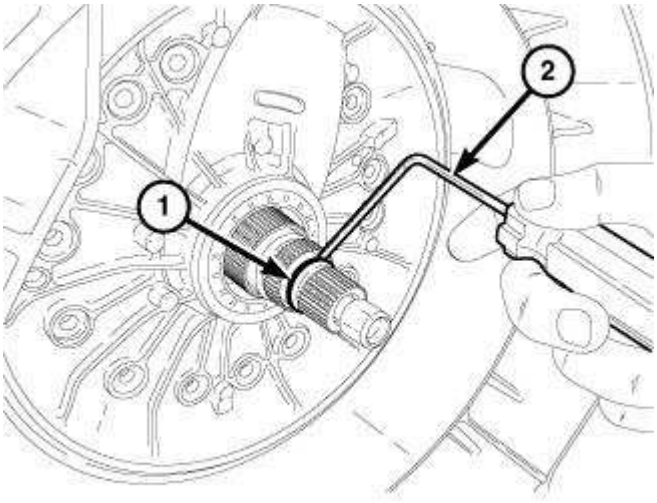

Fig. 162: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

12. Install the **new** input shaft O-ring (1).
13. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
14. Install the transmission. Refer to **INSTALLATION**.

SEAL, OUTPUT SHAFT

REMOVAL

REAR WHEEL DRIVE

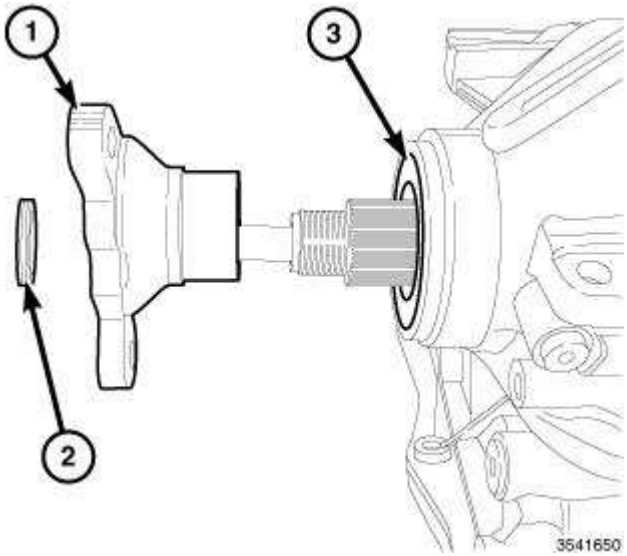

Fig. 163: RWD
Courtesy of CHRYSLER GROUP, LLC

1. Remove the propeller shaft. Refer to **REMOVAL** . Move propeller shaft to the right and tie up.
2. Using a suitable punch, remove the staking from the nut.
3. Remove the propeller shaft flange nut about using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1).
4. Remove the flange (1), and flange dust seal (2).
5. Remove the output shaft seal (3) with suitable screw and slide hammer.

ALL WHEEL DRIVE

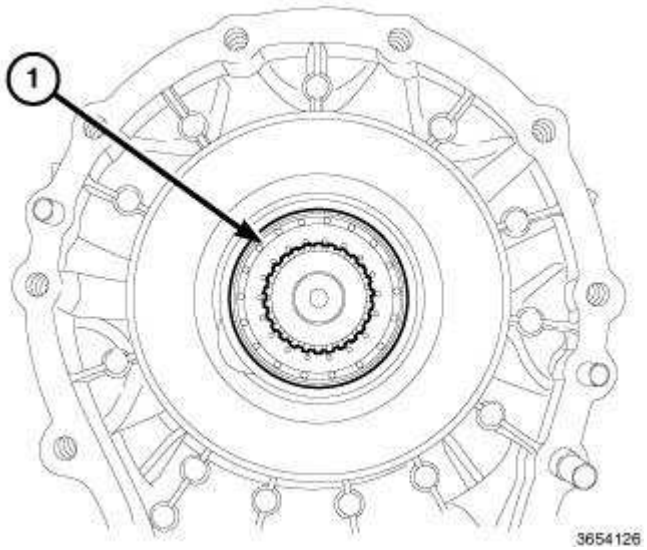

Fig. 164: Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transfer case. Refer to **REMOVAL** .
2. Remove the output shaft seal (1) with suitable screw and slide hammer.

INSTALLATION

REAR WHEEL DRIVE

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Using (special tool #8481, Installer, Gear) install the output shaft seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
4. Install the propeller shaft flange onto the output shaft and install an **new** flange nut. Tighten the nut, with a 34 mm 12 point socket, to 60 N.m (44 ft.lbs.).
5. Stake the nut.
6. Install the propeller shaft. Refer to **INSTALLATION** .
7. Perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

ALL WHEEL DRIVE

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Using (special tool #8481, Installer, Gear) install the output shaft seal.
3. Install the transfer case. Refer to **INSTALLATION** .
4. Perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

SEAL, TORQUE CONVERTER HUB

REMOVAL

REMOVAL

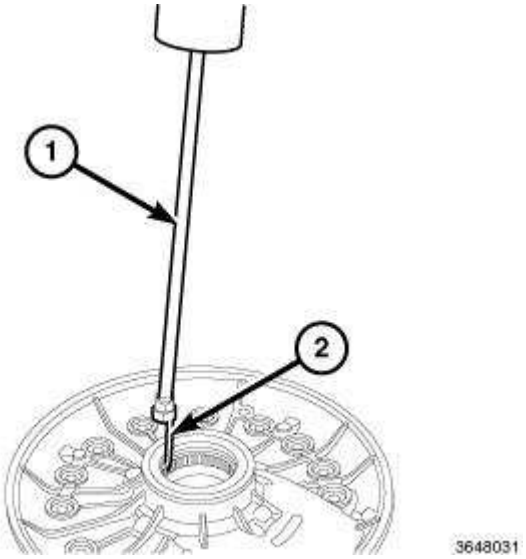

Fig. 165: Remover, Seal & Slide Hammers
Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter. Refer to **TORQUE CONVERTER, REMOVAL**.
2. Using (special tool #9667, Remover, Seal) and (special tool #C-3752, Slide Hammers) remove the torque converter hub seal.

INSTALLATION

INSTALLATION

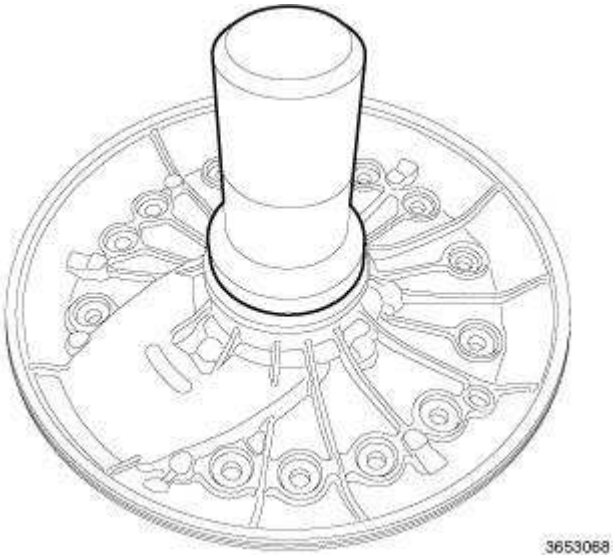

Fig. 166: Oil Pump Cover Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the torque converter hub seal over the input shaft and against the transmission oil pump cover.

2. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) install a new torque converter hub seal.
3. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.

SENSOR, SPEED

DESCRIPTION

DESCRIPTION

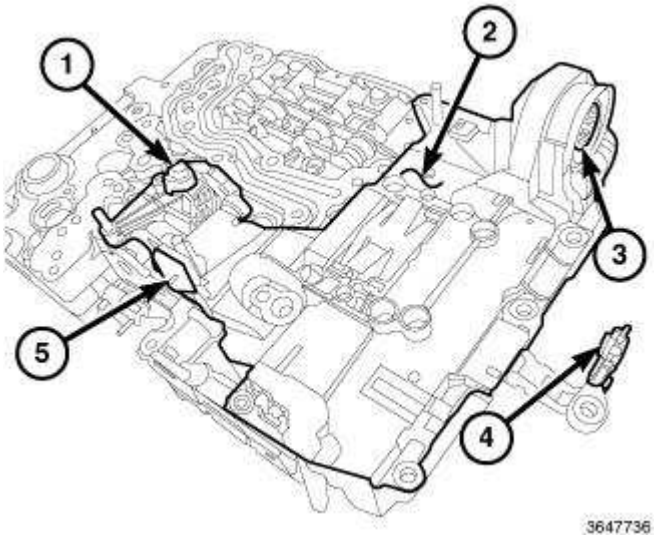

Fig. 167: Input Speed Sensor, Output Speed Sensor, Tcm (Includes Transmission Temperature Sensor) & Park Position Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - Input Speed Sensor	4 - Output Speed Sensor
2 - TCM (Includes Transmission Temperature Sensor)	5 - Park Position Sensor
3 - External Wire Harness Connector	

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

The input speed sensor (1) and the output speed sensor (4) are integrated components of the TCMA and not serviced individually.

OPERATION

OPERATION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

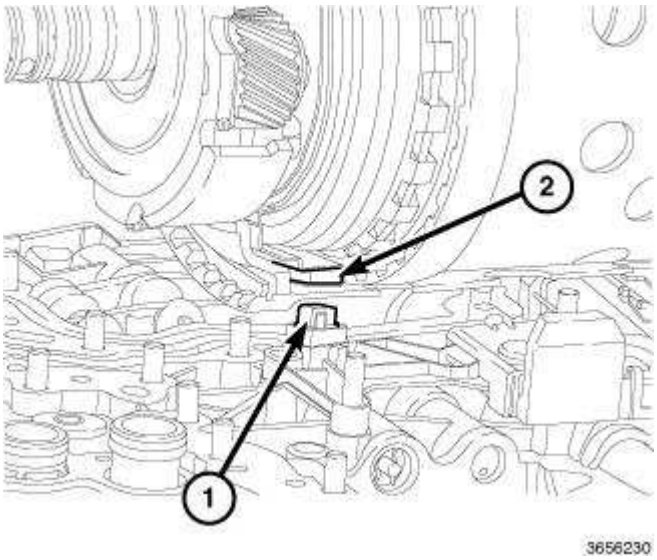

Fig. 168: ISS & Magnetic Ring
Courtesy of CHRYSLER GROUP, LLC

The input speed sensor (ISS) and output speed sensor (OSS) are Hall-effect sensors that measure shaft rotational speed. The ISS (1) is located at the front of the TCMA and reads input shaft speed from the magnetic ring (2) on the P2 carrier.

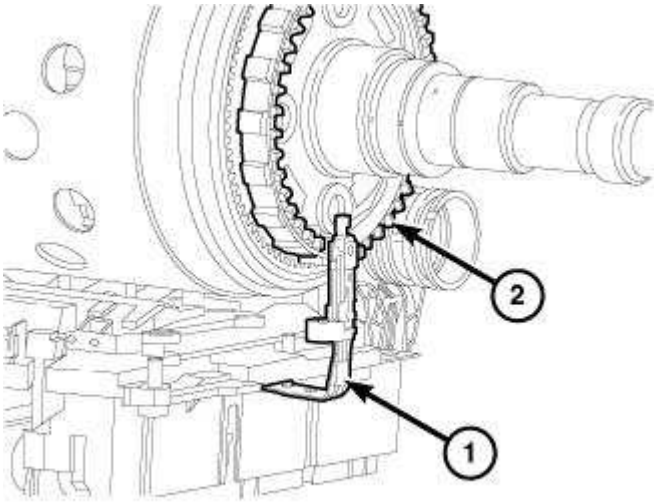

Fig. 169: OSS & P4 Carrier
Courtesy of CHRYSLER GROUP, LLC

The OSS (1) is located at the back of the TCMA and reads output shaft speed from the P4 carrier (2).

SHIFTER, TRANSMISSION

DESCRIPTION

FLOOR SHIFT

COMPONENTS

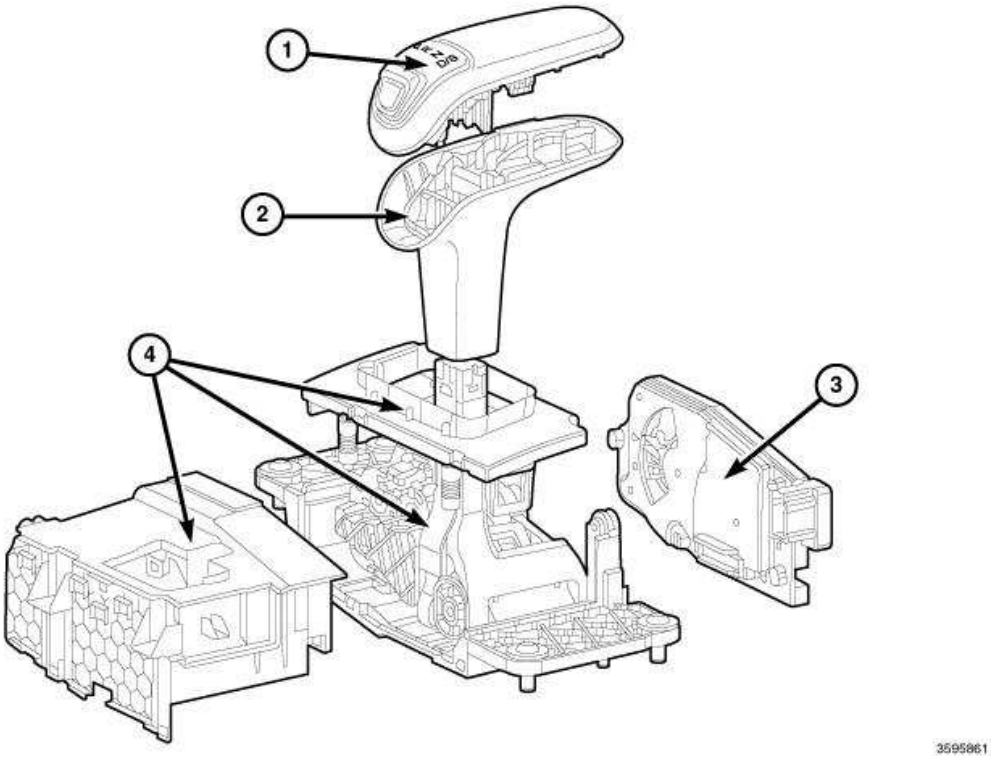

Fig. 170: Upper Shifter Knob Assembly, Lower Shifter Knob / Shroud, Electronic Module & Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

1- UPPER SHIFTER KNOB ASSEMBLY
2 - LOWER SHIFTER KNOB / SHROUD
3 - ELECTRONIC MODULE
4 - SHIFTER ASSEMBLY

The E-Shifter is a floor mounted device which controls the transmission without the benefit of a physical connection.

PADDLE SHIFT

Some vehicles may be equipped with optional paddle shift. For more information on paddle shift. Refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

OPERATION

FLOOR SHIFT

E-SHIFTER

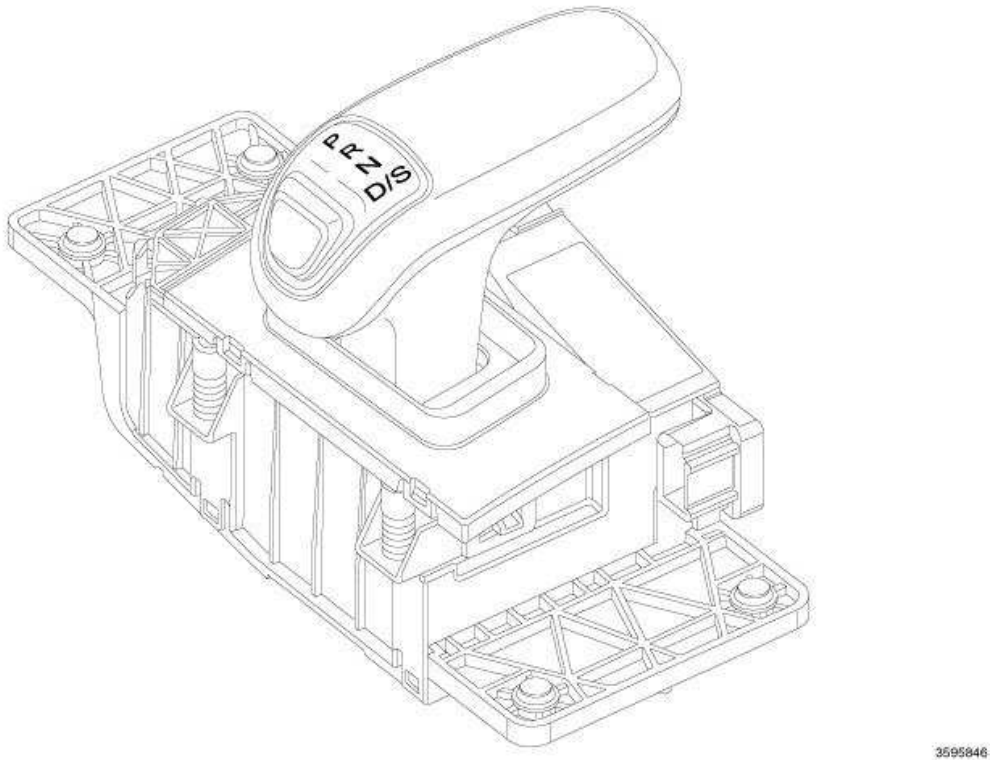

Fig. 171: E-Shifter
Courtesy of CHRYSLER GROUP, LLC

The 8HP45 automatic transmission is operated with the help of an E-Shifter located in the floor console. E-shift or "Shift by Wire" is a vehicle level system that electronically performs the function of current mechanical shifter/linkage/transmission hardware. The E-Shifter is an electronic switch/module using CAN messaging to communicate driver requests for transmission gear changes. The use of an E-Shifter eliminates the system linkage & mechanical connection to transmission park pawl & sprag for normal operation. There are four positions to which the selection lever can be shifted: P, R, N, D/L. With the Sport option package P, R, N, D/S. In addition the Sport option package integrates paddle shifters at the steering wheel with allows the operator to manually chose gears as long as they comply with engine speed parameters.

PADDLE SHIFT

Some vehicles may be equipped with optional paddle shift. Refer to **SWITCH, REMOTE RADIO, OPERATION** .

REMOVAL

REMOVAL

2- Solenoid D
3 - Solenoid B
4 - Solenoid E
5 - Solenoid C
6 - TCC Solenoid
7 - Line Pressure Solenoid
8 - Park Release Solenoid
9 - Park Hold Mechanical Solenoid
10 - Park Release Mechanical Valve

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

The solenoids are integrated into the Transmission Control Module Assembly (TCMA) of the 8HP45 transmission and are not replaceable individually.

OPERATION

OPERATION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions, and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter, and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

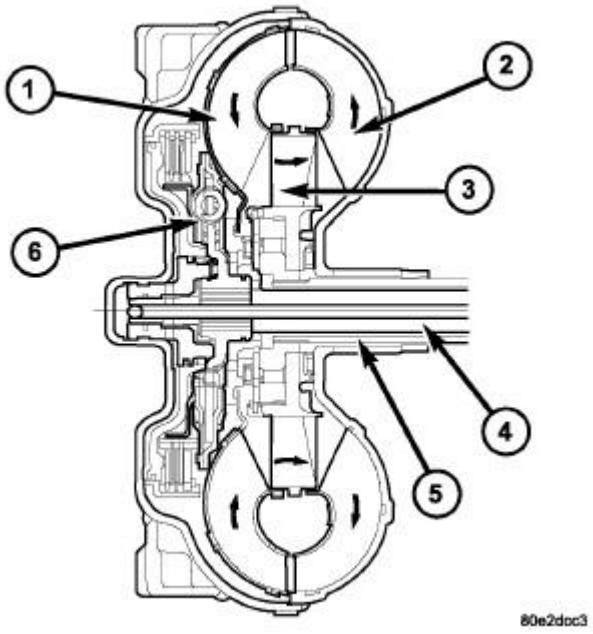

Fig. 181: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT

5 - STATOR SHAFT
6 - TURBINE DAMPER

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. Refer to **Fig. 181**. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil (fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

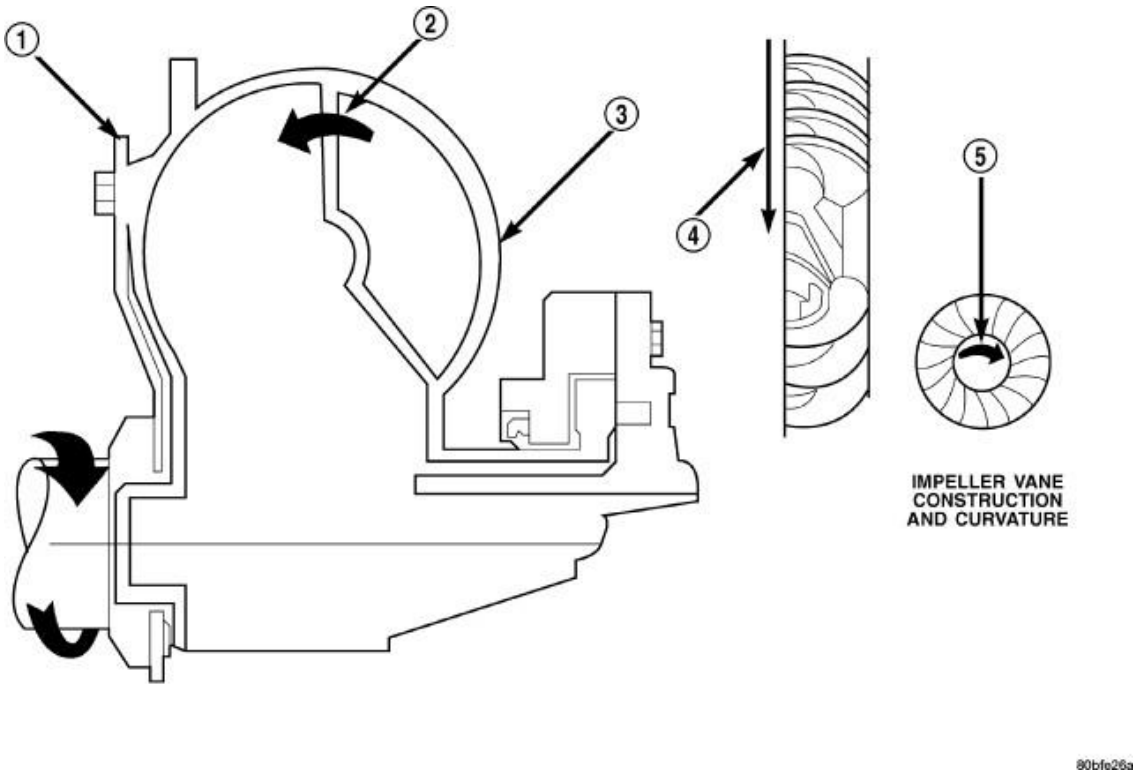

Fig. 182: Identifying Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION

2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller (3) is an integral part of the converter housing. Refer to **Fig. 182**. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

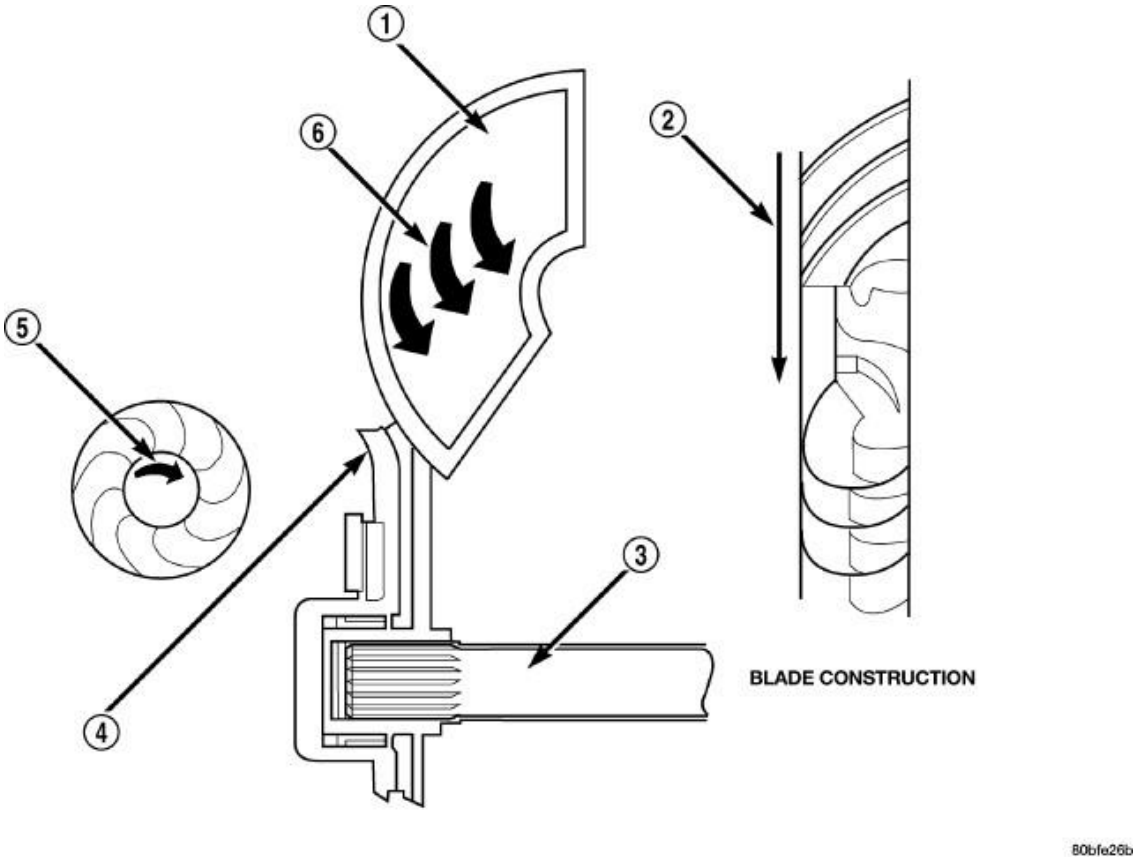

Fig. 183: Identifying Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. Refer to **Fig. 183**. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is

similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

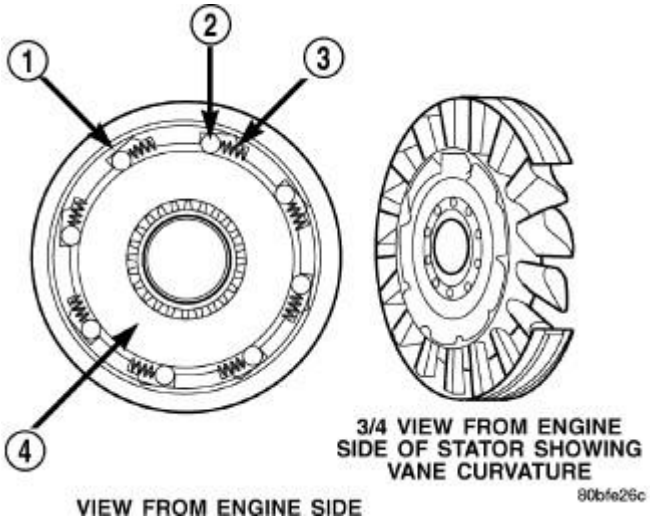

Fig. 184: Identifying Over-Running Clutch
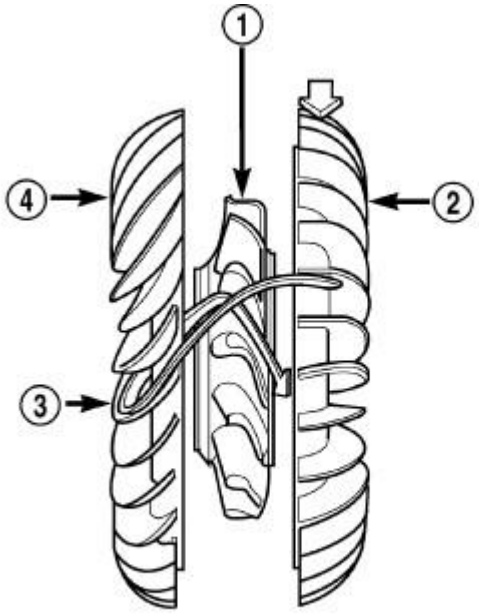
Courtesy of CHRYSLER GROUP, LLC

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator assembly (1-4) is mounted on a stationary shaft which is an integral part of the oil pump. Refer to **Fig. 184**.



80bfe26d

Fig. 185: Identifying Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case. Refer to **Fig. 185**. The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

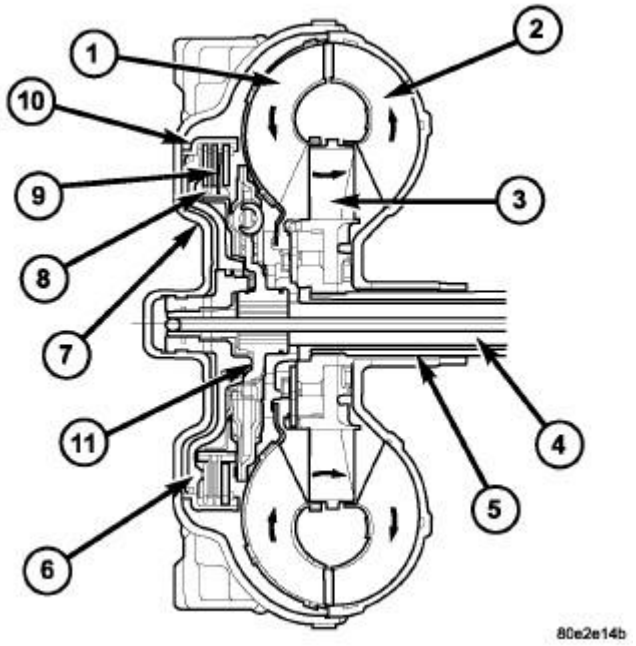


Fig. 186: Identifying Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER
9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Refer to **Fig. 186**. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature

10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

The torque converter housing has a unique shape to incorporate the torque converter clutch and flex plate connection. The torque converter uses the typical turbine, impeller and stator assemblies found in a standard torque converter assembly. The torque converter drives the pump through the splines on the inside of the hub. The torque converter uses a multi-disc torque converter clutch system that improves the durability and the holding pressure in the lock-up circuit. The torque converter incorporates a turbine dampening system. This system suppresses torsional vibrations from the engine to ensure optimal shift quality and reduce noise and vibration concerns.

TURBINE

When the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller (2) and turbine are rotating at about the same speed and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbines piston and friction material (9) a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

HYDRO-MECHANICAL AND ELECTRICAL

The torque converter clutch (TCC) is engaged and released by the transmission control module assembly (TCMA). The TCC can be engaged and controlled in any forward gear from 1 through 8. In addition, the 8HP45 transmission incorporates a neutral idle control (NIC) function. Instead of the engine continuing to drive the converter when the vehicle comes to rest, the converter is partially disconnected from the driveline so only a slight residual load remains. Decoupling of the torque converter during NIC is accomplished by allowing clutch B to slip.

TCC RELEASE

When the TCC is open, the TCC piston is pushed to its default position by torque converter chamber pressure. The torque converter switch valve (SV-TC) provides pressure for torque converter operation which has been regulated by the converter pressure regulating valve (TC-V). After exiting the torque converter, fluid moves into the cooling and lubrication circuits. The converter pressure retention valve (TCH1-V) ensures the torque converter pressure is a minimum of 0.35 bar (5 psi) when the TCC is open.

TCC APPLY

When the TCC solenoid is energized, fluid is directed to the torque converter switch valve (SV-TC) and TCC lockup valve (TCC-V). The TCC lockup valve directs fluid to the TCC and torque converter chamber. The torque converter switch valve directs fluid exiting the converter chamber to a secondary pressure retention valve (TCH2-V) which is calibrated to retain 1.0 bar (14.5 psi) of pressure in the converter. The torque converter switch valve also directs line pressure to the cooler and lubrication circuit.

REMOVAL

REMOVAL

1. Remove transmission from vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

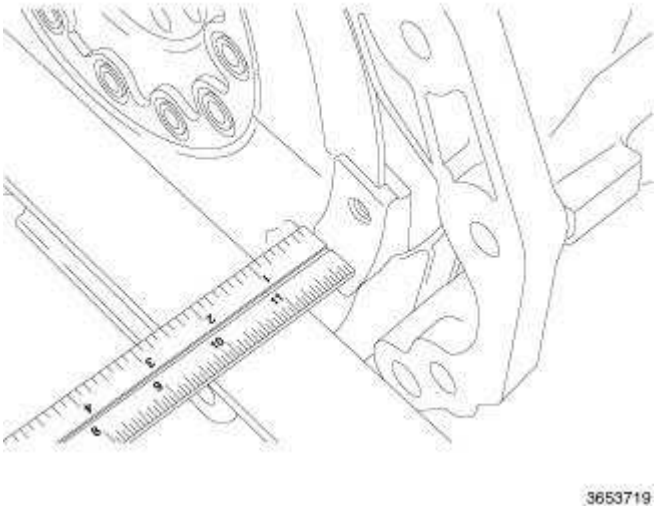

Fig. 188: Scale And Straightedge
Courtesy of CHRYSLER GROUP, LLC

NOTE: Check converter hub for sharp edges, burrs, scratches, or nicks. Polish the hub with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub onto oil pump drive gear.
5. While pushing torque converter inward, rotate the converter until the converter is fully seated onto the oil pump drive gear.
6. Check converter seating with a scale and straightedge. Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle. Refer to **INSTALLATION**.
9. Perform the TRANSMISSION FILL AFTER SERVICE procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VALVE BODY

DESCRIPTION

DESCRIPTION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body includes the Transmission Control Module (TCM), all solenoids and sensors, and can be referred to as the Transmission Control Module Assembly (TCMA). The TCM is attached to the valve body between the transmission case and the valve body. If any component of the valve body **including the TCM** sensors or solenoids need replaced, the complete TCMA (valve body) must be replaced. For replacement of the TCMA (valve body). Refer to **VALVE BODY, REMOVAL**. Components of the valve body and TCM are as follows:

VALVE BODY

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body, which includes the Transmission Control Module (TCM), controls the delivery and pressure of transmission fluid. The TCM is integrated into the valve body. The TCM regulates the amount of hydraulic pressure used to engage the clutches and the Torque Converter Clutch (TCC), in addition to directing hydraulic pressure to engage or release any given clutch for any given required gear. The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module. Due to the complexity of the 8HP45 transmission control system, always refer to the appropriate transmission electrical/electronic diagnostics in this information when attempting to diagnose transmission problems.

If the Transmission Control Module Assembly (TCMA) is replaced, it **must** be programmed and a drive learn needs to be performed before returning the vehicle to the customer. for programming and drive learn procedures. Refer to appropriate diagnostic information .

REMOVAL

REMOVAL

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Refer to STANDARD PROCEDURE . Failure to follow these instructions may result in damage to the TCM/TCMA.

1. Raise the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Drain the transmission fluid into a clean container. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

9 - MULTI-DISC HOLDING CLUTCH B2	19 - STATOR SHAFT
10 - OUTPUT SHAFT	20 - TORQUE CONVERTER LOCK-UP CLUTCH

The NAG1 automatic transmission is an electronically controlled 5-speed transmission with a lock-up clutch in the torque converter. Refer to **Fig. 1**. The ratios for the gear stages are obtained by 3 planetary gear sets. Fifth gear is designed as an overdrive with a high-speed ratio.

NAG1 identifies a family of transmissions and means "N"ew "A"utomatic "G"earbox, generation 1.

Various marketing names are associated with the NAG1 family of transmissions, depending on the transmission variation being used in a specific vehicle. Some examples of the marketing names are: W5A300, W5A380, and W5A580. The marketing name can be interpreted as follows:

- W = A transmission using a hydraulic torque converter.
- 5 = 5 forward gears.
- A = Automatic Transmission.
- 580 = Maximum input torque capacity in Newton meters.

The gears are actuated electronically/hydraulically. The gears are shifted by means of an appropriate combination of three multi-disc holding clutches, three multi-disc driving clutches, and two freewheeling clutches.

Electronic transmission control enables precise adaptation of pressures to the respective operating conditions and to the engine output during the shift phase which results in a significant improvement in shift quality.

Furthermore, it offers the advantage of a flexible adaptation to various vehicle and engines.

Basically, the automatic transmission with electronic control offers the following advantages:

- Reduces fuel consumption.
- Improved shift comfort.
- More favourable step-up through the five gears.
- Increased service life and reliability.
- Lower maintenance costs.

TRANSMISSION IDENTIFICATION

The transmission can be generically identified visually by the presence of a round 13-way connector located near the front corner of the transmission oil pan, on the right side. Specific transmission information can be found stamped into a pad on the left side of the transmission, above the oil pan rail.

TRANSMISSION GEAR RATIOS

The gear ratios for the NAG1 automatic transmission are as follows:

1st Gear

3.59:1

2nd Gear

2.19:1

3rd Gear

1.41:1

4th Gear

1.00:1

5th Gear

0.83:1

Reverse

3.16:1

TRANSMISSION HOUSING

The converter housing and transmission are made from a light alloy. These are bolted together and centered via the outer multi-disc carrier of multi-disc holding clutch, B1. A coated intermediate plate provides the sealing. The oil pump and the outer multi-disc carrier of the multi-disc holding clutch, B1, are bolted to the converter housing. The stator shaft is pressed into it and prevented from rotating by splines. The electrohydraulic unit is bolted to the transmission housing from underneath. A sheet metal steel oil pan forms the closure.

MECHANICAL SECTION

The mechanical information consists of a input shaft, output shaft, a sun gear shaft, and three planetary gear sets which are coupled to each other. The planetary gear sets each have four planetary pinion gears. The oil pressure for the torque converter lock-up clutch and clutch K2 is supplied through bores in the input shaft. The oil pressure to clutch K3 is transmitted through the output shaft. The lubricating oil is distributed through additional bores in both shafts. All the bearing points of the gear sets, as well as the freewheeling clutches and actuators, are supplied with lubricating oil. The parking lock gear is connected to the output shaft via splines.

Freewheeling clutches F1 and F2 are used to optimize the shifts. The front freewheel, F1, is supported on the extension of the stator shaft on the transmission side and, in the locking direction, connects the sun gear of the front planetary gear set to the transmission housing. In the locking direction, the rear freewheeling clutch, F2, connects the sun gear of the center planetary gear set to the sun gear of the rear planetary gear set.

ELECTROHYDRAULIC CONTROL UNIT

The electrohydraulic control unit comprises the shift plate made from light alloy for the hydraulic control and an electrical control unit. The electrical control unit comprises of a supporting body made of plastic, into which the electrical components are assembled. The supporting body is mounted on the shift plate and screwed to it.

Strip conductors inserted into the supporting body make the connection between the electrical components and a plug connector. The connection to the wiring harness on the vehicle and the transmission control module (TCM) is produced via this 13-pin plug connector with a bayonet lock.

SHIFT GROUPS

The hydraulic control components (including actuators) which are responsible for the pressure distribution before, during, and after a gear change are described as a shift group. Each shift group contains a command valve, a holding pressure shift valve, a shift pressure shift valve, overlap regulating valve, and a solenoid.

The hydraulic system contains three shift groups: 1-2/4-5, 2-3, and 3-4. Each shift group can also be described as being in one of two possible states. The active shift group is described as being in the shift phase when it is actively engaging/disengaging a clutch combination. The 1-2/4-5 shift group control the B1 and K1 clutches. The 2-3 shift group controls the K2 and K3 clutches. The 3-4 shift group controls the K3 and B2 clutches.

OPERATION

OPERATION

The transmission control is divided into the electronic and hydraulic transmission control functions. While the electronic transmission control is responsible for gear selection and for matching the pressures to the torque to be transmitted, the transmission's power supply control occurs via hydraulic elements in the electrohydraulic control module. The oil supply to the hydraulic elements, such as the hydrodynamic torque converter, the shift elements and the hydraulic transmission control, is provided by way of an oil pump connected with the torque converter.

The Transmission Control Module (TCM) allows for the precise adaptation of pressures to the corresponding operating conditions and to the engine output during the gearshift phase, resulting in a noticeable improvement in shift quality. The engine speed limit can be reached in the individual gears at full throttle and kickdown. The shift range can be changed in the forward gears while driving, but the TCM employs a downshift safeguard to prevent over-revving the engine. The system offers the additional advantage of flexible adaptation to different vehicle and engine variants.

EMERGENCY RUNNING FUNCTION

In order to ensure a safe driving state and to prevent damage to the automatic transmission, the TCM control module switches to limp-home mode in the event of critical faults. A diagnostic trouble code (DTC) assigned to the fault is stored in memory. All solenoid and regulating valves are thus de-energized.

The net effect is:

- The last engaged gear remains engaged.
- The modulating pressure and shift pressures rise to the maximum levels.
- The torque converter lockup clutch is deactivated.

In order to preserve the operability of the vehicle to some extent, the hydraulic control can be used to engage 2nd gear or reverse using the following procedure:

- Stop the vehicle.
- Move selector lever to "P".
- Switch off engine.
- Wait at least 10 seconds.
- Start engine.
- Move selector lever to D: 2nd gear.
- Move selector lever to R: Reverse gear.

The limp-home function remains active until the DTC is rectified or the stored DTC is erased with the appropriate scan tool. Sporadic faults can be reset via ignition OFF/ON.

CLUTCH APPLICATION

for which shift elements are applied in each gear position. Refer to **CLUTCH APPLICATION**.

CLUTCH APPLICATION

C - FIRST GEAR RATIO	F - FIXED PARTS

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred to the output shaft (26). Refer to **Fig. 3** &**Fig. 2**.

FRONT PLANETARY GEAR SET

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing

by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

REAR PLANETARY GEAR SET

The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (15). The sun gear (23) is held against the housing by the engaged multiple-disc holding clutch B2 (6), by the locked freewheel F2 (24) during acceleration and by the engaged multiple-disc clutch K3 (12) during deceleration. The planetary gears (19) turn on the fixed sun gear (23) and increase the torque from the annulus gear (11) to the planetary carrier (15). The planetary carrier (15) moves at a reduced speed in the running direction of the engine.

CENTER PLANETARY GEAR SET

The annulus gear (10) is driven at the same speed as the rear planetary carrier (15) as a result of a mechanical connection. The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

12 - DRIVING CLUTCH K3	25 - INPUT SHAFT
13 - FRONT PLANETARY CARRIER	26 - OUTPUT SHAFT
A - ENGINE SPEED	D - SECOND GEAR RATIO
B - TRANSMISSION INPUT SPEED	E - FIXED PARTS
C - FIRST GEAR RATIO	

Torque from the torque converter is increased via the input shaft (25) and the center and rear planetary gearset and transferred to the output shaft (26). Refer to **Fig. 5** & **Fig. 4**.

FRONT PLANETARY GEAR SET

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore blocked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and input shaft.

REAR PLANETARY GEAR SET

The annulus gear (11) turns at the input speed as a result of the mechanical connection to the front planetary carrier (13). The sun gear (23) is held against the housing by the engaged multiple-disc holding clutch B2 (6), by the locked freewheel F2 (24) during acceleration and by the engaged multiple-disc clutch K3 (12) during deceleration. The planetary pinion gears (19) turn on the fixed sun gear (23) and increase the torque from the annulus gear (11) to the planetary carrier (15). The planetary carrier (15) moves at a reduced speed in the running direction of the engine.

CENTER PLANETARY GEAR SET

The annulus gear (10) is driven at the same speed as the rear planetary carrier (15) as a result of a mechanical connection. The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (5) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and the center planetary gearset and transferred to the output shaft (26). Refer to **Fig. 7** & **Fig. 6**.

FRONT PLANETARY GEAR SET

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore locked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and input shaft (25).

REAR PLANETARY GEAR SET

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns in the same way as the planetary carrier (15) due to the mechanical connection with the locked front planetary gearset. This planetary gearset is therefore locked and turns as a closed unit.

CENTER PLANETARY GEAR SET

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Speed and torque are not converted by the direct gear ratio of the 4th gear. Power is transferred from the input shaft (25) to the output shaft (26) via three locked planetary gearsets. Refer to **Fig. 9** & **Fig. 8**.

FRONT PLANETARY GEAR SET

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore locked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and the input shaft (25).

REAR PLANETARY GEAR SET

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns in the same way as the planetary carrier (15) due to the mechanical connection with the locked front planetary gearset. The planetary gearset is therefore locked and turns as a closed unit.

CENTER PLANETARY GEAR SET

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The multiple-disc clutch K3 (12) connects the sun gears (22) and (23) of the rear and center planetary gearset. The planetary gearset is locked by the same speeds of the annulus gear (10) and the sun gear (22) and it turns as a closed unit.

A - ENGINE SPEED	D - SECOND GEAR RATIO
B - TRANSMISSION INPUT SPEED	E - THIRD GEAR RATIO
C - FIRST GEAR RATIO	F - FIXED PARTS

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred to the output shaft (26). Refer to **Fig. 11** & **Fig. 10**.

FRONT PLANETARY GEAR SET

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

REAR PLANETARY GEAR SET

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns at a reduced speed due to the mechanical connection with the front planetary carrier (13). The planetary pinion gears (19) turn between the annulus gear (11) and the sun gear (23). The sun gear (23) moves at an increased speed in the running direction of the engine.

CENTER PLANETARY GEAR SET

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The multiple-disc clutch K3 (12) transfers an increased speed to the sun gear (22) due to the connection with the sun gear (23). The planetary pinion gears (18) turn between the annulus gear (10) and the sun gear (22). The speed of the planetary carrier (14) and the output shaft connected to the planetary carrier (5) lies between that of the annulus gear (10) and the sun gear (22). This provides a step-up ratio.

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred with reversed direction of rotation to the output shaft (26). Refer to **Fig. 13** & **Fig. 12**.

FRONT PLANETARY GEAR SET

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

REAR PLANETARY GEAR SET

The planetary carrier (15) is held against the housing by the engaged multiple-disc holding clutch B3 (5). The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (13). The planetary gears (19) turn between the annulus gear (11) and the sun gear (23). The direction is reversed by the held planetary carrier (15) so that the sun gear (23) turns in the opposite direction to the running direction of the engine.

CENTER PLANETARY GEAR SET

The annulus gear (10) is held against the housing by the multiple-disc holding clutch B3 (5) via the mechanical connection to the planetary carrier (15). The sun gear (22) turns backwards due to the engaged multiple-disc clutch K3 (12). The planetary gears (18) turn on the fixed annulus gear (10) and increase the torque from the sun gear (22) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the opposite direction to the running direction of the engine.

13 - FRONT PLANETARY CARRIER	26 - OUTPUT SHAFT
A - ENGINE SPEED	D - SECOND GEAR RATIO
B - TRANSMISSION INPUT SPEED	E - FIXED PARTS
C - FIRST GEAR RATIO	

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred with reversed direction of rotation to the output shaft (26). Refer to **Fig. 15** & **Fig. 14**.

FRONT PLANETARY GEAR SET

The clutch K1 (7) is shifted. The planetary carrier (13) and sun gear (21) are connected to each other

as a result. The annulus gear (8) is driven via the input shaft (25). The planetary gear set is locked and turns as a unit.

REAR PLANETARY GEAR SET

The planetary carrier (15) is held against the housing by the engaged multiple-disc holding clutch B3 (5). The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (13). The planetary pinion gears (19) turn between the annulus gear (11) and the sun gear (23). The direction is reversed by the held planetary carrier (15) so that the sun gear (23) turns in the opposite direction to the running direction of the engine.

CENTER PLANETARY GEAR SET

The annulus gear (10) is held against the housing by the multiple-disc holding clutch B3 (5) via the mechanical connection to the planetary carrier (15). The sun gear (22) turns backwards due to the engaged multiple-disc clutch K3 (12). The planetary gears (18) turn on the fixed annulus gear (10) and increase the torque from the sun gear (22) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the opposite direction to the running direction of the engine.

SHIFT GROUPS/ SHIFT SEQUENCE

1-2 SHIFT - FIRST GEAR ENGAGED

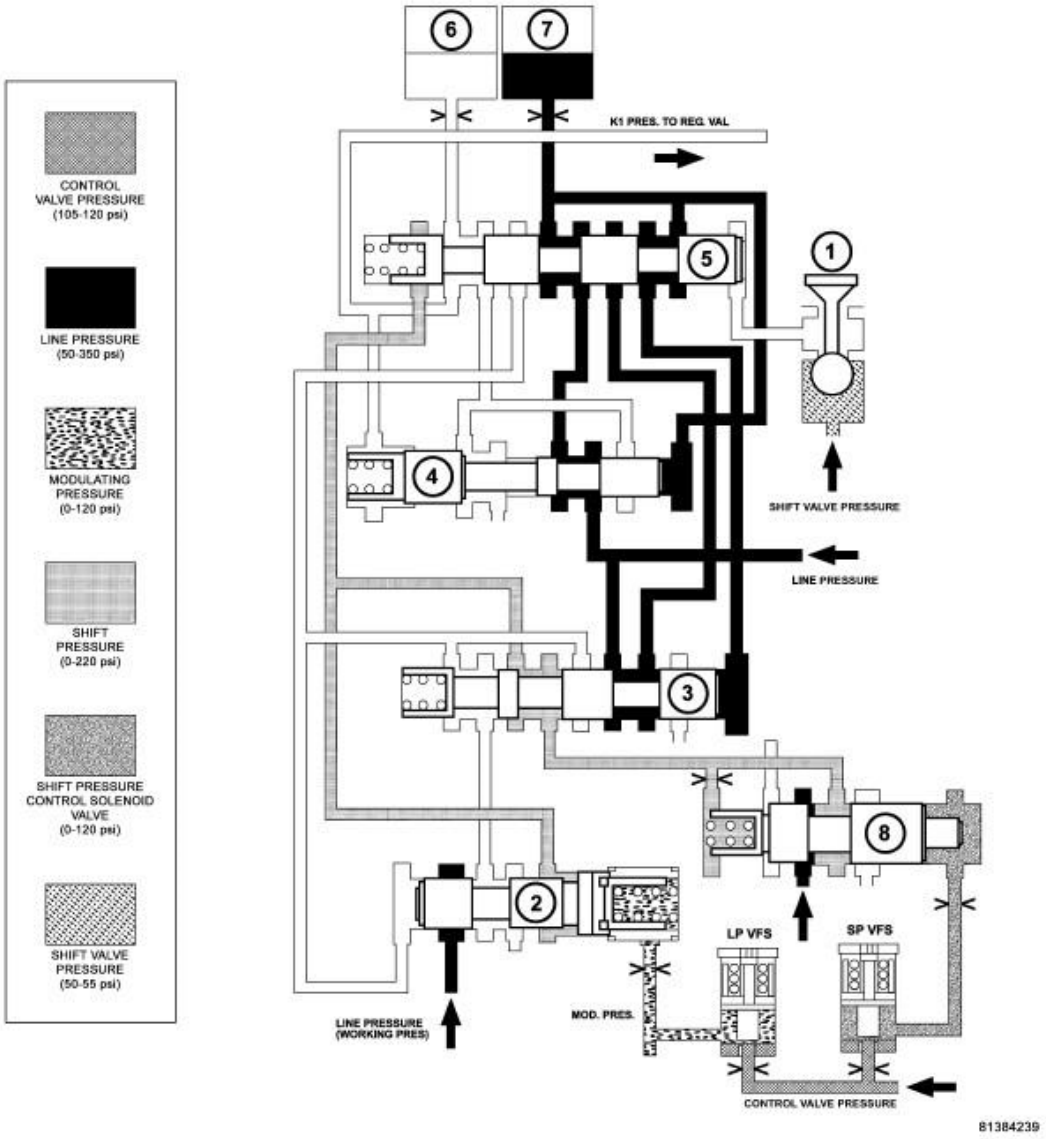

Fig. 16: First Gear Engaged Hydraulic Circuit
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The end face of the command valve (5) is kept unpressurized via the solenoid valve for 1-2 and 4-5 shift (1). Refer to **Fig. 16**. Because of the holding pressure shift valve (4), the working pressure (p-A) is present at the multiple-disc holding clutch B1 (7). Clutch K1 (6) is unpressurized.

SHIFT PHASE - 1-2 SHIFT PHASE 1

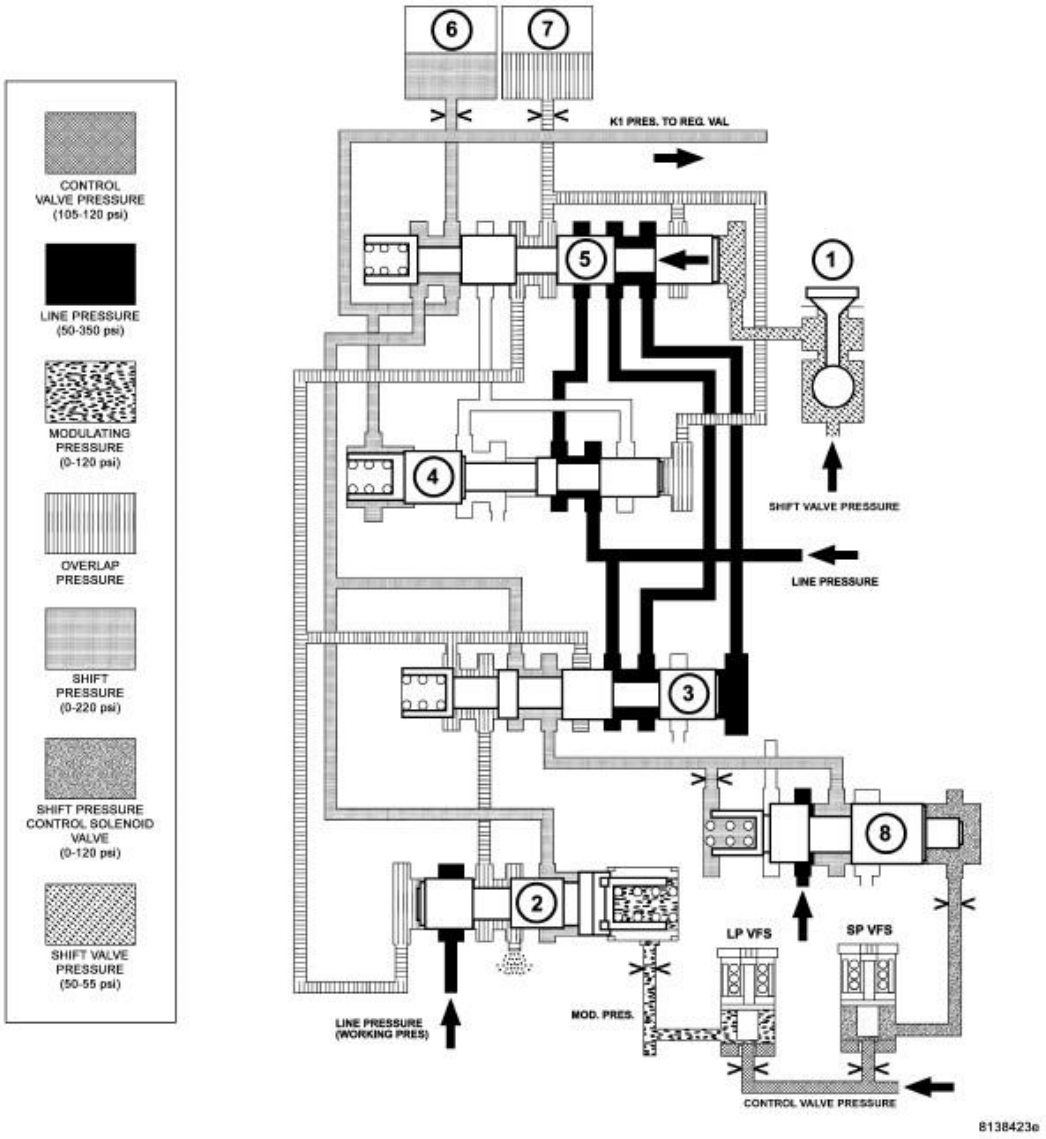

Fig. 17: Shift Phase - 1-2 Shift Phase 1
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

When the 1-2 and 4-5 shift solenoid valve (1) is turned on, the shift valve pressure (p-SV) is directed onto the end face of the command valve (5). Refer to **Fig. 17**. The command valve is moved and the shift pressure (p-S) coming from the shift pressure shift valve (3) is directed via the command valve (5) onto clutch K1 (6).

Simultaneously the clutch B1 (7) is subjected to overlap pressure by the overlap regulating valve (2). The pressure in the clutch B1 (7) as it disengages is controlled during the shift phase depending on engine load by the modulating pressure and the applying clutch pressure (the shift pressure in clutch K1). The controlled pressure in clutch B1 (7) is inversely proportional to the capacity of the clutch being engaged. The rising shift pressure (p-S) at clutch K1 (6) acts on the annular face of the overlap regulating valve (2) and reduces the overlap pressure regulated by the overlap regulating valve (2). When a corresponding pressure level is reached at the holding pressure shift valve (4), this valve switches over.

SHIFT PHASE - 1-2 SHIFT PHASE 2

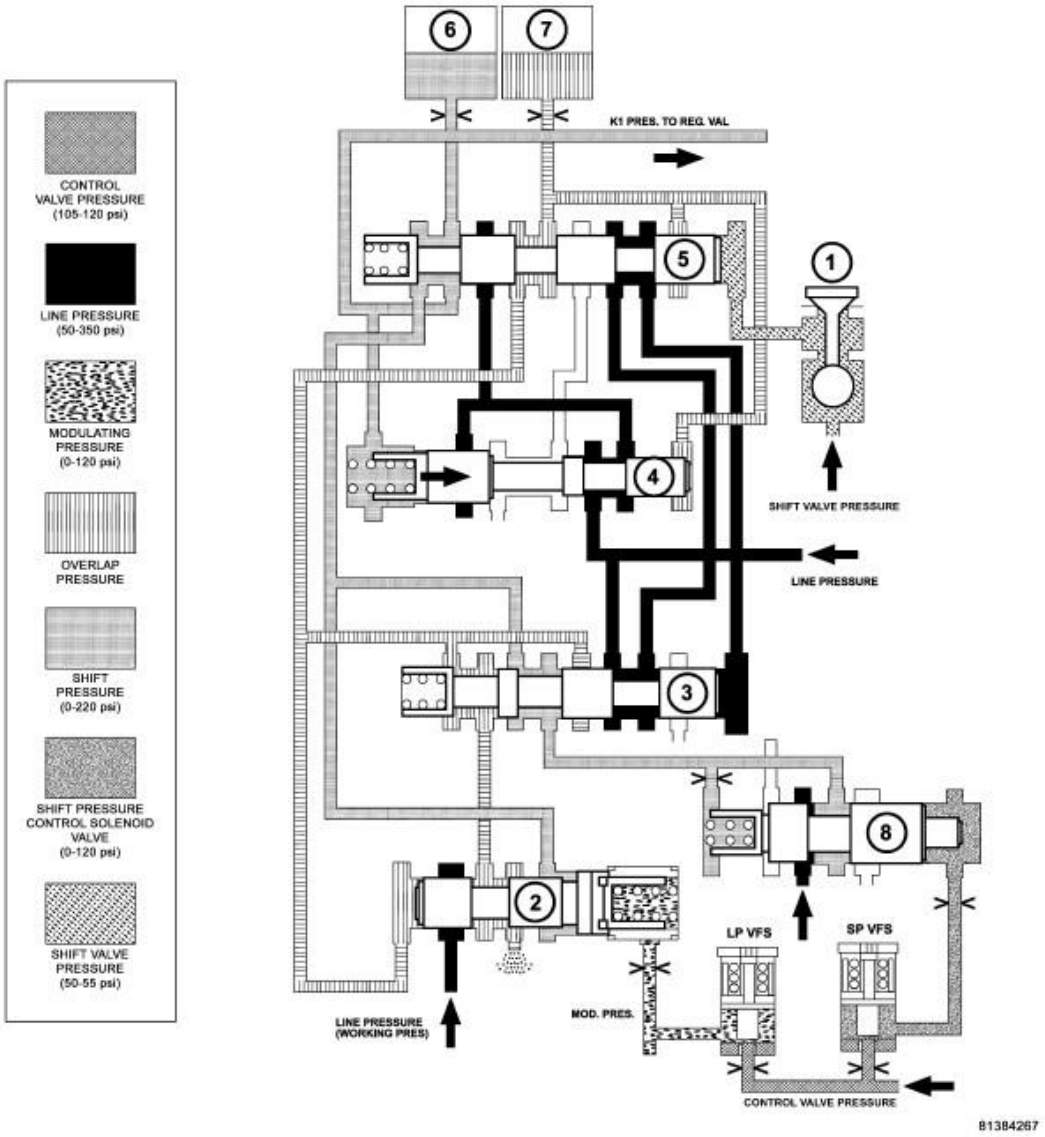

Fig. 18: Shift Phase - 1-2 Shift Phase 2
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE

2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The B1 (7) pressure acting on the end face of the shift pressure shift valve (3) is replaced by the working pressure (p-A). Refer to **Fig. 18**. The shift pressure is also routed to the spring end of the holding valve (4) and the holding valve downshifts. The line pressure is then routed to the command valve (5).

SECOND GEAR ENGAGED

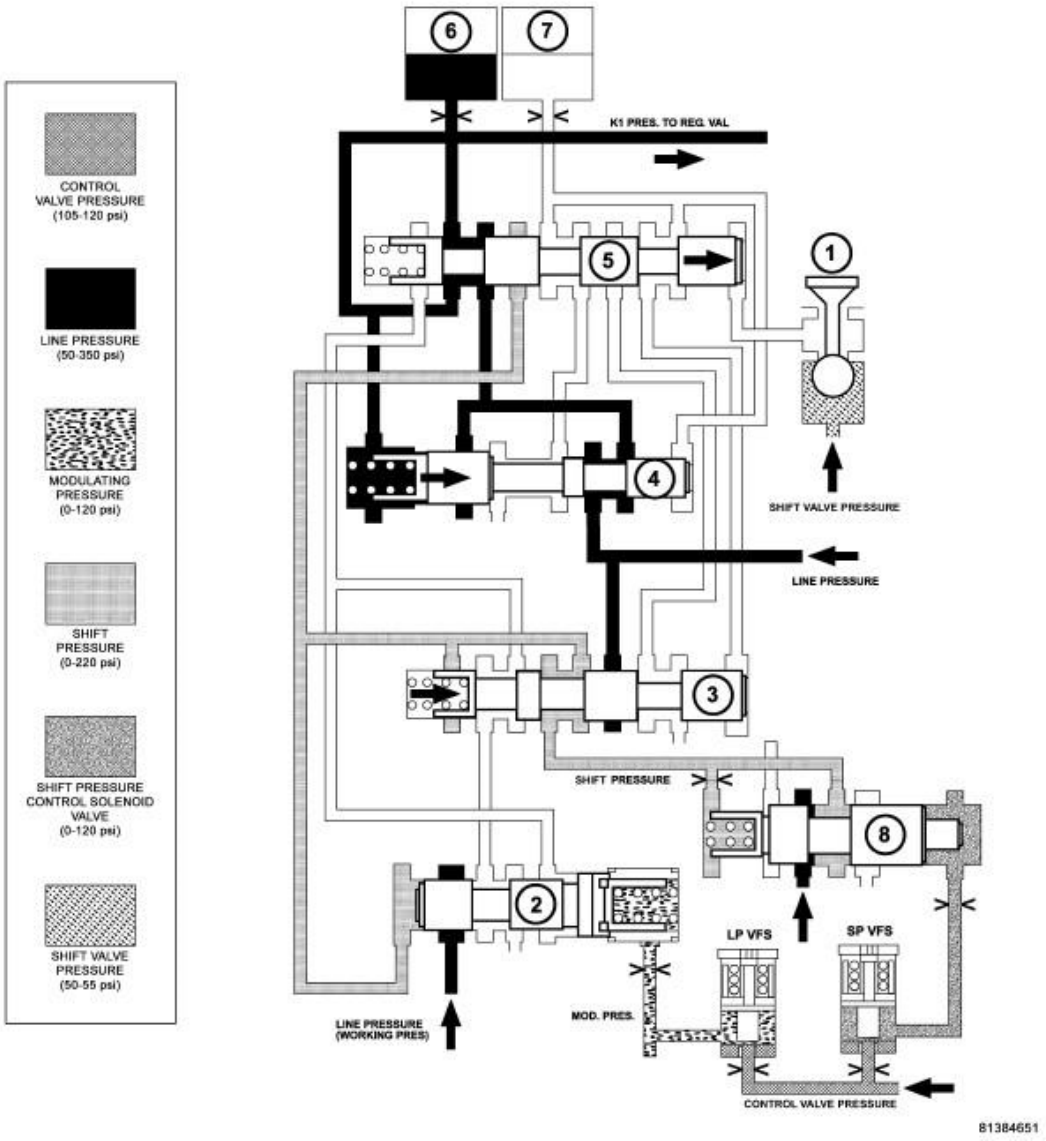

Fig. 19: Second Gear Engaged
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

After the gearchange is complete, the pressure on the end face of the command valve (5) is reduced via the 1-2 and 4-5 shift solenoid valve (1), and the command valve (5) is pushed back to its basic position. Refer to **Fig. 19**. Via the holding pressure shift valve (4) the working pressure (p-A) now passes via the command valve (5) to clutch K1 (6). The multiple-disc holding clutch B1 (7) is deactivated (unpressurized). The spring of the shift pressure shift valve (3) pushes the valve back to its basic position.

SHIFT PHASE - 2-1 SHIFT PHASE 1

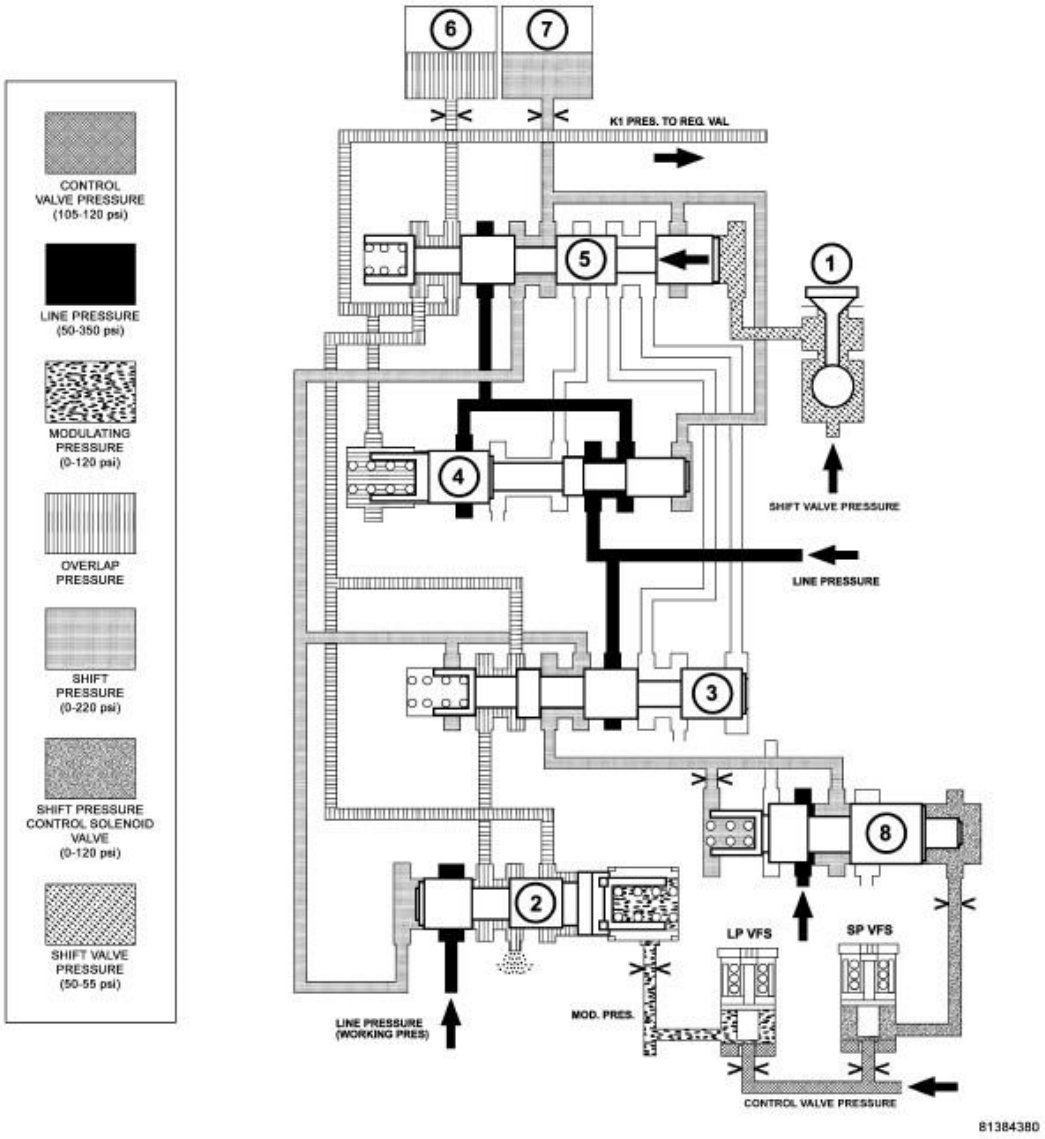

Fig. 20: Shift Phase - 2-1 Shift Phase 1
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The 1-2/4-5 shift solenoid (1) is turned ON to apply shift pressure (p-S) to the end face of the 1-2/4-5 command valve (5). Refer to **Fig. 20**. This allows the command valve to up-shift and the shift pressure coming from the 1-2/4-5 shift valve (3) is routed to the holding clutch B1 (7) via the command valve.

Simultaneously, the pressure in the releasing clutch, K1 (6), is regulated at the 1-2/4-5 overlap valve (2). The pressure in the K1 clutch as it disengages is controlled during the shift phase depending on engine load, via the modulating pressure (p-MOD), and the shift pressure in clutch B1 (7). The increasing shift pressure in clutch B1, which also acts on the end face of the overlap valve, reduces the overlap pressure.

SHIFT PHASE - 2-1 SHIFT PHASE 2

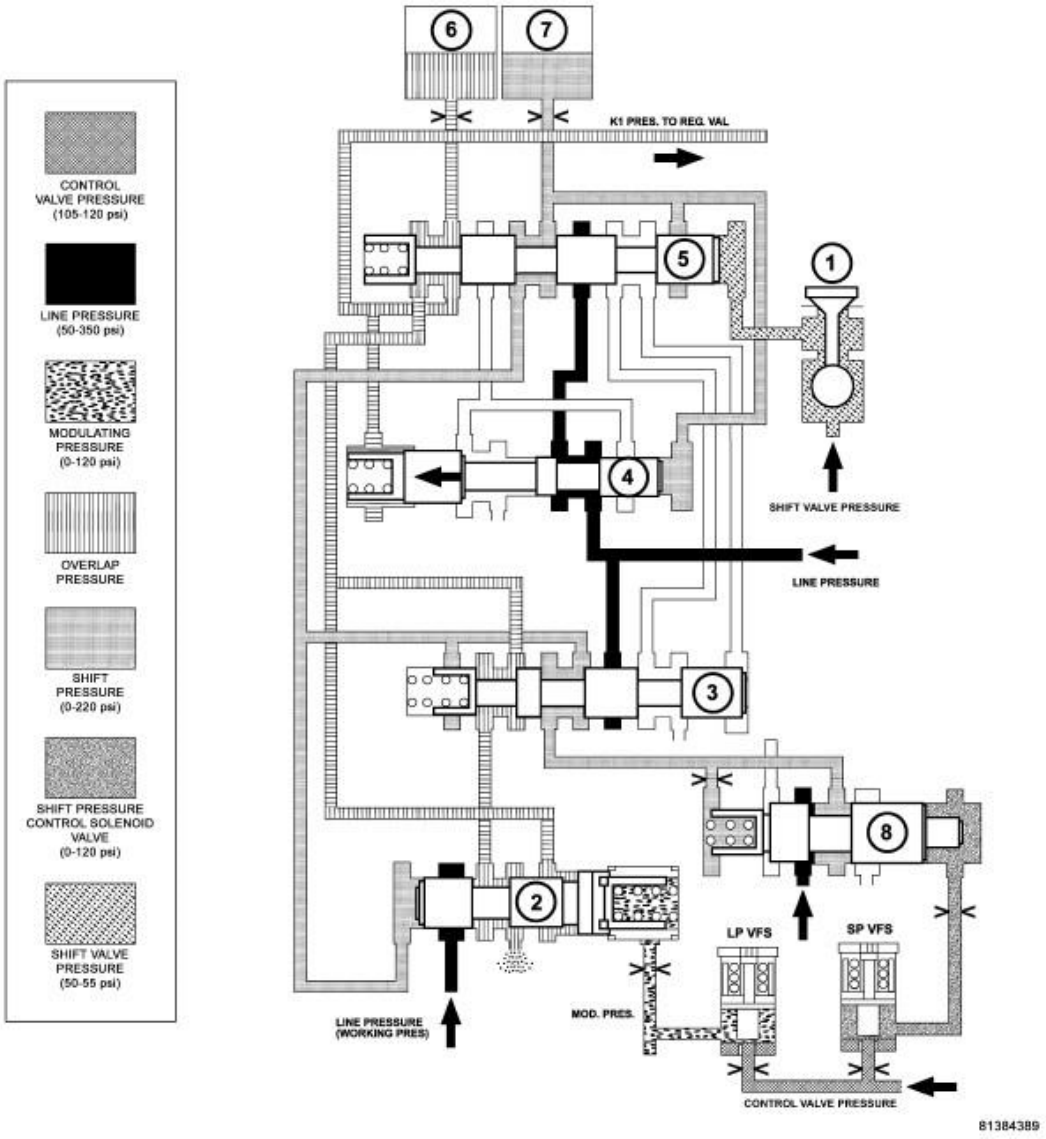

Fig. 21: Shift Phase - 2-1 Shift Phase 2
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1

4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The pressure in clutch B1 (7) acting on the end face of the 1-2/4-5 holding valve (4) forces the valve to up-shift against the spring pressure and allows line pressure (p-A) to pass through the command valve (5). Refer to Fig. 21.

2-1 SHIFT - FIRST GEAR ENGAGED

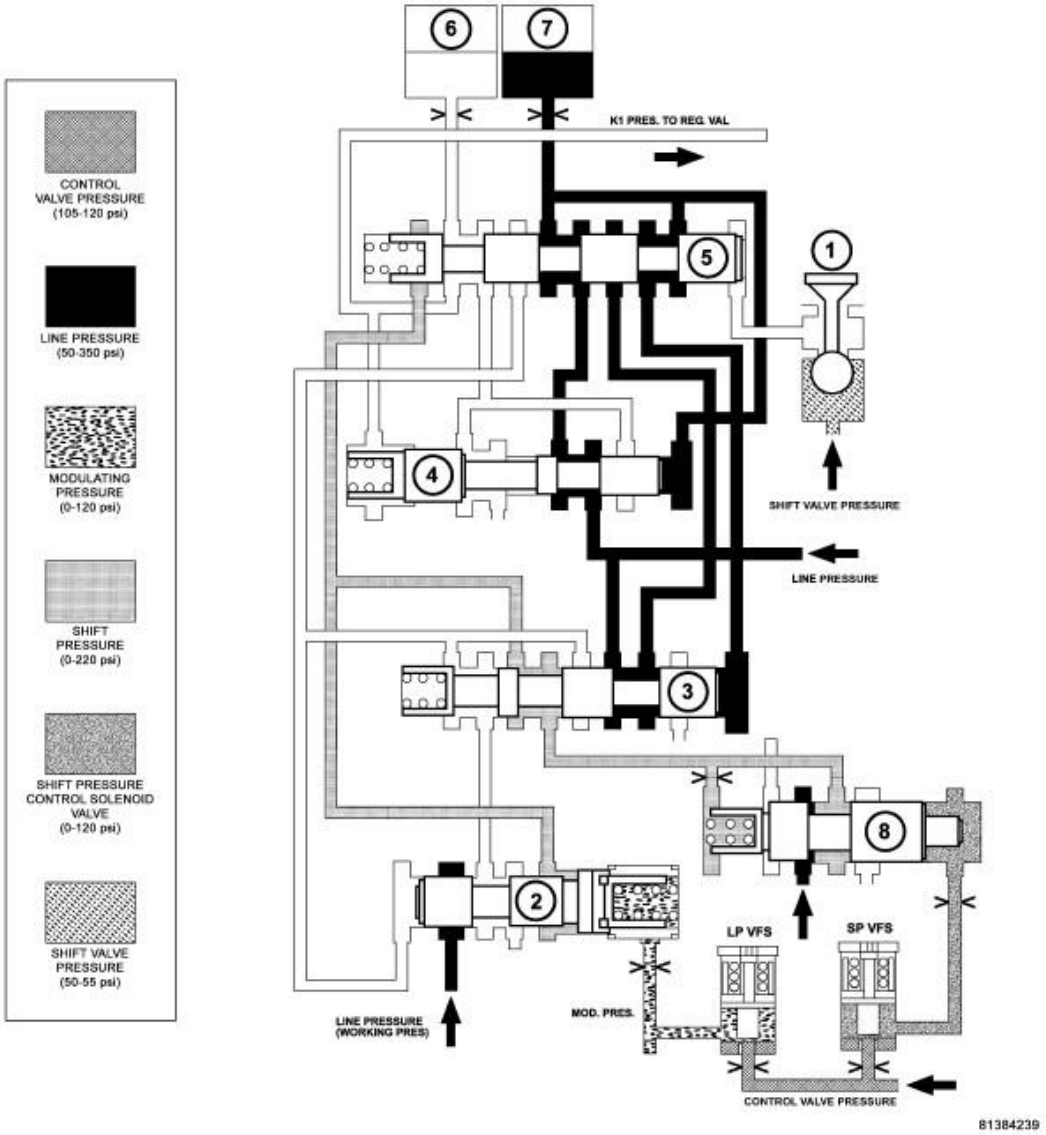

Fig. 22: First Gear Engaged Hydraulic Circuit
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1

3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

After the gear change is complete, the 1-2/4-5 shift solenoid (1) is turned off. Refer to **Fig. 22**. This reduces the pressure on the end face of the 1-2/4-5 command valve (5) to 0 psi and the spring pressure downshifts the valve to its initial position. The line pressure (p-A) is switched to the holding clutch B1 (7) and the end face of the holding valve by the downshifted command valve. The upshifted holding valve also allows the remaining pressure in clutch K1 (6) to be vented.

3 - HOLDING CLUTCH B3	13 - 3-4 COMMAND VALVE
4 - DRIVING CLUTCH K3	14 - 3-4 SHIFT PRESSURE SHIFT VALVE
5 - HOLDING CLUTCH B2 PISTON	15 - 3-4 OVERLAP REGULATING VALVE
6 - HOLDING CLUTCH B2 PISTON OPPOSING FACE	16 - BALL VALVE

7 - SHIFT PRESSURE REGULATING SOLENOID	17 - 1-2/4-5 COMMAND VALVE
8 - SHIFT PRESSURE REGULATING VALVE	18 - 1-2/4-5 COMMAND VALVE
9 - SHIFT VALVE B2	19 - BALL VALVE
10 - 3-4 SHIFT SOLENOID	

With the engine started and the gearshift lever in the NEUTRAL or PARK positions, holding clutch B1 (1) and driving clutch K3 (4) are applied and the various valves in the 1-2/4-5 shift group are positioned to apply pressure to the holding clutch B2. Refer to **Fig. 23**.

ACTIVATION SEQUENCE

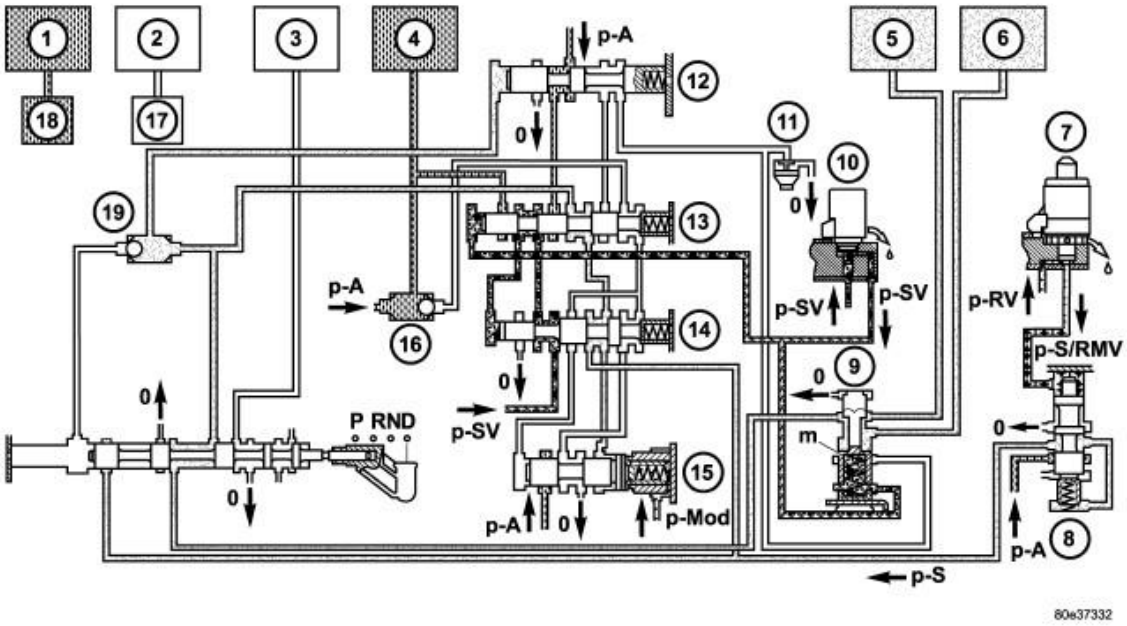

Fig. 24: Activation Sequence
Courtesy of CHRYSLER GROUP, LLC

1 - HOLDING CLUTCH B1	11 - PRESSURE HOLDING VALVE
2 - DRIVING CLUTCH K1	12 - 3-4 HOLDING PRESSURE SHIFT VALVE
3 - HOLDING CLUTCH B3	13 - 3-4 COMMAND VALVE
4 - DRIVING CLUTCH K3	14 - 3-4 SHIFT PRESSURE SHIFT VALVE
5 - HOLDING CLUTCH B2 PISTON	15 - 3-4 OVERLAP REGULATING VALVE
6 - HOLDING CLUTCH B2 PISTON OPPOSING FACE	16 - BALL VALVE
7 - SHIFT PRESSURE REGULATING SOLENOID	17 - 1-2/4-5 COMMAND VALVE
8 - SHIFT PRESSURE REGULATING VALVE	18 - 1-2/4-5 COMMAND VALVE
9 - SHIFT VALVE B2	19 - BALL VALVE

10 - 3-4 SHIFT SOLENOID	

The selector valve opens the shift pressure (p-S) feed connection from the ball valve (19) with the shift valve B2 (9). Refer to **Fig. 24**. With the shift valve B2 (9) in the upper position, shift pressure (p-S) travels behind the piston B2 (5) and simultaneously to the opposing face of the piston B2 (6). The multiple-disc holding clutch B2 begins to close.

The pressure on the opposing face of the piston B2 (6) ensures a soft activation of the multiple-disc holding clutch B2.

FIRST GEAR ENGAGED

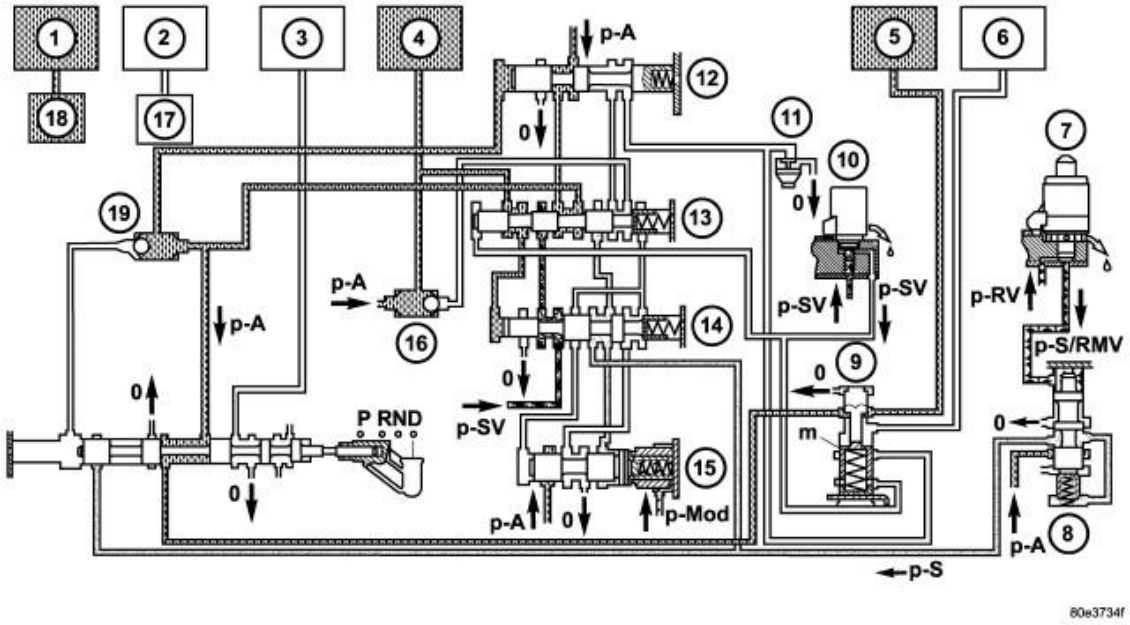

Fig. 25: First Gear Engaged
Courtesy of CHRYSLER GROUP, LLC

1 - HOLDING CLUTCH B1	11 - PRESSURE HOLDING VALVE
2 - DRIVING CLUTCH K1	12 - 3-4 HOLDING PRESSURE SHIFT VALVE
3 - HOLDING CLUTCH B3	13 - 3-4 COMMAND VALVE
4 - DRIVING CLUTCH K3	14 - 3-4 SHIFT PRESSURE SHIFT VALVE
5 - HOLDING CLUTCH B2 PISTON	15 - 3-4 OVERLAP REGULATING VALVE
6 - HOLDING CLUTCH B2 PISTON OPPOSING FACE	16 - BALL VALVE
7 - SHIFT PRESSURE REGULATING SOLENOID	17 - 1-2/4-5 COMMAND VALVE
8 - SHIFT PRESSURE REGULATING VALVE	18 - 1-2/4-5 COMMAND VALVE
9 - SHIFT VALVE B2	19 - BALL VALVE

10 - 3-4 SHIFT SOLENOID	

The TCM monitors the activation sequence via the speed of the input shaft, which slows down as the frictional connection in the multiple-disc holding clutch increases. When the speed drops to the specified level, the TCM shuts off the power to the 3-4 shift solenoid valve (10). Refer to **Fig. 25**. The spring chamber of the shift valve B2 (9) is depressurized and switches downwards. This connects the line to the opposing face of the piston B2 (6) with the pressure holding valve (11). The pressure on the opposing face of the piston B2 (6) drops to a residual pressure.

The working pressure (p-A) is formed and travels via the 2-3 holding pressure shift valve, the 2-3 command valve and the ball valve (16) to multi-plate clutch K3 (4) and via the 3-4 command valve (13) to the end face of the 3-4 shift pressure shift valve (14). The 3-4 shift pressure shift valve (14) is moved against the force of the spring towards the right. At the same time the 3-4 solenoid valve (10) is energized. This allows shift valve pressure (p-SV) to enter the spring chamber of the shift valve B2 (9) and to reach the end face of the 3-4 command valve (13). The shift valve B2 (9) is held in the upper position and the 3-4 command valve (13) switches towards the right. At the end face of the 3-4 shift pressure shift valve (14) the working pressure (p-A) is replaced by shift valve pressure (p-SV).

The 3-4 command valve (13) moves to the left. Working pressure (p-A) travels via the holding pressure shift valve (12) and the 3-4 command valve (13) to the piston of multiple-disc holding clutch B2 (5).

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.
- Transfer case performance (if equipped).

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment (if equipped) and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Adjust gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
3. Road test and note how transmission upshifts, downshifts, and engages.
4. Check fluid level and condition.

VEHICLE IS DISABLED

1. Check for broken or disconnected gearshift cable.
2. Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
3. Check fluid level and condition.
4. Check shifter linkage: Is cable connected to lever at transmission and does the lever move with gear change on the console shifter ? If no movement, repair shift cable and or shifter.
5. With shifter in Park, attempt to rotate drive shaft(s) to ensure transmission output shaft coupler/flange is secure.
6. Check the transfer case operation (if equipped).
7. Raise and support vehicle on safety stands, start engine with transmission in Park position and allow to idle for several minutes, shift transmission into gear, and note following:
    1. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
    2. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
    3. If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.
8. Air pressure test the B1, K3, and B2 clutch circuits. Refer to **DIAGNOSIS AND TESTING**.
9. Check the TCM, Wiring, Valve body, and Solenoids (Utilize fault codes to diagnose if available).
10. Remove oil pan and check filter presence and condition (not plugged and seated).
11. If debris is found in the pan, tear down transmission and inspect all hard parts, Front Annulus Gear and Gear to Retainer and Input Shaft (Shaft to Retainer) etc., and clutches. If the hard parts did not show signs of damage replace the torque converter and filter.
12. Remove valve body, disassemble, and inspect Line Pressure Regulating valve for being stuck, clean and remove debris.
13. Check pump rotor for failed inner lugs that are driven by the T/C hub.

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results. Refer to **CLUTCH APPLICATION**.

CLUTCH APPLICATION

GEAR	RATIO	B1	B2	B3	K1	K2	K3	F1	F2

AUTOMATIC TRANSMISSION

CONDITION	POSSIBLE CAUSES	CORRECTION
Harsh N-D Engagement or Harsh N-R Engagement	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Transmission in limp-home mode.	2. Check TCM for DTCs. Repair as needed.
	3. Driveline lash/movement.	3. Check engine mounts, transmission mount, driveshaft couplings, rear crossmember mounts, axle mounts and axle lash.

	4. Converter clutch or lock up control valve malfunction.	4. Perform converter clutch diagnostics test. Inspect valve body for stuck or sticky lock up control valve. If valve motion is free, replace lock up solenoid and retest.
	5. Valve Body Malfunction.	5. Inspect valve body for stuck or sticky regulator valve.
	6. Clutch or planetary component damage.	6. Remove, disassemble and repair transmission as necessary.
	7. Water in Trans.	7.Perform TSB, recommend to split and clean VB if heavily contaminated.
DELAYED N-D OR N-R ENGAGEMENT	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Torque converter fluid drain back, delayed soft engagement.	2. If vehicle moves normally after 3 seconds of shifting into gear, no repair is necessary. If longer, inspect pump for worn bushing.
	3. Fluid Level Low.	3. Check and adjust fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	4. Filter plugged.	4. Check TC out pressure, if < 10psi, check for plugged filter. Replace if needed.
	5. Filter damaged or missing, missing o-ring.	5. Check for damaged/missing filter or cut/missing o-ring.
	6. Valve Body Malfunction.	6. Inspect valve body for stuck/ sticky regulator valve or shift group valves.
	7. Oil pump gears worn/damaged.	7. Inspect pump for damage or excessive clearances. Replace if needed.
NO DRIVE OR REVERSE ENGAGEMENT (vehicle will not move)	1. Misadjusted/damaged shift cable.	1. Inspect shift system. Adjust and/or replace worn/damaged parts.

	2. Fluid level low.	2. Check and adjust fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	3. Filter plugged.	3. Check TC out pressure, if < 10psi, check for plugged filter. Replace if needed.
	4. Filter damaged or missing, missing filter o-ring.	4. Check for damaged/missing filter or cut/missing o-ring.
	5 Hydraulic system-Low/no line pressure.	5. Remove Electrohydraulic Unit. Inspect or sticky/stuck regulator valve. If valve motion is free, replace line pressure solenoid and retest. If condition still exists check for worn/damaged pump. Replace pump assembly if needed.
	6. TCM in Limp Mode	6. Clear codes and reset.
	7. Stuck Pressure Regulator Valve	7. Split Electrohydraulic Unit t and inspect pressure regulator valve. Remove debris if present. Be certain all shift valves are free, if any valve can't be freed replace Electrohydraulic Unit.
	8. Broken Weld at Front Annulus	8. Replace Hard Parts as Necessary.
	9. Broken Input Shaft Weld	9. Replace Hard Parts as Necessary.
	10. Defective T/C	10. Replace T/C, make sure filter is not clogged.
	11. Broken Output Shaft Weld	11. Replace parts as necessary
	12. Broken/Missing Rear Annulus Weld.	12. Replace parts as necessary.
	13. Unseated Rear Annulus Gear snap ring.	13. Properly install or replace snap ring.
	14. Valves not returned to their home position.	14. Split Electrohydraulic Unit and inspect 3-4 command valve as well as all other valves, being certain they move freely and are free of debris.

SHUDDER GARAGE SHIFT R-D OR D-R	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Customer applying throttle while shift is in progress.	2. Instruct customer to wait until shift is complete prior to applying throttle.
HARSH ROLLING GARAGE SHIFT R-D OR D-R	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Customer shifting into desired range with vehicle motion.	2. Instruct customer to only shift into the desired range with the vehicle stopped and the service brake applied.
	3. Transmission in limp-home mode.	3. Check TCM for DTCs. Repair as needed.
ENGINE STALLS	1. TCC Solenoid Wire in Harness.	1. Inspect for and repair any short, ground, or open.
	2. TCC Solenoid Defective, Bent Terminals or Debris Shorting Terminals.	2. Check for codes. Refer to appropriate diagnostic information .
	3. Debris sticking the TCC Solenoid Open.	3. Remove the TCC Solenoid and try to blow air through it. No air should flow. If air flows freely, replace the TCC Solenoid.
	4. TCC LU Control Valve Stuck.	4. Split the Electrohydraulic Unit and inspect the TCC LU valve for any debris. Remove debris if present. If valve can't be freed replace Electrohydraulic Unit.
ENGINE STALLS WHEN TRANSMISSION IS SHIFTED INTO R OR D.	1. Converter clutch or lock up control valve malfunction.	1. Perform converter clutch diagnostics test. Inspect valve body for stuck or sticky lock up control valve. If valve motion is free, replace lock up solenoid and retest.
	2. Defective torque converter.	2. Replace torque converter.

CLUNK/CLICK NOISE DURING GARAGE SHIFT FROM R-D OR D-R	1. Stick-slip condition between output flange and output shaft nut upon torque reversal from R to D or D to R. Click on first launch.	1. Replace output flange and nut.
HARSH UPSHIFT OR DOWNSHIFT	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Electrohydraulic Unit malfunction.	2. Inspect valve body for sticky/stuck valves. Repair as needed. If valve motion is free, replace shift pressure solenoid and line pressure solenoid and retest.
	3. Damaged or misbuilt clutch.	3. Remove, disassemble and repair transmission as needed.
EMCC SHUDDER AND/OR ROUGH SHIFTs	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Fluid condition, contamination or wrong type.	2. Change fluid per service information procedures. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	3. Electrohydraulic Unit malfunction.	3. Remove Electrohydraulic Unit. Inspect for sticky/stuck lock up control valve. If valve motion is free, replace the lock up solenoid and retest.
	4. Defective torque converter.	4. Replace torque converter.
GRATING OR SCRAPING NOISE PROPORTIONAL TO ENGINE SPEED	1. Torque converter bolts contacting dust shield.	1. Dust shield bent. Replace if needed. Torque converter bolt backed out. Replace with new bolt and torque to proper level.
	2. Damaged/broken drive plate.	2. Inspect driveplate. Replace if needed.
GRATING OR SCRAPING		1. Check driveshaft, center

NOISE PROPORTIONAL TO TRANSMISSION OUTPUT SPEED	1. Driveshaft or rear axle noise.	bearing and axle for noise or contact with other components.
	2. Transmission output bearing noise.	2. Replace output bearing and retest.
	3. Internal transmission damage.	3. Remove, disassemble and repair transmission as needed.
HIGH PITCHED WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid level low.	1. Check and adjust fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	2. Transmission in limp-home mode.	2. Check TCM for DTCs. Repair as needed.
	3. Filter plugged.	3. Check TC out pressure, if < 10psi, check for plugged filter. Replace if needed.
	4. Filter damaged or missing.	4. Check for damaged/missing filter or cut/missing o-ring.
	5. Oil pump bushing worn/ damaged.	5. Visually inspect for worn or damaged pump bushing. Replace pump assembly if needed.
	6. Oil pump gears worn/ damaged.	6. Inspect for worn or damaged pump gears. Replace pump assembly if needed.
NOISE ONLY IN 1ST OR 5TH GEAR	1. Broken Tab on K1/K2 Thrust bearing.	1. Replace K1/K2 Thrust bearing.
FLARES ON THE 1 - 2 SHIFT	1. Failed F1 ORC. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION** .	1. Replace F1 ORC, B1 Retainer and K1 Retainer.
	2. Stuck 1-2 / 4-5 valve.	2. Split Electrohydraulic Unit and inspect 1-2/4-5 valves. Remove debris if present. If valve can't be freed replace Electrohydraulic Unit.
BUMPSHIFT ON 2-1 DOWNSHIFT	1. K1 belleville retainer snap ring.	1. K1 Belleville retainer snap rings may become unseated. Disassemble trans and re-seat snap ring. Verify there are no stuck 1-2/4-5 shift valves in the Electrohydaulic unit prior to removing the trans.

FLARES ON THE 2-3 SHIFT	1.K2 Piston Bottomed Out.	1. Replace Input Shaft Assembly. This issue can be verified by making immediate repeated shifts between 2nd and 3rd. If the flare is eliminated on subsequent shifts to 3rd, It is likely that this is the issue.
	2. Failed F2 ORC. Refer to **AIR CHECKING TRANSMISSION CLUTCH OPERATION** .	2. Replace F2 ORC, Rear Sun Gear and Front Sun Gear
	3. Stuck 2-3 Valves.	3. Split Electrohydraulic Unit and inspect 2-3 valves. Remove debris if present. If valve can't be freed replace Electrohydraulic Unit.
	4. K2 Clutch Slipping.	4. Inspect and if damaged replace K2 Clutch Discs and Seals.
	5. 2-3 Shift Pressure Valve Spring Deformed.	5. It is possible that when the steel cover plate was screwed to the Electrohydraulic Unit, the spring was pinched thus deforming the bore and sticking the valve. Remove the Electrohydraulic Unit and remove the steel plate covering the 2-3 shift pressure valve. If the valve can't be freely removed from the bore, the spring was pinched and the Electrohydraulic Unit requires replacement.
	6. B1 bushing missing.	6. Replace B1 retainer and input shaft.
SLIPS ON 2-3 UPSHIFT	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Fluid level low.	2. Check and adjust fluid level. Refer to **FLUID AND**

		FILTER, STANDARD PROCEDURE.
	3. Filter damaged or missing.	3. Check for damaged/missing filter or cut/missing o-ring.
	4. Valve body malfunction.	4. Check for sticky/stuck 2-3 shift pressure valve or regulator valve.
	5. F2 or B2 clutch damaged.	5. Disassemble transmission, inspect for damaged F2 or B2 clutch. Repair as needed.
FLARE OR NEUTRALS ON THE 3-4 / 4-3 SHIFT	1. Debris sticking the 3-4 Holding Valve	1. Split Electrohydraulic Unit and remove the 3-4 Shift Pressure and 3-4 Holding Valves. Flush the valves and bores with a solvent such as mineral spirits. (Note: Debris can be a very small sliver unnoticable unless flushing onto filter paper.) Only if the valve can not be freed should the Electrohydraulic Unit be replaced.
	2. Debris Sticking the 3-4 Shift Pressure Valve	2. Split Electrohydraulic Unit and remove the 3-4 Shift Pressure and 3-4 Holding Valves. Flush the valves and bores with a solvent such as mineral spirits. (Note: Debris can be a very small sliver unnoticable unless flushing onto filter paper.) Only if the valve can not be freed should the Electrohydraulic Unit be replaced.
	3. Two Plastic Check Balls in one pocket.	3. Split the Electrohydraulic Unit and inspect and verify that there is only one plastic check ball in each of the 4 pockets. If there are two in any pocket, remove one and re-assemble.
		1. Disassemble the transmission, remove the pump and gears from the

SLIPS, BANGS INTO GEAR, DELAYED ENGAGEMENT, VENT TUBE LEAK	1. Casting Void in the Bell Housing.	bell housing. Inspect the pump gear face in the bell housing for a 3/16" diameter void between the pump suction and drainback circuits. If void is present, replace the bell housing.
SLIPS ON 3-4 UPSHIFT	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Fluid level low.	2. Check and adjust fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	3. Filter damaged or missing.	3. Check for damaged/missing filter or cut/missing o-ring.
	4. Valve body malfunction.	4. Check for sticky/stuck 3 - 4 shift pressure valve or regulator valve.
	5. K3 or B2 clutch damaged.	5. Disassemble transmission, inspect for damaged K3 or B2 clutch. Repair as needed.
SLIPS ON 4-5 UPSHIFT	1. Transmission adaptation/ calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to **MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE** .
	2. Fluid level low.	2. Check and adjust fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	3. Filter damaged or missing.	3. Check for damaged/missing filter or cut/missing o-ring.
	4. Electrohydraulic Unit malfunction.	4. Check for sticky/stuck 1 - 2/4- 5 shift pressure valve or regulator valve.
		5. Disassemble

	5. B1 or K1 clutch damaged.	transmission, inspect for damaged B1 or K1 clutch. Repair as needed.
IN-GEAR SHUDDER ON HEAVY ACCELERATION	1. Fluid level low.	1. Check and adjust fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
	2. Filter damaged or missing.	2. Check for damaged/missing filter or cut/missing o-ring.
NO DRIVE ENGAGEMENT FOLLOWING A SHIFT TO N	1. Customer shifting into N at vehicle speeds greater than 25 mph and tipping in on the throttle.	1. Instruct the customer that they should not shift into N at vehicle speeds greater 25 mph.
	2. Shift system malfunction.	2. Inspect shift system for proper adjustment or damage. Check shifter for DTCs. Repair as needed.
REVERSE GEAR POSITION BLOCKED ENGAGEMENT WHEN MOVING SHIFT LEVER FROM D POSITION	1. Customer shifting into R at vehicle speeds greater than 7 mph.	1. Instruct customer that R shifter position is blocked at vehicle speeds greater than 7 mph.
	2. Shift system malfunction.	2. Inspect shift system for proper adjustment or damage. Check shifter for DTCs. Repair as needed.
NO ENGINE CRANKING IN P OR N	1. Gearshift cable adjustment.	1. Adjust shift cable and retest.
	2. Shift system malfunction.	2. Check shifter DTCs. Inspect shift cable and lever assembly. Adjust and/or replace worn/ damaged parts.
	3. Valve body malfunction.	3. Starter lockout contact malfunction. Remove valve body, replace lead frame assembly. Refer to **CONTACT, TEMPERATURE SENSOR\PARK-NEUTRAL, OPERATION**.
INCORRECT TRANSMISSION TEMPERATURE	1. Defective Trans Temp Sensor.	1. Verify proper temperature sensor operation.
	1. Loose/Corroded TCM Connector	1. Disconnect, inspect, and reconnect TCM connector.

SPEED SENSOR ERROR	(Both C1 and C2 Connectors).	Make sure to check for any pushed out pins.
	2. Unlatched Electrohydraulic Unit connector.	2. Remove the Electrohydraulic Unit connector and inspect for any oil or damaged pins. (Note: There is no Electrohydraulic Unit connector pin in position #5) Re-attach the connector and insure that the locking ring tab is fully latched.
	3. Wires Shorted or Open.	3. Ohm the speed sensor wires to make sure there is not a short to another circuit or ground. Visually inspect for any chafing of the wires. Repair as necessary.
	4. TCM Defective.	4. After checking the wiring and connectors replace the TCM.
FLUID LEAK	1. Leak in area of bell housing.	1. Check bolt torque on internal bell housing bolts. If loose, replace fastener and torque to proper level. If bolts are to proper torque level, check pump outer seal and impeller seal. Replace if needed.
	2. Leak in area of control unit (valve body) electrical connector.	2. Check connector for damaged (cut), flattened or missing o-rings. Replace as needed.
	3. Leak in area of pan gasket.	3. Check for proper torque on oil pan clamps. Check for mis-positioned or rolled gasket. Repair as needed.
	4. Leak in area of park guide plug.	4. Remove park guide plug. Check for damaged (cut) or missing o-ring. If o-ring is in good condition, install new plug.
	5. Leak in area of shift lever.	5. Check for damaged shift lever seal or damaged lever. Repair as needed.
		6. Check for worn/damaged

	6. Leak in area of output flange.	slinger seal and output seal. Visually inspect output flange seal surface for damage. Repair as needed.
	7. Leak in area of transmission vent.	7. Check fluid level for overfill condition. Adjust as needed. If fluid level is within specification, ride check vehicle. Monitor transmission temperature. If high operating temperatures are observed, fluid may be contaminated or cooling system malfunctioning. Change fluid per service information procedures. if needed. Refer to **DIAGNOSIS AND TESTING** .
	8. Leak in area of transmission fill tube.	8. Inspect fill tube cap for proper installation. Inspect fill tube grommet between case and fill tube for leakage. Repair as needed.

AIR CHECKING TRANSMISSION CLUTCH OPERATION

8 - K2 CLUTCH PORT
9 - TORQUE CONVERTER CLUTCH LOCK - UP PORT

10 - TORQUE CONVERTER IN PORT
11 - COOLER OUT PORT
12 - TORQUE CONVERTER OUT PORT

When the adapter plates (special tool #10007, Plate, Air Pressure Test) (1&2) are placed over the ports, proper operation of the transmission clutches can be verified. Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle (where applicable) or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission.

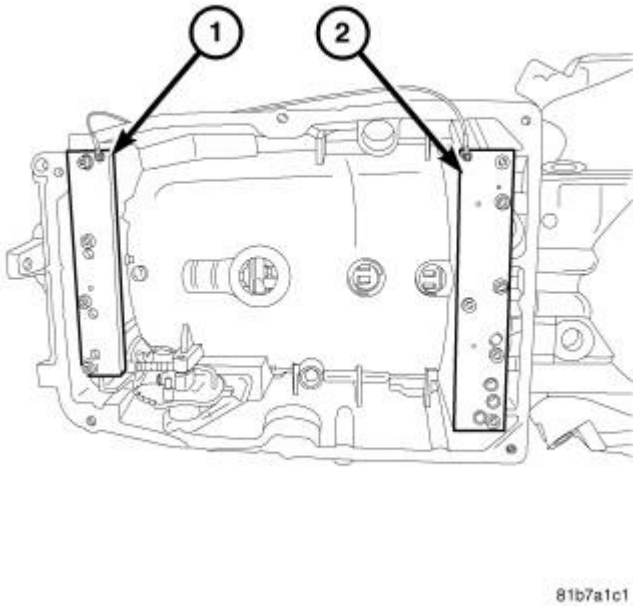

Fig. 28: Nag1 Transmission Adapter Plate
Courtesy of CHRYSLER GROUP, LLC

1 - AIR ADAPTER PLATE 10007 - 2
2 - AIR ADAPTER PLATE 10007 - 1

NOTE: The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.

NOTE: When checking the K1 clutch, air must pass through numerous passages to reach the clutch it's self, therefore only a slight application will be noted.

1. Remove the oil pan.
2. Remove the valve body (electrohydraulic unit). Refer to **UNIT, ELECTROHYDRAULIC CONTROL, REMOVAL**.
3. Using the existing valve body (electrohydraulic unit) mounting bolts attach the Air Adapter

Plates (special tool #10007, Plate, Air Pressure Test) (1&2). Tighten the bolt to 8 N.m (71 in. lbs.).

4. Apply 30 psi of air pressure to each port

If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

REMOVAL

REMOVAL

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

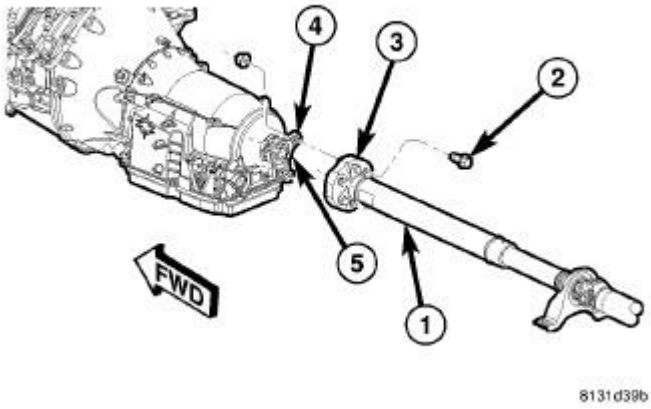

Fig. 50: Disconnect Propeller Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - PROPELLER SHAFT
2 - BOLTS
3 - PROPELLER SHAFT COUPLER
4 - COMPANION FLANGE
5 - PROPELLER SHAFT PILOT

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove the exhaust system.
4. For AWD vehicles, remove the transfer case. Refer to **REMOVAL** .
5. Removel the transmission to engine oil pan bolts.

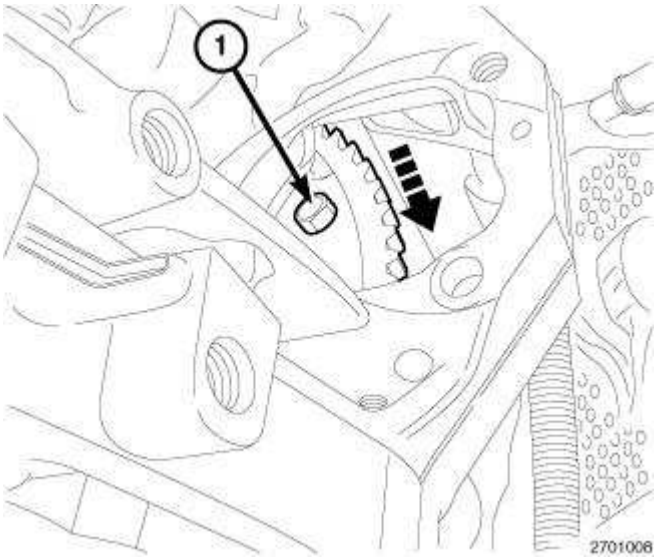

Fig. 51: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The starters are located on the right side of the transmission for RWD vehicles and they are on the left side for AWD vehicles.

6. Remove the bolts (2) holding the starter motor (1) to the transmission. Refer to **STARTER, REMOVAL** .
7. Remove the starter (1) from the transmission starter pocket and safely relocate.
8. Remove any splash shields necessary to gain access to the crankshaft damper bolts.
9. For gas engines, rotate crankshaft in clockwise direction until converter bolts (1) are accessible. Then remove bolts one at a time. Rotate crankshaft with a socket wrench on the dampener bolt.

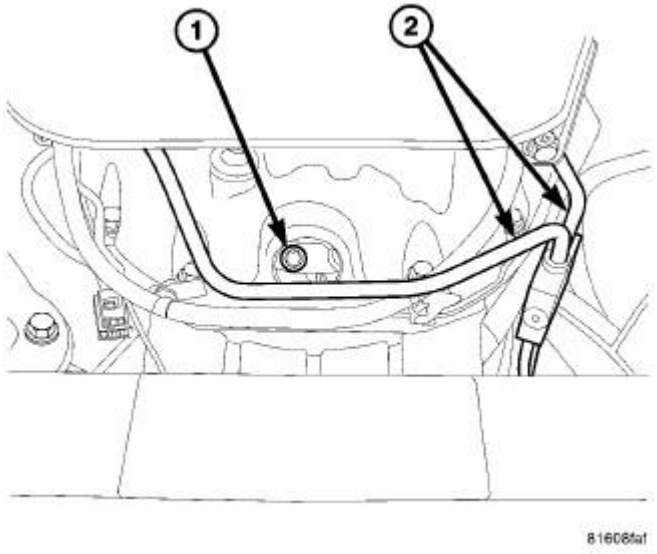

Fig. 52: Torque Converter To Flex Plate Bolts & Fluid Lines

Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER BOLTS
2 - TRANSMISSION COOLER LINES

10. For diesel engines, rotate crankshaft in clockwise direction until converter bolts (1) are accessible. Then remove bolts (1) one at a time. Rotate crankshaft with socket wrench on dampener bolt.

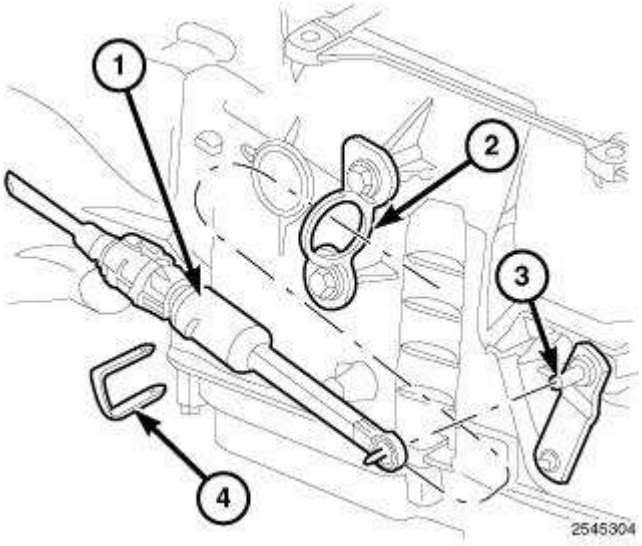

Fig. 53: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

11. Remove the gearshift cable retaining clip (4) (if equipped).
12. Disconnect the gearshift cable (1) from the shift lever (3), and remove cable from bracket (2).

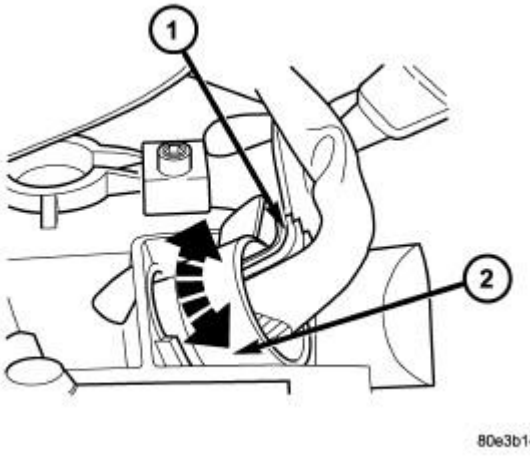

Fig. 54: Removing/Installing Wiring Connector Plug
Courtesy of CHRYSLER GROUP, LLC

1 - PLUG CONNECTOR
2 - ADAPTER PLUG

13. Disconnect 13-pin plug connector (1). Turn bayonet lock of the adapter plug (2) anti-clockwise.
14. Remove the 13-pin connector (1) from the transmission.
15. Remove the fill tube bolt at the transmission case.

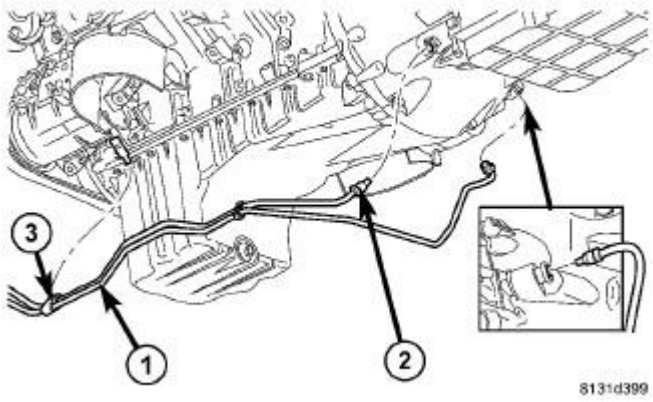

Fig. 55: Transmission Lines
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION OIL COOLER LINES
2 - COOLER LINE FITTINGS
3 - SUPPORT CLAMPS

16. Disconnect transmission fluid cooler lines (1) at transmission fittings (2) and clips (3).
17. Disconnect the transmission vent hose from the transmission.

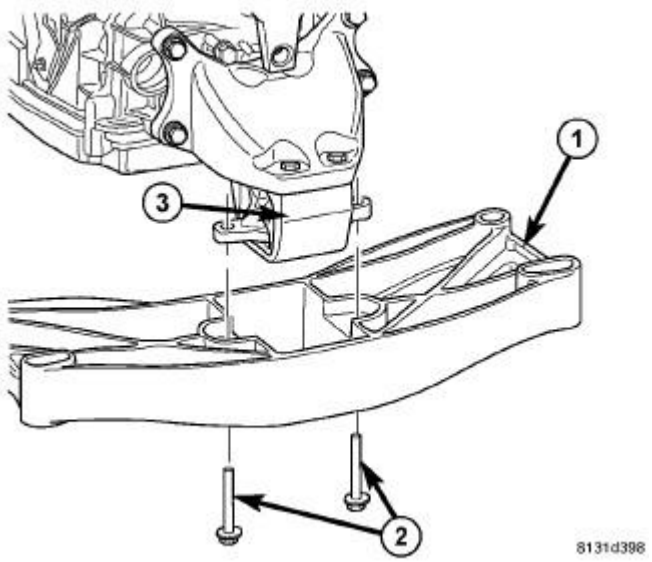

Fig. 56: Locating Transmission Mount, Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Raise transmission slightly with service jack to relieve load on crossmember and supports.
19. Remove bolts (2) securing rear support and cushion (3) to transmission crossmember (1).
20. Remove bolts attaching crossmember (1) to frame and remove crossmember.

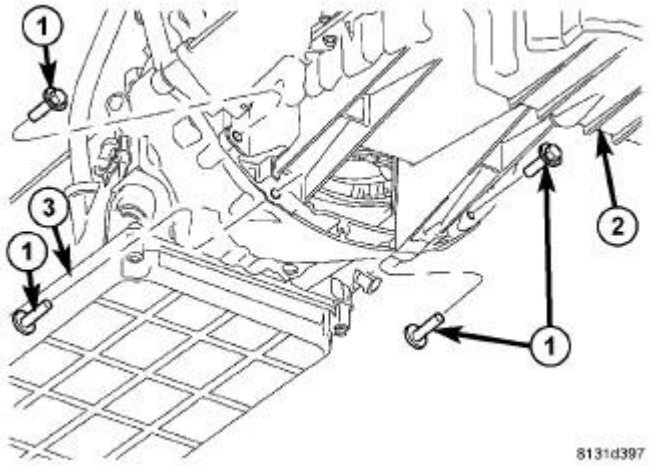

Fig. 57: Removing Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - BOLTS
2 - ENGINE OIL PAN
3 - TRANSMISSION

21. Remove the bolts (1) holding the engine oil pan (2) to the transmission (3), gas engines.

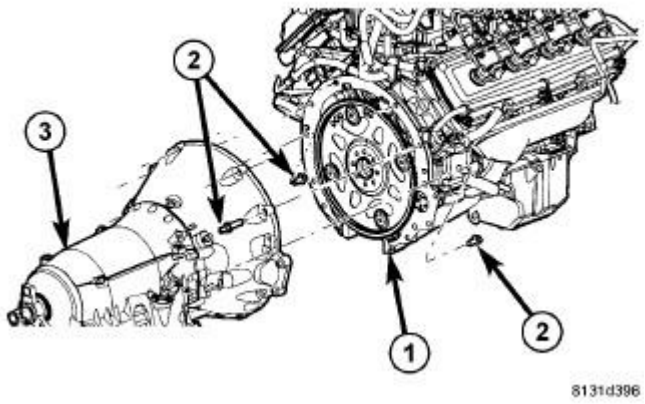

Fig. 58: Removing Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE
2 - BOLTS
3 - TRANSMISSION

22. Remove all remaining bolts (2) securing the transmission (3) to the engine block (1).
23. While removing the fill tube from the transmission case, carefully work transmission and torque converter assembly rearward off engine block dowels.
24. Hold torque converter in place during transmission removal.
25. Lower transmission and remove assembly from under the vehicle.
26. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

DISASSEMBLY

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .

NOTE: Tag all clutch pack assemblies, as they are removed, for reassembly identification.

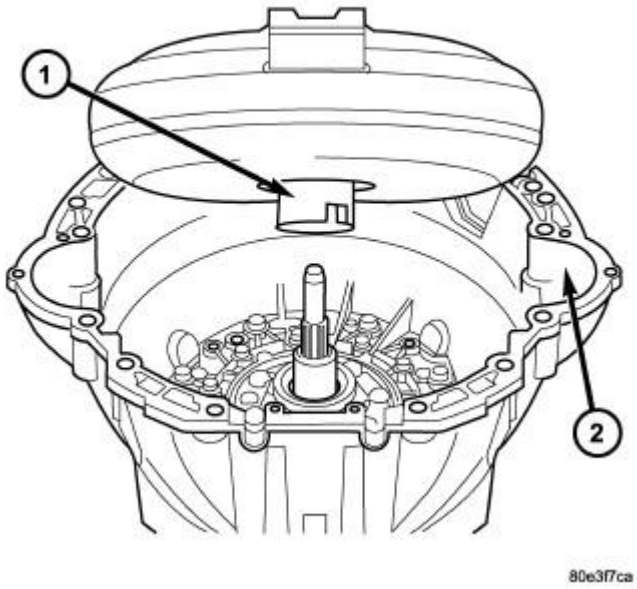

Fig. 59: Removing/Installing Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER
2 - CONVERTER HOUSING

1. Remove the torque converter (1). Refer to **Fig. 59**.

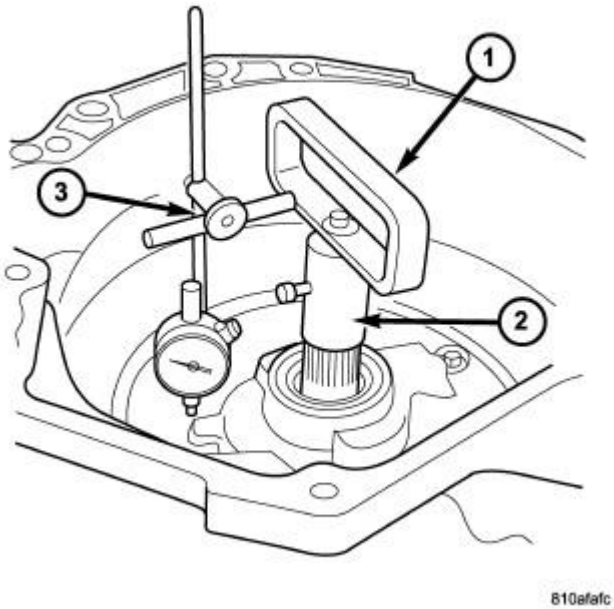

Fig. 60: Checking Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 8266-8
2 - TOOL 8266-18
3 - TOOL C-3339A

2. Place transmission in a vertical position.
3. Measure input shaft end play as follows: Refer to**Fig. 60**.
    1. Attach Adapter (special tool #8266-18, Spline Tool, NAG1) (2) to Handle (special tool #8266-8, Handle) (1).
    2. Attach dial indicator (special tool #C-3339A, Set, Dial Indicator) (3) to Handle (special tool #8266-8, Handle) (1).
    3. Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter (special tool #8266-18, Spline Tool, NAG1) (2) to secure it to the input shaft.
    4. Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
    5. Move the input shaft in and out. Record the maximum travel for assembly reference.

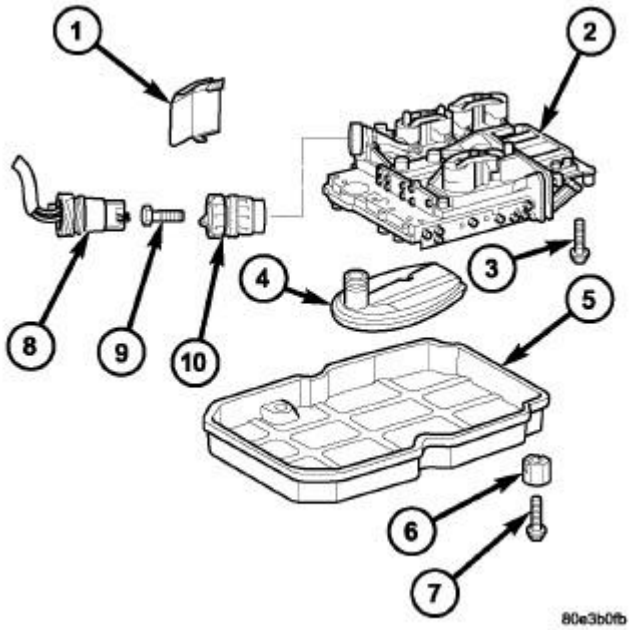

Fig. 61: Removing/Installing Electrohydraulic Unit
Courtesy of CHRYSLER GROUP, LLC

1 - HEAT SHIELD
2 - ELECTROHYDRAULIC UNIT

3 - BOLT
4 - OIL FILTER
5 - OIL PAN
6 - CLAMPING ELEMENT
7 - BOLT
8 - 13-PIN PLUG CONNECTOR
9 - BOLT
10 - ADAPTER PLUG

4. Loosen adapter plug bolt (9) and remove from the adapter plug (10) from the transmission housing. Refer to **Fig. 61**.
5. Detach oil pan (5). Refer to **Fig. 61**.
6. Remove oil filter (4). Refer to **Fig. 61**.
7. Unscrew Torx® socket bolts (3) and remove electrohydraulic unit (2).
8. Air check the transmission. Refer to **DIAGNOSIS AND TESTING**.

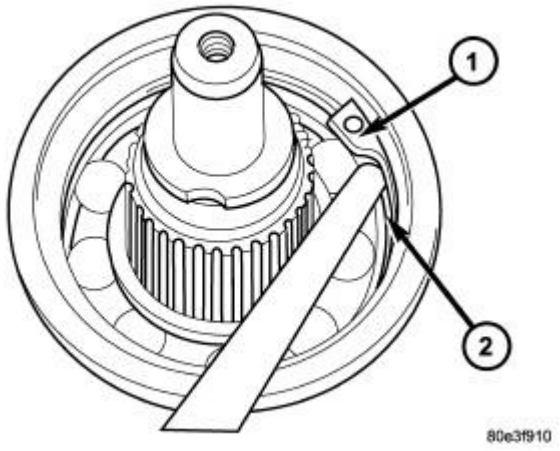

Fig. 62: Removing/Installing Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINING RING
2 - OUTPUT SHAFT BEARING

9. Place the transmission in PARK to prepare for the removal of the output shaft nut.
10. Remove the nut, with a 30 mm 12 point socket, holding the propeller shaft flange to the output shaft and remove the flange.
11. Remove the transmission rear oil seal with a suitable slide hammer and screw.
12. Remove the transmission output shaft washer. Be sure to tag the washer since it is very similar to the geartrain end-play shim and they must not be interchanged.
13. Remove the transmission rear output shaft bearing retaining ring (1).

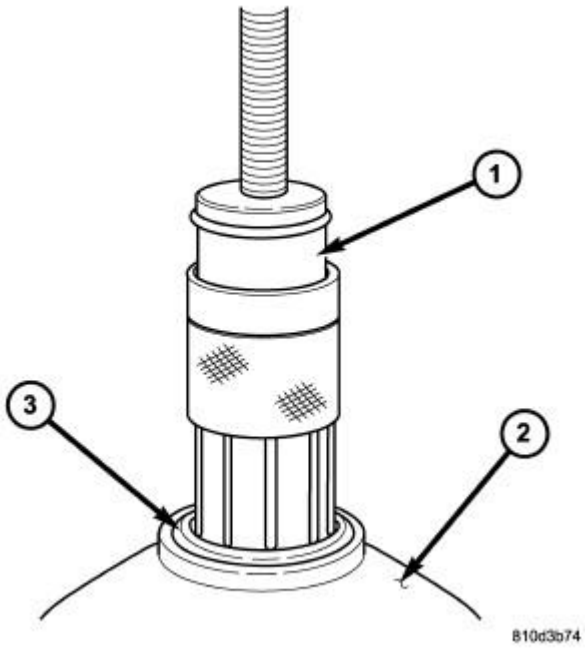

Fig. 63: Removing Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - OUTPUT SHAFT BEARING

14. Position Bearing Remover (special tool #9082A, Remover, Bearing) (1) over the inner race of the output shaft bearing (3). Refer to **Fig. 63**.

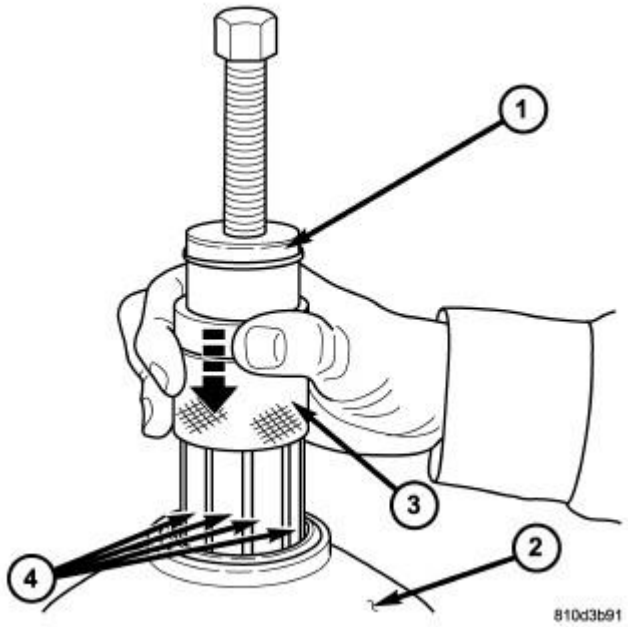

Fig. 64: Slide Remover 9082a Collar Downward
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - COLLAR
4 - FINGERS

NOTE: Due to production variations in the bearing, it may not be possible to slide the collar fully downward. It is only necessary to slide the collar down far enough that the fingers securely grasp the inner bearing race.

15. Slide the collar (3) on the Bearing Remover (special tool #9082A, Remover, Bearing) (1) downward over the fingers (4) of the tool. Refer to **Fig. 64**.

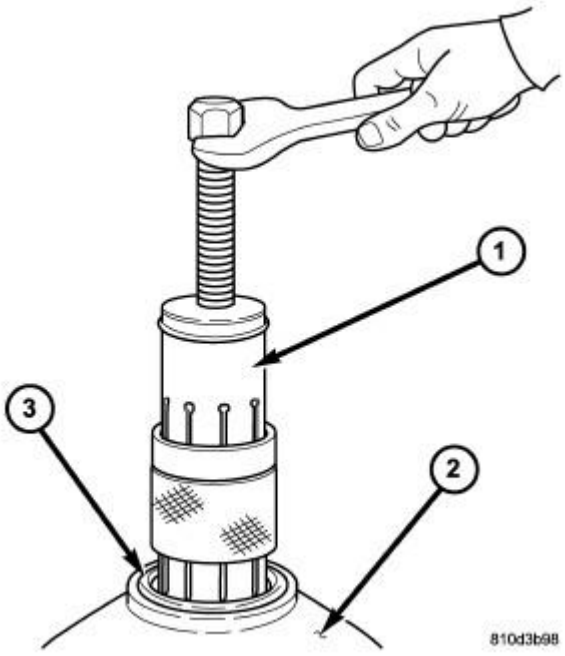

Fig. 65: Removing Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - OUTPUT SHAFT BEARING

16. Remove the output shaft bearing (3). Refer to **Fig. 65**.
17. Remove the geartrain end-play shim from the output shaft. Be sure to tag the shim since it is very similar to the output shaft washer and they must not be interchanged.

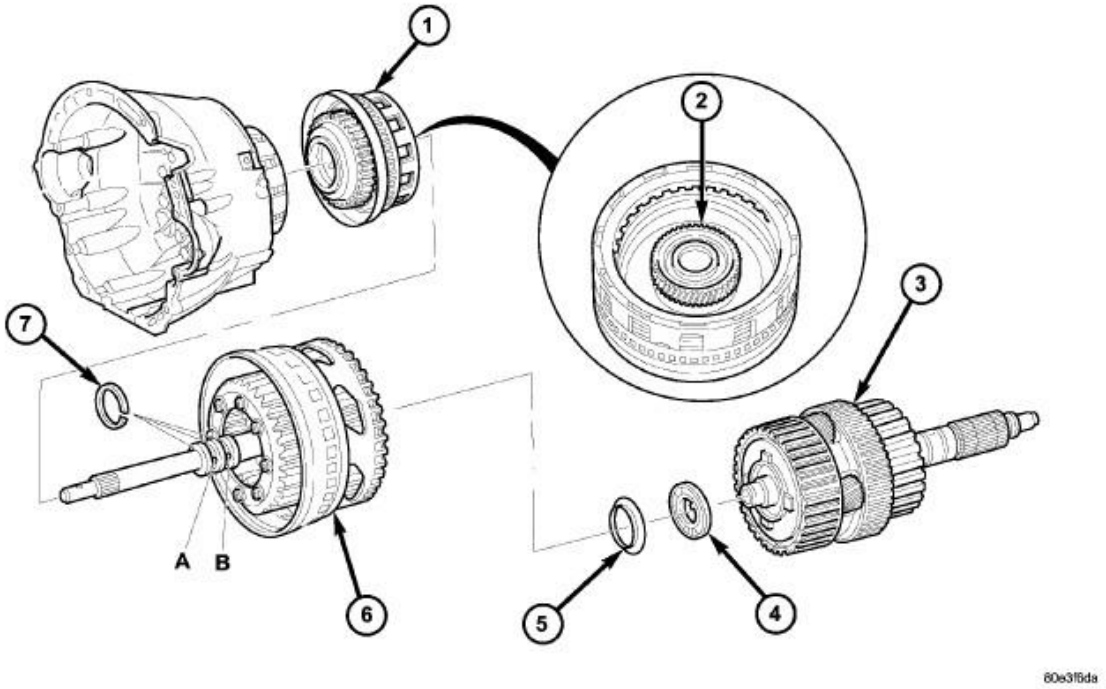

Fig. 66: Remove K1, K2, And K3 Clutches
Courtesy of CHRYSLER GROUP, LLC

1 - DRIVING CLUTCH K1	5 - THRUST WASHER
2 - SUN GEAR OF FRONT PLANETARY GEAR SET	6 - FRONT PLANETARY GEAR SET, DRIVING CLUTCH K2, AND INPUT SHAFT
3 - DRIVING CLUTCH K3, OUTPUT SHAFT, AND CENTER AND REAR PLANETARY GEAR SETS	7 - SEALING RINGS
4 - THRUST NEEDLE BEARING	

18. Remove the bolts holding the transmission housing to the converter housing from inside the converter housing.
19. Stand the transmission upright on the converter housing.
20. Remove the remaining bolts holding the transmission housing to the converter housing.
21. Remove the transmission housing from the converter housing.
22. Remove output shaft with center and rear gear set and clutch K3 (3). Refer to **Fig. 66**.
23. Remove thrust needle bearing (4) and thrust washer (5). Refer to **Fig. 66**.
24. Remove input shaft with clutch K2 and front gear set (6).
25. Remove clutch K1 (1).

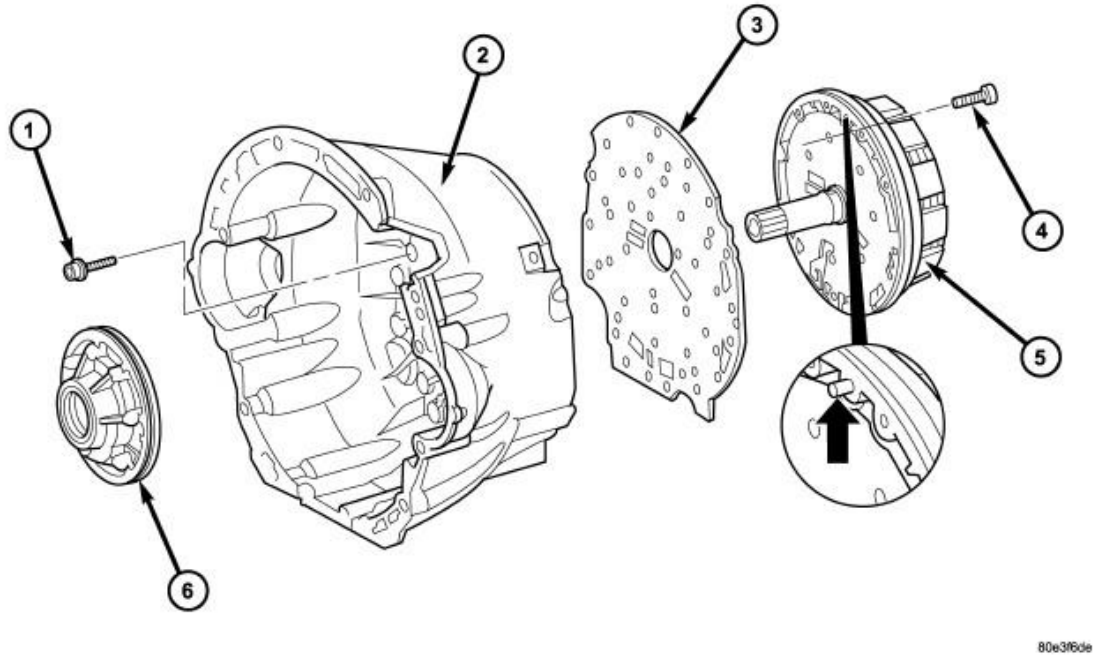

Fig. 67: Removing/Installing Holding Clutch B1 And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - BOLTS - M6X32	4 - BOLTS - M8X35
2 - CONVERTER HOUSING	5 - HOLDING CLUTCH B1
3 - INTERMEDIATE PLATE	6 - OIL PUMP

26. Unscrew Torx® socket bolts (4) and remove oil pump (6). Refer to **Fig. 67**. Screw two opposed bolts into the oil pump housing and press the oil pump out of the converter housing by applying light blows with a plastic hammer.
27. Remove and discard the torque converter hub seal and the oil pump outer o-ring seal from the oil pump.
28. Unscrew Torx® socket bolts (1) and remove multiple-disc holding clutch B1 (5) from converter housing. Refer to **Fig. 67**. Screw two opposed bolts into the multiple-disc holding clutch B1 (5) and separate from the converter housing by applying light blows with a plastic hammer.
29. Detach intermediate plate (3) from converter housing (2). Refer to **Fig. 67**.

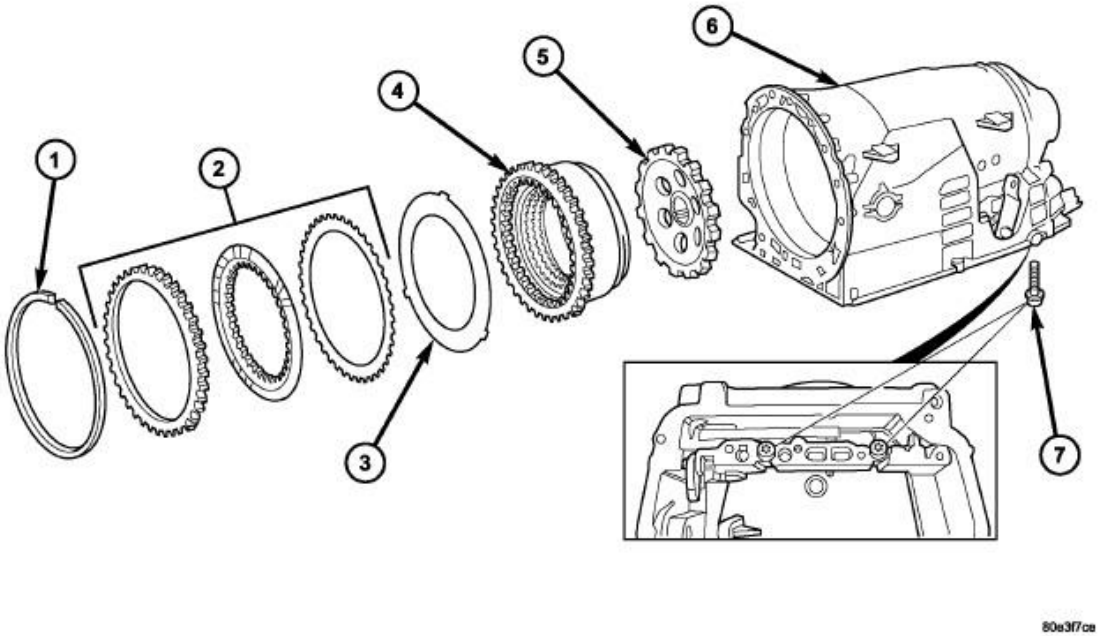

Fig. 68: Identifying B2, B3 And Parking Gear
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING	5 - PARK GEAR
2 - HOLDING CLUTCH B3 DISCS	6 - TRANSMISSION HOUSING
3 - SPRING WASHER	7 - BOLTS - M8X60
4 - HOLDING CLUTCH B2	

30. Remove multiple-disc pack B3 (2) and spring washer (3) by removing snap-ring (1) in transmission housing. Refer to **Fig. 68**. To facilitate removal of the snap-ring (1), compress the multiple-disc pack B3 (2). Note which clutch disc is removed just prior to the spring washer (3) for re-assembly. If the clutch discs are re-used, this disc must be returned to its original position on top of the spring washer.
31. Unscrew Torx® socket bolts (7). Refer to **Fig. 68**.
32. Remove multiple-disc holding clutch B2 (4) from transmission housing. Refer to **Fig. 68**. The externally toothed disc carrier for multiple-disc holding clutch B2 is also the piston for multiple-disc holding clutch B3.
33. Remove parking lock gear (5). Refer to **Fig. 68**.

CLEANING

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they

prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .**

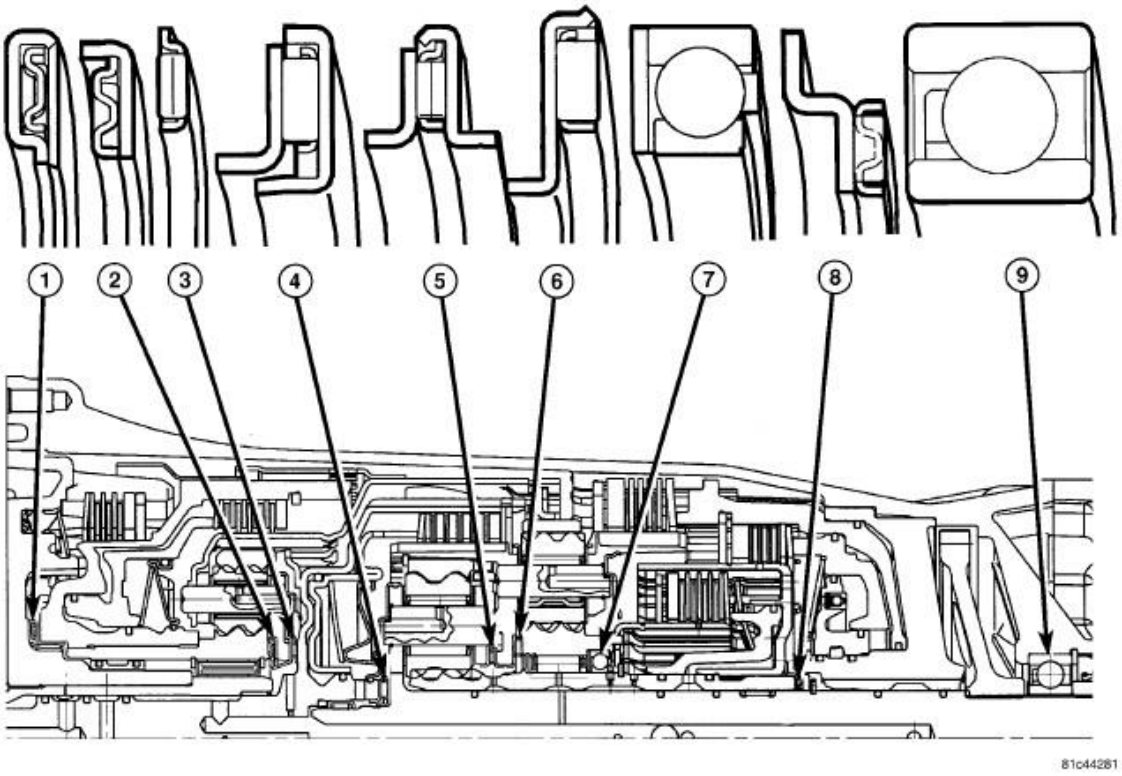

Fig. 69: Nag1 Bearing Orientation
Courtesy of CHRYSLER GROUP, LLC

1 - THRUST BEARING NO. 1	6 - THRUST BEARING NO. 6
2 - THRUST BEARING NO. 2	7 - ROLLER BEARING NO. 7
3 - THRUST BEARING NO. 3	8 - THRUST BEARING NO. 8
4 - THRUST BEARING NO. 4	9 - ROLLER BEARING NO. 9
5 - THRUST BEARING NO. 5	

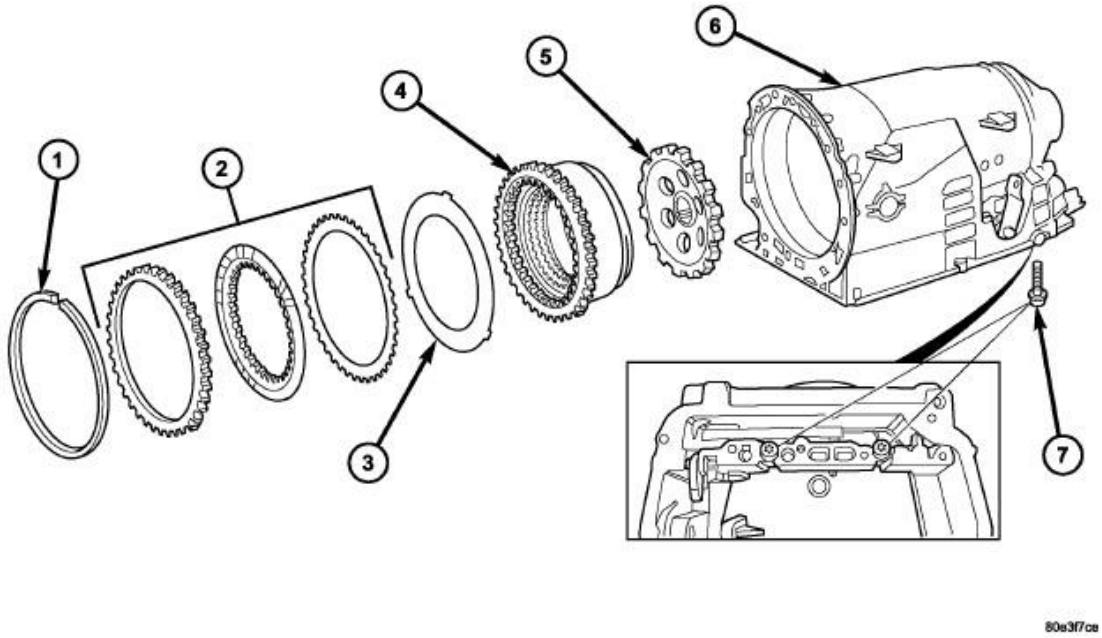

Fig. 70: Identifying B2, B3 And Parking Gear
Courtesy of CHRYSLER GROUP, LLC

1 - SNAP-RING	5 - PARK GEAR
2 - HOLDING CLUTCH B3 DISCS	6 - TRANSMISSION HOUSING
3 - SPRING WASHER	7 - BOLTS - M8X60
4 - HOLDING CLUTCH B2	

1. Insert parking lock gear (5). Refer to **Fig. 70**.
2. Install multiple-disc holding clutch B2 (4) in transmission housing (6). Refer to **Fig. 70**.
3. Screw in both Torx® socket bolts (7). Tighten the bolts to 16 N.m (141 in.lbs.).

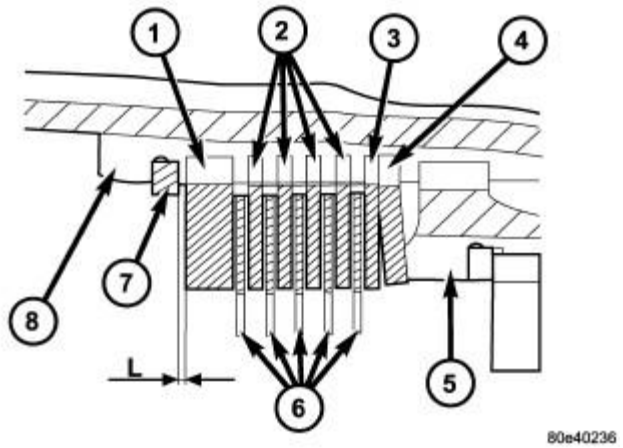

Fig. 71: Measure B3 Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - OUTER DISC - 6.5 MM (0.256 IN.)	5 - PISTON
2 - OUTER DISCS - 1.8 MM (0.071 IN.)	6 - FRICTION DISCS
3 - OUTER DISCS - 1.8 MM (0.071 IN.)	7 - SNAP-RING
4 - SPRING WASHER	8 - B3 DISC CARRIER

NOTE: During the measurement the snap ring (7) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (8). Refer to Fig. 71.

NOTE: Pay attention to sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the spring washer (4) to its original location. Place new friction multiple-discs in ATF fluid for one hour before installing.

CAUTION: Apply only light pressure (less than 10 N (3 lbs.) of force) to the clutch pack when measuring the clutch clearance with the feeler gauge. Applying excessive force to the clutch will give an incorrect reading and lead to a transmission failure.

4. Insert and measure spring washer (4) and multiple-disc pack B3 (2, 6). Refer to **Fig. 71**.
    1. Put multiple-discs for multiple-disc holding clutch B3 together in the sequence shown in the illustration and insert individually.
    2. Using a feeler gauge, determine the play "L" at three points between the snap ring (7) and outer multiple-disc (1). B3 clutch clearance should be 1.0-1.4 mm (0.039-0.055 in.). Adjust the clearance as necessary.
    3. Adjust with snap-ring (7), if necessary. Snap-rings are available in thicknesses of 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), 4.1 mm (0.162 in.), 4.4 mm (0.173 in.), and 4.7 mm (0.185 in.).

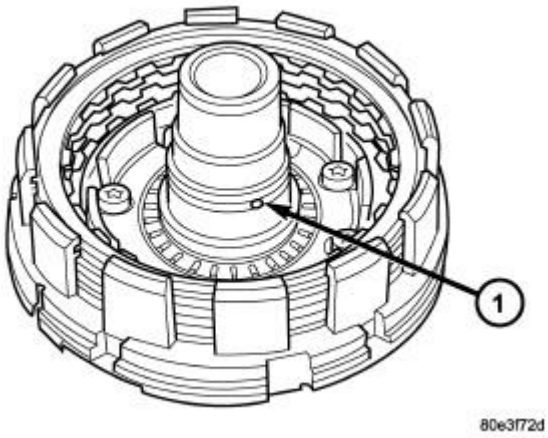

Fig. 72: Check K1 Feed Hole
Courtesy of CHRYSLER GROUP, LLC

1 - K1 CLUTCH FEED HOLE

5. Check that the K1 clutch feed hole (1) in the inner hub of clutch B1 is free before installing clutch B1. Refer to **Fig. 72**.

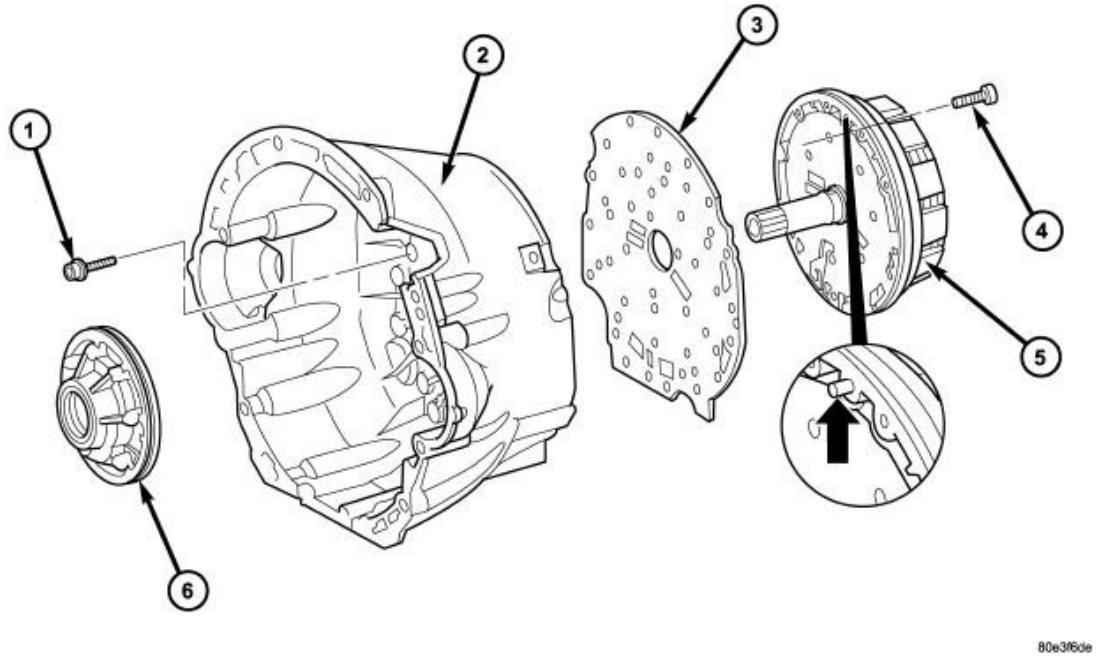

Fig. 73: Removing/Installing Holding Clutch B1 And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

1 - BOLTS - M6X32	4 - BOLTS - M8X35
2 - CONVERTER	5 - HOLDING CLUTCH B1

HOUSING	
3 - INTERMEDIATE PLATE	6 - OIL PUMP

6. Place intermediate plate (3) on converter housing (2) and align.

NOTE: The intermediate plate can generally be used several times. The plate must not be coated with additional sealant

7. Install the holding clutch B1 (5) onto the converter housing and intermediate plate. Refer to **Fig. 73**. Installed position of clutch B1 in relation to converter housing is specified by a plain dowel pin in clutch B1 (arrow).
8. Install the bolts to hold clutch B1 (5) to the converter housing. Refer to **Fig. 73**.
9. Securely tighten multiple-disc holding clutch B1 (5) on converter housing (2) to 10 N.m (89 in.lbs.).

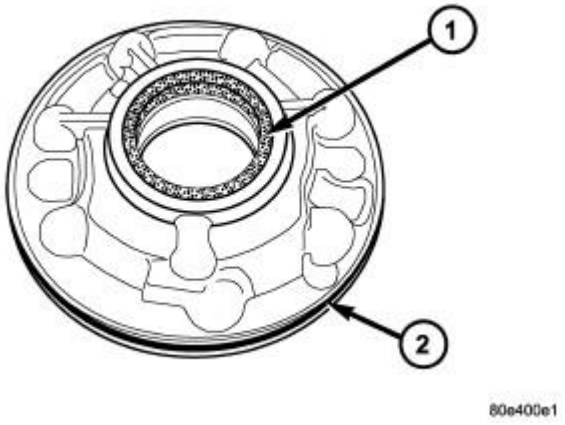

Fig. 74: Identifying Oil Pump Seals
Courtesy of CHRYSLER GROUP, LLC

1 - INNER OIL SEAL
2 - OUTER OIL SEAL

10. Install new torque converter hub seal (1) into the oil pump using Seal Installer (special tool #8902A, Installer, Seal). Refer to **Fig. 74**.
11. Install new oil pump outer o-ring seal onto oil pump. Refer to **Fig. 74**.

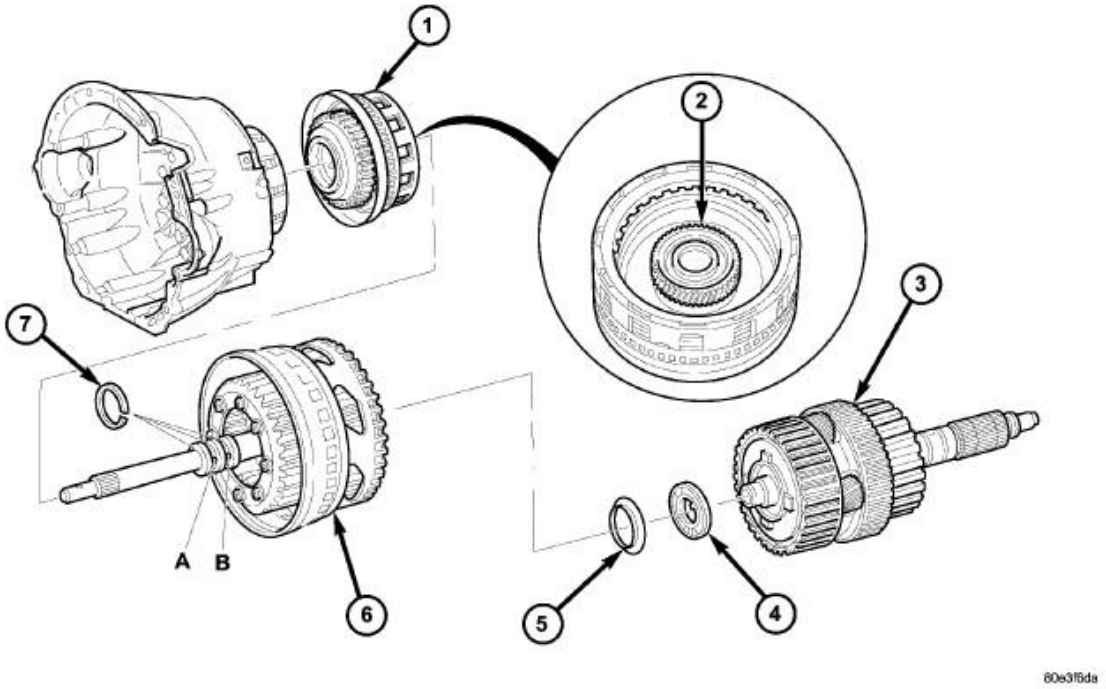

Fig. 75: Remove K1, K2, And K3 Clutches
Courtesy of CHRYSLER GROUP, LLC

1 - DRIVING CLUTCH K1	5 - THRUST WASHER
2 - SUN GEAR OF FRONT PLANETARY GEAR SET	6 - FRONT PLANETARY GEAR SET, DRIVING CLUTCH K2, AND INPUT SHAFT
3 - DRIVING CLUTCH K3, OUTPUT SHAFT, AND CENTER AND REAR PLANETARY GEAR SETS	7 - SEALING RINGS
4 - THRUST NEEDLE BEARING	

12. Install oil pump (6) and securely tighten. Tighten the oil pump bolts to 20 N.m (177 in.lbs.).
13. Using grease, insert sealing rings (7) in the groove so that the joint remains together. Refer to **Fig. 75**.
14. Install the K1 (1) clutch onto the B1 clutch. Refer to **Fig. 75**.
15. Install input shaft with clutch K2 (6) and front gear set (1). Refer to **Fig. 75**.
16. Install front washer (5) and thrust needle bearing (4). Refer to **Fig. 75**.

NOTE: **Insure that the pinion gears are fully seated in the Rear Annulus (Hollow) Gear. If 50% of the pinion gear splines protrude, the Rear Annulus Gear was installed upside down in the K2 Clutch Retainer.**

17. Install output shaft with center and rear gear set and clutch K3 (3). Refer to **Fig. 75**.

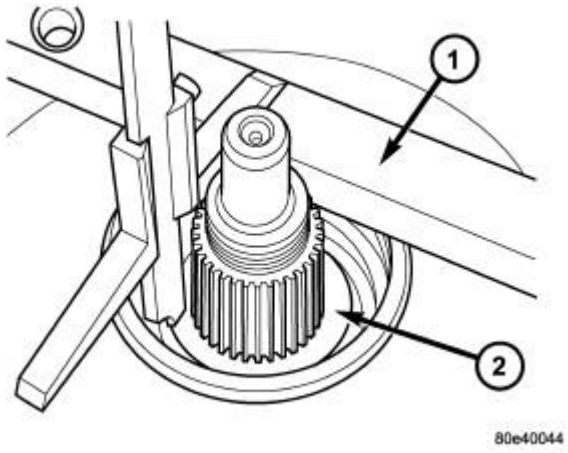

Fig. 76: Measuring From Transmission Housing To Park Gear
Courtesy of CHRYSLER GROUP, LLC

1 - GAUGE BAR 6311
2 - PARK GEAR

18. Using grease, install both Teflon rings in the groove at the rear of the output shaft so that the joint stays together.
19. Mount transmission housing on converter housing.
20. Screw in Torx® socket bolts through the transmission housing into the converter housing. Tighten the bolts to 20 N.m (177 in.lbs.).

NOTE: Verify that there are no nicks or other irregularities in the surface of the transmission case that will cause an inaccurate measurement.

21. Measure end-play between park pawl gear and grooved ball bearing in order to select the proper geartrain end-play shim.
22. Place Gauge Bar (special tool #6311, Gauge Bar) (1) on transmission housing. Using a depth gauge, measure from the gauge bar (1) to the parking lock gear (2). Refer to **Fig. 76**.

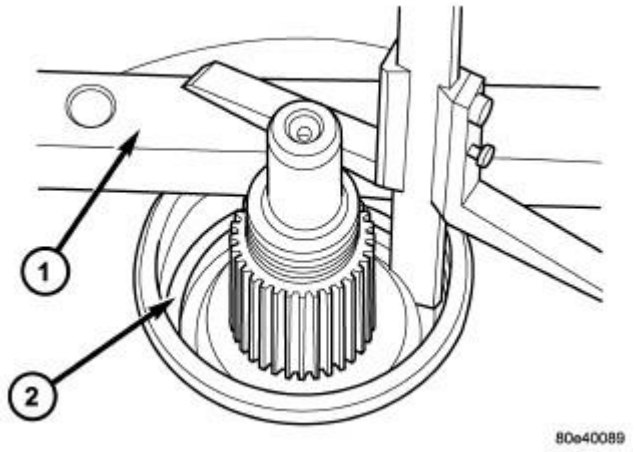

Fig. 77: Measuring From Transmission Housing To Rear Bearing Contact Surface
Courtesy of CHRYSLER GROUP, LLC

1 - GAUGE BAR 6311
2 - OUTPUT SHAFT BEARING CONTACT SURFACE

23. Using a depth gauge, measure from the Gauge Bar (special tool #6311, Gauge Bar) (1) to the contact surface of the output shaft bearing (2) in the transmission housing. Refer to**Fig. 77**.
24. Subtract the first figure from the second figure to determine the current end-play of the transmission. Select a shim or a combination of two shims such that the end-play will be 0.3-0.5 mm (0.012-0.020 in.). Shims are available in thicknesses of 0.2 mm (0.008 in.), 0.3 mm (0.012 in.), 0.4 mm (0.016 in.), and 0.5 mm (0.020 in.).
25. Install the selected end-play shim.

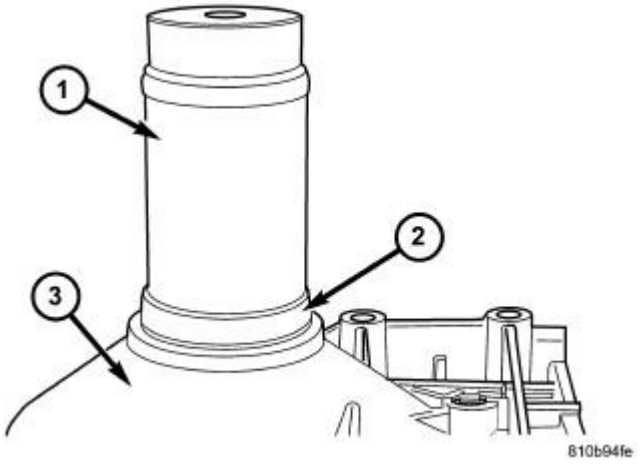

Fig. 78: Installing Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING INSTALLER 9287

2 - BEARING
3 - TRANSMISSION CASE

26. Screw in Torx® socket bolts through the converter housing into the transmission housing. Tighten the bolts to 20 N.m (177 in.lbs.).
27. Install output shaft bearing (2) in rear transmission housing. Using Bearing Installer (special tool #9287, Installer, Bearing) (1), install the output shaft bearing (2) into the transmission housing. Refer to **Fig. 78**. **The closed side of the plastic cage must point towards the parking lock gear.**

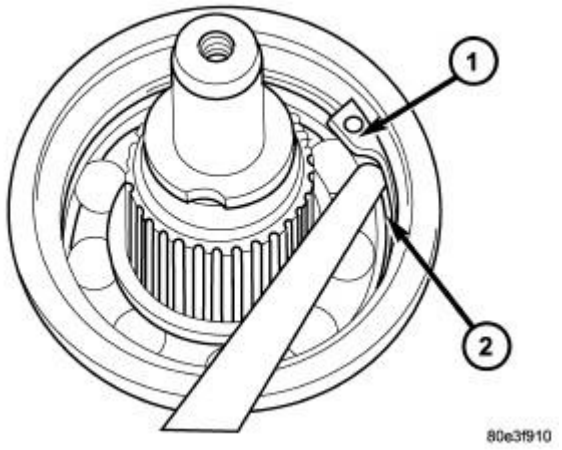

Fig. 79: Removing/Installing Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINING RING
2 - OUTPUT SHAFT BEARING

28. Install the retaining ring (1). Refer to **Fig. 79**. Ensure that the retaining ring is seated correctly in the groove.
29. Check that there is no play between the bearing and the retaining ring using feeler gauge.
30. There must be no play between the retaining ring and the bearing. If the ring cannot be installed, a thinner ring must be used. If there is play between the ring and the bearing, a thicker ring must be installed. Retaining rings are available in thicknesses of 2.0 mm (0.079 in.), 2.1 mm (0.083 in.), and 2.2 mm (0.087 in.).

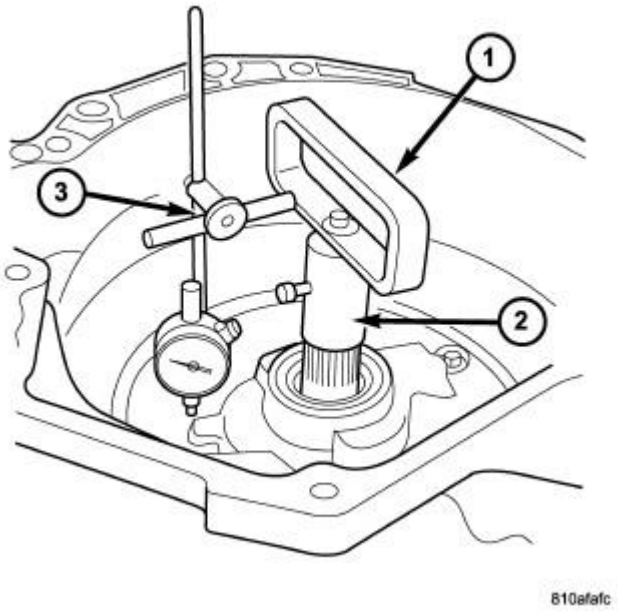

Fig. 80: Checking Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

1 - TOOL 8266-8
2 - TOOL 8266-18
3 - TOOL C-3339A

31. Rotate the transmission so that the bellhousing is pointed upward and ensuring that the output shaft is allowed to move freely.
32. Measure input shaft end-play. Refer to **Fig. 80**.

NOTE: If end-play is incorrect, transmission is incorrectly assembled, or the geartrain end-play shim is incorrect. The geartrain end-play shim is selective.

NOTE: If necessary, a combination of shims can be used to achieve the required end-play.

1. Attach Adapter (special tool #8266-18, Spline Tool, NAG1) (2) to Handle (special tool #8266-8, Handle) (1).
2. Attach dial indicator (special tool #C-3339A, Set, Dial Indicator) (3) to Handle (special tool #8266-8, Handle) (1).
3. Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter (special tool #8266-18, Spline Tool, NAG1) to secure it to the input shaft.

4. Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
5. Move input shaft in and out and record reading. End play should be 0.3-0.5 mm (0.012-0.020 in.). Adjust as necessary.

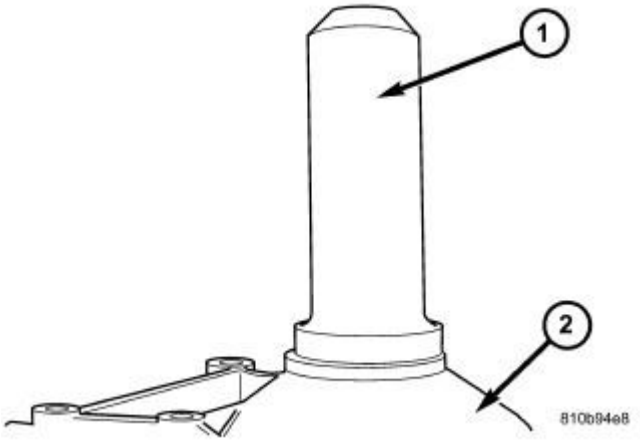

Fig. 81: Installing Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL INSTALLER 8902A
2 - TRANSMISSION CASE

NOTE: The output shaft shim should be 0.3 mm (0.012 in.). If a 0.3 mm (0.012 in.) shim is not available, use a 0.2 mm (0.008 in.) 0.4 mm (0.016 in.) or 0.5 mm (.020 in.) shim.

33. Install the output shaft shim onto the output shaft.
34. Install a new transmission rear seal into the transmission case with Seal Installer (special tool #8902A, Installer, Seal) (1). Refer to **Fig. 81**.

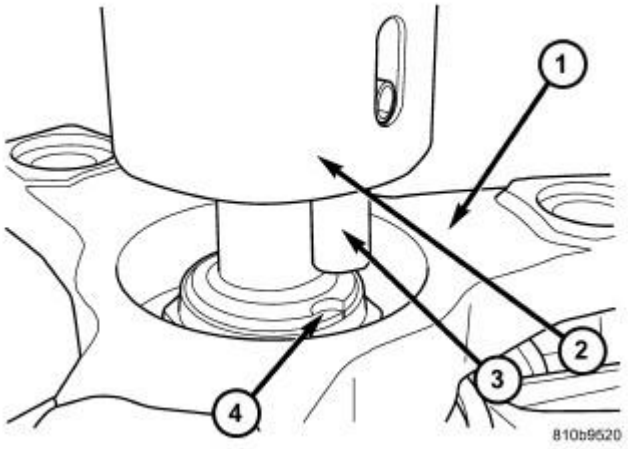

Fig. 82: Align Staking Tool
Courtesy of CHRYSLER GROUP, LLC

1 - PROPELLER SHAFT FLANGE
2 - STAKING TOOL 9078
3 - ALIGNMENT PIN
4 - OUTPUT SHAFT NOTCH

35. Place the transmission in PARK to prepare for the installation of the output shaft nut.
36. Inspect the seal protector on the rear of the output shaft flange. Replace the seal protector if damaged. the seal protector can be removed using a suitable pry tool and installed with a suitable tube style tool.
37. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut, with a 30 mm 12 point socket, to 200 N.m (147.5 ft.lbs.).
38. Place the Staking Tool (special tool #9078, Staking Tool) (2) and Driver Handle (special tool #C-4171, Driver Handle, Universal) onto the output shaft.
39. Rotate the Staking Tool (special tool #9078, Staking Tool) (2) until the alignment pin (3) engages the output shaft notch (4). Refer to **Fig. 82**.

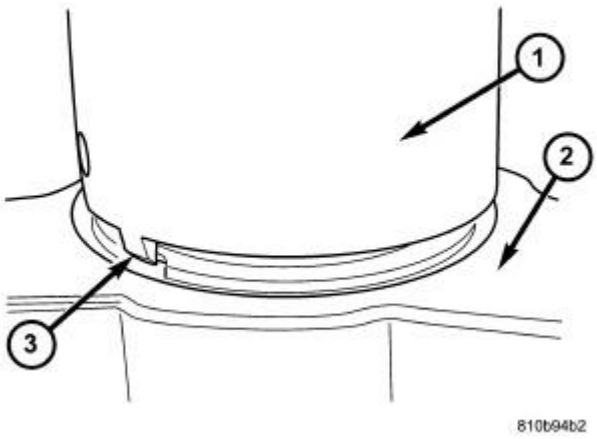

Fig. 83: Stake Output Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

1 - STAKING TOOL 9078
2 - PROPELLER FLANGE
3 - STAKING PIN

40. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2). Refer to **Fig. 83**.
41. Strike the Driver handle (special tool #C-4171, Driver Handle, Universal) with a suitable hammer until the output shaft nut is securely staked to the output shaft.

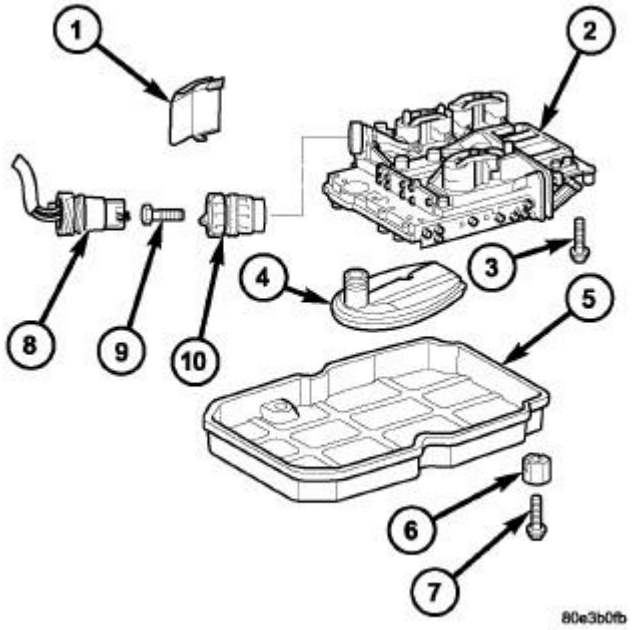

Fig. 84: Removing/Installing Electrohydraulic Unit

2 - ELECTROHYDRAULIC UNIT
3 - BOLT
4 - OIL FILTER
5 - OIL PAN
6 - CLAMPING ELEMENT
7 - BOLT
8 - 13-PIN PLUG CONNECTOR
9 - BOLT
10 - ADAPTER PLUG

42. Install electrohydraulic unit (2). Tighten the bolts to 8 N.m (71 in.lbs.).
43. Install oil filter (4). Refer to **Fig. 84**.
44. Install oil pan (5). Refer to **Fig. 84**. Tighten the bolts to 8 N.m (71 in.lbs.).
45. Install the adapter plug (10). Refer to **Fig. 84**. Tighten the bolt (9) to 2.5 N.m (22 in. lbs.).

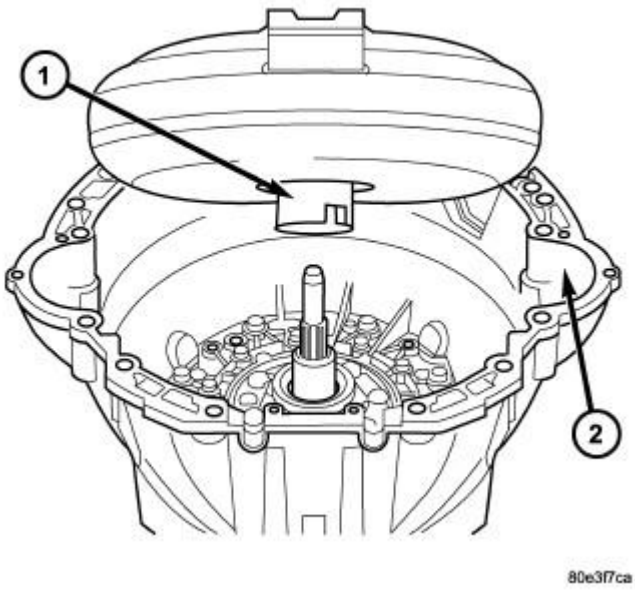

Fig. 85: Removing/Installing Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER
2 - CONVERTER HOUSING

46. Install the torque converter. Refer to **Fig. 85**.

INSTALLATION

INSTALLATION

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 800/1000 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.

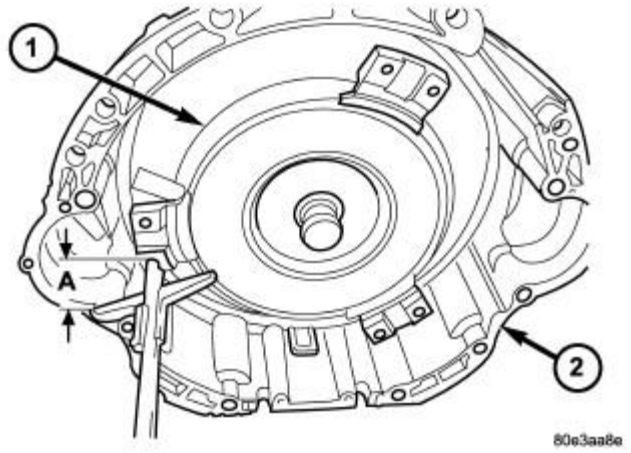

Fig. 86: Measuring Torque Converter Installation Depth
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER
2 - TRANSMISSION HOUSING

4. Place torque converter (1) in position in transmission (2).

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

5. Align torque converter to oil pump seal opening.
6. Insert torque converter hub into oil pump.
7. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
8. Check converter seating with a scale and straightedge (A). Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.
9. If necessary, temporarily secure converter with C-clamp attached to the converter housing.

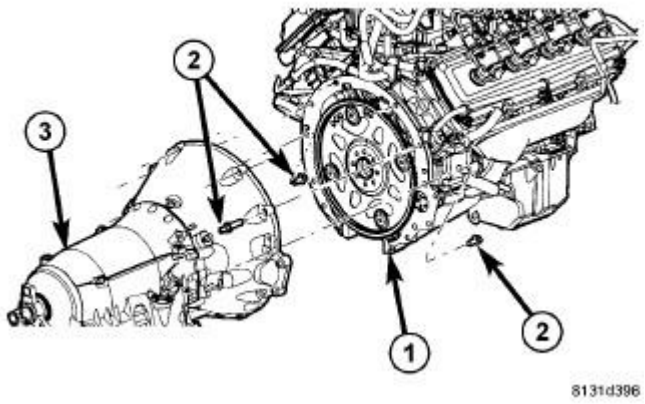

Fig. 87: Removing Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE
2 - BOLTS
3 - TRANSMISSION

10. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
11. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
12. Raise transmission (3) and align the torque converter with the drive plate and the transmission converter housing with the engine block (1).
13. Move transmission forward. Then raise, lower, or tilt transmission to align the converter housing with the engine block dowels.
14. While installing the fill tube into the transmission case, carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
15. Install two torque converter housing bolts (2) to attach the transmission to the engine.
16. Install the remaining torque converter housing to engine bolts (2). Tighten to 39 N.m (29 ft.lbs.).
17. Install the fill tube bolt at the transmission case. Tighten the bolt to 12 N.m (105 lbs in.).

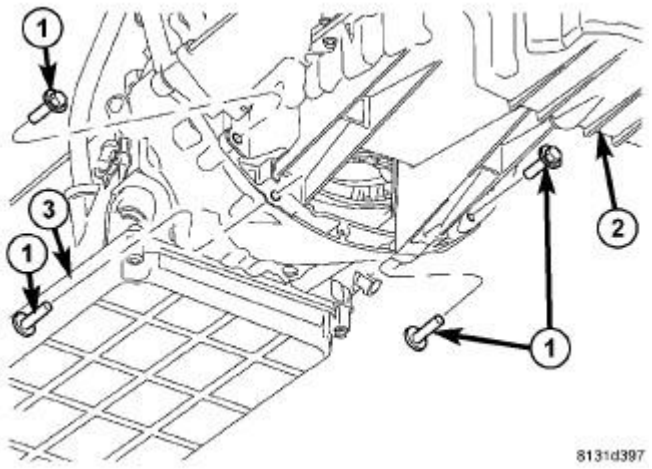

Fig. 88: Removing Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - BOLTS
2 - ENGINE OIL PAN
3 - TRANSMISSION

18. Install the transmission (3) to engine oil pan (2) bolts (1). Tighten to 39 N.m (29 ft.lbs.).

    CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

19. For gas engines, install all torque converter-to-driveplate bolts (1) by hand.
20. Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 42 N.m (31 ft. lbs.).

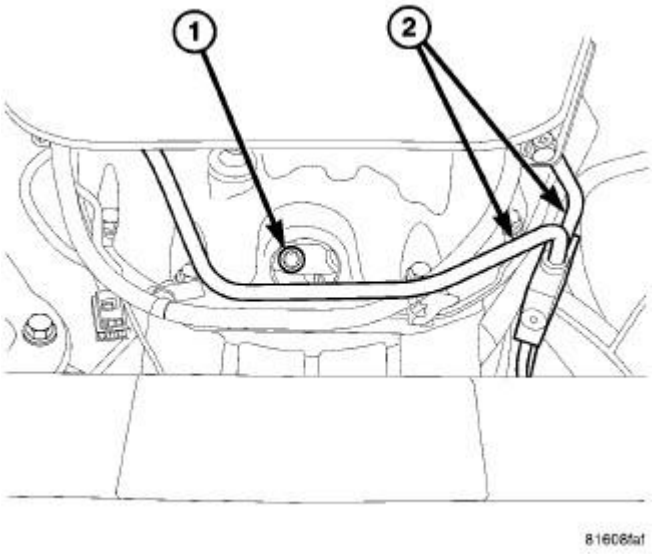

Fig. 89: Torque Converter To Flex Plate Bolts & Fluid Lines
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER BOLTS
2 - TRANSMISSION COOLER LINES

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

21. For diesel engines, install all torque converter-to-driveplate bolts (1) by hand.

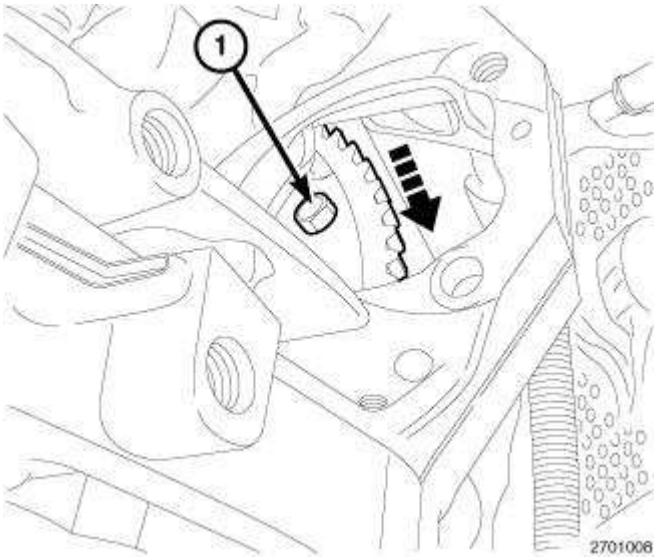

Fig. 90: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 42 N.m (31 ft. lbs.).

NOTE: The starters are located on the right side of the transmission for RWD vehicles and they are on the left side for AWD vehicles.

23. Install starter motor (1). Refer to **STARTER, INSTALLATION** .

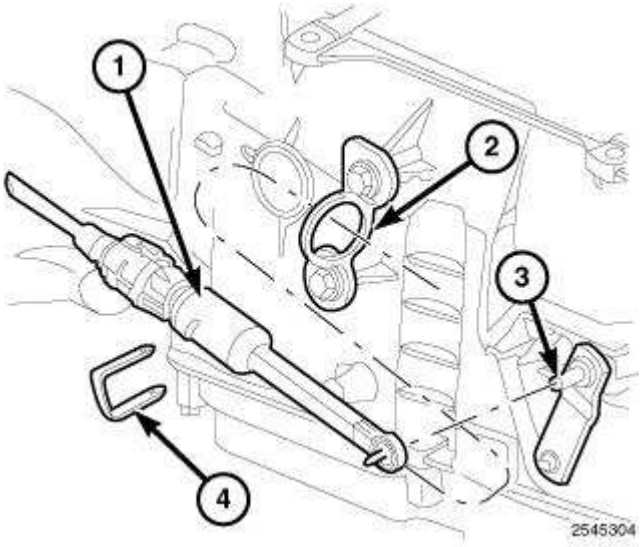

Fig. 91: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

24. Route the gearshift cable (1) through the mounting bracket (2).
25. Engage the gearshift cable (1) eyelet onto the transmission manual shift lever (3).
26. Install the gearshift cable retaining clip (4) (if equipped).

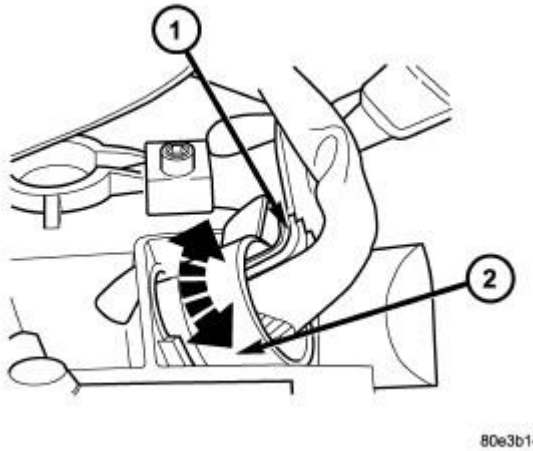

Fig. 92: Removing/Installing Wiring Connector Plug

Courtesy of CHRYSLER GROUP, LLC

1 - PLUG CONNECTOR
2 - ADAPTER PLUG

27. Check O-rings on plug connector (1), and replace if necessary.
28. Install the plug connector (1) into the adapter plug (2). Turn bayonet lock of the adapter plug (2) clockwise to connect plug connector (1).

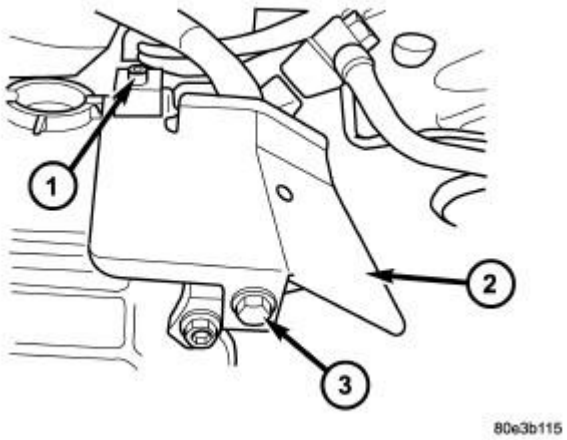

Fig. 93: Removing/Installing Heat Shield
Courtesy of CHRYSLER GROUP, LLC

1 - SCREW
2 - HEAT SHIELD
3 - BOLT

29. Position the heat shield (2), if equipped, onto the transmission housing and install the screw (1) and bolt (3) to hold the shield in place.

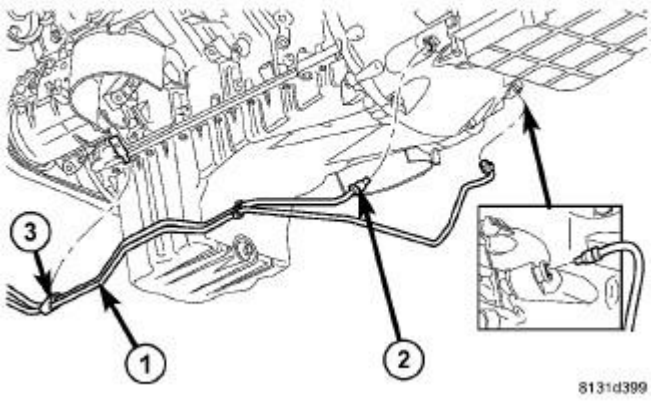

Fig. 94: Transmission Lines
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION OIL COOLER LINES
2 - COOLER LINE FITTINGS
3 - SUPPORT CLAMPS

30. Connect the cooler line fittings (2) and cooler lines (1) to the transmission.

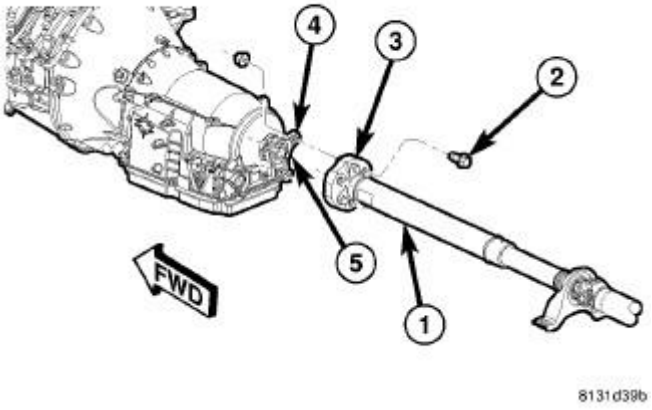

Fig. 95: Disconnect Propeller Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - PROPELLER SHAFT
2 - BOLTS
3 - PROPELLER SHAFT COUPLER
4 - COMPANION FLANGE
5 - PROPELLER SHAFT PILOT

31. For AWD vehicles, install the transfer case, refer to **INSTALLATION** .
32. For RWD vehicles:
    1. Align and connect the propeller shaft (1). Refer to **INSTALLATION** .

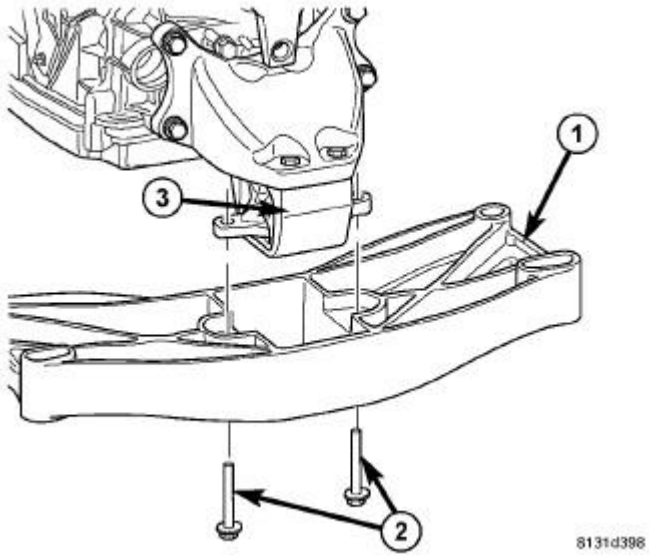

Fig. 96: Locating Transmission Mount, Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

33. Install rear support (3) to transmission. Tighten bolts to 47 N.m (35 ft.lbs.)
34. Install rear transmission crossmember (1). Tighten crossmember to frame bolts to 68 N.m (50 ft.lbs.).
35. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts (2) to 47 N.m (35 ft.lbs.).
36. Install exhaust components.
37. Install any necessary splash shields.
38. Adjust gearshift cable if necessary.
39. Lower vehicle.
40. Connect negative battery cable.
41. Fill the transmission with the appropriate transmission fluid according to the standard procedure. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** &**FLUID AND FILTER, STANDARD PROCEDURE**.

    NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to MODULE, TRANSMISSION CONTROL, STANDARD PROCEDURE .

42. Verify proper operation.

SPECIAL TOOLS

SPECIAL TOOLS

	10007 - Plate, Air Pressure Test (Originally Shipped In Kit Number(s) 10007.)
	6311 - Gauge Bar (Originally Shipped In Kit Number(s) 6692, 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)
	8266-18 - Spline Tool, NAG1 (Originally Shipped In Kit Number(s) 9202, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN, 9329, 9516, 9516-CAN, 9518, 9540, 9785.)
	8266-8 - Handle (Originally Shipped In Kit Number(s) 9202A-CAN, 9202CC, 9299CC, 9299CC, 9300A-CAN.)
	8900A - Multi Use Spring Compressor (Originally Shipped In Kit Number(s) 9202, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN, 9329-SUP, 9516-SUP, 9518-SUP, 9540-SUP, 9785-SUP.)
	8901A - Pressing Tool (Originally Shipped In Kit Number(s) 8901A.)
	8902A - Installer, Seal (Originally Shipped In Kit Number(s) 9202, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN, 9329, 9516, 9516-CAN, 9518, 9540, 9785.)
	9078 - Staking Tool (Originally Shipped In Kit Number(s) 9202, 9202CC, 9299, 9300, 9300A-CAN, 9300-CAN, 9300-CAN, 9329, 9516, 9516-CAN, 9518, 9540, 9785.)
	9082A - Remover, Bearing (Originally Shipped In Kit Number(s) 9202, 9299, 9329, 9516, 9518, 9540, 9785.)
	9287 - Installer, Bearing (Originally Shipped In Kit Number(s) 9202, 9202CC, 9299, 9329, 9516, 9516-CAN, 9518, 9540, 9785.)
	9336A - Dipstick (Originally Shipped In Kit Number(s) 9336A, 9541.)
	9902 - Installer, Seal (Originally Shipped In Kit Number(s) 9901.)
	C-3339A - Set, Dial Indicator (Originally Shipped In Kit Number(s) 9202.)
	C-4171 - Driver Handle, Universal (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)
	C-4755 - Trim Stick (Originally Shipped In Kit Number(s) 9299, 9299CC, 9299CC, 9300A-CAN.)

BEARING, OUTPUT SHAFT

REMOVAL

REMOVAL

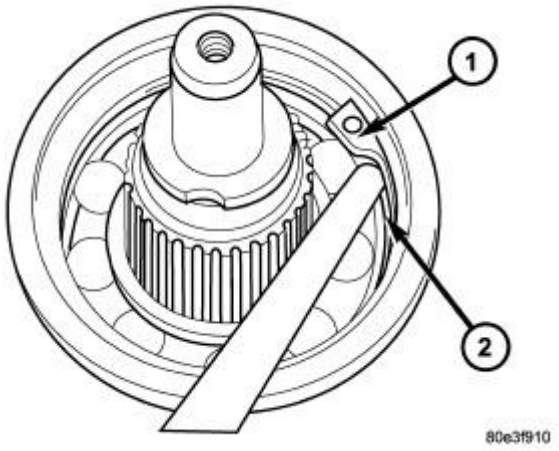

Fig. 97: Removing/Installing Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINING RING
2 - OUTPUT SHAFT BEARING

1. Raise and support vehicle.
2. Remove the propeller shaft. Refer to **REMOVAL** .
3. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
4. Remove the nut, with a 30 mm 12 point socket, holding the propeller shaft flange to the output shaft and remove the flange.
5. Remove the transmission rear oil seal with a suitable slide hammer and screw.
6. Remove the transmission output shaft washer. Be sure to tag the washer since it is very similar to the geartrain end-play shim and they must not be interchanged.
7. Remove the transmission rear output shaft bearing retaining ring (1). Refer to **Fig. 97**.

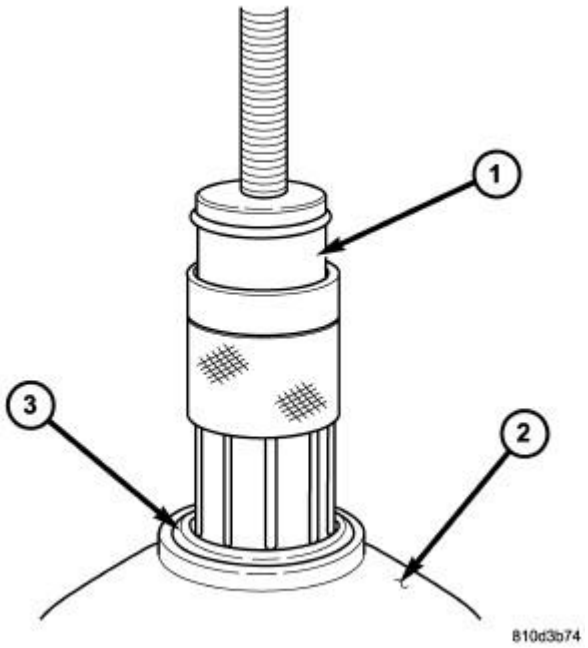

Fig. 98: Removing Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - OUTPUT SHAFT BEARING

8. Position Bearing Remover (special tool #9082A, Remover, Bearing) (1) over the inner race of the output shaft bearing. Refer to **Fig. 98**.

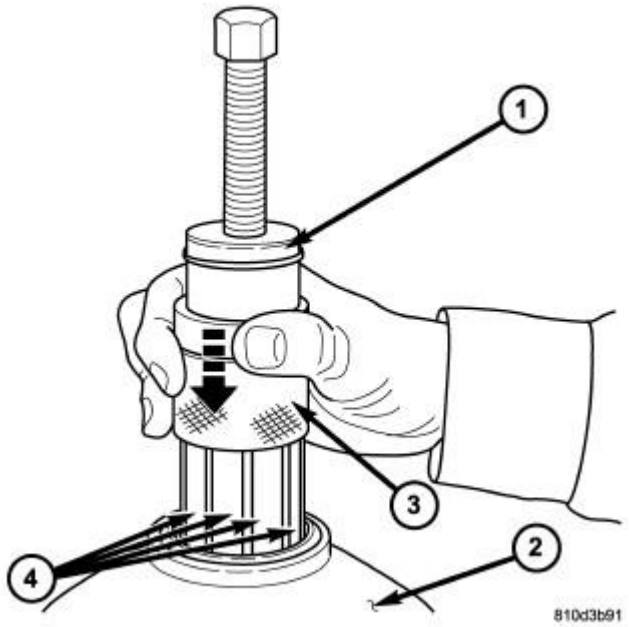

Fig. 99: Slide Remover 9082a Collar Downward
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - COLLAR
4 - FINGERS

NOTE: Due to production variations in the bearing, it may not be possible to slide the collar fully downward. It is only necessary to slide the collar down far enough that the fingers securely grasp the inner bearing race.

9. Slide the collar (3) on the Bearing Remover (special tool #9082A, Remover, Bearing) (1) downward over the fingers (3) of the tool. Refer to **Fig. 99**.

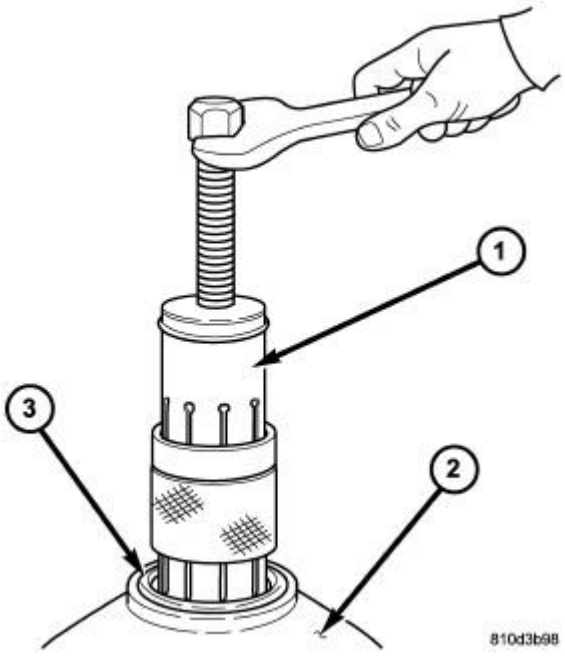

Fig. 100: Removing Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - OUTPUT SHAFT BEARING

CAUTION: Verify that the geartrain end-play shim has remained on the output shaft and against the park gear. The shim may be adhered to the bearing inner race. Retrieve the shim from the bearing and install over the output shaft and against the park gear.

10. Remove the output shaft bearing (3). Refer to **Fig. 100**.

INSTALLATION

INSTALLATION

NOTE: The output shaft shim should be 0.3 mm (0.012 in.). If a 0.3 mm (0.012 in.) shim is not available, use a 0.2 mm (0.008 in.) 0.4 mm (0.016 in.) or 0.5 mm (.020 in.) shim.

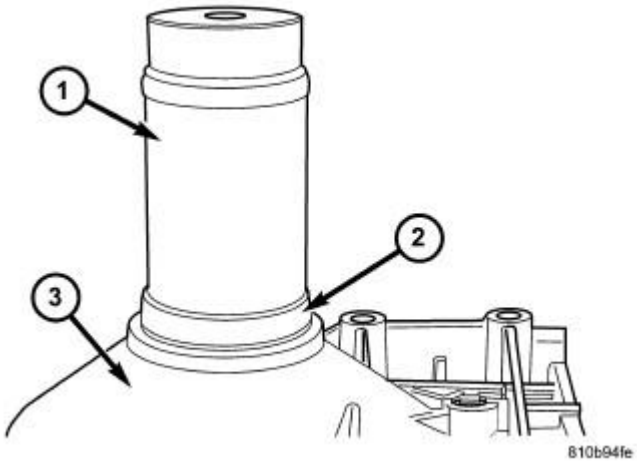

Fig. 101: Installing Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING INSTALLER 9287
2 - BEARING
3 - TRANSMISSION CASE

CAUTION: Verify that the geartrain end-play shim is properly installed over the output shaft and against the park gear.

1. Install output shaft bearing in the rear transmission housing. Using Bearing Installer (special tool #9287, Installer, Bearing) (1), install the output shaft bearing (2) into the transmission housing. Refer to **Fig. 101**. **The closed side of the plastic cage must point towards the parking lock gear.**

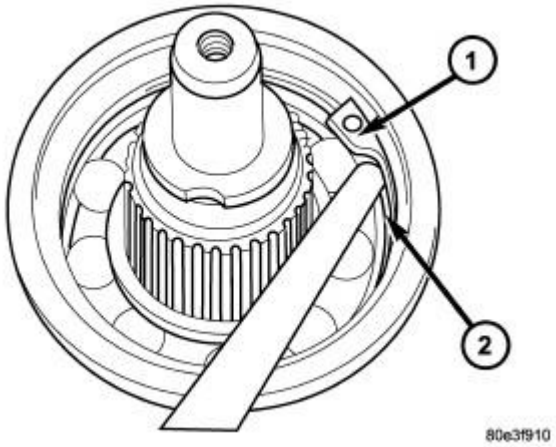

Fig. 102: Removing/Installing Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER GROUP, LLC

1 - RETAINING RING
2 - OUTPUT SHAFT BEARING

2. Install the retaining ring (1). Refer to **Fig. 102**. Ensure that the retaining ring is seated correctly in the groove.
3. Check that there is no play between the bearing and the retaining ring using feeler gauge.
4. There must be no play between the retaining ring and the bearing. If the ring cannot be installed, a thinner ring must be used. If there is play between the ring and the bearing, a thicker ring must be installed. Retaining rings are available in thicknesses of 2.0 mm (0.079 in.), 2.1 mm (0.083 in.), and 2.2 mm (0.087 in.).
5. Install the output shaft washer onto the output shaft.

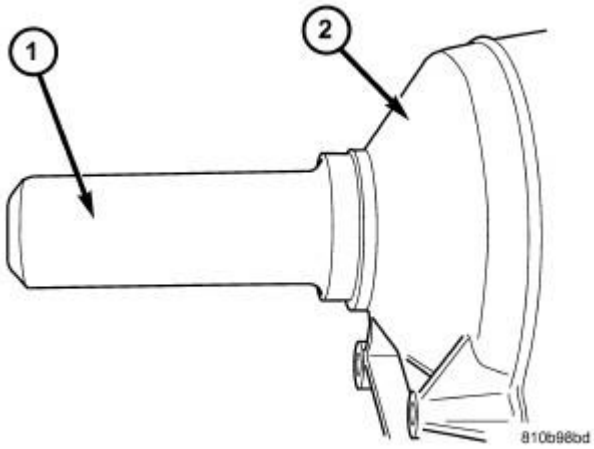

Fig. 103: Installing Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL INSTALLER 8902A
2 - TRANSMISSION CASE

6. Install a new transmission rear seal into the transmission case with Seal Installer (special tool #8902A, Installer, Seal) (1). Refer to **Fig. 103**.
7. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
8. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut, with a 30 mm 12 point socket, to 200 N.m (147.5 ft.lbs.).

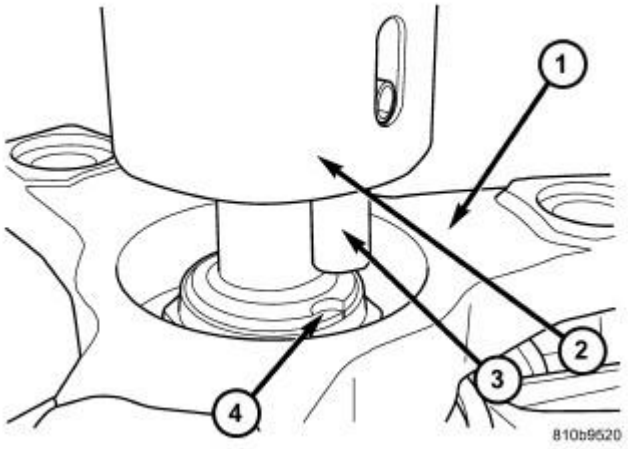

Fig. 104: Align Staking Tool
Courtesy of CHRYSLER GROUP, LLC

1 - PROPELLER SHAFT FLANGE
2 - STAKING TOOL 9078
3 - ALIGNMENT PIN
4 - OUTPUT SHAFT NOTCH

9. Stake the output shaft nut to the output shaft as follows.Place the Staking Tool (special tool #9078, Staking Tool) (2) and Driver Handle (special tool #C-4171, Driver Handle, Universal) onto the output shaft.
10. Rotate the Staking Tool (special tool #9078, Staking Tool) (2) until the alignment pin (3) engages the output shaft notch (4). Refer to **Fig. 104**.

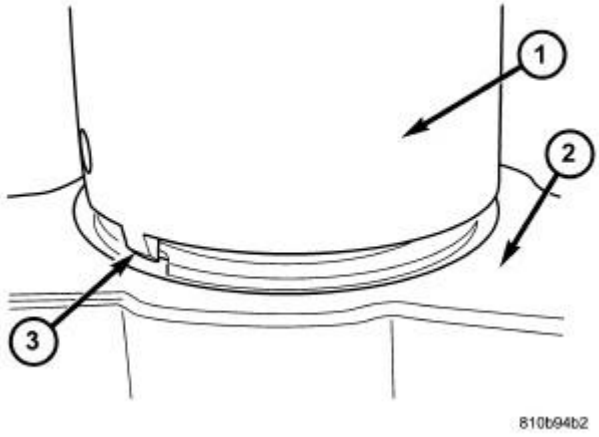

Fig. 105: Stake Output Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

1 - STAKING TOOL 9078

2 - PROPELLER FLANGE
3 - STAKING PIN

11. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2). Refer to **Fig. 105**.
12. Strike the Driver handle (special tool #C-4171, Driver Handle, Universal) with a suitable hammer until the output shaft nut is securely staked to the output shaft.
13. Install the propeller shaft. Refer to **INSTALLATION** .

CABLE, SHIFT

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
    1. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
    2. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
    3. NEUTRAL position - Normal position. Engine starts must be possible.
    4. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

ADJUSTMENTS

GEARSHIFT CABLE - FLOOR MOUNT

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position contact may be faulty.

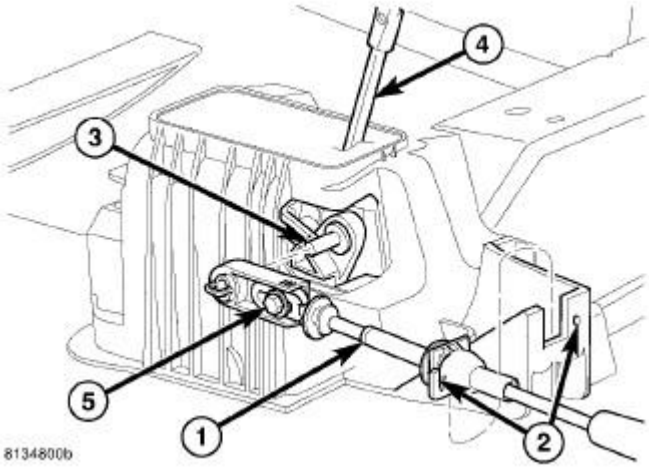

Fig. 106: Gearshift Cable AT Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER
5 - ADJUSTMENT BOLT

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Loosen the shift cable adjustment screw (5). Refer to **Fig. 106**.
4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.

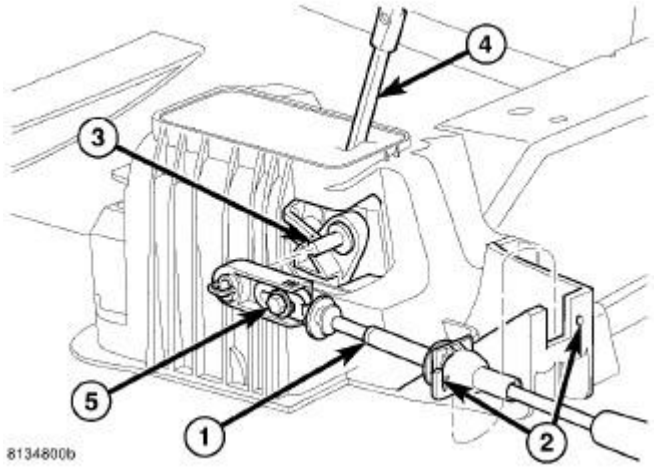

Fig. 107: Gearshift Cable AT Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER
5 - ADJUSTMENT BOLT

9. Lower vehicle
10. Tighten the shift cable adjustment screw (5) to 7 N.m (65 in. Refer to **Fig. 107**.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. Refer to **CONSOLE, FLOOR, INSTALLATION** .

GEARSHIFT CABLE - COLUMN MOUNT

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position contact may be faulty.

1. If necessary, remove the instrument panel side trim at the end of the instrument panel.
2. If necessary, remove the knee bolster fasteners.
3. If necessary, disconnect the trunk release harness connector to the trunk release switch on the knee bolster, and remove the knee bolster.

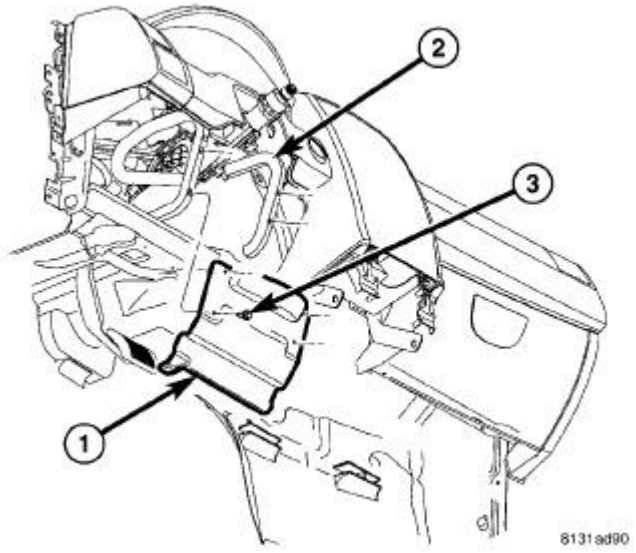

Fig. 108: Reinforcement I/P Steering Column
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, remove the screws (3), and remove the instrument panel steering column cover reinforcement (1).

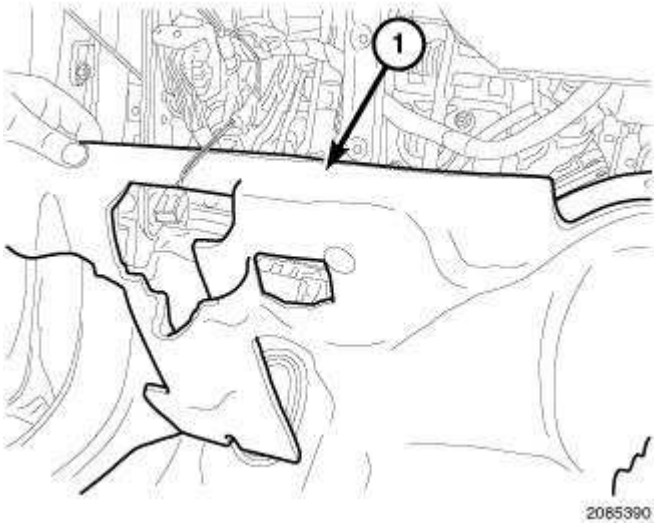

Fig. 109: Identifying Silencer Panel
Courtesy of CHRYSLER GROUP, LLC

5. If necessary, remove the silencer panel fasteners, and remove the silencer panel (1).
6. Shift transmission into PARK.

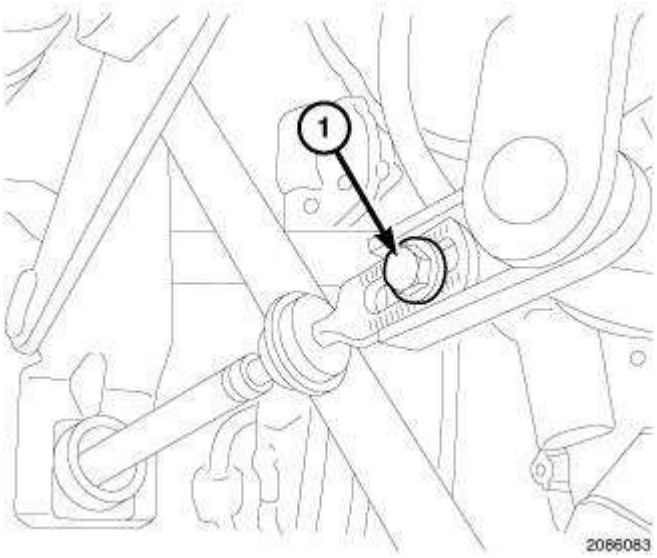

Fig. 110: Shift Cable & Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Loosen the shift cable adjustment screw (1).
8. Raise vehicle.
9. Unsnap cable eyelet from transmission shift lever.
10. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
11. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
12. Snap cable eyelet onto transmission shift lever.
13. Lower vehicle
14. Tighten the shift cable adjustment screw (1) to 7 N.m (65 in.lbs.).
15. Verify correct operation of the shifter.

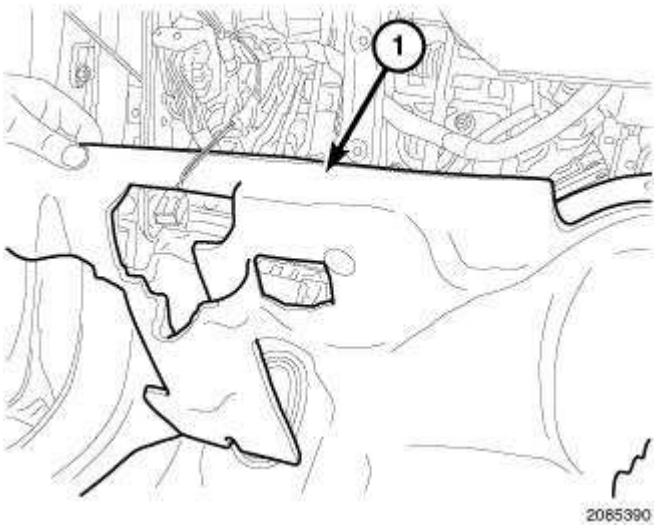

Fig. 111: Identifying Silencer Panel
Courtesy of CHRYSLER GROUP, LLC

16. If removed, install the silencer panel (1), and the silencer panel fasteners.

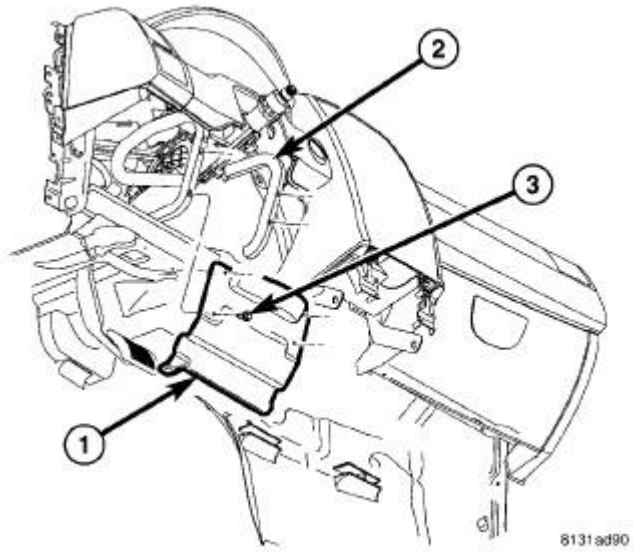

Fig. 112: Reinforcement I/P Steering Column
Courtesy of CHRYSLER GROUP, LLC

17. If removed, install the instrument panel steering column cover reinforcement (1), and the screws (3).
18. If removed, reconnect the trunk release harness connector to the trunk release switch on the knee bolster, and install the knee bolster.
19. If removed, install the knee bolster fasteners.
20. If removed, install the instrument panel side trim at the end of the instrument panel.

REMOVAL

FLOOR MOUNT

1. Shift transmission into PARK.
2. Raise vehicle.

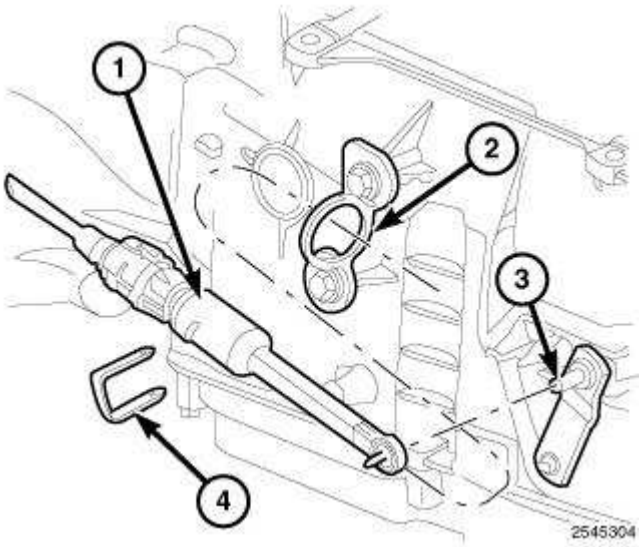

Fig. 113: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

3. Remove the gearshift cable retaining clip (4) (if equipped).
4. Disengage the gearshift cable (1) eyelet at transmission manual shift lever (3) and pull cable out of the mounting bracket (2).
5. Lower the vehicle.
6. Remove the floor console as necessary to access the shift mechanism and cables. Refer to **CONSOLE, FLOOR, REMOVAL** .
7. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.

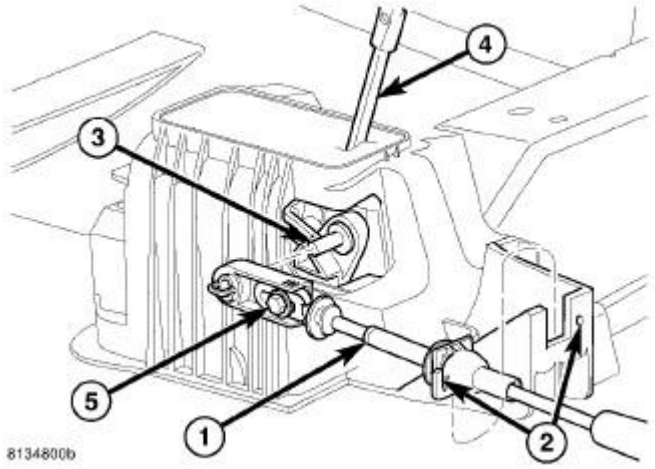

Fig. 114: Gearshift Cable AT Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER
5 - ADJUSTMENT BOLT

8. Remove the gearshift cable (1) from the shift lever pin (3).
9. Remove the gearshift cable retainer (2) from the notch (2) in the shifter assembly.

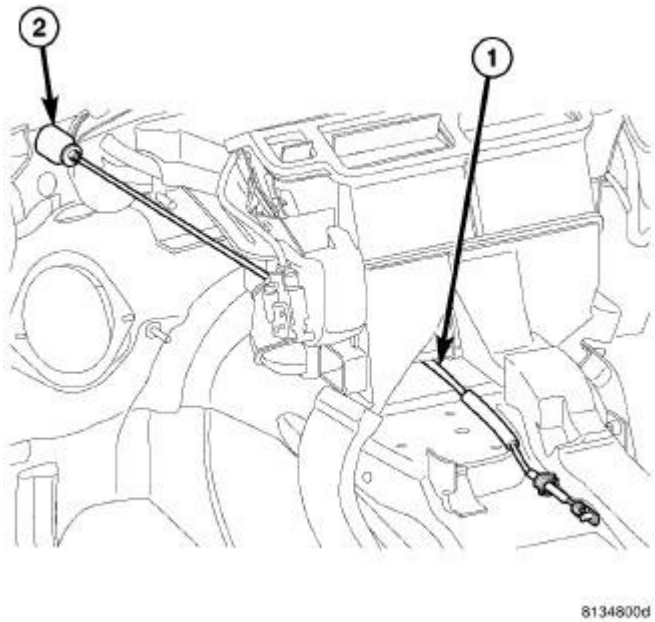

Fig. 115: Gearshift Cable Grommet

Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

10. From under the hood, remove the shift cable grommet (2) from the dash panel.
11. Remove gearshift cable (1) from vehicle.

COLUMN MOUNT

1. Place the shifter in PARK
2. Raise the vehicle.

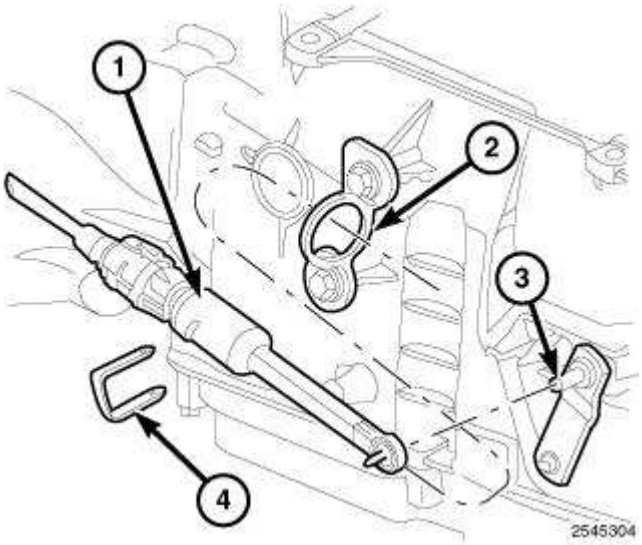

Fig. 116: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

3. Remove the gearshift cable retaining clip (4) (if equipped).
4. Disconnect the gearshift cable (1) from the shift lever (3), and remove cable from bracket (2).
5. Lower the vehicle.
6. Remove the instrument panel side trim.
7. Remove the knee bolster fasteners, and the knee bolster.
8. If equipped, disconnect the trunk release harness connector from the trunk release switch on the knee bolster.

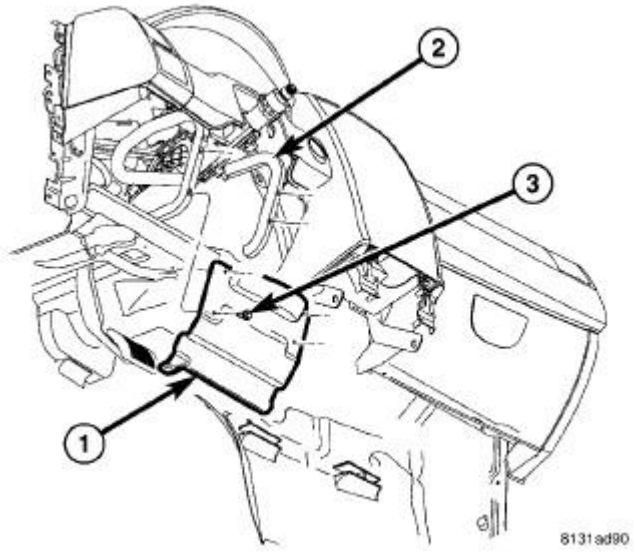

Fig. 117: Reinforcement I/P Steering Column
Courtesy of CHRYSLER GROUP, LLC

9. Remove the screws (3), and the instrument panel steering column cover reinforcement (1).

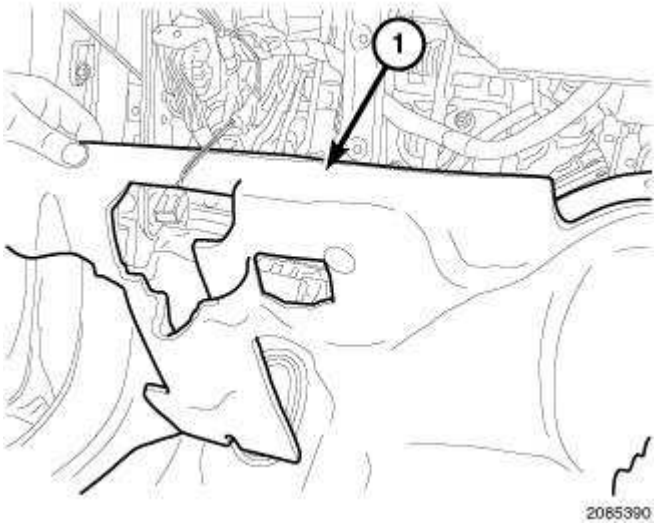

Fig. 118: Identifying Silencer Panel
Courtesy of CHRYSLER GROUP, LLC

10. Remove the silencer panel fasteners and silencer panel (1).

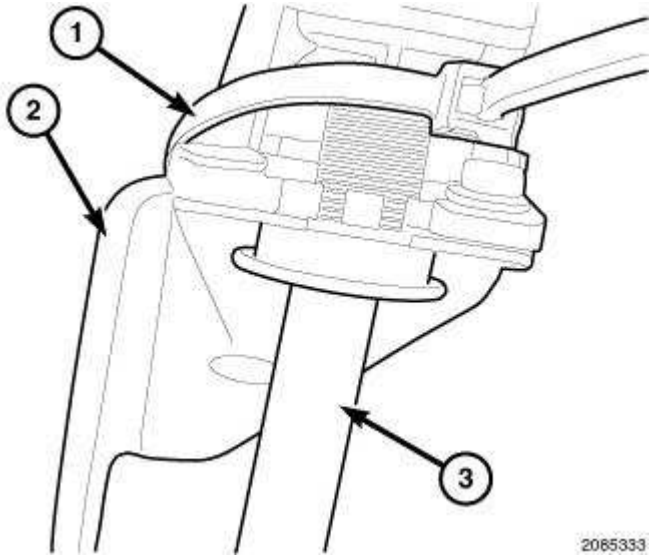

Fig. 119: Tie Strap To Secure Shift Cable To Shift Bracket
Courtesy of CHRYSLER GROUP, LLC

11. If equipped, remove the tie strap (1) that secures the shift cable (3) to the shift bracket (2).

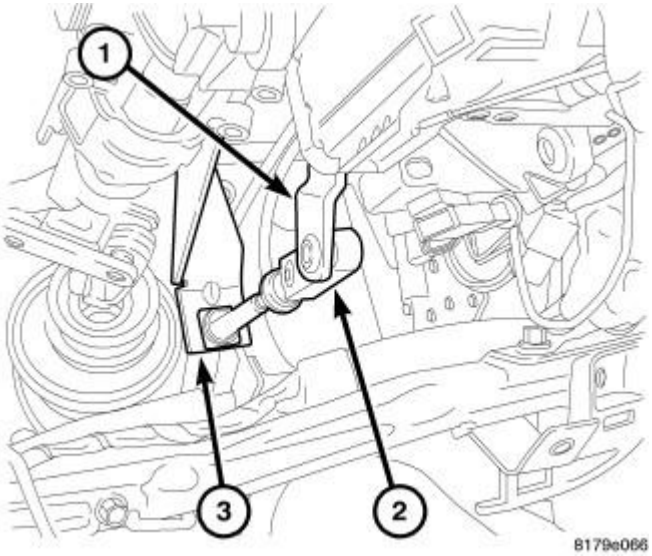

Fig. 120: Shift Cable AT Column
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the shift cable (2) from the shift mechanism (1).
13. Disconnect the shift cable from to cable bracket (3).

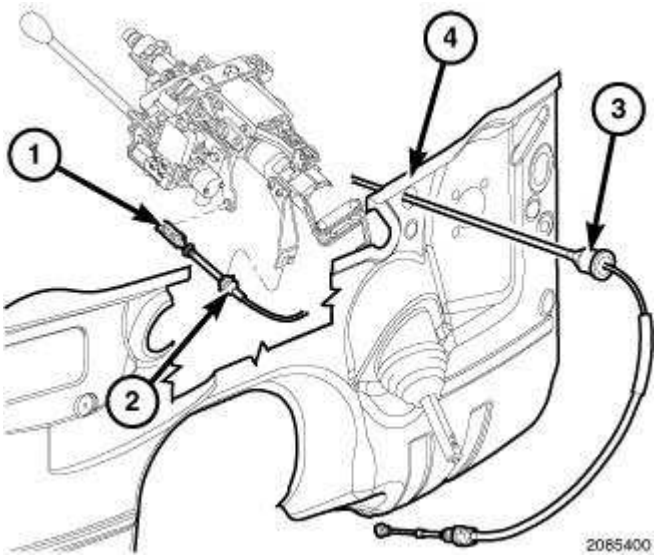

Fig. 121: Identifying Shifter Cable Routing
Courtesy of CHRYSLER GROUP, LLC

14. Remove the shifter cable grommet (3) from the opening in the dash panel (4), and remove the shifter cable.

INSTALLATION

FLOOR MOUNT

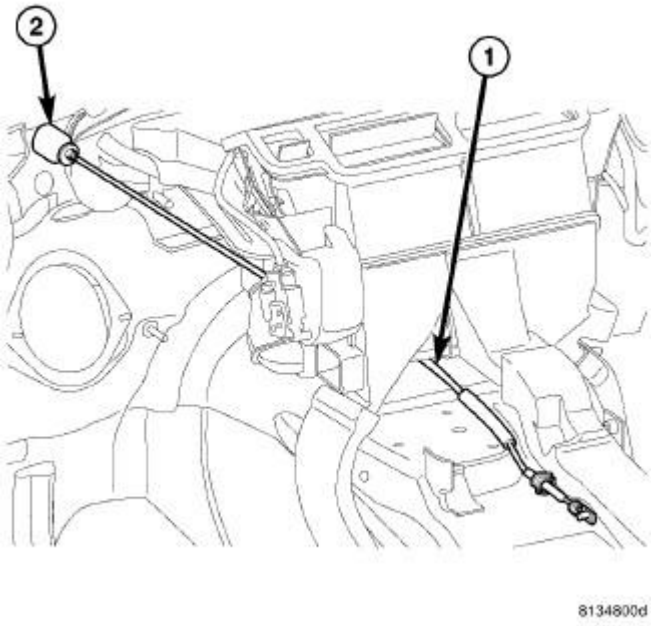

Fig. 122: Gearshift Cable Grommet
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - GROMMET

1. From under the hood, route the gearshift cable (1) through the dash panel and toward the shifter assembly.
2. From under the hood, install the grommet (2) to the dash panel.

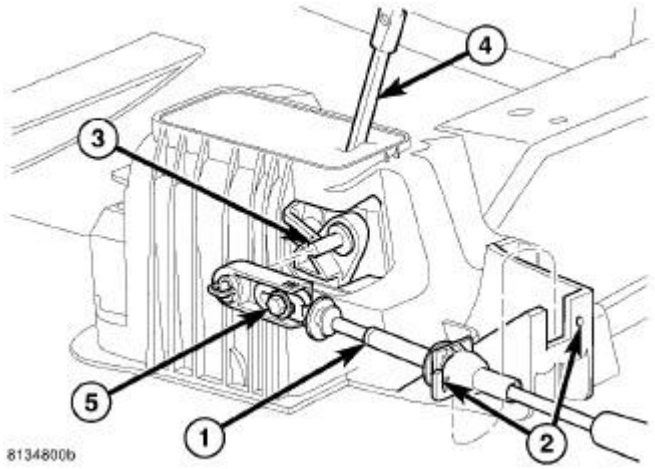

Fig. 123: Gearshift Cable AT Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER
5 - ADJUSTMENT BOLT

3. Engage the gearshift cable retainer (2) into the notch (2) in the shifter assembly.
4. Install the gearshift cable (1) onto the shift lever pin (3).
5. Loosen the cable adjustment screw (5), if necessary.

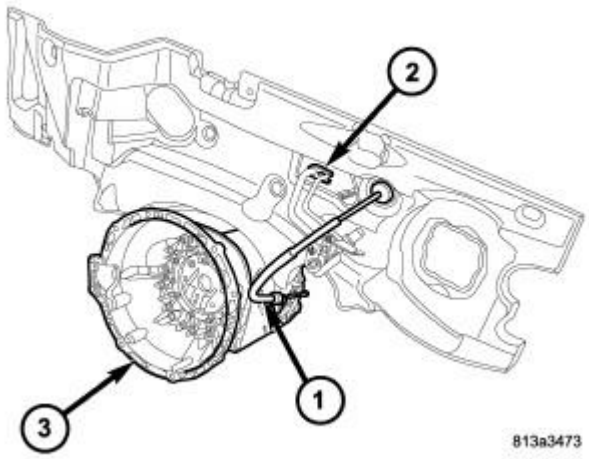

Fig. 124: Gearshift Cable Routing
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSHIFT CABLE
2 - HEATER HOSES
3 - TRANSMISSION

6. From under the hood, route the gearshift cable (1) forward of the air conditioning lines and the heater hoses (2) and toward the transmission (3) manual lever.
7. Place shifter into PARK.
8. Raise vehicle.
9. Verify that the transmission is in the PARK position by trying to rotate the propeller shaft. If the propeller shaft rotates, move the transmission manual shift lever to the full rearward position and turn the propeller shaft until the PARK system is engaged.

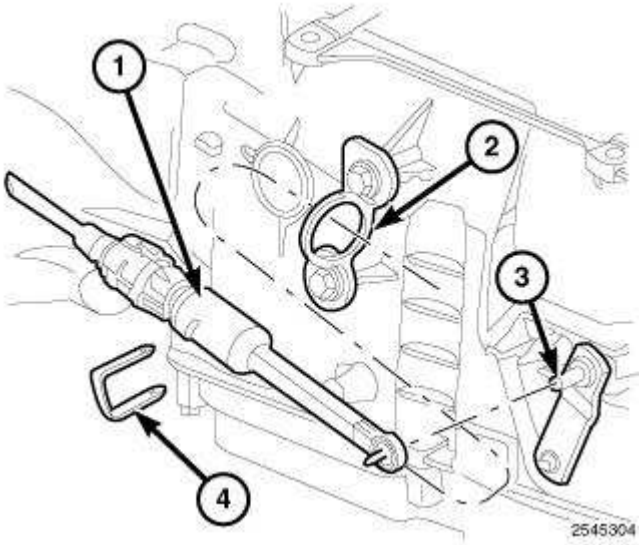

Fig. 125: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
Courtesy of CHRYSLER GROUP, LLC

10. Route the gearshift cable (1) through the mounting bracket (2).
11. Engage the gearshift cable (1) eyelet onto the transmission manual shift lever (3).
12. Install the gearshift cable retaining clip (4) (if equipped).
13. Lower vehicle.
14. Verify that the shifter is in the PARK position.

1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER

5 - ADJUSTMENT BOLT

15. Tighten the adjustment screw (5) to 7 N.m (65 in.lbs.).
16. Verify correct shifter operation.
17. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
18. Install the floor console, lower instrument panel components. Refer to **CONSOLE, FLOOR, INSTALLATION** and dash panel insulation pad as necessary. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .

COLUMN MOUNT

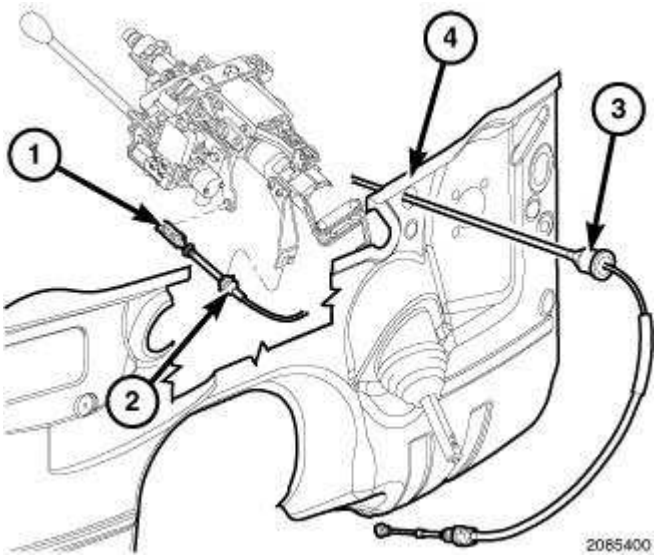

Fig. 127: Identifying Shifter Cable Routing
Courtesy of CHRYSLER GROUP, LLC

1. Route the shifter cable through the dash panel (4), and install the shifter cable grommet (3) into the hole into the dash panel (4).

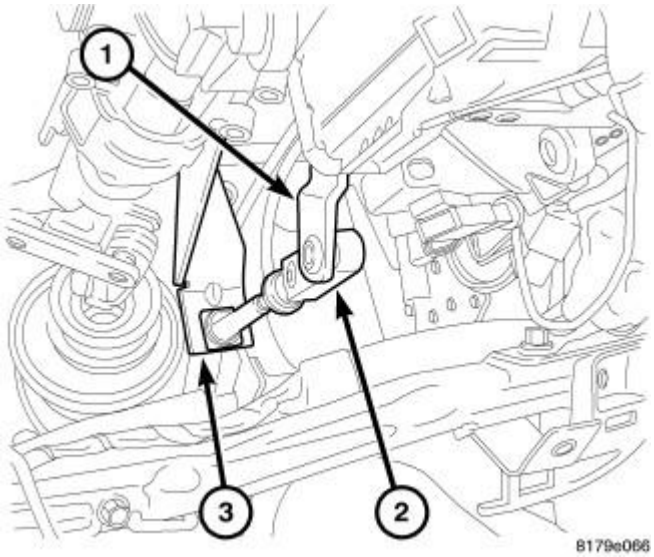

Fig. 128: Shift Cable AT Column
Courtesy of CHRYSLER GROUP, LLC

2. Reconnect the shift cable (2) to the shift mechanism (1).
3. Reconnect the shift cable to the cable bracket (3).

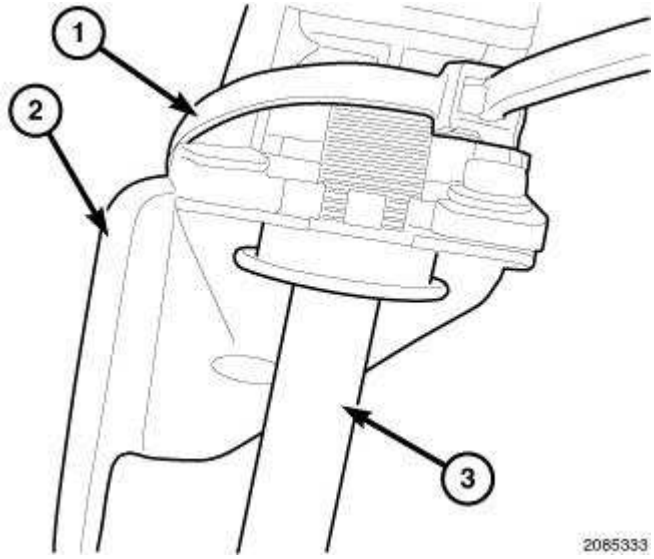

Fig. 129: Tie Strap To Secure Shift Cable To Shift Bracket
Courtesy of CHRYSLER GROUP, LLC

4. Use a tie strap (1) to secure the shift cable (3) to the shift bracket (2).
5. Place shifter into PARK.
6. Raise vehicle.

NOTE: The transmission must be in PARK.

4 - SNAP-RING	8 - MULTI-USE SPRING COMPRESSOR 8900

2. Remove snap-ring (7). Refer to **Fig. 134**.
3. Remove multiple-disc pack (6) and disc spring (5) from outer multiple-disc carrier. Note which clutch disc is removed just prior to the disc spring (5) for re-assembly. If the clutch discs are re-used, this disc must be returned to its original position on top of the disc spring.
4. Place the Multi-use Spring Compressor (special tool #8900A, Multi Use Spring Compressor) (8) on disc spring (3) and compress the spring until the snap-ring (4) is exposed. Refer to **Fig. 134**.
5. Remove snap-ring (4).
6. Remove piston (2) from the outer multiple-disc carrier by carefully blowing compressed air into the bore (A).

ASSEMBLY

ASSEMBLY

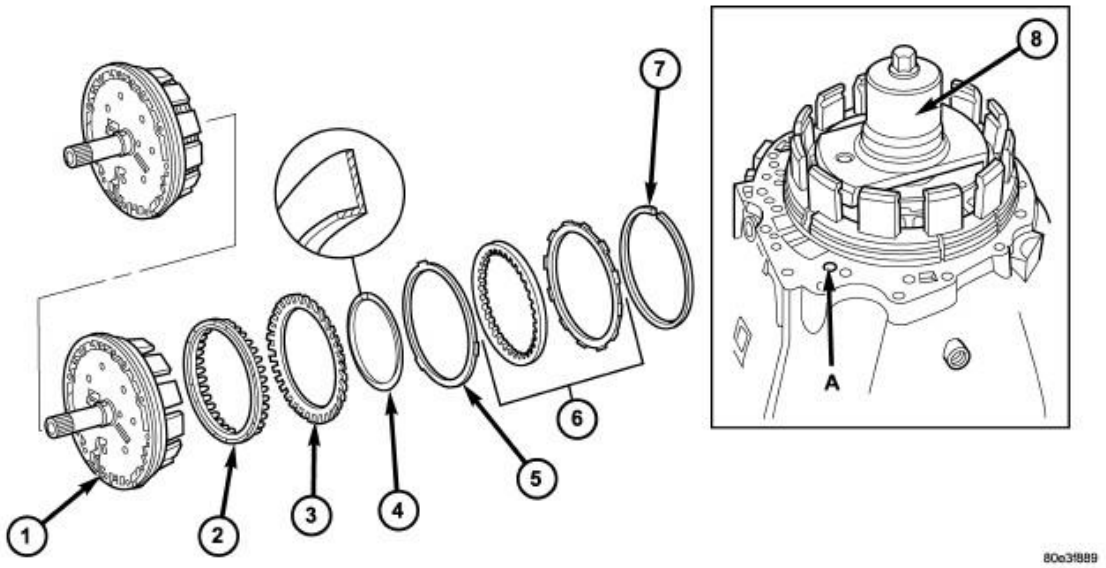

Fig. 135: Identifying Holding Clutch B1

1 - HOLDING CLUTCH B1 OUTER CARRIER	5 - DISC SPRING
2 - PISTON	6 - MULTIPLE DISC PACK
3 - DISC SPRING	7 - SNAP-RING
4 - SNAP-RING	8 - MULTI-USE SPRING COMPRESSOR 8900

NOTE: Check vulcanized gasket, replace if necessary.

1. Install piston (2) in outer multiple-disc carrier (1). Refer to **Fig. 135**.
2. Place compressor (8) on disc spring (3) and compress until the groove of the snap-ring is exposed.

   NOTE: The collar of the snap-ring must point towards the multiple-disc pack. After installing, check snap-ring for correct seat.

3. Insert snap-ring (4). Refer to **Fig. 135**.

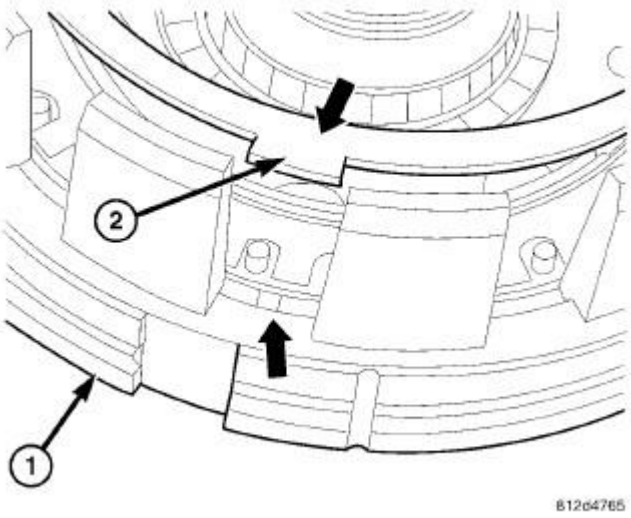

Fig. 136: Installing The Disc Spring
Courtesy of CHRYSLER GROUP, LLC

1 - B1 MULTIPLE-DISC CARRIER
2 - DISC SPRING

4. Insert disc spring (2) in the outer multiple-disc carrier. Refer to **Fig. 136**. Observe the disc spring (2) installation position. The lugs of the disc spring (2) washer must align with the 3 raised pads (arrow) of the B1 multiple-disc carrier (1). The cone of the spring washer must point downwards.

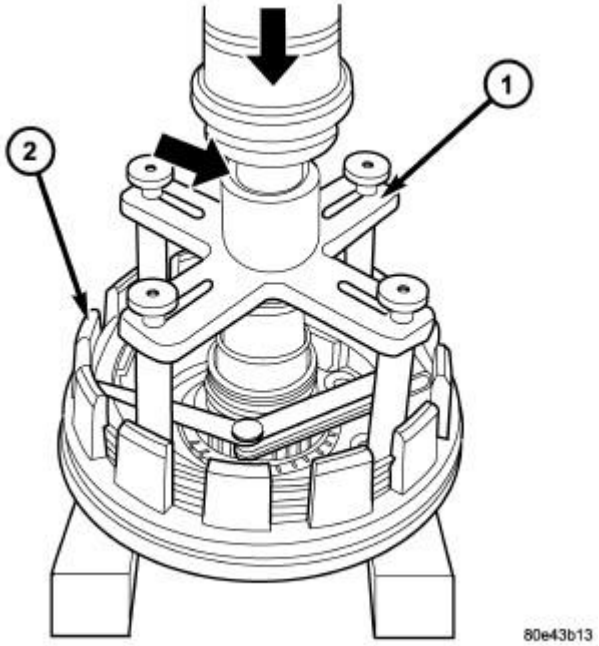

Fig. 137: Measure B1 Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSING TOOL 8901A
2 - B1 CLUTCH OUTER CARRIER

5. Insert the multiple-disc pack (6) in the outer multiple-disc carrier and measure the clutch clearance.

NOTE: Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disc spring (5) to its original location.

CAUTION: When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

NOTE: Place new friction multiple-discs in ATF fluid for one hour before installing.

6. Measure B1 clutch clearance by mounting Pressing Tool 8901A (1) on outer multiple disc. Refer to **Fig. 137**.

7. Using a lever press, compress pressing tool to the upper most line marked 1200 N (the marking ring is still visible, see small arrow).

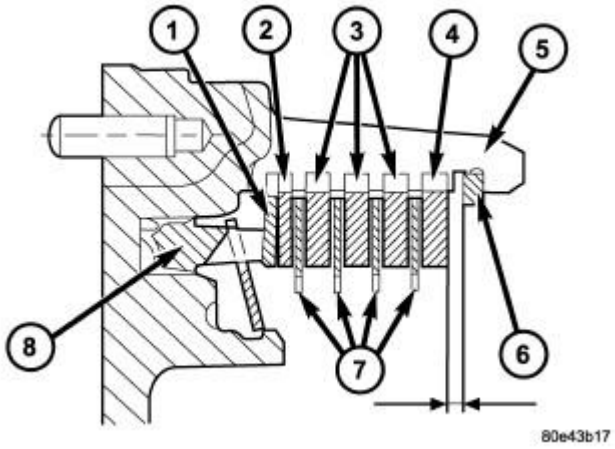

Fig. 138: B1 Clutch Stack-Up - Double Sided Discs

1 - DISC SPRING
2 - OUTER MULTIPLE DISC - 1.8 mm (0.071 IN.)
3 - OUTER MULTIPLE DISC - 2.8 mm (0.110 IN.)
4 - OUTER MULTIPLE DISC - 4.0 mm (0.158 IN.)
5 - B1 OUTER CARRIER
6 - SNAP-RING
7 - INNER MULTIPLE DISCS
8 - PISTON

8. For transmissions using double sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (6) and outer multiple-disc (4). Refer to **Fig. 138**. During the measurement, the snap-ring (6) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (5). The correct clearance for transmissions using double sided friction discs is 2.3-2.7 mm (0.091-0.106 in.) for two friction disc versions, 2.7-3.1 mm (0.106-0.122 in.) for three disc versions, and 3.0-3.4 mm (0.118-0.134 in.) for four disc versions.
9. Adjust with snap-ring (6), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

2 - OUTER MULTIPLE DISC
3 - OUTER MULTIPLE DISC - 4.0 mm (0.158 IN.)
4 - B1 OUTER CARRIER
5 - SNAP-RING
6 - INNER MULTIPLE DISCS
7 - PISTON

10. For transmissions using single sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (5) and outer multiple-disc (3). Refer to **Fig. 139**. During the measurement, the snap-ring (5) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (4). The correct clearance is 2.2-2.6 mm (0.087-0.102 in.) for four friction disc versions, 2.4-2.8 mm (0.095-0.110 in.) for six disc versions, and 2.6-3.0 mm (0.102-0.118 in.) for eight disc versions.
11. Adjust with snap-ring (5), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

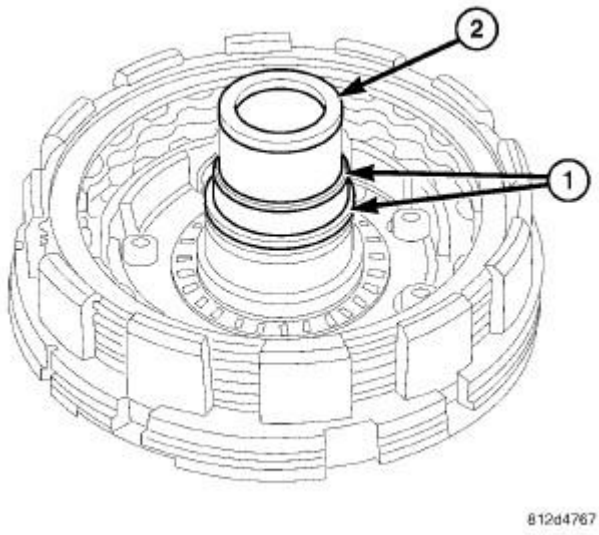

Fig. 140: Identifying Teflon Rings
Courtesy of CHRYSLER GROUP, LLC

1 - TEFLON RINGS
2 - PLATE CARRIER HUB

12. Install the teflon rings (1) onto the B1 plate carrier hub (2). Refer to **Fig. 140**.
13. Coat Teflon rings (1) lightly with grease and insert in the groove so that the joint remains together.

CLUTCH, B2

DISASSEMBLY

DISASSEMBLY

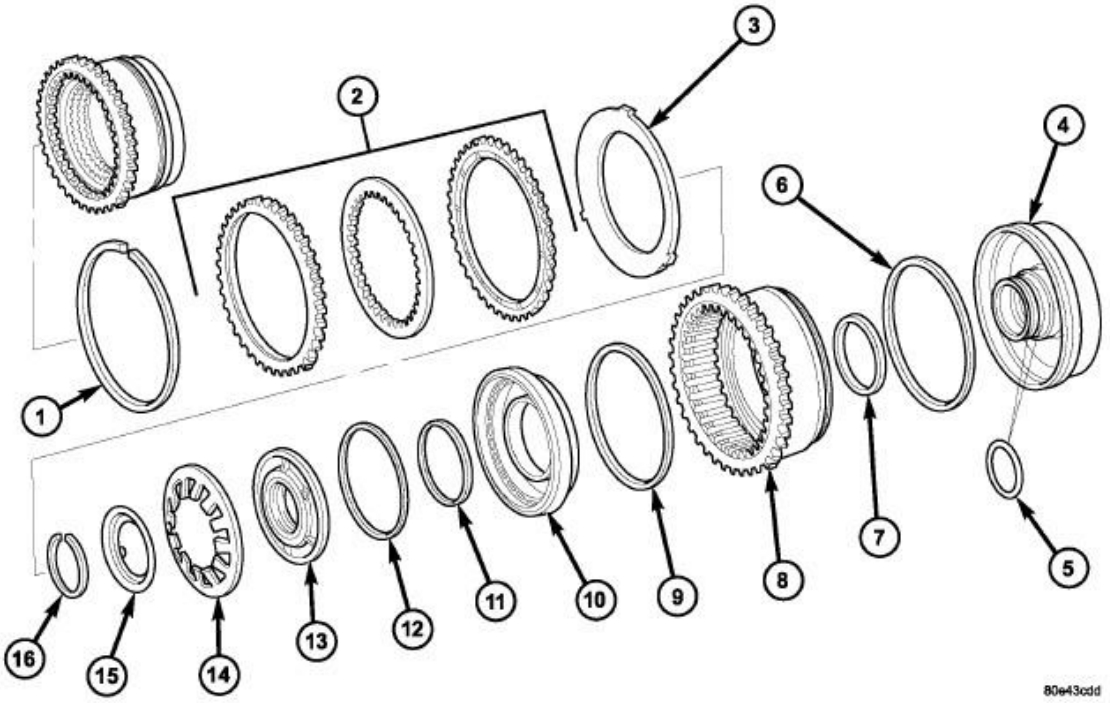

Fig. 141: Exploded View Of Holding Clutch B2

7 - B3 PISTON SEALING RING	15 - SPRING PLATE
8 - B3 PISTON/B2 OUTER DISC CARRIER	16 - SNAP-RING

2. Assemble piston guide (4) and B3 piston (8) in the correct position. Refer to **Fig. 144**. Verify that the missing tooth in the B3 piston/B2 outer disc carrier (8) is aligned with the centerline of the two threaded holes in the B2 and B3 piston guide (4).
3. Insert B2 piston (10) in B3 piston (8). Refer to **Fig. 144**.

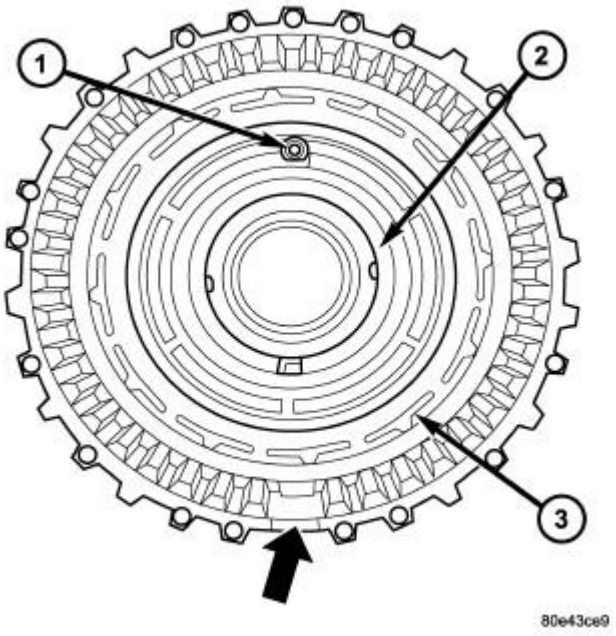

Fig. 145: B2 Piston & Piston Guide Ring
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE
2 - PISTON GUIDE RING
3 - B2 PISTON

4. Insert piston guide ring (2). Refer to **Fig. 145**. The valve (1) in the piston guide ring must be on top.
5. Insert disc spring (14) and spring plate (15). Refer to **Fig. 144**. Insert disc spring with the curvature towards the spring plate
6. Place Multi-use Spring Compressor (special tool #8900A, Multi Use Spring Compressor) on the disc spring (14) and compress the spring until the groove for the snap-ring is exposed.
7. Insert snap-ring (16).

NOTE: Pay attention to sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disc spring (3) to its original location. Place new friction multiple-discs in ATF fluid for one hour before installing.

8. Insert disc spring (3) and multiple-disc pack (2) in the B2 outer multiple-disc carrier.
9. Insert snap-ring (1).

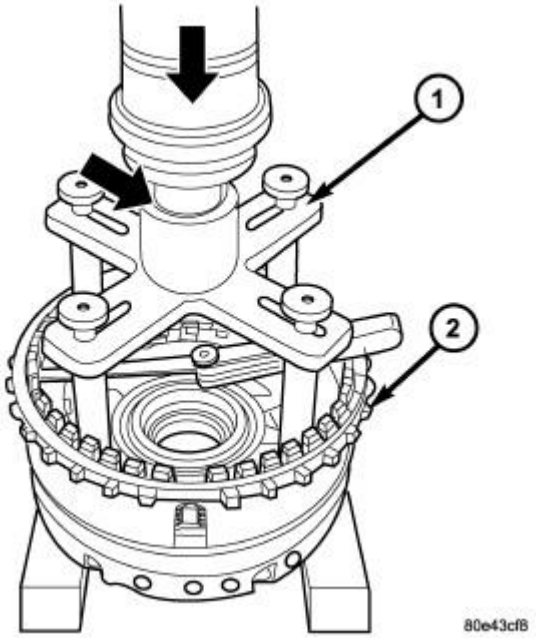

Fig. 146: Measuring B2 Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSING TOOL 8901A
2 - B3 PISTON / B2 OUTER DISC CARRIER

NOTE: During the measurement the snap-ring must contact the upper bearing surface of the groove in the outer multiple-disc carrier.

10. Measure the B2 clutch pack clearance by mounting the Pressing Tool 8901A (1) on outer multiple disc. Refer to **Fig. 146**.
11. Using a lever press, compress pressing tool to the upper most line marked 1200 N (the marking ring is still visible, see small arrow).

6 - OUTER MULTIPLE DISC - 1.8 MM (0.071 IN.)
7 - OUTER MULTIPLE DISC - 6.5 MM (0.256 IN.)
8 - SNAP-RING

12. Using a feeler gauge, determine the play "L" at three points between the snap-ring (8) and outer multiple-disc (7). Refer to **Fig. 147**.
13. The correct clutch clearance is 1.9-2.3 mm (0.075-0.091 in.) for the four friction disc versions and 2.0-2.4 mm (0.079-0.095 in.) for the five disc versions.
14. Adjust with snap-ring (8), if necessary. Snap-rings are available in thicknesses of 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

CLUTCH, FREEWHEELING

OPERATION

OPERATION

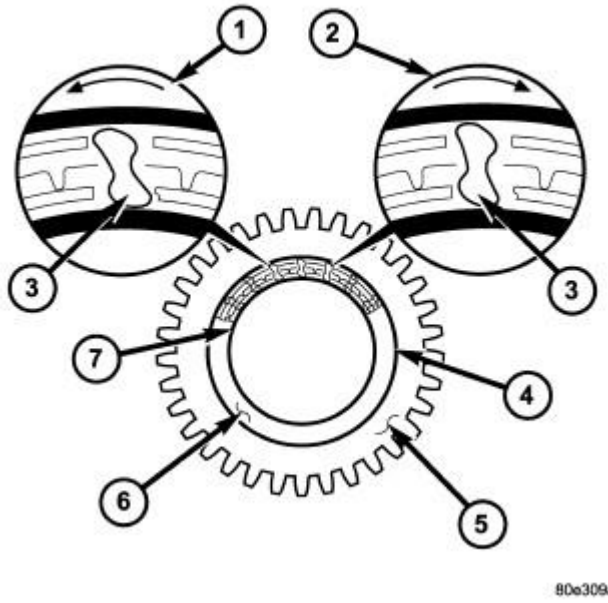

Fig. 148: Identifying Freewheeling Clutch Components
Courtesy of CHRYSLER GROUP, LLC

1 - ROTATION DIRECTION "A"
2 - ROTATION DIRECTION "B"
3 - LOCKING ELEMENTS
4 - OUTER RACE
5 - FRONT OR REAR SUN GEAR
6 - LOCKING ELEMENT CAGE
7 - INNER RACE

The freewheeling clutch optimizes individual gearshifts. Refer to **Fig. 148**. They lock individual elements of a planetary gear set together or against the transmission housing in one direction of rotation to allow the torque to be transmitted.

If the inner race (7) of the freewheeling clutch is locked and the outer race (4) turns counter-clockwise (1), the locking elements (3) adopt a diagonal position on account of their special contours, allowing the freewheel function. The inner race (4) slides under the locking elements (3) with minimal friction. If the rotation of the outer race (4) changes to clockwise (2), the locking elements (3) stand up and lock the outer and inner races (4, 7) together.

DISASSEMBLY

DISASSEMBLY

1 - K3 INNER DISC CARRIER AND REAR PLANETARY SUN GEAR
2 - ANTI-FRICTION BEARING
3 - FREEWHEELING CLUTCH F2

6. Check the anti-friction bearing (2) in the rear planetary sun gear for damage. Refer to **Fig. 150**. Replace as necessary.

ASSEMBLY

ASSEMBLY

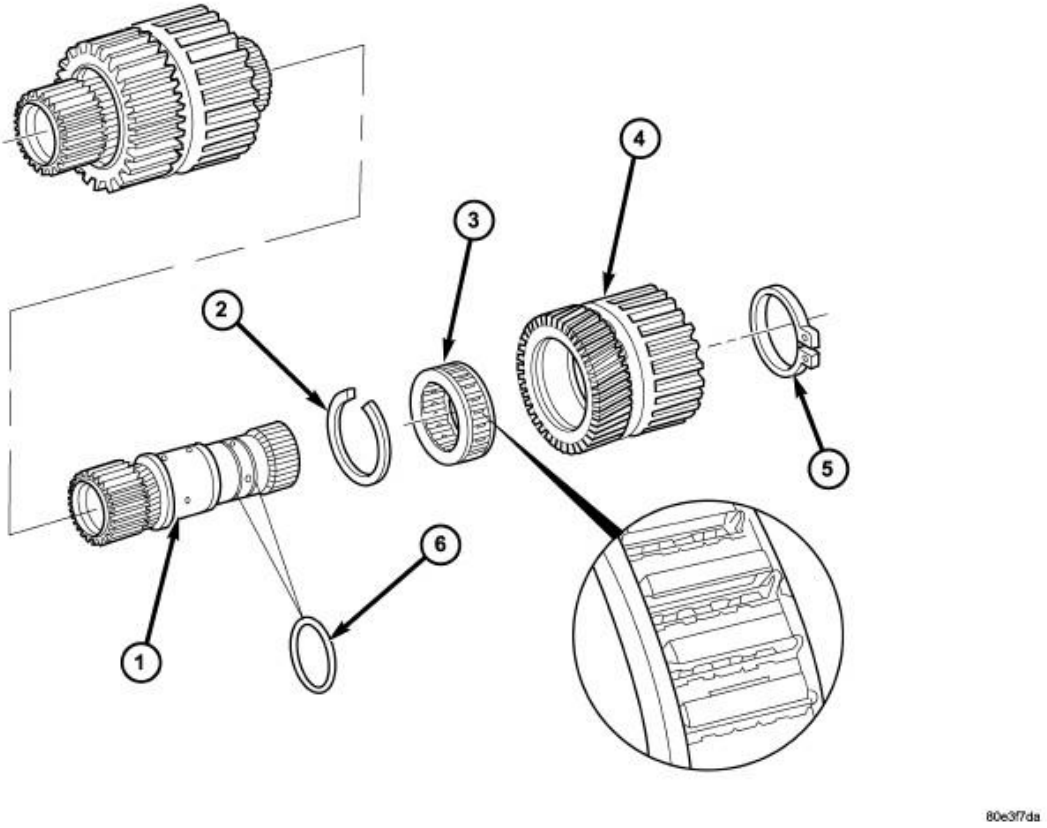

Fig. 151: Identifying Freewheeling Clutch F2
Courtesy of CHRYSLER GROUP, LLC

1 - HOLLOW SHAFT	4 - K3 INNER DISC CARRIER AND REAR PLANETARY SUN GEAR
2 - F2 CLUTCH SNAP-RING	5 - RETAINING RING
3 - FREEWHEELING CLUTCH F2	6 - O-RINGS

NOTE: On freewheeling F2 clutches (3) with metal cages, the side of the freewheeling clutch with the markings (part number, etc.) must be up when the clutch is installed in the sun gear (4). Markings will be visable when the clutch is installed before installing the snap-ring.

NOTE: On freewheeling F2 clutches (3) with plastic cages, the directional arrow on the side of the freewheeling clutch indicates the direction of installation into the sun gear (4). The brass top of the cage will be toward the snap-ring.

1. Press freewheeling clutch F2 (3) into sun gear (4).
2. Install snap-ring (2) for freewheeling clutch.
3. Check O-rings (6) on hollow shaft, replace if necessary.
4. Install rear sun gear (4) with K3 internally toothed disc carrier and rear freewheeling clutch (3)

onto the hollow shaft.

5. Verify proper operation of the freewheeling clutch F2. When the assembly is held with the F2 clutch snap-ring upward, it should be possible to rotate the hollow shaft counter-clockwise.
6. Install retaining ring (5) onto hollow shaft (1).

CLUTCH, INPUT

DESCRIPTION

DESCRIPTION

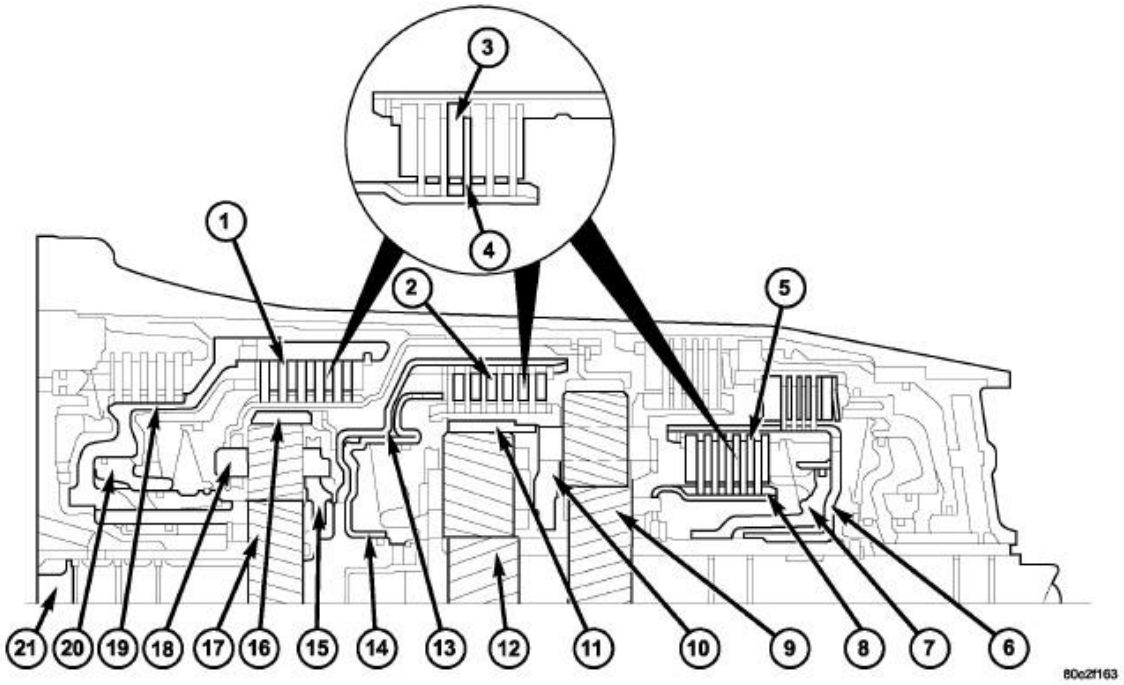

Fig. 152: Identifying Input Clutches

	DISC CARRIER
8 - K3 CLUTCH INTERNALLY TOOTHED DISC CARRIER	19 - K1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET SUN GEAR	20 - K1 CLUTCH PISTON
10 - CENTER PLANETARY GEARSET PLANETARY CARRIER	21 - INPUT SHAFT
11 - CENTER PLANETARY GEARSET ANNULUS GEAR	

Three multi-plate input clutches (1, 2, 5), the front, middle and rear multi-plate clutches K1 (1), K2 (2), and K3 (5), are located in the planetary gear sets in the transmission housing. Refer to **Fig. 152**.

A multi-plate input clutch consists of a number of internally toothed discs (4) on an internally toothed disc carrier and externally toothed discs (3) on an externally toothed disc carrier.

OPERATION

OPERATION

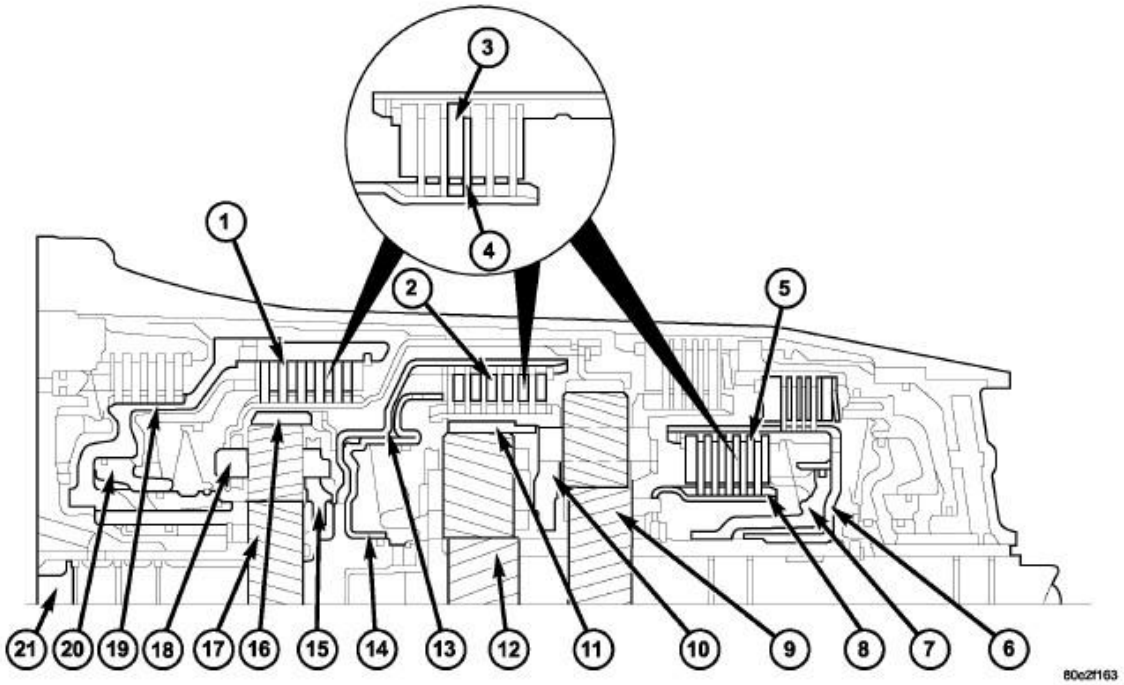

Fig. 153: Identifying Input Clutches
Courtesy of CHRYSLER GROUP, LLC

1 - K1 CLUTCH	12 - CENTER PLANETARY GEARSET SUN GEAR
2 - K2 CLUTCH	13 - K2 CLUTCH EXTERNALLY TOOTHED DISC CARRIER

3 - EXTERNALLY TOOTHED DISC	14 - K2 CLUTCH PISTON
4 - INTERNALLY TOOTHED DISC	15 - FRONT PLANETARY GEARSET PLANETARY CARRIER
5 - K3 CLUTCH	16 - FRONT PLANETARY GEARSET ANNULUS GEAR
6 - K3 CLUTCH EXTERNALLY TOOTHED DISC CARRIER	17 - FRONT PLANETARY GEARSET SUN GEAR
7 - K3 CLUTCH PISTON	18 - K1 CLUTCH INTERNALLY TOOTHED DISC CARRIER
8 - K3 CLUTCH INTERNALLY TOOTHED DISC CARRIER	19 - K1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET SUN GEAR	20 - K1 CLUTCH PISTON
10 - CENTER PLANETARY GEARSET PLANETARY CARRIER	21 - INPUT SHAFT
11 - CENTER PLANETARY GEARSET ANNULUS GEAR	

The input clutches produce a non-positive locking connection between two elements of a planetary gear set or between one element from each of two planetary gear sets in order to transmit the drive torque. Refer to **Fig. 153**.

If the piston (20) on multi-plate clutch K1 (1) is subjected to oil pressure, it presses the internal and external discs of the disc set together. The sun gear (17) is locked with the planetary carrier (15) via the externally toothed disc carrier (19) and the internally toothed disc carrier (18). The front planetary gear set is thus locked and turns as a closed unit.

If the multi-plate clutch K2 (2) is actuated via the piston (14), the piston compresses the disc set. The annulus gear (16) of the front planetary gear set is locked with the annulus gear (11) of the center planetary gear set via the externally toothed disc carrier (13) and the center planetary carrier (10) on which the internally toothed discs are seated. Annulus gear (16) and annulus gear (11) turn at the same speed as the input shaft (21)

If the multi-plate clutch K3 (5) is actuated via the piston (7), the piston compresses the disc set. The sun gear (12) of the center planetary gear set is locked with the sun gear (9) of the rear planetary gear set via the externally toothed disc carrier (6) and the internally toothed disc carrier (8). Sun gear (12) and sun gear (9) turn at the same speed.

CLUTCH, K1

DISASSEMBLY

DISASSEMBLY

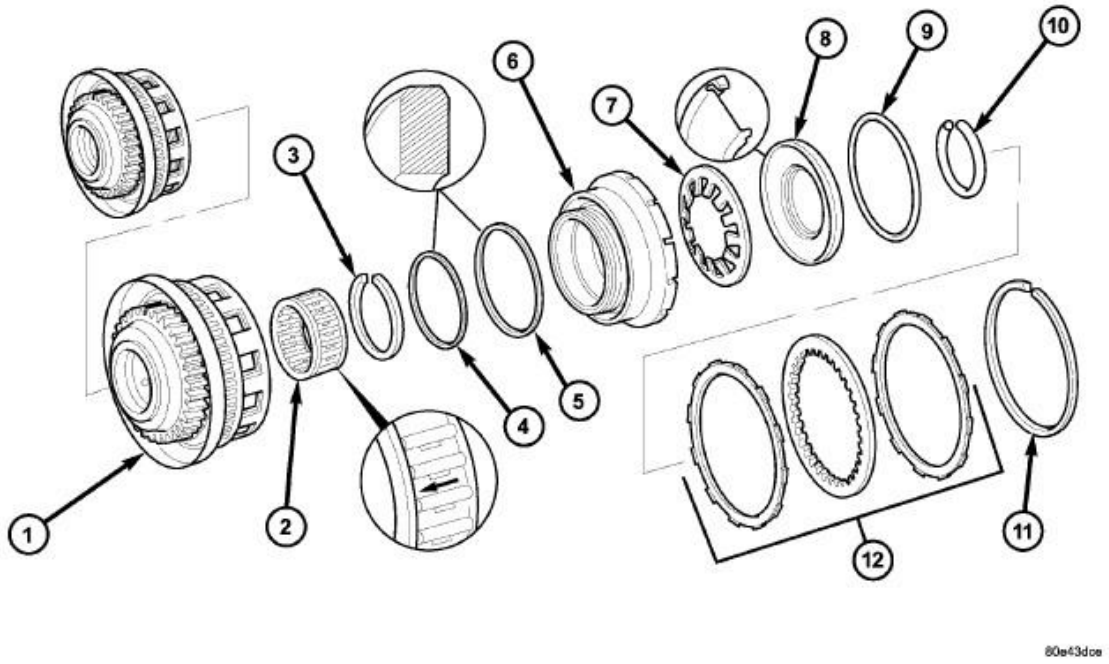

Fig. 154: Input Clutch K1 Components
Courtesy of CHRYSLER GROUP, LLC

1 - K1 OUTER DISC CARRIER	7 - DISC SPRING
2 - FREEWHEELING CLUTCH F1	8 - SPRING PLATE

10. For transmissions using double sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (5) and outer multiple-disc (3). Refer to **Fig. 159**.
11. During the measurement the snap-ring (5) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (4).
12. The correct clutch clearance for transmissions with double sided friction discs is 2.7-3.1 mm (0.106-0.122 in.) for three friction disc versions, 3.0-3.4 mm (0.118-0.134 in.) for four disc versions, 3.3-3.7 mm (0.130-0.146 in.) for five disc versions, and 3.6-4.0 mm (0.142-0.158 in.) for six disc versions.
13. Adjust with snap-ring (5), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).
14. Insert front freewheeling clutch F1 (2) and fit snap-ring (3). The freewheeling clutch F1 (2) must be installed in the direction of the arrow.

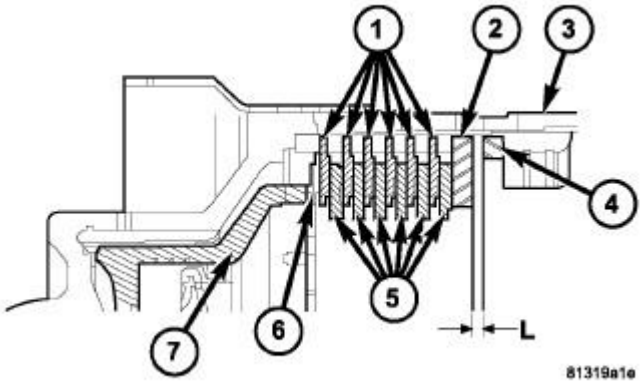

Fig. 160: Input Clutch K1 Stack-Up - Single Sided Discs

1 - OUTER MULTIPLE DISCS
2 - OUTER MULTIPLE DISC - 4.0MM (0.158 IN.)
3 - K1 OUTER DISC CARRIER
4 - SNAP-RING
5 - INNER MULTIPLE DISCS
6 - DISC SPRING
7 - PISTON

15. For transmissions using single sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (4) and outer multiple-disc (2). Refer to **Fig. 160**.
16. During the measurement the snap-ring (4) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (3).
17. The correct clutch clearance for transmissions with single sided friction discs is 2.4-2.8 mm (0.095-0.110 in.) for six friction disc versions, 2.6-3.0 mm (0.102-0.118 in.) for eight disc versions, 2.8-3.2 mm (0.110-0.126 in.) for ten disc versions, and 2.9-3.3 mm (0.114-0.130 in.) for twelve disc versions.
18. Adjust with snap-ring (4), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).
19. Insert front freewheeling clutch F1 (2) and fit snap-ring (3). The freewheeling clutch F1 (2) must be installed in the direction of the arrow.

1 - SNAP-RING	6 - PISTON
2 - MULTIPLE DISC PACK	7 - SEALING RING
3 - DISK SPRING	8 - OUTER DISC CARRIER
4 - SNAP-RING	9 - MULTI-USE SPRING COMPRESSOR 8900
5 - SPRING PLATE	

1. Install piston (6) in the outer multiple-disc carrier (8). Refer to **Fig. 170**. Check sealing ring (7), replace if necessary. The rounded off edges of the sealing ring must point outwards.
2. Insert the spring plate (5). Insert the spring plate with the curvature towards the piston.
3. Mount the Multi-use Spring Compressor (special tool #8900A, Multi Use Spring Compressor) (9) on the spring plate and clamp until the snap-ring groove is exposed.
4. Insert snap-ring (4). The collar of the snap-ring must point towards the multiple-disc pack.

CAUTION: When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

NOTE: **Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disk spring (3) to its original location.**

NOTE: **Place new friction multiple-discs in ATF fluid for one hour before installing.**

5. Install disk spring (3) and multiple-disc pack (2) in outer multiple-disc carrier (8).
6. Insert snap-ring (1).

13. For transmissions using single sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (7) and outer multiple-disc (2). Refer to **Fig. 173**.
14. During the measurement the snap-ring (7) must contact the upper bearing surface of the groove in the outer multiple-disc carrier.
15. The correct clutch clearance for transmissions with single sided friction discs is 2.3-2.7 mm (0.091-0.106 in.) for six friction disc versions, 2.4-2.8 mm (0.095-0.110 in.) for eight disc versions, and 2.5-2.9 mm (0.099-0.114 in.) for ten disc versions.
16. Adjust with snap-ring (7), if necessary. Snap-rings are available in thicknesses of 2.0 mm (0.079 in.), 2.3 mm (0.091 in.), 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), and 3.5 mm (0.138 in.).

CONTACT, TEMPERATURE SENSOR\PARK-NEUTRAL

DESCRIPTION

PARK/NEUTRAL CONTACT

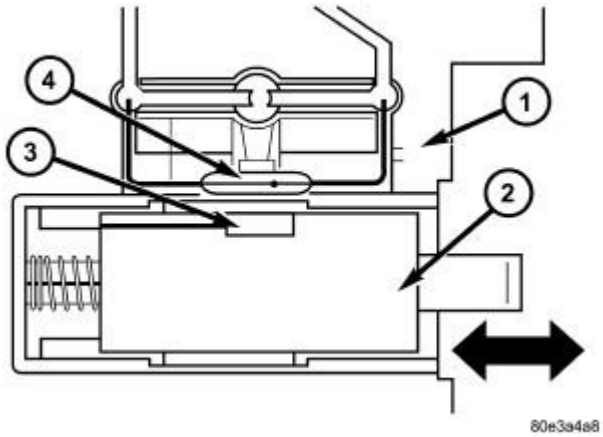

Fig. 174: Cutaway View Of Park/Neutral Contact
Courtesy of CHRYSLER GROUP, LLC

1 - SHELL OF ELECTRIC CONTROL MODULE
2 - PLUNGER
3 - PERMANENT MAGNET
4 - DRY-REED CONTACT

The park/neutral contact (4) is located in the shell of the electric control unit and is fixed to the conductor tracks. Refer to **Fig. 174**.

Its purpose is to recognize selector valve and selector lever positions "P" and "N". The park/neutral contact consists of:

- the plunger (2).
- the permanent magnet (3).
- the dry-reed contact (4).

TRANSMISSION TEMPERATURE SENSOR

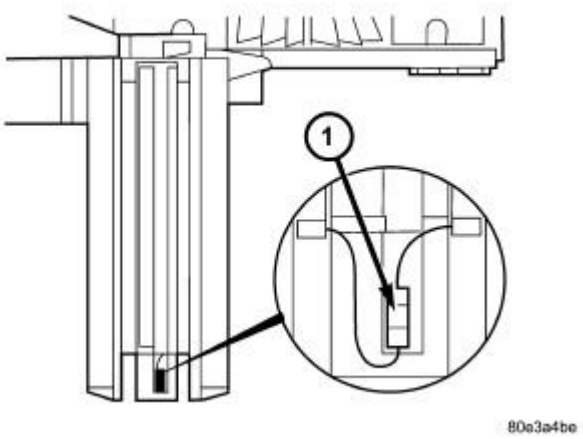

Fig. 175: Cutaway View Of Transmission Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION TEMPERATURE SENSOR

The transmission oil temperature sensor (1) is located in the shell of the electric valve control unit and is fixed to the conductor tracks. Refer to **Fig. 175**.

Its purpose is to measure the temperature of the transmission oil and pass the temperature to the TCM as an input signal. It is a temperature-dependent resistor (PTC).

OPERATION

PARK/NEUTRAL CONTACT

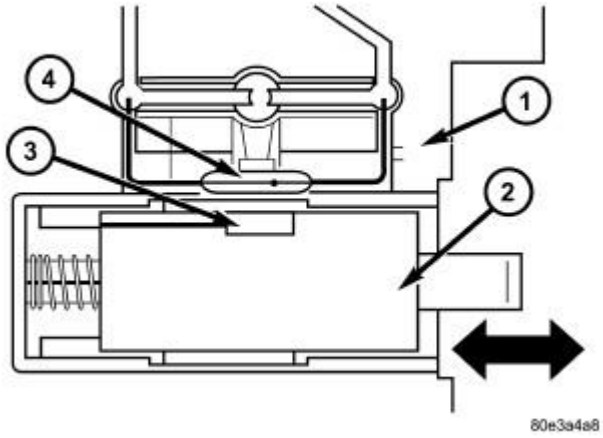

Fig. 176: Cutaway View Of Park/Neutral Contact
Courtesy of CHRYSLER GROUP, LLC

1 - SHELL OF ELECTRIC CONTROL MODULE

2 - PLUNGER
3 - PERMANENT MAGNET
4 - DRY-REED CONTACT

In selector lever positions "P" and "N" the park/neutral contact (4) is actuated by a cam track which is located on the detent plate. Refer to **Fig. 176**. The permanent magnet (3) is moved away from the dry-reed contact (4). The dry-reed contact (4) is opened. The TCM receives an electric signal. The circuit to the starter in the selector lever positions "P" and "N" is closed.

TRANSMISSION TEMPERATURE SENSOR

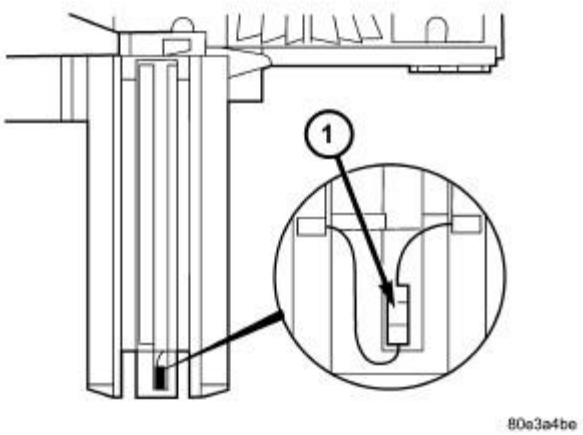

Fig. 177: Cutaway View Of Transmission Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - TRANSMISSION TEMPERATURE SENSOR

The temperature of the transmission oil has a considerable effect on the shifting time and therefore the shift quality. By measuring the oil temperature, shift operations can be optimized in all temperature ranges. The transmission oil temperature sensor (1) is switched in series with the park/neutral contact. Refer to **Fig. 177**. The temperature signal is transferred to the TCM only when the dry-reed contact of the park/neutral contact is closed in REVERSE or a forward gear position.

FLUID AND FILTER

OPERATION

OPERATION

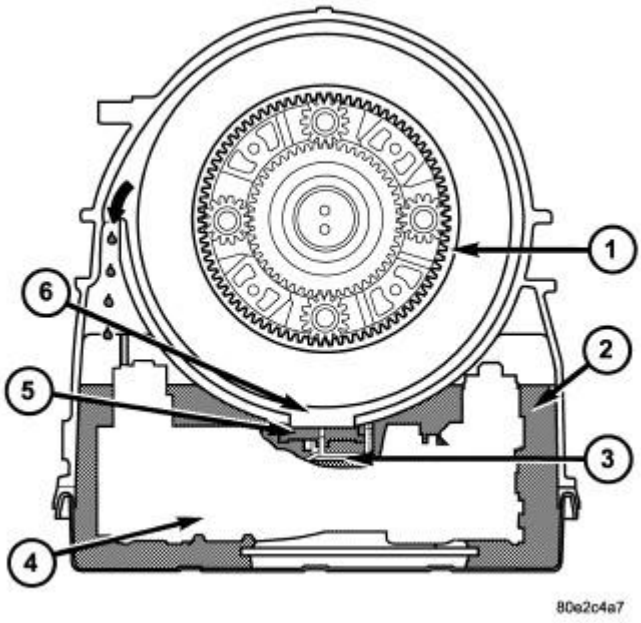

Fig. 179: Fluid Level Control
Courtesy of CHRYSLER GROUP, LLC

1 - GEARSET CHAMBER
2 - OIL GALLERY
3 - SHELL OF ELECTROHYDRAULIC UNIT
4 - ELECTROHYDRAULIC UNIT
5 - FLOAT
6 - OPENING

With low oil levels, the lubricating oil which flows constantly out of the gearset, flows back to oil gallery (2) though the opening (6). If the oil level rises, the oil presses the float (5) against the housing opening (6). Refer to **Fig. 179**. The float (5) therefore separates the oil gallery (2) from the gearset chamber (1). The lubricating oil which continues to flow out of the gearsets is thrown against the housing wall, incorporated by the rotating parts and flows back into the oil gallery (2) through the upper opening (arrow).

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if

inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

CHECK OIL LEVEL

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

WARNING: There is a risk of accident from vehicle starting off by itself when engine running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick (special tool #9336A, Dipstick) into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

NOTE: The dipstick will protrude from the fill tube when installed.

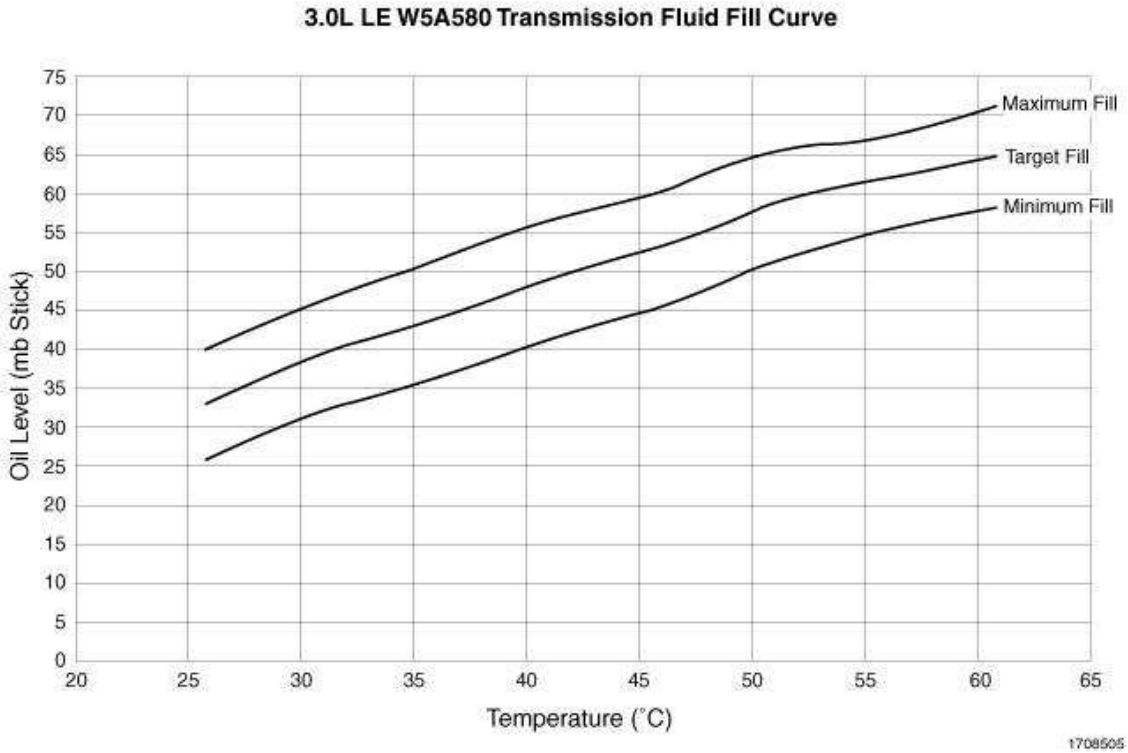

Fig. 180: Nag1 Diesel Fill Graph
Courtesy of CHRYSLER GROUP, LLC

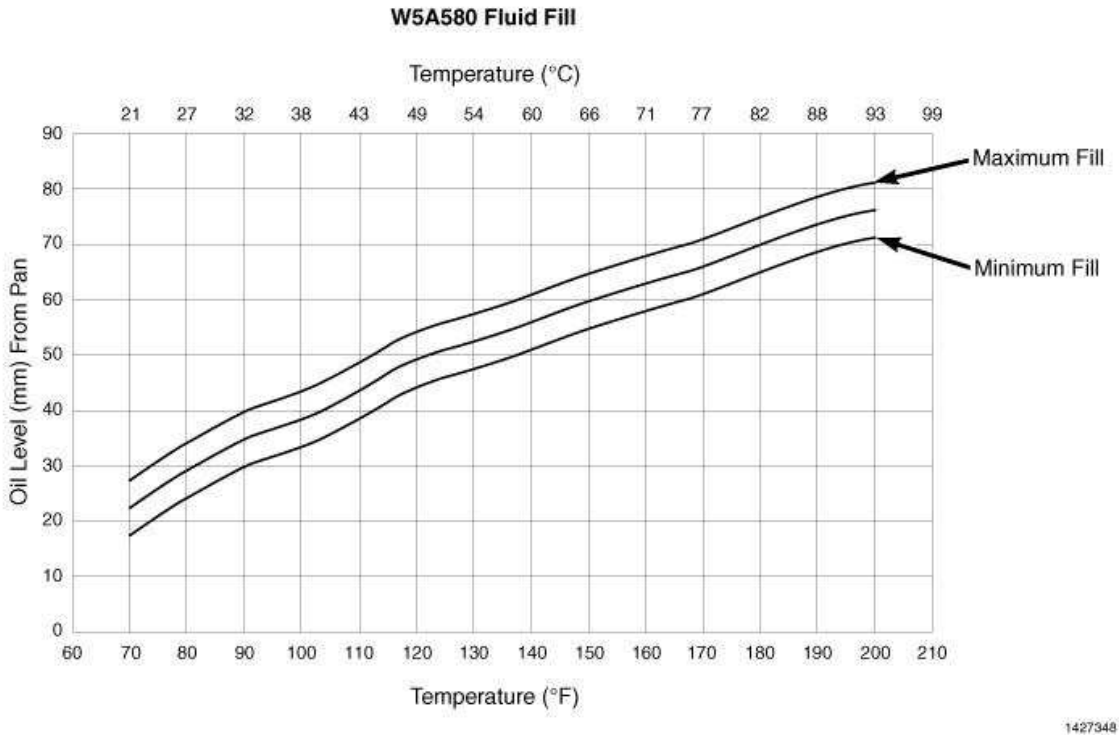

Fig. 181: Nag1 Gasoline Transmission Fill Graph
Courtesy of CHRYSLER GROUP, LLC

6. Check transmission oil temperature using the appropriate scan tool.

NOTE: **The true transmission oil temperature can only be read by a scan tool in REVERSE or any forward gear position. Refer to CONTACT, TEMPERATURE SENSOR\PARK-NEUTRAL, OPERATION.**

7. The transmission Oil Dipstick (special tool #9336A, Dipstick) has indicator marks every 10 mm. With the transmission in Park, determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.
3. Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to the transmission:

1. If only fluid and filter were changed, add **5.0 L (10.6pts.)** of transmission fluid to transmission.
2. If the transmission was completely overhauled or the torque converter was replaced or drained, add **7.7 L (16.3 pts.)** of transmission fluid to transmission.

4. Check the transmission fluid and adjust as required. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

FLUID/FILTER SERVICE

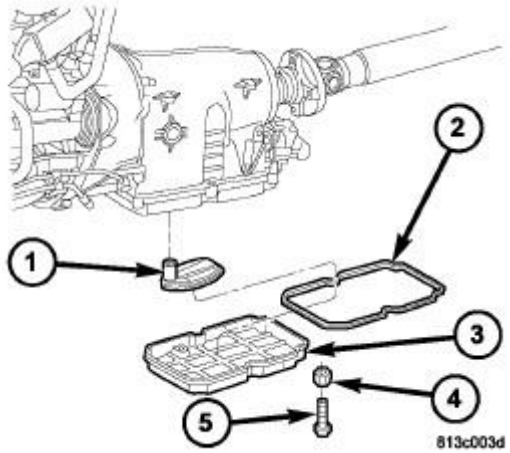

Fig. 182: Fluid/Filter Service Points
Courtesy of CHRYSLER GROUP, LLC

1 - OIL FILTER
2 - OIL PAN GASKET
3 - OIL PAN
4 - RETAINER
5 - BOLT

1. Run the engine until the transmission oil reaches operating temperature.
2. Raise and support vehicle.
3. Remove the bolts (5) and retainers (4) holding the oil pan to the transmission. Refer to **Fig. 182**.
4. Remove the transmission oil pan (3) and gasket (2) from the transmission.
5. Remove the transmission oil filter (1) and o-ring from the electrohydraulic control unit.
6. Clean the inside of the oil pan (3) of any debris. Inspect the oil pan gasket (2) and replace if necessary.
7. Install a new oil filter (1) and o-ring into the electrohydraulic control unit.
8. Install the oil pan (3) and gasket (2) onto the transmission.
9. Install the oil pan bolts (5) and retainers (4). Torque the bolts to 8 N.m (70 in.lbs.).
10. Lower the vehicle and add 5.0 L (10.6 pts.) of transmission fluid to the transmission.

11. Check the oil level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

3 - SUN GEAR
4 - PLANETARY CARRIER

Three planetary gear sets are used to produce the different gear ratios. Refer to **Fig. 183**. These are located in the mechanical part of the transmission as the front, middle and rear planetary gear sets.

OPERATION

OPERATION

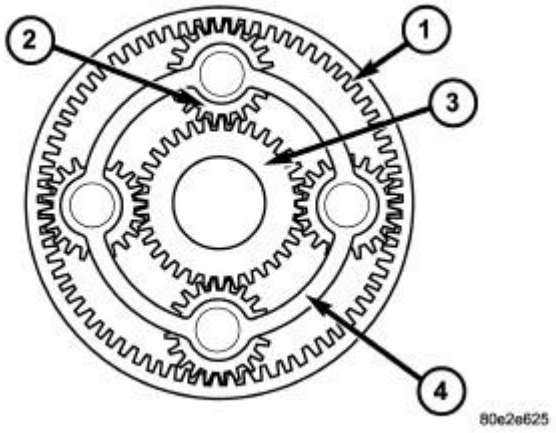

Fig. 184: Planetary Geartrain
Courtesy of CHRYSLER GROUP, LLC

1 - ANNULUS GEAR
2 - PLANETARY PINION GEARS
3 - SUN GEAR
4 - PLANETARY CARRIER

The annulus gear (1) and sun gear (3) elements of a planetary gear system are alternately driven and braked by the actuating elements of the multi-plate clutch and multiple-disc brake. Refer to **Fig. 184**. The planetary pinion gears (2) can turn on the internal gearing of the annulus gear (1) and on the external gearing of the sun gear (3). This allows for a variety of gear ratios and the reversal of the rotation direction without the need for moving gear wheels or shift collars. When two components of the planetary gear set are locked together, the planetary gear set is locked and turns as a closed unit.

The torque and engine speed are converted according to the lever ratios and the ratio of the number of teeth on the driven gears to that on the drive gears, and is referred to as the gear ratio. The overall ratio of a number of planetary gear sets connected in series is obtained by multiplying the partial ratios.

DISASSEMBLY

DISASSEMBLY

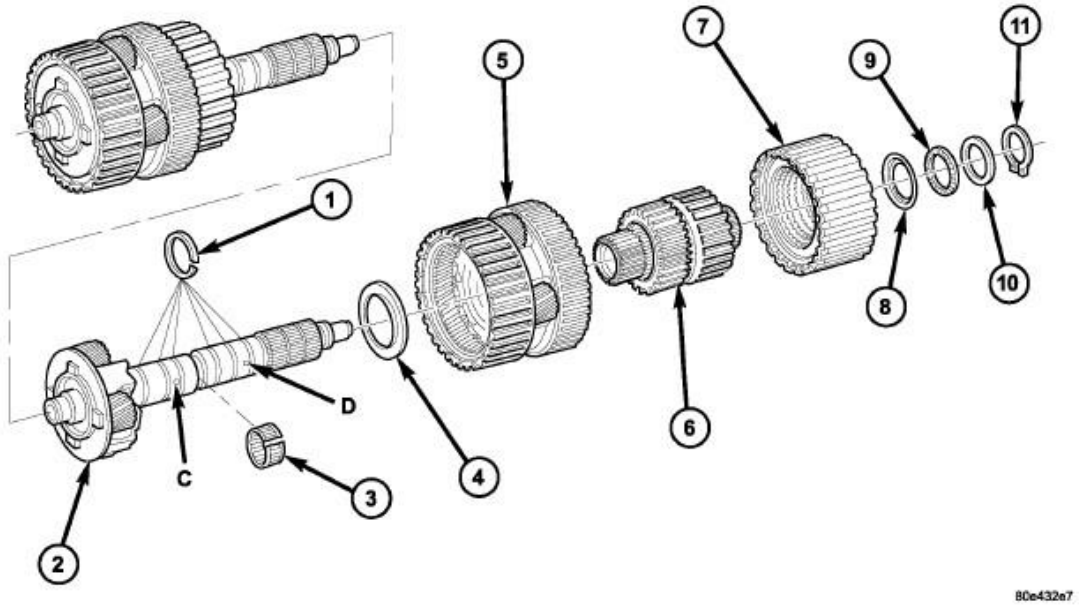

Fig. 185: Output Shaft With Center And Rear Planetary Geartrain

2 - THRUST WASHER
3 - SHIM
4 - AXIAL NEEDLE BEARING
5 - RETAINING RING
6 - OUTPUT SHAFT WITH CENTER PLANETARY CARRIER

NOTE: During the test, apply a contact force by hand to K3 in the direction of the arrow.

8. Inspect axial play between shim (10) and retaining ring (11). Refer to **Fig. 187**. Check axial play "S" between shim (10) and retaining ring (1) using a feeler gauge. Clearance should be 0.15-0.6 mm (0.006-0.024 in.). Shims are available in thicknesses of 3.0 mm (0.118 in.), 3.4 mm (0.134 in.), and 3.7 mm (0.146 in.). Adjust as necessary

HOLDING CLUTCHES

DESCRIPTION

DESCRIPTION

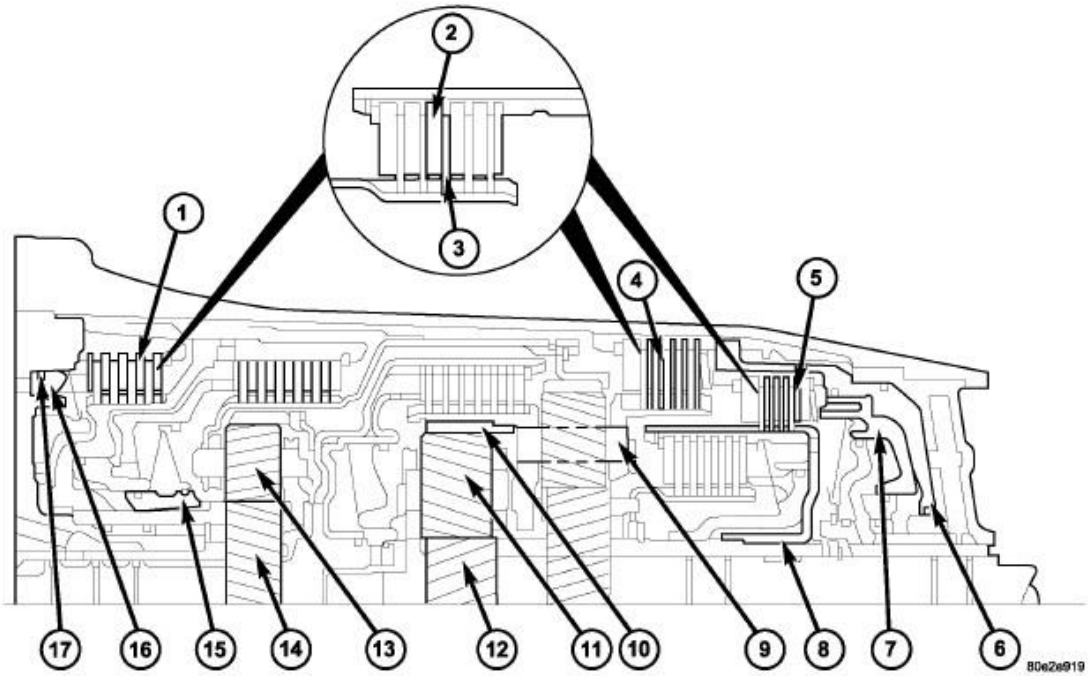

Fig. 188: Identifying Holding Clutches
Courtesy of CHRYSLER GROUP, LLC

1 - B1 CLUTCH	10 - CENTER PLANETARY GEARSET ANNULUS GEAR
2 - EXTERNALLY TOOTHED DISC	11 - CENTER PLANETARY GEARSET PINION GEARS
3 - INTERNALLY TOOTHED DISC	12 - CENTER PLANETARY GEARSET SUN GEAR
4 - B3 CLUTCH	13 - FRONT PLANETARY GEARSET PINION GEARS
5 - B2 CLUTCH	14 - FRONT PLANETARY GEARSET SUN GEAR
6 - B3 CLUTCH PISTON	15 - B1 CLUTCH INTERNALLY TOOTHED DISC CARRIER
7 - B2 CLUTCH PISTON	16 - B1 CLUTCH PISTON
8 - B2 CLUTCH INTERNALLY TOOTHED DISC CARRIER	17 - B1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET PLANETARY CARRIER	

Three multiple-disc holding clutches, the front, B1 (1), middle, B3 (4), and rear multiple disc clutches, B2 (5), are located in the planetary gear sets in the transmission housing. Refer to **Fig. 188**.

A multiple-disc holding clutch consists of a number of internally toothed discs (3) on an internally toothed disc carrier and externally toothed discs (2) on an externally toothed disc carrier, which is

rigidly connected to the transmission housing.

OPERATION

OPERATION

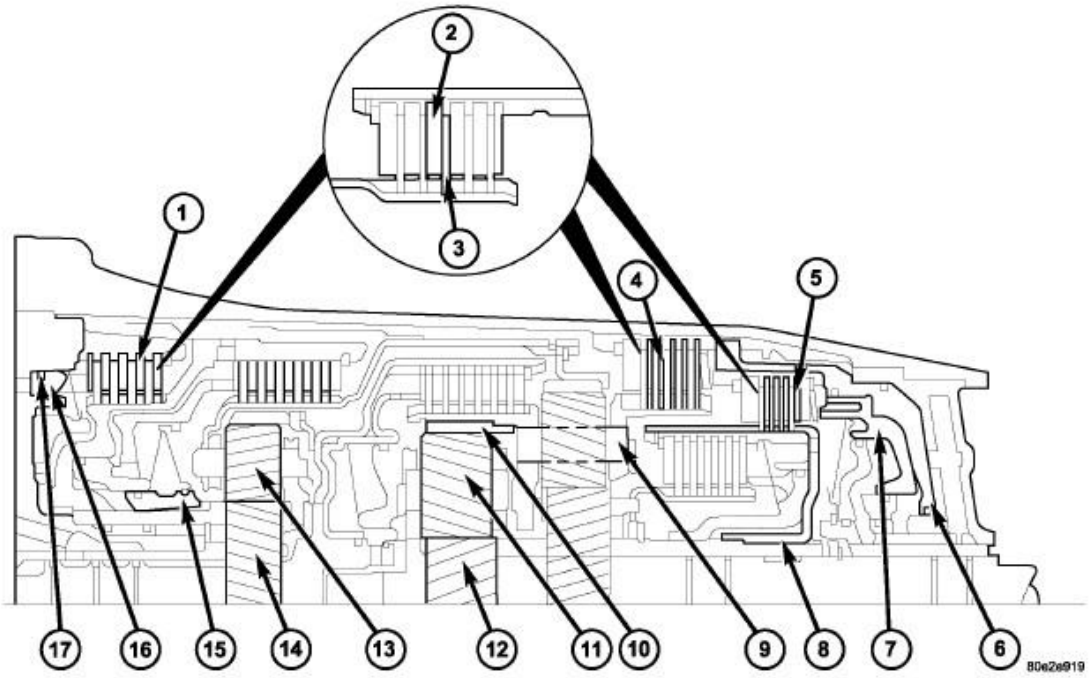

Fig. 189: Identifying Holding Clutches
Courtesy of CHRYSLER GROUP, LLC

1 - B1 CLUTCH	10 - CENTER PLANETARY GEARSET ANNULUS GEAR
2 - EXTERNALLY TOOTHED DISC	11 - CENTER PLANETARY GEARSET PINION GEARS
3 - INTERNALLY TOOTHED DISC	12 - CENTER PLANETARY GEARSET SUN GEAR
4 - B3 CLUTCH	13 - FRONT PLANETARY GEARSET PINION GEARS
5 - B2 CLUTCH	14 - FRONT PLANETARY GEARSET SUN GEAR
6 - B3 CLUTCH PISTON	15 - B1 CLUTCH INTERNALLY TOOTHED DISC CARRIER
7 - B2 CLUTCH PISTON	16 - B1 CLUTCH PISTON
8 - B2 CLUTCH INTERNALLY TOOTHED DISC CARRIER	17 - B1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET PLANETARY CARRIER	

The holding clutches connect the annulus gear, sun gear, or planetary carrier of a planetary gear set against the transmission housing in order to transmit the drive torque. Refer to **Fig. 189**.

If the piston (16) on multiple-disc holding clutch B1 (1) is subjected to oil pressure, it presses the internal (3) and external discs (2) of the disc set together. The internally toothed disc carrier (15) locks the sun gear (14) against the housing. The planetary pinion gears (13) turn on the sun gear (14).

If the multiple-disc holding clutch B2 (5) is actuated via the piston (7), the piston compresses the disc set. The internally toothed disc carrier (8) locks the sun gear (12) against the housing. The planetary pinion gears (11) turn on the sun gear (12).

If the multiple-disc holding clutch B3 (4) is actuated via the piston (6), the planetary carrier (9) and the annulus gear (10) are locked. When the multiple-disc brake B3 (4) is actuated, the direction of rotation is reversed.

KNOB, GEARSHIFT

REMOVAL

REMOVAL

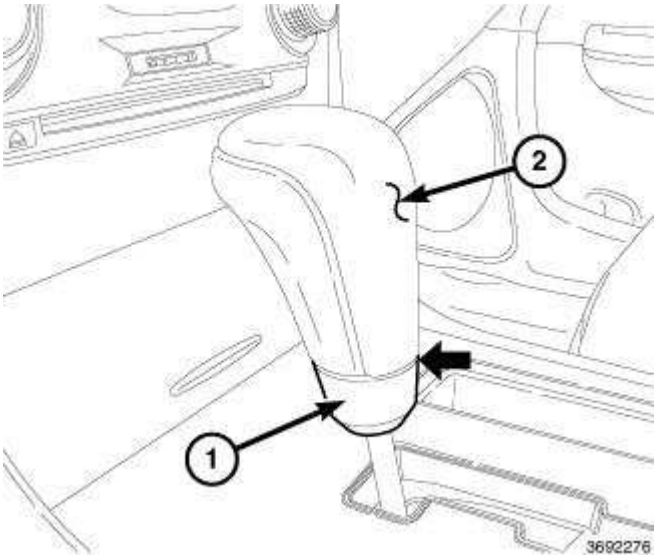

Fig. 190: Collar & Shifter Knob
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #C-4755, Trim Stick) or the equivalent pry the collar (1) away from the shifter knob (2).

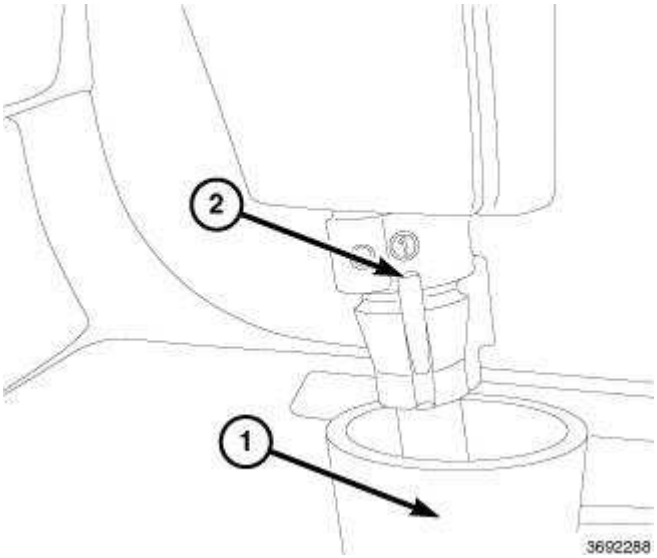

Fig. 191: Disengage The Collar & Disengage The Collar
Courtesy of CHRYSLER GROUP, LLC

2. Completely disengage the collar (1) from the shifter knob (2).

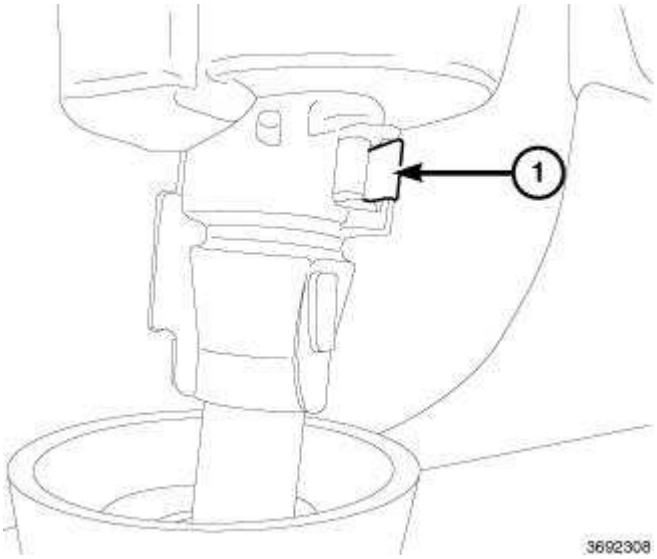

Fig. 192: Retention Clip Tab
Courtesy of CHRYSLER GROUP, LLC

3. Grasp the retention clip tab with pliers or the equivalent and remove the clip from the knob.
4. Grasp the knob and pull firmly upward to remove from the shifter assembly.

INSTALLATION

INSTALLATION

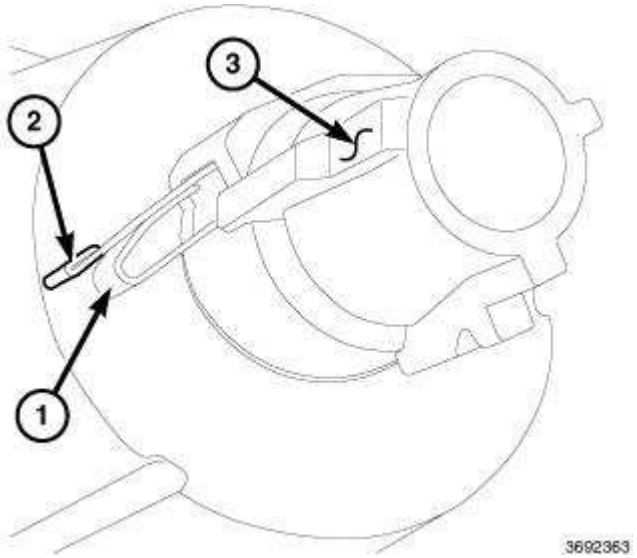

Fig. 193: Retention Spring, Shift Knob & Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: The clip must be installed with the correct orientation or subsequent knob removals will require much more force.

1. Install the retention spring (1) to the shift knob (3) with the tab (2) facing the instrument panel.

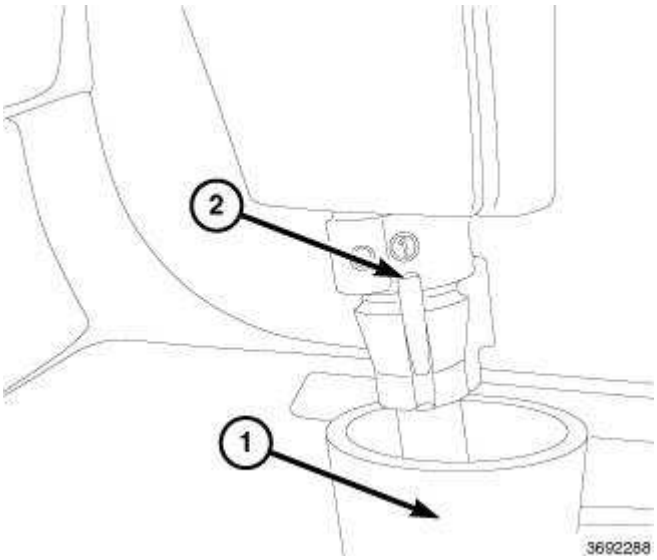

Fig. 194: Disengage The Collar & Disengage The Collar
Courtesy of CHRYSLER GROUP, LLC

2. Install the collar (1) and the knob (2) to the shifter shaft assembly.
3. Firmly push the knob onto the shaft.
4. Orient the collar so that it aligns with the angle of the knob.

5. Install the collar (1) to the shift knob (2) and seat fully.

MECHANISM, BRAKE TRANSMISSION SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

NOTE: Some shifter assemblies may have a small external trim cover to actuate the Brake Transmission Shifter/Ignition Interlock (BTSI).

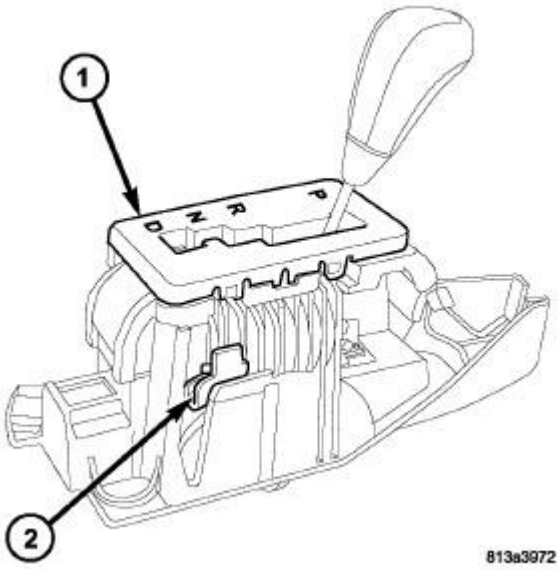

Fig. 196: BTSI Override
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFTER ASSEMBLY
2 - BTSI OVERRIDE

The Brake Transmission Shifter/Ignition Interlock (BTSI) is an electronically operated system that prevents the transmission gear shifter from being moved out of PARK without the proper driver inputs. The system contains a solenoid that is integral to the shifter assembly. The solenoid permits shifter movement out of PARK when the brake is depressed and prevents shifter movement into REVERSE unless a shift into REVERSE is permitted.

A BTSI override (2) is provided on the side of the shifter mechanism (1) to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

OPERATION

OPERATION

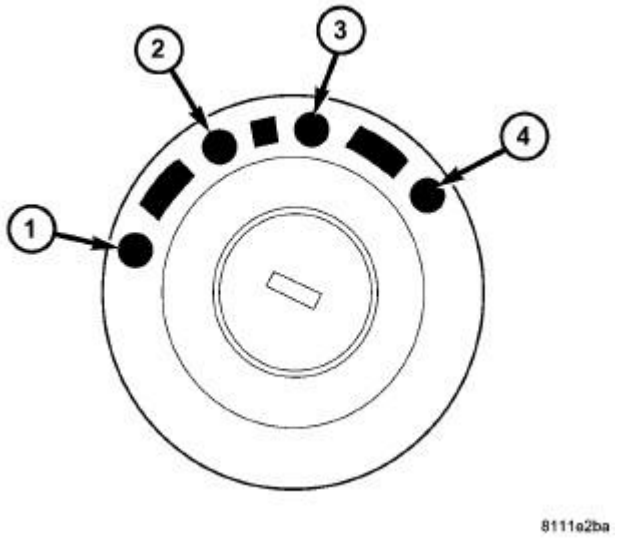

Fig. 197: Ignition Key/Switch Positions
Courtesy of CHRYSLER GROUP, LLC

1 - LOCK
2 - ACC
3 - ON
4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK (1) position. Refer to **Fig. 197**. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the ignition is in the ON position and the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear, except "PARK", and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.

5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

BTSI OVERRIDE

NOTE: Some shifter assemblies may have a small external trim cover to actuate the Brake Transmission Shifter/Ignition Interlock (BTSI).

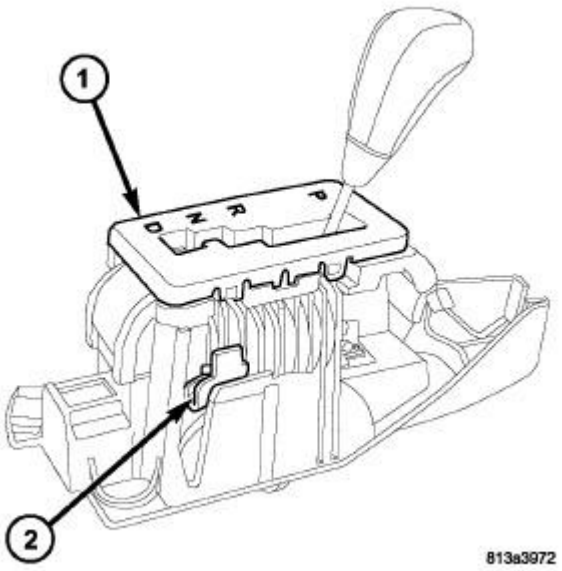

Fig. 198: BTSI Override
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFTER ASSEMBLY
2 - BTSI OVERRIDE

In the event of an electrical failure, the vehicle can be shifted out of PARK by using the following procedure.

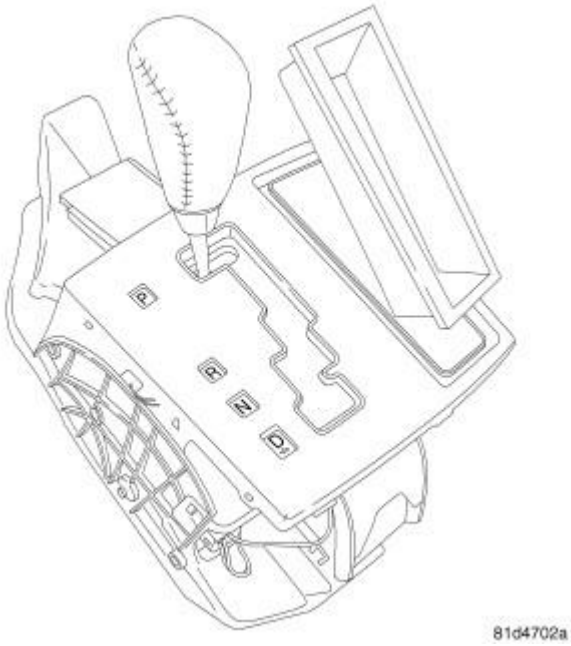

Fig. 199: Cubby Bin Liner
Courtesy of CHRYSLER GROUP, LLC

1. Turn the key to the ACC or ON position.
2. Remove the liner to the cubby bin to the right side of the shifter.

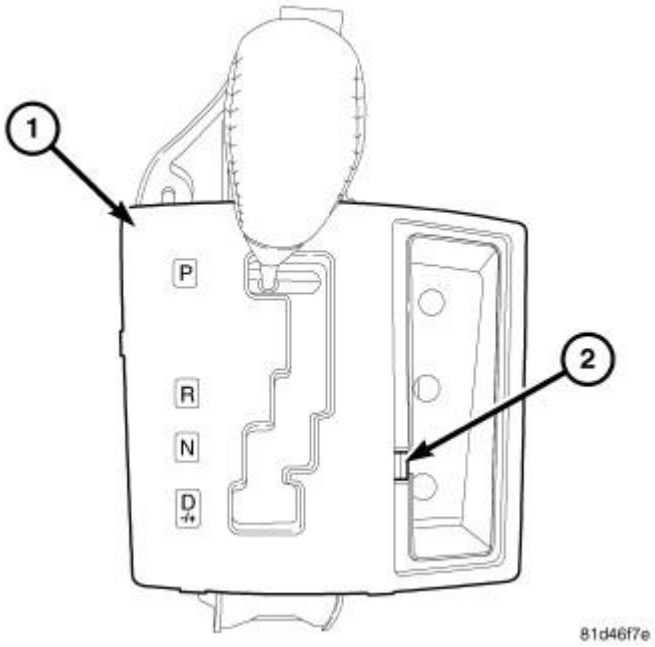

Fig. 200: Nag1 BTSI
Courtesy of CHRYSLER GROUP, LLC

3. Depress the BTSI override (2) on the side of the shifter assembly (1).

4. While the override is depressed, move the shifter out of the PARK position.
5. Return the cubby bin liner to its original location.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

SYSTEM VERIFICATION

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from ACC to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

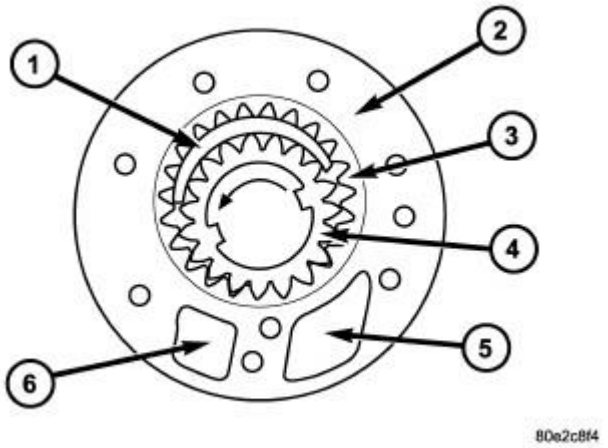

Fig. 201: Identifying Oil Pump Components
Courtesy of CHRYSLER GROUP, LLC

1 - CRESCENT
2 - OIL PUMP
3 - EXTERNAL GEAR
4 - INTERNAL GEAR
5 - INLET CHAMBER
6 - PRESSURE CHAMBER

The oil pump (2) (crescent-type pump) is installed in the bellhousing behind the torque converter and is driven by the drive flange of the torque converter. Refer to **Fig. 201**. The pump creates the oil pressure required for the hydraulic procedures.

OPERATION

OPERATION

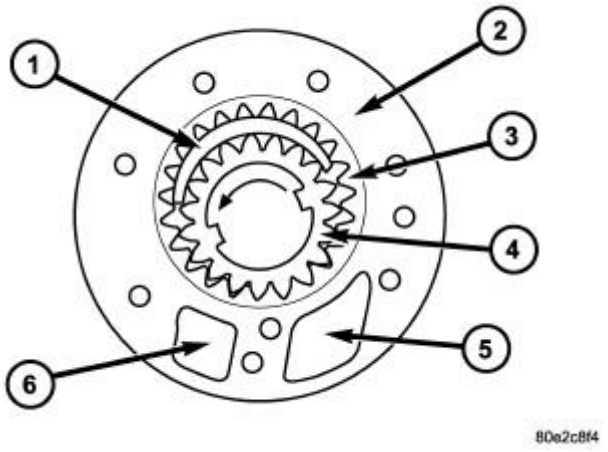

Fig. 202: Identifying Oil Pump Components
Courtesy of CHRYSLER GROUP, LLC

1 - CRESCENT
2 - OIL PUMP
3 - EXTERNAL GEAR
4 - INTERNAL GEAR
5 - INLET CHAMBER
6 - PRESSURE CHAMBER

When the engine is running, the oil is pumped through the inlet chamber (5) along the upper and lower side of the crescent (1) to the pressure chamber (6) of the housing. Refer to **Fig. 202**. The meshing of the teeth prevents oil flowing from the delivery side to the intake side. An external gear (3) is eccentrically mounted in the pump housing. The external gear is driven by the internal gear (4) which is connected to the torque converter hub.

DISASSEMBLY

DISASSEMBLY

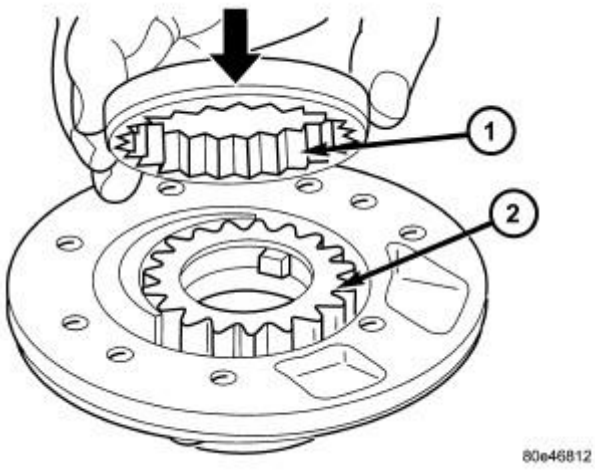

Fig. 203: Oil Pump Gears
Courtesy of CHRYSLER GROUP, LLC

1 - OUTER PUMP ROTOR
2 - INNER PUMP ROTOR

1. Remove pump gears (1 and 2) from pump housing. Refer to **Fig. 203**.

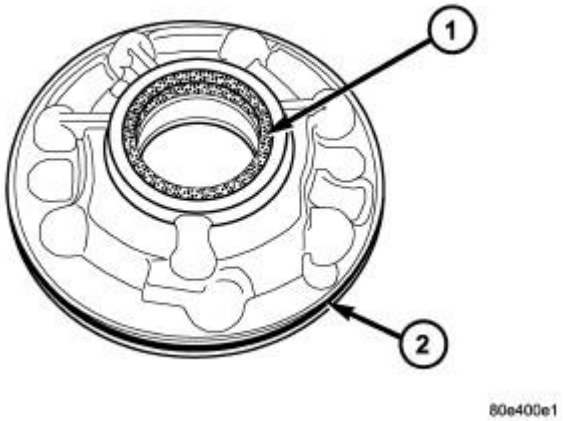

Fig. 204: Identifying Oil Pump Seals
Courtesy of CHRYSLER GROUP, LLC

1 - INNER OIL SEAL
2 - OUTER OIL SEAL

2. Remove the inner oil pump seal (1). Refer to **Fig. 204**.
3. Replace the outer oil pump O-ring (2). Refer to **Fig. 204**.

INSPECTION

INSPECTION

Before measuring any oil pump components, perform a thorough visual inspection of all the components. If any sign of scoring, scratches, or other damage is seen, replace the oil pump as an assembly.

SIDE CLEARANCE

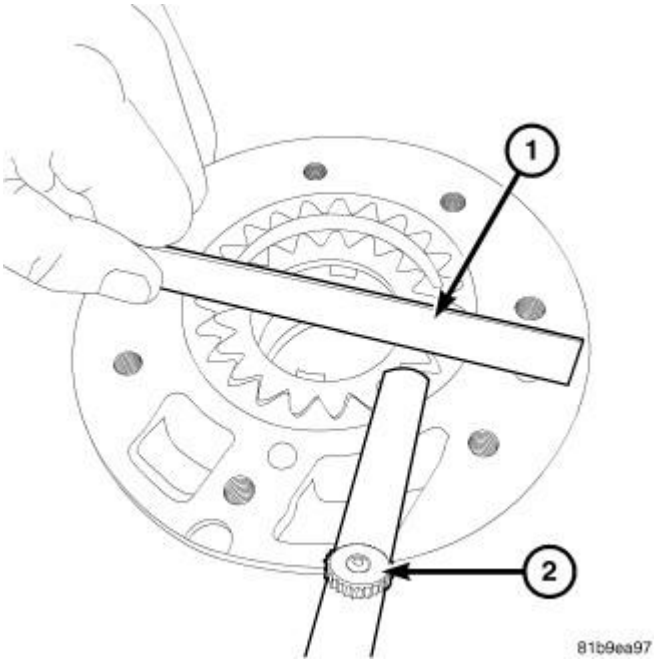

Fig. 205: Oil Pump Side Clearance Check
Courtesy of CHRYSLER GROUP, LLC

1 - FLAT PLATE
2 - FEELER GAUGE

Side clearance is the difference between the thickness of the pump gears and the depth of the pocket in the pump housing. Side clearance can be measured by laying a flat plate (1) across the mounting face of the pump housing, and measuring the distance between the plate and the gears with a feeler gauge (2).

Acceptable side clearance:

- Inner gear: 0.064 mm (0.0025 in) max
- Outer gear: 0.069 mm (0.0027 in) max

TIP CLEARANCE

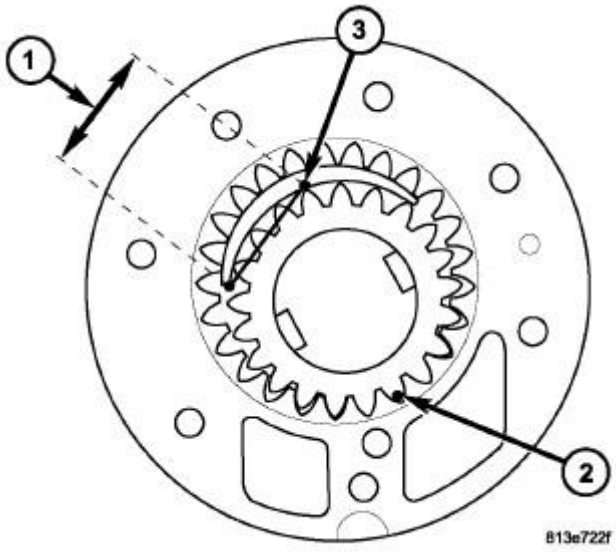

Fig. 206: Oil Pump Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - MEASURE 37MM FROM THE CORNER OF CRESCENT
2 - TIGHT MESH HERE
3 - MEASURE TIP CLEARANCE HERE

Tip clearance is the difference between the tip diameters of the gear teeth and the corresponding diameters of the pocket in the pump housing.

Tip clearance for the inner gear can be checked by moving the inner gear into tight mesh (2) with the outer gear as shown in illustration. Refer to **Fig. 206**. Clearance between the ID of the crescent feature of the housing and the OD of the teeth of the inner gear (3) should then me measured at a point 37 mm (1.45 in.) from the corner of the crescent (1) feature, as shown in illustration below.

Acceptable tip clearance for inner gear:

- 0.85 mm (0.033 in) max

ASSEMBLY

ASSEMBLY

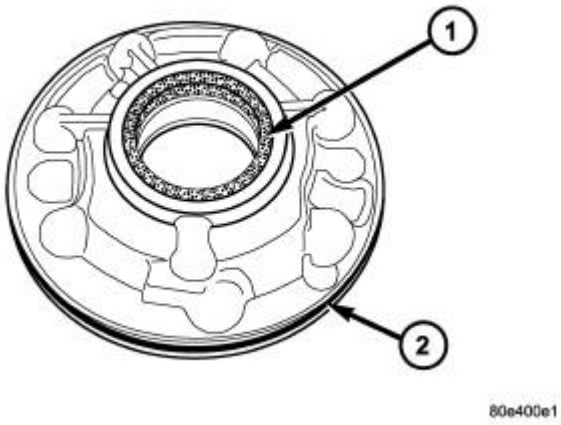

Fig. 207: Identifying Oil Pump Seals
Courtesy of CHRYSLER GROUP, LLC

1 - INNER OIL SEAL
2 - OUTER OIL SEAL

1. Install new inner oil pump seal (1) with Seal Installer 8902A. Refer to **Fig. 207**.
2. Replace O-ring (2). Refer to **Fig. 207**.

1. Pierce the new transmission fill tube seal along the molded "Y" from the outside.

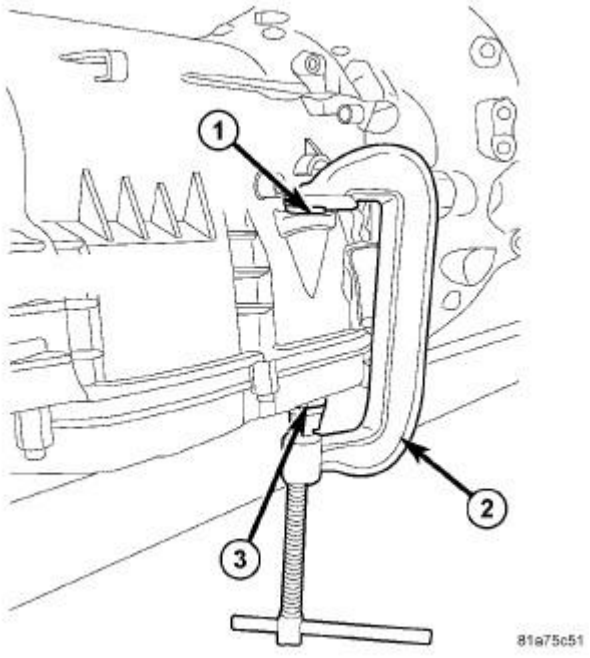

Fig. 212: C-Clamp
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL INSTALLER DISC 9902 2 - "C" CLAMP 3 - SHIM STOCK

NOTE: If the new fill tube seal can not be fully installed into the transmission case fill tube bore by hand, a "C" clamp must be used.

CAUTION: Do not over tighten the "C" clamp during fill tube oil seal installation. Transmission oil pan damage or bending may occur.

2. Lubricate the new transmission fill tube seal with MOPAR® ATF+4 ATF and install the new fill tube seal into the transmission case fill tube bore.
    1. Position seal installer disc (special tool #9902, Installer, Seal) (1) between the "C" clamp (2) and the new transmission fill tube seal
    2. Position a shim stock (3) between the "C" clamp (2) and the **edge** of the transmission oil pan.
    3. Lightly tighten the "C" clamp until the fill tube seal is fully installed into the transmission case fill tube bore.
3. Clean and lubricate the end of the transmission fill tube with MOPAR® ATF+4 ATF and install the fill tube into the transmission case fill tube bore.

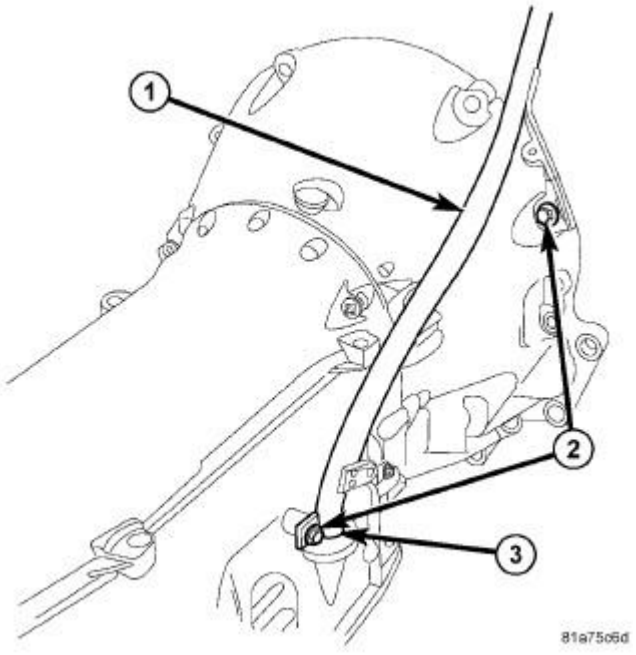

Fig. 213: Typical Fill Tube Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - FILL TUBE

2 - FILL TUBE BOLTS 3 - FILL TUBE SEAL

4. Loosely install the fill tube bolts (2).
5. Tighten the upper fill tube bolt to 39 N.m (29 ft.lbs.).
6. Tighten the lower fill tube bolt to 12 N.m (105 in.lbs.).

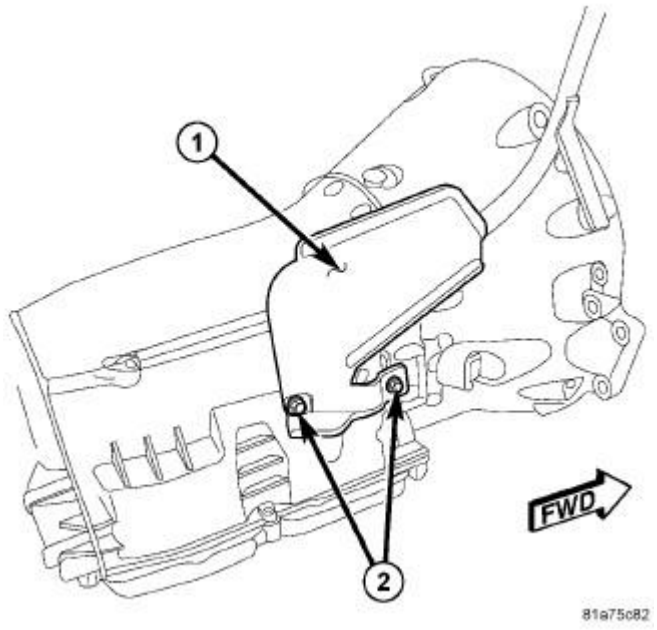

Fig. 214: Water Shield
Courtesy of CHRYSLER GROUP, LLC

1 - WATER SHIELD 2 - WATER SHIELD BOLTS

7. Install the water shield (1) and water shield bolts (2) (if equipped).
8. Tighten the water shield bolts to 12 N.m (9 ft.lbs).
9. Lower vehicle to check and fill transmission as necessary.

SEAL, OUTPUT SHAFT

REMOVAL

REMOVAL

1. Remove the propeller shaft. Refer to **REMOVAL** . Move propeller shaft to the right and tie up.
2. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft

nut.

NOTE: When removing the propeller shaft flange be certain the shim remains on the output shaft.

3. Remove the nut, with a 30 mm 12 point socket, holding the propeller shaft flange to the output shaft and remove the flange.
4. Remove the output shaft seal with suitable screw and slide hammer.

INSTALLATION

INSTALLATION

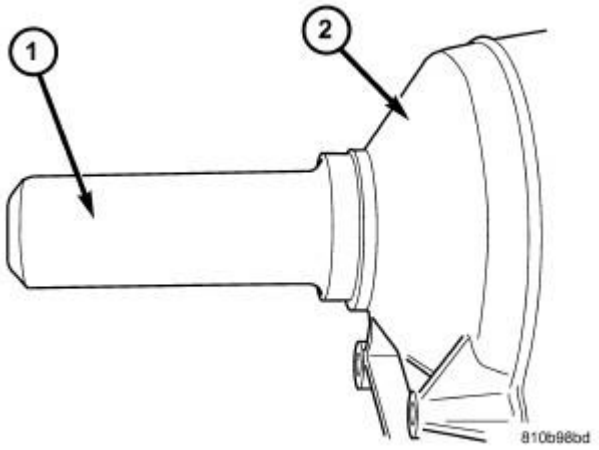

Fig. 215: Installing Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL INSTALLER 8902A
2 - TRANSMISSION CASE

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Use Seal Installer (special tool #8902A, Installer, Seal) (1) to install the seal. Refer to **Fig. 215**.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.

NOTE: When installing the propeller shaft flange be certain the shim remained on the output shaft.

4. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut, with a 30 mm 12 point socket, to 200 N.m (147.5 ft.lbs.).

5 - VALVE HOUSING OF SHIFT PLATE
6 - N2 SPEED SENSOR
7 - SPRING
8 - N3 SPEED SENSOR
9 - EXCITER RING
10 - DRIVING CLUTCH K1 EXTERNALLY TOOTHED DISC

The speed sensors, N2 and N3, (6, 8) are fixed to the shell of the electrohydraulic control unit's leadframe via contact blades. Refer to **Fig. 220**. The speed sensors are pressed against the transmission housing (2) by a spring (7) which is held against the valve housing of the shift plate (5). This ensures a defined distance between the speed sensors and the exciter ring (4).

OPERATION

OPERATION

5 - VALVE HOUSING OF SHIFT PLATE
6 - N2 SPEED SENSOR
7 - SPRING

8 - N3 SPEED SENSOR
9 - EXCITER RING
10 - DRIVING CLUTCH K1 EXTERNALLY TOOTHED DISC

Signals from the speed sensors, N2 and N3, (6, 8) are recorded in the transmission control module (TCM), together with the wheel and engine speeds and other information, and are processed into an input signal for electronic control. Refer to **Fig. 221**.

Speed sensor N2 (6) records the speed of the front planetary rear annulus assembly (10). Speed sensor N3 (8) records the speed of the K1 clutch (3).

RELATIVE SPEED SENSOR READINGS - NAG 1 TRANSMISSION

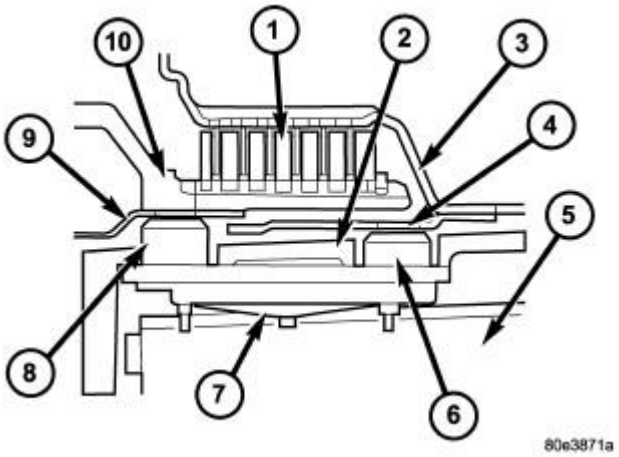

Fig. 222: Locating Input Speed Sensors

1 - DRIVING CLUTCH K1
2 - TRANSMISSION HOUSING
3 - DRIVING CLUTCH K1 INTERNALLY TOOTHED DISC
4 - EXCITER RING
5 - VALVE HOUSING OF SHIFT PLATE
6 - N2 SPEED SENSOR
7 - SPRING
8 - N3 SPEED SENSOR
9 - EXCITER RING
10 - DRIVING CLUTCH K1 EXTERNALLY TOOTHED DISC

There are several things to note regarding the function of the N2 and N3 speed sensors.

- K1 clutch (N3 speed sensor) will show no rotation whenever the B1 Brake is applied. N3 = Zero in 1st, 5th and Reverse.

- With the vehicle moving forward or reverse, N2 speed sensor reading will be greater than zero in all gears
- Whenever the K1 clutch is applied (2nd, 3rd, and 4th) N2 will be equal to N3.
- There is no speed sensor internal to the transmission that directly measures input shaft speed. However, when K1 is applied N2 equals input shaft/turbine speed.
- The engine speed is fed to the TCM via can bus thus providing impeller speed.
- There is no speed sensor internal to the transmission that directly measures output shaft speed. ABS wheel sensors provide output shaft speed.
- K1 clutch (N3 speed sensor) will show no rotation whenever the B1 Brake is applied. N3 is equal to zero in 1st, 5th and Reverse gears.
- With the vehicle moving forward or reverse, N2 speed sensor reading will be greater than zero in all gears.
- Whenever the K1 clutch is applied (2nd, 3rd, and 4th) N2 will be equal to N3.
- There is no speed sensor internal to the transmission that directly measures input shaft speed. However, when K1 is applied N2 equals input shaft/turbine speed.
- The engine speed is fed to the TCM via the vehicle's communication bus thus providing impeller speed.
- There is no speed sensor internal to the transmission that directly measures output shaft speed. ABS wheel sensors provide output shaft speed.

NOTE: N2 sensor, N3 sensor, output shaft speed sensor are speeds relative to the input shaft turbine speed.

GEAR	INPUT SHAFT/TURBINE SPEED	N2 SENSOR	N3 SENSOR	OUTPUT SHAFT SPEED	OVERALL RATIO
1ST	1.0000	0.6081	0.0000	0.2782	3.59
2ND	1.0000	1.0000	1.0000	0.4574	2.19
3RD	1.0000	1.0000	1.0000	0.7115	1.41
4TH	1.0000	1.0000	1.0000	1.0000	1.00
5TH	1.0000	0.6081	0.0000	1.2035	0.83
REVERSE (S)	1.0000	0.6081	0.0000	-0.3157	-3.17

Based on the preceding chart, it appears that N3 sensor is redundant and provides no additional information. However, the TCM needs to know Input Shaft/Turbine speed. Since the N2 sensor is not directly tied to the Input Shaft, the N3 sensor is required to inform the TCM to divide the N2 value by 0.6081 or 1.0000 to calculate actual Turbine speed.

SHIFTER, TRANSMISSION

DESCRIPTION

DESCRIPTION

FLOOR MOUNT SHIFTER

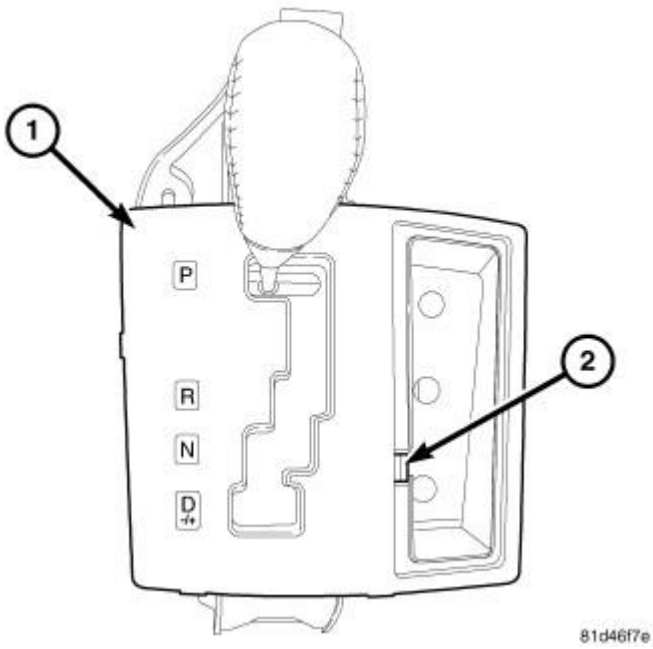

Fig. 223: Nag1 BTSI
Courtesy of CHRYSLER GROUP, LLC

The automatic transmission is operated with the help of a shift lever assembly (SLA) (1) located in the floor console. There are four positions to which the selection lever can be shifted: P, R, N, D. In addition, the selector lever can be moved sideways (+/-) in position "D" to adjust the shift range.

All selector lever positions, as well as selected shift ranges in position "D", are identified by the SLA. The information is then sent to the transmission control module (TCM) via an electrical connection. At the same time, the selector lever positions "P", "R", "N" and "D" are transmitted by a shift cable to the selector shaft in the transmission.

The SLA is comprised of the following functions:

- **Key lock:** Depending on the selector lever position, the ignition cylinder is locked/unlocked, i.e., the ignition key can be removed only if the selector lever is in position "P". An electronic micro switch in the shifter assembly is used to perform this function.
- **Park lock:** The selector lever is not released from position "P" until the brake pedal has been applied and the ignition key is in the ON" position. Shift lock is controlled by the ignition module in conjunction with the brake switch and a locking solenoid in the SLA. As soon as the brake pedal is applied firmly, the locking solenoid is energized and retracted to unlock the selector lever. If the selector lever cannot be moved out of position "P" due to a malfunction, the shift lock function can be overriden (2).
- **Reverse inhibitor:** As soon as the vehicle speed exceeds approximately 4-7 mph, it is no longer possible to move the selector lever from position "N" to position "R". The reverse inhibit functionality is controlled by the same solenoid as the park lock. As the vehicle accelerates past the calibrated speed threshold, the solenoid is energized to block the sideways motion of the

shift lever necessary to move from NEUTRAL to REVERSE. The reverse inhibit is not released until the vehicle speed falls below approximately 4-7 mph and the shifter is moved out of the "D" shifter position.

COLUMN MOUNTED SHIFTER

Some vehicles may be equipped with an optional column mount shifter, which is serviced with the steering column. Refer to **COLUMN, INSTALLATION** or **COLUMN, REMOVAL** .

OPERATION

OPERATION

With the selector lever in position "D", the transmission control module (TCM) automatically shifts the gears that are best-suited to the current operating situation. This means that shifting of gears is continuously adjusted to current driving and operating conditions in line with the selected shift range and the accelerator pedal position. Starting off is always performed in 1st gear.

The selector lever positions are determined by a sensor assembly internal to the shift lever assembly (SLA). The sensor assembly identifies the various positions of the SLA according to the following table.

Shift Lever Position	Bit 0	Bit 1	Bit 2	Bit 3
Default	0	0	0	0
"D"	1	0	1	0
"N"	0	1	1	0
"R"	1	1	1	0
"P"	0	0	0	1
"+"	1	0	0	1
"-"	0	1	0	1
"ND"	1	1	0	1
"RN"	0	0	1	1
"PR"	1	0	1	1
Implausible	1	1	1	1

NOTE: There are currently two different software functions out for "AutoStick" most cars use the upper gear limit functionality as described, but some cars (SRT and RT) use more of a 'gear hold' functionality. These vehicles are able to toggle between 1-2-3-4-5-D when you do the + / - shifts and will not downshift automatically, these systems "hold the gear"

The permissible shifter positions and transmission operating ranges are:

- P = Parking lock and engine starting.

- R = Reverse.
- N = Neutral and engine starting (no power is transmitted to the axles).
- D = The shift range includes all forward gears.

The shift range can be adjusted to the current operating conditions by tipping the selector lever to the left-hand side ("-") or the right-hand side ("+") when in position "D". If the shift range is limited, the display in the instrument cluster indicates the selected shift range and not the currently engaged gear.

- 4= Shift range is limited to gears 1 to 4.
- 3= Shift range is limited to gears 1 to 3.
- 2= Shift range is limited to gears 1 to 2.
- 1= Shift range is limited to the 1st gear.

Tipping the shift lever will have the following results:

- **Tipping the selector lever toward "-" one time after another:** The shift range is reduced in descending sequence by one gear each time, i.e., from D - 4 - 3 - 2 - 1. If the selected limitation of the shift range would result in a downshift causing excessive engine speed, the shifting is not executed and the engaged gear as well as the shift range remain unchanged. This is to prevent the engine from overspeeding. Engine retardation is low with the selector lever in position "D". To make use of the full braking power of the engine, "manual" downshifting by tipping the lever towards the left-hand side is recommended. If this has been done, subsequent upshifting must be carried out manually as well.
- **Tipping the selector lever toward "-" and holding it in this position:** The currently engaged gear in range "D" is indicated in the instrument cluster display and the shift range is limited to this gear.
- **Tipping the selector lever toward "+" one time after another:** The shift range is increased by one gear each time and the increased shift range is displayed in the instrument cluster; possibly, the transmission upshifts to a faster gear.
- **Tipping the selector lever toward "+" several times:** The shift range is increased by one gear each time the lever is tipped until the shift range ends up in "D".
- **Tipping the selector lever toward "+" and holding it in this position:** The shift range is extended immediately to "D", shift ranges are indicated in ascending sequence; possibly, the transmission upshifts to a faster gear due to the extension of the shift range.

REMOVAL

SHIFTER - FLOOR MOUNT

9. Install the wiring harness connectors (2) to the shifter assembly.
10. Verify that the shift lever is in the PARK position and the transmission park sprag is set by rocking the vehicle.
11. Tighten the adjustment screw to 7 N.m (65 in.lbs.).
12. Verify correct shifter, park lock, and BTSI operation.
13. Install any console parts removed for access to shift lever assembly and shift cables. Refer to **CONSOLE, FLOOR, INSTALLATION** .

SHIFTER - COLUMN MOUNT

The column mounted shifter is serviced with the steering column. Refer to **COLUMN, INSTALLATION** .

SOLENOID, TRANSMISSION

DESCRIPTION

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion. The shift valves (solenoids) are On-Off solenoids and are powered up by the TCM with a 12-volt power source and are internally grounded in the transmission. The Torque Converter Clutch (TCC) and Pressure Control (PC) solenoids are also powered up by the TCM and internally grounded in the transmission but are pulse with modulated (PWM). PWM measurable voltage varies depending on percentage of modulation requested by the TCM.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed** . The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

1. Increase the amount of current applied to the coil or
2. Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

UPSHIFT/DOWNSHIFT SOLENOID VALVES

The shift pressure control solenoid valve (1) is located in the shell of the electric valve control unit and pressed against the shift plate by a spring. Refer to **Fig. 235**.

Its purpose is to control the shift pressure depending on the continuously changing operating conditions, such as load and gear change.

The shift pressure regulating solenoid valve (1) has an interference fit and is sealed off to the valve body of the shift plate (4) by a seal (arrow). The contact springs (2) at the solenoid valve engage in a

slot in the conductor tracks (3). The force of the contact springs (2) ensures secure contacts.

OPERATION

OPERATION

NOTE: A scan tool can only display a estimated pressure based on the current fed to the solenoid. Therefore if there's a stuck Line Pressure Regulating valve and the transmission has insufficient pressure, the scan tool will still display estimated MOD and Shift pressures because the solenoids are being fed the correct amount of current.

The solenoids are fed a 12-volt source from the TCM (Transmission Control Module). When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

UPSHIFT/DOWNSHIFT SOLENOID VALVES

6 - O-RING
7 - CONDUCTOR TRACK
8 - CONTACT SPRING

If a solenoid valve (1) is actuated by the TCM, it opens and guides the control pressure (p-SV) to the assigned command valve. Refer to **Fig. 236**. The solenoid valve remains actuated and therefore open until the shifting process is complete. The shift pressure (p-SV) to the command valve is reduced to zero as soon as the power supply to the solenoid valve is interrupted.

MODULATING PRESSURE CONTROL SOLENOID VALVE

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - TURBINE DAMPER

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. Refer to **Fig. 240**. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil (fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

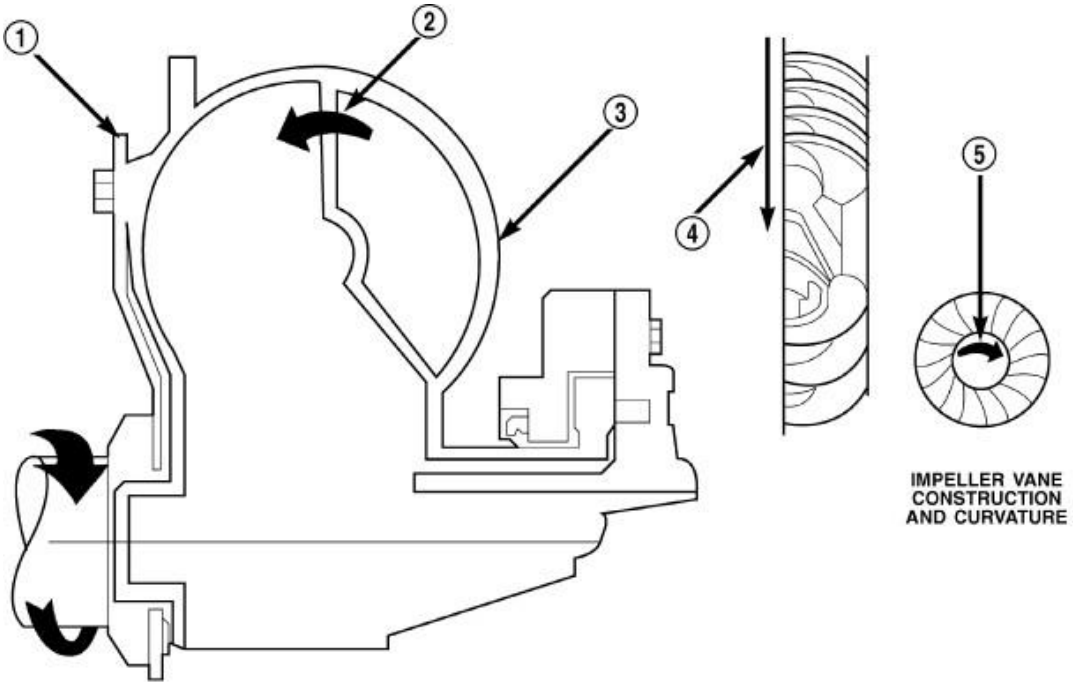

Fig. 241: Identifying Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller (3) is an integral part of the converter housing. Refer to **Fig. 241**. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

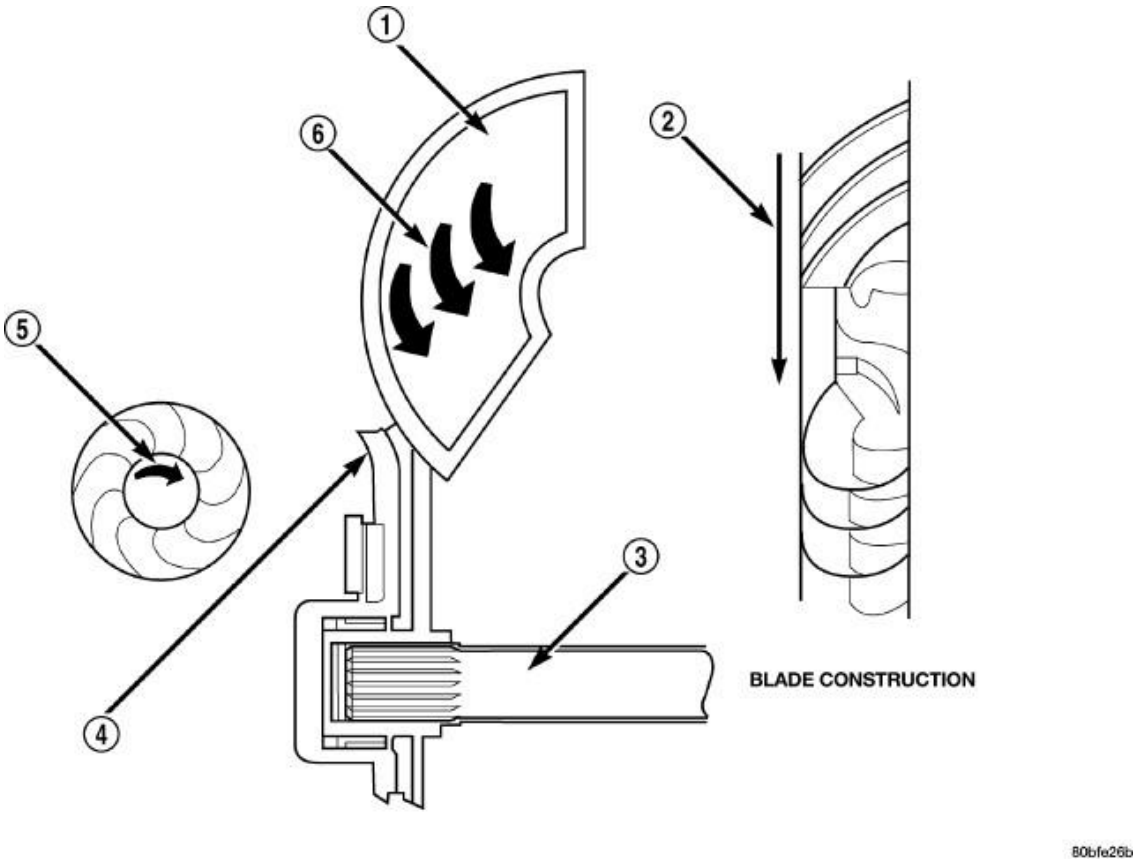

Fig. 242: Identifying Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. Refer to **Fig. 242**. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

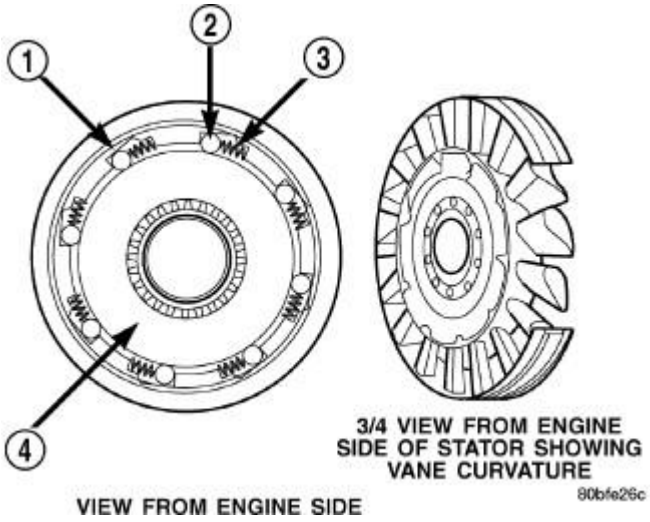

Fig. 243: Identifying Over-Running Clutch
Courtesy of CHRYSLER GROUP, LLC

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator assembly (1-4) is mounted on a stationary shaft which is an integral part of the oil pump. Refer to **Fig. 243**.

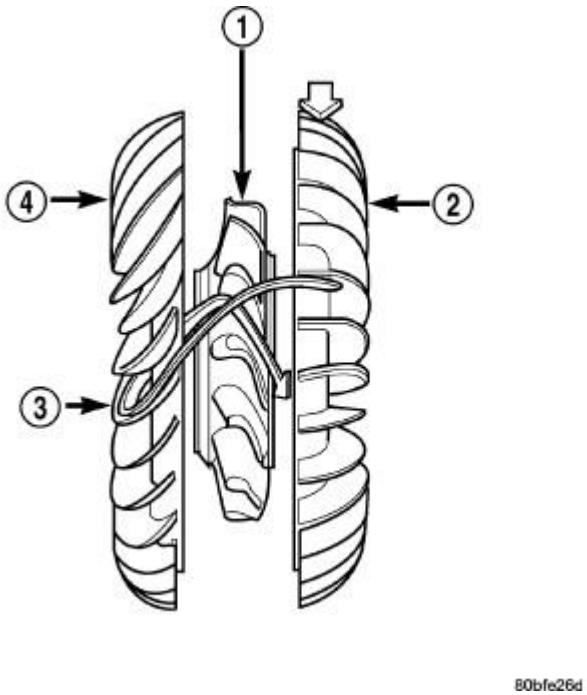

Fig. 244: Identifying Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case. Refer to **Fig. 244**. The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

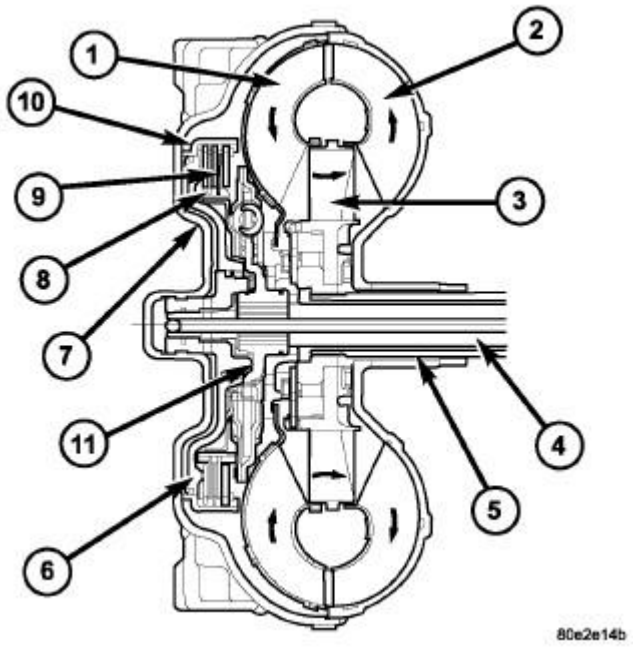

Fig. 245: Identifying Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER
9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER

11 - TURBINE DAMPER

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Refer to **Fig. 245**. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

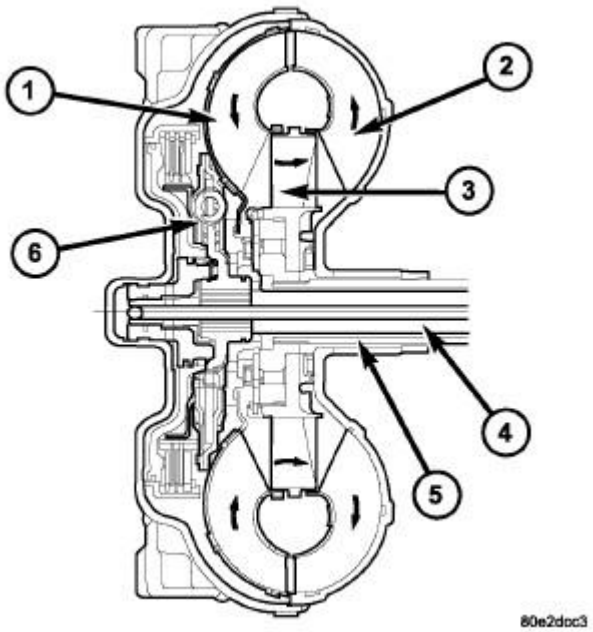

Fig. 246: Torque Converter

Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - TURBINE DAMPER

The converter impeller (driving member) (2), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. Refer to **Fig. 246**. The converter turbine (driven member) (1), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft (4).

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

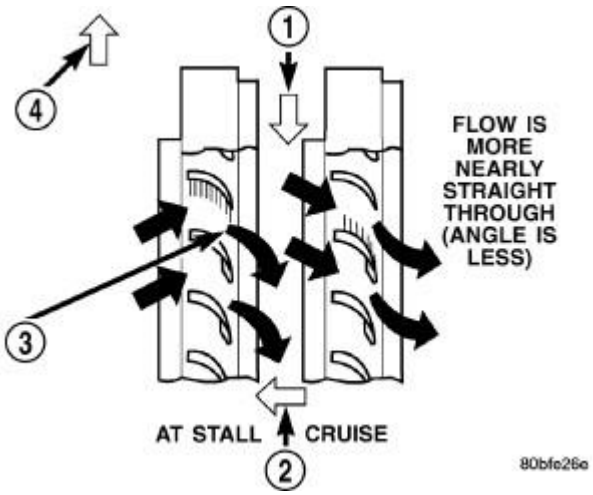

Fig. 247: Identifying Stator Operation
Courtesy of CHRYSLER GROUP, LLC

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES

4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. Refer to **Fig. 247**. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

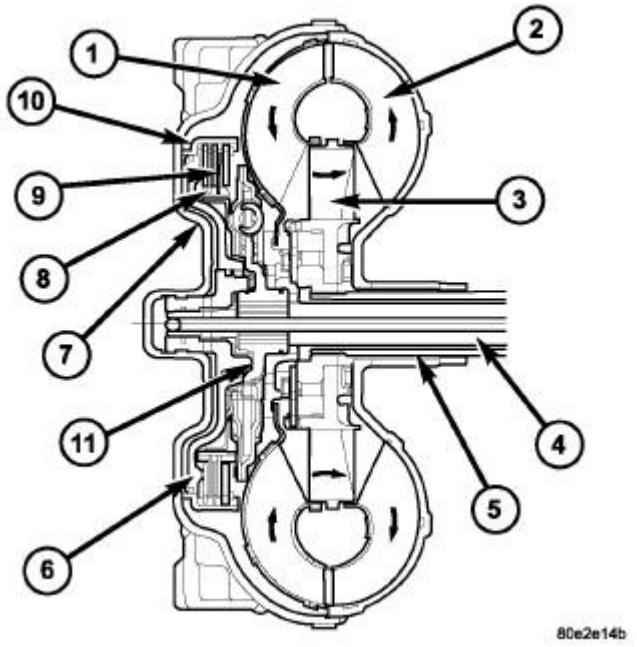

Fig. 248: Identifying Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER

9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

In a standard torque converter, the impeller (2) and turbine (1) are rotating at about the same speed and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material (9), a total converter engagement can be obtained. Refer to **Fig. 248**. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the torque converter solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

NO EMCC

Under No EMCC conditions, the TCC Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the TCC Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the TCC Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine RPM.

GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the TCC Solenoid duty cycle.

REMOVAL

REMOVAL

1. Remove transmission and torque converter from vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

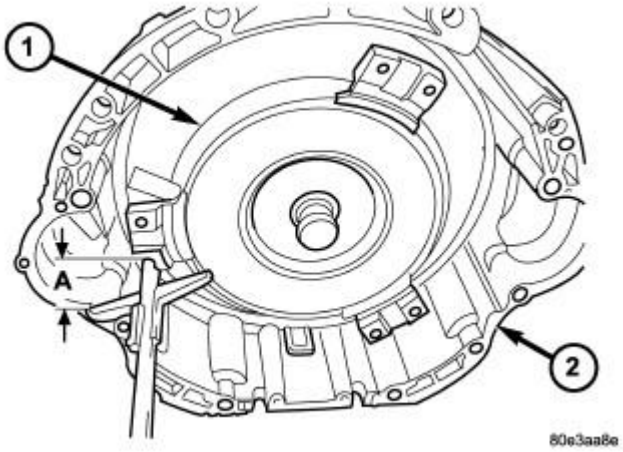

Fig. 249: Measuring Torque Converter Installation Depth
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER
2 - TRANSMISSION HOUSING

Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale and straightedge. Refer to **Fig. 249**. Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.

UNIT, ELECTROHYDRAULIC CONTROL

DESCRIPTION

DESCRIPTION

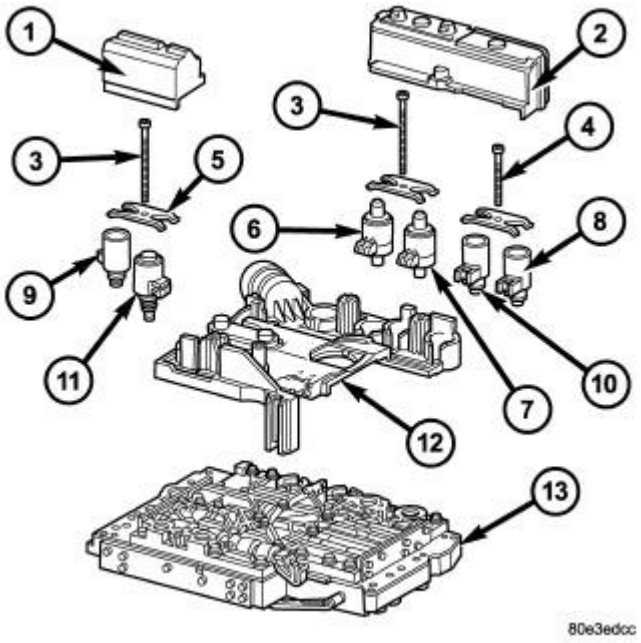

Fig. 250: Electrical Unit Components

9 - TORQUE CONVERTER LOCK-UP SOLENOID
10 - 1-2/4-5 SHIFT SOLENOID
11 - 2-3 SHIFT SOLENOID
12 - ELECTRICAL CONTROL UNIT
13 - SHIFT PLATE

The electrohydraulic control unit comprises the shift plate (13) made from light alloy for the hydraulic control and an electrical control unit (12). Refer to **Fig. 250**. The electrical control unit (12) comprises of a supporting body made of plastic, into which the electrical components (1 - 11) are assembled. The supporting body is mounted on the shift plate (13) and screwed to it.

Strip conductors inserted into the supporting body make the connection between the electrical components and a plug connector. The connection to the wiring harness on the vehicle and the transmission control module (TCM) is produced via this 13-pin plug connector with a bayonet lock.

ELECTRICAL CONTROL UNIT

9 - STARTER INTERLOCK CONTACT
10 - 2-3 SHIFT SOLENOID
11 - TORQUE CONVERTER LOCK-UP SOLENOID
12 - N2 SPEED SENSOR

The electric valve control unit (7) consists of a plastic shell which houses the RPM sensors (1, 12), regulating solenoid valves (3, 4), solenoid valves (5, 6, 10), the TCC solenoid valve (11), the park/neutral contact (9), and the transmission oil temperature sensor (8). Refer to **Fig. 251**. Conductor tracks integrated into the shell connect the electric components to a plug connection (2). This 13-pin plug connection (2) establishes the connection to the vehicle-side cable harness and to the transmission control module (TCM). With the exception of the solenoid valves, all other electric components are fixed to the conductor tracks.

HYDRAULIC CONTROL UNIT

WORKING PRESSURE (LINE PRESSURE OR OPERATING PRESSURE) (P-A)

The working pressure provides the pressure supply to the hydraulic control and the transmission shift elements. It is the highest hydraulic pressure in the entire hydraulic system. The working pressure is regulated at the working pressure regulating valve in relation to the load and gear. All other pressures required for the transmission control are derived from the working pressure.

LUBRICATION PRESSURE (P-SM)

At the working pressure regulating valve surplus oil is diverted to the lubrication pressure regulating valve, from where it is used in regulated amounts to lubricate and cool the mechanical transmission components and the torque converter. Furthermore, the lubrication pressure (p-Sm) is also used to limit the pressure in the torque converter.

SHIFT PRESSURE (P-S)

The shift pressure is determined by the shift pressure regulating solenoid valve and the shift pressure regulating valve. The shift pressure:

- Regulates the pressure in the activating shift element during the shift phase.
- Determines together with the modulating pressure the pressure reduction at the deactivating shift element as regulated by the overlap regulating valve.
- Initializes 2nd gear in limp-home mode.

MODULATING PRESSURE (P-MOD)

The modulating pressure influences the size of the working pressure and determines together with

the shift pressure the pressure regulated at the overlap regulating valve. The modulating pressure is regulated at the modulating pressure regulating solenoid valve, which is under regulating valve pressure. The modulating pressure is variable and relative to the engine load.

REGULATING VALVE/CONTROL VALVE PRESSURE (P-RV)

The regulating valve pressure is regulated at the regulating valve pressure regulating valve in relation to the working pressure (p-A) up to a maximum pressure of 8 bar (116 psi). It supplies the modulating pressure regulating solenoid valve, the shift pressure regulating solenoid valve and the shift valve pressure regulating valve.

SHIFT VALVE PRESSURE (P-SV)

The shift valve pressure (p-SV) is derived from the regulating valve pressure (p-RV), is regulated at the shift valve pressure regulating valve and is then present at the:

- 1-2 and 4-5 shift solenoid valve.
- 3-4 shift solenoid valve.
- 2-3 shift solenoid valve.
- Torque converter lockup solenoid valve.
- 3-4 and 2-3 shift pressure shift valve.

The shift valve pressure (p-SV) controls the command valves via the upshift/downshift solenoid valves.

OVERLAP PRESSURE (P- U)

The overlap pressure controls the shift component pressure reduction during a shift phase. The pressure in a shift element as it disengages is controlled during the shift phase depending on engine load (modulating pressure) and the pressure in the shift element as it engages. The adjusted pressure is inversely proportional to the transmission capability of the shift element being engaged (controlled overlap).

WORKING PRESSURE REGULATING VALVE (OPERATING PRESSURE)

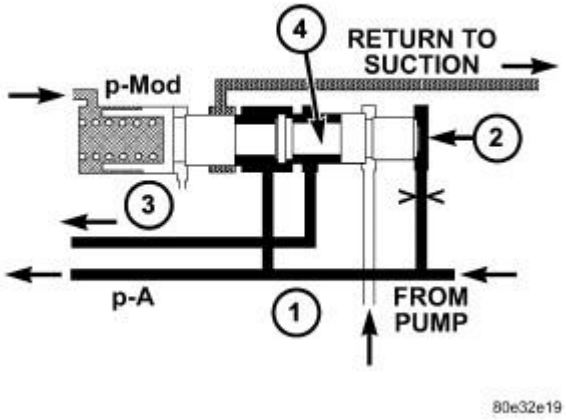

Fig. 252: Working Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE FROM K1/K2
2 - END FACE
3 - TO TORQUE CONVERTER REGULATING VALVE
4 - WORKING PRESSURE REGULATING VALVE

The working pressure regulating valve (4) is located in the valve housing of the shift plate. Refer to **Fig. 252**. It regulates the primary pressure of the hydraulic system.

TORQUE CONVERTER LOCKUP CLUTCH REGULATING VALVE

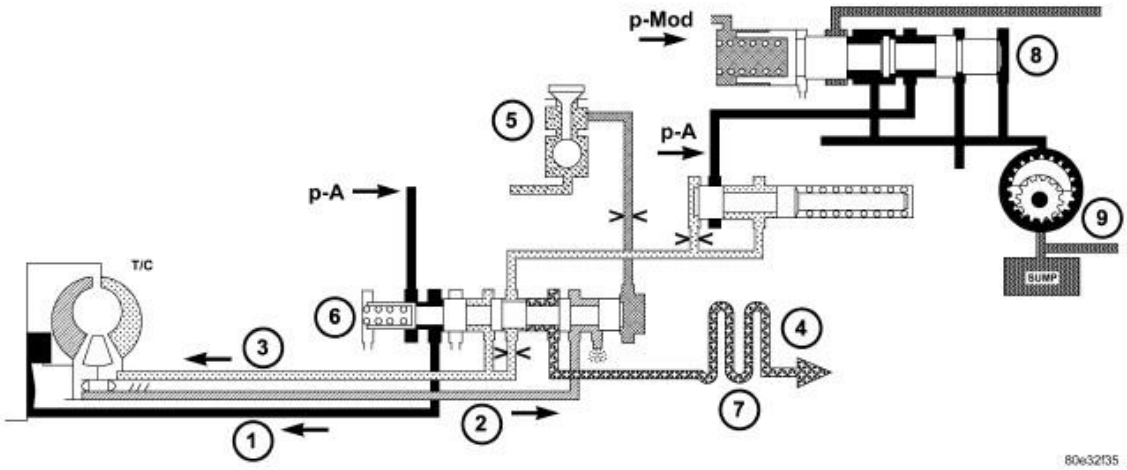

Fig. 253: Torque Converter Lockup Clutch Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER LOCK-UP CLUTCH
2 - TORQUE CONVERTER OUTPUT
3 - TORQUE CONVERTER INPUT
4 - LUBRICATION
5 - TORQUE CONVERTER LOCK-UP SOLENOID
6 - TORQUE CONVERTER LOCK-UP CLUTCH REGULATING VALVE
7 - OIL COOLER
8 - LINE PRESSURE REGULATING VALVE
9 - OIL PUMP

The torque converter lock-up clutch regulating valve (6) is located in the valve housing of the electrohydraulic control module. Refer to **Fig. 253**. The valve is responsible for the hydraulic control of the torque converter lockup clutch and distribution of the lubricating oil.

OVERLAP REGULATING VALVE

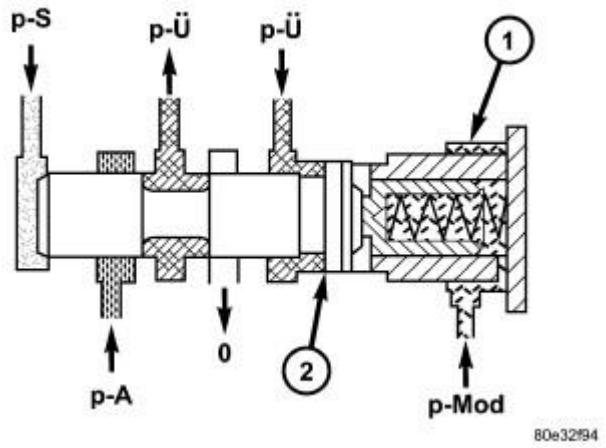

Fig. 254: Cutaway View Of Overlap Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - OVERLAP REGULATING VALVE
2 - ANNULAR SURFACE ON OVERLAP REGULATING VALVE

Each shift group is assigned one overlap regulating valve (1). Refer to **Fig. 254**. The 1-2 / 4-5 overlap regulating valve is installed in the shift valve housing; the 2-3 and 3-4 overlap regulating valves are installed in the valve housing. The overlap regulating valve regulates the pressure reduction during a shift phase.

COMMAND VALVE

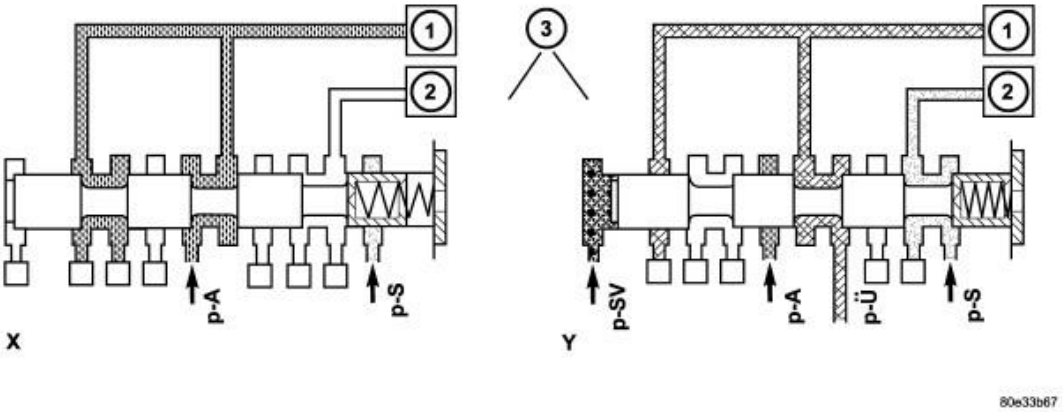

Fig. 255: Cutaway View Of Command Valve
Courtesy of CHRYSLER GROUP, LLC

1 - HOLDING CLUTCH B1
2 - DRIVING CLUTCH K1
3 - 1-2/4-5 COMMAND VALVE

Each shift group possesses one command valve (3). Refer to **Fig. 255**. The 1-2 / 4-5 and 2-3 command valves are installed in the shift valve housing, the 3-4 command valve is installed in the valve housing. The command valve switches the shift group from the stationary phase to the shift phase and back again.

HOLDING PRESSURE SHIFT VALVE

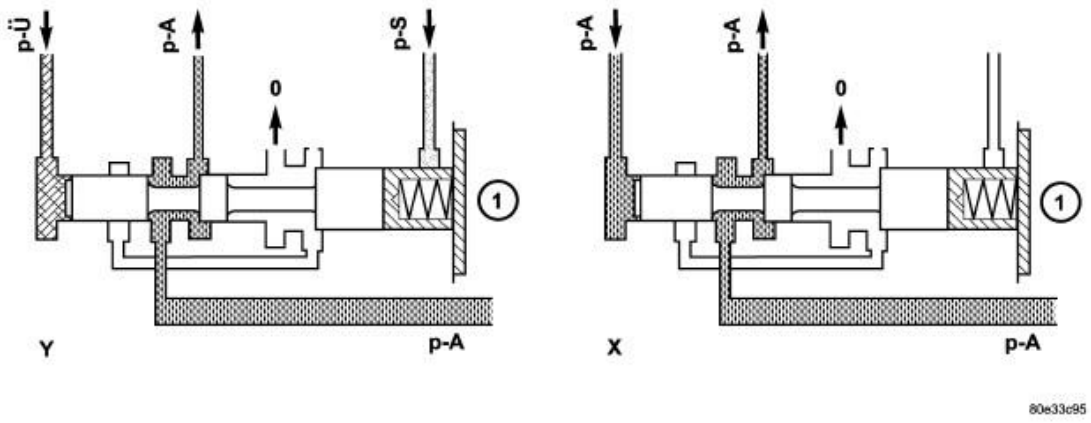

Fig. 256: Identifying Shift Valve Holding Pressure
Courtesy of CHRYSLER GROUP, LLC

1 - HOLDING PRESSURE SHIFT VALVE

Each shift group possesses one holding pressure shift valve (1). Refer to **Fig. 256**. The 1-2 / 4-5 and 2-3 holding pressure shift valves are installed in the shift valve housing; the 3-4 holding pressure shift valve is installed in the valve housing. The holding pressure shift valve allocates the working pressure to one actuator of a shift group.

SHIFT PRESSURE SHIFT VALVE

1 - 1-2/4-5 COMMAND VALVE
2 - DRIVING CLUTCH K1
3 - HOLDING CLUTCH B1
4 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE

Each shift group possesses one shift pressure shift valve (4). Refer to **Fig. 257**. The 1-2 / 4-5 and 2-3 shift pressure shift valves are installed in the shift valve housing; the 3-4 shift pressure shift valve is installed in the valve housing. It assigns the shift pressure (p-S) to the activating actuator and the overlap pressure (p- U) regulated by the overlap regulating valve to the deactivating actuator.

LUBRICATION PRESSURE REGULATING VALVE

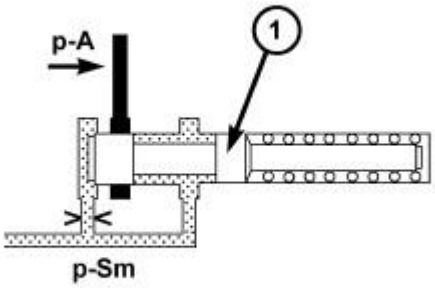

Fig. 258: Lubrication Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - LUBRICATION PRESSURE REGULATING VALVE

The lubrication pressure regulating valve (1) is located in the valve housing of the electrohydraulic control module. Refer to **Fig. 258**. The valve controls the fluid to lubricate and cool the mechanical part of the transmission, and limits the pressure in the torque converter.

SHIFT PRESSURE REGULATING VALVE

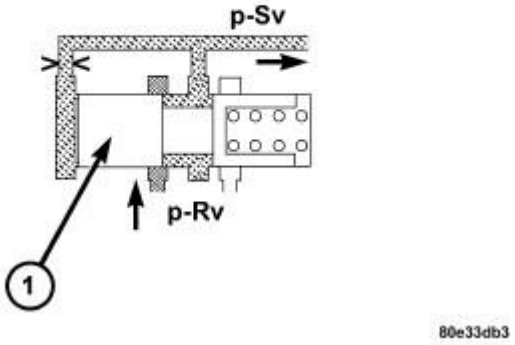

Fig. 259: Shift Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT PRESSURE REGULATING VALVE

The shift pressure regulating valve (1) is located in the valve housing of the shift plate. Refer to **Fig. 259**. It regulates the shift pressure (p-S).

REGULATING VALVE PRESSURE REGULATING VALVE

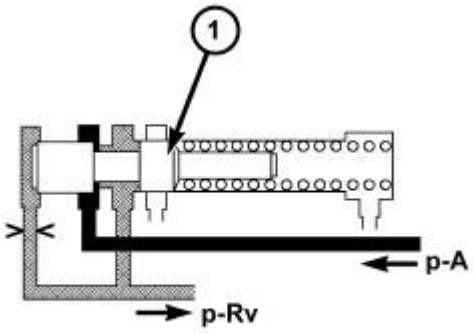

Fig. 260: Regulating Valve Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - REGULATING VALVE PRESSURE REGULATING VALVE

The regulating valve pressure regulating valve (1) is located in the valve housing of the electrohydraulic control module. Refer to **Fig. 260**. It regulates the regulating valve/control valve pressure (p-RV).

SHIFT VALVE PRESSURE REGULATING VALVE

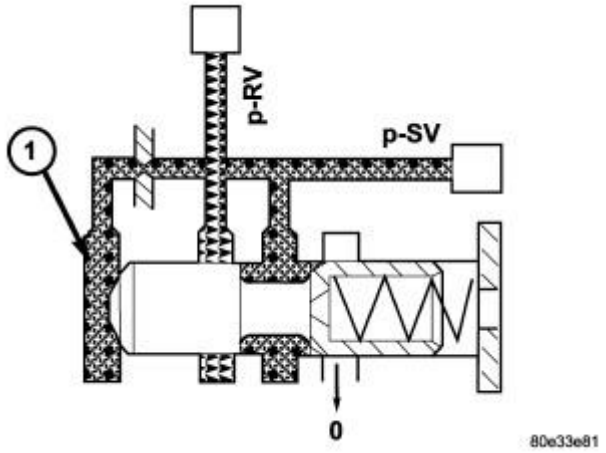

Fig. 261: Shift Valve Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT VALVE PRESSURE REGULATING VALVE

The shift valve pressure regulating valve (1) is located in the valve housing of the electrohydraulic control module. Refer to **Fig. 261**. It regulates the shift valve pressure (p-SV).

OPERATION

OPERATION

ELECTRICAL CONTROL UNIT

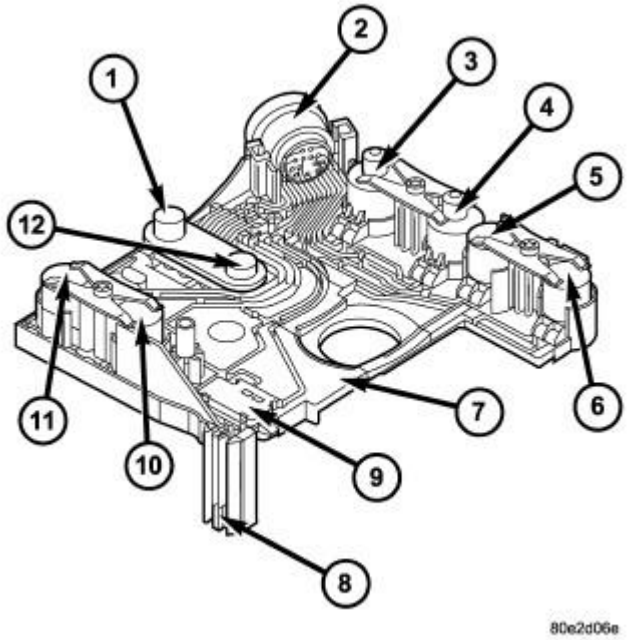

Fig. 262: Identifying Electrical Control Unit Components

8 - TRANSMISSION TEMPERATURE SENSOR
9 - STARTER INTERLOCK CONTACT
10 - 2-3 SHIFT SOLENOID
11 - TORQUE CONVERTER LOCK-UP SOLENOID
12 - N2 SPEED SENSOR

Signals from the transmission control module (TCM) are converted into hydraulic functions in the electric valve control unit (7). Refer to **Fig. 262**. The RPM sensors (1, 12), starter interlock contact (9), and transmission oil temperature sensor (8) of the electric valve control unit (7) supply the TCM with input signals. The solenoid valves are controlled by the TCM and trigger the hydraulic functions.

HYDRAULIC CONTROL UNIT

WORKING PRESSURE REGULATING VALVE (LINE PRESSURE OR OPERATING PRESSURE)

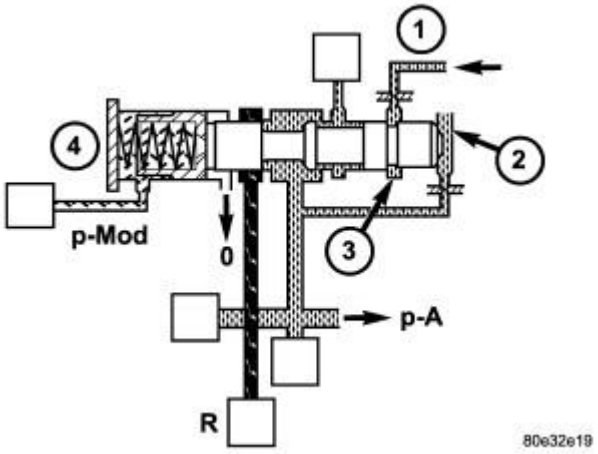

Fig. 263: Working Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE FROM K1/K2
2 - END FACE
3 - ANNULAR SURFACE
4 - WORKING PRESSURE REGULATING VALVE

The working pressure (p-A) is regulated at the working pressure regulating valve (4) in relation to load (modulating pressure, p-Mod) and gear (K1 or K2 pressure) (1). Refer to **Fig. 263**. The spring in the working pressure regulating valve sets a minimum pressure level (basic pressure).

TORQUE CONVERTER LOCKUP CLUTCH REGULATING VALVE

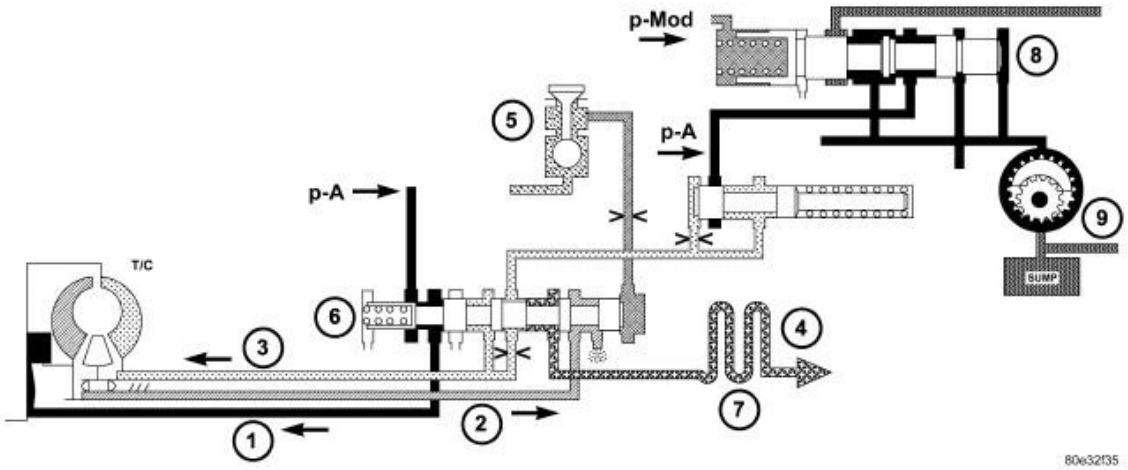

Fig. 264: Torque Converter Lockup Clutch Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - TORQUE CONVERTER LOCK-UP CLUTCH
2 - TORQUE CONVERTER OUTPUT
3 - TORQUE CONVERTER INPUT
4 - LUBRICATION
5 - TORQUE CONVERTER LOCK-UP SOLENOID
6 - TORQUE CONVERTER LOCK-UP CLUTCH REGULATING VALVE
7 - OIL COOLER
8 - LINE PRESSURE REGULATING VALVE
9 - OIL PUMP

The torque converter lockup clutch regulating valve (6) regulates the torque converter lock-up clutch working pressure (p-TCC) in relation to the torque converter clutch control pressure (p-S/TCC). Refer to **Fig. 264**. According to the size of the working pressure (p-A), the torque converter lockup clutch is either Engaged, Disengaged, or Slipping. When the regulating valve (6) is in the lower position, lubricating oil flows through the torque converter and oil cooler (7) into the transmission (torque converter lockup clutch unpressurized). In its regulating position (slipping, torque converter lockup clutch pressurized), a reduced volume of lubricating oil flows through the annular passage bypassing the torque converter and passing direct through the oil cooler into the transmission. The rest of the lubricating oil is directed via the throttle "a" into the torque converter in order to cool the torque converter lockup clutch.

OVERLAP REGULATING VALVE

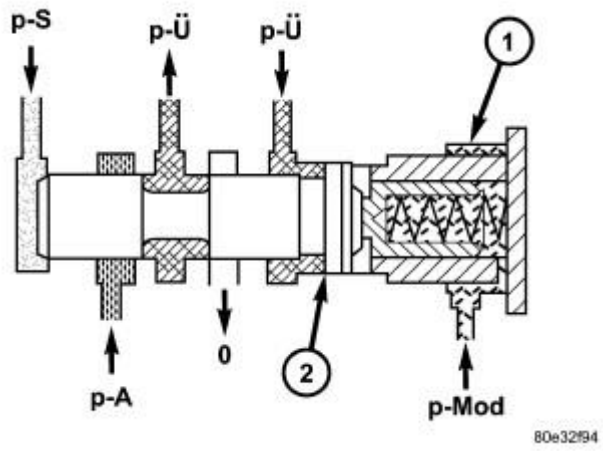

Fig. 265: Cutaway View Of Overlap Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - OVERLAP REGULATING VALVE
2 - ANNULAR SURFACE ON OVERLAP REGULATING VALVE

During the shift phase the pressure in the deactivating shift actuator is regulated in relation to the engine load (modulating pressure, p-Mod) and the pressure in the activating actuator. Refer to **Fig. 265**. The regulated pressure is inversely proportional to the transfer capacity of the activating shift actuator (regulated overlap).

COMMAND VALVE

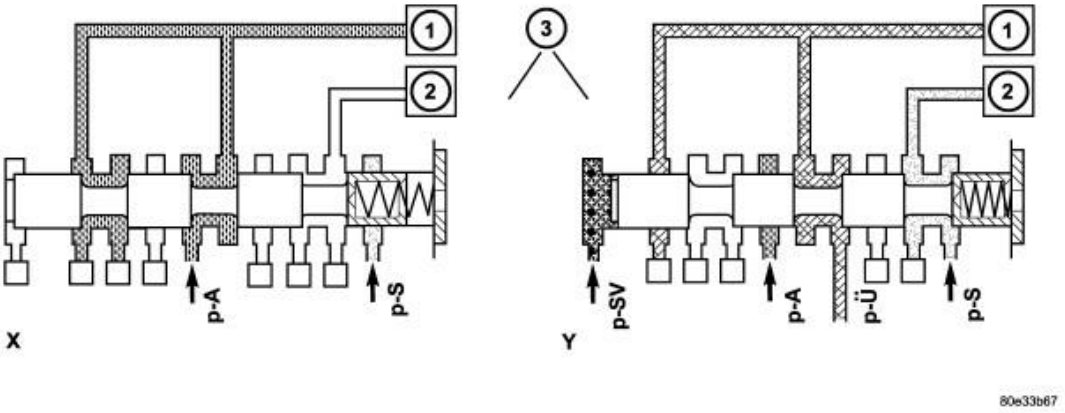

Fig. 266: Cutaway View Of Command Valve
Courtesy of CHRYSLER GROUP, LLC

1 - HOLDING CLUTCH B1

2 - DRIVING CLUTCH K1
3 - 1-2/4-5 COMMAND VALVE

When the end face is unpressurized (stationary phase), the working pressure (p-A) is directed to the actuated shift element. If the end face of the command valve is subjected to the shift valve pressure (p-SV) (shift phase), then the shift pressure (p-S) is switched to the activating element and the overlap pressure (p- U) is switched to the deactivating element. Refer to **Fig. 266**.

SHIFT VALVE HOLDING PRESSURE

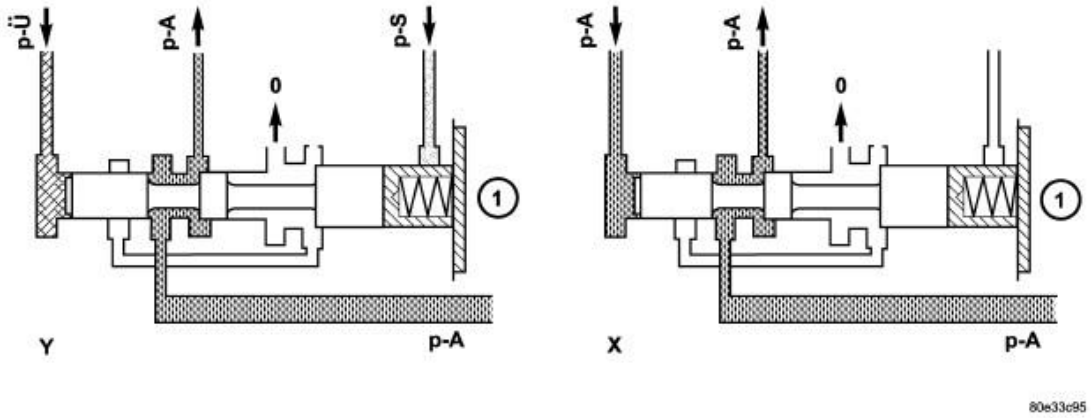

Fig. 267: Identifying Shift Valve Holding Pressure
Courtesy of CHRYSLER GROUP, LLC

1 - HOLDING PRESSURE SHIFT VALVE

The holding pressure shift valve (1) is actuated by the pressures present at the end face in the actuators and a spring. Refer to **Fig. 267**. It assigns the working pressure (p-A) to the actuator with the higher pressure (taking into account the spring force and the effective surface area). The other element of the shift group is then unpressurized. The valve switches over only during the shift phase and only at a certain pressure ratio between the overlap pressure (p- U) and the shift pressure (p-S).

SHIFT PRESSURE SHIFT VALVE

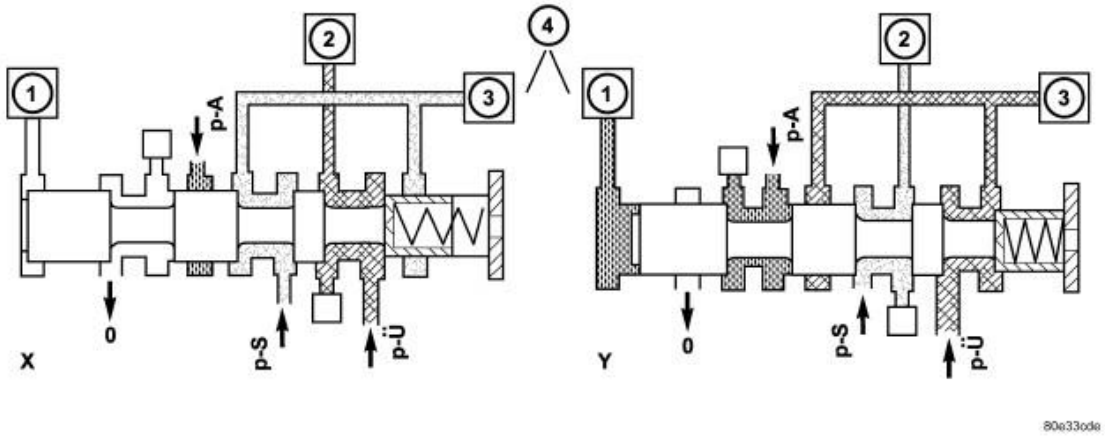

Fig. 268: Identifying Shift Pressure Shift Valve Components
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2/4-5 COMMAND VALVE
2 - DRIVING CLUTCH K1
3 - HOLDING CLUTCH B1
4 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE

When the multiple-disc brake B1 (3) is activated, the working pressure (p-A) is applied to the end face of the 1-2 / 4-5 shift pressure shift valve (4) via the command valve (1). Refer to **Fig. 268**. Its shift state is maintained during the shift phase by substituting the shift element pressure acting on its end face (and which is variable during the shift phase) with a corresponding constant pressure. When the multi-plate clutch K1 (2) is activated, the end face of the shift valve is unpressurized during the stationary and shift phases, so the shift state is maintained during the shift phase in this case too.

LUBRICATION PRESSURE REGULATING VALVE

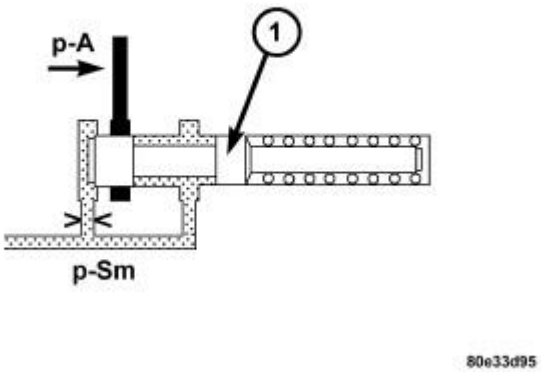

Fig. 269: Lubrication Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - LUBRICATION PRESSURE REGULATING VALVE

At the working pressure regulating valve surplus oil is diverted to the lubrication pressure regulating valve (1), from where the lubrication pressure (p-Sm) is used in regulated amounts to supply the transmission lubrication system including the torque converter. Refer to **Fig. 269**.

SHIFT PRESSURE REGULATING VALVE

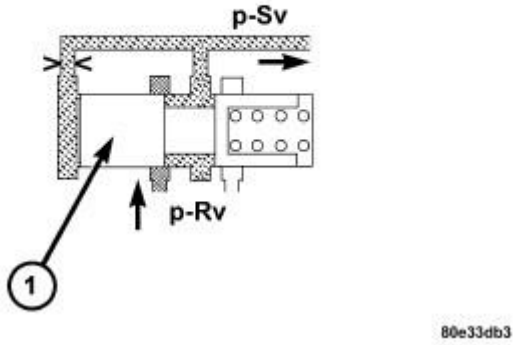

Fig. 270: Shift Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT PRESSURE REGULATING VALVE

The shift pressure is determined by the shift pressure regulating solenoid valve and the shift pressure regulating valve (1). Refer to **Fig. 270**. In addition, pressure from the clutch K2 is also present at the annular surface of the shift pressure regulating valve. This reduces the shift pressure in 2nd gear.

REGULATING VALVE PRESSURE REGULATING VALVE

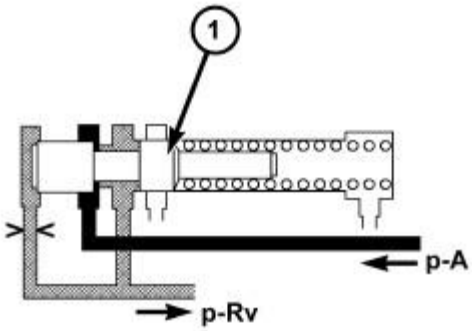

Fig. 271: Regulating Valve Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - REGULATING VALVE PRESSURE REGULATING VALVE

The regulating valve pressure (p-RV) is set at the regulating valve pressure regulating valve (1) in relation to the working pressure (p-A) as far as the maximum pressure. Refer to **Fig. 271**.

SHIFT VALVE PRESSURE REGULATING VALVE

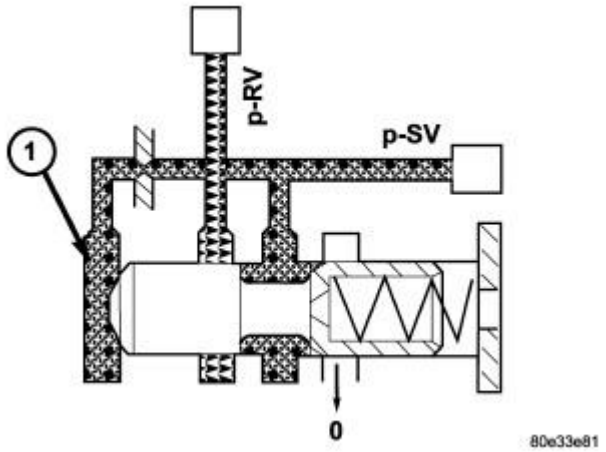

Fig. 272: Shift Valve Pressure Regulating Valve
Courtesy of CHRYSLER GROUP, LLC

1 - SHIFT VALVE PRESSURE REGULATING VALVE

The non-constant regulating valve pressure (p-RV) is regulated to a constant shift valve pressure (p-SV) at the shift valve pressure regulating valve (1) and is used to supply the 1-2 and 4-5 / 3-4 / 2-3 solenoid valves and the torque converter lockup clutch PWM solenoid valve. Refer to **Fig. 272**.

REMOVAL

REMOVAL

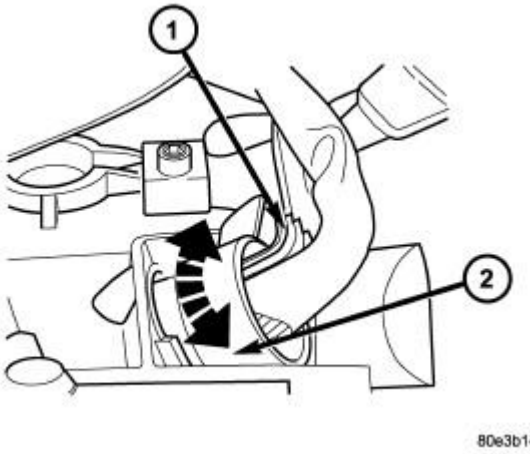

Fig. 273: Removing/Installing Wiring Connector Plug
Courtesy of CHRYSLER GROUP, LLC

1 - PLUG CONNECTOR
2 - ADAPTER PLUG

1. Move selector lever to position "P".
2. Raise vehicle.
3. Disconnect 13-pin plug connector (1). Refer to **Fig. 273**. Turn bayonet lock of the adapter plug (2) anti-clockwise.

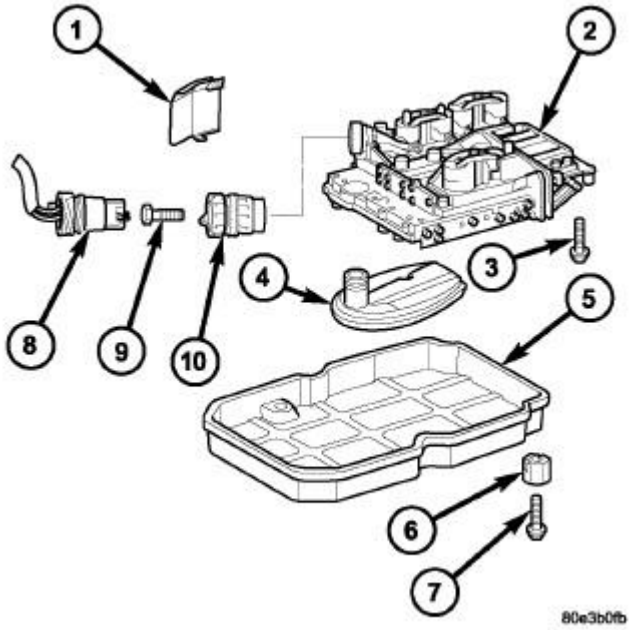

Fig. 274: Removing/Installing Electrohydraulic Unit
Courtesy of CHRYSLER GROUP, LLC

2 - ELECTROHYDRAULIC UNIT
3 - BOLT
4 - OIL FILTER
5 - OIL PAN
6 - CLAMPING ELEMENT
7 - BOLT
8 - 13-PIN PLUG CONNECTOR
9 - BOLT
10 - ADAPTER PLUG

4. Loosen the adapter plug bolt (9) and remove from the adapter plug (10) from the transmission housing. Refer to **Fig. 274**.
5. Detach oil pan (5).
6. Remove oil filter (4).
7. Unscrew Torx® socket bolts (3) and remove electrohydraulic control module (2).

DISASSEMBLY

DISASSEMBLY

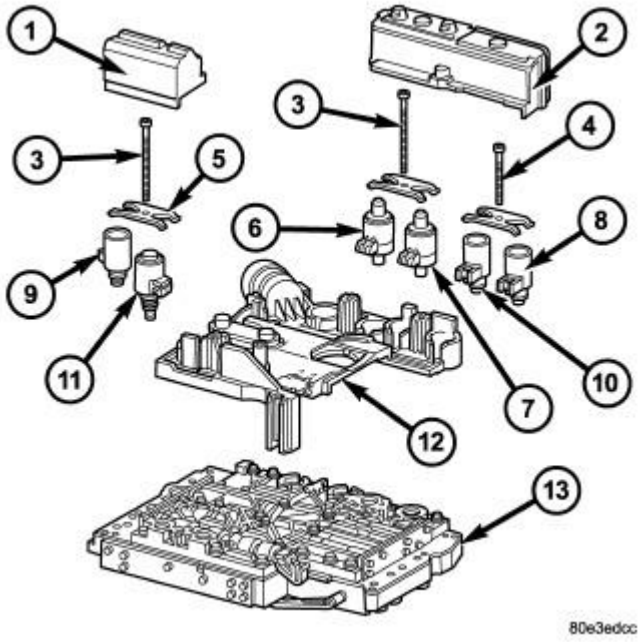

Fig. 275: Electrical Unit Components
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID CAP (if equipped)

2 - SOLENOID CAP (if equipped)
3 - BOLT - M6X32
4 - BOLT - M6X30
5 - LEAF SPRING
6 - MODULATING PRESSURE REGULATING SOLENOID VALVE
7 - SHIFT PRESSURE REGULATING SOLENOID
8 - 3-4 SHIFT SOLENOID
9 - TORQUE CONVERTER LOCK-UP SOLENOID
10 - 1-2/4-5 SHIFT SOLENOID
11 - 2-3 SHIFT SOLENOID
12 - ELECTRICAL CONTROL UNIT
13 - SHIFT PLATE

1. Remove electrohydraulic unit from the vehicle. Refer to **UNIT, ELECTROHYDRAULIC CONTROL, REMOVAL**.
2. Remove solenoid caps (1, 2) if equipped.
3. Unscrew Torx® socket bolts (3, 4).

NOTE: Pay attention to the different lengths of the Torx® socket bolts.

4. Remove leaf springs (5).
5. Withdraw solenoid valves (6 - 11) from shift plate (13).

NOTE: Check O-rings on solenoid valves for damage and replace if necessary.

6. Bend away retaining lug on stiffening rib on transmission oil temperature sensor.
7. Remove electrohydraulic control module (12) from the shift plate (13).

30. Remove the Line Pressure Regulating Valve assembly (1), Lubricating Pressure Regulating Valve assembly (2) and the 2-3 Overlap Regulating Valve, Sleeve and Piston assembly (3) from the valve body.
31. Check all valves for ease of movement and shavings.

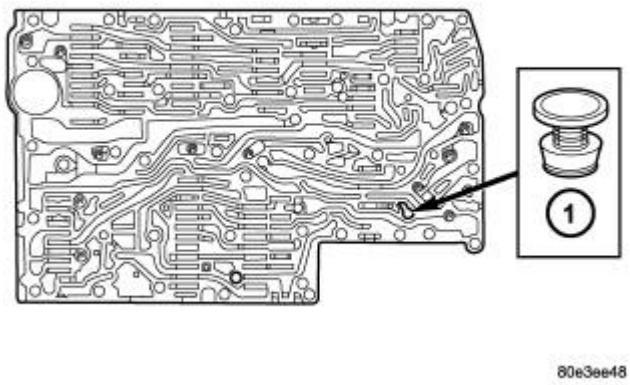

Fig. 286: Pressure Feed Valve Location
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE FEED VALVE

32. Remove the pressure supply valve (1) from the valve body.

CLEANING

CLEANING

NOTE: Fine and extremely fine metallic particles have been known affect valve operation in this transmission. While these particles may be to small to see with the naked eye, they can cause flares, or momentary going into neutral, on shifts.

Clean and flush the valve housings, valves, plugs, springs, and separator plates thoroughly with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

INSPECTION

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only

very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced. If crocus cloth is used be certain to flush valve body thoroughly.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

ASSEMBLY

ASSEMBLY

CAUTION: Make certain all valves and springs are assembled correctly. Failure to follow this caution may result in transmission failure.

NAG1 VALVE BODY SPRING DIMENSION		
VALVE	**SPRING FREE LENGTH**	**TOTAL COILS**
2-3 Holding	18.8 -19.6 mm (0.74 - 0.77 in.)	12
T/C Clutch Damper	37.5 - 38.5 mm (1.48 - 1.51 in.)	19.5
1-2 / 4-5 Overlap	20.95 - 21.65 mm (0.82 - 0.85 In.)	14.5
Shift Pressure Regulator	22.4 - 23.6 mm (0.88 - 0.93 in.)	14.5
Control Valve Pressure Regulator	79.2 - 82.4 mm (3.12 - 3.24 in.)	29
Shift Solenoid Pressure Regulating Valve	32.6 - 34.4 mm (1.28 - 1.35 in.)	15.5

T/C Clutch (LU) Regulator	22.8 - 23.6 mm (0.90 - 0.93 in.)	18.5
B2 Shift Valve	25.8 - 27.0 mm (1.01 - 1.06 in.)	16.5
3/4 Over Lap	21.0 - 20.4 mm (0.83 - 0.80 in.)	13
3-4 Holding, 1-2 / 4-5 Holding, 1-2 / 4-5 Shift Pressure	21.1 - 22.5 mm (0.83 - 0.88 in.)	14
3-4 Command, 3-4 Shift Pressure, 1-2 / 4-5 Command, 2-3 Shift Pressure, 2-3 Command	23.9 - 25.3 mm (0.94 - 1.00 in.)	11.5
Lubricating Pressure Regulating Valve	64.8 - 68.2 mm (2.55 - 2.68 in.)	24
2-3 Overlap	16.9 - 18.7 mm (0.66 - 0.74 in.)	13
Line Pressure Regulator	43.8 - 46.2 mm (1.72 - 1.82 in.)	13.5

NOTE: Pay great attention to cleanliness for all work on the shift plate. Fluffy cloths must not be used. Leather cloths are particularly good. After dismantling, all parts must be washed and blown out with compressed-air, noting that parts may be blown away.

Shift Solenoid Pressure Regulating Valve (4)	32.6 - 34.4 mm (1.28 - 1.35 in.)	15.5

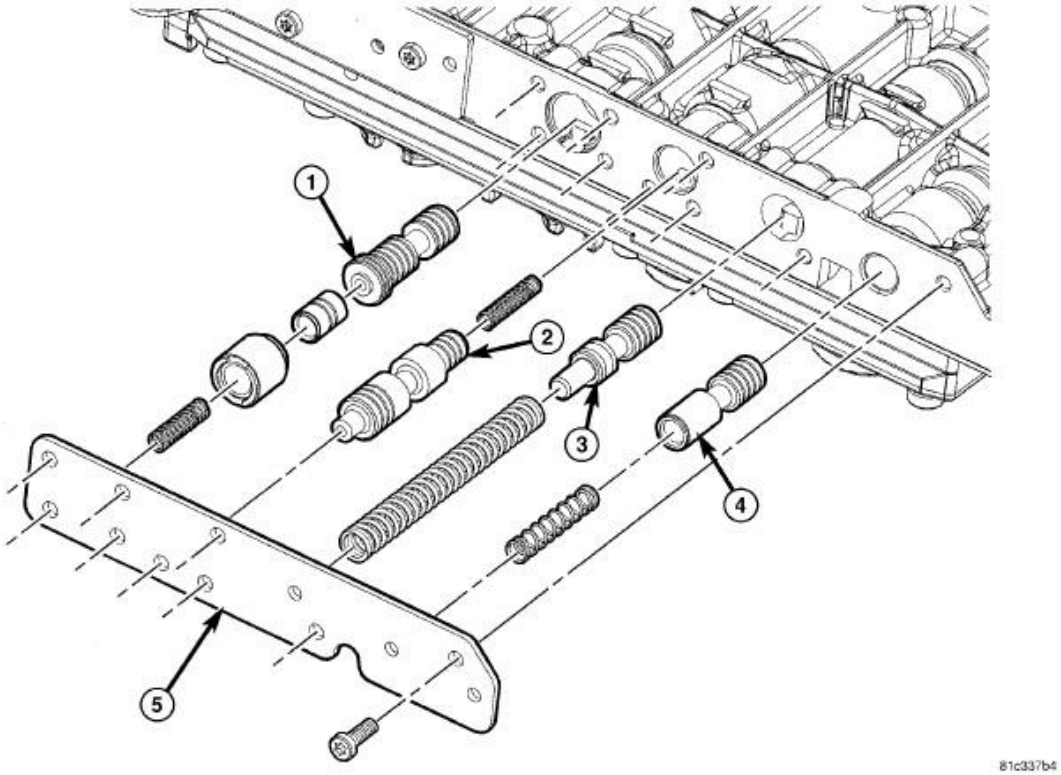

Fig. 289: Lower Valve Body Section 2
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2 / 4-5 OVERLAP REGULATING SLEEVE AND PISTON	4 - SHIFT SOLENOID PRESSURE REGULATING VALVE
2 - SHIFT PRESSURE REGULATING VALVE	5 - SIDE COVER
3 - CONTROL VALVE PRESSURE REGULATOR	

4. Lubricate and install the 1-2 / 4-5 Overlap Regulating Valve, Sleeve, and Piston assembly (1), Shift Pressure Regulating Valve assembly (2), Control Valve Pressure Regulator Valve assembly (3) and Shift Solenoid Pressure Regulating Valve assembly (4) into the valve body.
5. Install the side cover and the screws holding the side cover (5) to the valve body and valve housing. Tighten the screws to 4 N.m (35 in.lbs.).

NAG1 VALVE BODY SPRING DIMENSION		
VALVE	**SPRING FREE LENGTH**	**TOTAL COILS**
1-2 / 4-5 Holding (2), 1-2 / 4-5 Shift Pressure (3)	21.1 - 22.5 mm (0.83 - 0.88 in.)	14
1-2 / 4-5 Command (1)	23.9 - 25.3 mm (0.94 -1.00 in.)	11.5

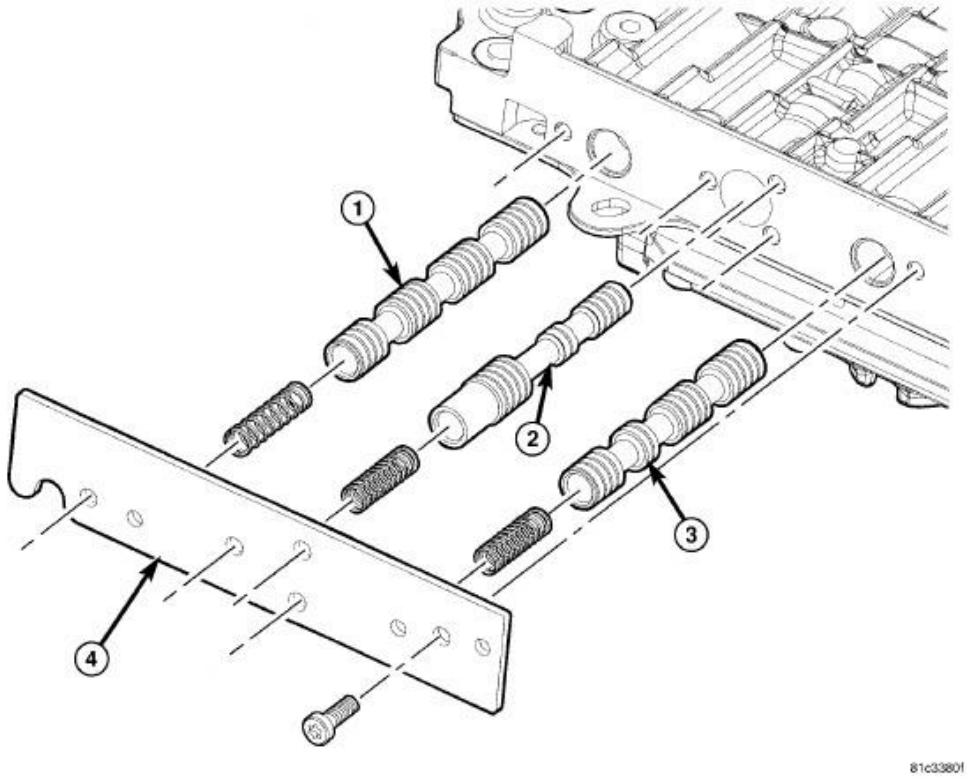

Fig. 290: Lower Valve Body Section 3
Courtesy of CHRYSLER GROUP, LLC

1 - 1-2 / 4-5 COMMAND VALVE	3 - 1-2 / 4-5 SHIFT PRESSURE
2 - 1-2 / 4-5 HOLDING PRESSURE SHIFT VALVE	4 - SIDE COVER

6. Lubricate and install the 1-2 / 4-5 Command valve assembly (1), 1-2 / 4-5 Holding Pressure Shift Valve (2) and the 1-2 / 4-5 Shift Pressure assembly (3) into the valve body.

7. Install the side cover and the screws holding the side cover (4) to the valve body and valve housing. Tighten the screws to 4 N.m (35 in.lbs.).

NAG1 VALVE BODY SPRING DIMENSION		
VALVE	**SPRING FREE LENGTH**	**TOTAL COILS**
3/4 Over Lap (5)	20.4 - 21.0 mm (0.80 - 0.83 in.)	13
3-4 Holding (2)	21.1 - 22.5 mm (0.83 - 0.88 in.)	14
3-4 Command (3), 3-4 Shift Pressure (4)	23.9 - 25.3 mm (0.94 -1.00 in.)	11.5

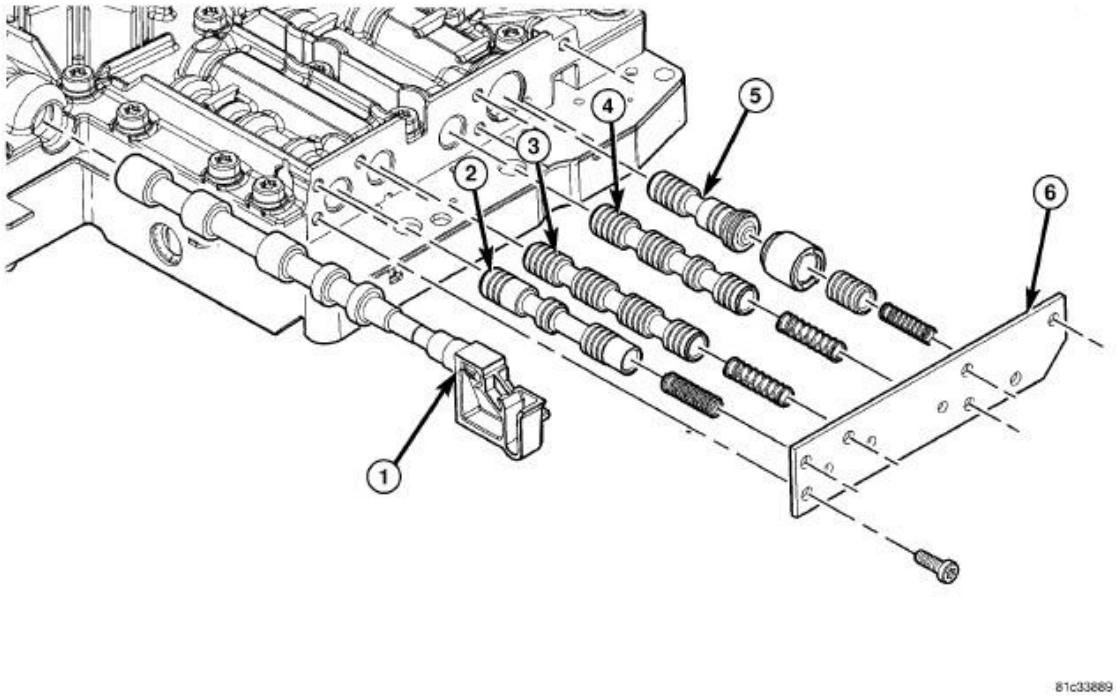

Fig. 291: Upper Valve Body Section 1
Courtesy of CHRYSLER GROUP, LLC

1 - SELECTOR VALVE	4 - 3-4 SHIFT PRESSURE
2 - 3-4 HOLDING PRESSURE SHIFT VALVE	5 - 3-4 OVERLAP REGULATING VALVE, SLEEVE, AND PISTON
3 - 3-4 COMMAND VALVE	6 - SIDE COVER

8. Lubricate and install the sector valve (1).

9. Lubricate and install 3-4 Holding Pressure Shift Valve assembly (2), 3-4 Command Valve assembly (3), 3-4 Shift Pressure assembly (4) and the 3-4 Overlap Regulating Valve Sleeve and Piston assembly (5) into the valve body.
10. Install the side cover and the screws holding the side cover (6) to the valve body and valve housing. Tighten the screws to 4 N.m (35 in.lbs.).

NAG1 VALVE BODY SPRING DIMENSION		
VALVE	**SPRING FREE LENGTH**	**TOTAL COILS**
Lubricating Pressure Regulating Valve (2)	64.8 - 68.2 mm (2.55 - 2.68 in.)	24
2-3 Overlap (3)	16.9 - 18.7 mm (0.66 - 0.74 in.)	13
Line Pressure Regulator (1)	43.8 - 46.2 mm (1.72 - 1.82 in.)	13.5

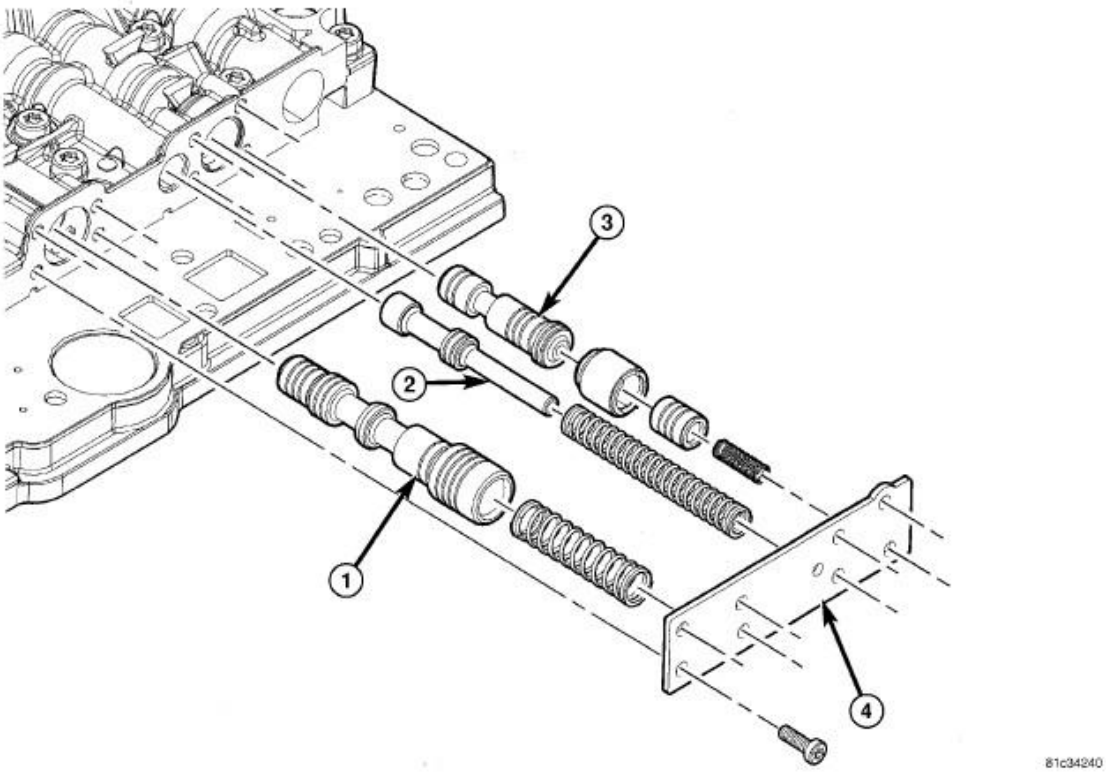

Fig. 292: Upper Valve Body Section 2
Courtesy of CHRYSLER GROUP, LLC

1 - LINE PRESSURE REGULATING VALVE	3 - 2-3 OVERLAP REGULATING VALVE, SLEEVE, AND PISTON
2 - LUBRICATING PRESSURE REGULATING VALVE	4 - SIDE COVER

11. Lubricate and install the Operating Pressure Regulating Valve assembly (1), Lubricating Pressure Regulating Valve assembly (2) and the 2-3 Overlap Regulating Valve, Sleeve and Piston assembly (3) into the valve body.
12. Install the side cover and the screws holding the side cover (6) to the valve body and valve housing. Tighten the screws to 4 N.m (35 in.lbs.).

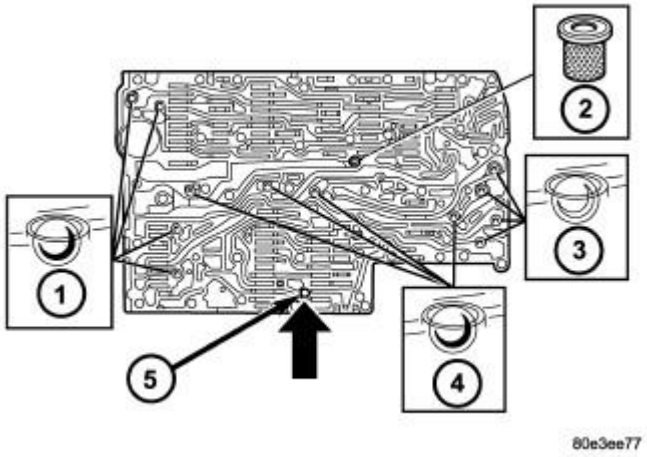

Fig. 293: Check Balls And Strainer Location
Courtesy of CHRYSLER GROUP, LLC

1 - STEEL CHECK BALLS
2 - CENTRAL STRAINER
3 - STEEL CHECK BALLS
4 - PLASTIC CHECK BALLS
5 - PLAIN DOWEL PIN

NOTE: A total of 12 valve balls are located in the valve body, four made from plastic (4) and eight from steel (1, 3).

13. Install all check balls (1, 3, 4) and the central strainer (2). Refer to **Fig. 293**.

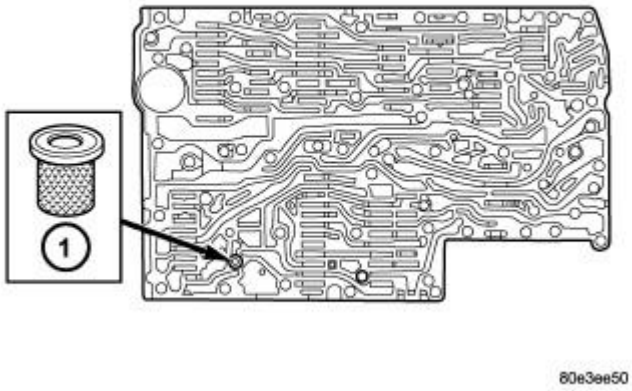

Fig. 294: Converter Lock-Up Solenoid Valve Strainer Location
Courtesy of CHRYSLER GROUP, LLC

1 - CONVERTER LOCK-UP SOLENOID STRAINER

14. Install the strainer (1) in the inlet to torque converter lock-up control solenoid valve. Refer to **Fig. 294**.

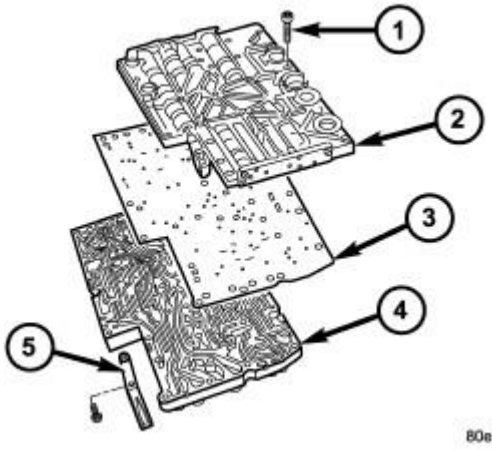

Fig. 295: Shift Plate Components
Courtesy of CHRYSLER GROUP, LLC

1 - BOLTS - 29
2 - VALVE HOUSING
3 - SEALING PLATE
4 - VALVE BODY
5 - LEAF SPRING

15. Position the sealing plate (3) onto the valve body (4). Refer to **Fig. 295**.

16. Install the valve housing (2) onto the valve body (4) and sealing plate (3).
17. Install the shift plate Torx® bolts (1). Refer to **Fig. 295**. Tighten the bolts to 8 N.m (71 in.lbs.).
18. Install leaf spring (5). Refer to **Fig. 295**.

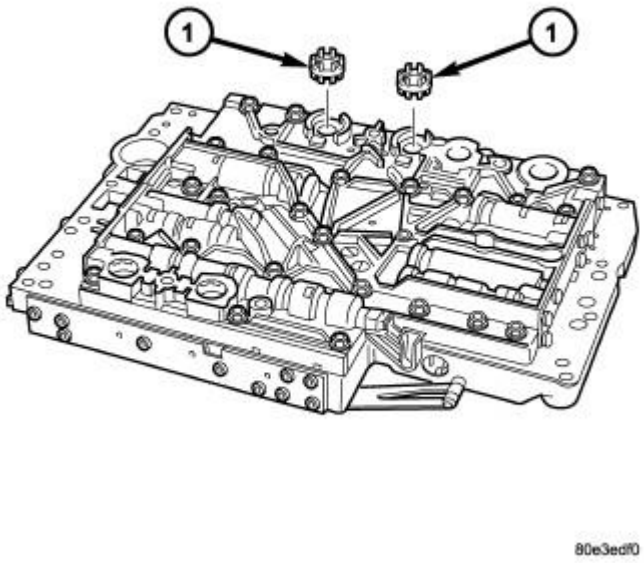

Fig. 296: Solenoid Valve Strainer Locations
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID VALVE STRAINERS

19. Install the strainers (1) for the modulating pressure and shift pressure control solenoid valves into the valve housing. Refer to **Fig. 296**.

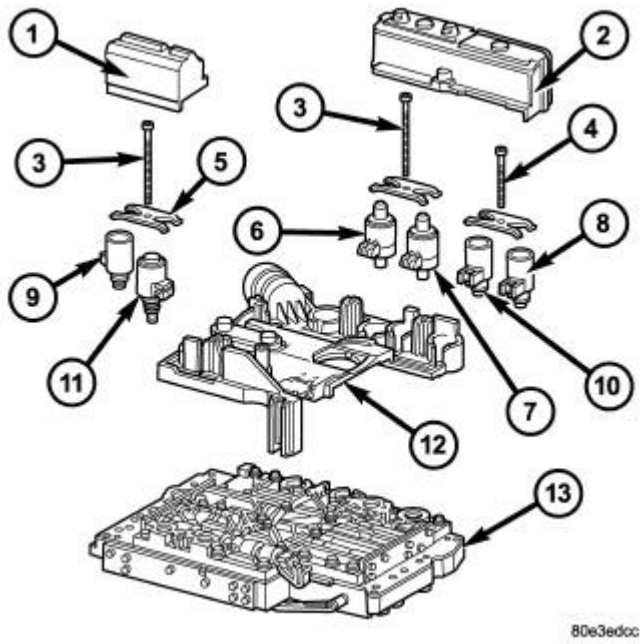

Fig. 297: Electrical Unit Components
Courtesy of CHRYSLER GROUP, LLC

1 - SOLENOID CAP (if equipped)
2 - SOLENOID CAP (if equipped)
3 - BOLT - M6X32
4 - BOLT - M6X30
5 - LEAF SPRING
6 - MODULATING PRESSURE REGULATING SOLENOID VALVE
7 - SHIFT PRESSURE REGULATING SOLENOID
8 - 3-4 SHIFT SOLENOID
9 - TORQUE CONVERTER LOCK-UP SOLENOID
10 - 1-2/4-5 SHIFT SOLENOID
11 - 2-3 SHIFT SOLENOID
12 - ELECTRICAL CONTROL UNIT
13 - SHIFT PLATE

20. Install the electrohydraulic control module (12) onto the shift plate (13). Refer to **Fig. 297**.
21. Bend the retaining lug on stiffening rib on transmission oil temperature sensor to retain the electrohydraulic control module.
22. Install the solenoid valves (6 - 11) into shift plate (13).

NOTE: Check O-rings on solenoid valves for damage and replace if necessary.

23. Install the leaf springs (5).
24. Install the Torx® socket bolts (3, 4). Refer to **Fig. 297**. Tighten the bolts to 8 N.m (71 in.lbs.).

NOTE: Pay attention to the different lengths of the Torx® socket bolts.

25. Install the solenoid caps (1, 2) if equipped.
26. Install the electrohydraulic unit into the vehicle.

INSTALLATION

INSTALLATION

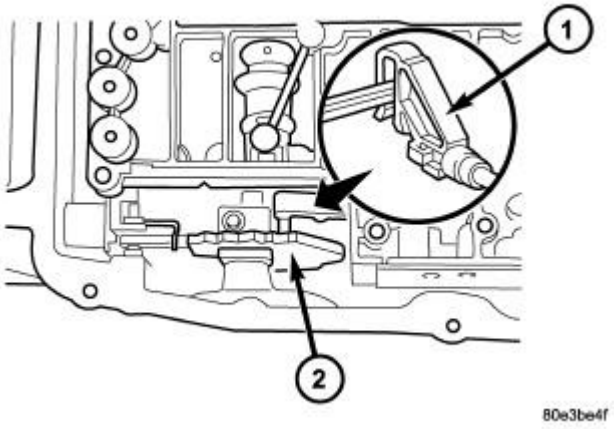

Fig. 298: Connect The Selector Valve To The Detent Plate
Courtesy of CHRYSLER GROUP, LLC

1 - SELECTOR VALVE
2 - DETENT PLATE

1. Position the electrohydraulic unit in the transmission housing.
2. Insert selector valve (1) in driver of detent plate (2). Refer to **Fig. 298**. When installing the electrohydraulic control module in the transmission housing, the plastic part of the selector valve (1) must engage in the driver of the detent plate (2).

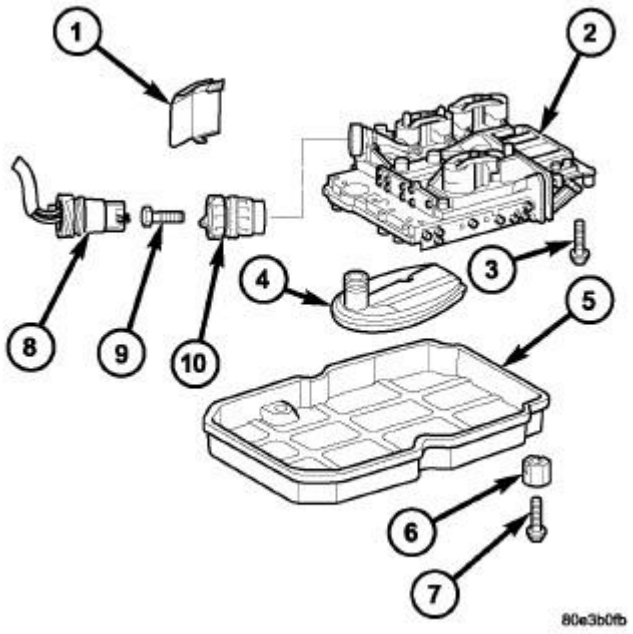

Fig. 299: Removing/Installing Electrohydraulic Unit
Courtesy of CHRYSLER GROUP, LLC

1 - HEAT SHIELD
2 - ELECTROHYDRAULIC UNIT
3 - BOLT
4 - OIL FILTER
5 - OIL PAN
6 - CLAMPING ELEMENT
7 - BOLT
8 - 13-PIN PLUG CONNECTOR
9 - BOLT
10 - ADAPTER PLUG

3. Install the Torx® socket bolts (3) and torque to 8 N.m (71 in. Refer to **Fig. 299**.lbs.).
4. Install a new oil filter (4). Refer to **Fig. 299**.
5. Install oil pan (5) and torque the oil pan bolts to 8 N.m (71 in. lbs.). Refer to **Fig. 299**.
6. Install the adapter plug (10) into the transmission housing and tighten the bolt (9) to 2.5 N.m (22 in.lbs.) Refer to **Fig. 299**.

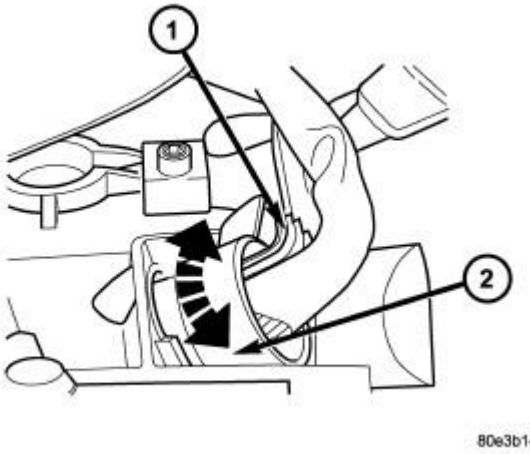

Fig. 300: Removing/Installing Wiring Connector Plug
Courtesy of CHRYSLER GROUP, LLC

1 - PLUG CONNECTOR
2 - ADAPTER PLUG

7. Check O-ring on plug connector (1), and replace if necessary. Refer to **Fig. 300**.
8. Install the plug connector (1) into the adapter plug (2). Turn bayonet lock of adapter plug (2) clockwise to connect plug connector (1).
9. Fill the transmission with the correct oil using the standard procedure. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** and **FLUID AND FILTER, STANDARD PROCEDURE**.

GENERAL INFORMATION

Trouble Shooting - Basic Procedures

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

ACCESSORIES & ELECTRICAL

CHARGING SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC CHARGING SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Vehicle Will Not Start	
Dead battery	Check battery cells, alternator belt tension and alternator output
Loose or corroded battery connections	Check all charging system connections
Ignition circuit or switch malfunction	Check and replace as necessary
Alternator Light Stays On With Engine Running	
Loose or worn alternator drive belt	Check alternator drive tension and condition, See Belt Adjustment in TUNE-UP article in the TUNE-UP section

Loose alternator wiring connections	Check all charging system connections
Short in alternator light wiring	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Defective alternator stator or diodes	See Bench Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Alternator Light Stays Off With Ignition Switch ON	
Blown fuse	See WIRING DIAGRAMS
Defective alternator	See Testing in ALTERNATOR article
Defective indicator light bulb or socket	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Alternator Light Stays OFF With Ignition Switch ON	
Short in alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective rectifier bridge	See Bench Tests in ALTERNATOR article
Lights or Fuses Burn Out Frequently	
Defective alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Defective battery	Check and replace as necessary
Ammeter Gauge Shows Discharge	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Defective wiring	Check all wires and wire connections
Defective alternator or regulator	See Bench Tests and On-Vehicle Tests in ALTERNATOR article
Defective ammeter, or improper ammeter wiring connection	See Testing in STANDARD

	INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Noisy Alternator	
Loose drive pulley	Tighten drive pulley attaching nut
Loose mounting bolts	Tighten all alternator mounting bolts
Worn or dirty bearings	See Bearing Replacement ALTERNATOR article
Defective diodes or stator	See Bench Test in ALTERNATOR article
Battery Does Stay Charged	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in appropriate TUNE-UP article in the TUNE-UP section
Loose or corroded battery connections	Check all charging system connections
Loose alternator connections	Check all charging system connections
Defective alternator or battery	See On-Vehicle Tests and Bench Tests in ALTERNATOR article
Add-on electrical accessories exceeding alternator capacity	Install larger alternator
Battery Overcharged-Uses Too Much Water	
Defective battery	Check alternator output and repair as necessary
Defective alternator	See On-Vehicle Test and Bench Tests in ALTERNATOR article
Excessive alternator voltage	Check alternator output and repair as necessary

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

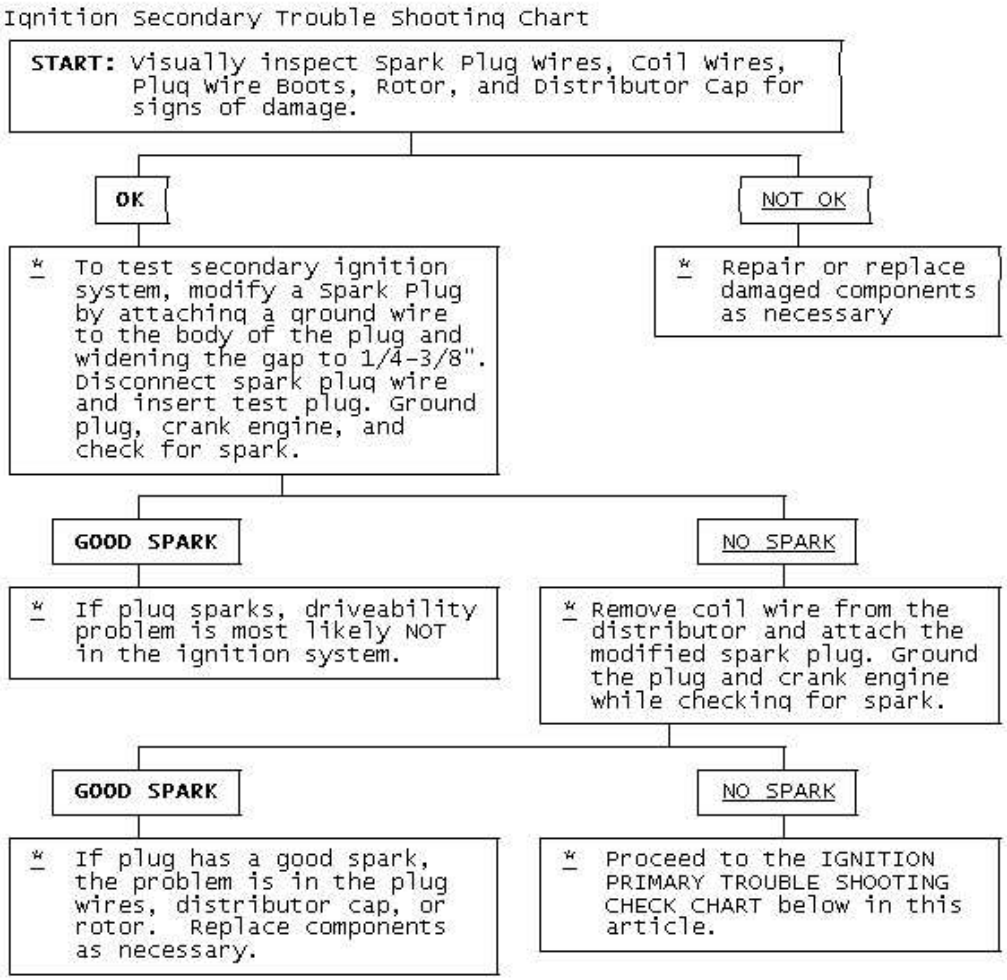

Fig. 1: Ignition Secondary Trouble Shooting Chart

Ignition Primary Trouble Shooting Chart

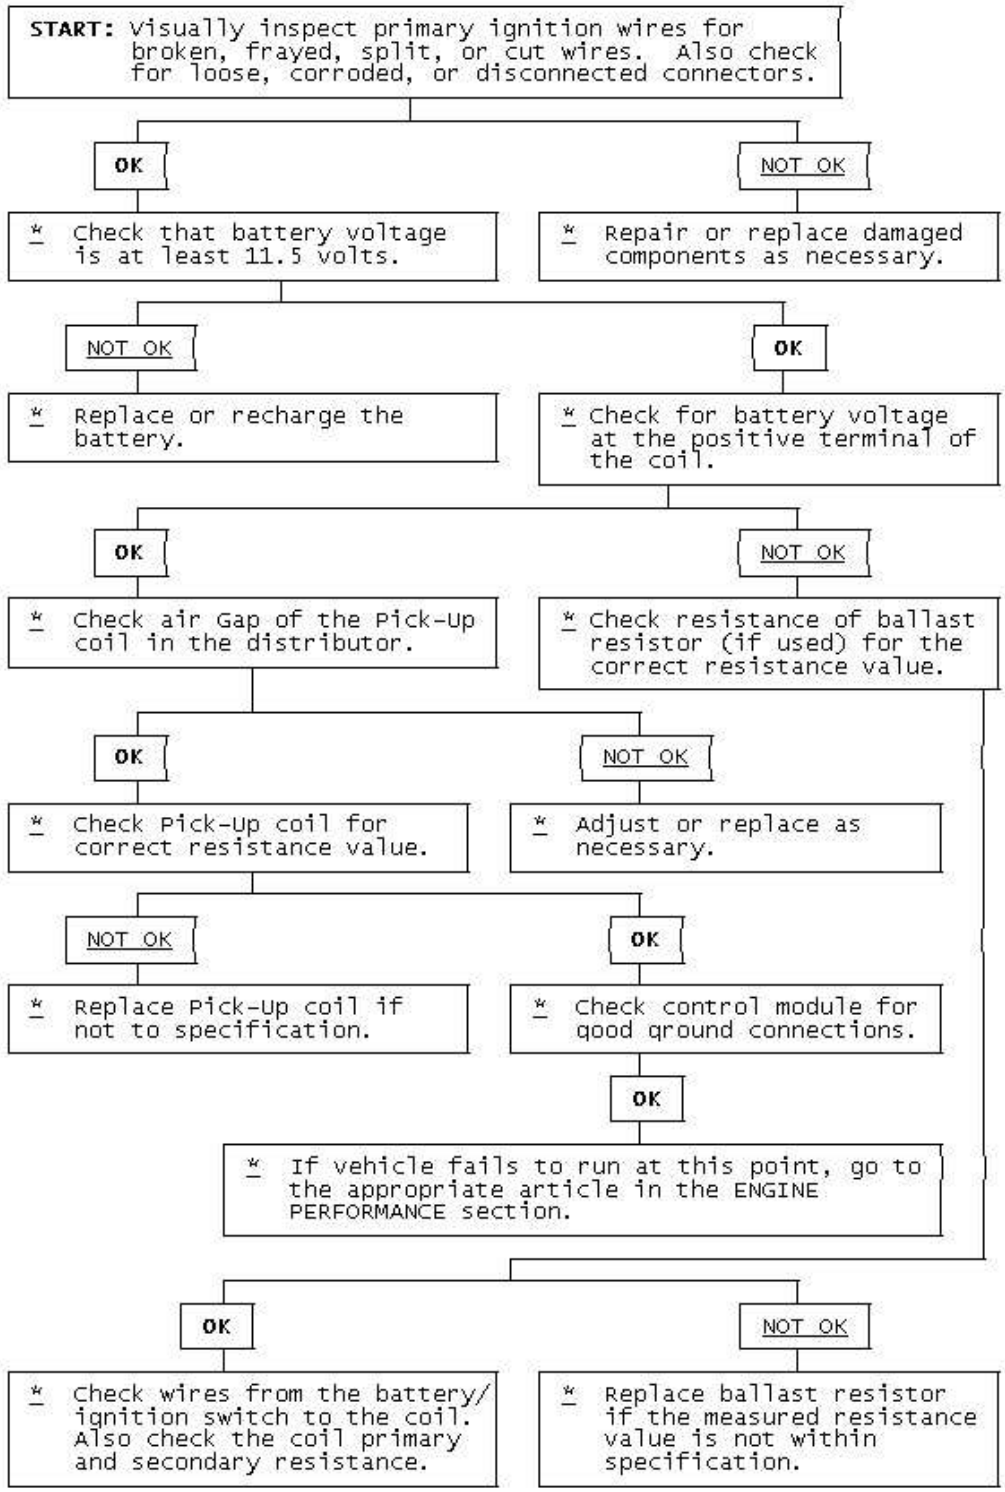

Fig. 2: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole	See STARTER article shoes
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article

Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearing	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER

	article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch	Replace ignition switch contacts sticking
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	solenoid
Low Current Draw	
Worn brushes or weak brush springs	Replace brushes or brush

	springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

AIR CONDITIONING & HEAT

AIR CONDITIONING TROUBLE SHOOTING

WARNING: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC AIR CONDITIONING TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Compressor Not Working	Compressor clutch circuit open.
.....	Compressor clutch coil inoperative.
.....	Poor clutch ground connection.
.....	Fan belts loose.
.....	Thermostatic switch inoperative.
.....	Thermostatic switch not adjusted.
.....	Ambient temperature switch open.
.....	Superheat fuse blown.
Excessive Noise or Vibration	Missing or loose mounting bolts.
.....	Bad idler pulley bearings.
.....	Fan belts not tightened correctly.
.....	Compressor clutch contacting body.
.....	Excessive system pressure.
.....	Compressor oil level low.
.....	Damaged clutch bearings.
.....	Damaged reed valves.
.....	Damaged compressor.
Insufficient or No Cooling; Compressor Working	Expansion valve inoperative.
.....	Heater control valve stuck open.

.....	Low system pressure.
.....	Blocked condenser fins.
.....	Blocked evaporator fins.
.....	Vacuum system leak.
.....	Vacuum motors inoperative.
.....	Control cables improperly adjusted.
.....	Restricted air inlet.
.....	Mode doors binding.
.....	Blower motor inoperative.
.....	Temperature above system capacity.

HEATER SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC HEATER SYSTEM TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Insufficient, Erratic, or No Heat	Low Coolant Level
.....	Incorrect thermostat.
.....	Restricted coolant flow through core.
.....	Heater hoses plugged.
.....	Misadjusted control cable.
.....	Sticking heater control valve.
.....	Vacuum hose leaking.
.....	Vacuum hose blocked.
.....	Vacuum motors inoperative.
.....	Blocked air inlet.
.....	Inoperative heater blower motor.
.....	Oil residue on heater core fins.
.....	Dirt on heater core fins.
Too Much Heat	Improperly adjusted cables.
.....	Sticking heater control valve.
.....	No vacuum to heater control valve.
.....	Temperature door stuck open.
Air Flow Changes During Acceleration	Vacuum system leak.
.....	Bad check valve or reservoir.
Air From Defroster At All Times	Vacuum system leak.

.....	Improperly adjusted control cables.
.....	Inoperative vacuum motor.
Blower Does Not Operate Correctly	Blown fuse.
.....	Blower motor windings open.
.....	Resistors burned out.
.....	Motor ground connection loose.
.....	Wiring harness connections loose.
.....	Blower motor switch inoperative.
.....	Blower relay inoperative.
.....	Fan binding or foreign object in housing.
.....	Fan blades broken or bent.

BRAKES

BRAKE SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BRAKE SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes Pull Left or Right	
Incorrect tire pressure	Inflate tires to proper pressure
Front end out of alignment	See WHEEL ALIGNMENT
Mismatched tires	Check tires sizes
Restricted brake lines or hoses	Check hose routing
Loose or malfunctioning caliper	See DISC BRAKES or BRAKE SYSTEM
Bent shoe or oily linings	See DRUM BRAKES or BRAKE SYSTEM
Malfunctioning rear brakes	See DRUM, DISC BRAKES or BRAKE SYSTEM
Loose suspension parts	See SUSPENSION
Noises Without Brakes Applied	
Front linings worn out	Replace linings
Dust or oil on drums or rotors	See DRUM, DISC BRAKES or BRAKE SYSTEM
Noises With Brakes Applied	

Insulator on outboard shoe damaged	See DISC BRAKES or BRAKE SYSTEM
Incorrect pads or linings	Replace pads or linings
Brake Rough, Chatters or Pulsates	
Excessive lateral runout	Check rotor runout
Parallelism not to specifications	Reface or replace rotor
Wheel bearings not adjusted	See SUSPENSION
Rear drums out-of-round	Reface or replace drums
Disc pad reversed, steel against rotor	Remove and reinstall pad
Excessive Pedal Effort	
Malfunctioning power unit	See POWER BRAKES or BRAKE SYSTEM
Partial system failure	Check fluid and pipes
Worn disc pad or lining	Replace pad or lining
Caliper piston stuck or sluggish	See DISC BRAKES or BRAKE SYSTEM
Master cylinder piston stuck	See MASTER CYLINDERS or BRAKE SYSTEM
Brake fade due to incorrect pads for linings	Replace pads or linings
Linings or pads glazed	Replace pads or linings
Worn drums	Reface or replace drums
Excessive Pedal Travel	
Partial brake system failure	Check fluid and pipes
Insufficient fluid in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Air trapped in system	See BRAKE BLEEDING or BRAKE SYSTEM
Rear brakes not adjusted	See Adjustments in DRUM BRAKES or BRAKE SYSTEM
Bent shoe or lining	See DRUM BRAKES or BRAKE SYSTEM
Plugged master cylinder cap	See MASTER CYLINDERS or BRAKE SYSTEM
Improper brake fluid	Replace brake fluid
Pedal Travel Decreasing	
Compensating port plugged	See MASTER CYLINDERS or BRAKE SYSTEM
Swollen cup in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Master cylinder piston not returning	See MASTER CYLINDERS or BRAKE SYSTEM
Weak shoe retracting springs	See DRUM BRAKES

	BRAKE SYSTEM
Wheel cylinder piston sticking	See DRUM BRAKES or BRAKE SYSTEM
Dragging Brakes	
Master cylinder pistons not returning	See MASTER CYLINDERS BRAKE SYSTEM
Restricted brake lines or hoses	Check line routing
Incorrect parking brake adjustment	See DRUM BRAKES BRAKE SYSTEM
Parking Brake cables frozen	See DRUM BRAKES BRAKE SYSTEM
Incorrect installation of inboard disc pad	Remove and replace correctly
Power booster output rod too long	See POWER BRAKE UNITS BRAKE SYSTEM
Brake pedal not returning freely	See DISC, DRUM BRAKES BRAKE SYSTEM
Brakes Grab or Uneven Braking Action	
Malfunction of combination valve	See CONTROL VALVE or BRAKE SYSTEM
Malfunction of power brake unit	See POWER BRAKE UNITS or BRAKE SYSTEM
Binding brake pedal	See DISC, DRUM BRAKES or BRAKE SYSTEM
Pulsation or Roughness	
Uneven pad wear caused by caliper	See DISC BRAKES or BRAKE SYSTEM
Uneven rotor wear	See DISC BRAKES or BRAKE SYSTEM
Drums out-of-round	Reface or replace drums

ENGINE MECHANICAL

COOLING SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

COOLING SYSTEM TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION

Overheating	
Coolant Leak	Fill/Pressure Test System
A/C Condenser Fins Clogged	Remove/Clean Condenser
Radiator Fins Clogged	Remove/Clean Radiator
Thermostat Stuck Closed	Replace Thermostat
Clogged Cooling System Passages	Clean/Flush Cooling System
Water Pump Malfunction	Replace Water Pump
Fan Clutch Malfunction	Replace Fan Clutch
Retarded Ignition Timing	Reset Ignition Timing
Cooling Fan Malfunction	Test Cooling Fan/Circuit
Cooling Fan Motor Malfunction	Test Fan Motor
Cooling Fan Relay Malfunction	Test Fan Relay
Faulty Radiator Cap	Replace Radiator Cap
Broken/Slipping Fan Belt	Replace Fan Belt
Restricted Exhaust	Repair Exhaust System
Corrosion	
Impurities In Coolant	Clean/Flush System
Coolant Leakage	
Damaged hose	Replace Hose
Leaky Water Pump	Replace Water Pump
Damaged Radiator Seam	Replace/Repair Radiator
Leaky Thermostat Cover	Replace Thermostat Cover
Cylinder Head Problem	Check Head/Head Gasket
Leaky Freeze Plugs	Replace Freeze Plugs
Recovery System Inoperative	
Loose and/or Defective Radiator Cap	Replace Radiator Cap
Overflow Tube Clogged and/or Leaking	Repair Tube
Recovery Bottle Vent Restricted	Clean Vent
No Heater Core Flow	
Collapsed Heater Hose	Replace Heater Hose
Plugged Heater Core	Clean/Replace Heater Core
Faulty Heater Valve	Replace Heater Valve

GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Lopes At Idle	
Intake manifold-to-head leaks	Replace manifold gasket, See ENGINES
Blown head gasket	Replace head gasket, See ENGINES
Worn timing gears, chain or sprocket	Replace gears, chain or sprocket
Worn camshaft lobes	Replace camshaft, See ENGINES
Overheated engine	Check cooling system, See COOLING
Blocked crankcase vent valve	Remove restriction
Leaking EGR valve	Repair leak and/or replace valve
Faulty fuel pump	Replace fuel pump
Engine Has Low Power	
Leaking fuel pump	Repair leak and/or replace fuel pump
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Sticking valves or weak valve springs	Check valve train components, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Worn camshaft lobes	Replace camshaft, See ENGINES
Blown head gasket	Replace head gasket. See ENGINES.
Clutch slipping	Adjust pedal and/or replace components, See ENGINES
Engine overheating	Check cooling system, See COOLING
Auto. Trans. pressure regulator valve faulty	Replace pressure regulator valve
Auto. Trans. fluid level too low	Add fluid as necessary
Improper vacuum diverter valve operation	Replace vacuum diverter valve
Vacuum leaks	Inspect vacuum system and repair as required
Leaking piston rings	Replace piston rings, See

	ENGINES
Faulty High Speed Operation	
Low fuel pump volume	Replace fuel pump
Leaking valves or worn	Replace valves and/or springs, See ENGINES
Incorrect valve timing	Reset valve timing,See ENGINES
Intake manifold restricted	Remove restriction
Worn distributor shaft	Replace distributor
Faulty Acceleration	
Improper fuel pump stroke	Remove pump and reset pump stroke
Incorrect ignition timing	Reset ignition timing, See TUNE-UP
Leaking valves	Replace valves, See ENGINES
Worn fuel pump diaphragm or piston	Replace diaphragm or piston
Intake Backfire	
Improper ignition timing	Reset ignition timing, See TUNE-UP
Faulty accelerator pump discharge	Replace accelerator pump
Improper choke operation	Check choke and adjust as required
Defective EGR valve	Replace EGR valve
Fuel mixture too lean	Reset air/fuel mixture, See TUNE-UP
Choke valve initial clearance too large	Reset choke valve initial clearance
Exhaust Backfire	
Vacuum leak	Inspect and repair vacuum system
Faulty vacuum diverter valve	Replace vacuum diverter valve
Faulty choke operation	Check choke and adjust as required
Exhaust system leak	repair exhaust system leak
Engine Detonation	
Ignition timing too far advanced	Reset ignition timing, See TUNE-UP
Faulty ignition system	Check ignition timing, See TUNE-UP
Spark plugs loose or faulty	Retighten or replace plugs

Fuel delivery system clogged	Inspect lines, pump and filter for clog
EGR valve inoperative	Replace EGR valve
PCV system inoperative	Inspect and/or replace hoses or valve
Vacuum leaks	Check vacuum system and repair leaks
Excessive combustion chamber deposits	Remove built-up deposits
Leaking, sticking or broken valves	Inspect and/or replace valves
External Oil Leakage	
Fuel pump improperly seated or worn gasket	Remove pump, replace gasket and seat properly
Oil pan gasket broken or pan bent	Straighten pan and replace gasket
Timing chain cover gasket broken	Replace timing chain cover gasket
Rear main oil seal worn	Replace rear main oil seal
Oil pan drain plug not seated properly	Remove and reinstall drain plug
Camshaft bearing drain hole blocked	Remove restriction
Oil pressure sending switch leaking	Remove and reinstall sending switch
Excessive Oil Consumption	
Worn valve stems or guides	Replace stems or guides, See ENGINES
Valve "O" ring seals damaged	Replace "O" ring seals, See ENGINES
Plugged oil drain back holes	Remove restrictions
Improper PCV valve operation	Replace PCV valve
Engine oil level too high	Remove excess oil
Engine oil too thin	Replace thicker oil
Valve stem oil deflectors damaged	Replace oil deflectors
Incorrect piston rings	Replace piston rings, See ENGINES
Piston ring gaps not staggered	Reinstall piston rings, See ENGINES
Insufficient piston ring tension	Replace rings, See ENGINES
Piston ring grooves or oil return	slots clogged Replace piston rings, See ENGINES
Piston rings sticking in grooves	Replace piston rings, See ENGINES

Piston ring grooves excessively worn	Replace piston and rings, See ENGINES
Compression rings installed upside down	Replace compression rings correctly, See ENGINES
Worn or scored cylinder walls	Rebore cylinders or replace block
Mismatched oil ring expander and rail	Replace oil ring expander and rail, See ENGINES
Intake gasket dowels too long	Replace intake gasket dowels
Excessive main or connecting rod bearing clearance	Replace main or connecting rod bearings, See ENGINES
No Oil Pressure	
Low oil level	Add oil to proper level
Oil pressure sender or gauge broken	Replace sender or gauge
Oil pump malfunction	Remove and overhaul oil pump, See ENGINES
Oil pressure relief valve sticking	Remove and reinstall valve
Oil pump passages blocked	Overhaul oil pump, See ENGINES
Oil pickup screen or tube blocked	Remove restriction
Loose oil inlet tube	Tighten oil inlet tube
Loose camshaft bearings	Replace camshaft bearings, See ENGINES
Internal leakage at oil passages	Replace block or cylinder head
Low Oil Pressure	
Low engine oil level	Add oil to proper level
Engine oil too thin	Remove and replace with thicker oil
Excessive oil pump clearance	Reduce oil pump clearance, See ENGINES
Oil pickup tube or screen blocked	Remove restrictions
Main, rod or cam bearing clearance excessive	Replace bearing to reduce clearance, See ENGINES
High Oil Pressure	
Improper grade of oil	Replace with proper oil
Oil pressure relief valve stuck closed	Eliminate binding
Oil pressure sender or gauge faulty	Replace sender or gauge
Noisy Main Bearings	
Inadequate oil supply	Check oil delivery to main bearings

Excessive main bearing clearance	Replace main bearings, See ENGINES
Excessive crankshaft end play	Replace crankshaft, See ENGINES
Loose flywheel or torque converter	Tighten attaching bolts
Loose or damaged vibration damper	Tighten or replace vibration damper
Crankshaft journals out-of-round	Re-grind crankshaft journals
Excessive belt tension	Loosen belt tension
Noisy Connecting Rods	
Excessive bearing clearance or missing bearing	Replace bearing, See ENGINES
Crankshaft rod journal out-of-round	Re-grind crankshaft journal
Misaligned connecting rod or cap	Remove rod or cap and realign
Incorrectly tightened rod bolts	Remove and re-tighten rod bolts
Noisy Pistons and Rings	
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Bore tapered or out-of-round	Rebore block
Piston ring broken	Replace piston rings, See ENGINES
Piston pin loose or seized	Replace piston pin, See ENGINES
Connecting rods misaligned	Realign connecting rods
Ring side clearance too loose or tight	Replace with larger or smaller rings
Carbon build-up on piston	Remove carbon
Noisy Valve Train	
Worn or bent push rods	Replace push rods, See ENGINES
Worn rocker arms or bridged pivots	Replace push rods, See ENGINES
Dirt or chips in valve lifters	Remove lifters and remove dirt/chips
Excessive valve lifter leak-down	Replace valve lifters, See ENGINES
Valve lifter face worn	Replace valve lifters, See ENGINES
Broken or cocked valve springs	Replace or reposition springs

Too much valve stem-to-guide clearance	Replace valve guides, See ENGINES
Valve bent	Replace valve, See ENGINES
Loose rocker arms	Retighten rocker arms, See ENGINES
Excessive valve seat run-out	Reface valve seats, See ENGINES
Missing valve lock	Install new valve lock
Excessively worn camshaft lobes	Replace camshaft, See ENGINES
Plugged valve lifter oil holes	Eliminate restriction or replace lifter
Faulty valve lifter check ball	Replace lifter check ball, See ENGINES
Rocker arm nut installed upside down	Remove and reinstall correctly
Valve lifter incorrect for engine	Remove and replace valve lifters
Faulty push rod seat or lifter plunger	Replace plunger or push rod
Noisy Valves	
Improper valve lash	Re-adjust valve lash, See ENGINES
Worn or dirty valve lifters	Clean and/or replace lifters
Worn valve guides	Replace valve guides, See ENGINES
Excessive valve seat or face run-out	Reface seats or valve face
Worn camshaft lobes	Replace camshaft, See ENGINES
Loose rocker arm studs	Re-tighten rocker arm studs, See ENGINES
Bent push rods	Replace push rods, See ENGINES
Broken valve springs	Replace valve springs, See ENGINES
Burned,Sticking or Broken Valves	
Weak valve springs or warped valves	Replace valves and/or springs, See ENGINES
Improper lifter clearance	Re-adjust clearance or replace lifters
Worn guides or improper guide clearance	Replace valve guides, See ENGINES

Out-of-round valve seats or improper seat width	Re-grind valve seats
Gum deposits on valve stems, seats or guide	Remove deposits
Improper spark timing	Re-adjust spark timing
Broken Pistons/Rings	
Undersize pistons	Replace with larger pistons, See ENGINES
Wrong piston rings	Replace with correct rings, See ENGINES
Out-of-round cylinder bore	Re-bore cylinder bore
Improper connecting rod alignment	Remove and realign connecting rods
Excessively worn ring grooves	Replace pistons, See ENGINES
Improperly assembled piston pins	Re-assemble pin-to-piston, See ENGINES
Insufficient ring gap clearance	Install new rings, See ENGINES
Engine overheating	Check cooling system
Incorrect ignition timing	Re-adjust ignition timing, See TUNE-UP
Excessive Exhaust Noise	
Leaks at manifold to head, or to pipe	Replace manifold or pipe gasket
Exhaust manifold cracked or broken	Replace exhaust manifold, See ENGINES

ENGINE PERFORMANCE

CARBURETOR TROUBLE SHOOTING:

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC COLD START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Choke not closing	Check choke operation, see FUEL SYSTEMS
Choke linkage bent	Check linkage, see FUEL SYSTEM

Engine Starts, Then Dies	
Choke vacuum kick setting too wide	Check setting and adjust see, FUEL SYSTEMS
Fast idle RPM too low	Reset RPM to specification, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Vacuum leak	Inspect vacuum system for leaks
Low fuel pump outlet	Repair or replace pump, see FUEL SYSTEMS
Low carburetor fuel level	Check float setting see FUEL SYSTEM
Engine Quits Under Load	
Choke vacuum kick setting incorrect	Reset vacuum kick setting,see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEM
Incorrect hot fast idle speed RPM	Reset fast idle RPM, see TUNE-UP
Engine Starts, Runs Up, Then Idles, Slowly With Black Smoke	
Choke vacuum kick set too narrow	Reset vacuum kick, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Hot fast idle RPM too low	Reset fast idle RPM, see TUNE-UP

BASIC HOT START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Engine flooded	Allow fuel to evaporate

BASIC COLD ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Stalls in Gear	
Choke vacuum kick setting incorrect	Reset choke vacuum kick, see FUEL SYSTEMS
Fast idle RPM incorrect	Reset fast idle RPM, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam see FUEL SYSTEMS

Acceleration Sag or Stall	
Defective choke control switch	Replace choke control switch
Choke vacuum kick setting incorrect	Reset choke vacuum kick see, FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, FUEL SYSTEMS
Accelerator pump defective	Repair or replace pump see FUEL SYSTEMS
Secondary throttles not closed	Inspect lockout adjustment, see FUEL SYSTEMS
Sag or Stall After Warmup	
Defective choke control switch	Replace choke control switch, see FUEL SYSTEMS
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, see FUEL SYSTEMS
Backfiring & Black Smoke	
Plugged heat crossover system	Remove restriction

BASIC WARM ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Hesitation With Small Amount of Gas Pedal Movement	
Vacuum leak	Inspect vacuum lines
Accelerator pump weak or inoperable	Replace pump, see FUEL SYSTEMS
Float level setting too low	Reset float level, see,FUEL SYSTEMS
Metering rods sticking or binding	Inspect and/or replace rods, see FUEL SYSTEMS
Carburetor idle or transfer system plugged	Inspect system and remove restriction
Frozen or binding heated air inlet	Inspect heated air door for binding
Hesitation With Heavy Gas Pedal Movement	
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Metering rod carrier sticking or binding	Remove restriction
Large vacuum leak	Inspect vacuum system and repair leak
Float level setting too low	Reset float level, see FUEL

	SYSTEMS
Defective fuel pump, lines or filter	Inspect pump, lines and filter
Air door setting incorrect	Adjust air door setting, see FUEL

DIESEL ENGINE TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

BASIC DIESEL ENGINE TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Crank	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Bad starter connections or bad starter	Check connections and/or replace starter
Engine Cranks Slowly, Won't Start	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Engine oil too heavy	Replace engine oil
Engine Cranks Normally, But Will Not Start	
Glow plugs not functioning	Check glow plug system, see FUEL SYSTEMS
Glow plug control not functioning	Check controller, see FUEL SYSTEMS
Fuel not injected into cylinders	Check fuel injectors, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Fuel filter blocked	Replace fuel filter
Fuel tank filter blocked	Replace fuel tank filter
Fuel pump not operating	Check pump operation and/or replace pump
Fuel return system blocked	Inspect system and remove restriction

No voltage to fuel solenoid	Check solenoid and connections
Incorrect or contaminated fuel	Replace fuel
Incorrect injection pump timing	Re-adjust pump timing, see FUEL SYSTEMS
Low compression	Check valves, pistons, rings, see ENGINES
Injection pump malfunction	Inspect and/or replace injection pump
Engine Starts, Won't Idle	
Incorrect slow idle adjustment	Reset idle adjustment, see TUNE-UP
Fast idle solenoid malfunctioning	Check solenoid and connections
Fuel return system blocked	Check system and remove restrictions
Glow plugs go off too soon	See glow plug diagnosis in FUEL SYSTEMS
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Incorrect or contaminated fuel	Replace fuel
Low compression	Check valves, piston, rings, see ENGINES
Injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Fuel solenoid closes in RUN position	Check solenoid and connections
Engines Starts/Idles Rough W/out Smoke or Noise	
Incorrect slow idle adjustment	Reset slow idle, see TUNE-UP
Injection line fuel leaks	Check lines and connections
Fuel return system blocked	Check lines and connections
Air in fuel system	Bleed air from system
Incorrect or contaminated fuel	Replace fuel
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engines Starts and Idles Rough W/out Smoke or Noise, But Clears After Warm-Up	
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Engine not fully broken in	Put more miles on engine

Air in system	Bleed air from system
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engine Idles Correctly, Misfires Above Idle	
Blocked fuel filter	Replace fuel filter
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Incorrect or contaminated fuel	Replace fuel
Engine Won't Return To Idle	
Fast idle adjustment incorrect	Reset fast idle, see TUNE-UP
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
External linkage binding	Check linkage and remove binding
Fuel Leaks On Ground	
Loose or broken fuel line	Check lines and connections
Internal injection pump seal leak	Replace injection pump, see FUEL SYSTEMS
Cylinder Knocking Noise	
Injector nozzles sticking open	Test injectors, see FUEL SYSTEMS
Very low nozzle opening pressure	Test injectors and/or replace
Loss of Engine Power	
Restricted air intake	Remove restriction
EGR valve malfunction	Replace EGR valve
Blocked or damaged exhaust system	Remove restriction and/or replace components
Blocked fuel tank filter	Replace filter
Restricted fuel filter	Remove restriction and/or replace filter
Block vent in gas cap	Remove restriction and/or replace cap
Tank-to-injection pump fuel supply blocked	Check fuel lines and connections
Blocked fuel return system	Remove restriction
Incorrect or contaminated fuel	Replace fuel
Blocked injector nozzles	Check nozzle for blockage, see FUEL SYSTEMS
Low compression	Check valves, rings, pistons, see ENGINES

Loud Engine Noise With Black Smoke	
Basic timing incorrect	Reset timing, see FUEL SYSTEMS
EGR valve malfunction	Replace EGR valve
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Incorrect injector pump housing pressure	Check pressure, see FUEL SYSTEMS
Engine Overheating	
Cooling system leaks	Check cooling system and repair leaks
Belt slipping or damaged	Check tension and/or replace belt
Thermostat stuck closed	Remove and replace thermostat, see ENGINE COOLING
Head gasket leaking	Replace head gasket
Oil Light on at Idle	
Low oil pump pressure	Check oil pump operation, see ENGINES
Oil cooler or line restricted	Remove restriction and/or replace cooler
Engine Won't Shut Off	
Injector pump fuel solenoid does not return fuel valve to OFF position	Remove and check solenoid and replace if needed

VACUUM PUMP DIAGNOSIS

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

FUEL INJECTION TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC FUEL INJECTION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start (Cranks Normally)	
Cold start valve inoperative	Test valve and circuit
Poor connection;vacuum or wiring	Check vacuum and electrical connections
Contaminated fuel	Test fuel for water or alcohol
Defective fuel pump relay or circuit	Test relay and wiring
Battery too low	Charge and test battery
Low fuel pressure	Test pressure regulator and fuel pump, check for restricted lines and filters
No distributor reference pulses	Repair ignition system as necessary
Open coolant temperature sensor circuit	Test sensor and wiring
Shorted W.O.T. switch in T.P.S.	Disconnect W.O.T. switch, engine should start
Defective ECM	Replace ECM
Fuel tank residual pressure valve leaks	Test for fuel pressure drop after shut down
Hard Starting	
Disconnected hot air tube to air cleaner	Reconnect tube and test control valve
Defective Idle Air Control (IAC) valve	Test valve operation and circuit
Shorted, open or misadjusted T.P.S.	Test and adjust or replace T.P.S.
EGR valve open	Test EGR valve and control circuit
Poor Oxygen sensor signal	Test for shorted or circuit
Incorrect mixture from PCV system	Test PCV for flow, check sealing of oil filter cap
Poor High Speed Operation	
Low fuel pump volume	Faulty pump or restricted fuel lines or filters
Poor MAP sensor signal	Test MAP sensor, vacuum hose and wiring
Poor Oxygen sensor signal	Test for shorted or open sensor or circuit
Open coolant temperature sensor circuit	Test sensor and wiring
Faulty ignition operation	Check wires for cracks or poor con- nections, test

	secondary voltage with oscilloscope
Contaminated fuel	Test fuel for water or alcohol
Intermittent ECM ground	Test ECM ground connection for resistance
Restricted air cleaner	Replace air cleaner
Restricted exhaust system	Test for exhaust manifold back pressure
Poor MAF sensor signal	Check leakage between sensor and manifold
Poor VSS signal	If tester for ALCL hook-up is available check that VSS reading matches speedometer
Ping or Knock on Acceleration	
Poor Knock sensor signal	Test for shorted or open sensor or circuit
Poor Baro sensor signal	Test for shorted or open sensor or circuit
Improper ignition timing	See VEHICLE EMISSION CONTROL LABEL (where applicable)
Check for engine overheating problems	Low coolant, loose belts or electric cooling fan inoperative

NOTE: For additional electronic fuel injection trouble shooting information, see the appropriate article in the ENGINE PERFORMANCE section (not all vehicles have Computer Engine Control articles). Information is provided there for diagnosing fuel system problems on vehicles with electronic fuel injection.

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

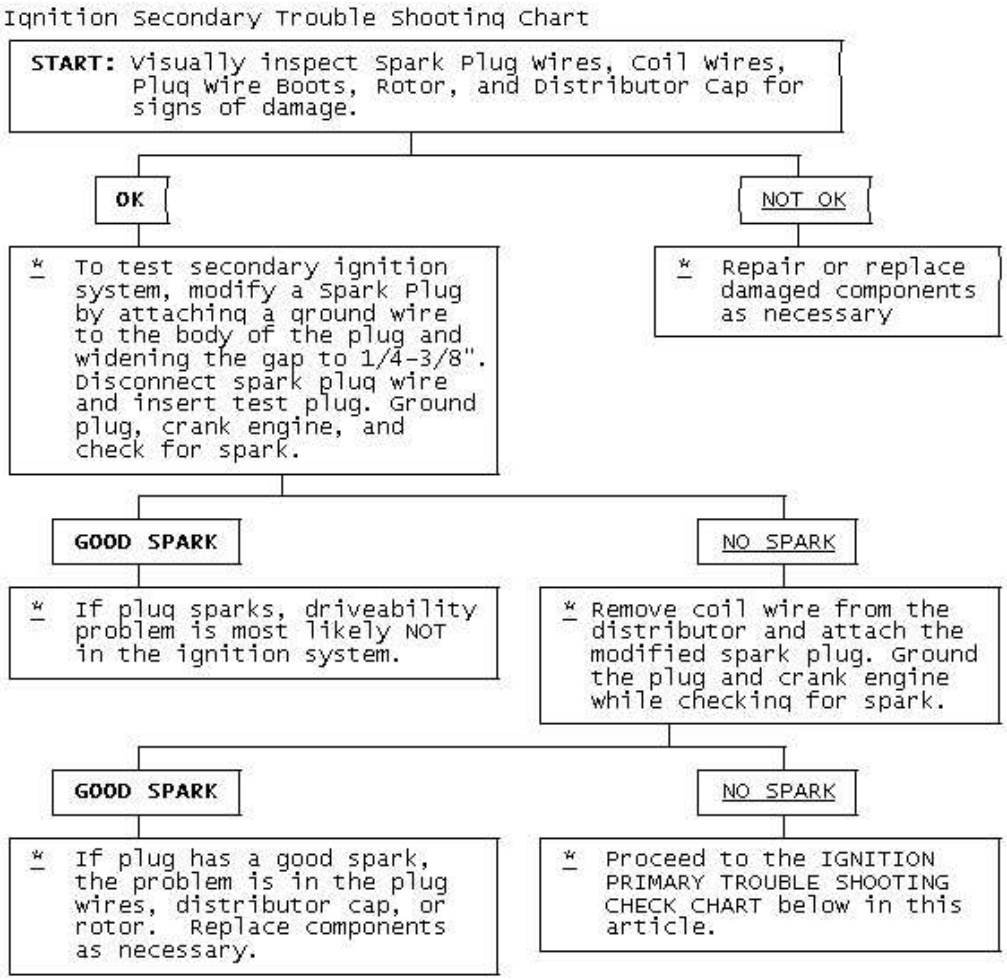

Fig. 3: Ignition Secondary Trouble Shooting Chart

Ignition Primary Trouble Shooting Chart

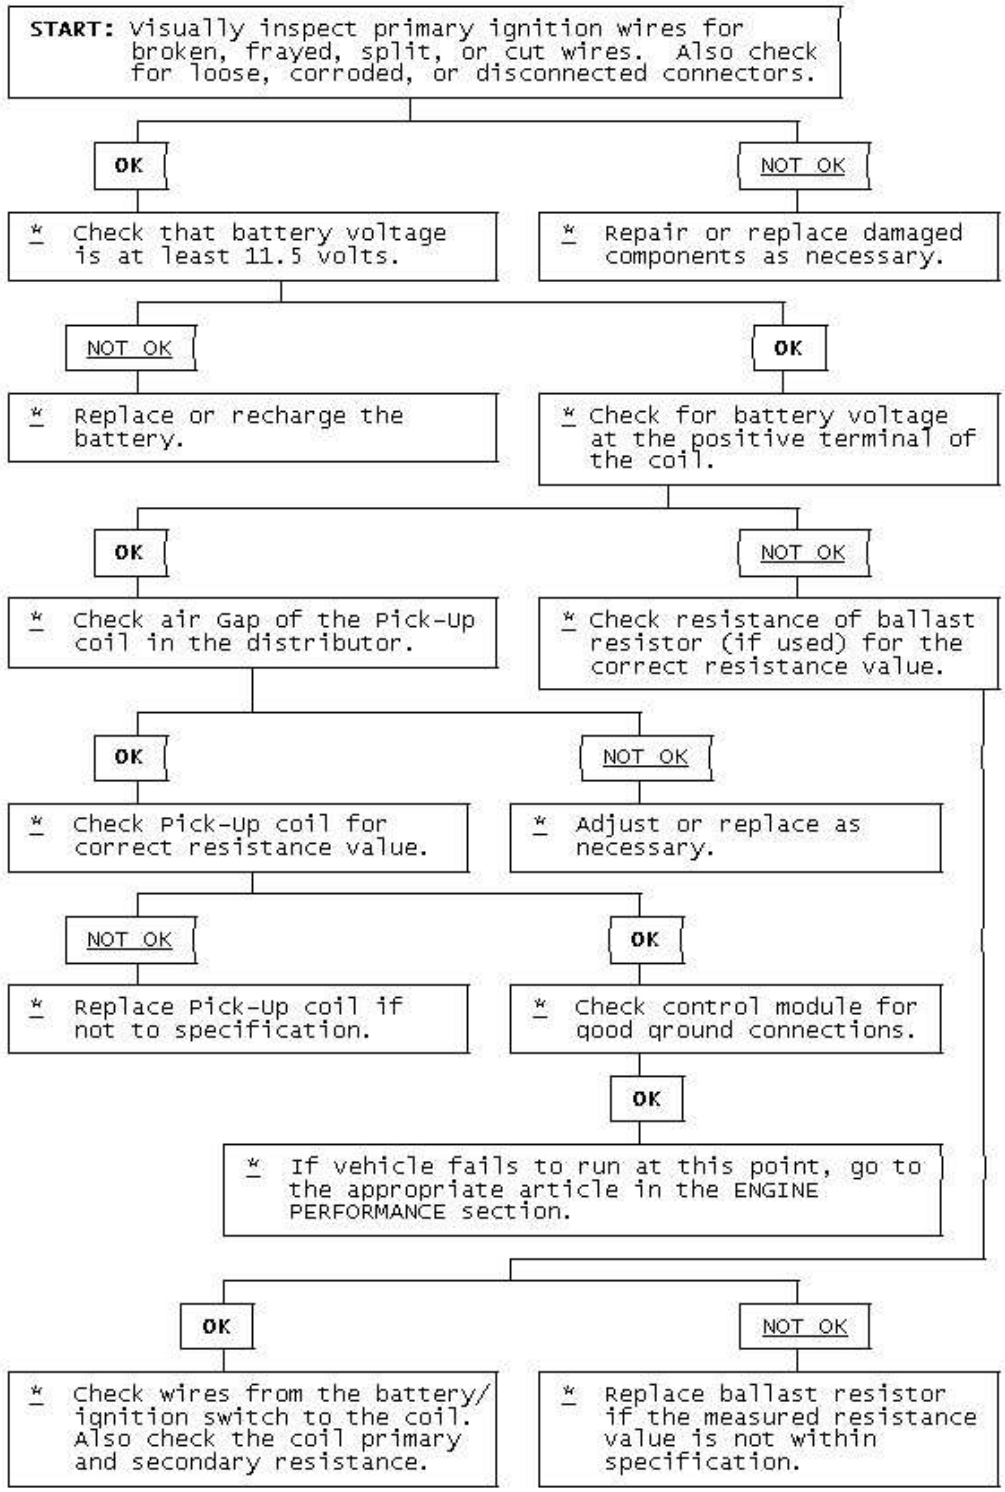

Fig. 4: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	See Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole shoes	See STARTER article
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion

	gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearings	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article

Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch contacts sticking	Replace ignition switch
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid

Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	Replace solenoid
Low Current Draw	
Worn brushes or weak	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

TUNE-UP TROUBLE SHOOTING - GAS ENGINE VEHICLES

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC SPARK PLUG TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Normal Spark Plug Condition	
Light Tan or Gray deposits	No Action
Electrode not burned or fouled	No Action
Gap tolerance not changed	No Action
Cold Fouling or Carbon Deposits	
Overrich air/fuel mixture	Adjust air/fuel mixture, see ENGINE PERFORMANCE section
Faulty choke	Replace choke assembly, see ENGINE PERFORMANCE section
Clogged air filter	Clean and/or replace air filter
Incorrect idle speed or dirty carburetor	Reset idle speed and/ or clean carburetor
Faulty ignition wires	Replace ignition wiring
Prolonged operation at idle	Shut engine off during long idle

Sticking valves or worn valve guide seals	Check valve train
Wet Fouling or Oil Deposits	
Worn rings and pistons	Install new rings and pistons
Excessive cylinder wear	Rebore or replace block
Excessive valve guide clearance	Worn or loose bearing
Gap Bridged	
Deposits in combustion chamber becoming fused to electrode	Clean combustion chamber of deposits
Blistered Electrode	
Engine overheating	Check cooling system
Wrong type of fuel	Replace with correct fuel
Loose spark plugs	Retighten spark plugs
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Pre-Ignition or Melted Electrodes	
Incorrect type of fuel	Replace with correct fuel
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Burned valves	Replace valves
Engine Overheating	Check cooling system
Wrong type of spark plug, too hot	Replace with correct spark plug, see ENGINE PERFORMANCE
Chipped Insulators	
Severe detonation	Check for over-advanced timing or combustion
Improper gapping procedure	Re-gap spark plugs
Rust Colored Deposits	
Additives in unleaded fuel	Try different fuel brand
Water In Combustion Chamber	
Blown head gasket or cracked head	Repair or replace head or head gasket

NOTE: **Before diagnosing an electronic ignition system, ensure that all wiring is connected properly between distributor, wiring connector and spark plugs. Ignition problem will show up either as: Engine Will Not Start or Engine Runs Rough.**

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	

Open circuit between distributor and bulkhead connector	Repair circuit
Open circuit between bulkhead connector and ignition switch	Repair circuit
Open circuit between ignition switch and starter solenoid	Repair circuit
Engine Runs Rough	
Fuel lines leaking or clogged	Tighten fitting, remove restriction
Initial timing incorrect	Reset ignition timing see ENGINE PERFORMANCE
Centrifugal advance malfunction	Repair distributor advance
Defective spark plugs or wiring	Replace plugs or plug wiring
Component Failure	
Spark arc-over on cap, rotor or coil	Replace cap, rotor or or coil
Defective pick-up coil	Replace pick-up coil
Defective ignition coil	Replace ignition coil
Defective vacuum unit	Replace vacuum unit
Defective control module	Replace control module

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS - USING OSCILLOSCOPE PATTERNS

CONDITION & POSSIBLE CAUSE	CORRECTION
Firing Voltage Lines are the Same, but Abnormally High	
Retarded ignition timing	Reset ignition timing, see ENGINE PERFORMANCE section
Fuel mixture too lean	Readjust carburetor, see ENGINE PERFORMANCE
High resistance in coil wire	Replace coil wire
Corrosion in coil tower terminal	Clean and/or replace coil
Corrosion in distributor coil terminal	Clean and/or replace distributor cap
Firing Voltage Lines are the Same but Abnormally Low	
Fuel mixture too rich	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in coil wire causing arcing	Replace coil wire
Cracked coil tower causing arcing	Replace coil
Low coil output	Replace coil
Low engine compression	Determine cause and repair
One or More, But Not All Firing Voltage Lines are Higher Than Others	
Carburetor idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
EGR valve stuck open	Clean and/or replace valve

High resistance in spark plug wires	Replace spark plug wires
Cracked or broken spark plug insulator	Replace spark plugs
Intake vacuum leak	Repair leak
Defective spark plugs	Replace spark plugs
Corroded spark plug terminals	Replace spark plugs
One or More, But Not All Firing Voltage Lines Are Lower Than Others	
Curb idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in plug wires	Replace plug wires causing arcing
Cracked coil tower causing arcing	Replace coil
Low compression	Determine cause and repair
Defective spark plugs	Replace spark plugs
Corroded spark plugs	Replace spark plugs
Cylinders Not Firing	
Cracked distributor cap terminals	Replace distributor cap
Shorted spark plug wire	Determine cause and repair
Mechanical problem in engine	Determine cause and repair
Defective spark plugs	Replace spark plugs
Spark plugs fouled	Replace spark plugs

BASIC DRIVEABILITY PROBLEMS TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Hard Starting	
Binding carburetor linkage	Eliminate binding
Binding choke linkage	Eliminate binding
Binding choke piston	Eliminate binding
Restricted choke vacuum	Check vacuum lines for blockage
Worn or dirty needle valve and seat	Clean carburetor, see ENGINE PERFORMANCE
Float sticking	Readjust or replace float see the ENGINE PERFORMANCE section
Incorrect choke adjustment	Reset choke adjustment see ENGINE PERFORMANCE
Defective coil	Replace coil
Improper spark plug gap	Regap spark plugs
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Detonation	

Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective spark plugs	Replace spark plugs
Fuel lines clogged	Clean fuel lines
EGR system malfunction	Check and repair EGR system
PCV system malfunction	Repair PCV system
Vacuum leaks	Check and repair vacuum system
Loose fan belts	Tighten or replace fan belts, see ENGINE PERFORMANCE
Restricted airflow	Remove restriction
Vacuum advance malfunction	Check distributor operation
Dieseling	
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate blinding
Binding choke linkage or fast idle cam	Eliminate binding
Defective idle solenoid	Replace idle solenoid see ENGINE PERFORMANCE
Improper base idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Incorrect idle mixture setting	Reset idle mixture, see ENGINE PERFORMANCE
Faulty Acceleration	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Engine cold and choke too lean	Adjust choke and allow engine to warm-up
Defective spark plugs	Replace spark plugs
Defective coil	Replace coil
Faulty Low Speed Operation	
Clogged idle transfer slots	Clean idle transfer slots, see FUEL
Restricted idle air bleeds and passages	Disassemble and clean carburetor, see FUEL
Clogged air cleaner	Replace air filter
Defective spark plugs	Replace spark plugs
Defective ignition wires	Replace ignition wire see ENGINE PERFORMANCE
Defective distributor cap	Replace distributor cap

Faulty High Speed Operation	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective distributor centrifugal advance	Replace advance mechanism
Defective distributor vacuum advance	Replace advance unit
Incorrect spark plugs or plug gap	Check gap and/or replace spark plugs
Faulty choke operation	Check choke and repair as required
Clogged vacuum passages	Remove restrictions
Improper size or clogged main jet	Check jet size and clean, see FUEL
Restricted air cleaner	Check filter and replace as necessary
Defective distributor cap, rotor or coil	Replace cap, rotor or coil
Misfire at All Speeds	
Defective spark plugs	Replace spark plugs
Defective spark plug wires	Replace spark plug wires
Defective distributor cap, rotor, or coil	Replace cap, rotor, or coil
Cracked or broken vacuum hoses	Replace vacuum hoses
Vacuum leaks	Repair vacuum leaks
Fuel lines clogged	Remove restriction
Hesitation	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair Vacuum leaks
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate binding
Binding choke linkage or fast idle cam	Eliminate binding
Improper float setting	Readjust float setting, see FUEL
Cracked or broken ignition wires	Replace ignition wires
Rough Idle, Missing or Stalling	
Incorrect curb idle or fast idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect basic timing	Reset ignition timing see ENGINE PERFORMANCE
Improper idle mixture adjustment	Reset idle mixture, see ENGINE PERFORMANCE
Improper feedback system operation	Check feedback system see ENGINE PERFORMANCE

Incorrect spark plug gap	Reset spark plug gap, see ENGINE PERFORMANCE
Moisture in ignition components	Dry components
Loose or broken ignition wires	Replace ignition wires
Damaged distributor cap or or rotor	Replace distributor cap or rotor
Faulty ignition coil	Replace ignition coil
Fuel filter clogged or worn	Replace fuel filter
Damaged idle mixture screw	Replace idle mixture screw, see FUEL
Improper fast idle cam adjustment	Reset fast idle cam adjustment, see TUNE- see ENGINE PERFORMANCE
Improper EGR valve operation	Replace EGR valve
Faulty PCV valve air flow	Replace PCV valve
Choke binding or improper choke setting	Reset choke or eliminate binding
Vacuum leak	Repair vacuum leak
Improper float bowl fuel level	Reset float adjustment, see FUEL
Clogged air bleed or idle passages	Clean carburetor passages, see FUEL
Clogged or worn air cleaner filter	Replace air filter
Faulty choke vacuum diaphragm	Replace diaphragm, see ENGINE PERFORMANCE
Exhaust manifold heat valve inoperative	Replace heat valve
Improper distributor spark advance	Check distributor operation
Leaking valves or valve components	Check and repair valvetrain
Improper carburetor mounting	Remove and remount carburetor
Excessive play in distributor shaft	Replace distributor
Loose or corroded wiring connections	Repair or replace as required
Engine Surges	
Improper PCV valve airflow	Replace PCV valve
Vacuum leaks	Repair vacuum leaks
Clogged air bleeds	Remove restriction
EGR valve malfunction	Replace EGR valve
Restricted air cleaner filter	Replace air filter
Cracked or broken vacuum hoses	Replace vacuum hoses
Cracked or broken ignition wires	Replace ignition wires
Vacuum advance malfunction	Check unit and replace as

	necessary
Defective or fouled spark plugs	Replace spark plugs
Ping or Spark Knock	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Distributor centrifugal or vacuum advance malfunction	Check operation and replace as necessary
Carburetor setting too lean	Readjust mixture setting, see ENGINE PERFORMANCE
Vacuum leak	Eliminate vacuum leak
EGR valve malfunction	Replace EGR valve
Poor Gasoline Mileage	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair vacuum leaks
Defective ignition wires	Replace wires
Incorrect choke setting	Readjust setting, see ENGINE PERFORMANCE
Defective vacuum advance	Replace vacuum advance
Defective spark plugs	Replace spark plugs
Binding carburetor power piston	Eliminate binding
Dirt in carburetor jets	Clean and/or replace jets
Incorrect float adjustment	Readjust float setting, see FUEL
Defective power valve	Replace power valve, see ENGINE PERFORMANCE
Incorrect idle speed	Readjust idle speed
Engine Stalls	
Improper float level	Readjust float level
Leaking needle valve and seat	Replace needle valve and seat
Vacuum leaks	Eliminate vacuum leaks

VACUUM PUMP - DIESEL TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items

such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

VACUUM PUMP (DIESEL) TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

MANUAL TRANSMISSION

MANUAL TRANSMISSION TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low gear oil level, Loose bell housing bolts, Worn bearings or gears
Clunk On Deceleration (FWD Only)	Loose engine mounts, Worn inboard CV joints, Worn differential pinion shaft, Side gear hub counterbore in case worn oversize
Gear Clash When Shifting Forward Gears	Clutch Out Of Adjustment, Shift linkage damaged or out of adjustment, Gears or synchronizers damaged, Low gear oil level
Transmission Noisy When Moving (RWD Only) Quiet In Neutral With Clutch Engaged	Worn rear outputshaft bearing
Gear Rattle	Worn bearings, Wrong gear oil, Low gear oil, Worn gears
Steady Ticking At Idle (Increases With RPM)	Broken tooth on gear
Gear Clash When Shifting Forward Gears	Worn or broken synchronizers
Loud Whine In Reverse	Normal condition (1)
Noise When Stepping On Clutch	Bad release bearing, Worn pilot bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty release bearing, Uneven pressure plate

	fingers
Click Or Snap When Clutch Is Engaged	Worn clutch fork, Worn or broken front bearing retainer
Transmission Shifts Hard	Clutch not releasing, Shift mechanism binding, Clutch installed backwards
Will Not Shift Into One Gear, Shifts Into All Others	Bent shift fork, Worn detent balls
Locked Into Gear, Cannot Shift	Clutch adjustment, Worn detent balls
Transmission Jumps Out Of Gear	Pilot bearing worn, Bent shift fork, Worn gear teeth or face, Excessive gear train end play, Worn synchronizers, Missing detent ball spring, Shift mechanism worn or out of adjustment, Engine or transmission mount bolts loose or out of adjustment, Transmission not aligned
Shift Lever Rattle	Worn shift lever or detents, Worn shift forks, Worn synchronizers sleeve
Shift Lever Hops Under Acceleration	Worn engine or transmission mounts
(1) Most units use spur cut gears in reverse and are noisy	

POWERTRAIN

CLUTCH TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC CLUTCH TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Chattering or Grabbing	
Incorrect clutch adjustment	Adjust clutch
Oil, grease or glaze on facings	Disassemble and clean or replace
Loose "U" joint flange	See DRIVE AXLES article
Worn input shaft spline	Replace input shaft
Binding pressure plate	Replace pressure plate
Binding release lever	See CLUTCH article
Binding clutch disc hub	Replace clutch disc
Unequal pressure plate contact	Replace worn/misaligned components
Loose/bent clutch disc	Replace clutch disc

Incorrect transmission alignment	Realign transmission
Worn pressure plate, disc or flywheel	Replace damaged components
Broken or weak pressure springs	Replace pressure plate
Sticking clutch pedal	Lubricate clutch pedal & linkage
Incorrect clutch disc facing	Replace clutch disc
Engine loose in chassis	Tighten all mounting bolts
Failure to Release	
Oil or grease on clutch facings	Clean or replace clutch clutch disc
Incorrect release lever or pedal adjustment	See CLUTCH article
Worn or broken clutch facings	Replace clutch disc
Bent clutch disc or pressure plate	Replace damaged components
Clutch disc hub binding on input shaft	Clean or replace clutch disc and/or input shaft
Binding pilot bearing	Replace pilot bearing
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Binding clutch cable	See CLUTCH article
Defective clutch master	Replace master cylinder
Defective clutch slave	Replace slave cylinder
Air in hydraulic system	Bleed hydraulic system
Rattling	
Weak or broken release lever spring	Replace spring and check alignment
Damaged pressure plate	Replace pressure plate
Broken clutch return spring	Replace return spring
Worn splines on clutch disc or input shaft	Replace clutch disc and/or input shaft
Worn clutch release bearing	Replace release bearing
Dry or worn pilot bearing	Lubricate or replace pilot bearing
Unequal release lever contact	Align or replace release lever
Incorrect pedal free play	Adjust free play
Warped or damaged clutch disc	Replace damaged components
Slipping	
Pressure springs worn or	Release pressure plate
Oily, greasy or worn facings	Clean or replace clutch disc
Incorrect clutch alignment	Realign clutch assembly

Warped clutch disc or pressure plate	Replace damaged components
Binding release levers or clutch pedal	Lubricate and/or replace release components
Squeaking	
Worn or damaged release	Replace release bearing
Dry or worn pilot or release bearing	Lubricate or replace assembly
Pilot bearing turning in crankshaft	Replace pilot bearing and/or crankshaft
Worn input shaft bearing	Replace bearing and seal
Incorrect transmission alignment	Realign transmission
Dry release fork between pivot	Lubricate release fork and pivot
Heavy and/or Stiff Pedal	
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Dry or binding clutch pedal hub	Lubricate and align components
Floor mat interference with pedal	Lay mat flat in proper area
Dry or binding ball/fork pivots	Lubricate and align components
Faulty clutch cable	Replace clutch cable
Noisy Clutch Pedal	
Faulty interlock switch	Replace interlock switch
Self-adjuster ratchet noise	Lubricate or replace self-adjuster
Speed control interlock switch	Lubricate or replace interlock switch
Clutch Pedal Sticks Down	
Binding clutch cable	See CLUTCH article
Springs weak in pressure plate	Replace pressure plate
Binding in clutch linkage	Lubricate and free linkage
Noisy	
Dry release bearing	Lubricate or replace release bearing
Dry or worn pilot bearing	Lubricate or replace bearing
Worn input shaft bearing	Replace bearing
Transmission Click	
Weak springs in pressure	Replace pressure plate plate
Release fork loose on ball stud	Replace release fork and/or ball stud
Oil on clutch disc damper	Replace clutch disc

Broken spring in slave cylinder	Replace slave cylinder

DRIVE AXLE - NOISE DIAGNOSIS

Unrelated Noises

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. Ensure cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any of its parts.

Non-Drive Axle Noises

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and wheel trim rings.

In certain conditions, the pitch of the exhaust gases may e gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings also can cause a whistling or whining noise. Ensure none of these components are causing the noise before disassembling the drive axle.

Gear Noise

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear ke sure that tires, exhaust, and vehicle trim have been checked as possible causes.

Chuckle

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused ive clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough the cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding

wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

Knock

This is very similar to a chuckle, though it may be louder, and occur on acceleration or deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

Clunk

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in Drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in Drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, drive axle is not the source of clunk noise.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at drive shaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about 1/3 of drive shaft speed.

Chatter On Turns

This is a condition where the entire front or rear of vehicle vibrates when vehicle is moving. The vibration is plainly felt as well as heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates this chatter.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (Drive, cruise, coast and

float), and will persist with transmission in Neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect parts, replace wheel seals and install a new set of bearings. Re-evaluate vehicle for noise before removing any internal components.

Vibration

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and can occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can d into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalanced parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

DRIVE AXLE - RWD TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing. For definitions of listed noises or sounds, see DRIVE AXLE - NOISE DIAGNOSIS under POWERTRAIN.**

DRIVE AXLE (RWD) TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Knocking or Clunking	
Differential Side Gear Clearance	Check Clearance
Worn Pinion Shaft	Replace Pinion Shaft
Axle Shaft End Play	Check End Play
Missing Gear Teeth	Check Differential/Replace Gear
Wrong Axle Backlash	Check Backlash
Misaligned Driveline	Realign Driveline
Clinking During Engagement	
Side Gear Clearance	Check Clearance
Ring and Pinion Backlash	Check Backlash
Worn/Loose Pinion Shaft	Replace Shaft/Bearing
Bad "U" Joint	Replace "U" Joint
Sticking Slip Yoke	Lube Slip Yoke

Broken Rear Axle Mount	Replace Mount
Loose Drive Shaft Flange	Check Flange
Click/Chatter On Turns	
Differential Side Gear Clearance	Check Clearance
Wrong Turn On Plates (1)	Replace Clutch Plates
Wrong Differential Lubricant (1)	Change Lubricant
Knock Or Click	
Flat Spot on Rear Wheel Bearing	Replace Wheel Bearing
Low Vibration At All Speeds	
Faulty Wheel Bearing	Replace Wheel Bearing
Faulty "U" Joint	Replace "U" Joint
Faulty Drive Shaft	Balance Drive Shaft
Faulty Companion Flange	Replace Flange
Faulty Slip Yoke Flange	Replace Flange
(1) Limited slip differential only.	

FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Grease Leaks	CV boot torn or cracked
Clicking Noise on Cornering	Damaged outer CV
Clunk Noise on Acceleration	Damaged inner CV
Vibration or Shudder on Acceleration	Sticking, damaged or worn CV Misalignment or spring height

STEERING & SUSPENSION

MANUAL STEERING GEAR TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC MANUAL STEERING GEAR TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise in Rack and Pinion	
Rack and pinion mounting bracket loose	Tighten all mounting bolts
Lack of/or incorrect lubricant	Correct as necessary
Steering gear mounting bolts loose	Tighten all mounting bolts
Excessive Play	
Front wheel bearing improperly adjusted	See FRONT SUSPENSION article
Loose or worn steering linkage	See STEERING LINKAGE article
Loose or worn steering gear shift	See MANUAL STEERING GEAR article
Steering arm loose on gear shaft	See MANUAL STEERING GEAR article
Steering gear housing bolts loose	Tighten all mounting bolts
Steering gear adjustment too loose	See MANUAL STEERING GEAR article
Steering arms loose on knuckles	Tighten and check steering linkage
Rack and pinion mounting loose	Tighten all mounting bolts
Rack and pinion out of adjustment	See adjustment in STEERING article
Tie rod end loose	Tighten and check steering linkage
Excessive Pitman shaft-to-ball nut lash	Repair as necessary
Poor Returnability	
Lack of lubricant in ball joint or linkage	Lubricate and service systems
Binding in linkage or ball joints	See STEERING LINKAGE and SUSPENSION article
Improper front end alignment	See WHEEL ALIGNMENT article
Improper tire pressure	Inflate to proper pressure
Tie rod binding	Inflate to proper pressure
Shaft seal rubbing shaft	See STEERING COLUMN article
Excessive Vertical Motion	
Improper tire pressure	Inflate to proper pressure
Tires, wheels or rotors out of balance	Balance tires then check wheels and rotors
Worn or faulty shock absorbers	Check and replace if necessary

Loose tie rod ends or steering	Tighten or replace if necessary
Loose or worn wheel bearings	See SUSPENSION article
Steering Pulls to One Side	
Improper tire pressure	Inflate to proper pressure
Front tires are different sizes	Rotate or replace if necessary
Wheel bearings not adjusted properly	See FRONT SUSPENSION article
Bent or broken suspension components	See FRONT SUSPENSION article
Improper wheel alignment	See WHEEL ALIGNMENT article
Brakes dragging	See BRAKES article
Instability	
Low or uneven tire pressure	Inflate to proper pressure
Loose or worn wheel bearings	See FRONT SUSPENSION article
Loose or worn idler arm bushing	See FRONT SUSPENSION article
Loose or worn strut bushings	See FRONT SUSPENSION article
Incorrect front wheel alignment	See WHEEL ALIGNMENT article
Steering gear not centered	See MANUAL STEERING GEARS article
Springs or shock	Check and replace if necessary
Improper cross shaft	See MANUAL STEERING GEARS article

POWER STEERING TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC POWER STEERING TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise	
Pressure hoses touching engine parts	Adjust to proper clearance

Loose Pitman shaft	Adjust or replace if necessary
Tie rods ends or Pitman arm loose	Tighten and check system
Rack and pinion mounts loose	Tighten all mounting bolts
Free play in worm gear	See POWER STEERING GEAR article
Loose sector shaft or thrust bearing adjustment	See POWER STEERING GEAR
Free play in pot coupling	See STEERING COLUMN article
Worn shaft serrations	See STEERING COLUMN article
Growl in Steering Pump	
Excessive pressure in hoses	Restricted hoses, see POWER STEERING GEAR article
Scored pressure plates	See POWER STEERING GEAR article
Scored thrust plates or rotor	See POWER STEERING GEAR article
Extreme wear of cam ring	See POWER STEERING GEAR article
Rattle in Steering Pump	
Vanes not installed	See POWER STEERING PUMP article
Vanes sticking in rotor	See POWER STEERING PUMP article
Swish noise in Pump	
Defective flow control valve	See POWER STEERING PUMP article
Groan in Steering Pump	
Air in fluid	See POWER STEERING PUMP article
Poor pressure hose connection	Tighten and check, replace if necessary
Squawk When Turning	
Damper "O" ring on valve spool cut	See POWER STEERING PUMP article
Moan or Whine in Pump	
Pump shaft bearing scored	Replace bearing and fluid
Air in fluid or fluid level low	See POWER STEERING PUMP article
Hose or column grounded	Check and replace if

	necessary
Cover "O" ring missing or damaged	See POWER STEERING PUMP article
Valve cover baffle missing or damaged	See POWER STEERING PUMP article
Interference of components in pump	See POWER STEERING PUMP article
Loose or poor bracket alignment	Correct or replace if necessary
Hissing When Parking	
Internal leakage in steering gear	Check valved assembly first
Chirp in Steering Pump	
Loose or worn power steering belt	Adjust or replace if necessary
Buzzing When Not Steering	
Noisy pump	See POWER STEERING PUMP article
Free play in steering shaft bearing	See STEERING COLUMN article
Bearing loose on shaft serrations	See STEERING COLUMN article
Clicking Noise in Pump	
Pump slippers too long	See POWER STEERING PUMP article
Broken slipper springs	See POWER STEERING PUMP article
Excessive wear or nicked rotors	See POWER STEERING PUMP article
Damaged cam contour	See POWER STEERING PUMP article
Poor Return of Wheel	
Wheel rubbing against turn signal	See STEERING COLUMN SWITCHES article
Flange rubbing steering gear adjuster	See STEERING COLUMN article
Tight or frozen steering shaft bearing	See STEERING COLUMN article
Steering gear out of adjustment	See POWER STEERING GEAR article
Sticking or plugged spool valve	See POWER STEERING PUMP article
Improper front end alignment	See WHEEL ALIGNMENT

	article
Wheel bearings worn or loose	See FRONT SUSPENSION article
Ties rods or ball joints binding	Check and replace if necessary
Intermediate shaft joints binding	See STEERING COLUMN article
Kinked pressure hoses	Correct or replace if necessary
Loose housing head spanner nut	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Sector shaft adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Worm thrust bearing adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Reaction ring sticking in cylinder	See POWER STEERING GEAR article
Reaction ring sticking in housing head	See POWER STEERING GEAR article
Steering pump internal leakage	See POWER STEERING PUMP article
Steering gear-to-column misalignment	See STEERING COLUMN article
Lack of lubrication in linkage	Service front suspension
Lack of lubrication in ball joints	Service front suspension
Increased Effort When Turning Wheel Fast Foaming, Milky Power Steering Fluid, Low Fluid Level or Low Pressure	
High internal pump leakage	See POWER STEERING PUMP article
Power steering pump belt slipping	Adjust or replace if necessary
Low fluid level	Check and fill to proper level
Engine idle speed to low	Adjust to correct setting
Air in pump fluid system	See POWER STEERING PUMP article
Pump output low	See POWER STEERING PUMP article
Steering gear malfunctioning	See POWER STEERING GEAR article

Wheel Surges or Jerks	
Low fluid level	Check and fill to proper level
Loose fan belt	Adjust or replace if necessary
Insufficient pump pressure	See POWER STEERING PUMP article
Sticky flow control valve	See POWER STEERING PUMP article
Linkage hitting oil pan at full turn	Replace bent components
Kick Back or Free Play	
Air in pump fluid system	See POWER STEERING PUMP article
Worn poppet valve in steering gear	See POWER STEERING PUMP article
Excessive over center lash	See POWER STEERING GEAR article
Thrust bearing out of adjustment	See POWER STEERING GEAR article
Free play in pot coupling	See POWER STEERING PUMP article
Steering gear coupling loose on shaft	See POWER STEERING PUMP article
Steering disc mounting bolts loose	Tighten or replace if necessary
Coupling loose on worm shaft	Tighten or replace if necessary
Improper sector shaft adjustment	See POWER STEERING GEAR article
Excessive worm piston side play	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Universal joint loose	Tighten or replace if necessary
Defective rotary valve	See POWER STEERING GEAR article
No Power When Parking	
Sticking flow control valve	See POWER STEERING PUMP article
Insufficient pump pressure output	See POWER STEERING PUMP article
Excessive internal pump leakage	See POWER STEERING PUMP article

Excessive internal gear leakage	See POWER STEERING PUMP article
Flange rubs against gear adjust plug	See STEERING COLUMN article
Loose pump belt	Adjust or replace if necessary
Low fluid level	Check and add proper amount of fluid
Engine idle too low	Adjust to correct setting
Steering gear-to-column misaligned	See STEERING COLUMN article
No Power, Left Turn	
Left turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Left turn reaction seal damaged/missing	See POWER STEERING GEAR article
Cylinder head "O" ring damaged	See POWER STEERING PUMP article
No Power, Right Turns	
Column pot coupling bottomed	See STEERING COLUMN article
Right turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Right turn reaction seal damaged	See POWER STEERING GEAR article
Internal leakage through piston end plug	See POWER STEERING GEAR article
Internal leakage through side plugs	See POWER STEERING GEAR article
Lack of Effort in Turning	
Left and/or right reaction seal sticking in cylinder head	Replace, see POWER STEERING GEAR article
Wanders to One Side	
Front end alignment incorrect	See WHEEL ALIGNMENT article
Unbalanced steering gear valve	See POWER STEERING GEAR article
Low Pressure Due to Steering Pump	
Flow control valve stuck or inoperative	See POWER STEERING PUMP article
Pressure plate not flat against cam ring	See POWER STEERING PUMP article
Extreme wear of cam ring	Replace and check

	adjustments
Scored plate, thrust plate or rotor	See POWER STEERING PUMP article
Vanes not installed properly	See POWER STEERING PUMP article
Vanes sticking in rotor slots	See POWER STEERING PUMP article
Cracked/broken thrust or pressure plate	See POWER STEERING PUMP article

STEERING COLUMN TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STEERING COLUMN TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Noise in Steering	
Coupling pulled apart	See STEERING COLUMNS article
Column not correctly aligned	See STEERING COLUMNS article
Broken lower joint	Replace joint
Horn contact ring not	See STEERING COLUMN article
Bearing not lubricated	See STEERING COLUMN article
Shaft snap ring not properly seated	Reseat or replace snap ring
Plastic spherical joint not lubricated	See STEERING COLUMN article
Shroud or housing loose	Tighten holding screws
Lock plate retaining ring not seated	See STEERING COLUMN article
Loose sight shield	Tighten holding screws
High Steering Shaft Effort	
Column assembly misaligned	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Tight steering universal joint	See STEERING COLUMN article

High Shift Effort	
Column is out of alignment	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Seals or bearings not lubricated	See STEERING COLUMNS article
Mounting bracket screws too long	Replace with new shorter screws
Burrs on shift tube	Remove burrs or replace tube
Lower bowl bearing assembled wrong	See STEERING COLUMN article
Shift tube bent or broken	Replace as necessary
Improper adjustment of shift levers	See STEERING COLUMN article
Improper Trans. Shifting	
Sheared shift tube joint	Replace as necessary
Sheared lower shaft lever	Replace as necessary
Improper shift lever adjustment	See STEERING COLUMN article
Improper gate plate adjustment	See STEERING COLUMN article
Excess Play in Column	
Instrument panel bracket bolts loose	Tighten bolts and check bracket
Broken weld nut on jacket	See STEERING COLUMN article
Instrument bracket capsule sheared	See STEERING COLUMN article
Column bracket/jacket bolts loose	Tighten bolts and check bracket
Steering Locks in Gear	
Release lever mechanism	See STEERING COLUMN article

SUSPENSION TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC SUSPENSION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Front End Noise	
Loose or worn wheel	See Wheel Bearing Adjustment in SUSPENSION
Worn shocks or shock mountings	Replace struts or strut mountings
Worn struts or strut mountings	Replace struts or strut mountings
Loose or worn lower control arm	See SUSPENSION
Loose steering gear-to-frame bolts	See STEERING
Worn control arm bushings	See SUSPENSION
Ball joints not lubricated	Lubricate ball joints & see Ball Joint Checking in SUSPENSION
Front Wheel Shake, Shimmy, or Vibration	
Tires or wheels out of balance	Check tire balance
Incorrect wheel alignment	See WHEEL ALIGNMENT
Drive shaft unbalanced	Check drive shaft balance
Loose or worn wheel bearings	See WHEEL ALIGNMENT
Loose or worn tie rod ends	See SUSPENSION
Worn upper ball joints	See Ball Joint Checking in SUSPENSION
Worn shock absorbers	Replace shock absorbers
Worn strut bushings	Replace strut bushings
Car Pulls to One Side	
Mismatched or uneven tires	Check tire condition
Broken or sagging springs	See SUSPENSION
Loose or worn strut bushings	See SUSPENSION
Improper wheel alignment	See WHEEL ALIGNMENT
Improper rear axle alignment	Check rear axle alignment
Power steering gear unbalanced	See STEERING
Front brakes dragging	See BRAKES
Abnormal Tire Wear	
Unbalanced tires	Check tire balance & rotation
Sagging or broken springs	See SUSPENSION
Incorrect front end alignment	See WHEEL ALIGNMENT
Faulty shock absorbers	Replace chock absorbers
Scuffed Tires	
Toe-In incorrect	See WHEEL ALIGNMENT
Suspension arm bent or twisted	See appropriate

	SUSPENSION article
Springs Bottom or Sag	
Bent or broken springs	See SUSPENSION
Leaking or worn shock absorbers	Replace shock absorbers
Frame misalignment	Check frame for damage
Spring Noises	
Loose "U" Bolts	See SUSPENSION
Loose or worn bushings	See SUSPENSION
Worn or missing interliners	See SUSPENSION
Shock Absorber Noise	
Loose shock mountings	Check & tighten mountings
Worn bushings	Replace bushings
Air in system	Bleed air from system
Undercoating on shocks	Remove undercoating
Car Leans or Sways on Corners	
Loose stabilizer bar	See SUSPENSION
Faulty shocks or mountings	Replace shocks or mountings
Broken or sagging springs	See SUSPENSION
Shock Absorbers Leaking	
Worn seals or reservoir tube crimped	See SUSPENSION
Broken Springs	
Loose "U" bolts	See SUSPENSION
Inoperative shock absorbers	Replace shock absorbers

WHEEL ALIGNMENT TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC WHEEL ALIGNMENT TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Premature Tire Wear	
Improper tire inflation	Check tire pressure
Front alignment out of tolerance	See ALIGNMENT SPECS in WHEEL ALIGNMENT section
Suspension components worn	See SUSPENSION section
Steering system components worn	See STEERING section

Improper standing height	See WHEEL ALIGNMENT
Uneven or sagging springs	See SUSPENSION section
Bent wheel	See WHEEL ALIGNMENT
Improper torsion bar adjustment	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARING ADJ. in SUSPENSION section
Worn or defective shock	Replace shock absorbers
Tires out of balance	Check tire balance
Pulls to One Side	
Improper tire inflation	Check tire pressure
Brake dragging	See BRAKE section
Mismatched tires	See WHEEL ALIGNMENT
Broken or sagging spring	See SUSPENSION section
Broken torsion bar	See SUSPENSION section
Power steering valve not centered	See STEERING section
Front alignment out of tolerance	See WHEEL ALIGNMENT section
Defective wheel bearing	See WHEEL BEARINGS in SUSPENSION section
Uneven sway bar links	See SUSPENSION section
Frame bent	Check for frame damage
Steering system bushing worn	See STEERING section
Hard Steering	
Idler arm bushing too tight	See STEERING LINKAGE in STEERING section
Ball joint tight or seized	See SUSPENSION section
Steering linkage too tight	See STEERING LINKAGE in STEERING section
Power steering fluid low	Add proper amount of fluid
Power steering drive belt loose	See STEERING section
Power steering pump defective	See STEERING section
Steering gear out of adjustment	See STEERING section
Incorrect wheel alignment	See WHEEL ALIGNMENT
Damaged steering gear	See STEERING section
Damaged suspension	See SUSPENSION section
Bent steering knuckle or supports	See SUSPENSION section
Vehicle "Wanders"	
Strut rod or control arm bushing worn	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARINGS in SUSPENSION section
Improper tire inflation	Check tire pressure

Stabilizer bar missing or defective	See SUSPENSION section
Wheel alignment out of tolerance	See Adjustment in WHEEL ALIGNMENT section
Broken spring	See SUSPENSION section
Defective shock absorber	Replace shock absorbers
Worn steering & suspension components	See SUSPENSION section
Front End Shimmy	
Tire out of balance/round	Check tire balance
Excessive wheel runout	See WHEEL ALIGNMENT
Insufficient or improper caster	See WHEEL ALIGNMENT section
Worn suspension or steering components	See SUSPENSION section
Defective shock absorbers	Replace shock absorber
Wheel bearings worn or loose	See WHEEL BEARING ADJ. in SUSPENSION section
Power steering reaction Bracket loose	See STEERING section
Steering gear box (rack) mounting loose	See STEERING section
Steering gear adjustment loose	See STEERING section
Worn spherical joints	See SUSPENSION section
Toe-In Not Adjustable	
Lower control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Camber Not Adjustable	
Control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Hub & bearing not seated properly	See SUSPENSION section

ACCESSORIES AND EQUIPMENT

Body - Interior & Exterior - Chrysler 300

WARNING

USE OF HEAT DURING REPAIR

WARNING: Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- **avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.**
- **do not stand under a hoisted vehicle that is not properly supported**

on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

RESTRAINT WARNINGS

WARNING: To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can

compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtain airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic

circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

DESCRIPTION

Throughout this information, references to the Chrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to **VEHICLE INFORMATION** for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this information, no reference will be made to a vehicle family code.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate information for proper procedures.

WATER LEAK TESTS

> **WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the

leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to **HOISTING, STANDARD PROCEDURE** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing

surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate information for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BUZZ, SQUEAKS AND RATTLES

Buzz, Squeaks and Rattles (BSR's) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using various tapes or lubricants. Tapes including foam, flock and anti-squeak, can be used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the table for materials and usage. Refer to **BUZZ, SQUEAKS AND RATTLES**.

BUZZ, SQUEAKS AND RATTLES

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
ITCH AND SQUEAK TAPE	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 107° C (-40° to 225° F)
BLACK NYLON FLOCK	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 82° C (-40° to 180° F)
HIGH DENSITY URETHANE FOAM	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 82° C (-40° to 180° F)
OPEN CELL FOAM TAPE	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 82° C (-40° to 180° F)
CLOSED CELL LOW DENSITY FOAM TAPE	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 82° C (-40° to 180° F)
NYE® GREASE 880	Long life.	Suspensions. Examples: Strut bushings, sway bars.	-40° to 200° C (-40° to 390° F)
KRYTOX® OIL	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34° to 205° C (-30° to 400° F)
KRYTOX® GREASE	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34° to 205° C (-30° to 400° F)

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
    1. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
    2. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

NET, FORM AND PIERCE REPAIR

CAUTION: Failure to follow these recommendations could result in damage or failure to the part and the related parts.

Net, form and pierce is a manufacturing process which takes place during the original build of the vehicle. The original part will have a beveled platform that will decrease toward the fastener location mounting hole. Replacement parts in these areas may not include bevel (form) and / or fastener hole (pierce) and will need to be adapted for proper fit and finish.

The primary locations which may utilize net, form and pierce are:

- Fender Reinforcement (at front end module mount)
- Fender Tower Mounts
- Hood Hinge (lower half)
- Rear Body Header (liftgate hinge mounts)
- Strut Tower (at upper control arm mount)

NOTE: Shock tower is net, pierce only.

NOTE: The thickness of shims is not to exceed the original thickness of the factory bevel. If more shims are needed damage is still present and must be repaired properly.

If the replacement part did not come with a fastener hole, one of equal size and location will have to be drilled. Body shims should be used in the fender reinforcement to front end module. The hood hinge area, fender tower mounts, and rear body header will utilize washers as spacers where a

specific spacer does not exist. The shims and spacers should be sealed between each other and to the stationary surface. Care should be taken when smoothing sealer around washers to ensure undetectable repair. Refinish the repair area per the paint manufacturers recommendations for corrosion resistance and appearance purposes.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler LLC vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

RIGID PLASTICS:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

SEMI-RIGID PLASTICS:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

FLEXIBLE PLASTICS:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

REPAIR PROCEDURE:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

ADHESION PROMOTER/SURFACE MODIFIER:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**

- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

WARNING: Failure to follow these instructions may result in serious or fatal injury.

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPTHALATE/EEBC ALLOY	BEXLOY, "M", PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS
PC	POLYCARBONATE	LEXAN, MERLON,	TAIL LIGHT LENSES, IP

		CALIBRE, MAKROLON PC	TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN, MARLEX, PRFAX, NORYL, GTX, PPO	INTERIOR TRIM, DOOR PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO-POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/PROPROPYLENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/PROPROPYLENE CO-POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	"?
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLON, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES
PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION,

			STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS
TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

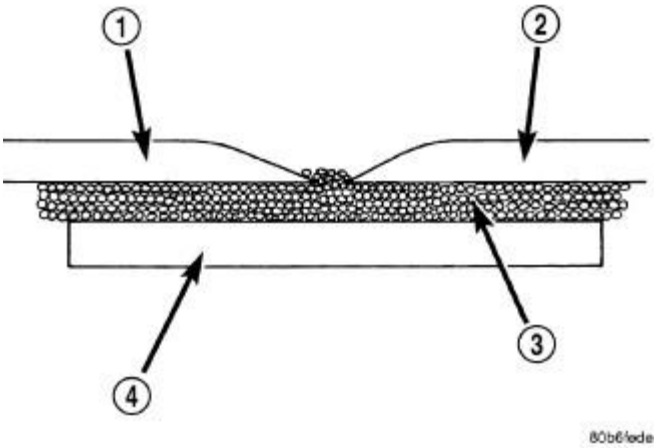

Fig. 1: Identifying Panel Sectioning
Courtesy of CHRYSLER GROUP, LLC

1 - EXISTING PANEL 2 - NEW PANEL 3 - PANEL ADHESIVE 4 - BONDING STRIP

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive

pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

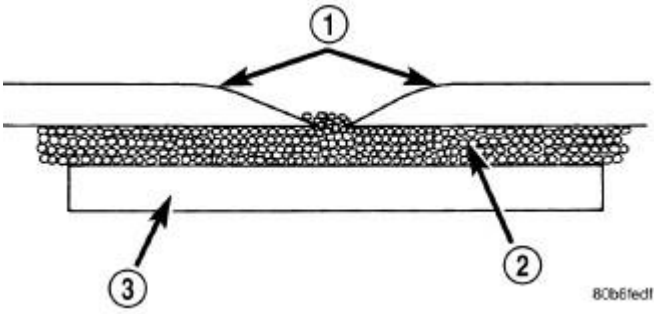

Fig. 2: Identifying Panel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1 - SOFTENED EDGES 2 - PANEL ADHESIVE 3 - BONDING STRIP

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

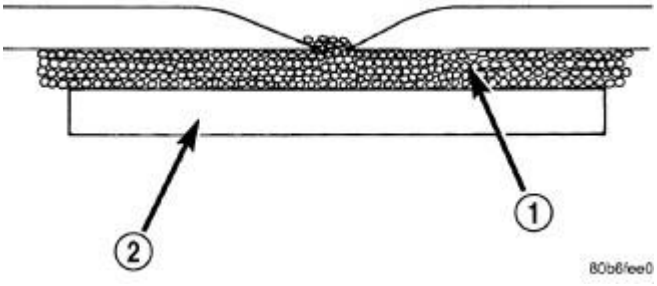

Fig. 3: Identifying Panel Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1 - PANEL ADHESIVE 2 - REINFORCEMENT

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

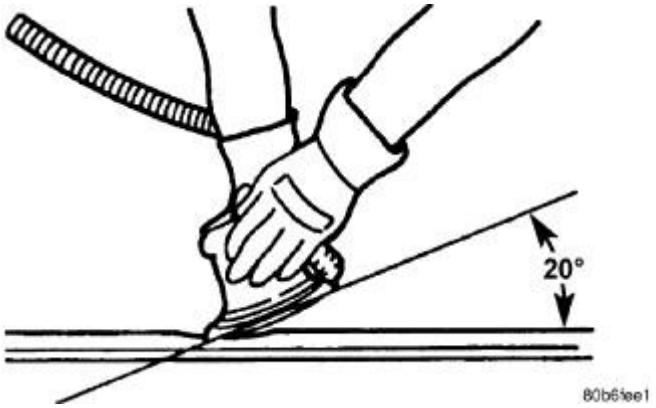

Fig. 4: Beveling Area Around Crack AT 20 Degree Angle
Courtesy of CHRYSLER GROUP, LLC

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

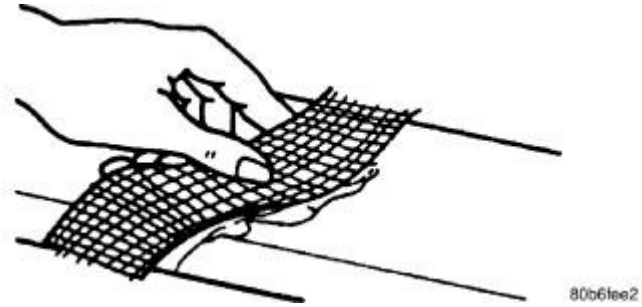

Fig. 5: Identifying Bonding Surface Repair Area
Courtesy of CHRYSLER GROUP, LLC

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength

and appearance without exceeding the value of the replacement part.

- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

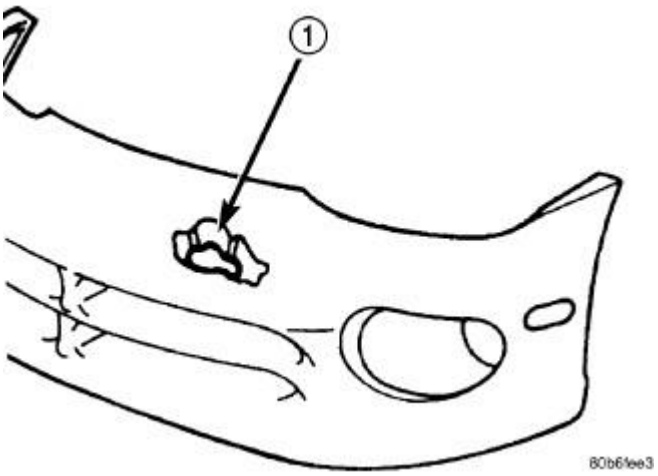

Fig. 6: Identifying Damage Components
Courtesy of CHRYSLER GROUP, LLC

1 - PUNCTURE

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture (1) or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Sand surfaces around repair area with 80 -120 grit sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

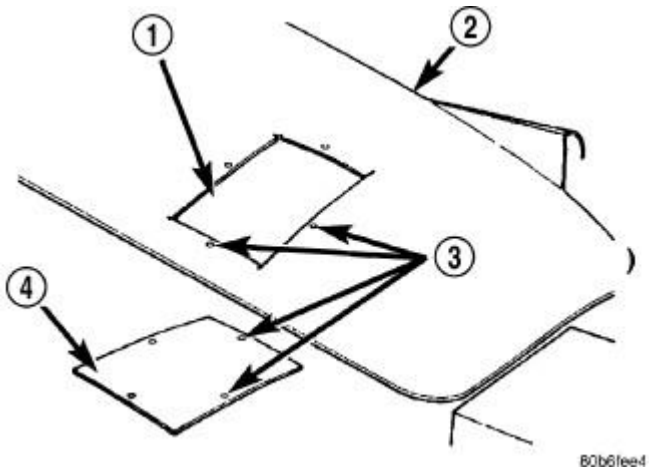

Fig. 7: Identifying Damaged Panel Cutout And Patch
Courtesy of CHRYSLER GROUP, LLC

1 - CUTOUT 2 - DAMAGED BODY PANEL 3 - 4 MM (0.160 IN.) HOLES 4 - PATCH CUT TO SIZE

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

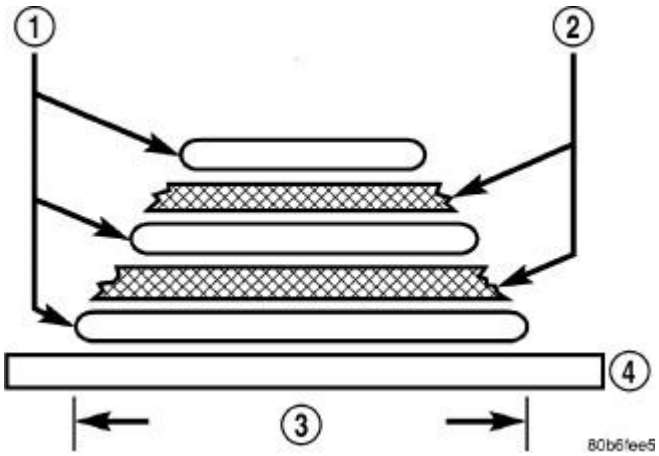

Fig. 8: Identifying Fabricated Panel
Courtesy of CHRYSLER GROUP, LLC

1 - STRUCTURAL ADHESIVE 2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE

3 - WIDTH OF V-GROOVE
4 - WAXED PAPER

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

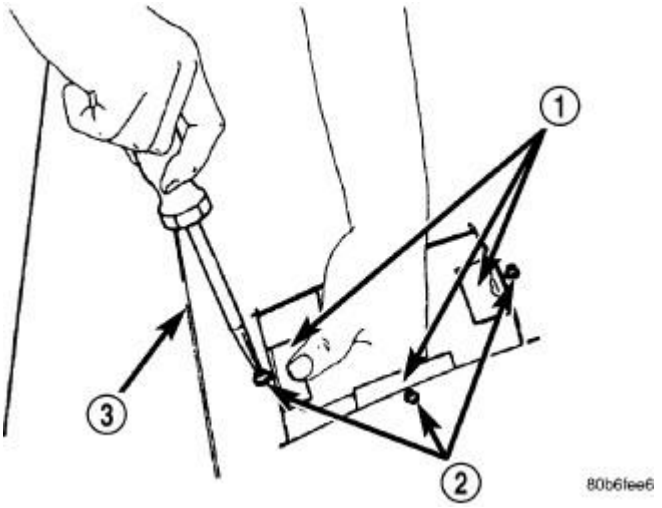

Fig. 9: Securing Support Squares To Body Panel
Courtesy of CHRYSLER GROUP, LLC

1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

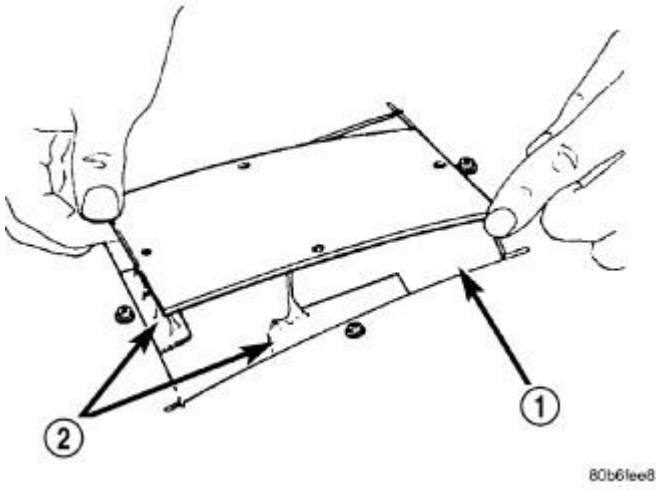

Fig. 10: Identifying Cutout And Support Squares
Courtesy of CHRYSLER GROUP, LLC

1 - CUTOUT 2 - SUPPORT SQUARES

12. Position patch in cutout (1) against support squares (2) and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

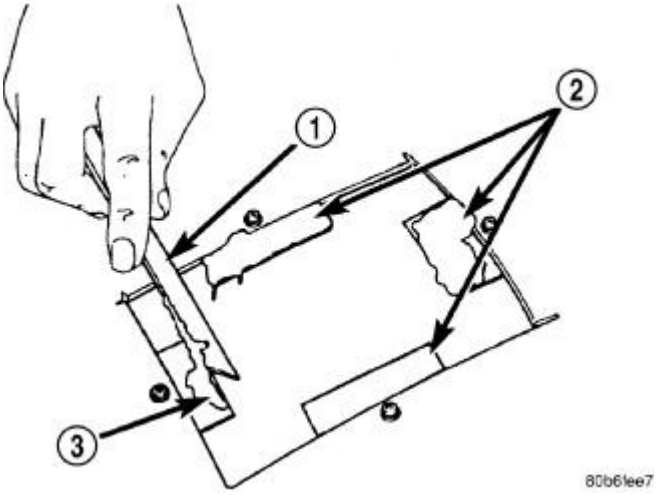

Fig. 11: Applying Adhesive
Courtesy of CHRYSLER GROUP, LLC

1 - APPLICATOR 2 - SUPPORT SQUARES 3 - ADHESIVE

14. Apply a coat of adhesive (3) to the exposed ends of the support squares (2).

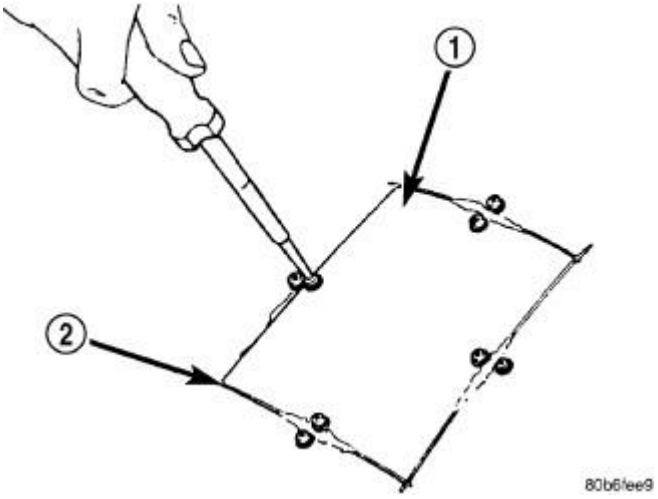

Fig. 12: Applying Coat Of Adhesive To Exposed Ends Of Support Squares
Courtesy of CHRYSLER GROUP, LLC

1 - PATCH 2 - GAP

15. Install screws to hold the patch (1) to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.

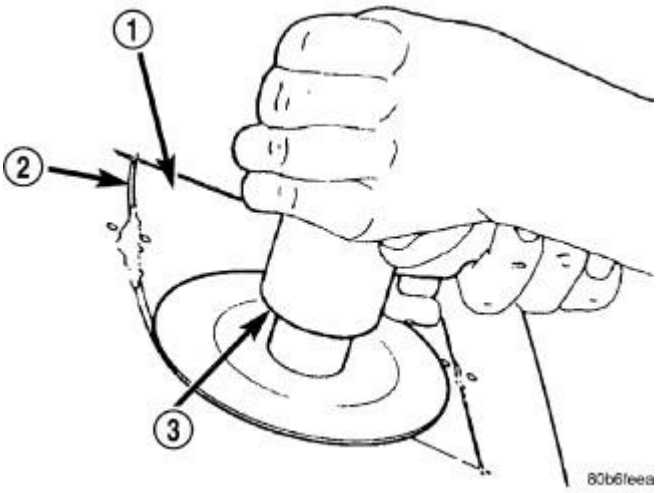

Fig. 13: Grinding Surface
Courtesy of CHRYSLER GROUP, LLC

1 - PATCH 2 - GAP 3 - DISC GRINDER

17. Using a 125 mm (5 in.) 24 grit disc grinder (3), grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 75% -80% deep (original material thickness) path across the gaps (2) around the patch (1). With compressed air, blow dust from around patch.

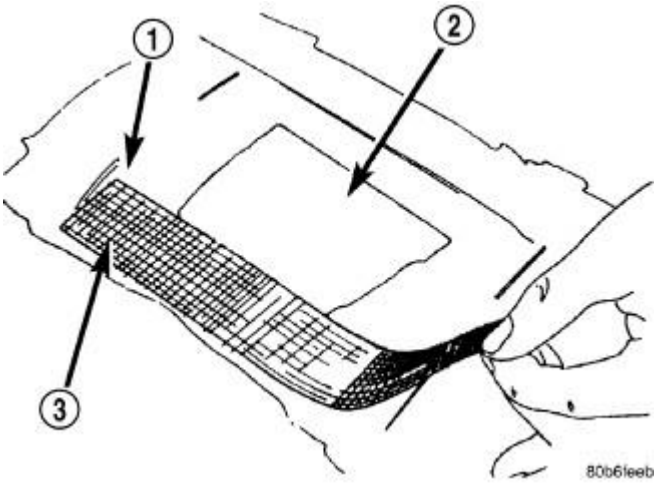

Fig. 14: Covering Gaps With Mesh
Courtesy of CHRYSLER GROUP, LLC

1 - GROUND DOWN AREA 2 - PATCH 3 - MESH

18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.

19. Mix enough adhesive to cover the entire patch area.

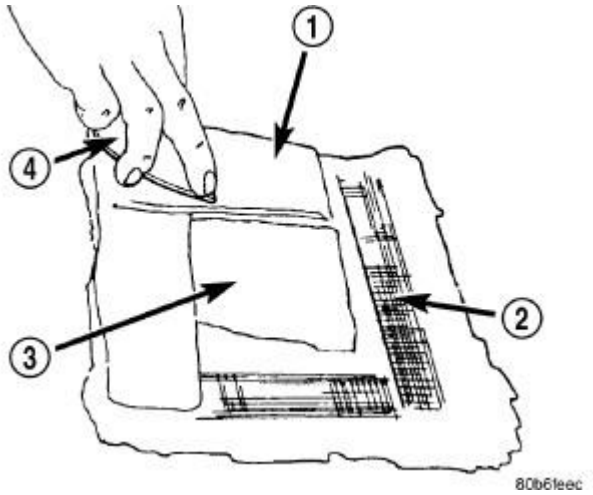

Fig. 15: Applying Adhesive Over Mesh Around Patch
Courtesy of CHRYSLER GROUP, LLC

1 - ADHESIVE
2 - MESH
3 - PATCH
4 - SPREADER

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

SPECIFICATIONS

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After

lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE

ENGINE OIL

- Door Hinges - Hinge Pin and Pivot Contact Areas
- Hood Hinges - Pivot Points
- Liftgate Hinges

MOPAR® SPRAY WHITE LUBE OR EQUIVALENT

- Door Check Straps
- Liftgate Latches
- Liftgate Prop Pivots
- Ash Receiver
- Fuel Filler Door Remote Control Latch Mechanism
- Parking Brake Mechanism
- Sliding Seat Tracks
- Liftgate Latch

MOPAR® Multipurpose GREASE OR EQUIVALENT

- All Other Hood Mechanisms

MOPAR® LOCK CYLINDER LUBRICANT OR EQUIVALENT

- Door Lock Cylinders
- Liftgate Lock Cylinder

DECKLID/HATCH/LIFTGATE/TAILGATE

BUMPER

REMOVAL

LOWER

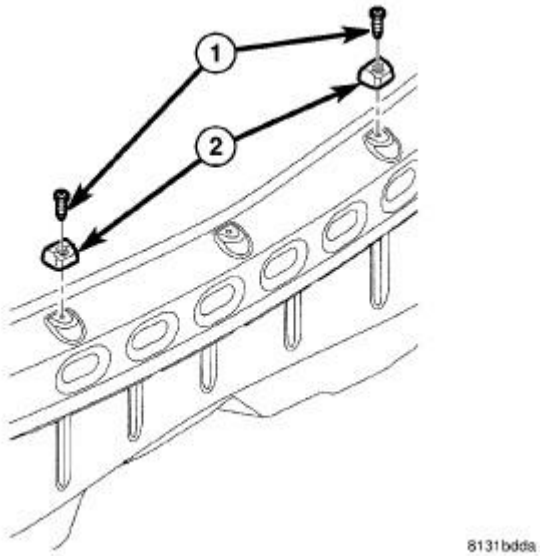

Fig. 16: Lower Decklid Bumpers
Courtesy of CHRYSLER GROUP, LLC

1. Open the deck lid.
2. Remove the push-pin fastener (1) that secures the lower bumper (2) to the rear fascia flange that extends over the deck opening lower panel.
3. Remove the bumper.

UPPER

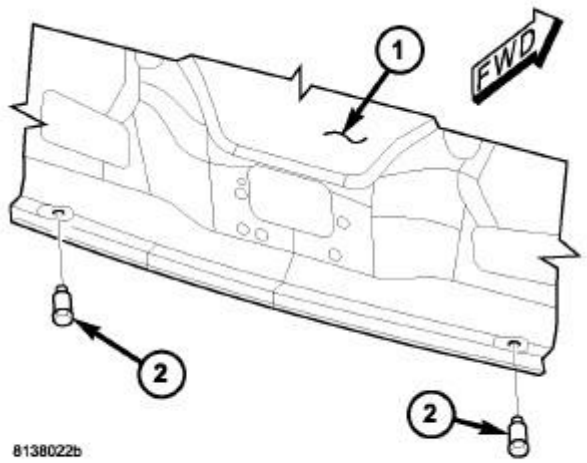

Fig. 17: Upper Decklid Bumpers
Courtesy of CHRYSLER GROUP, LLC

1. Open the deck lid.
2. Unscrew the upper bumper (2) from the lower flange of the deck lid inner panel (1).

INSTALLATION

LOWER

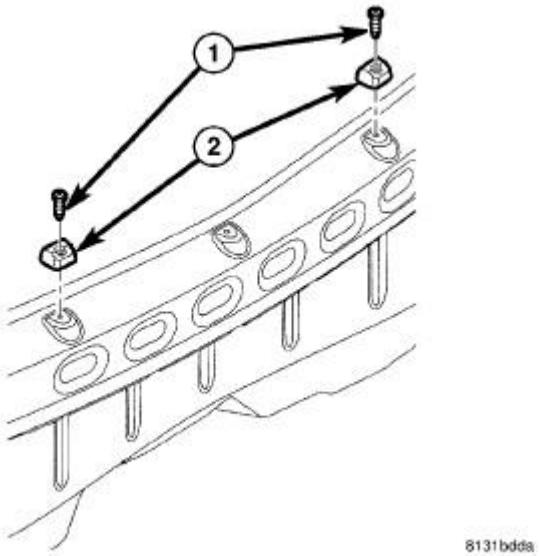

Fig. 18: Lower Decklid Bumpers
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower bumper (2) to the rear fascia flange that extends over the deck opening lower panel.
2. Secure the bumper with a push-pin fastener.
3. Close the deck lid.

UPPER

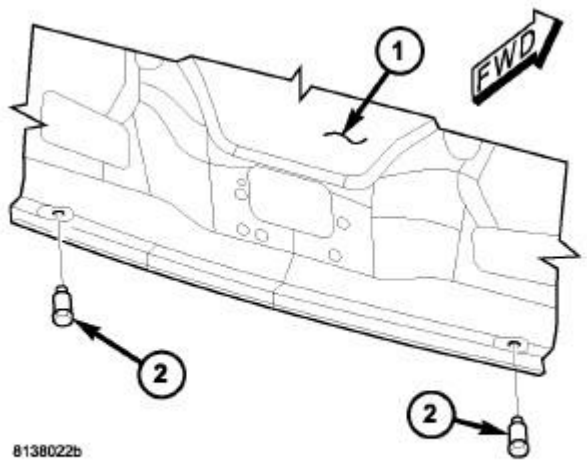

Fig. 19: Upper Decklid Bumpers
Courtesy of CHRYSLER GROUP, LLC

1. Screw the upper bumper (2) into the hole in the lower flange of the deck lid inner panel (1).
2. Thread the bumper in or out of the deck lid as necessary to achieve proper deck lid closing and alignment.
3. Close the deck lid.

DECKLID

REMOVAL

REMOVAL

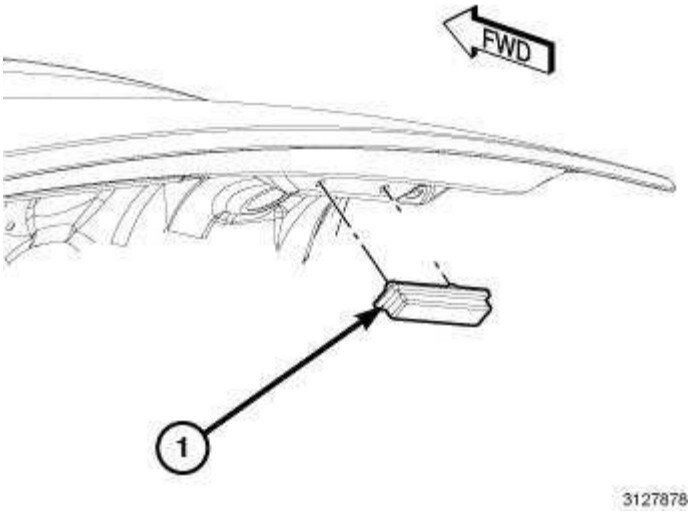

Fig. 20: Trunk Lid Handle

Courtesy of CHRYSLER GROUP, LLC

1. Open the vehicle trunk.
2. Remove the spare tire cover/trunk floor carpet (1) from the spare tire well.
3. Disconnect and isolate the negative cable.
4. Remove the decklid bumper (1). Repeat for the other side.

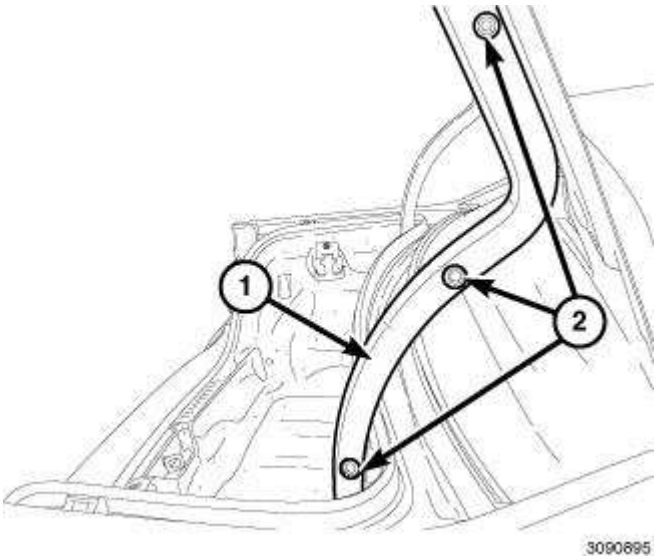

Fig. 21: RH Hinge Trim Push-In Fasteners & Hinge Trim
Courtesy of CHRYSLER GROUP, LLC

5. Remove the hinge trim push-in fasteners (2) and remove the hinge trim (1). If necessary, repeat for the opposite side.

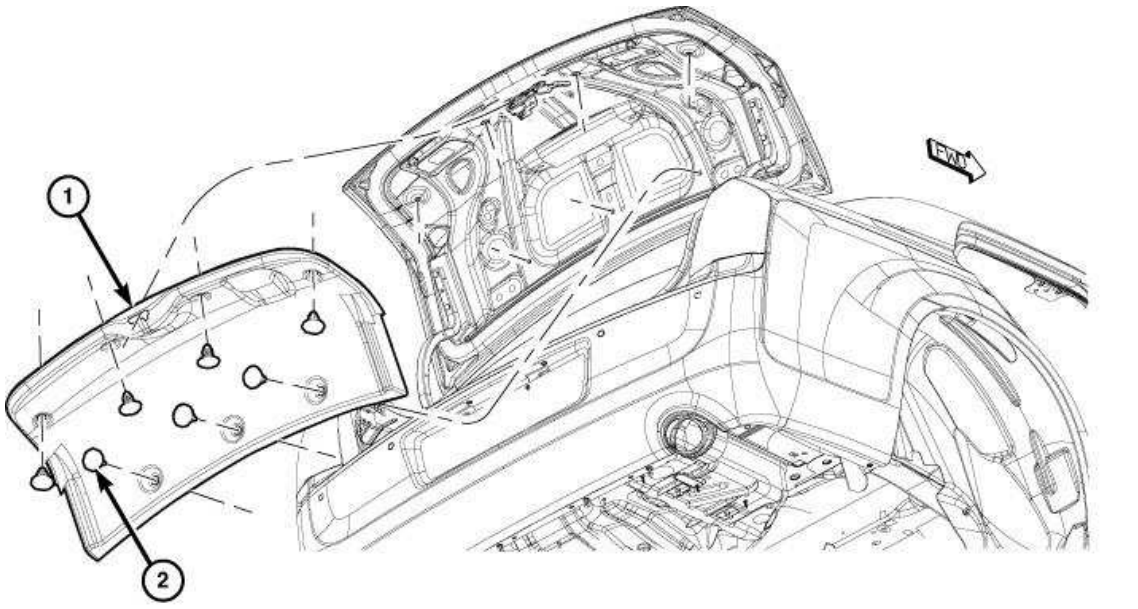

Fig. 22: Push-In Retainers & Decklid Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle must be routed through the deck lid insulator.

6. Remove the push-in retainers (2) securing the deck lid insulator (1) to the decklid.

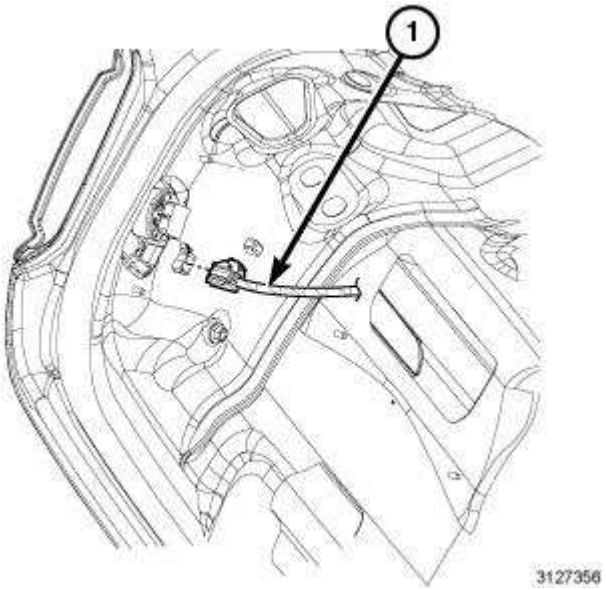

Fig. 23: Lightbar Harness
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect and detach the vehicle to lightbar harness (1) from the decklid.

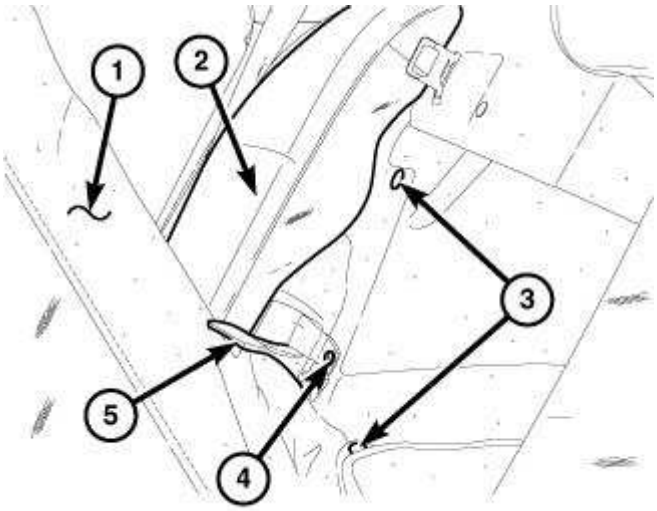

Fig. 24: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Pull the RH rear seat back (1) forward, exposing the luggage compartment. Repeat for the opposite side.
9. Behind the RH rear seat, pull the carpet tab (5) up, exposing the rear seat back side bolster bracket retaining bolt (4). Repeat for the opposite side.
10. Remove the RH rear seat back side bolster bracket bolt (4). Repeat for the opposite side.
11. Remove the push-in fasteners (3) that secure the trunk side trim. Repeat for the opposite side.

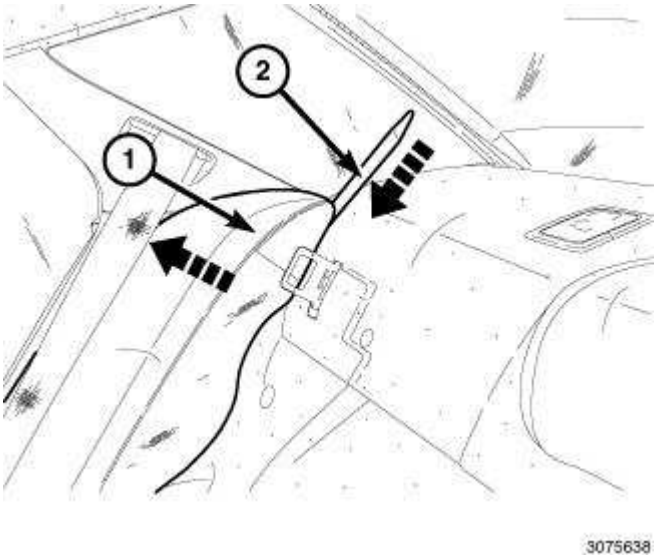

Fig. 25: Trim Stick & Seat Back Bolster
Courtesy of CHRYSLER GROUP, LLC

12. Using a trim stick (special tool #C-4755, Trim Stick) (2) or equivalent, push down between the rear shelf and the RH rear seat back bolster (1) to release the retaining clip, and pull out on the seat back bolster (1) to remove.Repeat for the opposite side.

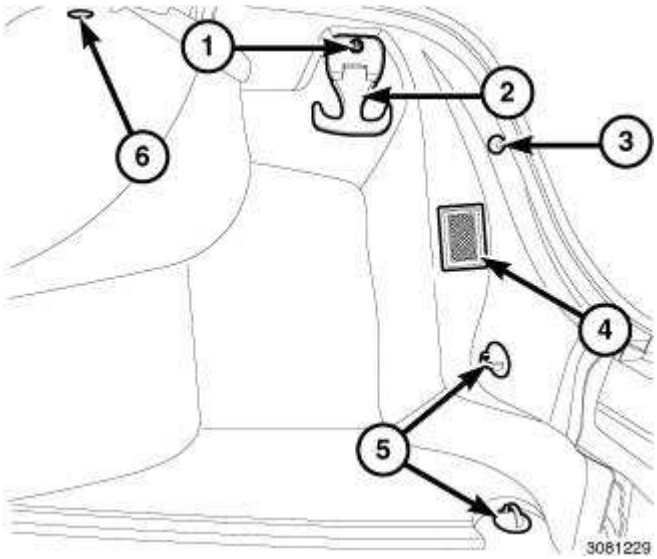

Fig. 26: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

13. Remove the cargo net hook screw (1) and upper cargo hook (2).
14. Remove the push-in retainer (3) that secures the wheel well cover trim.
15. Remove the cargo net lower hooks (5).
16. Carefully pull back the wheel well cover enough to disconnect the trunk lamp (4) harness connector, and remove the wheel well cover trim.
17. Remove the wheel well cover trim from the trunk/cargo area.

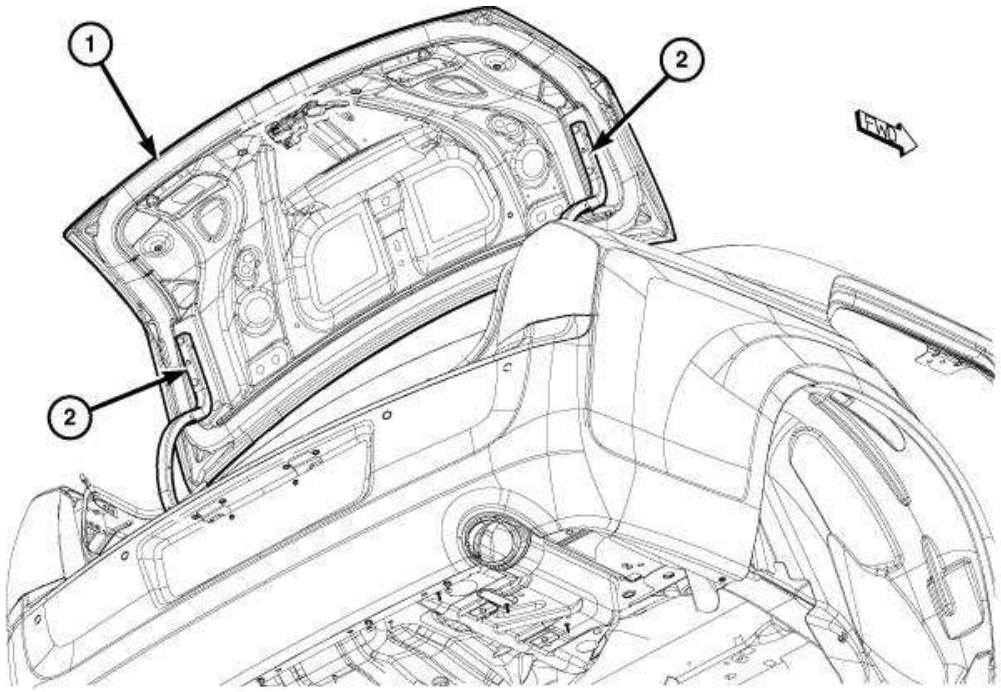

Fig. 27: Hinge Bracket, Deck Lid Inner Panel, Hinge & Decklid
Courtesy of CHRYSLER GROUP, LLC

18. Remove the decklid spring. Refer to **HINGE, REMOVAL** & **HINGE, SPRING, REMOVAL**.
19. Using a china marker/paint pen or equivalent, mark the hinge bracket (2) locations on the deck lid inner panel (1) to aid reinstallation.
20. With the aid of an assistant, remove the bolts attaching the hinge (2) to the decklid (1).
21. Remove the decklid (1).

INSTALLATION

INSTALLATION

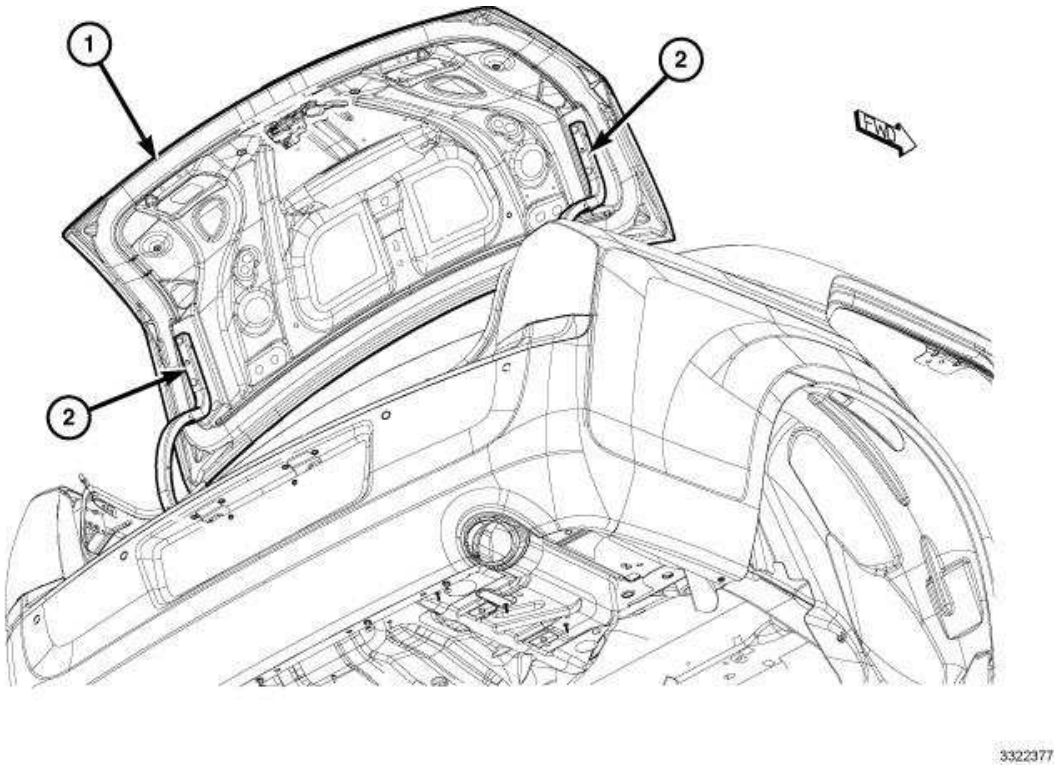

Fig. 28: Hinge Bracket, Deck Lid Inner Panel, Hinge & Decklid
Courtesy of CHRYSLER GROUP, LLC

1. With the aid of an assistant, position the decklid (1) to the springs.
2. Loosely install the bolts attaching the hinge (2) to the decklid (1).
3. Align the decklid to the reference marks where the hinge (2) attaches to the decklid (1).
4. Install and tighten the two bolts that secure the hinge (2) to the deck lid (1). Tighten the screws to 28 N.m (21 ft. lbs.).
5. Install the decklid spring. Refer to **HINGE, INSTALLATION** & **HINGE, SPRING, INSTALLATION**.
6. Adjust the deck lid hinge position as necessary to achieve proper spacing and operation.

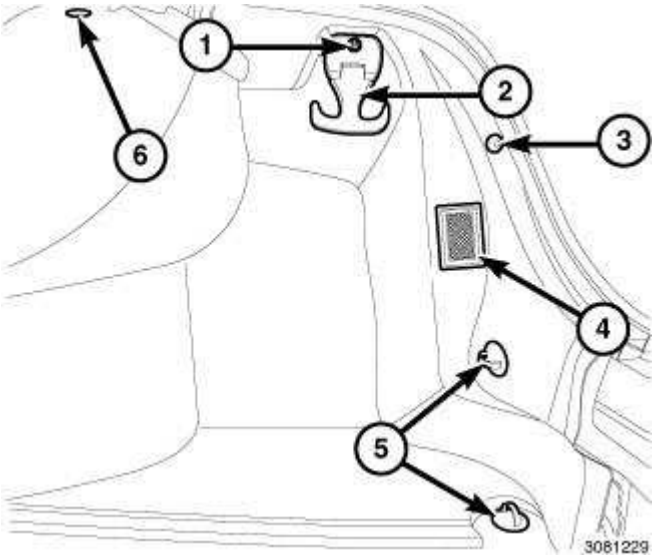

Fig. 29: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

7. Position the wheel well cover trim into the trunk/cargo area.
8. Connect the trunk lamp (4) harness connector.
9. Install the cargo net lower hooks (5).
10. Install the push-in retainer (3) that secures the wheel well cover trim.
11. Install the cargo net hook screw (1) and upper cargo hook (2).

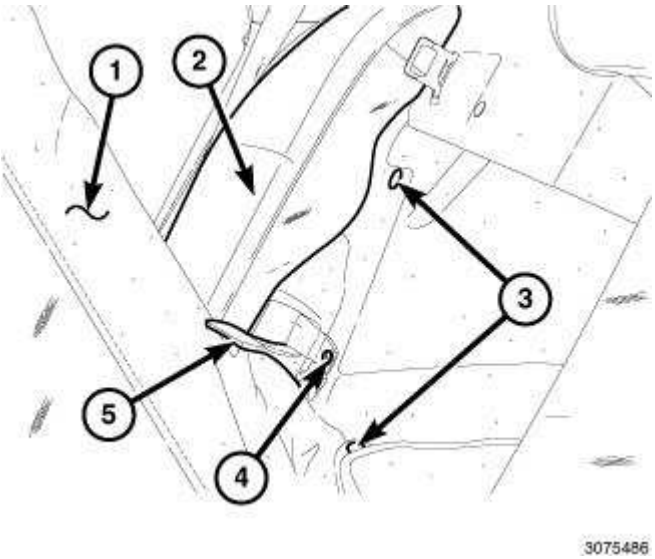

Fig. 30: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

12. Position the rear seat bolster (2), push rearward to engage the retaining clip between the rear

shelf and the bolster.

13. Install the push-in fasteners (3) that secure the trunk side trim. Repeat for the opposite side.
14. Install the RH rear seat back side bolster bracket bolt (4). Repeat for the opposite side.

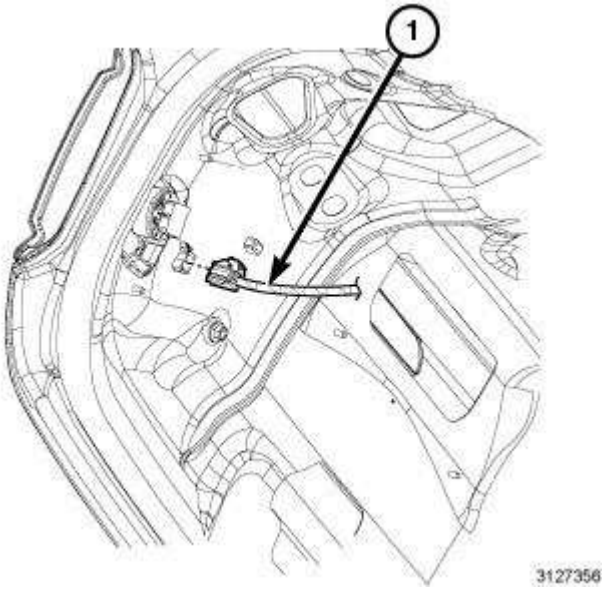

Fig. 31: Lightbar Harness
Courtesy of CHRYSLER GROUP, LLC

15. Connect and attach the vehicle to lightbar harness (1) to the decklid.

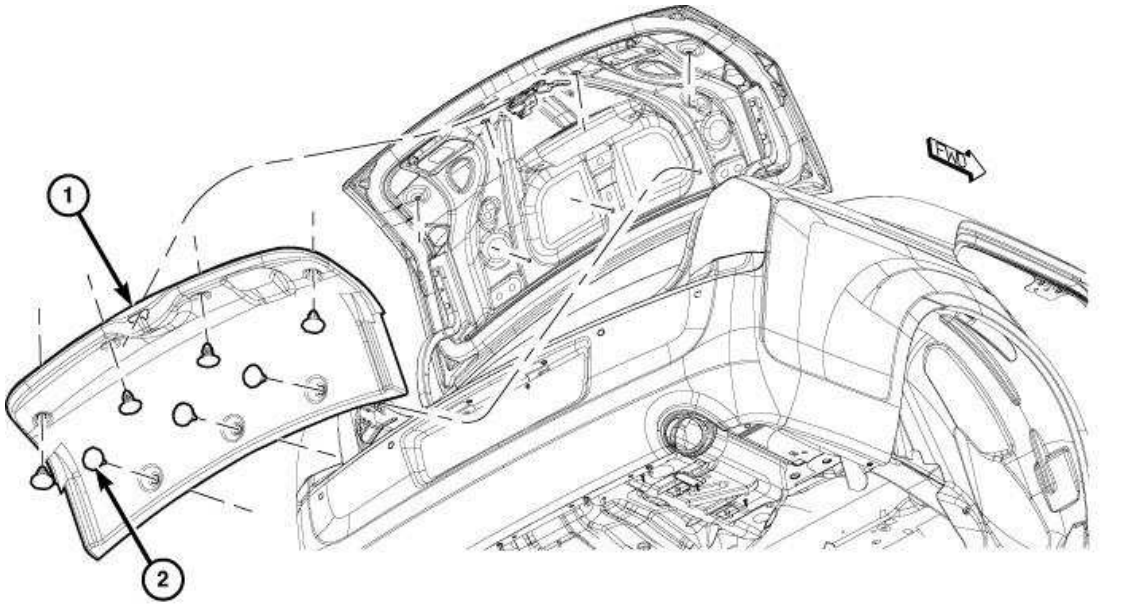

Fig. 32: Push-In Retainers & Decklid Cover

Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle (2) must be routed through the deck lid insulator.

16. Position the decklid insulator.
17. Install the push-in retainers (3) securing the decklid insulator (1) to the decklid.

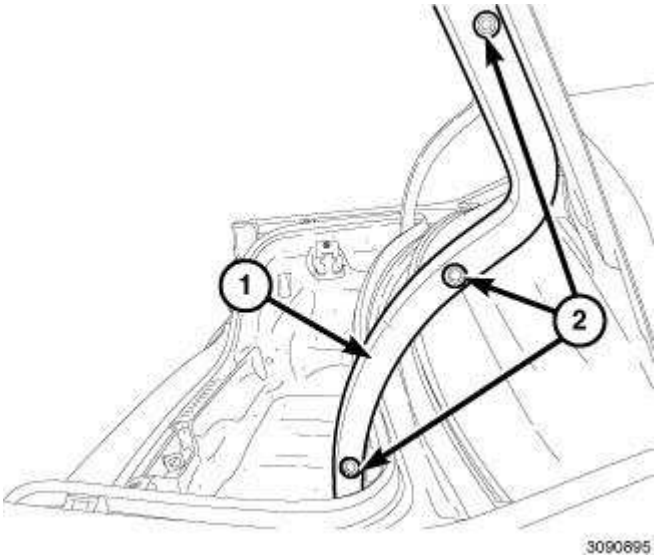

Fig. 33: RH Hinge Trim Push-In Fasteners & Hinge Trim
Courtesy of CHRYSLER GROUP, LLC

18. Position the hinge trim (1) to the hinge.
19. Install the hinge trim push-in fasteners (2). If necessary, repeat for the opposite side.

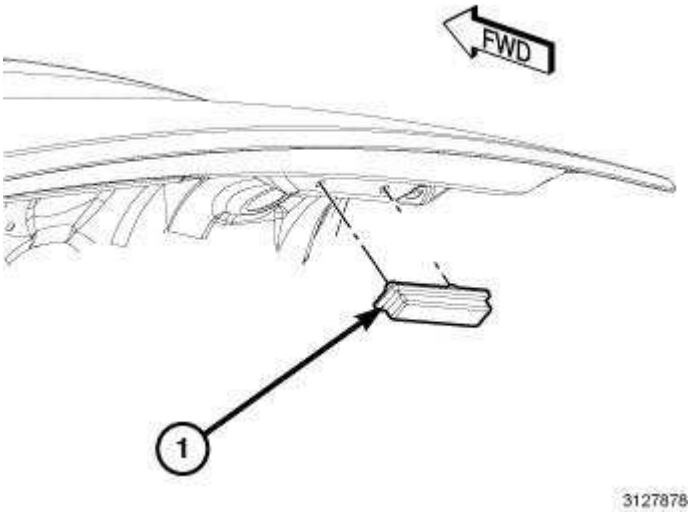

Fig. 34: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

20. Install the decklid bumper (1). Repeat for the other side.
21. Disconnect and isolate the battery negative cable.
22. Install the spare tire cover/trunk floor carpet over the spare tire well.
23. Close the vehicle trunk.

HINGE

REMOVAL

REMOVAL

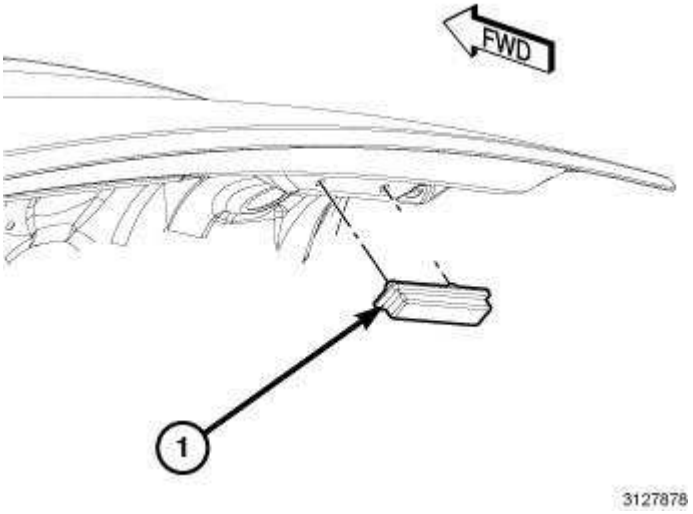

Fig. 35: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

1. Open the vehicle trunk.
2. Remove the spare tire cover/trunk floor carpet from the spare tire well.
3. Disconnect and isolate the negative cable.
4. Remove the decklid bumper (1). Repeat for the other side.

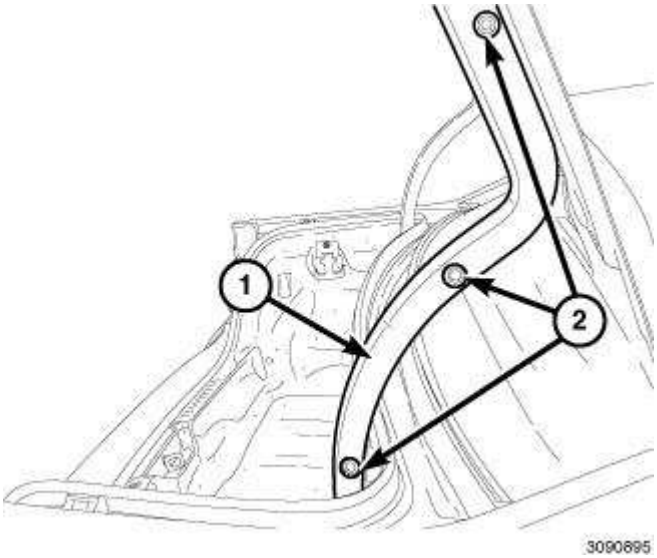

Fig. 36: RH Hinge Trim Push-In Fasteners & Hinge Trim

8. Pull the RH rear seat back (1) forward, exposing the luggage compartment. Repeat for the opposite side.
9. Behind the RH rear seat, pull the carpet tab (5) up, exposing the rear seat back side bolster bracket retaining bolt (4). Repeat for the opposite side.
10. Remove the RH rear seat back side bolster bracket bolt (4). Repeat for the opposite side.

11. Remove the push-in fasteners (3) that secure the trunk side trim. Repeat for the opposite side.

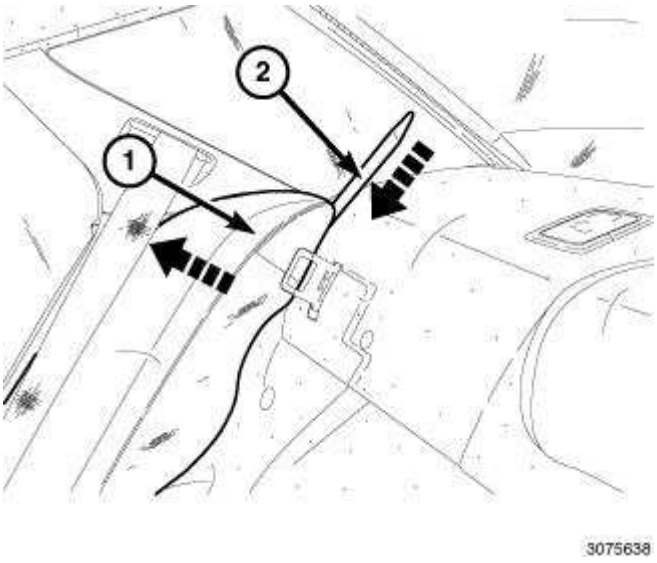

Fig. 40: Trim Stick & Seat Back Bolster
Courtesy of CHRYSLER GROUP, LLC

12. Using a trim stick (special tool #C-4755, Trim Stick) (2) or equivalent, push down between the rear shelf and the RH rear seat back bolster (1) to release the retaining clip, and pull out on the seat back bolster (1) to remove. Repeat for the opposite side.

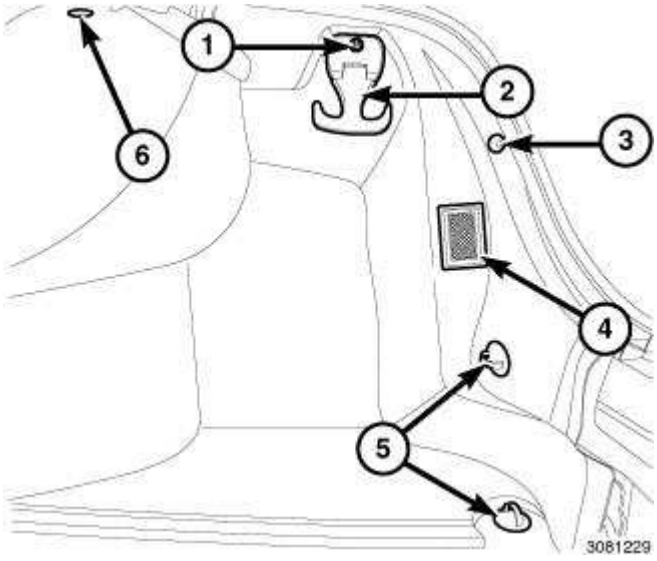

Fig. 41: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

13. Remove the cargo net hook screw (1) and upper cargo hook (2).
14. Remove the push-in retainer (3) that secures the wheel well cover trim.

15. Remove the cargo net lower hooks (5).
16. Carefully pull back the wheel well cover enough to disconnect the trunk lamp (4) harness connector, and remove the wheel well cover trim.
17. Remove the wheel well cover trim from the trunk/cargo area.

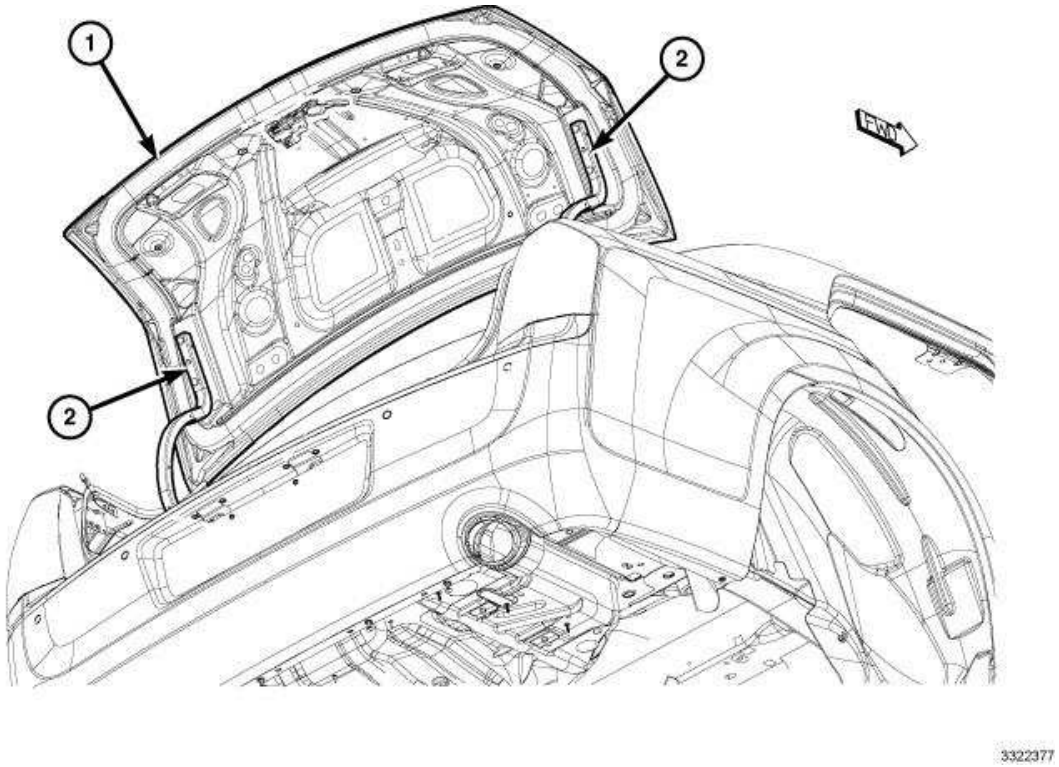

Fig. 42: Hinge Bracket, Deck Lid Inner Panel, Hinge & Decklid
Courtesy of CHRYSLER GROUP, LLC

18. Remove the decklid spring. Refer to **HINGE, REMOVAL** & **HINGE, SPRING, REMOVAL**.
19. Using a china marker/paint pen or equivalent, draw reference marks where the hinge (2) attaches to the decklid (1).
20. With the aid of an assistant, remove the bolts attaching the hinge (2) to the decklid (1).
21. Remove the decklid (1).

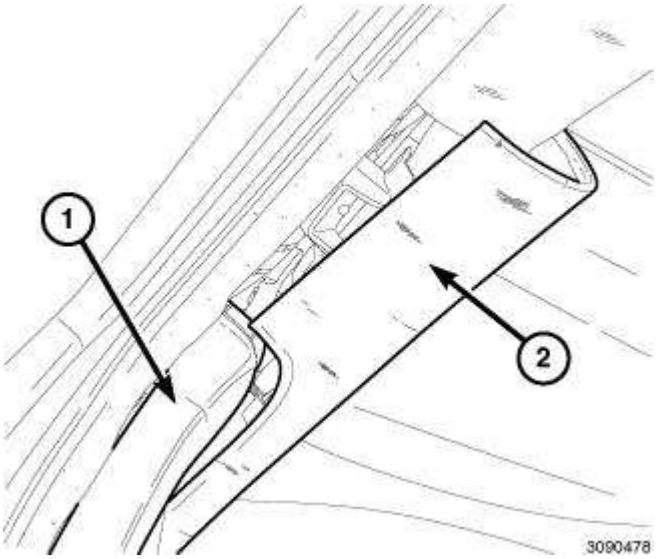

Fig. 43: Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

22. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, remove the quarter trim panel (2). Repeat on the opposite side.

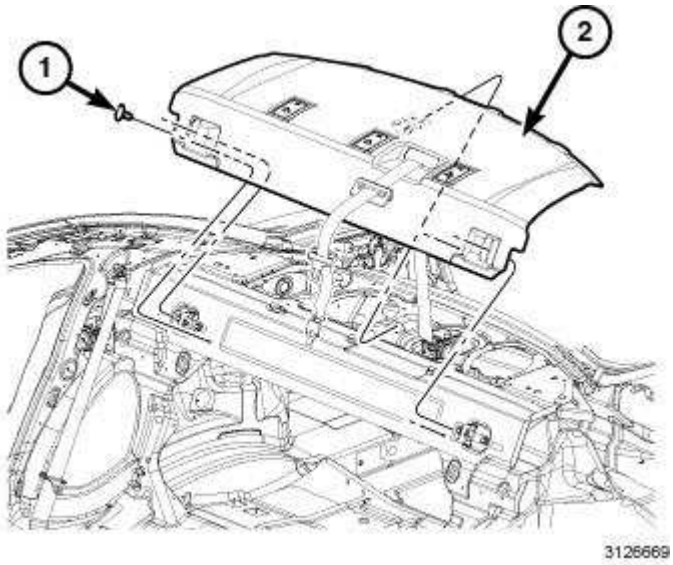

Fig. 44: Push Pin Fastener & Tray Trim Panel
Courtesy of CHRYSLER GROUP, LLC

23. Remove the push pin fastener (1) securing the package tray trim panel (2). Repeat on opposite side.
24. Pull the package tray trim panel (2) forward to disengage the retaining clip.
25. Position the package tray trim panel (2) away from the package tray.

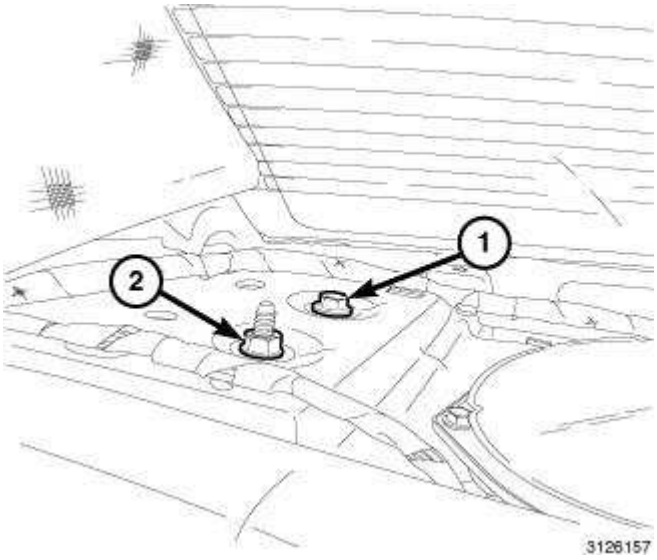

Fig. 45: Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

26. Remove the bolt (1) and the nut (2) securing the hinge to the package tray.
27. Remove the hinge from the vehicle.

INSTALLATION

INSTALLATION

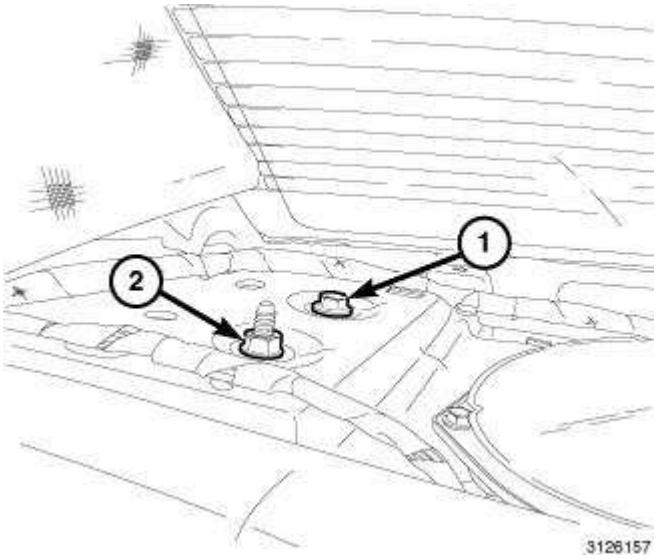

Fig. 46: Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

1. Position the hinge into the package tray.

2. Remove the bolt (1) and the nut (2) securing the hinge to the package tray. Tighten the bolt and nut to 28 N.m (21 ft. lbs.).

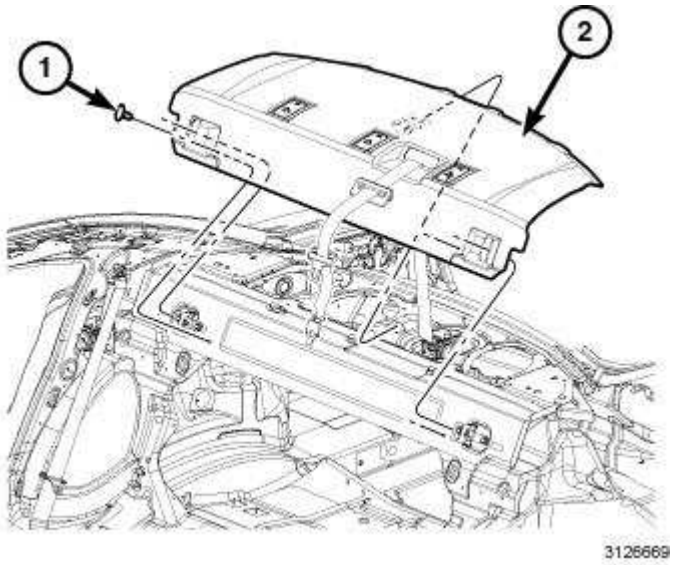

Fig. 47: Push Pin Fastener & Tray Trim Panel
Courtesy of CHRYSLER GROUP, LLC

3. Position the package tray trim panel (2) towards the package tray.
4. Push the package tray trim panel (2) rearward to engage the retaining clip.
5. Install the push pin fastener (1) securing the package tray trim panel (2). Repeat on opposite side.

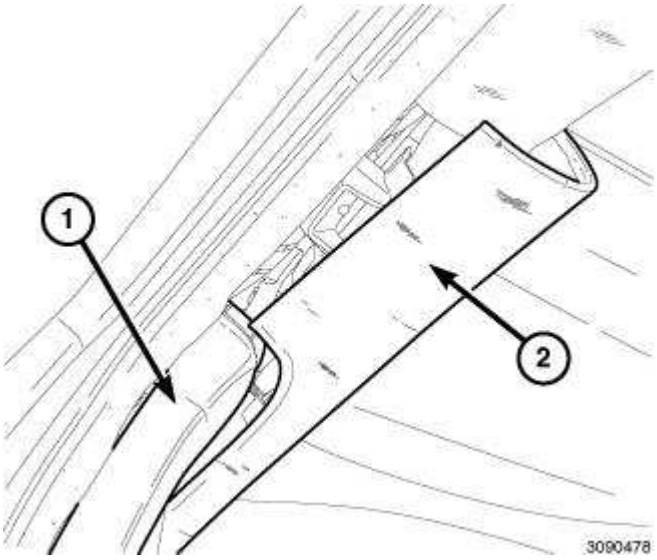

Fig. 48: Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

6. Install the quarter trim panel (2). Repeat on the opposite side.

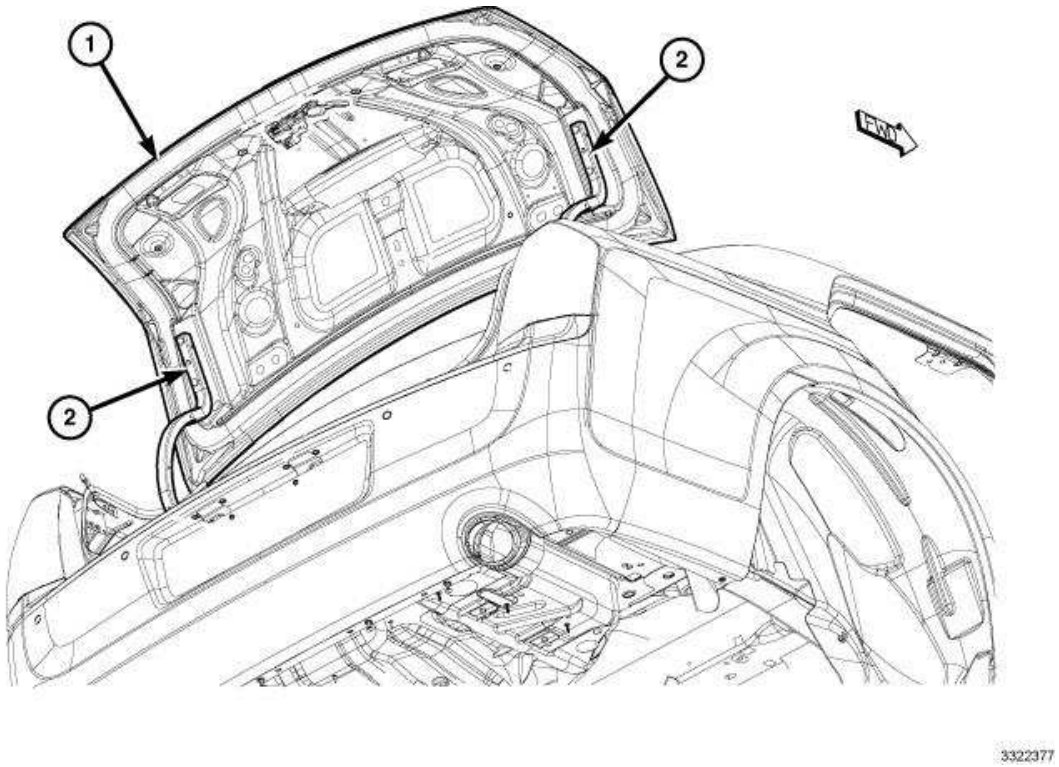

Fig. 49: Hinge Bracket, Deck Lid Inner Panel, Hinge & Decklid
Courtesy of CHRYSLER GROUP, LLC

7. With the aid of an assistant, position the decklid (1) to the springs.
8. Loosely install the bolts attaching the hinge (2) to the decklid (1).
9. Align the decklid to the reference marks where the hinge (2) attaches to the decklid (1).
10. Install and tighten the two bolts that secure the hinge (2) to the deck lid (1). Tighten the screws to 28 N.m (21 ft. lbs.).
11. Install the decklid spring. Refer to **HINGE, INSTALLATION** & **HINGE, SPRING, INSTALLATION**.
12. Adjust the deck lid hinge position as necessary to achieve proper spacing and operation.

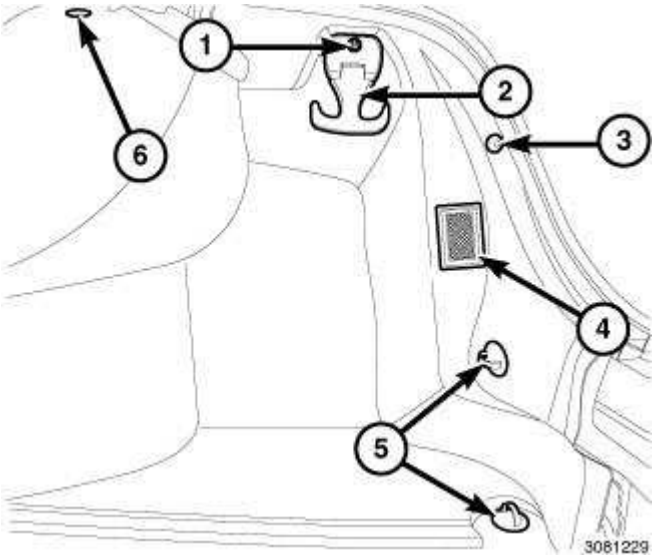

Fig. 50: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

13. Position the wheel well cover trim into the trunk/cargo area.
14. Connect the trunk lamp (4) harness connector.
15. Install the cargo net lower hooks (5).
16. Install the push-in retainer (3) that secures the wheel well cover trim.
17. Install the cargo net hook screw (1) and upper cargo hook (2).

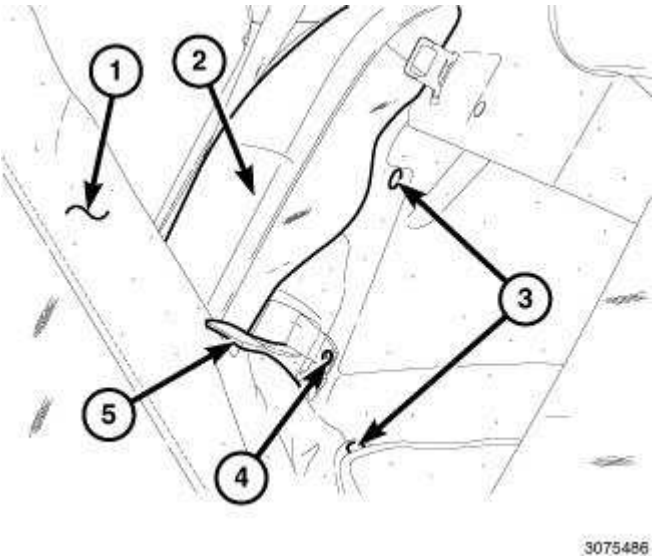

Fig. 51: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

18. Position the rear seat bolster (2), push rearward to engage the retaining clip between the rear

shelf and the bolster.

19. Install the push-in fasteners (3) that secure the trunk side trim. Repeat for the opposite side.
20. Install the RH rear seat back side bolster bracket bolt (4). Repeat for the opposite side.

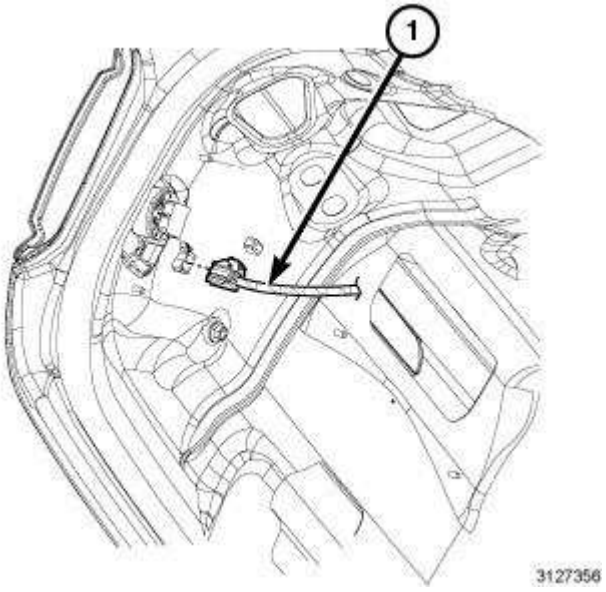

Fig. 52: Lightbar Harness
Courtesy of CHRYSLER GROUP, LLC

21. Connect and attach the vehicle to lightbar harness (1) to the decklid.

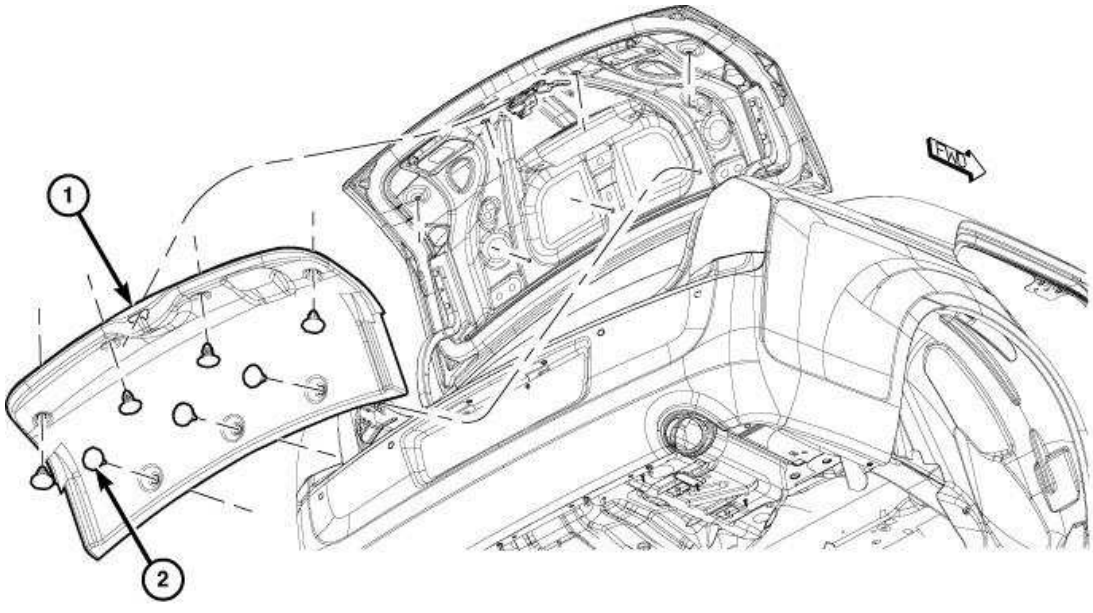

Fig. 53: Push-In Retainers & Decklid Cover

Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle (2) must be routed through the deck lid insulator.

22. Position the decklid insulator.
23. Install the push-in retainers (3) securing the decklid insulator (1) to the decklid.

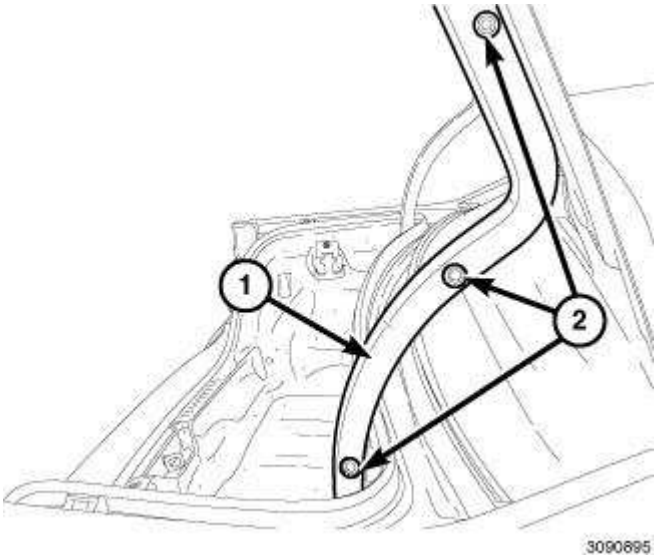

Fig. 54: RH Hinge Trim Push-In Fasteners & Hinge Trim
Courtesy of CHRYSLER GROUP, LLC

24. Position the hinge trim (1) to the hinge.
25. Install the hinge trim push-in fasteners (2). If necessary, repeat for the opposite side.

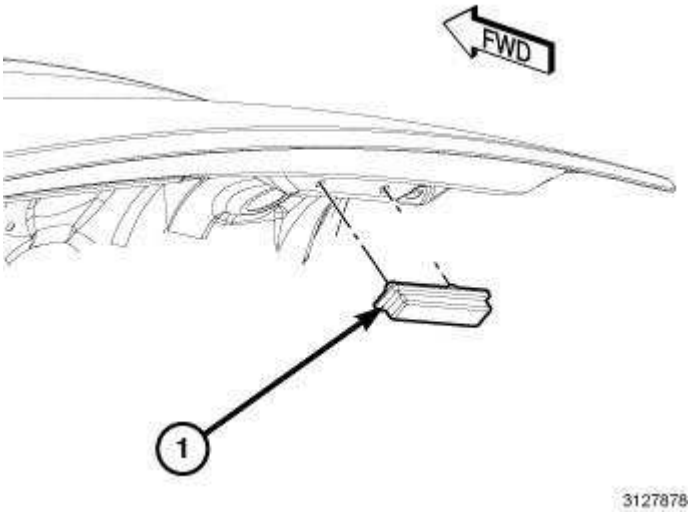

Fig. 55: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

26. Install the decklid bumper (1). Repeat for the other side.
27. Connect the battery negative cable.
28. Install the spare tire cover/trunk floor carpet over the spare tire well.
29. Close the vehicle trunk.

HINGE, SPRING

REMOVAL

REMOVAL

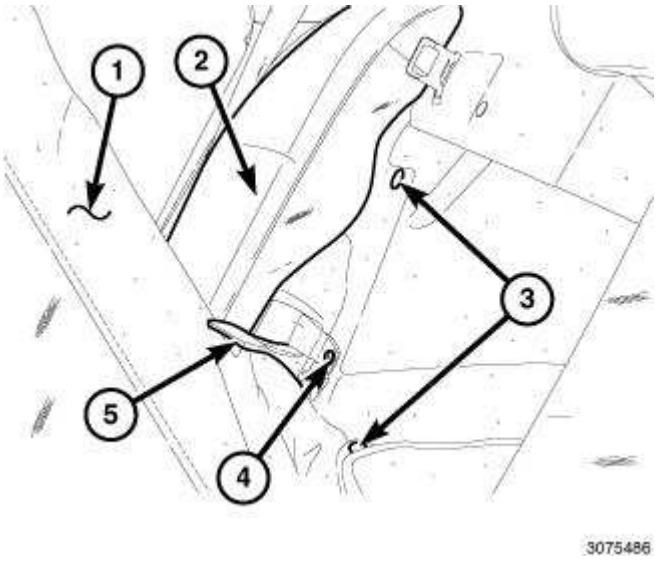

Fig. 56: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Open the decklid.
2. Remove the spare tire cover/trunk floor carpet and disconnect the negative battery cable.
3. Pull the RH rear seat back (1) forward, exposing the luggage compartment. Repeat for the opposite side.
4. Behind the RH rear seat, pull the carpet tab (5) up, exposing the rear seat back side bolster bracket retaining bolt (4). Repeat for the opposite side.
5. Remove the RH rear seat back side bolster bracket bolt (4). Repeat for the opposite side.
6. Remove the push-in fasteners (3) that secure the trunk side trim. Repeat for the opposite side.

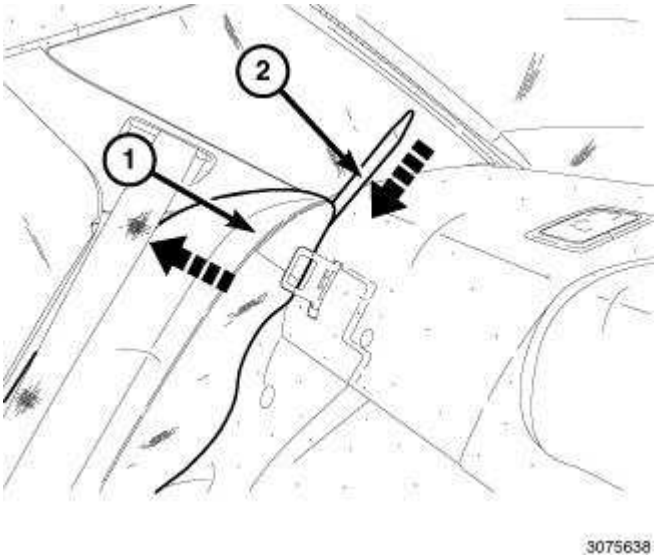

Fig. 57: Trim Stick & Seat Back Bolster
Courtesy of CHRYSLER GROUP, LLC

7. Using a trim stick (special tool #C-4755, Trim Stick) (2) or equivalent, push down between the rear shelf and the RH rear seat back bolster (1) to release the retaining clip, and pull out on the seat back bolster (1) to remove. Repeat for the opposite side.

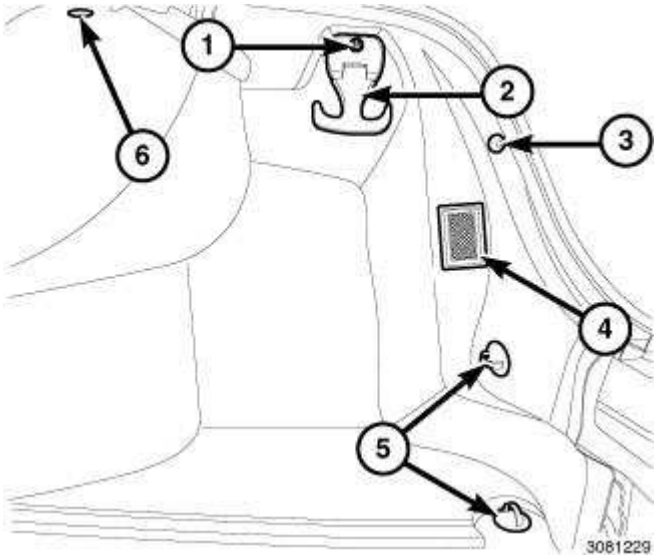

Fig. 58: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

8. Remove the cargo net hook screw (1) and upper cargo hook (2).
9. Remove the push-in retainer (3) that secures the wheel well cover trim.
10. Remove the cargo net lower hooks (5).

11. Carefully pull back the wheel well cover enough to disconnect the trunk lamp (4) harness connector, and remove the wheel well cover trim.
12. Remove the wheel well cover trim from the trunk/cargo area.

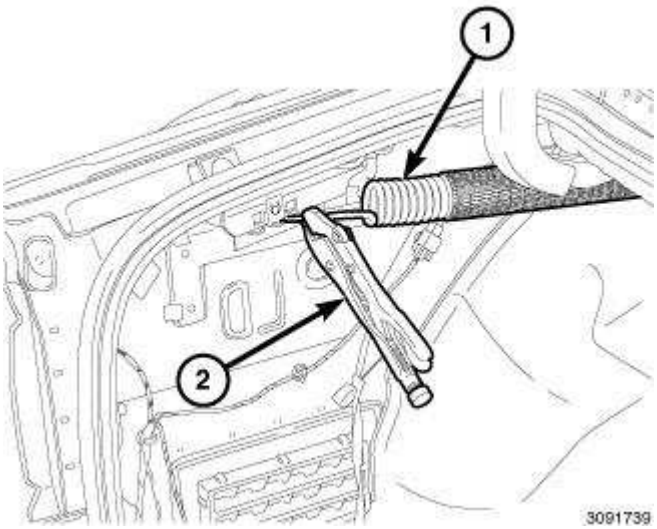

Fig. 59: Spring & Vise Grips
Courtesy of CHRYSLER GROUP, LLC

13. Using a china marker or equivalent, mark the forward and rearward decklid spring attachment locations on the spring (1) and it's respective brackets.
14. Support the decklid with a suitable prop or block to prevent it from closing.
15. Remove the gas prop. Refer to **PROP, GAS, REMOVAL**.
16. Using electrical tape, apply four to six wraps of tape near the rear of the decklid spring (1).

NOTE: Prior to tape application, make sure there is enough clearance to insert tool.

17. Using vise grips, clamp the vise grips (2) on the tape wrapped area of the spring (1).

CAUTION: Apply enough pressure to ensure a firm grip. Do not over-tighten as damage to the spring may occur.

18. Using the vise grips (2), pull rearward and inward towards the center of the vehicle to disengage the spring (1) from the rear bracket.
19. Remove the spring (1) from the front bracket.
20. If necessary, repeat for the opposite side.

INSTALLATION

INSTALLATION

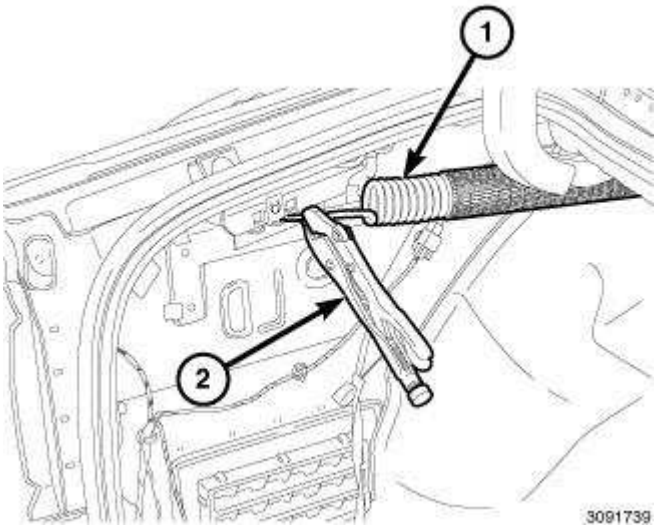

Fig. 60: Spring & Vise Grips
Courtesy of CHRYSLER GROUP, LLC

1. Using the reference marks made in the removal steps, install the spring (1) into the front bracket.
2. Using the vise grips (2) and the reference marks made in the removal steps, pull rearward and outward towards the vehicle side to engage the spring (1) into the rear bracket.
3. Remove the vise grips (2) from the spring.
4. Remove the tape wrap from the spring (1).
5. Install the gas prop, Refer to **PROP, GAS, INSTALLATION**.

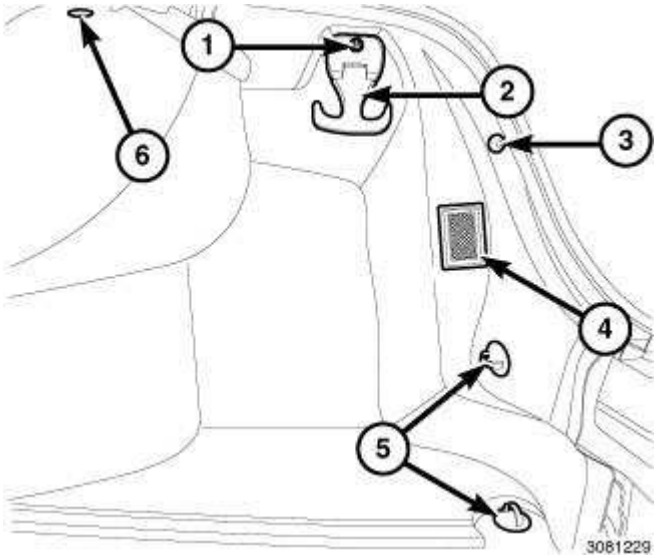

Fig. 61: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH shown in illustration, LH typical.

6. Position the wheel well cover trim into the trunk/cargo area.
7. Connect the trunk lamp (4) harness connector.
8. Install the cargo net lower hooks (5).
9. Install the push-in retainer (3) that secures the wheel well cover trim.
10. Install the cargo net hook screw (1) and upper cargo hook (2).

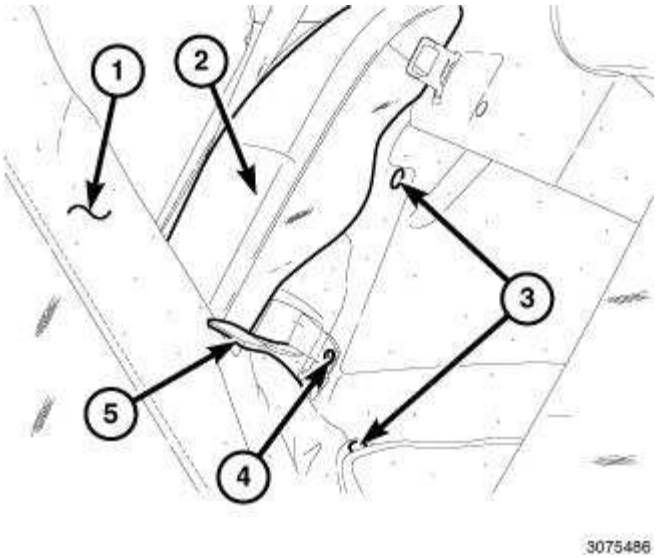

Fig. 62: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Position the rear seat bolster (2), push rearward to engage the retaining clip between the rear shelf and the bolster.
12. Install the push-in fasteners (3) that secure the trunk side trim. Repeat for the opposite side.
13. Install the RH rear seat back side bolster bracket bolt (4). Repeat for the opposite side.
14. If necessary, repeat for the opposite side.
15. Remove the decklid support prop/block.
16. Connect the negative battery cable.
17. Install the spare tire cover/trunk floor carpet over the spare tire well and close the decklid.

LATCH

REMOVAL

REMOVAL

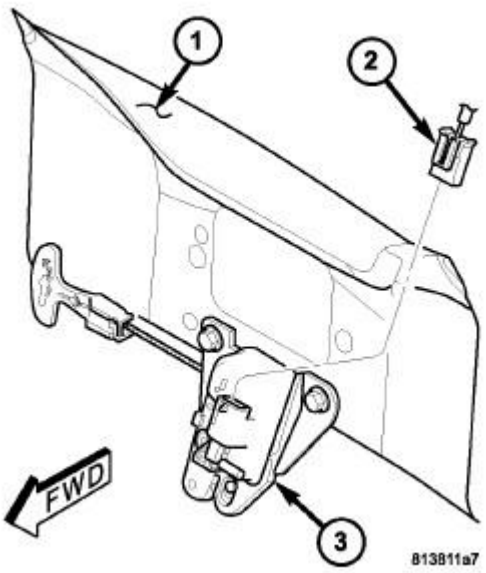

Fig. 63: Deck Lid
Courtesy of CHRYSLER GROUP, LLC

1. Open the deck lid.
2. Disconnect and isolate the battery negative cable.
3. Remove the cover from over the latch on the inside of the deck lid.
4. Disconnect the connector (2) of the body wire harness take out for the deck lid (1) from the latch connector receptacle (3).

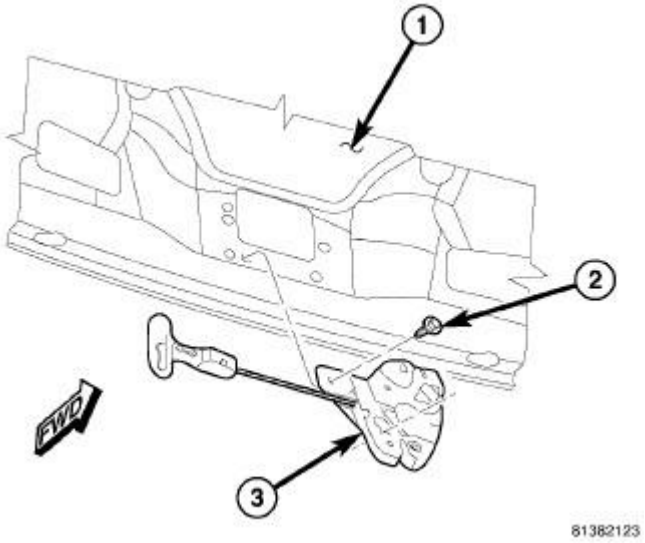

Fig. 64: Latch

Courtesy of CHRYSLER GROUP, LLC

5. Remove the two screws (2) that secure the latch (3) to the inside of the deck lid (1).
6. Remove the latch from the inside of the deck lid.

INSTALLATION

INSTALLATION

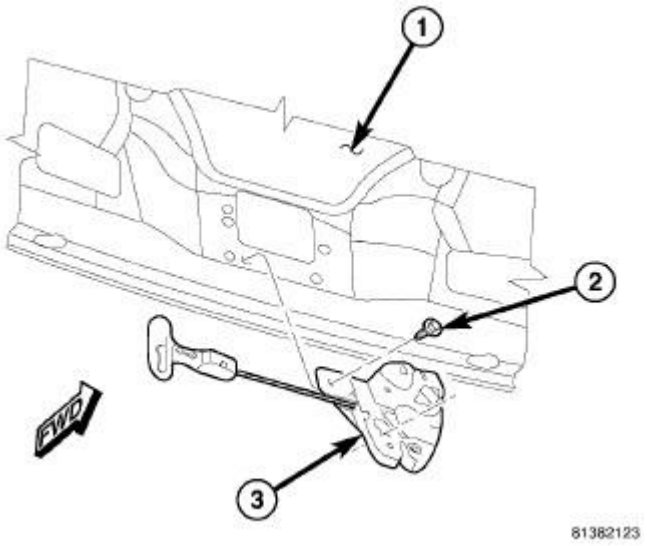

Fig. 65: Latch
Courtesy of CHRYSLER GROUP, LLC

1. Position the latch (3) to the inside of the deck lid (1).
2. Install and tighten the two screws (2) that secure the latch to the inside of the deck lid. Tighten the screws to 8 N.m (71 in. lbs.).

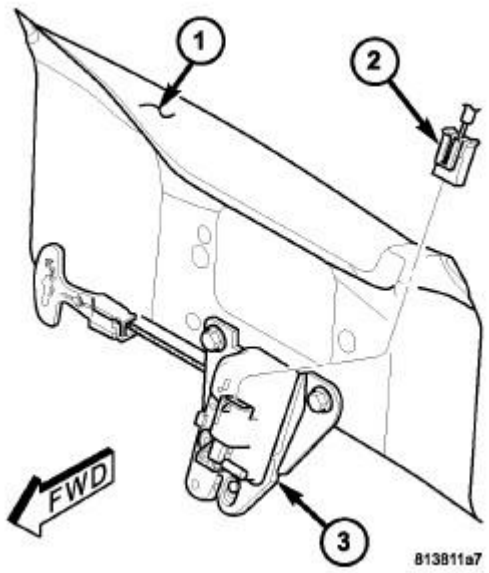

Fig. 66: Deck Lid
Courtesy of CHRYSLER GROUP, LLC

3. Reconnect the connector (2) of the body wire harness take out for the deck lid (1) to the latch connector receptacle (3).
4. Reinstall the cover over the latch on the inside of the deck lid.
5. Reconnect the battery negative cable.
6. Close the deck lid.

PROP, GAS

REMOVAL

REMOVAL

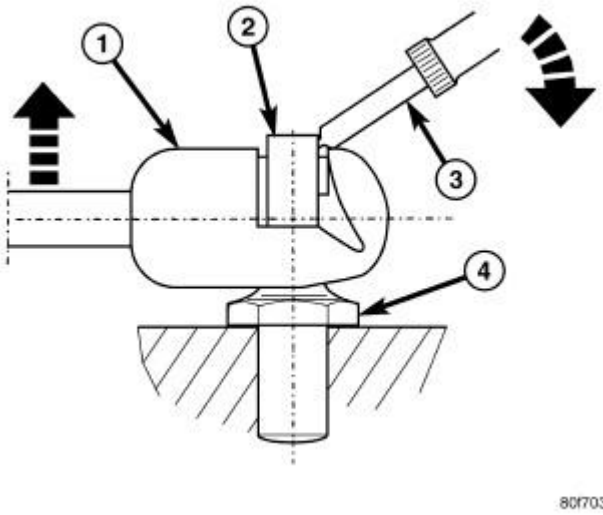

Fig. 67: Removing PDU Ball Socket From Ball Stud
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH shown in illustration, RH typical.

1. Open and support the deck lid with a suitable prop or block.

WARNING: To avoid personal injury or death, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of deck lid support.

2. Insert a small flat-bladed tool (3) into the notch on the outer face of one ball socket end (1) of the support cylinder and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the deck lid hinge.
3. Release the retaining clip to its installed position.

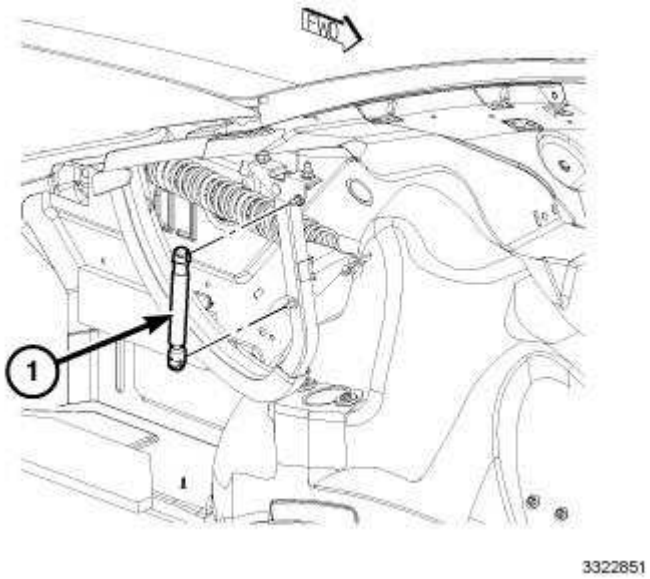

Fig. 68: Support Cylinder
Courtesy of CHRYSLER GROUP, LLC

4. Remove the support cylinder (1) from the deck lid hinge.

INSTALLATION

INSTALLATION

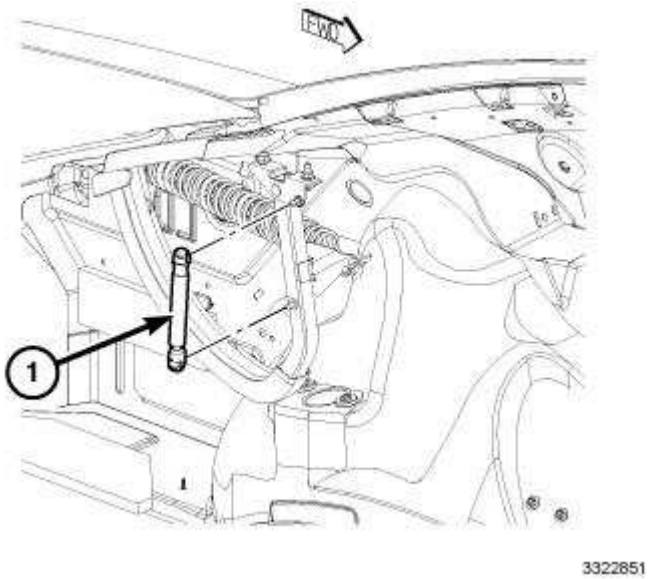

Fig. 69: Support Cylinder
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH shown in illustration, RH typical.

1. Position the ball socket on the cylinder end of the support cylinder (1) to the ball stud on the

upper bracket of the deck lid hinge.

2. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
3. Position the ball socket on the rod end of the support cylinder to the ball stud on the lower bracket of the deck lid hinge.
4. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
5. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
6. Remove the service prop or block and close the deck lid.

SPOILER, DECKLID

REMOVAL

REMOVAL

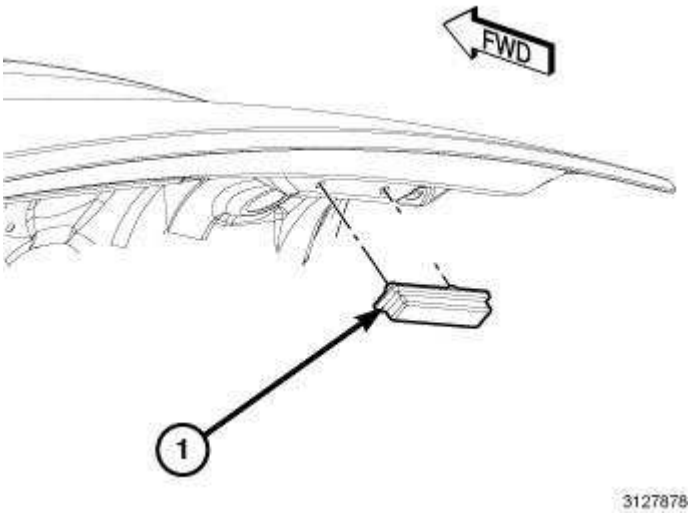

Fig. 70: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

1. Open the vehicle trunk.
2. Remove the decklid bumper (1). Repeat for the other side.

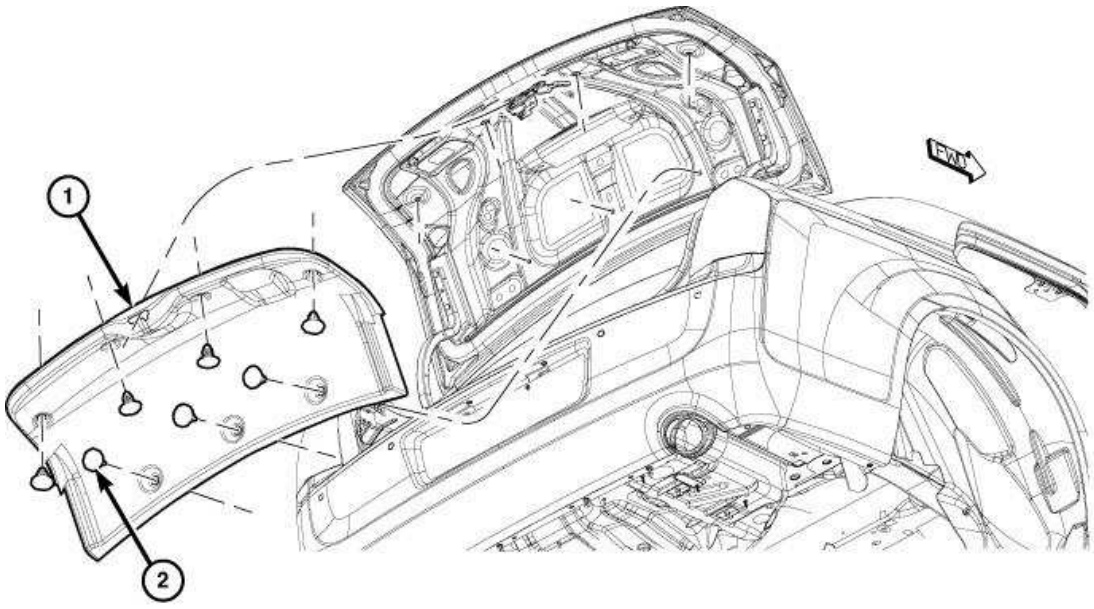

Fig. 71: Push-In Retainers & Decklid Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle must be routed through the deck lid insulator.

3. Remove the push-in retainers (2) securing the deck lid insulator (1) to the decklid.

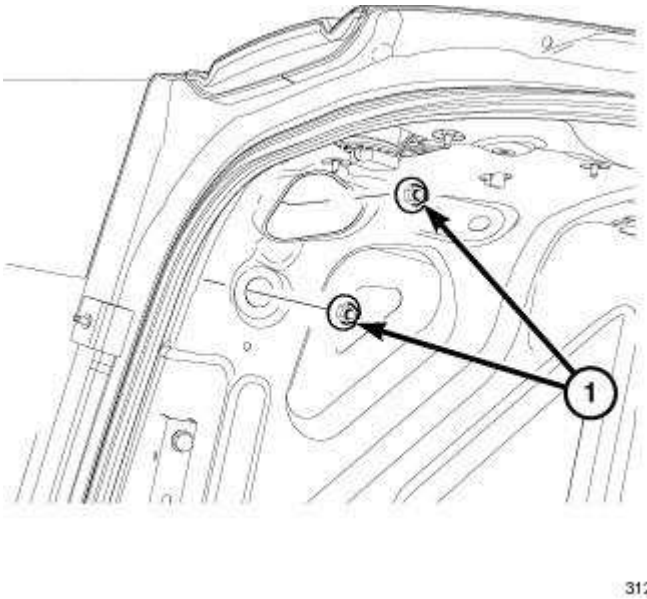

Fig. 72: Spoiler Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the spoiler nuts from spoiler studs through the access hole in the decklid. Repeat for the opposite side.

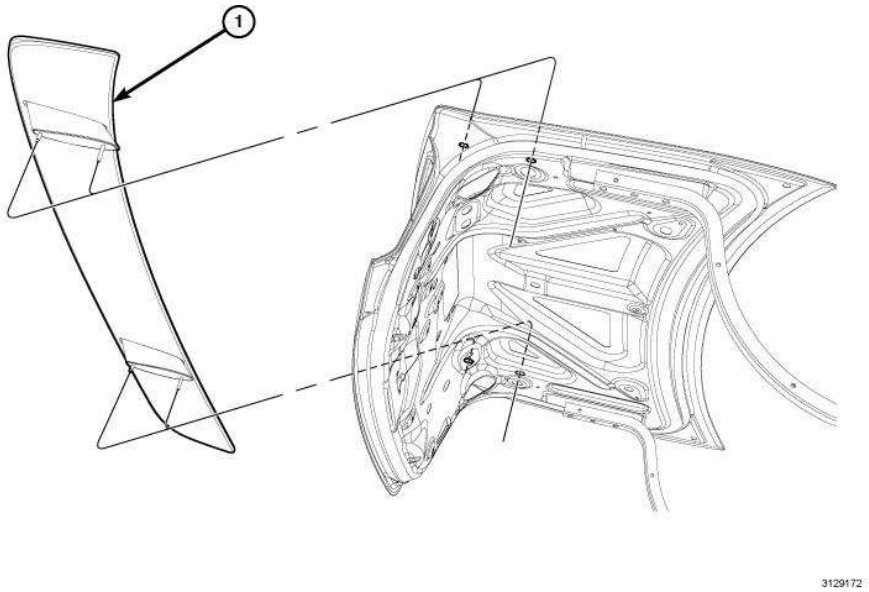

Fig. 73: Spoiler
Courtesy of CHRYSLER GROUP, LLC

5. Lower the decklid.
6. Remove spoiler (1) from decklid by lifting straight up and rearward.

INSTALLATION

INSTALLATION

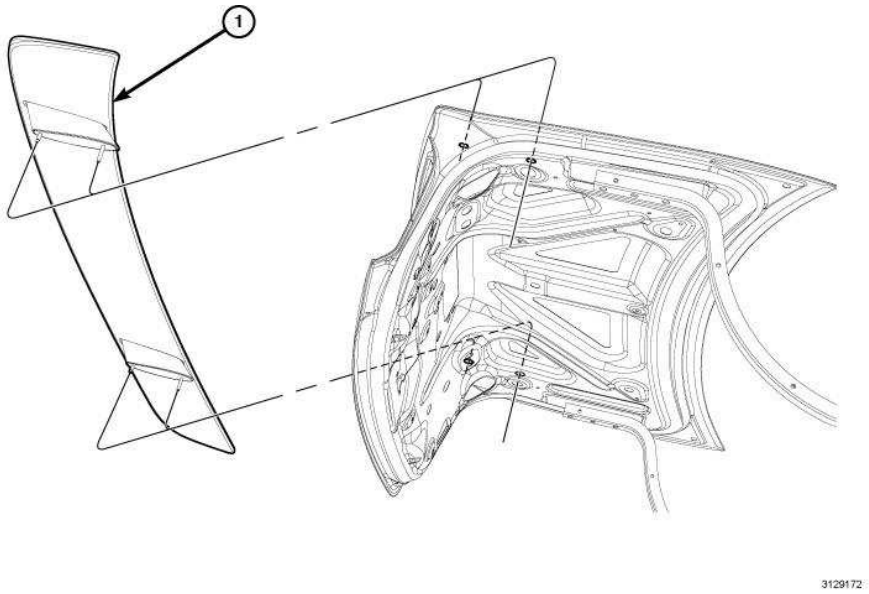

Fig. 74: Spoiler

Courtesy of CHRYSLER GROUP, LLC

1. Position the spoiler (1) by aligning the studs through decklid holes.

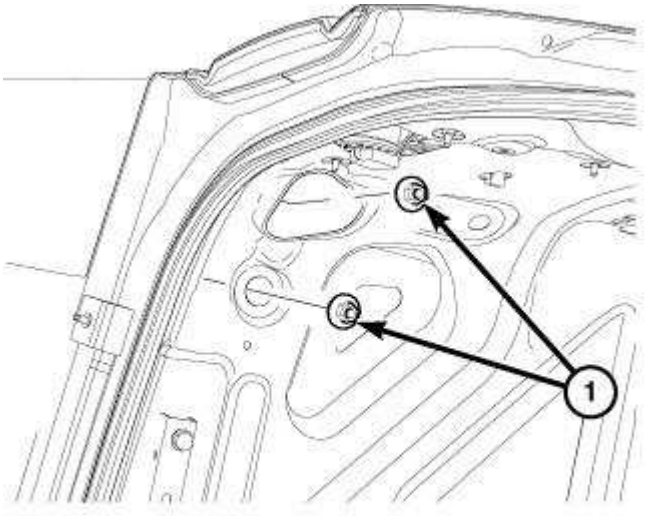

Fig. 75: Spoiler Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Lift the decklid.
3. Loosely install the nuts (1) to the spoiler studs through the access holes in the decklid. Repeat for the opposite side.
4. Torque the nuts to 6 N.m (4.4 ft. lbs.). Repeat for the opposite side.

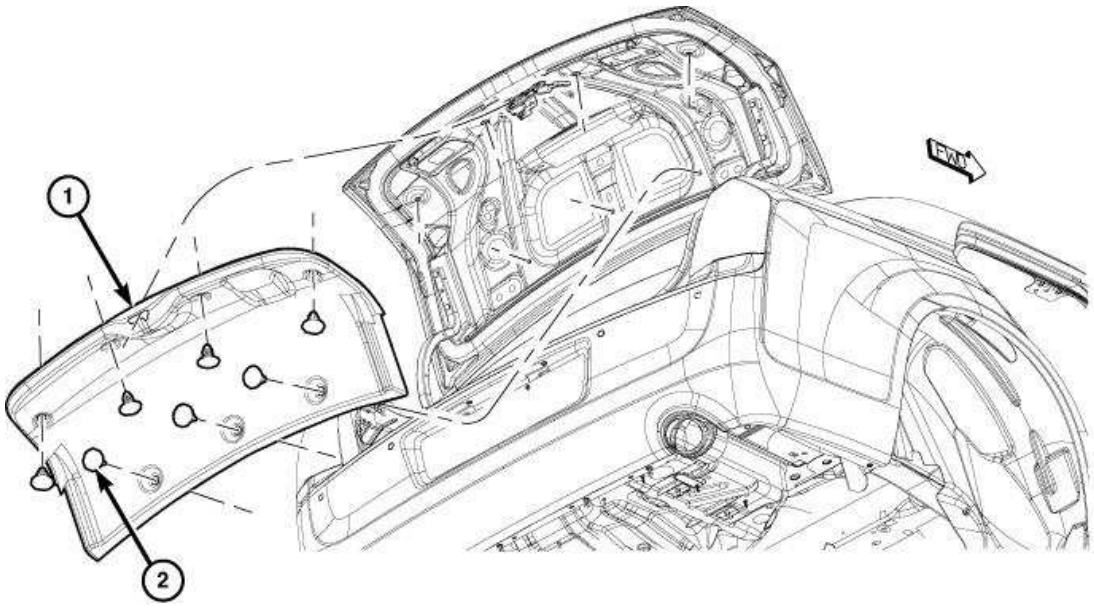

Fig. 76: Push-In Retainers & Decklid Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle must be routed through the deck lid insulator.

5. Position the decklid insulator.
6. Install the push-in retainers (2) securing the decklid insulator (1) to the decklid.

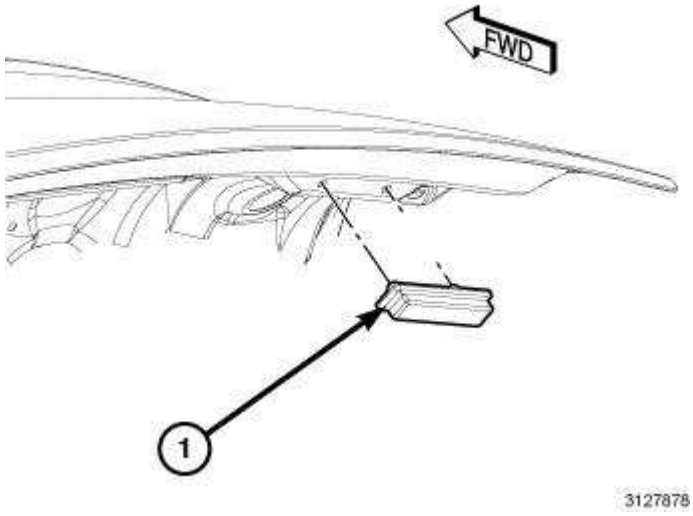

Fig. 77: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

7. Install the decklid bumper (1). Repeat for the other side.

STRIKER, LATCH

REMOVAL

REMOVAL

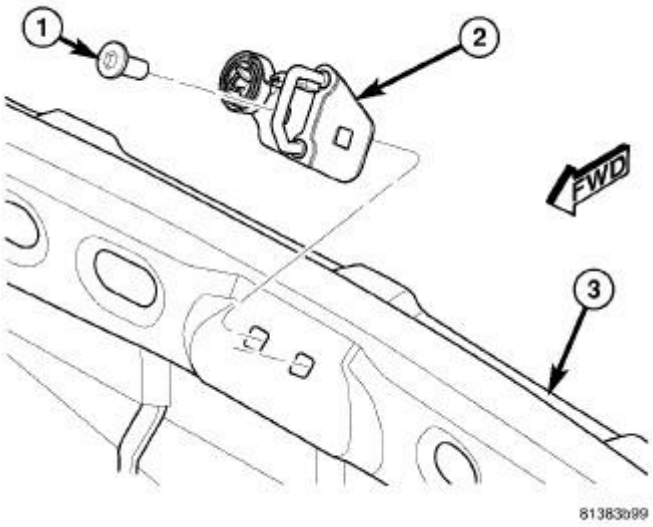

Fig. 78: Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Open the deck lid.
2. Remove the trunk rear trim panel from the inside of the deck opening lower panel (3). Refer to **PANEL, TRUNK TRIM, REAR, REMOVAL**.
3. Mark the deck lid latch striker (2) location on the inside of the deck opening lower panel to aid reinstallation.
4. Remove the two screws (1) that secure the latch striker to the inside of the deck opening lower panel.
5. Remove the latch striker from the vehicle.

INSTALLATION

INSTALLATION

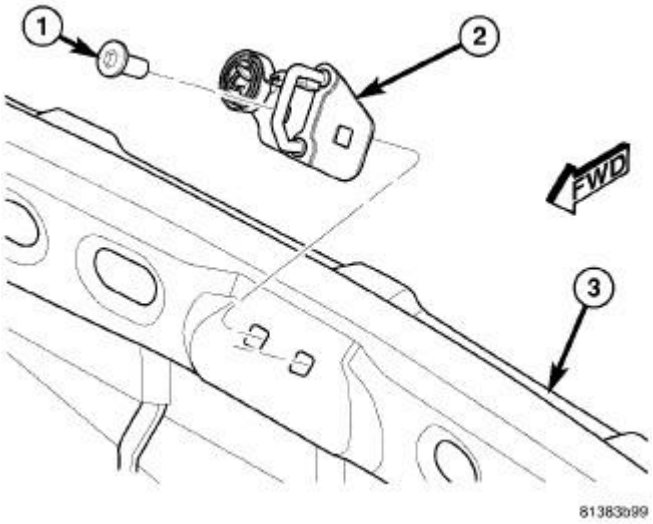

Fig. 79: Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the deck lid latch striker (2) to the inside of the deck opening lower panel (3).
2. Install and tighten the two screws (1) that secure the latch striker to the deck opening lower panel. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper deck lid latch operation.
4. Reinstall the trunk rear trim panel to the deck opening lower panel. Refer to **PANEL, TRUNK TRIM, REAR, INSTALLATION**.
5. Close the deck lid.

DOOR - FRONT

DESCRIPTION

DESCRIPTION

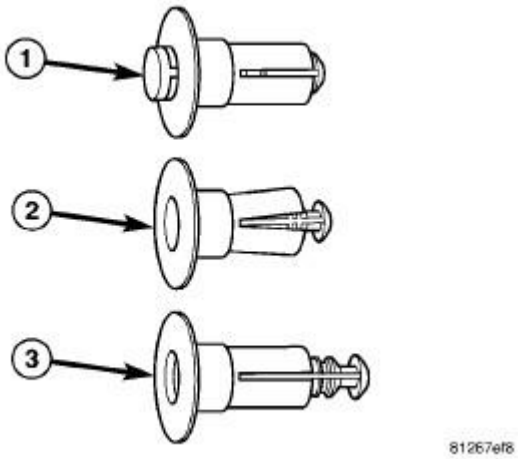

Fig. 80: Push Pin Fastener
Courtesy of CHRYSLER GROUP, LLC

1 - OPEN POSITION
2 - LOCK POSITION
3 - RELEASE POSITION

1. The push pin fastener is in the open position (1) when the center pin is pull outward approximately 2 mm. Then the push pin fastener is ready to be used.
2. To install push pin place it into position, and push the center pin in flush with the head of the push pin to lock it into position (2).
3. To remove the push pin fastener, push the center pin inward approximately 2 mm to release push pin fastener (3).

CYLINDER, DOOR LOCK

REMOVAL

REMOVAL

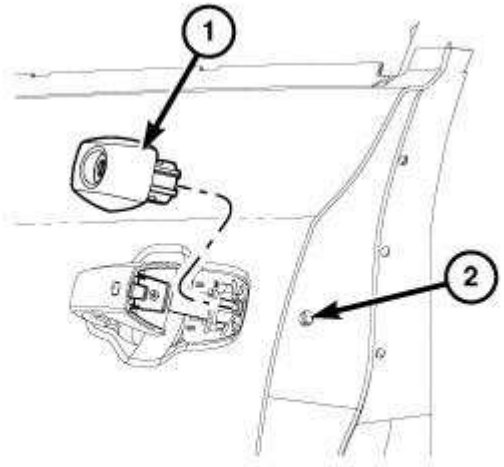

Fig. 81: PIA Fastener & Door Lock Cylinder/Delete Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lock cylinder is only present on the front driver door. The remaining doors are equipped with a delete cap. The delete caps are removed/installed similar to the lock cylinder.

1. Disconnect the negative battery cable.
2. Open the front door.
3. Remove the protective plug used to cover the PIA fastener (2) located rearward of the door lock cylinder/delete cap (1).
4. Remove the door lock cylinder/delete cap (1) from the front door by loosening the PIA fastener (2) accessed rearward of the handle and gently prying door lock cylinder/delete cap (1) away.**Do not attempt to remove the PIA fastener.**

INSTALLATION

INSTALLATION

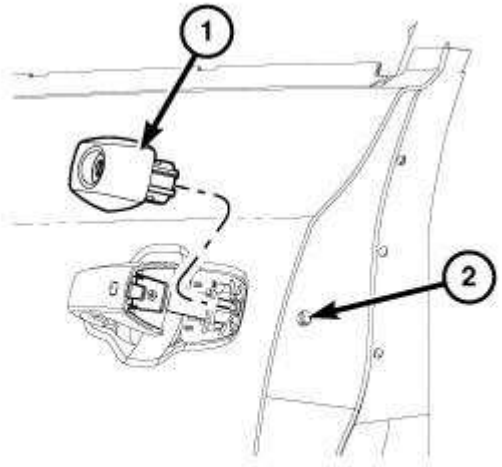

Fig. 82: PIA Fastener & Door Lock Cylinder/Delete Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lock cylinder is only present on the front driver door. The remaining doors are equipped with a delete cap. The delete caps are removed/installed similar to the lock cylinder.

1. Position the door lock cylinder (1) to the front door, once properly positioned, tighten the PIA fastener (2) accessible rearward of the handle. Tighten the fastener securely and install the protective plug over the fastener opening.
2. Connect the negative battery cable.

DOOR

REMOVAL

REMOVAL

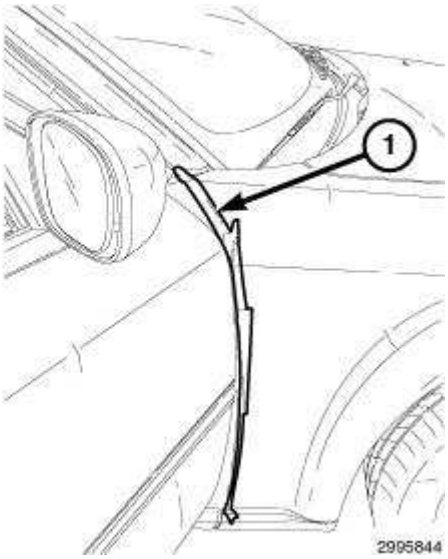

Fig. 83: Applying Tape To Rear Fender Edge For Protection
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the front door.
3. Using masking tape or equivalent, apply a strip of tape (1) to the rear fender edge near the door for protection.
4. Support the door with a suitable lifting device.

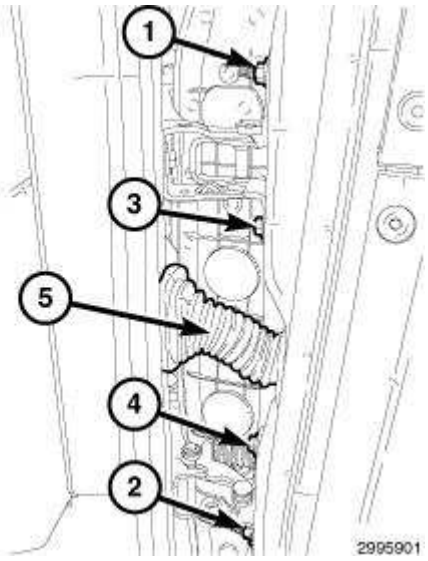

Fig. 84: Removing/Installing Front Door Wire Harness Boot & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disengage the front door wire harness boot (5) and connector from the outside of the lower A-pillar.
6. Disconnect the door wire harness connectors.

7. Remove the hinge to door nuts (1, 2) from the door.
8. Remove the hinge to door bolts (3, 4) from the door.

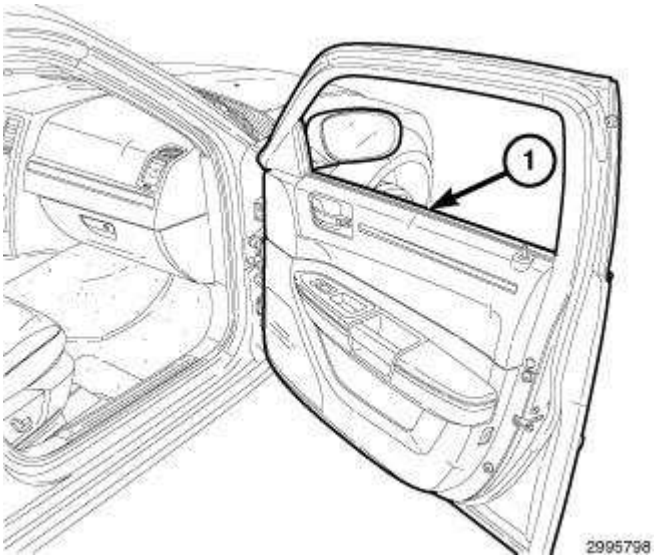

Fig. 85: Removing/Installing Door From The Hinges
Courtesy of CHRYSLER GROUP, LLC

NOTE: Have an assistant to aid in removal/installation.

9. Remove the door from the hinges by pulling straight out.

INSTALLATION

INSTALLATION

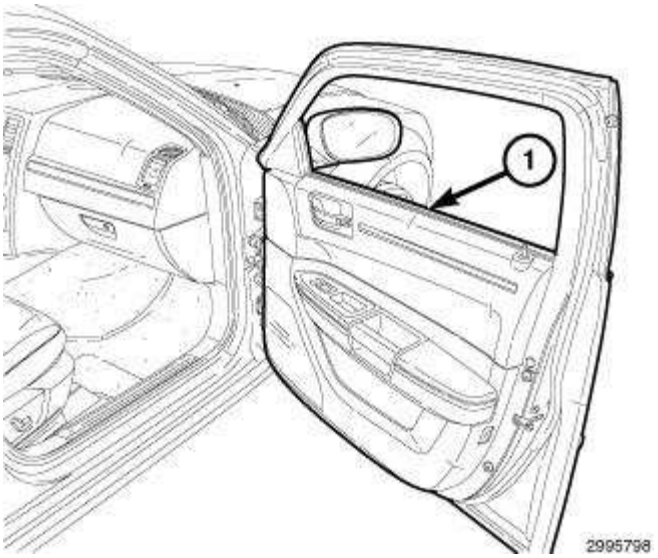

Fig. 86: Removing/Installing Door From The Hinges
Courtesy of CHRYSLER GROUP, LLC

NOTE: Have an assistant to aid in removal/installation.

1. Support the front door (1) with a suitable lifting device.
2. Position and align the door hinge studs with the upper and lower hinge brackets.
3. Push the door in towards (1) the vehicle to seat the studs into the hinge brackets.

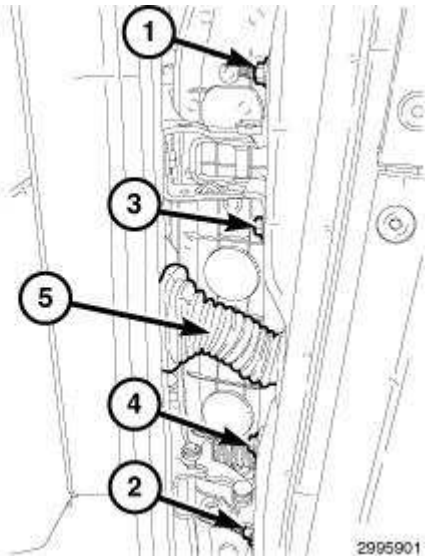

Fig. 87: Removing/Installing Front Door Wire Harness Boot & Connector
Courtesy of CHRYSLER GROUP, LLC

4. Install and tighten the nuts (1, 2) into both the upper and lower front door hinge studs to secure the door hinge brackets to the door. Tighten the fasteners to 24 N.m (18 ft. lbs.).
5. Install and tighten the bolts (3, 4) into both the upper and lower front door hinge studs to secure the door hinge brackets to the door. Tighten the fasteners to 24 N.m (18 ft. lbs.).
6. Remove the lifting device supporting the door.
7. Carefully pull the body wire harness connector(s) (5) out from the A-pillar far enough to reconnect them to the door wire harness boot and connector.
8. Engage the front door wire harness boot and connector (5 into the wiring clearance hole on the outside of the lower A-pillar.
9. Reconnect the battery negative cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted.

10. Adjust the door hinge positions as necessary to achieve proper door spacing and operation.

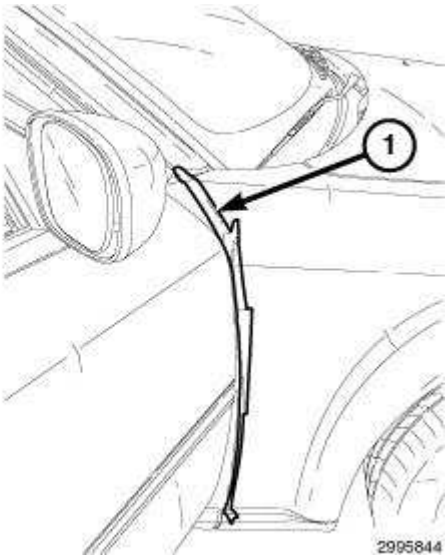

Fig. 88: Applying Tape To Rear Fender Edge For Protection
Courtesy of CHRYSLER GROUP, LLC

11. Remove the tape strip (1) from the rear edge of front fender.

GLASS, DOOR

REMOVAL

REMOVAL

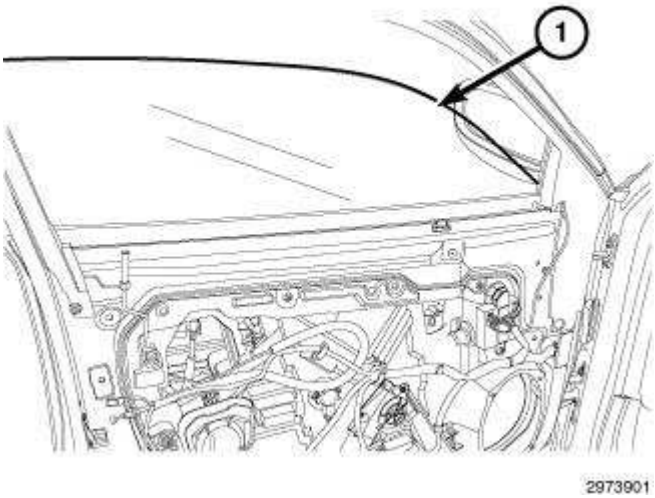

Fig. 89: Window
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel from the inside of the front door. Refer to **PANEL, DOOR TRIM, REMOVAL**.

2. Remove the inner belt weatherstrip from the front door.
3. Open the latch access panel located on the carrier plate near the lock rod assembly.
4. Remove the clear adhesive patch covering the front window regulator access hole located just behind the electronic door module. If the clear adhesive patch is not present, there will be an indented area in the same location that will need to be cut out.
5. Temporarily install the window switch pod, reconnect the negative battery cable and lower the window (1) until the white regulator tabs are visible in both access holes.
6. With the help of an assistant holding the glass, release the window regulator tab and lift the window up and tape the glass (1) to the door header.
7. Remove the door carrier plate. Refer to **PLATE, CARRIER, REMOVAL**.
8. With the help of an assistant holding the glass, remove the tape and lower the glass (1) into the carrier plate cavity.
9. Remove the glass (1) through the carrier plate cavity.

INSTALLATION

INSTALLATION

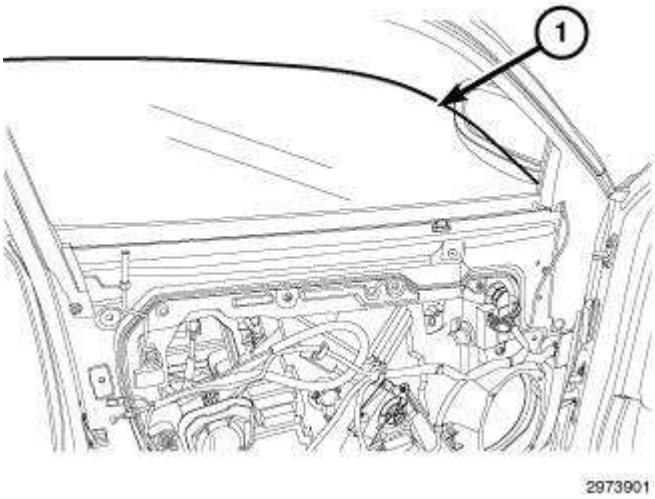

Fig. 90: Window
Courtesy of CHRYSLER GROUP, LLC

1. Install the glass (1) through the carrier plate cavity.
2. With the help of an assistant holding the glass, lift the glass into place and secure with tape.
3. Install the carrier plate. Refer to **PLATE, CARRIER, INSTALLATION**.
4. Remove the tape or wedge from the window, lower the glass and engage the window regulator tabs into the glass.
5. Add or re-apply a clear adhesive patch covering the front window regulator access hole.
6. Close the latch access panel.

7. Reinstall the inner belt weatherstrip onto the front door.
8. Reinstall the trim panel onto the inside of the front door. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

HANDLE, EXTERIOR

REMOVAL

REMOVAL

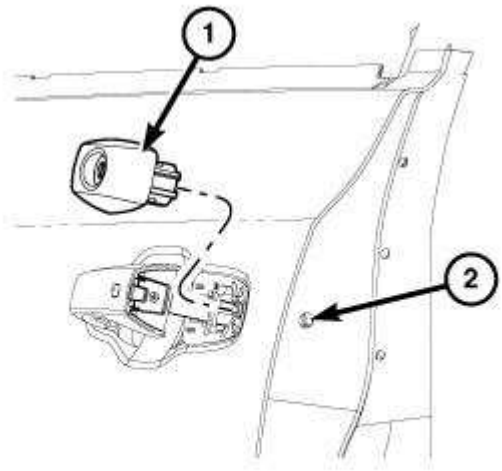

Fig. 91: PIA Fastener & Door Lock Cylinder/Delete Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH Shown in illustration, RH typical.

1. Disconnect the negative battery cable.
2. Remove the door lock cylinder (1) from the front door. Refer to **CYLINDER, DOOR LOCK, REMOVAL**.

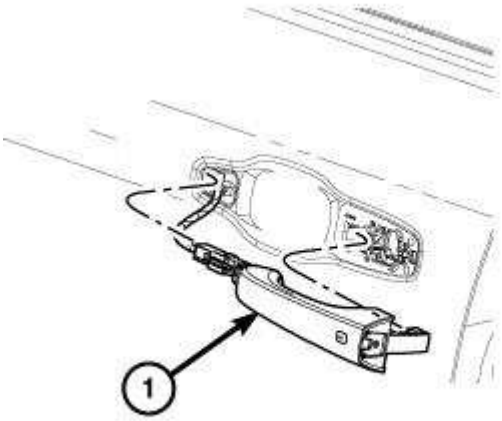

Fig. 92: Slide Handle
Courtesy of CHRYSLER GROUP, LLC

3. Slide handle (1) rearward and out.
4. Disconnect the harness connector and remove the handle (1).

INSTALLATION

INSTALLATION

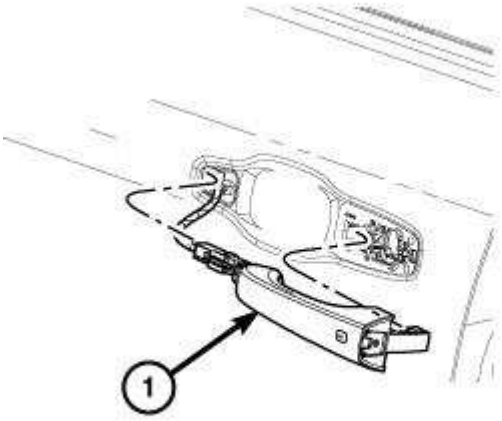

Fig. 93: Slide Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH Shown in illustration, RH typical.

1. Connect the harness connector and position the handle (1) to the door.

2. Slide handle (1) in and forward.

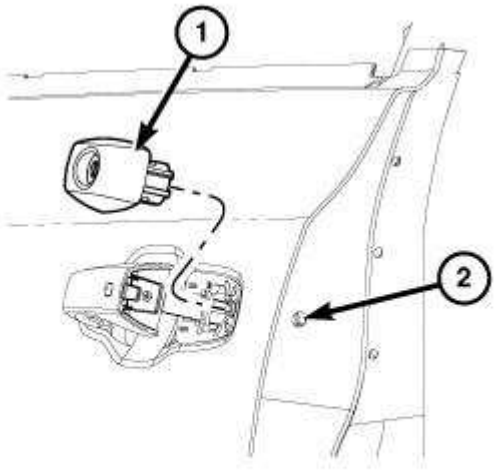

Fig. 94: PIA Fastener & Door Lock Cylinder/Delete Cap
Courtesy of CHRYSLER GROUP, LLC

3. Install the door lock cylinder (1) to the front door. Refer to **HANDLE, EXTERIOR, INSTALLATION**.
4. Connect the negative battery cable.

HINGE, DOOR

REMOVAL

REMOVAL

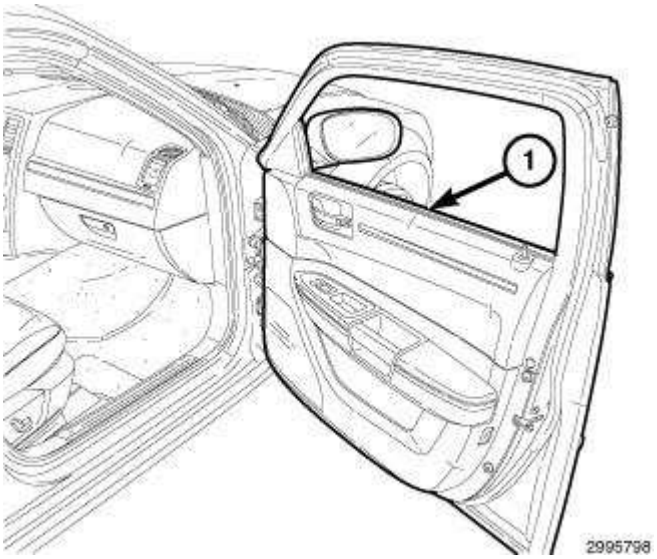

Fig. 95: Removing/Installing Door From The Hinges
Courtesy of CHRYSLER GROUP, LLC

1. Remove the door from the vehicle. Refer to **DOOR, REMOVAL**.

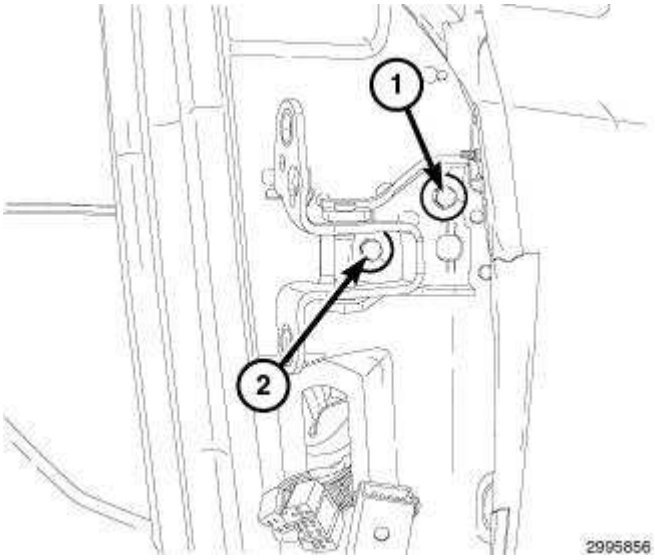

Fig. 96: Locating Fasteners of Upper And Lower Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Upper hinge shown in illustration, lower hinge similar.

2. Mark the upper or lower hinge bracket location on the outside of the lower A-pillar to aid installation.
3. Remove the fasteners (1, 2) that secure the hinge bracket to the outside of the lower A-pillar.
4. Remove the hinge bracket from the A-pillar.

INSTALLATION

INSTALLATION

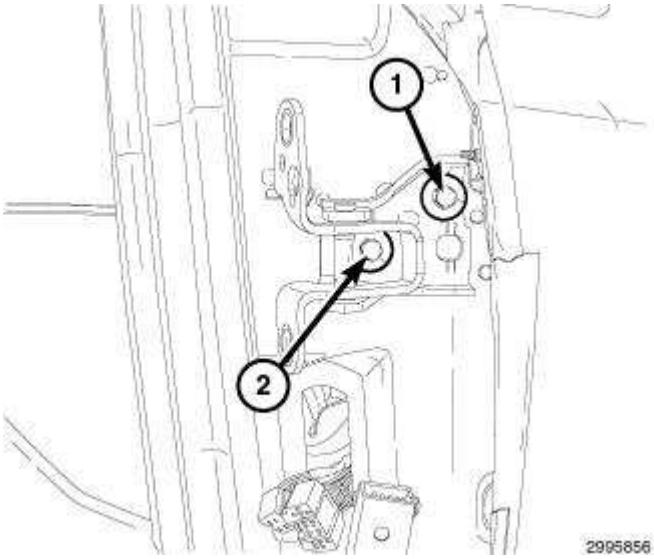

Fig. 97: Locating Fasteners of Upper And Lower Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Upper hinge shown in illustration, lower hinge similar.

1. Position and align the upper or lower hinge to the outside face of the lower A-pillar using the reference marks made when removing.
2. Install and tighten the fasteners (1, 2) that secure the hinge to the lower A-pillar. Tighten the fasteners to 30 N.m (22 ft. lbs.).

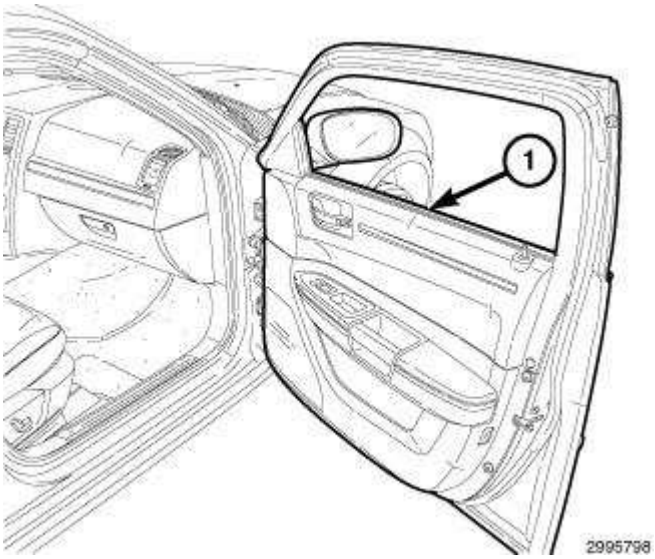

Fig. 98: Removing/Installing Door From The Hinges
Courtesy of CHRYSLER GROUP, LLC

3. Install the front door onto the vehicle, Refer to **DOOR, INSTALLATION**.

LATCH, DOOR

DESCRIPTION

DESCRIPTION

The door latch is integrated to the door's module/carrier plate. To remove or install the latch, the carrier plate will need to be removed for access. Refer to **PLATE, CARRIER, REMOVAL** &**PLATE, CARRIER, INSTALLATION**.

MOLDING, INTERIOR WINDOW TRIM

REMOVAL

REMOVAL

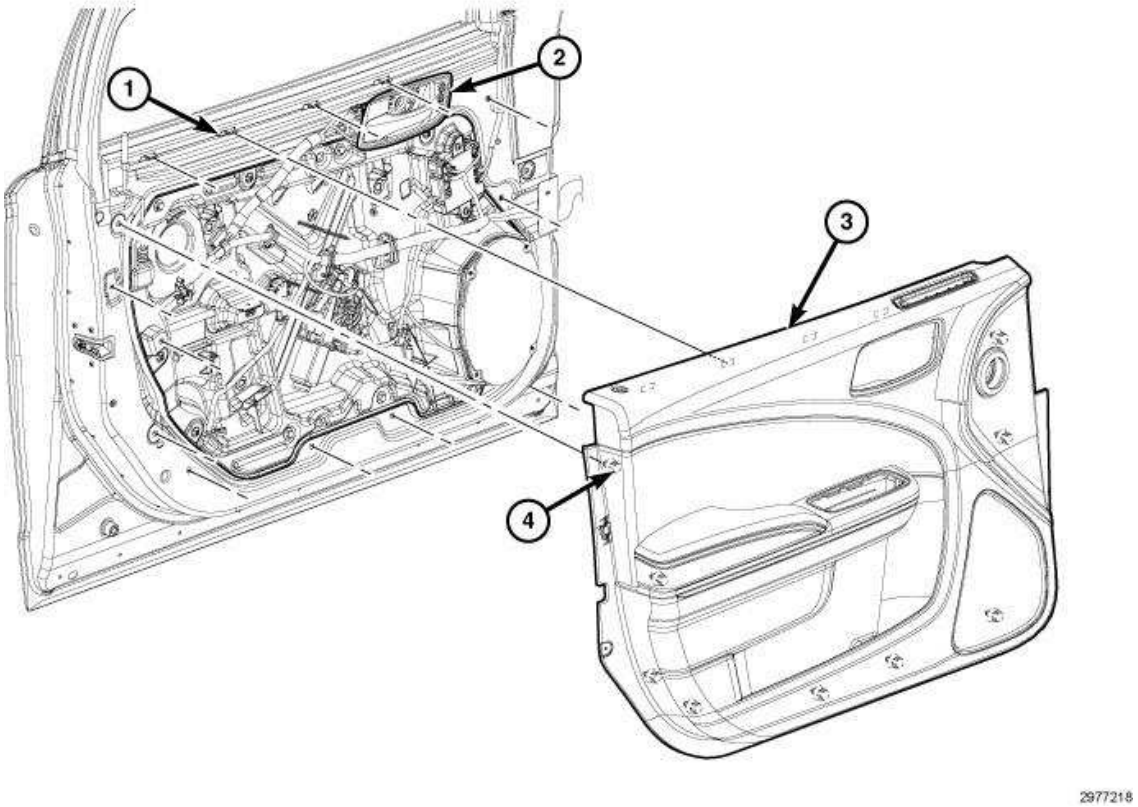

Fig. 99: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the door trim panel (3). Refer to **PANEL, DOOR TRIM, REMOVAL**.

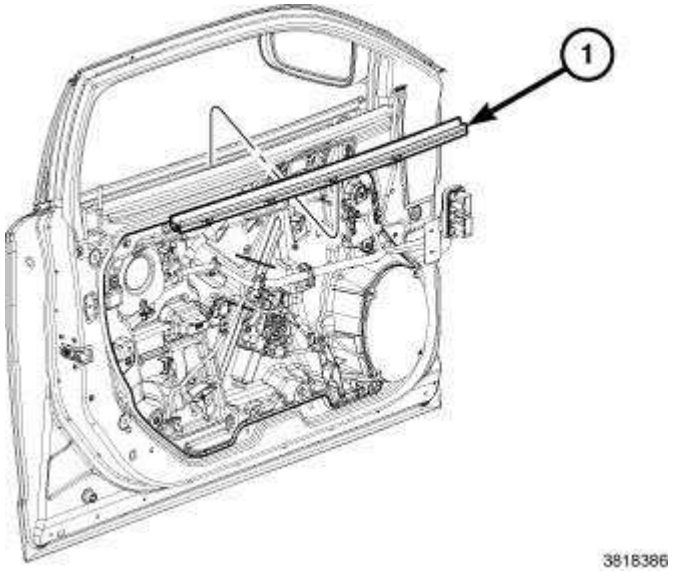

Fig. 100: Inner Molding Weatherstrip
Courtesy of CHRYSLER GROUP, LLC

3. Remove the inner molding weatherstrip (1).

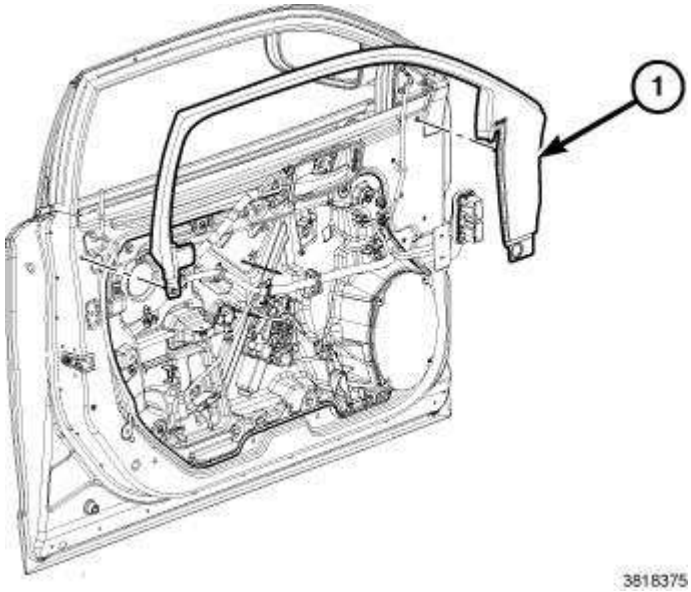

Fig. 101: Interior Window Trim Molding
Courtesy of CHRYSLER GROUP, LLC

4. Using (special tool #C-4755, Trim Stick), detach the fasteners and retaining tabs securing the interior window trim molding (1) and position slightly away from the door.
5. If equipped, disconnect the speaker from the molding (1).
6. Remove the interior window trim molding (1).

INSTALLATION

INSTALLATION

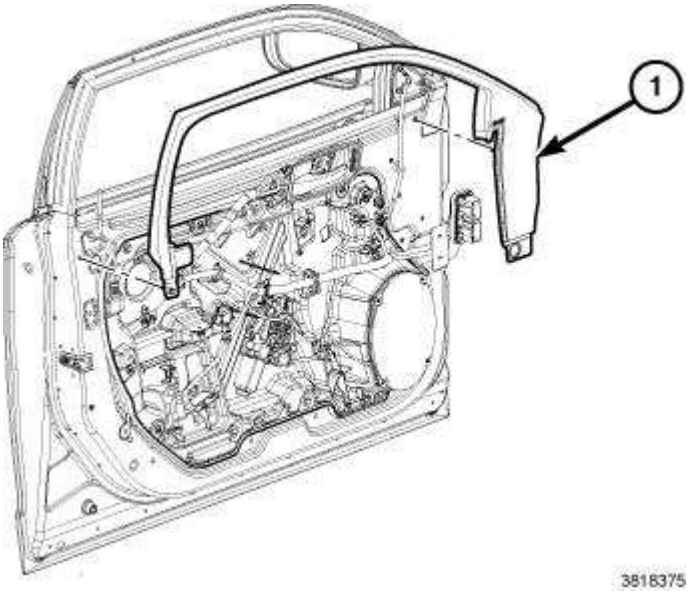

Fig. 102: Interior Window Trim Molding
Courtesy of CHRYSLER GROUP, LLC

1. Position the interior window trim molding (1) near the door.
2. If equipped, connect the speaker wire harness to the molding (1).
3. Align the interior window trim molding (1) to the door. Install the fasteners securing the trim molding, engage all retaining tabs.

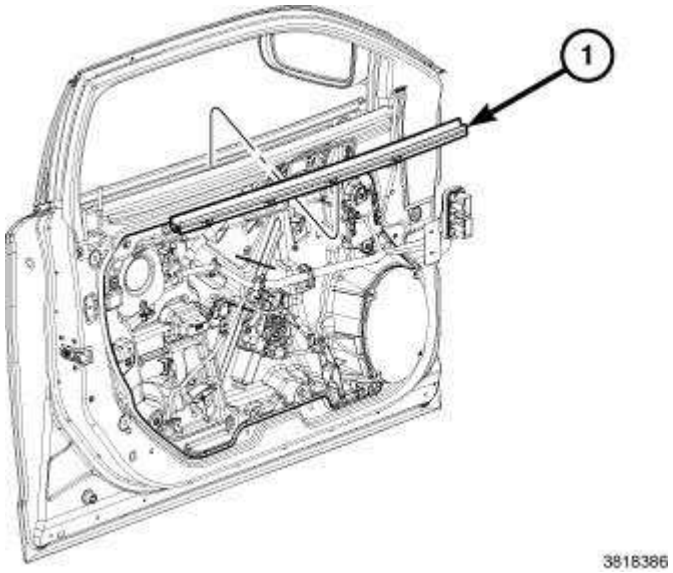

Fig. 103: Inner Molding Weatherstrip
Courtesy of CHRYSLER GROUP, LLC

4. Install the inner molding weatherstrip (1).

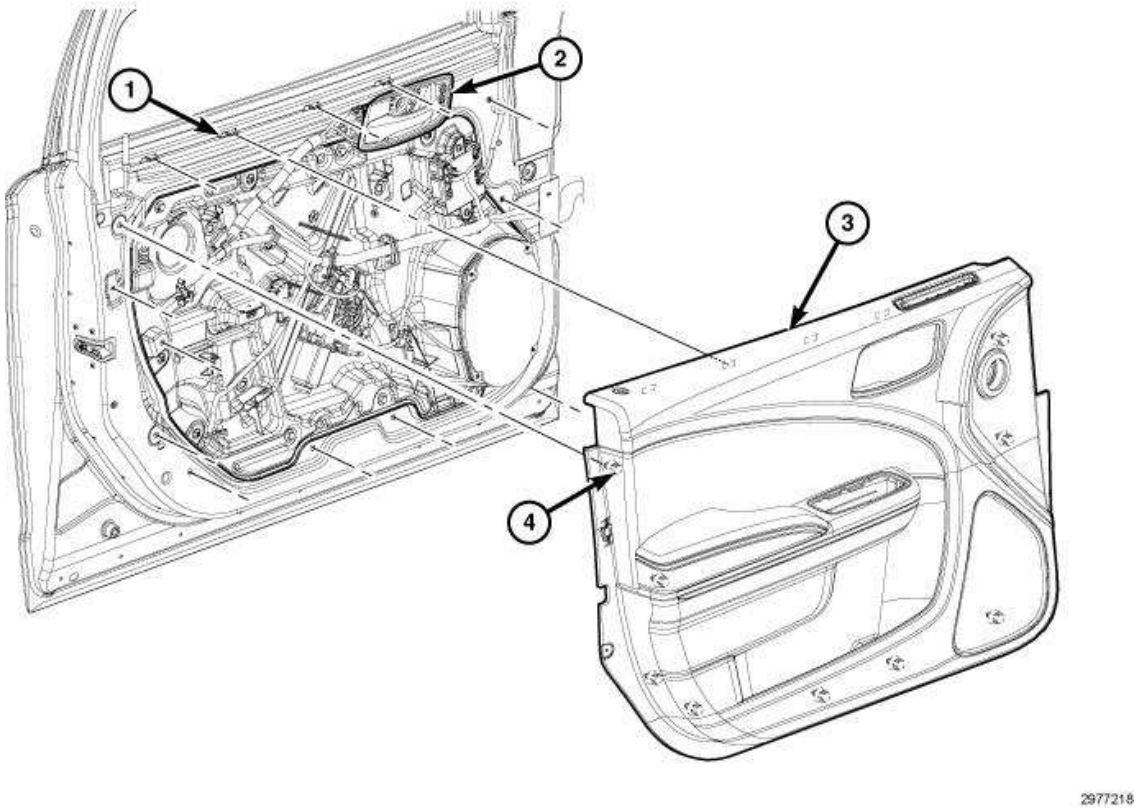

Fig. 104: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Install the door trim panel (3). Refer to **PANEL, DOOR TRIM, INSTALLATION**.
6. Connect the battery negative cable.

PANEL, DOOR TRIM

REMOVAL

REMOVAL

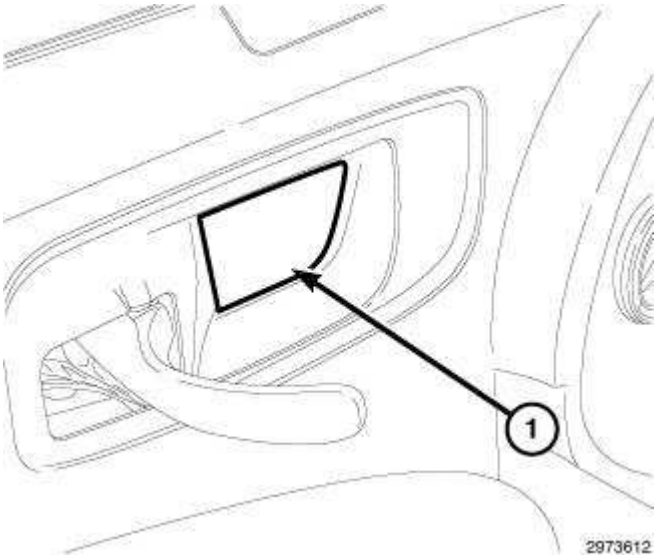

Fig. 105: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a small pick tool, pull out on interior latch handle and remove the trim plate (1).

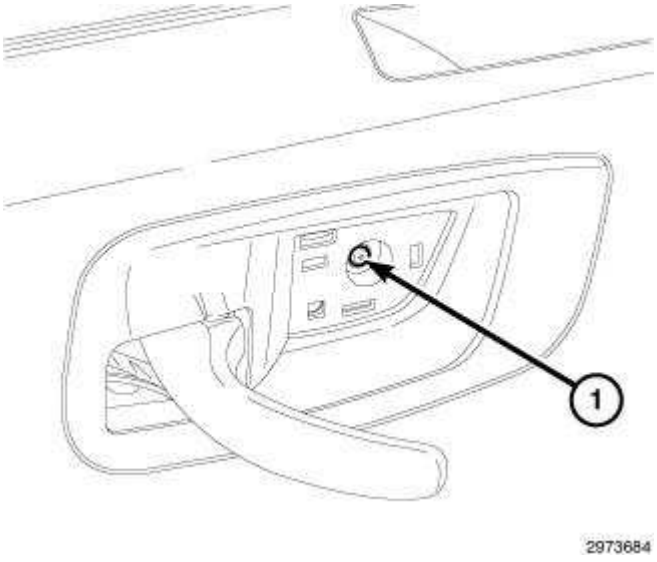

Fig. 106: Screw
Courtesy of CHRYSLER GROUP, LLC

3. Pull out on interior latch handle and remove the screw (1).

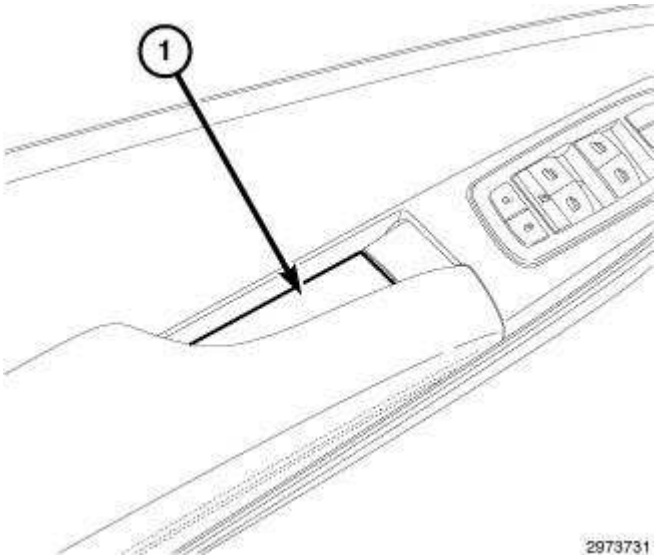

Fig. 107: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

4. Using a small pick tool, remove the trim plate (1) just behind the armrest.

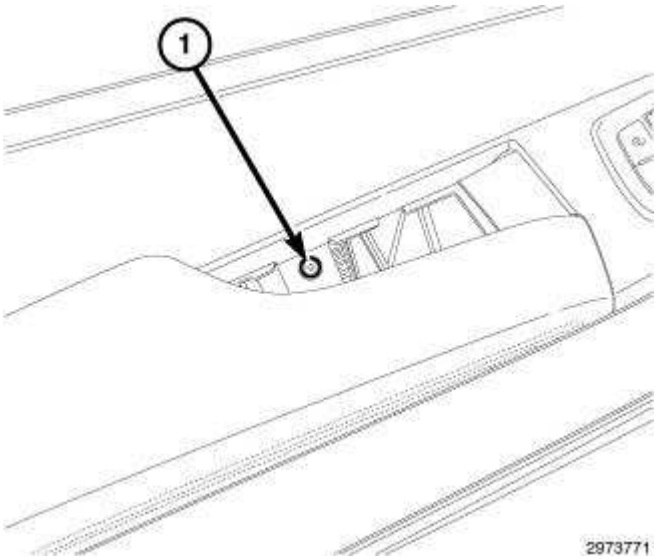

Fig. 108: Screw
Courtesy of CHRYSLER GROUP, LLC

5. Remove the screw (1) just behind the armrest.
6. Remove and disconnect the power window switch. Refer to **SWITCH, POWER WINDOW, REMOVAL** .

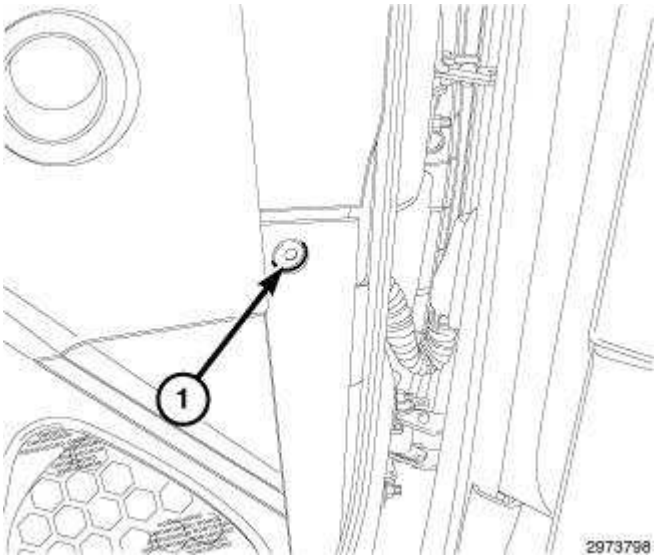

Fig. 109: Push Pin Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Remove the push pin fastener (1) near the front of the door.

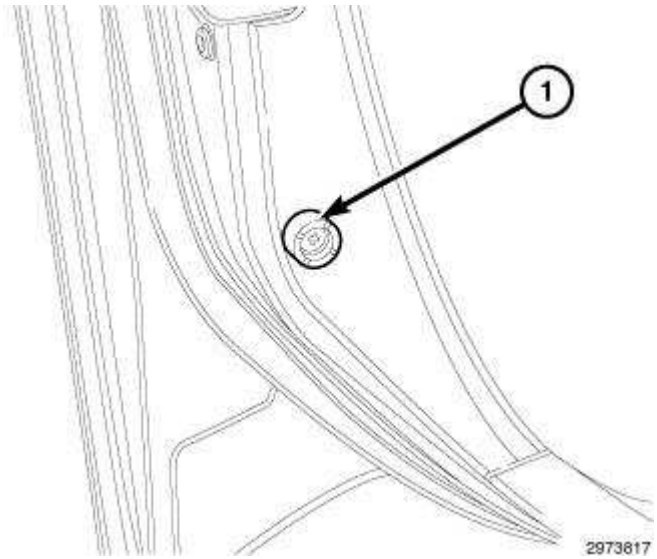

Fig. 110: Screw/Bumper
Courtesy of CHRYSLER GROUP, LLC

8. Remove the screw/bumper (1) from the rear of the door trim.

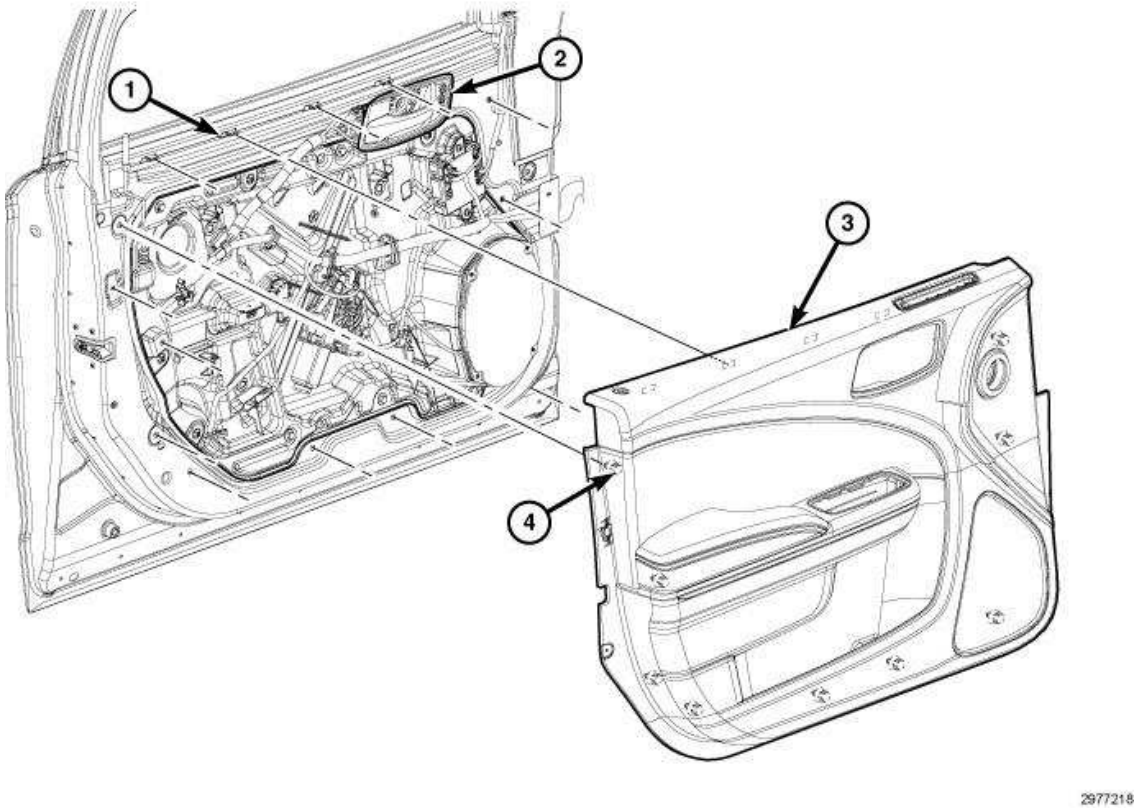

Fig. 111: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

9. Remove the latch handle assembly (2) from the door.

NOTE: **If desired, the latch handle assembly can be left installed to the door trim panel. If left installed, the technician will need to detach the latch cable at the handle before the door trim panel is fully removed.**

10. Using (special tool #C-4755, Trim Stick) or equivalent, disengage the door trim snap retainers (4) and slightly reposition the trim panel (3).
11. Raise the trim panel (3) up and peel the belt molding off from the flange.**Do not fully remove at this time.** .

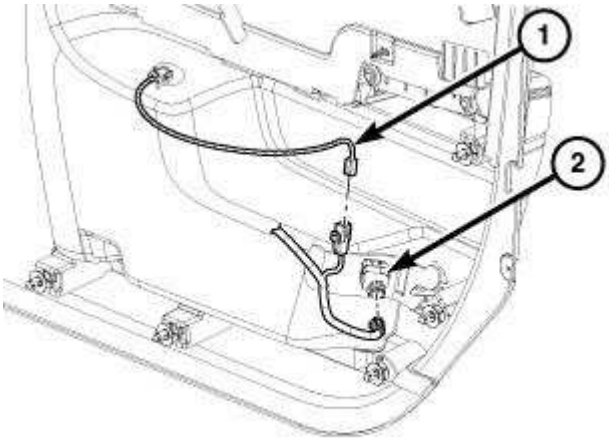

Fig. 112: Harness & Fuel Door Release Switch
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the harness (1) from the fuel door release switch (2).
13. Remove the door trim panel.
14. If necessary, use a flat bladed screwdriver to disengage the belt molding clips from the trim panel.

INSTALLATION

INSTALLATION

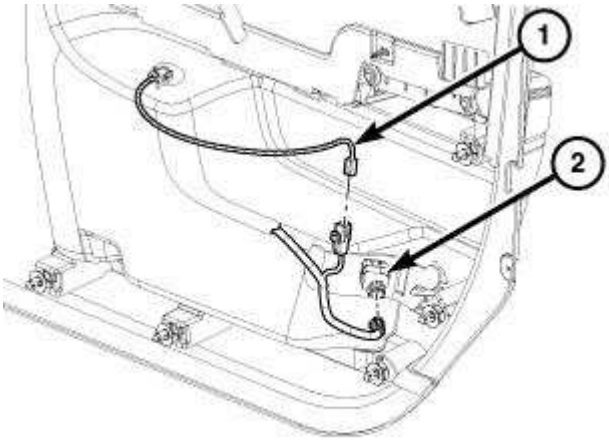

Fig. 113: Harness & Fuel Door Release Switch
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, engage the belt molding clips (1) to the trim panel.
2. Prior to installation, check to be certain that all snap retainers are in good condition on the door trim panel and the door's carrier plate. Replace if necessary.
3. Position the door trim panel near the door. **Do not install at this time.**

4. Connect the harness (1) to the fuel door release switch (2).

NOTE: **If the latch handle assembly is installed to the door trim panel, the technician will need to attach the latch cable at the handle before the door trim panel is installed.**

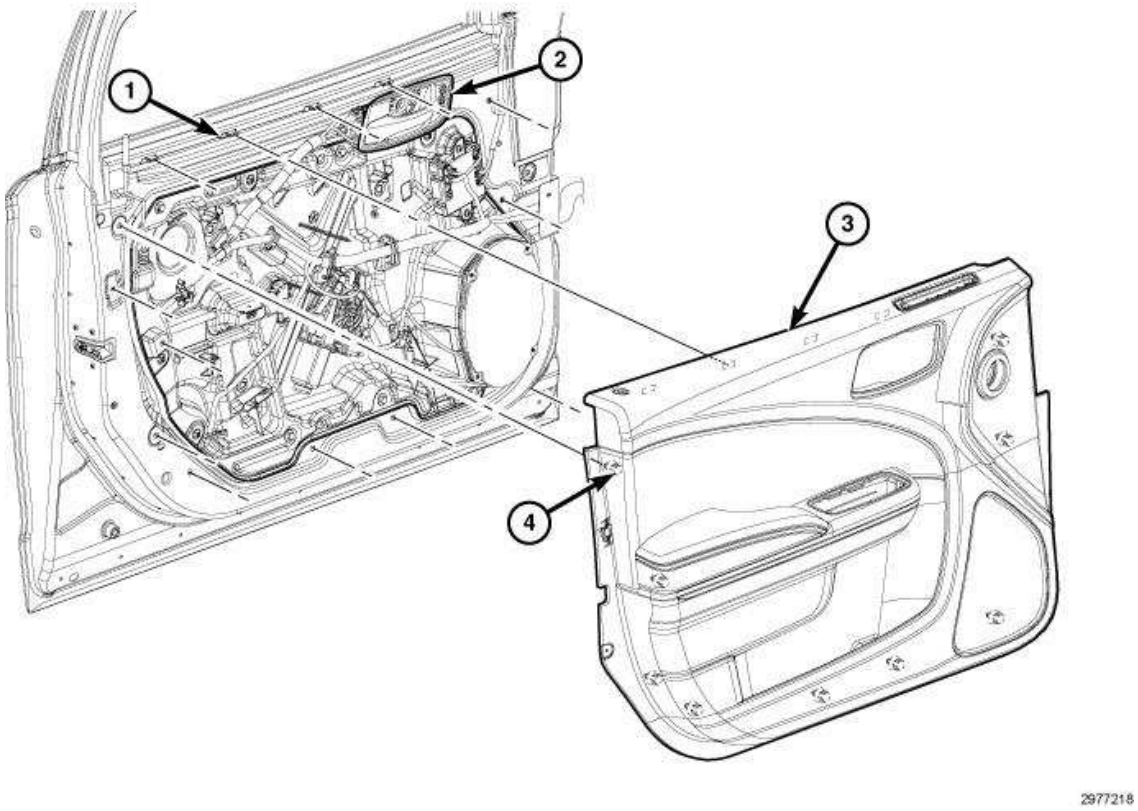

Fig. 114: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Feed the latch handle assembly (2) on an angle through the opening in the door trim panel (3). Once the latch handle is fed through the opening, snap it into place.
6. Using firm pressure, engage the door trim snap retainers (1, 4) into the door's carrier plate.

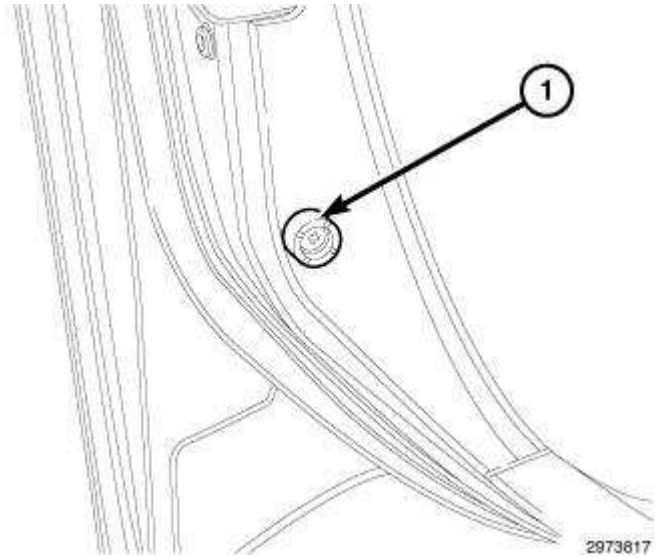

Fig. 115: Screw/Bumper
Courtesy of CHRYSLER GROUP, LLC

7. Install the screw/bumper (1) to the rear of the door trim.

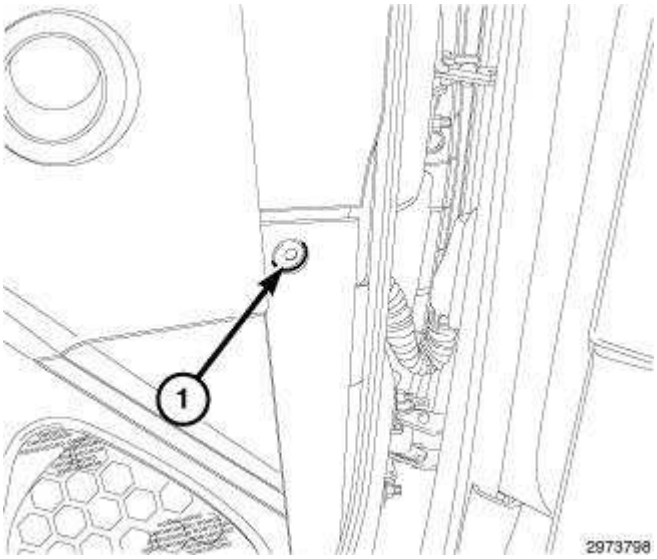

Fig. 116: Push Pin Fastener
Courtesy of CHRYSLER GROUP, LLC

8. Install the push pin fastener (1) near the front of the door.

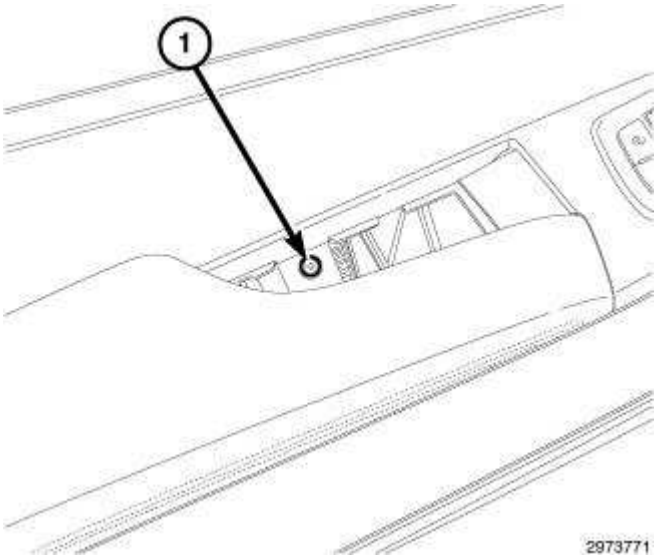

Fig. 117: Screw
Courtesy of CHRYSLER GROUP, LLC

9. Install the screw (1) just behind the armrest. Tighten the screw to 2 N.m (16 in. lbs.).
10. Connect and install the power window switch. Refer to **SWITCH, POWER WINDOW, INSTALLATION** .

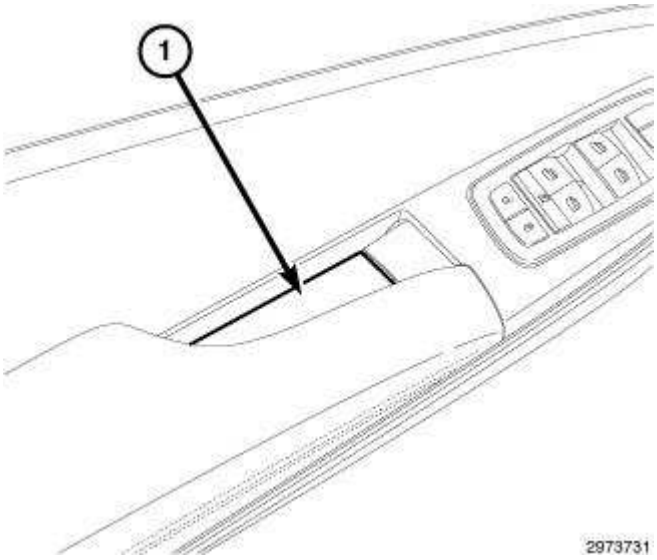

Fig. 118: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

11. Install the trim plate (1) just behind the armrest.

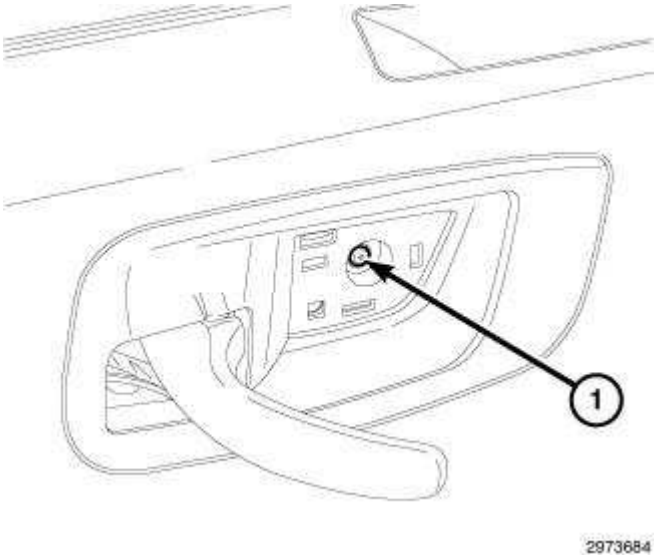

Fig. 119: Screw
Courtesy of CHRYSLER GROUP, LLC

12. Pull out on interior latch handle and install the screw (1) securing the latch handle to the carrier plate. Tighten the screw to 2 N.m (16 in. lbs.).

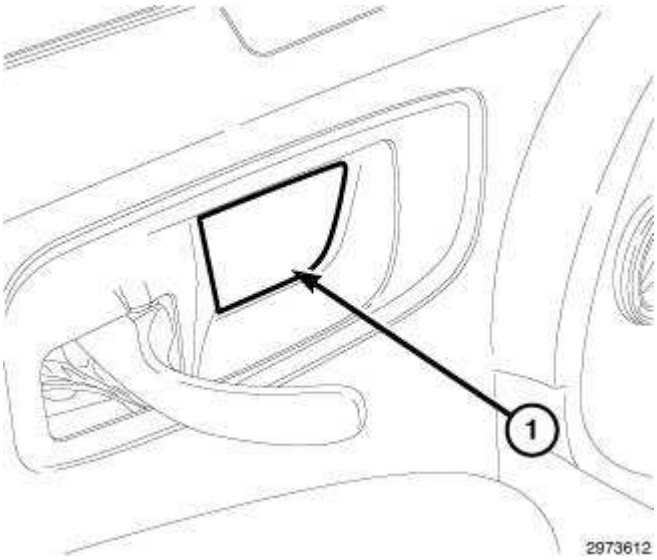

Fig. 120: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

13. Pull out on interior latch handle and install the trim plate (1).

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, calibration of this feature is required whenever power to the door module is disrupted.**

A battery reconnect procedure must be performed anytime the battery has

been disconnected.

14. Connect the battery negative cable.

PLATE, CARRIER

REMOVAL

REMOVAL

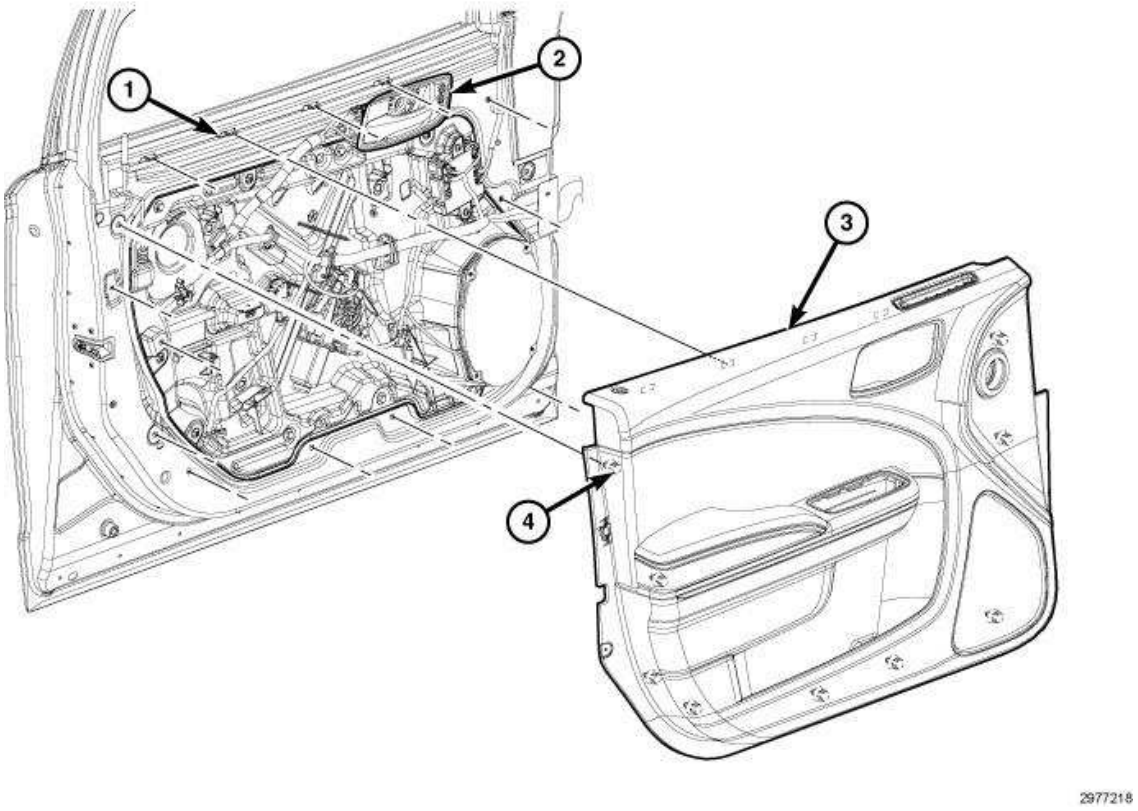

Fig. 121: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front door trim (3). Refer to **PANEL, DOOR TRIM, REMOVAL**.

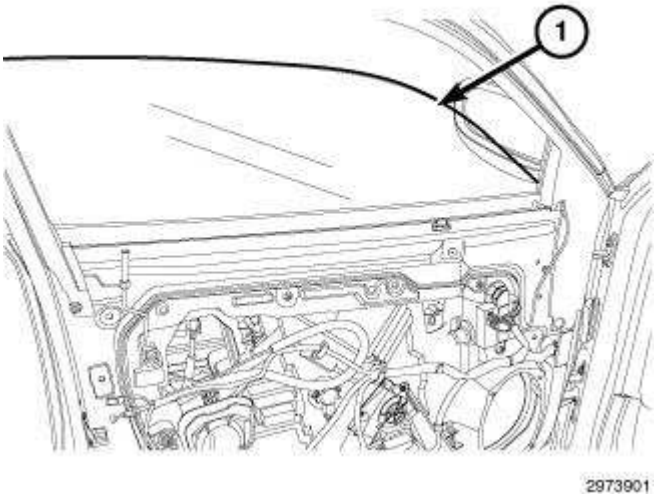

Fig. 122: Window
Courtesy of CHRYSLER GROUP, LLC

3. Open the latch access panel located on the carrier plate near the lock rod assembly.
4. Remove the clear adhesive patch covering the front window regulator access hole located just behind the electronic door module. If the clear adhesive patch is not present, there will be an indented area in the same location that will need to be cut out.
5. Temporarily install the window switch pod, reconnect the negative battery cable and lower the window until the white regulator tabs are visible in both access holes.
6. With the help of an assistant holding the glass, release the front and rear window regulator tabs and lift the window up.
7. Secure the window glass into place with a wedge or tape.
8. Disconnect the negative battery cable and remove the window switch pod.

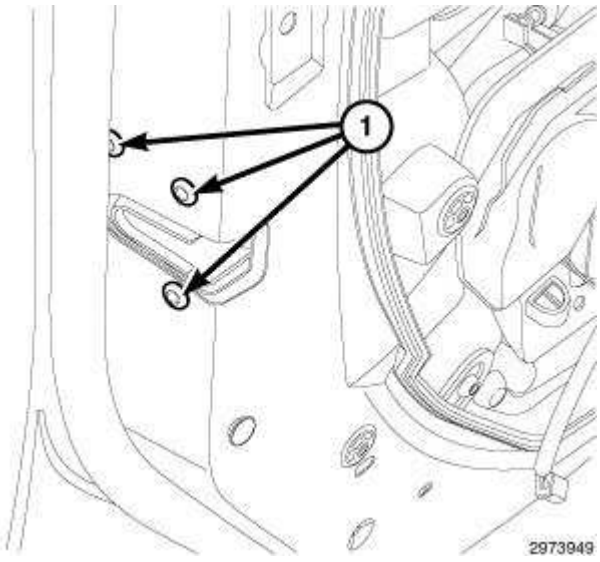

Fig. 123: Front Door Latch Mounting Screws

Courtesy of CHRYSLER GROUP, LLC

9. Remove the front door latch mounting screws (1).

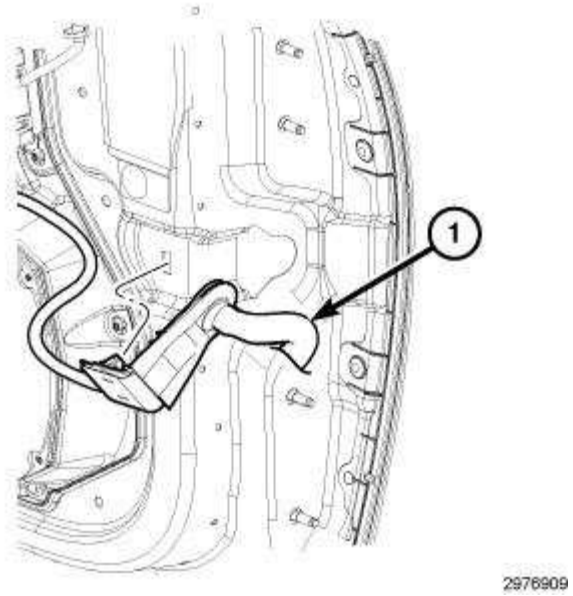

Fig. 124: front door harness wiring
Courtesy of CHRYSLER GROUP, LLC

10. Remove the front door harness wiring (1) bracket from the front of the door.

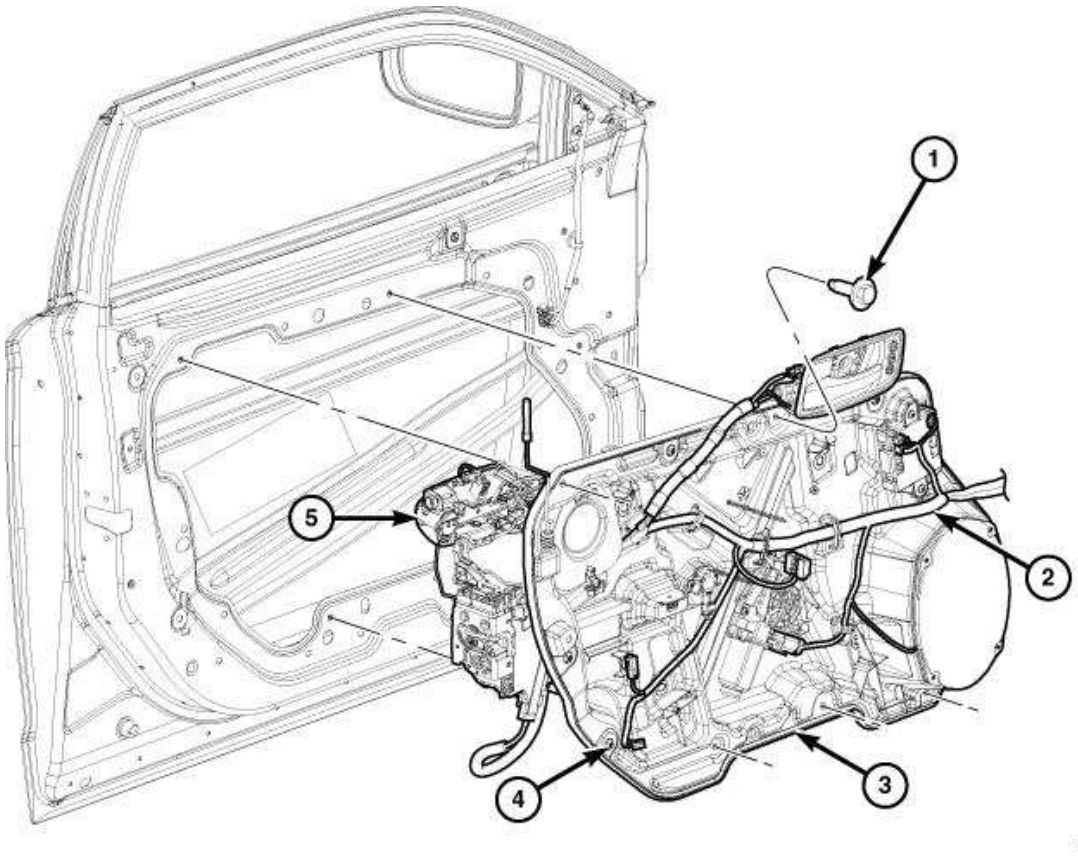

Fig. 125: Front Door Wiring Harness, Front Door Carrier Plate, Exterior Handle Assembly, Bolts & Carrier Plate Torx Head Retainers
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the front door wiring harness (2) from all door carrier motors, modules, sensors and the latch.
12. Remove the front door wiring harness (2) from the front door carrier plate (3).
13. If necessary, disconnect the link rods from the rear of the exterior handle assembly (5) through the access plate in the carrier plate.
14. Remove the five carrier plate bolts (1).
15. Disengage the six carrier plate torx head retainers (4).
16. Remove the carrier plate (3) from the front door.
17. If servicing the latch, separate the presenter and the latch from the carrier plate.

INSTALLATION

INSTALLATION

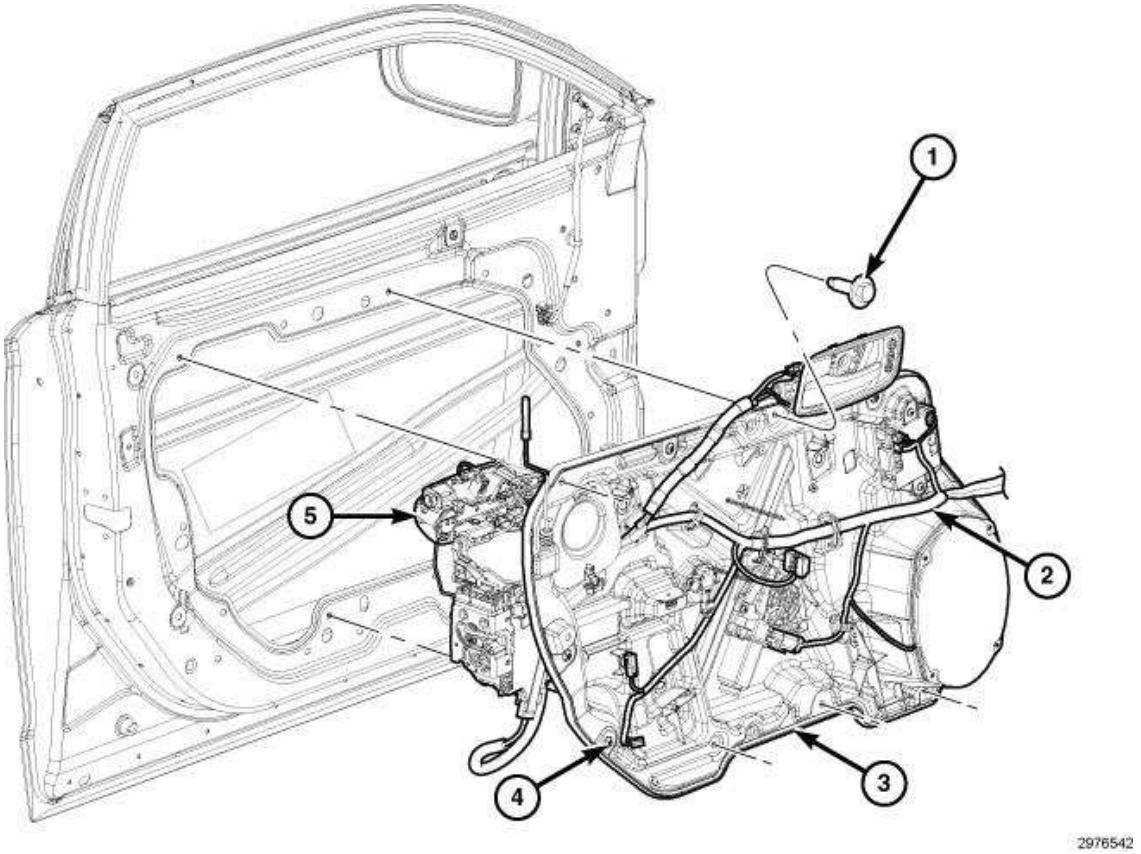

Fig. 126: Front Door Wiring Harness, Front Door Carrier Plate, Exterior Handle Assembly, Bolts & Carrier Plate Torx Head Retainers
Courtesy of CHRYSLER GROUP, LLC

1. If servicing the latch, attach the presenter and the latch to the carrier plate.
2. Position the carrier plate (3) to the front door.
3. Engage the six carrier plate torx head retainers (4).
4. Install the five carrier plate bolts (1). Tighten the bolts to 6 N-m (53 in. lbs.).
5. If necessary, connect the link rods to the rear of the exterior handle assembly (5).
6. Install the front door wiring harness (2) to the front door carrier plate (3).
7. Connect the front door wiring harness (2) to all door carrier motors, modules, sensors and the latch.

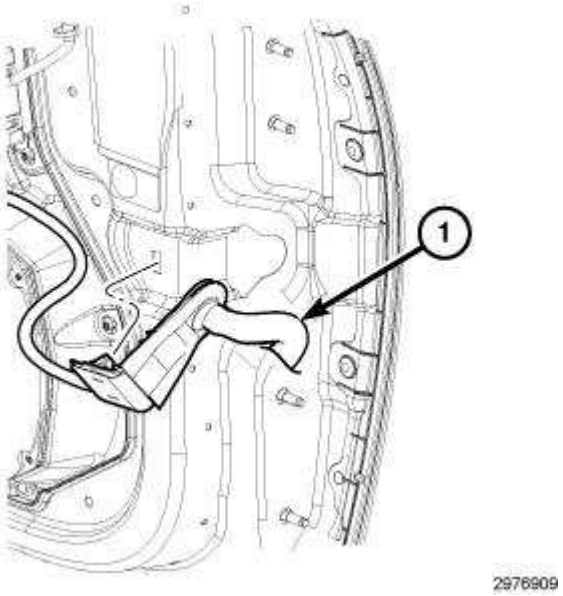

Fig. 127: front door harness wiring
Courtesy of CHRYSLER GROUP, LLC

8. Install the front door harness wiring (1) bracket to the front of the door.

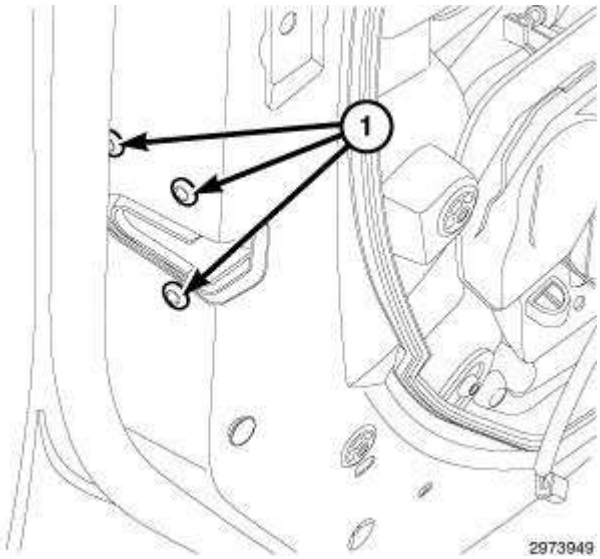

Fig. 128: Front Door Latch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

9. Install the front door latch mounting screws (1). Tighten the screws to 7 N-m (62 in. lbs.).

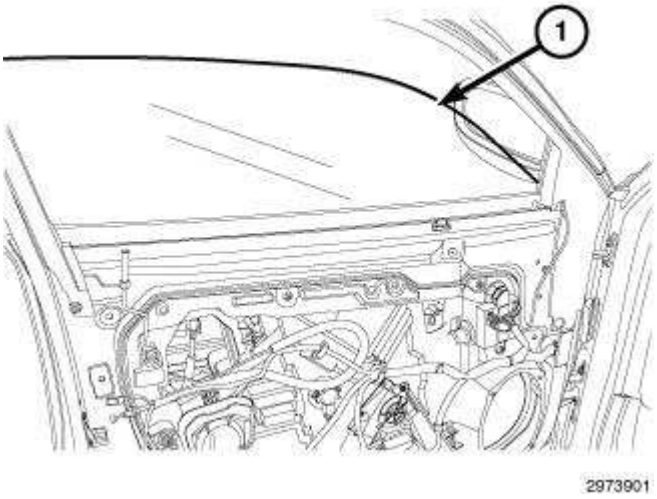

Fig. 129: Window
Courtesy of CHRYSLER GROUP, LLC

10. With the help of an assistant holding the glass, remove the wedge or tape securing the window glass into place.
11. With the help of an assistant holding the glass, slowly lower the glass into place and align with the white regulator tabs.
12. Engage the window regulator tabs into the glass.
13. Add or re-apply a clear adhesive patch covering the front window regulator access hole.
14. Close the latch access panel.

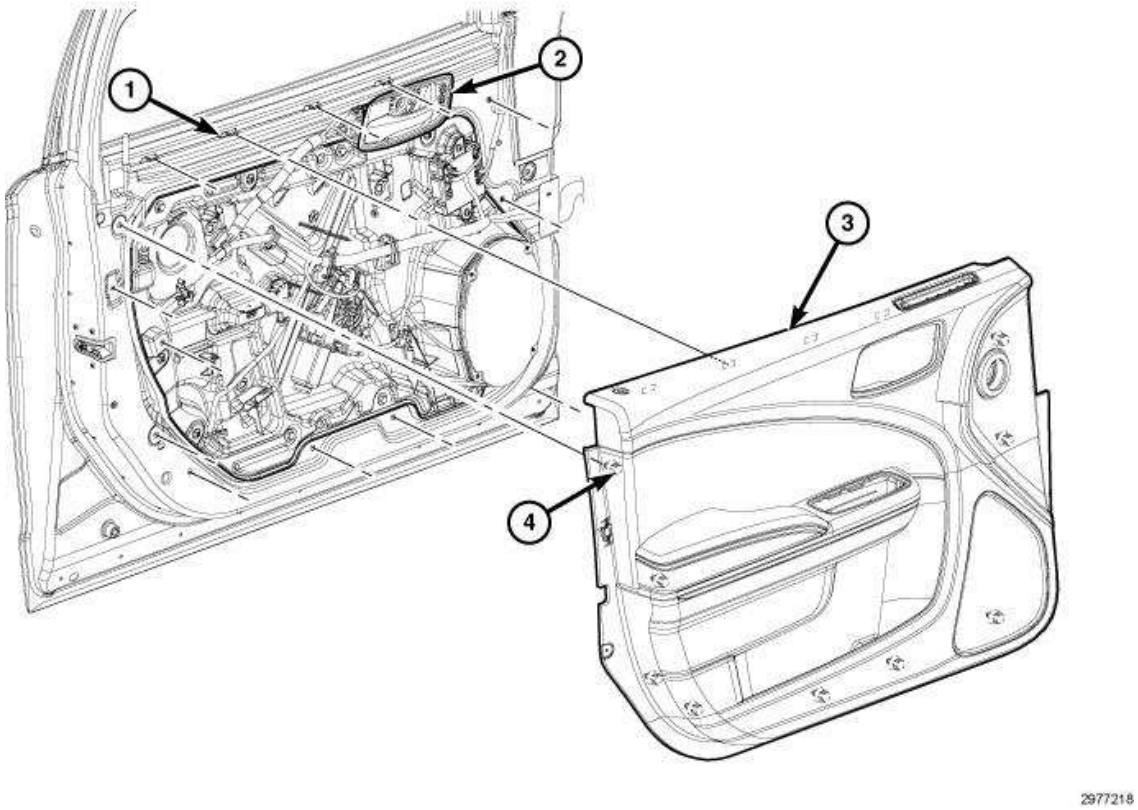

Fig. 130: Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

15. Install the front door trim (3). Refer to **PANEL, DOOR TRIM, INSTALLATION**.
16. Connect the battery negative cable.

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, calibration of this feature is required whenever power to the door module is disrupted.**

A battery reconnect procedure must be performed anytime the battery has been disconnected.

REGULATOR, WINDOW

DESCRIPTION

DESCRIPTION

The window regulator is incorporated into the door module carrier plate. The motor for the regulator is a serviceable part that can be replaced by only removing the door trim panel and its 3 attaching screws. The regulator itself is not serviceable. To remove/install the door module carrier plate. Refer to **PLATE, CARRIER, REMOVAL** & **PLATE, CARRIER, INSTALLATION**.

STRIKER, DOOR LATCH

REMOVAL

REMOVAL

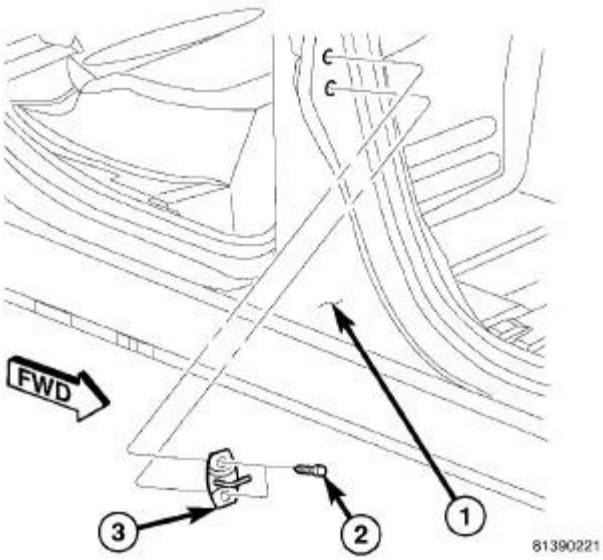

Fig. 131: Front Door Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Open the front door.
2. Mark the front door latch striker (3) location on the face of the outer B-pillar (1) to aid reinstallation.
3. Remove the two screws (2) that secure the striker to the B-pillar.
4. Remove the striker from the B-pillar.

INSTALLATION

INSTALLATION

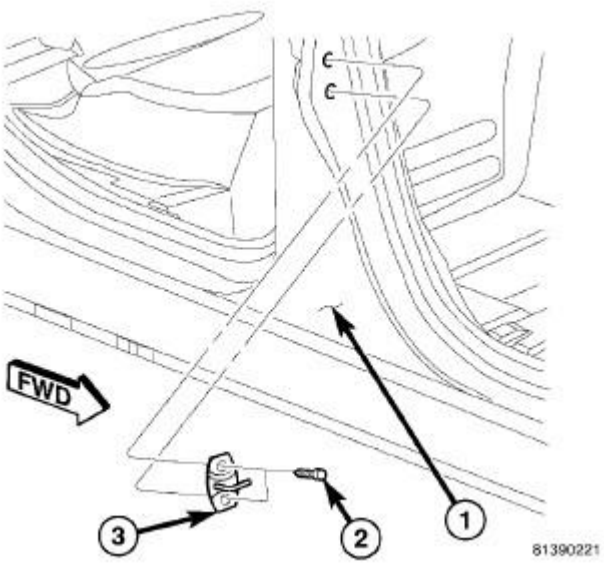

Fig. 132: Front Door Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door latch striker (3) on the face of the outer B-pillar (1).
2. Install and tighten the two screws (2) that secure the striker to the B-pillar. Tighten the screws to 33 N.m (24 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper door spacing and latch operation.

DOORS - REAR

DOOR, REAR

REMOVAL

REMOVAL

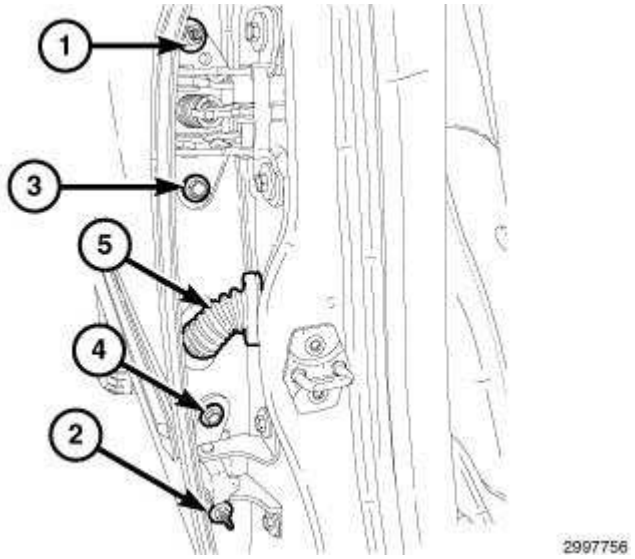

Fig. 133: Removal/Installation Of Nuts And Bolts of Rear Door
Courtesy of CHRYSLER GROUP, LLC

NOTE: Have an assistant to aid in removal/installation.

1. Disconnect and isolate the battery negative cable.
2. Open the front door.
3. Mark the upper and/or lower hinge bracket location on the door.
4. Carefully pull the door wire harness boot and connector (5) out from the B-pillar far enough to access and disconnect the body wire harness connector.
5. Remove the bolts (3, 4) securing the hinge bracket to the door.
6. Open the door to the full open position.
7. Support the door with a suitable lifting device.
8. Remove the nuts (1, 2) securing the hinge bracket to the door.
9. Remove the rear door from the vehicle.

INSTALLATION

INSTALLATION

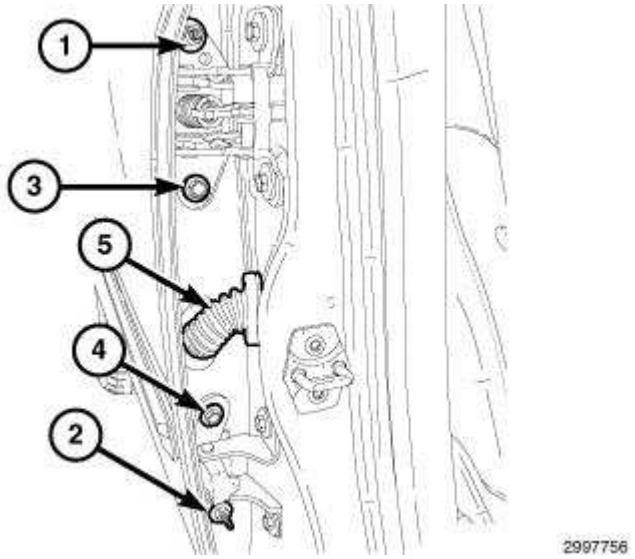

Fig. 134: Removal/Installation Of Nuts And Bolts of Rear Door
Courtesy of CHRYSLER GROUP, LLC

NOTE: Have an assistant to aid in removal/installation.

1. Support the front door (1) with a suitable lifting device.
2. Position and align the door hinge studs with the upper and lower hinge brackets using the reference marks made in removal.
3. Push the door in towards the vehicle to seat the studs into the hinge brackets.
4. Install and tighten the nuts (1, 2) into both the upper and lower front door hinge studs to secure the door hinge brackets to the door. Tighten the fasteners to 24 N.m (18 ft. lbs.).
5. Install and tighten the bolts (3, 4) into both the upper and lower front door hinge studs to secure the door hinge brackets to the door. Tighten the fasteners to 24 N.m (18 ft. lbs.).
6. Remove the lifting device supporting the door.
7. Carefully pull the body wire harness connector(s) (5) out from the A-pillar far enough to reconnect them to the door wire harness boot and connector.
8. Engage the front door wire harness boot and connector (5) into the wiring clearance hole on the outside of the lower A-pillar.
9. Reconnect the battery negative cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted.

10. Adjust the door hinge positions as necessary to achieve proper door spacing and operation.

GLASS, DOOR

REMOVAL

REMOVAL

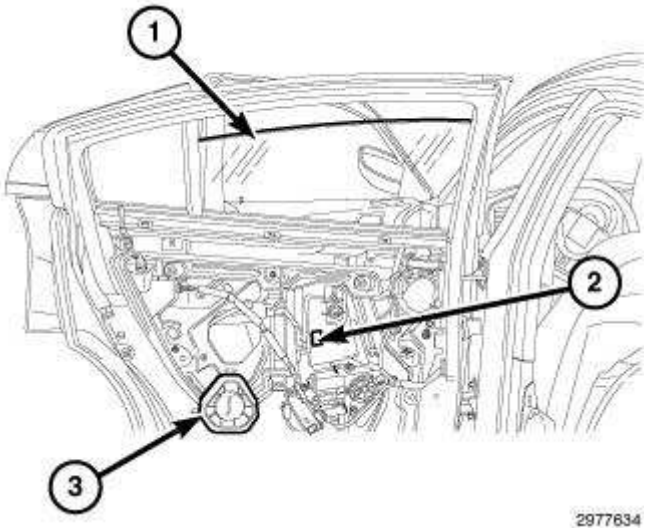

Fig. 135: Rear Door Glass, Latch Access Cover & Access Hole
Courtesy of CHRYSLER GROUP, LLC

1. Raise the rear door glass (1) up to it's full position.
2. Remove the trim panel from the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
3. Remove the inner belt weatherstrip from the rear door.
4. Open the latch access cover (3).
5. Remove the cover for the regulator tab access hole. If a clear adhesive patch is not present, there will be an indented area in the same location that will need to be cut out.
6. Temporarily install the window switch pod, reconnect the negative battery cable and lower the window until the white regulator tab is visible in the access hole (2).
7. With the help of an assistant holding the glass, release the window regulator tab and lift the window up and tape the glass (1) to the door header.
8. Remove the door carrier plate. Refer to **PLATE, CARRIER, REMOVAL**.
9. Remove the tape securing the glass, lower the sliding glass into the carrier plate cavity.

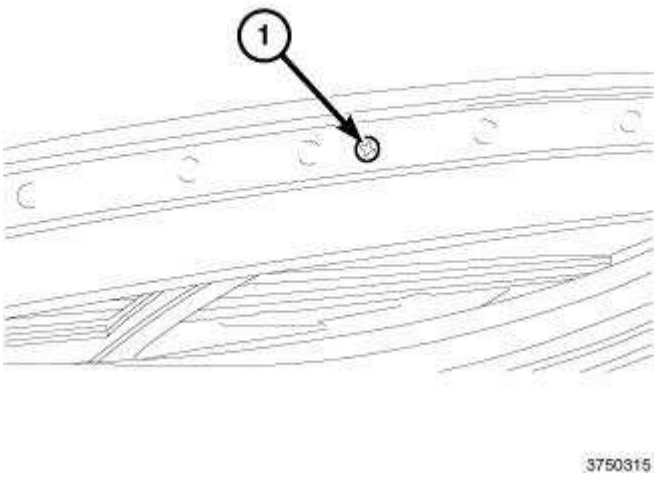

Fig. 136: Fastener
Courtesy of CHRYSLER GROUP, LLC

10. Peel back the door weatherstrip, remove the fastener securing the fixed glass run to the door.

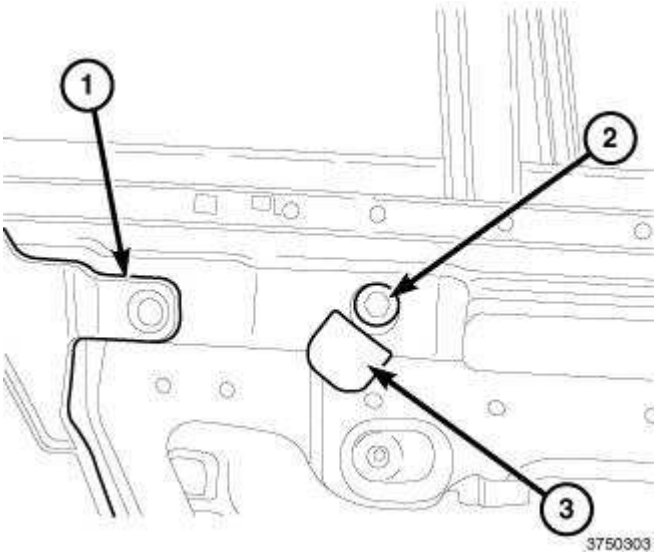

Fig. 137: Upper Trim, Cover & Fastener
Courtesy of CHRYSLER GROUP, LLC

11. Detach and remove the upper trim (1) from the door.
12. Remove the cover (3) for the lower fixed glass fastener access hole.
13. Remove the fastener (2) securing the fixed glass to the door.
14. Lift the fixed glass and glass run on an angle to remove.
15. Remove the sliding glass through the carrier plate cavity.

INSTALLATION

INSTALLATION

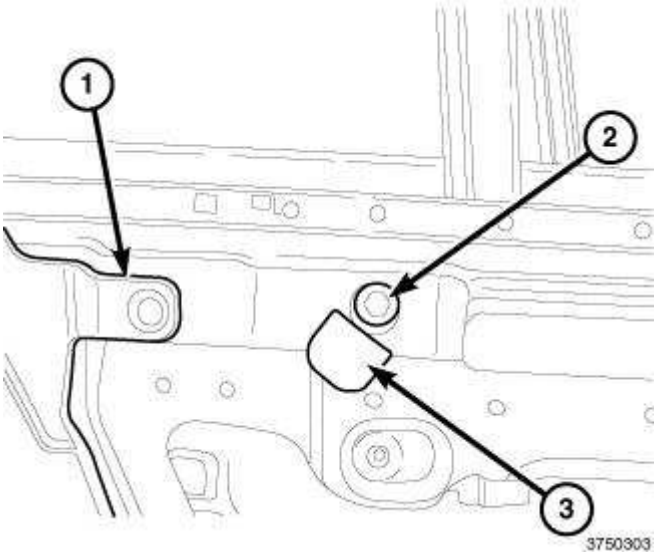

Fig. 138: Upper Trim, Cover & Fastener
Courtesy of CHRYSLER GROUP, LLC

1. Insert the rear door glass (1) into the carrier plate cavity.
2. Lower the fixed glass and glass run on an angle to position into the door.
3. Install the fastener (2) securing the fixed glass to the door. Tighten the fastener securely.
4. Install the cover (3) for the lower fixed glass fastener access hole.
5. Align, position and attach the upper trim (1) to the door.

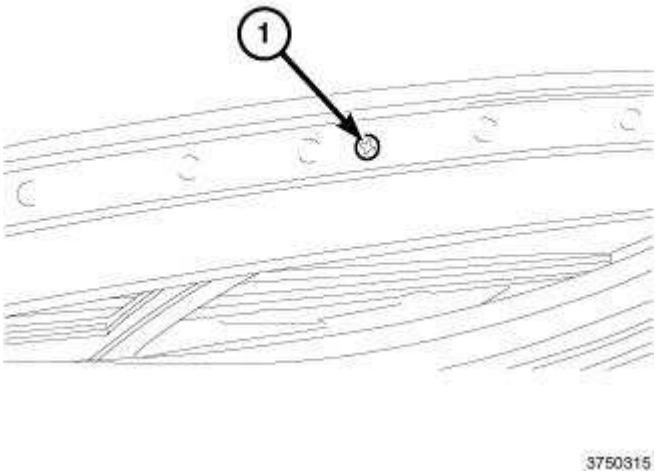

Fig. 139: Fastener
Courtesy of CHRYSLER GROUP, LLC

6. Install the fastener (1) securing the fixed glass to the door. Tighten the fastener securely.

7. Install the door weatherstrip.

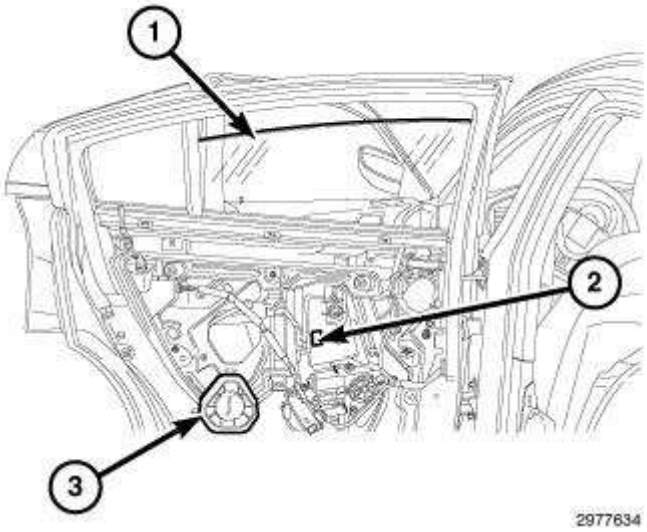

Fig. 140: Rear Door Glass, Latch Access Cover & Access Hole
Courtesy of CHRYSLER GROUP, LLC

8. Lift the sliding glass (1) and tape the glass to the door header.
9. Install the rear door carrier plate. Refer to **PLATE, CARRIER, INSTALLATION**.
10. Install the outside door handle.
11. With the help of an assistant holding the glass, remove the tape securing the glass, lower and align the glass with the regulator tab.
12. Engage the window regulator tab into the glass.
13. Apply a clear adhesive patch or equivalent to the front window regulator access hole.
14. Close the latch access cover (3).
15. Reinstall the inner belt weatherstrip onto the rear door.
16. Reinstall the trim panel onto the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.

HANDLE, EXTERIOR

REMOVAL

REMOVAL

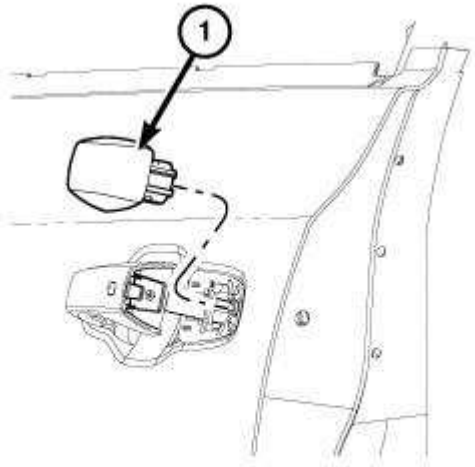

Fig. 141: Blank Cylinder Bezel
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH Shown in illustration, RH typical.

1. Disconnect the negative battery cable.
2. Remove the blank cylinder bezel (1) from the door by removing the PIA fastener accessed rearward of the handle and prying away.

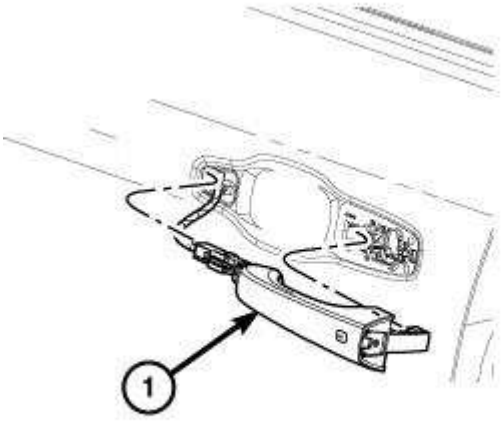

Fig. 142: Slide Handle
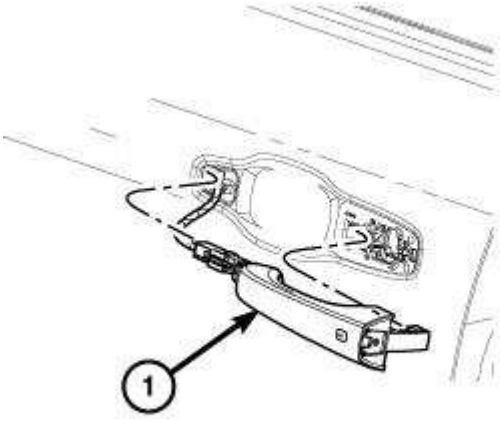
Courtesy of CHRYSLER GROUP, LLC

3. Slide handle (1) rearward and out.
4. Disconnect the harness connector and remove the handle (1).

INSTALLATION

INSTALLATION

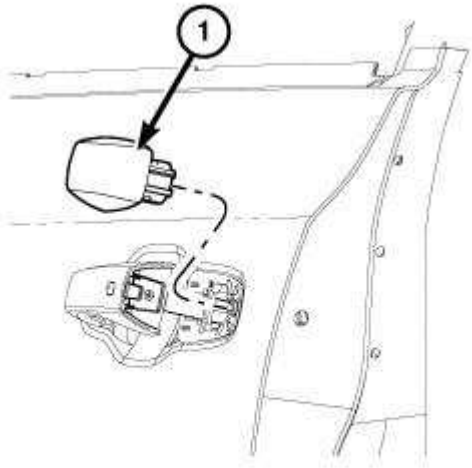


3329122

Fig. 143: Slide Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH Shown in illustration, RH typical.

1. Connect the harness connector and position the handle (1) to the door.
2. Slide handle (1) in and forward.



3329280

Fig. 144: Blank Cylinder Bezel
Courtesy of CHRYSLER GROUP, LLC

3. Install the blank cylinder bezel (1) to the front door by positioning and installing the PIA fastener accessed rearward of the handle. Tighten the fastener securely.
4. Connect the negative battery cable.

HINGE, DOOR

REMOVAL

REMOVAL

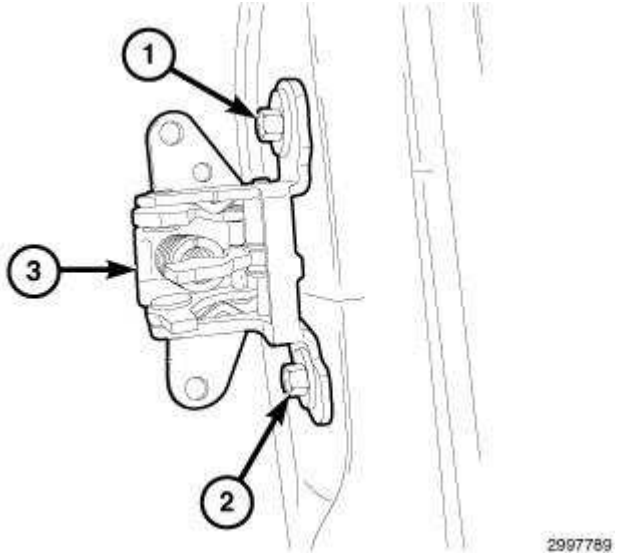


Fig. 145: Identifying Screws And Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Upper hinge shown in illustration, lower hinge similar.

1. Remove the rear door from the vehicle. Refer to **DOOR, REAR, REMOVAL**.
2. Mark the upper (3) and/or lower hinge bracket location on the outside of the lower B-pillar to aid reinstallation.
3. Remove the two screws (1, 2) that secure the hinge bracket to the outside of the lower B-pillar.
4. Remove the hinge bracket (3) from the B-pillar.

INSTALLATION

INSTALLATION

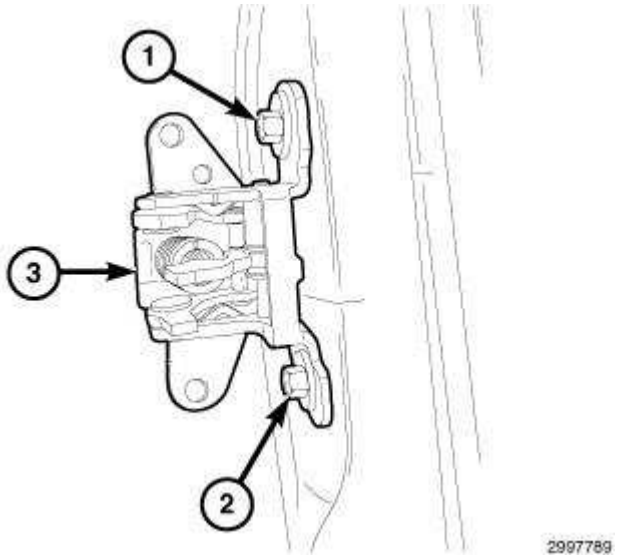

Fig. 146: Identifying Screws And Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Upper hinge shown in illustration, lower hinge similar.

1. Position and align the upper (3) and/or lower hinge to the outside face of the lower A-pillar using the reference marks made when removing.
2. Install and tighten the fasteners (1, 2) that secure the hinge to the lower A-pillar. Tighten the fasteners to 30 N.m (22 ft. lbs.).
3. Reinstall the rear door onto the vehicle. Refer to **DOOR, REAR, INSTALLATION**.

LATCH, DOOR

DESCRIPTION

DESCRIPTION

The door latch is integrated to the door's module/carrier plate. To remove or install the latch, the carrier plate will need to be removed for access. Refer to **PLATE, CARRIER, REMOVAL** & **PLATE, CARRIER, INSTALLATION**.

PANEL, REAR DOOR TRIM

REMOVAL

REMOVAL

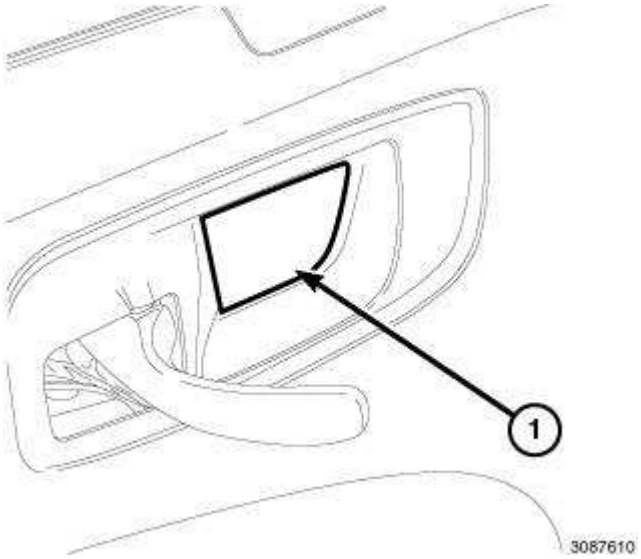

Fig. 147: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a small pick tool, pull out on interior latch handle and remove the trim plate (1).

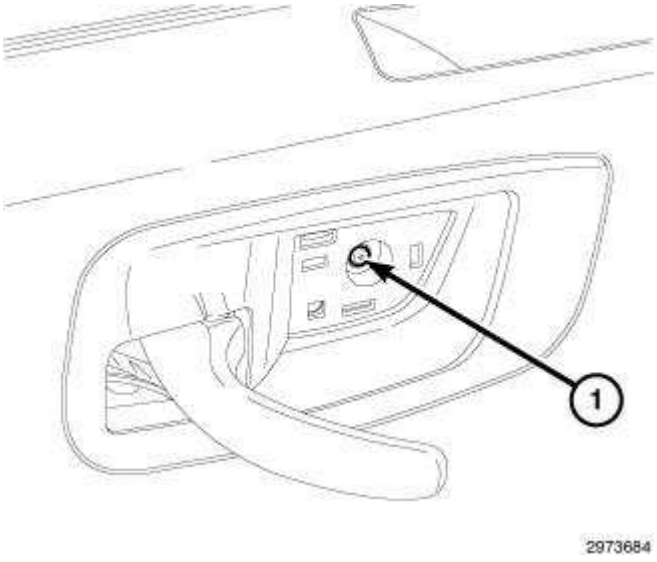

Fig. 148: Screw
Courtesy of CHRYSLER GROUP, LLC

3. Pull out on interior latch handle and remove the screw (1).

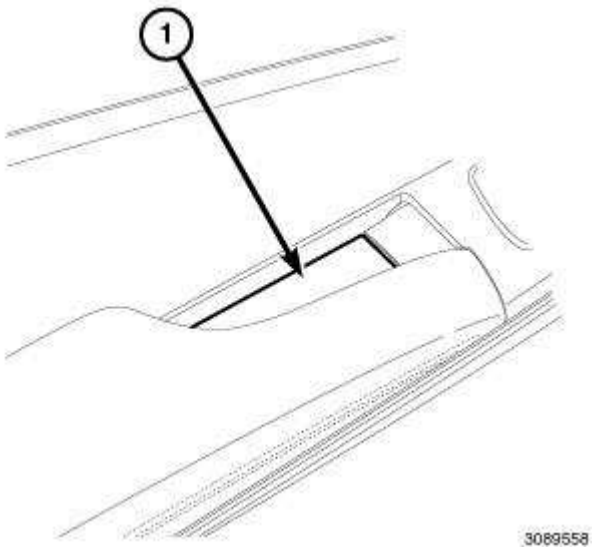

Fig. 149: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

4. Using a small pick tool, remove the trim plate (1) just behind the armrest.

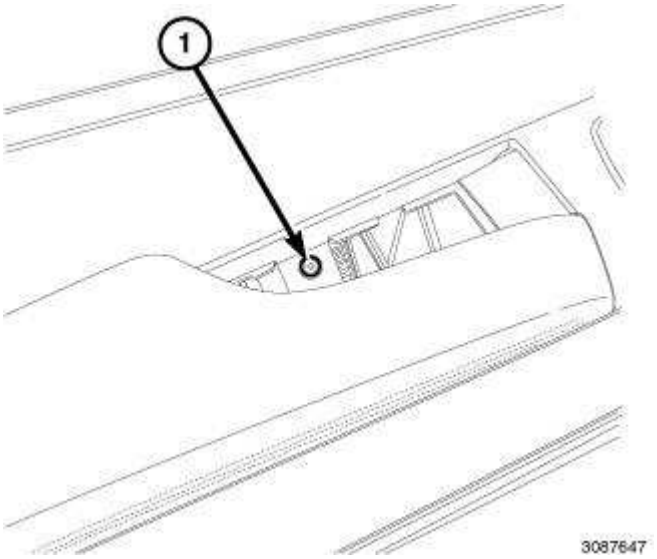

Fig. 150: Screw
Courtesy of CHRYSLER GROUP, LLC

5. Remove and disconnect the power window switch. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
6. Remove the screw (1) just behind the armrest.

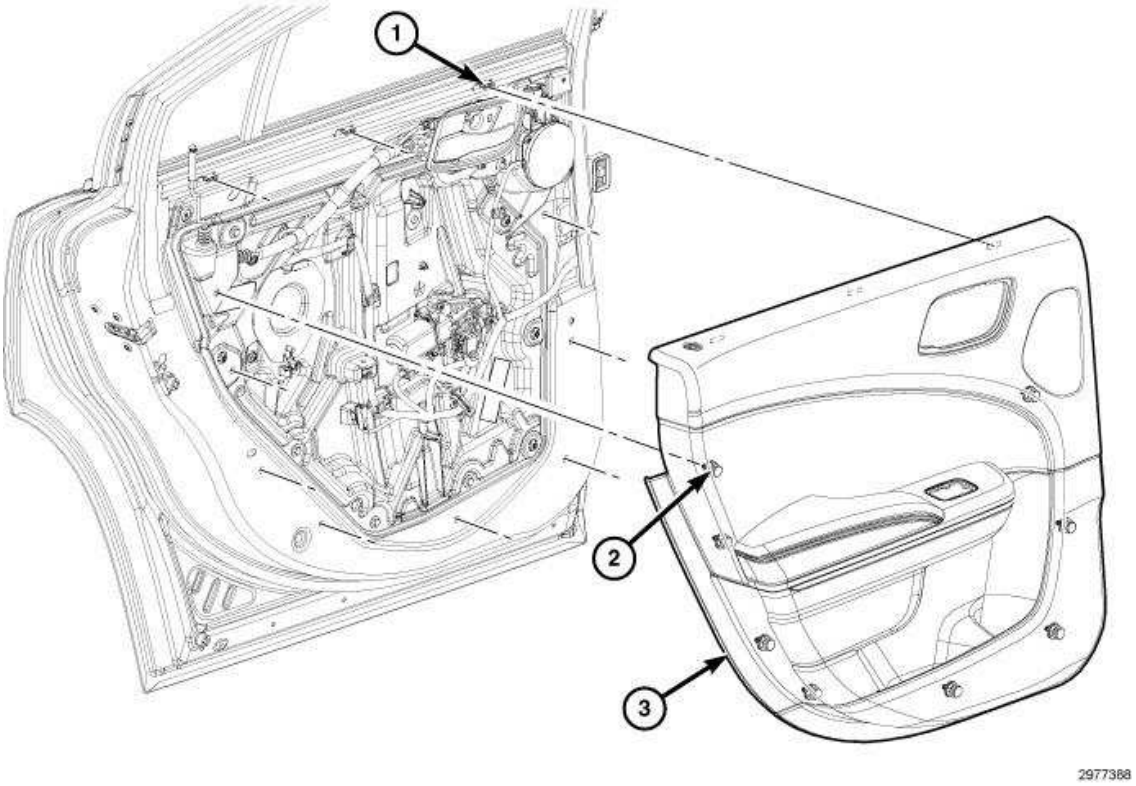

Fig. 151: Door Trim Snap Retainers & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

7. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the door trim snap retainers (2).
8. Raise the trim panel (3) up and peel the belt molding off from the flange.**Do not fully remove at this time.**

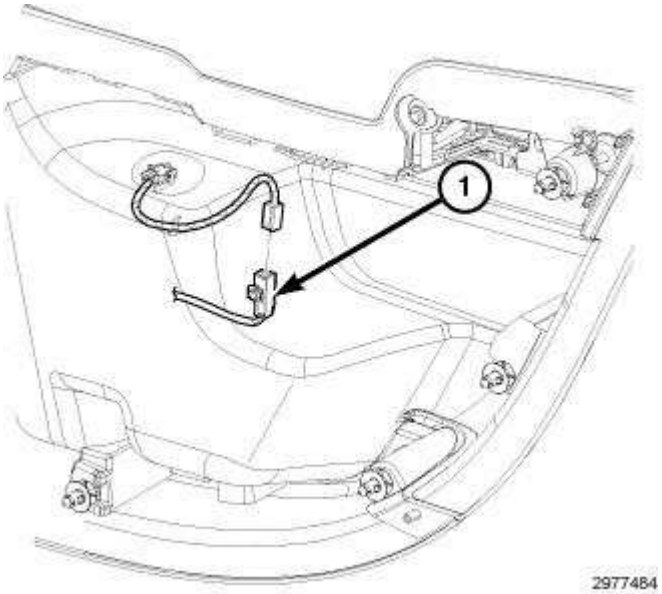

Fig. 152: Map Light Harness
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the map light harness (1).
10. Remove the door trim panel.
11. If necessary, use a flat bladed screwdriver to disengage the belt molding clips (1) from the trim panel.

INSTALLATION

INSTALLATION

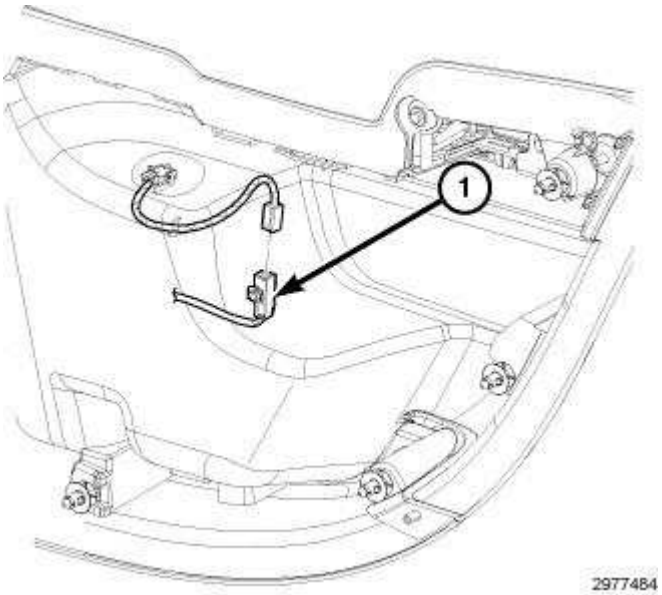

Fig. 153: Map Light Harness
Courtesy of CHRYSLER GROUP, LLC

1. Prior to installation, check to be certain that all snap retainers are in good condition on the door trim panel and the door's carrier plate. Replace if necessary.
2. Position the door trim panel near the door. **Do not install at this time.**
3. Connect the map light harness (1).

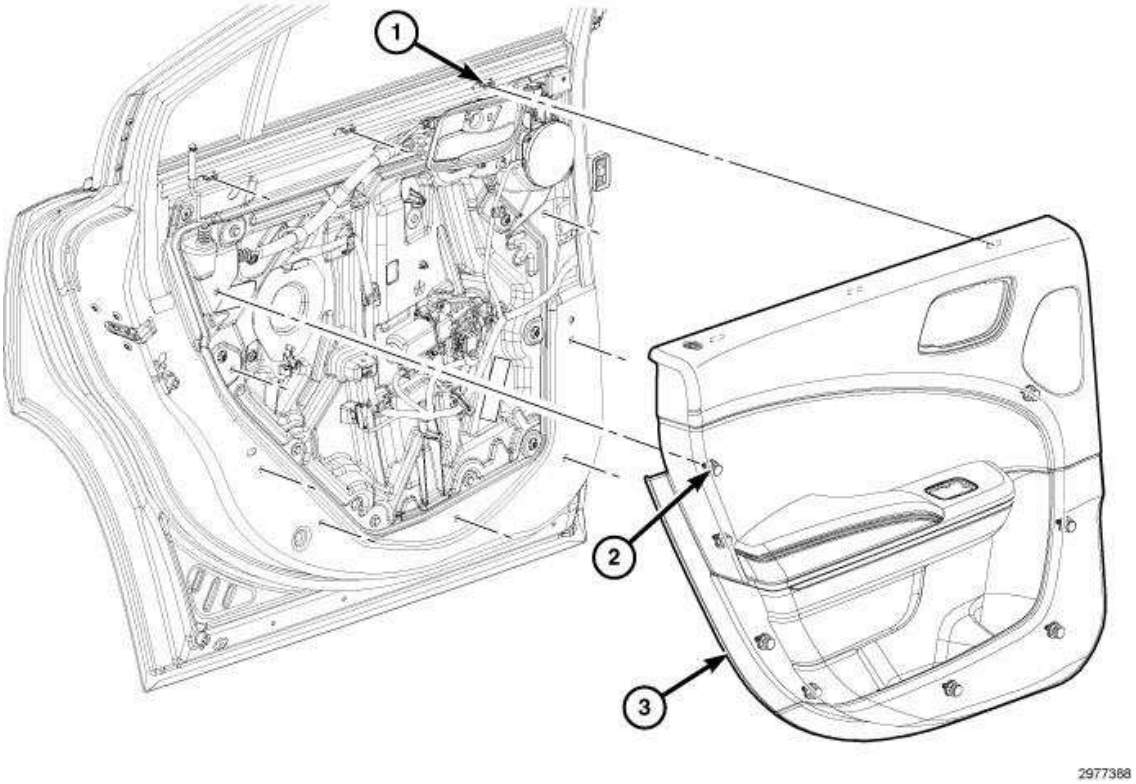

Fig. 154: Door Trim Snap Retainers & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

4. Feed the latch handle assembly on an angle through the opening in the door trim panel (3). Once the latch handle is fed through the opening, snap it into place.
5. Using firm pressure, engage the door trim snap retainers (1, 2) into the door's carrier plate.

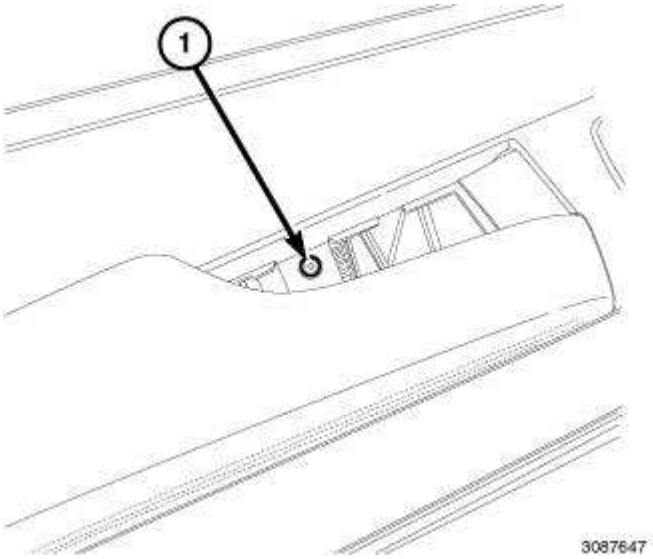

Fig. 155: Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install the screw (1) just behind the armrest. Tighten the screw to 2 N.m (16 in. lbs.).
7. Connect and install the power window switch. Refer to **SWITCH, POWER WINDOW, INSTALLATION** .

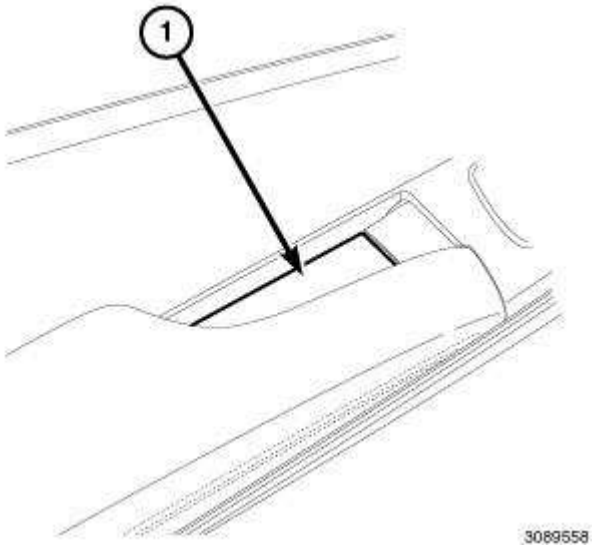

Fig. 156: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

8. Install the trim plate (1) just behind the armrest.

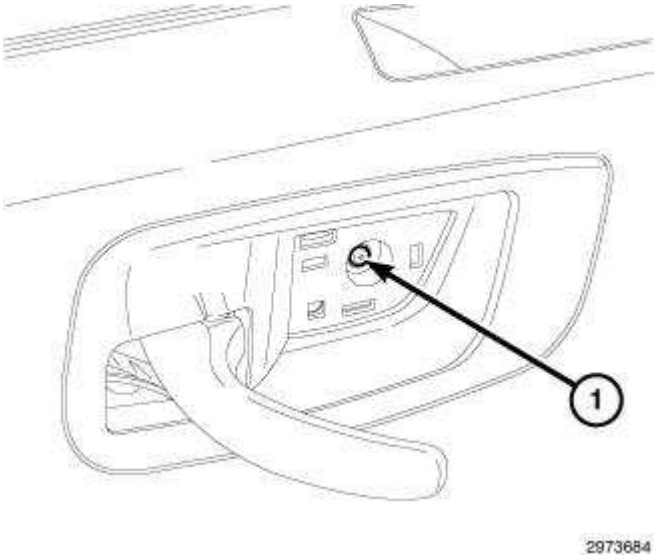

Fig. 157: Screw
Courtesy of CHRYSLER GROUP, LLC

9. Pull out on interior latch handle and install the screw (1) securing the latch handle to the carrier plate. Tighten the screw to 2 N.m (16 in. lbs.).

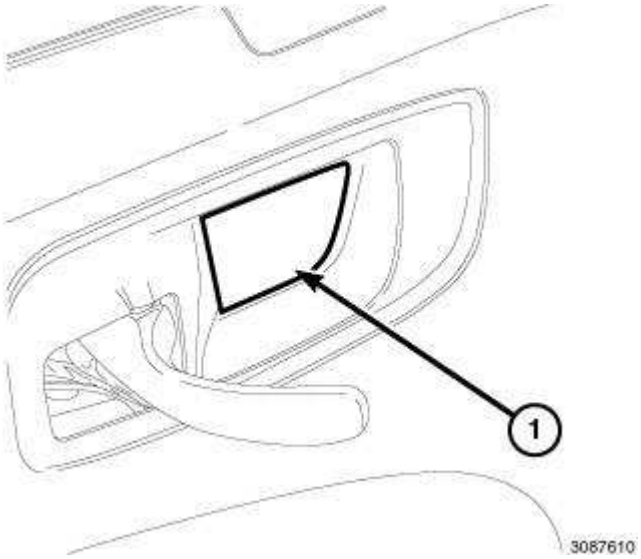

Fig. 158: Trim Plate
Courtesy of CHRYSLER GROUP, LLC

10. Pull out on interior latch handle and install the trim plate (1).

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, calibration of this feature is required whenever power to the door module is disrupted.**

A battery reconnect procedure must be performed anytime the battery has

been disconnected.

11. Connect the battery negative cable.

PLATE, CARRIER

REMOVAL

REMOVAL

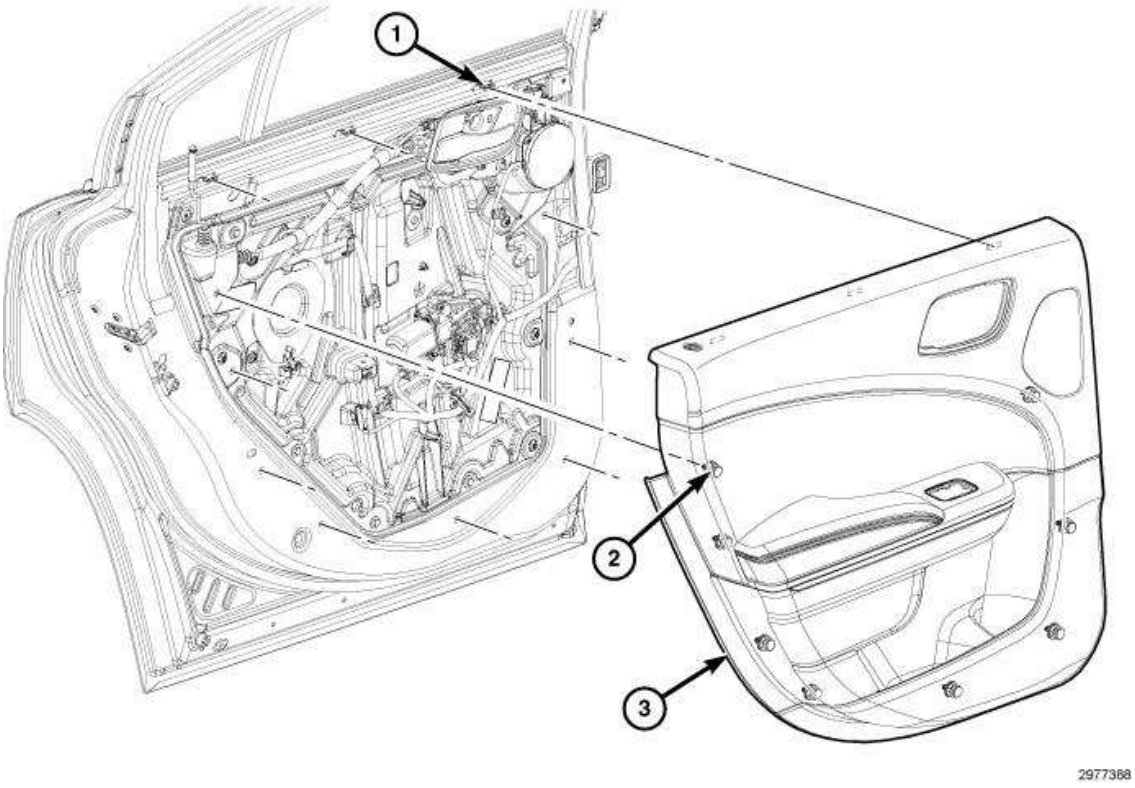

Fig. 159: Door Trim Snap Retainers & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Raise the window to it's fully up position.
2. Disconnect and isolate the battery negative cable.
3. Remove the rear door trim. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.

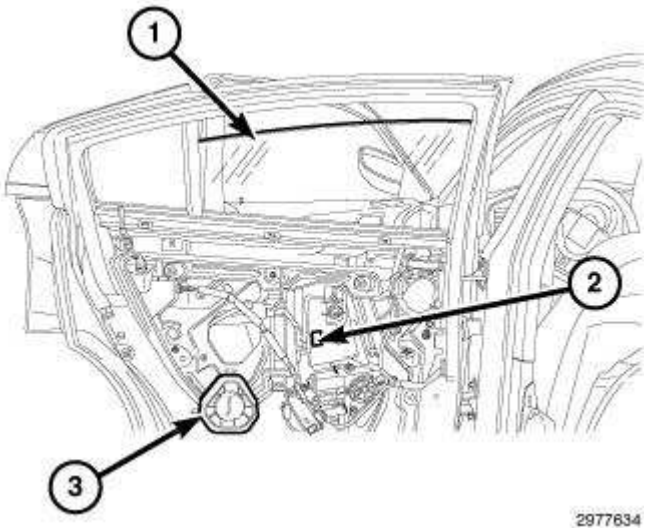

Fig. 160: Rear Door Glass, Latch Access Cover & Access Hole
Courtesy of CHRYSLER GROUP, LLC

4. Remove the cover from the access hole (2).
5. Temporarily install the window switch pod, reconnect the negative battery cable and lower the window until the white regulator tab is visible in the access hole (2).
6. With the help of an assistant holding the glass, release the window regulator tab and lift the window up.
7. Secure the window glass into place with a wedge or tape.
8. Disconnect the negative battery cable and remove the window switch pod.
9. Disconnect the door harness from the vehicle body harness.

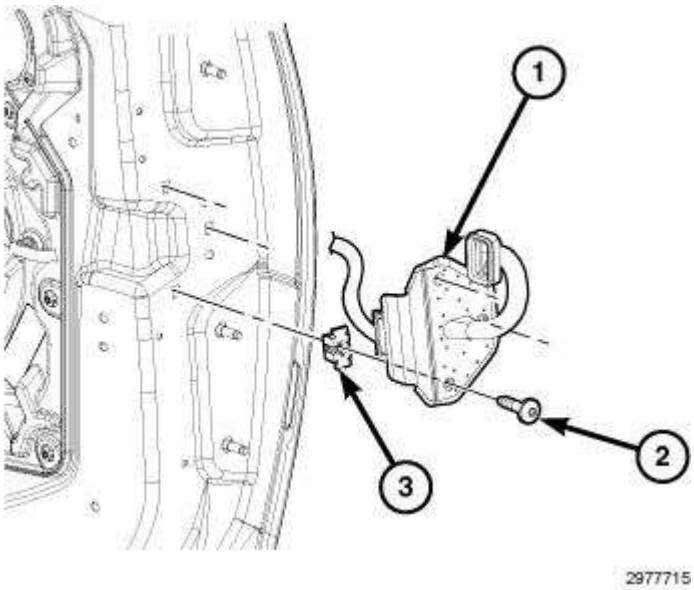

Fig. 161: Latch Access Panel, Screws & Harness Grommet/Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Open the latch access panel (3).
11. Remove the screws (2) from the harness grommet/bracket (1).
12. Remove the harness grommet/bracket (1) from the door.

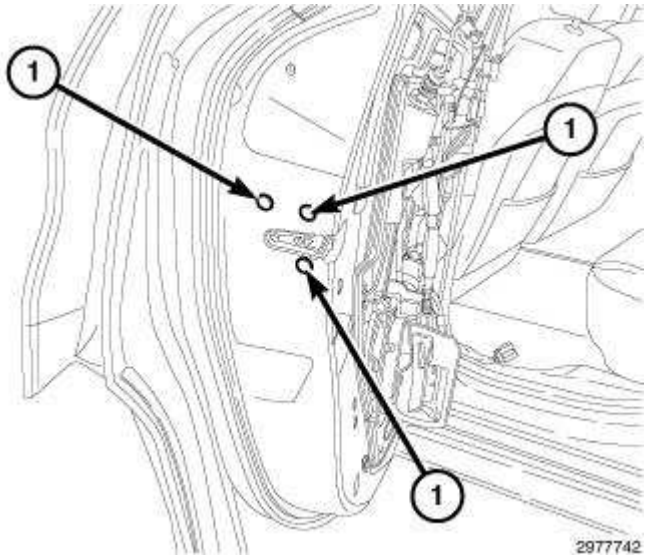

Fig. 162: Rear Door Latch Screws
Courtesy of CHRYSLER GROUP, LLC

13. Remove the exterior door handle. Refer to **HANDLE, EXTERIOR, REMOVAL**.
14. Remove the rear door latch screws (1).

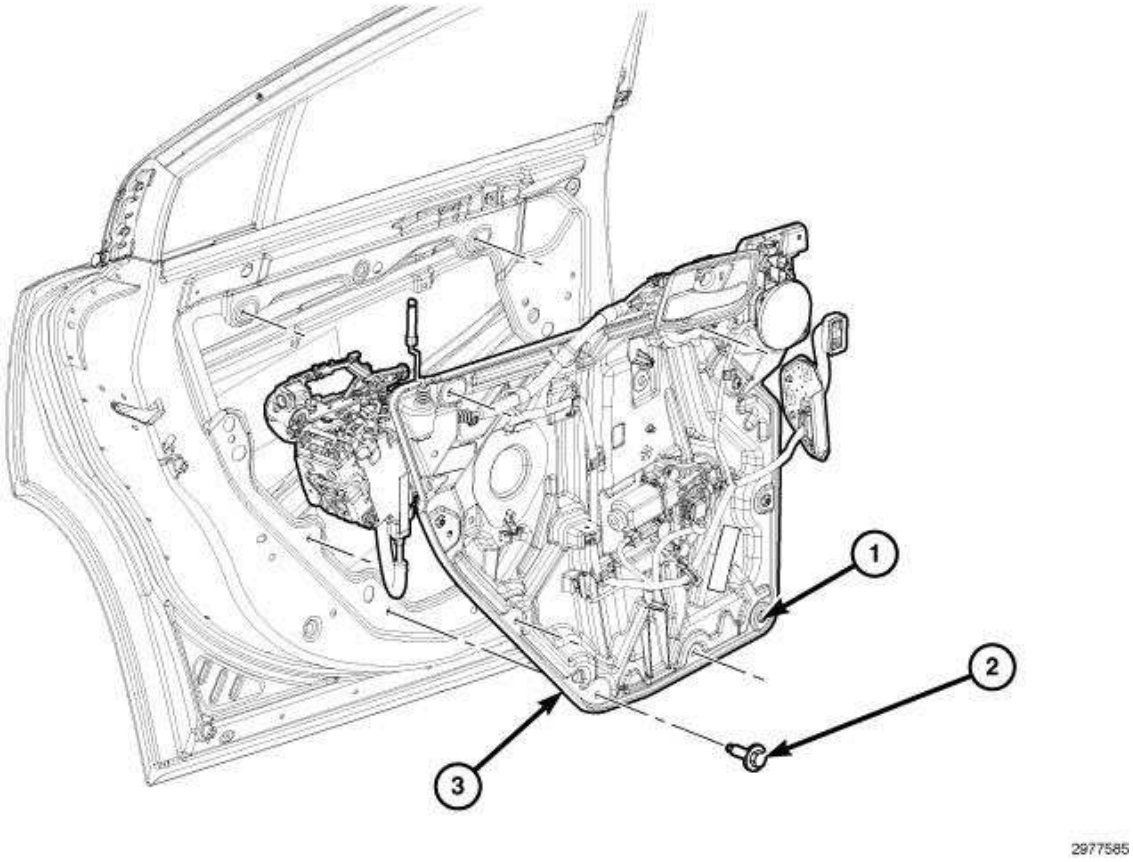

Fig. 163: Seven Carrier Plate Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the seven carrier plate bolts (2).
16. Disengage the four carrier plate torx head retainers (1).
17. Remove the carrier plate (3) from the rear door.
18. If servicing the latch, separate the presenter and the latch from the carrier plate.

INSTALLATION

INSTALLATION

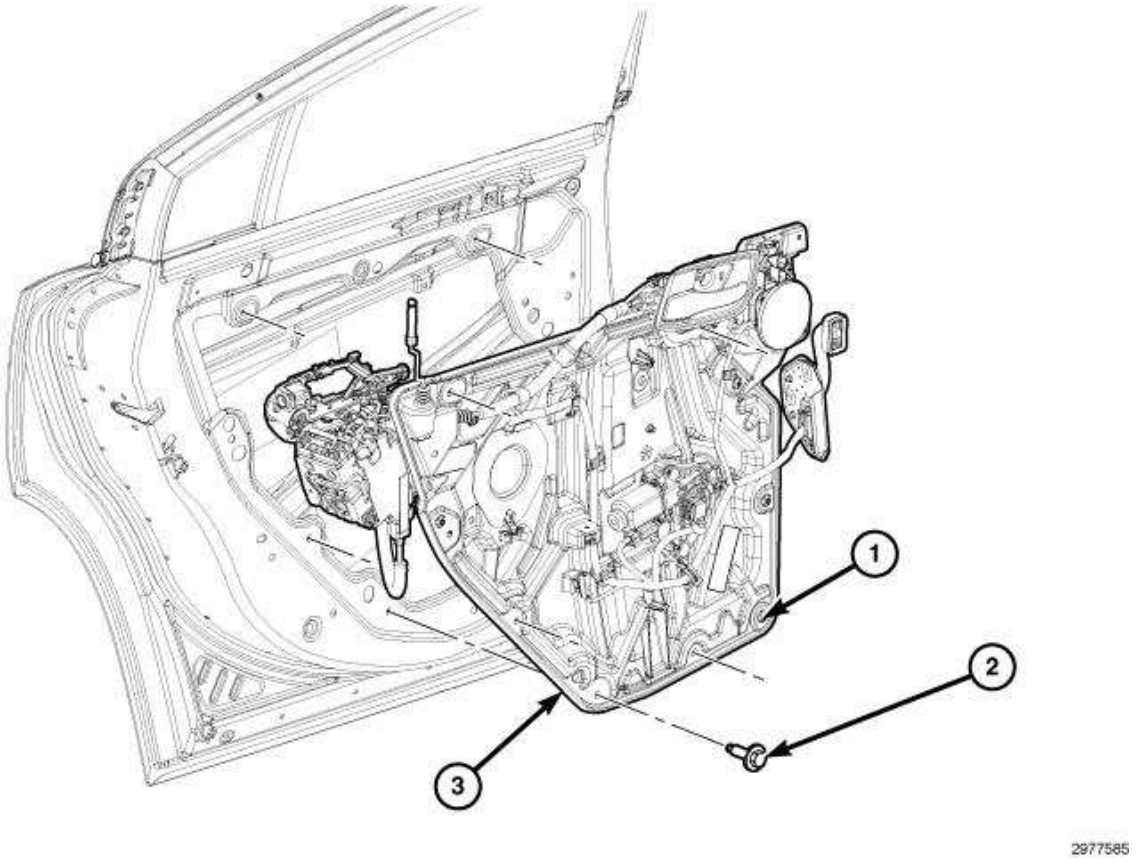

Fig. 164: Seven Carrier Plate Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If servicing the latch, attach the presenter and the latch to the carrier plate.
2. Position the carrier plate (3) to the rear door.
3. Engage the four carrier plate torx head retainers (1).
4. Install the seven carrier plate bolts (2). Tighten the bolts to 6 N-m (53 in. lbs.).

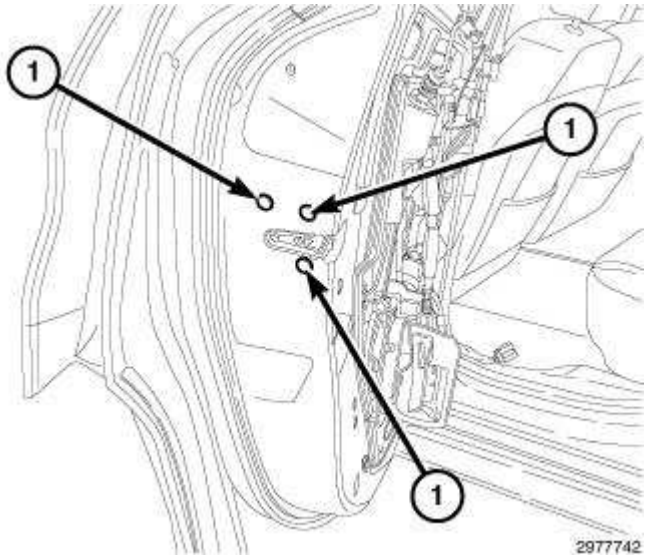

Fig. 165: Rear Door Latch Screws
Courtesy of CHRYSLER GROUP, LLC

5. Install the rear door latch mounting screws (1). Tighten the screws to 7 N-m (62 in. lbs.).

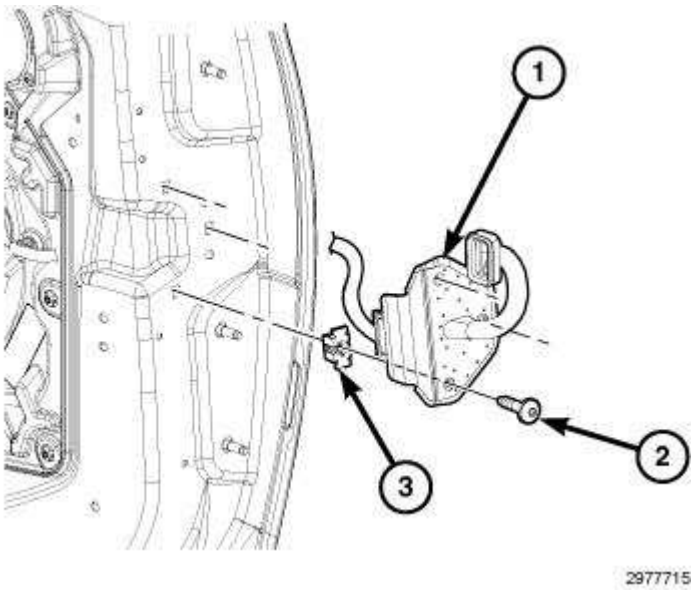

Fig. 166: Latch Access Panel, Screws & Harness Grommet/Bracket
Courtesy of CHRYSLER GROUP, LLC

6. Position the harness grommet/bracket (1) to the door.
7. Install the screws (2) securing the harness grommet/bracket (1) to the door. Tighten the screws securely.

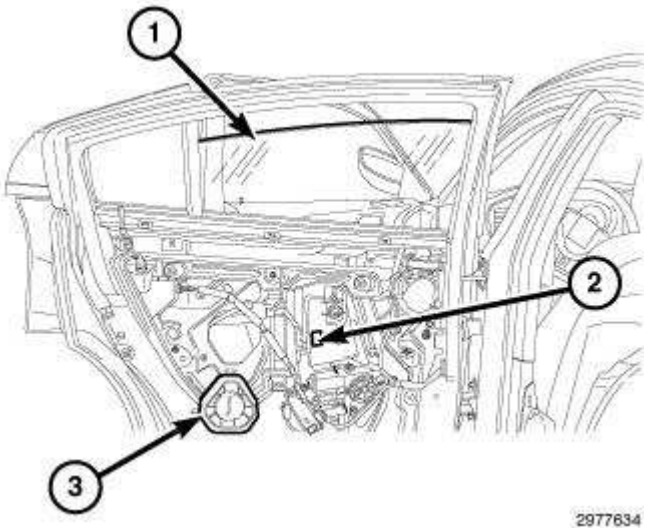

Fig. 167: Rear Door Glass, Latch Access Cover & Access Hole
Courtesy of CHRYSLER GROUP, LLC

8. Connect the door harness to the vehicle body harness.
9. Remove the wedge or tape securing the window glass into place.
10. With the help of an assistant holding the glass, lower the glass and align with the regulator tab.
11. Engage the window regulator tabs into the glass.
12. Apply tape to cover the front window regulator access hole.
13. Install the exterior door handle. Refer to **HANDLE, EXTERIOR, INSTALLATION**.
14. Close the latch access panel.

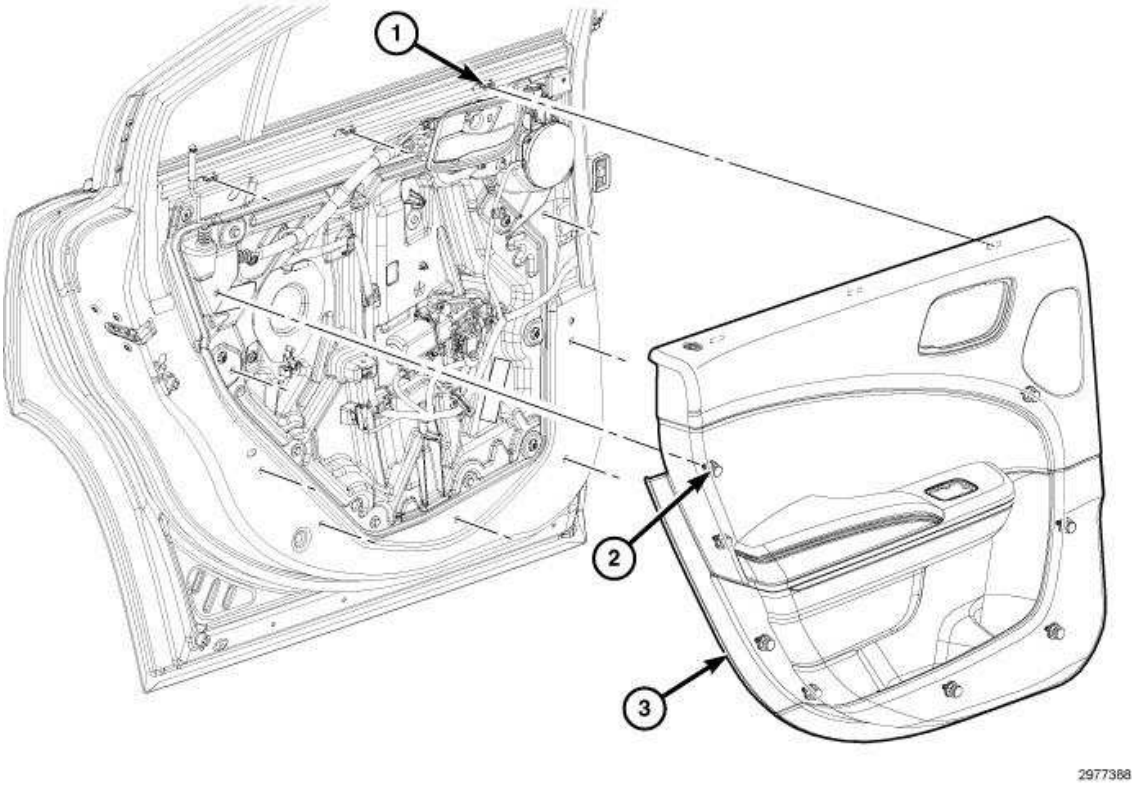

Fig. 168: Door Trim Snap Retainers & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

15. Install the rear door trim (3). Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected.

16. Connect the battery negative cable.

REGULATOR, WINDOW

DESCRIPTION

DESCRIPTION

The window regulator is incorporated into the door module carrier plate. The motor for the regulator is a serviceable part that can be replaced by only removing the door trim panel and its 3 attaching screws. The regulator itself is not serviceable. To remove/install the door module carrier plate. Refer to **PLATE, CARRIER, REMOVAL** &**PLATE, CARRIER, INSTALLATION**.

STRIKER, DOOR LATCH

REMOVAL

REMOVAL

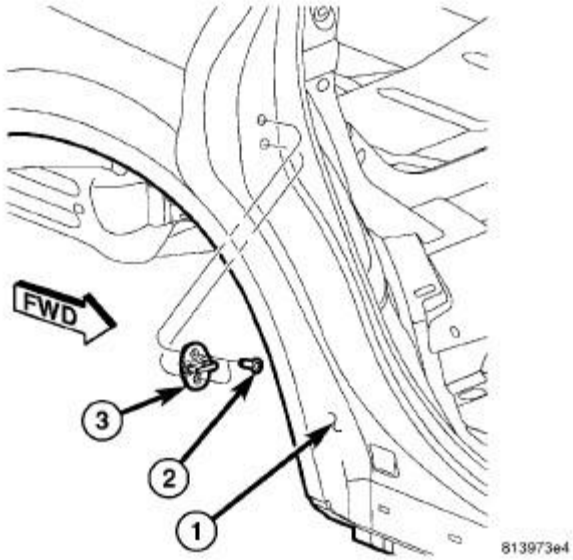

Fig. 169: Striker
Courtesy of CHRYSLER GROUP, LLC

1. Open the rear door.
2. Mark the rear door latch striker (3) location on the face of the outer C-pillar (1) to aid reinstallation.
3. Remove the two screws (2) that secure the striker to the C-pillar.
4. Remove the striker from the C-pillar.

INSTALLATION

INSTALLATION

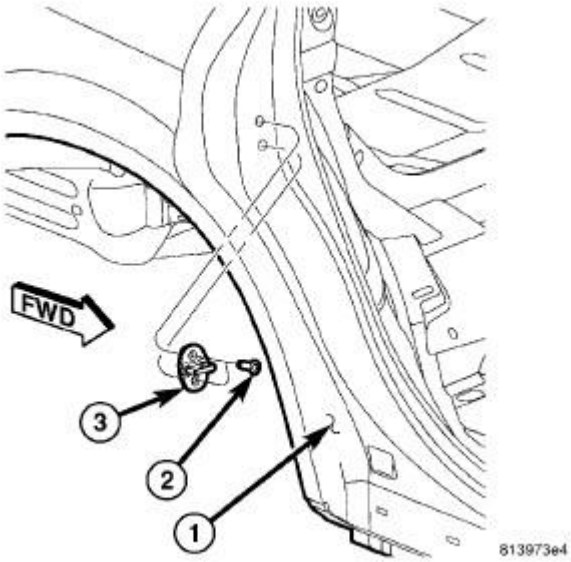

Fig. 170: Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear door latch striker (3) on the face of the outer C-pillar (1).
2. Install and tighten the two screws (2) that secure the striker to the C-pillar. Tighten the screws to 33 N.m (24 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper door spacing and latch operation.

EXTERIOR

CLADDING, BODY

REMOVAL

REMOVAL

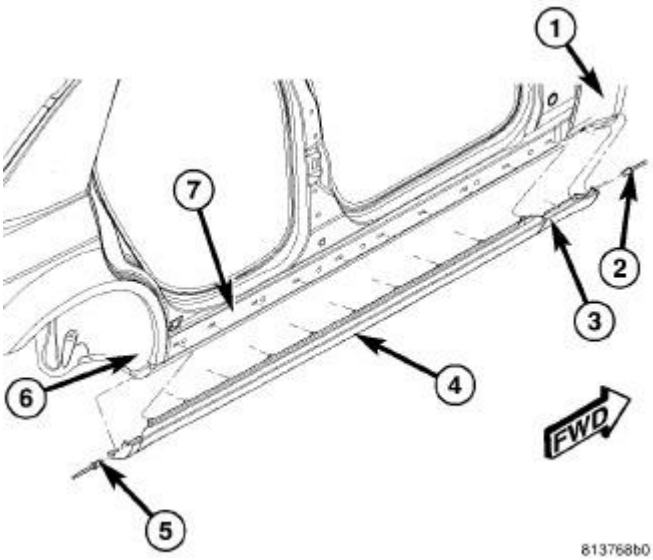

Fig. 171: Body Side Cladding
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheels from the side of the vehicle being serviced. Refer to **REMOVAL** .
3. Remove the pop rivets (2 and 5) from the front fender (1) and rear quarter panel (6).
4. Remove the rear body side cladding (4) by disengaging the cladding retaining clips from the rocker panel (7).
5. Remove the front body side cladding (3) by disengaging the retaining clip from the front fender.

INSTALLATION

INSTALLATION

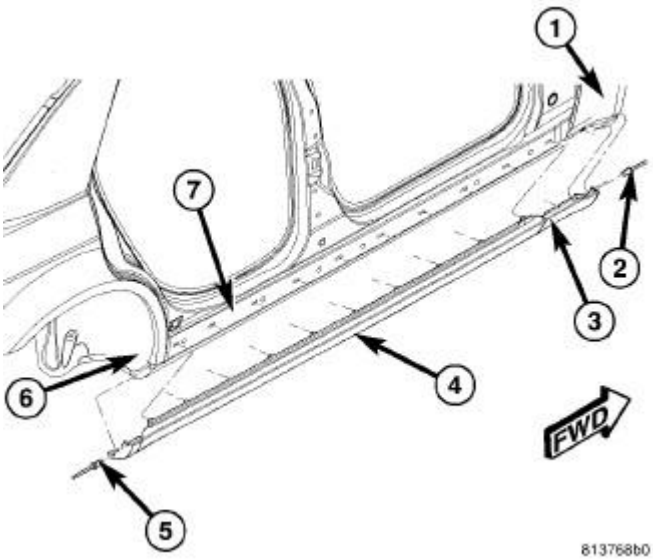

Fig. 172: Body Side Cladding
Courtesy of CHRYSLER GROUP, LLC

1. Position the front body side cladding (3) to the front fender (1).
2. Engaging the front cladding retaining clip to the front fender.
3. Position the rear body side cladding (4) to the rocker panel (6).
4. Engaging the rear cladding retaining clips to the rocker panel.
5. Install the pop rivets (2 and 5).
6. Install the wheels. Refer to **INSTALLATION** .
7. Lower the vehicle.

COVER, COWL PANEL

REMOVAL

REMOVAL

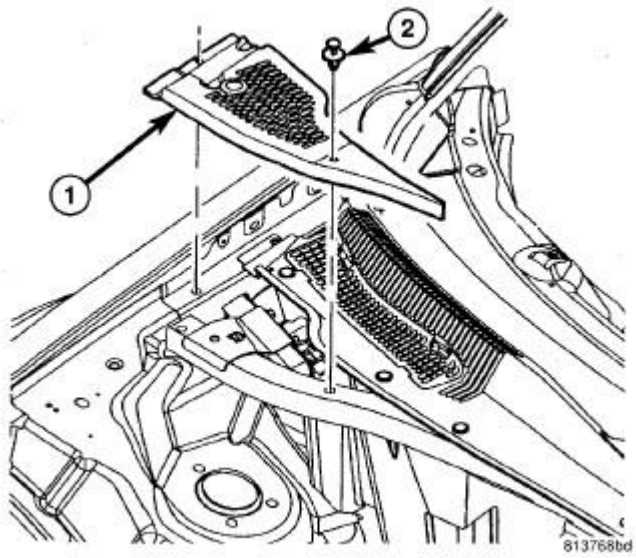

Fig. 173: Cowl Panel 1
Courtesy of CHRYSLER GROUP, LLC

1. Remove the two push pins (2) that secure the front cowl top panel (1) to the right rear corner of the engine compartment
2. Remove the front cowl top panel.

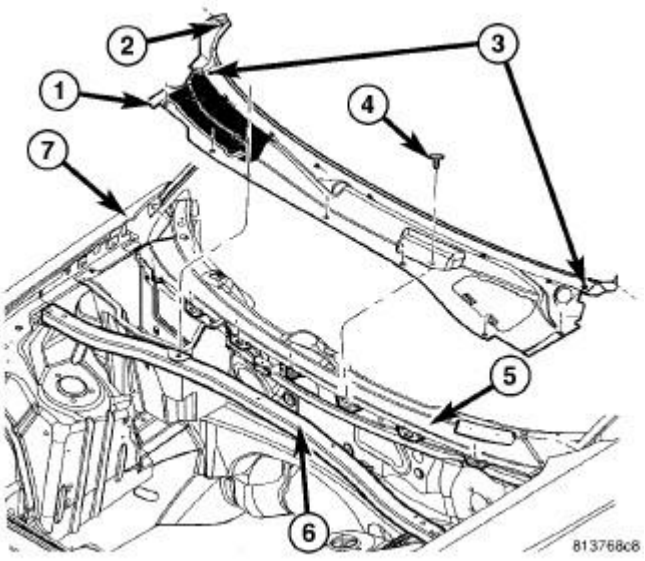

Fig. 174: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

3. Remove the windshield wiper arms. Refer to **ARM, WIPER, REMOVAL** .
4. Remove the push-pin (2) that secures each end of the cowl top panel (1) to each front fender (7).

5. Disengage the two 1/4-turn fasteners (3) that secure the cowl top panel to the dash panel (5).
6. Remove the six push-pins (4) that secure the cowl top panel to the strut tower support (6).
7. Disengage the integral retaining clips that secure the cowl top panel to the dash panel and remove the cowl panel from the engine compartment.

INSTALLATION

INSTALLATION

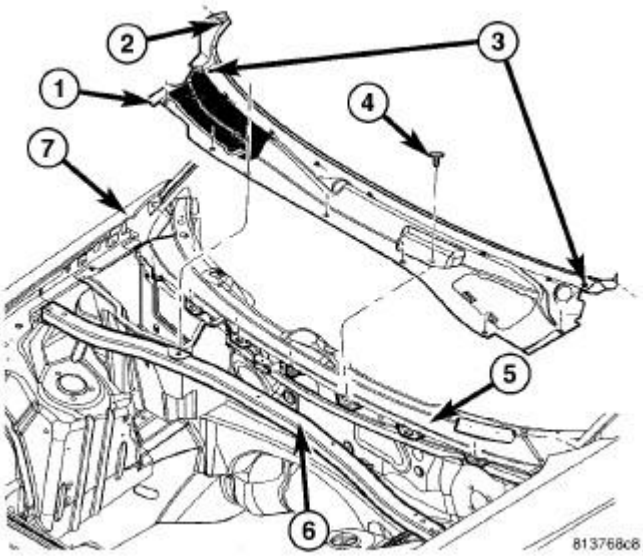

Fig. 175: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the cowl top panel (1) into the engine compartment.
2. Engage the integral retaining clips that secure the cowl top panel to the dash panel (5).
3. Install the six push-pins (4) that secure the cowl top panel to the strut tower support (6).
4. Engage the 1/4-turn fasteners (3) that secure cowl top panel to the dash panel.
5. Install the push-pin (2) that secures each end of the cowl top panel to each front fender (7).
6. Install the windshield wiper arms. Refer to **ARM, WIPER, INSTALLATION** .

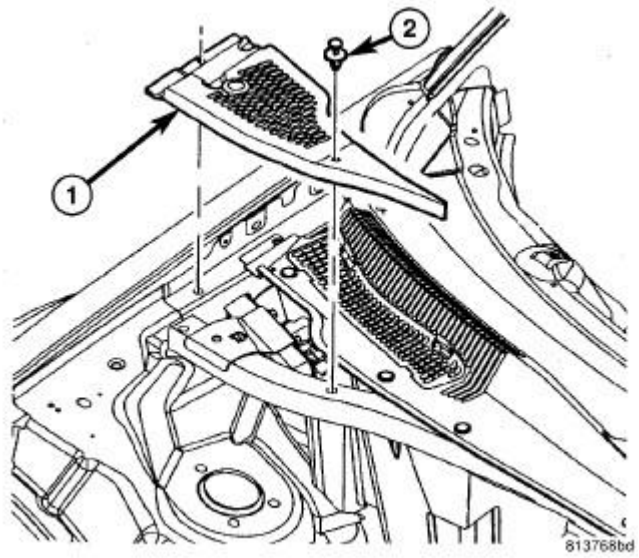

Fig. 176: Cowl Panel 1
Courtesy of CHRYSLER GROUP, LLC

7. Position the front cowl top panel (1) to the right rear corner of the engine compartment.
8. Install the two push-pins (2) that secure the front cowl top panel.

CROSSMEMBER, HEADLAMP MOUNTING

REMOVAL

REMOVAL

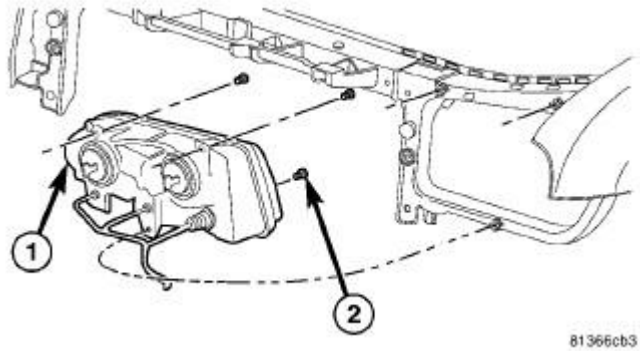

Fig. 177: Headlamp Attaching Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
3. Remove the headlamp units (1).

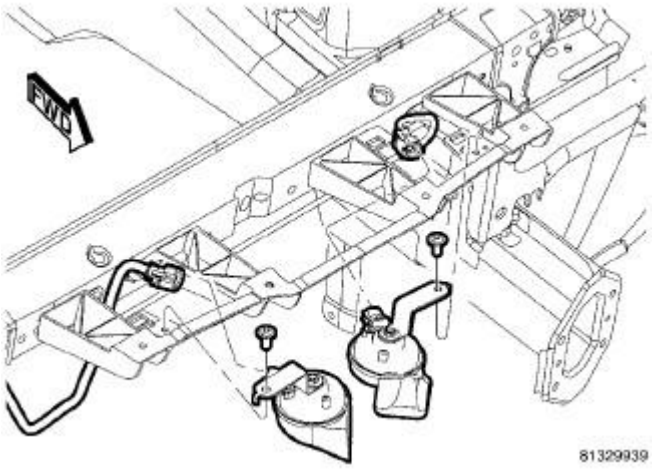

Fig. 178: Horn Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the headlamp wire harness from the horns.
5. Remove the bolts that secure the horns to the headlamp mounting crossmember and remove the horns.

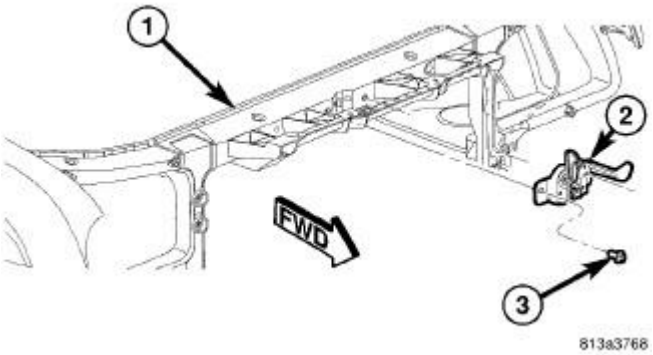

Fig. 179: Removing Hood Latch
Courtesy of CHRYSLER GROUP, LLC

6. Mark the location of the hood latch (2) on the front of the headlamp mounting crossmember (1) to aid in reinstallation.
7. Remove the two bolts (3) that secure the hood latch to the headlamp mounting crossmember and position the hood latch and cable out of the way.

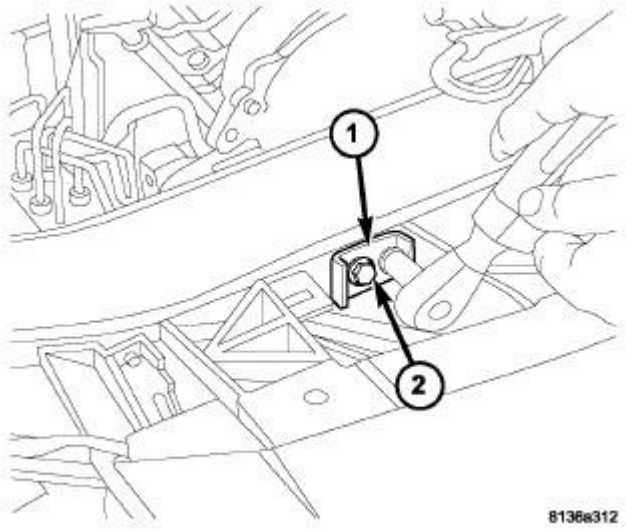

Fig. 180: Radiator Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolts (2) the secure the radiator mounting brackets (1) to the headlamp mounting crossmember.

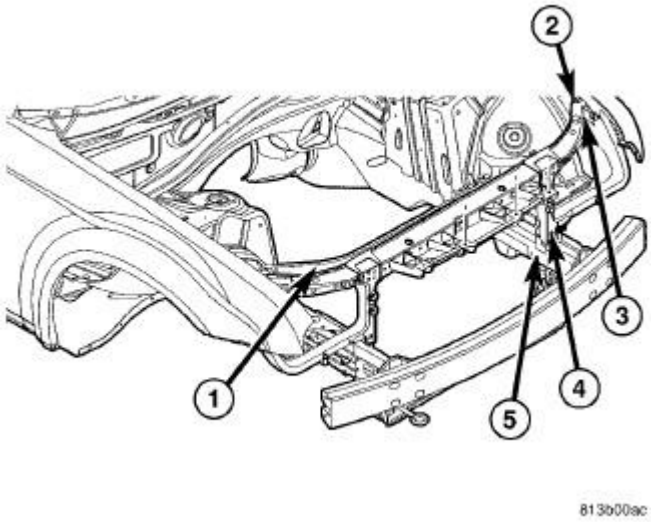

Fig. 181: Headlamp Mounting Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the location of the headlamp mounting crossmember to the other body components prior to removal of the crossmember to aid in reinstallation.

9. Mark the location of the headlamp mounting crossmember (1) to the front fenders.
10. Remove the bolts (2 and 3) that secure the headlamp mounting crossmember to the front fenders.
11. Remove the bolts (4) that secure the headlamp mounting crossmember to the front frame rails (5).
12. Remove the headlamp mounting crossmember from the engine compartment.

INSTALLATION

INSTALLATION

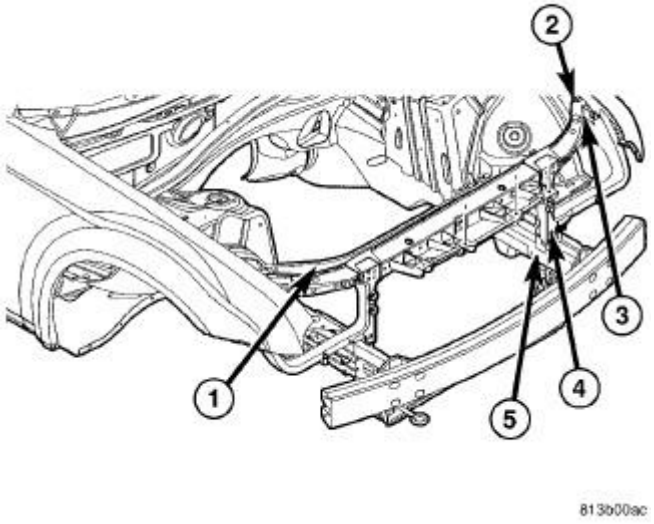

Fig. 182: Headlamp Mounting Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.

1. Position the headlamp mounting crossmember (1) into the engine compartment.
2. Loosely install the bolts (2 and 3) that secure the headlamp mounting crossmember to the front fenders.
3. Loosely install the bolts (4) that secure the headlamp mounting crossmember to the front frame rails (5).
4. Align the headlamp mounting crossmember using the alignment marks previously indicated and tighten all of the retaining bolts to 28 N.m (21 ft. lbs.).

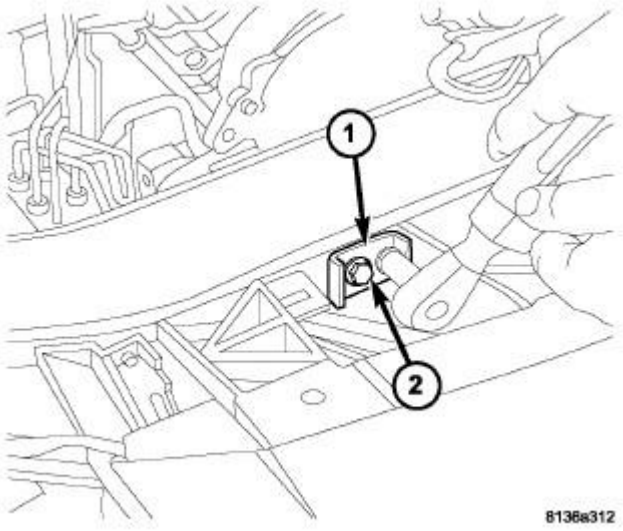

Fig. 183: Radiator Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Install the bolts (2) that secure the radiator mounting bracket (1) to the headlamp mounting crossmember. Tighten the bolts to 5 N.m (45 in. lbs.).

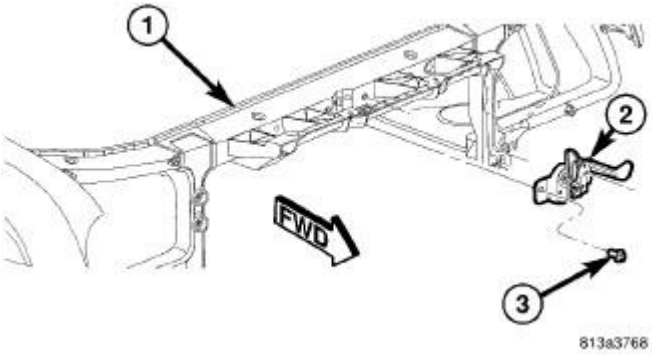

Fig. 184: Removing Hood Latch
Courtesy of CHRYSLER GROUP, LLC

6. Position the latch (2) to the front of the crossmember (1).
7. Loosely install the two bolts (3) that secure the hood latch to the headlamp mounting crossmember.
8. Align the hood latch using the alignment marks previously indicated and tighten the hood latch bolts to 28 N.m (21 ft. lbs.).

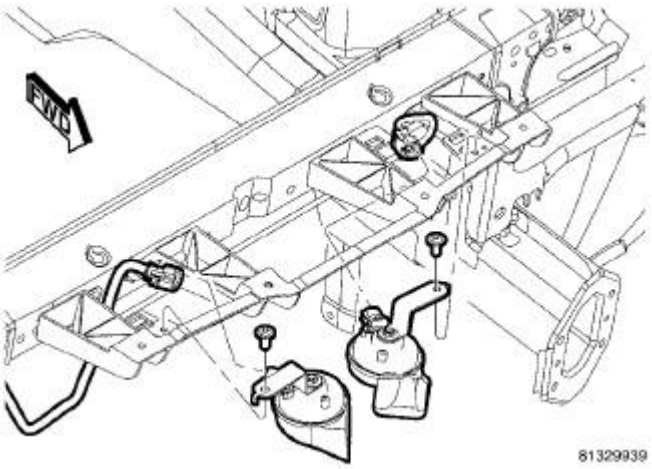

Fig. 185: Horn Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Install the horns onto the headlamp mounting crossmember. Tighten the bolts to 28 N.m (21 ft. lbs.).
10. Connect the headlamp wire harness to the horns.

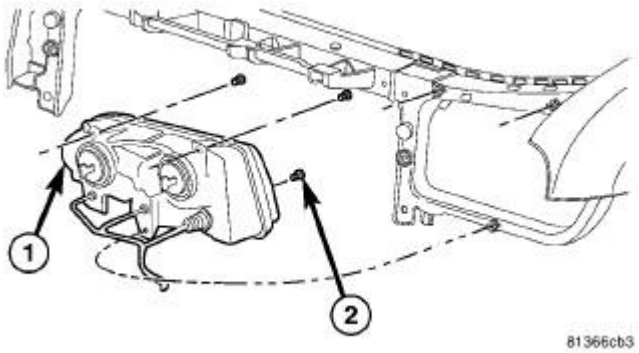

Fig. 186: Headlamp Attaching Screws
Courtesy of CHRYSLER GROUP, LLC

11. Install the headlamp units (1).
12. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
13. Reconnect the negative battery cable.
14. Carefully close the hood and verify hood latch and panel alignment. Adjust as necessary.
15. If equipped with ACC (Adaptive Cruise Control), module must be realigned.

FENDER, FRONT

REMOVAL

REMOVAL

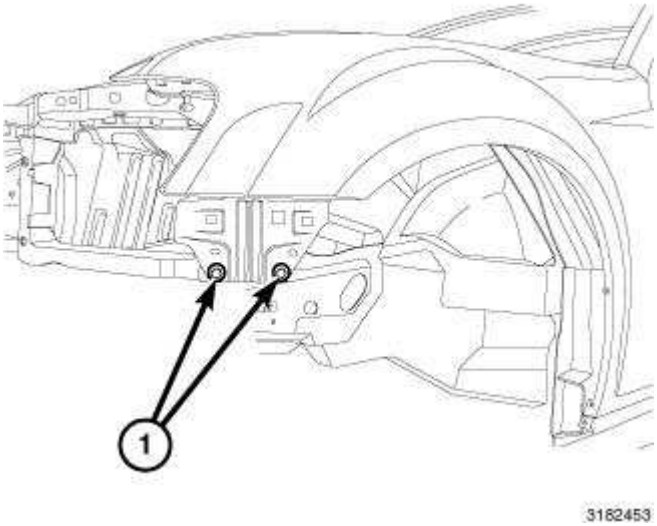

Fig. 187: Two Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove the front wheel.
4. Remove the front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** & **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL**.
5. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
6. Remove the headlamp. Refer to **UNIT, FRONT LAMP, REMOVAL** .
7. Remove the two fasteners (1) securing the fender's front dogleg to the front end module.

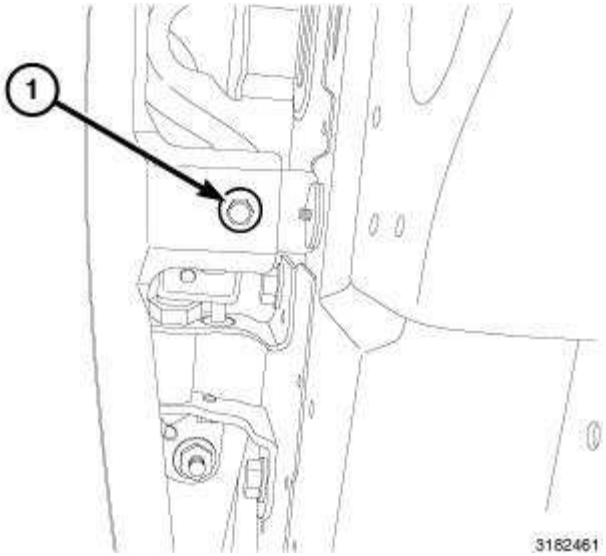

Fig. 188: Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Accessing through the wheelhouse, remove the bolt (1) securing the fender's rear dogleg to the bodyside bracket.

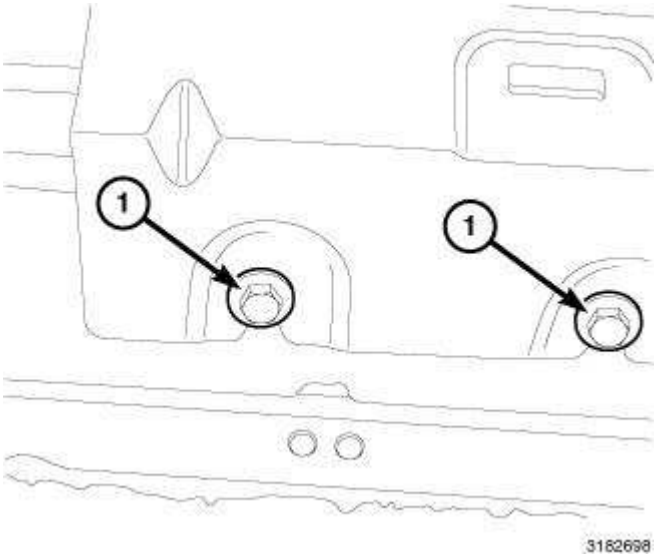

Fig. 189: Two Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the rocker panel/cladding.
10. Remove the two bolts (1) securing the lower fender dogleg to the sill.

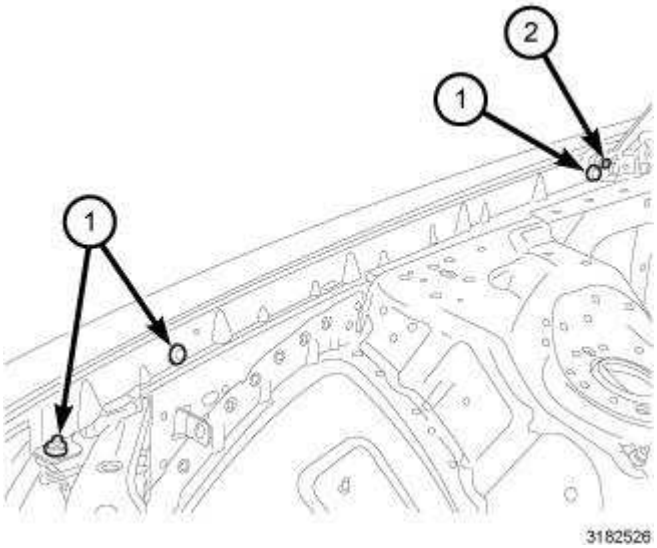

Fig. 190: Hood Hinge & Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Lower the vehicle.
12. Open the hood and support with a suitable prop or block.
13. Remove the hood hinge (2). Refer to **HINGE, HOOD, REMOVAL**.

14. Remove the fasteners (1) securing the inner fender ledge.
15. Remove the fender from the vehicle.

INSTALLATION

INSTALLATION

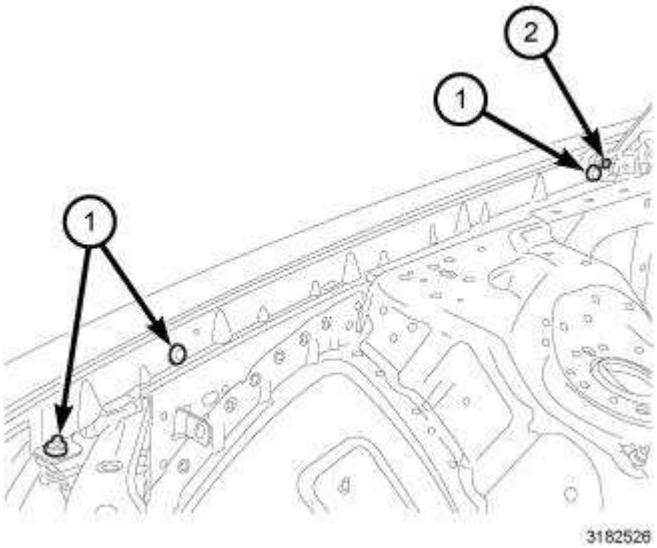

Fig. 191: Hood Hinge & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the fender to the vehicle.
2. Install the fasteners (1) securing the inner fender ledge. Tighten the fasteners to 8 N-m (71 in. lbs.).
3. Install the hood hinge (2). Refer to **HINGE, HOOD, INSTALLATION**.
4. Raise and support the vehicle.

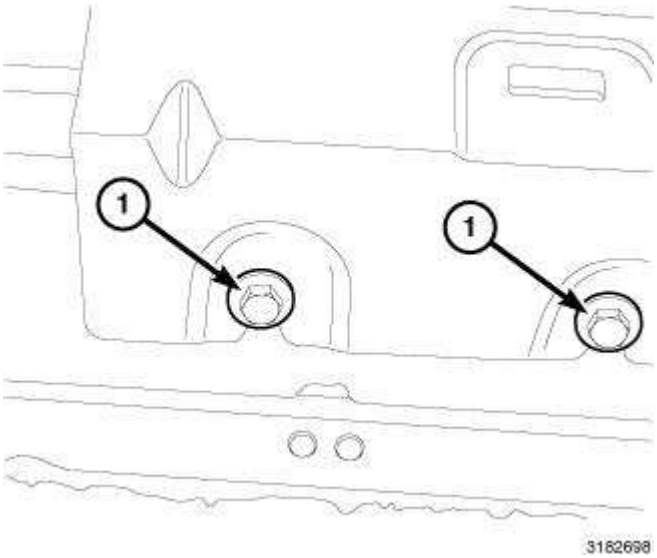

Fig. 192: Two Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the two bolts (1) securing the lower fender dogleg to the sill. Tighten the fasteners to 9 N-m (80 in. lbs.).
6. Install the rocker panel/cladding.

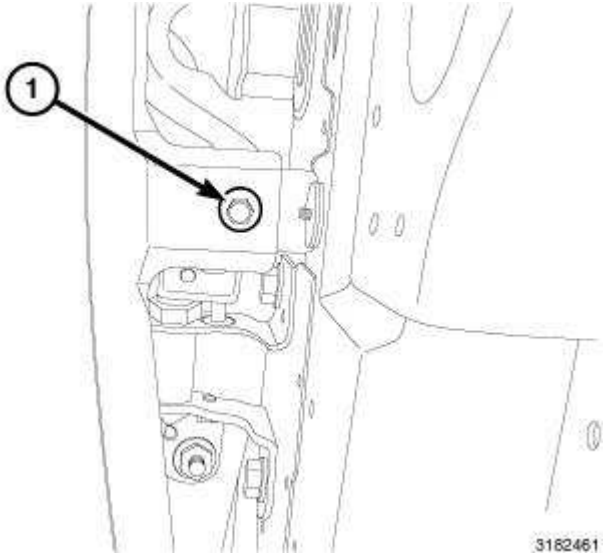

Fig. 193: Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Accessing through the wheelhouse, install the bolt (1) securing the fender's rear dogleg to the bodyside bracket. Tighten the fastener to 8 N-m (71 in. lbs.).

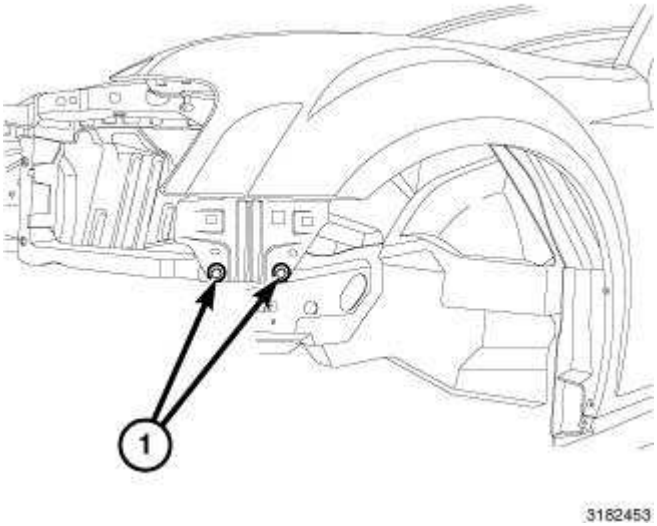

Fig. 194: Two Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Install the two fasteners (1) securing the fender's front dogleg to the front end module. Tighten the fasteners to 8 N-m (71 in. lbs.).
9. Install the headlamp. Refer to **UNIT, FRONT LAMP, INSTALLATION** .
10. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
11. Check the fender for proper gap and flushness. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
12. Install the front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** & **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION**.
13. Install the front wheel.
14. Lower the vehicle.
15. Connect the negative battery cable.
16. Close the hood.

GRILLE

REMOVAL

REMOVAL

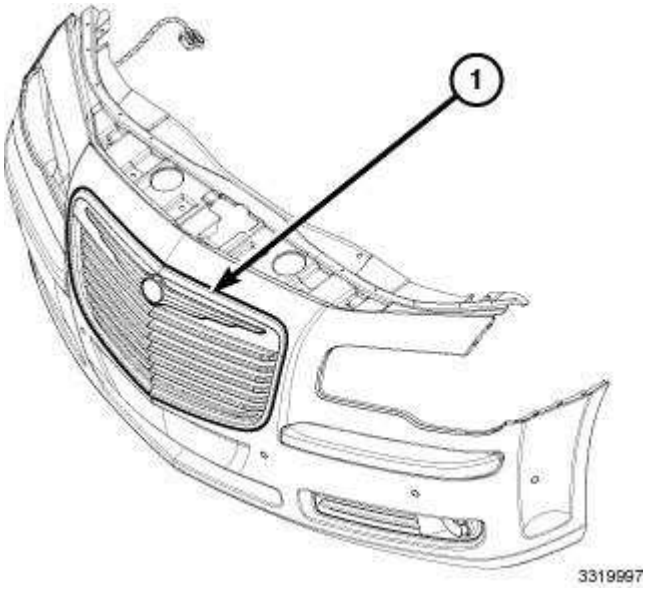

Fig. 195: Front Fascia
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Take the proper precautions to protect the face of the front fascia from cosmetic damage.

1. Remove the front fascia (1) and place it on a workbench. Refer to **FASCIA, FRONT, REMOVAL** .
2. Remove the screws that secure the grille (1) to the inside of the front fascia.

3. Remove the grille (1) from the front fascia.

INSTALLATION

INSTALLATION

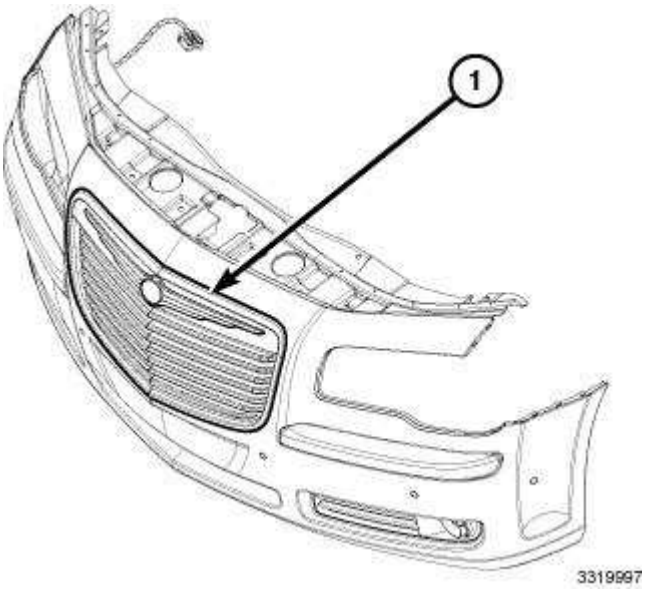

Fig. 196: Front Fascia
Courtesy of CHRYSLER GROUP, LLC

1. Position the grille (1) into the front fascia.
2. Install the screws that secure the grille to the front fascia. Tighten the screws securely.
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .

INLET, FRESH AIR

REMOVAL

REMOVAL

NOTE: On SRT 8 models only.

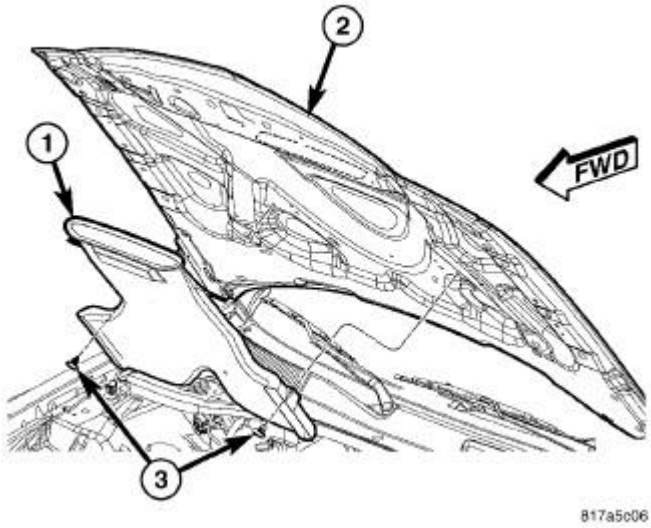

Fig. 197: Air Inlet
Courtesy of CHRYSLER GROUP, LLC

1. Remove hood liner.
2. Remove push pins (2) and remove air inlet (1) from hood (2).

INSTALLATION

INSTALLATION

NOTE: On SRT 8 models only.

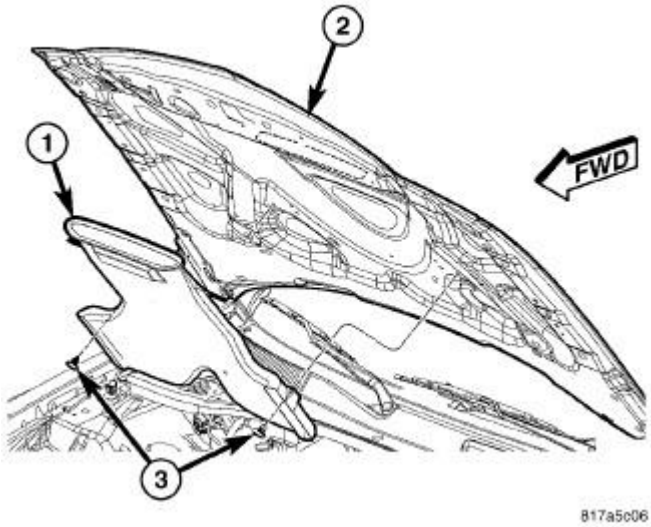

Fig. 198: Air Inlet

Courtesy of CHRYSLER GROUP, LLC

1. Place air inlet (1) to hood (2).
2. Insert push pins (3) fastening air inlet to hood.
3. Install hood liner and push pins.

MIRROR, OUTSIDE REARVIEW

REMOVAL

REMOVAL

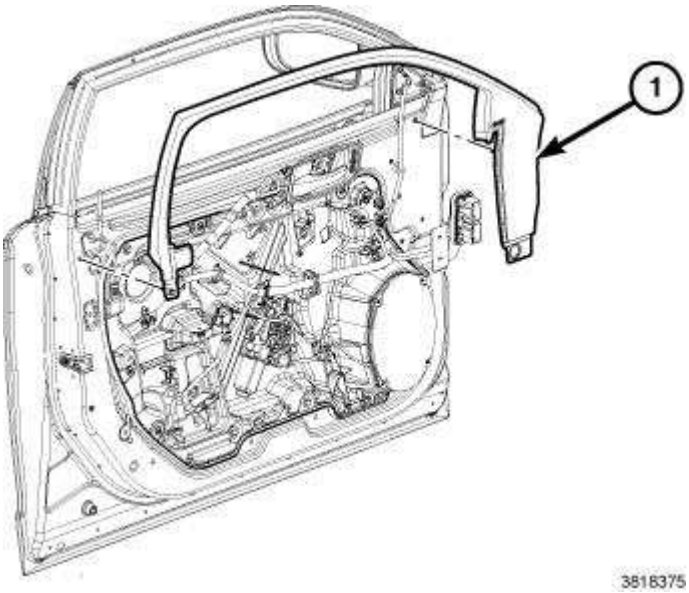

Fig. 199: Interior Window Trim Molding
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the window trim molding (1) to gain access to the mirror fasteners. Refer to **MOLDING, INTERIOR WINDOW TRIM, REMOVAL**.

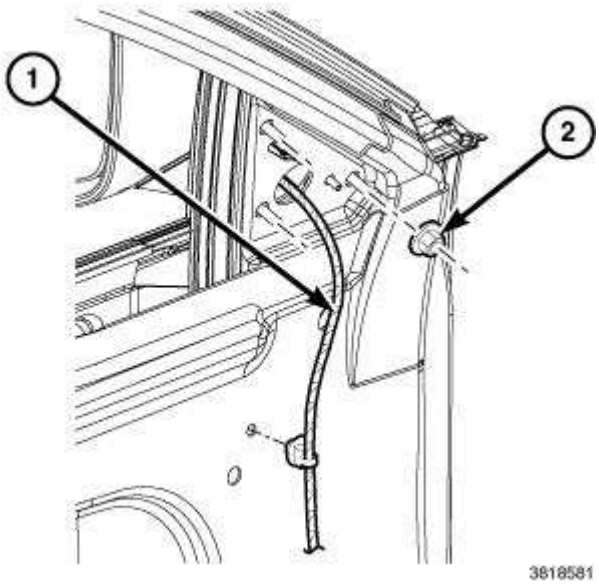

Fig. 200: Mirror Electrical Harness & Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Detatch and disconnect the mirror wire harness (1) from the door wire harness.
4. Remove the three nuts (2) that secure the outside rearview mirror to the front door.

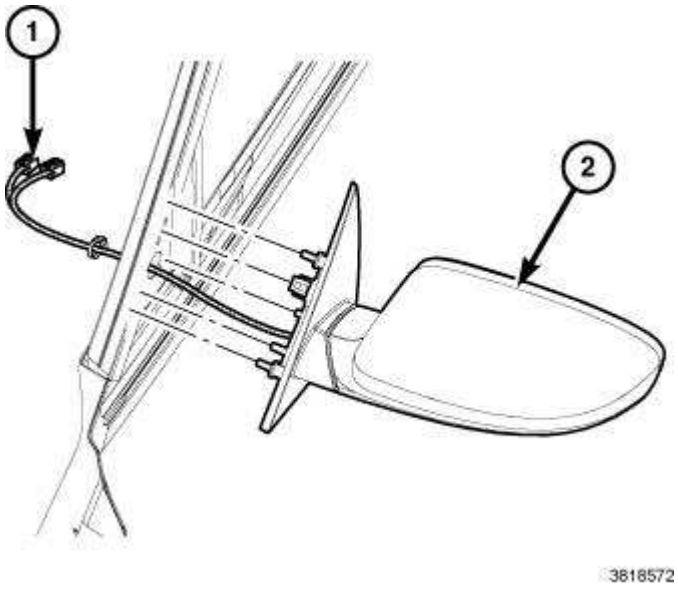

Fig. 201: Outside Rearview Mirror & Harness
Courtesy of CHRYSLER GROUP, LLC

5. Remove the outside rearview mirror (2) from the front door. Feed the harness (1) through the access hole in the mirror flag.

INSTALLATION

INSTALLATION

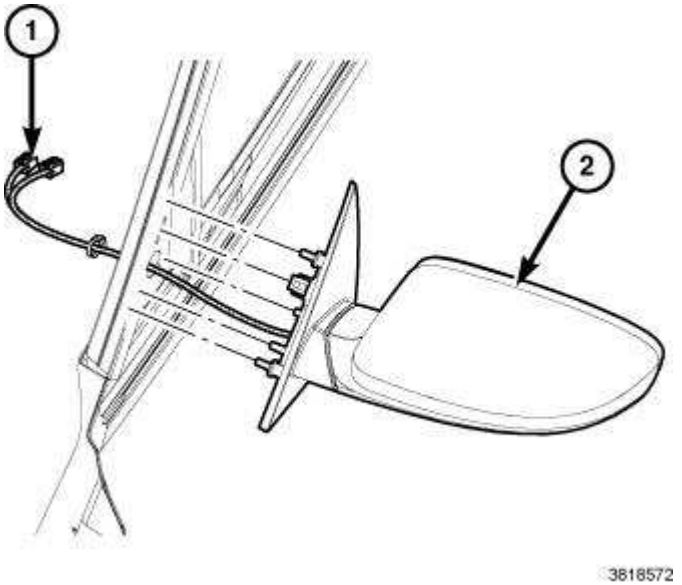

Fig. 202: Outside Rearview Mirror & Harness
Courtesy of CHRYSLER GROUP, LLC

1. Feed the mirror wire harness (1) through the access hole in the mirror flag.
2. Position the outside rearview mirror (2) to the front door.

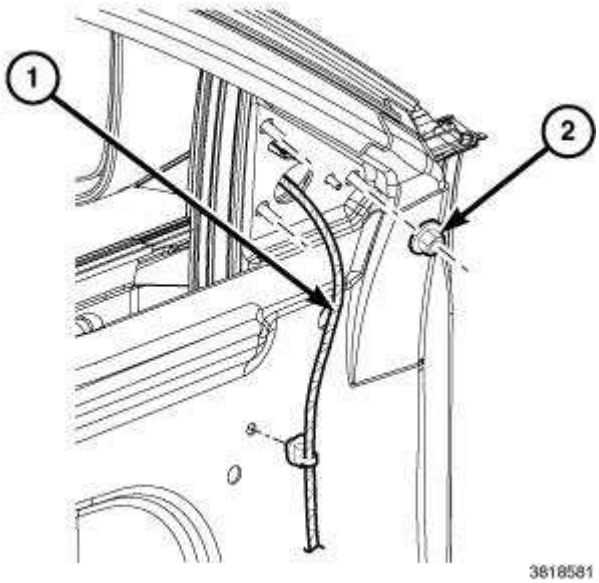

Fig. 203: Mirror Electrical Harness & Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Install the three nuts (1) that secure the mirror to the front door. Tighten the nuts to 7 N.m (60 in. lbs.).

4. Connect and attach the mirror electrical harness (1).

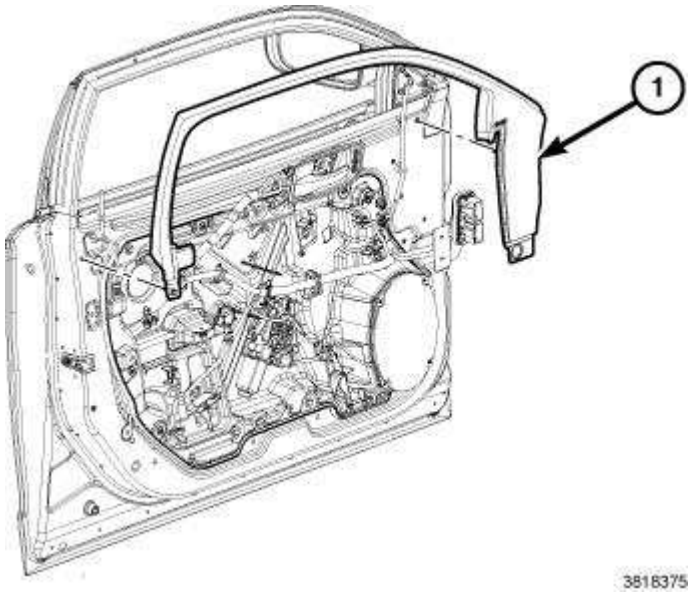

Fig. 204: Interior Window Trim Molding
Courtesy of CHRYSLER GROUP, LLC

5. Install the window trim molding (1). Refer to **MOLDING, INTERIOR WINDOW TRIM, INSTALLATION**.
6. Reconnect the negative battery cable.

MIRROR, OUTSIDE REARVIEW, GLASS

REMOVAL

REMOVAL

GLASS

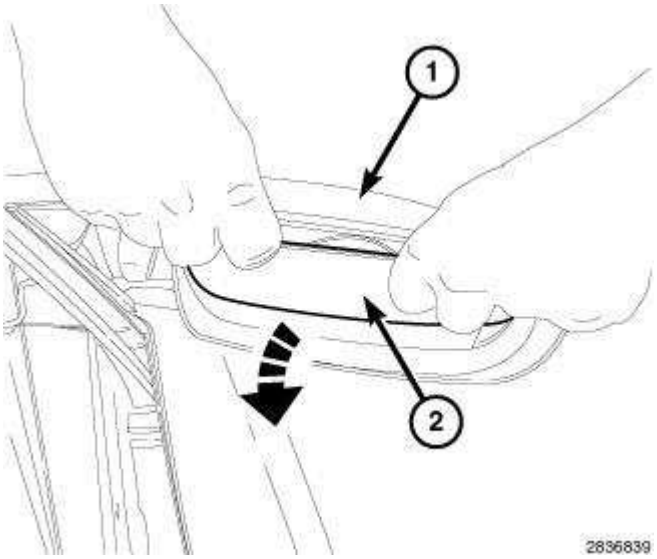

Fig. 205: Mirror Glass Case & Mirror Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Always wear eye and hand protection when servicing the mirror glass. Failure to observe these warnings may result in personal injury from broken glass.

1. Push mirror glass case (2) into full down position
2. Disconnect and isolate the negative battery cable.
3. Place thumbs behind mirror glass case (2) and push out from the mirror assembly (1). This will disengage the mirror glass case's snap attachment feature.

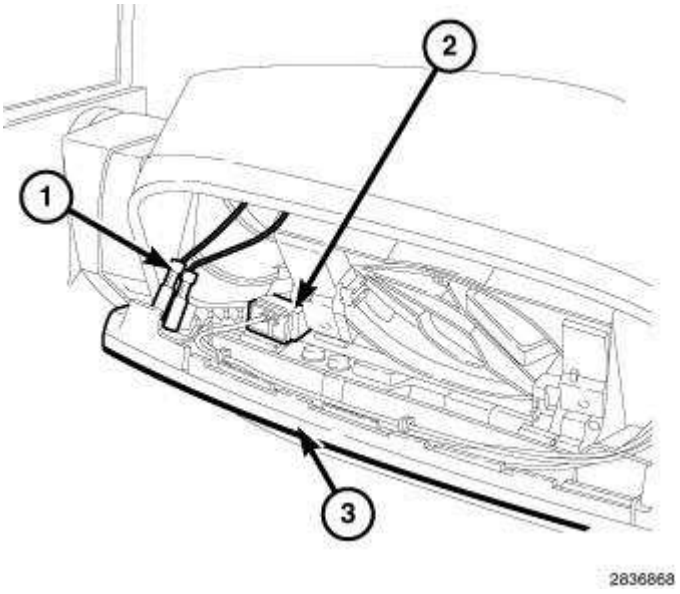

Fig. 206: Heater Wires & Mirror Motor Glass Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, disconnect the blind spot indicator and heater wires (1) by pulling on thumb tabs.
5. Disconnect the mirror motor glass electrical connector (2).

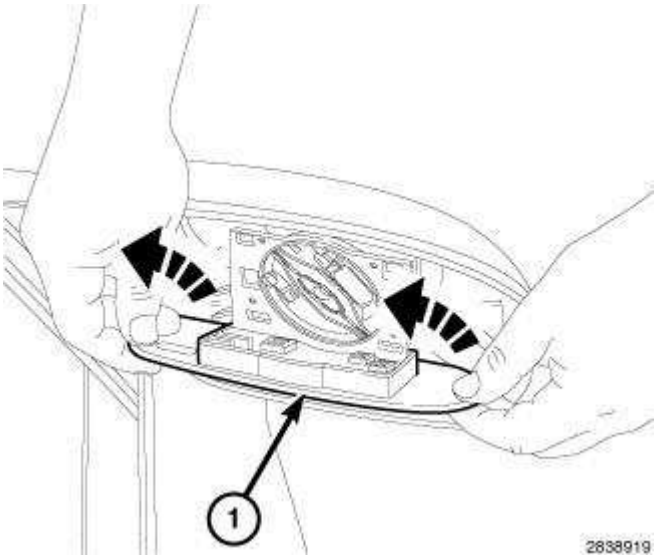

Fig. 207: Mirror Glass Case
Courtesy of CHRYSLER GROUP, LLC

6. Remove the mirror glass case (1) from the glass motor by pulling up and out. This will disengage the "hook" feature at the bottom of the mirror glass case assembly (1).

MIRROR CAP

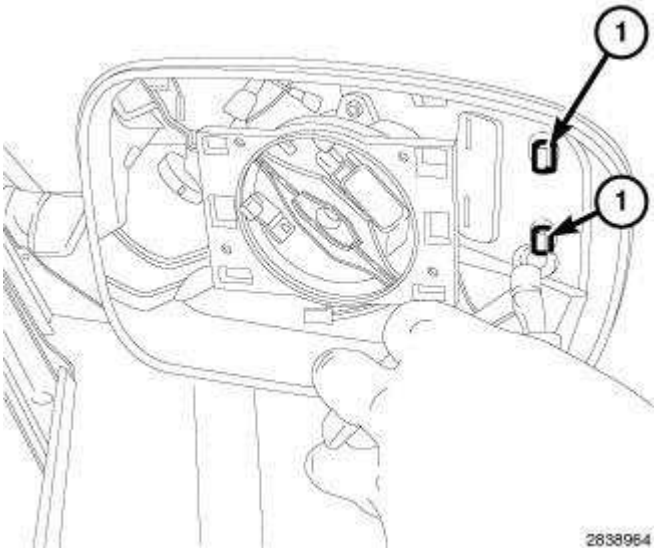

Fig. 208: Mirror Cap Outboard Snaps
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use caution when removing the mirror cap, retainer tabs may break during cap removal.

NOTE: **In the event that the mirror cap retainer tabs were broken during a previous disassembly, a piece of double sided adhesive tape would have been added between the mirror cap and shell to improve retention. If the tape is present it will make the amount of force needed to remove the cap higher.**

1. Remove the mirror glass.
2. Using a flat head screw driver, pliers or equivalent, disengage the mirror cap outboard snaps (1).

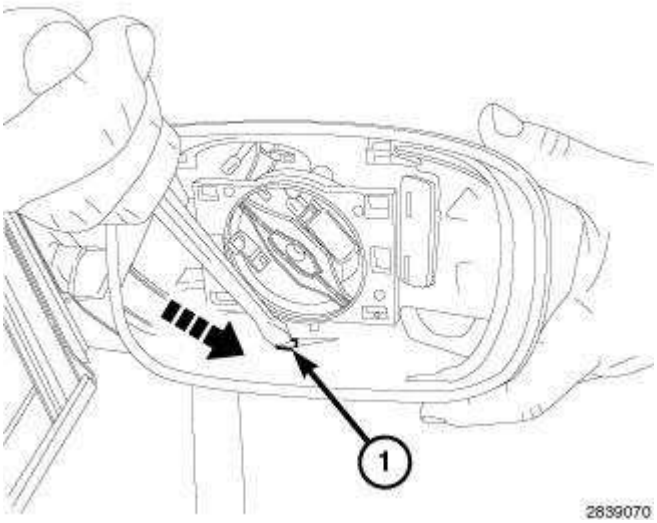

Fig. 209: Bottom Snap
Courtesy of CHRYSLER GROUP, LLC

3. Using a flat head screw driver, apply downward pressure to the bottom snap (1).
4. Push with the screw driver and pull on the cap with your opposite hand creating a gap between the shell and the shell cap.
5. Continue to pull on the cap using both hands as necessary until the cap breaks away from the shell.

INSTALLATION

INSTALLATION

GLASS

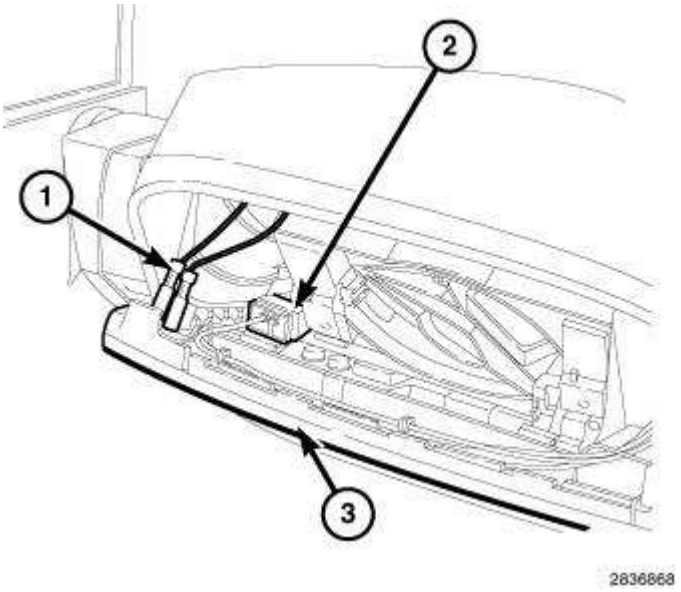

Fig. 210: Heater Wires & Mirror Motor Glass Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install the glass case (3) to motor by pushing the glass case "hooks" into place.
2. If equipped, connect the blind spot indicator and heater wires (1).
3. Connect the mirror motor glass electrical connector (2).

CAUTION: Make sure wires are not caught between the glass case and the motor.

4. Push the glass case (3) on until the glass case snaps are fully seated on motor.

NOTE: An audible snap is normal.

5. Repeat steps for the opposite side.
6. Connect the negative battery cable.

MIRROR CAP

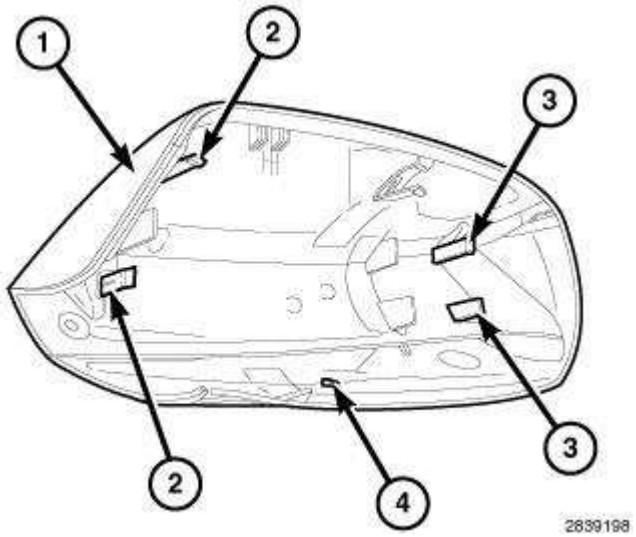

Fig. 211: Snap Locations & Kit Supplied Chrome Mirror Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the mirror cap retaining tabs are broken, install a piece of double sided adhesive tape to the affected area.

NOTE: In the event that the mirror cap retainer tabs were broken during a previous disassembly, a piece of double sided adhesive tape would have been added between the mirror cap and shell to improve retention. If the tape is present it will need to be removed and replaced with a new piece before reassembly.

1. Review the snap locations (2, 3 & 4) on the kit supplied chrome mirror cap (1).

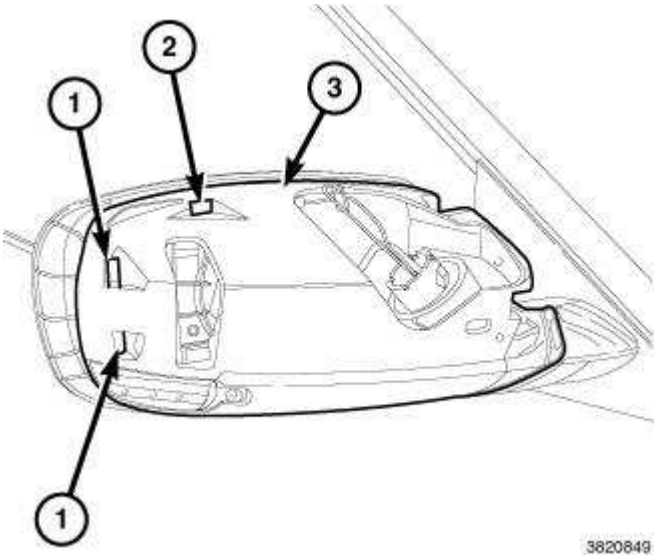

Fig. 212: Snap Locations & Mirror Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Review the snap locations (1 & 2) on the mirror assembly (3).

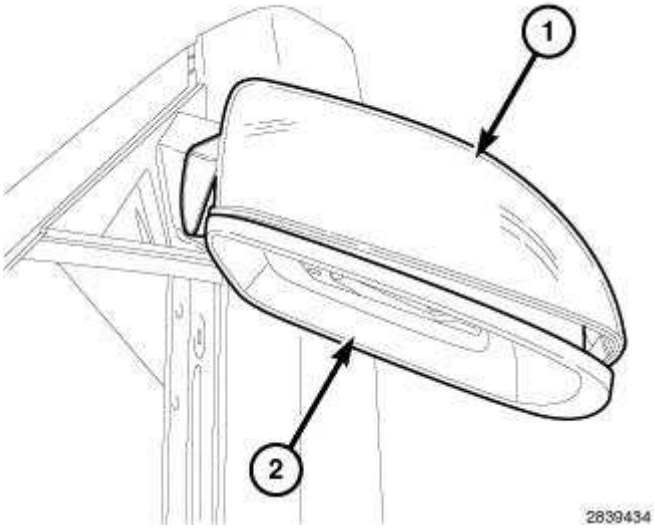

Fig. 213: Mirror Cap & Mirror Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Begin installation by aligning the snaps on the mirror cap (1) with the snap locations on the mirror assembly (2).
4. Verify that all snaps are in the correct position.
5. Apply gentle pressure on the mirror cap (1) until all snaps are fully seated into the mirror assembly (2).

SHIELD, SPLASH, FRONT WHEELHOUSE

REMOVAL

REMOVAL

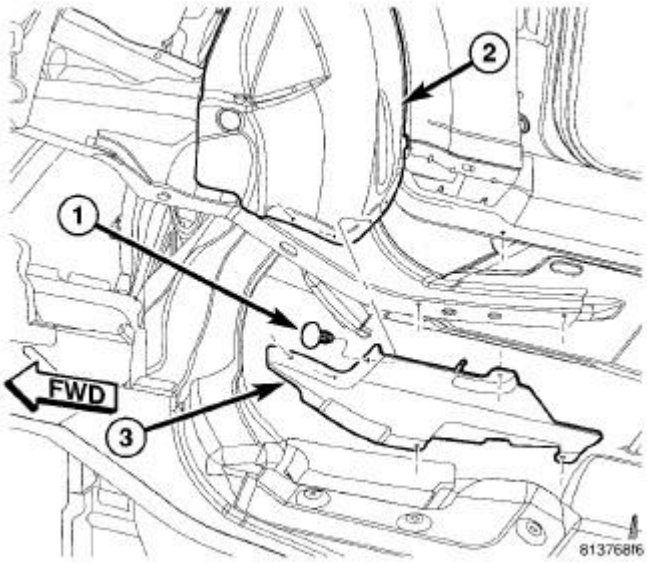

Fig. 214: Removing/Installing Shield
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheels from the side of the vehicle being serviced. Refer to **REMOVAL** .
3. Remove the body side cladding from the side of the vehicle being serviced.
4. Remove the push-pins (1) that secure the lower front wheelhouse shield (3) to the front wheelhouse shield (3) and the body.
5. Remove lower front wheelhouse shield from the vehicle.

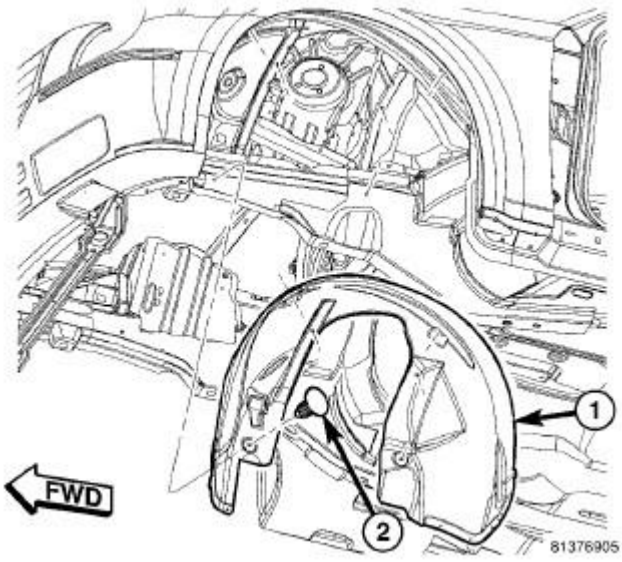

Fig. 215: Removing/Installing Front Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

6. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL** .
7. Remove the push-pins (2) that secure the front wheelhouse shield (1) to the body.
8. Remove the front wheelhouse shield from the vehicle.

INSTALLATION

INSTALLATION

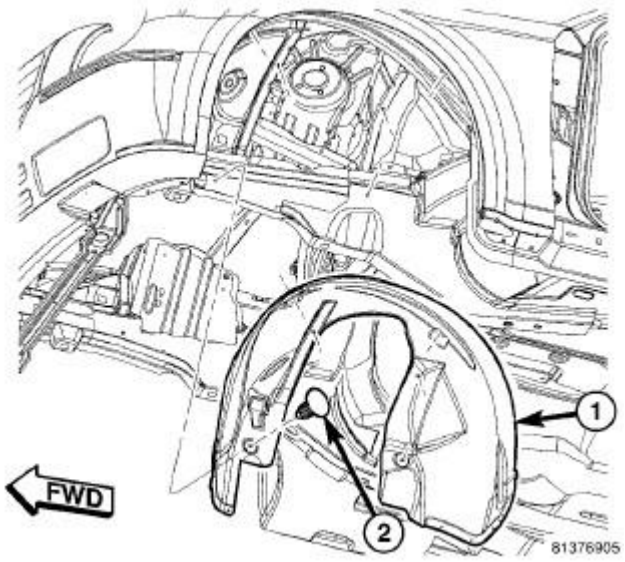

Fig. 216: Removing/Installing Front Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

1. Position the front wheelhouse shield (1) into the front fenderwell.
2. Install the push-pin (2) that secure the front wheelhouse shield to the body.
3. Install the front belly pan. Refer to **BELLY PAN, INSTALLATION** .

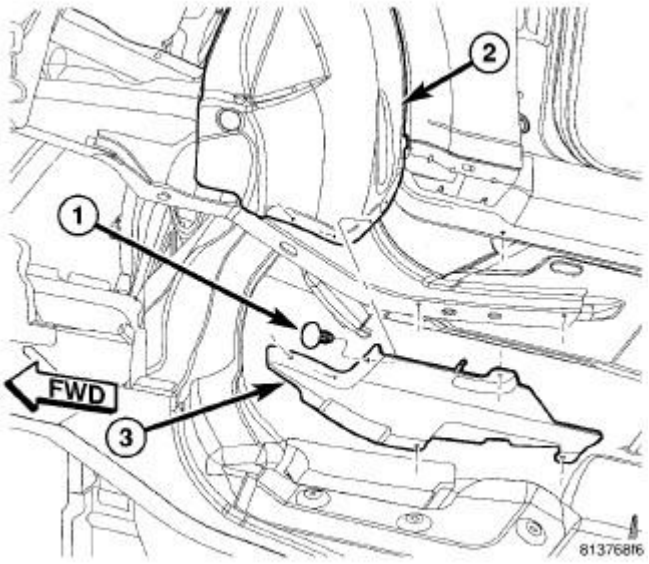

Fig. 217: Removing/Installing Shield
Courtesy of CHRYSLER GROUP, LLC

4. Position the lower front wheelhouse shield (3) onto the body.
5. Install the push-pins (1) that secure the lower front wheelhouse shield to the front wheelhouse shield (2) and the body.
6. Install the body side cladding.
7. Install the front wheels. Refer to **INSTALLATION** .
8. Lower the vehicle.

SHIELD, SPLASH, REAR WHEELHOUSE

REMOVAL

REMOVAL

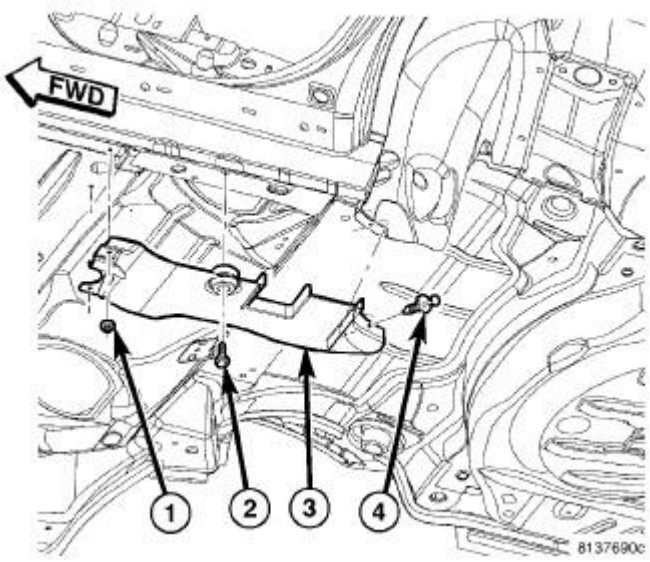

Fig. 218: Shield 1
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheels from the side of the vehicle being serviced. Refer to **REMOVAL** .
3. Remove the rear portion of the body side cladding from the side of the vehicle being serviced.
4. Remove the nuts (1), bolt (2) and the push-pins (4), that secure the lower rear wheelhouse shield (3) to the body.
5. Remove lower rear wheelhouse shield from the vehicle.

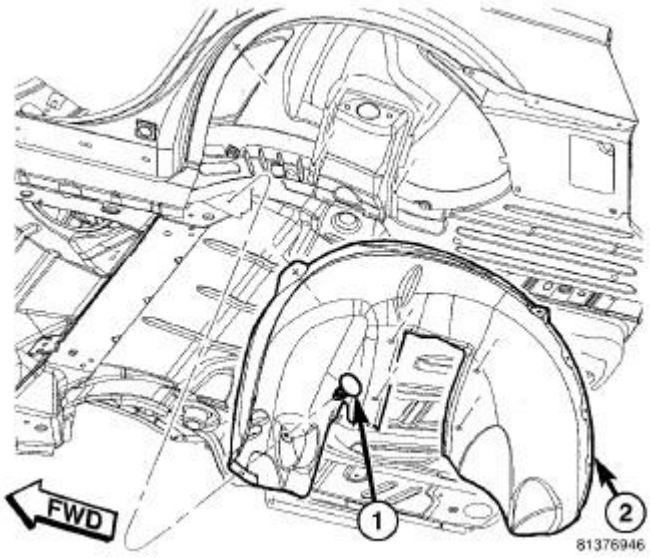

Fig. 219: Removing/Installing Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

6. Remove the push-pins (1) that secure the rear wheelhouse shield (2) to the body.
7. Remove the rear wheelhouse shield from the vehicle.

INSTALLATION

INSTALLATION

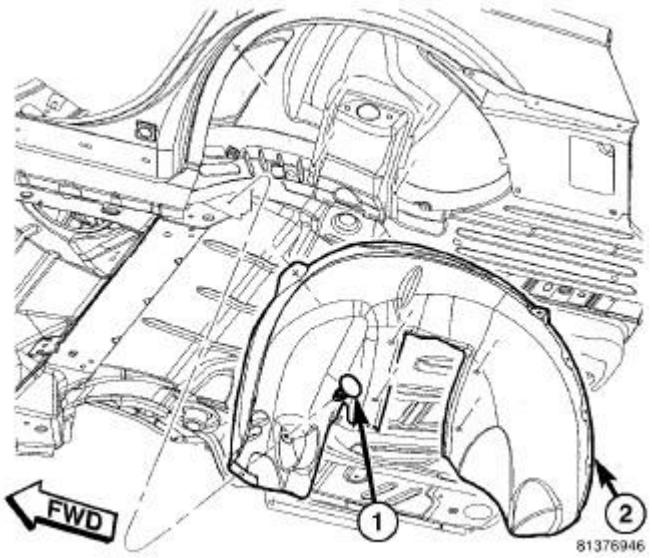

Fig. 220: Removing/Installing Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear wheelhouse shield (2) into the rear wheelwell.
2. Install the push-pins (1) that secure the rear wheelhouse shield to the body.

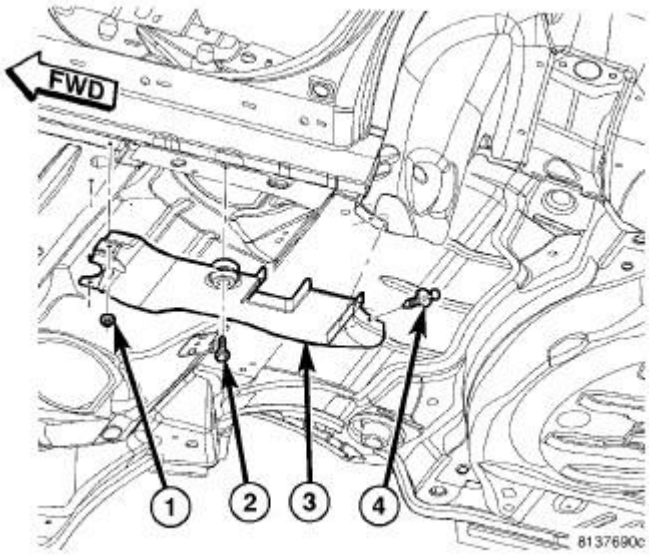

Fig. 221: Shield 1
Courtesy of CHRYSLER GROUP, LLC

3. Position the lower rear wheelhouse shield (3) onto the body.
4. Install the nuts (1), bolt (2) and the push-pins (4) that secure the lower rear wheelhouse shield to the body. Tighten the nuts and the bolt securely.
5. Install the rear portion of the body side cladding.
6. Install the wheels. Refer to **INSTALLATION** .
7. Lower the vehicle.

TRIM, COWL EXTENSION

REMOVAL

REMOVAL

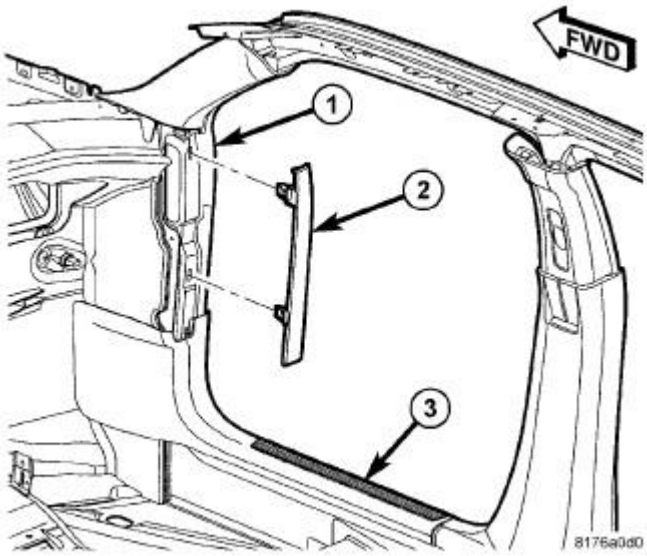

Fig. 222: Cowl Trim Extension
Courtesy of CHRYSLER GROUP, LLC

1. Insert special tool (special tool #C-4755, Trim Stick) (from the outside in the direction of arrow 2) under the middle of the trim extension (2).
2. Slide trim stick up to the upper spring clip retainer, and pry to disengage clip.
3. Slide the trim stick down to the lower spring clip retainer, and pry to disengage clip.

INSTALLATION

INSTALLATION

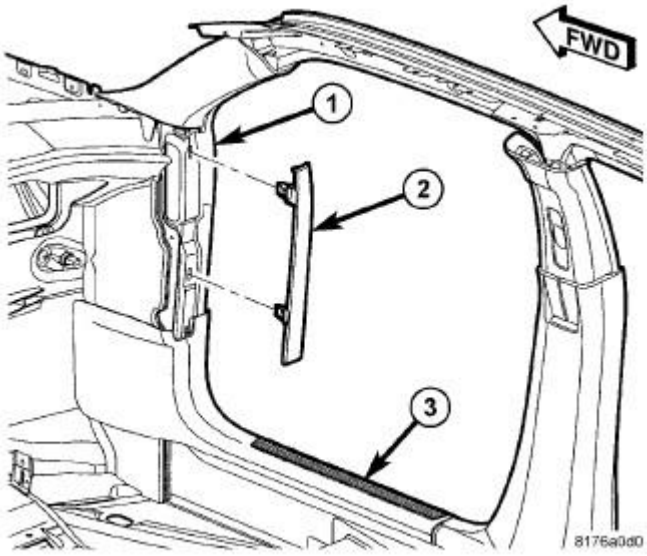

Fig. 223: Cowl Trim Extension
Courtesy of CHRYSLER GROUP, LLC

1. Place trim extension (2) against cowl (1) and align spring clips with holes on cowl.
2. Tap trim extension on to cowl (1) ensuring trim extension (2) is properly seated.

HOOD

BUMPER, HOOD

REMOVAL

REMOVAL

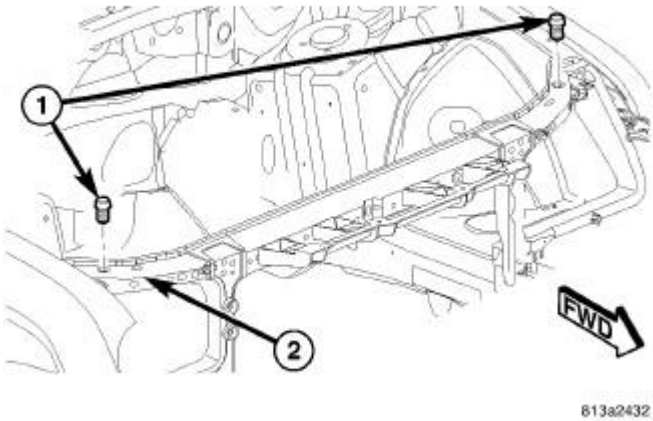

Fig. 224: Hood Adjuster Bumpers
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood.
2. Unscrew the hood adjustment bumper(s) (1) from the mounting hole(s) in the top of the headlamp mounting crossmember (2).
3. Remove the adjustment bumper(s) from the vehicle.

INSTALLATION

INSTALLATION

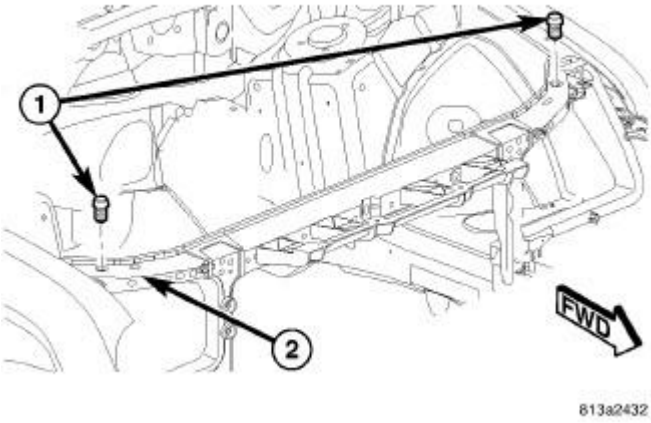

Fig. 225: Hood Adjuster Bumpers
Courtesy of CHRYSLER GROUP, LLC

1. Install the hood adjustment bumper(s) (1) into the mounting hole(s) located in the top of the headlamp mounting crossmember (2).
2. Adjust the adjustment bumper(s) in or out of the crossmember as necessary to achieve proper hood alignment.

CABLE, HOOD RELEASE

REMOVAL

REMOVAL

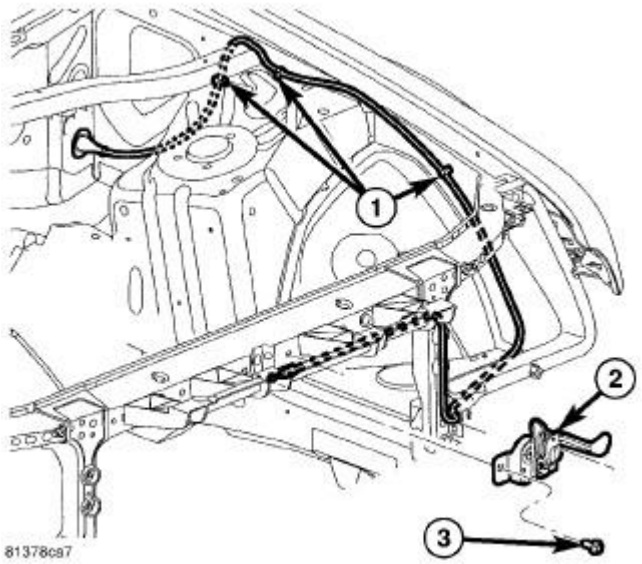

Fig. 226: Latch Release Cable
Courtesy of CHRYSLER GROUP, LLC

1. Remove the hood latch (2) from the vehicle. Refer to **LATCH, HOOD, REMOVAL**.
2. Remove the left headlamp unit from the vehicle.
3. Disengage the hood latch release cable from the integral routing clips on the headlamp mounting crossmember and the routing clips (1) along the left side of the engine compartment.

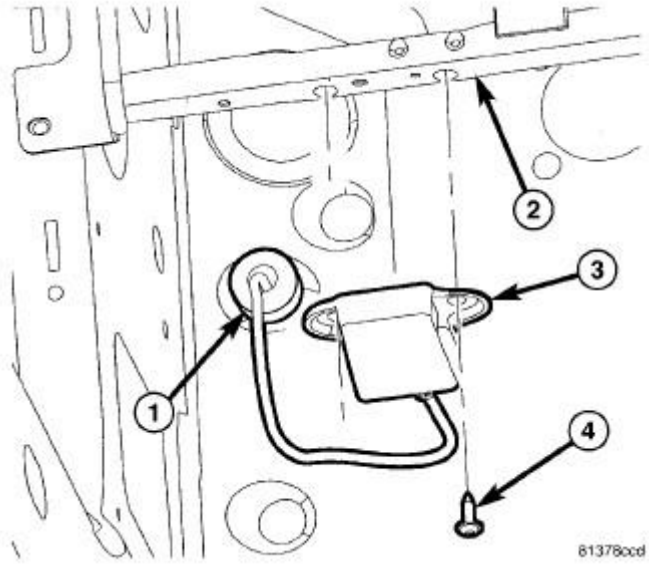

Fig. 227: Hood Latch Release Handle
Courtesy of CHRYSLER GROUP, LLC

4. From the passenger compartment, remove the closeout panel from beneath the left side of the instrument panel. Refer to **PANEL, SILENCER, REMOVAL**.

5. Unseat the hood latch release cable grommet (1) from the dash panel.
6. Remove the two screws (4) that secure the hood latch release handle (3) to the lower instrument panel reinforcement (2).
7. Remove the hood latch release handle and cable through the passenger compartment of the vehicle.

INSTALLATION

INSTALLATION

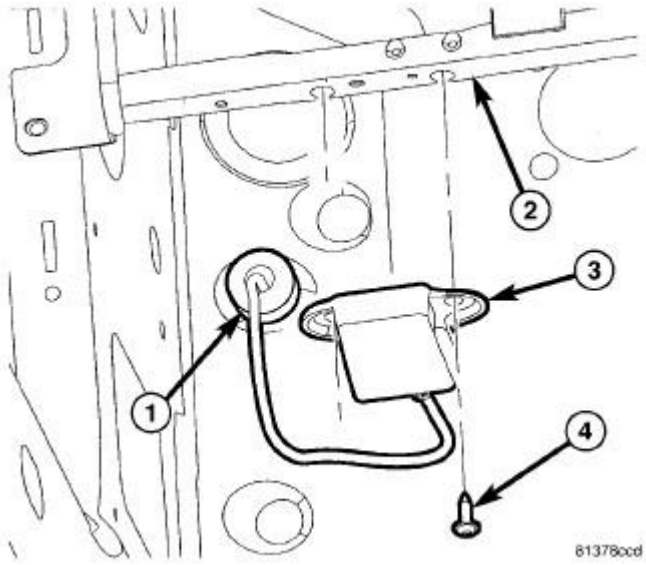

Fig. 228: Hood Latch Release Handle
Courtesy of CHRYSLER GROUP, LLC

1. Position the hood latch release handle and cable (3) under the left side of the instrument panel in the passenger compartment of the vehicle.
2. Thread the cable through the appropriate hole in the dash panel far enough to seat the cable grommet (1) into the hole.
3. Position the hood latch release handle to the lower instrument panel reinforcement (2).
4. Install and tighten the two screws (4) that secure the handle to the reinforcement. Tighten the screws to 5 N.m (45 in. lbs.).
5. Reinstall the closeout panel beneath the left side of the instrument panel. Refer to **PANEL, SILENCER, INSTALLATION**.

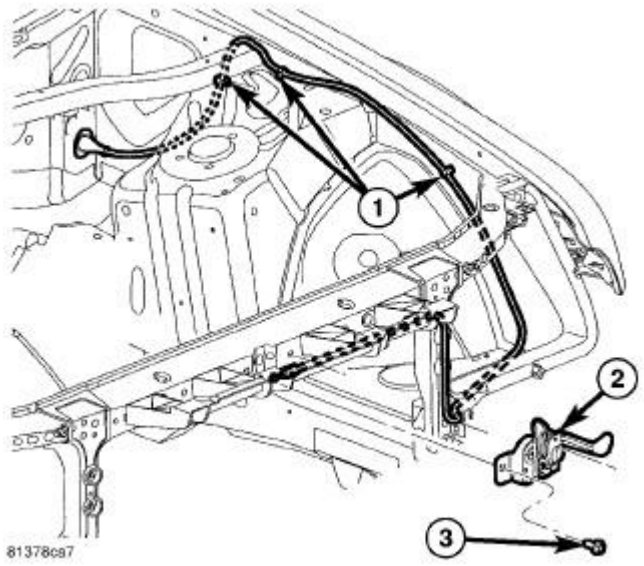

Fig. 229: Latch Release Cable
Courtesy of CHRYSLER GROUP, LLC

6. Route the hood latch release cable from the dash panel along the left side of the engine compartment to the center of the headlamp mounting crossmember as shown in illustration.
7. Fully engage the cable into the integral routing clips on the headlamp mounting crossmember and the routing clips (1) along the left side of the engine compartment.
8. Reinstall the left headlamp unit to the vehicle.
9. Reinstall the hood latch (2) to the vehicle. Refer to **LATCH, HOOD, INSTALLATION**.

HINGE, HOOD

REMOVAL

REMOVAL

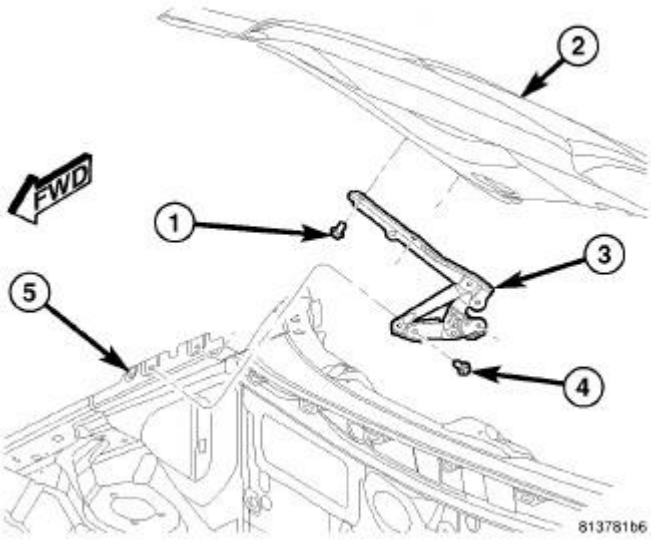

Fig. 230: Hinge
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood (2) with a suitable prop or block.
2. For BUX models, disconnect the negative battery cable and wait at least two minutes.
3. For BUX models, remove the electronic pedestrian protection hood hing actuator, refer to **ACTUATOR, ELECTRONIC PEDESTRIAN PROTECTION HOOD HINGE, REMOVAL** .
4. If the vehicle is so equipped, disconnect the upper end of the gas support cylinder from the upper bracket of the hood hinge (3). Refer to **PROP, GAS, REMOVAL**.
5. Mark the location of the hood hinge upper bracket on the hood (2) inner panel to aid reinstallation.
6. Remove the two screws (1) that secure the hinge to the hood.
7. Mark the hinge lower bracket location on the inside of the front fender ledge (5) to aid reinstallation.
8. Remove the two screws (4) that secure the hinge to the fender.
9. Remove the hood hinge from the vehicle.

INSTALLATION

INSTALLATION

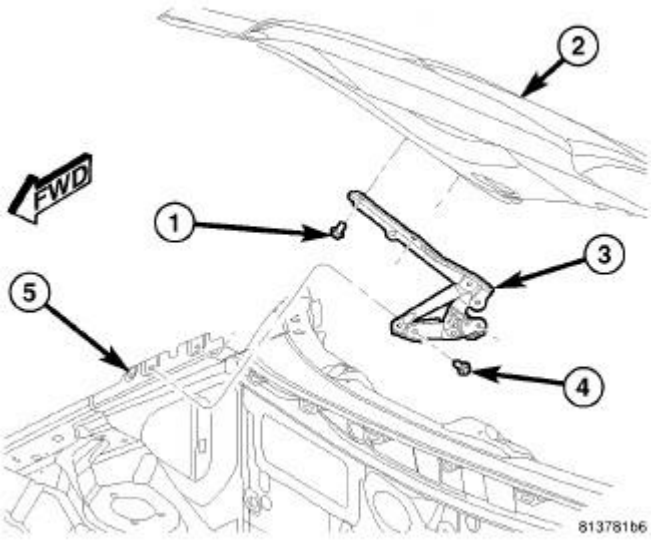

Fig. 231: Hinge
Courtesy of CHRYSLER GROUP, LLC

1. For BUX models, in the case of active hood deployment. Refer to **STANDARD PROCEDURE** .
2. Using the reference marks, position the lower bracket of the hood hinge (3) to the inside of the front fender ledge (5) on the vehicle.
3. Install and tighten the two screws (4) that secure the hinge to the fender. Tighten the screws to 28 N.m (21 ft. lbs.).
4. Position the hood panel (2) to the upper hinge bracket on the vehicle.
5. Install and tighten the two screws (2) that secure the hinge to the hood. Tighten the screws to 28 N.m (21 ft. lbs.).
6. For BUX models, install the electronic pedestrian protection hood hinge actuator. Refer to **ACTUATOR, ELECTRONIC PEDESTRIAN PROTECTION HOOD HINGE, INSTALLATION** .
7. For BUX models, connect the negative battery cable and wait at least two minutes.
8. If the vehicle is so equipped, reinstall the upper end of the gas support cylinder to the upper hinge bracket. Refer to **PROP, GAS, INSTALLATION**.
9. Remove the fixture being used to support the hood for service and close the hood.
10. Adjust the hood hinge position as necessary to achieve proper spacing and operation.

HOOD

REMOVAL

REMOVAL

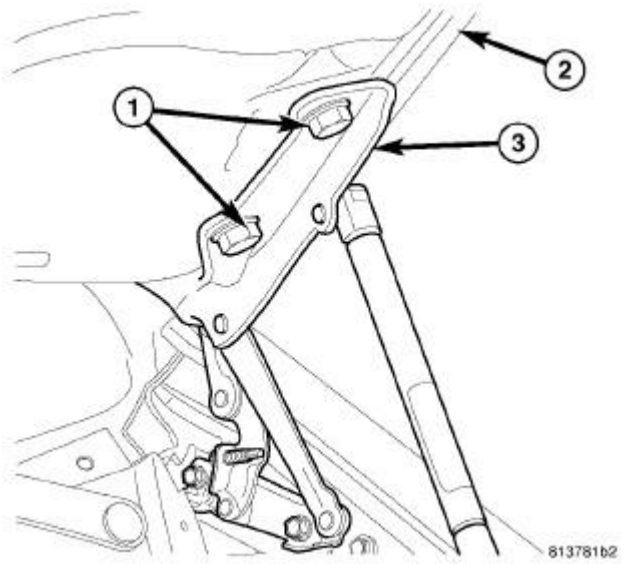

Fig. 232: Upper Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood (2).
2. Disconnect the washer supply hose between the body and the two washer nozzles on the underside of the hood.
3. Mark both upper hinge bracket (3) locations on the hood inner panel to aid reinstallation.
4. With the aid of an assistant, support the hood while removing the two screws (1) that secure each upper hinge bracket to the hood.
5. Remove the hood from the vehicle.

INSTALLATION

INSTALLATION

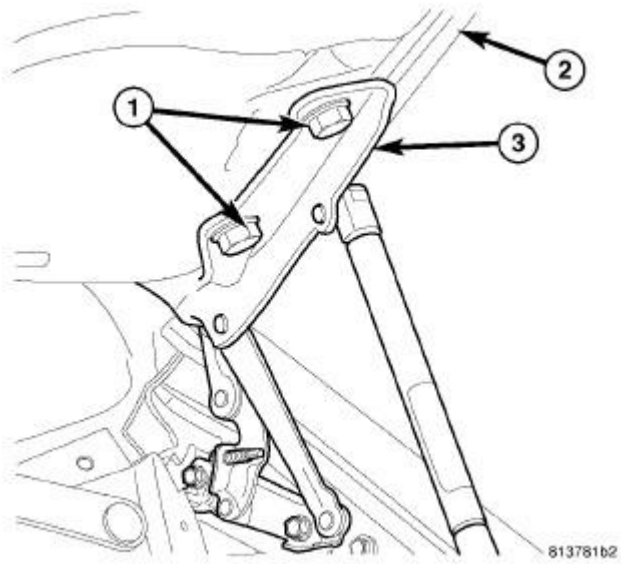

Fig. 233: Upper Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

1. With the aid of an assistant, support and position the hood panel (2) to the two upper hinge brackets (3) on the vehicle.
2. Install and tighten the two screws (1) that secure each upper hinge bracket to the hood. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Reconnect the washer supply hose between the body and the two washer nozzles on the underside of the hood.
4. Close the hood.
5. Adjust the hood hinge positions and the hood adjuster bumpers as necessary to achieve proper spacing and operation.

LATCH, HOOD

REMOVAL

REMOVAL

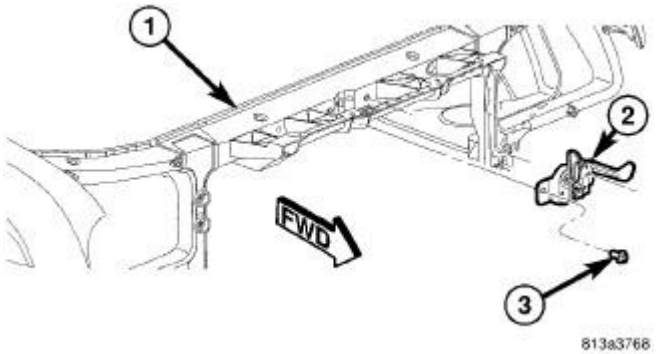

Fig. 234: Removing Hood Latch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Unsnap the left underhood appearance cover (4) from the headlamp mounting crossmember (1).
3. Disengage the interlocking feature on the inboard end of the left underhood appearance cover from the inboard end of the right cover (2) and remove it from the vehicle.
4. Unsnap the right underhood appearance cover from the headlamp mounting crossmember and remove it from the vehicle.
5. Mark the location of the hood latch (2) on the front of the headlamp mounting crossmember (1) to aid reinstallation.
6. Remove the two screws (3) that secure the latch to the front of the crossmember.

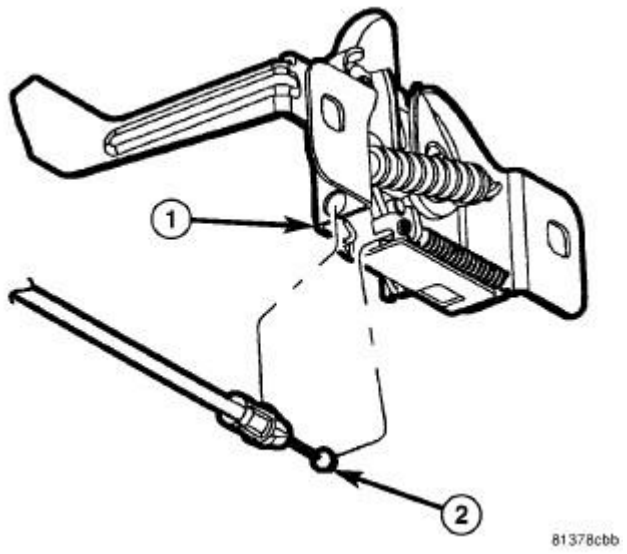

Fig. 235: Hood Latch Release Cable
Courtesy of CHRYSLER GROUP, LLC

7. If equipped with remote start, disconnect the harness connector from the hood latch.
8. Pull the latch (1) away from the front of the crossmember far enough to access and disengage the hood latch release cable housing from the latch and the cable ball end (2) from the latch lever.
9. Remove the hood latch from the vehicle.

INSTALLATION

INSTALLATION

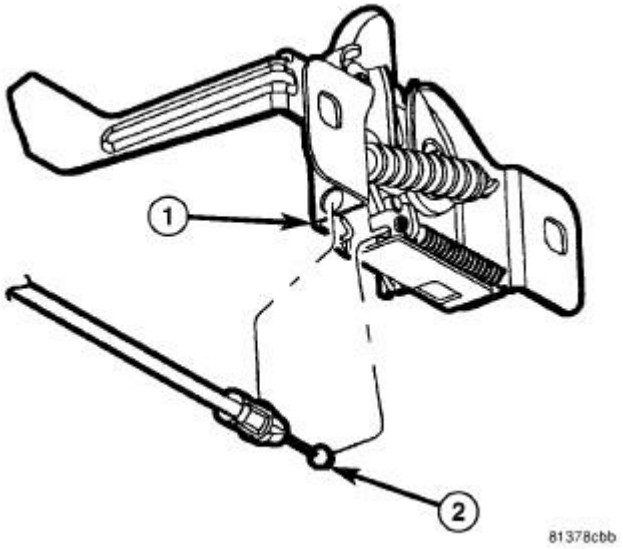

Fig. 236: Hood Latch Release Cable
Courtesy of CHRYSLER GROUP, LLC

1. Position the hood latch (1) close enough to the front of the headlamp mounting crossmember to access and engage the hood latch release cable ball end (2) to the latch lever and the cable housing to the latch.
2. If equipped with remote start, connect the wiring connector to the hood latch.

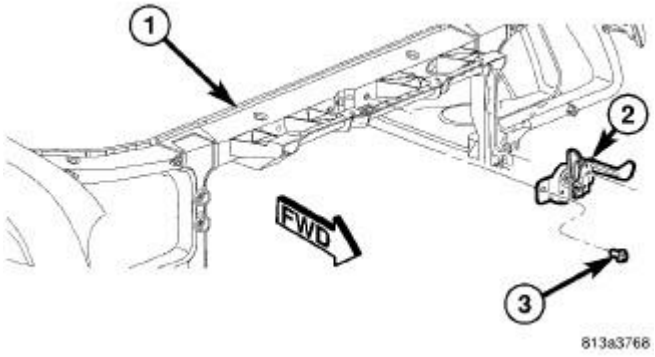

Fig. 237: Removing Hood Latch
Courtesy of CHRYSLER GROUP, LLC

3. Position the latch (2) to the front of the crossmember (1).
4. Install and tighten the two screws (3) that secure the latch to the crossmember. Tighten the screws to 28 N.m (21 ft. lbs.).
5. Adjust the latch position as necessary to achieve proper hood latch operation.

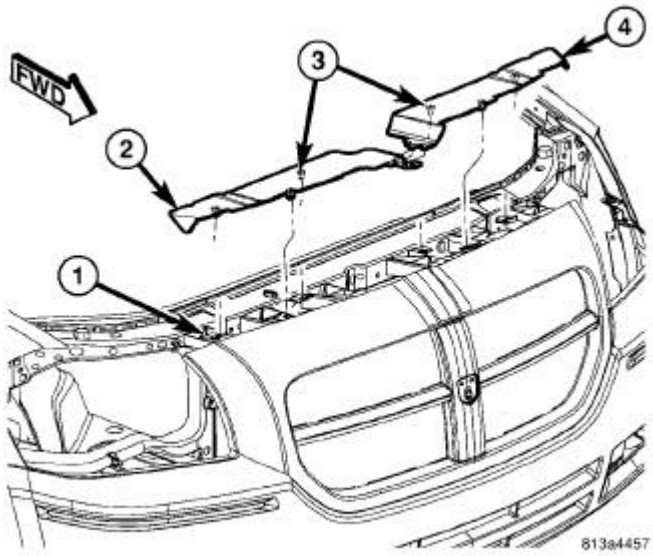

Fig. 238: Upper Radiator Closeout Panel
Courtesy of CHRYSLER GROUP, LLC

6. Position the right underhood appearance cover (2) to the headlamp mounting crossmember (1).
7. Using hand pressure, press the right appearance cover downward until each of the integral clips (3) snaps into the receptacles in the headlamp mounting crossmember.
8. Engage the interlocking feature on the inboard end of the left appearance cover (4) with the inboard end of the right cover and position it to the headlamp mounting crossmember.
9. Using hand pressure, press the left appearance cover downward until each of the integral clips snaps into the receptacles in the headlamp mounting crossmember.
10. Reconnect the battery negative cable.

PROP, GAS

REMOVAL

REMOVAL

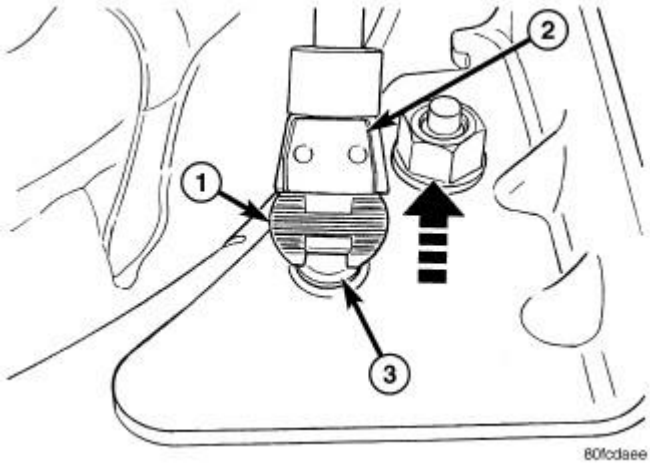

Fig. 239: Lower Notch Of Retainer Of Lower Ball Socket End
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood with a suitable prop or block.
2. Insert a small flat-bladed tool into the lower notch of the retainer (1) of the lower ball socket end (2) of the support cylinder on the top of the fender load beam and carefully pry the retaining clip upward to the installation position.

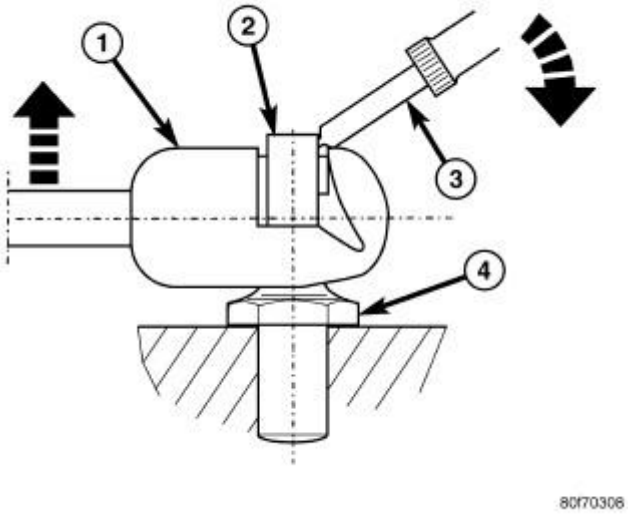

Fig. 240: Prying Retaining Clip Outward
Courtesy of CHRYSLER GROUP, LLC

WARNING: To avoid personal injury or death, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected

loss of hood support.

3. Insert a small flat-bladed tool (3) into the notch on the outer face of the upper ball socket end (1) of the support cylinder and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the upper hood hinge bracket.
4. Release the retaining clip to its installed position.
5. Disengage the lower ball socket from the ball stud.
6. Remove the support cylinder from the vehicle.

INSTALLATION

INSTALLATION

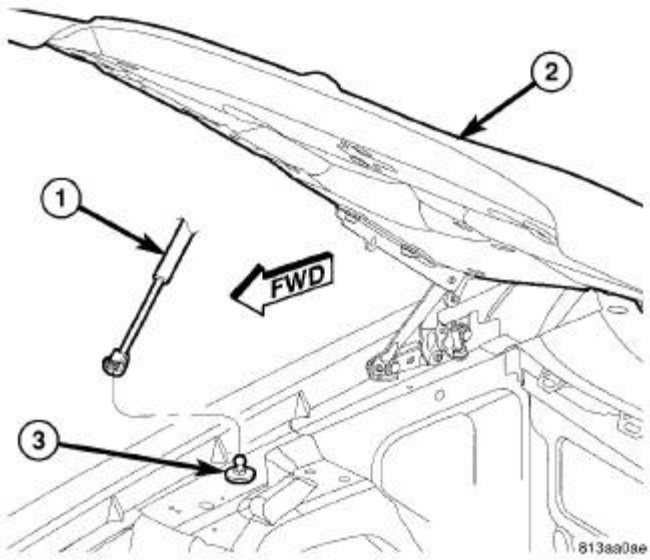

Fig. 241: Ball Stud & Support Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the ball stud (3) on the top of the fender load beam is in good condition and properly installed. Tighten the ball stud to 28 N.m (21 ft. lbs.).
2. Position the ball socket on the rod end of the support cylinder (1) to the ball stud on the top of the fender load beam.

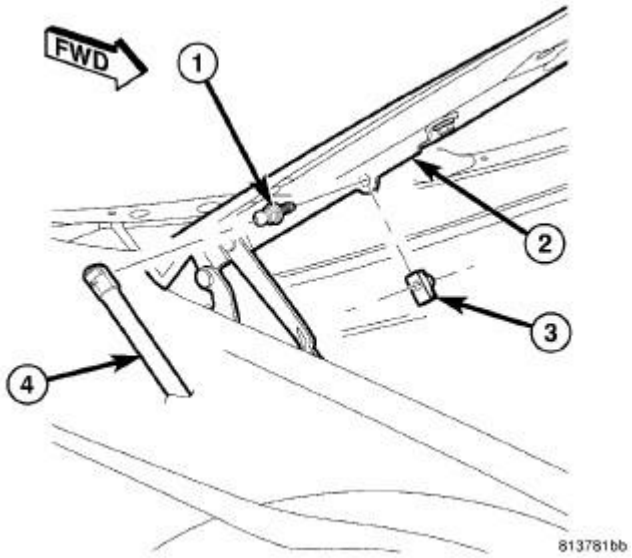

Fig. 242: Ball Stud & U-Nut
Courtesy of CHRYSLER GROUP, LLC

3. Check to be certain that the ball stud (1) secured by a U-nut (3) to the upper bracket (2) of the hood hinge is in good condition and properly installed. Tighten the ball stud to 28 N.m (21 ft. lbs.).
4. Position the ball socket on the cylinder end of the support cylinder (4) to the ball stud on the upper bracket of the hood hinge.
5. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
6. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
7. Remove the service prop or block and close the hood.

ROD, HOOD PROP

REMOVAL

REMOVAL

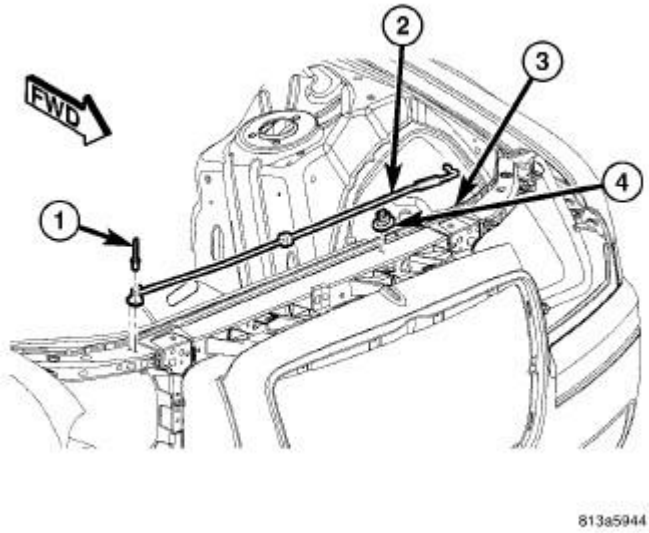

Fig. 243: Prop Rod
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood.
2. Remove the blind rivet (1) that secures the hood prop rod (2) pivot bracket to the right side of the headlamp mounting crossmember (3).
3. Disengage the prop rod from the rod clip (4) on the left side of the headlamp mounting crossmember.
4. Remove the hood prop rod from the vehicle.

INSTALLATION

INSTALLATION

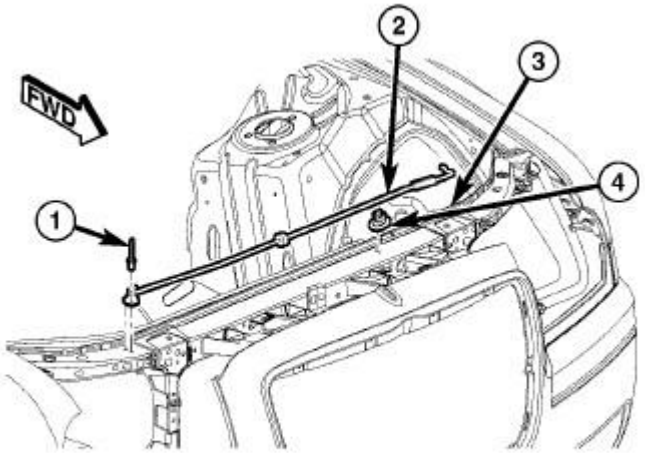

Fig. 244: Prop Rod
Courtesy of CHRYSLER GROUP, LLC

1. Position the hood prop rod (2) pivot bracket to the right side of the headlamp mounting crossmember (3).
2. Secure the pivot bracket to the headlamp mounting crossmember with a new blind rivet (1).
3. Engage the prop rod into the rod clip (4) on the left side of the headlamp mounting crossmember.
4. Close the hood.

STRIKER, HOOD

REMOVAL

REMOVAL

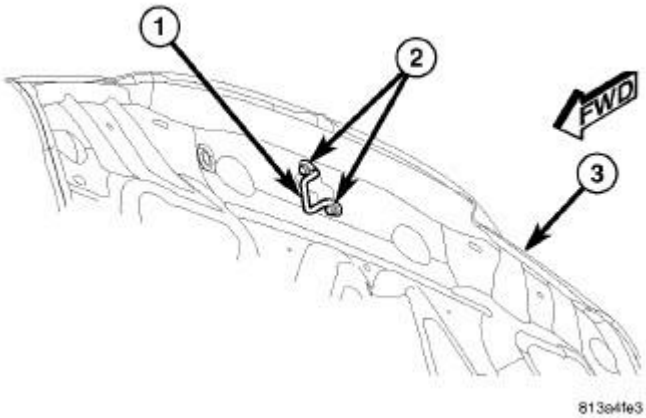

Fig. 245: Removing/Installing Hood Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood (3).
2. Remove the two screws (2) that secure the latch striker (1) to the hood inner reinforcement.
3. Remove the striker from the vehicle.

INSTALLATION

INSTALLATION

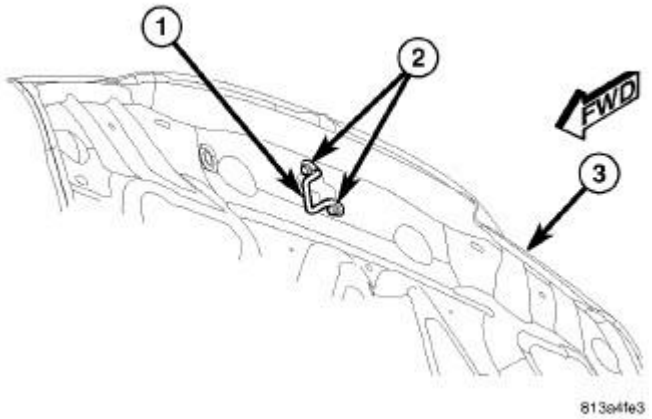

Fig. 246: Removing/Installing Hood Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the latch striker (1) to the underside of the hood (3).
2. Install and tighten the two screws (2) that secure the striker to the hood inner reinforcement. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Close the hood.

INSTRUMENT PANEL

BEZEL, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION

The instrument cluster bezel is integrated with the cluster. An instrument cluster hood is present and must be removed to access the fasteners securing the cluster to the instrument panel.

REMOVAL

REMOVAL

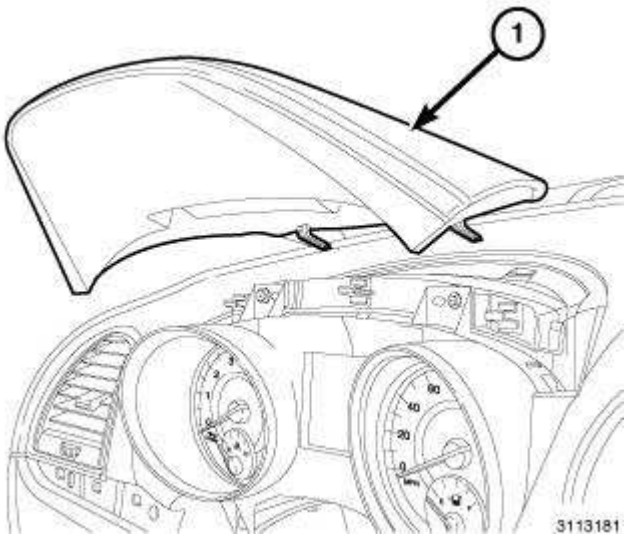

Fig. 247: Instrument Cluster Bezel Hood
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent (1), gently pry between the instrument cluster bezel hood (1) and the instrument panel to release the snap retainers that secure the bezel hood.

INSTALLATION

INSTALLATION

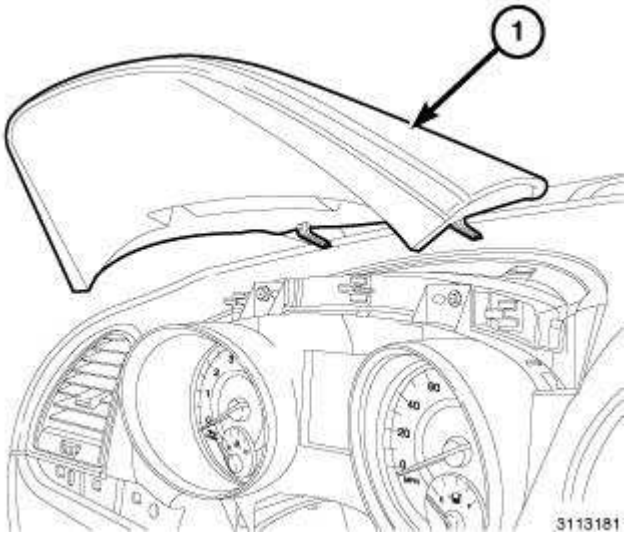

Fig. 248: Instrument Cluster Bezel Hood
Courtesy of CHRYSLER GROUP, LLC

1. Align the instrument cluster bezel hood (1) to the instrument panel and hand tap to engage the snap retainers that secure the bezel hood.

BEZEL, INSTRUMENT PANEL, CENTER

REMOVAL

REMOVAL

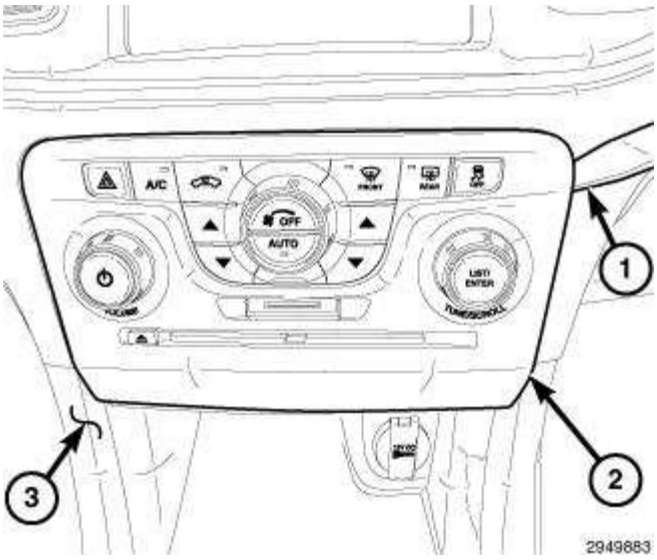

Fig. 249: Switch Bank
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Disconnect the negative battery cable.
3. Remove the AC/heater control faceplate (2) from the I/P. Refer to **POD, SWITCH BANK, REMOVAL** .

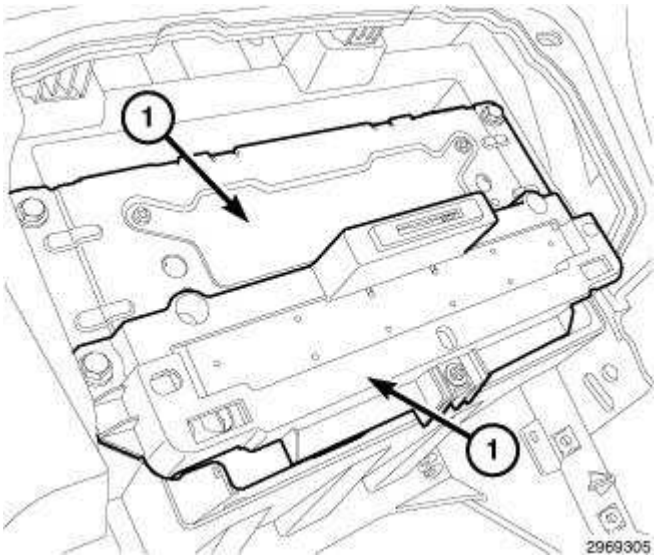

Fig. 250: Telematics Gateway Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Remove and disconnect the telematics gateway assembly (1). Refer to **MODULE, TELEMATICS GATEWAY, REMOVAL** .

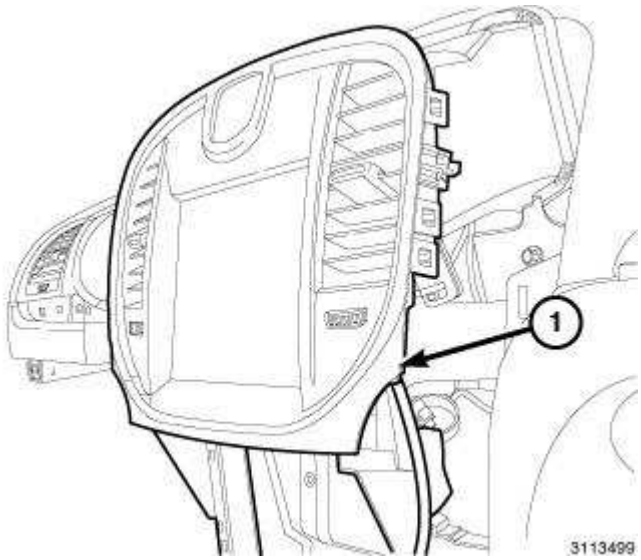

Fig. 251: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Using (special tool #C-4755, Trim Stick) or equivalent, remove the center bezel (1) from the instrument panel by releasing the snap retainers from the instrument panel.

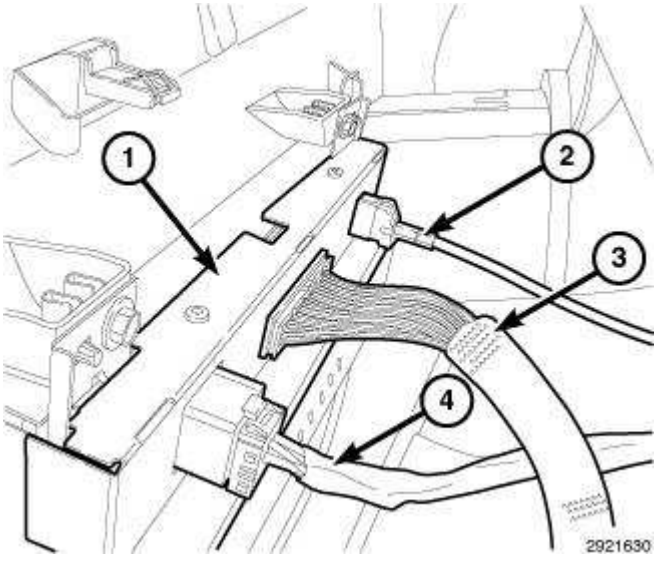

Fig. 252: Harness Connectors & Display Screen
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the harness connectors (2, 3 & 4) from the rear of the display screen (1).
7. Disconnect the clock harness and remove the center trim bezel.

INSTALLATION

INSTALLATION

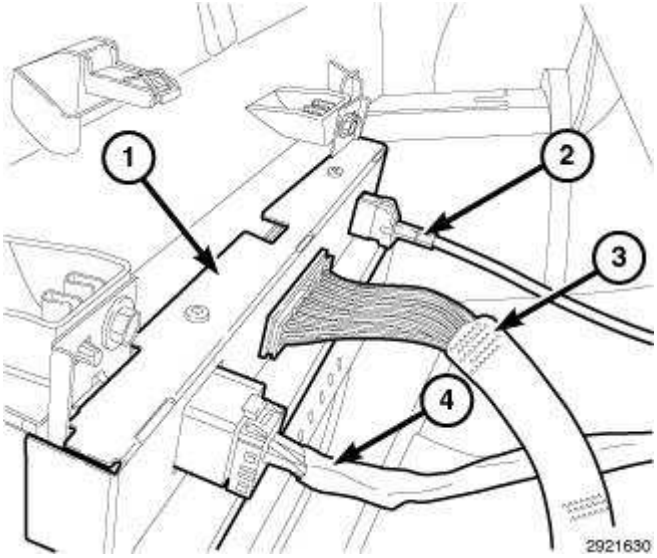

Fig. 253: Harness Connectors & Display Screen
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions
2. Position the center bezel near the instrument panel.
3. Connect the harness connectors (2, 3 & 4) from the rear of the display screen (1).
4. Connect the clock harness and align the center trim bezel to the instrument panel.

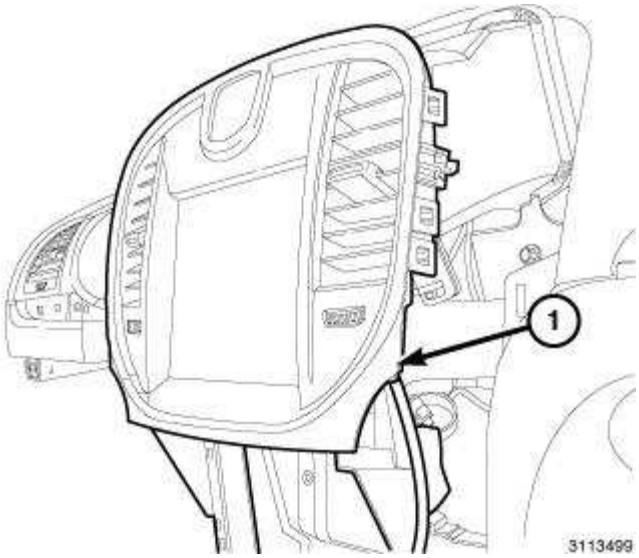

Fig. 254: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Install the center bezel (1) onto the instrument panel (2) and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers into the instrument panel.

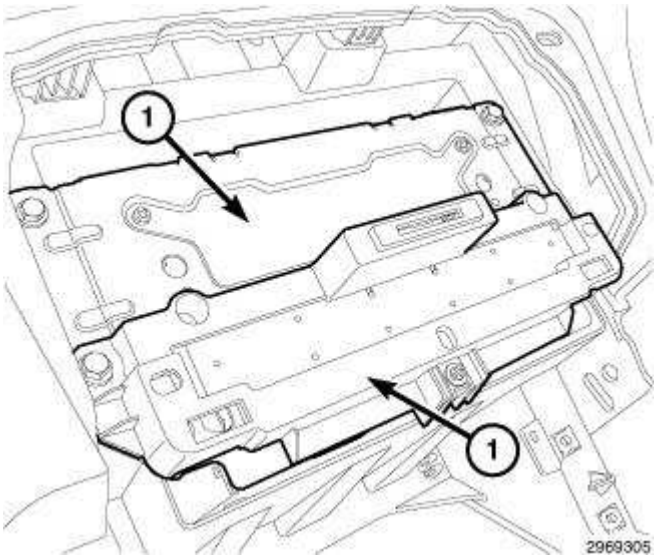

Fig. 255: Telematics Gateway Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Connect and install the telematics gateway assembly (1). Refer to **MODULE, TELEMATICS GATEWAY, INSTALLATION** .

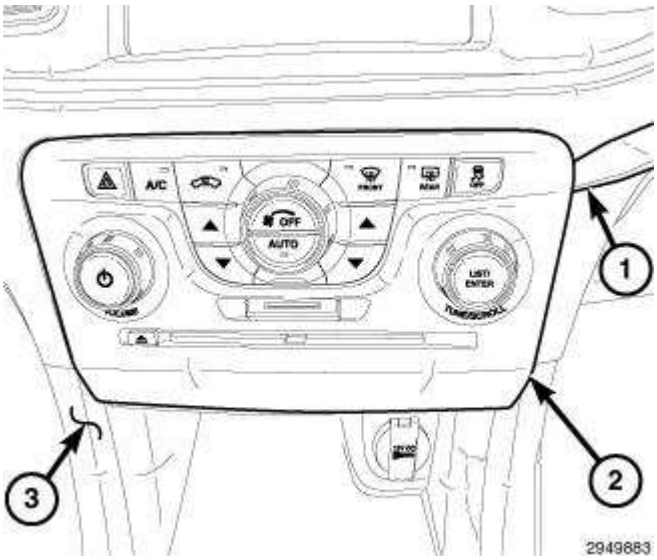

Fig. 256: Switch Bank
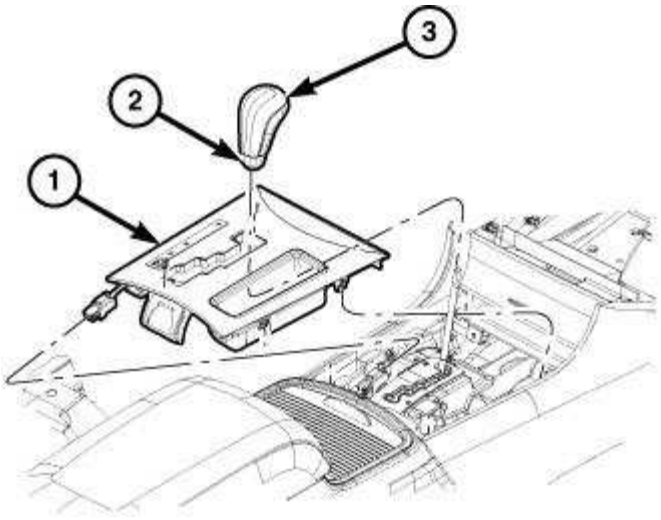
Courtesy of CHRYSLER GROUP, LLC

7. Connect and install the AC/heater control faceplate (2) to the I/P. Refer to **POD, SWITCH BANK, INSTALLATION** .
8. Connect the negative battery cable.

BIN, INSTRUMENT PANEL

REMOVAL

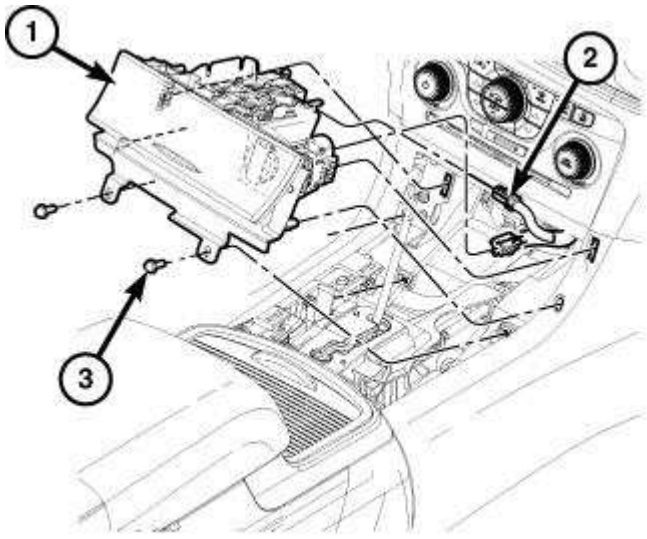
REMOVAL



2964689

Fig. 257: Shifter Knob, Retaining Ring & Shifter Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Using a thin wire type tool, locate and press the release while pulling up on the shifter knob (3).
3. Remove the shifter knob (3) and retaining ring (2).
4. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, gently pry between the shifter bezel (1) and the floor console to release the snap retainers that secure the bezel.**Do not pull with excessive force or fully remove at this time.**
5. Disconnect the shifter bezel wiring harness and remove the shifter bezel (1).



3305304

Fig. 258: Two Screws, Storage Bin & LED/Lamp Wiring Harness

Courtesy of CHRYSLER GROUP, LLC

6. Remove the two screws (3) securing the storage bin (1) to the front console.
7. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, gently pry between the storage bin (1) and the floor console side close out panel to release the two snap retainers that secure the storage bin (1) to the front console and close out panel.
8. Disconnect the 12V power outlet wiring harness from the rear of the storage bin (1).
9. Disconnect the LED/Lamp wiring harness (2) from the rear of the storage bin (1) and remove the storage bin from the I/P.

INSTALLATION

INSTALLATION

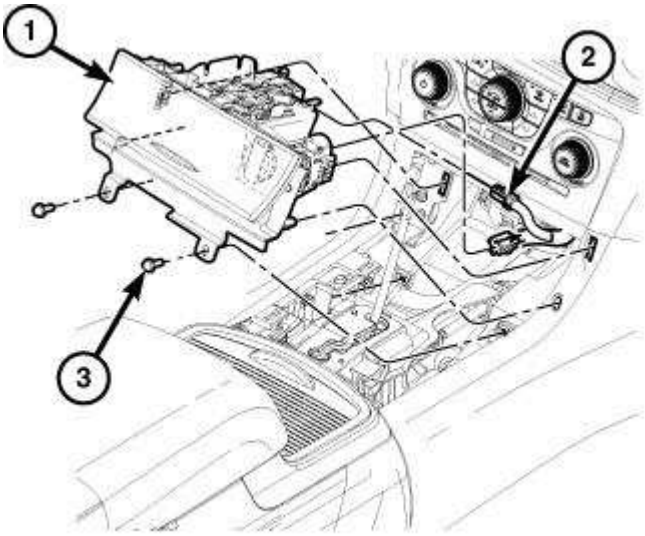


Fig. 259: Two Screws, Storage Bin & LED/Lamp Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

1. Connect the LED/Lamp wiring harness (2) to the rear of the storage bin (1).
2. Connect the 12V power outlet wiring harness to the rear of the storage bin (1).
3. Align the storage bin (1) to the front floor console and the side close out panel to engage the two snap retainers and alignment pins that secure the storage bin (1) to the floor console.
4. Install the two screws (3) securing the storage bin (1) to the front console. Tighten the screws to 2 N.m (18 in. lbs.).

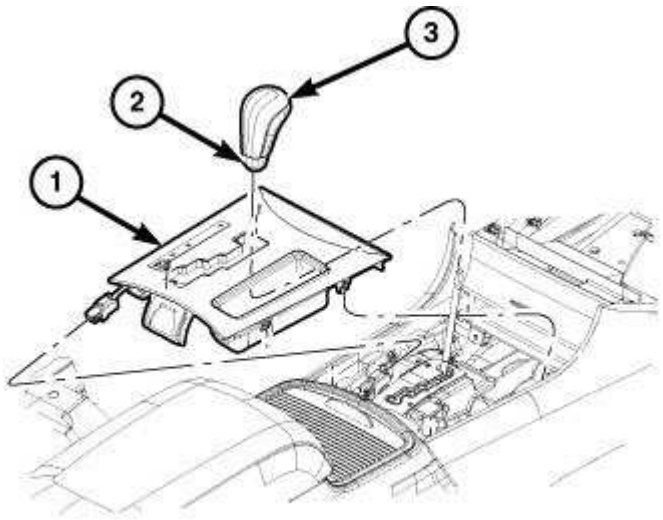

Fig. 260: Shifter Knob, Retaining Ring & Shifter Bezel
Courtesy of CHRYSLER GROUP, LLC

5. Connect the shifter bezel wiring harness and position the console shifter bezel (1) over the gear selector lever.
6. Position the tabs on the underside of the console shifter bezel (1) into the holes in the floor console. Use hand pressure to engage the retaining tabs.
7. Install and tighten the two screws (1) that secure the front of the console shifter bezel to the console. Tighten the screws to 3 N.m (23 in. lbs.).
8. Position the mat (5) into the console rear bin with the curved edge oriented forward in the vehicle.
9. Slide the retaining ring over the shifter shaft (2) and slide the shifter knob (3) onto the shaft and push down into place until fully locked.
10. Reconnect the negative battery cable.

COVER, INSTRUMENT PANEL

REMOVAL

REMOVAL

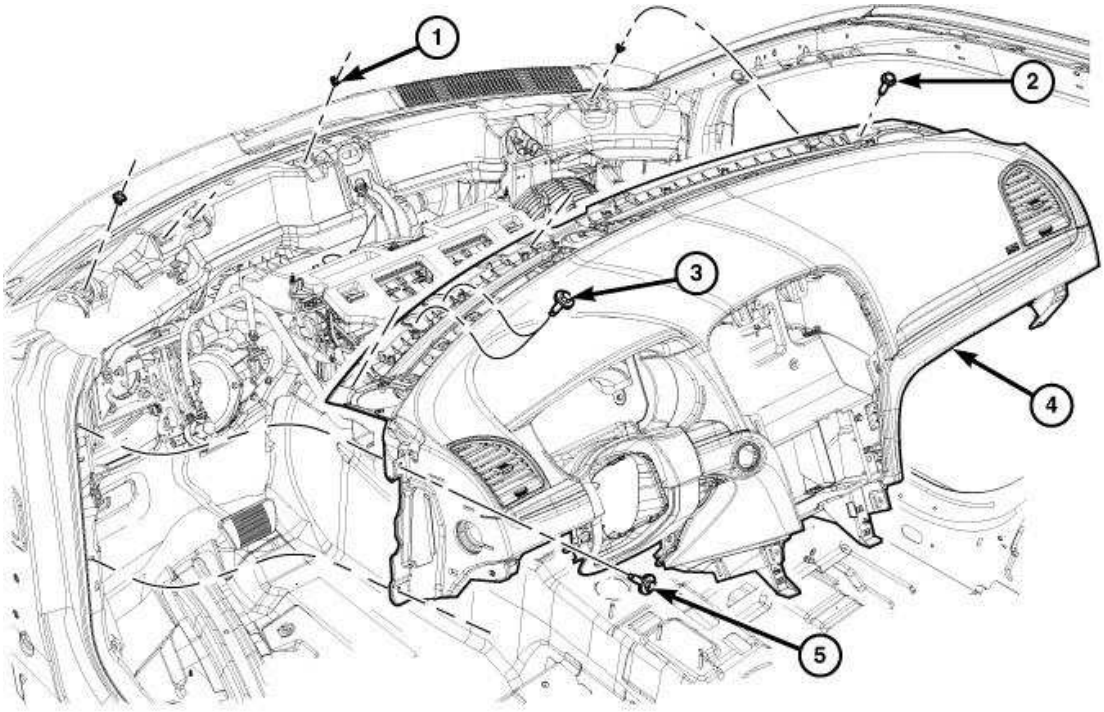

Fig. 261: Instrument Panel
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, remove the instrument panel and place on bench. Refer to **PANEL, INSTRUMENT, REMOVAL**.

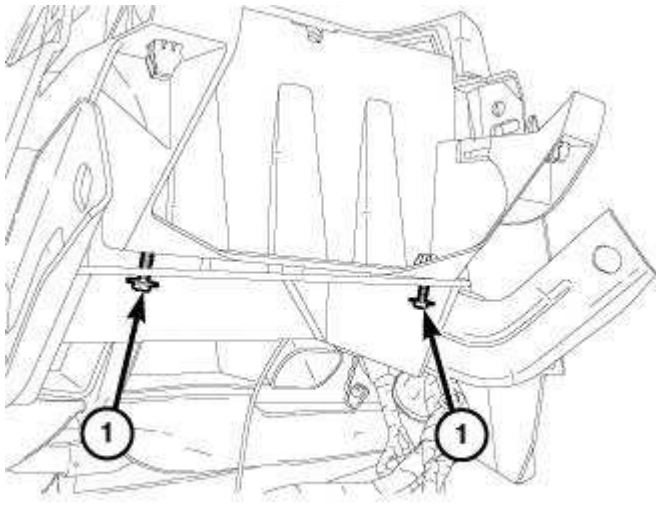

Fig. 262: Two Screws
Courtesy of CHRYSLER GROUP, LLC

2. With the help of an assistant, turn the I/P upright.

3. Remove the two screws (1) that secure the telematics gateway assembly reinforcement to the I/P cover.

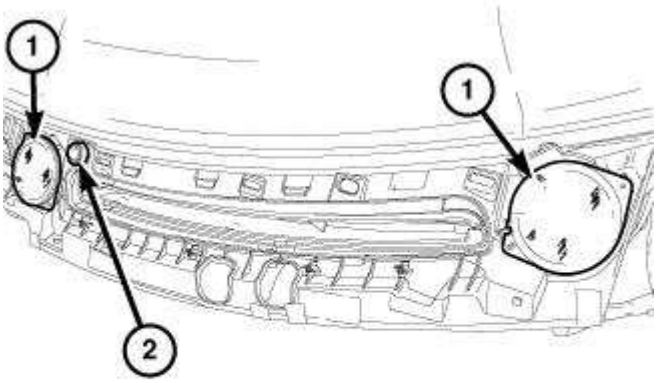

Fig. 263: Speakers & Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the passenger side airbag. Refer to **AIR BAG, PASSENGER, REMOVAL** .
5. Remove the defroster duct. Refer to **DUCT, DEFROSTER, REMOVAL** .
6. Remove the speakers (1) from the I/P. Refer to **SPEAKER, REMOVAL** .
7. Remove the sun sensor (2) from the I/P. Refer to **SENSOR, SUN, REMOVAL** .

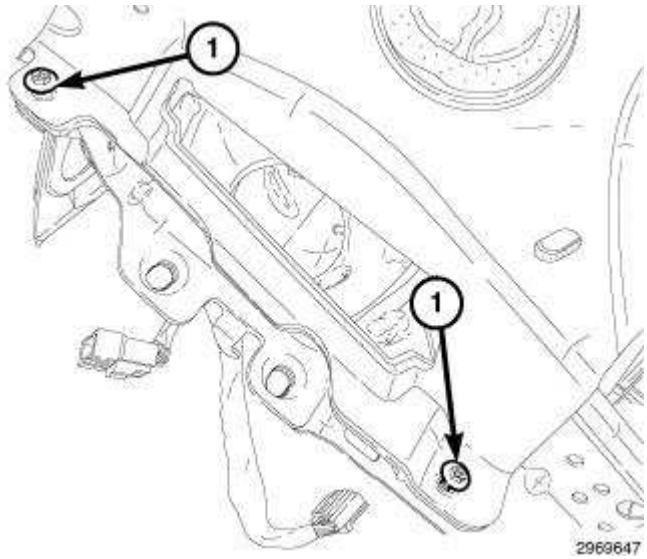

Fig. 264: Screws
Courtesy of CHRYSLER GROUP, LLC

8. Remove the two I/P cover to structure side screws (1). Repeat for the opposite side.

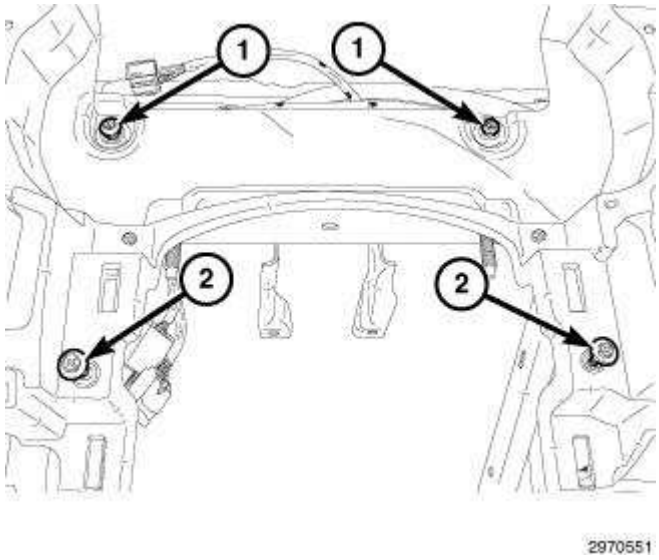

Fig. 265: Screws
Courtesy of CHRYSLER GROUP, LLC

9. Remove the screws (1) that attach the I/P cover to structure in the instrument cluster area.
10. Remove the screws (2) that attach the I/P cover to structure in the steering column area.

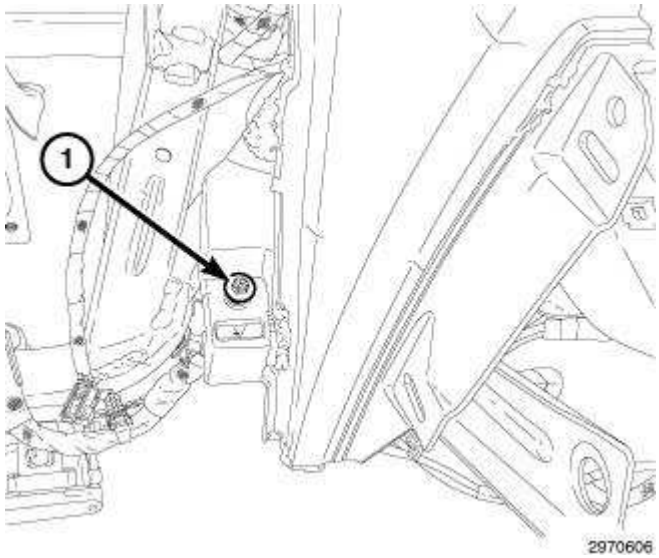

Fig. 266: Screw
Courtesy of CHRYSLER GROUP, LLC

11. Remove the screw (1) that attaches the I/P cover to the structure in the lower center stack area, on the driver side.

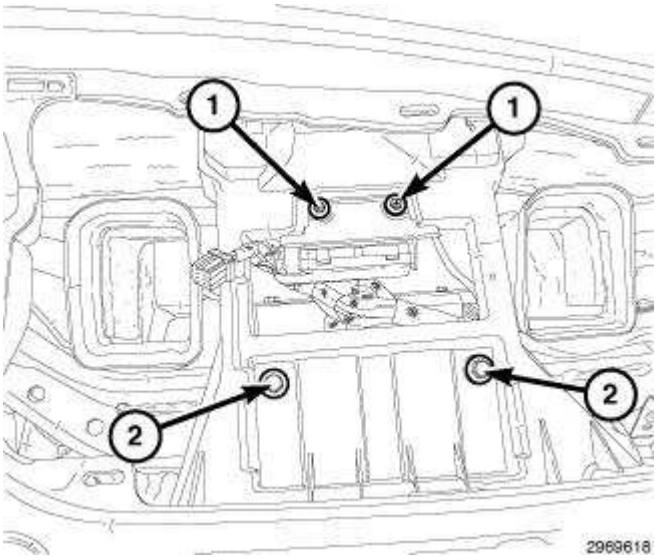

Fig. 267: Two Screws & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the two screws (1) from the module.
13. Remove the two I/P to structure bolts (2).

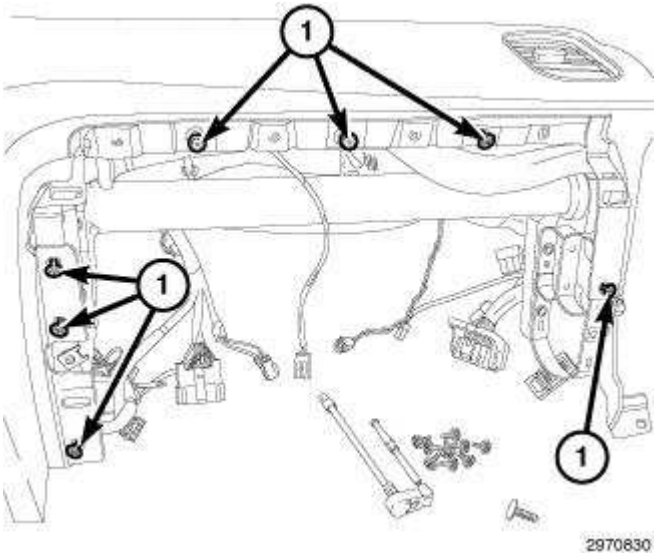

Fig. 268: Seven Screws
Courtesy of CHRYSLER GROUP, LLC

14. Remove the seven screws (1) attaching the I/P cover to the structure in the glove box area.

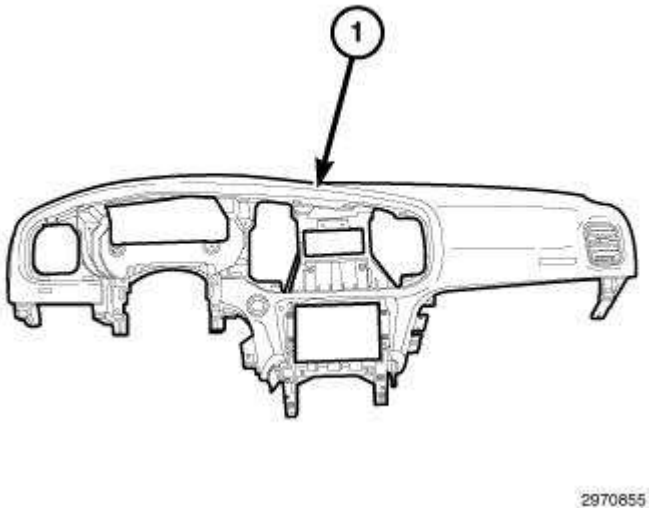

Fig. 269: Cover
Courtesy of CHRYSLER GROUP, LLC

15. Disconnect and remove the WIN module.
16. Remove the I/P cover (1) from the structure.

INSTALLATION

INSTALLATION

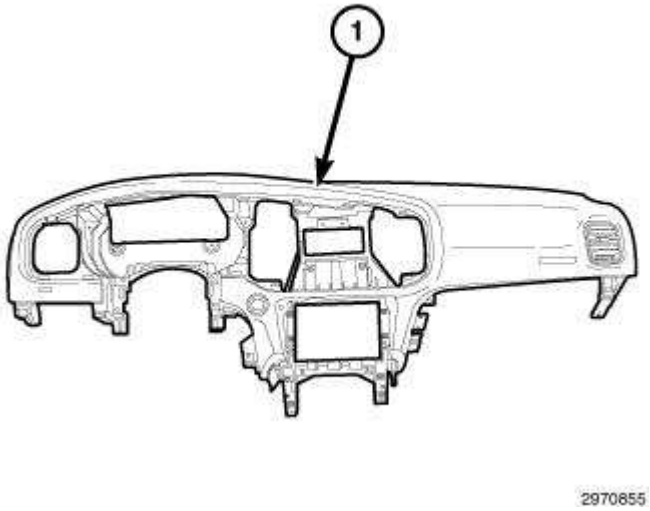

Fig. 270: Cover
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, position the I/P cover (1) to the structure.
2. Connect and install the WIN module.

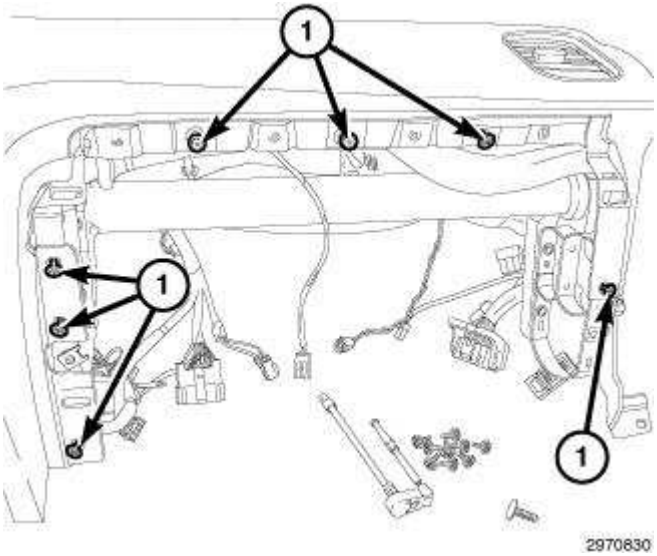

Fig. 271: Seven Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install the seven screws (1) attaching the I/P cover to the structure in the glove box area. Tighten the screws securely.

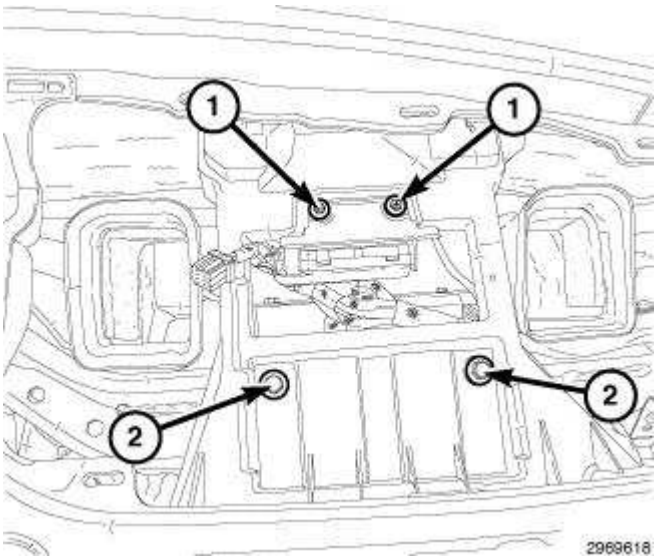

Fig. 272: Two Screws & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Position the module and install the two screws (1) to the module. Tighten the screws securely.
5. Install the two I/P to structure bolts (2). Tighten the bolts securely.

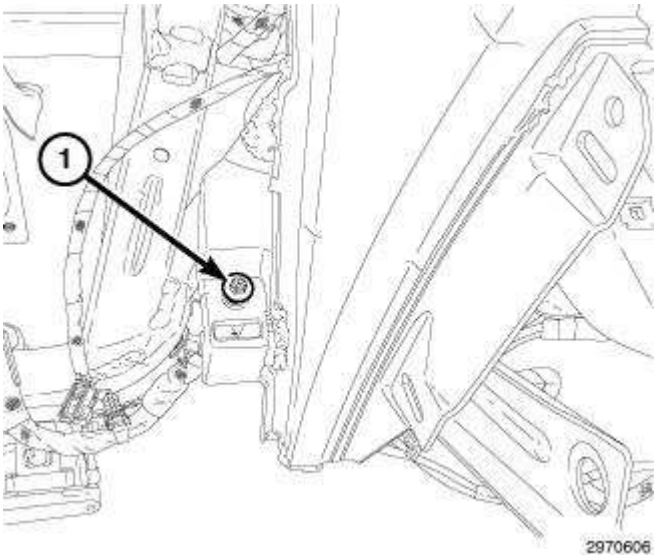

Fig. 273: Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install the screw (1) that attaches the I/P cover to the structure in the lower center stack area, on the driver side. Tighten the screw securely.

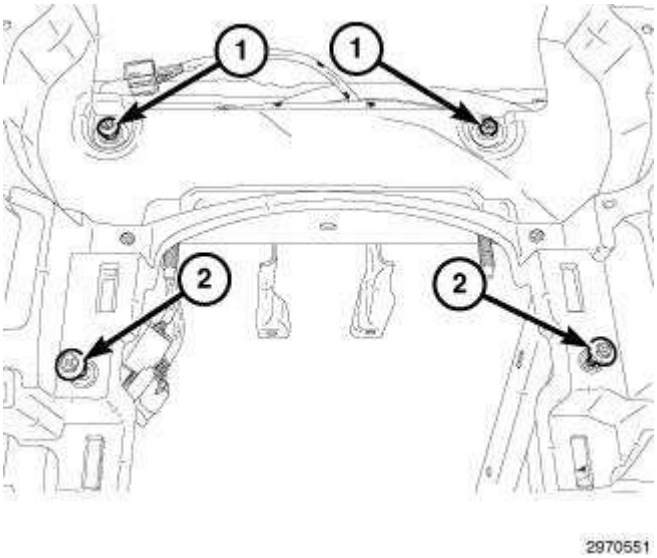

Fig. 274: Screws
Courtesy of CHRYSLER GROUP, LLC

7. Install the screws (1) that attach the I/P cover to structure in the instrument cluster area. Tighten the screws securely.
8. Remove the screws (2) that attach the I/P cover to structure in the steering column area. Tighten the screws securely.

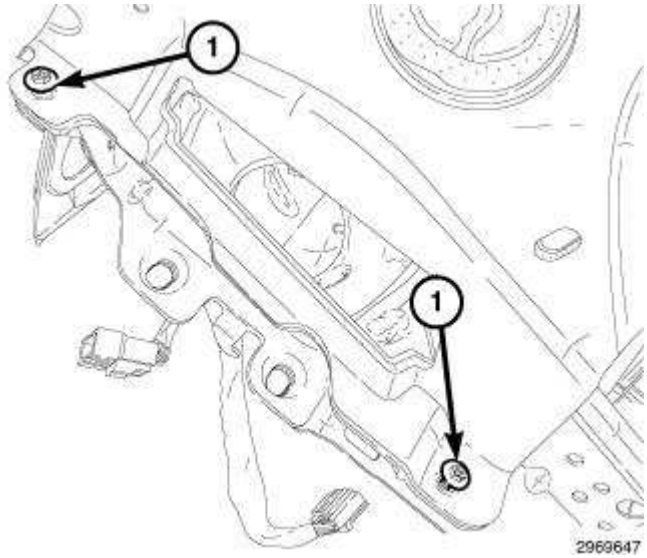

Fig. 275: Screws
Courtesy of CHRYSLER GROUP, LLC

9. Install the two I/P cover to structure side screws (1). Repeat for the opposite side. Tighten the screws securely.

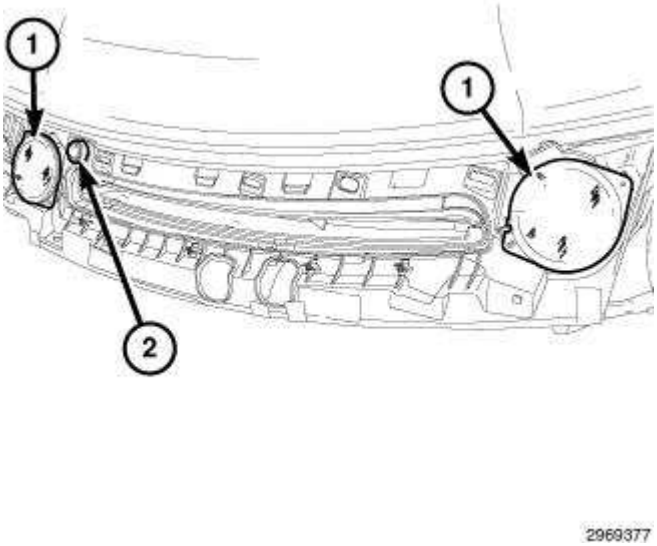

Fig. 276: Speakers & Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

10. Install the sun sensor (2) to the I/P. Refer to **SENSOR, SUN, INSTALLATION** .
11. Install the speakers (1) to the I/P. Refer to **SPEAKER, INSTALLATION** .
12. Install the defroster duct. Refer to **DUCT, DEFROSTER, INSTALLATION** .
13. Install the passenger side airbag. Refer to **AIR BAG, PASSENGER, INSTALLATION** .

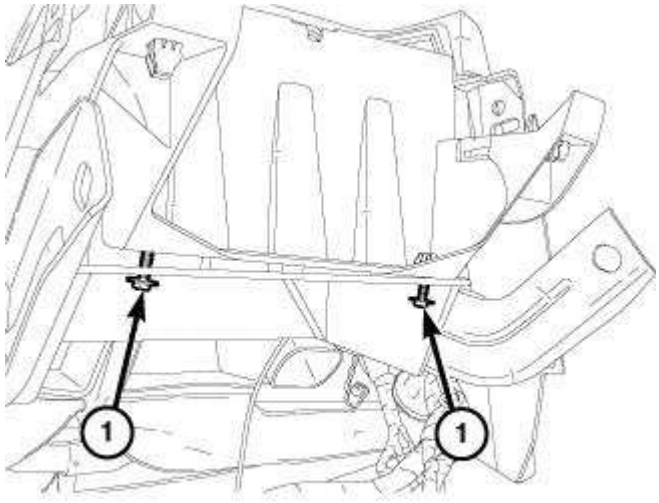

Fig. 277: Two Screws
Courtesy of CHRYSLER GROUP, LLC

14. With the help of an assistant, turn the I/P upright.
15. Install the two screws (1) that secure the telematics gateway reinforcement to the I/P cover. Tighten the screws securely.

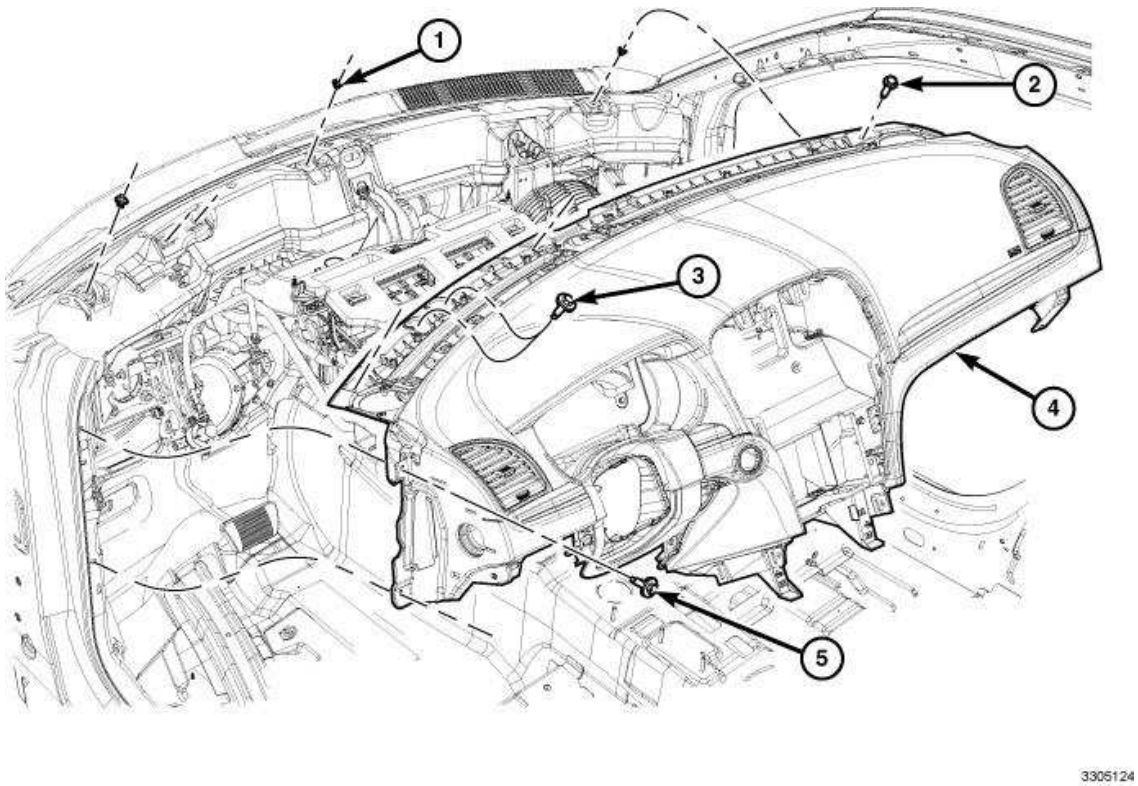

Fig. 278: Instrument Panel
Courtesy of CHRYSLER GROUP, LLC

16. With the help of an assistant, install the instrument panel into the vehicle. Refer to **PANEL, INSTRUMENT, INSTALLATION**.

COVER, STEERING COLUMN OPENING

REMOVAL

REMOVAL

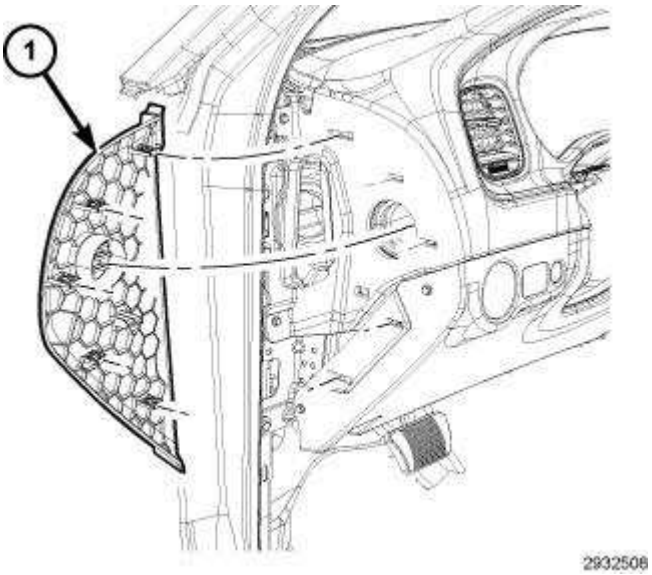

Fig. 279: End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate negative battery cable.
2. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent (1), gently pry between the end cap (1) and the instrument panel to release the snap retainers that secure the end cap. Repeat on opposite side.

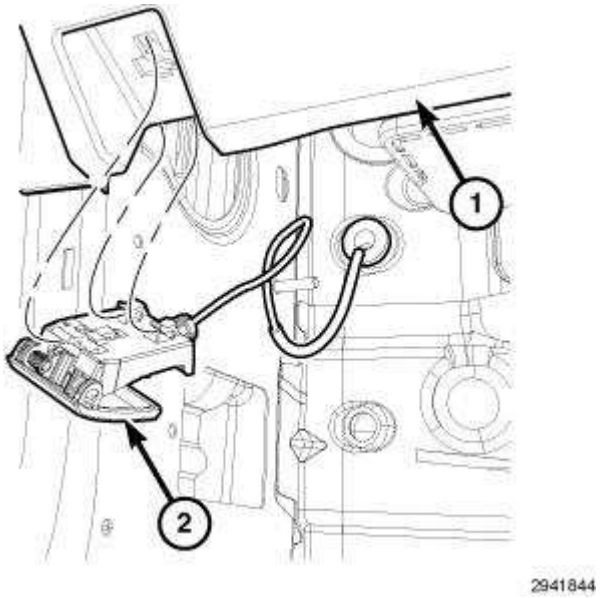

Fig. 280: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

3. Remove the hood release handle (2) from the knee blocker trim (1) by pushing down to disengage and then pulling rearward on the handle.

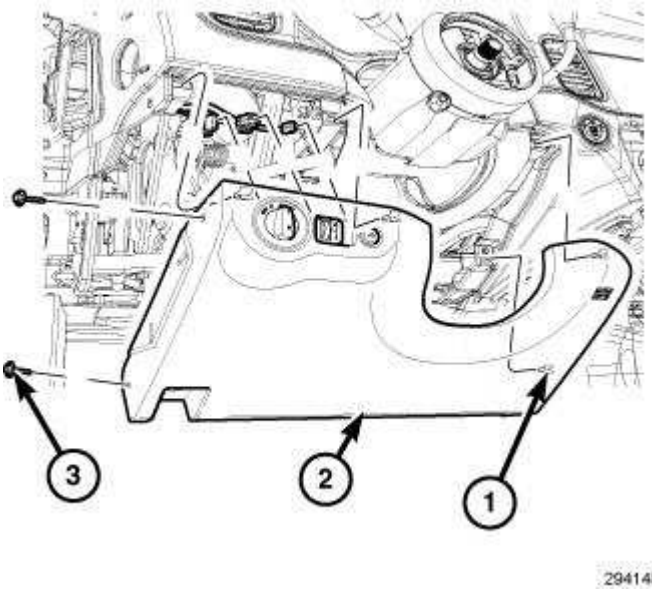

Fig. 281: Two Side Screws, Lower Screw & Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

NOTE: Steering wheel removed for clarity.

4. Remove the two side screws (3) and the lower screw (1) securing the knee blocker trim (2) to the instrument panel.
5. Using (special tool #C-4755, Trim Stick) or equivalent (1), partially remove the upper portion of

the knee blocker trim (2) by gently prying between the knee blocker trim (2) and the instrument panel to release the upper snap retainers.**Do not remove the knee blocker trim or pull with excessive force.**

6. Disconnect the in-car temperature sensor.

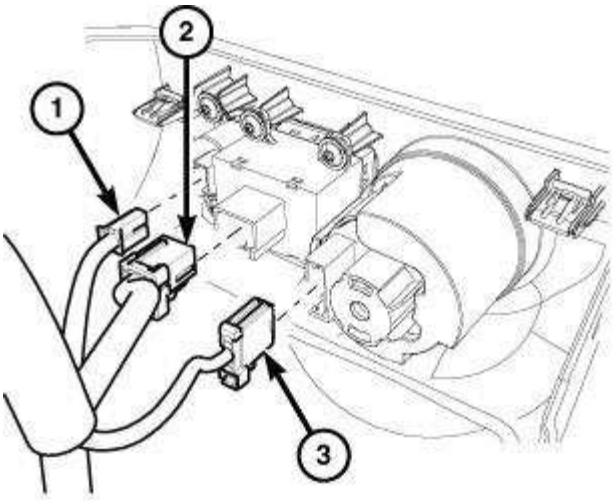

Fig. 282: Light Switch Harnesses
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the light switch harnesses (1, 2 & 3) from the switch and finish removing the knee blocker trim.

INSTALLATION

INSTALLATION

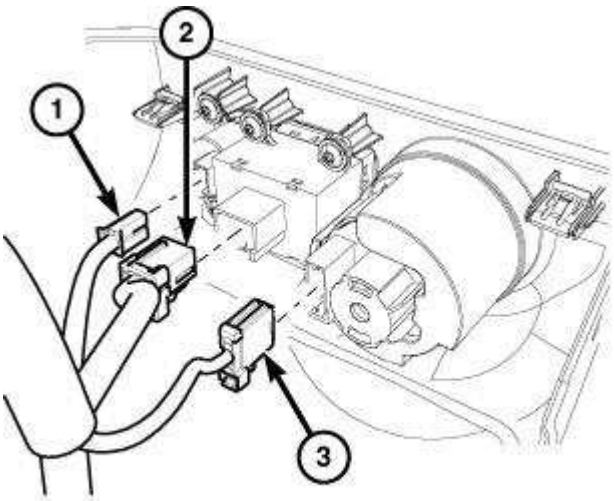

Fig. 283: Light Switch Harnesses

Courtesy of CHRYSLER GROUP, LLC

1. Connect the light switch harnesses (1, 2 & 3) to the switch located on the knee blocker trim.

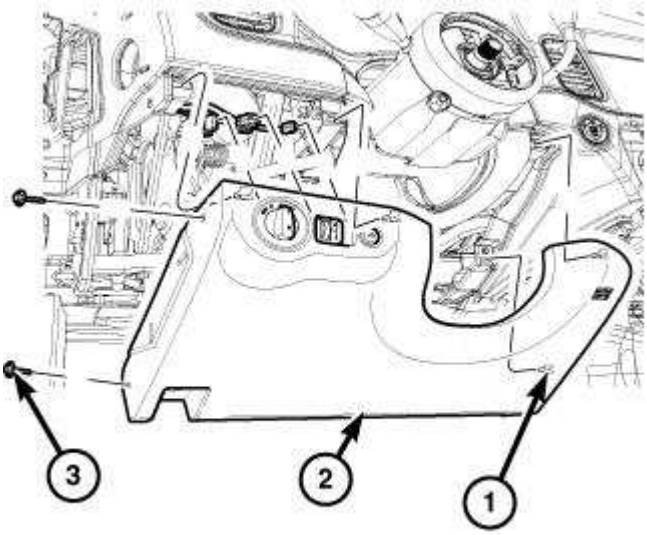

Fig. 284: Two Side Screws, Lower Screw & Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

NOTE: Steering wheel removed for clarity.

2. Connect the in-car temperature sensor.
3. Install the upper portion of the knee blocker trim (2) by pushing on the knee blocker trim (2) to engage the upper snap retainers.
4. Install the two side screws (3) and the lower screw (1) securing the knee blocker trim (2) to the instrument panel. Tighten the screws to 30 in-lbs.

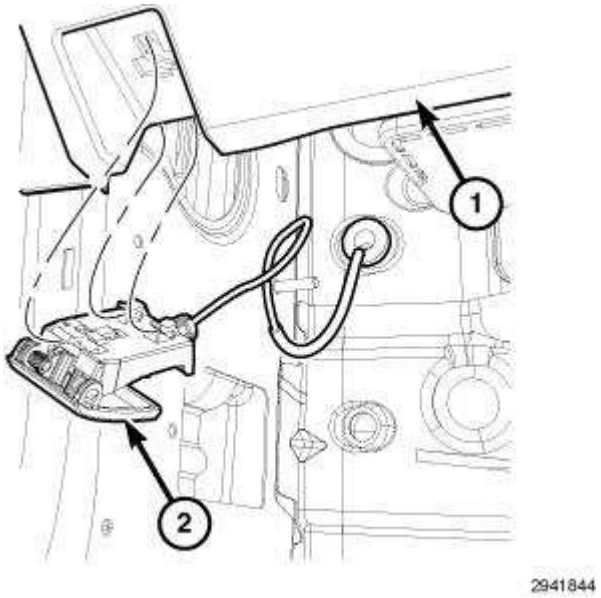

Fig. 285: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

5. Install the hood release handle (2) to the knee blocker trim by aligning and pushing up.

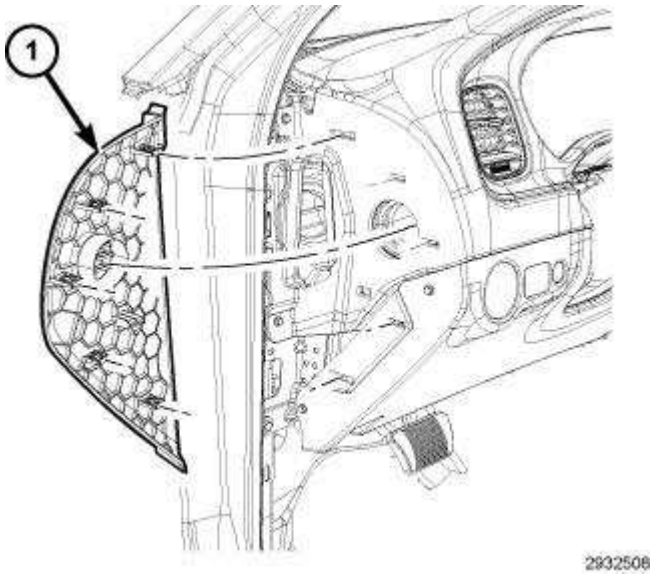

Fig. 286: End Cap
Courtesy of CHRYSLER GROUP, LLC

6. Install the end cap (1) to the instrument panel and engage the snap retainers that secure the end cap. Repeat on opposite side.
7. Connect the negative battery cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door

module is disrupted.

CYLINDER, GLOVE BOX LOCK

DESCRIPTION

DESCRIPTION

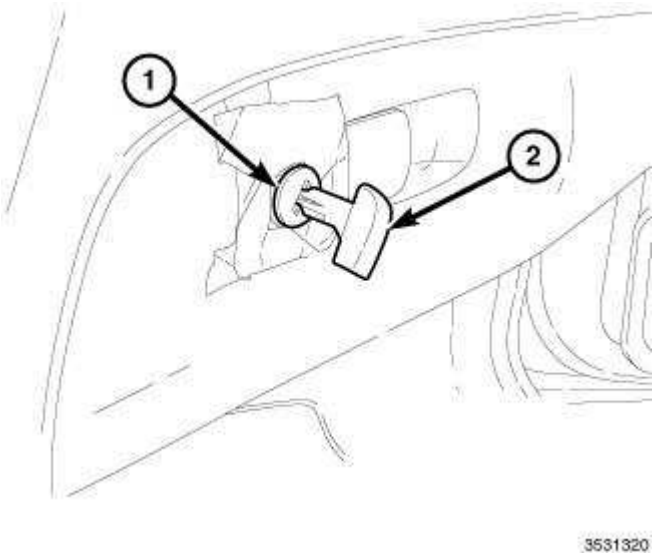

Fig. 287: Glove Box Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

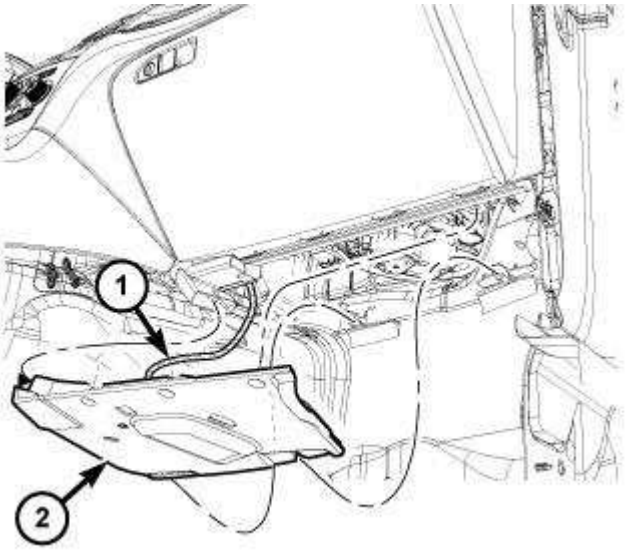
The glove box lock cylinder (1) is not serviceable part. If the glove box module or door are replaced, the lock cylinder will need to be transferred. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** & **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.

GLOVE BOX, INSTRUMENT PANEL

REMOVAL

REMOVAL

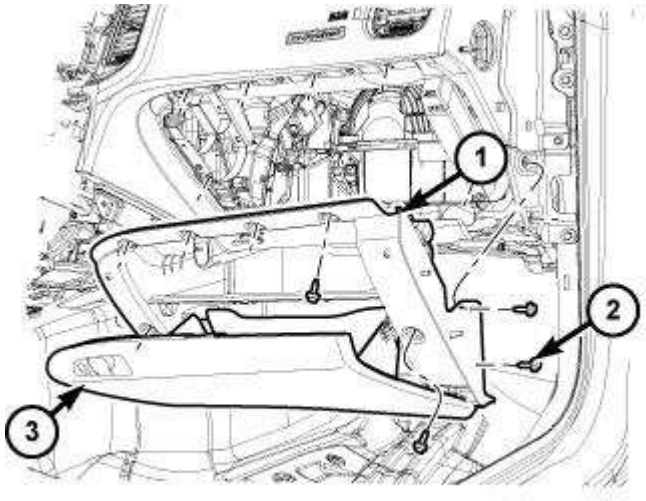
GLOVE BOX MODULE



2932866

Fig. 288: Right Side Instrument Panel Silencer & LED Harness
Courtesy of CHRYSLER GROUP, LLC

1. Remove the right side instrument panel end cap.
2. Remove the right side instrument panel silencer (2) and disconnect the LED harness (1). Refer to **PANEL, SILENCER, REMOVAL**.



2933122

Fig. 289: Ground Eyelet, Two Side Screws & Glove Box Compartment
Courtesy of CHRYSLER GROUP, LLC

3. Open the glove box door (3).
4. Remove the two side screws (2) from the glove box compartment (1).
5. Remove the six screws from the glove box compartment (1).
6. Disconnect the wiring harness and remove the glove box compartment (1).

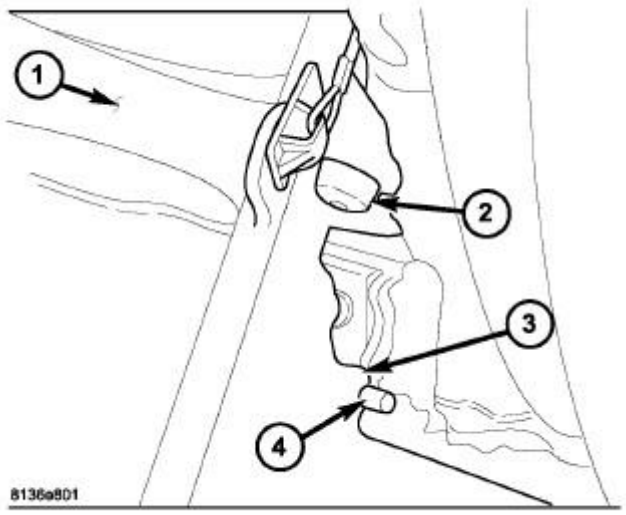


Fig. 290: Removing/Installing Glove Box Bin
Courtesy of CHRYSLER GROUP, LLC

1. Open the glove box bin (1).
2. Push in on both sides of glove box bin to disengage the glove box stops (2) and lower the bin.
3. Pivot the glove box bin downward and disengage the glove box hinge hooks (3) from the instrument panel hinge brackets (4) located at each end of the bin.

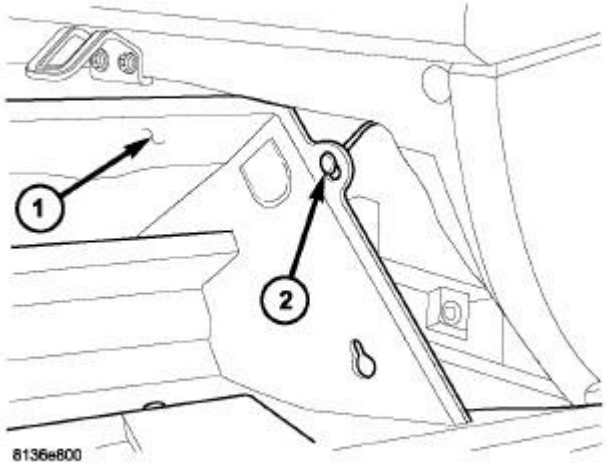

Fig. 291: Glove Box Bin Support Strap
Courtesy of CHRYSLER GROUP, LLC

4. Turn the glove box bin (1) sideways and remove the support strap and retainer assembly (2) from the outboard end of the bin.
5. Remove the glove box bin from the vehicle.

LOCK CYLINDER

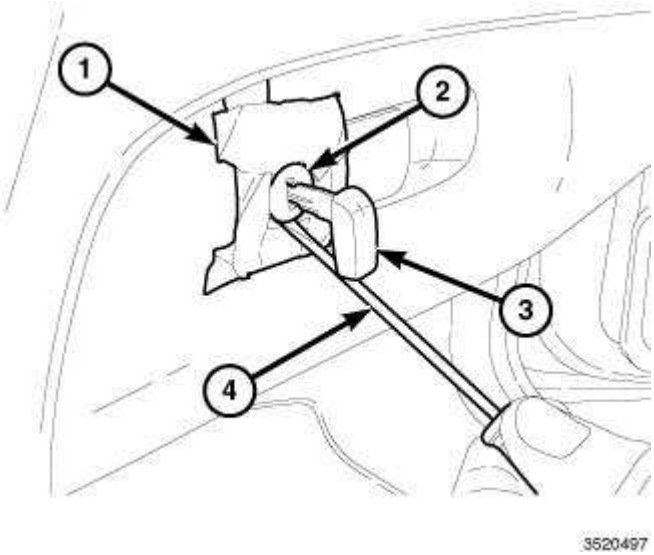

Fig. 292: Masking Tape, Lock Cylinder, Key & Screwdriver
Courtesy of CHRYSLER GROUP, LLC

1. Prior to removal, place masking tape (1) or equivalent around the perimeter of the lock cylinder (2).
2. Insert the key (3) into the lock cylinder (2) and turn the key into the locked position.
3. Insert a small flat bladed screwdriver (4) into the opening between the lock cylinder (2) and bezel at the "6 o'clock position".
4. Apply downward pressure on the screwdriver (4) while turning the key clockwise approximately 45°.

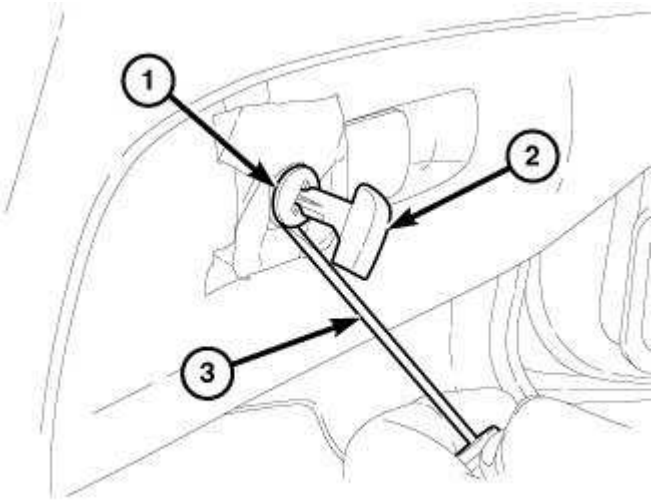

Fig. 293: Lock Cylinder, Key & Screwdriver
Courtesy of CHRYSLER GROUP, LLC

5. Remove the lock cylinder (1), key (2) and screwdriver (3) together.

INSTALLATION

INSTALLATION

GLOVE BOX MODULE

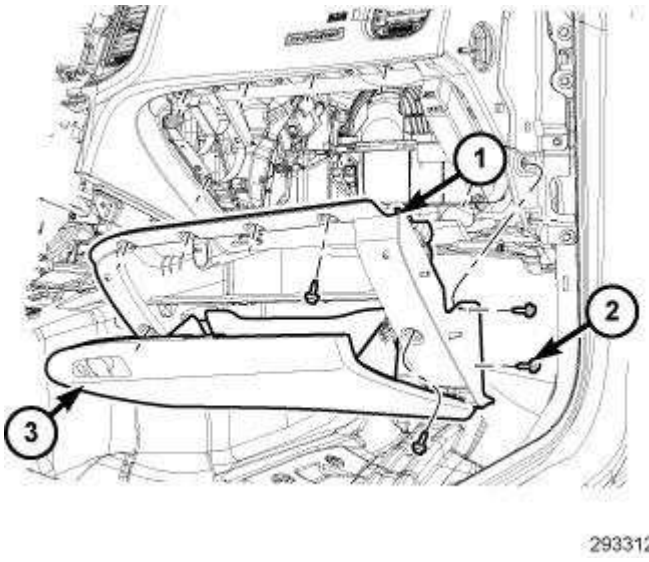

Fig. 294: Ground Eyelet, Two Side Screws & Glove Box Compartment
Courtesy of CHRYSLER GROUP, LLC

1. Connect the wiring harness and position the glove box compartment (1) into the I/P.
2. Install the six screws to the glove box compartment (1). Tighten the screws to 30 in-lbs.

3. Install the two side screws (2) securing the glove box compartment (1) to the I/P. Tighten the screws to 30 in-lbs.
4. Close the glove box door (3).

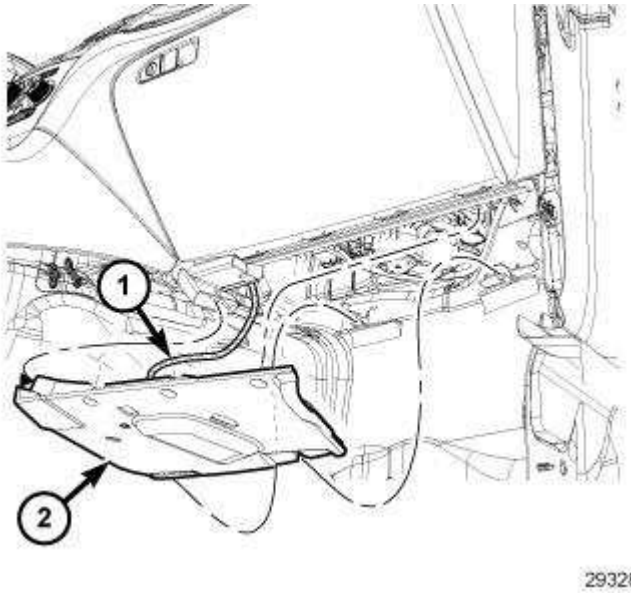

Fig. 295: Right Side Instrument Panel Silencer & LED Harness
Courtesy of CHRYSLER GROUP, LLC

5. Connect the LED harness (1) and install the right side instrument panel silencer (2).

DOOR

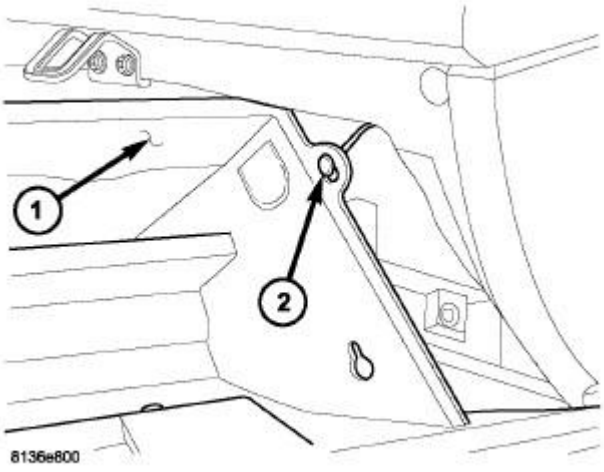

Fig. 296: Glove Box Bin Support Strap
Courtesy of CHRYSLER GROUP, LLC

1. Position the glove box bin (1) into the vehicle.
2. Turn the glove box bin sideways and install the support strap and retainer assembly (2) onto the outboard end of the bin.

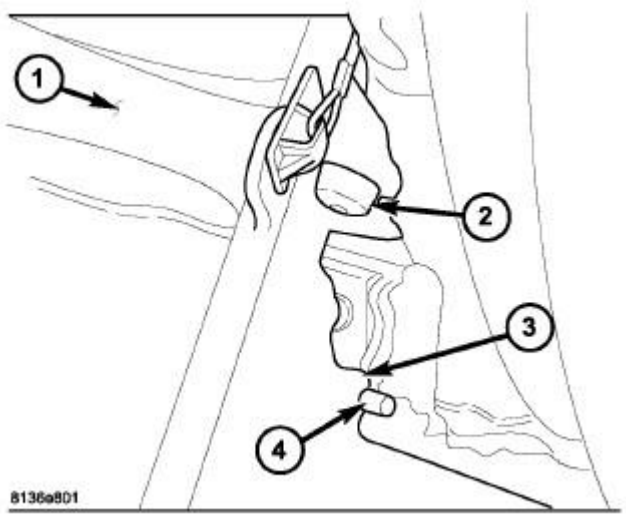

Fig. 297: Removing/Installing Glove Box Bin
Courtesy of CHRYSLER GROUP, LLC

3. Engage the glove box bin hinge hooks (3) onto the instrument panel hinge brackets (4) located at each end of the glove box bin (1) and pivot the bin upward.
4. To engage the glove box stops (2), push inward on both sides of the glove box bin and pivot the glove box into the instrument panel.
5. Close the glove box bin.

LOCK CYLINDER

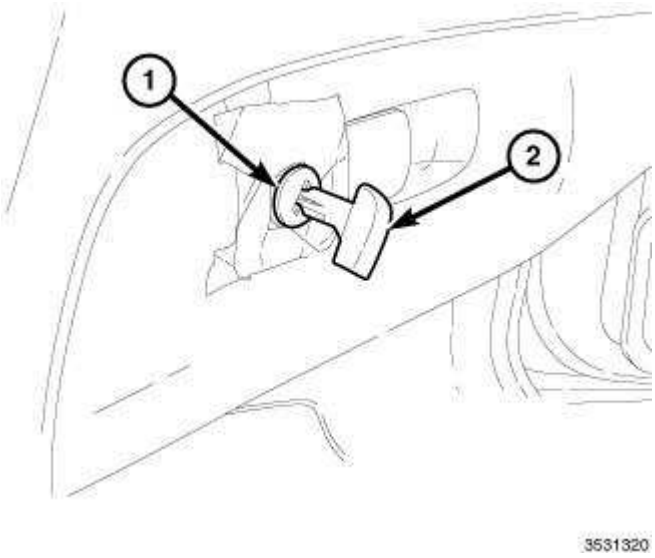

Fig. 298: Glove Box Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Install the lock cylinder (1) and key (2) into the glove box door together in a position approximately 45° clockwise from the locked position.

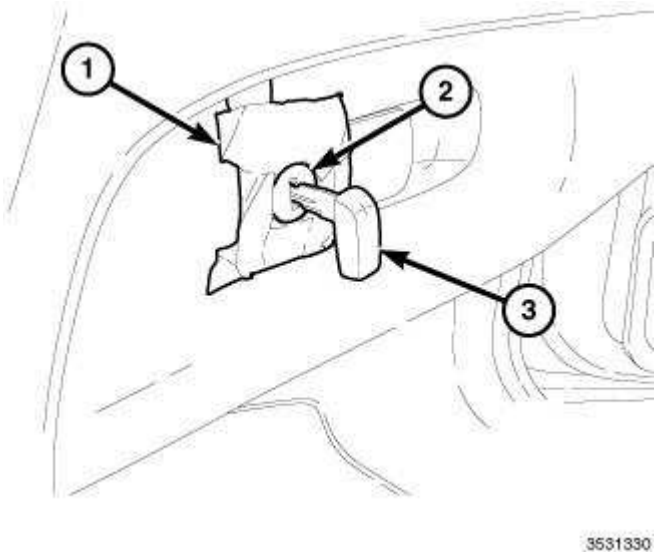

Fig. 299: Key, Lock Cylinder & Masking Tape
Courtesy of CHRYSLER GROUP, LLC

2. Turn the key (3) counter clockwise to the locked position.
3. Remove the key (3) from the lock cylinder (2).
4. Reinsert the key and verify the lock cylinder is functioning properly.
5. Remove the masking tape (1) from the lock cylinder perimeter.

GRILLE, DEFROSTER

REMOVAL

REMOVAL

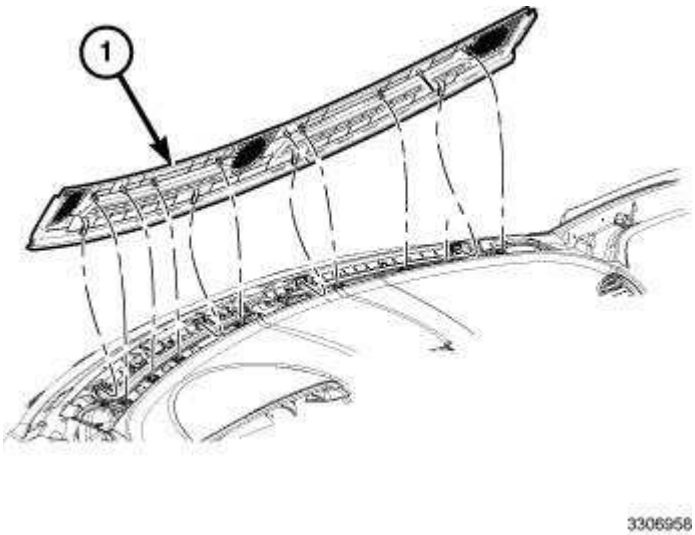

Fig. 300: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Remove the A-pillar trim panels.
3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, gently pry between the instrument panel top cover and the rearward edge of the defroster grille (1) to release the snap clip retainers that secure the defroster grille.
4. Pull the defroster grille (1) rearward and remove the defroster grille.

INSTALLATION

INSTALLATION

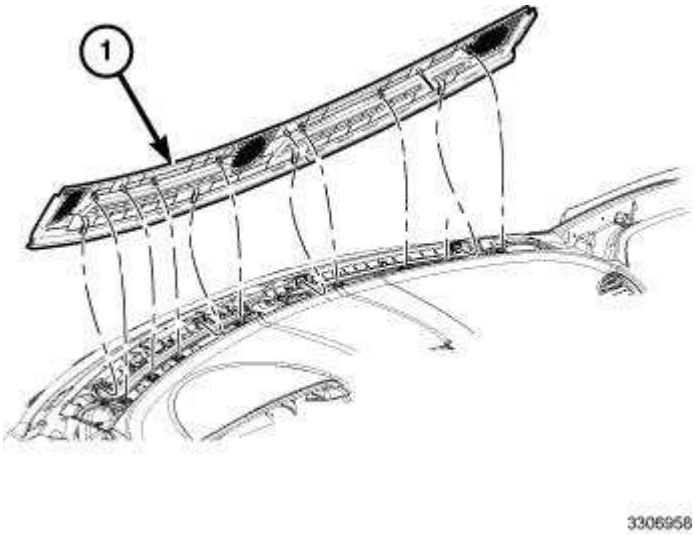

Fig. 301: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Align and position the front hooks of the defroster grille (1) onto the top of the instrument panel.
3. Carefully push the defroster grille (1) forward to fully seat the hooks into the instrument panel top cover.
4. Carefully push down on the defroster grille (1) to fully seat the snap clip retainers into the instrument panel top cover.
5. Install the A-pillar trim panels.

LATCH, GLOVE BOX DOOR

DESCRIPTION

DESCRIPTION

The glove box door latch is integrated into the glove box door. The glove box door latch is not a serviceable part. The glove box door key cylinder can be replaced. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL**& **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.

PANEL, INSTRUMENT

REMOVAL

REMOVAL

WARNING: To avoid personal injury or death, on vehicles equipped with air bags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid personal injury or death, never strike or drop the occupant restraint controller, as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

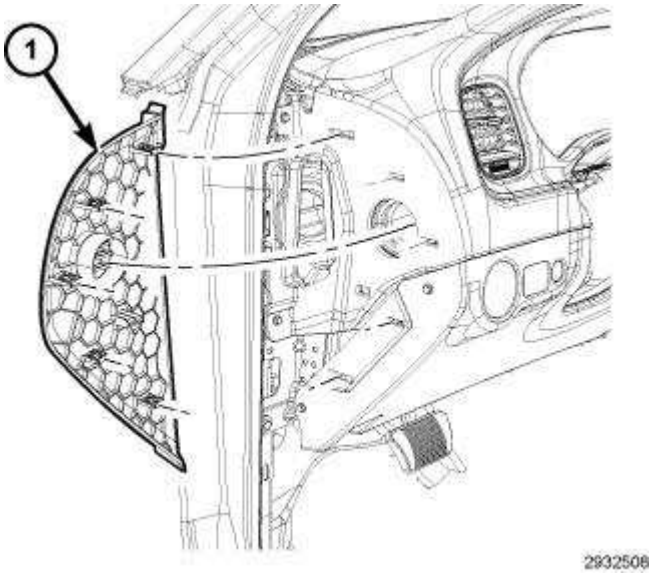

Fig. 302: End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Disconnect and isolate negative battery cable.
3. Using (special tool #C-4755, Trim Stick) or equivalent (1), gently pry between the end cap (1) and the instrument panel to release the snap retainers that secure the end cap. Repeat on opposite side.

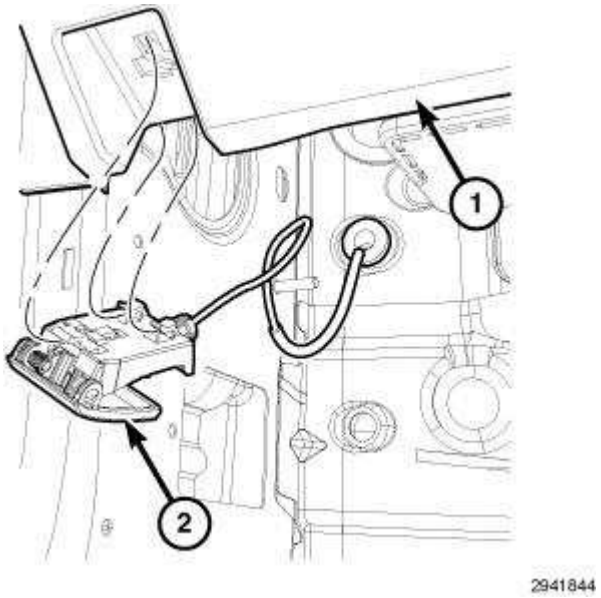

Fig. 303: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

4. Remove the hood release handle (2) from the knee blocker trim (1) by pushing down to disengage and then pulling rearward on the handle.

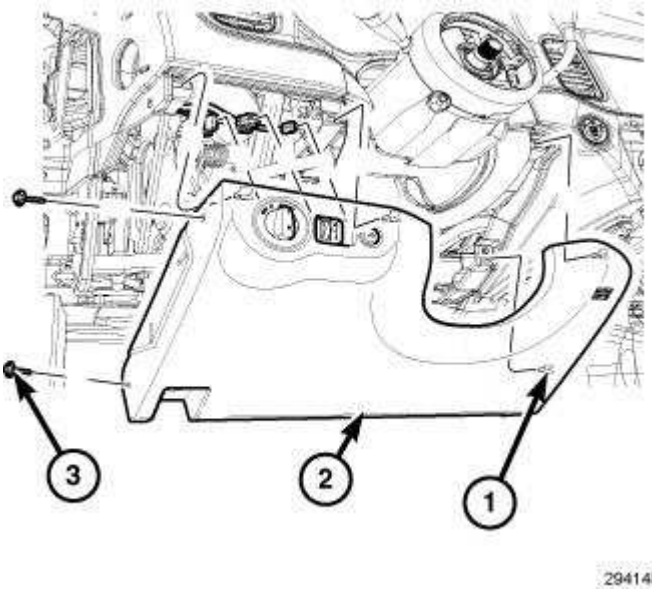

Fig. 304: Two Side Screws, Lower Screw & Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

NOTE: Steering wheel removed for clarity.

5. Remove the two side screws (3) and the lower screw (1) securing the knee blocker trim (2) to the instrument panel.
6. Using (special tool #C-4755, Trim Stick) or equivalent (1), partially remove the upper portion of

the knee blocker trim (2) by gently prying between the knee blocker trim (2) and the instrument panel to release the upper snap retainers.**Do not remove the knee blocker trim or pull with excessive force.**

7. Disconnect the in-car temperature sensor.

27. Remove the floor console. Refer to **CONSOLE, FLOOR, REMOVAL**.
28. Disconnect the occupant restraint module harnesses (1 & 2).

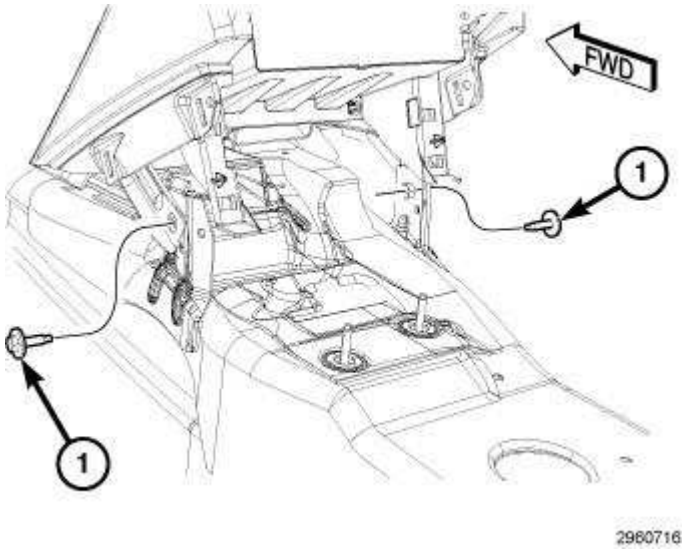

Fig. 319: Floor Pan Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Remove the lower I/P to floor pan bracket bolts (1).

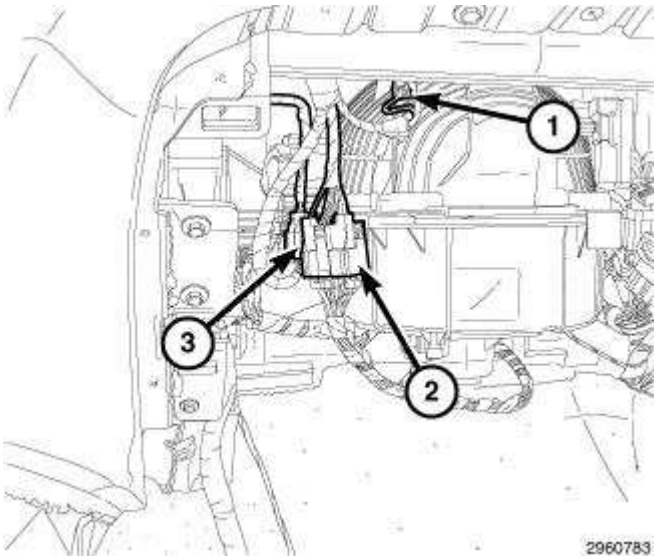

Fig. 320: HVAC And Antenna Harnesses
Courtesy of CHRYSLER GROUP, LLC

30. Disconnect the HVAC and antenna harnesses (1, 2, 3).

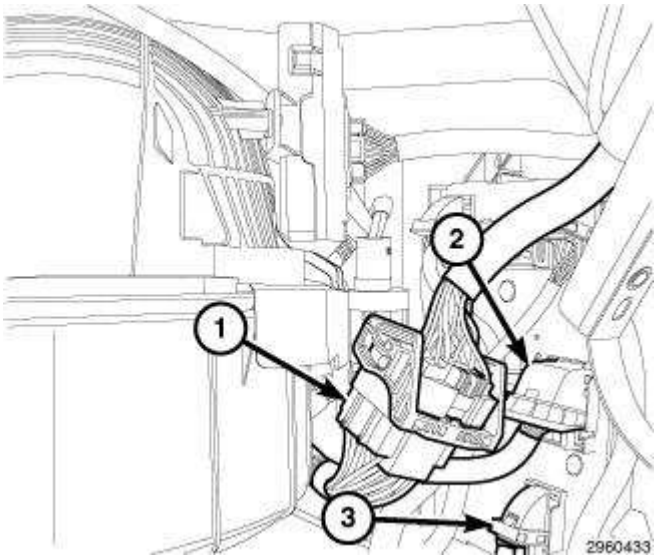

Fig. 321: Bulkhead Harness
Courtesy of CHRYSLER GROUP, LLC

31. Disconnect the bulkhead harness (1) on the right hand side of the vehicle.
32. Disconnect the harnesses (2 & 3) from the vehicle control module.

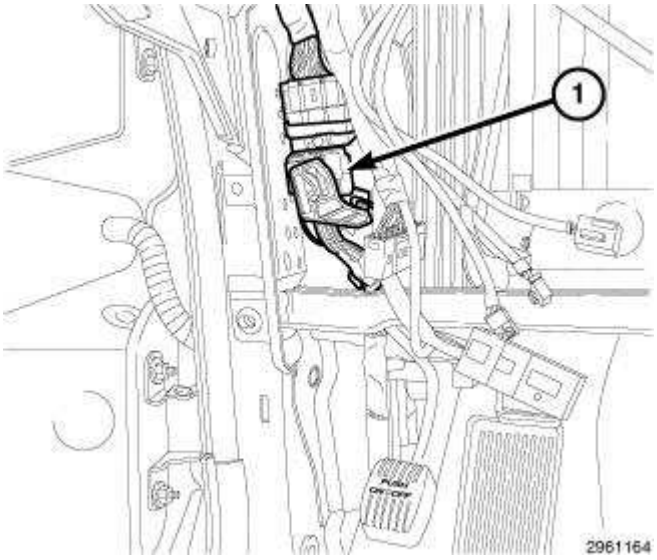

Fig. 322: Bulkhead Harness
Courtesy of CHRYSLER GROUP, LLC

33. Disconnect the bulkhead harness (1) on the left hand side of the vehicle.

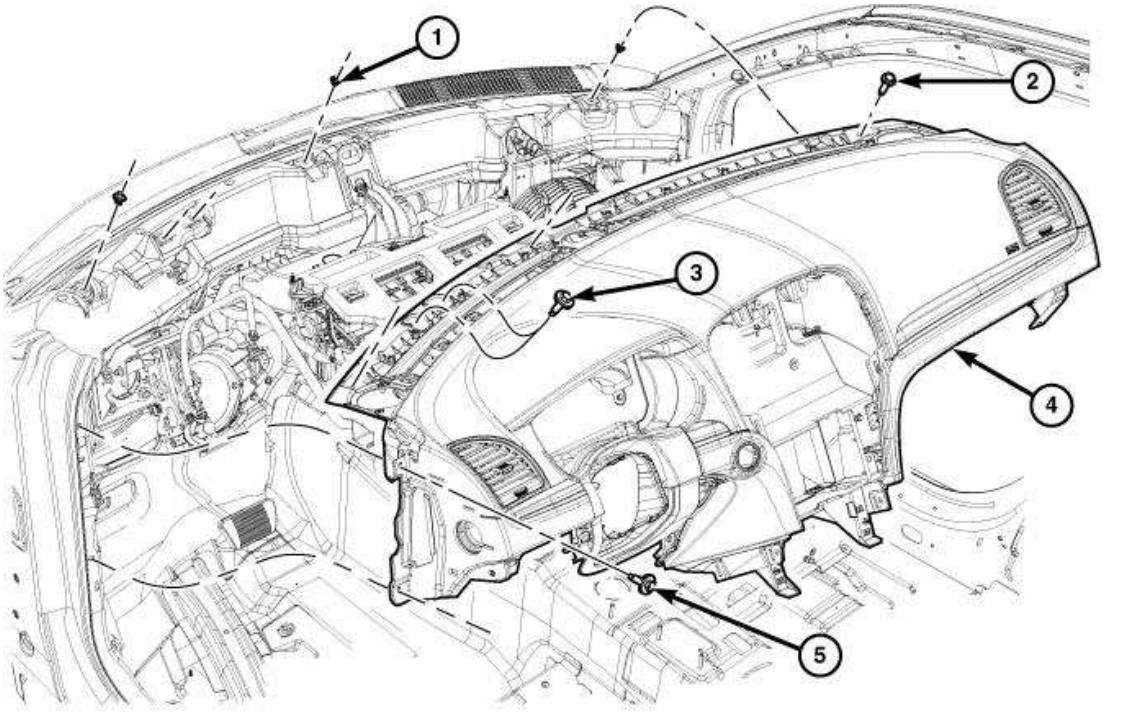

Fig. 323: Instrument Panel
Courtesy of CHRYSLER GROUP, LLC

34. Remove the five upper bolts (2, 3).
35. Remove the three side bolts (5), repeat for the opposite side.
36. With the help of an assistant, remove the instrument panel by lifting up and out.
37. If required, remove the spring nuts (1) from the dash panel.

INSTALLATION

INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with air bags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid personal injury or death, never strike or drop the occupant restraint controller, as it can damage the impact sensor or affect its

calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

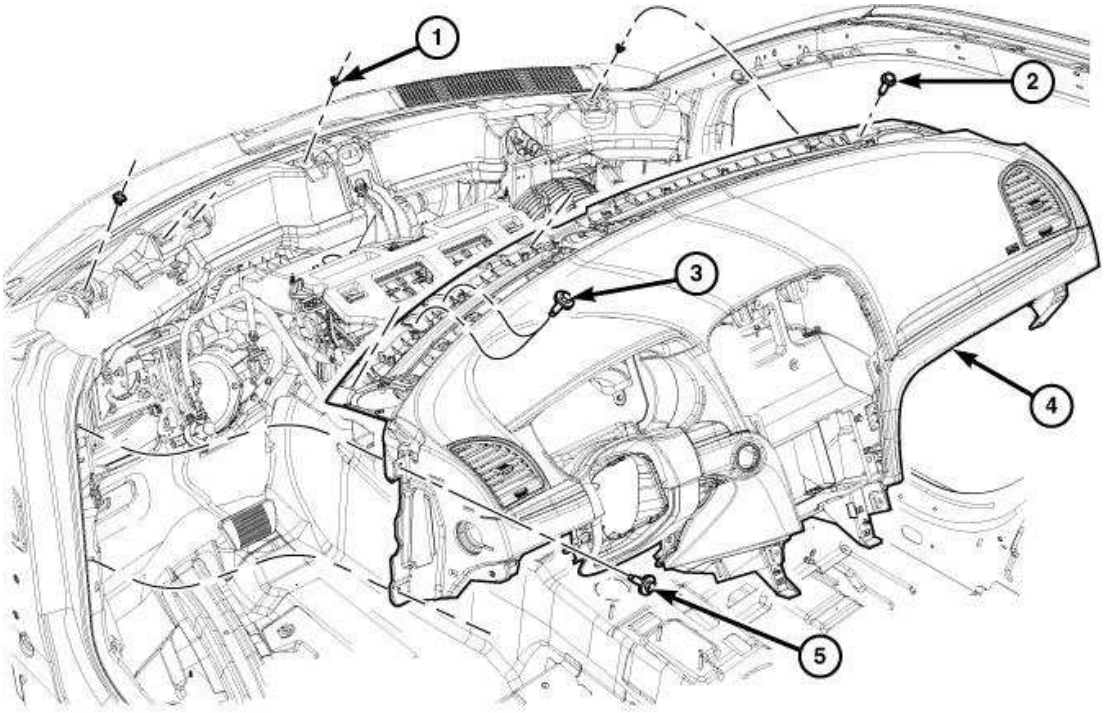

Fig. 324: Instrument Panel
Courtesy of CHRYSLER GROUP, LLC

1. If required, install new spring nuts (1) into the dash panel.
2. With the help of an assistant, install the instrument panel (4). **Make sure the instrument panel (4) hooks are properly seated into their openings.** .
3. Install the three side bolts (5), tighten the bolts to 16 N-m (12 ft. lbs.), repeat for the opposite side.

4. Install the five upper bolts (2, 3), tighten the bolts to 21 N-m (15 ft. lbs.)

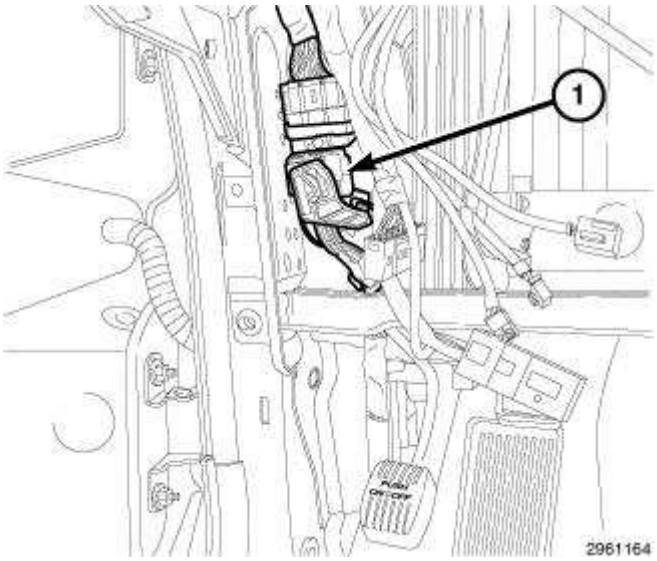

Fig. 325: Bulkhead Harness
Courtesy of CHRYSLER GROUP, LLC

5. Connect the bulkhead harness (1) to the vehicle harness on the left hand side of the vehicle.

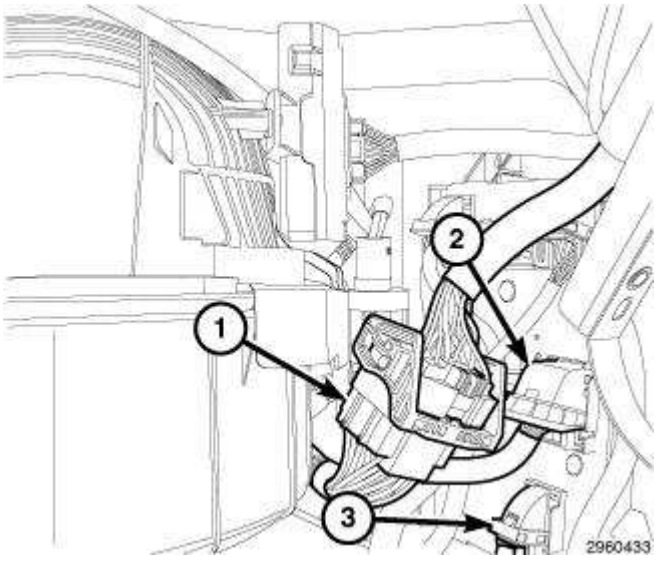

Fig. 326: Bulkhead Harness
Courtesy of CHRYSLER GROUP, LLC

6. Connect the harnesses (2 & 3) to the vehicle control module.
7. Connect the bulkhead harness (1) to the vehicle harness on the right hand side of the vehicle.

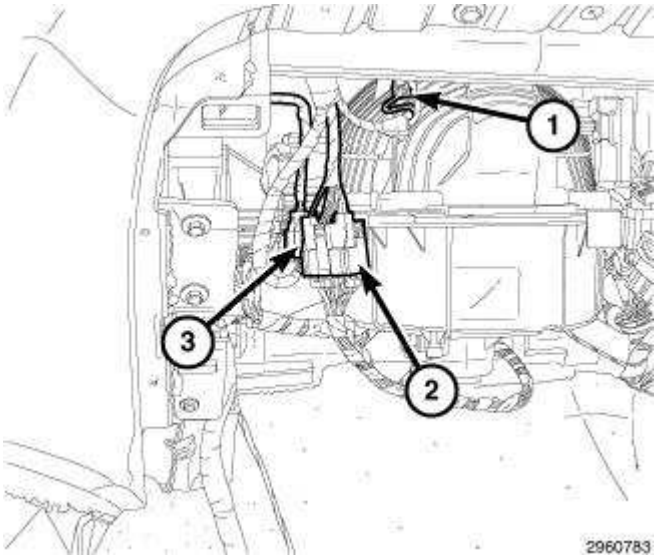

Fig. 327: HVAC And Antenna Harnesses
Courtesy of CHRYSLER GROUP, LLC

8. Connect the antenna and HVAC harnesses (1, 2, 3).

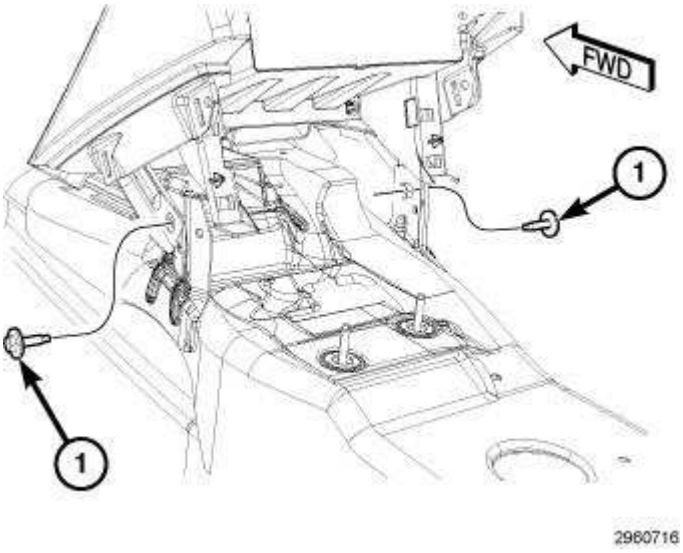

Fig. 328: Floor Pan Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the lower I/P to floor pan bracket bolts (1), tighten the bolts to 16 N-m (12 ft. lbs.).

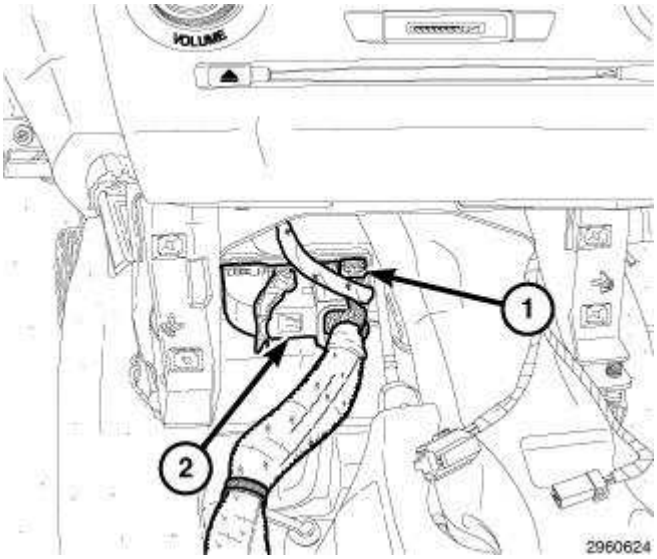

Fig. 329: Occupant Restraint Module Harnesses
Courtesy of CHRYSLER GROUP, LLC

10. Connect the occupant restraint module harnesses (1 & 2).
11. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.

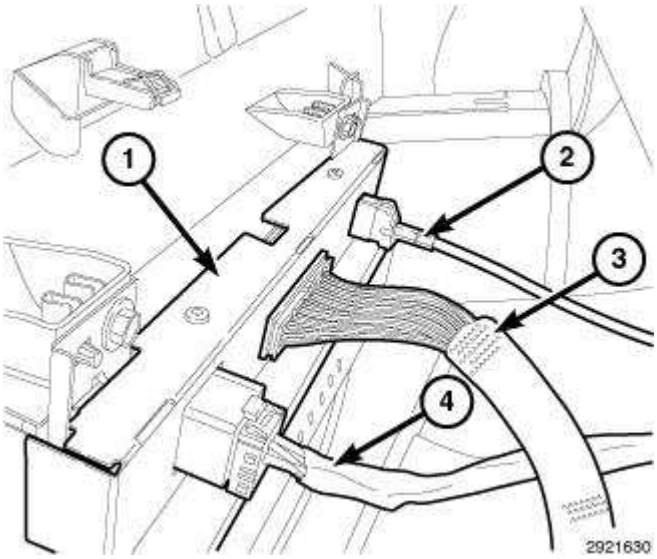

Fig. 330: Harness Connectors & Display Screen
Courtesy of CHRYSLER GROUP, LLC

12. Install the instrument cluster from the vehicle. Refer to **INSTALLATION** .
13. Position the instrument cluster bezel near it's opening in the I/P and connect the harness connectors (2, 3 & 4) to the rear of the display screen (1).

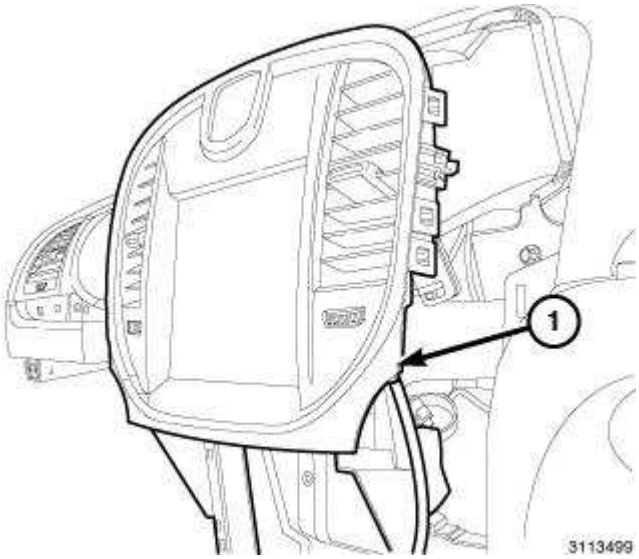

Fig. 331: Instrument Cluster Bezel Retainer
Courtesy of CHRYSLER GROUP, LLC

14. Install the center bezel (1) onto the instrument panel (2) and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers into the instrument panel.
15. Install the instrument cluster bezel to the vehicle.

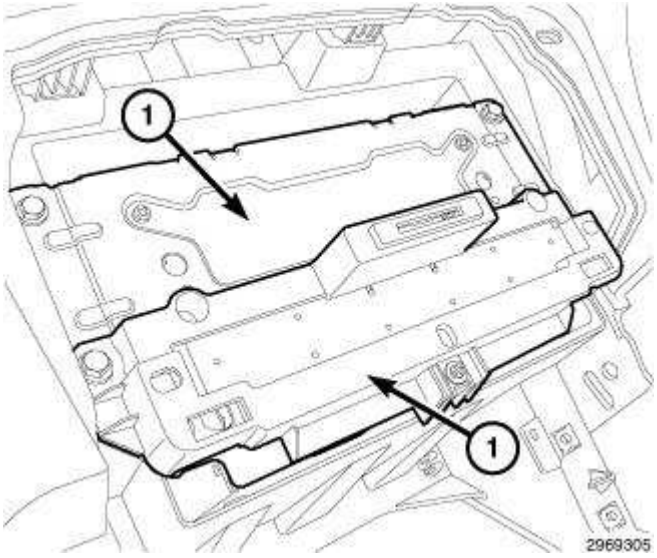

Fig. 332: Telematics Gateway Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: The telematics gateway mounting fasteners also secure the bottom portion of the center trim bezel.

16. Connect and install the telematics gateway assembly (1). Refer to **MODULE, TELEMATICS GATEWAY, INSTALLATION** .

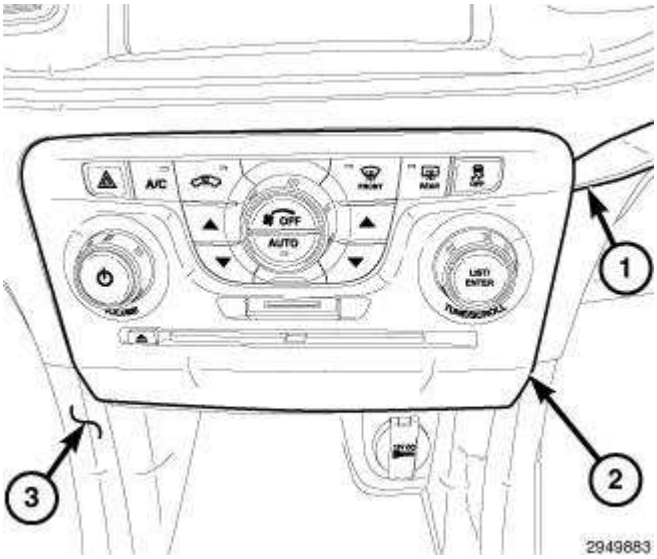

Fig. 333: Switch Bank
Courtesy of CHRYSLER GROUP, LLC

17. Connect and install the AC/heater control faceplate (2) to the I/P. Refer to **POD, SWITCH BANK, INSTALLATION** .

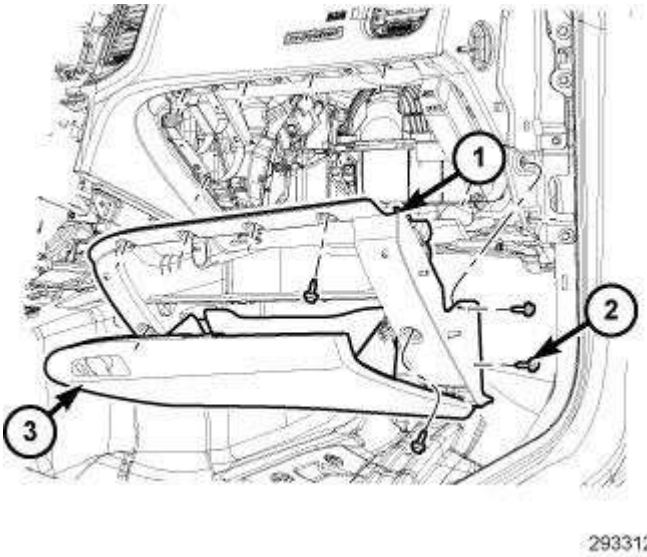

Fig. 334: Ground Eyelet, Two Side Screws & Glove Box Compartment
Courtesy of CHRYSLER GROUP, LLC

18. Connect the wiring harness and position the glove box compartment (1) into the I/P.
19. Install the six screws to the glove box compartment (1). Tighten the screws to 30 in-lbs.
20. Install the two side screws (2) securing the glove box compartment (1) to the I/P. Tighten the screws to 30 in-lbs.
21. Install the glove box door (3).

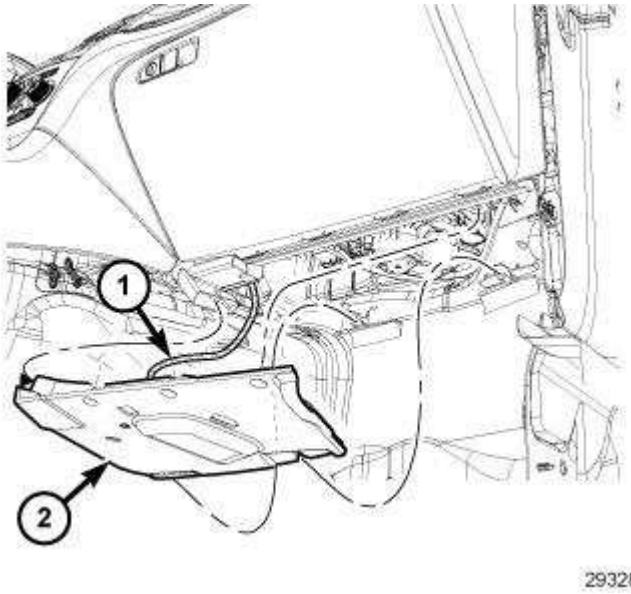

Fig. 335: Right Side Instrument Panel Silencer & LED Harness
Courtesy of CHRYSLER GROUP, LLC

22. Connect the LED harness (1) and install the right side instrument panel silencer (2).

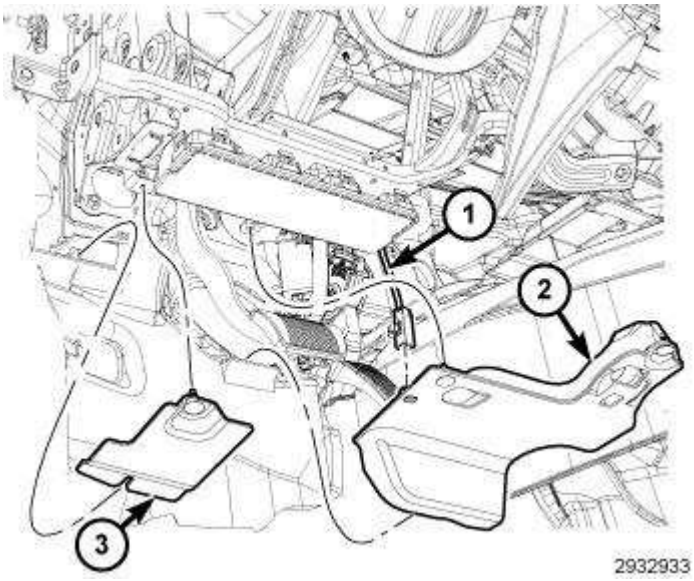

Fig. 336: LED Harness & Left Side Instrument Panel Silencers
Courtesy of CHRYSLER GROUP, LLC

23. Connect the LED harness (1) and install the left side instrument panel silencers (2, 3).

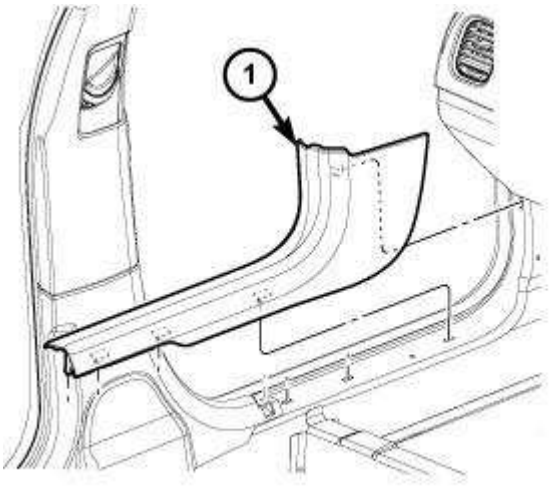

Fig. 337: Door Scuff Plate
Courtesy of CHRYSLER GROUP, LLC

24. Install the door scuff plate (1).
25. Install the lower portion of the door weatherstrip.

NOTE: Repeat steps 22-23 on the opposite side.

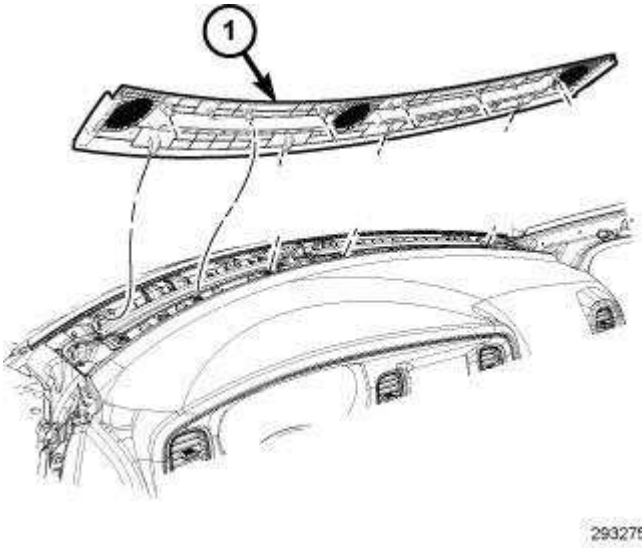

Fig. 338: Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

26. Position the defroster grille (1) to the instrument panel and press firmly to engage the snap retainers that secure the defroster grille.

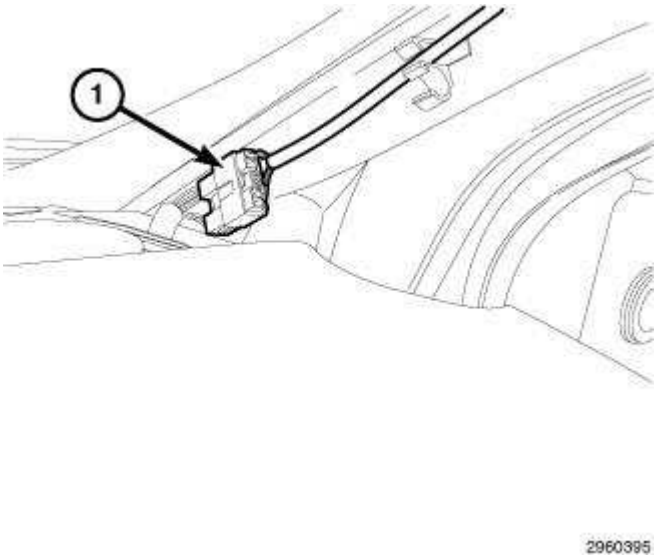

Fig. 339: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

27. Connect the wire harness connector (1) located on the A-pillar, repeat on opposite side.

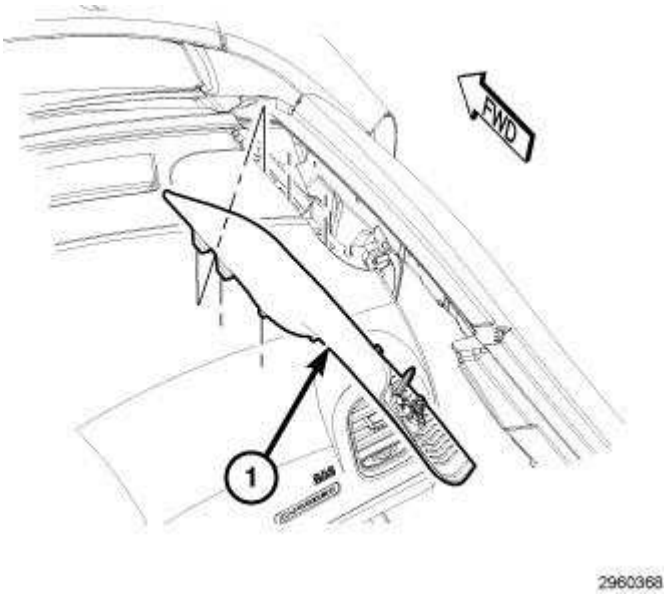

Fig. 340: A-Pillar Trim Panels
Courtesy of CHRYSLER GROUP, LLC

28. Install the A-pillar trim panels. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.

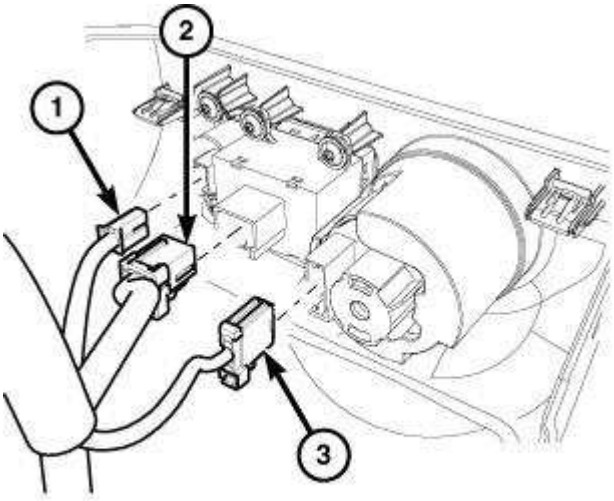

Fig. 341: Light Switch Harnesses
Courtesy of CHRYSLER GROUP, LLC

29. Install the steering column assembly. Refer to **COLUMN, INSTALLATION** .
30. Connect the light switch harnesses (1, 2 & 3) to the switch located on the knee blocker trim.

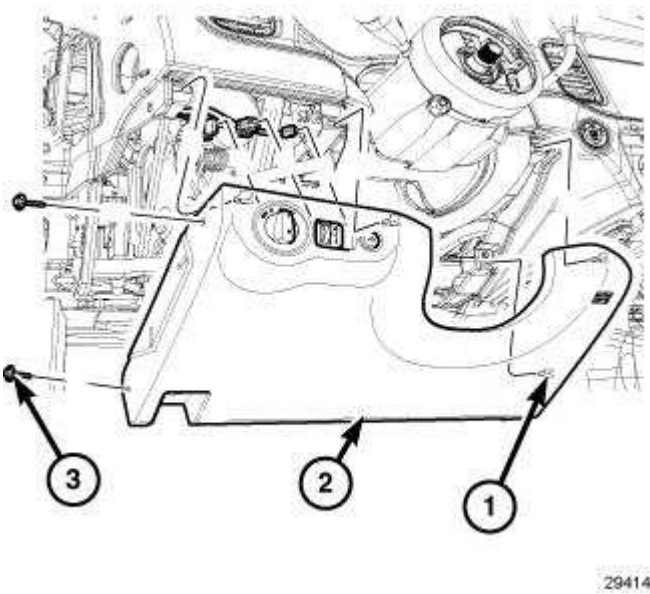

Fig. 342: Two Side Screws, Lower Screw & Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

NOTE: Steering wheel removed for clarity.

31. Connect the in-car temperature sensor.
32. Install the upper portion of the knee blocker trim (2) by pushing on the knee blocker trim (2) to engage the upper snap retainers.

33. Install the two side screws (3) and the lower screw (1) securing the knee blocker trim (2) to the instrument panel. Tighten the screws to 30 in-lbs.

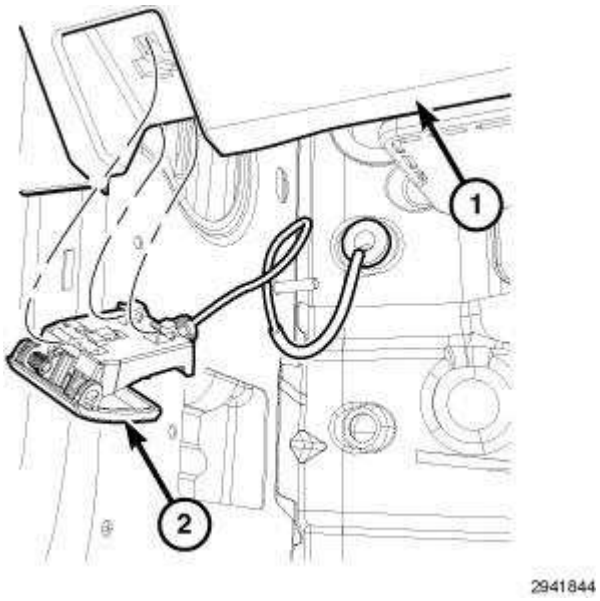

Fig. 343: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

34. Install the hood release handle (2) to the knee blocker trim by aligning and pushing up.

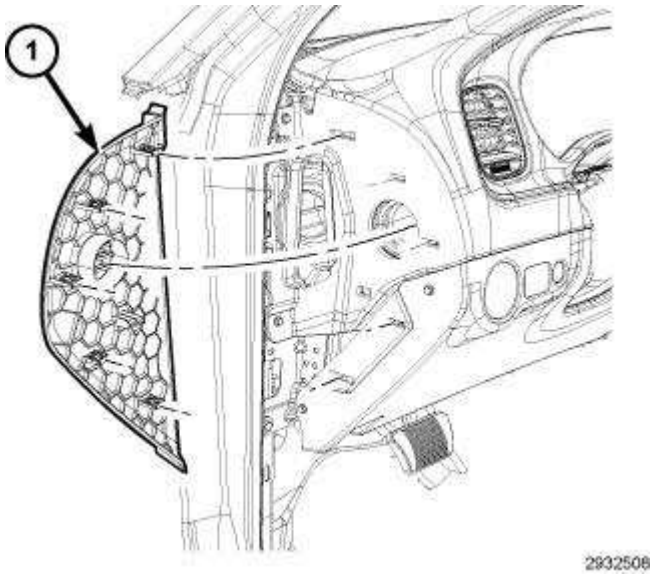

Fig. 344: End Cap
Courtesy of CHRYSLER GROUP, LLC

35. Install the end cap (1) to the instrument panel and engage the snap retainers that secure the end cap. Repeat on opposite side.
36. Connect the negative battery cable.

37. Perform the supplemental restraint system verification test. Refer to **STANDARD PROCEDURE** .

PANEL, SILENCER

REMOVAL

REMOVAL

DRIVER SIDE

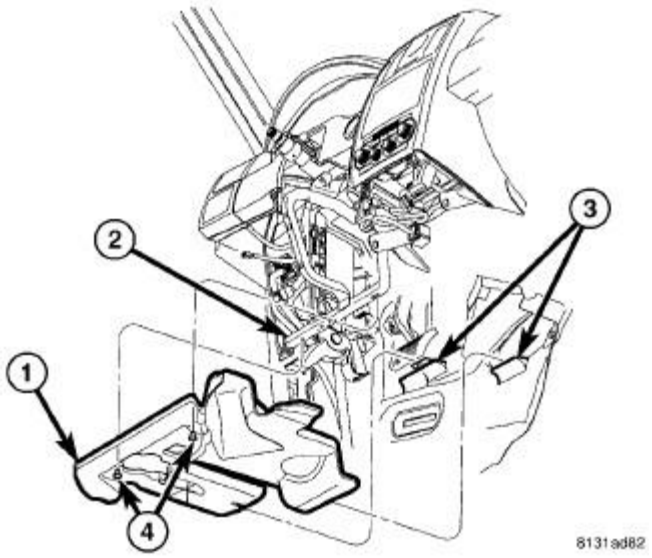

Fig. 345: Left Instrument Panel Closeout Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the push-pins (4) that secure the instrument panel silencer (1) to the instrument panel bracket (2).
2. Pull the instrument panel silencer rearward to disengage it from the brackets (3) located near the dash panel.
3. Remove the instrument panel silencer from the vehicle.

PASSENGER SIDE

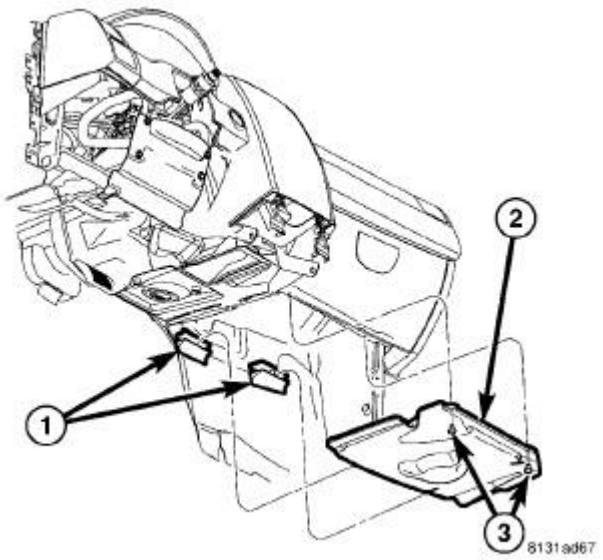

Fig. 346: Right Instrument Panel Closeout Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the push-pins (3) that secure the instrument panel silencer (2) to the instrument panel.
2. Pull the instrument panel silencer rearward to disengage it from the brackets (1) located near the dash panel.
3. Remove the instrument panel silencer from the vehicle.

INSTALLATION

INSTALLATION

DRIVER SIDE

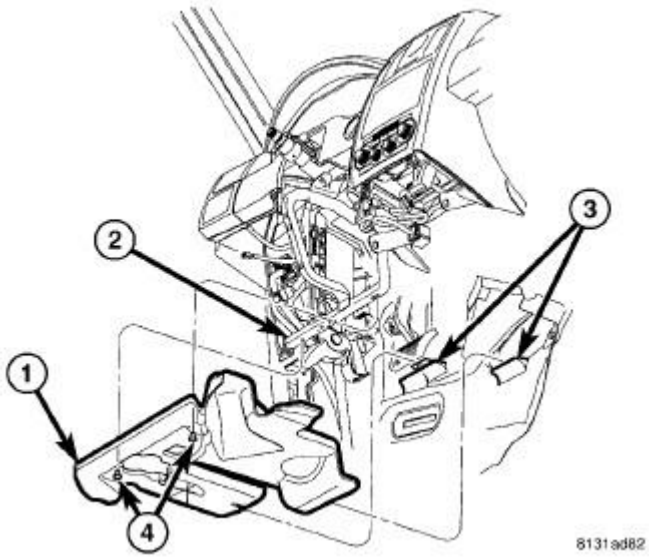

Fig. 347: Left Instrument Panel Closeout Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the instrument panel silencer (1) into the vehicle.
2. Install the instrument panel silencer above the brackets (3) located near the dash panel.
3. Install the push-pins (4) that secure the instrument panel silencer to the instrument panel bracket (2).

PASSENGER SIDE

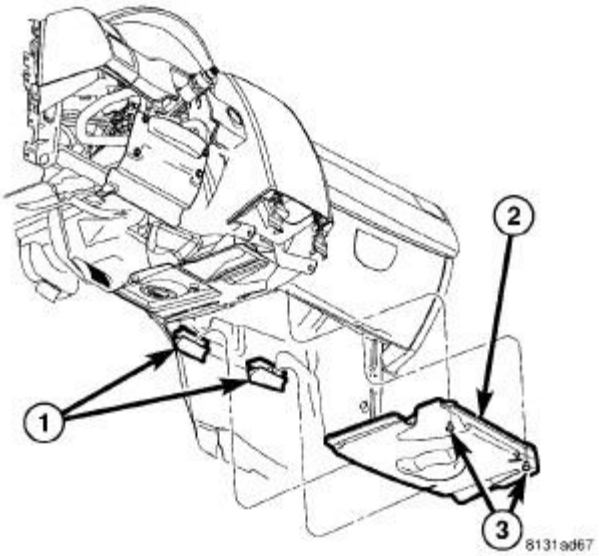

Fig. 348: Right Instrument Panel Closeout Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the instrument panel silencer (2) into the vehicle.
2. Install the instrument panel silencer above the brackets (1) located near the dash panel.
3. Install the push-pins (3) that secure the instrument panel silencer to the instrument panel.

STRIKER, GLOVE BOX DOOR LATCH

REMOVAL

REMOVAL

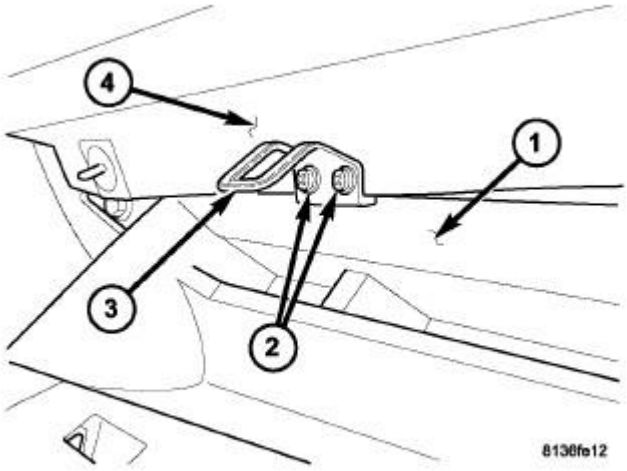

Fig. 349: Striker-Latch-Glove Box R And I
Courtesy of CHRYSLER GROUP, LLC

1. Open the glove box door (1).
2. Remove the two screws (2) that secure the glove box latch striker (3) to the instrument panel (4).
3. Remove the glove box latch striker from the instrument panel.

INSTALLATION

INSTALLATION

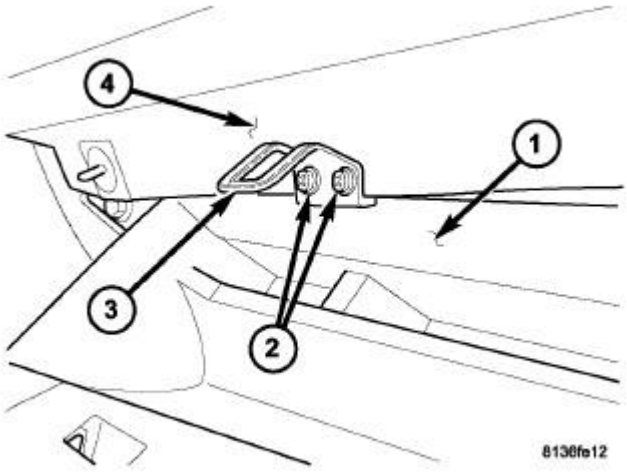

Fig. 350: Striker-Latch-Glove Box R And I
Courtesy of CHRYSLER GROUP, LLC

1. Position the glove box latch striker (3) onto the instrument panel (4).
2. Install the two screws (2) that secure the glove box latch striker onto the instrument panel. Tighten the screws securely.
3. Close glove box door (1).

INTERIOR

CARPET

REMOVAL

FRONT

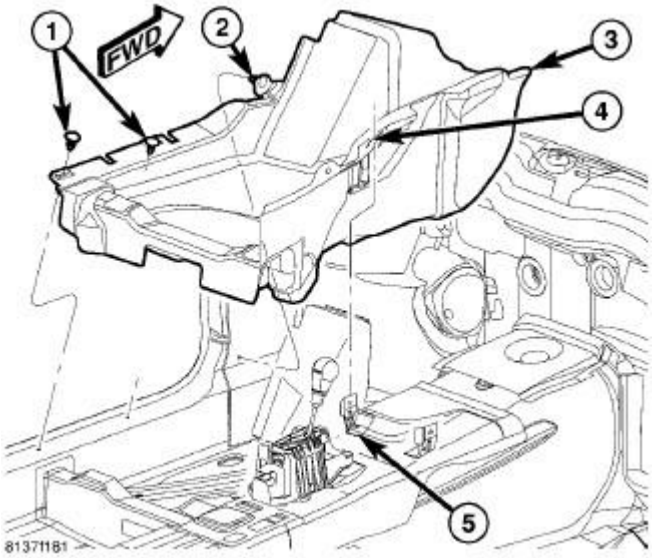

Fig. 351: Close And Lock Tonneau Cover (Close Top) Operation Chart
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front carpet consists of two individual carpets, one for the driver side and one for the passenger side. These carpets can be removed from and installed into the vehicle individually.

1. Remove the driver and/or passenger front seat from the vehicle as appropriate. Refer to **SEAT, FRONT, REMOVAL**.
2. Remove the center console from the front floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, REMOVAL**.
3. Remove the trim from the driver or passenger side lower cowl side inner panel as appropriate. Refer to **PANEL, COWL TRIM, REMOVAL**.
4. Remove the two push-pin fasteners (1) that secure the outboard edge of the front carpet (3) to the front door opening sill.

5. On the driver side only, remove the push-pin fastener (2) that secures the front carpet to the cowl side inner panel above the foot rest.

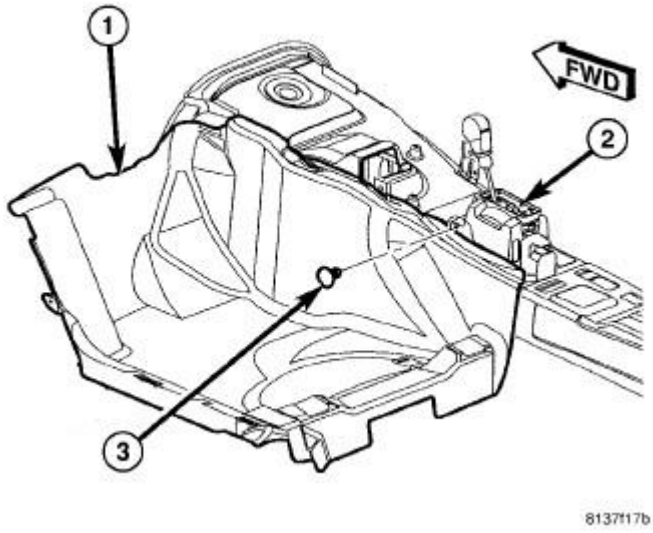

Fig. 352: Inboard Edge Of Front Carpet To Transmission Shifter Bracket
Courtesy of CHRYSLER GROUP, LLC

6. On the driver side only, remove the push-pin fastener (3) that secures the inboard edge of the front carpet (1) to the transmission shifter bracket (2).
7. Remove the front carpet from the floor panel.

REAR

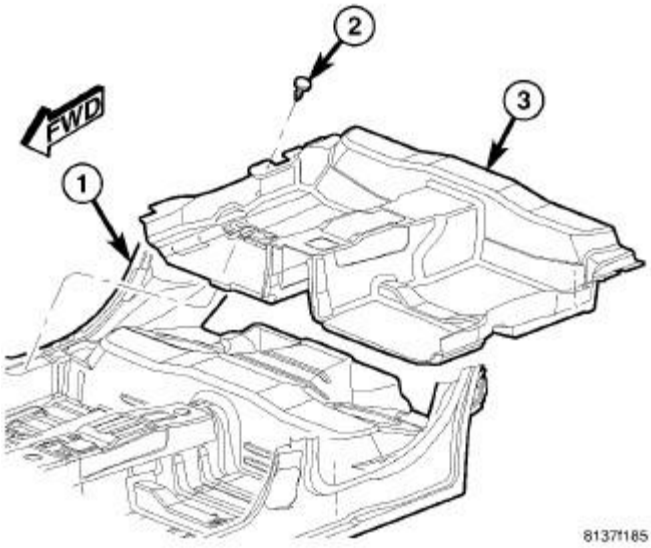

Fig. 353: Rear Carpet

Courtesy of CHRYSLER GROUP, LLC

1. Remove the driver and passenger front seats from the vehicle. Refer to **SEAT, FRONT, REMOVAL**.
2. Remove the center console from the front floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, REMOVAL**.
3. Remove the trim from the inside of both lower B-pillars. Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
4. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** & **COVER, SEAT CUSHION, SECOND ROW, REMOVAL**.
5. Remove the scuff plate from both rear door sills. Refer to **PLATE, SCUFF, REAR DOOR SILL, REMOVAL**.
6. Remove the push-pin fasteners (2) that secure the outboard edges of the rear carpet (3) near the front of each rear door opening (1) sill.
7. Lift the rear carpet from the floor panel far enough to extract the body wire harness take outs and connectors through the appropriate slits in the carpeting.
8. Remove the rear carpet from the vehicle through one of the rear door openings.

TRUNK - SEDAN

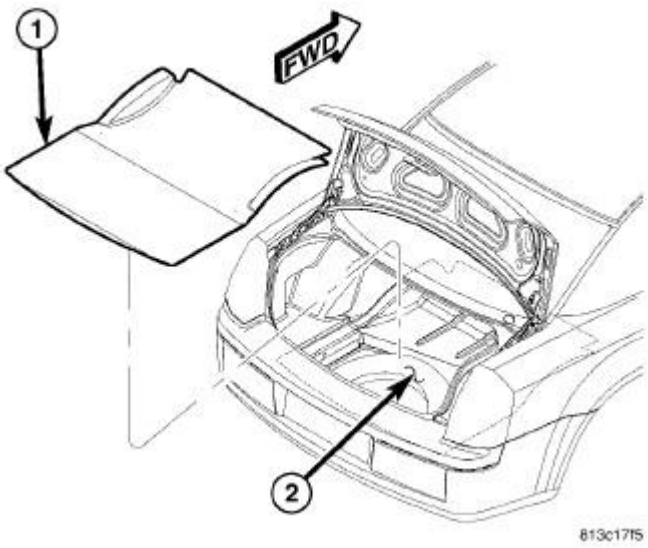

Fig. 354: Spare Tire Cover/Trunk Floor Carpet
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, remove the cargo liner and/or cargo net from the luggage compartment.
2. Fold and remove the spare tire cover/trunk floor carpet (1) from over the spare tire well (2).

INSTALLATION

FRONT

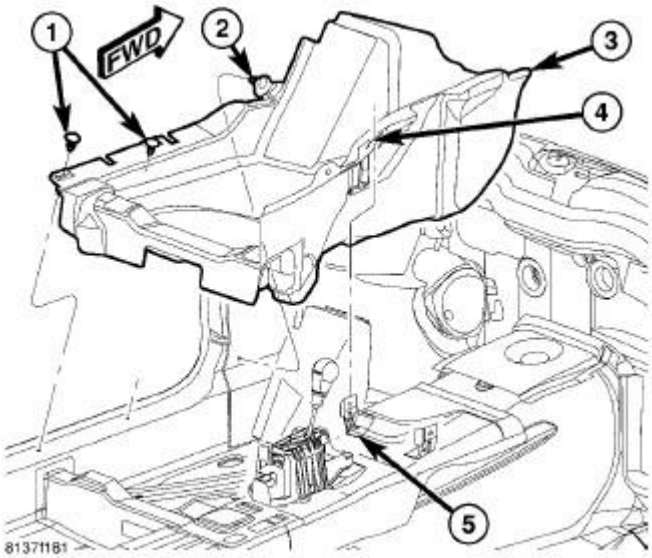

Fig. 355: Close And Lock Tonneau Cover (Close Top) Operation Chart
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front carpet consists of two individual carpets, one for the driver side and one for the passenger side. These carpets can be removed from and installed into the vehicle individually.

1. Position and fit the front carpet (3) onto the floor panel. Be certain that the rear of the front carpet is fitted over the floor panel front crossmember and butts up against the front of the rear carpet without interference with the rear floor air duct opening. Be certain that the front of the front carpet is fitted to the dash panel without interference with the steering column, the accelerator or the heater and air conditioner unit. On the driver side only, be certain the slit (4) on the inboard edge of the carpet is engaged around the left instrument panel support bracket (5) on the top of the floor panel transmission tunnel.
2. Install the two push-pin fasteners (1) that secure the outboard edge of the front carpet to the front door opening sill.
3. On the driver side only, install the push-pin fastener (2) that secures the front carpet to the cowl side inner panel above the foot rest.

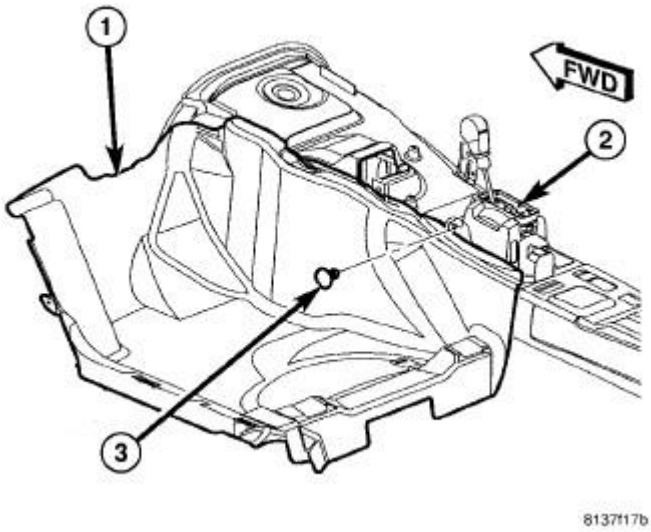

Fig. 356: Inboard Edge Of Front Carpet To Transmission Shifter Bracket
Courtesy of CHRYSLER GROUP, LLC

4. On the driver side only, install the push-pin fastener (3) that secures the inboard edge of the front carpet (1) to the transmission shifter bracket (2).
5. Reinstall the trim onto the driver or passenger side lower cowl side inner panel as appropriate. Refer to **PANEL, COWL TRIM, INSTALLATION**.
6. Reinstall the center console onto the front floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION**.
7. Reinstall the driver and/or passenger front seat into the vehicle as appropriate. Refer to **SEAT, FRONT, INSTALLATION**.

REAR

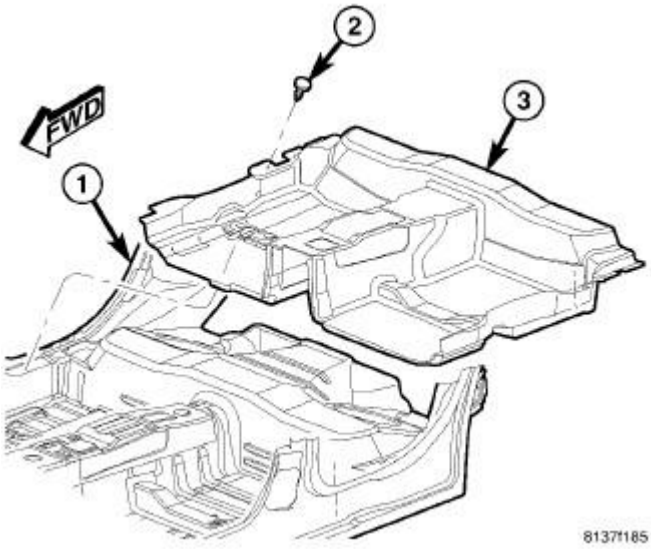

Fig. 357: Rear Carpet
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear carpet (3) into the vehicle through one of the rear door openings.
2. Pull the body wire harness take outs and connectors through the appropriate slits in the rear carpet.
3. Fit the rear carpet to the floor panel. Be certain to align the holes in the carpet with the corresponding holes in the floor panel. Be certain that the rear edge of the carpet is fitted over the rear seat kick-up area and over the rear seat cushion cups on the top of the kick-up area. Be certain that the front edge of the carpet is fitted over the front seat rear crossmember and butts up against the rear of the front seat front crossmember.
4. Install the push-pin fasteners (2) that secure the outboard edges of the rear carpet near the front of each rear door opening (1) sill.
5. Reinstall the scuff plate onto both rear door sills. Refer to **PLATE, SCUFF, REAR DOOR SILL, INSTALLATION**.
6. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** & **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION**.
7. Reinstall the trim onto the inside of both lower B-pillars. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.
8. Reinstall the center console onto the front floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION**.
9. Reinstall the driver and passenger front seats into the vehicle. Refer to **SEAT, FRONT, INSTALLATION**.

TRUNK - SEDAN

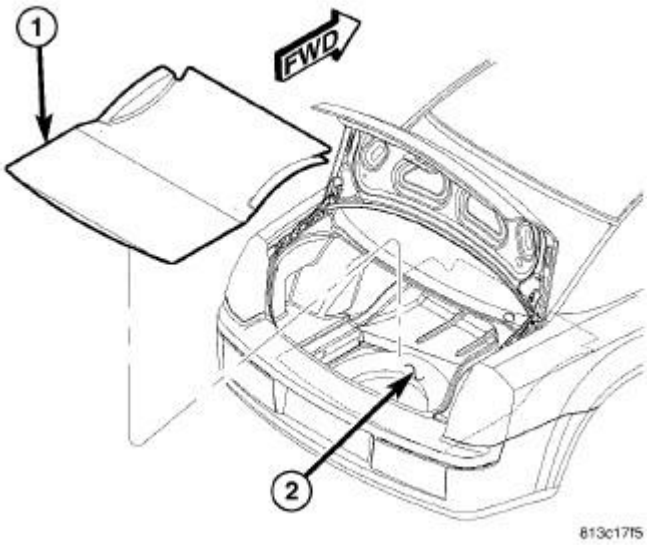

Fig. 358: Spare Tire Cover/Trunk Floor Carpet
Courtesy of CHRYSLER GROUP, LLC

1. Fold the spare tire cover/trunk floor carpet (1) and place it within the luggage compartment.
2. Unfold, position and fit the spare tire cover/trunk floor carpet over the spare tire well (2) in the luggage compartment.
3. If equipped, reinstall the cargo liner and/or cargo net into the luggage compartment.

CONSOLE, FLOOR

REMOVAL

REMOVAL

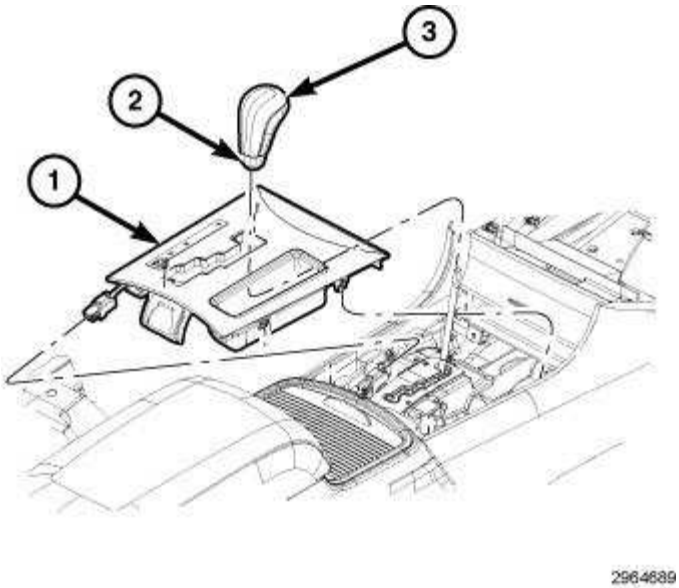

Fig. 359: Shifter Knob, Retaining Ring & Shifter Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Apply the parking brake.
2. Turn the ignition switch to the On position, apply the service brakes and place the gear selector lever into the Neutral position.
3. Turn the ignition switch to the Off position and release the service brakes.

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, calibration of this feature is required whenever power to the door module is disrupted.**

A battery reconnect procedure must be performed anytime the battery has been disconnected.

4. Disconnect and isolate the battery negative cable.
5. Using a thin wire type tool, locate and press the release while pulling up on the shifter knob (3).
6. Remove the shifter knob (3). Refer to **KNOB, GEARSHIFT, REMOVAL** & **SHIFTER, TRANSMISSION, REMOVAL** .
7. Using (special tool #C-4755, Trim Stick) or equivalent, gently pry between the shifter bezel (1) and the floor console to release the snap retainers that secure the bezel.**Do not pull with excessive force or fully remove at this time.**
8. Disconnect the shifter bezel wiring harness and remove the shifter bezel (1).

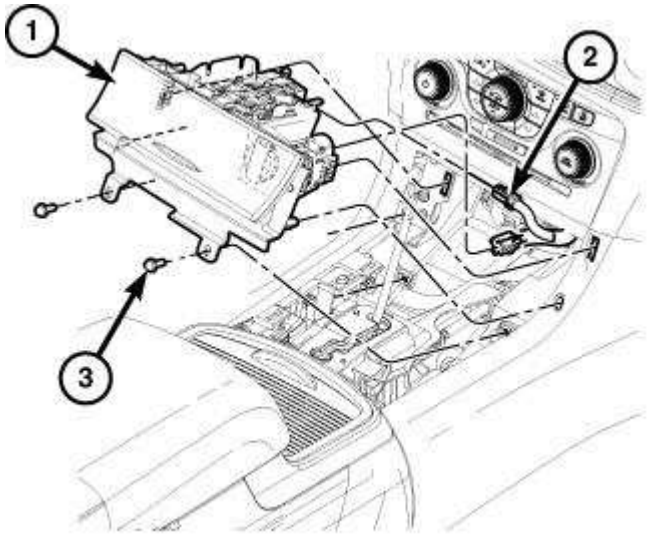

Fig. 360: Two Screws, Storage Bin & LED/Lamp Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

9. Remove the two screws (3) securing the storage bin (1) to the front console.
10. Using (special tool #C-4755, Trim Stick) or equivalent, gently pry between the storage bin (1)

and the floor console side close out panel to release the two snap retainers that secure the storage bin (1) to the front console and close out panel.

11. Disconnect the 12V power outlet wiring harness from the rear of the storage bin (1).
12. Disconnect the LED/Lamp wiring harness (2) from the rear of the storage bin (1) and remove the storage bin from the I/P.

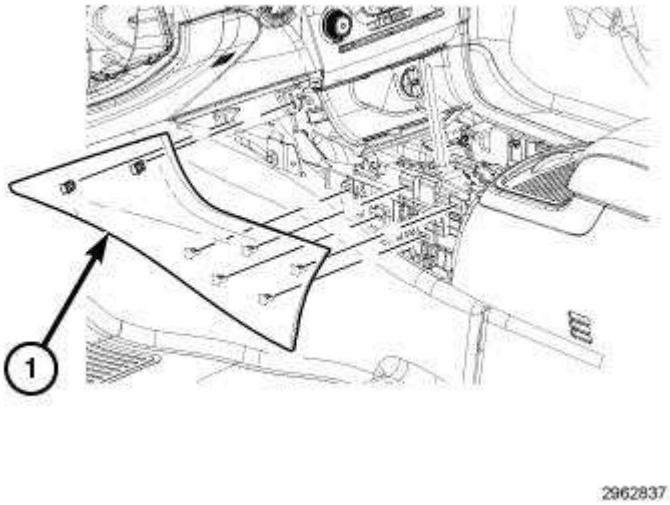

Fig. 361: Side Close Out Panel
Courtesy of CHRYSLER GROUP, LLC

13. Using (special tool #C-4755, Trim Stick) or equivalent, gently pry between the instrument panel and the floor console side close out panel (1) to release the two snap retainers that secure the close out panel to the instrument panel.
14. Using (special tool #C-4755, Trim Stick) or equivalent, gently pry between the floor console side close out panel (1) and the floor console to release the five snap retainers that secure the close out panel to the floor console.

NOTE: Repeat steps 14-15 for the opposite side.

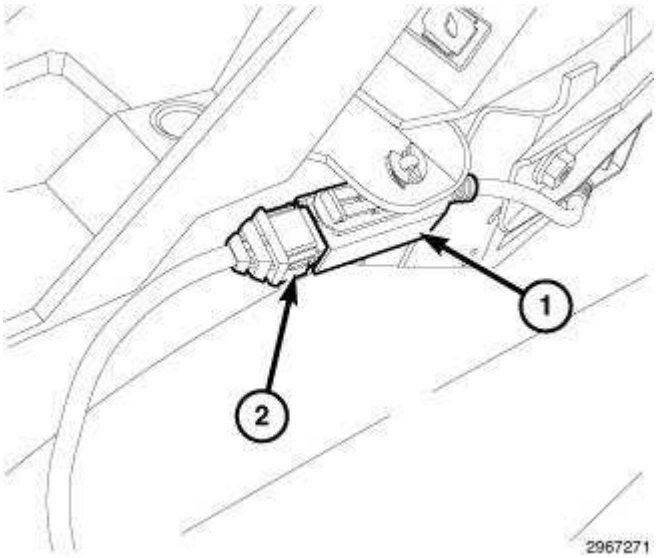

Fig. 362: USB Jumper Harness
Courtesy of CHRYSLER GROUP, LLC

15. If equipped, disconnect USB jumper harness (2).
16. Remove the connector (1) from the floor console tab by disengaging the retaining tab on the connector and sliding forward.

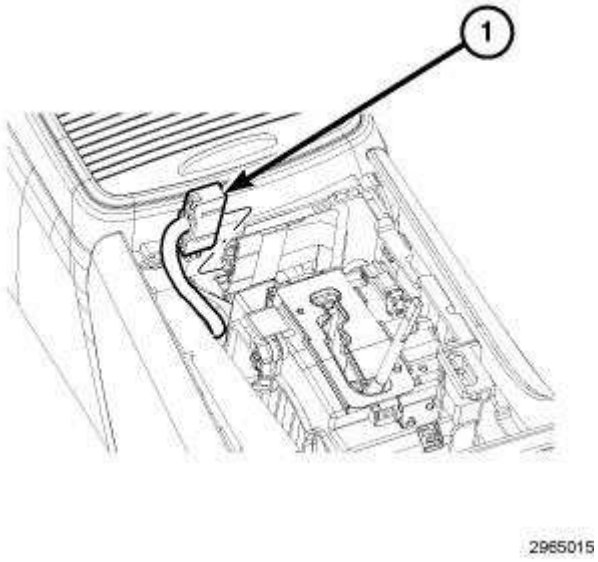

Fig. 363: Power Outlet Harness
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the console storage bin's power outlet harness (1).

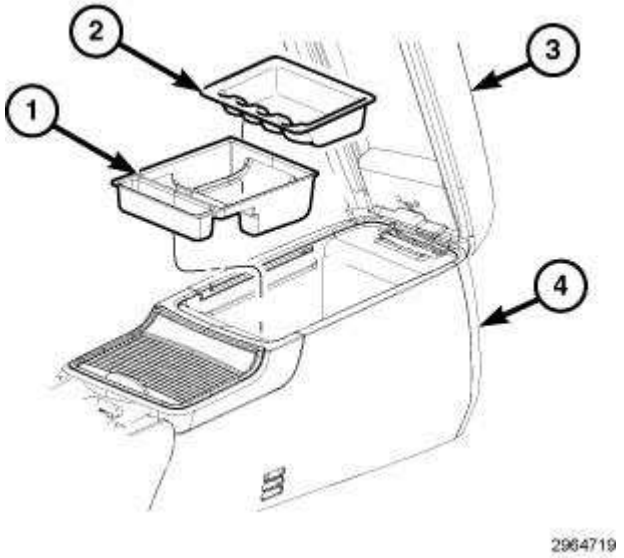

Fig. 364: Lid & Bins
Courtesy of CHRYSLER GROUP, LLC

18. Open the lid (3) of the console rear bin (4) and remove the coin holder bin (2).
19. Remove the mat bin (1) from the console rear bin (4).

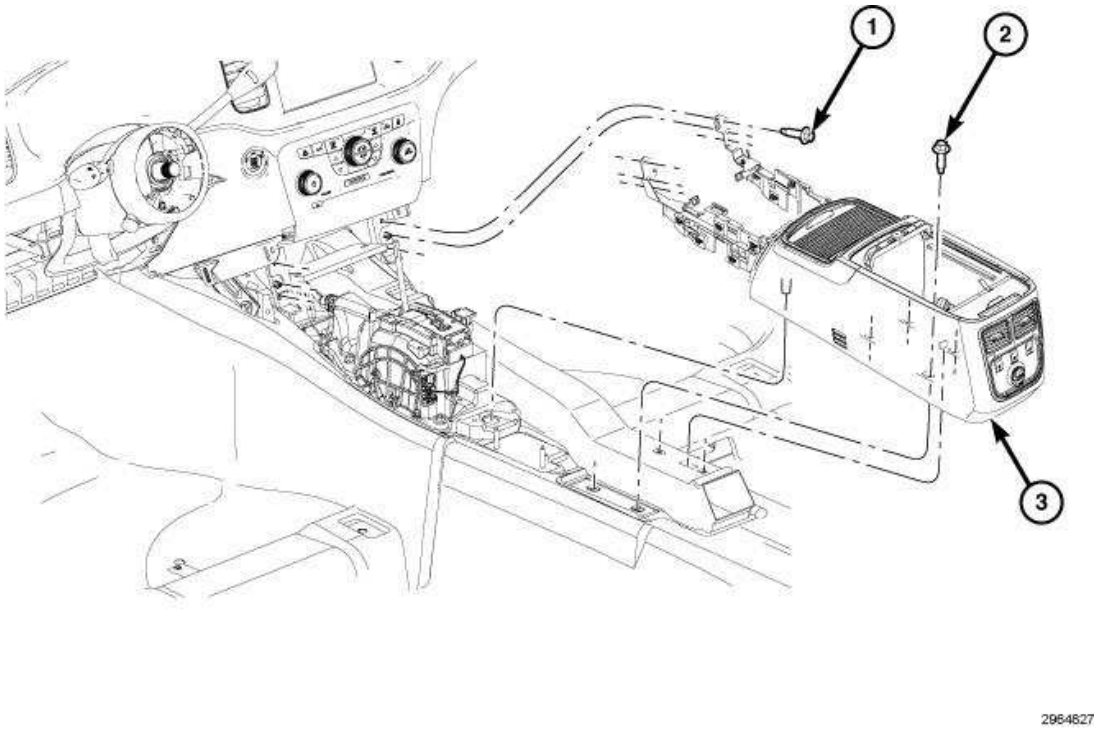

Fig. 365: Four Screws & Floor Console
Courtesy of CHRYSLER GROUP, LLC

20. Remove the four screws (2) from the rear bin that secure the floor console (3) to the floor panel

transmission tunnel.

21. Remove the four screws (1) that secure the front of the console (3) to the instrument panel.
22. Slide the floor console (3) rearward and tilt up. If equipped, disconnect the rear heated seat connector.
23. Remove the floor console from the vehicle.

INSTALLATION

INSTALLATION

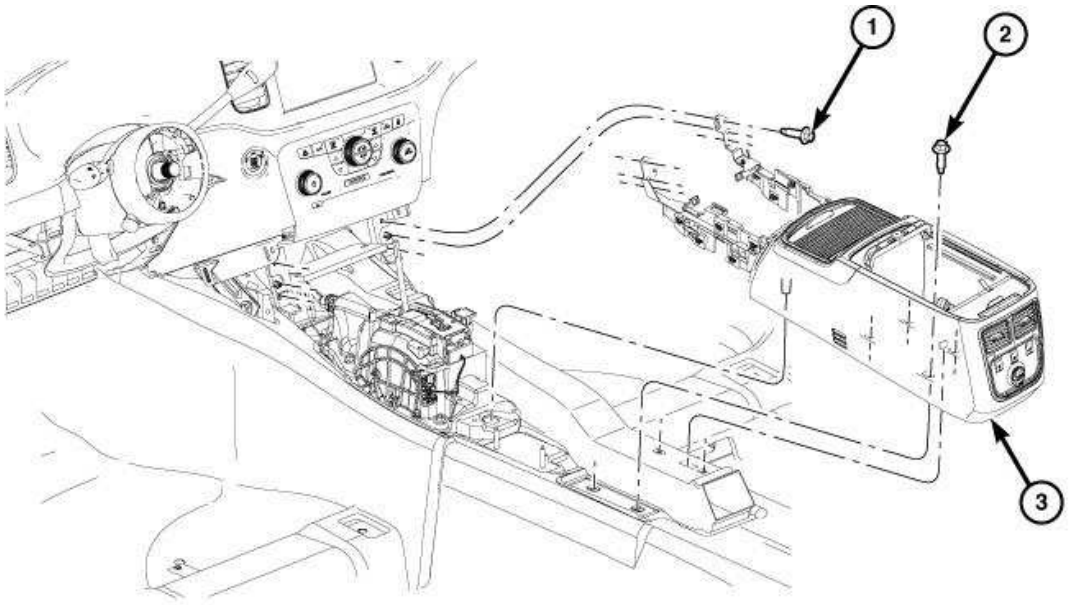

Fig. 366: Four Screws & Floor Console
Courtesy of CHRYSLER GROUP, LLC

1. Position the floor console (3) into the vehicle rearward far enough to access and if equipped, reconnect the rear heated seat connector.
2. While holding both sides of the console (3) at the front carefully engage the ears at the front of the console to the slots at the lower instrument panel.
3. Locate the two alignment holes at the front of the console (3) over the two alignment pins on the instrument panel.
4. Engage the locating pin on the underside of the console rear bin into the slot in the top of the floor panel transmission tunnel.
5. Install and tighten the four screws (1) that secure the front of the console (3) to the instrument panel. Tighten the screws to 2 N.m (18 in. lbs.).
6. Install and tighten the four screws (2) into the rear bin that secure the console (3) to the floor panel transmission tunnel. Tighten the screws to 4 N.m (35 in. lbs.).

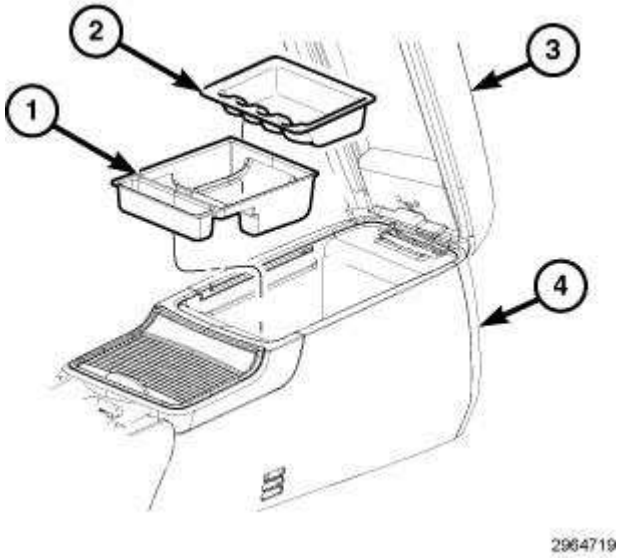

Fig. 367: Lid & Bins
Courtesy of CHRYSLER GROUP, LLC

7. Open the lid (3) of the console rear bin (4) and install the mat bin (1) into the console rear bin (4).
8. Install the coin holder bin (2).

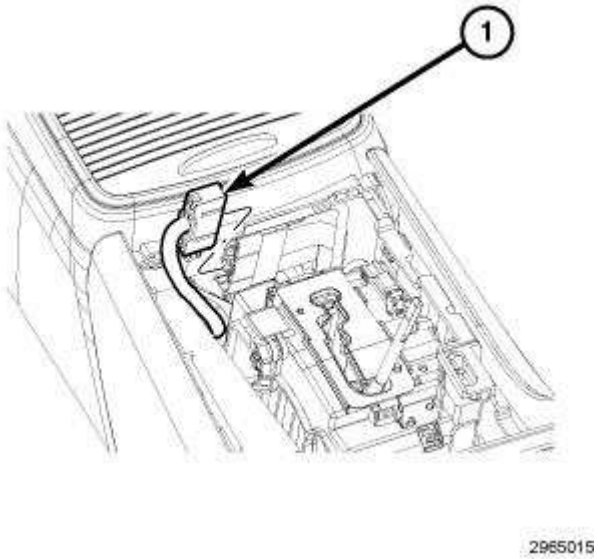

Fig. 368: Power Outlet Harness
Courtesy of CHRYSLER GROUP, LLC

9. Connect the console storage bin's power outlet harness (1).

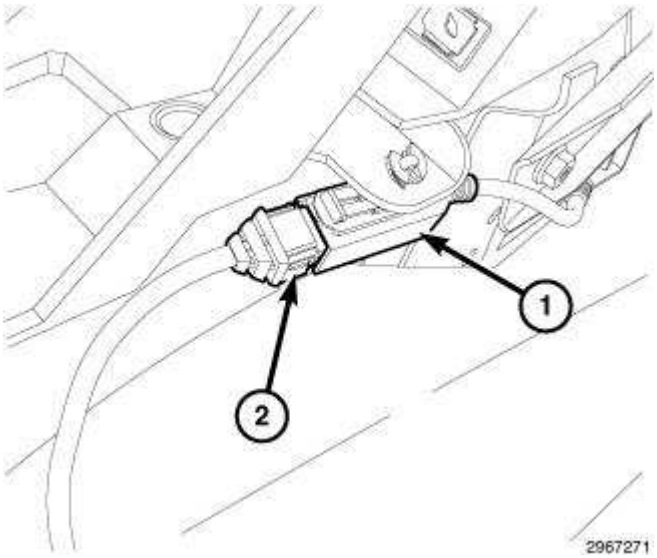

Fig. 369: USB Jumper Harness
Courtesy of CHRYSLER GROUP, LLC

10. If equipped, install the connector (1) to the floor console tab by engaging the retaining tab on the connector to the fastener and sliding rearward.
11. If equipped, connect the USB jumper harness (2).

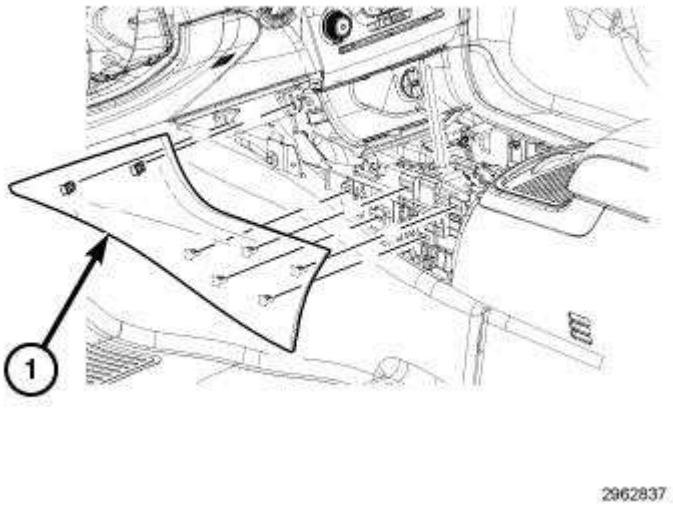

Fig. 370: Side Close Out Panel
Courtesy of CHRYSLER GROUP, LLC

12. Align the floor console side close out panel (1) to the floor console and use hand pressure to engage the five snap retainers that secure the close out panel to the floor console.
13. Align the floor console side close out panel (1) to the floor console and use hand pressure to engage the two snap retainers that secure the close out panel to the instrument panel.

NOTE: Repeat steps 12-13 for the opposite side.

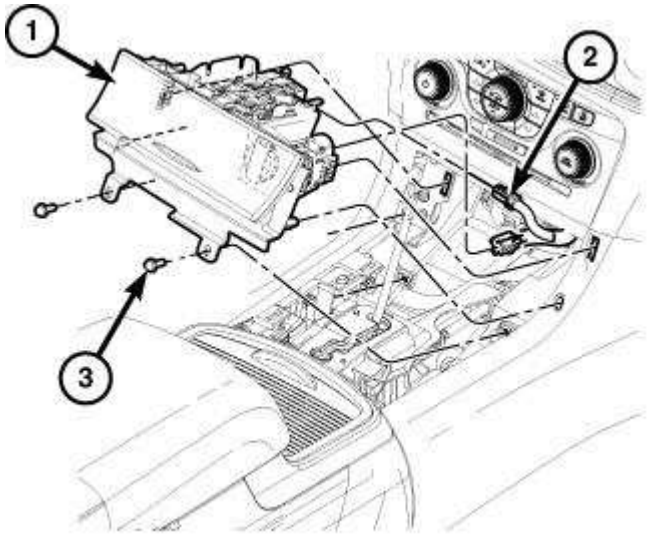

Fig. 371: Two Screws, Storage Bin & LED/Lamp Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

14. Connect the LED/Lamp wiring harness (2) to the rear of the storage bin (1).
15. Connect the 12V power outlet wiring harness to the rear of the storage bin (1).
16. Align the storage bin (1) to the front floor console and the side close out panel to engage the two snap retainers and alignment pins that secure the storage bin (1) to the floor console.
17. Install the two screws (3) securing the storage bin (1) to the front console. Tighten the screws to 2 N.m (18 in. lbs.).

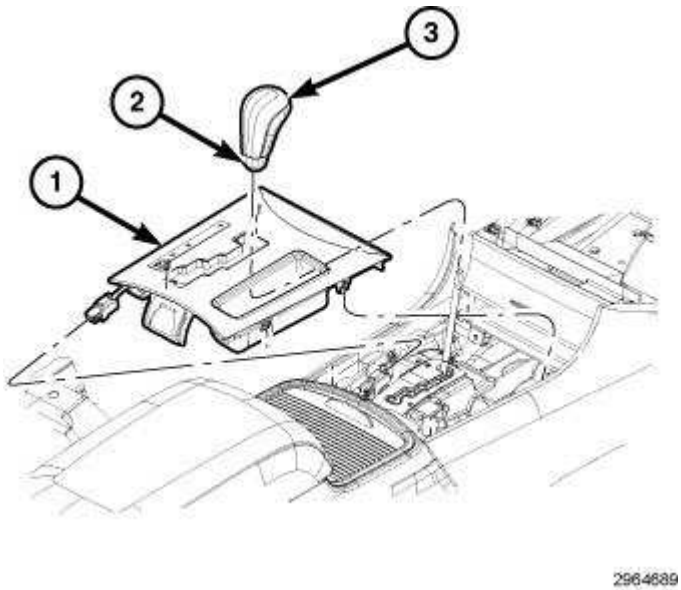

Fig. 372: Shifter Knob, Retaining Ring & Shifter Bezel
Courtesy of CHRYSLER GROUP, LLC

18. Connect the shifter bezel wiring harness and position the console shifter bezel (1) over the gear

selector lever.

19. Position the tabs on the underside of the console shifter bezel (1) into the holes in the floor console. Use hand pressure to engage the retaining tabs.
20. Install and tighten the two screws (1) that secure the front of the console shifter bezel to the console. Tighten the screws to 3 N.m (23 in. lbs.).
21. Position the mat (5) into the console rear bin with the curved edge oriented forward in the vehicle.
22. Install the shifter knob (3). Refer to **SHIFTER, TRANSMISSION, INSTALLATION** or **KNOB, GEARSHIFT, INSTALLATION** .

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, calibration of this feature is required whenever power to the door module is disrupted.**

A battery reconnect procedure must be performed anytime the battery has been disconnected.

23. Reconnect the battery negative cable.

CONSOLE, OVERHEAD

DESCRIPTION

DESCRIPTION

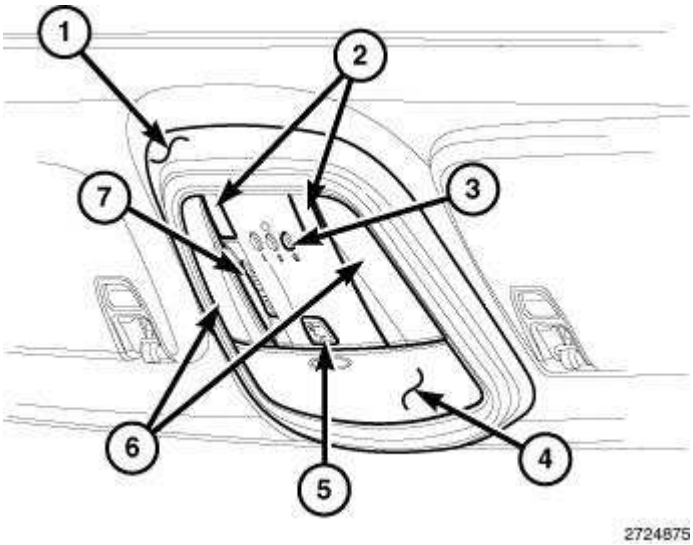

Fig. 373: View Of Overhead Console Transmitter Push Buttons
Courtesy of CHRYSLER GROUP, LLC

An overhead console is standard on this vehicle and includes the following components:

- Overhead storage compartment (4)

- Front map/reading lamps switches (2)
- Power sunroof switch (7) - if equipped
- Universal transmitter (3) - if equipped
- Power rear liftgate (5) - if equipped

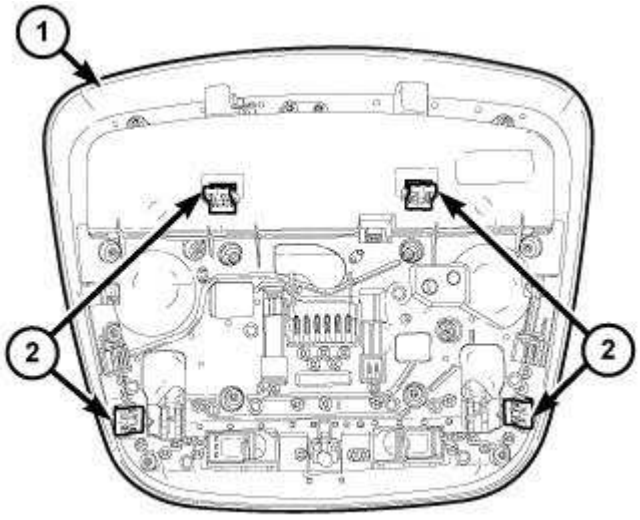

Fig. 374: Overhead Console Assembly & Four Snap Clips
Courtesy of CHRYSLER GROUP, LLC

The overhead console assembly (1) is mounted by four snap clips (2) securing it to a molded plastic retainer bracket located above the headliner. The Electronic Overhead Module is secured to the overhead console with screws and is only serviced as an assembly with the overhead console.

REMOVAL

REMOVAL

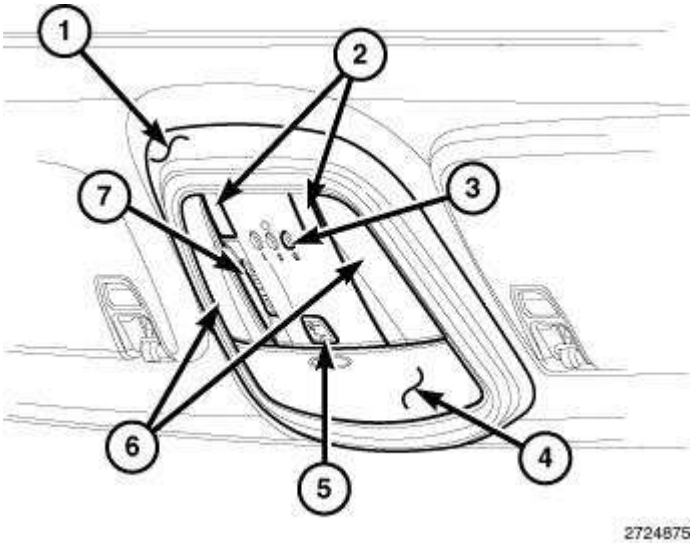

Fig. 375: View Of Overhead Console Transmitter Push Buttons
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Pull downward on the sides of the overhead console housing firmly and evenly to disengage the snap clips from the overhead console bracket.

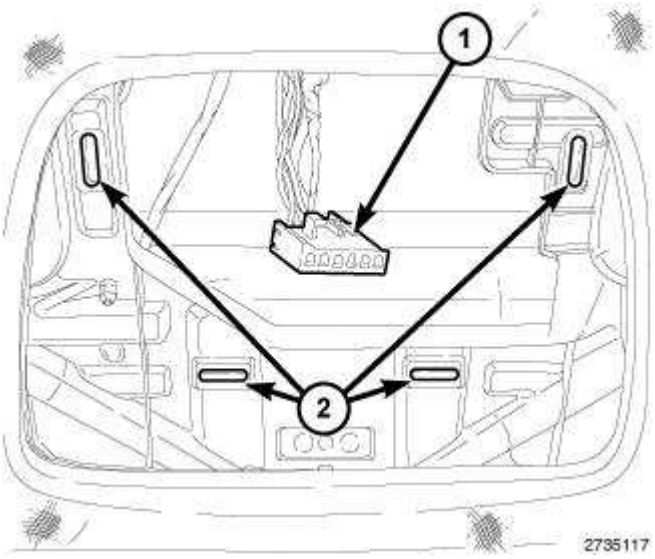

Fig. 376: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Lower the overhead console far enough to access the wire harness connectors (1).
4. Disconnect the roof wire harness connectors from the connector receptacles.
5. Remove the overhead console.

INSTALLATION

INSTALLATION

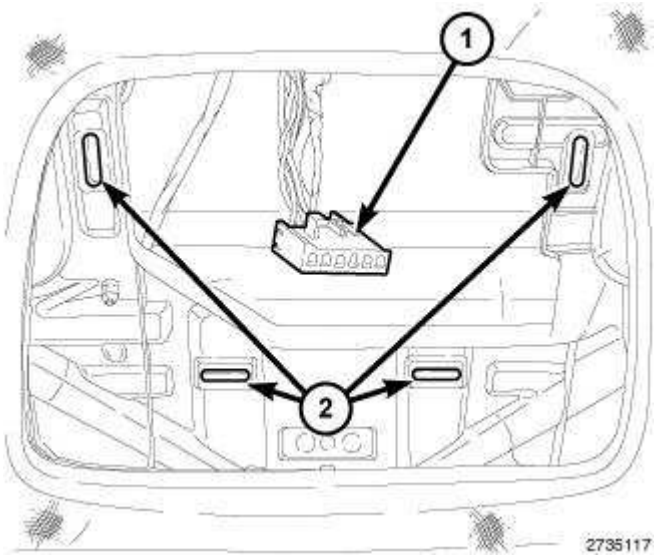

Fig. 377: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the overhead console near the mounting location on the headliner.
2. Connect the roof wire harness connectors (1) to the overhead console connector receptacles.
3. Align the snap clips on the overhead console housing with their receptacles (2) in the overhead console bracket.

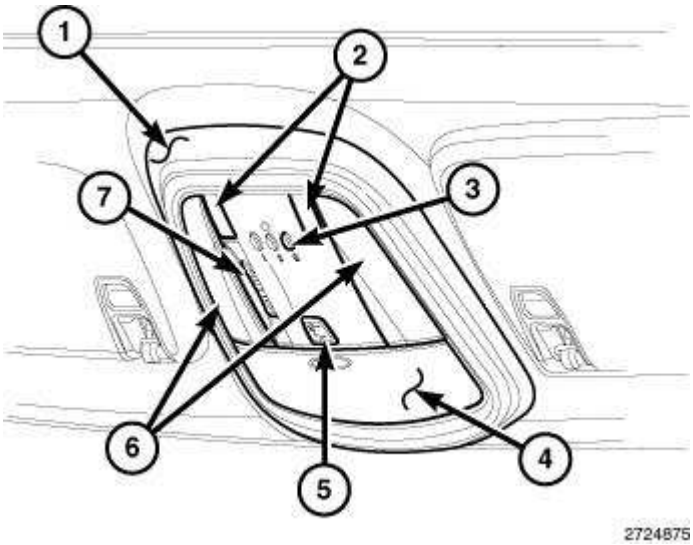

Fig. 378: View Of Overhead Console Transmitter Push Buttons
Courtesy of CHRYSLER GROUP, LLC

4. Push upward firmly and evenly on the sides of the overhead console housing (1) over the snap clip locations until the snap clips are fully engaged with their receptacles in the overhead console bracket.
5. Connect the negative battery cable.

FOOT REST, FLOOR, FRONT

REMOVAL

REMOVAL

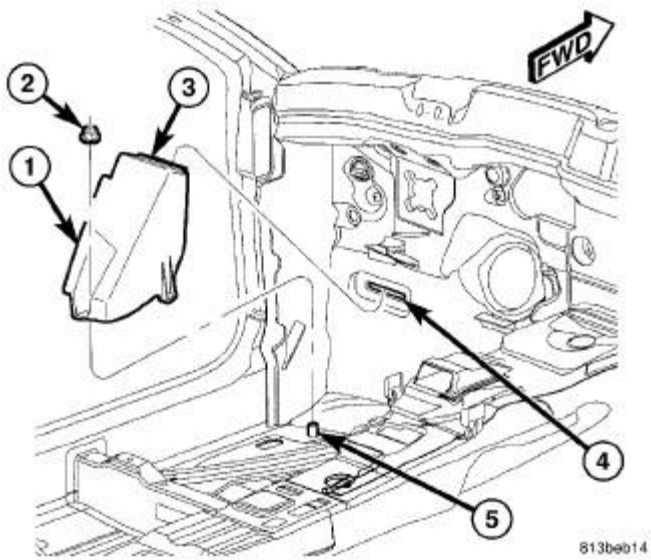

Fig. 379: Front Floor Foot Rest
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim from the driver side lower cowl side inner panel. Refer to **PANEL, COWL TRIM, REMOVAL**.
2. Remove the push-pin fastener that secure the driver side front carpet to the cowl side inner panel and the front door opening sill.
3. Pull the front floor carpet up and away from the foot rest (1) far enough to access and remove the nut (2) that secures the foot rest to the weld stud (5) on the front floor panel.
4. Lift the base of the foot rest upward far enough to disengage the tab (3) at the top of the foot rest from the slot (4) in the dash panel.

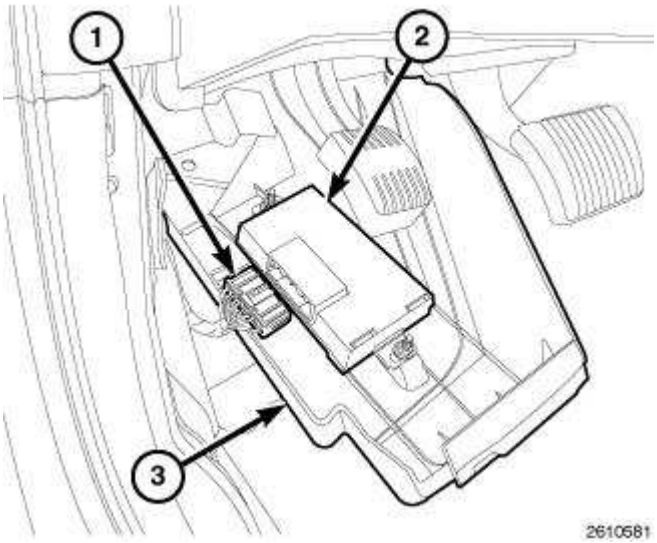

Fig. 380: DTCM Connector
Courtesy of CHRYSLER GROUP, LLC

5. (if equipped) Turn foot rest over and disconnect the DTCM connector (1) from the DTCM (2).
6. Remove the foot rest (3) from the vehicle.

INSTALLATION

INSTALLATION

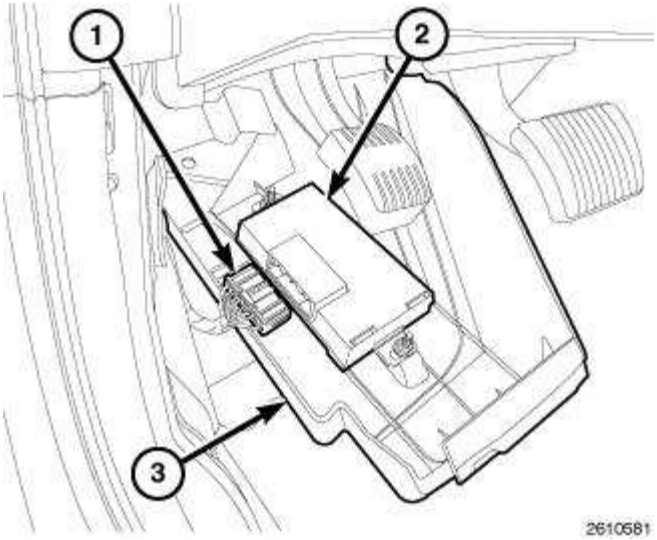

Fig. 381: DTCM Connector
Courtesy of CHRYSLER GROUP, LLC

1. (if equipped) Connect the electrical connector (1) to the DTCM (2).

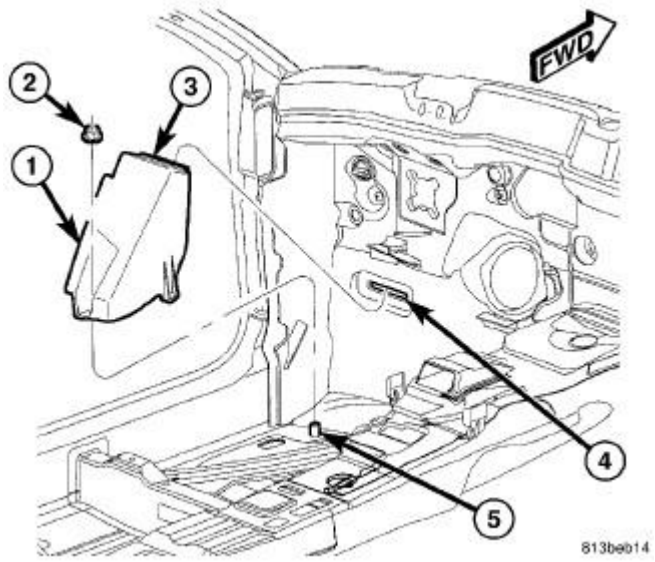

Fig. 382: Front Floor Foot Rest
Courtesy of CHRYSLER GROUP, LLC

2. Pull the outboard edge of the driver side front floor carpet up and away from the floor far enough to position the foot rest (1) between the front floor panel and the carpet.
3. Engage the tab (3) at the top of the foot rest into the slot (4) in the dash panel.
4. Position the hole at the base of the foot rest over the weld stud (5) on the front floor panel.
5. Install and tighten the nut (2) that secures the foot rest to the weld stud. Tighten the nut to 16 N.m (12 ft. lbs.).
6. Reposition the driver side front carpet to the cowl side inner panel and the front door opening sill and secure with the push-pin fastener.
7. Reinstall the trim onto the driver side lower cowl side inner panel. Refer to **PANEL, COWL TRIM, INSTALLATION**.

HEADLINER

REMOVAL

REMOVAL

WITH SUNROOF

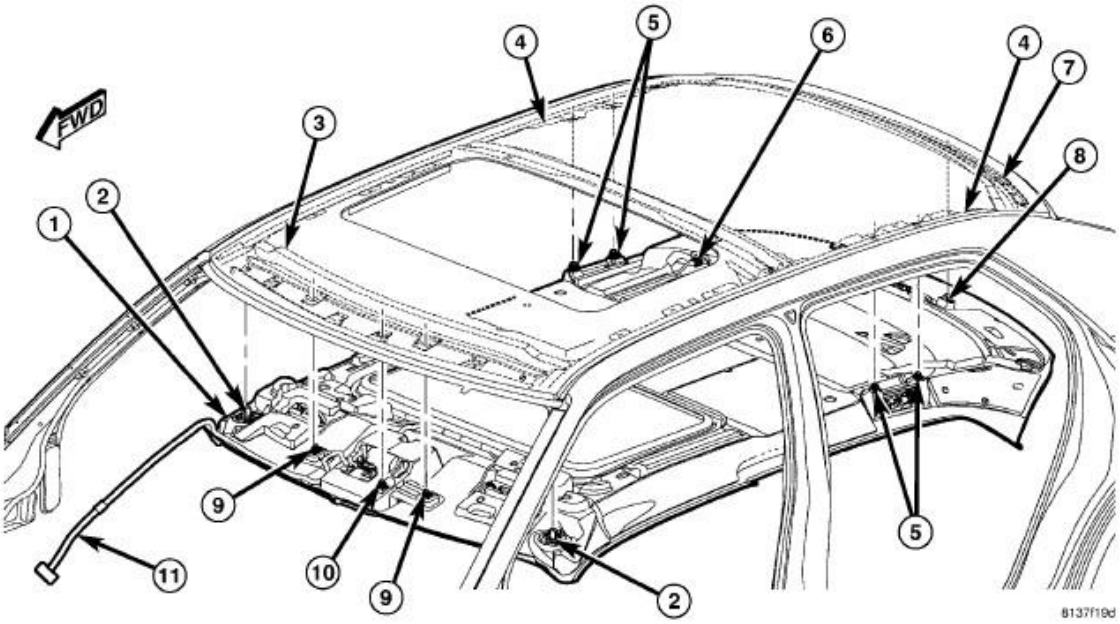

Fig. 383: Removing/Installing Headliner
Courtesy of CHRYSLER GROUP, LLC

NOTE: In the event the headliner is damaged or creased during removal, it will need to be replaced with a new headliner.

1. Disconnect and isolate the battery negative cable.
2. Remove the windshield. Refer to **WINDSHIELD, REMOVAL**.
3. Remove the trim from both upper A-pillars. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.
4. Disengage the headliner wire harnesses from the retainers on each inner A-pillar and disconnect the connectors (11) from the body wire harness connectors near the base of each A-pillar.
5. Remove the trim from both upper B-pillars. Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
6. Remove the trim from both upper C-pillars. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
7. If the vehicle is so equipped, remove the overhead console from the center of the headliner (1) near the windshield header (3).
8. If the vehicle is so equipped, disconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout(s) and connector(s) as well as the headliner wire harness from the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
9. Remove both sun visors and both visor receptacles from the headliner near the windshield header.
10. Remove both grab handle/coat hook/rear dome/reading lamp units from the headliner at the inner rear roof side rails (4).
11. Remove the trim welt from the headliner sunroof opening.
12. Recline both front seat backs.

13. Carefully pull the headliner downward at the windshield header far enough to disengage the spring clip retainers at each sun visor mounting location (2), at each visor receptacle location (9), and at the overhead console location (10).
14. Carefully pull the headliner downward at the inner rear roof side rails far enough to disengage the spring clip retainers at each grab handle location (5).
15. Carefully pull the headliner downward near the center of the rear roof header (7) far enough to disengage the rear spring clip retainer (8).
16. Reach between the headliner and the roof panel from the right rear door opening to access and disconnect the sunroof jumper wire connector from the headliner wire harness sunroof take out and connector (6).
17. Carefully remove the headliner through the windshield opening.

WITHOUT SUNROOF

NOTE: In the event the headliner is damaged or creased during removal, it will need to be replaced with a new headliner.

NOTE: Do not remove the headliner from the vehicle unless replacing with a new headliner. Repeated removals of the headliner can cause damage due to fatigue of the headliner material.

1. Disconnect and isolate the battery negative cable.
2. Remove the windshield. Refer to **WINDSHIELD, REMOVAL**.
3. Remove the trim from both upper A-pillars. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.
4. Disengage the headliner wire harnesses from the retainers on each inner A-pillar and disconnect the connectors (11) from the body wire harness connectors near the base of each A-pillar.
5. Remove the trim from both upper B-pillars. Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
6. Remove the trim from both upper C-pillars. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
7. If the vehicle is so equipped, remove the overhead console from the center of the headliner near the windshield header.
8. If the vehicle is so equipped, disconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout(s) and connector(s) of the headliner wire harness from the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
9. Remove both sun visors and both visor receptacles from the headliner near the windshield header.
10. Remove both grab handle/coat hook/rear dome/reading lamp units from the headliner at the inner rear roof side rails.
11. Recline both front seat backs.
12. Carefully pull the headliner downward at the windshield header far enough to disengage the spring clip retainers at each sun visor mounting location (2), at each visor receptacle location, and at the overhead console location.

13. Carefully pull the headliner downward at the inner rear roof side rails far enough to disengage the spring clip retainers at each grab handle location.
14. Carefully pull the headliner downward near the center of the rear roof header far enough to disengage the rear spring clip retainer.
15. Carefully bow the headliner longitudinally as necessary to remove the unit through the right rear door opening.

INSTALLATION

INSTALLATION

WITH SUNROOF

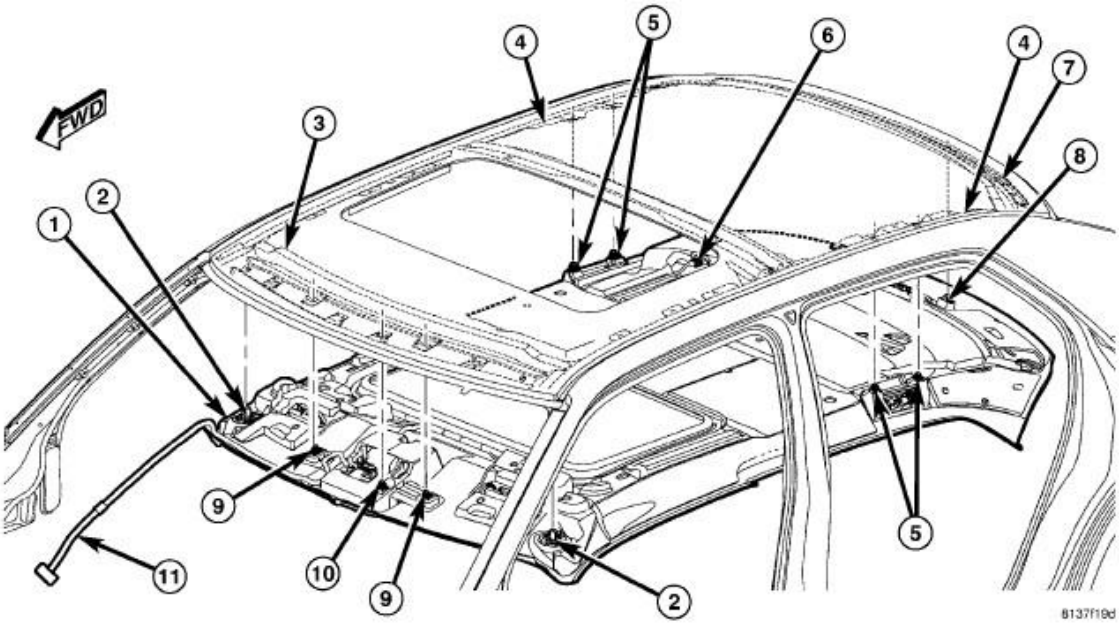

Fig. 384: Removing/Installing Headliner
Courtesy of CHRYSLER GROUP, LLC

NOTE: In the event the headliner is damaged or creased during removal, it will need to be replaced with a new headliner.

1. Carefully insert the headliner through the windshield opening.
2. Reach between the headliner and the roof panel from the right rear door opening to access and reconnect the sunroof jumper wire connector to the headliner wire harness sunroof take out and connector (6).

NOTE: In order to ease installation and ensure proper headliner positioning it is important to install the headliner spring clip retainers in the correct sequence as follows.

3. Position the spring clip at the right visor receptacle location (9) to the appropriate hole in the

windshield header (3) and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.

4. Position the rear spring clip retainer (8) to the appropriate hole near the center of the rear roof header (7) and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.
5. Position the two spring clip retainers at each grab handle location (5) to the appropriate holes in the inner rear roof side rails (4) and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
6. Position the spring clip retainers at each sun visor mounting location (2), at the left visor receptacle location (9), and at the overhead console location (10) to the appropriate holes in the windshield header and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
7. Reinstall the trim welt onto the headliner sunroof opening.
8. Reinstall both grab handle/coat hook/rear dome/reading lamp units into the headliner at the inner rear roof side rails.
9. Reinstall both sun visors and both visor receptacles onto the headliner near the windshield header.
10. If the vehicle is so equipped, reconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout and connector of the headliner wire harness to the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
11. If the vehicle is so equipped, reinstall the overhead console to the center of the headliner near the windshield header.
12. Reinstall the trim onto both upper C-pillars. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.
13. Reinstall the trim onto both upper B-pillars. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.
14. Engage the headliner wire harnesses into the retainers on each inner A-pillar and reconnect the connectors (11) to the body wire harness connectors near the base of each A-pillar. Be certain the harnesses are not twisted and that the connectors are both fully engaged.
15. Reinstall the trim onto both upper A-pillars. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.
16. Install the windshield. Refer to **WINDSHIELD, INSTALLATION**.
17. Reconnect the battery negative cable.

WITHOUT SUNROOF

NOTE: In the event the headliner is damaged or creased during removal, it will need to be replaced with a new headliner.

1. Carefully bow the headliner longitudinally as necessary to position the unit into the vehicle through the right rear door opening.

NOTE: In order to ease installation and ensure proper headliner positioning it is important to install the headliner spring clip retainers in the correct sequence as follows.

2. Position the spring clip at the right visor receptacle location to the appropriate hole in the windshield header and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.
3. Position the rear spring clip retainer to the appropriate hole near the center of the rear roof header and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.
4. Position the two spring clip retainers at each grab handle location to the appropriate holes in the inner rear roof side rails and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
5. Position the spring clip retainers at each sun visor mounting location, at the left visor receptacle location, and at the overhead console location to the appropriate holes in the windshield header and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
6. Reinstall both grab handle/coat hook/rear dome/reading lamp units into the headliner at the inner rear roof side rails.
7. Reinstall both sun visors and both visor receptacles onto the headliner near the windshield header.
8. If the vehicle is so equipped, reconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout and connector of the headliner wire harness to the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
9. If the vehicle is so equipped, reinstall the overhead console to the center of the headliner near the windshield header.
10. Reinstall the trim onto both upper C-pillars. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.
11. Reinstall the trim onto both upper B-pillars. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.
12. Engage the headliner wire harnesses into the retainers on each inner A-pillar and reconnect the connectors (11) to the body wire harness connectors near the base of each A-pillar. Be certain the harnesses are not twisted and that the connectors are both fully engaged.
13. Reinstall the trim onto both upper A-pillars. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.
14. Install the windshield. Refer to **WINDSHIELD, INSTALLATION**.
15. Reconnect the battery negative cable.

MIRROR, REARVIEW

REMOVAL

REMOVAL

PRISMATIC MIRROR

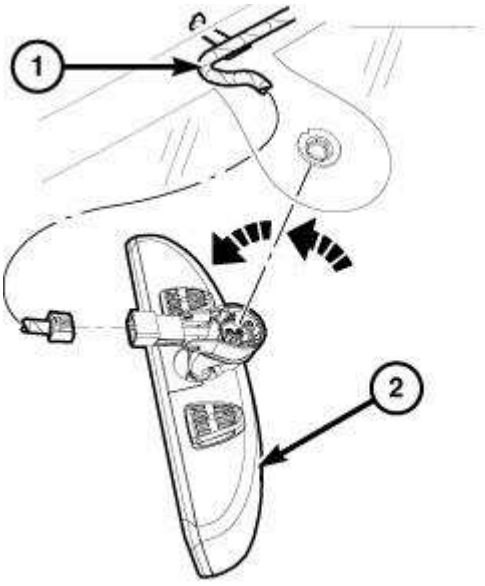

Fig. 385: Mirror Harness Connector & Mirror Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: View shown in illustration from exterior of the vehicle.

1. Disconnect the negative battery cable.
2. Remove the harness trim cover.
3. Disconnect the mirror harness connector (1).
4. Accessing through the vehicle interior, twist the mirror assembly (2) clockwise and release the mirror from the aluminum button attached to the windshield.

TELEMATICS MIRROR

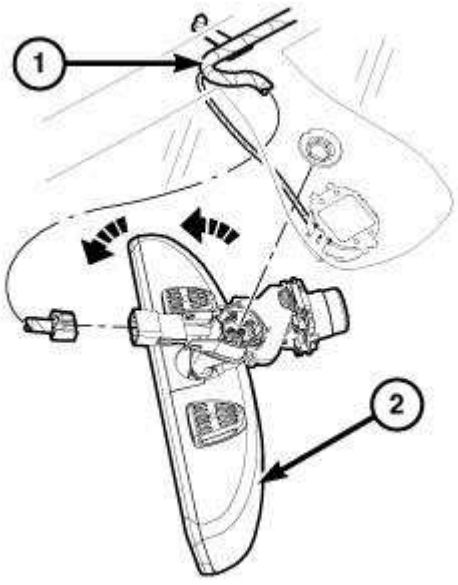

Fig. 386: Mirror Harness Connector & Mirror Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: View shown in illustration from exterior of the vehicle.

1. Disconnect the negative battery cable.
2. Using (special tool #C-4755, Trim Stick), separate the mirror trim, harness trim covers and remove.
3. Disconnect the mirror harness connector (1).
4. Accessing through the vehicle interior, twist the mirror assembly (2) clockwise and release the mirror from the aluminum button attached to the windshield.

INSTALLATION

INSTALLATION

PRISMATIC MIRROR

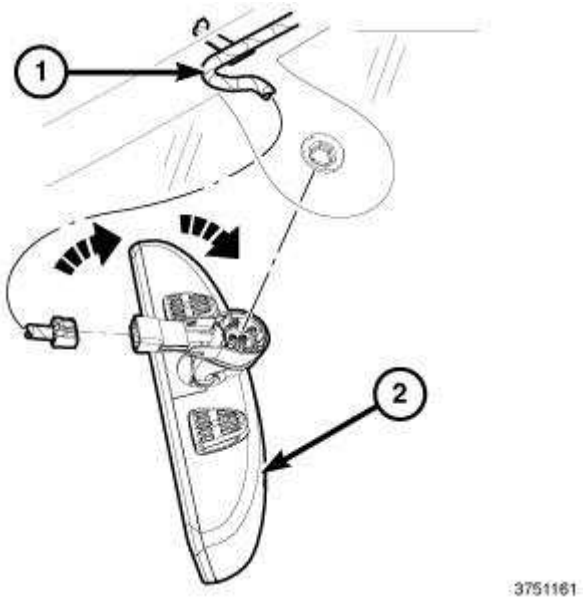

Fig. 387: Mirror Assembly & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: View shown in illustration from exterior of the vehicle.

1. Place the rearview mirror over the aluminum button in the upper center of the windshield.
2. Accessing through the vehicle interior, twist the mirror assembly (2) counter clockwise to install the mirror on the aluminum button attached to the windshield.

NOTE: Mirror must be fully seated or wedged onto the button before rotating.

3. Connect the mirror harness connector (1) to the mirror (2).
4. Position the harness back and install the harness cover.
5. Connect the negative battery cable.

TELEMATICS MIRROR

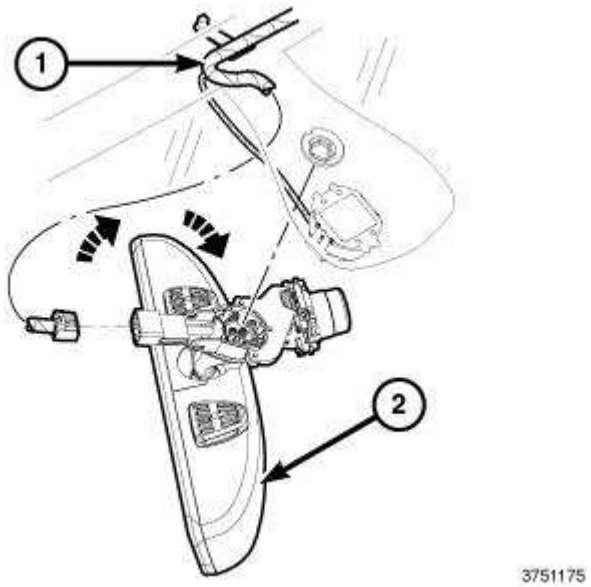

Fig. 388: Mirror Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Place the rearview mirror over the aluminum button in the upper center of the windshield.
2. Twist the mirror base onto the button in a counter clockwise direction to attach the mirror.

NOTE: Mirror must be fully seated or wedged onto the button before rotating.

NOTE: Mirror must be rotated in a counter clockwise direction to prevent the mirror from touching the rain sensor.

3. Position the rain sensor wire harness back into place and secure accordingly.
4. Connect the electrical connector (1) and install the trim cover.

NOTE: Rain sensor connection should be verified prior to install the mirror trim covers.

5. Install the mirror trim and harness trim covers

NOTE: Failure to calibrate the Smartbeam camera may diminish system performance and cause Diagnostic Trouble Codes (DTCs) to set.

6. Perform the Smartbeam System Calibration Procedure. Refer to **SMART BEAM, STANDARD PROCEDURE** .
7. Connect the negative battery cable.

REAR VIEW MIRROR SUPPORT BRACKET

1. Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
2. Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerator to the surface on the bracket according to the following instructions:
    1. Crush the vial to saturate the felt applicator.
    2. Remove the paper sleeve.
    3. Apply accelerator to the contact surface on the bracket.
    4. Allow the accelerator to dry for five minutes.
    5. Do not touch the bracket contact surface after the accelerator has been applied.
5. Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
6. Install the bracket according to the following instructions:
    1. Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
    2. Apply an even coat of adhesive to the contact surface on the bracket.
    3. Align the bracket with the marked position on the windshield glass.
    4. Press and hold the bracket in place for at least one minute.

    NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

    NOTE: Failure to calibrate the Smartbeam camera may diminish system performance and cause Diagnostic Trouble Codes (DTCs) to set.

9. If equipped, perform the Smartbeam System Calibration Procedure after installing the mirror. Refer to **SMART BEAM, STANDARD PROCEDURE** .

PANEL, A-PILLAR TRIM

REMOVAL

REMOVAL

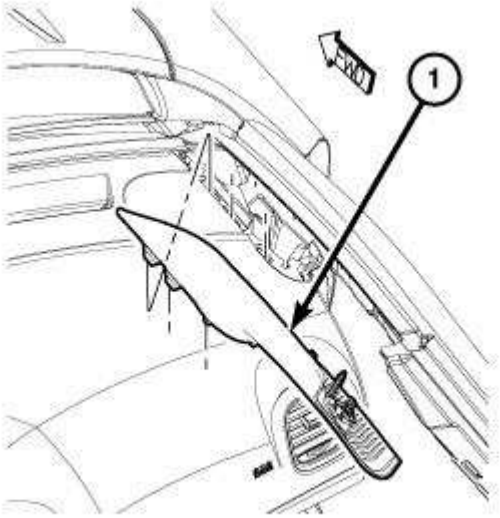

Fig. 389: A-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #C-4755, Trim Stick) trim stick or another suitable wide flat-bladed tool, carefully pry the upper end of the A-pillar trim (1) rearward from the inside of the A-pillar far enough to disengage the two spring clip retainers that secure the trim to the slots in the pillar.
2. Disengage the base of the A-pillar trim from the end of the instrument panel top cover.
3. Remove the A-pillar trim from the vehicle.

INSTALLATION

INSTALLATION

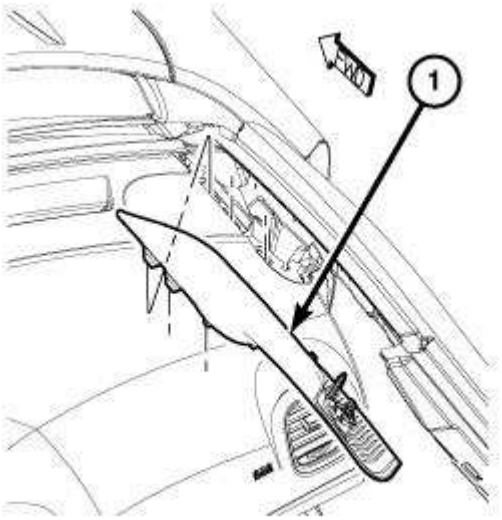

Fig. 390: A-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

1. Engage the base of the A-pillar trim (1) to the end of the instrument panel top cover.
2. Align the spring clip retainers on the trim with the slots in the inner A-pillar.
3. Using hand pressure, press firmly and evenly forward on the trim over each of the spring clip locations until the retainers snap into place.

PANEL, B-PILLAR TRIM

REMOVAL

REMOVAL

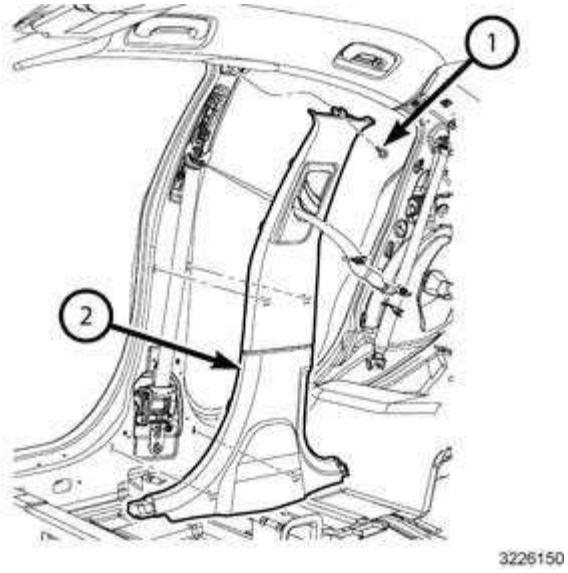

Fig. 391: B-Pillar

Courtesy of CHRYSLER GROUP, LLC

1. Detach the seat belt at the seat. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
2. Detach the front and rear door scuff trim panels at the B-pillar (1).
3. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, starting at the bottom of the B-pillar (1) and working upward, disengage the retaining clips.
4. Remove the B-Pillar (1).

INSTALLATION

INSTALLATION

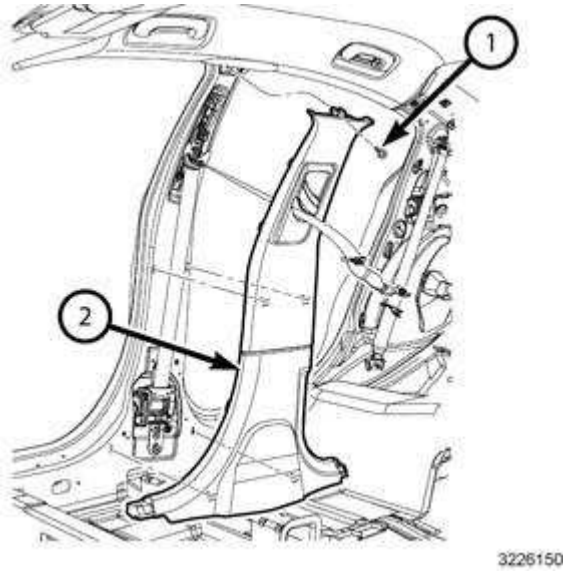

Fig. 392: B-Pillar
Courtesy of CHRYSLER GROUP, LLC

1. Align and position the B-Pillar (1).
2. Starting at the top of the B-pillar (1) and working downward, hand tap to engage the retaining clips.
3. Re-attach the front and rear door scuff trim panels at the B-pillar (1).
4. Re-install the seat belt at the seat. Refer to **RETRACTOR, SEAT BELT, INSTALLATION** .

PANEL, C-PILLAR TRIM

REMOVAL

UPPER

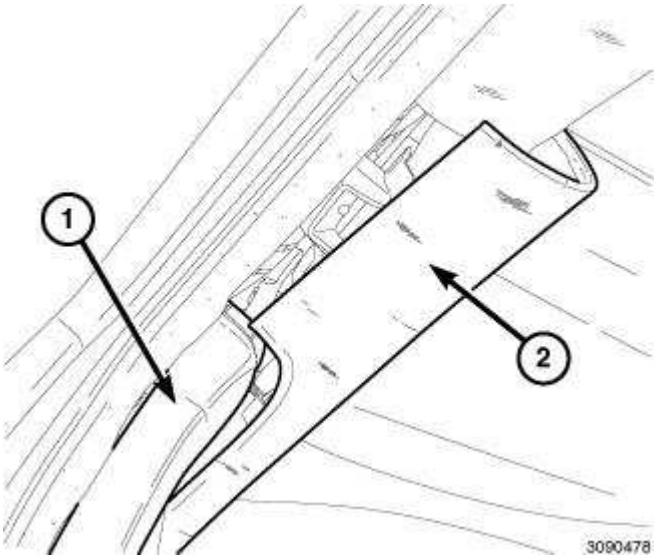

Fig. 393: Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, carefully pry the upper C-pillar trim (1) away from the lower C-Pillar trim (2).
3. Remove the upper C-Pillar trim (2).

LOWER

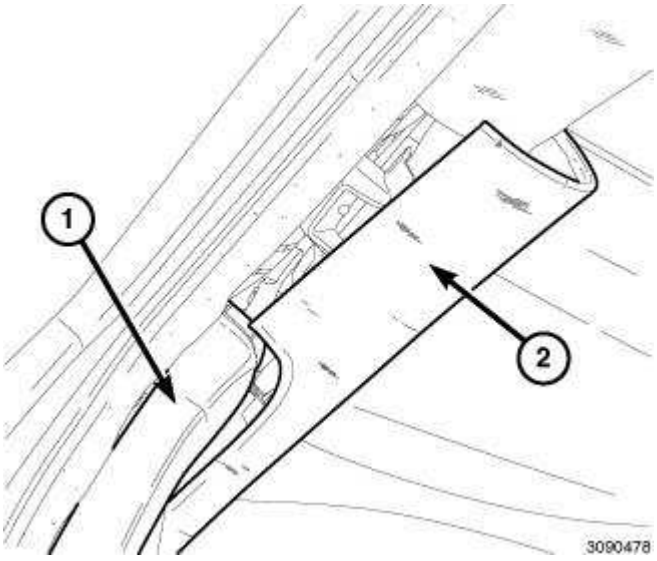

Fig. 394: Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Using (special tool #C-4755, Trim Stick) or equivalent, carefully pry the upper C-pillar trim (1) away from the lower C-Pillar trim (2).

3. Remove the upper C-Pillar trim (2).
4. Remove the seat belt(s) at the rear seat. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
5. Remove the rear seat back and cushion from the vehicle. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** or **COVER, SEAT CUSHION, SECOND ROW, REMOVAL** or **SEAT BACK, SECOND ROW, REMOVAL**.

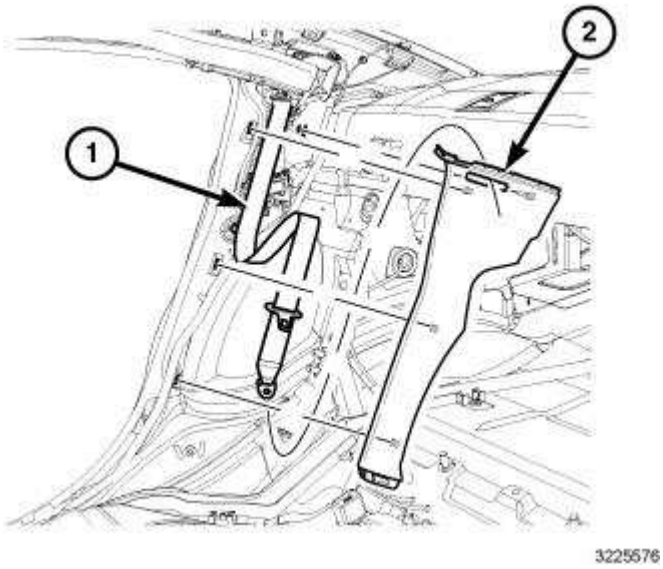

Fig. 395: Seat Belt & C-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

6. Remove the rear seat back side bolster from the quarter inner panel. Refer to **BOLSTER, SEAT, REMOVAL**.
7. Using (special tool #C-4755, Trim Stick) or equivalent, carefully pry the lower C-pillar trim (1) away to disengage it's retaining clips/tabs.
8. Feed the seat belt (1) through the panel opening and remove the lower C-pillar trim (2) from the quarter inner panel.

INSTALLATION

UPPER

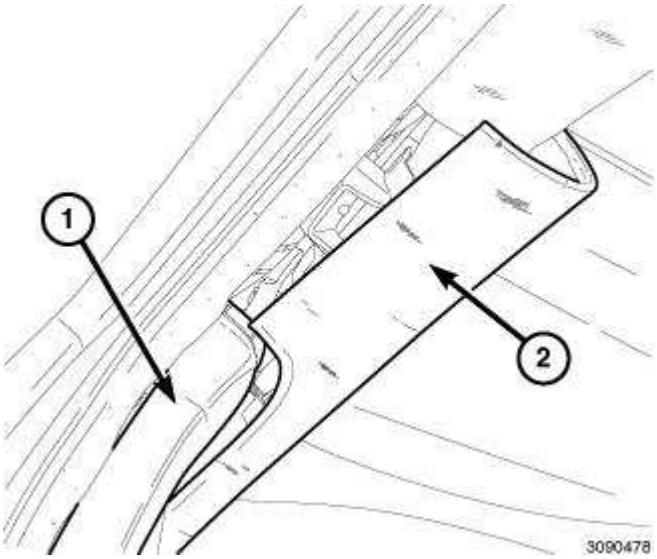

Fig. 396: Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Align and position the upper C-Pillar trim panel (2) to the sheet metal and to the lower C-pillar trim panel (1).
2. Hand tap to install the upper C-Pillar trim panel (2).
3. Connect the negative battery cable.

LOWER

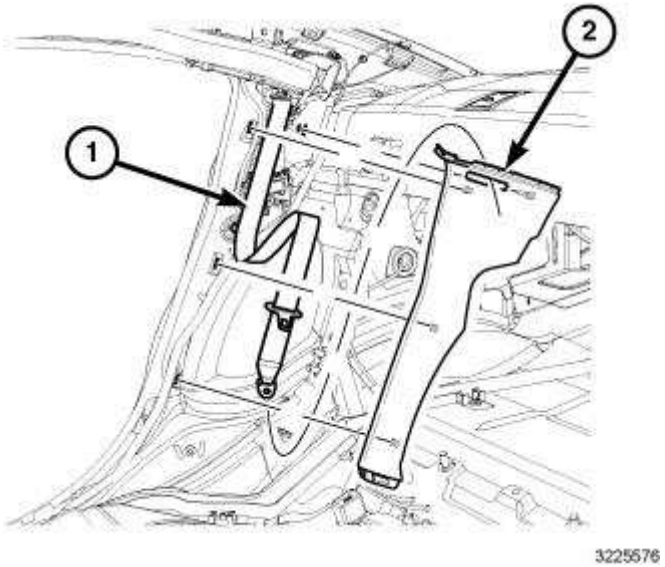

Fig. 397: Seat Belt & C-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the spring nuts (2) are properly installed and in good condition on the quarter inner panel (1). Replace the spring nut if any damage is evident.

2. Feed the seat belt (1) through the lower C-Pillar trim panel (2).
3. Position the lower C-pillar trim (2) onto the quarter inner panel with the lower edge sequenced over the rear extension of the rear door sill scuff plate.
4. Hand tap to secure the lower C-pillar trim (1) to the rear shelf panel.

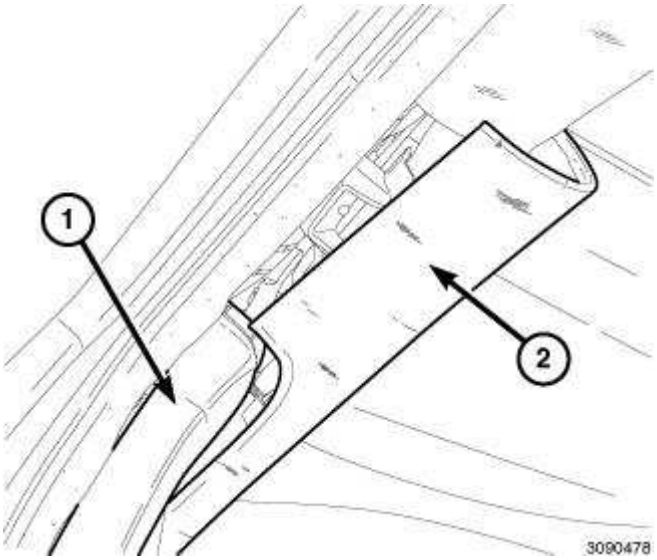

Fig. 398: Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Align and position the upper C-Pillar trim panel (2).
6. Hand tap to install the upper C-Pillar trim panel (2).
7. Install the seat belt at the seat. Refer to **RETRACTOR, SEAT BELT, INSTALLATION** .
8. Install the rear seat back side bolster to the quarter inner panel. Refer to **BOLSTER, SEAT, INSTALLATION**.
9. Reinstall the rear seat back and cushion into the vehicle. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** or **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION** or **SEAT BACK, SECOND ROW, INSTALLATION**.
10. Connect the negative battery cable.

PANEL, COWL TRIM

REMOVAL

UPPER

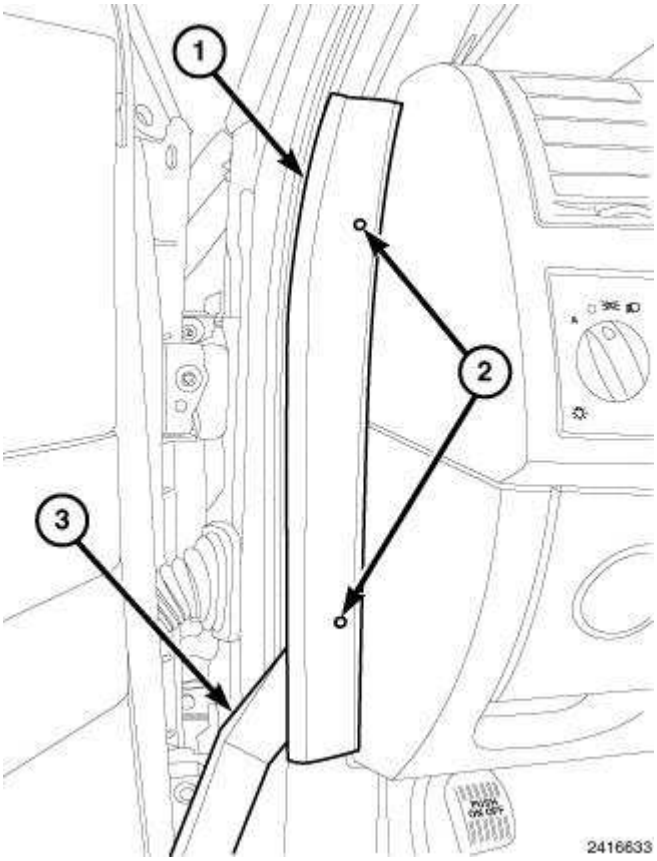

Fig. 399: Removing Upper Cowl Trim Panel - Lower Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

1. Using trim tool (special tool #C-4829A, Remover, Trim) or equivalent (3), directly below the lower retaining clip (2), release the clip.

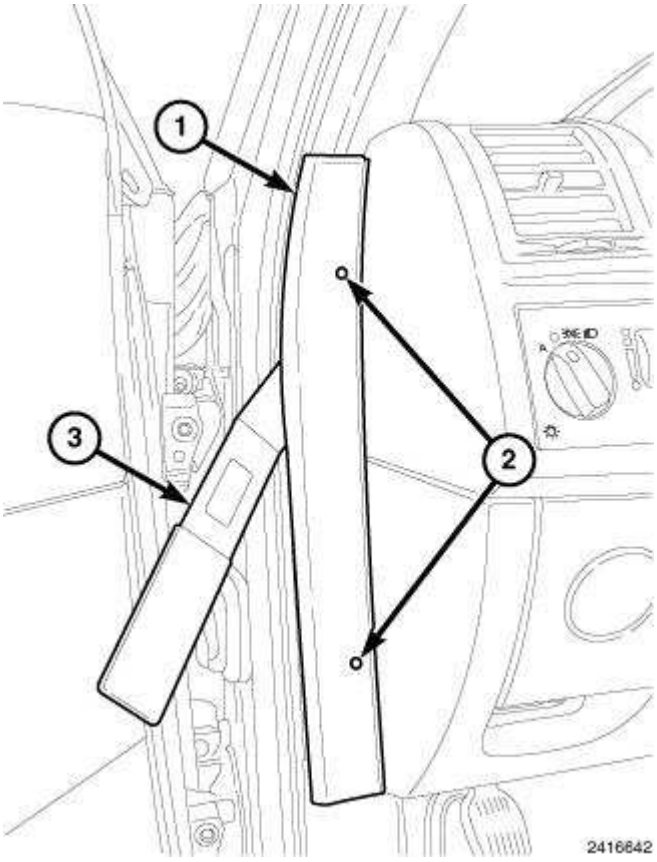

Fig. 400: Upper Cowl Trim Panel
Courtesy of CHRYSLER GROUP, LLC

2. Using trim tool (special tool #C-4829A, Remover, Trim) or equivalent (3), directly below the upper retaining clip (2), release the clip and remove the upper cowl trim panel (1).

LOWER

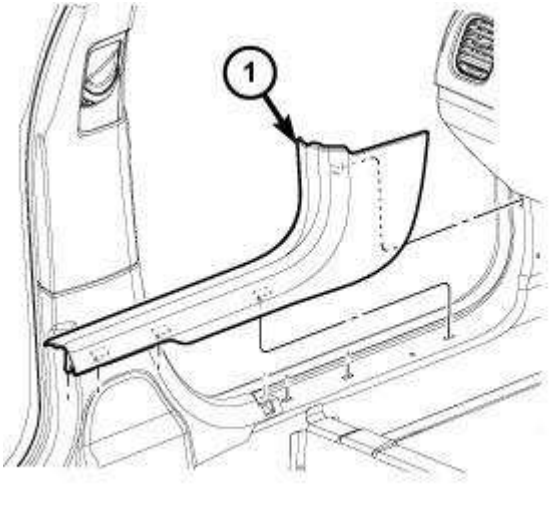

Fig. 401: Door Scuff Plate

Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper cowl trim from the front of the front door opening. Refer to **PANEL, COWL TRIM, REMOVAL**.
2. Using a trim stick or another suitable wide flat-bladed tool and starting nearest the B-pillar trim, carefully pry the lower cowl trim (1) upward from the front door opening sill far enough to disengage the three spring clip retainers that secure the trim to the slots in the sill.
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the lower cowl trim rearward from the front of the front door opening far enough to disengage the spring clip retainer that secures the trim to the slot in the cowl (1).
4. Remove the lower cowl trim from the vehicle.

INSTALLATION

UPPER

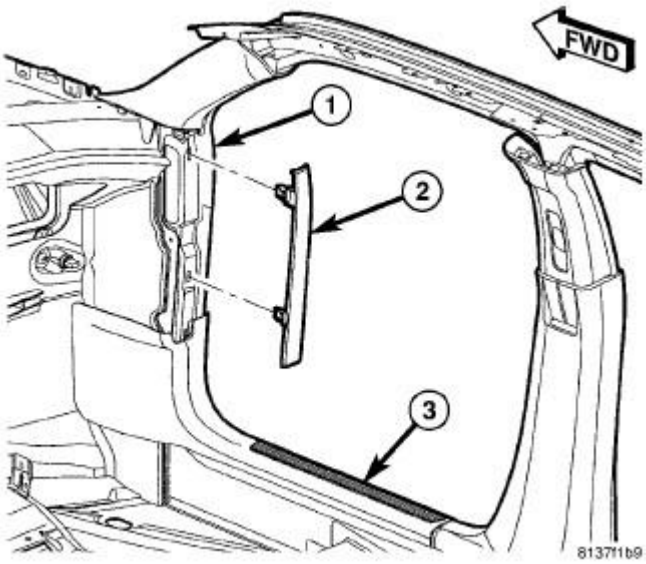

Fig. 402: Upper Cowl Trim
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper cowl trim (2) to the cowl (1) at the front of the front door opening and the lower cowl trim (3).
2. Align the two spring clip retainers on the trim with the slots in the cowl.
3. Using hand pressure, press firmly and evenly downward on the trim over each of the spring clip locations until the retainers snap into place.

LOWER

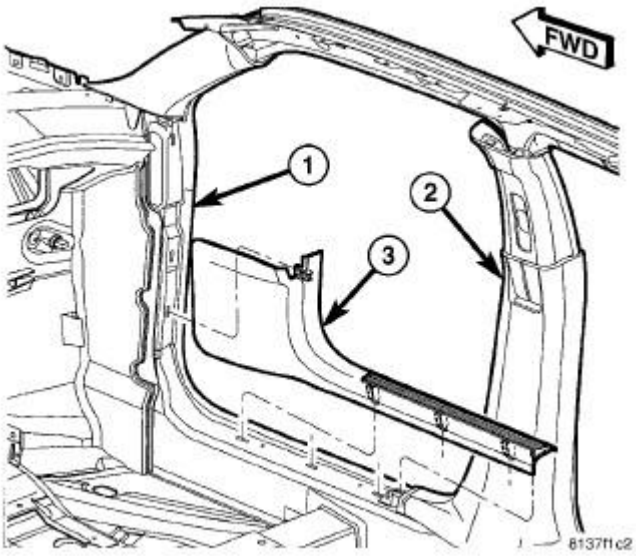

Fig. 403: Lower Cowl Trim
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the three plastic nuts are properly installed and in good condition in the slots of the front door opening sill. Replace a plastic nut if any damage is evident.
2. Position the vertical portion of the lower cowl trim (3) to the cowl (1) at the front of the front door opening.
3. Align the spring clip retainer on the trim with the slot in the cowl (1).
4. Using hand pressure, press firmly and evenly forward on the trim over the spring clip location until the retainer snaps into place.
5. Position the horizontal portion of the lower cowl trim to the front door sill and the B-pillar trim (2).
6. Align the three spring clip retainers on the trim with the slots in the sill.
7. Using hand pressure, press firmly and evenly downward on the trim over each of the spring clip locations until the retainers snap into place.
8. Reinstall the upper cowl trim to the front of the front door opening. Refer to **PANEL, COWL TRIM, INSTALLATION**.

PANEL, REAR SHELF

REMOVAL

REMOVAL

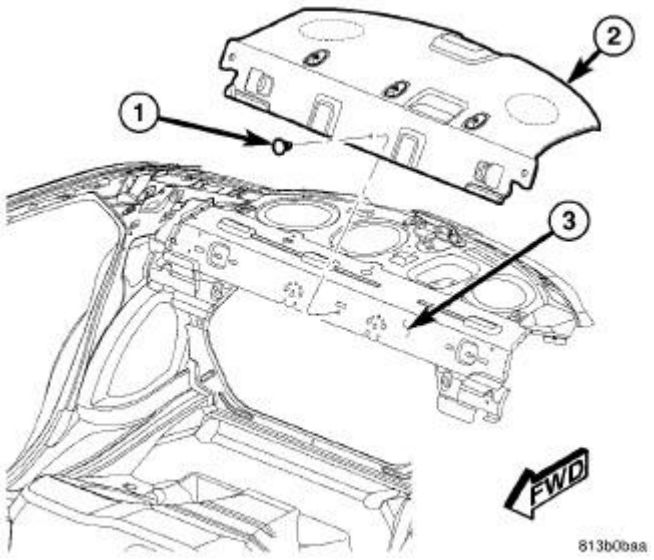

Fig. 404: Rear Shelf Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the right and left lower and upper C-pillar trim from the vehicle. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
3. Remove the nut that secures the center rear seat belt lower anchor to the stud on the floor panel and feed the seat belt webbing back through the opening in the top of the rear shelf panel trim (2) to the retractor.
4. Remove the push-pin fastener (1) that secures the trim to the rear shelf panel (3).
5. Slide the trim forward to disengage the S-clip that secures the underside of the trim to the center of the shelf panel.
6. Remove the trim from the rear shelf panel.

INSTALLATION

INSTALLATION

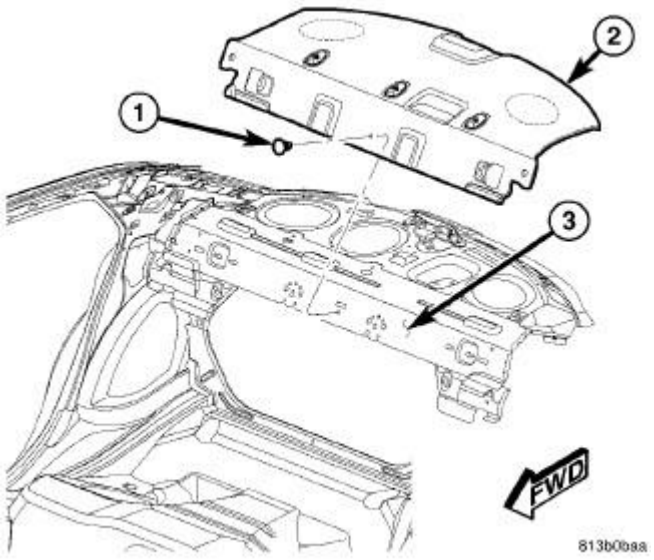

Fig. 405: Rear Shelf Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the trim (2) onto the rear shelf panel (3).
2. Slide the rear edge of the trim rearward to engage the lens bezel of the center high-mounted stop lamp and far enough to engage the S-clip that secures the underside of the trim to the center of the shelf panel.
3. Install the push-pin fastener (1) that secures the trim to the rear shelf panel.
4. Pull the center rear seat belt lower anchor and belt webbing from the retractor through the opening in the top of the rear shelf panel trim and back down to the stud on the floor panel.
5. Install and tighten the nut that secures the seat belt lower anchor to the stud on the floor panel. Tighten the nut to 34 N.m (25 ft. lbs.).
6. Reinstall the right and left upper and lower C-pillar trim to the vehicle. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.
7. Reconnect the battery negative cable.

PANEL, TRUNK TRIM, REAR

REMOVAL

REMOVAL

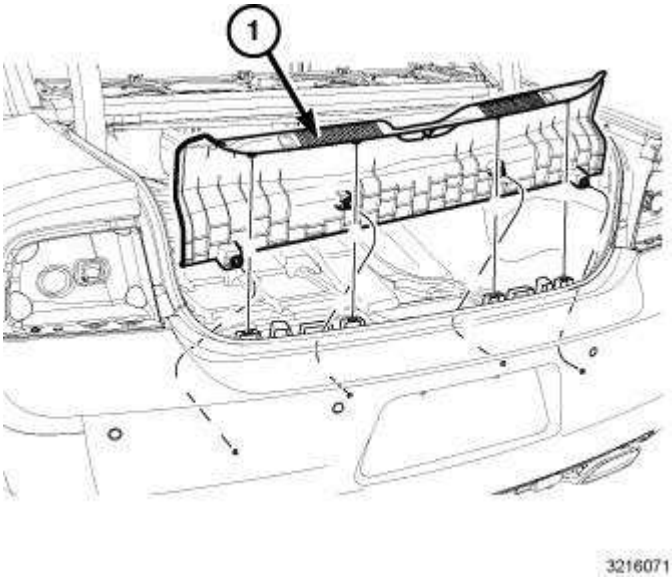

Fig. 406: Trunk Scuff Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Open the decklid.
2. Fold-up load floor to vertical position.
3. If necessary, partially remove the decklid weatherstrip.
4. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the lower retaining clips.
5. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the upper retaining clips.
6. Remove the trunk scuff trim panel (1) from the vehicle.

INSTALLATION

INSTALLATION

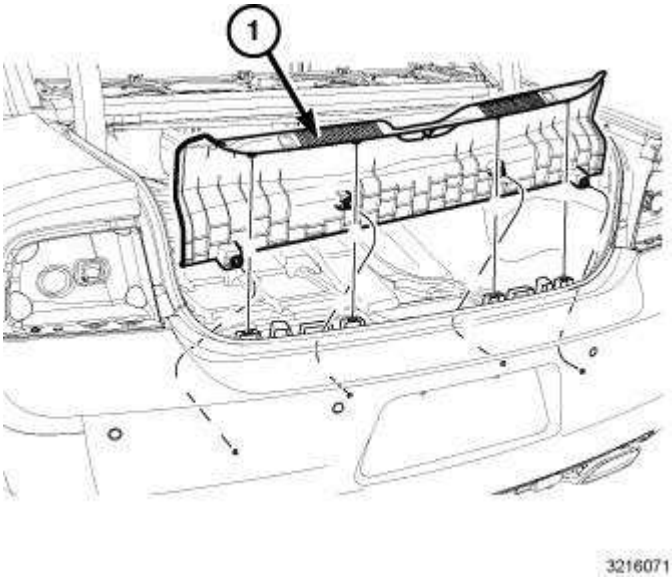

Fig. 407: Trunk Scuff Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Align and position the trunk scuff trim panel (1) to the vehicle.
2. Hand tap to engage the retaining clips.
3. Return the load floor to the horizontal position.
4. If necessary, re-install the decklid weatherstrip.
5. Close the decklid.

PLATE, SCUFF, REAR DOOR SILL

REMOVAL

REMOVAL

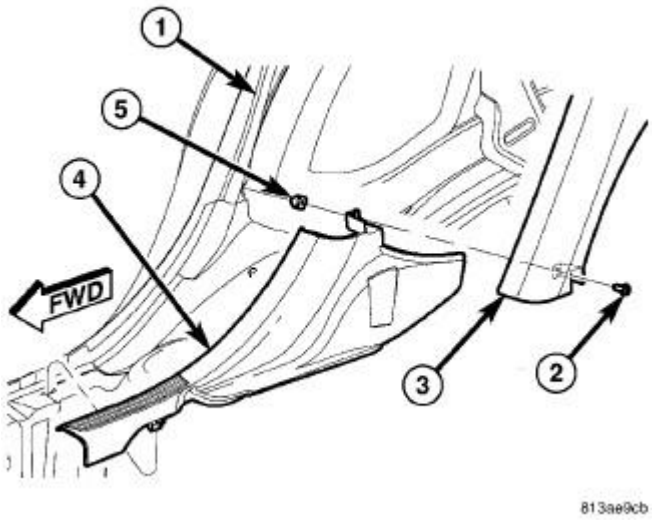

Fig. 408: Rear Door Sill Scuff Plate
Courtesy of CHRYSLER GROUP, LLC

1. Remove the screw (2) that secures the rear door scuff plate (4) to the quarter inner panel.
2. Remove the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel.
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the scuff plate upwards from the sill far enough to disengage the two spring clip retainers that secure the scuff plate to the slots in the sill.
4. Disengage the rear extension of the scuff plate from under the lower C-pillar trim (Sedan) or quarter trim panel (Wagon) (3).
5. Remove the rear door scuff plate from the vehicle.

INSTALLATION

INSTALLATION

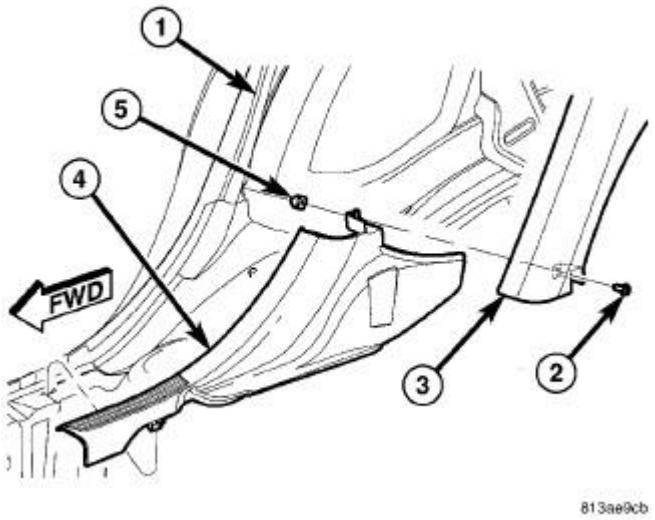

Fig. 409: Rear Door Sill Scuff Plate
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that spring nut (5) is properly installed and in good condition in the quarter inner panel (1).
2. Check to be certain that a plastic nut is properly installed and in good condition in the slot of the rear door opening sill. Replace the plastic nut if any damage is evident.
3. Engage the rear extension of the rear door scuff plate (4) under the lower C-pillar trim (Sedan) or quarter trim panel (Wagon) (3) on the quarter inner panel.
4. Align the two spring clip retainers on the scuff plate with the slots in the rear door sill.
5. Using hand pressure, press firmly and evenly downward on the scuff plate over each of the spring clip locations until the retainers snap into place.
6. Position the outboard rear seat belt lower anchor to the quarter inner panel.
7. Install and tighten the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel. Tighten the screw to 32 N.m (24 ft. lbs.).
8. Install and tighten the screw (2) that secures the scuff plate trim panel and the lower C-pillar trim (Sedan) or quarter trim panel (Wagon) to the quarter inner panel. Tighten the screw to 11 N.m (8 ft. lbs.).

SUNSHADE, REAR WINDOW

REMOVAL

REMOVAL

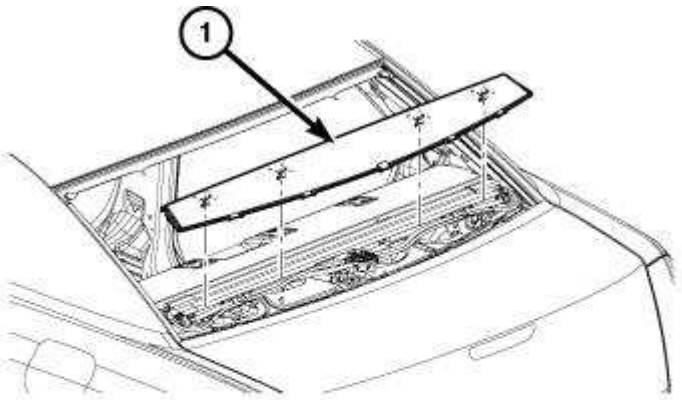

Fig. 410: Sunshade Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs from the sunshade trim panel (1) and remove.

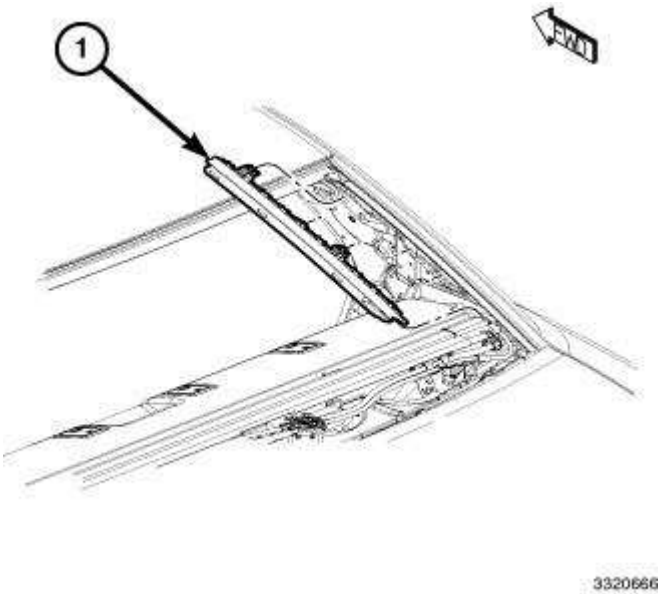

Fig. 411: Sunshade Guide Track
Courtesy of CHRYSLER GROUP, LLC

3. Remove the C-pillar trim. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
4. Disengage the sunshade from the track.
5. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs

from the sunshade guide track (1) and remove the track.

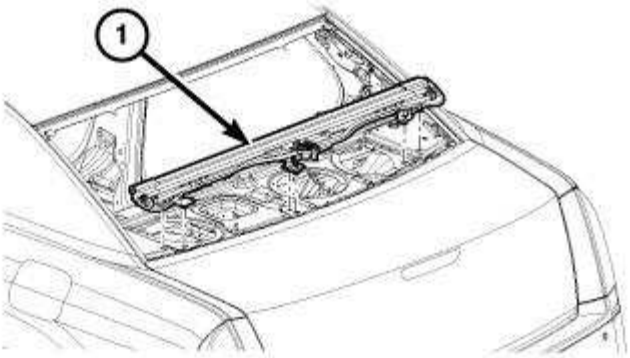

Fig. 412: Rear Window Sunshade
Courtesy of CHRYSLER GROUP, LLC

6. Remove the package tray trim panel. Refer to **PANEL, REAR SHELF, REMOVAL**.
7. Remove the fasteners securing the rear window sunshade (1) to the package tray.
8. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs securing the sunshade (1).
9. Disconnect the sunshade electrical connector and remove the rear window sunshade (1) from the vehicle.

INSTALLATION

INSTALLATION

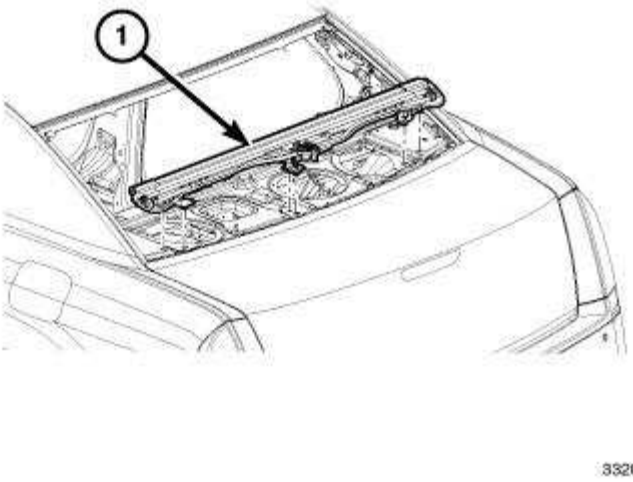

Fig. 413: Rear Window Sunshade
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear window sunshade into the vehicle and connect the sunshade electrical connector.
2. Align the retaining tabs to the openings in the package tray and hand tap to engage the retaining tabs securing the sunshade (1).
3. Install the fasteners securing the rear window sunshade (1) to the package tray. Tighten the fasteners securely.
4. Install the package tray trim panel. Refer to **PANEL, REAR SHELF, INSTALLATION**.

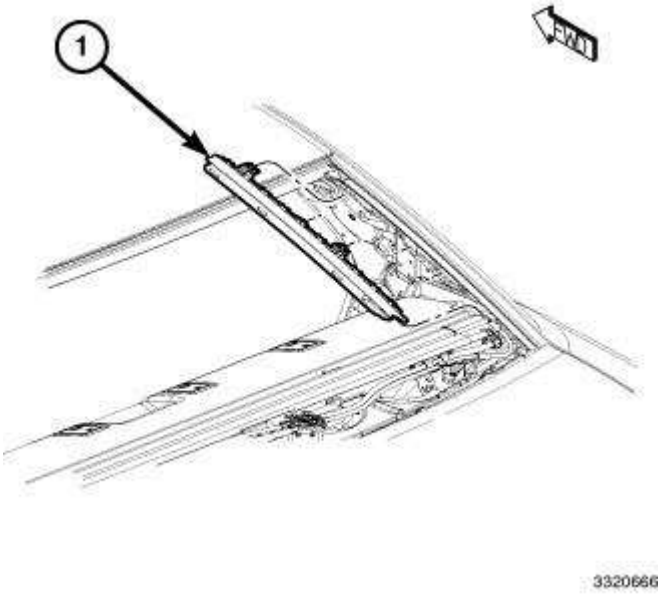

Fig. 414: Sunshade Guide Track
Courtesy of CHRYSLER GROUP, LLC

5. Position and align the sunshade guide track (1) to the C-pillar, hand tap to engage the retaining tabs securing the sunshade guide track to the C-pillar.
6. Engage the sunshade to the track.
7. Install the C-pillar trim. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.

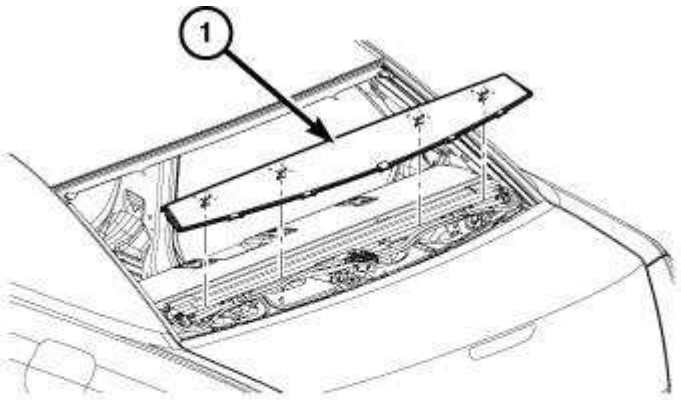

Fig. 415: Sunshade Trim Panel
Courtesy of CHRYSLER GROUP, LLC

8. Align the sunshade trim panel (1), hand tap to engage the retaining tabs.
9. Connect the negative battery cable.

WELT, TRUNK

REMOVAL

REMOVAL

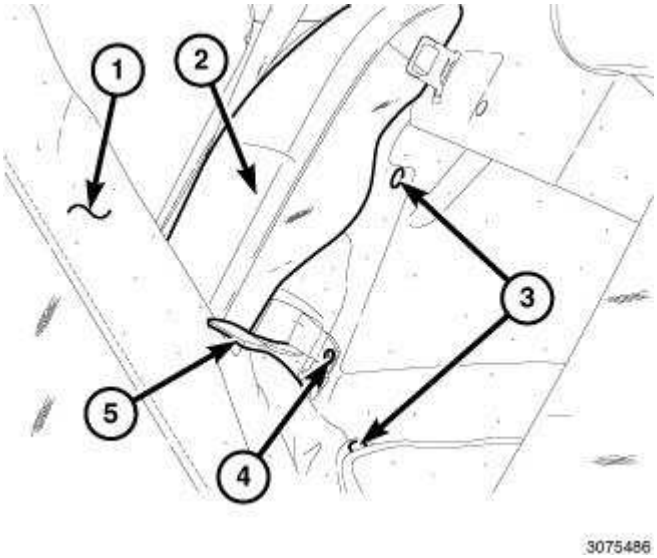

Fig. 416: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trunk rear trim panel from the luggage compartment. Refer to **PANEL, TRUNK TRIM, REAR, REMOVAL**.
2. Pull the RH rear seat back (1) forward, exposing the luggage compartment.
3. Behind the RH rear seat, pull the carpet tab (5) up, exposing the rear seat back side bolster bracket retaining bolt (4).
4. Remove the push-in fasteners (3) that secure the trunk side trim.

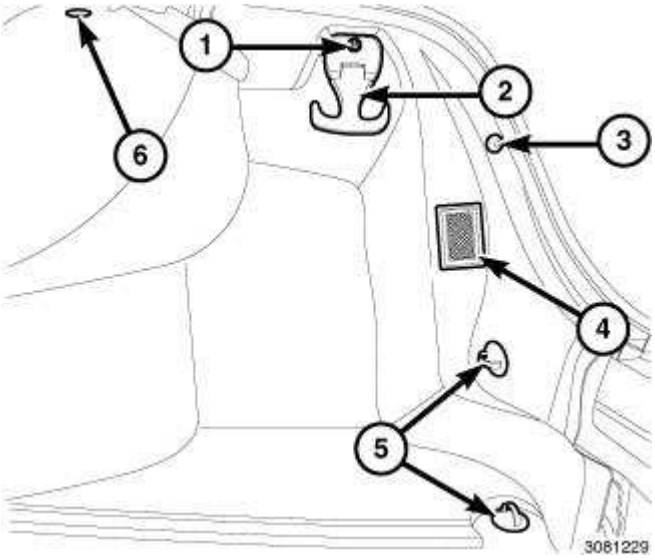

Fig. 417: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

5. Remove the wheel well cover trim as follows:
    1. On the RH side, remove the cargo net hook screw (1) and upper cargo hook (2).
    2. On the RH side, remove the push-in retainer (3) that secures the wheel well cover trim.
    3. On the RH side, remove the cargo net lower hooks (5).
    4. Carefully pull back the wheel well cover enough to disconnect the trunk lamp (4) harness connector, and remove the wheel well cover trim.

INSTALLATION

INSTALLATION

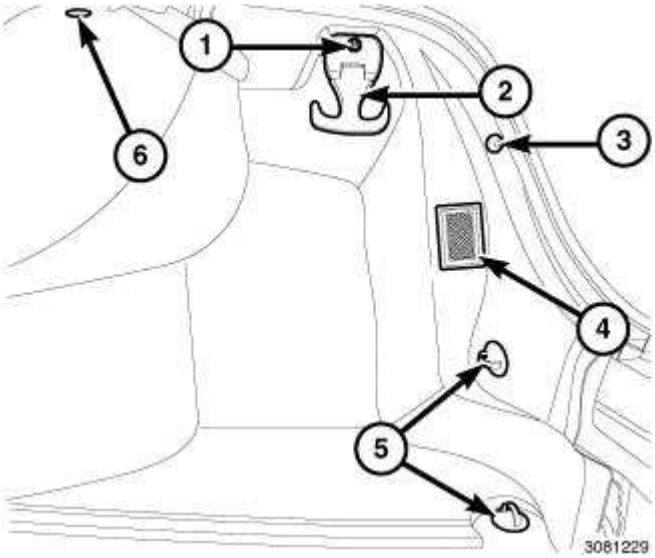

Fig. 418: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Install the wheel well cover trim as follows:
    1. Position the wheel well cover and connect the trunk lamp (4) harness connector.
    2. Install the cargo net lower hooks (5).
    3. Install the push-in retainer (3) that secures the wheel well cover trim.
    4. Install the cargo net hook screw (1) and upper cargo hook (2).
2. Reinstall the trunk rear trim panel into the luggage compartment. Refer to **PANEL, TRUNK TRIM, REAR, INSTALLATION**.

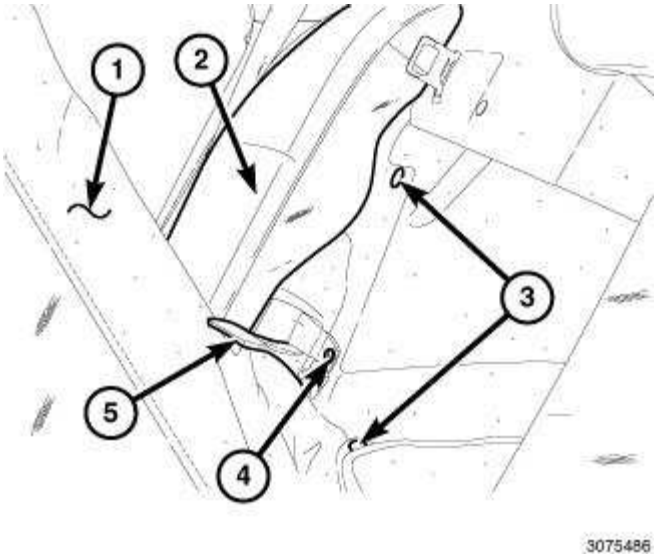

Fig. 419: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Position the forward portion of the trunk side trim and install the push pin fasteners (3) to secure

the trunk side trim.

4. Reposition the carpet tab (5), covering the rear seat back side bolster bracket retaining bolt (4).

PAINT

SPECIFICATIONS

SPECIFICATIONS

Exterior vehicle body color(s) are identified on the Vehicle Certification Label or the Body Code Plate.

The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the same color names used on most repair product containers.

EXTERIOR COLORS

EXTERIOR COLOR	CHRYSLER CODE
Midnight Blue Pearlcoat	BB8
Deep Molten Red Pearlcoat	BR8
Tungsten Met. Clearcoat	CDM
Gloss Black Clearcoat	DX8
Bright White Clearcoat	GW7
Luxury Brown Pearlcoat	GTW
Sapphire Crystal Met. Clearcoat	JBF
Deep Cherry Red Crystal Pearlcoat	JRP
Ivory 3 Coat	JWD
Crystal Blue Pearlcoat	KDB
Cashmere Pearlcoat	KFS
Bright Silver Met. Clearcoat	WS2

INTERIOR COLORS

INTERIOR COLOR	CHRYSLER CODE
Dark Frost Beige/Light Frost Beige	L9
Black/Light Frost Beige	XL
Black/Radar Red	XR
Black	X9

SEATS

WARNING

WARNING

WARNING: **During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® parts catalog. Failure to follow these instructions may result in personal injury or death.**

WARNING: **On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.**

WARNING: **On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Airbag Control Module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.**

WARNING: **Replace all restraint system components only with parts specified in the Chrysler Mopar® parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.**

WARNING: **The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® parts catalog. Failure to follow these instructions may result in personal injury or death.**

WARNING: On vehicles equipped with the Occupant Classification System (OCS) do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

ADJUSTER, SEAT, FRONT

REMOVAL

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Remove the seat cushion as necessary. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** or **COVER, SEAT CUSHION, SECOND ROW, REMOVAL**.

POWER

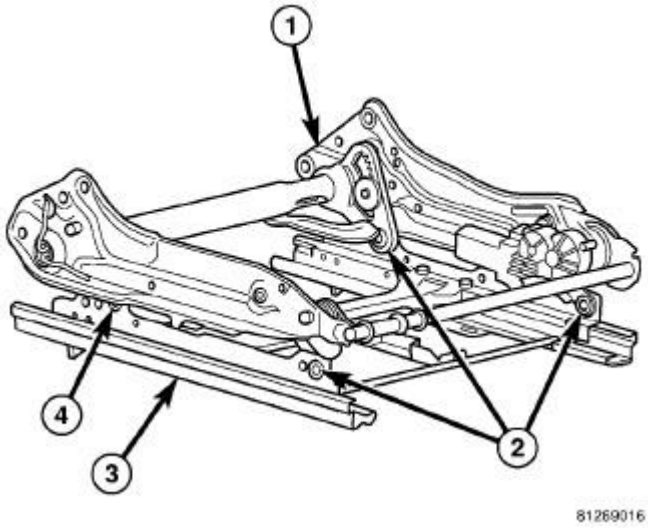

Fig. 420: Identifying Power Adjusters & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the seat risers. Refer to **RISER, SEAT, FRONT, REMOVAL**.
2. Remove the bolts and nuts (2 AND 4) and separate the height adjuster assembly from the length adjuster assembly (3).

NOTE: Bolt (4) is a different size from the other three bolts (2). Note the location for proper installation.

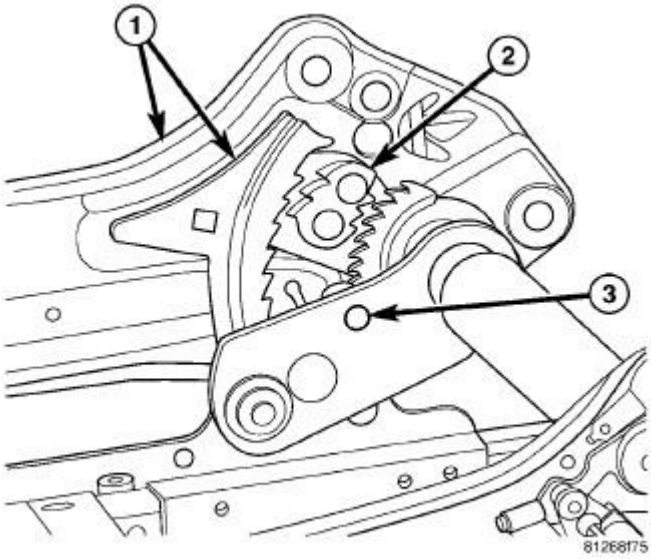

Fig. 421: Locking Pawl
Courtesy of CHRYSLER GROUP, LLC

WARNING: A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- **Locking pawl (2) loose**
- **Locking pawl (2) engaged into the seat frame side member (1)**
- **Height adjuster only works on outboard side**
- **Broken or missing shear pin (3)**

If any one or more of these symptoms exist replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in personal injury or death.

MANUAL

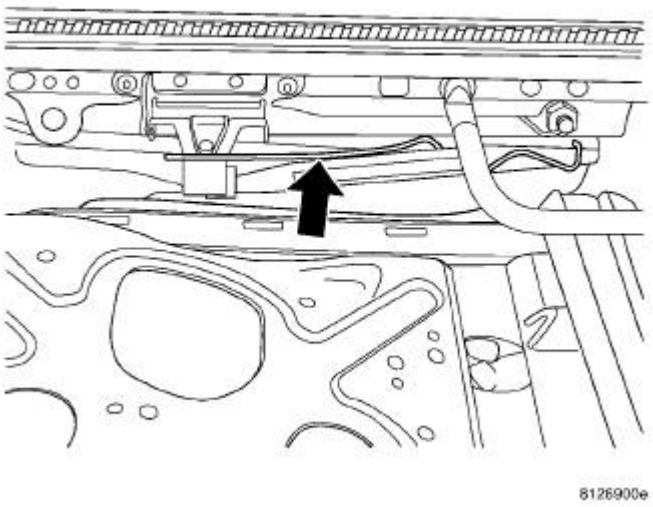

Fig. 422: Towel Bar Spring
Courtesy of CHRYSLER GROUP, LLC

1. Remove the spring clip.

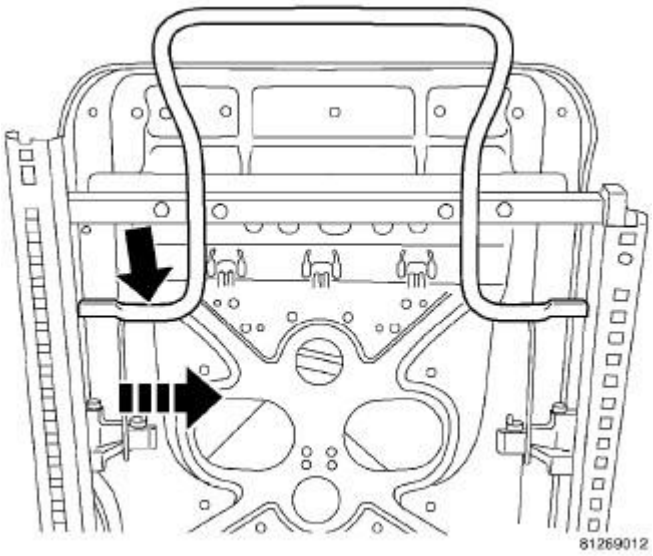

Fig. 423: Towel Bar
Courtesy of CHRYSLER GROUP, LLC

2. Squeeze the towel bar together and pull the towel bar out of the left and right seat tracks.

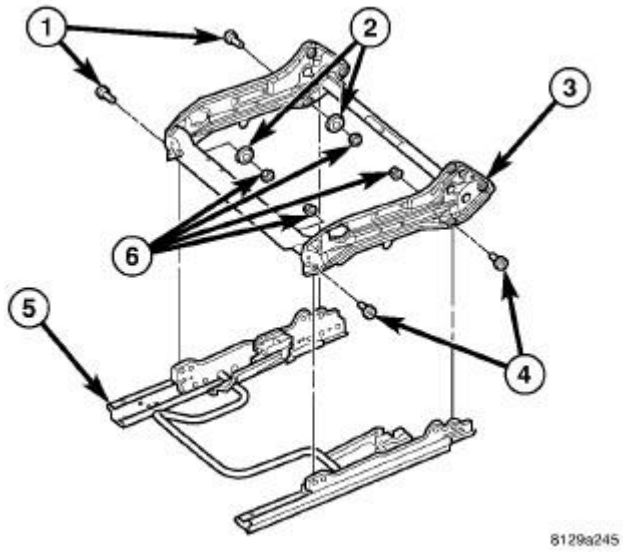

Fig. 424: Manual Adjusters
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bolts (1 AND 4), nuts (6) and spacers (2) and separate the side member assembly (3) from the length adjuster assembly (5).

INSTALLATION

INSTALLATION

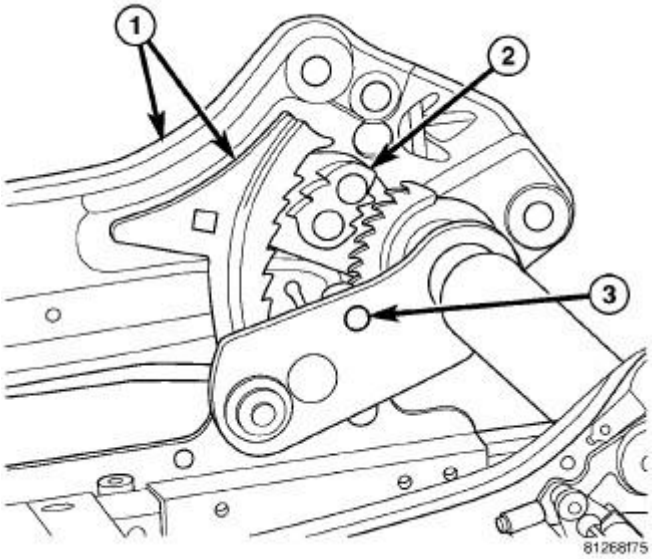

Fig. 425: Locking Pawl
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.

WARNING: A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- **Locking pawl (2) loose**
- **Locking pawl (2) engaged into the seat frame side member (1)**
- **Height adjuster only works on outboard side**
- **Broken or missing shear pin (3)**

If any one or more of these symptoms exist replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in personal injury or death.

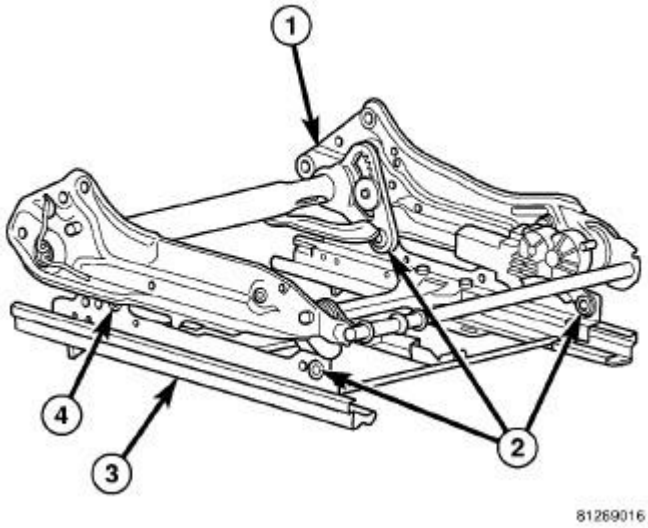

Fig. 426: Identifying Power Adjusters & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the seat risers. Refer to **RISER, SEAT, FRONT, INSTALLATION**.
3. Position the height adjuster assembly (1) onto the length adjuster assembly (3) and install the nuts, bolts and spacers on the inboard side.

NOTE: Bolts (2) and (4) are different and need to be installed into the correct positions.

4. Tighten the bolts to 21 N.m (15 ft. lbs.).
5. Install the seat cushion and install the seat. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** or **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION**.

MANUAL

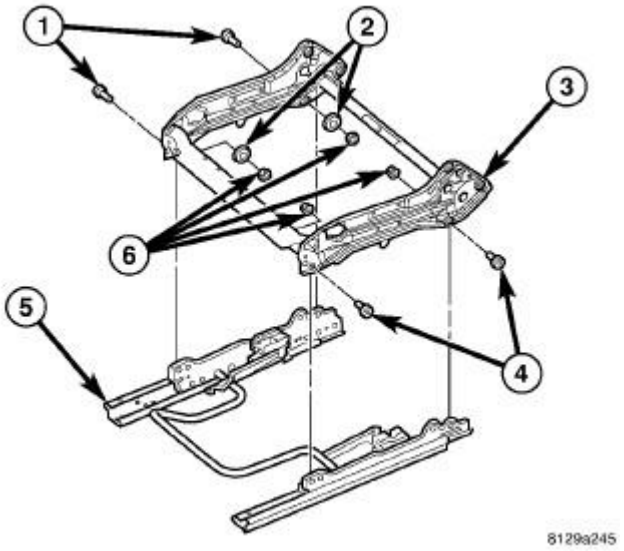

Fig. 427: Manual Adjusters
Courtesy of CHRYSLER GROUP, LLC

1. Install the seat risers. Refer to **RISER, SEAT, FRONT, INSTALLATION**.
2. Position the side member assembly (3) onto the length adjuster assembly (5) and install the nuts (6), bolts (1 AND 4) and spacers (2) on the inboard side.
3. Tighten the bolts to 42 N.m (31 ft. lbs.).

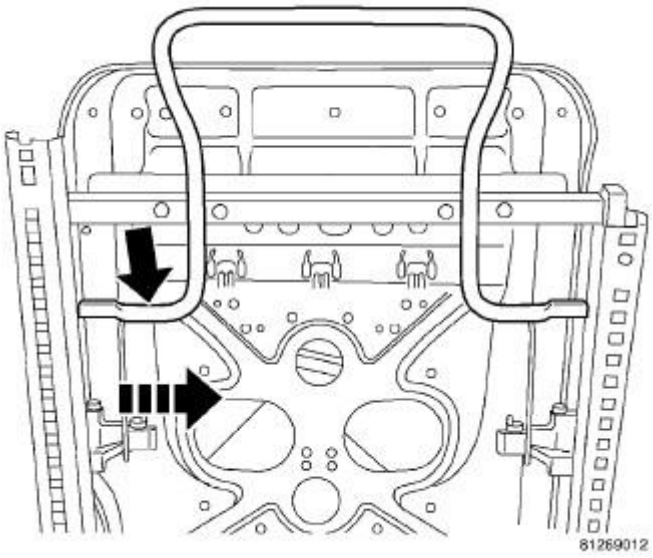

Fig. 428: Towel Bar
Courtesy of CHRYSLER GROUP, LLC

4. Squeeze the towel bar together and insert the ends into the bushings on both tracks.

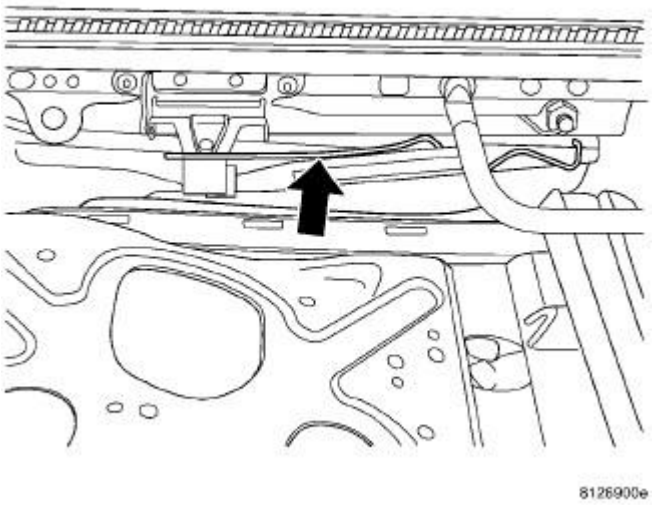

Fig. 429: Towel Bar Spring
Courtesy of CHRYSLER GROUP, LLC

5. Install the spring clip.
6. Install the seat cushion and install the seat. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** or **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION**.

ARMREST, REAR

REMOVAL

REMOVAL

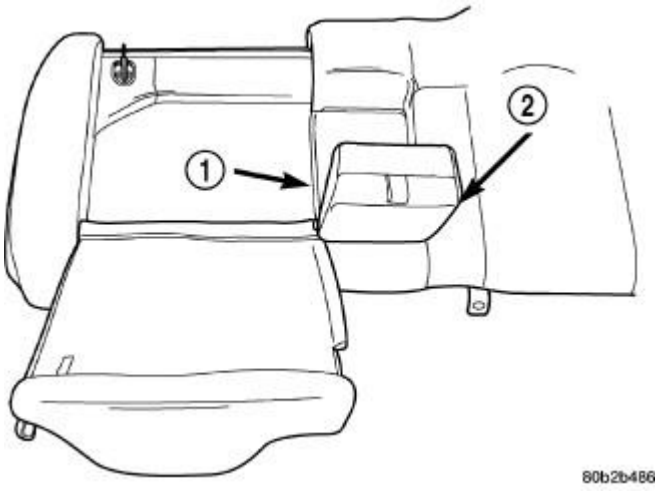

Fig. 430: Rear Seat Arm Rest - 60/40
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT
2 - RETAINING C-CLIP

1. Fold down 40 side rear seat back.
2. Remove arm rest bolt (1).
3. Remove retaining C-clip (2).
4. Remove arm rest.

INSTALLATION

INSTALLATION

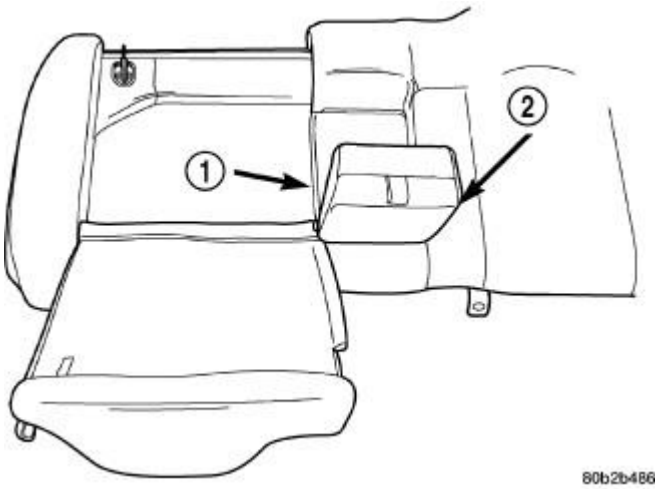

Fig. 431: Rear Seat Arm Rest - 60/40
Courtesy of CHRYSLER GROUP, LLC

1 - BOLT
2 - RETAINING C-CLIP

1. Place arm rest in bracket.
2. Install arm rest bolt (1). Tighten to 12 N.m (9 ft. lbs.).
3. Install retaining C-clip (2).
4. Reposition the seats.

BOLSTER, SEAT

REMOVAL

REMOVAL

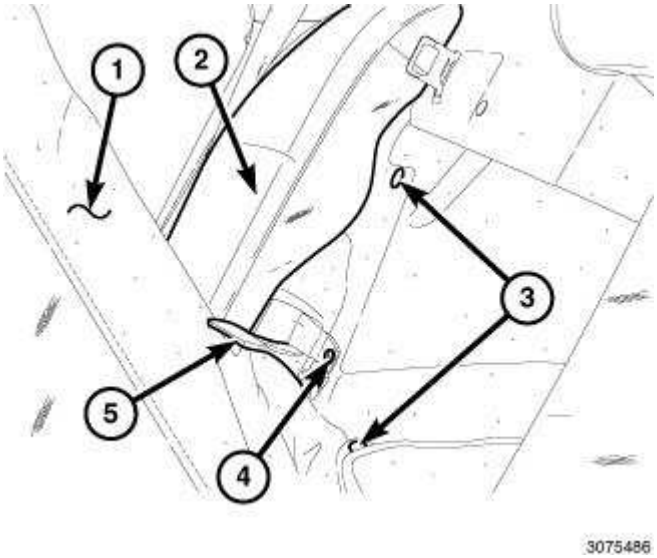

Fig. 432: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Pull the RH rear seat back (1) forward, exposing the luggage compartment.
2. Behind the RH rear seat, pull the carpet tab (5) up, exposing the rear seat back side bolster bracket retaining bolt (4).
3. Remove the RH rear seat back side bolster bracket bolt (4).

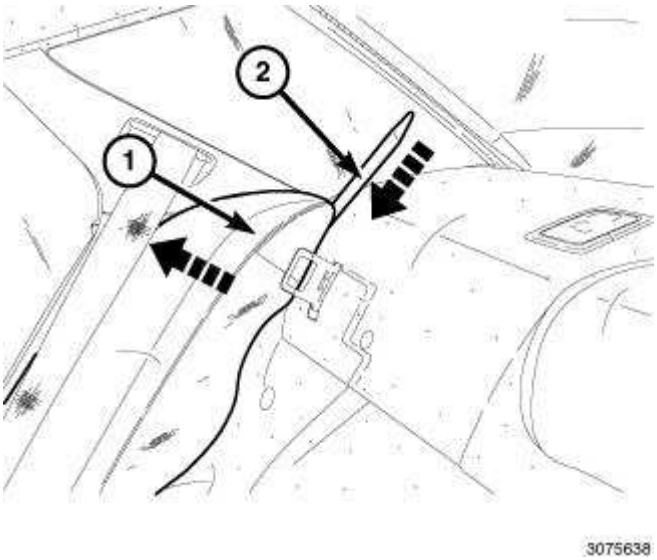

Fig. 433: Trim Stick & Seat Back Bolster
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick (special tool #C-4755, Trim Stick) (2) or equivalent, push down between the rear shelf and the RH rear seat back bolster (1) to release the retaining clip, and pull out on the seat back bolster (1) to remove.

INSTALLATION

INSTALLATION

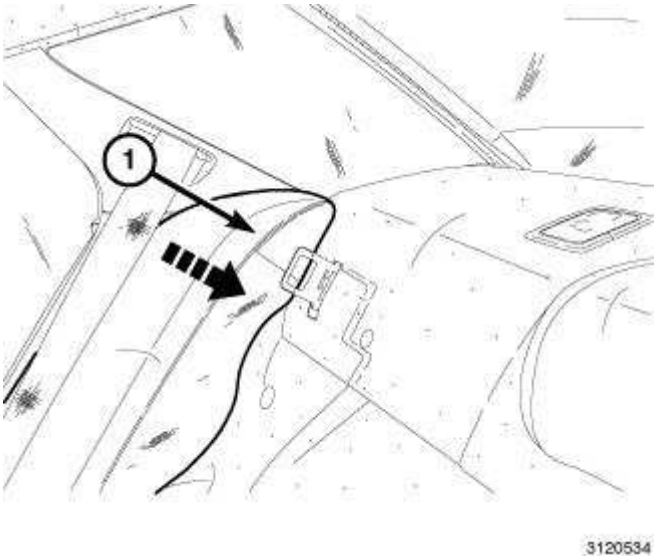

Fig. 434: Rear Seat Back Bolster
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear seat back bolster (1) and push in to engage the upper clip into the body.

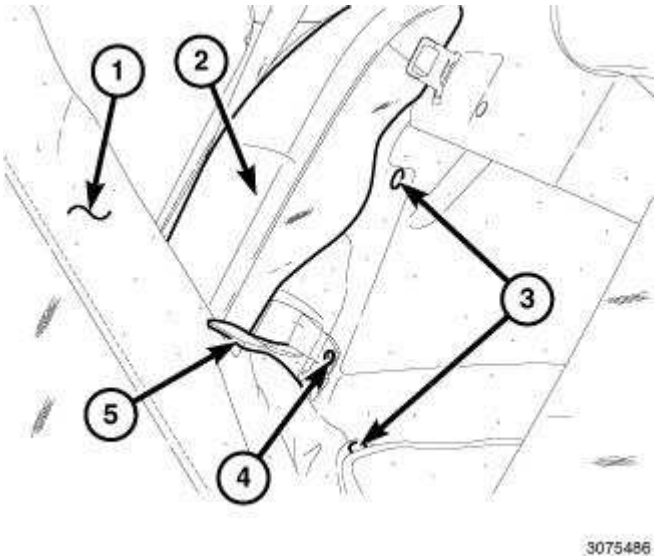

Fig. 435: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the RH rear seat back side bolster bracket bolt (4). Tighten the bolt securely.
3. Reposition the carpet tab (5), covering the rear seat back side bolster bracket retaining bolt (4).

COVER, SEAT BACK, FRONT

REMOVAL

REMOVAL

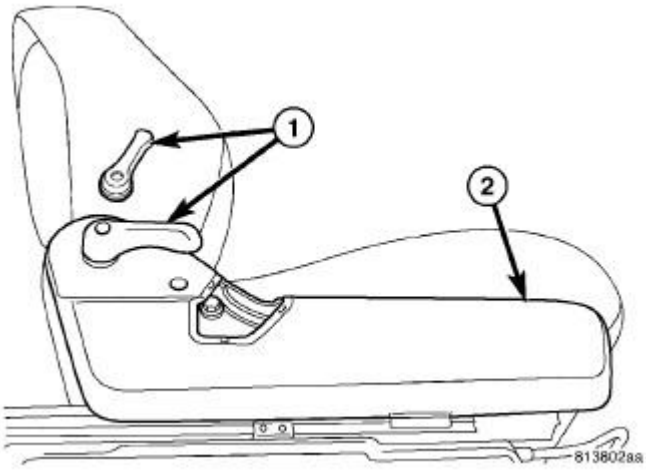

Fig. 436: Handles & Shields
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Remove the front seat. Refer to **SEAT, FRONT, REMOVAL**.
3. Remove the lumbar and recliner handles (1).
4. Remove the screws and remove the side shields (2).

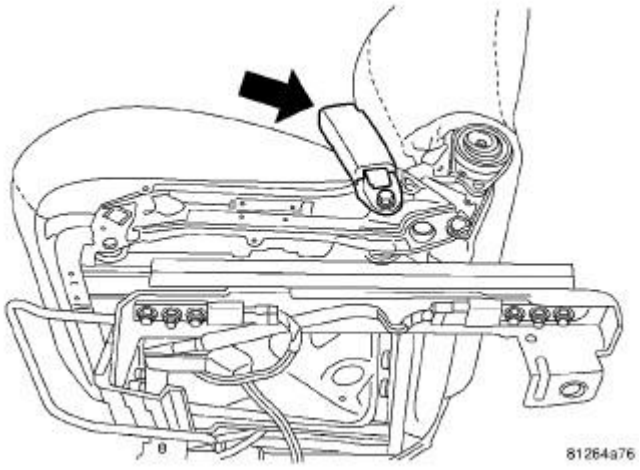

Fig. 437: Buckle
Courtesy of CHRYSLER GROUP, LLC

5. Remove the belt buckle.

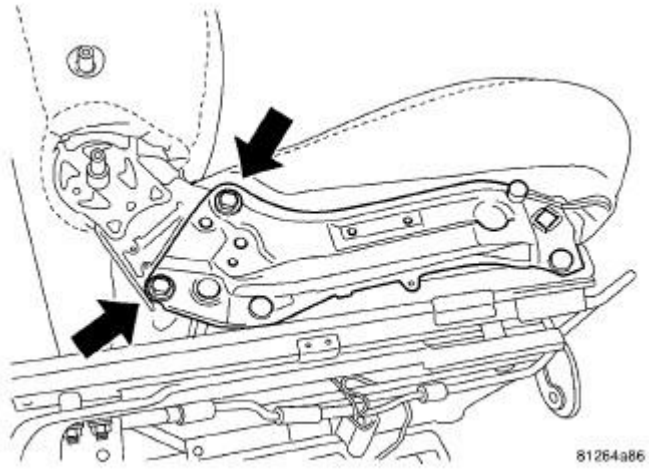

Fig. 438: Back Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the seat back bolts from both sides.

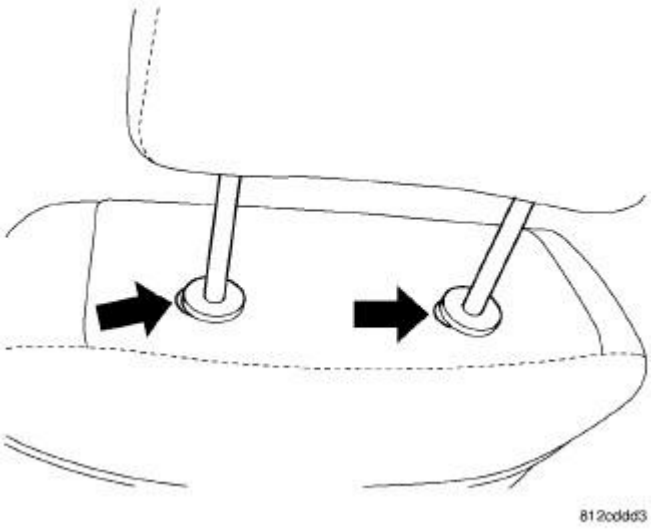

Fig. 439: Removing/Installing Head Rest
Courtesy of CHRYSLER GROUP, LLC

7. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

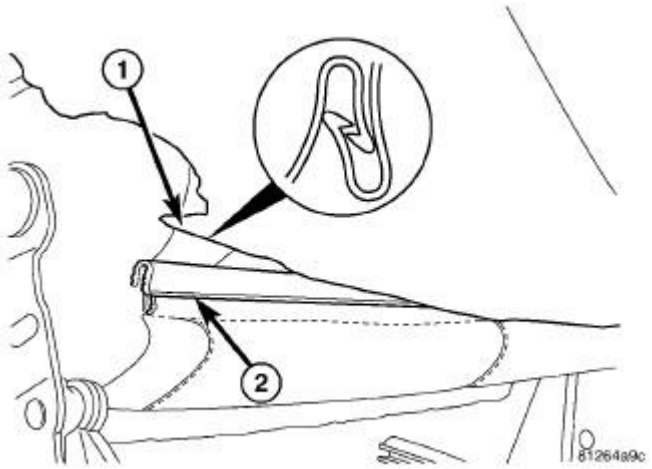

Fig. 440: J-Straps
Courtesy of CHRYSLER GROUP, LLC

8. Separate the j-straps (1 AND 2) and pull cover up over frame and remove cushion.
9. Pinch both headrest sleeve ribs from inside the seat back frame with pliers or equivalent.
10. Strike the bottom of the sleeve with a rubber mallet or equivalent, and remove the headrest sleeves.

INSTALLATION

INSTALLATION

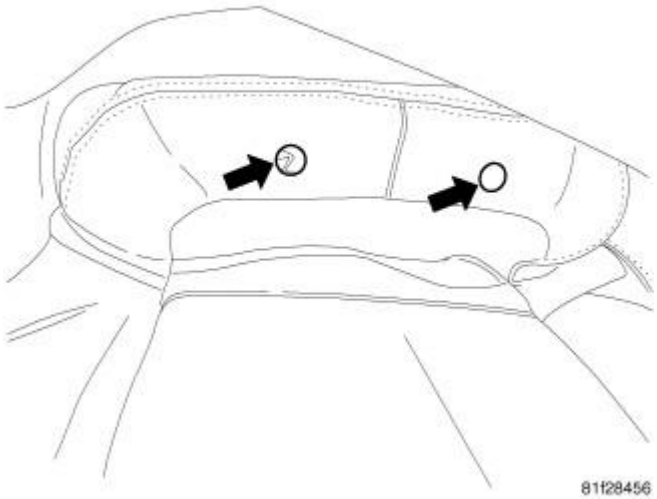

Fig. 441: Align Head Rest
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.

2. With the cover turned inside out, align the head rest guide sleeve holes with the trim cover on the foam pad.
3. Roll the cover down over the seat back.

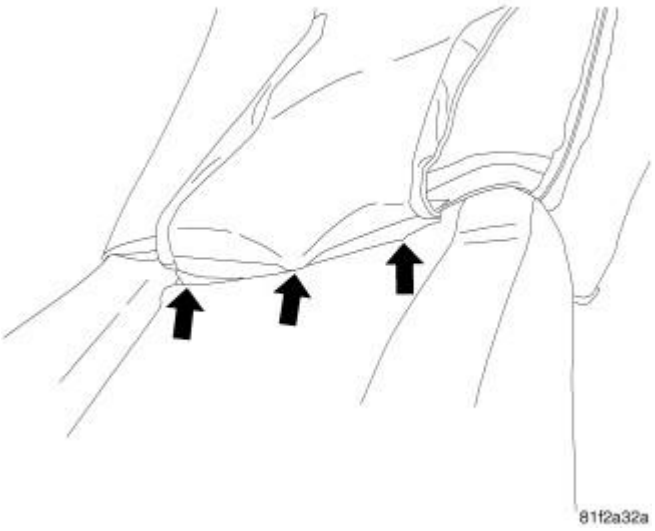

Fig. 442: Horizontal Wire
Courtesy of CHRYSLER GROUP, LLC

4. Hog ring the horizontal wire in the trim cover to the wire in the foam pad.
5. Continue rolling the cover completely down the back.

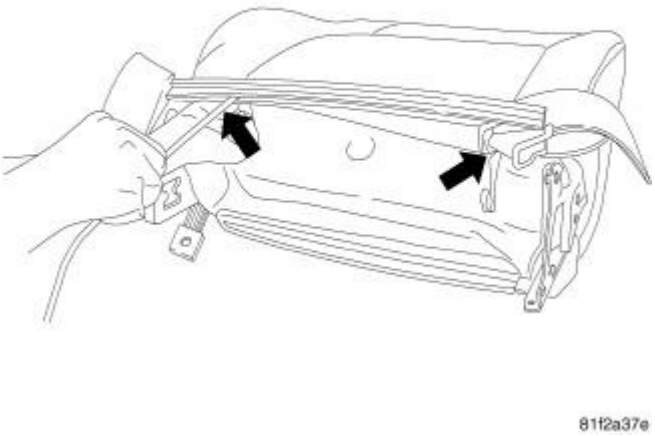

Fig. 443: Vertical Support Wire
Courtesy of CHRYSLER GROUP, LLC

6. Insert the two vertical support wires into the vertical pockets on the trim cover.

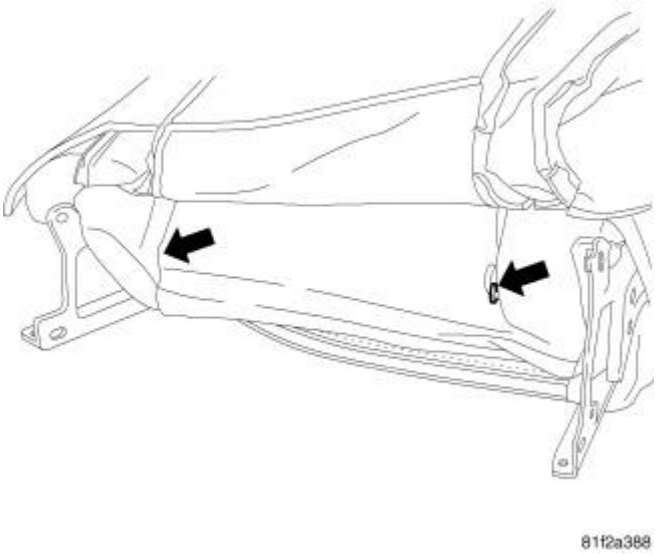

Fig. 444: Vertical Hog Ring
Courtesy of CHRYSLER GROUP, LLC

7. Hog ring the support wires to the support wires in the foam pad.
8. Pull the trim tab up and hook it onto the back frame.

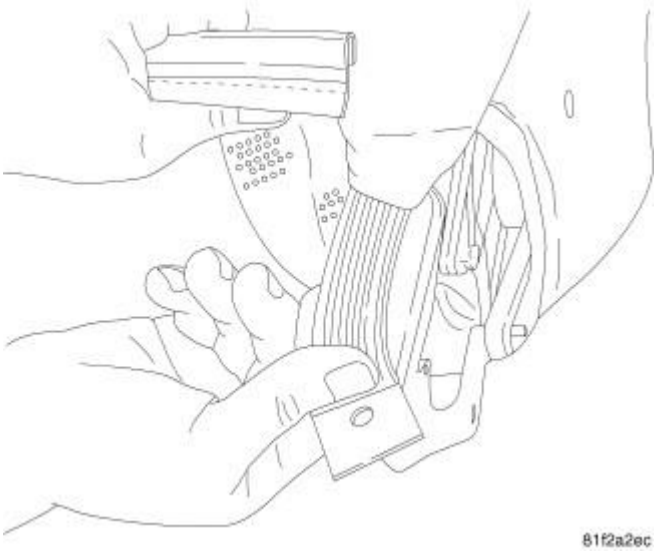

Fig. 445: Elastic Band
Courtesy of CHRYSLER GROUP, LLC

9. Attach the elastic band.
10. Connect the j-strap.

COVER, SEAT CUSHION, FRONT

REMOVAL

REMOVAL

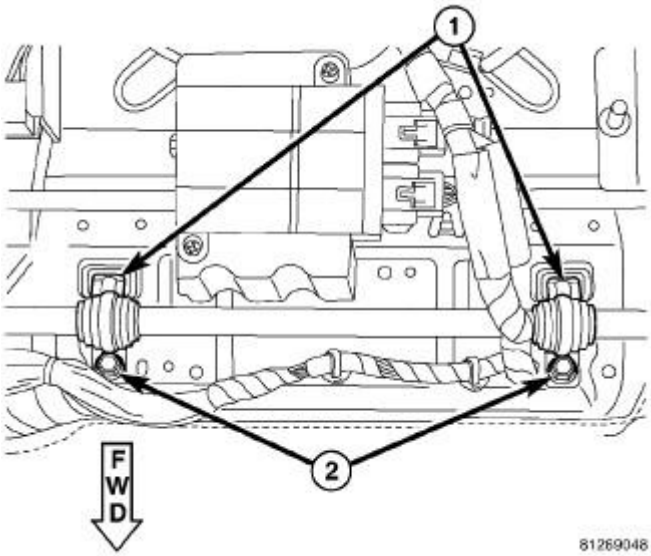

Fig. 446: Cushion Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Move the seat to the forward position and disconnect and isolate the batter negative cable.
3. Remove the bolts (2) and the clamps (1) and remove the seat cushion.
4. Disconnect the electrical connector, if equipped.

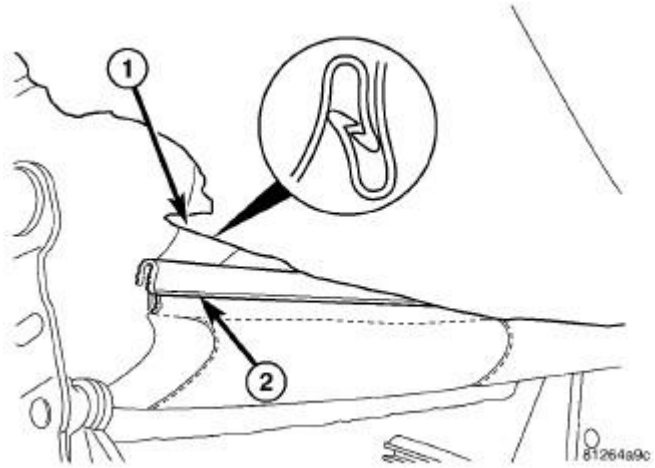

Fig. 447: J-Straps
Courtesy of CHRYSLER GROUP, LLC

5. Separate the j-straps (1 AND 2) and seat cushion cover and foam.

INSTALLATION

INSTALLATION

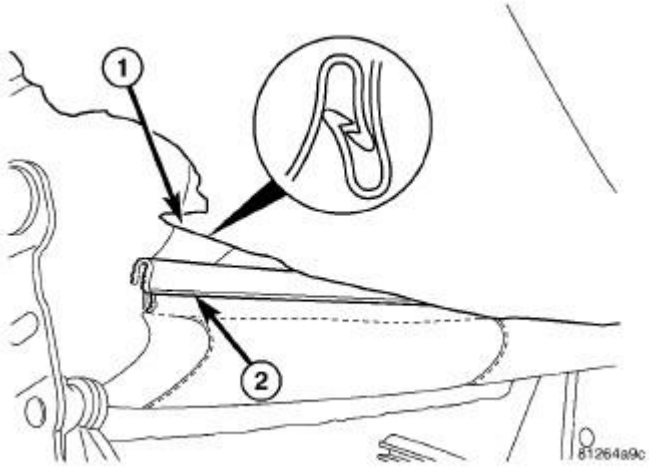

Fig. 448: J-Straps
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Position the cushion cover and foam over the seat pan and connect the j-straps (1 AND 2).

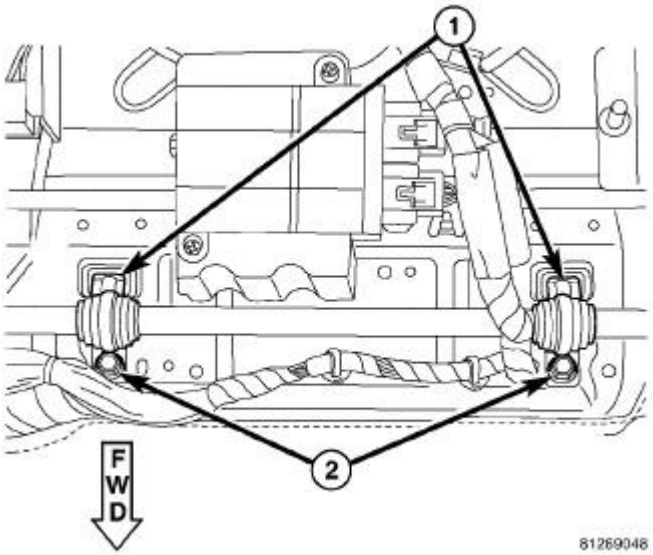

Fig. 449: Cushion Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Position the seat cushion assembly onto the seat frame and install the clamps (1).
4. Connect the wire harness to the seat cushion pan, if equipped.

5. Install the bolts (2) and tighten to 10 N.m (90 in. lbs.).
6. Connect battery negative cable.

COVER, SEAT CUSHION, SECOND ROW

REMOVAL

REMOVAL

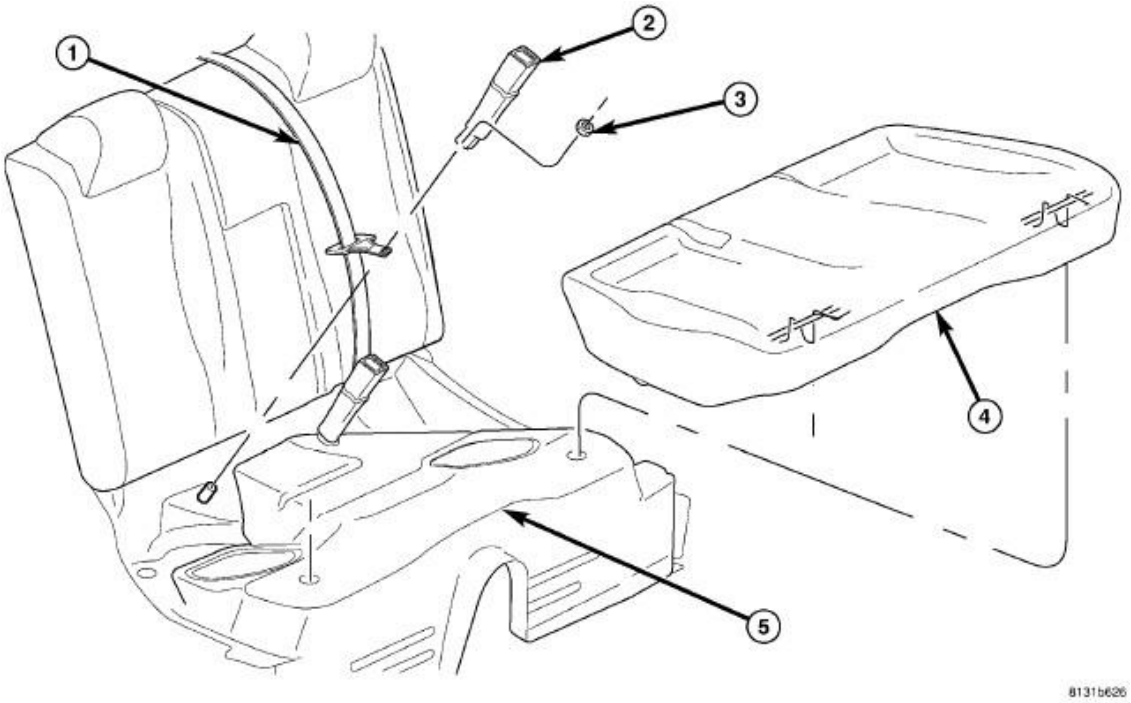

Fig. 450: Rear Seat Cushion & Rear Seat Belt Rib Buckle
Courtesy of CHRYSLER GROUP, LLC

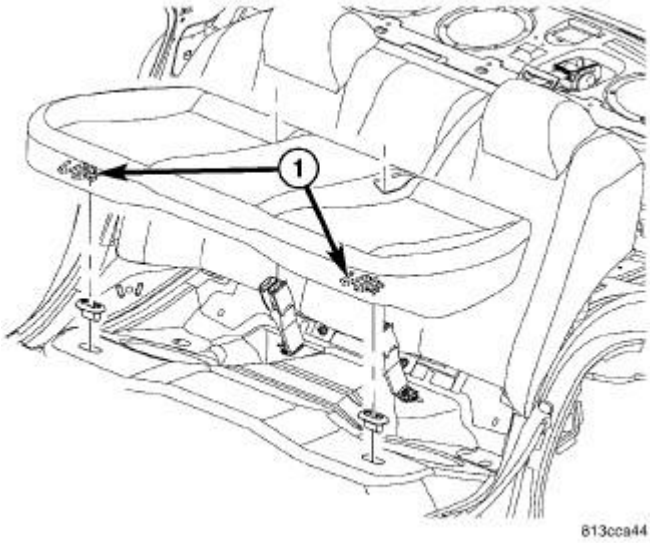

Fig. 451: Rear Seat Cushion
Courtesy of CHRYSLER GROUP, LLC

1. Pull upward at forward edge of cushion each retainer loop of the rear seat cushion to disengage retainer loops from cups in floor.
2. Remove rear seat cushion (4) from vehicle.

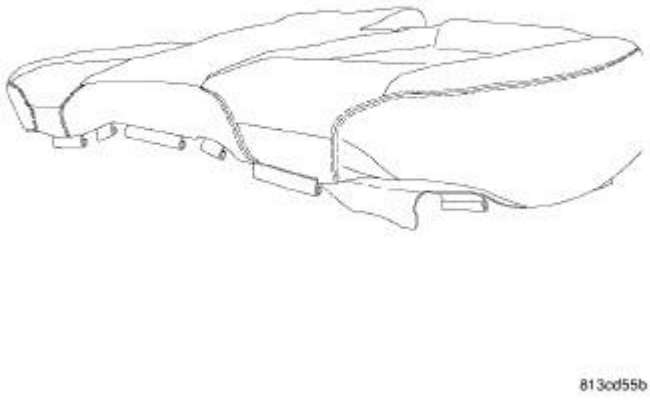

Fig. 452: Connect J-Straps
Courtesy of CHRYSLER GROUP, LLC

3. Disengage the J-straps attaching seat cover to the cushion.

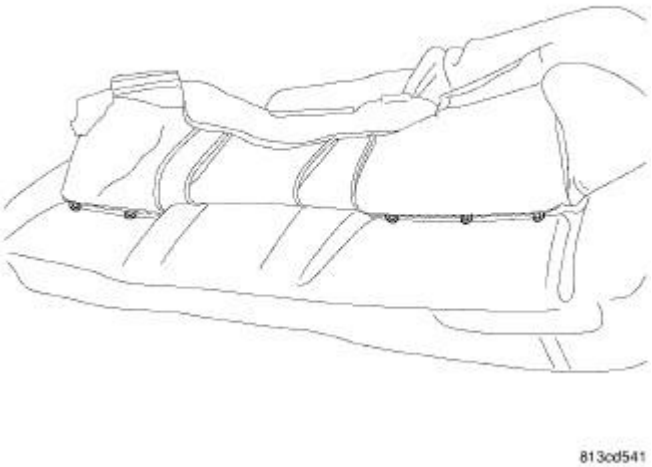

Fig. 453: Move Seat Cover To Access Hog Rings
Courtesy of CHRYSLER GROUP, LLC

4. Fold rear of the seat cover forward to uncover hog rings.

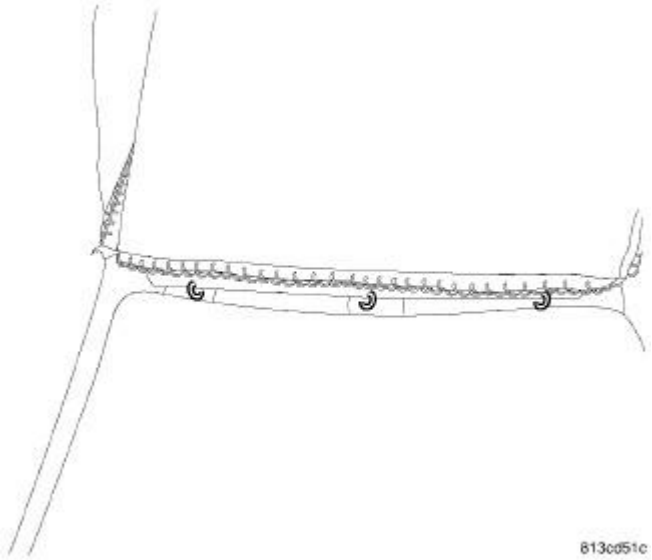

Fig. 454: Rear Seat Cushion Hog Rings (4)
Courtesy of CHRYSLER GROUP, LLC

5. Start on the rear side of the cushion and cut hog rings.

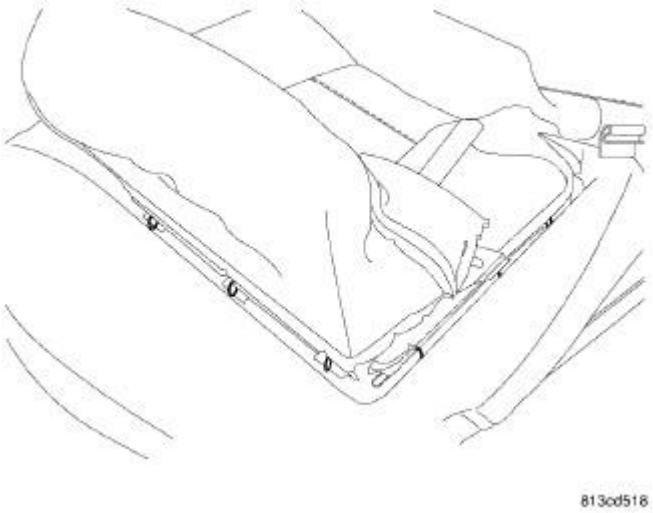

Fig. 455: Rear Seat Cushion Hog Rings (3)
Courtesy of CHRYSLER GROUP, LLC

6. Cut the hog rings on the outer side of the cushion.

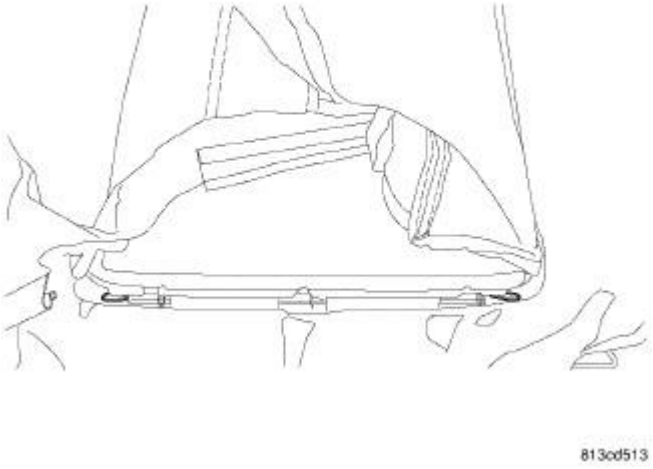

Fig. 456: Rear Seat Cushion Hog Rings (2)
Courtesy of CHRYSLER GROUP, LLC

7. Work around the outer edges and cut the hog rings.

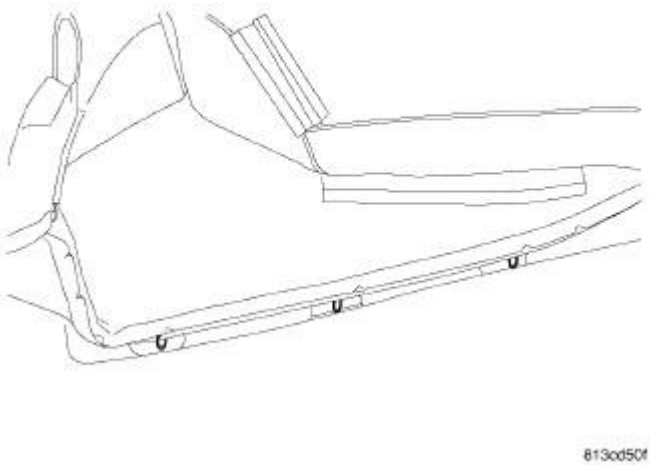

Fig. 457: Rear Seat Cushion Hog Rings (1)
Courtesy of CHRYSLER GROUP, LLC

8. Fold cover up to access the inner hog rings and cut them.
9. Repeat operation on the other side of cushion.
10. Remove seat cushion cover from seat cushion.

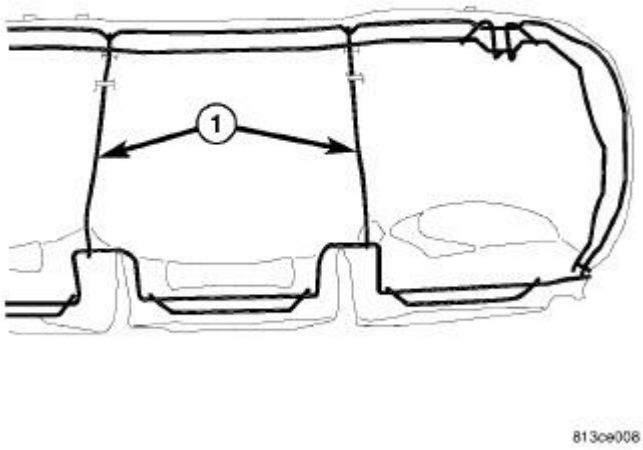

Fig. 458: Cushion Support
Courtesy of CHRYSLER GROUP, LLC

11. If replacing cushion, remove the cushion support by cutting the hog rings attaching it to the foam and remove.

INSTALLATION

INSTALLATION

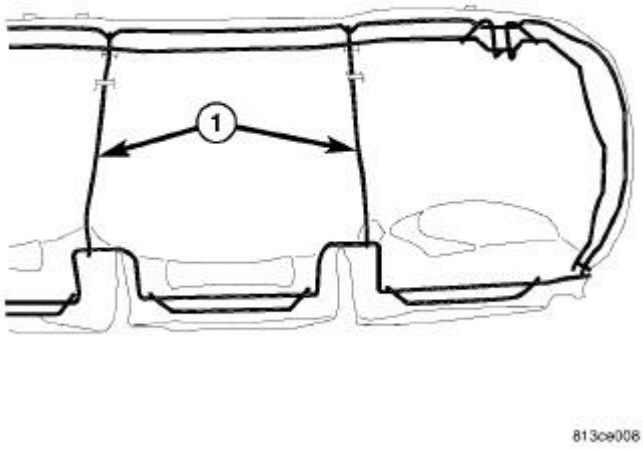

Fig. 459: Cushion Support
Courtesy of CHRYSLER GROUP, LLC

1. Install hog rings attaching cushion support, if remove.

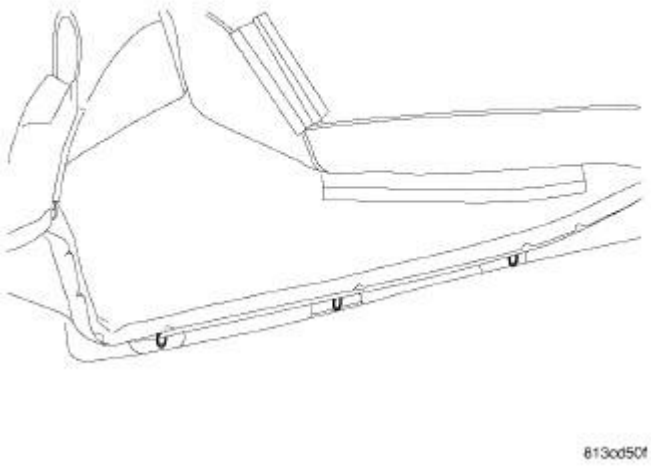

Fig. 460: Rear Seat Cushion Hog Rings (1)
Courtesy of CHRYSLER GROUP, LLC

2. Place seat cover into position on the foam.
3. Install the attaching hog rings on the inner side of the seat cover and cushion.

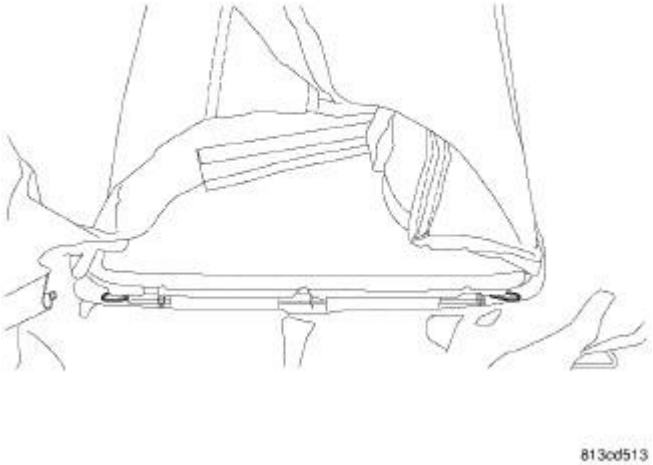

Fig. 461: Rear Seat Cushion Hog Rings (2)
Courtesy of CHRYSLER GROUP, LLC

4. Install hog rings on the on the front side the seat cover.

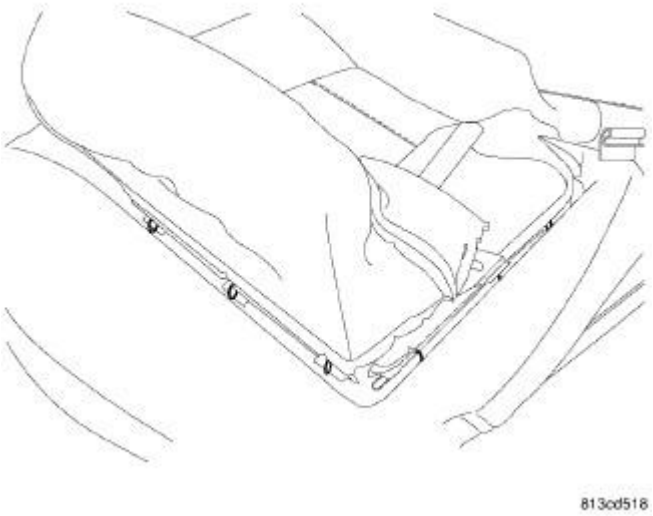

Fig. 462: Rear Seat Cushion Hog Rings (3)
Courtesy of CHRYSLER GROUP, LLC

5. Install hog rings on the outer side of the seat cover. Check for seat cover wrinkles.

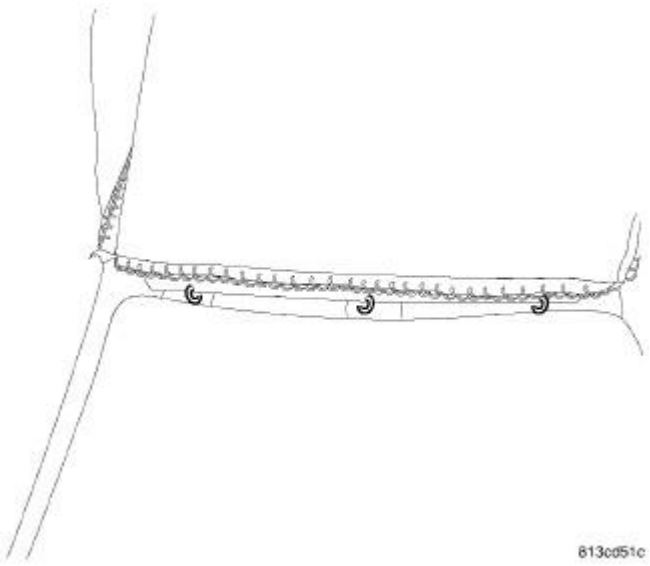

Fig. 463: Rear Seat Cushion Hog Rings (4)
Courtesy of CHRYSLER GROUP, LLC

6. Install the hog rings on the rear side of seat cover.
7. Repeat the operation for the other side of cushion.

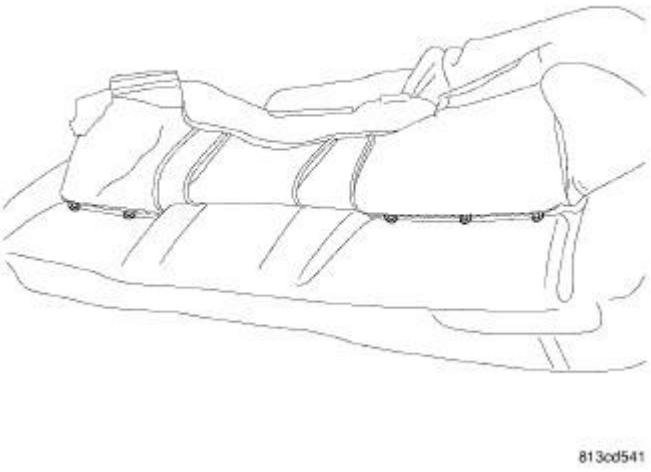

Fig. 464: Move Seat Cover To Access Hog Rings
Courtesy of CHRYSLER GROUP, LLC

8. Position seat cover in to position on the foam and check for seat cover wrinkles.

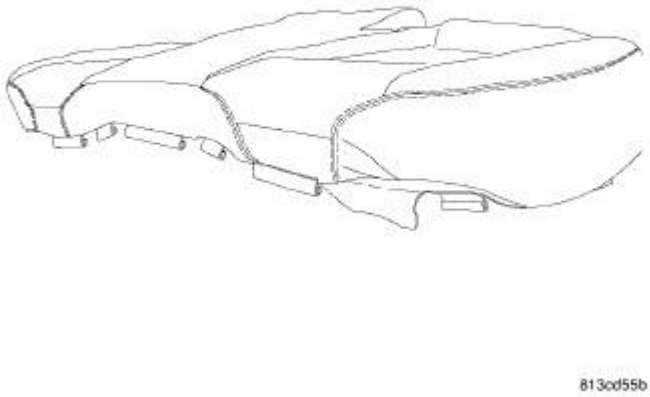

Fig. 465: Connect J-Straps
Courtesy of CHRYSLER GROUP, LLC

9. Connect the J-straps, and smooth out seat cover.
10. Steam wrinkles from seat cushion, if necessary.

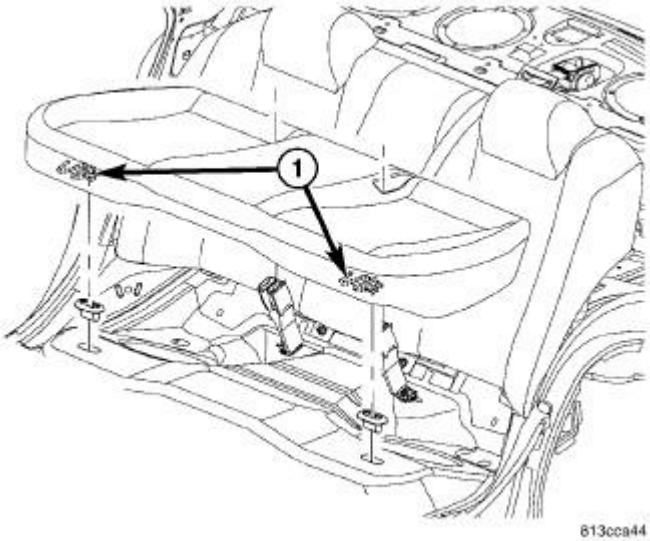

Fig. 466: Rear Seat Cushion
Courtesy of CHRYSLER GROUP, LLC

11. Place seat cushion (4) into position.
12. Engage retainer loops into cup on floor kick up.
13. Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.

RISER, SEAT, FRONT

REMOVAL

REMOVAL

MANUAL LENGTH ADJUSTER

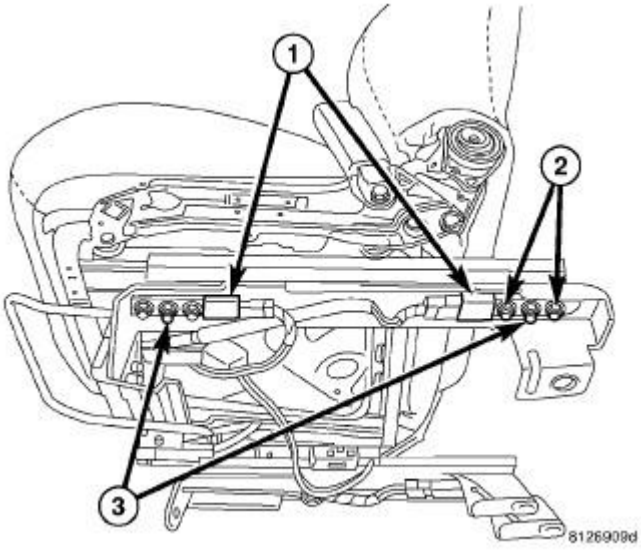

Fig. 467: PASS Seat Manual Track
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Remove the seat. Refer to **SEAT, FRONT, REMOVAL**.
3. Move the seat to the forward position on the tracks and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

NOTE: Passenger seat with strain gauges shown in illustration, drivers side seat similar.

5. Disconnect strain gauge electrical connectors (1), if equipped.
6. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

POWER LENGTH ADJUSTER

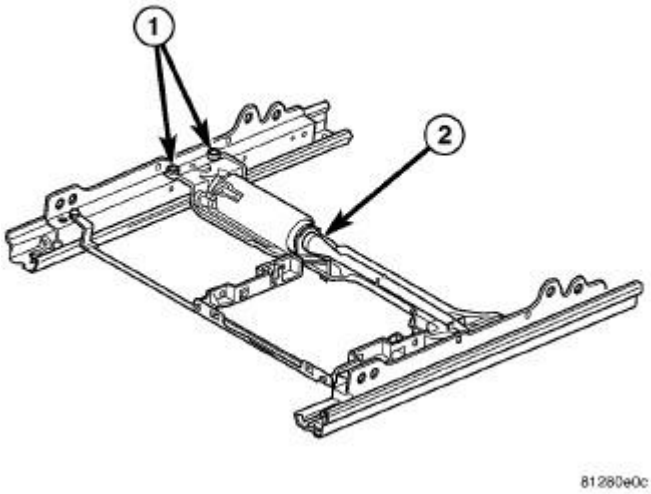

Fig. 468: Power Length Adjuster
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Unbolt the seat from the floor as necessary to gain access to the riser bolts. Refer to **SEAT, FRONT, REMOVAL**.
3. Move the seat to the forward position on the tracks, tip the seat backwards in vehicle and remove the seat adjuster bolts/nuts (1).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (1).

NOTE: Manual seat length adjuster shown in illustration, power similar.

5. If the seat cannot be moved forward or backward, remove the seat cushion. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** or **COVER, SEAT CUSHION, SECOND ROW, REMOVAL**.
6. Remove the four bolts (1) and remove the motor and cable assembly (2) from the length adjuster assembly.

CAUTION: When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

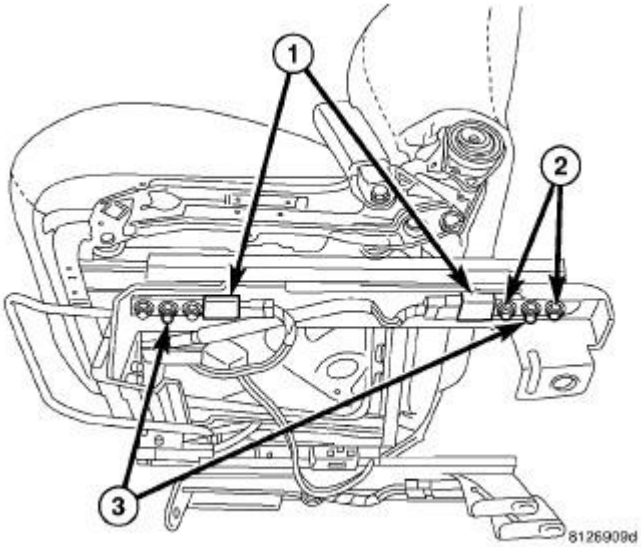

Fig. 469: PASS Seat Manual Track
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect and isolate battery negative cable.
8. Remove the seat off of the risers and disconnect the electrical connectors.
9. Disconnect strain gauge electrical connectors (1), if equipped.
10. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

INSTALLATION

INSTALLATION

MANUAL LENGTH ADJUSTER

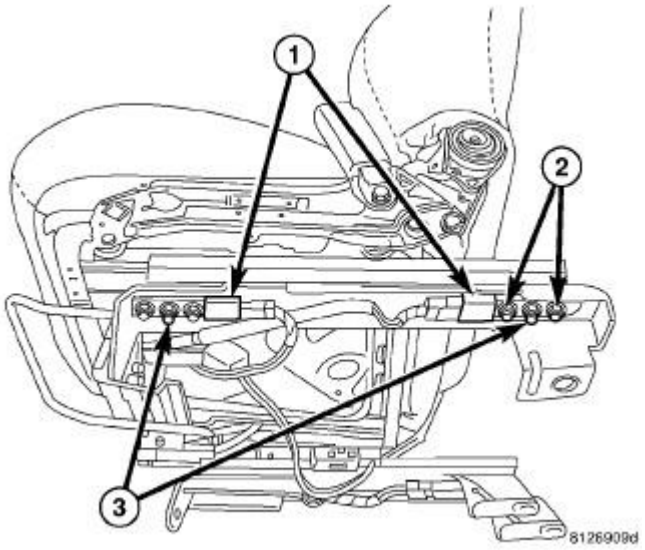

Fig. 470: PASS Seat Manual Track
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.

   NOTE: Passenger seat with strain gauges shown in illustration, drivers side seat similar.

2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N.m (30 ft. lbs.).
4. If necessary, connect the electrical connections (1).
5. Move the seat to the forward position on the tracks and install the rear seat adjuster bolts/nuts (3).
6. Tighten the bolts to 45 N.m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts to 45 N.m (33 ft. lbs.).
9. Install the seat. Refer to **SEAT, FRONT, INSTALLATION**.

POWER LENGTH ADJUSTER

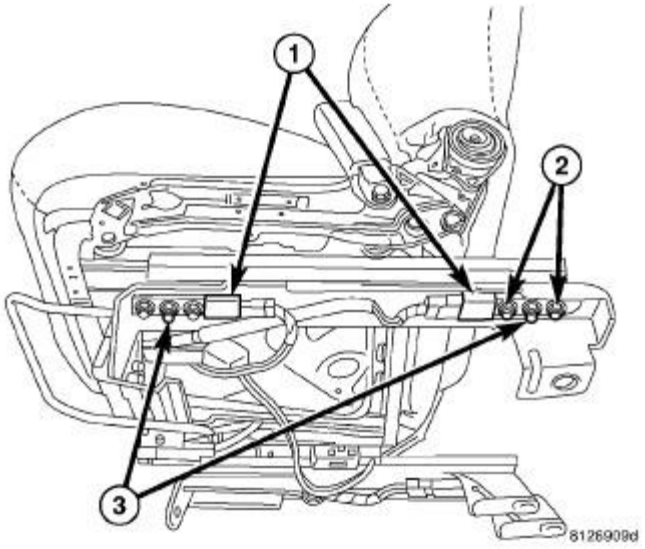

Fig. 471: PASS Seat Manual Track
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. If equipped, install the strain gauges and install the bolts (2).

3. Tighten the bolts to 40 N.m (30 ft. lbs.).
4. Position the seat into the vehicle onto the risers and connect the electrical connectors.
5. Move the seat to the forward position on the tracks and install the seat adjuster bolts/nuts (3).
6. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N.m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N.m (33 ft. lbs.).
9. If necessary, connect the strain gauge electrical connections (1).

CAUTION: When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

10. Bolt the seat to the floor. Refer to **SEAT, FRONT, INSTALLATION**.

SEAT BACK, SECOND ROW

REMOVAL

REMOVAL

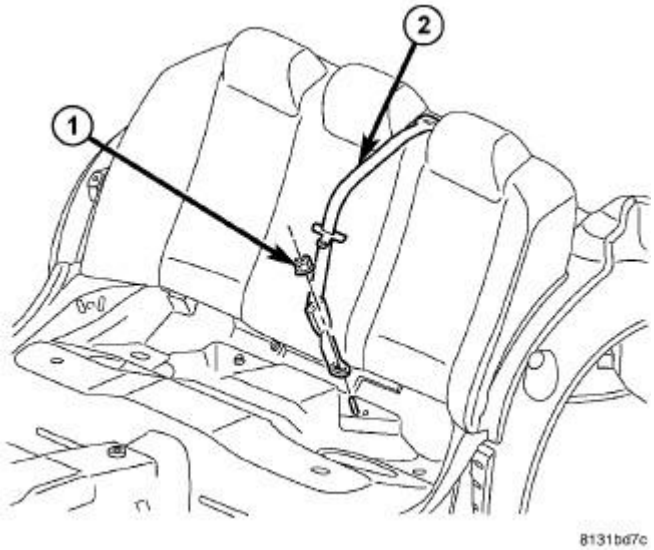

Fig. 472: Rear Center Seat Belt Anchor 49
Courtesy of CHRYSLER GROUP, LLC

1. Remove the seat cushion. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** or **COVER, SEAT CUSHION, SECOND ROW, REMOVAL**.
2. Remove the nut and disconnect the seat belt anchor.

40% SEAT BACK SIDE

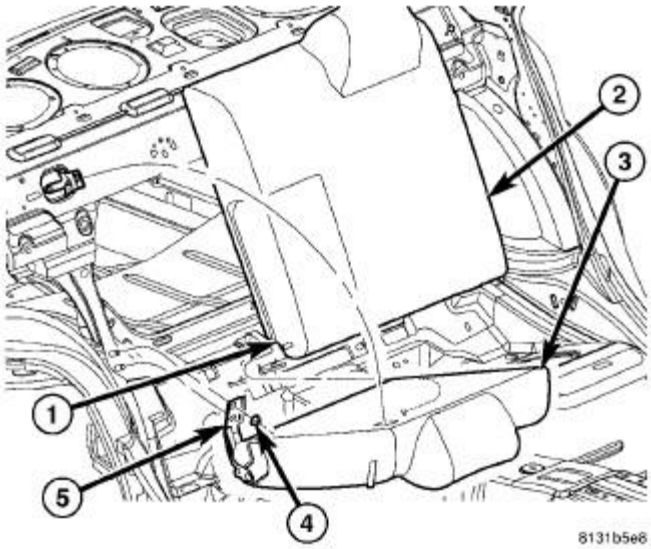

Fig. 473: Rear Seat Back 40%
Courtesy of CHRYSLER GROUP, LLC

1. Fold the 40% section of the seat (3) down.
2. Remove the two nuts (4) attaching seat back.
3. Pivot the seat back off the pivot pin (1) located on the 60% seat back (2).
4. Remove the seat back from vehicle.

60/40 SEAT BACK - DOMESTIC SEDAN

60% SEAT BACK SIDE

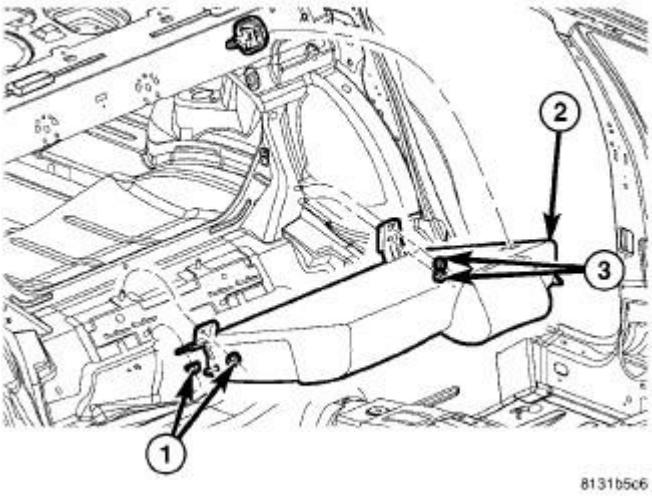

Fig. 474: Rear Seat Back 60%
Courtesy of CHRYSLER GROUP, LLC

1. With the 40% seat back removed.
2. Fold the 60% section of the seat down.
3. Remove the four nuts attaching seat back (4).
4. Remove the seat back for vehicle.

60/40 SEAT BACK - EXPORT SEDAN

40% SEAT BACK SIDE

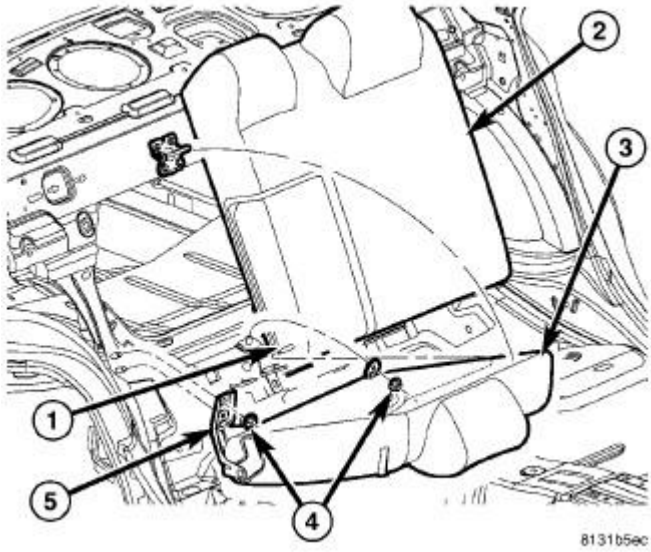

Fig. 475: Rear Seat Back 40% - Export

Courtesy of CHRYSLER GROUP, LLC

1. Fold the 40% section of the seat (3) down.
2. Remove the three nuts (4) attaching seat back.
3. Remove the seat back from vehicle.

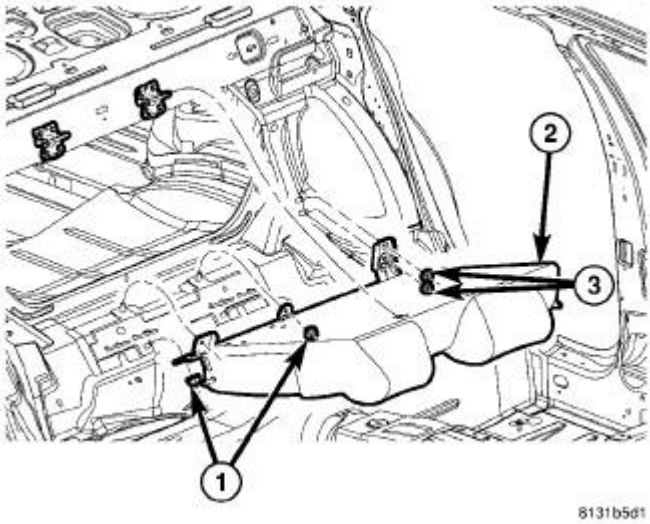

Fig. 476: Rear Seat Back 60% - Export
Courtesy of CHRYSLER GROUP, LLC

60/40 SEAT BACK - EXPORT SEDAN

60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Remove the four nuts (1) and (3) attaching seat back.
3. Remove the seat back from vehicle.

NON-FOLDING SEAT BACK

1. Remove the lower seat back mounting fasteners.
2. Disengage the upper seat back snap fasteners by using a flat blade tool inserted at the top of the seat and pushing down on spring fasteners to disengage.
3. Remove the seat back from the vehicle.

INSTALLATION

INSTALLATION

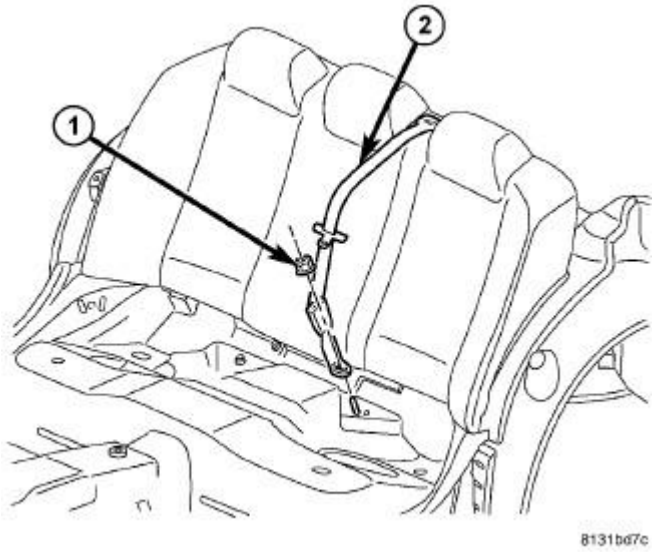

Fig. 477: Rear Center Seat Belt Anchor 49
Courtesy of CHRYSLER GROUP, LLC

1. Place seat belt into position and install the seat belt anchor nut. Tighten nut to 32 N.m (24 ft. lbs.).
2. Place the seat cushion into position and push downward on the forward edge of the seat cushion to lock into position. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** or **COVER, SEAT CUSHION, SECOND ROW, REMOVAL**.

60/40 SEAT BACK DOMESTIC SEDAN

60% SEAT BACK SIDE

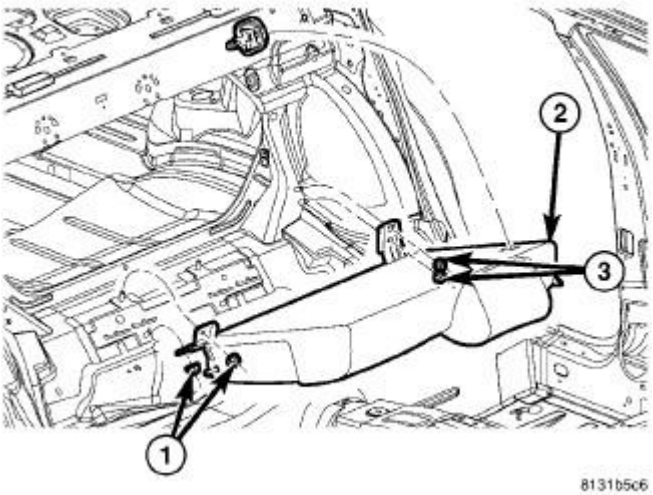

Fig. 478: Rear Seat Back 60%

Courtesy of CHRYSLER GROUP, LLC

1. With the 40% seat back removed.
2. Place 60% seat back (2) into position on the studs.
3. Fold the 60% section of the seat down.
4. Install the four nuts (1) and (3) attaching seat back (2). Tighten nuts to 57 N.m (42 ft. lbs.).

60/40 SEAT BACK DOMESTIC SEDAN

40% SEAT BACK SIDE

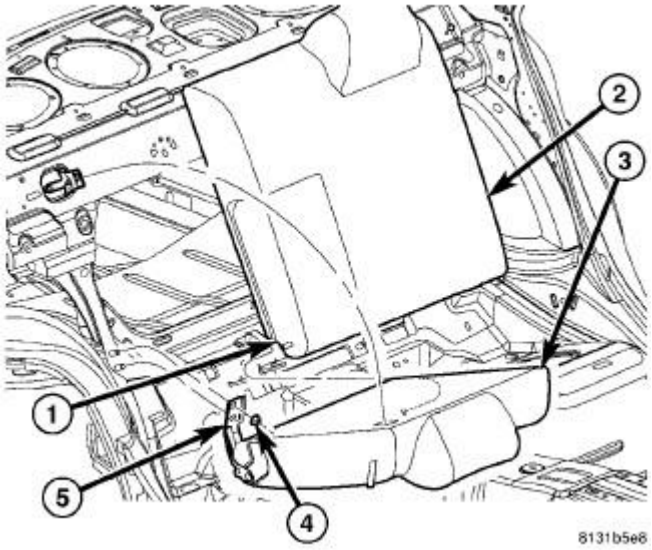

Fig. 479: Rear Seat Back 40%
Courtesy of CHRYSLER GROUP, LLC

1. Place the 40% section (3) into position.
2. Slide 40% seat back onto the pivot pin (1) located on the 60% seat back (2).
3. Install the two nuts (5) attaching seat back. Tighten nuts to 57 N.m (42 ft. lbs.).

60/40 SEAT BACK EXPORT SEDAN

60% SEAT BACK SIDE

Courtesy of CHRYSLER GROUP, LLC

1. With the 40% seat back removed.
2. Place 60% seat back (2) into position on the studs.
3. Fold the 60% section of the seat down.
4. Install the four nuts (1) and (3) attaching seat back (2). Tighten nuts to 57 N.m (42 ft. lbs.).

60/40 SEAT BACK EXPORT SEDAN

40% SEAT BACK SIDE

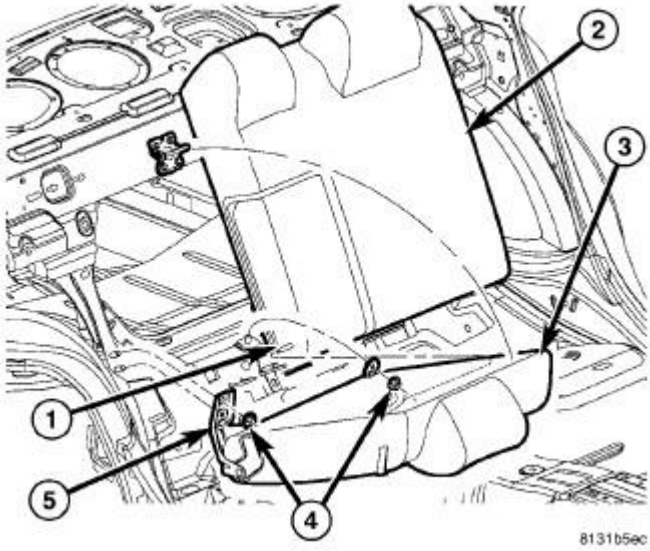

Fig. 481: Rear Seat Back 40% - Export

Courtesy of CHRYSLER GROUP, LLC

1. Place the 40% section (3) into position onto the studs.
2. Fold the 40% section of the seat down.
3. Install the four nuts (4) attaching seat back (3). Tighten nuts to 57 N.m (42 ft. lbs.).

NON-FOLDING SEAT BACK

1. Install the seat back to the vehicle.
2. Align the snap fasteners at the top of the rear seat back and engage the snap fasteners to secure the seat back.
3. Install the lower seat back mounting fasteners. Tighten to 57 N.m (42 ft. lbs.).

SEAT, FRONT

REMOVAL

REMOVAL

WARNING: Review all warnings and cautions prior to servicing the seats. Refer to SEATS, WARNING. Failure to follow these instructions may result in serious or fatal injury.

WARNING: Handled seats carefully when servicing. Be careful not to drop seats on the workbench or floor. If dropped, the seat position sensor may become damaged and inoperative. Failure to follow these instructions may result in serious or fatal injury.

NOTE: Typical left side seat shown in illustrations. Right side seat similar.

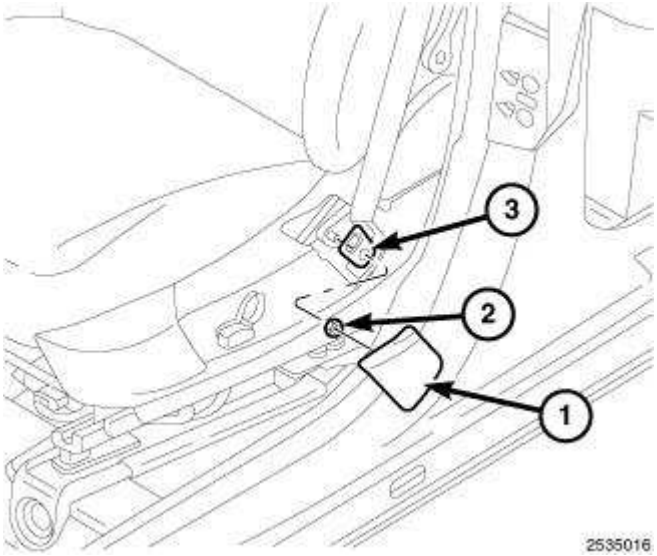

Fig. 482: Front Seat Belt To Outboard
Courtesy of CHRYSLER GROUP, LLC

1. Move the seat full forward.
2. Remove the trim cover (1).
3. Remove the nut (2) from the stud located on the outboard seat cushion frame.
4. Remove the lower seat belt anchor (3) from the stud.

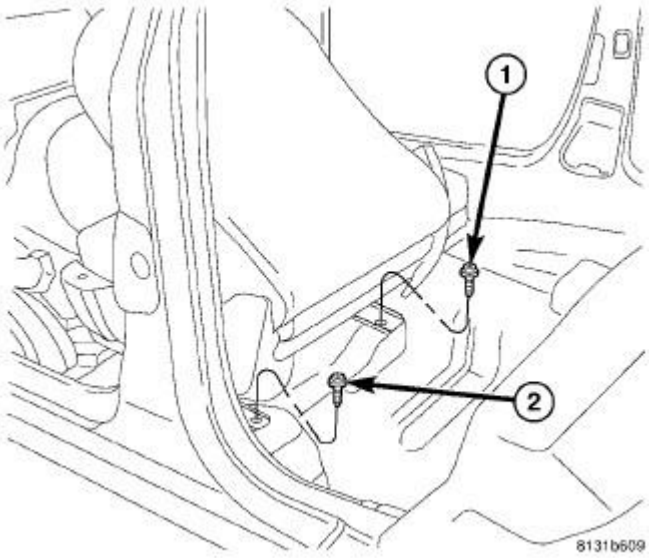

Fig. 483: Front Seat Left Side Rear Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two bolts (1 and 2) that secure the rear of the seat to the body.

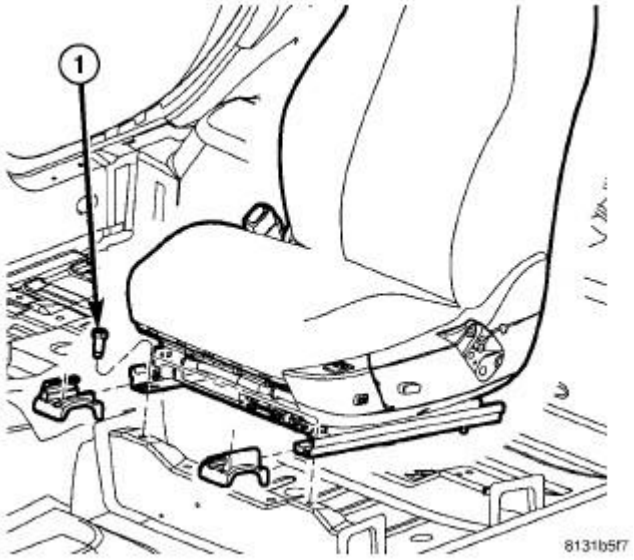

Fig. 484: Front Seat Left Side Front Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Move the seat full rearward.
7. Disconnect and isolate the negative battery cable.
8. Remove the two bolts (1) that secure the front of the seat to the body.
9. Tip the seat rearward and disconnect the electrical connectors, as required.
10. Remove the seat from the vehicle and carefully place it on a work bench or the floor.

INSTALLATION

INSTALLATION

WARNING: Handled seats carefully when servicing. Be careful not to drop seats on the workbench or floor. If dropped, the seat position sensor may become damaged and inoperative. Failure to follow these instructions may result in serious or fatal injury.

NOTE: Typical left side seat shown in illustrations. Right side seat similar.

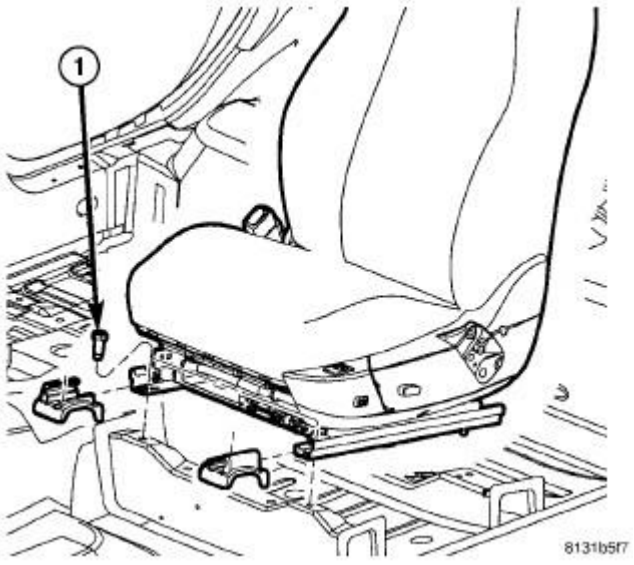

Fig. 485: Front Seat Left Side Front Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Place the seat into the vehicle and connect the electrical connectors.
2. Install the two bolts (1) that secure the front of the seat to the body. Tighten the bolts to 70 N.m (52 ft. lbs.).

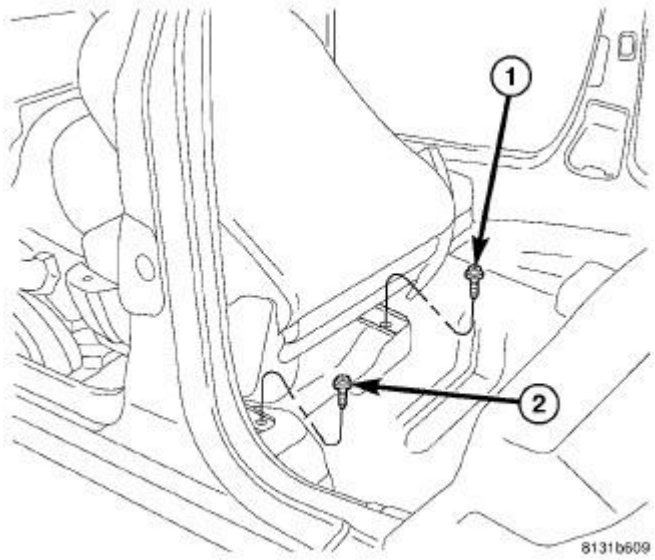

Fig. 486: Front Seat Left Side Rear Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Reconnect the negative battery cable.
4. Move the seat full forward.
5. Install the two bolts (1) that secure the rear of the seat to the body. Tighten the bolts to 70 N.m (52 ft. lbs.).

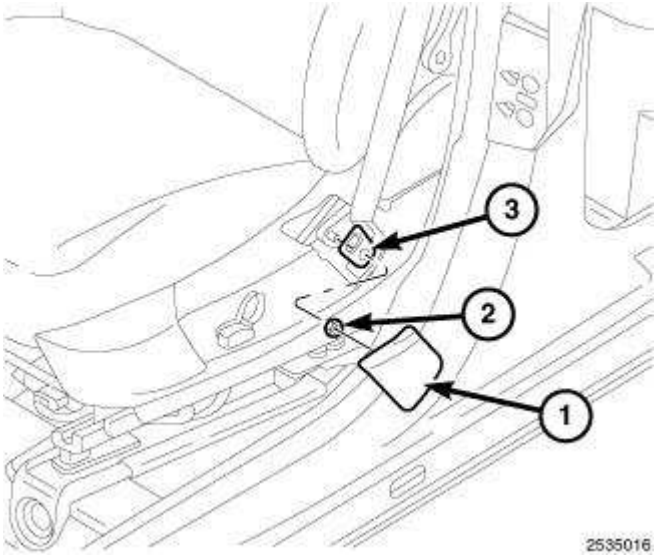

Fig. 487: Front Seat Belt To Outboard
Courtesy of CHRYSLER GROUP, LLC

6. Install the lower seat belt anchor (3) onto the stud located on the seat cushion frame.
7. Install the nut (2) that secures the lower seat belt anchor to the stud. Tighten the nut to 37 N.m (27 ft. lbs.).

8. Install the trim cover (1).
9. Perform the supplemental restraint system verification test. Refer to **STANDARD PROCEDURE** .

STRIKER, SEAT BACK, SECOND ROW

REMOVAL

REMOVAL

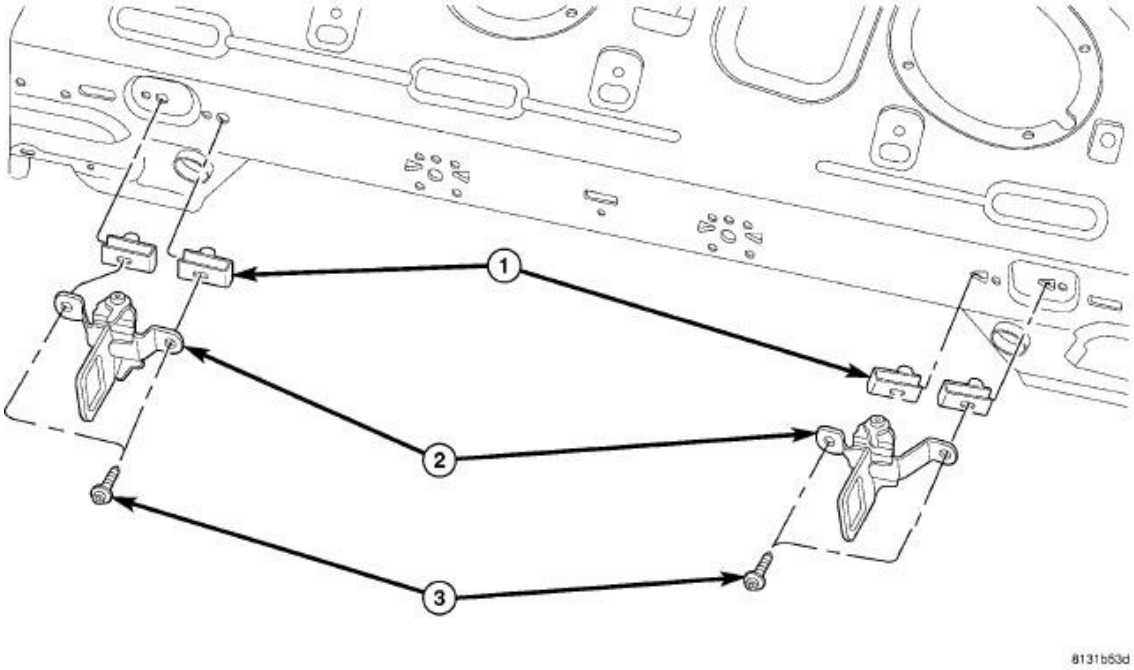

Fig. 488: Rear Seat Back Striker 60/40 Seats
Courtesy of CHRYSLER GROUP, LLC

1. Remove the sedan seat back striker (2), remove the attaching screws (3) and remove seat back striker from the vehicle.

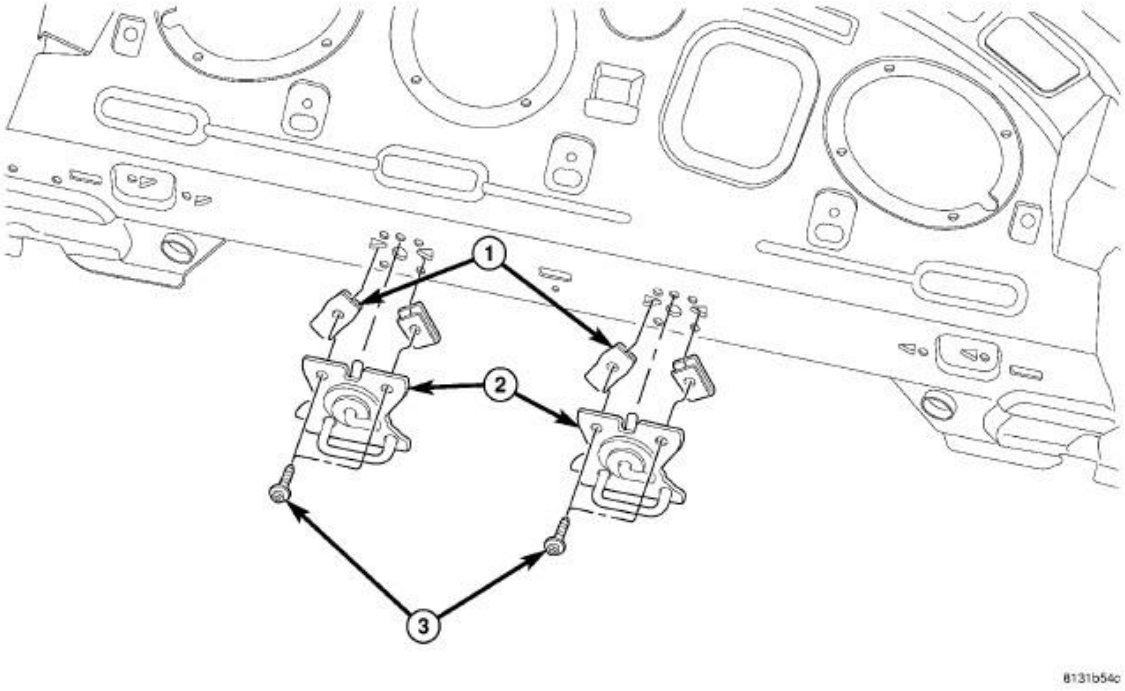

Fig. 489: Rear Seat Back Striker 60/40 Seats - Export
Courtesy of CHRYSLER GROUP, LLC

2. Remove the export sedan seat back striker (2), remove the attaching screws (3) and remove seat back striker from the vehicle.

INSTALLATION

INSTALLATION

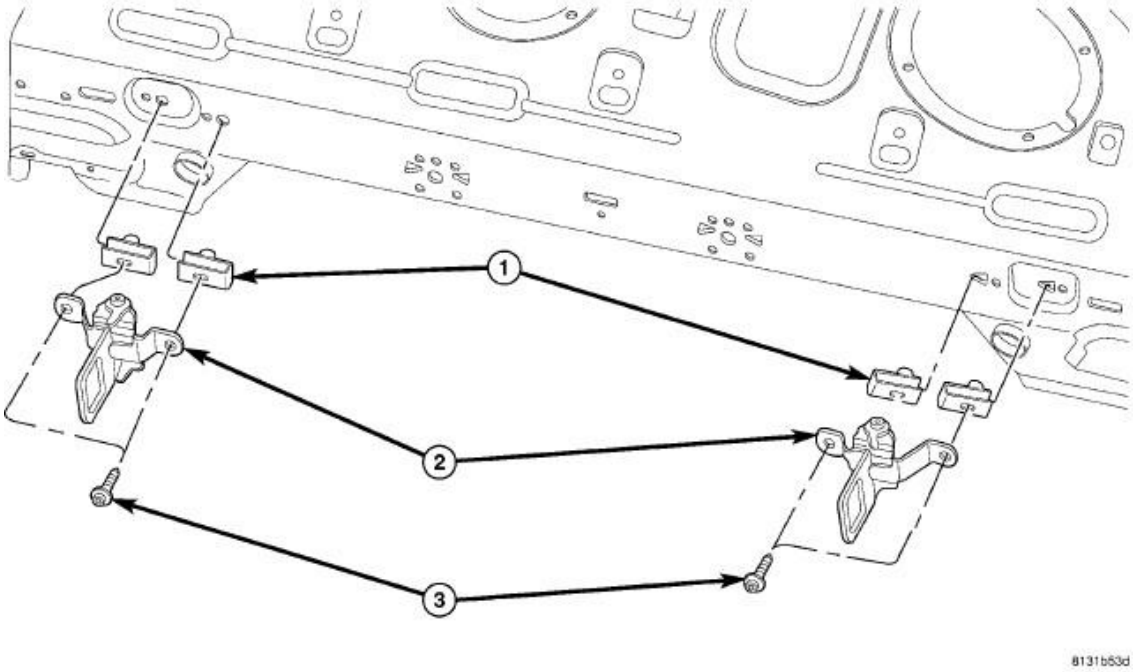

Fig. 490: Rear Seat Back Striker 60/40 Seats
Courtesy of CHRYSLER GROUP, LLC

1. Spring nut(s) (1) replace, if necessary.
2. Place the sedan back seat striker (2) into position and Install attaching screws (3).

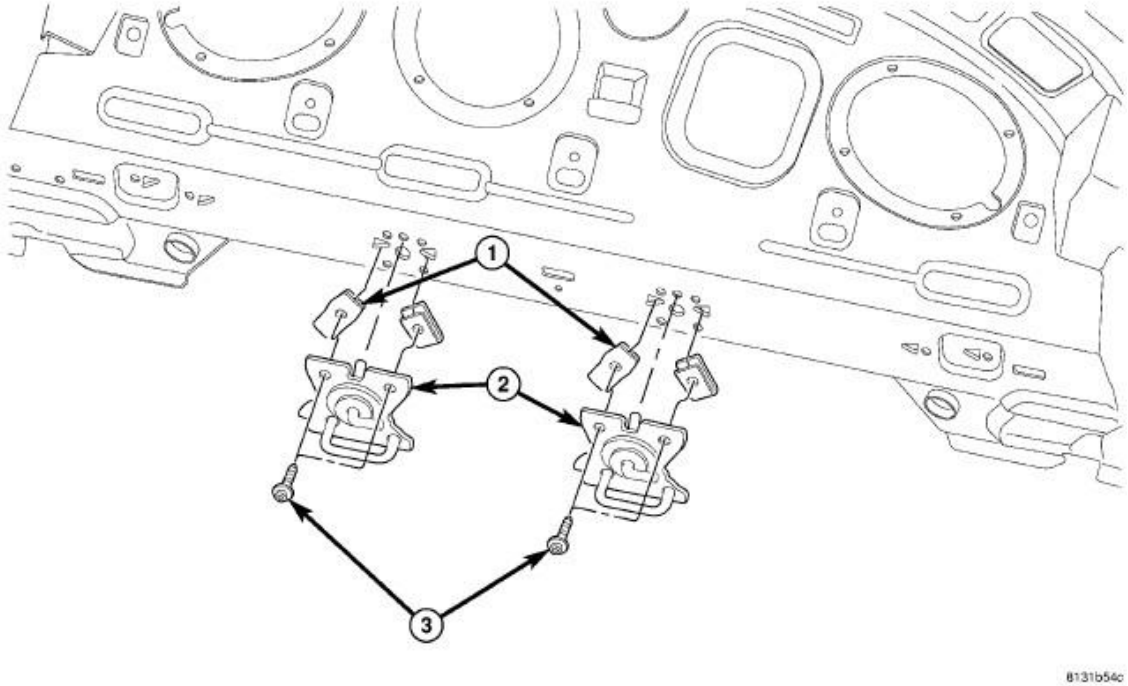

Fig. 491: Rear Seat Back Striker 60/40 Seats - Export
Courtesy of CHRYSLER GROUP, LLC

3. Spring nut(s) (1) replace, if necessary.
4. Place the (Export) sedan back seat striker (2) into position and Install attaching screws (3).

SUPPORT, LUMBAR

REMOVAL

REMOVAL

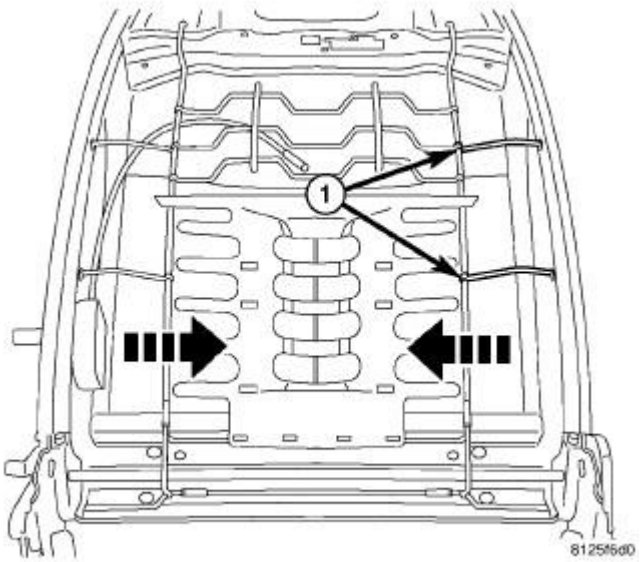

Fig. 492: Identifying Lumbar Mat Side Wires
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.
2. Remove the seat back cushion/cover.
3. Release the lumbar mat side wires (1) by pulling out on the wire supports and then pulling them in.

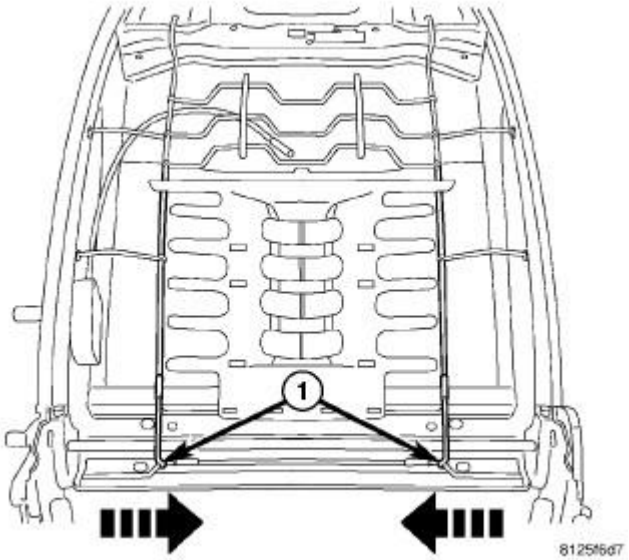

Fig. 493: Lumbar Screen 2
Courtesy of CHRYSLER GROUP, LLC

4. Squeeze the lower support wires (1) in and release the lower wires.

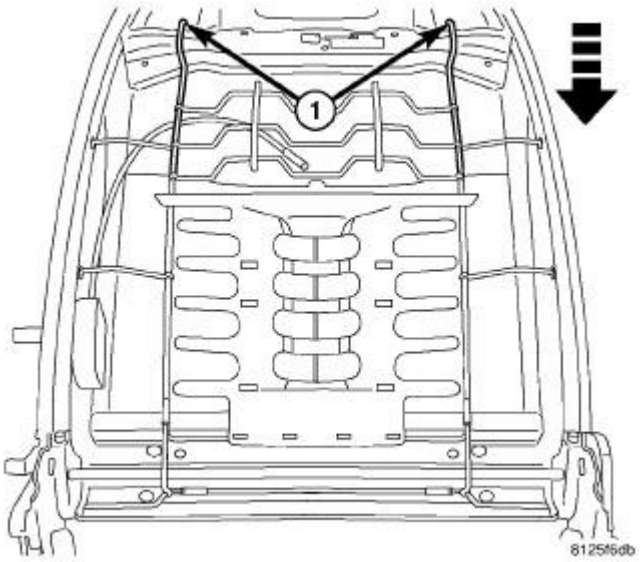

Fig. 494: Lumbar Screen 3
Courtesy of CHRYSLER GROUP, LLC

5. Pull the upper support wires (1) down and release the lumbar mat from the seat back frame.

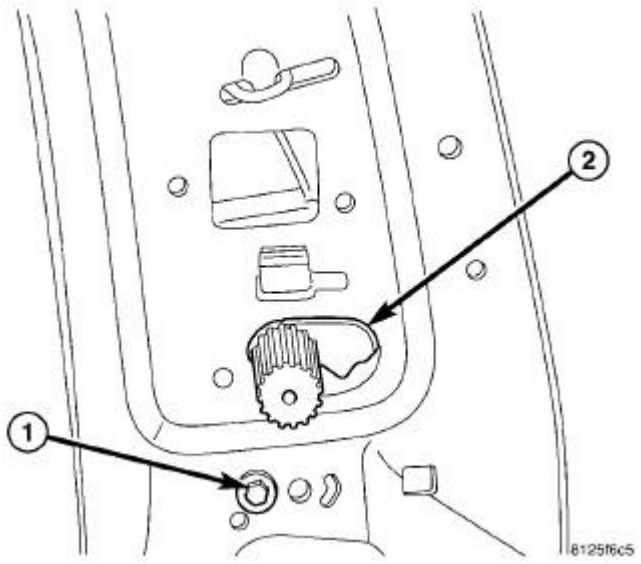

Fig. 495: Lumbar Actuator
Courtesy of CHRYSLER GROUP, LLC

6. Remove the rivet (1) and remove the lumbar mechanism (2).

INSTALLATION

INSTALLATION

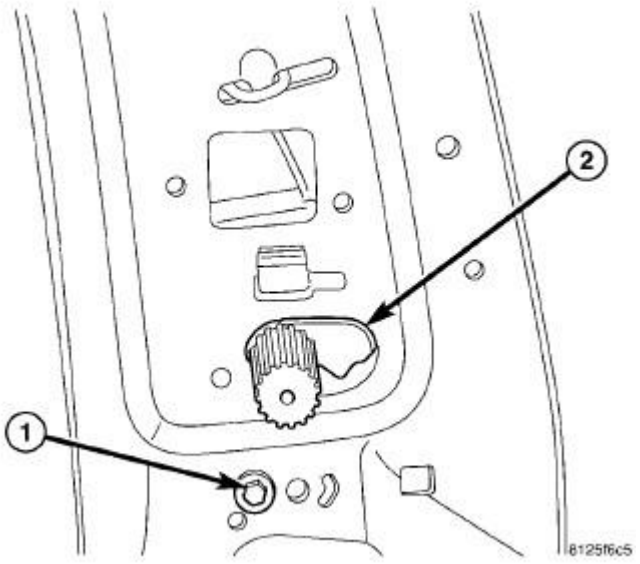

Fig. 496: Lumbar Actuator
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, WARNING**.

2. Install the lumbar mechanism (2) and install a new rivet (1).

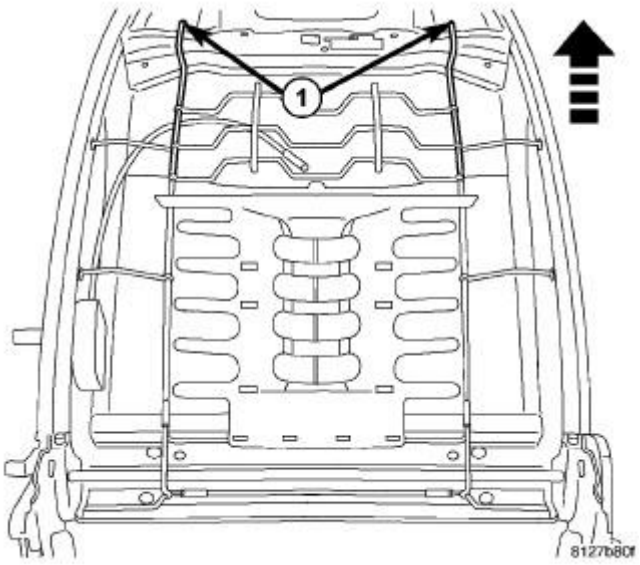

Fig. 497: Lumbar Screen 3
Courtesy of CHRYSLER GROUP, LLC

3. Place lumbar mat onto seat back frame and insert the upper support wires (1) into the frame.

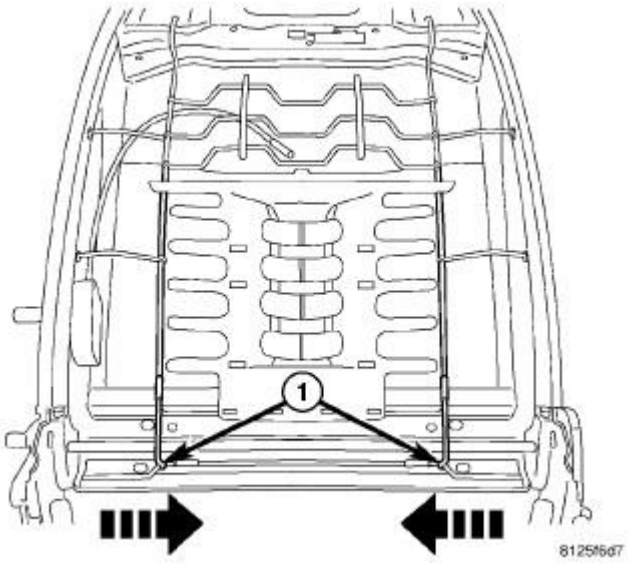

Fig. 498: Lumbar Screen 2
Courtesy of CHRYSLER GROUP, LLC

4. Squeeze the lower support wires (1) together and insert into the lower frame.

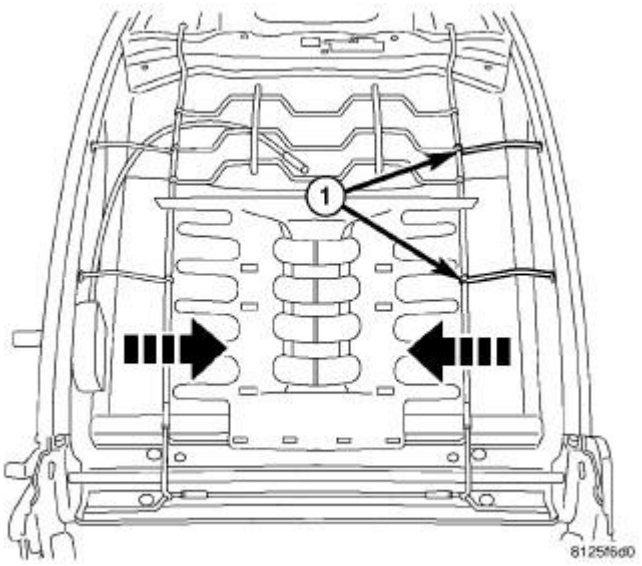

Fig. 499: Identifying Lumbar Mat Side Wires
Courtesy of CHRYSLER GROUP, LLC

5. Squeeze the side support wires together and insert them into the sides of the seat back frame.
6. Install the seat back cushion/cover. Refer to **COVER, SEAT BACK, FRONT, INSTALLATION**.

STATIONARY GLASS

WARNING

WARNING

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- **urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **Chrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.**
- **be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.**
- **vapors that are emitted from the urethane adhesive or primer could**

cause personal injury. Use them in a well-ventilated area.

- **skin contact with urethane adhesive should be avoided. Personal injury may result.**
- **always wear eye and hand protection when working with glass.**

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

BACKLITE

REMOVAL

REMOVAL

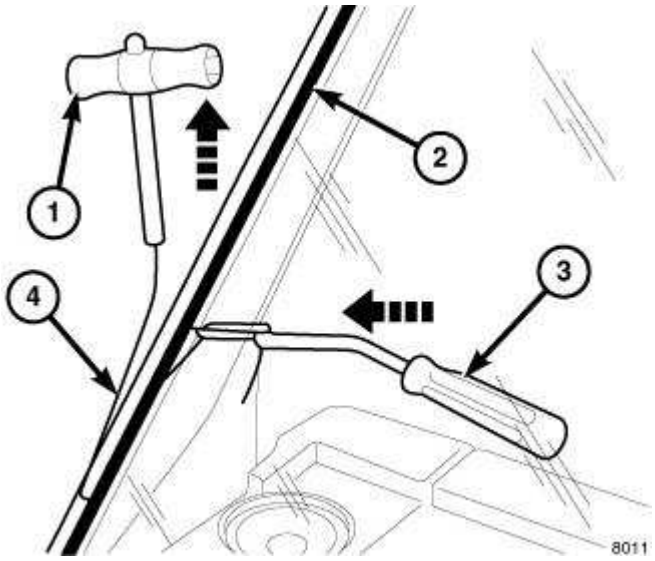

Fig. 500: Adhesive Separation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Windshield removal shown in illustration, backlite similar.

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **STATIONARY GLASS, WARNING**.
2. Remove the trim panel from the rear shelf. Refer to **PANEL, REAR SHELF, REMOVAL**.
3. Disconnect the wire connectors from rear window defogger terminals and, rear window mounted radio antenna, if equipped.

CAUTION: Be careful not to damage painted surfaces when cutting urethane around the backlight.

4. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the backlite to the backlite fence.
5. Carefully remove the backlite from the vehicle.

INSTALLATION

INSTALLATION

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the backlite. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

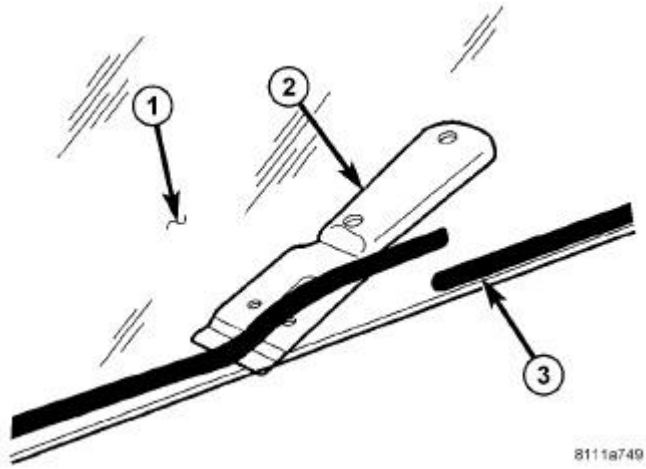

Fig. 501: Glass Adhesive Preparation
Courtesy of CHRYSLER GROUP, LLC

1. If the backlite (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

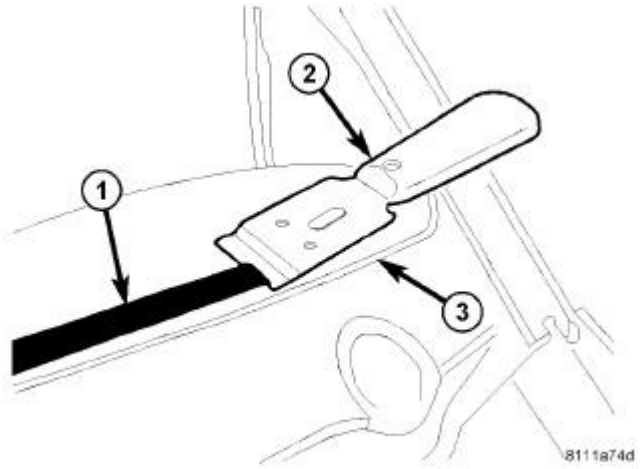

Fig. 502: Smoothing Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To prevent corrosion, do not damage paint on the backlite fence when removing original urethane.**

NOTE: **The backlite fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Replace any missing or damaged spacers around the perimeter of the backlite fence.**

2. Using a razor knife (2), level the original bead of urethane (1) on the backlite fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.

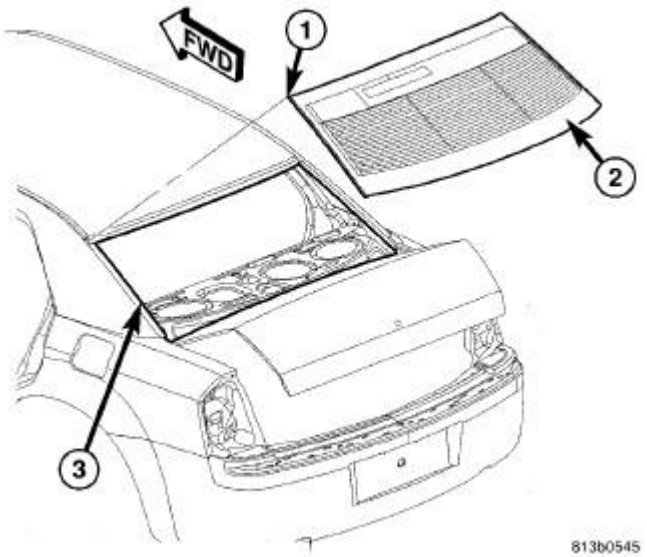

Fig. 503: Backlight
Courtesy of CHRYSLER GROUP, LLC

3. Install a new rubber seal (1) around the top and side edges of backlite (2).
4. Using an assistant, position the backlite into the backlite opening and against the backlite fence (3).
5. Verify the backlite lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the backlite.
6. Mark the backlite and fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the backlite from the backlite opening and place it on a suitable padded work surface.

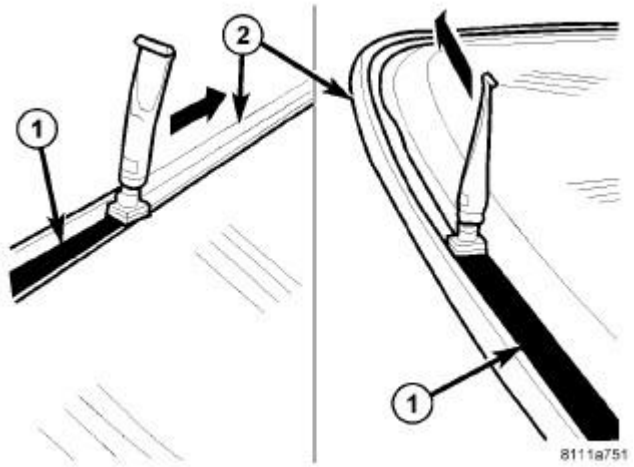

Fig. 504: Windshield Primer
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not use solvent based glass cleaners to clean the backlite before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the backlite with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the backlight (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide around the perimeter of the backlight and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the backlite.
12. Re-prime any area that is not fully and evenly primed.

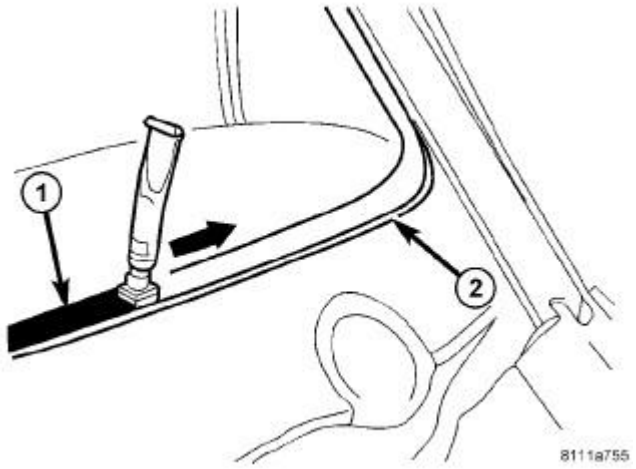

Fig. 505: Applying Windshield Primer
Courtesy of CHRYSLER GROUP, LLC

13. Clean the backlite fence with an ammonia based glass cleaner and a lint-free cloth.
14. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the backlite fence (2). Allow at least three minutes drying time.
15. Using a flashlight, verify that the primer is completely and evenly installed along the backlite fence.
16. Re-prime any area that is not fully and evenly primed.

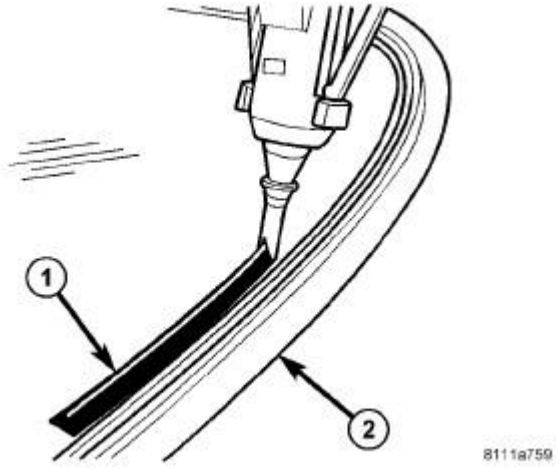

Fig. 506: Applying Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always apply the bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12

hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

17. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the backlite.

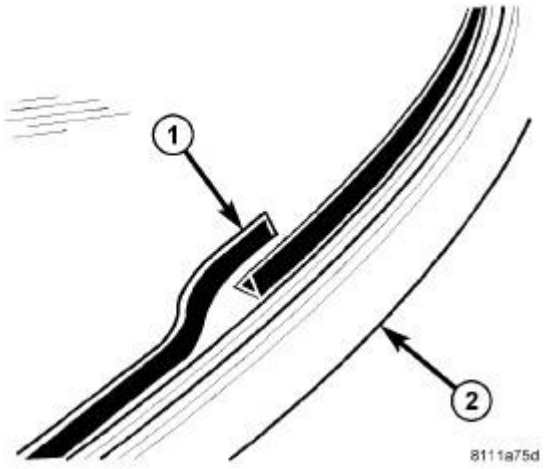

Fig. 507: Identifying Windshield Adhesive Overlap
Courtesy of CHRYSLER GROUP, LLC

18. Run the end of the adhesive bead (1) on the backlite (2) parallel to the start of the bead and smooth the ends flush.

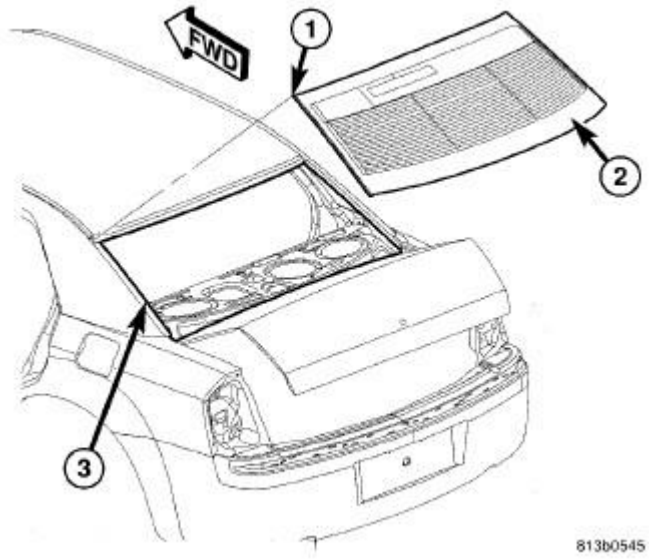

Fig. 508: Backlight
Courtesy of CHRYSLER GROUP, LLC

19. Using an assistant, position the backlite (2) over the backlite opening.
20. Using the grease pencil marks or tape as reference points, align the backlite to the opening.
21. Carefully lower the backlite onto the backlite fence (3). Guide the backlite and the rubber seal (1) around the backlite into its proper location.

CAUTION: It is not possible to move the backlite after installation. The backlite should never be pressed into place by more than one person, because the backlite can break if pressed simultaneously on both sides.

22. Push the backlite inward until the backlite comes into contact with the spacers located on each side of the backlite fence.
23. Connect the wire connectors to the rear window defogger terminals and, rear window mounted radio antenna, if equipped.
24. Install the trim panel to the rear shelf. Refer to **PANEL, REAR SHELF, INSTALLATION**.

WINDSHIELD

DESCRIPTION

DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

REMOVAL

REMOVAL

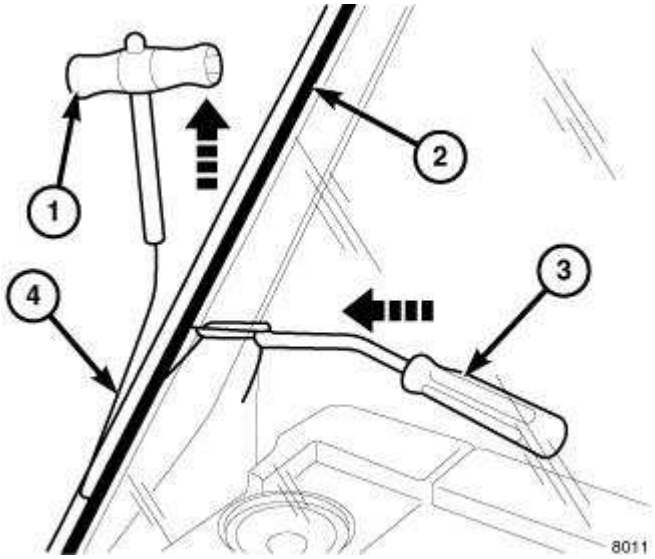

Fig. 509: Adhesive Separation
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **STATIONARY GLASS, WARNING**.
2. Remove the rear view mirror. Refer to **MIRROR, REARVIEW, REMOVAL**.
3. Remove the cowl grille. Refer to **COVER, COWL PANEL, REMOVAL**.

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

4. Remove the windshield side moldings.
5. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.
6. Carefully remove the windshield from the vehicle.

INSTALLATION

INSTALLATION

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with

urethane or primers.

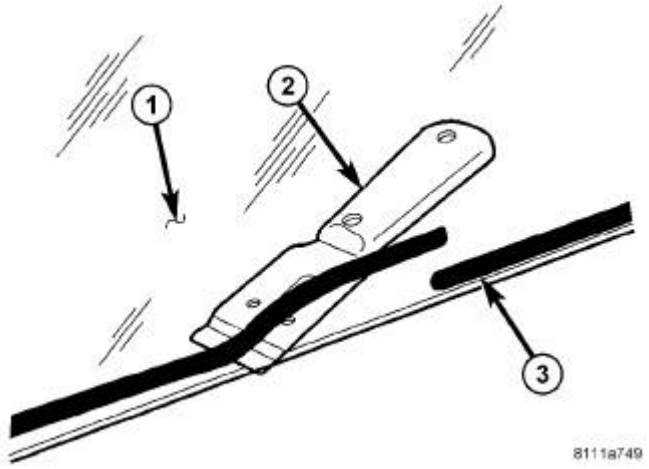

Fig. 510: Glass Adhesive Preparation
Courtesy of CHRYSLER GROUP, LLC

1. If the windshield (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

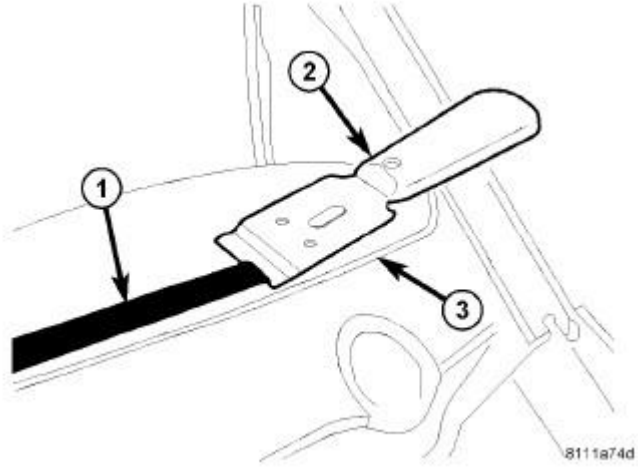

Fig. 511: Smoothing Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

NOTE: To prevent corrosion, do not damage paint on windshield fence when removing original urethane.

NOTE: The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely

affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.

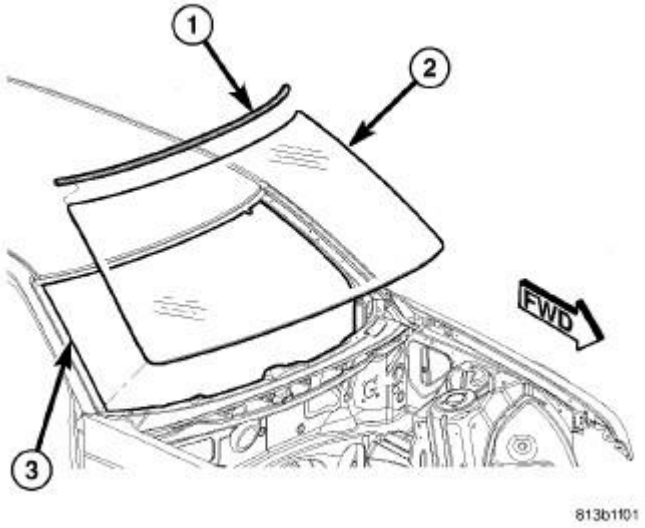

Fig. 512: Windshield
Courtesy of CHRYSLER GROUP, LLC

3. Install a new rubber seal (1) along the top of the windshield (2).
4. Using an assistant, position the windshield into the windshield opening and against the windshield fence (3).
5. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
6. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

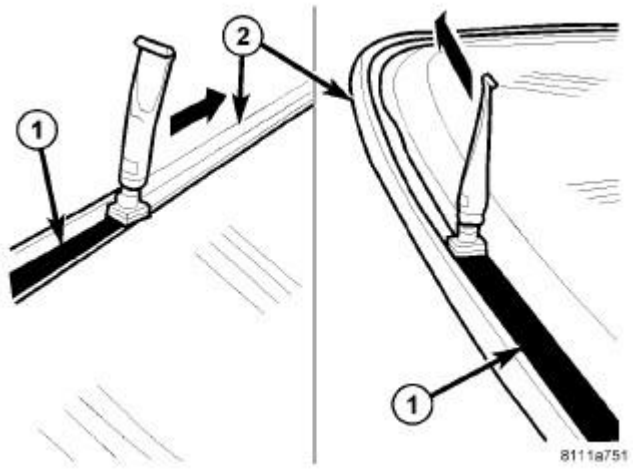

Fig. 513: Windshield Primer
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
12. Re-prime any area that is not fully and evenly primed.

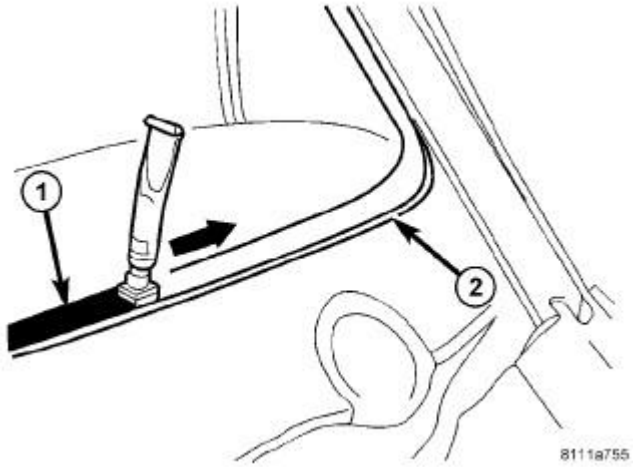

Fig. 514: Applying Windshield Primer

Courtesy of CHRYSLER GROUP, LLC

13. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
14. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
15. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
16. Re-prime any area that is not fully and evenly primed.

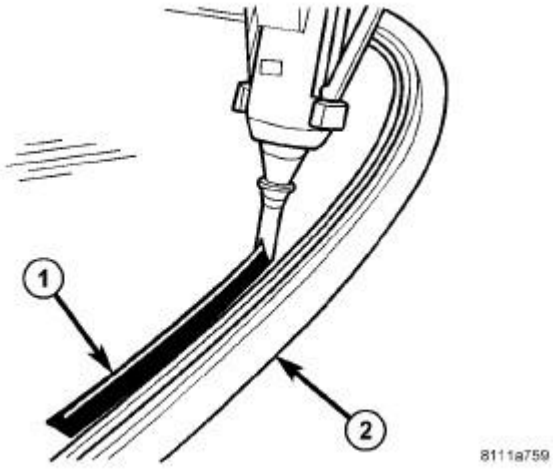

Fig. 515: Applying Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

17. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the windshield.

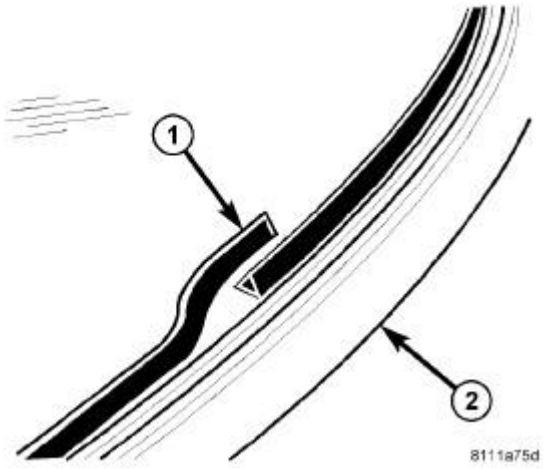

Fig. 516: Identifying Windshield Adhesive Overlap

18. Run the end of the adhesive bead (1) on the windshield (2) parallel to the start of the bead and smooth the ends flush.

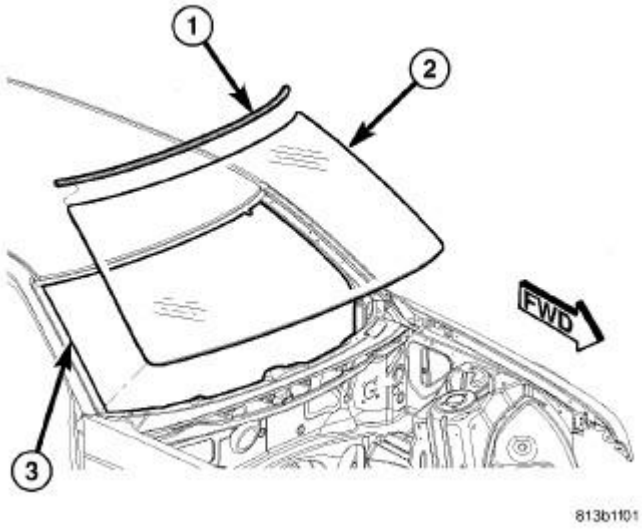

Fig. 517: Windshield
Courtesy of CHRYSLER GROUP, LLC

19. Using an assistant, position the windshield (2) over the windshield opening.
20. Using the grease pencil marks or tape as reference points, align the windshield to the opening.
21. Carefully lower the windshield onto the windshield fence. Guide the windshield and the rubber seal at the top the windshield into its proper location.

CAUTION: It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one

person, because the windshield can break if pressed simultaneously on both sides.

22. Push the windshield inward until the windshield comes into contact with the spacers located on each side of the windshield fence (2).
23. Install the windshield side moldings.
24. Install the cowl grille. Refer to **COVER, COWL PANEL, REMOVAL**.
25. Install the rear view mirror. Refer to **MIRROR, REARVIEW, INSTALLATION**.

SUNROOF, DUAL PANE

DESCRIPTION

DESCRIPTION

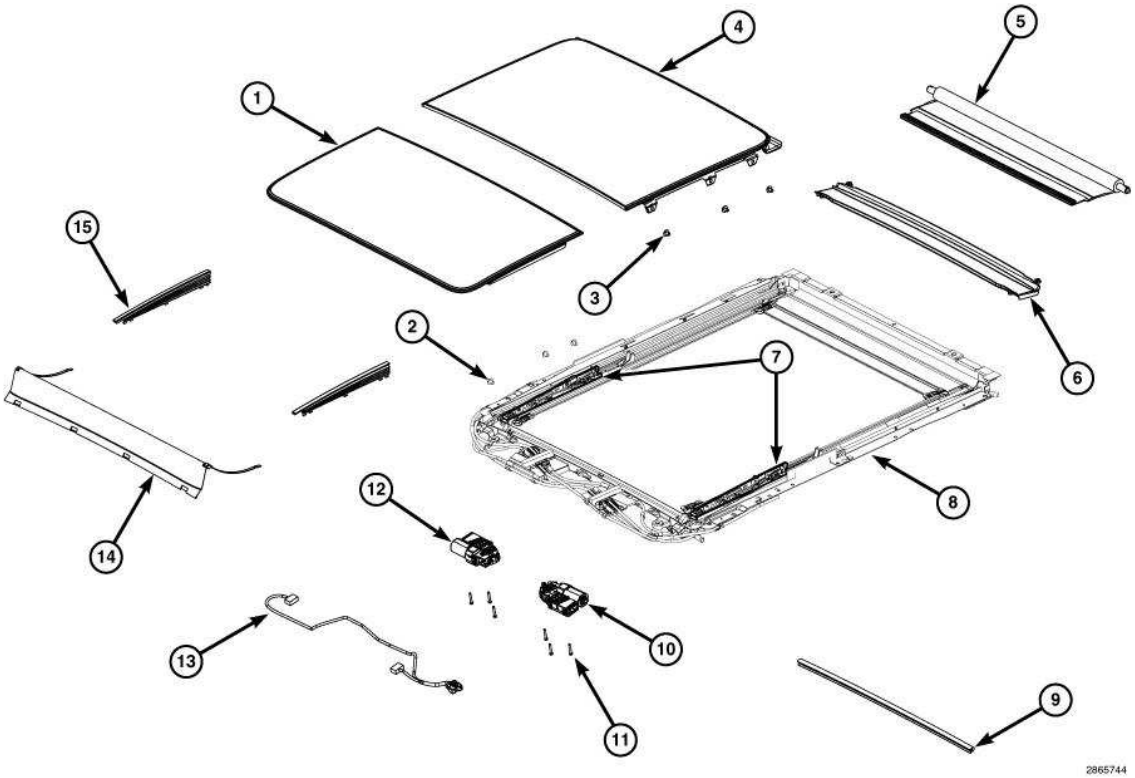

Fig. 518: Exploded View Of Dual Pane Sunroof
Courtesy of CHRYSLER GROUP, LLC

PARTS LIST

1 - FRONT GLASS PANEL	9 - SEAL
2 - FRONT GLASS FASTENERS (6) 4.5 N.m (40 in. lbs.)	10 - FRONT GLASS MOTOR

3 - REAR GLASS FASTENERS (6) 4.5 N.m (40 in. lbs.)	11 - MOTOR SCREWS 4 N.m (35 in. lbs.)
4 - REAR GLASS PANEL	12 - SUNSHADE MOTOR
5 - ROLLO SUNSHADE	13 - WIRE HARNESS
6 - DRAIN CHANNEL	14 - WIND DEFLECTOR
7 - GLASS GUIDES	15 - MECHANISM COVERS
8 - SUNROOF ASSEMBLY	

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The front sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the fixed rear glass panel when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes an electric rolling sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion.Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The electric rolling sunshade

REMOVAL

REMOVAL

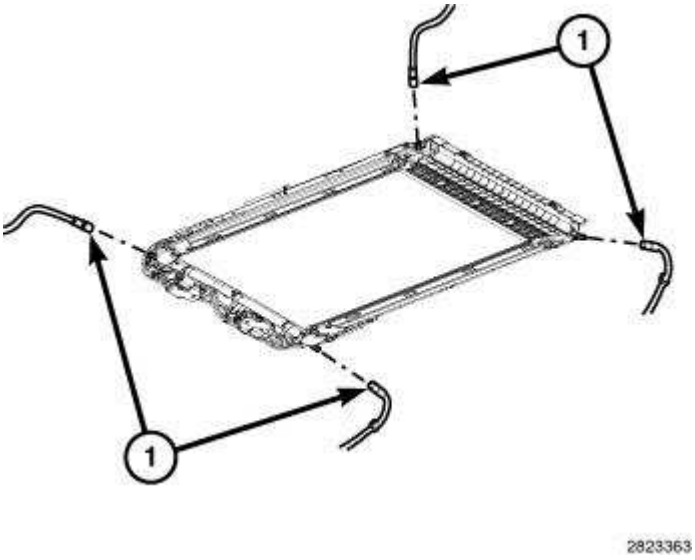

Fig. 519: Four Drain Tubes
Courtesy of CHRYSLER GROUP, LLC

NOTE: For exploded view and call outs. Refer to SUNROOF, DUAL PANE, DESCRIPTION.

1. Move glass panel to the fully closed position.
2. Disconnect and isolate the battery negative cable.
3. Lower the headliner in the vehicle enough to gain access to the sunroof assembly. Refer to **HEADLINER, REMOVAL**.
4. Disconnect the four drain tubes (1) from sunroof housing.
5. Disconnect the sunroof wire harness electrical connector.

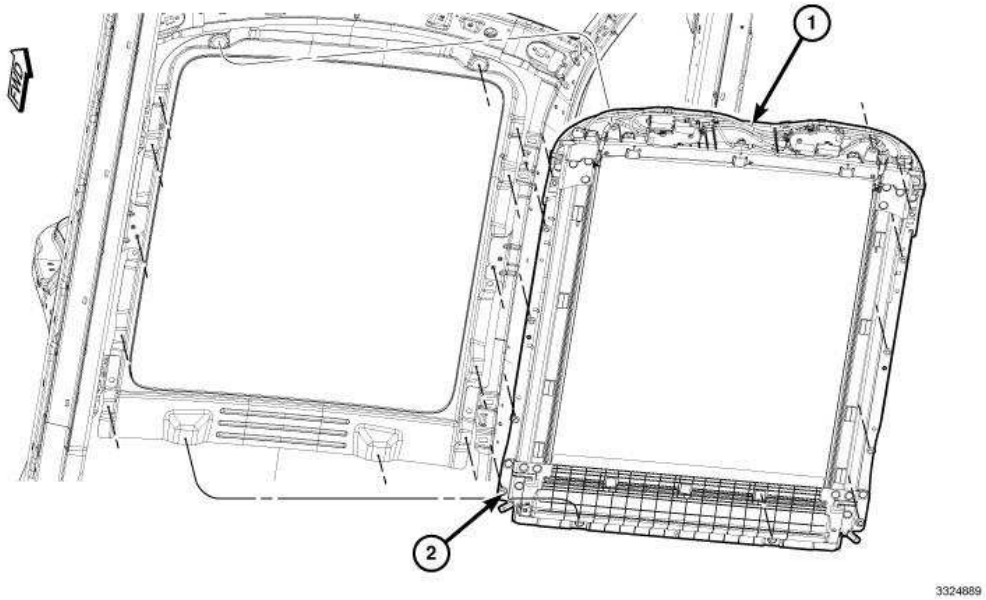

Fig. 520: Fourteen Bolts & Sunroof Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Loosen the fourteen bolts (2) attaching sunroof assembly.
7. With the help of an assistant, support the sunroof and remove the fourteen bolts (2) attaching the sunroof assembly (1) to the roof panel.
8. Remove the sunroof assembly (1) from vehicle.

INSTALLATION

INSTALLATION

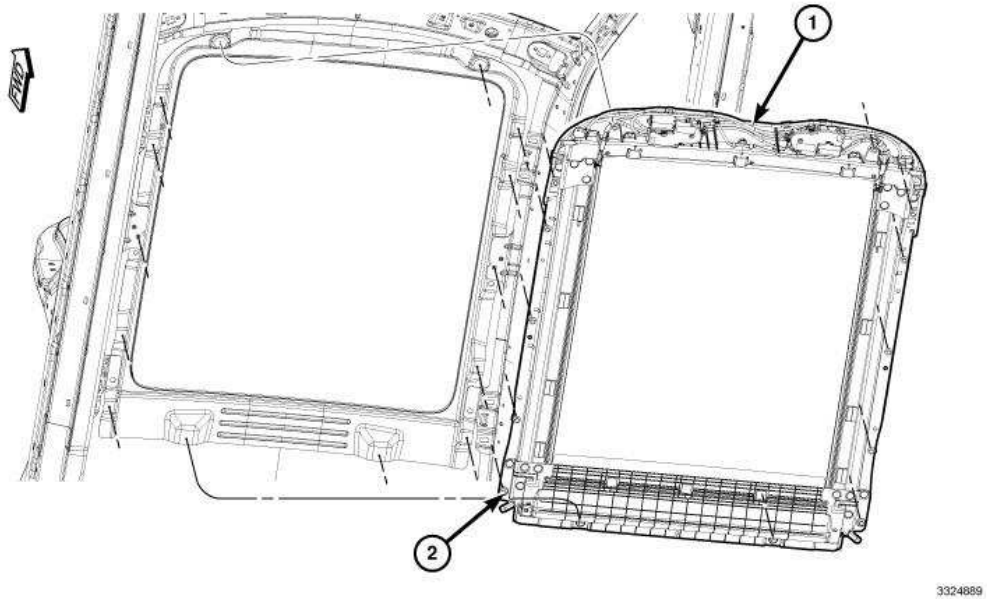

Fig. 521: Fourteen Bolts & Sunroof Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: After installation the sunroof motor will need to be initialized.

1. Verify that glass panel is fully closed.
2. Locate the alignment holes along the sides of the module assembly and position the holes so that they line up with the holes located in sunroof frame.
3. Raise sunroof module assembly (1) and guide it carefully into position.
4. While supporting the sunroof assembly (1), install the 14 bolts (2). Tighten the bolts to 9 N.m (80 in. lbs.).

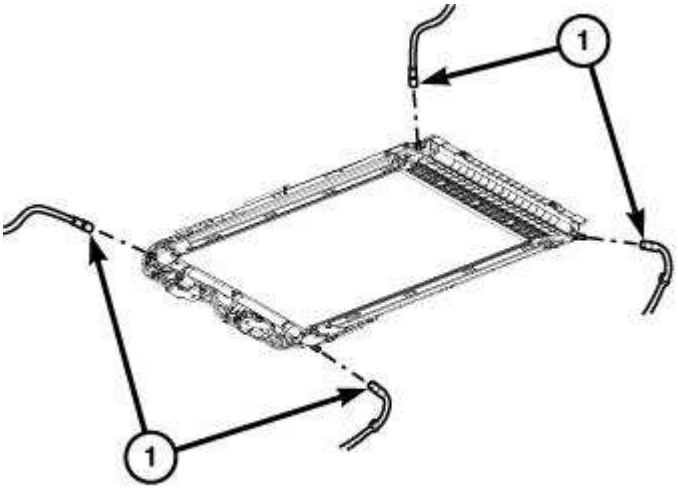

Fig. 522: Four Drain Tubes
Courtesy of CHRYSLER GROUP, LLC

5. Connect the electrical connector.
6. Connect the drain tubes (1) to the sunroof.
7. Connect the battery negative cable.
8. Test sunroof operation, adjust if necessary. Refer to **ADJUSTMENTS** .
9. Install the headliner. Refer to **HEADLINER, INSTALLATION**.
10. Initialize sunroof motor. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE** .

CHANNEL, SUNROOF DRAIN

REMOVAL

REMOVAL

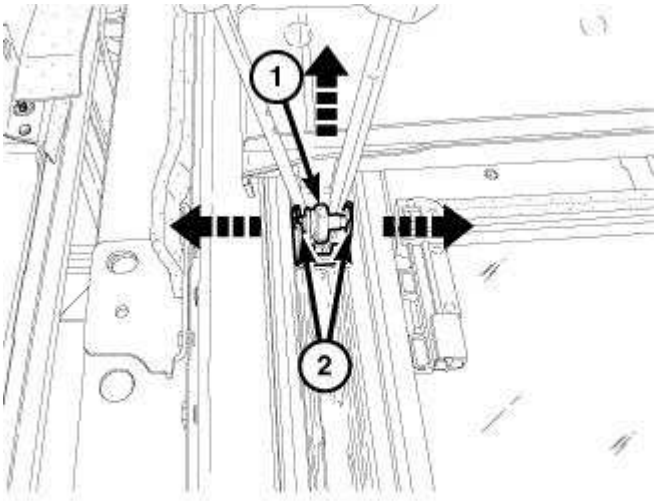

Fig. 523: Vertical Uprights
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Vertical uprights (2) located on the channel support should be pried apart using care. If an upright is damaged during service the entire sunroof assembly will need to be replaced.

1. Remove the front glass panel. Refer to **GLASS, SUNROOF, FRONT, REMOVAL** or **GLASS, SUNROOF, REAR, REMOVAL**.
2. Remove each side of the drain channel (1) by prying apart the two vertical uprights (2) on the channel support.

INSTALLATION

INSTALLATION

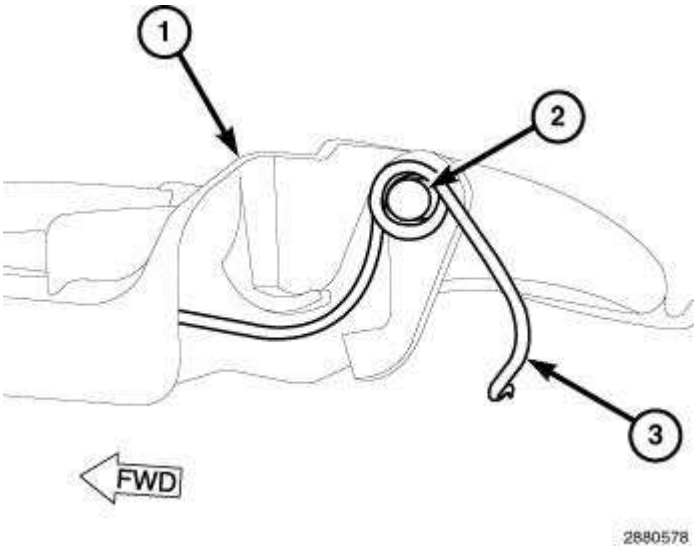

Fig. 524: Channel Spring, Axle & Channel
Courtesy of CHRYSLER GROUP, LLC

1. Place channel spring (3) over channel axle (2).

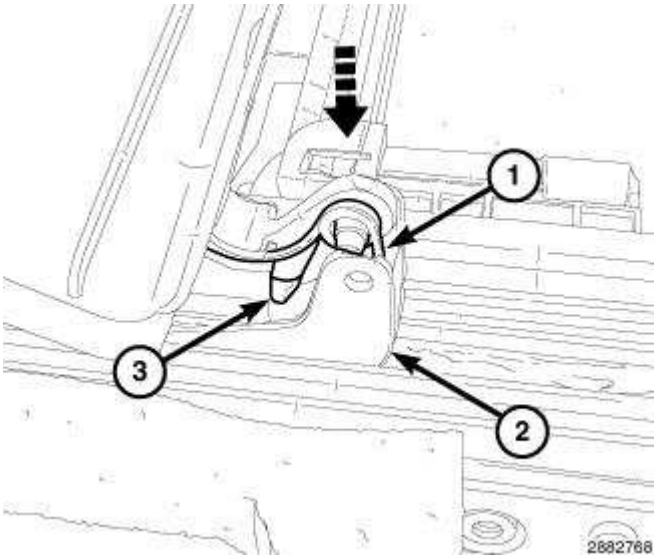

Fig. 525: Channel, Support & Stop Tab
Courtesy of CHRYSLER GROUP, LLC

2. Carefully snap the channel (1) into the support (2) by pushing down on the channel while holding the spring in place.

NOTE: Make sure the stop tab (3) is free to move within the support (2).

3. Install the front glass panel. Refer to **GLASS, SUNROOF, FRONT, INSTALLATION** or **GLASS, SUNROOF, REAR, INSTALLATION**.

COVER, SUNROOF MECHANISM

REMOVAL

REMOVAL

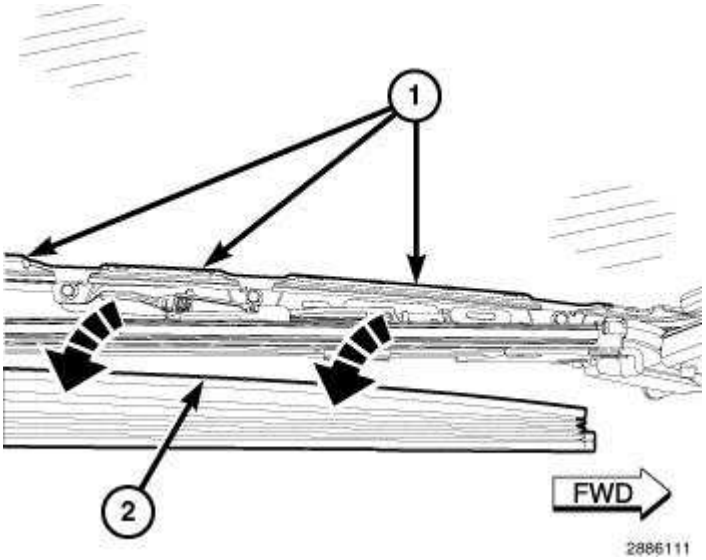

Fig. 526: Mechanism Cover & Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Move the front glass into the full closed position.
2. Open the sunshade into the full open position.
3. Separate the mechanism cover (2) from the tabs (1) on the glass panel.

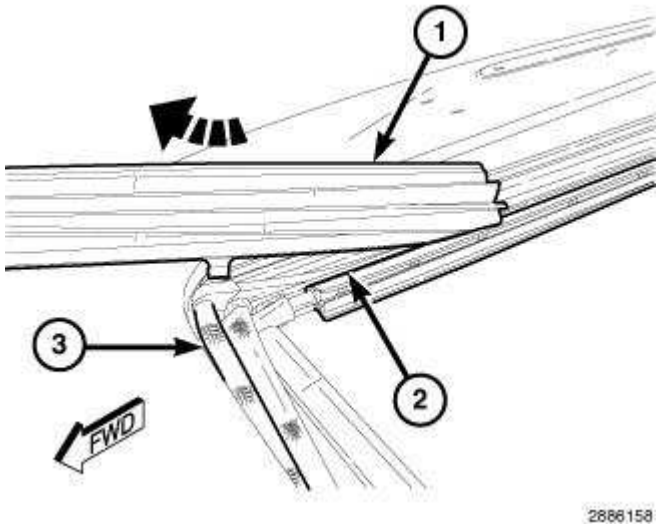

Fig. 527: Wind Deflector, Mechanism Covers & Frame
Courtesy of CHRYSLER GROUP, LLC

4. Hold the mechanism covers down and open the front glass into the full open position.
5. Hold the wind deflector (3) down and slide the mechanism covers (1) out the front of the guide in the frame (2).

INSTALLATION

INSTALLATION

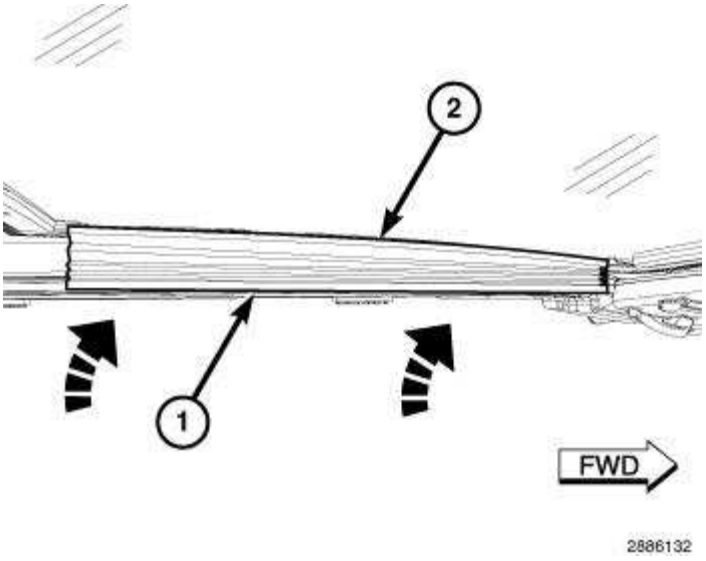

Fig. 528: Mechanism Cover & Cover
Courtesy of CHRYSLER GROUP, LLC

1. With the sunroof in the open position, snap the mechanism cover (1) into the lower guide channel.
2. Hold down each cover and close the sunroof.
3. Snap the upper portion of the cover (3) into the retaining clips on the glass panel between the locating features.

DEFLECTOR, WIND

REMOVAL

REMOVAL

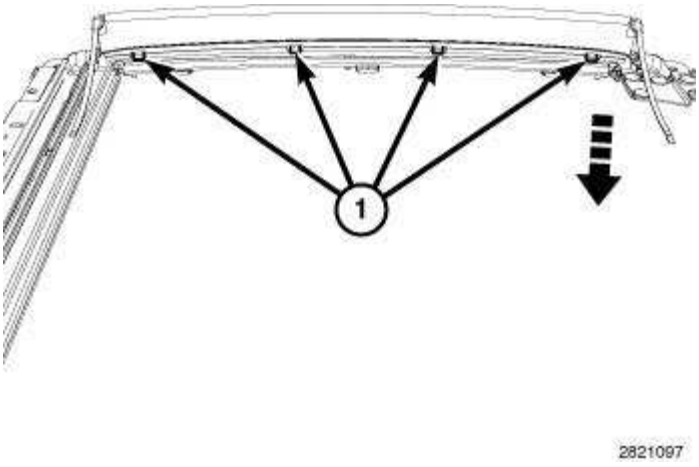

Fig. 529: Plastic Clips
Courtesy of CHRYSLER GROUP, LLC

1. Move the front glass into the full open position.
2. Push down the lower rod to remove from the under plastic clips (1).

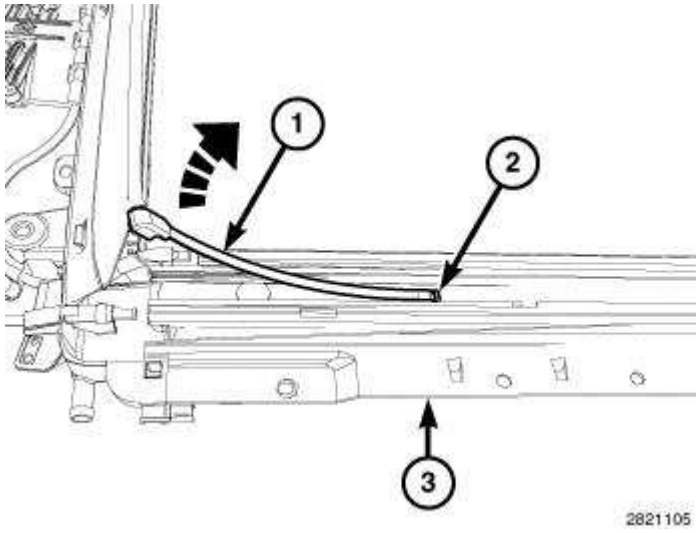

Fig. 530: Spring Arms, Slots & Frame
Courtesy of CHRYSLER GROUP, LLC

3. Rotate the deflector up and remove the spring arms (1) from the slots (2) in the frame (3).

INSTALLATION

INSTALLATION

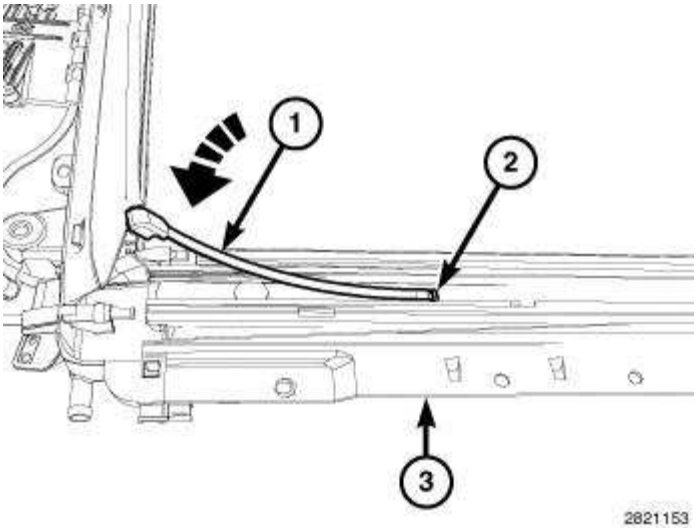

Fig. 531: Spring Arms, Slots & Frame
Courtesy of CHRYSLER GROUP, LLC

1. Position the deflector spring arms (1) into the slots (2) of the frame (3).

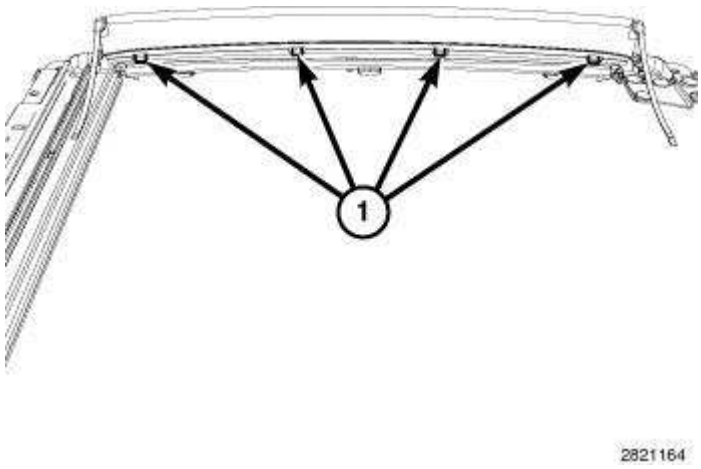

Fig. 532: Plastic Clips
Courtesy of CHRYSLER GROUP, LLC

2. Place the lower rod under the plastic clips (1) and slide up into the clips. Be careful not to snap off the plastic clips.
3. Verify the sunroof operation and alignment.

GLASS, SUNROOF, FRONT

ADJUSTMENTS

ADJUSTMENTS

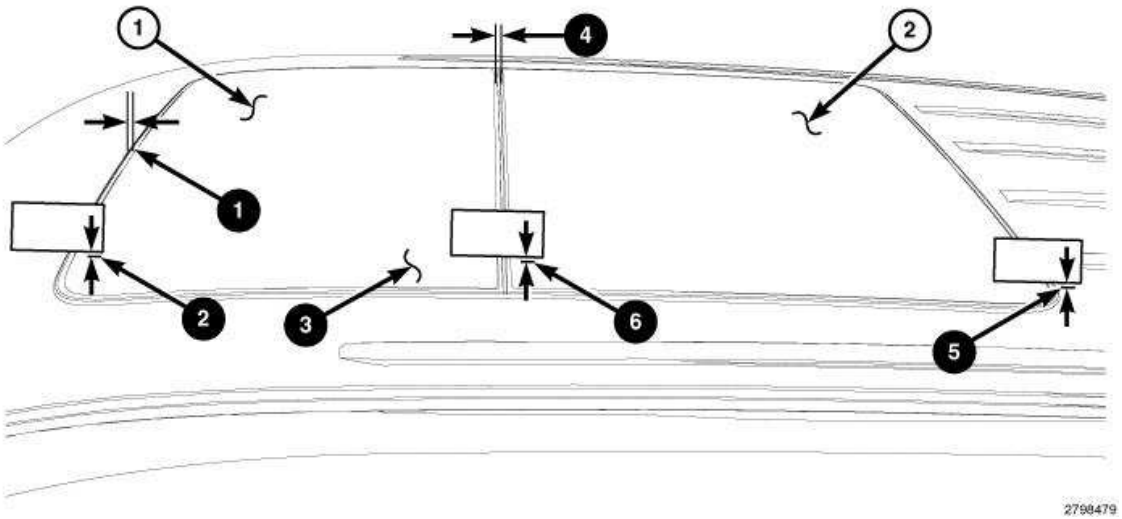

Fig. 533: DUAL PANE SUNROOF GLASS ADJUSTMENT
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT GLASS PANEL
2 - REAR GLASS PANEL
GLASS ADJUSTMENT SEQUENCE

1 - SET THE FRONT GLASS PANEL FRONT GAP TO 3 mm (0.12 in.)
2 - SET THE FRONT OF THE FRONT GLASS PANEL FLUSH TO UNDER FLUSH 2.5 mm (0.10 in.)
3 - SET THE REAR OF THE FRONT GLASS PANEL FLUSH WITH THE ROOF
4 - SET THE FRONT OF THE REAR GLASS PANEL GAP TO 3.5 mm TO 4 mm (0.14 in. to 0.16 in)
5 - SET THE REAR OF THE REAR GLASS PANEL OVER FLUSH 0 mm TO 2.5 mm (0.0 in. to 0.10 in)
6 - SET THE FRONT OF THE REAR GLASS PANEL FLUSH TO UNDER FLUSH 2.5 mm (0.10 in.)

1. Open the sunshade fully.
2. Verify the sunroof glass panel is in the fully closed position.
3. Separate the mechanism covers from the tabs on the glass panel.
4. Loosen the attaching screws on each side of the rear glass panel enough to permit adjustment of the glass gap and flush.
5. Loosen the attaching screws on each side of the front glass panel enough to permit adjustment of the glass gap and flush.

NOTE: Use shims to maintain gap during the flush adjustments.

6. Adjust the front edge of the front glass gap to 3 mm (0.12 in.).
7. Adjust the front surface of the front sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) below the top surface of the roof.
8. Tighten the front glass panel attaching screws to 4.5 N.m (40 in. lbs.).
9. Adjust the rear surface of the front sunroof glass panel flush with the top surface of the roof.
10. Tighten the remaining front glass panel attaching screws to 4.5 N.m (40 in. lbs.).

NOTE: Use shims to maintain gap during the flush adjustments.

11. Adjust the front edge of the rear glass gap 3.5 mm (0.12 in.) minimum to 4.0 mm (35.5 in.) maximum.
12. Adjust the rear surface of the rear sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) above the top surface of the roof.
13. Tighten the rear screws of the rear glass panel to 4.5 N.m (40 in. lbs.).
14. Adjust the front surface of the rear sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) below the top surface of the front glass panel.
15. Tighten the remaining rear glass panel attaching screws to 4.5 N.m (40 in. lbs.).
16. Check for proper fit. If not OK, repeat glass panel adjustment.
17. Position the mechanism covers over the glass tabs between the locating features and seat fully.
18. Verify sunroof operation and alignment.

REMOVAL

REMOVAL

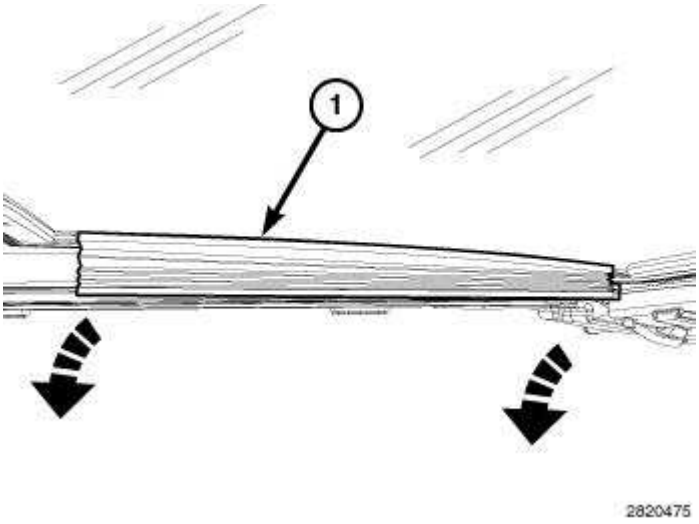

Fig. 534: Mechanism Covers
Courtesy of CHRYSLER GROUP, LLC

1. Move the glass panel into the full closed position.
2. Open the sunshade fully.
3. Separate the mechanism covers (1) from the tabs on the glass panel.

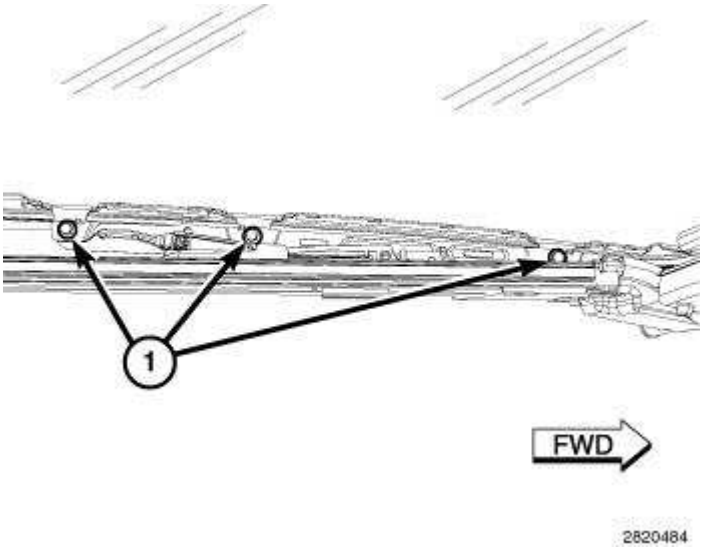

Fig. 535: Six Glass Panel Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the six glass panel screws (1).

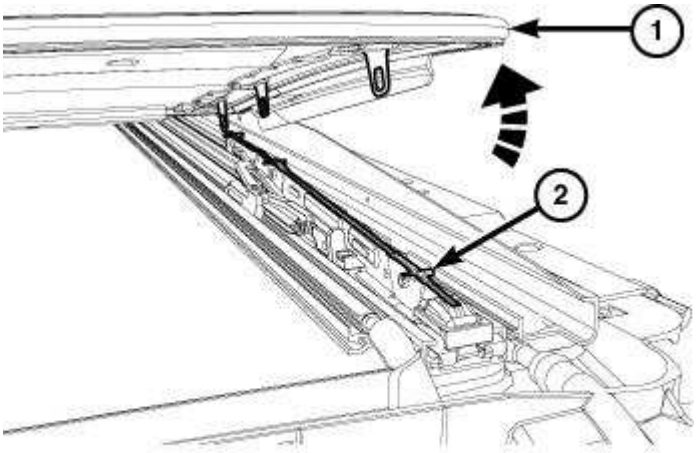

Fig. 536: Glass Panel & Guide Mechanisms
Courtesy of CHRYSLER GROUP, LLC

5. Lift off the glass panel (1) from the guide mechanisms (2) and remove from vehicle.

INSTALLATION

INSTALLATION

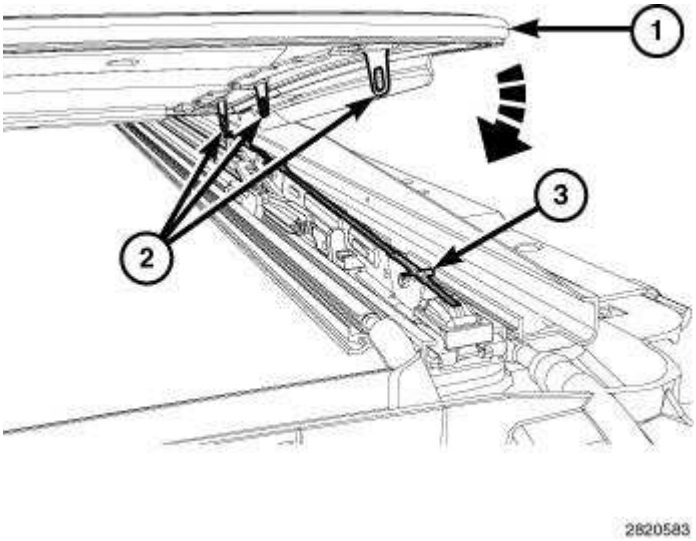

Fig. 537: Glass Panel, Six Glass Tabs & Guide Mechanism/Lift Arms
Courtesy of CHRYSLER GROUP, LLC

1. Position the glass panel (1) onto the guide mechanism/lift arms (3).

CAUTION: Make sure that all six glass tabs (2) go into the slots on the guide mechanism/lift arms (3).

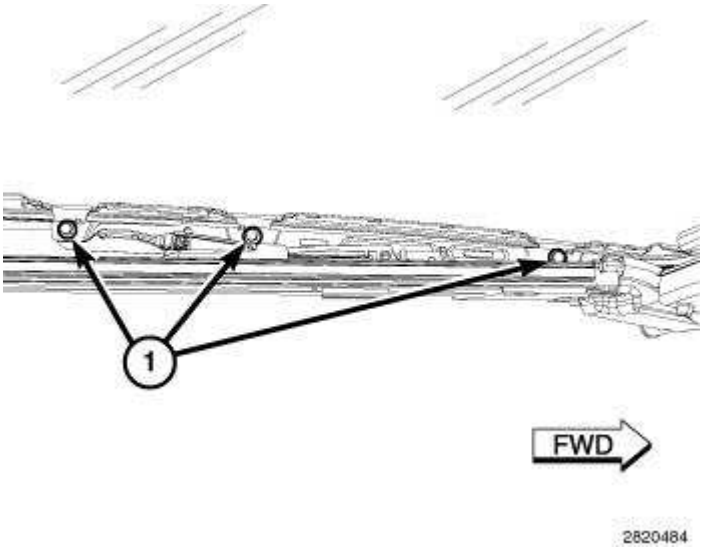

Fig. 538: Six Glass Panel Screws
Courtesy of CHRYSLER GROUP, LLC

2. Start the six attaching screws (1).
3. Connect a 12v power supply and verify that the sunroof is in the closed position.
4. Adjust the sunroof glass. Refer to **ADJUSTMENTS** .
5. Tighten the six screws (1) to 4.5 N.m (40 in. lbs.).

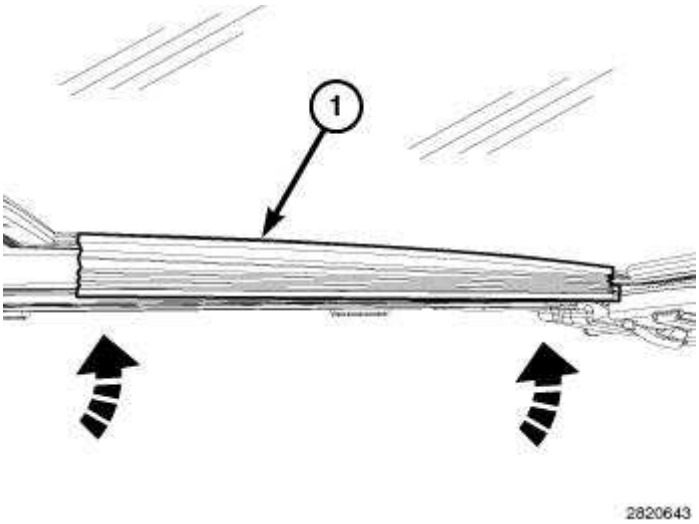

Fig. 539: Mechanism Covers
Courtesy of CHRYSLER GROUP, LLC

6. Position the mechanism covers (1) over the glass tabs between the locating features and seat fully.
7. Verify sunroof operation and alignment.

GLASS, SUNROOF, REAR

ADJUSTMENTS

ADJUSTMENTS

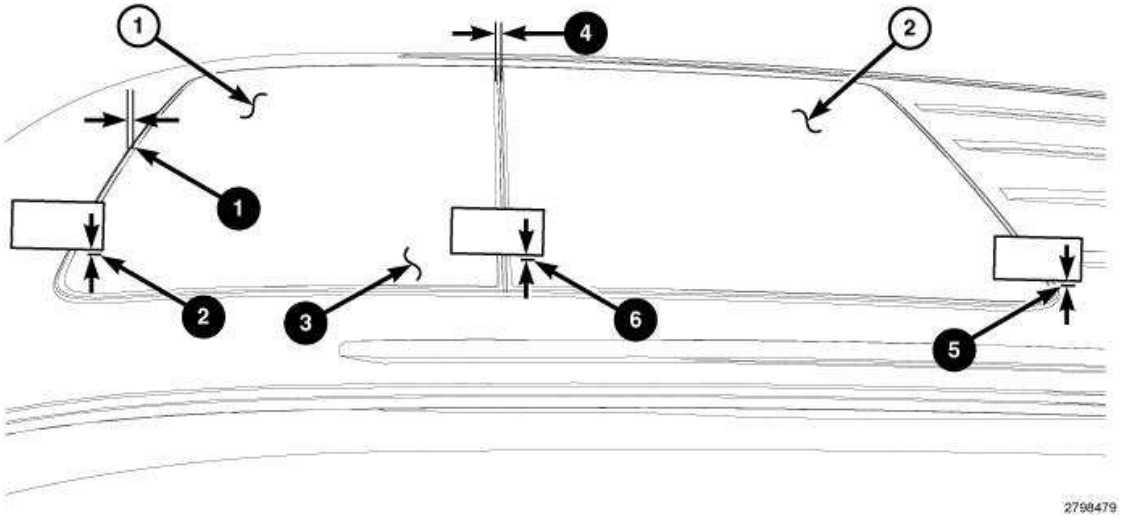

Fig. 540: DUAL PANE SUNROOF GLASS ADJUSTMENT
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT GLASS PANEL
2 - REAR GLASS PANEL
GLASS ADJUSTMENT SEQUENCE
1 - SET THE FRONT GLASS PANEL FRONT GAP TO 3 mm (0.12 in.)
2 - SET THE FRONT OF THE FRONT GLASS PANEL FLUSH TO UNDER FLUSH 2.5 mm (0.10 in.)
3 - SET THE REAR OF THE FRONT GLASS PANEL FLUSH WITH THE ROOF
4 - SET THE FRONT OF THE REAR GLASS PANEL GAP TO 3.5 mm TO 4 mm (0.14 in. to 0.16 in)
5 - SET THE REAR OF THE REAR GLASS PANEL OVER FLUSH 0 mm TO 2.5 mm (0.0 in. to 0.10 in)
6 - SET THE FRONT OF THE REAR GLASS PANEL FLUSH TO UNDER FLUSH 2.5 mm (0.10 in.)

1. Open the sunshade fully.
2. Verify the sunroof glass panel is in the fully closed position.
3. Separate the mechanism covers from the tabs on the glass panel.
4. Loosen the attaching screws on each side of the rear glass panel enough to permit adjustment of the glass gap and flush.
5. Loosen the attaching screws on each side of the front glass panel enough to permit adjustment of the glass gap and flush.

NOTE: Use shims to maintain gap during the flush adjustments.

6. Adjust the front edge of the front glass gap to 3 mm (0.12 in.).
7. Adjust the front surface of the front sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) below the top surface of the roof.
8. Tighten the front glass panel attaching screws to 4.5 N.m (40 in. lbs.).
9. Adjust the rear surface of the front sunroof glass panel flush with the top surface of the roof.
10. Tighten the remaining front glass panel attaching screws to 4.5 N.m (40 in. lbs.).

NOTE: Use shims to maintain gap during the flush adjustments.

11. Adjust the front edge of the rear glass gap 3.5 mm (0.12 in.) minimum to 4.0 mm (35.5 in.) maximum.
12. Adjust the rear surface of the rear sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) above the top surface of the roof.
13. Tighten the rear screws of the rear glass panel to 4.5 N.m (40 in. lbs.).
14. Adjust the front surface of the rear sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) below the top surface of the front glass panel.
15. Tighten the remaining rear glass panel attaching screws to 4.5 N.m (40 in. lbs.).
16. Check for proper fit. If not OK, repeat glass panel adjustment.
17. Position the mechanism covers over the glass tabs between the locating features and seat fully.
18. Verify sunroof operation and alignment.

REMOVAL

REMOVAL

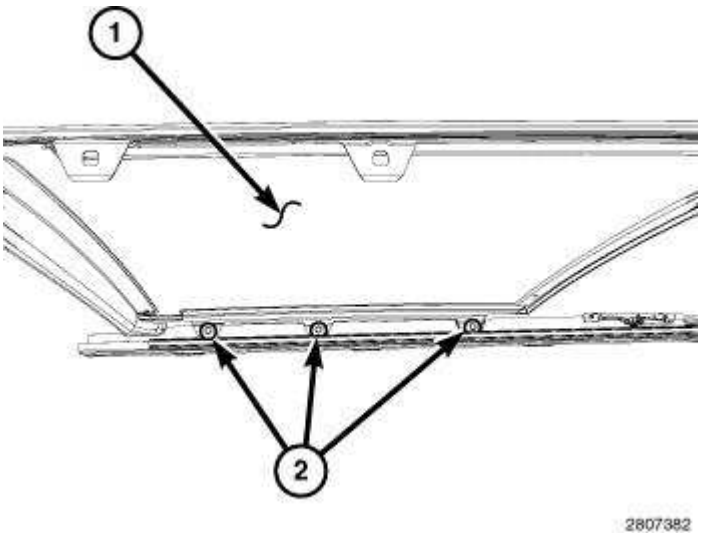

Fig. 541: Six Bolts & Glass Panel
Courtesy of CHRYSLER GROUP, LLC

1. Close the front glass panel and open the sunshade fully.

2. Remove the sunroof assembly. Refer to **SUNROOF, DUAL PANE, REMOVAL**.
3. Remove the six bolts (2) and remove the glass panel (1).

INSTALLATION

INSTALLATION

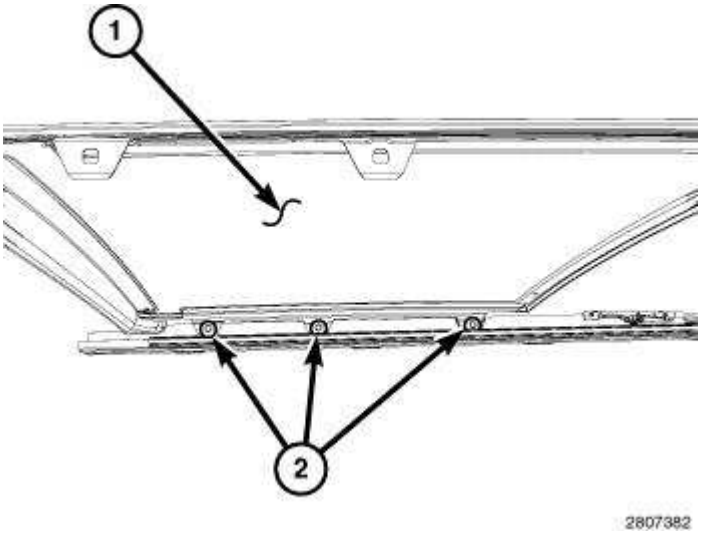

Fig. 542: Six Bolts & Glass Panel
Courtesy of CHRYSLER GROUP, LLC

1. Install the glass (1) and install the six bolts (2).
2. Install the sunroof assembly. Refer to **SUNROOF, DUAL PANE, INSTALLATION**.
3. Check and adjust the sunroof glass panels. Refer to **ADJUSTMENTS** .
4. Verify sunroof operation and alignment.

GUIDE, SUNROOF, GLASS

REMOVAL

REMOVAL

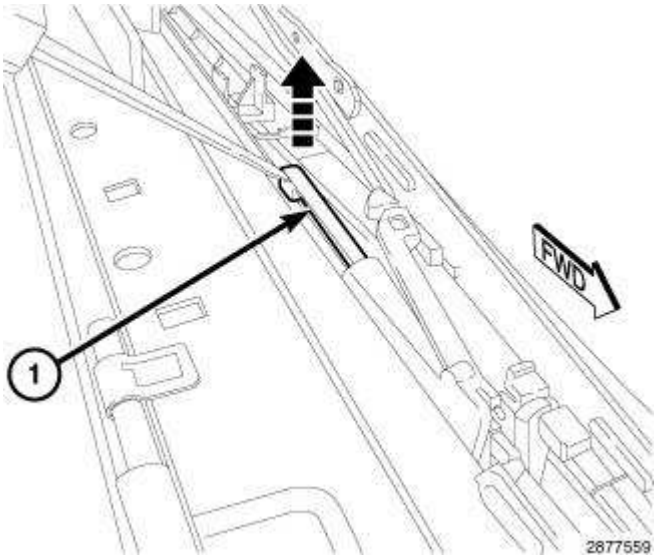

Fig. 543: Locking Lever & Channel Guide
Courtesy of CHRYSLER GROUP, LLC

1. Place the sunroof in the vent position.
2. Remove the sunroof assembly. Refer to **SUNROOF, DUAL PANE, REMOVAL**.
3. Remove the motor. Refer to **MOTOR, SUNROOF, REMOVAL** .
4. Remove the glass. Refer to **GLASS, SUNROOF, FRONT, REMOVAL** or **GLASS, SUNROOF, REAR, REMOVAL**.
5. Remove the wind deflector. Refer to **DEFLECTOR, WIND, REMOVAL**.
6. Lift the locking lever out of the notch in the channel guide.

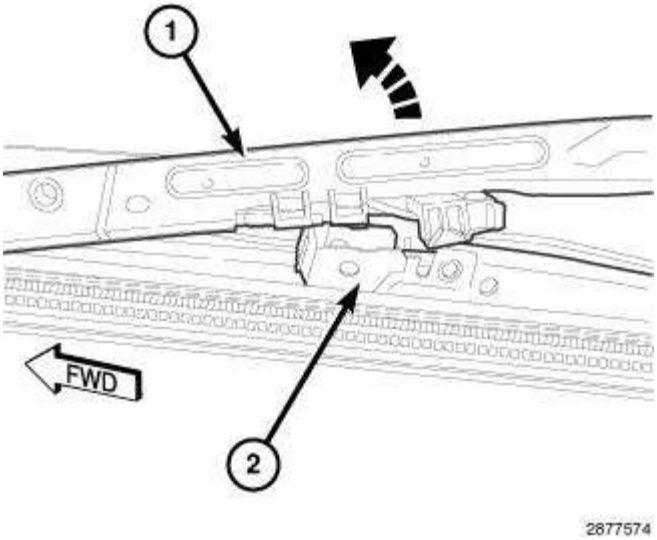

Fig. 544: Mechanism Forward
Courtesy of CHRYSLER GROUP, LLC

7. Slide the mechanism forward until the wedge shaped mechanism piece releases.

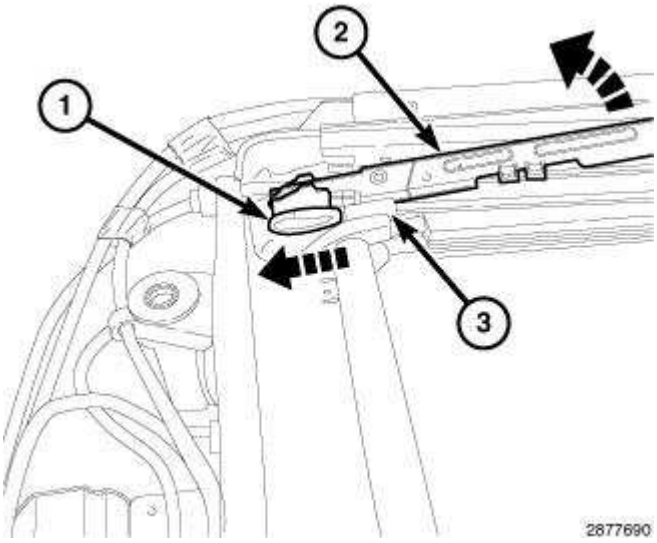

Fig. 545: Glass Guide
Courtesy of CHRYSLER GROUP, LLC

8. Lift the glass guide and push forward out of the channel guide.

INSTALLATION

INSTALLATION

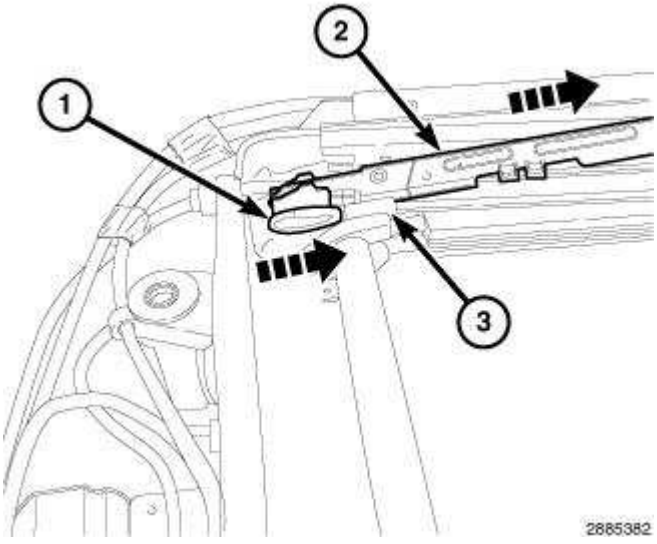

Fig. 546: Front Foot & Guide Channel
Courtesy of CHRYSLER GROUP, LLC

1. Insert the front foot into the guide channel and push the guide assembly rearward.

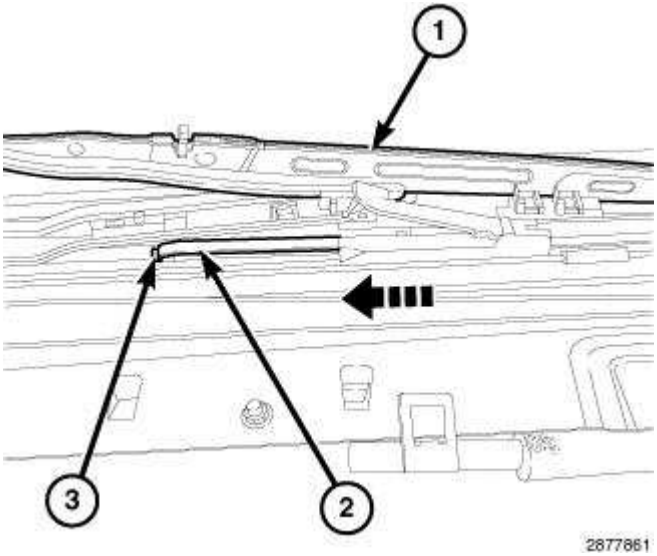

Fig. 547: Guide Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Slide the guide assembly rearward until the locking lever engages into the notch in the channel guide.

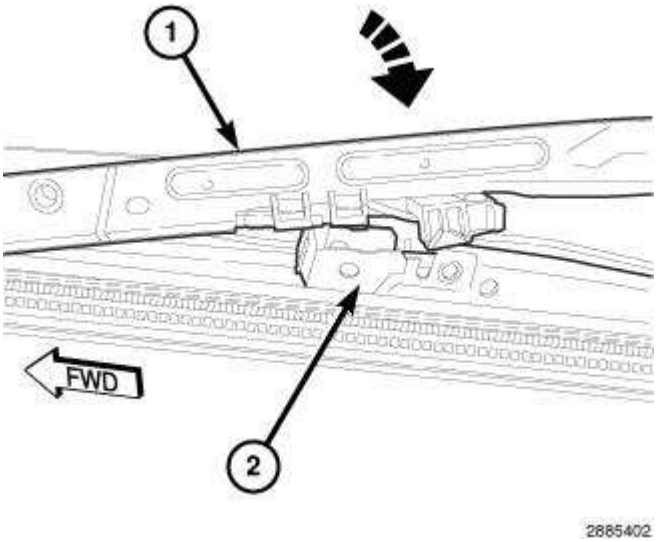

Fig. 548: Guide Assembly & Drive Unit
Courtesy of CHRYSLER GROUP, LLC

3. Slide the guide assembly (1) rearward until the wedge shaped mechanism piece connects to the drive unit (2).
4. Install the wind deflector. Refer to **DEFLECTOR, WIND, INSTALLATION**.
5. Install the glass. Refer to **GLASS, SUNROOF, FRONT, INSTALLATION** or **GLASS, SUNROOF, REAR, INSTALLATION**.
6. Install the glass motor. Refer to **MOTOR, SUNROOF, INSTALLATION** .

7. Install the sunroof assembly. Refer to **SUNROOF, DUAL PANE, INSTALLATION**.

SUNSHADE, SUNROOF

REMOVAL

REMOVAL

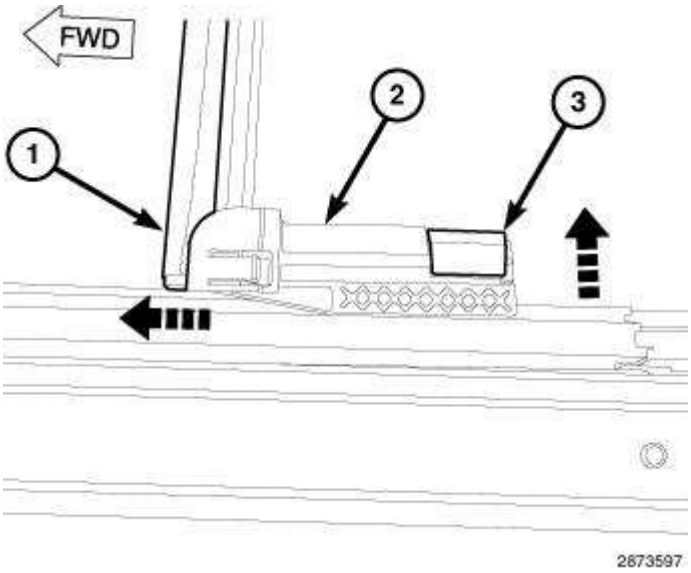

Fig. 549: Front Shade Aluminum Beam & Cable Overmolds
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear glass panel. Refer to **GLASS, SUNROOF, FRONT, REMOVAL** or **GLASS, SUNROOF, REAR, REMOVAL**.
2. Release the front shade aluminum beam (1) from the cable overmolds (2).

NOTE: The sunshade retraction spring force is significant. Firmly hold onto the sunshade while releasing the shade from the overmolds in the following steps.

3. Release the white clips (3) from the cable overmold (2).
4. Allow the spring to retract remaining fabric into the roll.

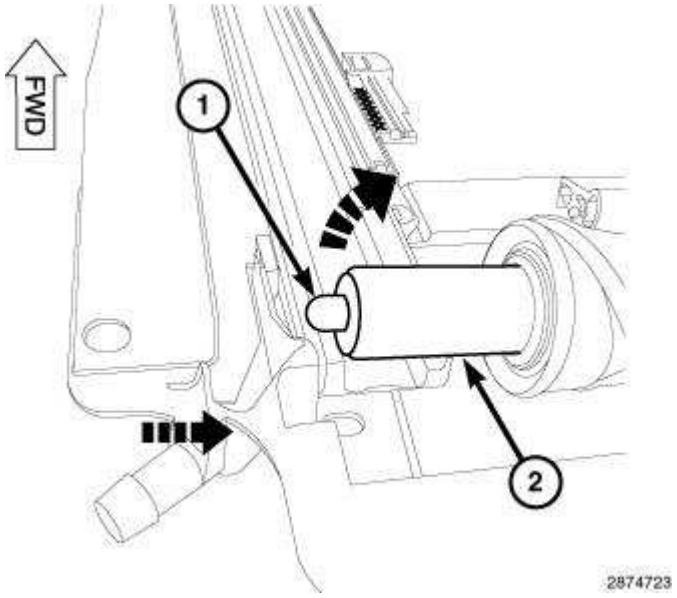

Fig. 550: Fabric Roll & White Plastic Pin
Courtesy of CHRYSLER GROUP, LLC

5. While holding the spring loaded tube and fabric roll (2), push in the white plastic pin (1) on the left hand side of the shade tube and lift.

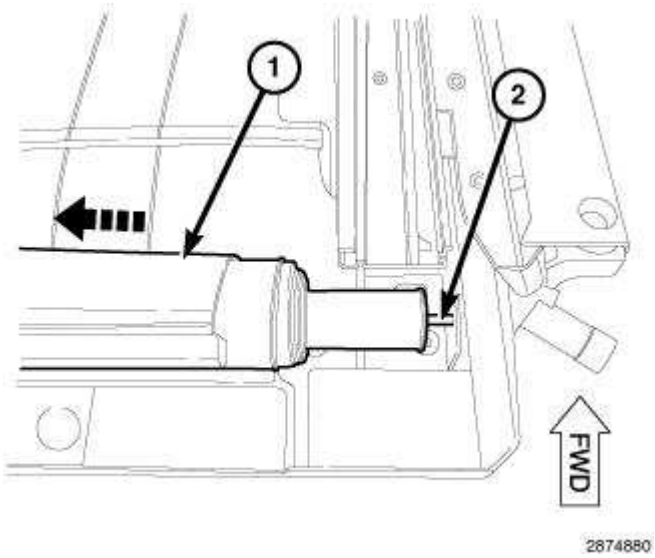

Fig. 551: Shade Assembly & Steel Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the sunshade spring lock is released before it engages in the internal slot, the sunshade has to be replaced with a new one. Once released, the sunshade spring lock can not be reset.

6. Carefully pull the shade assembly (1) to the left twisting slightly until the steel rod (2) on the right hand side of the shade tube engages internal slot.

7. When at least one inch of the inner steel rod is exposed it can be removed from the rear beam without the spring unwinding.

INSTALLATION

INSTALLATION

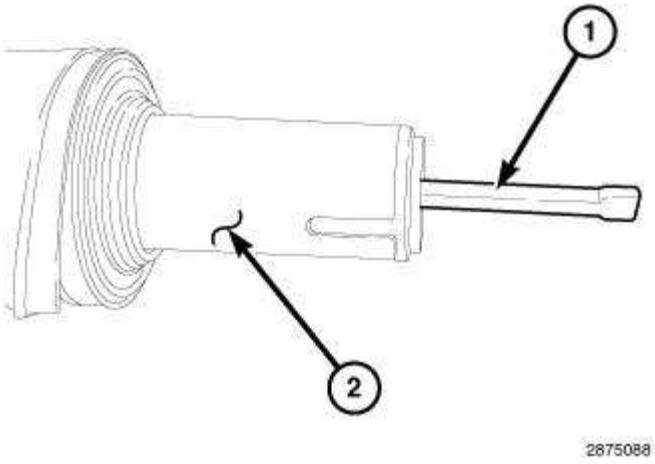

Fig. 552: Flattened Steel Rod & Shade Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Locate the flattened steel rod on the right hand side of the shade assembly

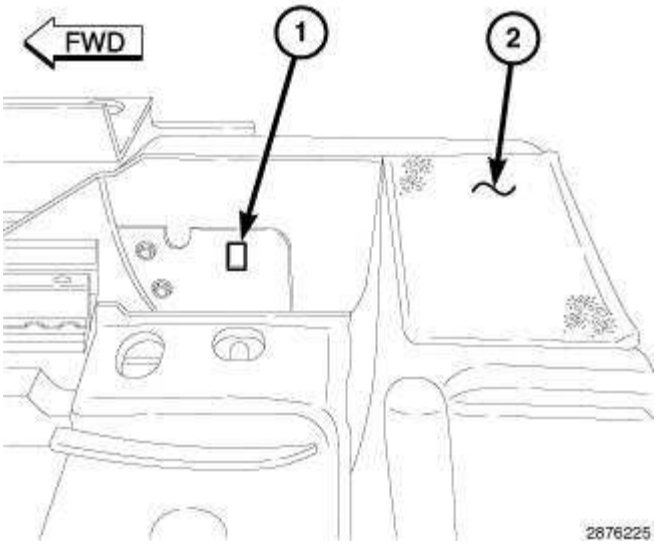

Fig. 553: Flattened Steel Rod & Rear Beam
Courtesy of CHRYSLER GROUP, LLC

2. Insert the flattened steel rod into the slot (1) in the steel plate in the rear beam (2).

CAUTION: If the sunshade spring lock is released before the sunshade is installed, the sunshade has to be replaced with a new one. Once released, the sunshade spring lock can not be reset.

3. With the sunroof held firmly, push the sunshade assembly to the right to release the shade spring lock.
4. Push the left side of the sunshade down until the white plastic pin snaps into the hole on the right hand side of the rear beam.

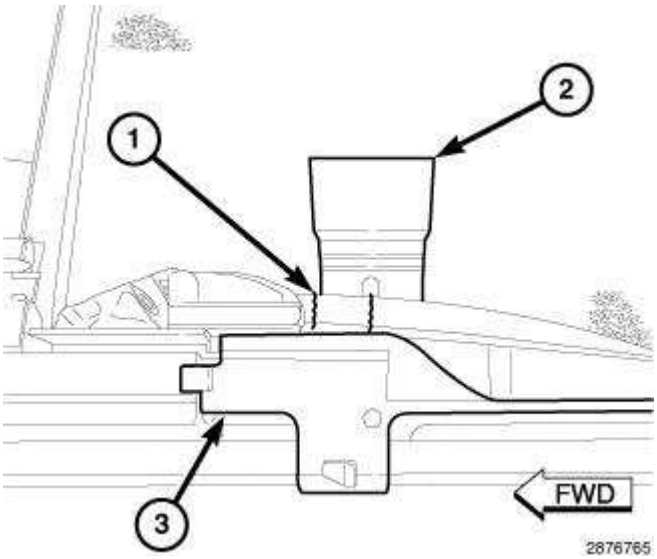

Fig. 554: Front Shade Beam & Fabric
Courtesy of CHRYSLER GROUP, LLC

NOTE: The sunshade retraction spring force is significant. Firmly hold onto the sunshade while securing the shade to the overmolds in the following steps.

5. Extend the front shade beam forward of the cable overmolds and work the fabric under the cable overmolds.
6. Insert the white clips into the stitched pockets on the sunshade cloth and install the clip onto the rear edge of the cable overmold.

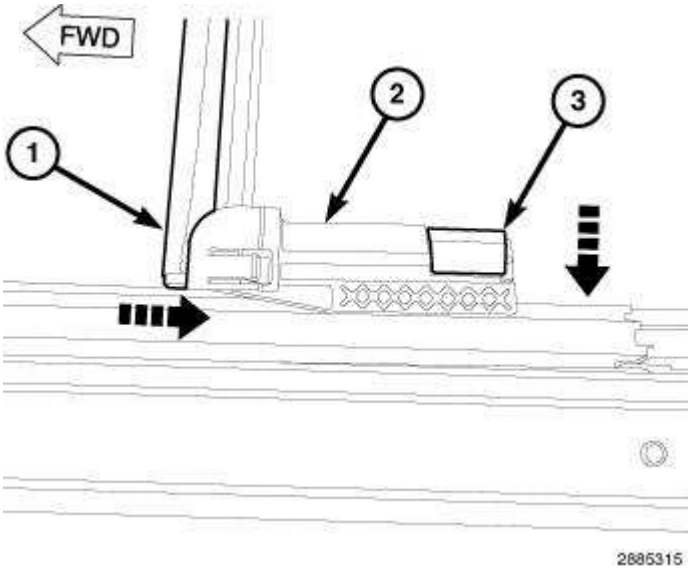

Fig. 555: Sunshade Front Beam & Cable Overmolds
Courtesy of CHRYSLER GROUP, LLC

7. Rotate the sunshade front beam (1) into the front of the cable overmolds (2) and seat until they click into place fully.
8. Install the rear sunroof glass assembly. Refer to **GLASS, SUNROOF, FRONT, INSTALLATION** or **GLASS, SUNROOF, REAR, INSTALLATION**.

TUBE, SUNROOF DRAIN

REMOVAL

REMOVAL

FRONT

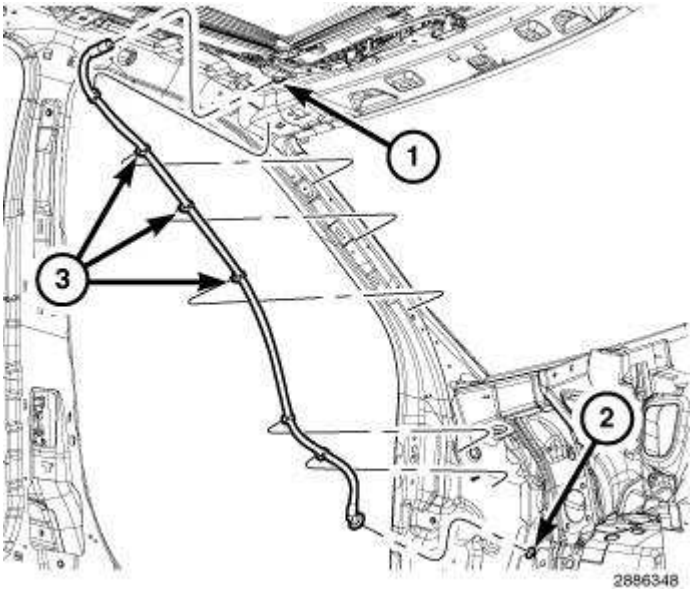

Fig. 556: Sunroof, Front Drain Tube Support Clips & Floor Grommet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Driver side shown in illustration, passenger side typical unless noted.

1. Remove the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.
2. Remove the lower cowl panel. Refer to **PANEL, COWL TRIM, REMOVAL**.
3. If servicing the driver side, remove the steering column opening trim panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.
4. If servicing the passenger side, remove the glove box module. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL**.
5. Lower the headliner as necessary to gain access to the drain tube. Refer to **HEADLINER, REMOVAL**.
6. Separate the drain tube support clips (3).
7. Disconnect the drain tube from the floor grommet (2).
8. Disconnect the tube from the sunroof (1) and pull the tube up through the instrument panel.

REAR

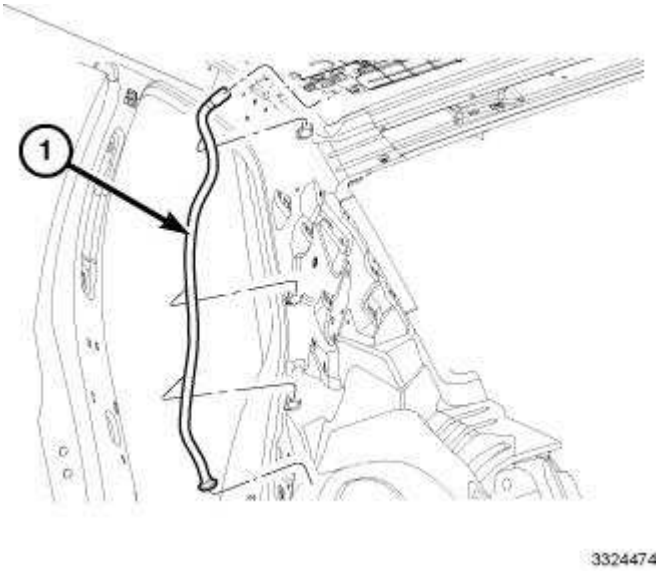

Fig. 557: Drain Tube
Courtesy of CHRYSLER GROUP, LLC

1. Remove the lower C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
2. Lower the headliner as necessary to gain access to the drain tube. Refer to **HEADLINER, REMOVAL**.
3. Separate the drain tube support clips.
4. Disconnect the drain tube (1) from the floor grommet.
5. Disconnect the tube from the sunroof and remove the tube (1).

INSTALLATION

INSTALLATION

FRONT

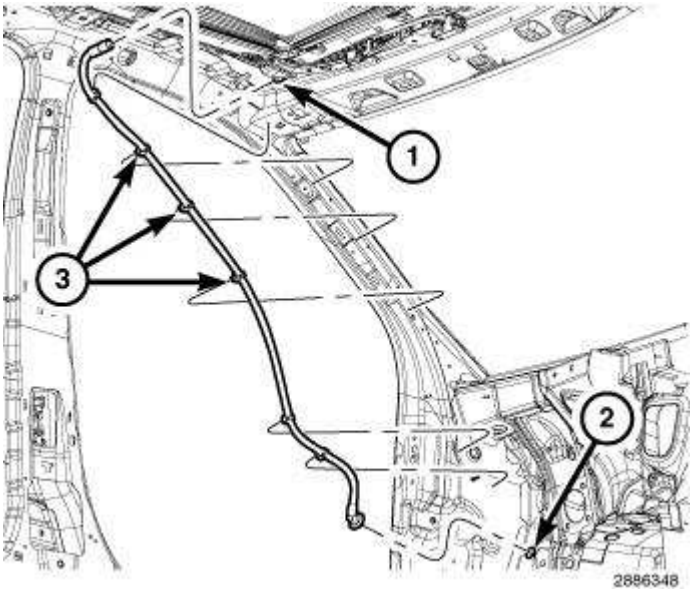

Fig. 558: Sunroof, Front Drain Tube Support Clips & Floor Grommet
Courtesy of CHRYSLER GROUP, LLC

1. Install the front tube and seat the push pin fasteners (3) fully.
2. Position the lower portion through the grommet (2) in the body.
3. Connect the new drain tube to the sunroof housing (1) and test drainage.
4. If servicing the passenger side, install the glove box module. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.
5. If servicing the driver side, install the steering column opening trim panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION**.
6. Install the lower cowl panel. Refer to **PANEL, COWL TRIM, INSTALLATION**.
7. Install the headliner. Refer to **HEADLINER, INSTALLATION**.
8. Install the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.

REAR

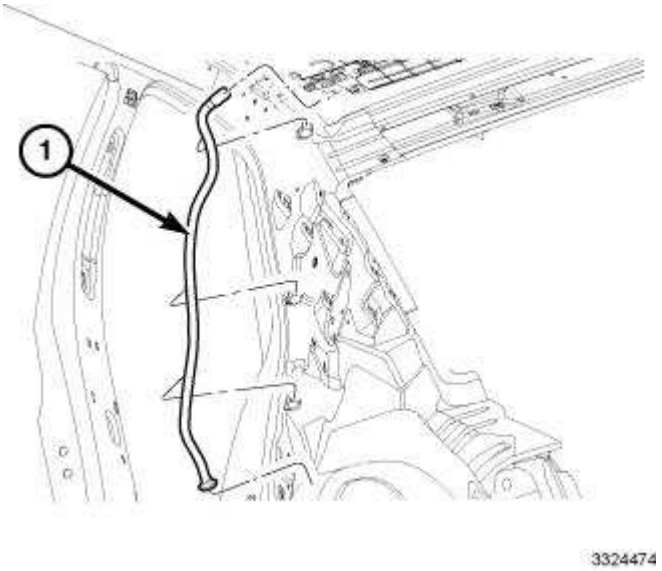

Fig. 559: Drain Tube
Courtesy of CHRYSLER GROUP, LLC

1. Install the rear tube and seat the push pin fasteners fully.
2. Position the lower portion through the grommet in the body.
3. Connect the new drain tube (1) to the sunroof housing and test drainage.
4. Install the headliner. Refer to **HEADLINER, INSTALLATION**.
5. Install the lower C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.

BODY STRUCTURE

GAP AND FLUSH

SPECIFICATIONS

BRAKES

Base - Service Information - Chrysler 300

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION

CAUTION

CAUTION: Use only Mopar® brake fluid or an equivalent from a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use petroleum-based fluid because seal damage in the brake system will result.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

CAUTION: During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

CAUTION: Disc brake calipers are made of aluminum. They are anodized and appear black in color. When handling the calipers or brake rotors, be careful to avoid damaging them, and avoid scratching or nicking the brake pad lining.

CAUTION: Anytime the battery has been disconnected and is reconnected it is important that this be performed properly. The vehicle may be equipped

with systems that require special calibration processes.

STANDARD PROCEDURE

BASE BRAKE BLEEDING

CAUTION: Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

NOTE: For bleeding the antilock brake hydraulic system, Refer to STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING .

NOTE: Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

NOTE: Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the brake hydraulic system.

- Right rear wheel
- Left rear wheel
- Right front wheel
- Left front wheel

NOTE: Pressure bleeding is highly recommended to bleed this brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

The base brake system can be bled using the pressure method or the manual method. Both methods are presented in this text.

PRESSURE BLEEDING METHOD

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

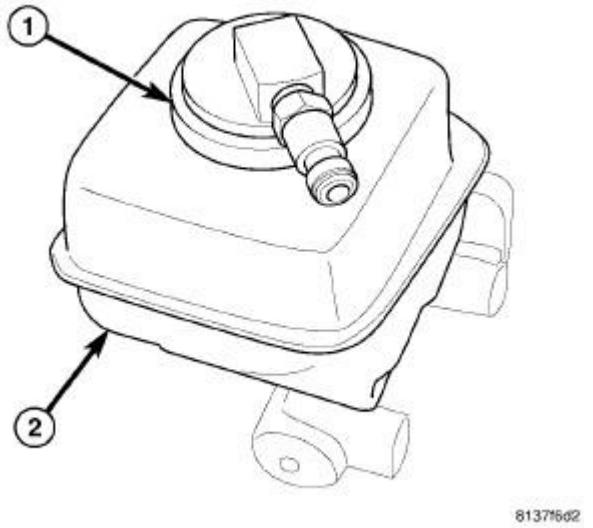

Fig. 1: Fluid Reservoir & Adapter
Courtesy of CHRYSLER GROUP, LLC

1. Remove filler cap from the top of fluid reservoir (2) on master cylinder.
2. Install Adapter (1), Special Tool (special tool #6921, Cap, Master Cylinder), in the caps place on the reservoir (2).
3. Attach Bleeder Tank, Special Tool C-3496-B, or equivalent, to Adapter (special tool #6921, Cap, Master Cylinder) (1). Pressurize the system following the pressure bleeder manufacturer's instructions.

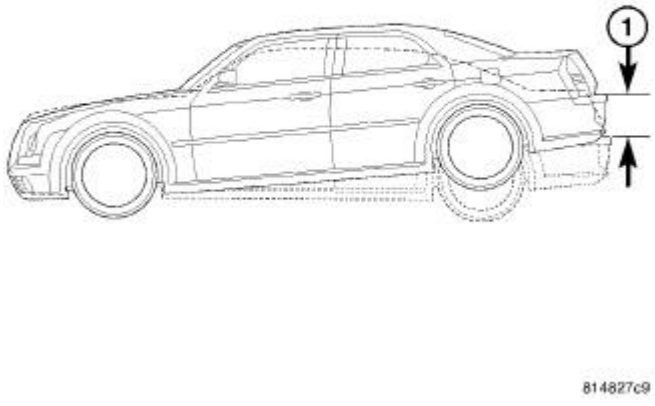

Fig. 2: Vehicle Rear Raised For Bleeding
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).**

4. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

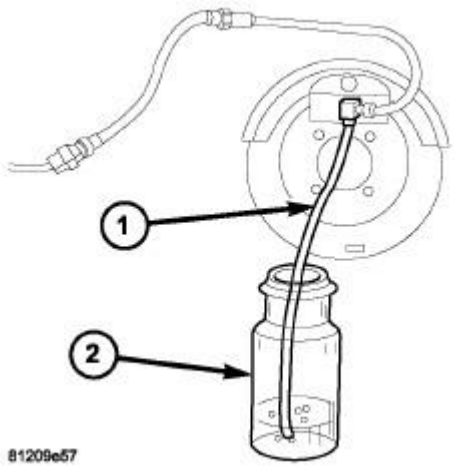

Fig. 3: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

5. If installed, remove rubber dust caps from all four bleeder screws on calipers.
6. Starting at the first wheel circuit as listed earlier, attach a clear hose (1) to the bleeder screw at that wheels brake caliper and feed the other end of hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: **Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

7. Open bleeder screw at least one full turn or more to obtain an adequate flow of brake fluid.
8. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (1) and jar (2), close the bleeder screw.
9. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
10. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be

trapped in the hydraulic system. Rebleed the brake system as necessary.

11. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. Refer to **STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING** .
12. Reinstall all 4 bleeder screw dust caps.
13. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING METHOD

NOTE: To bleed the base brake system manually, an assistants help is required.

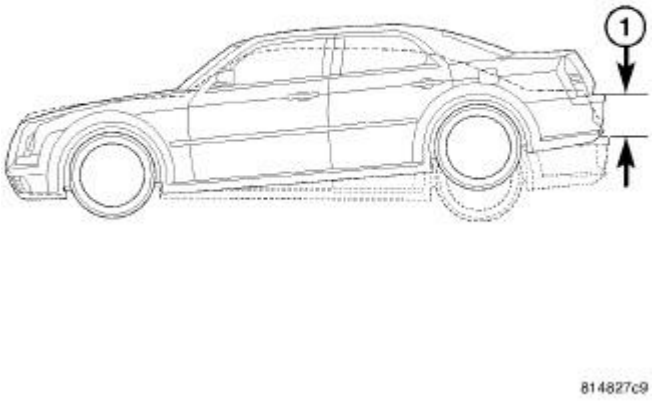

Fig. 4: Vehicle Rear Raised For Bleeding
Courtesy of CHRYSLER GROUP, LLC

NOTE: To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).

1. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

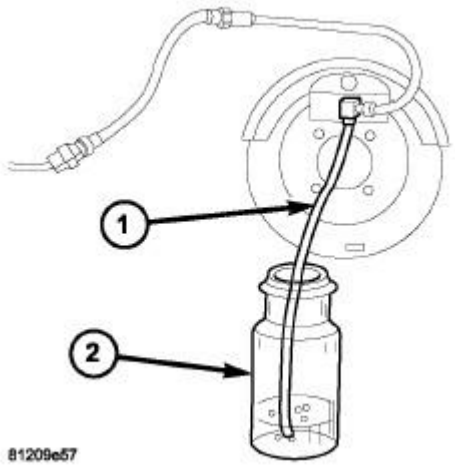

Fig. 5: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

2. Remove rubber duct caps from all 4 bleeder screws.
3. Attach a clear hose (1) to the bleeder screw at one wheel and feed the other end of the hose into a clear jar (2) containing fresh brake fluid.
4. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

5. While the pedal is being held down, open the bleeder screw at least 1 full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.
6. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
7. Repeat steps One through Five until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

8. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake

hydraulic system.

9. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.
10. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. Refer to **STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING** .
11. Reinstall all 4 bleeder screw dust caps.
12. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

BASE BRAKE BLEEDING - SRT8

Use the following procedure to bleed the rear brake calipers of this vehicle. The front brake calipers may be bled using the same procedure as the standard model.

CAUTION: Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

NOTE: For bleeding the antilock brake hydraulic system, refer to STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING .

NOTE: Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

NOTE: Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

NOTE: Pressure bleeding is highly recommended to bleed this brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

Although it is recommended that the base brake system be bled using the pressure method, the manual method can also be performed. Both methods are presented in this text.

PRESSURE BLEEDING METHOD

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

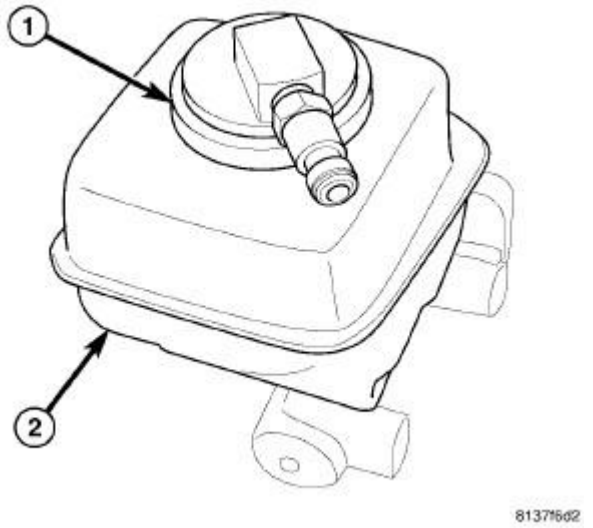

Fig. 6: Fluid Reservoir & Adapter
Courtesy of CHRYSLER GROUP, LLC

1. Remove filler cap from the top of fluid reservoir (2) on master cylinder.
2. Install Adapter (1), Special Tool (special tool #6921, Cap, Master Cylinder), in the caps place on the reservoir (2).
3. Attach Bleeder Tank, Special Tool C-3496-B, or equivalent, to Adapter (special tool #6921, Cap, Master Cylinder) (1). Pressurize the system following the pressure bleeder manufacturer's instructions.

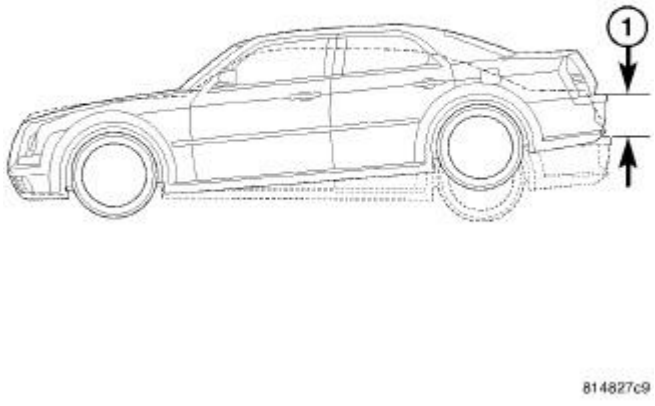

Fig. 7: Vehicle Rear Raised For Bleeding
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).**

4. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

NOTE: **The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the brake hydraulic system.**

- **Right rear wheel**
- **Left rear wheel**
- **Right front wheel**
- **Left front wheel**

REAR BRAKES

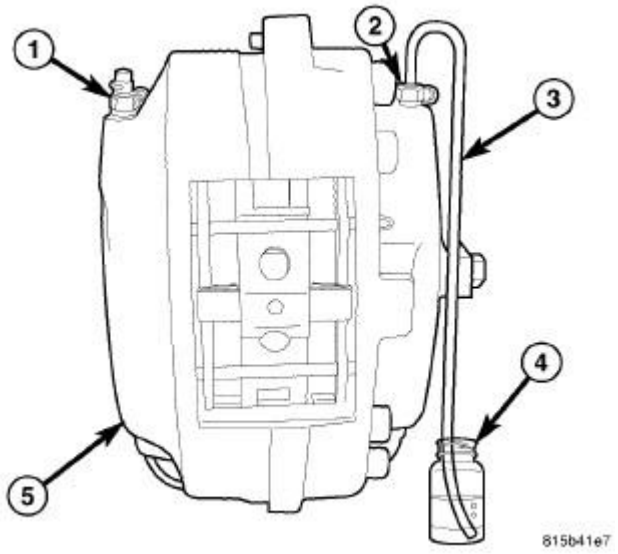

Fig. 8: Bleeding Caliper Inboard Half
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove rubber dust caps from both bleeder screws on each caliper.
2. Starting at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (3) to the inboard bleeder screw (2) at that wheels brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some

air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

3. Open inboard bleeder screw (2) at least one full turn or more to obtain an adequate flow of brake fluid.
4. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (3) and jar (4), close the bleeder screw (2).
5. Remove clear hose and install bleeder screw dust cap.

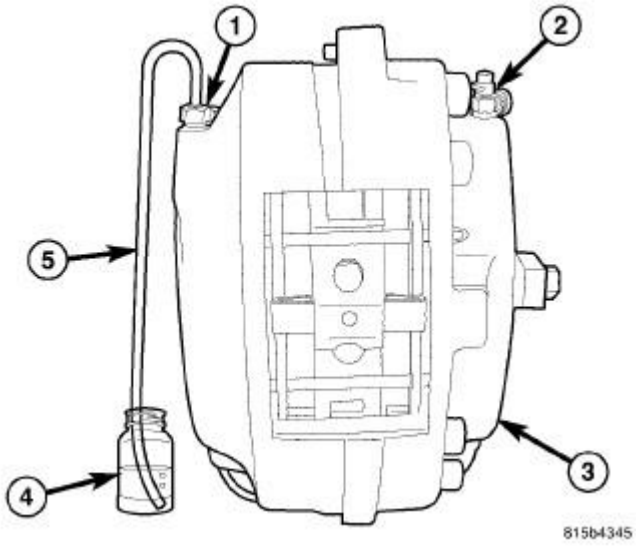

Fig. 9: Bleeding Caliper Outboard Half
Courtesy of CHRYSLER GROUP, LLC

6. Attach a clear hose (5) to the outboard bleeder screw (1) at that same wheels brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

7. Open outboard bleeder screw (1) at least one full turn or more to obtain an adequate flow of brake fluid.
8. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (5) and jar (4), close the bleeder screw (1).
9. Remove clear hose and install bleeder screw dust cap.
10. Bleed opposite rear brake wheel circuits as necessary in the same manner until all air is removed from the brake hydraulic system, then proceed to the front brakes.

FRONT BRAKES

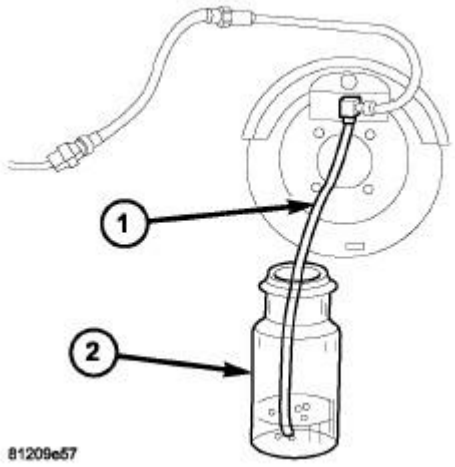

Fig. 10: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove rubber dust cap from bleeder screw on each front brake caliper.
2. Starting at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (1) to the bleeder screw at that wheels brake caliper and feed the other end of hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

3. Open bleeder screw at least one full turn or more to obtain an adequate flow of brake fluid.
4. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (1) and jar (2), close the bleeder screw.

5. Install bleeder screw dust cap.
6. Bleed opposite front brake wheel circuit as necessary in the same manner until all air is removed from the brake hydraulic system.
7. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. Refer to **STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING** .
8. Once all brakes are bled, check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.
9. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING METHOD

NOTE: To bleed the base brake system manually, an assistants help is required.

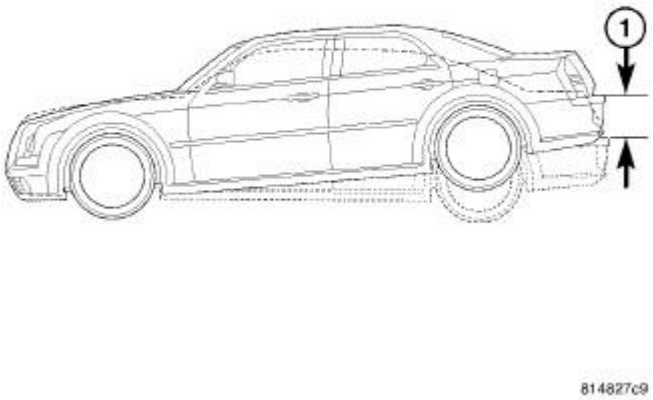

Fig. 11: Vehicle Rear Raised For Bleeding
Courtesy of CHRYSLER GROUP, LLC

NOTE: To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).

1. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

NOTE: The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the brake hydraulic system.

- **Right rear wheel**
- **Left rear wheel**
- **Right front wheel**
- **Left front wheel**

REAR BRAKES

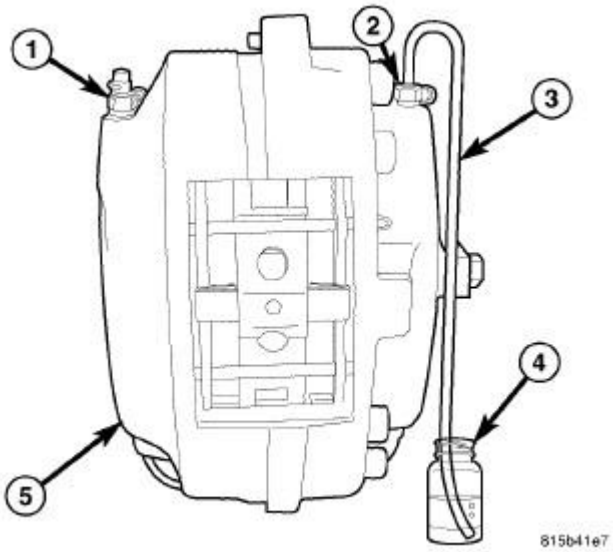

Fig. 12: Bleeding Caliper Inboard Half
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove rubber dust caps from both bleeder screws on each caliper.
2. Starting at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (3) to the inboard bleeder screw (2) at that wheels brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.
3. Have an assistant pump the brake pedal three or four times, then hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

4. While the pedal is being held down, open the inboard bleeder screw (2) at least one full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.

5. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
6. Repeat the above three steps until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. **Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level.** This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

7. Remove clear hose and install bleeder screw dust cap.

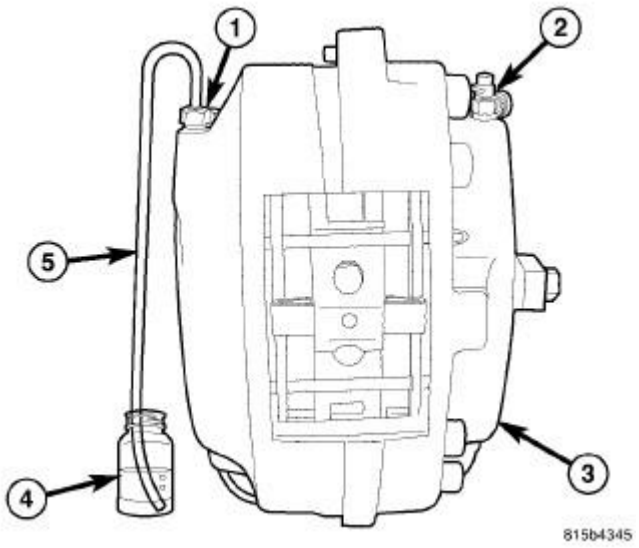

Fig. 13: Bleeding Caliper Outboard Half
Courtesy of CHRYSLER GROUP, LLC

8. Attach a clear hose (5) to the outboard bleeder screw (1) at that same wheels brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.
9. Have an assistant pump the brake pedal three or four times, then hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

10. While the pedal is being held down, open the outboard bleeder screw (2) at least one full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.
11. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
12. Repeat the above three steps until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. **Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level.** This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: **Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.**

13. Remove clear hose and install bleeder screw dust cap.
14. Bleed opposite rear brake wheel circuits as necessary in the same manner until all air is removed from the brake hydraulic system, then proceed to the front brakes.

FRONT BRAKES

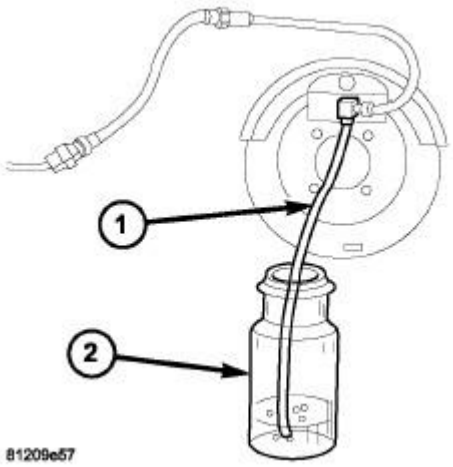

Fig. 14: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove rubber dust cap from bleeder screw on each front brake caliper.
2. Starting at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (1) to the bleeder screw at one wheel and feed the other end of the hose into a clear jar (2) containing fresh brake fluid.
3. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some

air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

4. While the pedal is being held down, open the bleeder screw at least one full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.
5. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
6. Repeat steps One through Five until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

7. Install bleeder screw dust cap.
8. Bleed opposite front brake wheel circuit as necessary in the same manner until all air is removed from the brake hydraulic system.
9. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. Refer to **STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING** .
10. Once all brakes are bled, check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.
11. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

ELECTRICAL

PUMP, ELECTRIC VACUUM

DESCRIPTION

DESCRIPTION

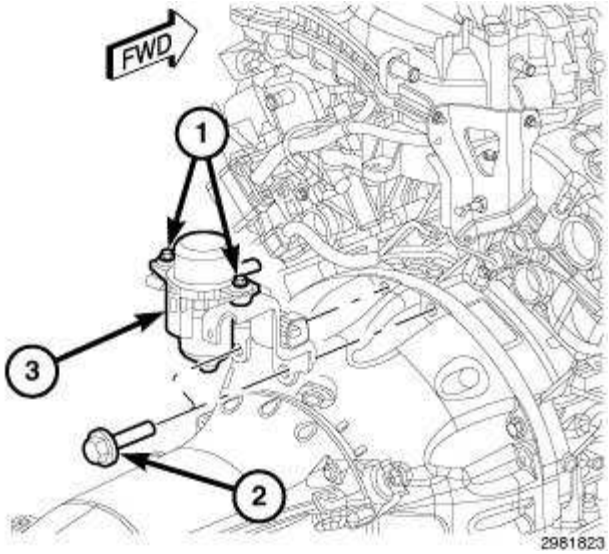

Fig. 15: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Only vehicles with a 3.6L engine have an electric vacuum pump.

There is an electric vacuum pump (3) located on the back of the engine mounted to the top of the transmission. The vacuum pump (3) has one electrical connector on a pigtail connected to the mounting bracket. The vacuum pump (3) mounts to the bracket with two rubber insulated studs (1) to reduce vibration, and the bracket mounts to the transmission with two bolts (2). The vacuum hose has a quick-connect type end with a locking tab at the vacuum pump.

OPERATION

OPERATION

The Electric Vacuum Pump (EVP) system is installed to provide supplemental vacuum to the brake booster when the engine vacuum supply is low. The vacuum pump is connected to the engine and the brake booster through a series of hoses and one-way flow check valves. A pressure senor, mounted in the brake booster, provides information to the Antilock Brake System (ABS) module, then the vacuum level is sent over CAN to the Powertrain Control Module (PCM). The PCM modulates the EVP operation to maintain the brake booster vacuum within a given range. This system ensures that the customer experiences a consistent brake pedal feel under all driving conditions.

A two wire electrical connector is used to supply power and ground for the vacuum pump. Operating voltage is between 9V - 16V. Control of the vacuum pump is provided by the Powertrain Control Module (PCM) using a low side driver to a normally open relay (coil side). The relay coil side power is from a fuse in the under hood PDC. The switched power to the vacuum pump relay comes directly from the battery through an inline fuse holder located in the engine compartment.

The PCM monitors the Manifold Absolute Pressure (MAP) sensor and when the signal indicates low engine vacuum the PCM will cycle the vacuum pump as necessary to add vacuum to the power brake booster. The vacuum hoses are connected between the vacuum pump, the engine manifold (for MAP sensor signal), and the power brake booster vacuum sensor (on the brake booster). When the PCM cycles the vacuum pump on, the PCM monitors the MAP sensor and if the vacuum signal does not indicate a rising vacuum then DTCs will be set. Additionally the Antilock Brake System (ABS) module monitors the vacuum at the brake booster vacuum sensor and DTCs will also set in the ABS module.

REMOVAL

REMOVAL

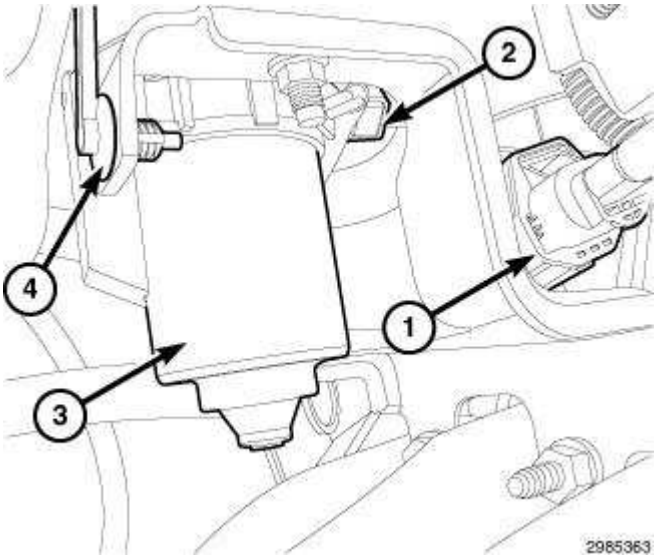

Fig. 16: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine appearance cover.
2. Disconnect the electrical connector (1) and remove the harness connector (4) from the mounting bracket.
3. Release the locking tab and disconnect the quick connect vacuum hose (2) from the vacuum pump (3).

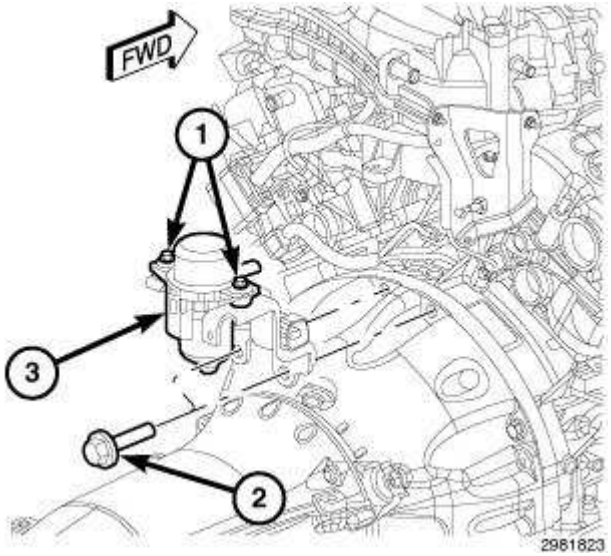

Fig. 17: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

4. Remove the vacuum pump bracket bolts (2) and remove the vacuum pump assembly (3) from the vehicle.

INSTALLATION

INSTALLATION

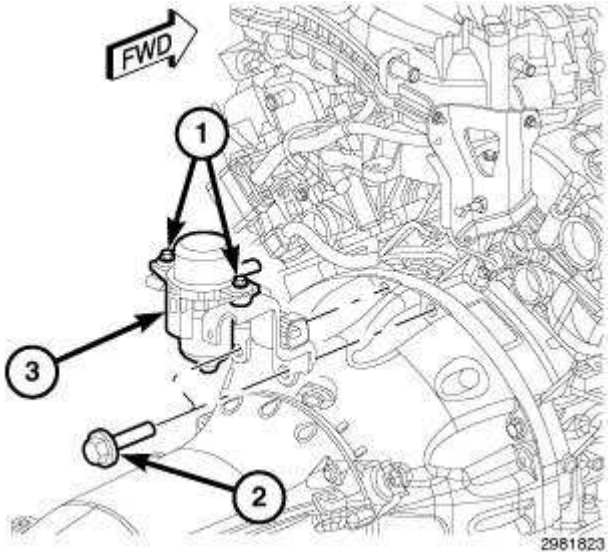

Fig. 18: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

1. Position the vacuum pump assembly (3), install the bracket mounting bolts (2) and tighten to 55 N.m (41 ft. lbs.).

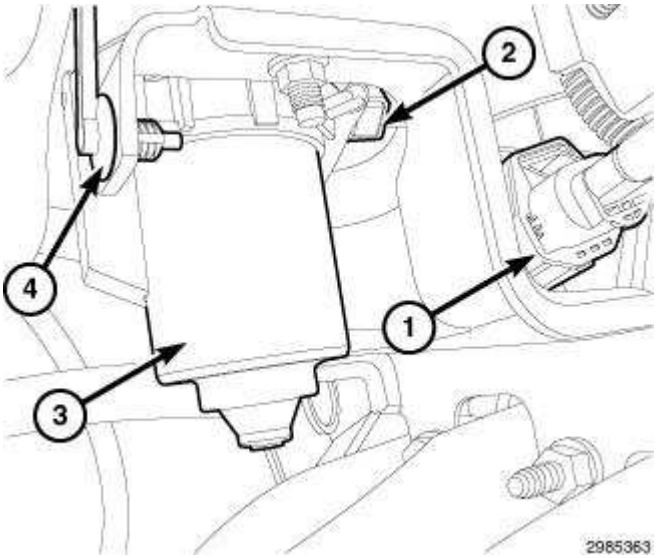

Fig. 19: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

2. Attach the harness connector to the bracket (4), and connect the electrical connector (1).
3. Connect the quick-connect vacuum hose (2) to the vacuum pump (3) and seat the locking tab.
4. Install the engine appearance cover.

SWITCH, BRAKE FLUID LEVEL

REMOVAL

REMOVAL

The brake fluid level sensor (2) is an integral part of the master cylinder fluid reservoir (1). Refer to **RESERVOIR, BRAKE MASTER CYLINDER, INSTALLATION**.

HYDRAULIC/MECHANICAL

DESCRIPTION

NON SRT

Four-wheel disc brakes are standard on this vehicle. There are two four-wheel disc brake systems available, a standard and a premium. The standard disc brake system is referred to as "Seventeen-Inch." The premium disc brake system is referred to as "Eighteen-Inch."

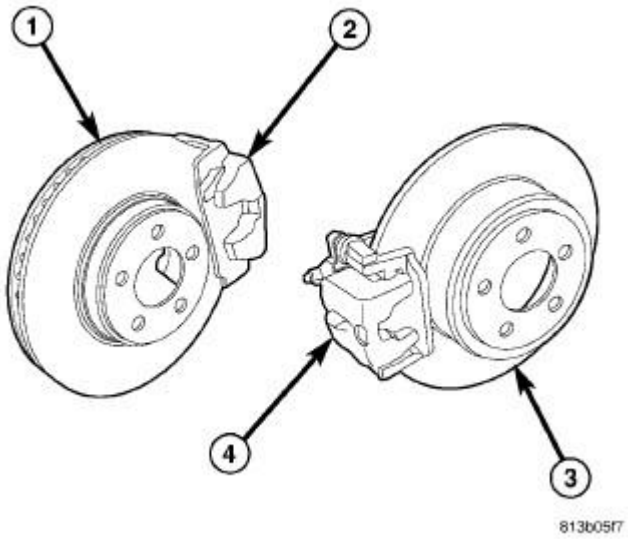

Fig. 22: 17 Inch Brakes
Courtesy of CHRYSLER GROUP, LLC

"Seventeen-inch" four-wheel disc brakes (so called because they are designed to fit inside 17-inch wheels) are standard on rear-wheel drive models with V6 engines. They feature single-piston aluminum calipers (2) and vented rotors (1) in the front and single-piston aluminum calipers (4) with solid rotors (3) in the rear.

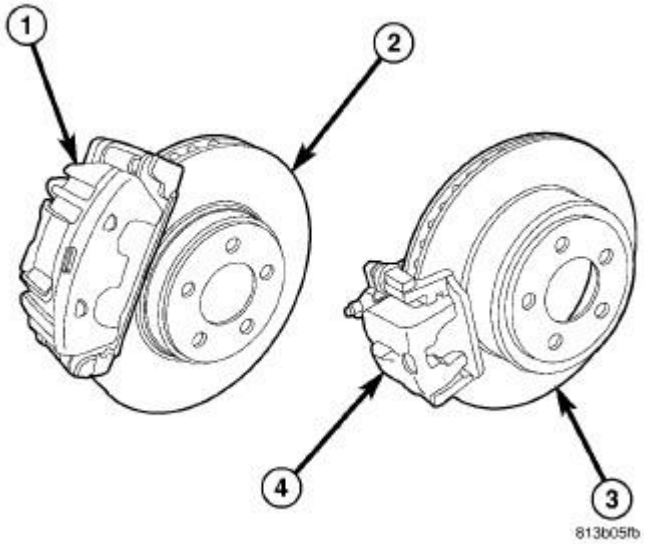

Fig. 23: 18 Inch Brakes
Courtesy of CHRYSLER GROUP, LLC

"Eighteen-inch" four-wheel disc brakes (so called because they are designed to fit inside 18-inch wheels) are standard on all international models and optional on other models. They feature twin-piston aluminum calipers (1) and vented rotors (2) in the front and single-piston aluminum calipers (4)

with vented rotors (3) in the rear. Although the rear calipers appear the same as the 17-inch system, the rear calipers used with this system feature a wider jaw to compensate for the wider, vented brake rotors used.

Although the twin-piston caliper used is the same, Rear-Wheel-Drive (RWD) models mount the caliper to the rear (trailing end) of the knuckle while All-Wheel-Drive (AWD) models mount the caliper to the front (leading end) of the knuckle.

All calipers are aluminum construction and are the low-drag type. New-technology caliper construction allows minimal drag of the pads on the discs with low clearance to the rotors to maintain maximum pedal feel and responsiveness.

All calipers are anodized, giving them an off-black appearance. This coating offers corrosion protection and a long-term neat appearance.

Phenolic pistons are used in all calipers. The premium twin caliper pistons have stainless steel caps for protection against damage due to contact with the brake pads.

All brake rotors are fully coated with Geomet™, a water-soluble, environmental friendly corrosion preventive. Both the friction surfaces and the vents are coated. During initial brake applications of a new rotor, the brake pads scrub the coating off the friction surfaces, ensuring that the remainder will be rust free. Coating the vents also ensures that there will not be a loss of heat capacity over time.

SRT

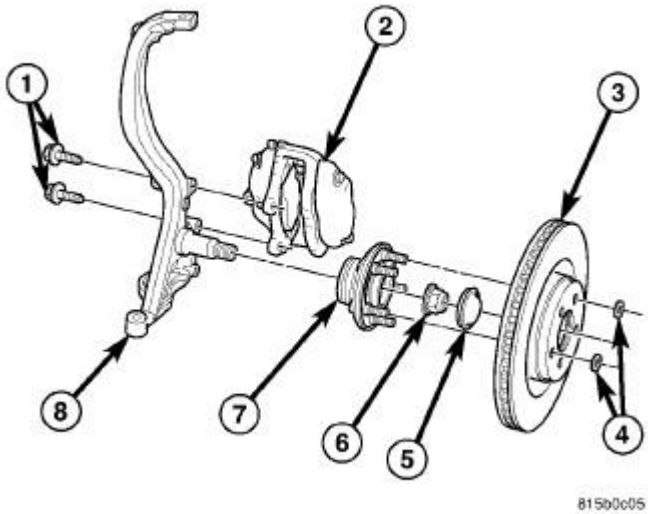

Fig. 24: Exploded View Of Front Disc Brakes - Srt-8
Courtesy of CHRYSLER GROUP, LLC

SRT8 models utilize four-wheel disc brakes. All brake calipers (2) are four-piston opposed fixed design manufactured by Brembo.

All brake rotors (3) are the internal vented type. There are no dust shields behind the front brake rotors.

All SRT8 calipers mount directly to the knuckle. They do not use brake caliper adapters.

The SRT8 rear brake rotors have integrated parking brake drums like the standard rear disc brake system.

Each front brake caliper features four 42 mm pistons, two in each outer half of the caliper. The two outer halves of this caliper connect hydraulically using internal passageways. These calipers are not serviceable. Do not attempt disassembly.

Each rear brake caliper features four pistons also, two in each half of the caliper. Each half has one 28 mm and one 32 mm piston. When mounted, the smaller size (28 mm) piston is located at the top while the larger size (32 mm) piston is located at the bottom. The two halves of the caliper are connected hydraulically by means of an external brake tube located on the bottom of the caliper assembly. Each caliper half has its own bleeder screw at the top and must be bled individually when bleeding is required. These calipers are not serviceable. Do not attempt disassembly.

BLOCK, BRAKE LINE UNION

DESCRIPTION

DESCRIPTION

A junction block is used on vehicles that are not equipped with antilock brakes (ABS) allowing use of the same brake tubes on all applications. The junction block is located in the engine compartment, in front of the right wheel well. The junction block mounts in the same location as the ABS integrated control unit (ICU) does on vehicles with ABS.

It has six threaded ports to which the brake tubes connect. Two are for the brake tubes coming from the master cylinder. The remaining four ports are for the brake tubes going to each wheel brake assembly.

The junction block contains a proportioning valve. The proportioning valve is not serviced separately from the junction block.

OPERATION

OPERATION

The junction block distributes the brake fluid coming from the master cylinder primary and secondary ports to the four brake tubes leading to the wheel brakes. Since the junction block mounts in the same location as the ABS integrated control unit (ICU), it allows for the common use of brake tubes on the vehicle whether it is equipped with or without ABS.

The junction block includes a rear brake proportioning valve. Placed in the fluid flow passages leading to the rear brake tube ports, it balances front-to-rear braking.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION & WARNING.

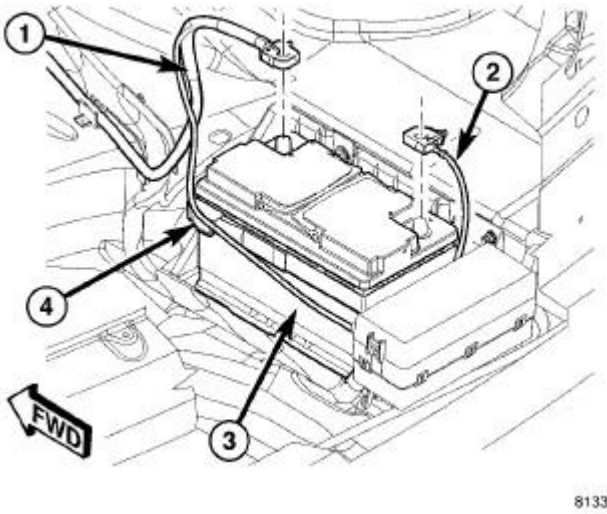

Fig. 25: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

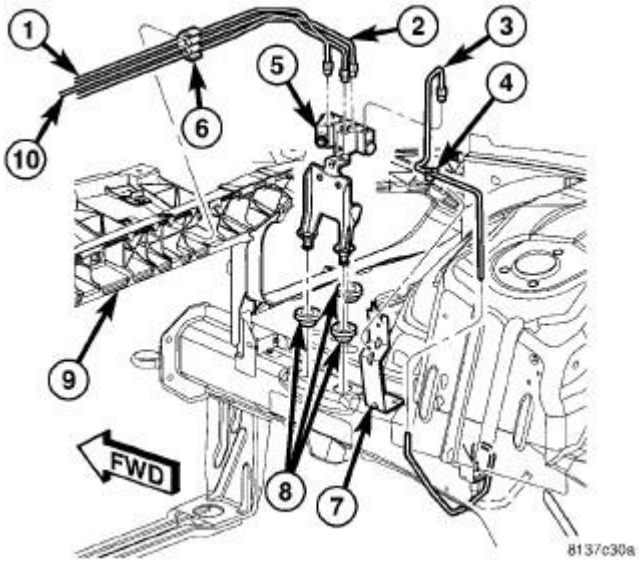

Fig. 26: Junction Block & Brake Tubes
Courtesy of CHRYSLER GROUP, LLC

3. Remove brake tubes (1, 2, 3 and 10) at junction block (5).

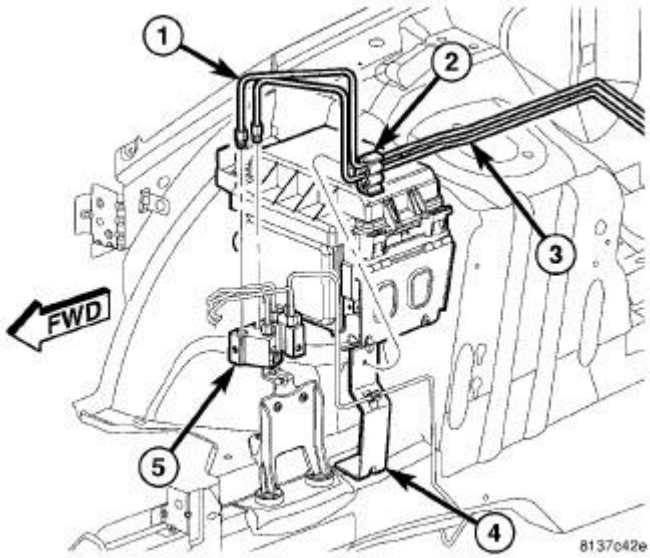

Fig. 27: Rear Tubes AT Junction Block
Courtesy of CHRYSLER GROUP, LLC

4. Remove remaining brake tubes (1 and 3) at junction block (5).

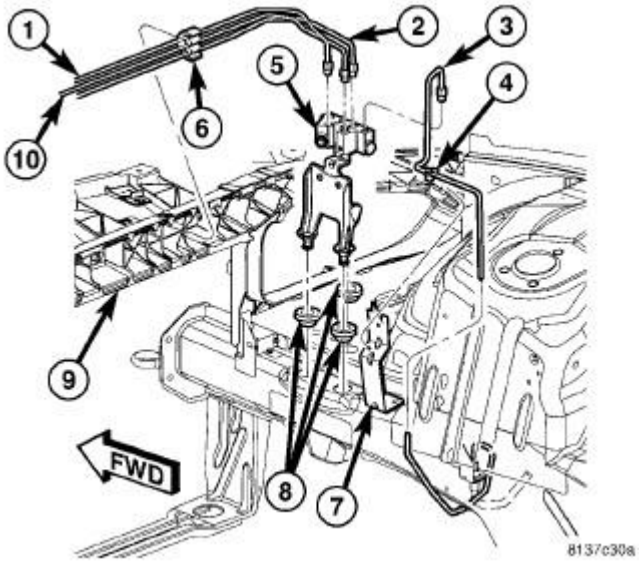

Fig. 28: Junction Block & Brake Tubes
Courtesy of CHRYSLER GROUP, LLC

5. Pull up on junction block (5) and remove from mounting grommets (8).

INSTALLATION

INSTALLATION

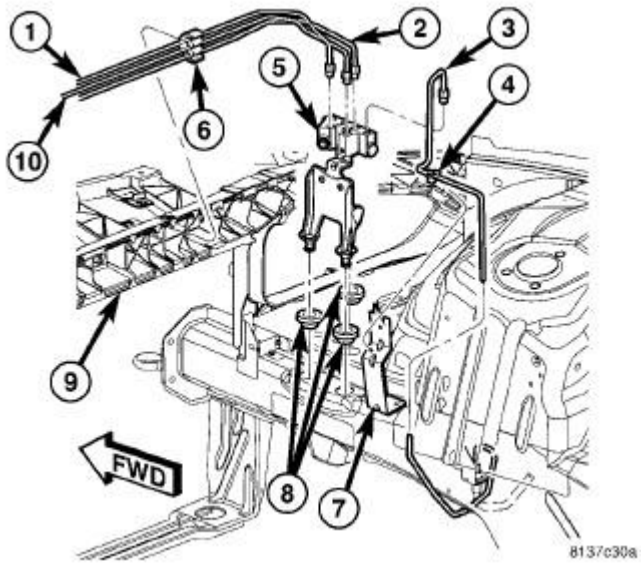

Fig. 29: Junction Block & Brake Tubes
Courtesy of CHRYSLER GROUP, LLC

1. Install junction block (5), pushing mounting bracket down into mounting grommets (8) located in body of vehicle.

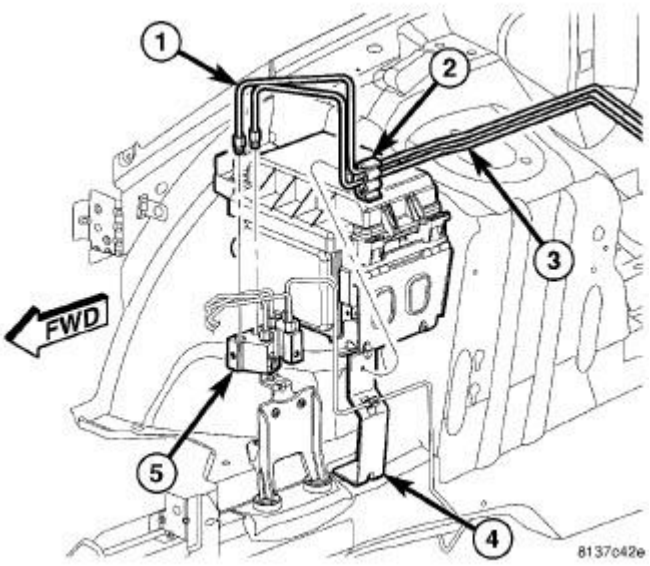

Fig. 30: Rear Tubes AT Junction Block
Courtesy of CHRYSLER GROUP, LLC

2. Install brake tubes to rear (1 and 3) at hydraulic control unit. Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

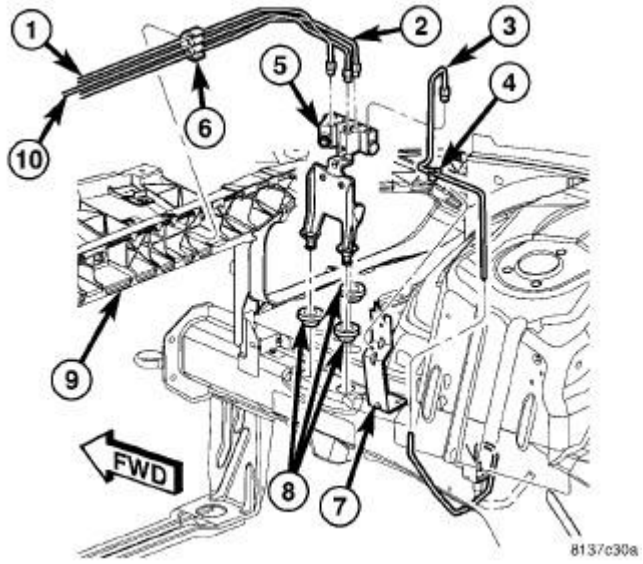

Fig. 31: Junction Block & Brake Tubes
Courtesy of CHRYSLER GROUP, LLC

3. Install brake tubes (1, 2, 3 and 10) at junction block (5). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.
4. Remove brake pedal holding tool.

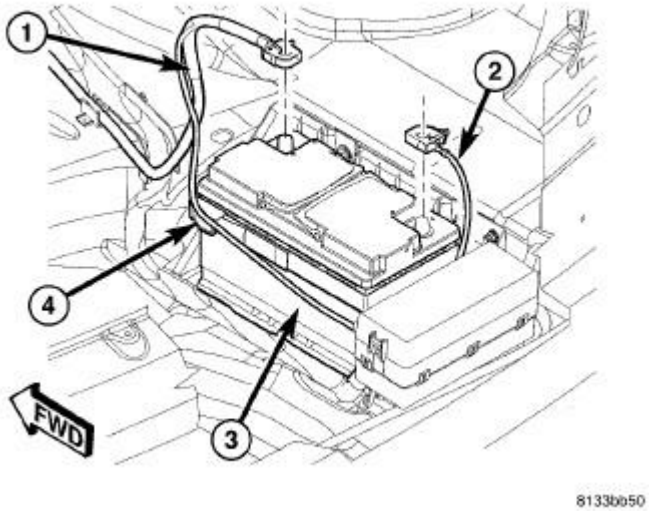

Fig. 32: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

5. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

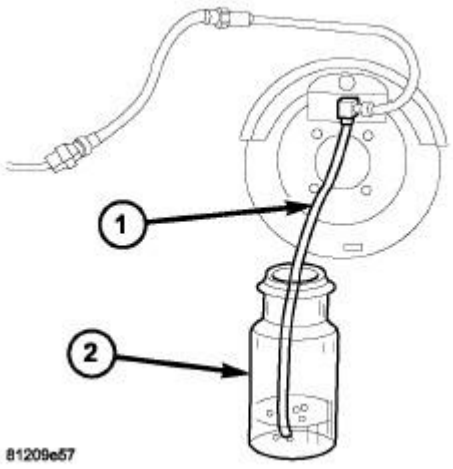

Fig. 33: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

6. Fill and bleed (1) base brake hydraulic system. Refer to **BASE BRAKE BLEEDING** .
7. Road test vehicle to verify proper operation of brakes.

BOOSTER, POWER BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

REMOVAL

REMOVAL

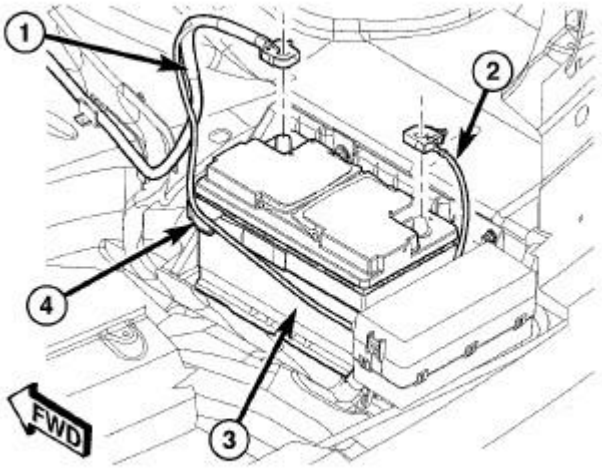

Fig. 34: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

1. Move driver's seat to full rearward position.
2. Disconnect and isolate battery negative cable (2) from battery post.
3. Remove windshield wiper module Refer to **LINKAGE, WIPER ARM, REMOVAL** .
4. Remove master cylinder. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.

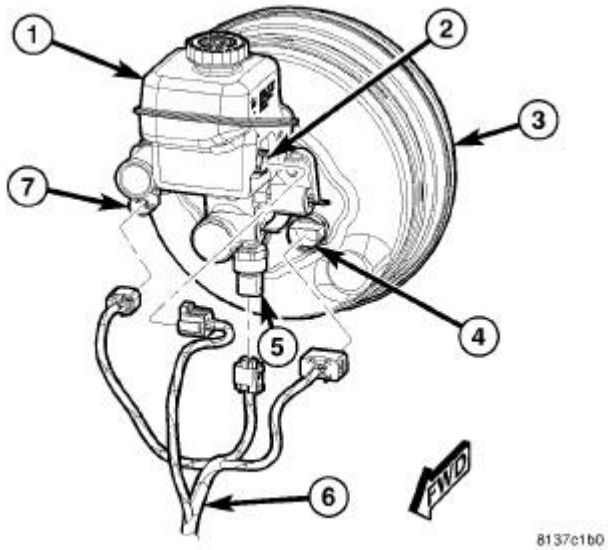

Fig. 35: Identifying Master Cylinder Wiring Harness & Connectors
Courtesy of CHRYSLER GROUP, LLC

5. If equipped with MK25 and Electronic Stability Control (ESC), disconnect wiring harness (6) connector at pedal travel sensor (7) on power brake booster (3).
6. If equipped with MK25 and ESC, disconnect wiring harness (6) connector at active brake booster solenoid (4).

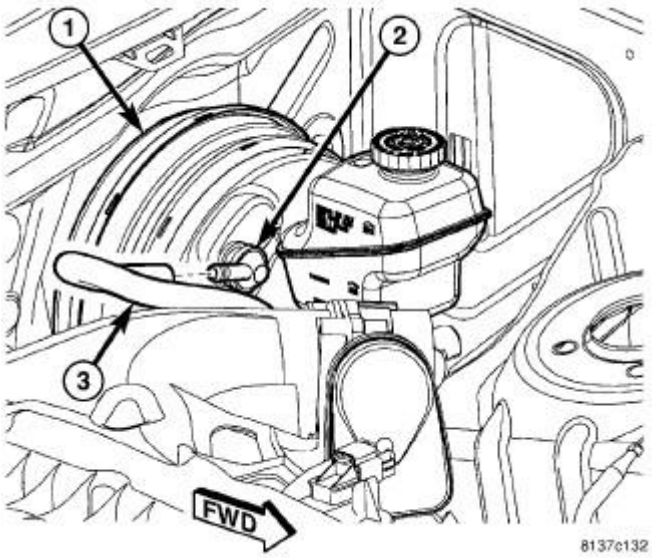

Fig. 36: Vacuum Hose Connection
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect vacuum hose (3) from check valve (2) on face of booster (1). **Do not remove check valve from booster.**

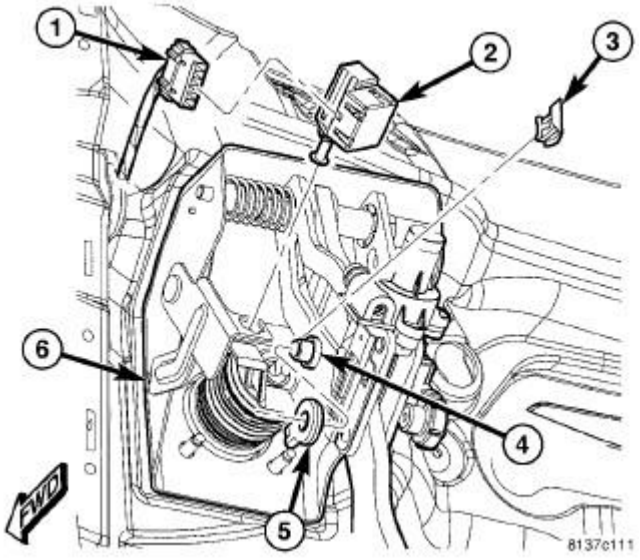

Fig. 37: Locating Stop Lamp Switch And Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

8. Remove brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
9. Remove booster push rod from pin on brake pedal. To do so:
    1. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip (3).
    2. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
    3. **Discard retaining clip (3). It is not to be reused. Install NEW retaining clip when assembling.**
10. Slide booster push rod (5) off brake pedal pin (4).

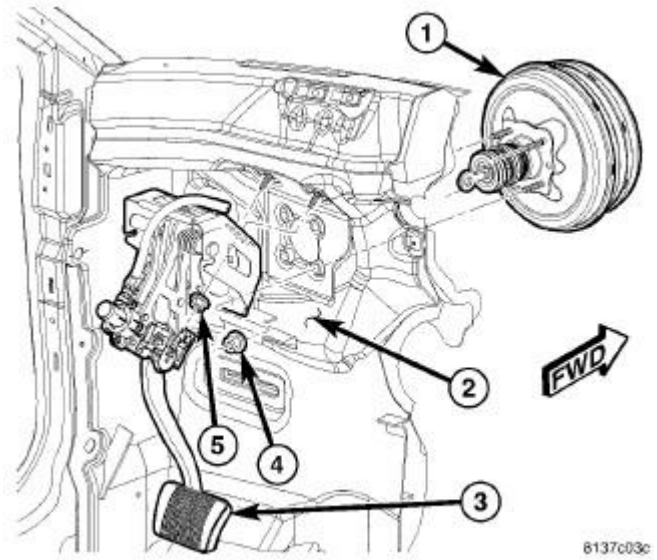

Fig. 38: Booster & Pedal Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Remove four power brake booster mounting nuts (4).
12. Slide power brake booster forward out of dash panel and remove through opening between cross-brace and windshield.

BOOSTER - RHD

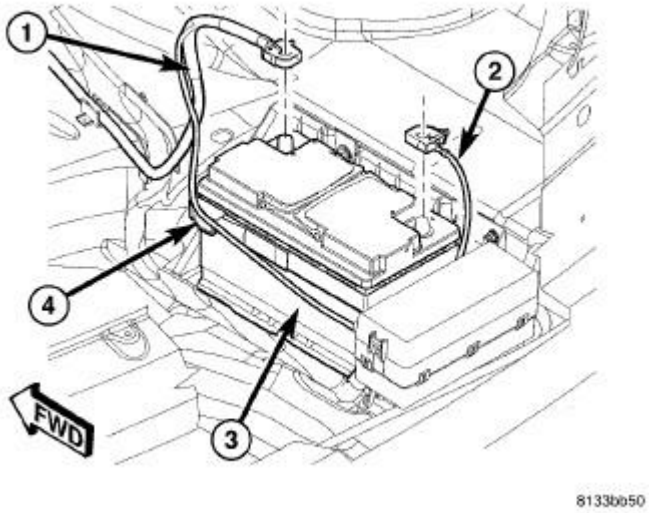

Fig. 39: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Move driver's seat to full rearward position.
2. Disconnect and isolate negative battery cable (1).
3. Remove windshield wiper module. Refer to **LINKAGE, WIPER ARM, REMOVAL** .

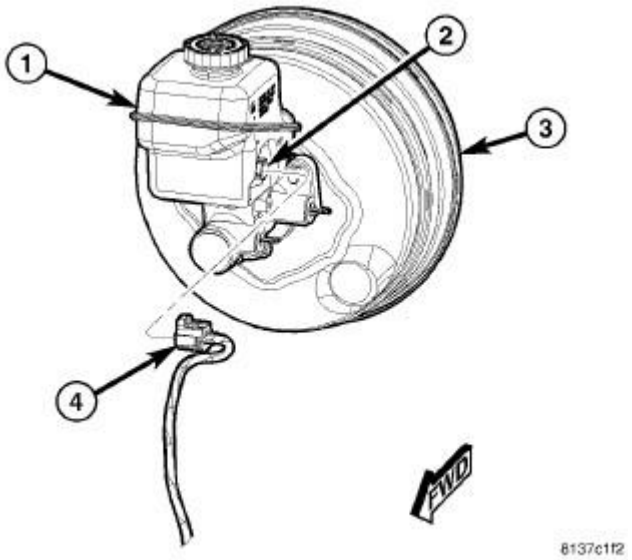

Fig. 40: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect wiring harness connector (4) from brake fluid level sensor (2) in master cylinder brake fluid reservoir (1).

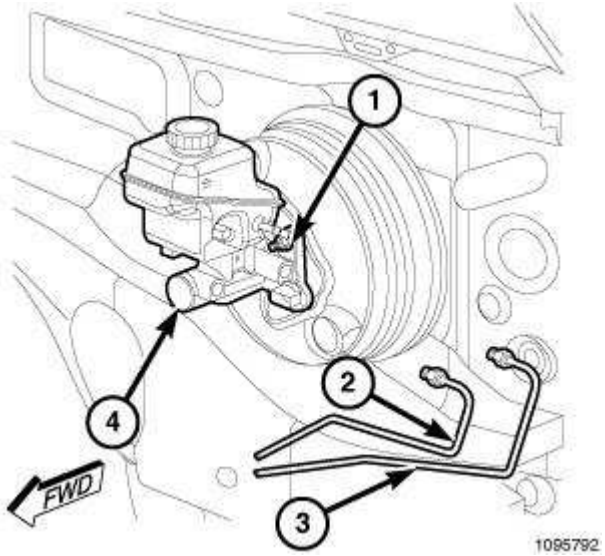

Fig. 41: Brake Tubes AT Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

5. Remove primary (3) and secondary (2) brake tubes from master cylinder (4). Install sealing plugs in open brake tube outlet ports.

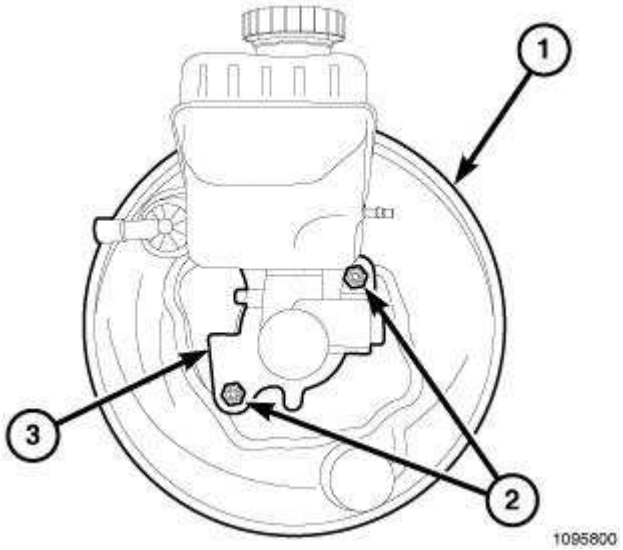

Fig. 42: Master Cylinder Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing master cylinder from power brake vacuum booster, master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into power brake vacuum booster. Use only Mopar® Brake Parts Cleaner or equivalent.

6. Remove two nuts (2) attaching master cylinder (3) to power brake booster (1).

7. Slide master cylinder (3) straight out of power brake booster (1).

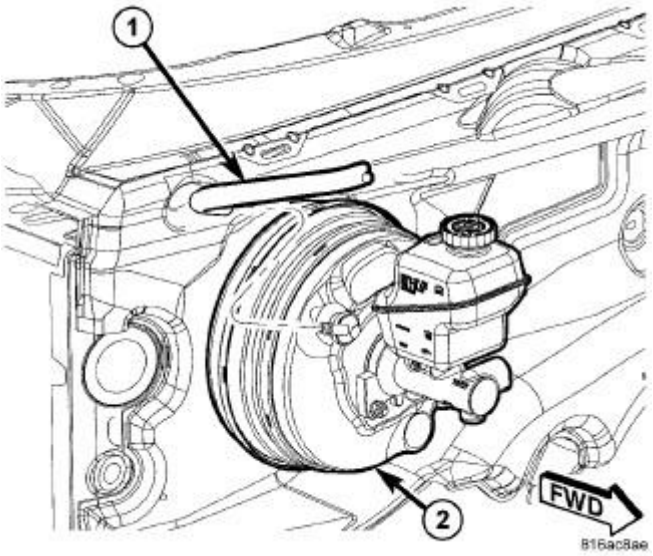

Fig. 43: Vacuum Hose Connection - RHD
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect vacuum hose (1) from check valve on face of booster (2). **Do not remove check valve from booster.**
9. Remove driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .
10. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

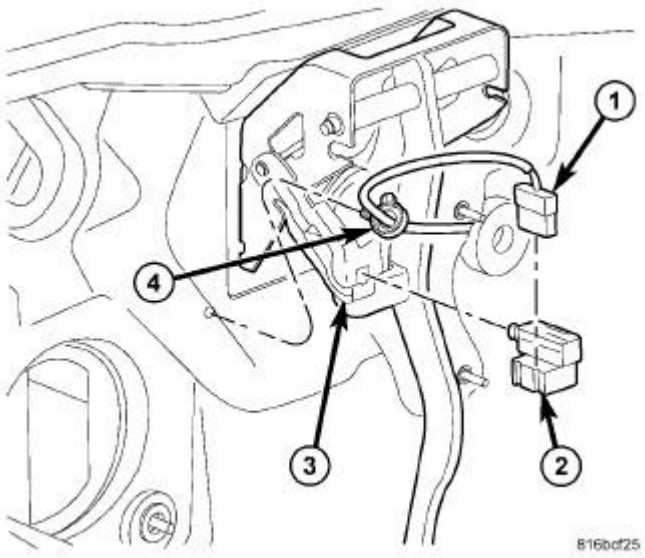

Fig. 44: Stop Lamp Switch Mounting - RHD

Courtesy of CHRYSLER GROUP, LLC

11. Remove stop lamp switch (2). Refer to **SWITCH, STOP LAMP, REMOVAL** .

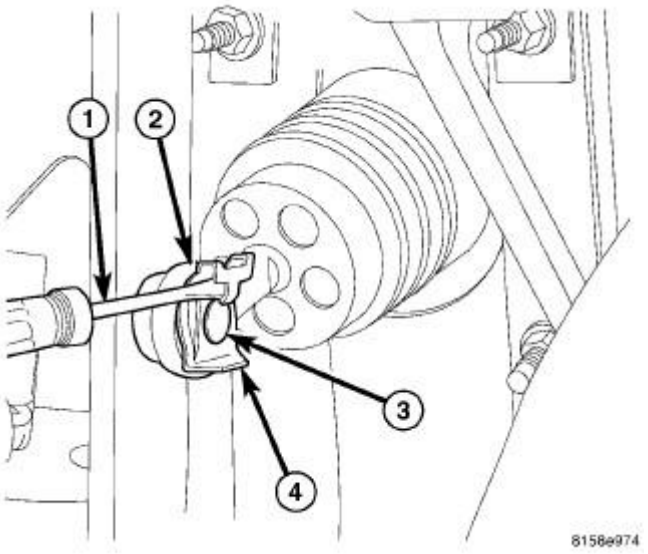

Fig. 45: View Of Pedal Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing booster push rod from brake pedal pin, be careful not to damage rubber O-ring on pin.

12. Remove booster push rod from pin on brake pedal. To do so:
    1. Position small screwdriver (1) between center tang on power brake booster brake pedal pin retaining clip (4).
    2. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin (3), then slide retaining clip off brake pedal pin.
    3. **Discard retaining clip. It is not to be reused. Install NEW retaining clip when assembling.**
13. Slide booster push rod (2) off brake pedal pin (3).

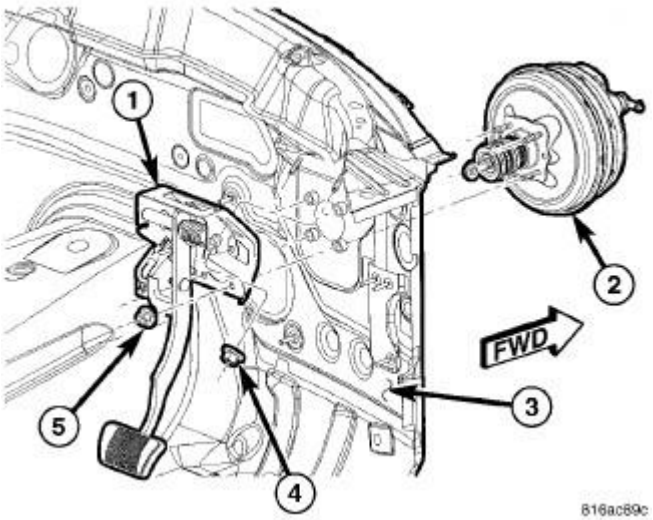

Fig. 46: Booster And Pedal Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

14. Remove four power brake booster mounting nuts (5).
15. Slide power brake booster forward out of dash panel and remove through opening between cross-brace and windshield.

INSTALLATION

INSTALLATION

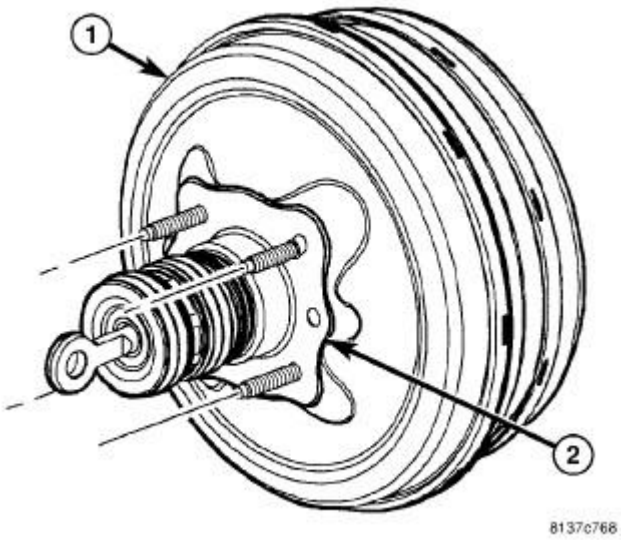

Fig. 47: Booster Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before installing booster, make sure there is a NEW booster seal (2) placed over push rod and mounting studs on rear of booster (1).**

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

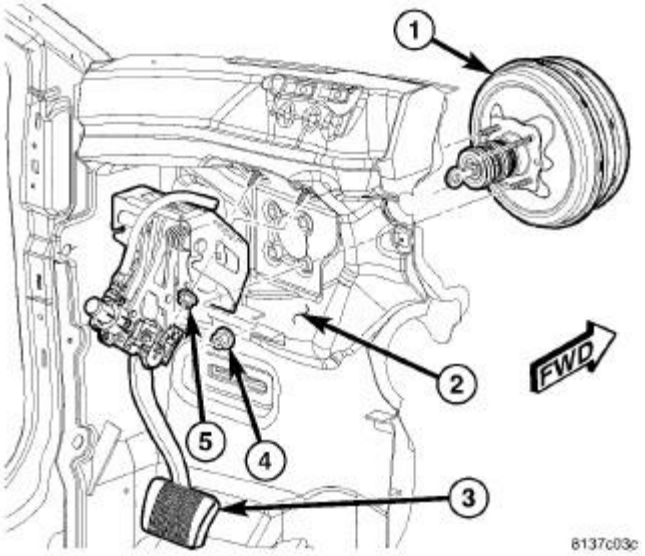

Fig. 48: Booster & Pedal Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install power brake booster through opening between cross-brace and windshield. Guide booster (1) push rod and mounting studs through dash panel (2).

   NOTE: **Be sure to tighten all four booster mounting nuts to specifications or a vacuum leak can result.**

2. Install four power brake booster mounting nuts (4). Tighten nuts to 25 N.m (18 ft. lbs.) torque.

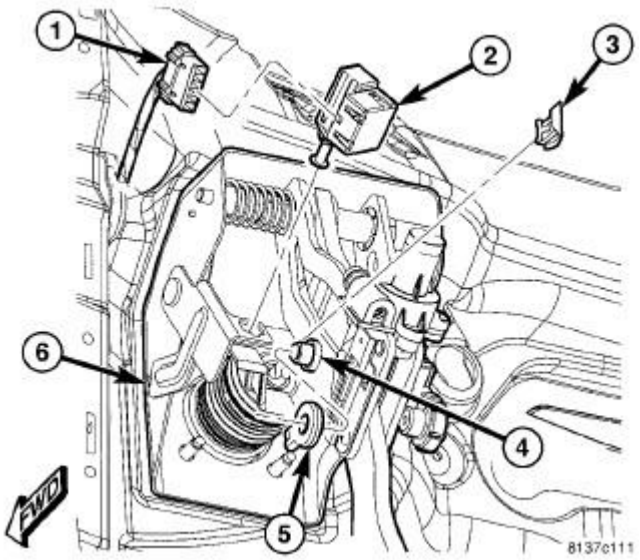

Fig. 49: Locating Stop Lamp Switch And Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

3. Slide booster push rod (5) onto brake pedal pin (4). Install NEW retaining clip (3) securing push rod to brake pedal.
4. Install and adjust brake lamp switch (2). Refer to **SWITCH, STOP LAMP, INSTALLATION** .

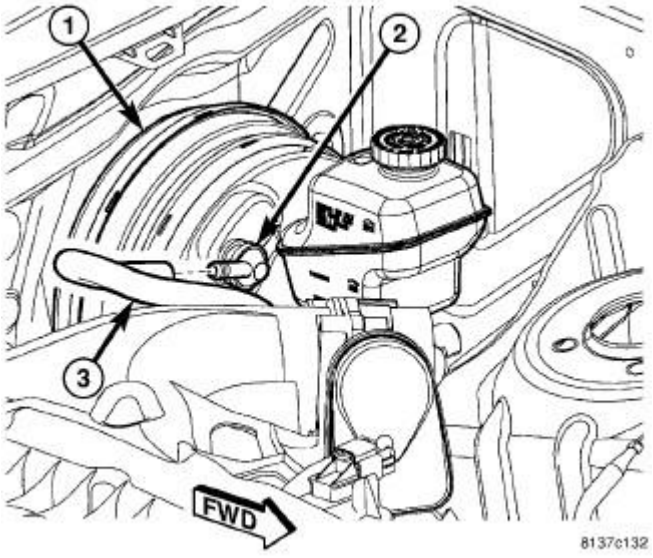

Fig. 50: Vacuum Hose Connection
Courtesy of CHRYSLER GROUP, LLC

5. Connect vacuum hose (3) to check valve (2) on face of booster (1). **Do not remove check valve from booster.**

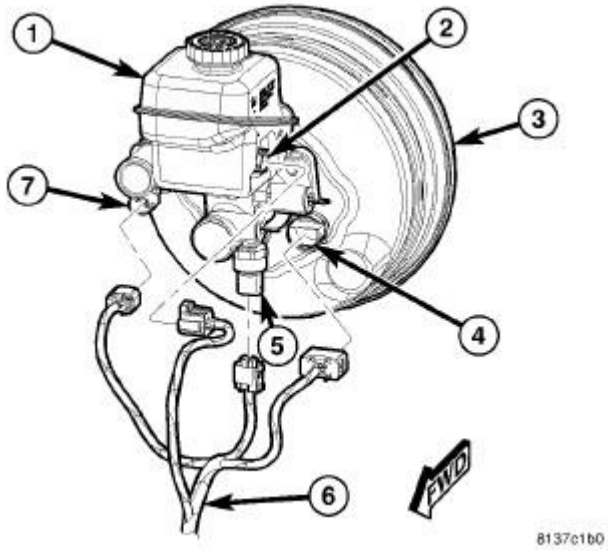

Fig. 51: Identifying Master Cylinder Wiring Harness & Connectors
Courtesy of CHRYSLER GROUP, LLC

6. If equipped with MK25 and Electronic Stability Control (ESC), connect wiring harness (6) connector at pedal travel sensor (7) on power brake booster (3).
7. If equipped with MK25 and ESC, connect wiring harness (6) connector at active brake booster solenoid (4).
8. Install master cylinder (1). Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.
9. Install windshield wiper module and components removed to access. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .

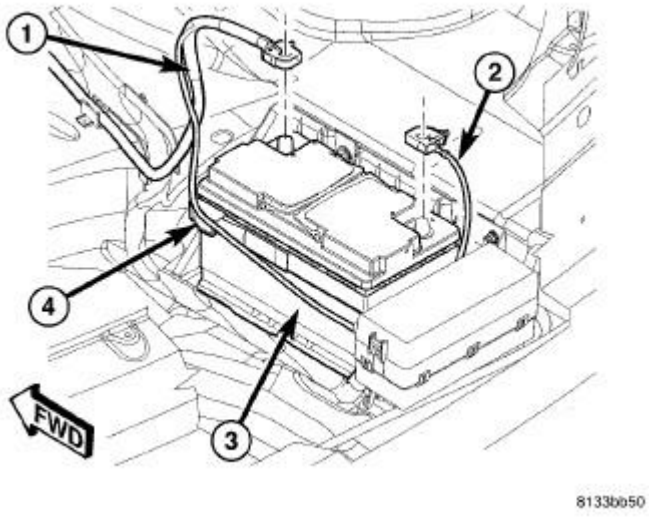

Fig. 52: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
11. Fill and bleed brakes as necessary.
12. Road test vehicle to ensure proper operation of brakes.

BOOSTER - RHD

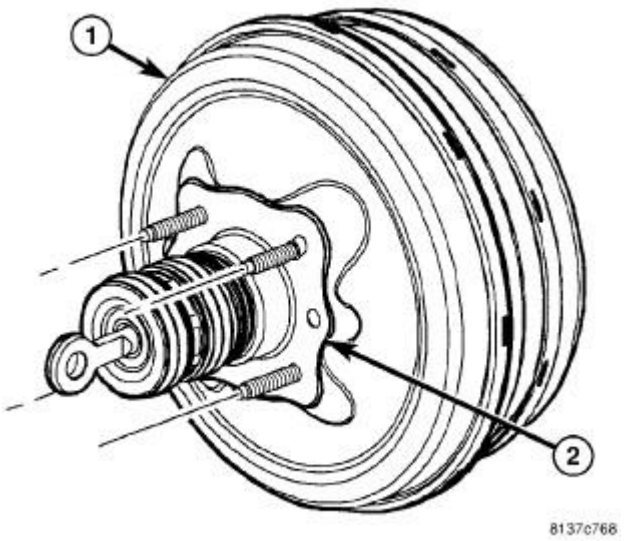

Fig. 53: Booster Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install a NEW booster seal (2) over push rod and mounting studs on rear of booster (1).

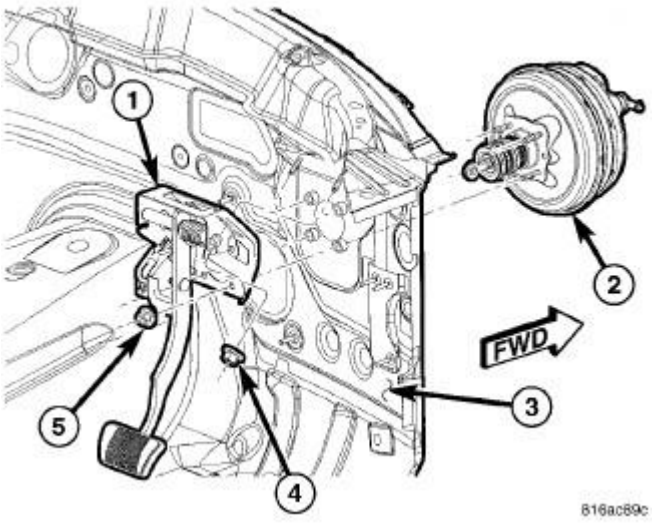

Fig. 54: Booster And Pedal Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

2. Install power brake booster through opening between cross-brace and windshield. Guide booster (2) push rod and mounting studs through dash panel (3).

NOTE: Be sure to evenly tighten all four booster mounting nuts to specifications or a vacuum leak can result.

3. Install four power brake booster mounting nuts (5). Tighten nuts to 25 N.m (18 ft. lbs.).

CAUTION: When installing booster push rod on brake pedal pin, be careful not to damage rubber O-ring on pin.

4. Slide booster push rod onto brake pedal pin. Install NEW retaining clip securing push rod to brake pedal.

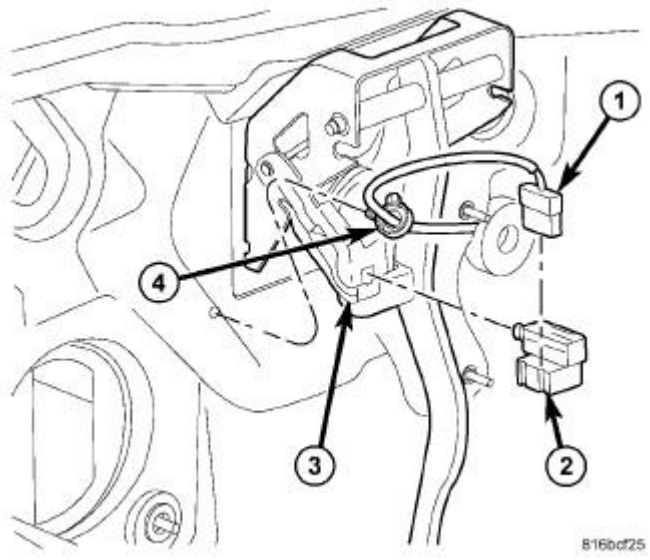

Fig. 55: Stop Lamp Switch Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

5. Install and adjust brake lamp switch (2). Refer to **SWITCH, STOP LAMP, INSTALLATION** .
6. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
7. Install driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .

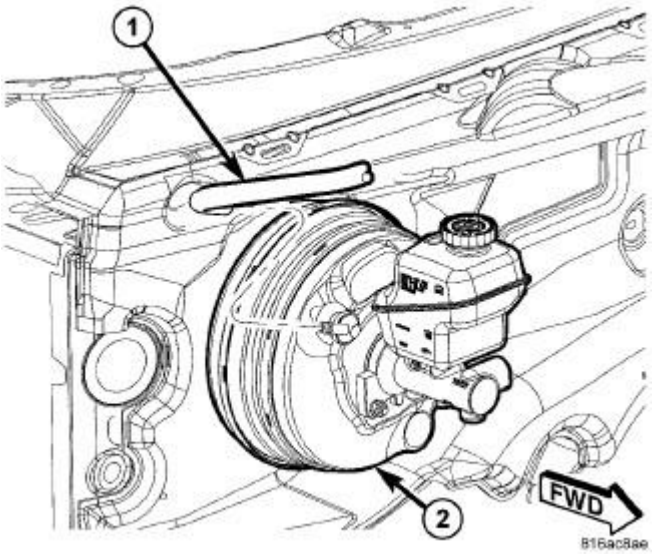

Fig. 56: Vacuum Hose Connection - RHD
Courtesy of CHRYSLER GROUP, LLC

8. Connect vacuum hose (1) to check valve on face of booster (2). **Do not remove check valve from booster.**

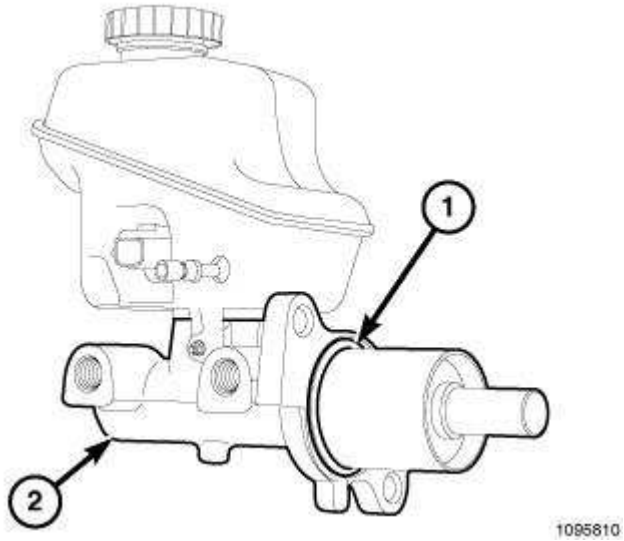

Fig. 57: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When replacing master cylinder on vehicle, a NEW vacuum seal (2) MUST be installed on master cylinder.

9. Install NEW vacuum seal (1) on rear of master cylinder (2) making sure seal fits squarely in mounting groove.

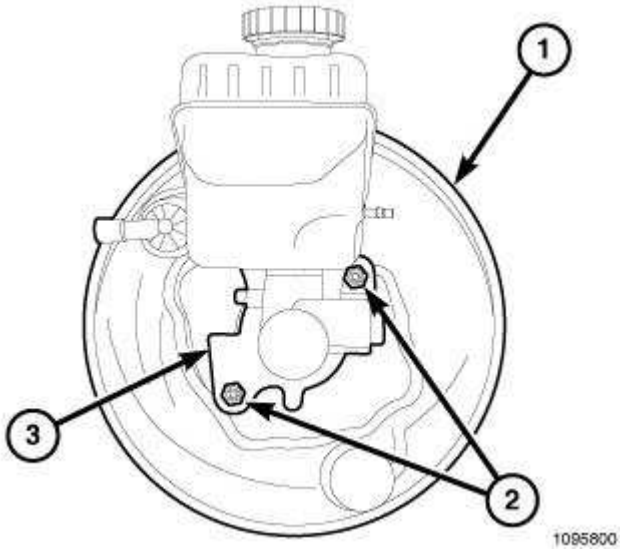

Fig. 58: Master Cylinder Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

10. Position master cylinder (3) on studs of power brake booster, aligning booster push rod with master cylinder piston.
11. Install two master cylinder mounting nuts (1). Tighten mounting nuts to 15 N.m (133 in. lbs.).

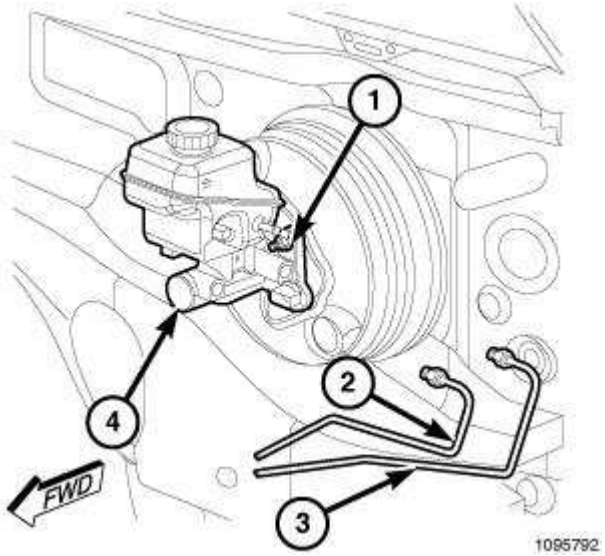

Fig. 59: Brake Tubes AT Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

12. Thread primary (3) and secondary (2) brake tubes into master cylinder primary and secondary ports. Tighten tube nuts to 20 N.m (177 in. lbs.).

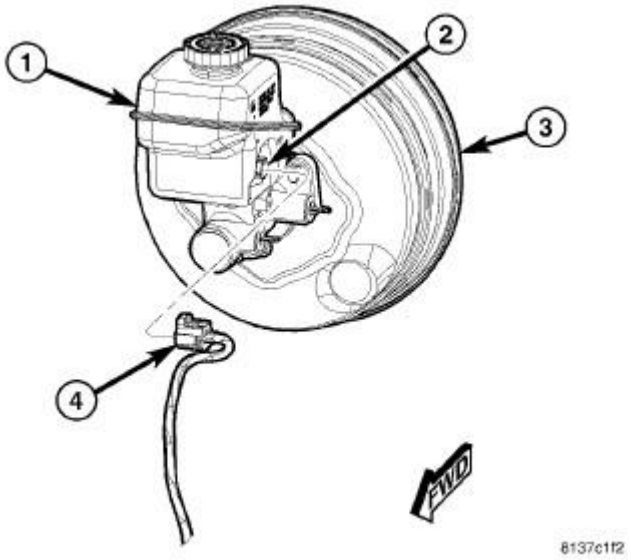

Fig. 60: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

13. Connect wiring harness connector (4) to brake fluid level sensor (2) mounted in brake fluid reservoir (1).
14. Install windshield wiper module and components. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .

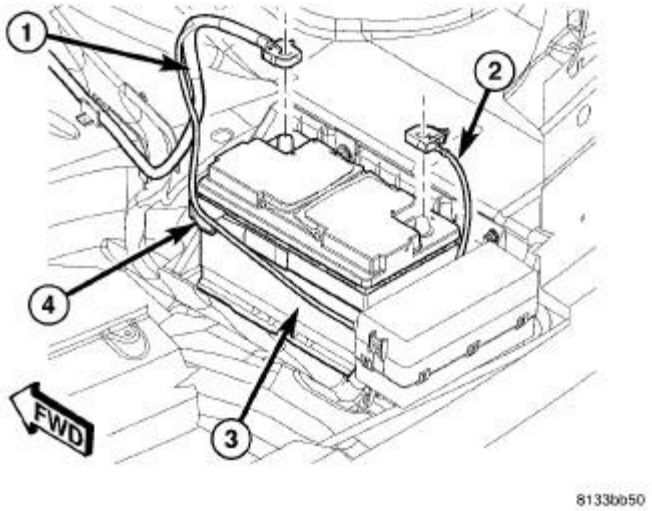

Fig. 61: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

15. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
16. Fill and bleed brakes as necessary.

17. Road test vehicle to ensure proper operation of brakes.

CALIPER, DISC BRAKE, FRONT SRT8

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

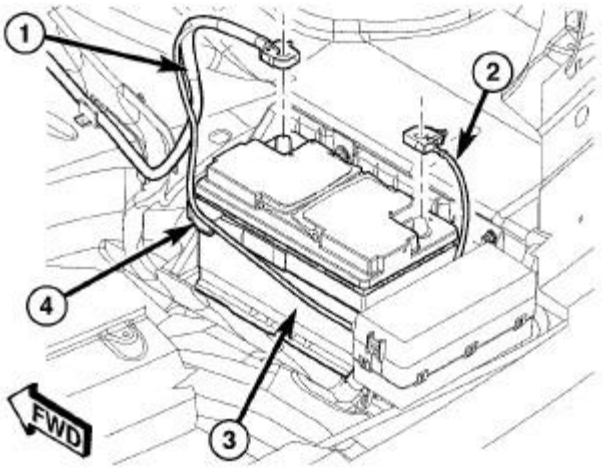

Fig. 62: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

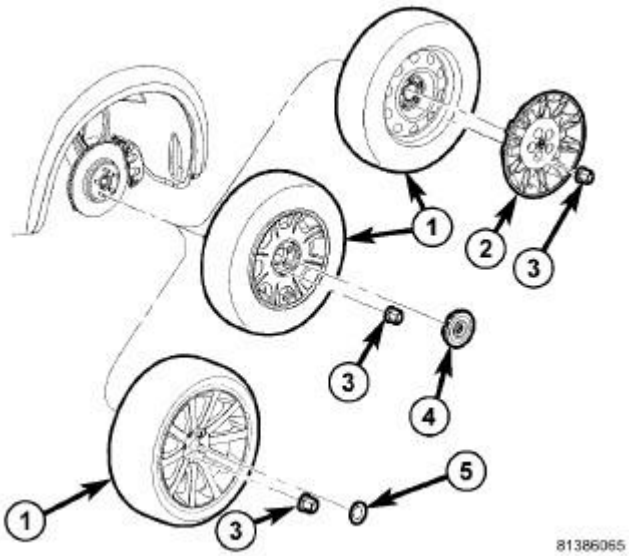

Fig. 63: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

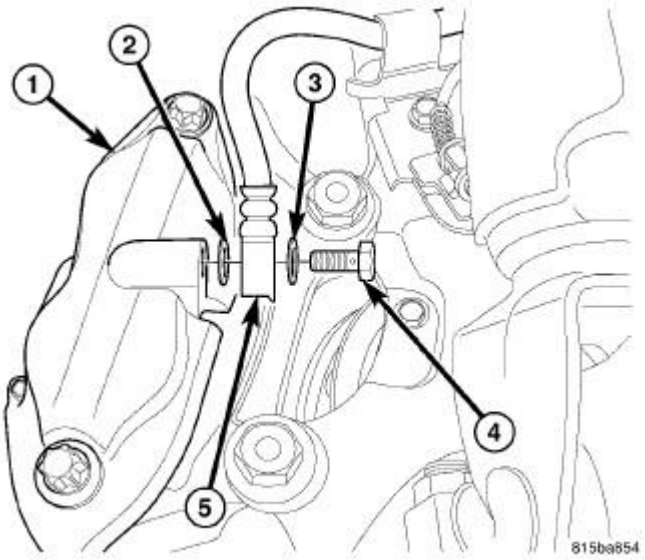

Fig. 64: Flex Hose Connection AT Caliper - Srt8
Courtesy of CHRYSLER GROUP, LLC

5. Remove banjo bolt (4) connecting flexible brake hose (5) to caliper (1). There are two sealing washers (2, 3) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; use NEW washers upon installation.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick

as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

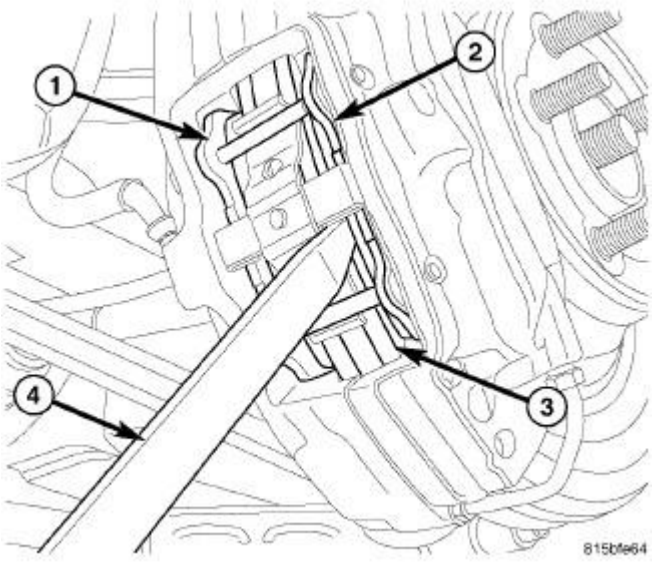

Fig. 65: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

6. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
7. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

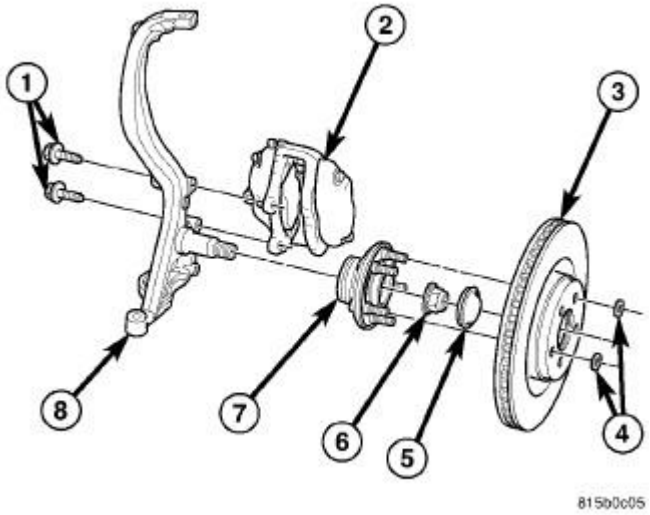

Fig. 66: Exploded View Of Front Disc Brakes - Srt-8
Courtesy of CHRYSLER GROUP, LLC

8. Remove caliper mounting bolts (1).
9. Remove brake caliper (2) with pads from knuckle (3) and brake rotor (3).
10. If brake pads need to be removed from caliper.

NOTE: These calipers are not serviceable. Do not attempt disassembly.

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. Refer to INSPECTION .

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block or used brake pad (not to be reused) over pistons before installing C-clamp to avoid damaging piston.
2. If brake pads need to be installed in caliper before installation. Refer to **PADS, BRAKE, SRT8, INSTALLATION** or **PADS, BRAKE, FRONT, INSTALLATION** or **PADS, BRAKE, REAR, INSTALLATION**.

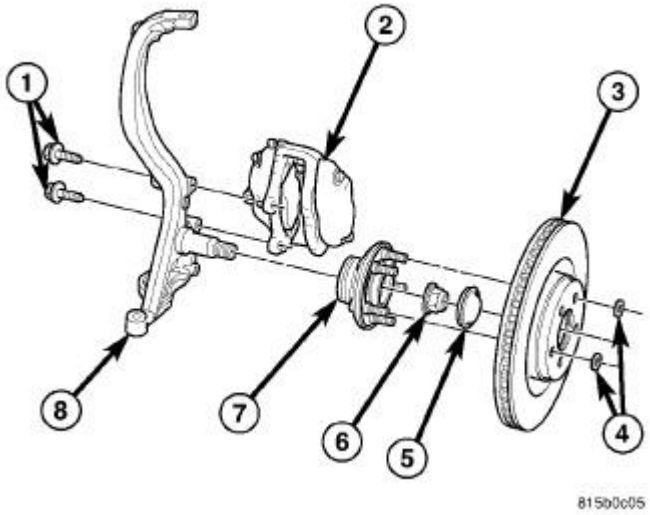

Fig. 67: Exploded View Of Front Disc Brakes - Srt-8
Courtesy of CHRYSLER GROUP, LLC

3. Slide caliper with pads (2) over brake rotor (3) and align with knuckle (8).
4. Install caliper mounting bolts (1). Tighten bolts to 190 N.m (140 ft. lbs.) torque.

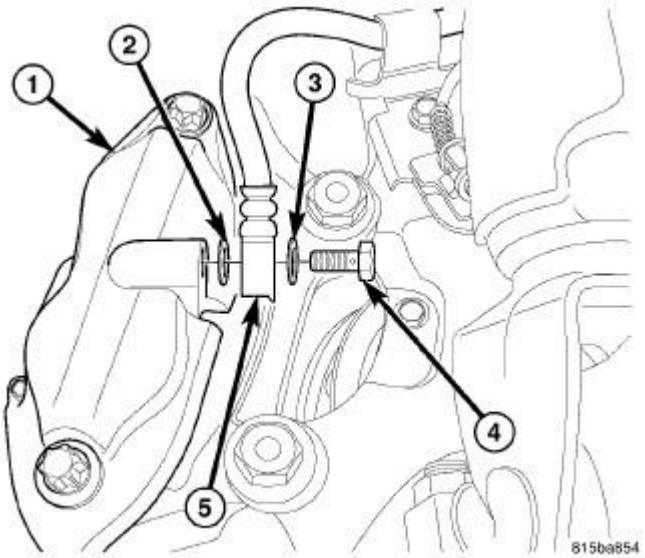

Fig. 68: Flex Hose Connection AT Caliper - Srt8
Courtesy of CHRYSLER GROUP, LLC

5. Install banjo bolt (4) attaching brake hose (5) to caliper (1). Install NEW washers (2, 3) on each side of hose fitting as banjo bolt is placed through banjo fitting. Thread banjo bolt into caliper and tighten to 33 N.m (24 ft. lbs.) torque.

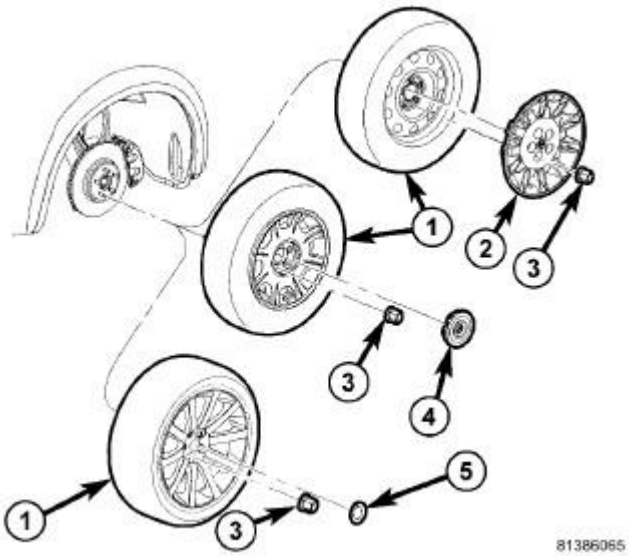

Fig. 69: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) torque. Refer to **INSTALLATION** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

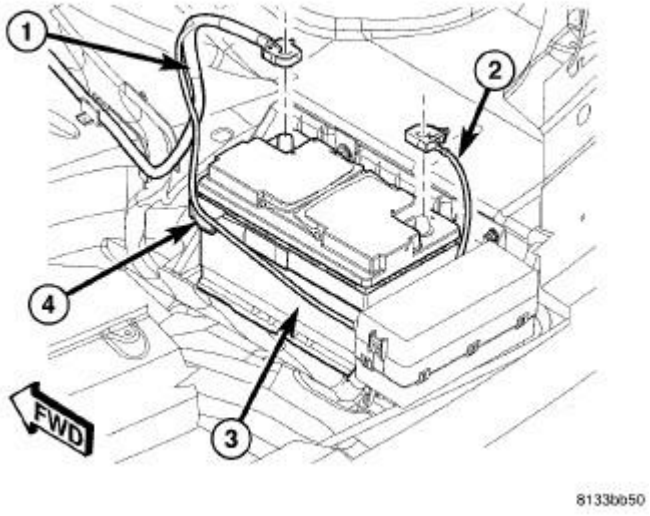

Fig. 70: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **STANDARD PROCEDURE** .

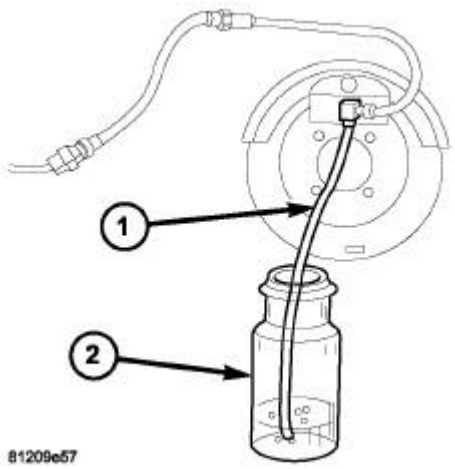

Fig. 71: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** Refer to **BASE BRAKE BLEEDING** .

    CAUTION: If NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. Refer to **PADS, BRAKE, SRT8, STANDARD PROCEDURE**.

CALIPER, DISC BRAKE, REAR SRT8

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

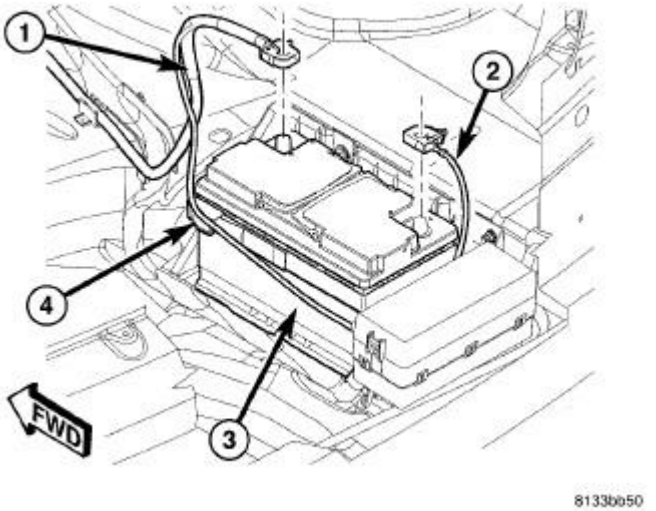

Fig. 72: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

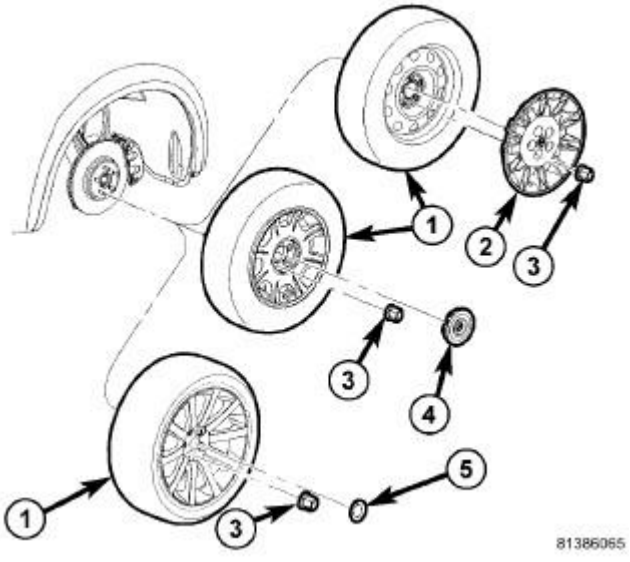

Fig. 73: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

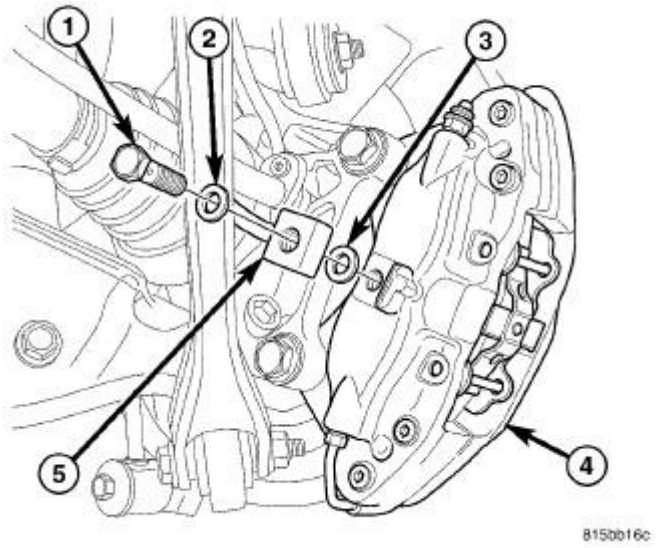

Fig. 74: Rear Flex Hose Connection - Srt8
Courtesy of CHRYSLER GROUP, LLC

5. Remove banjo bolt (1) connecting flexible brake hose (5) to caliper (4). There are two sealing washers (2, 3) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

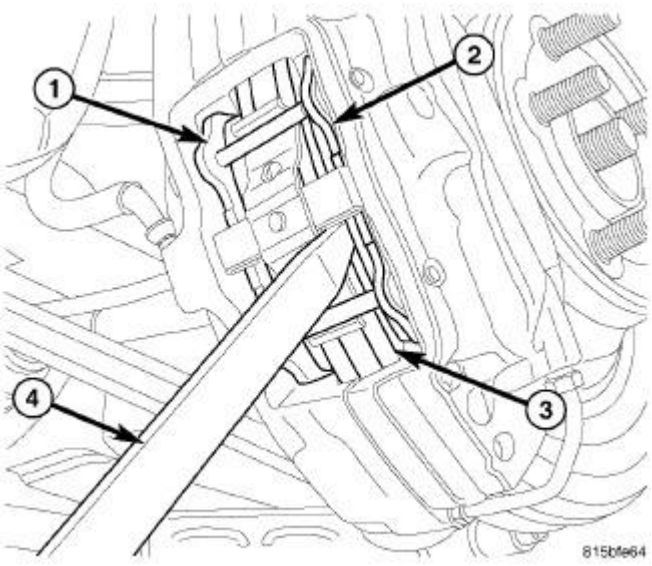

Fig. 75: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

6. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
7. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

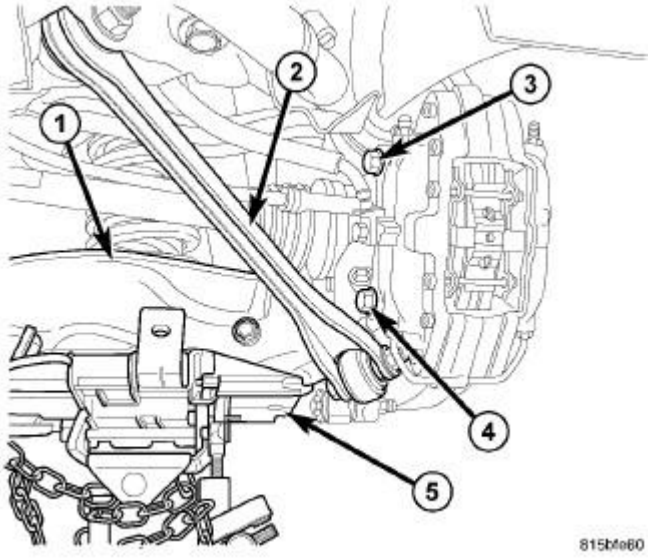

Fig. 76: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

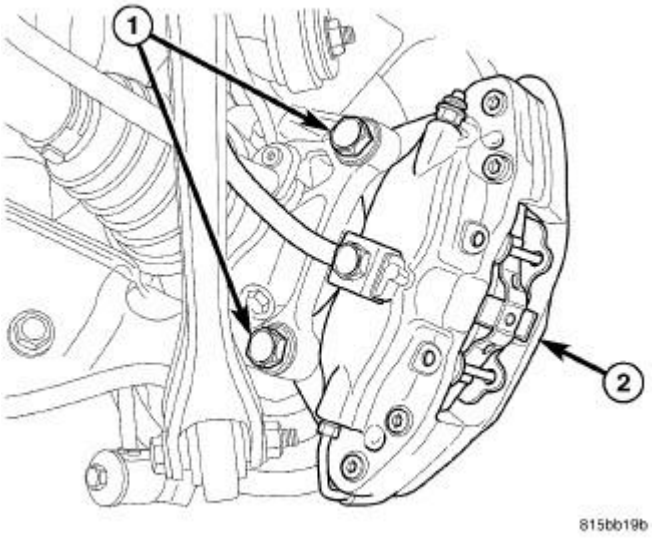

Fig. 77: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the lower and upper caliper mounting bolts (1).
10. Remove brake caliper (2) with pads from knuckle and brake rotor.
11. If brake pads need to be removed from caliper.

NOTE: These calipers are not serviceable. Do not attempt disassembly.

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. Refer to INSPECTION .

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block or used brake pad (not to be reused) over piston before installing C-clamp to avoid damaging piston.
2. If brake pads need to be installed in caliper before installation. Refer to **PADS, BRAKE, SRT8, INSTALLATION** or **PADS, BRAKE, FRONT, INSTALLATION** or **PADS, BRAKE, REAR, INSTALLATION**.

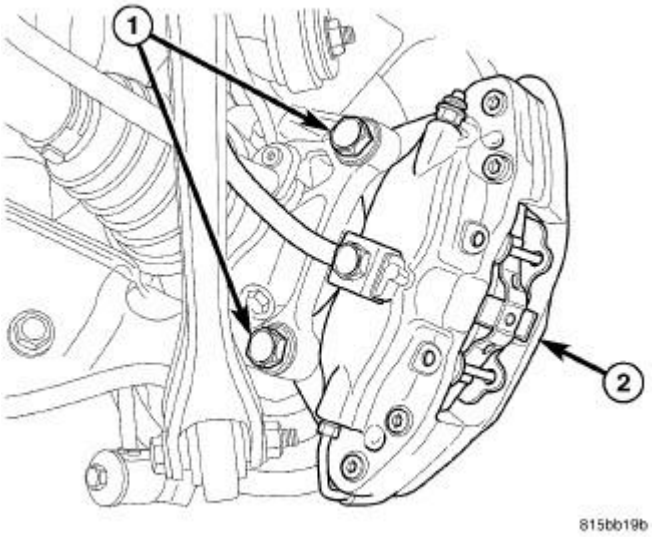

Fig. 78: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Slide caliper with pads (2) over brake rotor and align with knuckle.
4. Install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
5. Remove jack from under spring link.

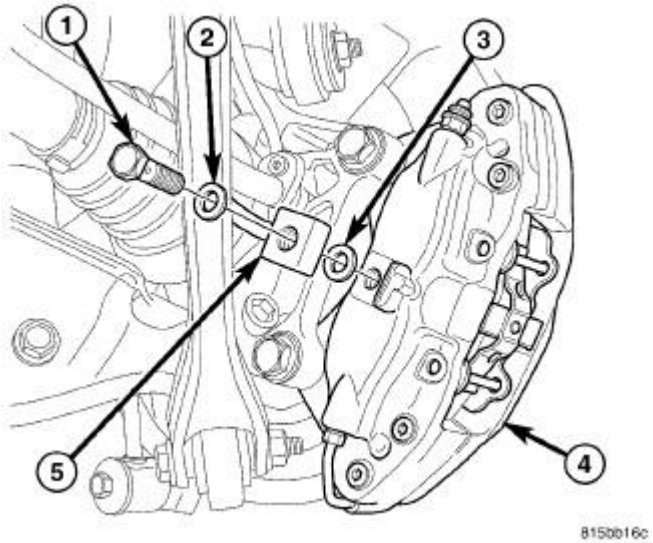

Fig. 79: Rear Flex Hose Connection - Srt8
Courtesy of CHRYSLER GROUP, LLC

6. Install banjo bolt (1) attaching brake hose (5) to caliper (4). Install NEW washers (2, 3) on each side of hose fitting as banjo bolt is placed through banjo fitting. Thread banjo bolt into caliper and tighten to 33 N.m (24 ft. lbs.) torque.

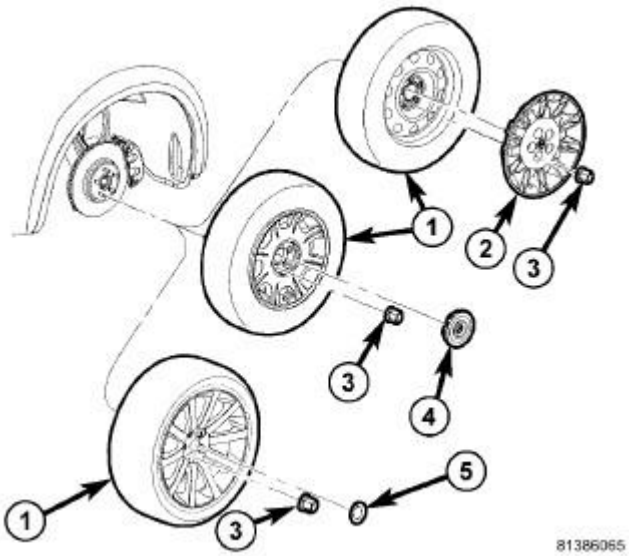

Fig. 80: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) torque. Refer to **INSTALLATION** .
8. Lower vehicle.
9. Remove brake pedal holding tool.

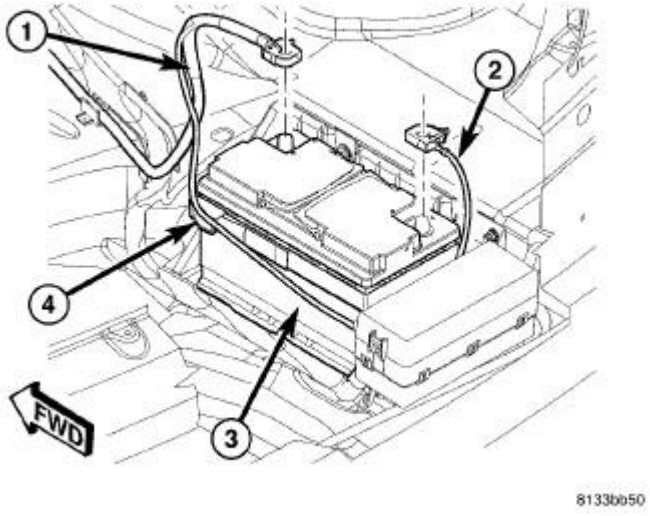

Fig. 81: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **STANDARD PROCEDURE** .

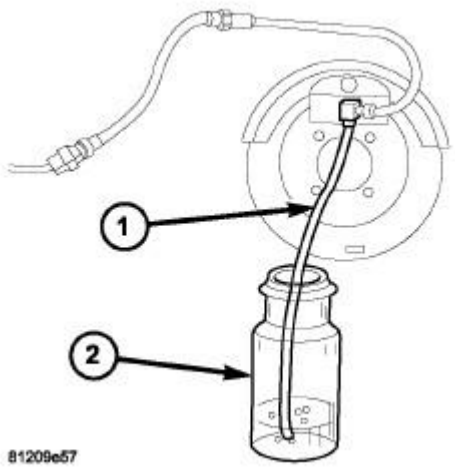

Fig. 82: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

11. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** Refer to **BASE BRAKE BLEEDING** .

    CAUTION: If NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

12. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. Refer to **PADS, BRAKE, SRT8, STANDARD PROCEDURE**.

CALIPER, DISC BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

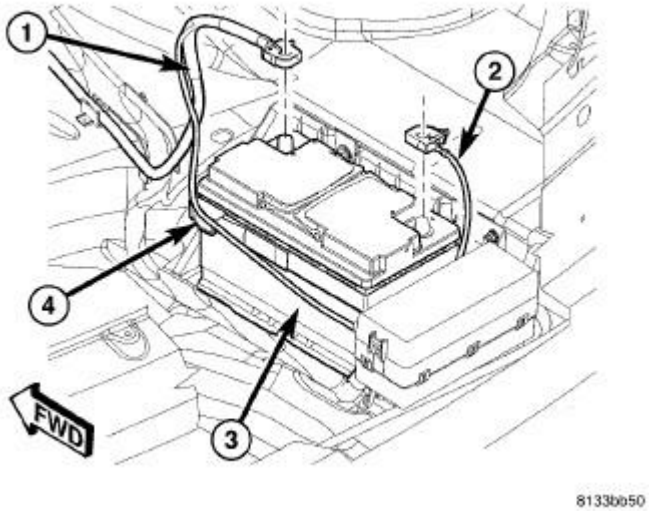

Fig. 83: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

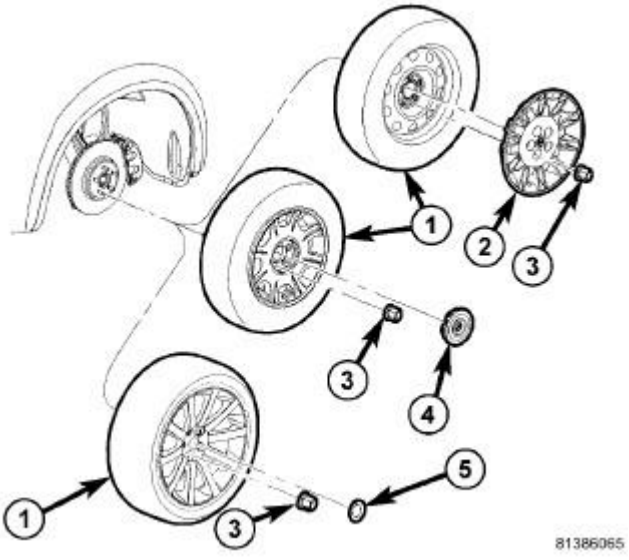

Fig. 84: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

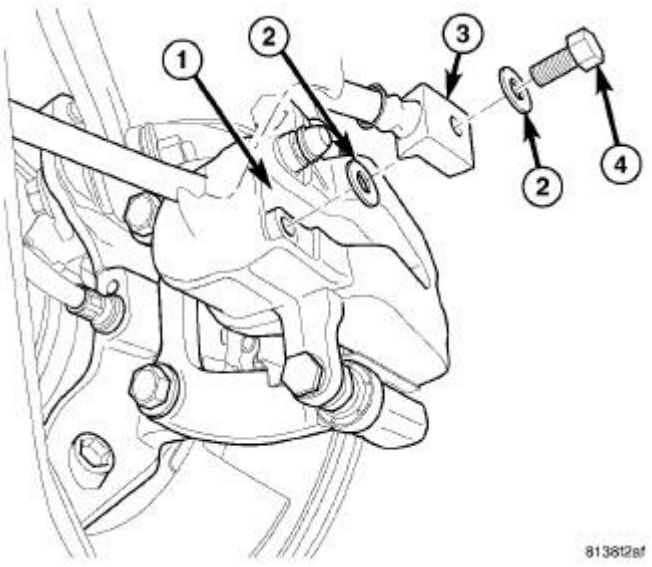

Fig. 85: Flex Hose Connection AT Rear Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Remove banjo bolt (4) connecting flexible brake hose (3) to caliper (1). There are two sealing washers (2) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

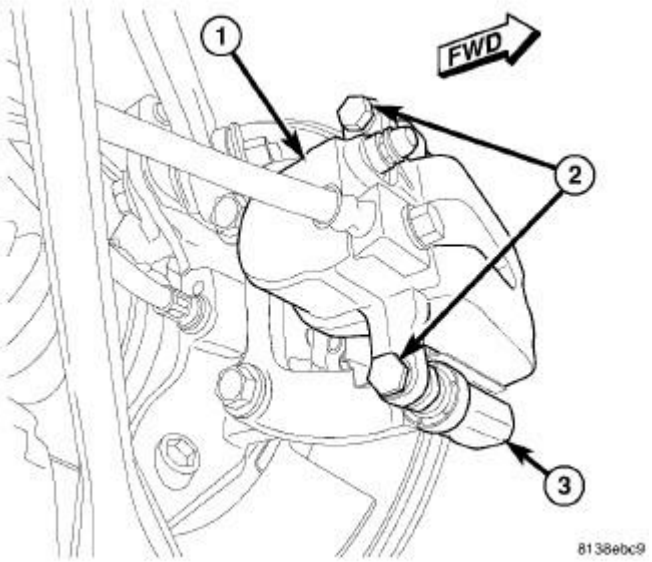

Fig. 86: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (2).

7. Remove brake caliper (1) from brake adapter (3) and pads.

DISASSEMBLY

DISASSEMBLY

NOTE: Before disassembling brake caliper, clean and inspect it. Refer to INSPECTION and CLEANING . .

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

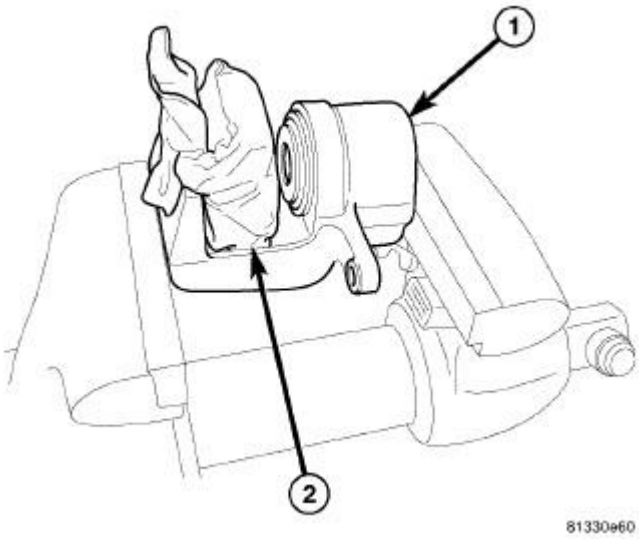

Fig. 87: Rear Caliper In Vise
Courtesy of CHRYSLER GROUP, LLC

1. Drain brake fluid from caliper.
2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as shown in illustration. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using

compressed air pressure to remove piston. Do not use high pressure.

4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).

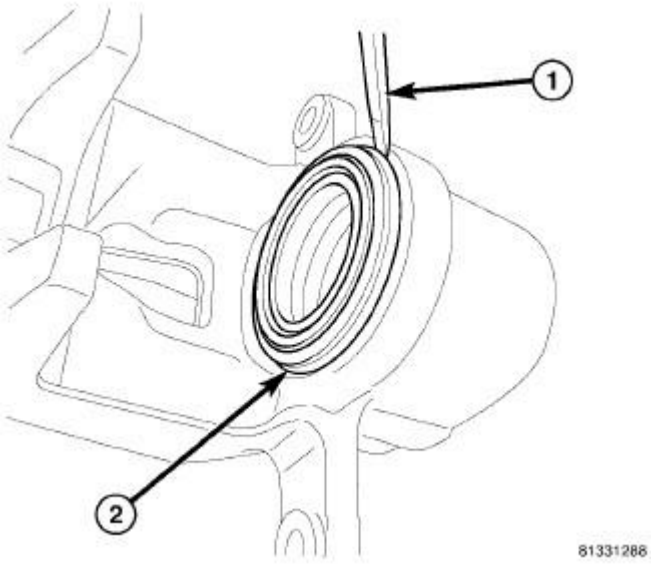

Fig. 88: Removing Rear Caliper Dust Boot
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.

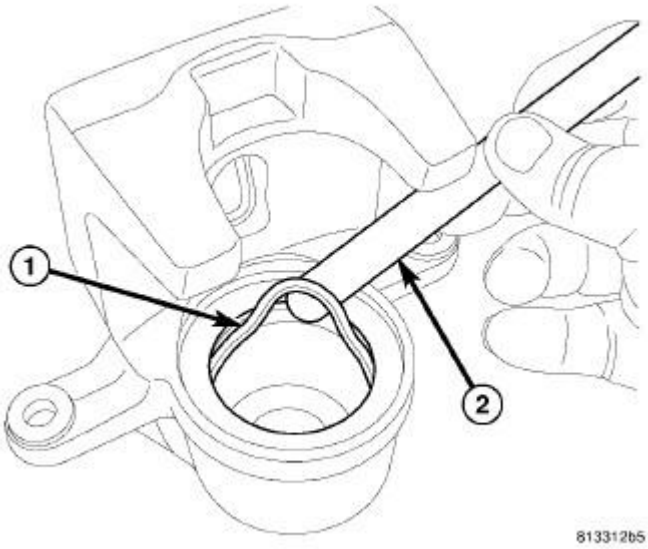

Fig. 89: Removing Rear Caliper Piston Seal
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

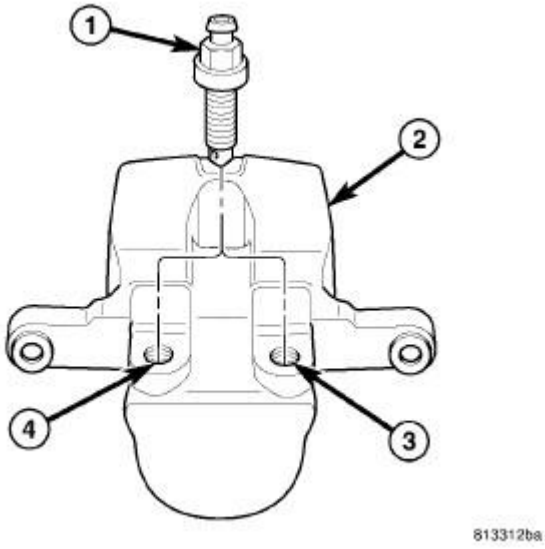

Fig. 90: Rear Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

8. Remove caliper bleeder screw (1) from caliper housing (2).

9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

NOTE: It is not recommended to hone caliper bore. The anodized coating would be compromised.

CLEANING

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

ASSEMBLY

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid or equivalent

when assembling brake caliper.

NOTE: Never use used or old piston seals or boots for reassembly.

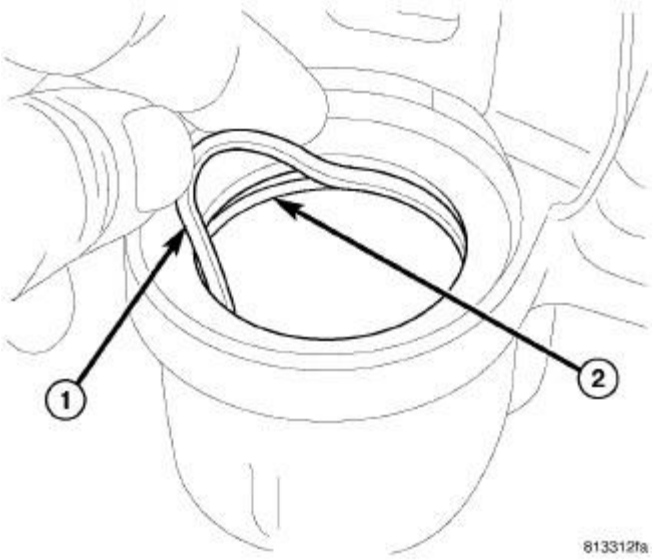

Fig. 91: Installing Rear Caliper Piston Seal
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

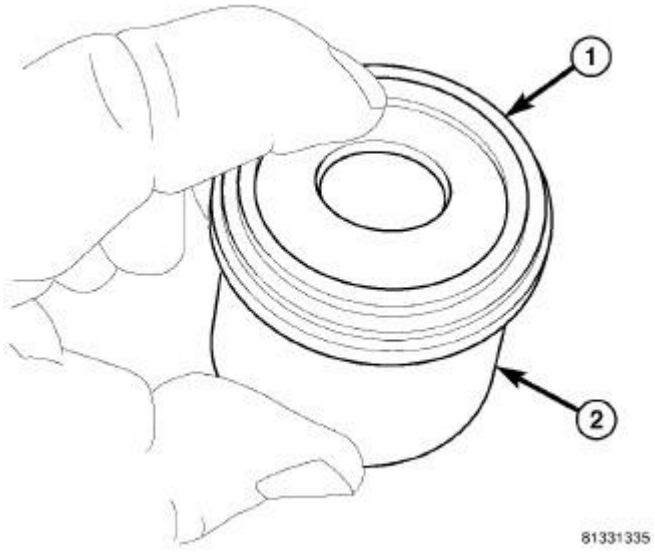

Fig. 92: Installing Boot On Caliper Piston
Courtesy of CHRYSLER GROUP, LLC

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.

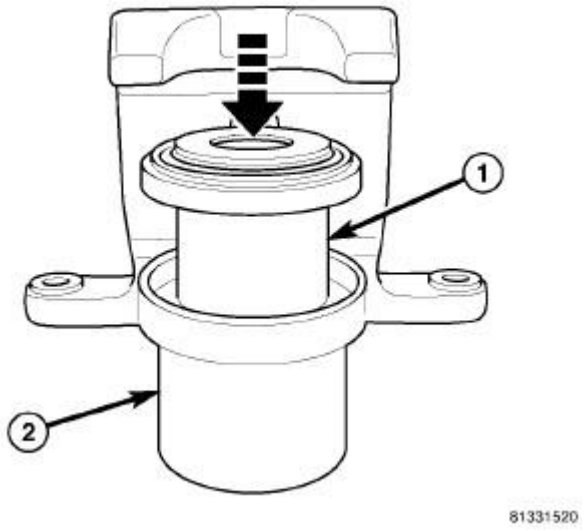

Fig. 93: Installing Piston In Rear Caliper
Courtesy of CHRYSLER GROUP, LLC

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided.

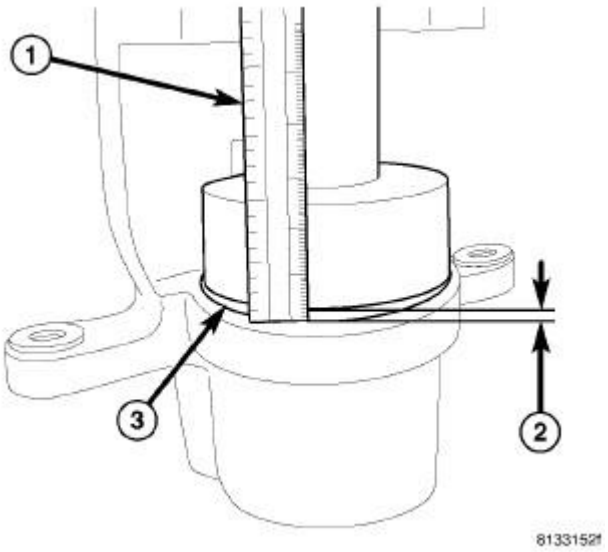

Fig. 94: Measuring Dust Boot Height
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing dust boot in following step, use care not to over-install boot or damage will occur. The boot (3) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (2) of boot still showing above caliper housing.

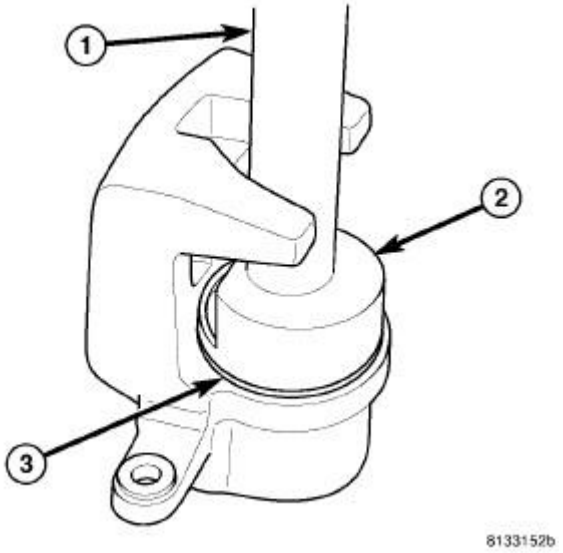

Fig. 95: Installing Dust Boot Using Tool
Courtesy of CHRYSLER GROUP, LLC

5. Seat dust boot (3) in caliper counterbore using Installer, Special Tool (special tool #9314, Installer, Dust Boot), with Handle, Special Tool (special tool #C-4171, Driver Handle, Universal). Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

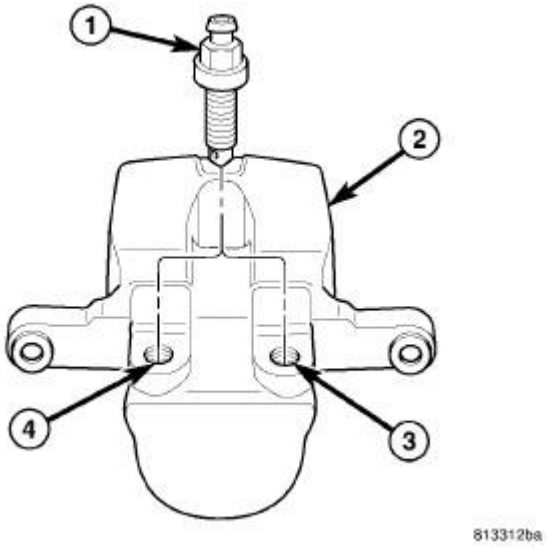

Fig. 96: Rear Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to 15 N.m (125 in. lbs.) torque.
7. Install caliper on vehicle. Refer to **CALIPER, DISC BRAKE, FRONT SRT8, INSTALLATION** or **CALIPER, DISC BRAKE, REAR SRT8, INSTALLATION** or **CALIPER, DISC BRAKE, REAR, INSTALLATION** or **CALIPER, DISC BRAKE, SINGLE PISTON, INSTALLATION** or **CALIPER, DISC BRAKE, TWIN PISTON, INSTALLATION**.

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. Refer to INSPECTION .

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

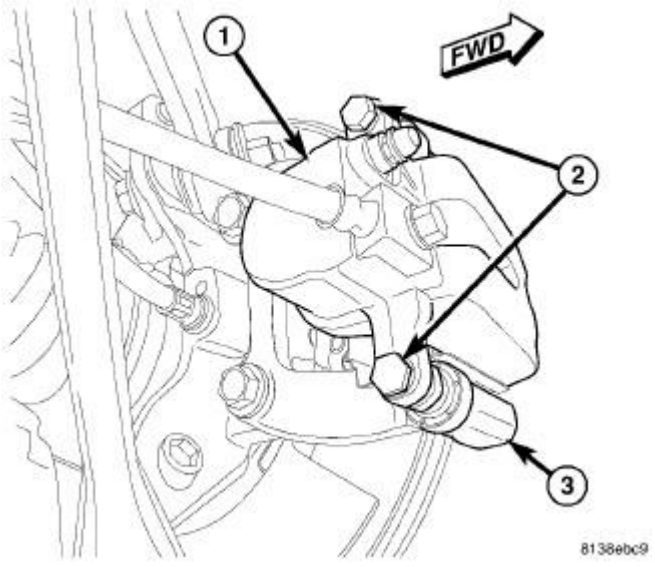

Fig. 97: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.).

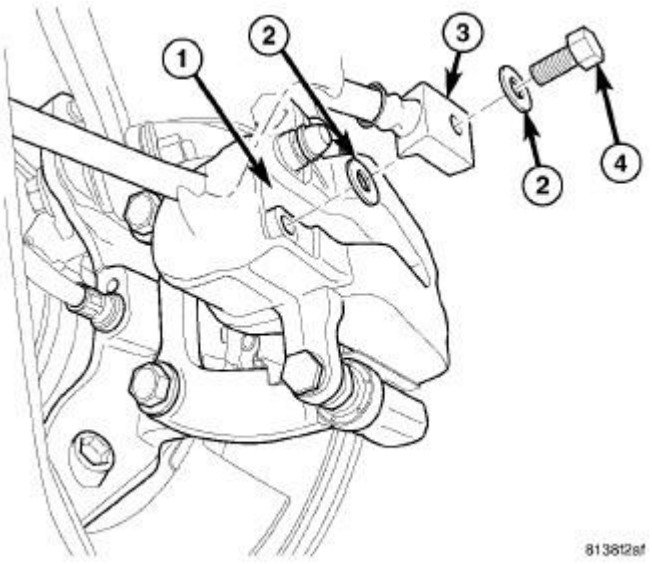

Fig. 98: Flex Hose Connection AT Rear Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Install banjo bolt (4) attaching brake hose (3) to caliper (1). Install NEW washers (2) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

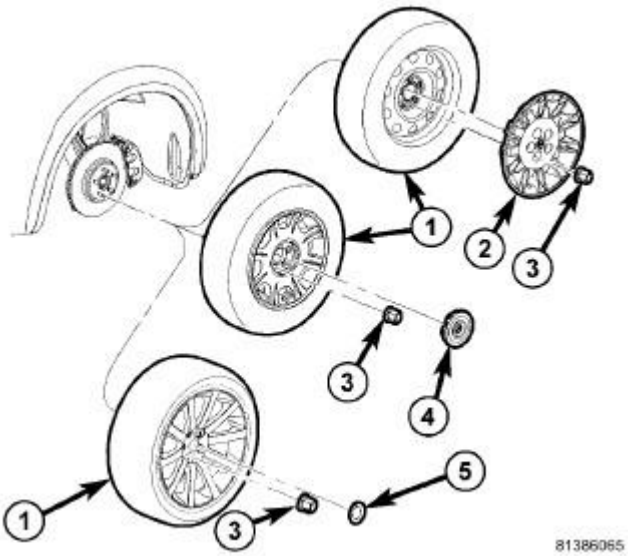

Fig. 99: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

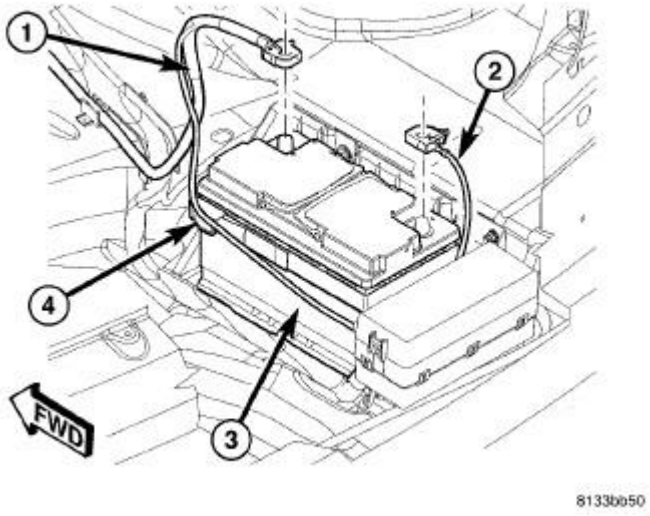

Fig. 100: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

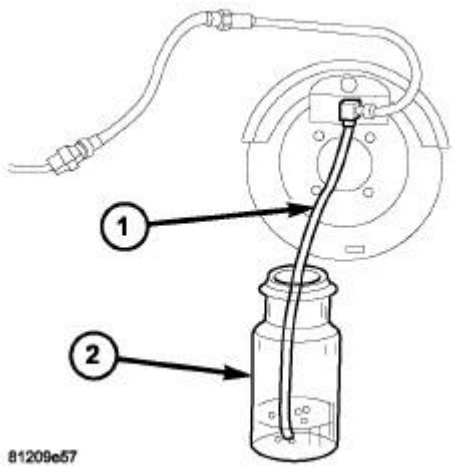

Fig. 101: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** Refer to **BASE BRAKE BLEEDING** .
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

CALIPER, DISC BRAKE, SINGLE PISTON

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

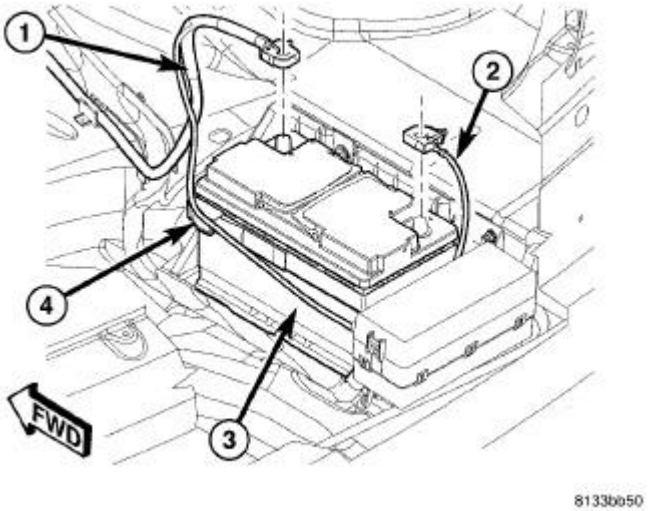

Fig. 102: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

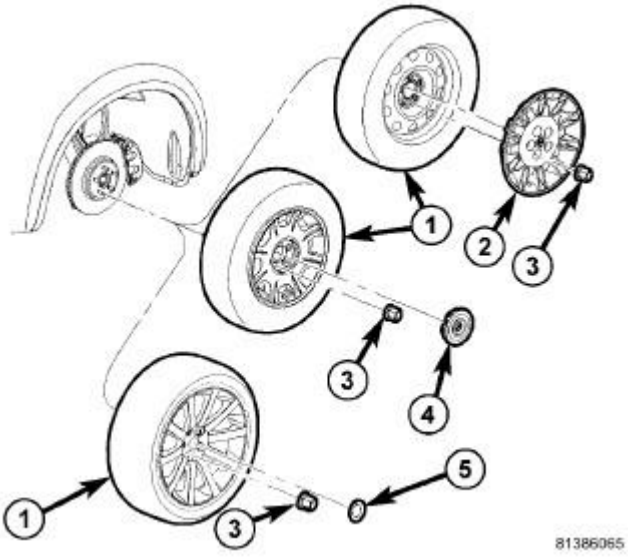

Fig. 103: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

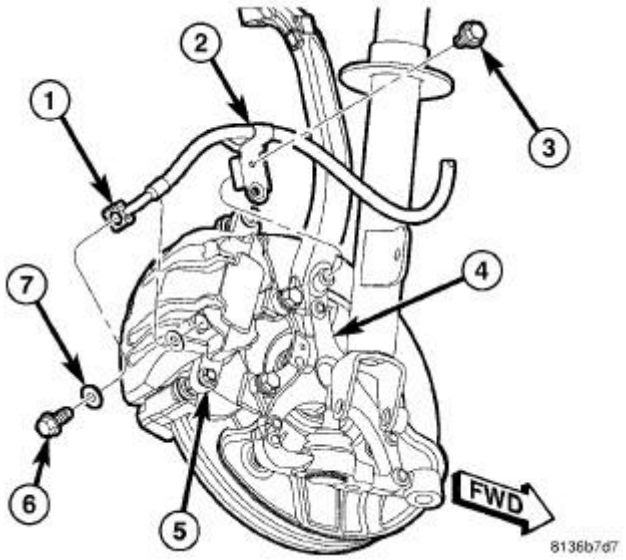

Fig. 104: Front Brake Flex Hose AT Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Remove banjo bolt (6) connecting flexible brake hose (1) to caliper (5). There are two sealing washers (7) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

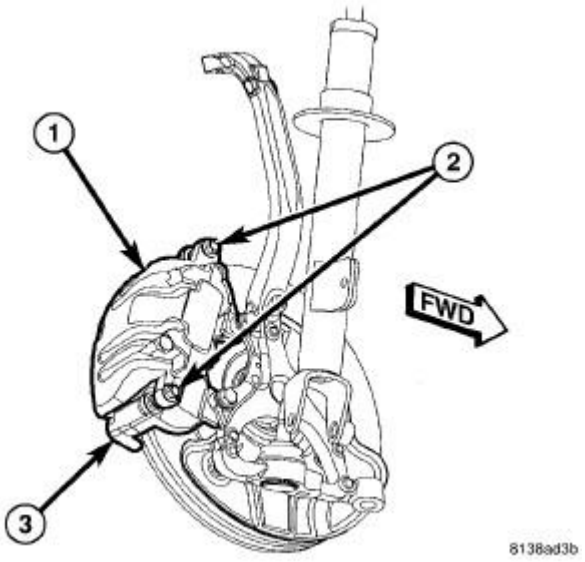

Fig. 105: Front Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (2).

7. Remove brake caliper (1) from brake adapter (3) and pads.

DISASSEMBLY

DISASSEMBLY

NOTE: Before disassembling brake caliper, clean and inspect it. Refer to INSPECTION and CLEANING . .

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Drain brake fluid from caliper.

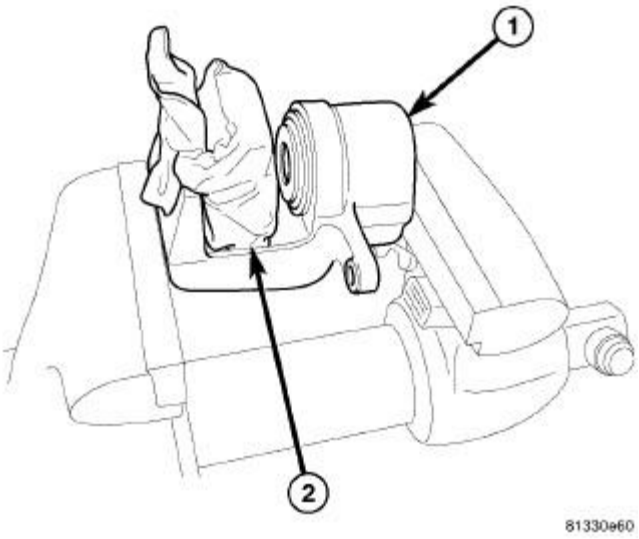

Fig. 106: Rear Caliper In Vise
Courtesy of CHRYSLER GROUP, LLC

2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as shown in illustration. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using

compressed air pressure to remove piston. Do not use high pressure.

4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).

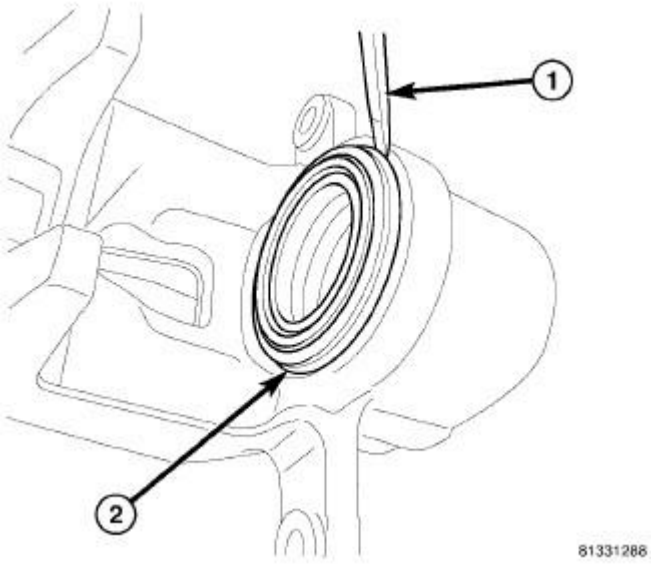

Fig. 107: Removing Rear Caliper Dust Boot
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.

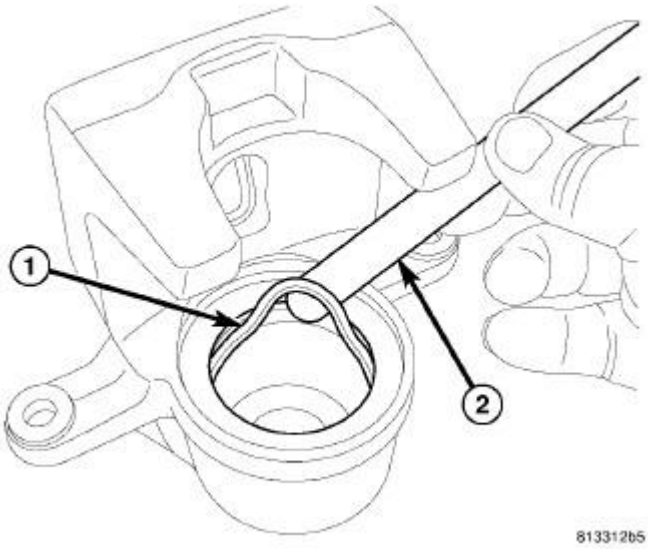

Fig. 108: Removing Rear Caliper Piston Seal
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

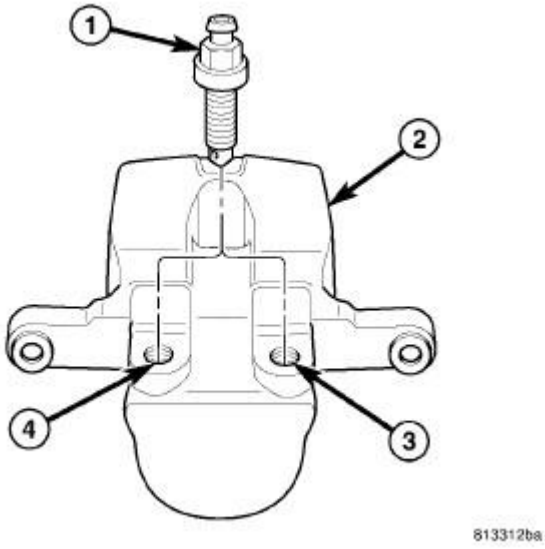

Fig. 109: Rear Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

8. Remove caliper bleeder screw (1) from caliper housing (2).

9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

NOTE: It is not recommended to hone caliper bore. The anodized coating would be compromised.

CLEANING

CLEANING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

ASSEMBLY

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid or equivalent

when assembling brake caliper.

NOTE: Never use used or old piston seals or boots for reassembly.

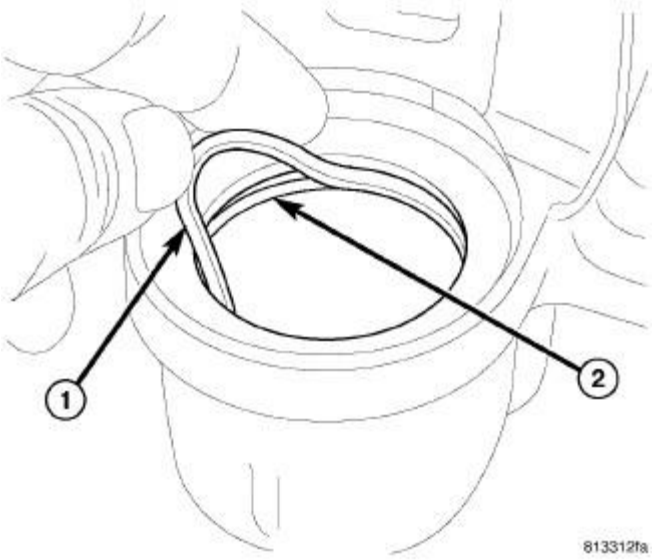

Fig. 110: Installing Rear Caliper Piston Seal
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

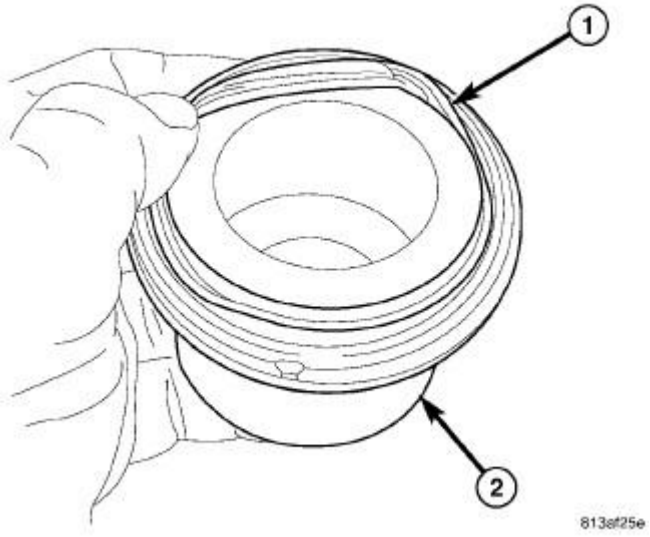

Fig. 111: Installing Boot On Piston
Courtesy of CHRYSLER GROUP, LLC

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.

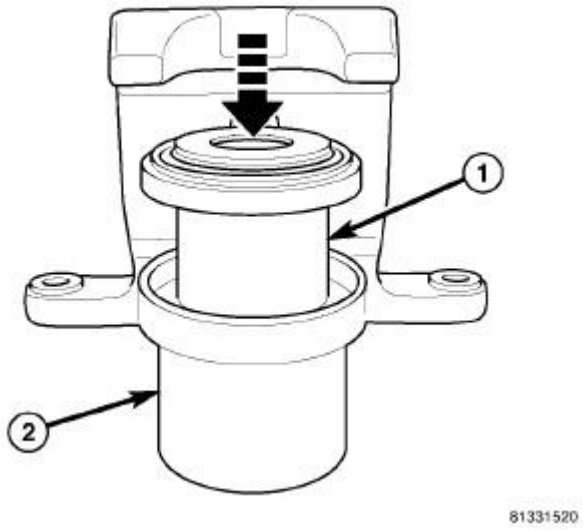

Fig. 112: Installing Piston In Rear Caliper
Courtesy of CHRYSLER GROUP, LLC

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided. **The dust boot will not seat at this time. Refer to following step.**

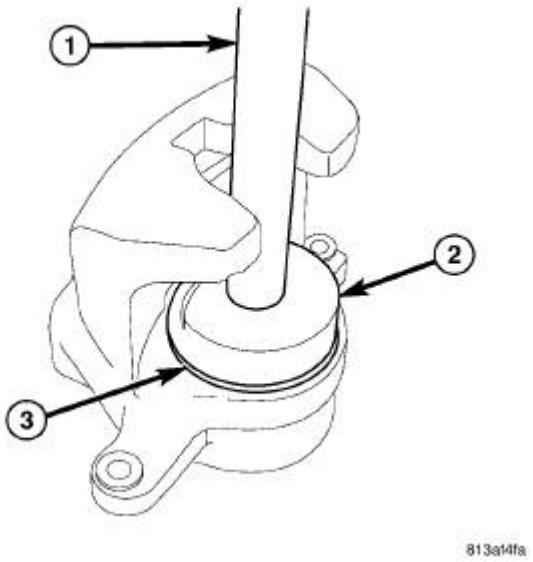

Fig. 113: Seat dust boot, Installer & Handle
Courtesy of CHRYSLER GROUP, LLC

5. Seat dust boot (3) in caliper counterbore using Installer (2), Special Tool (special tool #9315, Installer, Dust Boot), with Handle (1), Special Tool (special tool #C-4171, Driver Handle, Universal). Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

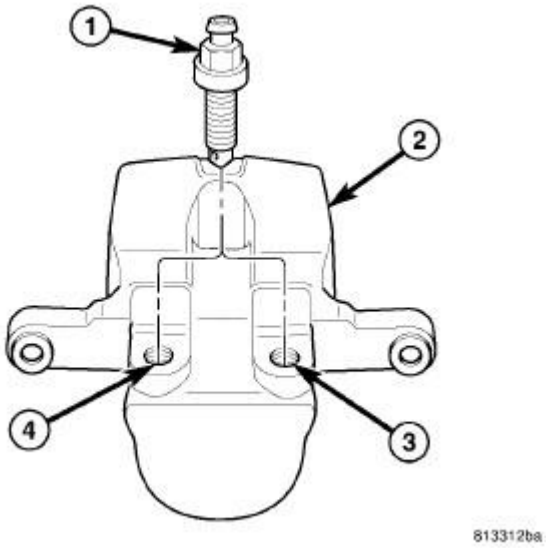

Fig. 114: Rear Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to 15 N.m (125 in. lbs.) torque.
7. Install caliper on vehicle. Refer to **CALIPER, DISC BRAKE, FRONT SRT8, INSTALLATION** or **CALIPER, DISC BRAKE, REAR SRT8, INSTALLATION** or **CALIPER, DISC BRAKE, REAR, INSTALLATION** or **CALIPER, DISC BRAKE, SINGLE PISTON, INSTALLATION** or **CALIPER, DISC BRAKE, TWIN PISTON, INSTALLATION**.

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. Refer to INSPECTION .

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

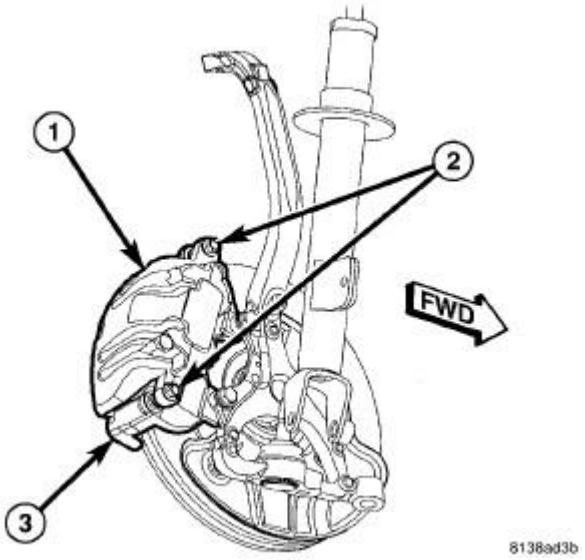

Fig. 115: Front Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N.m (44 ft. lbs.).

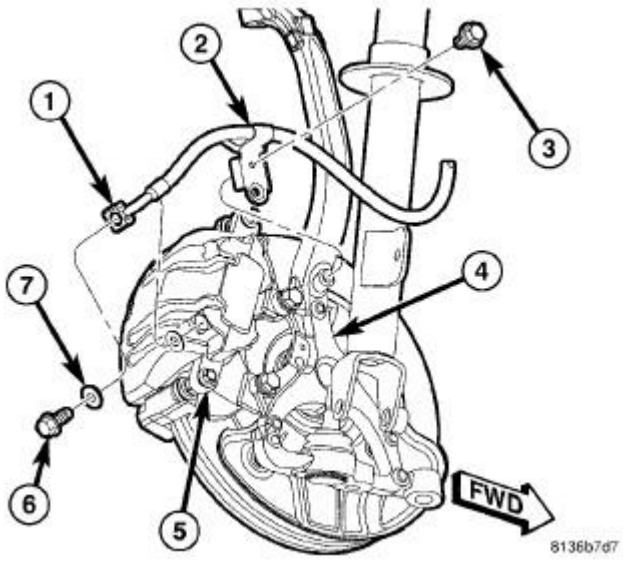

Fig. 116: Front Brake Flex Hose AT Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Install banjo bolt (6) attaching brake hose (1) to caliper (5). Install NEW washers (7) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

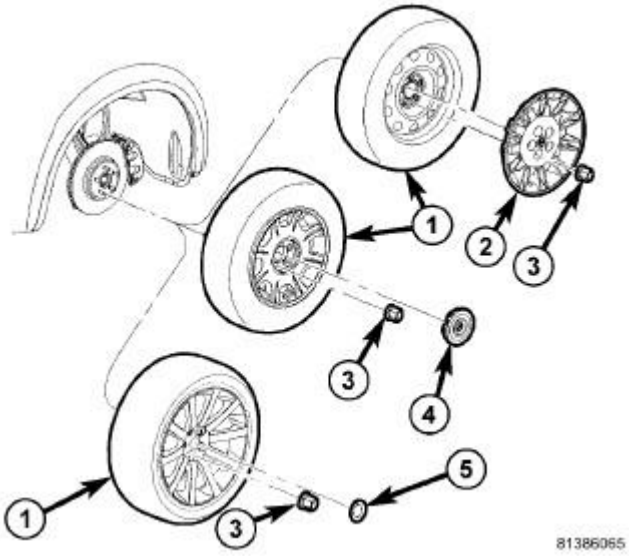

Fig. 117: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

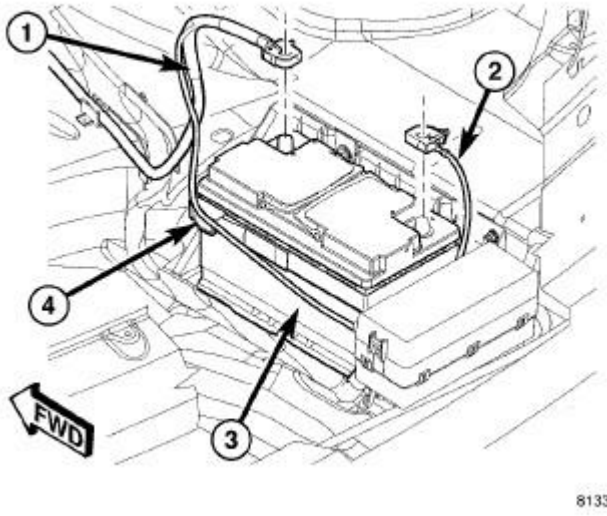

Fig. 118: Disconnecting/Connecting Battery Cables

Courtesy of CHRYSLER GROUP, LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

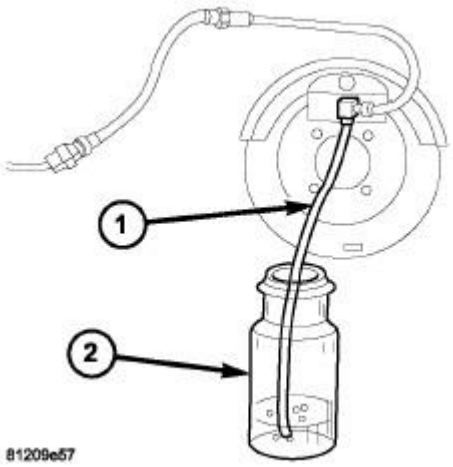

Fig. 119: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** Refer to **BASE BRAKE BLEEDING** .
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

CALIPER, DISC BRAKE, TWIN PISTON

REMOVAL

ALL-WHEEL-DRIVE

NOTE: Before proceeding. Refer to CAUTION or WARNING.

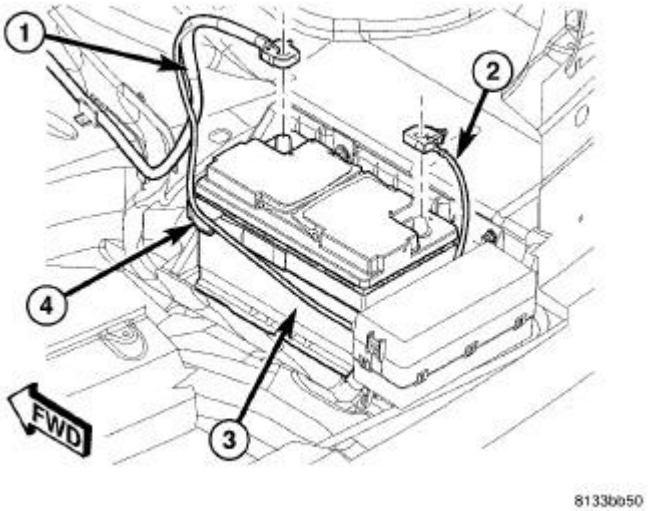

Fig. 120: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

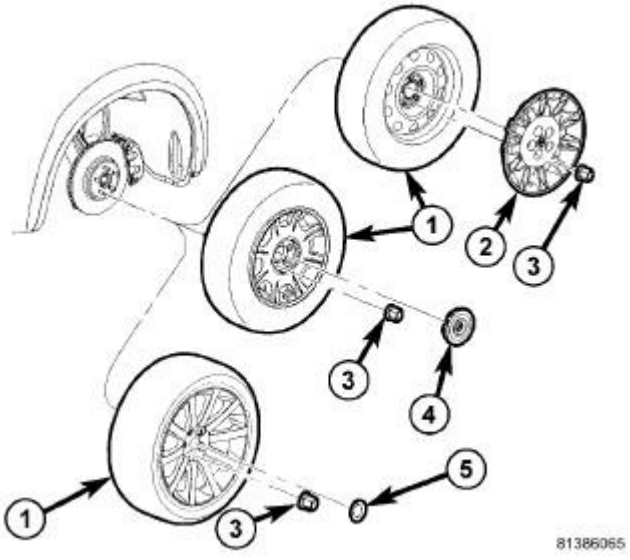

Fig. 121: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

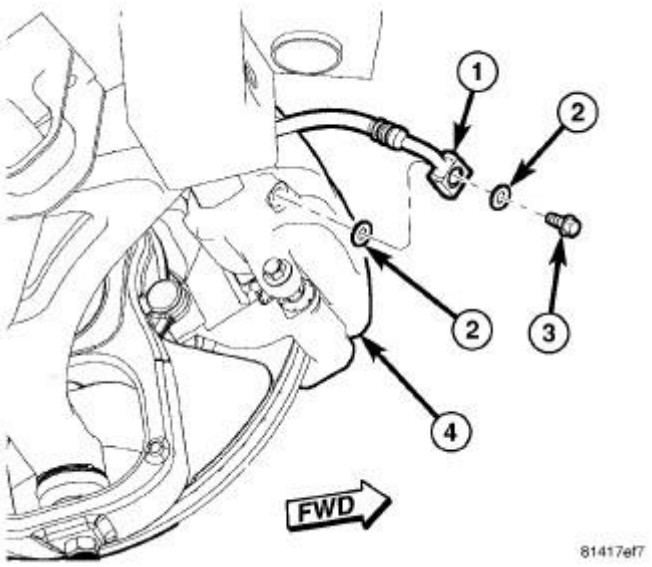

Fig. 122: Front Brake Flex Hose AT Caliper - AWD
Courtesy of CHRYSLER GROUP, LLC

5. Remove banjo bolt (3) connecting flexible brake hose (1) to caliper (4). There are two sealing washers (2) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

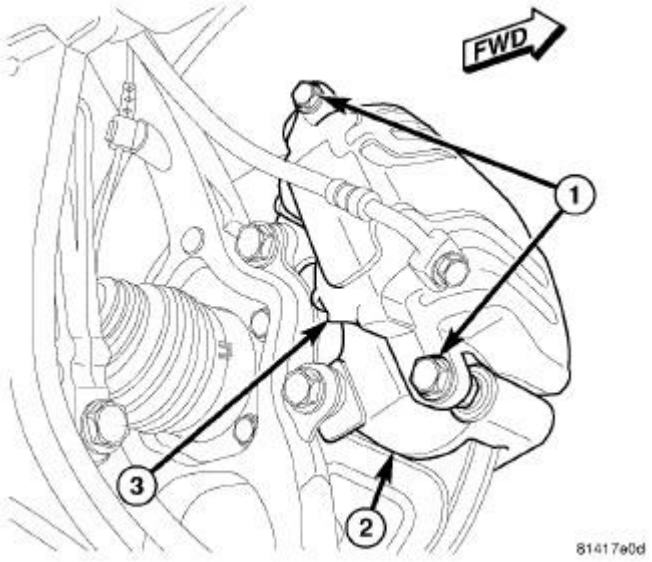

Fig. 123: Front Caliper Mounting - AWD
Courtesy of CHRYSLER GROUP, LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (1).

7. Remove brake caliper (3) from brake adapter (2) and pads.

REAR-WHEEL-DRIVE

NOTE: Before proceeding. Refer to CAUTION or WARNING.

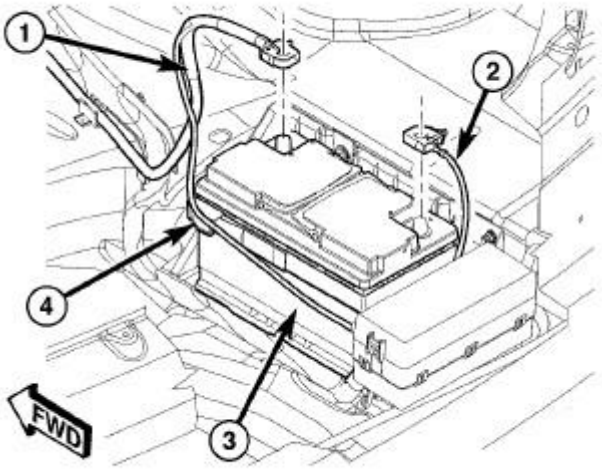

Fig. 124: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

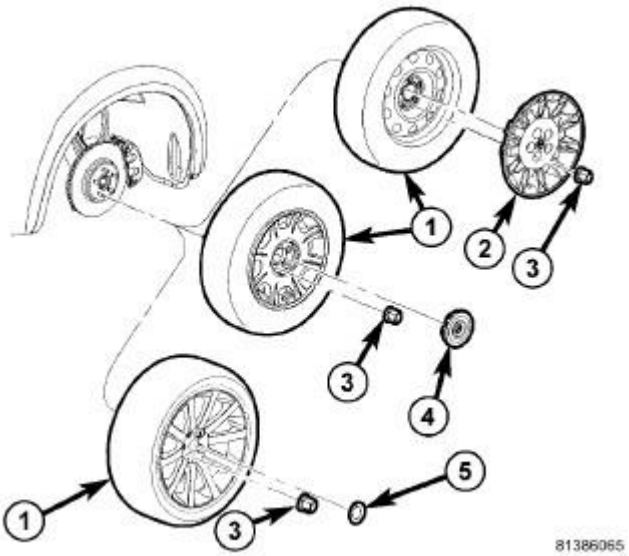

Fig. 125: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

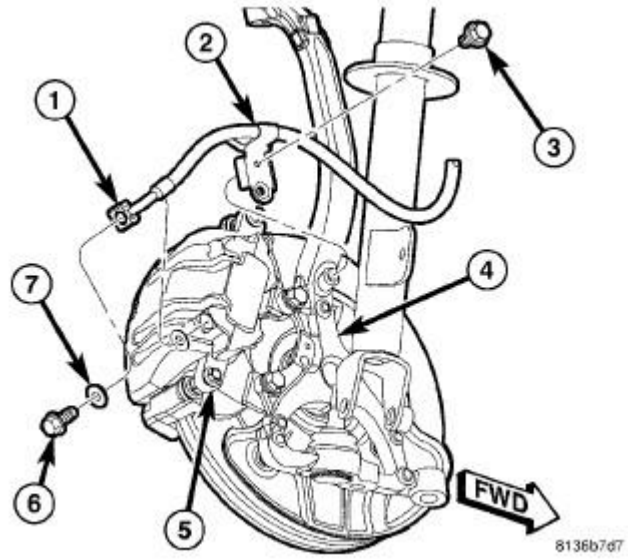

Fig. 126: Front Brake Flex Hose AT Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Remove banjo bolt (6) connecting flexible brake hose (1) to caliper (5). There are two sealing washers (7) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

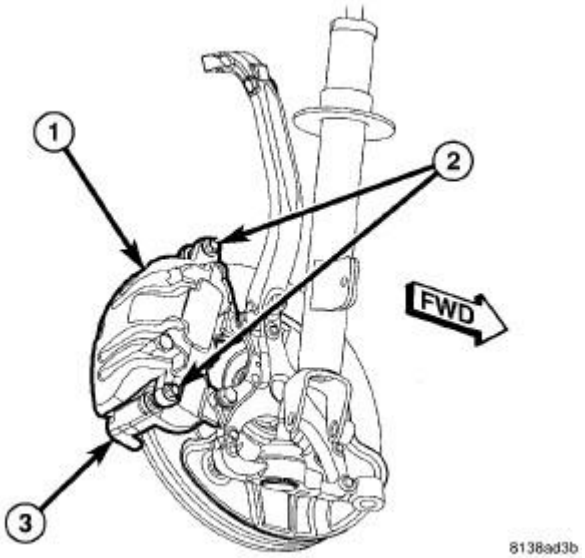

Fig. 127: Front Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (2).
7. Remove brake caliper (1) from brake adapter (3) and pads.

DISASSEMBLY

DISASSEMBLY

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to INSPECTION and CLEANING . .

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such practice.

1. Drain brake fluid from caliper.

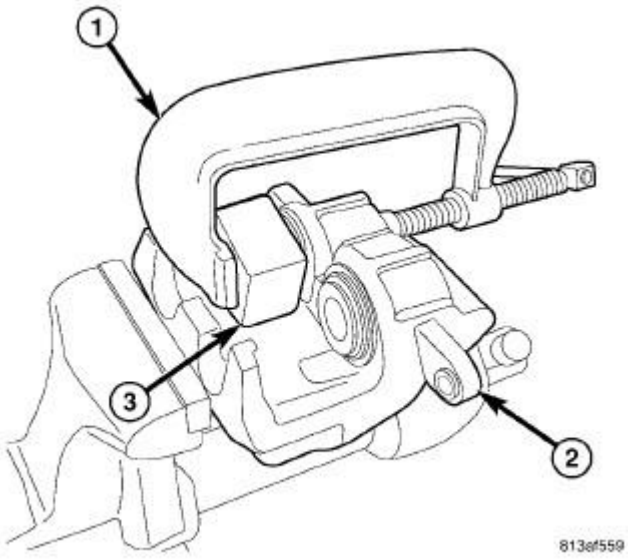

Fig. 128: C-Clamp Over Piston Number 1
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use excessive force when clamping caliper (2) in vise. Caliper housing is made of aluminum. Excessive vise pressure will cause bore distortion.

2. Mount caliper (2) in vise equipped with protective jaws.
3. C-clamp (1) a block of wood (3) over one piston.

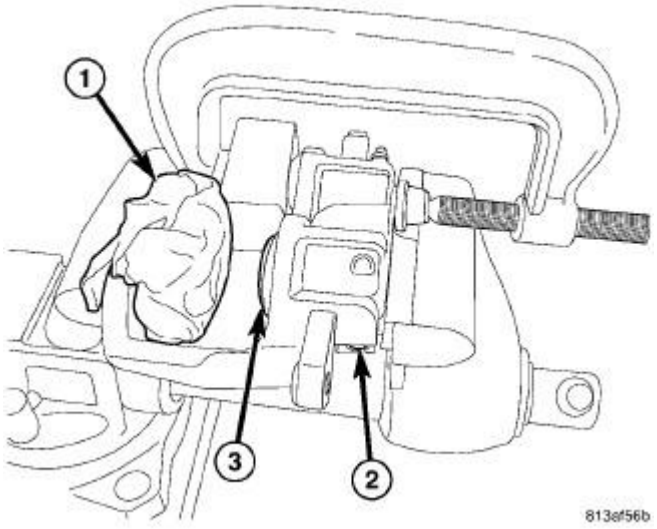

Fig. 129: Padded Block In Front Of Piston Number 2
Courtesy of CHRYSLER GROUP, LLC

4. Take another block of wood and pad it with one-inch thickness of shop towels. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out.
5. Place the padded block of wood (1) in outboard shoe side of caliper (2) in front of exposed piston (3). This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using compressed air to remove piston. Do not use high pressure.

WARNING: Never attempt to catch piston as it leaves bore. This could result in personal injury.

CAUTION: Do not blow piston out of bore with sustained air pressure. This could result in a cracked piston. Use only short spurts of air.

6. Apply **short spurts of low pressure air** with a rubber tipped blow gun through caliper brake hose port. Use only enough air pressure to ease piston out of bore.
7. Remove piston from caliper (2).
8. Remove C-clamp and block of wood.

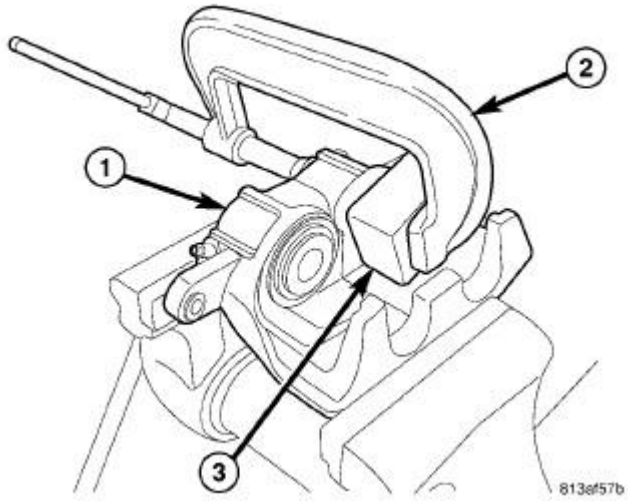

Fig. 130: C-Clamp Over Piston Number 2 Boot
Courtesy of CHRYSLER GROUP, LLC

9. C-clamp (1) the block of wood (3) over dust boot of first piston removed. This will seal empty piston bore.

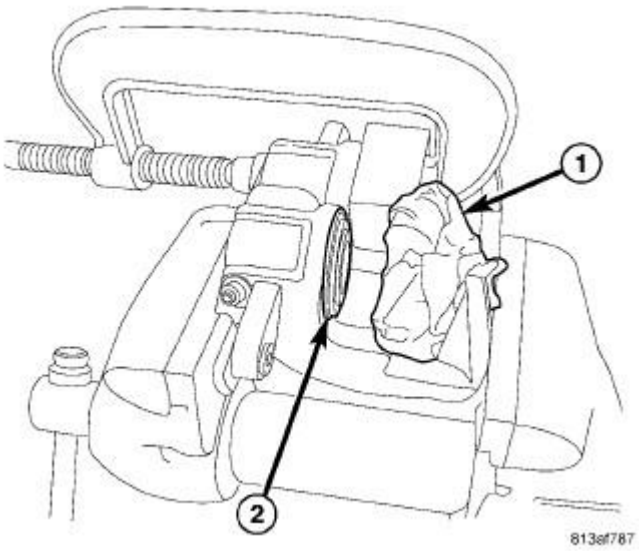

Fig. 131: Padded Block In Front Of Piston 1
Courtesy of CHRYSLER GROUP, LLC

10. Move padded piece of wood (1) in front of piston (2) yet to be removed.
11. Remove second piston using same procedure with **short spurts of low pressure air** .
12. Remove C-clamp and block of wood from caliper.

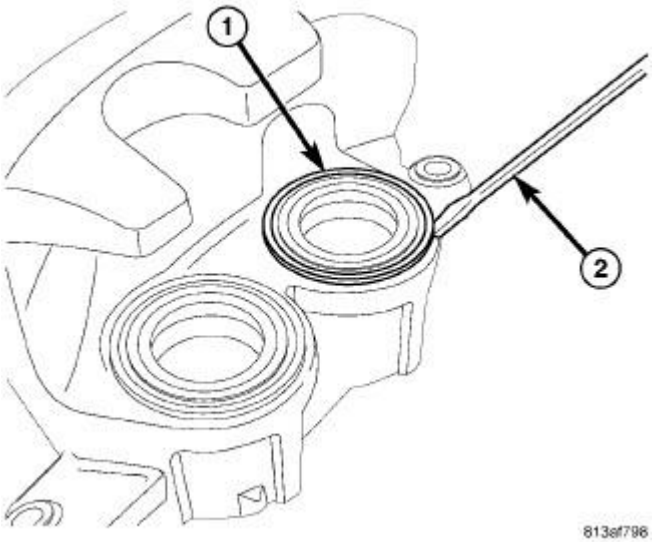

Fig. 132: Removing Dust Boots
Courtesy of CHRYSLER GROUP, LLC

13. Remove piston dust boots (1) (over each bore) with an appropriate pry tool (2). **Use care not to damage aluminum housing.**

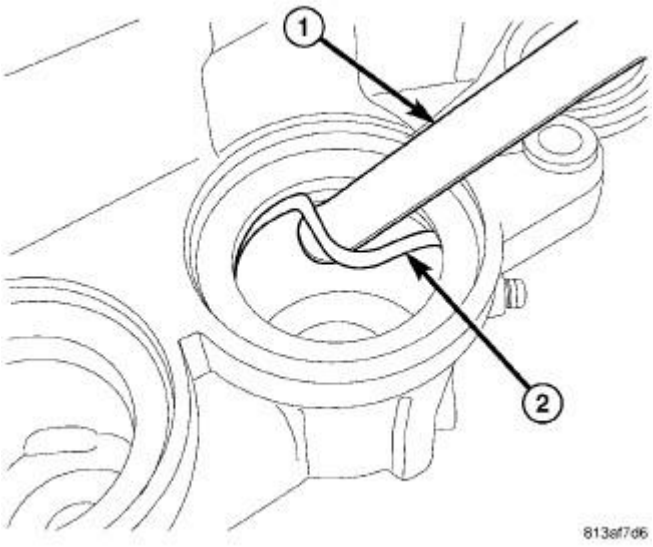

Fig. 133: Removing Piston Seals
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use an appropriate tool (1) to remove piston seals (2) to avoid scratching piston bore. Do not use a screwdriver or other metal tool to remove seals.

14. Using a soft tool such as a plastic trim stick (1), remove piston seals (2) from caliper bores.

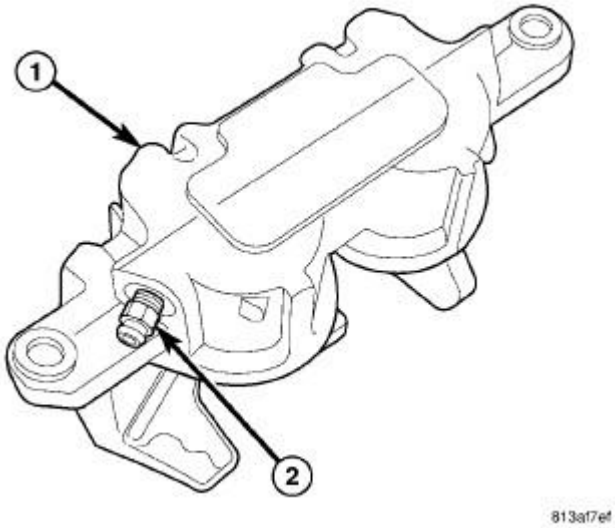

Fig. 134: Twin Piston Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

15. Remove caliper bleeder screw (2) from caliper housing (1).

16. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
17. Inspect both piston and bore for scoring or pitting.

NOTE: It is not recommended to hone caliper bore. The anodized coating would be compromised.

CLEANING

CLEANING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

ASSEMBLY

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid when

assembling brake caliper.

NOTE: Never use old or used piston seals or boots for assembly.

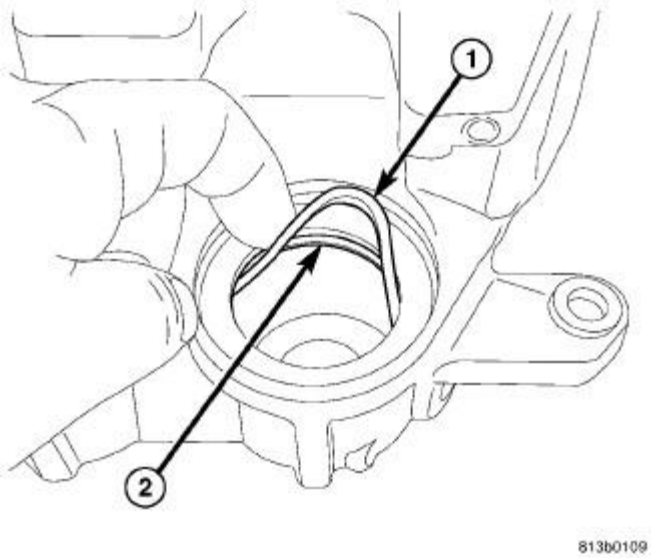

Fig. 135: Installing Piston Seals
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate caliper pistons, piston seals (1) and piston bores (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) into groove of each caliper piston bore (2).

NOTE: Make sure seal is fully seated and not twisted in groove.

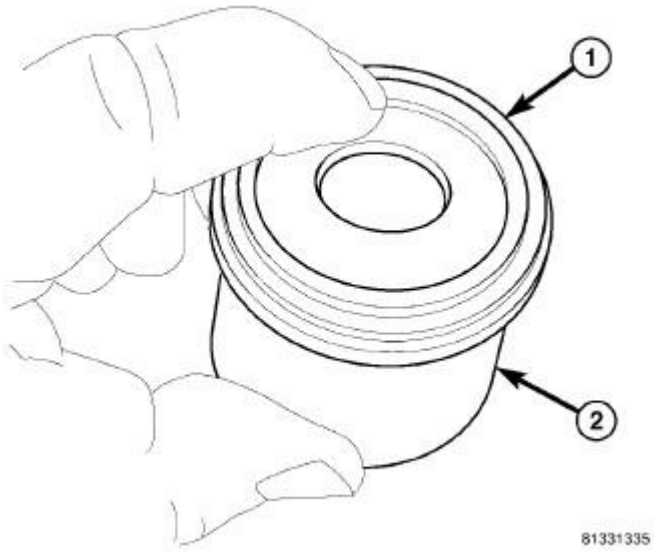

Fig. 136: Installing Boot On Caliper Piston
Courtesy of CHRYSLER GROUP, LLC

3. Install NEW boot (1) on each piston (2) and work boot lip into groove at top of piston. Stretch boot rearward straightening boot folds, then move boot forward as necessary until folds snap uniformly into place.

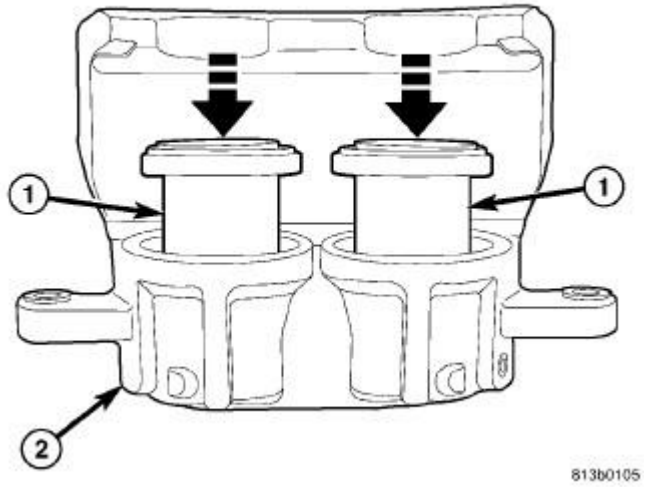

Fig. 137: Installing Pistons In Caliper
Courtesy of CHRYSLER GROUP, LLC

4. Install each piston (1), one at a time, into its caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage is avoided.

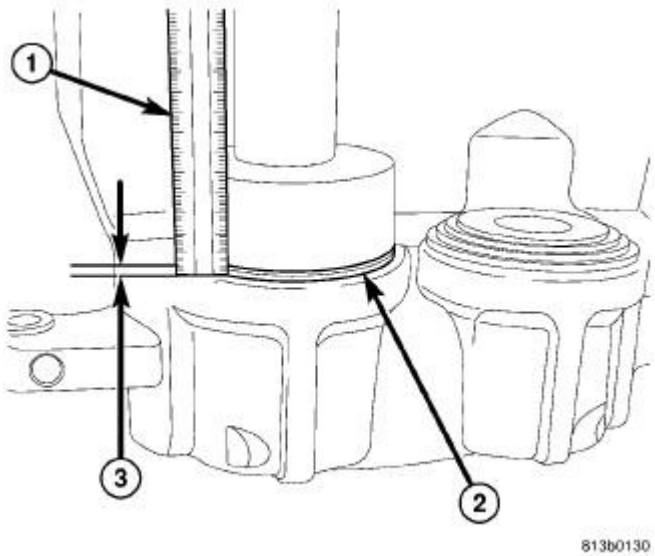

Fig. 138: Measuring Dust Boot Heights
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When seating dust boots in following step, use care not to over-install boots or damage will occur. Each boot (2) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (3) of boot still showing above caliper housing.

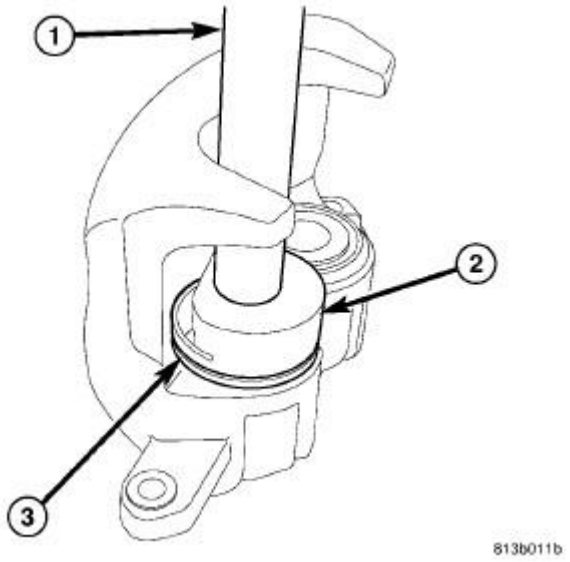

Fig. 139: Seat dust boots, Installer & Handle
Courtesy of CHRYSLER GROUP, LLC

5. Seat dust boots (3) in caliper counterbores using Installer (special tool #9315, Installer, Dust Boot) (2) with Handle (special tool #C-4171, Driver Handle, Universal) (1). Install each dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

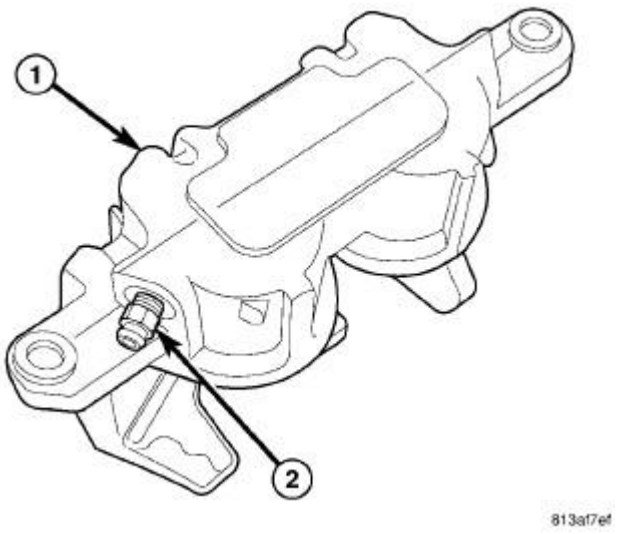

Fig. 140: Twin Piston Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install caliper bleeder screw (2) in caliper housing (1). Tighten bleeder screw to 15 N.m (125 in. lbs.) torque.
7. Install caliper on vehicle. Refer to **CALIPER, DISC BRAKE, FRONT SRT8, INSTALLATION** or **CALIPER, DISC BRAKE, REAR SRT8, INSTALLATION** or **CALIPER, DISC BRAKE, REAR, INSTALLATION** or **CALIPER, DISC BRAKE, SINGLE PISTON, INSTALLATION** or **CALIPER, DISC BRAKE, TWIN PISTON, INSTALLATION**.

INSTALLATION

ALL-WHEEL-DRIVE

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. Refer to INSPECTION .

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

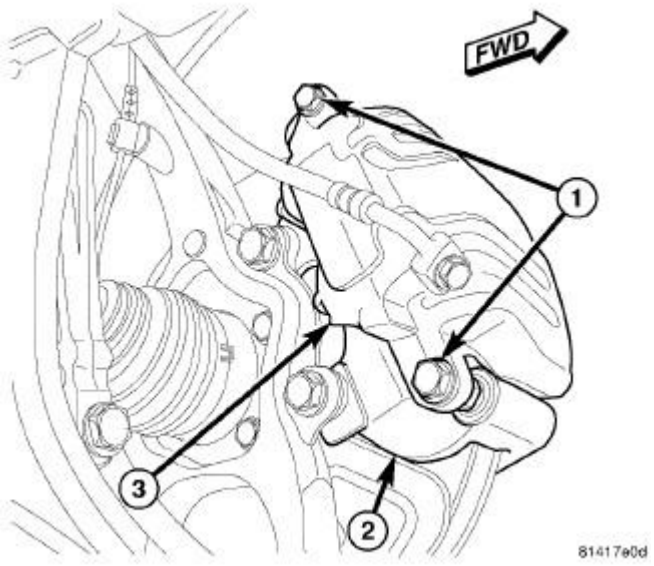

Fig. 141: Front Caliper Mounting - AWD
Courtesy of CHRYSLER GROUP, LLC

3. Slide caliper (3) over brake pads and onto caliper adapter (2).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (1) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (1). While holding guide pins from turning, tighten bolts to 60 N.m (44 ft. lbs.).

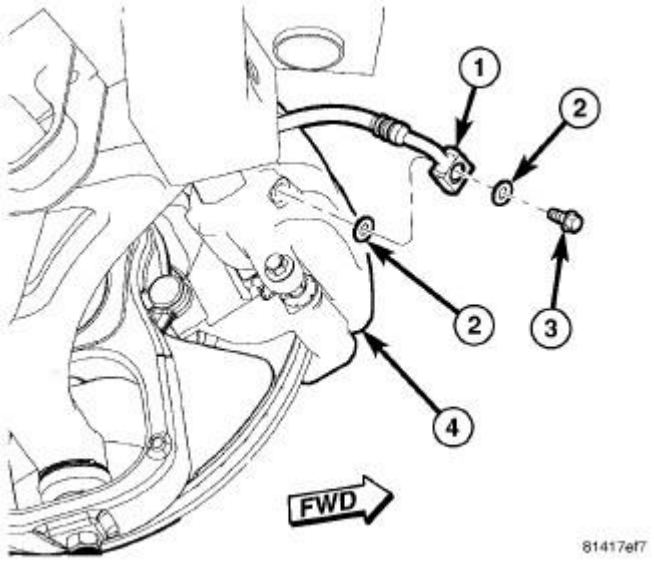

Fig. 142: Front Brake Flex Hose AT Caliper - AWD
Courtesy of CHRYSLER GROUP, LLC

5. Install banjo bolt (3) attaching brake hose (1) to caliper (4). Install NEW washers (2) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

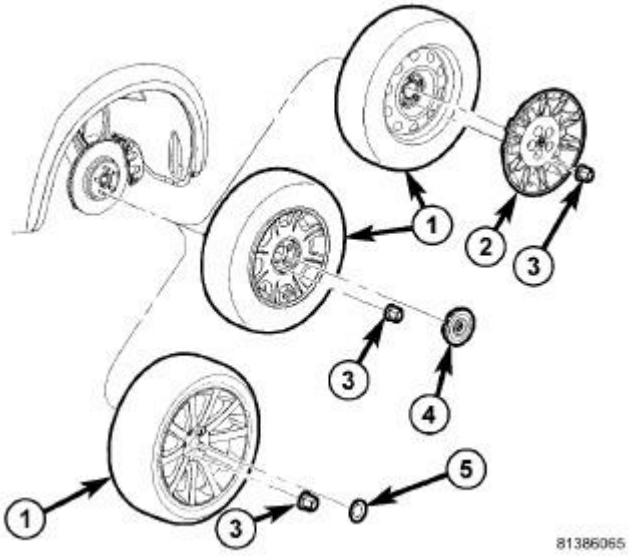

Fig. 143: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

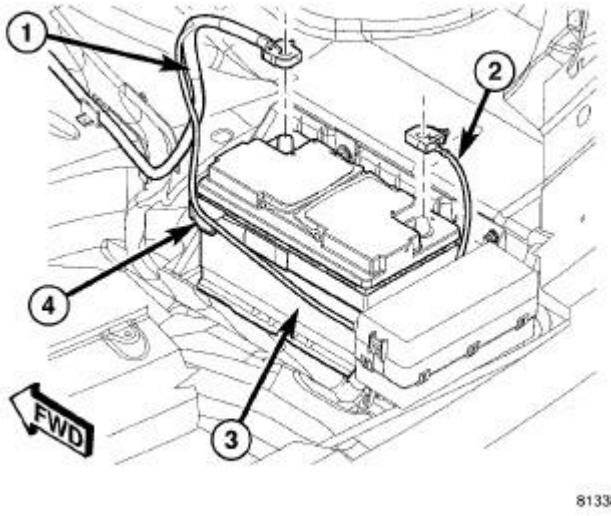

Fig. 144: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

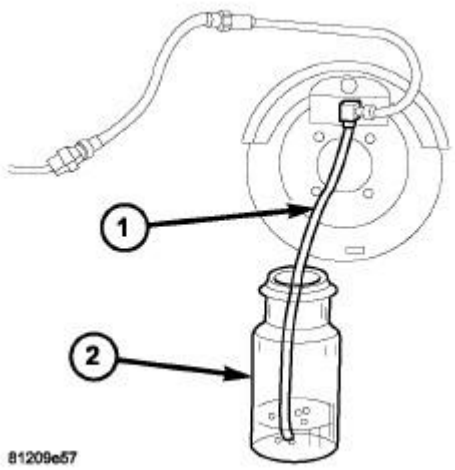

Fig. 145: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** Refer to **BASE BRAKE BLEEDING** .
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

REAR-WHEEL-DRIVE

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. Refer to INSPECTION .

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

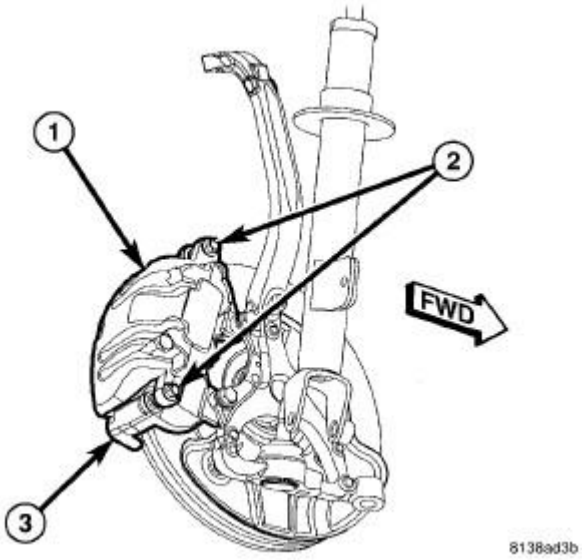

Fig. 146: Front Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N.m (44 ft. lbs.).

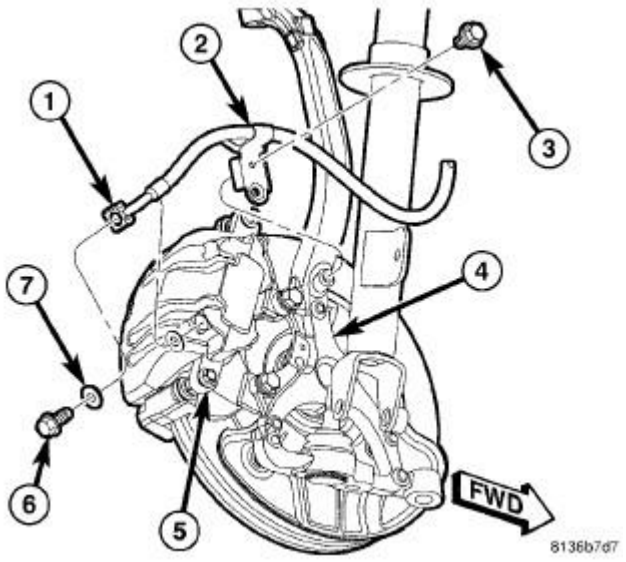

Fig. 147: Front Brake Flex Hose AT Caliper
Courtesy of CHRYSLER GROUP, LLC

5. Install banjo bolt (6) attaching brake hose (1) to caliper (5). Install NEW washers (7) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

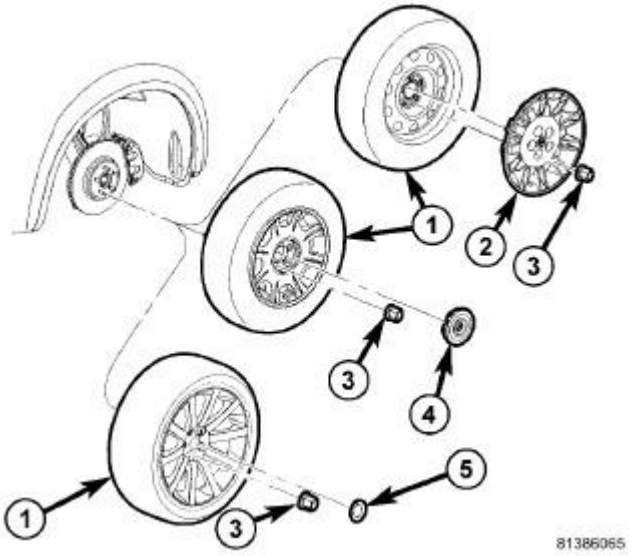

Fig. 148: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

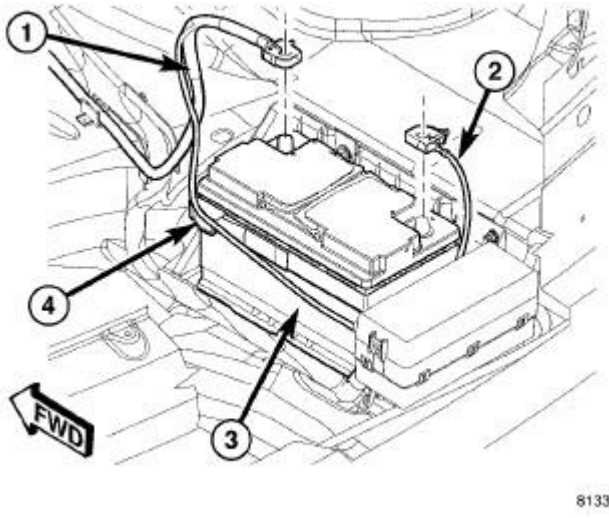

Fig. 149: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

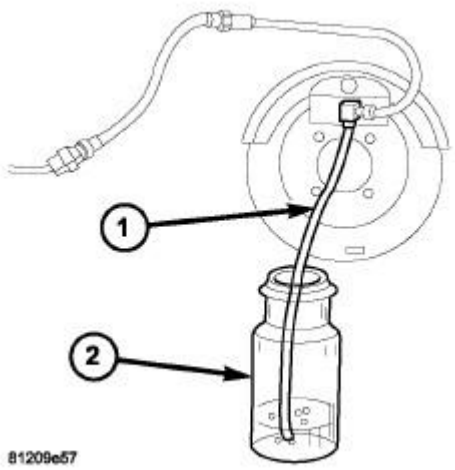

Fig. 150: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed** . Refer to **BASE BRAKE BLEEDING** .
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

FLUID

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brake hydraulic unit and all hydraulic fluid hoses.

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards.

No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

BRAKE FLUID - EXPORT

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. If DOT 3 brake fluid is not available, brake fluid conforming to DOT 4 specifications may be used in its place. The fluids are compatible, but DOT 4 usage may require additional fluid maintenance. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER, BRAKE

DESCRIPTION

DESCRIPTION

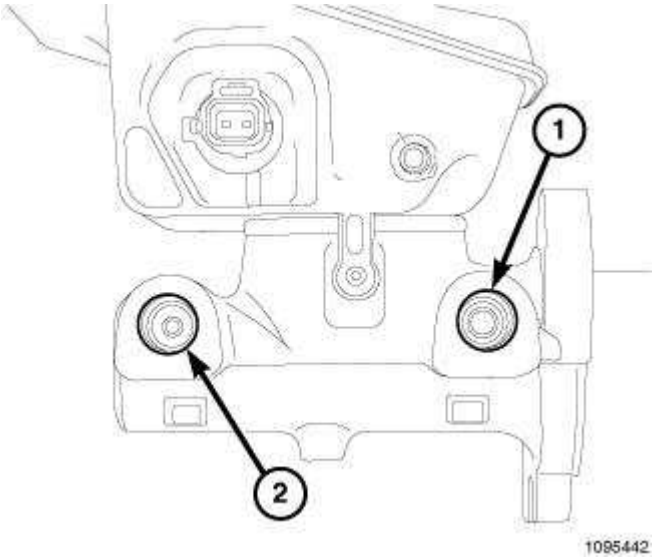

Fig. 151: Primary And Secondary Ports
Courtesy of CHRYSLER GROUP, LLC

The master cylinder has a cast aluminum housing with a top mounted reservoir. The dual outlet port design housing features a primary port (1) machined for 8 mm (5/16 inch) tubing and a secondary port (2) machined for 6.25 mm (1/4 inch) tubing.

The master cylinder has a 25.4 mm bore.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

CAUTION: When clamping master cylinder in vise, only clamp master cylinder by its mounting flange. Do not clamp master cylinder piston rod, reservoir, seal or body.

1. Clamp master cylinder in a vise.

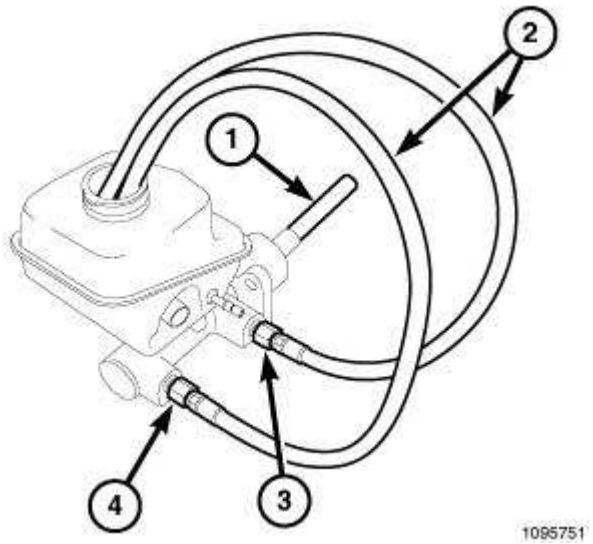

Fig. 152: Bleeding Tools On Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing Adapters in master cylinder, do not overtighten. Damage to master cylinder could occur.

NOTE: Bleeder Adapters (special tool #9748-1, Adapter, Bleeder) and (special tool #9748-2, Adapter, Bleeder) are not interchangeable. To avoid mix-up, Bleeder Adapter (special tool #9748-1, Adapter, Bleeder) is silver while Bleeder Adapter (special tool #9748-2, Adapter, Bleeder) is black.

2. Attach special tools for bleeding master cylinder in following fashion:
    1. Thread Adapter (3), Special Tool (special tool #9748-2, Adapter, Bleeder), into primary outlet port. Tighten Adapter to 14 N.m (124 in. lbs.).
    2. Thread Adapter (4), Special Tool (special tool #9748-1, Adapter, Bleeder), into secondary outlet port. Tighten Adapter to 14 N.m (124 in. lbs.).
    3. Thread a Bleeder Tube (2), Special Tool (special tool #8358-1, Bleed Tube), into each Adapter. Tighten each tube to 14 N.m (124 in. lbs.). Flex each bleeder tube and place open end into mouth of fluid reservoir as far down as possible.

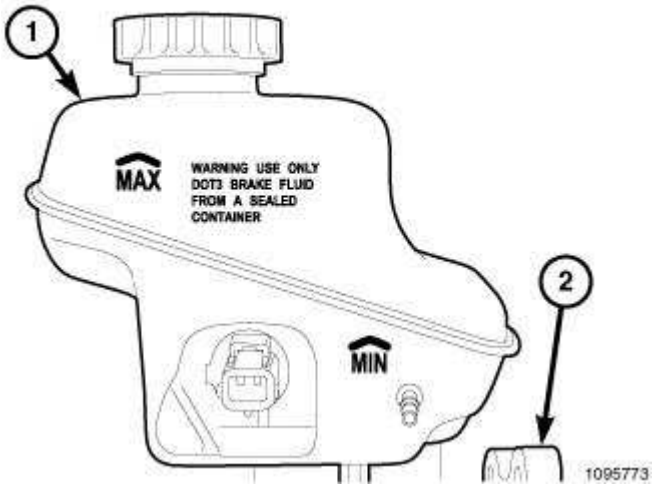

Fig. 153: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure open ends of bleeder tubes stay below surface of brake fluid once reservoir is filled to proper level.

3. Fill brake fluid reservoir (1) to the MAX level with Mopar® brake fluid or equivalent conforming to DOT 3 specifications. Make sure fluid level is above tips of bleeder tubes in reservoir to ensure no air is ingested during bleeding.

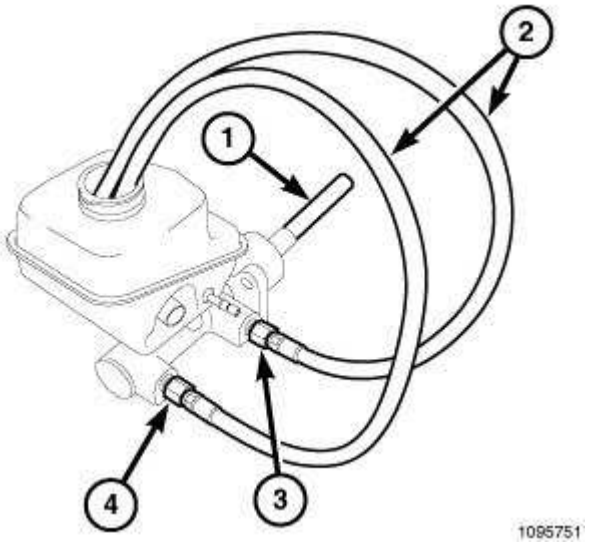

Fig. 154: Bleeding Tools On Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

4. Using a wooden dowel as a pushrod (1), slowly depress master cylinder pistons, then release pressure, allowing pistons to return to released position. Repeat several times until all air bubbles are expelled. Make sure fluid level stays above tips of bleeder tubes in reservoir while bleeding.
5. Remove bleeder tubes (2) and adapters (3, 4) from master cylinder outlet ports, then plug outlet ports and install fill cap on reservoir.
6. Remove master cylinder from vise.
7. Install master cylinder on vehicle. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

REMOVAL

MASTER CYLINDER

CAUTION: Vacuum in power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent power brake booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping brake pedal, with vehicle's engine not running, until a firm feeling brake pedal is achieved.

1. With engine not running, pump brake pedal until a firm pedal is achieved (4-5 strokes).

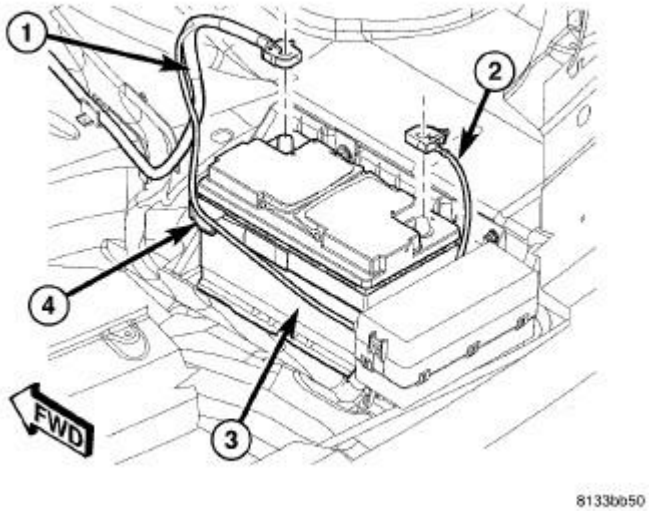

Fig. 155: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect and isolate battery negative cable (2) from battery post.

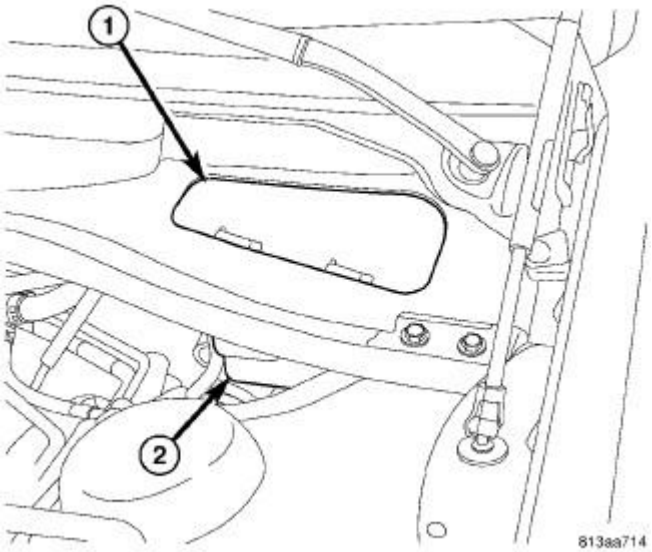

Fig. 156: Cowl Access Panel
Courtesy of CHRYSLER GROUP, LLC

3. Remove access panel (1) in cowl area to expose master cylinder (2).
4. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

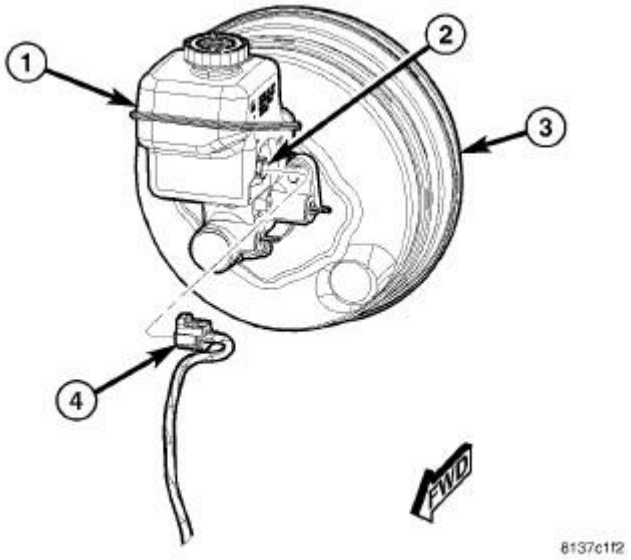

Fig. 157: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect wiring harness connector (4) from brake fluid level sensor (2) in master cylinder brake fluid reservoir (1).

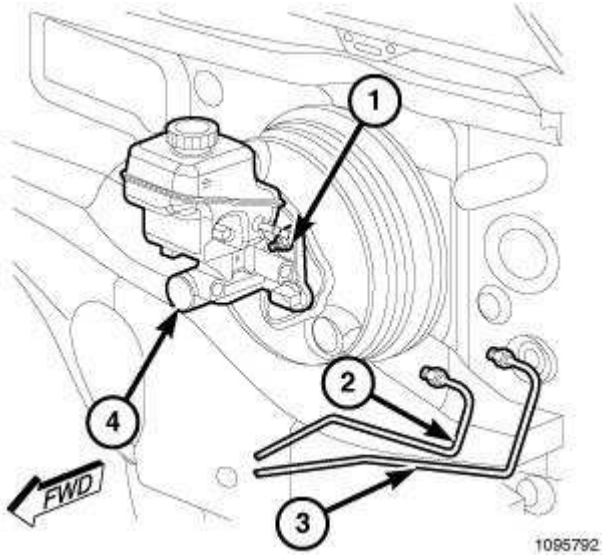

Fig. 158: Brake Tubes AT Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect primary (3) and secondary (2) brake tubes from master cylinder (4). Install sealing plugs in open brake tube outlet ports.

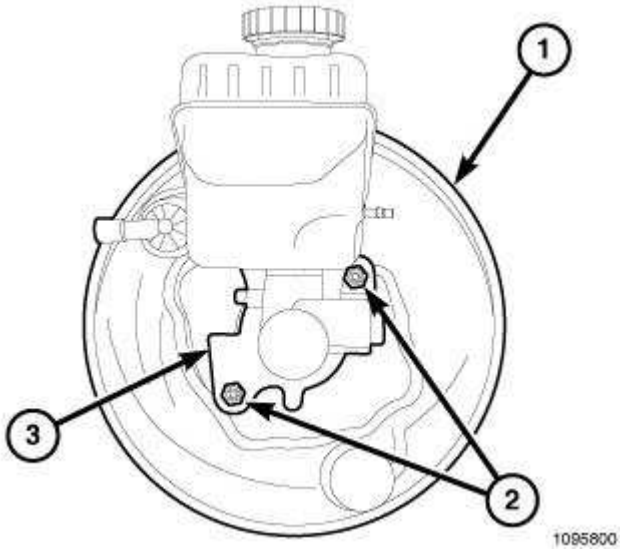

Fig. 159: Master Cylinder Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing master cylinder from power brake vacuum booster, master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into power brake vacuum booster. Use only Mopar® Brake Parts Cleaner or equivalent.

7. Remove two nuts (2) attaching master cylinder (3) to power brake booster (1).
8. Slide master cylinder (3) straight out of power brake booster (1).

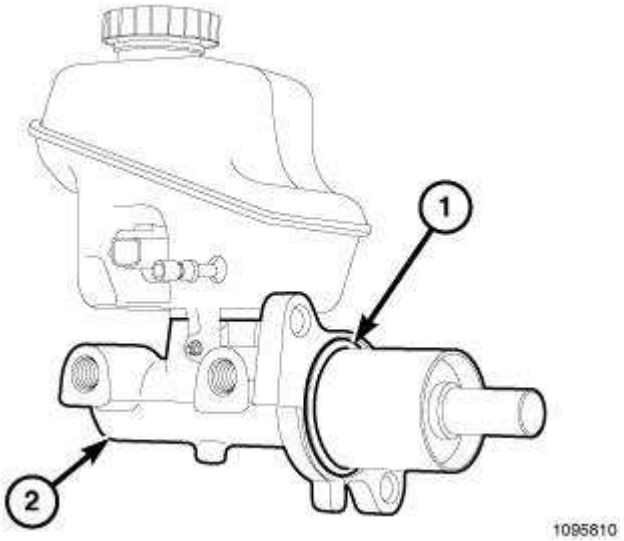

Fig. 160: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Vacuum seal (1) on rear of master cylinder (2) is used to allow vacuum ability in power brake vacuum booster. Vacuum seal MUST be replaced whenever master cylinder is removed from power brake vacuum booster.

9. Remove vacuum seal (1) located on mounting flange of master cylinder (2). Vacuum seal is removed by **carefully** pulling it off rear of master cylinder. **Do not attempt to pry seal off master cylinder by inserting a sharp tool between seal and master cylinder casting. Damage can occur.**

MASTER CYLINDER - RHD

CAUTION: Vacuum in power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent power brake booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping brake pedal, with vehicle's engine not running, until a firm feeling brake pedal is achieved.

1. With engine not running, pump brake pedal until a firm pedal is achieved (4-5 strokes).

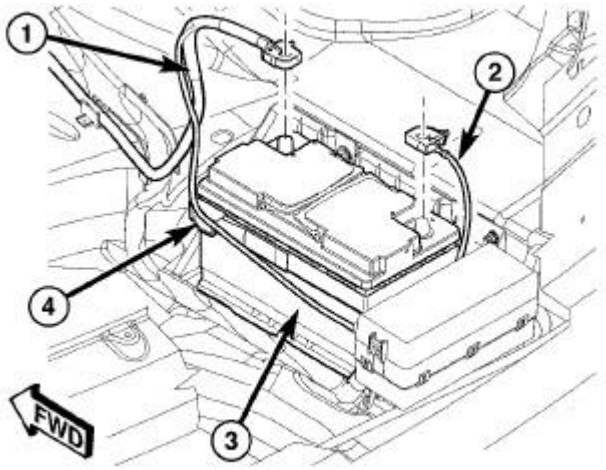

Fig. 161: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect and isolate battery negative cable (2) from battery post.

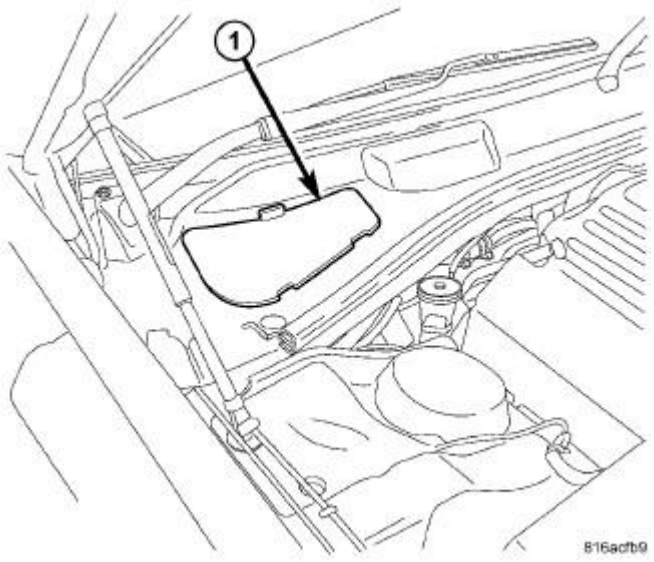

Fig. 162: Cowl Access Panel - RHD
Courtesy of CHRYSLER GROUP, LLC

3. Remove access panel (1) in cowl area to expose master cylinder.
4. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

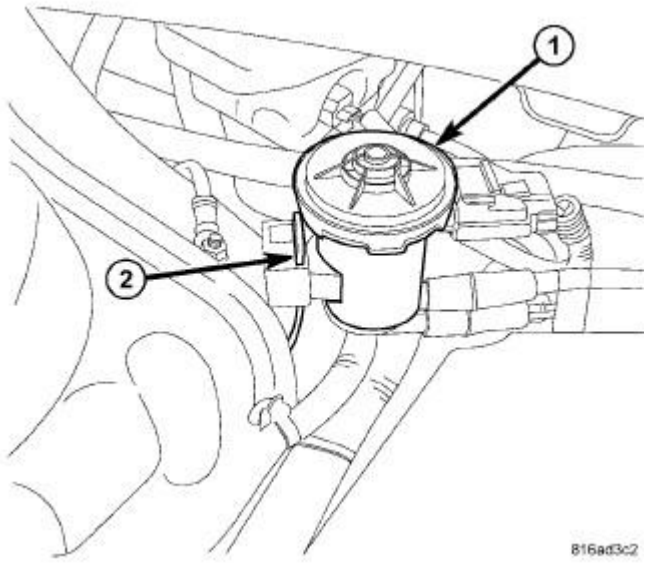

Fig. 163: EVAP/Purge Solenoid
Courtesy of CHRYSLER GROUP, LLC

5. Remove purge solenoid (1) from mount (2) and move it to side leaving hoses and wiring connected.

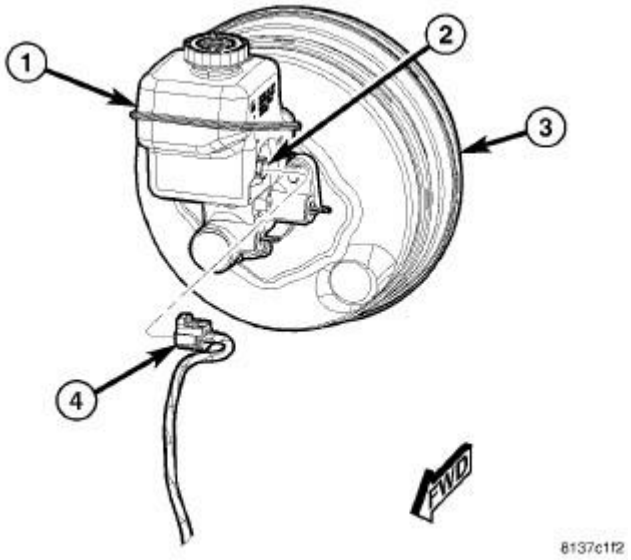

Fig. 164: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect wiring harness connector (4) from brake fluid level sensor (2) in master cylinder brake fluid reservoir (1).

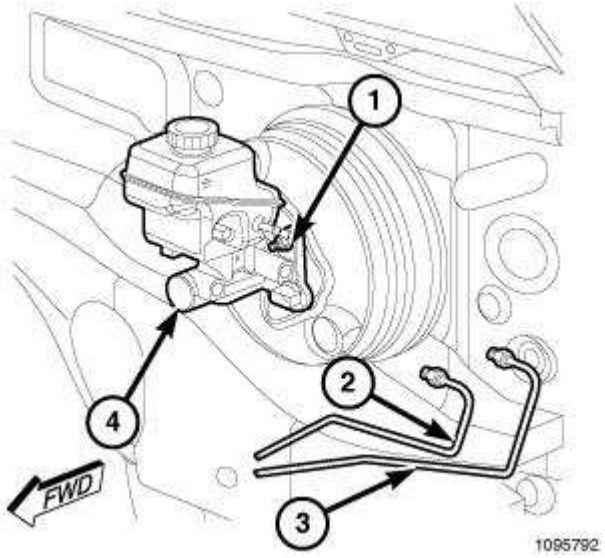

Fig. 165: Brake Tubes AT Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

7. Remove primary (3) and secondary (2) brake tubes from master cylinder (4). Install sealing plugs in open brake tube outlet ports.

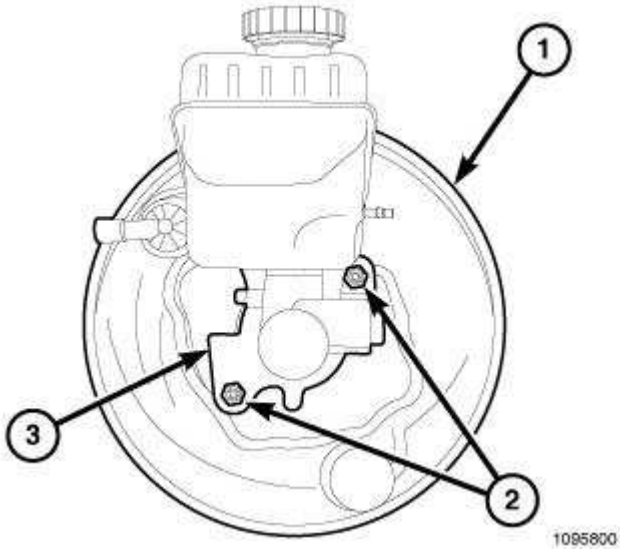

Fig. 166: Master Cylinder Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing master cylinder from power brake vacuum booster, master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into power brake vacuum booster. Use only Mopar® Brake Parts Cleaner or equivalent.

8. Remove two nuts (2) attaching master cylinder (3) to power brake booster (1).
9. Slide master cylinder (3) straight out of power brake booster (1).

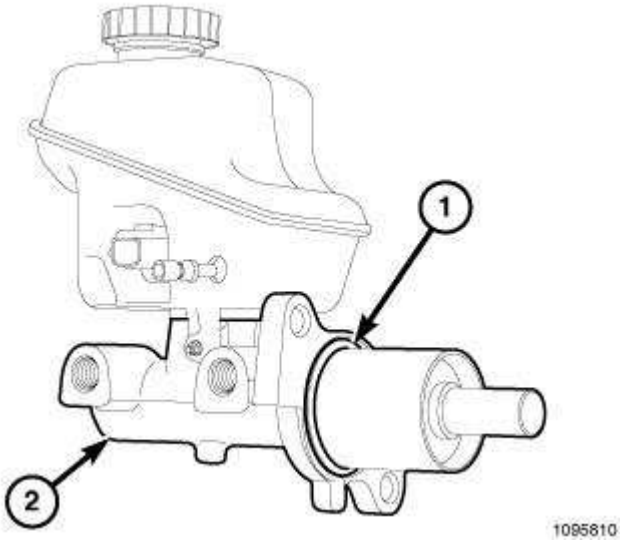

Fig. 167: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Vacuum seal (1) on rear of master cylinder (2) is used to allow vacuum ability in power brake vacuum booster. Vacuum seal MUST be replaced whenever master cylinder is removed from power brake vacuum booster.

10. Remove vacuum seal (1) located on mounting flange of master cylinder (2). Vacuum seal is removed by **carefully** pulling it off rear of master cylinder. **Do not attempt to pry seal off master cylinder by inserting a sharp tool between seal and master cylinder casting. Damage can occur.**

DISASSEMBLY

DISASSEMBLY

1. Clean master cylinder housing and brake fluid reservoir. Use only Mopar® Brake Parts Cleaner or equivalent.

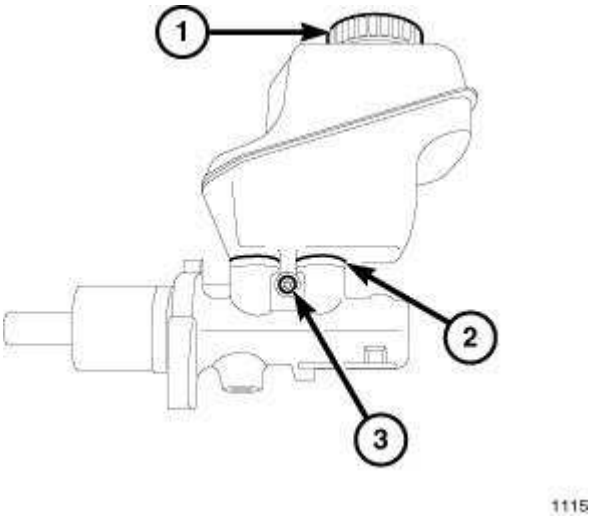

Fig. 168: Fluid Reservoir Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove brake fluid reservoir cap (1). Using a syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

3. Remove screw (3) fastening fluid reservoir to master cylinder housing.
4. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

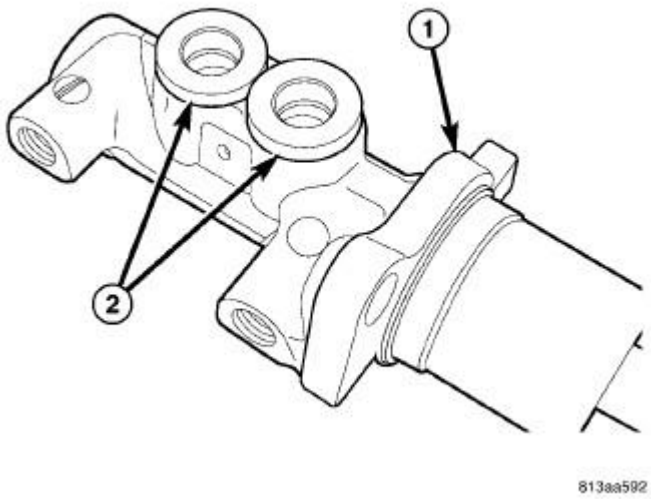

Fig. 169: Reservoir Seal Grommets
Courtesy of CHRYSLER GROUP, LLC

5. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

ASSEMBLY

ASSEMBLY

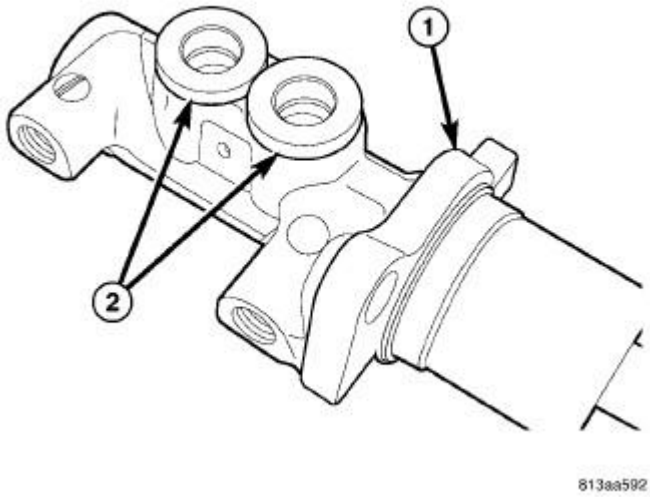

Fig. 170: Reservoir Seal Grommets
Courtesy of CHRYSLER GROUP, LLC

1. Install NEW brake fluid reservoir sealing grommets (2) in master cylinder housing (1).

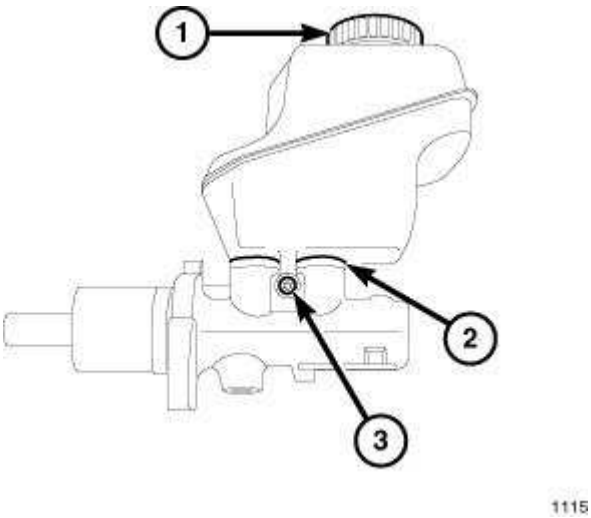

Fig. 171: Fluid Reservoir Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.
3. Install fluid reservoir mounting screw (3). Tighten screw to 28 N.m (250 in. lbs.).
4. Thoroughly bleed master cylinder before installing it on vehicle. Refer to **MASTER CYLINDER, BRAKE, STANDARD PROCEDURE**.

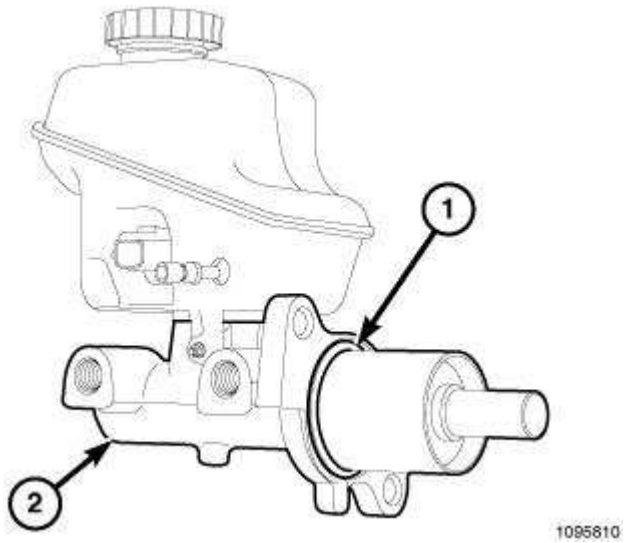

Fig. 172: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

5. Install master cylinder on power brake booster. Upon installation, vacuum seal (1) on rear of master cylinder must be replaced. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

INSTALLATION

MASTER CYLINDER

1. Thoroughly bleed master cylinder before installing it on vehicle. Refer to **MASTER CYLINDER, BRAKE, STANDARD PROCEDURE**.

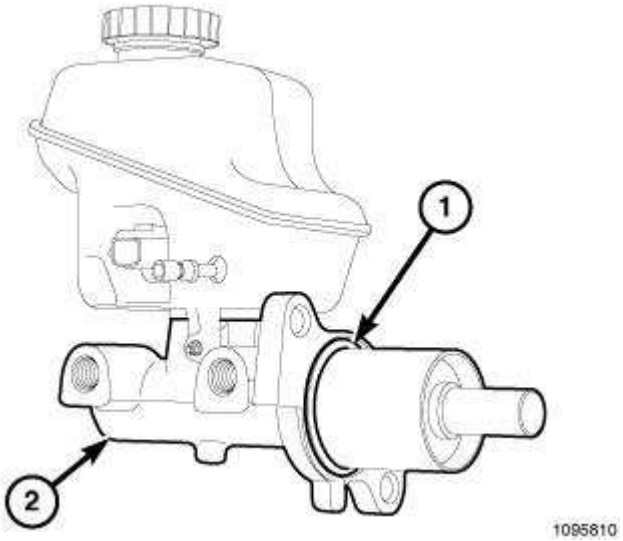

Fig. 173: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When replacing master cylinder on vehicle, a NEW vacuum seal (1) MUST be installed on master cylinder.

2. Install NEW vacuum seal (1) on rear of master cylinder (2) making sure seal fits squarely in mounting groove.

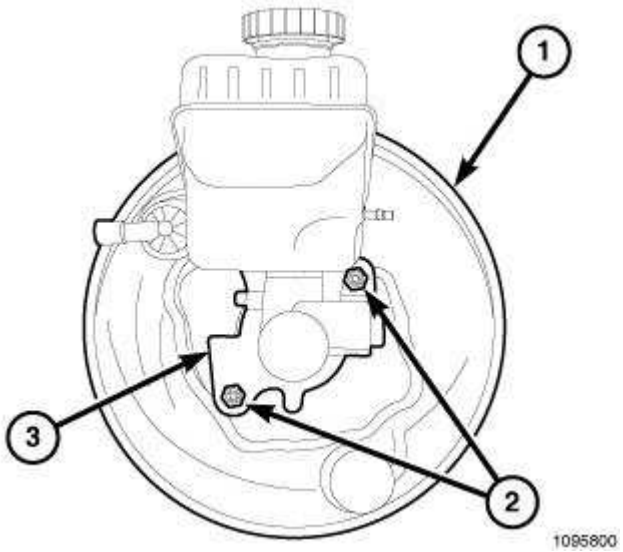

Fig. 174: Master Cylinder Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Position master cylinder (3) on studs of power brake booster, aligning booster push rod with master cylinder piston.
4. Install two master cylinder mounting nuts (2). Tighten mounting nuts to 15 N.m (133 in. lbs.).

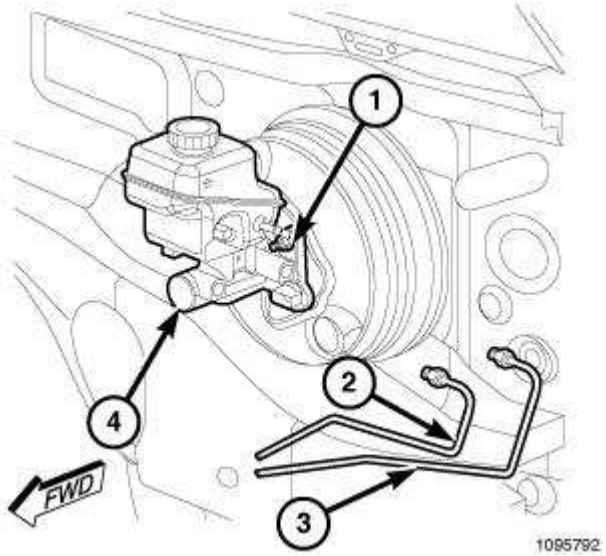

Fig. 175: Brake Tubes AT Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

5. Thread primary (3) and secondary (2) brake tubes into master cylinder primary and secondary ports. Tighten tube nuts to 20 N.m (177 in. lbs.).

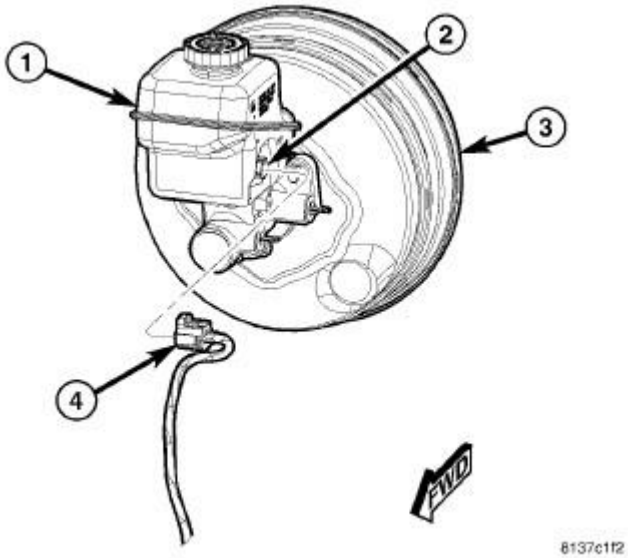

Fig. 176: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

6. Connect wiring harness connector (4) to brake fluid level sensor (2) mounted in brake fluid reservoir (1).

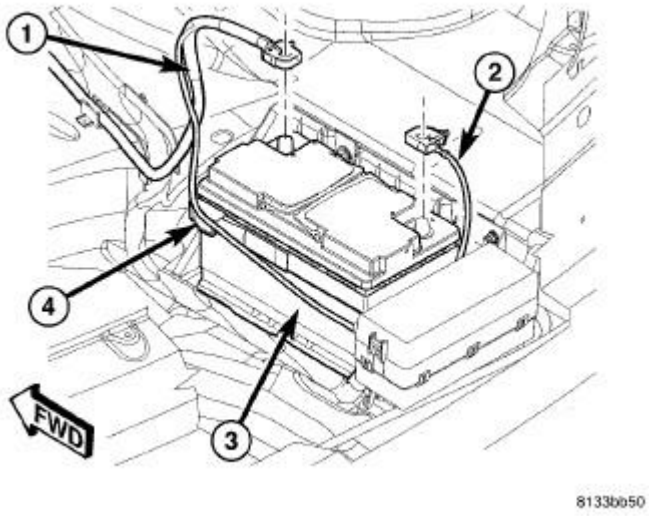

Fig. 177: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

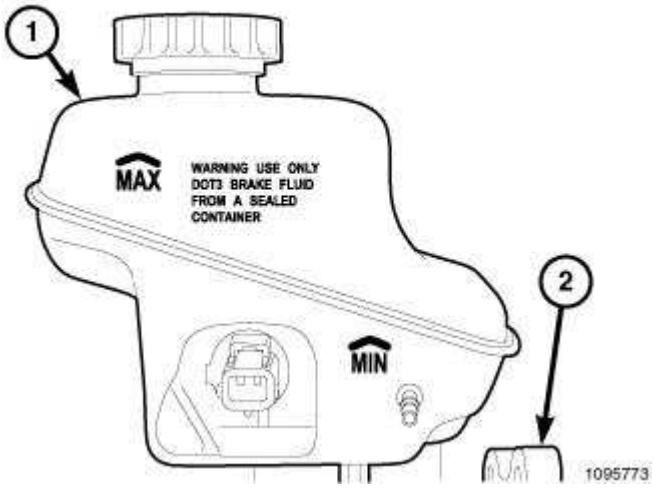

Fig. 178: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

WARNING: Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire brake hydraulic system and check for leaks. Refer to BASE BRAKE

BLEEDING .

8. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.
9. Install access panel in cowl area.
10. Road test vehicle to ensure proper operation of brakes.

MASTER CYLINDER - RHD

1. Thoroughly bleed master cylinder before installing it on vehicle. Refer to **MASTER CYLINDER, BRAKE, STANDARD PROCEDURE**.

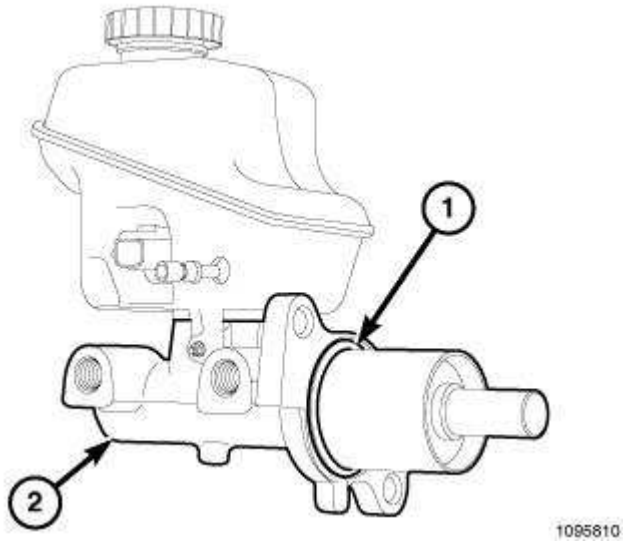

Fig. 179: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When replacing master cylinder on vehicle, a NEW vacuum seal (2) MUST be installed on master cylinder.

2. Install NEW vacuum seal (1) on rear of master cylinder (2) making sure seal fits squarely in mounting groove.

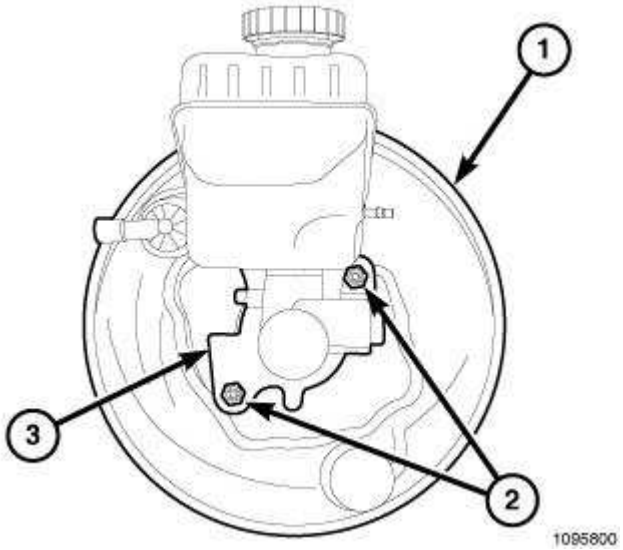

Fig. 180: Master Cylinder Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Position master cylinder (3) on studs of power brake booster, aligning booster push rod with master cylinder piston.
4. Install two master cylinder mounting nuts (1). Tighten mounting nuts to 15 N.m (133 in. lbs.).

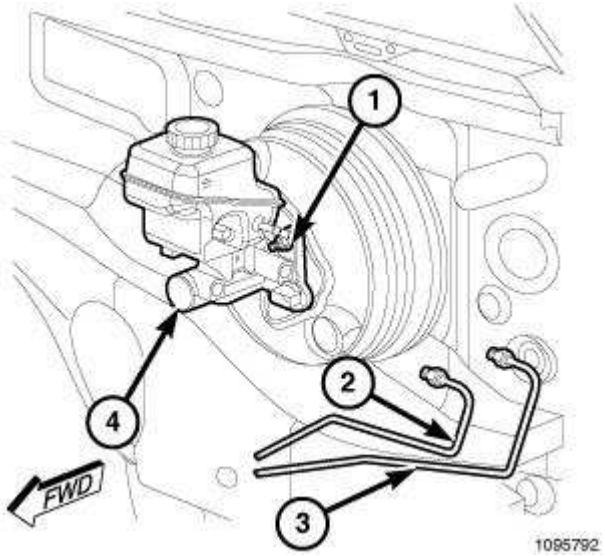

Fig. 181: Brake Tubes AT Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

5. Thread primary (3) and secondary (2) brake tubes into master cylinder primary and secondary ports. Tighten tube nuts to 20 N.m (177 in. lbs.).

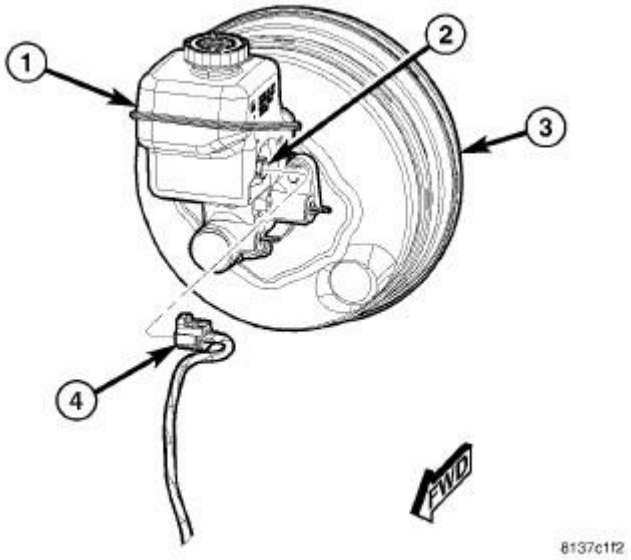

Fig. 182: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

6. Connect wiring harness connector (4) to brake fluid level sensor (2) mounted in brake fluid reservoir (1).

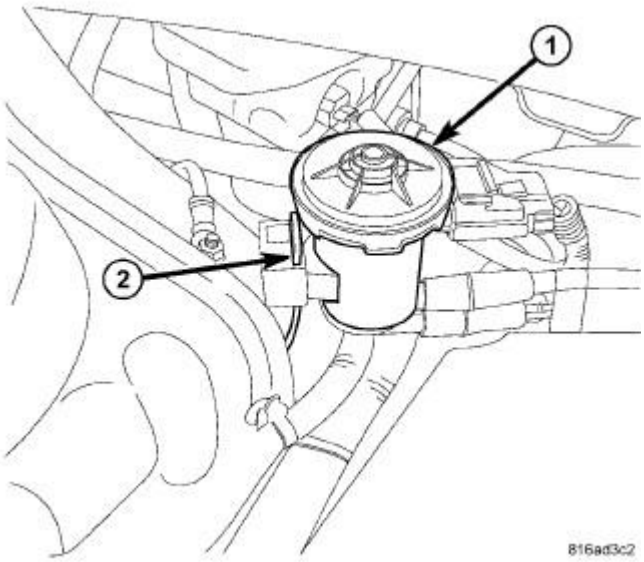

Fig. 183: EVAP/Purge Solenoid
Courtesy of CHRYSLER GROUP, LLC

7. Install purge solenoid (1) on mount (2).

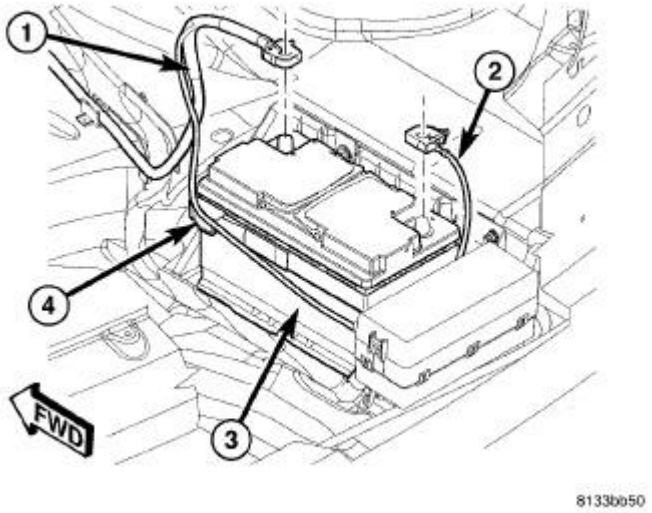

Fig. 184: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

8. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

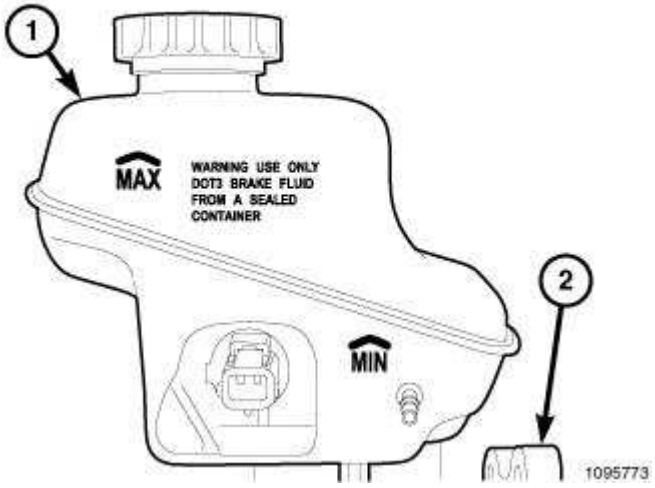

Fig. 185: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

WARNING: Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire brake hydraulic system and check for leaks. Refer to BASE BRAKE BLEEDING .

9. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.

10. Install access panel in cowl area.
11. Road test vehicle to ensure proper operation of brakes.

PADS, BRAKE, SRT8

STANDARD PROCEDURE

STANDARD PROCEDURE - BRAKE PAD BURNISHING

CAUTION: After installing NEW brake pads, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

When NEW brake pads are installed on a vehicle, this procedure must be used to correctly burnish (seat) the brake linings to the brake rotor discs.

1. Accelerate the vehicle to a steady speed of about 40 mph (65 km/h).
2. Using light brake pedal pressure, slow the vehicle from 40 mph to 0 mph in approximately 6 seconds.
3. Accelerate back up to 40 mph for approximately one minute to allow the brakes to cool down.
4. Repeat this procedure 15 to 20 times to correctly seat the brake lining material.

REMOVAL

REMOVAL

NOTE: Review all Warnings and Cautions. Refer to WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

NOTE: Perform 2 through8 on each side of vehicle to complete pad set removal.

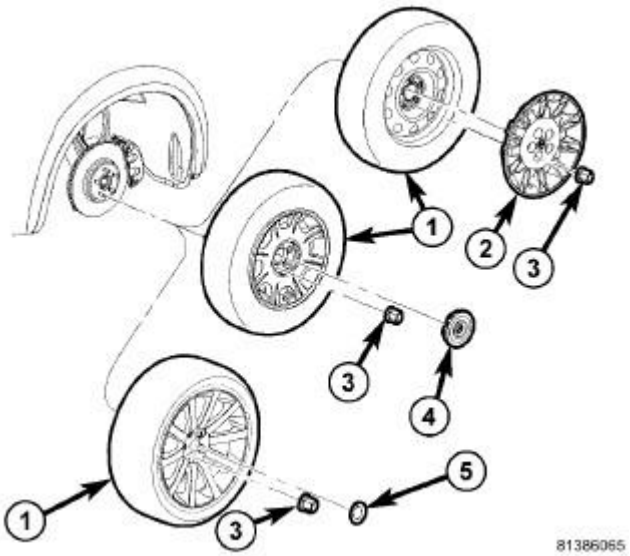

Fig. 186: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

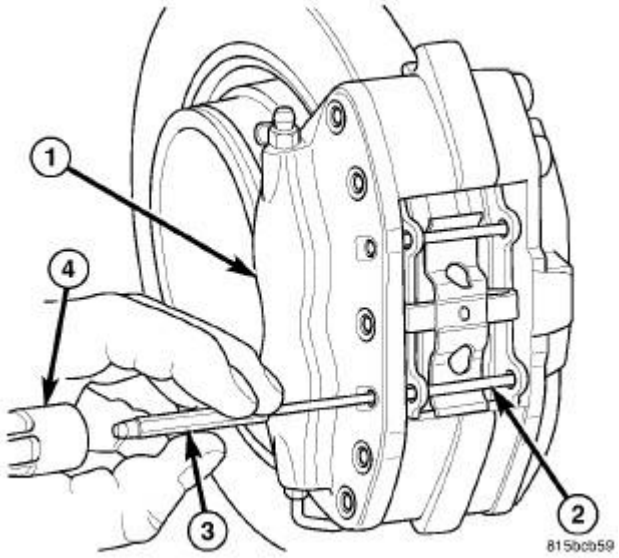

Fig. 187: Removing Lower Support Pin
Courtesy of CHRYSLER GROUP, LLC

3. Using hammer (4) and pin punch (3) on outboard end, tap lower brake pad support pin (2) out of caliper (1).

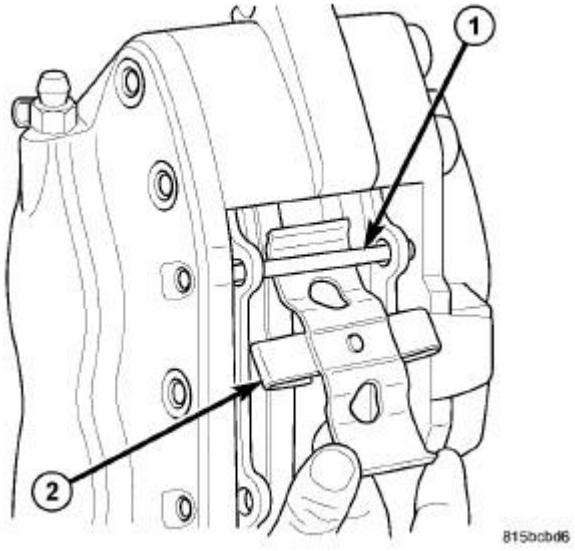

Fig. 188: Removing/Installing Spring Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove brake pad spring clip (2) out from under the upper support pin (1) still in caliper.

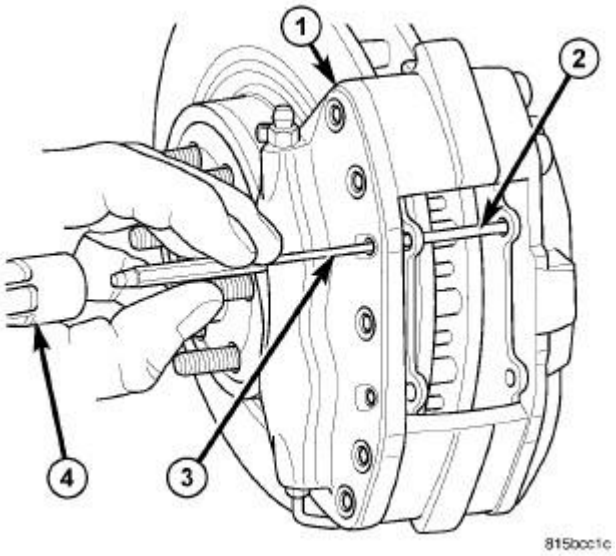

Fig. 189: Removing Upper Support Pin
Courtesy of CHRYSLER GROUP, LLC

5. Using pin punch (3) and hammer (4), remove upper brake pad support pin (2) in same manner used on lower support pin.

CAUTION: When pushing pistons back into caliper bores, if hand pressure is not sufficient, use only a trim stick as shown in illustration or other

suitable soft tool to do so. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor or pads.

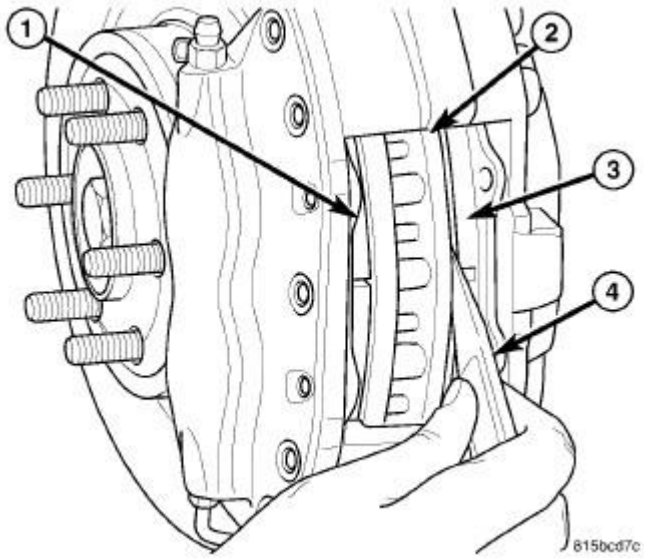

Fig. 190: Pushing Back Pistons Into Bores
Courtesy of CHRYSLER GROUP, LLC

6. Using hand pressure, pull pads back to seat caliper pistons into bores if possible. If not possible, perform the following to do this correctly without damaging the caliper, pistons, dust boots or brake rotor disc.
    1. Place trim stick (3) between inboard brake pad and outer edge of rotor (1).
    2. Using trim stick (3), apply pressure against the inboard brake pad until both pistons are completely bottomed in bores of inboard caliper half. Leave trim stick in place to hold pistons in place.
    3. Place second trim stick between outboard brake pad and rotor, then repeat above step on outboard pad and pistons.

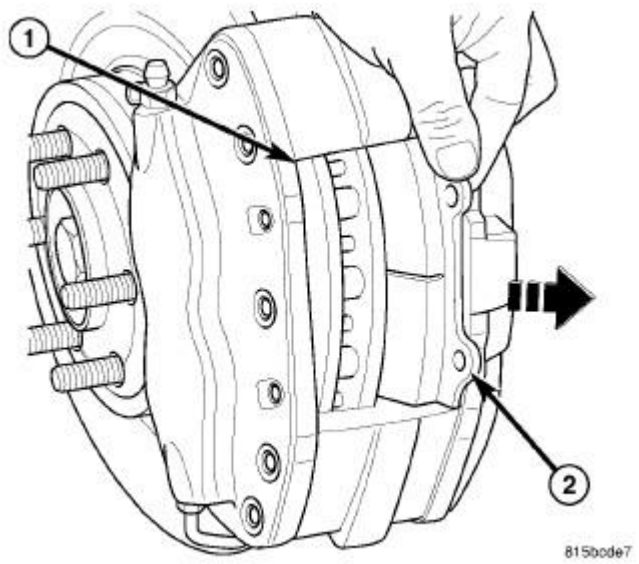

Fig. 191: Brake Pad Removal
Courtesy of CHRYSLER GROUP, LLC

7. Remove inboard brake pad (2) through opening in caliper (1). Remove outboard brake pad in same manner.

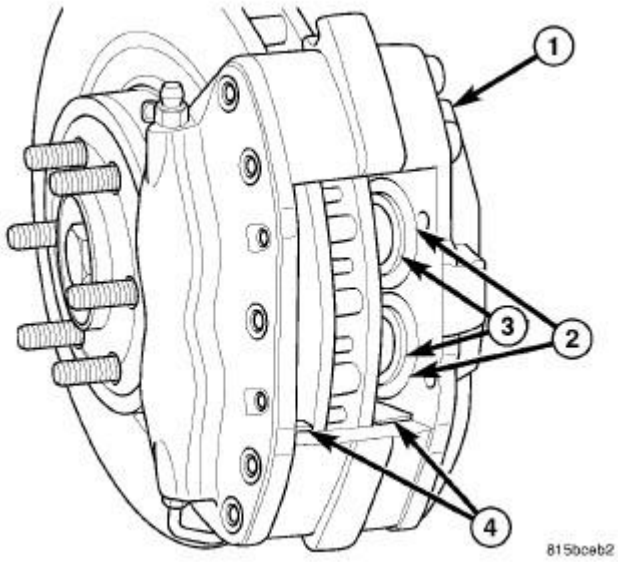

Fig. 192: Piston And Seal Inspection
Courtesy of CHRYSLER GROUP, LLC

8. Once brake pads are removed from caliper (1), inspect all four caliper pistons (3) and dust boots (2) for evidence of brake fluid leakage. Also inspect dust boots on all caliper pistons for any cuts, tears or heat cracks and brake pad supports (4) (if equipped) for excess wear or damage. If caliper fails inspection, it should be replaced.

CLEANING

CLEANING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

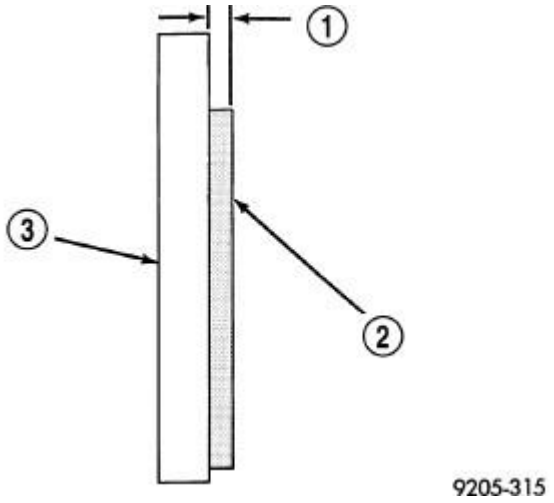

Fig. 193: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.
2 - BRAKE SHOEd ASSEMBLY FRICTION MATERIAL
3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a

brake pad lining (2) measured at its **thinnest point** measures one millimeter (0.04 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

INSTALLATION

INSTALLATION

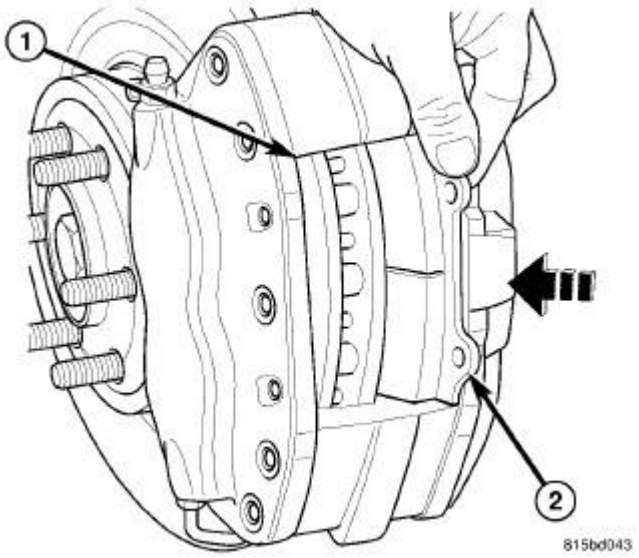

Fig. 194: Brake Pad Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform 1 through11 on each side of vehicle to complete pad set installation before proceeding with12.

1. Make sure all caliper pistons are fully seated (bottomed) in bores.
2. If equipped, remove the film from the brake pad double sticky isolator.
3. Slide NEW inboard (2) and outboard brake pads into opening (1) in disc brake caliper. **If installing rear brake pads, make sure beveled end of each pad lining is directed against the direction the rotor is rotating in when vehicle is moving forward, in other words, the rear pads need to have beveled end facing upward.**

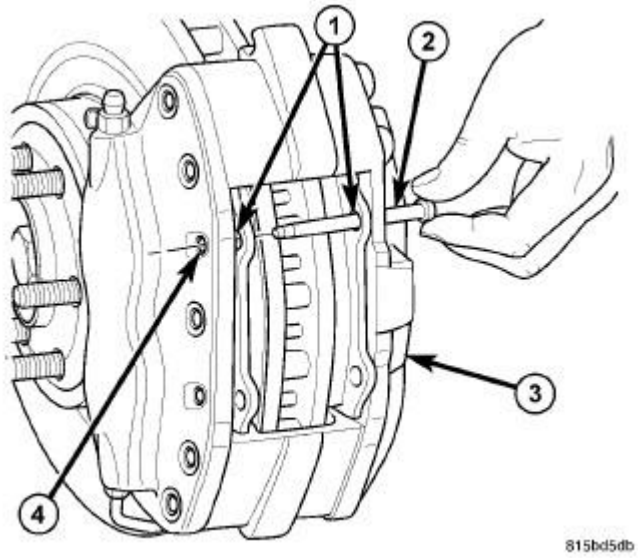

Fig. 195: Installing Upper Support Pin
Courtesy of CHRYSLER GROUP, LLC

4. From inboard side, slide upper brake pad support pin (2) through caliper (3) and upper holes in both brake pads (1). Ensure that small end of support pin is in hole (4) in outboard half of caliper.

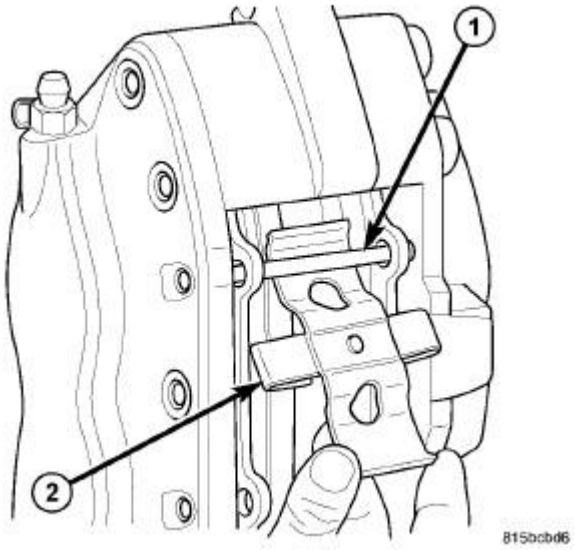

Fig. 196: Removing/Installing Spring Clip
Courtesy of CHRYSLER GROUP, LLC

5. Install upper end of brake pad spring clip (2) under upper brake pad support pin (1).

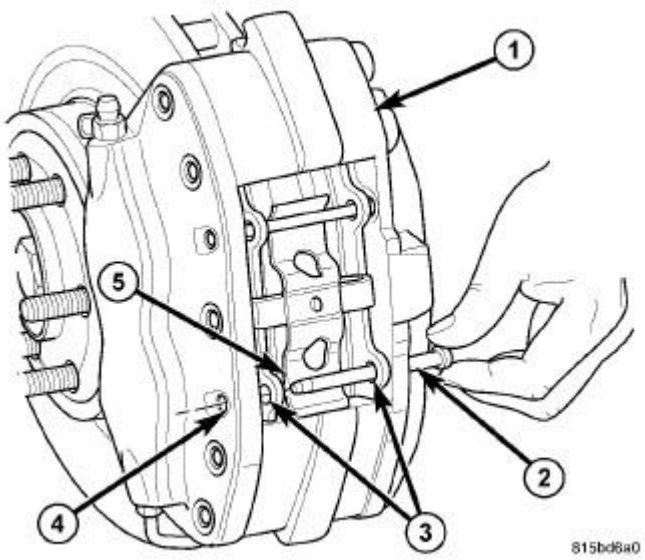

Fig. 197: Installing Lower Support Pin
Courtesy of CHRYSLER GROUP, LLC

6. Press on lower end of spring clip (5) until it touches brake rotor.
7. Slide lower brake pad support pin (2) through caliper (1) and lower holes in both brake pads (3) in the same manner the upper pin was installed. Ensure small end of support pin is in hole (4) in outboard half of caliper.
8. Release the spring clip allowing it to engage lower support pin.

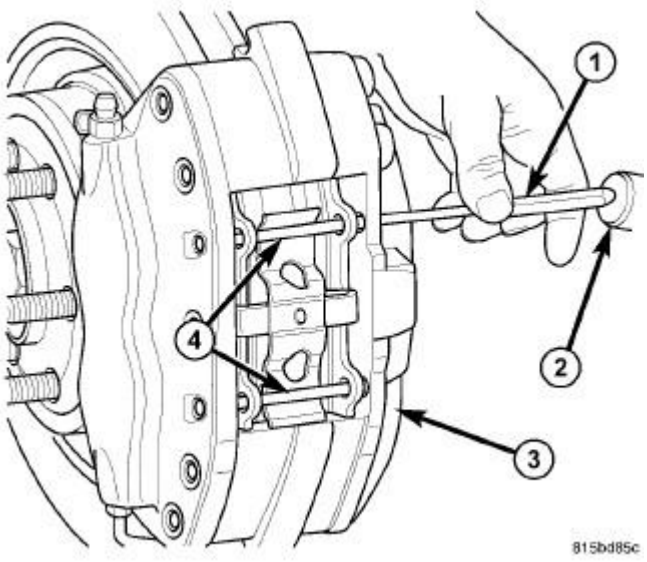

Fig. 198: Seating Support Pins
Courtesy of CHRYSLER GROUP, LLC

9. From inboard side, seat upper and lower support pins (4) into caliper (3) using pin punch (1)

and hammer (2). Support pins must be driven into caliper until support pin retaining rings are locked into place.

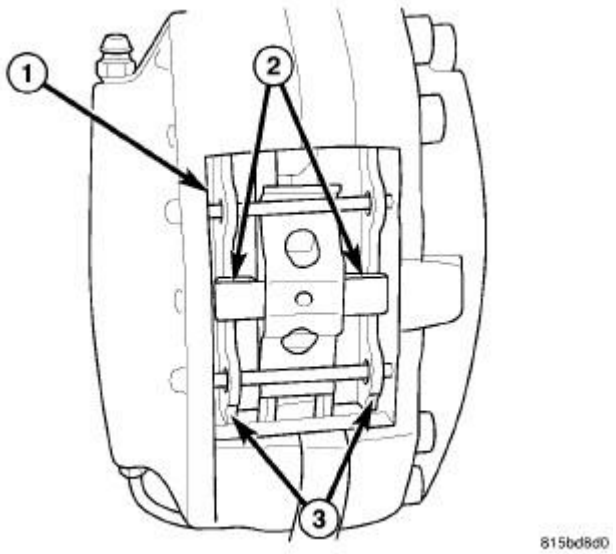

Fig. 199: Correctly Assembled Pads In Caliper
Courtesy of CHRYSLER GROUP, LLC

10. Once support pins are fully installed into caliper, inspect assembled caliper to make sure spring clip (2) is centered in opening (1) of caliper, correctly engaging upper and lower support pins, and is resting against both brake pads (3).

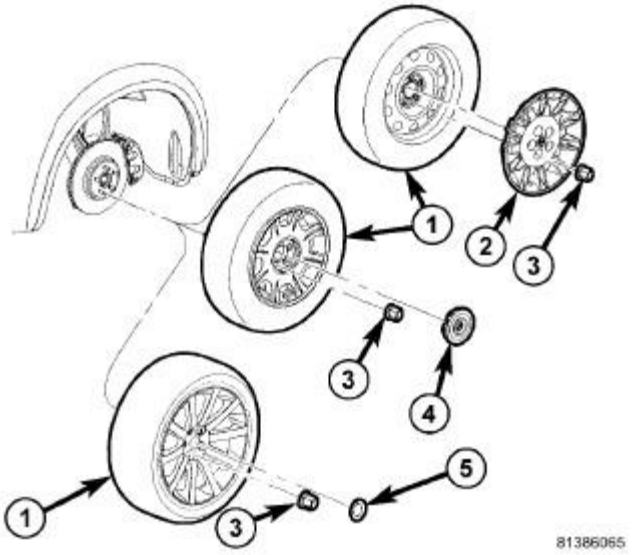

Fig. 200: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.)

torque. Refer to **INSTALLATION** .

12. Lower vehicle.
13. Pump brake pedal several times to set pads to caliper and brake rotor.

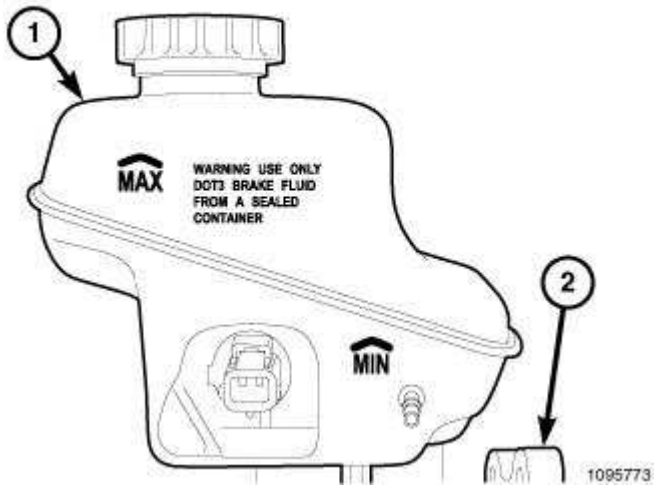

Fig. 201: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

14. Check and adjust brake fluid level in reservoir (1).

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

NOTE: When NEW brake pads are installed, they must be burnished (seated) to the rotor. This must be done to ensure the proper performance of the replacement brake pads.

15. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pad linings. NEW brake pads need to be burnished properly. Refer to **PADS, BRAKE, SRT8, STANDARD PROCEDURE**.

PADS, BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

NOTE: **Perform steps 2 through 6 on each side of the vehicle.**

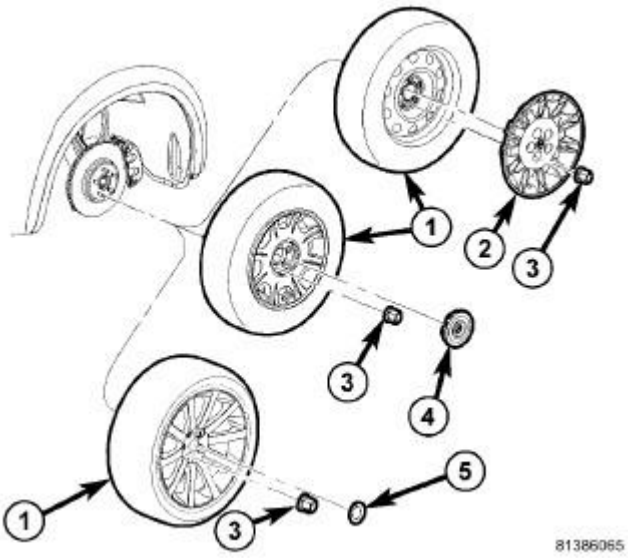

Fig. 202: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

NOTE: **In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.**

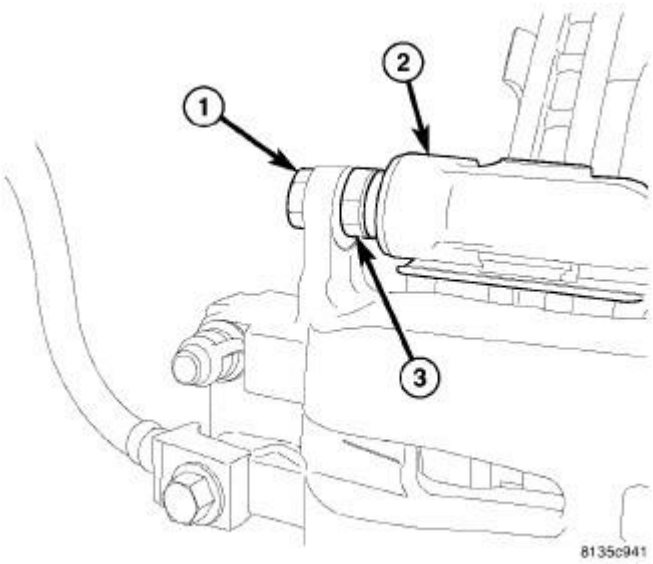

Fig. 203: Caliper Guide Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove lower caliper guide pin bolt. To do so, hold the guide pin (3) stationary while turning bolt (1).

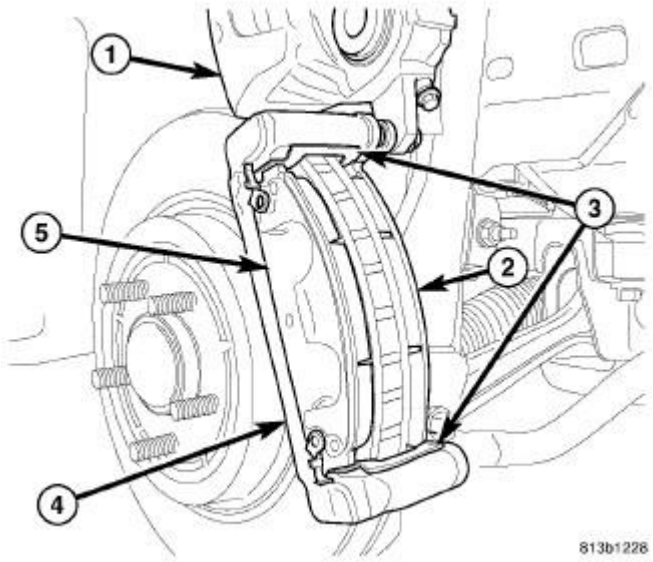

Fig. 204: Access To Front Pads
Courtesy of CHRYSLER GROUP, LLC

4. Rotate caliper upward (1), exposing brake pads (2 and 5). **Use care not to overextend brake hose when doing this or damage may occur.**
5. Remove inboard (2) and outboard (5) brake pads from caliper adapter (4).
6. If necessary, remove anti-rattle clips (3) from upper and lower abutments of adapter (4).

CLEANING

CLEANING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

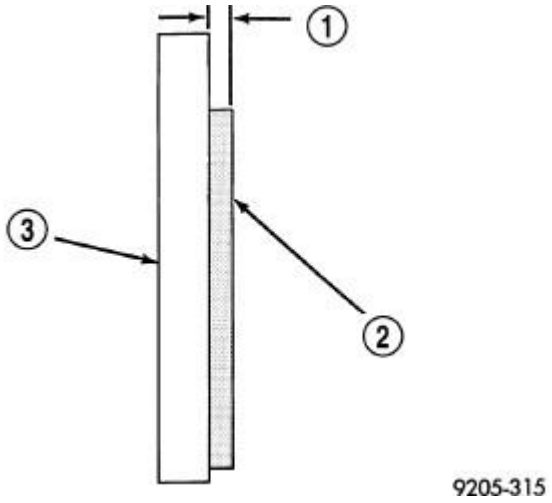

Fig. 205: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.
2 - BRAKE SHOEd ASSEMBLY FRICTION MATERIAL
3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a

brake pad lining (2) measured at its **thinnest point** measures one millimeter (0.04 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

INSTALLATION

INSTALLATION

NOTE: Perform steps 1 through 7 on each side of the vehicle.

1. Completely retract caliper piston(s) back into bore(s) of caliper. To do so:
    1. Remove fluid reservoir cap.
    2. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston(s) before installing C-clamp to avoid damaging piston(s).
    3. Install fluid reservoir cap.

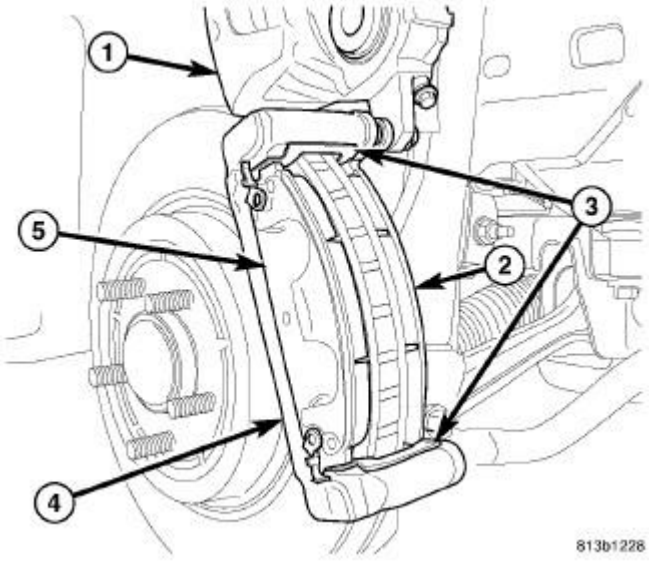

Fig. 206: Access To Front Pads
Courtesy of CHRYSLER GROUP, LLC

2. If removed, attach anti-rattle clips (3) to upper and lower abutments of adapter (4).
3. If equipped, remove the film from the brake pad double sticky isolator.

4. Install NEW inboard (2) and outboard (5) brake pads on caliper adapter (4). NEW Inboard and outboard pads are interchangeable.
5. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
6. Rotate caliper downward, aligning upper mounting boss with lower guide pin.

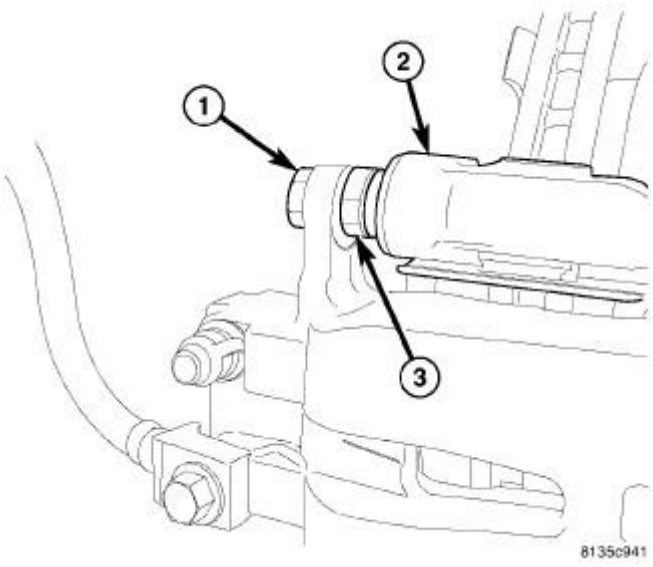

Fig. 207: Caliper Guide Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Install Upper caliper guide pin bolt (1). While holding guide pin (3) stationary tighten bolt to 60 N.m (44 ft. lbs.).

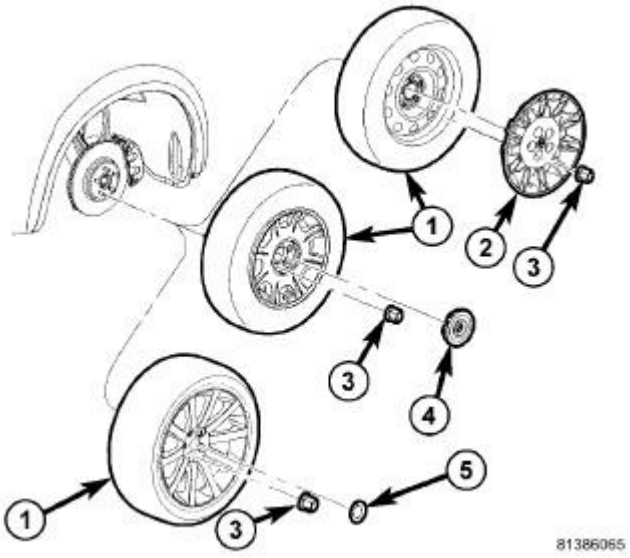

Fig. 208: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
9. Lower vehicle.
10. Pump brake pedal several times to set pads to caliper and brake rotor.

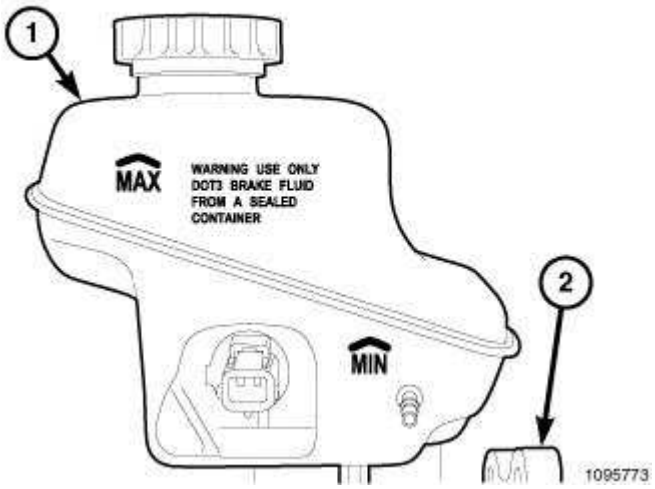

Fig. 209: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

11. Check and adjust brake fluid level in reservoir (1).

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owners Manual Supplement which was supplied when the vehicle was originally delivered.

12. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes. If the vehicle is equipped with the Police Package, a burnish procedure must be followed (Refer to preceding Caution).

PADS, BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

   NOTE: Perform steps 2 through 6 on each side of the vehicle.

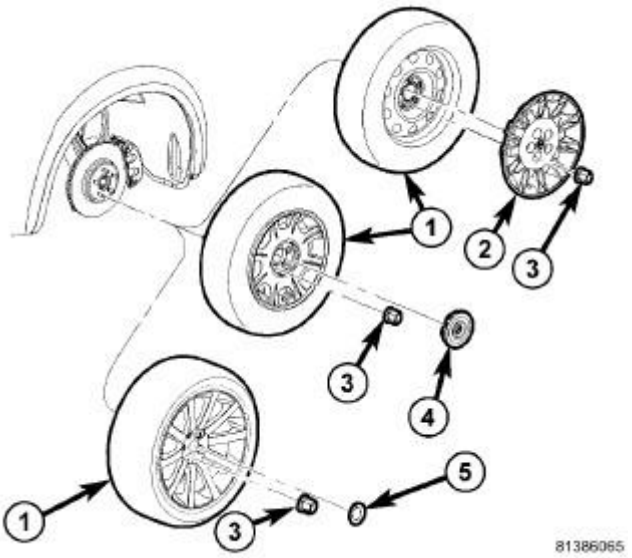

Fig. 210: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

   NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

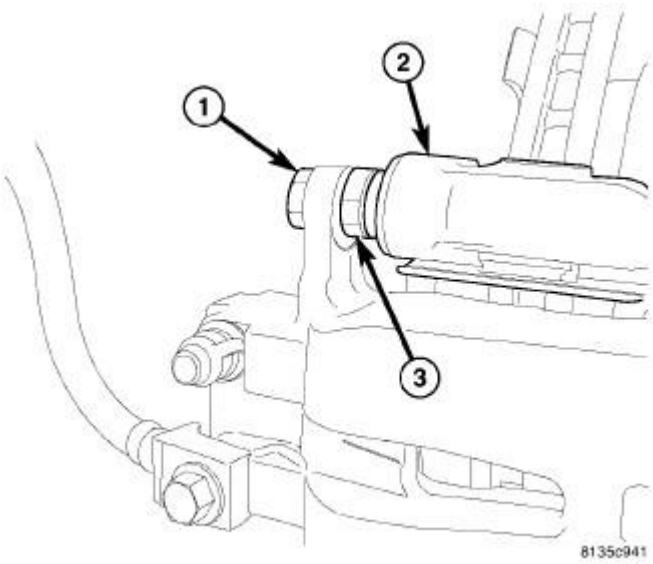

Fig. 211: Caliper Guide Pin & Bolt

2. If removed, attach anti-rattle clips (1) to upper and lower abutments of adapter (4).
3. If equipped, remove the film from the brake pad double sticky isolator.

4. Install NEW inboard (2) and outboard (3) brake pads on caliper adapter (4). NEW Inboard and outboard pads are interchangeable.
5. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
6. Rotate caliper upward, aligning upper mounting boss with upper guide pin.

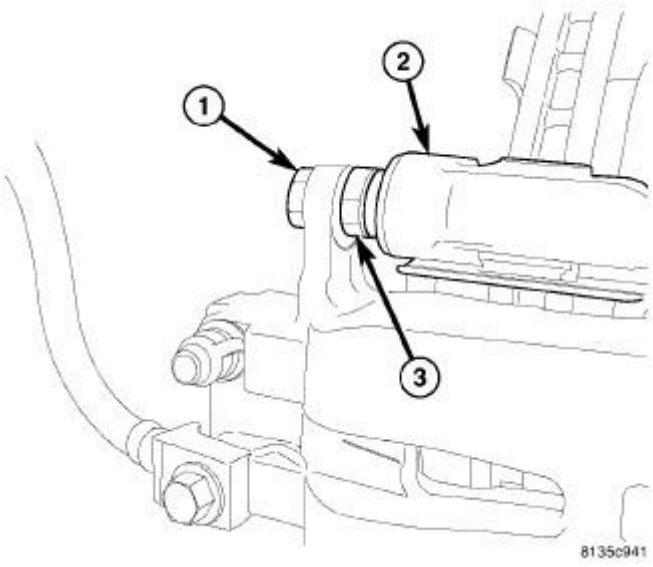

Fig. 215: Caliper Guide Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

7. Install upper caliper guide pin bolt (1). While holding guide pin (3) stationary tighten bolt to 31 N.m (23 ft. lbs.).

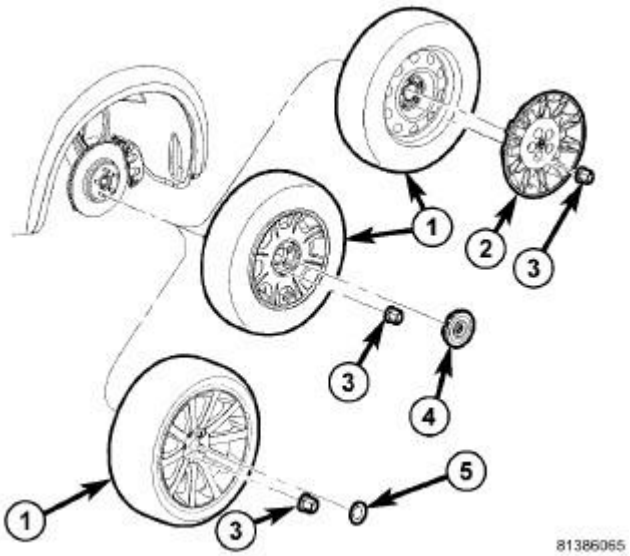

Fig. 216: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
9. Lower vehicle.
10. Pump brake pedal several times to set pads to caliper and brake rotor.

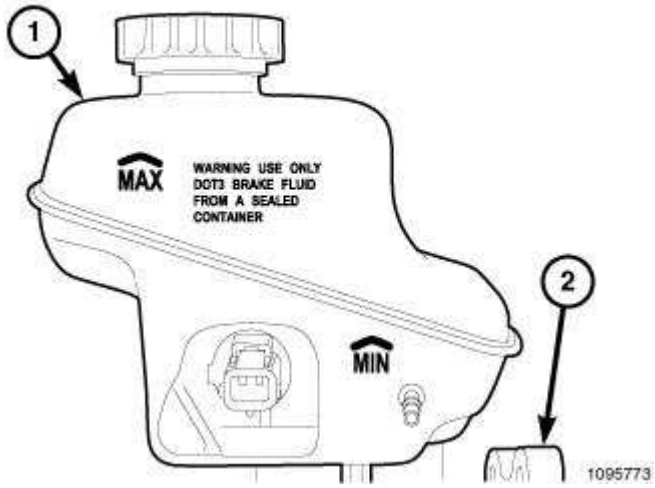

Fig. 217: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

11. Check and adjust brake fluid level in reservoir (1).

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake

applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owners Manual Supplement which was supplied when the vehicle was originally delivered.

12. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes. If the vehicle is equipped with the Police Package, a burnish procedure must be followed (Refer to preceding Caution).

PEDAL(S), BRAKE AND/OR ACCELERATOR

REMOVAL

PEDAL

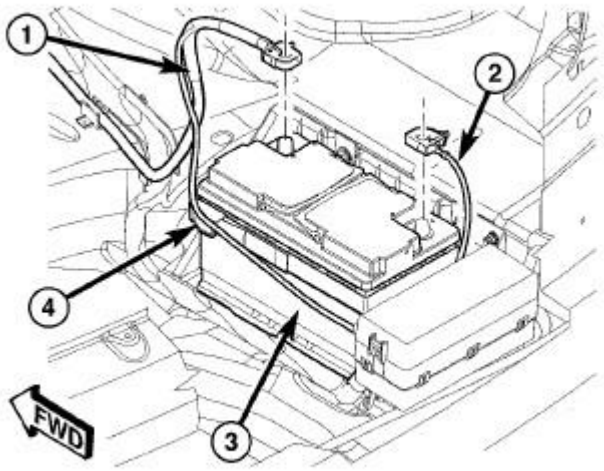

Fig. 218: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Remove driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .
3. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

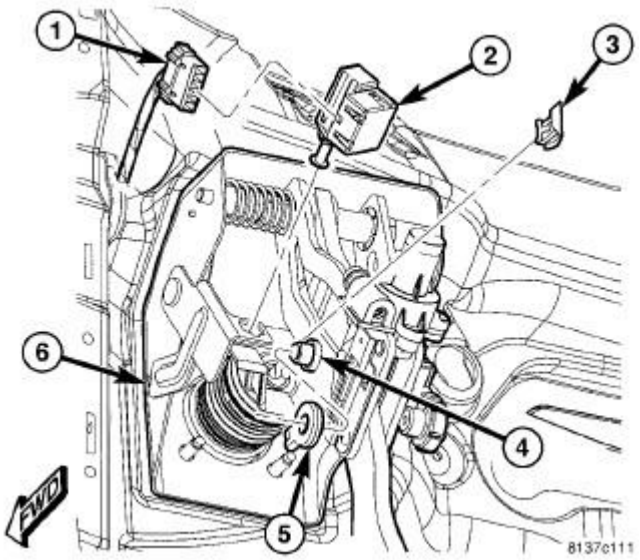

Fig. 219: Locating Stop Lamp Switch And Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

4. Remove brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
5. Remove booster push rod from pin on brake pedal. To do so:
    1. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip (3).
    2. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
    3. **Discard retaining clip (3). It is not to be reused. Install NEW retaining clip when assembling.**
6. Slide booster push rod (5) off brake pedal pin (4).

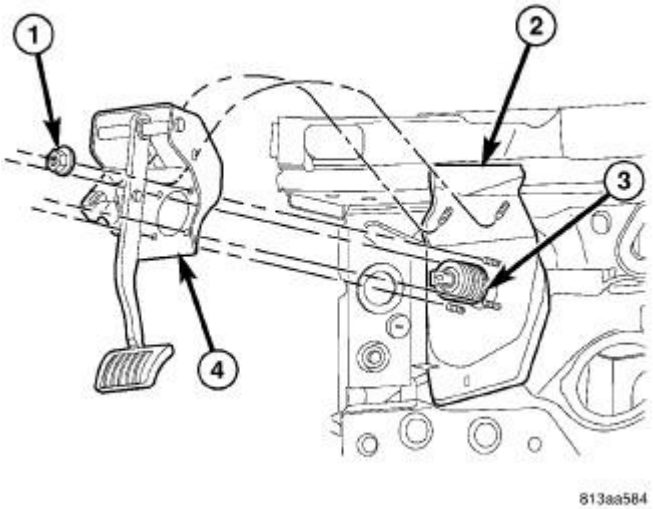

Fig. 220: Brake Pedal Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Remove four power brake booster (3) mounting nuts (1).
8. Remove two nuts (1) fastening pedal bracket to upper dash panel (2).
9. Push power brake booster (3) forward into engine compartment as far as possible by hand. Do not force it.
10. Remove brake pedal (4).

PEDAL - RHD

1. Move driver's seat to full rearward position.

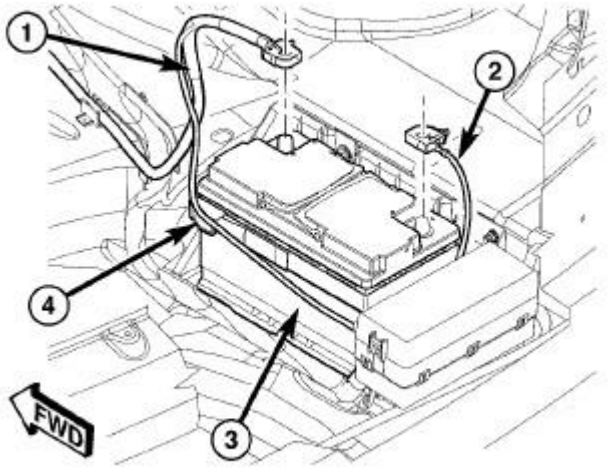

Fig. 221: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect and isolate battery negative cable (2) from battery post.
3. Remove driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .
4. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

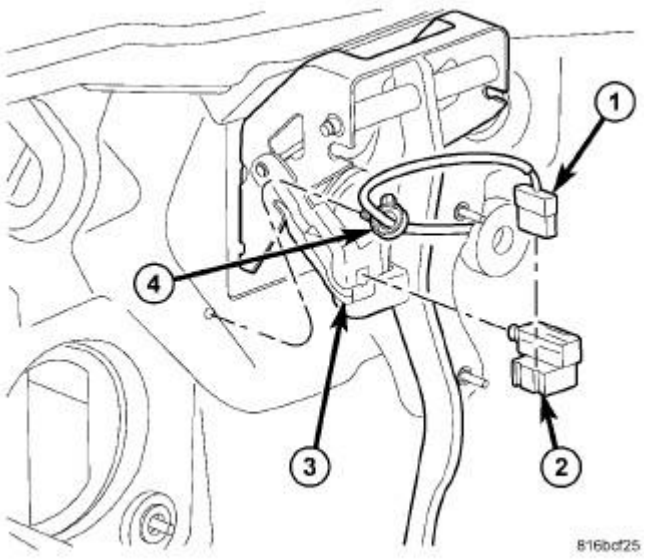

Fig. 222: Stop Lamp Switch Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

5. Remove stop lamp switch (2). Refer to **SWITCH, STOP LAMP, REMOVAL** .

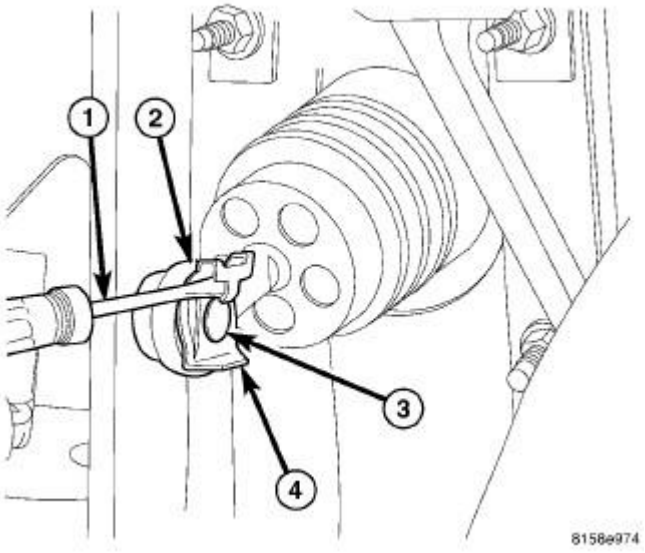

Fig. 223: View Of Pedal Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing booster push rod from brake pedal pin, be careful not to damage rubber O-ring on pin.

6. Remove booster push rod from pin on brake pedal. To do so:
    1. Position small screwdriver (1) between center tang on power brake booster brake pedal

pin retaining clip (4).

2. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin (3), then slide retaining clip off brake pedal pin.
3. **Discard retaining clip. It is not to be reused. Install NEW retaining clip when assembling.**

7. Slide booster push rod (2) off brake pedal pin (3).

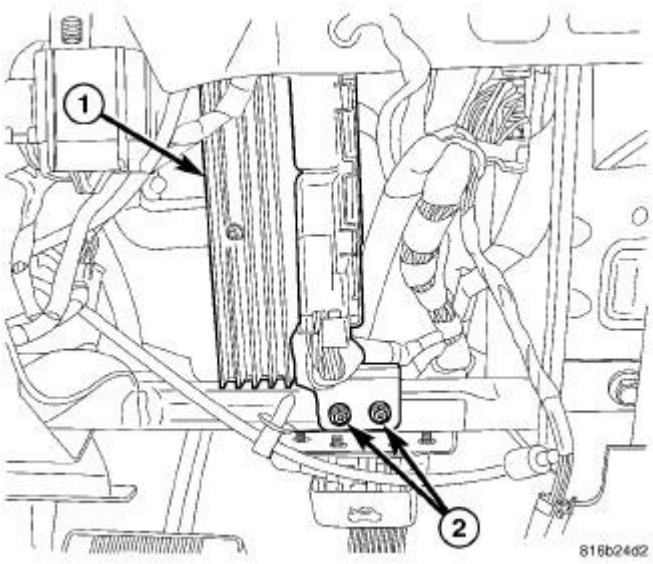

Fig. 224: Radio Amplifier /Transmission Control Module
Courtesy of CHRYSLER GROUP, LLC

8. Remove two lower (2) and one upper mounting screw fastening the radio amplifier/transmission control module assembly (1) in place.
9. Disconnect four wiring connectors and remove radio amplifier/transmission control module assembly (1).

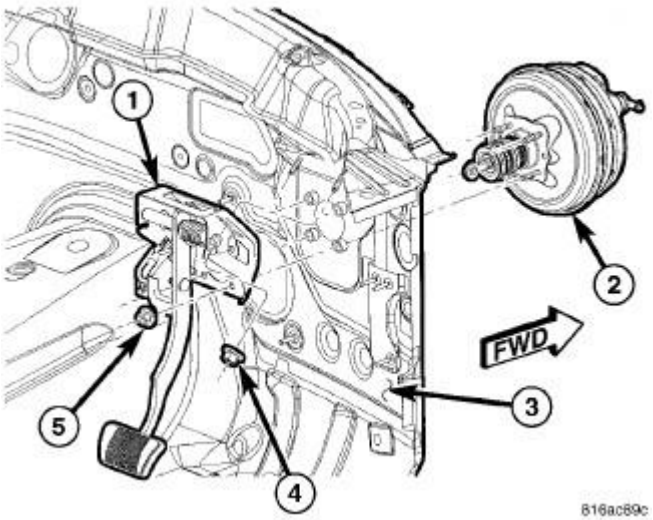

Fig. 225: Booster And Pedal Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

10. Remove four power brake booster (2) mounting nuts (5).
11. Remove two nuts (4) fastening pedal bracket to upper dash panel (3).
12. Push power brake booster (3) forward into engine compartment as far as possible by hand. Do not force it.
13. Remove brake pedal (1).

INSTALLATION

PEDAL

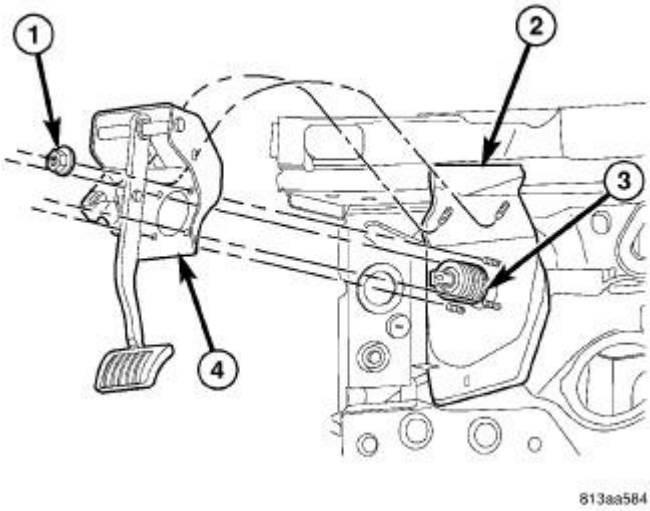

Fig. 226: Brake Pedal Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install adjustable brake pedal assembly (4) under instrument panel and slide over booster push rod.
2. From engine compartment side, push power brake booster (3) mounting studs back through dash panel (2) and brake pedal bracket.
3. Install two upper mounting nuts (1) fastening pedal bracket to upper dash panel (2). **Do not tighten at this time.**
4. Install four power brake booster mounting nuts (1). Tighten nuts to 25 N.m (18 ft. lbs.) torque.
5. Tighten two upper mounting nuts (1) to 25 N.m (18 ft. lbs.) torque.

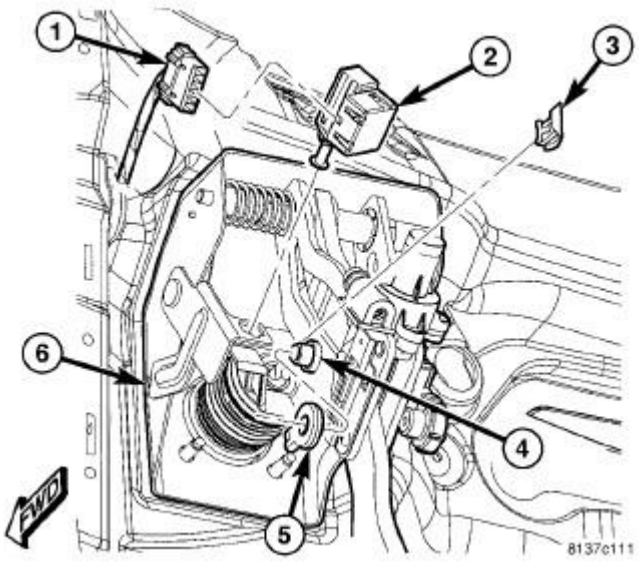

Fig. 227: Locating Stop Lamp Switch And Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

6. Slide booster push rod (5) onto brake pedal pin (4). Install NEW retaining clip (3) securing push rod to brake pedal.
7. Install and adjust brake lamp switch (2). Refer to **SWITCH, STOP LAMP, INSTALLATION** .
8. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
9. Install driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .

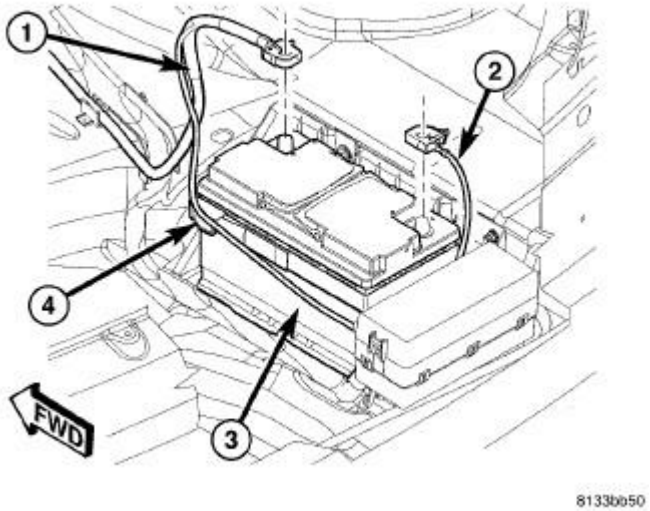

Fig. 228: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
11. Road test vehicle testing operation of brakes.

PEDAL - RHD

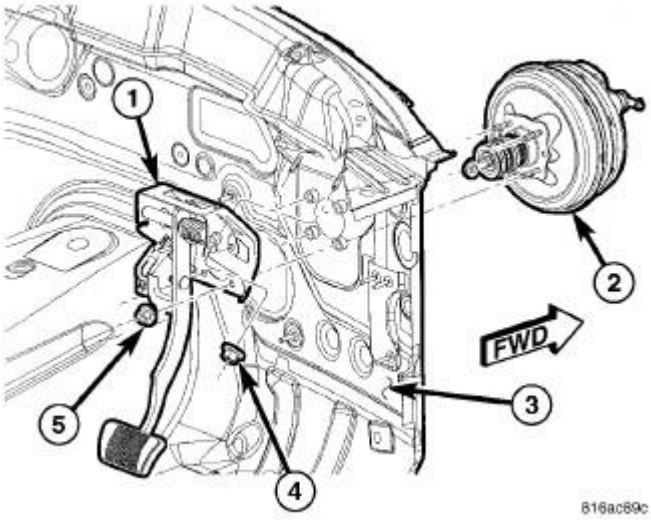

Fig. 229: Booster And Pedal Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

1. Install brake pedal assembly (4) under instrument panel and slide over booster push rod.
2. From engine compartment side, push power brake booster (3) mounting studs back through

dash panel (2) and brake pedal bracket.

3. Install two upper mounting nuts (4) fastening pedal bracket to dash panel (3). **Do not tighten at this time.**
4. Install four power brake booster mounting nuts (5). Tighten nuts to 25 N.m (18 ft. lbs.).
5. Tighten two upper mounting nuts (4) to 25 N.m (18 ft. lbs.).

CAUTION: When installing booster push rod on brake pedal pin, be careful not to damage rubber O-ring on pin.

6. Slide booster push rod onto brake pedal pin. Install NEW retaining clip securing push rod to brake pedal.

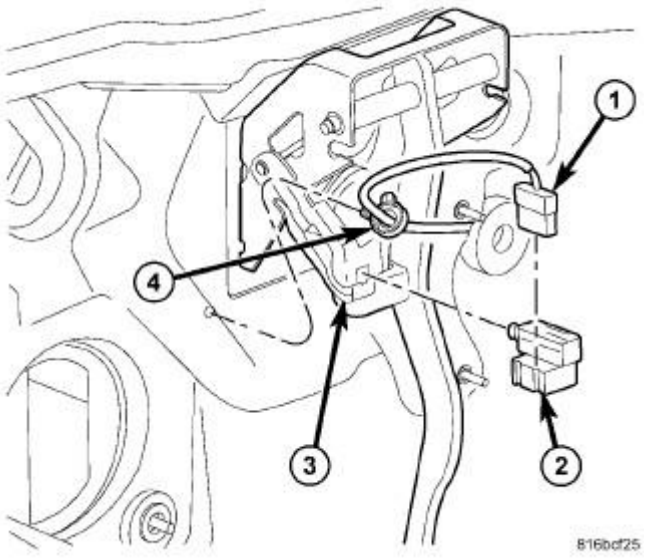

Fig. 230: Stop Lamp Switch Mounting - RHD
Courtesy of CHRYSLER GROUP, LLC

7. Install and adjust brake lamp switch (2). Refer to **SWITCH, STOP LAMP, INSTALLATION** .

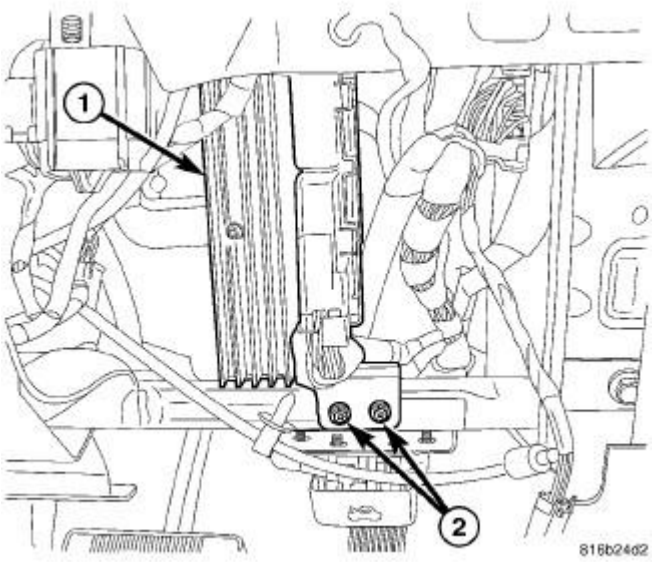

Fig. 231: Radio Amplifier /Transmission Control Module
Courtesy of CHRYSLER GROUP, LLC

8. Connect four wiring connectors to radio amplifier/transmission control module assembly (1).
9. Place radio amplifier/transmission control module assembly (1) in mounted position. Install one upper and two lower (2) mounting screws.
10. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
11. Install driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .

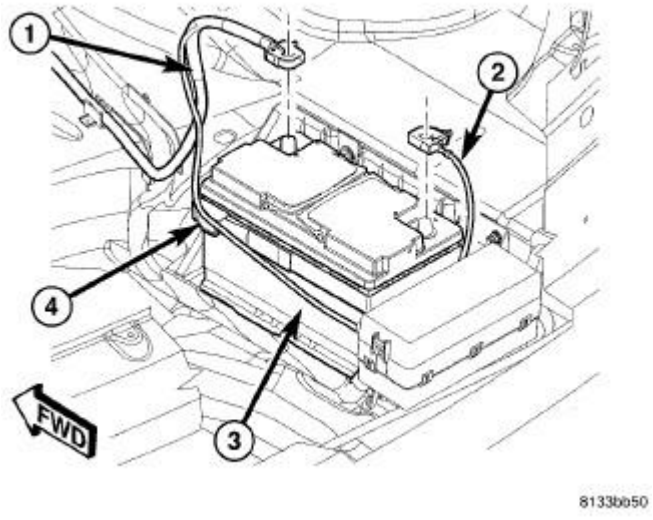

Fig. 232: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

12. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
13. Road test vehicle testing operation of brakes.

PEDAL(S), BRAKE AND/OR ACCELERATOR, ADJUSTABLE

STANDARD PROCEDURE

STANDARD PROCEDURE - ADJUSTABLE PEDALS SYCHRONIZATION

NOTE: Although the pedals can be synchronized at either the full-forward or full-rearward positions (both pedals must be in the same position), it is recommended to do so with the pedals positioned in the full-forward position due to service part positioning from the factory.

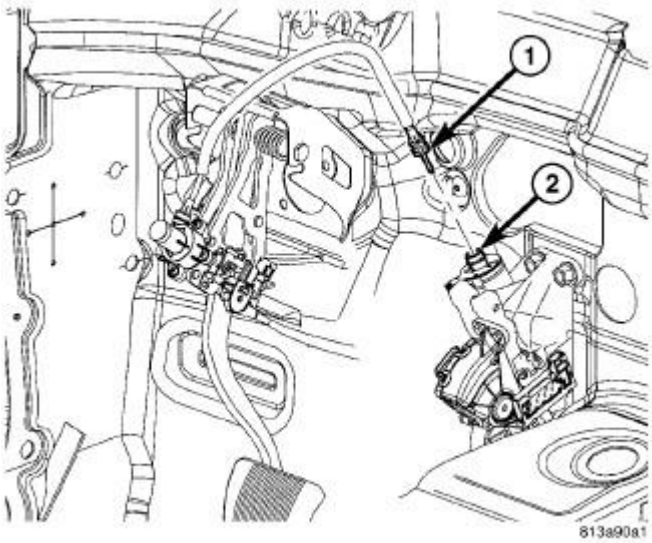

Fig. 233: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the adjuster cable (1) running between the accelerator pedal module and the brake pedal assembly at the adjuster motor (2).

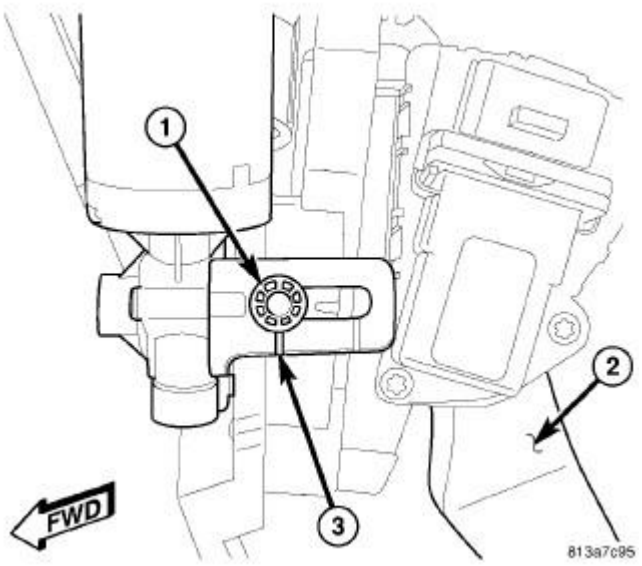

Fig. 234: Accelerator Pedal Adjusted Full-Forward
Courtesy of CHRYSLER GROUP, LLC

2. Using the switch, position the accelerator pedal (2) in the full-forward position. The pin on the pedal (1) will line up with the adjustment line (2) at this point.

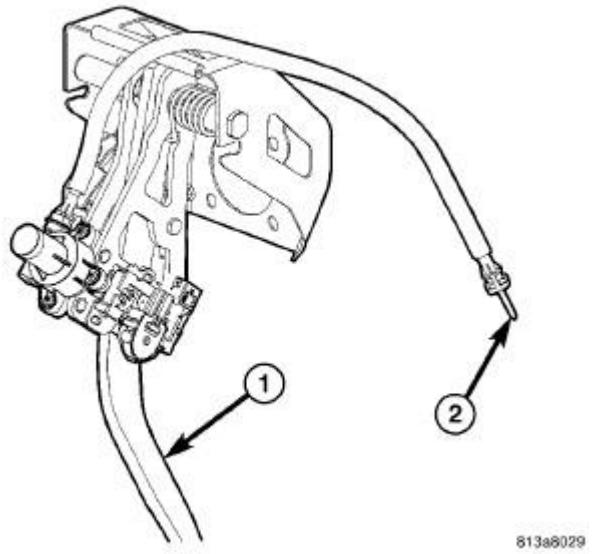

Fig. 235: Cable End To Be Rotated
Courtesy of CHRYSLER GROUP, LLC

3. Using a drill motor, or other suitable device, rotate the adjuster cable strand (2) from the accelerator pedal end to position the brake pedal (1) toward the full-forward position.

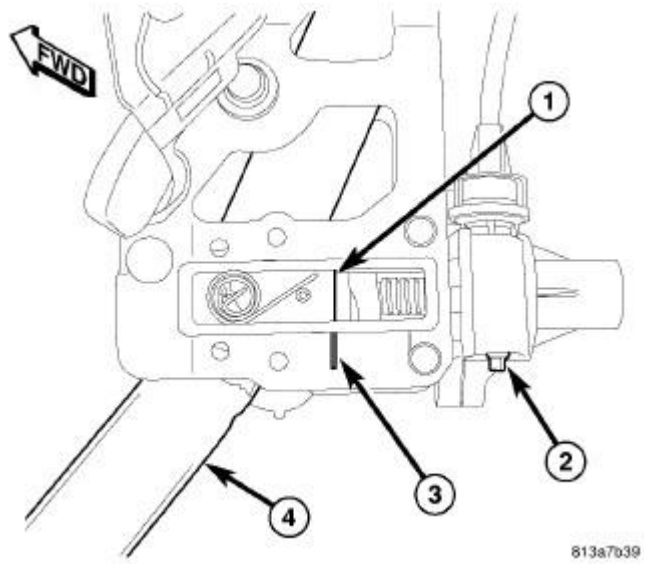

Fig. 236: Brake Pedal Adjusted Full-Forward
Courtesy of CHRYSLER GROUP, LLC

4. Rotate the adjuster cable strand until the brake pedal (4) gear drive block (1) lines up with the full-forward adjustment line (3) as shown in illustration. If equipped, fine adjustments can be made by turning the adjustment knob (2) by hand to line up the components.
5. Reconnect the adjuster cable to the adjuster motor. If the cable resists connection, if equipped, turn the adjustment knob (2) by hand until the cable drops into place. If not equipped with the adjustment knob, wiggle the cable around until the cable drops into place.
6. Verify proper operation of the adjustable pedals.

REMOVAL

REMOVAL

1. Move driver's seat to full rearward position.

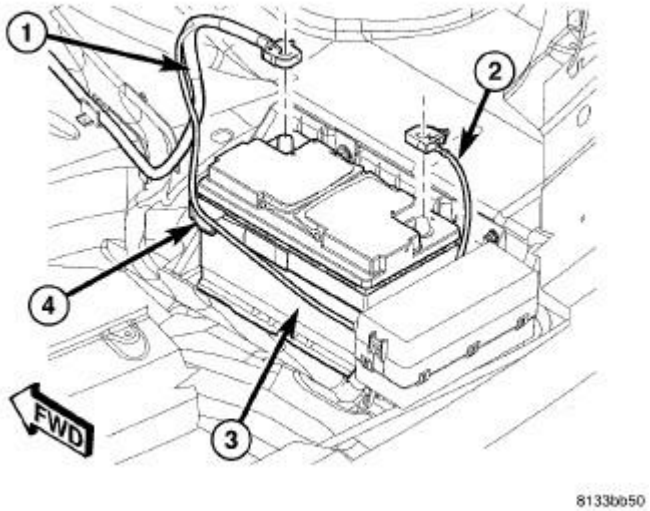

Fig. 237: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect and isolate battery negative cable (2) from battery post.

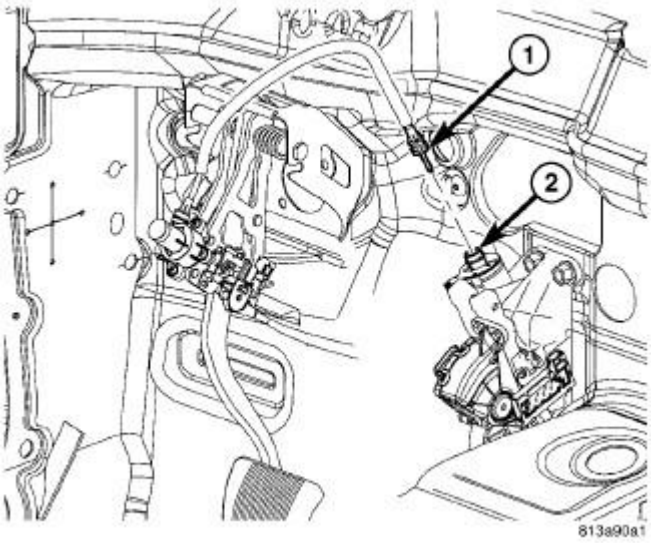

Fig. 238: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect adjuster cable (1) at accelerator adjuster motor (2).

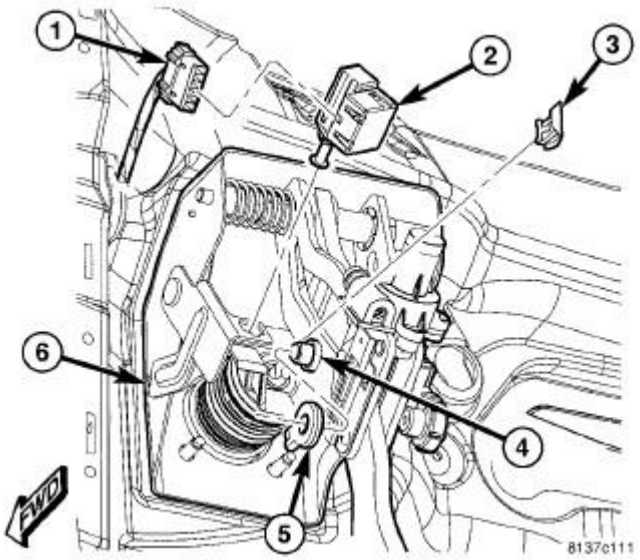

Fig. 239: Locating Stop Lamp Switch And Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

4. Remove brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
5. Remove booster push rod from pin on brake pedal. To do so:
    1. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip (3).
    2. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
    3. **Discard retaining clip (3). It is not to be reused. Install NEW retaining clip when assembling.**
6. Slide booster push rod (5) off brake pedal pin (4).

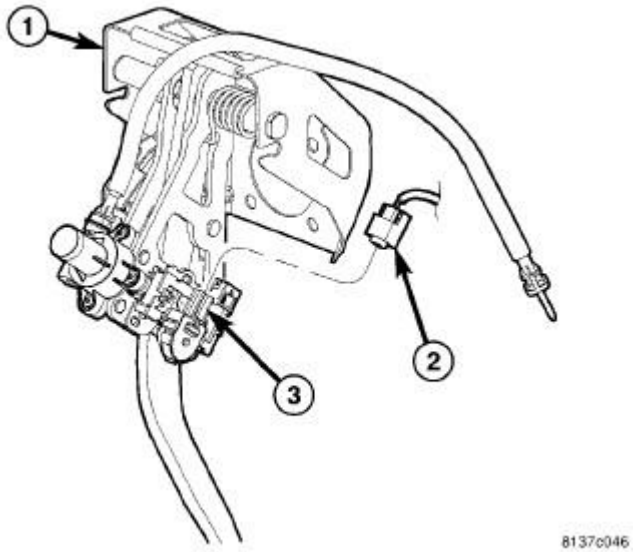

Fig. 240: Pedal Position Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect wiring connector (2) at brake pedal position sensor (3).

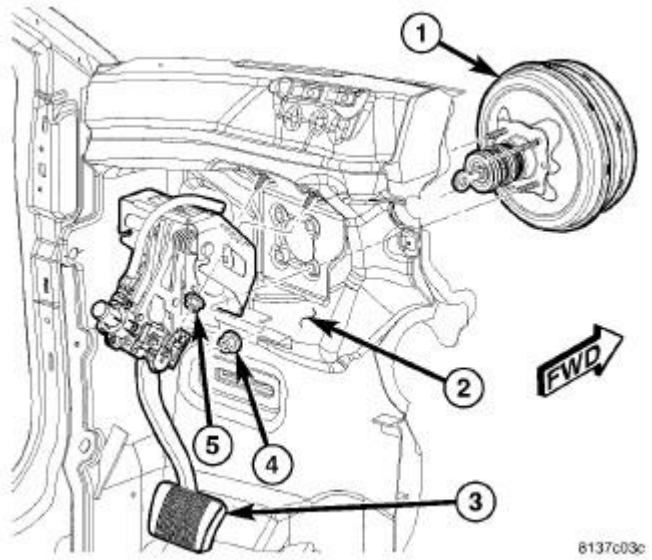

Fig. 241: Booster & Pedal Mounting
Courtesy of CHRYSLER GROUP, LLC

8. Remove four power brake booster mounting nuts (4).
9. Remove two nuts (5) fastening pedal bracket to upper dash panel (2).
10. Push power brake booster (1) forward into engine compartment as far as possible by hand. Do not force it.
11. Remove adjustable brake pedal assembly (3).
12. Remove adjuster cable at brake pedal gear drive.

INSTALLATION

INSTALLATION

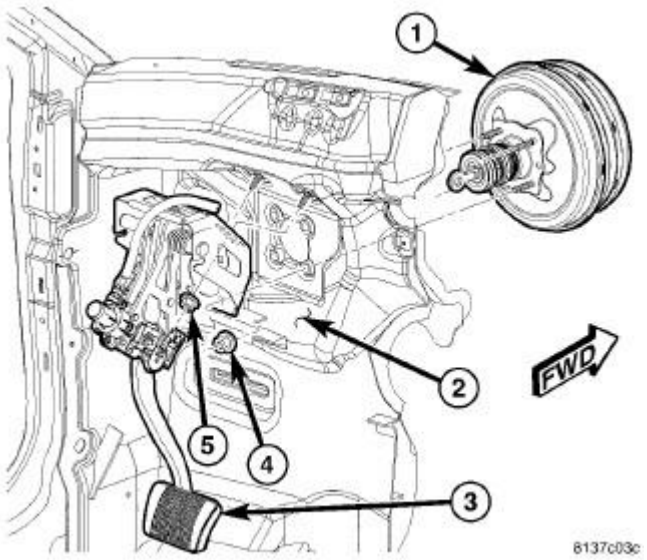

Fig. 242: Booster & Pedal Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Attach cable to brake pedal gear drive.
2. Install adjustable brake pedal assembly (3) under instrument panel and slide over booster push rod.
3. From engine compartment side, push power brake booster (1) mounting studs back through dash panel (2) and brake pedal bracket.
4. Install two nuts (5) fastening pedal bracket to upper dash panel (2). **Do not tighten at this time.**
5. Install four power brake booster mounting nuts (4). Tighten nuts to 25 N.m (18 ft. lbs.) torque.
6. Tighten two upper mounting nuts (5) to 25 N.m (18 ft. lbs.) torque.

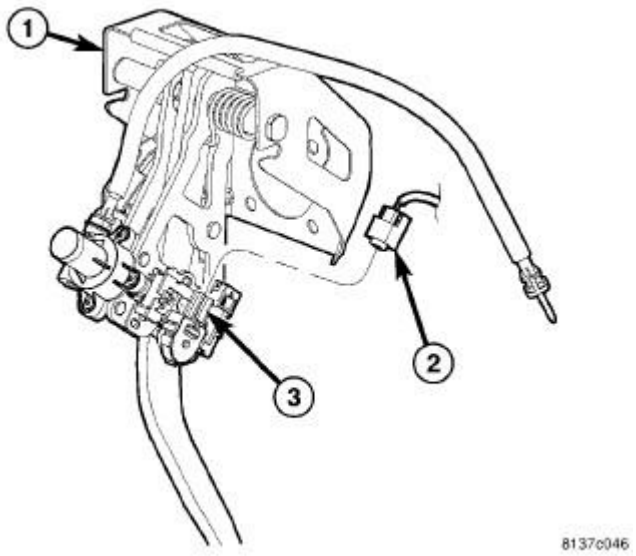

Fig. 243: Pedal Position Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

7. Connect wiring connector (2) at brake pedal position sensor (3).

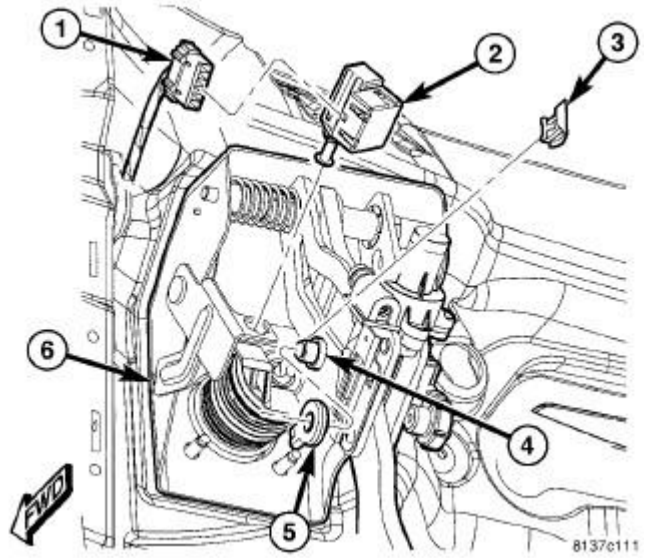

Fig. 244: Locating Stop Lamp Switch And Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

8. Slide booster push rod (5) onto brake pedal pin (4). Install NEW retaining clip (3) securing push rod to brake pedal.
9. Install and adjust brake lamp switch (2). Refer to **SWITCH, STOP LAMP, INSTALLATION** .

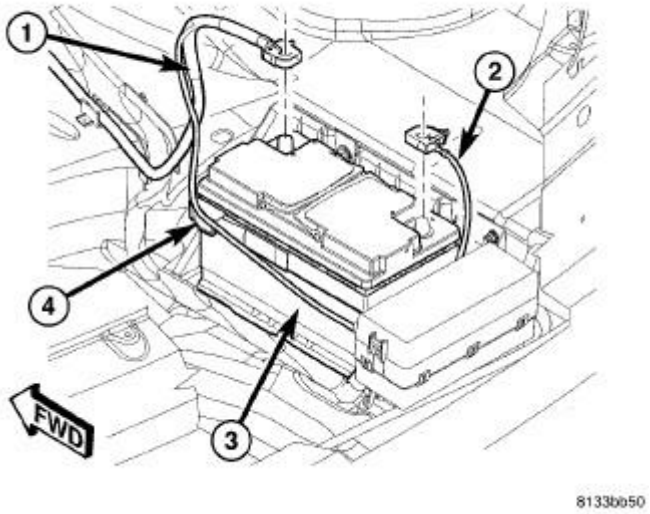

Fig. 245: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

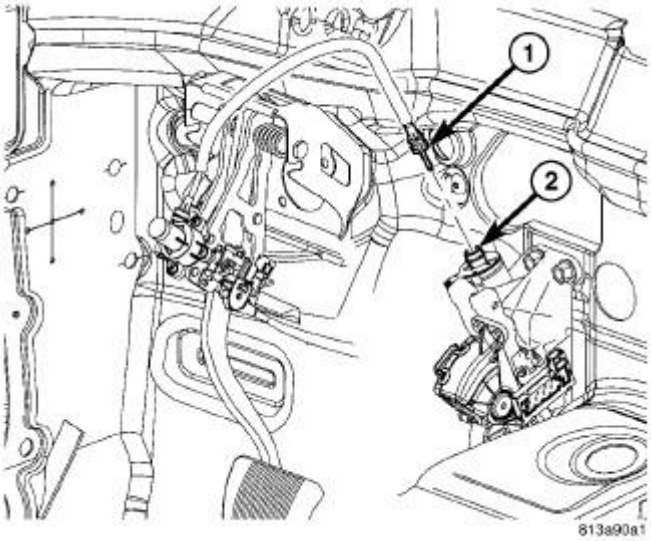

Fig. 246: Cable Attachment To Accelerator Module
Courtesy of CHRYSLER GROUP, LLC

11. Synchronize brake pedal to accelerator pedal, then connect adjuster cable (1) to adjuster motor (2). Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, ADJUSTABLE, STANDARD PROCEDURE**.
12. If vehicle is equipped with memory seats, the system will need to be initialized. Refer to appropriate diagnostic information.
13. Test operation of adjustable pedals.
14. Road test vehicle testing operation of brakes and accelerator.

RESERVOIR, BRAKE MASTER CYLINDER

REMOVAL

REMOVAL

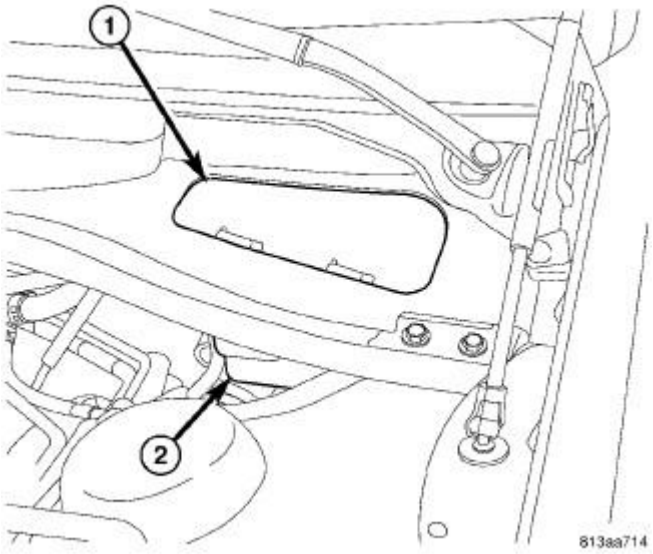

Fig. 247: Cowl Access Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove access panel (1) in cowl area to expose master cylinder (2).
2. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

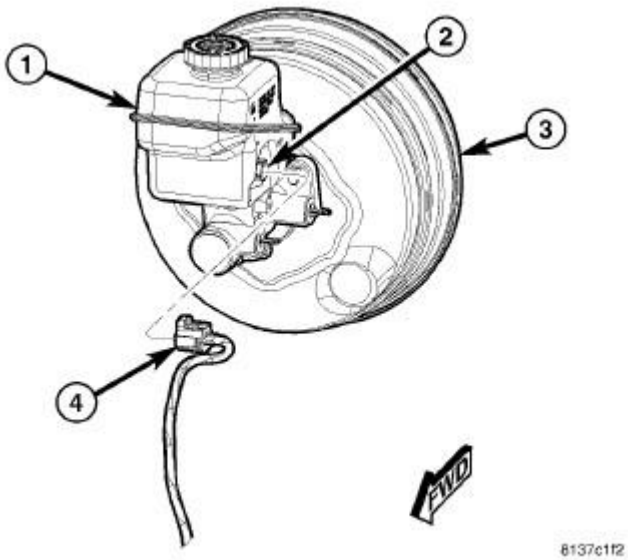

Fig. 248: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect wiring harness connector (4) from brake fluid level sensor (2) in master cylinder brake fluid reservoir (1).

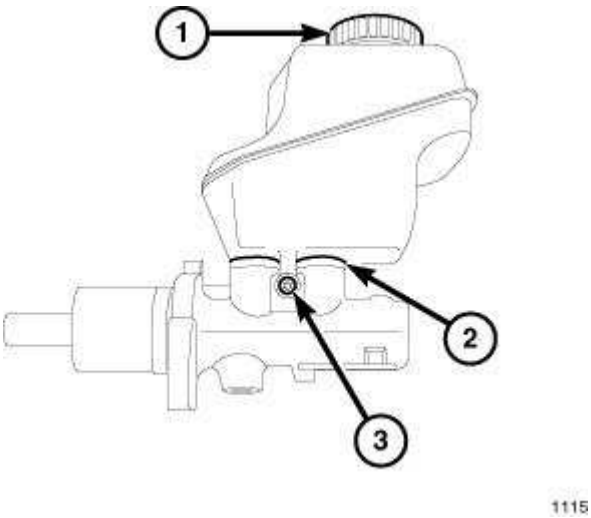

Fig. 249: Fluid Reservoir Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove brake fluid reservoir cap (1). Using a clean syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

5. Remove screw (3) fastening fluid reservoir to master cylinder housing.
6. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

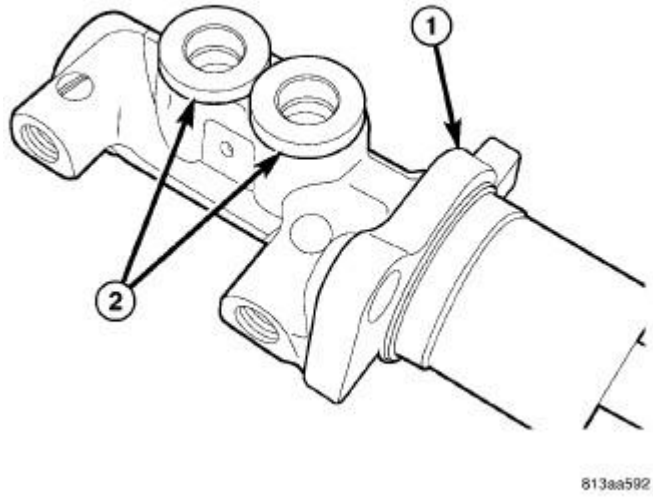

Fig. 250: Reservoir Seal Grommets
Courtesy of CHRYSLER GROUP, LLC

7. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

INSTALLATION

INSTALLATION

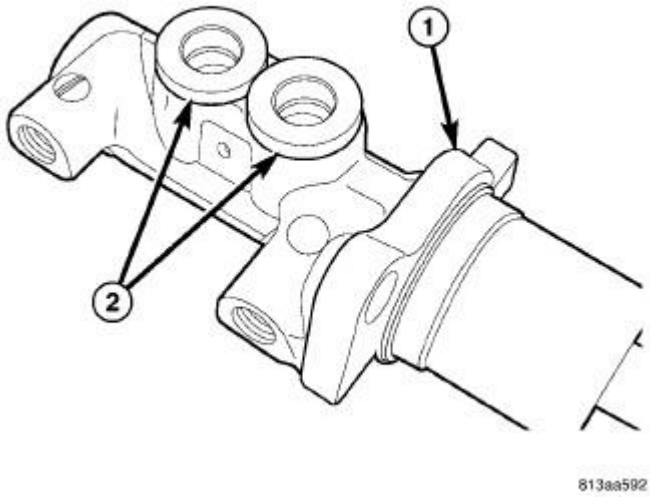

Fig. 251: Reservoir Seal Grommets
Courtesy of CHRYSLER GROUP, LLC

1. Install NEW brake fluid reservoir sealing grommets (2) in master cylinder housing (1).

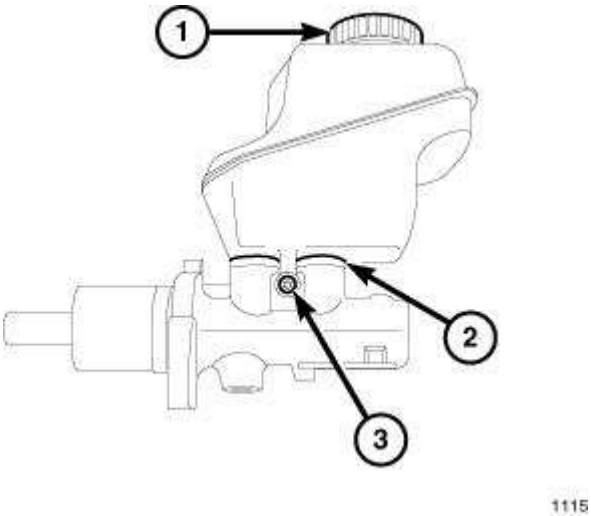

Fig. 252: Fluid Reservoir Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly

pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.

3. Install fluid reservoir mounting screw (3). Tighten screw to 28 N.m (250 in. lbs.) torque.

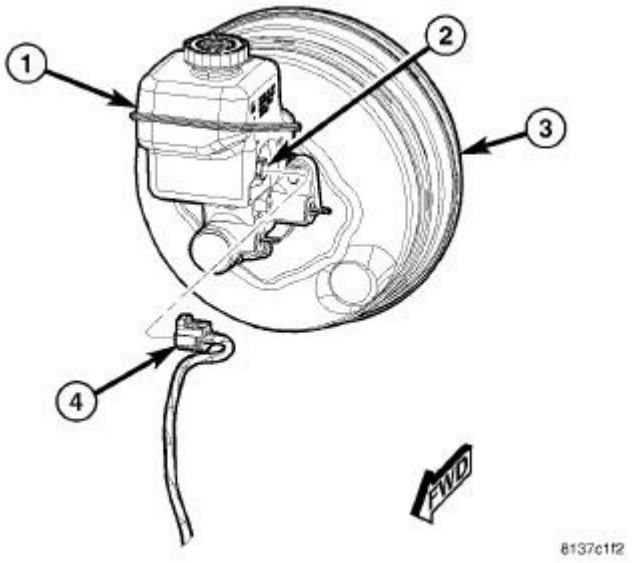

Fig. 253: Brake Fluid Level Sensor Connection
Courtesy of CHRYSLER GROUP, LLC

4. Connect wiring harness connector (4) to brake fluid level sensor (2) mounted in brake fluid reservoir (1).

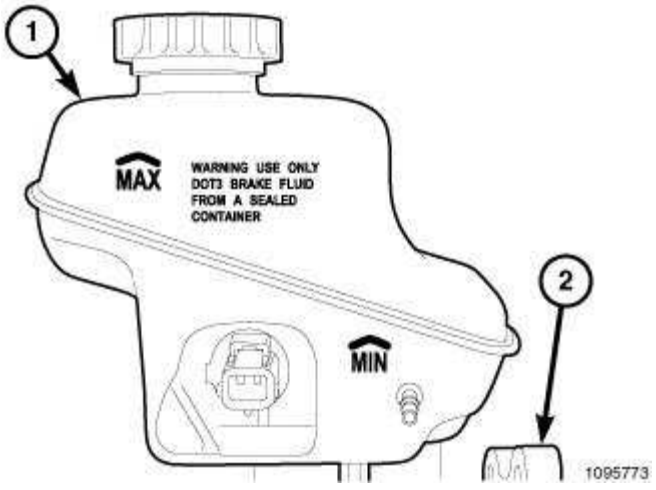

Fig. 254: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

5. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.

6. Install access panel in cowl area.

WARNING: Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire brake hydraulic system and check for leaks. Refer to BASE BRAKE BLEEDING .

7. Road test vehicle to ensure proper operation of brakes.

ROTOR, BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

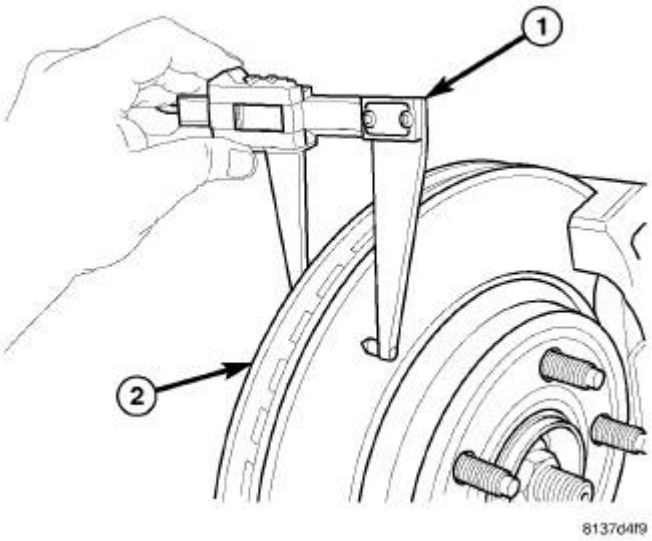

Fig. 255: Measuring Rotor Thickness
Courtesy of CHRYSLER GROUP, LLC

Measure rotor thickness (1) at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

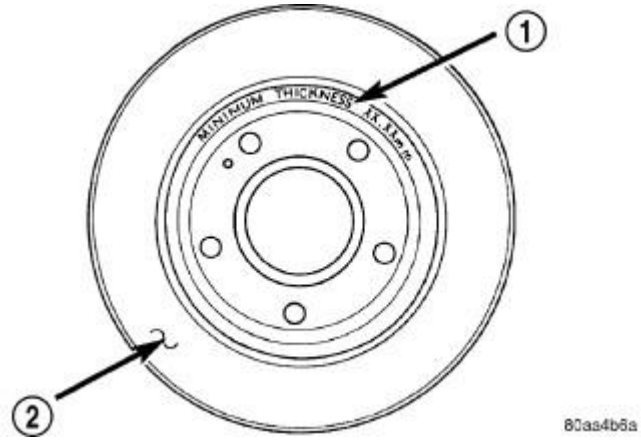

Fig. 256: Minimum Brake Rotor Thickness Markings (Typical)
Courtesy of CHRYSLER GROUP, LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

Most minimum thickness specifications (1) are cast into the rotor's unmachined surface (2). Some

brake rotors have the minimum thickness specification located elsewhere. Limits can also be found in this component's specification table. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.

ROTOR THICKNESS VARIATION

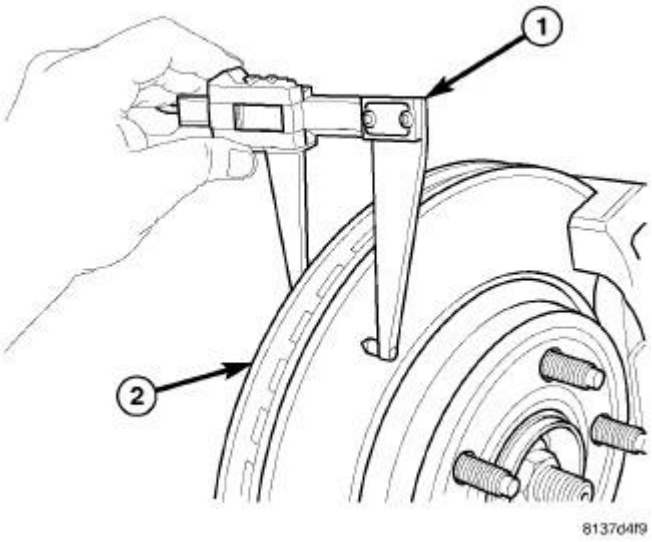

Fig. 257: Measuring Rotor Thickness
Courtesy of CHRYSLER GROUP, LLC

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor. If thickness measurements vary beyond the specification listed in the specification table, the rotor should be refaced or replaced. Refer to **ROTOR, BRAKE, SPECIFICATIONS** and **ROTOR, BRAKE, STANDARD PROCEDURE**.

ROTOR RUNOUT

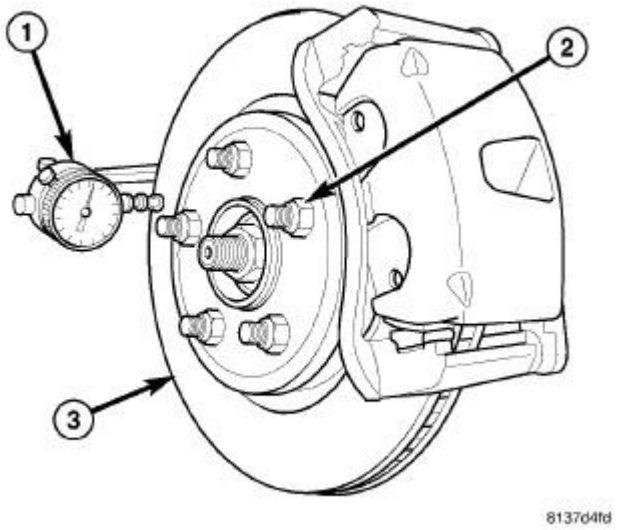

Fig. 258: Measuring Rotor Runout
Courtesy of CHRYSLER GROUP, LLC

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly. Refer to **REMOVAL** .
3. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N.m (110 ft. lbs.) torque.
4. Mount Dial Indicator (1), Special Tool (special tool #C-3339A, Set, Dial Indicator), with Wheel, Special Tool (special tool #25-W, Roller Contact Point), or equivalent, to knuckle. Position Dial Indicator Wheel to contact rotor braking surface approximately ten millimeters from outer edge of rotor (3).
5. Slowly rotate brake rotor checking lateral runout, marking the low and high spots. Record these measurements.
6. Check and record runout of opposite side of rotor in same fashion, marking the low and high spots.
7. Compare runout measurement to specifications. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.

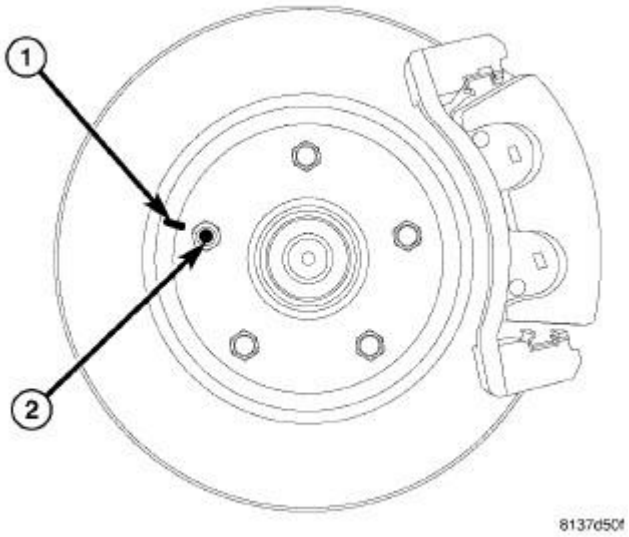

Fig. 259: Wheel Stud & Rotor Index Marked
Courtesy of CHRYSLER GROUP, LLC

If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor (1) and the one wheel stud (2) closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.

8. Remove the rotor from the hub. Refer to **ROTOR, BRAKE, REMOVAL**.

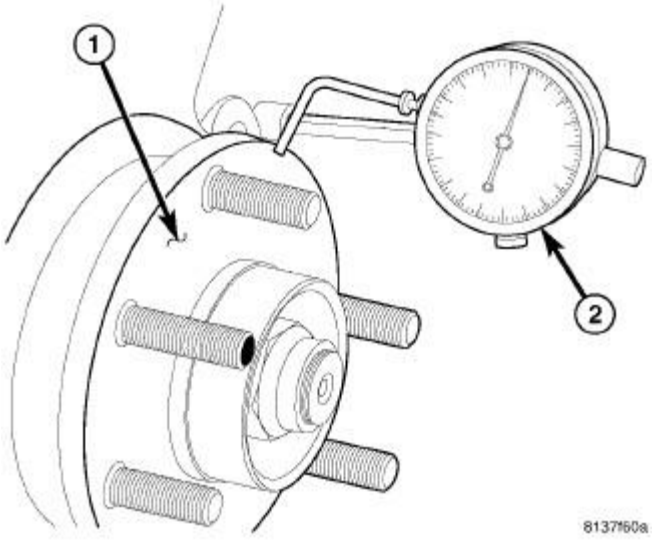

Fig. 260: Measuring Hub Runout
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.**

9. Mount Dial Indicator (2), Special Tool (special tool #C-3339A, Set, Dial Indicator), to the knuckle. Position Dial Indicator stem so it contacts hub face (1) near outer diameter. Care must be taken to position stem outside of stud circle, but inside of chamfer on the hub rim.
10. Slowly rotate hub measuring runout. Hub runout should not exceed 0.01 mm (0.0004 inch). If runout exceeds this specification, the hub must be replaced. Refer to **HUB AND BEARING, REMOVAL** or **HUB AND BEARING, REMOVAL** .

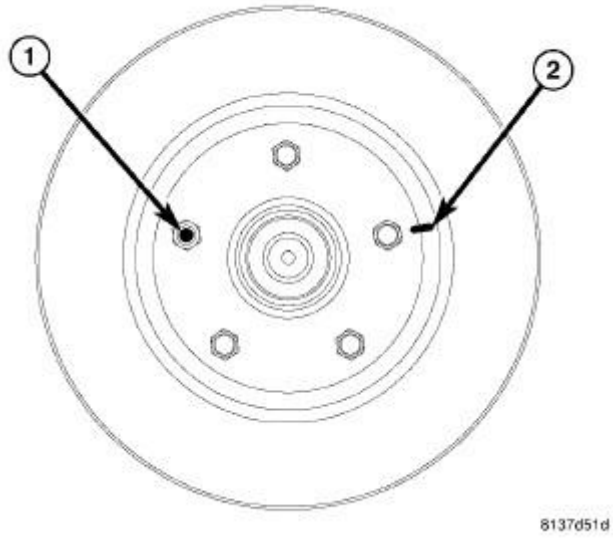

Fig. 261: Rotor Reindexed On Wheel Studs
Courtesy of CHRYSLER GROUP, LLC

11. If hub runout does not exceed this specification, install original rotor back on hub, aligning chalk mark on rotor (2) with a wheel mounting stud, two studs apart from original stud (1).

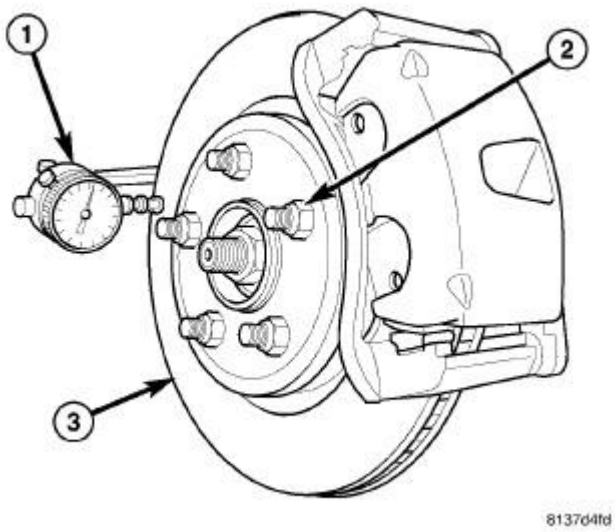

Fig. 262: Measuring Rotor Runout
Courtesy of CHRYSLER GROUP, LLC

12. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N.m (110 ft. lbs.) torque.
13. Mount Dial Indicator (1) and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.
14. If runout is still not within specifications, reface or replace brake rotor. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

STANDARD PROCEDURE

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

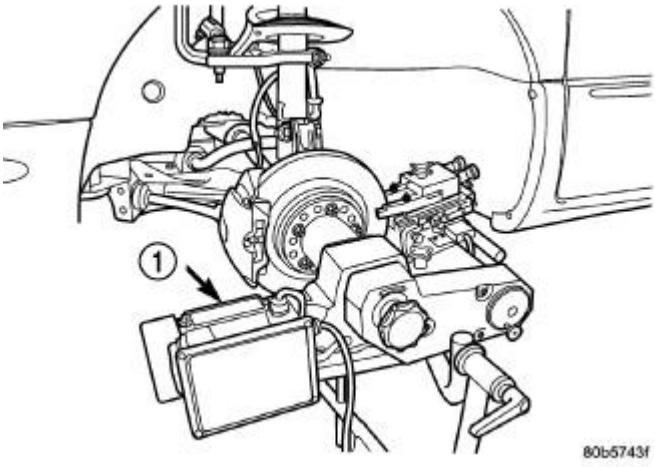

Fig. 263: On-Car Brake Lathe
Courtesy of CHRYSLER GROUP, LLC

1 - ON-CAR BRAKE LATHE

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

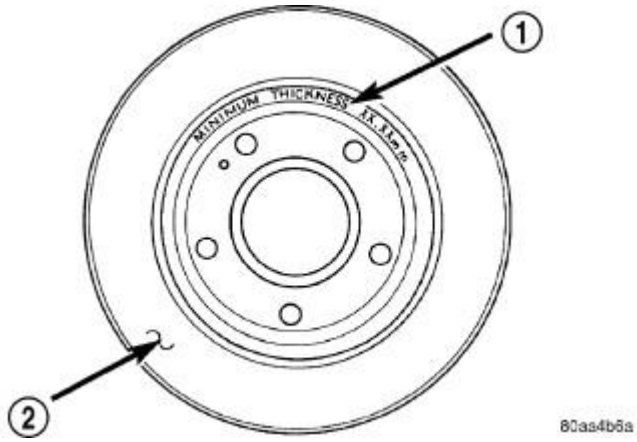

Fig. 264: Minimum Brake Rotor Thickness Markings (Typical)
Courtesy of CHRYSLER GROUP, LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

NOTE: **Most brake rotors (2) have markings for minimum allowable thickness specification cast into an unmachined surface of the rotor or stamped into the hat section (1). Some brake rotors have the minimum thickness specification located elsewhere. Minimum thickness specifications can also be found in this component's specification table. Refer to ROTOR, BRAKE, SPECIFICATIONS.**

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in this informations specification table. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.

SPECIFICATIONS

SPECIFICATIONS

NOTE: **When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning (machining) equipment is required.**

LIMITS/SPECIFICATIONS - 17 INCH BRAKES (BASE)

REMOVAL

FRONT

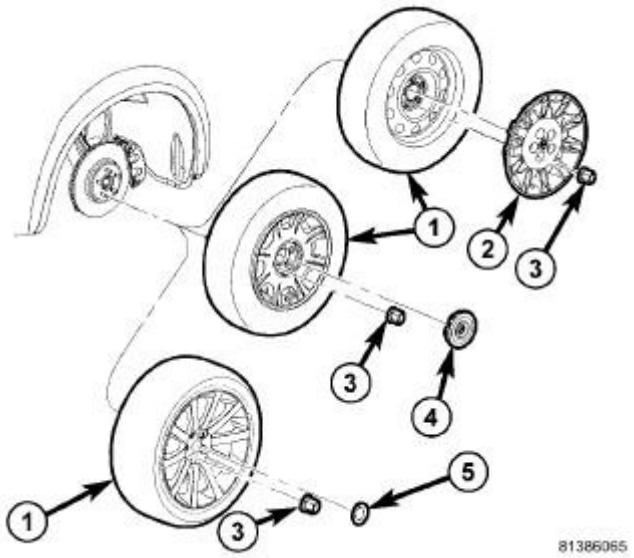

Fig. 265: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be

accomplished before mounting bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

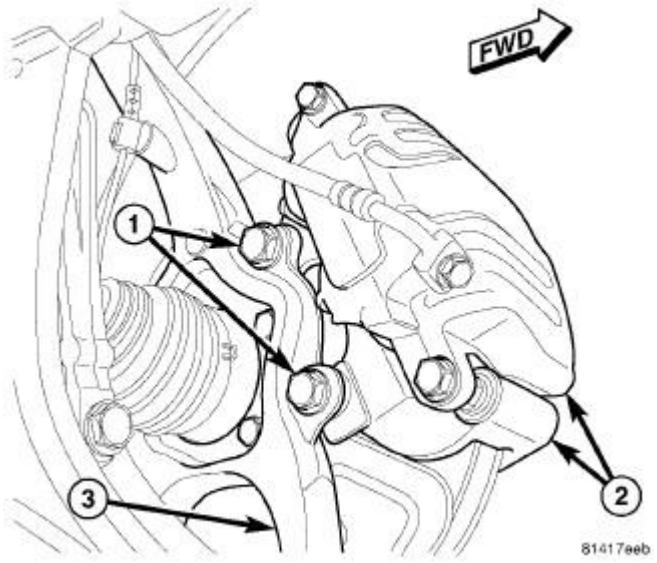

Fig. 266: Locating Front Caliper Bolts AT Knuckle

7. Remove any clips (3) retaining brake rotor (2) to wheel studs.
8. Slide brake rotor (2) off hub and bearing (1).

FRONT - SRT8

NOTE: Before proceeding. Refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

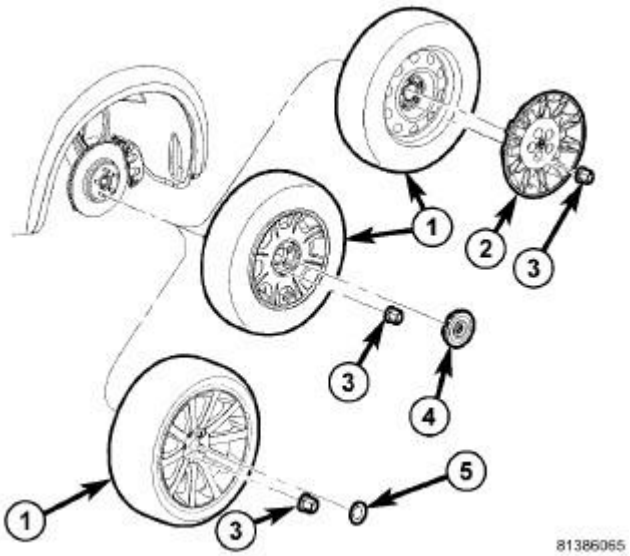

Fig. 269: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

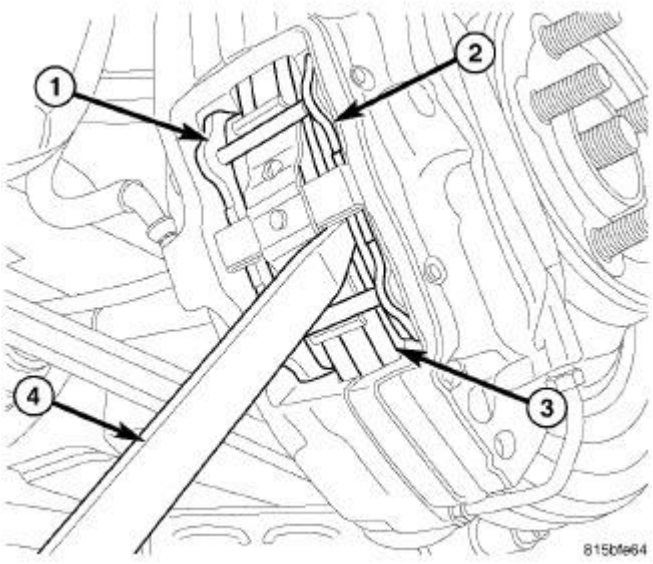

Fig. 270: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

3. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
4. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

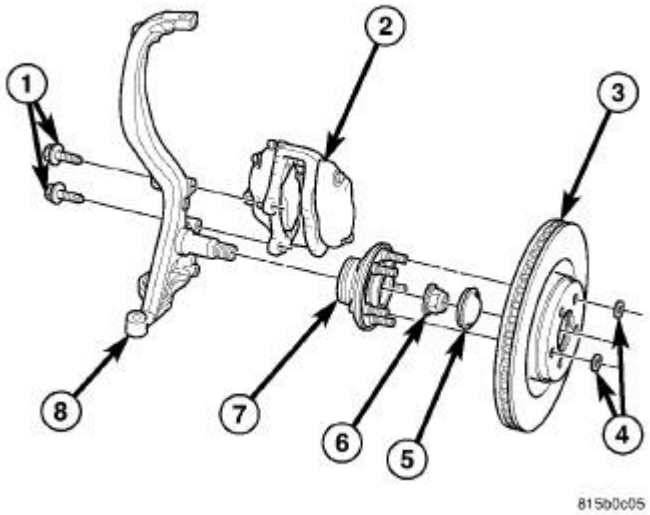

Fig. 271: Exploded View Of Front Disc Brakes - Srt-8
Courtesy of CHRYSLER GROUP, LLC

5. Remove caliper mounting bolts (1).
6. Remove brake caliper (2) with pads from knuckle (8) and brake rotor (3). Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
7. Remove any clips (4) retaining brake rotor (3) to wheel studs.
8. Slide brake rotor (3) off hub and bearing (7).

REAR

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

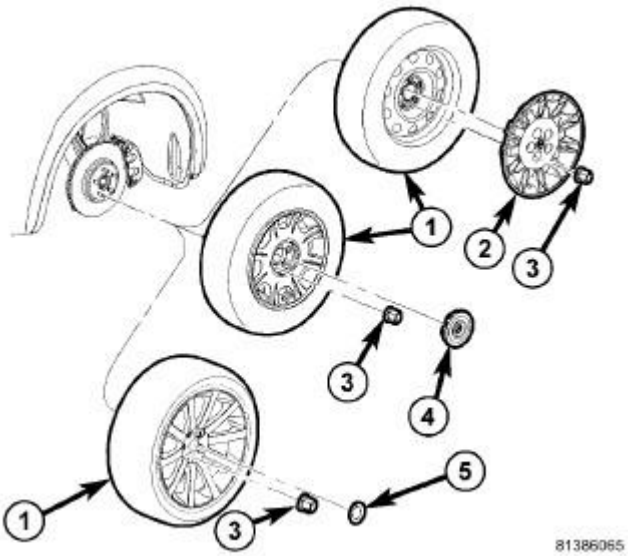

Fig. 272: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

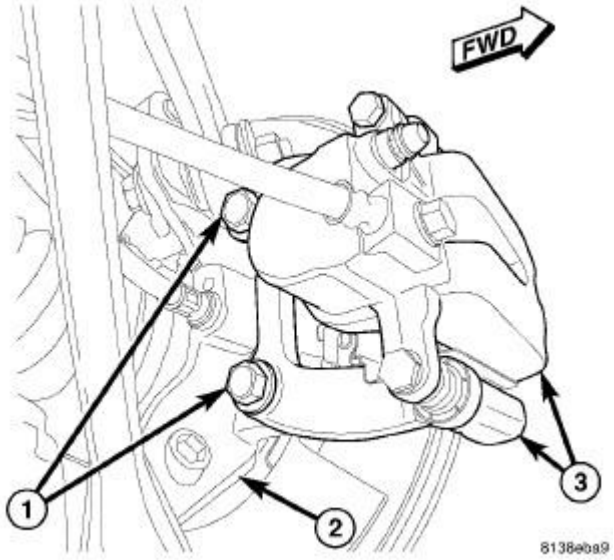

Fig. 273: Rear Caliper & Adapter Mounting

Courtesy of CHRYSLER GROUP, LLC

3. Remove two bolts (1) securing disc brake caliper adapter (3) to knuckle (2).
4. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

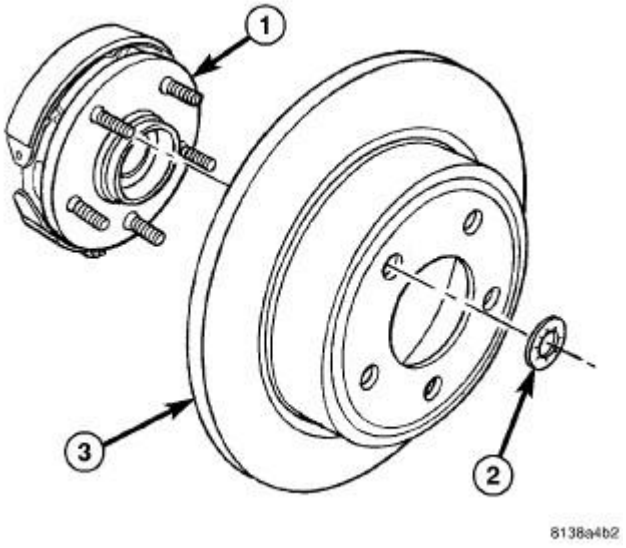

Fig. 274: Solid Brake Rotor Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Remove any clips (2) retaining brake rotor (3) to wheel mounting studs.
6. Slide brake rotor (3) off hub and bearing (1).

REAR - SRT8

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

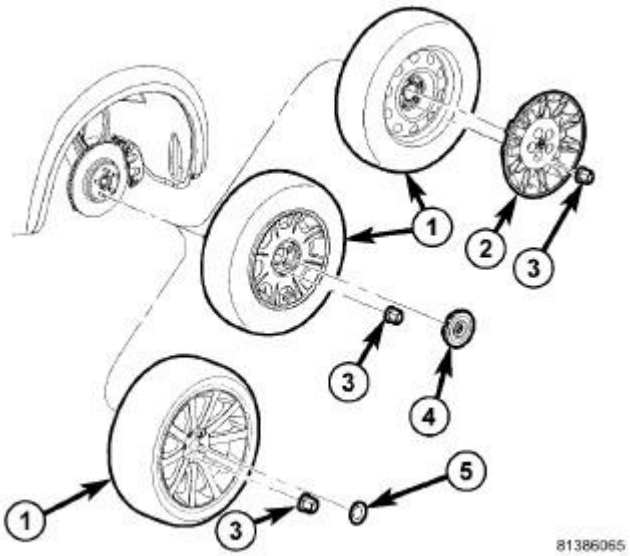

Fig. 275: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

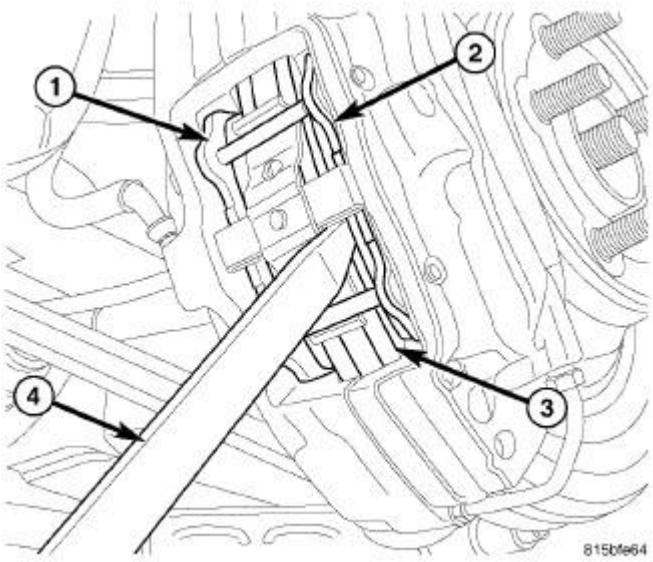

Fig. 276: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

3. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
4. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

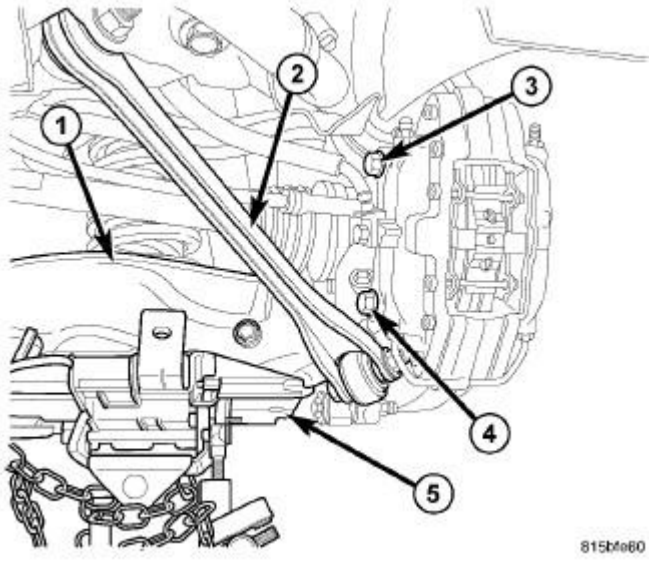

Fig. 277: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

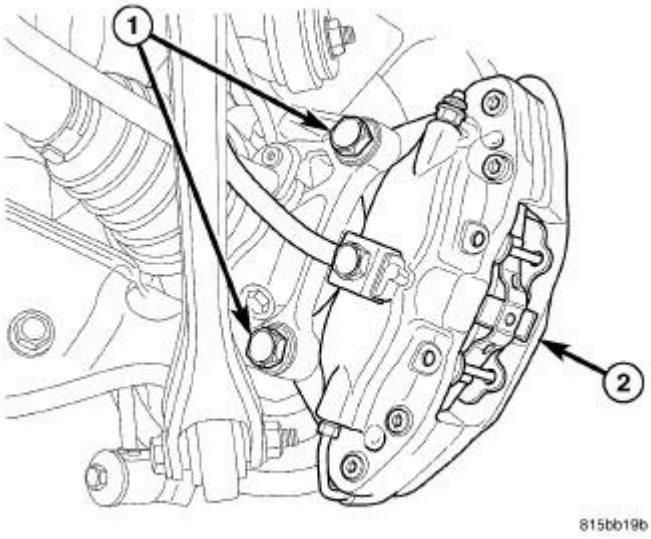

Fig. 278: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower and upper caliper mounting bolts (1).
7. Remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

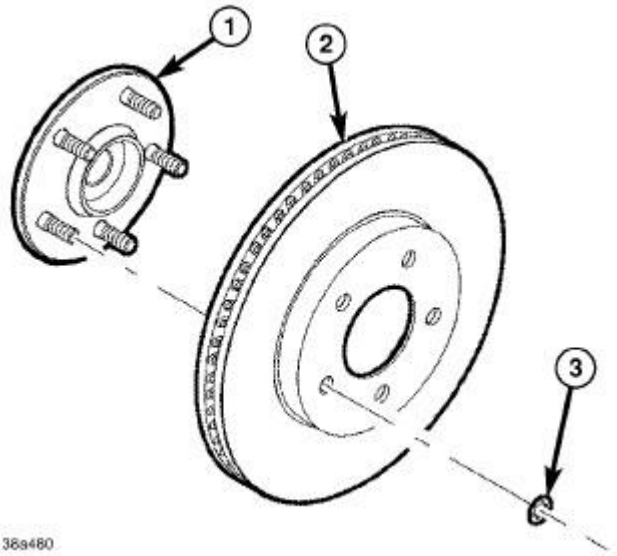

Fig. 279: Locating Clips Retaining Brake Rotor

8. Remove any clips (3) retaining brake rotor (2) to wheel mounting studs.
9. Slide brake rotor (2) off hub and bearing (1).

INSTALLATION

FRONT

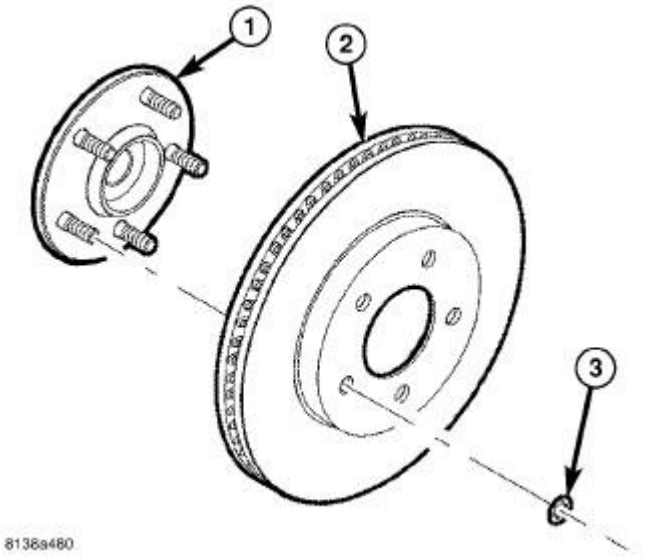

Fig. 280: Locating Clips Retaining Brake Rotor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect brake pads before installation. Refer to INSPECTION .

1. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
2. Install brake rotor (2) over studs on hub and bearing.

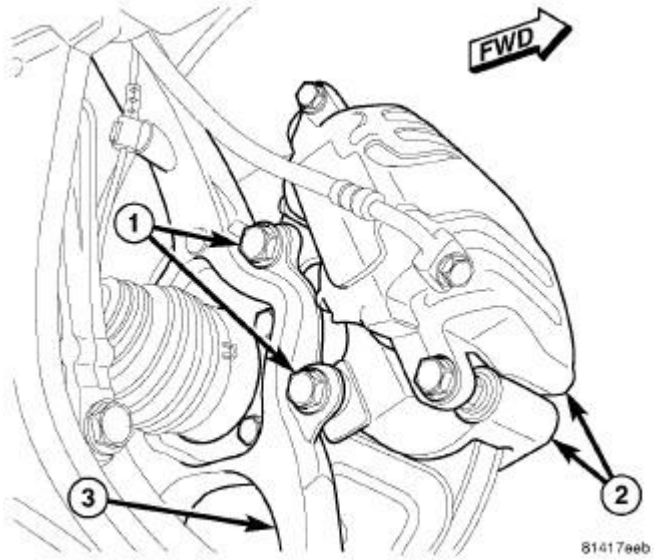

Fig. 281: Locating Front Caliper Bolts AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

NOTE: New caliper mounting bolts should be used because they come with a lock patch of thread locker on them. If reusing caliper mounting bolts, ensure

the bolts and threads are clean of any leftover adhesive and apply Mopar® Stud N' Bearing Mount Adhesive or equivalent.

3. AWD - Install disc brake caliper and adapter assembly (2) over brake rotor.
4. AWD - Install **NEW** mounting bolts (1) securing caliper adapter (2) to knuckle (3). Tighten bolts to 95 N.m (70 ft. lbs.).

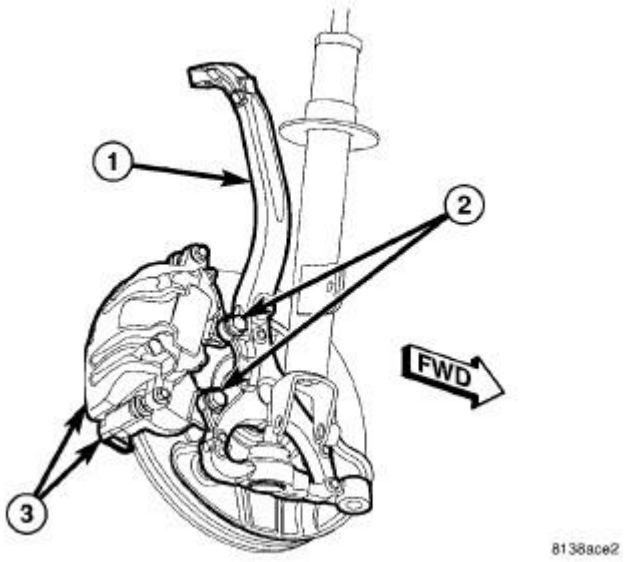

Fig. 282: Front Caliper & Adapter Mounting
Courtesy of CHRYSLER GROUP, LLC

5. RWD - Install disc brake caliper and adapter assembly (3) over brake rotor.
6. RWD - Install mounting bolts (2) securing caliper adapter (3) to knuckle (1). Tighten bolts to 95 N.m (70 ft. lbs.).

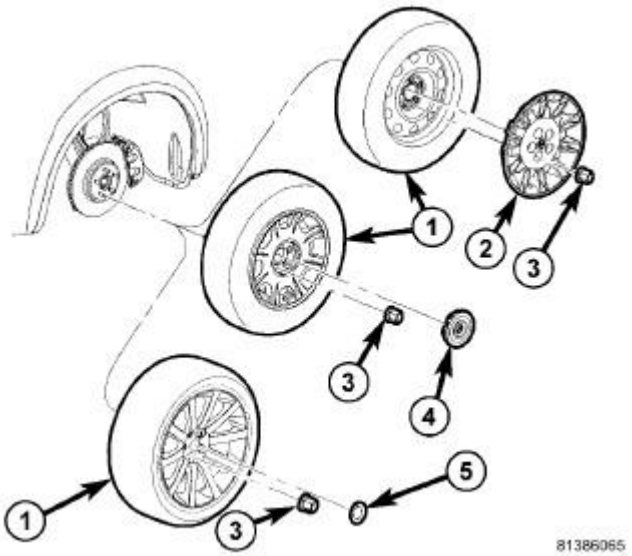

Fig. 283: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
8. Lower vehicle.
9. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

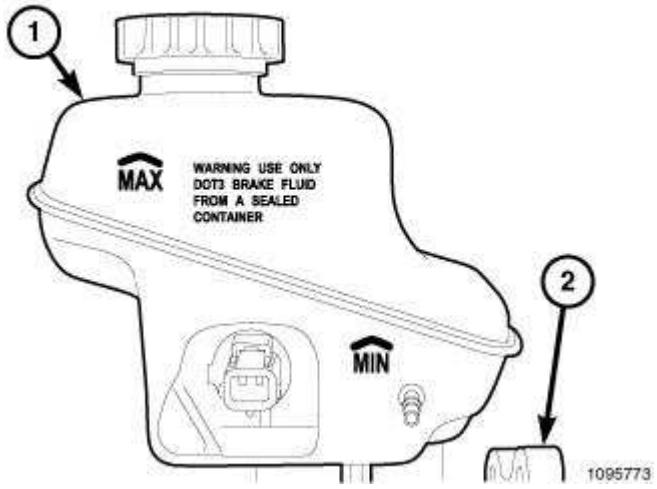

Fig. 284: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

10. Check and adjust brake fluid level in reservoir (1) as necessary.

CAUTION: If NEW brake rotors or pads have been installed, keep in mind that

braking effectiveness might be somewhat reduced during the first brake applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owners Manual Supplement which was supplied when the vehicle was originally delivered.

11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes. If the vehicle is equipped with the Police Package, a burnish procedure must be followed (Refer to preceding Caution).

FRONT - SRT8

NOTE: Inspect brake pads before installation. Refer to INSPECTION .

9. Check and adjust brake fluid level in reservoir (1) as necessary.

CAUTION: If NEW brake rotors or pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

10. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. Refer to **PADS, BRAKE, SRT8, STANDARD PROCEDURE**.

TUBES AND HOSES, BRAKE

INSPECTION

INSPECTION

Brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.

Flexible rubber hose is used at both the front and rear wheel brakes. Inspection of the flexible brake hoses should be performed whenever the brake system is serviced and every 12, 000 km (7, 500 miles) or 12 months, whichever comes first. Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the hose becomes exposed due to cracks or abrasions in the hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

NOTE: This vehicle is equipped with more than one size (diameter) brake tube depending on location on the vehicle. If a brake tube must be replaced, always use the same size brake tubing as that being replaced. Never use under-size brake tubing.

VALVE, PROPORTIONING

DESCRIPTION

DESCRIPTION

A proportioning valve is used on each vehicle without antilock brakes. One valve is used for both rear brake hydraulic circuits. The proportioning valve is located in the junction block. Refer to **BLOCK, BRAKE LINE UNION, DESCRIPTION**. The valve is not serviceable and must be replaced as part of the junction block.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

This vehicle uses drum-in-hat style parking brakes at each rear wheel. The system is actuated using a foot-operated mechanism and three parking brake cables.

CABLE, PARKING BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding. Refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

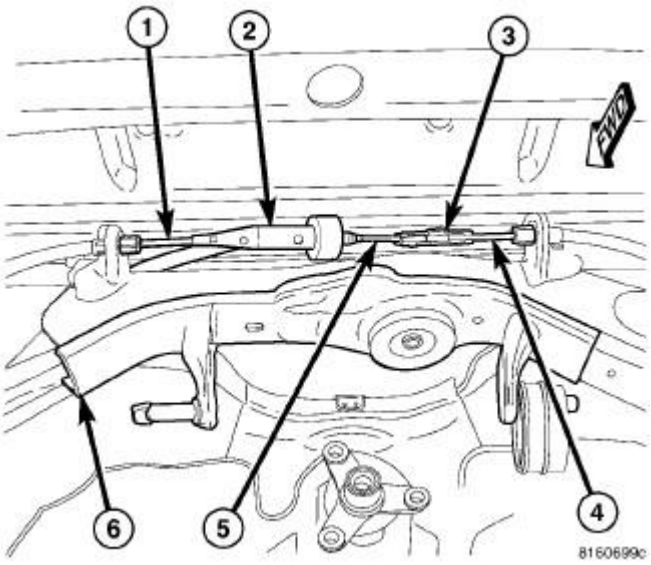

Fig. 297: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential (not shown).

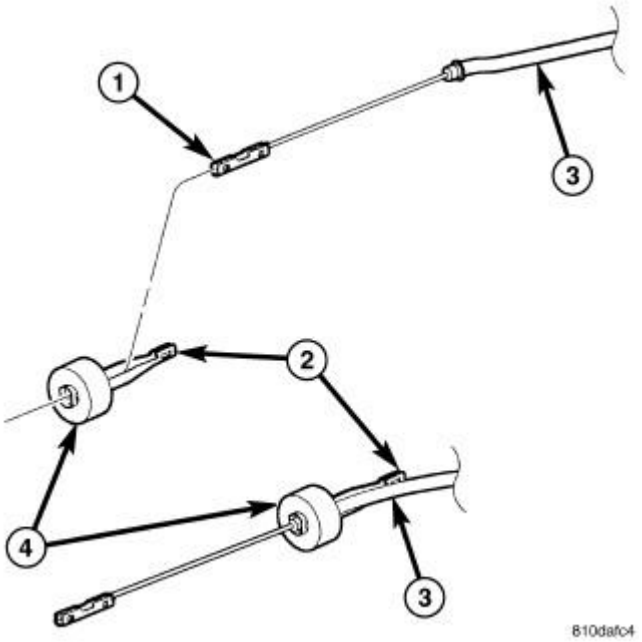

Fig. 298: Front Cable Installation Into Equalizer
Courtesy of CHRYSLER GROUP, LLC

3. Remove front cable (3) from equalizer (2).

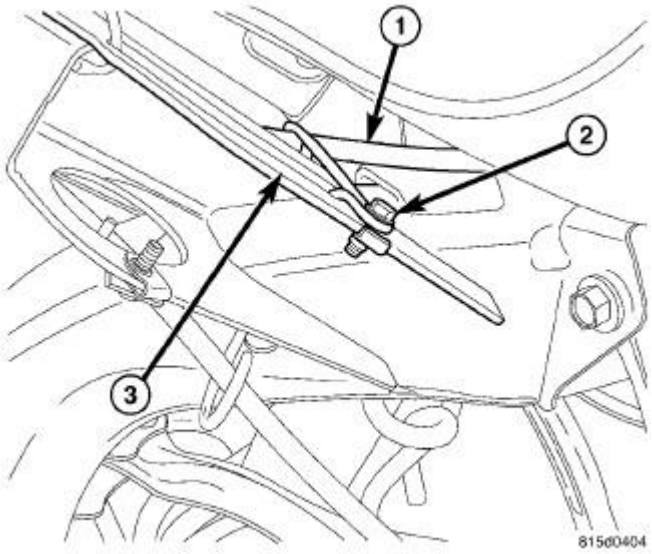

Fig. 299: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (2) fastening cable (1) routing bracket to rear crossmember front flange (3).

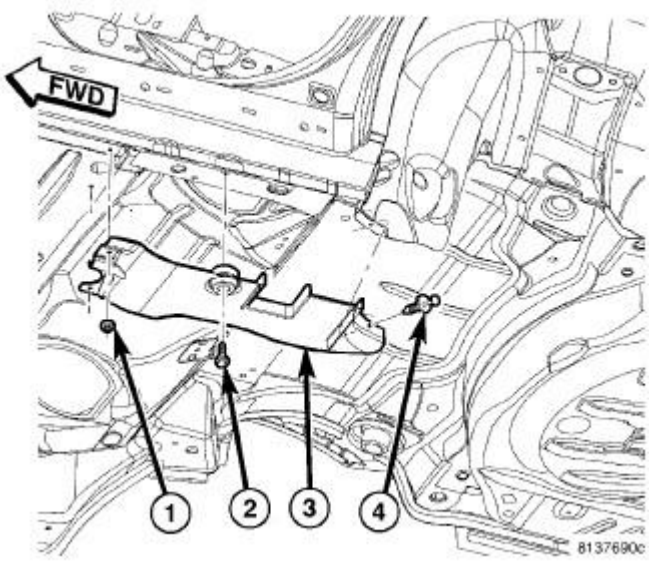

Fig. 300: Shield 1
Courtesy of CHRYSLER GROUP, LLC

5. Remove nuts (1), bolt (2) and push-pins (4), securing lower rear wheelhouse shield (3) to body of vehicle. Remove lower rear wheelhouse shield.

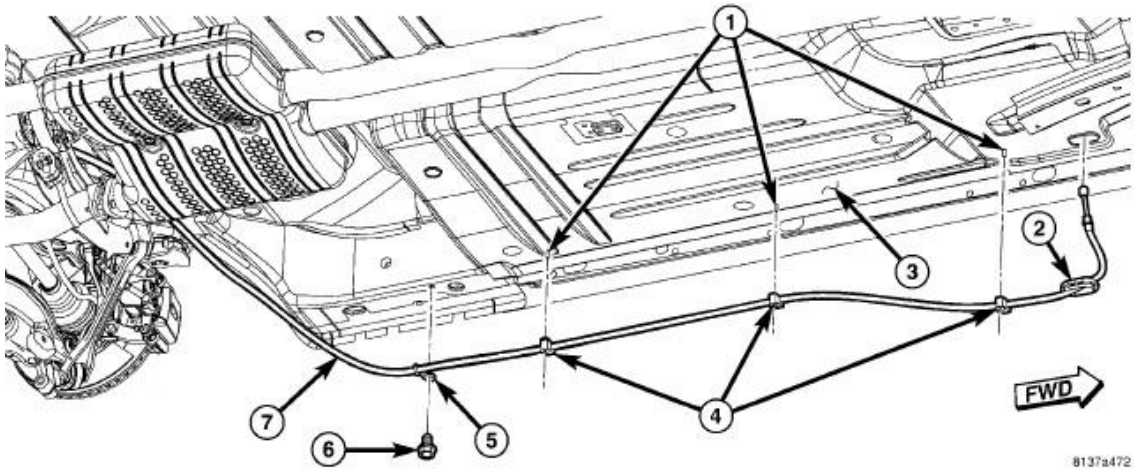

Fig. 301: Front Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

6. Remove screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).
7. Lower vehicle.
8. Remove driver door opening sill scuff plate and cowl side trim.
9. Remove clip and roll back carpet away from front cable.

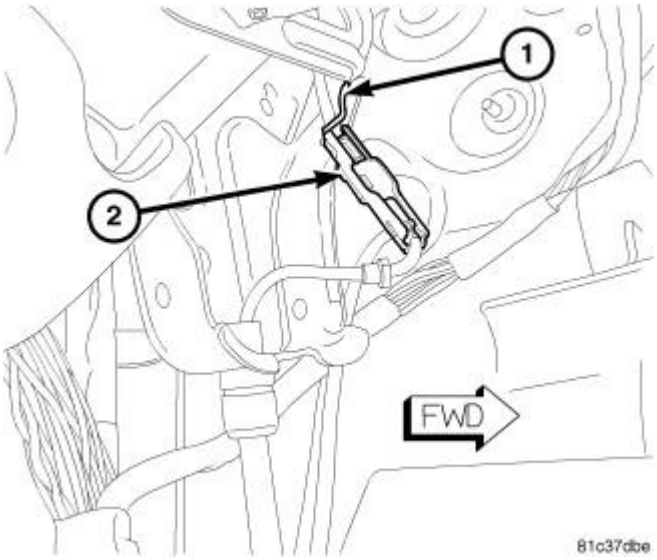

Fig. 302: Cable Connector Secured In Fork
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove front parking brake cable from cable connector at lever without securing connector first. If not secured, cable connector will wind up inside lever assembly making it most difficult to retrieve and reconnect to front cable upon installation.

10. Using pliers, reach up inside parking brake lever assembly and pull downward on parking brake cable connector. Secure cable connector (2) in retaining fork (1) formed into parking brake lever bracket as shown in illustration.

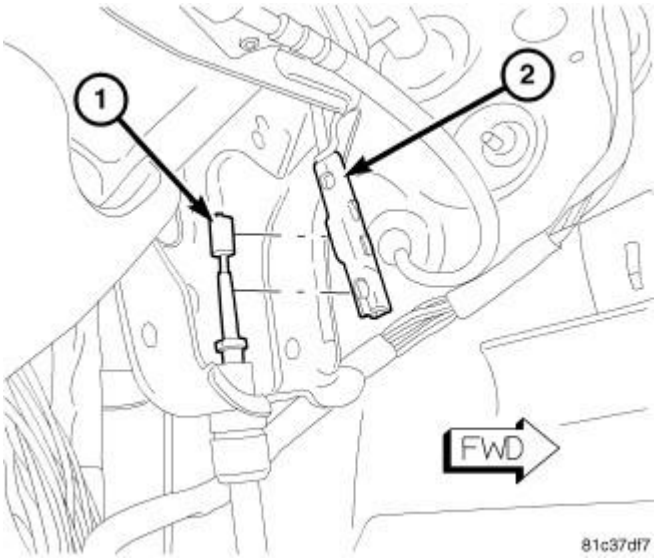

Fig. 303: Front Cable AT Lever Connector
Courtesy of CHRYSLER GROUP, LLC

11. Disengage and remove front parking brake cable strand (1) from cable connector (2), leaving

cable connector secured in retaining fork.

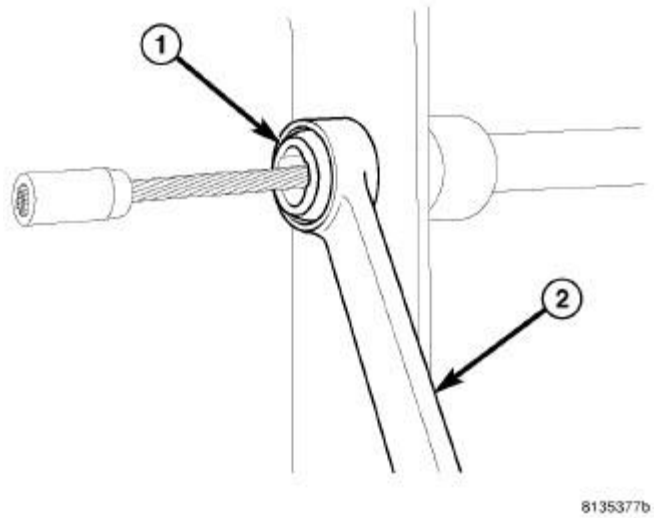

Fig. 304: Removing Cable Using Wrench
Courtesy of CHRYSLER GROUP, LLC

1 - CABLE RETAINER
2 - 12-POINT BOX WRENCH

12. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown in illustration to collapse retainer fingers. Pull cable from bracket.

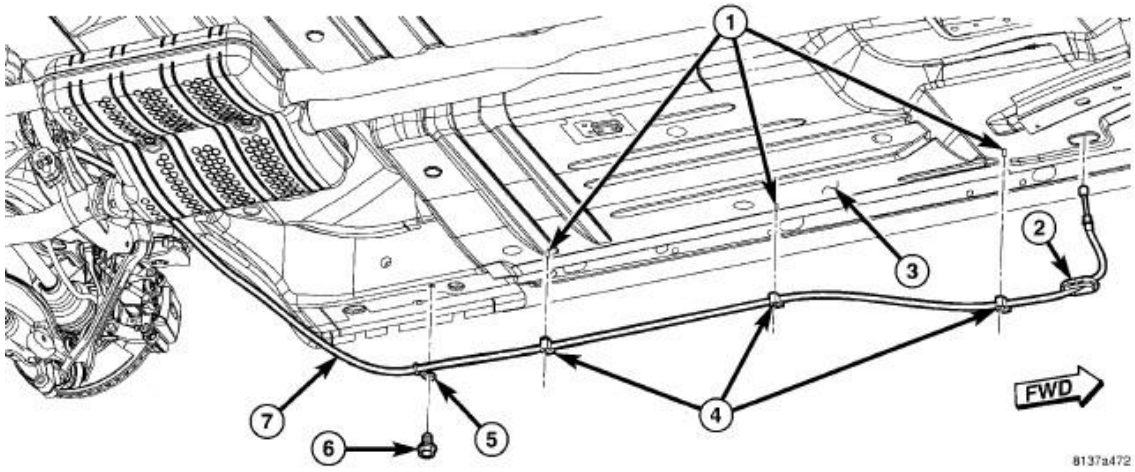

Fig. 305: Front Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

13. Remove parking brake cable grommet (2) from floor pan (3).
14. Remove parking brake cable (7) through hole in floor pan.

INSTALLATION

INSTALLATION

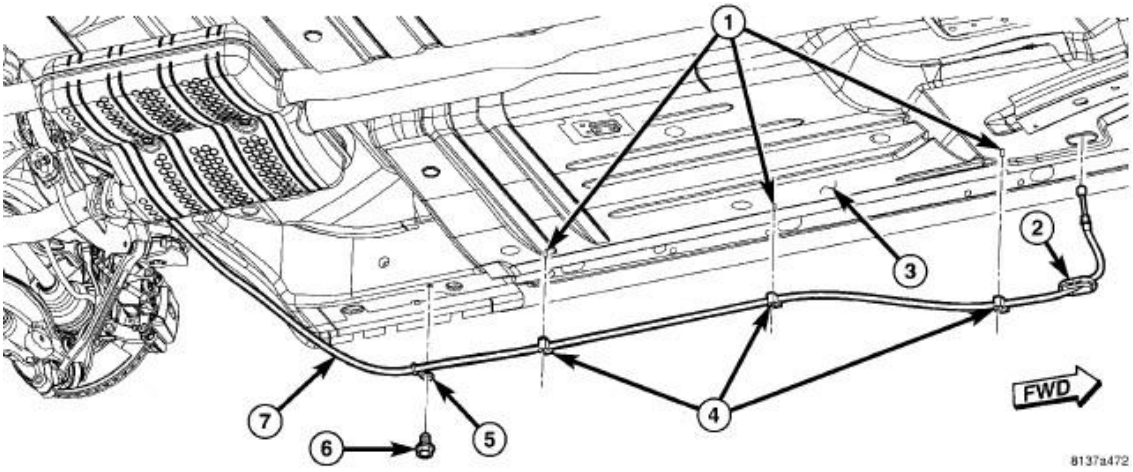

Fig. 306: Front Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

1. Guide parking brake cable (7) down through hole in floor pan.
2. Install parking brake cable grommet (2) in hole of floor pan (3).

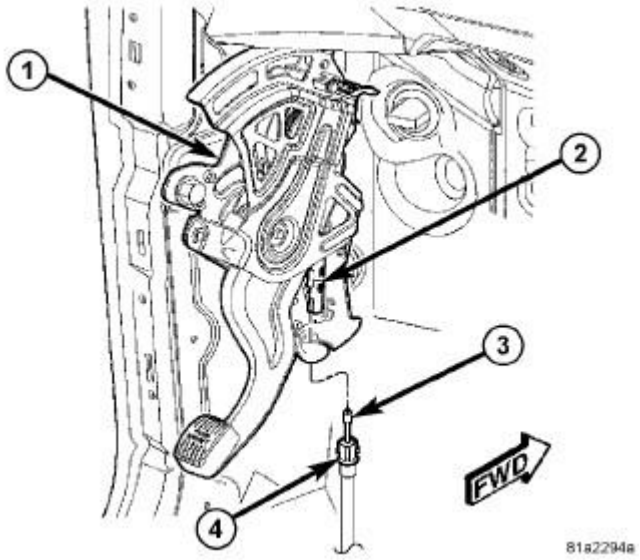

Fig. 307: Front Cable AT Lever
Courtesy of CHRYSLER GROUP, LLC

3. Guide cable strand (3) up through lever bracket and press cable housing retainer (4) into bracket allowing retainer fingers to lock cable in place.

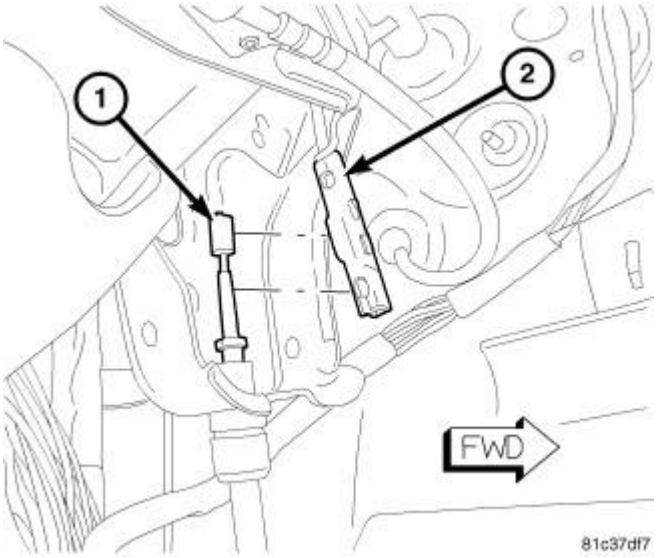

Fig. 308: Front Cable AT Lever Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect front parking brake cable strand (1) to cable connector (2) secured in retaining fork.
5. Once front parking brake cable strand is completely seated in cable connector (2), lift cable connector out of retaining fork using pliers and slowly allow lever mechanism to take up slack in cable.
6. Lay carpet back into place and install retaining clip.
7. Install driver door opening sill scuff plate and cowl side trim.
8. Raise and support vehicle.

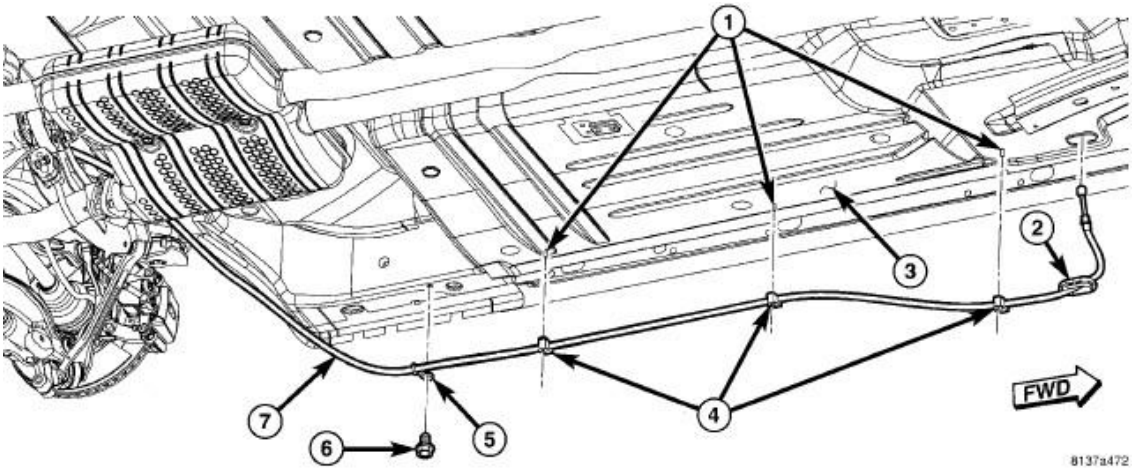

Fig. 309: Front Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

9. Install screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).

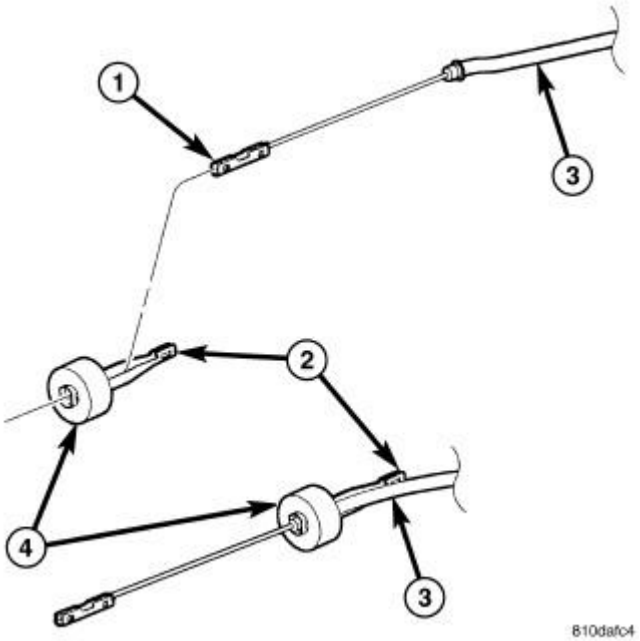

Fig. 310: Front Cable Installation Into Equalizer
Courtesy of CHRYSLER GROUP, LLC

10. Route cable above rear crossmember, then slide cable end (1) (shown in illustration with connector) and housing (3) through equalizer (2) above rear axle differential.

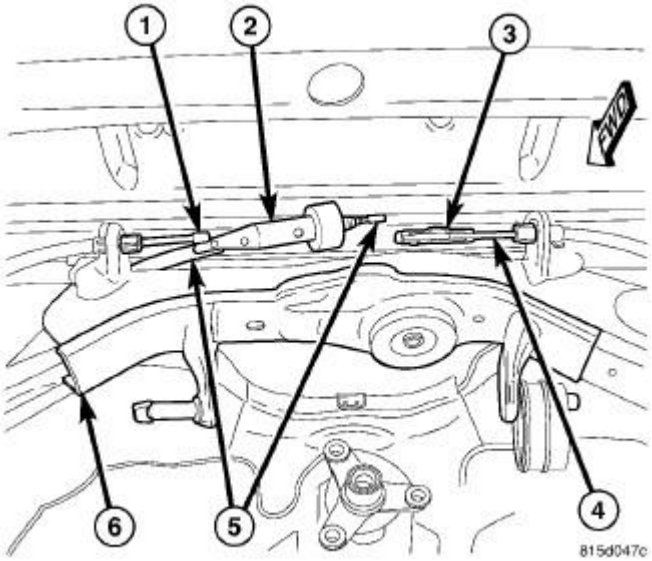

Fig. 311: Parking Brake Cables AT Rear Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out

parking brake lever to service parking brake components.

11. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) (axle differential not shown).

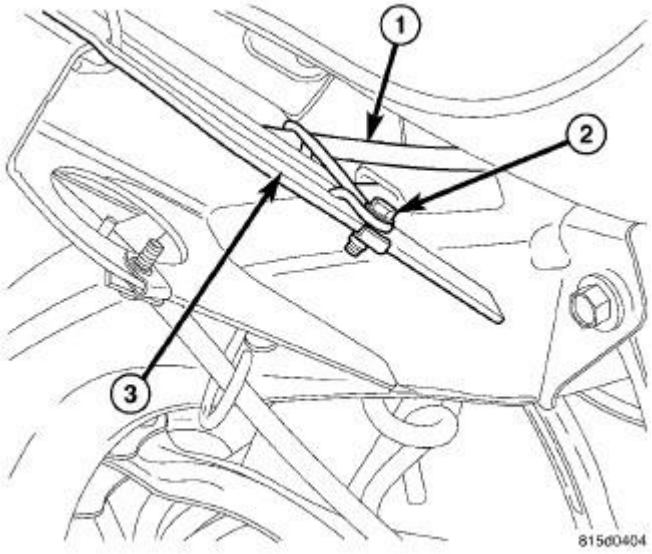

Fig. 312: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

12. Install screw (2) fastening cable (1) routing bracket to rear crossmember front flange (3).

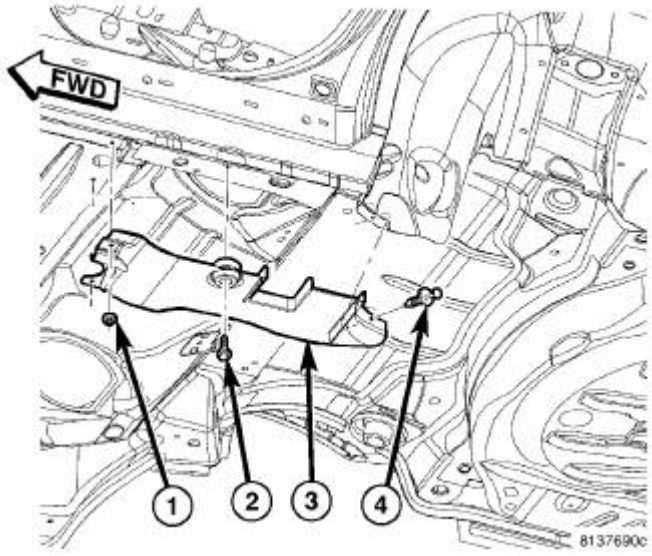

Fig. 313: Shield 1
Courtesy of CHRYSLER GROUP, LLC

13. Position lower rear wheelhouse shield (3) onto body of vehicle. Install nuts (1), bolt (2) and push-pins (4) securing lower rear wheelhouse shield to body. Tighten nuts and bolt securely.
14. Lower vehicle until rear wheels are just above floor level.
15. Apply parking brake lever. Release lever, then reapply.
16. Check to make sure rear wheels will not rotate with lever applied.
17. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
18. Apply parking brake lever.
19. Lower vehicle.

CABLE, PARKING BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

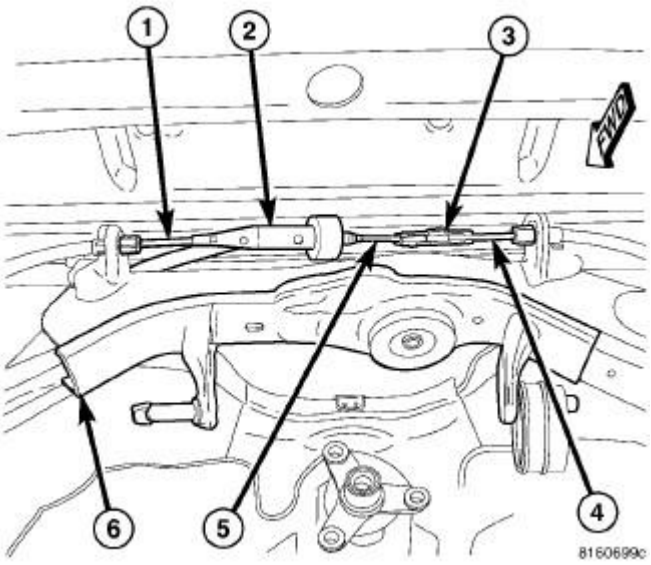

Fig. 314: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect rear parking brake cable near front cable as follows:
   - If removing left rear cable, disconnect cable (1) at equalizer (2) above rear axle differential

(not shown) and rear crossmember (6).

- If removing right rear cable, disconnect cable (4) at connector (3) above rear axle differential (not shown) and rear crossmember (6).

3. Remove parking brake shoes on side of cable service. Refer to **SHOES, PARKING BRAKE, REMOVAL**.

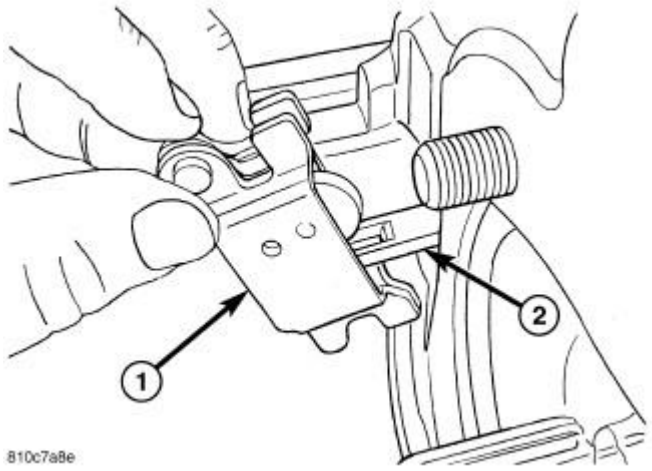

Fig. 315: Removing/Installing Actuator

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

4. Remove shoe actuator lever (1) from end of cable (2) and support.

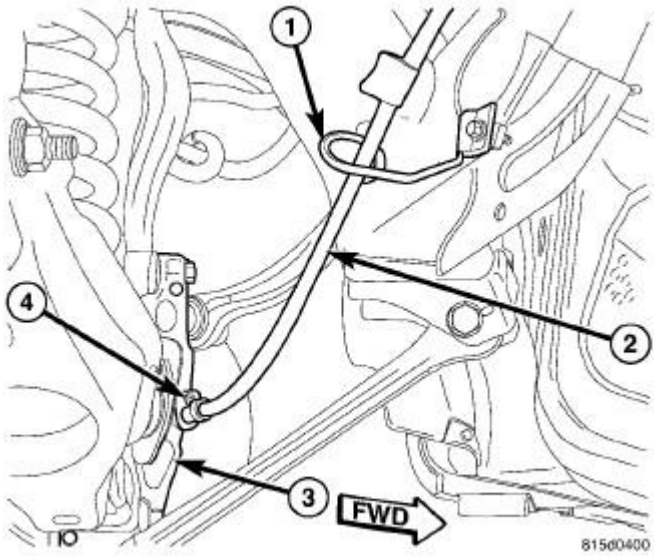

Fig. 316: Rear Cable Routing To Knuckle

Courtesy of CHRYSLER GROUP, LLC

5. Remove screw (4) fastening cable (2) to knuckle (3). Remove cable from knuckle.
6. Remove cable (2) from routing guide (1).

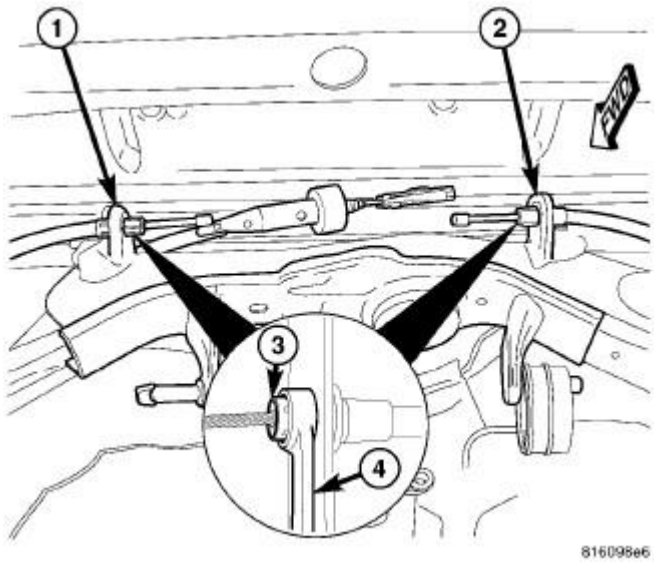

Fig. 317: Cables AT Crossmember Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Place 13 mm 12-point box wrench (4) over cable strand and completely onto cable retainer (3) as shown in illustration at crossmember bracket (1 - left) (2 - right). It may be necessary to wiggle wrench around somewhat to collapse retainer fingers. With wrench in place, pull cable from bracket.
8. Remove parking brake cable from vehicle.

INSTALLATION

INSTALLATION

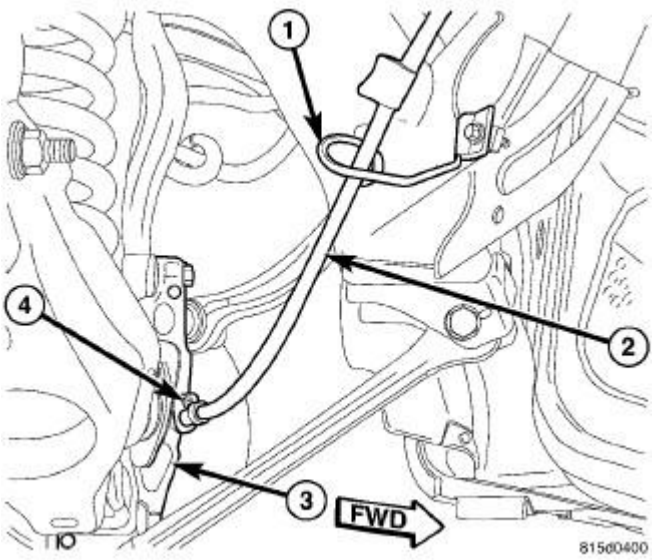

Fig. 318: Rear Cable Routing To Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Route leading end of rear parking brake cable (2) up through cable guide (1) on crossmember.

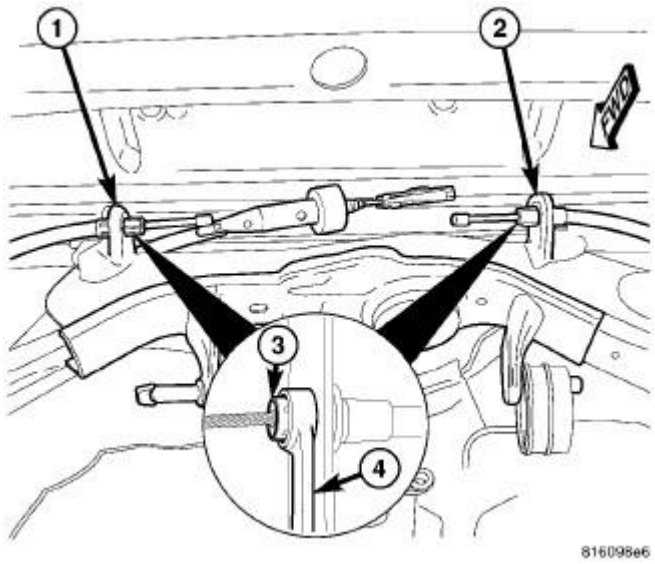

Fig. 319: Cables AT Crossmember Bracket
Courtesy of CHRYSLER GROUP, LLC

2. Guide cable leading end through crossmember bracket (1 - left) (2 - right) near equalizer and press cable housing retainer into bracket allowing retainer fingers to lock cable in place.

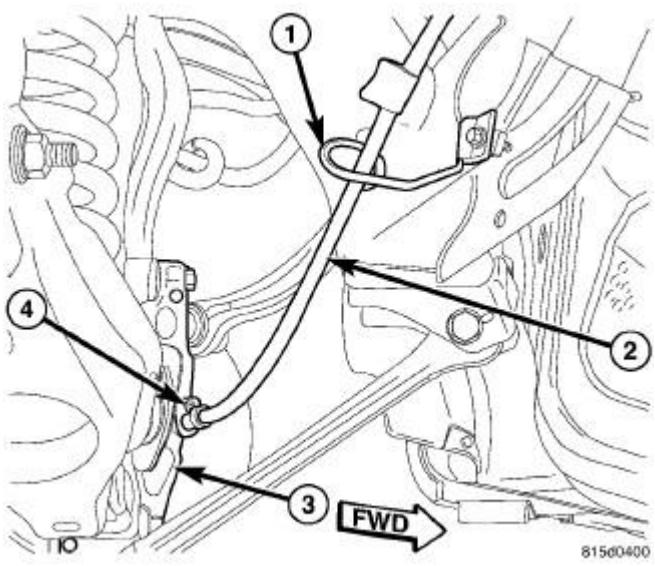

Fig. 320: Rear Cable Routing To Knuckle
Courtesy of CHRYSLER GROUP, LLC

3. Insert opposite end of cable (2) through rear knuckle (3) and install mounting screw (4). Tighten screw to 8 N.m (71 in. lbs.) torque.

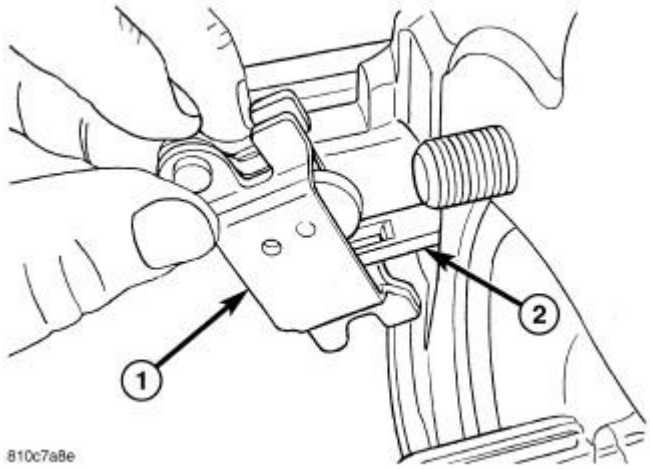

Fig. 321: Removing/Installing Actuator
Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

4. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
5. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION**.

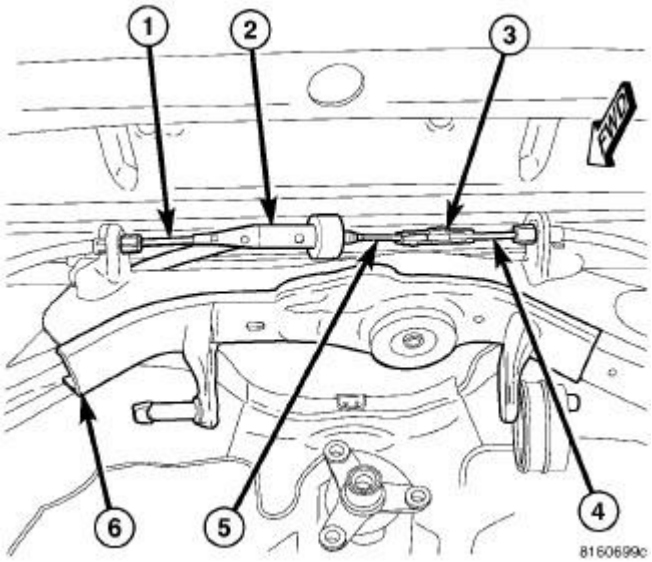

Fig. 322: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock out parking brake lever to service parking brake components.

6. Connect rear parking brake cable at equalizer/front cable as follows:
   - If installing left rear cable, connect cable (1) at equalizer (2) above rear axle differential (not shown) and rear crossmember (6).
   - If installing right rear cable, connect cable (4) at connector (3) above rear axle differential (not shown) and rear crossmember (6).
7. Lower vehicle until rear wheels are just above floor level.
8. Apply parking brake lever. Release lever, then reapply.
9. Check to make sure rear wheels will not rotate with lever applied.
10. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
11. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS**.
12. Lower vehicle.

LEVER, PARKING BRAKE

REMOVAL

LEVER

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

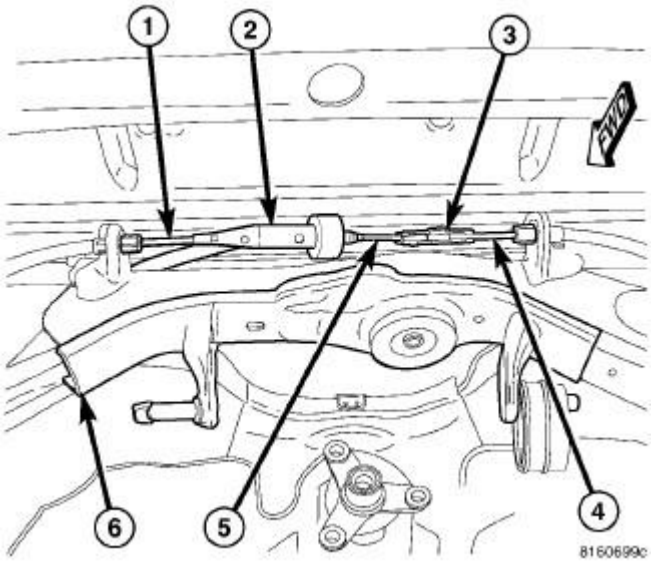

Fig. 323: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable.
3. Lower vehicle.
4. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

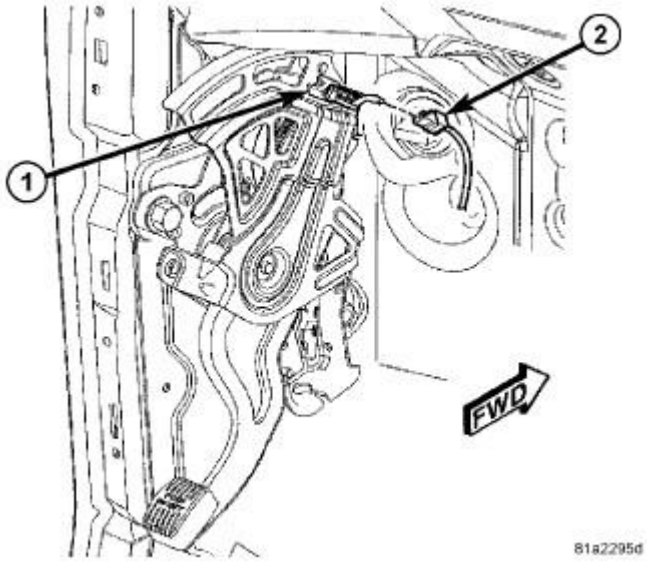

Fig. 324: Parking Brake Switch Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect wiring connector (2) at parking brake switch (1).

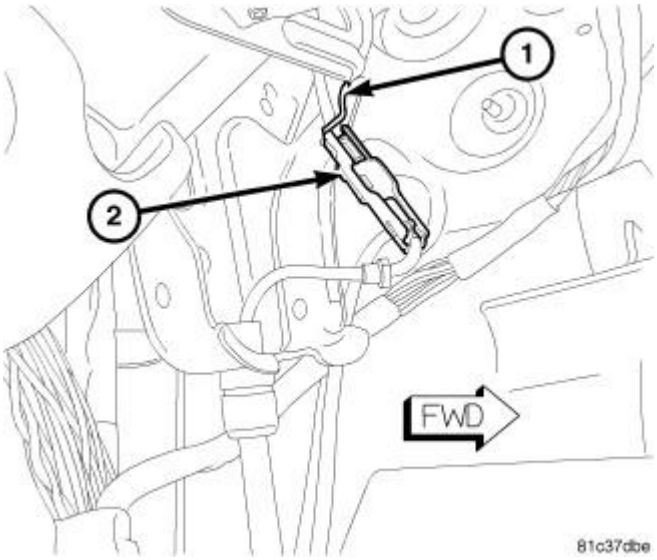

Fig. 325: Cable Connector Secured In Fork
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove front parking brake cable from cable connector at lever without securing connector first. If not secured, cable connector will wind up inside lever assembly making it most difficult to retrieve and reconnect to front cable upon installation.

6. Using pliers, reach up inside parking brake lever assembly and pull downward on parking brake cable connector. Secure cable connector (2) in retaining fork (1) formed into parking brake lever bracket as shown in illustration.

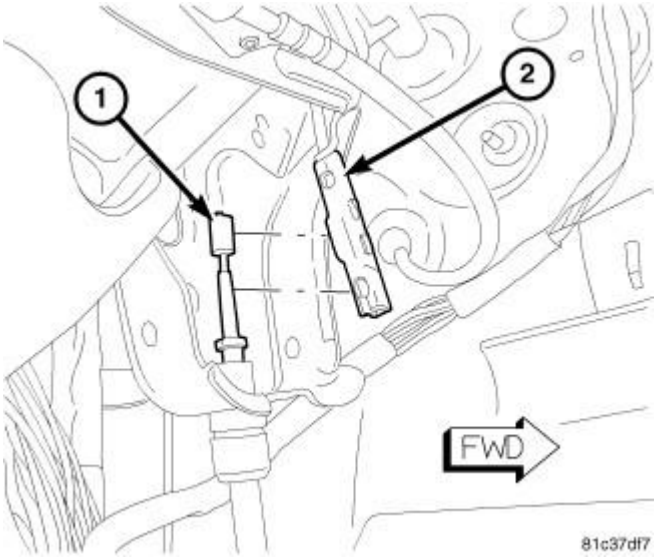

Fig. 326: Front Cable AT Lever Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disengage and remove front parking brake cable strand (1) from cable connector (2), leaving cable connector secured in retaining fork.

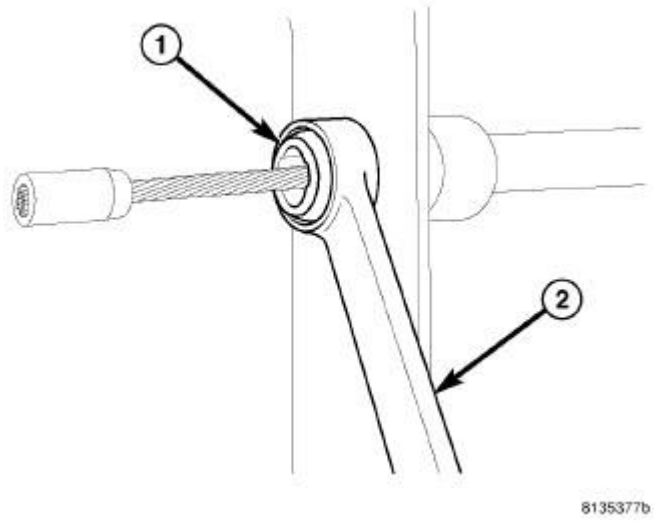

Fig. 327: Removing Cable Using Wrench
Courtesy of CHRYSLER GROUP, LLC

1 - CABLE RETAINER
2 - 12-POINT BOX WRENCH

8. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown in illustration to collapse retainer fingers. Pull cable from bracket.

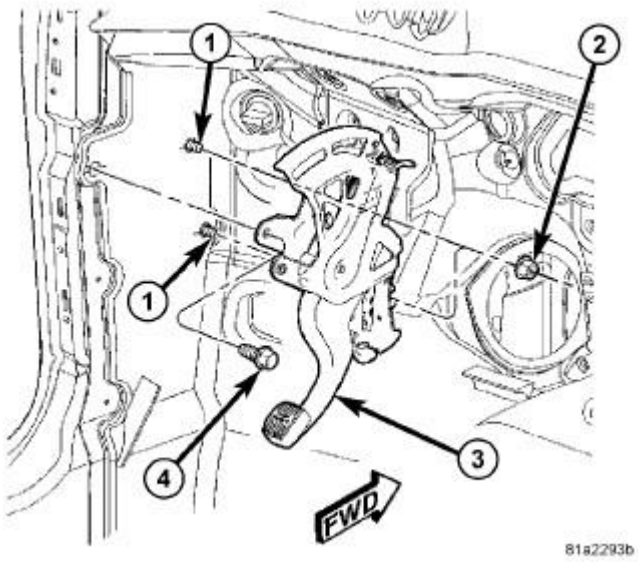

Fig. 328: Lever Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt (4) and two nuts (2) mounting parking brake lever (3) to body.
10. Remove parking brake lever (3).

LEVER - RHD

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

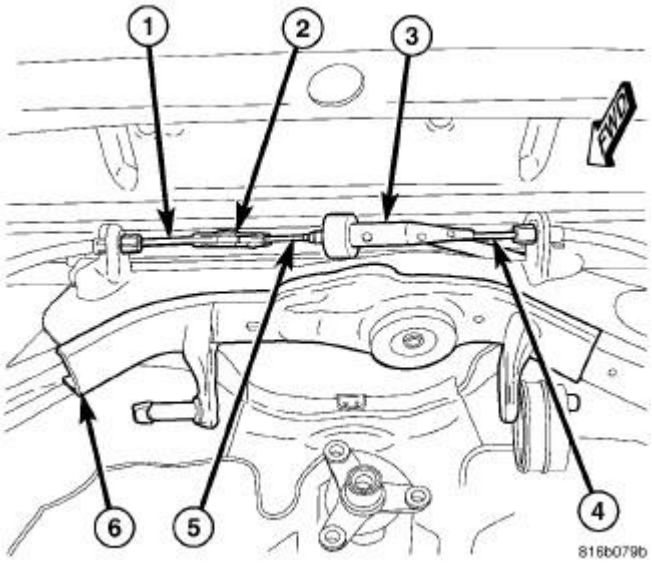

Fig. 329: Cables AT Equalizer - RHD

Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (5) at connector (2) to right rear parking brake cable.
3. Lower vehicle.
4. Remove driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .
5. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
6. Remove foot rest. Refer to **FOOT REST, FLOOR, FRONT, REMOVAL** .
7. Roll back carpet at center console to access lever mounting nuts.

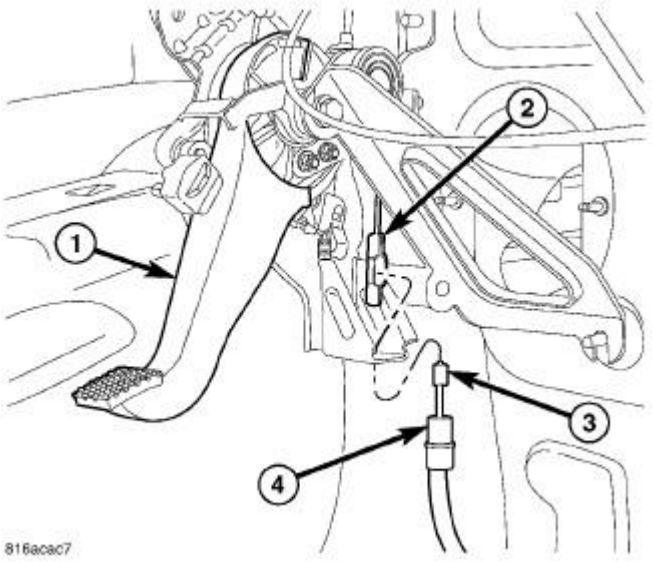

Fig. 330: Cable Connection AT Lever - RHD
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect wiring connector at parking brake switch on lever.
9. Disconnect front parking brake cable strand (3) at lever connector (2).

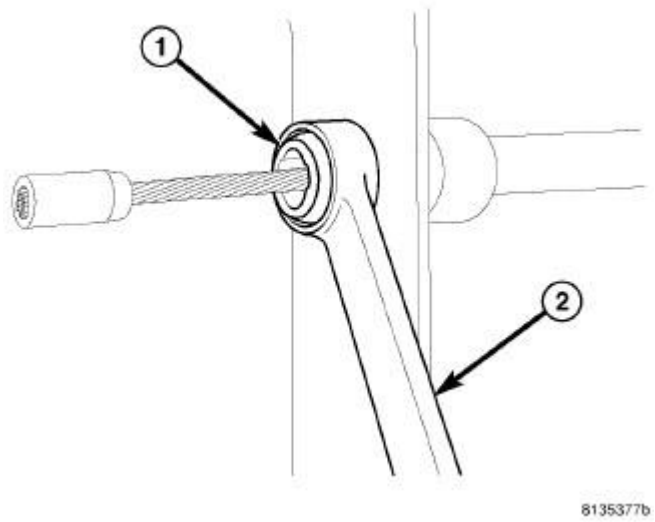

Fig. 331: Removing Cable Using Wrench
Courtesy of CHRYSLER GROUP, LLC

1 - CABLE RETAINER
2 - 12-POINT BOX WRENCH

10. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown in illustration to collapse retainer fingers. Pull cable from bracket.

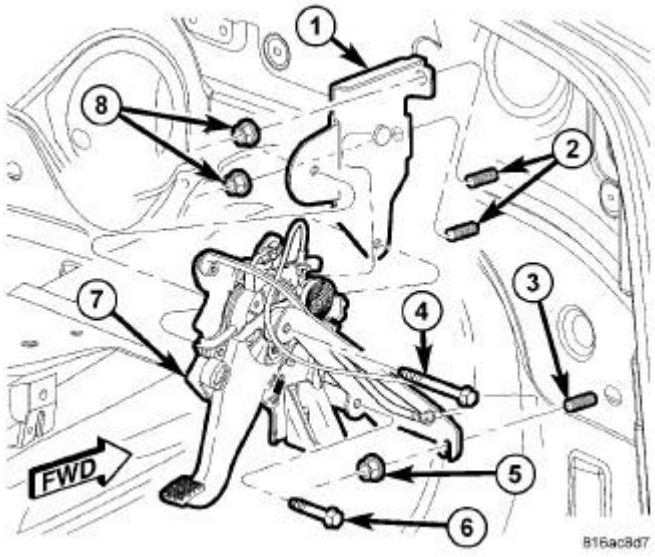

Fig. 332: Parking Brake Lever - RHD
Courtesy of CHRYSLER GROUP, LLC

11. Loosen nut (5) mounting parking brake lever (7) to body.

12. Remove nuts (8) mounting parking brake lever (7) to body.
13. Remove parking brake lever (7).

INSTALLATION

LEVER

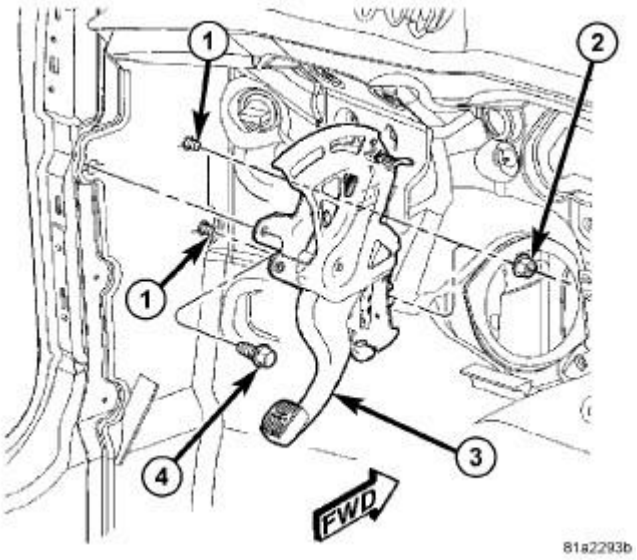

Fig. 333: Lever Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install parking brake lever (3) over mounting studs (1).
2. Install bolt (4) and two nuts (2) mounting parking brake lever to body. Tighten bolt and nuts to 26 N.m (19 ft. lbs.).

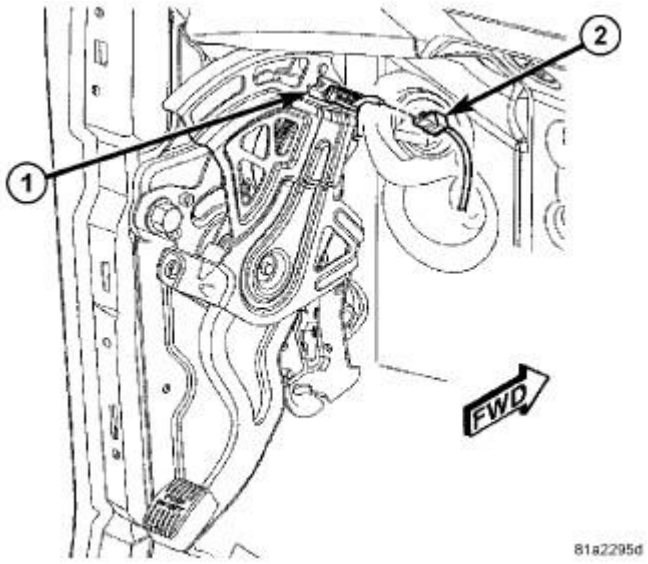

Fig. 334: Parking Brake Switch Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect wiring connector (2) at parking brake switch (1).

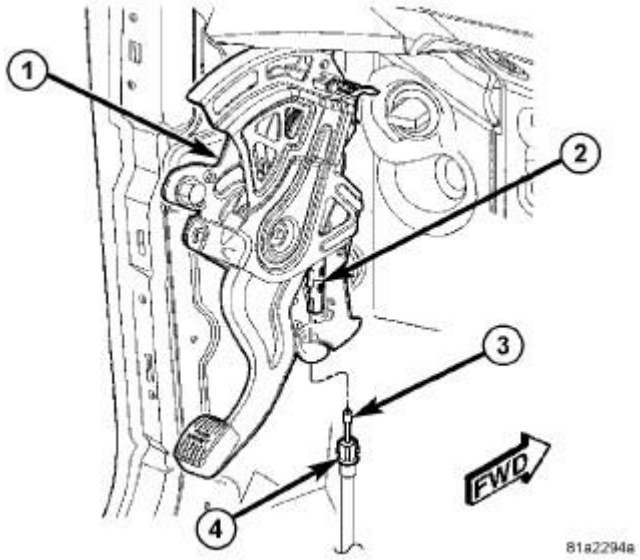

Fig. 335: Front Cable AT Lever
Courtesy of CHRYSLER GROUP, LLC

4. Guide cable strand (3) up through lever bracket and press cable housing retainer (4) into bracket allowing retainer fingers to lock cable in place.

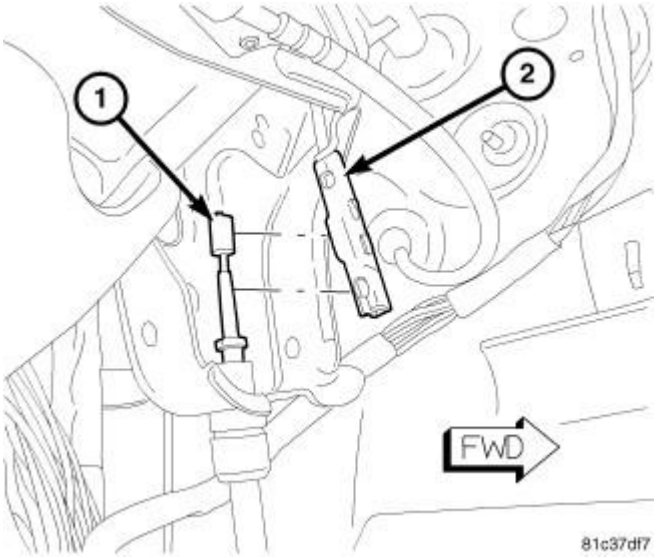

Fig. 336: Front Cable AT Lever Connector
Courtesy of CHRYSLER GROUP, LLC

5. If original parking brake lever is being installed:
    1. Connect front parking brake cable strand (1) to cable connector (2) secured in retaining fork.
    2. Once front parking brake cable strand is completely seated in cable connector (2), lift cable connector out of retaining fork using pliers and slowly allow lever mechanism to take up slack in cable.

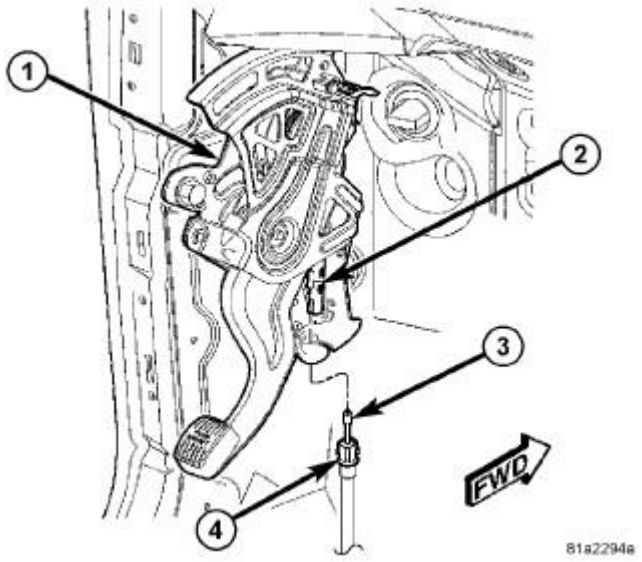

Fig. 337: Front Cable AT Lever
Courtesy of CHRYSLER GROUP, LLC

6. If NEW parking brake lever is being installed:

1. Connect front parking brake cable strand (3) at lever connector (2).
2. Once front parking brake cable strand is completely seated in cable connector (2), remove pin locking out automatic tensioning spring.

7. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
8. Raise and support vehicle.

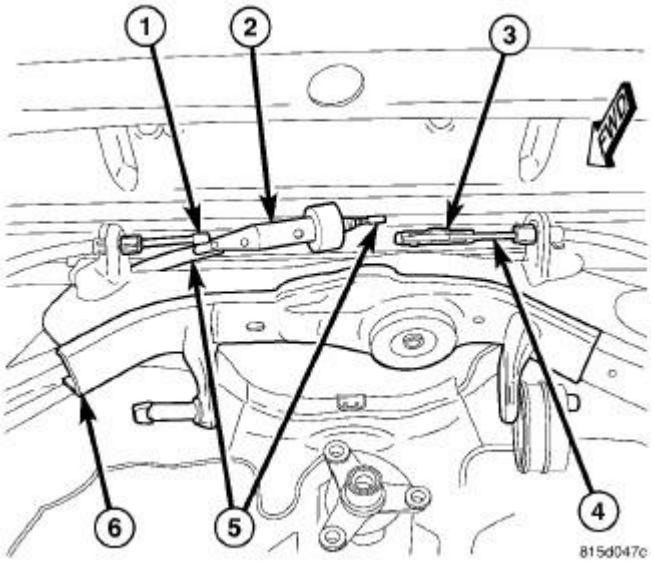

Fig. 338: Parking Brake Cables AT Rear Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

9. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).
10. Lower vehicle until rear wheels are just above floor level.
11. Apply parking brake lever. Release lever to test release cable and handle. Reapply lever. While doing this, check to make sure the red indicator lamp in the cluster turns on and off properly.
12. Check to make sure rear wheels will not rotate with lever applied.
13. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
14. Apply parking brake lever.
15. Lower vehicle.

LEVER - RHD

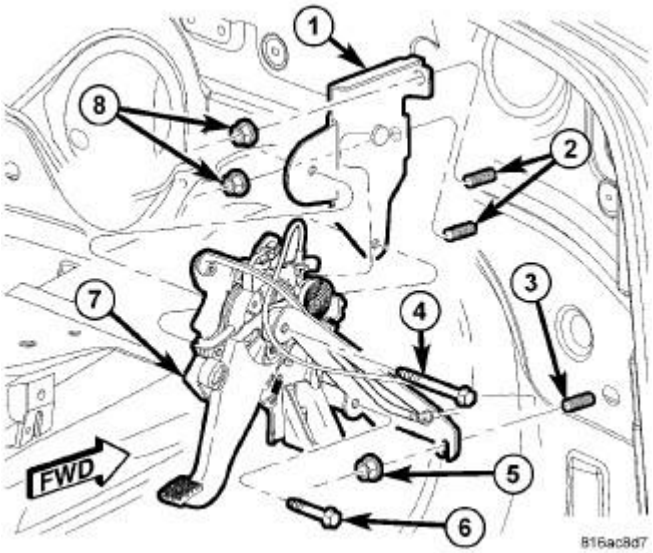

Fig. 339: Parking Brake Lever - RHD
Courtesy of CHRYSLER GROUP, LLC

1. Install parking brake lever (7) over mounting studs (2, 3).
2. Install two nuts (8) mounting left side of parking brake lever to body. Tighten nuts to 26 N.m (19 ft. lbs.).
3. Tighten nut (5) left on stud (3) to 26 N.m (19 ft. lbs.).

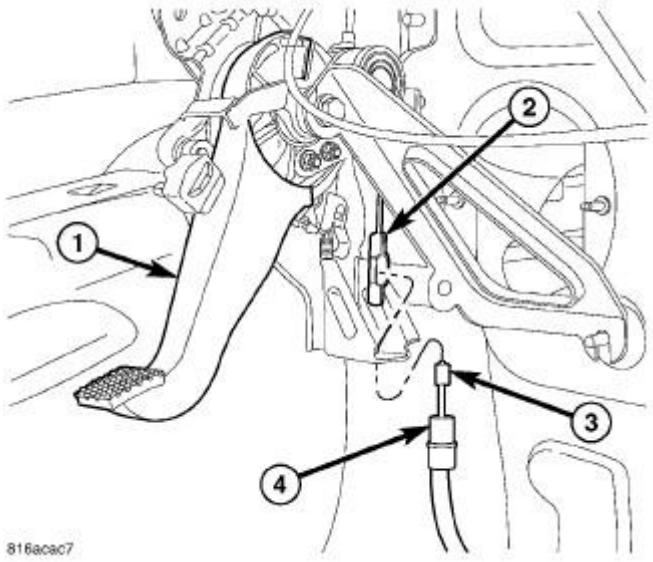

Fig. 340: Cable Connection AT Lever - RHD
Courtesy of CHRYSLER GROUP, LLC

4. Connect wiring connector at parking brake switch.
5. Guide front parking brake cable strand (3) up through lever bracket and press cable housing

retainer (4) into bracket allowing retainer fingers to lock cable in place.

6. Connect parking brake cable strand (3) at lever connector (2).
7. If installing new lever, remove pin locking out automatic tensioning spring.
8. Reposition carpet back to original position at center console.
9. Install foot rest. Refer to **FOOT REST, FLOOR, FRONT, INSTALLATION** .
10. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
11. Install driver side silencer under instrument panel. Refer to **PANEL, SILENCER, INSTALLATION** .
12. Raise and support vehicle.

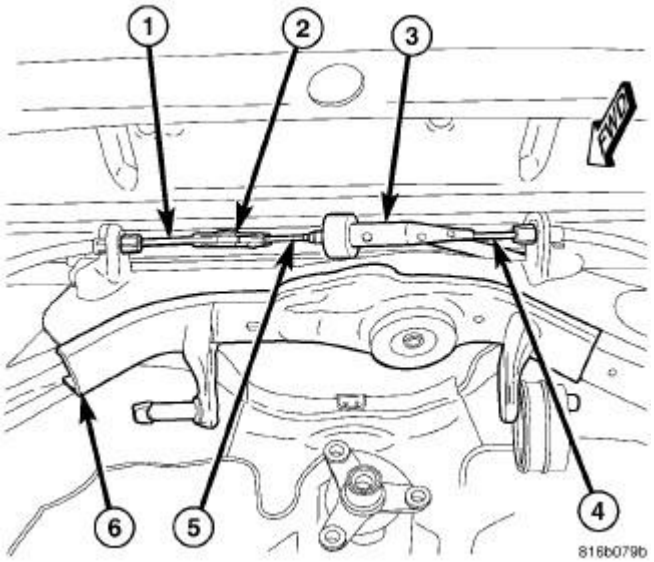

Fig. 341: Cables AT Equalizer - RHD
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

13. Connect front parking brake cable (5) at connector (2) to left rear parking brake cable (1).
14. Lower vehicle until rear wheels are just above floor level.
15. Apply parking brake lever. Release lever to test release cable and handle. Reapply lever. While doing this, check to make sure the red indicator lamp in the cluster turns on and off properly.
16. Check to make sure rear wheels will not rotate with lever applied.
17. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
18. Apply parking brake lever.
19. Lower vehicle.

SHOES, PARKING BRAKE

ADJUSTMENTS

ADJUSTMENTS

While most vehicles require only a fine adjustment of the parking brake shoes, some vehicles may require a preliminary adjustment before a fine adjustment can be made. If a preliminary adjustment must be made, refer to PRELIMINARY ADJUSTMENT following the fine adjustment procedure listed below.

1. Place parking brake lever in "full released" position.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

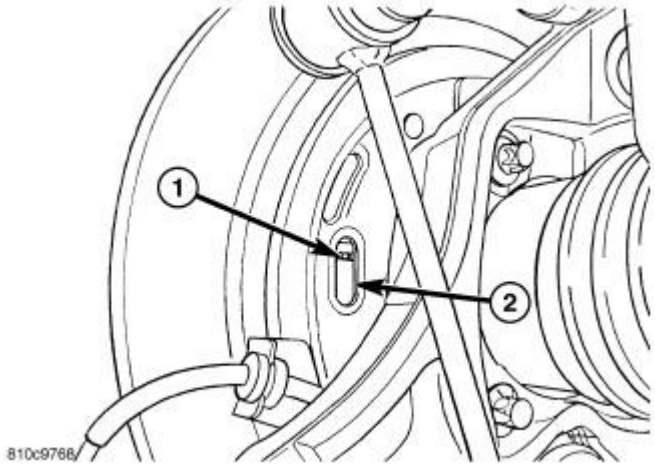

Fig. 342: Access To Shoe Adjuster Star-Wheel
Courtesy of CHRYSLER GROUP, LLC

1 - ADJUSTER STAR WHEEL
2 - ACCESS HOLE

3. Remove plug in parking brake shoe support to access adjuster star-wheel (1).

NOTE: Through the access hole (2), rotate the adjuster star wheel (1) in the following direction to expand the shoes outward against the drum.

- **Left brake - Rotate star-wheel toward rear of vehicle.**
- **Right brake - Rotate star-wheel toward front of vehicle.**

4. Using an appropriate tool, turn adjuster star wheel (1) until wheel will not rotate (dead lock).
5. Back off adjuster six detents (teeth).
6. Rotate wheel, checking for light drag. If drag is too heavy, continue to back off adjuster one

detent at a time until light drag is present. **Do not back off star-wheel more than 17 detents from wheel lock.**

7. Install access plug.
8. Adjust opposite wheel parking brake shoes using same method.
9. Lower vehicle.
10. Apply and release parking brake lever once to ensure proper operation of parking brakes.

PRELIMINARY ADJUSTMENT

1. Remove rear brake rotor. Refer to **ROTOR, BRAKE, REMOVAL**.

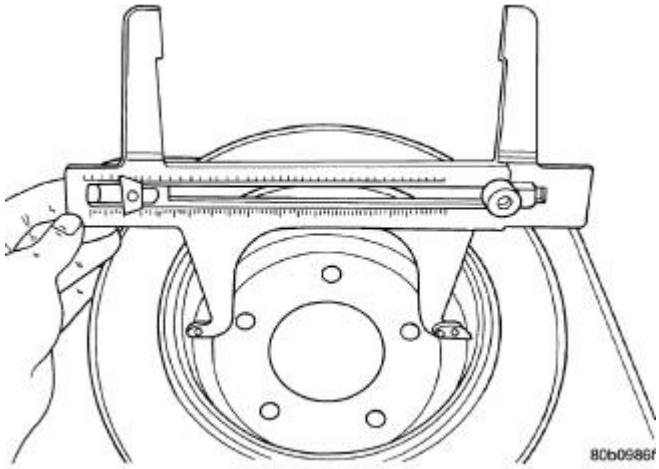

Fig. 343: Measuring Parking Brake Drum Diameter
Courtesy of CHRYSLER GROUP, LLC

2. Using Brake Shoe Gauge, Special Tool (special tool #C-3919, Gauge, Brake Shoes), or equivalent, measure inside diameter of parking brake drum portion of rotor. Set Gauge.

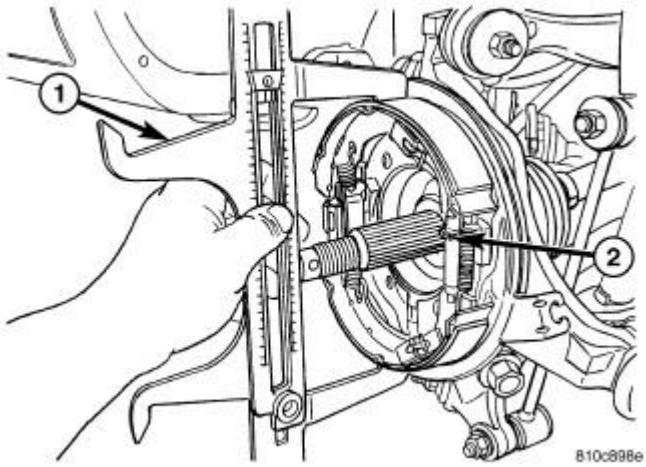

Fig. 344: Measuring Parking Brake Shoes

Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE GAUGE
2 - ADJUSTER STAR WHEEL

3. Place Gauge (1) over parking brake shoes at widest point.
4. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge.
5. Install rear brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION**.
6. Perform fine adjustment of parking brake shoes.

REMOVAL

REMOVAL

NOTE: The following procedure may be used to remove shoes on either side of the vehicle.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Access and remove rear hub and bearing. Refer to **HUB AND BEARING, REMOVAL** .

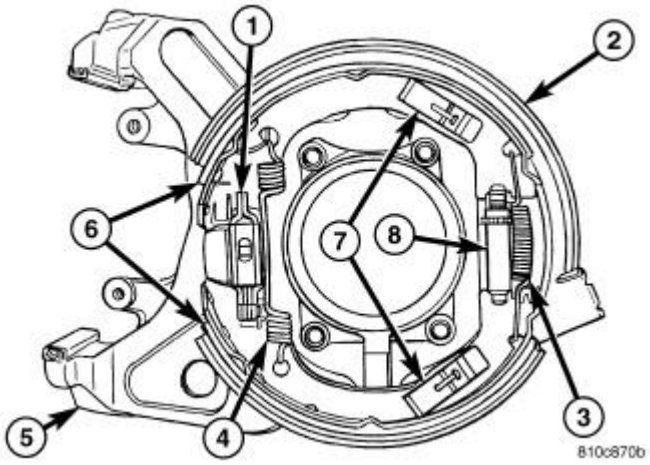

Fig. 345: Identifying Parking Brake Components
Courtesy of CHRYSLER GROUP, LLC

1 - ACTUATOR
2 - SUPPORT
3 - ADJUSTER SPRING
4 - RETURN SPRING
5 - CALIPER ADAPTER
6 - SHOES

7 - HOLD-DOWN CLIPS AND PINS
8 - ADJUSTER

3. Completely back off parking brake shoe adjustment (8).
4. Remove parking brake shoe adjuster spring (3).
5. Remove shoe adjuster (8).
6. Remove upper brake shoe hold-down clip and pin (7).
7. Remove upper shoe (6) from return spring (4) and shoe actuator lever (1).
8. Remove return spring (4) from lower shoe (6).

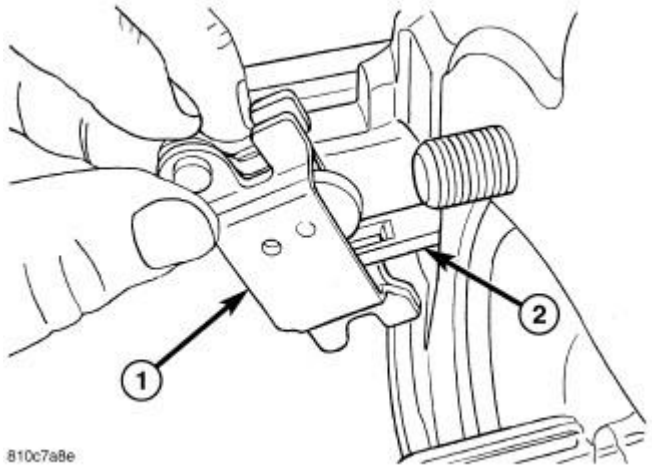

Fig. 346: Removing/Installing Actuator
Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

9. Remove shoe actuator lever (1) from end of cable (2).

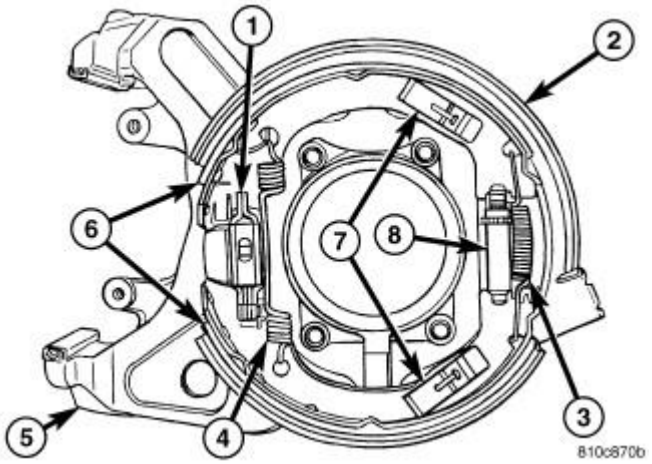

Fig. 347: Identifying Parking Brake Components
Courtesy of CHRYSLER GROUP, LLC

1 - ACTUATOR
2 - SUPPORT
3 - ADJUSTER SPRING
4 - RETURN SPRING
5 - CALIPER ADAPTER
6 - SHOES
7 - HOLD-DOWN CLIPS AND PINS
8 - ADJUSTER

10. Remove lower brake shoe hold-down clip and pin (7).
11. Remove lower shoe (6).
12. Inspect springs, adjuster, lever and aluminum shoe anchor pin for wear or damage. Replace as necessary.

INSTALLATION

INSTALLATION

NOTE: The following procedure may be used to install shoes on either side of the vehicle.

NOTE: Inspect springs, adjuster, lever and aluminum shoe anchor pin for wear or damage prior to installation. Replace as necessary.

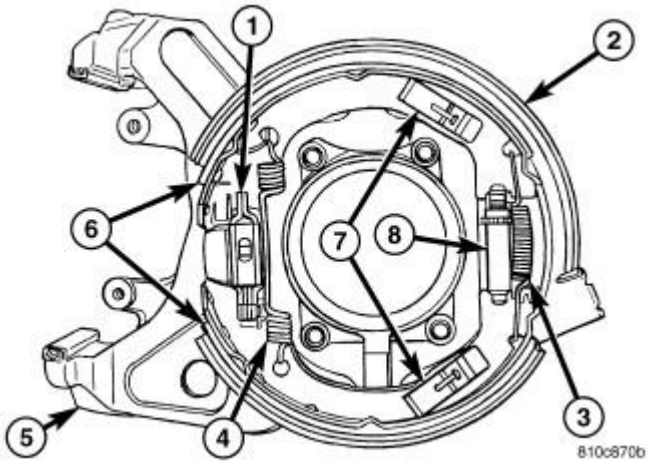

Fig. 348: Identifying Parking Brake Components
Courtesy of CHRYSLER GROUP, LLC

1 - ACTUATOR
2 - SUPPORT
3 - ADJUSTER SPRING
4 - RETURN SPRING
5 - CALIPER ADAPTER
6 - SHOES
7 - HOLD-DOWN CLIPS AND PINS
8 - ADJUSTER

1. Install lower brake shoe hold-down pin (7) through rear of support (2).
2. Install lower shoe (6) against support plate (2).
3. Install lower brake shoe hold-down clip (7).

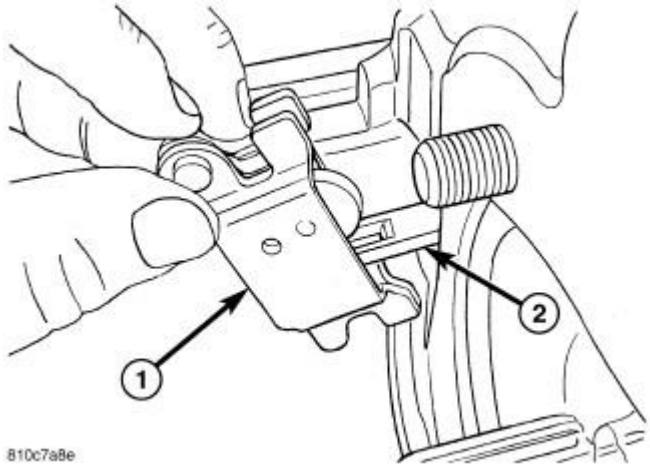

Fig. 349: Removing/Installing Actuator

Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

4. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.

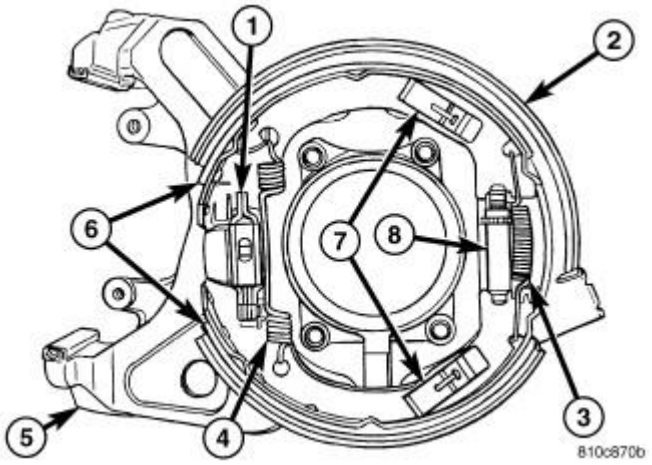

Fig. 350: Identifying Parking Brake Components
Courtesy of CHRYSLER GROUP, LLC

1 - ACTUATOR
2 - SUPPORT
3 - ADJUSTER SPRING
4 - RETURN SPRING
5 - CALIPER ADAPTER
6 - SHOES
7 - HOLD-DOWN CLIPS AND PINS
8 - ADJUSTER

5. Install return spring (4) to lower shoe (6).
6. Install upper shoe (6) against support plate and onto shoe actuator lever.
7. Install upper brake shoe hold-down pin (7) through rear of support and upper shoe.
8. Install upper brake shoe hold-down clip (7).
9. Attach return spring (4) to upper shoe (6).
10. Install shoe adjuster (8). Place end of adjuster with star wheel upward.
11. Install parking brake shoe adjuster spring (3).

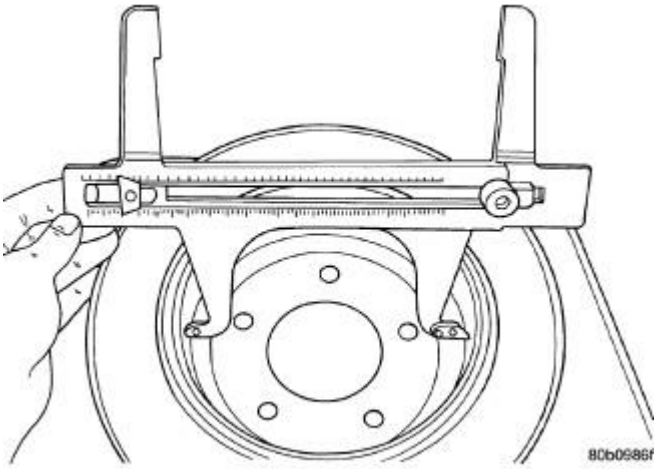

Fig. 351: Measuring Parking Brake Drum Diameter
Courtesy of CHRYSLER GROUP, LLC

12. Using Brake Shoe Gauge, Special Tool (special tool #C-3919, Gauge, Brake Shoes), or equivalent, measure inside diameter of parking brake drum portion of rotor. Set gauge.

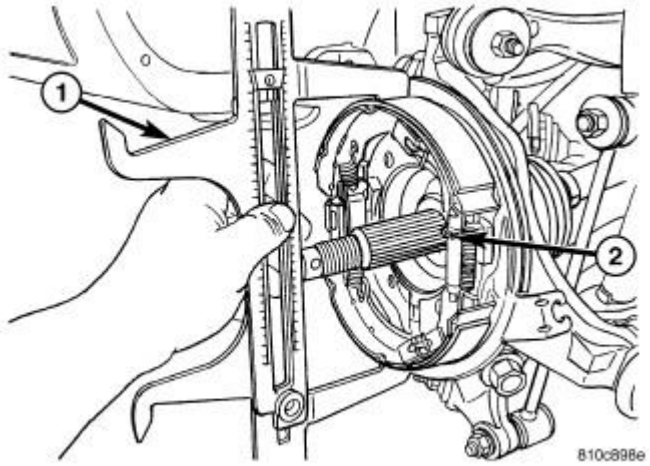

Fig. 352: Measuring Parking Brake Shoes
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE GAUGE
2 - ADJUSTER STAR WHEEL

13. Place Gauge (1) over parking brake shoes at widest point.
14. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
15. Install hub and bearing with wheel speed sensor as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION** .

16. Lower vehicle.
17. Perform final adjustment of parking brake shoes. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS**.

CABIN AIR FILTER

Chrysler - 300, Charger & Magnum

REMOVAL & INSTALLATION

CABIN AIR FILTER

NOTE: Manufacturer's terminology for this filter is Particulate Air Filter.

Removal

1. Remove front air inlet grille (1) from the wiper module screen (2) located under the dash panel in the engine compartment. Refer to **Fig. 1**.
2. Open the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5). Refer to **Fig. 1**.

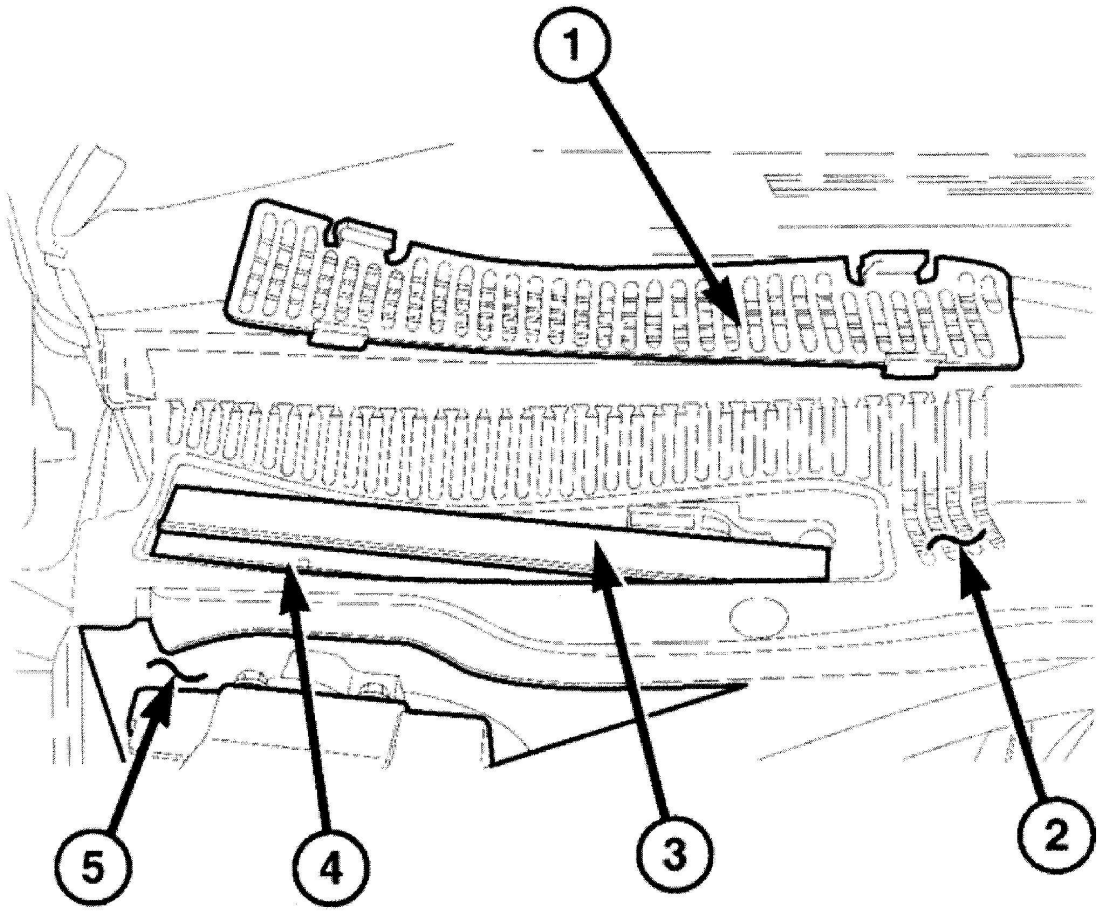

Fig. 1: Underhood Dash Panel Components

Courtesy of DAIMLERCHRYSLER CORPORATION

NOTE: To aid in reinstallation, note the installed position of the particulate air filter prior to removal of the filter.

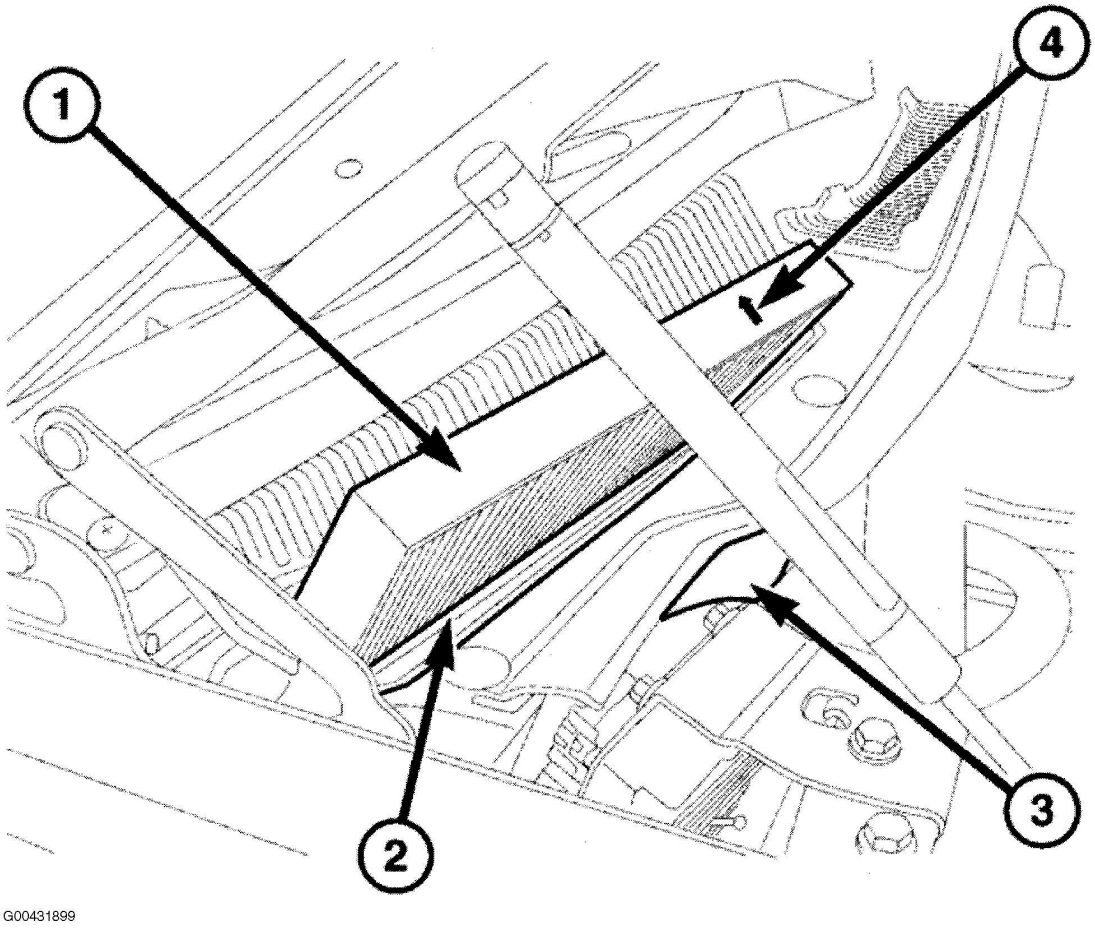

Fig. 2: Particulate Air Filter Position & Location
Courtesy of DAIMLERCHRYSLER CORPORATION

3. Remove the particulate air filter (1) from the particulate air filter housing (2) located inside of the dash panel plenum (3). Note the direction of air flow indicated by an arrow (4) on the filter. Refer to **Fig. 2**.

Installation

NOTE: The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

1. Install the particulate air filter (1) into the particulate air filter housing (2) located inside of the dash panel plenum (3). Insert the particulate air filter down directly into the filter housing with the arrow (4) on the filter pointing to the rear of the vehicle. The particulate air filter is held in place by friction between the filter element and the filter housing, so no fasteners are required. Refer to **Fig. 2**.
2. Close the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5). Refer to **Fig. 1**.
3. Install the air inlet grille (1) onto the wiper module screen (2). Refer to **Fig. 1**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trip if the problem does not occur again.

ON-BOARD DIAGNOSTIC SYSTEM

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test. Refer to **BATTERY, STANDARD PROCEDURE** .
- loose generator belt.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Diagnostic manual for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to the Battery information for procedures. Refer to **DIAGNOSIS AND TESTING** .
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) or IPM (if equipped) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation for torque specifications. Refer to **SPECIFICATIONS**.
5. Inspect generator drive belt condition and tension.
6. Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.
7. Inspect automatic belt tensioner (if equipped). Refer to **ENGINE COOLING SYSTEM** for more information.
8. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

SPECIFICATIONS

REMOVAL

3.0L

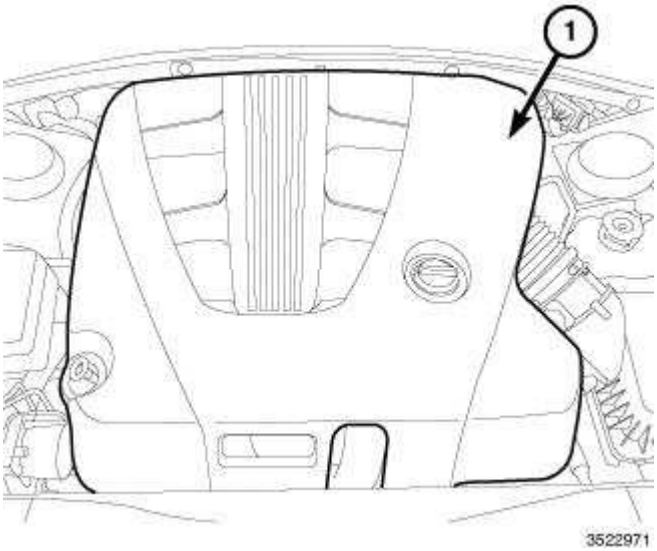

Fig. 1: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

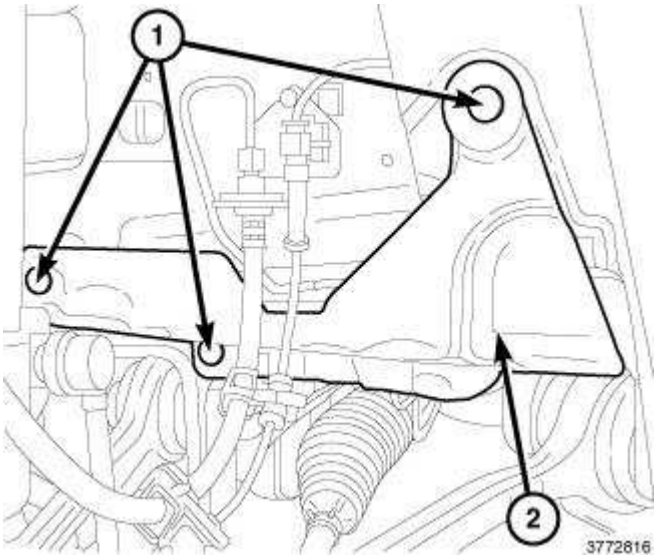

Fig. 2: Three Push Pins & Lower Splash Shield
Courtesy of CHRYSLER GROUP, LLC

3. Remove the right front wheel and tire assembly. Refer to **REMOVAL** .
4. Remove the three push pins (1) and the lower splash shield (2).

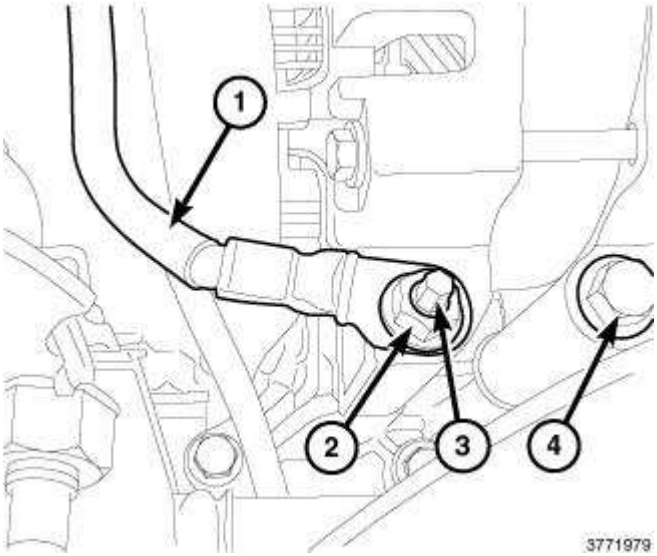

Fig. 3: Lower Generator Bolt, Nut, Ground Cable & Stud
Courtesy of CHRYSLER GROUP, LLC

5. Lower the vehicle.
6. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL** .
7. Remove the lower generator bolt (4).
8. Remove the nut (2) the ground cable (1), and stud (3) from the bottom of generator.

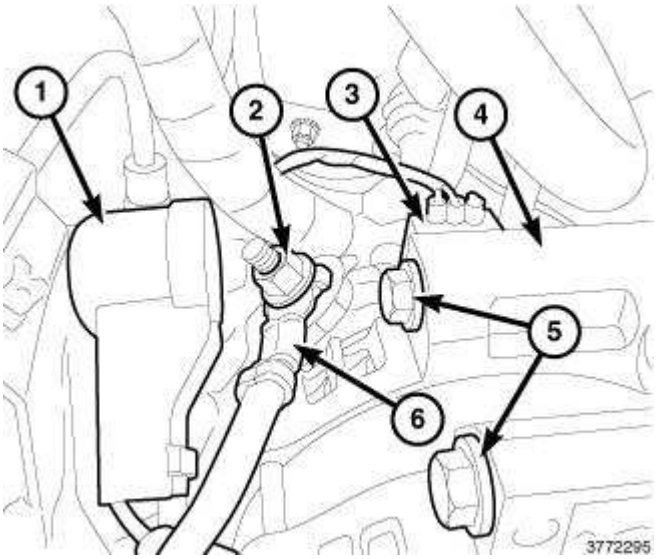

Fig. 4: Field Generator Wire Harness Connector, Protective Cover, Two Upper Bolts, Generator & B+ Cable
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the field generator wire harness connector (3).
10. Remove the protective cover (1) from the B+ cable (6).
11. Remove the two upper bolts (5) and the generator (4).

3.6L

WARNING: Disconnect the negative battery cable before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage the electrical system.

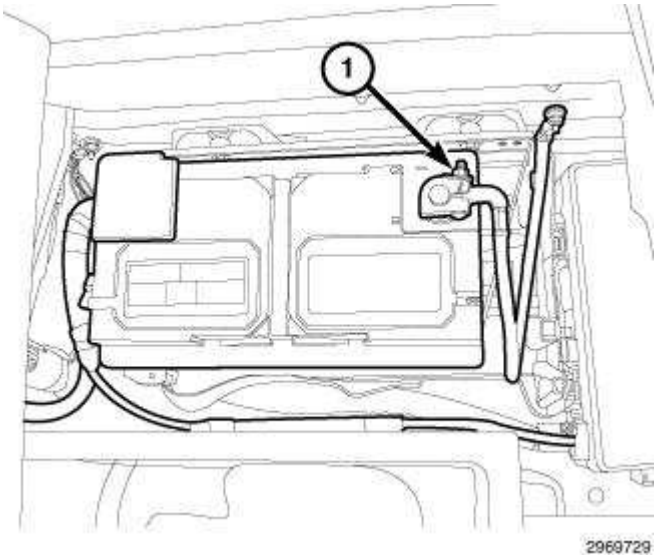

Fig. 5: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

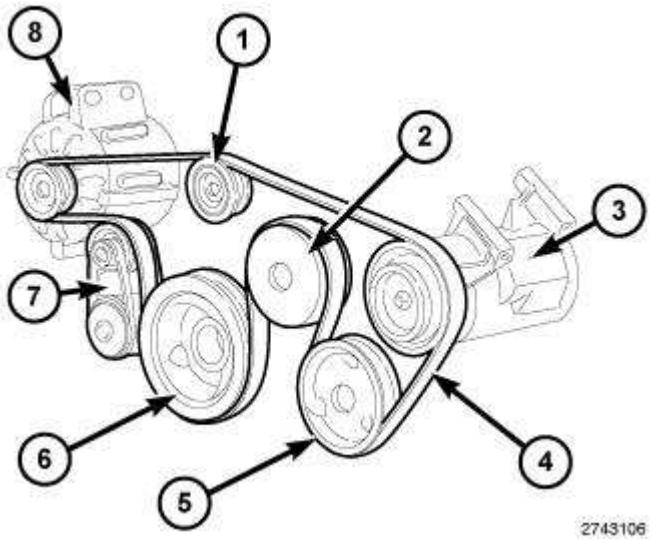

Fig. 6: Drive Belt Tensioners & Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and remove the accessory drive belt (4), then slowly rotate the tensioner into the freearm position.

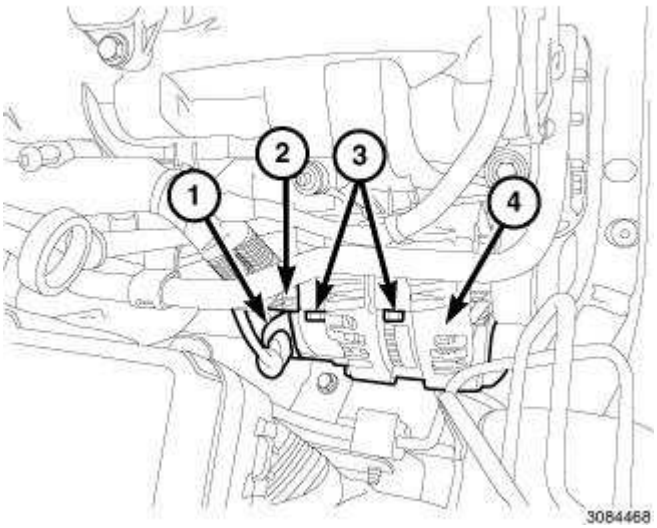

Fig. 7: Retaining Bolts, Insulator Cover, Generator And Field Wire Connector
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper generator retaining bolts (3).

4. Remove the insulator cover (1) from the B+ output terminal at the rear of the generator (4).
5. Remove the B+ terminal retaining nut at the rear of the generator and remove the B+ terminal.
6. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector (2).

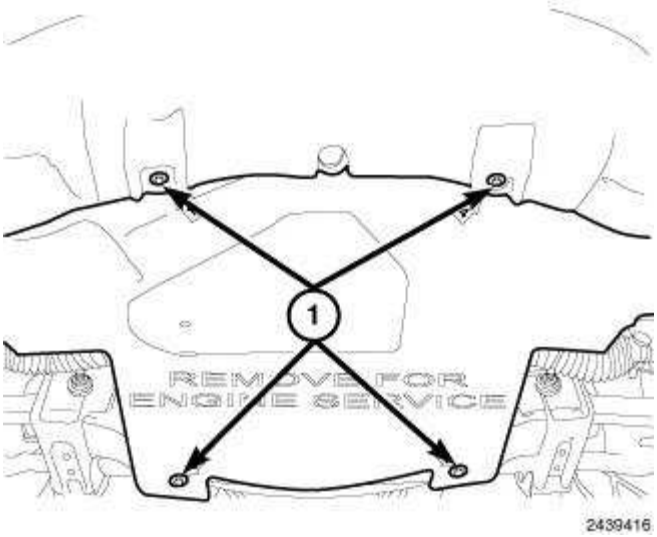

Fig. 8: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Raise and support the vehicle.
8. Remove the belly pan retainers (1) and remove the belly pan.

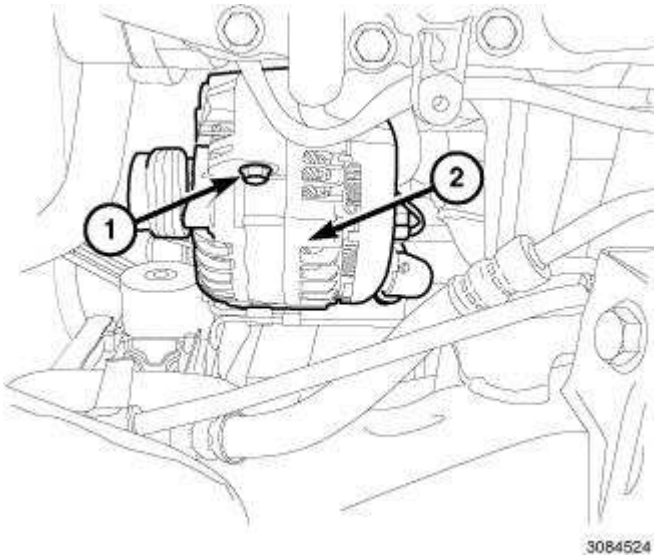

Fig. 9: Generator Retaining Bolt And Generator
Courtesy of CHRYSLER GROUP, LLC

9. Remove the lower generator retaining bolt (1).

10. Remove the generator (2) from below the engine compartment.

5.7L

WARNING: Disconnect the negative battery cable before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage the electrical system.

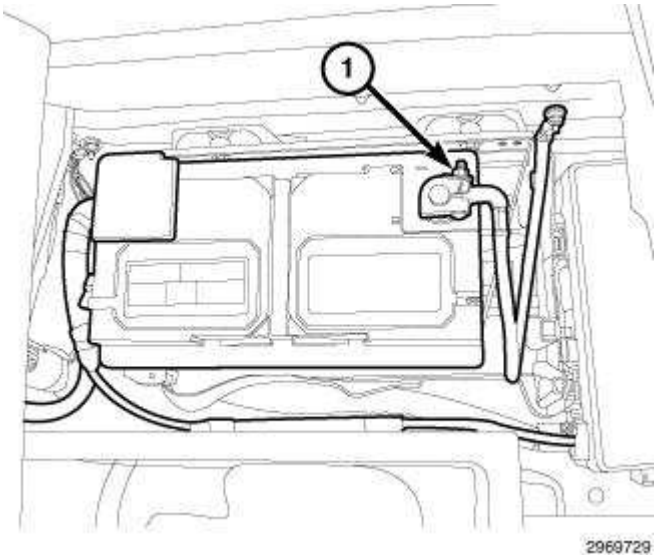

Fig. 10: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

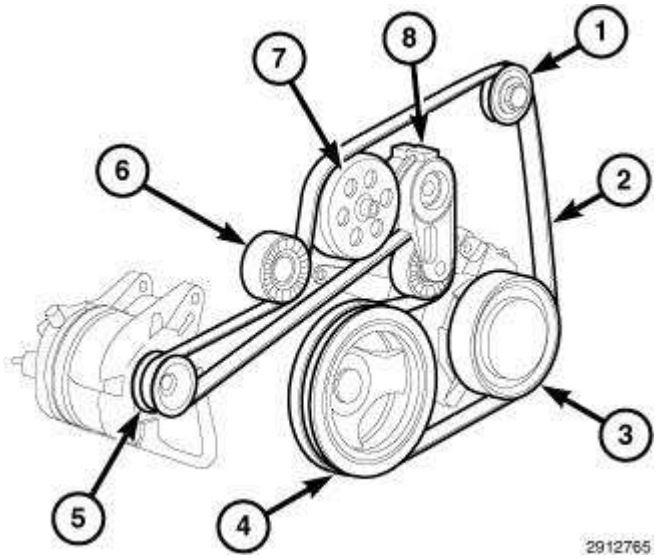

Fig. 11: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.

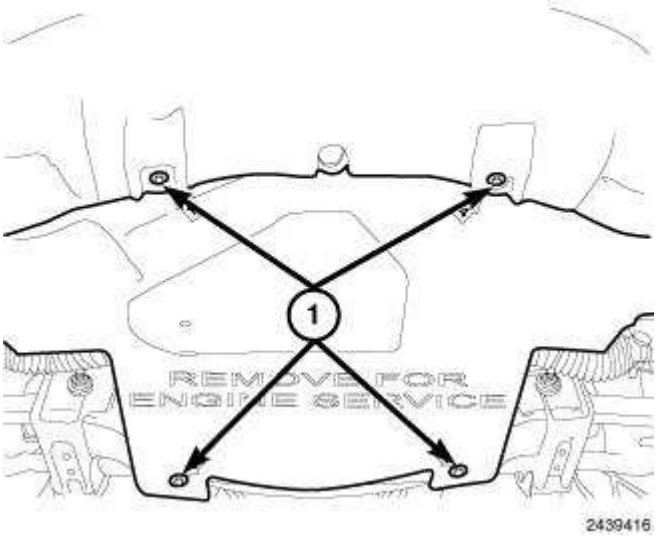

Fig. 12: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Raise and support the vehicle.
4. Remove the belly pan retainers (1) and remove the belly pan.

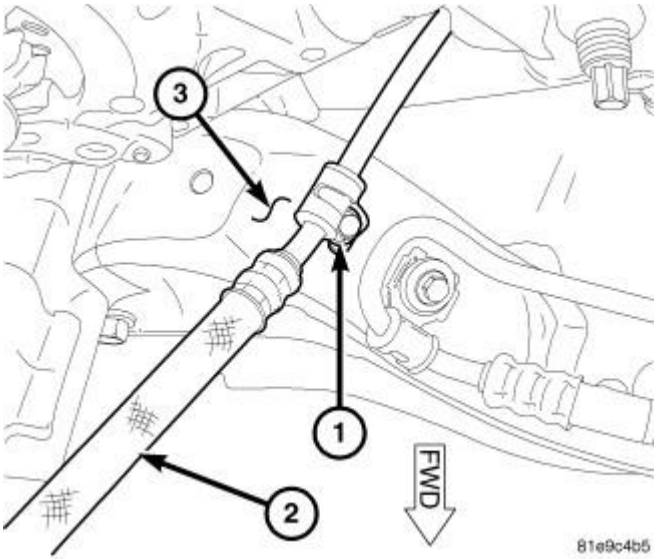

Fig. 13: Trans Cooler Line Clamp
Courtesy of CHRYSLER GROUP, LLC

5. Remove the transmission cooler line retaining clamp (1) at the right crossmember (3) and position the transmission cooler line (2) aside.

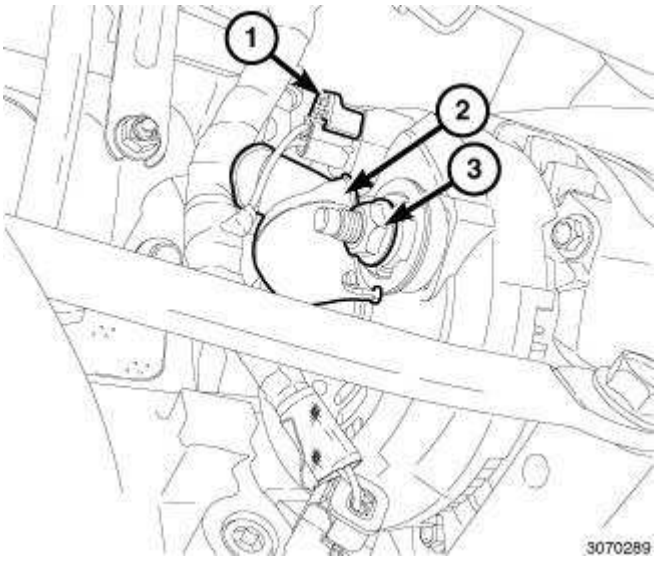

Fig. 14: Connector Tab, Insulator Cover And Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

6. Depress the field wire connector tab (1) at the rear of the generator and disconnect the field wire connector.
7. Remove the insulator cover (2) from B+ output terminal at the rear of the generator.
8. Remove the B+ terminal retaining nut (3) at the rear of the generator and remove the B+ terminal.

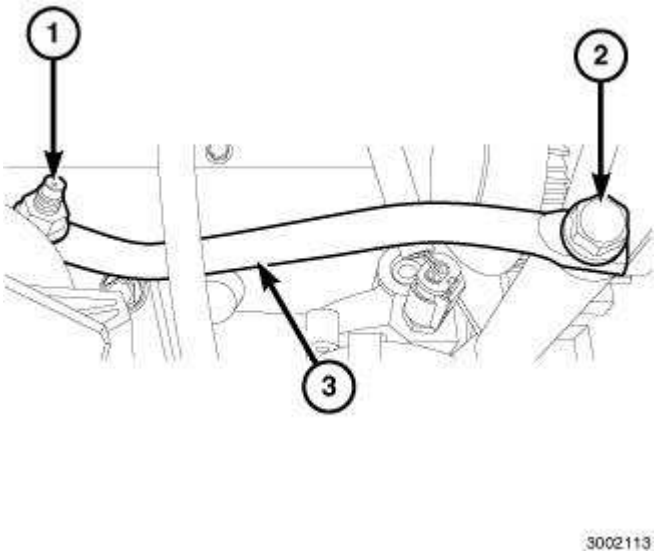

Fig. 15: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove the generator support bracket to engine mount retaining nut (1).
10. Remove the generator support bracket retaining bolt (2) and remove the support bracket (3).

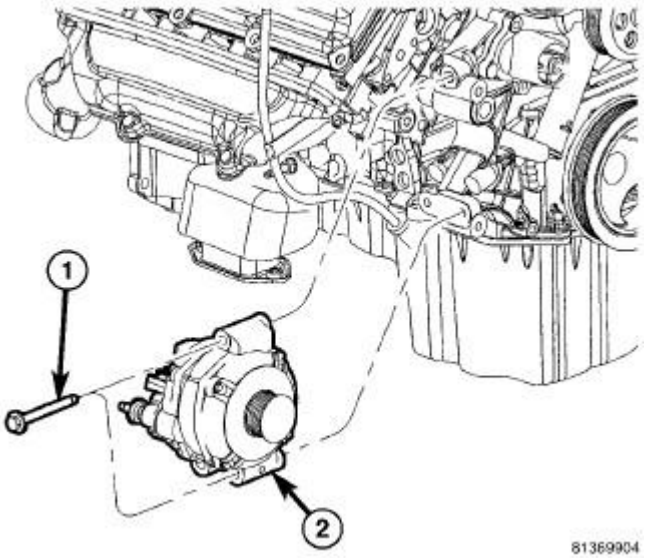

Fig. 16: Generator - 5.7L
Courtesy of CHRYSLER GROUP, LLC

11. Remove the remaining lower generator retaining bolt (1).
12. Lower the vehicle.
13. Remove the upper generator retaining bolt (1) and remove the generator (2) from the vehicle.

WARNING: Disconnect the negative cable from the battery before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage to the electrical system.

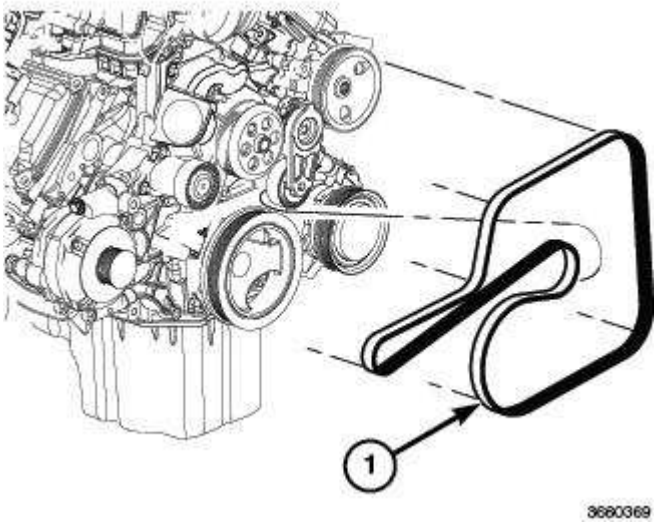

Fig. 17: Serpentine Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .
3. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL** .

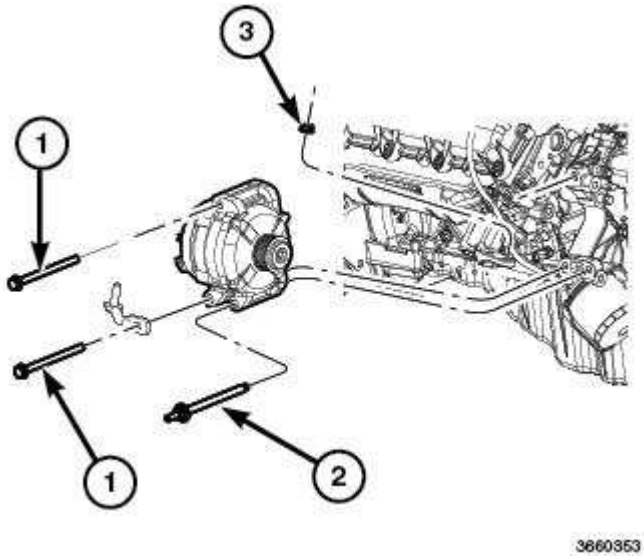

Fig. 18: Field Wire Connector, Upper And Lower Rear Generator Mounting Bolts & Lower Front Stud Nut Bolt

Courtesy of CHRYSLER GROUP, LLC

4. Unsnap the plastic insulator cap from the B+ output terminal.
5. Remove the B+ terminal mounting nut at the rear of the generator. Disconnect the terminal from the generator.
6. Disconnect the field wire connector (3) at the rear of the generator by pushing on the connector tab.
7. Remove the one upper and lower rear generator mounting bolts (1).

NOTE: Not required to loosen the bracket bolt, the generator will slide out.

8. Remove the lower front stud nut bolt (2).
9. Remove the generator from vehicle.

INSTALLATION

3.0L

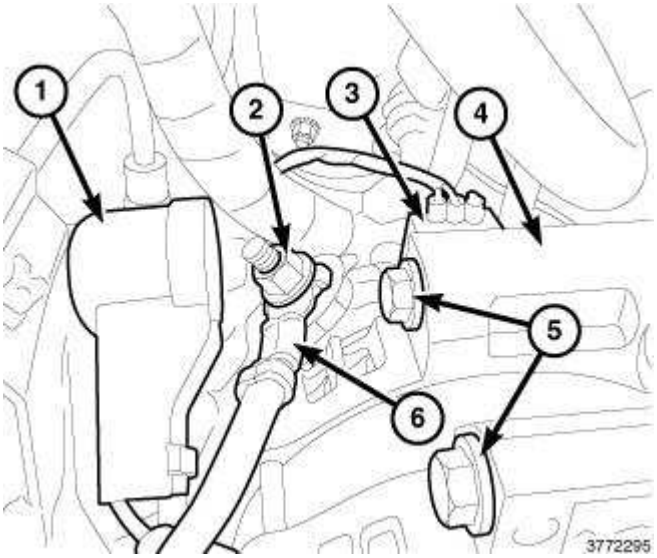

Fig. 19: Field Generator Wire Harness Connector, Protective Cover, Two Upper Bolts, Generator & B+ Cable
Courtesy of CHRYSLER GROUP, LLC

1. Position the generator (4) to the engine and install the upper generator bolts (5). Tighten bolts (5) to 28 N.m (21 ft. lbs).
2. Install the B+ cable (6) to the generator. Tighten nut (2) to 11 N.m (97 in. lbs.).
3. Install the protective cover (1) from the B+ cable (6).
4. Connect the field generator wire harness connector (3).

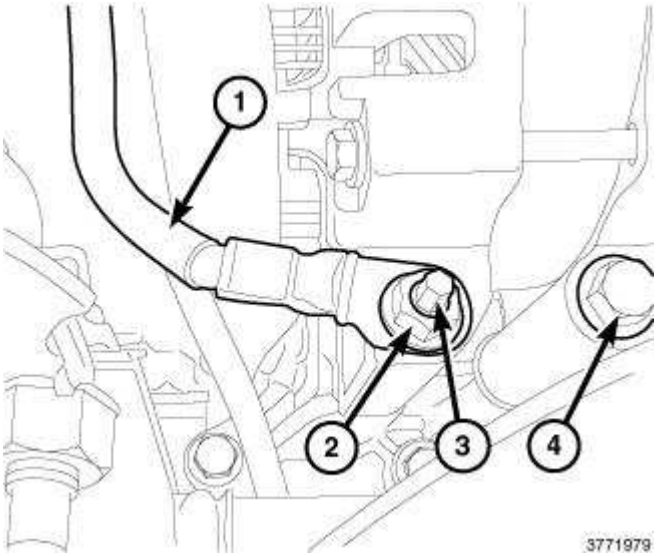

Fig. 20: Lower Generator Bolt, Nut, Ground Cable & Stud
Courtesy of CHRYSLER GROUP, LLC

5. Install the lower generator stud (3) and tighten to 12 N.m (106 in. lbs.).
6. Install the ground cable (1) to the generator. Tighten nut (2) to 28 N.m (21 ft. lbs).
7. Install the lower generator bolt (4) and tighten to 28 N.m (21 ft. lbs).
8. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

Courtesy of CHRYSLER GROUP, LLC

11. Position the belly pan and install the belly pan retainers (1).
12. Lower the vehicle.
13. Tighten the generator upper retaining bolt to 65 N.m (48 ft. lbs.).

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

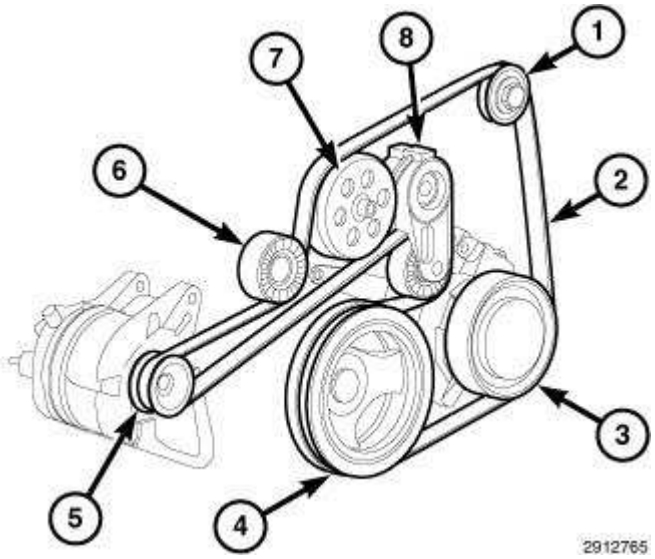

Fig. 34: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

14. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop, install the accessory drive belt (2) onto the pulleys and slowly release the tensioner.

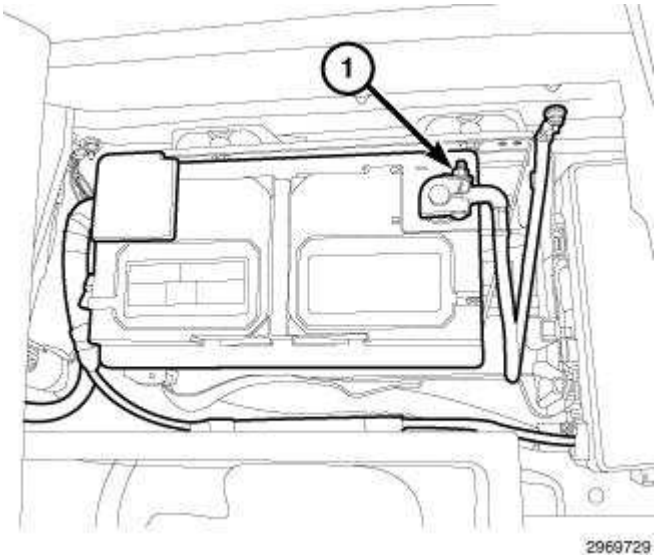

Fig. 35: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

15. Connect the negative battery cable and tighten the nut (1) to 5 N.m (45 in. lbs.).

6.4L

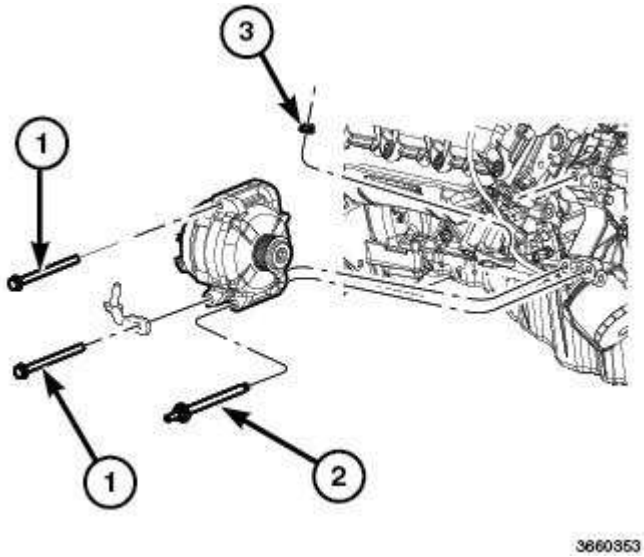

Fig. 36: Field Wire Connector, Upper And Lower Rear Generator Mounting Bolts & Lower Front Stud Nut Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the generator to the engine.
2. Install the lower rear then upper mounting bolt (1).
3. Install the front lower stud nut bolt (2).

   Torque the bolts to 41 N.m (30 ft. lbs.).

4. Snap the field wire connector (3) into the rear of the generator.
5. Install the B+ terminal eyelet to the generator output stud.

   Tighten the mounting nut to 12 N.m (108 in. lbs.).

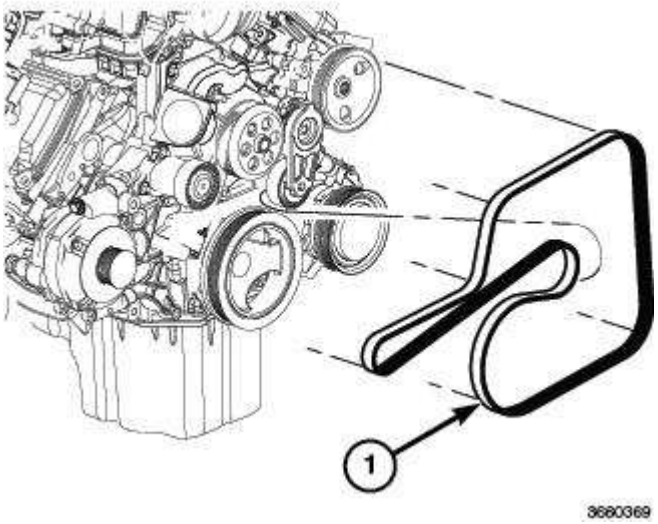

Fig. 37: Serpentine Belt Routing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt must be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to ACCESSORY DRIVE the Belt Schematics .

6. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
7. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION** or **BODY, AIR CLEANER, INSTALLATION, 5.7L** or **BODY, AIR CLEANER, INSTALLATION** .
8. Install the negative battery cable.

ACCESSORIES AND EQUIPMENT

Chime/Buzzer - Service Information - Chrysler 300

DESCRIPTION

CHIME WARNING SYSTEM

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based IC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the IC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The IC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **chime** tone.
- **Slow Rate Repetitive Chime** - Repeated **chime** tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated **chime** tones that are issued at a fast rate of about 180 chimes per minute.

Hard-wired circuitry connects the IC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the IC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The IC chime warning system circuits and components cannot be adjusted or repaired. If the IC circuitry, the on-board transducer or the relay are damaged or ineffective, the IC unit must be

replaced.

BLIND SPOT MONITOR SYSTEM

The Blind Spot Monitor (BSM) system is an optional factory-installed electronic driving aid. During driving maneuvers the system alerts the vehicle operator to vehicles located in the alert zones immediately behind and to the left or right of the vehicle which, due to the surrounding rear vehicle structure, might be otherwise difficult to perceive. When an object is detected, the system uses an electromechanical transducer within the cluster and Light Emitting Diode (LED) indicators within the side view mirrors to provide the vehicle operator with visual and audible indications of the presence of other vehicles.

The BSM system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - In vehicles equipped with the optional blind spot monitor system, the optional Electronic Vehicle Information Center (EVIC) in the instrument cluster displays textual warnings and error messages and emits audible warnings related to the current operating status of the BSM system and provides an interface that allows the vehicle operator to manually disable or enable the system using the customer programmable features option.
- **Blind Spot Display** - Vehicles equipped with the blind spot monitor system have an LED display unit mounted in the side view mirrors. The body of the displays are concealed to the back side of the side view mirrors. Only the amber colored triangle is visible on the outer surface of the mirror glass.
- **Blind Spot Module** - Vehicles equipped with the blind spot monitor system include a module which is secured to the right quarter inner panel by two retainers and concealed behind the interior trim panel.
- **Blind Spot Sensors** - Vehicles equipped with the blind spot system have two radar blind spot sensors that are concealed behind the rear bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket secured at horizontal intervals located on the back side of the rear bumper fascia near the left and right wheel openings.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The blind spot monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced.

PARK ASSIST SYSTEM

A park assist system is an optional factory-installed electronic parking aid. In some markets only a rear park assist system is offered, while other markets may have both front and rear park assist systems available. During parking and other similar vehicle maneuvers, this system alerts the vehicle operator to obstacles located in the path immediately in front of or behind the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an object is detected, the system uses the cluster display, and the vehicles audio system to provide the vehicle operator with visual, and audible indications of the presence, and proximity of such objects.

The park assist system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - In vehicles equipped with the optional park assist system, the optional EVIC in the instrument cluster displays textual warnings and error messages, and emits audible warnings related to the current operating status of the park assist system.
- **Park Assist Switch** - The optional park assist system can be manually disabled or enabled using the U-Connect Touch ™ screen module; located in the instrument panel center stack. The operator can select from one of three options under the settings tab to enable or disable the system, the tone alerts, or the visual alerts.
- **Park Assist Module** - Vehicles equipped with the park assist system include a park assist module which is concealed within the molded plastic park assist module housing. There are three mounting tabs integral to the module housing that secure the module to the vehicle body. Two connector receptacles containing terminal pins that connect the module to the vehicle electrical system are integral to the one side of the housing.
- **Park Assist Sensors** - Vehicles equipped with the rear park assist system have four ultrasonic park assist sensors that are concealed behind the rear bumper fascia. In addition to the rear sensors, vehicles equipped with the front park assist system have six ultrasonic park assist sensors that are concealed behind the front bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the back side of the front or rear bumper fascias.

Hard-wired circuitry connects the various park assist system components to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The park assist system components cannot be adjusted or repaired. If any of the park assist system components are damaged or ineffective, that component must be replaced.

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the ON position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **ABS Indicator Warning** - On vehicles equipped with an optional Antilock Brake System (ABS), the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will generate one short chime each time the ABS indicator is illuminated. This warning indicates a failure condition has been monitored affecting the operation of the ABS related components or circuits. This warning will only occur following completion of the ABS indicator bulb test, and will only occur once during any ignition cycle.
- **Adjustable Pedal System Warning** - On vehicles equipped with the optional adjustable pedal system, the IC will generate one short chime each time a pedal adjustment request is received and a **PEDAL ADJUST. DISABLED - CRUISE CONTROL SET** or a **PEDAL ADJUST. DISABLED - SHIFTER IN REVERSE** textual message is displayed in the EVIC display of the IC. A single short chime will also be sounded each time a pedal adjustment request is received while a failure condition has been monitored affecting the operation of the adjustable pedal system related components or circuits.
- **Airbag Indicator Warning** - The IC will generate one short chime when the ignition switch is in the ON position, and the airbag indicator is illuminated. This warning indicates a failure condition has been monitored affecting the operation of the Supplemental Restraint System (SRS) related components or circuits. This warning will only occur following completion of the airbag indicator bulb test.
- **Automatic Oil Change Indicator** - On vehicles with a gasoline engine, the IC will generate one short chime each time an **OIL CHANGE REQUIRED** or **OIL CHANGE RESET** textual message is displayed in the EVIC display of the IC. This warning indicates that a duty-cycle algorithm contained within the software of the Powertrain Control Module (PCM) has determined that a recommended oil change interval has been attained, or that a reset of the interval has been requested following performance of the recommended service. will only occur once during any ignition cycle.
- **Charging System Indicator Warning** - The IC will generate one short chime each time the ignition switch is in the ON position and the charging system indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the operation of the charging system related components or circuits.
- **Check Gas Cap Warning** - On domestic market vehicles with a gasoline engine, the IC will generate one short chime each time the **CHECK GASCAP** textual message is displayed in the EVIC display of the IC. This warning will only occur once during any ignition cycle.
- **Check Gauges Warning** - The IC will generate one short chime each time the **CHECK GAUGES** textual message is displayed in the EVIC display of the IC. This warning indicates that a gross leak has been detected in the on-board vapor recovery system.
- **Check Engine Indicator Warning** - The IC will generate one short chime when the ignition switch is in the ON position and the check engine (Malfunction Indicator Lamp/MIL) indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the

operation of a critical fuel or emissions related component or circuit.

- **Door Ajar Warning** - The IC will generate one short chime when a **DOOR(S) OPEN** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.
- **Electronic Stability Control (ESC) System Warning** - On vehicles equipped with the optional ESC, the IC will generate one short chime when the **ESC OFF** textual message is displayed in the EVIC display of the IC. This warning indicates that the ESC system has been manually disabled using the ESC switch.
- **Electronic Stability System Fault Warning** - On vehicles equipped with the optional ESC, the IC will generate one short chime each time the ESC indicator is illuminated in the instrument cluster. This warning indicates a failure condition has been monitored affecting the operation of the ESC related components or circuits. This warning will only occur following completion of the ESC indicator bulb test, and will only occur once during any ignition cycle.
- **Fasten Seat Belt Indicator Warning** - The IC will generate repetitive chimes at a slow rate to announce that a hard-wired input from the seat belt switch and the ignition switch indicate that the driver side front seat belt is not fastened with the ignition switch in the ON position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled. Refer to **INDICATORS, INSTRUMENT CLUSTER, OPERATION** .
- **Head/Park Lamps-ON Warning** - The IC will generate repetitive chimes at a fast rate to indicate that hard-wired inputs from the headlamp switch and the ignition switch indicate that the exterior lamps are turned ON with the ignition switch in the OFF position, and either a hard-wired input or an electronic message is received over the Controller Area Network (CAN) data bus indicating that the driver side front door is open. The chimes will continue to sound until the exterior lamps are turned OFF, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Hood Ajar Warning** - On vehicles sold in a market where a hood ajar switch is required equipment, the IC will generate one short chime each time a **HOOD OPEN** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the hood is not closed or completely latched while the vehicle is moving.
- **Key-In-Ignition Warning** - The IC will generate repetitive chimes at a fast rate to indicate that hard-wired inputs from the key-in ignition switch and the ignition switch indicate that the key is in the ignition lock cylinder with the ignition switch in the OFF position, and either a hard-wired input or an electronic message is received over the CAN data bus indicating that the driver side front door is open. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Low Brake Fluid Warning** - The IC will generate one short chime when a **LOW BRAKE FLUID LEVEL** textual message is displayed in the EVIC display of the IC. This warning indicates that the monitored fluid level in the brake master cylinder is low.
- **Low Coolant Warning** - The IC will generate one short chime when the **COOLANT LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored engine coolant level in the coolant reserve bottle is low. This chime will only occur once during any ignition cycle.
- **Low Fuel Warning** - The IC will generate one short chime when the **FUEL LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the

monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.

- **Low Oil Pressure Indicator Warning** - The IC will generate one short chime when the low oil pressure indicator is illuminated and the engine speed is greater than 300 revolutions per minute. This warning indicates that the monitored engine oil pressure is low.
- **Low Wash Warning** - The IC will generate one short chime when the **WASHER FLUID LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored washer fluid level in the washer reservoir is low.
- **Memory System Warning** - On vehicles equipped with the optional memory system, the IC will generate one short chime each time a memory recall request is received and a **MEMORY SYSTEM DISABLED - SEATBELT FASTENED** textual message and icon, or a **MEMORY SYSTEM DISABLED - VEHICLE NOT IN PARK** textual message is displayed in the EVIC display of the IC. A single short chime will also be sounded each time a memory recall request is received while the memory system is inhibited due to a vehicle speed input that is greater than zero.
- **Overspeed Warning** - The IC will generate repetitive chimes at a slow rate when the **WARNING! LIMIT SPEED** textual message is displayed in the EVIC display of the IC. This warning indicates that the vehicle speed is over a pre-programmed speed value. This feature is only enabled on vehicles that have been configured for sale in a Middle East Gulf Coast Country (GCC).
- **Park Assist System Warning** - On vehicles equipped with the optional park assist system, the IC will generate one short chime when the **PARK ASSIST DISABLED** textual message is displayed in the EVIC display of the IC. This warning indicates that the park assist system has been manually disabled using the park assist switch. On vehicles with park assist system this chime warning will only occur as the gear selector lever is being moved from any position except REVERSE or NEUTRAL into REVERSE or NEUTRAL.
- **Park Brake Reminder** - The IC will generate one short chime when the brake/park brake indicator is illuminated to announce that the park brake is applied or not fully released and the vehicle is moving. This chime will only occur once during any ignition cycle.
- **Perform Service Reminder** - On vehicles equipped with a diesel engine, the IC will generate one short chime when the **PERFORM SERVICE** textual message is displayed in the EVIC display of the IC. This reminder occurs when the service distance is at or below zero (miles or kilometers), and will repeat at each subsequent ignition cycle until the service distance is reset, increased or until the service reminder function is disabled. This chime will only occur once during any ignition cycle.
- **Remote Keyless Entry System Warning** - The IC will generate one short chime when a **SERVICE KEYLESS SYS., KEY FOB NOT DETECTED, VEHICLE NOT IN PARK,** or **VEHICLE NOT IN REVERSE** textual error message is displayed in the reconfigurable display of the IC. This message indicates that a Passive Entry and Keyless Go (PEKG) system feature is inoperable due to the displayed error condition.
- **FOBIK PROGRAMMING. Refer to STANDARD PROCEDURE .**
- **Service Column Lock Warning** - On right-hand drive vehicles manufactured with the electronic steering column lock, the IC will generate one short chime each time the **SERVICE COLUMN LOCK** textual message is displayed in the reconfigurable display of the IC. This warning indicates that a failure condition has been monitored affecting the operation of the electronic

steering column lock components or circuits.

- **Service Exhaust Warning** - On vehicles equipped with a diesel engine, the IC will generate one short chime each time the **SERVICE EXHAUST** textual message is displayed in the EVIC display of the IC. This warning indicates that a clogged or damaged diesel engine exhaust particulate filter has been monitored, which may affect diesel engine performance and emissions. This chime will only occur once during any ignition cycle.
- **Service Park Assist System Warning** - On vehicles equipped with the optional park assist system, the IC will generate one short chime each time the **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the EVIC display of the IC. This warning indicates a failure condition has been monitored affecting the operation of the park assist system related components or circuits.
- **Service Tire Pressure Monitor System Warning** - On vehicles equipped with an optional base or premium Tire Pressure Monitor (TPM) system, the IC will generate one short chime each time a **SERVICE TIRE PRESS. SYSTEM** textual message is displayed in the EVIC display of the IC. This warning indicates a failure condition has been monitored affecting the operation of the tire pressure monitor system related components or circuits.
- **Tire Pressure Monitor Warning** - On vehicles equipped with an optional base or premium Tire Pressure Monitor (TPM) system, the IC will generate one short chime each time a **LOW PRESSURE** textual message is displayed in the EVIC display of the IC. This warning indicates that a low pressure condition has been monitored in one of the tires on or in the vehicle.
- **Trans Overtemp Warning** - The IC will generate one short chime each time the **TRANSMISSION OVER TEMP** textual message is displayed in the EVIC display of the IC. This warning indicates that the fluid temperature in the automatic transmission is excessive. This chime will repeat each time the trans overtemp message is cycled from OFF to ON.
- **Turn Signal/Hazard Warning Flasher Emulation** - The IC will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The IC will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs ineffective. In either case, the clicks will continue until the turn signal and hazard warning systems are turned OFF.
- **Turn Signal On Warning** - The IC will generate one short chime and a **TURN SIGNAL ON** textual message with a blinking right or left turn signal icon are displayed in the EVIC display of the IC. This warning indicates that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). The hazard warning flashers will not activate this chime feature.

The IC provides chime service for all available features in the chime warning system, except for the audible warning function provided by each of the optional park assist system display modules. The IC relies on its internal programming, numerous hard-wired inputs, and electronic message inputs received from other modules over the CAN and the Local Interface Network (LIN) data buses to provide the chime warning system features. The internal programming of the IC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard-wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of

wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR SYSTEM

The Blind Spot Monitor (BSM) system is active only when the ignition switch is in the ON or START positions, the transmission gear selector lever is in the DRIVE or NEUTRAL position and the vehicle speed is greater than 10 kilometers-per-hour (6 miles-per-hour). In vehicles equipped with this option, the system is enabled from the factory as a default. The system can be manually disabled and enabled by the vehicle operator using the customer programmable features option of the optional Electronic Vehicle Information Center (EVIC) in the instrument cluster.

The BSM system provides another feature called Rear Cross Path (RCP). The RCP feature is active only when the gear selector is in the reverse position. The RCP feature is intended to aid the driver when backing out of parking spaces where vision of oncoming vehicles may be blocked. The host vehicle must proceed slowly and cautiously out of the parking space until the rear end of the vehicle is exposed. The RCP system will then have a clear view of the cross traffic and if an on coming vehicle is detected, alert the driver. The RCP monitors the rear detection zones on both sides of the vehicle, for objects that are moving toward the side of the vehicle with a minimum speed of 1 to 2 mph (1 km/h to 3 km/h), to objects moving a maximum of 10 mph (16 km/h), such as in parking lot situations.

The microprocessor based blind spot monitor module is the central component of the BSM system. It receives and analyzes data from the sensors, calculates and communicates the proper information to the Driver/Passenger door module to illuminate the display, performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM), and is grounded through a take out and eyelet terminal of the body wire harness that is secured by a screw to the body sheet metal.

Two BSM radar sensors in the rear bumper fascia allow the blind spot monitor system to locate and identify nearby obstacles. The width of the BSM detection zone covers one lane over on both side of the vehicle, approximately 13ft (4.0m). The length of the BSM zone starts at the outside rear view mirror and extends approximately 15ft (4.5m) from the edge of the rear bumper.

The BSM display units, located within the side view mirrors, provide the vehicle operator with a visual warning indicating that an object has been detected within one of the vehicles detection zones. The BSM display **ICON** is illuminated immediately if an object of interest is in the detection zone and meets the warning criteria. However, the BSM system will not illuminate the **ICON** if the object of interest from the rear of the zone and passes the host vehicle at a speed greater that 31mph (50kph), or enters the detection zone from the front of the zone and remains in the zone for less than 1.5

seconds or passes through the zone with a relative speed greater than 12mph (20kph), or if the target vehicle passes the host vehicle in the opposite direction.

The BSM audible alert, is a single chime tone that can also be enabled. The chime tone is only sounded when the turn signal is activated and an object of interest is in the detection zone on the same side and meets the warning criteria. The chime tone is not active during normal driving conditions unless the turn signal is activated. The BSM system also sends a radio mute signal over the CAN data bus to the radio when the chime tone is activated. This request signal activates the radio mute function while the chime tone is sounded, approximately 2 to 3 seconds, then resumes normal radio function. The audible alert my also be deactivated if the operator prefers using the driver preferences within the EVIC. The BSM system can be configured for lights and chime, lights only, and system off.

The RCP function uses the same BSM icon and audible chime. However, the RCP function always combines the BSM display with the audible chime if an object is detected within the RCP detection zone. The BSM icon is illuminated on the side where the object is detected and a rapid repeating short chime tone is sounded. The audible chime can not be deactivated in the RCP function.

When the BSM module monitors a problem in any of the system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the instrument cluster, and a **SERVICE BLIND SPOT SYSTEM** or **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** textual message is displayed in the EVIC display.

The hardwired circuits between components related to the blind spot monitor system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the blind spot monitor system or the electronic controls or communication between modules and other devices that provide some features of the system. The most reliable, efficient, and accurate means to diagnose the blind spot monitor system or the electronic controls and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

The park assist system is active only when the ignition switch is in the RUN position, the transmission gear selector lever is in either the REVERSE position and the vehicle speed is less than 18 kph (12 mph). The park assist system is enabled from the factory as a default but can be manually disabled or enabled using the U-Connect Touch ™ screen module, under the settings tab, by adding or removing a check mark in the OFF selection box, for more information. Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, OPERATION** .

The disable feature is provided for trailer towing purposes. With a trailer attached to the vehicle the audible and visible park assist alerts would be incessant whenever the gear selector lever was in the REVERSE position due to the proximity of the trailer to the rear of the vehicle. When the system is disabled, a park assist icon will appear within the display. On vehicles equipped with an optional

EVIC, a **PARK ASSIST OFF** textual message will appear within the EVIC display of the instrument cluster whenever the gear selector lever is in the REVERSE position.

The microprocessor based park assist module is the central component of the park assist system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information Instrument Cluster (IC), performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Power Distribution Center (PDC), and is grounded through a take out of the body wire harness.

Four ultrasonic park assist sensors in the rear bumper fascia allow the park assist system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the park assist module, then signal the module when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 0.3 meters (11.8 inches) to about 2.0 meters (80 inches), and the detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both rear sides (corners) of the vehicle.

The park assist display, located within the EVIC unit, provides the vehicle operator with a visible warning if the vehicle comes to within about 100 centimeters (39 inches) to 200 centimeters (79 inches) of the detected object. The display is visible to the vehicle operator only when looking forward and an object is detected within the detection zone. The system will also emit a series of short, intermittent, audible beeps and automatically lower the volume of the audio system 20 dB below a set tone alert volume, if the vehicles audio system is turned ON. The audible warning changes from intermittent beeps to a continuous tone as the vehicle comes to within 30 centimeters (12 inches) of a detected object.

When the park assist module monitors a problem in any of the park assist system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The park assist module then sends an electronic message over the CAN data bus, and one of several **SERVICE PARK ASSIST SYSTEM** textual and graphical message is displayed within the EVIC display, when the message is received by the IC.

The hard-wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The following textual message May appear within the Electronic Vehicle Information Center (EVIC):

1. **BLIND SPOT SYSTEM OFF** - Message to the vehicle operator at "Key ON" to indicate the system has been turned off.
2. **SERVICE BLIND SPOT SYSTEM** - Message indicates that the BSM system is permanently unavailable. An EVIC message will be displayed and the BSM warning display in both mirrors will be permanently illuminated. This may be due to a hardware failure.
3. **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** - Message indicates that the BSM system is temporarily unavailable as a result of one of the following reasons:

- Sensor blockage - BSM display in both mirrors will illuminate as long as blockage exists.
- Radar interference - BSM display **ICON** will illuminate ONLY on the side of the interference during the first 15 seconds of interference. If the interference remains present, the system will illuminate the opposite side **ICON** and send a "temporarily Unavailable" message.
- Sensor over temperature - BSM display in both mirrors will illuminate as long as condition exists.

NOTE: If the "BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE" message is received for a minimum of 5 minutes, please verify that the area of the rear fascia where the sensors are located is not blocked by snow, ice or road debris. If the area is blocked, remove the blockage and verify the message is no longer present in the EVIC display.

NOTE: If the vehicle has experienced any trauma in the area where the sensors are located, even if the fascia is not damaged, the sensor may have become misaligned. A misaligned sensor will result in the BSM system to not operate properly.

The hard-wired circuits between components related to the blind spot monitor system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the blind spot monitor system or the electronic controls or communication between modules and other devices that provide some features of the system. The most reliable, efficient, and accurate means to diagnose the blind spot monitor system or the electronic controls and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: The presence of jackhammers, large trucks, and other vibrations in the vicinity of the vehicle could impact the performance of the system.

The following textual messages May appear in the Electronic Vehicle Information Center (EVIC):

1. **SERVICE PARK ASSIST** - If a service park assist textual message appears in the EVIC display, the system may or have a hard fault, and further investigation may be needed.
2. **CLEAN PARK ASSIST SENSORS** - If a clean park assist sensors textual message appears in the EVIC display, be certain to confirm the following:
   - The rear bumper is free of ice, snow, mud or other obstructions that will prevent the system from operating properly.

     The park assist system is self correcting, please verify that the area of the rear bumper where the sensors are located is not blocked by ice, snow, mud or other obstructions. If the area is blocked, remove the blockage, shift the transmission selector lever into reverse and verify the message is no longer present in the EVIC display. The system may also be corrected when the vehicle is driven at a speed greater than 14 kph (8 mph).
3. **SERVICE PARK ASSIST SENSORS** - If a service park assist sensors textual message appears in the EVIC display, a sensor, or the sensor wiring may be damaged, and further investigation may be needed.
4. **PARK ASSIST OFF** - If a park assist OFF textual message appears in the EVIC display, the system may be manually cut-off

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DISPLAY, BLIND SPOT

DESCRIPTION

DESCRIPTION

Vehicles equipped with the Blind Spot Monitor (BSM) system have an Light Emitting Diode (LED) display unit mounted in the side view mirrors. The body of the displays are concealed to the back side of the side view mirror glass. Only the amber colored triangle is visible on the outer surface of the mirror glass. The BSM display units are an integral part to the mirror glass and are only serviced with the glass. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** or **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, INSTALLATION** or **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** for service information.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The blind spot monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced. For more information on the blind spot monitor system and its components. Refer to **DESCRIPTION**.

OPERATION

OPERATION

The Blind Spot Monitor (BSM) display units, located within the side view mirrors, provide the vehicle operator with a visual warning indicating that an object has been detected within one of the vehicles detection zones. The BSM display **ICON** is illuminated immediately if an object of interest is in the detection zone and meets the warning criteria. However, the BSM system will not illuminate the **ICON** if the object of interest from the rear of the zone and passes the host vehicle at a speed greater that 31mph (50kph), or enters the detection zone from the front of the zone and remains in the zone for less than 1.5 seconds or passes through the zone with a relative speed greater than 12mph (20kph), or if the target vehicle passes the host vehicle in the opposite direction. For more information on the BSM display and other components in the system. Refer to **OPERATION**.

DISPLAY, PARK ASSIST

DESCRIPTION

DESCRIPTION

The Park Assist display is an integral part of the Electronic Vehicle Information Center (EVIC). The park assist **ICON** , for image information, is only displayed when an object is detected. Refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** . An electronic message is sent to the Cab Compartment Node (CCN) from the park assist module, over the Controller Area Network (CAN) Data Bus when an object is within the detection area. The CCN then displays the object detection icon with the corresponding alert bar for the distance and location of the object within the EVIC display.

Depending on market and system capabilities, the display icon has as many as 24 different variations with the corresponding alert bars, depending on size, location and distance of the object being detected. The image will display three solid bars followed by a single tone for maximum distance then will flash and reduce the amount of bars as the proximity to the object is reduced followed by a repetitive tone, down to a single bar with a continuos tone.

The EVIC display is only serviced as a complete unit with the instrument cluster. It cannot be adjusted or repaired. If ineffective or damaged, the entire display unit must be replaced, for more information. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .

OPERATION

OPERATION

The Park Assist system for this vehicle is only available on vehicles equipped with an Electronic Vehicle Information Center (EVIC). The park assist display is an integrated part of the EVIC and receives battery current and ground from, and is completely controlled by, the Cab Compartment Node (CCN). The CCN will display the park assist **ICON** whenever an object is detected and a signal is received from the park assist module, over the Controller Area Network (CAN) data bus. The icon image displayed has as many as 24 different variations depending on size, distance and location of the object being detected. The microprocessor in the park assist module continually monitors the display status, and will store a Diagnostic Trouble Code (DTC) in memory for any monitored fault it detects in the park assist display.

The hard-wired circuits between components related to the park assist display may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist display or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist display or the electronic controls and communication related to park assist display operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MODULE, BLIND SPOT

DESCRIPTION

DESCRIPTION

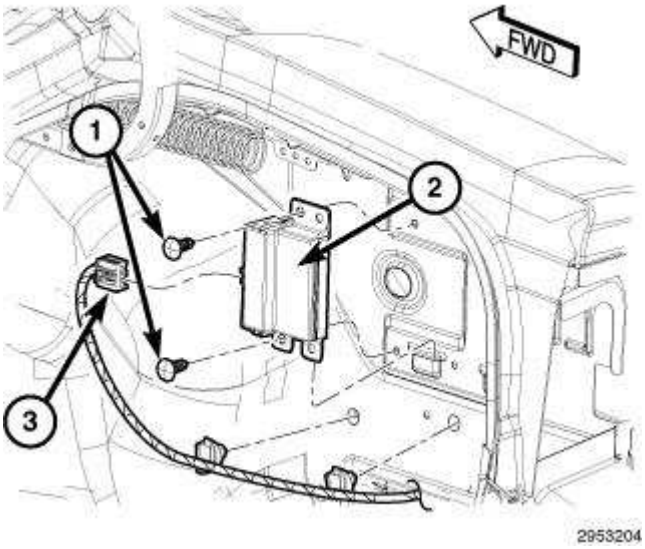

Fig. 1: Blind Spot Monitor (BSM) System Module
Courtesy of CHRYSLER GROUP, LLC

Blind Spot Module: Vehicles equipped with the Blind Spot Monitor (BSM) system, includes a module that is secured to a mounting bracket within the right inner quarter panel. Concealed beneath the inner quarter trim panel, the module is secured to the mounting bracket by two push-pin type retainers.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the vehicle electrical system. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle, and retained by many different methods. These circuits may be connected to each other, and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out, and location views for the various wire harness connectors, splices and grounds.

The Blind Spot Monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced. For more information on the blind spot monitor system and its components. Refer to **DESCRIPTION**.

OPERATION

OPERATION

The microprocessor based Blind Spot Monitor (BSM) module is the central component of the BSM system. It receives and analyzes data from the sensors, calculates and communicates the proper information to the Driver/Passenger door module to illuminate the display, performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM), and is grounded through a

take out and eyelet terminal of the body wire harness that is secured by a screw to the body sheet metal. For more information on the operation of the BSM module and other components in the BSM system Refer to **OPERATION**.

REMOVAL

REMOVAL

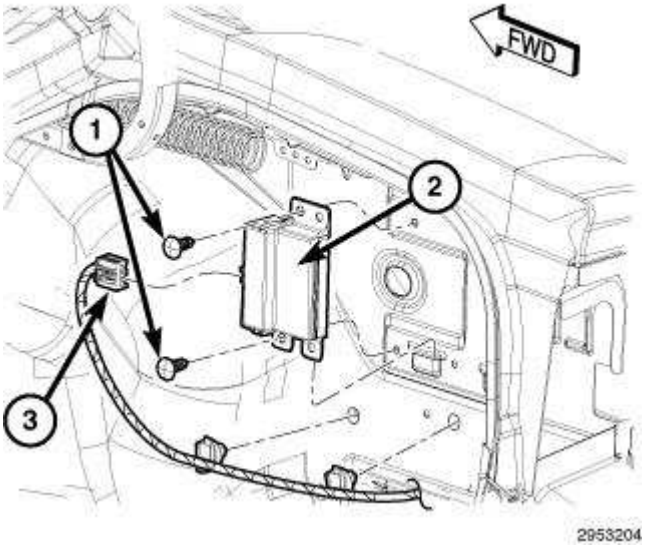

Fig. 2: Blind Spot Monitor (BSM) System Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the inner trim panel from the right quarter panel to access the blind spot module (1), which is located just behind the right rear wheel well. Refer to **WELT, TRUNK, REMOVAL** .
3. Disconnect the body wire harness connector (3) from the module connector receptacle.
4. Remove the push-pin type retainers (1) that secure the Blind Spot Monitor (BSM) module to the inner panel.
5. Remove the module from the vehicle.

INSTALLATION

INSTALLATION

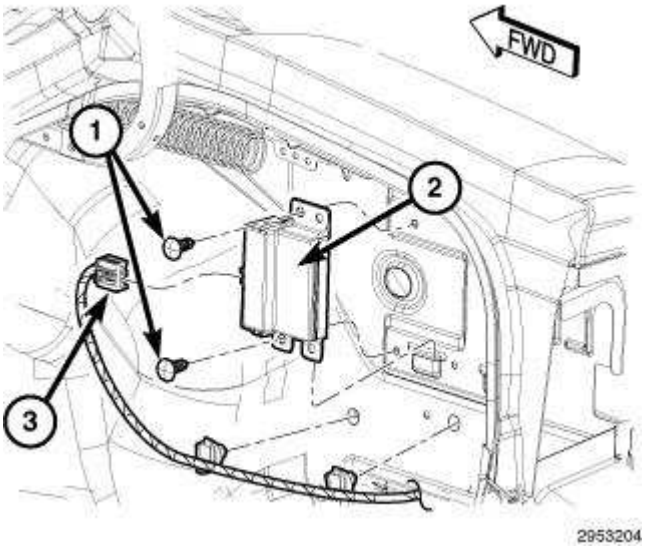

Fig. 3: Blind Spot Monitor (BSM) System Module

1. Position the park assist module (1) to the right inner panel, at the rear of the vehicle.
2. Install the push-pin type retainers (3).
3. Connect the body wire harness connectors (2) to the module connector receptacles.
4. Install the trim onto the right quarter inner panel. Refer to **WELT, TRUNK, INSTALLATION** .
5. Connect the negative battery cable.

SENSOR, BLIND SPOT

DESCRIPTION

DESCRIPTION

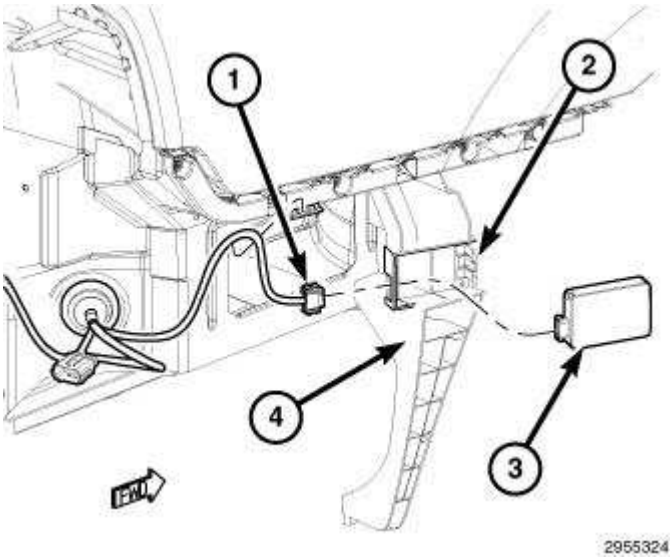

Fig. 6: Blind Spot Monitor (BSM) System Sensor
Courtesy of CHRYSLER GROUP, LLC

Blind Spot Sensors: Vehicles equipped with the Blind Spot Monitor (BSM) system, have two radar blind spot sensors that are concealed behind the rear bumper fascia. Each sensor is snapped into an individual molded plastic bracket and secured at horizontal intervals located near the left and right wheel openings.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the vehicle electrical system. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and, to the vehicle's electrical system through the use of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The Blind Spot Monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced. For more information on the blind spot monitor system and its components. Refer to **DESCRIPTION**.

OPERATION

OPERATION

Two Blind Spot Monitor (BSM) radar sensors in the rear bumper fascia allow the blind spot monitor system to locate and identify nearby obstacles. The width of the BSM detection zone covers one lane over on both side of the vehicle, approximately 13ft (4.0m). The length of the BSM zone starts at the outside rear view mirror and extends approximately 15ft (4.5m) from the edge of the rear bumper. For more information on the BSM sensors and other components in the system. Refer to **OPERATION**.

REMOVAL

REMOVAL

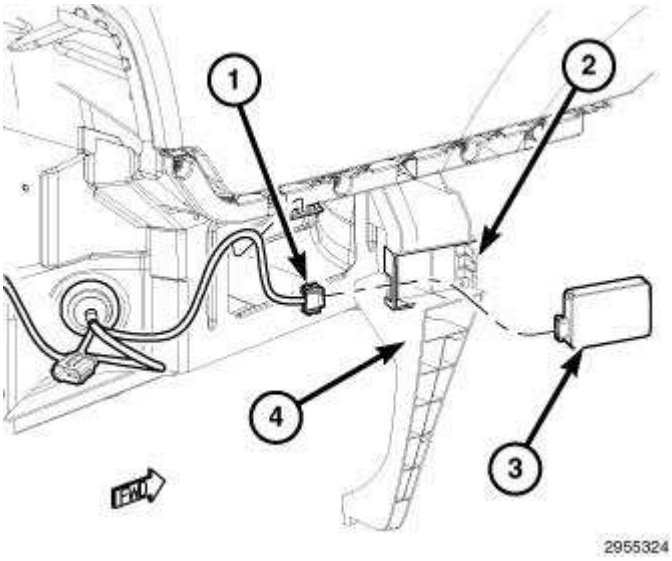

Fig. 7: Blind Spot Monitor (BSM) System Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the bumper fascia from the rear of the vehicle. Refer to **FASCIA, REAR, REMOVAL** .
3. Disconnect the wire harness connector (1) from the blind spot monitor sensor (3) connector receptacle.
4. Carefully pry the sensor bracket latch features (2) away from the top and bottom latch tabs of the sensor far enough to disengage the sensor from the bracket (4).

INSTALLATION

INSTALLATION

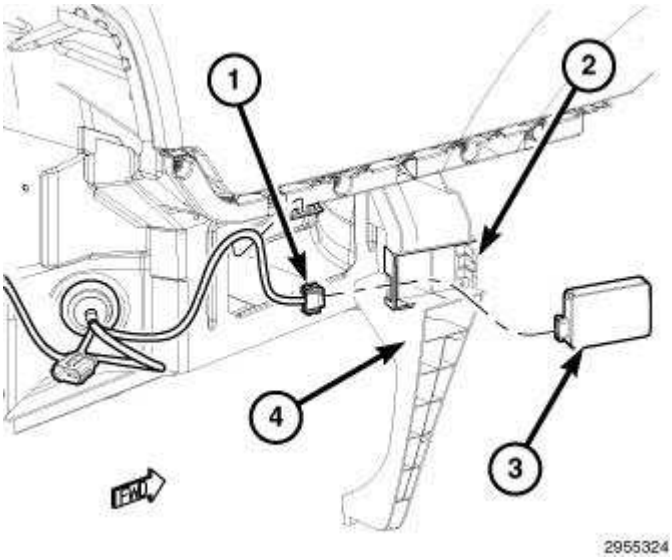

Fig. 8: Blind Spot Monitor (BSM) System Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Align and insert the sensor into the sensor bracket (4) until the bracket latch features (2) are fully engaged over the top and bottom latch tabs of the sensor (3).
2. Connect the wire harness connector (1) to the sensor connector receptacle.
3. Install the bumper fascia onto the rear of the vehicle. Refer to **FASCIA, REAR, INSTALLATION** .
4. Connect the negative battery cable.

SENSOR, PARK ASSIST

REMOVAL

REMOVAL

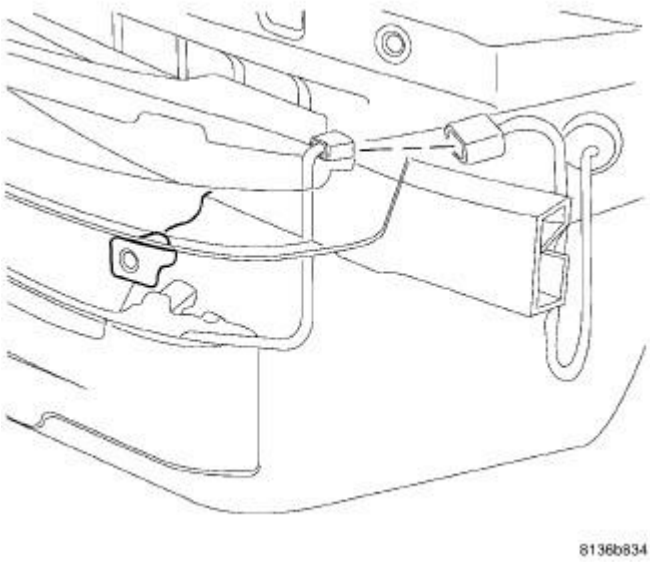

Fig. 9: Removing/Installing Park Assist Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove rear fascia. Refer to **FASCIA, REAR, REMOVAL** .
3. Unsnap Park Assist Sensor from the retaining housing and remove from fascia.

INSTALLATION

INSTALLATION

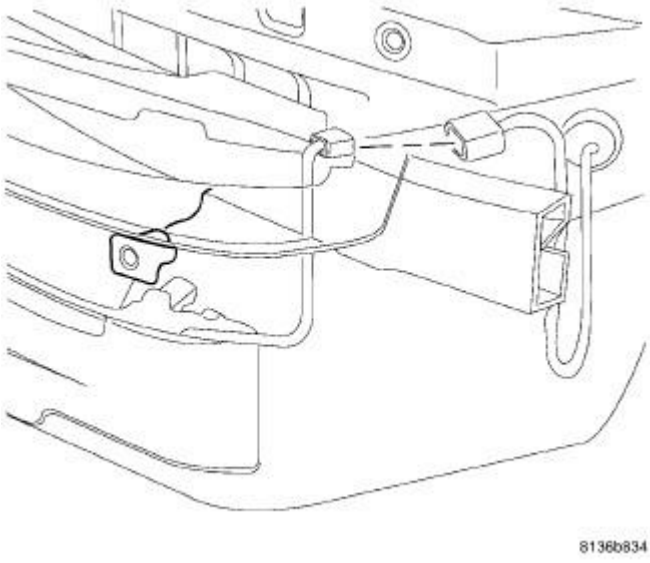

Fig. 10: Removing/Installing Park Assist Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Position the Park Assist Sensor over the retaining housing and firmly snap into housing in rear fascia.
2. Install the rear fascia. Refer to **FASCIA, REAR, INSTALLATION** .
3. Connect the battery negative cable.

SWITCH, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 11: Integrated Center Stack (ICS) Screen
Courtesy of CHRYSLER GROUP, LLC

The Park Assist switch is integral to the instrument panel Integrated Center Stack (ICS) Screen (1), also known as the U-Connect Touch ™ screen module. The park assist system can be manually disabled or enabled using the U-Connect Touch ™ screen module controls under the settings tab, for more information. Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, OPERATION** .

The U-Connect Touch ™ screen module cannot be adjusted or repaired and, if the park assist switch is ineffective or damaged, the entire ICS must be replaced, for more information. Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, REMOVAL** .

OPERATION

OPERATION

The status of the park assist controls are continually monitored by the Integrated Center Stack (ICS) Screen (1), also known as the U-Connect Touch ™ screen module. The ICS receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The inputs to, and outputs from the ICS consist of electronic communication with

the Body Control Module (BCM) over the Controller Area Network (CAN) data bus.

Each time the park assist controls are used the ICS circuitry sends an electronic **park assist switch status** message input to the BCM over the CAN data bus. The BCM then sends an electronic **park assist switch request** message to the park assist module over the CAN data bus. The park assist module responds to each **park assist switch request** message by toggling the status of the park assist system from enabled to disabled, or from disabled to enabled, then sends an electronic **park assist system status** message back to the BCM over the CAN data bus as confirmation.

The BCM responds to the system status message received from the ICS, by sending a message to the IC over the CAN-C data bus to display **Park assist system off** in the Electronic Vehicle Information Center (EVIC) display; when the system has been disabled by the vehicle operator. The **Park assist system off** message will display each time the ignition switch is in the ON or START positions, and remain that way until a bus message is received that the system has been enabled.

The hard-wired circuits between components related to the park assist switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist switch or the electronic controls and communication related to park assist switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ACCESSORIES AND EQUIPMENT

Chime/Buzzer - Service Information - Chrysler 300

DESCRIPTION

CHIME WARNING SYSTEM

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based IC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the IC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The IC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **chime** tone.
- **Slow Rate Repetitive Chime** - Repeated **chime** tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated **chime** tones that are issued at a fast rate of about 180 chimes per minute.

Hard-wired circuitry connects the IC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the IC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The IC chime warning system circuits and components cannot be adjusted or repaired. If the IC circuitry, the on-board transducer or the relay are damaged or ineffective, the IC unit must be

replaced.

BLIND SPOT MONITOR SYSTEM

The Blind Spot Monitor (BSM) system is an optional factory-installed electronic driving aid. During driving maneuvers the system alerts the vehicle operator to vehicles located in the alert zones immediately behind and to the left or right of the vehicle which, due to the surrounding rear vehicle structure, might be otherwise difficult to perceive. When an object is detected, the system uses an electromechanical transducer within the cluster and Light Emitting Diode (LED) indicators within the side view mirrors to provide the vehicle operator with visual and audible indications of the presence of other vehicles.

The BSM system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - In vehicles equipped with the optional blind spot monitor system, the optional Electronic Vehicle Information Center (EVIC) in the instrument cluster displays textual warnings and error messages and emits audible warnings related to the current operating status of the BSM system and provides an interface that allows the vehicle operator to manually disable or enable the system using the customer programmable features option.
- **Blind Spot Display** - Vehicles equipped with the blind spot monitor system have an LED display unit mounted in the side view mirrors. The body of the displays are concealed to the back side of the side view mirrors. Only the amber colored triangle is visible on the outer surface of the mirror glass.
- **Blind Spot Module** - Vehicles equipped with the blind spot monitor system include a module which is secured to the right quarter inner panel by two retainers and concealed behind the interior trim panel.
- **Blind Spot Sensors** - Vehicles equipped with the blind spot system have two radar blind spot sensors that are concealed behind the rear bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket secured at horizontal intervals located on the back side of the rear bumper fascia near the left and right wheel openings.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The blind spot monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced.

PARK ASSIST SYSTEM

A park assist system is an optional factory-installed electronic parking aid. In some markets only a rear park assist system is offered, while other markets may have both front and rear park assist systems available. During parking and other similar vehicle maneuvers, this system alerts the vehicle operator to obstacles located in the path immediately in front of or behind the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an object is detected, the system uses the cluster display, and the vehicles audio system to provide the vehicle operator with visual, and audible indications of the presence, and proximity of such objects.

The park assist system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - In vehicles equipped with the optional park assist system, the optional EVIC in the instrument cluster displays textual warnings and error messages, and emits audible warnings related to the current operating status of the park assist system.
- **Park Assist Switch** - The optional park assist system can be manually disabled or enabled using the U-Connect Touch ™ screen module; located in the instrument panel center stack. The operator can select from one of three options under the settings tab to enable or disable the system, the tone alerts, or the visual alerts.
- **Park Assist Module** - Vehicles equipped with the park assist system include a park assist module which is concealed within the molded plastic park assist module housing. There are three mounting tabs integral to the module housing that secure the module to the vehicle body. Two connector receptacles containing terminal pins that connect the module to the vehicle electrical system are integral to the one side of the housing.
- **Park Assist Sensors** - Vehicles equipped with the rear park assist system have four ultrasonic park assist sensors that are concealed behind the rear bumper fascia. In addition to the rear sensors, vehicles equipped with the front park assist system have six ultrasonic park assist sensors that are concealed behind the front bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the back side of the front or rear bumper fascias.

Hard-wired circuitry connects the various park assist system components to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The park assist system components cannot be adjusted or repaired. If any of the park assist system components are damaged or ineffective, that component must be replaced.

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the ON position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **ABS Indicator Warning** - On vehicles equipped with an optional Antilock Brake System (ABS), the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will generate one short chime each time the ABS indicator is illuminated. This warning indicates a failure condition has been monitored affecting the operation of the ABS related components or circuits. This warning will only occur following completion of the ABS indicator bulb test, and will only occur once during any ignition cycle.
- **Adjustable Pedal System Warning** - On vehicles equipped with the optional adjustable pedal system, the IC will generate one short chime each time a pedal adjustment request is received and a **PEDAL ADJUST. DISABLED - CRUISE CONTROL SET** or a **PEDAL ADJUST. DISABLED - SHIFTER IN REVERSE** textual message is displayed in the EVIC display of the IC. A single short chime will also be sounded each time a pedal adjustment request is received while a failure condition has been monitored affecting the operation of the adjustable pedal system related components or circuits.
- **Airbag Indicator Warning** - The IC will generate one short chime when the ignition switch is in the ON position, and the airbag indicator is illuminated. This warning indicates a failure condition has been monitored affecting the operation of the Supplemental Restraint System (SRS) related components or circuits. This warning will only occur following completion of the airbag indicator bulb test.
- **Automatic Oil Change Indicator** - On vehicles with a gasoline engine, the IC will generate one short chime each time an **OIL CHANGE REQUIRED** or **OIL CHANGE RESET** textual message is displayed in the EVIC display of the IC. This warning indicates that a duty-cycle algorithm contained within the software of the Powertrain Control Module (PCM) has determined that a recommended oil change interval has been attained, or that a reset of the interval has been requested following performance of the recommended service. will only occur once during any ignition cycle.
- **Charging System Indicator Warning** - The IC will generate one short chime each time the ignition switch is in the ON position and the charging system indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the operation of the charging system related components or circuits.
- **Check Gas Cap Warning** - On domestic market vehicles with a gasoline engine, the IC will generate one short chime each time the **CHECK GASCAP** textual message is displayed in the EVIC display of the IC. This warning will only occur once during any ignition cycle.
- **Check Gauges Warning** - The IC will generate one short chime each time the **CHECK GAUGES** textual message is displayed in the EVIC display of the IC. This warning indicates that a gross leak has been detected in the on-board vapor recovery system.
- **Check Engine Indicator Warning** - The IC will generate one short chime when the ignition switch is in the ON position and the check engine (Malfunction Indicator Lamp/MIL) indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the

operation of a critical fuel or emissions related component or circuit.

- **Door Ajar Warning** - The IC will generate one short chime when a **DOOR(S) OPEN** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.
- **Electronic Stability Control (ESC) System Warning** - On vehicles equipped with the optional ESC, the IC will generate one short chime when the **ESC OFF** textual message is displayed in the EVIC display of the IC. This warning indicates that the ESC system has been manually disabled using the ESC switch.
- **Electronic Stability System Fault Warning** - On vehicles equipped with the optional ESC, the IC will generate one short chime each time the ESC indicator is illuminated in the instrument cluster. This warning indicates a failure condition has been monitored affecting the operation of the ESC related components or circuits. This warning will only occur following completion of the ESC indicator bulb test, and will only occur once during any ignition cycle.
- **Fasten Seat Belt Indicator Warning** - The IC will generate repetitive chimes at a slow rate to announce that a hard-wired input from the seat belt switch and the ignition switch indicate that the driver side front seat belt is not fastened with the ignition switch in the ON position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled. Refer to **INDICATORS, INSTRUMENT CLUSTER, OPERATION** .
- **Head/Park Lamps-ON Warning** - The IC will generate repetitive chimes at a fast rate to indicate that hard-wired inputs from the headlamp switch and the ignition switch indicate that the exterior lamps are turned ON with the ignition switch in the OFF position, and either a hard-wired input or an electronic message is received over the Controller Area Network (CAN) data bus indicating that the driver side front door is open. The chimes will continue to sound until the exterior lamps are turned OFF, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Hood Ajar Warning** - On vehicles sold in a market where a hood ajar switch is required equipment, the IC will generate one short chime each time a **HOOD OPEN** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the hood is not closed or completely latched while the vehicle is moving.
- **Key-In-Ignition Warning** - The IC will generate repetitive chimes at a fast rate to indicate that hard-wired inputs from the key-in ignition switch and the ignition switch indicate that the key is in the ignition lock cylinder with the ignition switch in the OFF position, and either a hard-wired input or an electronic message is received over the CAN data bus indicating that the driver side front door is open. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Low Brake Fluid Warning** - The IC will generate one short chime when a **LOW BRAKE FLUID LEVEL** textual message is displayed in the EVIC display of the IC. This warning indicates that the monitored fluid level in the brake master cylinder is low.
- **Low Coolant Warning** - The IC will generate one short chime when the **COOLANT LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored engine coolant level in the coolant reserve bottle is low. This chime will only occur once during any ignition cycle.
- **Low Fuel Warning** - The IC will generate one short chime when the **FUEL LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the

monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.

- **Low Oil Pressure Indicator Warning** - The IC will generate one short chime when the low oil pressure indicator is illuminated and the engine speed is greater than 300 revolutions per minute. This warning indicates that the monitored engine oil pressure is low.
- **Low Wash Warning** - The IC will generate one short chime when the **WASHER FLUID LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored washer fluid level in the washer reservoir is low.
- **Memory System Warning** - On vehicles equipped with the optional memory system, the IC will generate one short chime each time a memory recall request is received and a **MEMORY SYSTEM DISABLED - SEATBELT FASTENED** textual message and icon, or a **MEMORY SYSTEM DISABLED - VEHICLE NOT IN PARK** textual message is displayed in the EVIC display of the IC. A single short chime will also be sounded each time a memory recall request is received while the memory system is inhibited due to a vehicle speed input that is greater than zero.
- **Overspeed Warning** - The IC will generate repetitive chimes at a slow rate when the **WARNING! LIMIT SPEED** textual message is displayed in the EVIC display of the IC. This warning indicates that the vehicle speed is over a pre-programmed speed value. This feature is only enabled on vehicles that have been configured for sale in a Middle East Gulf Coast Country (GCC).
- **Park Assist System Warning** - On vehicles equipped with the optional park assist system, the IC will generate one short chime when the **PARK ASSIST DISABLED** textual message is displayed in the EVIC display of the IC. This warning indicates that the park assist system has been manually disabled using the park assist switch. On vehicles with park assist system this chime warning will only occur as the gear selector lever is being moved from any position except REVERSE or NEUTRAL into REVERSE or NEUTRAL.
- **Park Brake Reminder** - The IC will generate one short chime when the brake/park brake indicator is illuminated to announce that the park brake is applied or not fully released and the vehicle is moving. This chime will only occur once during any ignition cycle.
- **Perform Service Reminder** - On vehicles equipped with a diesel engine, the IC will generate one short chime when the **PERFORM SERVICE** textual message is displayed in the EVIC display of the IC. This reminder occurs when the service distance is at or below zero (miles or kilometers), and will repeat at each subsequent ignition cycle until the service distance is reset, increased or until the service reminder function is disabled. This chime will only occur once during any ignition cycle.
- **Remote Keyless Entry System Warning** - The IC will generate one short chime when a **SERVICE KEYLESS SYS., KEY FOB NOT DETECTED, VEHICLE NOT IN PARK,** or **VEHICLE NOT IN REVERSE** textual error message is displayed in the reconfigurable display of the IC. This message indicates that a Passive Entry and Keyless Go (PEKG) system feature is inoperable due to the displayed error condition.
- **FOBIK PROGRAMMING. Refer to STANDARD PROCEDURE .**
- **Service Column Lock Warning** - On right-hand drive vehicles manufactured with the electronic steering column lock, the IC will generate one short chime each time the **SERVICE COLUMN LOCK** textual message is displayed in the reconfigurable display of the IC. This warning indicates that a failure condition has been monitored affecting the operation of the electronic

steering column lock components or circuits.

- **Service Exhaust Warning** - On vehicles equipped with a diesel engine, the IC will generate one short chime each time the **SERVICE EXHAUST** textual message is displayed in the EVIC display of the IC. This warning indicates that a clogged or damaged diesel engine exhaust particulate filter has been monitored, which may affect diesel engine performance and emissions. This chime will only occur once during any ignition cycle.
- **Service Park Assist System Warning** - On vehicles equipped with the optional park assist system, the IC will generate one short chime each time the **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the EVIC display of the IC. This warning indicates a failure condition has been monitored affecting the operation of the park assist system related components or circuits.
- **Service Tire Pressure Monitor System Warning** - On vehicles equipped with an optional base or premium Tire Pressure Monitor (TPM) system, the IC will generate one short chime each time a **SERVICE TIRE PRESS. SYSTEM** textual message is displayed in the EVIC display of the IC. This warning indicates a failure condition has been monitored affecting the operation of the tire pressure monitor system related components or circuits.
- **Tire Pressure Monitor Warning** - On vehicles equipped with an optional base or premium Tire Pressure Monitor (TPM) system, the IC will generate one short chime each time a **LOW PRESSURE** textual message is displayed in the EVIC display of the IC. This warning indicates that a low pressure condition has been monitored in one of the tires on or in the vehicle.
- **Trans Overtemp Warning** - The IC will generate one short chime each time the **TRANSMISSION OVER TEMP** textual message is displayed in the EVIC display of the IC. This warning indicates that the fluid temperature in the automatic transmission is excessive. This chime will repeat each time the trans overtemp message is cycled from OFF to ON.
- **Turn Signal/Hazard Warning Flasher Emulation** - The IC will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The IC will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs ineffective. In either case, the clicks will continue until the turn signal and hazard warning systems are turned OFF.
- **Turn Signal On Warning** - The IC will generate one short chime and a **TURN SIGNAL ON** textual message with a blinking right or left turn signal icon are displayed in the EVIC display of the IC. This warning indicates that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). The hazard warning flashers will not activate this chime feature.

The IC provides chime service for all available features in the chime warning system, except for the audible warning function provided by each of the optional park assist system display modules. The IC relies on its internal programming, numerous hard-wired inputs, and electronic message inputs received from other modules over the CAN and the Local Interface Network (LIN) data buses to provide the chime warning system features. The internal programming of the IC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard-wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of

wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR SYSTEM

The Blind Spot Monitor (BSM) system is active only when the ignition switch is in the ON or START positions, the transmission gear selector lever is in the DRIVE or NEUTRAL position and the vehicle speed is greater than 10 kilometers-per-hour (6 miles-per-hour). In vehicles equipped with this option, the system is enabled from the factory as a default. The system can be manually disabled and enabled by the vehicle operator using the customer programmable features option of the optional Electronic Vehicle Information Center (EVIC) in the instrument cluster.

The BSM system provides another feature called Rear Cross Path (RCP). The RCP feature is active only when the gear selector is in the reverse position. The RCP feature is intended to aid the driver when backing out of parking spaces where vision of oncoming vehicles may be blocked. The host vehicle must proceed slowly and cautiously out of the parking space until the rear end of the vehicle is exposed. The RCP system will then have a clear view of the cross traffic and if an on coming vehicle is detected, alert the driver. The RCP monitors the rear detection zones on both sides of the vehicle, for objects that are moving toward the side of the vehicle with a minimum speed of 1 to 2 mph (1 km/h to 3 km/h), to objects moving a maximum of 10 mph (16 km/h), such as in parking lot situations.

The microprocessor based blind spot monitor module is the central component of the BSM system. It receives and analyzes data from the sensors, calculates and communicates the proper information to the Driver/Passenger door module to illuminate the display, performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM), and is grounded through a take out and eyelet terminal of the body wire harness that is secured by a screw to the body sheet metal.

Two BSM radar sensors in the rear bumper fascia allow the blind spot monitor system to locate and identify nearby obstacles. The width of the BSM detection zone covers one lane over on both side of the vehicle, approximately 13ft (4.0m). The length of the BSM zone starts at the outside rear view mirror and extends approximately 15ft (4.5m) from the edge of the rear bumper.

The BSM display units, located within the side view mirrors, provide the vehicle operator with a visual warning indicating that an object has been detected within one of the vehicles detection zones. The BSM display **ICON** is illuminated immediately if an object of interest is in the detection zone and meets the warning criteria. However, the BSM system will not illuminate the **ICON** if the object of interest from the rear of the zone and passes the host vehicle at a speed greater that 31mph (50kph), or enters the detection zone from the front of the zone and remains in the zone for less than 1.5

seconds or passes through the zone with a relative speed greater than 12mph (20kph), or if the target vehicle passes the host vehicle in the opposite direction.

The BSM audible alert, is a single chime tone that can also be enabled. The chime tone is only sounded when the turn signal is activated and an object of interest is in the detection zone on the same side and meets the warning criteria. The chime tone is not active during normal driving conditions unless the turn signal is activated. The BSM system also sends a radio mute signal over the CAN data bus to the radio when the chime tone is activated. This request signal activates the radio mute function while the chime tone is sounded, approximately 2 to 3 seconds, then resumes normal radio function. The audible alert my also be deactivated if the operator prefers using the driver preferences within the EVIC. The BSM system can be configured for lights and chime, lights only, and system off.

The RCP function uses the same BSM icon and audible chime. However, the RCP function always combines the BSM display with the audible chime if an object is detected within the RCP detection zone. The BSM icon is illuminated on the side where the object is detected and a rapid repeating short chime tone is sounded. The audible chime can not be deactivated in the RCP function.

When the BSM module monitors a problem in any of the system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the instrument cluster, and a **SERVICE BLIND SPOT SYSTEM** or **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** textual message is displayed in the EVIC display.

The hardwired circuits between components related to the blind spot monitor system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the blind spot monitor system or the electronic controls or communication between modules and other devices that provide some features of the system. The most reliable, efficient, and accurate means to diagnose the blind spot monitor system or the electronic controls and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

The park assist system is active only when the ignition switch is in the RUN position, the transmission gear selector lever is in either the REVERSE position and the vehicle speed is less than 18 kph (12 mph). The park assist system is enabled from the factory as a default but can be manually disabled or enabled using the U-Connect Touch ™ screen module, under the settings tab, by adding or removing a check mark in the OFF selection box, for more information. Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, OPERATION** .

The disable feature is provided for trailer towing purposes. With a trailer attached to the vehicle the audible and visible park assist alerts would be incessant whenever the gear selector lever was in the REVERSE position due to the proximity of the trailer to the rear of the vehicle. When the system is disabled, a park assist icon will appear within the display. On vehicles equipped with an optional

EVIC, a **PARK ASSIST OFF** textual message will appear within the EVIC display of the instrument cluster whenever the gear selector lever is in the REVERSE position.

The microprocessor based park assist module is the central component of the park assist system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information Instrument Cluster (IC), performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Power Distribution Center (PDC), and is grounded through a take out of the body wire harness.

Four ultrasonic park assist sensors in the rear bumper fascia allow the park assist system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the park assist module, then signal the module when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 0.3 meters (11.8 inches) to about 2.0 meters (80 inches), and the detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both rear sides (corners) of the vehicle.

The park assist display, located within the EVIC unit, provides the vehicle operator with a visible warning if the vehicle comes to within about 100 centimeters (39 inches) to 200 centimeters (79 inches) of the detected object. The display is visible to the vehicle operator only when looking forward and an object is detected within the detection zone. The system will also emit a series of short, intermittent, audible beeps and automatically lower the volume of the audio system 20 dB below a set tone alert volume, if the vehicles audio system is turned ON. The audible warning changes from intermittent beeps to a continuous tone as the vehicle comes to within 30 centimeters (12 inches) of a detected object.

When the park assist module monitors a problem in any of the park assist system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The park assist module then sends an electronic message over the CAN data bus, and one of several **SERVICE PARK ASSIST SYSTEM** textual and graphical message is displayed within the EVIC display, when the message is received by the IC.

The hard-wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The following textual message May appear within the Electronic Vehicle Information Center (EVIC):

1. **BLIND SPOT SYSTEM OFF** - Message to the vehicle operator at "Key ON" to indicate the system has been turned off.
2. **SERVICE BLIND SPOT SYSTEM** - Message indicates that the BSM system is permanently unavailable. An EVIC message will be displayed and the BSM warning display in both mirrors will be permanently illuminated. This may be due to a hardware failure.
3. **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** - Message indicates that the BSM system is temporarily unavailable as a result of one of the following reasons:

- Sensor blockage - BSM display in both mirrors will illuminate as long as blockage exists.
- Radar interference - BSM display **ICON** will illuminate ONLY on the side of the interference during the first 15 seconds of interference. If the interference remains present, the system will illuminate the opposite side **ICON** and send a "temporarily Unavailable" message.
- Sensor over temperature - BSM display in both mirrors will illuminate as long as condition exists.

NOTE: If the "BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE" message is received for a minimum of 5 minutes, please verify that the area of the rear fascia where the sensors are located is not blocked by snow, ice or road debris. If the area is blocked, remove the blockage and verify the message is no longer present in the EVIC display.

NOTE: If the vehicle has experienced any trauma in the area where the sensors are located, even if the fascia is not damaged, the sensor may have become misaligned. A misaligned sensor will result in the BSM system to not operate properly.

The hard-wired circuits between components related to the blind spot monitor system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the blind spot monitor system or the electronic controls or communication between modules and other devices that provide some features of the system. The most reliable, efficient, and accurate means to diagnose the blind spot monitor system or the electronic controls and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: The presence of jackhammers, large trucks, and other vibrations in the vicinity of the vehicle could impact the performance of the system.

The following textual messages May appear in the Electronic Vehicle Information Center (EVIC):

1. **SERVICE PARK ASSIST** - If a service park assist textual message appears in the EVIC display, the system may or have a hard fault, and further investigation may be needed.
2. **CLEAN PARK ASSIST SENSORS** - If a clean park assist sensors textual message appears in the EVIC display, be certain to confirm the following:
   - The rear bumper is free of ice, snow, mud or other obstructions that will prevent the system from operating properly.

     The park assist system is self correcting, please verify that the area of the rear bumper where the sensors are located is not blocked by ice, snow, mud or other obstructions. If the area is blocked, remove the blockage, shift the transmission selector lever into reverse and verify the message is no longer present in the EVIC display. The system may also be corrected when the vehicle is driven at a speed greater than 14 kph (8 mph).
3. **SERVICE PARK ASSIST SENSORS** - If a service park assist sensors textual message appears in the EVIC display, a sensor, or the sensor wiring may be damaged, and further investigation may be needed.
4. **PARK ASSIST OFF** - If a park assist OFF textual message appears in the EVIC display, the system may be manually cut-off

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DISPLAY, BLIND SPOT

DESCRIPTION

DESCRIPTION

Vehicles equipped with the Blind Spot Monitor (BSM) system have an Light Emitting Diode (LED) display unit mounted in the side view mirrors. The body of the displays are concealed to the back side of the side view mirror glass. Only the amber colored triangle is visible on the outer surface of the mirror glass. The BSM display units are an integral part to the mirror glass and are only serviced with the glass. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** or **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, INSTALLATION** or **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** for service information.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The blind spot monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced. For more information on the blind spot monitor system and its components. Refer to **DESCRIPTION**.

OPERATION

OPERATION

The Blind Spot Monitor (BSM) display units, located within the side view mirrors, provide the vehicle operator with a visual warning indicating that an object has been detected within one of the vehicles detection zones. The BSM display **ICON** is illuminated immediately if an object of interest is in the detection zone and meets the warning criteria. However, the BSM system will not illuminate the **ICON** if the object of interest from the rear of the zone and passes the host vehicle at a speed greater that 31mph (50kph), or enters the detection zone from the front of the zone and remains in the zone for less than 1.5 seconds or passes through the zone with a relative speed greater than 12mph (20kph), or if the target vehicle passes the host vehicle in the opposite direction. For more information on the BSM display and other components in the system. Refer to **OPERATION**.

DISPLAY, PARK ASSIST

DESCRIPTION

DESCRIPTION

The Park Assist display is an integral part of the Electronic Vehicle Information Center (EVIC). The park assist **ICON** , for image information, is only displayed when an object is detected. Refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** . An electronic message is sent to the Cab Compartment Node (CCN) from the park assist module, over the Controller Area Network (CAN) Data Bus when an object is within the detection area. The CCN then displays the object detection icon with the corresponding alert bar for the distance and location of the object within the EVIC display.

Depending on market and system capabilities, the display icon has as many as 24 different variations with the corresponding alert bars, depending on size, location and distance of the object being detected. The image will display three solid bars followed by a single tone for maximum distance then will flash and reduce the amount of bars as the proximity to the object is reduced followed by a repetitive tone, down to a single bar with a continuos tone.

The EVIC display is only serviced as a complete unit with the instrument cluster. It cannot be adjusted or repaired. If ineffective or damaged, the entire display unit must be replaced, for more information. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .

OPERATION

OPERATION

The Park Assist system for this vehicle is only available on vehicles equipped with an Electronic Vehicle Information Center (EVIC). The park assist display is an integrated part of the EVIC and receives battery current and ground from, and is completely controlled by, the Cab Compartment Node (CCN). The CCN will display the park assist **ICON** whenever an object is detected and a signal is received from the park assist module, over the Controller Area Network (CAN) data bus. The icon image displayed has as many as 24 different variations depending on size, distance and location of the object being detected. The microprocessor in the park assist module continually monitors the display status, and will store a Diagnostic Trouble Code (DTC) in memory for any monitored fault it detects in the park assist display.

The hard-wired circuits between components related to the park assist display may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist display or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist display or the electronic controls and communication related to park assist display operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MODULE, BLIND SPOT

DESCRIPTION

DESCRIPTION

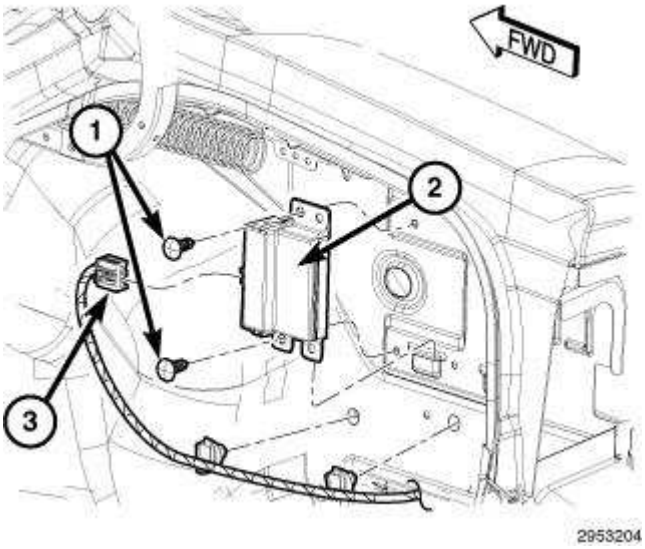

Fig. 1: Blind Spot Monitor (BSM) System Module
Courtesy of CHRYSLER GROUP, LLC

Blind Spot Module: Vehicles equipped with the Blind Spot Monitor (BSM) system, includes a module that is secured to a mounting bracket within the right inner quarter panel. Concealed beneath the inner quarter trim panel, the module is secured to the mounting bracket by two push-pin type retainers.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the vehicle electrical system. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle, and retained by many different methods. These circuits may be connected to each other, and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out, and location views for the various wire harness connectors, splices and grounds.

The Blind Spot Monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced. For more information on the blind spot monitor system and its components. Refer to **DESCRIPTION**.

OPERATION

OPERATION

The microprocessor based Blind Spot Monitor (BSM) module is the central component of the BSM system. It receives and analyzes data from the sensors, calculates and communicates the proper information to the Driver/Passenger door module to illuminate the display, performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM), and is grounded through a

take out and eyelet terminal of the body wire harness that is secured by a screw to the body sheet metal. For more information on the operation of the BSM module and other components in the BSM system Refer to **OPERATION**.

REMOVAL

REMOVAL

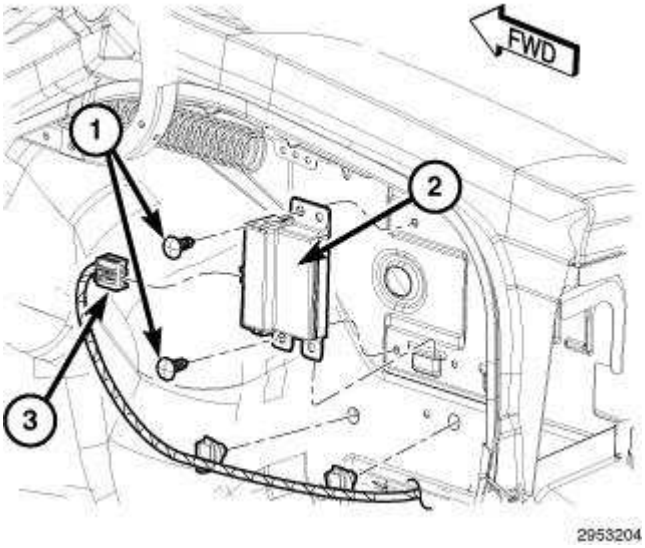

Fig. 2: Blind Spot Monitor (BSM) System Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the inner trim panel from the right quarter panel to access the blind spot module (1), which is located just behind the right rear wheel well. Refer to **WELT, TRUNK, REMOVAL** .
3. Disconnect the body wire harness connector (3) from the module connector receptacle.
4. Remove the push-pin type retainers (1) that secure the Blind Spot Monitor (BSM) module to the inner panel.
5. Remove the module from the vehicle.

INSTALLATION

INSTALLATION

2. Install the push-pin type retainers (3).
3. Connect the body wire harness connectors (2) to the module connector receptacles.
4. Install the trim onto the right quarter inner panel. Refer to **WELT, TRUNK, INSTALLATION** .
5. Connect the negative battery cable.

SENSOR, BLIND SPOT

DESCRIPTION

DESCRIPTION

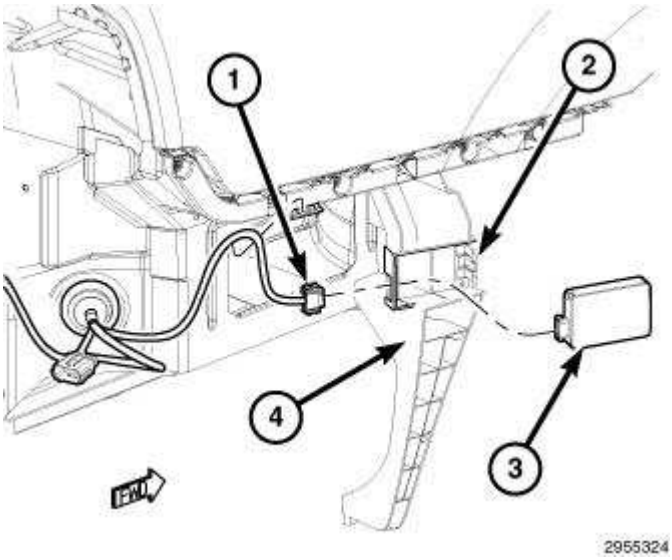

Fig. 6: Blind Spot Monitor (BSM) System Sensor
Courtesy of CHRYSLER GROUP, LLC

Blind Spot Sensors: Vehicles equipped with the Blind Spot Monitor (BSM) system, have two radar blind spot sensors that are concealed behind the rear bumper fascia. Each sensor is snapped into an individual molded plastic bracket and secured at horizontal intervals located near the left and right wheel openings.

Hard-wired circuitry connects the various blind spot monitor system components to each other through the vehicle electrical system. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and, to the vehicle's electrical system through the use of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The Blind Spot Monitor system components cannot be adjusted or repaired. If any of the BSM system components are damaged or inoperative, that component must be replaced. For more information on the blind spot monitor system and its components. Refer to **DESCRIPTION**.

OPERATION

OPERATION

Two Blind Spot Monitor (BSM) radar sensors in the rear bumper fascia allow the blind spot monitor system to locate and identify nearby obstacles. The width of the BSM detection zone covers one lane over on both side of the vehicle, approximately 13ft (4.0m). The length of the BSM zone starts at the outside rear view mirror and extends approximately 15ft (4.5m) from the edge of the rear bumper. For more information on the BSM sensors and other components in the system. Refer to **OPERATION**.

REMOVAL

REMOVAL

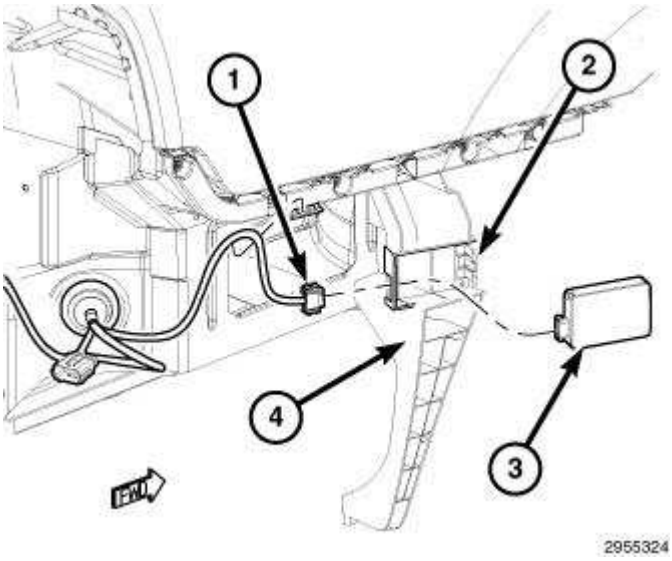

Fig. 7: Blind Spot Monitor (BSM) System Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the bumper fascia from the rear of the vehicle. Refer to **FASCIA, REAR, REMOVAL** .
3. Disconnect the wire harness connector (1) from the blind spot monitor sensor (3) connector receptacle.
4. Carefully pry the sensor bracket latch features (2) away from the top and bottom latch tabs of the sensor far enough to disengage the sensor from the bracket (4).

INSTALLATION

INSTALLATION

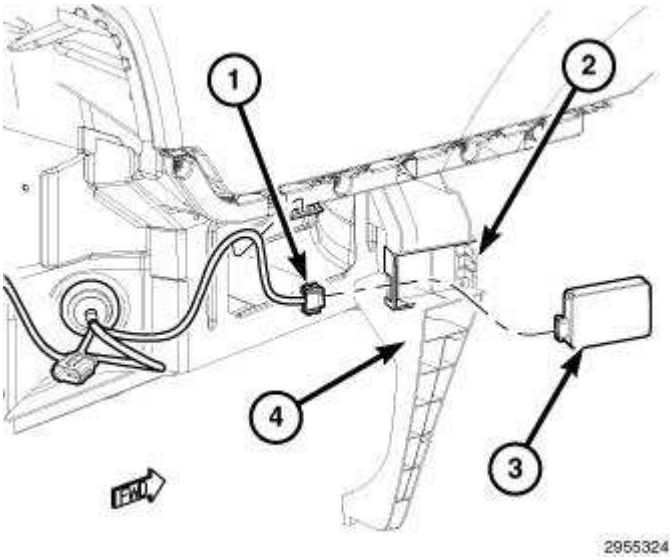

Fig. 8: Blind Spot Monitor (BSM) System Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Align and insert the sensor into the sensor bracket (4) until the bracket latch features (2) are fully engaged over the top and bottom latch tabs of the sensor (3).
2. Connect the wire harness connector (1) to the sensor connector receptacle.
3. Install the bumper fascia onto the rear of the vehicle. Refer to **FASCIA, REAR, INSTALLATION** .
4. Connect the negative battery cable.

SENSOR, PARK ASSIST

REMOVAL

REMOVAL

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove rear fascia. Refer to **FASCIA, REAR, REMOVAL** .
3. Unsnap Park Assist Sensor from the retaining housing and remove from fascia.

INSTALLATION

INSTALLATION

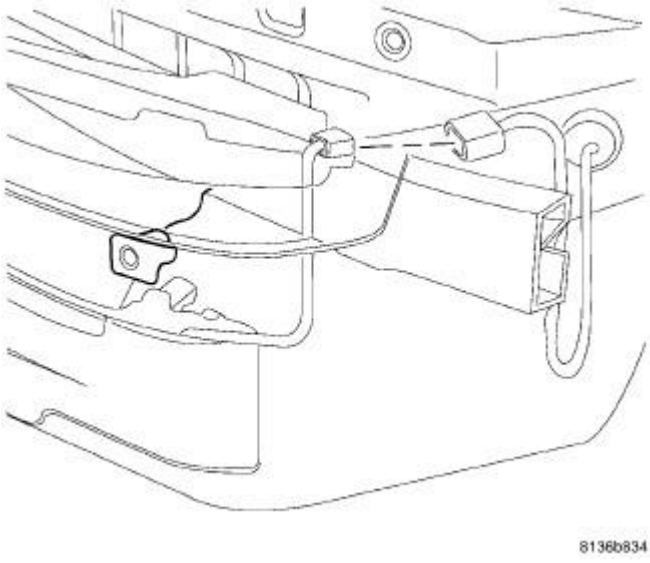

Fig. 10: Removing/Installing Park Assist Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Position the Park Assist Sensor over the retaining housing and firmly snap into housing in rear fascia.
2. Install the rear fascia. Refer to **FASCIA, REAR, INSTALLATION** .
3. Connect the battery negative cable.

SWITCH, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 11: Integrated Center Stack (ICS) Screen
Courtesy of CHRYSLER GROUP, LLC

The Park Assist switch is integral to the instrument panel Integrated Center Stack (ICS) Screen (1), also known as the U-Connect Touch ™ screen module. The park assist system can be manually disabled or enabled using the U-Connect Touch ™ screen module controls under the settings tab, for more information. Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, OPERATION** .

The U-Connect Touch ™ screen module cannot be adjusted or repaired and, if the park assist switch is ineffective or damaged, the entire ICS must be replaced, for more information. Refer to **MODULE, INTEGRATED CENTER STACK SCREEN, REMOVAL** .

OPERATION

OPERATION

The status of the park assist controls are continually monitored by the Integrated Center Stack (ICS) Screen (1), also known as the U-Connect Touch ™ screen module. The ICS receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The inputs to, and outputs from the ICS consist of electronic communication with

the Body Control Module (BCM) over the Controller Area Network (CAN) data bus.

Each time the park assist controls are used the ICS circuitry sends an electronic **park assist switch status** message input to the BCM over the CAN data bus. The BCM then sends an electronic **park assist switch request** message to the park assist module over the CAN data bus. The park assist module responds to each **park assist switch request** message by toggling the status of the park assist system from enabled to disabled, or from disabled to enabled, then sends an electronic **park assist system status** message back to the BCM over the CAN data bus as confirmation.

The BCM responds to the system status message received from the ICS, by sending a message to the IC over the CAN-C data bus to display **Park assist system off** in the Electronic Vehicle Information Center (EVIC) display; when the system has been disabled by the vehicle operator. The **Park assist system off** message will display each time the ignition switch is in the ON or START positions, and remain that way until a bus message is received that the system has been enabled.

The hard-wired circuits between components related to the park assist switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist switch or the electronic controls and communication related to park assist switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ACCESSORIES AND EQUIPMENT

Clock - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

Chrysler vehicles include an electrically operated analog clock as standard equipment. The clock includes hands for both hours and minutes, but no second hand. The hands are protected behind a clear acrylic lens. The clock includes a reset button that allows the hands to be reset or adjusted to the desired time. Two Light Emitting Diode (LED) lamps provide panel lamps dimmer controlled back lighting for visibility at night when the exterior lighting is turned ON.

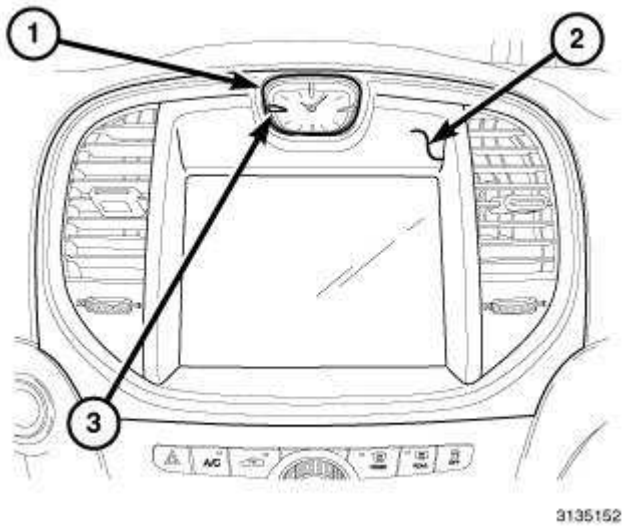

Fig. 1: Identifying Analog Clock, Center Stack Bezel, And Reset Button
Courtesy of CHRYSLER GROUP, LLC

The analog clock (1) is secured with three screws to the back of the instrument panel center stack bezel (2), between the two center panel air distribution outlets. The reset button (3) extends through a clearance hole in the clock lens at the 45 minute mark. The molded plastic clock housing includes two integral mounting tabs and an integral connector receptacle, which connects the clock to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The clock can not be repaired and, if ineffective or damaged, the entire clock unit must be replaced. The two incandescent bulb and bulb holder units are available for individual service replacement.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

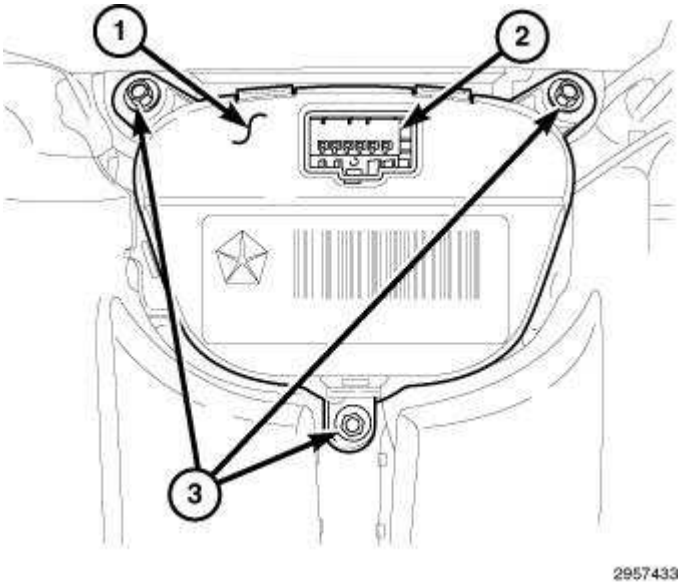

Fig. 2: Screws, Clock, And Back Of Center Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel center bezel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .
3. Remove the three screws (3) that secure the clock (1) to the back of the center bezel.
4. Remove the clock from the center bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

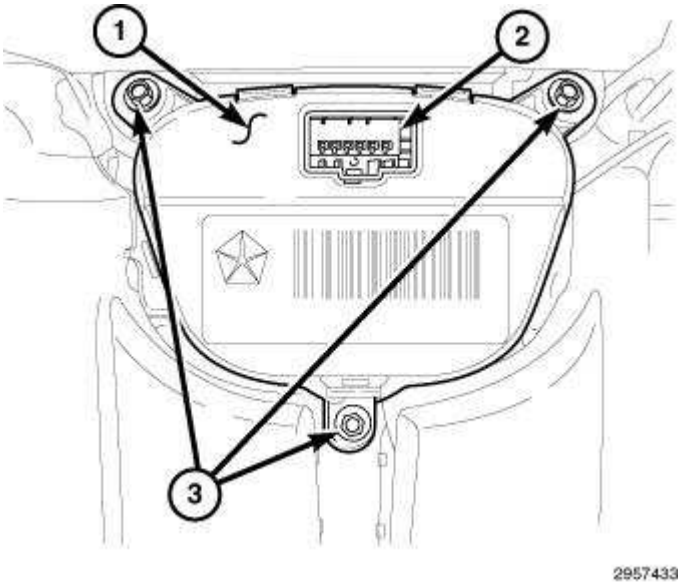

Fig. 3: Screws, Clock, And Back Of Center Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Position the clock (1) to the back of the instrument panel center bezel.
2. Install and tighten the three screws (3) that secure the clock to the center bezel.
3. Position the center bezel assembly at the instrument panel.
4. Install the center bezel onto the instrument panel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
5. Connect the negative battery cable.
6. Depress the clock reset button (4) as necessary to adjust the clock to the proper time setting.

ACCESSORIES AND EQUIPMENT

Speed Control - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

Two electronic speed control systems are available factory-installed equipment on this vehicle: a conventional system and an adaptive system. Additional details of these two systems and their components can be found under the subheadings and paragraphs that follow.

CONVENTIONAL SPEED CONTROL

The standard equipment conventional electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) is located below the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch in this vehicle is actually a brake pedal position sensor. This sensor is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION** .
- **Instrument Cluster** - A CRUISE indicator is located in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment. The PCM contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing four momentary switch push buttons is located in the right horizontal spoke of the steering wheel.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ABM, the IC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the SCM to relay the status of the speed control switches to the PCM, and by the PCM for control of the CRUISE indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the conventional electronic speed control system components to the

electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

ADAPTIVE SPEED CONTROL

The optional equipment adaptive electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Adaptive Speed Control Sensor** - An adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module and the radar sensor or module) is located on a bracket secured near the right outboard end of the front bumper support member of the Front End Module (FEM) behind the front fascia. Refer to **SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL, DESCRIPTION** .
- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) is located below the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch in this vehicle is actually a brake pedal position sensor. This sensor is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION** .
- **Instrument Cluster** - A CRUISE indicator is located in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is located in the Integrated Center Stack (ICS) and provides an interface to the vehicle operator for setting the adaptive speed control customer preferences as well as a display of the adaptive speed control and Forward Collision Warning (FCW) system status messages. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment. The PCM contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing six momentary switch push buttons is located in the right horizontal spoke of the steering wheel.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ACC sensor, the ABM, the IC, the EVIC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ACC sensor to provide inputs to the ABM, the EVIC and the PCM, is used by the ABM to provide inputs to the PCM, is used by the SCM to relay the status of the speed control switches to the PCM and is used by the PCM for control of the indicators in the IC and the indications in the EVIC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the adaptive electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

CONVENTIONAL SPEED CONTROL

The vehicle operator controls all conventional speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus. The PCM software continually monitors these inputs as well as electronic **vehicle distance** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) and numerous hard wired inputs, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

The PCM microprocessor continuously monitors all of the speed control system electrical circuits to determine the system readiness. If the PCM detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic

methods will not prove conclusive in the diagnosis of the PCM or the electronic controls or communication between other modules and devices that provide features of the conventional speed control system. The most reliable, efficient, and accurate means to diagnose the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ADAPTIVE SPEED CONTROL

The vehicle operator controls all adaptive speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) and to the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) over the Controller Area Network (CAN) data bus. The PCM and ACC sensor microprocessors continually monitor these inputs as well as electronic **wheel speed** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module), electronic **gear selector** message inputs from the Transmission Control Module TCM and numerous hard wired inputs, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

Using the MODE push button of the speed control switch pod on the face of the right horizontal spoke of the steering wheel, the vehicle operator can choose between adaptive speed control and conventional speed control modes of operation. As the name implies, when in the conventional speed control mode the speed control system is used as and functions exactly like a conventional speed control system. When in the adaptive speed control mode, the vehicle operator can use the DISTANCE push button of the speed control switch pod to select from one of three distance settings for the adaptive cruise system to maintain. These settings equate to the time in seconds separating the vehicle from a preceding vehicle. The ACC sensor then uses electronic message outputs to the ABM, the TCM and the PCM to maintain the selected separation distance. The available distance settings are:

- **1** - 1.0 second
- **2** - 1.5 seconds
- **3** - 2.0 seconds

The PCM and ACC sensor microprocessors continuously monitor all of the speed control system electrical circuits to determine the system readiness. If the PCM or ACC sensor detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM and ACC sensor use On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of

the instrument panel.

The hard wired inputs and outputs for the PCM and the ACC sensor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM, the ACC sensor or the electronic controls or communication between other modules and devices that provide features of the adaptive speed control system. The most reliable, efficient, and accurate means to diagnose the PCM, the ACC sensor or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

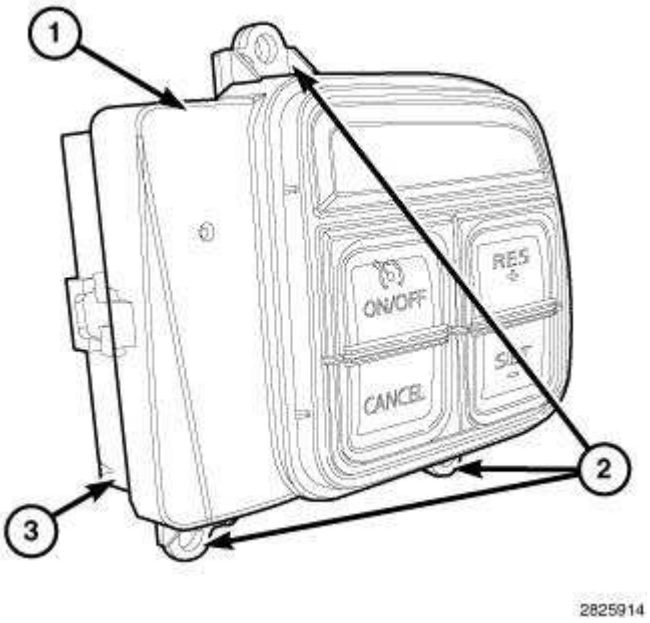

Fig. 1: Except Adaptive Speed Control
Courtesy of CHRYSLER GROUP, LLC

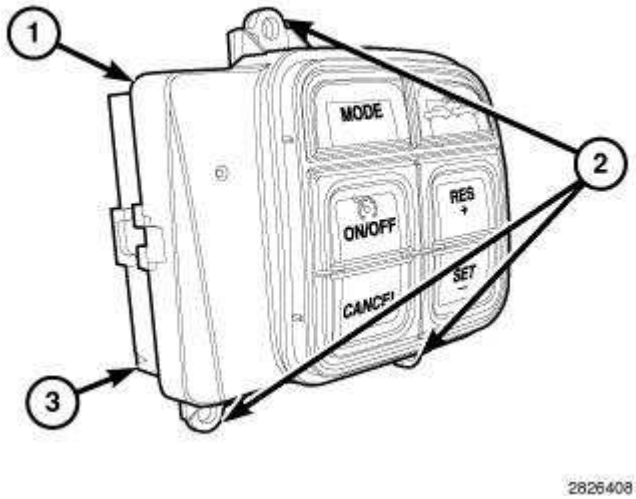

Fig. 2: With Adaptive Speed Control
Courtesy of CHRYSLER GROUP, LLC

The speed control switch pod (1) is located in the right spoke of the steering wheel spoke bezel. Two different switches are used. One switch has four buttons and is used on vehicles not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system. The other switch has six buttons and is used on vehicles equipped with the ACC system option. These switches are the primary control used by the vehicle operator to manage the particular speed control system installed in the vehicle. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs (2) to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle (3) integral to the inboard end of the switch pod housing connects the speed control switch and the Local Interface Network (LIN) slave node circuitry integral to the switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The speed control switch pod cannot be adjusted or repaired. If any function of the switch or the LIN slave node is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The speed control switch pod is a resistor multiplexed unit that provides hard wired inputs to the Steering Control Module (SCM) microprocessor integral to the Steering Column Control Module (SCCM). The speed control switch pod also contains the circuitry of a Local Interface Network (LIN) slave node, which provides source current for and communicates the switch or sensor states of the

Electronic Vehicle Information Center (EVIC) switches, the remote radio switches, the paddle shifter switches (if equipped), the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the SCM, which is the LIN master node.

The speed control switch pod for vehicles equipped with a conventional electronic speed control system and not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system contains four switch push buttons whose functions are:

- **On/Off** - This switch button enables or disables the speed control system and clears any previous speed control set speed from system memory.
- **Resume / +** - This switch button restores the vehicle to a previously stored set speed or accelerates the vehicle from an already attained set speed.
- **Cancel** - This switch button cancels the current speed control event, but does not turn the system OFF or clear the currently stored set speed.
- **Set / -** - This switch button sets the current vehicle speed as the stored set speed or decelerates (coasts) the vehicle to a speed that is slower than the already attained set speed.

The optional adaptive speed control switch pod for vehicles equipped with the ACC system option contains the same four switch push buttons as the conventional speed control switch pod, then adds two buttons whose functions are:

- **Mode** - This switch button toggles the speed control system between adaptive (ACC) or conventional (non-ACC) modes of operation.
- **Distance** - This switch button selects the separation or following distance (in seconds) that the ACC system maintains between this vehicle and any preceding vehicle. The three distance settings available are: **1** - about 1.0 second, **2** - about 1.5 seconds or **3** - about 2.0 seconds.

The SCM LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The SCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCM will set a Diagnostic Trouble Code (DTC) for any problem it detects in the speed control switch circuits, and will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the speed control switch pod as well as the hard wired circuits between the switch pod and the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM, the SCCM or the electronic controls and communication between

modules and other devices that provide some features of the speed control system. The most reliable, efficient, and accurate means to diagnose the speed control switch pod, the LIN slave or master nodes, the SCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

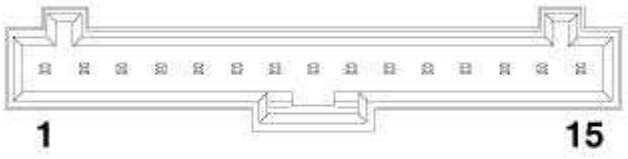

Fig. 3: Speed Control Switch Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following test confirms only correct speed control switch functions. It does not test or confirm any of the Local Interface Network (LIN) slave node inputs, outputs or functions. LIN slave node testing requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Remove the speed control switch pod from the steering wheel. Refer to **SWITCH, SPEED CONTROL, REMOVAL**.
2. Disconnect the steering wheel wire harness connector from the back of the speed control switch pod.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the

Speed Control Switch Tests table.

SPEED CONTROL SWITCH TESTS	
SWITCH POSITION	**PINS (*RESISTANCE - OHMS)**
NO PUSH BUTTONS DEPRESSED	13 and 14 (20708) 14 and 15 (20591)
ON / OFF	13 and 14 (464) 14 and 15 (133)
CANCEL	13 and 14 (896) 14 and 15 (457)
DISTANCE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (1515) 14 and 15 (899)
MODE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (2468) 14 and 15 (1518)
SET / - (DECEL)	13 and 14 (4088) 14 and 15 (2471)
RESUME / + (ACCEL)	13 and 14 (7408) 14 and 15 (4091)
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective speed control switch pod as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

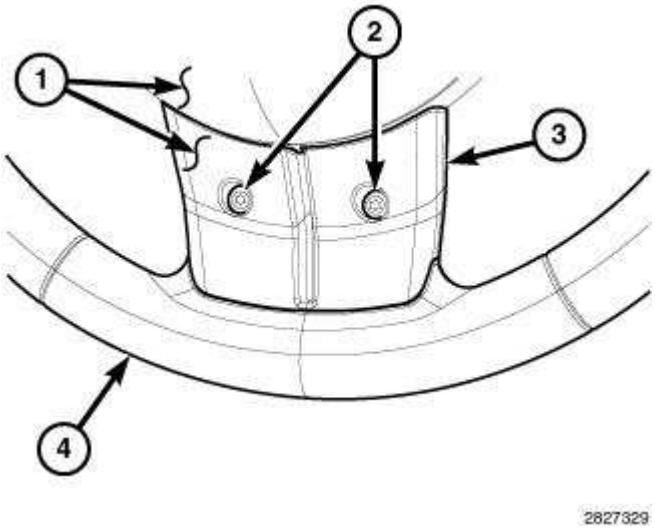

Fig. 4: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
3. From the back of the steering wheel (4), remove the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3).

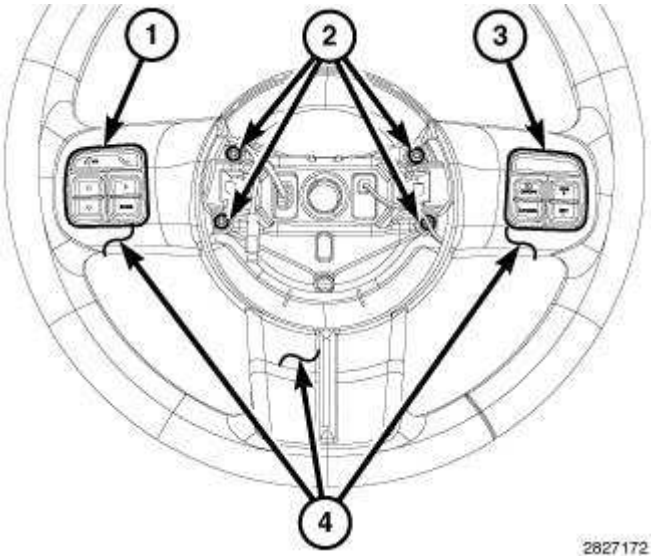

Fig. 5: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. From the face of the steering wheel, remove the four screws (2) that secure the front spoke bezel (4) to the steering wheel armature within the steering wheel hub cavity.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry at the parting line between the front spoke bezel and the steering wheel rear cover enough to unsnap the two horizontal members of the bezel from those of the rear cover.

6. Pull the front spoke bezel away from the steering wheel far enough to access and disconnect the steering wheel wire harness connections from the Electronic Vehicle Information Center (EVIC) switch pod (1) and the speed control switch pod (3).

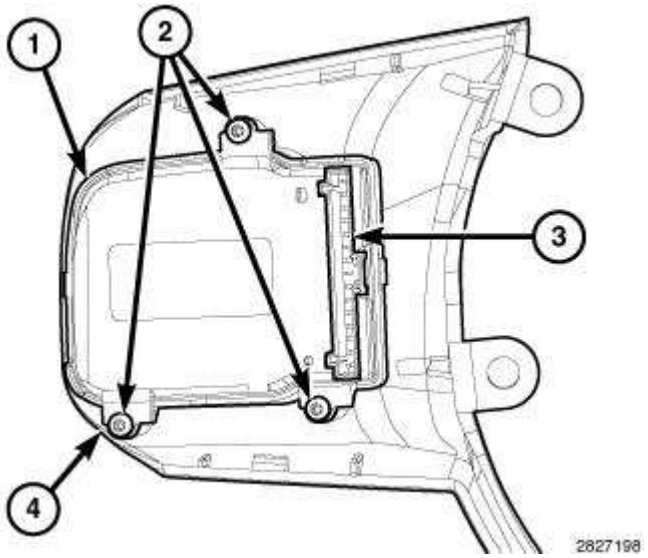

Fig. 6: Steering Wheel Spoke Front Bezel, Screws, Speed Control Switch Pod & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel spoke front bezel (4), remove the three screws (2) that secure the speed control switch pod (1) mounting tabs to the bezel.
8. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

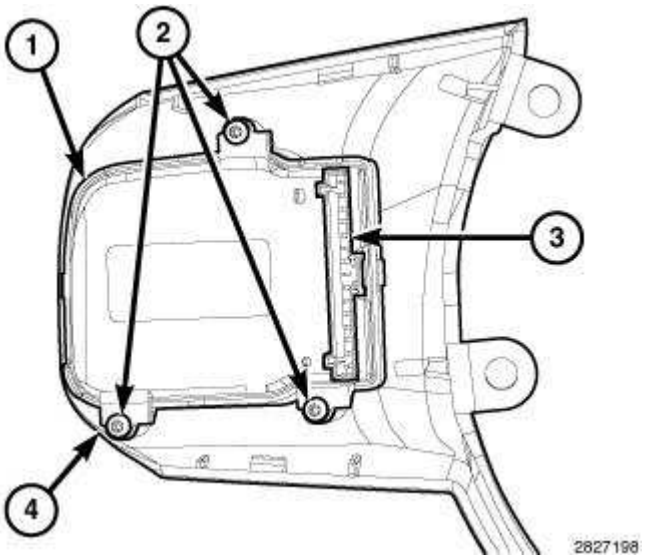

Fig. 7: Steering Wheel Spoke Front Bezel, Screws, Speed Control Switch Pod & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the speed control switch pod (1) to the back of the steering wheel spoke front bezel (4).
2. Install and tighten the three screws (2) that secure the switch mounting tabs to the bezel. Tighten the screws securely.
3. Position the front spoke bezel close enough to the steering wheel to reconnect the steering wheel wire harness connections to the Electronic Vehicle Information Center (EVIC) switch pod and the speed control switch pod connector receptacles (3).

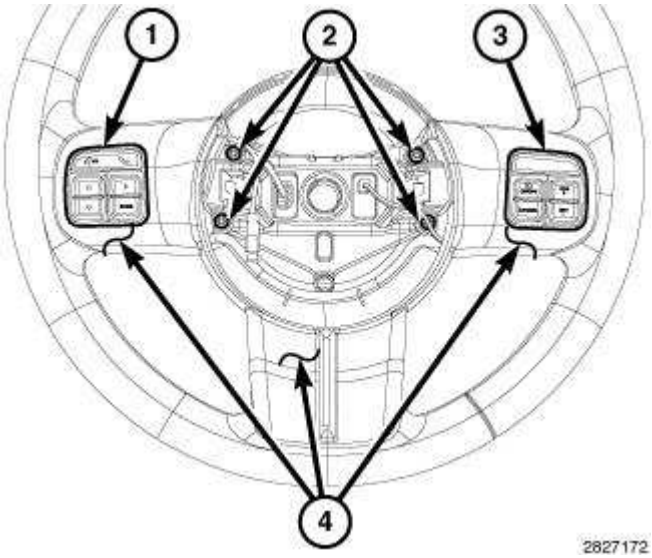

Fig. 8: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. Position the front spoke bezel (4), EVIC switch pod (1) and speed control switch pod (3) as a unit to the steering wheel. Be certain that the steering wheel wire harness is routed between the

lower or upper bezel stanchions and the inside circumference of the steering wheel hub cavity so that the wiring will not be pinched when the driver airbag is reinstalled.

5. Use hand pressure to squeeze the horizontal spokes of both the front spoke bezel and the steering wheel rear cover together until all of the snap features are fully engaged.
6. Install and tighten the four screws that secure the stanchions of the front spoke bezel to the steering wheel armature within the steering wheel hub cavity. Tighten the screws securely.

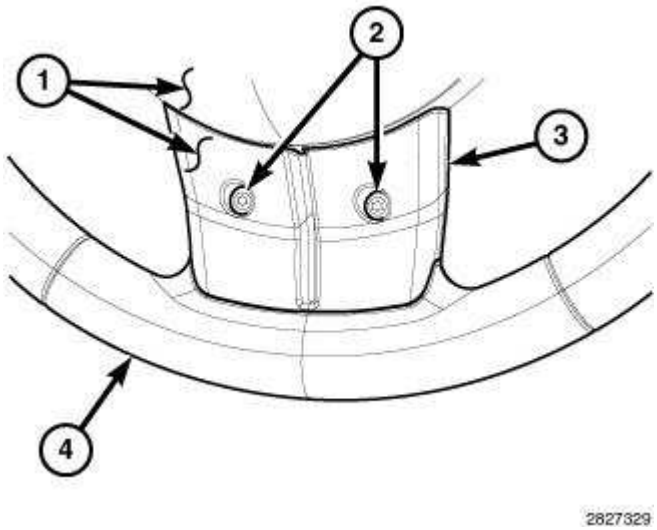

Fig. 9: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel (4), install and tighten the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3). Tighten the screws securely.
8. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION** .
9. Reconnect the battery negative cable.

DTC	Description
B128E-11	PTS SENSOR 1 - CIRCUIT SHORT TO GROUND
B128E-12	PTS SENSOR 1 - CIRCUIT SHORT TO BATTERY

B128E-25	PTS SENSOR 1 - SIGNAL SHAPE / WAVEFORM FAILURE
B128E-92	PTS SENSOR 1 - PERFORMANCE OR INCORRECT OPERATION
B128F-11	PTS SENSOR 2 - CIRCUIT SHORT TO GROUND
B128F-12	PTS SENSOR 2 - CIRCUIT SHORT TO BATTERY
B128F-25	PTS SENSOR 2- SIGNAL SHAPE / WAVEFORM FAILURE
B128F-92	PTS SENSOR 2 - PERFORMANCE OR INCORRECT OPERATION
B1290-11	PTS SENSOR 3 - CIRCUIT SHORT TO GROUND
B1290-12	PTS SENSOR 3 - CIRCUIT SHORT TO BATTERY
B1290-25	PTS SENSOR 3 - SIGNAL SHAPE / WAVEFORM FAILURE
B1290-92	PTS SENSOR 3 - PERFORMANCE OR INCORRECT OPERATION
B1291-11	PTS SENSOR 4- CIRCUIT SHORT TO GROUND
B1291-12	PTS SENSOR 4 - CIRCUIT SHORT TO BATTERY
B1291-25	PTS SENSOR 4 - SIGNAL SHAPE / WAVEFORM FAILURE
B1291-92	PTS SENSOR 4 - PERFORMANCE OR INCORRECT OPERATION
B1292-11	PTS SENSOR 5 - CIRCUIT SHORT TO GROUND
B1292-12	PTS SENSOR 5 - CIRCUIT SHORT TO BATTERY
B1292-25	PTS SENSOR 5 - SIGNAL SHAPE / WAVEFORM FAILURE
B1292-92	PTS SENSOR 5 - PERFORMANCE OR INCORRECT OPERATION
B1293-11	PTS SENSOR 6 - CIRCUIT SHORT TO GROUND
B1293-12	PTS SENSOR 6 - CIRCUIT SHORT TO BATTERY
B1293-25	PTS SENSOR 6 - SIGNAL SHAPE / WAVEFORM FAILURE
B1293-92	PTS SENSOR 6 - PERFORMANCE OR INCORRECT OPERATION
B1295-11	PTS SENSOR 8 - CIRCUIT SHORT TO GROUND
B1295-12	PTS SENSOR 8 - CIRCUIT SHORT TO BATTERY
B1295-25	PTS SENSOR 8 - SIGNAL SHAPE / WAVEFORM FAILURE
B1295-92	PTS SENSOR 8 - PERFORMANCE OR INCORRECT OPERATION
B1296-11	PTS SENSOR 9 - CIRCUIT SHORT TO GROUND
B1296-12	PTS SENSOR 9 - CIRCUIT SHORT TO BATTERY
B1296-25	PTS SENSOR 9 - SIGNAL SHAPE / WAVEFORM FAILURE
B1296-92	PTS SENSOR 9 - PERFORMANCE OR INCORRECT OPERATION
B1297-11	PTS SENSOR 10 - CIRCUIT SHORT TO GROUND
B1297-12	PTS SENSOR 10 - CIRCUIT SHORT TO BATTERY
B1297-25	PTS SENSOR 10 - SIGNAL SHAPE / WAVEFORM FAILURE
B1297-92	PTS SENSOR 10 - PERFORMANCE OR INCORRECT OPERATION
B1298-11	PTS SENSOR 11 - CIRCUIT SHORT TO GROUND
B1298-12	PTS SENSOR 11 - CIRCUIT SHORT TO BATTERY
B1298-25	PTS SENSOR 11 - SIGNAL SHAPE / WAVEFORM FAILURE
B1298-92	PTS SENSOR 11 - PERFORMANCE OR INCORRECT OPERATION
B210C-16	BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD
B210C-17	BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD
B2128-16	SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

	SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
B21DD-16	SYSTEM VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
B21DD-17	SYSTEM VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
B222A-00	VEHICLE LINE MISMATCH
B2232-00	(PTS) PARKTRONICS INTERNAL
U0001-00	CAN C BUS
U0100-00	LOST COMMUNICATION WITH PCM
U0121-00	LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0155-00	LOST COMMUNICATION WITH CLUSTER/CCN
U0401-00	IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM
U0418-00	IMPLAUSIBLE DATA RECEIVED FROM BRAKE SYSTEM CONTROL MODULE
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U0423-00	IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

MODULE, PASSENGER DOOR (PDM), (DMFL/R)

DIAGNOSTIC CODE INDEX

DTC	Description
B164E-11	PASSENGER MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND
B164E-12	PASSENGER MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO BATTERY
B164E-13	PASSENGER MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN
B1676-11	PASSENGER COURTESY LAMP CONTROL - CIRCUIT SHORT TO GROUND
B1676-15	PASSENGER COURTESY LAMP CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN
B16A3-11	PASSENGER WINDOW SWITCH BACKLIGHTING - CIRCUIT SHORT TO GROUND
B1805-2A	PASSENGER DOOR LOCK/UNLOCK SWITCH - STUCK
B185E-11	PASSENGER WINDOW CONTROL - CIRCUIT SHORT TO GROUND
B185E-12	PASSENGER WINDOW CONTROL - CIRCUIT SHORT TO BATTERY
B185E-13	PASSENGER WINDOW CONTROL - CIRCUIT OPEN
B1862-11	PASSENGER WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND
B1865-31	PASSENGER WINDOW POSITION SENSOR - NO SIGNAL
B1910-2A	PASSENGER WINDOW SWITCH - STUCK
B1D11-11	PASSENGER MIRROR POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND

B1D14-12	PASSENGER MIRROR VERTICAL POSITION SENSOR INPUT - CIRCUIT SHORT TO BATTERY
B1D14-14	PASSENGER MIRROR VERTICAL POSITION SENSOR INPUT - CIRCUIT SHORT TO GROUND OR OPEN
B1D17-12	PASSENGER MIRROR HORIZONTAL POSITION SENSOR INPUT - CIRCUIT SHORT TO BATTERY
B1D17-14	PASSENGER MIRROR HORIZONTAL POSITION SENSOR INPUT - CIRCUIT SHORT TO GROUND OR OPEN
B1D2A-11	PASSENGER MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND
B1D2A-12	PASSENGER MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY
B1D2A-13	PASSENGER MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN
B1D2E-11	PASSENGER MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND
B1D2E-12	PASSENGER MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY
B1D2E-13	PASSENGER MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN
B1D36-11	PASSENGER MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND
B1D36-15	PASSENGER MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN
B1E6A-11	PASSENGER MIRROR FOLD CONTROL - CIRCUIT SHORT TO GROUND
B1E6A-15	PASSENGER MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN
B1E98-11	PASSENGER ELECTROCHROMATIC CONTROL CIRCUIT - CIRCUIT SHORT TO GROUND
B1E98-12	PASSENGER ELECTROCHROMATIC CONTROL CIRCUIT - CIRCUIT SHORT TO BATTERY
B1E98-13	PASSENGER ELECTROCHROMATIC CONTROL CIRCUIT - CIRCUIT OPEN
B210C-16	BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD
B210C-17	BATTERY VOLTAGE INPUT - CIRCUIT VOLAGE ABOVE THRESHOLD
B21A1-00	ECU RESET/RECOVERY OCCURRED
B21DD-84	SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE
B21DD-85	SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE
B2219-54	PASSENGER DOOR MODULE CALIBRATED/LOST CALIBRATION
B2219-96	(PDM) PASSENGER DOOR MODULE INTERNAL - COMPONENT INTERNAL FAILURE
B2831-11	PASSENGER BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND
B2831-15	PASSENGER BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT

	SHORT TO BATTERY OR OPEN
B2852-11	PASSENGER DOOR AMBIENT LAMP CONTROL - CIRCUIT SHORT TO GROUND
B2852-15	PASSENGER DOOR AMBIENT LAMP CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN
B2851-11	PASSENGER MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO GROUND
B2851-15	PASSENGER MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN
U0010-00	CAN INTERIOR BUS
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0164-00	LOST COMMUNICATION WITH HVAC CONTROL MODULE
U0199-00	LOST COMMUNICATION WITH DRIVER DOOR MODULE
U0232-00	LOST COMMUNICATION WITH BLIND SPOT DETECTION MODULE

MODULE, POWERTRAIN CONTROL (PCM), 3.0L DIESEL

DIAGNOSTIC CODE INDEX

DTC	Description
P0016	CRANKSHAFT/CAMSHAFT MISALIGNMENT-BANK 1- SENSOR 1
P0045	TURBOCHARGER BOOST CONTROL CIRCUIT/OPEN
P0046	TURBOCHARGER BOOST CONTROL CIRCUIT/EXCESSIVE CURRENT
P0047	TURBOCHARGER BOOST CONTROL CIRCUIT LOW
P0048	TURBOCHARGER BOOST CONTROL CIRCUIT HIGH
P0053	O2 SENSOR 1/1 HEATER RESISTANCE
P0069	MANIFOLD ABSOLUTE PRESSURE / BAROMETRIC PRESSURE CORRELATION
P0070	AMBIENT AIR TEMPERATURE SENSOR STUCK
P0072	AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW
