2013 CHRYSLER 300

SERVICE & REPAIR MANUAL

ENGINE

3.0L Turbo Diesel - Service Information - Chrysler 300

DESCRIPTION

3.0L COMMON RAIL DIESEL ENGINE

The 3.0L (183 C.I.D.) six - cylinder "common rail" direct injection engine is a 60° overhead valve design. The engine utilize a cast iron cylinder block. The engine has aluminum cross flow cylinder heads, four valves per cylinder, central injectors and dual overhead camshafts. The 3.0L is turbocharged, intercooled, and also equipped with a EGR cooler.

Additional features are:

- Finger Follower Actuated Valves with Hydraulic Adjusters
- Turbocharger and intercooler
- Oil Jet Cooled Pistons
- Swirl Intake Ports
- Water cooled exhaust gas recirculation, Compliance with EURO V emission regulations
- Chain driven D.O.H.C. per bank of cylinders, with 4 valves per cylinder

The engine identification stamp (3) for the 3.0L is located on the right side of the engine block, by the generator behind its mounting bracket.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE LOW	1. Low oil level.	1. (a) Check and fill with clean engine oil.
		(b) Check for a severe oil leak, worn rings (burning oil), oil leaking from the turbocharger to the intake, or other root causes for low oil level.
	2. Oil viscosity thin, diluted or wrong specification.	2. (a) Verify the correct engine oil is being used.
		(b) Look for reduced viscosity from fuel dilution.
	3. Improperly operating pressure switch/gauge.	3. Verify the pressure switch is functioning correctly. If not, replace switch/gauge.
	4. Relief valve stuck open.	4. Check/replace valve.

	5. If cooler was replaced, shipping plugs may have been left in cooler	5. Check/remove shipping plugs.
	6. Worn oil pump.	6. Check and replace oil pump.
	7. Suction tube loose or seal leaking.	7. Check and replace seal.
	8. Loose main bearing cap.	8. Check and install new bearing. Tighten cap to proper torque.
	9. Worn bearings or wrong bearings installed.	9. Inspect and replace connecting rod or main bearings. Check and replace directed piston cooling nozzles.
	10. Directed piston cooling nozzles under piston, bad fit into main carrier.	10. Check directed piston cooling nozzles position.
	12. Loose directed piston cooling nozzle.	12. Tighten directed piston cooling nozzle.
LUBRICATING OIL PRESSURE TOO HIGH	1. Pressure switch/gauge not operating properly.	1. Verify pressure switch is functioning correctly. If not, replace switch/gauge.
	2. Engine running too cold.	2. Coolant Temperature Below Normal
	3. Oil viscosity too thick.	3. Make sure the correct oil is being used.
	4. Oil pressure relief valve stuck closed or binding	4. Check and replace valve.
LUBRICATING OIL LOSS	1. External leaks.	1. Visually inspect for oil leaks. Repair as required.
	2. Crankcase overfilled.	2. Verify that the correct dipstick is being used.
	3. Incorrect oil specification or viscosity.	3. (a) Make sure the correct oil is being used.
		(b) Look for reduced viscosity from dilution with fuel.
		(c) Review/reduce oil change intervals.
	4. Oil cooler leak	4. Check and replace the oil cooler.
	5. High blow-by forcing oil out the breather.	5. Check the breather tube area for signs of oil loss. Perform the required repairs.
	6. Turbocharger leaking oil to the air intake.	6. Inspect the air ducts for evidence of oil transfer. Repair as required (slight oil residue is normal).
COMPRESSION KNOCKS	1. Air in the fuel system.	1. Identify location of air leak and

		repair. Do not bleed high pressure fuel system.
	2. Poor quality fuel or water/gasoline contaminated fuel.	2. Verify by operating from a temporary tank with good fuel. Clean and flush the fuel tank. Replace fuel/water separator filter.
	3. Engine overloaded.	3. Verify the engine load rating is not being exceeded.
	4. Improperly operating injectors.	4. Check and replace misfiring/inoperative injectors.
EXCESSIVE VIBRATION	1. Loose or broken engine mounts.	1. Replace engine mounts.
	2. Damaged fan or improperly operating accessories.	2. Check and replace the vibrating components.
	3. Improperly operating vibration damper	3. Inspect/replace vibration damper.
	4. Improperly operating balance shaft	4. Inspect/replace balance shaft.
	5. Improperly operating electronically controlled viscous fan drive.	5. Inspect/replace fan drive.
	6. Worn or damaged generator bearing.	6. Check/replace generator.
	7. Flywheel housing misaligned.	7. Check/correct flywheel alignment.
	8. Loose or broken power component.	8. Inspect the crankshaft and rods for damage that causes an unbalance condition. Repair/replace as required.
	9. Worn or unbalanced driveline components.	9. Check/repair driveline components.
EXCESSIVE ENGINE NOISES	1. Drive belt squeal, insufficient tension or abnormally high loading.	1. Check the automatic tensioner and inspect the drive belt. Make sure water pump, tensioner pulley, fan hub, generator and power steering pump turn freely.
	2. Intake air or exhaust leaks.	2. Refer to Excessive Exhaust Smoke. Refer to **SMOKE DIAGNOSIS CHARTS**.
	3. Excessive valve lash.	3. Adjust valves. Make sure the rocker arms are not bent. Replace bent or severely worn components.
	4. Turbocharger noise.	4. Check turbocharger impeller and turbine wheel for housing contact.

		Repair/replace as required.
	5. Gear train noise.	5. Visually inspect and measure gear backlash. Replace gears as required.
	6. Power function knock.	6. Check/replace rod and main bearings.

SMOKE DIAGNOSIS CHARTS

The following charts include possible causes and corrections for **excess or abnormal** exhaust smoke. Small amounts of exhaust smoke (at certain times) are to be considered normal for a diesel powered engine.

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Air filter dirty or plugged.	Check and replace the filter if necessary.
Air intake system restricted.	Check entire air intake system including all hoses and tubes for restrictions, collapsed parts or damage. Repair/replace as necessary.
Air Leak in Intake System.	Check entire air intake system including all hoses and tubes for collapse, cracks, loose clamps, or holes in rubber ducts. Also check intake manifold for loose mounting hardware.
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Engine Control Module (ECM) has incorrect calibration.	Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Exhaust system restriction is above specifications.	Check exhaust pipes for damage/restrictions. Repair as necessary.
Fuel grade is not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel injection pump malfunctioning.	A DTC may have been set. If so refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Fuel injector malfunctioning.	A DTC may have been set. Perform "Injector Classification Programming" using scan tool. Also refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article and Return Fuel Quantity Test.
Fuel injector lower washer doubled or missing.	Remove and inspect injector washer.
Fuel return system restricted.	Check fuel return lines for restriction.
Intake manifold restricted.	Remove restriction.
Manifold Air Pressure (Boost) Sensor or sensor circuit malfunctioning.	A DTC should have been set. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Turbocharger air intake restriction.	Remove restriction.

Turbocharger damaged.	Refer to **TURBOCHARGER, DIAGNOSIS AND TESTING**.
Turbocharger has excess build up on compressor wheel or diffuser vanes.	Refer to **TURBOCHARGER, DIAGNOSIS AND TESTING**.
Turbocharger wheel clearance out of specification.	Refer to **TURBOCHARGER, DIAGNOSIS AND TESTING**.

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Air in fuel supply: Possible leak in fuel supply side.	Inspect fuel system
Coolant leaking into combustion chamber.	Perform pressure test of cooling system.
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
In very cold ambient temperatures, engine block heater is malfunctioning (if equipped).	Refer to **HEATER, ENGINE BLOCK, DIAGNOSIS AND TESTING** .
Engine coolant temperature sensor malfunctioning.	A DTC should have been set. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article. Also check thermostat operation.
Engine Control Module (ECM) has incorrect calibration.	A DTC should have been set. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Fuel filter plugged.	Refer to **DIAGNOSIS AND TESTING** .
Fuel grade not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel injector malfunctioning.	A DTC should have been set. Perform "Injector Identification Programming" or "Cylinder Cutout Test" using scan tool to isolate individual cylinders. Also refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Fuel injector hold-down(s) loose.	Replace the copper washer(s) (shim) and tighten to specifications.
Fuel injector protrusion not correct.	Check washer (shim) at bottom of fuel injector for correct thickness.
Fuel injection pump malfunctioning.	A DTC should have been set. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Fuel supply side restriction.	For fuel system testing. Refer to **DIAGNOSIS AND TESTING** .
Intake manifold air temperature sensor malfunctioning.	A DTC should have been set. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Intake manifold heater circuit not functioning correctly in cold weather.	A DTC should have been set. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article. Also check heater elements for correct operation.
Intake manifold heater elements not functioning	A DTC should have been set if heater

correctly in cold weather.	elements are malfunctioning. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** article.
Internal engine damage (scuffed cylinder).	Analyze engine oil and inspect oil filter to locate area of probable damage.
Restriction in fuel supply side of fuel system.	For fuel system testing. Refer to **DIAGNOSIS AND TESTING** .

EXCESSIVE BLUE SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Dirty air cleaner or restricted turbocharger intake duct.	Check Air Cleaner Housing for debris and replace filter as necessary
Air leak in boost system between turbocharger compressor outlet and intake manifold.	Service charge air system.
Obstruction in exhaust manifold.	Remove exhaust manifold and inspect for blockage.
Restricted turbocharger drain tube.	Remove turbocharger drain tube and remove obstruction.
Crankcase ventilation system plugged.	Inspect oil separator system for function and clear drain back hole in cylinder head cover/intake manifold
Valve seals are worn, brittle, or improperly installed.	Replace valve stem oil seals
Valve stems or guides are worn.	Remove valves and inspect valves and guides.
Broken or Improperly installed piston rings.	Tear down engine and inspect piston rings.
Excessive piston ring end gap.	Remove pistons and measure piston ring end gap.
Excessive cylinder liner wear and taper.	Remove pistons and measure cylinder liner wear and taper.
Cylinder damage.	Remove pistons and inspect cylinder liner for cracks or porosity. Repair with new cylinder liner if necessary.
Piston damage.	Remove pistons and inspect for cracks, holes. Measure piston for out-of-round and taper.
Turbocharger failure.	Refer to **TURBOCHARGER, DIAGNOSIS AND TESTING**.

STANDARD PROCEDURE

COMPRESSION TEST

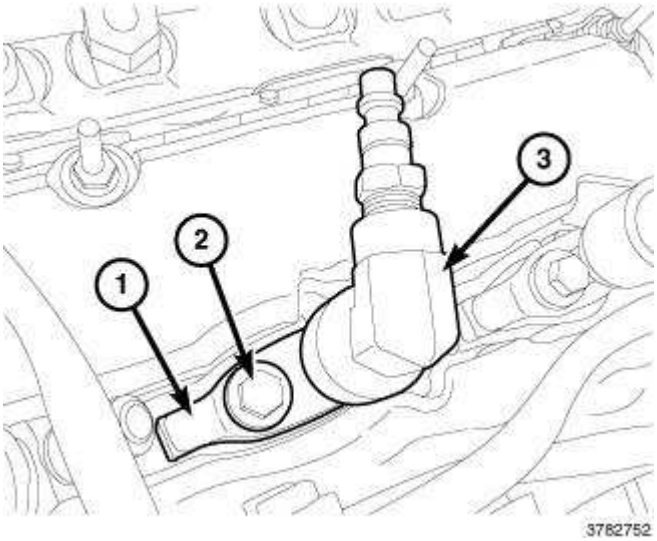

Fig. 1: Fuel Injector Clamp, Compression Test Adapter & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Warm up engine to operating temperature (approximately 80 °C, 176 °F).
2. Shut off engine.
3. Disable the low pressure fuel pump.
4. Remove the fuel injector. Refer to **INJECTOR(S), FUEL, REMOVAL** .
5. Crank engine several times with the starter to eliminate combustion residues in the cylinders.
6. Insert the (special tool #VM.10357, Adapter, Compression Test) (3) into fuel injector hole of cylinder to be tested. Install fuel injector clamp (1), bolt (2) and securely tighten.
7. Test compression pressure by cranking engine with starter for at least 8 revolutions.

Cylinder Compression Difference Between Cylinders	**5 Bar (73 psi)**

8. Carry out test procedure at the remaining cylinders in the same way.
9. Remove the (special tool #VM.10357, Adapter, Compression Test) from cylinder head.
10. Install the fuel injector. Refer to **INJECTOR(S), FUEL, INSTALLATION** .

DUST COVERS AND CAPS

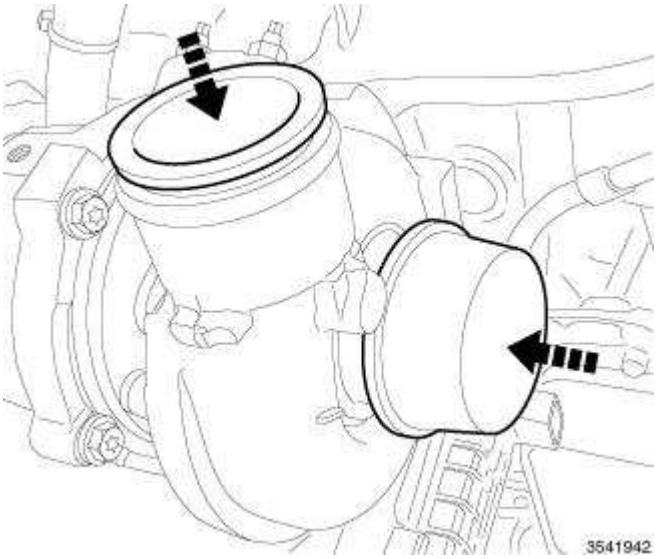

Fig. 2: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures cased by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

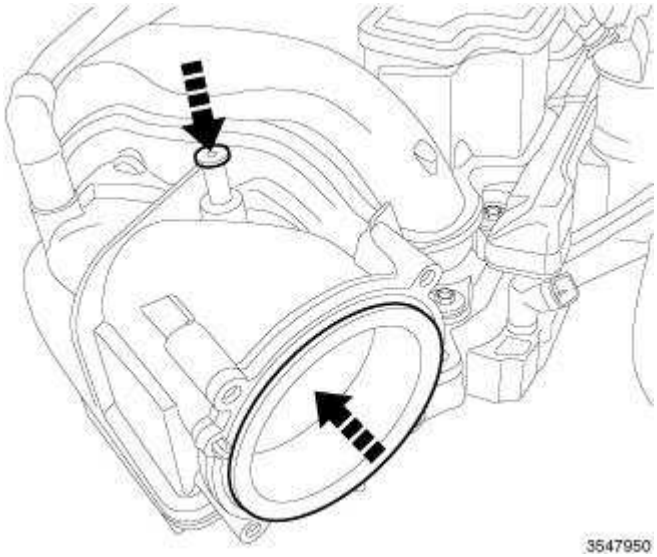

Fig. 3: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

ENGINE GASKET SURFACE PREPARATION

Fig. 4: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

Fig. 5: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc.

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results.**Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for

sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4 oz. / 16 oz. can with applicator.

MOPAR® THREEBOND ENGINE RTV SEALANT

MOPAR® THREEBOND ENGINE RTV SEALANT is a unique gasket material that is specially made to retain adhesion and sealing properties when used to seal components exposed to engine oil.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can with applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

1. Disconnect the negative cable(s) from the battery.
2. Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.
3. Place a shop towel around the fuel injectors to catch any fluid that may possibly be under pressure in the cylinder head. Remove the fuel injectors. Refer to **INJECTOR(S), FUEL, REMOVAL** .

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

4. With all injectors removed, rotate the crankshaft using the crankshaft.
5. Identify the fluid in the cylinders (coolant, fuel, oil, etc.).
6. Be sure all fluid has been removed from the cylinders.
7. Repair engine or components as necessary to prevent this problem from occurring again.
8. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.
9. Install fuel injectors. Refer to **INJECTOR(S), FUEL, INSTALLATION** .
10. Drain engine oil. Remove and discard the oil filter.
11. Install the drain plug. Tighten the plug to 50 N.m (37 ft. lbs.).
12. Install a new oil filter and tighten to 10 N.m 88 in. lbs.).
13. Fill engine crankcase with the specified amount and grade of oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
14. Connect the negative cable(s) to the battery.
15. Start the engine, allow to warm, turn engine off and check for any leaks.

SPECIFICATIONS

ENGINE SPECIFICATIONS

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION
Displacement 3.0L	3.0L (2987 cc) (182 CID)
Bore	83 mm (3.26 in.)
Stroke	92 mm (3.62)
Compression Ratio	16.5 :1
Valves Per Cylinder	4
Weight	229 Kg (505 Lbs.)

Power Output	176 Kw (240 CV) @ 4000 RPM
Torque	550 N.m (406 Ft. Lbs.) @ 1600 RPM
Idle Speed - Warm	650 RPM
Max RPM in Gear	4200
Max RPM in Neutral	4800
Ribbed V-Belt Tension	Automatic Belt Tensioner Roller
Thermostat Opening	88°C (190°F)
Cooling System Capacity	4.6 Liters (4.9 Qt.)
Engine Oil Capacity	9.2 L (9.7 Qt.) W/Filter Change
Timing System	Chain Driven Dual Overhead Camshafts
Air Intake	Dry Filter With Turbocharger and Charge Air Cooler
Fuel Supply	Electric Pump In The Fuel Tank
Fuel System	Direct Fuel Injection Common Rail System
Combustion Cycle	4 Stroke Diesel
Cylinder Compression Difference Between Cylinders	5 Bar (73 psi.)
Cooling System	Water Cooling
Engine Pre Heat	Glow Plug
Glow Plug Type	GPL2-4
Glow Plug Voltage	4.4 Volts
Emission Standards	Euro 5
Injector Opening Pressure	230 Bar (3, 335 psi)
Injection Pressure	1800 Bar (26, 106 psi)
Injection Pump	Bosch CP4.2, 2000 Bar (29008 psi)
Injection Order	1-4-2-5-3-6
Injector Type	CRI 2-18
Lubrication	Pressure Lubricated By Rotary Pump
Oil Quantity With Filter Change	9.2 Liters (9.7 Quarts)
Oil Pressure 80°C (176°F)	0.7 Bar (10 psi.) at Idle 2.5 Bar (36 psi) at 3800 RPM
Engine Rotation	Clockwise Viewed From Front Cover

Tolerance Class A	82.930 - 82.940 mm	3.2649 - 3.2653 in.
Tolerance Class B	82.940 - 82.950 mm	3.2653 - 3.2657 in.
Tolerance Class C	82.950 - 82.960 mm	3.2657 - 3.2661 in.

PISTON RINGS

DESCRIPTION	SPECIFICATION	
	Metric	**Standard**
No 1 Piston Ring		
Height	2 -0.01 / -0.03 mm	-0.000 - -0.001 in.
Gap	0.32 - 0.45 mm	0.01259 - 0.01771 in.
Vertical Play	0.13 - 0.17 mm	0.0051 - 0.0066 in.
Piston Ring End Gap		
Groove 1	0.12 - 0.16 mm	0.0048 - 0.0063
Groove 2	0.065 -- 0.110 mm	0.0026 - 0.0044
Groove 3	0.03 -- 0.07 mm	0.0012 - 0.0028
Dimensions Of The Piston Rings		
Keystone ring	NA	NA
Taper-faced ring	NA	NA

Bevel-edged ring	NA	NA
Piston Pin		
Diameter Bearing	29.975 - 29.980 mm	
Play in Piston	0.013 - 0.023 mm	in.

CONNECTING RODS

DESCRIPTION	SPECIFICATION	
	Metric	**Standard**
Connecting Rod Bolt		
Thread diameter	8 mm	0.315 in.
Shank length when new	47 mm	1.8504 in.
Maximum shank length	48 mm	1.8898 in.
Distance From Center Of Connecting Rod Bearing Bore To Connecting Rod Bushing Bore	167.97 - 168.03 mm	6.613 - 6.6154 in.
Width Of Connecting Rod At Connecting Rod Bearing Bore	17.90 - 18.10 mm	0.7048 - 0.7126 in.
Width Of Connecting Rod At Connecting Rod Bushing Bore	21.94 - 22.00 mm	0.8638 - 0.8662 in.
Connecting Rod Bushing Inner	30.038 - 30.044 mm	1.1826 - 1.1829 in.
Connecting Rod Bushing Outer Diameter	32.500 - 32.525 mm	1.2796 - 1.2806 in.
Piston Pin Play In Connecting Rod Bushing	0.028 - 0.034 mm	0.0012 - 0.0014 in.
Peak-To-Valley Height (Rz) Of Connecting Rod Bushing On Inside	5 mm	0.1969 in.
Connecting Rod Bearing Shell Basic Bore	67.600 - 67.614 mm	2.6615 - 2.662 in.
Permissible Out-Of-Roundness And Concentricity Of Basic Bore	0.020 mm	0.0008 in.
Permissible Twist Of Connecting Rod Bearing Bore To Connecting Rod Bush Bore Over A Length Of 100 mm	0.1 mm	0.004 in.
Permissible Variation Of Axial Parallelism Of Connecting rod Bearing Bore To Connecting rod Bushing Bore Over A Length Of 100 mm	0.045 mm	0.0018 in.
Permissible Difference In Weight Of Complete	2 grams	0.07 oz.

REMOVAL

REMOVAL

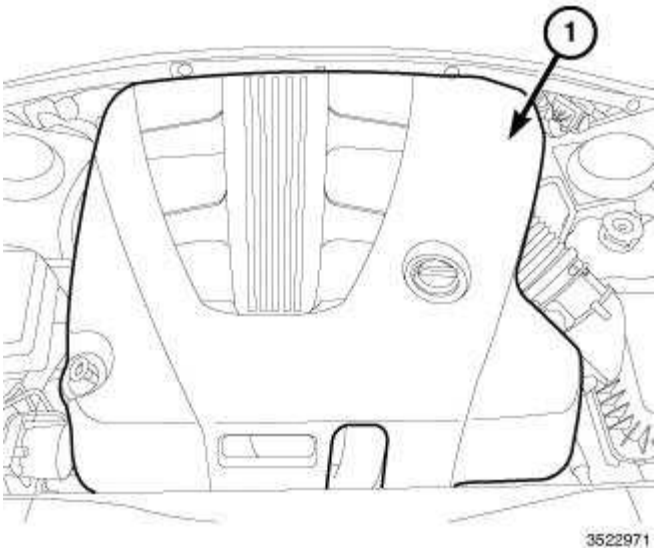

Fig. 6: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

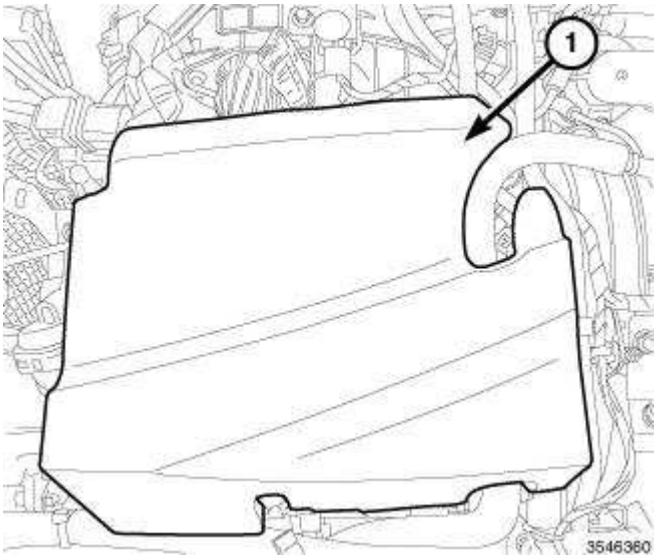

Fig. 7: Right Side Fuel Injector Silencer
Courtesy of CHRYSLER GROUP, LLC

3. Remove the right side fuel injector silencer (1).
4. Recover the A/C refrigerant. Refer to **PLUMBING, STANDARD PROCEDURE** .
5. Remove the hood. Refer to **HOOD, REMOVAL** .

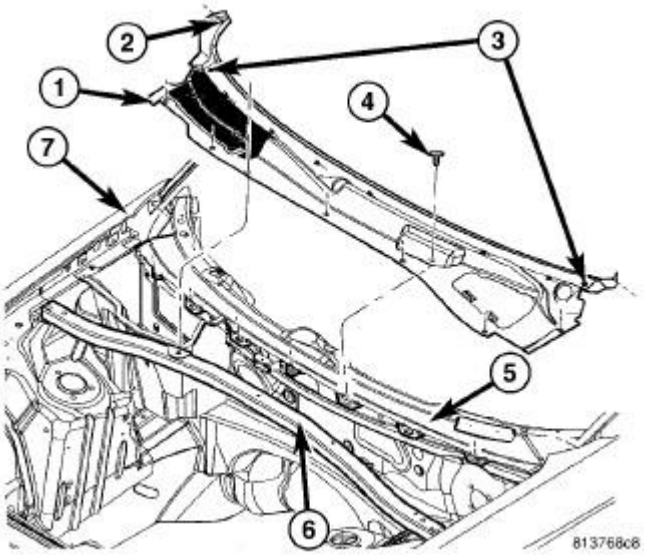

Fig. 8: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Remove the wiper arm linkage. Refer to **LINKAGE, WIPER ARM, REMOVAL** .
7. Remove bolts and the strut support brace (6).
8. Remove air cleaner body and turbocharger inlet hose. Refer to **BODY, AIR CLEANER, REMOVAL**.

9. Remove the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, REMOVAL** .
10. Remove the transmission belly pan.
11. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
12. Drain the engine oil. Using a new sealing washer, install and tighten the drain plug to 45 N.m (33 ft. lbs.).

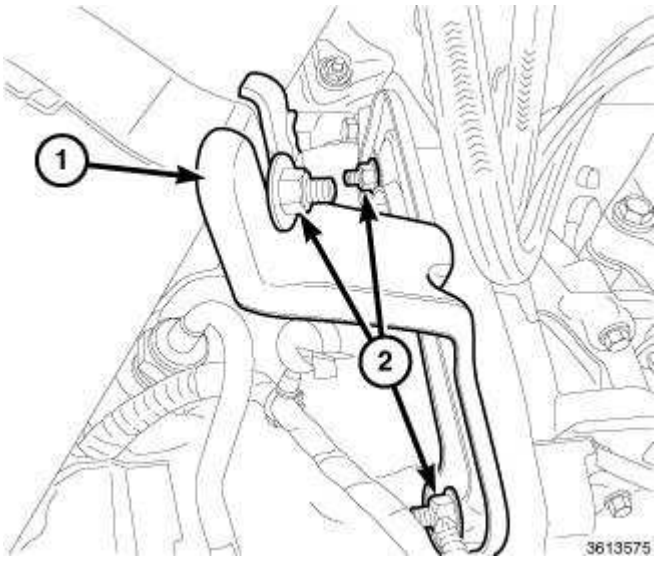

Fig. 9: Exhaust Steady Rest Bracket & Nuts
Courtesy of CHRYSLER GROUP, LLC

13. Detach the wire harness retainer from exhaust steady rest bracket.
14. Remove nuts (2) and the exhaust steady rest bracket (1).
15. Remove the left side Charge Air Cooler (CAC) hose at cooler.
16. Remove the right side CAC hose at cooler.
17. Remove the right side splash shield.
18. Remove the left side splash shield.
19. Lower the vehicle.

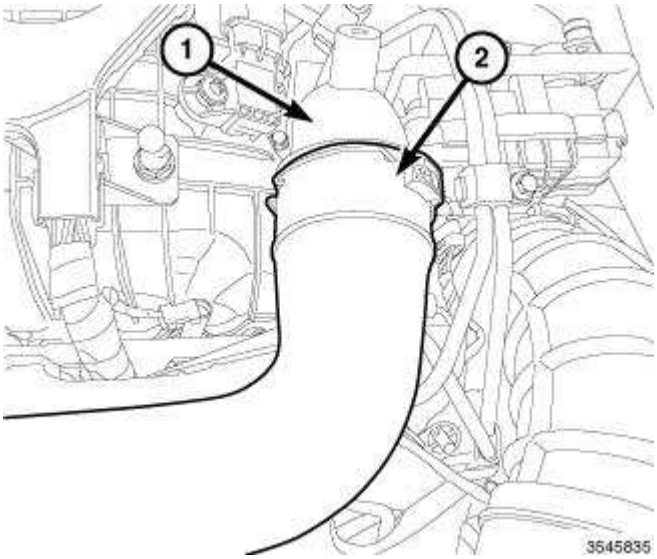

Fig. 10: Turbocharger & Charge Air Cooler (CAC) Hose
Courtesy of CHRYSLER GROUP, LLC

20. Disconnect the Charge Air Cooler (CAC) hose (2) from turbocharger (1).
21. Remove the two bolts securing the CAC hose to timing cover.

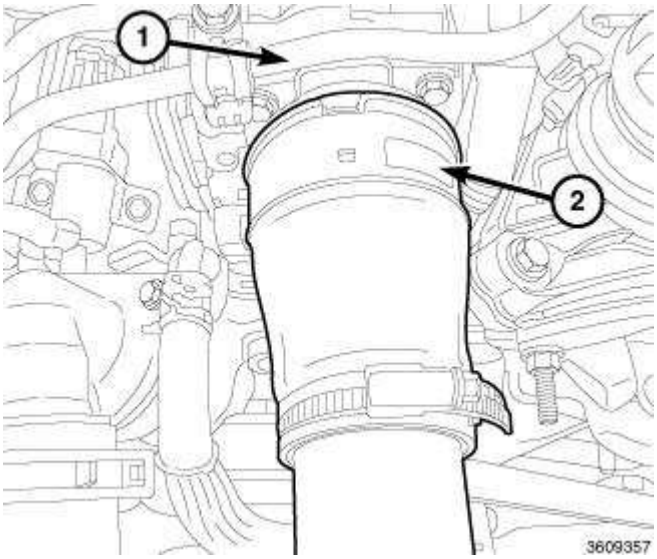

Fig. 11: EGR Air Flow Control Valve & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

22. Disconnect the CAC hose (1) from the EGR air flow control valve.
23. Remove bolt securing CAC hose to lower timing cover.

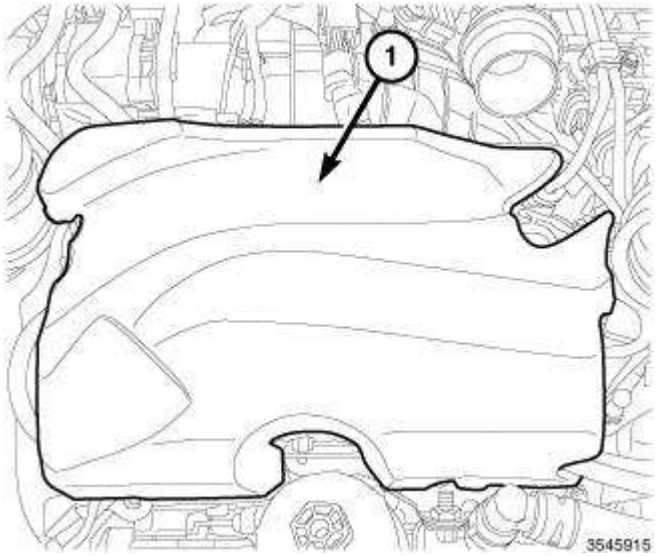

Fig. 12: Left Side Fuel Injector Silencer
Courtesy of CHRYSLER GROUP, LLC

24. Remove the left side fuel injector silencer (1).
25. Remove the upper radiator hose.
26. Remove the lower radiator hose.
27. Remove the degas hose at thermostat housing.

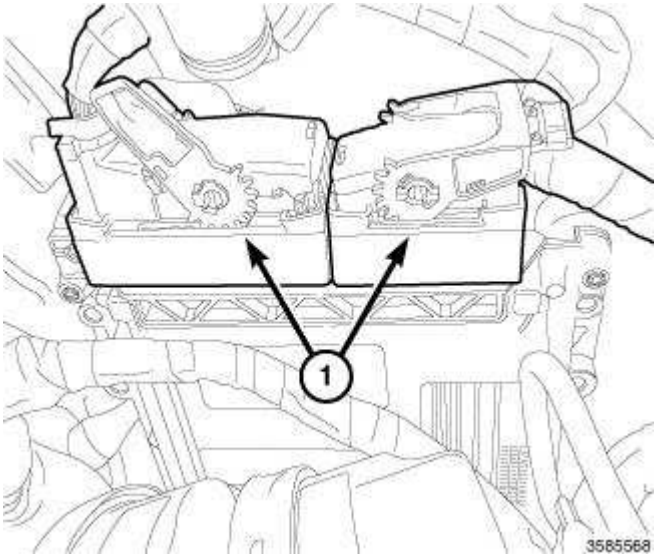

Fig. 13: Powertrain Control Module (PCM) Connectors
Courtesy of CHRYSLER GROUP, LLC

28. Disconnect the engine wire harness at the Powertrain Control Module (PCM).
29. Disconnect the second engine wire harness near master cylinder.
30. Remove the oxygen sensor. Refer to **SENSOR, OXYGEN, REMOVAL** .

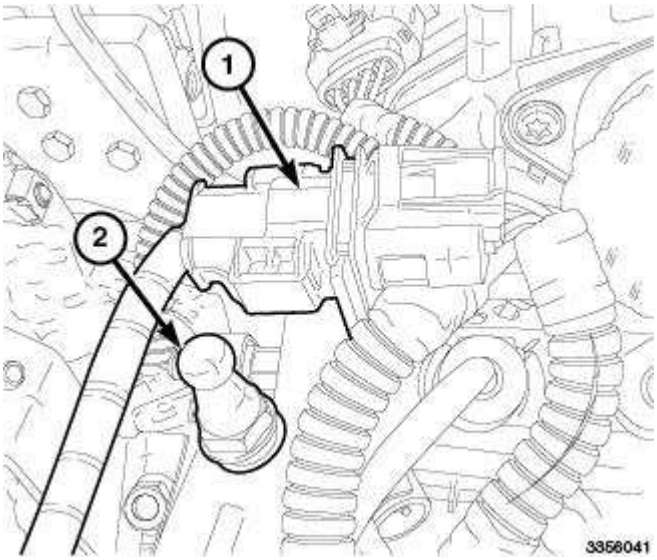

Fig. 14: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

31. Remove the ball stud bolt (2) securing the transmission fill tube.

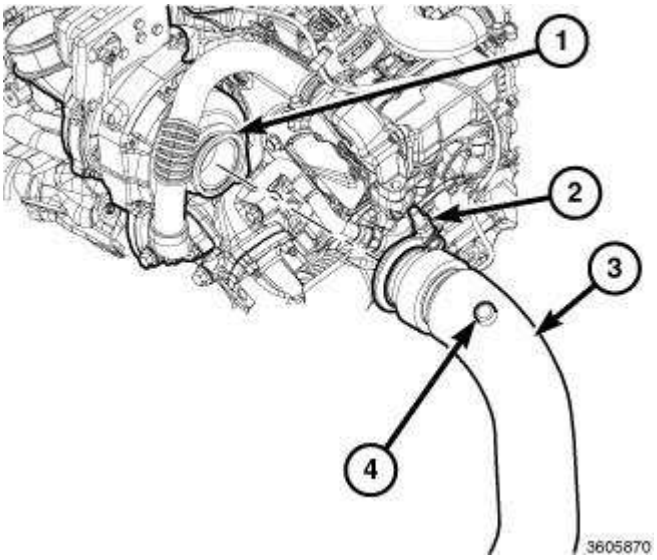

Fig. 15: Turbocharger Flange, Band Clamp & Down-Pipe
Courtesy of CHRYSLER GROUP, LLC

32. Remove the band clamp (2) and separate the down-pipe (3) from the turbocharger flange (1).
33. Disconnect the differential pressure sensor hoses.
34. Disconnect the upstream stream exhaust temperature sensor.
35. Disconnect both heater hoses at engine.
36. Disconnect the brake booster vacuum hose.

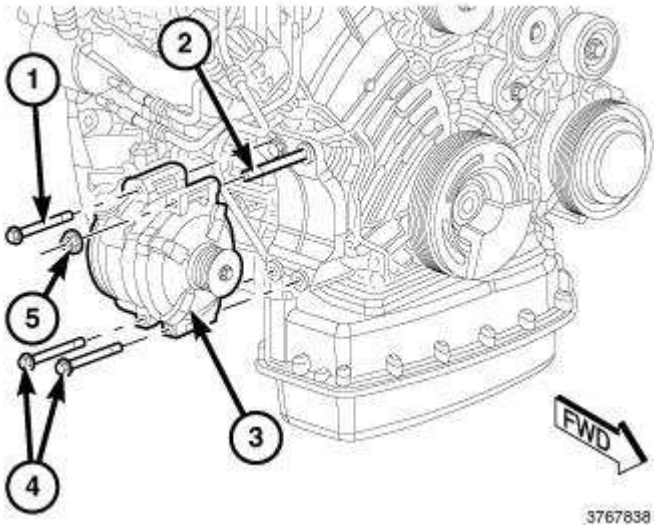

Fig. 16: Generator & Fasteners
Courtesy of CHRYSLER GROUP, LLC

37. Remove the generator (3). Refer to **GENERATOR, REMOVAL** .

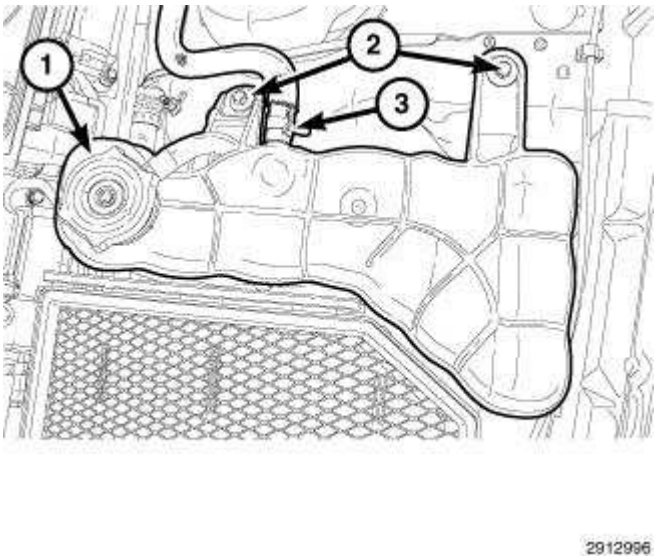

Fig. 17: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

38. Remove the coolant recovery bottle. Refer to **BOTTLE, COOLANT RECOVERY, REMOVAL** .

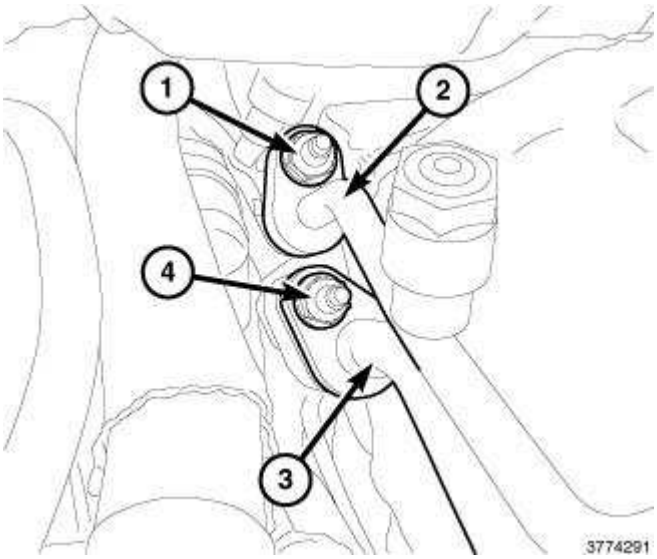

Fig. 18: A/C Liquid Line, A/C Suction Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

39. Remove nut and disconnect the A/C line junction near left strut tower. Install protective cap in openings.
40. Remove nut (4) and disconnect the A/C suction line (3). Install protective cap in openings.

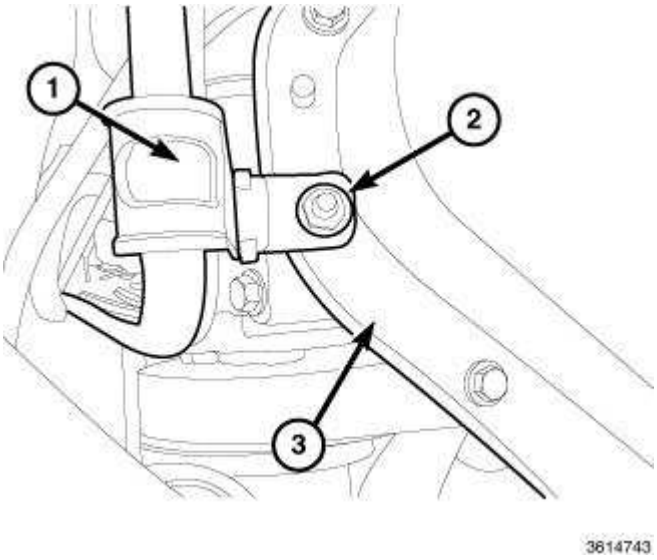

Fig. 19: Transmission Cooler Line Bracket, Nut & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

41. Raise the vehicle.
42. Remove nut (2) securing the transmission cooler line bracket (1) to oil pan (3).
43. Lower the vehicle.

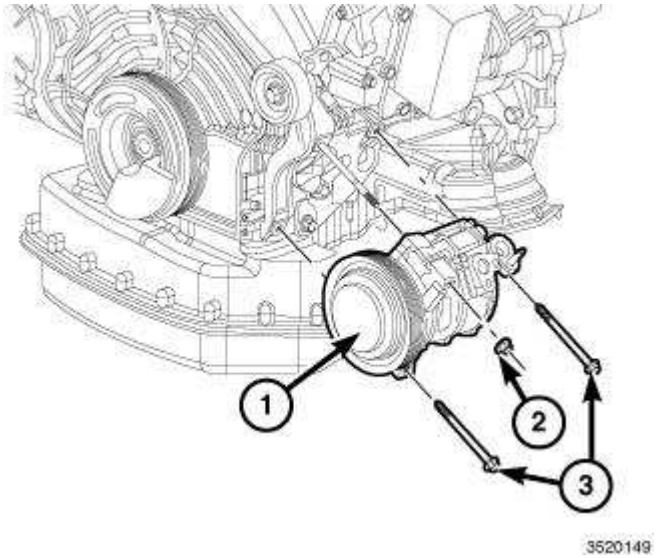

Fig. 20: A/C Compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

44. Disconnect the A/C compressor wire harness connector.
45. Remove nut and the A/C suction line at compressor. Install protective cap in openings.
46. Remove nut and the A/C discharge line at compressor. Install protective cap in openings.
47. Remove the nut (2) and stud securing the A/C compressor (1).
48. Remove bolts (3) securing the A/C compressor and position aside the A/C compressor.

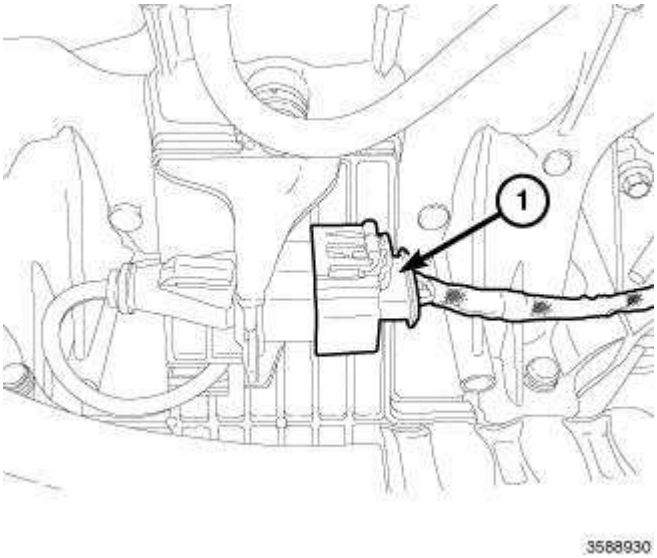

Fig. 21: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

49. Raise the vehicle.
50. Disconnect the Crankshaft Position Sensor (CKP) wiring harness connector (1).
51. Remove the starter. Refer to **STARTER, REMOVAL** .

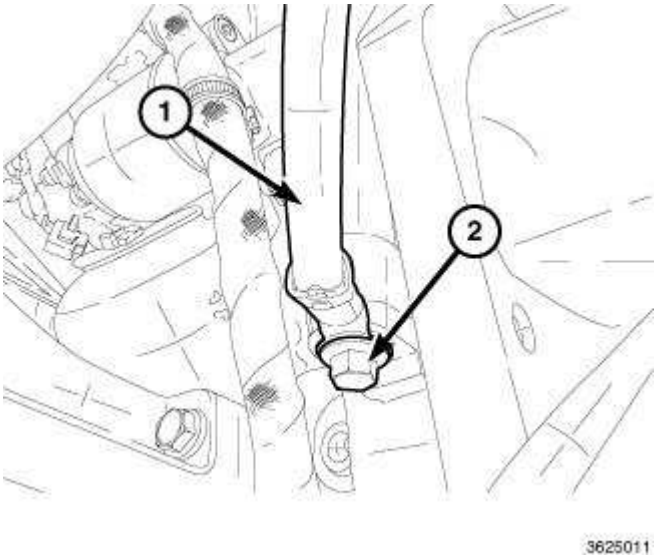

Fig. 22: Engine Ground Cable & Bolt
Courtesy of CHRYSLER GROUP, LLC

52. Remove bolt (2) and the engine ground cable (1).

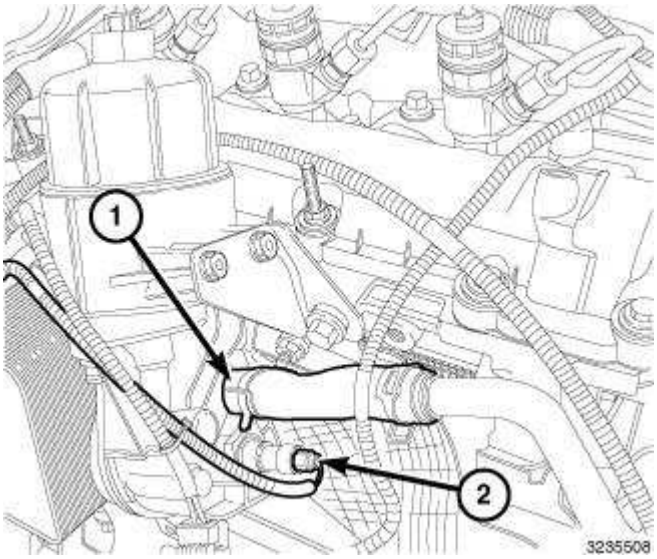

Fig. 23: Coolant Hose & Oil Pressure Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

53. Detach the wire harness retainer and disconnect the oil pressure switch wire harness connector (2).

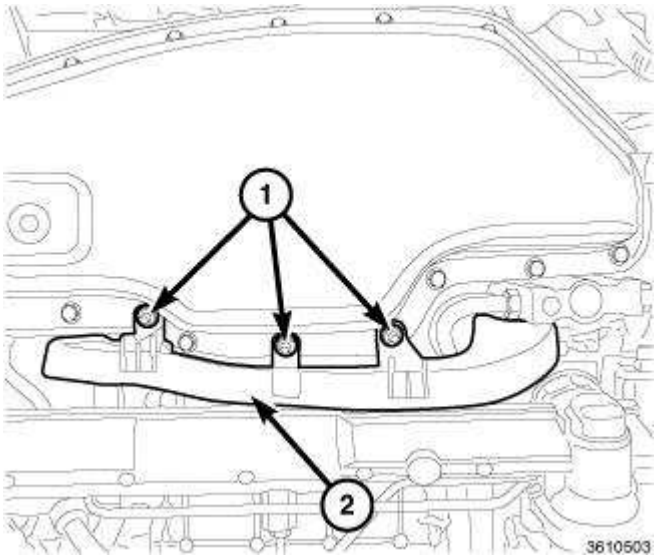

Fig. 24: Lower Engine Wire Harness & Nuts
Courtesy of CHRYSLER GROUP, LLC

54. Remove nuts (1) and allow wire harness (2) to drop down for clearance.
55. Detach the lower engine wire harness from upper oil pan.
56. Detach the wire harness retainer from oil dipstick tube.
57. Remove the torque converter bolts.

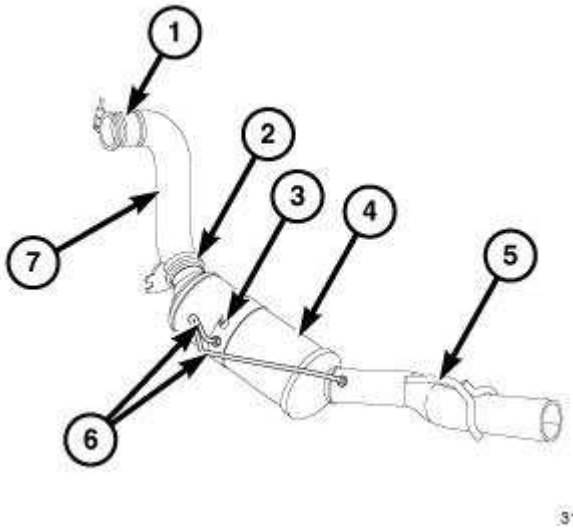

Fig. 25: Differential Pressure Sensor Tubing & Diesel Particulate Filter
Courtesy of CHRYSLER GROUP, LLC

58. Remove the diesel particulate filter. Refer to **FILTER, DIESEL PARTICULATE, REMOVAL** .

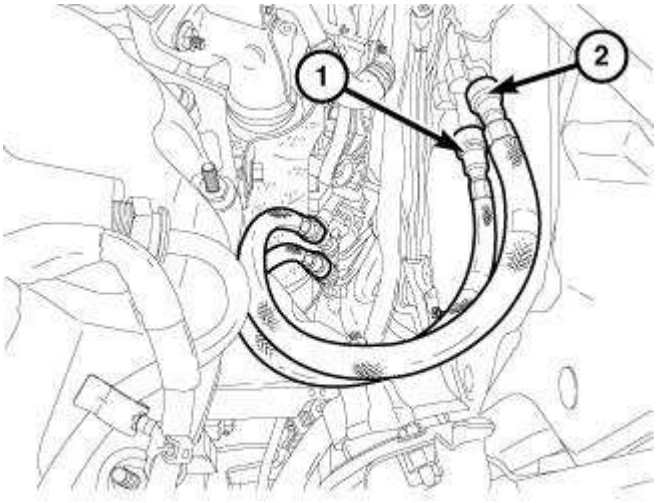

Fig. 26: Low Pressure Supply & Return Line
Courtesy of CHRYSLER GROUP, LLC

59. Disconnect the low pressure supply (1) and return (2) lines. Refer to **FITTING, QUICK CONNECT** .
60. Remove the four transmission-to-oil pan bolts.
61. Lower the vehicle.

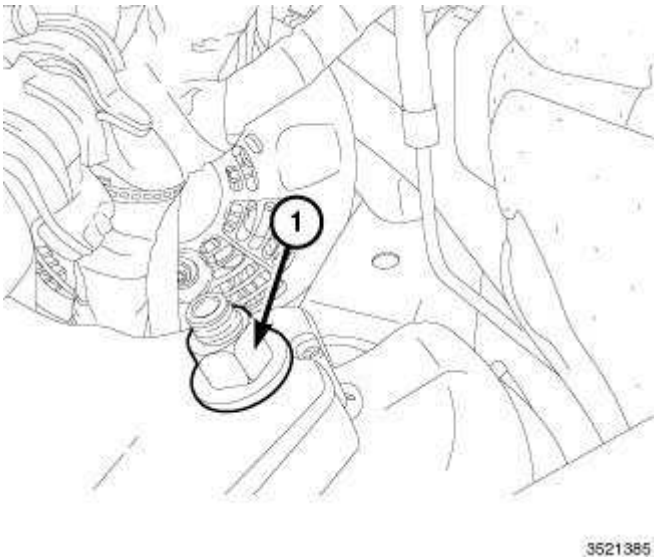

Fig. 27: Engine Mount Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

62. Remove the right and left engine mount retaining nuts (1).

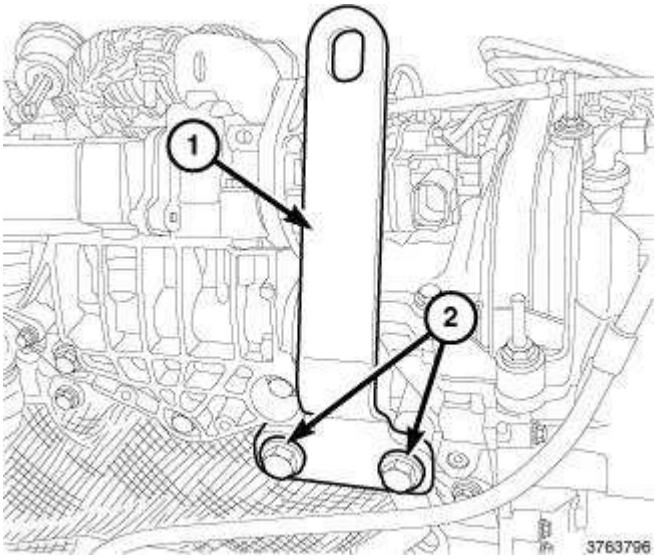

Fig. 28: Engine Lifting Bracket & Bolts - Right
Courtesy of CHRYSLER GROUP, LLC

63. Install the (special tool #VM.10360-2, Bracket, Engine Lifting (Right)) (1) and securely tighten bolts (2).

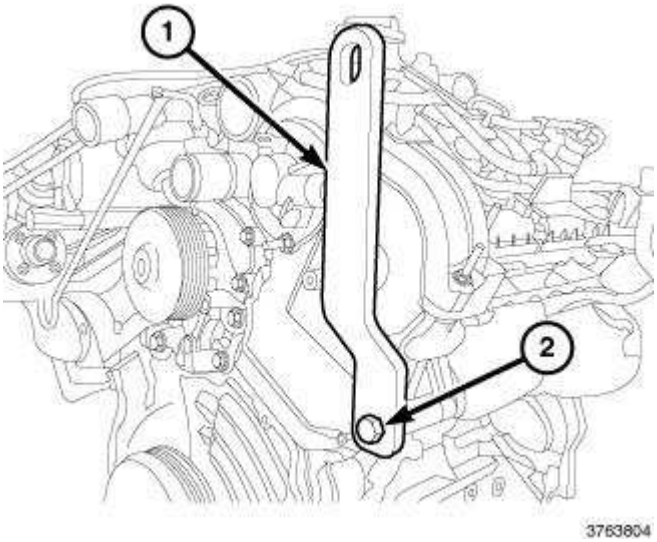

Fig. 29: Engine Lifting Bracket & Bolts - Left Front
Courtesy of CHRYSLER GROUP, LLC

64. Install the (special tool #VM.10360-3, Bracket, Engine Lifting (Left Front)) (1) and securely tighten bolt (2).

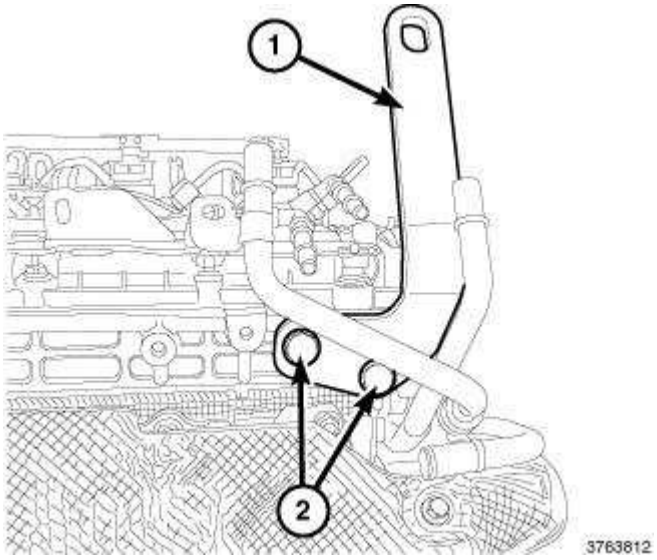

Fig. 30: Engine Lifting Bracket & Bolts - Left Rear
Courtesy of CHRYSLER GROUP, LLC

65. Install the (special tool #VM.10360-1, Bracket, Engine Lifting (Left Rear)) (1) and securely tighten bolts (2).
66. Position the engine hoist and connect engine lift chain to engine lift fixtures.
67. Position floor jack under the transmission.
68. Remove the upper five transmission-to-engine bolts.
69. Slightly raise the transmission.
70. Remove engine from vehicle.

INSTALLATION

INSTALLATION

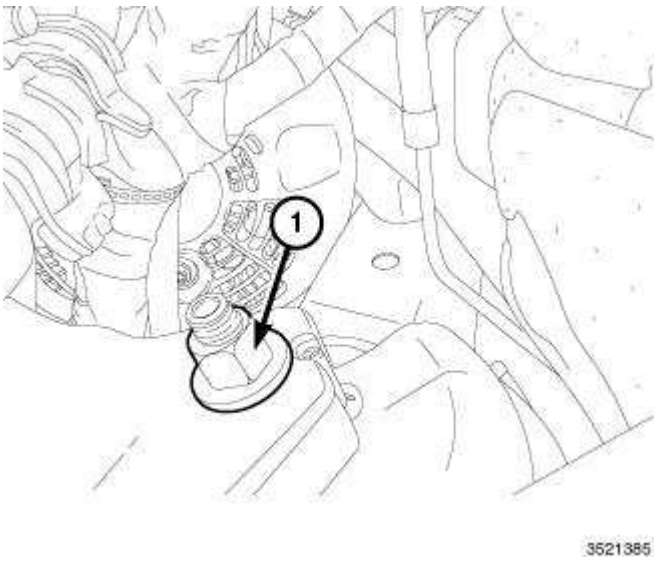

Fig. 31: Engine Mount Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Carefully align the engine assembly in the engine bay area and align with the transmission, **Do Not** lower the engine.
2. Align the engine to transmission, and lower the engine mounts into position.

NOTE: Right side shown in illustration, left side similar.

3. Install the right and left engine mount retaining nuts (1) and tighten to 61 N.m (45 ft. lbs.).
4. Remove engine lifting device.
5. Lower the transmission and remove floor jack from under transmission.
6. Install the upper five transmission-to-engine bolts and tighten to 39 N.m (29 ft. lbs.).

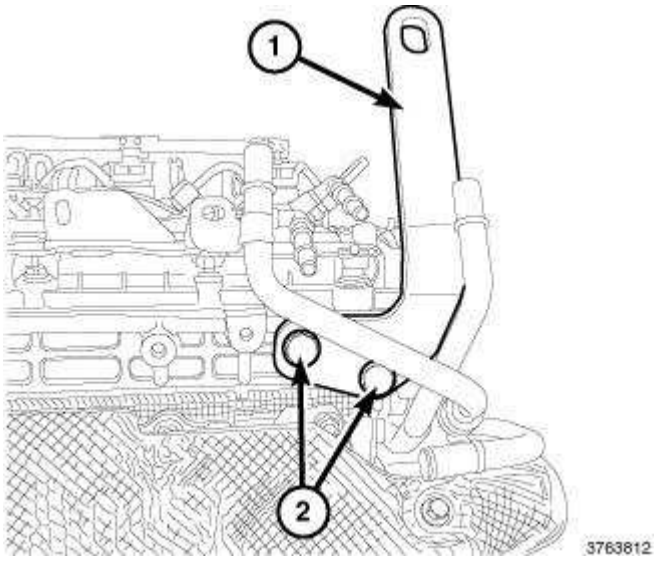

Fig. 32: Engine Lifting Bracket & Bolts - Left Rear
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (2) and the (special tool #VM.10360-1, Bracket, Engine Lifting (Left Rear)) (1).

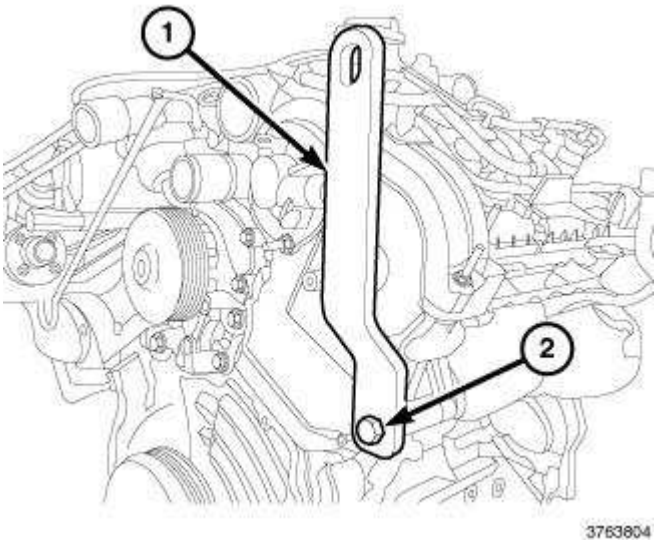

Fig. 33: Engine Lifting Bracket & Bolts - Left Front
Courtesy of CHRYSLER GROUP, LLC

8. Remove bolt (2) and the (special tool #VM.10360-3, Bracket, Engine Lifting (Left Front)) (1).

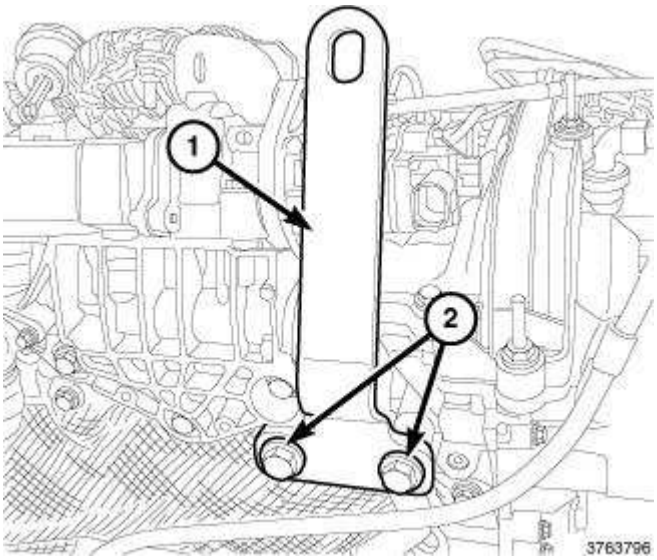

Fig. 34: Engine Lifting Bracket & Bolts - Right
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolts (2) and the (special tool #VM.10360-2, Bracket, Engine Lifting (Right)) (1).
10. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
11. Install the four transmission-to-oil pan bolts and tighten to 39 N.m (29 ft. lbs.).

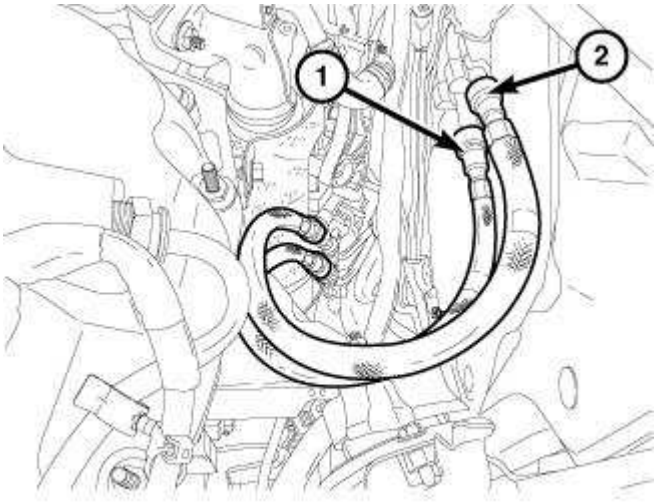

Fig. 35: Low Pressure Supply & Return Line
Courtesy of CHRYSLER GROUP, LLC

12. Connect the low pressure supply (1) and return (2) lines.
13. Install bolts securing the transmission cooler liner to oil pan and securely tighten bolts.

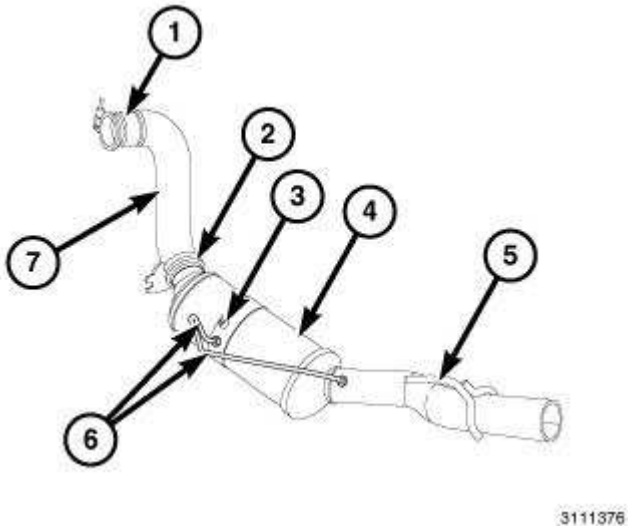

Fig. 36: Differential Pressure Sensor Tubing & Diesel Particulate Filter
Courtesy of CHRYSLER GROUP, LLC

14. Install the diesel particulate filter. Refer to **FILTER, DIESEL PARTICULATE, INSTALLATION** .

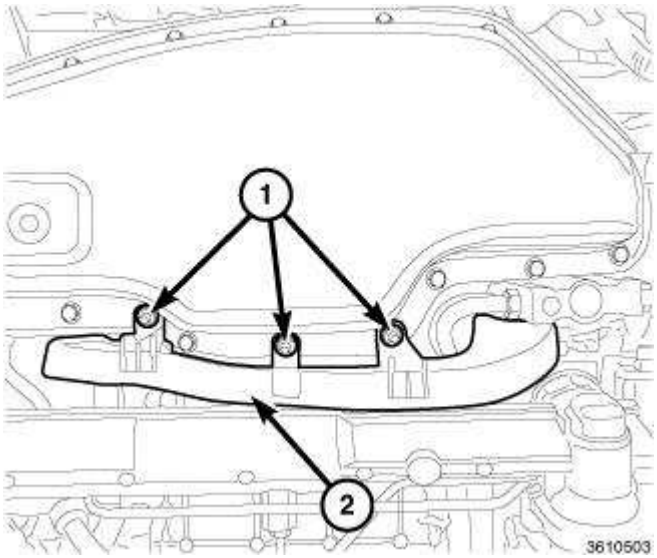

Fig. 37: Lower Engine Wire Harness & Nuts
Courtesy of CHRYSLER GROUP, LLC

15. Verify that the torque converter is pulled flush to the flexplate. Tighten bolts to 42 N.m (31 ft. lbs.).
16. Attach the wire harness retainer to the oil dipstick tube.
17. Attach the lower engine wire harness from upper oil pan.
18. Install the wire harness (2). Tighten nuts (1) to 11 N.m (97 in. lbs.).

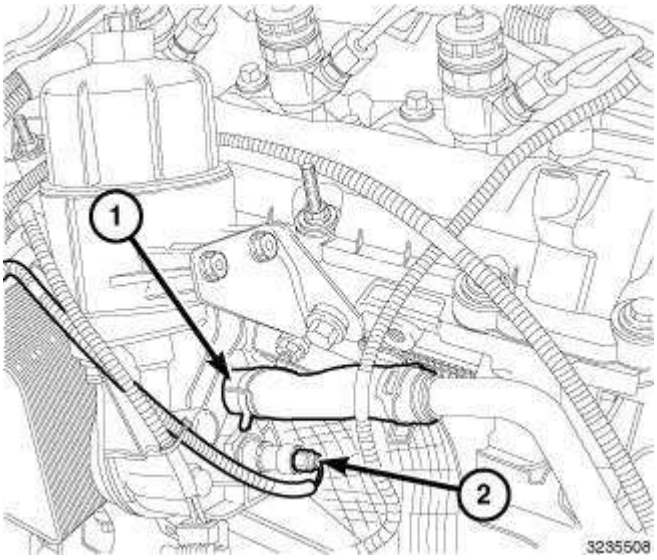

Fig. 38: Coolant Hose & Oil Pressure Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

19. Connect the oil pressure switch wire harness connector (2) and attach the wire harness retainer.

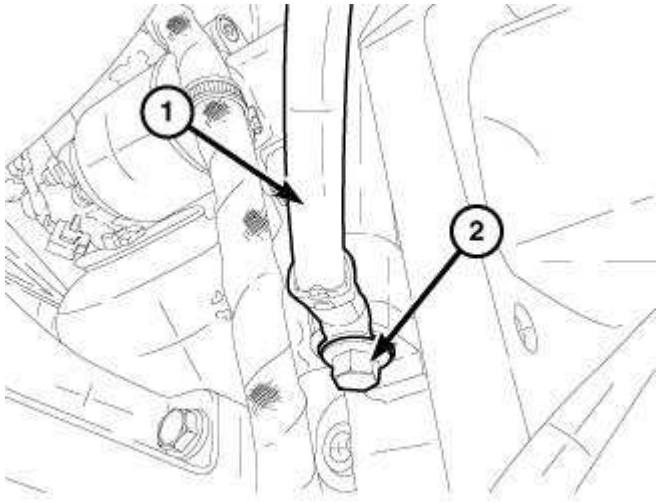

Fig. 39: Engine Ground Cable & Bolt
Courtesy of CHRYSLER GROUP, LLC

20. Install the engine ground cable (1). Tighten bolt (2) to 30 N.m (22 ft. lbs.).

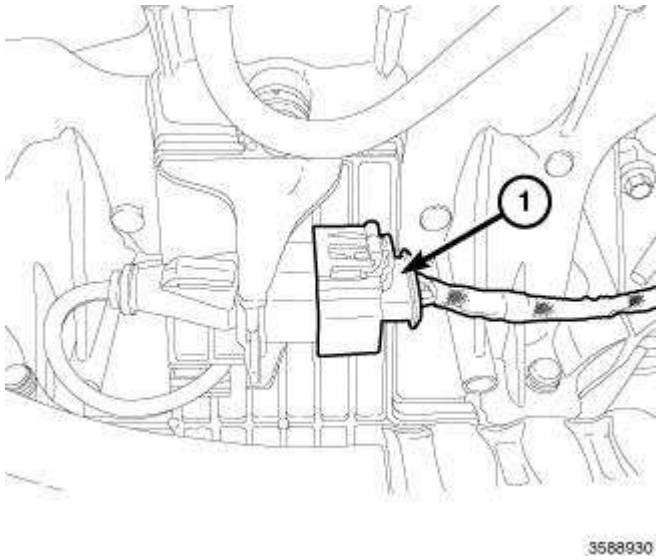

Fig. 40: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

21. Install the starter. Refer to **STARTER, INSTALLATION** .
22. Disconnect the Crankshaft Position Sensor (CKP) wiring harness connector (1).
23. Lower the vehicle.

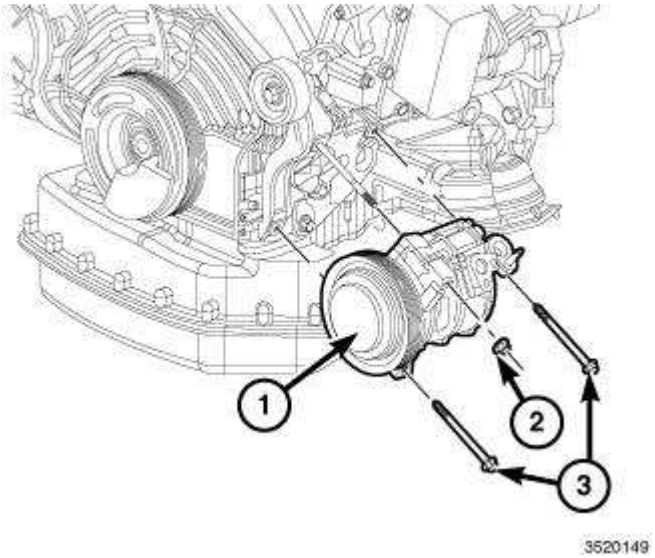

Fig. 41: A/C Compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

24. Install the A/C compressor. Tighten bolts (3) to 30 N.m (22 ft. lbs.).
25. Install the A/C compressor mounting stud and tighten to 11 N.m (97 in. lbs.).
26. Install the A/C compressor mounting nut (2) and tighten to 30 N.m (22 ft. lbs.).
27. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
28. Remove protective cap and install the A/C discharge line at compressor. Tighten nut to 22 N.m (16 ft. lbs.).
29. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
30. Remove protective cap and install the A/C suction line at compressor. Tighten nut to 22 N.m (16 ft. lbs.).
31. Connect the A/C compressor wire harness connector.

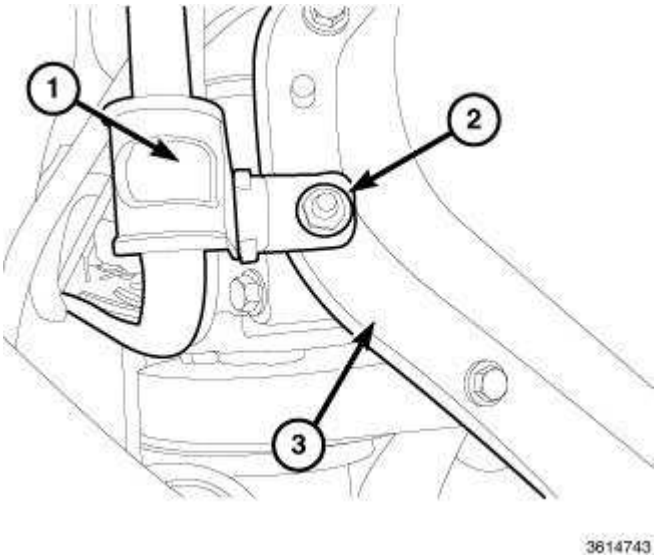

Fig. 42: Transmission Cooler Line Bracket, Nut & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

32. Raise the vehicle.
33. Install the transmission cooler line bracket (1) and tighten nuts (2) to 11 N.m (97 in. lbs.).
34. Lower the vehicle.

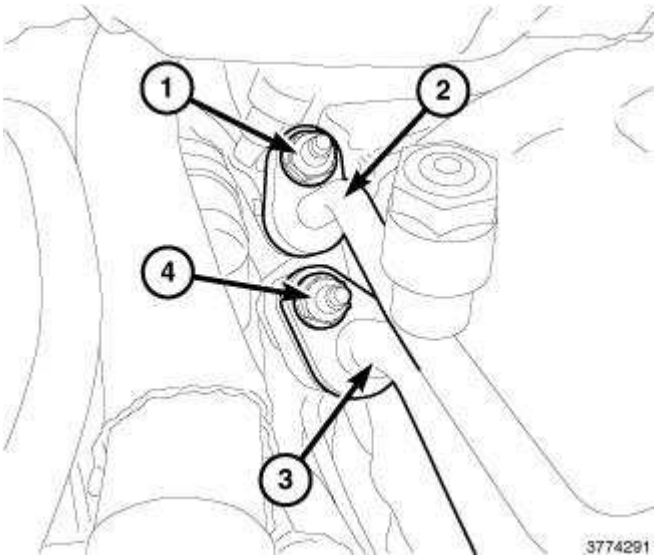

Fig. 43: A/C Liquid Line, A/C Suction Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

35. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use

only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

36. Remove the protective caps from opening and connect the A/C suction line (3). Tighten nut (4) to 22 N.m (16 ft. lbs.).
37. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
38. Remove the protective caps from opening and connect the A/C liquid line (2). Tighten nut (4) to 22 N.m (16 ft. lbs.).

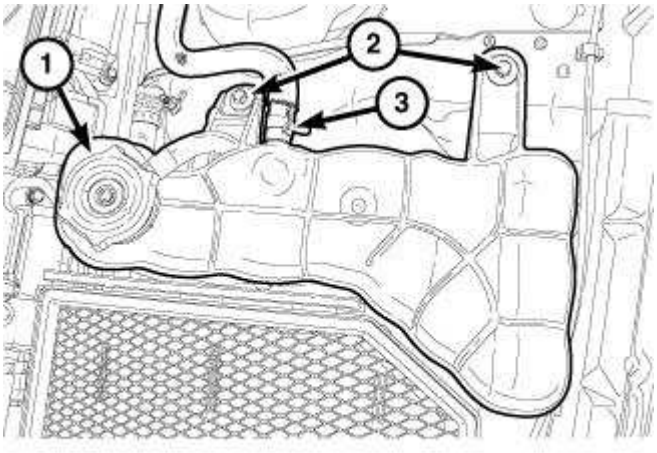

Fig. 44: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

39. Install the coolant recovery bottle. Refer to **BOTTLE, COOLANT RECOVERY, INSTALLATION** .

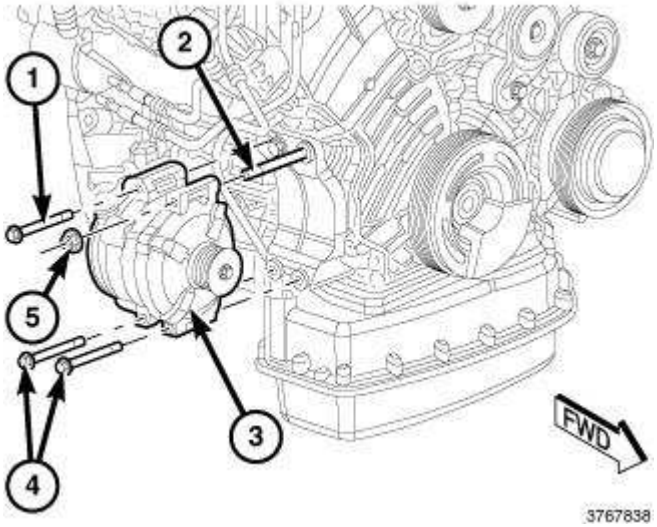

Fig. 45: Generator & Fasteners

Courtesy of CHRYSLER GROUP, LLC

40. Install the generator (3). Refer to **GENERATOR, INSTALLATION** .

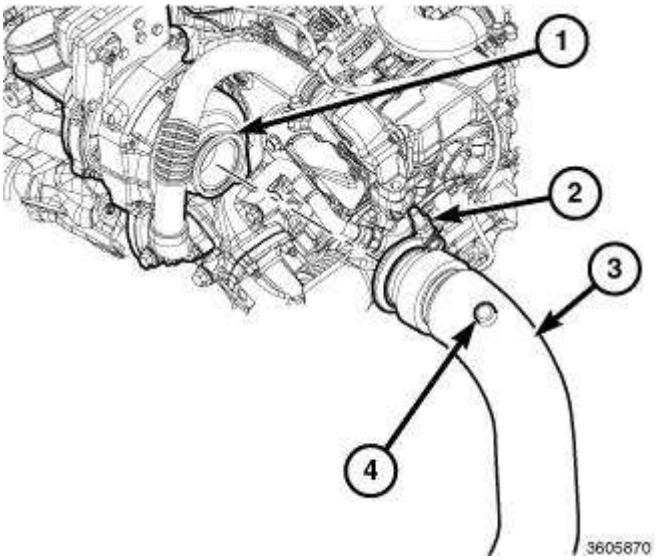

Fig. 46: Turbocharger Flange, Band Clamp & Down-Pipe
Courtesy of CHRYSLER GROUP, LLC

41. Connect the brake booster vacuum hose.
42. Connect both heater hoses at engine.
43. Connect the upstream stream exhaust gas temperature sensor.
44. Connect the differential pressure sensor hoses.
45. Connect the down-pipe (3) to the turbocharger flange (1) and install the band clamp (2). Tighten band clamp to (2) to 25 N.m (18 ft. lbs.).

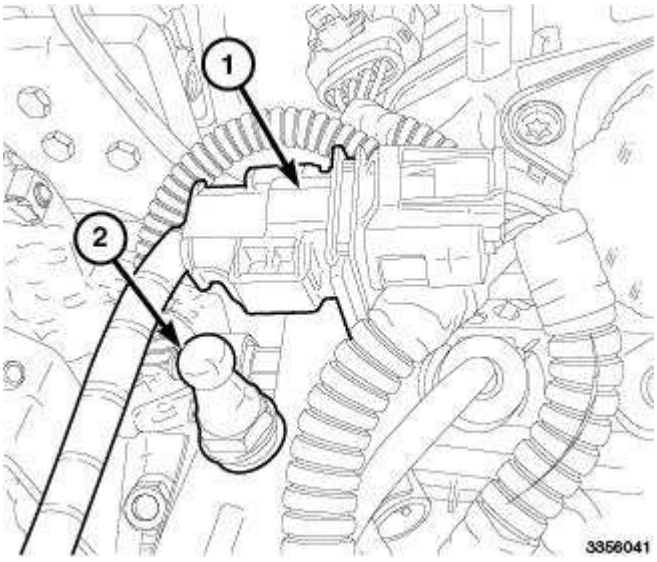

Fig. 47: Oxygen Sensor Connector & Ball Stud Fastener

Courtesy of CHRYSLER GROUP, LLC

46. Install the ball stud bolt (2) securing the transmission fill tube and securely tighten.

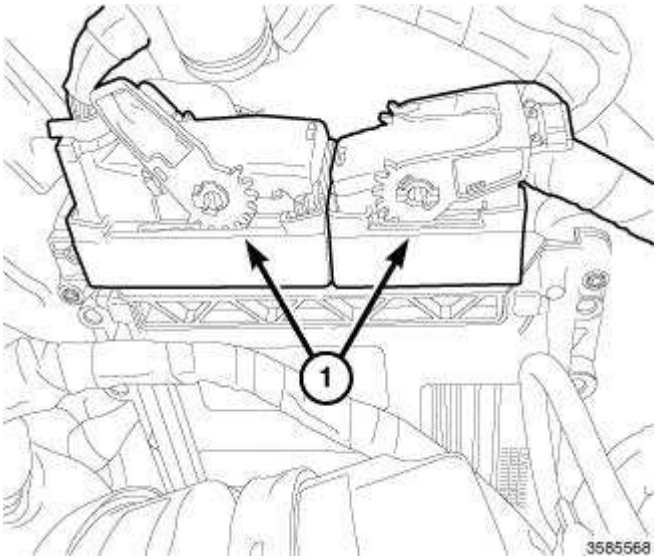

Fig. 48: Powertrain Control Module (PCM) Connectors
Courtesy of CHRYSLER GROUP, LLC

47. Install the oxygen sensor. Refer to **SENSOR, OXYGEN, INSTALLATION** .
48. Connect the second engine wire harness near master cylinder.
49. Connect the engine wire harness at the Powertrain Control Module (PCM).

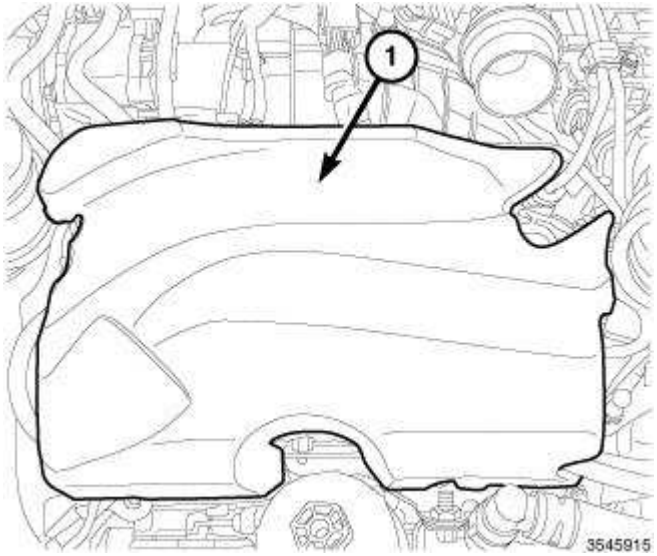

Fig. 49: Left Side Fuel Injector Silencer
Courtesy of CHRYSLER GROUP, LLC

50. Install the degas hose at thermostat housing.
51. Install the lower radiator hose.

52. Install the upper radiator hose.
53. Install the left side fuel injector silencer (1).

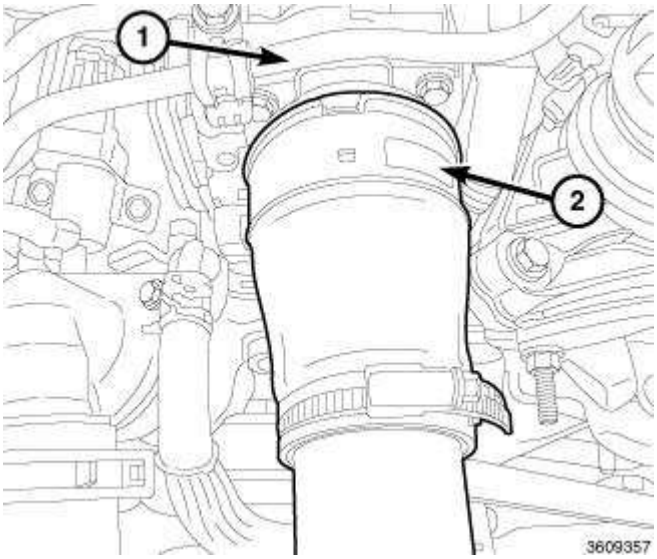

Fig. 50: EGR Air Flow Control Valve & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

54. Install bolt securing CAC hose to lower timing cover and securely tighten.
55. Connect the CAC hose (2) from the EGR air flow control valve.

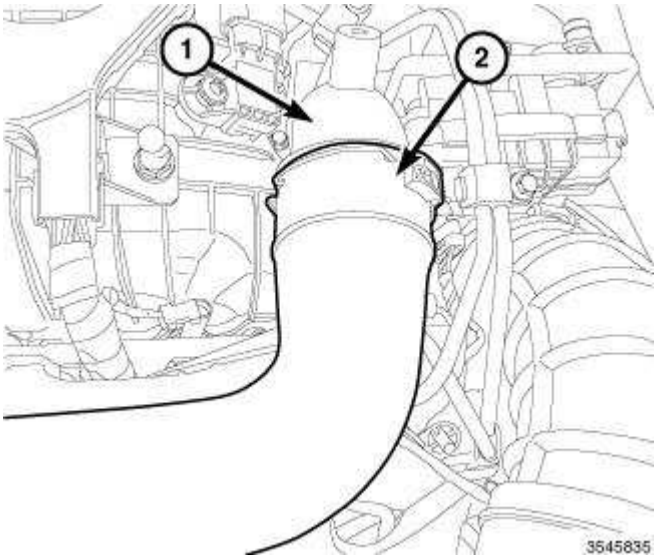

Fig. 51: Turbocharger & Charge Air Cooler (CAC) Hose
Courtesy of CHRYSLER GROUP, LLC

56. Install the two bolts securing the CAC hose to timing cover and securely tighten.
57. Connect the Charge Air Cooler (CAC) hose (2) from turbocharger (1).

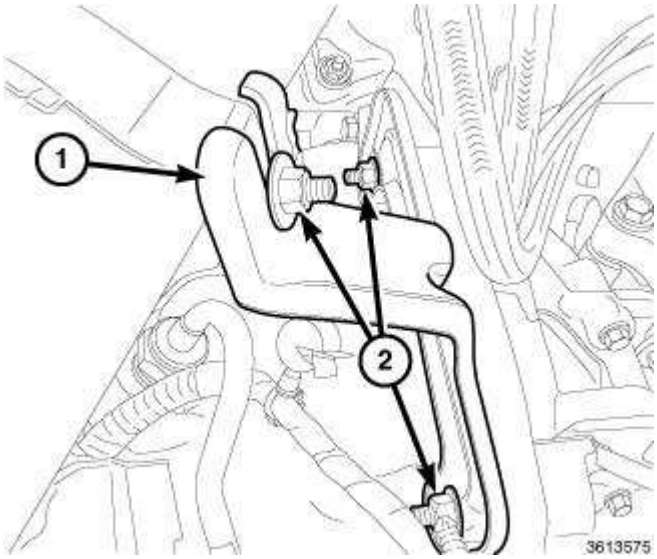

Fig. 52: Exhaust Steady Rest Bracket & Nuts
Courtesy of CHRYSLER GROUP, LLC

58. Raise the vehicle.
59. Install the lower generator bolt, nut, and ground wire:
    - Tighten bolt to 28 N.m (21 ft. lbs.).
    - Tighten nut to 28 N.m (21 ft. lbs.).
60. Install the left side splash shield.
61. Install the right side splash shield.
62. Install the right side CAC hose at cooler.
63. Install the left side Charge Air Cooler (CAC) hose at cooler.
64. Install the exhaust steady rest bracket (1). Tighten nuts (2) to 26 N.m (19 ft. lbs.).
65. Attach the wire harness retainer from exhaust steady rest bracket.
66. Install the transmission belly pan.
67. Install the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, INSTALLATION** .

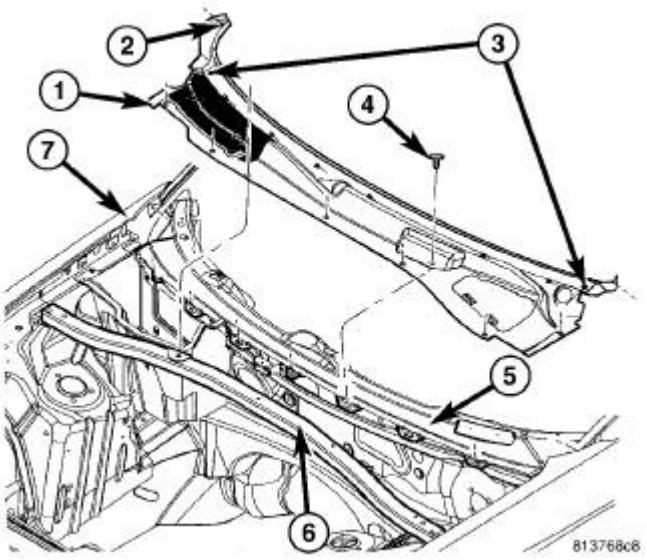

Fig. 53: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

68. Install air cleaner body and intake air tube. Refer to **BODY, AIR CLEANER, INSTALLATION**.
69. Install the strut support brace (6). Tighten bolts to 38 N.m (28 ft. lbs.).
70. Install the wiper arm linkage. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .

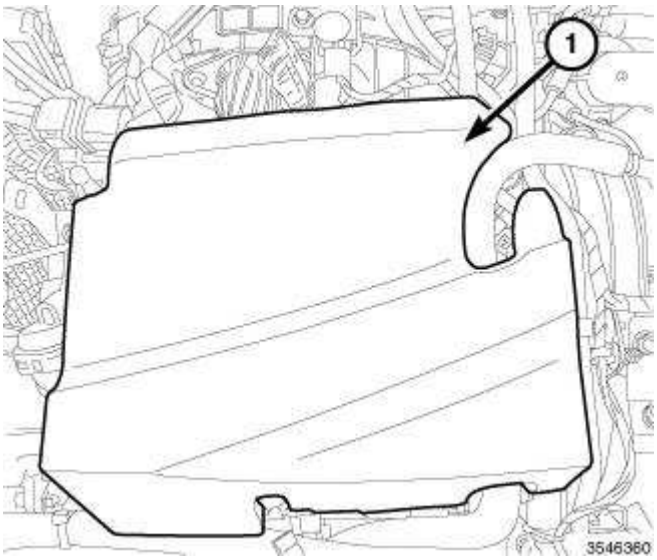

Fig. 54: Right Side Fuel Injector Silencer
Courtesy of CHRYSLER GROUP, LLC

71. Install the hood. Refer to **HOOD, INSTALLATION** .
72. Charge the A/C system with refrigerant. Refer to **PLUMBING, STANDARD PROCEDURE** .
73. Install the right side fuel injector silencer (1).
74. Install a new oil filter. Refer to **FILTER, ENGINE OIL, INSTALLATION**.

75. Fill engine with the recommended engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
76. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
77. Install the hood. Refer to **HOOD, INSTALLATION** .

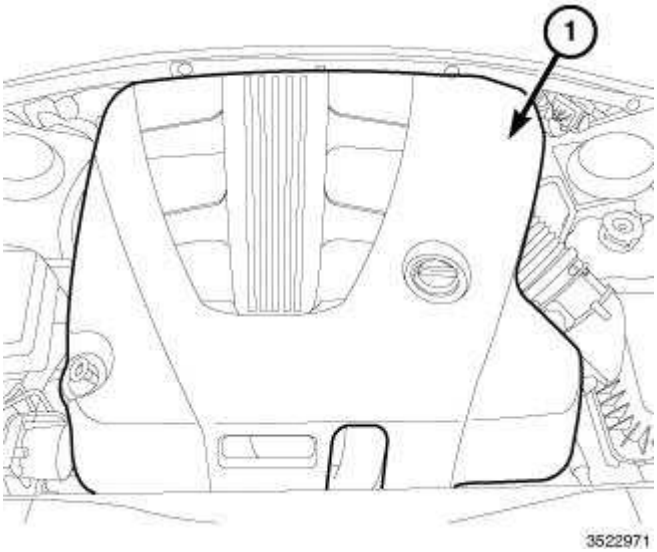

Fig. 55: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

78. Connect the negative battery cable.
79. Start engine and inspect for leaks.
80. Install engine cover (1).

COVER, ENGINE

DESCRIPTION

DESCRIPTION

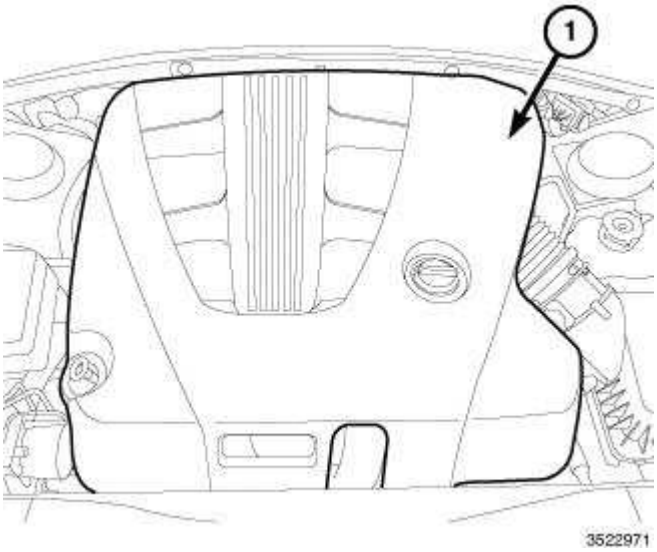

Fig. 56: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

The insulated engine cover (1) is made of composite material and used cosmetically to cover the top of the engine and greatly reduce engine noise. Four brackets secure the cover to the engine. Also there is an insulated pad on the each of the cylinder head covers to insulate the fuel injectors.

REMOVAL

REMOVAL

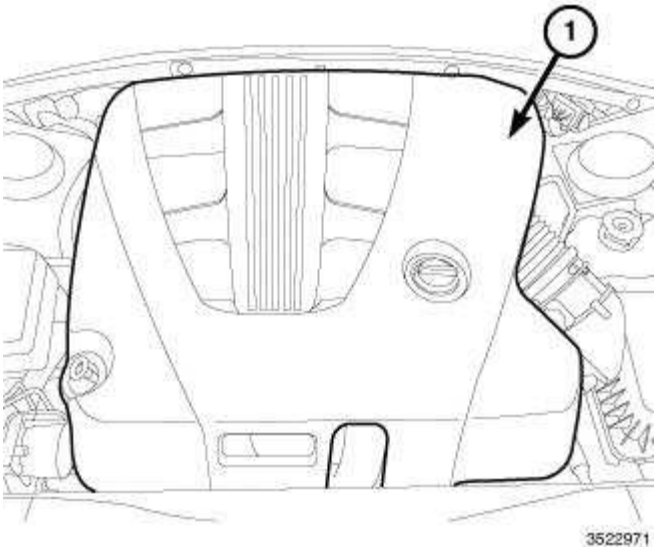

Fig. 57: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Pull upward on the engine cover (1) to release from mounting brackets and remove the engine cover (1).

INSTALLATION

INSTALLATION

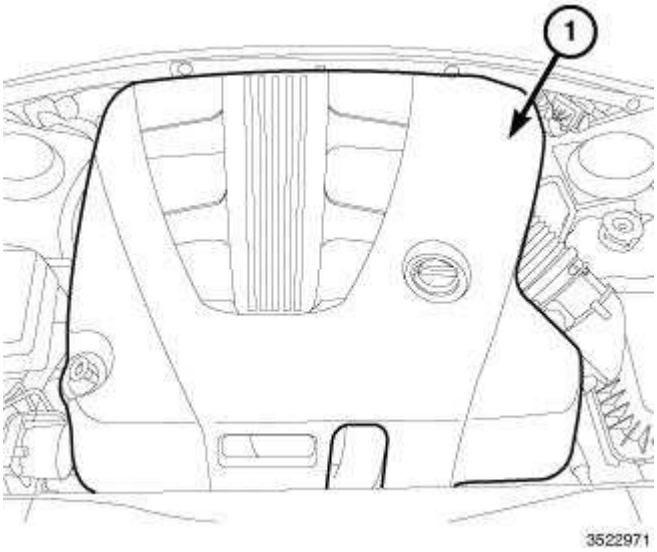

Fig. 58: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Align the engine cover (1) with the mounting bracket and push down to seat the cover.

CYLINDER HEAD

DESCRIPTION

DESCRIPTION

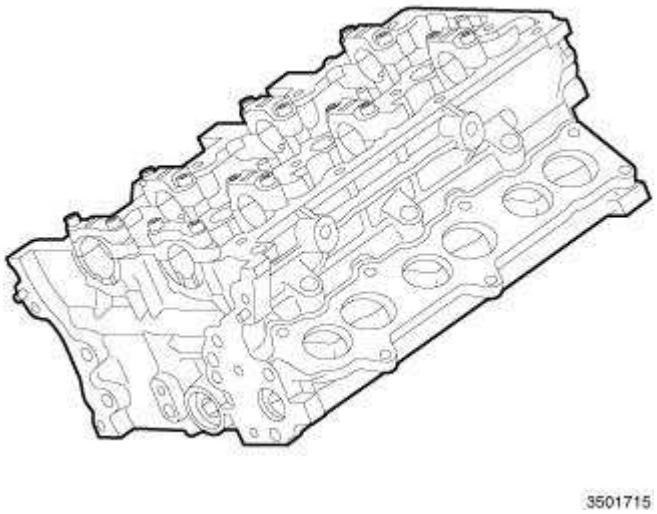

Fig. 59: Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The cylinder heads on the 3.0L V-6 are of a cross-flow design and have the following features:

- High-Strength Cast Aluminum Alloy Construction.
- Four Valves per Cylinder.
- Roller Finger Followers/Lifter Assemblies.
- Pressed-in Valve Guides and Valve Seats.

The 3.0L aluminum, overhead valve cylinder heads are made of high strength aluminum alloy and are each equipped with two camshafts, roller finger followers/lifter assemblies and four valve technology. The cylinder head can not be resurfaced. The cylinder head uses a Multi-layered Steel gasket for sealing.

The valve seats and valve guides are not serviceable.

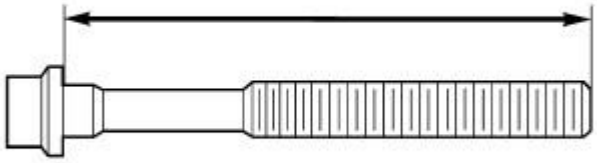
STANDARD PROCEDURE

INSPECTION

1. Measure cylinder head bolts between points shown.

Cylinder Head Bolts	Thread Diameter	14 x 1.5 mm

	Length When New	155 mm



80e214d0

Fig. 60: Measuring Cylinder Head Bolts
Courtesy of CHRYSLER GROUP, LLC

2. The cylinder head bolts are a one time use bolt that needs to be replace anytime they have been removed from the cylinder head.

REMOVAL

LEFT BANK

1. Disconnect the negative and positive battery cables.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove the glow plugs.
4. Remove the left side intake and exhaust camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.
5. Remove the rocker arms and lifters and note their original position.
6. Remove the water pump housing assembly. Refer to **PUMP, WATER, REMOVAL** .

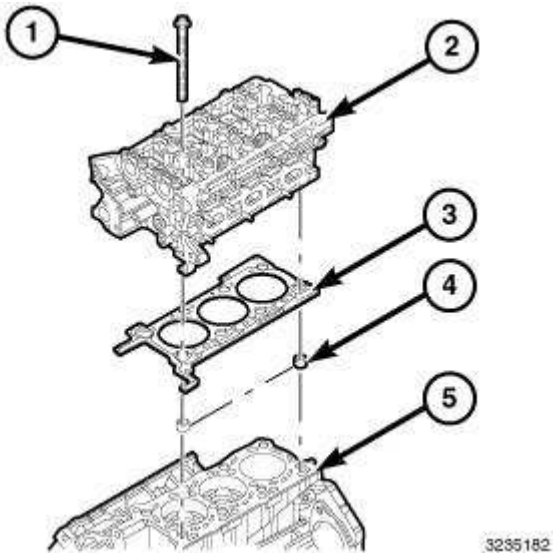


Fig. 61: Cylinder Head, Head Gasket, Engine Block & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do Not store the cylinder head on the sealing surface.

7. Remove and discard bolts (1) and the cylinder head (2) from the engine block (5).
8. Remove and discard the head gasket (3).

RIGHT BANK

1. Disconnect the negative and positive battery cables.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove the glow plugs.
4. Remove the right side intake and exhaust camshaft shafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.
5. Remove the rocker arms and lifters and note their original position.
6. Remove the water pump housing assembly. Refer to **PUMP, WATER, REMOVAL** .

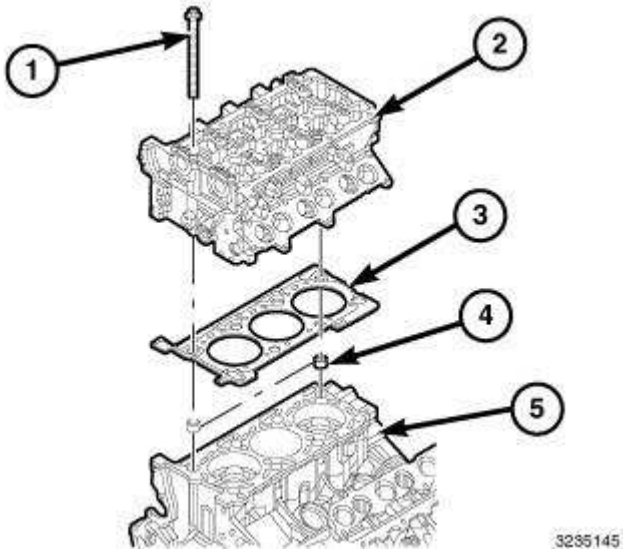

Fig. 62: Cylinder Head, Head Gasket, Engine Block & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do Not store the cylinder head on the sealing surface.

7. Remove bolts (1) and the cylinder head (2) from the engine block (5).
8. Remove and discard the head gasket (3).

CLEANING

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Clean the injector bores. Remove all gasket material and carbon. Refer to **Engine - Standard Procedure**.

Check to ensure that no fuel injector washer seals are left in the injector bores.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and engine block mating surfaces.

The cylinder head thickness is 133 ± 0.06 mm (5.2362 ± 0.0023 in.).

Cylinder head flatness tolerance 0.1 mm (0.0039 in.).

INSTALLATION

LEFT BANK

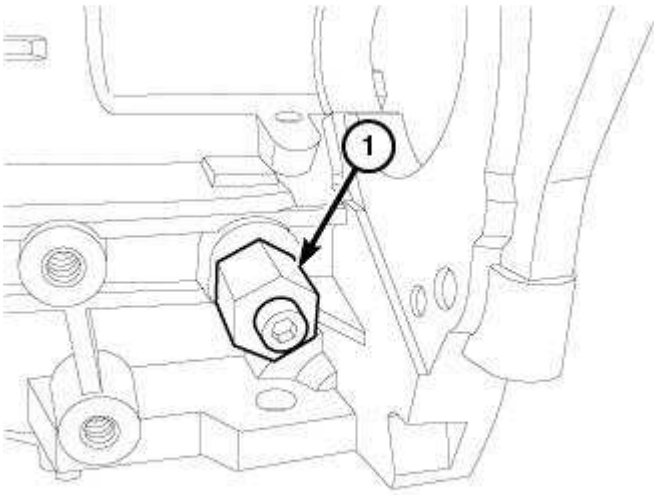

Fig. 63: Crankshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect gasket mating surfaces. Refer to **Engine/Cylinder Head - Cleaning**.
2. Remove the (special tool #VM.10339, Tool, Crankshaft Timing) (1).

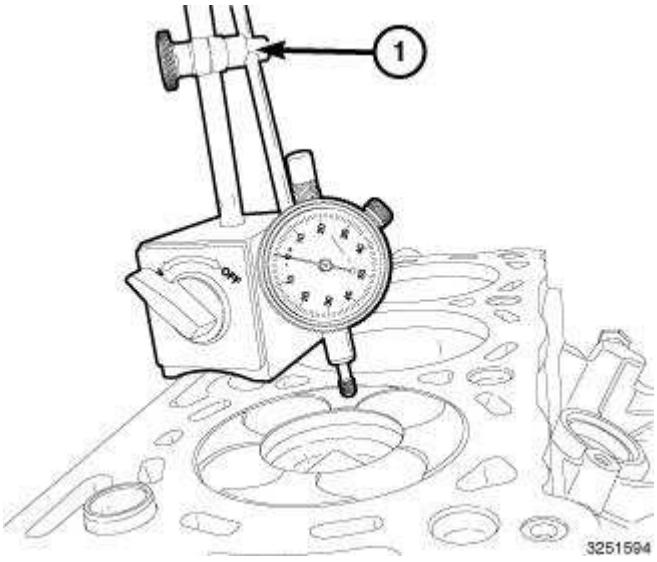

Fig. 64: Setting Number One Piston At Top Dead Center Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

3. Set the number one piston to top dead center (TDC).

4. Using the (special tool #C-3339A, Set, Dial Indicator) (1), assemble as illustrated.

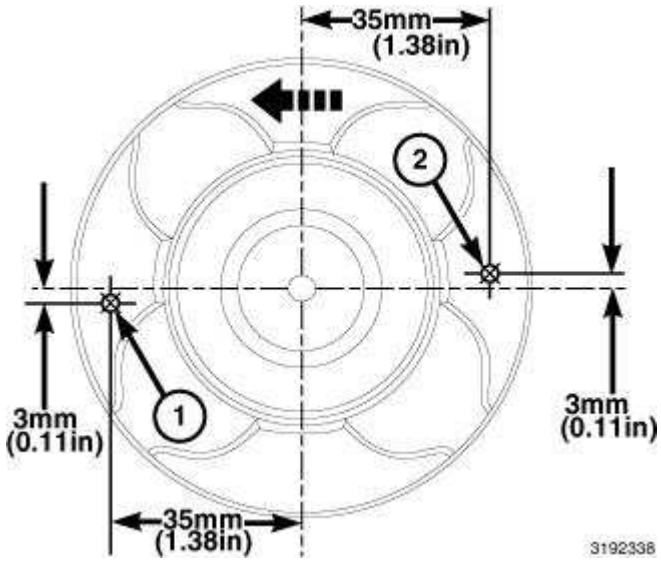

Fig. 65: Measuring Height Of The Piston At Top Dead Center
Courtesy of CHRYSLER GROUP, LLC

5. Zero the dial indicator on the top of the piston at location shown in illustration (1).
6. Use the dial indicator to measure the height of the piston at top dead center to the cylinder block and record measurements.
7. Zero the dial indicator on the top of the piston at location shown in illustration (2).
8. Use the dial indicator to measure the height of the piston at top dead center to cylinder block and record measurements.
9. Repeat the procedure for each cylinder.
10. Average the 3 piston protrusion readings to determine the required gasket thickness.

HEAD GASKET SELECTION CHART		
	Millimeters	Inches
PISTON CLEARANCE	0.130 - 0.220	0.0051 - 0.0086
CYLINDER HEAD GASKET THICKNESS	0.96	0.0377
GASKET IDENTIFICATION	NO HOLE	
PISTON CLEARANCE	0.221 - 0.310	0.0087 - 0.0122
CYLINDER HEAD GASKET THICKNESS	1.06	0.0417

GASKET IDENTIFICATION	ONE HOLE	
PISTON CLEARANCE	0.311 - 0.402	0.0122 - 0.0158
CYLINDER HEAD GASKET THICKNESS	1.16	0.0456
GASKET IDENTIFICATION	TWO HOLES	

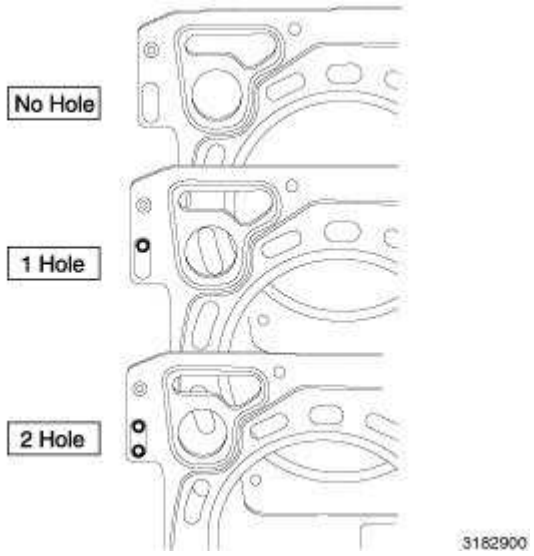

Fig. 66: Cylinder Head Gasket Identification

17. Remove bolts (2) and (special tool #VM.10343-3, Alignment Tool, Cylinder Head (Left Exhaust)) (1).
18. Remove bolts (4) and (special tool #VM.10343-2, Alignment Tool, Cylinder Head (Left Intake))

(3).

19. Install the water pump housing assembly. Refer to **PUMP, WATER, INSTALLATION** .

NOTE: Follower and tappet assemblies must be installed in same location as when removed.

20. Install the lifters and rocker arms into their original position as noted during removal.
21. Install the left side intake and exhaust camshafts. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
22. Install the glow plugs and tighten to 11 N.m (97 in. lbs.).
23. Install the oil cooler adapter. Refer to **ADAPTER, OIL COOLER, INSTALLATION**.
24. Install the intake manifold (4). Refer to **MANIFOLD, INTAKE, INSTALLATION**.

RIGHT BANK

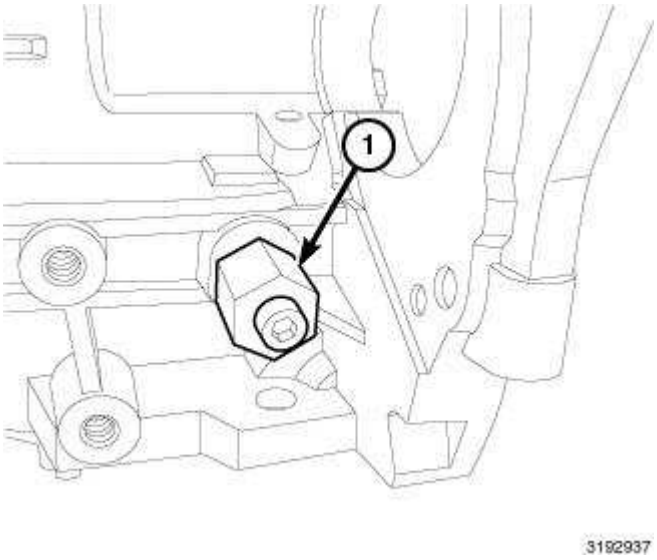

Fig. 71: Crankshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect gasket mating surfaces. Refer to **Engine/Cylinder Head - Cleaning**.
2. Remove the (special tool #VM.10339, Tool, Crankshaft Timing) (1).

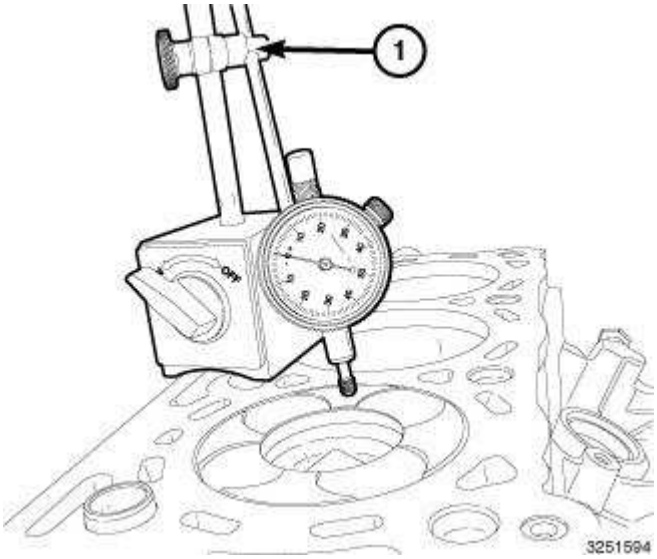

Fig. 72: Setting Number One Piston At Top Dead Center Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

3. Set the number one piston to top dead center (TDC).
4. Using the (special tool #C-3339A, Set, Dial Indicator) (1), assemble as illustrated.

17. Remove bolts (4) and (special tool #VM.10343-1, Alignment Tool, Cylinder Head (Right Intake)) (3).
18. Remove bolts (2) and (special tool #VM.10343-4, Alignment Tool, Cylinder Head (Right Exhaust)) (1).
19. Install the water pump housing assembly. Refer to **PUMP, WATER, INSTALLATION** .

NOTE: Follower and tappet assemblies must be installed in same location as when removed.

20. Install the lifters and rocker arms into their original position as noted during removal.
21. Install the right side intake and exhaust camshafts. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
22. Install the glow plugs and tighten to 11 N.m (97 in. lbs.).
23. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

CAMSHAFT, ENGINE

DESCRIPTION

DESCRIPTION

The camshafts are multiple-piece components with six machined lobes that are mounted to a hollow shaft with an interference fit. The cam lobes are induction hardened. Each camshaft has four bearing journals except for the right-bank intake camshaft. Due to the longer length needed to accommodate the centrifugal oil separator, the right-bank intake camshaft has five bearing journals. The camshaft journals have the same diameter and are supplied with oil pressure through lubrication passages in the cylinder head journals.

OPERATION

OPERATION

Each cylinder has two intake and two exhaust valves, and one glow plug. Valve lash is controlled by hydraulic lifter/roller finger followers inside the cylinder head, in bores under the camshafts. The finger followers transfer the camshaft lobe movement into vertical valve movement. The valve moves by the lobe of the camshaft pressing down on the finger follower roller.

The finger followers are located on top of the hydraulic lifters and the valves. The finger followers are not held rigidly into position; instead, they are held in position by resting on top of the valve and the hydraulic lifter pivoting ball.

WARNING: When the hydraulic lash adjusters are removed from the engine, they must be stored upright and in clean conditions. Install the finger followers and hydraulic lifters in the same location as removed.

WARNING: Replacement of the camshaft will also require replacement of the finger followers and hydraulic lifters.

REMOVAL

LEFT BANK

1. Disconnect the negative battery cable.
2. Remove the high pressure pump. Refer to **PUMP, FUEL INJECTION, HIGH PRESSURE, REMOVAL** .
3. Remove the timing chain and sprockets. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

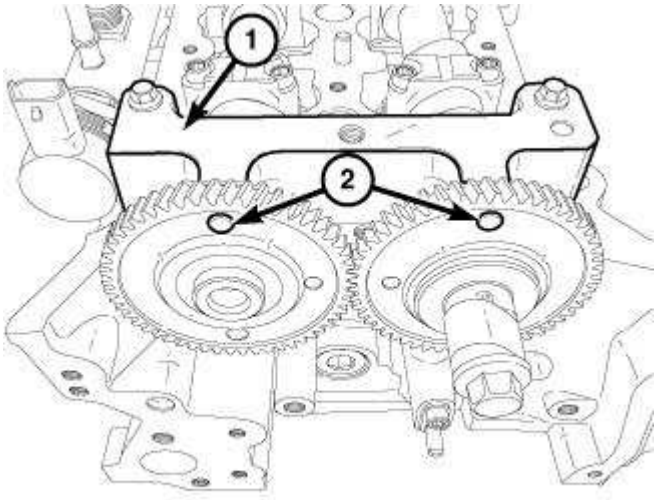

Fig. 79: Camshaft Timing Tool & Sprockets Holes - Left
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts and the left (special tool #VM.10338-2, Timing Tool, Camshaft (Left)) (1).
5. **Check the camshafts end play using (special tool #C-3339A, Set, Dial Indicator). End play should be between 0.1 mm - 0.3 mm (0.003 in. - 0.011 in.). If the camshaft endplay is not within specification, replace the cylinder head.**

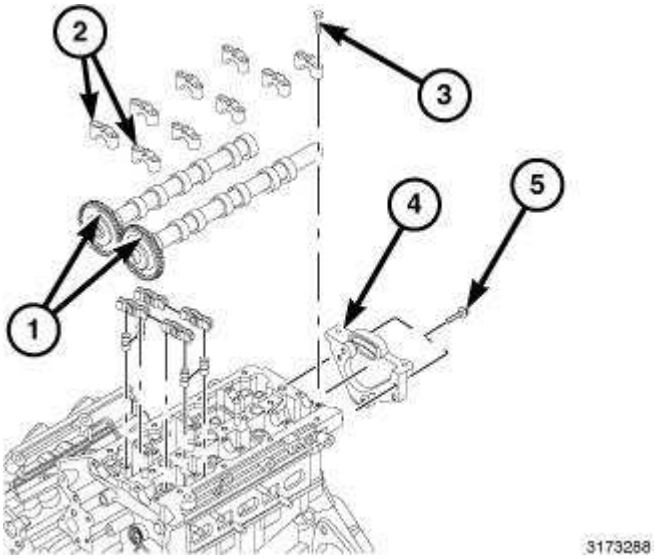

Fig. 80: Left Side Intake & Exhaust Camshaft, Camshaft Bearing Caps & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make a reference in the order the camshaft bearing caps were removed.

6. Remove bolts (3) and the intake and exhaust camshaft bearing caps (2).
7. Remove the left side intake and exhaust camshaft (1).

RIGHT BANK

1. Disconnect the negative battery cable.
2. Remove the right timing chain and sprocket. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

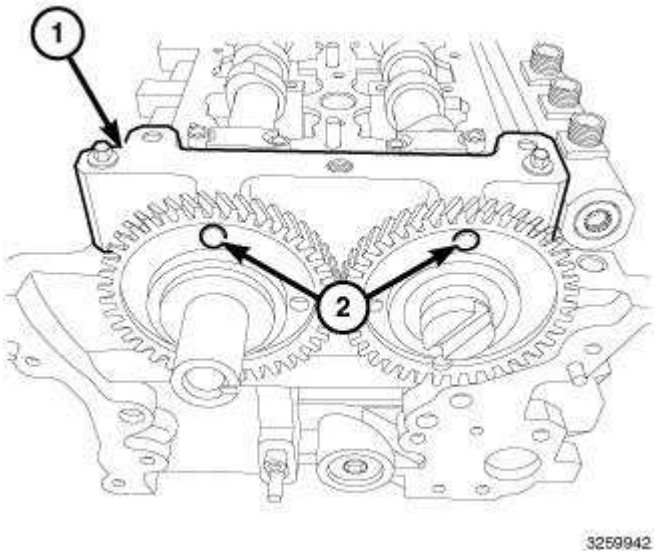

Fig. 81: Camshaft Timing Tool & Sprockets Holes - Right
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts and the right (special tool #VM.10338-1, Timing Tool, Camshaft (Right)) (1).
4. **Check the camshafts end play using (special tool #C-3339A, Set, Dial Indicator). End play should be between 0.1 mm - 0.3 mm (0.003 in. - 0.011 in.). If the camshaft endplay is not within specification, replace the cylinder head.**

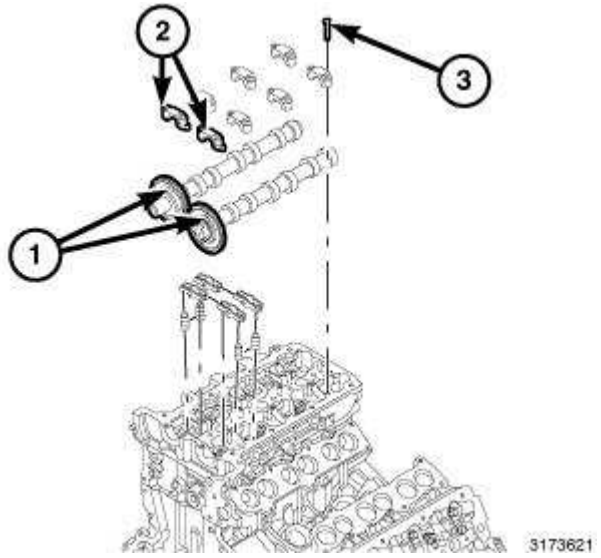

Fig. 82: Right Side Intake & Exhaust Camshaft, Camshaft Bearing Caps & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make a reference in the order the camshaft bearing caps were removed.

5. Remove bolts (3) and the intake and exhaust camshaft bearing caps (2).
6. Remove the right side intake and exhaust camshaft (1).

INSTALLATION

LEFT BANK

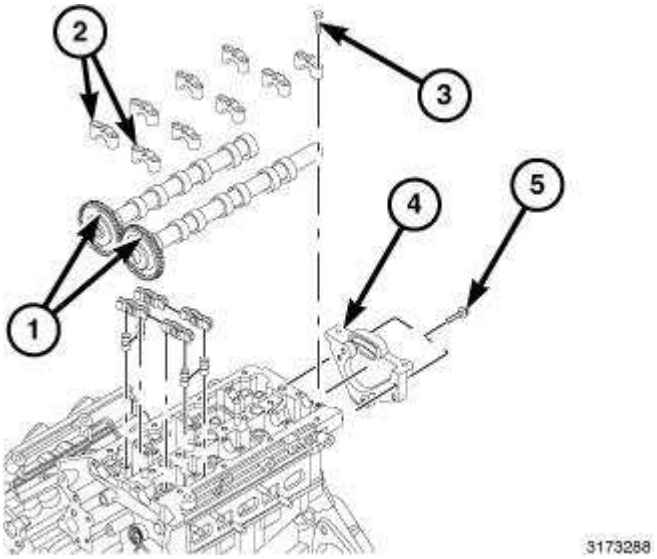

Fig. 83: Left Side Intake & Exhaust Camshaft, Camshaft Bearing Caps & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean all gasket sealing and mating surfaces.
2. Lubricate camshafts with Mopar® Engine Oil Supplement, or equivalent. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
3. Carefully install camshafts (1) onto cylinder head journals.

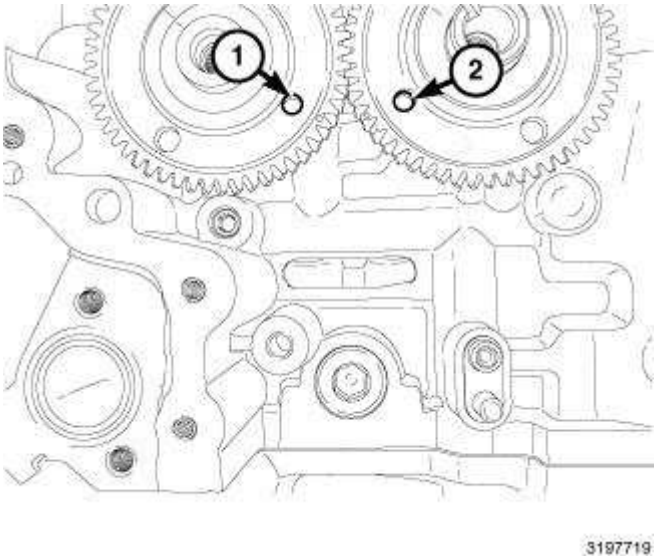

Fig. 84: Intake Camshaft Gear Timing Mark & Exhaust Camshaft Timing Gear Mark
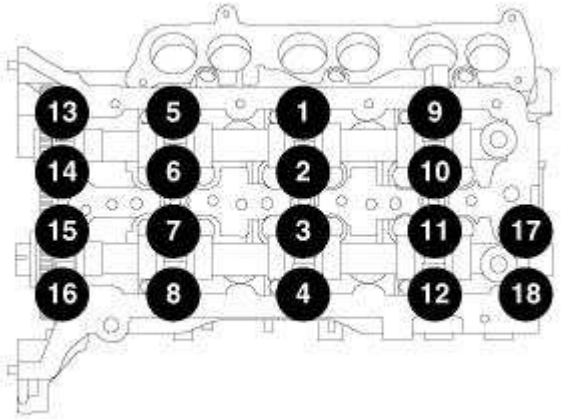
Courtesy of CHRYSLER GROUP, LLC

4. Set the intake camshaft gear timing mark (1) at the four O'clock position and the exhaust camshaft timing gear mark (2) to the eight O'clock position as shown in illustration.

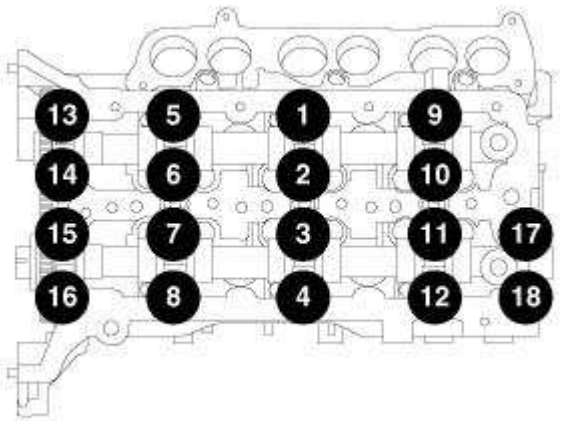


3173223

Fig. 85: Camshaft Bearing Cap Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the bearing caps, be sure to install the "A" is on the intake side and the "S" is on the exhaust side in the rightful order.

5. Install the camshaft bearing caps 1 through 12, 17 and 18 in the rightful order and tighten each retaining bolt finger tight.
6. Check the camshaft for proper timing. Refer to **Engine/Valve Timing - Standard Procedure**.



3173223

Fig. 86: Camshaft Bearing Cap Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

7. Using the tightening sequence shown in illustration, tighten bolts to 11 N.m (97 in. lbs.).
8. Install the timing chain and sprocket. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.

9. Install the high pressure pump. Refer to **PUMP, FUEL INJECTION, HIGH PRESSURE, INSTALLATION** .
10. Connect the negative battery cable.
11. Start engine and inspect for leaks.

RIGHT BANK

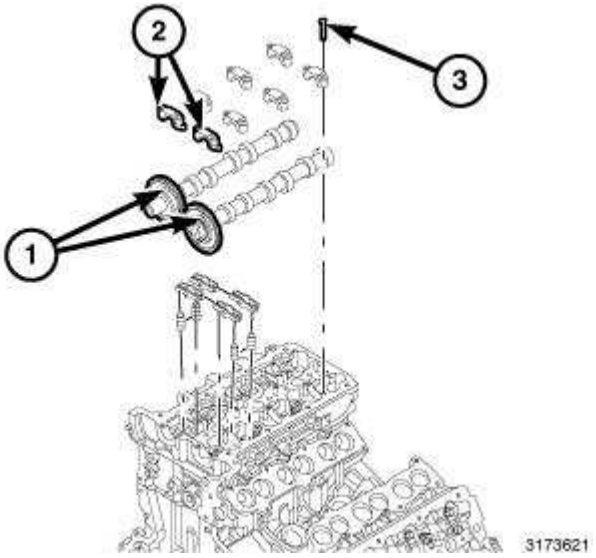


Fig. 87: Right Side Intake & Exhaust Camshaft, Camshaft Bearing Caps & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean all mating surfaces.
2. Lubricate camshafts with Mopar® Engine Oil Supplement, or equivalent. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
3. Carefully install camshafts (1) onto cylinder head journals.

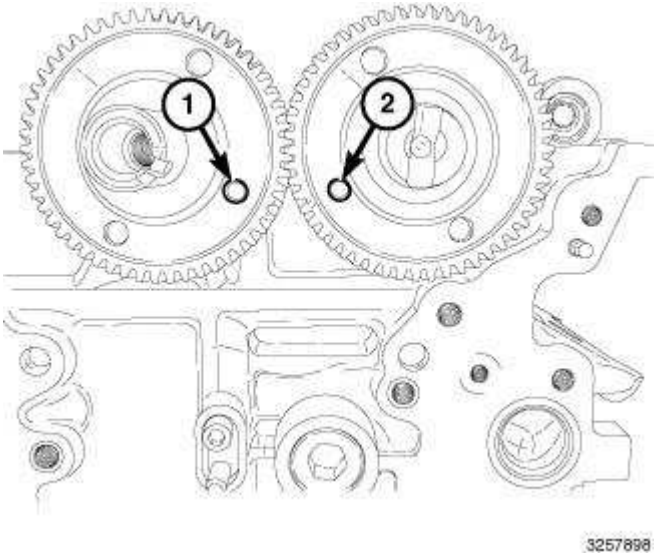

Fig. 88: Exhaust Camshaft Gear Timing Mark & Intake Camshaft Timing Gear Mark
Courtesy of CHRYSLER GROUP, LLC

4. Set the exhaust camshaft gear timing mark (1) at the four O'clock position and the intake camshaft timing gear mark (2) to the eight O'clock position.

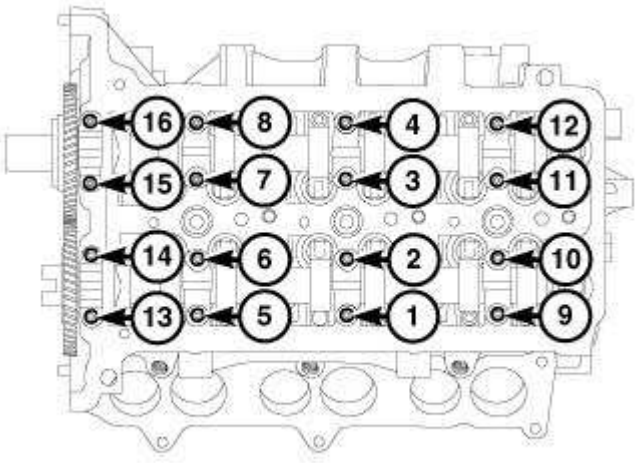

Fig. 89: Camshaft Bearing Cap Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the bearing caps, be sure to install the "A" is on the intake side and the "S" is on the exhaust side in the rightful order.

5. Install the camshaft bearing caps 1 through 12, in the rightful order and tighten each retaining bolt finger tight.
6. Check the camshaft for proper timing. Refer to **Engine/Valve Timing - Standard Procedure**.

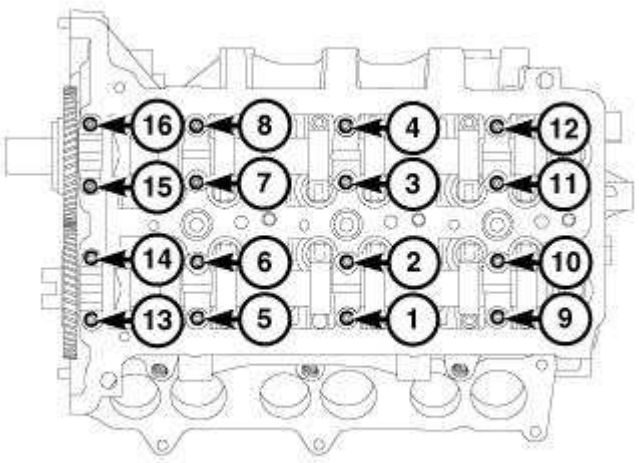

Fig. 90: Camshaft Bearing Cap Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

7. Using the tightening sequence shown in illustration, tighten bolts to 11 N.m (97 in. lbs.).
8. Install the right timing chain sprocket. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.
9. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
10. Install the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, INSTALLATION** .
11. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
12. Connect the negative battery cable.
13. Start engine and inspect for leaks.

COVER(S), CYLINDER HEAD

DESCRIPTION

DESCRIPTION

The 3.0L cylinder head cover is made of an injection molded composite and is used to cover the camshafts, lifters and followers.

REMOVAL

RIGHT BANK

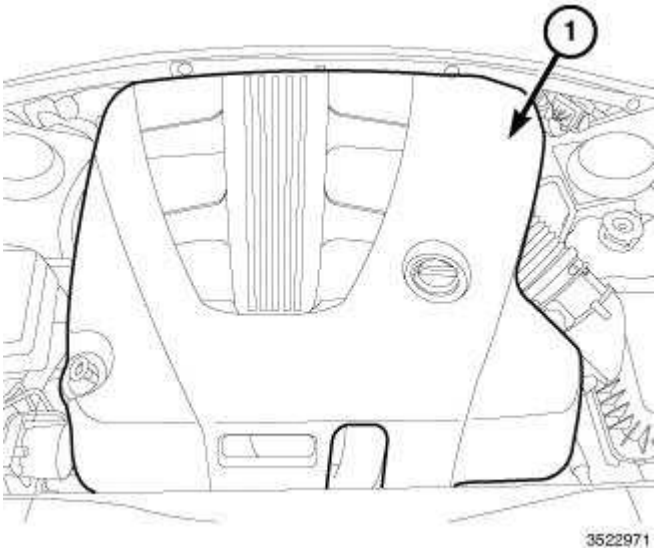

Fig. 91: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, REMOVAL** .
5. Remove the lower engine oil dipstick bolt.
6. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
7. Lower the vehicle.

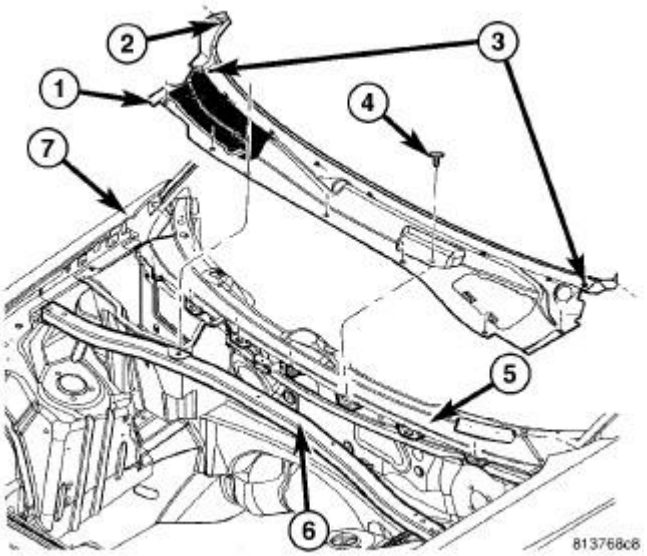

Fig. 92: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Remove the wiper arm linkage. Refer to **LINKAGE, WIPER ARM, REMOVAL** .
9. Remove bolts and the strut support brace (6).
10. Remove fasteners and the rear engine compartment heat shield.

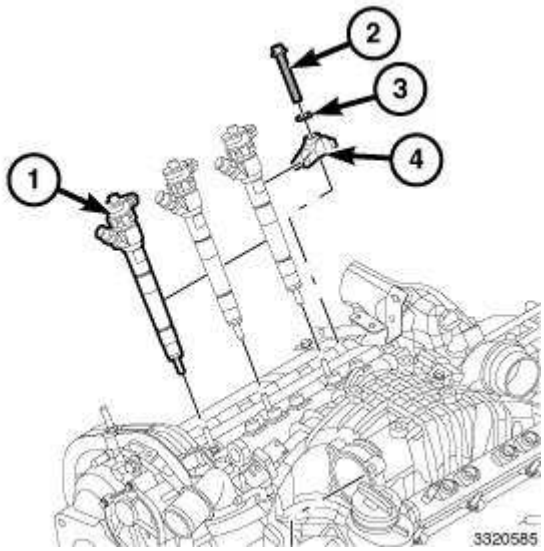

Fig. 93: Fuel Injector, Hold Down Bolt, Washer & Retaining Claw
Courtesy of CHRYSLER GROUP, LLC

11. Remove the right side fuel injectors. Refer to **INJECTOR(S), FUEL, REMOVAL** .
12. Remove the generator. Refer to **GENERATOR, REMOVAL** .

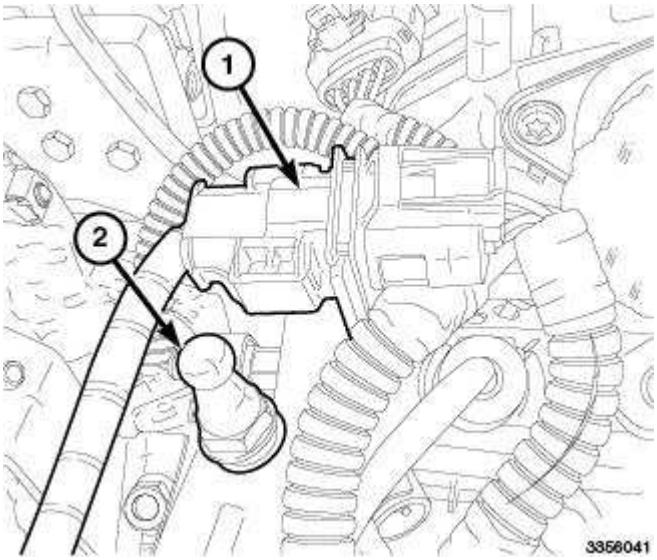

Fig. 94: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the oxygen sensor wiring harness connector (1).
14. Remove the ball stud fastener (2) securing upper trans fill tube bracket.
15. Remove nut and the engine oil dip stick.

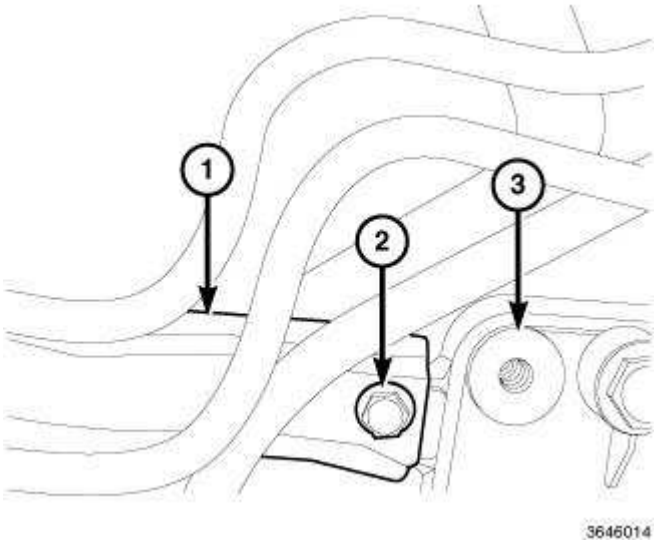

Fig. 95: Fuel Line Support Bracket, Generator Mounting Bracket & Bolt

NOTE: Cylinder head cover gasket is not a serviceable item.

3. Inspect the cylinder head cover gasket (1), if damaged replace the cylinder cover.

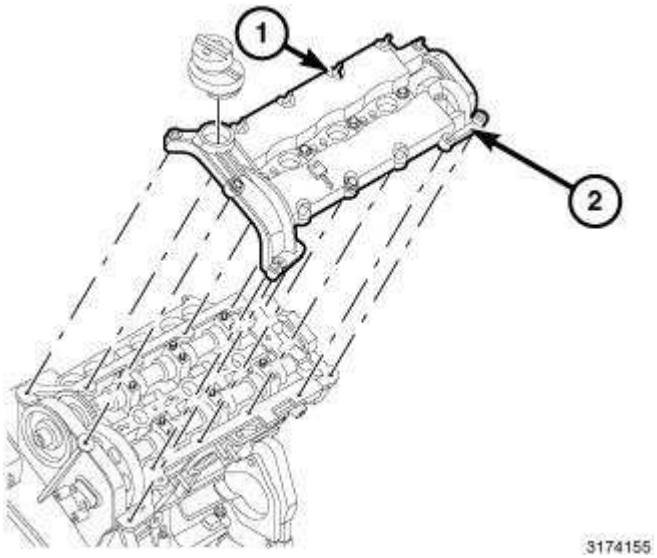

Fig. 138: Left Cylinder Head Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the cylinder head cover (2) and tighten bolts (1) finger tight.

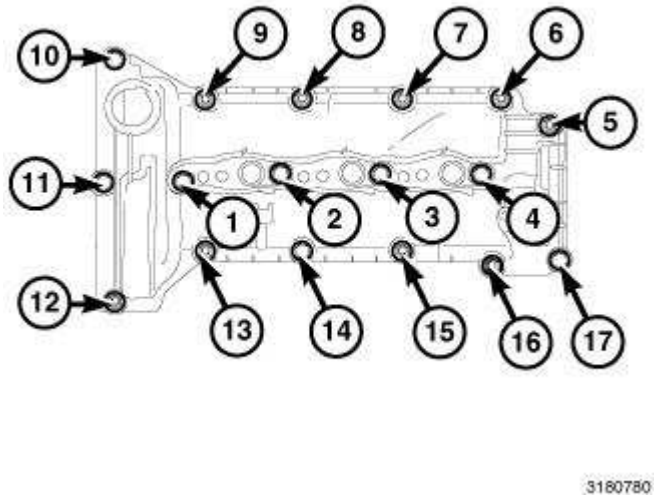

Fig. 139: Cylinder Head Cover Bolt Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

5. Using the tightening sequence shown in illustration, tighten bolts to 10 N.m (89 in. lbs.).

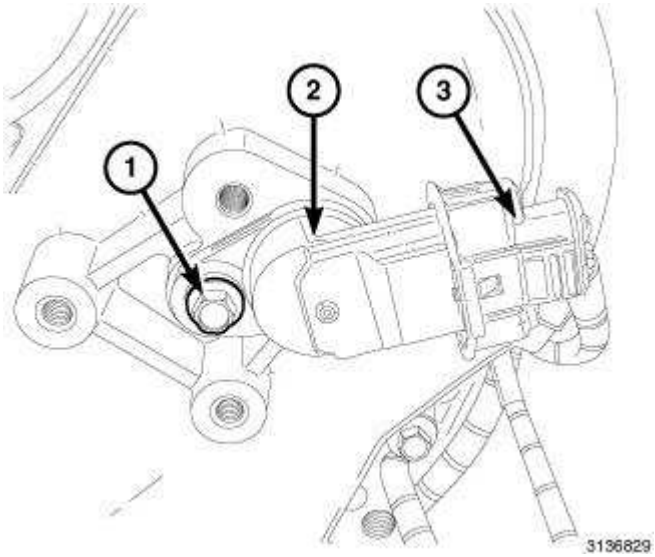

Fig. 140: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Connect Camshaft Position (CMP) sensor wire harness connector (3).

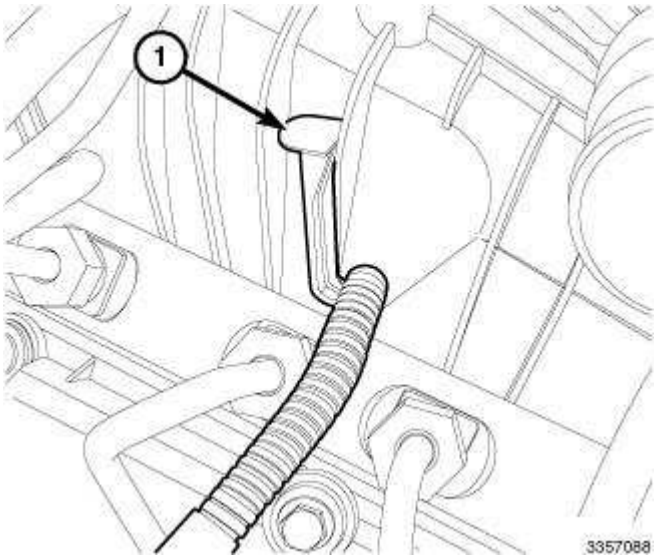

Fig. 141: Glow Plug Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Connect glow plug wire harness connector (1).

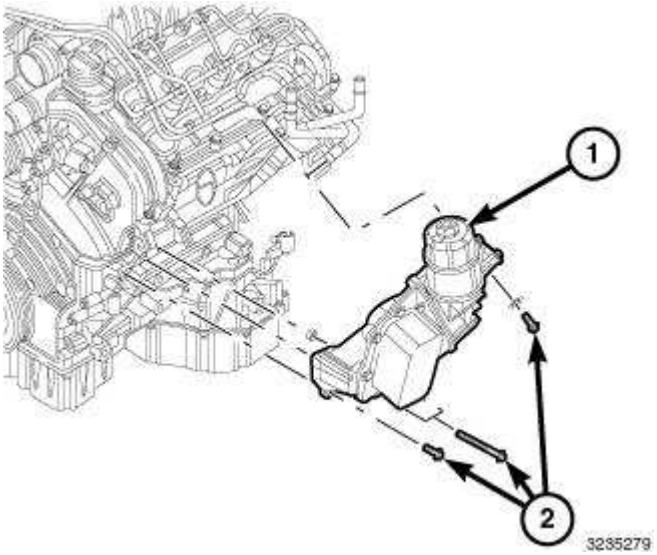

Fig. 142: Oil Cooler Adapter Assembly
Courtesy of CHRYSLER GROUP, LLC

8. Install the oil cooler adapter assembly. Refer to **ADAPTER, OIL COOLER, INSTALLATION**.

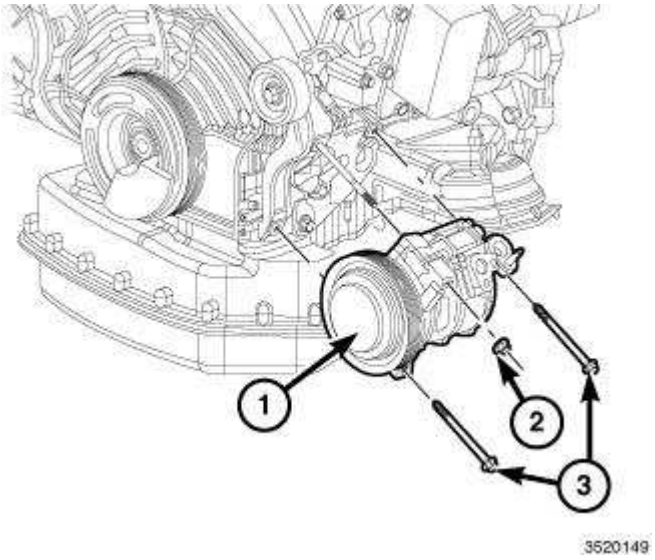

Fig. 143: A/C Compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

9. Install the A/C compressor (1). Tighten bolts (3) to 28 N.m (21 ft. lbs.).
10. Install the A/C compressor mounting stud. Tighten nut (2) to 28 N.m (21 ft. lbs.).
11. Connect the A/C compressor (1) wire harness connector.

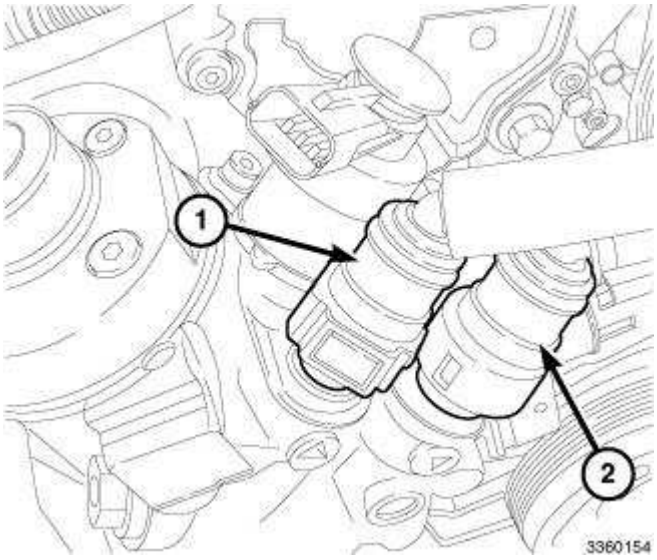

Fig. 144: Return Line & Low Pressure Supply Line
Courtesy of CHRYSLER GROUP, LLC

12. Install the support bracket securing coolant tube, brake booster hose, and fuel lines. Tighten nuts (2) to 11 N.m (97 in. lbs.).
13. Connect the two heater hoses at bulk head.
14. Connect the brake booster vacuum hose.
15. Connect the low pressure supply (2) and return (1) lines to the high pressure pump.

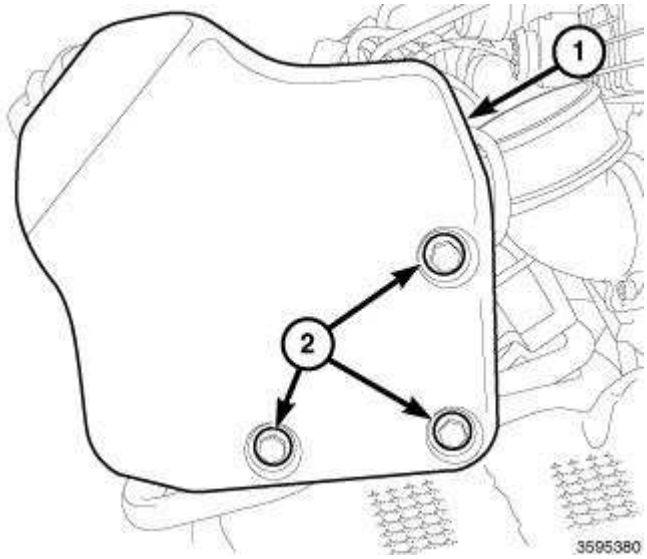

Fig. 145: High Pressure Pump Blocker & Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Install the fuel pump blocker (1). Tighten bolts (2) to 25 N.m (18 ft. lbs.).

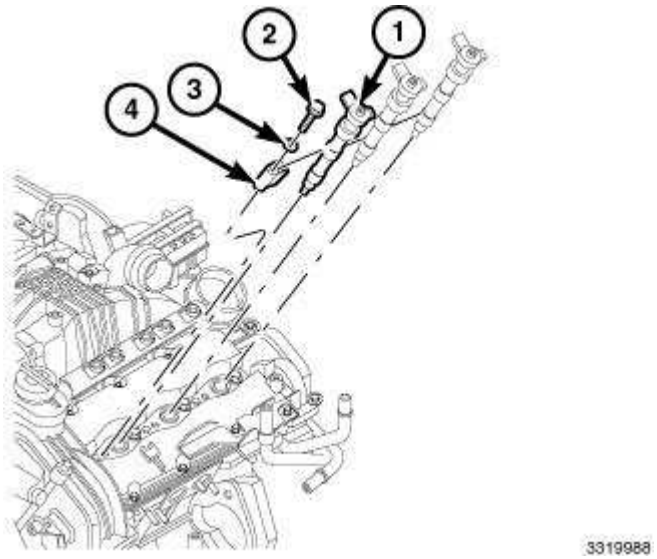

Fig. 146: Fuel Injector, Hold Down Bolt, Washer & Retaining Claw
Courtesy of CHRYSLER GROUP, LLC

17. Install the fuel injector. Refer to **INJECTOR(S), FUEL, INSTALLATION** .

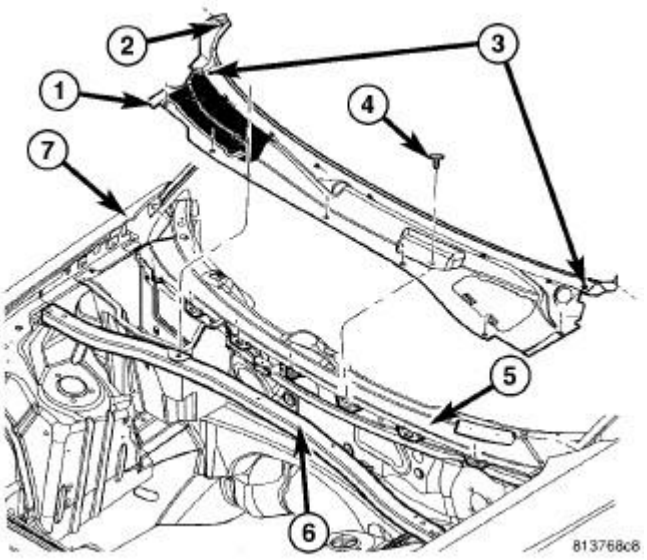

Fig. 147: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

18. Install air cleaner body and turbocharger inlet hose. Refer to **BODY, AIR CLEANER, INSTALLATION**.
19. Install the rear engine compartment heat shield and securely tighten the fasteners.
20. Install the strut support brace (6). Tighten bolts to 38 N.m (28 ft. lbs.).
21. Install the wiper arm linkage. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .
22. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
23. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
24. Lower the vehicle.

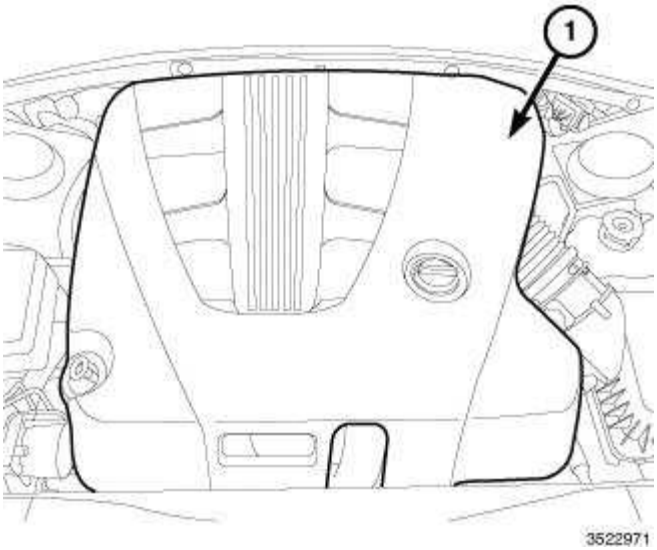

Fig. 148: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

25. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
26. Connect the negative battery cable.
27. Start the engine and inspect for leaks.
28. Install the engine cover (1).

LIFTER(S), HYDRAULIC

DESCRIPTION

DESCRIPTION

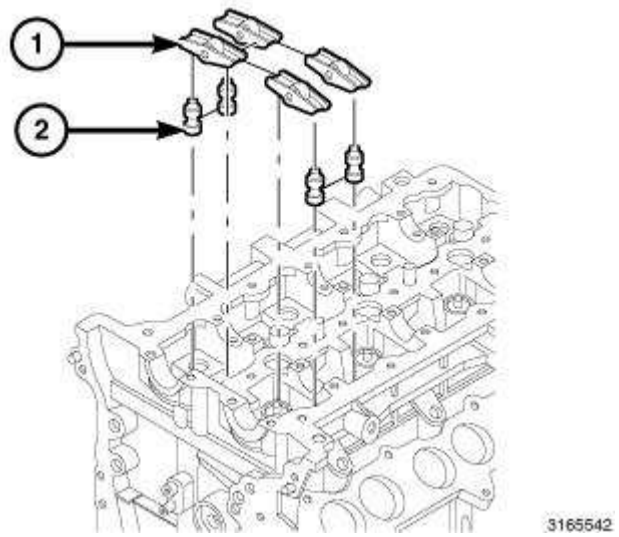

Fig. 149: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

Valve lash is controlled by hydraulic lifters located inside the cylinder head, in tappet bores below the camshafts.

REMOVAL

REMOVAL

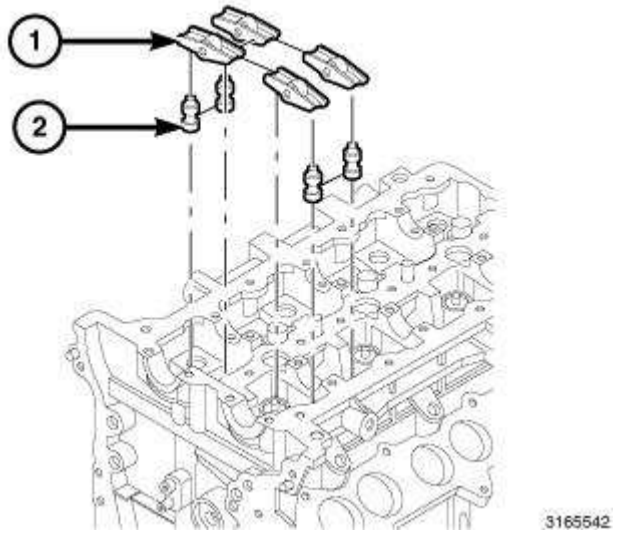

Fig. 150: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

1. Remove the appropriate camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: When the lifters are removed from the engine, they must be stored upright and in clean conditions.

2. Remove the rocker arm (1) and lifter (2) assembly.

INSPECTION

INSPECTION

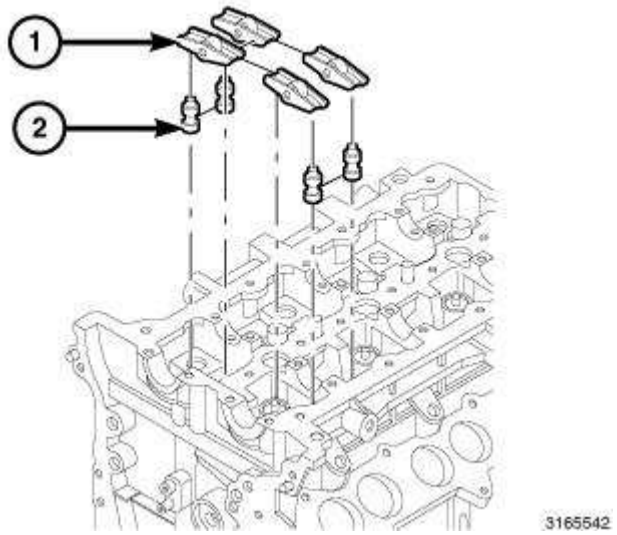

Fig. 151: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

1. Clean each lifter assembly in cleaning solvent to remove all varnish and sludge deposits. Inspect for indications of scuffing on the side and base of each lifter body (2).
2. Squeeze the lifter and be sure that the spring returns the lifter to its correct position.
3. Inspect the rocker arm (1) roller for damage or excessive wear.
4. Replace any worn or damaged components.

INSTALLATION

INSTALLATION

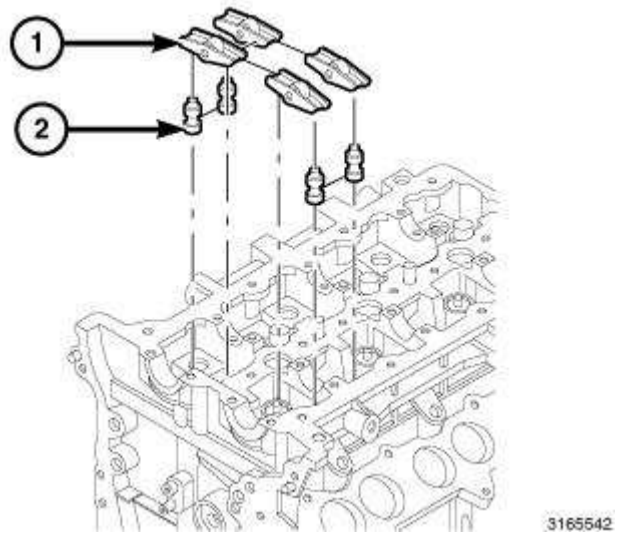

Fig. 152: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the lifters are removed from the engine, they must be stored upright and in clean conditions. Install the rocker arms and lifters in the same location as when removed.

CAUTION: Replacement of the camshaft will also require replacement of the rocker arms and lifters.

NOTE: Rocker arms and lifters must be installed in the same location as when removed.

1. Install the lifter (2) and the rocker arm (1) in the same location as noted during removal.
2. Install the camshaft(s). Refer to **CAMSHAFT, ENGINE, INSTALLATION**.

ROCKER ARM, VALVE

DESCRIPTION

DESCRIPTION

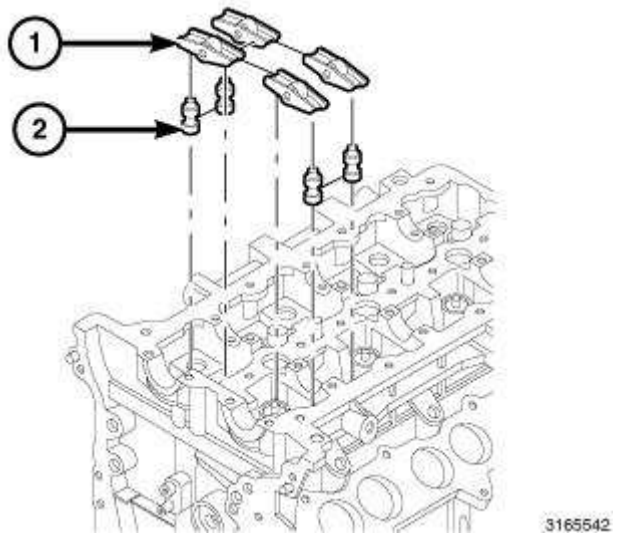

Fig. 153: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

The rocker arms (1) are located on the top of the hydraulic lifters (2) and the valves. The rocker arms are held in position by resting on top of the valve and the hydraulic lifter pivoting ball. There is a spring clip that holds the rocker arm to the hydraulic lifters pivoting ball.

OPERATION

OPERATION

The rocker arms are used as a link between the camshaft and valves. As the camshaft rotates, the lobes of the camshafts apply downward pressure on the rocker arms. This pressure is then transmitted to the valves which causes the valves to open.

REMOVAL

REMOVAL

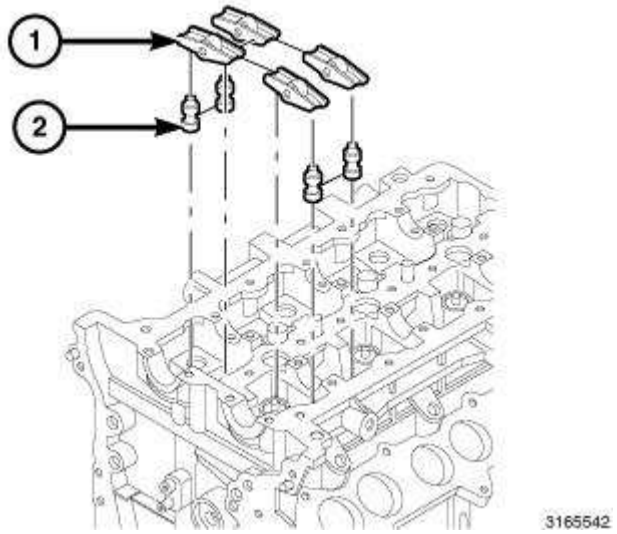

Fig. 154: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

1. Remove the appropriate camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

   NOTE: Rocker arms and lifters must be installed in the same location as when removed and stored in the up right position.

2. Remove the rocker arm (1) and lifter (2) assembly.

INSTALLATION

INSTALLATION

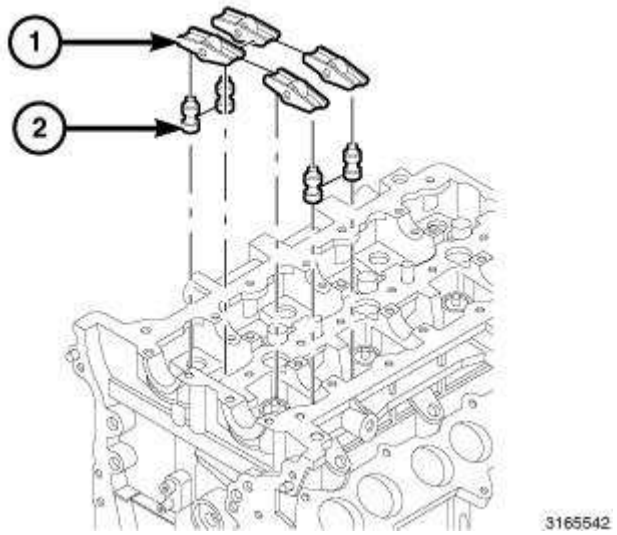

Fig. 155: Rocker Arms & Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Rocker arms and lifters must be installed in the same location as when removed.**

1. Install the rocker arm (1) and lifter (2) assembly in the same location as noted during removal.
2. Install the camshaft. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.

SEAL(S), CAMSHAFT

REMOVAL

REMOVAL

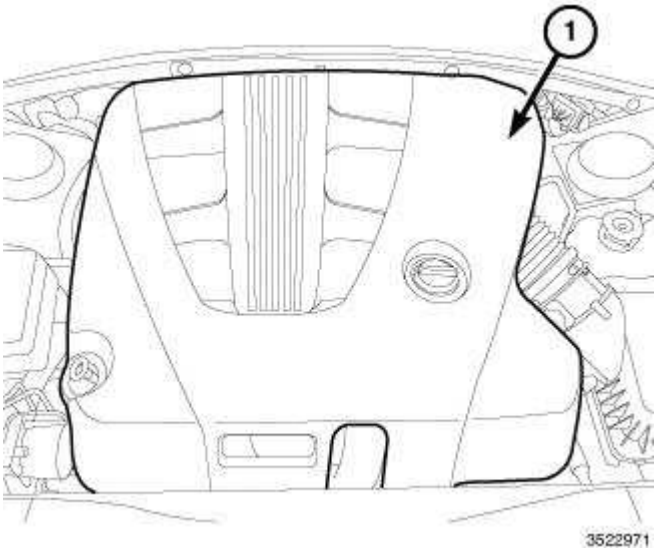

Fig. 156: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover (1).

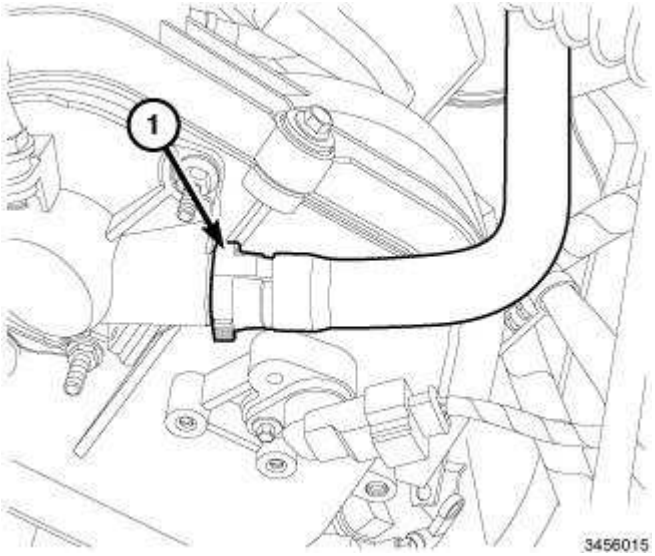

Fig. 157: CCV Hose
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the CCV hose (1) from oil breather/camshaft seal housing.

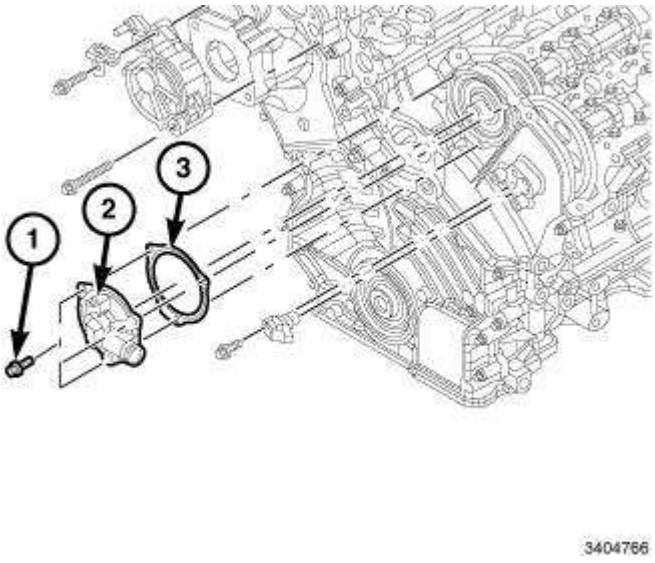

Fig. 158: Oil Breather/Camshaft Seal Housing, Gasket & Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts (1) and the oil breather/camshaft seal housing (2).
4. Remove and discard gasket (3).

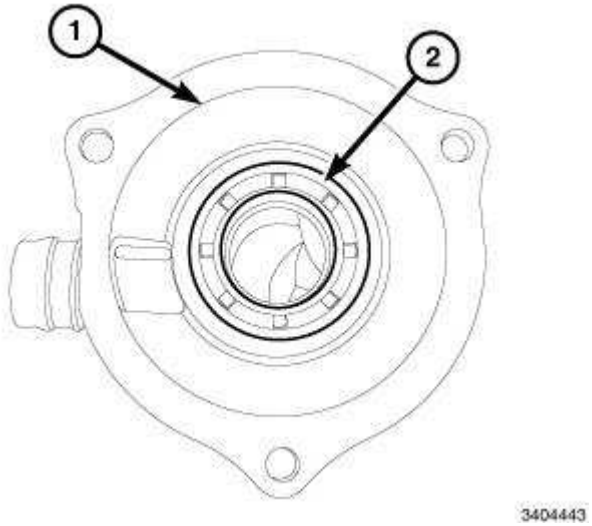

Fig. 159: Oil Breather/Camshaft Seal Housing & Camshaft Seals
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable tool remove the camshaft oil seal (2).

INSTALLATION

INSTALLATION

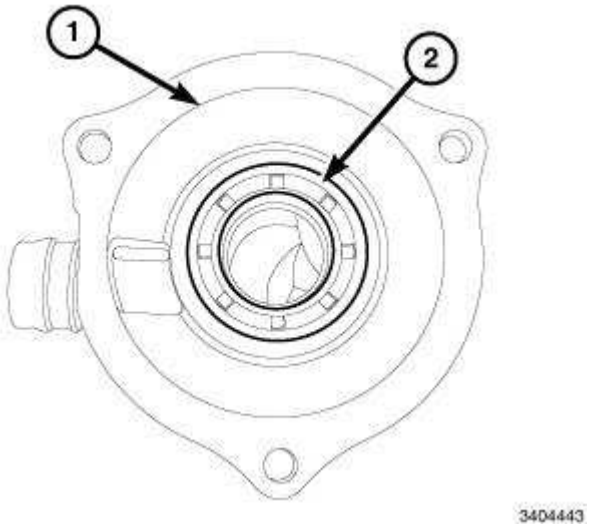

Fig. 160: Oil Breather/Camshaft Seal Housing & Camshaft Seals
Courtesy of CHRYSLER GROUP, LLC

1. Clean all gasket sealing mating surfaces.
2. Install the camshaft seals (2) into oil breather/camshaft seal housing (1).

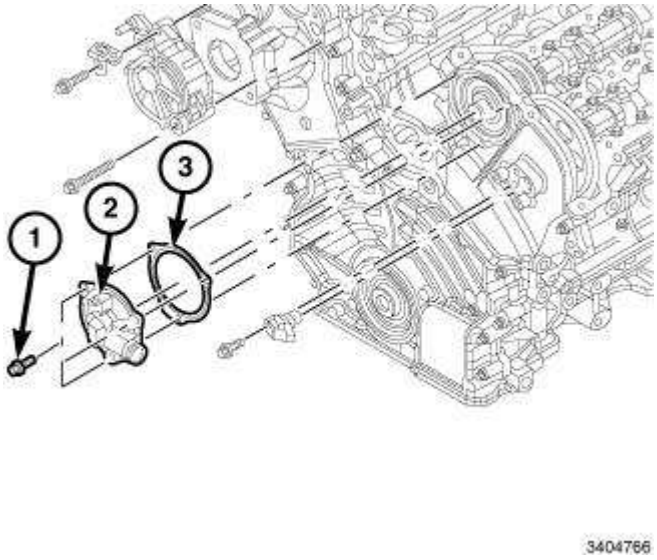

Fig. 161: Oil Breather/Camshaft Seal Housing, Gasket & Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a new gasket (3), install the oil breather/camshaft seal housing (2). Tighten bolts (1) to 14 N.m (124 in. lbs.).

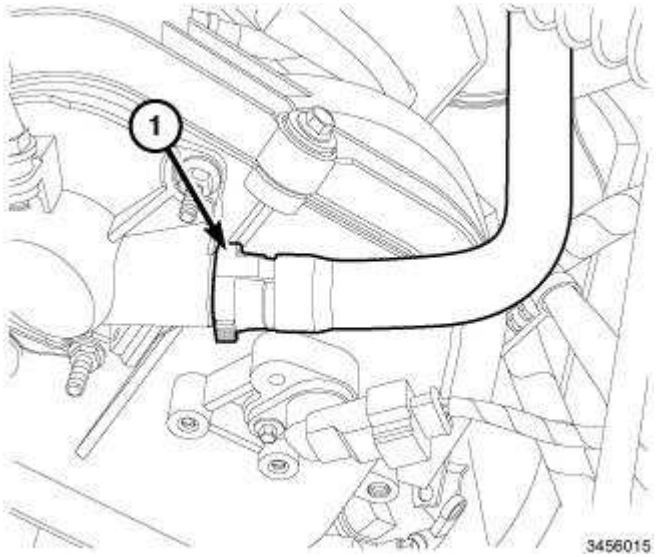

Fig. 162: CCV Hose
Courtesy of CHRYSLER GROUP, LLC

4. Connect the CCV hose (1) to the oil breather/camshaft seal housing.

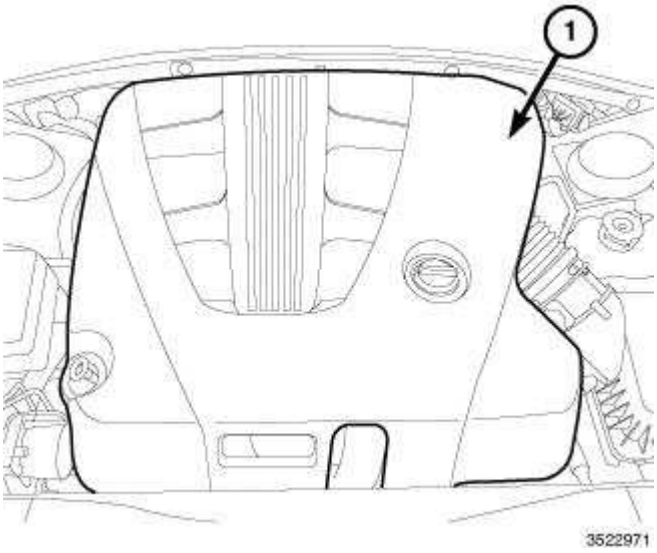

Fig. 163: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the engine cover (1).

VALVES, INTAKE AND EXHAUST

STANDARD PROCEDURE

VALVE SEALS

1. Disconnect the negative battery cable.
2. Remove the cylinder head and place on work bench. Refer to **CYLINDER HEAD, REMOVAL**.

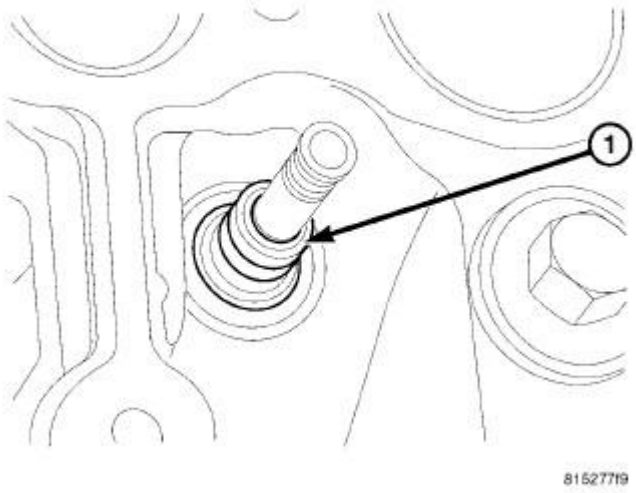

Fig. 164: Valve Seal

Courtesy of CHRYSLER GROUP, LLC

3. Use (special tool #C-3422-D, Compressor, Valve Spring) and (special tool #10224, Adapter, Valve Spring) and compress each valve spring.
4. Remove the valve locks, retainers, and springs.
5. Remove the valve seal (1).
6. Repeat this procedure for all cylinders.

VALVE SERVICE

This procedure is done with the engine cylinder head removed from the block.

DISASSEMBLY

1. Remove the engine cylinder head from the cylinder block. Refer to **CYLINDER HEAD, REMOVAL**.
2. Use (special tool #C-3422-D, Compressor, Valve Spring) and (special tool #10224, Adapter, Valve Spring) and compress each valve spring.
3. Remove the valve locks, retainers, and springs.
4. Use a smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.
5. Remove the valves, and place them in a rack in the same order as removed.

VALVE CLEANING

1. Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.
2. Clean all residue and gasket material from the engine cylinder head machined gasket surface.

INSPECTION

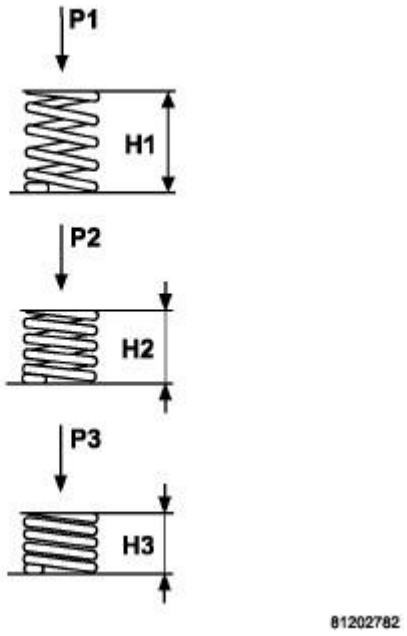

Fig. 165: Valve Spring Chart
Courtesy of CHRYSLER GROUP, LLC

1. Inspect for cracks in the combustion chambers and valve ports.
2. Inspect for cracks on the exhaust seat.
3. Inspect for cracks in the gasket surface at each coolant passage.
4. Inspect valves for burned, cracked or warped heads.
5. Inspect for scuffed or bent valve stems.
6. Replace valves displaying any damage.
7. Check valve spring height. Free length: 44.1 mm (1.736 in.); Closed valve: 34 mm (1.338 in.); Valve open 25.5 mm (1.003 in.).

VALVE SEAT REFACING

1. Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.
2. Use tapered stones to obtain the specified seat width when required.

VALVE GUIDES

Valve Guides Stem Clearance	Min	Max
Intake Valve Guide Stem Clearance	0.382 mm (0.150 in.)	0.6 mm (0.023 in.)
Exhaust Valve Guide Stem Clearance	0.382 mm (0.150 in.)	0.6 mm (0.023 in.)

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

1. Measure and record internal diameter of valve guides. Valve guide internal diameter is 6.0 to 6.012 mm (0.2362 to 0.2366 in.).
2. Measure valve stems and record diameters. Intake valve stem diameter 5 mm (0.1968 in.). Exhaust valve stem diameter 5 mm (0.1968 in.).
3. Subtract diameter of valve stem from internal diameter of its respective valve guide to obtain valve stem clearance in valve guide. Clearance of inlet valve stem in valve guide is 0.03 to 0.06 mm (.0011 to.0023 in). Clearance of exhaust valve stem in valve guide is 0.04 to 0.07 mm (.0015 to.0027 in).
4. If valve stem clearance in valve guide exceeds tolerances, new valve guides must be installed.

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

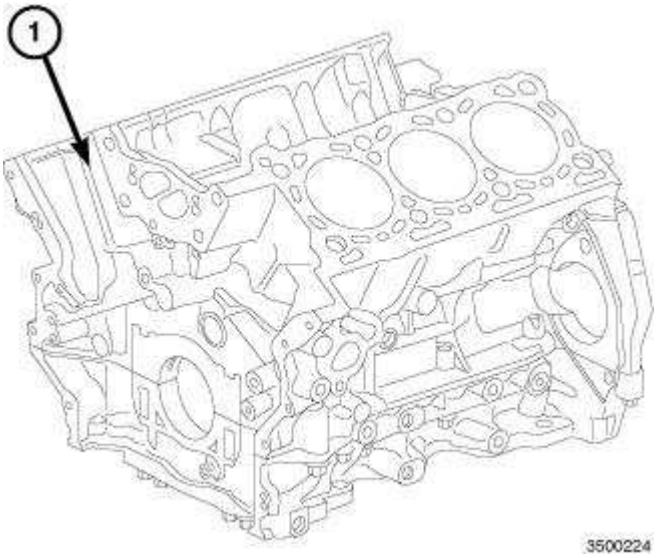

Fig. 166: 3.0L Engine Block
Courtesy of CHRYSLER GROUP, LLC

The 3.0L engine utilizes a cast Iron cylinder block (1) with a bedplate design. The cylinder angle is 60 degrees V block design. The cylinder block has increased rigidity that reduces structural flexing, plus a fractured connecting rod cap design that can not distort connecting rod cap fit.

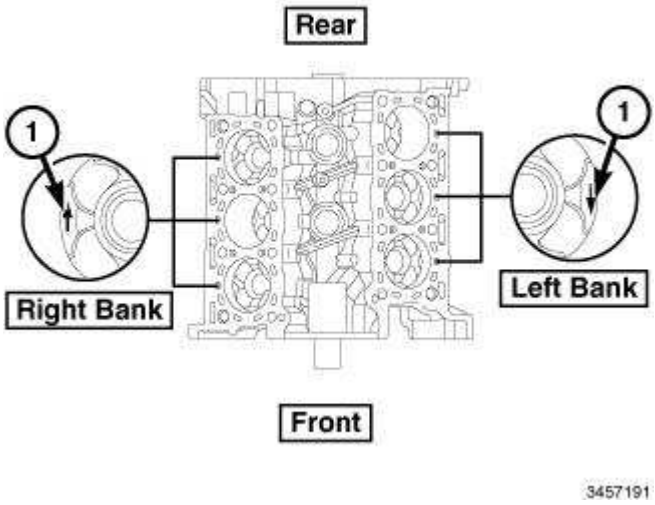

Fig. 167: Arrow Stamped On Piston Crown
Courtesy of CHRYSLER GROUP, LLC

Cylinders are numbered front to back, beginning with the right bank. The right bank cylinders are numbered 1, 2, 3. The left bank cylinders 4, 5, 6. The injection order of the engine is 1-4-2-5-3-6.

STANDARD PROCEDURE

STANDARD PROCEDURE - BEARING SELECTION CHARTS

CONNECTING ROD BEARINGS - LARGE END

Connecting Rod Journal Diameter - Connecting Rod Large End	Bearing Half	Connecting Rod Journal Diameter - Crankshaft		
		A	B	C
		67.500 - 67.494	67.494 - 67.488	67.488 - 67.482
A 71.000 - 71.006	Upper Bearing Shell	Red	Red	Blue
	Lower Bearing Shell	Red	Blue	Blue
B 71.006 - 71.012	Upper Bearing Shell	Red	Blue	Blue
	Lower Bearing Shell	Blue	Blue	Yellow
C 71.012 - 71.018	Upper Bearing Shell	Blue	Blue	Yellow
	Lower Bearing Shell	Blue	Yellow	Yellow

CRANKSHAFT BEARINGS

Cylinder Block Seat Diameter (Bed Plate)	Bearing Half	Crankshaft Main Journal Diameter		
		A	B	C
		73.958 - 73.952	73.952 - 73.946	73.946 - 73.940

	Lower Bearing Shell	Blue	Blue	Yellow
C 78.012 - 78.018	Upper Bearing Shell	Blue	Blue	Yellow
	Lower Bearing Shell	Blue	Yellow	Yellow

BEARING(S), CONNECTING ROD

REMOVAL

REMOVAL

1. Disconnect negative battery cable.
2. Remove the engine from vehicle and mount on suitable engine stand. Refer to **REMOVAL**.
3. Remove the oil pump pickup tube. Refer to **PICK-UP, OIL PUMP, REMOVAL**.

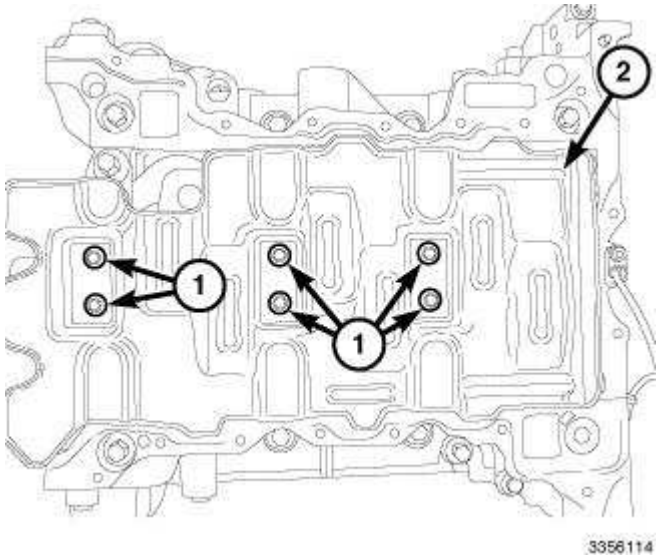

Fig. 168: Windage Tray & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (1) and the windage tray (2).

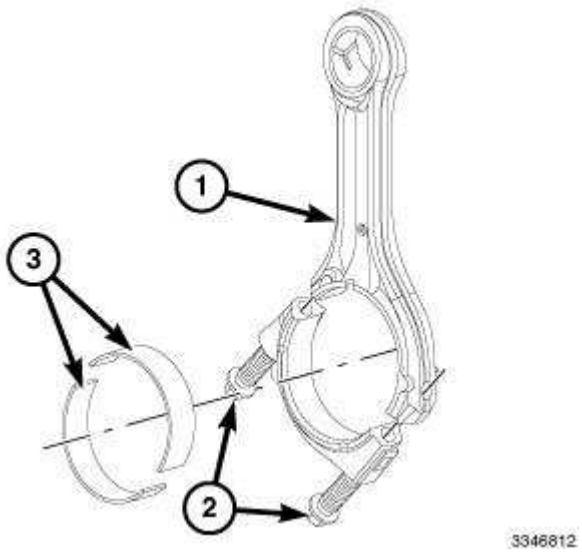

Fig. 169: Connecting Rod, Bearings & Bolts
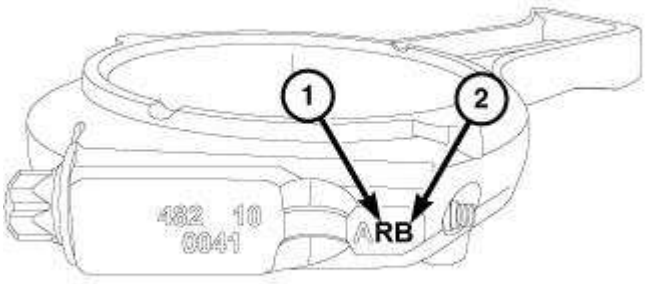
Courtesy of CHRYSLER GROUP, LLC

5. Remove the connecting rod bearing caps one at a time and discard bolts (2).
6. Carefully remove the upper half and lower bearing half (3) from the connecting rod.

INSTALLATION

INSTALLATION

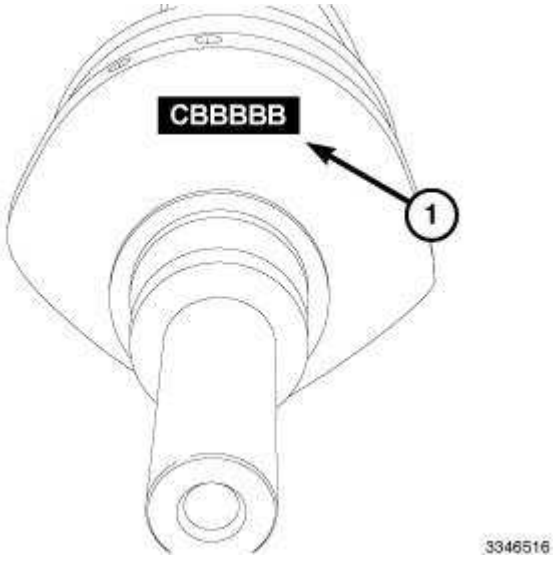


3346447

Fig. 170: Connecting Rod Shaft & Class Identification Mark
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the connecting rod has to be replaced only use connecting rod of the same weight, recognizable by a letter stamped on connecting rod shaft (1).

1. Each connecting rod has its own letter class identification mark (2) on connecting rod for bearing selection.



3346516

Fig. 171: Letters Stamped Into Crankshaft
Courtesy of CHRYSLER GROUP, LLC

2. Letter class identification mark on crankshaft (1).

Cylinder No.	1	2	3	4	5	6

Crankshaft Letter	C	B	B	B	B	B
Connecting Rod Letter	B	B	A	A	A	A

3. Choose the correct connecting rod bearings size from the above table. To determine the correct bearing size for each cylinder, each connecting rod "letter class", (letter stamped on each connecting rod), must be matched with crankshaft "letter class" (6 digits letters stamped on the first crankshaft counter weight). The letters stamped on the crankshaft are in the same orders as the cylinders. The first letter correspond to the first cylinder (timing system side), the second letter to the second one, etc. See bearing selection chart. Refer to **Engine/Engine Block - Standard Procedure**.

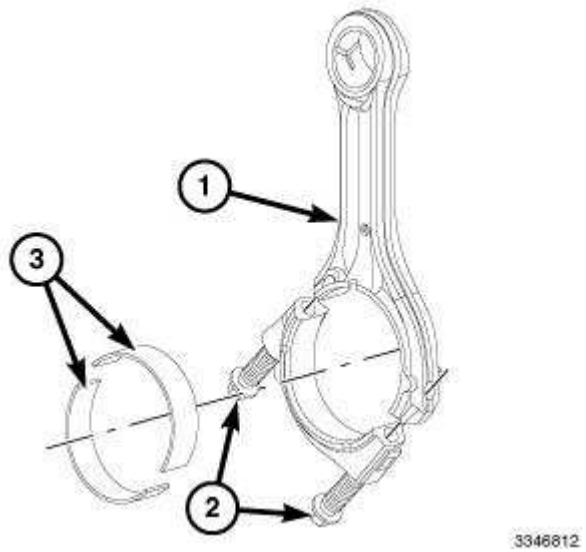


Fig. 172: Connecting Rod, Bearings & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Assemble connecting rod bearings (3) and bearing caps to their respective connecting rods (2) ensuring that the serrations on the cap and reference marks are aligned.
5. Using new bolts, tighten the connecting rod cap bolts to:
   - Step 1: Tighten to 10 N.m (88 in. lbs.).
   - Step 2: Tighten each bolt to 25 N.m (18 ft. lbs.).
   - Step 3: Tighten each bolt an additional 75 degrees turn.
   - Step 4: With the torque wrench set at 50 N.m (37 ft. lbs.) to check the tightening of each bolt.

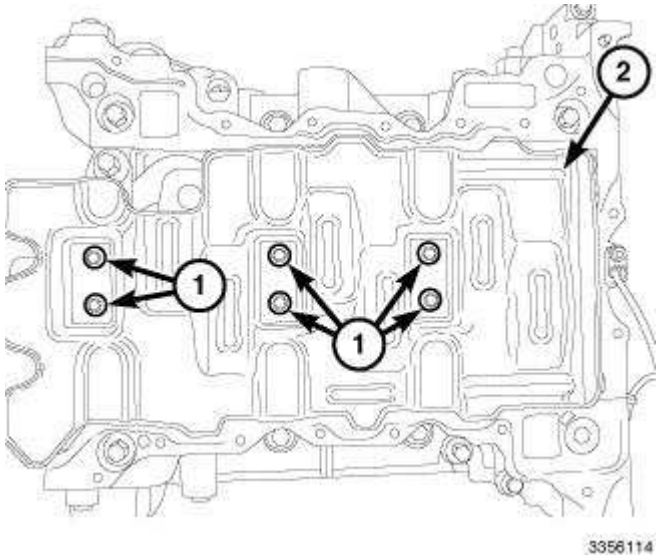

Fig. 173: Windage Tray & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the windage tray (2). Tighten bolts (1) to 11 N.m (97 in. lbs.).
7. Install the oil pump pickup tube. Refer to **PICK-UP, OIL PUMP, INSTALLATION**.
8. Install the engine into vehicle. Refer to **INSTALLATION**.
9. Connect the negative battery cable.

BEARING(S), CRANKSHAFT, MAIN

DESCRIPTION

DESCRIPTION

The bottom of the cylinder block has provisions for mounting the bedplate and the oil jets. The bedplate houses the other half of the main bearing shell. The bedplate is made of cast iron and bolts to the cylinder block. There is twenty six M12 mounting bolts, and three M8 mounting bolts.

The number four main bearing serves as the thrust washer location.

The upper main bearings have a oil supply holes and center grooves for lubrication of the main journals. The lower main bearings provide strength where it is needed.

The upper main bearings are available in three different thicknesses bearings. A color coded mark on the side of the bearing is used to identify it's thickness. Each color coded bearing is matched to it's respective journal. The select fit is obtained by matching the color coded bearings to grade identification marks on the cylinder block and crankshaft. Letters marked on the cylinder block identify the color of each upper-half main bearing, while letters marked on the front end of the crankshaft indicate the color of each lower half main bearing.

REMOVAL

REMOVAL

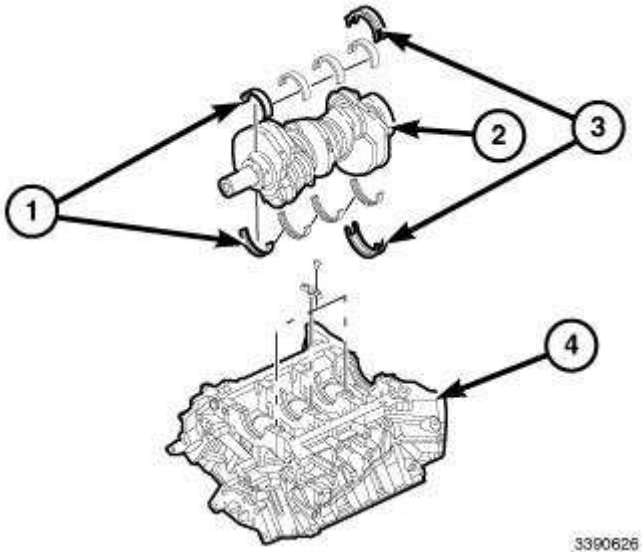

Fig. 174: Crankshaft, Bearings, Thrust Bearing & Engine Block
Courtesy of CHRYSLER GROUP, LLC

1. Remove the crankshaft (2). Refer to **CRANKSHAFT, REMOVAL**.

INSTALLATION

INSTALLATION

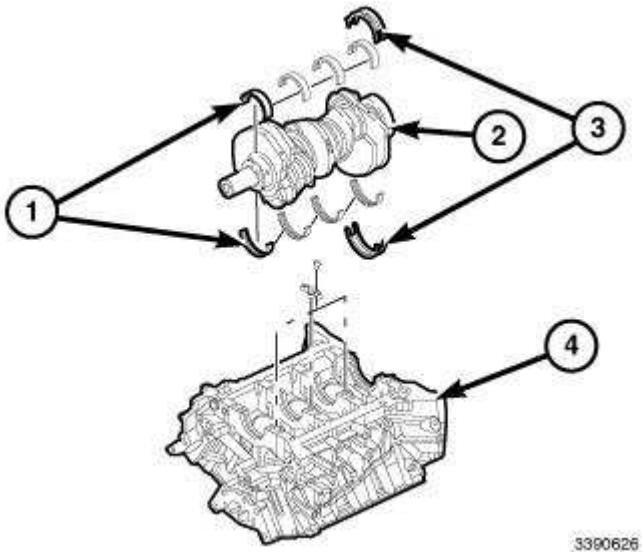

Fig. 175: Crankshaft, Bearings, Thrust Bearing & Engine Block
Courtesy of CHRYSLER GROUP, LLC

1. Install the crankshaft (2). Refer to **CRANKSHAFT, INSTALLATION**.

CRANKSHAFT

DESCRIPTION

DESCRIPTION

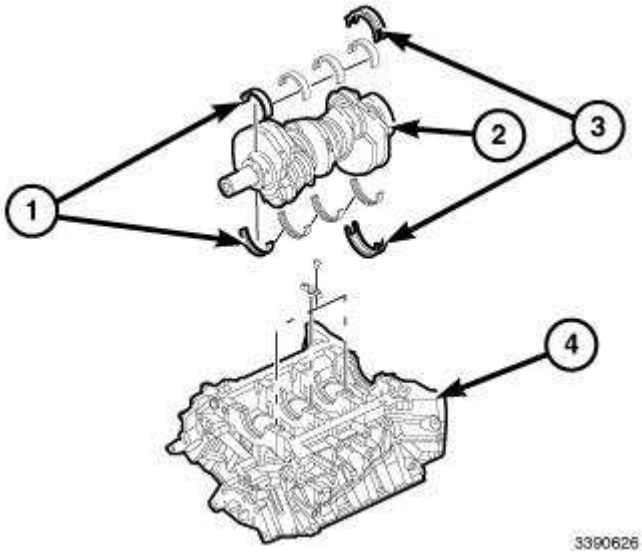

Fig. 176: Crankshaft, Bearings, Thrust Bearing & Engine Block
Courtesy of CHRYSLER GROUP, LLC

The crankshaft (1) for the 3.0L is a forged steel type design with four main bearing journals. The fourth crankshaft support controls crankshaft thrust.

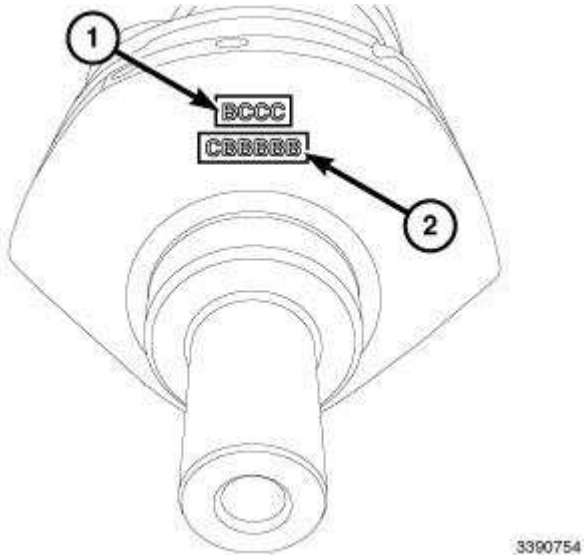

Fig. 177: Bearing Identification & Letters Stamped Into Crankshaft
Courtesy of CHRYSLER GROUP, LLC

The bearing identification for the upper crankshaft main journals is etched into the lower right side of engine block and the proper lower bearing selection can be found etched in the front of the crankshaft (1).

OPERATION

OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flexibility. The crankshaft has six separate throws arranged at different angles (splayed) to reduce second order free movements of inertia. Following the injection order 1-4-2-5-3-6, the crankshaft throw angles alternate between 46°.

STANDARD PROCEDURE

MEASURE CRANKSHAFT AND BLOCK JOURNALS

NOTE: After any bearing damage occurred, remove all debris which is present in the main oil gallery, connecting rod bores, and in the crankshaft and oil galleries.

1. Remove the crankshaft.
2. Clean all engine parts thoroughly.
3. Inspect the crankshaft, replace as necessary.
4. Inspect the crankcase for damage.
5. Inspect the crankshaft main bearing bedplate for damage.
6. Install the crankshaft main bearing caps and check for out of round. Replace as necessary.
7. Remove the main bearing caps and install the crankshaft with the correct selected bearings.

NOTE: Radial mounting of the main bearings of standard size crankshaft is possible by assigning the color-coded bearing shells. The upper main bearings can be identified by the four digit mark etched on the engine block below the high pressure pump. The lower main bearings can be identified by the code etched on the front of the crankshaft hub.

ASSIGNING CRANKSHAFT MAIN BEARING SHELLS

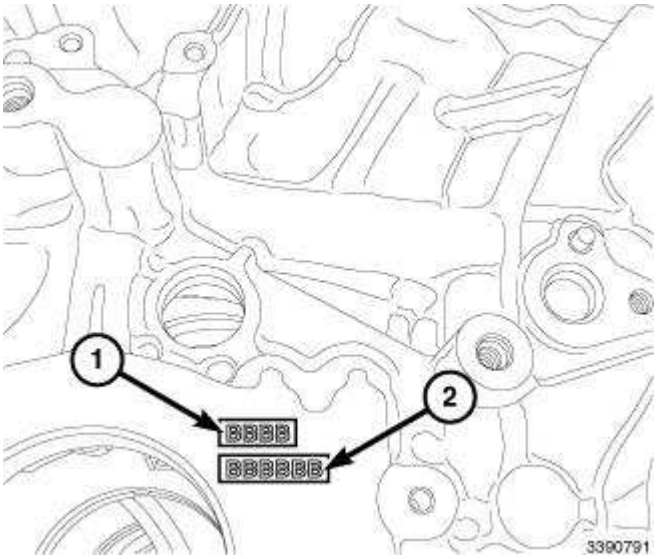

Fig. 178: Upper Main Bearing Identification
Courtesy of CHRYSLER GROUP, LLC

The upper main bearings can be identified by the four digit mark etched in the block (1) next to the oil pump.

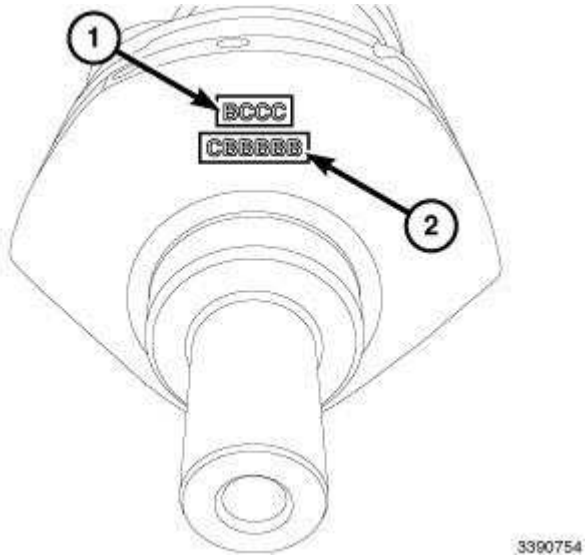

Fig. 179: Bearing Identification & Letters Stamped Into Crankshaft
Courtesy of CHRYSLER GROUP, LLC

The lower main bearings can be identified by the code etched on the front of the crankshaft counter weight (1). This color code indicates which bearing shell halves are to be used.

8. Select the correct bearing shells based upon the crankcase and crankshaft identification marks.
9. Mount the crankshaft axially using the thinnest thrust washer.
10. Inspect the crankshaft end play. If the crankshaft end play is out of specification, remove the crankshaft and install the larger thrust shim. repeat the procedure until crankshaft end play is

within specification.

11. Mount the crankshaft axially again and check each main bearing oil clearance with plasti-gauge. For bearing clearance specifications. Refer to **Engine - Specifications**.

CHECKING CRANKSHAFT END PLAY

1. Mount the (special tool #C-3339A, Set, Dial Indicator) to a stationary point at rear of engine. Locate the probe perpendicular against the rear of the crankshaft.
2. Move the crankshaft all the way to the front of its travel.
3. Zero the dial indicator.
4. Move the crankshaft all the way to the rear of it's travel and record the reading on the dial indicator. For crankshaft end play clearances, refer to the **Engine - Specifications**.

REMOVAL

REMOVAL

1. Remove the engine from the vehicle and mount engine on a suitable engine stand. Refer to **REMOVAL**.
2. Mount the engine onto a suitable engine stand.
3. Remove both cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.

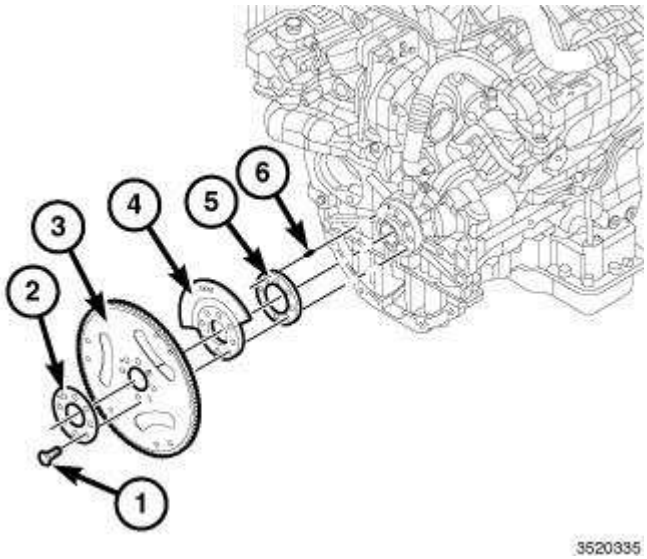

Fig. 180: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (1) and flex plate (3).
5. Remove the counter weight (4) and tone wheel (5).
6. Check the crankshaft end play. Refer to **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.

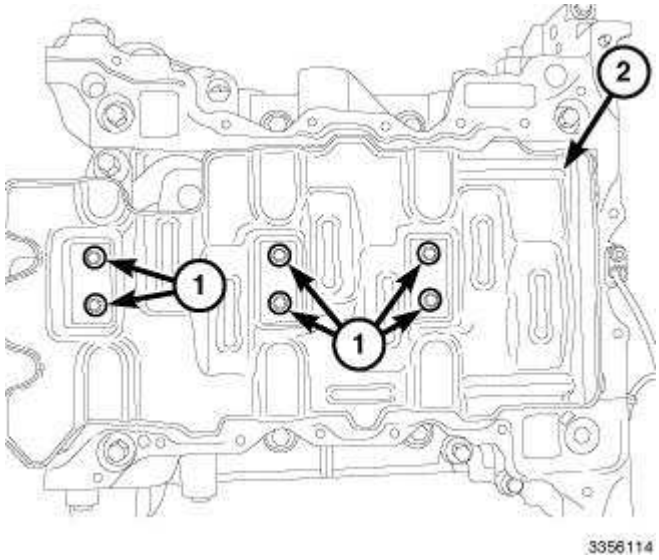

Fig. 181: Windage Tray & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
8. Remove bolts (1) and the windage tray (2).

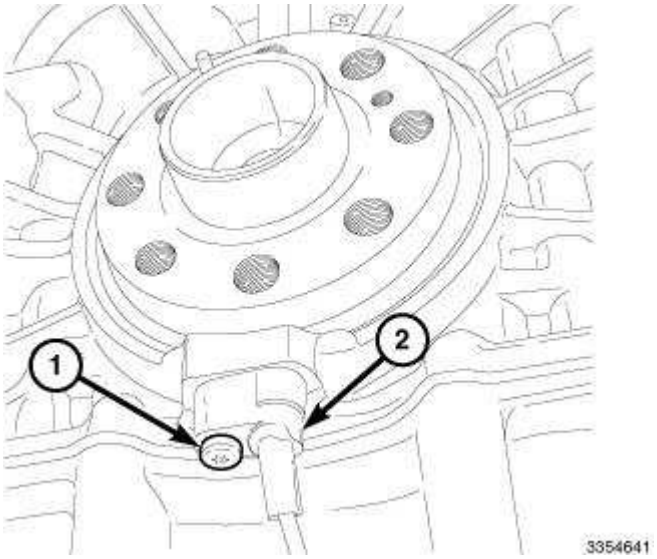

Fig. 182: Crankshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt (1) and the Crankshaft Position Sensor (CKP) (2).

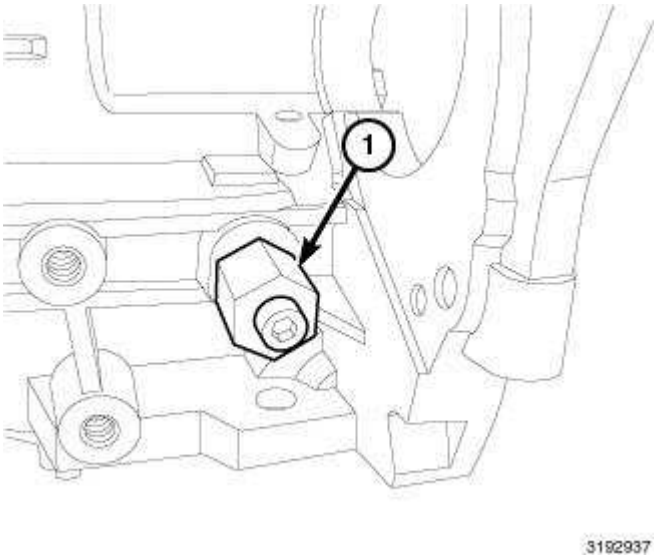

Fig. 183: Crankshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

10. Remove the (special tool #VM.10339, Tool, Crankshaft Timing) (1).

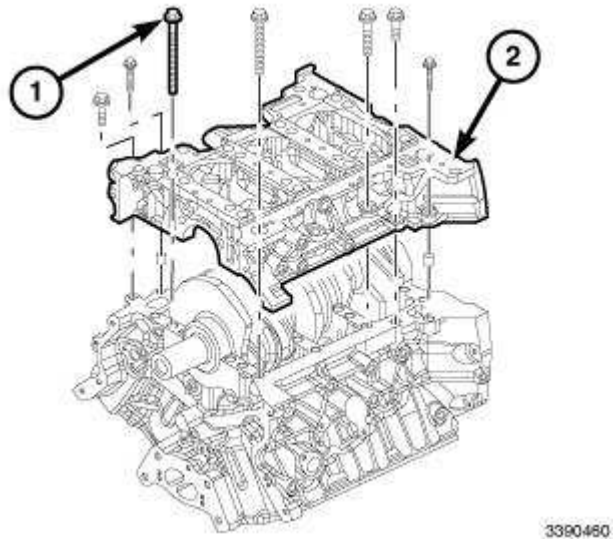

Fig. 184: Bed Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove bolts (1) securing the bed plate (2) to engine block.

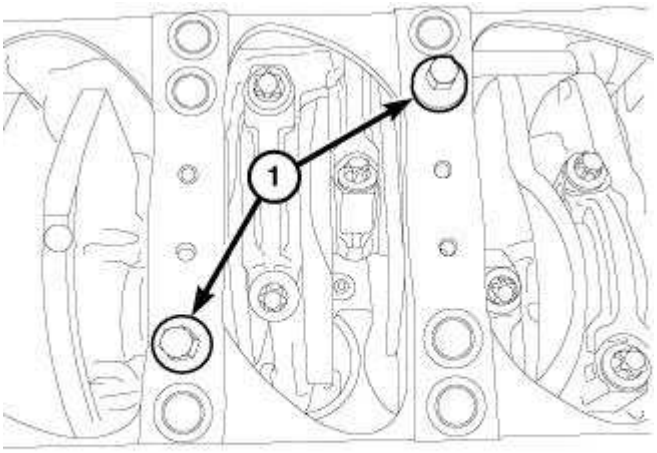

Fig. 185: Bed Plate Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install two bed plate bolts (1) finger tight.

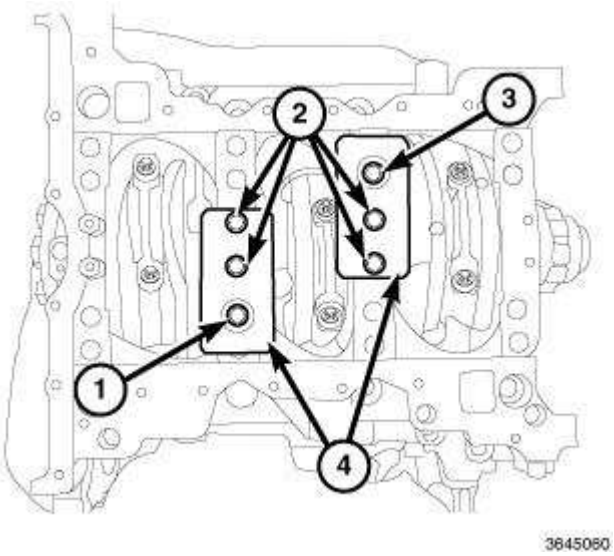

Fig. 186: Bedplate Removal Tools & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Install the (special tool #VM.10362, Tool, Bedplate Removal) (4) and securely tighten bolts (2).
14. Loosen bolts (1 and 3) in half turn increments until seal is broken.
15. Removal bolts (2) and the (special tool #VM.10362, Tool, Bedplate Removal) (4).
16. Remove bolts (1 and 3) and the bed plate.

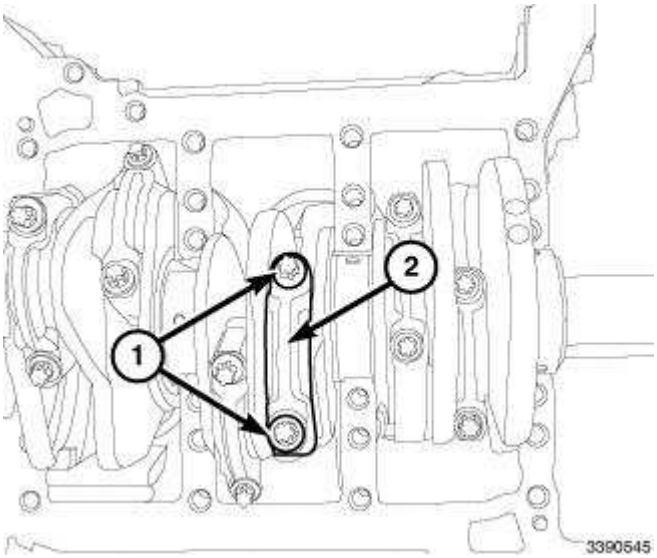

Fig. 187: Connecting Rods Bearing Cap & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the connecting rods to nick or score the crankshaft during assembly or disassembly.

CAUTION: Do not allow the connecting rod to bend or dent the oil jet. Serious engine damage may result from a misaligned oil jet.

17. Remove bolts (1) and the connecting rods bearing cap (2).

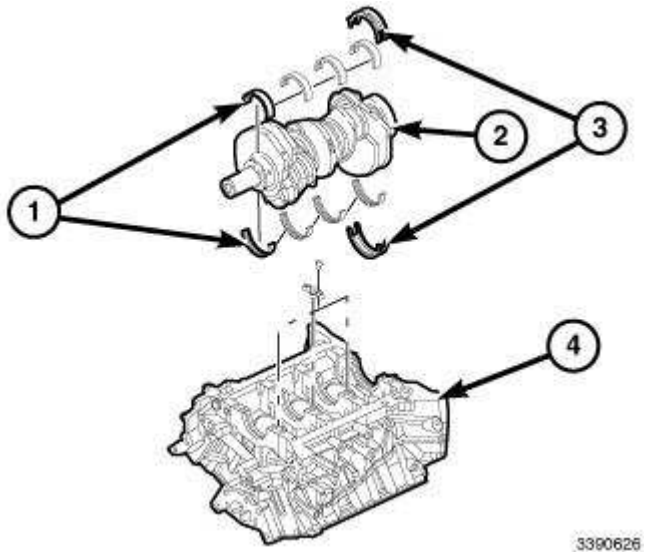

Fig. 188: Crankshaft, Bearings, Thrust Bearing & Engine Block
Courtesy of CHRYSLER GROUP, LLC

18. Remove the crankshaft (2).

19. Remove the thrust washer (3).
20. Remove the crankshaft bearings (1).

INSTALLATION

INSTALLATION

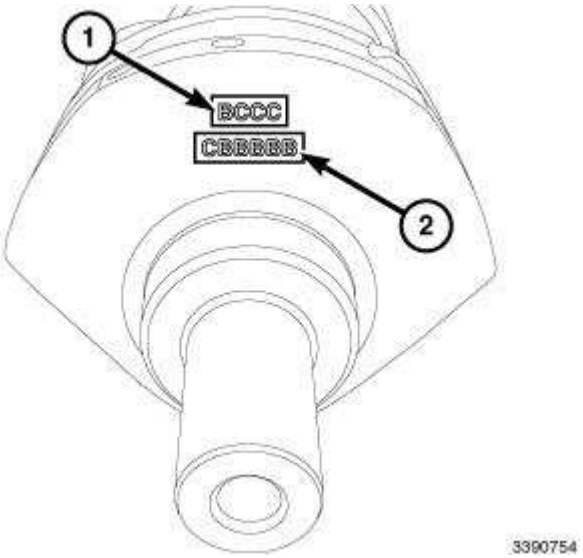

Fig. 189: Bearing Identification & Letters Stamped Into Crankshaft
Courtesy of CHRYSLER GROUP, LLC

1. Clean all sealing and mating surfaces. Be sure that the sealing and mating surfaces are free of oil and debris. Refer to **Engine - Standard Procedure**.

   NOTE: If any bearing damage has occurred, remove all debris from the connecting rod bores, crankshaft, and oil galleries. Remove the steel ball from the main oil gallery before cleaning.

2. Clean and inspect the crankshaft and bearings journals. Replace the bearings as necessary.
3. Locate the crankshaft bearing journal letter class (1) stamp on the crankshaft weight.

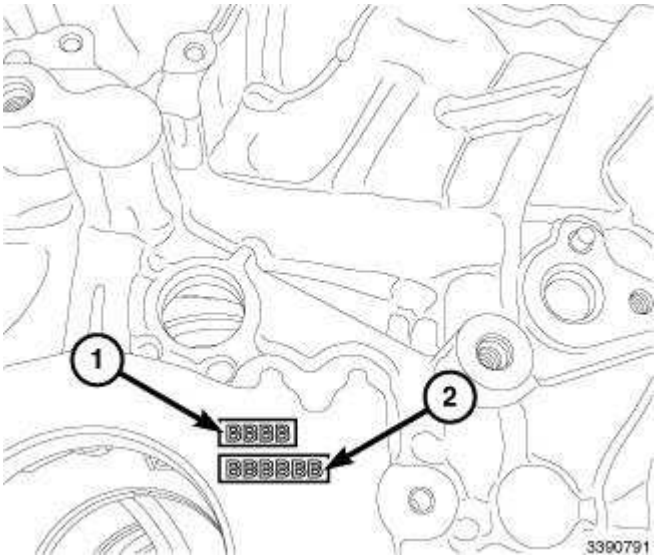

Fig. 190: Upper Main Bearing Identification
Courtesy of CHRYSLER GROUP, LLC

4. Locate the engine block crankshaft journal letter class stamp on the engine block (1).

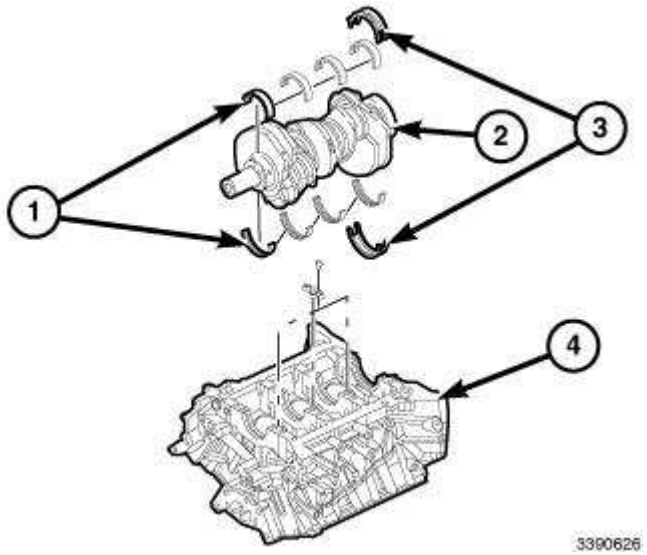

Fig. 191: Crankshaft, Bearings, Thrust Bearing & Engine Block
Courtesy of CHRYSLER GROUP, LLC

5. To determine the correct crankshaft journal letter class, each cylinder block seat diameter letter class must be matched with the crankshaft main journal diameter letter class. Both letter classes stamped on the cylinder block as well as on the crankshaft weight are in a progressive order starting from the front of the engine. The first letter corresponds to the first cylinder, the second to the second, etc. Use the crankshaft bearing selection chart to determine the half shell color. Refer to **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.
6. Select the correct and install top half of the crankshaft bearings (1) and the top half of the crankshaft thrust bearing (3) into engine block (4).

7. Using the bearing selection chart from step five, select the correct bearing and install lower half of the crankshaft bearings (1) and the lower half of the crankshaft thrust bearing (3) into bed plate.

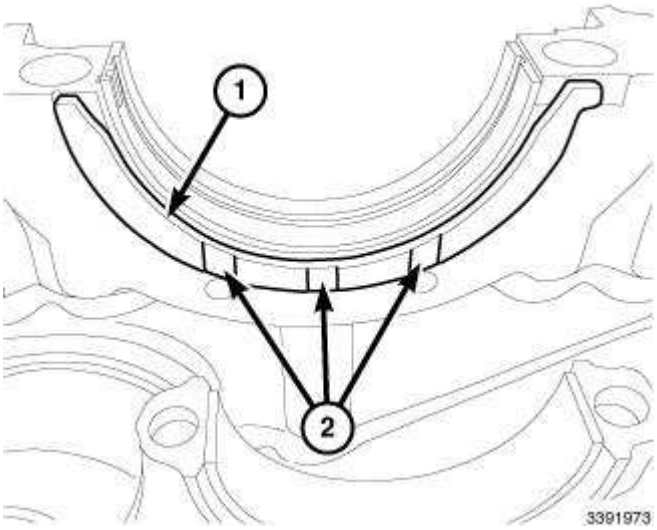

Fig. 192: Thrust Bearings & Oil Discharge Groves
Courtesy of CHRYSLER GROUP, LLC

8. When installing the thrust bearings (1) in the engine block and bed plate, make sure the oil discharge groves (2) face towards the crankshaft.

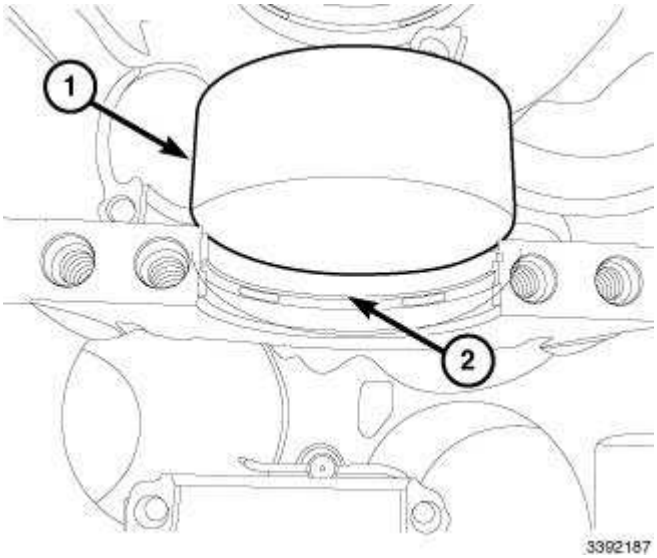

Fig. 193: Crankshaft Bearing Positioning Tool & Main Bearing
Courtesy of CHRYSLER GROUP, LLC

9. Using the (special tool #VM.10342, Tool, Crankshaft Bearing Positioning) (1) check the alignment of the first three main bearings (2) in engine block and bed plate.

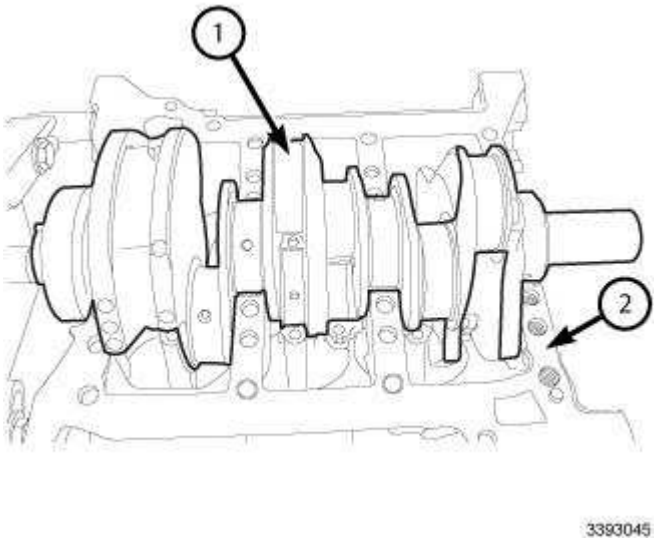

Fig. 194: Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the connecting rods to nick or score the crankshaft during assembly or disassembly.

10. Set the crankshaft (2) into the engine block.

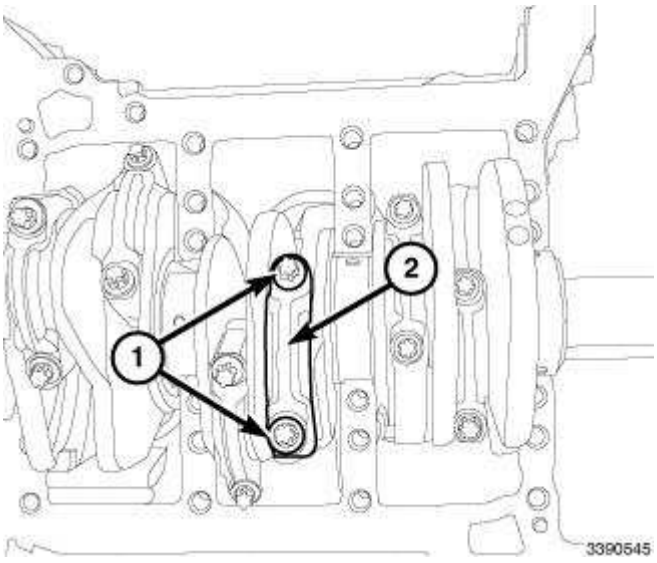

Fig. 195: Connecting Rods Bearing Cap & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the connecting rod to bend or dent the oil jet. Serious engine damage may result from a misaligned oil jet.

11. Using new bearings and bolts (1), install the connecting rod bearing caps (2). Refer to

BEARING(S), CONNECTING ROD, INSTALLATION.

12. Install the lower half of the crankshaft bearings and the lower half of the crankshaft thrust bearing into bed plate.

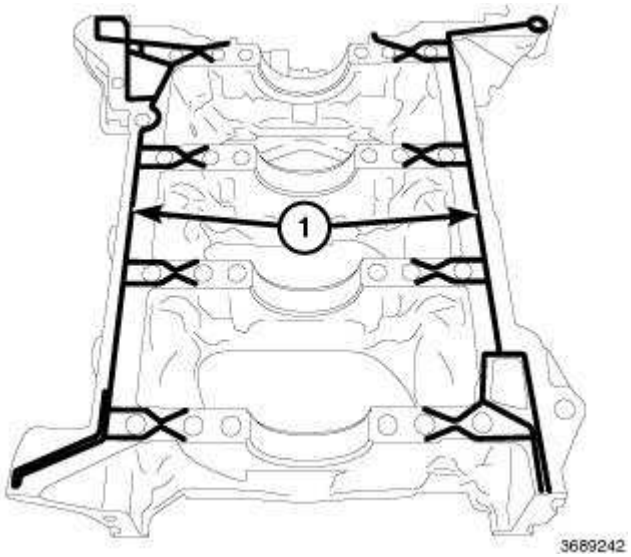

Fig. 196: RTV Sealant Compound On Bed Plate
Courtesy of CHRYSLER GROUP, LLC

13. Clean the gasket sealing surfaces. Refer to **Engine - Standard Procedure**.
14. Using Mopar® Threebond Engine RTV Sealant, apply a 1.5 mm thick bead of sealing compound to bedplate as illustrated (1) and **DO NOT** spread the sealing bead.

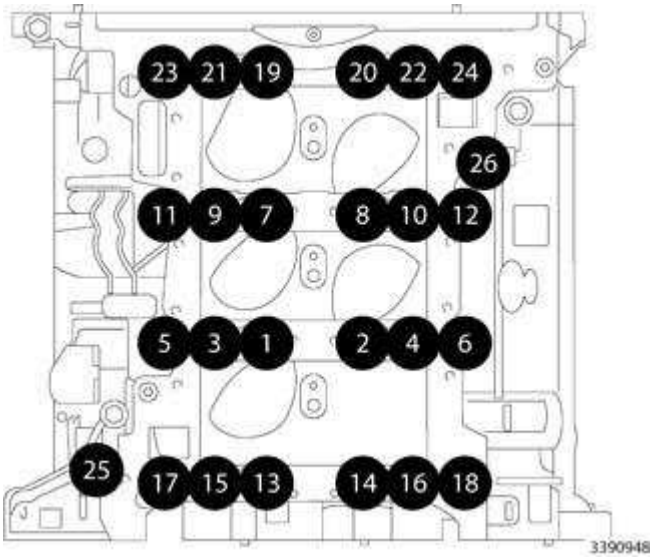

Fig. 197: Bed Plate Onto Engine Block Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

15. Install the bed plate onto the engine block.
16. Using new bolts, install the twenty six M12 bolts (1 - 26) and the three M8 bolts finger tight.

17. Using the tightening shown in illustration, tighten all M12 bolts to 45 N.m (33 ft. lbs.).

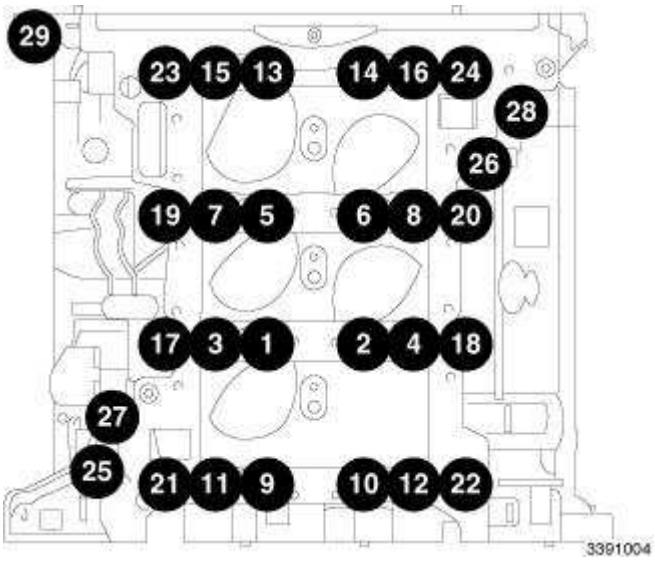

Fig. 198: Bed Plate Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

18. Using the tighten sequence shown in illustration to the following torque values:
    - Step 1: Using a torque angle gauge, tight the internal bed plate bolts (1 - 16) an additional 110 degrees turn.
    - Step 2: Tight the external bed plate bolts (17 - 26) to 120 N.m (89 ft. lbs.).
    - Step 3: Tighten the three M8 bolts (27 - 29) to 30 N.m 22 ft. lbs.).
    - Step 4: Check the torque of the M12 bolts (1 - 26) in a counterclockwise direction with the torque wrench set at 115 N.m (85 ft. lbs.).
19. The crankshaft should turn freely. If the crankshaft does not turn freely loosen and re-torque the bearing caps.

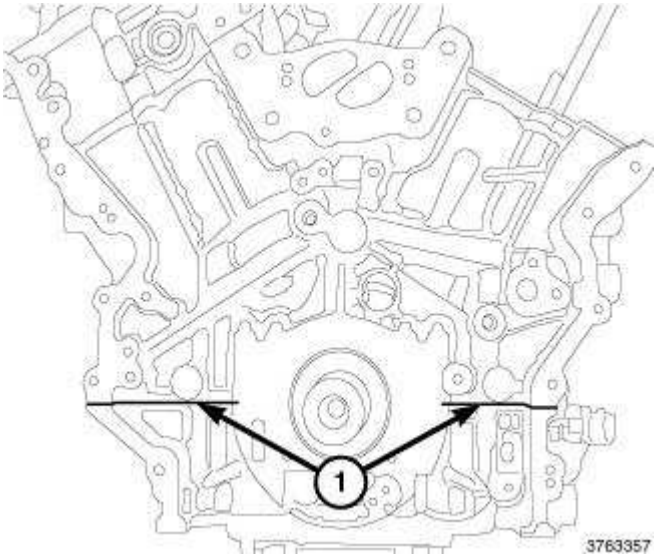

Fig. 199: RTV Sealant Excess Locations
Courtesy of CHRYSLER GROUP, LLC

20. Remove any excess Mopar® Threebond Engine RTV Sealant (1) that may have squeezed out in the front of engine.

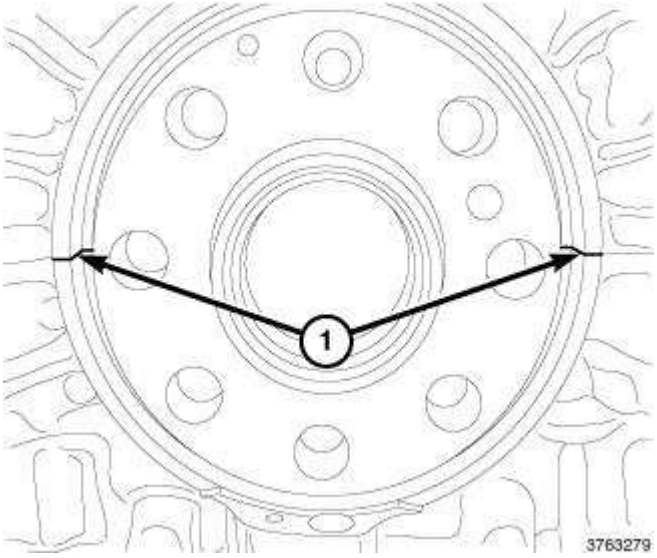

Fig. 200: Rear Oil Seal Excess RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

21. Remove any excess Mopar® Threebond Engine RTV Sealant (1) that may have squeezed out in rear oil seal bay.
22. Check the crankshaft end play. Refer to **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.

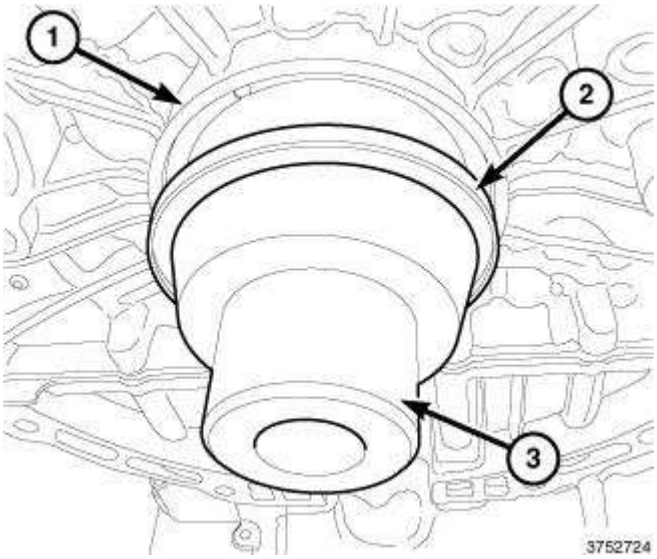

Fig. 201: Rear Seal Guide, Rear Oil Seal & Crankshaft
Courtesy of CHRYSLER GROUP, LLC

23. Install the (special tool #VM.10341-1, Guide, Rear Seal) (3) and slide the rear oil seal (2) onto the crankshaft.
24. Remove the (special tool #VM.10341-1, Guide, Rear Seal) (3).

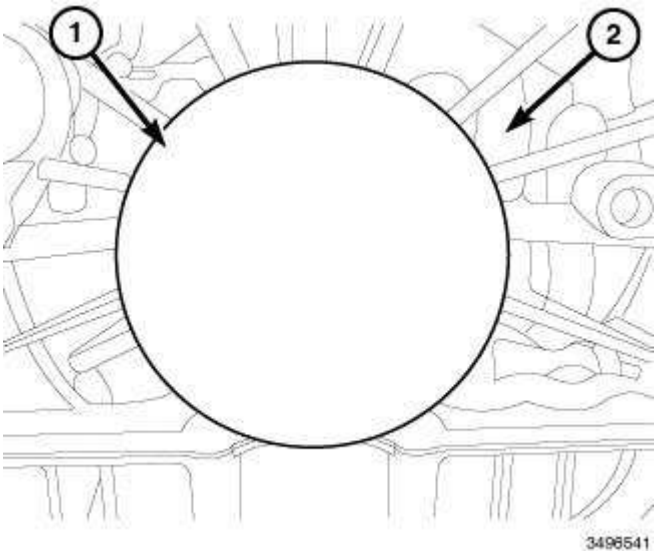

Fig. 202: Rear Seal Installer & Crankshaft Position Sensor (CKP) Boss
Courtesy of CHRYSLER GROUP, LLC

NOTE: Position the flat portion of the Rear Seal Installer should be facing down giving you clearance by the Crankshaft Position Sensor (CKP) boss.

25. Using the (special tool #VM.10341-2, Installer Tool, Rear Seal) (1) install the rear main oil seal into the engine block.

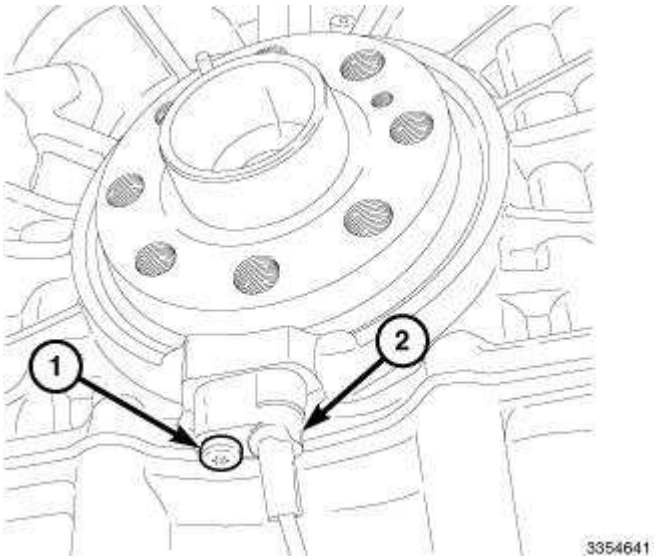

Fig. 203: Crankshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

26. Install the Crankshaft Position Sensor (CKP) (2). Tighten bolt (1) to 6 N.m (53 in. lbs.).

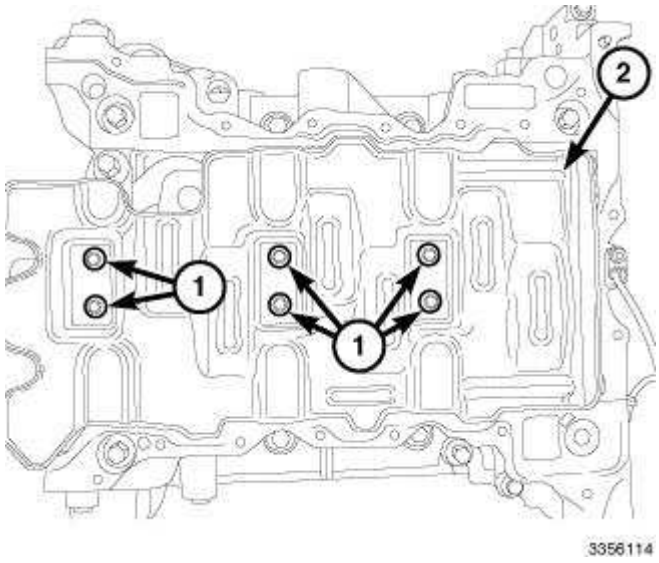

Fig. 204: Windage Tray & Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the windage tray (2). Tighten bolts (1) to 11 N.m (97 in. lbs.).
28. Install the oil pump. Refer to **PUMP, ENGINE OIL, INSTALLATION**.

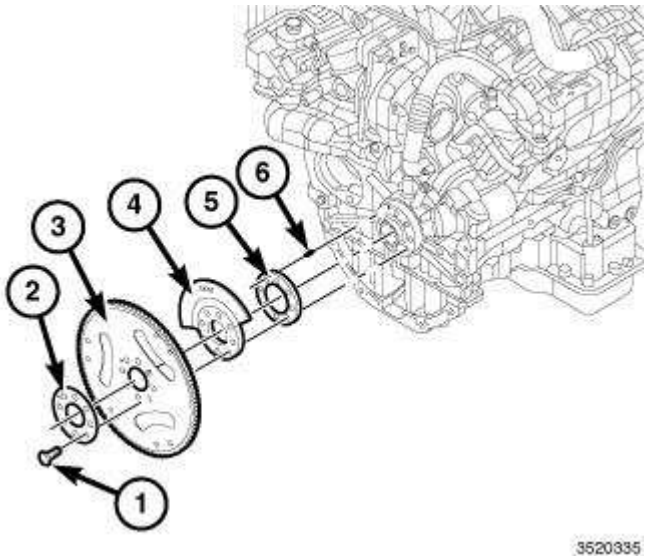

Fig. 205: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Install the tone wheel (5), counter weight (4), and the flex plate (3). Refer to **FLEXPLATE, INSTALLATION**.
30. Install both cylinder heads. Refer to **CYLINDER HEAD, INSTALLATION**.
31. Install the engine into vehicle. Refer to **INSTALLATION**.

DAMPER, VIBRATION

REMOVAL

REMOVAL

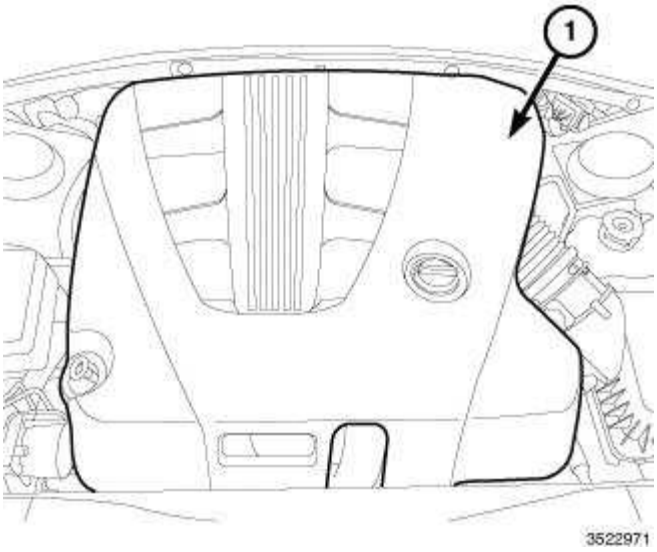

Fig. 206: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

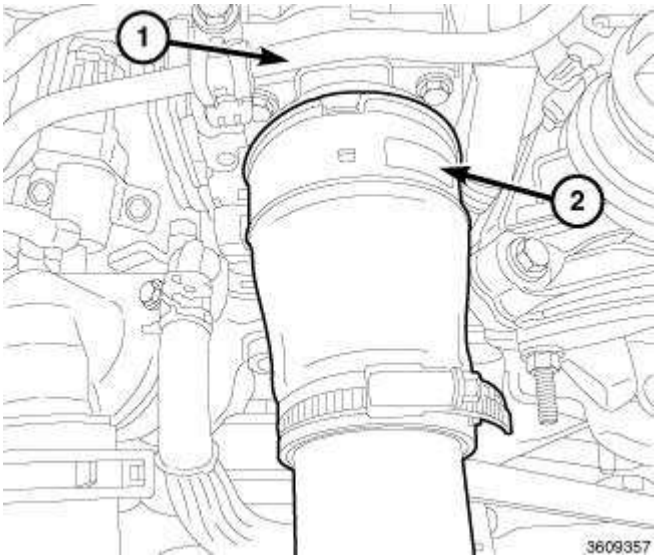

Fig. 207: EGR Air Flow Control Valve & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the Charge Air Cooler (CAC) hose (2) from the EGR air flow control valve and

position aside.

4. Remove bolt and position aside the CAC hose assembly.

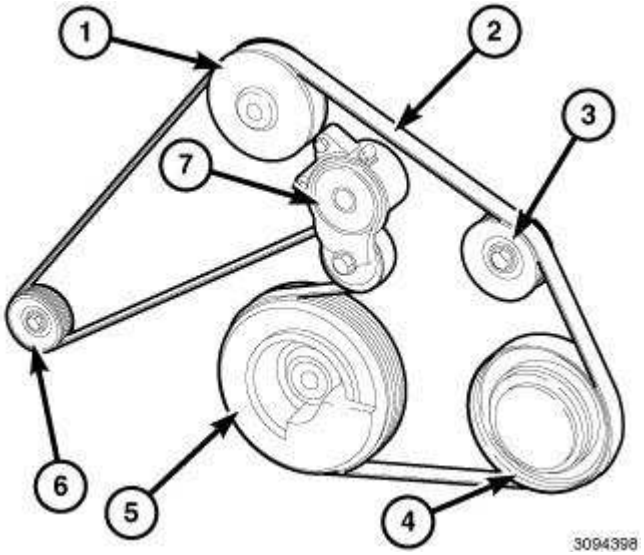

Fig. 208: Pulleys, Tensioner & Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

5. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Lock the engine 30 degrees ATDC. Refer to **Engine/Valve Timing - Standard Procedure**.

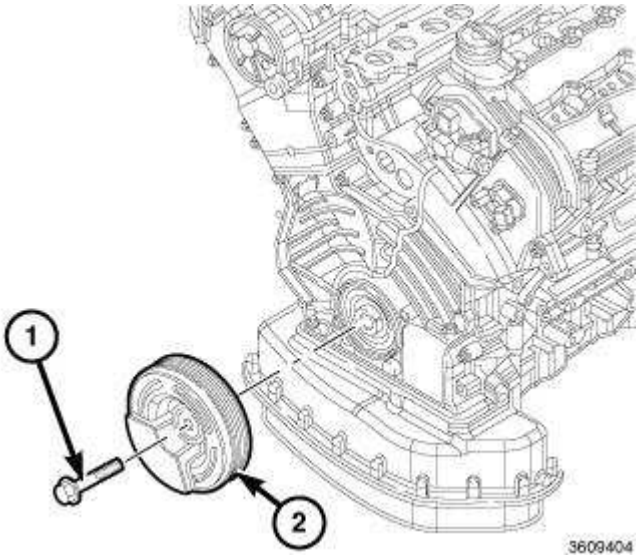

Fig. 209: Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Lower the vehicle.

NOTE: The crankshaft damper bolt is a left hand thread.

9. Remove bolt (1) and the vibration damper (2).

INSTALLATION

INSTALLATION

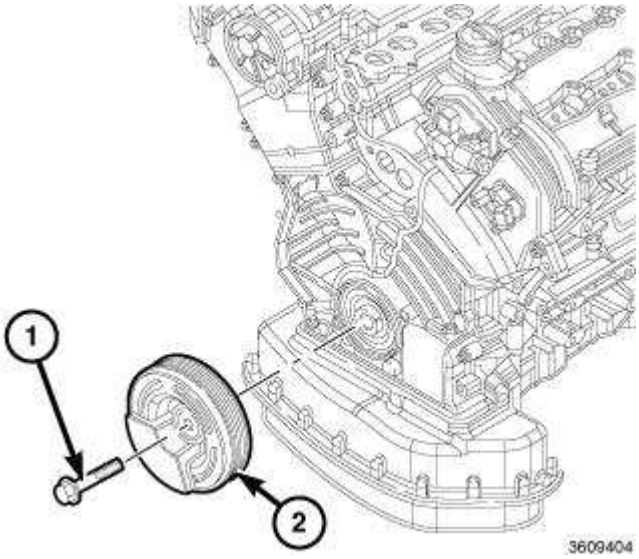

Fig. 210: Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft damper bolt is a left hand thread.

1. Install the vibration damper (2). Tighten bolt (1) to 100 N.m (74 ft. lbs.) plus an additional 125 degrees turn.

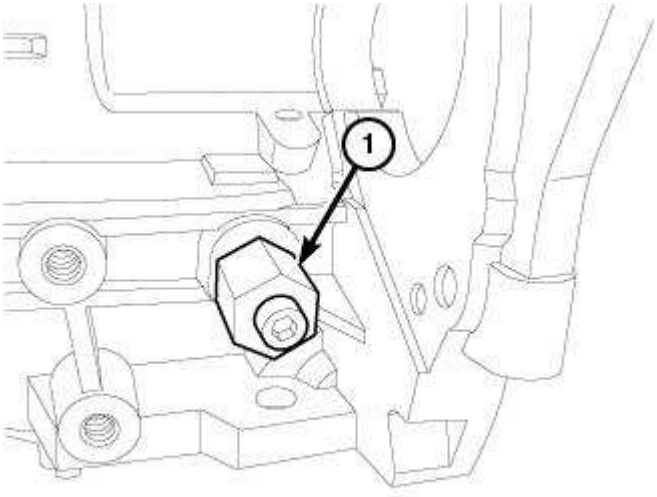

Fig. 211: Crankshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the (special tool #VM.10339, Tool, Crankshaft Timing) (1).

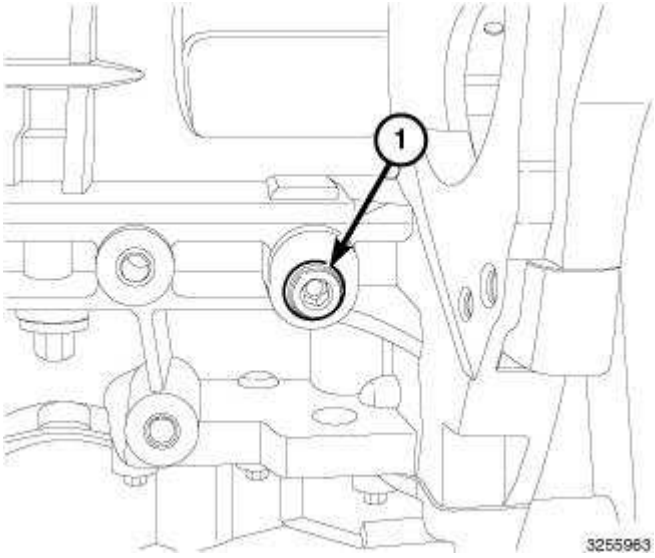

Fig. 212: Engine Block Plug
Courtesy of CHRYSLER GROUP, LLC

4. Install engine block plug (1). Tighten 30 N.m (22 ft. lbs.).
5. Lower the vehicle.

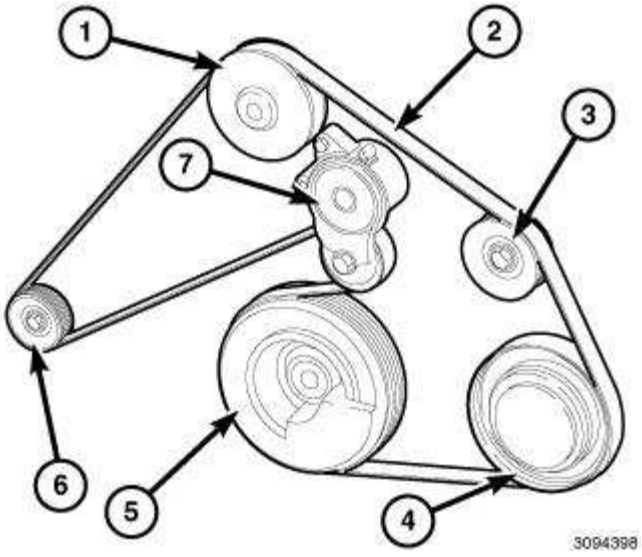

Fig. 213: Pulleys, Tensioner & Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

6. Installed the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

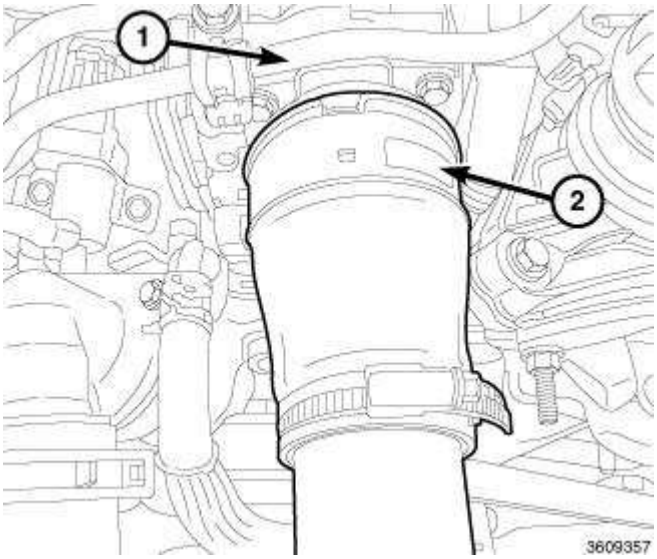

Fig. 214: EGR Air Flow Control Valve & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

7. Position the Charge Air Cooler (CAC) hose assembly and tighten bolts (1) to 11 N.m (97 in. lbs.).
8. Connect the CAC hose (2) to the EGR air flow control valve.

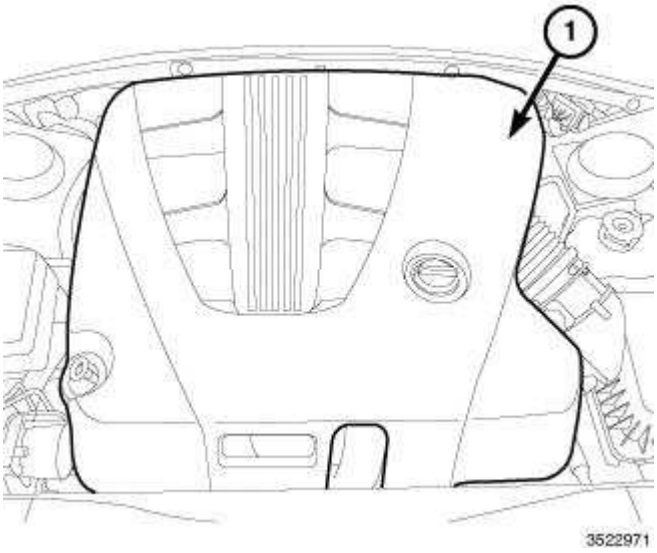

Fig. 215: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

9. Install the engine cover (1).
10. Connect the negative battery cable.

FLEXPLATE

DESCRIPTION

DESCRIPTION

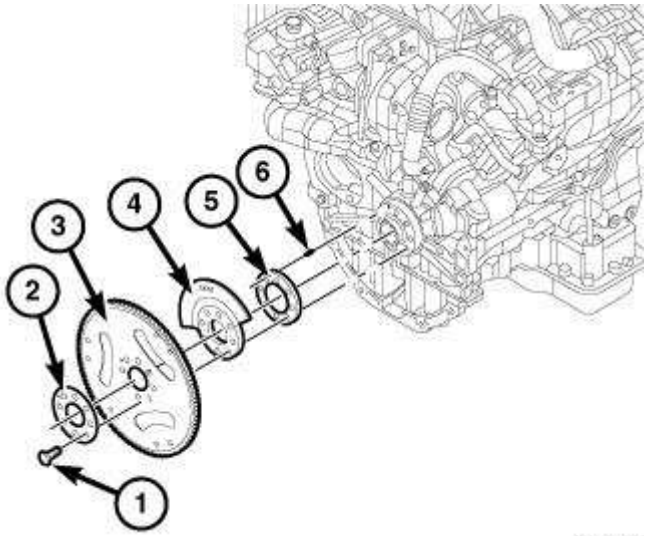

Fig. 216: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

The flex plate is fastened to the crankshaft and can only be installed one way. The crankshaft has a dowel locating pin that is used to align the magnetic tone wheel and the counter weight. The stamped-steel flex plate has a segment ring to provide engine speed and crankshaft position information to the Power Control Module (PCM). The crankshaft position sensor is mounted next to the segment ring and sends electrical pulses to the PCM.

REMOVAL

REMOVAL

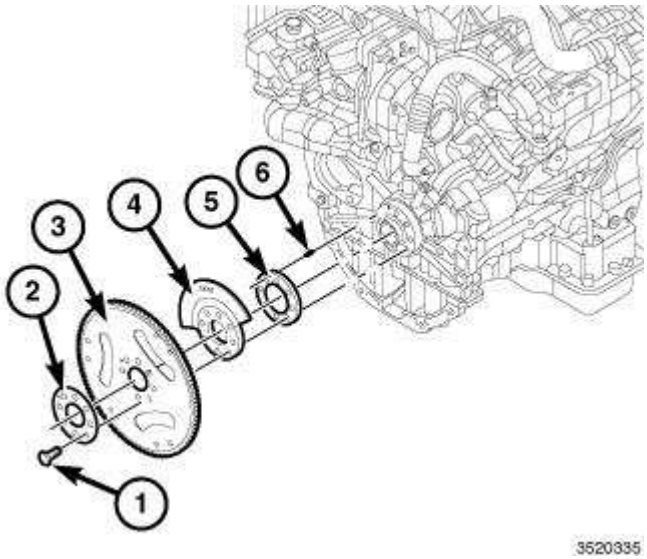

Fig. 217: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .
2. Paint mark the flex plate hub to flex plate relation.
3. Remove bolts (1) and flex plate (3).
4. If necessary, remove the counter weight (4) and tone wheel (5).
5. Inspect flex plate for damage.

INSTALLATION

INSTALLATION

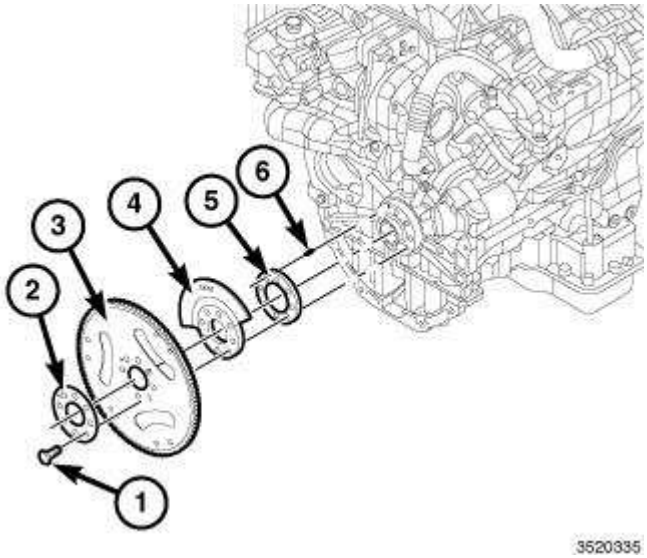

Fig. 218: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do Not lubricate new bolts as they are already coated with an anti-scuff treatment. Align the flex plate to hub paint marks, where applicable.

NOTE: Always use new flex plate bolts when ever the existing bolts have been removed

1. If removed, install the tone wheel (5) and counter weight (4).
2. Install the flex plate (3).

NOTE: With clean engine oil, lubricate the bolt side of backing plate (2).

3. Lubricate and install the backing plate (2) and tighten bolts (1) finger tight.

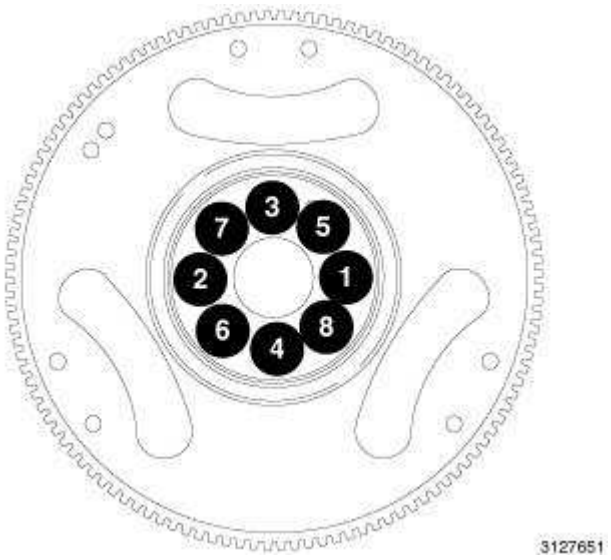

Fig. 219: Flex Plate Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Using the tightening sequence shown in illustration, Tighten bolts to:
   - Tighten bolts 50 N.m (37 ft. lbs.).
   - Loosen one bolt at a time and retighten bolt in a clockwise cross pattern to 125 N.m (92 ft. lbs.).
   - Using a torque angle gauge, tighten each bolt an additional 30 degrees in a clockwise cross pattern.
5. Install the transmission. Refer to **INSTALLATION** .

PUMP, VACUUM

DESCRIPTION

DESCRIPTION

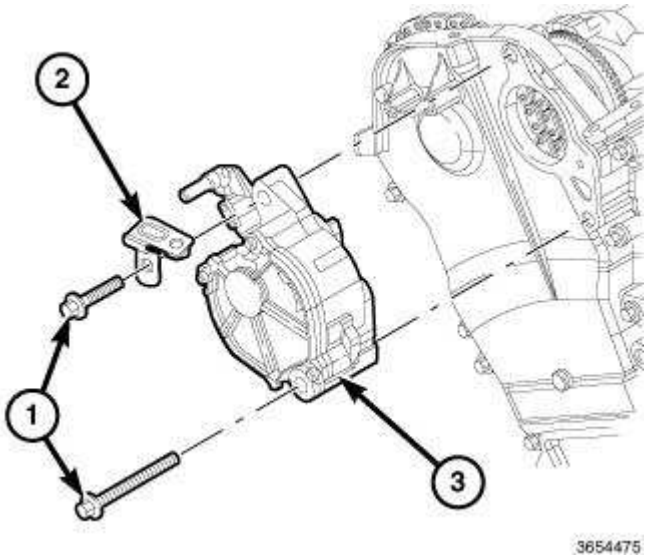

Fig. 220: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

The vacuum pump is a constant displacement, vane-type pump. Vacuum is generated by vanes mounted in the pump rotor. The rotor is located in the pump housing and is pressed onto the pump shaft.

The vacuum pump operates by a slotted extension attached to the vacuum pump shaft. The vacuum pump shaft slotted extension fits into, and is driven by, the intake camshaft gear.

The vacuum pump rotating components are internally lubricated and the vacuum pump has no serviceable parts. Do not disassemble or attempt to repair the pump.

OPERATION

OPERATION

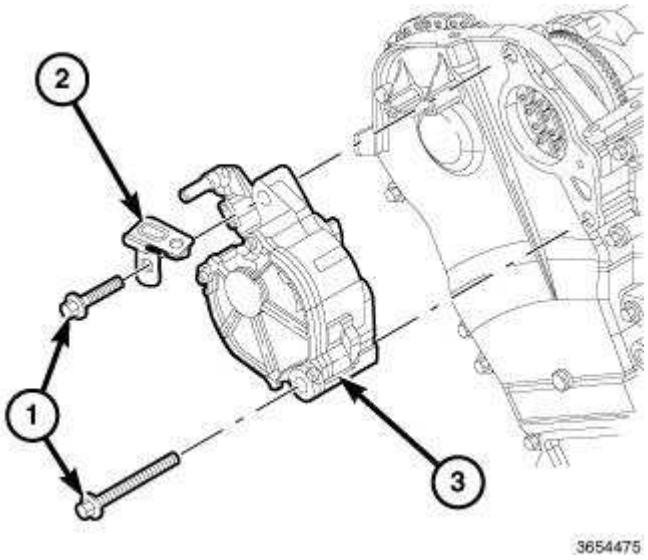

Fig. 221: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

Vacuum pump output is transmitted to the EGR vacuum bypass solenoid and brake vacuum booster, systems through a supply hose. The hose is connected to an outlet port on the pump housing and uses an in-line check valve to retain system vacuum when vehicle is not running.

Pump output ranges from a minimum of 8.5 to 25 inches vacuum.

The pump rotor and vanes are rotated by the slotted pump drive gear which fits into the camshaft drive gear.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start the engine allowing the engine to run for 30 seconds. Vacuum should be 18 inches HG (609 millibars). Verify the vacuum line is not leaking. If no leak is present replace vacuum pump. Refer to **PUMP, VACUUM, REMOVAL** and **PUMP, VACUUM, INSTALLATION**.

REMOVAL

REMOVAL

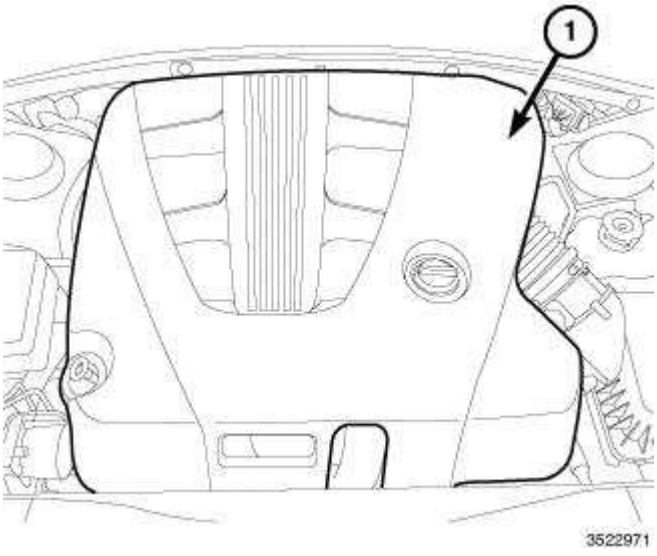

Fig. 222: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Remove the engine cover (1).

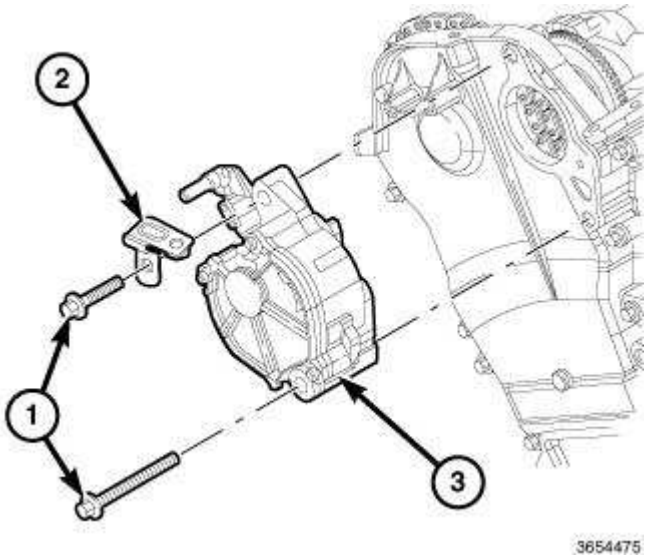

Fig. 223: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the vacuum line from vacuum pump.

NOTE: Observe position of driver on rear of pump upon removal.

4. Remove bolts (1) and the vacuum pump (2).

INSTALLATION

INSTALLATION

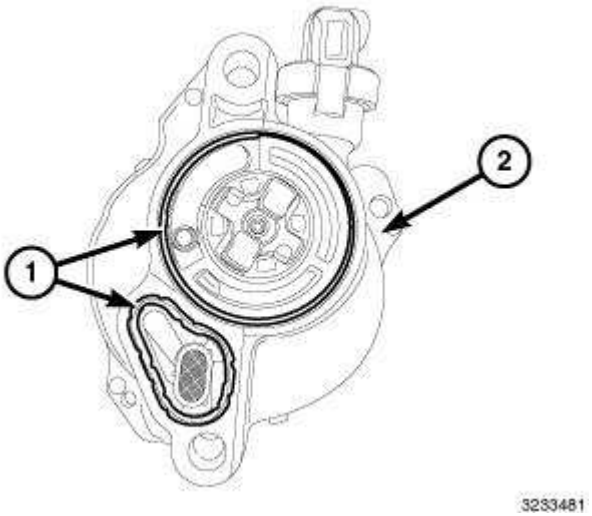

Fig. 224: Vacuum Pump & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Clean all sealing surfaces.
2. Install new O-ring seals (1) onto the vacuum pump (2).

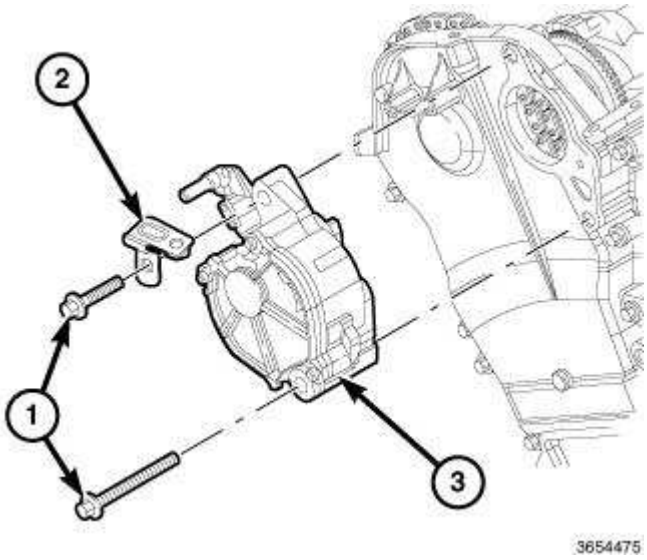

Fig. 225: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Position the slotted drive gear on rear of pump with the slot on the camshaft drive gear.
4. Install vacuum pump (2). Tighten bolts (1) to 30 N.m (22 ft. lbs.).
5. Install vacuum line onto the vacuum pump.

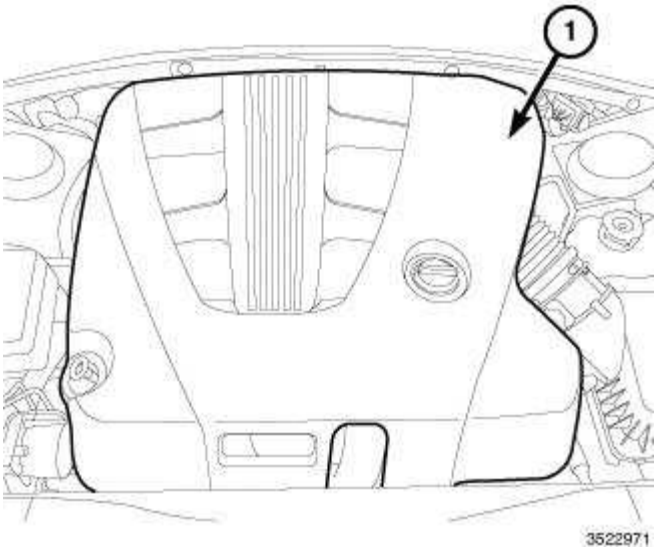

Fig. 226: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

6. Connect the negative battery cable.
7. Start the engine and inspect for leaks.

8. Install the engine cover (1).

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

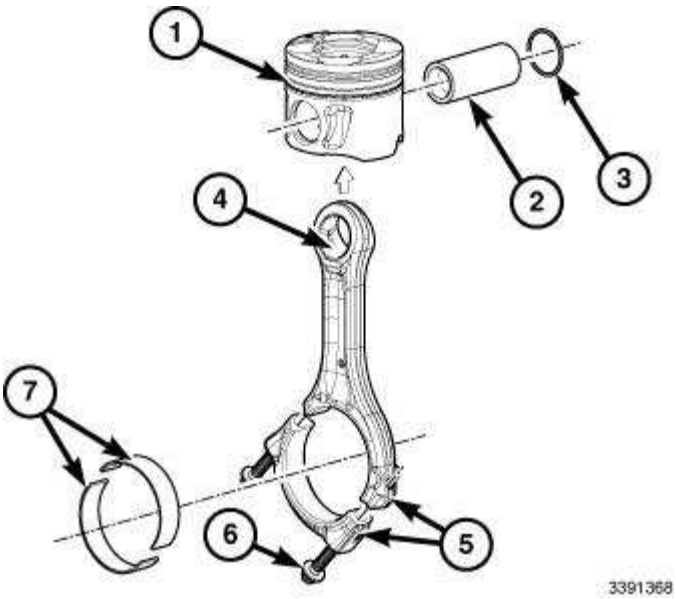

Fig. 227: Piston & Connecting Rod Components
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the connecting rod bolts are ever loosened, replace all of the connecting rods.

The pistons (1) are made of a high strength Aluminum Alloy B2+Phosphate and Graphite Coating. Conventional Cooling Gallery. Insert Ring + Parallel Type Groove. The piston crown consists of a combustion bowl and four recesses machined for the valves. Circlips (3) secure a full floating piston pin (2). The pistons have a phosphate surface treatment and the piston skirts have a graphite treatment for scuff resistance. The piston skirts have notches to provide the necessary clearance for the oil jets when the pistons are at BDC. The connecting rod (5) that are forged steel I-shaped with a diagonal slit and a tapered faced small end. The connecting rod (5) is a fracture split type rod.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the engine from the vehicle and mount on suitable engine stand. Refer to **REMOVAL**.
3. Remove both cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.

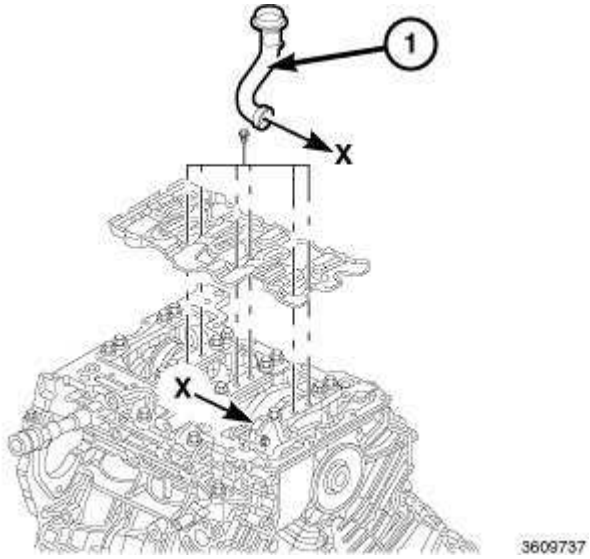

Fig. 228: Oil Pump Pickup Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the oil pump and pickup tube (1). Refer to **PUMP, ENGINE OIL, REMOVAL**.

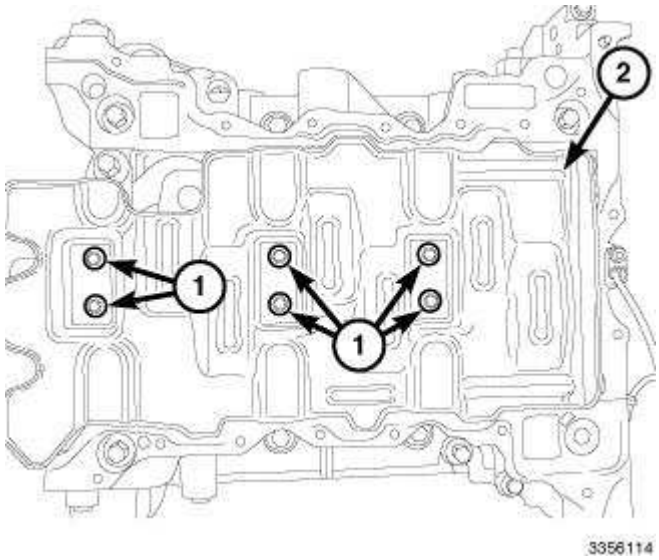

Fig. 229: Windage Tray & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove bolts (1) and the windage tray (2).

CAUTION: To prevent damage to the oil jets, remove the oil jets before removing the pistons.

CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage. Care must be taken not to

damage the crankshaft tone ring when removing cylinder number four oil jet.

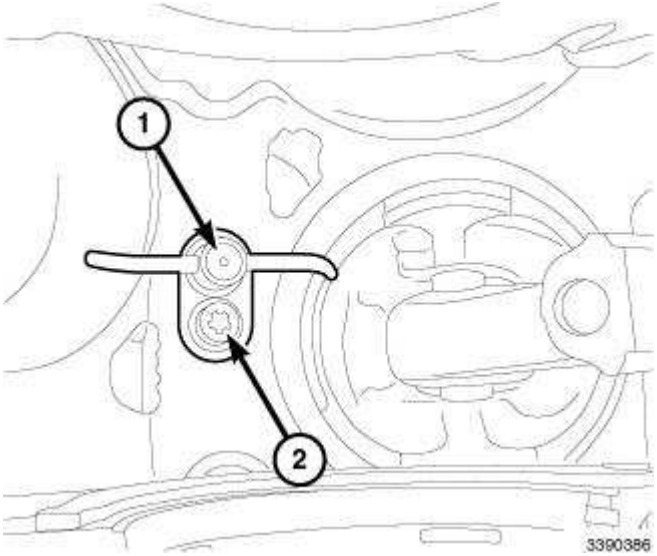

Fig. 230: Oil Jet & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the appropriate oil jet retaining bolt (2) and remove oil jet (1) from the engine block.

NOTE: The piston and connecting rod assembly must be removed through the top of cylinder block.

7. Remove the ridge from the top of the cylinder bores with a ridge reamer before removing pistons from cylinder block. **Be sure to keep the top of pistons covered during this operation.**
8. Rotate the crankshaft so the connecting rod is centered in the cylinder bore.
9. Remove the connecting rod cap bolts and remove the fracture-split rod cap.

NOTE: Use care not to nick or scratch the crankshaft journal or cylinder bore during removal.

10. Carefully remove the piston and connecting rod assembly out through the top of the cylinder block.
11. Mark the pistons with the matching cylinder number after removal.
12. Repeat this procedure for the remaining pistons and connecting rod assemblies.

PISTON PIN

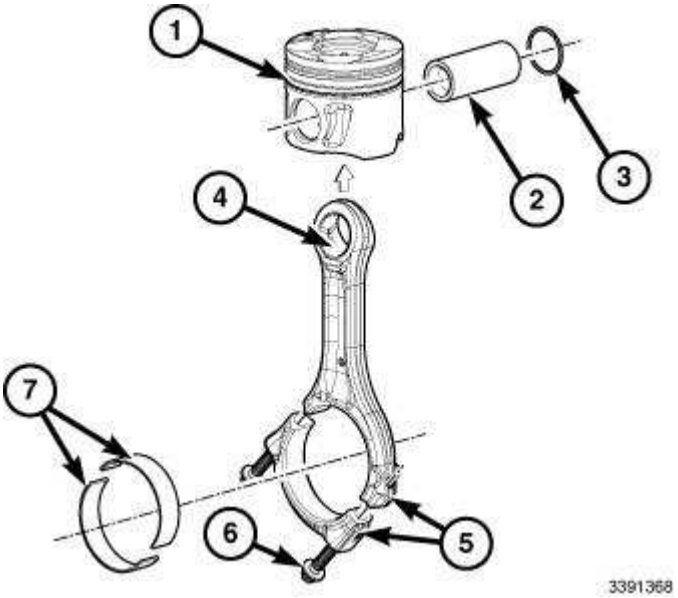

Fig. 231: Piston & Connecting Rod Components
Courtesy of CHRYSLER GROUP, LLC

1. Secure the connecting rod (5) in a soft jawed vice.
2. Remove the two snap rings (3) securing the piston pin (2).
3. Push the piston pin (2) out of the piston (1) and the connecting rod (5).
4. Remove the piston (1) from the connecting rod (5).
5. Measure the diameter of the piston pin in the center and on both ends. Refer to **Engine - Specifications**.
6. Repeat this procedure for the remaining pistons and connecting rod assemblies.

PISTON RING

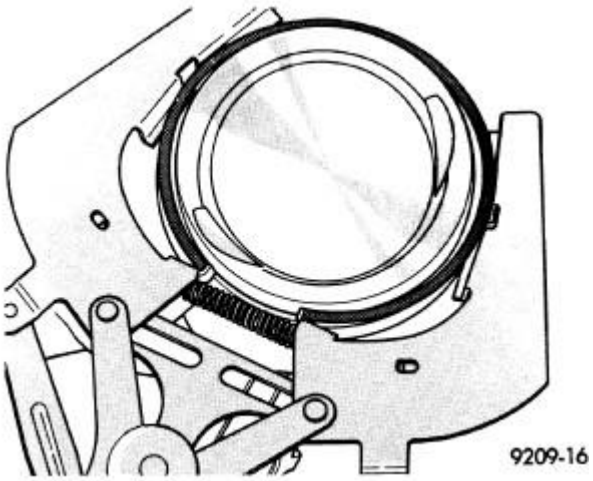

Fig. 232: Piston Rings - Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. The ID mark on the face of the top and second piston rings must point toward the piston crown.
2. Using a suitable ring expander, remove the top and second piston rings.
3. Remove the upper oil ring side rail, lower oil ring side rail and then the oil expander from the piston.
4. Carefully clean carbon from the piston crowns, skirts and ring grooves ensuring the 4 oil holes in the oil control ring groove are clear.
5. Repeat this procedure for the remaining pistons and connecting rod assemblies.

INSPECTION

INSPECTION

PISTONS

1. Check the piston pin bores in piston for roundness. Make 3 checks at 120° intervals. Maximum out of roundness.020 mm (.0008 in.).
2. The piston diameter should be measured approximately 10 mm (.394 in.) up from the base.
3. Skirt wear should not exceed 0.1 mm (.00039 in.).

PISTON PINS

1. Measure the diameter of piston pin in the center and both ends. Refer to **Engine - Specifications**.

CONNECTING RODS

CAUTION: Connecting rods must be replaced once the end caps are loosened. All six must have the same weight and the same number. Replacement connecting rods will only be supplied in sets of six. When assembling the connecting rod, be sure to paint mark or scribe mark each of the connecting rods and caps before installation, for alignment purposes later.

NOTE: Do Not lubricate the new connecting rod bolts. They are already coated with a anti scuff treatment.

Connecting rods are supplied in sets of six since they all must be of the same weight category.

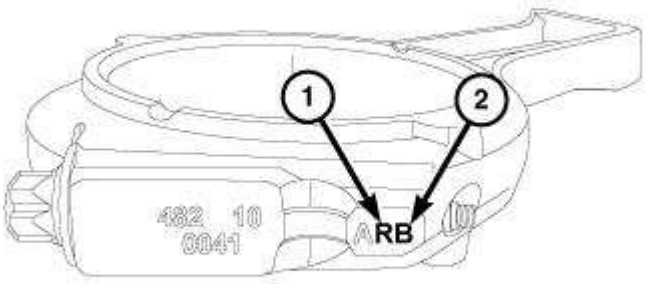
1. Assemble bearing shells and bearing caps to their respective connecting rods ensuring that the serrations on the cap and reference marks are aligned.
2. Using new bolts, tighten the connecting rod cap bolts to:
   - Step 1: Tighten to 10 N.m (88 in. lbs.).
   - Step 2: Tighten each bolt to 25 N.m (18 ft. lbs.).
   - Step 3: Tighten each bolt an additional 75 degrees turn.
   - Step 4: With the torque wrench set at 50 N.m (37 ft. lbs.) to check the tightening of each

bolt.

INSTALLATION

INSTALLATION

WARNING: All six connecting rods must have the same weight and letter classification. The connecting rod bolts are a one time use, and must be replaced every time they are loosened or removed.



3346447

Fig. 233: Connecting Rod Shaft & Class Identification Mark
Courtesy of CHRYSLER GROUP, LLC

Each connecting rod has its own letter weight class identification mark (1) on connecting rod. Only use connecting rods that are of the same weight class. (R = Rosso, V = Verde)

PISTON PIN

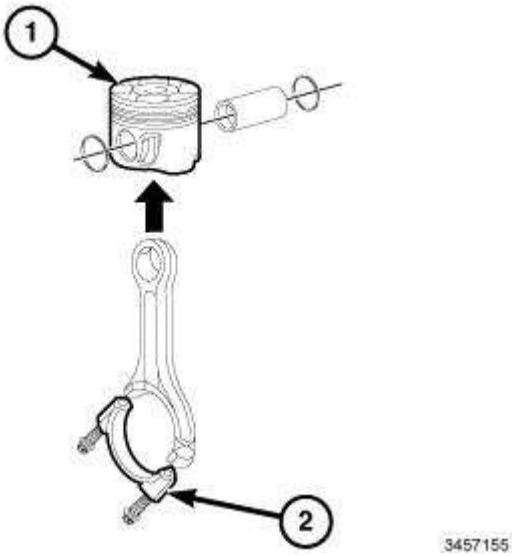


Fig. 234: Piston Crown & Connecting Rod Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: During piston assembly with the connecting rod, pay attention concerning the arrow position on the piston crown (1) and the stamping on the connecting rod cap (2): the arrow and the stamping must oppose one another and cannot be on the same side.

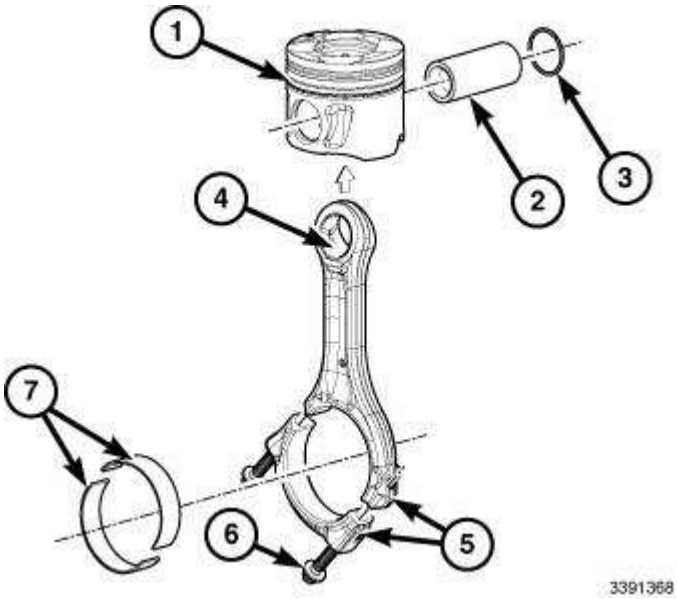

Fig. 235: Piston & Connecting Rod Components
Courtesy of CHRYSLER GROUP, LLC

1. Secure connecting rod (5) in soft jawed vice.
2. Lubricate piston pin (2) and piston (1) with clean engine oil.
3. Position piston (1) on connecting rod (5).

4. Install piston pin (2).
5. Install snap ring (3) in piston (1) to retain piston pin (2).
6. Remove connecting rod (5) from vice.

PISTON RINGS

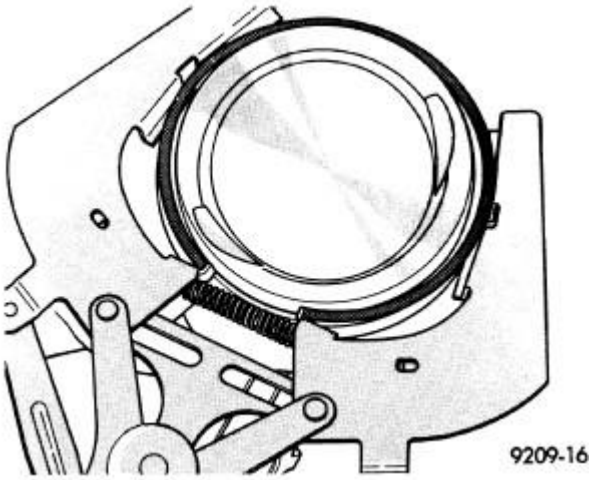

Fig. 236: Piston Rings - Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. Install rings on the pistons using a suitable ring expander.

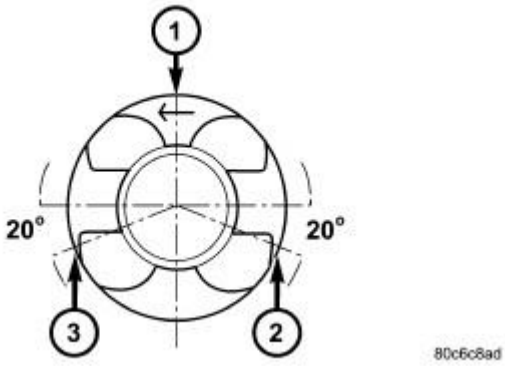

Fig. 237: Piston Ring Gap Location
Courtesy of CHRYSLER GROUP, LLC

1 - SECOND COMPRESSION RING GAP POSITION
2 - OIL CONTROL RING GAP POSITION
3 - TOP COMPRESSION RING GAP POSITION

2. Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows:

- Top ring gap must be positioned at the No. 3 position (looking at the piston crown from above).
- Second piston ring gap should be positioned at the No. 1 position.
- Oil control ring gap should be positioned at the No. 2 position.

PISTON

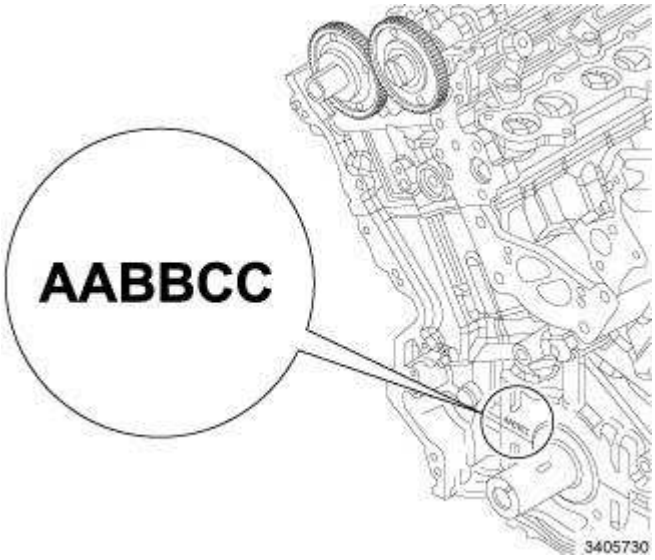

Fig. 238: Cylinder Identification Location
Courtesy of CHRYSLER GROUP, LLC

1. Identify the correct piston to cylinder location on left front of engine block.

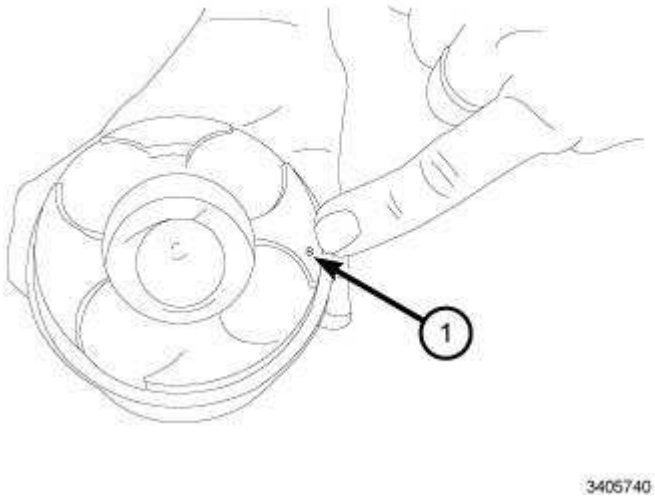

Fig. 239: Piston Lettering Identification
Courtesy of CHRYSLER GROUP, LLC

2. Identify the piston by the lettering shown in illustration on piston crown.

3. Using the reference table below select the correct piston to location.

NOTE: **The first letter correspond to the first cylinder, the second letter to the second one etc.**

Piston Letter On Crown	A	A	B	B	C	C
Cylinder Piston Location	1	2	3	4	5	6

4. Before installing the Piston Installer, make sure the oil ring expander ends are butted together.
5. Immerse the piston head and rings in clean engine oil, slide the piston installer over the piston and tighten. **Ensure position of rings does not change during this operation** .

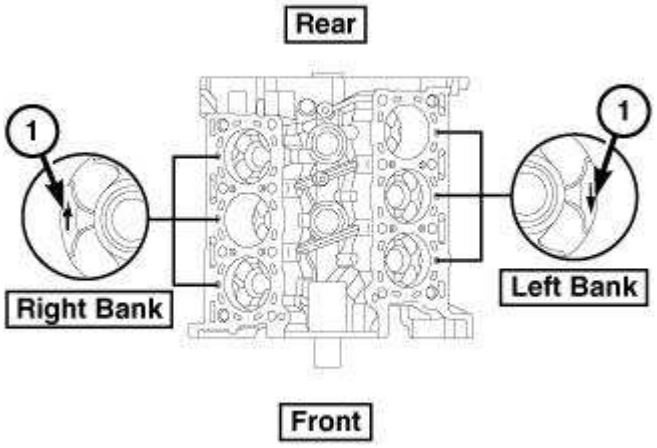

Fig. 240: Arrow Stamped On Piston Crown
Courtesy of CHRYSLER GROUP, LLC

6. When installing the pistons and connecting rod assembly, making sure that the arrow stamped on the piston crown (1) is turned toward the back side of the engine (flywheel side) for the right bank pistons 1 2 3 and toward the front side of the engine (timing chain side) for the left bank pistons 4 5 6.

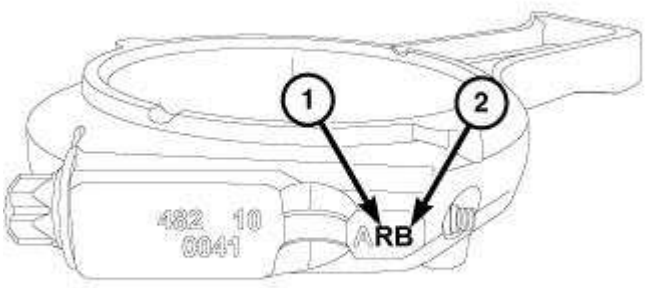

Fig. 241: Connecting Rod Shaft & Class Identification Mark
Courtesy of CHRYSLER GROUP, LLC

7. Each connecting rod has its own letter class identification mark (2) on connecting rod for bearing selection.

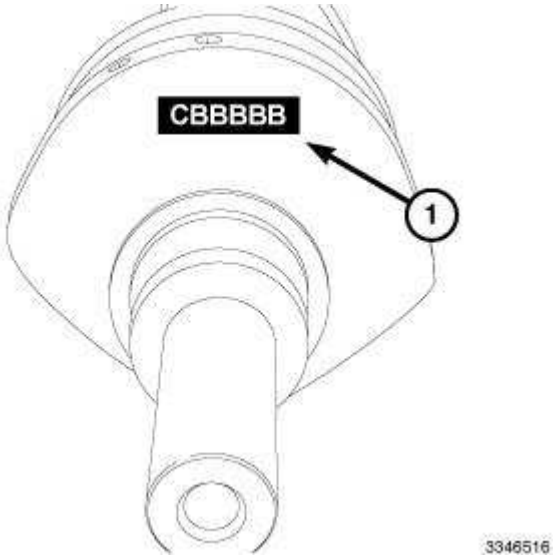

Fig. 242: Letters Stamped Into Crankshaft
Courtesy of CHRYSLER GROUP, LLC

8. To determine the correct bearing size for each cylinder. Each connecting rod letter class must be matched with the crankshaft letter class (1) with the bearing selection chart to determine the correct bearing color for each cylinder. The letters stamped into the crankshaft (1) are in the same order as the cylinders. The first letter corresponds to the first cylinder, the second to the second, etc. See bearing selection chart. Refer to **Engine/Engine Block - Standard Procedure**.

CAUTION: Care must be taken not to nick the crankshaft journal or cylinder bore when installing the pistons.

9. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.
10. Guide the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

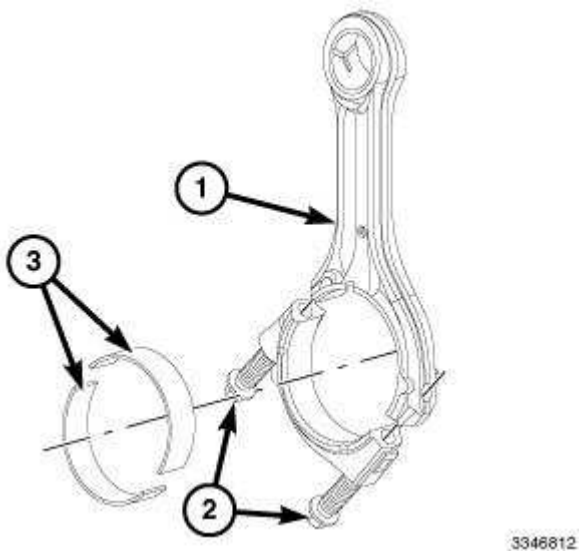

Fig. 243: Connecting Rod, Bearings & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Assemble connecting rod bearings (3) and bearing caps to their respective connecting rods (2) ensuring that the serrations on the cap and reference marks are aligned.

NOTE: The connecting rod bolts must be replaced every time they are loosened or removed.

12. Using new bolts, tighten the connecting rod cap bolts to:
    - Step 1: Tighten to 10 N.m (88 in. lbs.).
    - Step 2: Tighten each bolt to 25 N.m (18 ft. lbs.).
    - Step 3: Tighten each bolt an additional 75 degrees turn.
    - Step 4: With the torque wrench set at 50 N.m (37 ft. lbs.) to check the tightening of each bolt.

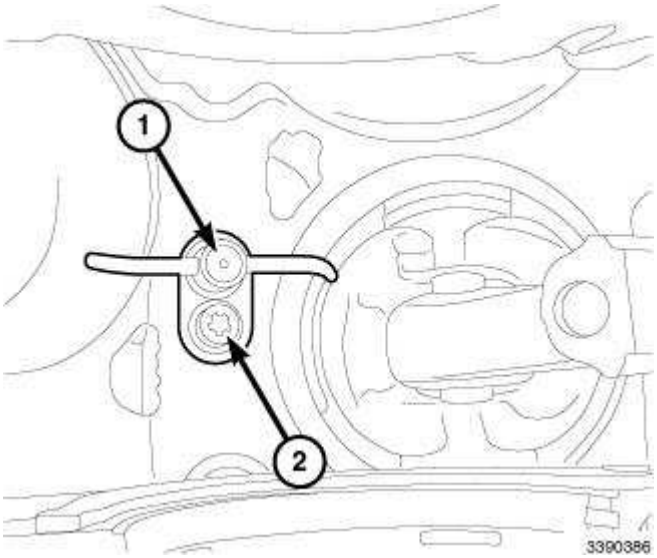

Fig. 244: Oil Jet & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

13. Install the oil jets. Refer to **JET, PISTON OIL COOLER, INSTALLATION**.

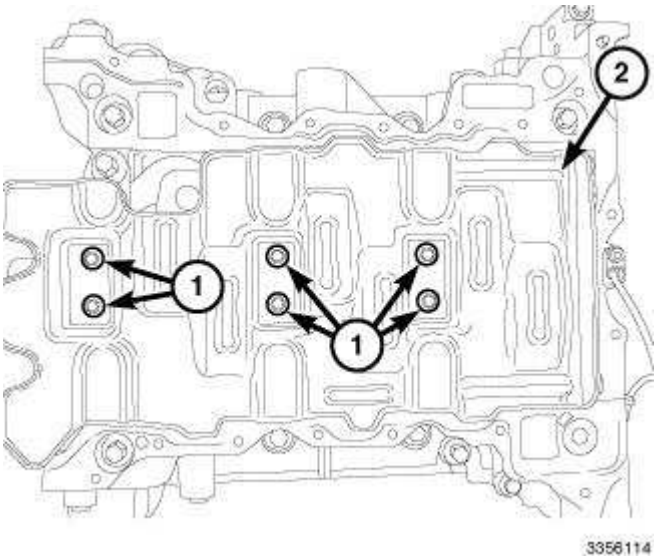

Fig. 245: Windage Tray & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Install the windage tray (2). Tighten bolts (1) to 11 N.m (97 in. lbs.).

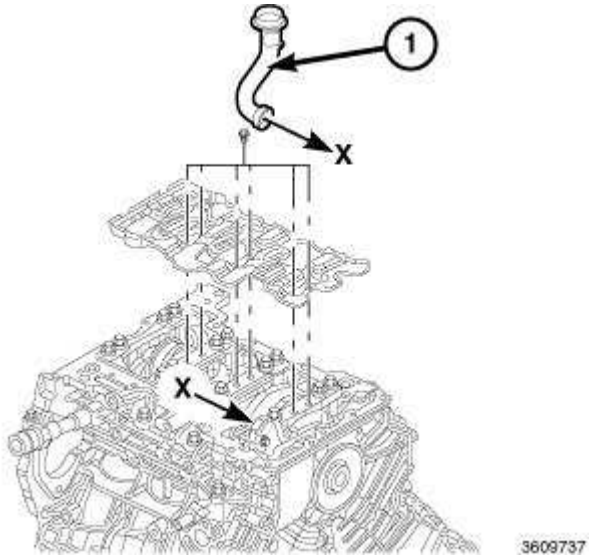

Fig. 246: Oil Pump Pickup Tube
Courtesy of CHRYSLER GROUP, LLC

15. Install the oil pump pickup tube (1). Refer to **PICK-UP, OIL PUMP, INSTALLATION**.
16. Install both cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.
17. Connect negative battery cable.

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

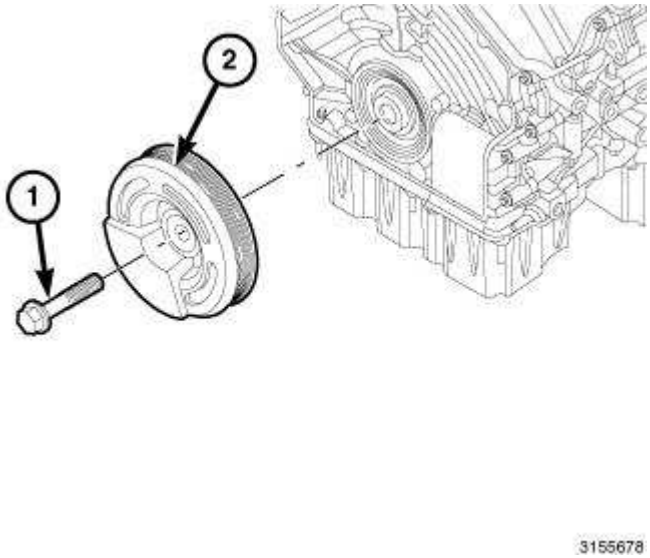

Fig. 247: Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Remove the vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.

CAUTION: Care must be taken when removing the crankshaft seal. DO NOT damage or gouge the timing chain cover.

3. Using suitable seal puller, remove the front crankshaft seal.

INSTALLATION

INSTALLATION

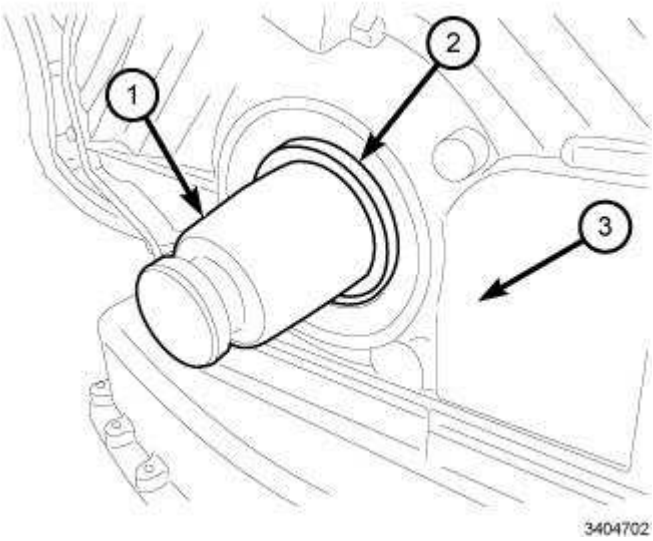

Fig. 248: Front Seal Guide & Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean timing chain cover seal surface.

NOTE: The lip of the front oil seal faces away from the engine on installation.

2. Install the (special tool #VM.10340-1, Guide, Front Seal) (1) and position the front seal (2) in place.
3. Remove the (special tool #VM.10340-1, Guide, Front Seal) (1).

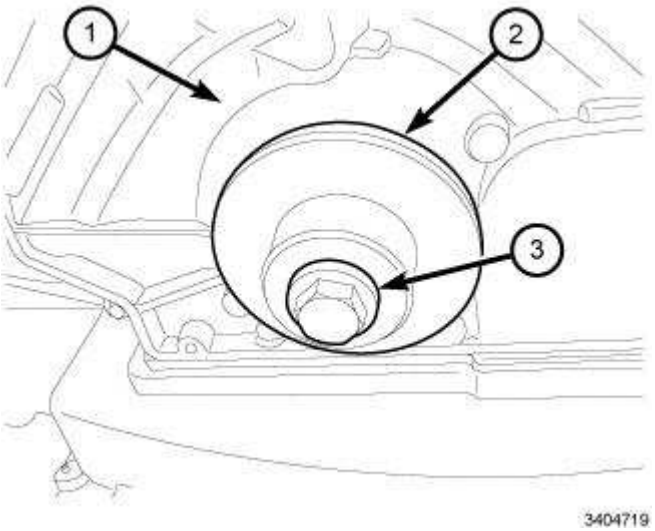

Fig. 249: Front Seal Installer Tool & Vibration Damper Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Using the (special tool #VM.10340-2, Installer Tool, Front Seal) (2), install the front crankshaft oil seal using the vibration damper bolt to draw the seal in place.
5. Remove bolt (3) and the (special tool #VM.10340-2, Installer Tool, Front Seal) (2).

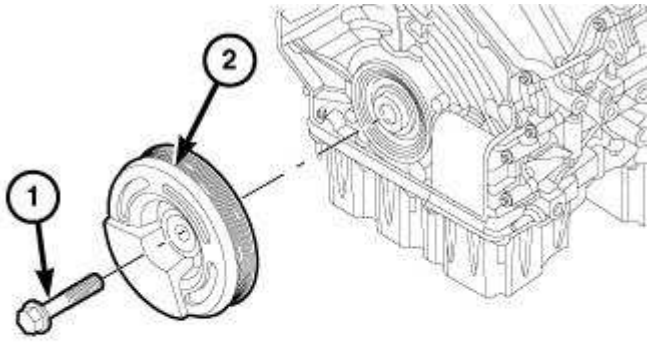

Fig. 250: Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION**.
7. Connect negative battery cable.

SEAL, CRANKSHAFT OIL, REAR

REMOVAL

REMOVAL

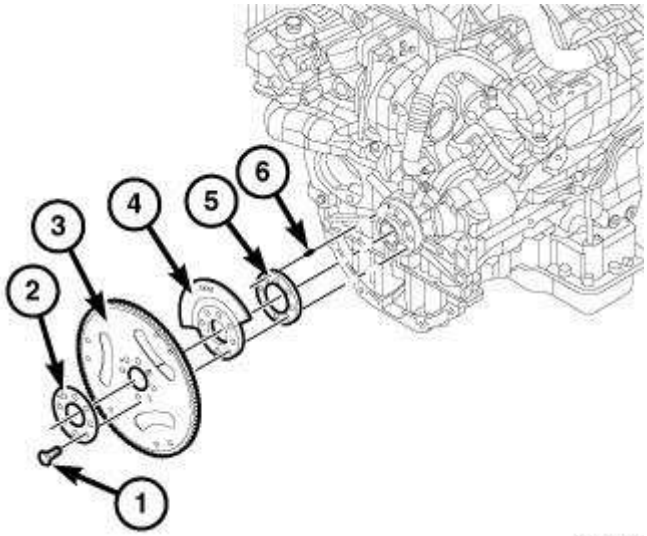

Fig. 251: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the flex plate (3), counter weight (4), and tone wheel (5). Refer to **FLEXPLATE, REMOVAL**.

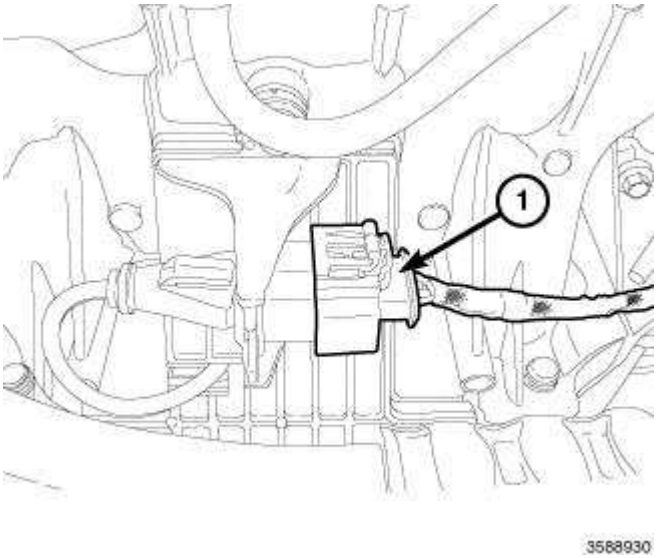

Fig. 252: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the Crankshaft Position Sensor (CKP) wire harness connector (1).

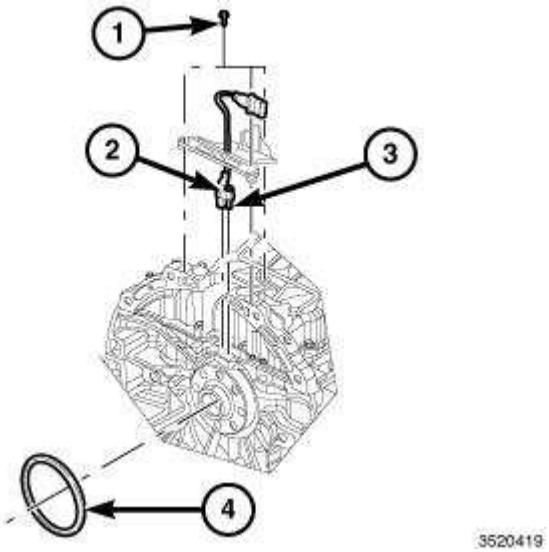

Fig. 253: CKP Sensor, Seal & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts (1) and the CKP cover.
4. Remove bolt (3) CKP sensor (2).

NOTE: Use care not to damage the rear main oil seal sealing surface.

5. Using suitable seal puller, remove the rear main oil seal (4).

INSTALLATION

INSTALLATION

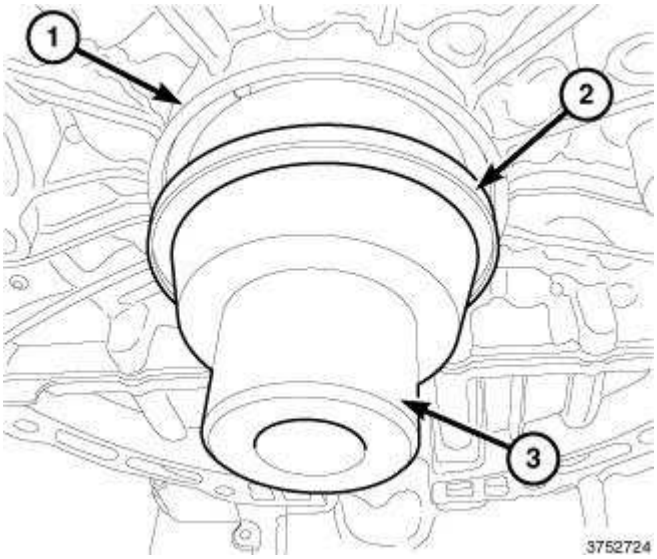

Fig. 254: Rear Seal Guide, Rear Oil Seal & Crankshaft
Courtesy of CHRYSLER GROUP, LLC

1. Clean around seal surface area.

NOTE: The lip of the front oil seal faces away from the engine on installation.

2. Install the (special tool #VM.10341-1, Guide, Rear Seal) (3) and slide the rear oil seal (2) onto the crankshaft.
3. Remove the (special tool #VM.10341-1, Guide, Rear Seal) (3).

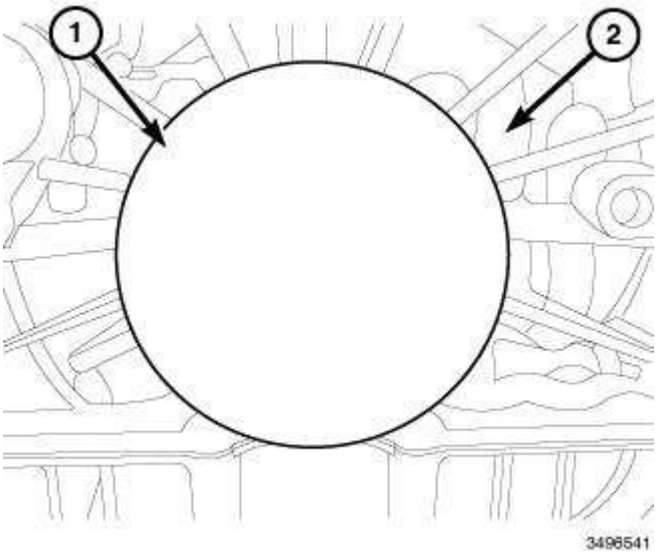

Fig. 255: Rear Seal Installer & Crankshaft Position Sensor (CKP) Boss
Courtesy of CHRYSLER GROUP, LLC

NOTE: Position the flat portion of the Rear Seal Installer should be facing down giving you clearance by the Crankshaft Position Sensor (CKP) boss.

4. Using the (special tool #VM.10341-2, Installer Tool, Rear Seal) (1) install the rear main oil seal into the engine block.

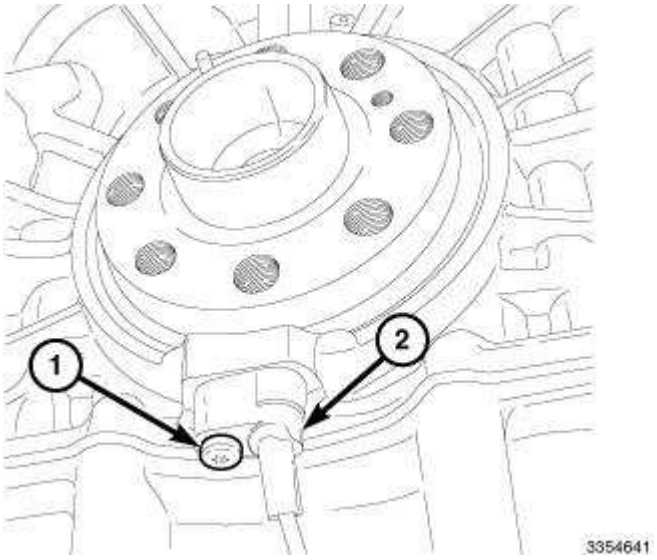

Fig. 256: Crankshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Clean the area and bore around CKP.
6. Install the Crankshaft Position Sensor (CKP) (2). Tighten bolt (1) to 6 N.m (53 in. lbs.).

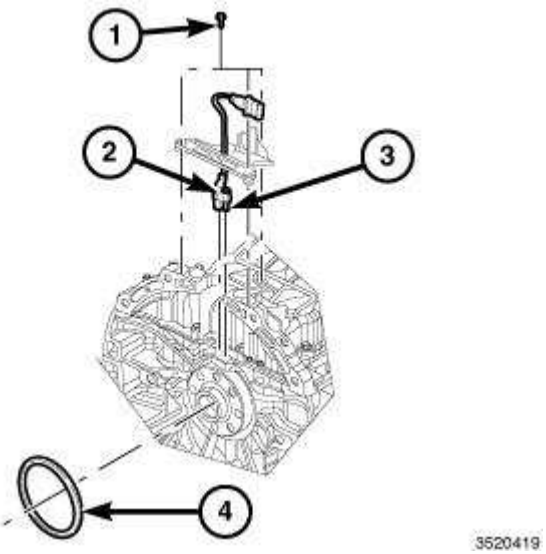

Fig. 257: CKP Sensor, Seal & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Install the CKP sensor cover. Tighten bolts (1) to 8 N.m (71 in. lbs.).

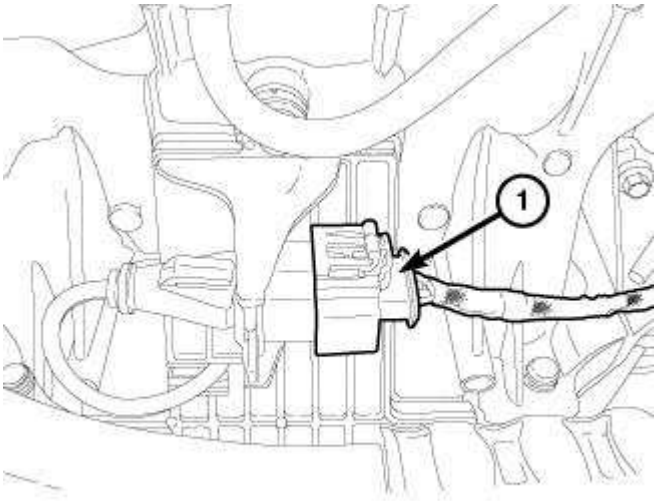

Fig. 258: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Connect the CKP wire harness connector (1).

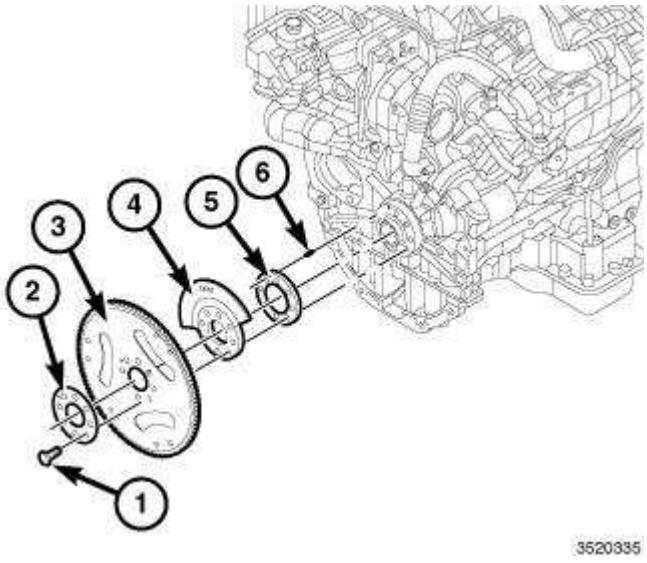

Fig. 259: Backing Plate, Flex Plate, Counter Weight, Tone Wheel & Bolts

9. Install the tone wheel (5), counter weight (4), and flex plate (3). Refer to **FLEXPLATE, INSTALLATION**.

ENGINE MOUNTING

INSULATOR, ENGINE MOUNT, REAR MOUNT

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the transmission belly pan.

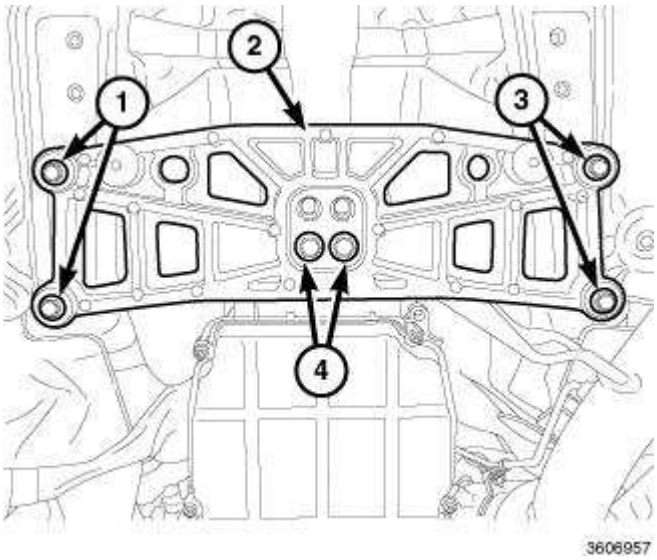

Fig. 260: Rear Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two bolts (4) from the rear engine mount isolator.
4. Using a suitable transmission jack, positioned under the transmission oil pan, raise the transmission until the weight is off of the isolator.
5. Remove bolts (1, 3) and the rear crossmember (2).

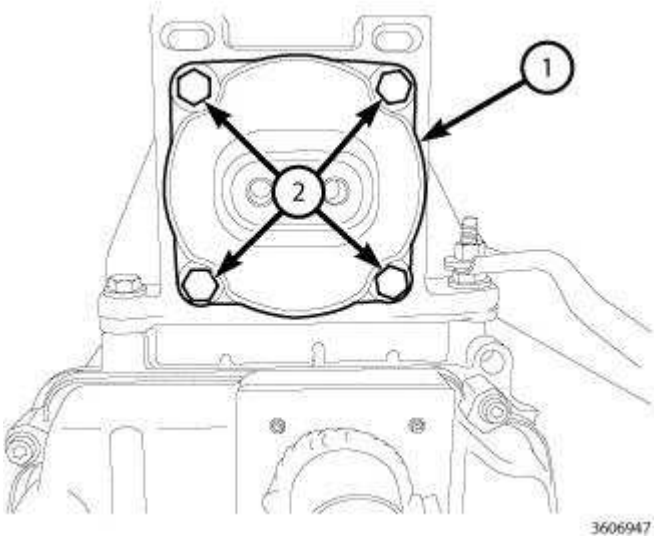

Fig. 261: Rear Engine Mount Isolator & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove bolts (2) and the rear engine mount isolator (1).

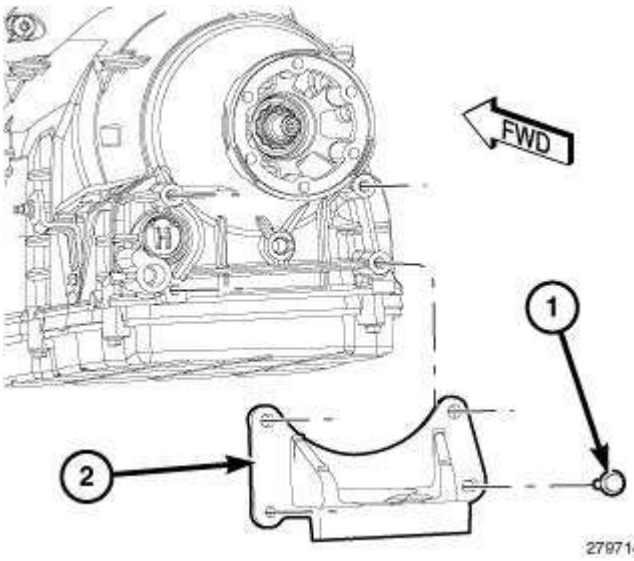

Fig. 262: Rear Engine Mount Bracket & Bolts (4x2)
Courtesy of CHRYSLER GROUP, LLC

7. If required, remove four bolts (1) and the rear engine mount bracket (2).

INSTALLATION

INSTALLATION

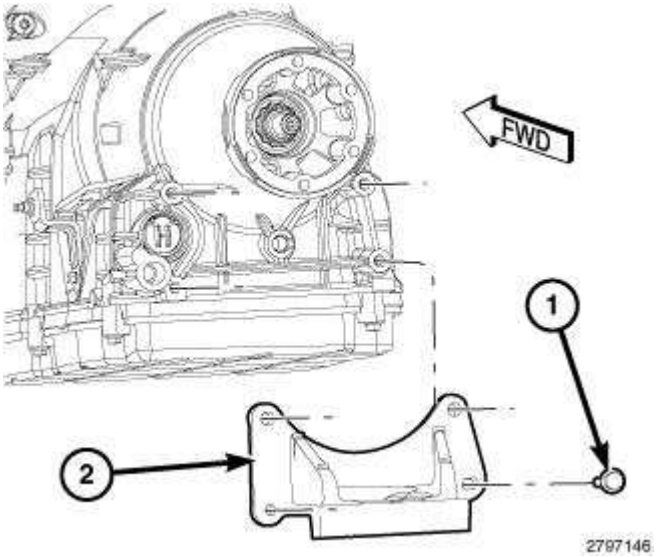

Fig. 263: Rear Engine Mount Bracket & Bolts (4x2)
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the rear engine mount bracket (2). Tighten bolts (1) to 33 N.m (24 ft. lbs.).

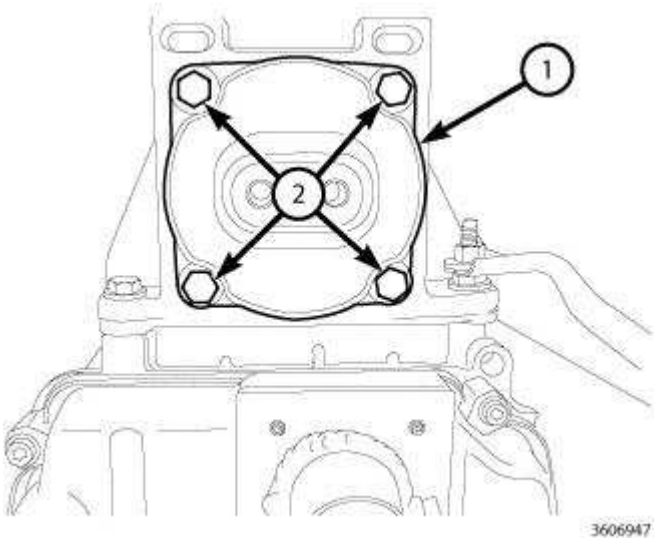

Fig. 264: Rear Engine Mount Isolator & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the rear engine mount isolator (1) Tighten bolts (2) to 61 N.m (45 ft. lbs.).

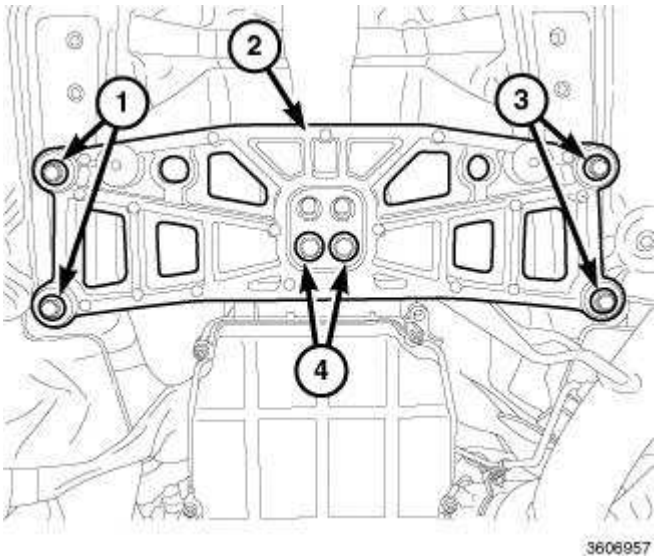

Fig. 265: Rear Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the crossmember (2). Tightened bolts (1 and 3) to 55 N.m (41 ft. lbs.).
4. Lower the transmission so the weight is resting on the isolator.
5. Install the rear engine mount isolator bolts (4) and tighten to 61 N.m (45 ft. lbs.).
6. Install the transmission belly pan.
7. Lower the vehicle.

INSULATOR, ENGINE MOUNT, LEFT

REMOVAL

REMOVAL

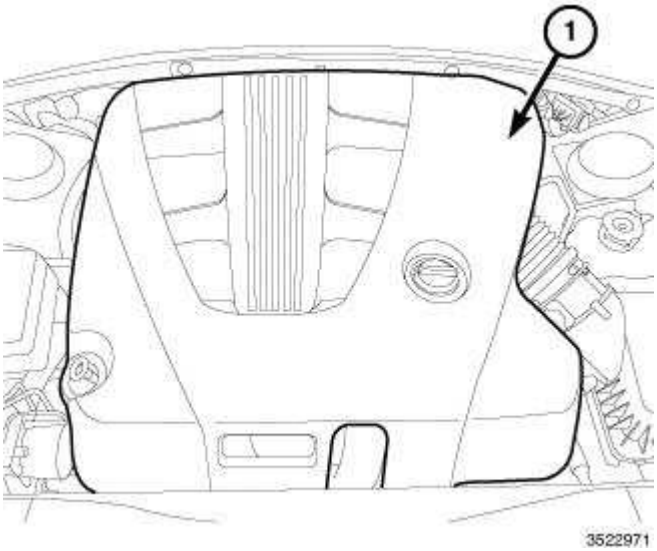

Fig. 266: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL**.

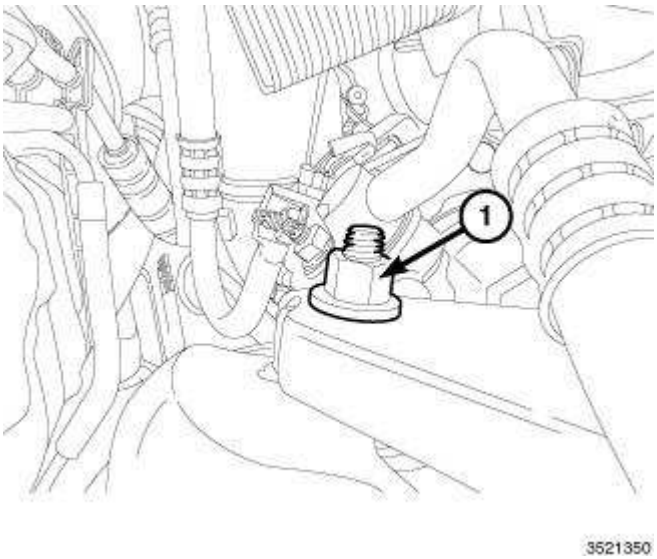

Fig. 267: Engine Mount Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove the left and right engine mount retaining nut (1).
5. Using (special tool #8534B, Fixture, Driveline Support) lift engine enough to gain access to the

engine mount without damaging the turbocharger.

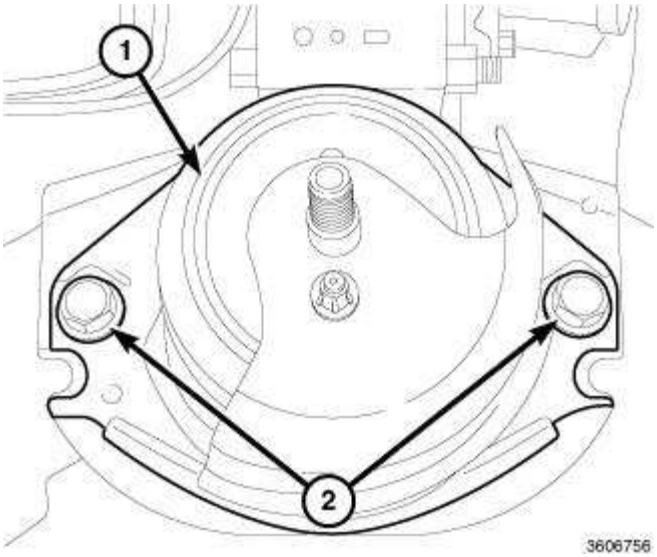

Fig. 268: Left Engine Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Removed the belly pan. Refer to **BELLY PAN, REMOVAL** .
8. Remove bolts (2) and the left engine mount (1).

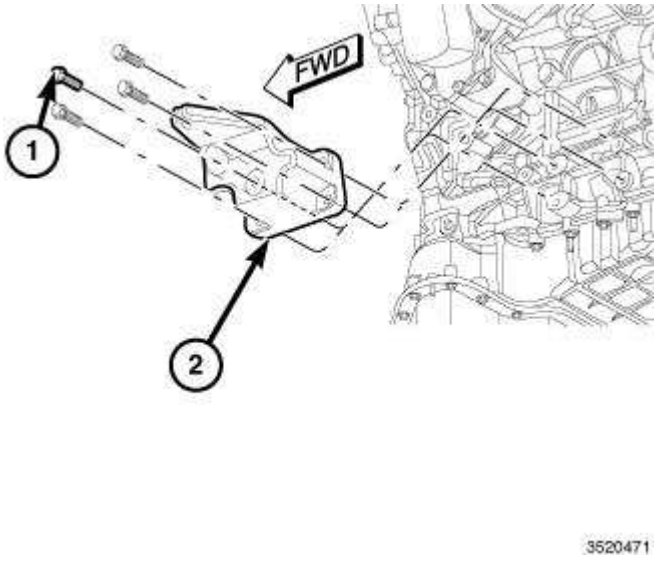

Fig. 269: Left Engine Mount Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, remove bolts (1) and the left engine mount bracket (2).

INSTALLATION

INSTALLATION

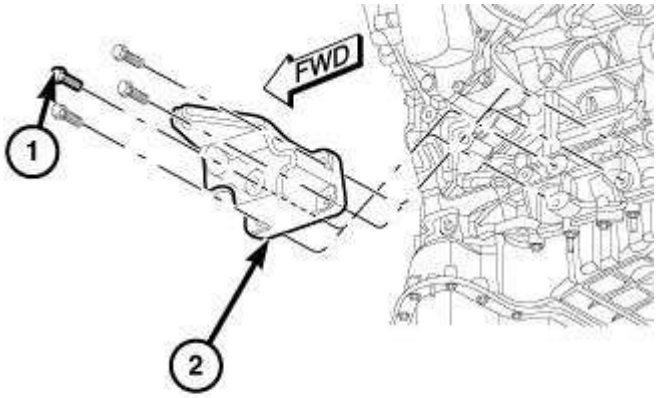

Fig. 270: Left Engine Mount Bracket & Bolts

Courtesy of CHRYSLER GROUP, LLC

2. Install the right engine mount (1). Tighten bolts (2) to 61 N.m (45 ft. lbs.).
3. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
4. Lower the vehicle.
5. Lower the engine into position and remove (special tool #8534B, Fixture, Driveline Support).

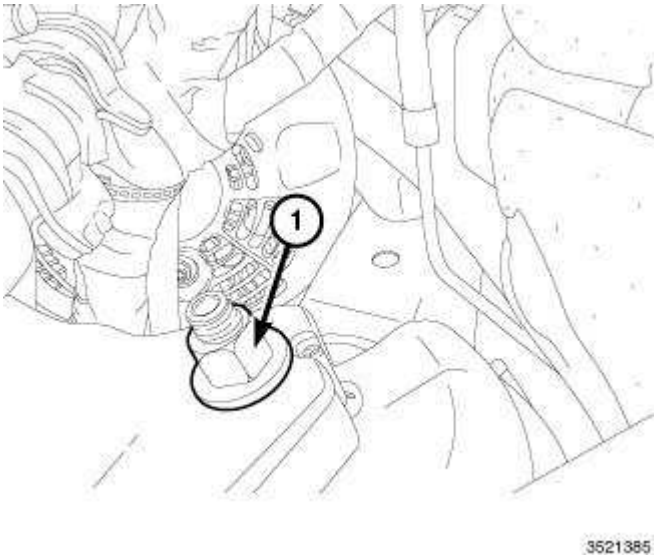

Fig. 280: Engine Mount Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Install the right and left engine mount retaining nuts (1) and tighten to 61 N.m (45 ft. lbs.).
7. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**.
8. Install the generator. Refer to **GENERATOR, INSTALLATION** .

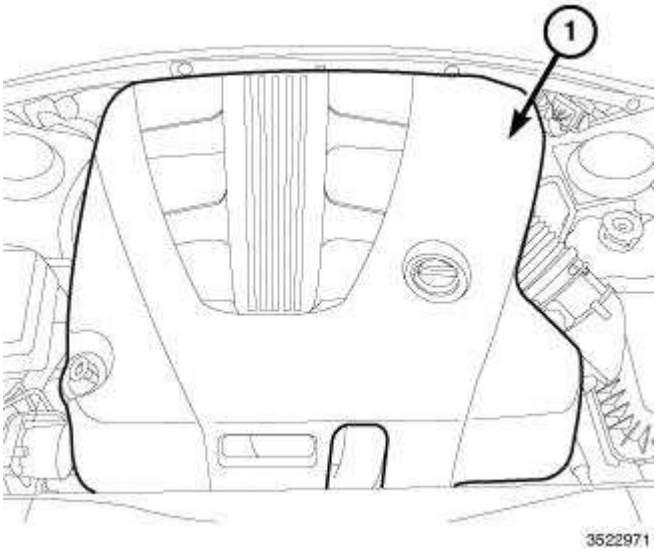

Fig. 281: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

9. Install the engine cover (1).
10. Connect the negative battery cable.

LUBRICATION

ADAPTER, OIL COOLER

REMOVAL

REMOVAL

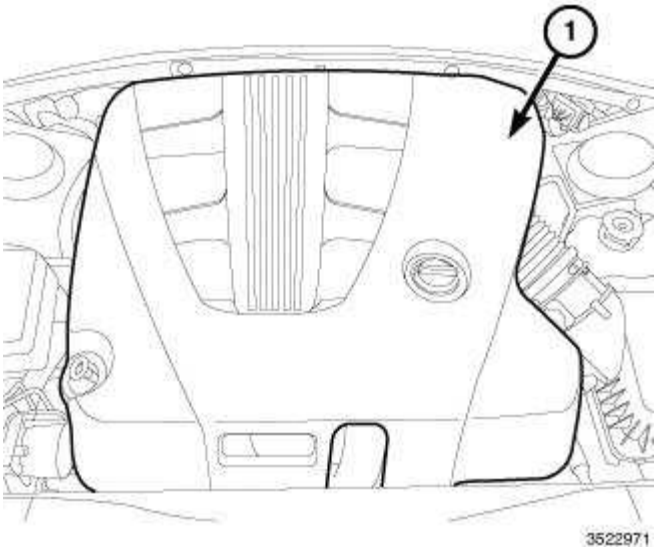

Fig. 282: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove engine cover (1).
3. Remove the air cleaner body and air tube. Refer to **BODY, AIR CLEANER, REMOVAL**.
4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, REMOVAL** .
6. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
7. Drain the engine oil. Using a new sealing washer, install and tighten drain plug to 45 N.m (33 ft. lbs.).

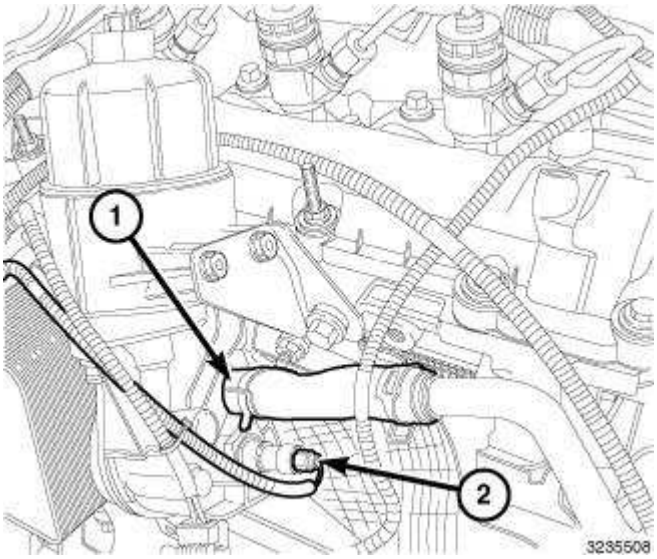

Fig. 283: Coolant Hose & Oil Pressure Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Lower the vehicle.
9. Disconnect the coolant hose (1) from oil cooler adapter.
10. Disconnect the oil pressure sensor harness connector (2).

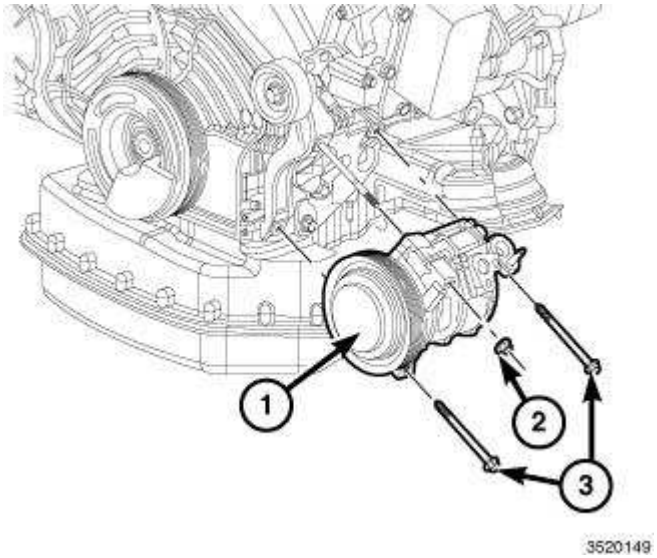

Fig. 284: A/C Compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Removal of the A/C compressor does not require the refrigerant to be evacuated.

11. Remove the A/C compressor and position aside. Refer to **COMPRESSOR, A/C, REMOVAL** .

13. Remove bolts (2) and the oil cooler adapter (1).

INSTALLATION

INSTALLATION

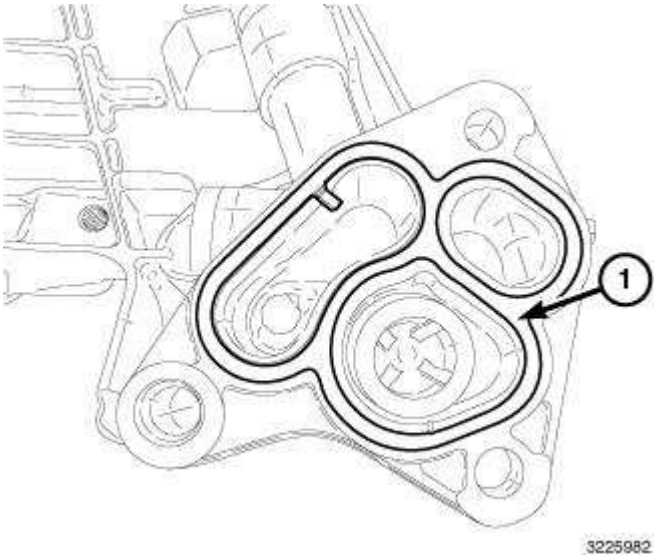

Fig. 287: Oil Cooler Adapter O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket sealing surfaces.
2. Install a new O-ring seal (1).

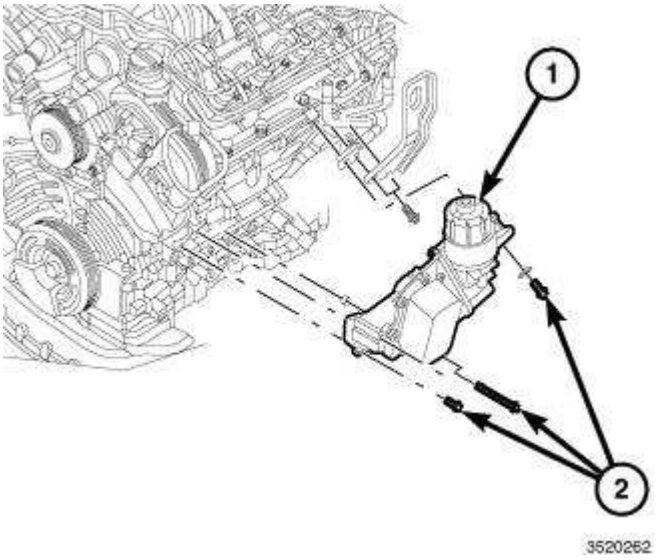

Fig. 288: Oil Cooler Adapter Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil cooler adapter (1). Tighten bolts (2) 30 N.m (22 ft. lbs.).

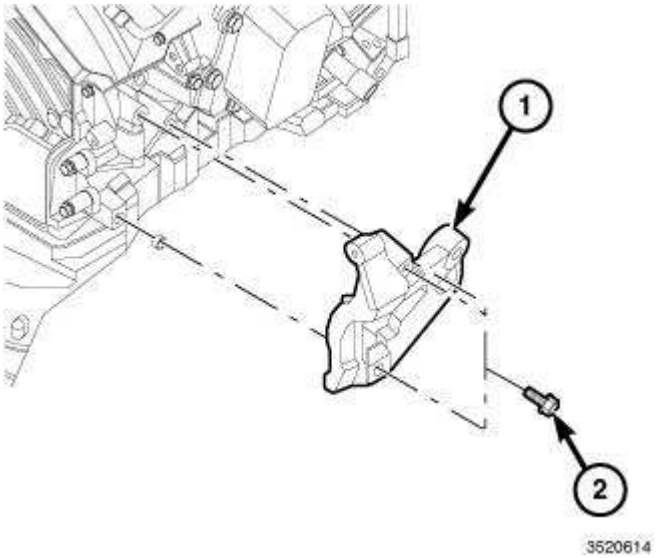

Fig. 289: A/C Compressor Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the A/C compressor bracket (1). Tighten bolts (2) 45 N.m (33 ft. lbs.).

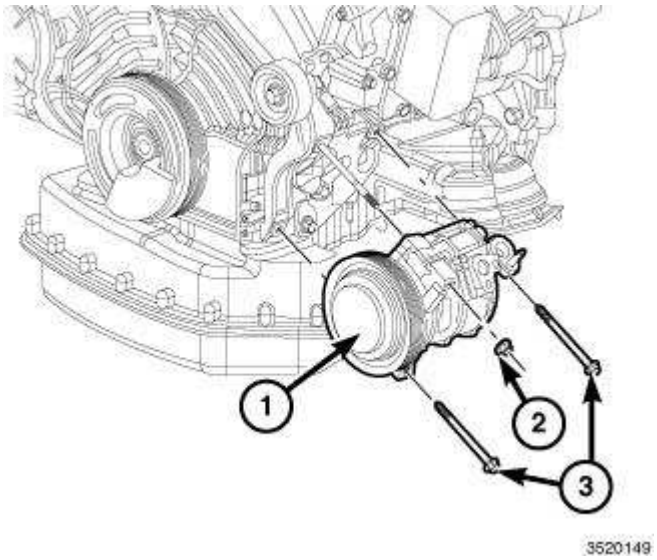

Fig. 290: A/C Compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .

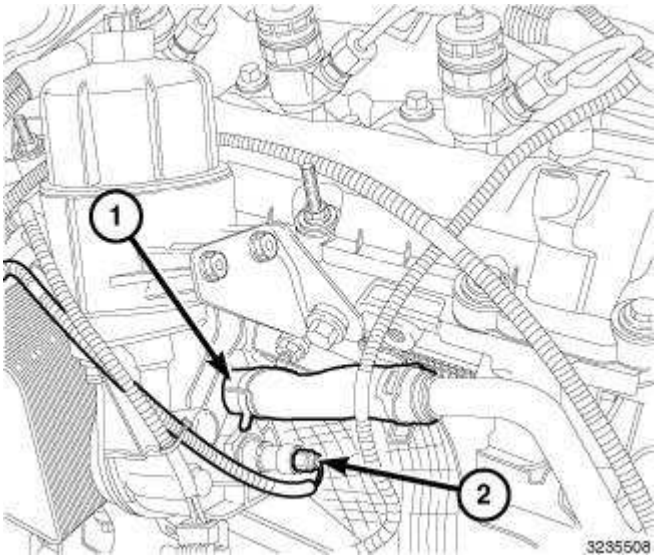

Fig. 291: Coolant Hose & Oil Pressure Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the oil pressure sensor harness connector (2).
7. Connect the coolant hose (1) from oil cooler adapter.
8. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
9. Install the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, INSTALLATION** .
10. Lower the vehicle.
11. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
12. Change the oil filter and fill the engine with recommended engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
13. Install the air tube and air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**.
14. Connect the negative battery cable.
15. Start the engine and check for leaks.

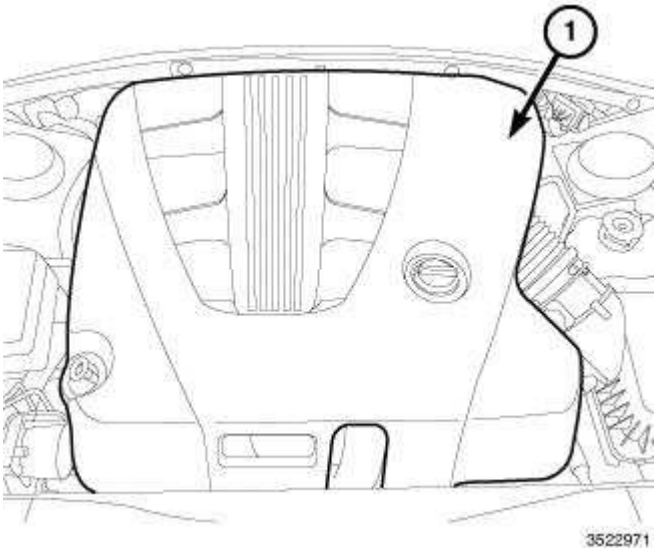

Fig. 292: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

16. Install the engine cover (1).

COOLER, OIL

DESCRIPTION

DESCRIPTION

Engine coolant is used to cool the oil. A plate-style external heat exchanger is located on the left side of the engine block. A single O-ring style gaskets seal the oil cooler to the oil cooler adapter. Replace the O-ring style gaskets whenever the oil cooler is removed or replaced. The oil is fed to the oil cooler through the oil filter. After the oil cooler, the oil is fed back to the main oil gallery of the cylinder block. The oil cooler and adapter is located on the left side of the engine block.

REMOVAL

REMOVAL

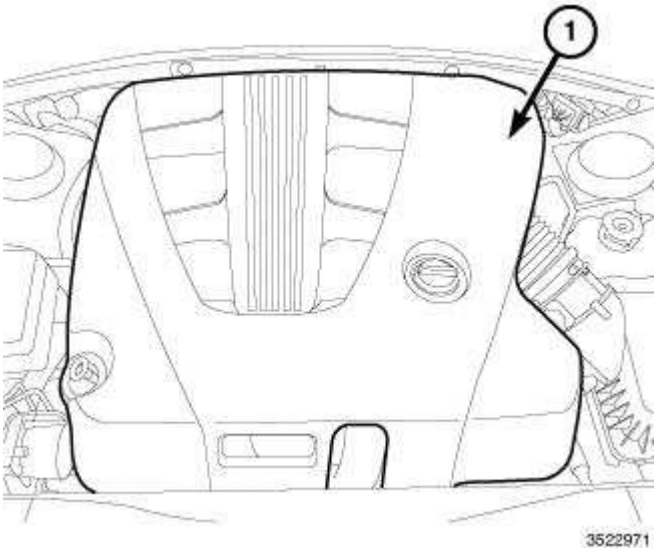

Fig. 293: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, REMOVAL** .
5. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

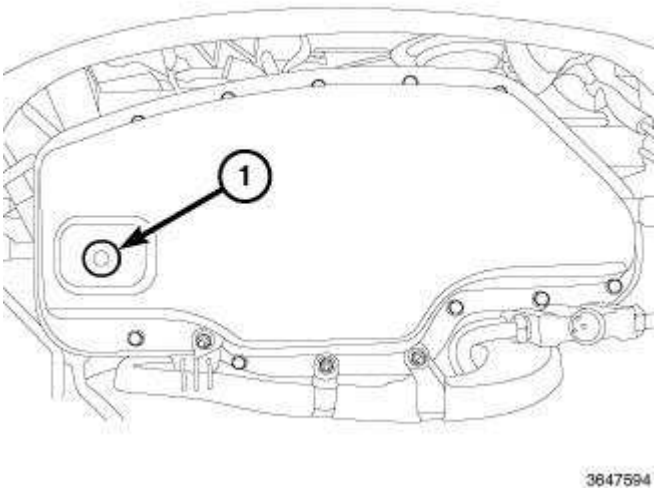

Fig. 294: Oil Pan Drain Plug
Courtesy of CHRYSLER GROUP, LLC

6. Drain the engine oil. Using a new sealing washer, install and tighten drain plug (1) to 45 N.m (33 ft. lbs.).

7. Lower the vehicle.
8. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL**.
9. Remove the serpentine drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

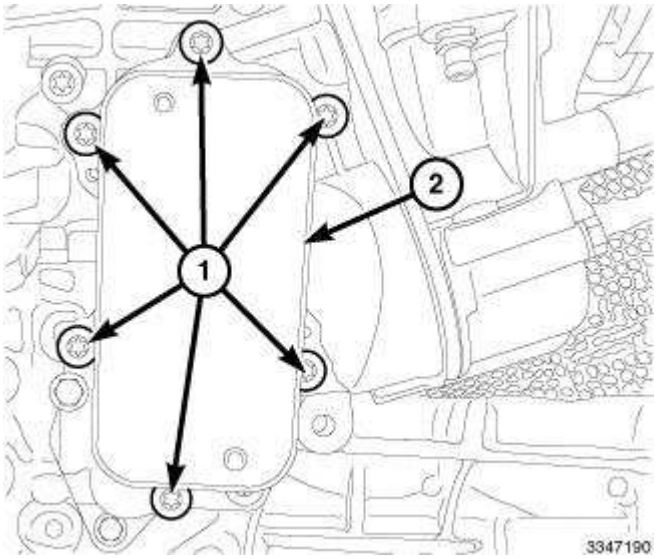

Fig. 295: Oil Cooler & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove bolts (1) and the engine oil cooler (2).

INSTALLATION

INSTALLATION

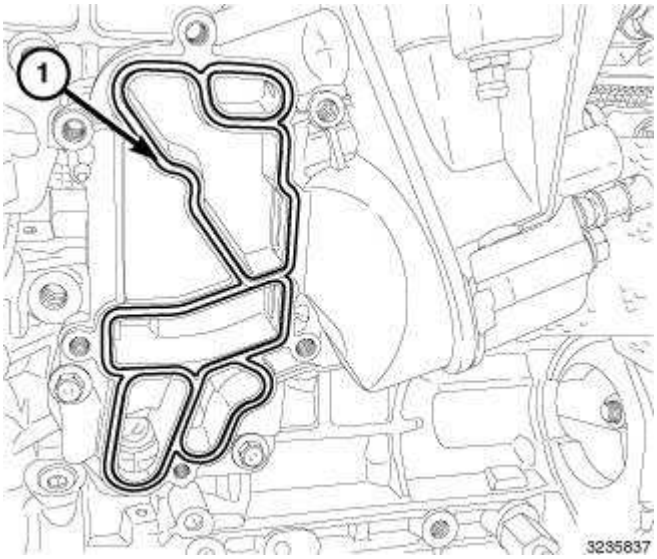

Fig. 296: Oil Cooler Adapter O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean all gasket mating surfaces. Refer to **Engine - Standard Procedure**.
2. Install a new O-ring seal onto the oil cooler adapter.

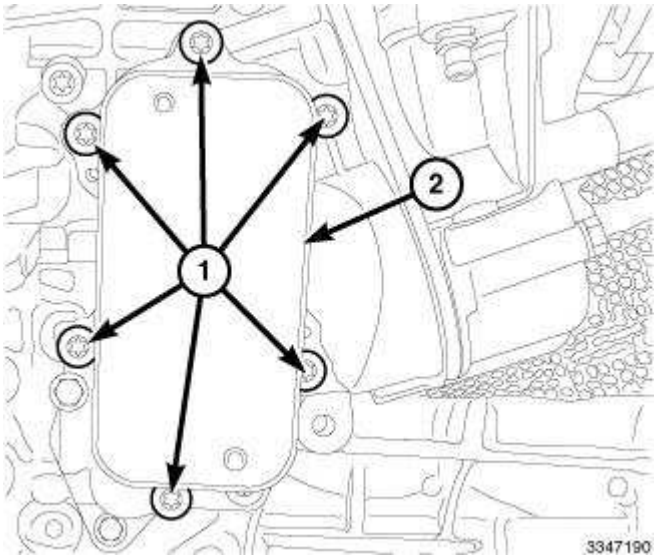

Fig. 297: Oil Cooler & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the engine oil cooler. Tighten bolts to 30 N.m (22 ft. lbs.).
4. Install the serpentine drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
5. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Install the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, INSTALLATION** .
8. Lower the vehicle.
9. Change the oil filter and fill the engine with recommended engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
10. Fill the cooling system. Refer to **STANDARD PROCEDURE** .

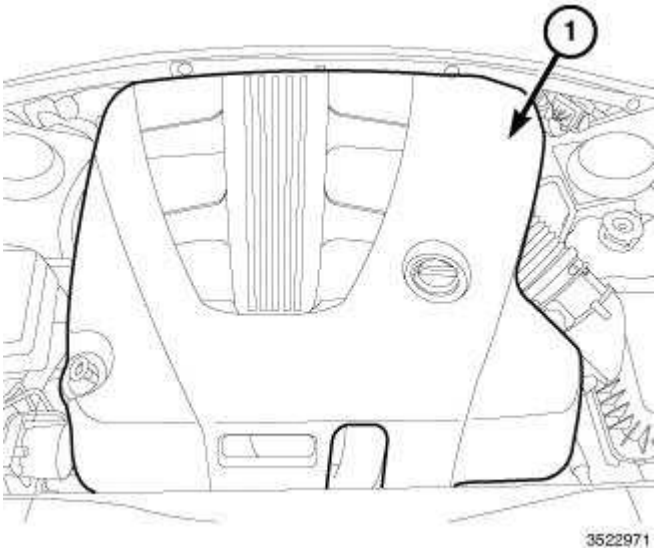

Fig. 298: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

11. Install the engine cover (1).
12. Connect the negative battery cable.

FILTER, ENGINE OIL

REMOVAL

REMOVAL

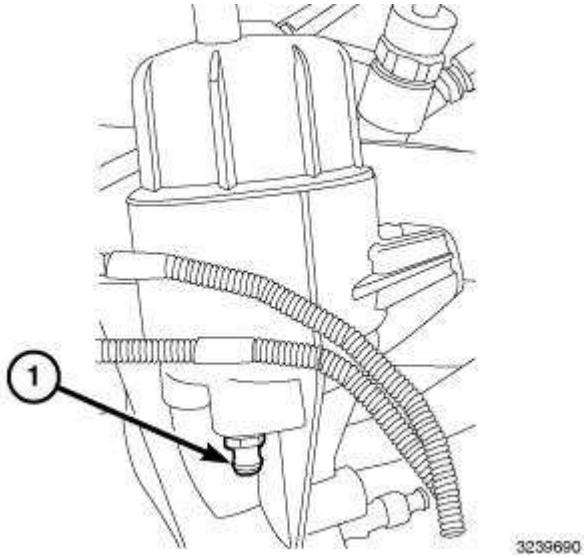

Fig. 299: Oil Filter Housing Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

1. Open the vent screw on top of oil cap.

2. Open the bleeder screw (1) and drain the oil filter housing and securely tighten bleeder screw.
3. Remove the oil filter cap.

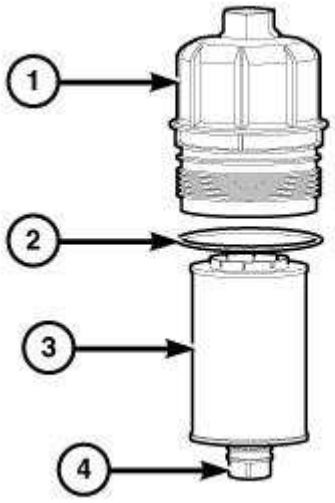

Fig. 300: Oil Filter Cover, O-Ring Gasket, Oil Filter & Base Oil Filter
Courtesy of CHRYSLER GROUP, LLC

4. While holding the oil filter cover (1), pushdown on base oil filter (4) to separate from cover and remove the oil filter (3).
5. Remove and discard O-ring gasket (2). Clean and inspect cap.

INSTALLATION

INSTALLATION

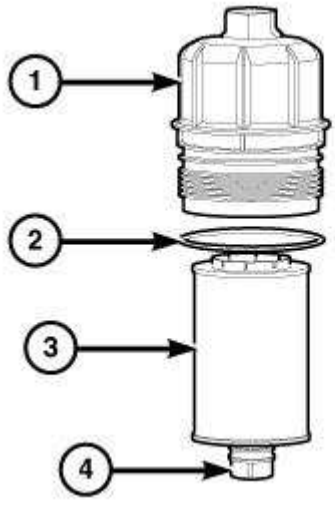

Fig. 301: Oil Filter Cover, O-Ring Gasket, Oil Filter & Base Oil Filter
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate and install the new oil filter cap O-ring gasket (2). Make sure the oil filter cap O-ring is in the correct location.
2. Install the oil filter (3) into oil filter cap (1).
3. Install oil filter cap (1) and tighten to 25 N.m (18 ft. lbs.).
4. Securely tighten the vent screw on top of the oil filter cap.

HOUSING, OIL FILTER

REMOVAL

REMOVAL

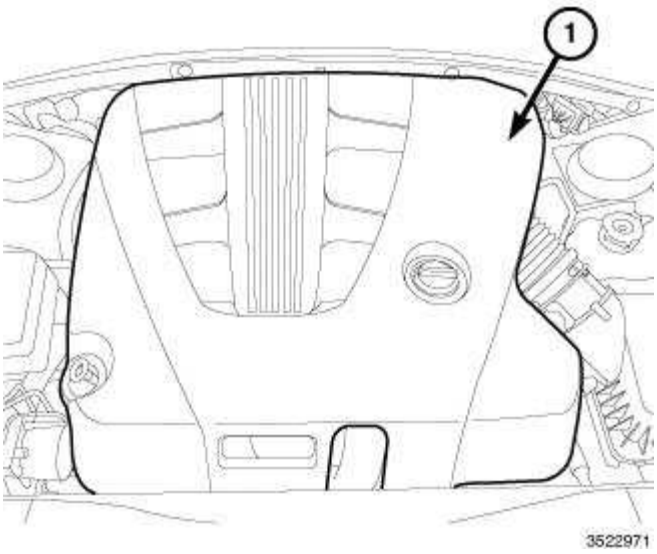

Fig. 302: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Remove the oil cooler adapter. Refer to **ADAPTER, OIL COOLER, REMOVAL**.

5. Remove bolts (2) and the oil filter housing (1).

INSTALLATION

INSTALLATION

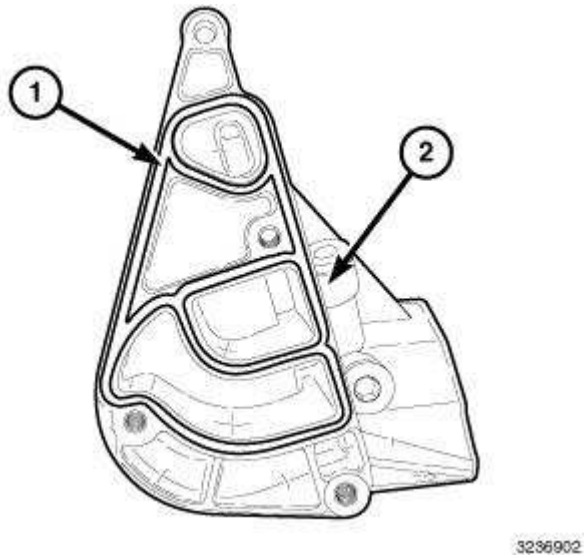

Fig. 305: Oil Filter Housing & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket sealing surfaces.
2. Install new O-ring seal (1) onto the oil filter housing (2).

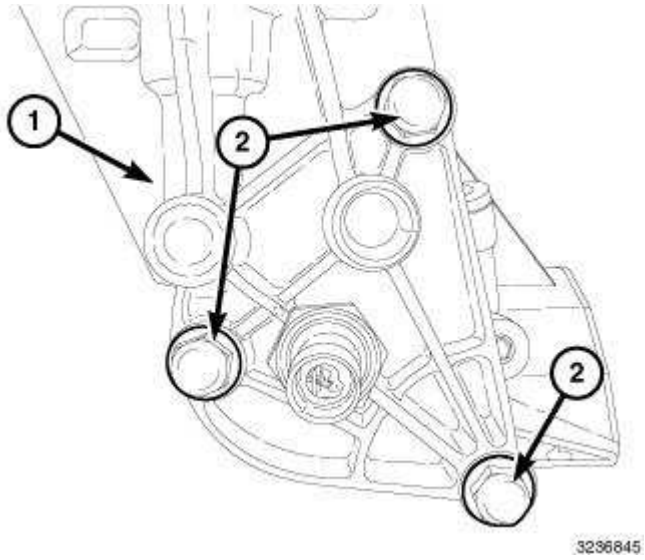

Fig. 306: Oil Filter Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install oil filter housing (1). Tighten bolts (2) to 30 N.m (22 ft. lbs.).

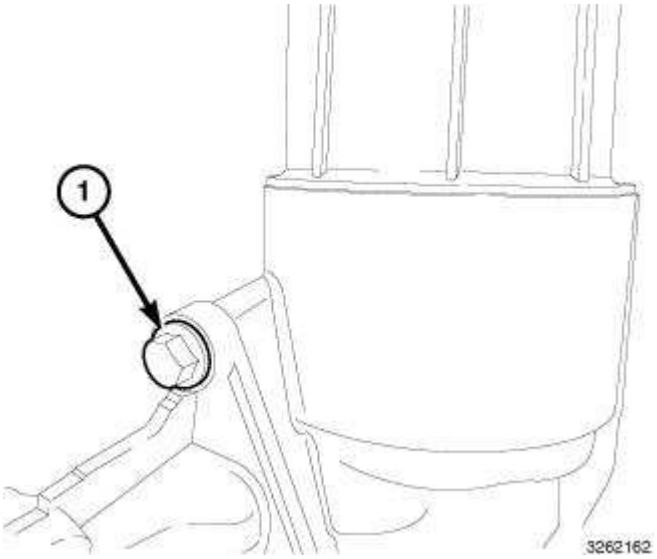

Fig. 307: Upper Oil Filter Housing Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install the front oil filter housing bolt and tighten to 15 N.m (133 in. lbs.).

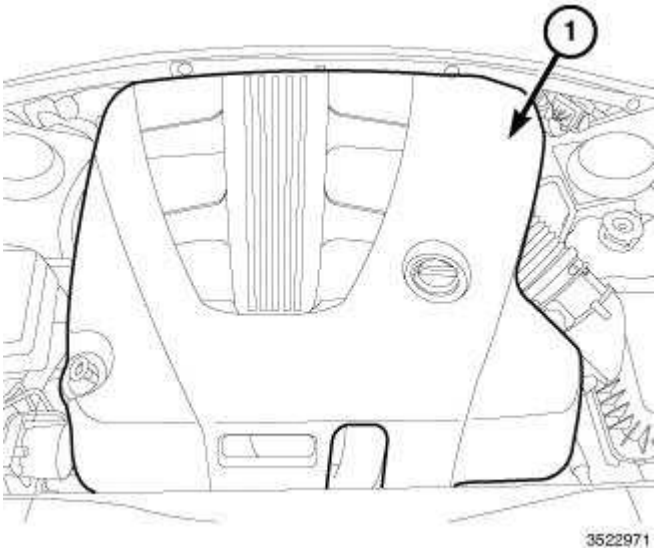

Fig. 308: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the oil cooler adapter. Refer to **ADAPTER, OIL COOLER, INSTALLATION**.
6. Connect the negative battery cable.
7. Start the engine and check for leaks.
8. Install the engine cover (1).

JET, PISTON OIL COOLER

DESCRIPTION

DESCRIPTION

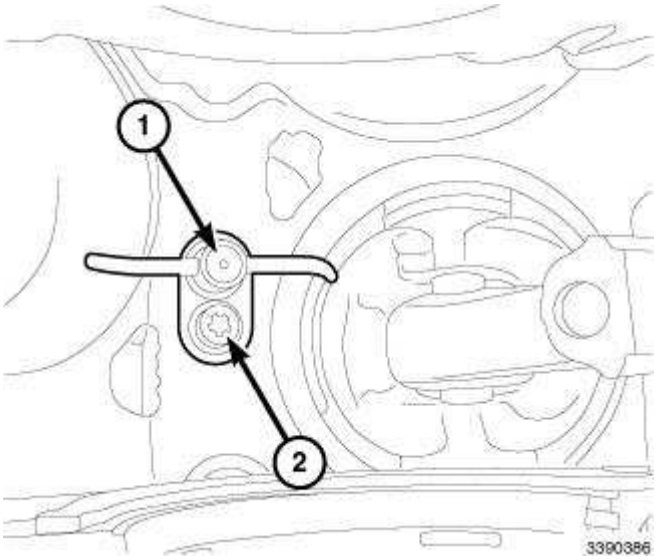

Fig. 309: Oil Jet & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

Three dual-nozzle oil jets (1) are bolted to the cylinder block underneath the main oil gallery. The jets connect with an oil-tight fit to the main gallery through lubrication passages. Each oil jet helps cool two opposite pistons. Proper oil jet alignment is important. Each nozzle is designed to alternatively spray oil through both cooling galleries within the piston. The oil spray is aimed at one of the cooling galleries as the piston approaches TDC. As the piston approaches BDC, the oil spray is aimed at the adjacent cooling gallery.

REMOVAL

REMOVAL

CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage.

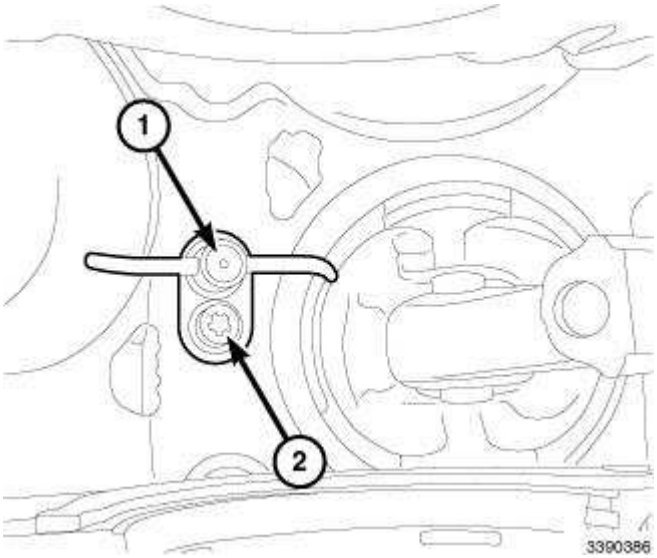

Fig. 310: Oil Jet & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the crankshaft. Refer to **CRANKSHAFT, REMOVAL**.
3. Remove bolt (2) and oil jet (1) from engine block.

INSTALLATION

INSTALLATION

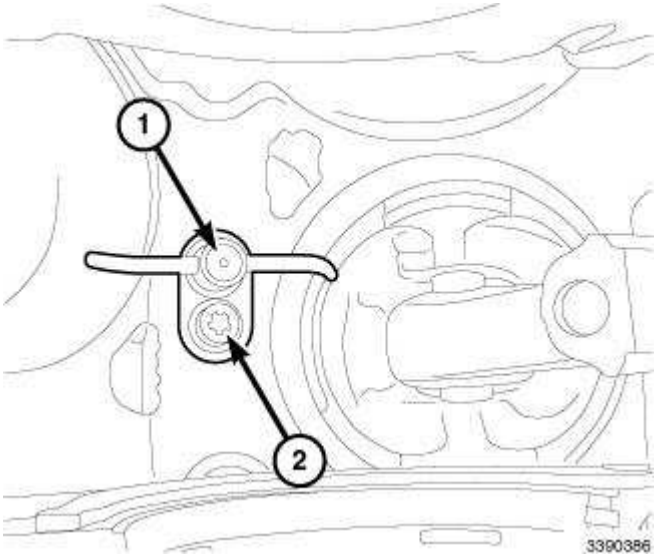

Fig. 311: Oil Jet & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage.

1. Install oil jet (1) in engine block. Tighten bolt (2) to 11 N.m (97 in. lbs.).
2. Install the crankshaft. Refer to **CRANKSHAFT, INSTALLATION**.
3. Connect the negative battery cable.

JET, TIMING CHAIN OIL

REMOVAL

REMOVAL

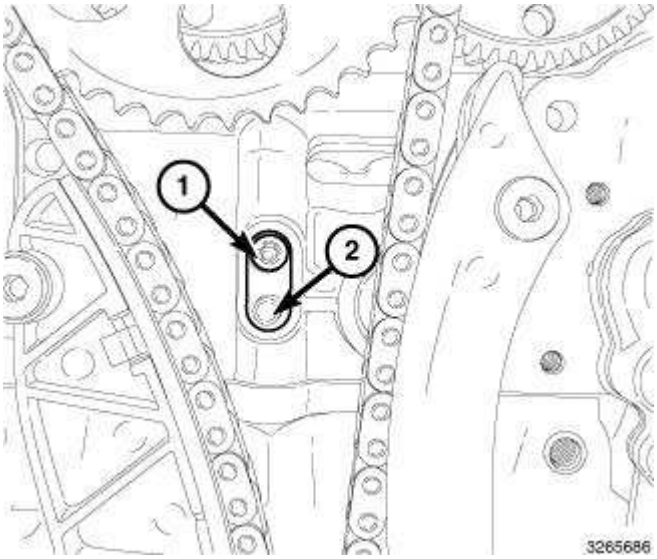

Fig. 312: Timing Chain Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

1. Disconnect the negative battery cable.
2. Remove the upper timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
3. Remove bolt (1) and the timing chain oil jet (2).
4. Remove and discard O-ring seal.

INSTALLATION

INSTALLATION

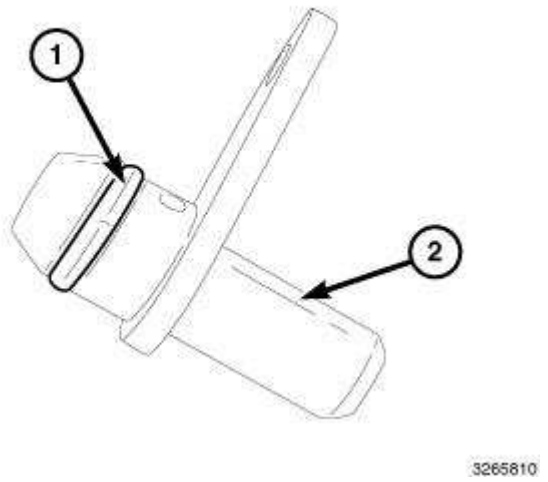

Fig. 313: Timing Chain Oil Jet & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install a new O-ring seal (1) onto the timing chain oil jet (2).

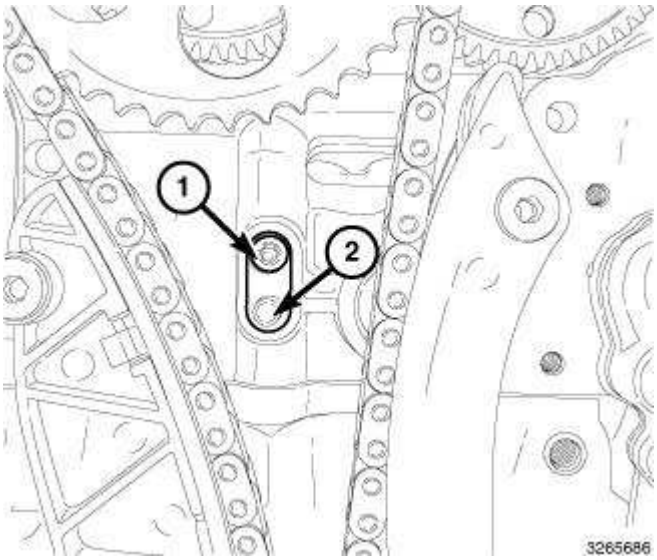

Fig. 314: Timing Chain Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

2. Install the timing chain oil jet (2). Tighten bolt (1) to 11 N.m (97 in. lbs.).
3. Install the upper timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
4. Fill engine oil to proper level.
5. Connect the negative battery cable.

OIL

DESCRIPTION

DESCRIPTION

Refer to the Lube and Maintenance information for oil specifications. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Change the engine oil and filter at mileage and time intervals described in the Maintenance Schedule. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

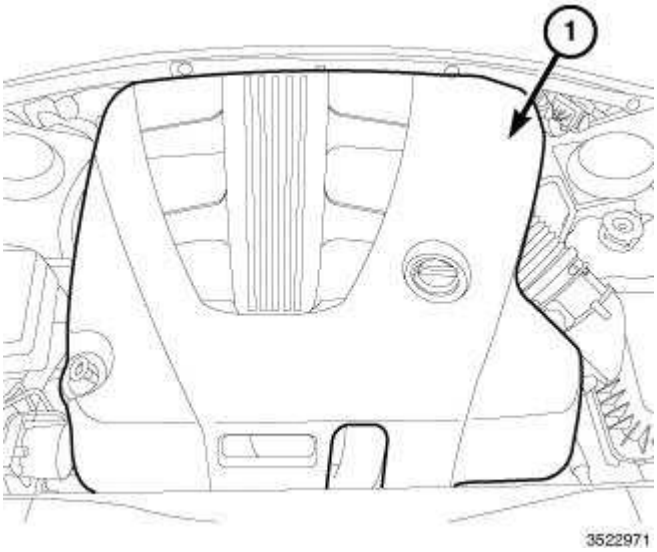

Fig. 315: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Run the engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn the engine off.
3. Remove the engine cover (1).

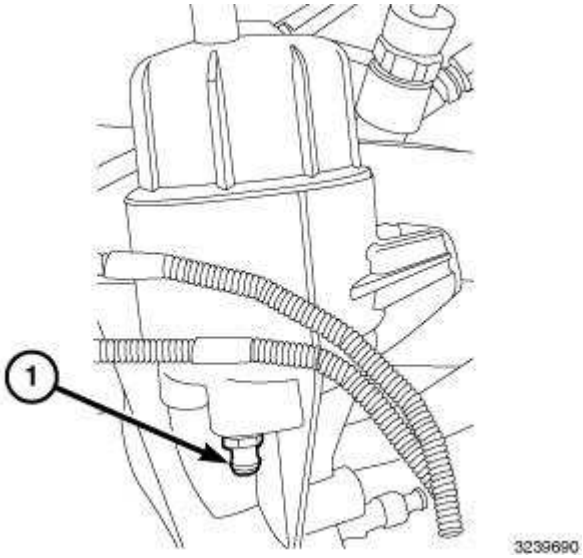

Fig. 316: Oil Filter Housing Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

4. Open the vent screw on top of oil cap.
5. Place an oil absorbent cloth around the oil filter housing at the base.
6. Open the bleeder screw (1) and drain the oil filter housing and securely tighten bleeder screw.
7. Rotate the oil filter cap (1) counterclockwise and remove the oil filter and cap.

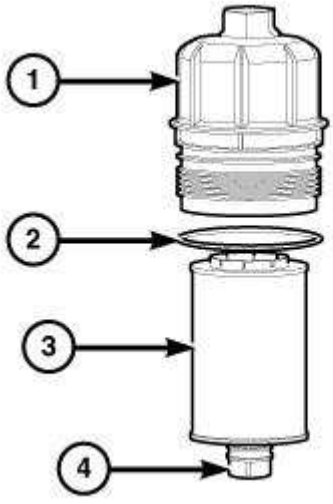

Fig. 317: Oil Filter Cover, O-Ring Gasket, Oil Filter & Base Oil Filter
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete

draining of the used engine oil.

NOTE: The oil filter (3) is attached to the oil filter cap (1).

8. While holding the oil filter cover (1), pushdown on base oil filter (4) to separate from cover and remove the oil filter (3).
9. Remove and discard O-ring gasket (2). Clean and inspect cap.

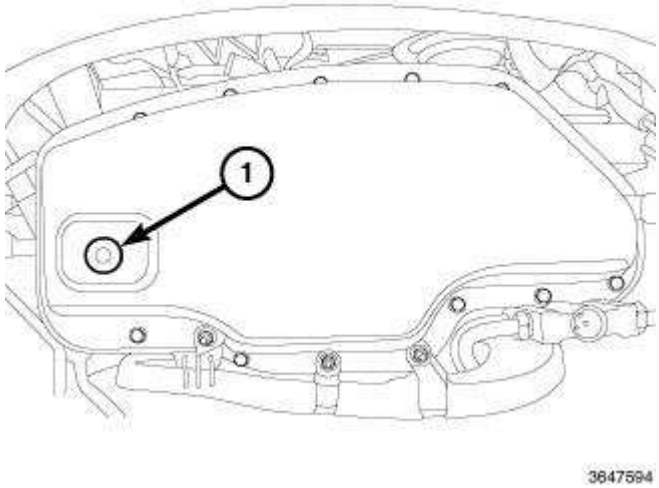

Fig. 318: Oil Pan Drain Plug
Courtesy of CHRYSLER GROUP, LLC

10. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
11. Place a suitable drain pan under the crankcase drain plug (1).
12. Drain the engine oil. Inspect the drain plug threads for stretching or other damage. Replace the drain plug (1) if damaged.
13. Using a new sealing washer, install and tighten the drain plug (1) to 45 N.m (33 ft. lbs.).

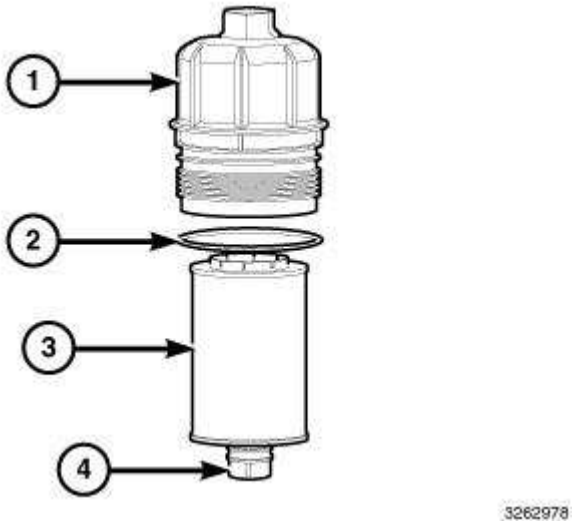

Fig. 319: Oil Filter Cover, O-Ring Gasket, Oil Filter & Base Oil Filter
Courtesy of CHRYSLER GROUP, LLC

14. Lower the vehicle.

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

15. Lubricate and install the new oil filter cap O-ring gasket (2). Make sure the oil filter cap O-ring is in the correct location.
16. Install the oil filter (3) into oil filter cap (1).
17. Install oil filter cap (1) and tighten to 25 N.m (18 ft. lbs.).
18. Securely tighten the vent screw on top of the oil filter cap.
19. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

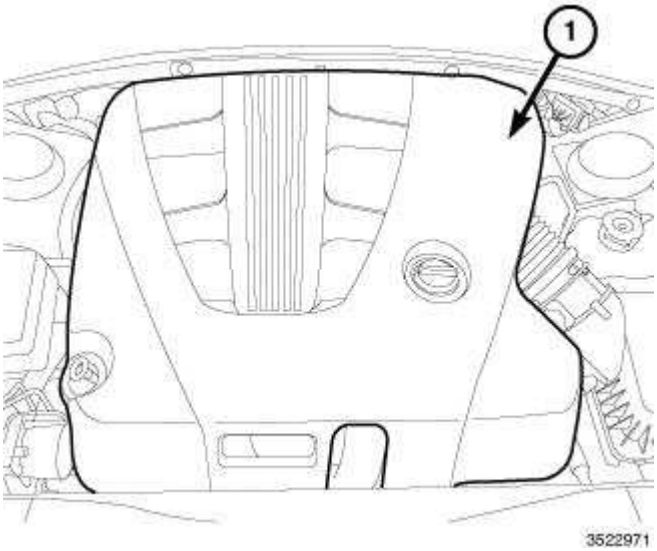

Fig. 320: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

20. Start the engine and inspect for leaks.
21. Stop the engine and check the oil level.
22. Install the engine cover (1).

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

PAN, OIL

REMOVAL

UPPER OIL PAN

1. Disconnect the negative battery cable.
2. Center and lock the steering wheel.
3. Remove bolts and the oil level indicator tube.

NOTE: The lower oil pan must be removed to access all of the upper oil pan retaining bolts.

4. Remove the lower oil pan. Refer to **PAN, OIL, REMOVAL**.

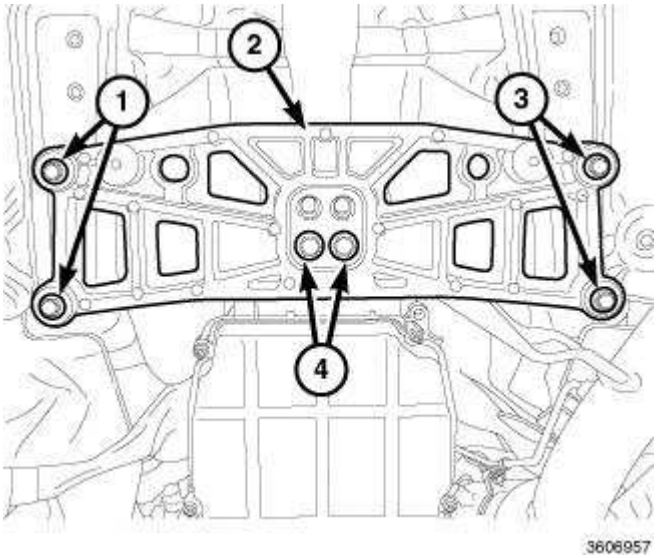

Fig. 321: Rear Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the transmission belly pan.
6. Remove the two bolts (4) from the rear engine mount isolator.
7. Using a suitable transmission jack, positioned under the transmission oil pan, raise the transmission to gain enough clearance to remove the CKP sensor cover.

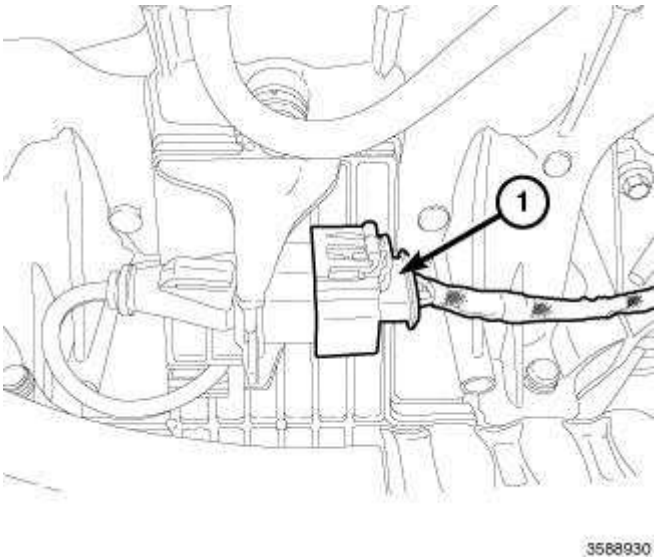

Fig. 322: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the Crankshaft Position Sensor (CKP) sensor wiring harness connector (1).

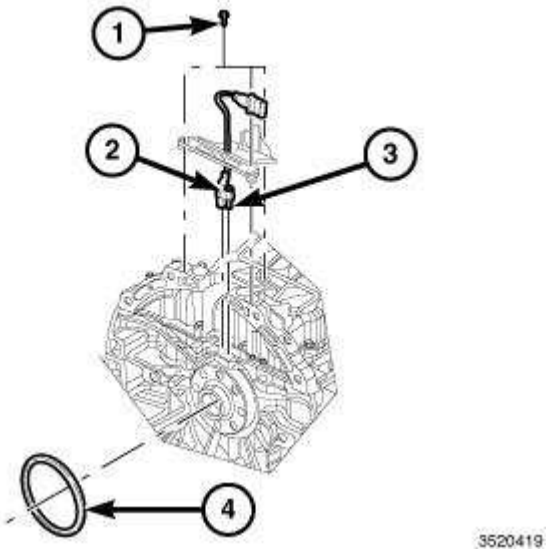

Fig. 323: CKP Sensor, Seal & Fasteners
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolts (1) and the CKP sensor cover.

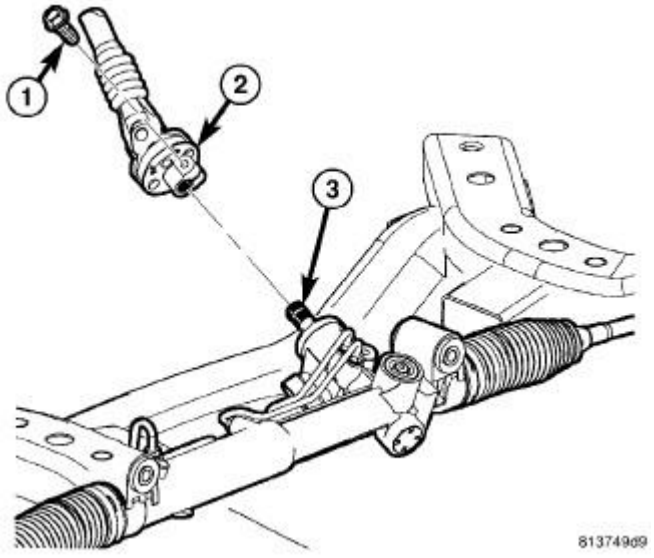

Fig. 324: Lower Intermediate Coupling Pinch Bolt, Lower Intermediate Shaft & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

10. Remove lower intermediate coupling pinch bolt (1) at steering gear (3). Separate lower intermediate shaft (2) from steering gear shaft (3).

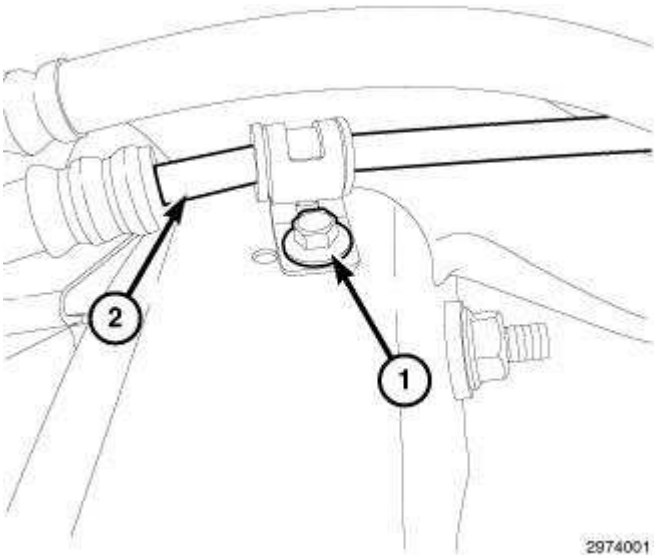

Fig. 325: Retaining Bolt & Return Line

11. Remove bolt (1) securing the return hose (2) to engine cradle.

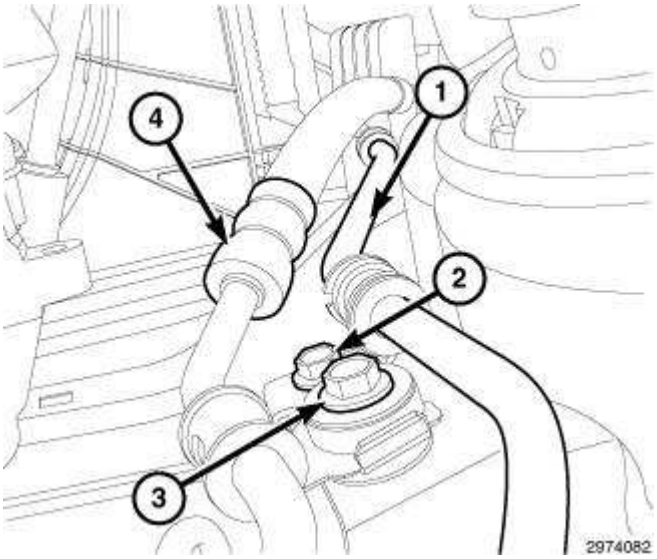

Fig. 326: Pressure Line, Return Line & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove bolt (3) securing pressure line (4) to right side of cradle.

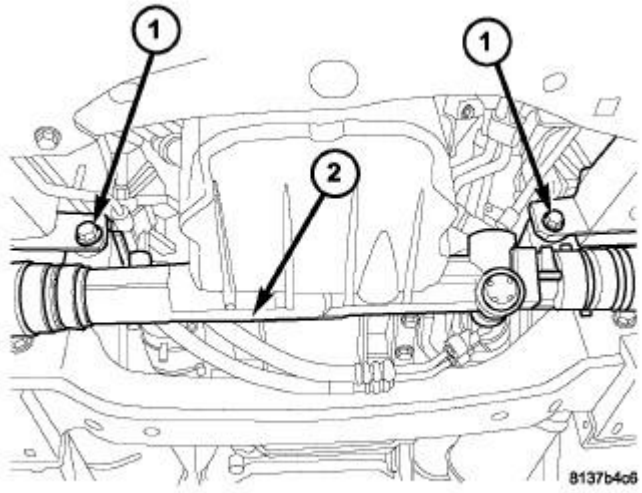

Fig. 327: Steering Gear & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove bolts (1) and allow the steering gear (2) to drop down out of mounts.

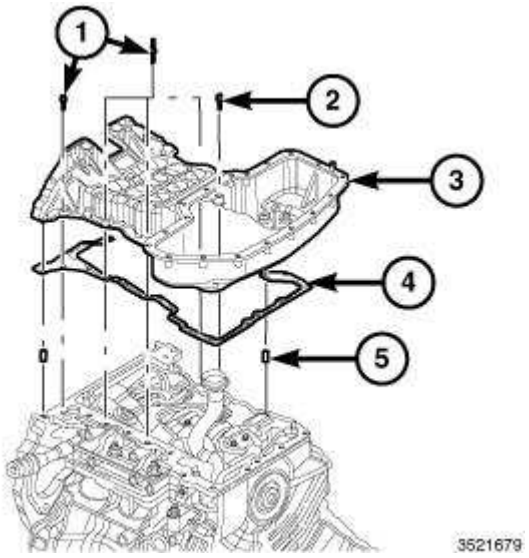

Fig. 328: Upper Oil Pan, Gasket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Remove bolt (2) and the oil pump pick-up tube.
15. Remove the four upper oil pan-to-transmission bolts.
16. Remove bolts (1) and the upper oil pan (3).
17. Remove and discard gasket (4).

LOWER OIL PAN

1. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
2. Drain the engine oil. Using a new sealing washer, install and tighten drain plug to 45 N.m (33 ft. lbs.).

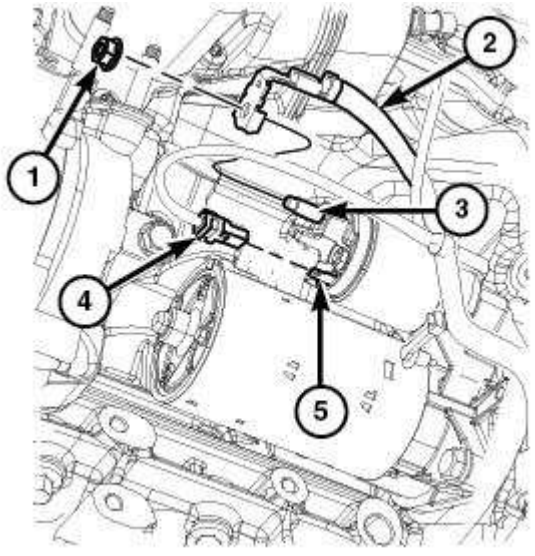

Fig. 329: Starter Cables, Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove nut (1) and the B+ cable (2) from the stud (3) and position aside.
4. Disconnect the solenoid wire harness connector (4) from the terminal (5).

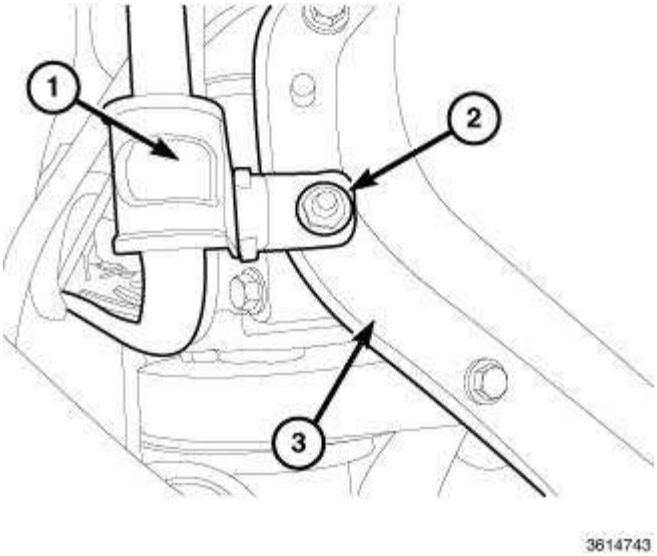

Fig. 330: Transmission Cooler Line Bracket, Nut & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (2) securing the transmission cooler line bracket (1) to oil pan (3).

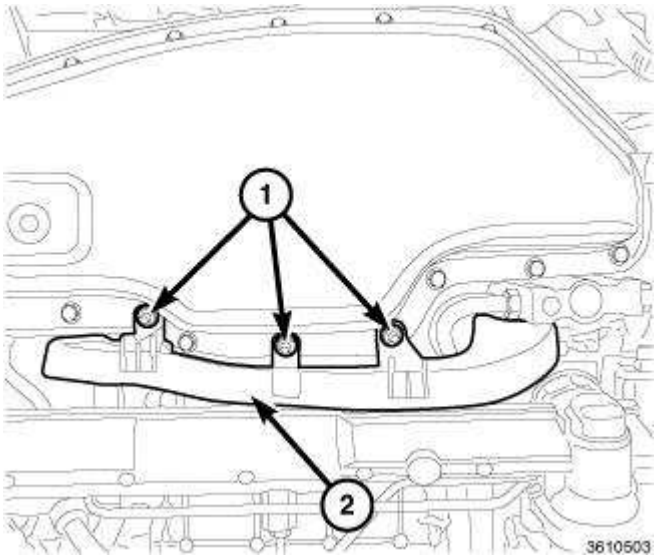

Fig. 331: Lower Engine Wire Harness & Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Remove nuts (1) and allow wire harness (2) to drop down for clearance.

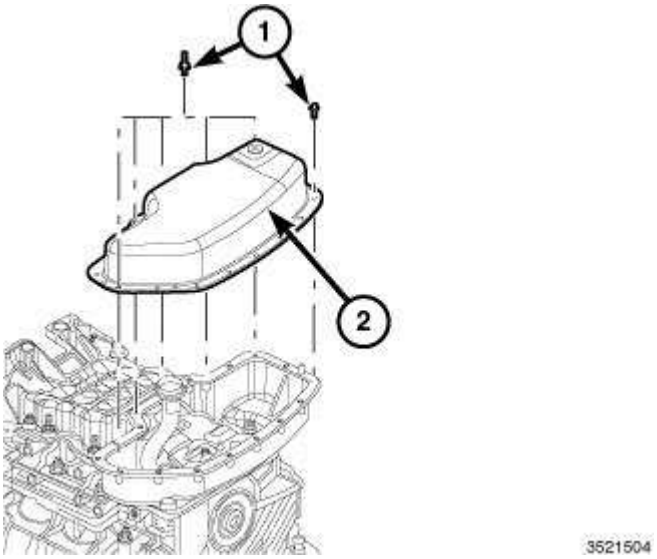

Fig. 332: Oil Pan & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (1) and the oil pan (2).

CLEANING

CLEANING - OIL PAN

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing)

alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

1. Clean the oil pan in solvent and wipe dry with a clean cloth.
2. Remove all residual sealant (1) from the upper and lower oil pans. Refer to **Engine - Standard Procedure**.

INSTALLATION

UPPER OIL PAN

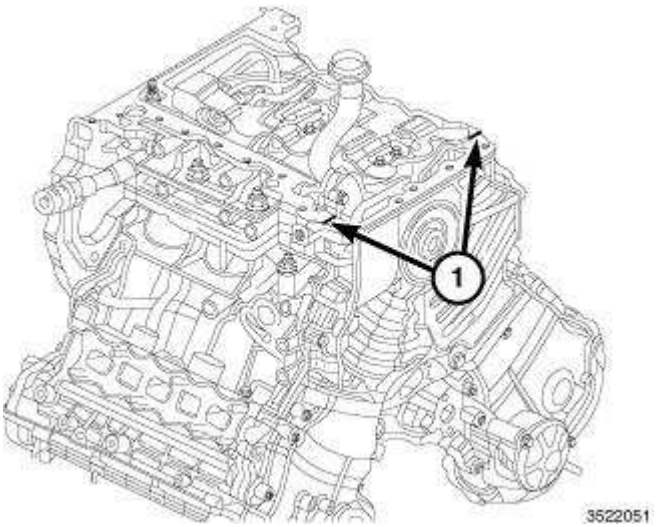

Fig. 333: RTV Sealant To Timing Cover To Engine Block T-Joints
Courtesy of CHRYSLER GROUP, LLC

1. Clean and gasket sealing surfaces. Refer to **Engine - Standard Procedure**.

NOTE: Clean the oil pan sealing surfaces with isopropyl alcohol in preparation for sealant application.

2. Apply a 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the timing cover to engine block T-joints (1).

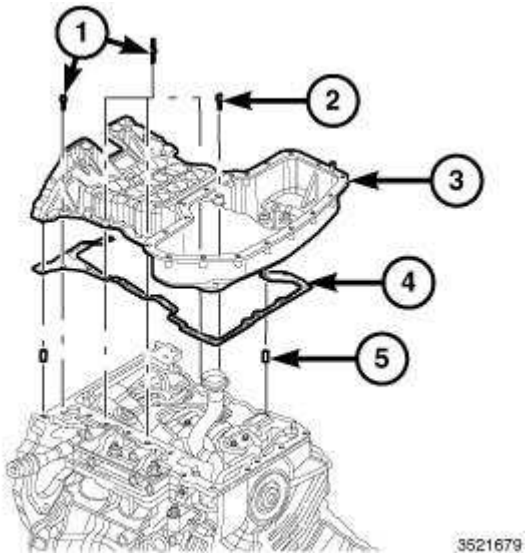

Fig. 334: Upper Oil Pan, Gasket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Install a new oil pan gasket (4).

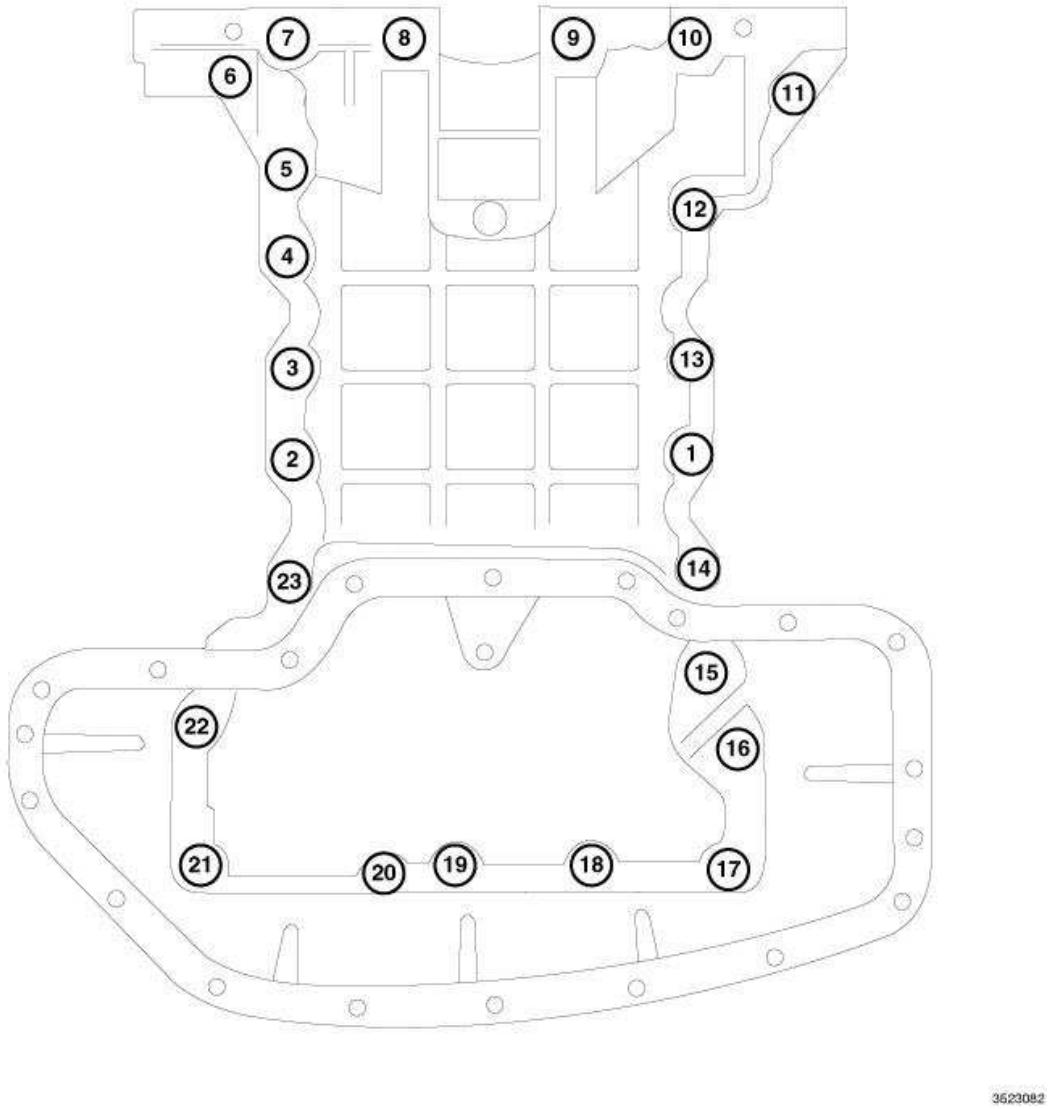

Fig. 335: Upper Oil Pan Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Bolts in the following positions are stud bolts (4, 14, 17, 19, 21, and 23).

4. Install the upper oil pan and tighten bolts finger tight:
   - Using the tightening sequence shown in illustration, tighten bolts to 15 N.m (133 in. lbs.).
   - Loosen each bolt one at a time 90 degrees, then using the tightening sequence shown in illustration tighten bolts to 15 N.m (133 in. lbs.).

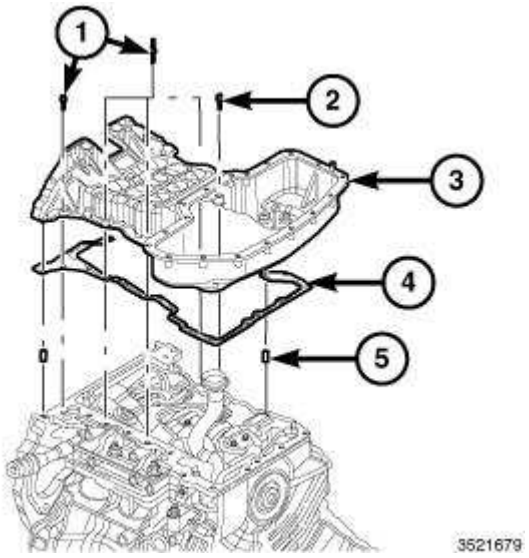

Fig. 336: Upper Oil Pan, Gasket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the four upper oil pan-to transmission to bolts and tighten to 39 N.m (29 ft. lbs.).
6. Install the oil pump pick-up tube. Tighten bolt (2) to 11 N.m (97 in. lbs.).

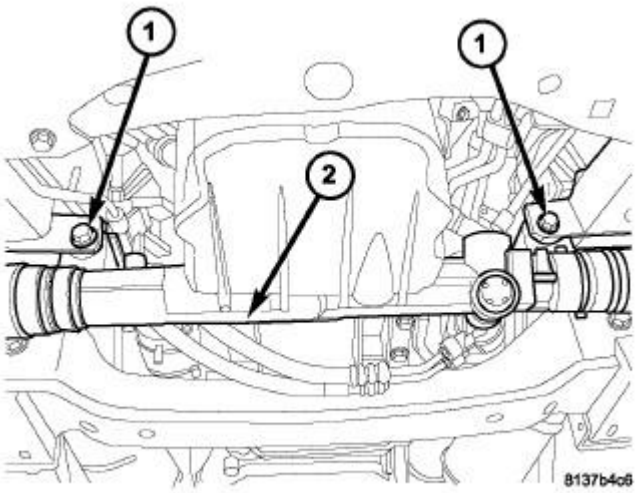

Fig. 337: Steering Gear & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Lift steering gear (2) into mounted position and install steering gear mounting bolts (1). Tighten bolts to 95 N.m (70 ft. lbs.).

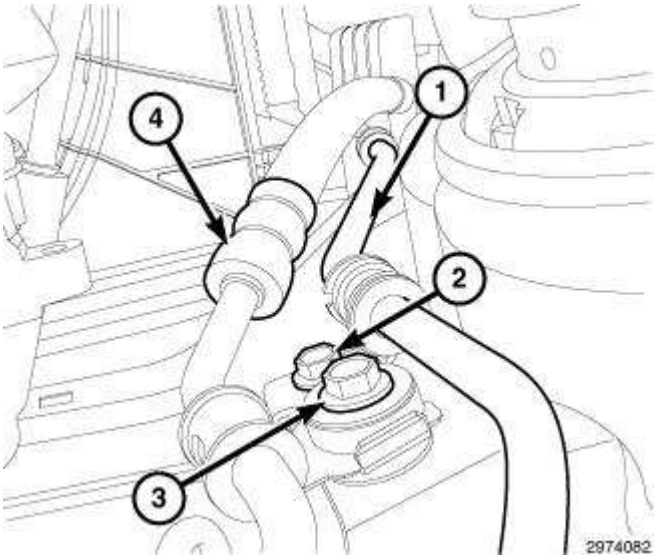

Fig. 338: Pressure Line, Return Line & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install bolt (2) securing return line (1) to right side of cradle and tighten to 19 N.m (168 in. lbs.).
9. Install bolt (3) securing pressure line (4) to right side of cradle and tighten to 19 N.m (168 in. lbs.).

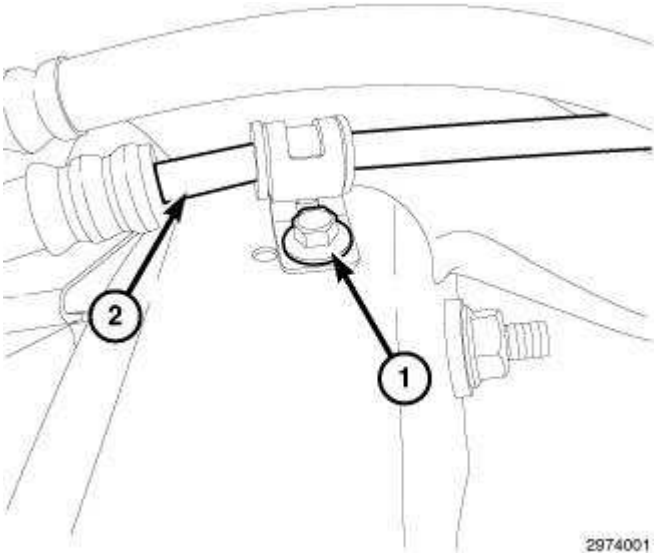

Fig. 339: Retaining Bolt & Return Line
Courtesy of CHRYSLER GROUP, LLC

10. Install bolt (1) securing the return hose (2) to engine cradle. Tighten bolt to 19 N.m (168 in. lbs.).

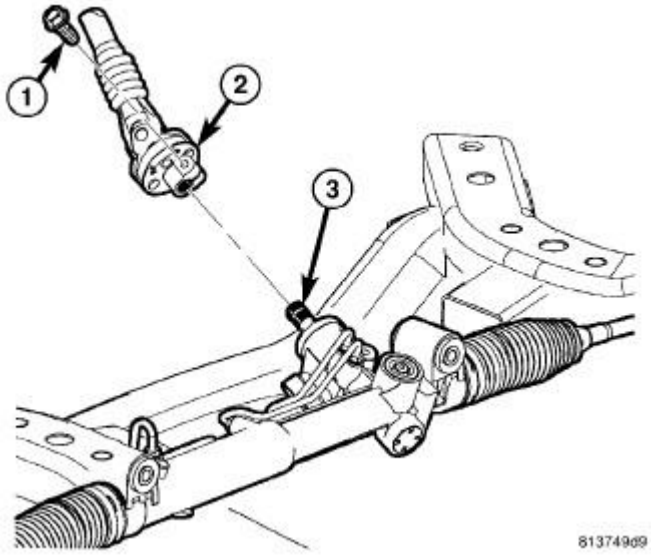

Fig. 340: Lower Intermediate Coupling Pinch Bolt, Lower Intermediate Shaft & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Prior to coupling installation, make sure gear is centered in its travel to match clockspring centering in steering column.

11. Align lower intermediate shaft (2) with input shaft (3) and install steering coupling. Install NEW pinch bolt and tighten to 45 N.m (33 ft. lbs.).

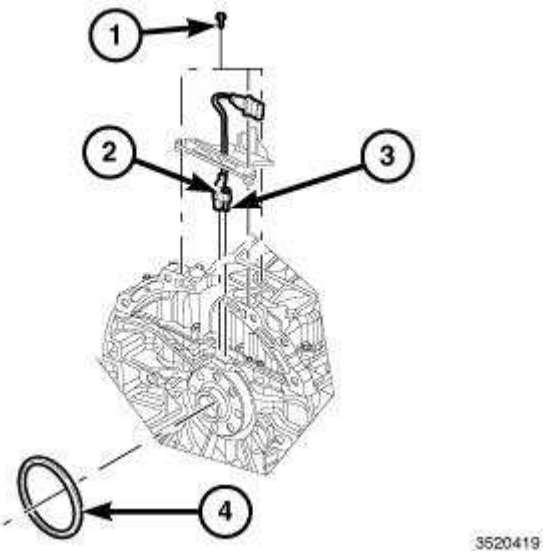

Fig. 341: CKP Sensor, Seal & Fasteners
Courtesy of CHRYSLER GROUP, LLC

12. Install the Crankshaft Position Sensor (CKP) sensor cover. Tighten bolts (1) to 8 N.m (71 in.

lbs.).

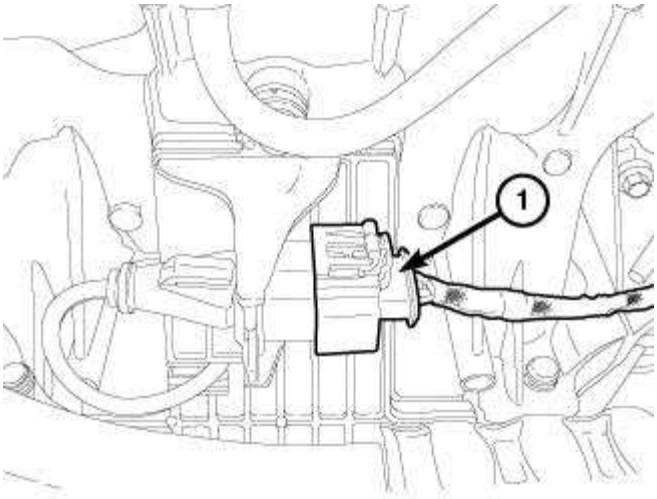

Fig. 342: Crankshaft Position Sensor (CKP) Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

13. Connect the CKP wire harness connector (1).

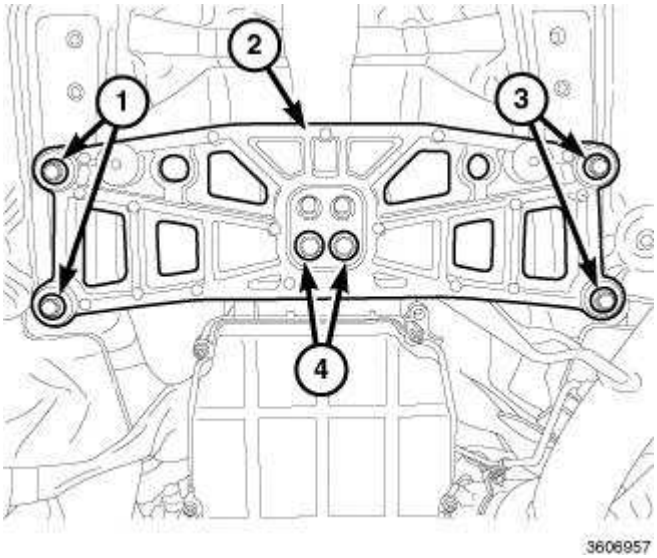

Fig. 343: Rear Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Lower the transmission so the weight is resting on the isolator.
15. Install the rear engine mount isolator bolts (4) and tighten to 61 N.m (45 ft. lbs.).
16. Install the transmission belly pan.
17. Install the lower oil pan. Refer to **PAN, OIL, INSTALLATION**.
18. Install the oil level indicator tube. Tighten bolts to 11 N.m (97 in. lbs.).

19. Replace the oil filter and fill the engine with recommended engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
20. Remove the steering wheel lock.
21. Connect the negative battery cable.

LOWER OIL PAN

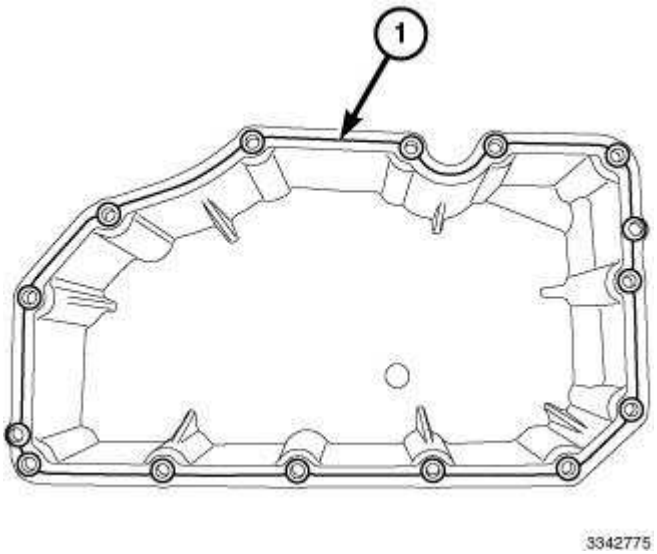

Fig. 344: Lower Oil Pan Gasket Sealing Surfaces
Courtesy of CHRYSLER GROUP, LLC

1. Clean and gasket sealing surfaces. Refer to **Engine - Standard Procedure**.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

NOTE: Sealing surfaces must be free of a gasket material and oil residue. Clean the oil pan sealing surfaces with isopropyl alcohol in preparation for sealant application.

2. Apply a 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the lower oil pan as shown in illustration (1).

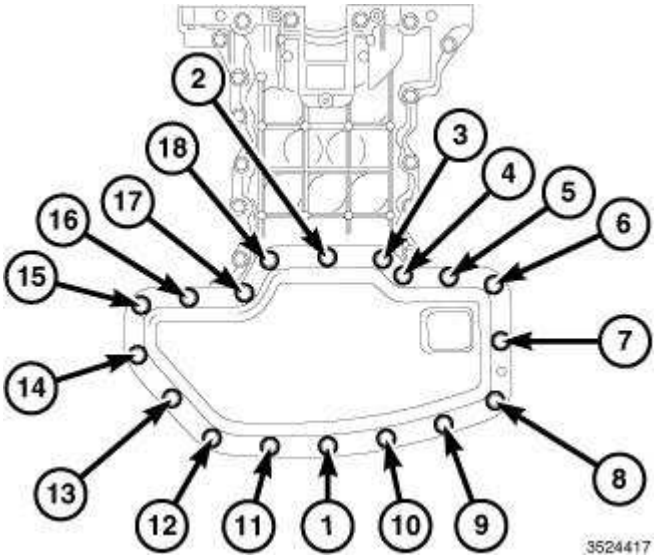

Fig. 345: Oil Pan To Engine Block Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Stud bolts go in the following locations: 2, 4, 6, 14, and 18.

3. Position the oil pan to engine block and install the oil pan bolts finger tight.
   - Using the tightening sequence shown in illustration, tighten the oil pan bolts to 15 N.m (133 in. lbs.).
   - Loosen each bolt one at a time 90 degrees, then using the tightening sequence shown in illustration tighten bolts to 15 N.m (133 in. lbs.).

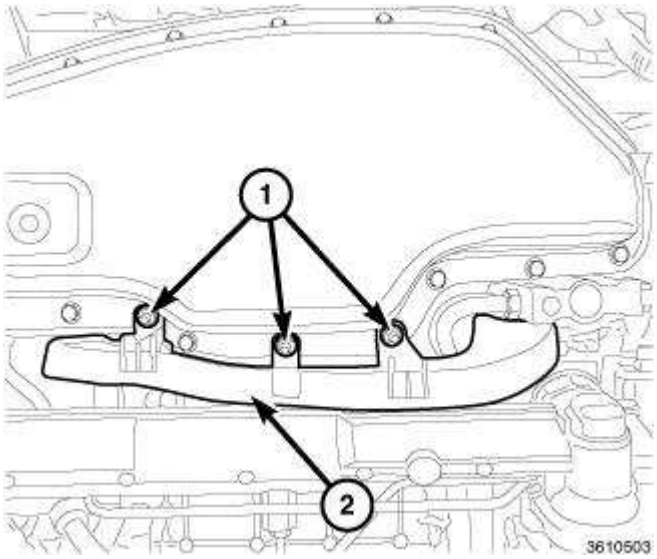

Fig. 346: Lower Engine Wire Harness & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Install the wire harness (2). Tighten nuts (1) to 11 N.m (97 in. lbs.).

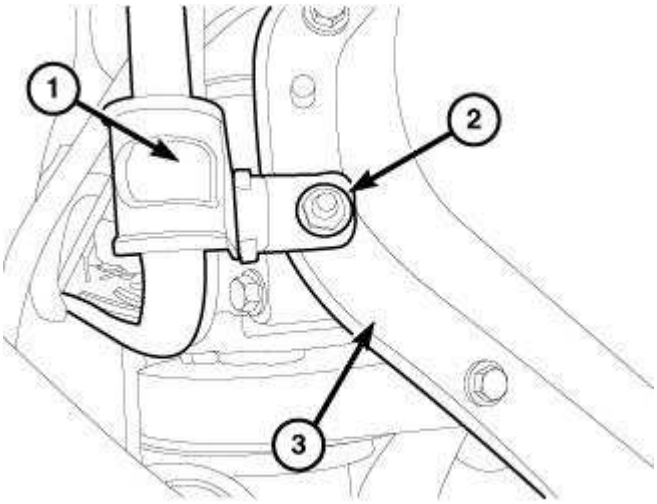

Fig. 347: Transmission Cooler Line Bracket, Nut & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

5. Install the transmission cooler line bracket (1) and tighten nuts (2) to 11 N.m (97 in. lbs.).

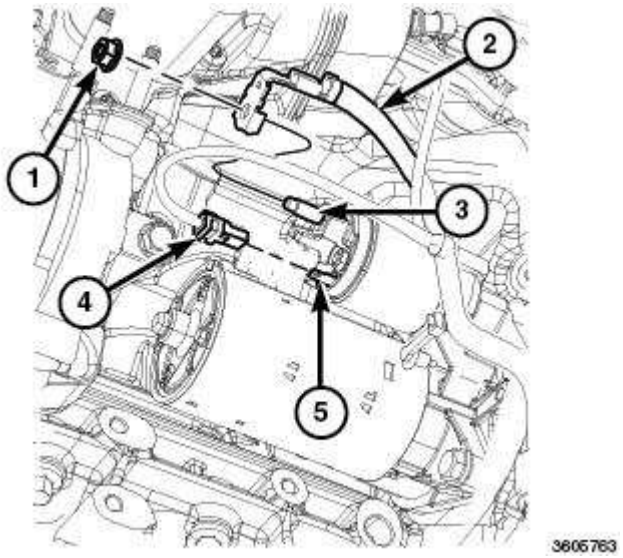

Fig. 348: Starter Cables, Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Connect the solenoid wire harness connector (4) to the solenoid terminal (5).
7. Install the B+ cable (2) to the solenoid stud (3). Tighten nut (1) to 11 N.m (97 in. lbs.).
8. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
9. Fill the engine with recommended engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

PICK-UP, OIL PUMP

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the lower oil pan. Refer to **PAN, OIL, REMOVAL**.

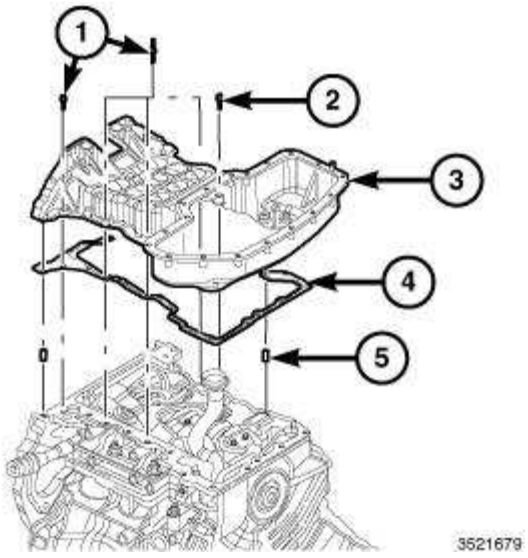

Fig. 349: Upper Oil Pan, Gasket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil pump pickup tube bolt (2).

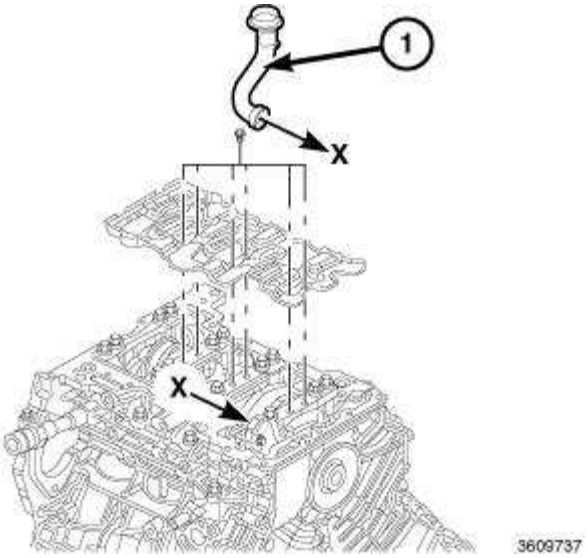

Fig. 350: Oil Pump Pickup Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the oil pump pickup tube (1) from oil pump.

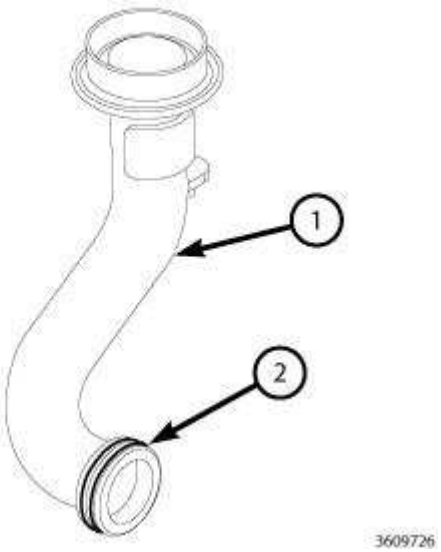

Fig. 351: Oil Pump Pickup Tube & O-Ring
Courtesy of CHRYSLER GROUP, LLC

5. Remove and discard O-ring (2).

INSTALLATION

INSTALLATION

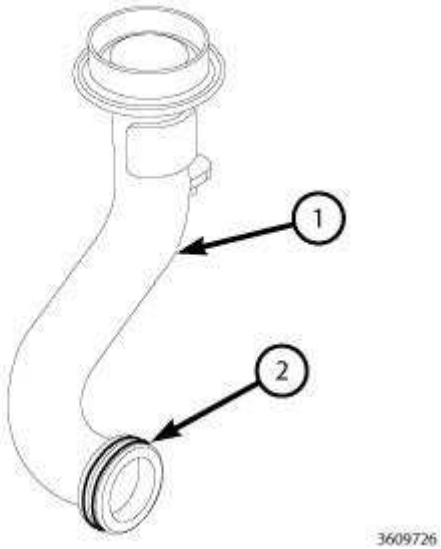

Fig. 352: Oil Pump Pickup Tube & O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate and install a new O-ring (2) on oil pump pickup tube (1).

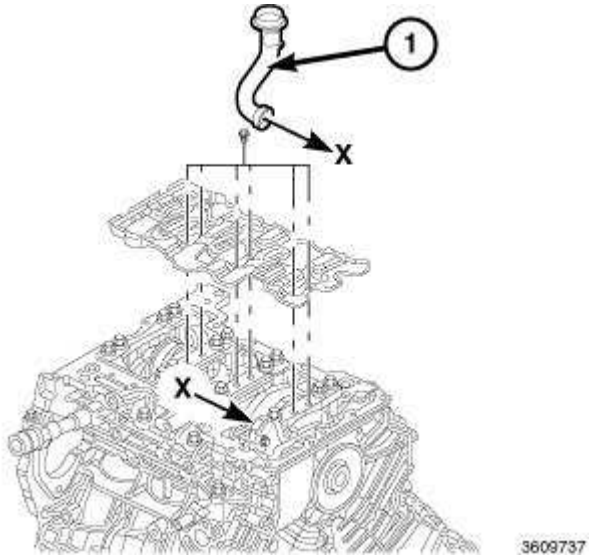

Fig. 353: Oil Pump Pickup Tube
Courtesy of CHRYSLER GROUP, LLC

2. Install pickup tube (2) into oil pump.

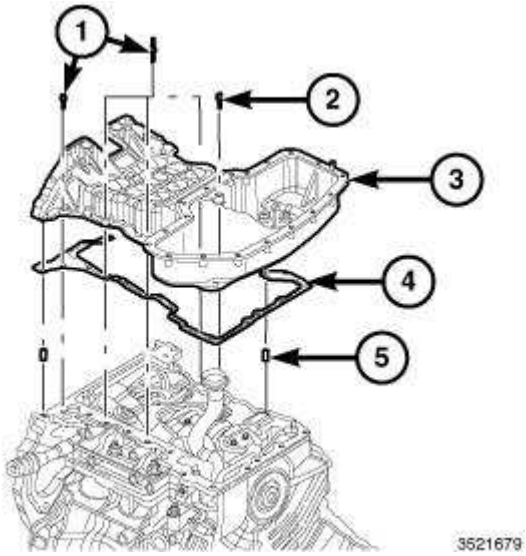

Fig. 354: Upper Oil Pan, Gasket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Tighten the oil pump pickup tube bolts (1) to 11 N.m (97 in. lbs.).
4. Install the lower oil pan. Refer to **PAN, OIL, INSTALLATION**.
5. Fill the engine to proper level with recommended engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Connect the negative battery cable.

PUMP, ENGINE OIL

REMOVAL

REMOVAL

1. Remove the oil pump pick-up tube. Refer to **PICK-UP, OIL PUMP, REMOVAL**.
2. Remove the lower timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

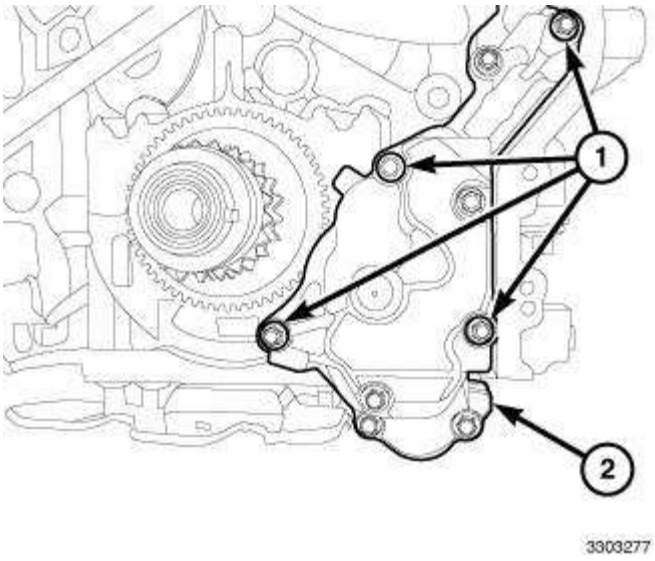

Fig. 355: Engine Oil Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts and the engine oil pump (1).

INSTALLATION

INSTALLATION

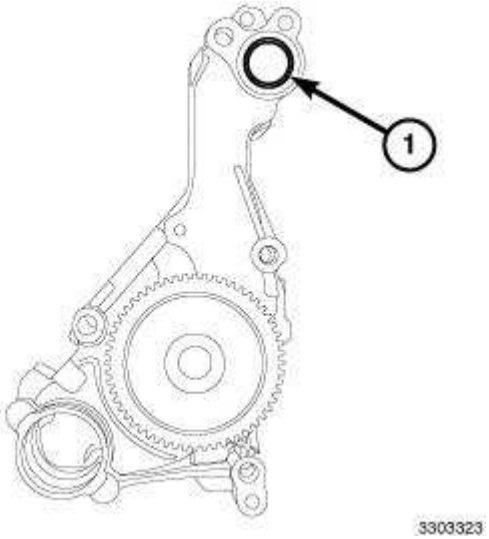

Fig. 356: Engine Oil Pump O-Ring Gasket

Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket sealing surfaces. Refer to **Engine - Standard Procedure**.
2. Install a new O-ring gasket (1) onto the oil pump.

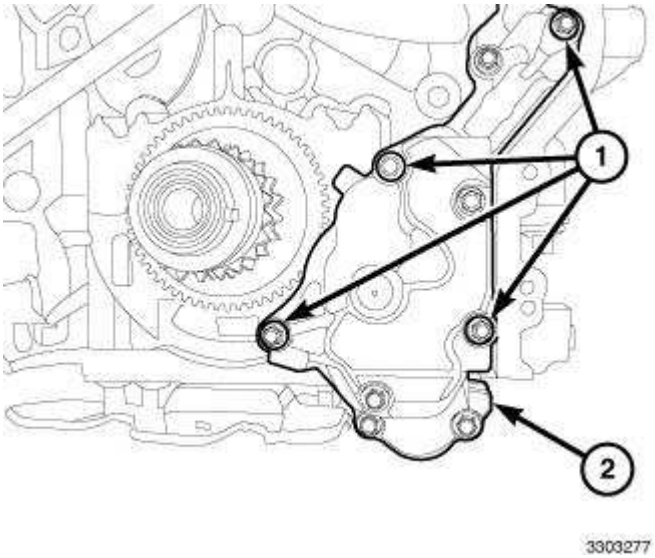

Fig. 357: Engine Oil Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil pump. Tighten bolts to 14 N.m (124 in. lbs.).
4. Install the lower timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
5. Install oil pump pick-up tube. Refer to **PICK-UP, OIL PUMP, INSTALLATION**.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

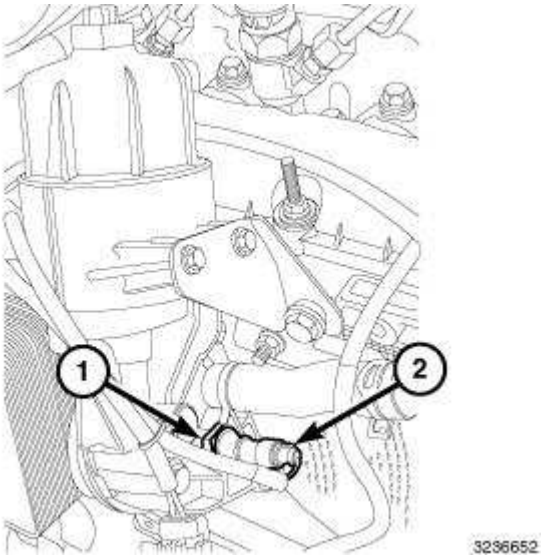

Fig. 358: Engine Oil Pressure Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

The engine oil pressure sensor (1) is mounted on the oil cooler adapter housing. The sensor provides an output voltage to the PCM that corresponds to the engine oil pressure. Under certain operating conditions, for example low oil pressure, it may be necessary for the PCM to increase the engine idle speed to ensue adequate engine lubrication.

The engine oil pressure sensor (1) is a single wire sensor with a threaded pressure port. The pressure port is mounted to the oil cooler adapter housing through an access hole. An aluminum seal ring seals the engine oil pressure sensor to the oil cooler adapter housing.

OPERATION

OPERATION

The engine oil pressure sensor receives a 5- volt reference from the PCM. The sensor ground is also provided by the PCM. The sensor output voltage varies from 0.5 to 4.5 volts depending on engine oil pressure.

REMOVAL

REMOVAL

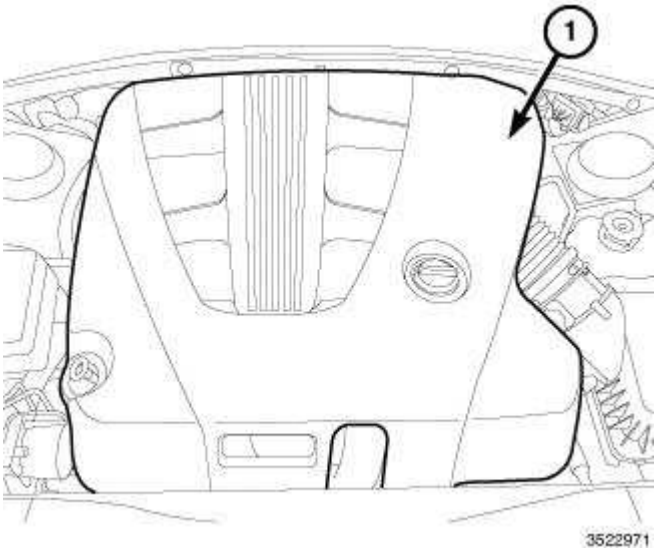

Fig. 359: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

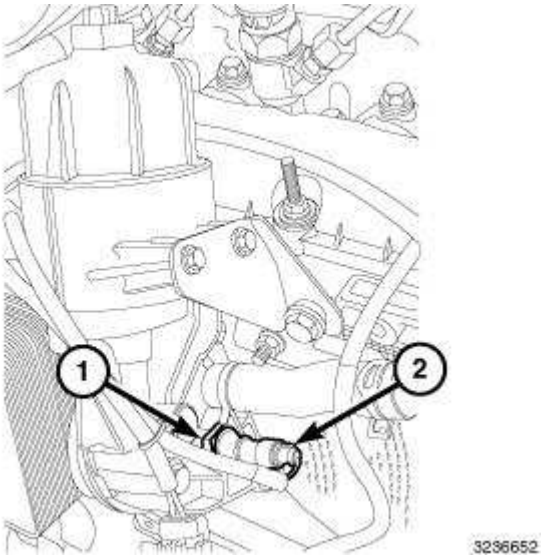

Fig. 360: Engine Oil Pressure Sensor & Connector

3. Disconnect engine oil pressure sensor harness connector (2).
4. Remove engine oil pressure sensor (1).

INSTALLATION

INSTALLATION

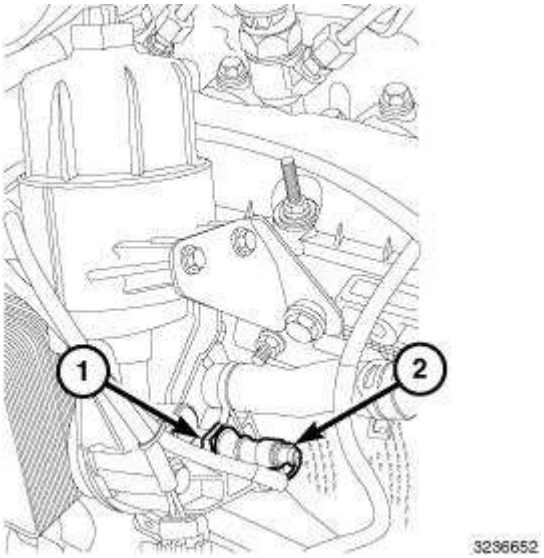

Fig. 361: Engine Oil Pressure Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install the engine oil pressure sensor (1). Tighten sensor (1) to 33 N.m (24 ft. lbs.).
2. Connect engine oil pressure sensor harness connector (2).

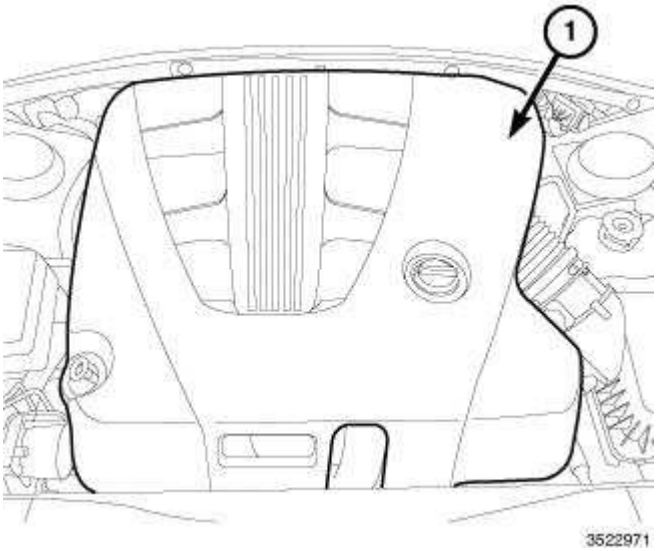

Fig. 362: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Install the engine cover (1).
4. Connect the negative battery cable.
5. Start vehicle and inspect for leaks.

MANIFOLDS

ACTUATOR, SWIRL VALVE

DESCRIPTION

DESCRIPTION

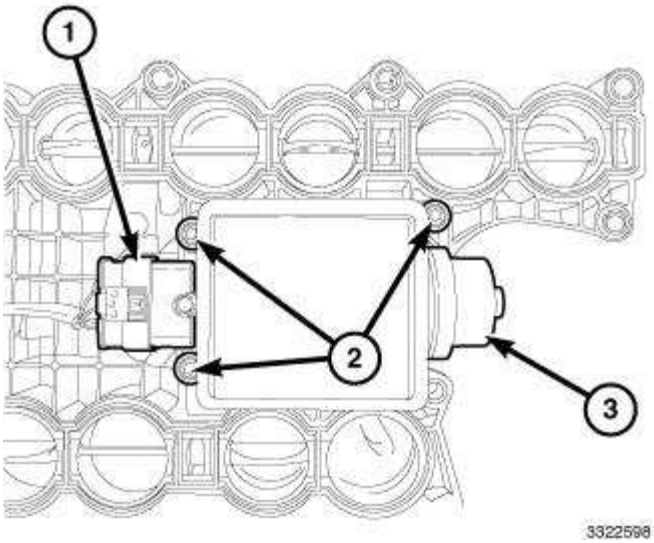

Fig. 363: Swirl Valve Actuator, Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

The intake manifolds feature swirl intake ports to reduce particulates at low engine speeds. Each cylinder incorporates one swirl port and one charge port. The swirl ports can be closed by the swirl valves. The valves are connected together via a linkage which is operated by the swirl valve actuator (3). The swirl valves are normally open by spring tension. The spring is integral with the swirl valve actuator. In the lower engine speed and load range, the swirl valves are closed by the swirl valve actuator (3). The entire air mass flows through the charge ports only, which results in greater swirling. The increased swirling produces uniform combustion for better engine performance and reduction of particulates. As rotational speed and load increases, the swirl valves open, so that optimal swirling and the required air mass are provided for the current operating conditions.

REMOVAL

REMOVAL

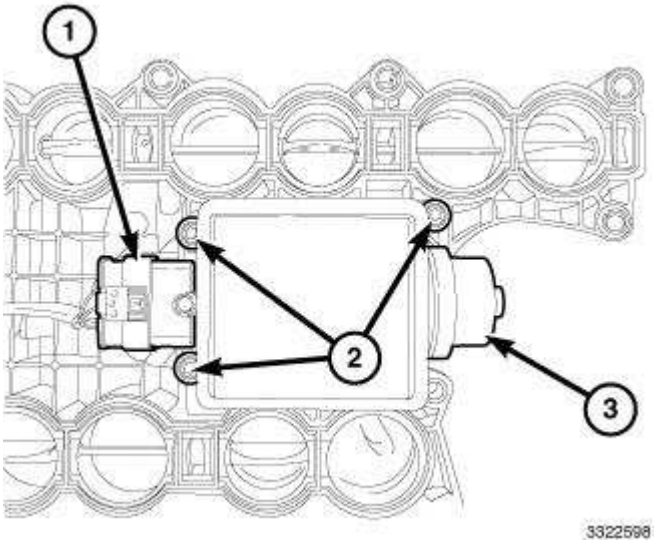

Fig. 364: Swirl Valve Actuator, Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Disconnect the swirl valve actuator harness connector (1).
4. Remove fasteners (2) and the swirl valve actuator (3).

INSTALLATION

INSTALLATION

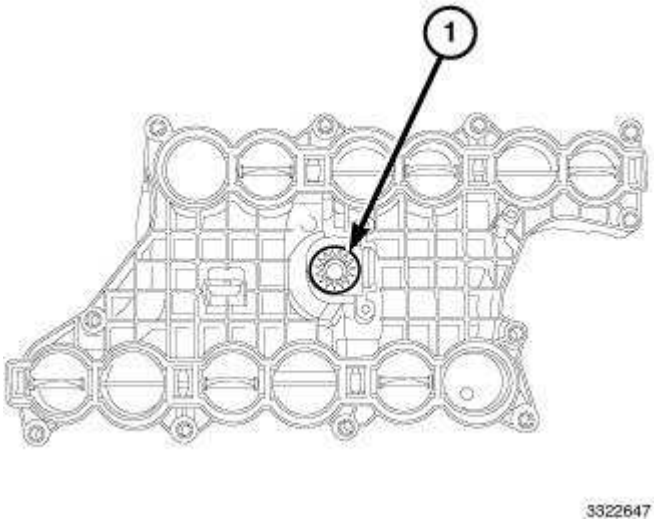

Fig. 365: Swirl Valve Gear
Courtesy of CHRYSLER GROUP, LLC

1. Inspect the swirl valve gear (1) for damage.

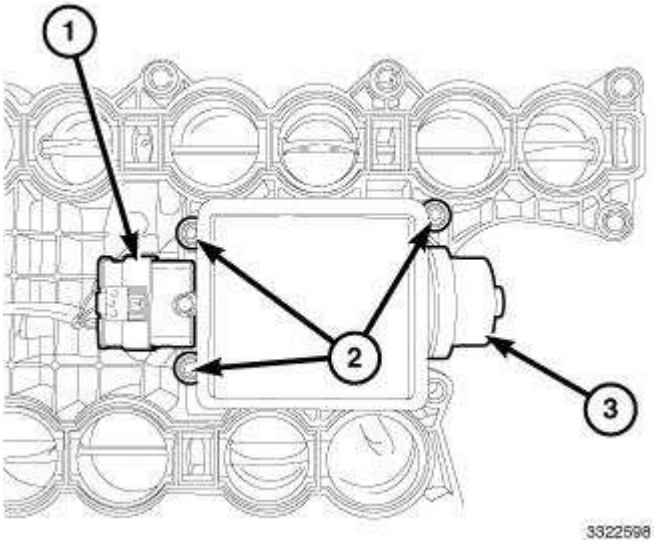

Fig. 366: Swirl Valve Actuator, Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the swirl valve actuator (3) and securely tighten fasteners (2).
3. Connect the swirl valve harness connector (1).
4. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
5. Connect the negative battery cable.

MANIFOLD, EXHAUST

REMOVAL

RIGHT BANK

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

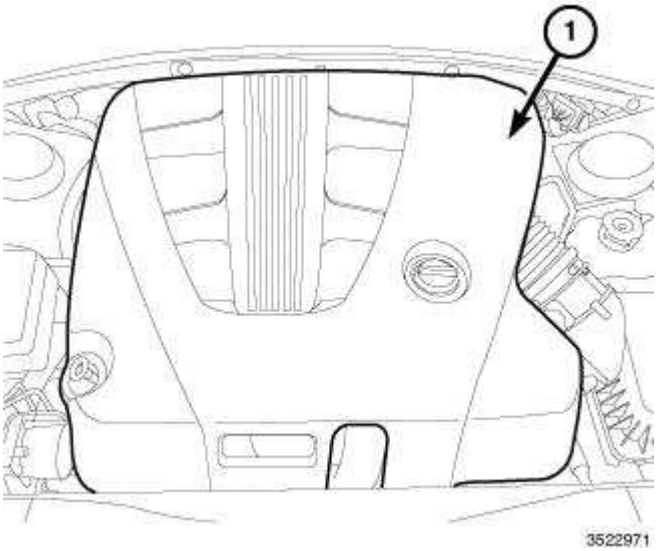

Fig. 367: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

MANIFOLD, INTAKE

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the turbocharger. Refer to **TURBOCHARGER, REMOVAL**.

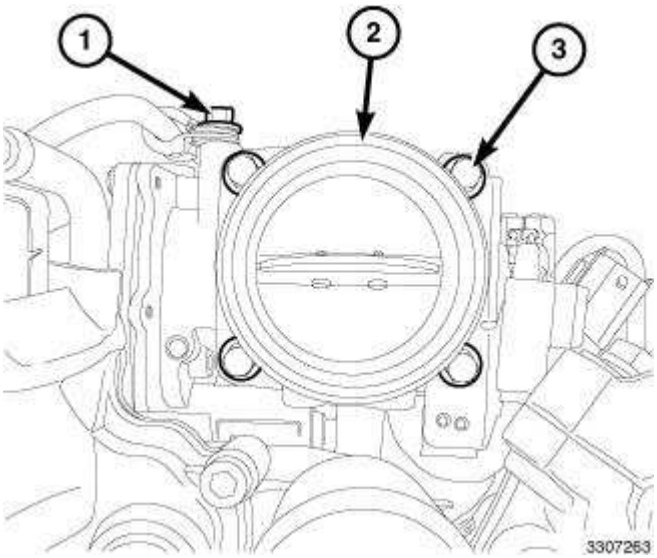

Fig. 427: (EGR) Air Flow Control Valve
Courtesy of CHRYSLER GROUP, LLC

3. Remove the EGR air flow control valve (2). Refer to **VALVE, EXHAUST GAS RECIRCULATION (EGR) AIRFLOW CONTROL, REMOVAL** .
4. Remove the fuel tubes. Refer to **TUBE(S), FUEL, REMOVAL** .
5. Disconnect the engine wire harness connectors.
6. Remove the ball stud fastener, bolts and position aside engine wiring harness.

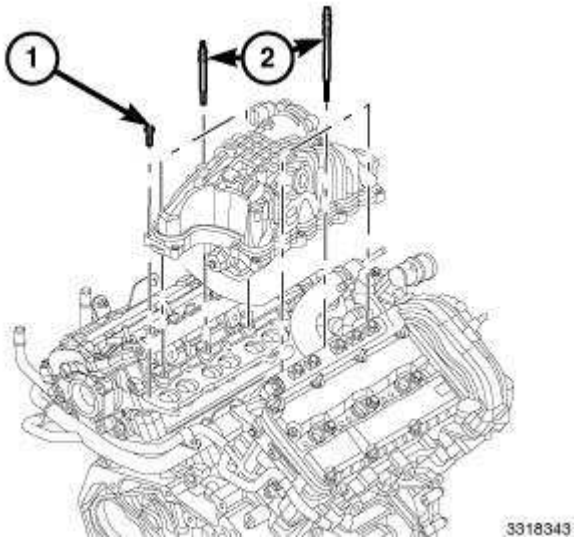

Fig. 428: Glow Plugs & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do Not rest the intake manifold on the swirl valve actuator. Care must be taken when handling the swirl valve assembly.

7. Remove bolts (1) and the intake manifold.
8. Remove and discard gasket.

INSTALLATION

INSTALLATION

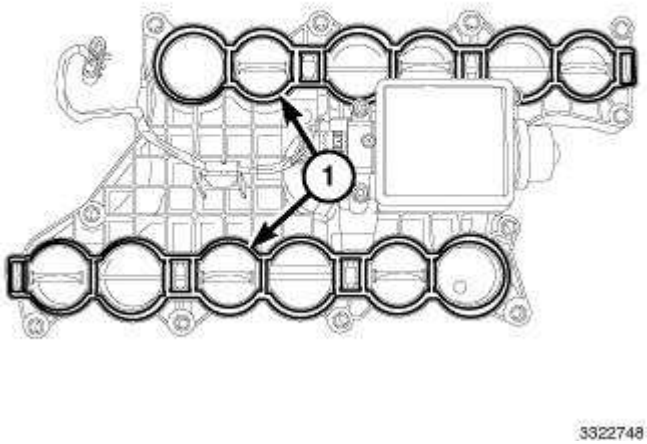

Fig. 429: Intake Manifold Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket sealing surfaces. Refer to **Engine - Standard Procedure**.
2. Install a new intake manifold gasket (1).

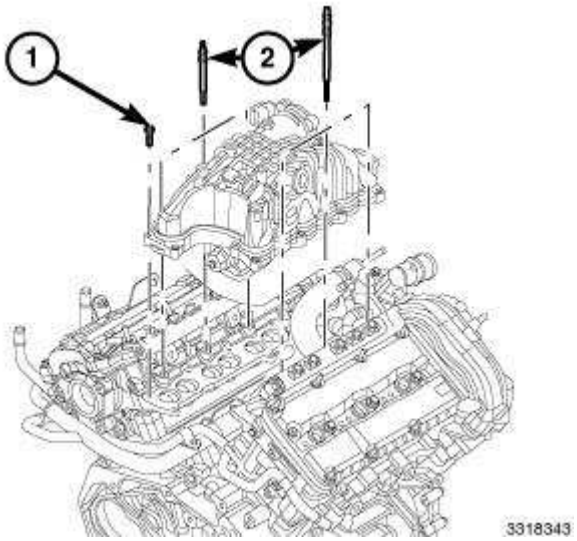

Fig. 430: Glow Plugs & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the intake manifold and tighten bolts finger tight.

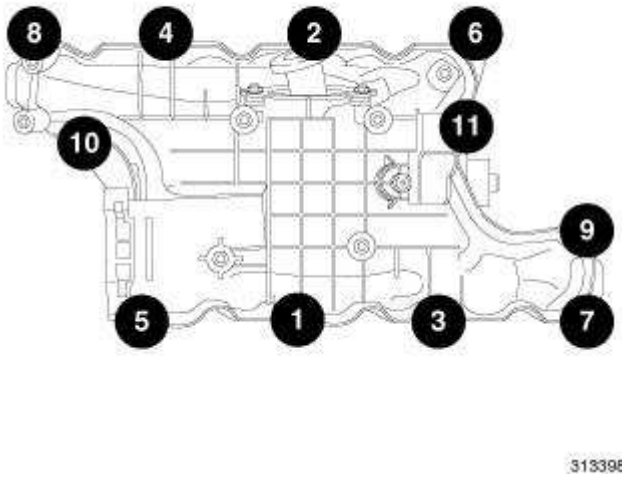

Fig. 431: Intake Manifold Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Using the tightening sequence shown in illustration, tighten bolts to 12 N.m (106 in. lbs.).

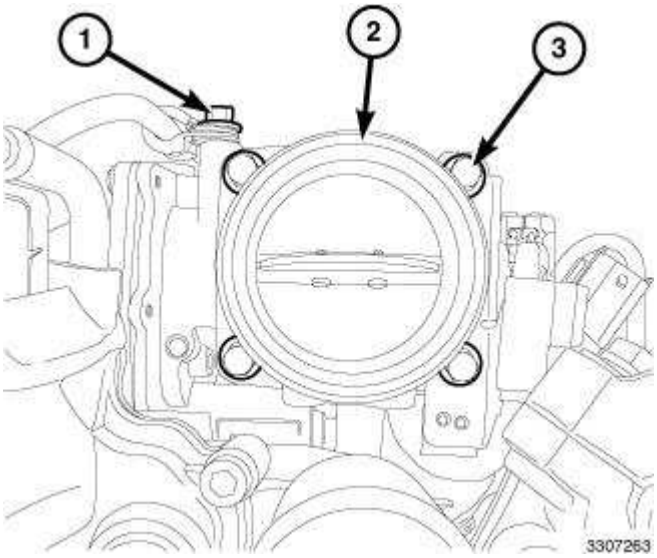

Fig. 432: (EGR) Air Flow Control Valve
Courtesy of CHRYSLER GROUP, LLC

5. Position and properly route and install the engine wiring harness.
6. Install the ball stud fastener and bolts and securely tighten.

NOTE: Fuel tubes are a one time only use and must be replaced anytime they have been removed.

7. Install the fuel tubes. Refer to **TUBE(S), FUEL, INSTALLATION** .
8. Install the EGR air flow control valve (2). Refer to **VALVE, EXHAUST GAS RECIRCULATION (EGR) AIRFLOW CONTROL, INSTALLATION** .
9. Install the turbocharger. Refer to **TURBOCHARGER, INSTALLATION**.
10. Connect the negative battery cable.
11. Start the engine, allow to warm, turn the engine off and inspect for leaks.

TURBOCHARGER SYSTEM

ACTUATOR, TURBOCHARGER

DESCRIPTION

DESCRIPTION

The turbocharger boost pressure servomotor is bolted to the side of the turbocharger housing and is responsible for controlling turbocharger boost pressure. It controls the boost pressure by varying the position of the guide vanes. The servomotor operates in response to a PWM signal from the Powertrain Control Module (PCM).

The turbocharger boost pressure servomotor is serviced with the turbocharger and **is not** serviceable separately. To replace the servomotor, replace the turbocharger. Refer to **TURBOCHARGER, REMOVAL**.

COOLER AND HOSES, CHARGE AIR

DESCRIPTION

DESCRIPTION

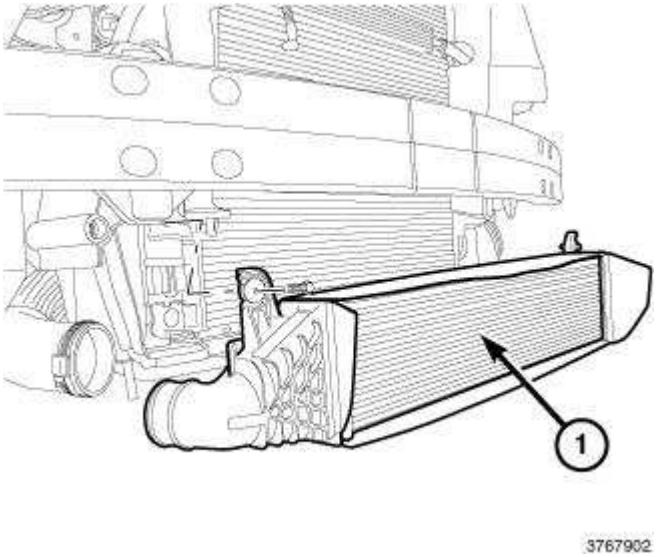

Fig. 433: Charge Air Cooler

Courtesy of CHRYSLER GROUP, LLC

The charge air system consists of a inlet air compressor which is part of the turbocharger housing, charge air cooler (1) located in front of the radiator, and charge air cooler plumbing.

The charge air cooler is a heat exchanger that uses air flow from vehicle motion to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases engine efficiency and power.

REMOVAL

REMOVAL

WARNING: If the engine was just turned off, the air intake system tubes may be hot.

NOTE: Note the location of the rubber air charge cooler to A/C condenser and air charger cooler to radiator air seals. The seals are use to prevent overheating and improve charge air and A/C efficiency.

1. Disconnect the battery negative cable.
2. Raise and support the vehicle.

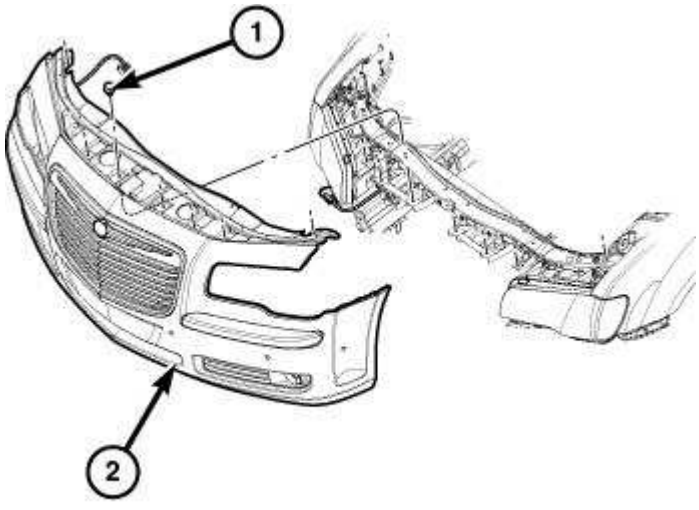

Fig. 434: Front Bumper Fascia & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the front bumper fascia hardware (1) and the fascia (2). Refer to **FASCIA, FRONT, REMOVAL** .

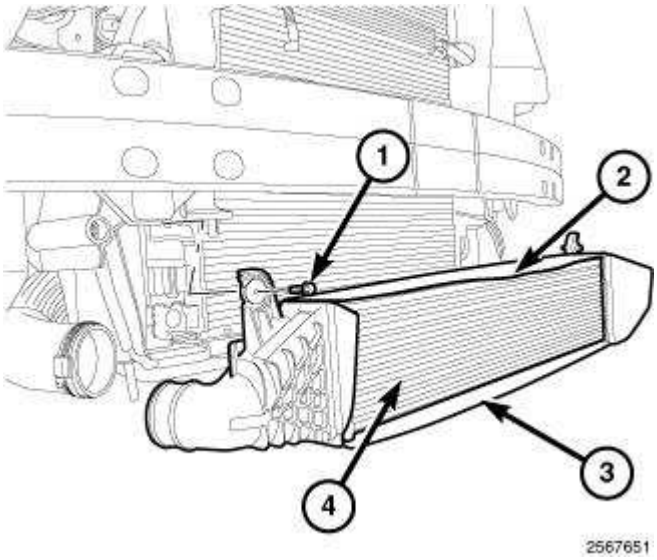

Fig. 435: Charge Air Cooler & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the hoses from the charge air cooler (4).

NOTE: Care must be taken not to damage the charge air cooler fins and the fins of other ancillary cooler components.

5. Remove the two mount bolts (1).
6. Lift the cooler up and then forward to allow the lower locators to clear the mount bushings.

CHARGE AIR COOLER HOSES

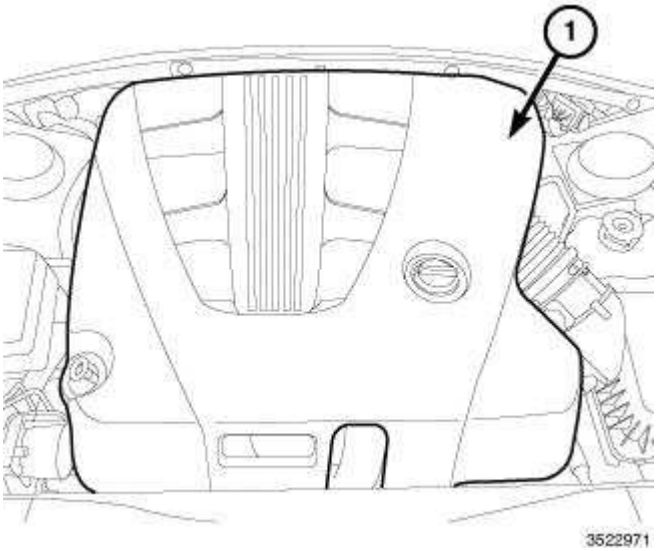

Fig. 436: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover (1).

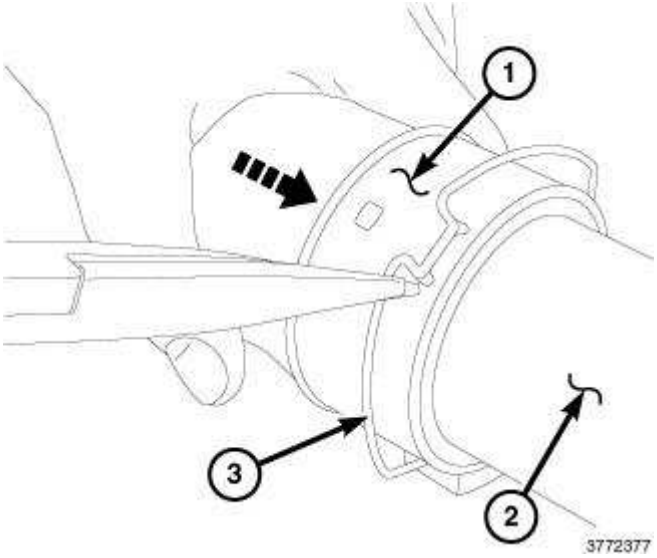

Fig. 437: Charge Air Cooler (CAC) Hose, Flange & Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Remove the Charge Air Cooler (CAC) hose (1) by pushing the hose into the cooler flange (2) while pulling the retainer (3) to the unseated position.

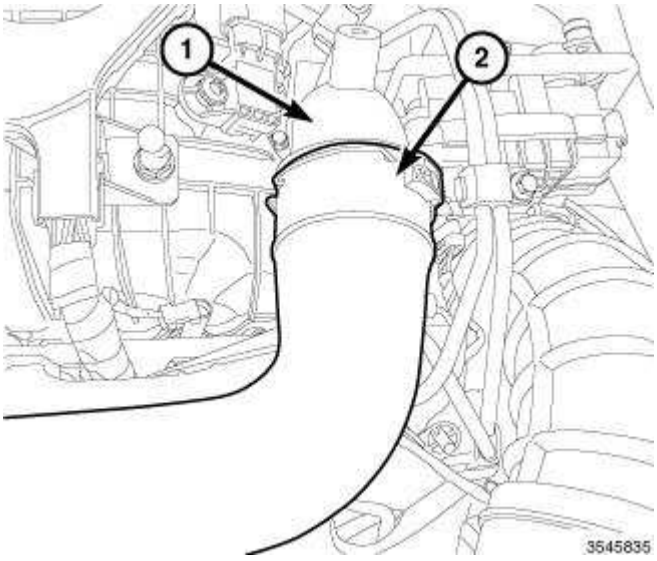

Fig. 438: Turbocharger & Charge Air Cooler (CAC) Hose
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the CAC hose (2) from turbocharger (1).

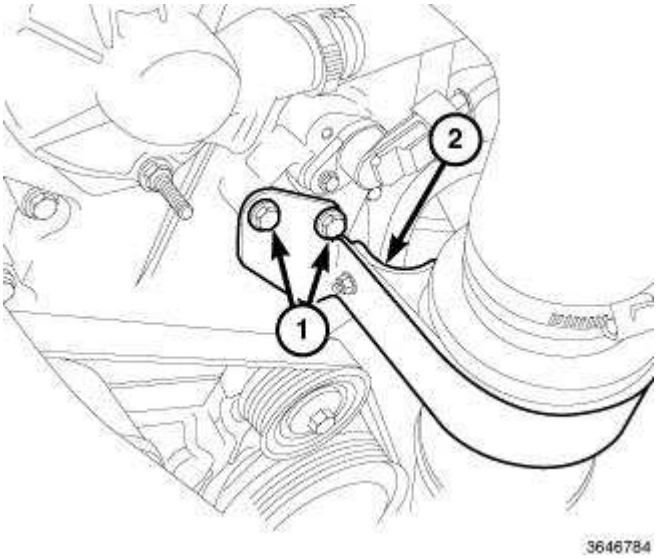

Fig. 439: CAC Hose Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two CAC bracket to timing cover bolts (1) and set the CAC hose assemble aside.
5. Disconnect and remove the left Charge Air Cooler (CAC) hose as an assembly.

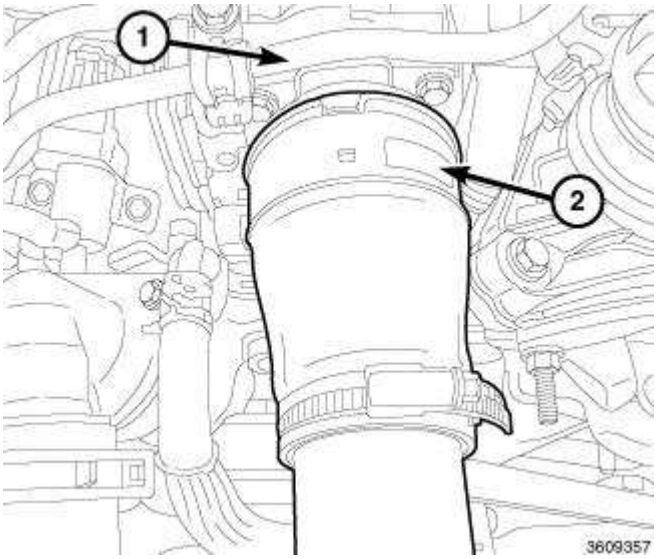

Fig. 440: EGR Air Flow Control Valve & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the right CAC hose (2) from the EGR air flow control valve.
7. Remove bolt securing the right CAC hose to lower timing cover.
8. Disconnect and remove the right CAC hose from the cooler.

INSPECTION

INSPECTION

Visually inspect the charge air cooler and plumbing for cracks, holes, loose clamps, or damage. Inspect the tubes, fins, and welds for tears, breaks, or other damage. Replace the charge air cooler if damage is found.

INSTALLATION

INSTALLATION

NOTE: Note the location of the rubber air charge cooler to A/C condenser and air charger cooler to radiator air seals. The seals are use to prevent overheating and improve charge air and A/C efficiency.

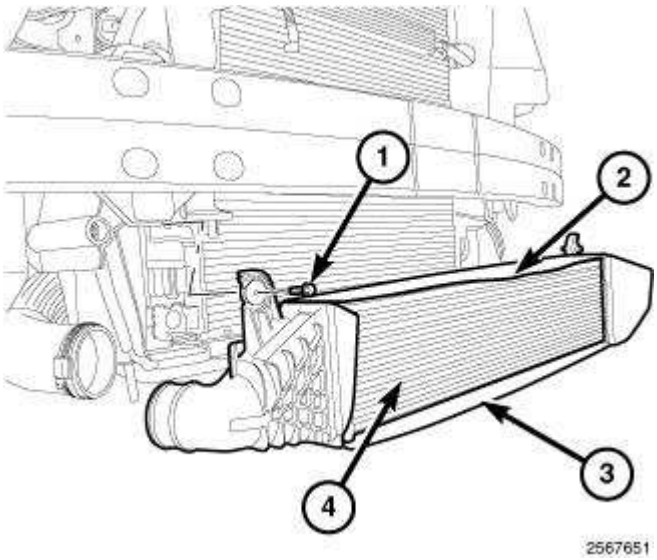

Fig. 441: Charge Air Cooler & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the charge air cooler (2) into the vehicle.
2. Press the charge air cooler to the radiator support till it clicks into place.
3. Install the two cooler bolts (1). Tighten the bolts to 14 N.m (124 in. lbs.)
4. Install the outlet hose to the charge air cooler with the clamp in position. Tighten the outlet clamp to 11 N.m (95 in. lbs.)

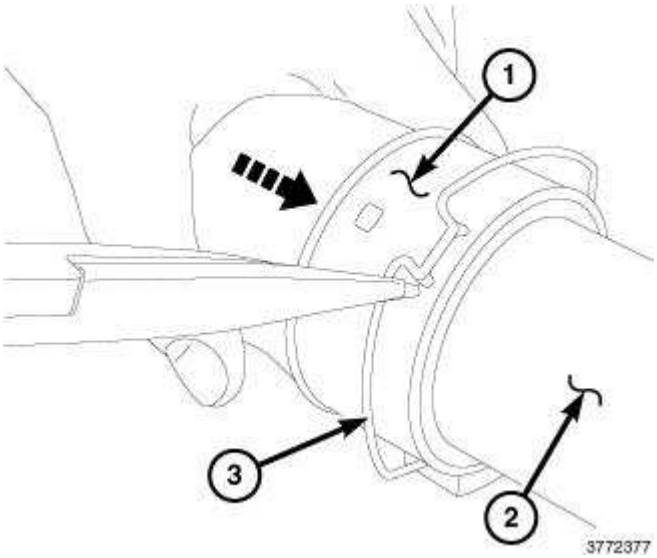

Fig. 442: Charge Air Cooler (CAC) Hose, Flange & Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the hose is fully seated before locking the hose retainer.

5. Install the inlet hose (1) onto the cooler inlet (2) and lock the hose retainer (3) into position.

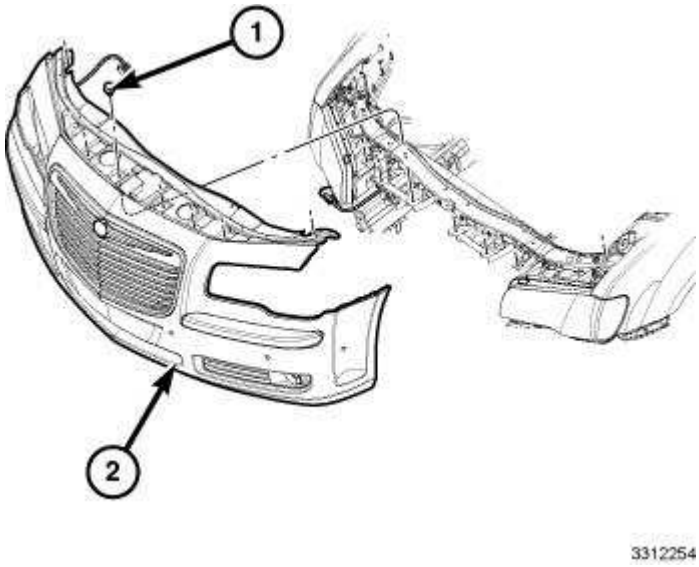

Fig. 443: Front Bumper Fascia & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install the front bumper fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
7. Lower the vehicle.
8. Connect the battery negative cable.
9. Start engine and check for leaks.

CHARGE AIR COOLER HOSES

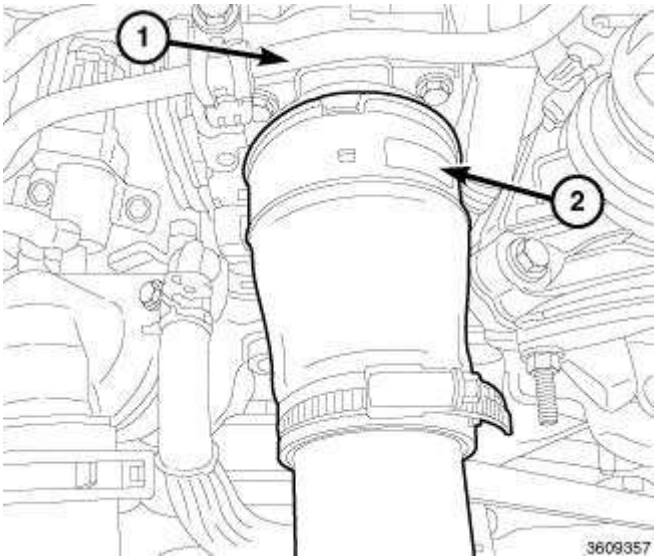

Fig. 444: EGR Air Flow Control Valve & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

1. Install and connect the right Charge Air Cooler (CAC) hose to the cooler.
2. Install the bolt that secures the CAC hose to the timing cover and tighten to 10 N.m (88.5 in. lbs.).
3. Connect the right CAC hose (2) to the EGR air flow control valve.

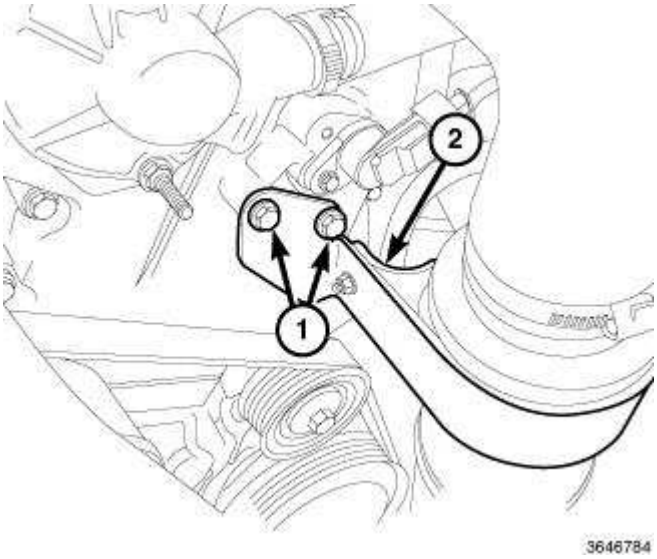

Fig. 445: CAC Hose Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install and connect the left CAC hose as an assembly.
5. Install the two bolts (1) securing the CAC hose and bracket (2) to timing cover and tighten to 10 N.m (88.5 in. lbs.).

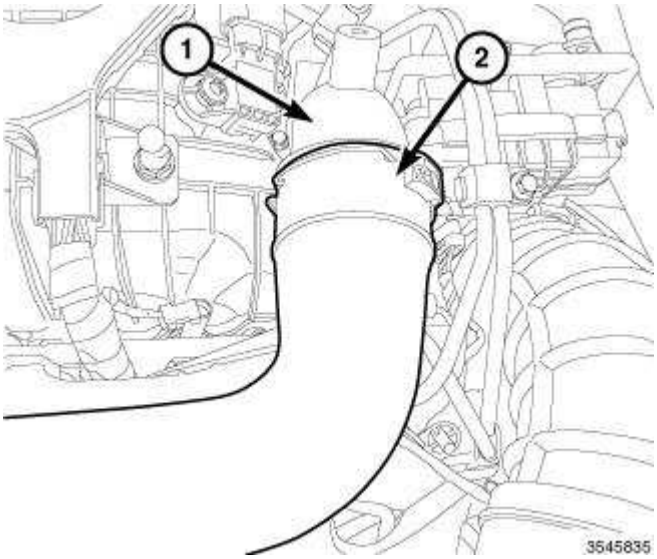

Fig. 446: Turbocharger & Charge Air Cooler (CAC) Hose
Courtesy of CHRYSLER GROUP, LLC

6. Connect the CAC hose (2) to the turbocharger (1).

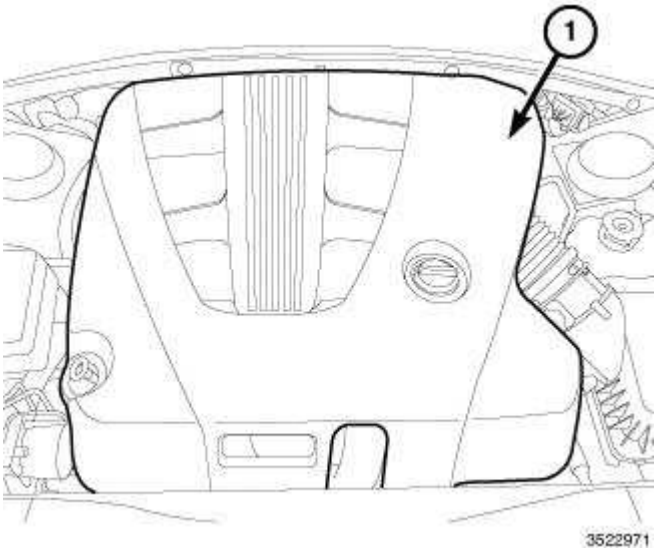

Fig. 447: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine cover (1).

TURBOCHARGER

DESCRIPTION

DESCRIPTION

CAUTION: The turbocharger is a performance part and must not be tampered with. The actuator bracket is an integral part of the turbocharger. Tampering with the actuator or other components can reduce durability by increasing cylinder pressure and thermal loading due to incorrect inlet and exhaust manifold pressure. Poor fuel economy and failure to meet regulatory emissions laws may result. Increasing the turbocharger boost WILL NOT increase engine power.

The turbocharger used on this vehicle is of the variable turbine type. These turbochargers use the entire exhaust energy to boost efficiency of the turbocharger and the engine.

The advantages of a turbocharger with variable turbine geometry are:

- Higher charge pressure already in the lower and in upper engine speed ranges.
- Higher torque as a result of improved cylinder charge.
- Reduction in exhaust emissions as a result of an improvement in the air supply of the engine.
- Increased power output as a result of the higher charge pressure combined with a reduced exhaust back pressure and thus improved charge cycle.

OPERATION

OPERATION

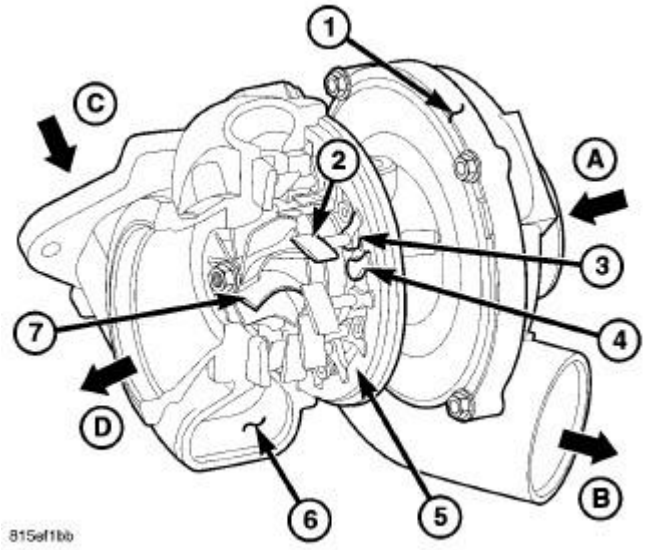

Fig. 448: Turbocharger Components
Courtesy of CHRYSLER GROUP, LLC

1 - COMPRESSOR HOUSING
2 - GUIDE VANE
3 - GUIDE STUD OF GUIDE VANE

4 - GUIDE STUD OF CONTROL LINKAGE
5- ADJUSTING RING
6 - TURBINE HOUSING
7 - TURBINE WHEEL
A - TURBO INLET (FRESH AIR)
B - TURBO OUTLET (COMPRESSED AIR)
C - EXHAUST GASES TO TURBINE WHEEL
D - EXHAUST OUTLET

The exhaust gases of the engine are directed through the exhaust manifold into the turbine housing (6) onto the turbine wheel (7). The flow energy of the exhaust gases cause the turbine wheel (7) to rotate. Consequently, the compressor wheel, which is connected through the turbine shaft with the turbine wheel (7), is driven at the same speed. The fresh air (A) inducted by the compressor wheel is compressed and passed to the engine.

The charge pressure is controlled by varying the position of the guide vanes (2). The guide stud (3) of the control linkage of the boost pressure actuator turns the adjusting ring (5) in the turbine housing (6). As a result, all the guide vanes (3) whose guide studs (4) likewise mesh into the adjusting ring (5), are also turned.

At low speeds, the flow cross-section is reduced by closing the guide vanes (2). Consequently the speed at which the exhaust gas impacts on the turbine wheel (7) is increased, as a result of which the speed of the turbocharger and thus the charge pressure rises.

At high engine speeds the guide vanes (2) are increasingly opened and the flow cross-section is thus enlarged, as a result of which the speed of the turbocharger reduces and the charge pressure drops.

The turbocharger guide vanes are controlled by the electronic actuator. The Powertrain Control Module (PCM) monitors the boost and charge air changes to the turbocharger system during operation. The PCM sends a PWM signal to the actuator. The actuator will then respond to the signal adjusting the guide vanes.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TURBOCHARGER

The turbocharger, charge air cooler and exhaust gas recirculation systems operate with one another and must be tested as a complete system. It is important that all components of the air intake system be thoroughly tested any time a symptom is present for one of these components.

It is typical to notice a small amount of engine oil in the air intake system. This comes from the crankcase ventilation and may weep out of hose connections that are not clamped properly. This does not mean that the turbocharger requires replacement.

If DTC's or the performance of the vehicle lead to the determination that the boost pressure and/or mass air flow values are out of range, the systems listed below should be inspected. If a DTC for the

inlet or intake air temperature has been stored, refer to the appropriate diagnostics.

NOTE: Also a continuous air leak may result in an intermittent symptom. The Powertrain Control Module (PCM) monitors the sensor readings continuously but only sets a DTC or reduces the engine torque when these readings are outside of the tolerances, which may occur under certain driving conditions.

Inspect the following:

- Air intake system plumbing: Loose or broken hoses or fittings may create an air leak resulting in a loss of pressure and mass air flow. (A smoke machine does not create enough pressure to find a leak in the air intake system).
- Turbo Resonator: Inspect the resonator (muffler, connected to the turbocharger) for air leaks at the seam between the two shells.
- Charge Air Cooler: A charge air cooler damaged by tools or external debris may leak air.
- Exhaust Gas Recirculation (EGR) valve: A sticking EGR valve influences the mass air flow causing implausibility with MAF, which displays one or more DTC's. Don't replace the EGR valve if no DTC's are present. Use the actuator test in the scan tool to move the EGR valve at idle speed. The MAF value should alternate between 500 to 600 mg/strk at 5% ratio (almost closed) and 200 to 300 mg/strk at 95% ratio (almost opened) when the "EGR Positioner" is being actuated by the scan tool.
- Mass Air Flow Sensor (MAF): The mass air flow, measured and provided by the MAF is critical for calculations performed by the PCM and may result in several DTC's related to the air intake system if not accurate.
- Boost Pressure Sensor: Make sure that the correct part number, or superseding part number, is installed. Refer to MOPAR® for the correct part number information.
- Turbocharger: Refer to **TURBOCHARGER DIAGNOSTIC PROCEDURE**. Consider that an operating turbocharger creates a flow sound, which is normal and does not require replacement. Other sounds like whistling are potentially caused by the resonator or improper line connections.

TURBOCHARGER DIAGNOSTIC PROCEDURE

1. Visually inspect all the blades of the turbocharger compressor and turbine wheel for damage which may have been caused by foreign particles. For example if the air filter was improperly installed or an incorrect air filter was installed.

   CAUTION: Do NOT try to move the actuator mechanism by pushing or pulling the connecting rod. There is a worm gear attached to the actuator mechanism, which doesn't allow any movement from its output side.

2. If the actuator mechanism doesn't move at all check power and ground supply of the actuator.
3. If the actuator mechanism doesn't move even though the electrical connection has been verified or moves erratically the turbocharger assembly is defective and must be replaced.

REMOVAL

REMOVAL

9. Remove the left side exhaust manifold. Refer to **MANIFOLD, EXHAUST, REMOVAL**.

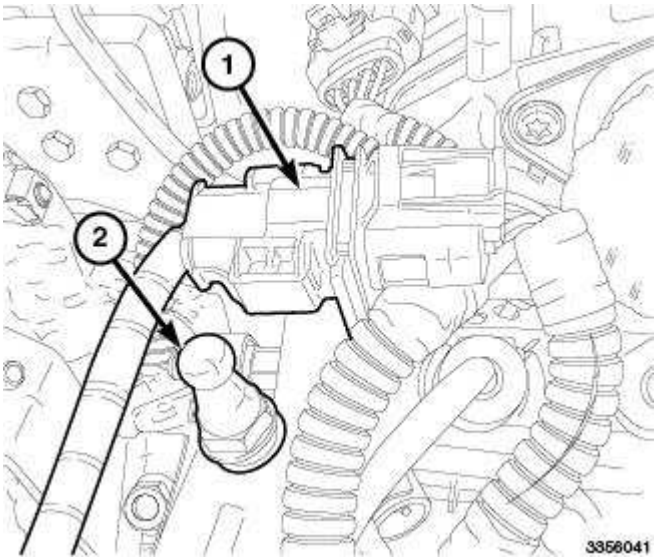

Fig. 455: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the O2 sensor wiring harness connector (1).
11. Remove the upper transmission indicator tube ball stud fastener (2).
12. Remove the transmission oil indicator tube mounting bracket.

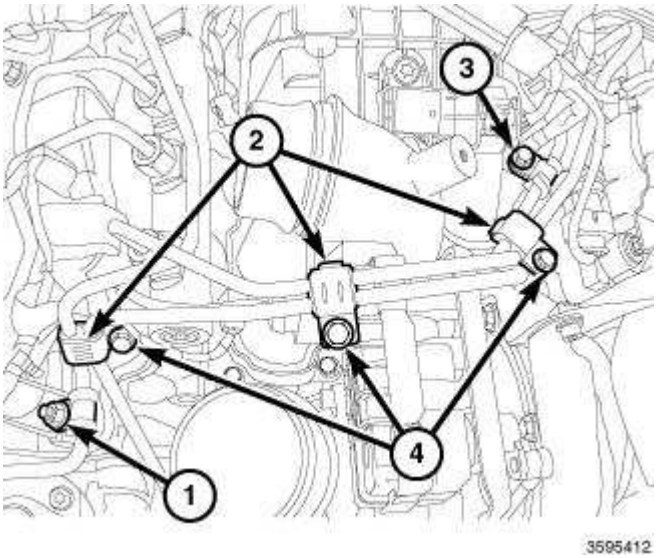

Fig. 456: Fuel Tube Securing Bolts & Bracket
Courtesy of CHRYSLER GROUP, LLC

13. Remove nut (1) securing the fuel tube.
14. Remove bolt (3) securing the fuel tube.
15. Remove bolts (4) and the bracket (2) securing the fuel tubes.

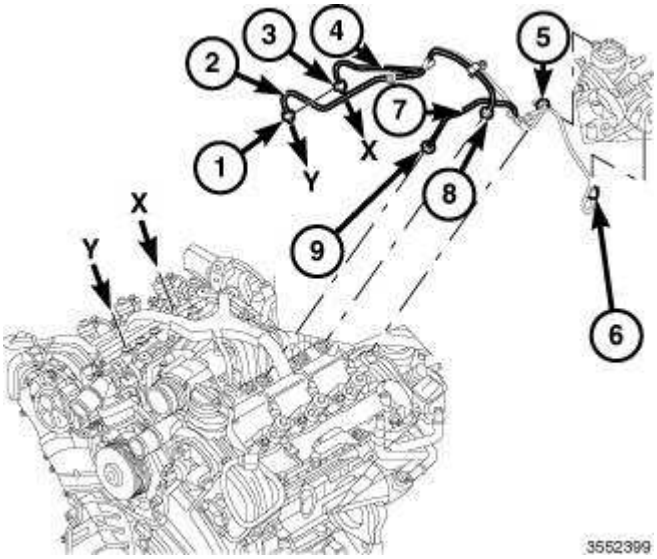

Fig. 457: High Pressure Fuel Crossover Tube, Left High Pressure Fuel Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fuel lines are a one time use only. The fuel lines must be discarded and a new line must be installed.

16. Loosen union nuts (3, 8) and remove the high pressure fuel crossover tube (4) and discard fuel tube.
17. Loosen union nuts (6, 9) and remove the left high pressure fuel tube (7) and discard fuel tube.

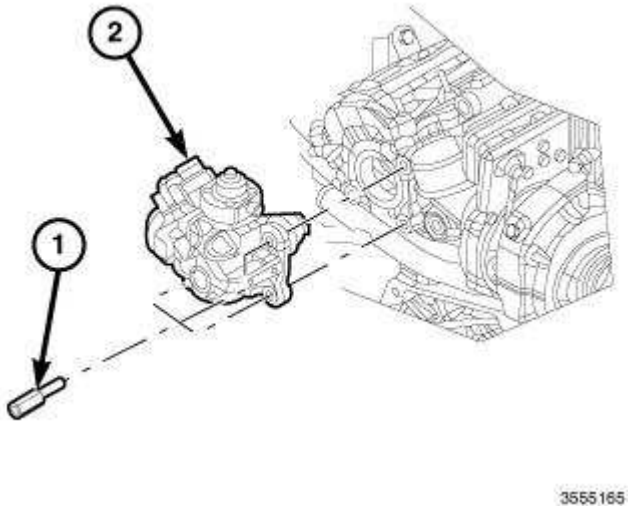

Fig. 458: Fuel Injection Pump
Courtesy of CHRYSLER GROUP, LLC

18. Remove the fuel injection pump. Refer to **PUMP, FUEL INJECTION, HIGH PRESSURE, REMOVAL** .

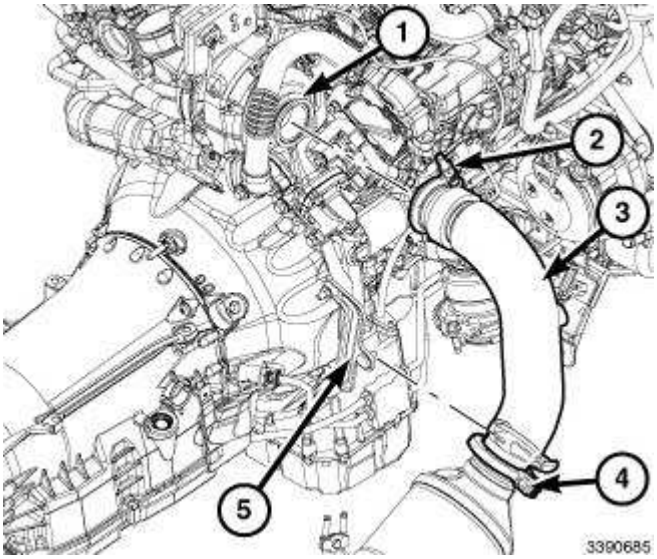

Fig. 459: Turbocharger Outlet, Exhaust Down Pipe & Clamps
Courtesy of CHRYSLER GROUP, LLC

19. Disconnect the turbocharger actuator electrical connector.
20. Loosen the clamp (2) for the exhaust down pipe (4) from the turbocharger outlet (1) and separate the downpipe from the outlet flange.
21. Raise and support the vehicle.
22. Loosen the nut that mounts the downpipe (3) to the transmission mount bracket (5).
23. Loosen the upper Diesel Particulate Filter (DPF) clamp (4) from the down pipe (3).
24. Lower the vehicle.
25. Remove the down pipe from the engine compartment.

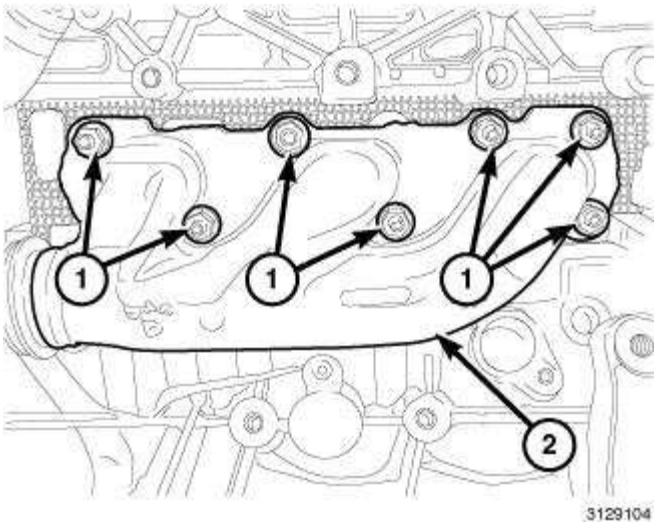

Fig. 460: Right Exhaust Manifold & Nuts
Courtesy of CHRYSLER GROUP, LLC

26. Remove the right side exhaust manifold (2). Refer to **MANIFOLD, EXHAUST, REMOVAL**.

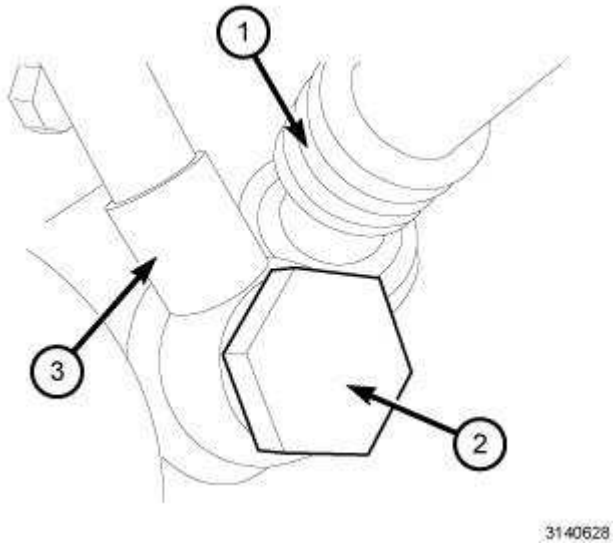

Fig. 461: Upper Banjo Bolt & Turbocharger Supply Lines
Courtesy of CHRYSLER GROUP, LLC

27. Remove the banjo bolt (2) at the engine block for the turbocharger supply line (3).

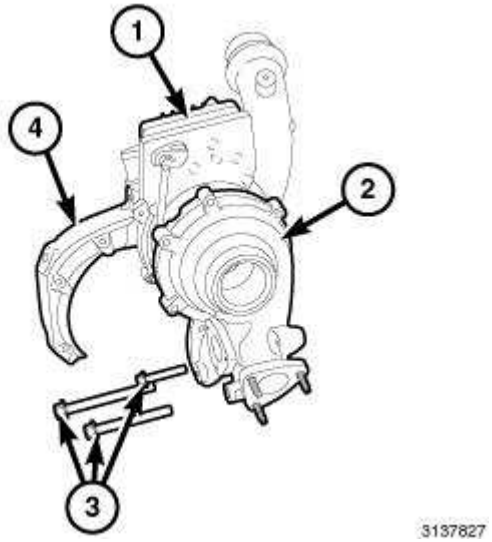

Fig. 462: Actuator, Turbo, Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

28. Remove the turbo mounting bolts (3).

NOTE: The turbocharger oil return line is fitted into a rubber grommet on the engine block. Care must be used when removing the turbocharger, that the return line is not damaged.

29. With care, lift the turbo upwards and away from the engine block, to remove the turbocharger oil return tube from the engine block.
30. If needed, remove the heat shield (4).
31. If needed, remove the actuator (1).

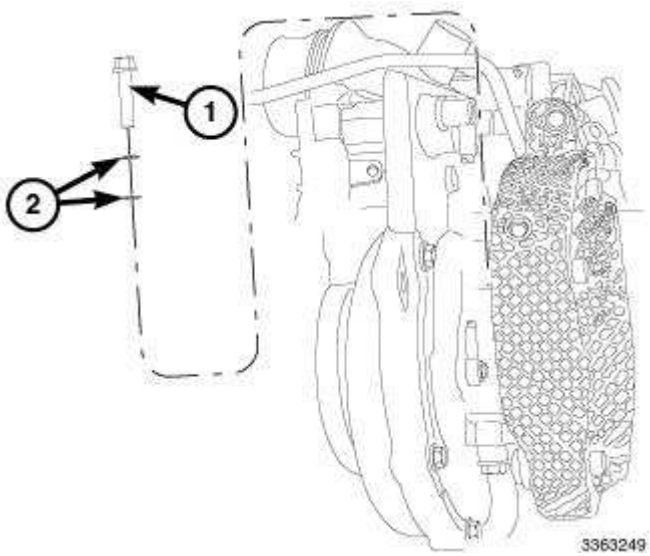

Fig. 463: Upper Turbocharger Supply Line Banjo Bolt & Copper Washers
Courtesy of CHRYSLER GROUP, LLC

32. Remove the upper turbocharger supply line banjo bolt (1).
33. Remove the supply line from the turbocharger.

INSPECTION

INSPECTION

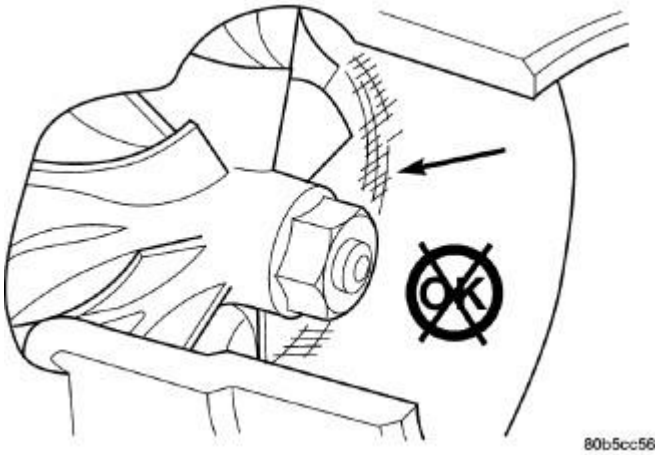

Fig. 464: Inspect Compressor Housing For Impeller Rubbing Condition
Courtesy of CHRYSLER GROUP, LLC

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

1. Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:
   - Cracks in the turbine and compressor housing that go completely through.
   - Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
   - Cracks in the mounting flange that intersect bolt through-holes.
   - Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.
2. Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips. Note: Some impellers may have a factory placed paint mark which, after normal operation, appears to be a crack. Remove this mark with a suitable solvent to verify that it is not a crack.
3. Visually inspect the turbocharger compressor housing for an impeller rubbing condition. Replace the turbocharger if the condition exists.

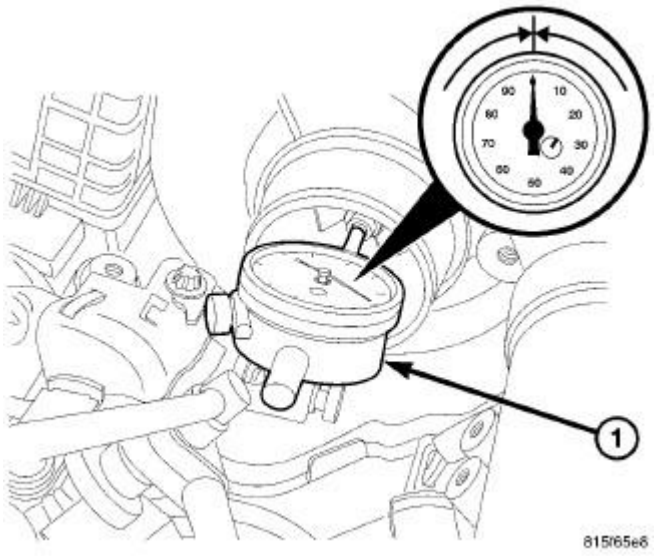

Fig. 465: Measuring Turbocharger End Play
Courtesy of CHRYSLER GROUP, LLC

1 - DIAL INDICATOR

4. Measure the turbocharger end play:
   1. Install a dial indicator (1) as shown in illustration. Zero the indicator at one end of travel.
   2. Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.026 mm (0.0001 in.) MIN. and 0.127 mm (0.005 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

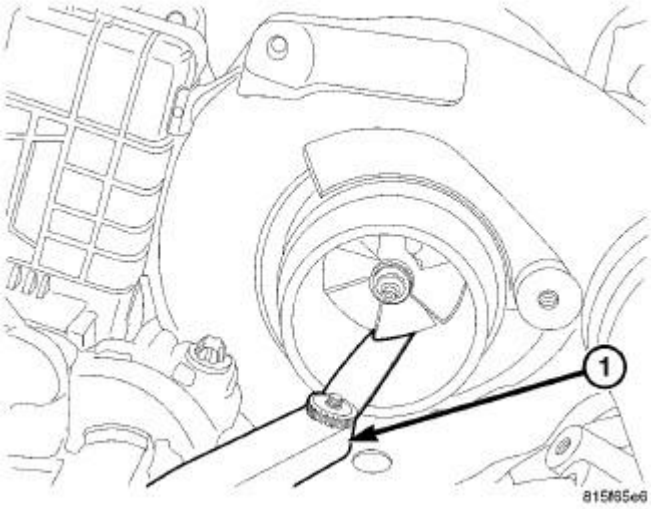

Fig. 466: Measuring Turbocharger Radial Bearing Clearance
Courtesy of CHRYSLER GROUP, LLC

1 - FEELER GAGE

5. Measure the turbocharger bearing radial clearance:
    1. Insert a narrow blade or wire style feeler gauge (1) between the compressor wheel and the housing.
    2. Gently push the compressor wheel toward the housing and record the clearance.
    3. With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.
    4. Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.
    5. Allowable radial bearing clearance is 0.076 mm (0.003 in.) MIN. and 0.102 mm (0.040 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assembly.

INSTALLATION

INSTALLATION

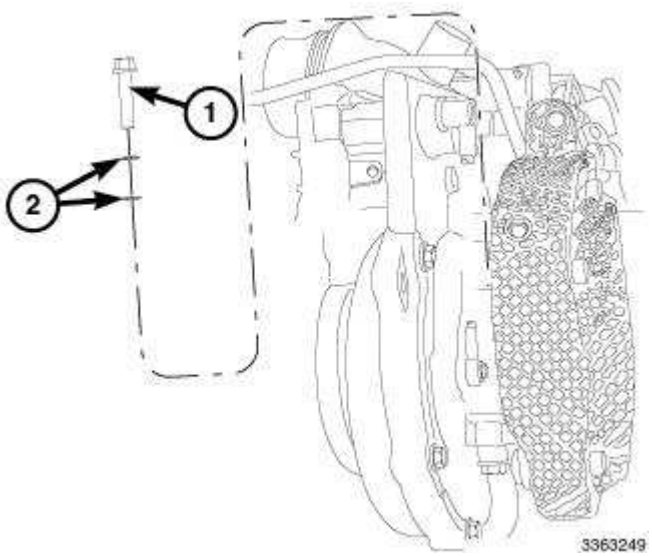

Fig. 467: Upper Turbocharger Supply Line Banjo Bolt & Copper Washers
Courtesy of CHRYSLER GROUP, LLC

1. Install new copper washers (2) for the oil supply line at the turbocharger. **Loosely** install the banjo bolt.

   NOTE: Do to tight clearances. To aid in installation. Use a petroleum based gel to hold a new copper washer to the engine block to allow installation of the oil supply line banjo bolt when the turbocharger is positioned into place.

2. Using a new copper washer for the oil supply line. Apply a petroleum base gel to one side of the washer and press it into the engine block side of the turbocharger supply port.

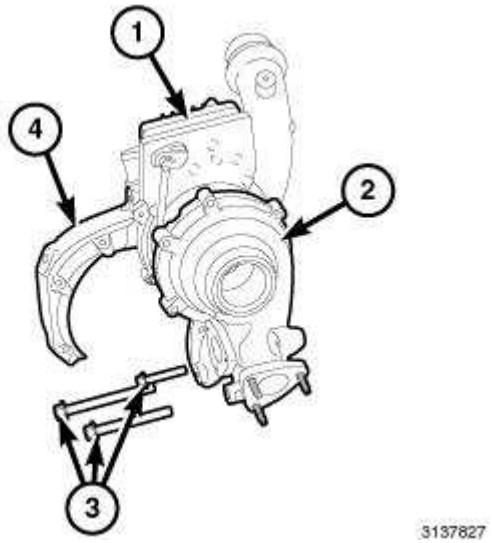

Fig. 468: Actuator, Turbo, Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install new oil return line grommet into the engine block.
4. Using care, position the turbo on to the engine block while guiding the oil return tube into the grommet.
5. Install the M10 mounting bolts to the engine block. Tighten M10 bolts to 55 N.m (41 ft. lbs.).
6. Install the M8 mounting bolt to the cylinder head. Tighten M8 bolts to 25 N.m (18 ft. lbs.).

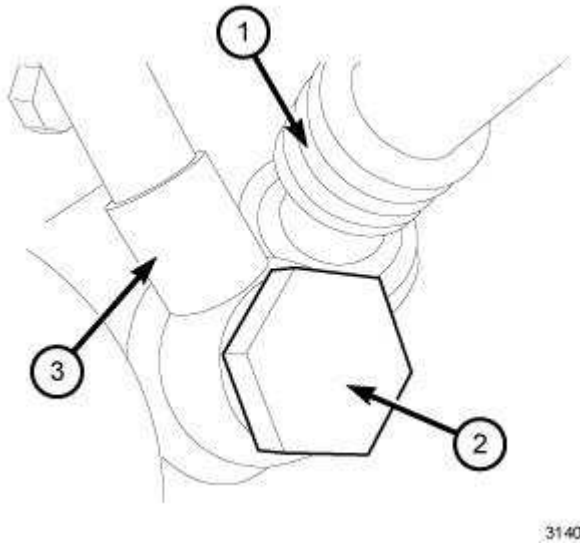

Fig. 469: Upper Banjo Bolt & Turbocharger Supply Lines
Courtesy of CHRYSLER GROUP, LLC

7. Install a new copper washer onto the supply line banjo bolt (2).
8. Tighten the oil supply line banjo bolt (2) at the engine block to 35 N.m (26 ft. lbs.).
9. Tighten the upper banjo bolt (1) to 25 N.m (18 ft. lbs.).

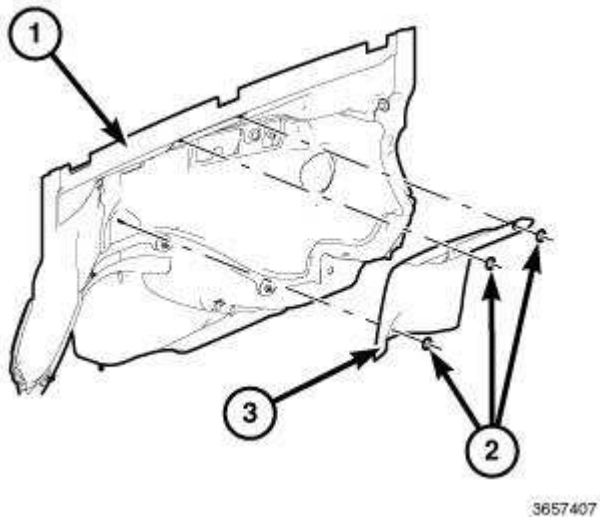

Fig. 470: Dash Extension, Heatshield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Install the dash extension heat shield (3). Tighten the nuts (2) to 3 N.m (27 in. lbs.).

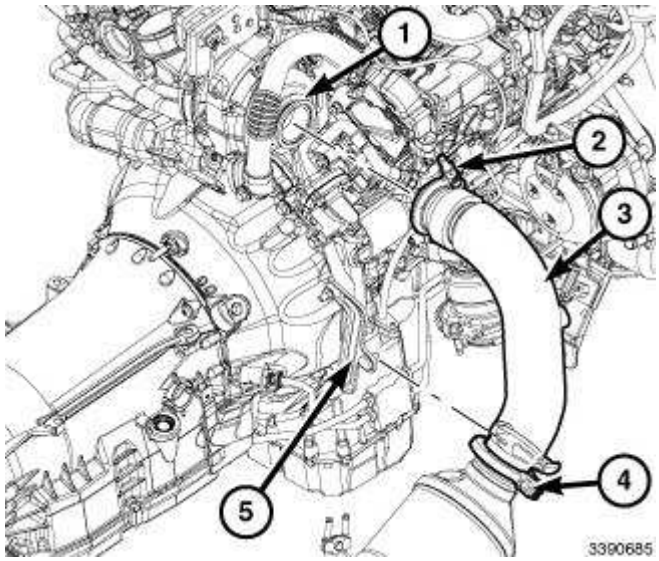

Fig. 471: Turbocharger Outlet, Exhaust Down Pipe & Clamps
Courtesy of CHRYSLER GROUP, LLC

11. Position the exhaust downpipe (3) onto the turbocharger outlet nozzle (1) and tighten the clamp (2) to 25 N.m (18 ft. lbs.).
12. Raise and support the vehicle.
13. Align the downpipe (3) to the Diesel Particulate Filter (DPF).
14. Mount the exhaust to the transmission mounting bracket (5). Tighten the nut to 26 N.m (19 ft. lbs.).
15. Lower the vehicle.

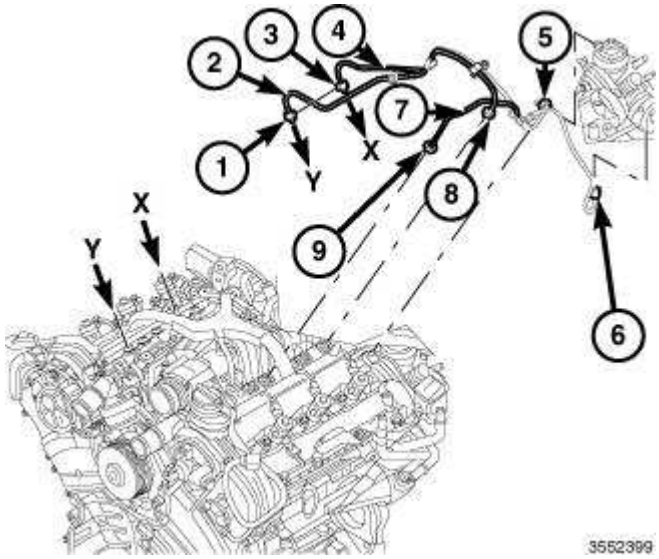

Fig. 472: High Pressure Fuel Crossover Tube, Left High Pressure Fuel Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The fuel lines are a one time use only. The fuel lines must be discarded and a new line must be installed.**

16. Install a new fuel cross over line (4). Tighten the union nuts (3 and 8) to 5 N.m (44 in. lbs.) plus an additional 75 degrees turn.
17. Install a new left high pressure fuel tube (7). Tighten union nut (6 and 9) to 5 N.m (44 in. lbs.) plus an additional 75 degrees turn.

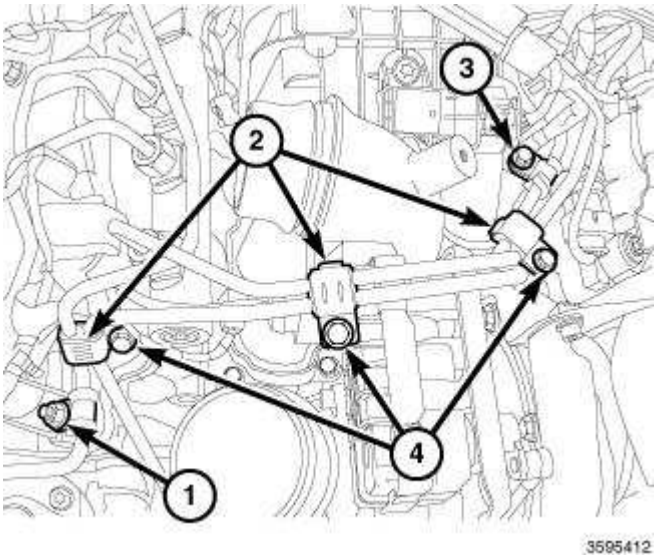

Fig. 473: Fuel Tube Securing Bolts & Bracket
Courtesy of CHRYSLER GROUP, LLC

18. Install the bolts (4) to the brackets (2) that secure the fuel tubes. Tighten to 11 N.m (97 in. lbs.).
19. Install the bolt securing the fuel line to the intake manifold (3). Tighten to 11 N.m (97 in. lbs.).
20. Install the nut (1) that secures the fuel line to the valve cover stud. Tighten to 11 N.m (97 in. lbs.).

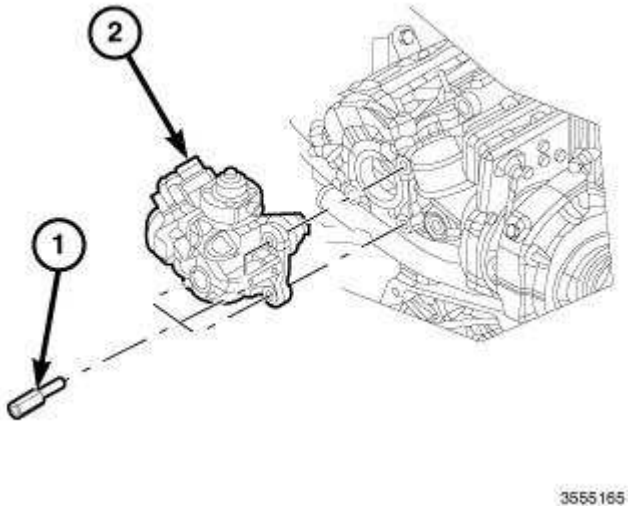

Fig. 474: Fuel Injection Pump
Courtesy of CHRYSLER GROUP, LLC

21. Install the fuel injection pump. Refer to **PUMP, FUEL INJECTION, HIGH PRESSURE, INSTALLATION** .

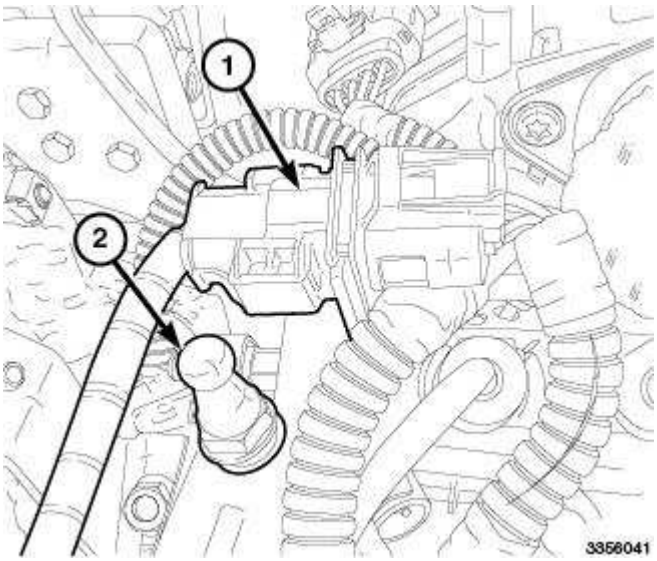

Fig. 475: Oxygen Sensor Connector & Ball Stud Fastener
Courtesy of CHRYSLER GROUP, LLC

22. Install the upper transmission indicator tube bracket. Tighten the stud (2) to 15 N.m (11 ft. lbs.).
23. Connect the O2 sensor wiring harness connector (1) and install it into the bracket.

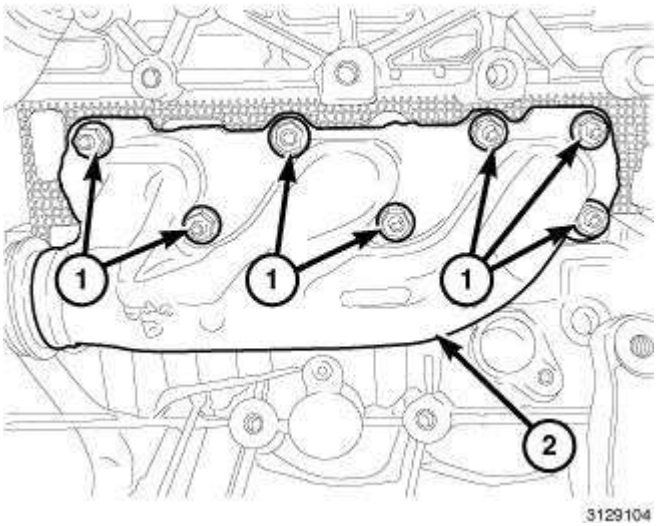

Fig. 476: Right Exhaust Manifold & Nuts
Courtesy of CHRYSLER GROUP, LLC

24. Install the right side exhaust manifold. Refer to **MANIFOLD, EXHAUST, INSTALLATION**.

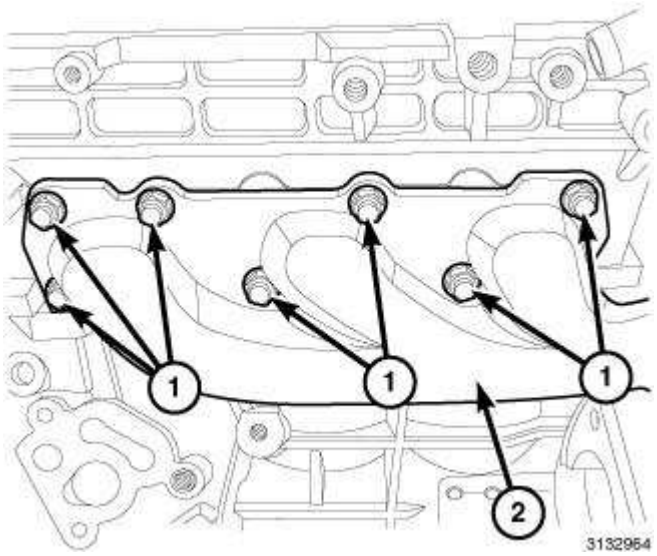

Fig. 477: Left Exhausts Manifold & Nuts
Courtesy of CHRYSLER GROUP, LLC

25. Install the left side exhaust manifold. Refer to **MANIFOLD, EXHAUST, INSTALLATION**.

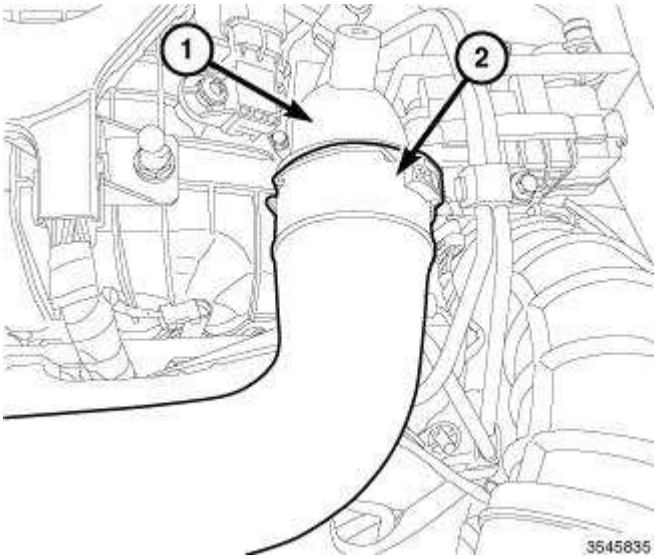

Fig. 478: Turbocharger & Charge Air Cooler (CAC) Hose
Courtesy of CHRYSLER GROUP, LLC

26. Install the CAC to the resonator.
27. Install the CAC hose (2) to the turbocharger (1).

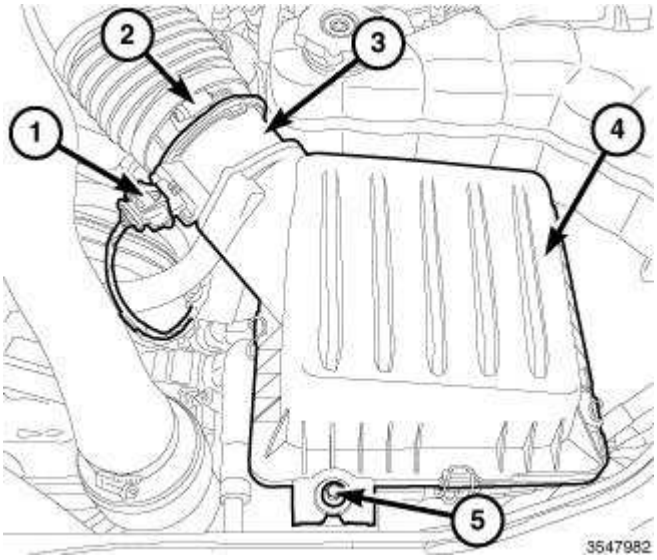

Fig. 479: Mass Air Flow (MAF) Sensor, Connector, Clamp, Air Cleaner Body & Fasteners
Courtesy of CHRYSLER GROUP, LLC

28. Install the air cleaner and air tube assembly. Refer to **BODY, AIR CLEANER, INSTALLATION**.
29. Connect the negative battery cable.

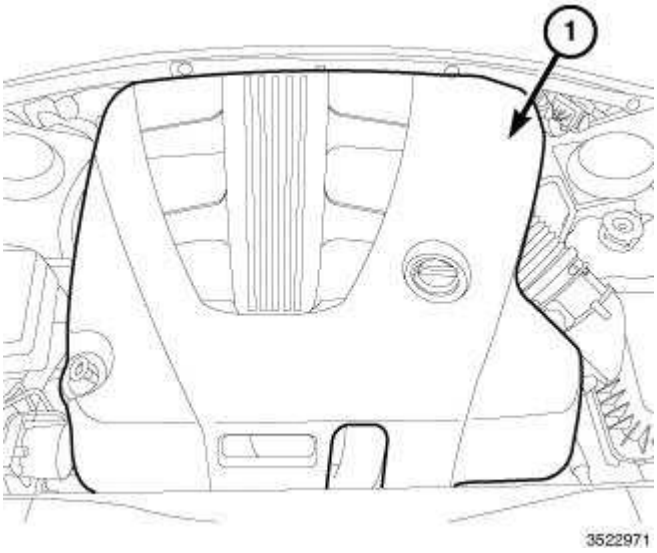

Fig. 480: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

30. Install the engine cover.

VALVE TIMING

STANDARD PROCEDURE

CAMSHAFT TIMING PROCEDURE

LEFT CAMSHAFT

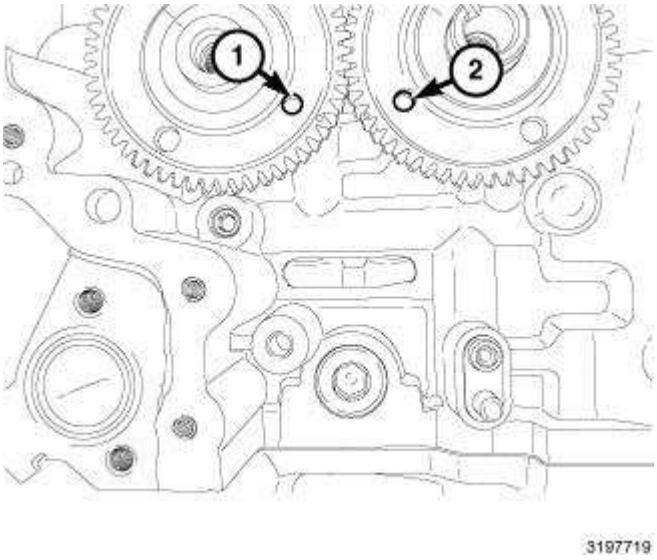

Fig. 481: Intake Camshaft Gear Timing Mark & Exhaust Camshaft Timing Gear Mark
Courtesy of CHRYSLER GROUP, LLC

1. The intake camshaft gear timing mark (1) should be at the four O'clock position and the exhaust camshaft timing gear mark (2) should be at the seven O'clock position.

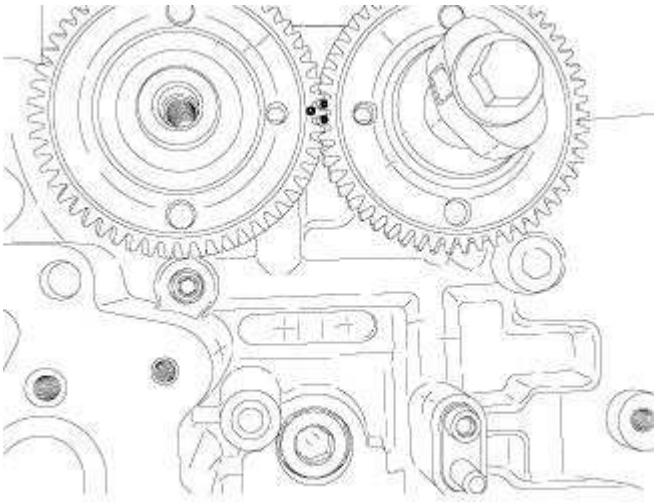

Fig. 482: Left Camshaft Gear Dots
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the camshafts to line up the three camshaft gear dots and install the left (special tool #VM.10338-2, Timing Tool, Camshaft (Left)) (1).

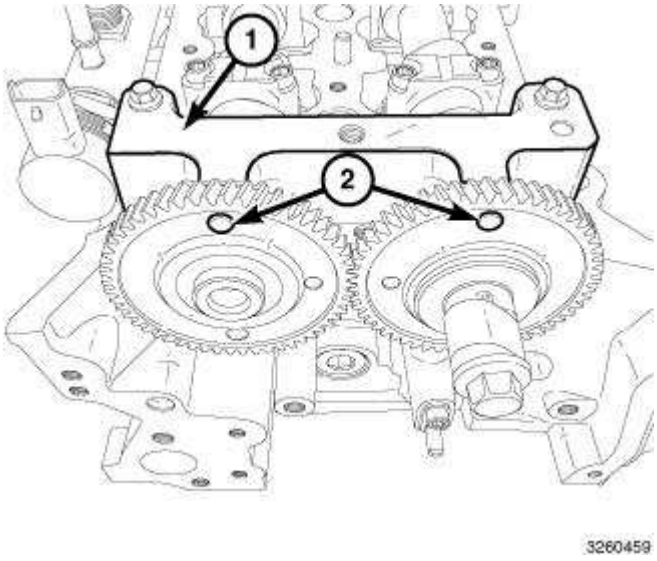

Fig. 483: Camshaft Timing Tool & Sprockets Holes - Left
Courtesy of CHRYSLER GROUP, LLC

3. If the (special tool #VM.10338-2, Timing Tool, Camshaft (Left)) (1) locking pins don't align up and fit into the holes (2) on the camshaft gears then the camshafts are not timed properly.

RIGHT CAMSHAFT

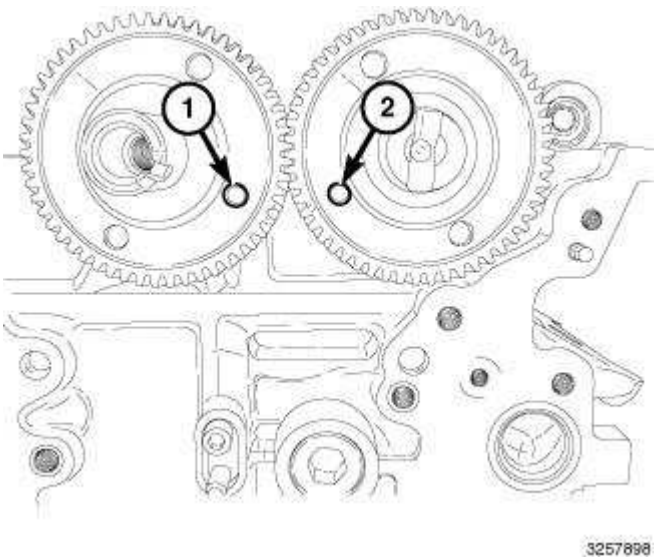

Fig. 484: Exhaust Camshaft Gear Timing Mark & Intake Camshaft Timing Gear Mark
Courtesy of CHRYSLER GROUP, LLC

1. The exhaust camshaft gear timing mark (1) should be at the four O'clock position and the intake camshaft timing gear mark (2) should be at the seven O'clock position.

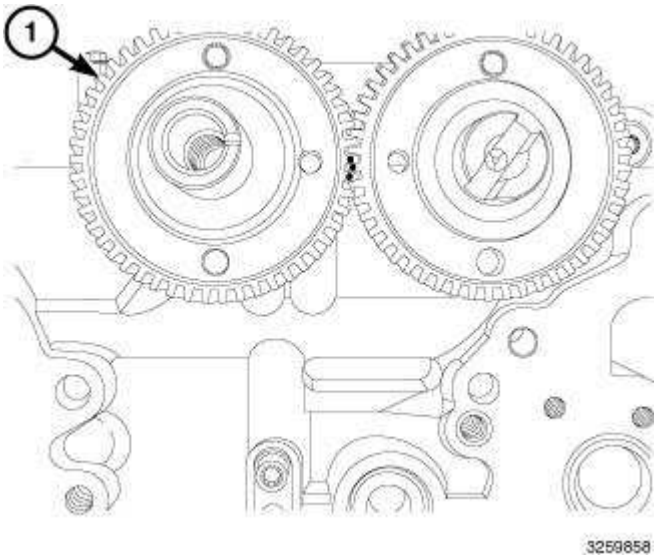

Fig. 485: Right Camshaft Gear Dots
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the camshafts to line up the three camshaft gear dots and install the right (special tool #VM.10338-1, Timing Tool, Camshaft (Right)) (1).

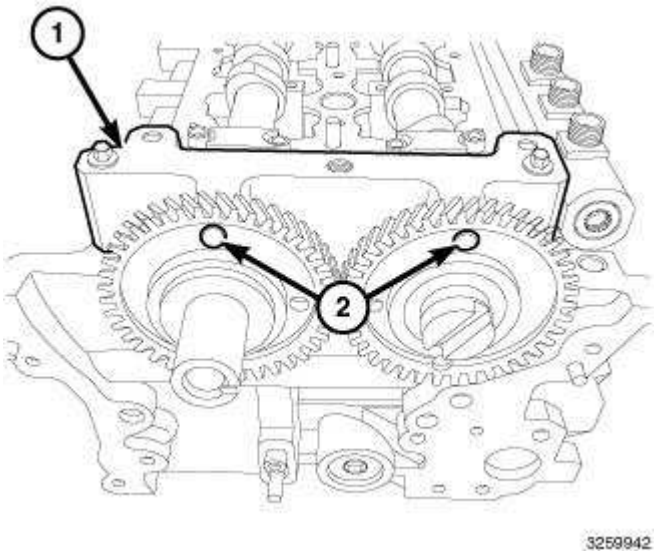

Fig. 486: Camshaft Timing Tool & Sprockets Holes - Right
Courtesy of CHRYSLER GROUP, LLC

3. If the (special tool #VM.10338-1, Timing Tool, Camshaft (Right)) (1) locking pins don't align up and fit into the holes (2) on the camshaft gears then the camshafts are not timed properly.

LOCKING ENGINE 30 DEGREES AFTER TDC

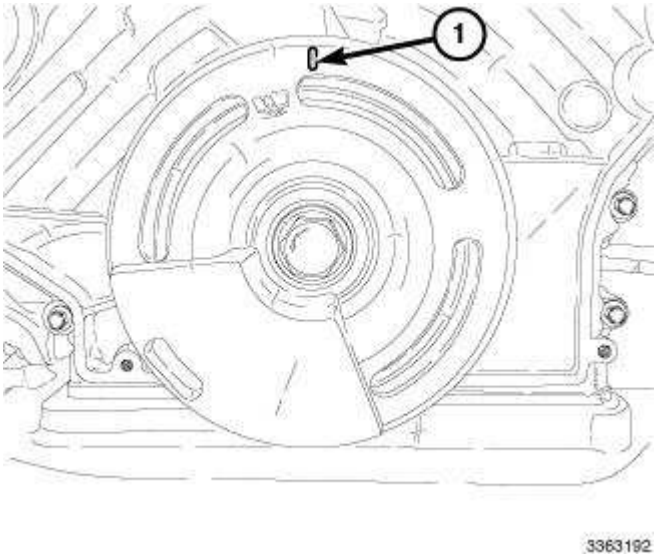

Fig. 487: Crankshaft At 12 O'clock Position
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Rotate the engine until timing mark (1) on the crankshaft is at the 12 O'clock position, (this is 30° ATDC).

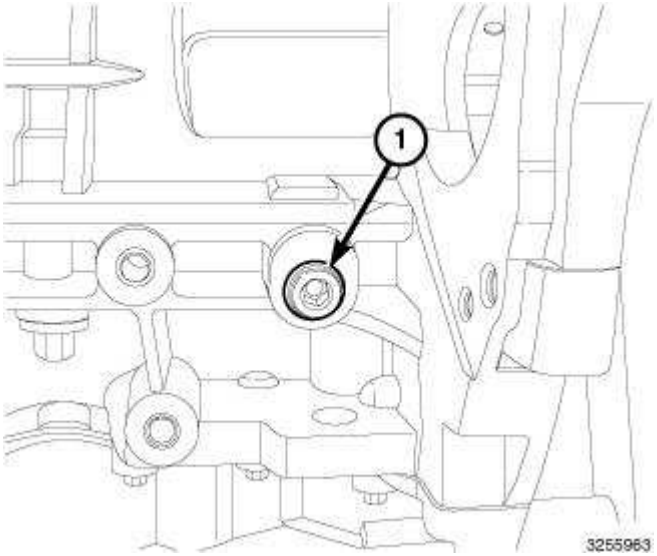

Fig. 488: Engine Block Plug
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine block plug (1).

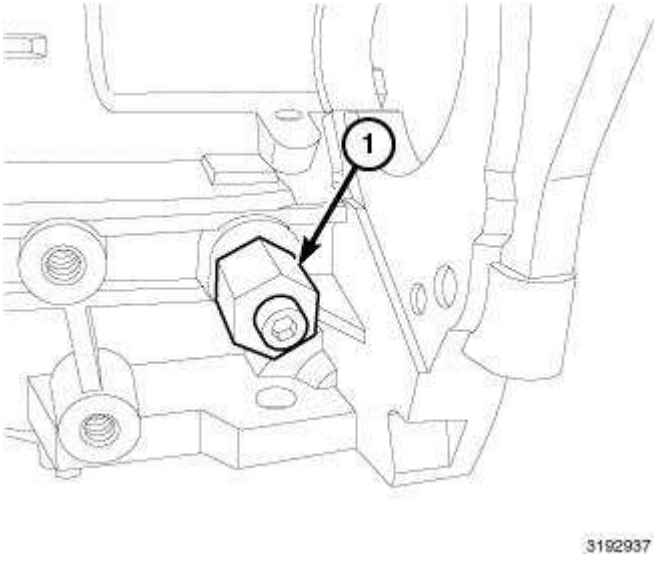

Fig. 489: Crankshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

4. Install the (special tool #VM.10339, Tool, Crankshaft Timing) (1) into the starter side of the engine block. If the (special tool #VM.10339, Tool, Crankshaft Timing) does not fully go into the engine block and stops short, the engine is not properly set to 30° ATDC. Rotate the engine so the (special tool #VM.10339, Tool, Crankshaft Timing) fully engages into engine block and crankshaft. Once full engaged thread tool into engine block and install the bolt. The crankshaft is now set at 30° ATDC.

CHAIN AND SPROCKETS, TIMING

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the lower timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
3. Lock the engine to 30 degrees ATDC. Refer to **Engine/Valve Timing - Standard Procedure**.

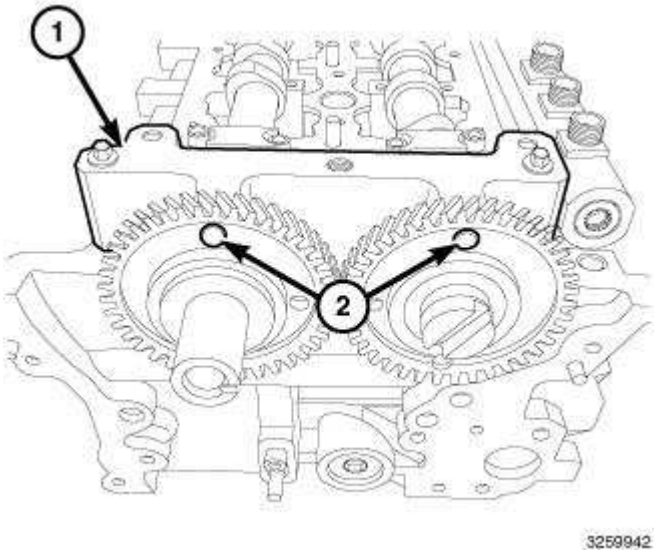

Fig. 490: Camshaft Timing Tool & Sprockets Holes - Right
Courtesy of CHRYSLER GROUP, LLC

4. Install the right (special tool #VM.10338-1, Timing Tool, Camshaft (Right)) (1) and securely tighten bolts.

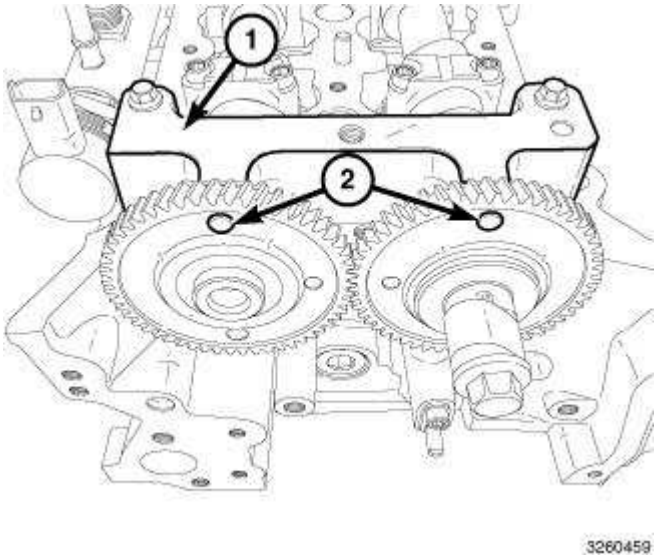

Fig. 491: Camshaft Timing Tool & Sprockets Holes - Left
Courtesy of CHRYSLER GROUP, LLC

5. Install the left (special tool #VM.10338-2, Timing Tool, Camshaft (Left)) (1) and securely tighten bolts.

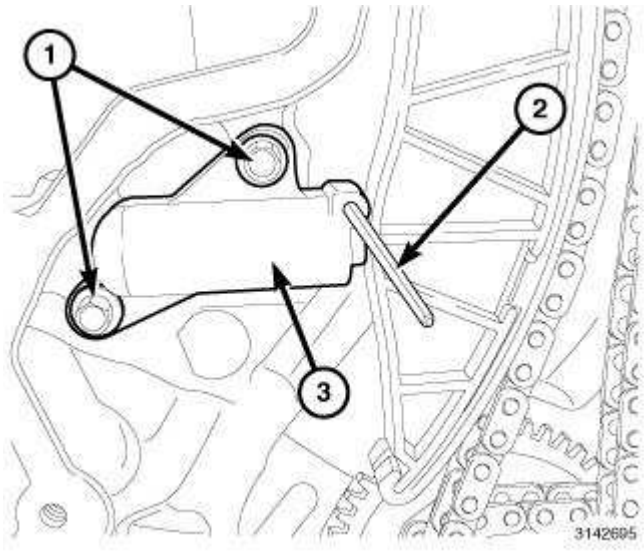

Fig. 492: Pin, Right Timing Chain Tensioner & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the (special tool #VM.10359, Pin, Tensioner) (2) into timing chain tensioner (3).
7. Remove bolts (1) and the right timing chain tensioner (3).

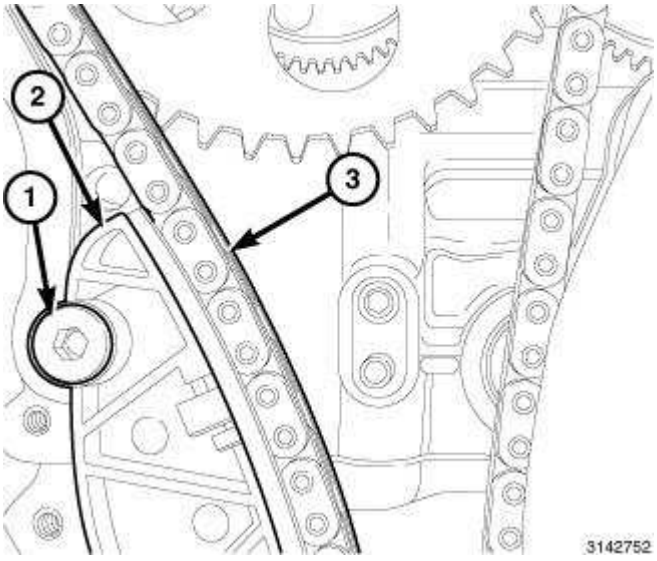

Fig. 493: Right Outer Timing Chain Guide & Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove bolt (1) and the right outer timing chain guide (2).

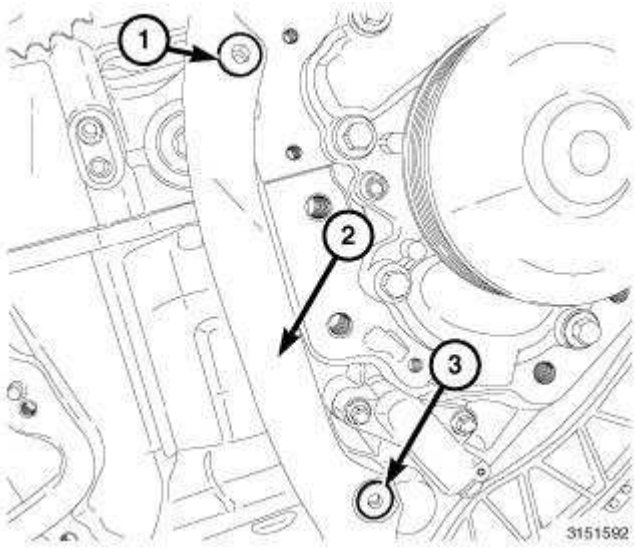

Fig. 494: Right Inner Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, remove bolt (1 and 3) and the right inner timing chain guide (2).

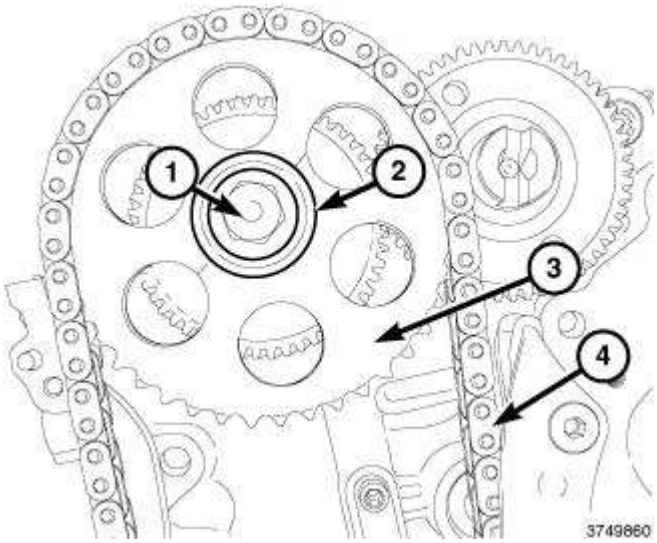

Fig. 495: Bolt, Washer, Timing Chain & Right Timing Chain Sprocket
Courtesy of CHRYSLER GROUP, LLC

10. Remove bolt (1) and washer (2).
11. Remove the right timing chain sprocket (4) and timing chain (3).

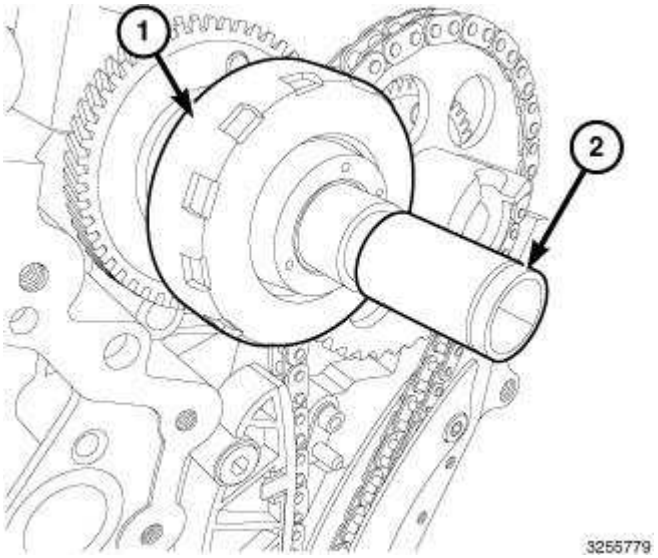

Fig. 496: Oil Separator & Oil Separator Remover/Installer Tool
Courtesy of CHRYSLER GROUP, LLC

12. Using the (special tool #VM.10344, Tool, Oil Separator Remover/Installer) (2), remove the oil separator (1) from the left intake camshaft.

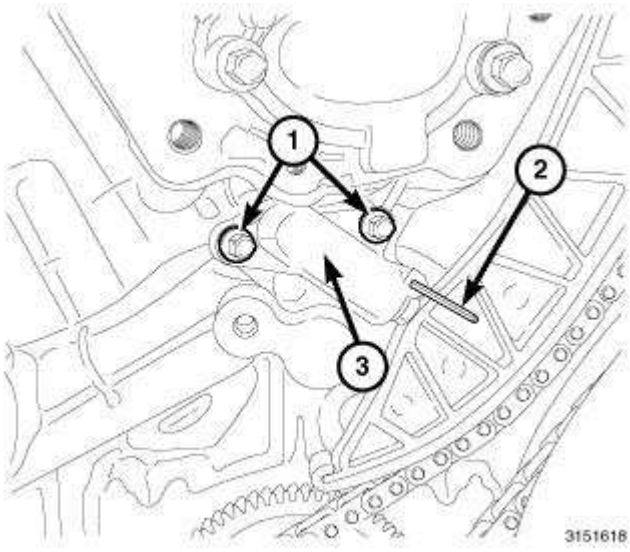

Fig. 497: Left Timing Chain Tensioner, Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

13. Install the (special tool #VM.10359, Pin, Tensioner) (2) into the timing chain tensioner (3).
14. Remove bolts (1) and the left timing chain tensioner (3).

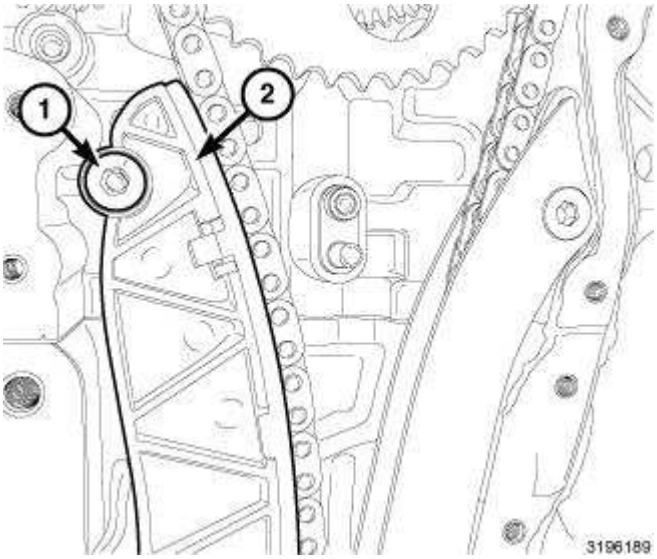

Fig. 498: Left Inner Timing Chain Guide & Bolt
Courtesy of CHRYSLER GROUP, LLC

15. Remove bolt (1), and the left inner timing chain guide (2).

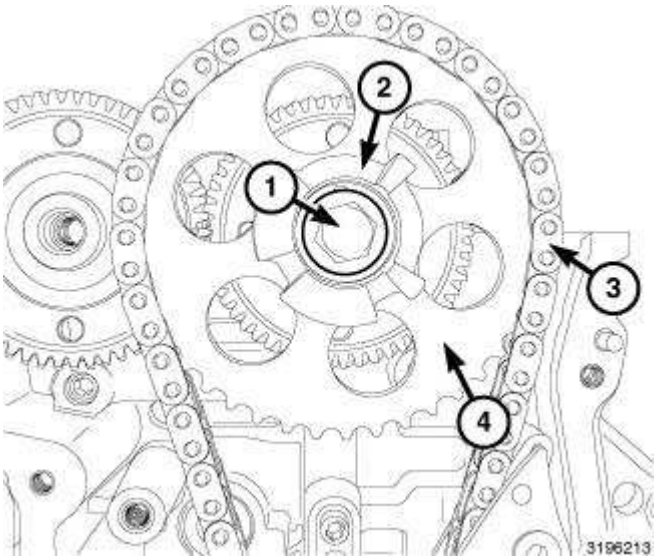

Fig. 499: Camshaft Position Sensor (CMP) Reluctor Wheel, Left Camshaft Timing Chain Sprocket, Timing Chain & Bolt
Courtesy of CHRYSLER GROUP, LLC

16. Remove bolt (1) and the Camshaft Position Sensor (CMP) reluctor wheel (2).
17. Remove the left camshaft timing chain sprocket (3) and timing chain (4).

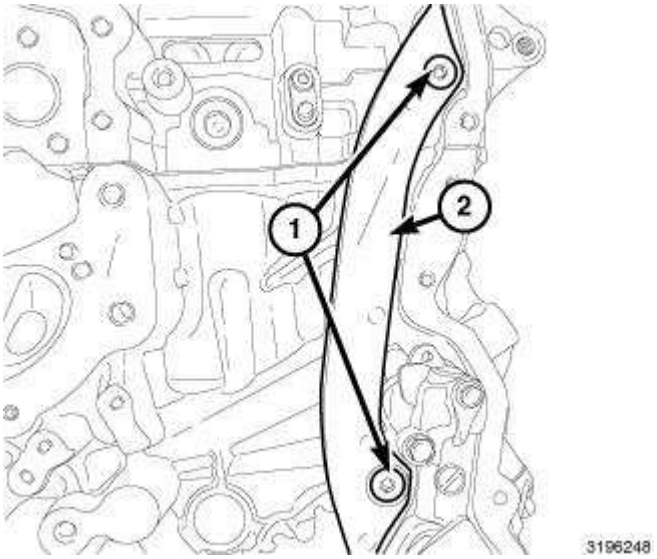

Fig. 500: Left Outer Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

18. If necessary, remove bolts (1) and the left outer timing chain guide (2).
19. If necessary, remove the crankshaft timing chain sprocket.
20. If necessary, remove the oil pump drive gear.

INSPECTION

INSPECTION

Inspect the following valve timing components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner arm and chain should be replaced.
- Primary chain tensioner plastic faces. Replace as required.

INSTALLATION

INSTALLATION

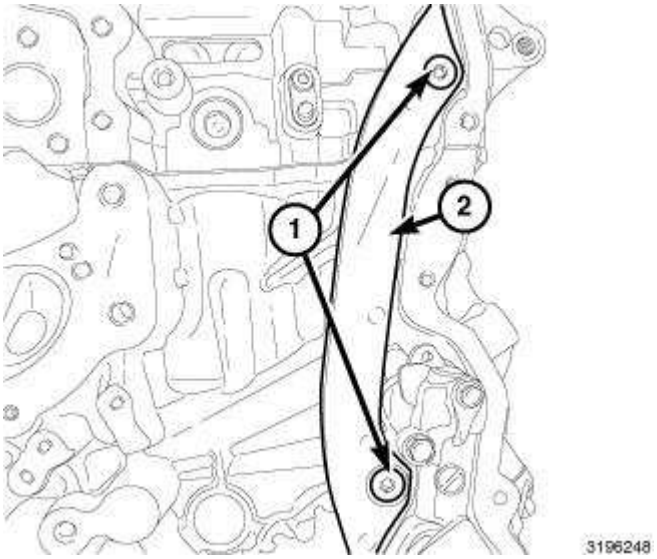

Fig. 501: Left Outer Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Camshafts should already be timed with dots facing each other and the (special tool #VM.10338, Tool, Camshaft Timing) installed.

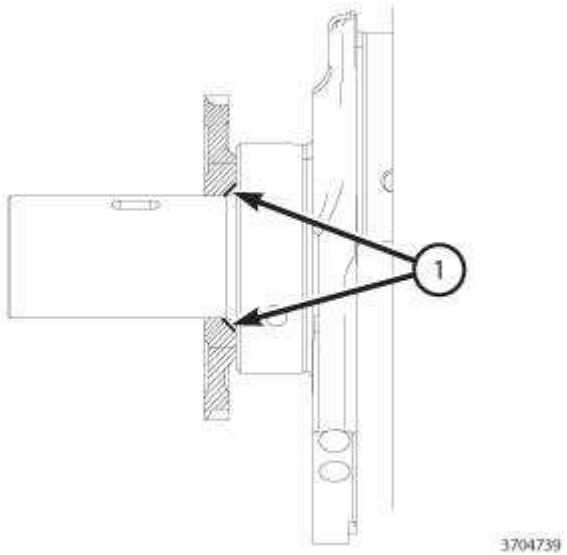

Fig. 502: Crankshaft Timing Chain Sprocket With Beveled Edge
Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil pump drive gear bevel edge (1) should be facing the engine.

1. If removed, install the oil pump drive gear with beveled edge (1) facing the engine.
2. If removed, install the crankshaft timing chain sprocket.
3. If removed, install the left outer timing chain guide (2). Tighten bolts (1) to 30 N.m (22 ft. lbs.).

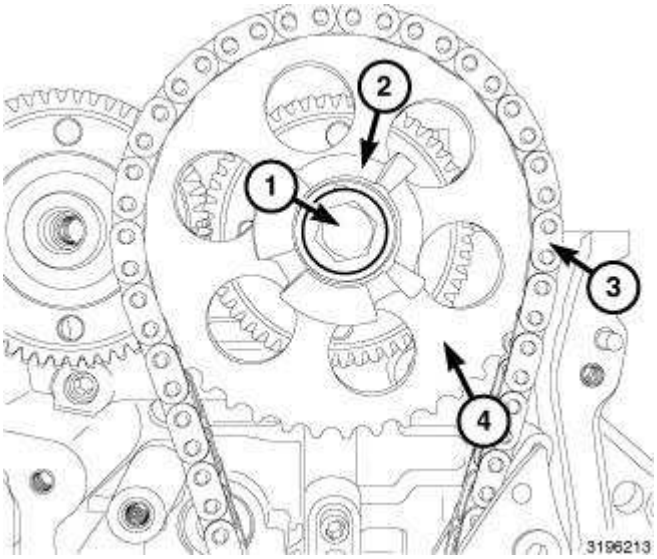

Fig. 503: Camshaft Position Sensor (CMP) Reluctor Wheel, Left Camshaft Timing Chain Sprocket, Timing Chain & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install the left timing chain (3) and camshaft timing chain sprocket (4).
5. Install the reluctor wheel (2). Tighten bolt (1) finger tight.

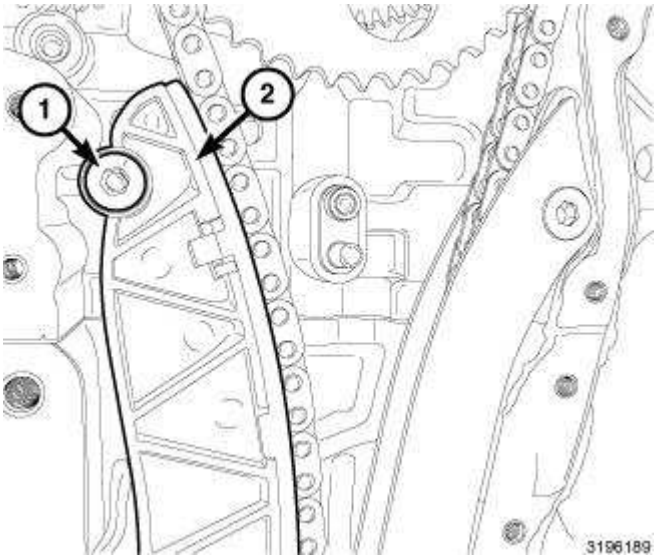

Fig. 504: Left Inner Timing Chain Guide & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the left inner timing chain guide (2). Tighten bolt (1) to 30 N.m (22 ft. lbs.).

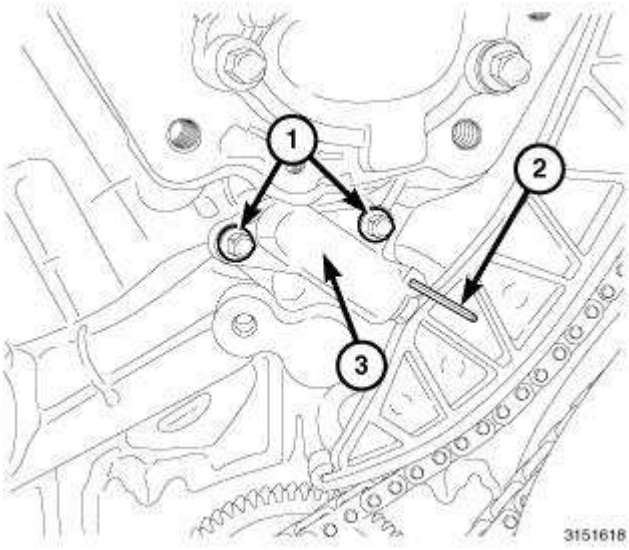

Fig. 505: Left Timing Chain Tensioner, Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Install the left timing chain tensioner (3). Tighten bolts (1) to 14 N.m (124 in. lbs.).
8. Remove the (special tool #VM.10359, Pin, Tensioner) (2) from timing chain tensioner (3).

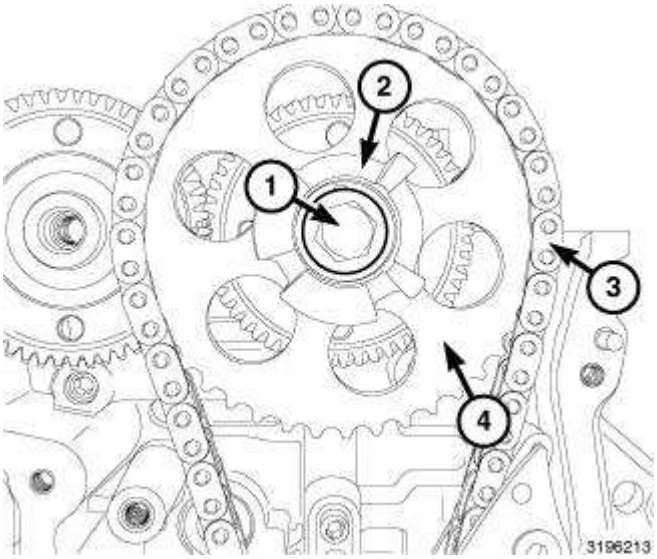

Fig. 506: Camshaft Position Sensor (CMP) Reluctor Wheel, Left Camshaft Timing Chain Sprocket, Timing Chain & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Tighten the reluctor wheel (2) bolt (1) to 100 N.m (74 ft. lbs.).

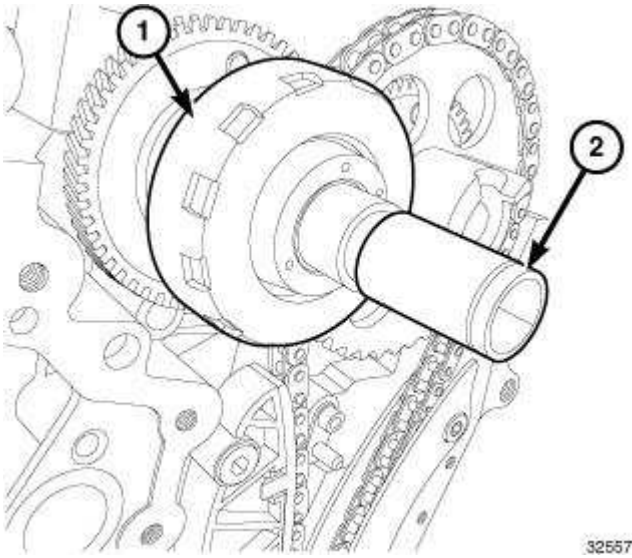

Fig. 507: Oil Separator & Oil Separator Remover/Installer Tool
Courtesy of CHRYSLER GROUP, LLC

10. Using the (special tool #VM.10344, Tool, Oil Separator Remover/Installer) (2), install the oil separator (1) and tighten to 30 N.m (22 ft. lbs.).

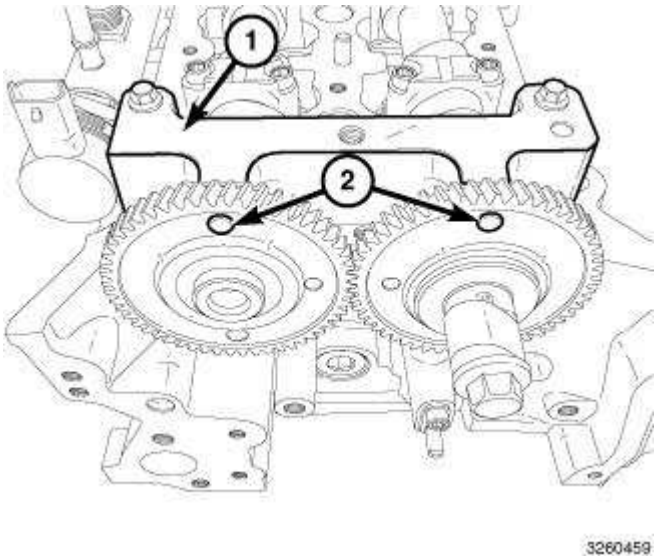

Fig. 508: Camshaft Timing Tool & Sprockets Holes - Left
Courtesy of CHRYSLER GROUP, LLC

11. Remove the (special tool #VM.10338-2, Timing Tool, Camshaft (Left)) (1).

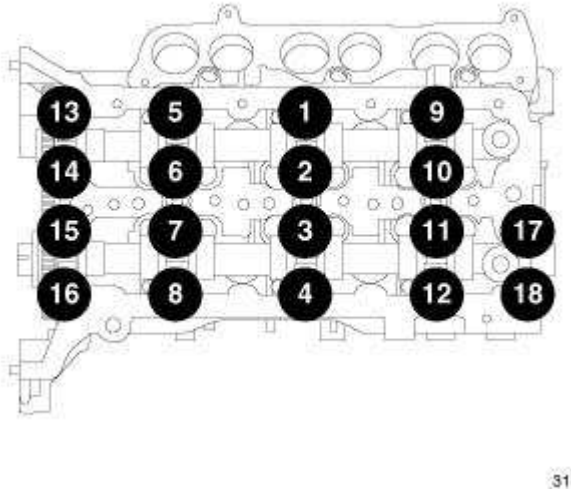

Fig. 509: Camshaft Bearing Cap Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

12. Install the left camshaft bearing caps 13 through 16 and tighten bolts to 11 N.m (97 in. lbs.).

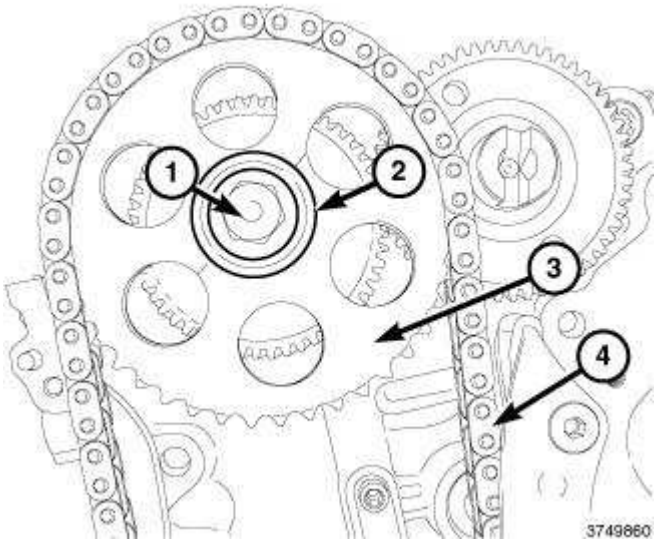

Fig. 510: Bolt, Washer, Timing Chain & Right Timing Chain Sprocket
Courtesy of CHRYSLER GROUP, LLC

13. Install the right timing chain (4) and timing chain sprocket (3).
14. Install the bolt (1) and washer (2) and tighten bolt (1) finger tight.

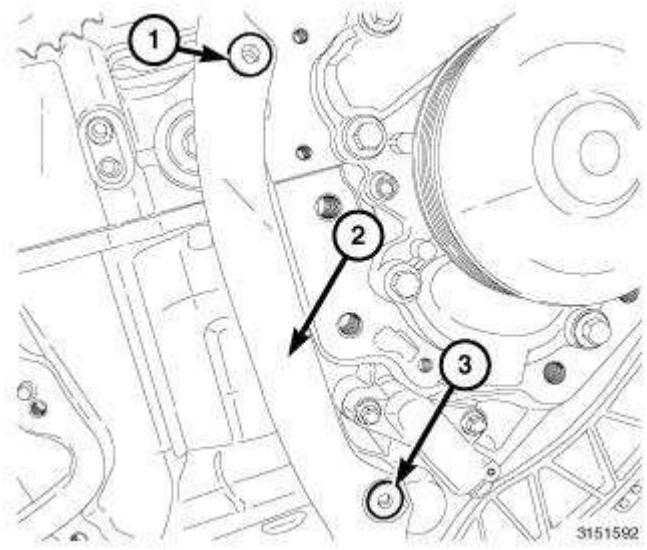

Fig. 511: Right Inner Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

15. If removed install the right inner timing chain guide (2). Tighten bolts (1 and 3) to 30 N.m (22 ft. lbs.).

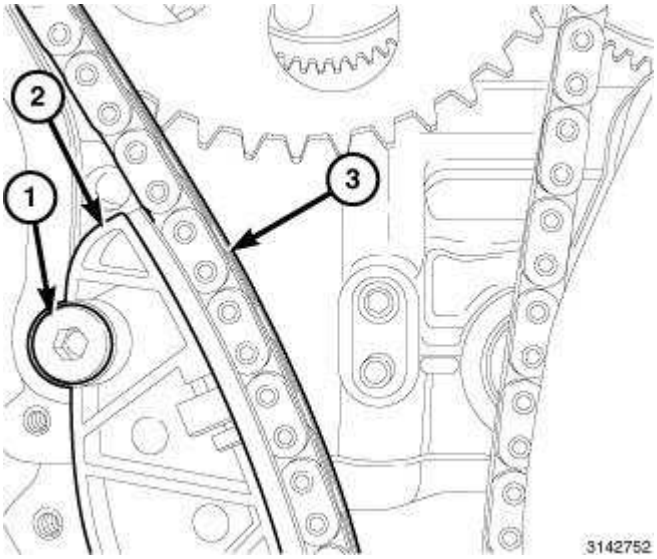

Fig. 512: Right Outer Timing Chain Guide & Bolt
Courtesy of CHRYSLER GROUP, LLC

16. Install the right outer timing chain guide (2). Tighten bolt (1) to 30 N.m (22 ft. lbs.).

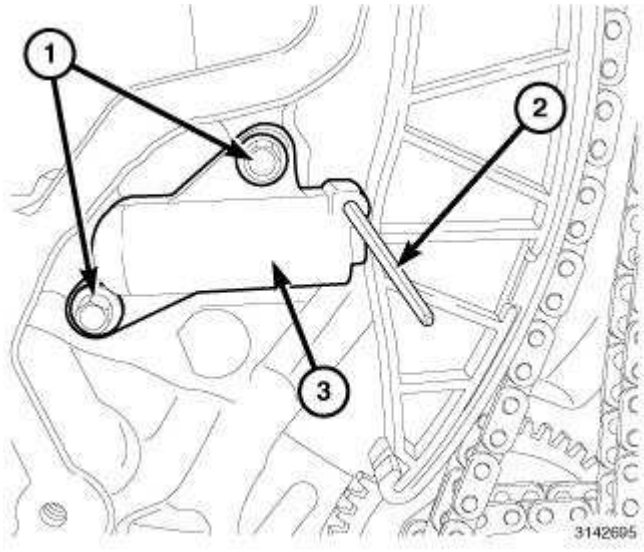

Fig. 513: Pin, Right Timing Chain Tensioner & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Install the right timing chain tensioner (3). Tighten bolts (1) to 14 N.m (124 in. lbs.).
18. Remove (special tool #VM.10359, Pin, Tensioner) (2) from timing chain tensioner (3).

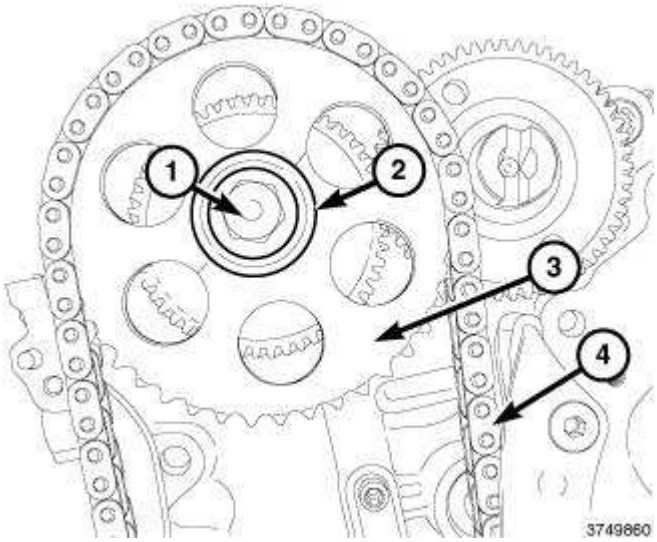

Fig. 514: Bolt, Washer, Timing Chain & Right Timing Chain Sprocket
Courtesy of CHRYSLER GROUP, LLC

19. Tighten the timing chain sprocket bolt (1) to 100 N.m (74 ft. lbs.).

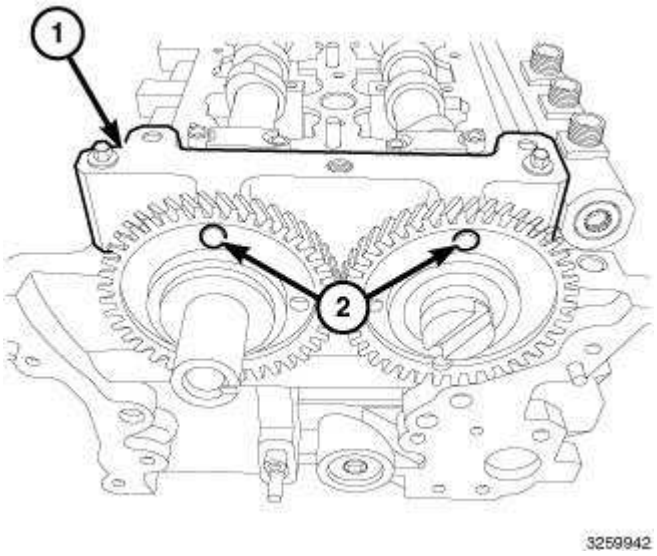

Fig. 515: Camshaft Timing Tool & Sprockets Holes - Right
Courtesy of CHRYSLER GROUP, LLC

20. Remove the (special tool #VM.10338-1, Timing Tool, Camshaft (Right)) (1).

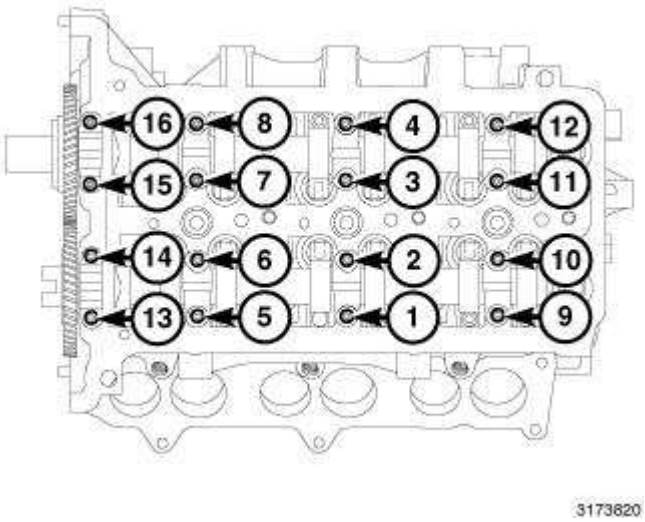

Fig. 516: Camshaft Bearing Cap Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

21. Install the right camshaft bearing caps 13 through 16 and tighten bolts to 11 N.m (97 in. lbs.).

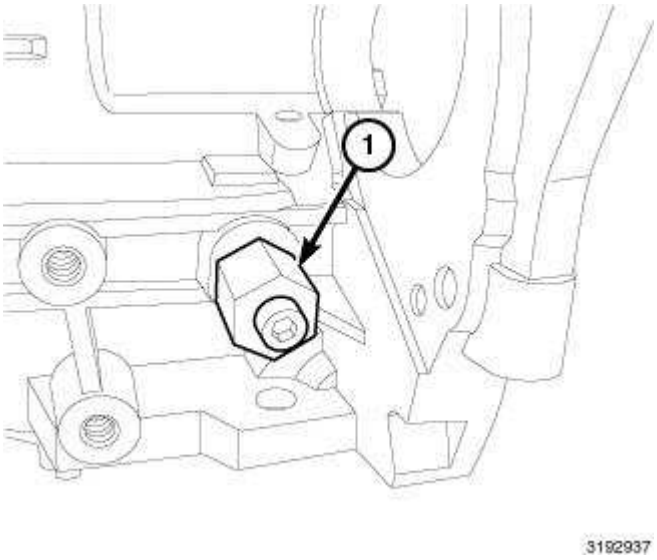

Fig. 517: Crankshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

22. Remove the (special tool #VM.10339, Tool, Crankshaft Timing) (1).

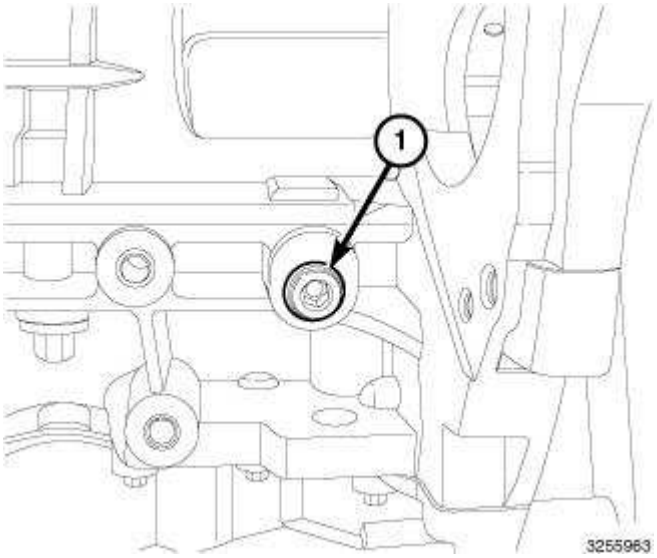

Fig. 518: Engine Block Plug
Courtesy of CHRYSLER GROUP, LLC

23. Install engine block plug (1). Tighten 30 N.m (22 ft. lbs.).
24. Install the lower timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
25. Install the right upper timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
26. Install the left upper timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
27. Install the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
28. Connect negative battery cable.

29. Start engine and inspect for leaks. Care must be taken to observe the fuel system warnings.

COVER(S), ENGINE TIMING

REMOVAL

UPPER TIMING COVER

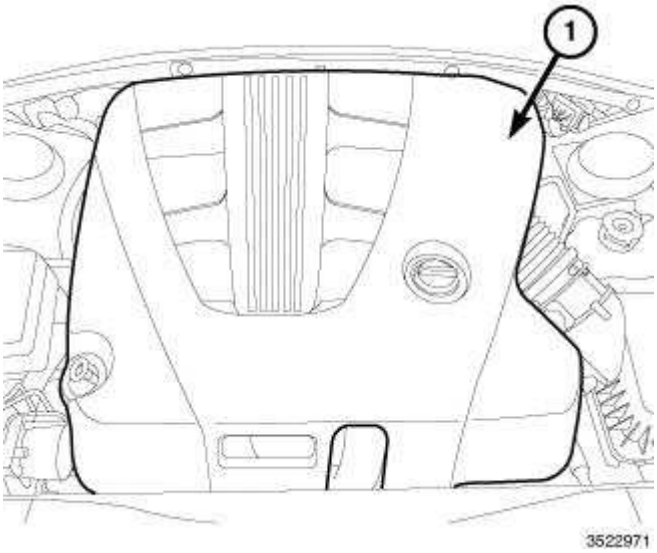

Fig. 519: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, REMOVAL** .
5. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
6. Lower the vehicle.
7. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL**.
8. Remove the charge air outlet tube.
9. Remove the upper and lower radiator hoses.
10. Remove the high pressure fuel injection pump. Refer to **PUMP, FUEL INJECTION, HIGH PRESSURE, REMOVAL** .
11. Remove the vacuum pump. Refer to **PUMP, VACUUM, REMOVAL**.
12. Remove the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

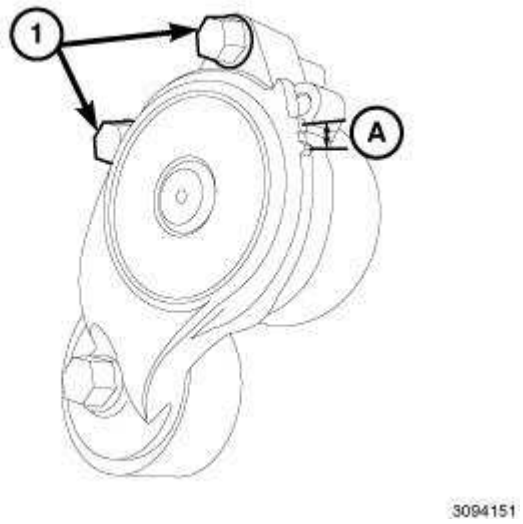

Fig. 520: Belt Wear Indicator (Measurement A)
Courtesy of CHRYSLER GROUP, LLC

13. Remove the serpentine belt tensioner. Refer to **TENSIONER, BELT, REMOVAL** .

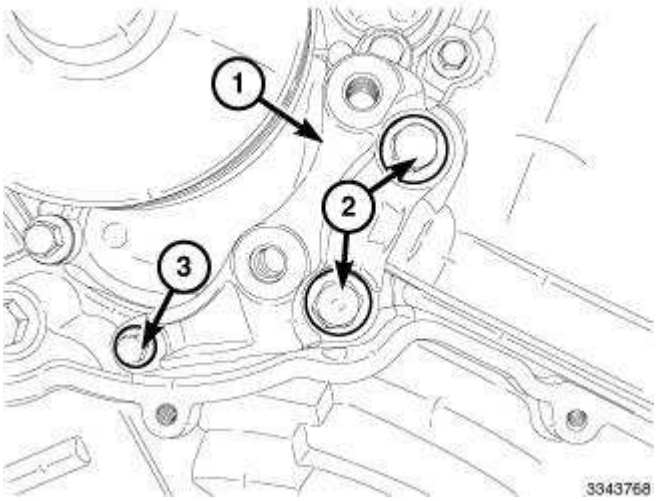

Fig. 521: Serpentine Belt Tensioner Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Remove bolts (2 and 3) and the serpentine belt tensioner bracket (1).

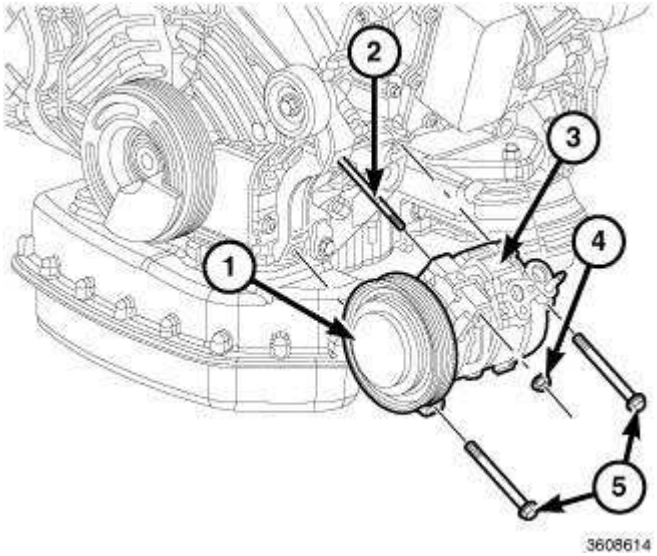

Fig. 522: A/C compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Removal of the A/C compressor does not require the refrigerant to be evacuated.

15. Disconnect the A/C compressor wire harness connector (3).
16. Remove nut (4), bolts (5) and position the aside A/C compressor (1).

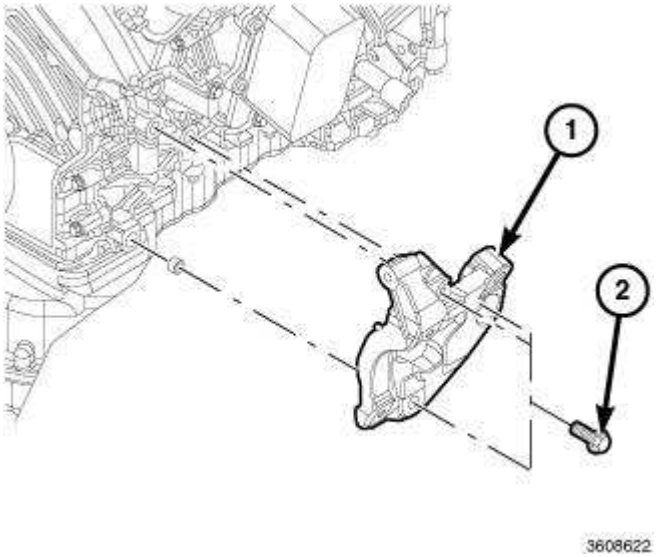

Fig. 523: A/C Compressor Mounting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove bolts (2) and the A/C compressor mounting bracket (1).

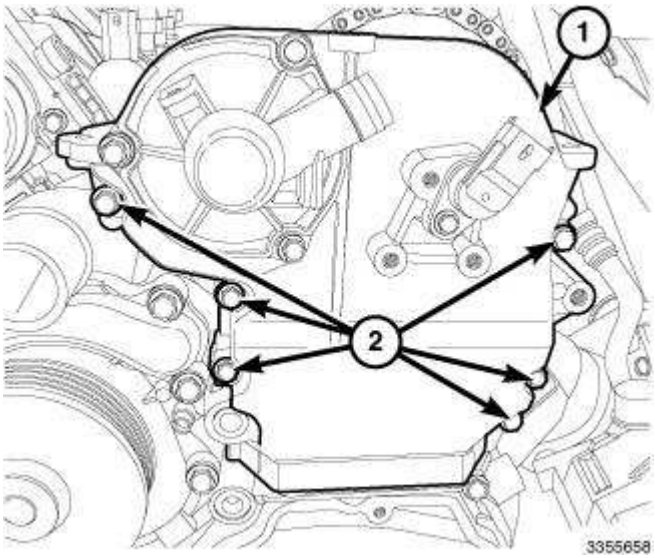

Fig. 524: Left Timing Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Disconnect the breather hose from left timing cover (1).
19. Remove bolts (2) and the left timing cover (1).

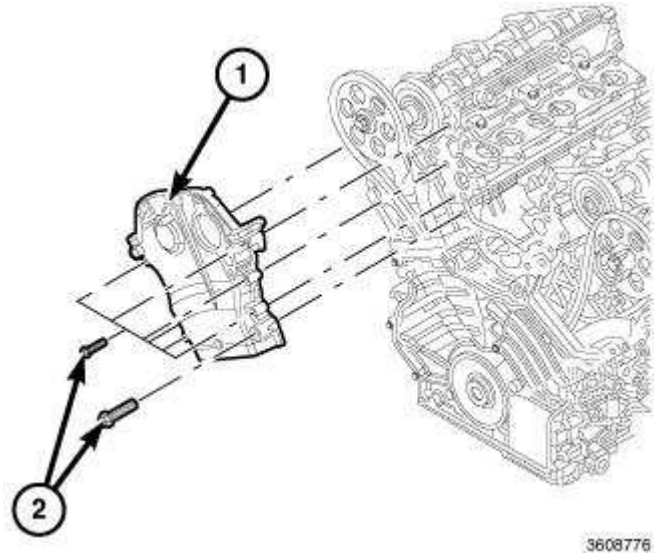

Fig. 525: Right Upper Timing Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

20. Remove bolts (2) and the right upper timing cover (1).

LOWER TIMING COVER

1. Disconnect the negative battery cable.
2. Remove the right and left upper timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

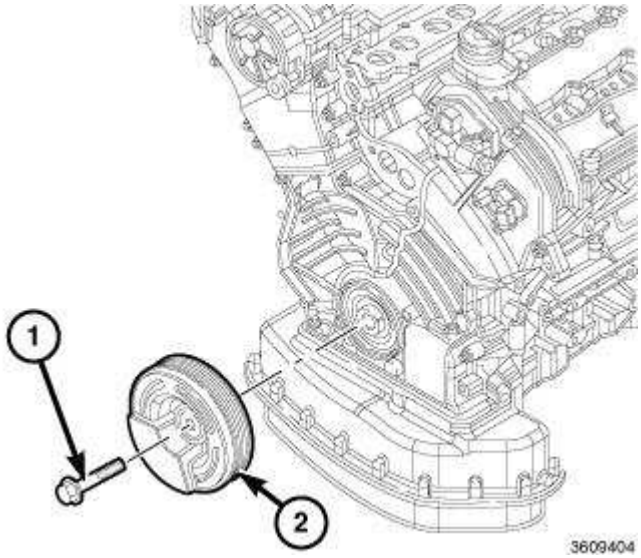

Fig. 526: Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft damper bolt is a left hand thread.

3. Remove the vibration damper (2). Refer to **DAMPER, VIBRATION, REMOVAL**.

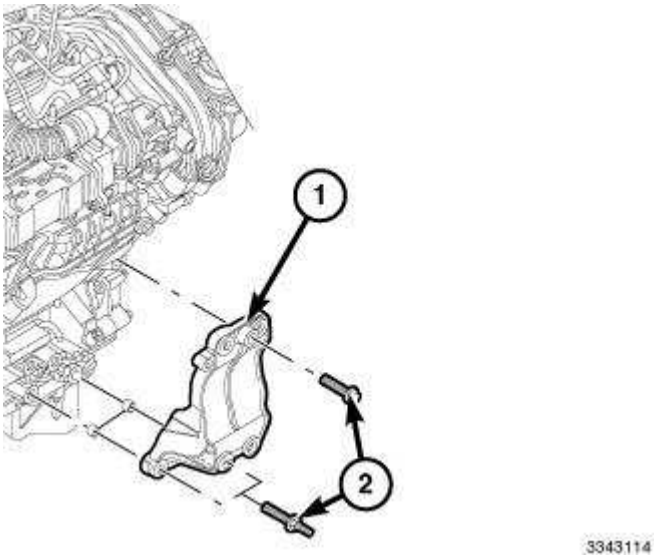

Fig. 527: Generator Mounting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the generator. Refer to **GENERATOR, REMOVAL** .
5. Remove bolts (2) and the generator mounting bracket (1).

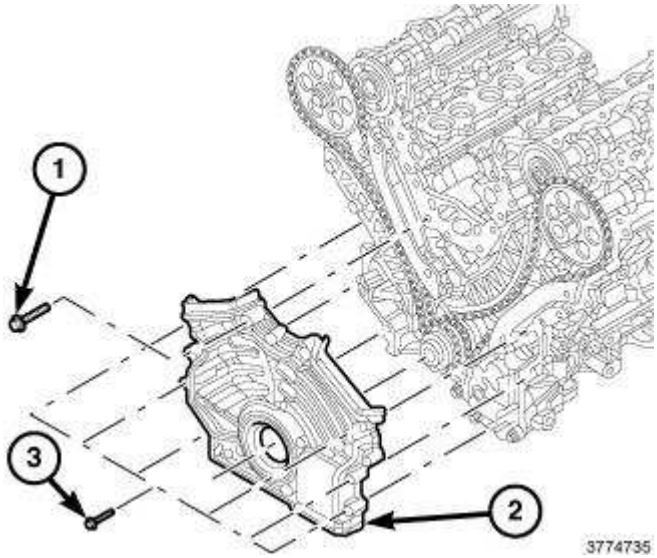

Fig. 528: Lower Timing Chain Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower oil pan. Refer to **PAN, OIL, REMOVAL**.
7. Remove bolts (1 and 3) and the lower timing chain cover (2).

INSTALLATION

UPPER TIMING COVER

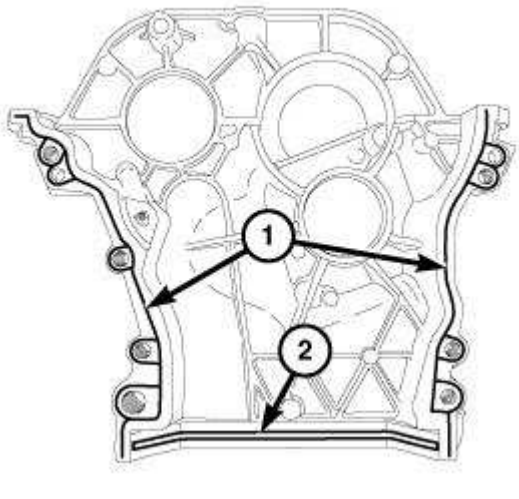

Fig. 529: RTV Sealant Locations To Right Upper Timing Cover
Courtesy of CHRYSLER GROUP, LLC

1. Clean and gasket sealing surfaces. Refer to **Engine - Standard Procedure**.

CAUTION: Engine assembly requires the use of a unique sealant that is

compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

NOTE: Sealing surfaces must be free of a gasket material and oil residue. Clean the oil pan sealing surfaces with isopropyl alcohol in preparation for sealant application.

2. Apply a 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to locations 1 and 2 of the right upper timing cover.
3. Install the right upper timing cover and tighten bolts finger tight.

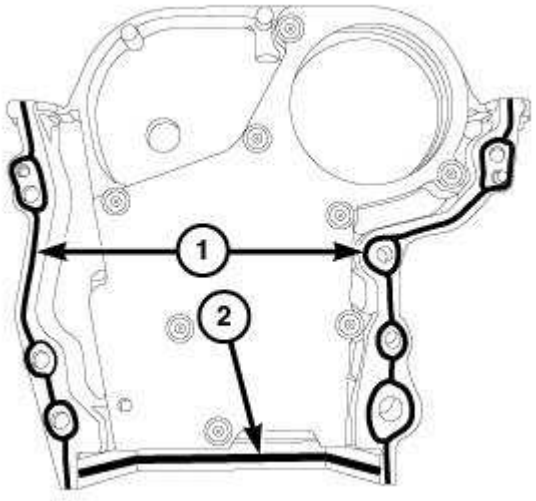

Fig. 530: RTV Sealant Locations To Left Upper Timing Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: Sealing surfaces must be free of a gasket material and oil residue. Clean the oil pan sealing surfaces with isopropyl alcohol in preparation for sealant application.

4. Apply a 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to locations 1 and 2 of the left upper timing cover.
5. Install the left upper timing cover and tighten bolts finger tight.

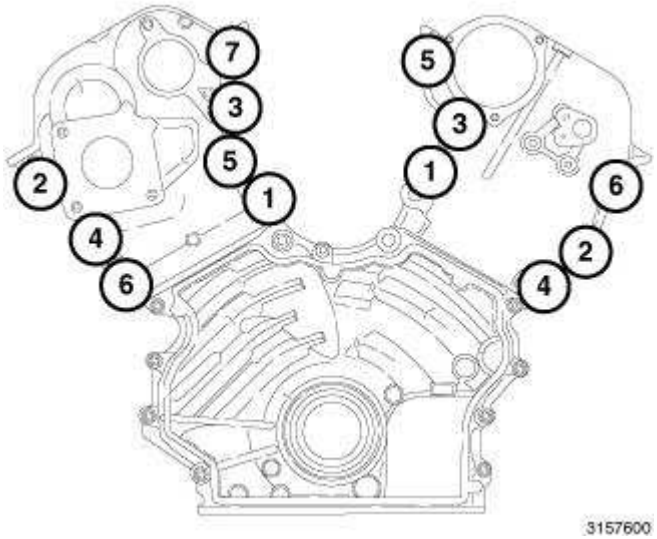

Fig. 531: Left & Right Upper Timing Cover Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Using the sequence shown in illustration, tighten right and left side bolts to:
   - M10 to 25 N.m (18 ft. lbs.).
   - M6 to 9 N.m (80 in. lbs.).
   - Loosen M10 bolt 60 degrees and retighten to 45 N.m (33 ft. lbs.).
   - Loosen M6 bolts 60 degrees and retighten to 15 N.m (133 in. lbs.).

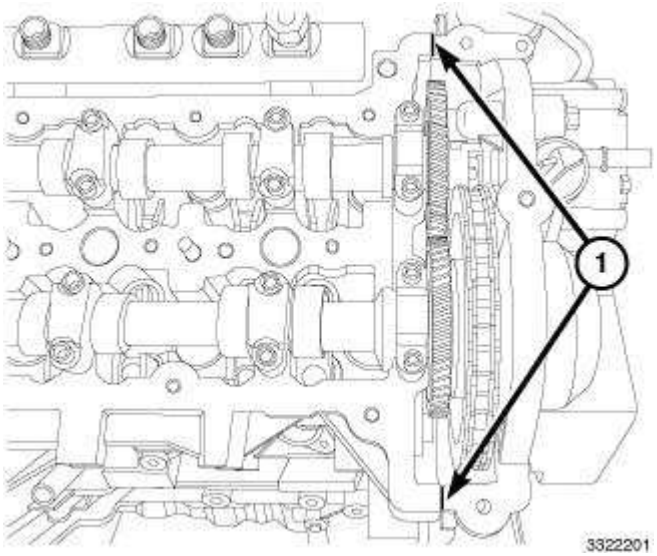

Fig. 532: RTV Sealant At The T-Joints
Courtesy of CHRYSLER GROUP, LLC

7. Remove any of Mopar® Threebond Engine RTV Sealant that may have squeezed out of the right upper timing cover T-joint (1).

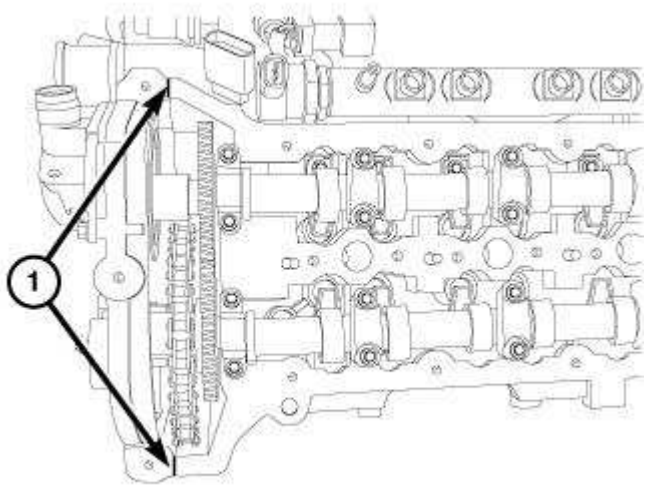

Fig. 533: Left Upper Timing Cover Excess RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

8. Remove any of Mopar® Threebond Engine RTV Sealant that may have squeezed out of the left upper timing cover T-joint (1).

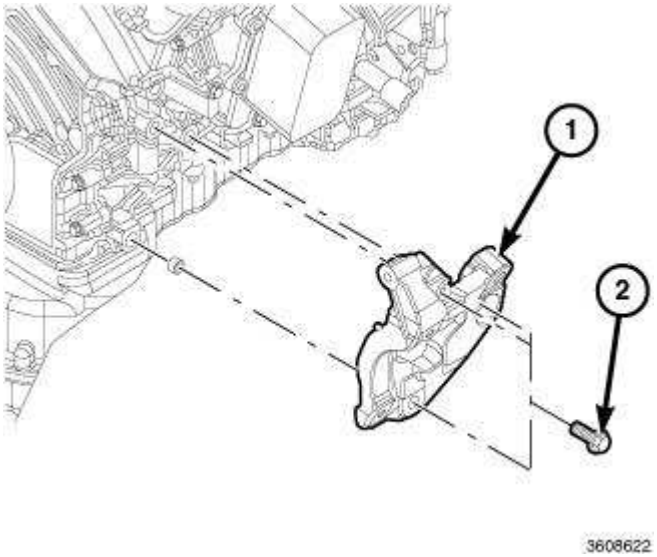

Fig. 534: A/C Compressor Mounting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the A/C compressor mounting bracket (1). Tighten bolts (2) to 45 N.m (33 ft. lbs.).

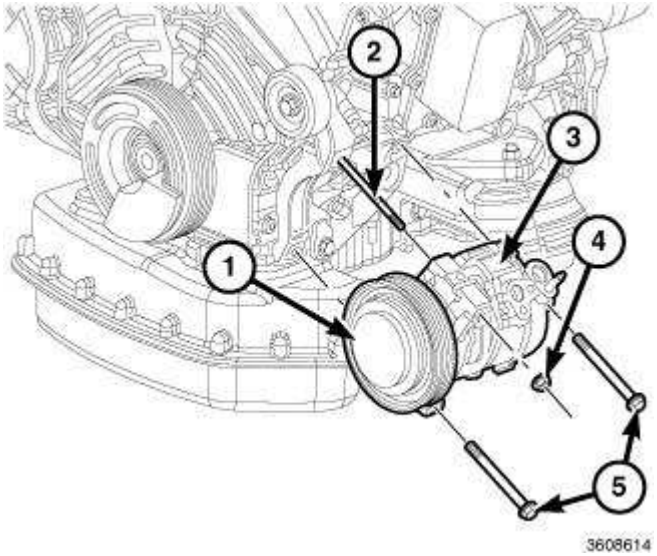

Fig. 535: A/C compressor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Install the A/C compressor and tighten fasteners using the following sequence to:
    - Bolt at the rear of compressor to 28 N.m (21 ft. lbs.).
    - Bolt at the front of compressor to 28 N.m (21 ft. lbs.).
    - Nut at the front of the compressor to 28 N.m (21 ft. lbs.).

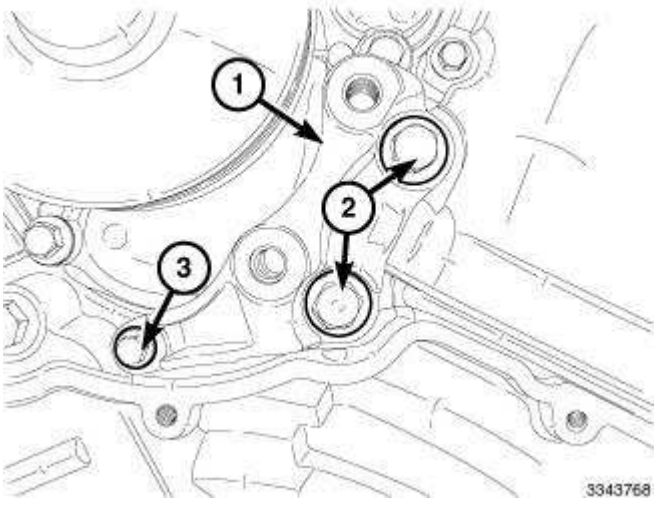

Fig. 536: Serpentine Belt Tensioner Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the serpentine belt tensioner bracket (1) and tighten bolts to:
    - M10 bolts to 45 N.m (33 ft. lbs.).
    - M6 bolt to 11 N.m (97 in. lbs.).

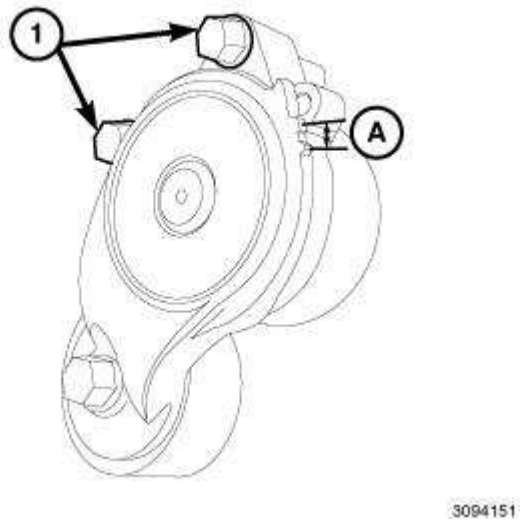

Fig. 537: Belt Wear Indicator (Measurement A)
Courtesy of CHRYSLER GROUP, LLC

12. Install the serpentine belt tensioner. Refer to **TENSIONER, BELT, INSTALLATION** .
13. Install the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
14. Install the vacuum pump. Refer to **PUMP, VACUUM, INSTALLATION**.
15. Install the lower and upper radiator hoses.
16. Install the charge air outlet tube.
17. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**.
18. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
19. Install the belly pan and lower fascia to suspension cradle close out panel. Refer to **BELLY PAN, INSTALLATION** .
20. Lower the vehicle.

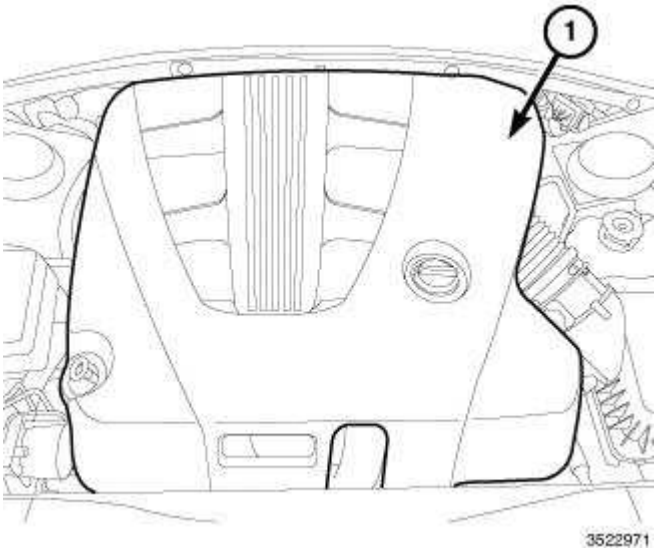

Fig. 538: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

21. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
22. Install the engine cover (1).
23. Connect the negative battery cable.
24. Start the engine and check for leaks.

LOWER TIMING COVER

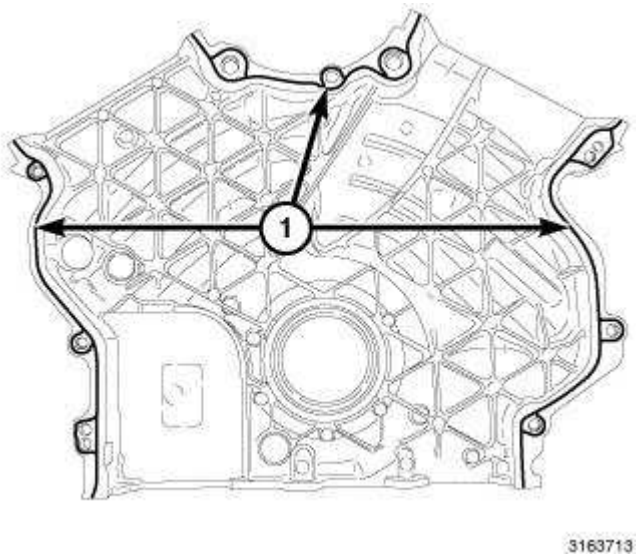

Fig. 539: Lower Timing Chain Cover RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

1. Clean the oil pan sealing surfaces with isopropyl alcohol in preparation for sealant application. Refer to **Engine - Standard Procedure**.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

2. Apply a 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the following locations (1).

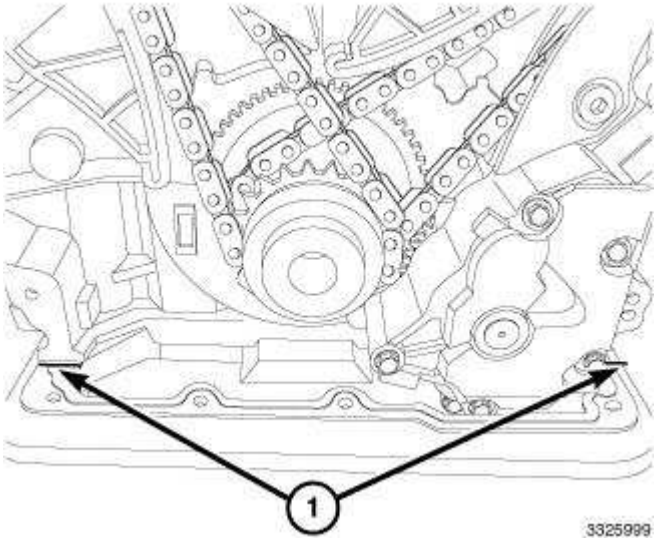

Fig. 540: Lower Timing Chain Cover RTV Sealant T-Joint Locations
Courtesy of CHRYSLER GROUP, LLC

3. Apply a 3 mm wide bead of Mopar® Threebond Engine RTV Sealant at the T-joint (1).

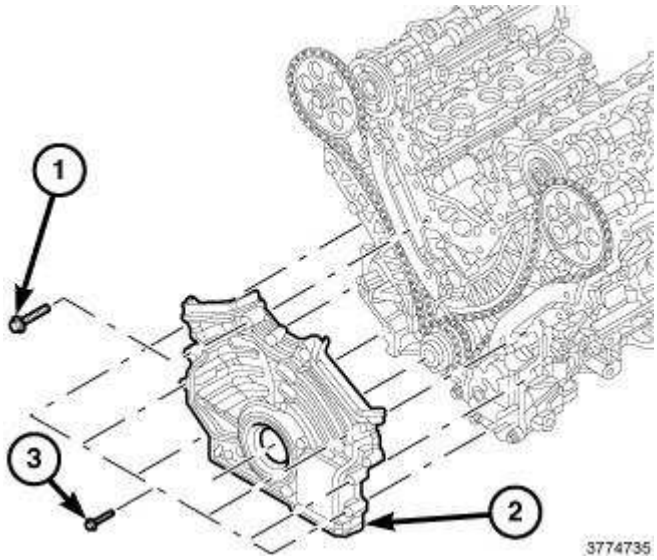

Fig. 541: Lower Timing Chain Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the timing chain cover (2) and tighten bolts (1 and 3) finger tight.

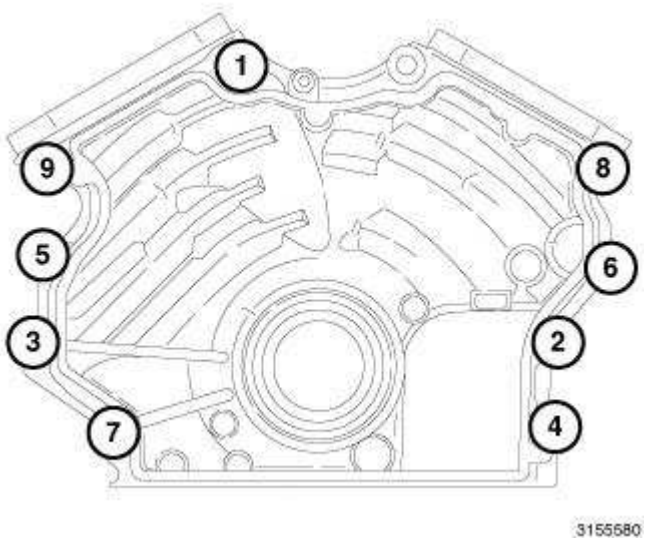

Fig. 542: Lower Timing Chain Cover Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Using the sequence shown in illustration, tighten bolts to:
   - M10 bolts (1) 25 N.m (18 ft. lbs.).
   - M6 to 9 N.m (80 in. lbs.).
   - Loosen M10 bolt 60 degrees and retighten to 45 N.m (33 ft. lbs.).
   - Loosen M6 bolts 60 degrees and retighten to 15 N.m (133 in. lbs.).

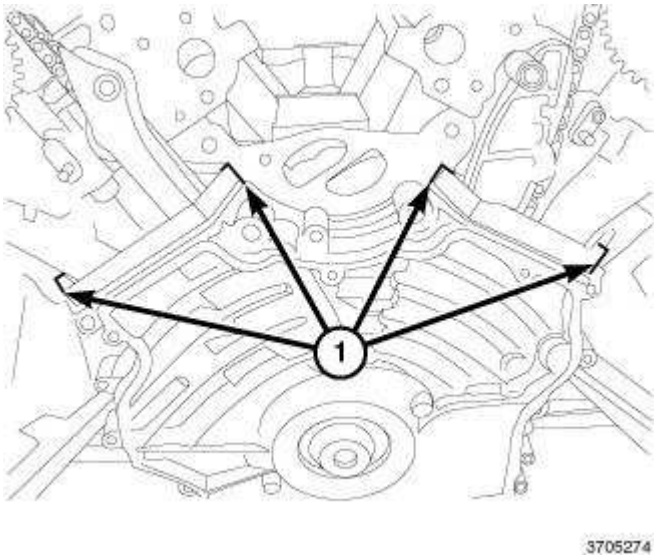

Fig. 543: Lower Timing Cover Excess RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

6. Remove any of Mopar® Threebond Engine RTV Sealant that may have squeezed out of the lower timing cover joints (1).
7. Install the lower oil pan. Refer to **PAN, OIL, INSTALLATION**.

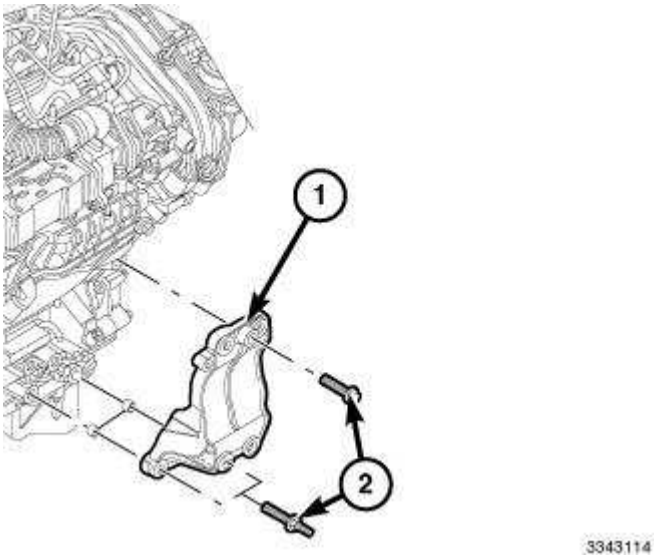

Fig. 544: Generator Mounting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the generator mounting bracket (1). Tighten bolts (2) to 45 N.m (33 ft. lbs.).
9. Install the generator. Refer to **GENERATOR, INSTALLATION** .

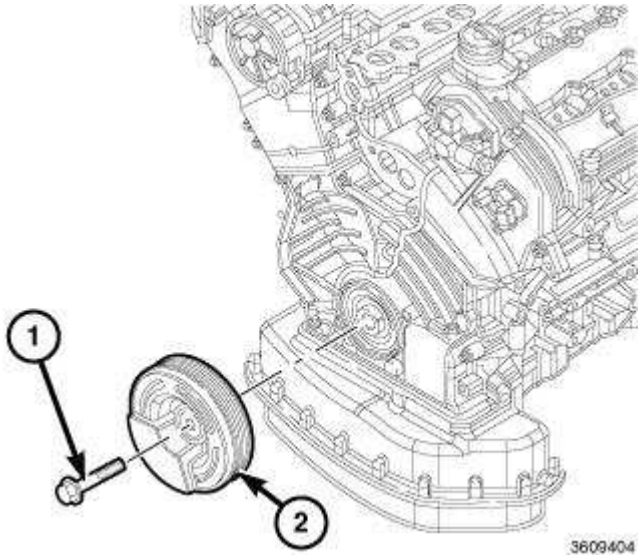

Fig. 545: Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft damper bolt is a left hand thread.

10. Install the vibration damper (2). Refer to **DAMPER, VIBRATION, INSTALLATION**.
11. Install the left and right upper timing chain cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
12. Connect the negative battery cable.

TENSIONER, ENGINE TIMING

DESCRIPTION

DESCRIPTION

Both timing chain tensioner is located on the engine block. The tensioner is hydraulically operated with the adjusting portion riding on the right timing chain guide. Hydraulic support for the tensioner is supplied by forward oil passages in the engine block.

REMOVAL

REMOVAL

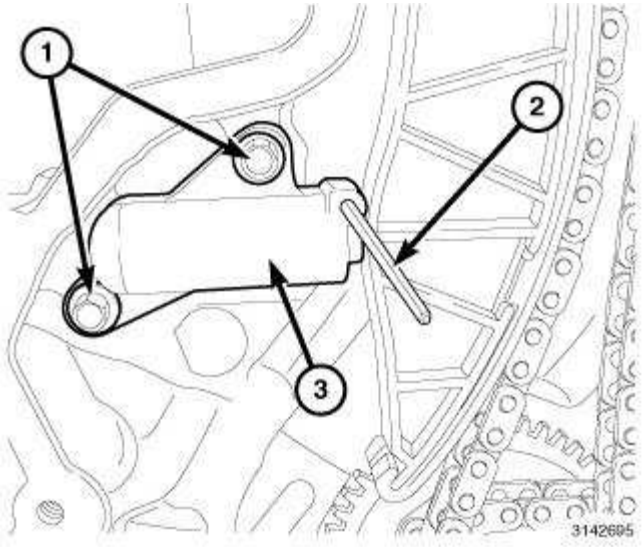

Fig. 546: Pin, Right Timing Chain Tensioner & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the lower timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
3. Pushing back the tensioner piston, and install (special tool #VM.10359, Pin, Tensioner) (2).
4. Remove bolts (1) and the right timing chain tensioner (3).

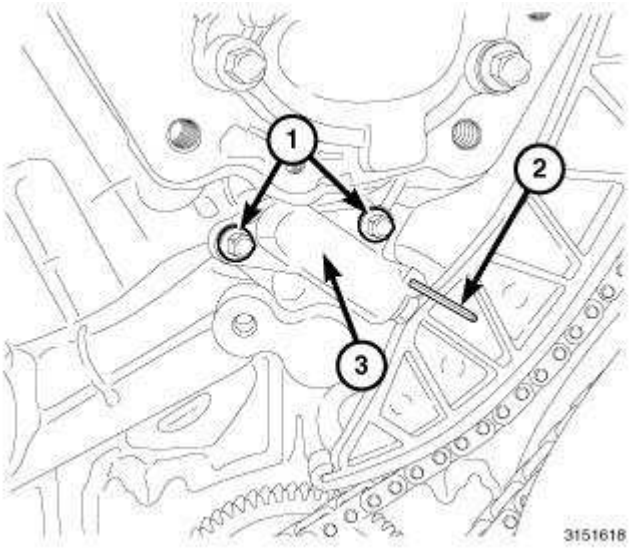

Fig. 547: Left Timing Chain Tensioner, Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Pushing back the piston, and install (special tool #VM.10359, Pin, Tensioner) (2).
6. Remove bolts (1) and the left timing chain tensioner (3).

INSTALLATION

INSTALLATION

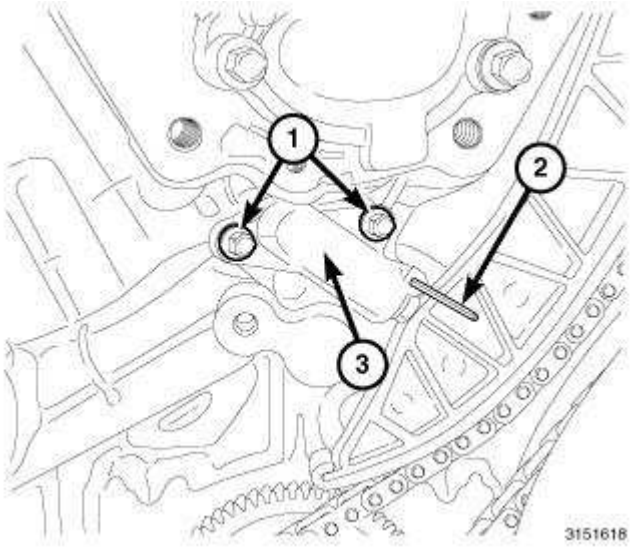

Fig. 548: Left Timing Chain Tensioner, Pin & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the left timing chain tensioner (3). Tighten bolts (1) to 11 N.m (97 in. lbs.).

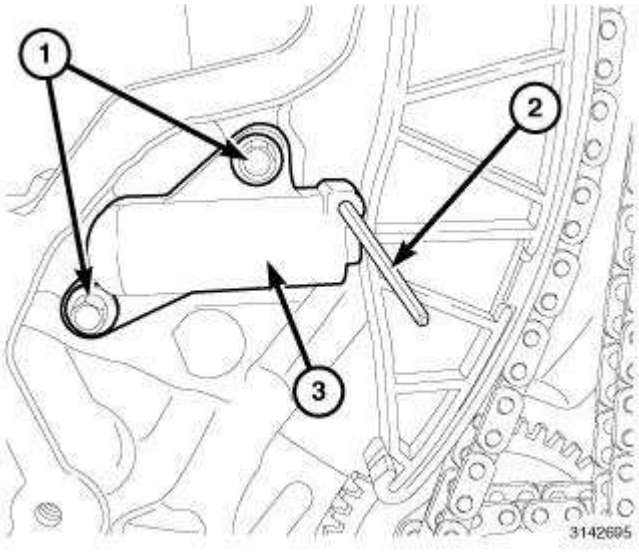

Fig. 549: Pin, Right Timing Chain Tensioner & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the right timing chain tensioner (3). Tighten bolts (1) to 11 N.m (97 in. lbs.).
3. Remove both (special tool #VM.10359, Pin, Tensioner) (2).
4. Install the lower timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
5. Connect the negative battery cable.
6. Start the engine and inspect for leaks.

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

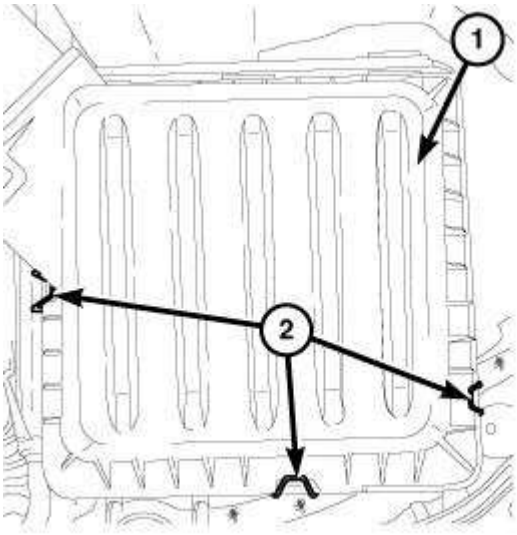

Fig. 550: Air Housing Cover & Spring Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: Housing removal is not necessary for element (filter) replacement.

1. Release the three spring clips (2) and remove the housing cover (1).

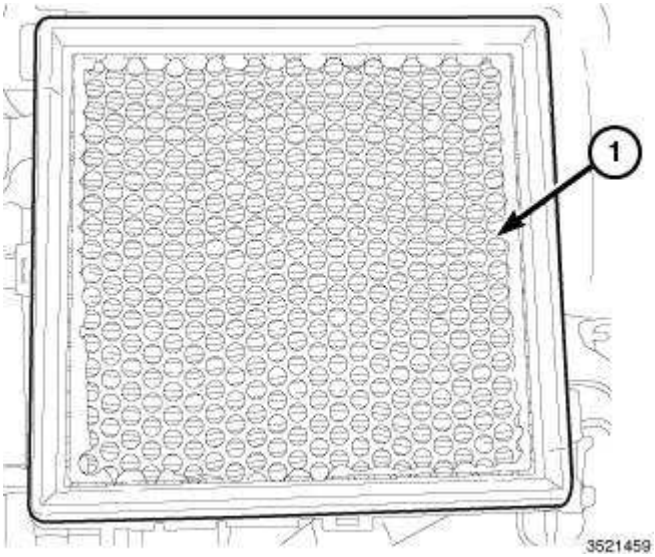

Fig. 551: Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

2. Remove air cleaner element (1) from housing.

INSTALLATION

INSTALLATION

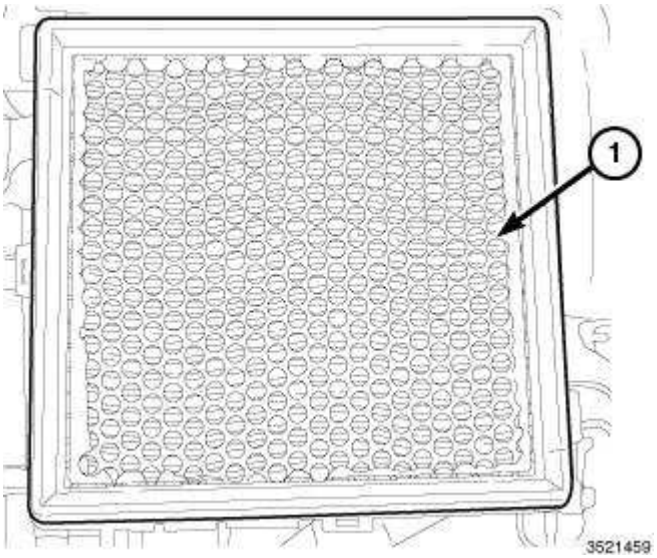

Fig. 552: Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, clean out the air cleaner body.
2. Install the air cleaner element (1) into housing.

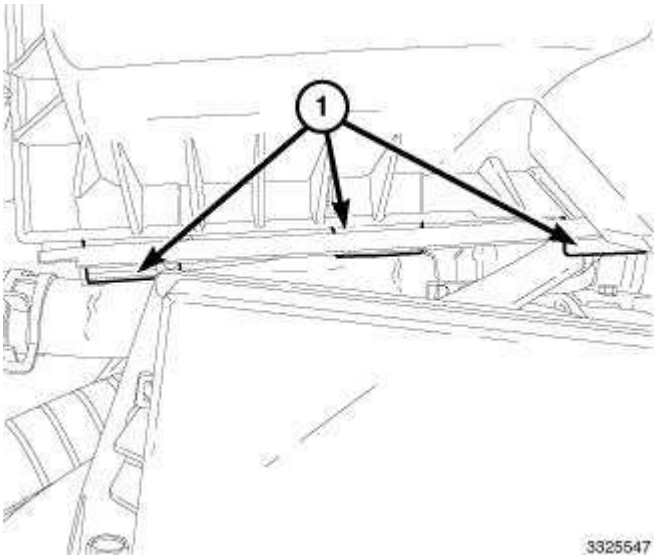

Fig. 553: Housing Cover Locating Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Position housing cover locating tabs (1) into rear housing and seat cover onto housing.

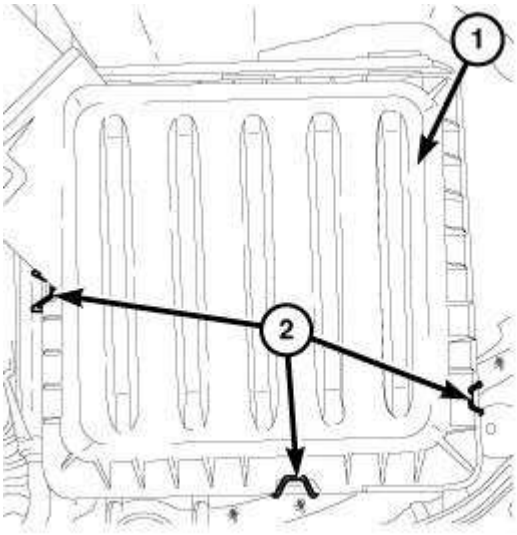

Fig. 554: Air Housing Cover & Spring Clips

5. Connect the negative battery cable.

ENGINE

3.6L - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

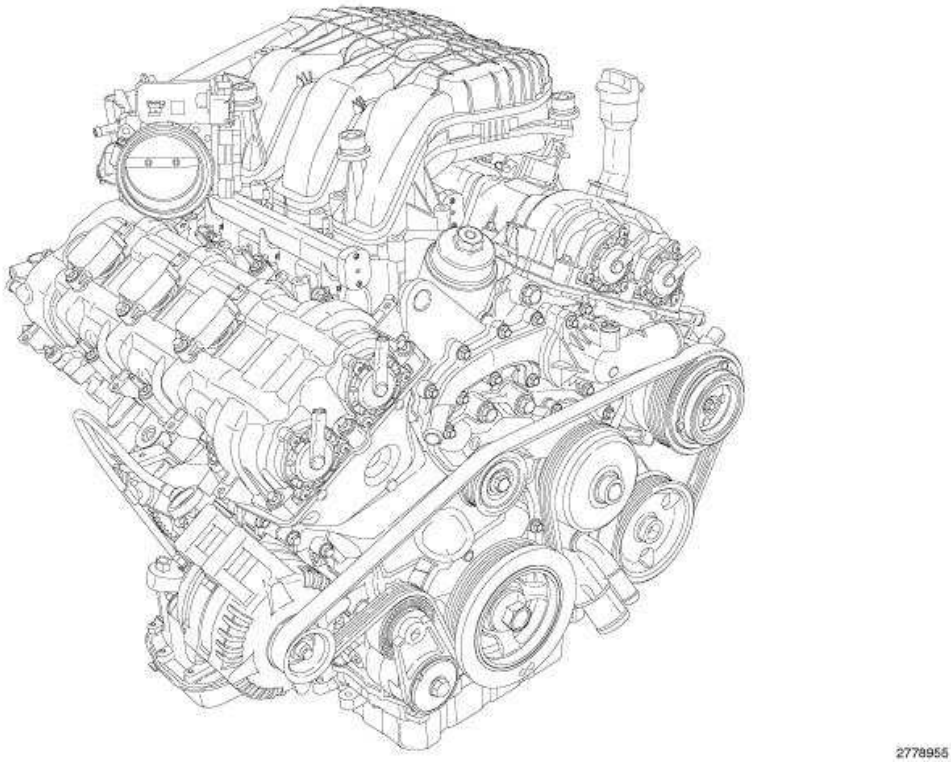

Fig. 1: 3.6L (219.7 CID) Flexible Fuel V-6 Engine
Courtesy of CHRYSLER GROUP, LLC

The 3.6 liter (219.7 CID) flexible fuel V-6 engine features Variable Valve Timing (VVT), Dual Overhead Camshafts (DOHC) and a high-pressure die-cast aluminum cylinder block with steel liners in a 60° configuration. The 3.6 liter engine has a chain driven variable discharge oil pump with a two-stage pressure regulator for improved fuel economy. The exhaust manifolds are integrated into the cylinder heads for reduced weight. The cylinders are numbered from front to rear. The right bank is numbered 1, 3, 5 and the left bank is numbered 2, 4, 6. The firing order is 1-2-3-4-5-6. The engine serial number is located on the left side of the cylinder block at the transmission flange.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

Refer to **ENGINE PERFORMANCE DIAGNOSTIC TABLE** and **ENGINE MECHANICAL DIAGNOSTIC TABLE** for possible causes and corrections of malfunctions.

Refer to **FUEL SYSTEM** article.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage Test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Engine Cylinder Head Gasket Failure Diagnosis. Refer to **CYLINDER HEAD GASKET**.
- Intake Manifold Leakage Diagnosis. Refer to **DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS**.

ENGINE PERFORMANCE DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery	1. Charge or replace as necessary. Refer to **BATTERY, DIAGNOSIS AND TESTING** .
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Refer to **CLEANING** .
	3. Faulty engine starting system.	3. Diagnose engine starting system. Refer to **DIAGNOSIS AND TESTING** .
	4. Faulty coil or control unit.	4. Replace ignition coil. Refer to **COIL, IGNITION, REMOVAL** .
	5. Incorrect spark plug gap.	5. Correct as necessary.
	6. Incorrect cam timing.	6. Verify cam timing. Refer to **Engine/Valve Timing - Standard Procedure**.
	7. Dirt or water in fuel system.	7. Clean fuel system.
	8. Faulty fuel pump or wiring.	8. Repair or replace as necessary.
	9. Faulty Camshaft Position (CMP) sensor.	9. Replace sensor. Refer to **SENSOR, CAMSHAFT POSITION, REMOVAL** .
	10. Faulty Crankshaft Position (CKP) sensor.	10. Replace sensor. Refer to **SENSOR, CRANKSHAFT POSITION, REMOVAL** .
ENGINE STALLS OR ROUGH IDLE	1. Vacuum leak.	1. Inspect intake manifold and vacuum hoses, repair or replace as necessary.

	2. Faulty Crankshaft Position (CKP) sensor.	2. Replace sensor. Refer to **SENSOR, CRANKSHAFT POSITION, REMOVAL** .
	3. Faulty ignition coil.	3. Replace ignition coil. Refer to **COIL, IGNITION, REMOVAL** .
	4. Incorrect cam timing.	4. Verify cam timing. Refer to **Engine/Valve Timing - Standard Procedure**.
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to **SPARK PLUG, REMOVAL** .
	2. Dirt or water in fuel system.	2. Clean fuel system.
	3. Faulty fuel pump.	3. Replace fuel pump. Refer to **MODULE, FUEL PUMP, REMOVAL** .
	4. Leaking cylinder head gasket.	4. Replace cylinder head gasket. Refer to **CYLINDER HEAD, REMOVAL**.
	5. Low compression.	5. Determine the cause and repair as necessary. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
	6. Burned, warped or pitted valves.	6. Replace as necessary. Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**.
	7. Plugged or restricted exhaust system.	7. Inspect and replace as necessary.
	8. Faulty ignition coil.	8. Replace ignition coil. Refer to **COIL, IGNITION, REMOVAL** .
	9. Incorrect cam timing.	9. Verify cam timing. Refer to **Engine/Valve Timing - Standard Procedure**.
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to **SPARK PLUG, REMOVAL** .
	2. Dirt in fuel system.	2. Clean fuel system.
	3. Burned, warped or pitted valves.	3. Replace as necessary. Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**.
	4. Faulty ignition coil.	4. Replace ignition coil. Refer to **COIL, IGNITION, REMOVAL** .
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to **SPARK PLUG, REMOVAL** .
	4. Faulty ignition coil.	2. Replace ignition coil. Refer to **COIL, IGNITION, REMOVAL** .
	3. Dirt or water in fuel system.	3. Clean fuel system.

ENGINE MECHANICAL DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in	1. Refer to **Engine/Lubrication/OIL -**

	crankcase.	**Standard Procedure**.
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. Inspect the valve guides for wear, cracks or looseness. If either condition exists, replace the cylinder head. Refer to **CYLINDER HEAD, REMOVAL**.
	8. Excessive runout of valve seats on valve faces.	8. Refer to **Engine/Cylinder Head/VALVES, Intake and Exhaust - Standard Procedure**.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of round.	6. Service or replace crankshaft.
	7. Loose flywheel or torque converter.	7. Tighten to correct torque

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: **The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.**

NOTE: **Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.**

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system and perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

   NOTE: **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

   NOTE: **If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.**

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

1. Check the coolant level and fill as required. DO NOT install the radiator cap.
2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
3. Remove the spark plugs.
4. Remove the oil filler cap.
5. Remove the air cleaner hose.
6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1, 379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

OIL CONSUMPTION TEST AND DIAGNOSIS

Diagnostic Procedures

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the owner's manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.

- **Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.**
- **Verify that the engine has the correct oil level dipstick and dipstick tube installed.**
- **Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.**

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with oil consumption diagnosis.

OIL CONSUMPTION DIAGNOSIS

1. Check the positive crankcase ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a **CYLINDER COMPRESSION PRESSURE LEAKAGE** test and **CYLINDER-TO-CYLINDER LEAKAGE TEST** using the standard leak down gauge following manufacturers suggested best practices.

   NOTE: Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. **Tapered and Out-of-Round Cylinders**

   The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. **Distorted Cylinders**

   This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. **Improper operation of "PCV "system**

   The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

   The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. **Worn Piston Ring Grooves**

   For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not

flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. **Worn, Broken or Stuck Piston Rings**

   When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. **Cracked or Broken Ring Lands**

   Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. **Worn Valve Stems and Guides**

   When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. **Bent or Misaligned Connecting Rods**

   Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. **Fuel Dilution**

   If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

   - Excess fuel can enter and mix with the oil via a leaking fuel injector
   - Gasoline contaminated with diesel fuel
   - Restricted air intake
   - Excessive idling

10. **Contaminated Cooling Systems**

    Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus

leading to higher oil consumption.

11. **Oil Viscosity**

    The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle owner's manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. **Dirty Engine Oil**

    Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. **Crankcase Overfull**

    Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. **Excessively High Oil Pressure**

    A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. **Aftermarket Performance Chips and Modification**

    Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. **Lugging Engine**

    Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. **Turbocharged Engines**

    There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated

plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. **Restricted Air Intake**

    Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

19. **Intake Manifold port seals**

    Engines that have a "V" configuration and a "wet valley" (3.3/3.8L) could draw oil into the intake ports due to improper sealing between the intake manifold ports and cylinder head. Causes may include improper torque of intake manifold bolts, corrosion (aluminum intake manifold) and or warped sealing surface.

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-rings. Misaligned or damaged.	1. Replace as necessary.
	(a) Loose fasteners, broken or porous metal parts.	(a) Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear oil seal.	2. Replace rear crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.
	3. Crankshaft seal flange. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan. Refer to **PAN, OIL, REMOVAL**.
	5. Engine timing cover seal, damaged or misaligned.	5. Replace seal. Refer to **SEAL, CRANKSHAFT OIL, FRONT, REMOVAL**.
	6. Scratched or damaged vibration damper hub.	6. Polish or replace damper.
OIL PRESSURE DROP	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure sensor.	2. Replace sensor. Refer to **SENSOR, OIL PRESSURE, REMOVAL**.
	3. Low oil pressure.	3. Check main bearing clearance. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**. 3. Check rod bearing clearance.

		Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
	4. Clogged oil filter.	4. Replace oil filter. Refer to **FILTER, ENGINE OIL, REMOVAL**.
	5. Worn oil pump.	5. Replace oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
	6. Thin or diluted oil.	6. Change oil and filter. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	7. Excessive bearing clearance.	7. Replace crankshaft bearings. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**. 7. Replace rod bearings. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
	8. Oil pump relief valve stuck.	8. Replace oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
	9. Oil pump pick-up tube loose, damaged or clogged.	9. Replace oil pump pick-up. Refer to **PICK-UP, OIL PUMP, REMOVAL**.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
	2. Carbon in oil ring slots.	2. Replace rings. Refer to **ROD, PISTON AND CONNECTING, REMOVAL**.
	3. Worn valve guides.	3. Replace cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.
	4. Leaking valve guide seals.	4. Replace valve guide seals. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

STANDARD PROCEDURE

ENGINE GASKET SURFACE PREPARATION

Fig. 2: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

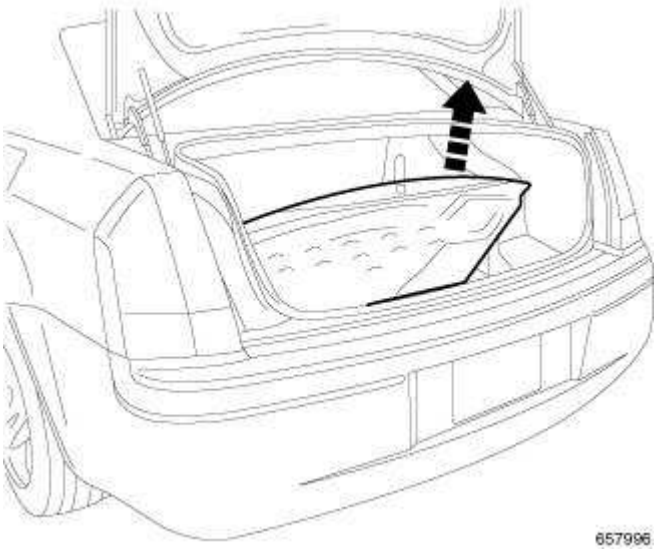

Fig. 3: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc.

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

DUST COVERS AND CAPS

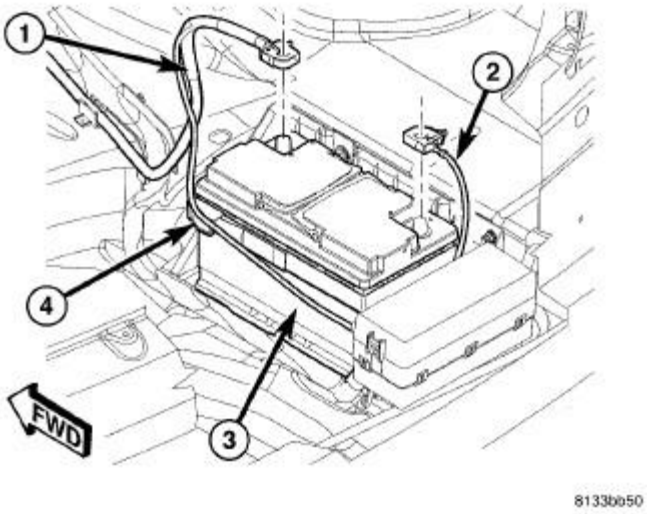

Fig. 4: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures cased by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

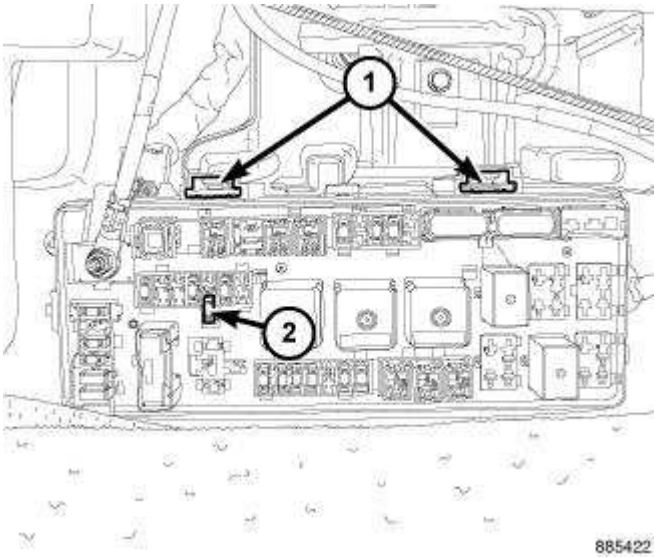

Fig. 5: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: All of the sealants mentioned below are not used on every engine, they are listed as a general reference guide. See service information for specific sealer usage.

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results.**Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers **must** free of grease or oil.

Surfaces should be cleaned with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, the parts should be assembled in no more than 10 minutes.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® THREEBOND ENGINE RTV SEALANT is a unique gasket material that is specially made to retain adhesion and sealing properties when used to seal components exposed to engine oil.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Threebond Engine RTV Sealant gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. The gasket surfaces should be cleaned with isopropyl alcohol wipes in preparation for sealant application. All mounting holes must be circled. For corner

sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be assembled within 20 minutes and torqued in place within 45 minutes. The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

ENGINE GASKET SURFACE PREPARATION

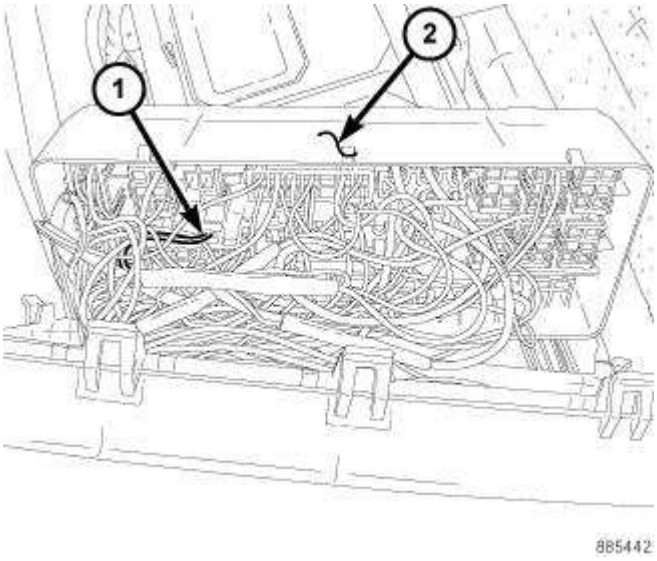

Fig. 6: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper.
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (1).

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (3).
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (2).

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

16. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
17. Remove the belly pan retainers (1) and remove the belly pan.
18. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
19. Drain the engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

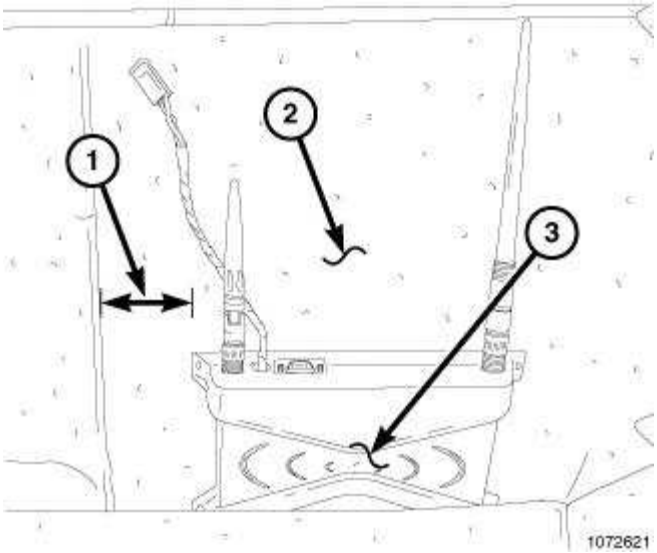

Fig. 13: Removing/Installing Front Axle
Courtesy of CHRYSLER GROUP, LLC

20. If equipped with AWD, remove the front axle assembly (1). Refer to **REMOVAL** .

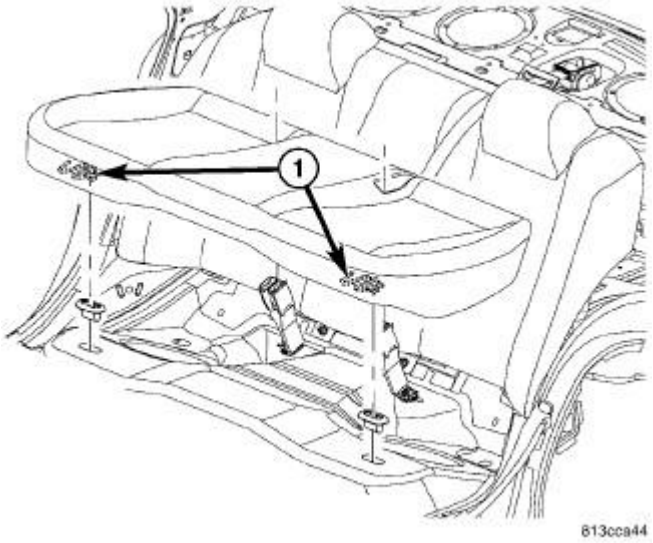

Fig. 14: Upstream Oxygen Sensor & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

21. Disconnect both left and right upstream oxygen sensor (2) electrical connectors (1).

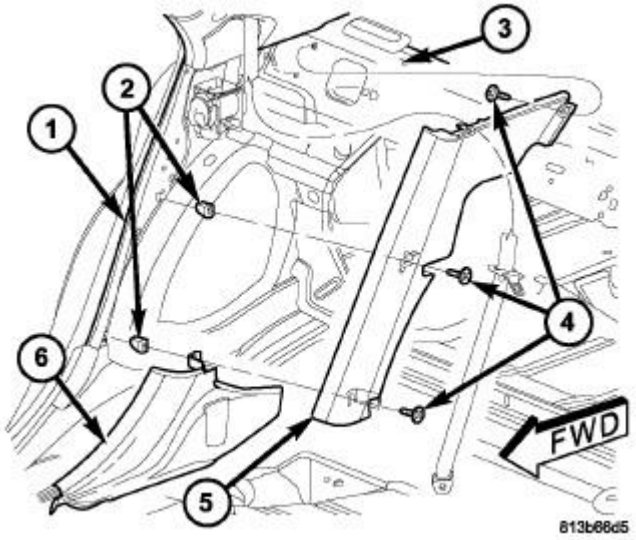

Fig. 15: Exhaust Down Pipe & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

22. Remove the exhaust down pipe (1) to catalytic converter retaining nuts (2) from both left and

right down pipes.

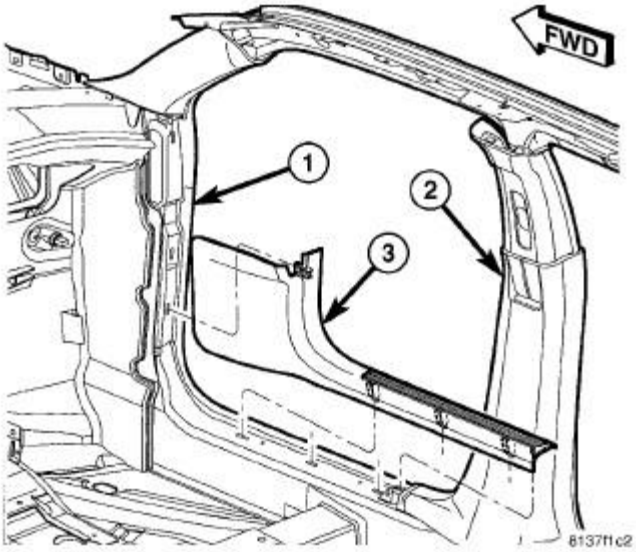

Fig. 16: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

23. Remove the starter motor. Refer to **STARTER, REMOVAL** .
24. Rotate the crankshaft in a clockwise direction until the torque converter bolts (1) are accessible through the starter mounting hole and remove the six torque converter bolts (1).
25. Lower the vehicle.

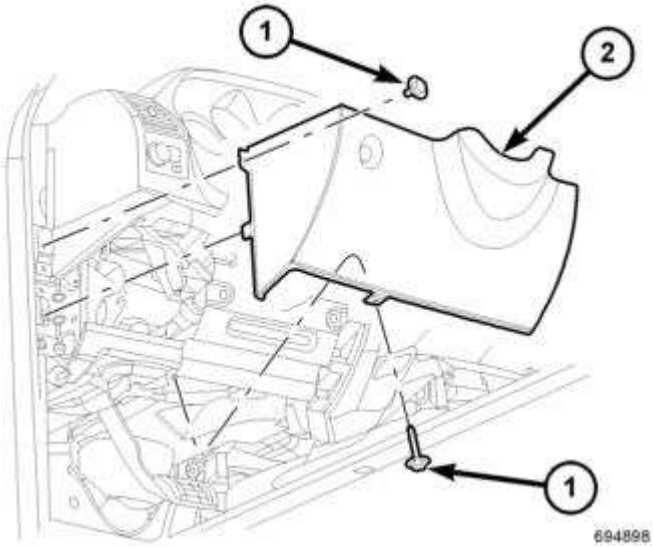

Fig. 17: Coolant Bottle Return Hose
Courtesy of CHRYSLER GROUP, LLC

26. Remove the coolant bottle return hose (1).

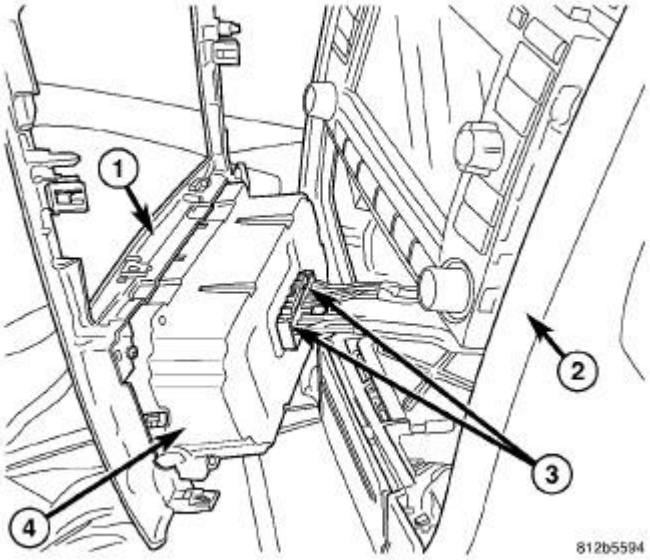

Fig. 18: Heater Core Purge Hose, Coolant Bottle Retaining Bolts & Coolant Bottle
Courtesy of CHRYSLER GROUP, LLC

27. Remove the heater core purge hose (1) from the coolant bottle.
28. Remove the coolant bottle retaining bolts (2).
29. Remove the coolant bottle (3).

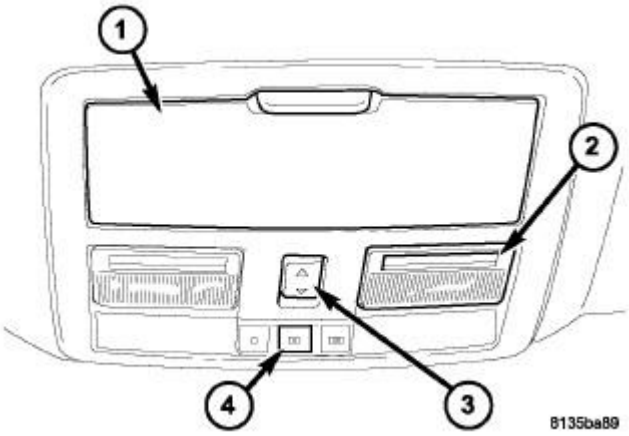

Fig. 19: EVAP Purge Solenoid, Electrical Connector & Vacuum Lines
Courtesy of CHRYSLER GROUP, LLC

30. Disconnect the vacuum line (3) at the EVAP purge solenoid (1).
31. Disconnect the EVAP purge solenoid vacuum line (4) at the intake manifold and remove the vacuum line.

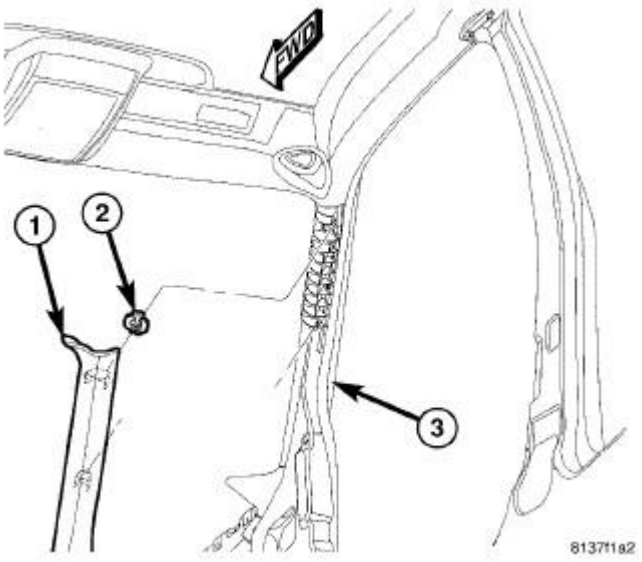

Fig. 20: PCV Valve, Intake Manifold, Brake Booster Vacuum Hose, MAP Sensor, ETC & CMP Sensor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

32. Disconnect the PCV hose from the PCV valve (1) and the intake manifold (2) and remove hose.
33. Disconnect the brake booster vacuum hose (3) and position aside.
34. Disconnect the electrical connector at the Manifold Absolute Pressure (MAP) Sensor (4).
35. Disconnect the electrical connector at the Electronic Throttle Control (ETC) (5).
36. Disconnect the electrical connector at the Camshaft Position Sensor (CMP) (6) and position harness aside.

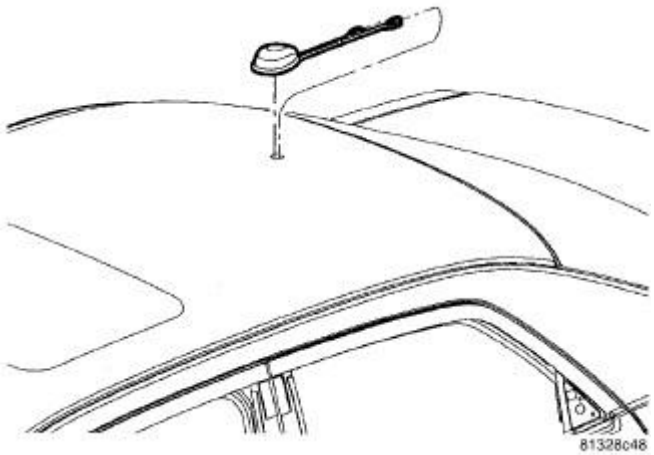

Fig. 21: Fresh Air Makeup Hose At Rear Of Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

37. Remove the fresh air makeup hose (2) from the rear of the intake manifold (1).

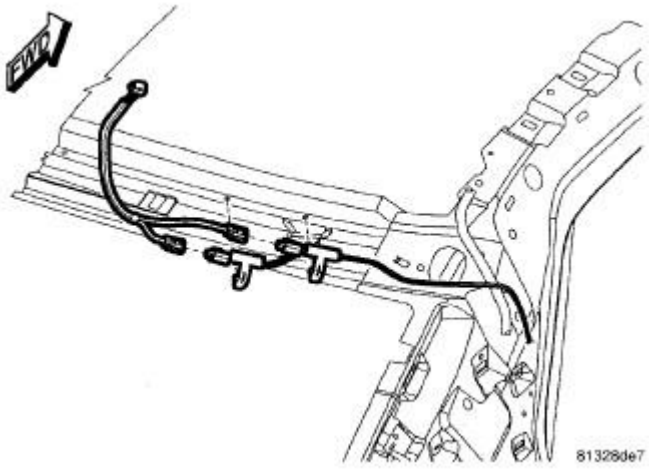

Fig. 22: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

38. Remove the upper intake manifold (2) and insulator. Refer to **MANIFOLD, INTAKE, REMOVAL**.

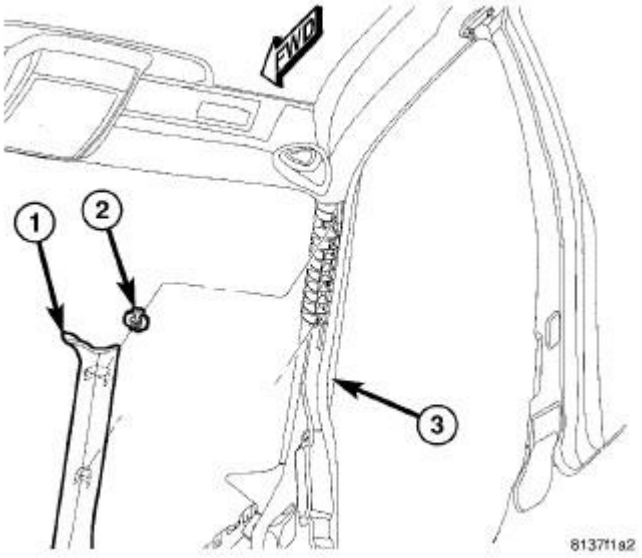

Fig. 23: Fuel Supply Hose At Underbody Fuel Supply Tube
Courtesy of CHRYSLER GROUP, LLC

39. Disconnect the fuel supply hose (1) from the underbody fuel supply tube (2). Refer to **FITTING, QUICK CONNECT** .

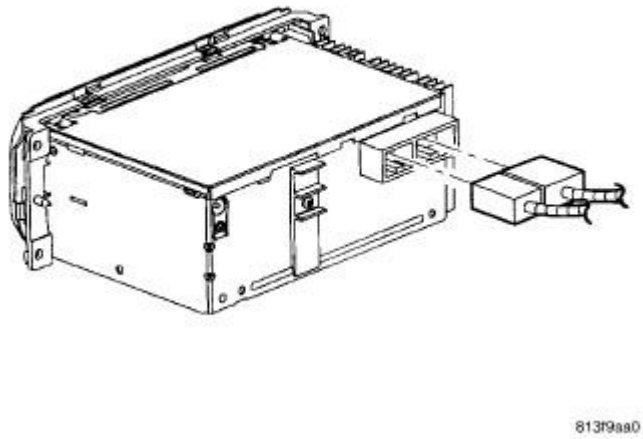

Fig. 24: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

40. Remove the cooling fan module. Refer to **FAN, COOLING, REMOVAL** .

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

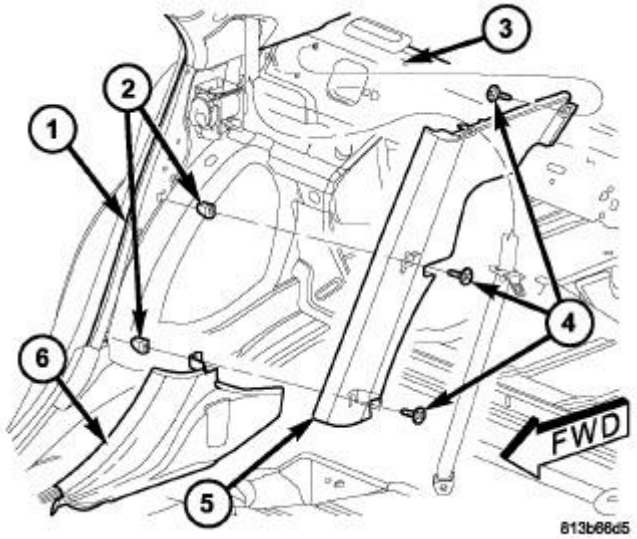

Fig. 25: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

41. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and remove the accessory drive belt (3), then slowly rotate the tensioner into the freearm position.

42. Remove the generator (1). Refer to **GENERATOR, REMOVAL** .

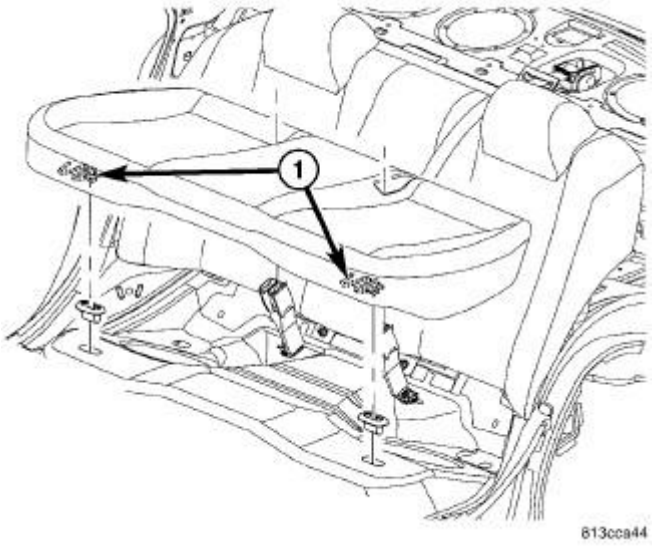

Fig. 26: Variable Valve Timing Solenoid Connectors & Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

43. Disconnect the electrical connectors (2) from the variable valve timing solenoids on the right cylinder head.
44. Unfasten the starter harness to main harness retainer (3).
45. Unfasten the two starter wire harness retainers (1) from the right cylinder head cover.

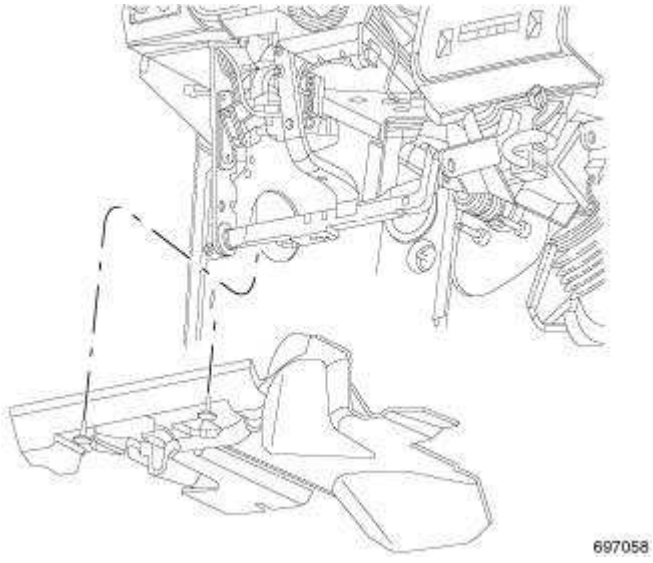

Fig. 27: Main Wire Harness Retainer & Connector

Courtesy of CHRYSLER GROUP, LLC

46. Unfasten the main wire harness retainer (2) from the right cylinder head cover mounting stud.

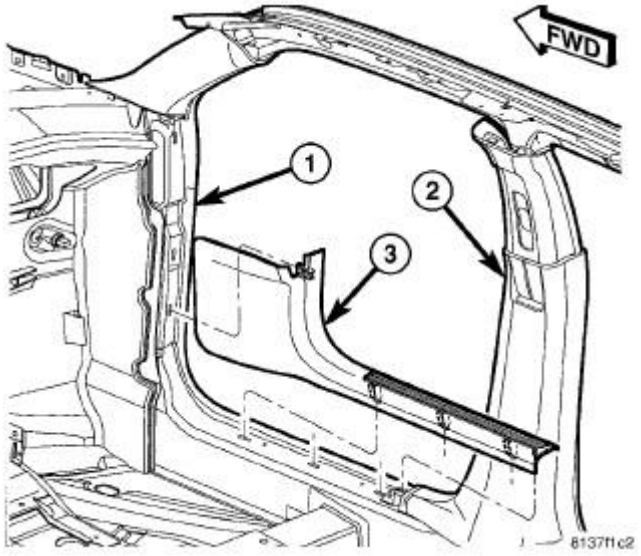

Fig. 28: Main Wire Harness Retainers At Right Cylinder Head Cover
Courtesy of CHRYSLER GROUP, LLC

47. Unfasten the four main wire harness retainers (1) from the right cylinder head cover.

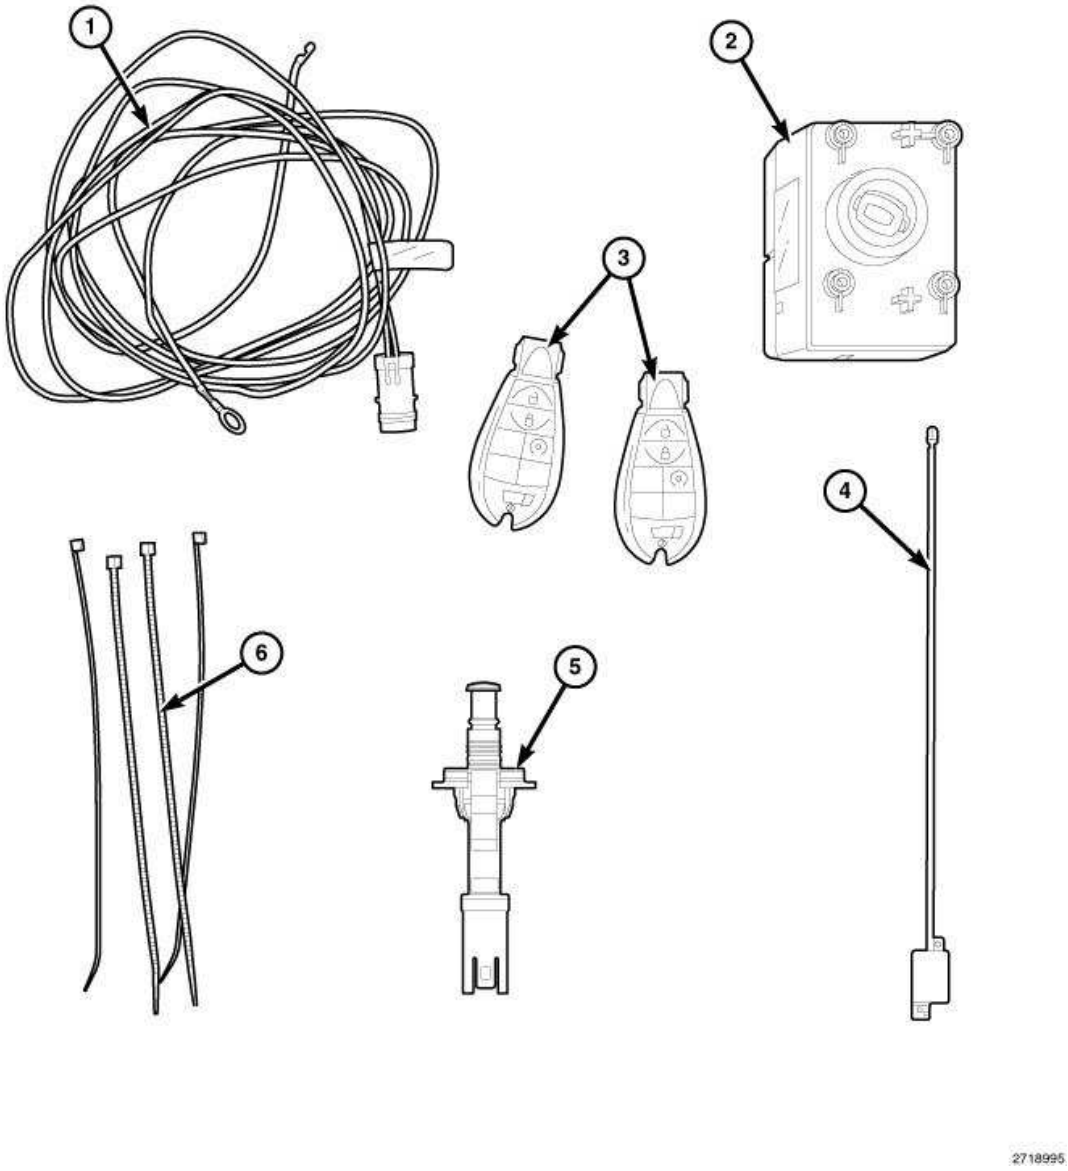

Fig. 29: Wire Harness Retainers, Oil Pump Solenoid Electrical Connector & Ground Strap
Courtesy of CHRYSLER GROUP, LLC

48. Disconnect the oil pump solenoid electrical connector (2).
49. Unfasten the four wire harness retainers (1).
50. Remove the ground strap (3) from the right engine mount bracket.

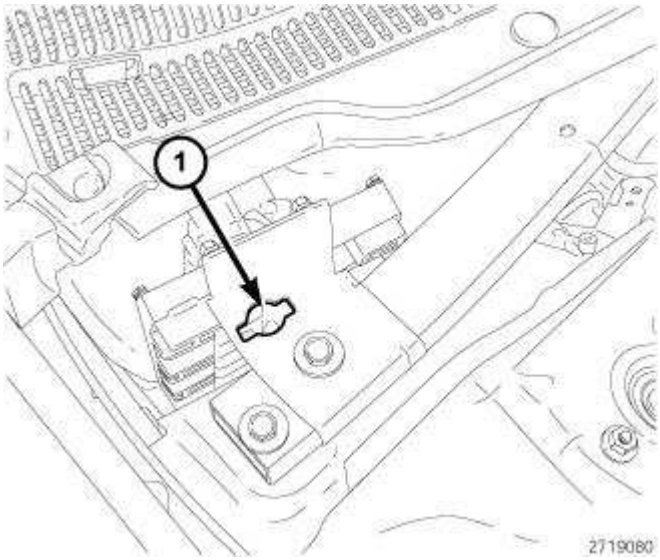

Fig. 30: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

51. Disconnect the electrical connectors (2) from the left variable valve timing solenoids.
52. Unfasten the two starter wire harness retainers (1) from the left cylinder head cover.

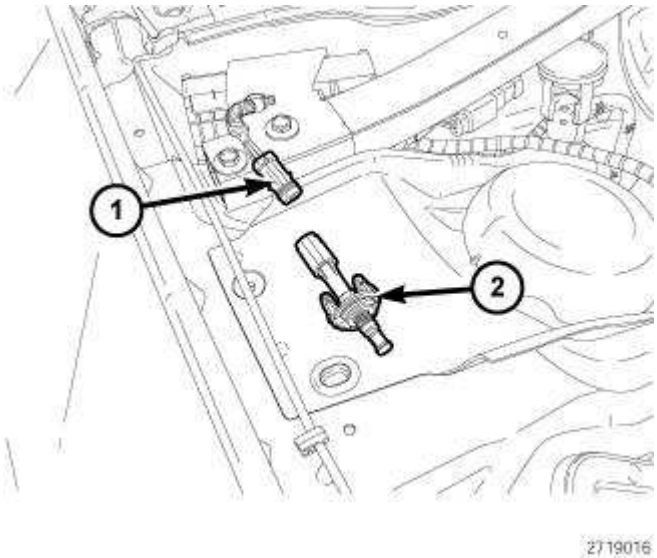

Fig. 31: A/C Compressor Electrical Connector & Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

53. Disconnect the A/C compressor electrical connector (1) and unfasten the wire harness retainer (2) from the A/C compressor discharge line.

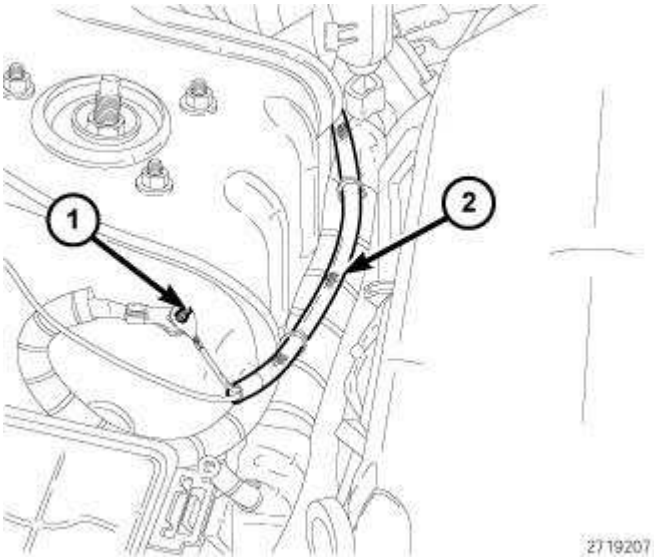

Fig. 32: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
Courtesy of CHRYSLER GROUP, LLC

54. Unfasten the two starter wire harness retainers (1) from the upper intake manifold support brackets.
55. Unfasten the main wire harness retainer (3) from the left cylinder head cover and two retainers (2) from the upper intake manifold support brackets.

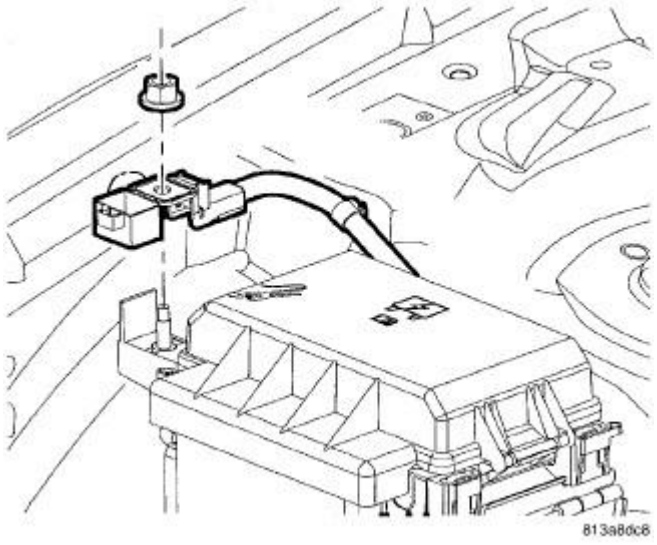

Fig. 33: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

56. Disconnect the Engine Coolant Temperature (ECT) sensor connector (3).
57. Disconnect the left Camshaft Position (CMP) sensor (5).

58. Unfasten the main wire harness retainer (2) from the cylinder head cover and one main wire harness retainer (4) from the cylinder head cover mounting stud.
59. Unfasten the main wire harness retainer (1) form the rear of the lower intake manifold.

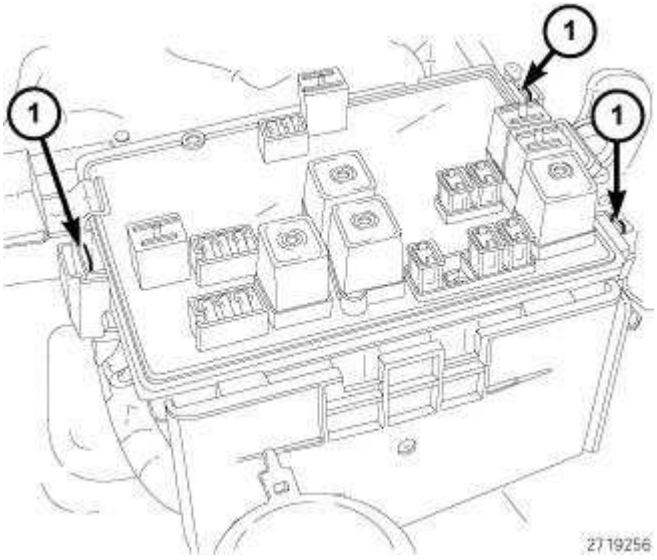

Fig. 34: Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

60. Remove the upper radiator hose (1) from the engine thermostat housing.

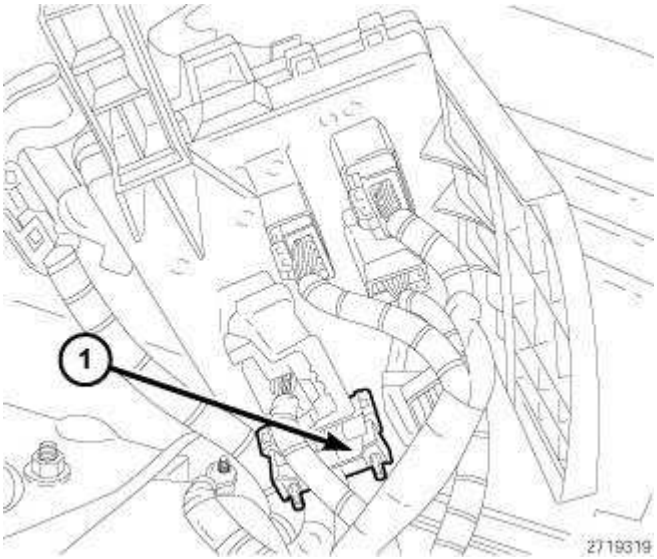

Fig. 35: Lower Heater Core Return Hose & Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

61. Remove the lower heater core return hose (1) from the engine coolant pump housing.
62. Remove the lower radiator hose (2) from the engine coolant pump housing.

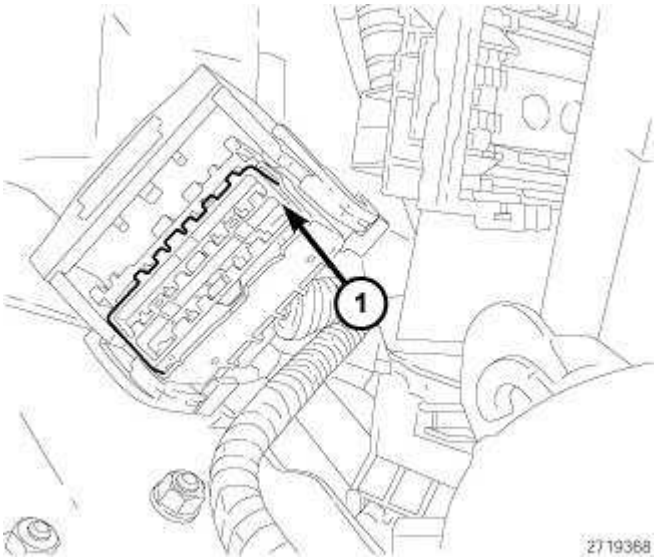

Fig. 36: Heater Core Return Tube Lower Support Bracket Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

63. Remove the heater core return tube lower support bracket retaining nut (1).

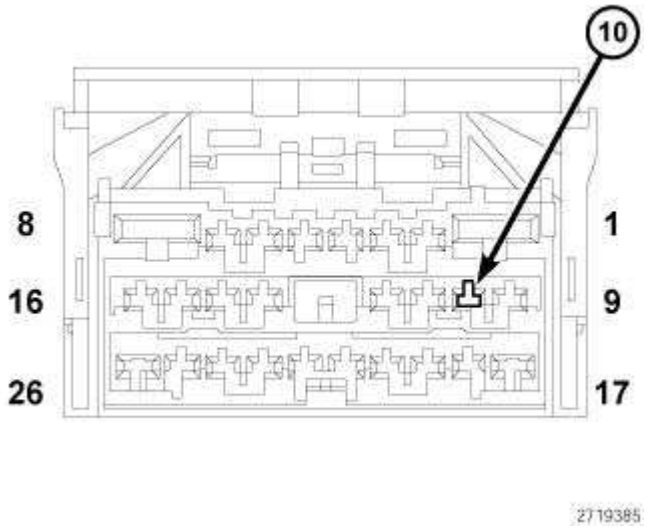

Fig. 37: Heater Core Return Hose
Courtesy of CHRYSLER GROUP, LLC

64. Disconnect the heater core return hose (1).

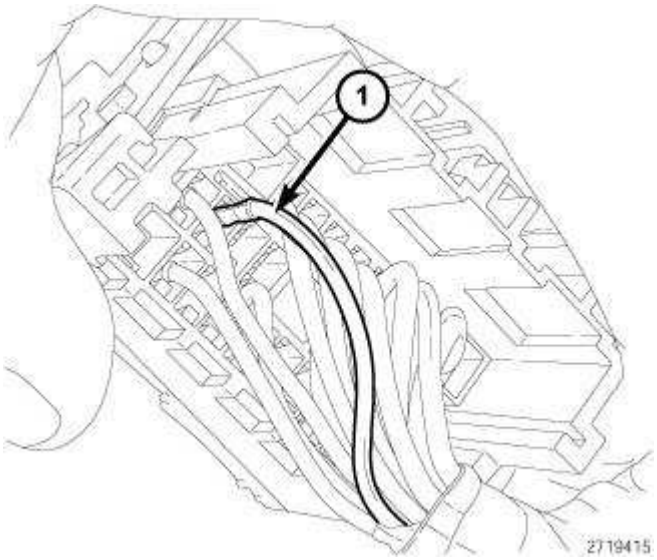

Fig. 38: Heater Core Return Tube Upper Support Bracket Retaining Nut & Tube
Courtesy of CHRYSLER GROUP, LLC

65. Remove the heater core return tube upper support bracket retaining nut (2) and remove tube (1).

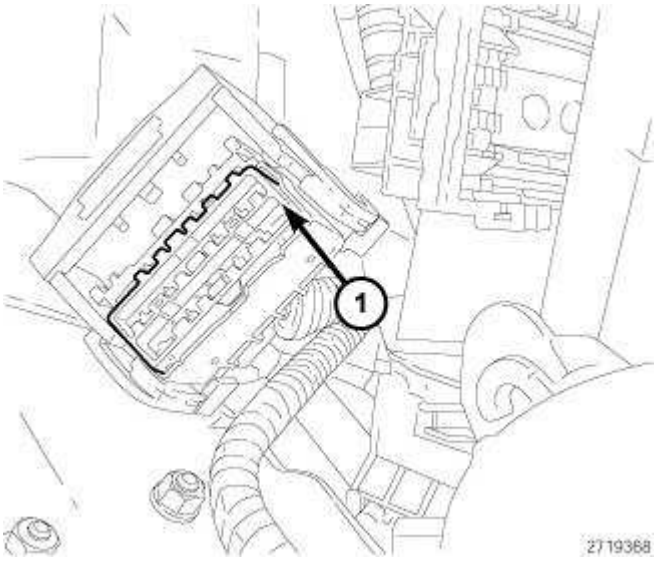

Fig. 39: A/C Compressor, Nut, Stud & Three Bolts
Courtesy of CHRYSLER GROUP, LLC

66. Remove the A/C compressor (2). Refer to **COMPRESSOR, A/C, REMOVAL** .
67. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

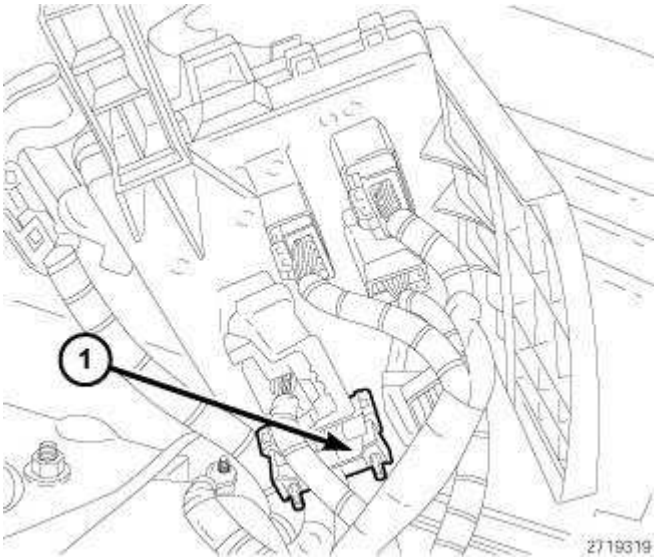

Fig. 40: Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

68. Remove the starter. Refer to **STARTER, REMOVAL** .
69. Unfasten the starter wire harness retainer (2) and the main wire harness retainer (1) from the engine block.

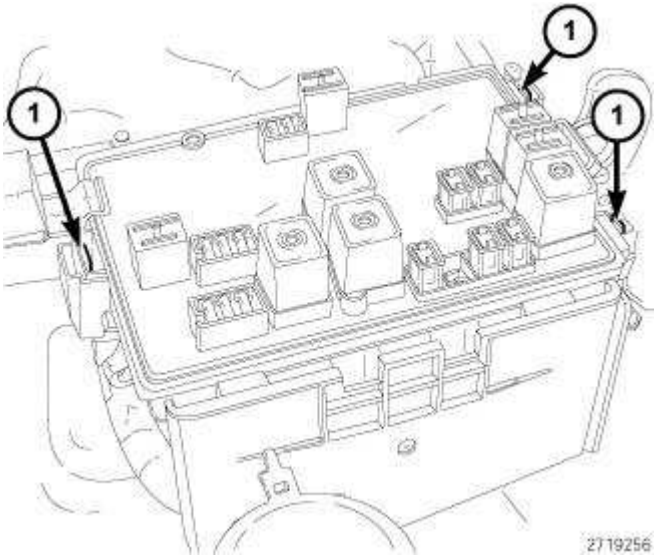

Fig. 41: Bolt & Transmission Cooling Lines
Courtesy of CHRYSLER GROUP, LLC

70. Remove the bolt (1) and reposition the transmission cooling lines (2).

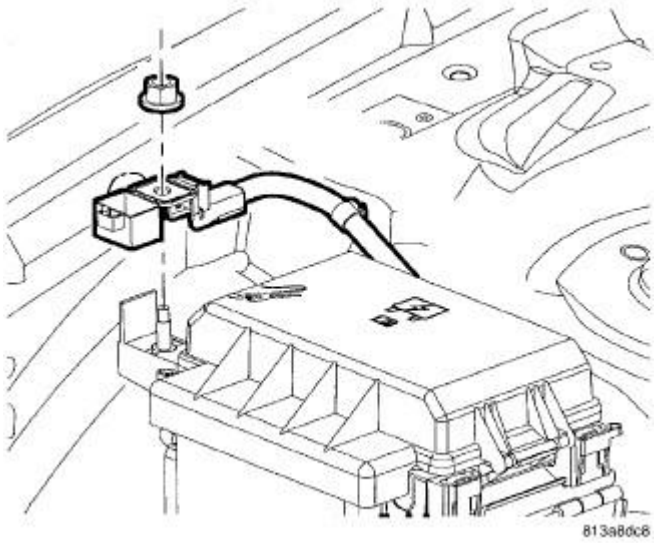

Fig. 42: CKP Sensor Heat Shield
Courtesy of CHRYSLER GROUP, LLC

71. Push back the heat shield (1) from the crankshaft position (CKP) sensor.

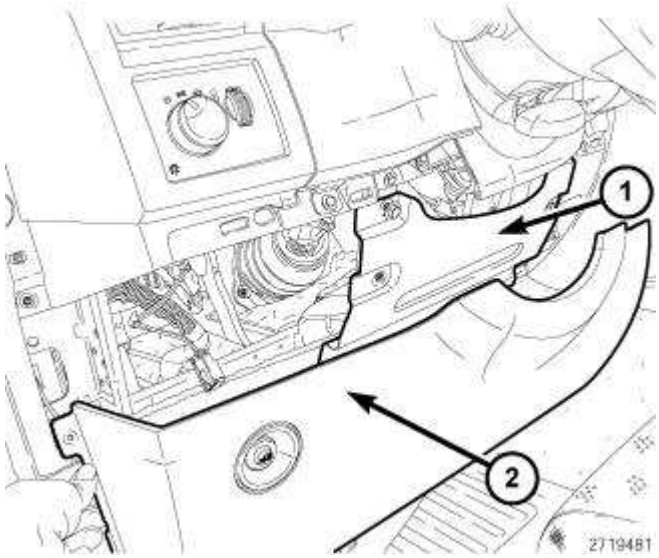

Fig. 43: Main Wire Harness Retainers & CKP Sensor
Courtesy of CHRYSLER GROUP, LLC

72. Disconnect the main wire harness from the Crankshaft Position (CKP) sensor (3).
73. Unfasten the main wire harness retainer (1) from the engine block and one main wire harness retainer (2) from the right engine mount bracket.
74. Disconnect and reposition the power cord from the engine block heater (if equipped).

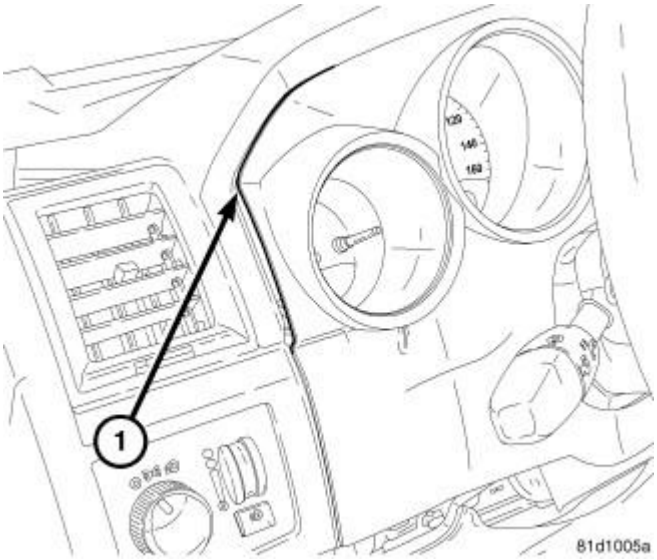

Fig. 44: Upper Side Transmission-To-Engine Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

75. Remove the two upper side transmission to engine retaining bolts (1).

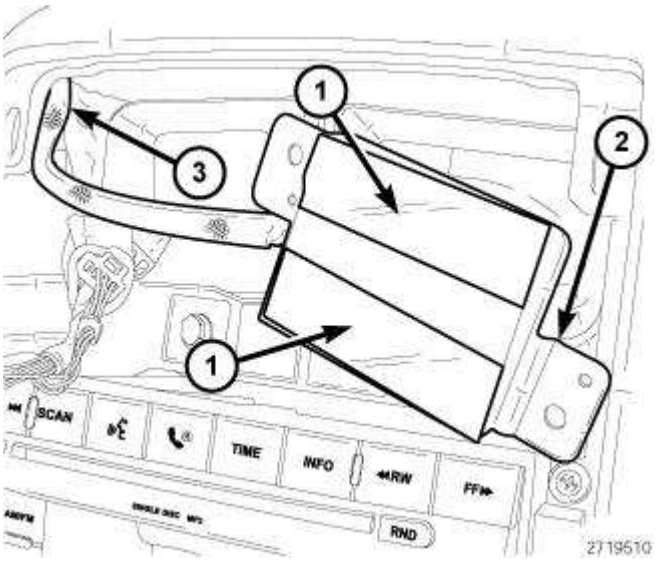

Fig. 45: Engine Injection/Ignition Harness & Engine Oil Pressure/Temperature Harness
Courtesy of CHRYSLER GROUP, LLC

76. Disconnect the main harness from the engine injection/ignition harness (1) at the rear of the left cylinder head.
77. Disconnect the main harness from the engine oil pressure/temperature harness (2) at the rear of the left cylinder head.

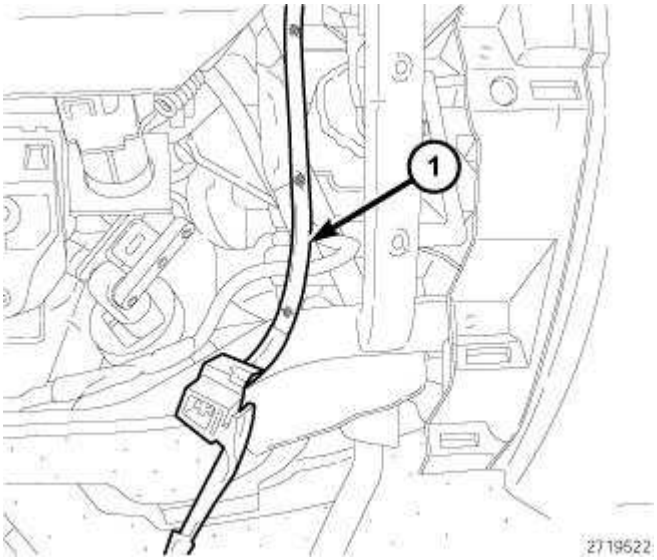

Fig. 46: Side Engine-To-Transmission Bolt, Transmission Dust Shield Retaining Bolt & Dust Shield
Courtesy of CHRYSLER GROUP, LLC

78. Remove the side engine to transmission bolt (1).

    Remove the transmission dust shield retaining bolt (2) and remove the dust shield (3)

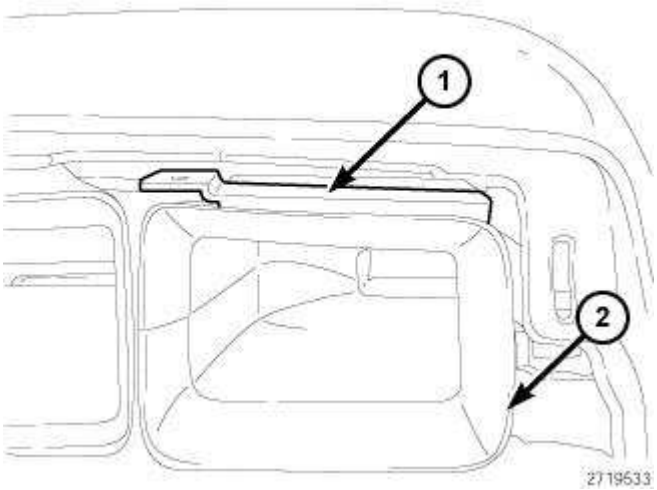

Fig. 47: Rubber Plugs
Courtesy of CHRYSLER GROUP, LLC

79. Remove the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

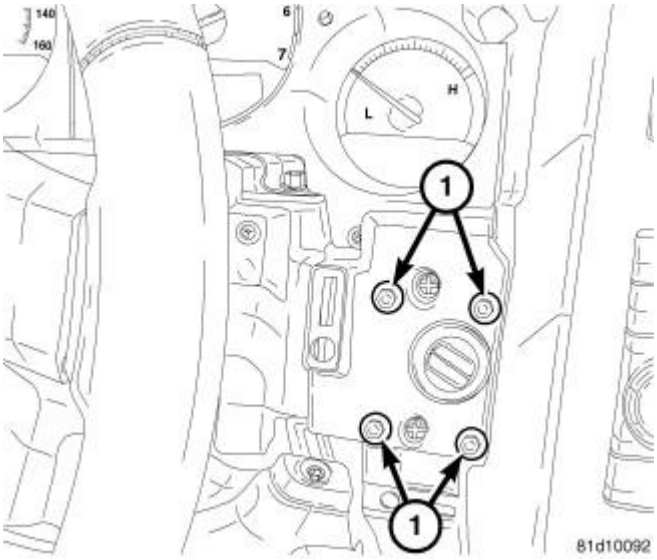

Fig. 48: Transmission-To-Engine Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

80. Remove four transmission to the engine oil pan bolts (1).

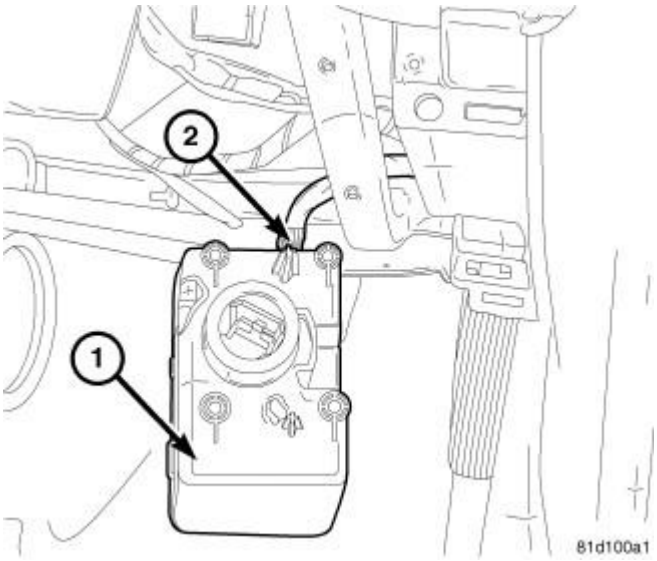

Fig. 49: Heater Core Inlet Tube, Oil Level Indicator & Bolts
Courtesy of CHRYSLER GROUP, LLC

81. Lower the vehicle.
82. Remove two bolts (3) and remove the heater core inlet tube (4).
83. Remove the bolt (1) and remove the oil level indicator (2).

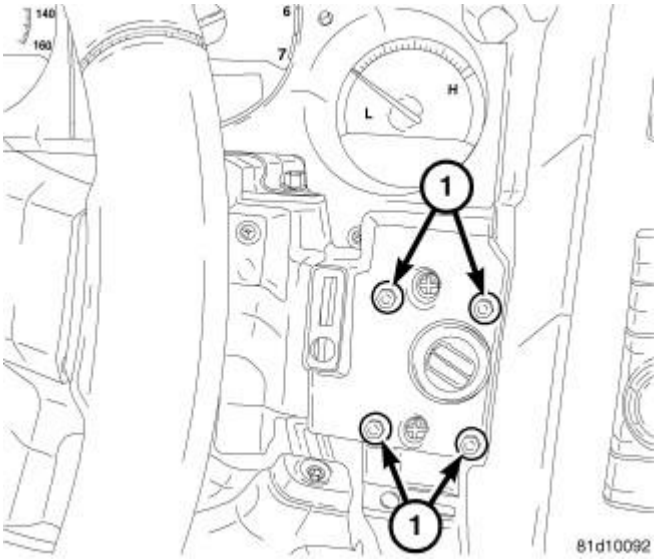

Fig. 50: Left Intake Manifold Support Brackets & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

84. Remove the left intake manifold support bracket retaining bolts (2) and remove the support brackets (1).

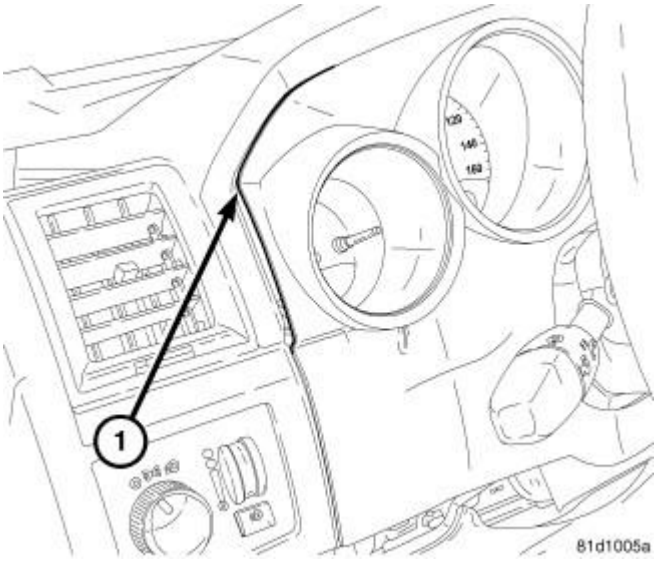

Fig. 51: Driver Side Engine Lifting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

85. Install the Driver Side Engine Lifting Bracket (special tool #10242-1, Brackets, Engine Lifting, Left Side) (1) on the left cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

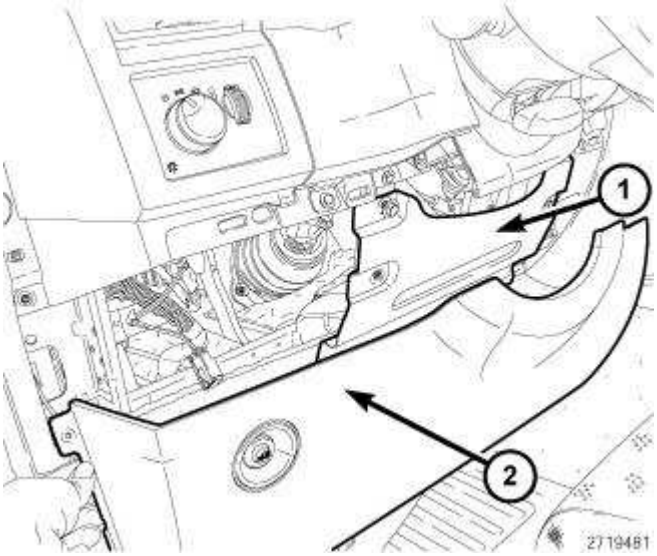

Fig. 52: Passenger Side Engine Lifting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

86. Install the Passenger Side Engine Lifting Bracket (special tool #10242-2, Brackets, Engine Lifting, Right Side) (1) on the right cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

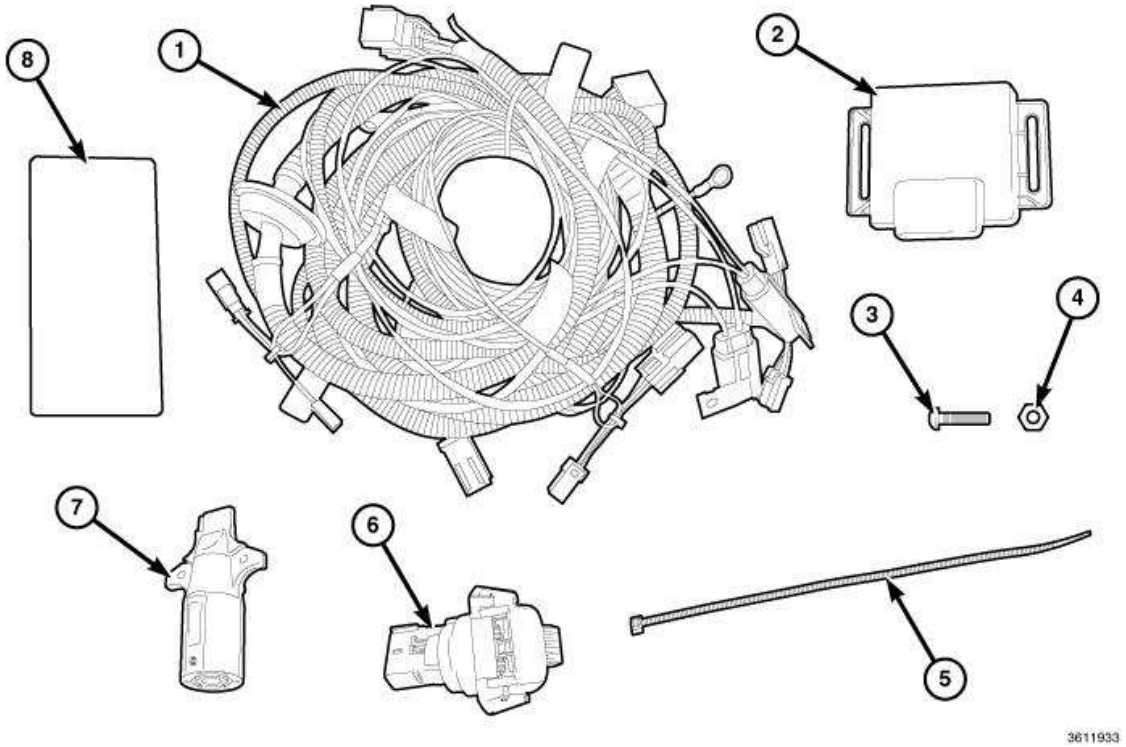

Fig. 53: Lifting Sling, Engine Lifting Brackets & Engine Hoist
Courtesy of CHRYSLER GROUP, LLC

87. Reposition the starter wire harness and the main wire harness to the rear of the engine compartment.
88. Position a load-leveling lifting sling (2), such as OTC® 4305 Engine Load Leveler or equivalent, between the engine lifting brackets (3) and an engine hoist (1).
89. Support the transmission with a suitable jack.

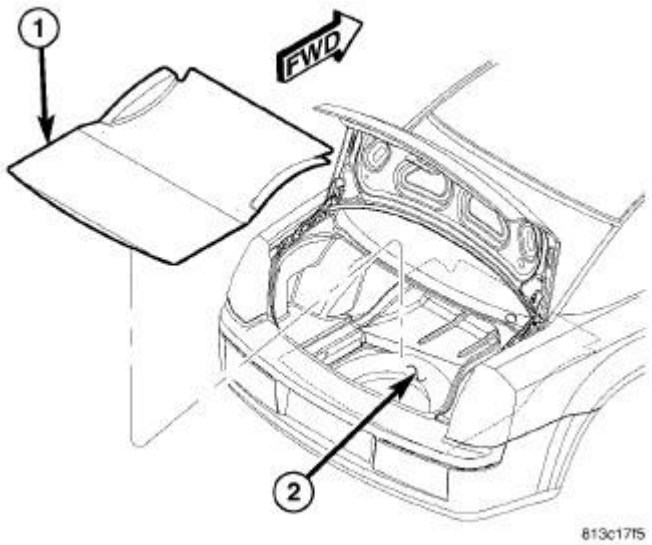

Fig. 54: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

90. Unfasten the harness retainer (4) from the electric vacuum pump mounting bracket.
91. Disconnect the electrical connector (1) from the electric vacuum pump (3).
92. Remove the quick connect vacuum hose (2) from the electric vacuum pump (3).

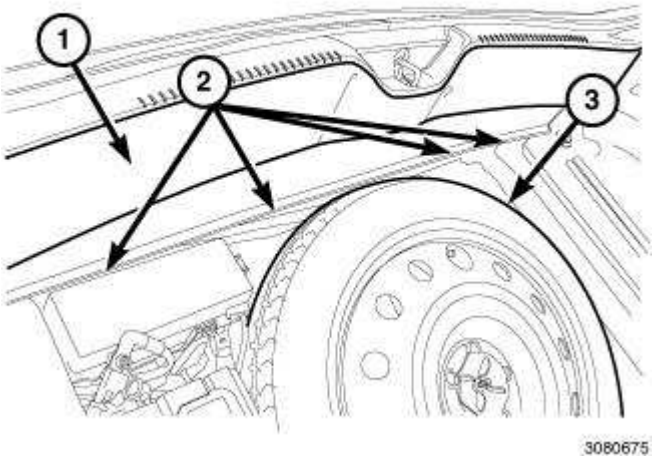

Fig. 55: Electric Vacuum Pump, Bolts & Studs

Courtesy of CHRYSLER GROUP, LLC

93. Remove the two upper transmission to engine retaining bolts (2) and remove the electric vacuum pump (3).

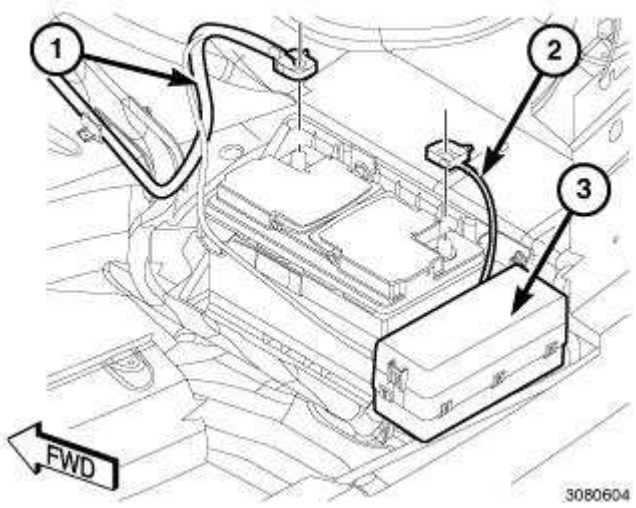

Fig. 56: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left engine mount shown in illustration, right engine mount similar.

94. Remove both left and right engine mount heat shield retaining nuts (3) and remove the heat shields (4).
95. Remove both left and right engine mount lower retaining bolts (2).

CAUTION: While slowly separating the engine from the vehicle, constant checks must be made to assure proper positioning and that no damage to other components or wiring harnesses occur during separation.

96. Carefully remove the engine from the engine compartment.
97. If required, remove the following components for installation on the replacement engine:

- Left exhaust down pipe
- Right exhaust down pipe
- Left engine mount bracket
- Left engine mount
- Right engine mount bracket
- Right engine mount
- Accessory drive belt tensioner

- Upper intake manifold support bracket
- Block heater (if equipped)

INSTALLATION

INSTALLATION

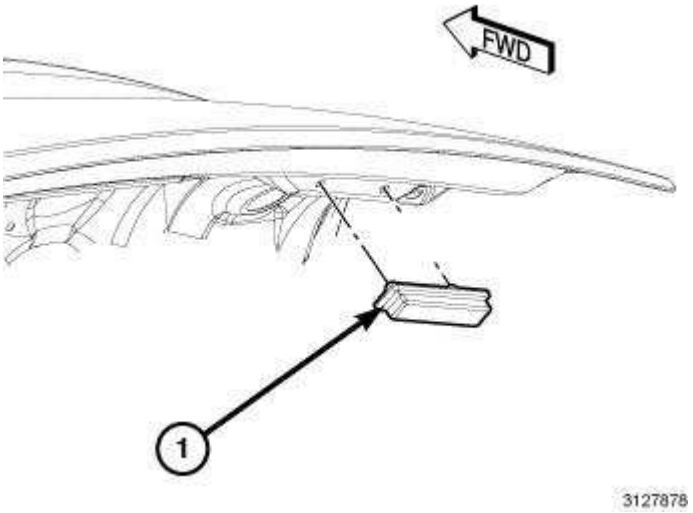

Fig. 57: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: If installing a replacement engine, transfer components such as engine mount brackets, block heater, accessories, heater hoses and tubes to the replacement engine.

1. If required, transfer the following components onto the replacement engine:
   - Left exhaust down pipe
   - Right exhaust down pipe
   - Left engine mount bracket
   - Left engine mount
   - Right engine mount bracket
   - Right engine mount
   - Accessory drive belt tensioner
   - Upper intake manifold support bracket
   - Block heater (if equipped)
2. If required, remove the upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

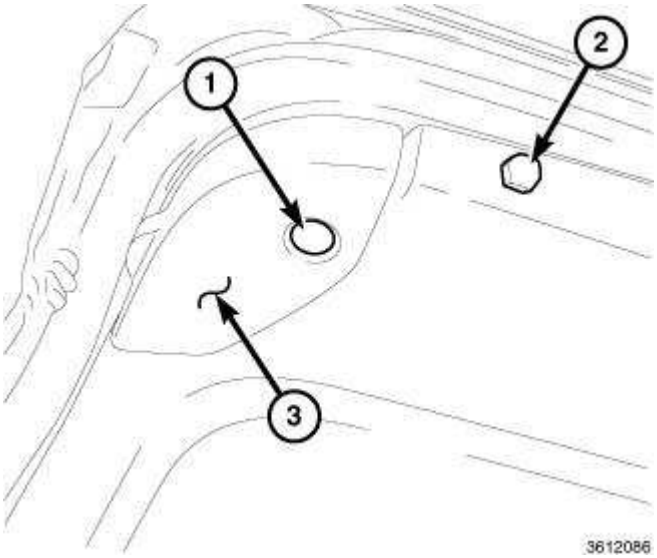

Fig. 58: Left Intake Manifold Support Brackets & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the left intake manifold support bracket retaining bolts (2) and remove the support brackets (1).

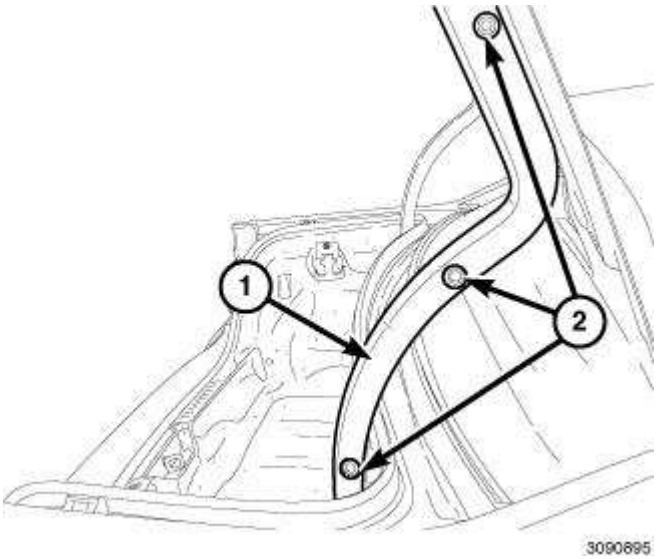

Fig. 59: Driver Side Engine Lifting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the Driver Side Engine Lifting Bracket (special tool #10242-1, Brackets, Engine Lifting, Left Side) (1) on the left cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

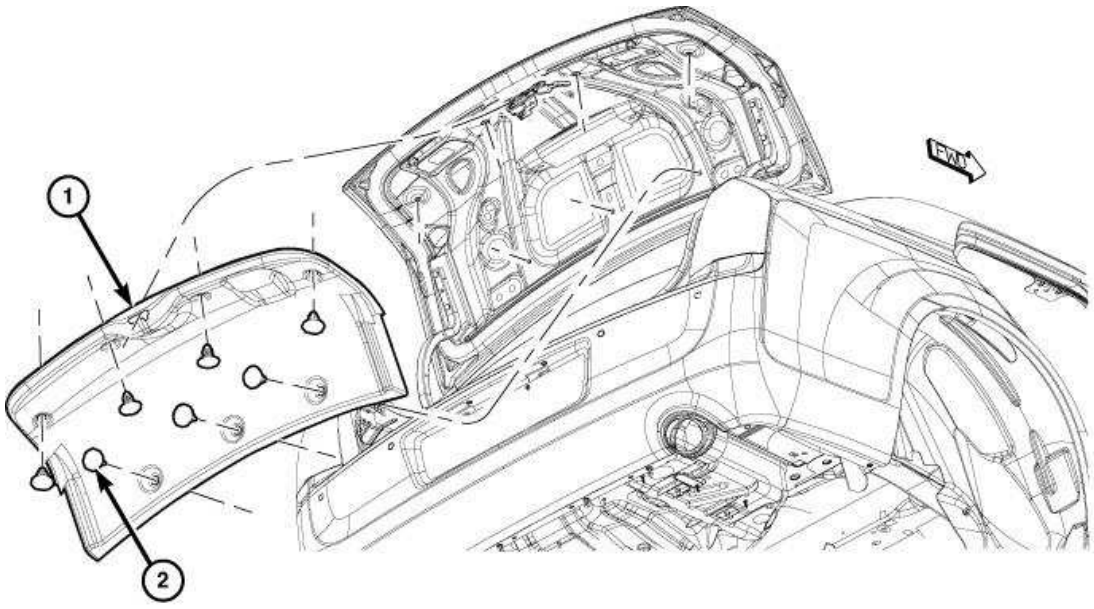

Fig. 60: Passenger Side Engine Lifting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the Passenger Side Engine Lifting Bracket (special tool #10242-2, Brackets, Engine Lifting, Right Side) (1) on the right cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

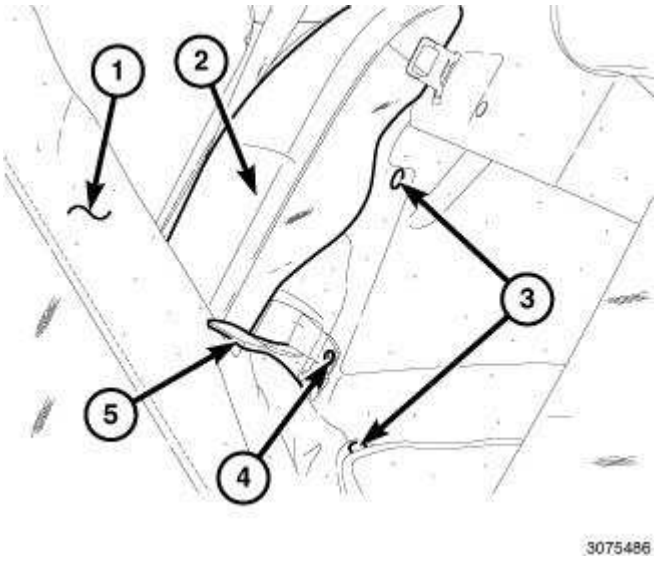

Fig. 61: Lifting Sling, Engine Lifting Brackets & Engine Hoist
Courtesy of CHRYSLER GROUP, LLC

6. Position a load-leveling lifting sling (2), such as OTC® 4305 Engine Load Leveler or equivalent, between the engine lifting brackets (3) and an engine hoist (1).

7. Reposition the starter wire harness and the main wire harness to the rear of the engine compartment.

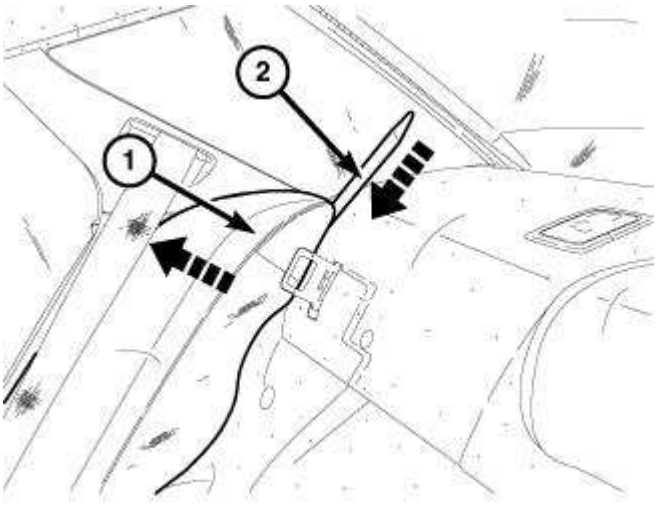

Fig. 62: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left engine mount shown in illustration, right engine mount similar.

8. Carefully lower the engine into the engine compartment while aligning the two locator dowels into the transmission housing.
9. Align the engine mounts, install both left and right engine mount lower retaining bolts (2) and tighten to 68 N.m (50 ft. lbs.).
10. Position both left and right engine mount heat shields (4), install the retaining nuts (3) and tighten to 12 N.m (9 ft. lbs.).

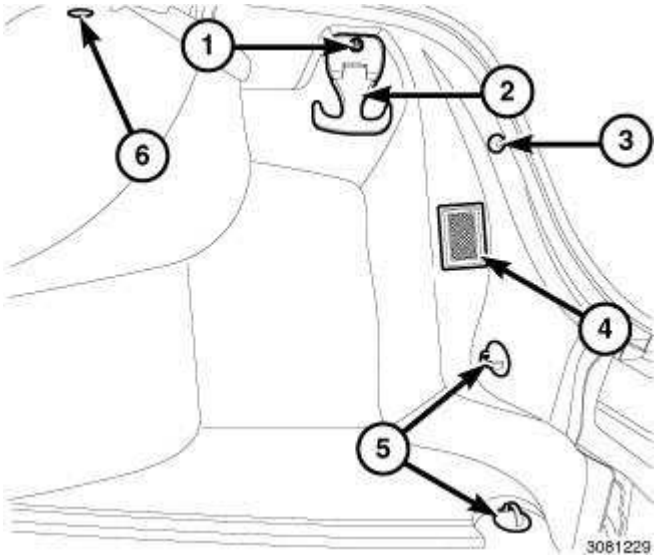

Fig. 63: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

11. Position the electric vacuum pump (3), install the two transmission to engine retaining bolts (2) and tighten to 55 N.m (41 ft. lbs.).

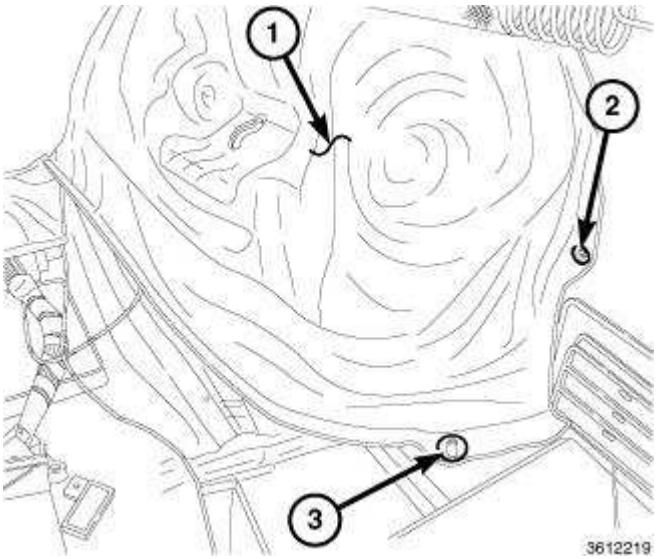

Fig. 64: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

12. Install the quick connect vacuum hose (2) to the electric vacuum pump (3).
13. Connect the electrical connector (1) to the electric vacuum pump (3).
14. Secure the harness retainer (4) to the mounting bracket.

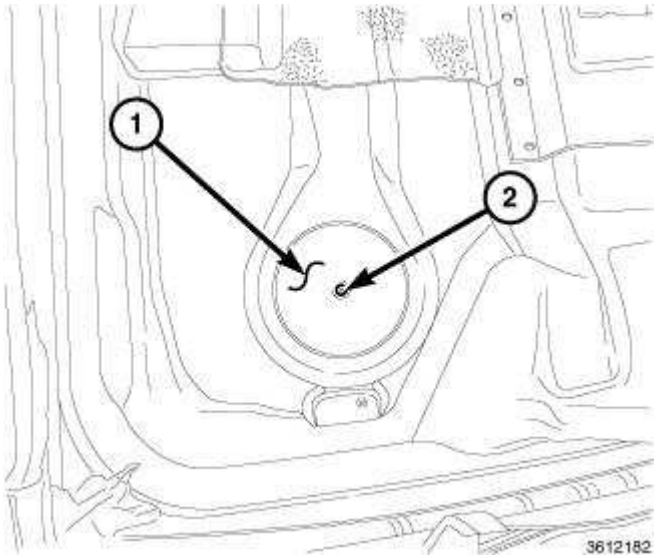

Fig. 65: Left Intake Manifold Support Brackets & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the engine lifting brackets and position the left upper intake manifold support brackets (1) and install the retaining studs (2) finger tight.

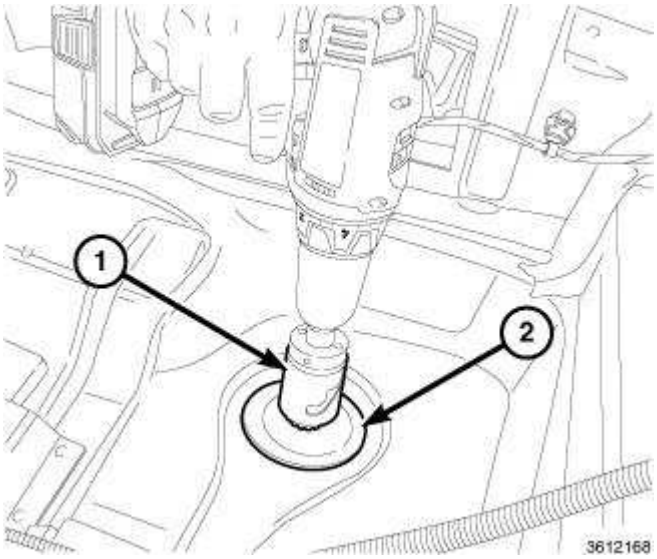

Fig. 66: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
Courtesy of CHRYSLER GROUP, LLC

16. Route the main wire harness and starter wire harness on the engine.
17. Secure the two starter wire harness retainers (1) to the upper intake manifold support brackets.
18. Secure the main wire harness retainer (3) to the left cylinder head cover and two retainers (2) to the upper intake manifold support brackets.

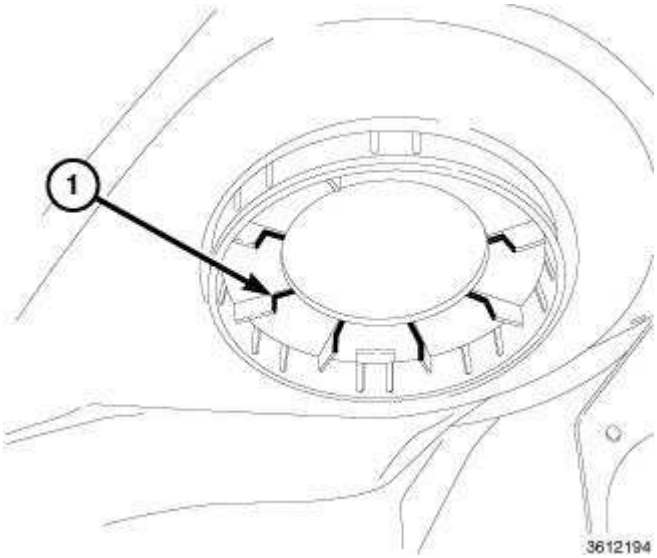

Fig. 67: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

19. Connect the Engine Coolant Temperature (ECT) sensor connector (3).
20. Connect the left Camshaft Position (CMP) sensor (5).
21. Secure the main wire harness retainer (2) to the cylinder head cover and one main wire harness retainer (4) to the cylinder head cover mounting stud.
22. Secure the main wire harness retainer (1) to the rear of the lower intake manifold.

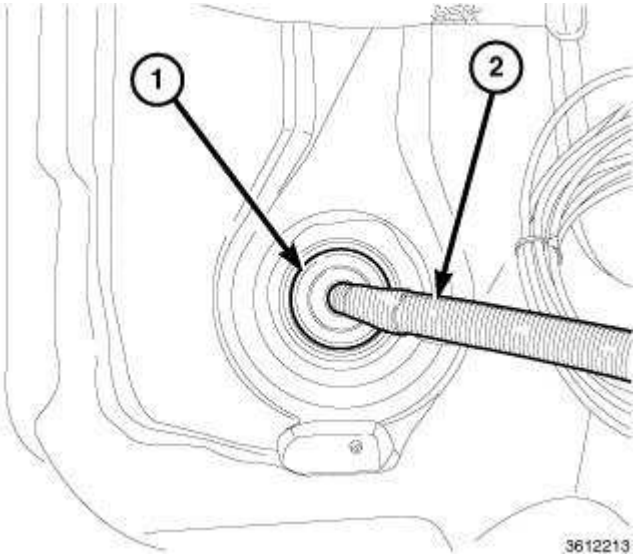

Fig. 68: Main Wire Harness Retainers At Right Cylinder Head Cover
Courtesy of CHRYSLER GROUP, LLC

23. Secure the four main wire harness retainers (1) to the right cylinder head cover.

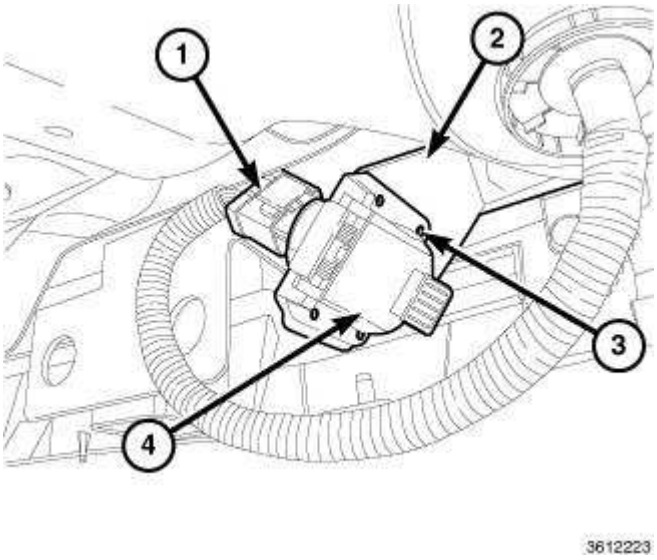

Fig. 69: Variable Valve Timing Solenoid Connectors & Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

24. Connect the electrical connectors (2) to the variable valve timing solenoids on the right cylinder head.
25. Secure the two starter wire harness retainers (1) to the right cylinder head cover.
26. Secure the starter harness to main harness retainer (3).

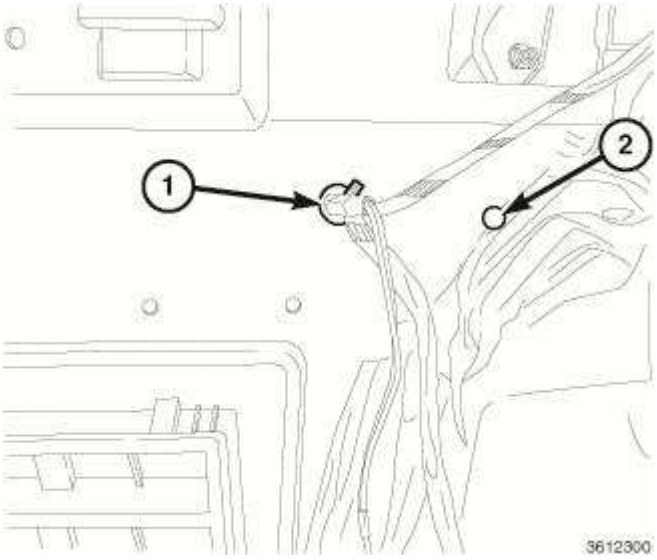

Fig. 70: Wire Harness Retainers, Oil Pump Solenoid Electrical Connector & Ground Strap
Courtesy of CHRYSLER GROUP, LLC

27. Connect the oil pump solenoid electrical connector (2).
28. Secure the four wire harness retainers (1).
29. Install the ground strap (3) to the right engine mount bracket.

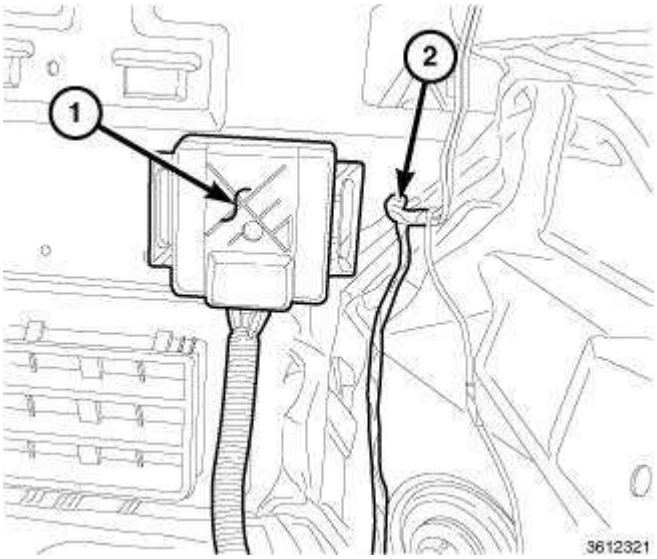

Fig. 71: Transmission-To-Engine Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

30. Remove the jack supporting the transmission.
31. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
32. Install the four transmission to the engine oil pan retaining bolts (1) and tighten to 55 N.m (41 ft. lbs.).

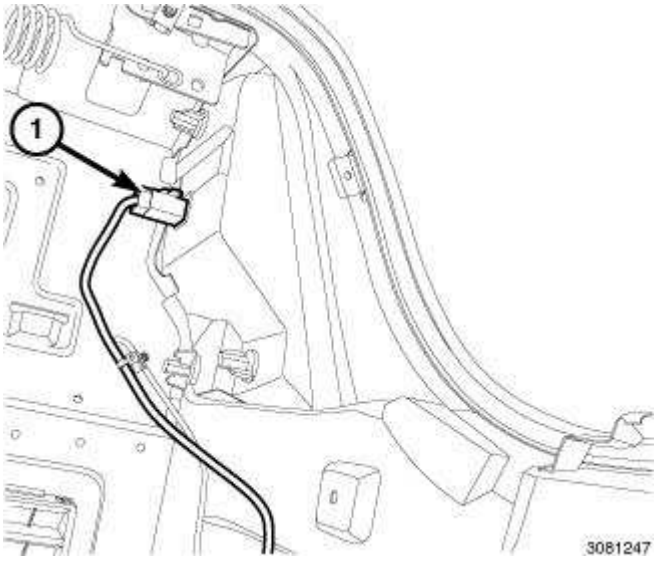

Fig. 72: Rubber Plugs
Courtesy of CHRYSLER GROUP, LLC

33. Install the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

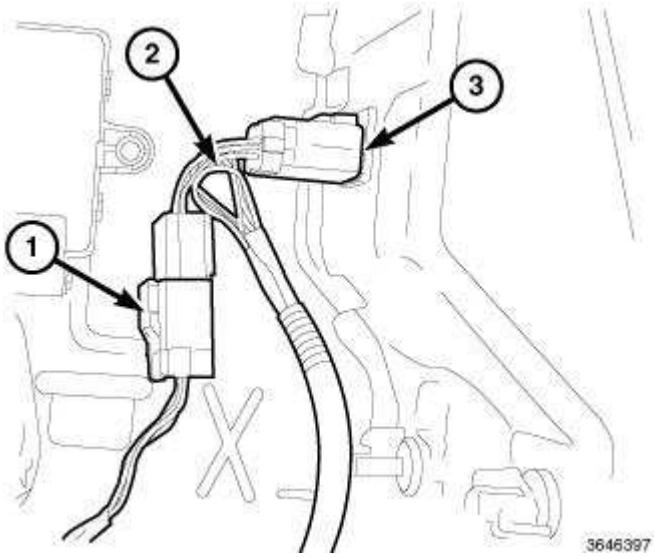

Fig. 73: Side Engine-To-Transmission Bolt, Transmission Dust Shield Retaining Bolt & Dust Shield
Courtesy of CHRYSLER GROUP, LLC

34. Install the side engine to transmission retaining bolt (1) and tighten to 55 N.m (41 ft. lbs.).
35. Position the torque converter dust shield (3), install the retaining bolt (2) and tighten to 12 N.m (9 ft. lbs.).

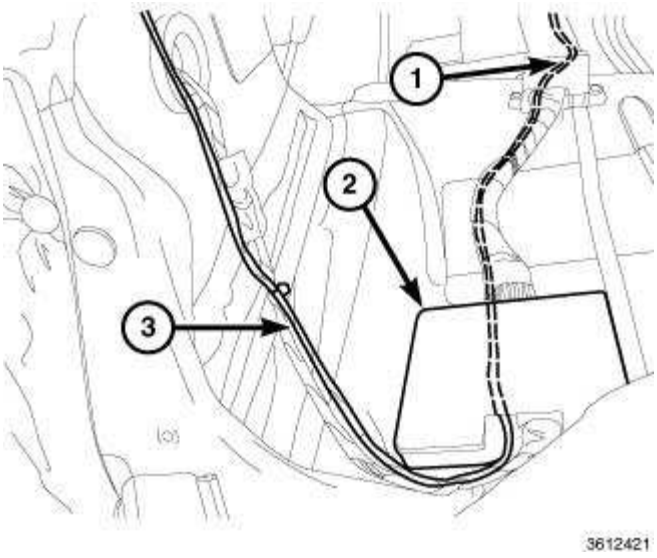

Fig. 74: Upper Side Transmission-To-Engine Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

36. Install the two upper side transmission to engine retaining bolts (1) and tighten to 55 N.m (41 ft. lbs.).

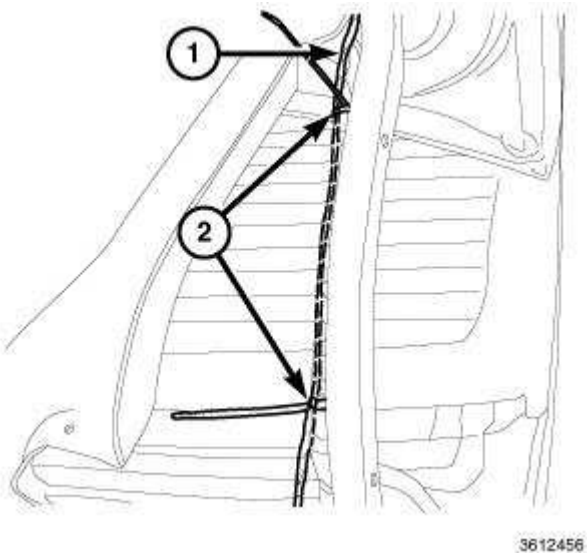

Fig. 75: Engine Injection/Ignition Harness & Engine Oil Pressure/Temperature Harness
Courtesy of CHRYSLER GROUP, LLC

37. Connect the main harness to the engine injection/ignition harness (1) at the rear of the left cylinder head.
38. Connect the main harness to the engine oil pressure/temperature harness (2) at the rear of the left cylinder head.

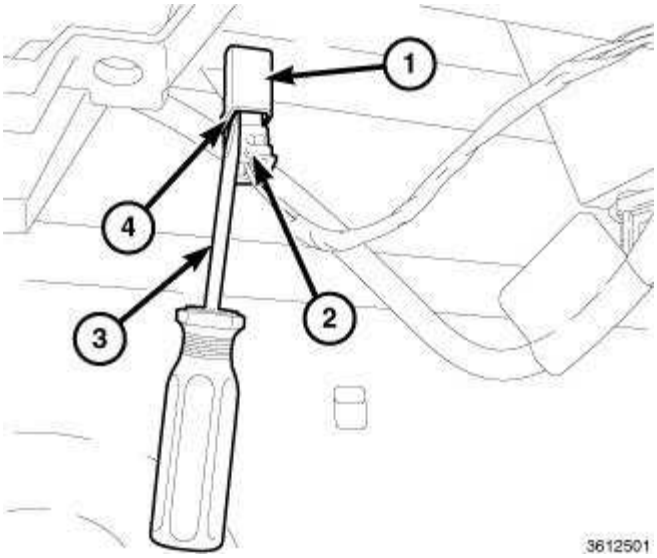

Fig. 76: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

39. Rotate the crankshaft in a clockwise direction and install the six torque converter bolts (1) through the starter mounting hole and tighten to 42 N.m (31 ft. lbs.).

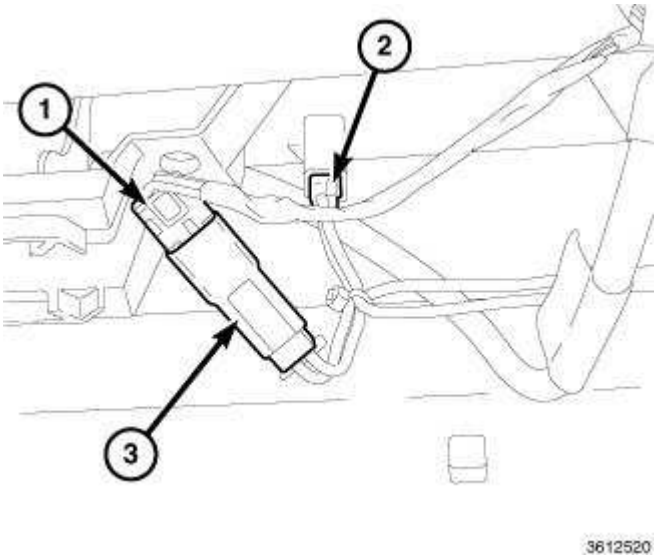

Fig. 77: Bolt & Transmission Cooling Lines
Courtesy of CHRYSLER GROUP, LLC

40. Install the transmission cooling lines (2) and tighten the bolt (1) to 12 N.m (106 in. lbs.).

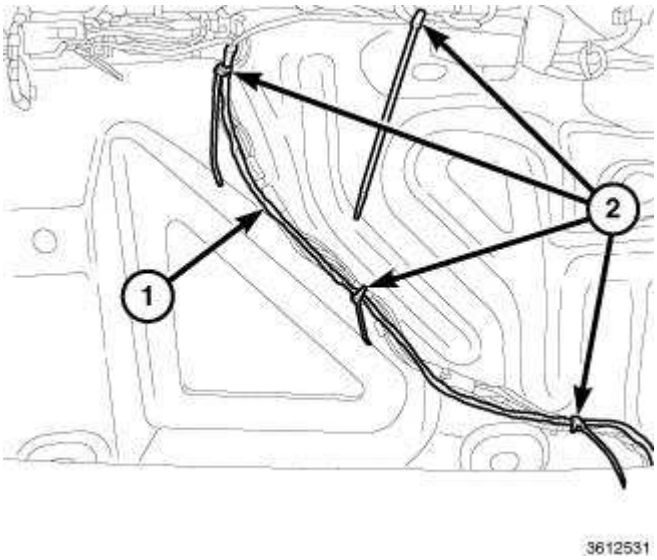

Fig. 78: Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

41. Secure the starter wire harness retainer (2) and the main wire harness retainer (1) to the engine block.
42. Install the starter. Refer to **STARTER, INSTALLATION** .

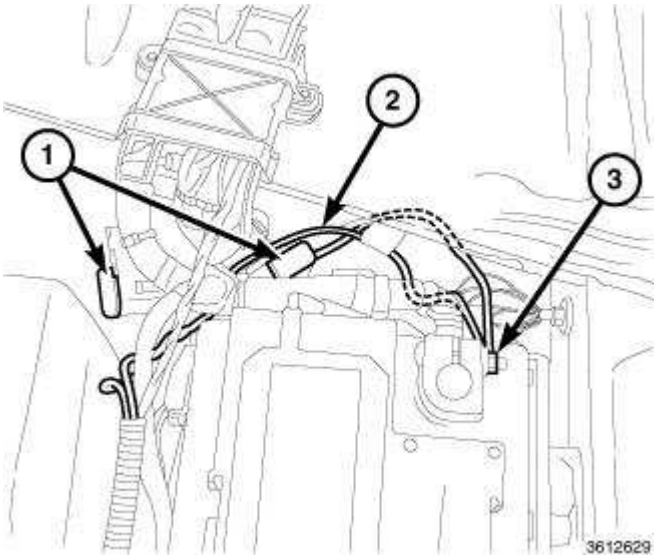

Fig. 79: Main Wire Harness Retainers & CKP Sensor
Courtesy of CHRYSLER GROUP, LLC

43. Connect the power cord to the engine block heater (if equipped).
44. Connect the main wire harness to the Crankshaft Position (CKP) sensor (3).
45. Secure the main wire harness retainer (1) to the engine block and one main wire harness retainer (2) to the right engine mounting bracket.

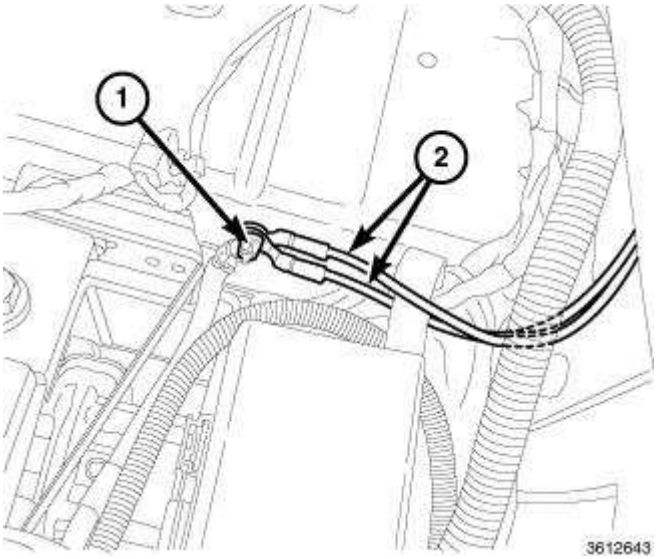

Fig. 80: CKP Sensor Heat Shield
Courtesy of CHRYSLER GROUP, LLC

46. Position the heat shield (1) over the crankshaft position (CKP) sensor.

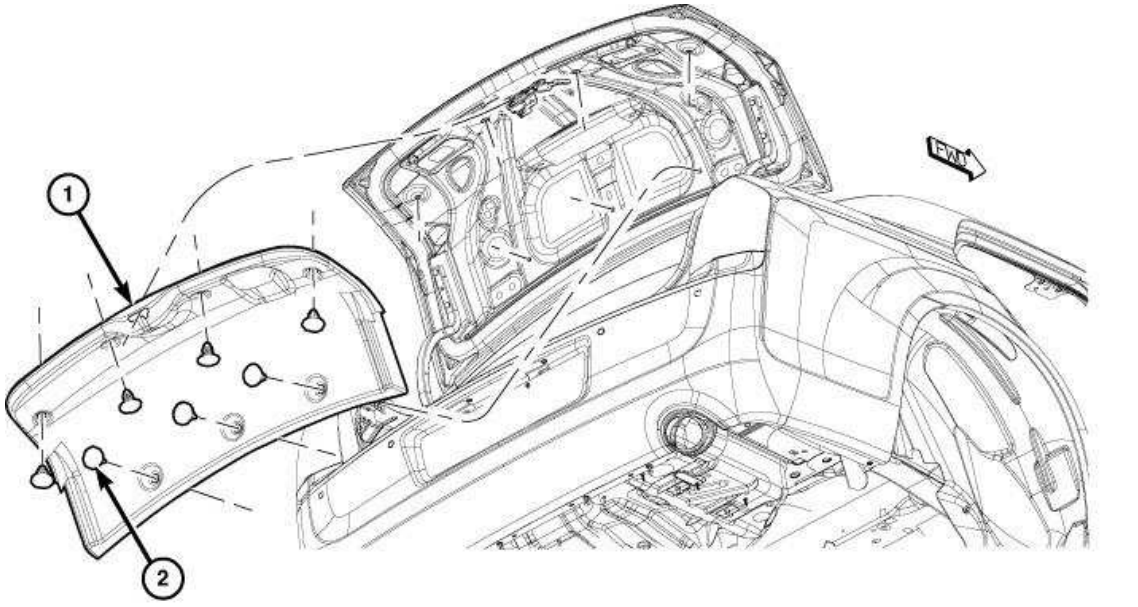

Fig. 81: Removing/Installing Front Axle
Courtesy of CHRYSLER GROUP, LLC

47. If equipped with AWD, install the front axle assembly (1) with propeller shaft, intermediate shaft, halfshafts, wheels and tires. Refer to **INSTALLATION** .
48. If required, fill the front axle with the specified type and amount of gear lubricant.

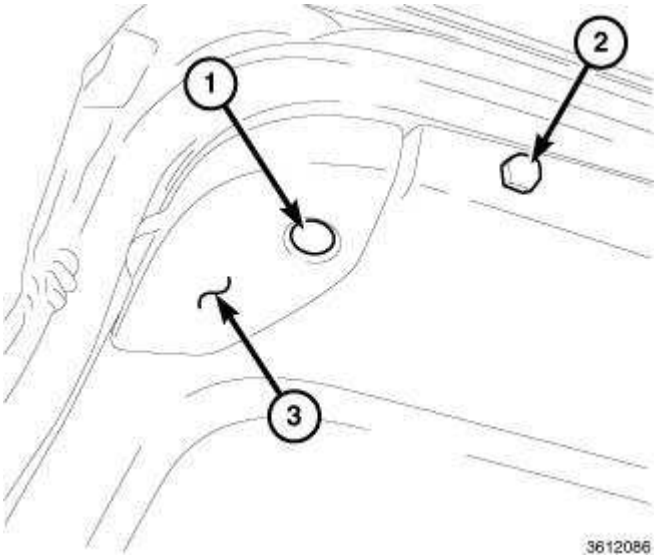

Fig. 82: Exhaust Down Pipe & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

49. Position both left and right exhaust down pipes (1) to the catalytic converters, install the retaining nuts (2) and tighten to 30 N.m (22 ft. lbs.)

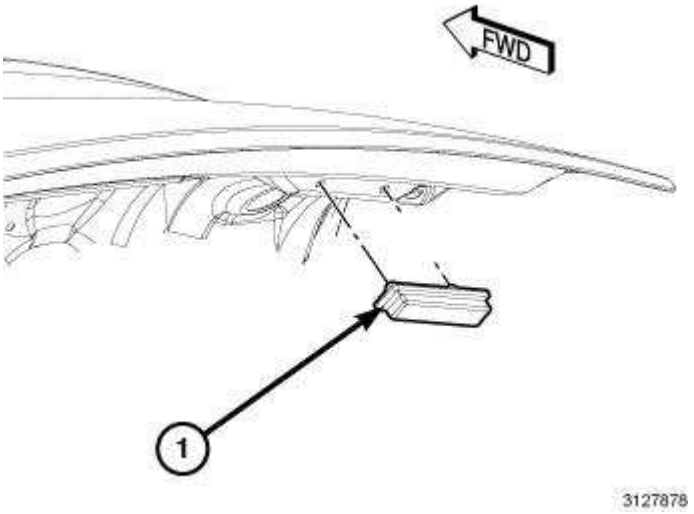

Fig. 83: Upstream Oxygen Sensor & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

50. Connect both left and right upstream oxygen sensor (2) electrical connectors (1) to the main wire harness.

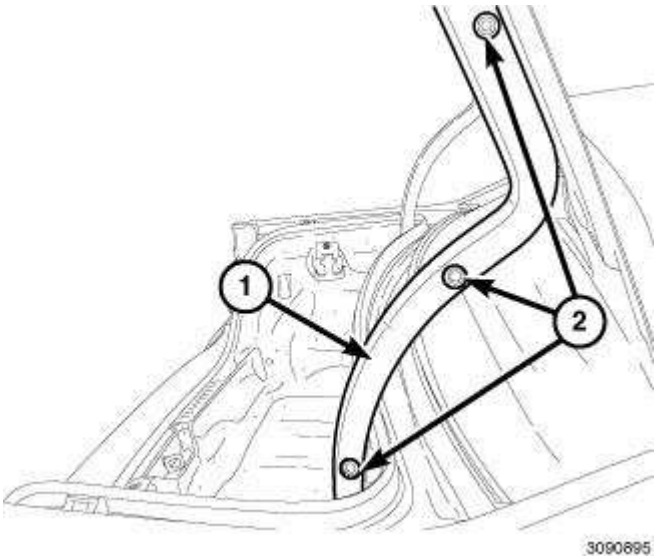

Fig. 84: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

51. Position the belly pan and install the retainers (1).
52. Lower the vehicle.

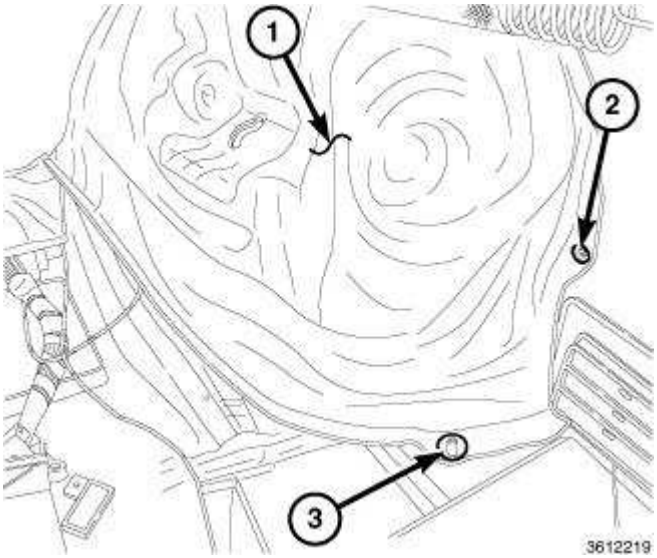

Fig. 85: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

53. Install the upper intake manifold and insulator. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

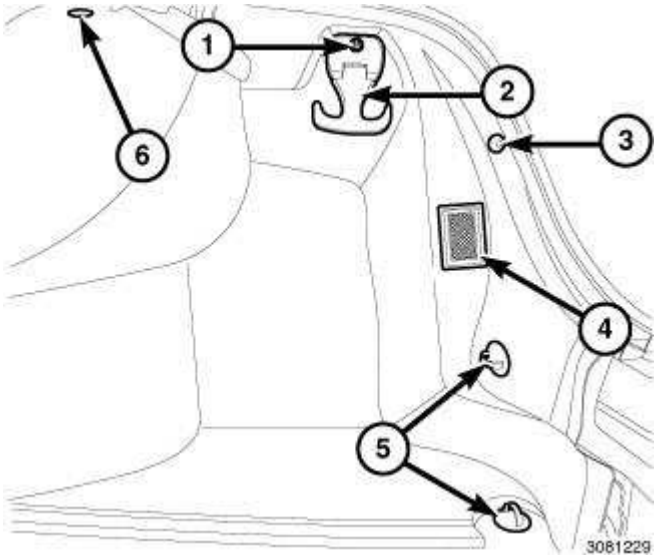

Fig. 86: Heater Core Inlet Tube, Oil Level Indicator & Bolts
Courtesy of CHRYSLER GROUP, LLC

54. Install the oil level indicator (2) with bolt (1) tightened to 12 N.m (106 in. lbs.).
55. Position the heater core inlet tube (4) and install two bolts (3) tightened to 12 N.m (106 in. lbs.).

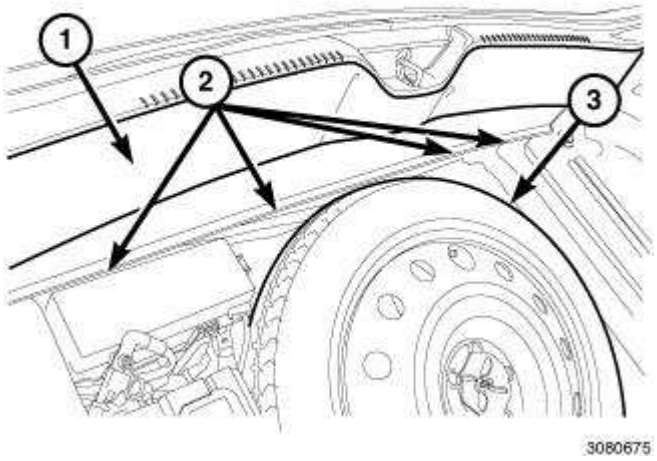

Fig. 87: A/C Compressor, Nut, Stud & Three Bolts
Courtesy of CHRYSLER GROUP, LLC

56. Install the A/C compressor (2). Refer to **COMPRESSOR, A/C, INSTALLATION** .

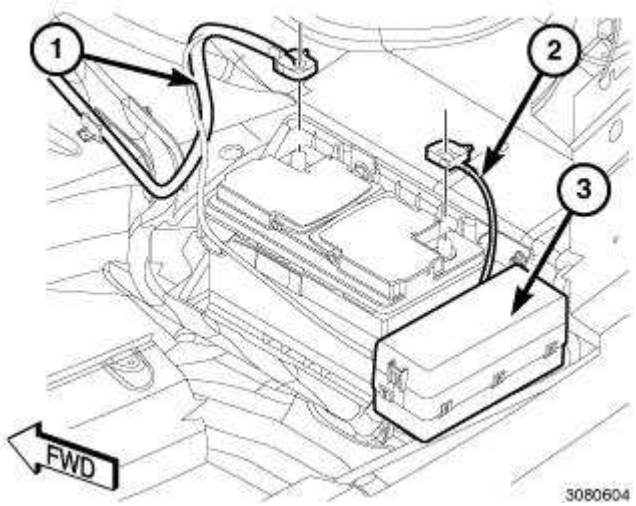

Fig. 88: Heater Core Return Tube Upper Support Bracket Retaining Nut & Tube
Courtesy of CHRYSLER GROUP, LLC

57. Position the heater core return tube (1), install the upper support bracket retaining nut (2) and tighten to 12 N.m (9 ft. lbs.).

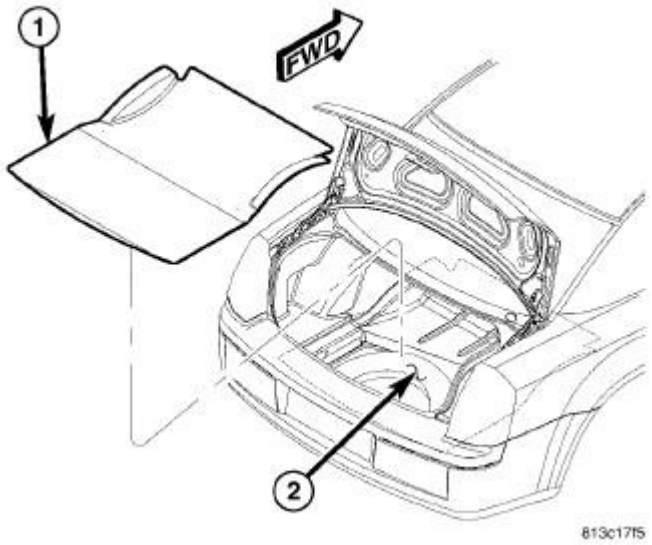

Fig. 89: Heater Core Return Hose
Courtesy of CHRYSLER GROUP, LLC

58. Connect the heater core return hose (1).

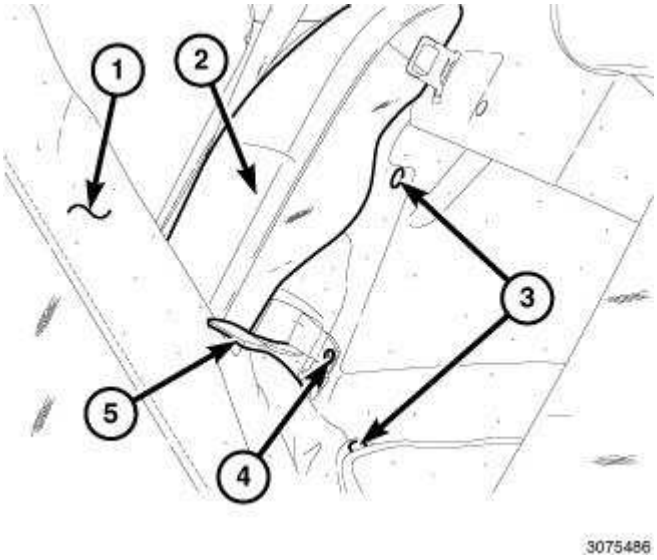

Fig. 90: Heater Core Return Tube Lower Support Bracket Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

59. Position the heater core return tube lower support bracket onto the A/C lower retaining stud, install the retaining nut (1) and tighten to 12 N.m (9 ft. lbs.).

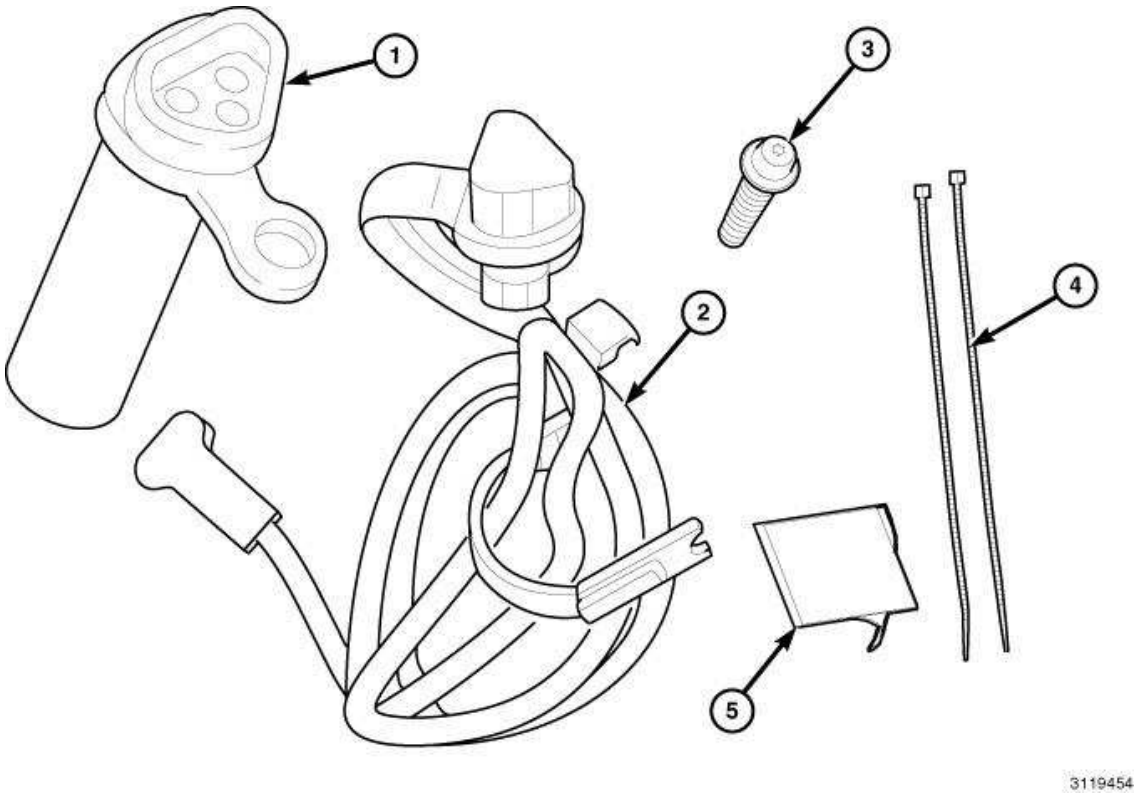

Fig. 91: Lower Heater Core Return Hose & Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

60. Install the lower heater core return hose (1) to the engine coolant pump housing.
61. Install the lower radiator hose (2) to the engine coolant pump housing.

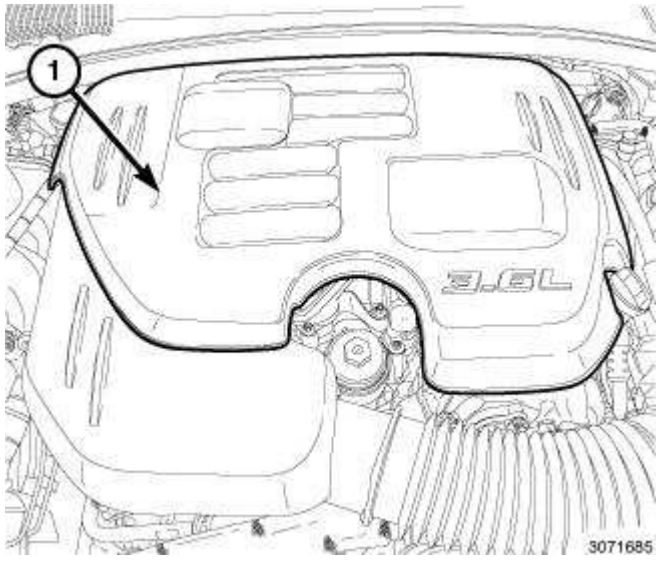

Fig. 92: Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

62. Install the upper radiator hose (1) to the engine thermostat housing.

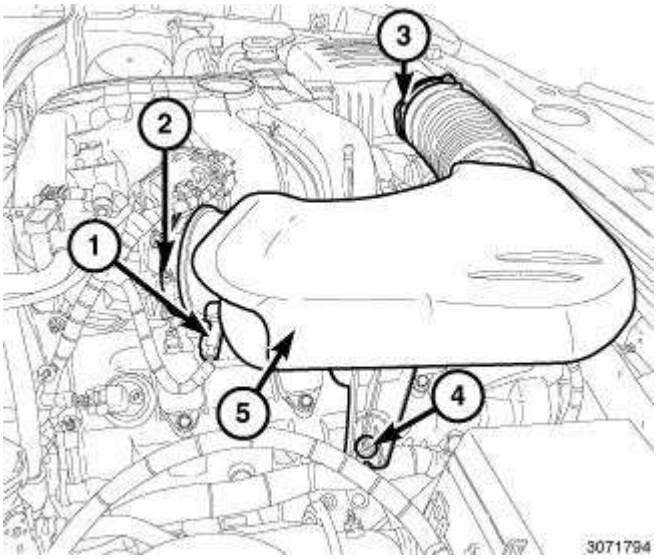

Fig. 93: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

63. Connect the electrical connectors (2) to the left variable valve timing solenoids.
64. Secure the two starter wire harness retainers (1) to the left cylinder head cover.

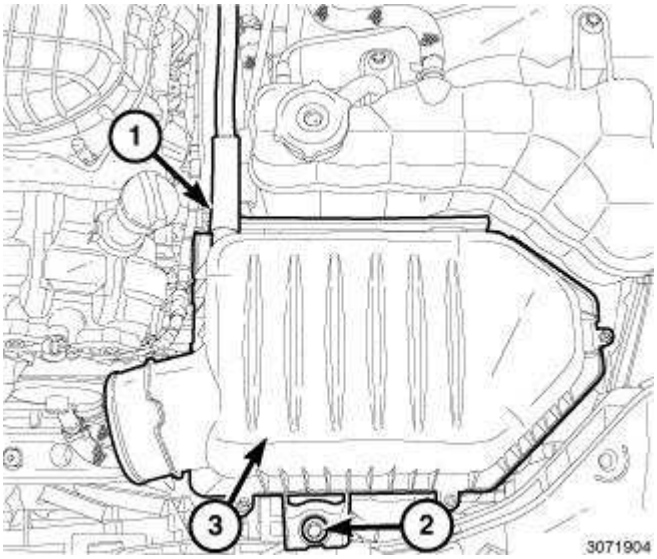

Fig. 94: A/C Compressor Electrical Connector & Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

65. Connect the A/C compressor electrical connector (1) and secure the wire harness retainer (2) to the A/C compressor discharge line.

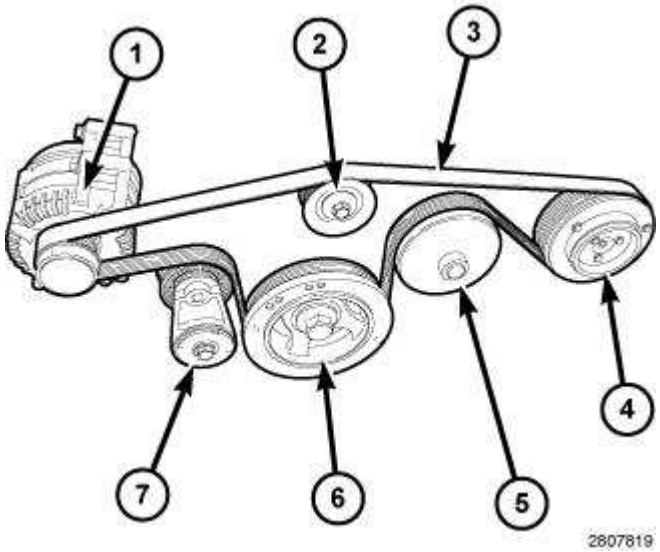

Fig. 95: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

66. Install the generator (1). Refer to **GENERATOR, INSTALLATION** .
67. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (3), then slowly rotate the tensioner into position.

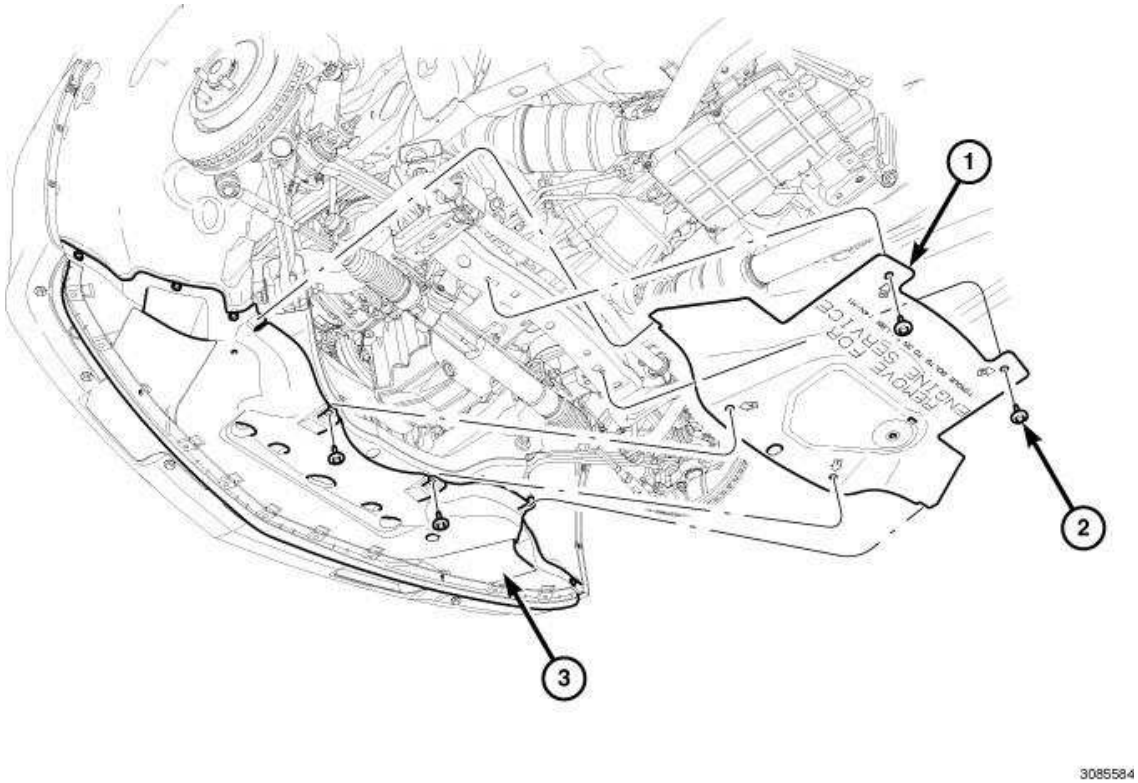

Fig. 96: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

68. Install the cooling fan module. Refer to **FAN, COOLING, INSTALLATION** .

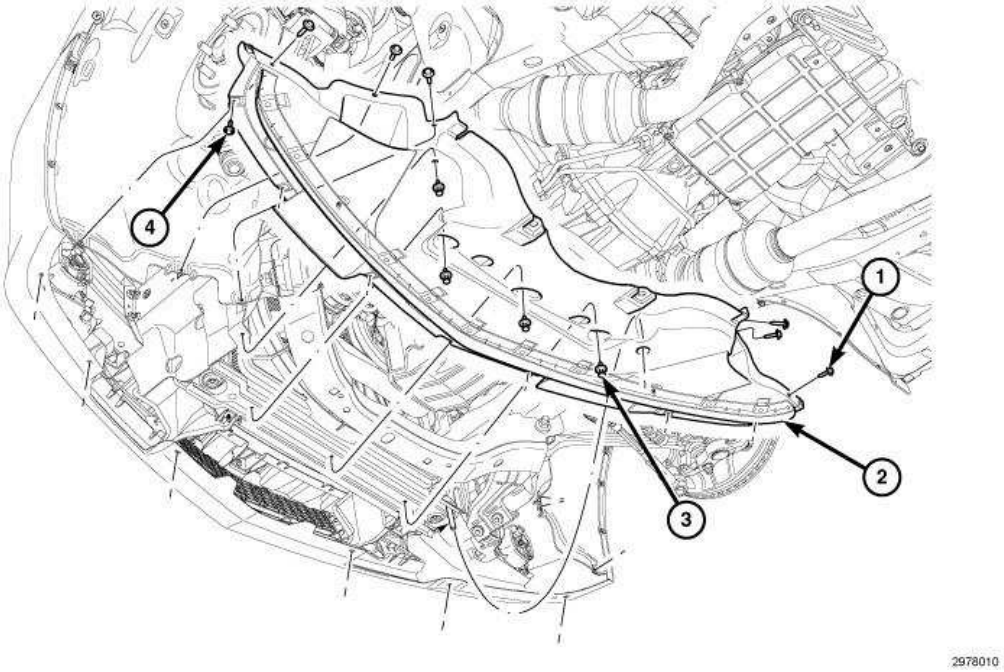

Fig. 97: Fuel Supply Hose At Underbody Fuel Supply Tube
Courtesy of CHRYSLER GROUP, LLC

69. Connect the fuel supply hose (1) to the underbody fuel tube (2). Refer to **FITTING, QUICK CONNECT** .

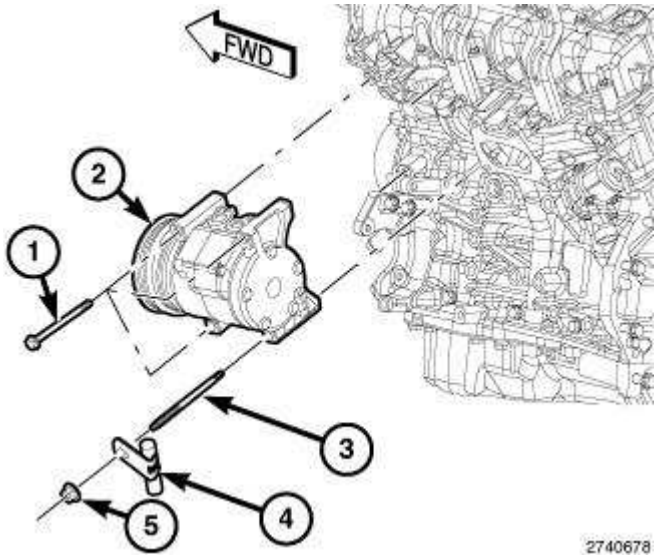

Fig. 98: Fresh Air Makeup Hose At Rear Of Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

70. Connect the fresh air makeup hose (2) to the rear of the intake manifold (1).

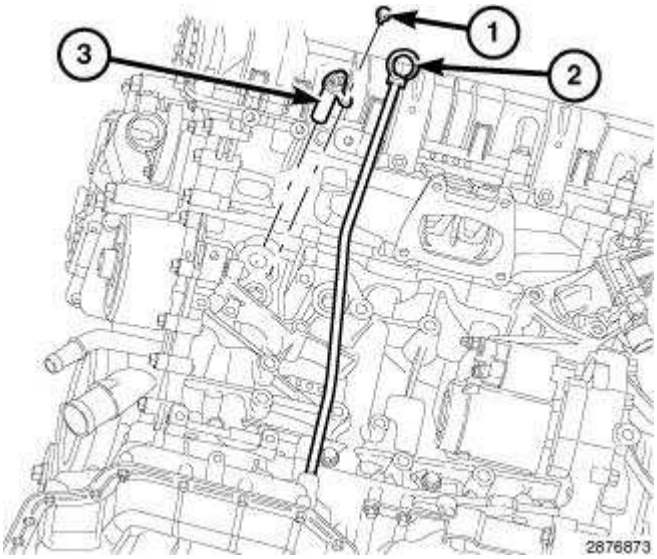

Fig. 99: PCV Valve, Intake Manifold, Brake Booster Vacuum Hose, MAP Sensor, ETC & CMP Sensor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

71. Connect the electrical connector to the right Camshaft Position Sensor (CMP) (6).
72. Secure the main wire harness retainer to the right cylinder head cover mounting stud.
73. Connect the electrical connector to the Electronic Throttle Control (ETC) (5).
74. Connect the electrical connector to the Manifold Absolute Pressure (MAP) Sensor (4).
75. Connect the brake booster vacuum hose (3).
76. Connect the PCV hose to the PCV valve (1) and to the intake manifold (2).

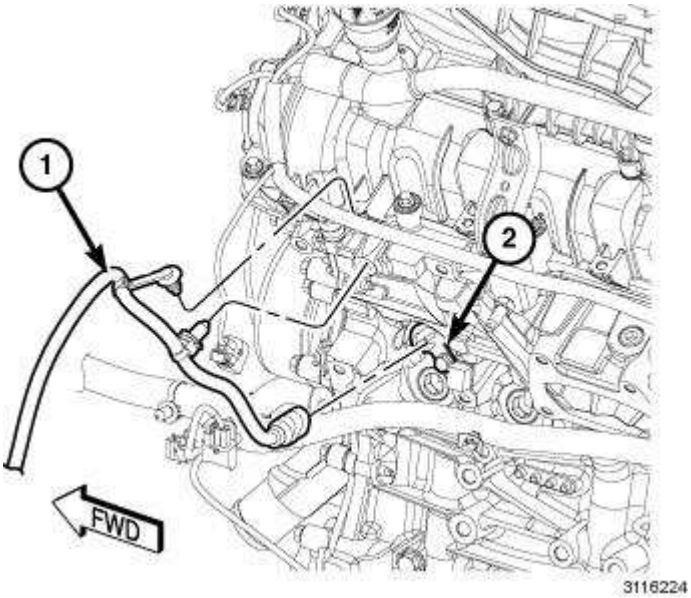

Fig. 100: EVAP Purge Solenoid, Electrical Connector & Vacuum Lines
Courtesy of CHRYSLER GROUP, LLC

77. Position the EVAP purge solenoid (1) vacuum line (4) and connect the vacuum line to the intake manifold.
78. Connect the other end of the vacuum line (3) to the EVAP purge solenoid (1).

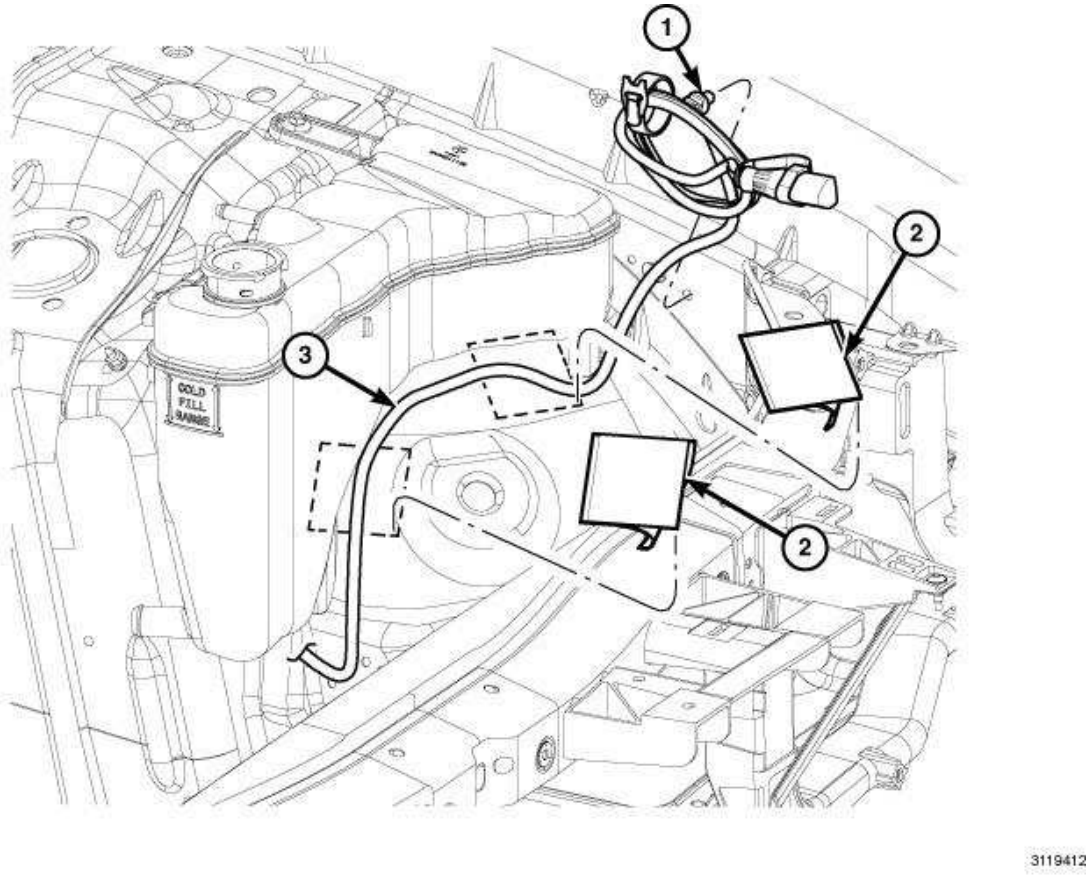

Fig. 101: Heater Core Purge Hose, Coolant Bottle Retaining Bolts & Coolant Bottle
Courtesy of CHRYSLER GROUP, LLC

79. Position the coolant bottle (3) into the engine compartment.
80. Install the coolant bottle retaining bolts (2) and tighten to 12 N.m (9 ft. lbs.).
81. Connect the heater core purge hose (1) to the coolant bottle.

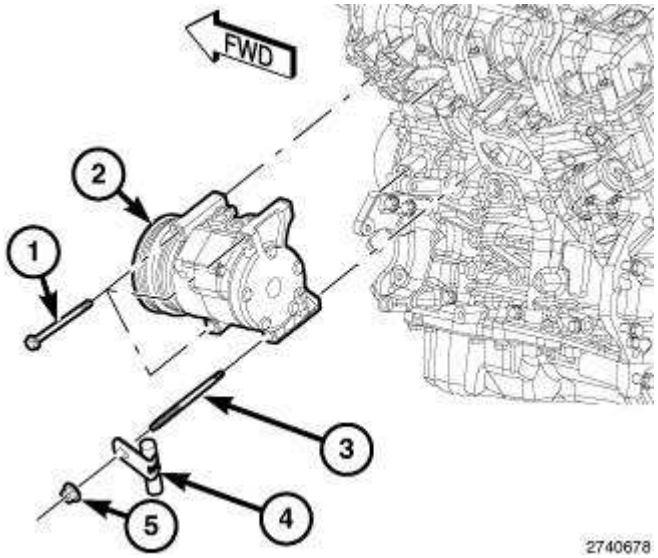

Fig. 102: Coolant Bottle Return Hose
Courtesy of CHRYSLER GROUP, LLC

82. Connect the coolant bottle return hose (1).

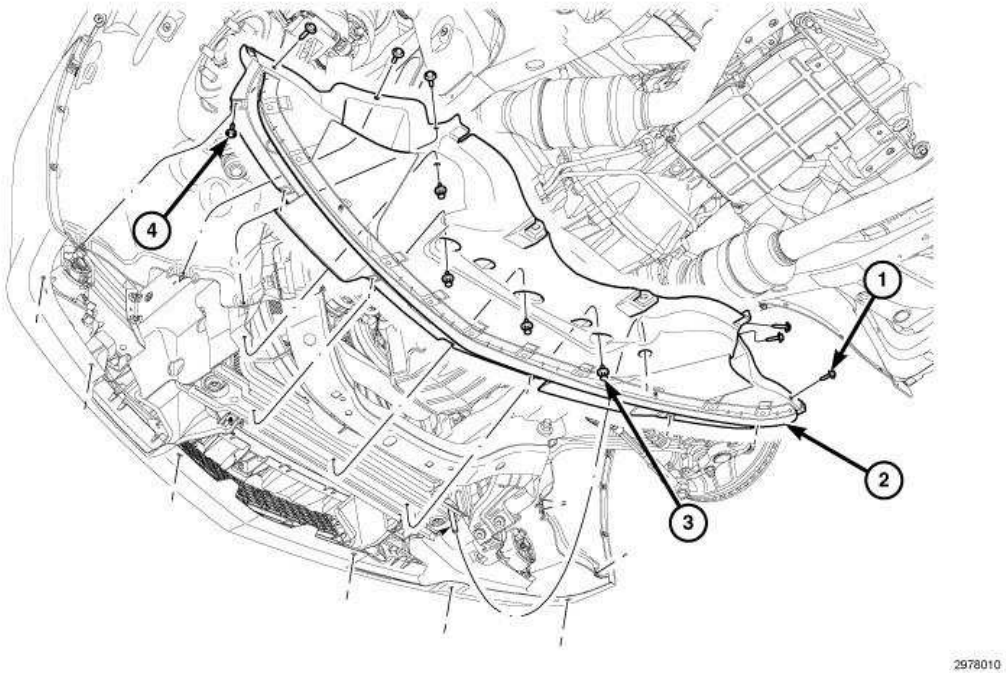

Fig. 103: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
Courtesy of CHRYSLER GROUP, LLC

83. Position the air cleaner housing (3) into the vehicle.
84. Install the air cleaner housing retaining bolt (2) and tighten to 12 N.m (9 ft. lbs.).
85. Connect the fresh air makeup hose (1) to the air cleaner housing.

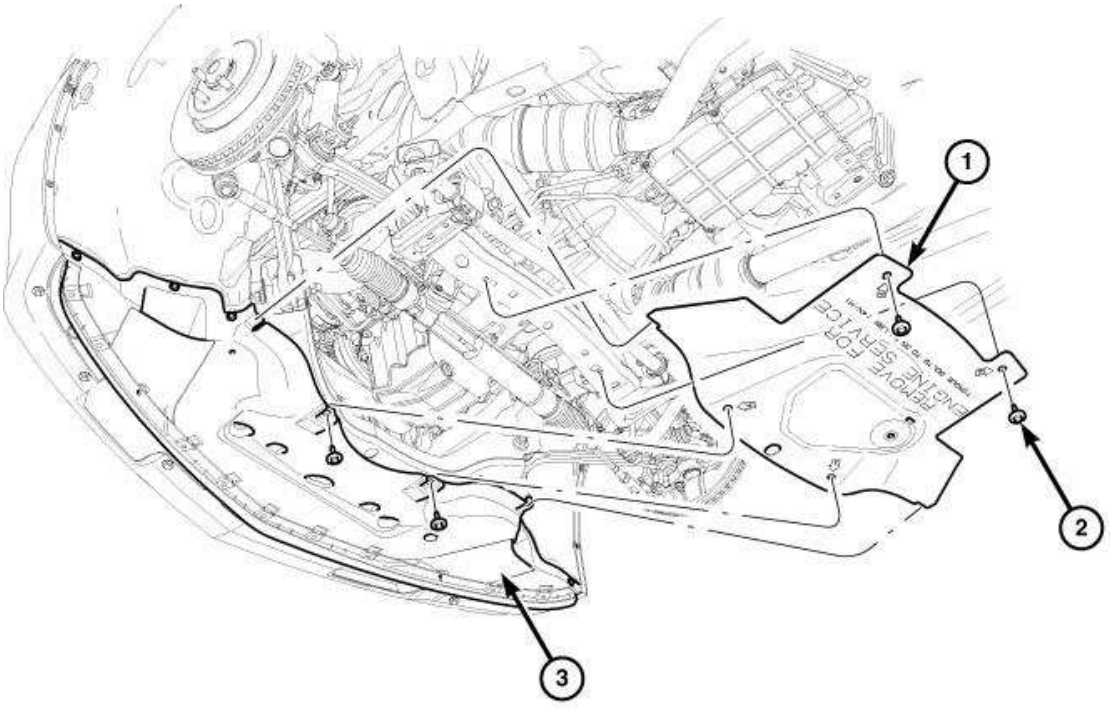

Fig. 104: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

86. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
87. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
88. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
89. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
90. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

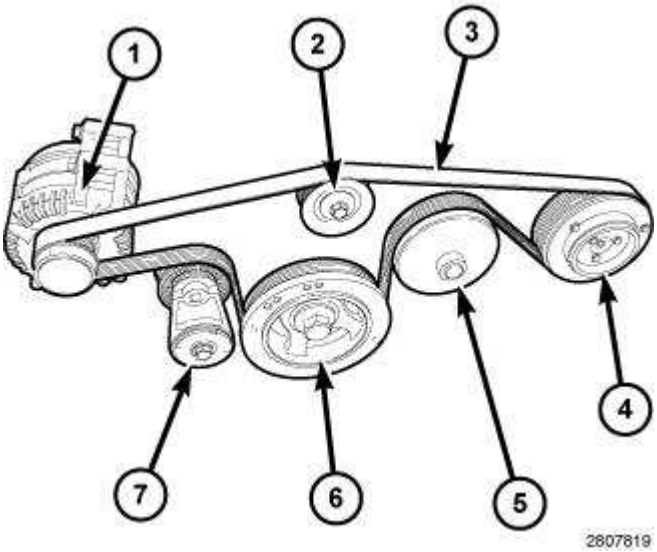

Fig. 105: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

91. Install the strut tower support (6).
92. Install the cowl panel cover (2). Refer to **COVER, COWL PANEL, INSTALLATION** .
93. Install the hood. Refer to **HOOD, INSTALLATION** .

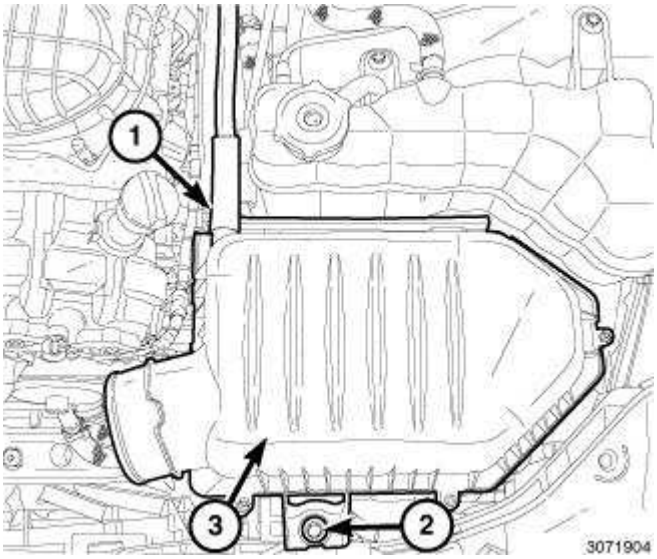

Fig. 106: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

94. If removed, install the oil filter and fill the engine crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
95. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .
96. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD**

PROCEDURE .

97. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

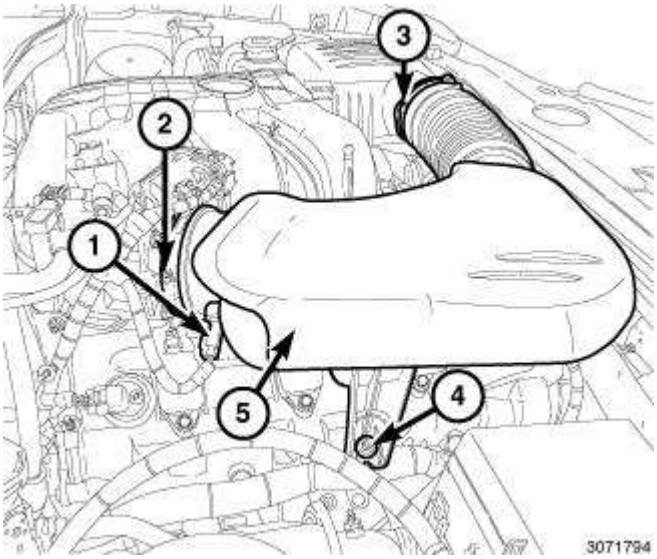

Fig. 107: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

98. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
99. Run the engine until it reaches normal operating temperature and check for leaks.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

SPECIAL TOOLS

SPECIAL TOOLS

10198 - Holder, Vibration Damper (Originally Shipped In Kit Number(s) 10223.)
10199 - Installer, Crankshaft Front Oil Seal (Originally Shipped In Kit Number(s) 10223.)
10200-1 - Holder, Timing Chain, Left Side
10200-3 - Pin
10202 - Locks, Camshaft/Phaser
10202-1 - Lock, Camshaft/Phaser, Right Side
10202-2 - Lock, Camshaft/Phaser, Left Side
10224 - Adapter, Valve Spring (Originally Shipped In Kit Number(s) 10223.)
10242-1 - Brackets, Engine Lifting, Left Side

(Originally Shipped In Kit Number(s) 10223.)
10242-2 - Brackets, Engine Lifting, Right Side
(Originally Shipped In Kit Number(s) 10223.)
10255 - Installer, Spark Plug Tube
10256 - Installer, Cam Installer, Cam Sensor/ Spark Plug Tube Seal
(Originally Shipped In Kit Number(s) 10256.)
10368 - Set, Universal Protective Cap
10369 - Holder, Timing Chain
7700-A - Tester, Cooling System
8189 - Guide Pins
(Originally Shipped In Kit Number(s) 8180, 8180CC, 8263, 8263CC.)
8511 - Remover, Seal
(Originally Shipped In Kit Number(s) 8283, 8283CC, 8527, 8527CC, 8575, 8575CC, 9975.)
8514 - Pins, Tensioner
(Originally Shipped In Kit Number(s) 8283, 8283CC, 8527, 8527CC, 8575, 8575CC, 9975.)
C-119 - Cylinder Indicator
C-3292A - Gauge, Pressure
C-3339A - Set, Dial Indicator
(Originally Shipped In Kit Number(s) 9202.)
C-3422-D - Compressor, Valve Spring
C-3685-A - Bloc-Chek Kit
C-385 - Compressor, Piston
MD998772A - Compressor, Valve Spring
(Originally Shipped In Kit Number(s) 8678, 8853, 8854.)

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

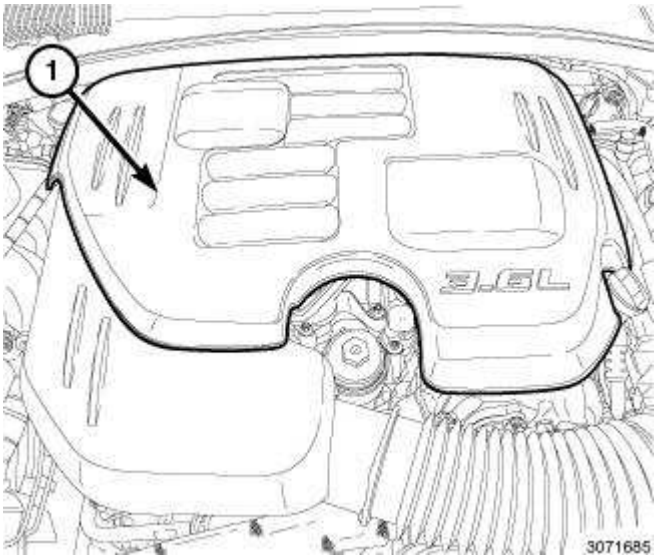

Fig. 108: Fresh Air Makeup Hose, Air Cleaner Housing & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the fresh air makeup hose (1) at the air cleaner housing (3).
2. Remove the air cleaner housing cover retaining bolts (2).

CAUTION: Do not use compressed air to clean out the air cleaner housing without first covering the air inlet to the throttle body. Dirt or foreign objects could enter the intake manifold causing engine damage.

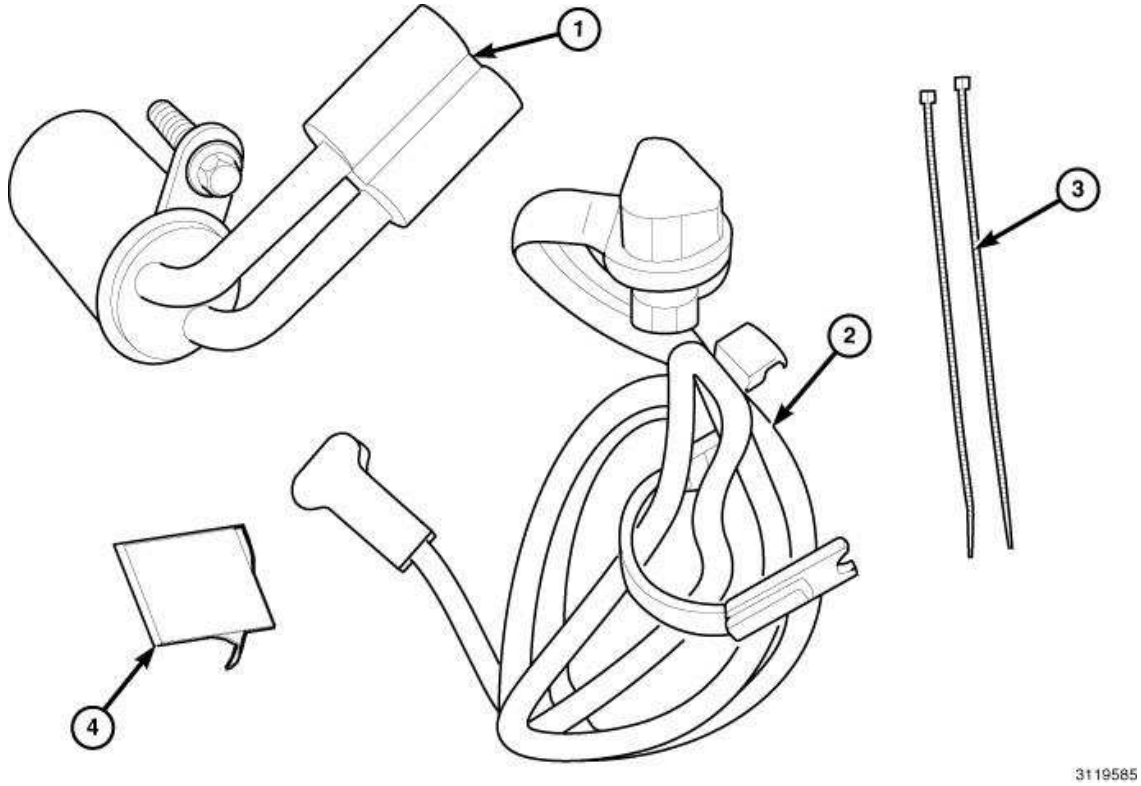

Fig. 109: Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

3. Lift the air cleaner housing cover off the housing and position aside.
4. Remove the air cleaner element (1).
5. Remove any dirt or debris from the bottom of the air cleaner housing.

INSTALLATION

INSTALLATION

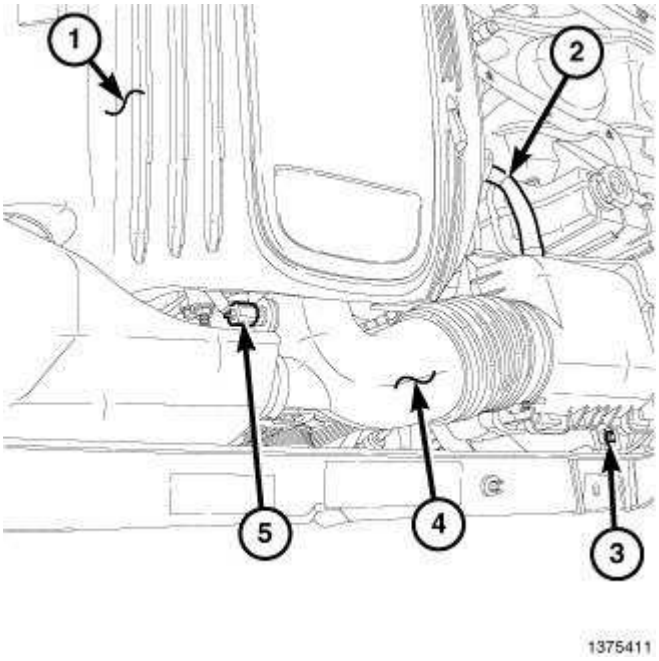

Fig. 110: Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

1. Install a new air cleaner element (1) into the air cleaner housing.
2. Position the air cleaner housing cover so that the alignment tabs insert into the lower housing.

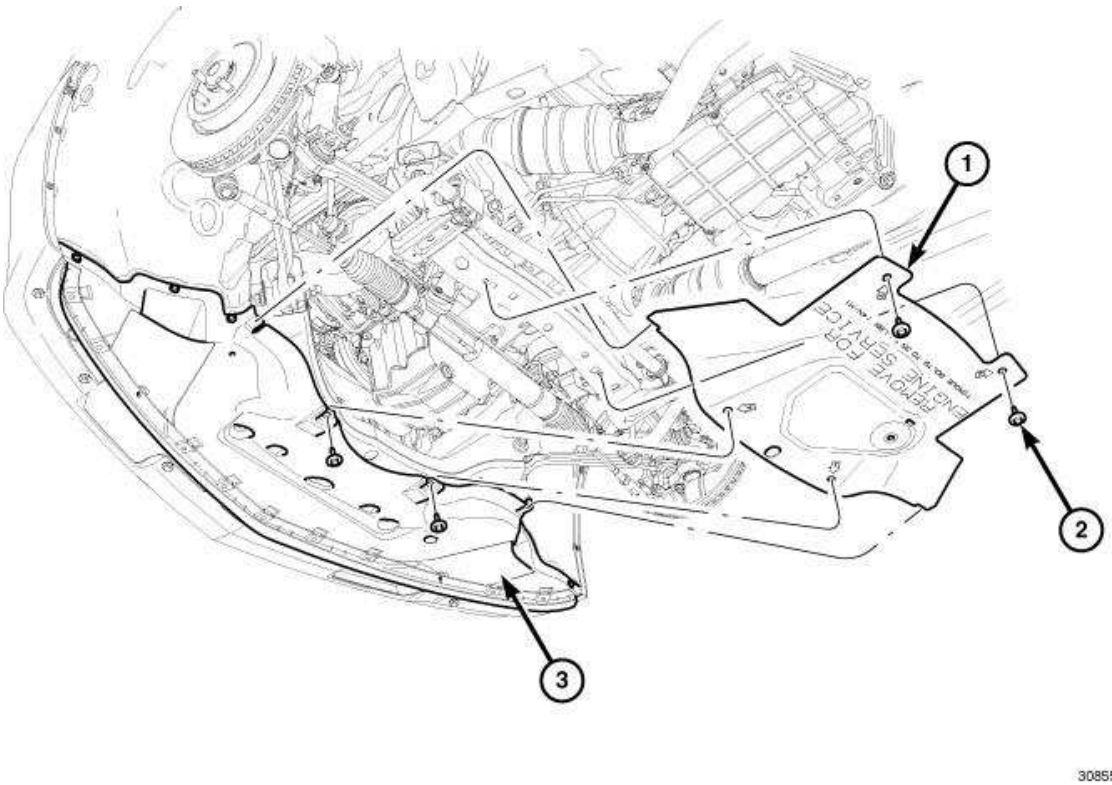

Fig. 111: Fresh Air Makeup Hose, Air Cleaner Housing & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Seat the cover (3) onto the housing and install the retaining bolts (2) and tighten to 4 N.m (35 in. lbs.).
4. Connect the fresh air makeup hose (1) onto the air cleaner housing.

BODY, AIR CLEANER

REMOVAL

REMOVAL

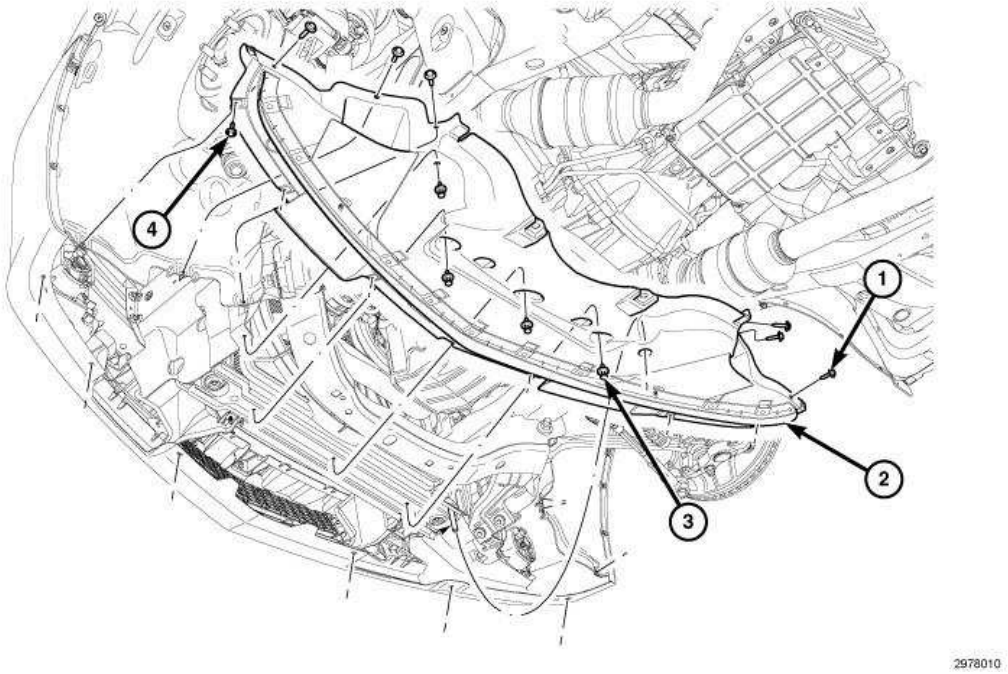

Fig. 112: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

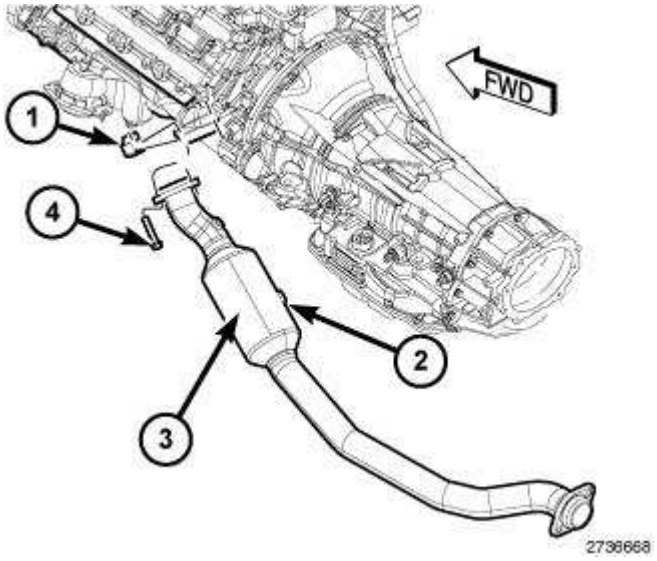

Fig. 113: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

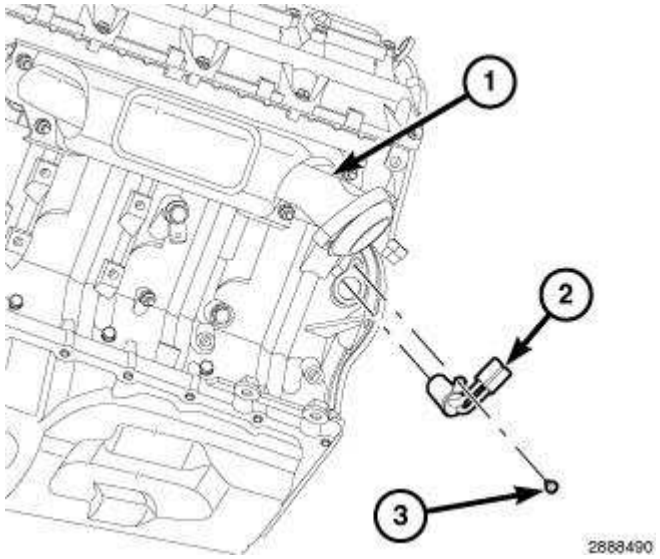

Fig. 114: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

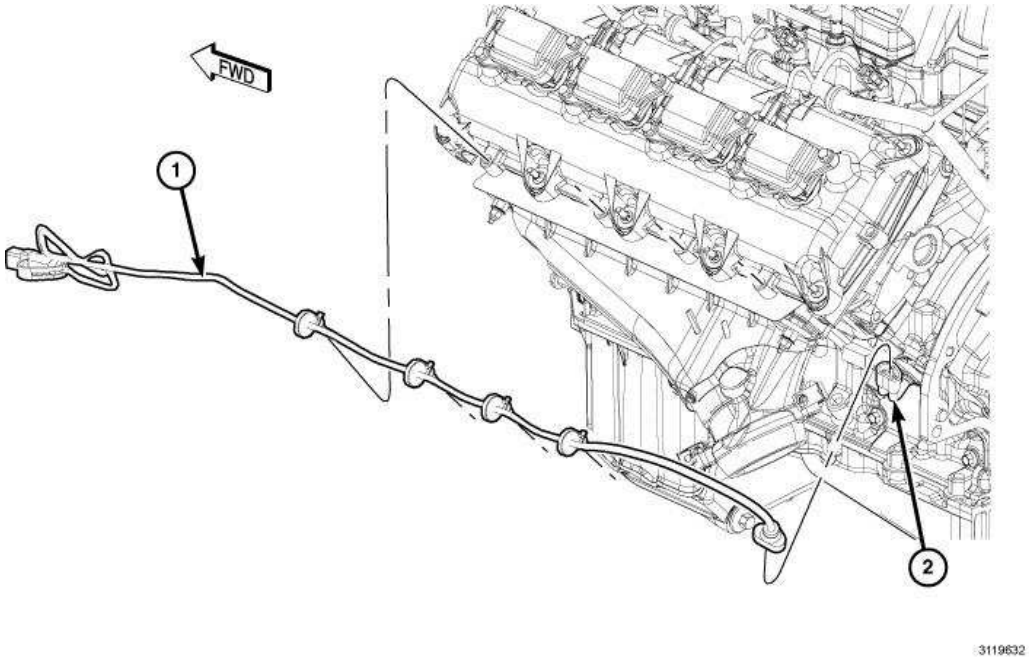

Fig. 115: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the fresh air makeup hose (1) from the air cleaner housing.
9. Remove the air cleaner housing retaining bolt (2).
10. Remove the air cleaner housing (3).

INSTALLATION

INSTALLATION

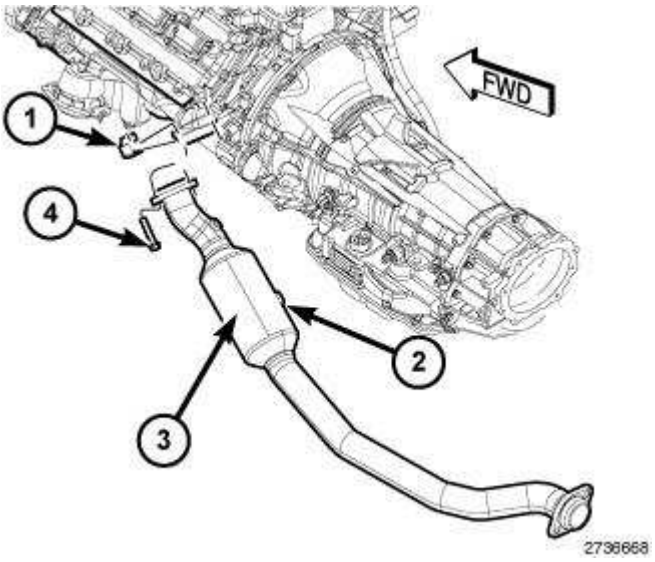

Fig. 116: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the air cleaner housing (3) into the vehicle.
2. Install the air cleaner housing retaining bolt (2) and tighten to 4 N.m (35 in. lbs.).
3. Connect the fresh air makeup hose (1) onto the air cleaner housing.

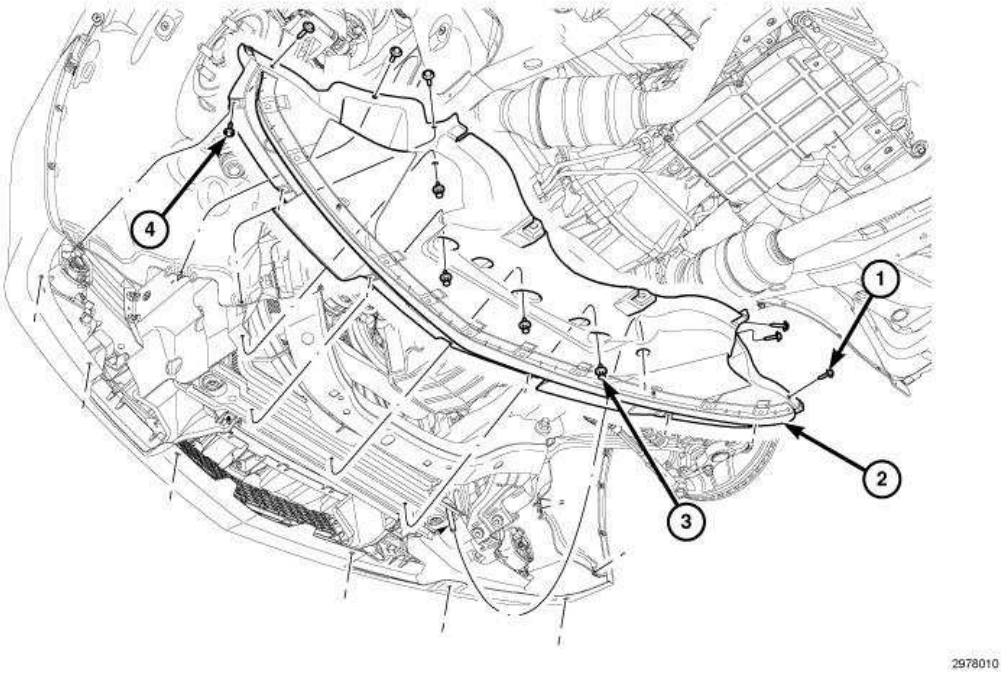

Fig. 117: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the air inlet hose assembly (5), connect the air inlet hose to the throttle body and the air cleaner housing.
5. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
6. Tighten the clamp (3) at the air cleaner housing to 4 N.m (35 in. lbs.).
7. Tighten the clamp (2) at the throttle body to 4 N.m (35 in. lbs.).
8. Connect the electrical connector (1) to the Inlet Air Temperature (IAT) sensor.

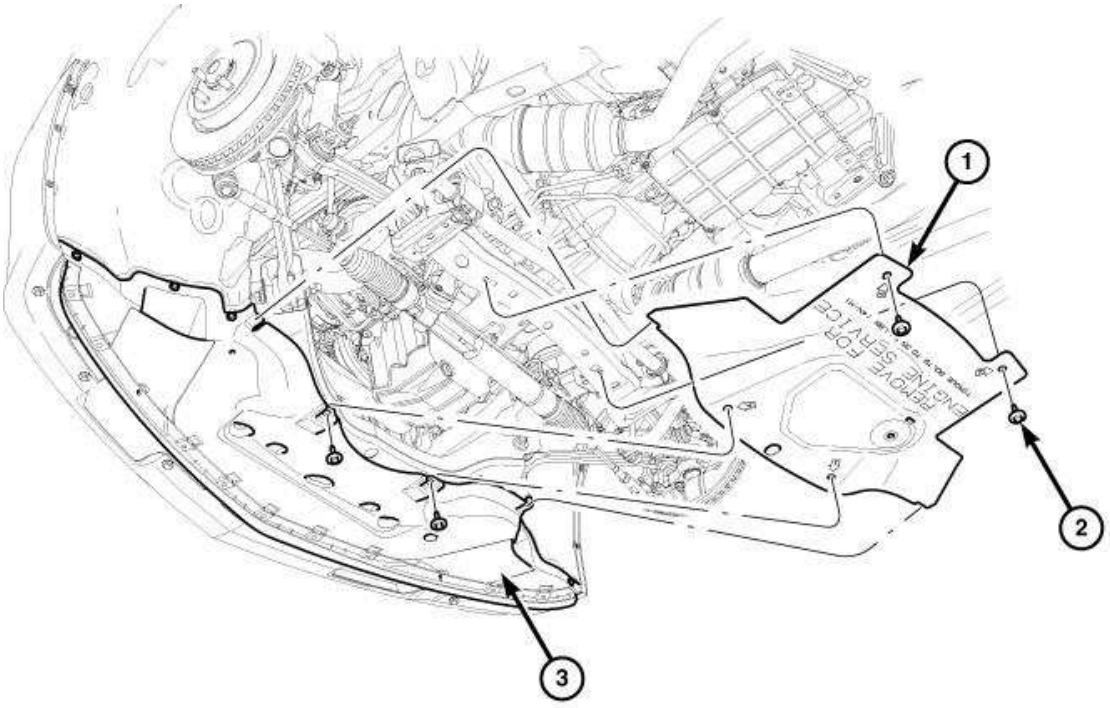

Fig. 118: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

9. Position the engine cover (1) and secure the retaining grommets to the ball studs.

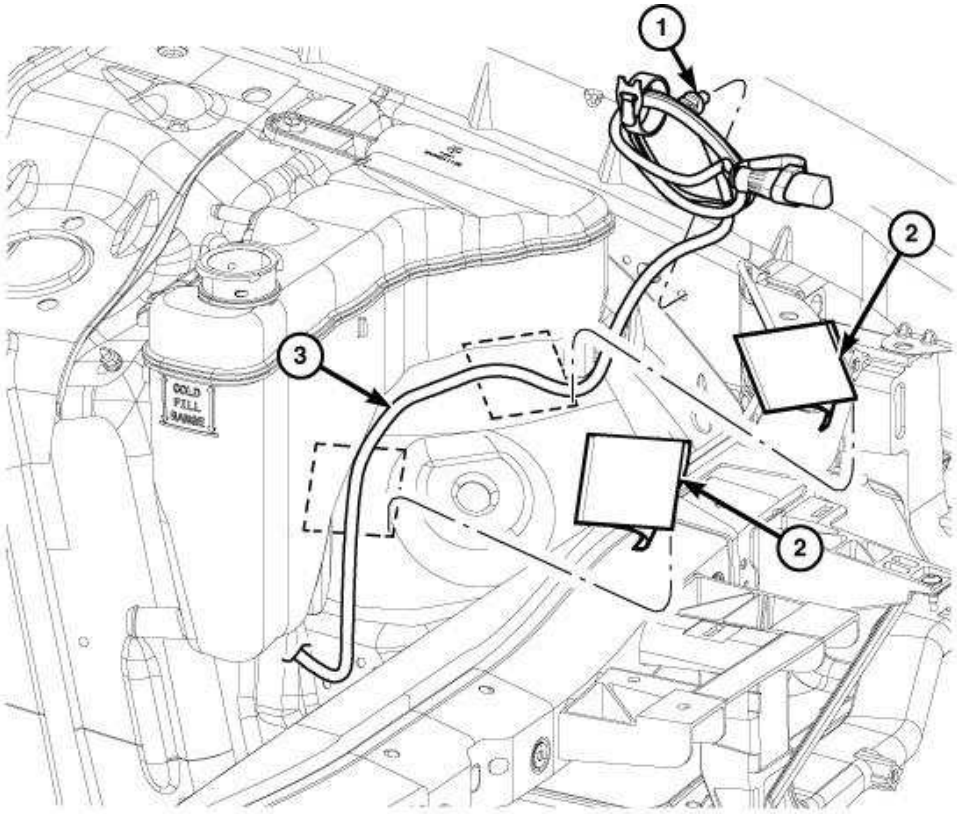

Fig. 119: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

10. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).

CYLINDER HEAD

DESCRIPTION

DESCRIPTION

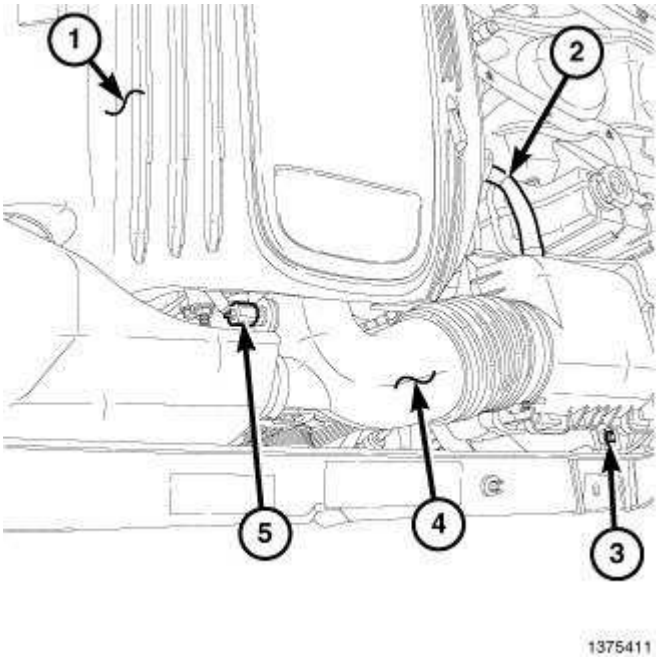

Fig. 120: Aluminum Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The 3.6L aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. The cylinder head features four valves per cylinder with pressed in powdered metal valve guides. The valve guides are not serviceable. The DOHC valvetrain uses roller rocker arms with hydraulic lifters. The cylinder head's camshaft bearing caps are made of powdered metal and the location and direction of each cap is marked on the side of the caps. The spark plug tubes are pressed into the cylinder heads and sealed in place. The tubes are a thin wall design and caution must be taken when working in the spark plug tube area.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating

- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

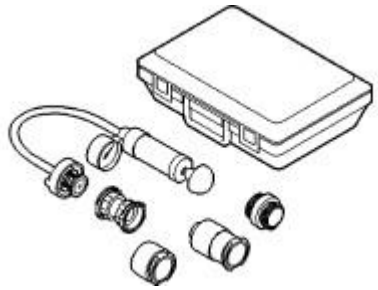

Fig. 121: Cooling System Pressure Tester - 7700-A
Courtesy of CHRYSLER GROUP, LLC

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester (special tool #7700-A, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Fig. 122: Bloc-Chek Kit C-3685-A
Courtesy of CHRYSLER GROUP, LLC

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform test following the procedures supplied with the tool kit.

HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

1. Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
2. Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.
3. Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
4. Low oil pressure.
5. The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.
6. Air ingested into oil due to broken or cracked oil pump pick up.
7. Worn valve guides.
8. Rocker arm ears contacting valve spring retainer.
9. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
10. Oil leak or excessive cam bore wear in cylinder head.
11. Faulty lash adjuster.

a. Check lash adjusters for "sponginess" while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel firm when pressed quickly. When pressed very slowly, lash adjusters should collapse.
b. Remove suspected lash adjusters, and replace.
c. Before installation, make sure adjusters are full of oil. This can be verified by little plunger travel when lash adjuster is depressed quickly.

REMOVAL

LEFT

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets

(pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

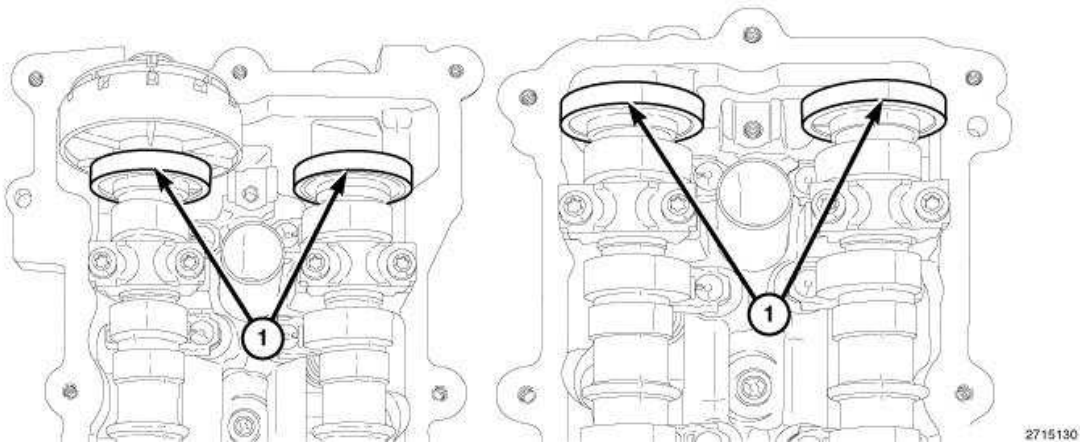

Fig. 123: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

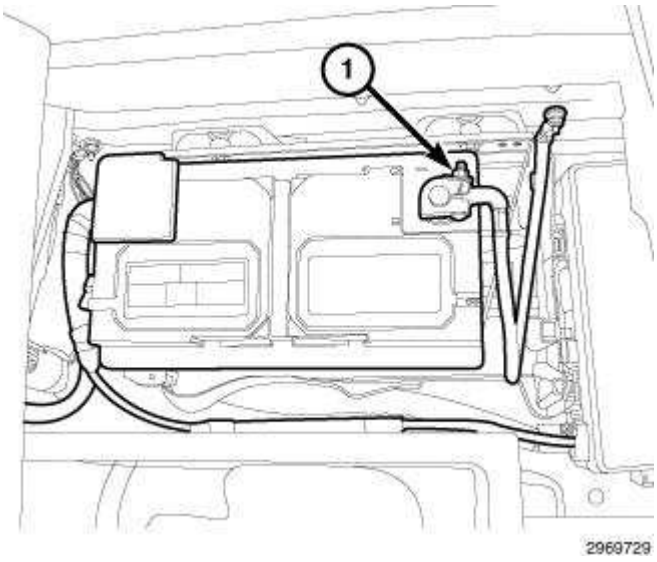

Fig. 124: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable (1).

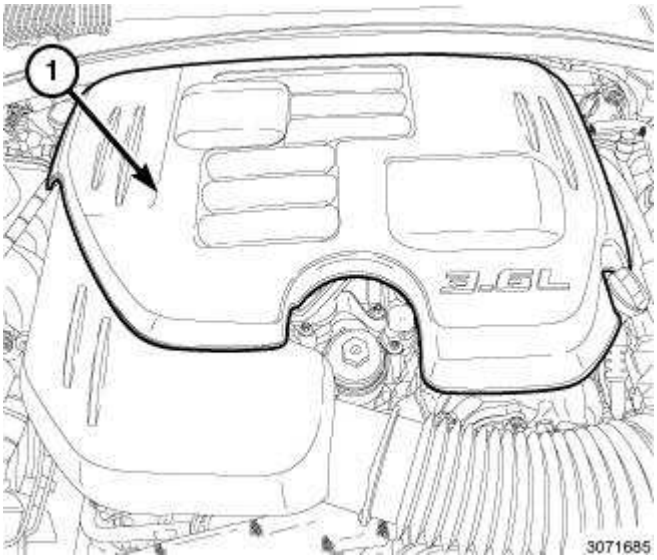

Fig. 125: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

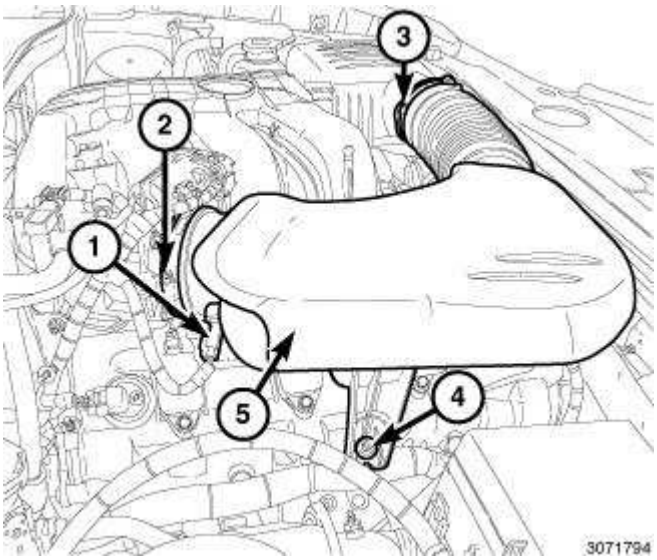

Fig. 126: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

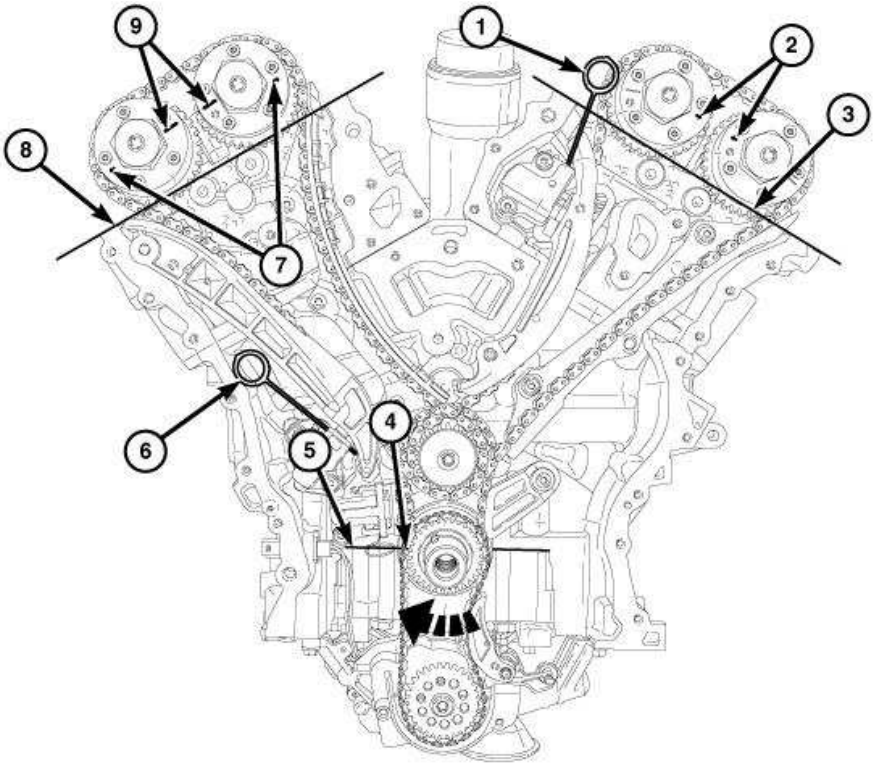
Fig. 145: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

42. Remove the ignition coils (2). Refer to **COIL, IGNITION, REMOVAL** .
43. Remove the cylinder head covers, lower and upper oil pans, crankshaft vibration damper and engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

NOTE: **Take this opportunity to measure timing chain wear. Refer to Engine/Valve Timing - Standard Procedure.**



2661245

Fig. 146: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

44. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

45. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

CAUTION: When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

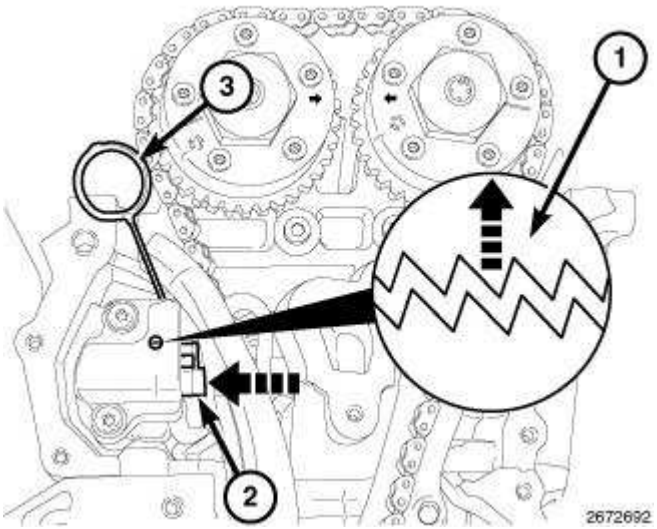


Fig. 147: Resetting Left Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

46. Reset the left cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and

installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Refer to **Engine/Valve Timing - Standard Procedure**.

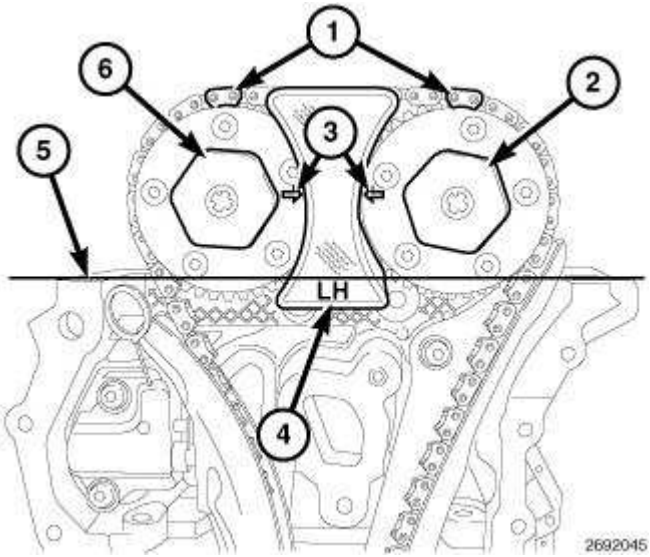

Fig. 148: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

47. Install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4).
48. Loosen both the intake oil control valve (6) and exhaust oil control valve (2).
49. Remove the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4).
50. Remove the oil control valve (2) from the left side exhaust cam phaser and pull the phaser off of the camshaft.
51. Remove the oil control valve (6) from the left side intake cam phaser and pull the phaser off of the camshaft.

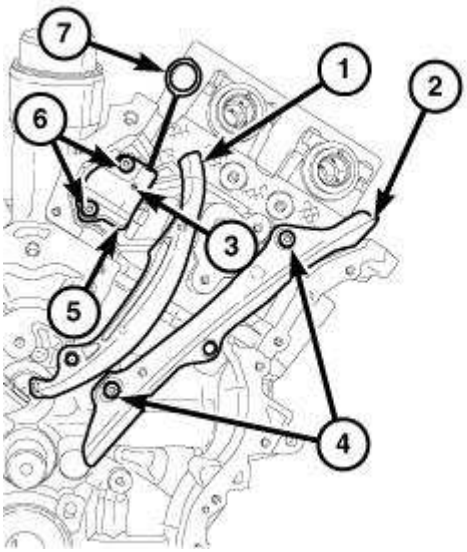

Fig. 149: Left Cam Chain Tensioner, Arm, Guide & Bolts

52. Remove the left cam chain tensioner arm (1).
53. Remove two T30 bolts (6) and the left cam chain tensioner (5).
54. Remove two T30 bolts (4) and the left cam chain guide (2).

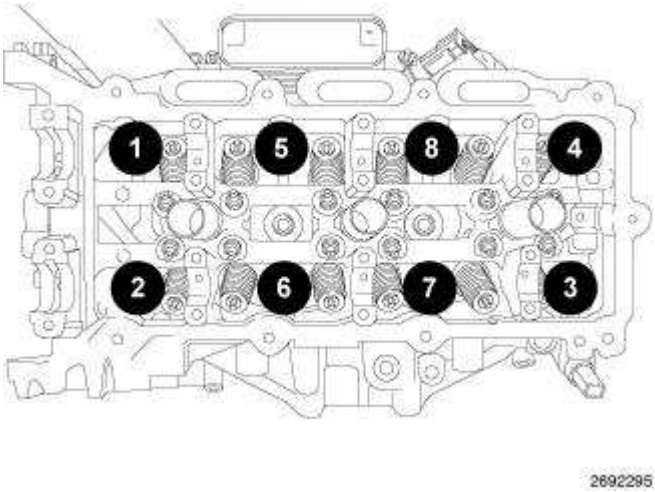

Fig. 150: Cylinder Head Retaining Bolt Removal Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

55. Remove the left camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: **If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.**

56. Remove the rocker arms. Refer to **ROCKER ARM, VALVE, REMOVAL**.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

57. If required, remove the hydraulic lifters. Refer to **LIFTER(S), HYDRAULIC, REMOVAL**.
58. Using the sequence shown in illustration, remove the cylinder head retaining bolts.

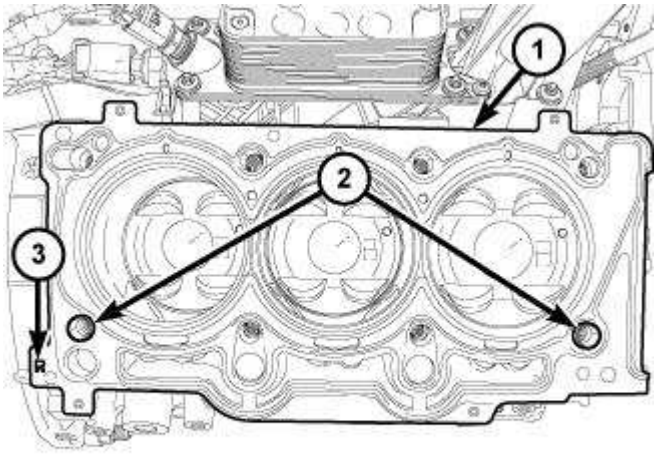

Fig. 151: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right head gasket shown in illustration, left head gasket similar.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.

59. Remove the cylinder head and gasket (1) and discard the gasket.

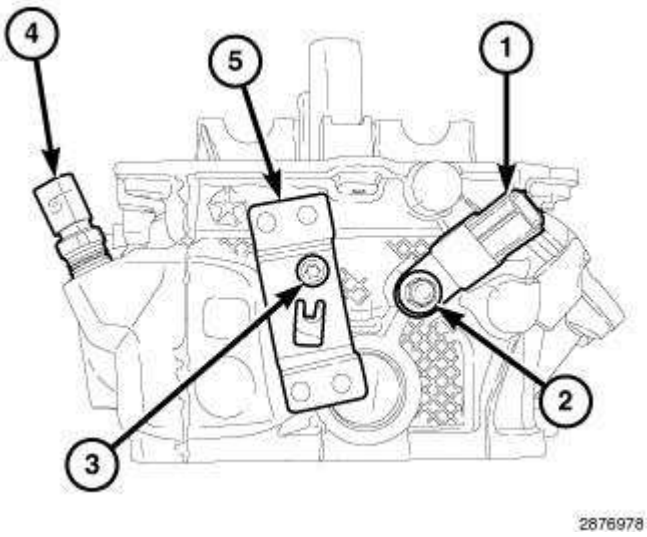

Fig. 152: ECT Sensor, Ignition Coil Capacitor, Engine Wire Harness Retainer Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

60. If required, remove the Engine Coolant Temperature (ECT) sensor (4).
61. If required, remove the bolt (2) and the ignition coil capacitor (1).
62. If required, remove the bolt (3) and the engine wire harness retainer bracket (5).

RIGHT

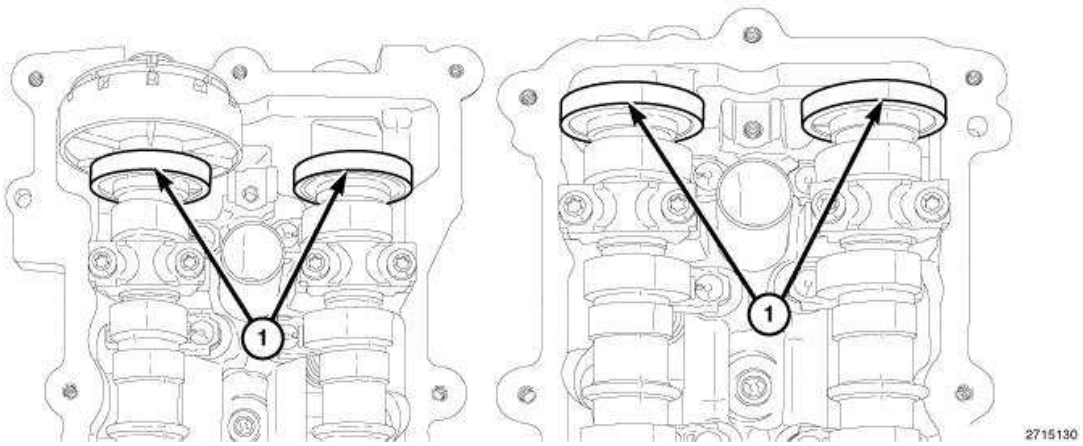

Fig. 153: Magnetic Timing Wheels

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

39. Install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5).
40. Loosen both the intake oil control valve (2) and exhaust oil control valve (7).
41. Remove the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5).
42. Remove the oil control valve (2) from the right side intake cam phaser and pull the phaser off of the camshaft.
43. Remove the oil control valve (7) from the right side exhaust cam phaser and pull the phaser off of the camshaft.

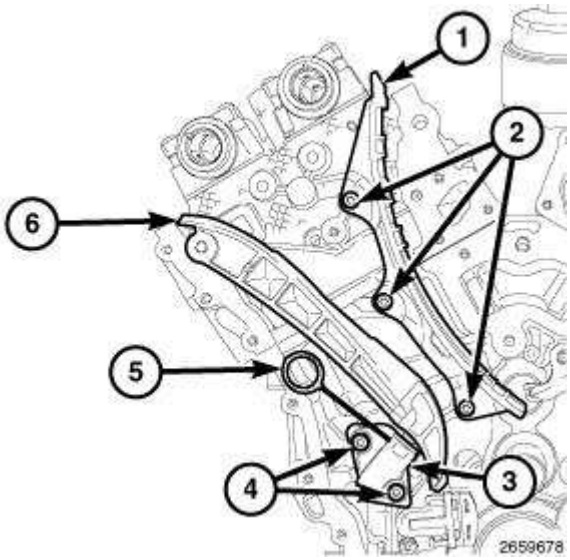

Fig. 171: Right Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

44. Remove the right cam chain tensioner arm (6).
45. Remove two T30 bolts (4) and the right cam chain tensioner (3).
46. Remove three T30 bolts (2) and the right cam chain guide (1).

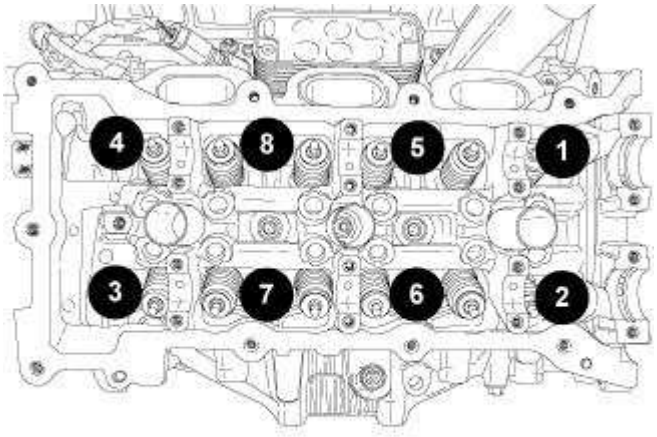

Fig. 172: Cylinder Head Retaining Bolt Removal Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

47. Remove the right camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

48. Remove the rocker arms. Refer to **ROCKER ARM, VALVE, REMOVAL**.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

49. If required, remove the hydraulic lifters. Refer to **LIFTER(S), HYDRAULIC, REMOVAL**.
50. Using the sequence shown in illustration, remove the cylinder head retaining bolts.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

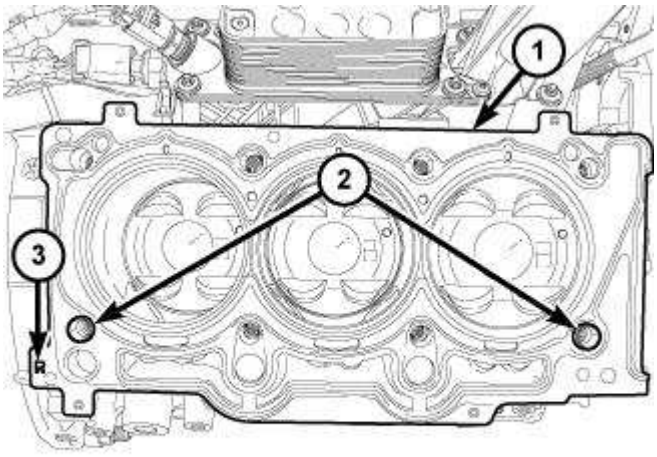

Fig. 173: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.

51. Remove the cylinder head and gasket. Discard the gasket.

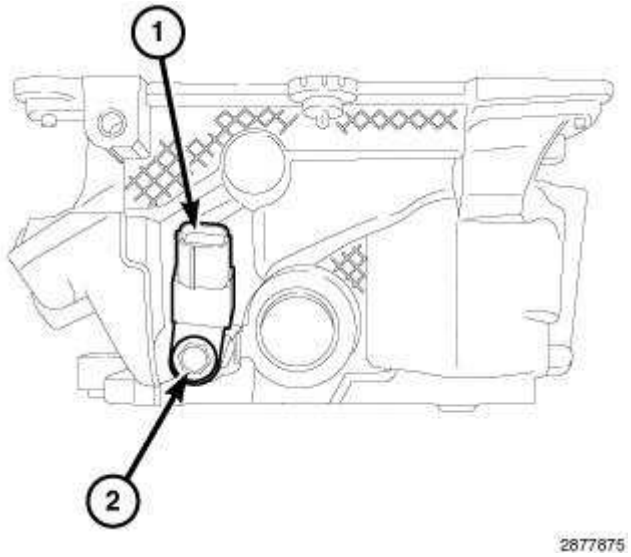

Fig. 174: Ignition Coil Capacitor & Bolt
Courtesy of CHRYSLER GROUP, LLC

52. If required, remove the bolt (2) and the ignition coil capacitor (1).

CLEANING

CLEANING

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

1. Remove all gasket material from cylinder head and block. Refer to **Engine - Standard Procedure**. Be careful not to gouge or scratch the aluminum head sealing surface.
2. Clean all engine oil passages.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

3. Clean out the cylinder head bolt holes in the engine block.

INSPECTION

INSPECTION

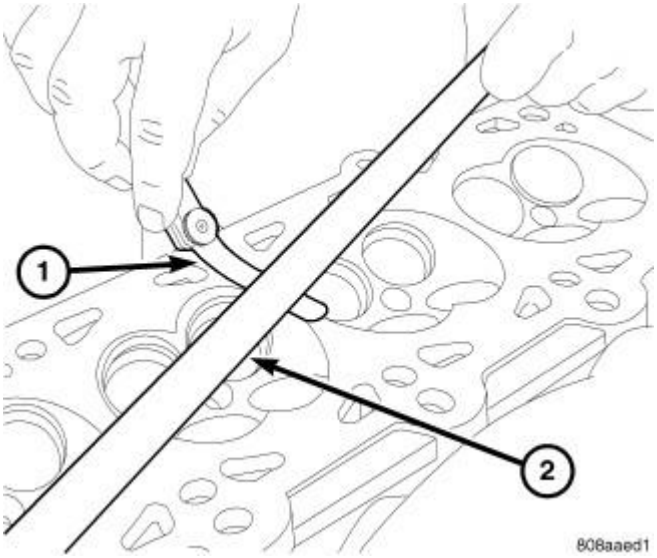

Fig. 175: Checking Cylinder Head Flatness
Courtesy of CHRYSLER GROUP, LLC

1. Check cylinder head warpage with a straight edge (2) and feeler gauge (1).
2. Cylinder head must be flat within specification. Refer to **Engine - Specifications**.
3. Verify that the valve tappets move freely in theirs bores and that they have been rotating.
4. Inspect camshaft bearing journals for scoring.
5. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
6. Inspect the following components and verify that they are within specification : Refer to **Engine - Specifications**.
    - Camshafts
    - Valve Tappets
    - Springs
    - Valve Seats
    - Valve Guides
    - Valves

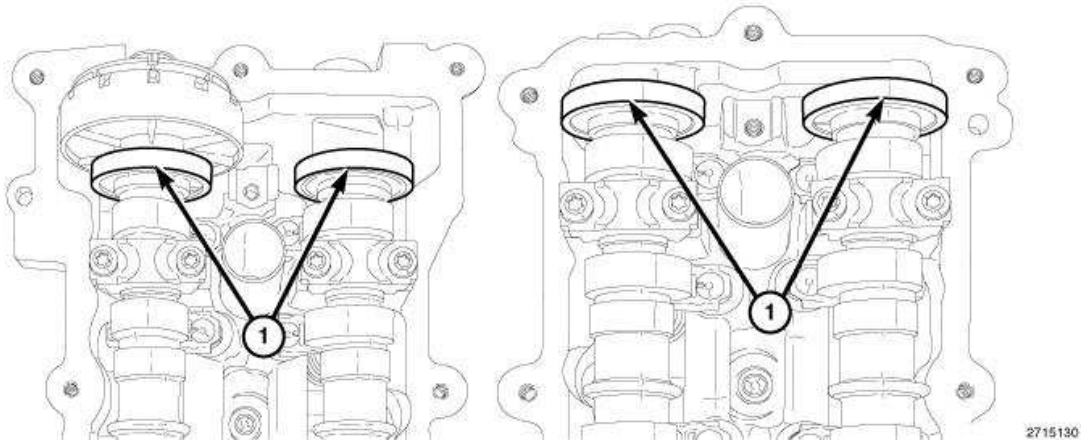

Fig. 176: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

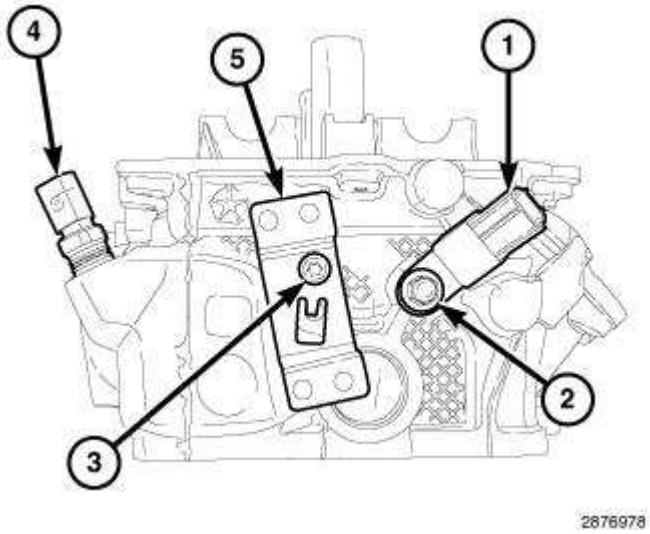

Fig. 177: ECT Sensor, Ignition Coil Capacitor, Engine Wire Harness Retainer Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the Engine Coolant Temperature (ECT) sensor (4) and tighten to 11 N.m (97 in. lbs.).
2. If removed, install the ignition coil capacitor (1) with a M6 bolt (2) and tightened to 10 N.m (89 in. lbs.).
3. If removed, install the engine wire harness retainer bracket (5) with a T30 bolt (3) and tightened to 12 N.m (106 in. lbs.).

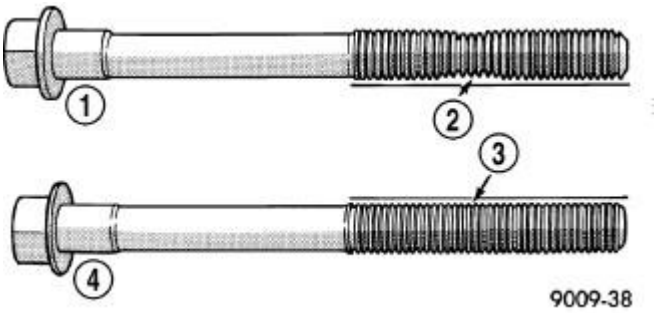

Fig. 178: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

NOTE: Typical cylinder head bolt shown in illustration.

4. Check cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

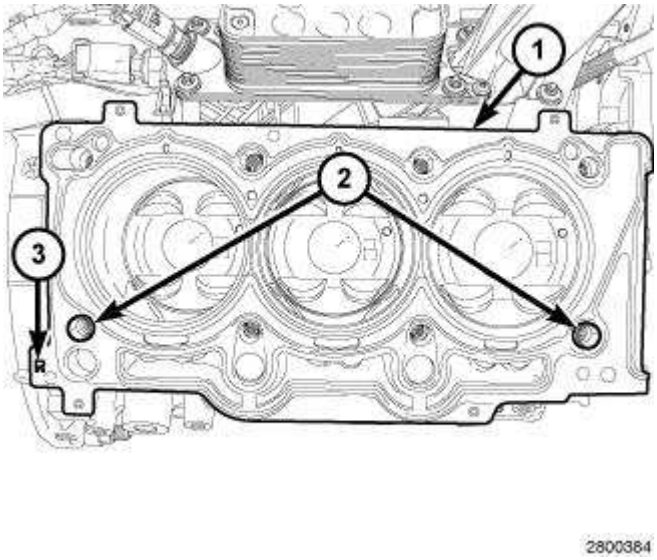

Fig. 179: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right head gasket shown in illustration, left head gasket similar.

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.

5. Clean and prepare the gasket sealing surfaces of the cylinder head and block. Refer to **Engine - Standard Procedure**.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

6. Clean out the cylinder head bolt holes in the engine block.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: The cylinder head gaskets are not interchangeable between the left and right cylinder heads and are clearly marked (3) with "R" for right and "L" for left.

7. Position the new cylinder head gasket (1) onto the locating dowels (2).

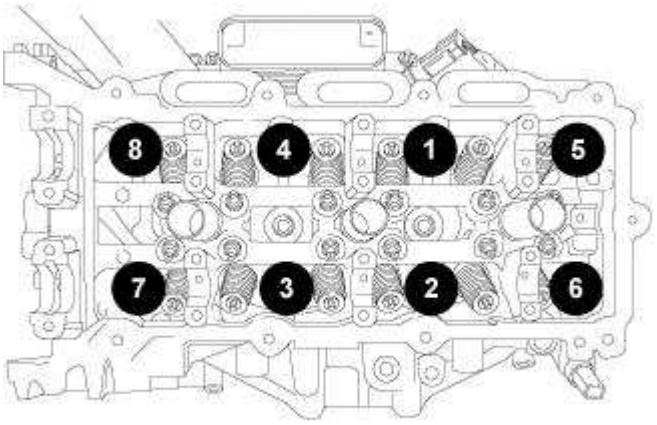

Fig. 180: Cylinder Head Retaining Bolt Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

8. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: Do not apply any additional oil to the bolt threads.

9. Install the eight cylinder head bolts finger tight.
10. Tighten the cylinder head bolts in the sequence shown in illustration, following this 9 step torque plus angle method. Tighten according to the following torque values:

- Step 1: All to 30 N.m (22 ft. lbs.)
- Step 2: All to 45 N.m (33 ft. lbs.)
- Step 3: All + 75° Turn **Do not use a torque wrench for this step.**
- Step 4: All + 50° Turn **Do not use a torque wrench for this step.**
- Step 5: Loosen all fasteners in reverse of sequence shown in illustration
- Step 6: All to 30 N.m (22 ft. lbs.)
- Step 7: All to 45 N.m (33 ft. lbs.)
- Step 8: All + 70° Turn **Do not use a torque wrench for this step.**
- Step 9: All + 70° Turn **Do not use a torque wrench for this step.**

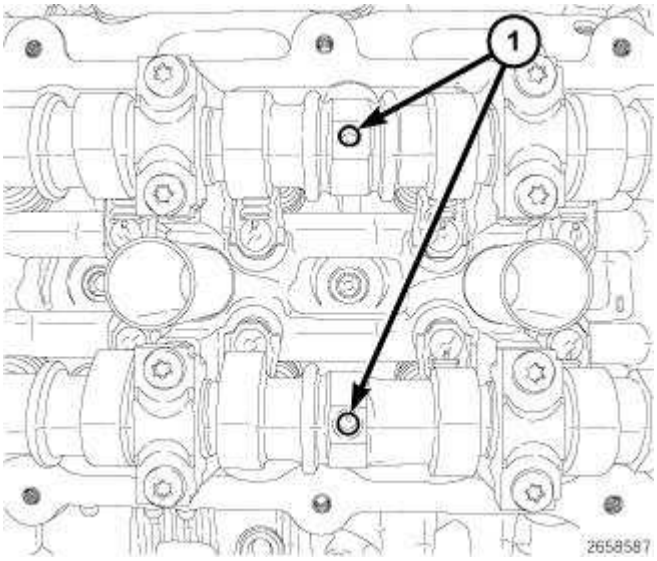

Fig. 181: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

NOTE: If the hydraulic lifters are being reused, reassemble them into their original locations.

11. If removed, install the hydraulic lifters. Refer to **LIFTER(S), HYDRAULIC, INSTALLATION**.

NOTE: If the rocker arms are being reused, reassemble them into their original

locations.

12. Install the rocker arms and camshafts. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
13. Rotate the camshafts clockwise to TDC by positioning the alignment holes (1) vertically.

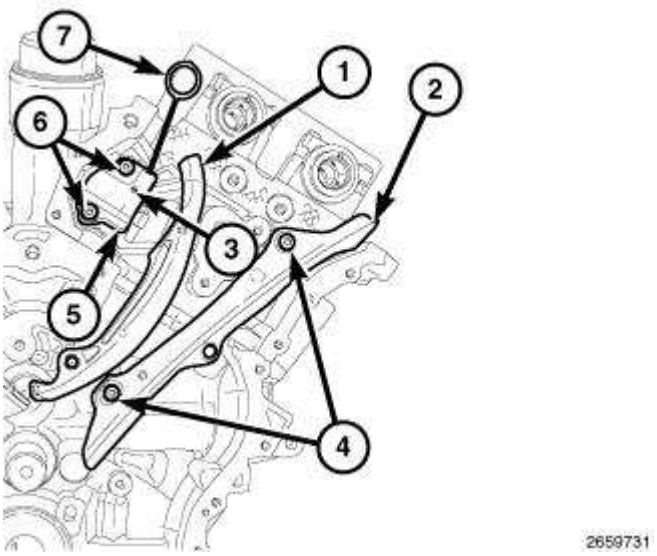

Fig. 182: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Install the left cam chain guide (2) with two bolts (4) and tighten the T30 bolts (4) to 12 N.m (9 ft. lbs.).
15. Install the left cam chain tensioner (5) to the cylinder head with two bolts (6) and tighten the T30 bolts (6) to 12 N.m (9 ft. lbs.).
16. Reset the left cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (7). Refer to **Engine/Valve Timing - Standard Procedure**.
17. Install the left tensioner arm (1).

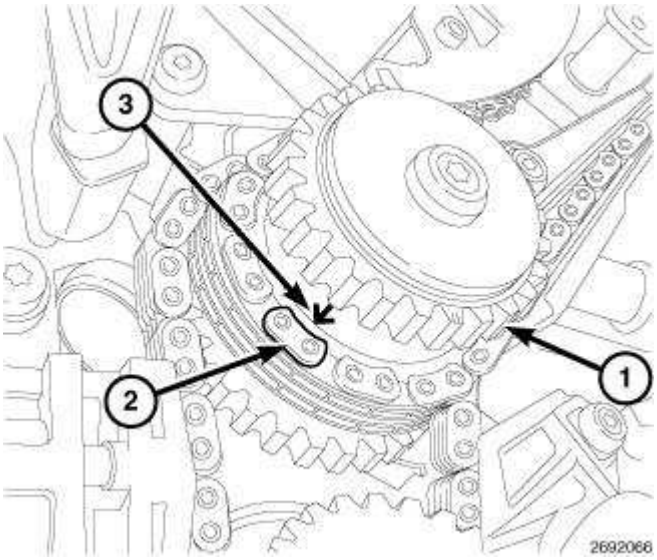

Fig. 183: Idler Sprocket, Plated Link & Arrow
Courtesy of CHRYSLER GROUP, LLC

18. Press the left intake cam phaser onto the intake camshaft, install and hand tighten the oil control valve.

> **CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

19. Drape the left side cam chain over the left intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

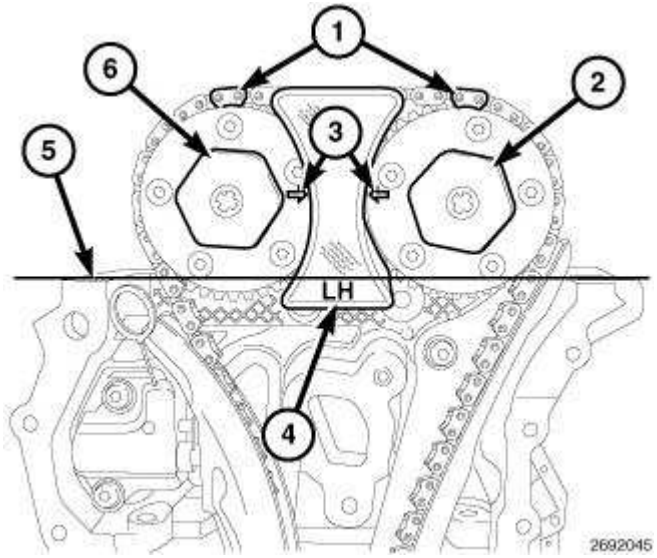

Fig. 184: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

20. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the valve cover sealing surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

21. Install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4) and tighten the oil control valves (2) and (6) to 150 N.m (110 ft. lbs.).

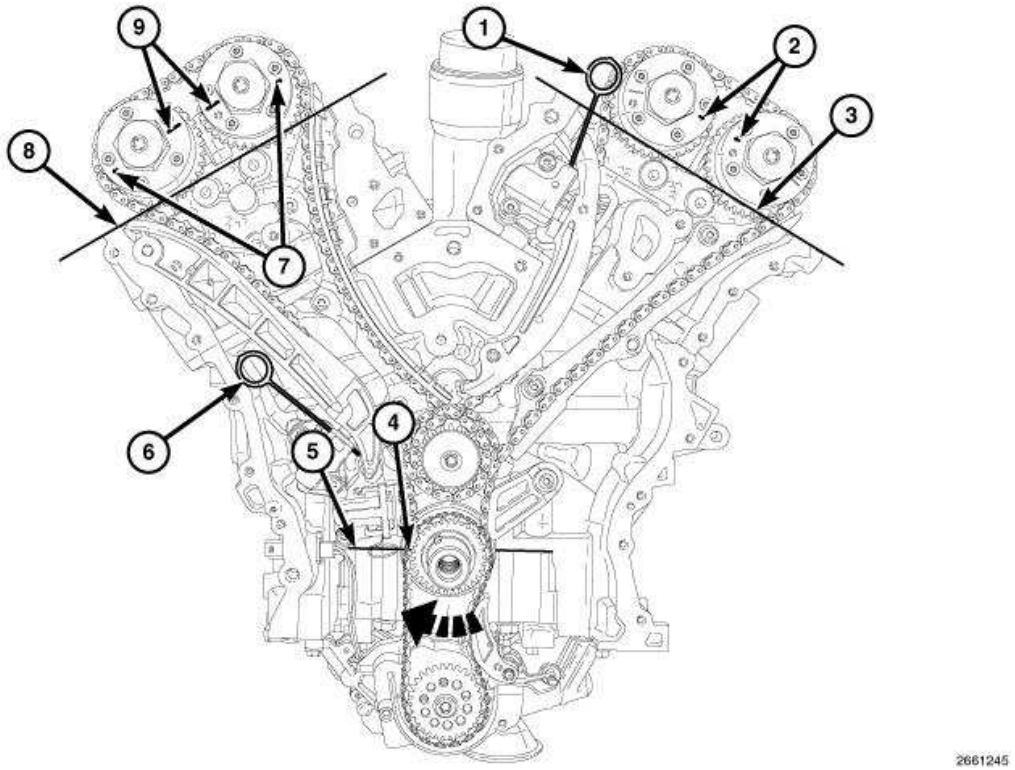

Fig. 185: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

22. Remove the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser).
23. Remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) from the left cam chain tensioner.
24. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned the with the block/bearing cap junction (5).
25. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).

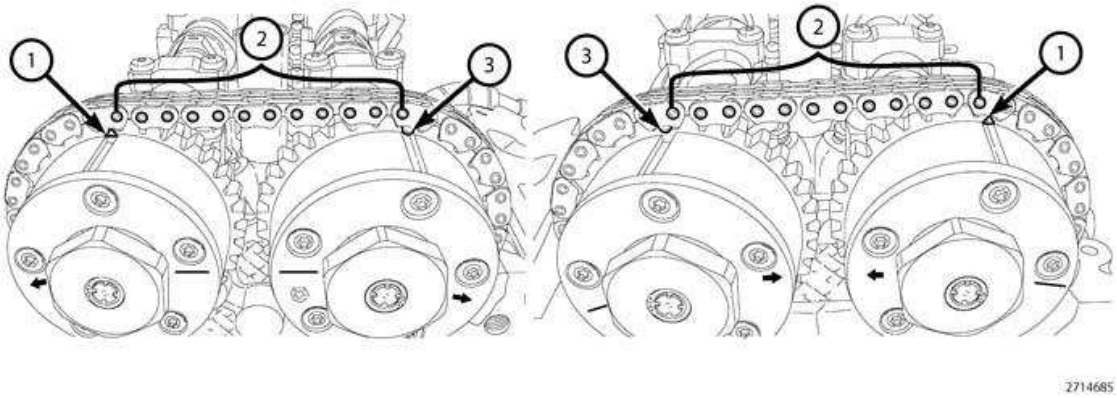

Fig. 186: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

26. There should be 12 chain pins (2) between the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
27. If the engine timing is not correct, repeat this procedure.
28. Install the engine timing cover, crankshaft vibration damper, upper and lower oil pans and cylinder head covers. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.

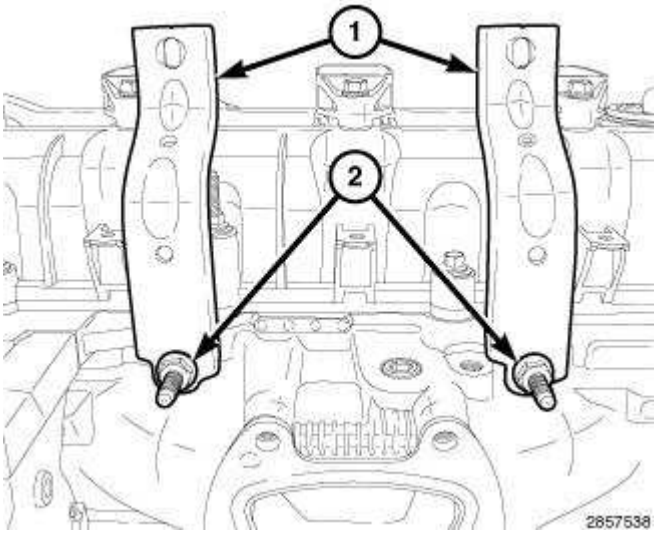

Fig. 187: Left Intake Manifold Support Brackets & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Install the left upper intake manifold support brackets (1) and tighten the stud (2) finger tight.

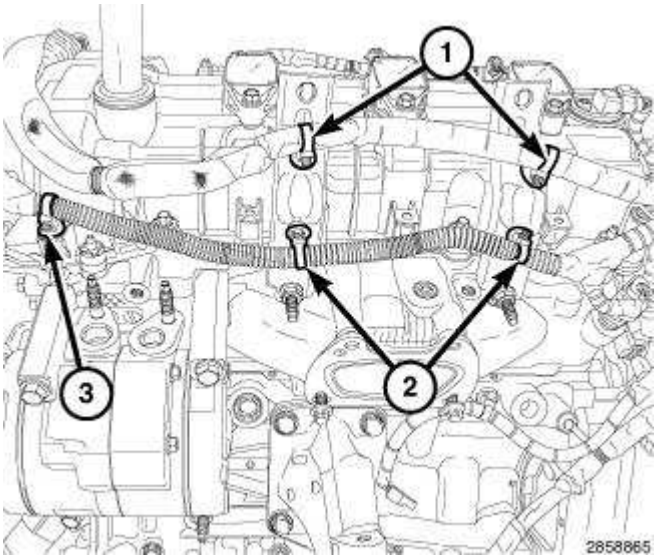

Fig. 188: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers

Courtesy of CHRYSLER GROUP, LLC

12. Install the right cam chain guide (1) with three bolts (2). Tighten the T30 bolts (2) to 12 N.m (106 in. lbs.).
13. Install the right cam chain tensioner (3) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N.m (106 in. lbs.).
14. Reset the right cam chain tensioner (3) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (5).
15. Install the right tensioner arm (6).

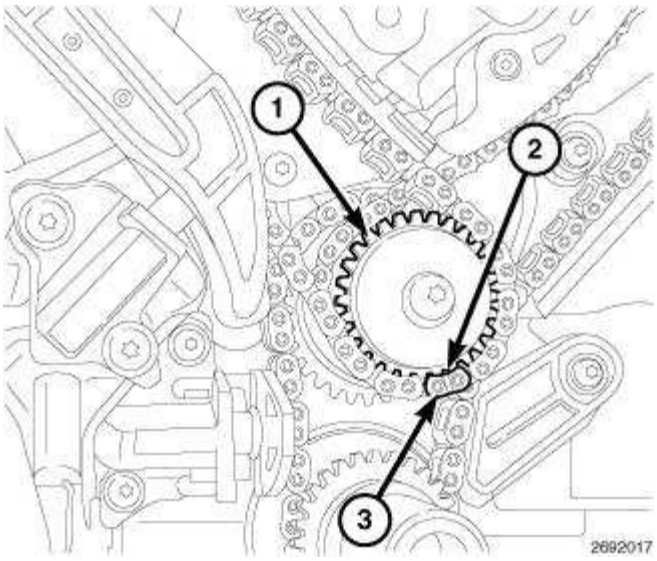

Fig. 216: Idler Sprocket, Dimple & Plated Link
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same

direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

16. Press the right exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve.
17. Drape the right side cam chain over the right exhaust cam phaser and onto the idler sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.

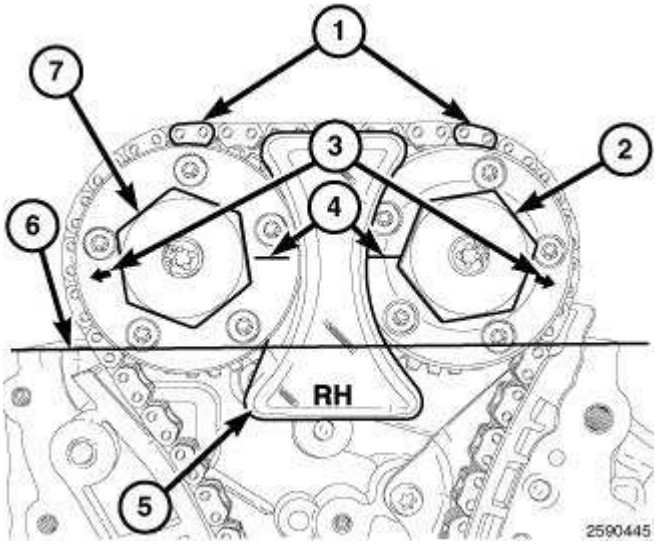

Fig. 217: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

18. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the valve cover sealing surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

19. Install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5) and tighten the oil control valves (2) and (7) to 150 N.m (110 ft. lbs.).

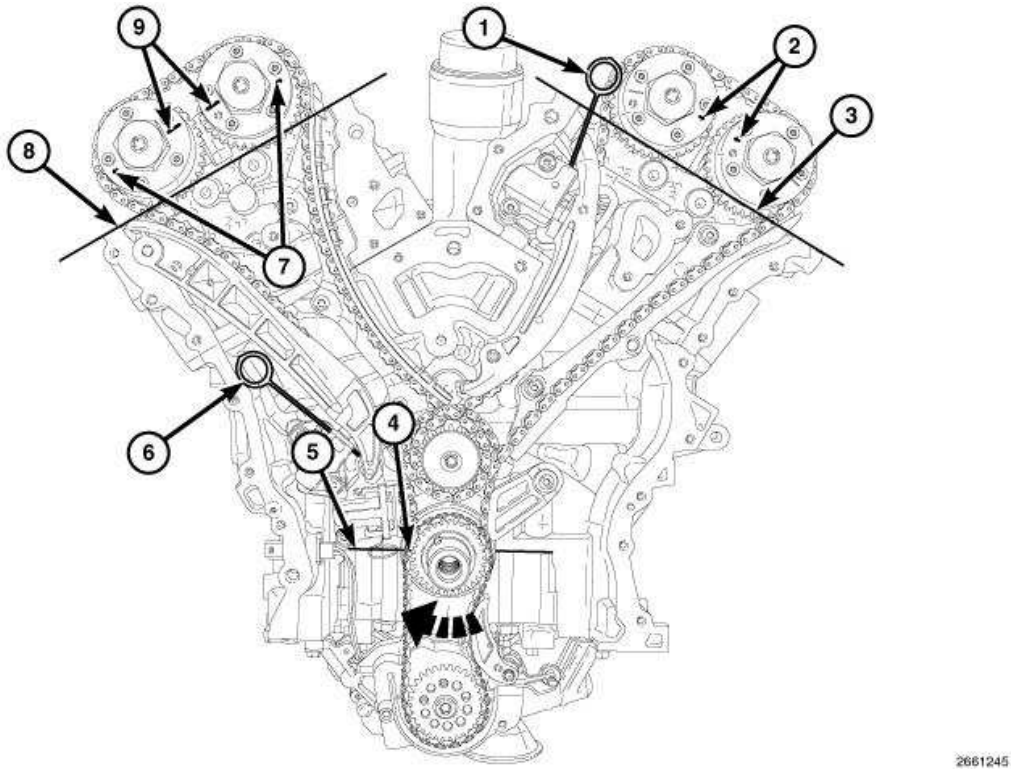

Fig. 218: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

20. Remove the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser).
21. Remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (6) from the RH cam chain tensioner.
22. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned the with the block/bearing cap junction (5).
23. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).

53. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
54. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
55. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
56. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

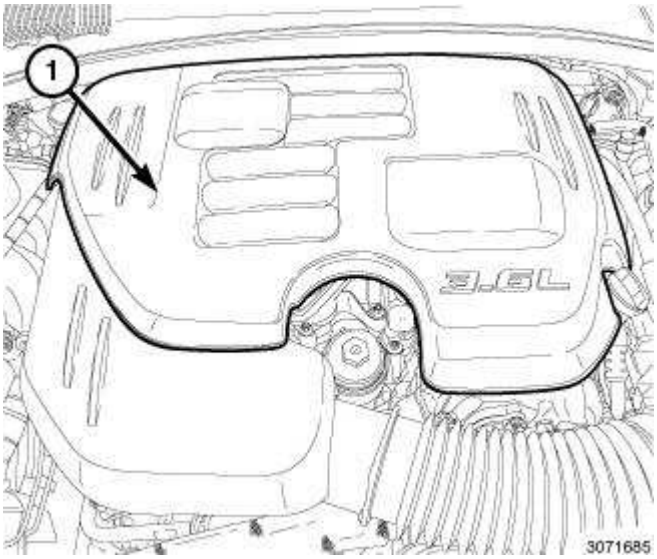

Fig. 232: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

57. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

58. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .
59. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

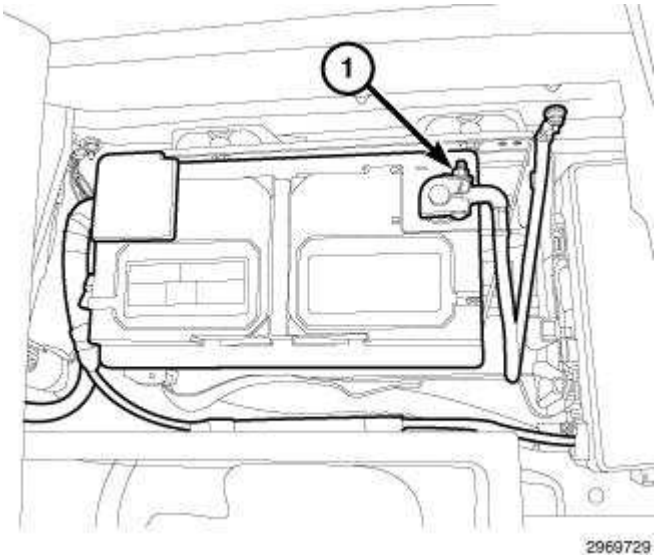

Fig. 233: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

60. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
61. Run the engine until it reaches normal operating temperature and check for leaks.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE

DESCRIPTION

DESCRIPTION

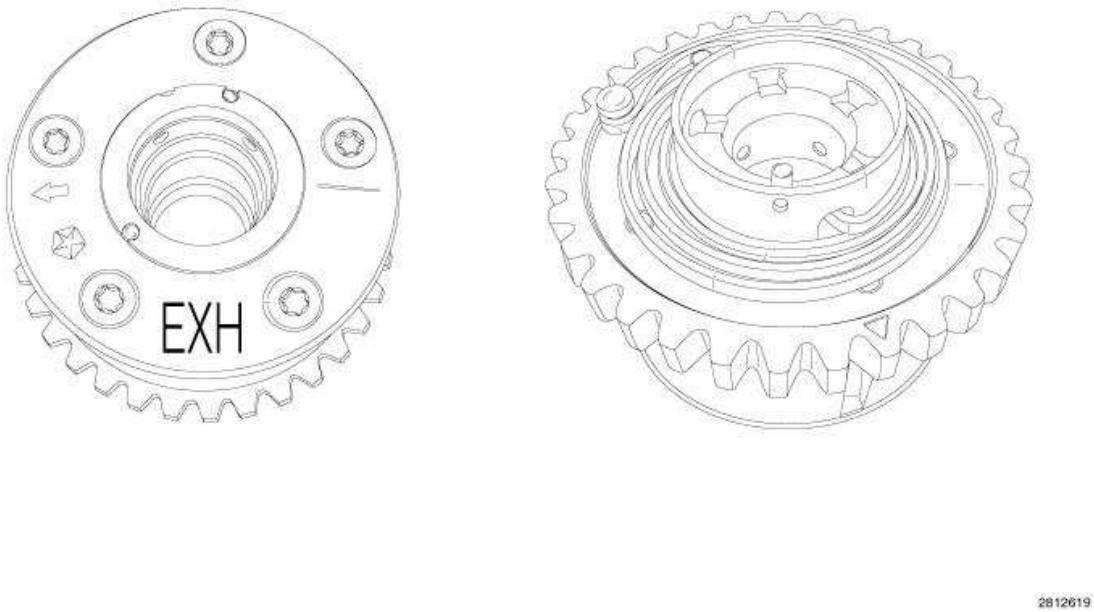

Fig. 234: Exhaust Phaser Assembly
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four phasers are located on the front of the camshafts, behind the VVT solenoids, inside of the engine timing cover. The exhaust phasers are identified with EXH and the intake phasers are identified with INT. The exhaust phaser has a clockspring, the intake phaser does not. The camshaft sprockets are integrated with the camshaft phaser and are serviced as an assembly. Do not attempt to disassemble the phasers, they are not serviceable. Phasers are interchangeable between the right and left cylinder heads but should be installed in the same location as removed.

The 3.6L engine has an Oil Control Valve (OCV) for each phaser. The OCV also acts as a bolt for mounting the Phaser to the camshaft. The OCVs spool valve is spring loaded and should move freely within the OCV body. The four OCVs are identical but should be installed in the same location as removed.

OPERATION

OPERATION

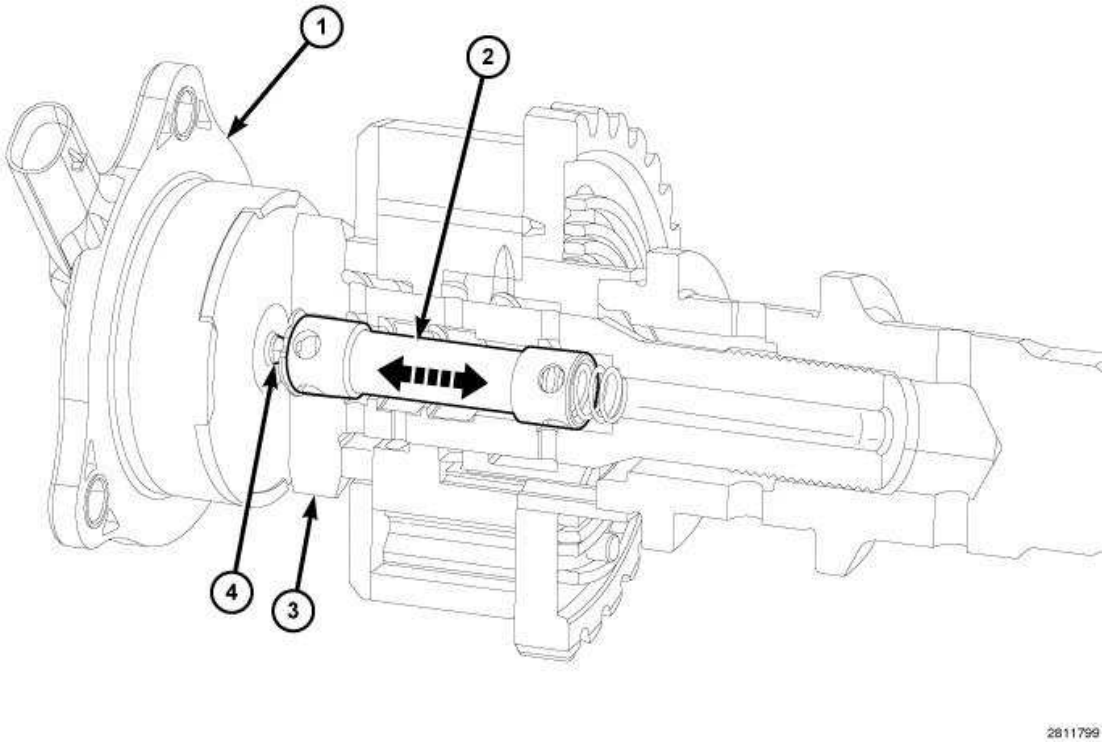

Fig. 235: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Each phaser position is adjusted using regulated oil pressure through the Oil Control Valve (OCV) (3). To begin phaser movement, a voltage signal is applied to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow.

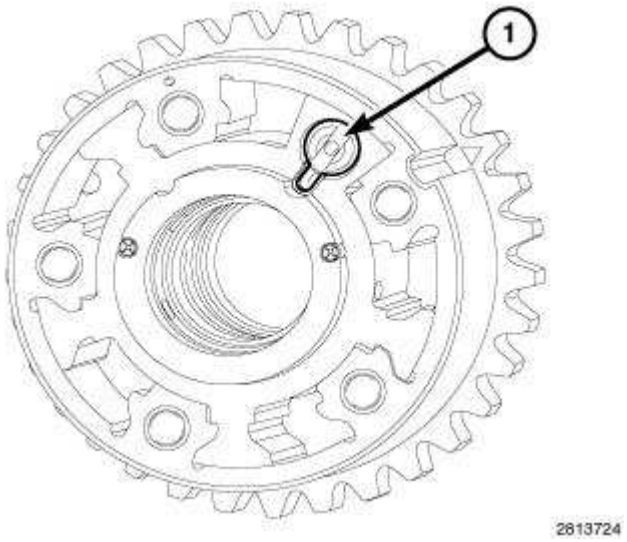

Fig. 236: Phasers In Lock-Pin Position
Courtesy of CHRYSLER GROUP, LLC

At engine startup, system oil pressure overcomes spring pressure and unlocks the phaser lock-pin (1) in preparation for phasing. The phasers remain in this position until a PCM signal is given to pulse-width modulate the VVT solenoid. At engine shutdown, as oil pressure is reduced, both Phasers return to their lock-pin position (1). However, because the exhaust Phaser needs to travel to a position above and beyond the standard camshaft clockwise rotation, the assistance of a clock spring is required. The intake Phaser on the other hand, simply relies on the torsional resistance from the valvetrain to push it back towards lock-pin position.

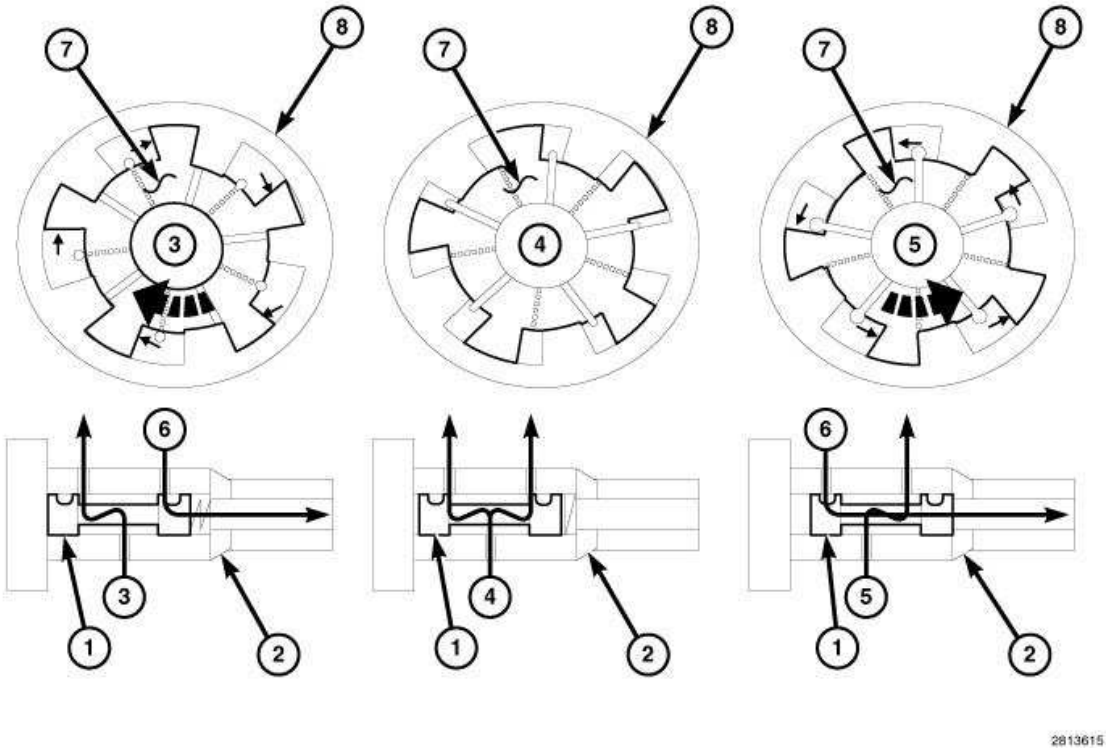

Fig. 237: Spool Valve, Vanes, OCV & Advance, Hold Or Retard Position
Courtesy of CHRYSLER GROUP, LLC

The position of the spool valve (1) inside the OCV (2) determines which ports and chambers inside the phaser are being fed, either to advance (3), hold (4) or retard (5) the timing of the phaser sprocket relative to the camshaft. The spool valve also returns oil from the chambers to the sump (6). The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM. As oil pressure pushes against the vanes (6) of the phaser rotor, the rotor begins to move. Since this rotor is physically attached to the camshaft, rotor rotation causes the camshaft position to rotate relative to the standard sprocket (7) position.

REMOVAL

LEFT

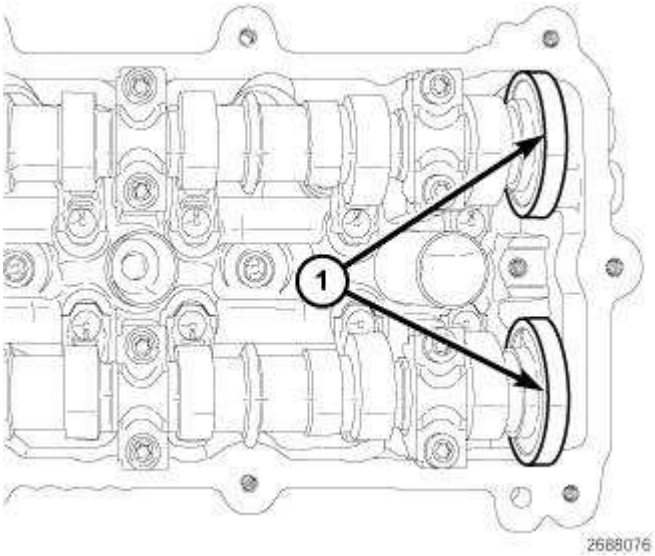

Fig. 238: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

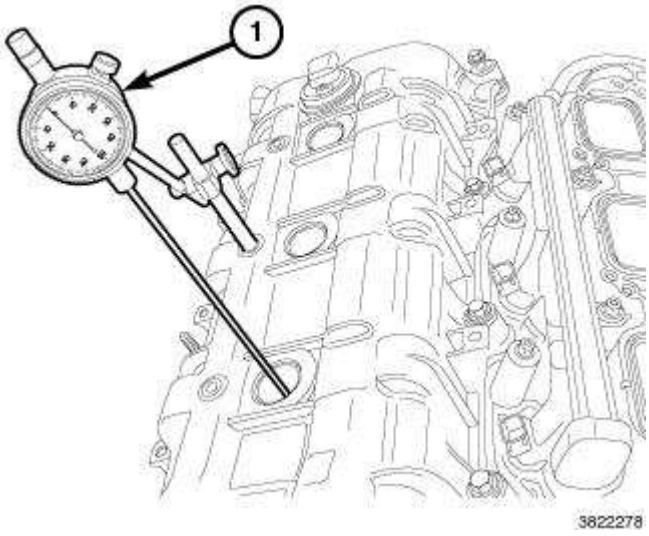

Fig. 239: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, left ignition coils and left cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. Remove the right ignition coils and all spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the number three cylinder ignition coil mount. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

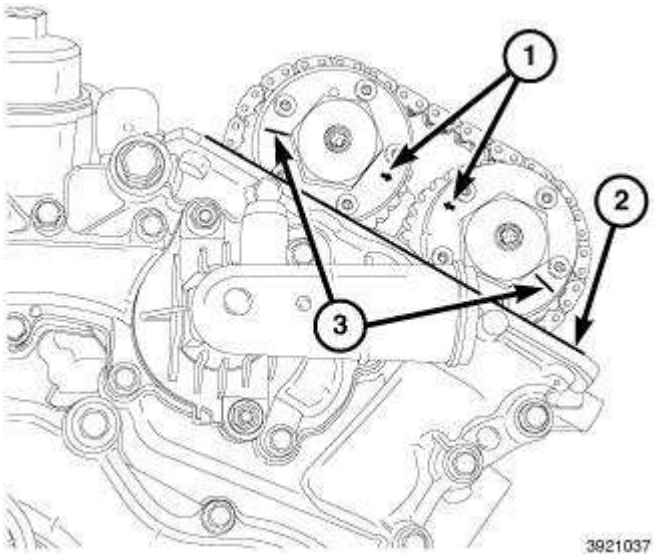

Fig. 240: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

4. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2) when the number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

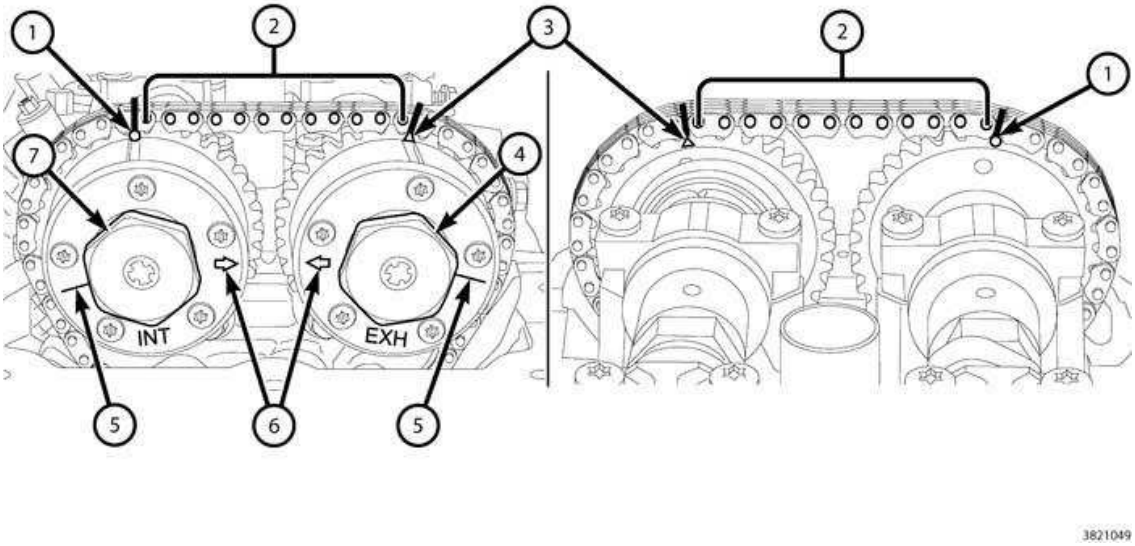

Fig. 241: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1) as viewed from either the front or rear of the cam phasers.
6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

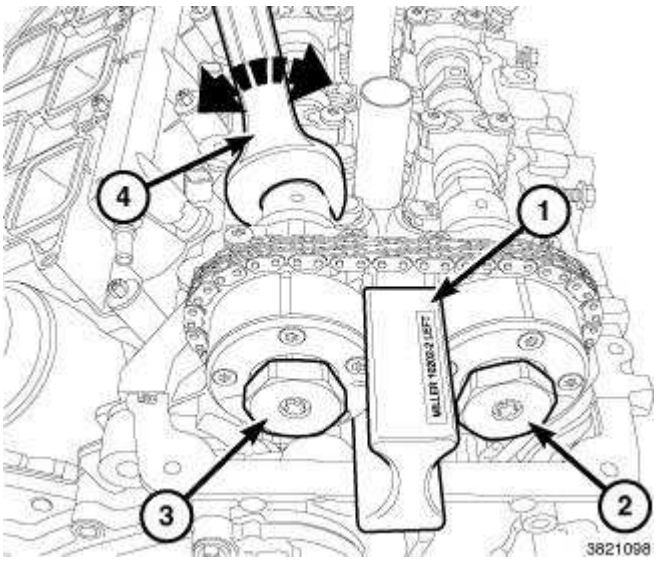

Fig. 242: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).
9. Remove the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1).

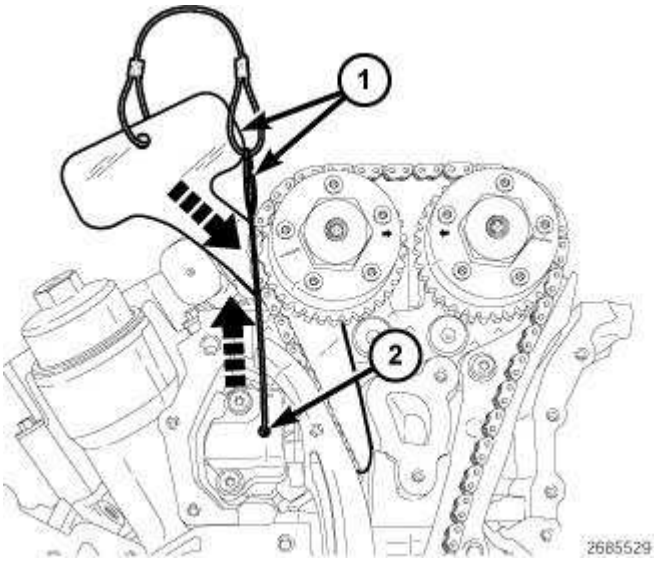

Fig. 243: Pin, Rack & Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows engine timing cover removed for clarity.

10. Using (special tool #10200-3, Pin) (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder remains in place while the phasers are removed. Refer to **Engine/Valve Timing - Standard Procedure**.

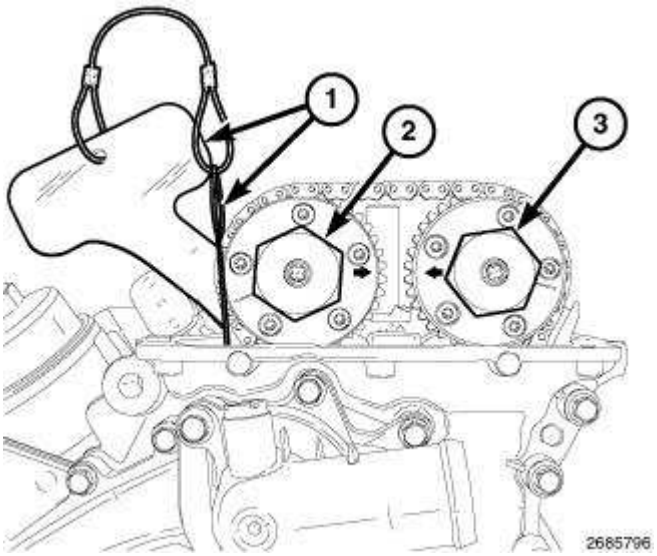

Fig. 244: Pin, Rack, Timing Chain Holder & Oil Control Valves
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil control valve (4) and pull the left side exhaust cam phaser off of the camshaft.
12. Remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

RIGHT

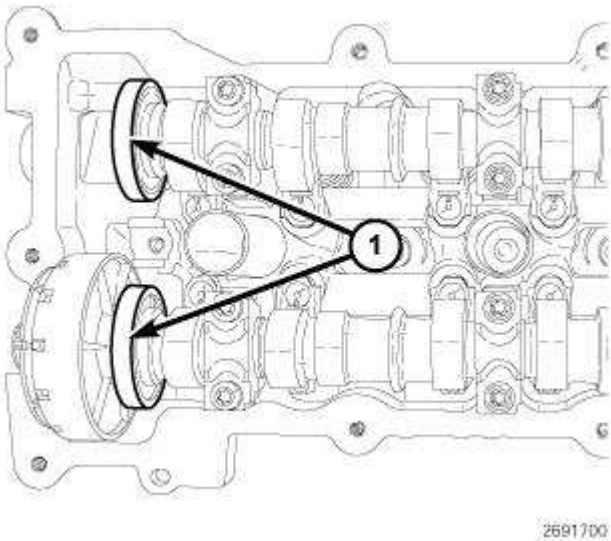

Fig. 245: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

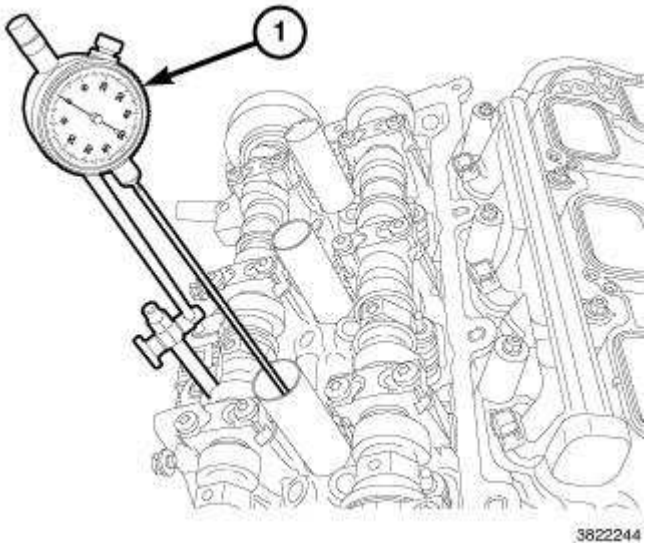

Fig. 246: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, right ignition coils and right cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. Remove the left ignition coils and all spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

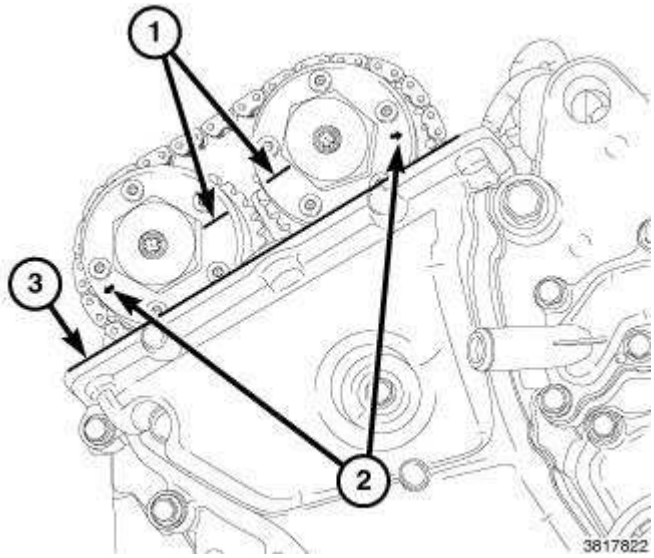

Fig. 247: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

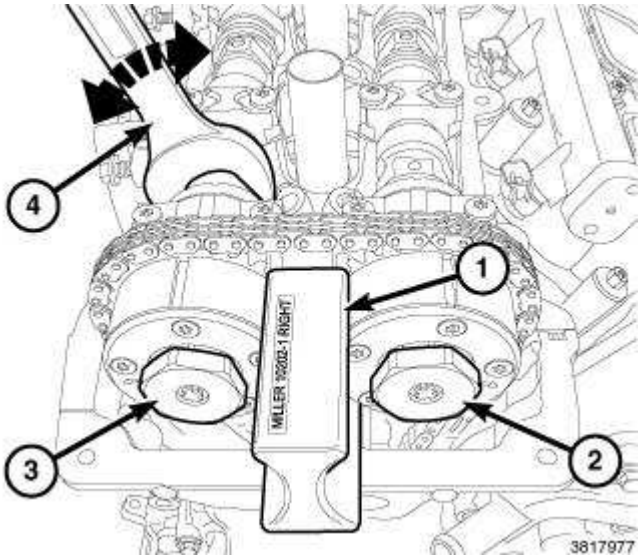

Fig. 249: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).
9. Remove the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).

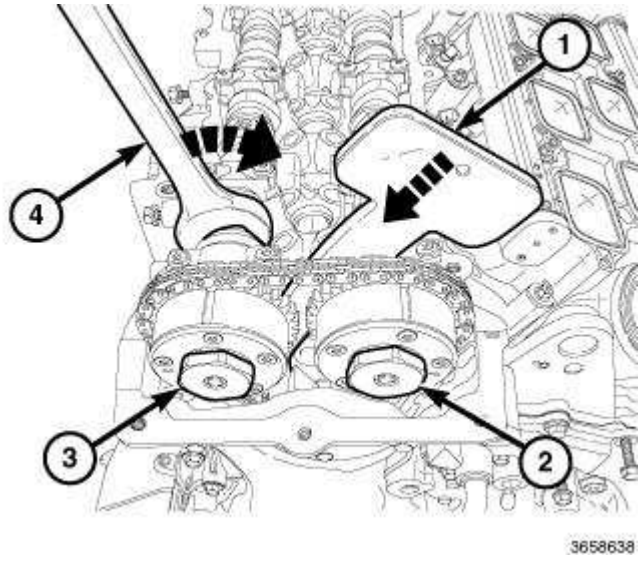

Fig. 250: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not insert the Timing Chain Holder into position without first

compressing the tensioner. The Timing Chain Holder is not designed to compress the tensioner and excessive force can damage the timing chain tensioner arm.

10. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert (special tool #10369, Holder, Timing Chain) (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

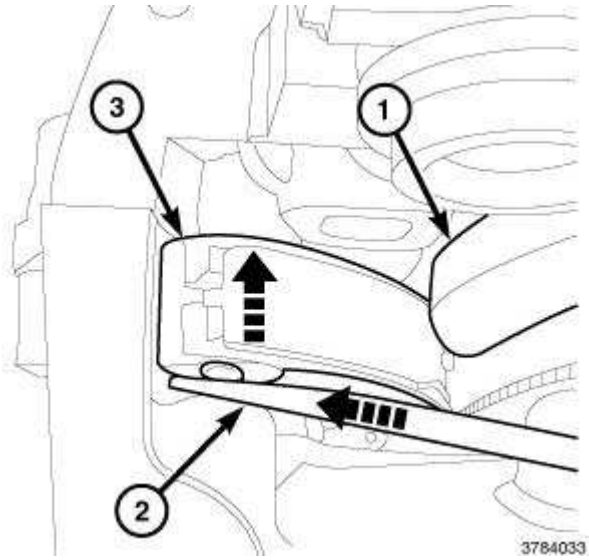

Fig. 251: Timing Chain Holder, Trim Stick & Tensioner Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the Timing Chain Holder (1) does not engage or slips from position, wedge a trim stick (2) or equivalent between the front cover and the tensioner arm (3) to push the tensioner arm towards the rear of the engine and then repeat the previous step.**

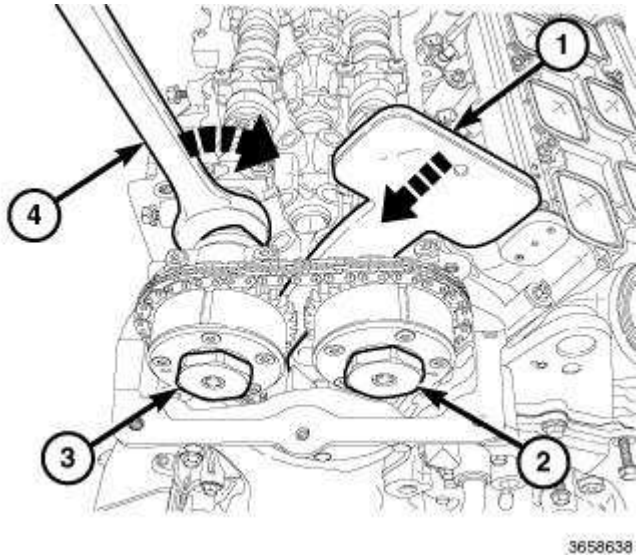

Fig. 252: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.
12. Remove the oil control valve (2) and pull the right side intake cam phaser off of the camshaft.

INSTALLATION

LEFT

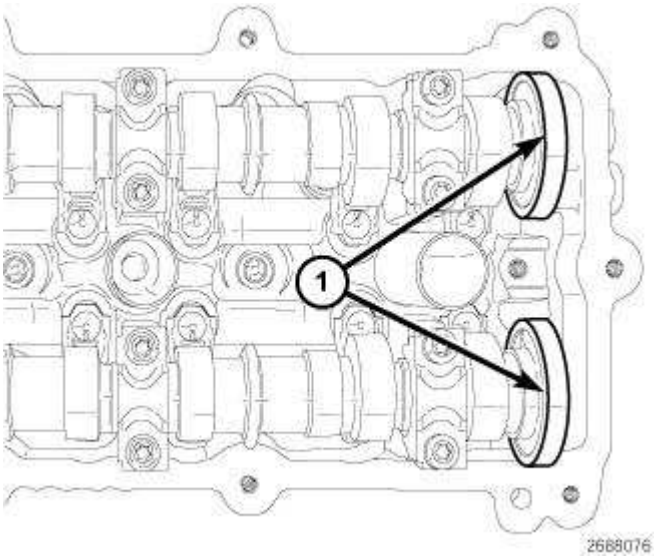

Fig. 253: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the

camshaft position sensor.

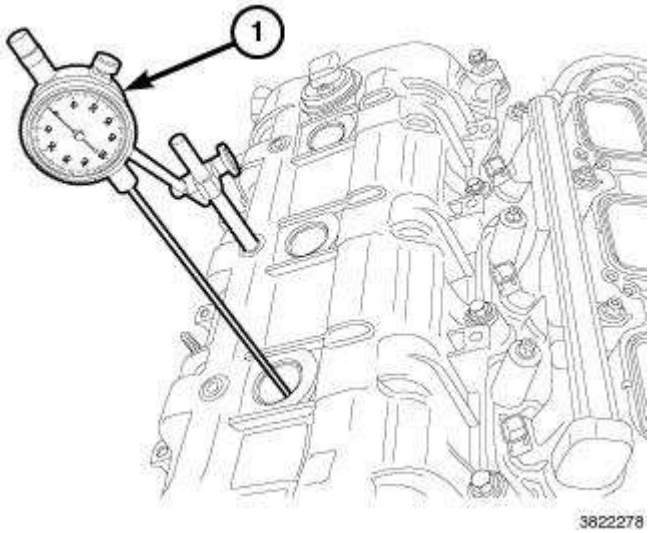

Fig. 254: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts. Refer to CAMSHAFT, ENGINE, REMOVAL.

1. Verify that the indicator dial (1) is set to zero when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

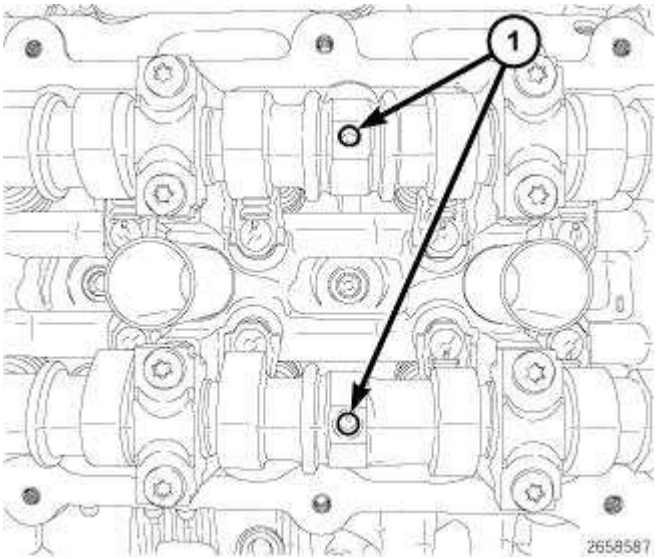

Fig. 255: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.

2.

3. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

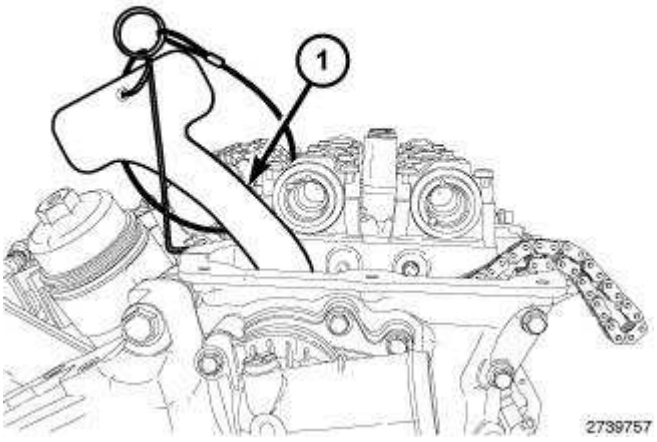

Fig. 256: Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted by repeating Step 10 of the Removal procedure. Refer to ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, REMOVAL.

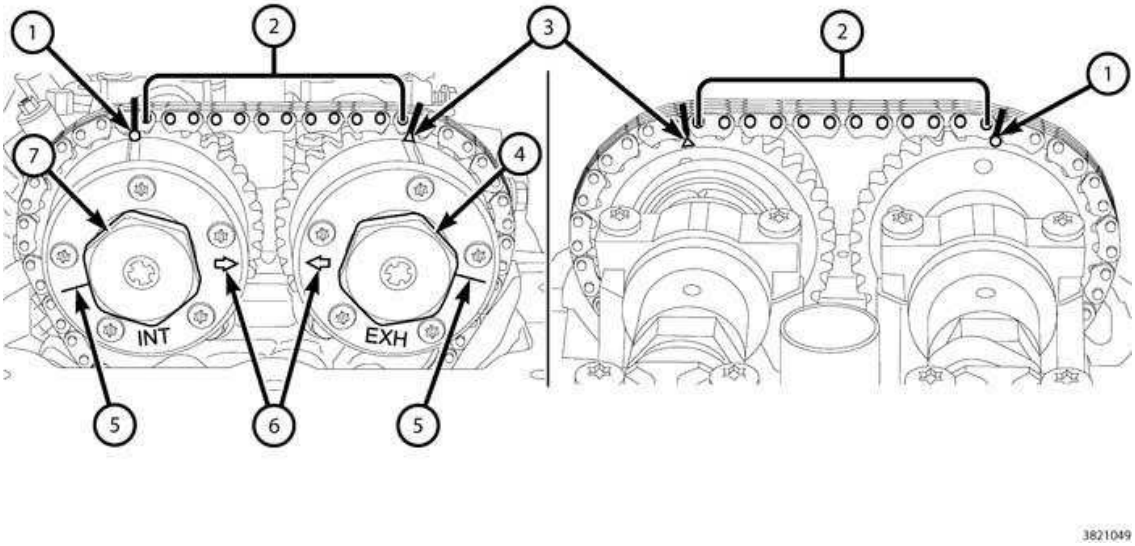

Fig. 257: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

4. Route the cam chain around the left intake cam phaser while aligning the paint mark with the phaser timing mark (1). Press the left intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (7).
5. While maintaining this alignment, route the cam chain around the exhaust cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (4).
6. The **SCRIBE LINES** (5) on the cam phasers should face away from each other and the **ARROWS** (6) should point toward each other and be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1).

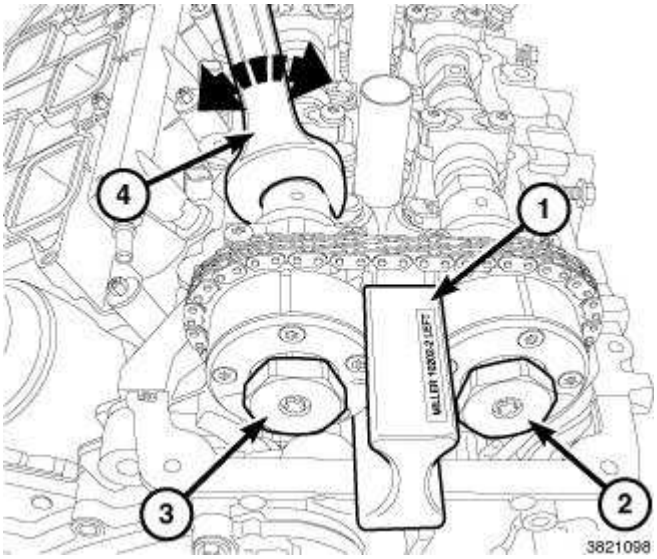

Fig. 258: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Tighten the oil control valves (2) and (3) to 150 N.m (110 ft. lbs.).
9. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.

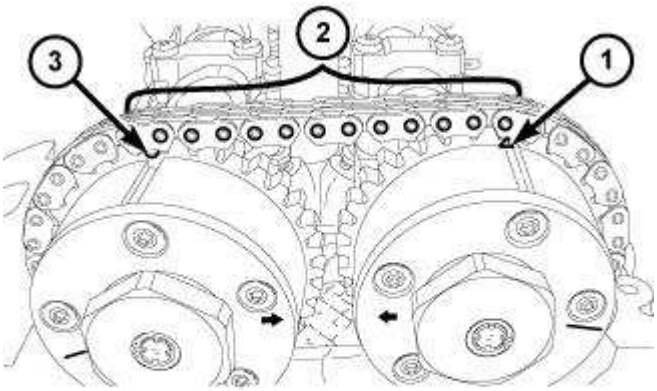

Fig. 259: Chain Pins, Arrows, Scribe Lines, Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

10. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;
    - The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
    - The **SCRIBE LINES** (3) on the left side cam phasers face away from each other.
    - The **ARROWS** (4) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface.
    - There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
11. If the engine timing is not correct, repeat this procedure.
12. Install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
13. Install the right ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .
14. Install the left cylinder head cover and left ignition coils. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
15. Install the upper intake manifold and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
16. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
17. Start the engine and perform the appropriate POWERTRAIN VERIFICATION TESTS : Refer to appropriate Electrical Diagnostics article.
    - Cam/Crank Variation Relearn
    - Target Coefficient Relearn

NOTE: **Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. For any DTCs that reset, refer to appropriate Electrical Diagnostics DIAGNOSTIC CODE INDEX article.**

RIGHT

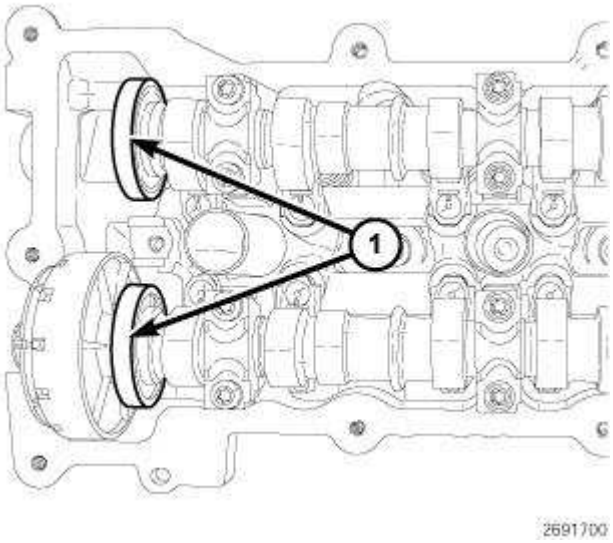

Fig. 260: Magnetic Timing Wheels

10. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;
    - The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
    - The **ARROWS** (4) on the right side cam phasers point away from each other.
    - The **SCRIBE LINES** (5) on the right side cam phasers are parallel to the cylinder head cover mounting surface.
    - There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
11. If the engine timing is not correct, repeat this procedure.
12. Install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
13. Install the left ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .
14. Install the right cylinder head cover and right ignition coils. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
15. Install the upper intake manifold and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
16. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
17. Start the engine and perform the appropriate POWERTRAIN VERIFICATION TESTS : Refer to appropriate Electrical Diagnostics article.
    - Cam/Crank Variation Relearn
    - Target Coefficient Relearn

NOTE: **Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. For any DTCs that reset, refer to appropriate Electrical Diagnostics DIAGNOSTIC CODE INDEX article.**

CAMSHAFT, ENGINE

DESCRIPTION

DESCRIPTION

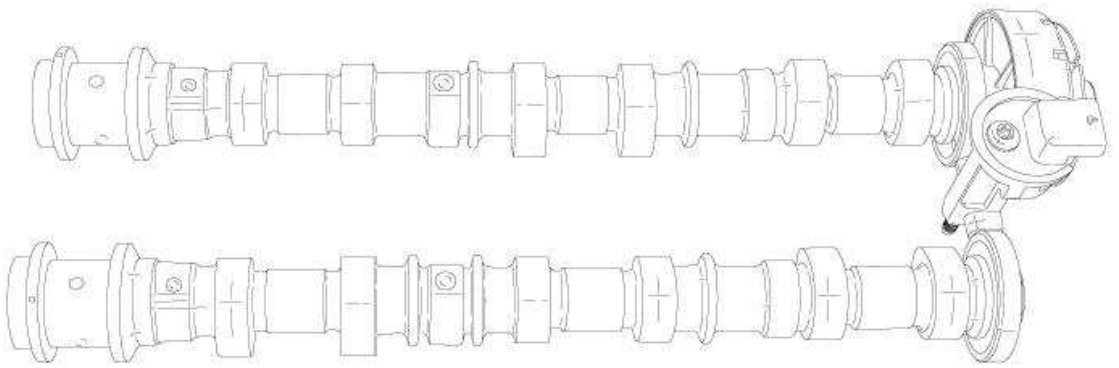

Fig. 267: Dual Over Head Camshaft (DOHC) Configuration
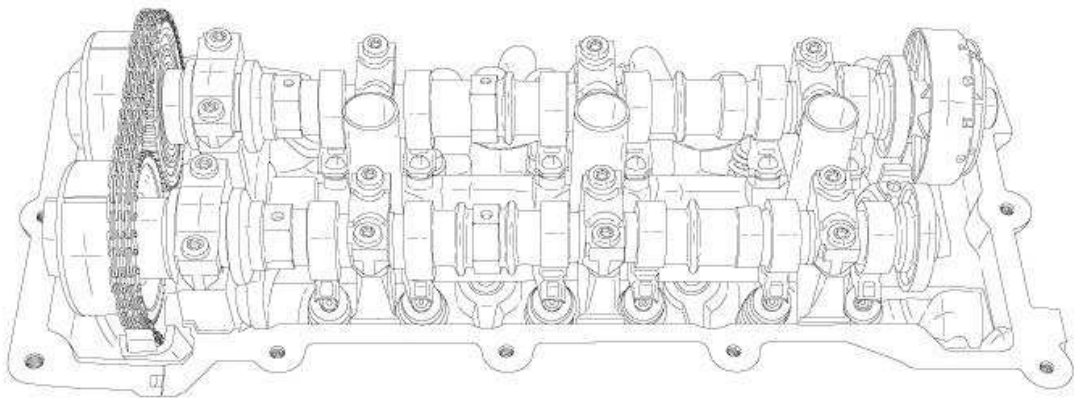
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have a pressed on magnetic timing wheel that is magnetic encoded. The two Camshaft Position (CMP) sensors are located between the timing wheels. Attached to the rear of the right exhaust camshaft is a centrifuge which is part of the crankcase ventilation system. The centrifuge is used to separate oil droplets from the crankcase gases before they enter the PCV valve. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal.

OPERATION

OPERATION



2820145

Fig. 268: Right Hand Camshafts
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH camshafts shown in illustration, LH camshafts similar.

The camshaft has precisely machined (egg shaped) lobes to provide accurate valve timing and duration. The camshaft is driven by the crankshaft via drive sprockets and chains.

STANDARD PROCEDURE

STANDARD PROCEDURE - CAMSHAFT END PLAY

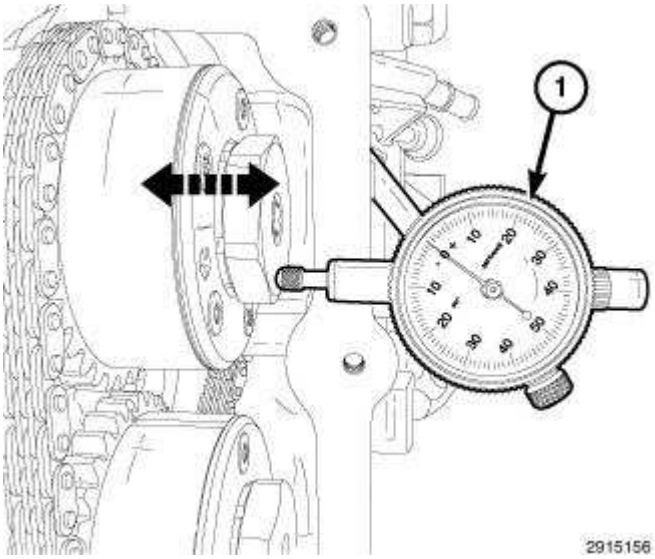


Fig. 269: Measuring Camshaft End Play Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right intake camshaft shown in illustration, other camshafts similar.

1. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the camshaft.
3. Move the camshaft all the way to the rear of its travel.
4. Zero the dial indicator.
5. Move the camshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **Engine - Specifications**.

REMOVAL

LEFT

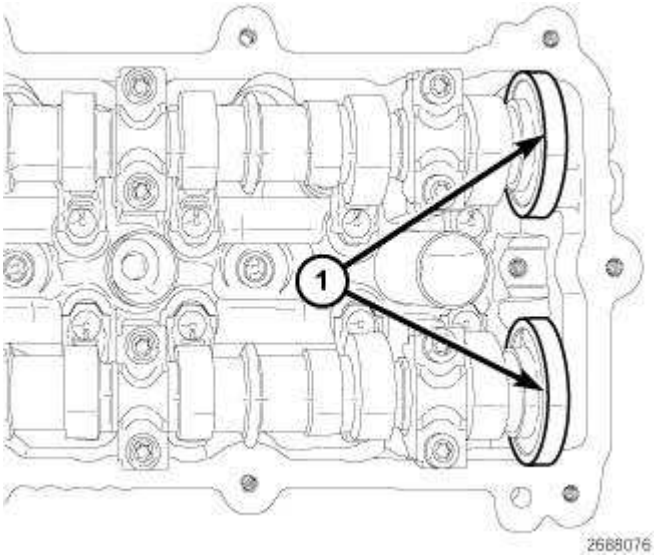

Fig. 270: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

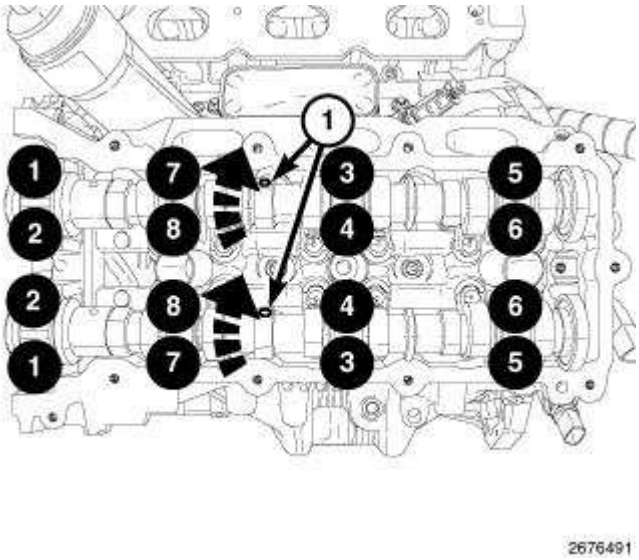

Fig. 271: Camshaft Bearing Cap Bolts Removal Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

1. Remove the upper intake manifold, all ignition coils, all spark plugs, left cylinder head cover and left cam phasers. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, REMOVAL**.
2. Rotate the camshafts counterclockwise to position the alignment holes (1) approximately 30° before top-dead-center. This places the camshafts in the neutral position (no valve load).

NOTE: Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked "1E->". The caps should be installed with the notch forward.

3. Loosen the camshaft bearing cap bolts in the sequence shown in illustration.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.

4. Remove the camshaft bearing caps and the camshafts.

RIGHT

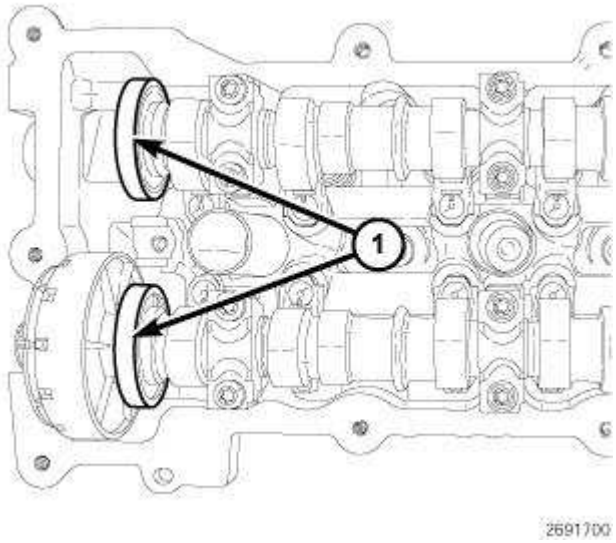

Fig. 272: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

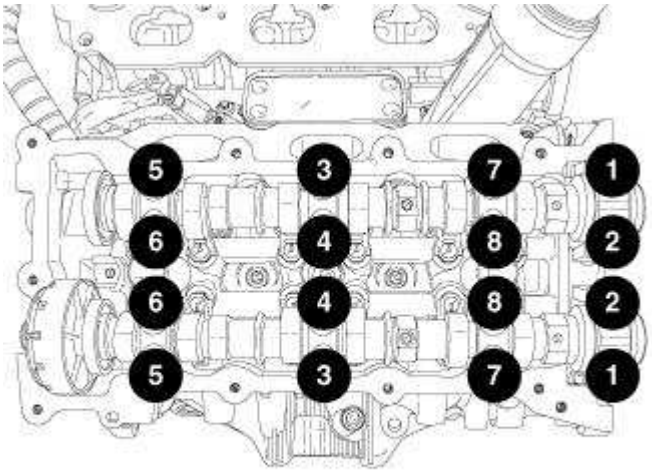

Fig. 273: Camshaft Bearing Cap Bolts Removal Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

1. Remove the upper intake manifold, all ignition coils, all spark plugs, right cylinder head cover and right cam phasers. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, REMOVAL**.

   NOTE: Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked "1E->". The caps should be installed with the notch forward.

2. Loosen the camshaft bearing cap bolts in the sequence shown in illustration.

   NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.

3. Remove the camshaft bearing caps and the camshafts.

INSPECTION

INSPECTION

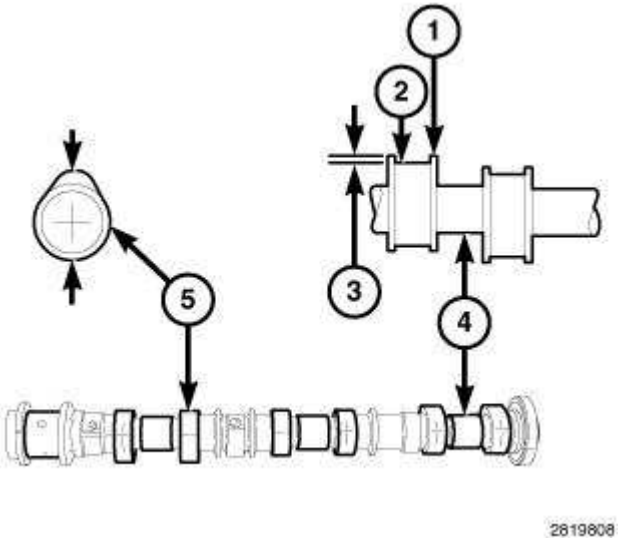

Fig. 274: Inspecting Camshaft Bearing Journals & Cam Lobes
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH intake camshaft shown in illustration, other camshafts similar.

1. Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the surface of the cam lobes (5) for abnormal wear (3). Measure and compare the unworn area (1) to the worn area (2). Replace camshafts that are not within specification. Refer to **Engine - Specifications**.

INSTALLATION

LEFT

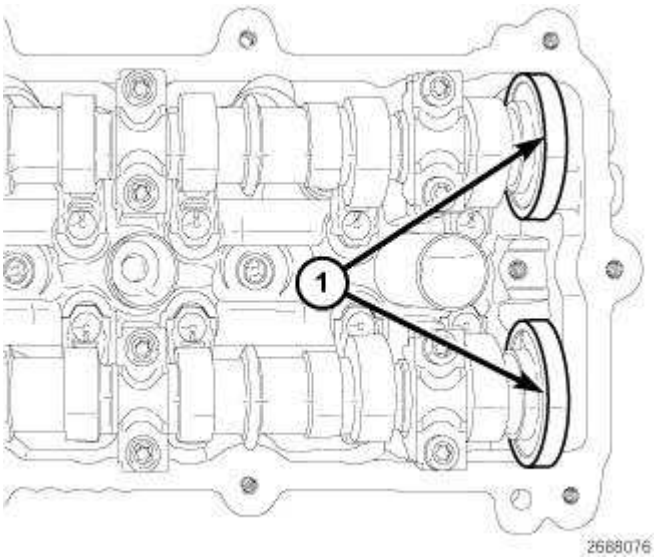

Fig. 275: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

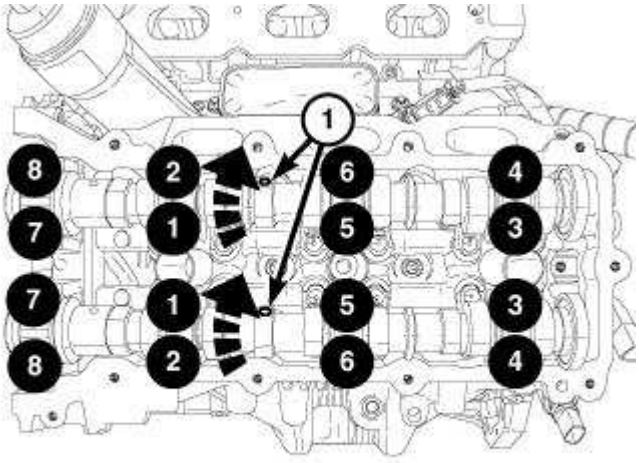

Fig. 276: Bearing Cap Retaining Bolts Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft journals with clean engine oil.
2. Install the left side camshaft(s) with the alignment holes (1) positioned approximately 30° before top-dead-center. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.
3. Install the camshaft bearing caps and hand tighten the retaining bolts to 2 N.m (18 in. lbs.).

NOTE: Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

4. Tighten the bearing cap retaining bolts in the sequence shown in illustration to 9.5 N.m (84 in. lbs.).

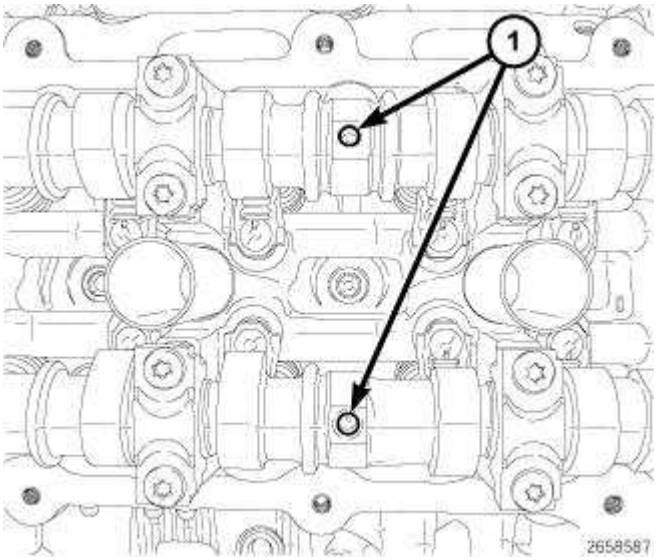

Fig. 277: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

5. Rotate the camshafts clockwise to top-dead-center by positioning the alignment holes (1) vertically.
6. Install the left cam phasers, cylinder head cover, spark plugs, ignition coils and the upper intake manifold. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, INSTALLATION**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT

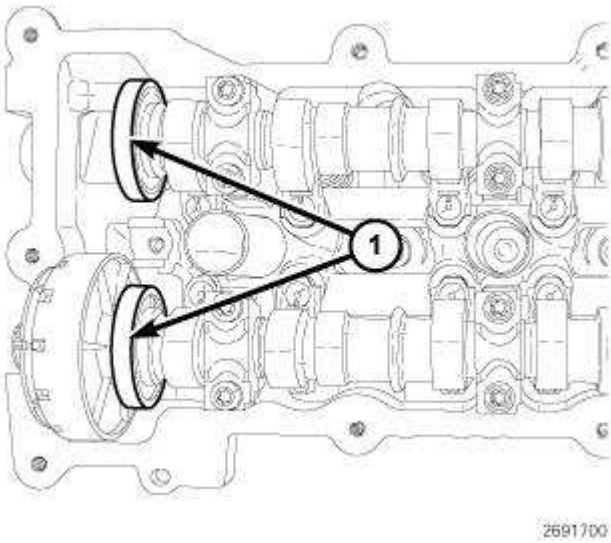

Fig. 278: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

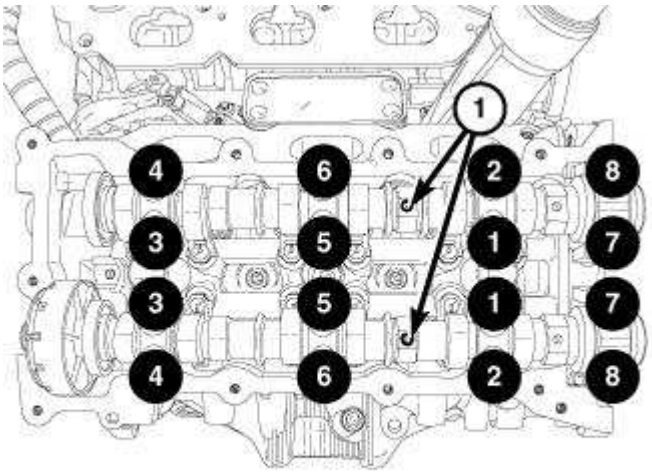

Fig. 279: Bearing Cap Retaining Bolts Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate camshaft journals with clean engine oil.
2. Install the right side camshaft(s) at top-dead-center by positioning the alignment holes (1) vertically. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.
3. Install the camshaft bearing caps and hand tighten the retaining bolts to 2 N.m (18 in. lbs.).

NOTE: Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

4. Tighten the bearing cap retaining bolts in the sequence shown in illustration to 9.5 N.m (84 in. lbs.).
5. Install the right cam phasers, cylinder head cover, spark plugs, ignition coils and the upper intake manifold. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, INSTALLATION**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system,

for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

COVER(S), CYLINDER HEAD

DESCRIPTION

DESCRIPTION

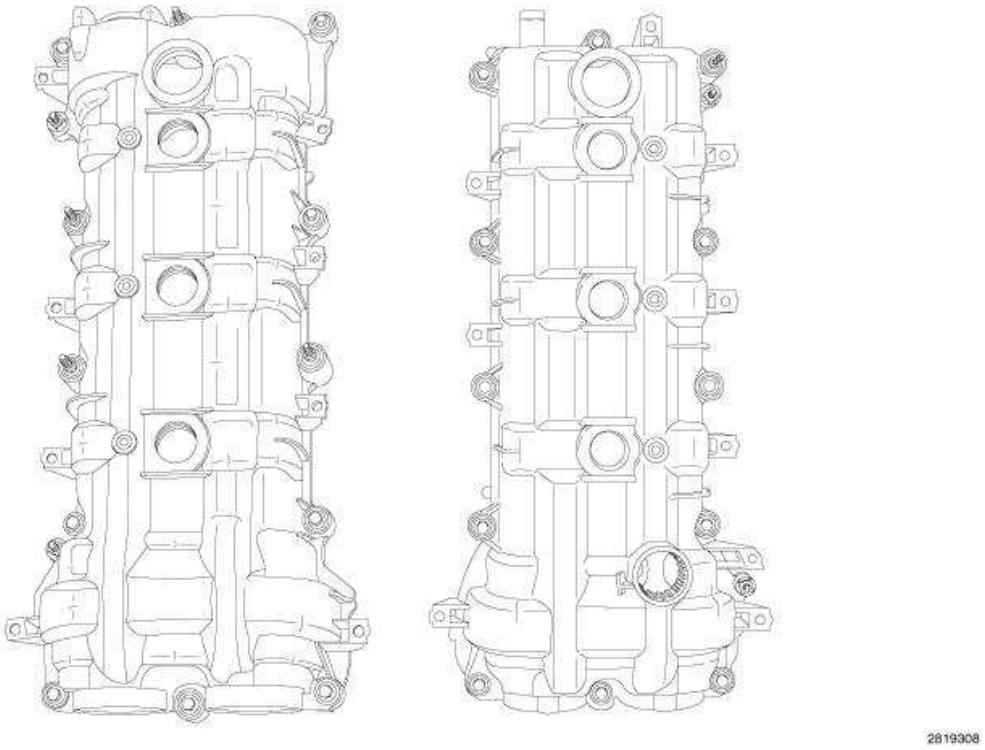

Fig. 280: Cylinder Head Covers
Courtesy of CHRYSLER GROUP, LLC

The cylinder head covers are made of a carbon and fiberglass composite. The cylinder head covers are not interchangeable from side-to-side. The cylinder head covers are sealed with a press-in-place gasket that is designed to isolate the cover from the cylinder head for improved NVH. There are two dowel pins on the outboard side of the cover flange to locate the cover to holes in the cylinder head. RTV is used to seal the T-joint at the timing cover, cylinder head and cylinder head cover.

REMOVAL

LEFT

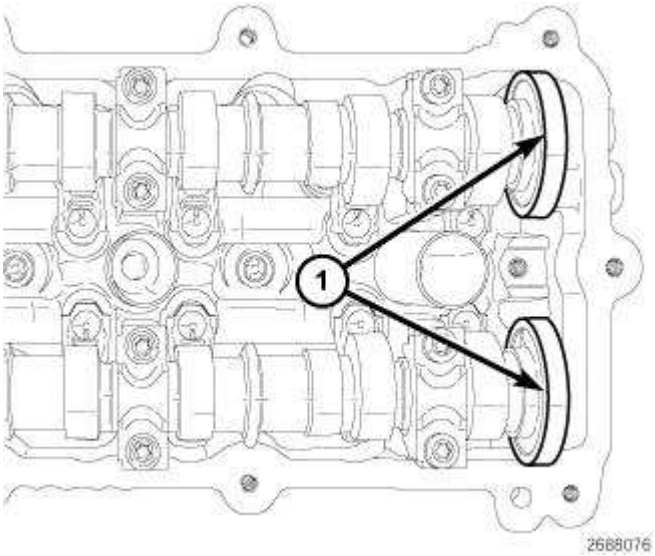

Fig. 281: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

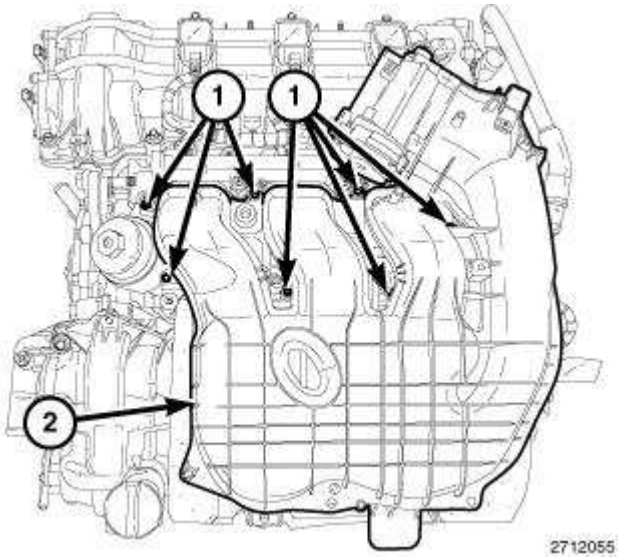

Fig. 282: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air inlet hose and upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL**.

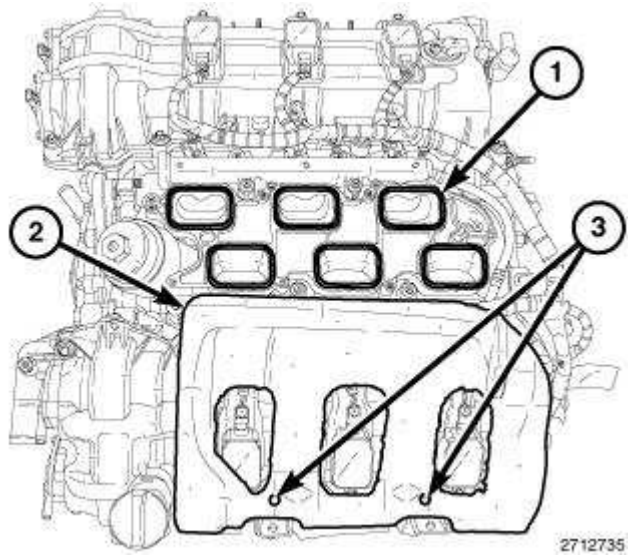

Fig. 283: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

3. Cover the open intake ports (1) to prevent debris from entering the engine.
4. Remove the insulator (2) from the LH cylinder head cover.

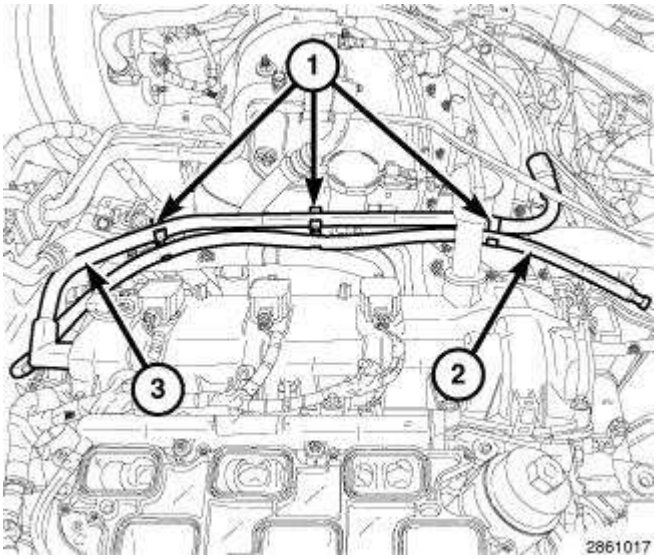

Fig. 284: Transmission Breather Hose, Make-Up Air Tube & Clips
Courtesy of CHRYSLER GROUP, LLC

5. Disengage the clips (1), remove the make-up air tube (3) from the left cylinder head cover and reposition the transmission breather hose (2).

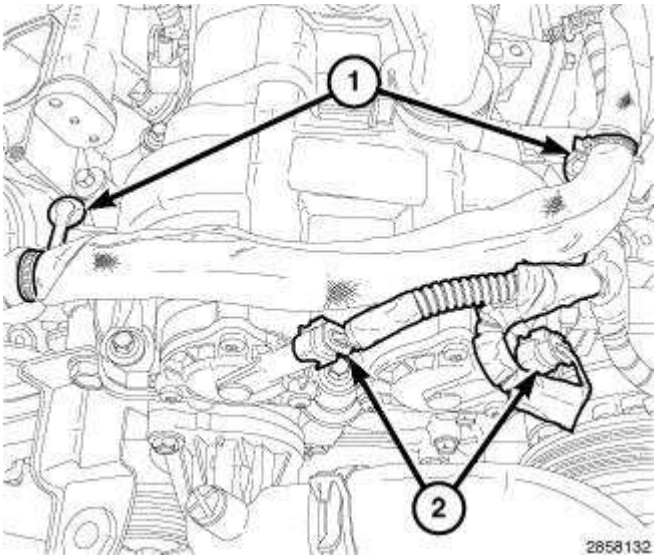

Fig. 285: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

6. Disconnect the electrical connectors (2) from the left variable valve timing solenoids.
7. Disengage two starter wire harness retainers (1) from the left cylinder head cover.

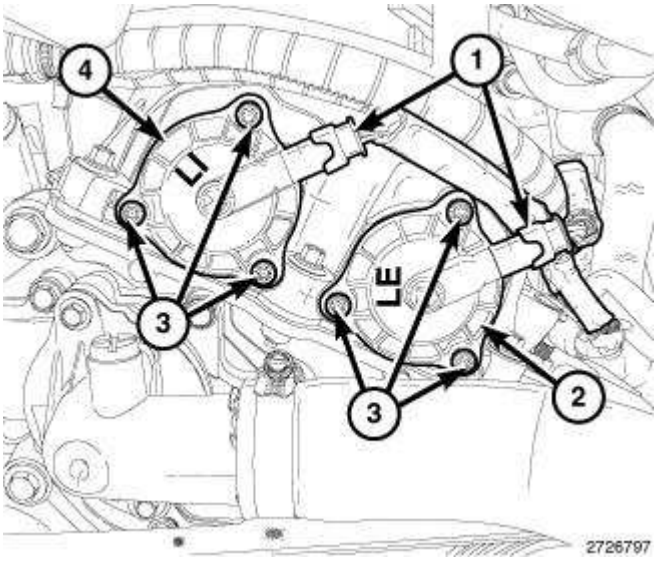

Fig. 286: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Mark the variable valve timing solenoids (2 and 4) with a paint pen or equivalent so that they may be reinstalled in their original locations.
9. Remove the variable valve timing solenoids. Refer to **SOLENOID, VARIABLE VALVE TIMING,**

REMOVAL .

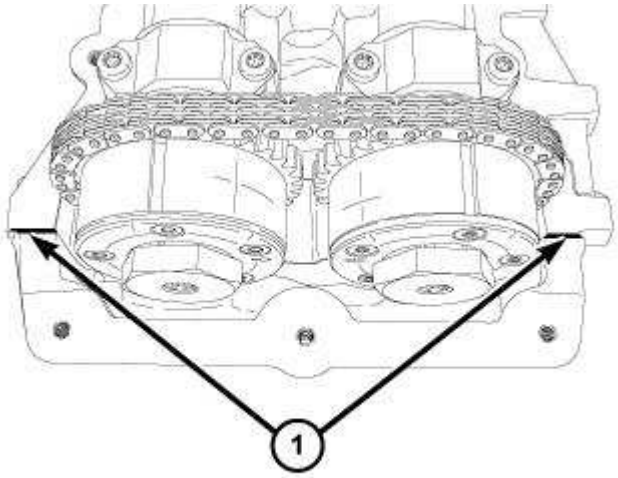
Fig. 293: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

17. Remove and discard the cylinder head cover gasket (1).
18. The spark plug tube seals (2) can be reused if not damaged.



2776075

Fig. 294: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

19. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces. Refer to **Engine - Standard Procedure**.

RIGHT

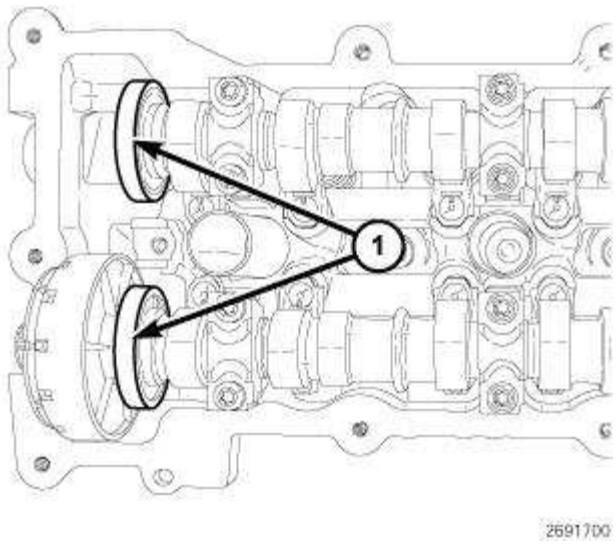


Fig. 295: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

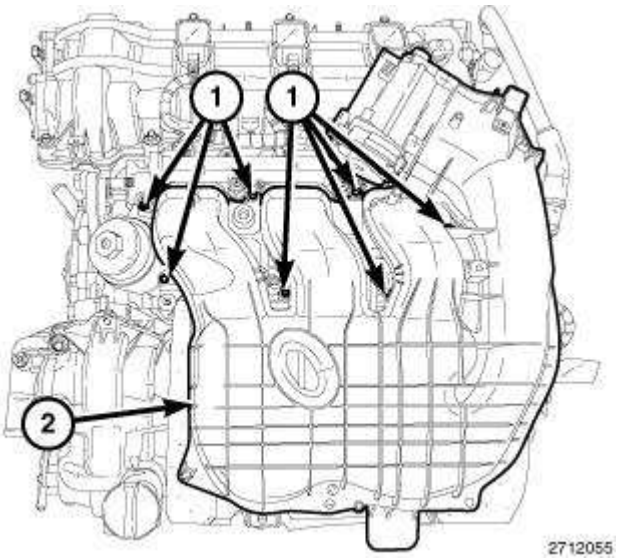

Fig. 296: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air inlet hose and upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL**.

17. Remove the upper transmission to engine bolt (1) and reposition the transmission oil level indicator tube (2).

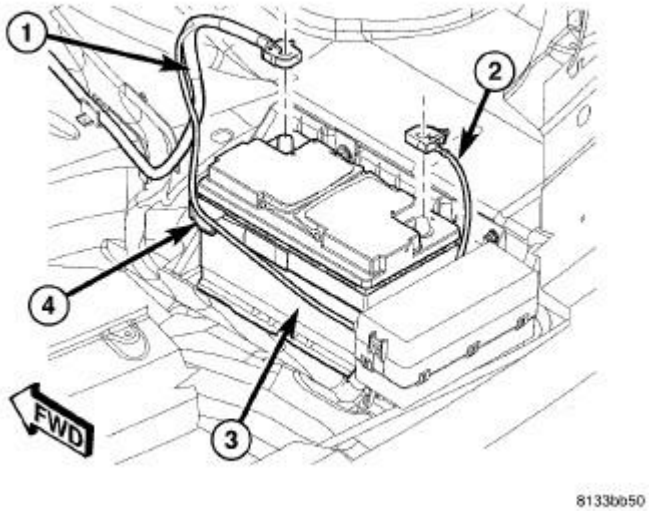

Fig. 307: PCV Valve & Screws
Courtesy of CHRYSLER GROUP, LLC

18. Lower the vehicle.
19. Remove the PCV valve (1). Refer to **VALVE, POSITIVE CRANKCASE VENTILATION (PCV), REMOVAL** .

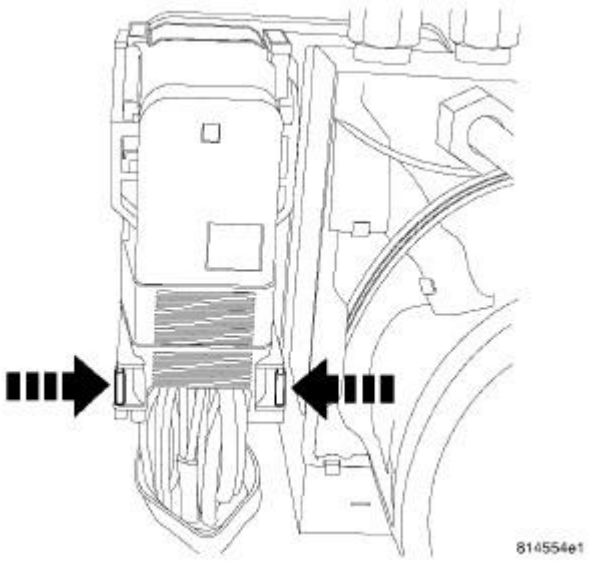

Fig. 308: Cylinder Head Cover Mounting Bolts & Studbolts
Courtesy of CHRYSLER GROUP, LLC

20. Loosen nine cylinder head cover mounting bolts (1) and three studbolts (2) and remove the cylinder head cover.

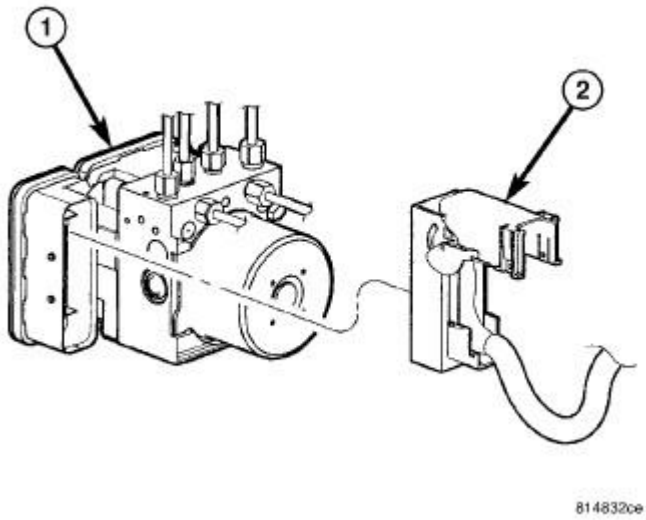

Fig. 309: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover is shown in illustration, the RH cylinder head cover is similar.

21. Remove and discard the cylinder head cover gasket (1).
22. The spark plug tube seals (2) can be reused if not damaged.

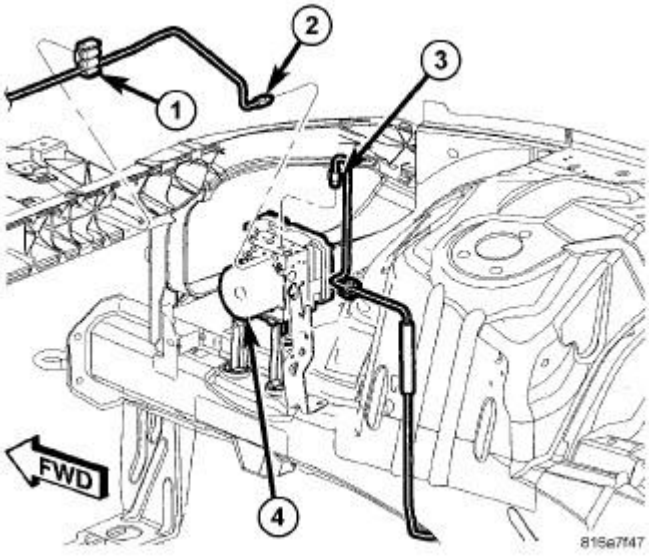

Fig. 310: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover T-joints are shown in illustration, the RH

cylinder head cover T-joints are similar.

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

23. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces. Refer to **Engine - Standard Procedure**.

INSTALLATION

LEFT

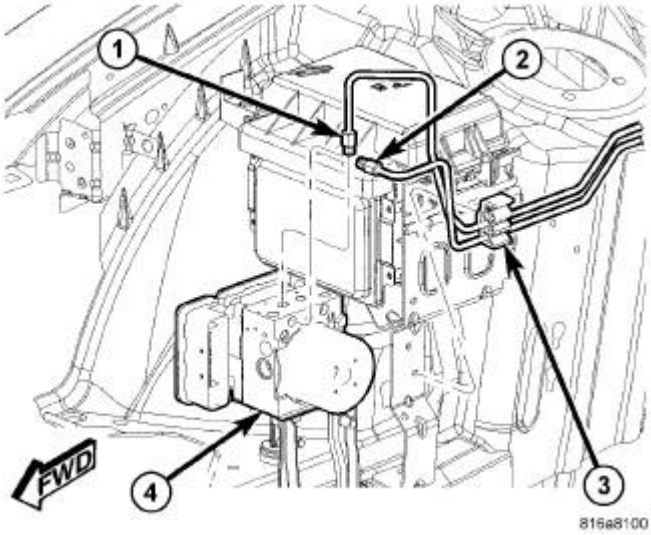

Fig. 311: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

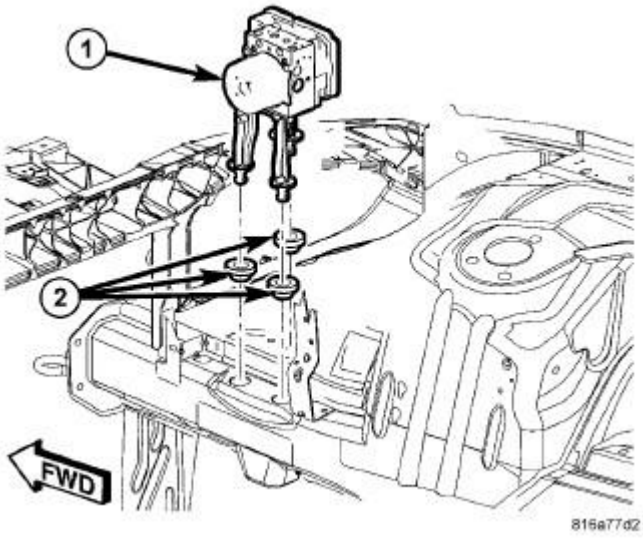

Fig. 312: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

1. Install the cylinder head cover gasket (1).
2. The spark plug tube seals (2) can be reused if not damaged.

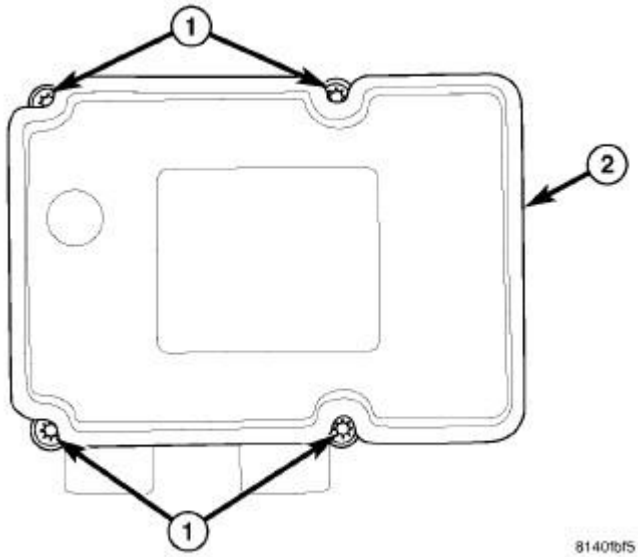

Fig. 313: Spark Plug Tube Seal & Installer
Courtesy of CHRYSLER GROUP, LLC

3. If required, install new spark plug tube seals (2) in the cylinder head cover:
    - Lubricate the spark plug tube seal inner and outer diameters with clean engine oil.
    - Place the spark plug tube seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/ Spark Plug Tube Seal) (1).

- Push the seal into the cylinder head cover until the base of the seal is seated.
- Remove the tool.

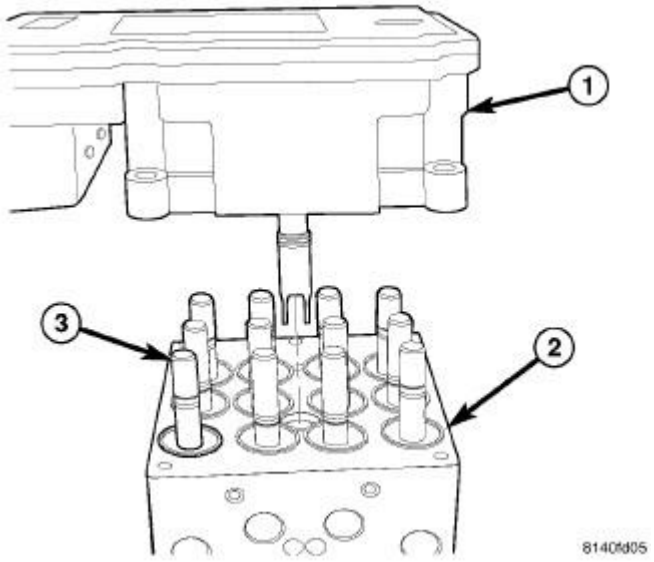

Fig. 314: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

4. Clean the timing engine timing cover, cylinder head and cylinder head cover mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the two engine timing cover to cylinder head T-joints as shown in illustration.

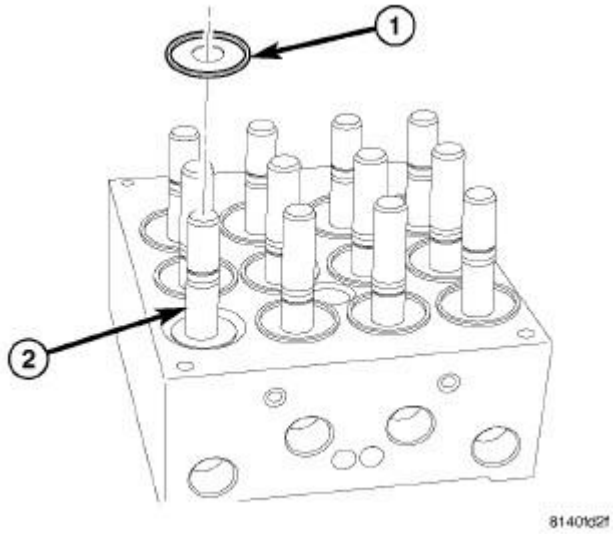

Fig. 315: Cylinder Head Cover Bolts & Double Ended Studs Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins (1) to the cylinder head and install the cylinder head cover.
7. Tighten the cylinder head cover bolts and double ended studs in the sequence shown in illustration to 12 N.m (106 in. lbs.).

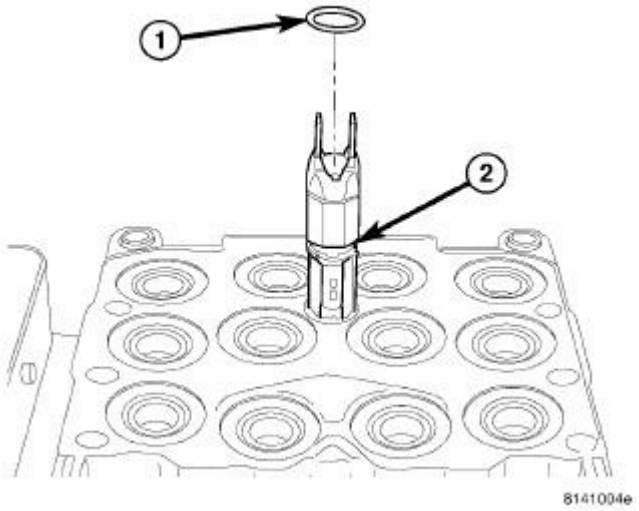

Fig. 316: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

8. If removed, install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
9. Install the ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .

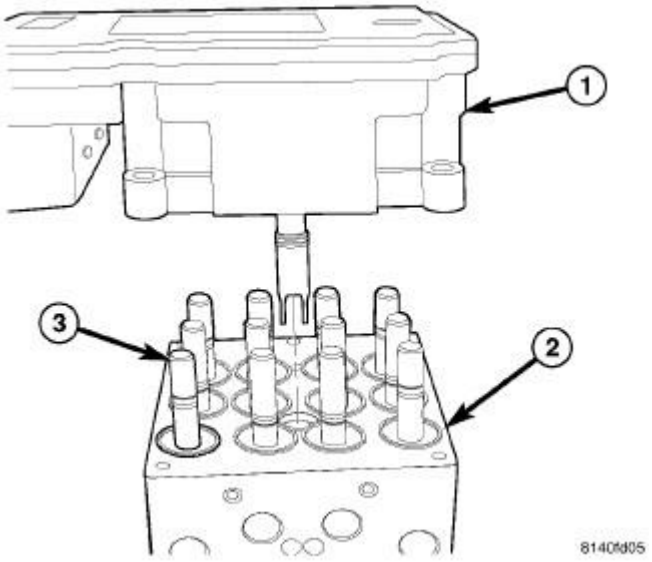

Fig. 317: Injection/Ignition Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

10. Engage two injection/ignition harness retainers (1) to the left cylinder head cover.

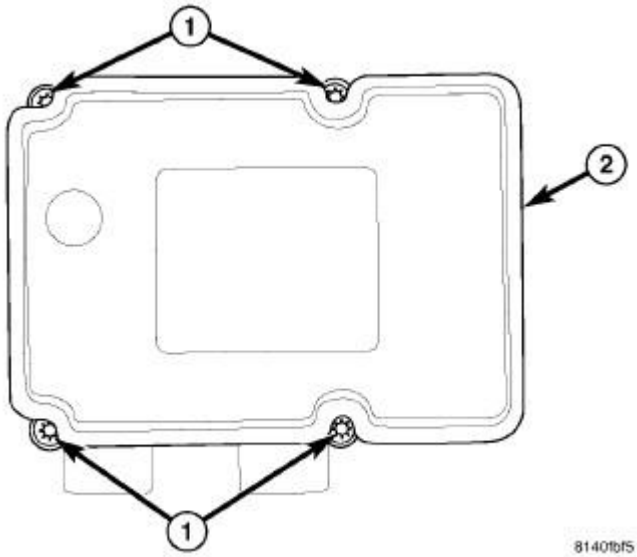

Fig. 318: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Refer to the markings made at disassembly and install the variable valve timing solenoids (2 and 4) in their original locations. Refer to **SOLENOID, VARIABLE VALVE TIMING, INSTALLATION** .

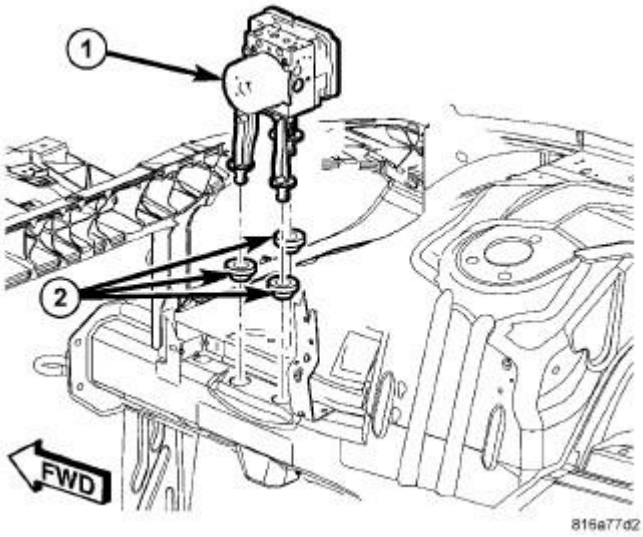

Fig. 319: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

12. Connect the electrical connectors (2) to the left variable valve timing solenoids.
13. Engage two starter wire harness retainers (1) to the left cylinder head cover.

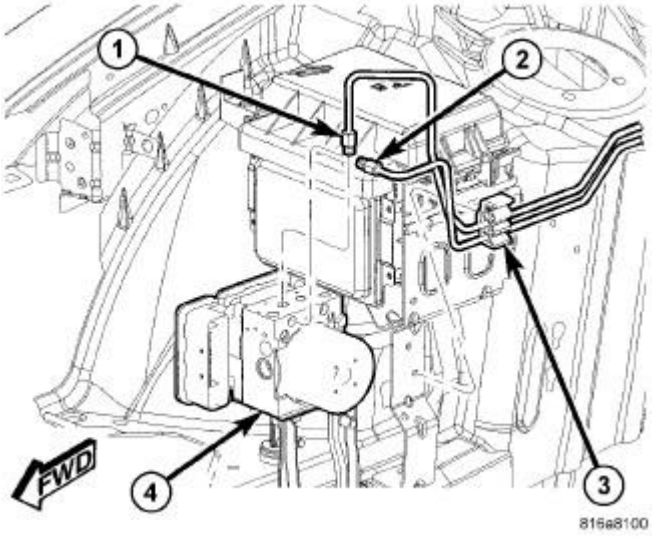

Fig. 320: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
Courtesy of CHRYSLER GROUP, LLC

14. Engage one main wire harness retainer (3) to the left cylinder head cover.

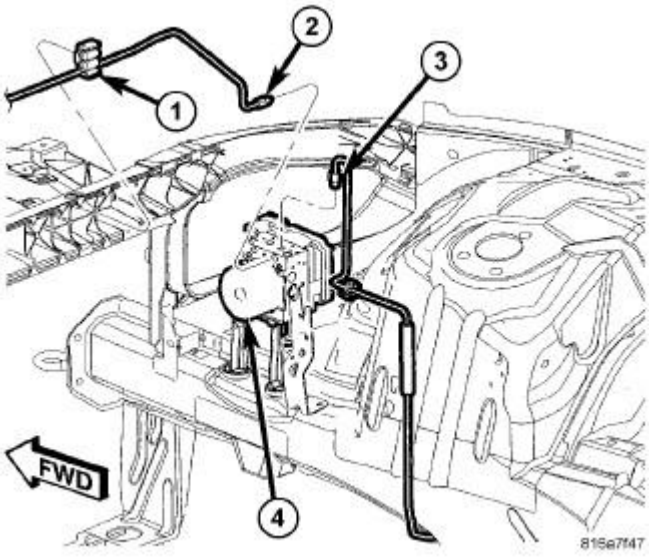

Fig. 321: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The RH CMP sensor is shown in illustration, the LH CMP sensor is similar. If both RH and LH CMP sensors where removed, install them into their original locations.

15. Install the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, INSTALLATION** .

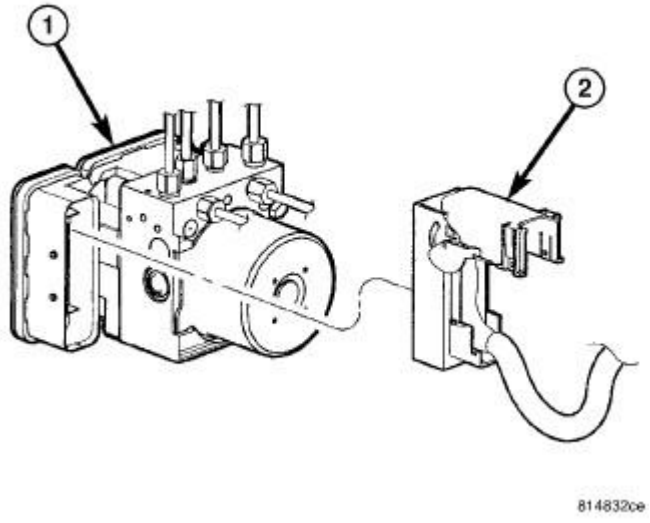

Fig. 322: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

16. Connect the electrical connector (5) to the left Camshaft Position (CMP) sensor.
17. Engage one main wire harness retainer (2) to the cylinder head cover and one main wire harness retainer (4) to the cylinder head cover mounting stud.

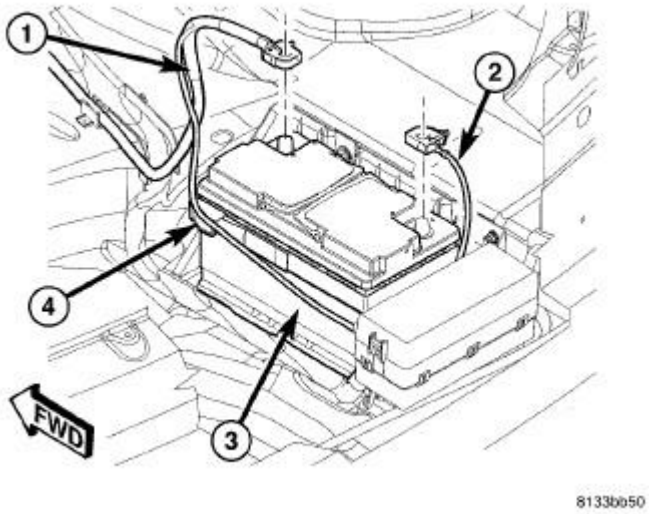

Fig. 323: Transmission Breather Hose, Make-Up Air Tube & Clips
Courtesy of CHRYSLER GROUP, LLC

18. Install the make-up air tube (3) to the left cylinder head cover and engage the clips (1) to the transmission breather hose (2).

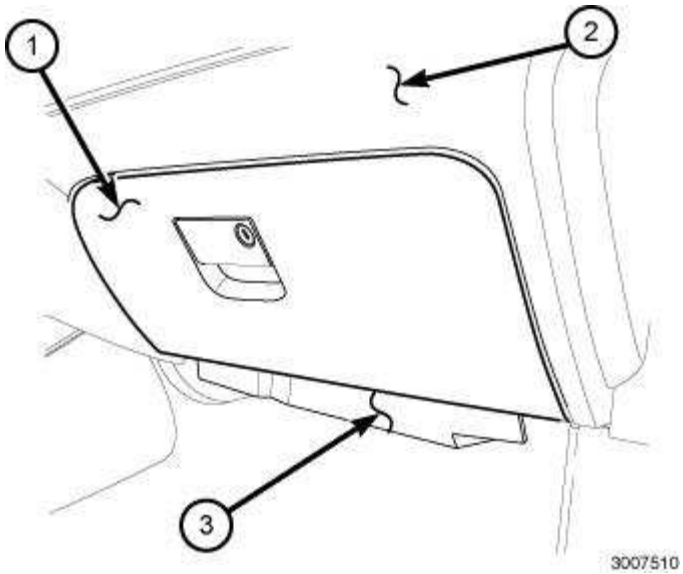

Fig. 324: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

19. Install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.

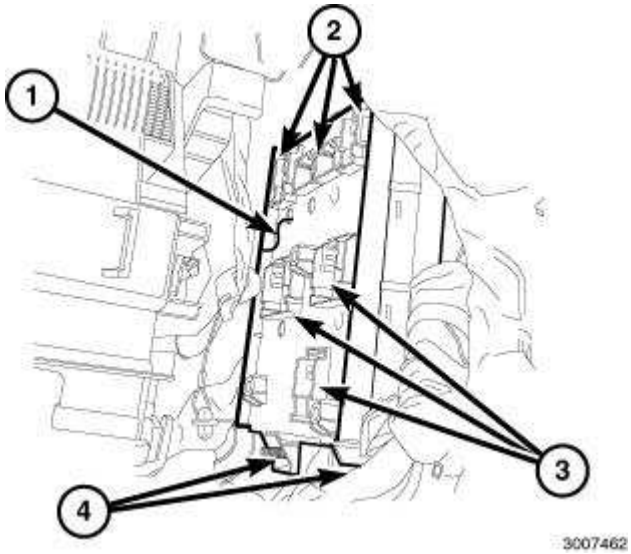

Fig. 325: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

20. Install the upper intake manifold (1), support brackets and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
21. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

RIGHT

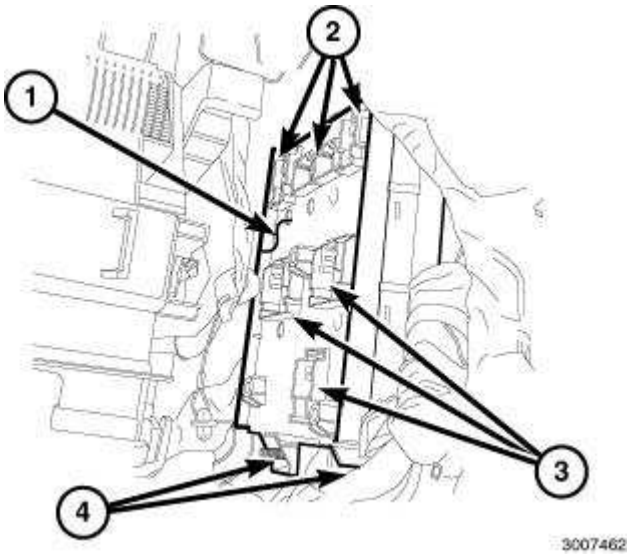

Fig. 326: Magnetic Timing Wheels

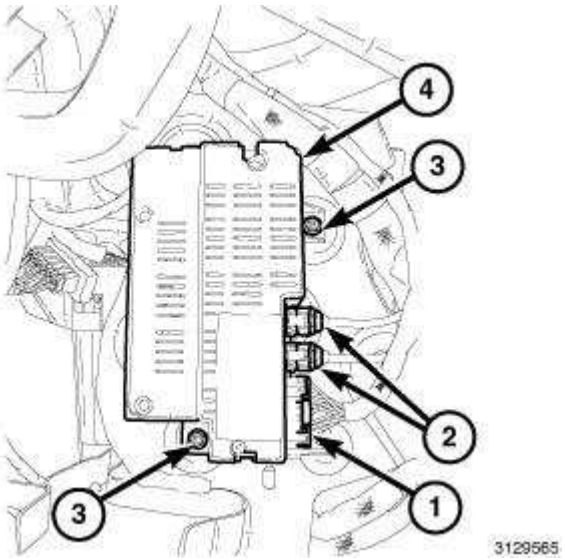

Fig. 339: Upper Transmission-To-Engine Bolt & Transmission Oil Level Indicator Tube
Courtesy of CHRYSLER GROUP, LLC

20. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
21. Install the transmission oil level indicator tube (2) with the upper transmission to engine bolt (1) tightened to 55 N.m (41 ft. lbs.).

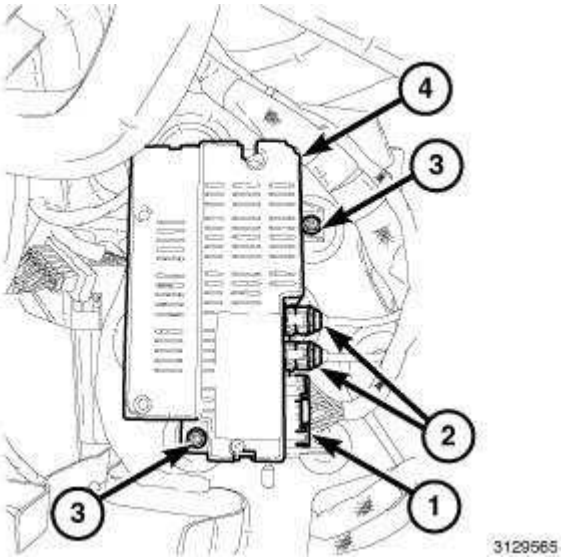

Fig. 340: Transmission Fluid Level Indicator Tube & Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Install the bolt (1) securing the transmission fluid level indicator tube (2) to the transmission housing and tighten to 12 N.m (106 in. lbs.).

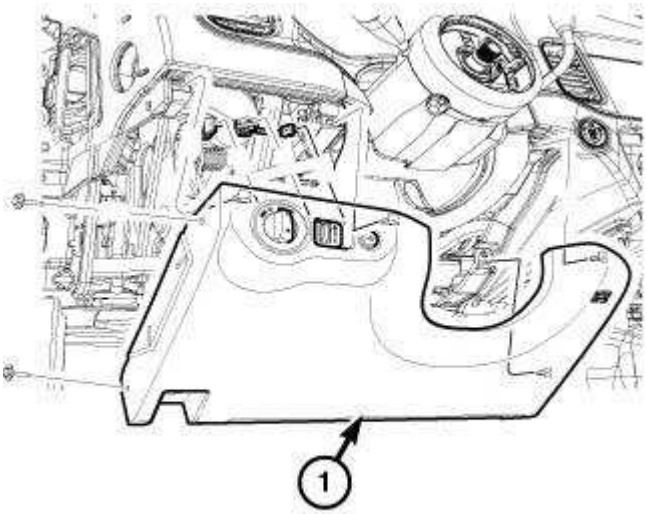

Fig. 341: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

23. Lower the vehicle.
24. If removed, install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.

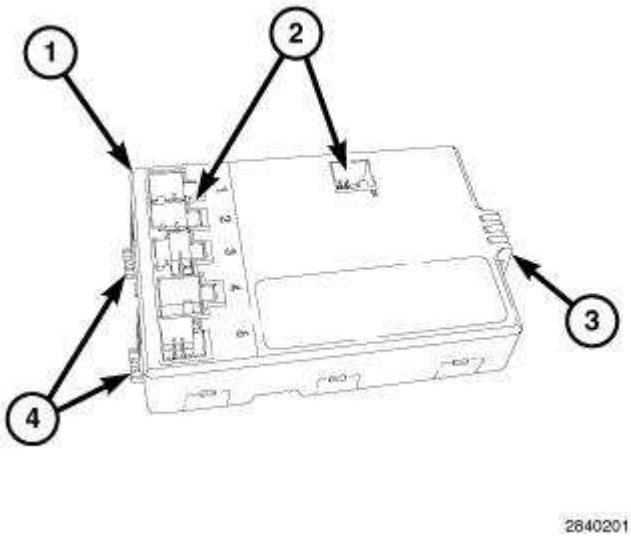

Fig. 342: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Install the upper intake manifold (1), support brackets and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
26. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

LIFTER(S), HYDRAULIC

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC LIFTER(S) NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of an NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to the following chart for possible causes and correction of a lash adjuster (tappet) type noise.

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level-too high or too low. This may allow aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct the engine oil level.
2. Insufficient running time after rebuilding a cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine

	off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in the lash adjuster (after 1 hour of run time).	3. See below: (a) Check lash adjusters for sponginess while installed in the cylinder head. Depress the rocker arm over the adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) If the lash adjuster(s) are still spongy, replace the lash adjuster(s). Refer to **LIFTER (S), HYDRAULIC, REMOVAL**.
4. Low oil pressure.	4. See below: (a) Check and correct the engine oil level. (b) Check the engine oil pressure. Refer to **Engine/Lubrication - Diagnosis and Testing**. (c) Check for excessive main bearing clearance and correct. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**. (d) Check for a worn oil pump. Refer to **Engine/Lubrication/PUMP, Engine Oil - Inspection**.
5. Oil passage to the cylinder head(s) plugged with debris.	5. Check cylinder head oil passages for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Measure valve stem-to-guide clearance. Refer to **VALVES, INTAKE AND EXHAUST, INSPECTION**.
7. Air ingested into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary. Refer to **PICK-UP, OIL PUMP, REMOVAL**.
8. Collapsed lash adjuster due to debris ingestion.	8. Clean debris from engine and replace lash adjuster(s). Refer to **LIFTER(S), HYDRAULIC, REMOVAL**.

REMOVAL

REMOVAL

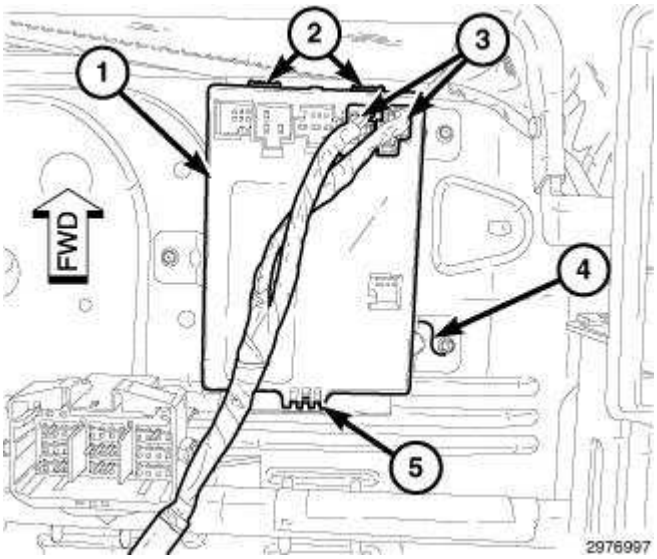

Fig. 343: Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head hydraulic lifters are shown in illustration, the RH cylinder head hydraulic lifters are similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s). Refer to **CAMSHAFT, ENGINE, REMOVAL**.

   NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s). Refer to **ROCKER ARM, VALVE, REMOVAL**.

   NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

4. Remove the hydraulic lifter(s) (1).

INSTALLATION

INSTALLATION

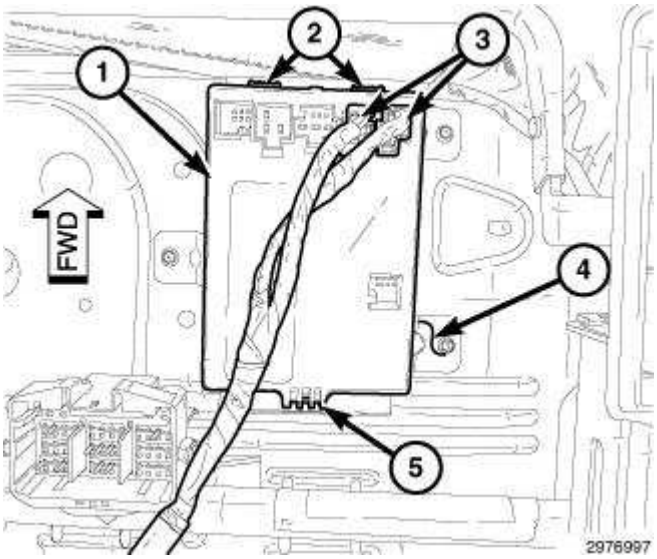

Fig. 344: Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head hydraulic lifters are shown in illustration, the RH cylinder head hydraulic lifters are similar. If the hydraulic lifters are being reused, reassemble them into their original locations.

1. Verify that the hydraulic lifters are at least partially full of oil. There should be little or no plunger travel when the hydraulic lifter is depressed.
2. Install the hydraulic lifter(s) (1).

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

3. Install the rocker arm(s). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
4. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

ROCKER ARM, VALVE

DESCRIPTION

DESCRIPTION

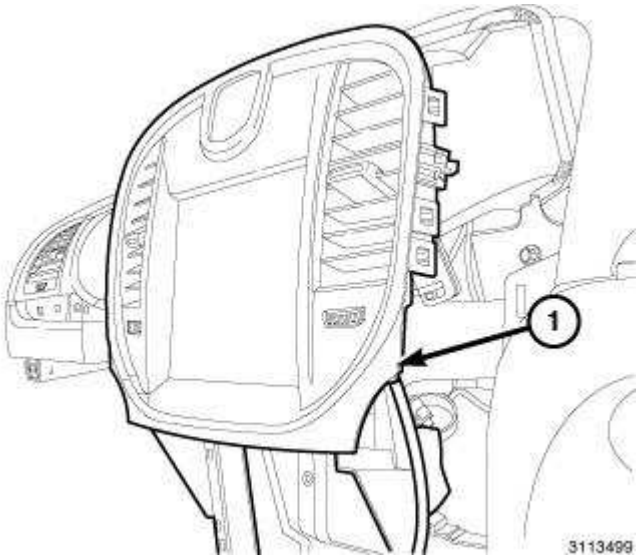

Fig. 345: Rocker Arm
Courtesy of CHRYSLER GROUP, LLC

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 0.5 mm oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

REMOVAL

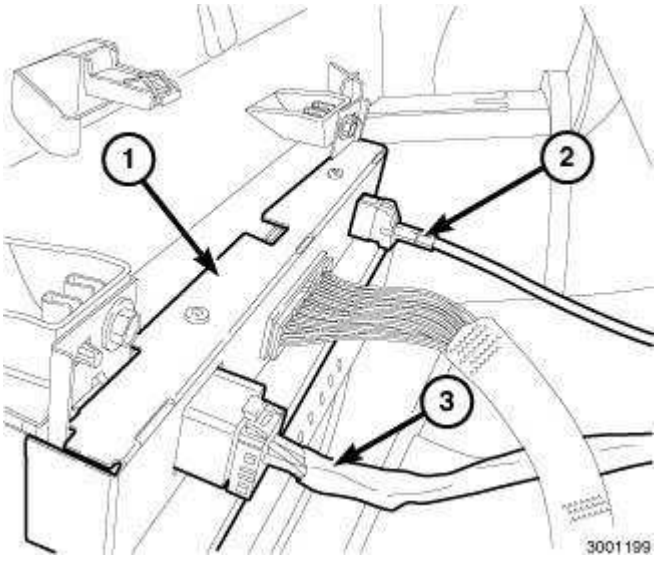

Fig. 346: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s). Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s) (1).

INSPECTION

INSPECTION

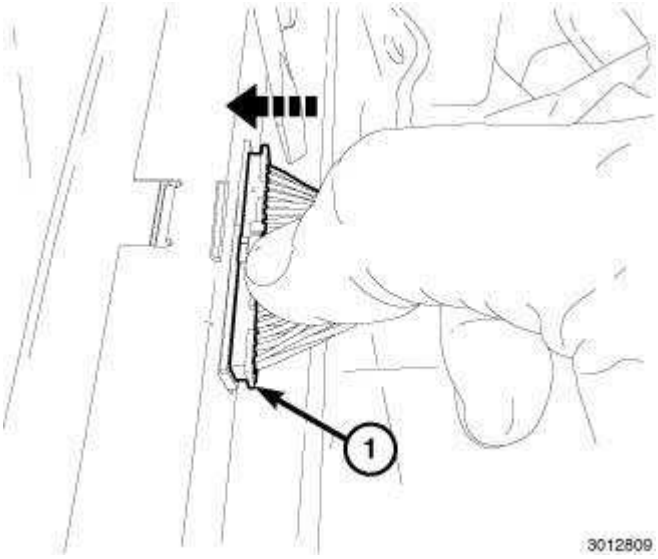

Fig. 347: Rocker Arm
Courtesy of CHRYSLER GROUP, LLC

Inspect the cam follower assembly for wear or damage. Refer to **Fig. 347**. Replace as necessary.

INSTALLATION

INSTALLATION

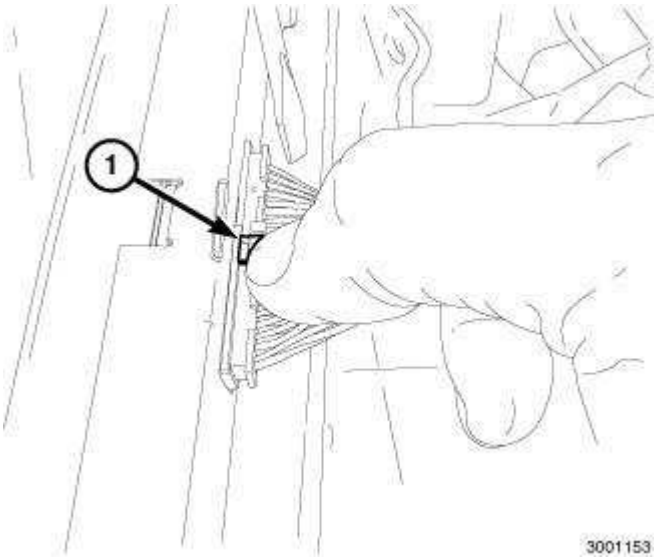

Fig. 348: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.

1. Lubricate the rocker arms with clean engine oil before installation.
2. Install the rocker arm(s) (1).
3. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SEAL(S), VALVE GUIDE

DESCRIPTION

DESCRIPTION

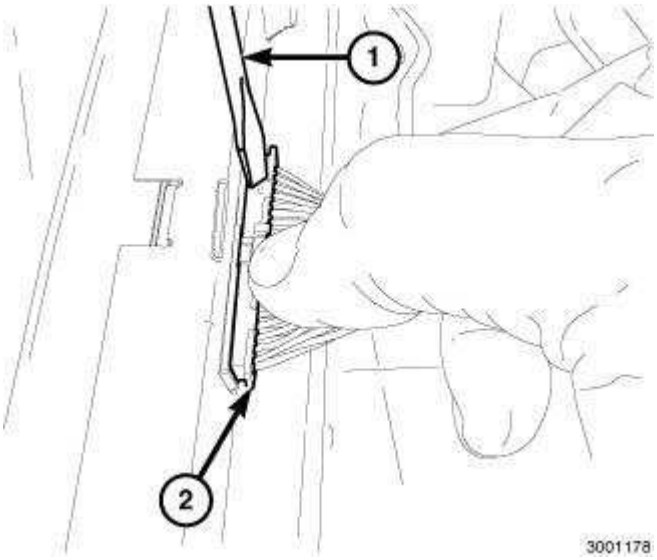

Fig. 349: Valve Stem Oil Seal, Valve Spring & Valve Guide
Courtesy of CHRYSLER GROUP, LLC

The valve stem oil seals (1) are made of elastomer over-molded steel in a non-integrated type guide mounted configuration. The seal is not held in place by the valve spring (2). The valve stem seals are not reusable if removed from the valve guides (3), they must be replaced. Always coat the valve seals with clean engine oil before installing the valves.

REMOVAL

REMOVAL

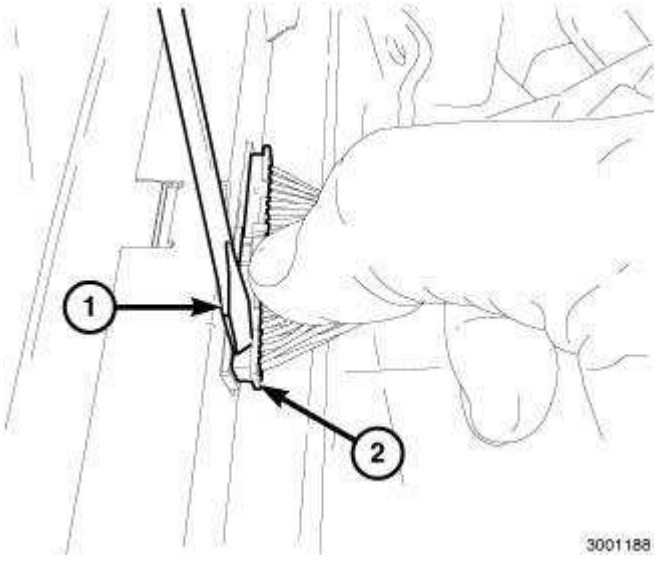

Fig. 350: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be

reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

1. Remove the valve spring(s) (2). Refer to **SPRING(S), VALVE, REMOVAL**.

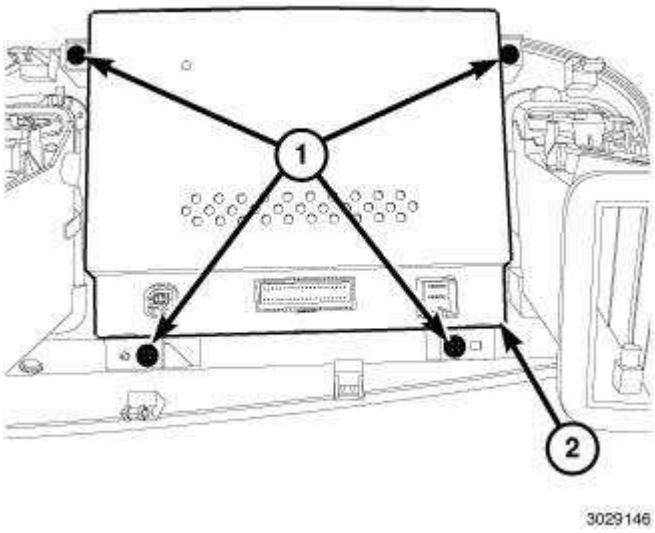

Fig. 351: Valve Guide Seal & Valve Seal Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 5 cylinder exhaust valve guide seal shown in illustration, all other valve guide seals similar.

2. Remove the valve guide seal (1) using a valve seal tool (2). Discard the removed seal.

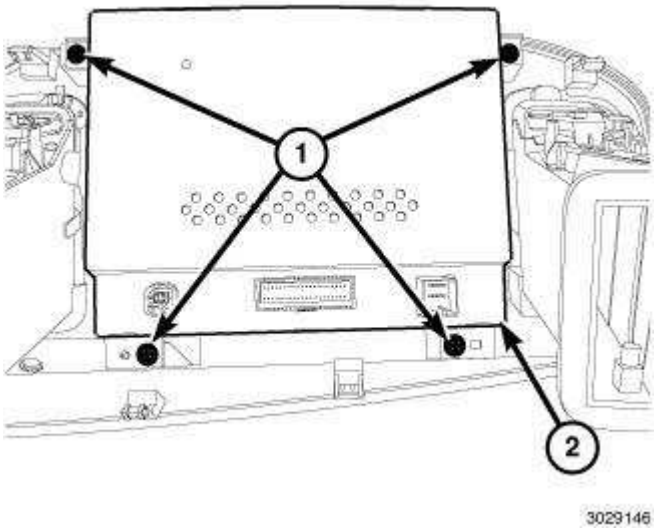

Fig. 352: Valve Spring Seat
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Number 5 cylinder exhaust valve spring seat shown in illustration, all other valve spring seats similar.**

3. If required, remove the valve spring seat (1).
4. If required, remove the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**.

INSTALLATION

INSTALLATION

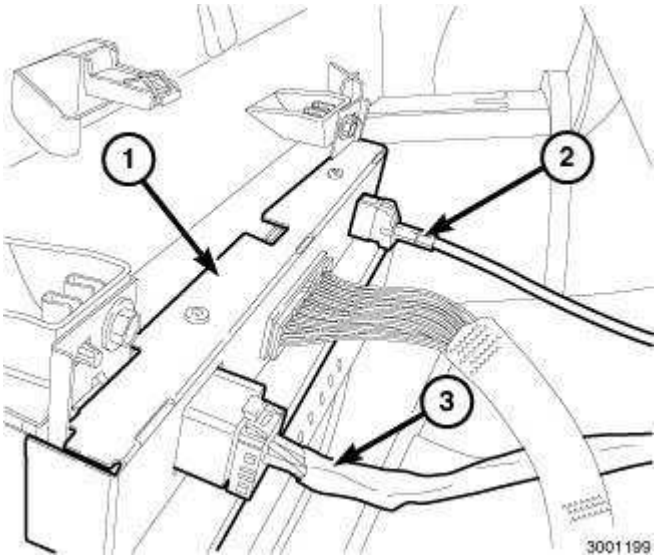

Fig. 353: Valve Spring Seat
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION**.

NOTE: **Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to Engine - Specifications. Number 5 cylinder exhaust valve shown in illustration, all other valves similar.**

2. If removed, install the spring seat (1) over the valve guide.

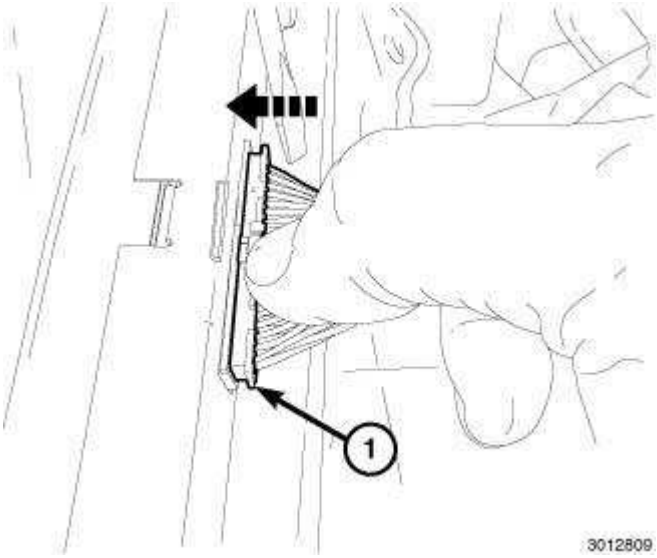

Fig. 354: Installing Valve Guide Seal
Courtesy of CHRYSLER GROUP, LLC

3. Apply engine oil to the lip of the valve guide seal (3). Install the valve guide seal (3) over the valve stem. Using an appropriate driver (1), push the seal firmly and squarely over the valve guide. **Do Not Force** the seal against the top of guide.

NOTE: **Ensure that the garter spring (2) is intact around the top of the valve guide seal (3). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.**

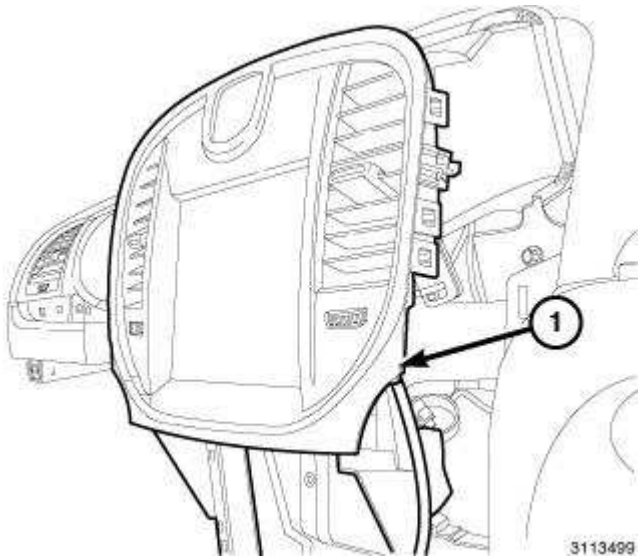

Fig. 355: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all**

other valves similar.

4. Install the valve spring(s) (2). Refer to **SPRING(S), VALVE, INSTALLATION**.

SPRING(S), VALVE

DESCRIPTION

DESCRIPTION

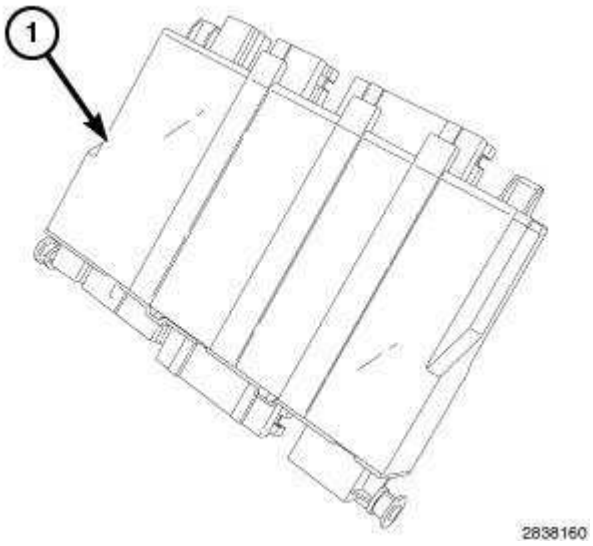

Fig. 356: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

The valve springs are a beehive design and made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. Valve guide seals are rubber overmolded on a steel support cylinder with a garter spring at the seal lip. The seals are not integrated with the valve spring seat. The valve spring seat is a flat steel washer. The steel valve spring retainers are designed for use with beehive springs and the valve spring retainer locks are a three bead Butt type design.

REMOVAL

IN VEHICLE

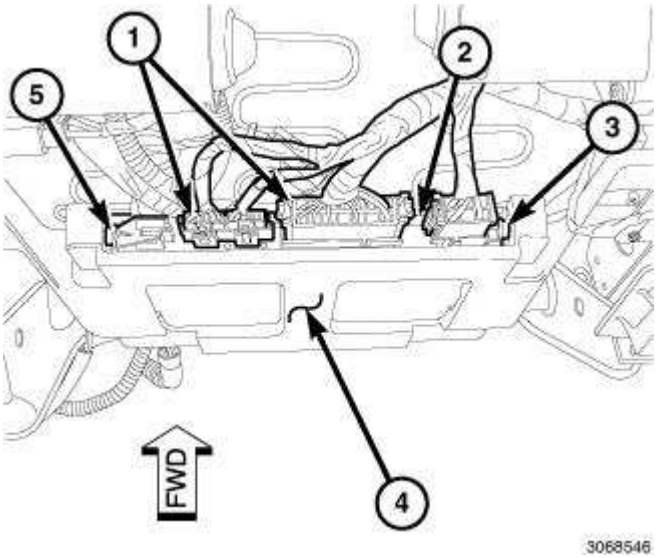

Fig. 357: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

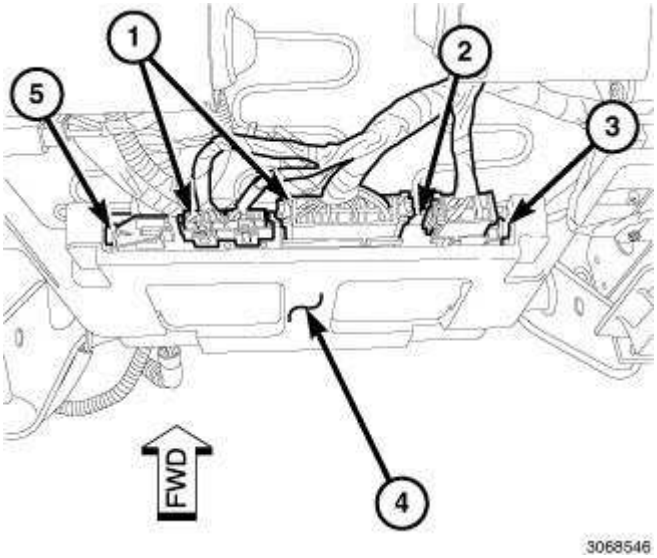

Fig. 358: A/C Suction & Liquid Line Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. If removing the LH exhaust valve springs, recover the refrigerant from the refrigerant system and remove the A/C suction and liquid line assembly (1). Refer to **LINE, A/C SUCTION, REMOVAL** .

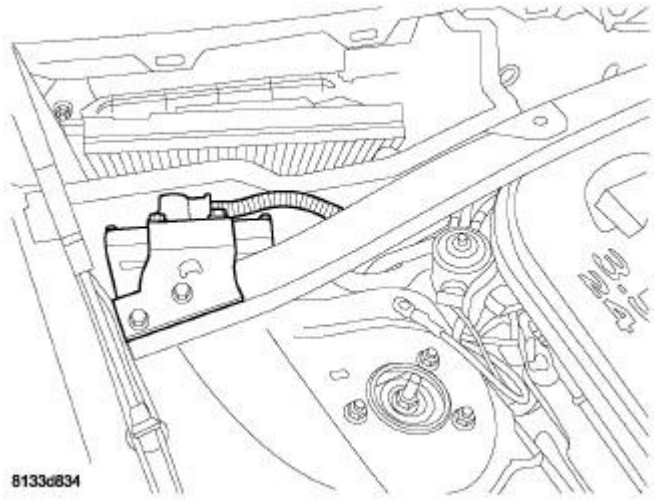

Fig. 359: Heater Core Return Tube, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Power steering pump not shown in illustration.

3. If removing the LH exhaust valve springs, remove the nut (1) and bolt (4) from the support brackets of the heater core return tube (3) and reposition the tube.

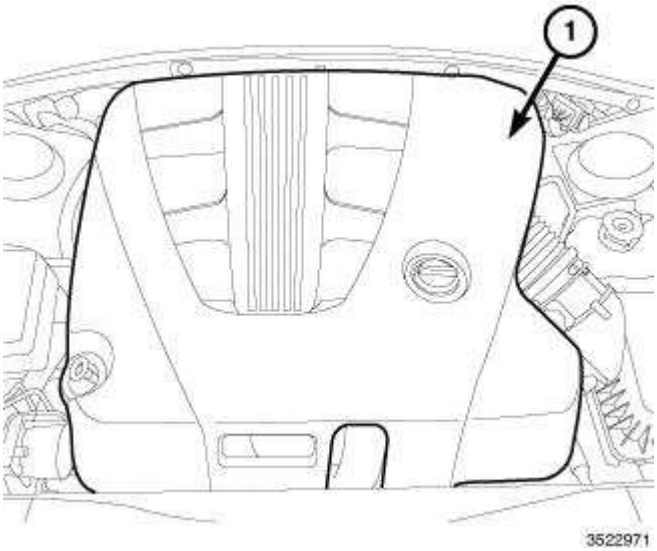

Fig. 360: Transmission Fluid Level Indicator Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

4. If removing the RH valve springs, remove the transmission fluid level indicator tube (2). Refer to **SEAL, FILL TUBE, REMOVAL** , **SEAL, OUTPUT SHAFT, REMOVAL** and **SEAL, TORQUE CONVERTER HUB, REMOVAL** .

5. Remove both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

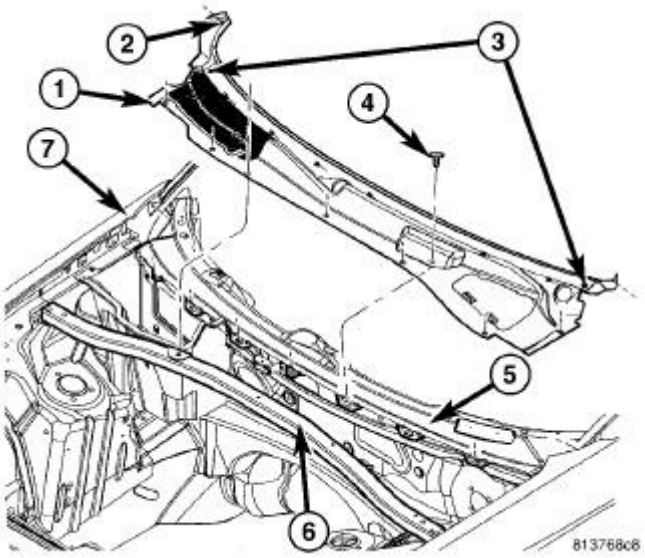

Fig. 361: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar.

NOTE: Only remove the camshafts from one head at a time. The opposite head must remain assembled in order to lock the crankshaft against rotation.

6. Remove the camshaft(s). Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

7. Remove the rocker arm(s) (1). Refer to **ROCKER ARM, VALVE, REMOVAL**.

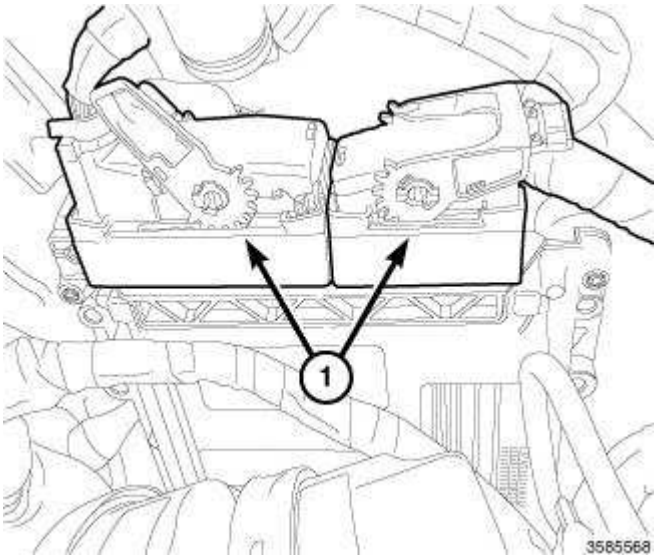

Fig. 362: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH camshaft phaser lock shown in illustration, LH camshaft phaser lock similar.

CAUTION: Air pressure applied to the cylinder holds the valves in place. This air pressure also has a tendency to force the piston down and rotate the crankshaft. Do not allow the crankshaft to rotate. Crankshaft rotation may damage the timing chain or front timing cover and affect camshaft timing.

8. If removing the LH camshafts, install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser)-1 (5) to lock the crankshaft against rotation. If removing the RH camshafts, install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser)-2 to lock the crankshaft against rotation.

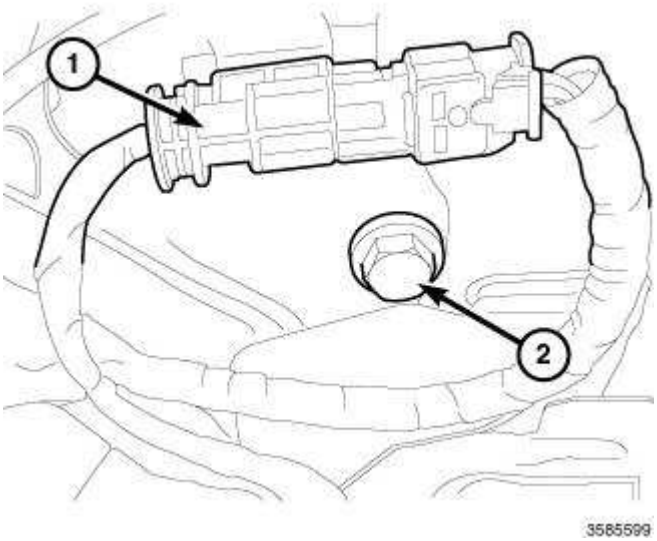

Fig. 363: Shop Air Supply & Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 4 cylinder intake valve spring compression shown in illustration, all other valves similar.

9. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL** .
10. Install Valve Spring Compressor (special tool #MD998772A, Compressor, Valve Spring) (2) onto the cylinder head.
11. Install a spark plug adapter attached to a regulated shop air supply (1). Pressurize the cylinder being serviced to 620.5 - 689 kPa (90 - 100 psi) to hold the valves in place.

CAUTION: Air pressure must be maintained as long as the valve springs are removed to prevent the valves from dropping into the cylinders.

12. Using Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (3), compress valve spring (4) and remove valve retaining locks (5).

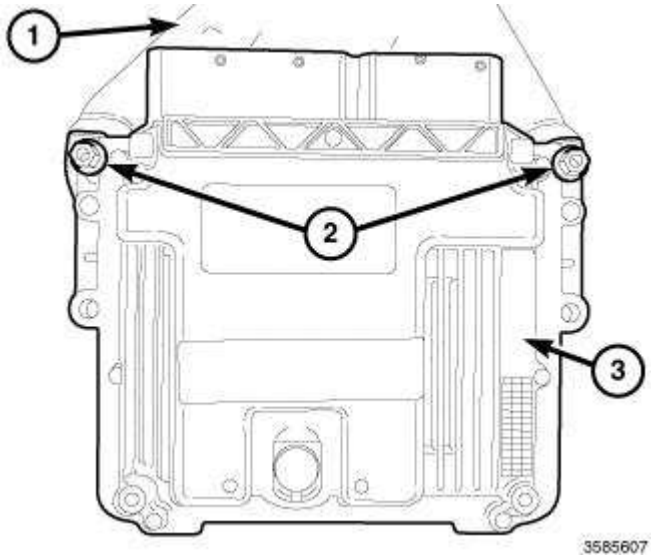

Fig. 364: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

13. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).
14. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

OFF VEHICLE

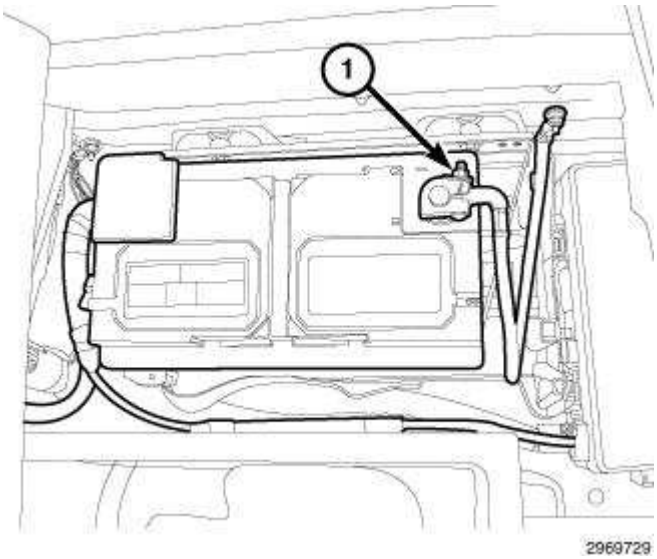

Fig. 365: Valve Spring Compressor Components
Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL**.
2. Position the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1).

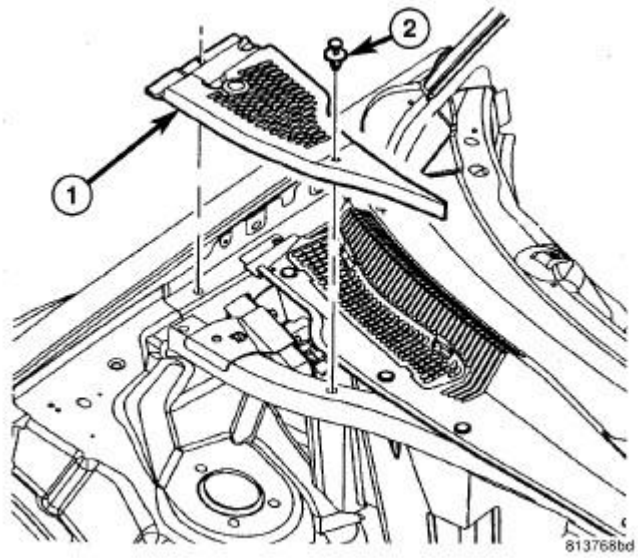

Fig. 366: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

3. Compress the valve spring (3) and remove the valve retaining locks (4).

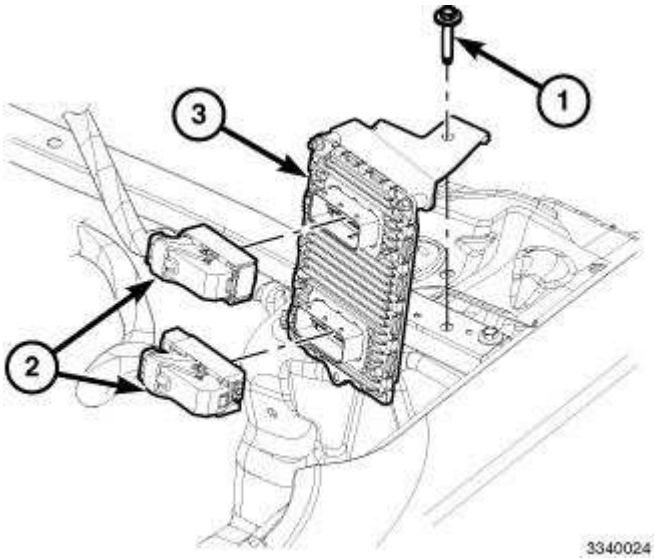

Fig. 367: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.**

4. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).
5. If required, remove the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**.
6. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

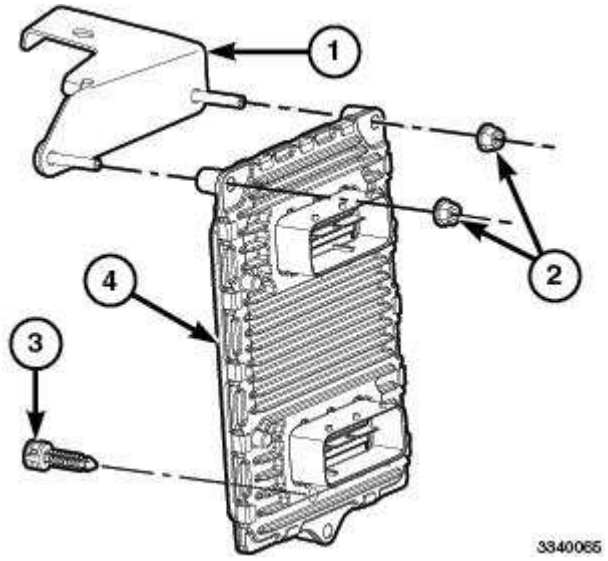

Fig. 368: Testing Valve Spring
Courtesy of CHRYSLER GROUP, LLC

When valves have been removed for inspection, reconditioning or replacement, valve springs should be checked against specifications for free-length, spring force and spring installed height. Refer to **Engine - Specifications**.

Spring force can be measured with a test fixture (2). Follow the tool manufactures instructions. Replace any springs that do not meet specifications.

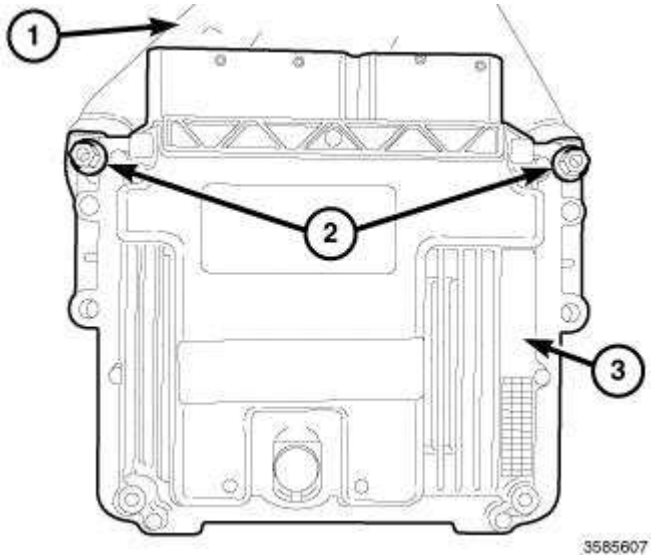

Fig. 369: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

Installed height of the valve spring must be checked with the valve assembled into the cylinder head. Refer to **SPRING(S), VALVE, INSTALLATION**.

If the valves or valve seats have been refinished and the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

INSTALLATION

IN VEHICLE

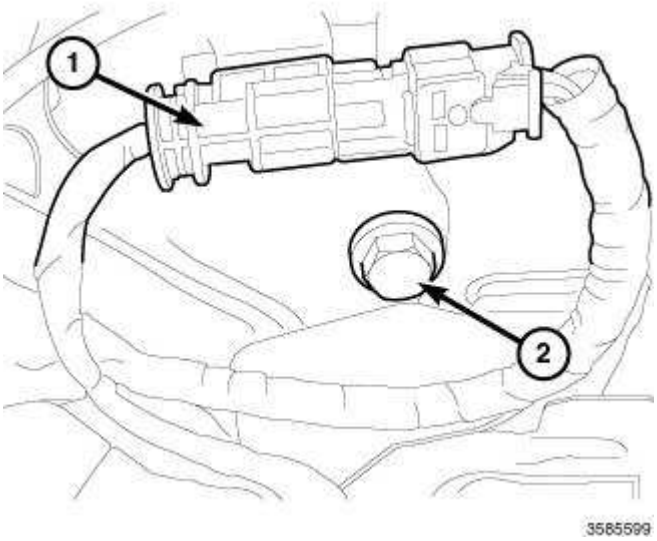

Fig. 370: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: **Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.**

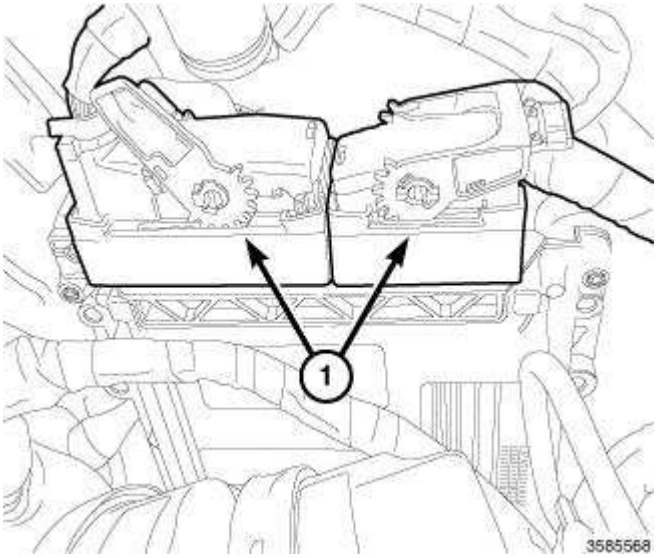

Fig. 371: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.**

2. Install the valve spring (2) and valve spring retainer (1).

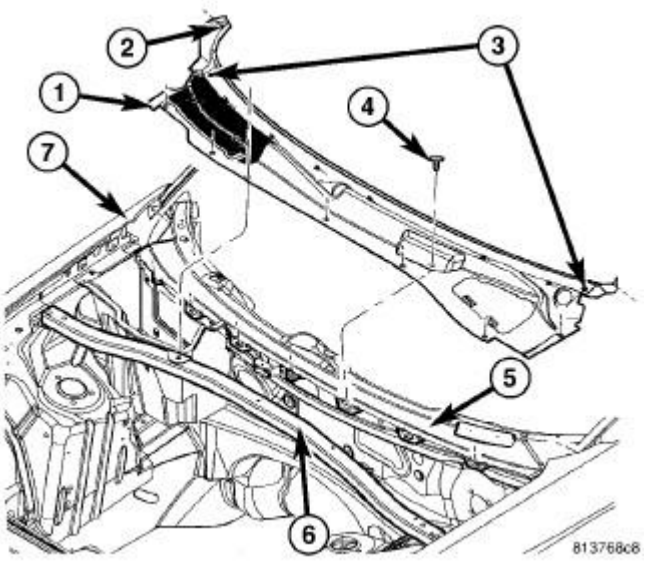

Fig. 372: Shop Air Supply & Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 4 cylinder intake valve spring compression shown in illustration, all other valves similar.

3. Using Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (3) with Valve Spring Compressor (special tool #MD998772A, Compressor, Valve Spring) (2), compress the valve spring (4) **only enough** to install the valve retaining locks (5).
4. Relieve the air pressure and remove the spark plug adapter.
5. Install the spark plug and tighten to 17.5 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION** .

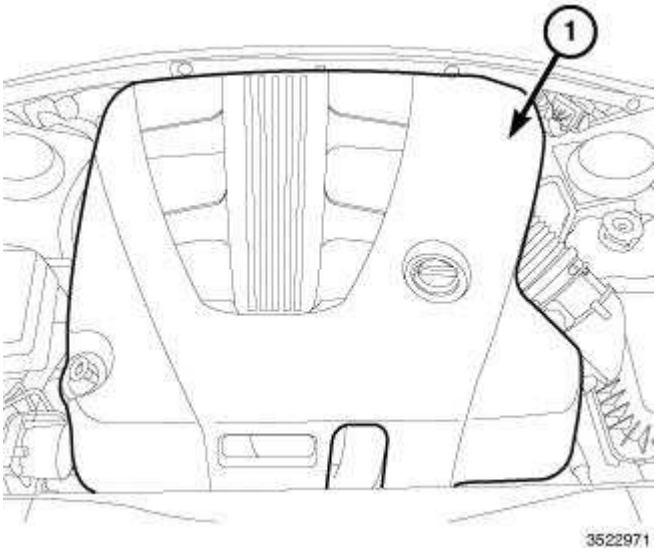

Fig. 373: Locating Rocker Arms

Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.

6. Install the rocker arm(s) (1). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
7. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.

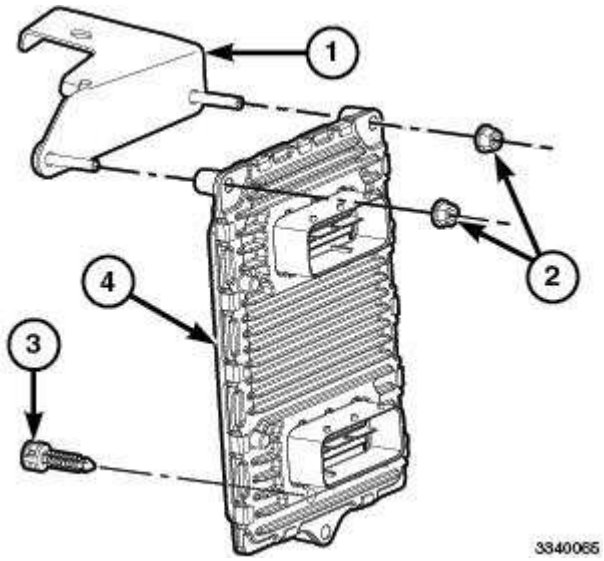

Fig. 374: Transmission Fluid Level Indicator Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

8. If removed, install the transmission fluid level indicator tube (2). Refer to **SEAL, FILL TUBE, INSTALLATION** , **SEAL, OUTPUT SHAFT, INSTALLATION** and **SEAL, TORQUE CONVERTER HUB, INSTALLATION** .

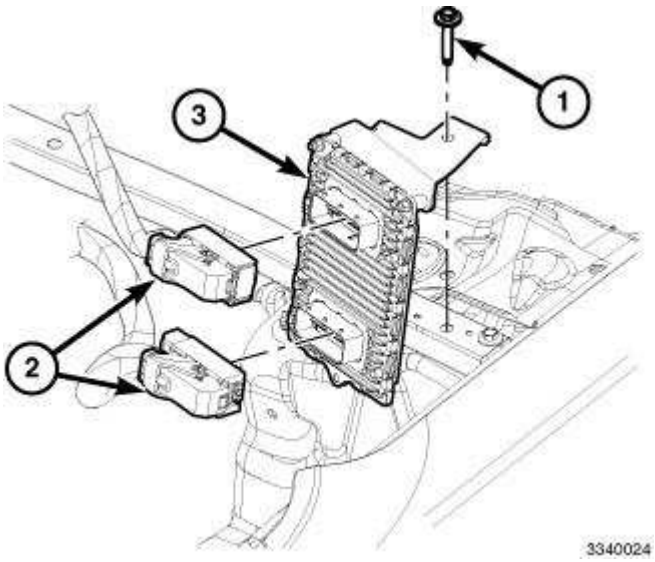

Fig. 375: Heater Core Return Tube, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Power steering pump not shown in illustration.

9. If removed, install the nut (1) and bolt (4) to the support brackets of the heater core return tube (3). Tighten the fasteners to 12 N.m (106 in. lbs.).

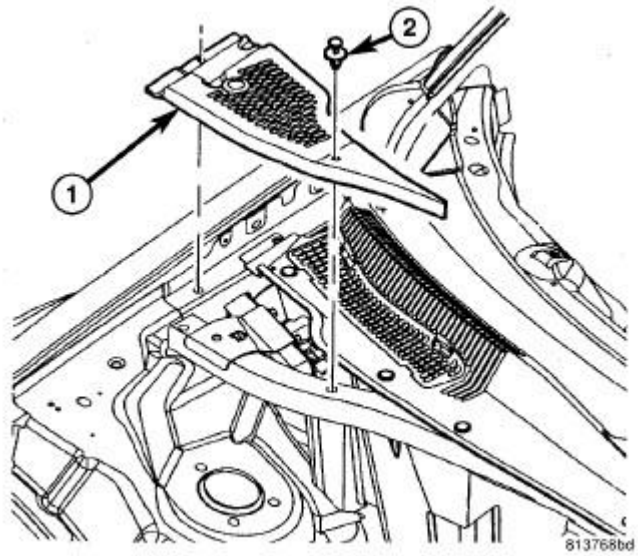

Fig. 376: A/C Suction & Liquid Line Assembly
Courtesy of CHRYSLER GROUP, LLC

10. If removed, install the A/C suction and liquid line assembly (1). Refer to **LINE, A/C SUCTION, INSTALLATION** .
11. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

OFF VEHICLE

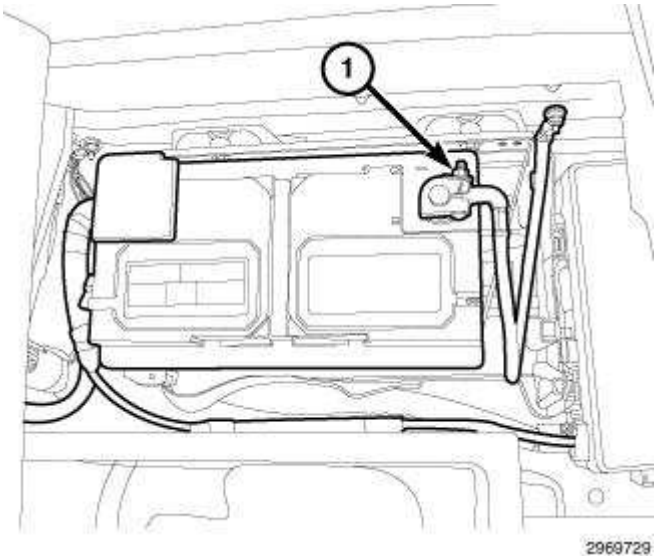

Fig. 377: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION**.

   NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to Engine - Specifications. Number 5 cylinder exhaust valve shown in illustration, all other valves similar.

2. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

   NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

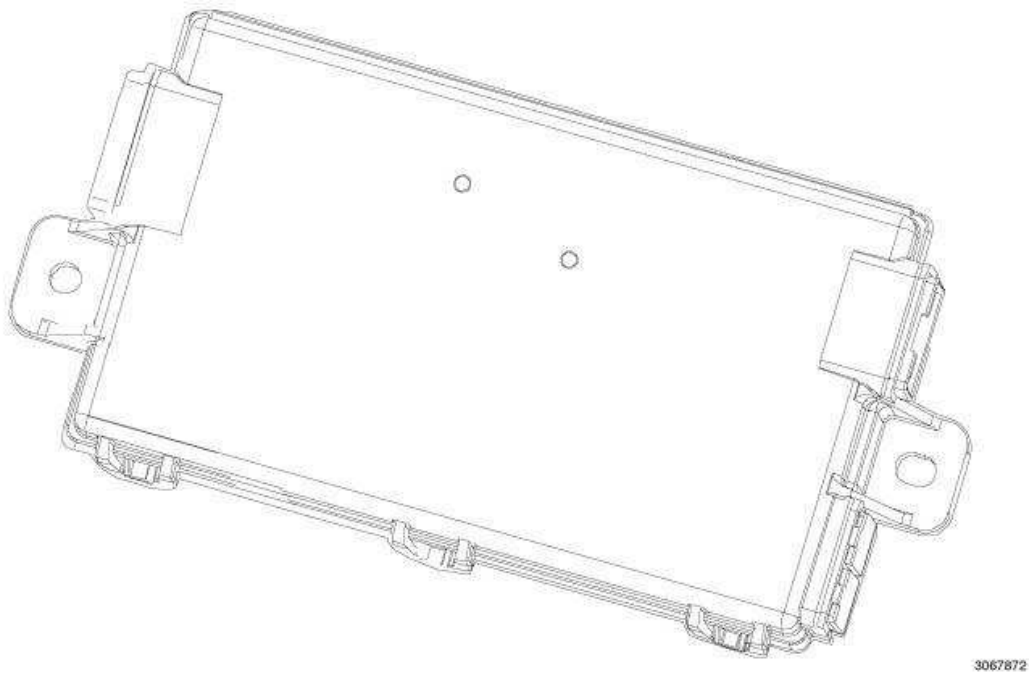

Fig. 378: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

3. Install the valve spring (2) and valve spring retainer (1).

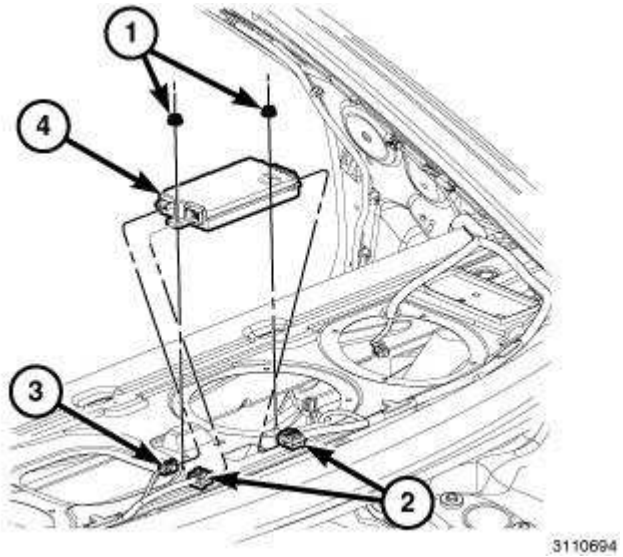

Fig. 379: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.**

4. Compress valve springs (3) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1). Install the retaining locks (4) and release the valve spring compression.

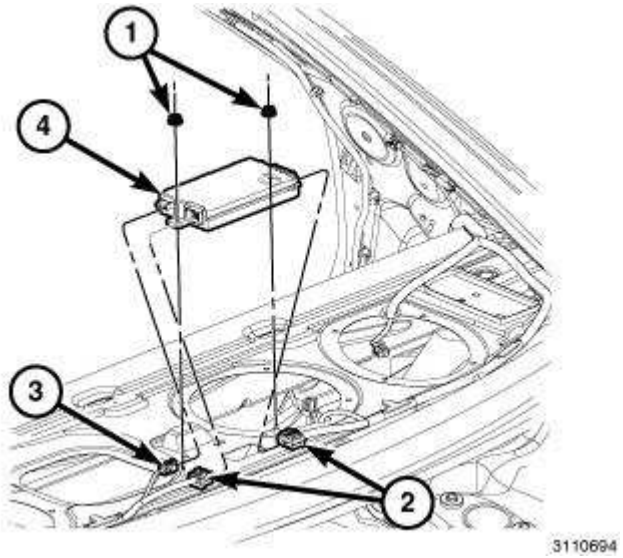

Fig. 380: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

5. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).
6. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION**.

TUBE, SPARK PLUG

REMOVAL

REMOVAL

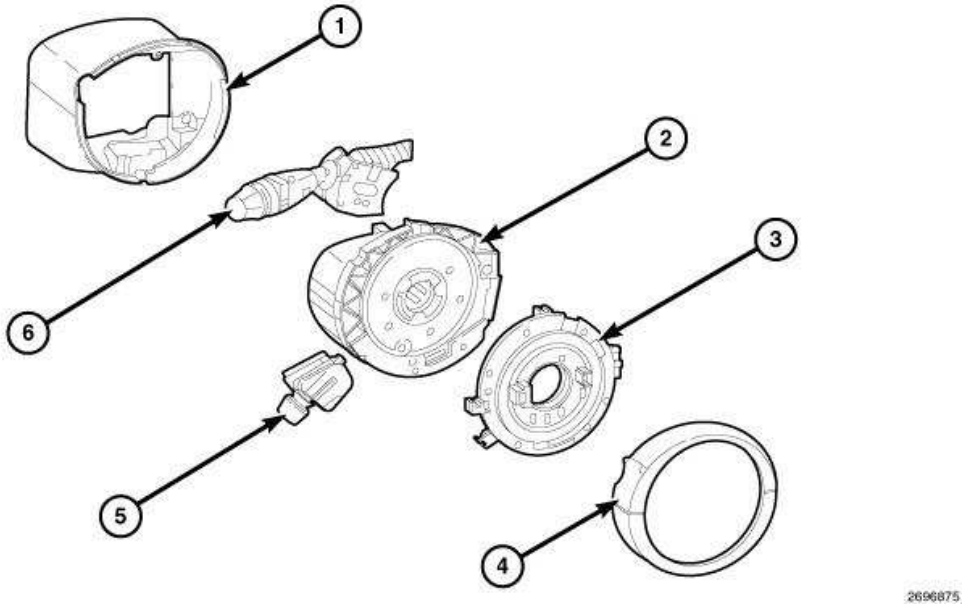

Fig. 381: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

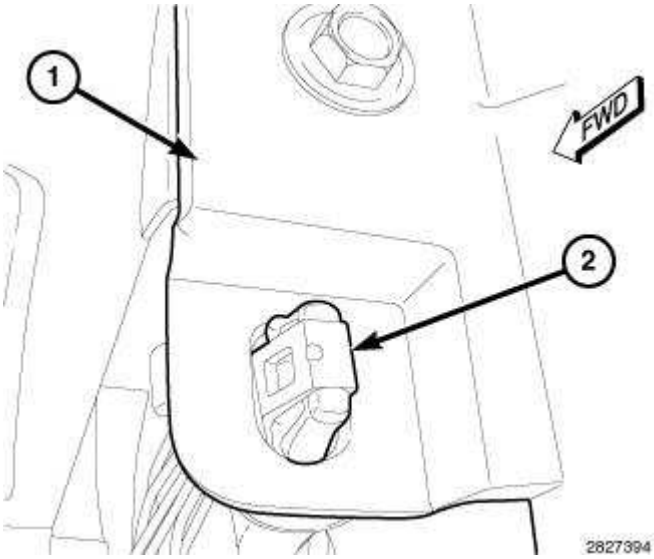

Fig. 382: Spark Plug Tube Installer & Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the ignition coils. Refer to **COIL, IGNITION, REMOVAL** .
3. Using compressed air, blow out any dirt or contaminates from around the top of the spark plugs.

4. Remove the cylinder head cover(s). Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
5. Install the top half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (1) into the spark plug tube to be removed (2).

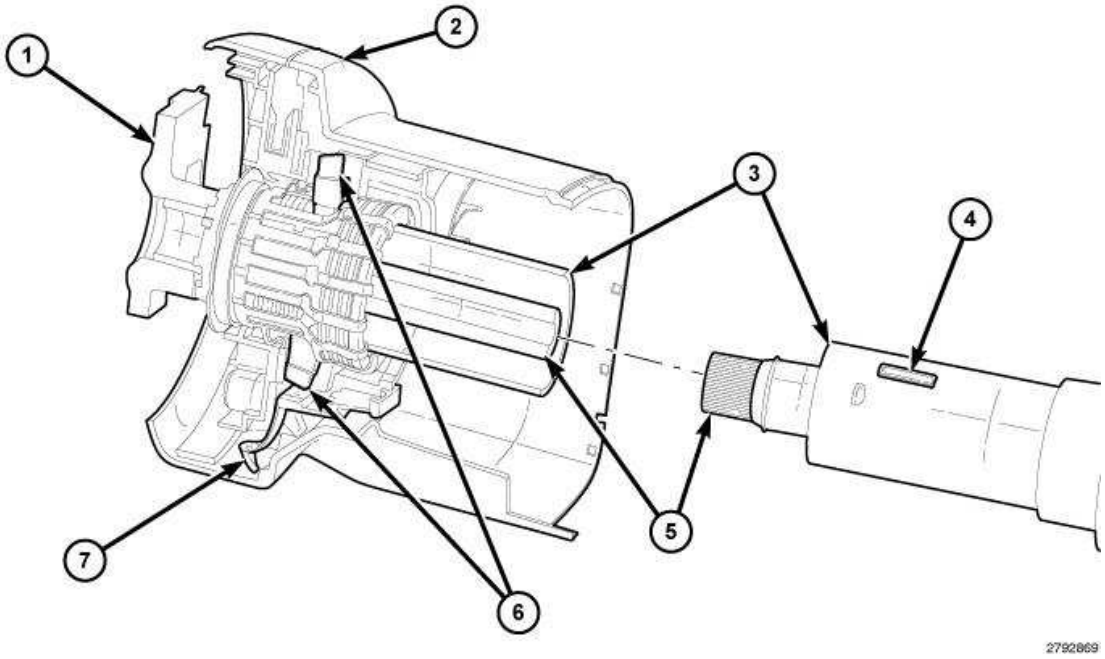

Fig. 383: Locking Pliers & Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable locking pliers (1), remove the spark plug tube (2) from the cylinder head and discard the tube.
7. Clean the area around the spark plug tube mounting with Mopar® Parts Cleaner or equivalent.

INSTALLATION

INSTALLATION

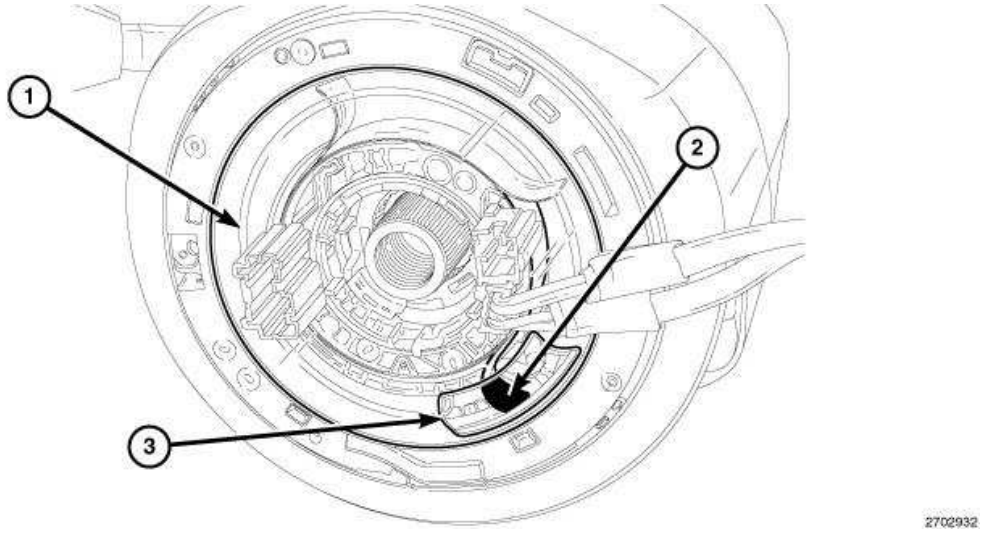

Fig. 384: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

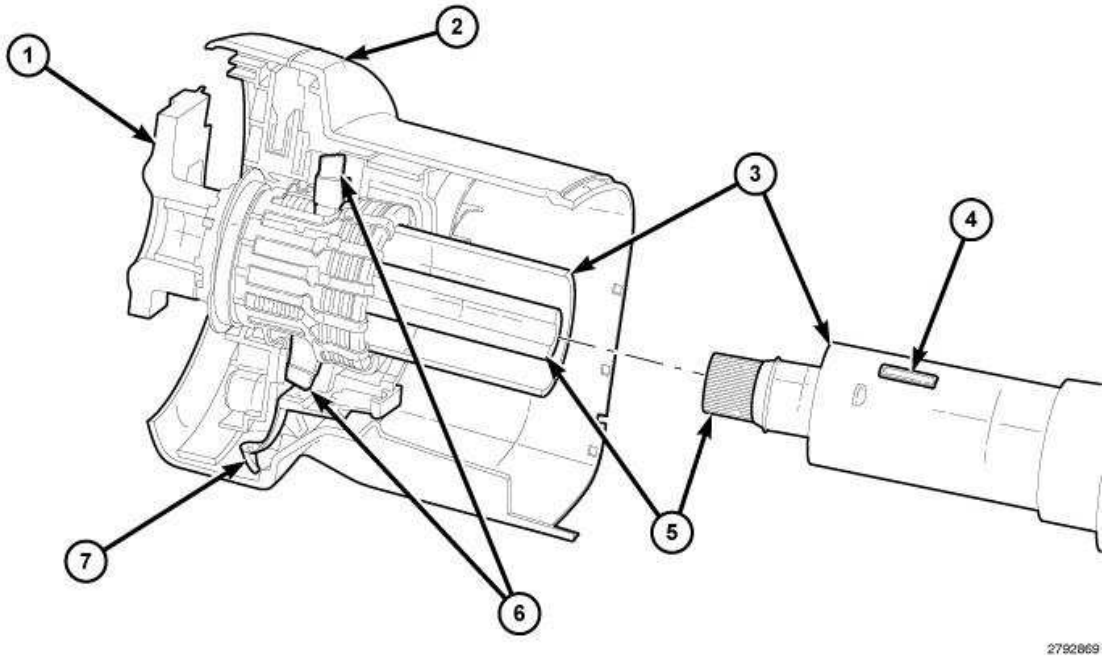

Fig. 385: Spark Plug Tube Installer
Courtesy of CHRYSLER GROUP, LLC

1. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL** .
2. Install the lower half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug

Tube) (1) into the cylinder head and tighten to 17.5 N.m (13 ft. lbs.).

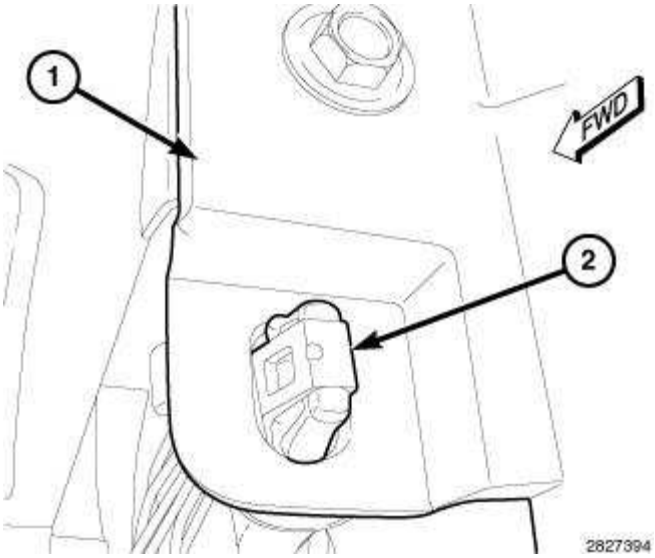

Fig. 386: Applying Stud & Bearing Mount Bead To Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

3. Apply Mopar® Stud and Bearing Mount to the new spark plug tube approximately 3 mm (0.118 in.) from the end of the tube, in a 2 mm (0.078 in.) wide bead (1).

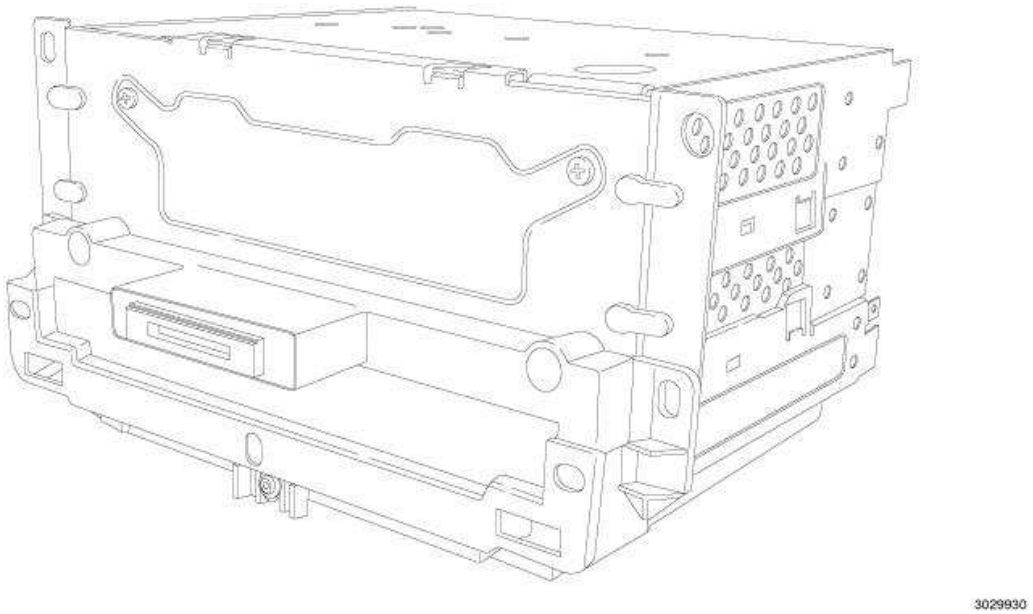

Fig. 387: Spark Plug Tube, Thrust Washers, Spark Plug Tube Installer & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Position the spark plug tube (3) on the top half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (2) and assemble the tool on the cylinder head. Make sure

there are two thrust washers (4) installed.

CAUTION: Do not overtighten the bolt (1). Overtightening can damage the cylinder head spark plug threads.

5. Tighten the bolt (1) to draw the spark plug tube into position. When the top half of the tool contacts the bottom half of the tool, the tube is installed.

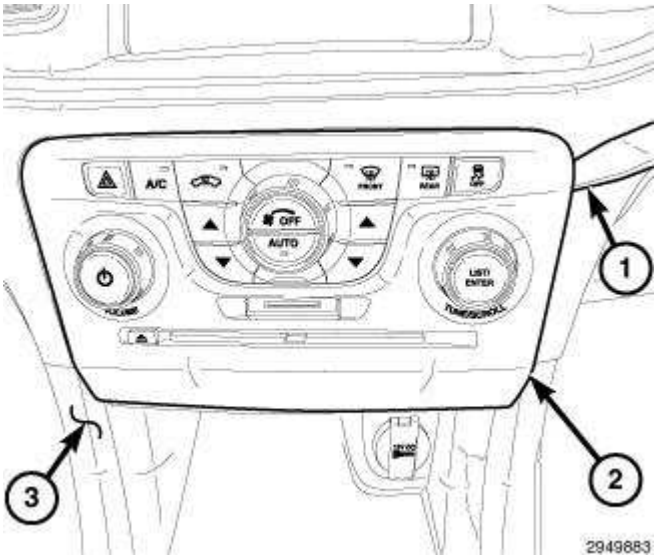

Fig. 388: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH cylinder head cover shown in illustration, RH cylinder head cover similar.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

6. Install the spark plug and tighten to 17.5 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION** .
7. If required, install a new spark plug tube seal (2). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
8. Install the cylinder head cover(s). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

VALVES, INTAKE AND EXHAUST

DESCRIPTION

DESCRIPTION

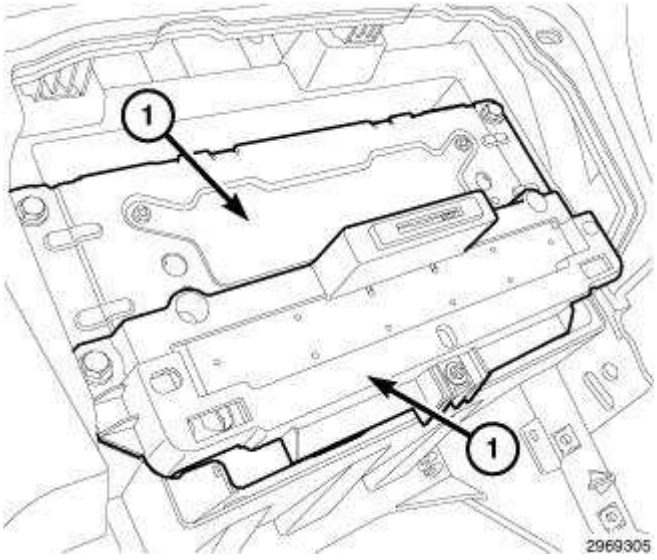

Fig. 389: Intake Valve & Exhaust Valve Component Configuration
Courtesy of CHRYSLER GROUP, LLC

The intake valve (6) is made from a one piece forged heat resistant (martensitic) steel. The exhaust valve (7) is a two piece construction with a forged (austenitic) head welded to the (martensitic) stem. Both valves have a nitrided surface treatment to prevent scuffing except at the tip and lock grooves. The four valves per cylinder are actuated by roller rocker arms, which pivot on stationary lash adjusters. All valves use three bead lock keepers (1) to retain springs (3) and to promote valve rotation.

STANDARD PROCEDURE

STANDARD PROCEDURE - REFACING INTAKE AND EXHAUST VALVES

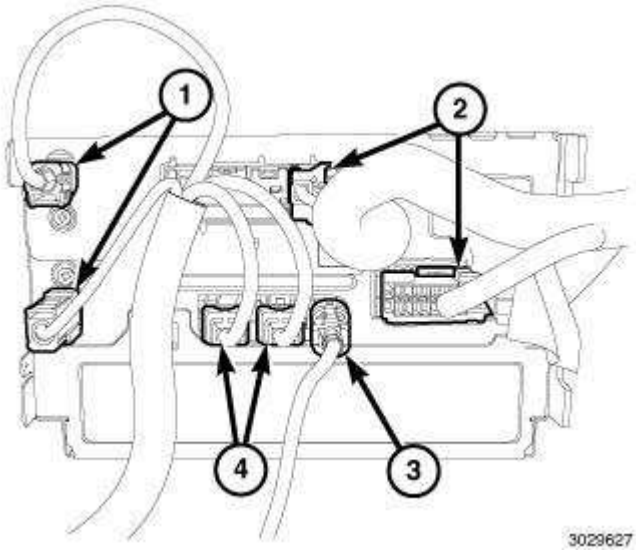

Fig. 390: Valve Face & Seat

Courtesy of CHRYSLER GROUP, LLC

1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA

The intake and exhaust valves have a 45.25 ± 0.25 degree face angle (1). The valve seats (2) have a 44.75 ± 0.25 degree face angle.

VALVES

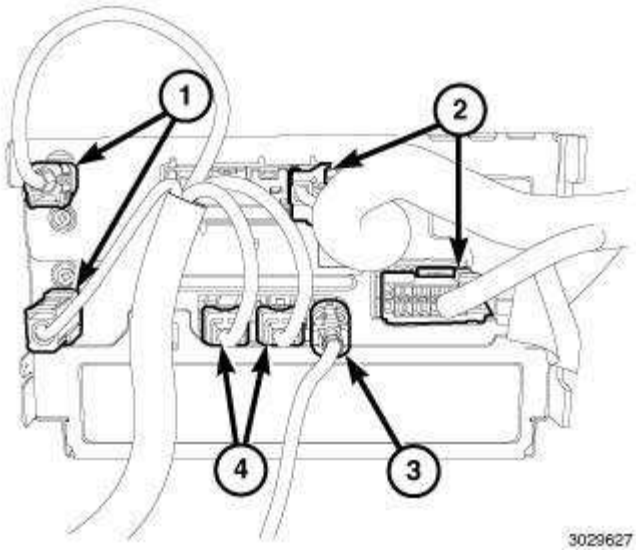

Fig. 391: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

Inspect the remaining margin (5) after the valves are refaced. Refer to **Engine - Specifications**.

VALVE SEATS

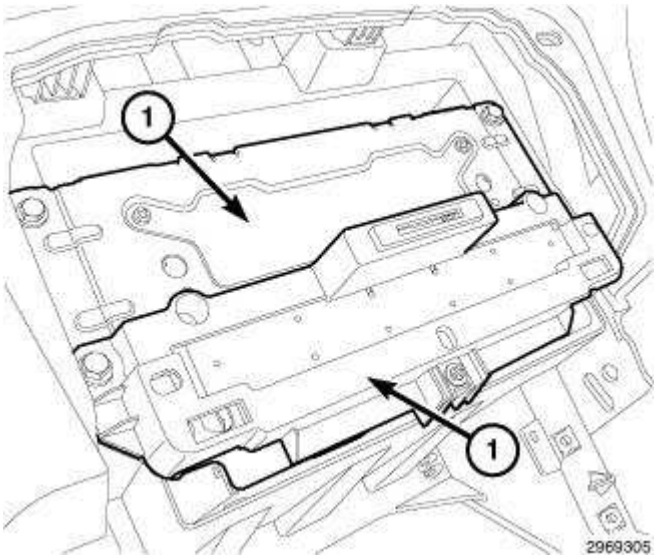

Fig. 392: Valve Face & Seat
Courtesy of CHRYSLER GROUP, LLC

1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA

NOTE: When refacing the valve seats, it is important that the correct size valve guide pilot be used for the reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Total runout should not exceed 0.050 mm (0.002 inch.) total indicator reading.
2. Inspect the valve seat (3) with Prussian blue to determine where the valve contacts the seat. To do this, coat the valve seat (3) **LIGHTLY** with Prussian blue then set the valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of the valve face (4), contact is satisfactory. If the blue is transferred to the top edge of the valve face, then lower the valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, then raise the valve seat with a 65 degree stone.

   NOTE: Valve seats which are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

3. When the seat is properly positioned the width of the intake seat should be 1.0 - 1.2 mm (0.04 - 0.05 in.) and the exhaust seats should be 1.41 - 1.61 mm (0.055 - 0.063 in.).

VALVE AND SPRING INSTALLED HEIGHT

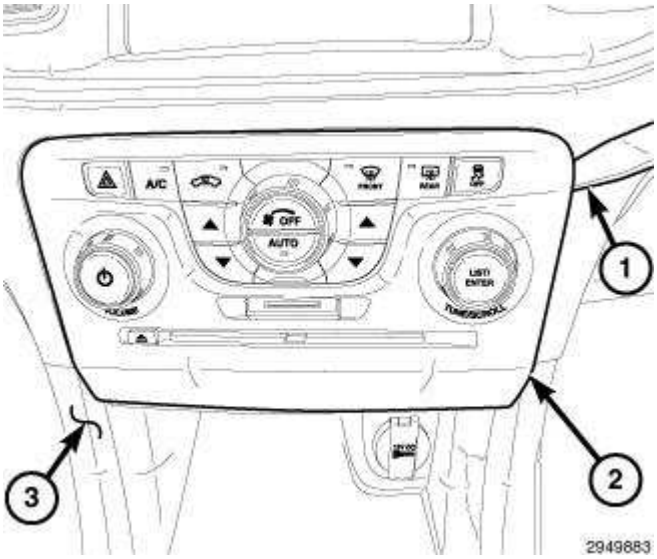

Fig. 393: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

   NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **Engine - Specifications**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).

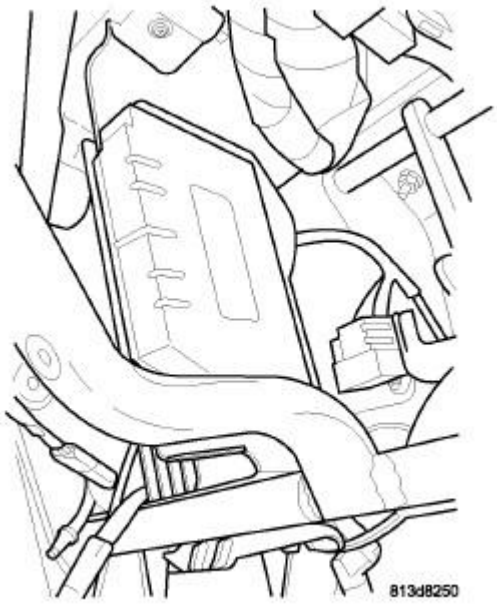

Fig. 394: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

3. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: **Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.**

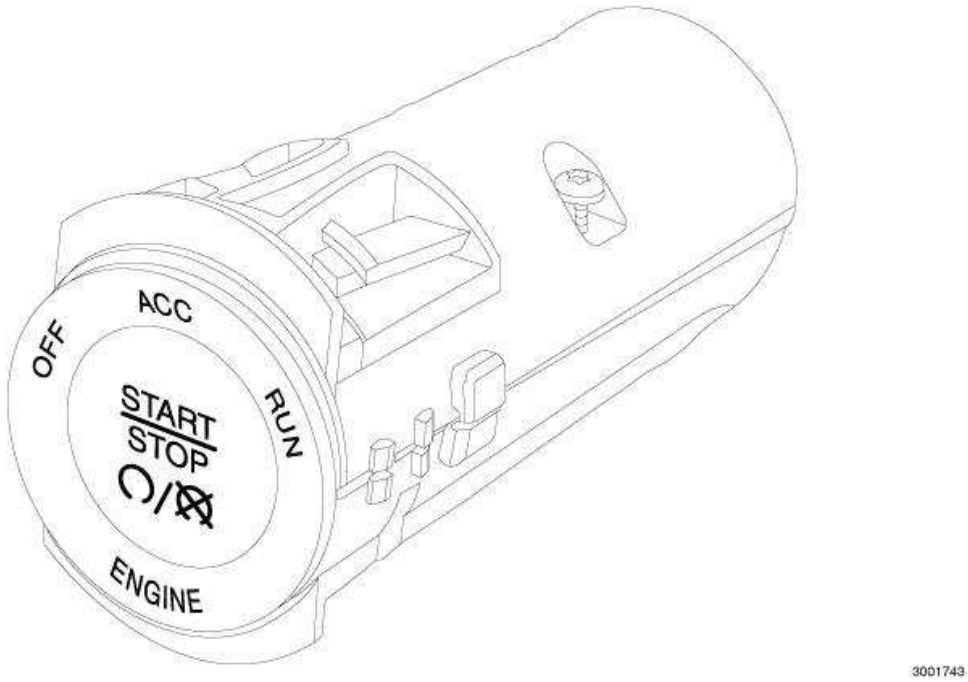

Fig. 395: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

4. Install the valve spring (2) and valve spring retainer (1).

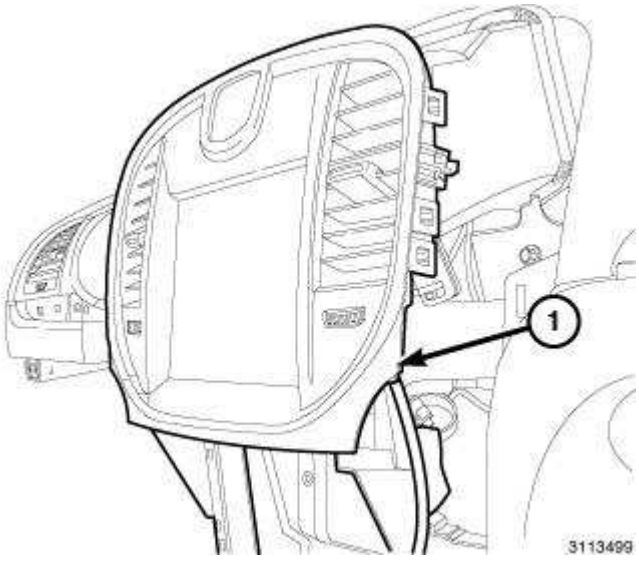

Fig. 396: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.**

5. Compress valve springs (3) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1). Install the retaining locks (4) and release the valve spring compression.

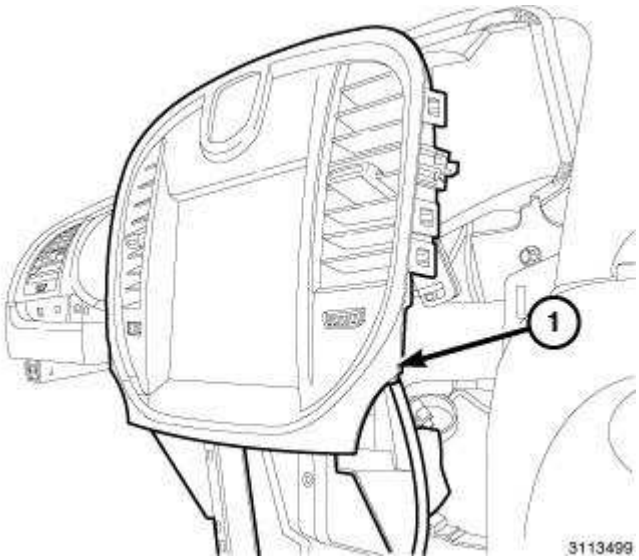

Fig. 397: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

6. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install a second spring seat (8) in the head counterbore under the valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

REMOVAL

REMOVAL

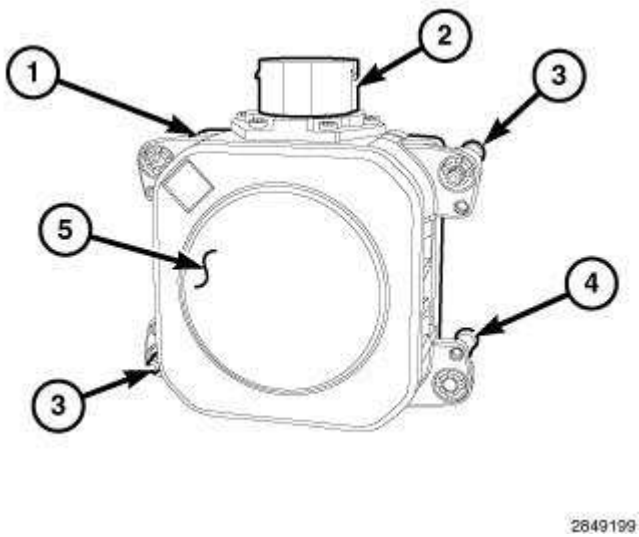

Fig. 398: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL**.

   NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

2. Remove the valve spring(s) (2). Refer to **SPRING(S), VALVE, REMOVAL**.

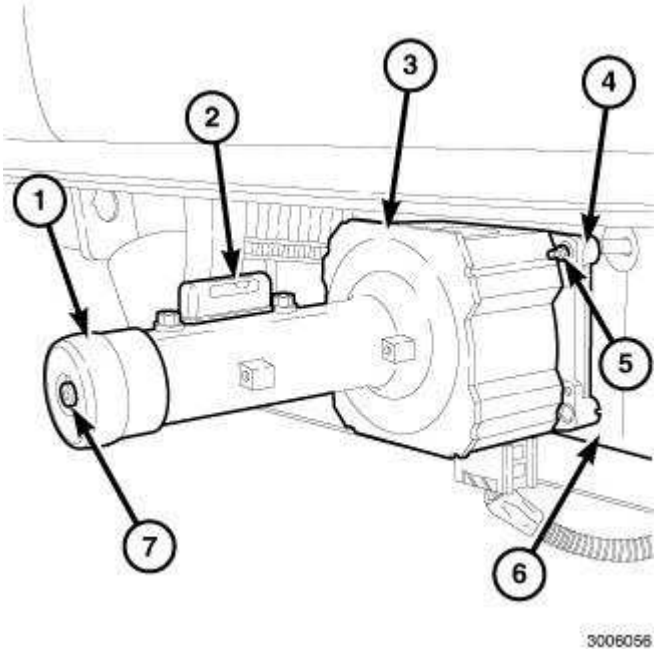

Fig. 399: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing the valves, remove any burrs from the valve stem retainer lock grooves (2) and stem tip (1) to prevent damage to the valve guides.

3. Remove the valve(s) (3). Identify each valve to ensure installation in the original location.

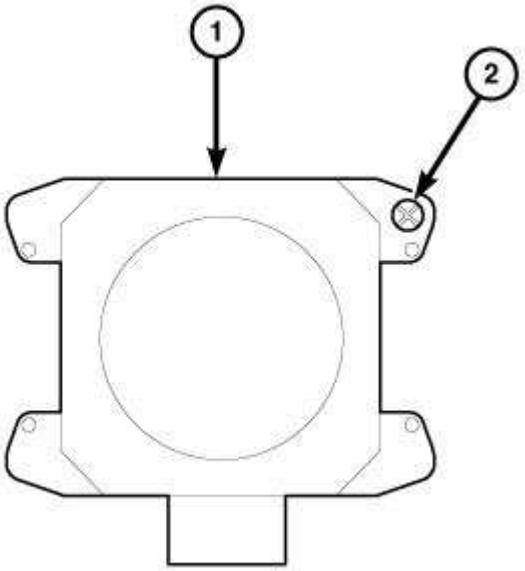

Fig. 400: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

4. If required, remove the valve guide seal (1) and spring seat (3). Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

VALVES

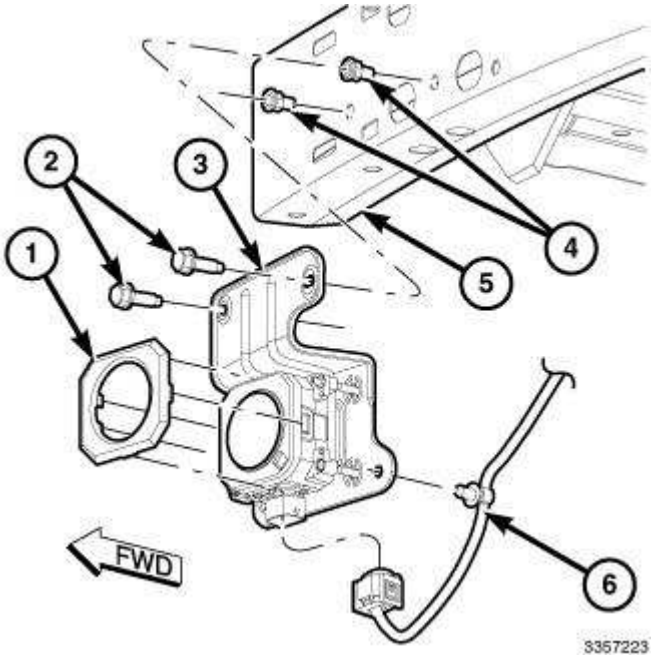

Fig. 401: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the valves thoroughly. Replace burned, warped and cracked valves.
2. Inspect the retainer lock grooves for wear or damage (2).
3. Inspect the valve face (4) for wear and pitting.
4. Measure the valve stems (3) and margins (5) for wear. Refer to **Engine - Specifications**.

VALVE GUIDES

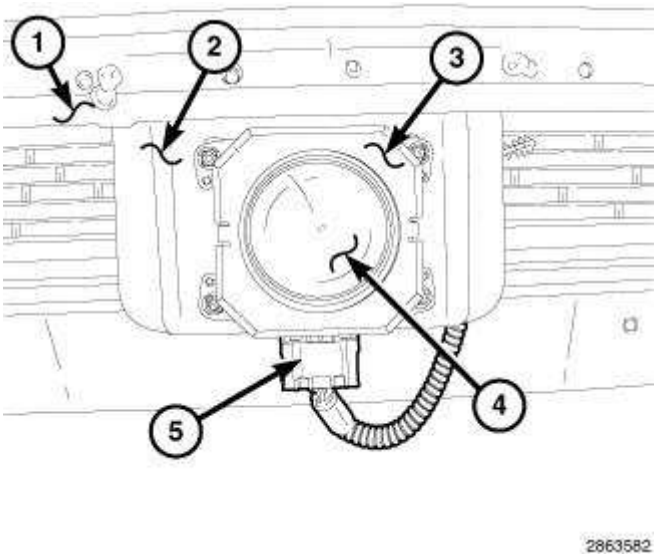

Fig. 402: Measuring Valve Guide Wear
Courtesy of CHRYSLER GROUP, LLC

1. Remove carbon and varnish deposits from inside of the valve guides with a reliable guide cleaner.
2. Measure valve stem-to-guide clearance as follows:
3. Install the valve (2) into the cylinder head so that it is 15 mm (0.590 inch.) off of the valve seat. A small piece of hose may be used to hold the valve in place.
4. Attach the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to the cylinder head and set it at a right angle to the valve stem being measured.
5. Move the valve to and from the indicator. Compare this reading to the specification. Refer to **Engine - Specifications**.

NOTE: If stem-to-guide clearance exceeds specifications, you must measure the valve stem. If the valve stem is within specification or if the valve guide is loose in the cylinder head, replace the cylinder head.

INSTALLATION

INSTALLATION

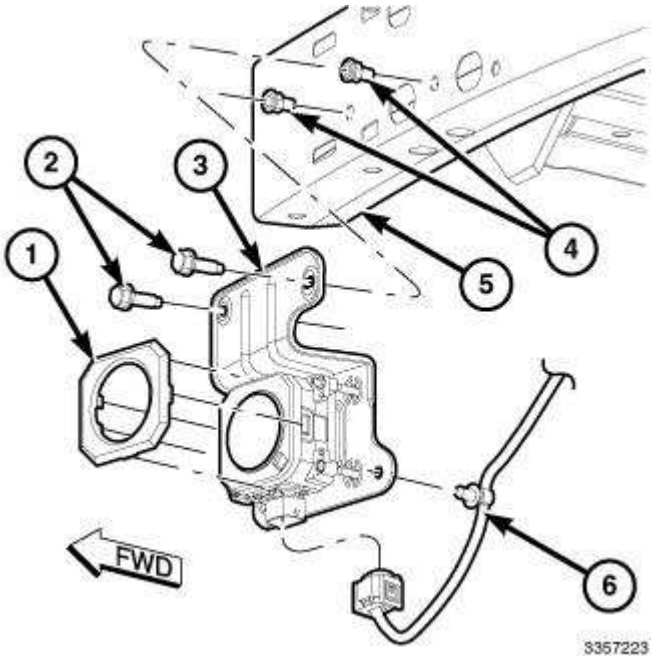

Fig. 403: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip

height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **Engine - Specifications**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).

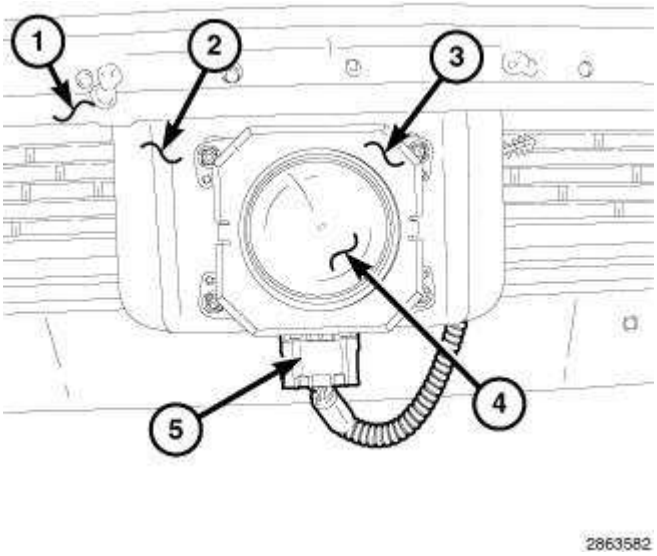

Fig. 404: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

3. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

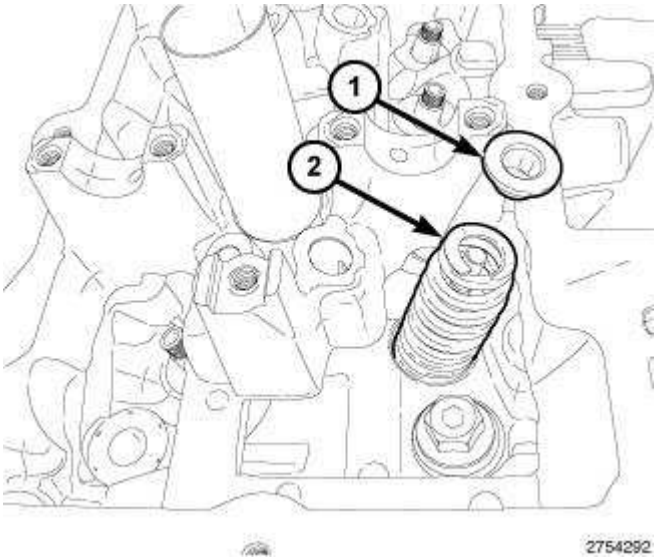

Fig. 405: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Install the valve spring(s) (2). Refer to **SPRING(S), VALVE, INSTALLATION**.

NOTE: **Reassemble the valves springs into their original locations. If the valves or valve seats have been refinished, verify that the valve spring installed height is within specification. Refer to Engine - Specifications. Number 5 cylinder exhaust valve spring shown in illustration, all other valves springs similar.**

5. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION**.

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

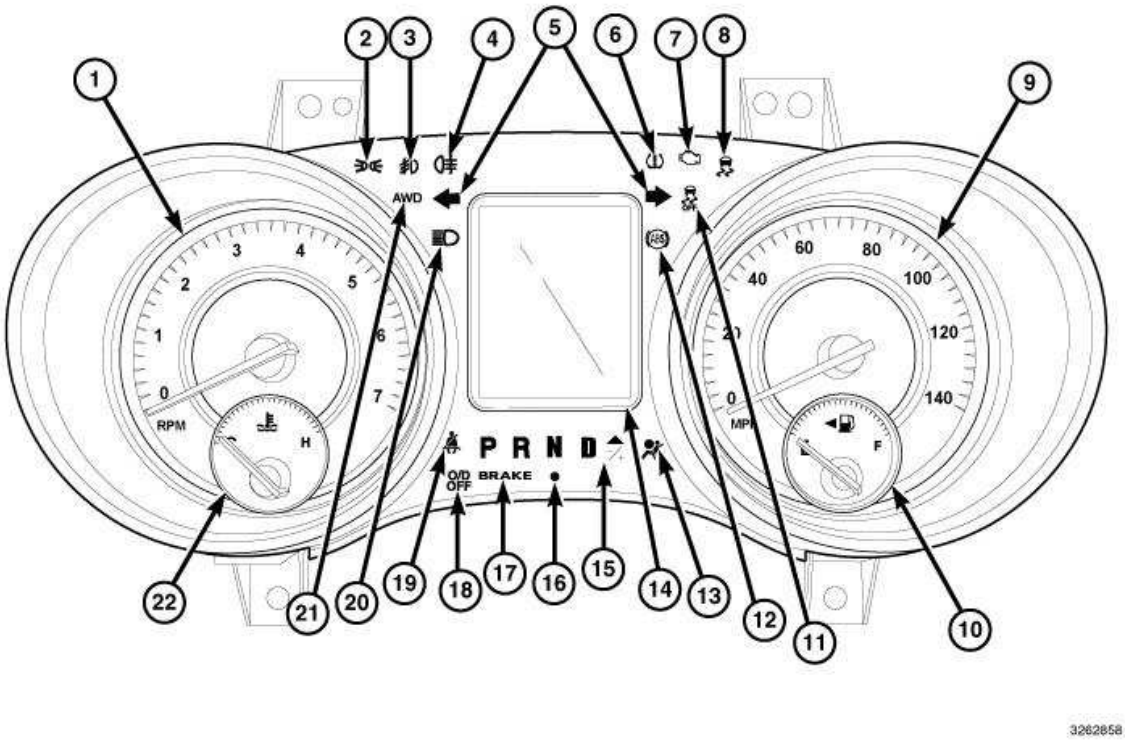

Fig. 406: Cylinder Block & Main Bearing Caps
Courtesy of CHRYSLER GROUP, LLC

The cylinder block is a 60 degree high-pressure die cast aluminum design with cast steel cylinder liners. The leading side of the block is on the right side and houses cylinders 1, 3 and 5. The cylinder block is an open deck design with cut slots between each cylinder. Two knock sensors are located in the block valley. The cylinder block has three sets of piston cooling jets which are attached to the main oil gallery. The four powdered metal main bearing caps are a cross-bolted design and have directional arrows molded into the caps. The number 2 main bearing is the location for the two piece

upper half thrust bearings. The thrust bearings are installed with the oil groves facing outward. The main bearing caps are a 6-bolt design and cross-bolted for improved lower end strength. There are three oil drain back drillings located on each of the cylinder banks.

STANDARD PROCEDURE

MEASURING BEARING CLEARANCE USING PLASTIGAGE

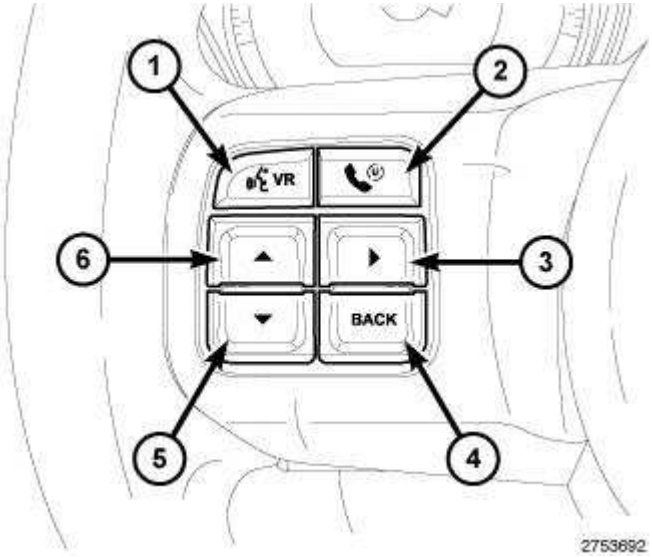

Fig. 407: Plastigage Placed In Lower Shell
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal shown in illustration.

Engine crankshaft and connecting rod bearing clearances can be determined by the use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove the oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage (1) across the entire width of the journal (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Plastigage must not crumble in use. If brittle, obtain fresh stock.
3. Torque the bearing cap bolts of the bearing being checked to the proper specifications. Refer to **Engine - Specifications**.

NOTE: DO NOT rotate the crankshaft. Plastigage will smear, causing inaccurate results.

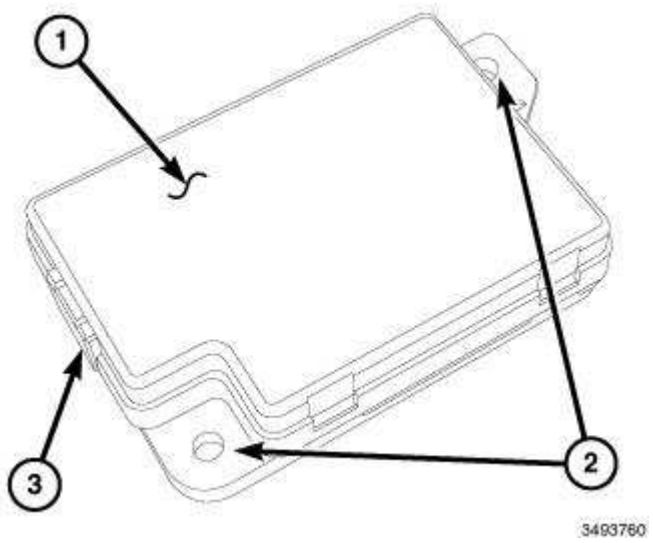

Fig. 408: Measuring Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical connecting rod cap shown in illustration.

4. Remove the bearing cap and compare the width of the flattened Plastigage (2) with the scale provided on the package (1). Locate the band closest to the same width. This band shows the amount of clearance. Differences in readings between the ends indicate the amount of taper present or the possibility of foreign material trapped under the bearing insert.
5. Record all readings taken. Compare clearance measurements to engine specifications. Refer to **Engine - Specifications**.

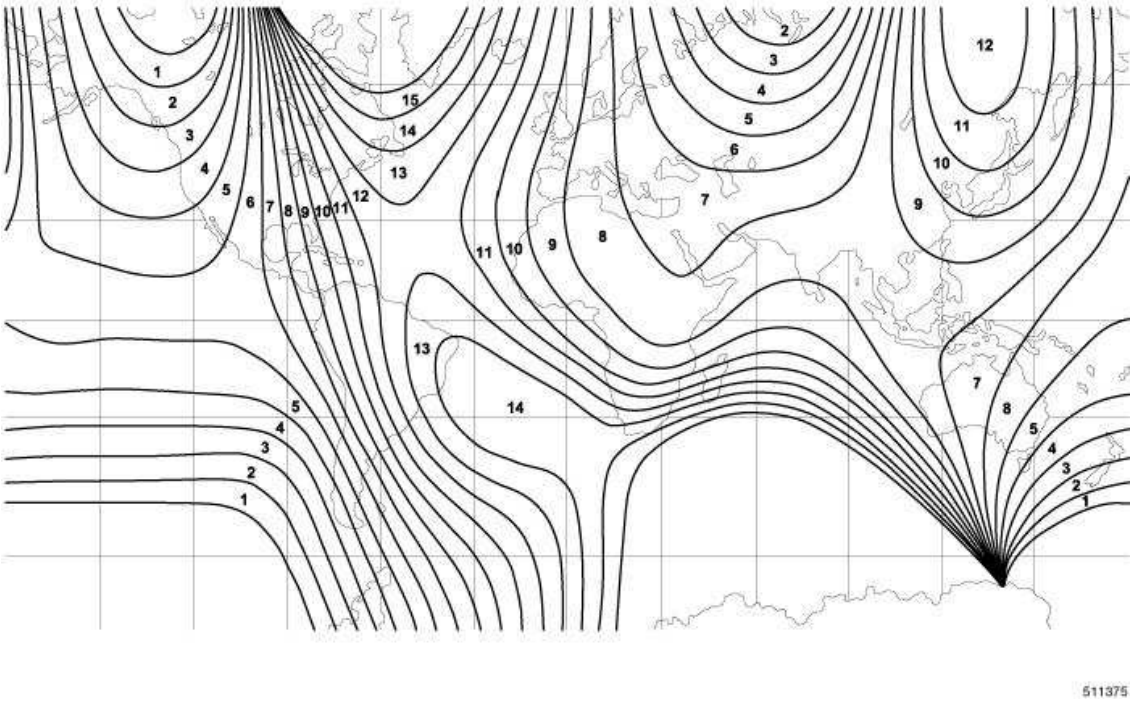

Fig. 409: Checking Connecting Rod Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical connecting rod journal shown in illustration.**

NOTE: **Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking. Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

6. Install the proper bearings to achieve the specified bearing clearances.
7. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

CYLINDER BORE HONING

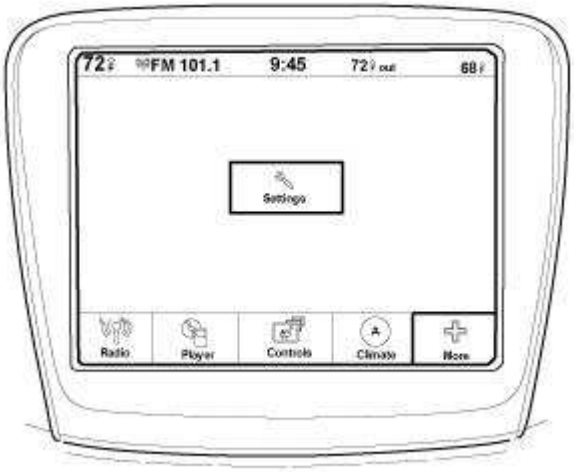

Fig. 410: Cylinder Bore Crosshatch Pattern
Courtesy of CHRYSLER GROUP, LLC

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

1. Used carefully, a cylinder bore sizing hone equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

   CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use of a cylinder surfacing hone equipped with 280 grit stones, about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil, available from major oil distributors.

   CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

3. Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings.
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle (1). The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle (2). Faster up and down strokes increase the crosshatch angle.
5. After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a

clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

INSPECTION

INSPECTION

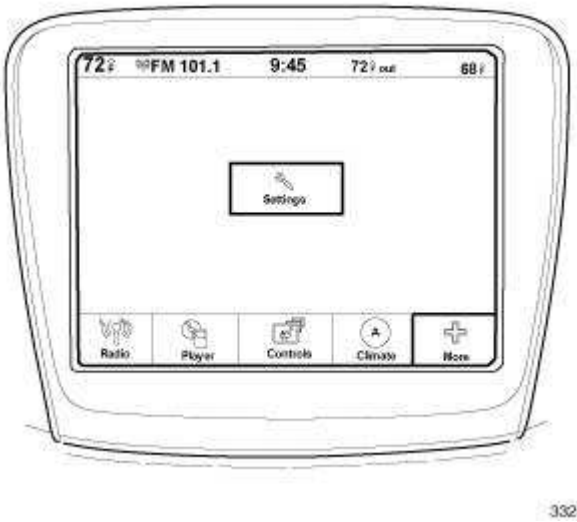

Fig. 411: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the main bearing inserts (1 and 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage the engine block must be replaced.

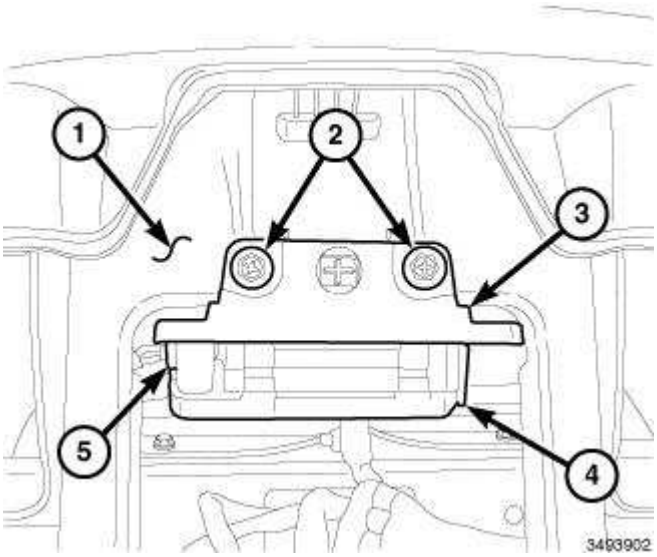

Fig. 412: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

9. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
12. Determine taper by subtracting the smaller diameter from the larger diameter.
13. Rotate measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specifications. Refer to **Engine - Specifications**.
14. Determine out-of-roundness by comparing the difference between A and B at each of the three levels. Verify that the maximum out of round is within specifications. Refer to **Engine - Specifications**.
15. If cylinder bore taper and out-of-roundness are within specification, the cylinder bore can be honed. Refer to **Engine/Engine Block - Standard Procedure**. If the cylinder bore taper or out-of-round condition exceeds the maximum limits, the cylinder block must be replaced.

NOTE: A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

BEARING(S), CONNECTING ROD

STANDARD PROCEDURE

CONNECTING ROD BEARING FITTING

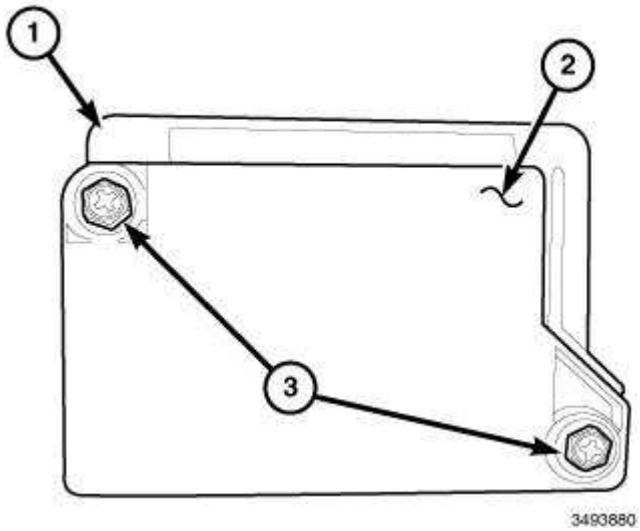

Fig. 413: Connecting Rod Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings are "select fit" to achieve proper oil clearance. Connecting rod bearing journal diameter grade markings (2) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4, 5, 6. Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal.

Connecting rod bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the three crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	58.9910 - 58.9969 mm (2.3225 - 2.3227 in.)
2	58.9970 - 59.0029 mm (2.3227 - 2.3229 in.)
3	59.0030 - 59.0090 mm (2.3229 - 2.3232 in.)

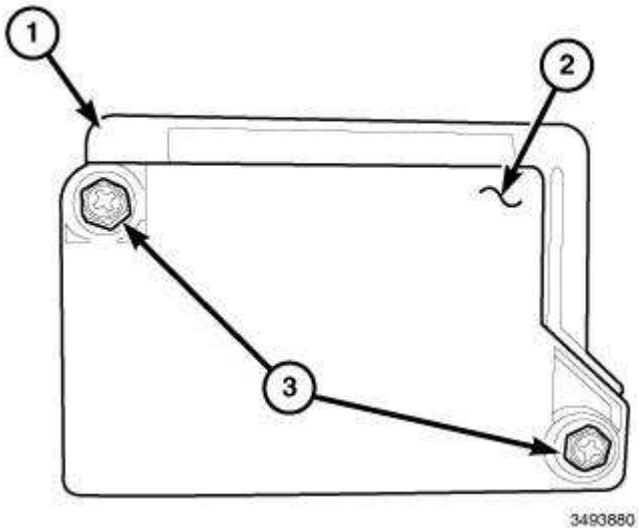

Fig. 414: Connecting Rod Bearing Shells & Bearing Size
Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

The connecting rod bearing shells (1) are marked with the bearing size (2) on the bearing lining surface. The bearings are available in three different sizes in order to achieve the desired oil clearance.

Rod bearing shells are available in three sizes. The chart below identifies the three bearing sizes.

Bearing Marking	Size mm (in.)
1	1.583 - 1.580 mm (0.0623 - 0.0622 in.)
2	1.580 - 1.577 mm (0.0622 - 0.0621 in.)
3	1.577 - 1.574 mm (0.0621 - 0.0620 in.)

Bearing oil clearance can also be determined by using Plastigage or equivalent. Refer to **Engine/Engine Block - Standard Procedure**.

CONNECTING ROD BEARING REPLACEMENT

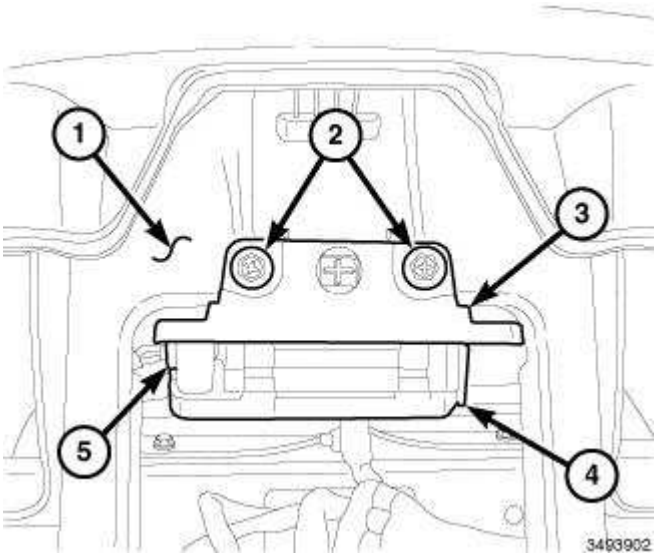

Fig. 415: Connecting Rod Bearing Shells & Bearing Size
Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings (1) are serviced in-vehicle. They must be replaced one-at-a-time in order to prevent the pistons from contacting the valves. The connecting rod bearings are "select fit" to achieve proper oil clearances. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.

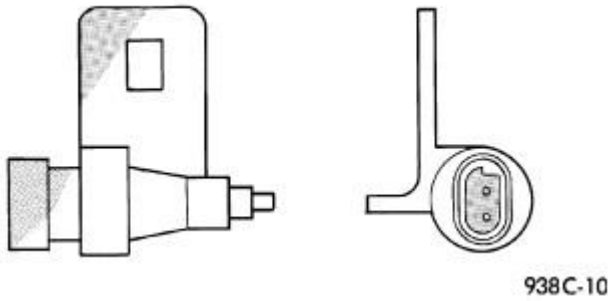

Fig. 416: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
3. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

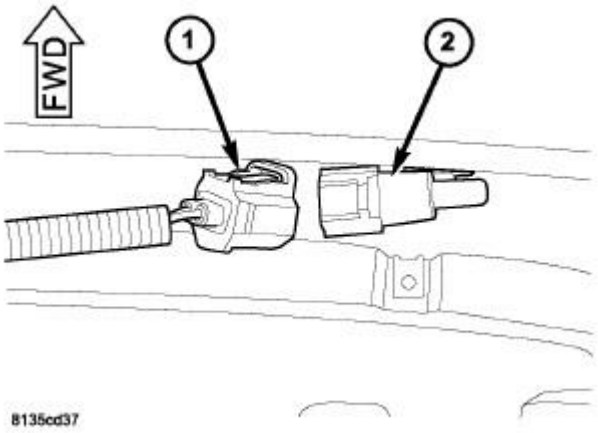

Fig. 417: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

5. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

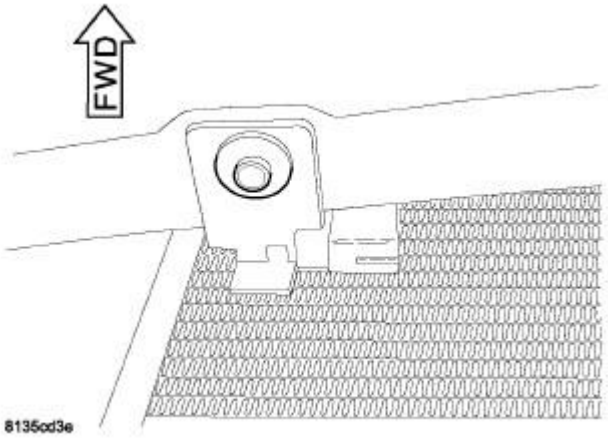

Fig. 418: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Replace only one connecting rod bearing at a time while all other connecting rod bearing caps remain properly tightened. If all

connecting rod bearing caps are removed, crankshaft rotation will result in valve and/or piston damage.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

6. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.
7. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Rotate the crankshaft away from the connecting rod and remove the bearing shell.
9. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
10. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
11. Rotate the crankshaft while guiding the connecting rod into position over the rod journal.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

12. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

13. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
14. If required, check the connecting rod side clearance. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.
15. Repeat the previous steps for each connecting rod bearing being replaced.

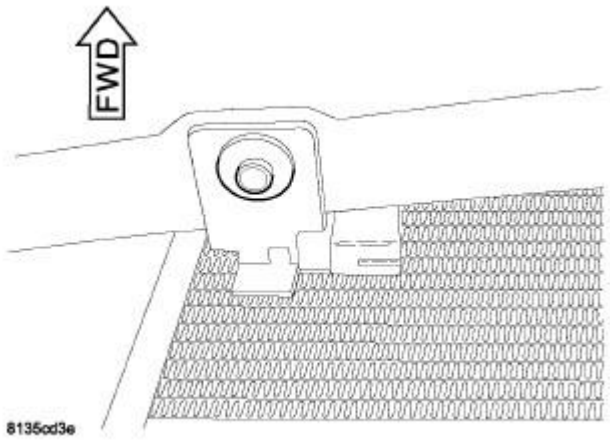

Fig. 419: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

16. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

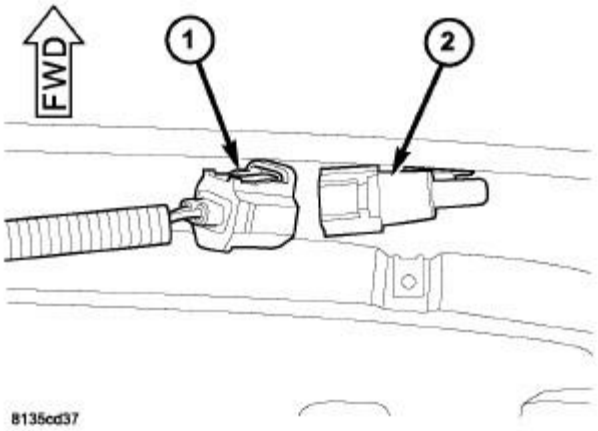

Fig. 420: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

17. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.
18. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
19. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION** .

20. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
21. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
22. Operate the engine until it reaches normal operating temperature.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

MAIN BEARING FITTING

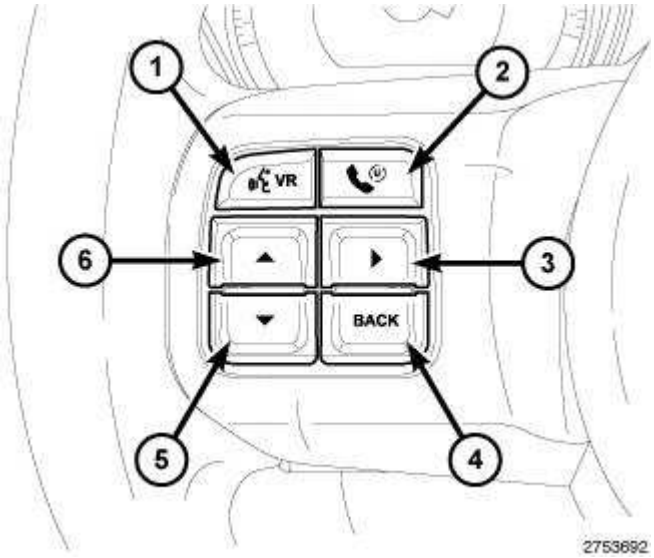

Fig. 421: Connecting Rod Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

The upper and lower main bearings are "select fit" to achieve proper oil clearances. Crankshaft main bearing journal diameter grade markings (1) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

Crankshaft main bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the five crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	71.9870 - 71.9905 mm (2.8341 - 2.8343 in.)
2	71.9906 - 71.9941 mm (2.8343 - 2.8344 in.)
3	71.9942 - 71.9977 mm (2.8344 - 2.8345 in.)
4	71.9978 - 72.0013 mm (2.8346 - 2.8347 in.)
5	72.0014 - 72.0050 mm (2.8347 - 2.8348 in.)

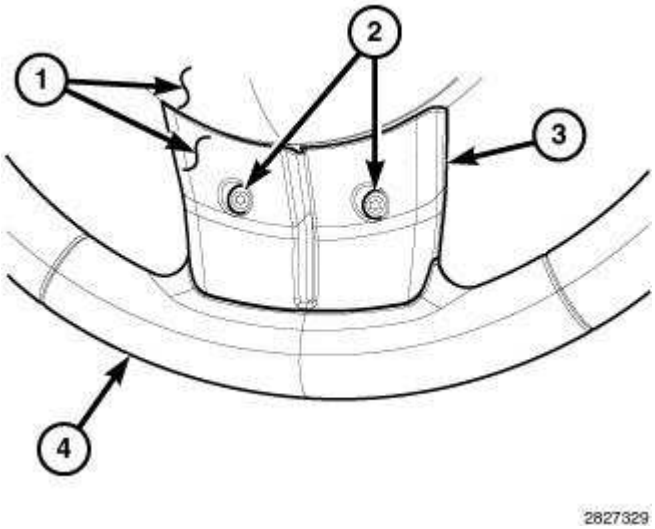

Fig. 422: Engine Block Main Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

Engine block main bearing journal diameter grade markings (2) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

Engine block main bearing journal grade markings correspond to specific journal diameters. The chart below identifies the five engine block grade markings and their associated journal diameters.

Engine Block Marking	Journal Size mm (in.)
1	77.0055 - 77.0090 mm (3.0317 - 3.0318 in.)
2	77.0019 - 77.0054 mm (3.0316 - 3.0317 in.)
3	76.9983 - 77.0018 mm (3.0314 - 3.0316 in.)
4	76.9947 - 76.9982 mm (3.0313 - 3.0314 in.)
5	76.9910 - 76.9946 mm (3.0311 - 3.0313 in.)

For upper and lower main bearing selection, obtain the grade identification marks from the crankshaft and engine block. Main bearings are available in five sizes. Upper and lower sizes can be mixed on a journal in order to achieve the desired oil clearance. The chart below identifies the five sizes available and how they should be selected based on crankshaft and engine block grade markings.

Engine Block Marking	Crankshaft Marking				
	1	**2**	**3**	**4**	**5**
1	1/1	1/2	2/2	2/3	3/3
2	1/2	2/2	2/3	3/3	3/4
3	2/2	2/3	3/3	3/4	4/4
4	2/3	3/3	3/4	4/4	4/5
5	3/3	3/4	4/4	4/5	5/5
	UPPER/LOWER Main Bearings to Achieve 0.024 - 0.050 mm (0.0009 -				

	0.0020 in.) Oil Clearance

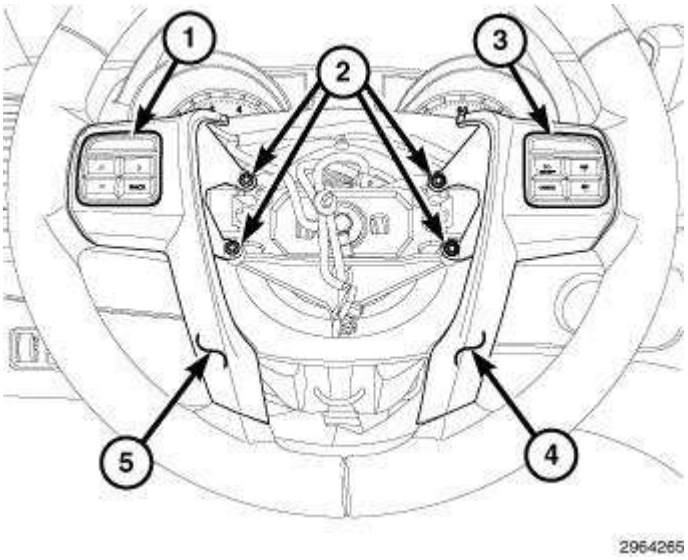

Fig. 423: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

The upper main bearing shell (2) and lower main bearing shell (1) are marked with the bearing size (3) on the bearing lining surface. The upper and lower bearings are available in five different sizes and can be mixed on a journal in order to achieve the proper oil clearance.

Upper and lower main bearing shells are available in five sizes. The chart below identifies the five bearing sizes.

Bearing Marking	Size mm (in.)
1	2.4951 - 2.4987 mm (0.0982 - 0.0984 in.)
2	2.4915 - 2.4951 mm (0.0981 - 0.0982 in.)
3	2.4879 - 2.4915 mm (0.0979 - 0.0981 in.)
4	2.4843 - 2.4879 mm (0.0978 - 0.0979 in.)
5	2.4807 - 2.4843 mm (0.0977 - 0.0978 in.)

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

Bearing oil clearance can also be determined by using Plastigage or equivalent. Refer to **Engine/Engine Block - Standard Procedure**.

MAIN BEARING REPLACEMENT

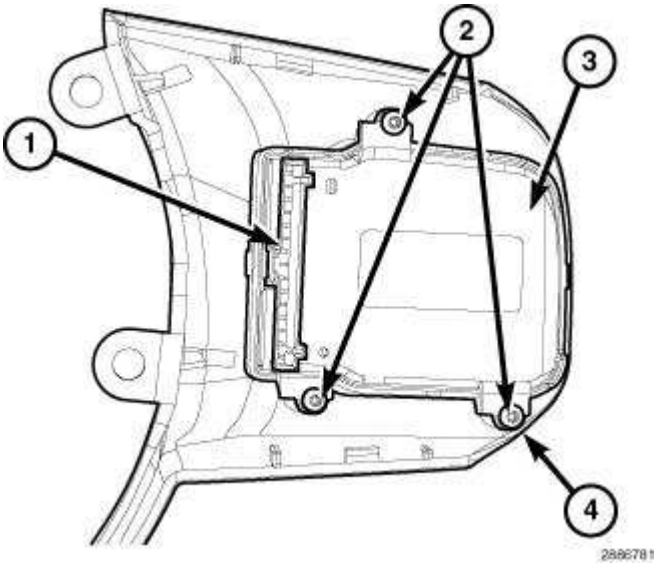

Fig. 424: Main Bearing Identification
Courtesy of CHRYSLER GROUP, LLC

The main bearings are serviced in-vehicle. They must be replaced one-at-a-time in order to properly support the crankshaft. The upper and lower main bearing shells are NOT interchangeable. The upper and lower main bearings are "select fit" to achieve proper oil clearances. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.

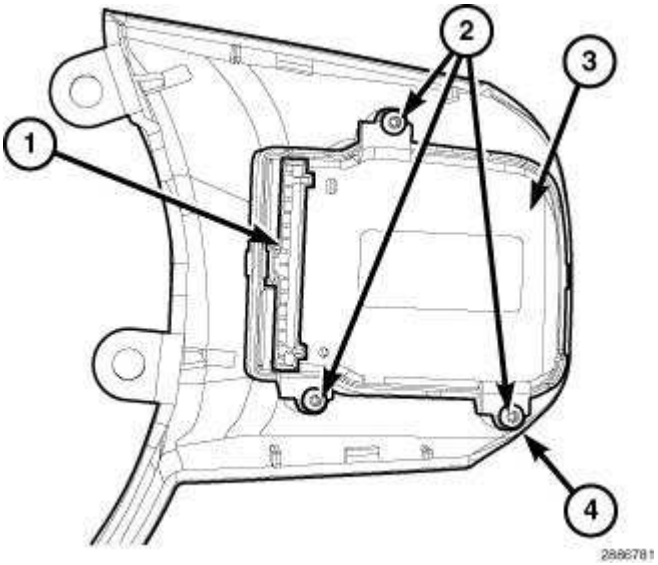

Fig. 425: Power Steering Pump Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Late production vehicles are equipped with Electro-Hydraulic Power Steering (EHPS) and do not have an engine mounted power steering pump.

1. Disconnect and isolate the negative battery cable.

2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
3. If equipped with an engine mounted power steering pump, remove the serpentine drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

NOTE: Only two power steering pump mounting bolts are shown in illustration. Another bolt is on the lower end of the pump near the pulley.

4. Remove the three power steering pump mounting bolts (1) and reposition the power steering pump, if equipped.

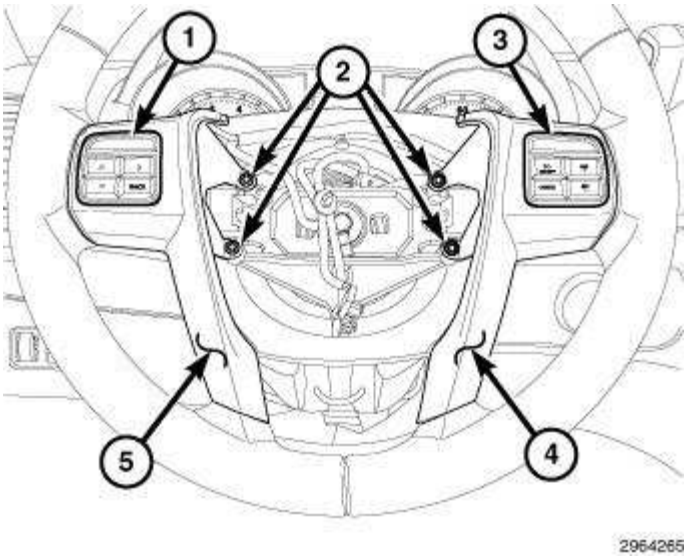

Fig. 426: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
6. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

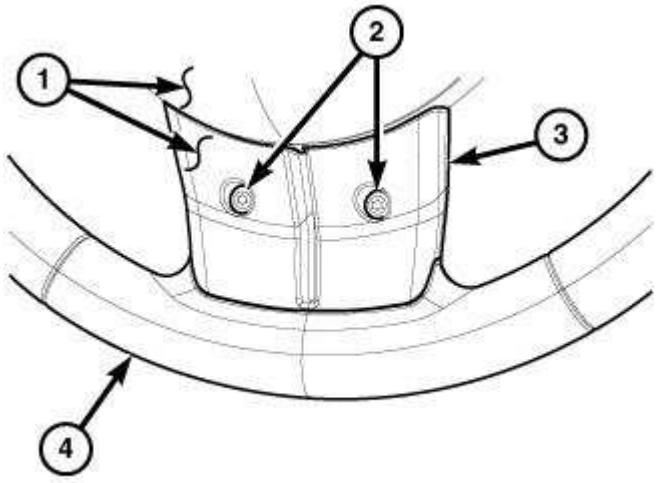

Fig. 427: Main Bearing Tie Bolts Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

7. Remove the eight main bearing tie bolts in the sequence shown in illustration.

CAUTION: DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

8. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

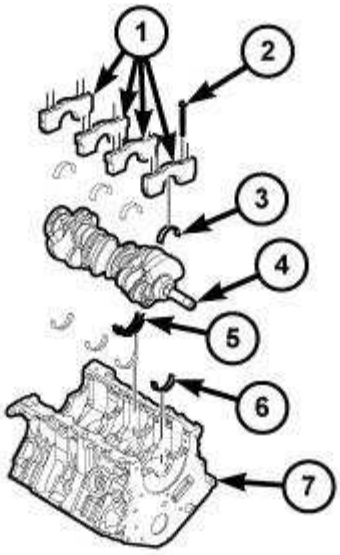

Fig. 428: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Replace only one main bearing at a time while all other main bearing caps remain properly tightened. If all main bearing caps are removed, the weight of the unsupported crankshaft will damage the crankshaft oil seals.

NOTE: Replace the main bearings in the following order; 2, 3, 1, 4.

9. Remove the two cap bolts (2) and remove the main bearing cap (1).
10. When removing the No. 2 bearing cap, also remove the thrust washers (5).
11. Slide the upper main bearing half (6) out from between the crankshaft and the engine block.
12. If required, select fit new main bearings to the engine block. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
13. Lubricate the upper main bearing half (6) with clean engine oil and slide the bearing into position.

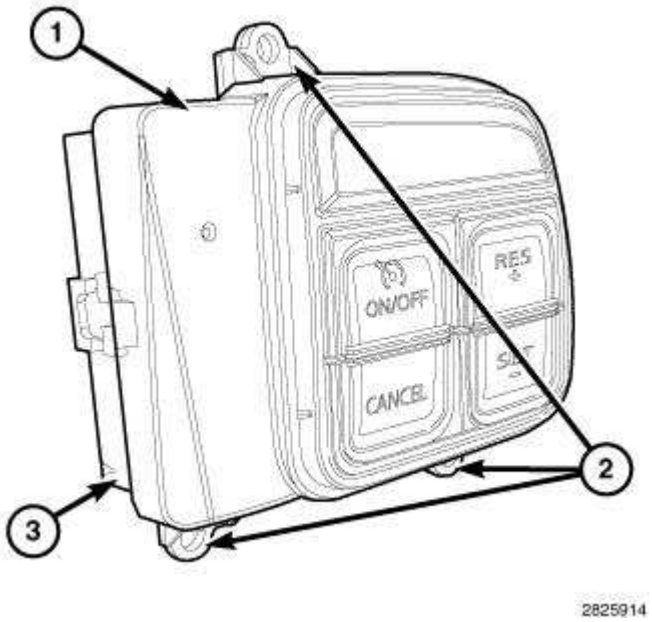

Fig. 429: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

14. When installing thrust washers (1) at the No. 2 main bearing location, use the following procedure:

1. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
2. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

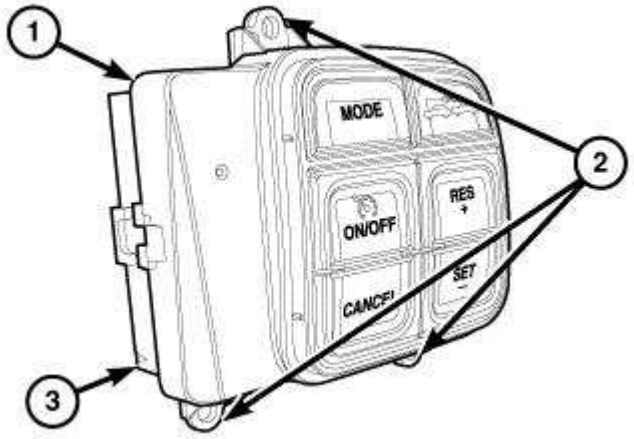

Fig. 430: Checking Cylinder Head Bolts For Stretching (Necking)
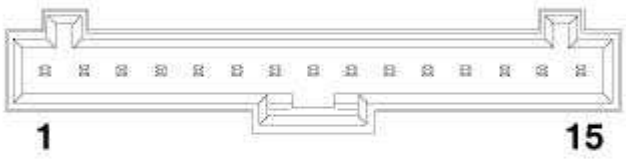
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

15. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

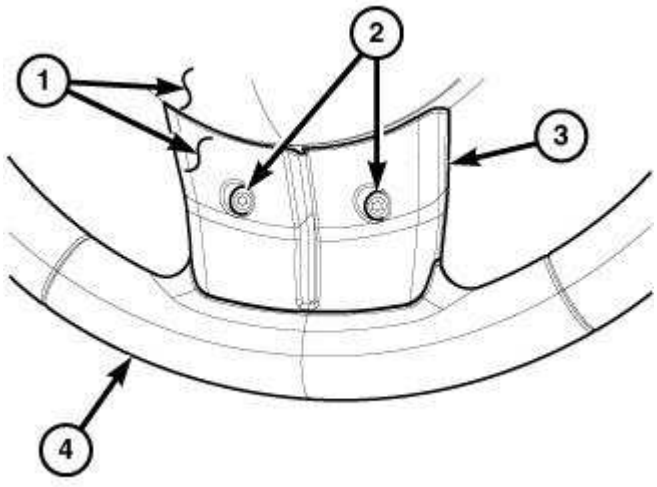


2827003

Fig. 431: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

16. Lubricate and install the lower bearing half (3) onto the main cap (1).
17. Install the main bearing cap (1) with two inner main bearing cap bolts (2) tightened to 20 N.m (15 ft. lbs.) plus 90°.
18. Repeat the previous steps for main bearings 3, 1 and 4.
19. Measure crankshaft end play. Refer to **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.



2827329

Fig. 432: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

20. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.

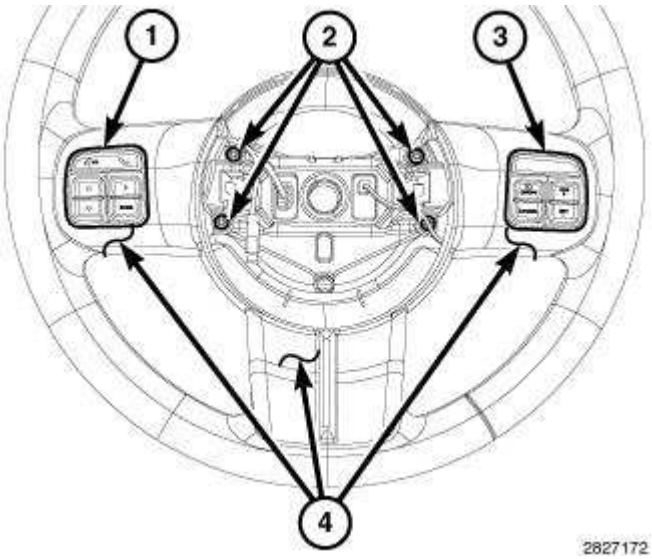


Fig. 433: Main Bearing Tie Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

21. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown in illustration to 28 N.m (21 ft. lbs.).
22. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION**.

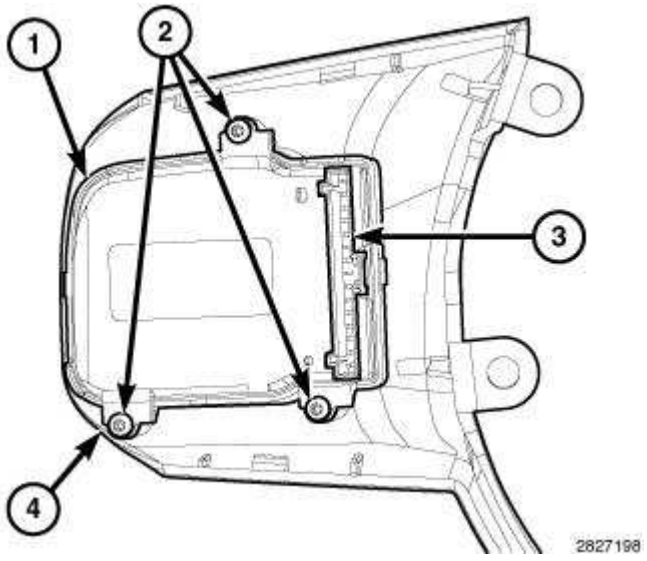

Fig. 434: Power Steering Pump Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Only two power steering pump mounting bolts are shown in illustration. Another bolt is on the lower end of the pump near the pulley.**

23. If removed, position the power steering pump (4) to the engine block. Install the three pump mounting bolts (1) and tighten to 25 N.m (18 ft. lbs.).
24. If removed, install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
25. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION** .
26. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
27. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
28. Operate the engine until it reaches normal operating temperature.

CRANKSHAFT

DESCRIPTION

DESCRIPTION

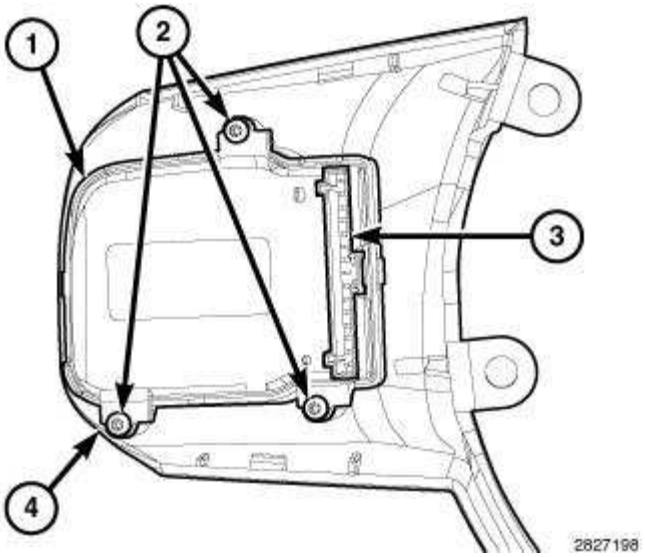

Fig. 435: Crankshaft
Courtesy of CHRYSLER GROUP, LLC

The crankshaft is a cast design and is constructed using ductile iron. The crankshaft is a three throw split pin design with counterweights for balancing purposes. The main journals are crossed drilled for rod bearing lubrication. The crankshaft is supported by four select fit main bearings with number 2 serving as the thrust washer location. The rear counterweight has provisions for crankshaft position sensor target wheel mounting. Both the front and rear seals are a single piece design and are mounted to the timing cover and cylinder block.

STANDARD PROCEDURE

STANDARD PROCEDURE - END PLAY

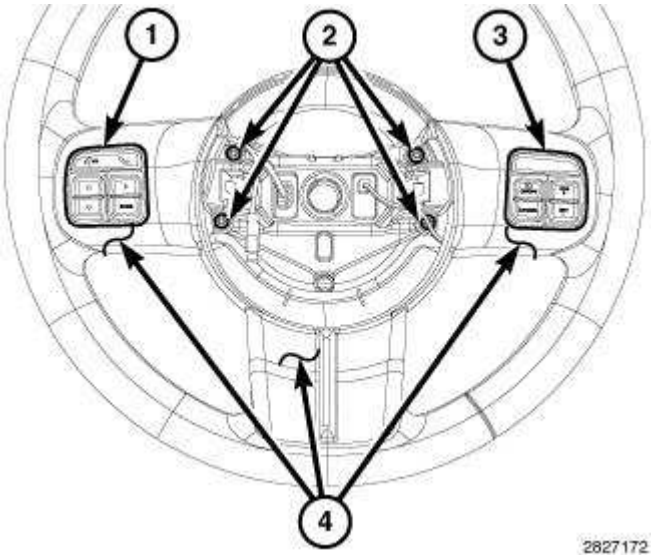

Fig. 436: Checking Crankshaft End Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine shown in illustration.

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the crankshaft.
2. Move the crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the crankshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **Engine - Specifications**.

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

REMOVAL

REMOVAL

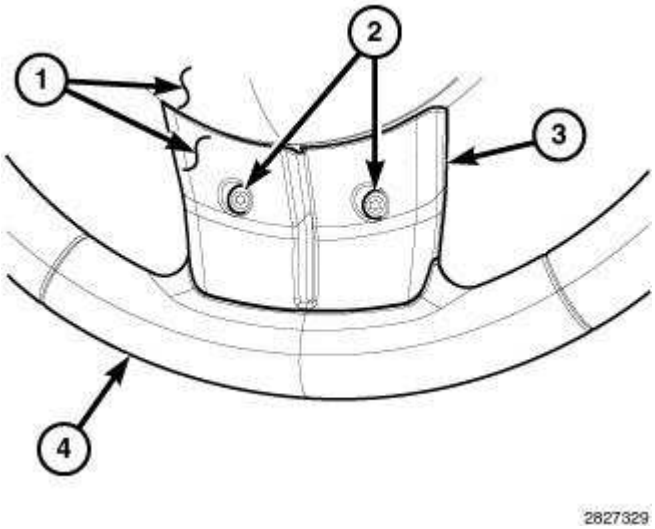

Fig. 437: Lifting Sling, Engine Lifting Brackets & Engine Hoist
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

1. Remove the engine. Refer to **REMOVAL**.

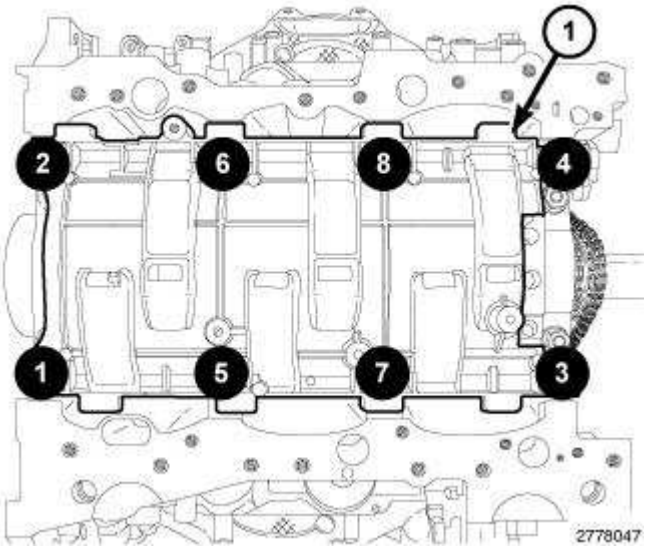

Fig. 438: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Remove the cylinder head covers, spark plugs, upper oil pan, engine timing cover, timing chain and sprockets. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.
3. Remove the flexplate and the rear crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.

4. Remove the oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
5. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

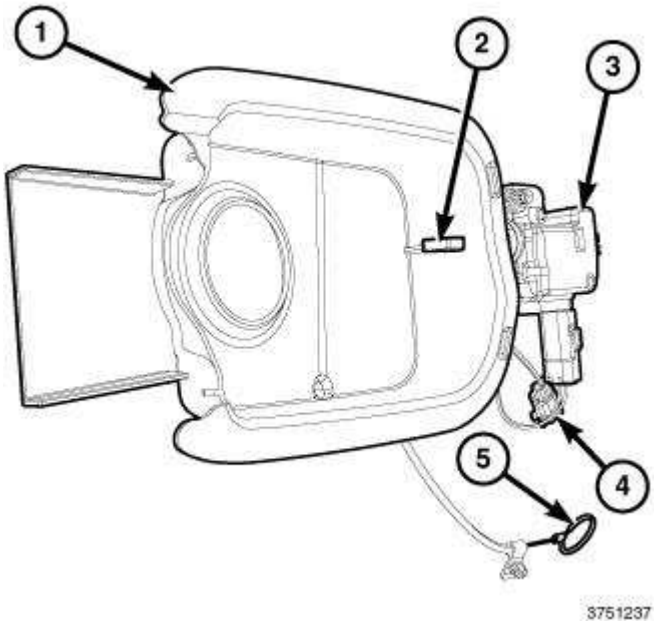

Fig. 439: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

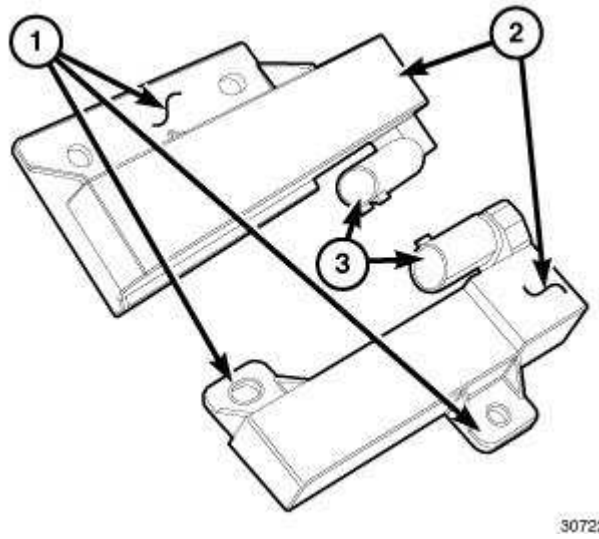

Fig. 440: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod caps (4). Discard the cap bolts.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

9. Push the connecting rod and piston into the cylinder until the connecting rod is clear of the crankshaft journal. Remove the guide pins. Repeat this procedure at each cylinder until all of the connecting rods are clear of the crankshaft.

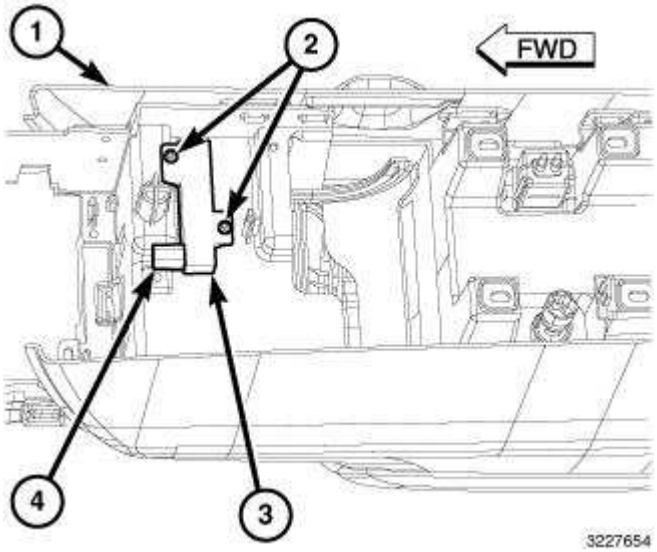

Fig. 441: Main Bearing Tie Bolts Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

Remove the main bearing cross bolts in the sequence shown in illustration.

CAUTION: DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

10. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

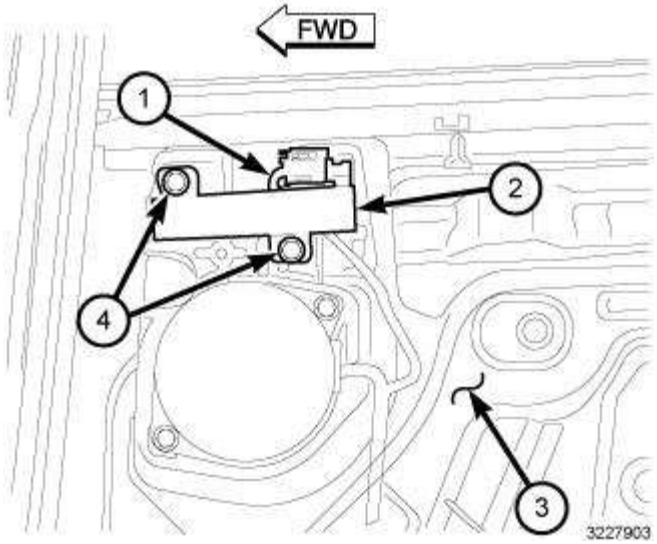

Fig. 442: Main Bearing Cap Bolts Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

11. Remove the eight main bearing cap bolts in the sequence shown in illustration and remove the main bearing caps.

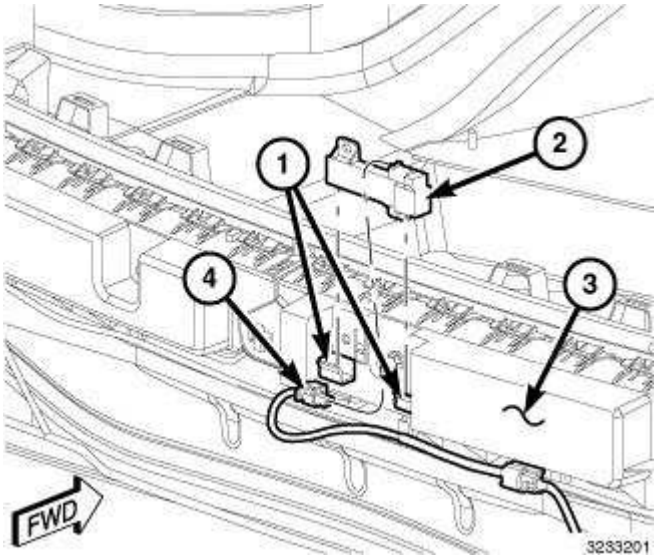

Fig. 443: Target Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rest the crankshaft on the target wheel (1). Damaged or bent target wheel teeth will destroy the target wheels ability to correctly relay crankshaft position to the crankshaft position sensor.

12. Remove the crankshaft from the engine block.
13. If required, remove the four bolts (2) and the target wheel (1). Discard the four bolts.

INSPECTION

INSPECTION

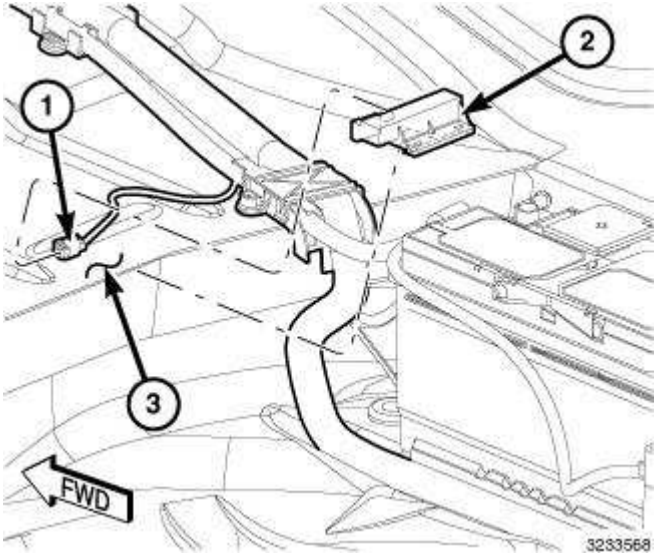

Fig. 444: Measuring Crankshaft Journal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal measurements shown in illustration.

1. Clean the oil off the bearing journals.
2. Determine the maximum diameter of the journals with a micrometer. Measure at two locations 90° apart at each end of the journals.
3. Compare the measured rod journal diameter to the crankshaft connecting rod bearing journal diameter grade marking chart Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal that will provide the proper oil clearance. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
4. Compare the measured main bearing journal diameter to the crankshaft main bearing journal diameter grade marking chart Obtain the main bearing journal grade identification marks from the engine block and select the upper and lower main bearing sizes that will provide the proper oil clearance. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
5. For connecting rod journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **Engine - Specifications**.
6. For main bearing journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **Engine - Specifications**.

INSTALLATION

INSTALLATION

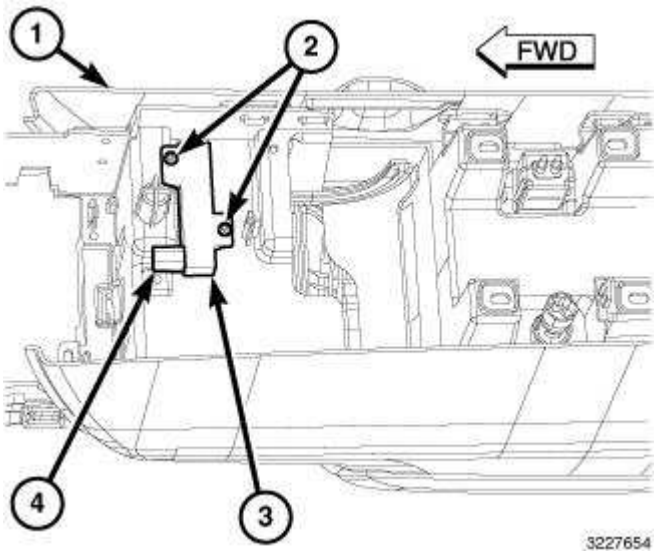

Fig. 445: Target Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If required, select and fit new crankshaft main bearings to the engine block. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
2. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
3. If removed, install the target wheel (1) to the crankshaft with four new bolts (2). Ensure the threaded holes in the crankshaft are free of residual thread lock adhesive. Tighten the bolts to 10 N.m (89 in. lbs.).

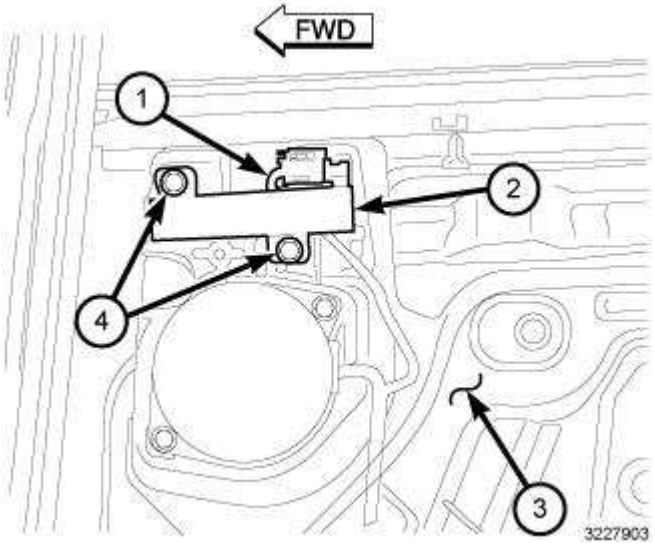

Fig. 446: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

4. If removed, lubricate and install the upper main bearing halves (6) into the engine block (7).

CAUTION: When installing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

5. Install the crankshaft (4) into the engine block (7).

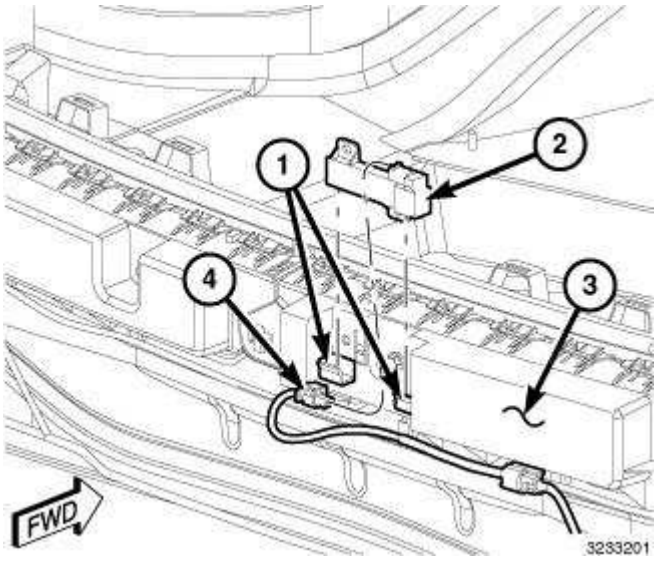

Fig. 447: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

6. Installing thrust washers (1) at the No. 2 main bearing location, using the following procedure:
    1. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
    2. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

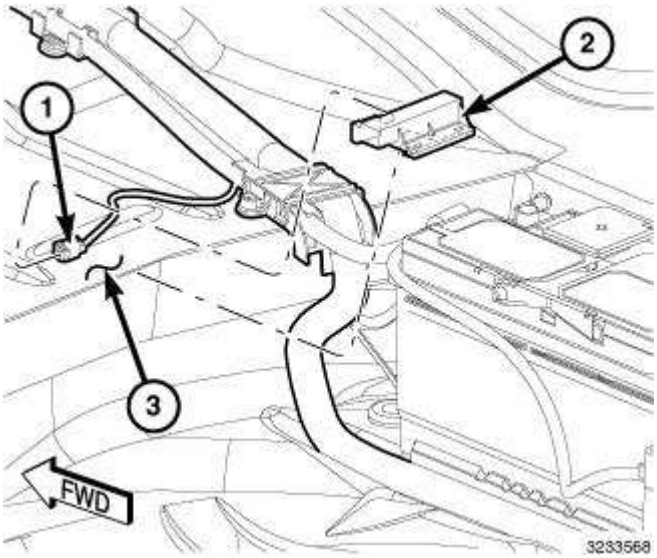

Fig. 448: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

7. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

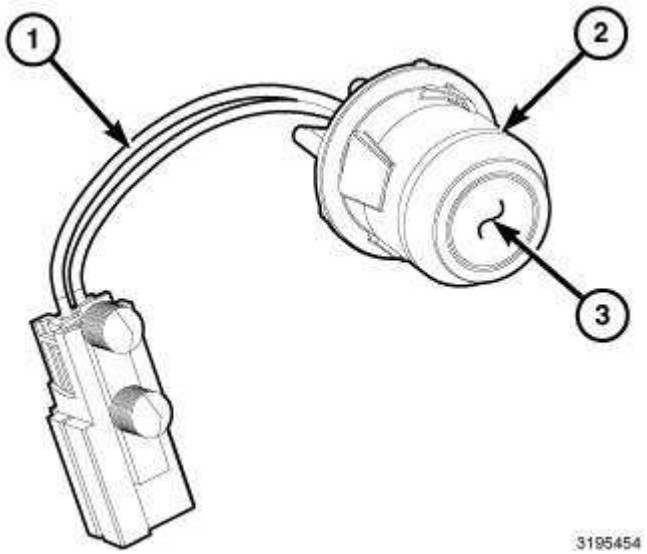

Fig. 449: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

8. If removed, lubricate and install the lower main bearing halves (3) onto the main caps (1).

9. Install the main bearing caps (1) with two inner main bearing cap bolts (2).

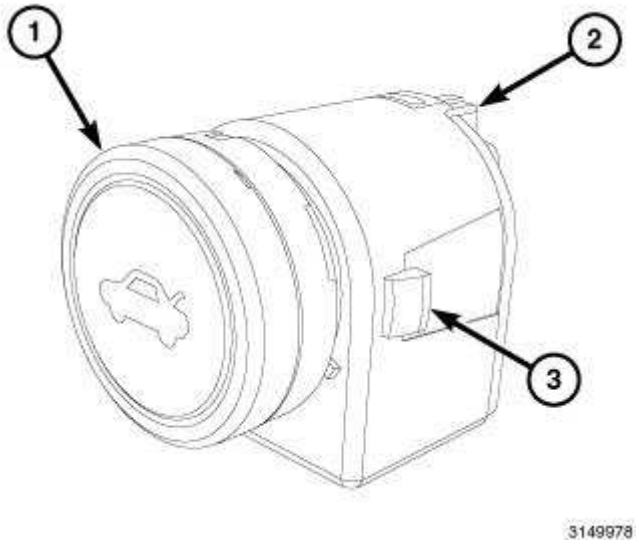

Fig. 450: Inner Main Bearing Cap Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the inner main bearing cap bolts in the sequence shown in illustration to 20 N.m (15 ft. lbs.) plus 90°.
11. Measure crankshaft end play. Refer to **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.

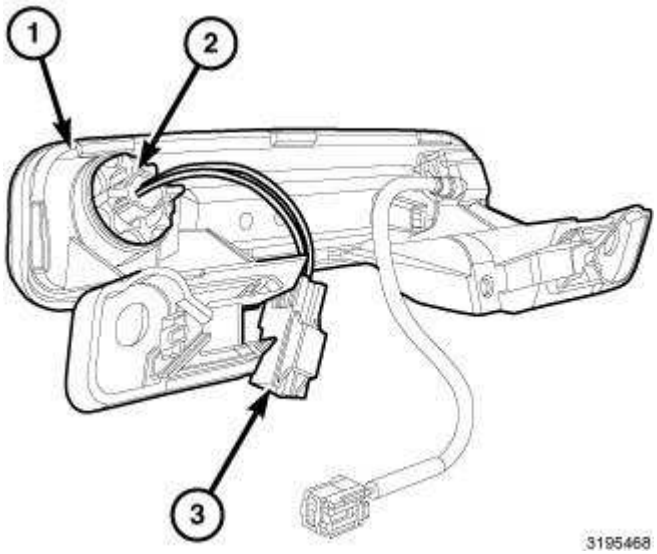

Fig. 451: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

12. If removed, install the bearing shell (8) on the connecting rod with the tang inserted into the

machined groove in the rod. Lubricate the bearing surface with clean engine oil.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

13. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

14. Pull the connecting rod and piston toward the crankshaft until the connecting rod is seated on the crankshaft journal. Remove the guide pins.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

15. If removed, install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

16. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
17. If required, check the connecting rod side clearance. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.
18. Repeat the previous steps for the remaining connecting rods.

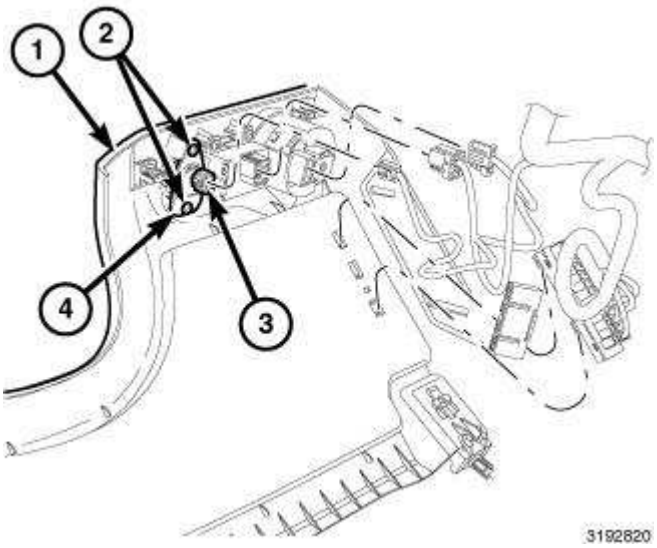

Fig. 452: Windage Tray With Main Bearing Cap Bolts Installation Sequence

Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray (1) with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.

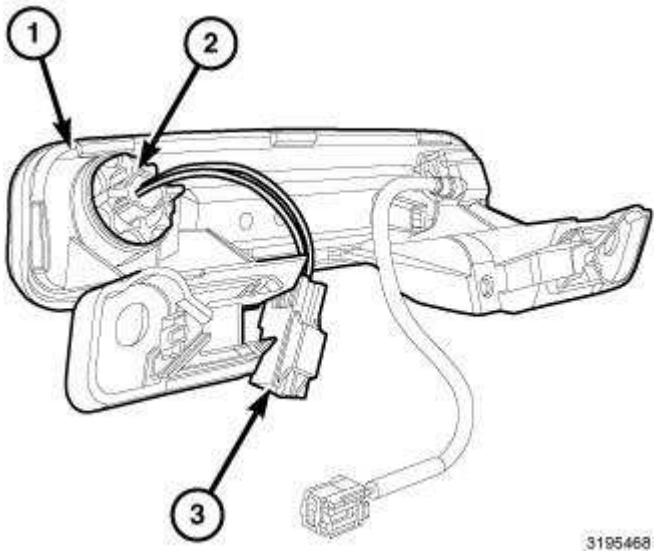

Fig. 453: Main Bearing Tie Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

20. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown in illustration to 28 N.m (21 ft. lbs.).
21. Install the engine oil pump and oil pump pick-up. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
22. Install the rear crankshaft oil seal and flexplate. Refer to **SEAL, CRANKSHAFT OIL, REAR, INSTALLATION**.
23. Install the timing chain and sprockets, engine timing cover, oil pans, spark plugs and cylinder head covers. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.

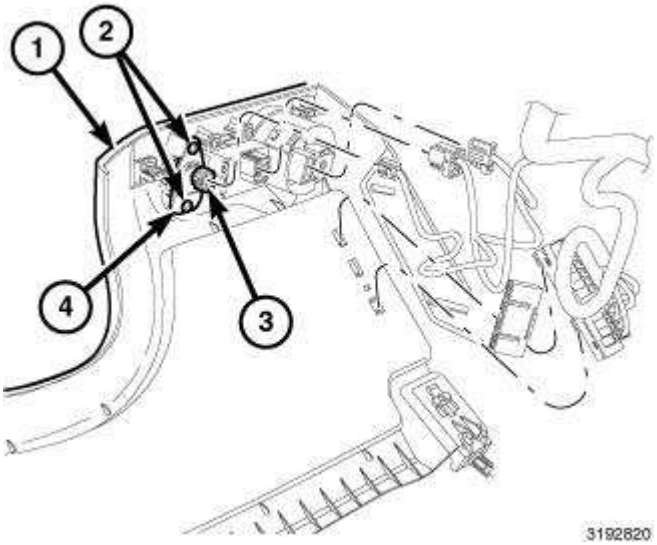

Fig. 454: Lifting Sling, Engine Lifting Brackets & Engine Hoist
Courtesy of CHRYSLER GROUP, LLC

24. Install the engine. Refer to **INSTALLATION**.
25. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
26. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
27. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
28. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

DAMPER, VIBRATION

REMOVAL

REMOVAL

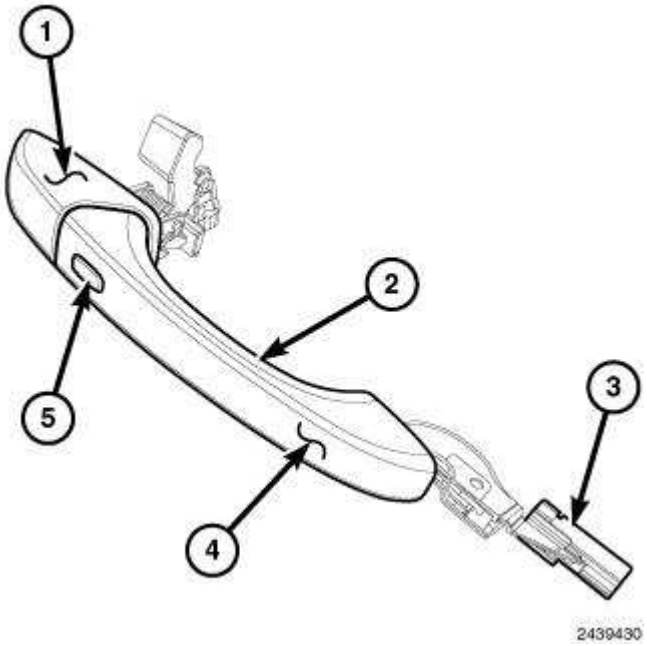

Fig. 455: Crankshaft Vibration Damper & Vibration Damper Holder
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

NOTE: A force greater than 350 N.m (260 ft. lbs.) may be required to remove the crankshaft vibration damper bolt.

2. Hold the crankshaft vibration damper (1) with Vibration Damper Holder (special tool #10198, Holder, Vibration Damper) (2) and remove the crankshaft vibration damper bolt.
3. Pull the crankshaft vibration damper (1) off of the crankshaft.

INSTALLATION

INSTALLATION

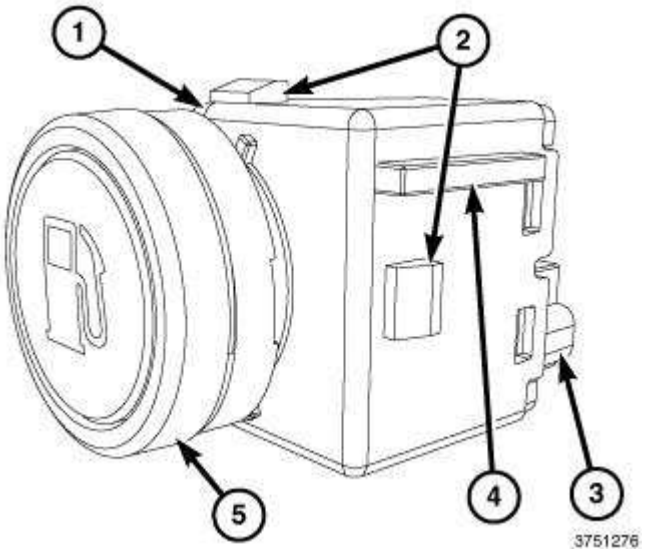

Fig. 456: Front Crankshaft Seal Surface
Courtesy of CHRYSLER GROUP, LLC

1. Apply a light coating of engine oil to the front crankshaft seal surface (1).

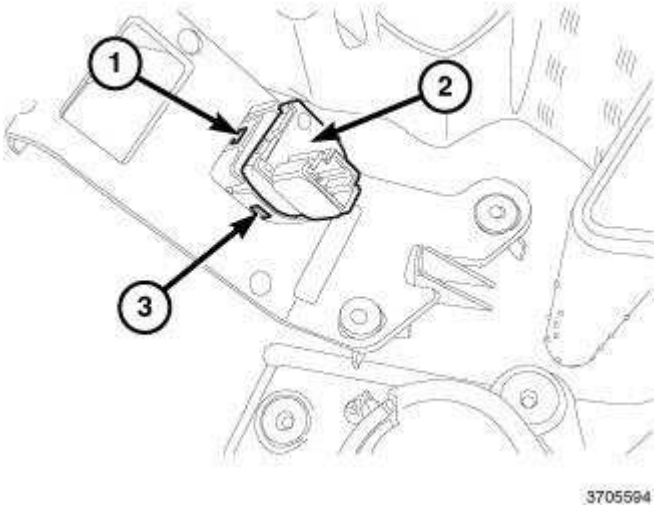

Fig. 457: Crankshaft Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Align the crankshaft vibration damper (1) to the flywheel key on the crankshaft and install the damper. Seat the damper on the crankshaft sprocket.
3. Install and hand tighten the crankshaft vibration damper bolt (2).

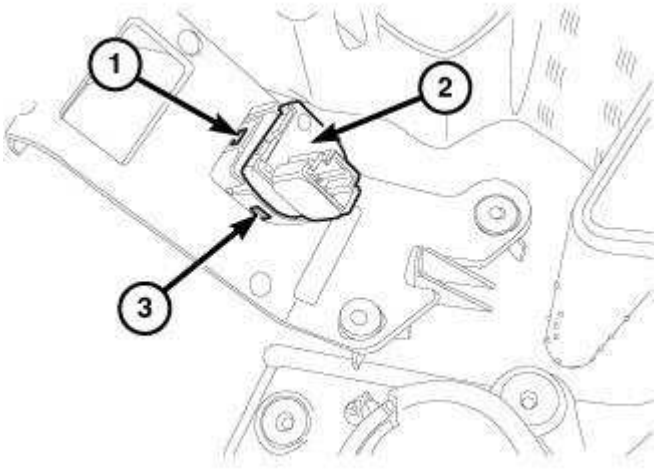

Fig. 458: Crankshaft Vibration Damper & Vibration Damper Holder
Courtesy of CHRYSLER GROUP, LLC

4. Hold the crankshaft vibration damper (1) with Vibration Damper Holder (special tool #10198, Holder, Vibration Damper) (2) and tighten the crankshaft vibration damper bolt to 40 N.m + 105° (30 ft. lbs. + 105°).
5. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

FLEXPLATE

REMOVAL

REMOVAL

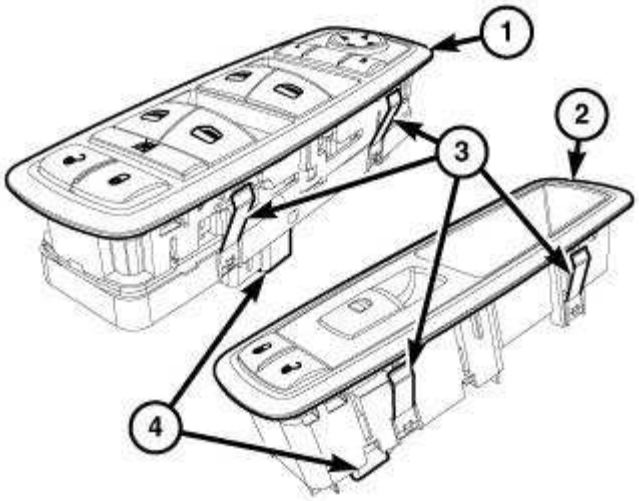

Fig. 459: Flexplate, Spacer Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .
2. Remove the bolts (1) and the spacer plate (2).
3. Remove the flexplate (3).

INSTALLATION

INSTALLATION

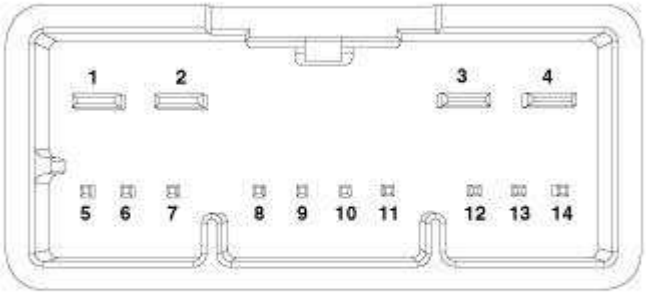

Fig. 460: Flexplate, Spacer Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the flexplate (3) onto the crankshaft.
2. Install the spacer (2) and the bolts (1) hand tight.
3. Tighten the flexplate retaining bolts (1) to 95 N.m (70 ft. lbs.) in a criss-cross pattern.
4. Install the transmission. Refer to **INSTALLATION** .

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

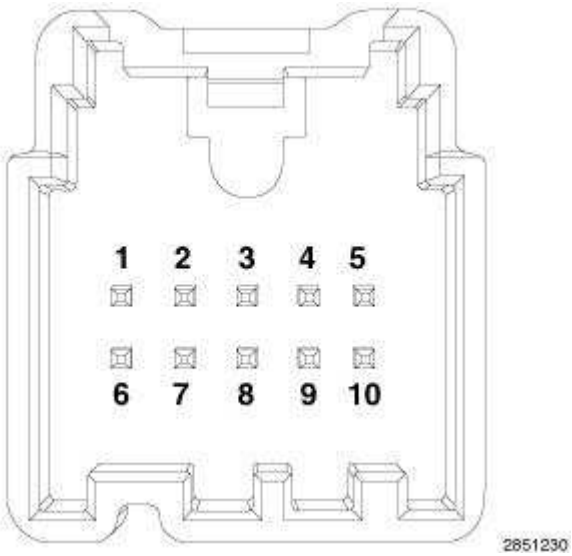

Fig. 461: Measuring Piston Ring End Gap
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the cylinder bore clean.
2. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder to a position 12 mm (0.50 in.) from the bottom of the cylinder bore.
3. Using a feeler gauge (1), check the ring end gap. Replace any rings not within specification.

Ring Position	Ring End Gap
No. 1 (top) Ring	0.25 - 0.40 mm (0.010 - 0.016 in.)
No. 2 (center) Ring	0.30 - 0.45 mm (0.012 - 0.018 in.)
Oil Control Ring (Steel Rail)	0.15 - 0.66 mm (0.006- 0.26 in.)

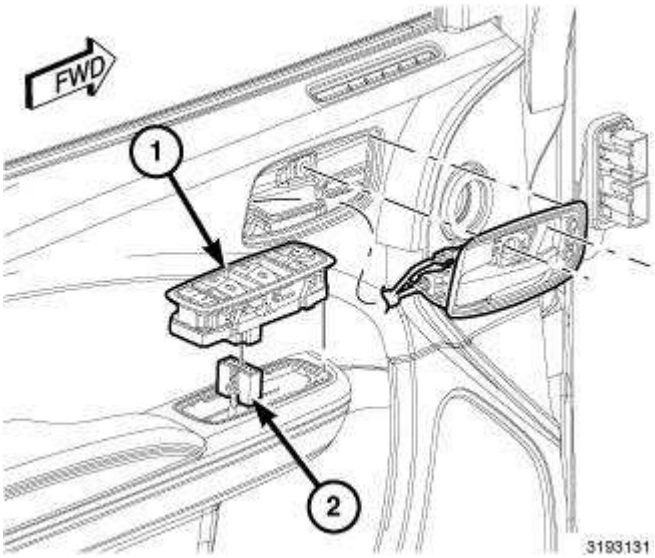

Fig. 462: Checking Piston Ring Grooves Clearances
Courtesy of CHRYSLER GROUP, LLC

4. Clean the piston ring grooves. Remove any nicks or burrs.
5. Measure the ring side clearance as shown in illustration. Make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.

Ring Position	Ring Side Clearance
No. 1 (top) Ring	0.025 - 0.033 mm (0.0010 - 0.0013 in.)
No. 2 (center) Ring	0.030 - 0.078 mm (0.0012 - 0.0031 in.)
Oil Control Ring (Steel Rails)	0.007 - 0.173 mm (.0003 - 0.0068 in.)

REMOVAL

REMOVAL

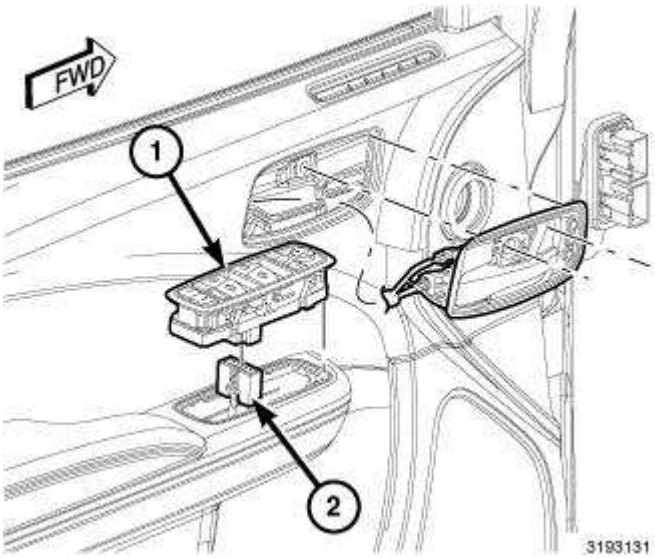

Fig. 463: Piston Ring Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. Remove the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, REMOVAL**.

CAUTION: To avoid damage to the piston rings, they must be removed in the following order:

- **No. 1 (upper) piston ring (1)**
- **No. 2 (intermediate) piston ring (2)**
- **Oil ring upper side rail (3)**
- **Oil ring lower side rail (4)**
- **Oil ring expander (5)**

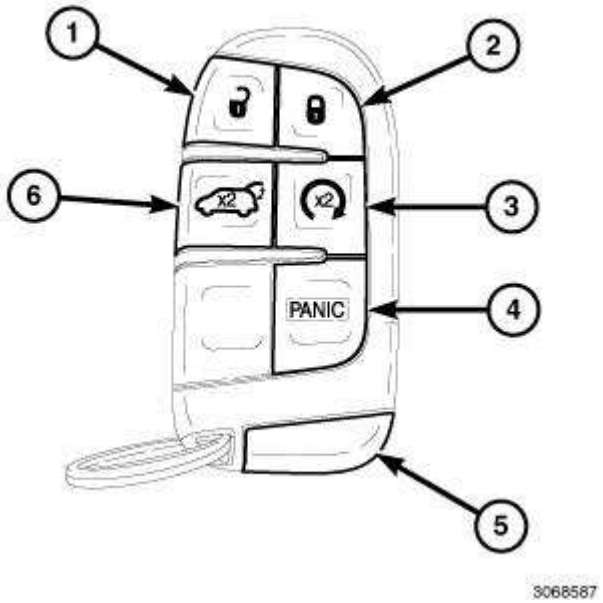

Fig. 464: Removing/Installing Upper & Intermediate Rings
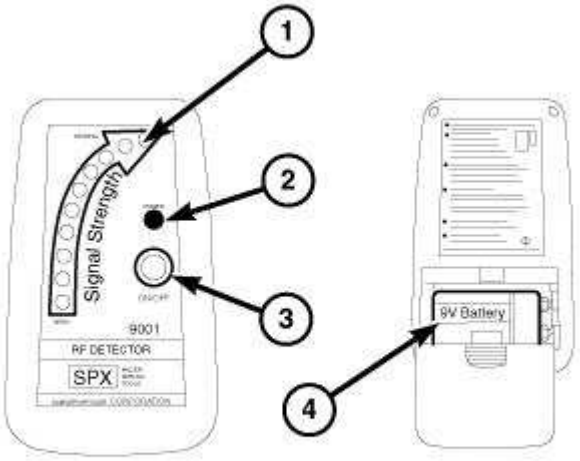
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

2. Remove the No. 1 (upper) piston ring using a ring expander tool.
3. Remove the No. 2 (intermediate) piston ring using a ring expander tool.



114508

Fig. 465: Removing/Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to remove the oil ring side rails.

4. Remove the oil ring upper side rail.
5. Remove the oil ring lower side rail.
6. Remove the oil ring expander (1).

INSTALLATION

INSTALLATION

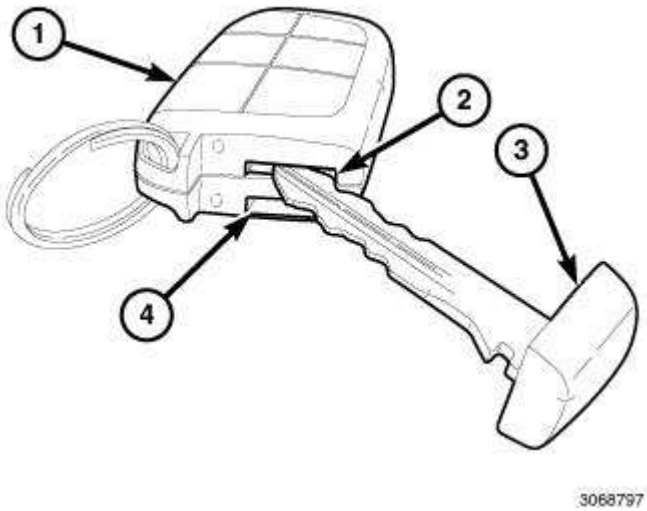


Fig. 466: Piston Ring Removal/Installation Sequence
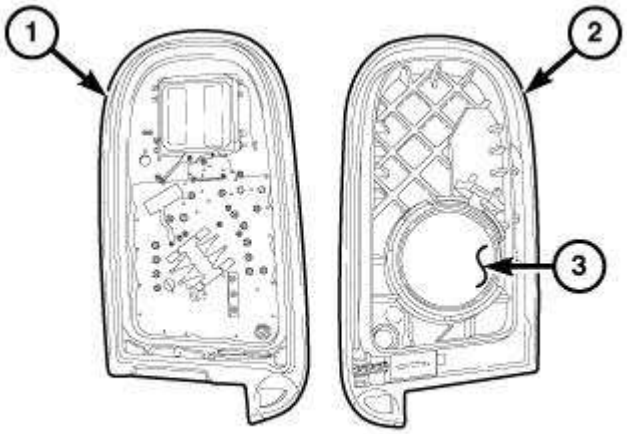
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. If required, fit new rings to the piston. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.

CAUTION: To avoid damage to the piston rings, they must be installed in the following order:

- **Oil ring expander (5)**
- **Oil ring lower side rail (4)**
- **Oil ring upper side rail (3)**
- **No. 2 (intermediate) piston ring (2)**
- **No. 1 (upper) piston ring (1)**

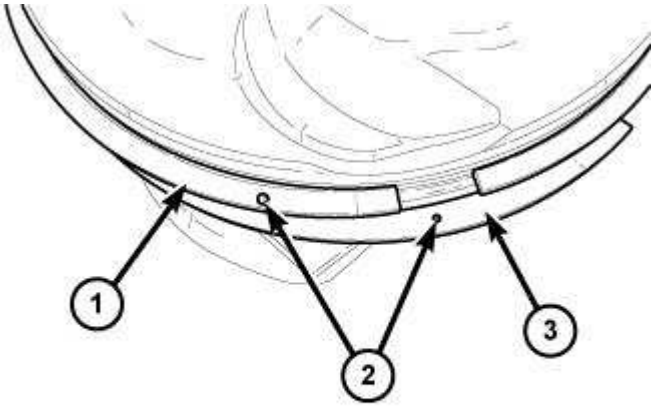


3068870

Fig. 467: Removing/Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to install the oil ring side rails.

2. Install the oil ring expander (1).
3. Install the oil ring lower side rail by placing one end between the piston ring groove and the oil ring expander. Hold this end firmly and press down the portion to be installed until the side rail is in position.
4. Install the oil ring upper side rail in the same manner as the lower side rail.



2791400

Fig. 468: Dot Marks On Piston Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The No. 1 (upper) piston ring (1) and No. 2 (intermediate) piston ring (3) have a different cross section. Install the rings with manufacturers I.D. mark (dot) (2) facing up, towards the top of the piston.**

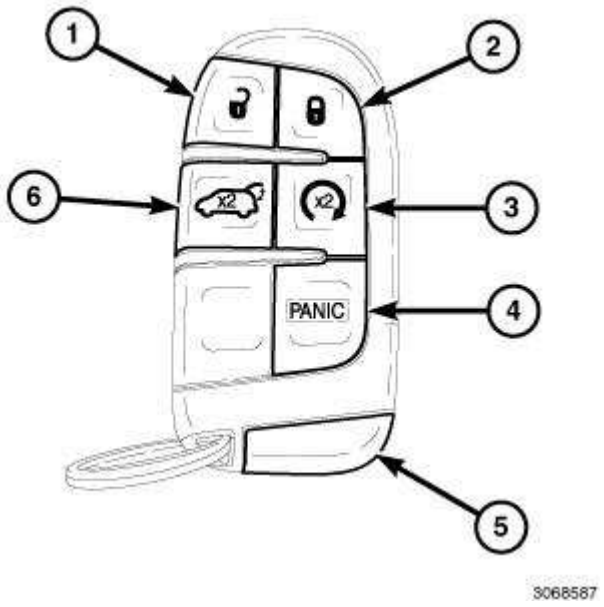


Fig. 469: Removing/Installing Upper & Intermediate Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical piston shown in illustration.**

5. Install the No. 2 (intermediate) piston ring using a ring expander tool.
6. Install the No. 1 (upper) piston ring using a ring expander tool.
7. Rotate the rings around the piston, the rings must rotate in the grooves with out binding.

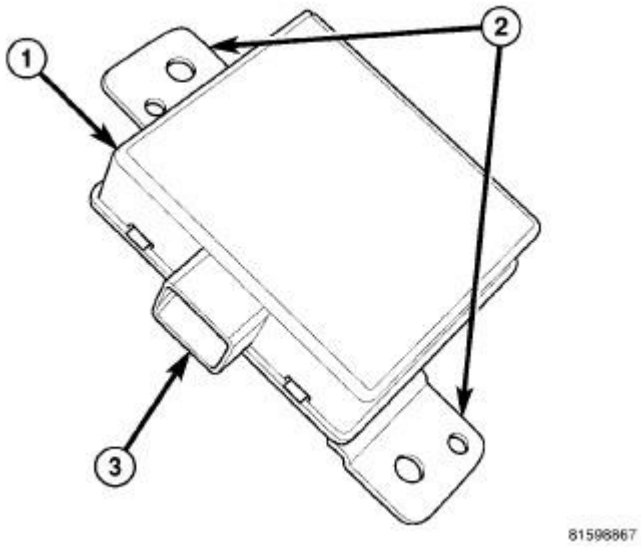

Fig. 470: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

8. Position the piston ring end gaps as follows:
    - Oil ring expander gap (5)
    - Oil ring lower side rail end gap (4)
    - Oil ring upper side rail end gap (1)
    - No. 2 (intermediate) ring end gap (5)
    - No. 1 (upper) ring end gap (2)
9. Install the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, INSTALLATION**.

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

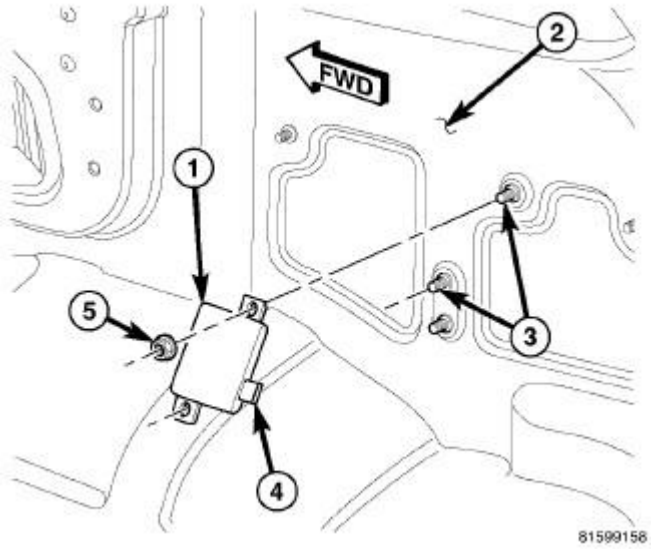

Fig. 471: Piston & Connecting Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are a lightweight design with ultra low tension piston rings for improved fuel economy. The pistons are made of a high strength aluminum alloy and the piston skirt has a Moly® coating. The top piston ring land has an anodized coating for improved wear. The piston is connected to the rod using a full floating pin with two locking clips. The connecting rod is forged steel with a bolted cracked cap design. The connecting rod bolts are not reusable. Pistons are available in two different diameters with grade markings for each bore indicated on the side of the cylinder block. The upper compression ring is a 1.2 mm steel ring with a spray coating. The intermediate compression ring is 1.2 mm micro napier design. Both compression rings have a dot or a mark on the piston ring. The marked side of the ring must face the top of the piston. The 2 mm three piece oil control ring is very thin. These are chrome plated rings and have a stainless steel expander.

STANDARD PROCEDURE

PISTON FITTING

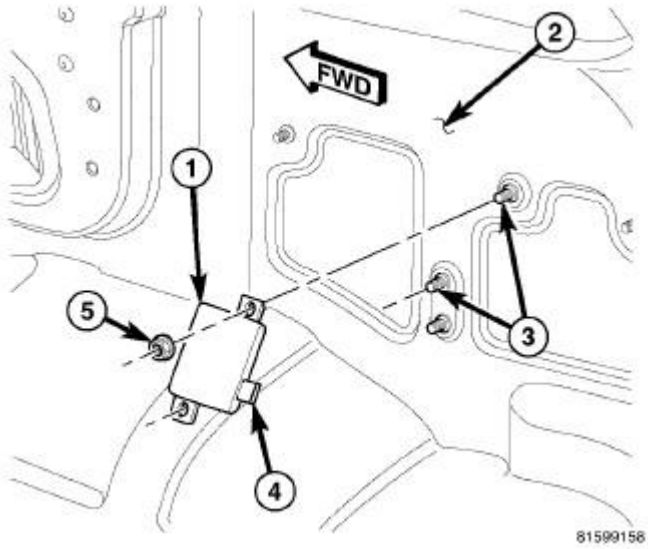

Fig. 472: Engine Block Main Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

The pistons are "select fit" to achieve proper oil clearance. Engine block cylinder bore diameter grade markings (1) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with cylinder number 1, 2, 3, 4, 5, 6.

Engine block cylinder bore diameter grade markings correspond to specific cylinder bore diameters. The chart below identifies the two engine block grade markings and their associated cylinder bore diameters.

Engine Block Marking	Cylinder Bore Size mm (in.)
1	95.995 ± 0.005 mm (3.7793 ± 0.0002 in.)
2	96.005 ± 0.005 mm (3.7797 ± 0.0002 in.)

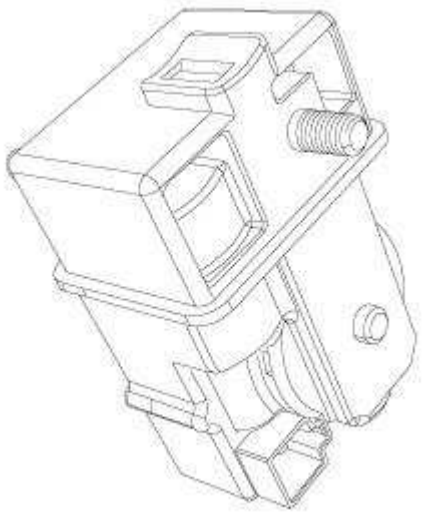

Fig. 473: Piston Size Located On Piston Crown
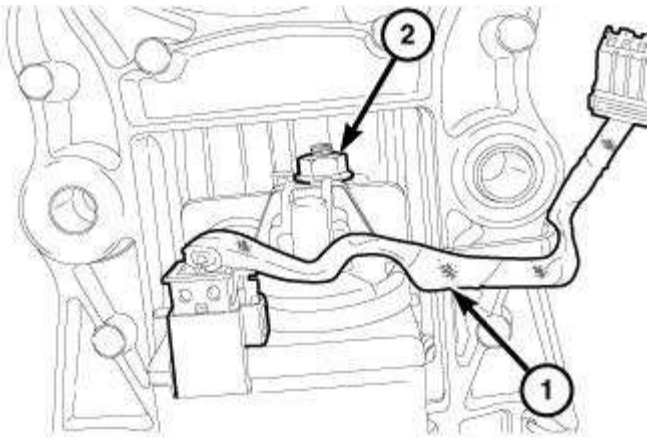
Courtesy of CHRYSLER GROUP, LLC

The piston is marked with the piston size (1 and 2) on the piston crown. The pistons are available in two different sizes in order to achieve the desired oil clearance. Select the piston size that corresponds to the engine block cylinder bore diameter grade markings for each cylinder.

Pistons are available in two sizes. The chart below identifies the two piston sizes.

Piston Marking	Size mm (in.)	
	Metal to Metal	Metal to Coating
1	95.995 ± 0.005 mm (3.7793 ± 0.0002 in.)	95.970 - 96.000 mm (3.7783 - 3.7795 in.)
2	95.965 ± 0.005 mm (3.7781 ± 0.0002 in.)	95.980 - 96.010 mm (3.7787 - 3.7835 in.)



3476879

Fig. 474: Coating Material On Piston
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

The coated pistons are serviced with the piston pin and connecting rod pre-assembled. The coating material (1 and 2) is applied to the piston after the final piston machining process. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

CONNECTING ROD SIDE CLEARANCE

DIAL INDICATOR

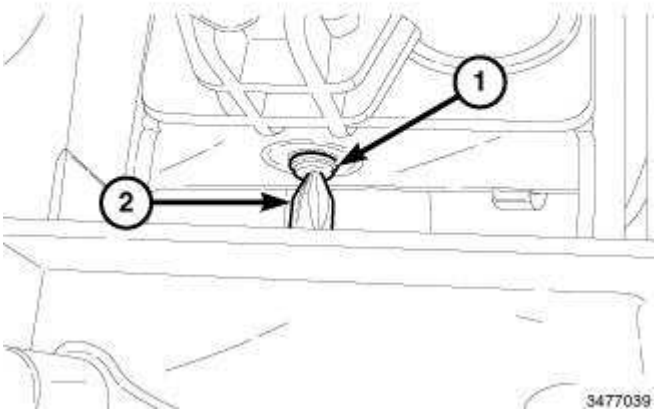


Fig. 475: Measuring Connecting Rod Side Clearance
Courtesy of CHRYSLER GROUP, LLC

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point on the engine. Locate the probe perpendicular to and resting against the connecting rod cap being checked.
2. Move the connecting rod all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the connecting rod forward to the limit of travel and read the dial indicator. Compare the measured side clearance to the specification. Refer to **Engine - Specifications**.
5. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

FEELER GAUGE

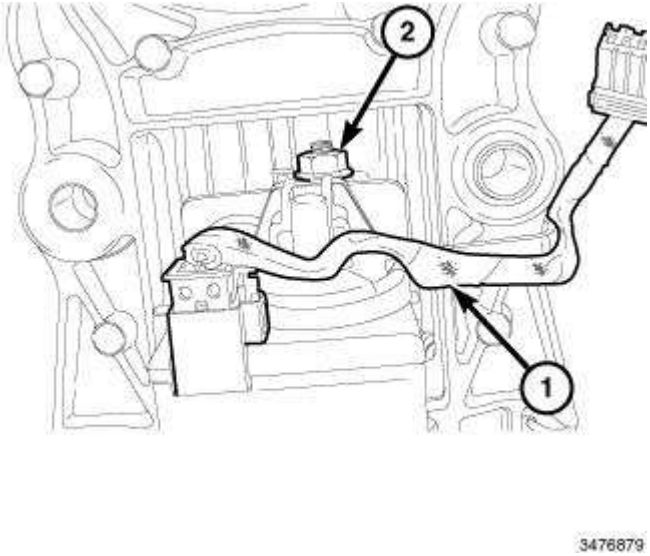

Fig. 476: Measuring Gap Between Connecting Rod & Crankshaft Journal Flange

Courtesy of CHRYSLER GROUP, LLC

1. Slide a snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. Compare the measured side clearance to the specification. Refer to **Engine - Specifications**.
2. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

REMOVAL

REMOVAL

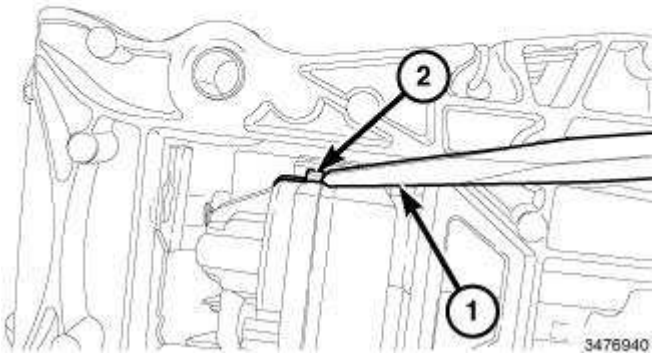

Fig. 477: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pans, engine timing cover and cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.
3. Remove the engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

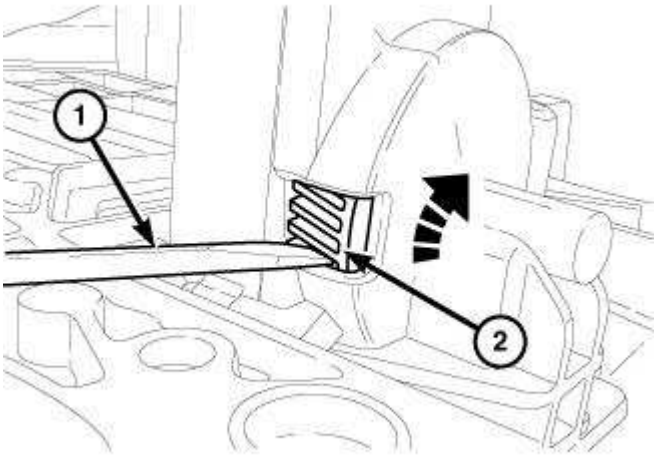

Fig. 478: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

5. If necessary, remove the top ridge of the cylinder bores with a reliable ridge reamer before removing the pistons from the engine block. **Be sure to keep the tops of pistons covered during this operation.** Pistons and connecting rods must be removed from the top of the engine block. When removing piston and connecting rod assemblies from the engine, rotate the crankshaft CW so that each connecting rod is centered in the cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

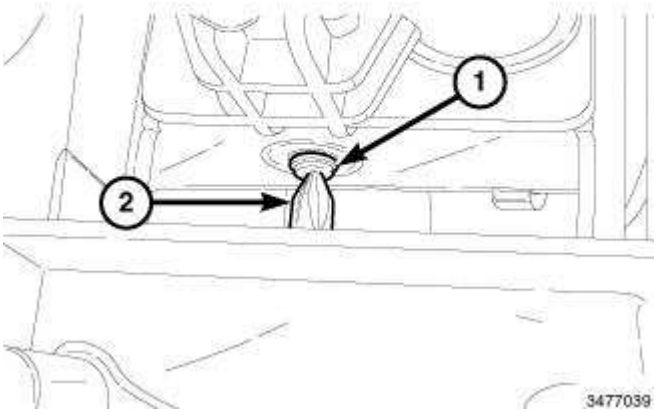

Fig. 479: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

9. Remove the piston and connecting rod (1) from cylinder bore.
10. Repeat the previous steps for each piston being removed.
11. Immediately after piston and connecting rod removal, reinstall the bearing cap (4) on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
12. If required, remove the piston rings. Refer to **RING(S), PISTON, REMOVAL**.
13. Repeat the previous steps for each piston being removed.

CLEANING

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

INSPECTION

INSPECTION

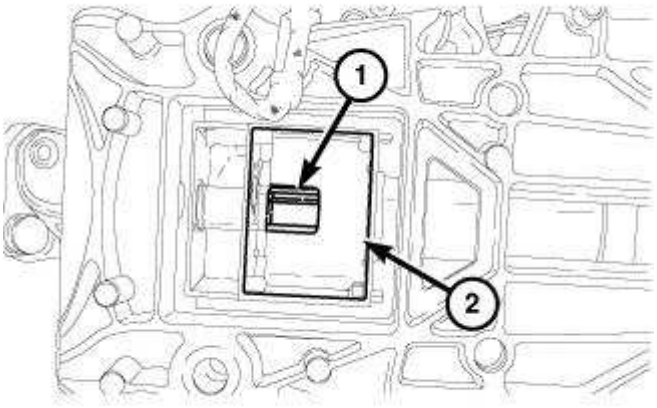

Fig. 480: Connecting Rod Bearing Shells & Bearing Size
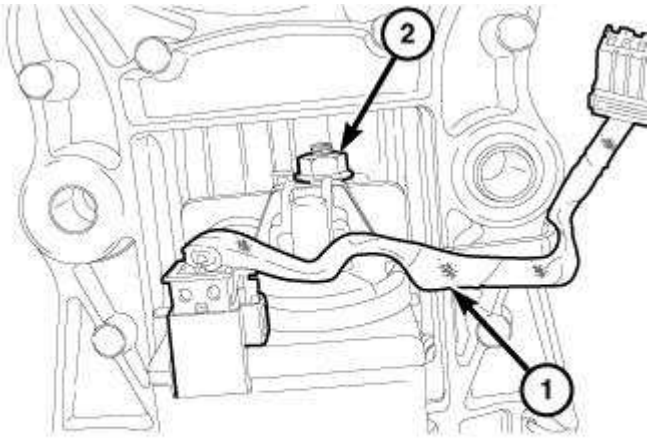
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the inserts (1) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Replace any bearing that shows abnormal wear. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.



3476879

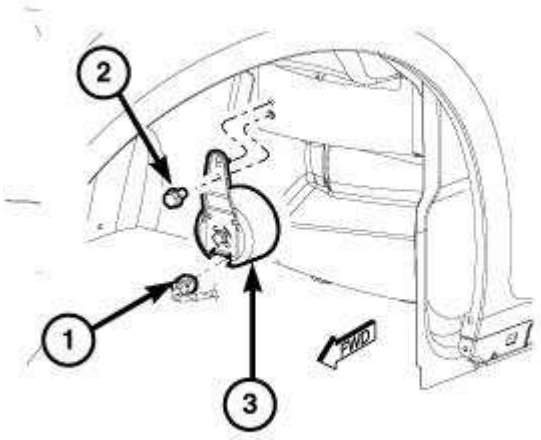
Fig. 481: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

6. Inspect the connecting rod bearing bores for signs of scoring, nicks and burrs.

NOTE: Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment.

7. Replace misaligned, bent or twisted connecting rods.

NOTE: Connecting rods are serviced with the piston pre-assembled. The pistons are "select fit" to achieve proper oil clearance. Refer to Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure.



3660951

Fig. 482: Coating Material On Piston
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

8. Inspect the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.
9. Check the piston for taper and out of round shape.

NOTE: The coating material (1 and 2) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is MANDATORY . Refer to Engine/Engine Block - Inspection.

10. Compare the measured cylinder bore diameter to the engine block cylinder bore grade marking chart Select the piston size that corresponds to the engine block markings for each cylinder to provide the proper oil clearance. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

NOTE: Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

NOTE: The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

INSTALLATION

INSTALLATION

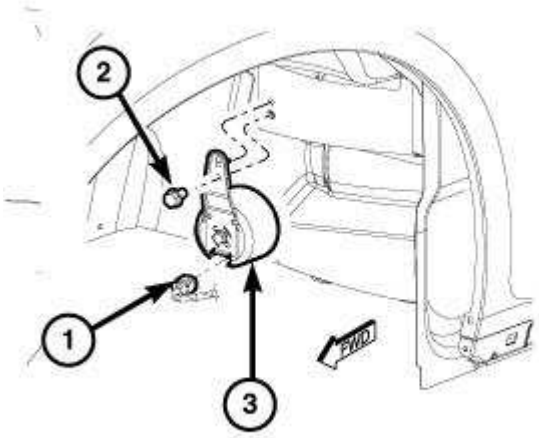


Fig. 483: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

1. If required, select and fit new piston and connecting rod assemblies to the engine block. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.
2. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
3. If required, hone the cylinder bores. Refer to **Engine/Engine Block - Standard Procedure**.
4. If removed, install the piston rings. Refer to **RING(S), PISTON, INSTALLATION**.
5. Position the piston ring end gaps as follows:
    - Oil ring expander gap (5)
    - Oil ring lower side rail end gap (4)
    - Oil ring upper side rail end gap (1)
    - No. 2 (intermediate) ring end gap (5)
    - No. 1 (upper) ring end gap (2)

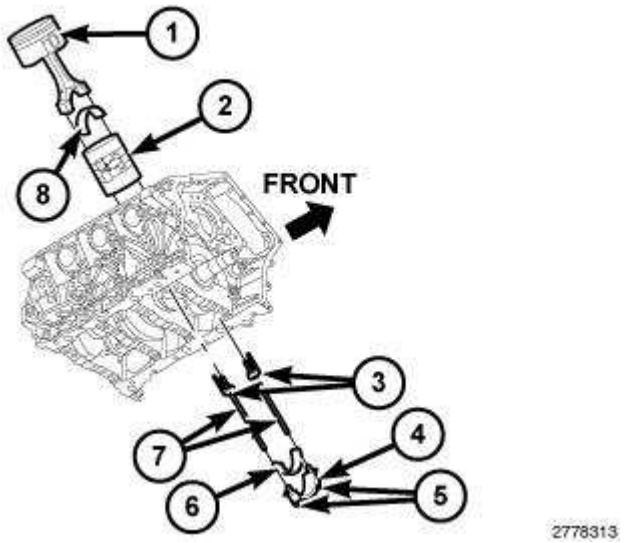

Fig. 484: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

NOTE: Ensure the position of the ring end gaps does not change when installing the ring compressor.

6. Lubricate the piston rings with clean engine oil. Position Piston Compressor (special tool #C-385, Compressor, Piston) (2) over the piston and rings. Tighten the compressor (2).

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

7. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being installed.

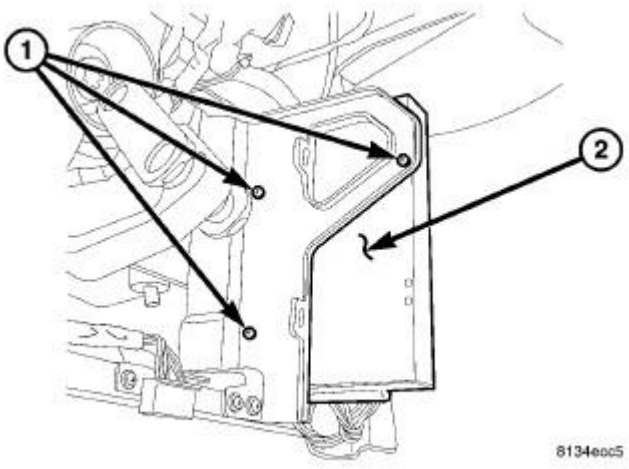

Fig. 485: Piston Installation Position
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right cylinder bank shown in illustration, left cylinder bank similar.

9. The pistons crowns are stamped with a mark (1) indicating installation position. This mark must be positioned toward the front of engine on both cylinder banks.
10. Wipe the cylinder bore clean and lubricate with clean engine oil.
11. Rotate the crankshaft until the connecting rod journal is on the center of cylinder bore.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

12. Insert the piston and connecting rod into the cylinder bore and carefully position the guide pins over the crankshaft journal.
13. Tap the piston down in the cylinder bore using a hammer handle while guiding the connecting rod into position over the rod journal.

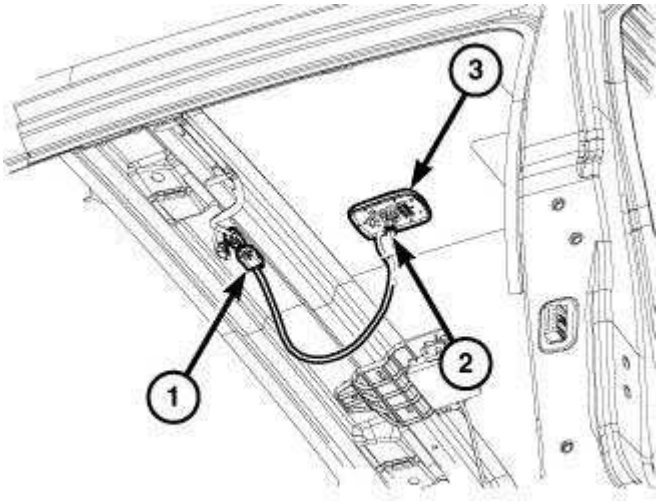

Fig. 486: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

14. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

15. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
16. If required, check the connecting rod side clearance. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.
17. Repeat the previous steps for each piston being installed.

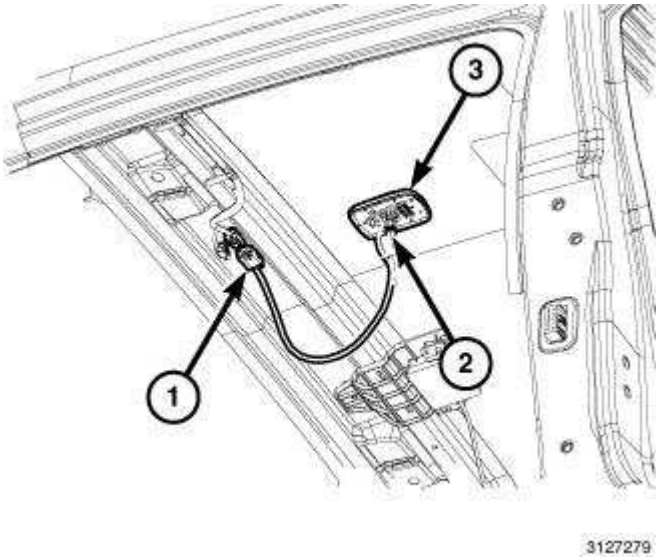

Fig. 487: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

18. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

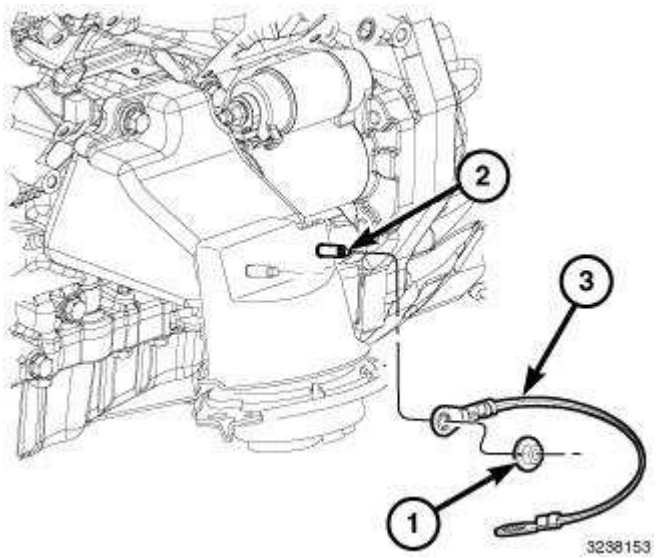

Fig. 488: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.
20. Install the engine oil pump and oil pump pick-up. Refer to **PUMP, ENGINE OIL,**

INSTALLATION.

21. Install the cylinder heads, engine timing cover and oil pans. Refer to **CYLINDER HEAD, INSTALLATION**.
22. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
23. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
24. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
25. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

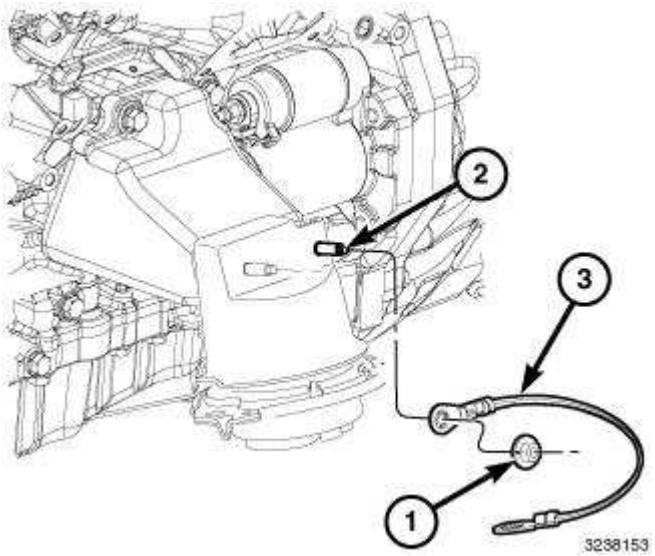

Fig. 489: Sleeve & Flywheel Key
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt and the crankshaft vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.
2. Install the sleeve (2) from Seal Remover (special tool #8511, Remover, Seal) around the flywheel key (1) and onto the nose of the crankshaft.

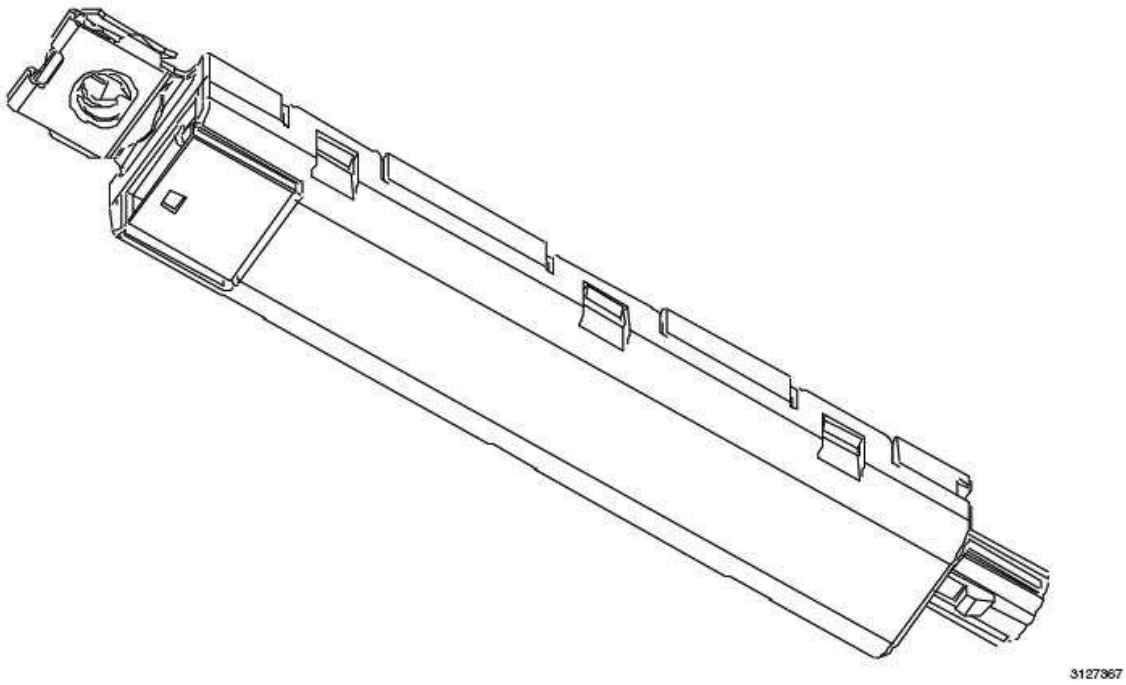

Fig. 490: Seal Remover & Front Crankshaft Oil Seal
Courtesy of CHRYSLER GROUP, LLC

3. Screw Seal Remover (special tool #8511, Remover, Seal) (1) into the front crankshaft oil seal (2).

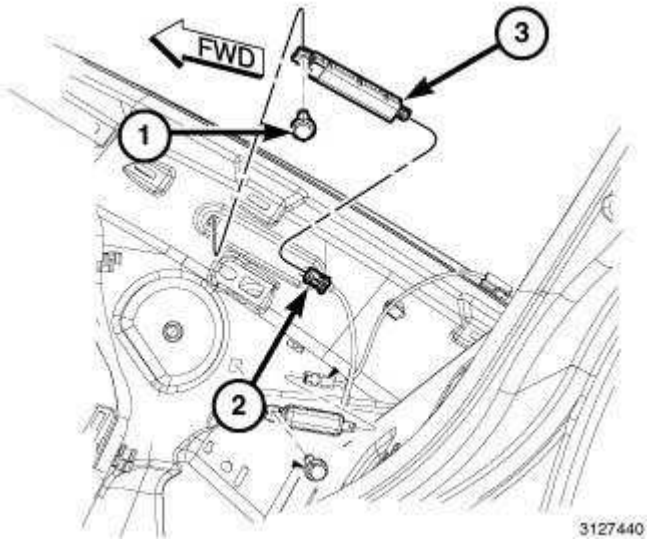

Fig. 491: Extractor Screw, Seal Remover & Front Crankshaft Oil Seal
Courtesy of CHRYSLER GROUP, LLC

4. Install the extractor screw (2) into the Seal Remover (special tool #8511, Remover, Seal) (1). Hold the seal remover stationary and tighten the extractor screw against the sleeve until the front crankshaft oil seal (3) is removed from the engine timing cover.

INSTALLATION

INSTALLATION

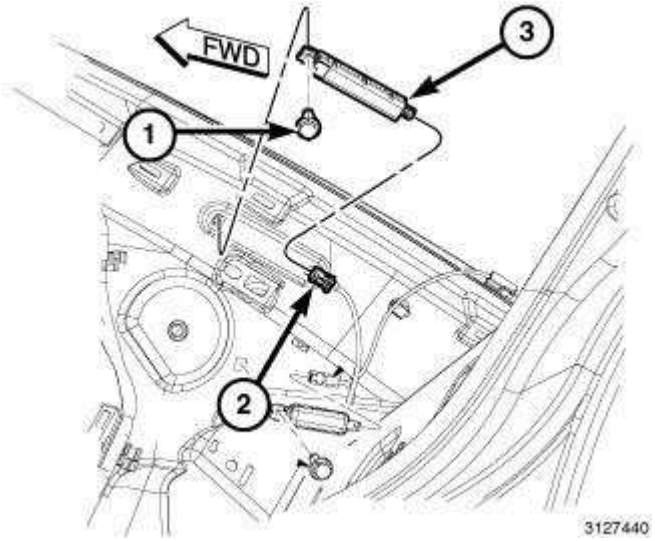

Fig. 492: Front Crankshaft Seal Installer & Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the front crankshaft oil seal (3) into place on the engine timing cover.
2. Align the Front Crankshaft Seal Installer (special tool #10199, Installer, Crankshaft Front Oil Seal) (1) to the flywheel key on the crankshaft and against the front crankshaft oil seal (3).

CAUTION: Only tighten the crankshaft vibration damper bolt until the oil seal is seated in the cover. Overtightening of the bolt can crack the front timing cover.

3. Install and tighten the crankshaft vibration damper bolt (2) until the Crankshaft oil seal is seated in the engine timing cover.
4. Install the crankshaft vibration damper and accessory drive belt. Refer to **DAMPER, VIBRATION, INSTALLATION**.

SEAL, CRANKSHAFT OIL, REAR

REMOVAL

REMOVAL

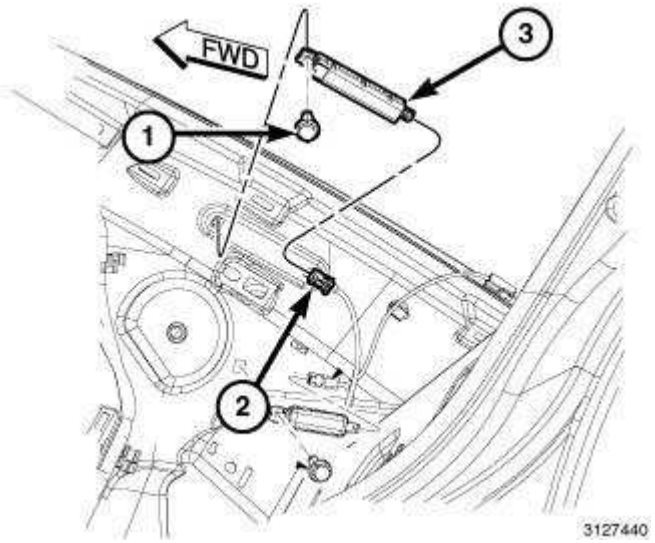

Fig. 493: Seal Retainer & Attaching Screws
Courtesy of CHRYSLER GROUP, LLC

The rear crankshaft oil seal is incorporated into the seal retainer (2) and can not be removed from the retainer. The rear crankshaft oil seal and seal retainer (2) are serviced as an assembly.

1. Remove the transmission. Refer to **REMOVAL** .
2. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL**.
3. Remove the upper oil pan. Refer to **PAN, OIL, REMOVAL**.
4. Remove the eight seal retainer attaching screws (1).
5. Remove and discard the seal retainer (2).

INSTALLATION

INSTALLATION

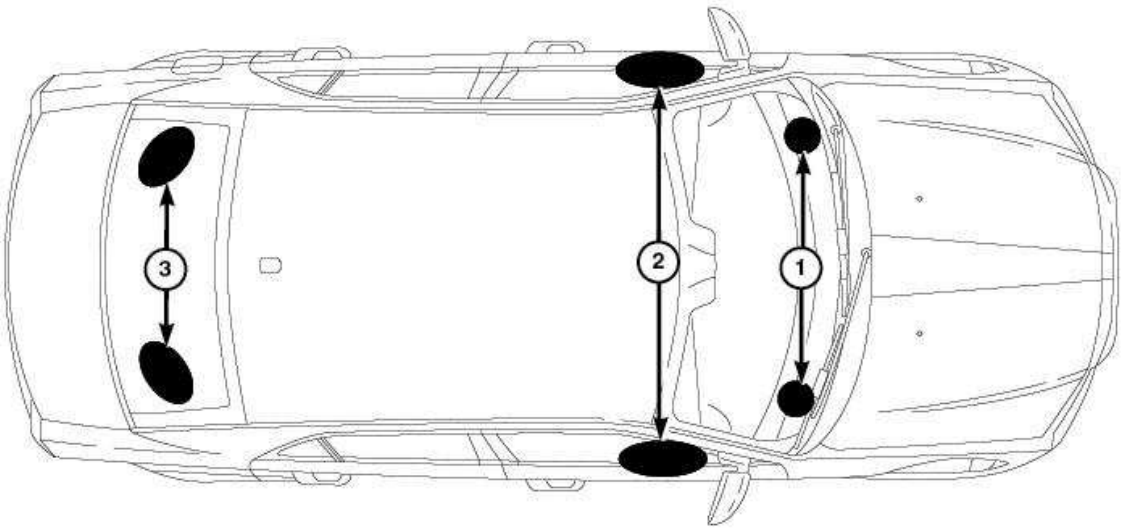

Fig. 494: Rear Crankshaft Oil Seal, Retainer & Seal Protector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rear crankshaft oil seal (2) and retainer (1) are an assembly. To avoid damage to the seal lip, DO NOT remove the seal protector (3) from the rear crankshaft oil seal before installation onto the engine.

CAUTION: Whenever the crankshaft is replaced, the rear crankshaft oil seal must also be replaced. Failure to do so may result in engine fluid leakage.

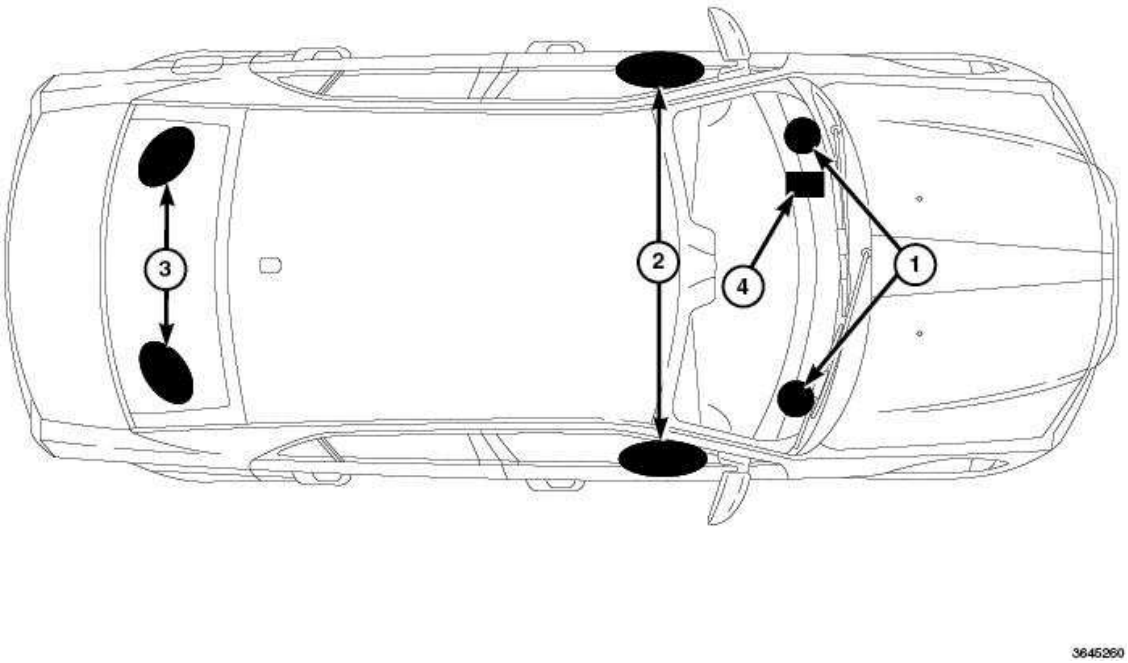

Fig. 495: Oil Seal Retainer Assembly & Seal Protector
Courtesy of CHRYSLER GROUP, LLC

1. Inspect the crankshaft to make sure there are no nicks or burrs on the seal surface.
2. Clean the engine block sealing surfaces thoroughly.

NOTE: **It is not necessary to lubricate the seal or the crankshaft when installing the seal retainer. Residual oil following installation can be mistaken for seal leakage.**

3. Carefully position the oil seal retainer assembly (2), and seal protector (1) on the crankshaft and push firmly into place on the engine block (during this step, the seal protector will be pushed from the rear oil seal assembly as a result of installing the rear oil seal).

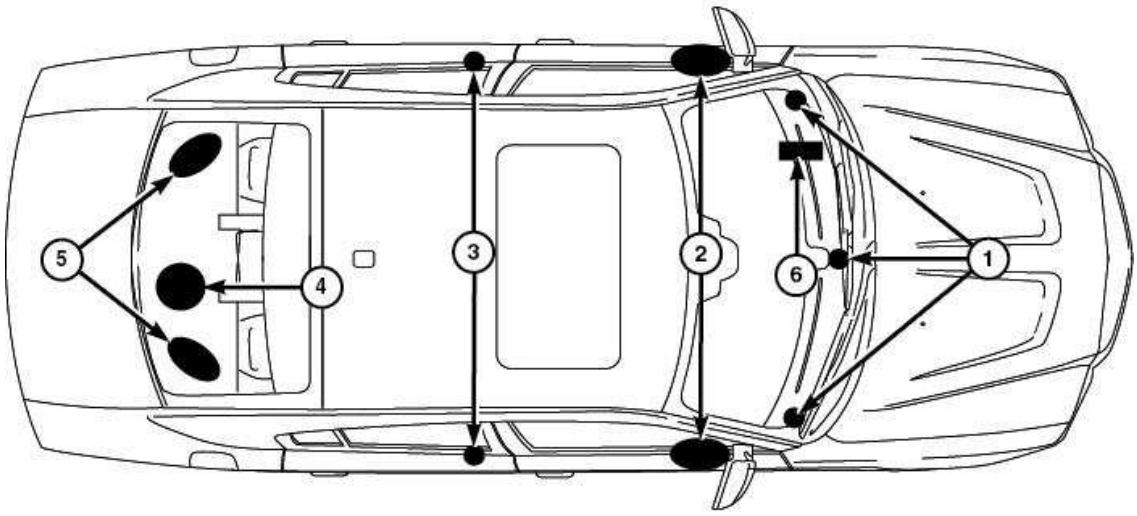

Fig. 496: Rear Seal Installed
Courtesy of CHRYSLER GROUP, LLC

4. Verify that the seal lip (2) on the retainer is uniformly curled inward toward the engine on the crankshaft (1).

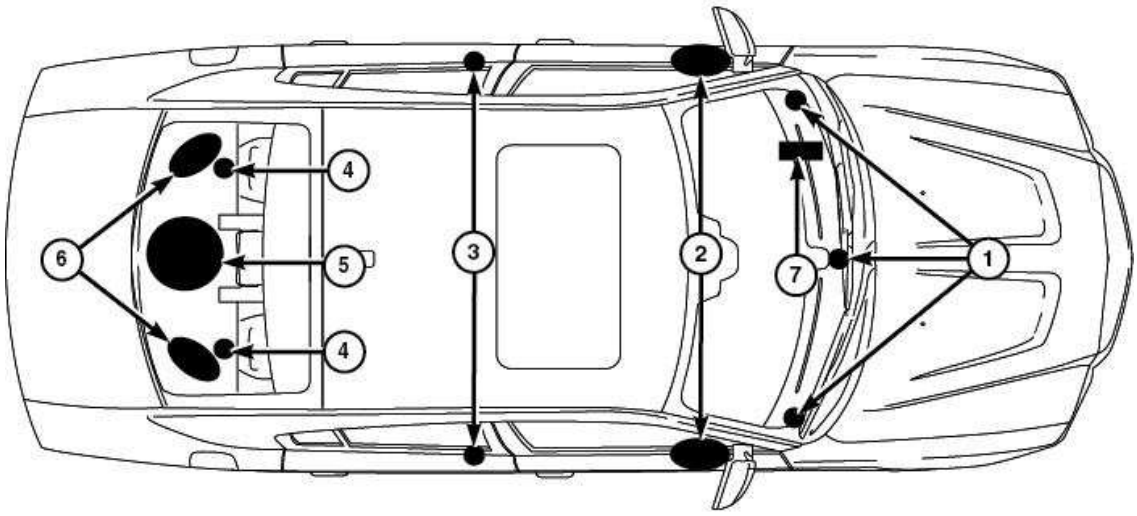

Fig. 497: Seal Retainer & Attaching Screws
Courtesy of CHRYSLER GROUP, LLC

5. Install the eight seal retainer bolts (1) and tighten to 12 N.m (106 in. lbs.).

NOTE: Make sure that the seal retainer flange is flush with the engine block oil pan sealing surface.

6. Install the upper oil pan. Refer to **PAN, OIL, INSTALLATION**.
7. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION**.
8. Install the transmission. Refer to **INSTALLATION** .
9. Fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

ENGINE MOUNTING

INSULATOR, ENGINE MOUNT, LEFT

REMOVAL

REMOVAL

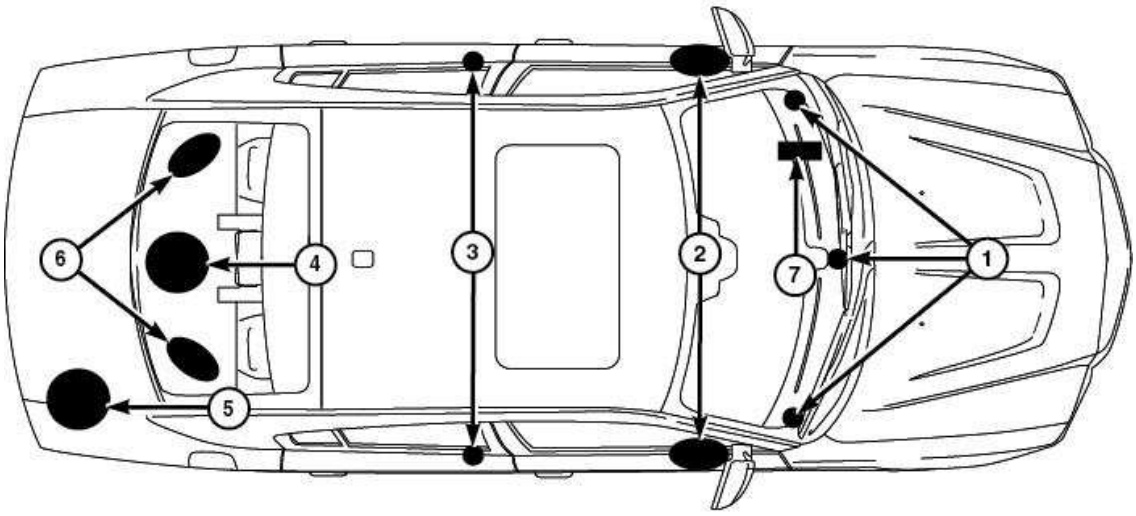

Fig. 498: Negative Battery Cable

5. Install two bolts (2) to the rear engine mount isolator and tighten to 65 N.m (48 ft. lbs.).
6. Lower the vehicle.

LUBRICATION

DESCRIPTION

DESCRIPTION

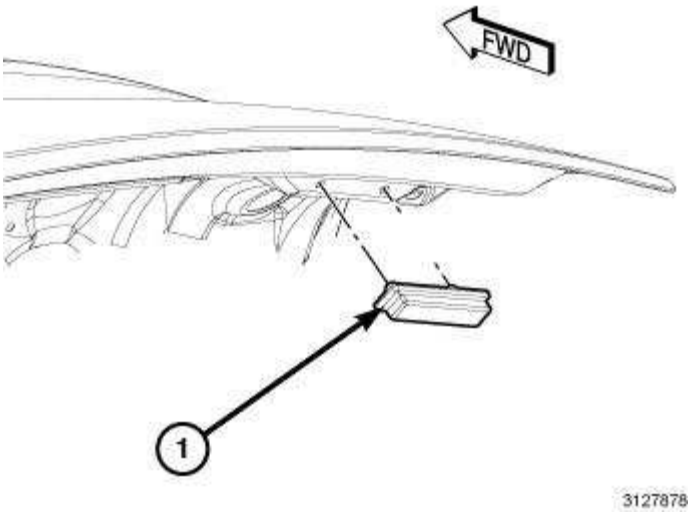

Fig. 540: 3.6L Engine
Courtesy of CHRYSLER GROUP, LLC

The lubrication system is a full flow filtration, pressure feed type lubrication system. The oil pump is mounted to the bottom of the cylinder block and chain driven by the crankshaft sprocket. The oil pump pick-up tube is attached to the oil pump and supported at the windage tray. There are three oil gallery plugs installed in the engine block. A system oil pressure sensor allows oil pressure to be monitored with a diagnostic scan tool. The oil pressure and oil temperature sensors are located on the oil filter housing assembly which is mounted to the top of the engine block between the cylinder heads. The oil cooler is mounted to the oil filter housing. There is a pressure relief valve in the oil pump that is only activated on a cold start or for emergency relief since the oil pump output is self-regulating. There are three piston oil cooler jets mounted to the engine block. Each jet cools two pistons.

OPERATION

OPERATION

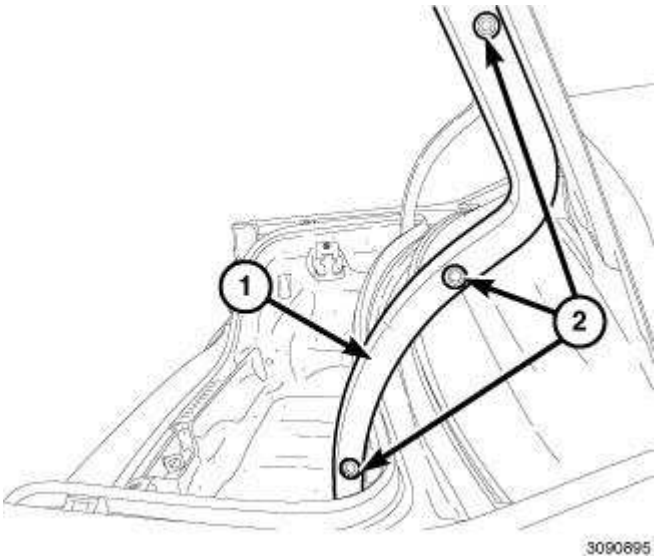

Fig. 541: Engine Lubrication Flow
Courtesy of CHRYSLER GROUP, LLC

The oil from the oil pan is pumped by a vane type oil pump mounted to the bottom of the cylinder block that is chain driven by the crankshaft sprocket. The oil from the pump travels to the oil filter element and then to the oil cooler assembly. After the oil has been filtered and cooled, the oil enters the main oil gallery. The pressurized oil travels through the main gallery to the four main journals to lubricate the crankshaft main bearings. The pressurized oil travels through the crankshaft main journals to cross-drilling supplying oil to the connecting rod journals. From the number one main bearing gallery, oil travels to the right secondary chain tensioner and to the primary chain idler shaft. The main oil gallery also supplies oil to three sets of piston oil cooling jets. From the cylinder block the oil flows through drillings into the left and right cylinder heads. Left cylinder head oil is supplied to the left secondary timing chain tensioner, camshaft journals and hydraulic lash adjusters. Right cylinder hear oil is supplied to the right camshaft journals and hydraulic lash adjusters. The camshaft valve

lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Oil also flows through each of the four forward camshaft bearings into the camshafts and phasers.

DIAGNOSIS AND TESTING

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or de-grease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of the oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles),

and repeat the inspection.

If the oil leak source is not positively identified at this time, proceed with the AIR LEAK DETECTION TEST METHOD below.

AIR LEAK DETECTION TEST METHOD

1. Disconnect the make-up air hose from the cylinder head cover. Cap or plug the make-up air hose nipple.
2. Remove the PCV hose from the PCV valve. Cap or plug the PCV valve nipple.
3. Attach an air hose with a pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

4. Gradually increase air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected leak source. Adjust the regulator to a suitable test pressure within this range that provides the best bubble generation which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.
5. If the leakage occurs at the rear oil seal area, follow the procedures for rear seal area leaks. Refer to **Engine/Lubrication - Diagnosis and Testing**.
6. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and make-up air hoses.
7. Clean the oil off of the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

CHECKING ENGINE OIL PRESSURE

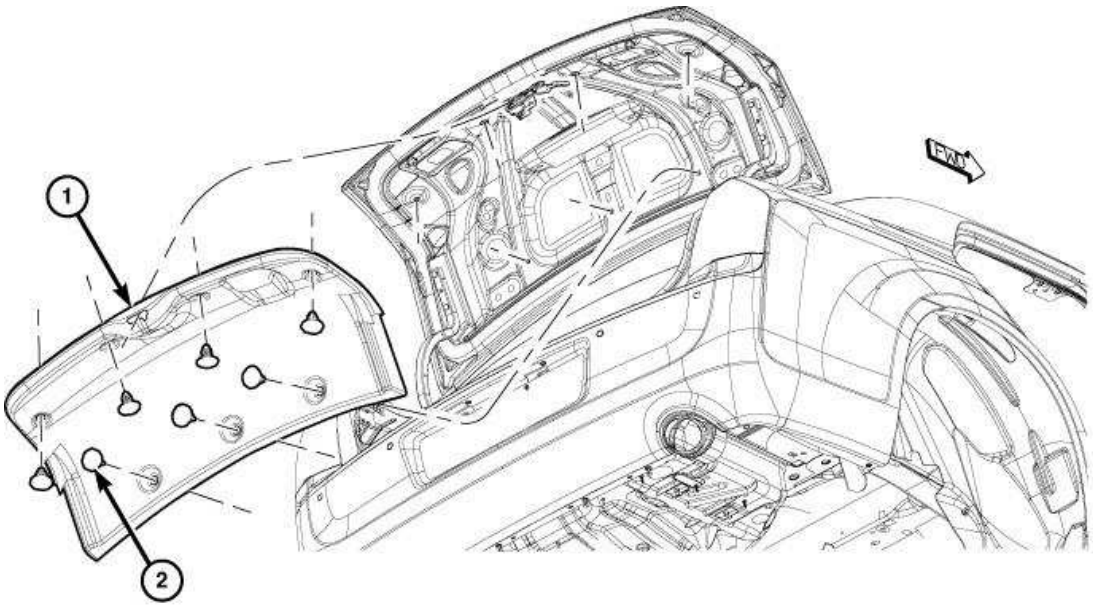

Fig. 542: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pressure sensor (2) from the oil filter housing (3). Refer to **SENSOR, OIL PRESSURE, REMOVAL**.

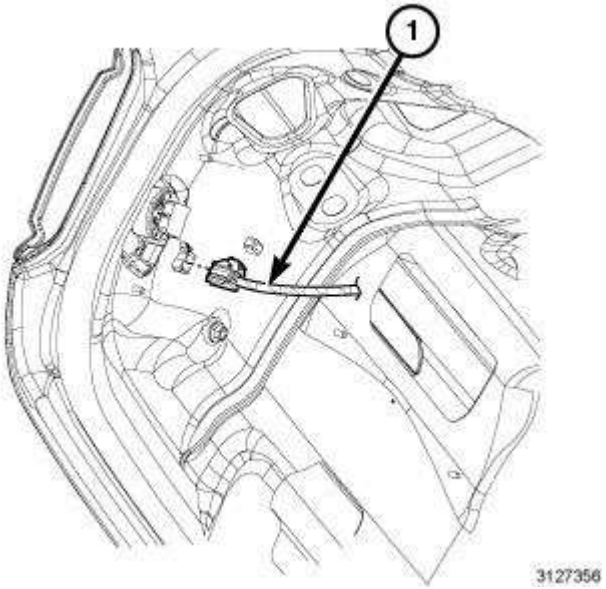

Fig. 543: Pressure Gauge Installed To Oil Pressure Port
Courtesy of CHRYSLER GROUP, LLC

3. Install Pressure Gauge (special tool #C-3292A, Gauge, Pressure) (1) to the oil pressure port. Tighten to 20 N.m (177 in. lbs.).
4. Install the upper and lower intake manifolds and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
6. Start and idle the engine. If oil pressure is 0 at idle, shut off the engine and consult the Engine Lubrication and Diagnostic Table. Refer to **ENGINE LUBRICATION DIAGNOSTIC TABLE**.
7. Run the engine until it reaches normal operating temperature.
8. Verify that the engine has acceptable oil pressure. Refer to **Engine - Specifications**.

REAR SEAL AREA LEAKS

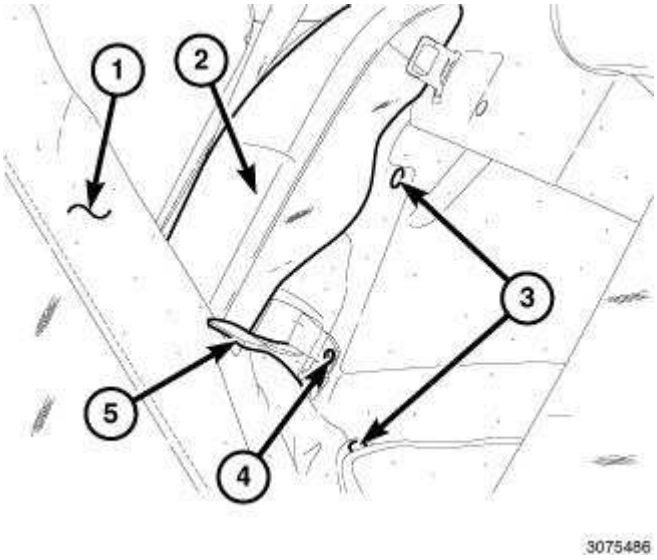

Fig. 544: Side Engine-To-Transmission Bolt, Transmission Dust Shield Retaining Bolt & Dust Shield
Courtesy of CHRYSLER GROUP, LLC

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the bolt (2) and the torque converter dust shield (3).

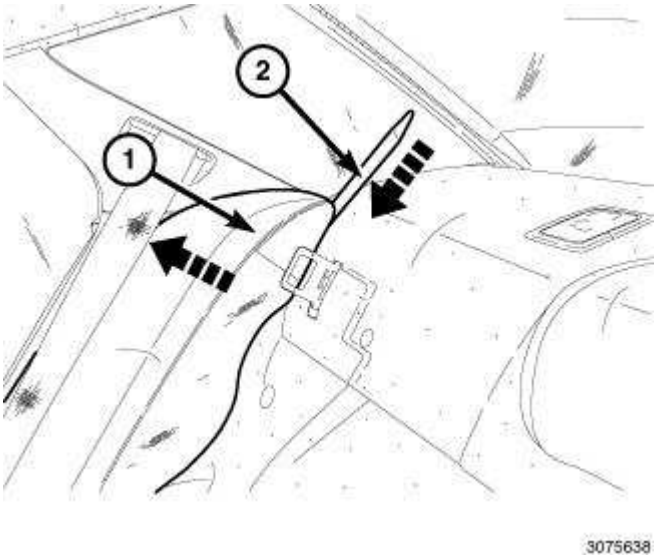

Fig. 545: Rubber Plugs
Courtesy of CHRYSLER GROUP, LLC

4. Remove two rubber plugs (1) covering the rear oil seal retainer flange bolts.
5. Inspect the flexplate and rear of the block for evidence of oil. Use a black light to check for the oil leak:
    1. Circular spray pattern generally indicates seal leakage or crankshaft damage.
    2. Where leakage tends to run straight down, possible causes are a porous block, rear oil seal retainer, oil galley pipe plug and rear seal retainer to oil pan mating surfaces.
6. If no leaks are detected, use the Air Leak Detection Method as outlined in Engine Oil Leak. Refer to **AIR LEAK DETECTION TEST METHOD**.

    CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

7. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

    CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

8. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.

COOLER, OIL

DESCRIPTION

DESCRIPTION

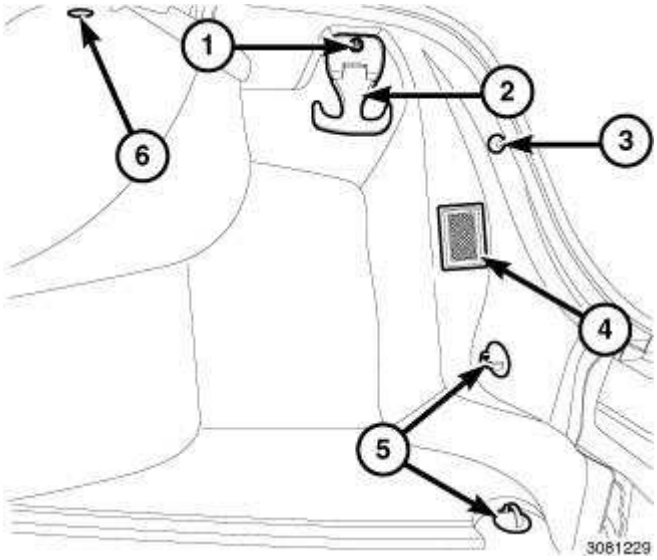

Fig. 546: Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil cooler is attached to the top of the oil filter housing which is located in the V of the cylinder block. The oil cooler is a plate style coolant-to-oil heat exchanger.

OPERATION

OPERATION

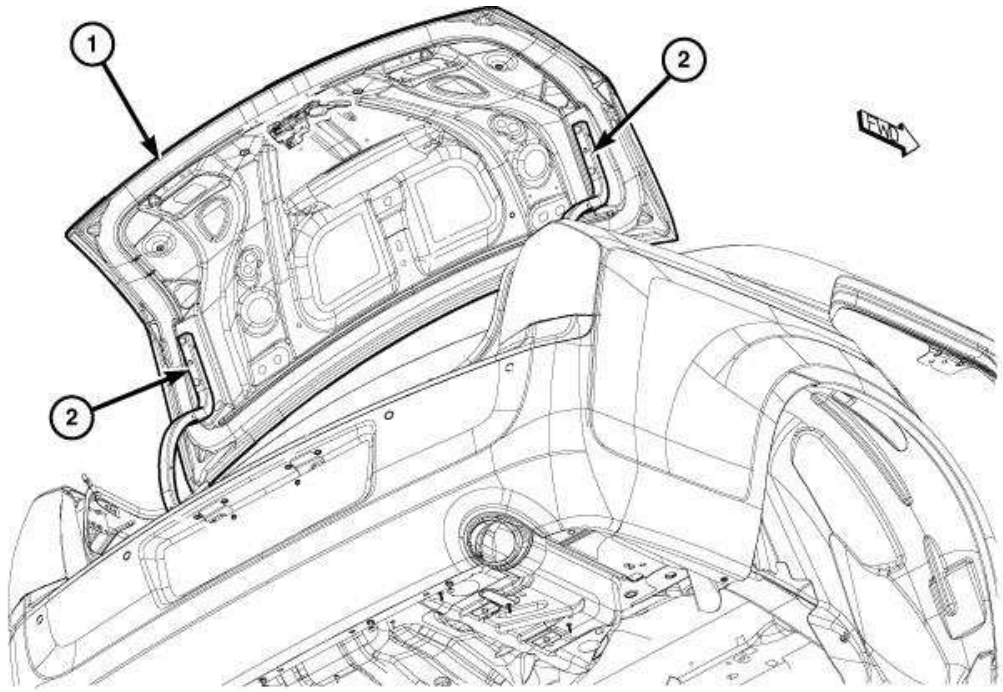

Fig. 547: Oil Flow & Coolant Flow Locations
Courtesy of CHRYSLER GROUP, LLC

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered it travels internally through the engine oil cooler and then to the main oil gallery (5).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

REMOVAL

REMOVAL

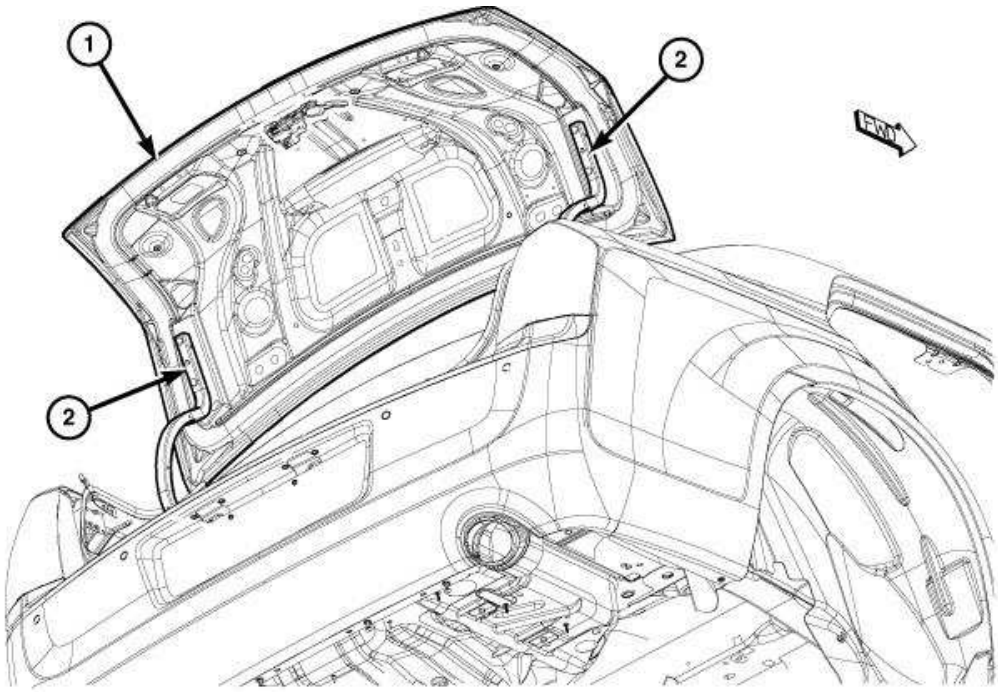

Fig. 548: Oil Cooler & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil cooler can not be cleaned out. In the event that the engine requires rebuilding or replacement, replace the oil cooler.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds. Refer to **MANIFOLD, INTAKE, REMOVAL**.
5. Remove four bolts (2) and two screws (1) and (3).
6. Remove the oil cooler (4).

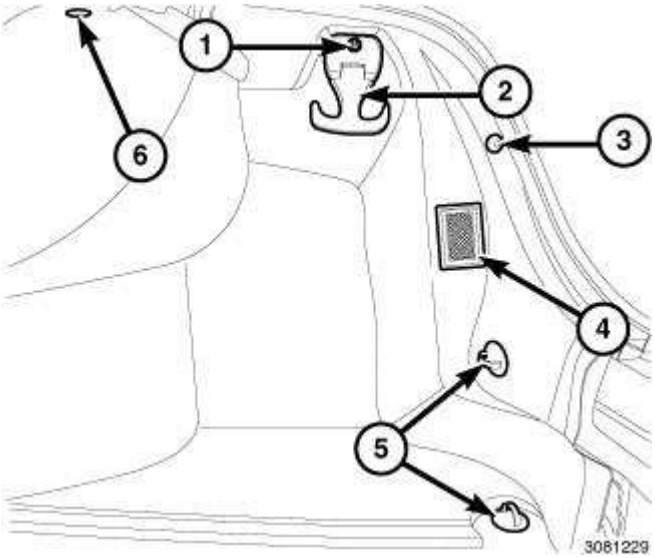

Fig. 549: Oil Cooler Seals & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

7. Remove and discard the oil cooler seals (1).

INSTALLATION

INSTALLATION

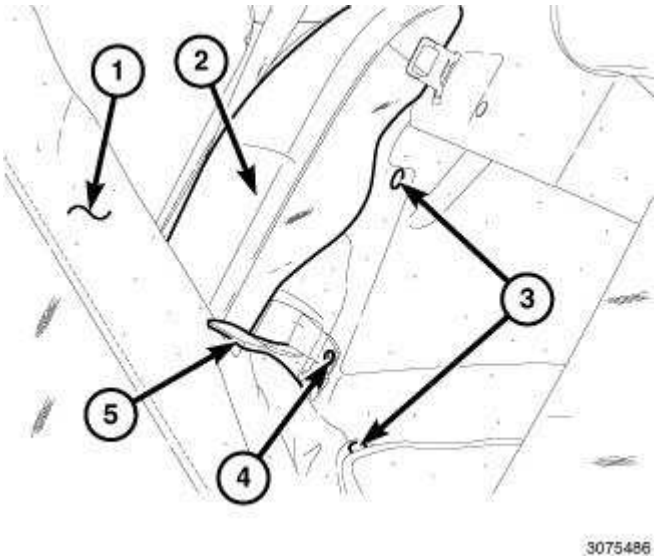

Fig. 550: Oil Cooler Seals & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use new dry seals (1) when installing the oil cooler. Do not lubricate the seals.

1. Install the new oil cooler seals (1) onto the oil filter housing (2).

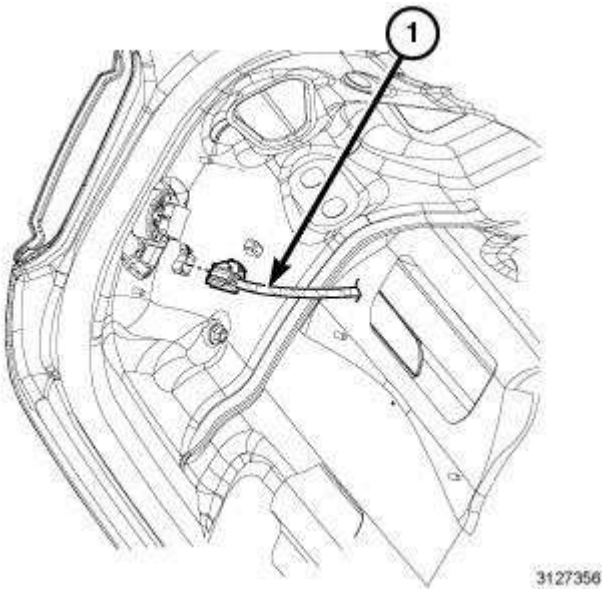

Fig. 551: Oil Cooler & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Position the oil cooler (4) on the oil filter housing.
3. Install two screws (1) and (3). Tighten the screws to 4 N.m (35 in. lbs.).
4. Install four bolts (2) and tighten to 12 N.m (106 in. lbs.).
5. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
6. Fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
7. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
8. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
9. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

FILTER, ENGINE OIL

REMOVAL

REMOVAL

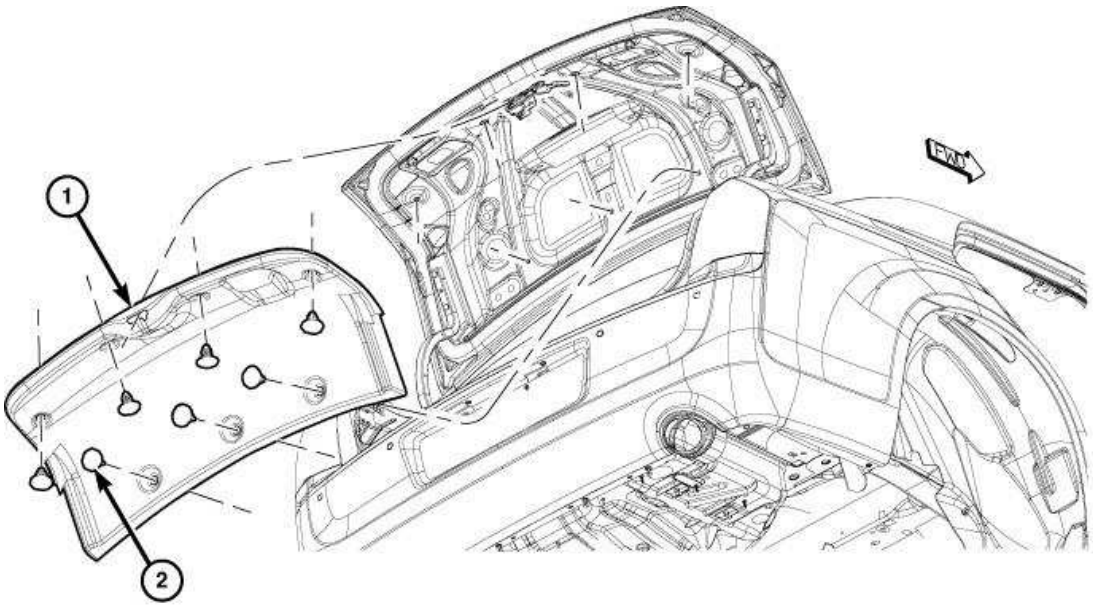

Fig. 552: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

All engines are equipped with a high quality full-flow, disposable type oil filter. Chrysler Corporation recommends a Mopar® or equivalent oil filter be used.

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.

1. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter (3) is attached to the oil filter cap (2).

2. Rotate the oil filter cap (1) counterclockwise and remove the cap (1) and filter (3) from the oil filter housing.

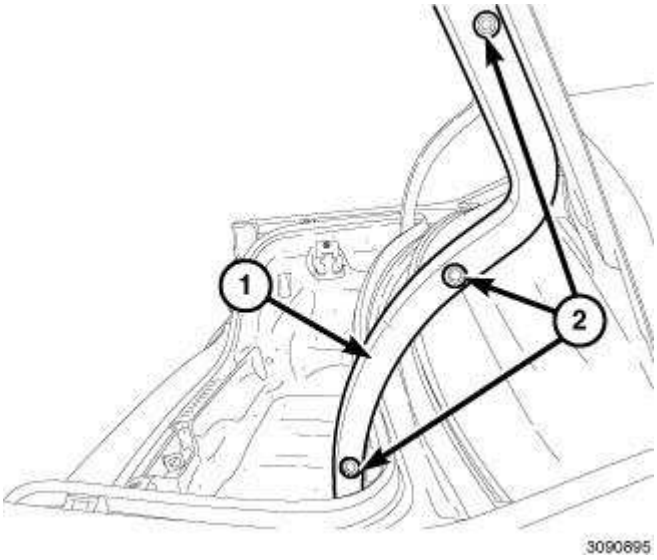

Fig. 553: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil filter (3) from the oil filter cap (2).
4. Remove and discard the O-ring seal (1).

INSTALLATION

INSTALLATION

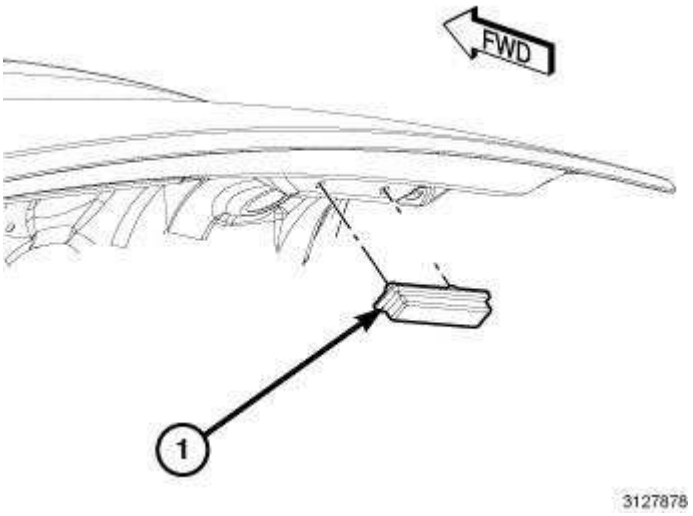

Fig. 554: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

1. Lightly lubricate the new O-ring seal (1) with clean engine oil.

2. Install the O-ring seal (1) on the filter cap (2).
3. Install the new oil filter (3) into the oil filter cap (2).

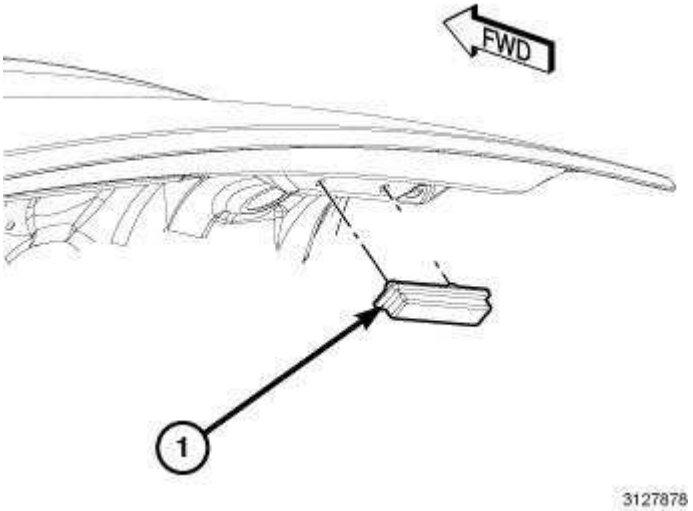

Fig. 555: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

4. Thread the oil filter cap (1) into the oil filter housing and tighten to 25 N.m (18 ft. lbs.).
5. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

HOUSING, OIL FILTER

DESCRIPTION

DESCRIPTION

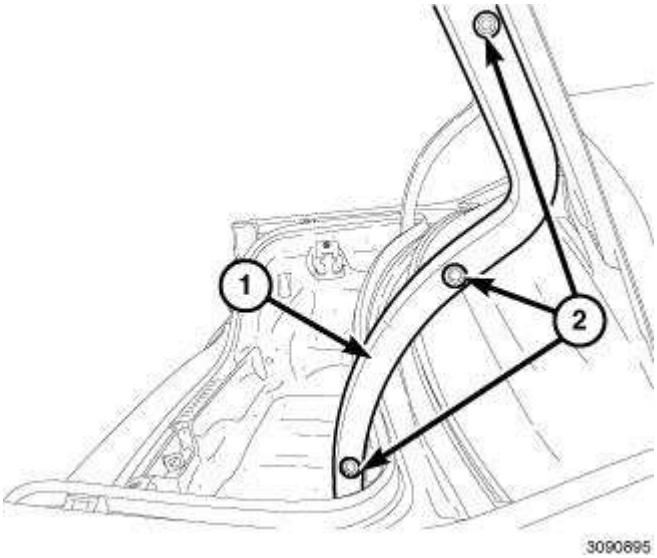

Fig. 556: Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil filter housing is located in the V of the cylinder block. The oil filter element is located within the housing and the engine oil cooler is attached to the top of the housing. Both the oil pressure and oil temperature sensors are located at the rear of the housing.

OPERATION

OPERATION

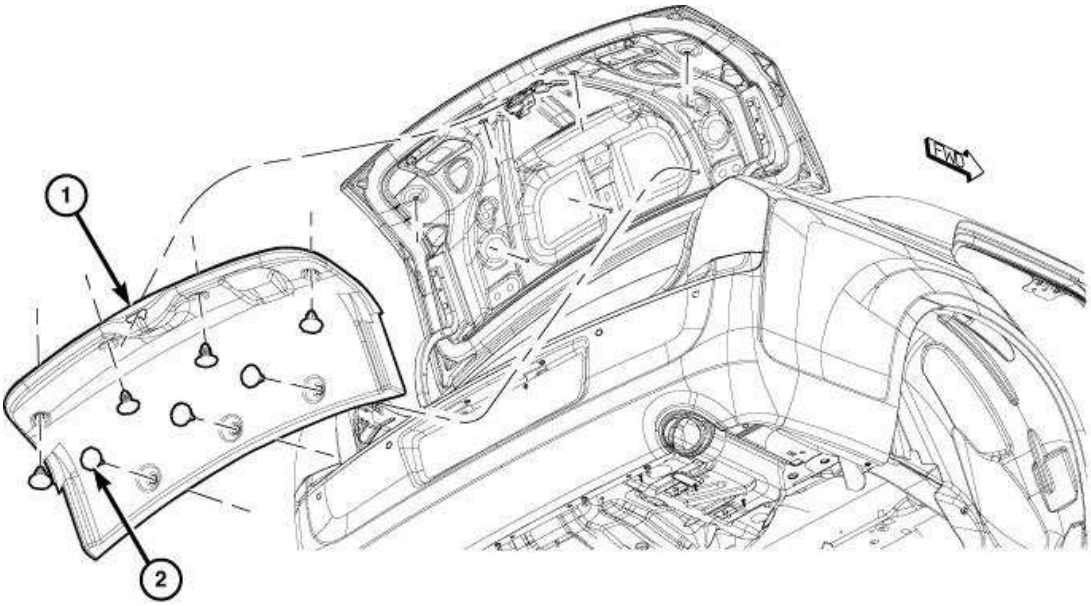

Fig. 557: Oil Flow & Coolant Flow Locations
Courtesy of CHRYSLER GROUP, LLC

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered and then cooled it travels to the main oil gallery (5). An oil filter by-pass is built into the housing and is not serviceable. Removing the oil filter cap from the housing allows oil to drain from the oil filter cavity into to the crankcase (2).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

REMOVAL

REMOVAL

NOTE: Always use new dry seals (2) when installing the oil filter housing. Do not lubricate the seals. The O-ring seal (1) can be reused. Lubricate the O-ring seal with clean engine oil prior to installation.

5. Install new oil filter housing seals (2) onto the oil filter housing.

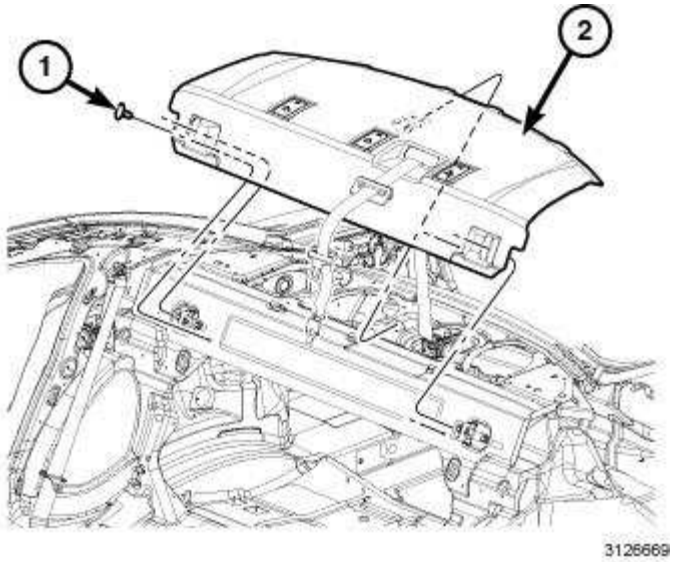

Fig. 567: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Install the heater hose (2) to the oil filter housing (1).
7. Position the oil filter housing (1) on the engine block.
8. Install five bolts and tighten in the sequence shown in illustration to 12 N.m (106 in. lbs.).
9. Connect the oil pressure sensor electrical connector (3).
10. Connect the oil temperature sensor electrical connector (4).
11. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
12. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
13. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
14. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
15. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

JET, PISTON OIL COOLER

DESCRIPTION

DESCRIPTION

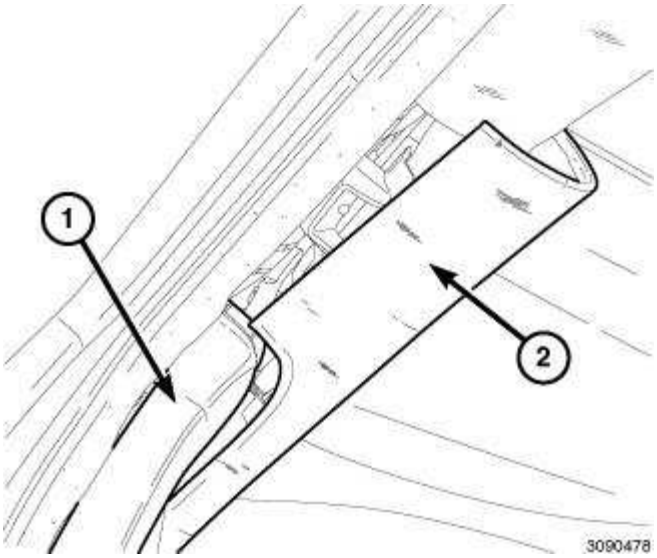

Fig. 568: Engine Blocked-Mounted Oil Jets
Courtesy of CHRYSLER GROUP, LLC

The 3.6 liter engine has three engine blocked-mounted oil jets (1) installed to cool the underside of each piston. The oil jets are fed by the main oil gallery, and spray upward on the bottom of the pistons and cylinder walls. Each set of jets has a check valve which closes below 2.5 bar (35 psi) to maintain ample oil pressure at idle. All three sets of oil jets are identical and seal to the engine block using an o-ring and fastener.

REMOVAL

REMOVAL

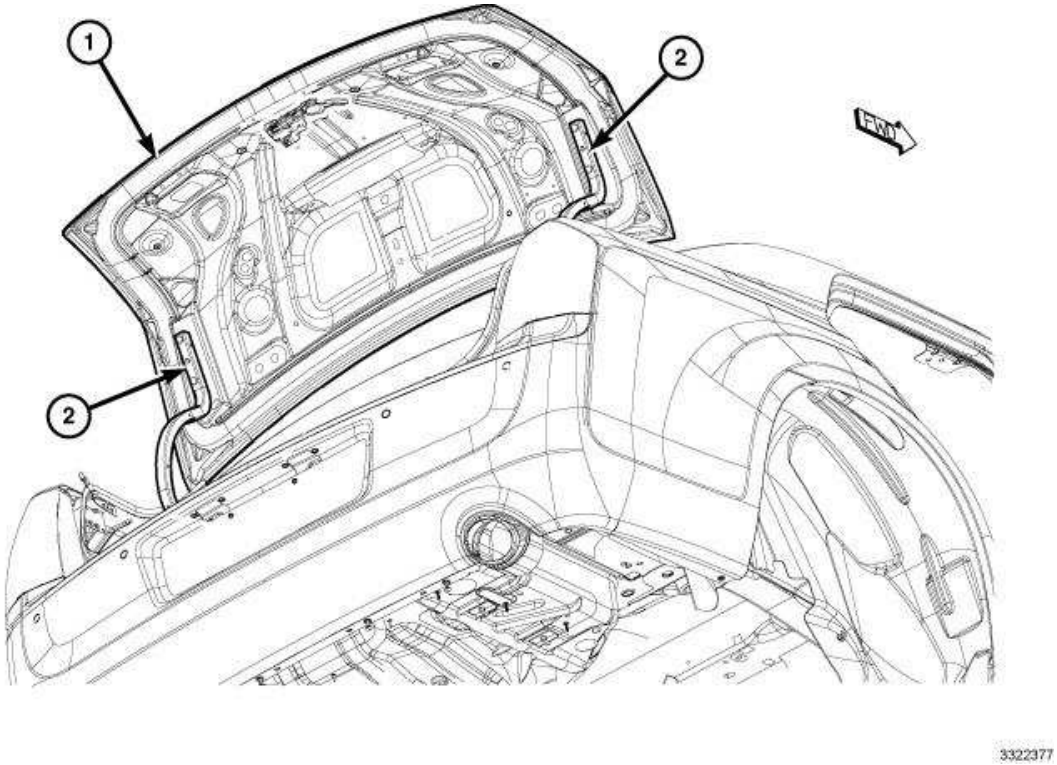

Fig. 569: Piston Oil Cooler Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Piston oil cooler jet for cylinders one/two shown in illustration. Piston oil cooler jets for cylinders three/four and five/six are similar.

1. Remove the crankshaft. Refer to **CRANKSHAFT, REMOVAL**.
2. Remove the bolt (1) and the piston oil cooler jet(s) (2) from the engine block.

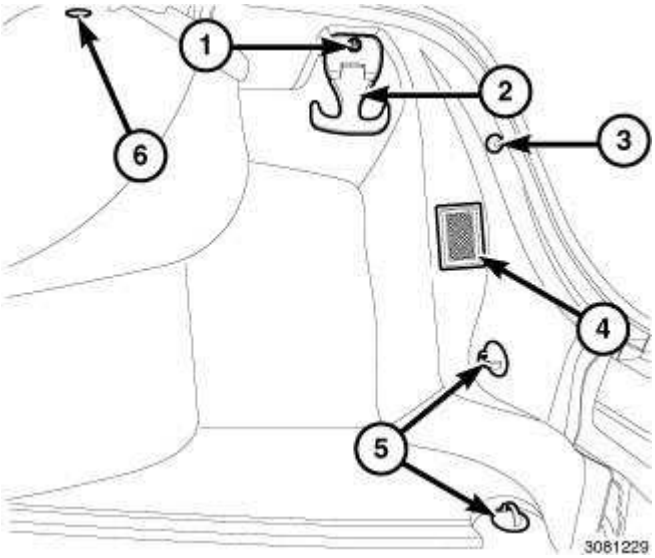

Fig. 570: Piston Oil Cooler Jet O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

3. Remove and discard the O-ring seal (1) from the piston oil cooler jet(s).

INSTALLATION

INSTALLATION

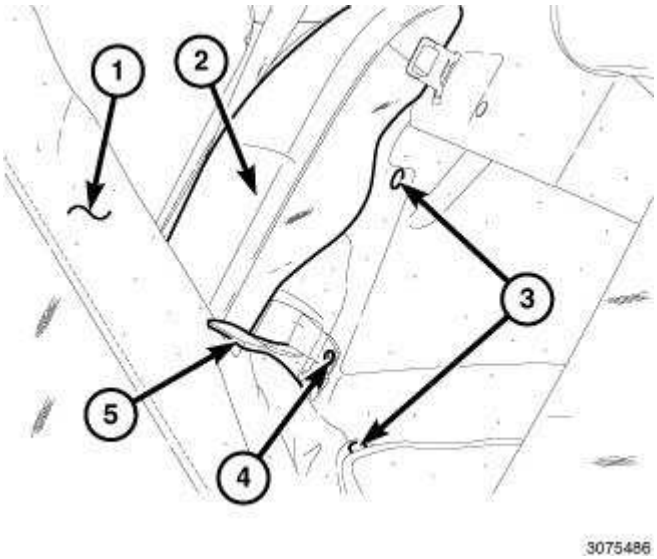

Fig. 571: Piston Oil Cooler Jet O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new O-ring seal (1) with engine oil and install on the piston oil cooler jet(s).

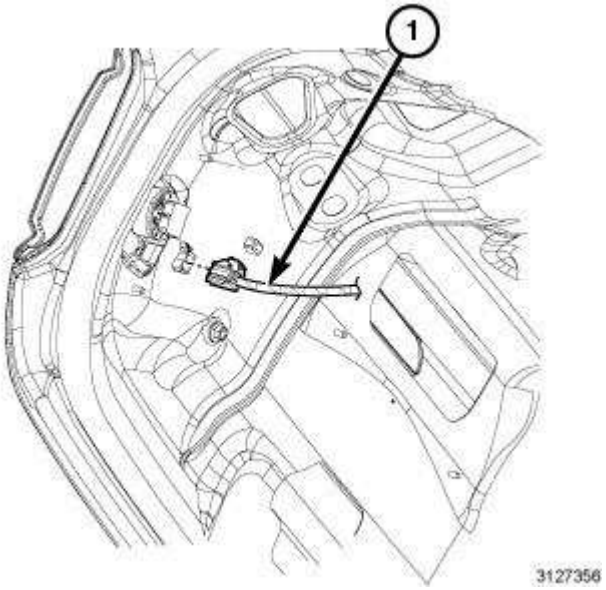

Fig. 572: Piston Oil Cooler Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Piston oil cooler jet for cylinders one/two shown in illustration. Piston oil cooler jets for cylinders three/four and five/six are similar.

2. Install the piston oil cooler jet(s) (2) into the engine block and tighten the retaining bolt (1) to 6 N.m (53 in. lbs.).
3. Install the crankshaft. Refer to **CRANKSHAFT, INSTALLATION**.
4. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
5. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
7. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Change the engine oil and filter at mileage and time intervals described in the Maintenance Schedule. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

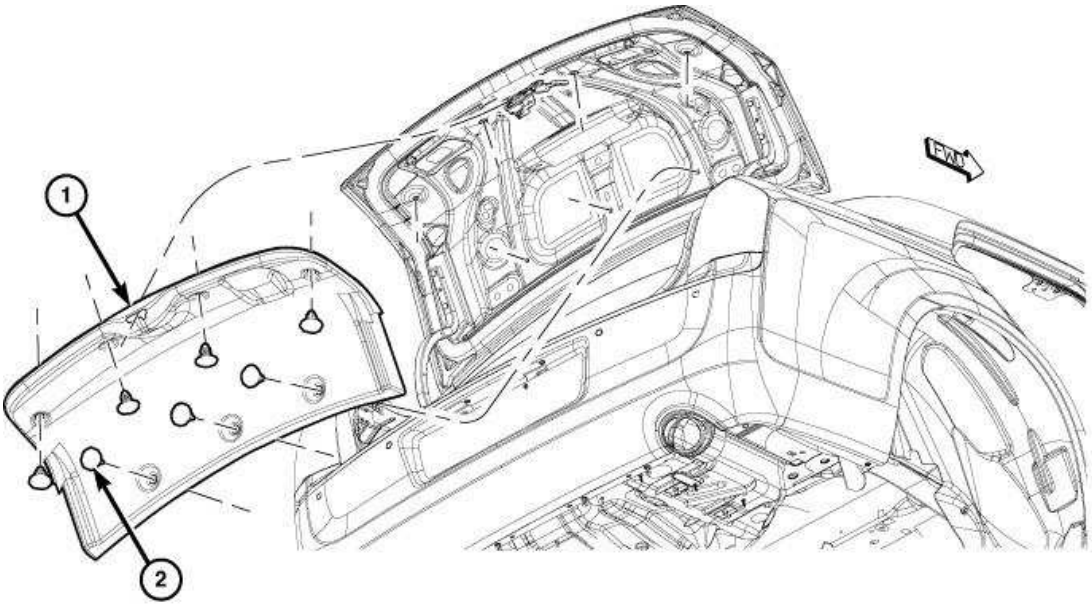

Fig. 573: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows engine cover removed for clarity.

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.

1. Run the engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn the engine off.
3. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter (3) is attached to the oil filter cap (2).

4. Rotate the oil filter cap (1) counterclockwise and remove the cap (1) and filter (3) from the oil filter housing.

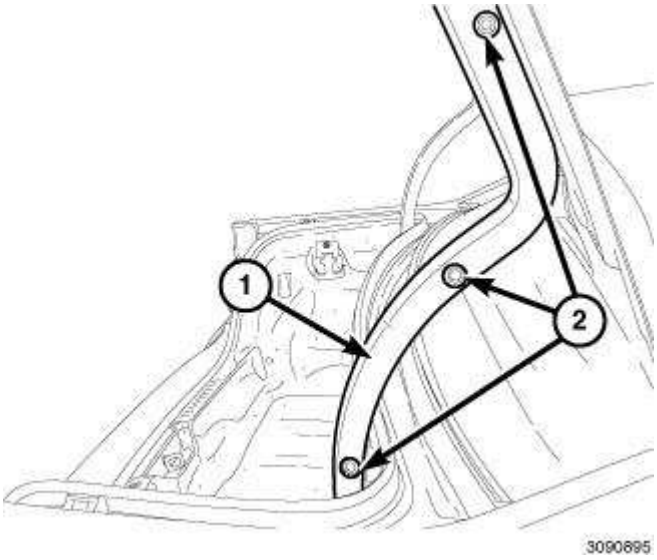

Fig. 574: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the belly pan retainers (1) and remove the belly pan.

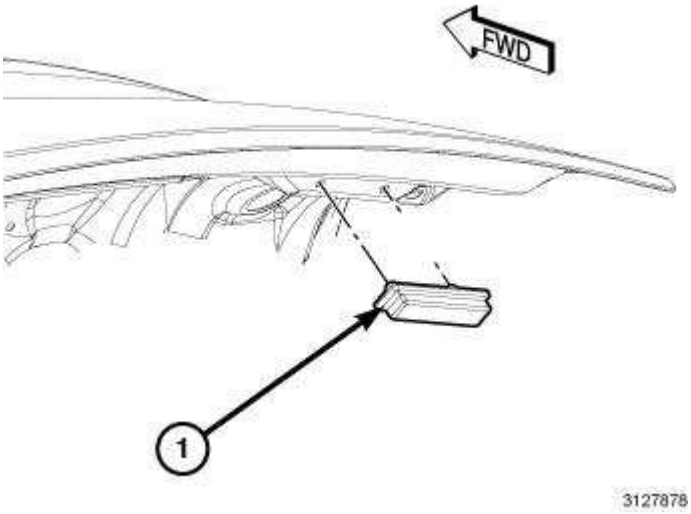

Fig. 575: Crankcase Drain Plug
Courtesy of CHRYSLER GROUP, LLC

7. Place a suitable drain pan under the crankcase drain plug (1).
8. Remove the drain plug (1) from oil pan and allow the oil to drain into the pan. Inspect the drain plug threads for stretching or other damage. Replace the drain plug and gasket if damaged.
9. Install the drain plug (1) in the oil pan and tighten to 27 N.m (20 ft. lbs.).

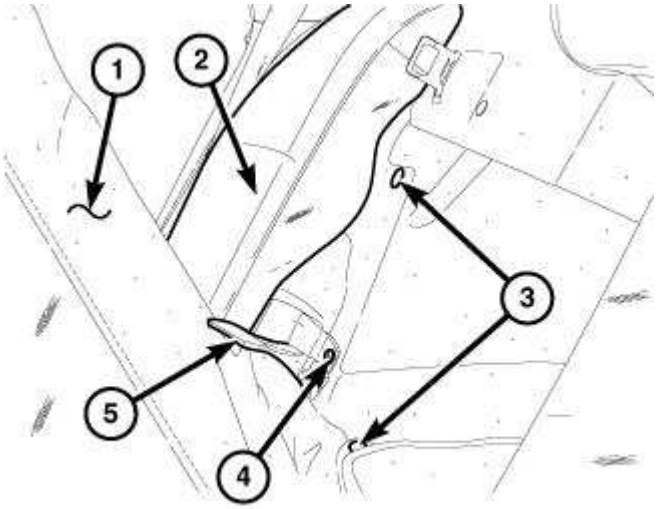

Fig. 576: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Position the belly pan and install the retainers (1).

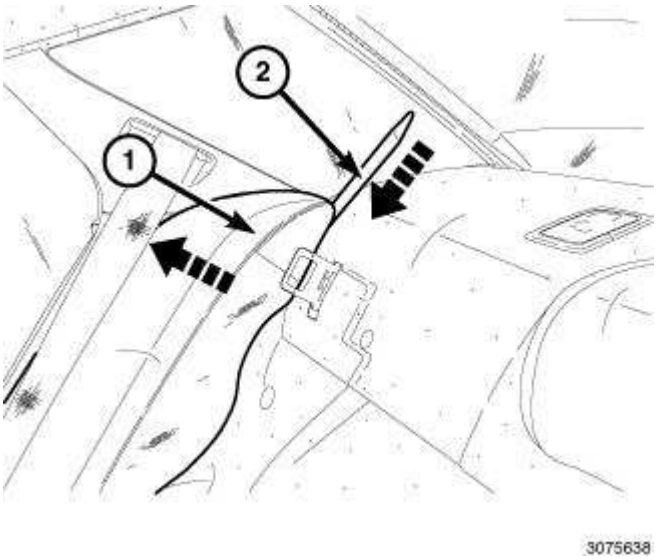

Fig. 577: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

11. Lower the vehicle.
12. Remove the oil filter (3) from the oil filter cap (2).
13. Remove and discard the O-ring seal (1).

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

14. Lightly lubricate the new O-ring seal (1) with clean engine oil.

15. Install the O-ring seal (1) on the filter cap (2).
16. Install the new oil filter (3) into the oil filter cap (2).

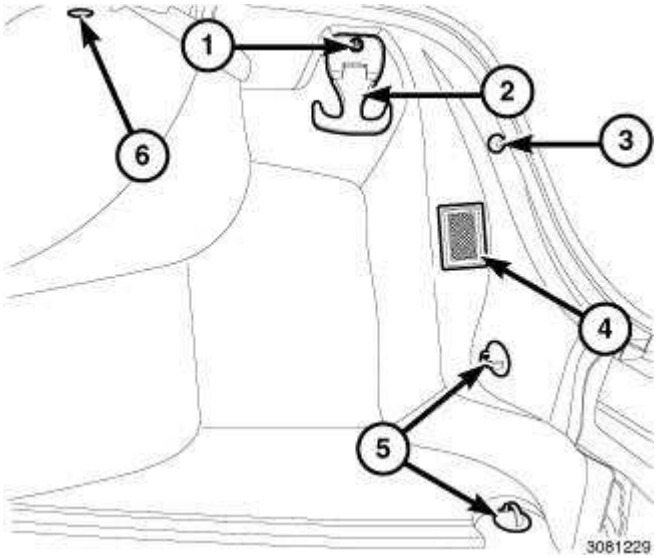

Fig. 578: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows engine cover removed for clarity.

17. Thread the oil filter cap (1) into the oil filter housing and tighten to 25 N.m (18 ft. lbs.).

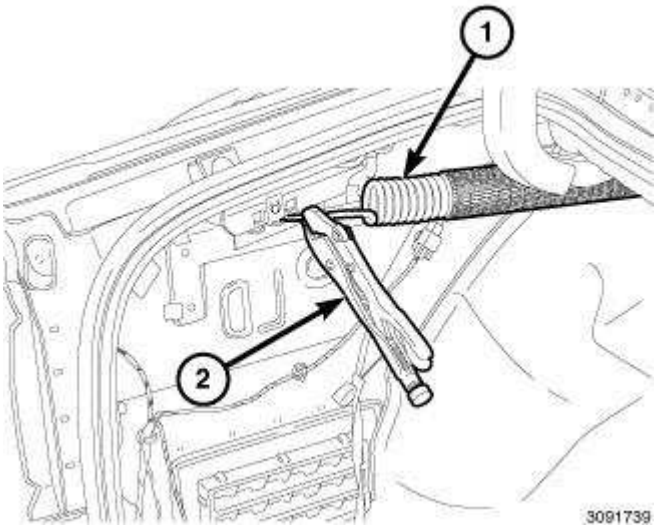

Fig. 579: Oil Fill Cap & Oil Level Gauge
Courtesy of CHRYSLER GROUP, LLC

18. Remove the oil fill cap (2). Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

19. Install the oil fill cap (2).
20. Start the engine and inspect for leaks.
21. Stop the engine and check the oil level (1).

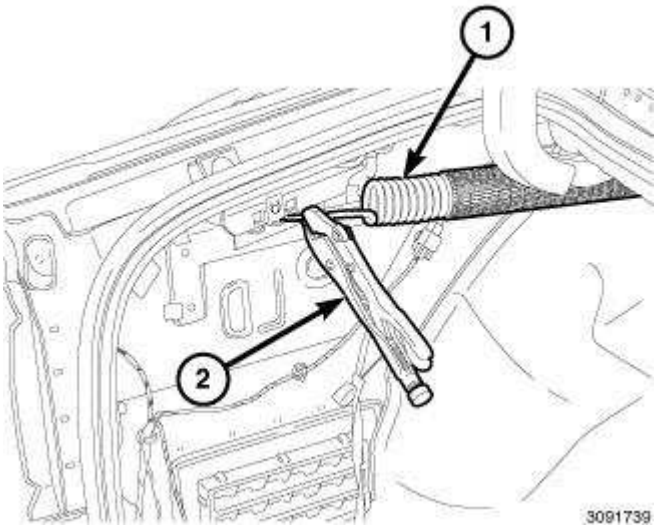

Fig. 580: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

22. Install the engine cover (1), if removed.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

PAN, OIL

DESCRIPTION

DESCRIPTION

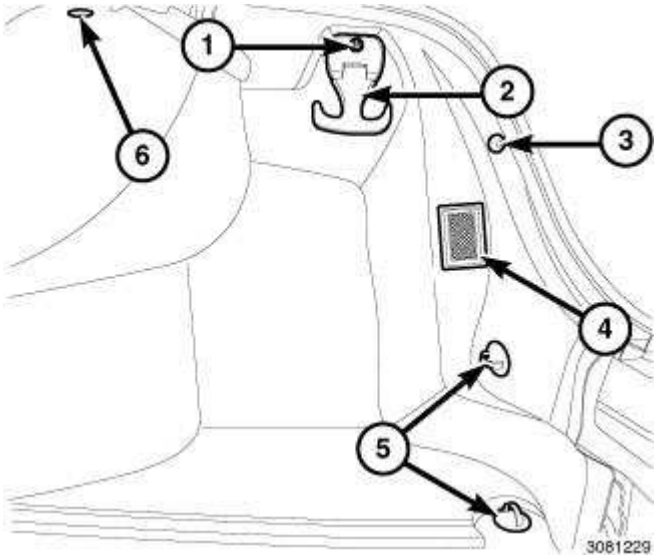

Fig. 581: Upper & Lower Oil Pan
Courtesy of CHRYSLER GROUP, LLC

There is an upper and lower oil pan. The upper oil pan is cast aluminum and also serves as the lower end structural support. The lower pan is a stamped steel design. Both upper and lower oil pans are sealed using Mopar® Threebond Engine RTV Sealant. The lower oil pan must be removed in order to access all of the upper oil pan attaching bolts.

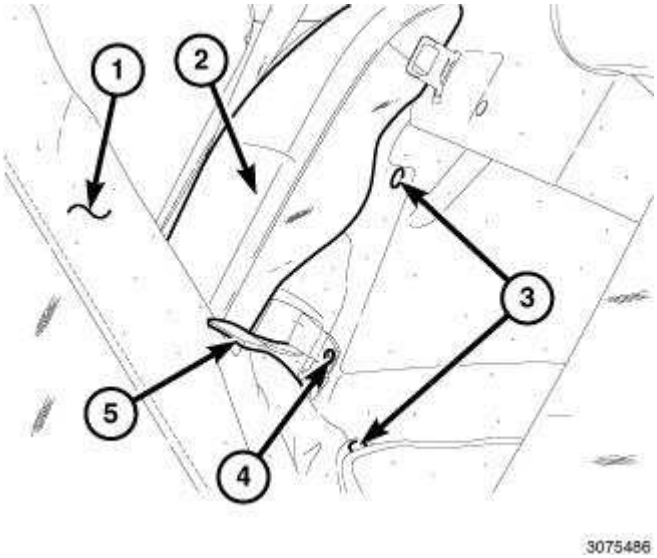

Fig. 582: Windage Tray
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not attempt to support the weight of the engine on the windage tray. The windage tray is a thin cast aluminum construction and can be easily damaged.

The high pressure die cast aluminum windage tray is mounted to the main bearing caps and is

designed to keep oil off of the connecting rods as the crankshaft rotates. When the oil is kept off the connecting rods, the engine rotates easier and oil foaming decreases. Like the oil pan, the windage tray is designed to stiffen the lower end of the engine. The tray is directional and the main bearing cap bolts hold it in place.

REMOVAL

AWD

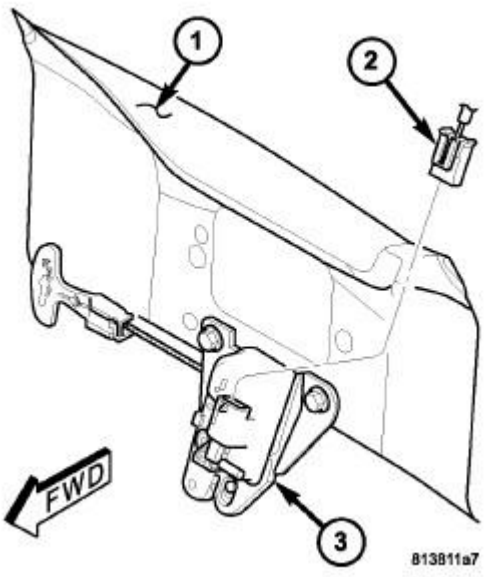

Fig. 583: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

23. Using the four indicated pry points, carefully remove the upper oil pan.
24. Remove all residual sealant from the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces. Refer to **Engine/Lubrication/PAN, Oil - Cleaning**.

CLEANING

CLEANING

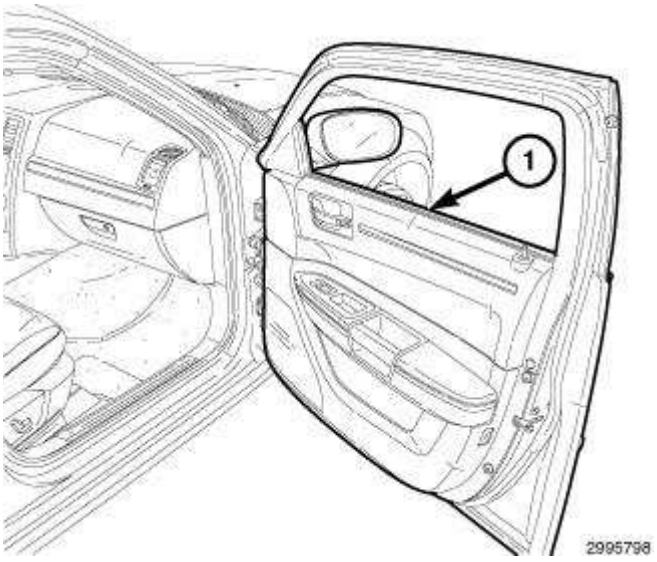

Fig. 615: Locating Sealant On Upper Oil Pan
Courtesy of CHRYSLER GROUP, LLC

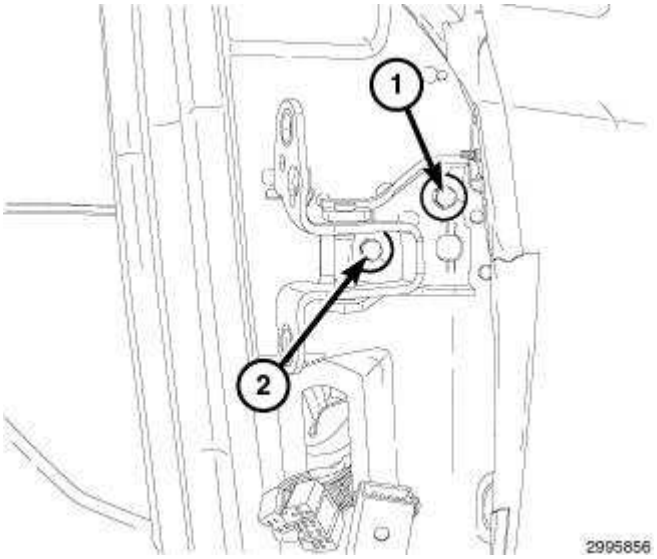

Fig. 616: Locating Sealant On Lower Oil Pan
Courtesy of CHRYSLER GROUP, LLC

1. Clean the oil pan in solvent and wipe dry with a clean cloth.

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

2. Remove all residual sealant (1) from the upper and lower oil pans. Refer to **Engine - Standard**

Procedure.

INSTALLATION

AWD

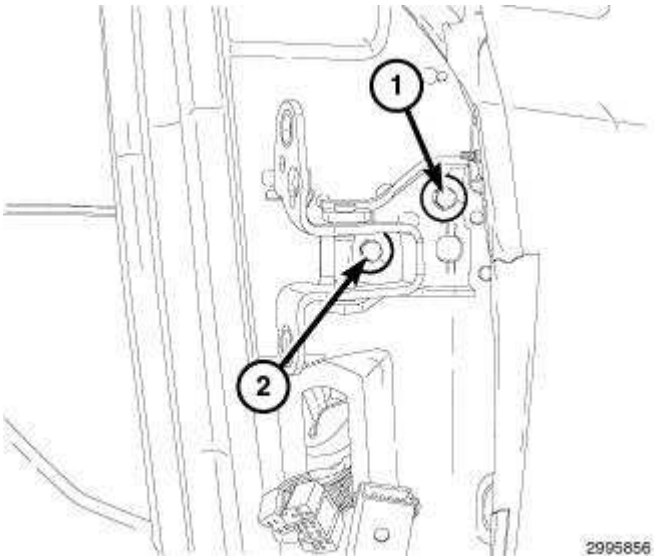

Fig. 617: Locating Sealant On Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

1. Clean the oil pan, timing chain cover, rear seal retainer and engine block mating surfaces with isopropyl alcohol in preparation for sealant application.
2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the oil pan as shown in illustration, in the following locations:
   - Oil pan to engine block flange (1)
   - Two timing cover to engine block T-joints (2)
   - Two rear seal retainer to engine block T-joints (3)

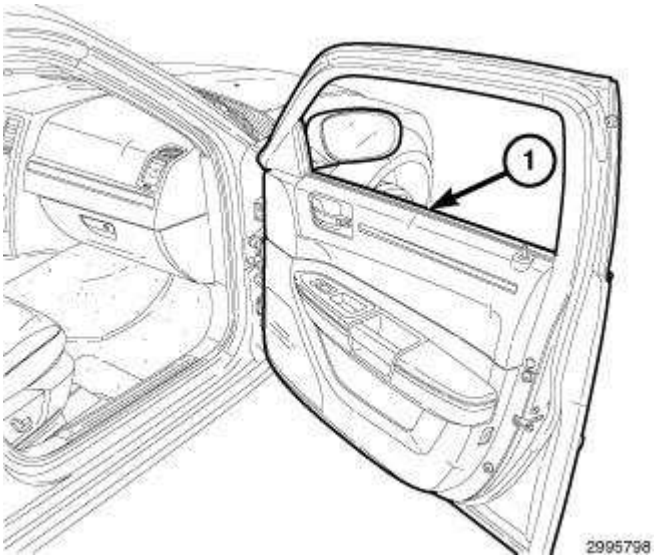

Fig. 618: Oil Pan Mounting Bolts (M8)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Make sure that the rear face of the oil pan is flush to the transmission bell housing before tightening any of the oil pan mounting bolts. A gap between the oil pan and the transmission could crack the oil pan or transmission casting.

3. Install the oil pan to the engine block making sure the oil pan is flush to the transmission bell housing. Secure the oil pan to the engine block with nineteen M8 oil pan mounting bolts (1) finger tight.

25. Position the engine cover (1) and secure the retaining grommets onto the ball studs.
26. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
27. Start and run the engine until it reaches normal operating temperature and check for leaks.

RWD LOWER

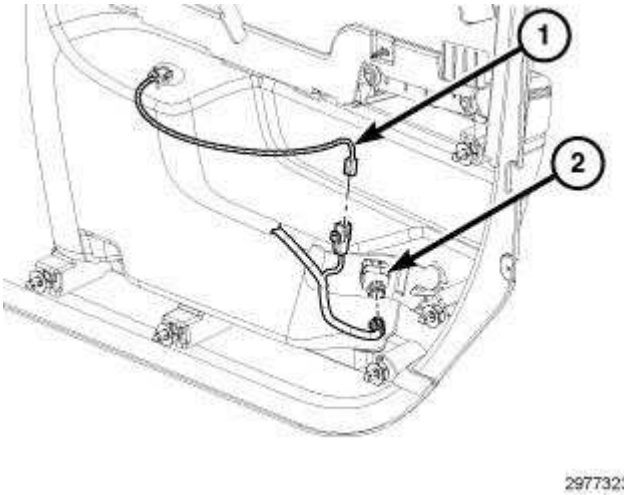

Fig. 633: Locating Sealant On Lower Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45

minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

1. Clean the upper and lower oil pan mating surfaces with isopropyl alcohol in preparation for sealant application.
2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the lower oil pan as shown in illustration.

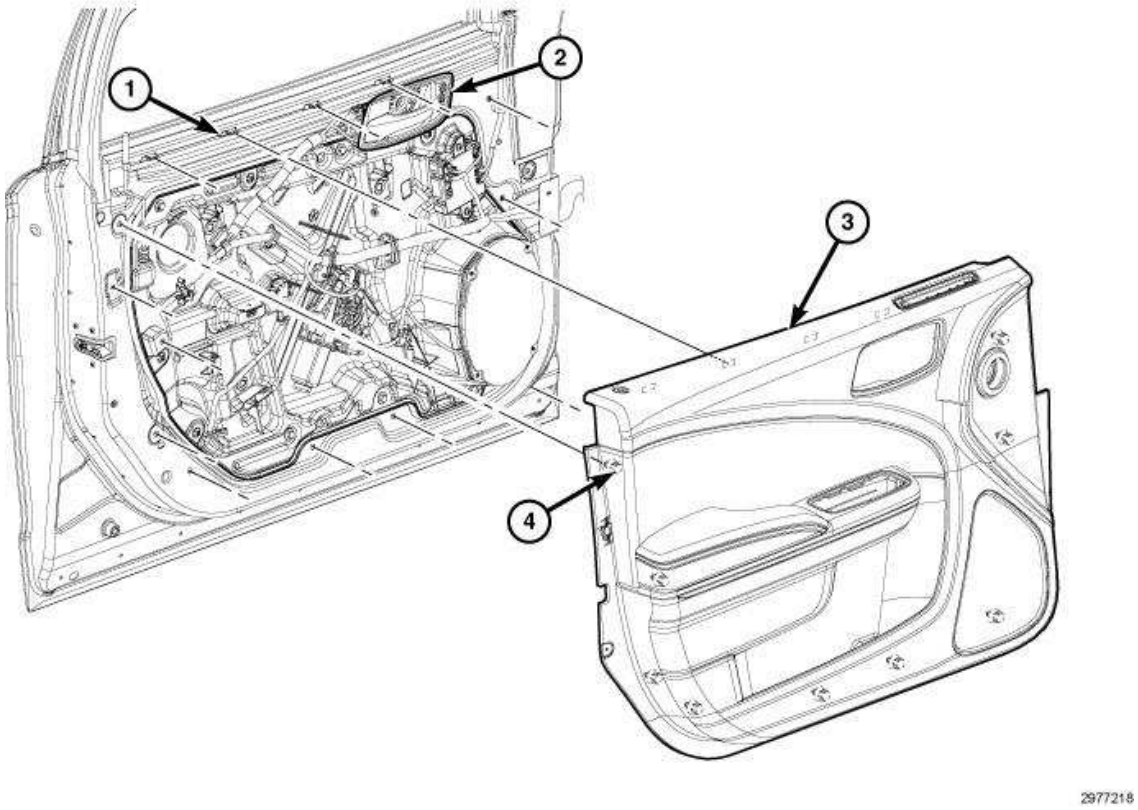

Fig. 634: Bolts, Studs, Nuts & Lower Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Following assembly, the Mopar® Threebond Engine RTV Sealant must be allowed to dry for 45 minutes prior to adding oil and engine operation. Premature exposure to oil prior to drying may result in engine fluid leakage.

3. Install two studs (2) into the upper oil pan flange.
4. Install the lower oil pan (1) to the upper oil pan with twelve bolts (4) and two nuts (3) tightened to 11 N.m (8 ft. lbs.).

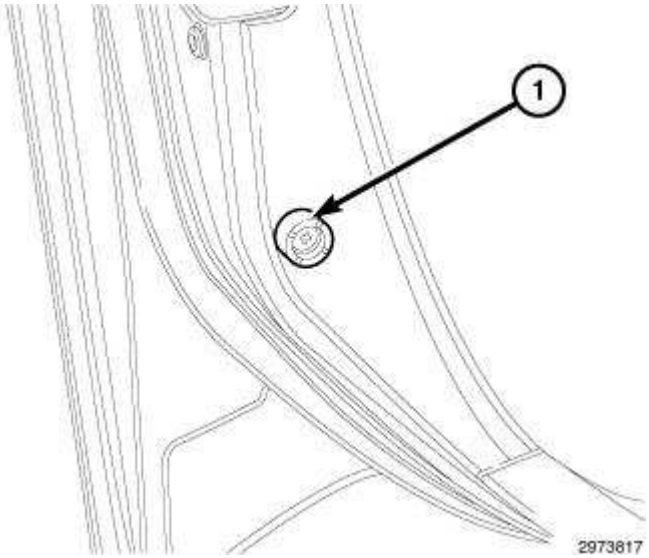

Fig. 635: Lower Splash Shield & Fasteners

1. Lubricate the new O-ring seal (1) with clean engine oil and install the O-ring onto the oil pump pick-up tube.

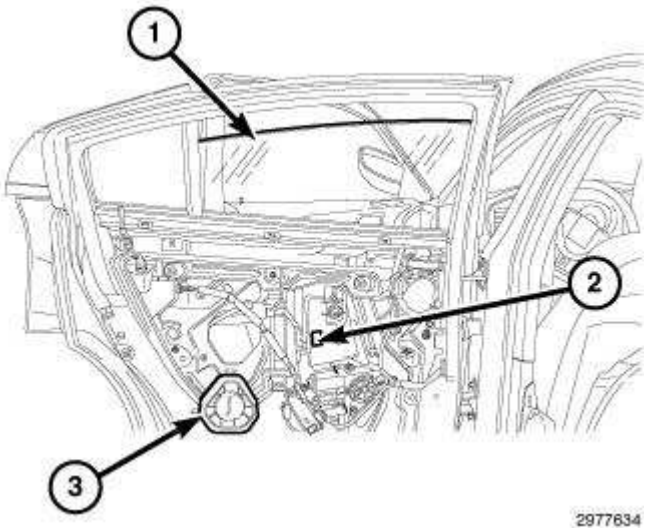

Fig. 655: Oil Pump Pick-Up Tube & Support Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the oil pump pick-up tube (1) onto the oil pump and install the retaining bolt (2) finger tight.
3. Install the oil pump pick-up tube support bracket retaining bolt (3) and tighten to 12 N.m (9 ft. lbs.).
4. Tighten the oil pump pick-up tube retaining bolt (2) to 12 N.m (9 ft. lbs.).
5. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
6. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

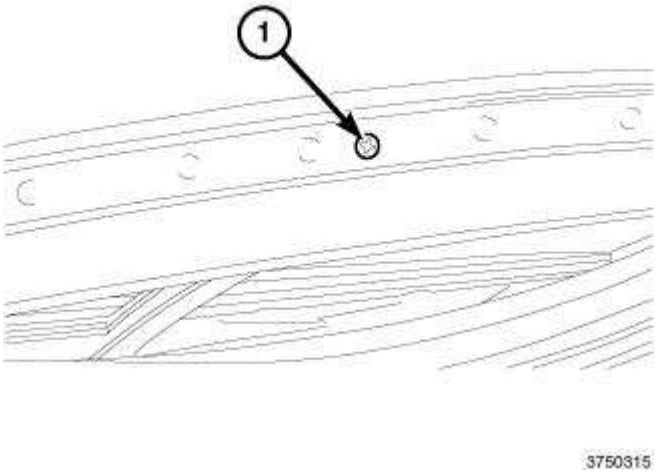

Fig. 656: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

7. Connect the negative battery cable (1) and tighten nut to 5 N.m (45 in. lbs.).
8. Run the engine until it reaches normal operating temperature and check for leaks.

PUMP, ENGINE OIL

DESCRIPTION

DESCRIPTION

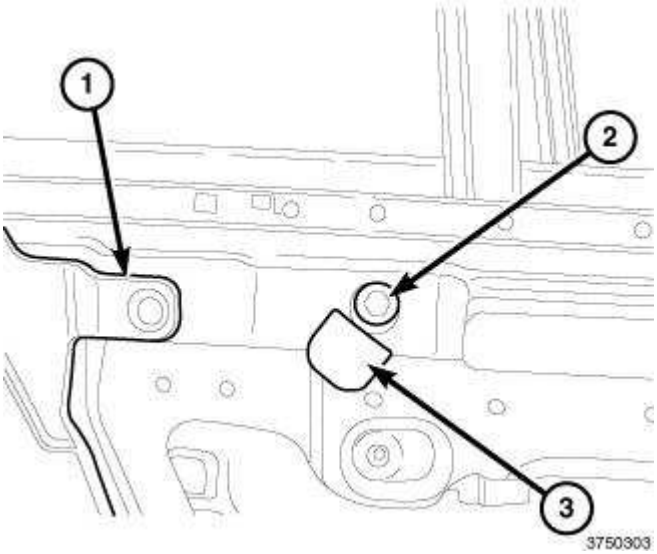

Fig. 657: Oil Pump Chain
Courtesy of CHRYSLER GROUP, LLC

The vane type engine oil pump is mounted to the underside of the cylinder block and is driven by the oil pump chain off the crankshaft at a 1:1 drive ratio. This pump location improves efficiency compared to an on-crankshaft location. The pump is driven with a silent chain which is tensioned using a spring loaded tensioner. The pump is not timed to the engine.

An internal mechanical ball and spring type relief valve prevents excess pressure in the engine by dumping oil into the sump and provides emergency protection at conditions such as a cold start with high engine speed.

The pump has a moving slide mechanism for variable displacement capability and an on-off solenoid for two-stage pressure regulation. The pump and the solenoid are not to be disassembled. Both are non-serviceable items and are to be replaced as a complete assembly.

OPERATION

OPERATION

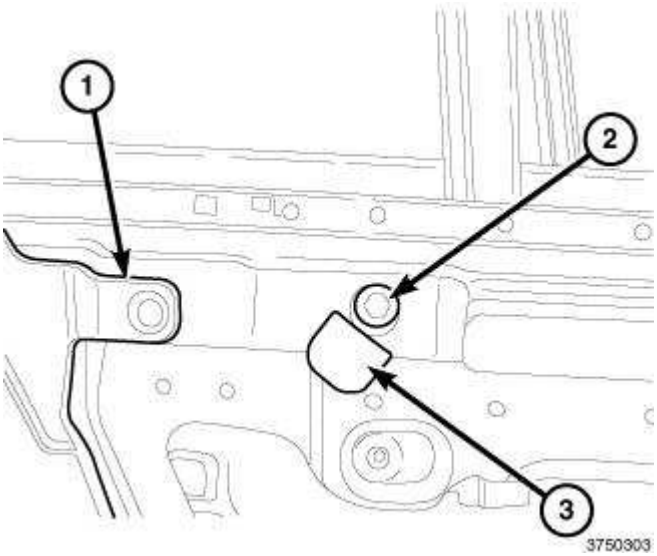

Fig. 658: Moving Element, On/Off Solenoid & Relief Valve
Courtesy of CHRYSLER GROUP, LLC

The engine oil pump features seven vanes and a moving element (1) that continuously adjusts to maintain a regulated oil pressure supply by varying the displacement of the pump. The pump has two regulated pressure stages of operation controlled by an on/off solenoid (2). Low pressure mode regulation (solenoid on) is approximately 200 kPa (29 psi) and high pressure mode regulation (solenoid off) is approximately 450 kPa (65 psi). The Powertrain Control Module (PCM) switches the pump between stages based on engine operating conditions, oil and coolant temperatures, speed and load. Under most typical conditions, the pump will run in low mode from idle up to around 3000 rpm, and switch from low to high mode between 3000 and 4000 rpm.

The maximum oil pressure in the engine is limited to 1000 kPa (145 psi) by the relief valve (3). Pressure in the main oil gallery of the engine can be monitored with diagnostic equipment through the oil pressure sensor mounted on the rear of the oil filter module. The minimum pressure for the engine is 41 kPa (6 psi) at any operating condition. Anything under this pressure could result in damage to critical moving parts.

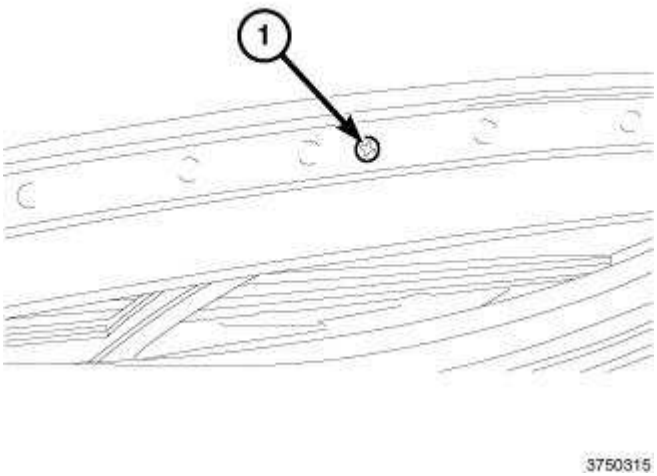

Fig. 659: Moving Element, Main Gallery Oil Pressure, Spring Pressure & Pump Driveshaft
Courtesy of CHRYSLER GROUP, LLC

In high pressure mode regulation (solenoid off) main gallery oil pressure (2) is applied to the moving element (1). The main gallery oil pressure works against spring pressure (3) to move the element to a more concentric location about the pump driveshaft (4) thus reducing displacement and pump output.

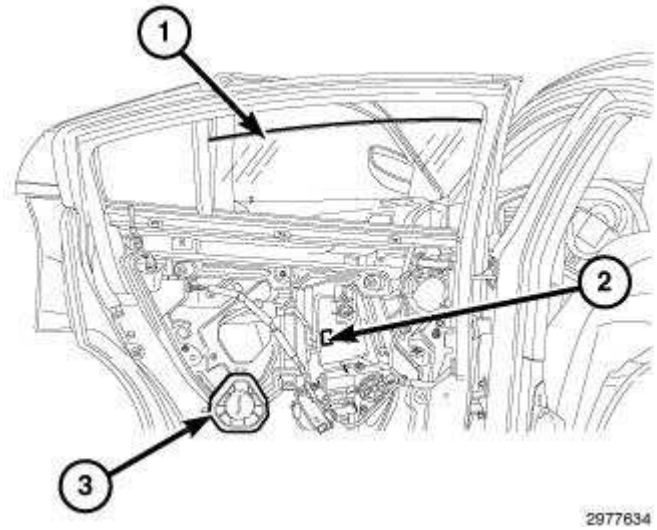

Fig. 660: Chamber & Spring
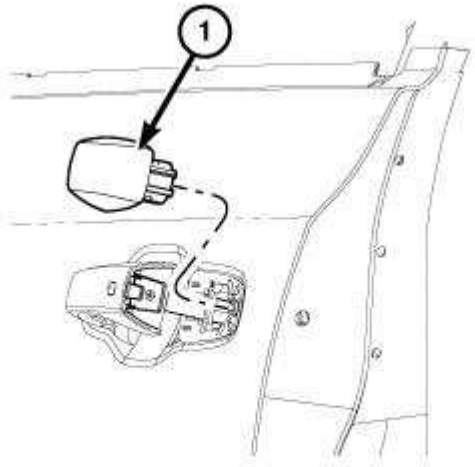
Courtesy of CHRYSLER GROUP, LLC

In low pressure mode regulation (solenoid on) the energized solenoid opens an additional chamber (1) to main gallery oil pressure increasing the force on the spring (2) to further reduce displacement and output pressure.

REMOVAL

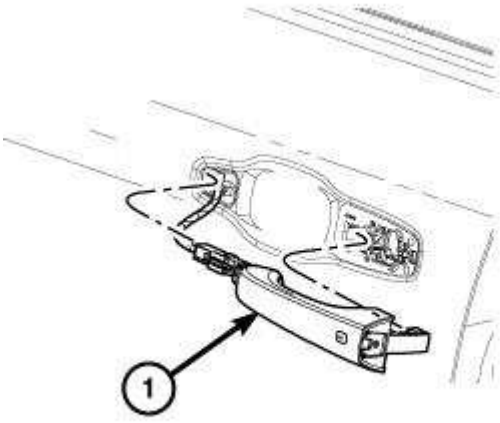
REMOVAL



3329280

Fig. 661: Oil Pump Pick-Up Tube & Support Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

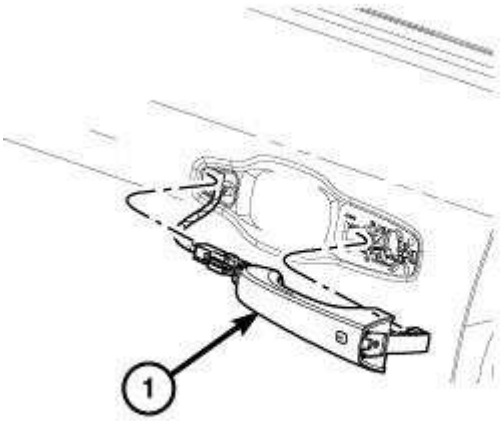
1. Disconnect and isolate the negative battery cable.
2. Remove the upper oil pan. Refer to **PAN, OIL, REMOVAL**.
3. Remove the oil pump pick-up (1). Refer to **PICK-UP, OIL PUMP, REMOVAL**.



3329122

Fig. 662: Oil Pump Solenoid Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

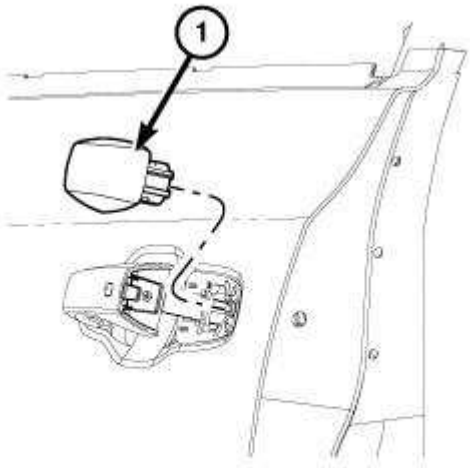
4. Disconnect the engine wire harness from the oil pump solenoid electrical connector (1).



3329122

Fig. 663: Oil Pump Solenoid Electrical Connector Retention Lock Tab
Courtesy of CHRYSLER GROUP, LLC

5. Depress the connector retention lock tab (1) to disengage the oil pump solenoid electrical connector from the engine block.



3329280

6. Remove bolts (2) and the timing gear splash shield (1).

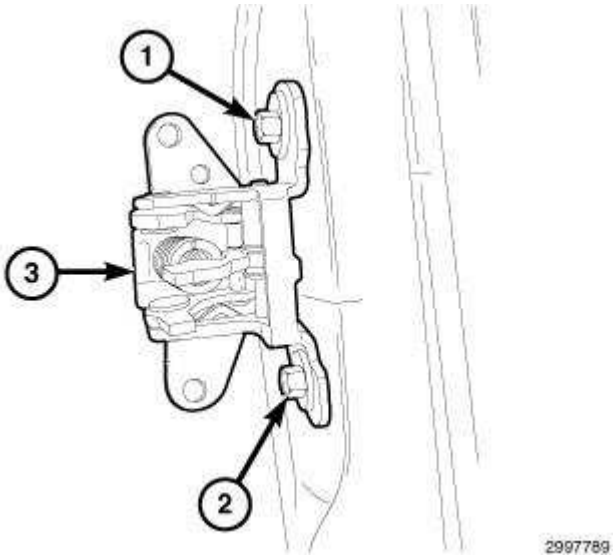

Fig. 665: Oil Pump Solenoid Electrical Connector & Primary Chain Tensioner Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows the engine timing cover removed for clarity.

7. Push the oil pump solenoid electrical connector into the engine block, rotate the connector slightly CW, push it past the primary chain tensioner mounting bolt (1) and into the engine.

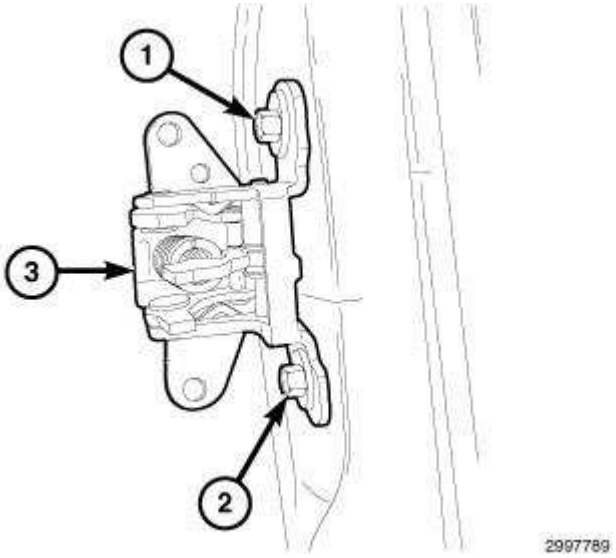

Fig. 666: Oil Pump Chain Tensioner & Retaining Pin
Courtesy of CHRYSLER GROUP, LLC

8. Push back the oil pump chain tensioner (2) and insert a suitable retaining pin (1) such as a 3 mm Allen wrench.

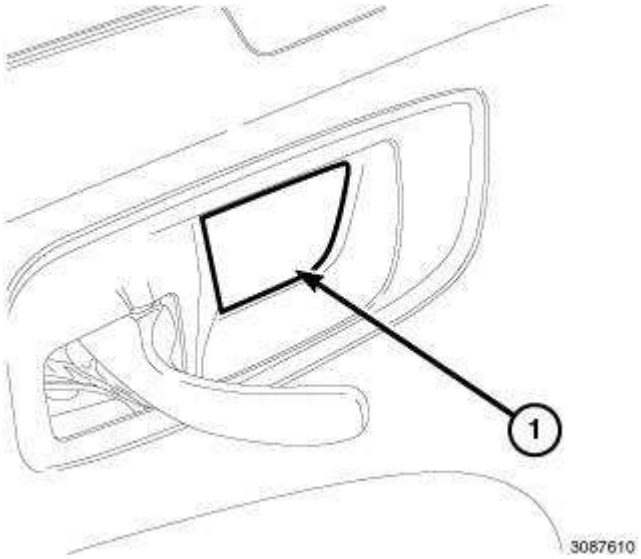

Fig. 667: Retaining Pin, Retaining Bolt, Oil Pump Chain & Sprocket
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

9. Mark the direction of rotation on the oil pump chain (3) and sprocket (4) using a paint pen or equivalent to aid in reassembly.

NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

10. Remove the oil pump sprocket T45 retaining bolt (2) and remove the oil pump sprocket (4).

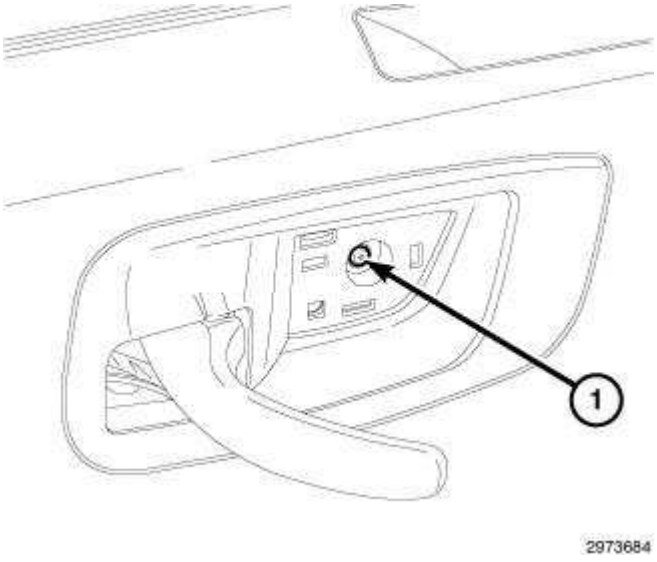

Fig. 668: Retaining Pin, Oil Pump Chain Tensioner Spring & Dowel Pin
Courtesy of CHRYSLER GROUP, LLC

11. Remove the retaining pin (3) and disengage the oil pump chain tensioner spring (1) from the dowel pin (2).
12. Remove the oil pump chain tensioner from the oil pump.

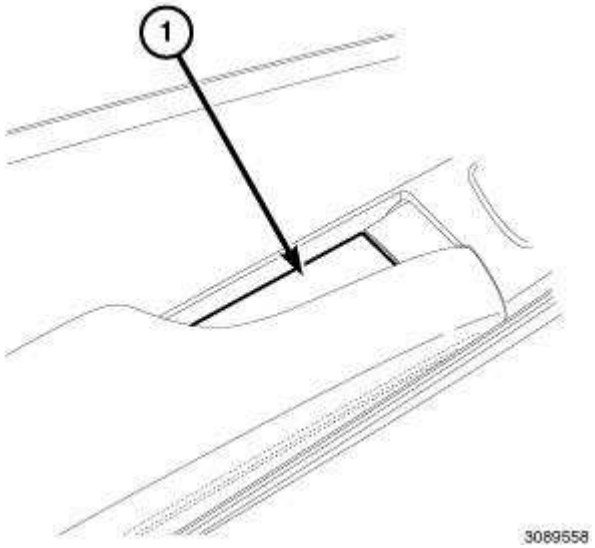

Fig. 669: Oil Pump, Locator Pins & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the four oil pump bolts (1) and remove the oil pump (3).

INSPECTION

INSPECTION

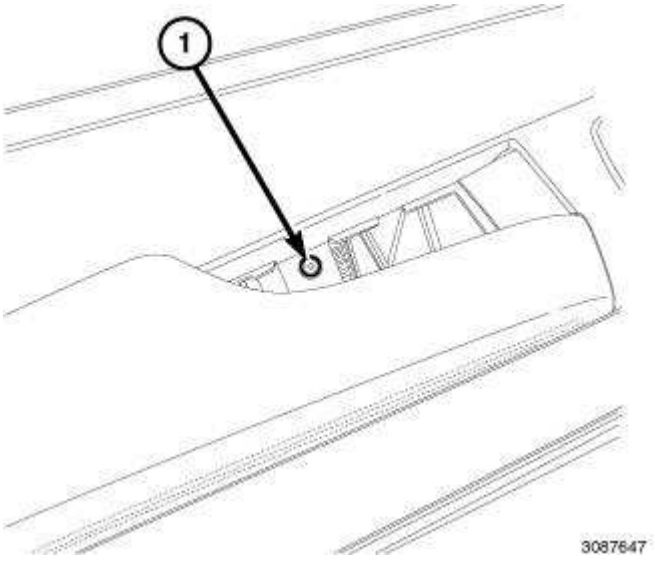

Fig. 670: Solenoid Wires, Connector Retention Lock Tab & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: The 3.6L Oil pump is released as an assembly. The assembly includes both the pump and the solenoid. There are no serviceable sub-assembly components. In the event the oil pump or solenoid are not functioning or out of specification they must be replaced as an assembly.

1. Inspect the solenoid wires (1) for cuts or chaffing.
2. Inspect the condition of the connector O-ring seal (3).
3. Inspect the connector retention lock tab (2) for fatigue or damage.

INSTALLATION

INSTALLATION

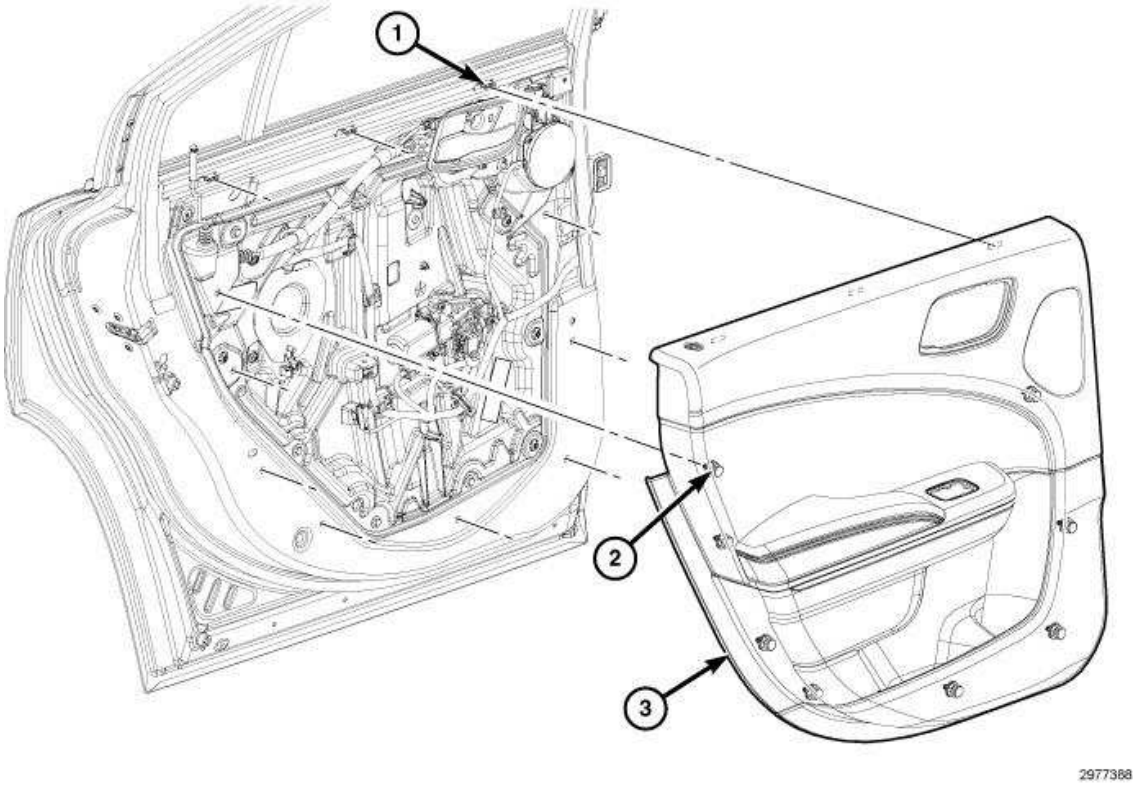

Fig. 671: Oil Pump, Locator Pins & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Align the locator pins (2) to the engine block and install the oil pump (3) with four bolts (1).

Tighten the bolts to 12 N.m (106 in. lbs.).

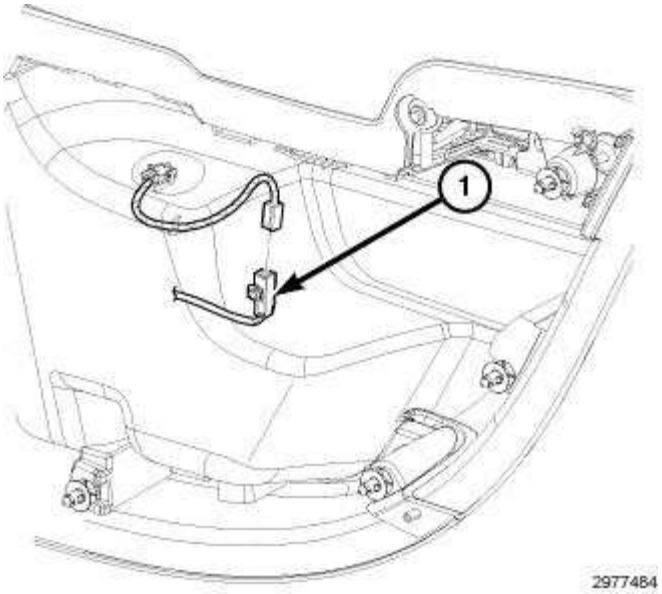

Fig. 672: Retaining Pin, Oil Pump Chain Tensioner Spring & Dowel Pin
Courtesy of CHRYSLER GROUP, LLC

2. Install the oil pump chain tensioner on the oil pump.
3. Position the oil pump chain tensioner spring (1) above the dowel pin (2).
4. Push back the oil pump chain tensioner and insert a suitable retaining pin (3) such as a 3 mm Allen wrench.

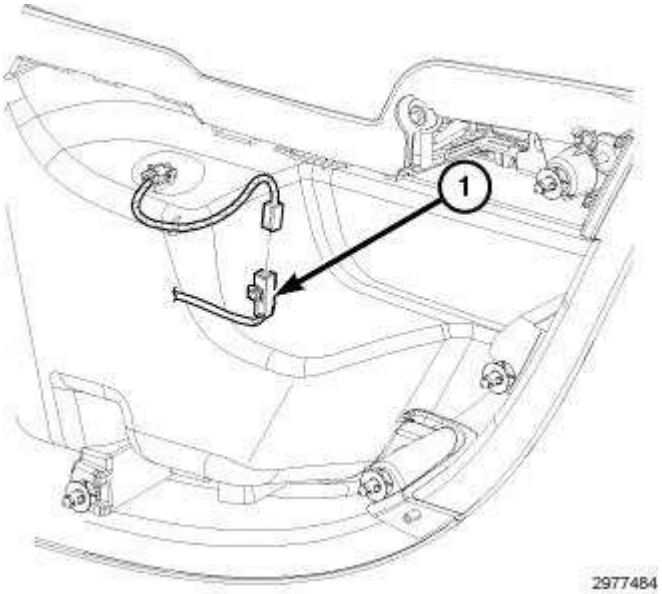

Fig. 673: Retaining Pin, Retaining Bolt, Oil Pump Chain & Sprocket
Courtesy of CHRYSLER GROUP, LLC

NOTE: **There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.**

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

5. Place the oil pump sprocket (4) into the oil pump chain (3). Align the oil pump sprocket with the oil pump shaft and install the sprocket. Install the T45 retaining bolt (2) and tighten to 25 N.m (18 ft. lbs.).
6. Remove the retaining pin (1). Verify that the oil pump chain is centered on the tensioner and crankshaft sprocket.
7. Rotate the crankshaft CW one complete revolution to verify proper oil pump chain installation.

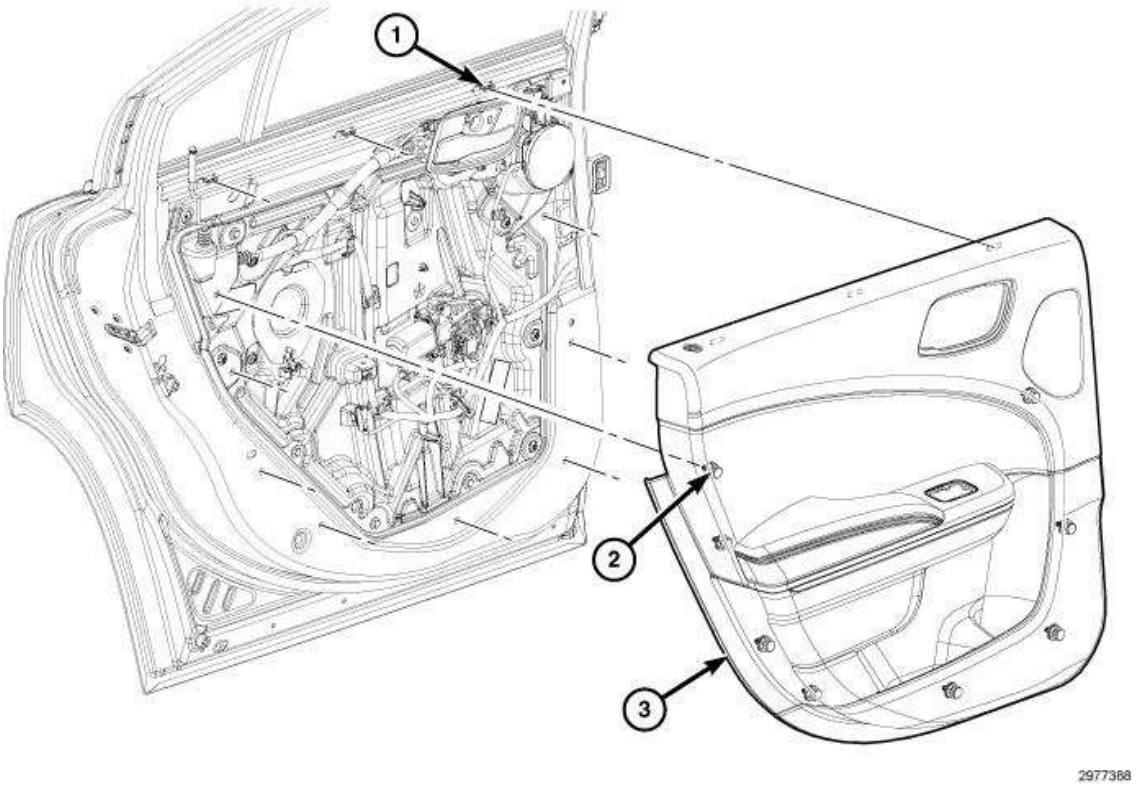

Fig. 674: Oil Pump Solenoid Electrical Connector & Primary Chain Tensioner Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows the engine timing cover removed for clarity.

8. Position the oil pump solenoid electrical connector (2) into the engine block. Rotate the connector so that it can be pushed past the primary chain tensioner mounting bolt (1). Then rotate the connector slightly CCW and push it into the engine block until it locks in place.

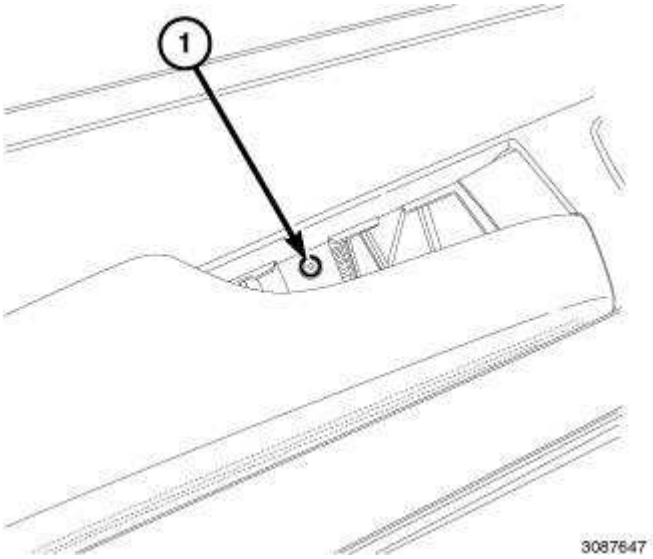

Fig. 675: Timing Gear Splash Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the timing gear splash shield (1). Tighten bolts (2) to 5 N.m (35 in. lbs.).

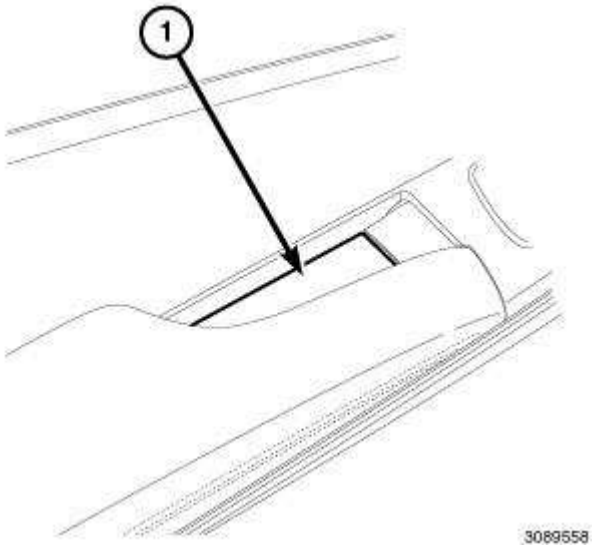

Fig. 676: Oil Pump Solenoid Electrical Connector Retention Lock Tab
Courtesy of CHRYSLER GROUP, LLC

10. Verify that the oil pump solenoid electrical connector retention lock tab (1) is engaged to the engine block.

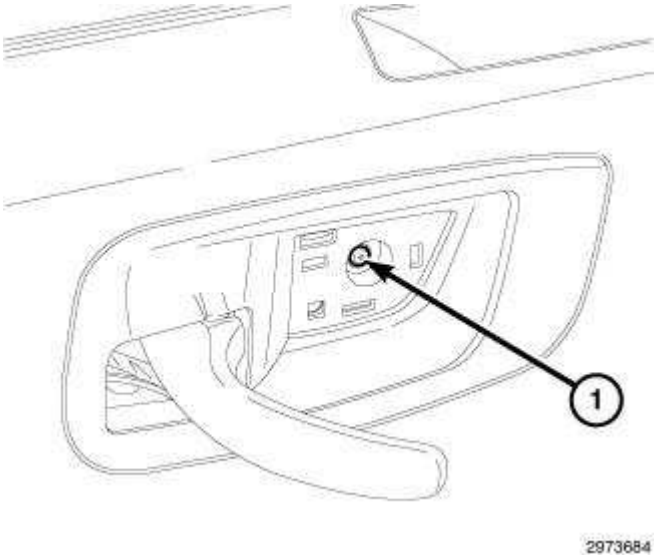

Fig. 677: Oil Pump Solenoid Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

11. Connect the engine wire harness to the oil pump solenoid electrical connector (1).

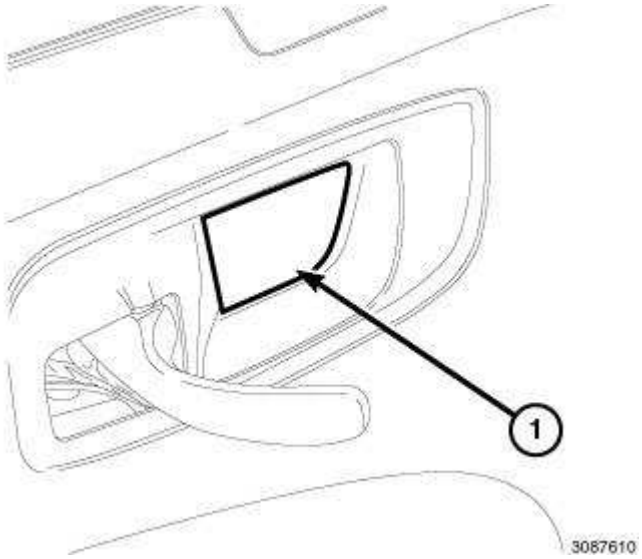

Fig. 678: Oil Pump Pick-Up Tube & Support Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the oil pump pick-up (1). Refer to **PICK-UP, OIL PUMP, INSTALLATION**.
13. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
14. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
15. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

CAUTION: A MIL or low oil pressure indicator that remains illuminated for more

than 2 seconds may indicate low or no engine oil pressure. Stop the engine and investigate the cause of the indication.

16. Start and run the engine until it reaches normal operating temperature.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

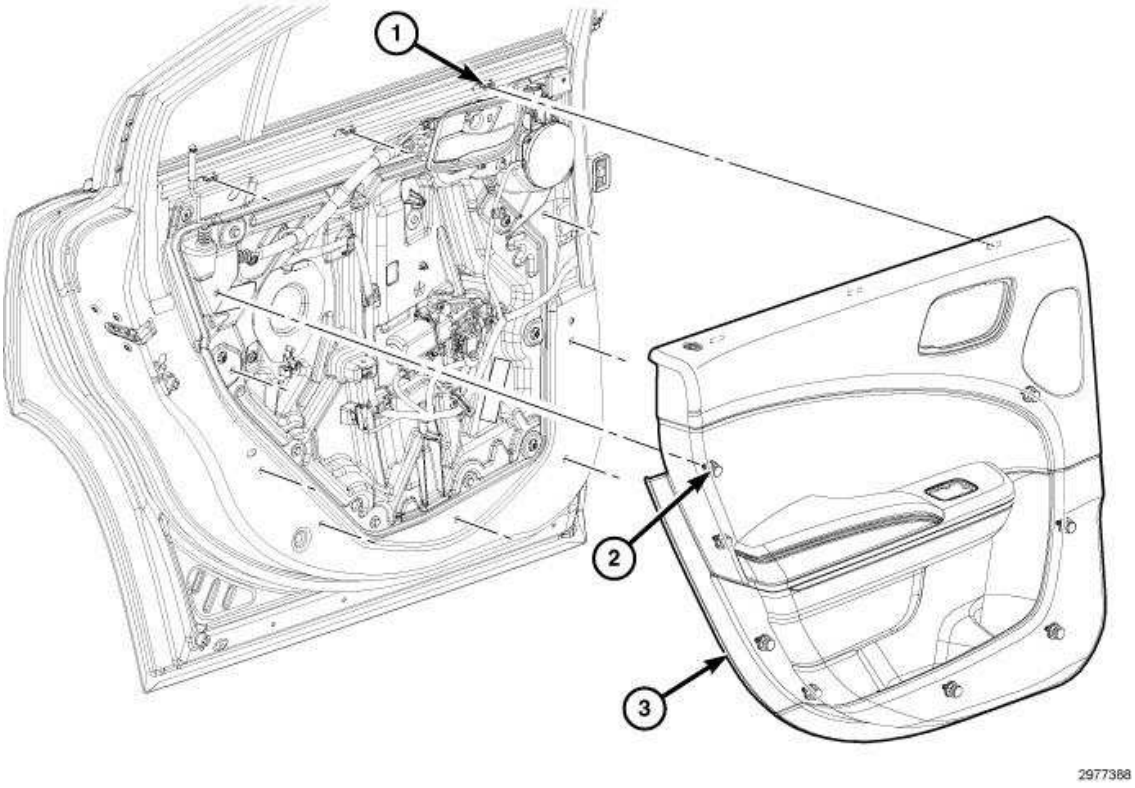

Fig. 679: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil pressure sensor (2) is located on the oil filter housing (3). The oil pressure sensor is a three wire sensor with a tapered threaded sensor port. The sensor port is mounted to the oil filter housing through an access hole. A thread lock patch seals the oil pressure sensor to the oil filter housing.

OPERATION

OPERATION

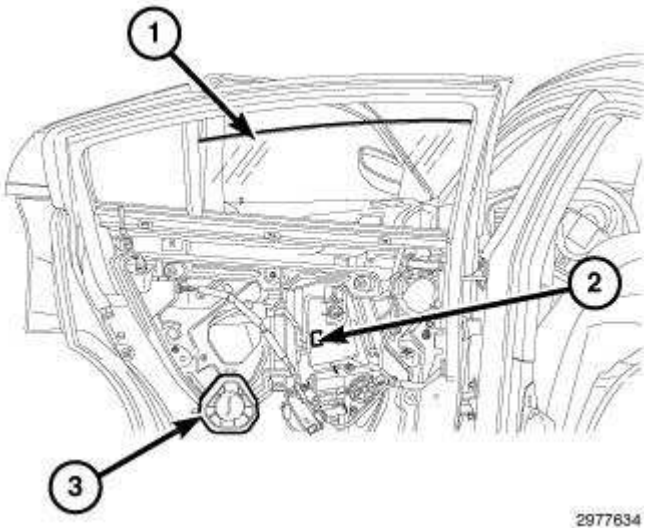

Fig. 680: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

The oil pressure sensor is a silicon based sensing unit that measures the pressure of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensor. The input to the PCM occurs on the signal return circuit. The oil pressure sensor is a linear sensor; as pressure changes, voltage changes proportionately and returns a voltage signal to the PCM that reflects oil pressure. The zero pressure reading is 0.5 volt and full scale is 4.5 volt.

REMOVAL

REMOVAL

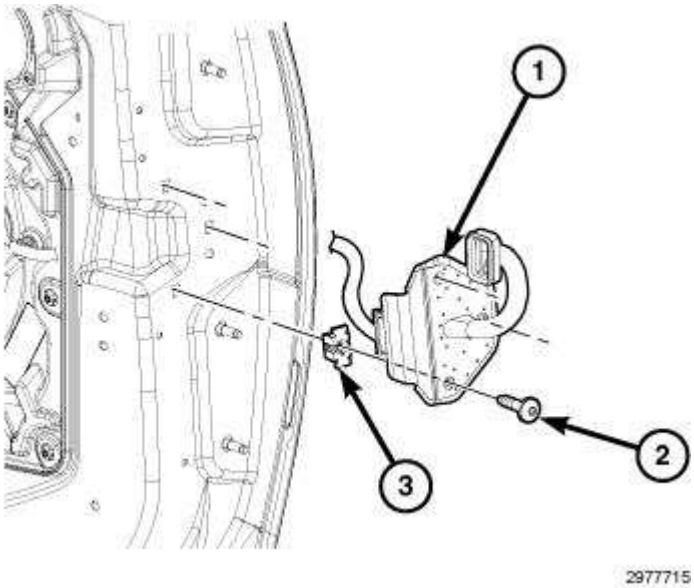

Fig. 681: Lower Intake Manifold & Attaching Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the air inlet hose, upper intake manifold and lower intake manifold with the fuel injectors and fuel rail (2). Refer to **MANIFOLD, INTAKE, REMOVAL**.

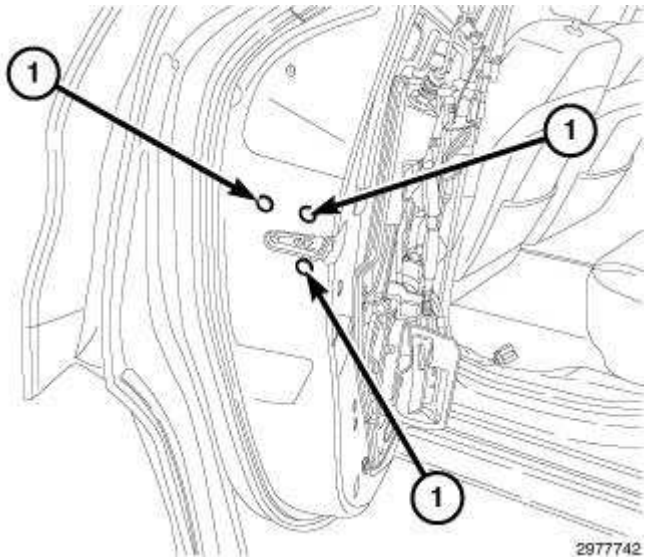

Fig. 682: Oil Temperature Sensor Electrical Connector, Oil Pressure Sensor Electrical Connector, Oil Filter Housing, Heater Hose & Bolts

Courtesy of CHRYSLER GROUP, LLC

5. Remove the oil pressure sensor (2) from the oil filter housing (3).

INSTALLATION

INSTALLATION

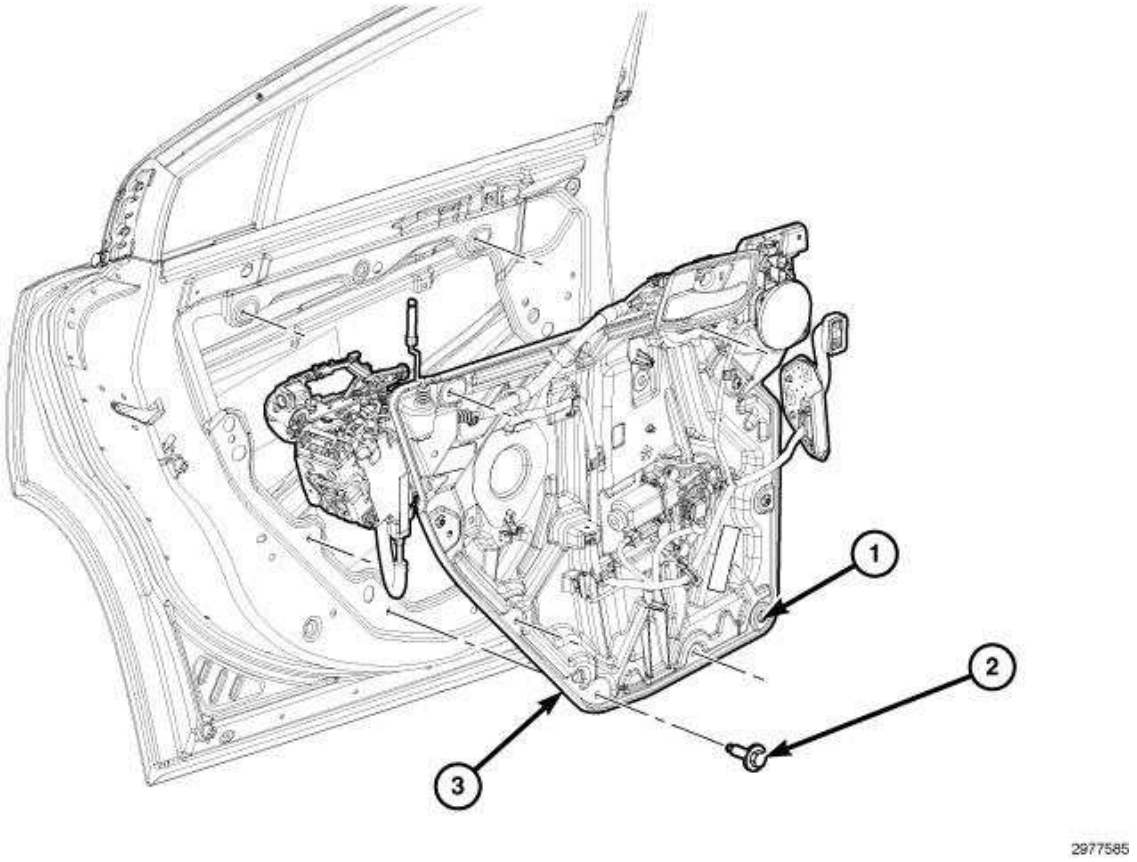

Fig. 684: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the oil pressure sensor (2) and tighten to 20 N.m (177 in. lbs.).

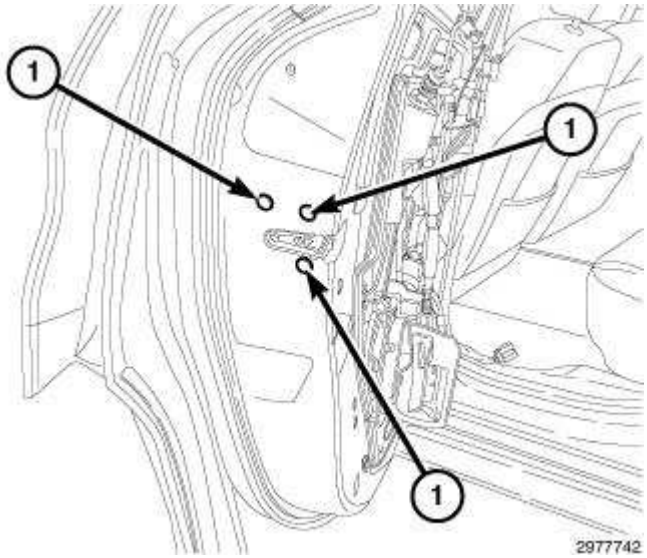

Fig. 685: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil pressure sensor electrical connector (3).
3. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

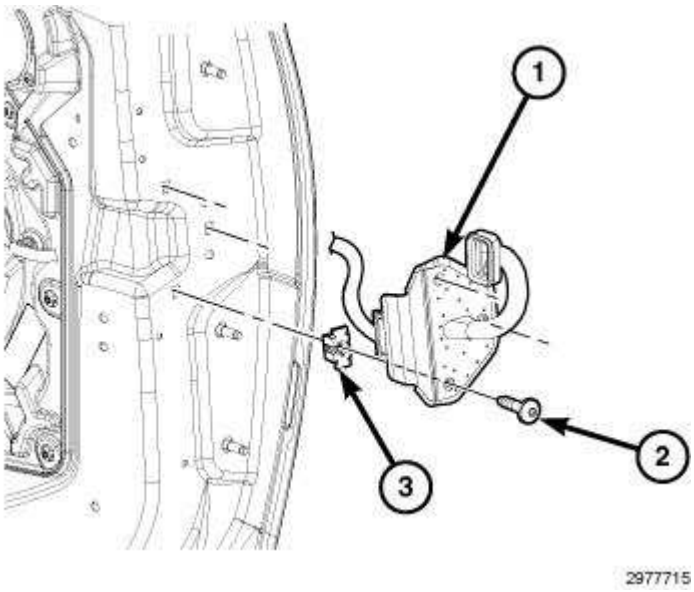

Fig. 686: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil temperature sensor (1) is located on the oil filter housing (3). The oil temperature sensor is a two wire sensor with a tapered threaded sensor probe. The sensor probe is mounted to the oil filter housing through an access hole. A thread lock patch seals the oil temperature sensor to the oil filter housing.

OPERATION

OPERATION

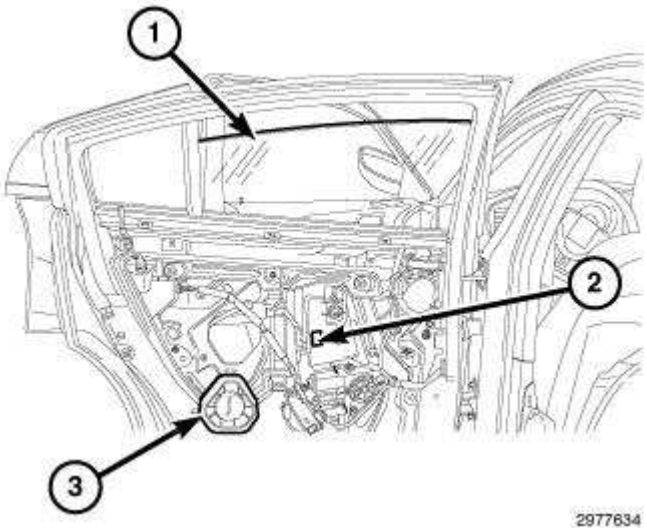

Fig. 687: Oil Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The oil temperature sensor is a variable resistor that measures the temperature of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensors low reference signal circuit. When the oil temperature is low, the sensor resistance is high. When the oil temperature is high, the sensor resistance is low.

REMOVAL

REMOVAL

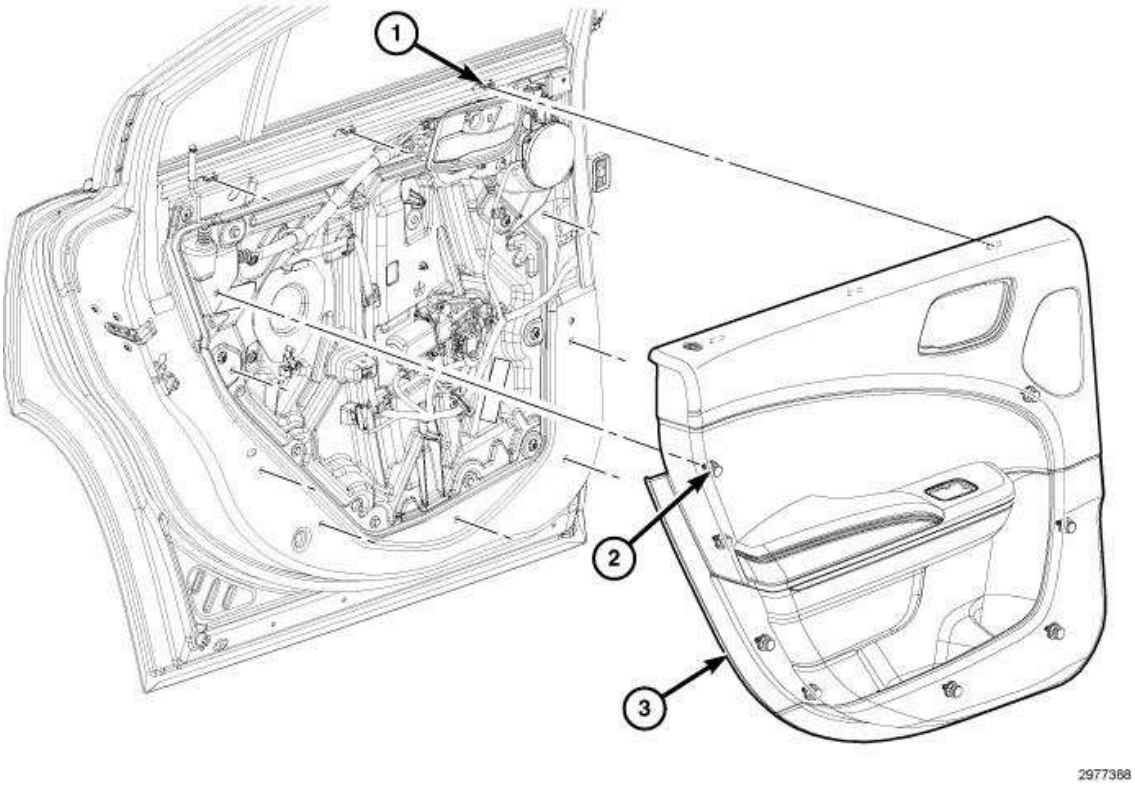

Fig. 688: Lower Intake Manifold & Attaching Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the air inlet hose, upper intake manifold and lower intake manifold with the fuel injectors and fuel rail (2). Refer to **MANIFOLD, INTAKE, REMOVAL**.

1. Connect the oil temperature sensor electrical connector (4).
2. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
3. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

MANIFOLDS

MANIFOLD, EXHAUST

DESCRIPTION

DESCRIPTION

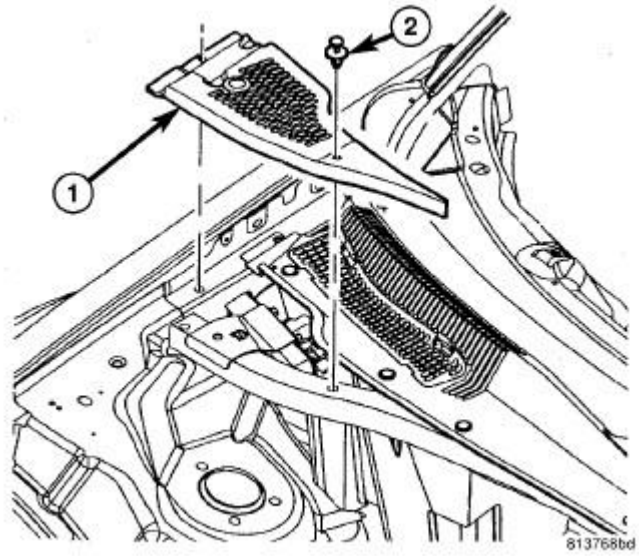

Fig. 693: Aluminum Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The 3.6L aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. If any damaged is found to the exhaust manifold portion, the cylinder head must be removed for repair or replacement. Refer to **CYLINDER HEAD, REMOVAL**.

MANIFOLD, INTAKE

DESCRIPTION

DESCRIPTION

UPPER INTAKE MANIFOLD

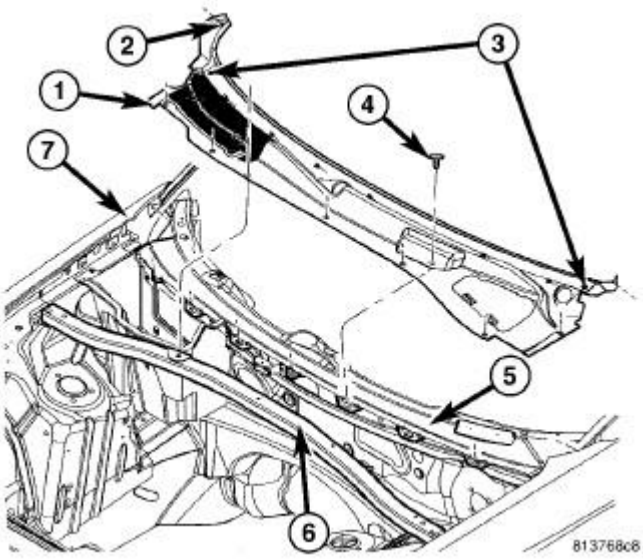

Fig. 694: Upper Intake Manifold Design
Courtesy of CHRYSLER GROUP, LLC

The upper intake manifold is an injection molded nylon composite design. The upper intake manifold is sealed to the lower intake manifold using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the upper intake manifold is removed from the engine. There is a silencer pad positioned between the upper and lower intake manifolds for improved noise, vibration and harshness (NVH). The left cylinder head cover has two alignment posts to aid proper installation of the silencer pad. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design. If the upper intake manifold is damaged or cracked, it must be replaced.

The Electronic Throttle Control (ETC) and Manifold Air Pressure (MAP) sensor are attached directly to the upper intake manifold. The upper intake manifold also provides vacuum ports for brake booster, positive crankcase ventilation (PCV) and emissions control.

LOWER INTAKE MANIFOLD

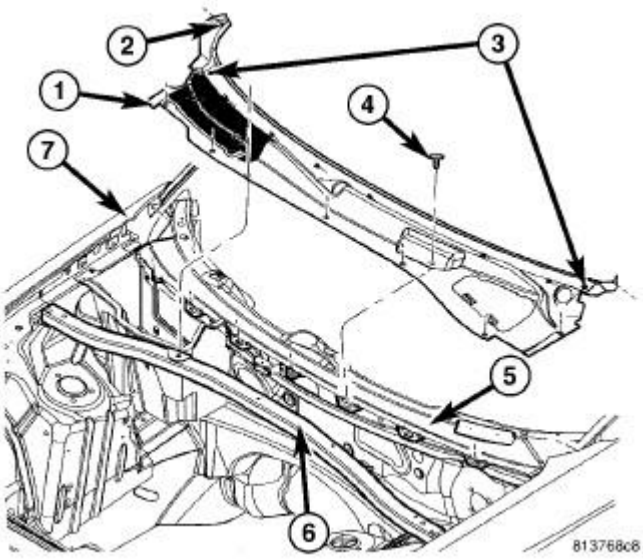

Fig. 695: Lower Intake Manifold Design
Courtesy of CHRYSLER GROUP, LLC

The lower intake manifold is an injection molded nylon composite design. The lower intake manifold is sealed to the cylinder heads using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the lower intake manifold is removed from the engine. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design.

The fuel injection fuel rail is also a composite design. The four fuel rail fasteners thread directly into the composite lower intake manifold and are a self-taping design. The lower intake manifold can be serviced without removing the fuel injector rail. The fuel rail and fuel injectors must be installed into the lower intake manifold as an assembly. Do not attempt to install the fuel rail when the injectors are in the manifold. Always install new O-rings on the fuel injectors.

If the lower intake manifold is damaged or cracked, it must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

> **WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or the fan. Do not wear loose clothing.**

1. Start the engine.
2. Spray a small stream of water (spray bottle) at the suspected leak area.

3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

UPPER

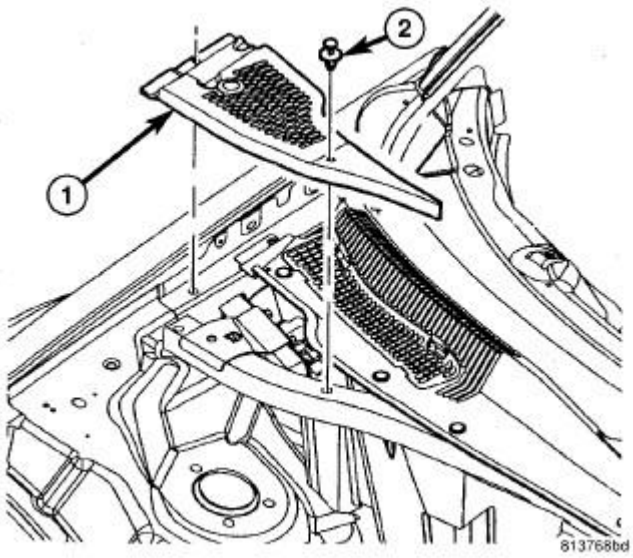

Fig. 696: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

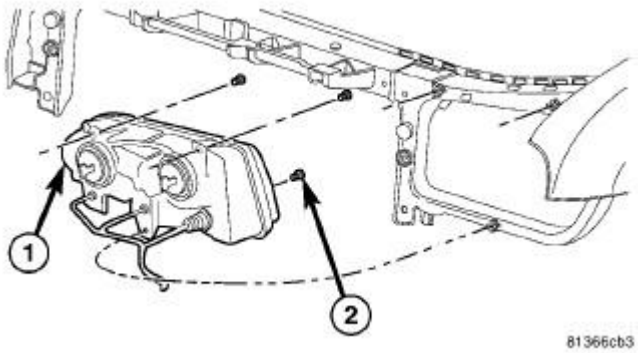

Fig. 697: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

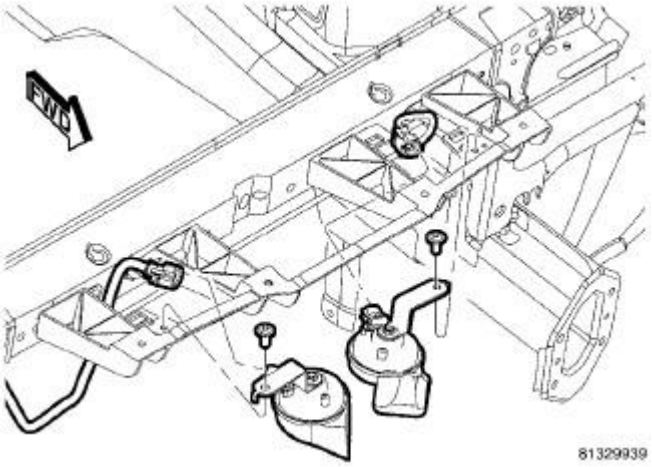

Fig. 698: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

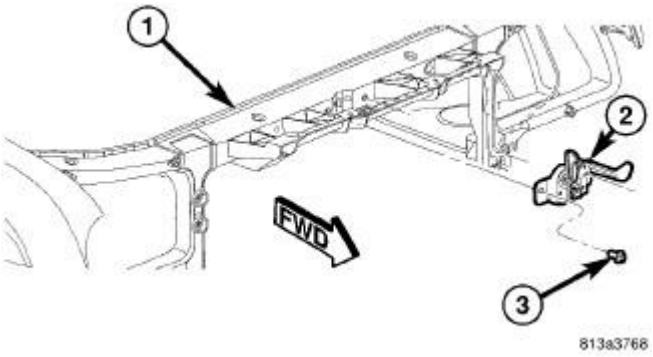

Fig. 699: Brake Booster Hose Retainer

15. Remove the two nuts (1), loosen two stud retainers (3) and reposition the two upper intake manifold support brackets (2).

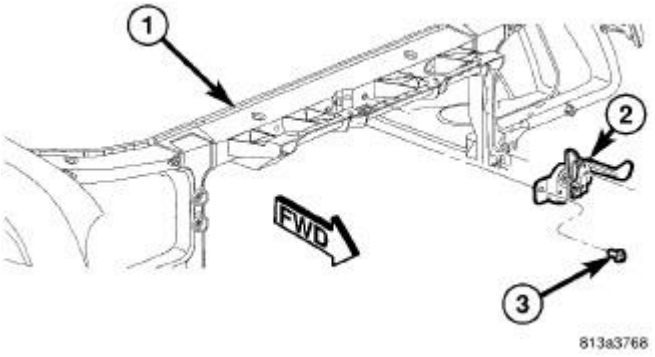

Fig. 704: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The upper intake manifold attaching bolts are captured in the upper intake manifold. Once loosened, the bolts will have to be lifted out of the lower intake manifold and held while removing the upper intake manifold.

NOTE: Exercise care not to inadvertently loosen the two fuel rail attachment bolts that are in close proximity of the upper intake manifold attaching bolts.

16. Remove the seven manifold attaching bolts (1) and remove the upper intake manifold (2).

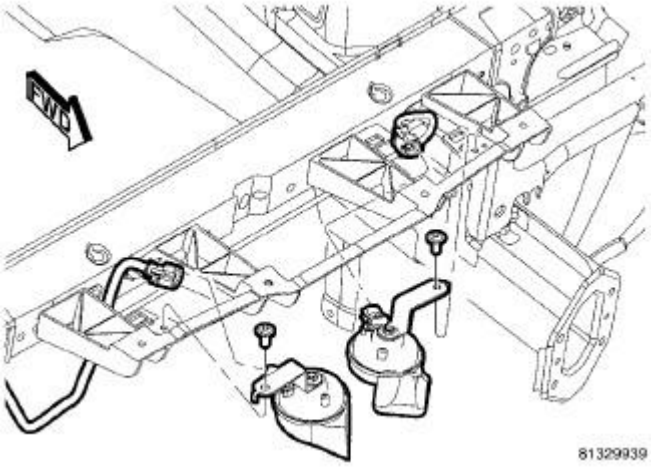

Fig. 705: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

17. Remove and discard the six upper to lower intake manifold seals (1).
18. Cover the open intake ports to prevent debris from entering the engine.
19. If required, remove the insulator (2) from the left cylinder head cover.

LOWER

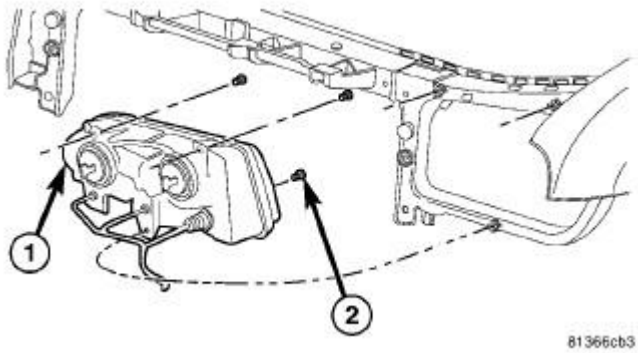

Fig. 706: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable (1).

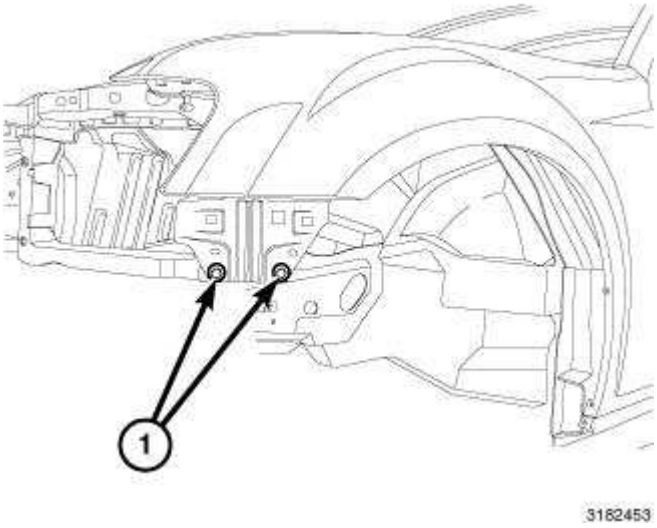

Fig. 707: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

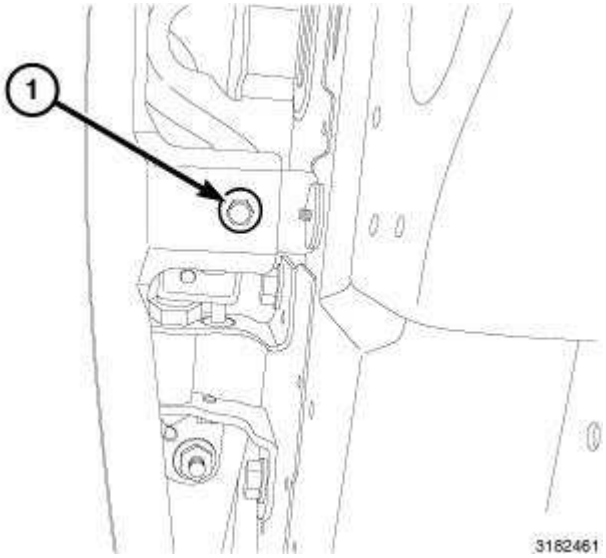

Fig. 708: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

18. If required, remove the fuel rail (2) and fuel injectors from the lower intake manifold. Refer to **RAIL, FUEL, REMOVAL** .

INSPECTION

INSPECTION

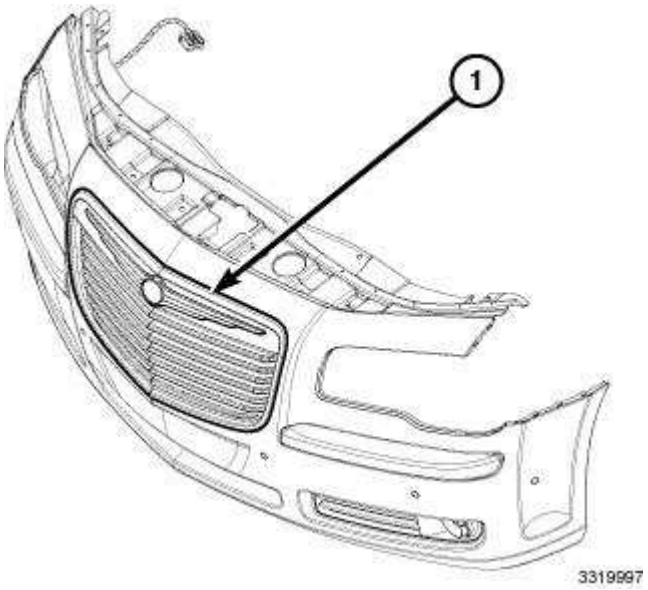

Fig. 716: Non-Repairable Damage To Lower Intake Manifold Due To Cross Threading Of An Upper Intake Manifold Attaching Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When the upper intake manifold (3) and lower intake manifold (1) are not aligned properly, cross threading of the upper intake manifold attaching bolts can occur. The graphic shows non-repairable damage to the lower intake manifold (1) due to cross threading of an upper intake manifold attaching bolt (2).**

Check both the upper and lower intake manifolds for:

- Damage and cracks
- Gasket surface damage or warping

Check the lower intake manifold for:

- Damaged fuel injector ports

If either the upper or lower manifold exhibits any damaged or warped conditions, replace the manifold.

INSTALLATION

UPPER

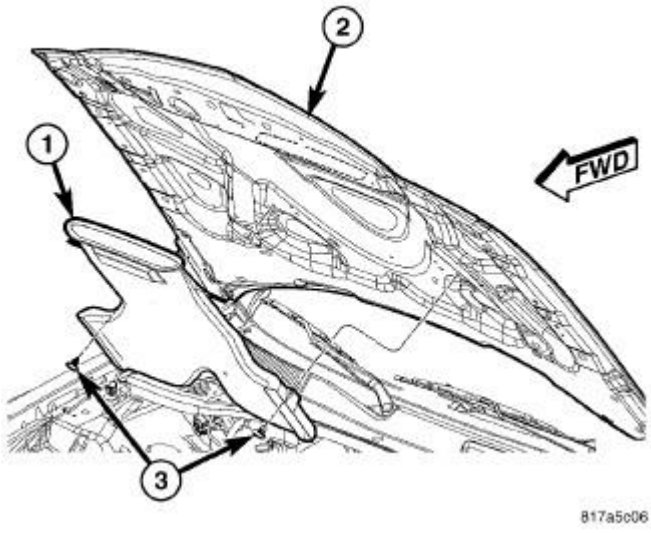

Fig. 717: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Prior to installing the upper intake manifold, verify that the four fuel rail bolts were not inadvertently loosened. The bolts must tightened in the sequence shown in illustration, to 7 N.m (62 in. lbs.). Refer to RAIL, FUEL, INSTALLATION .**

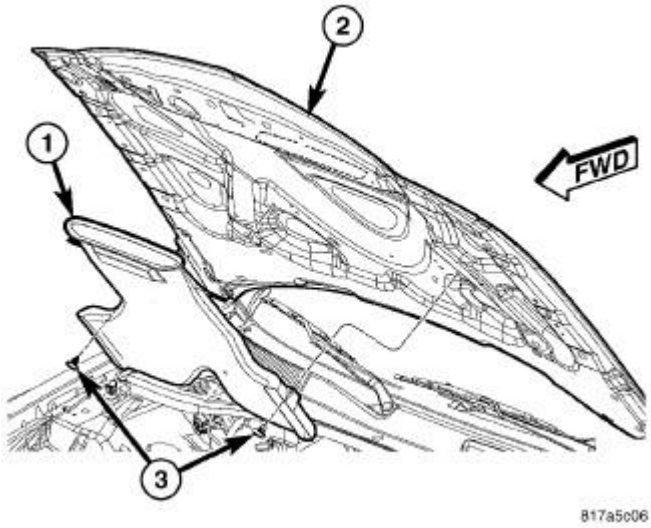

Fig. 718: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the sealing surfaces. Install new upper to lower intake manifold seals (1).

   NOTE: Make sure the fuel injectors and wiring harnesses are in the correct position so that they don't interfere with the upper intake manifold installation.

2. If removed, position the insulator (2) onto the two alignment posts (3) on top of the left cylinder head cover.

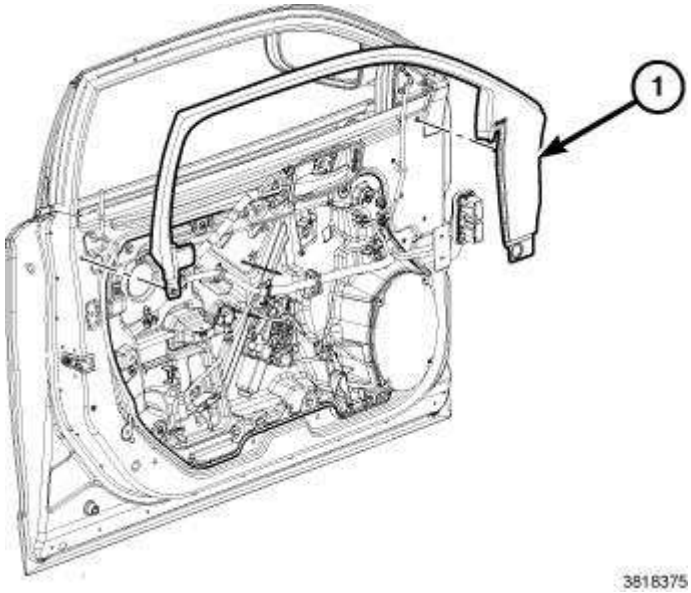

Fig. 719: Upper Intake Attaching Bolts, Locating Posts & Holes
Courtesy of CHRYSLER GROUP, LLC

3. Lift and hold the seven upper intake attaching bolts (1) clear of the mating surface. Back the bolts out slightly or if required, use an elastic band to hold the bolts clear of the mating surface.
4. Position the upper intake manifold (1) onto the lower intake manifold so that the two locating posts (2) on the upper intake manifold align with corresponding holes (3) in the lower intake manifold.

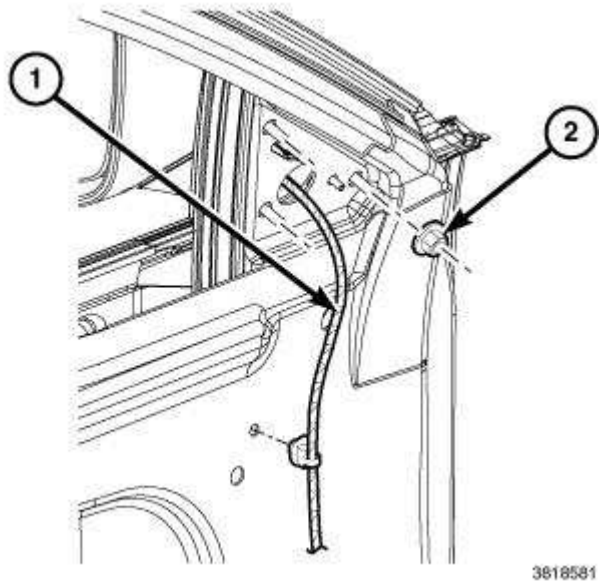

Fig. 720: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Install the seven upper intake manifold attaching bolts. Tighten the bolts in the sequence shown in illustration, to 8 N.m (71 in. lbs.).

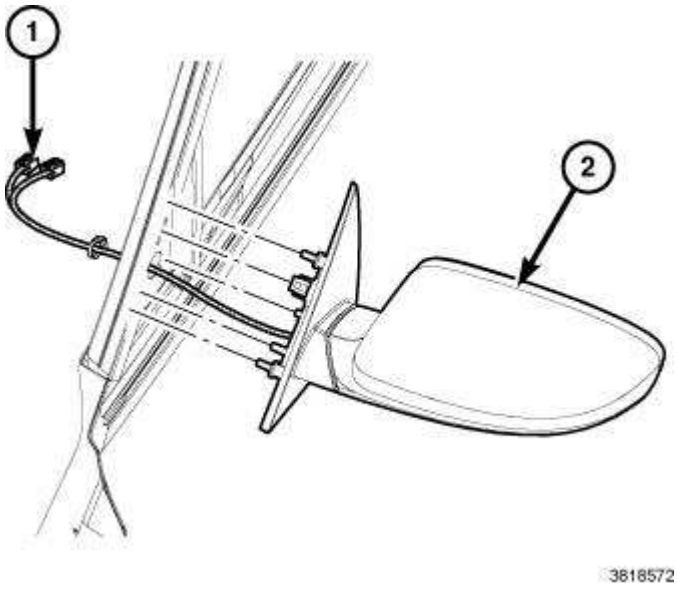

Fig. 721: Upper Intake Manifold Support Bracket, Stud & Fasteners

Courtesy of CHRYSLER GROUP, LLC

6. Install two nuts (1) to the upper intake manifold support bracket (2). Tighten the nuts (1) to 10 N.m (89 in. lbs.) and tighten the stud (3) to 20 N.m (15 ft. lbs.)
7. Engage the wire harness retainer (4) to the stud (3).

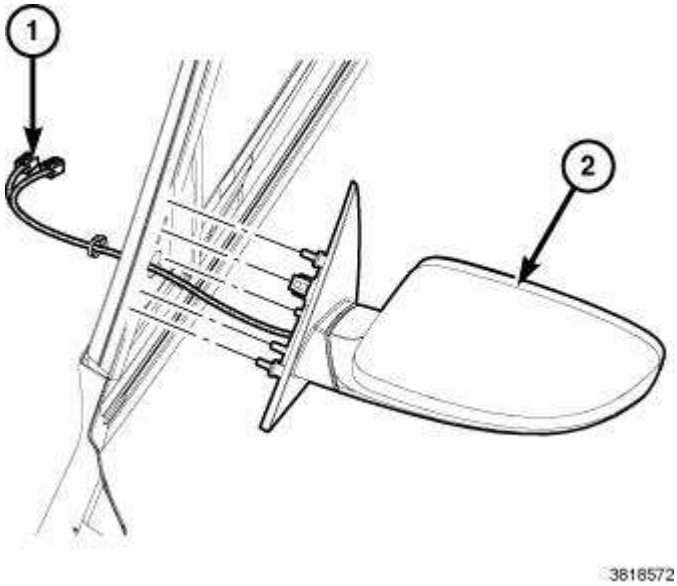

Fig. 722: Nuts, Stud Retainers & Upper Intake Manifold Support Brackets
Courtesy of CHRYSLER GROUP, LLC

8. Install the two upper intake manifold support brackets (2) with two stud retainers (3) and two nuts (1). Tighten the stud retainers (3) to 20 N.m (15 ft. lbs.) and tighten the nuts (1) to 10 N.m (89 in. lbs.).

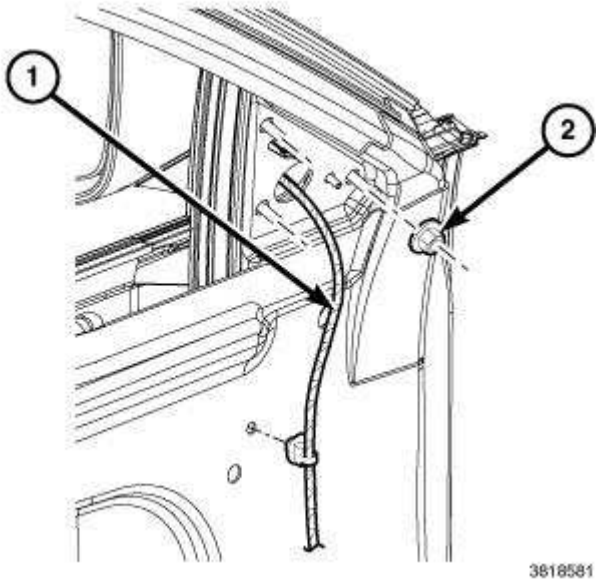

Fig. 723: Heater Core Return Tube Upper Support Bracket Retaining Nut & Tube

9. Position the heater core return tube (1), install the retaining nut (2) and tighten to 12 N.m (9 ft. lbs.).

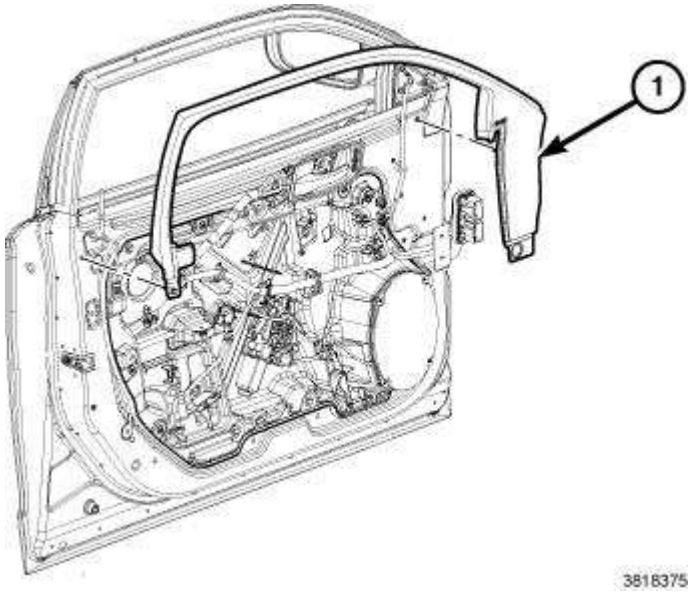

Fig. 724: MAP Sensor, ETC, PCV Hose, Brake Booster Vacuum Hose, EVAP Vapor Purge Line, Clip & Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

10. Connect the following hoses to the upper intake manifold:
    - Positive Crankcase Ventilation (PCV) (7)
    - Brake booster vacuum hose (6)
    - EVAP vapor purge line (3)
11. Connect the electrical connectors to the Manifold Absolute Pressure (MAP) sensor (2) and the Electronic Throttle Control (ETC) (4).
12. Secure the ETC harness to the clip (5) on the throttle body and fasten the wire harness retainer (1) to the upper intake manifold near the MAP sensor.

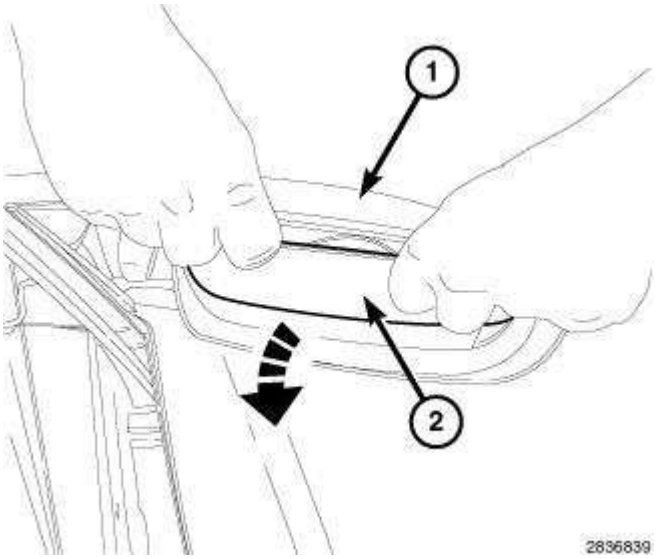

Fig. 725: Brake Booster Hose Retainer
Courtesy of CHRYSLER GROUP, LLC

13. Fasten the brake booster vacuum hose retainer (1) to the upper intake manifold.

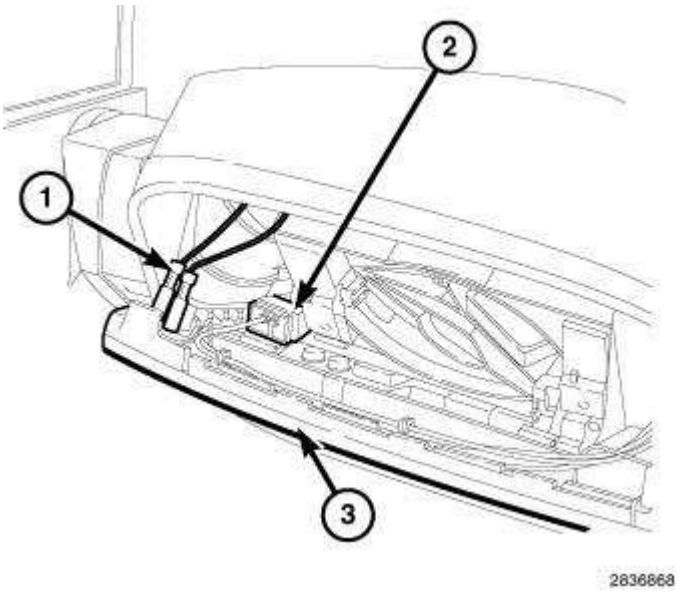

Fig. 726: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
15. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
16. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
17. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
18. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

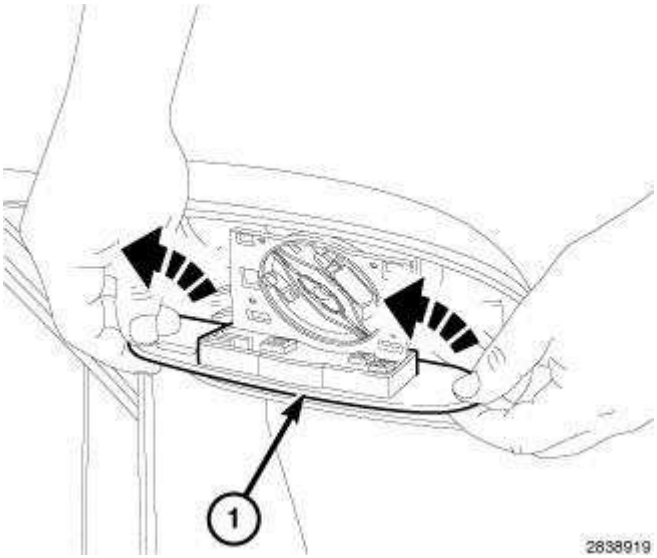

Fig. 727: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

19. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

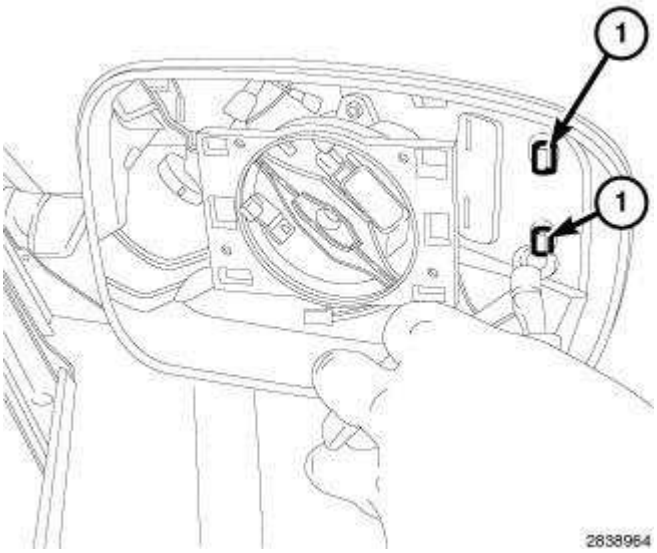

Fig. 728: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

20. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
21. Start the engine and check for leaks.

LOWER

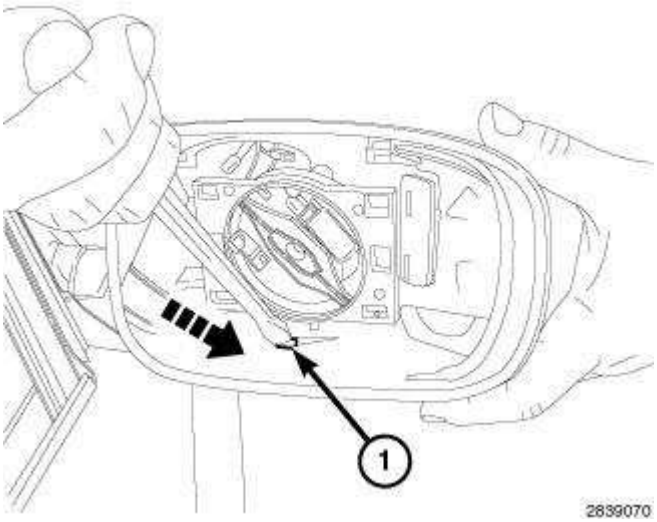

Fig. 729: Lower Intake Manifold To Cylinder Head Seals
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the sealing surfaces. Install new lower intake manifold to cylinder head seals (1).

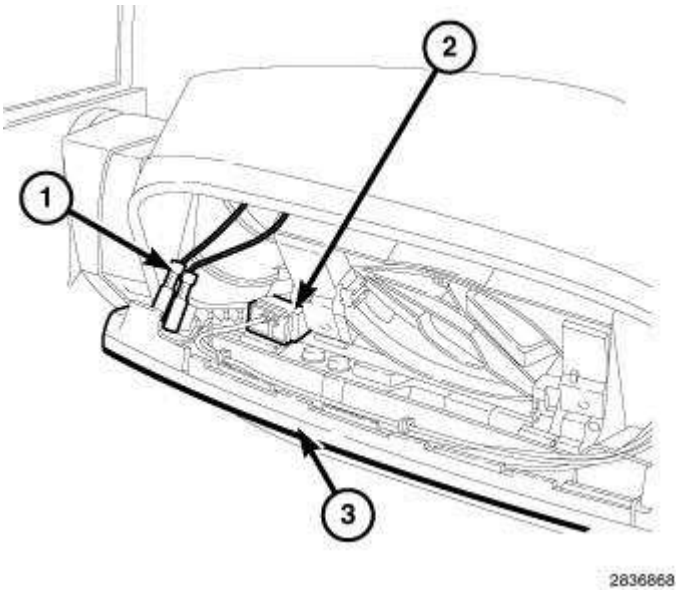

Fig. 730: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. If removed, install the fuel injectors and the fuel rail (1) to the lower intake manifold. Tighten the four bolts in the sequence shown in illustration, to 7 N.m (62 in. lbs.). Refer to **RAIL, FUEL, INSTALLATION** .

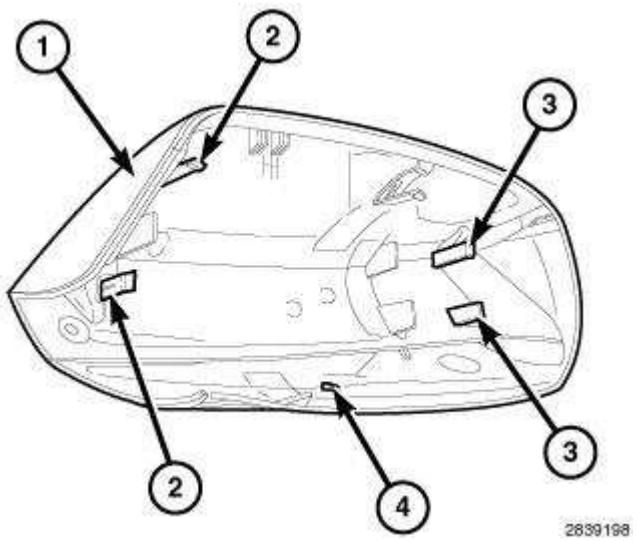

Fig. 731: Intake Manifold Retaining Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Position the lower intake manifold (1) onto the cylinder head surfaces.
4. Install the intake manifold retaining bolts and tighten in the sequence shown in illustration, to 8 N.m (71 in. lbs.).

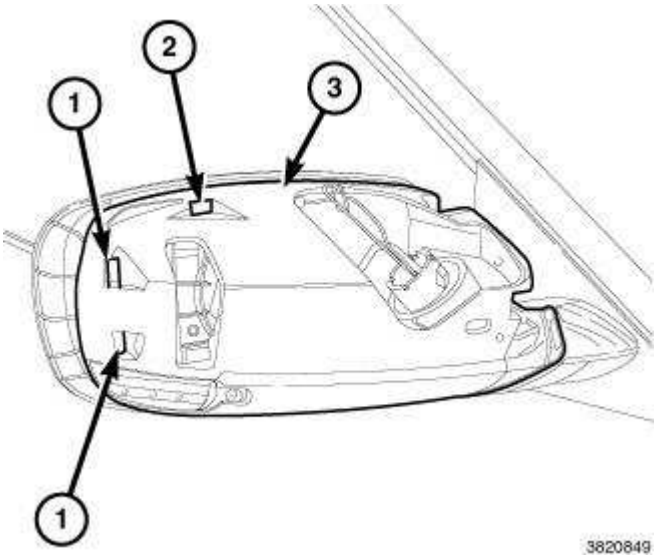

Fig. 732: Injection/Ignition Harness Retainer & Main Wire Harness Retainer

Courtesy of CHRYSLER GROUP, LLC

10. Install the upper intake manifold (1) and support brackets. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

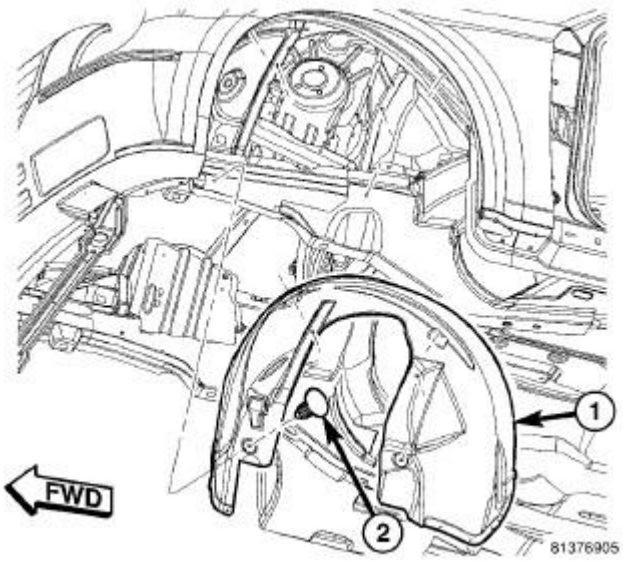

Fig. 736: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
12. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
13. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).

14. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
15. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

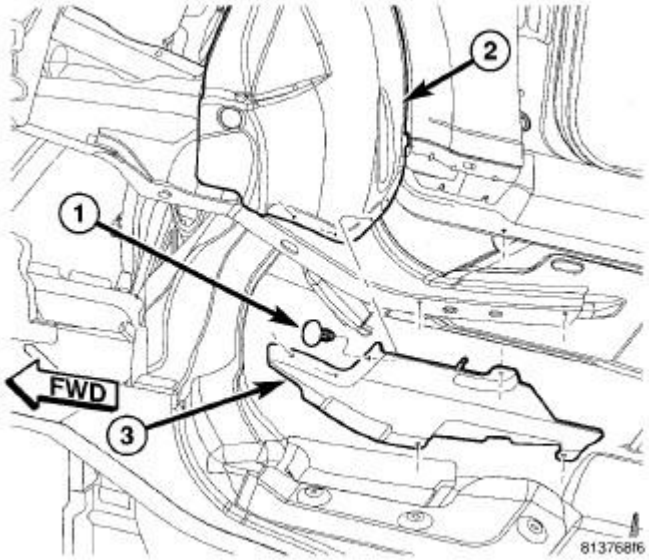

Fig. 737: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

16. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

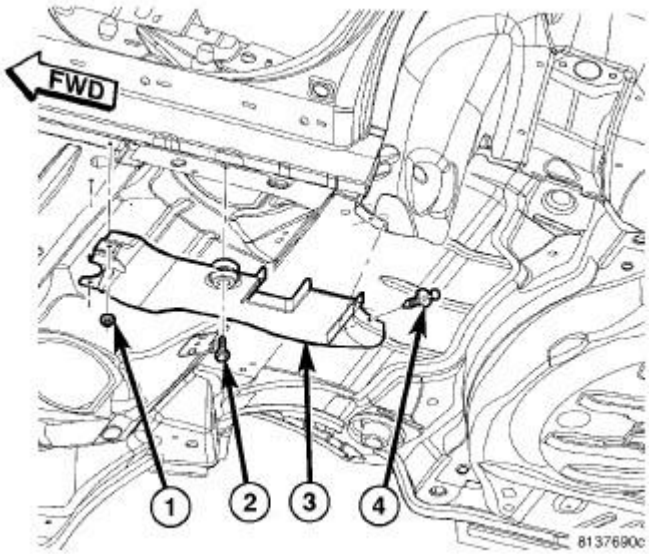

Fig. 738: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

17. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
18. Start the engine and check for leaks.

VALVE TIMING

DESCRIPTION

DESCRIPTION

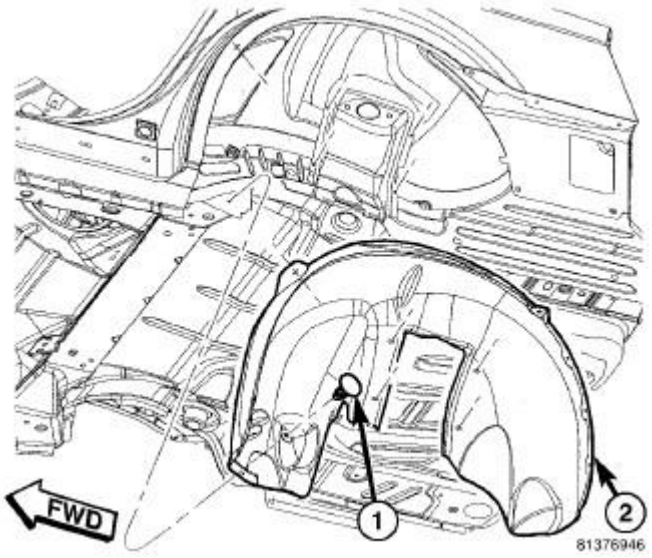

Fig. 739: Valve Timing System Components
Courtesy of CHRYSLER GROUP, LLC

The timing drive uses four silent chains. The silent chain link design improves sprocket engagement and reduces noise, vibration and harshness (NVH). One chain (5) drives the oil pump (4) and three chains drive the camshafts in a two stage design. The left secondary camshaft chain (1) uses an oil pressure controlled chain tensioner (9) with a ratcheting device. The right secondary camshaft chain (8) uses an oil pressure controlled tensioner (7) without a ratchet. The primary chain (2) also uses an oil pressure controlled tensioner (6) without a ratchet. A spring loaded tensioner (3) takes up the slack in the oil pump chain (5). The chain guides and tensioner arms are made of glass filled nylon with nylon wear faces.

OPERATION

OPERATION

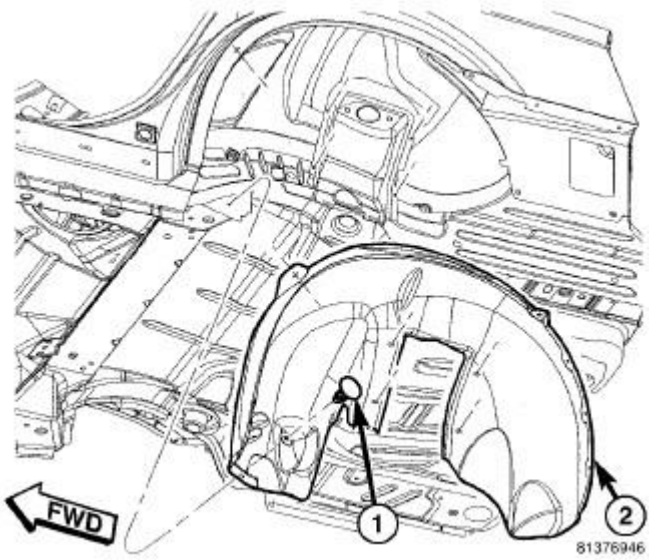

Fig. 740: Primary Chain, Idler Sprocket & Crankshaft Sprocket
Courtesy of CHRYSLER GROUP, LLC

The primary timing chain is a silent type. The primary chain drives the 28 tooth idler sprocket directly from a 21 tooth crankshaft sprocket. This results in a 75% speed reduction to the idler sprocket. The idler sprocket assembly connects the primary chain drive and the secondary chain drive. The idler sprocket assembly consists of two integral 22 tooth sprockets a 28 tooth sprocket. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is a light press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the bushings used in the idler sprocket assembly. Primary chain motion is controlled by a hydraulic oil damped tensioner and a fixed guide. The tensioner and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication.

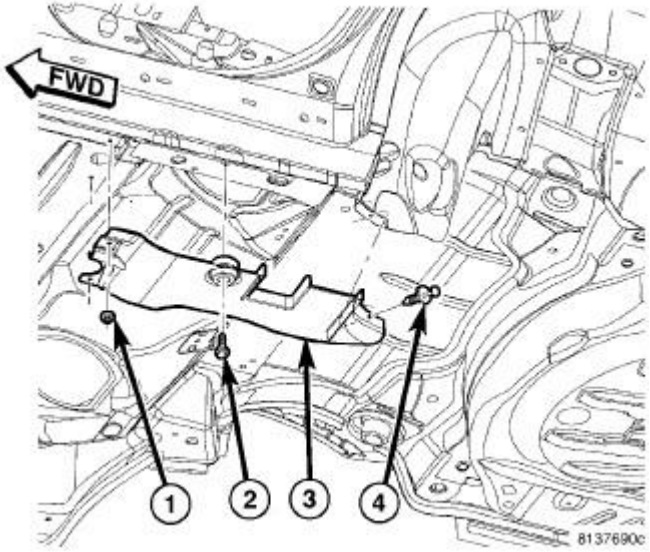

Fig. 741: Secondary Drive Chains
Courtesy of CHRYSLER GROUP, LLC

There are two identical secondary drive chains, both are silent type, one to drive the camshafts in each double overhead cam (DOHC) cylinder head. The secondary chains drive the 33 tooth camshaft sprockets directly from the 22 tooth idler sprockets. This speed reduction combined with the crankshaft to idler sprocket speed reduction produces the required 2:1 camshaft drive ratio. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The left hydraulic secondary chain tensioner is fed from the main oil gallery through the cylinder head. The right hydraulic secondary chain tensioner is fed from the number one main bearing journal. Each tensioner incorporates a controlled leak path through a device known as a vent disc located in the nose of the piston to manage chain loads. Only the left tensioner has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The two secondary timing chains are lubricated by holes in the oil controlled tensioners that spray oil through an opening in the tensioner arms. The holes are protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE

RESETTING LEFT CAM CHAIN TENSIONER

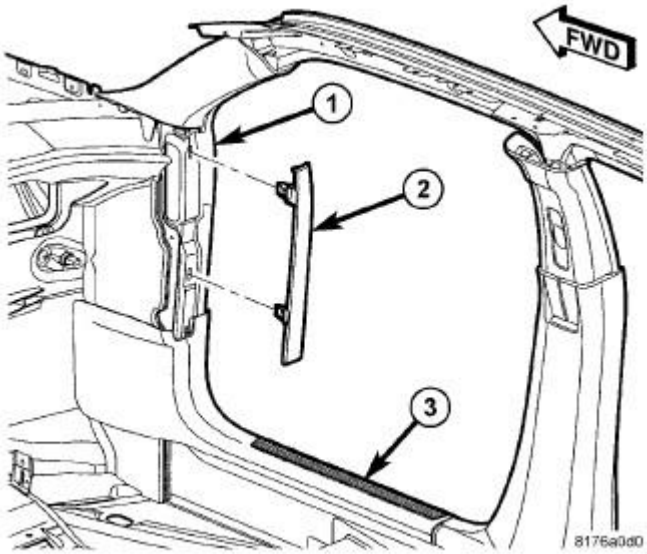

Fig. 742: Left Side Cam Chain Tensioner Ratchet Components
Courtesy of CHRYSLER GROUP, LLC

The left side cam chain tensioner used on the 3.6L engine is equipped with a ratchet. The ratchet consists of a rack (2) and a pawl (1). In use, the rack (2) extends with the piston (3) from the tensioner body. The pawl (1) will not allow the rack (2) to retract back into the tensioner body. In order to reset the tensioner, the pawl (1) must be disengaged from the rack (2) so that the piston (3) and rack (2) can be pushed back (4) into the tensioner body.

WITH ENGINE TIMING COVER REMOVED

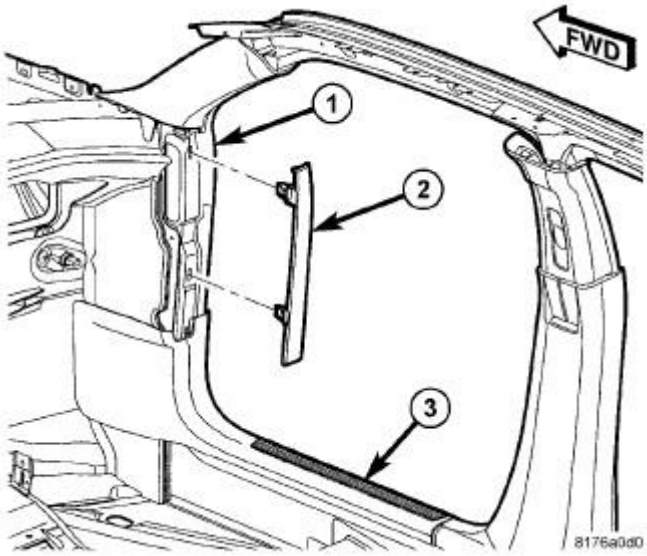

Fig. 743: Locating Slot In Rack & Allen Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: The slot (2) in the rack provides an anchor point for a pin that holds the rack in the retracted position.

1. Using a suitable tool, such as an allen wrench (1), lift the pawl off of the rack.
2. While holding the pawl off of the rack, push the rack and the piston into the tensioner body.

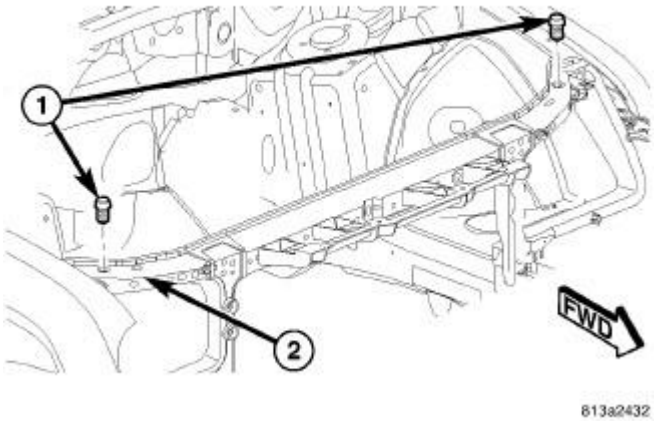

Fig. 744: Inserting Tensioner Pin To Hold Rack & Piston In Retracted Position
Courtesy of CHRYSLER GROUP, LLC

3. When the slot is aligned with the hole in the tensioner body, insert Tensioner Pin (special tool #8514, Pins, Tensioner) (1) to hold the rack and piston in the retracted position.

WITH ENGINE TIMING COVER INSTALLED

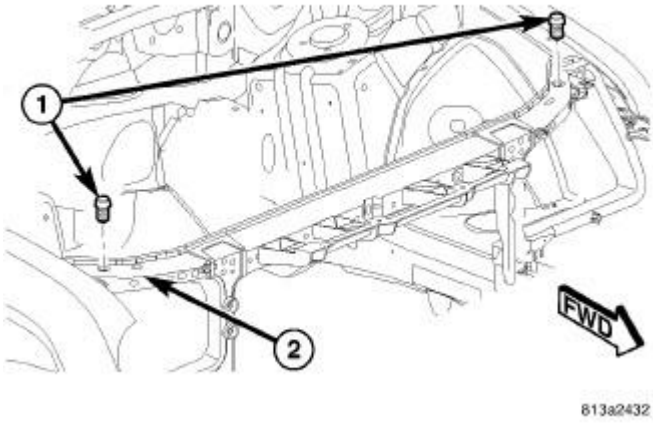

Fig. 745: Pin, Rack & Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows timing cover removed for clarity.

1. Using (special tool #10200-3, Pin) (2), lift the pawl off of the rack (3).

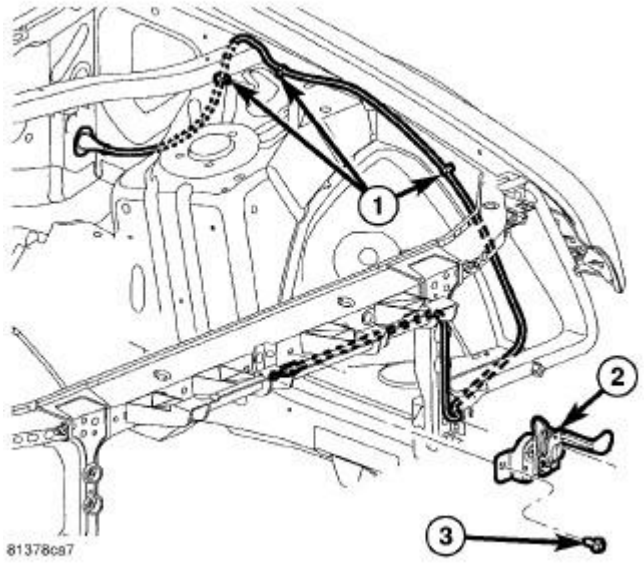

Fig. 746: Positioning Timing Chain Holder To Force Rack & Piston Back Into Tensioner Body
Courtesy of CHRYSLER GROUP, LLC

2. While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder must remain in place during service to keep the

rack and piston in the retracted position.

MEASURING TIMING CHAIN WEAR

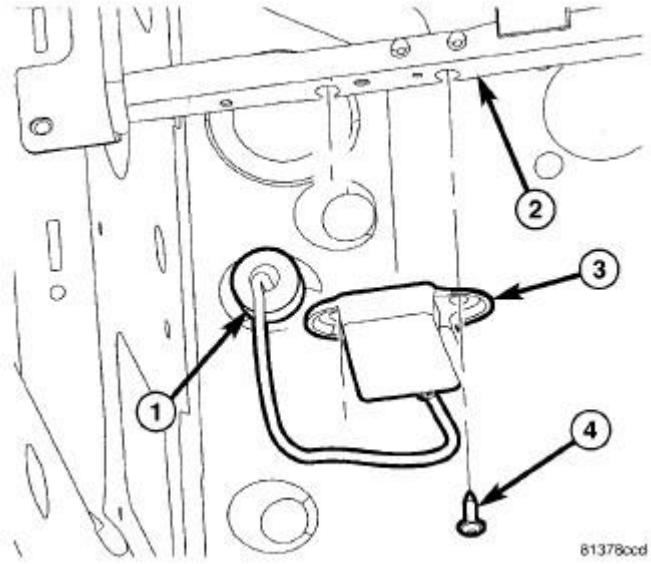

Fig. 747: Piston Extension & RH Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
2. To determine if the timing chains are worn, rotate the crankshaft clockwise until maximum tensioner piston extension (1) is obtained on the RH cam chain tensioner (2). Measure the distance between the secondary timing chain tensioner housing and the step ledge on the tensioner piston (1). Piston extension (1) must be less than 16 mm (0.630 in.).
3. Piston extension greater than 16 mm (0.630 in.) indicates that all timing chains are worn and require replacement. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

ENGINE TIMING VERIFICATION

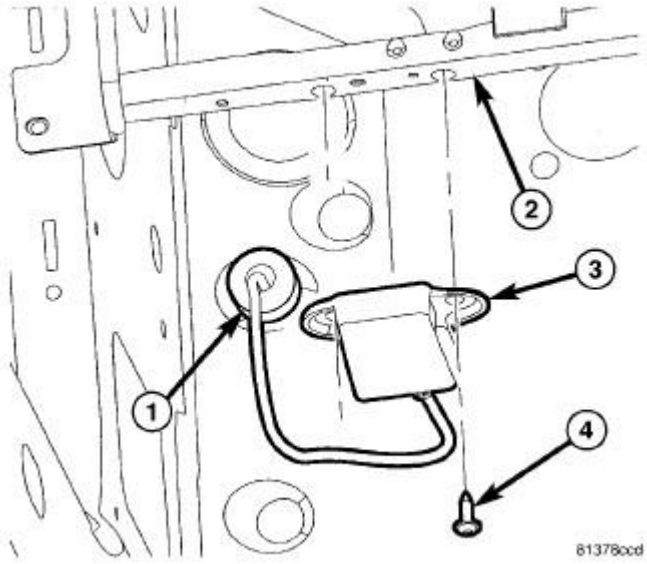

Fig. 748: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

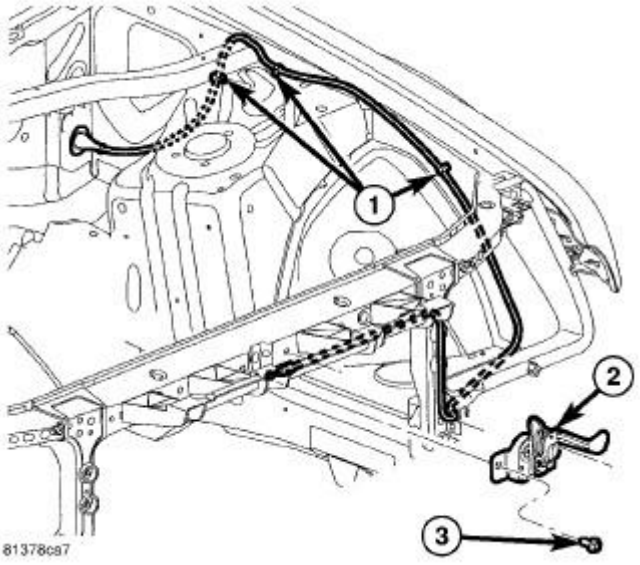

Fig. 749: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

Correct timing is critical for the NON free-wheeling designed, 3.6L engine. Engine timing can be verified by using the following procedures:

1. Remove the upper intake manifold and both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to **ZERO** .

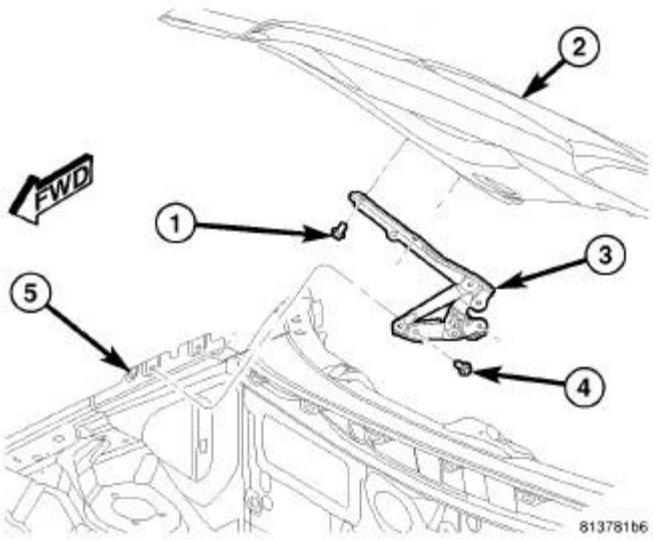

Fig. 750: Arrows, Scribe Lines & Cam Phasers
Courtesy of CHRYSLER GROUP, LLC

4. While maintaining this alignment, verify that the **ARROWS** (1) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (2) and that the right side cam phaser **ARROWS** (3) point away from each other and the **SCRIBE LINES** (5) are parallel to the cylinder head cover mounting surface (4).

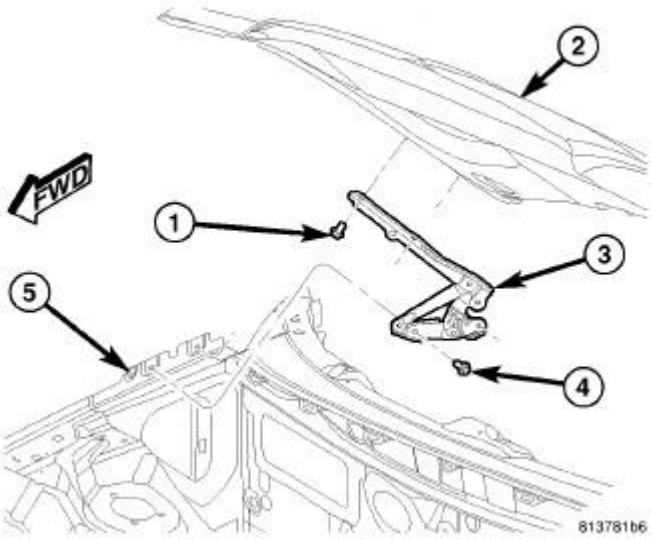

Fig. 751: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
6. If the engine timing is not correct, proceed to Timing Chain and Sprockets for service procedures. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

CHAIN AND SPROCKETS, TIMING

REMOVAL

REMOVAL

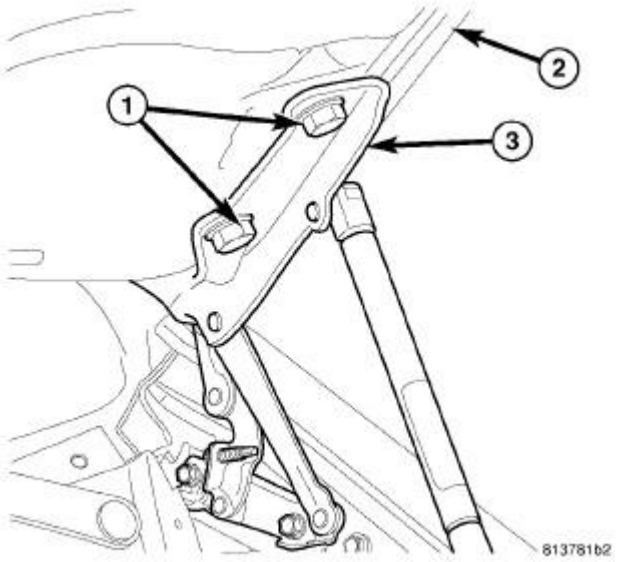

Fig. 752: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

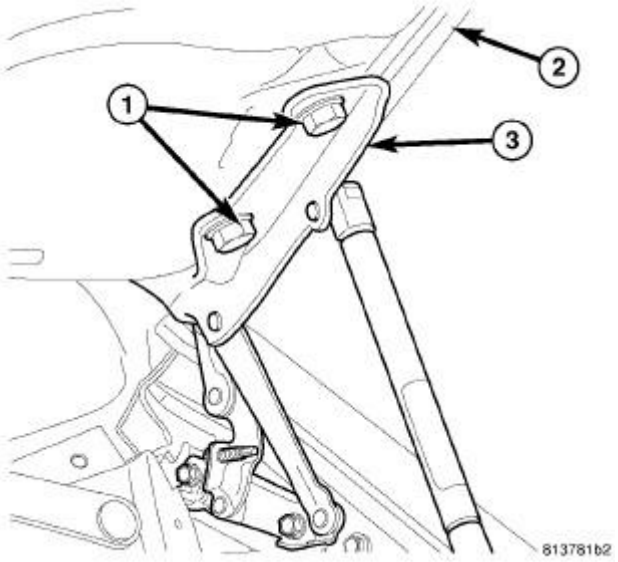

Fig. 753: Piston Extension & RH Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating

the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

NOTE: The Variable Valve Timing (VVT) assemblies (Phasers) and Oil Control Valves (OCVs) can be serviced without removing the engine timing cover. Refer to ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, REMOVAL.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner housing assembly and upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
4. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
7. Remove the oil pan, accessory drive belts, crankshaft vibration damper and engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

NOTE: Take this opportunity to measure timing chain wear. Refer to Engine/Valve Timing - Standard Procedure.

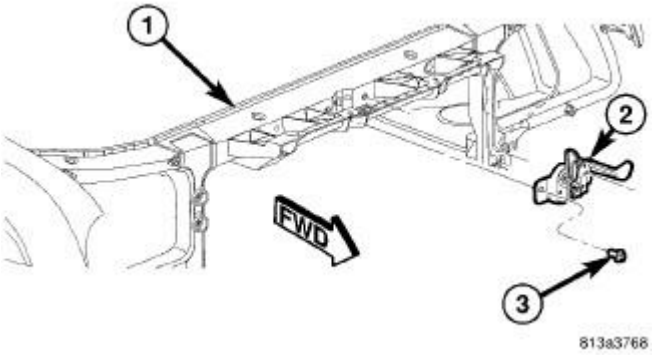

Fig. 754: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

8. Rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5).
9. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point

toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

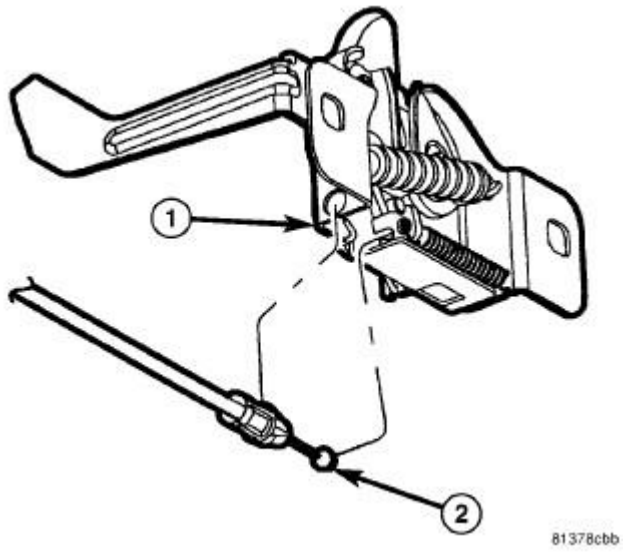

Fig. 755: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

10. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

11. Mark the direction of rotation on the following timing chains using a paint pen or equivalent to aid in reassembly:
    - Left side cam chain
    - Right side cam chain
    - Oil pump chain
    - Primary chain

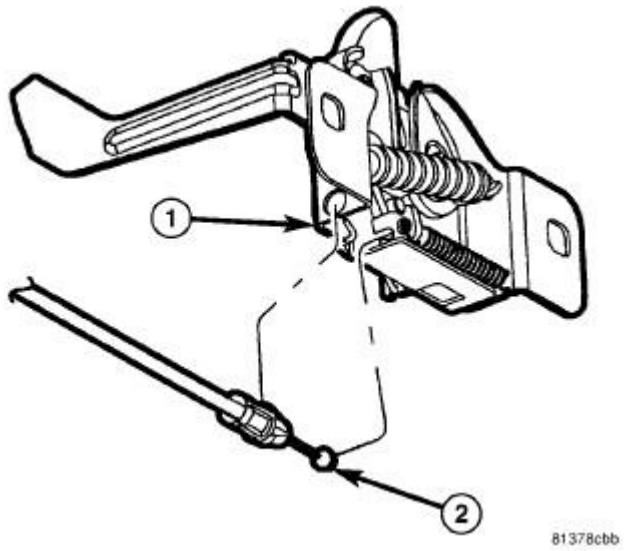

Fig. 756: Resetting Right Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

12. Reset the right side cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (1).

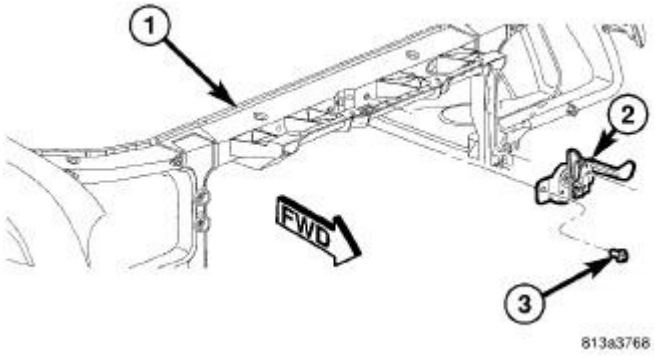

Fig. 757: Resetting Left Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

13. Reset the left side cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Refer to **Engine/Valve Timing - Standard Procedure**.

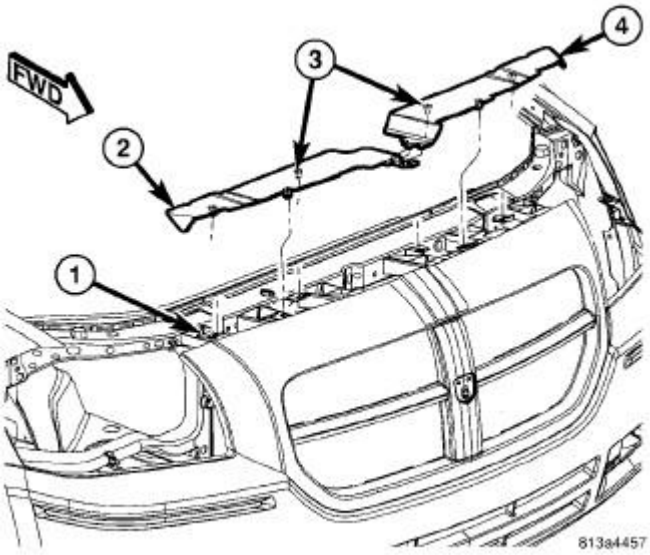

Fig. 758: Oil Pump Chain Tensioner, Spring, Retaining Bolt, Dowel Pin, Oil Pump Sprocket & Oil Pump Chain
Courtesy of CHRYSLER GROUP, LLC

14. Disengage the oil pump chain tensioner spring (3) from the dowel pin (2) and remove the oil pump chain tensioner (1).
15. Remove the oil pump sprocket T45 retaining bolt (4) and remove the oil pump sprocket (5) and oil pump chain (6).

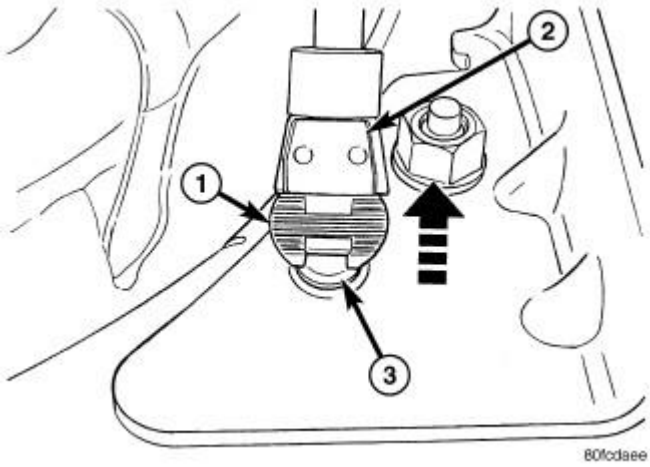

Fig. 759: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

16. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1) with the tool number

facing up.

17. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).
18. Remove the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).
19. Remove the oil control valve (2) from the right side intake cam phaser.
20. Pull the right side intake cam phaser off of the camshaft and remove the right side cam chain.
21. If required, remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.

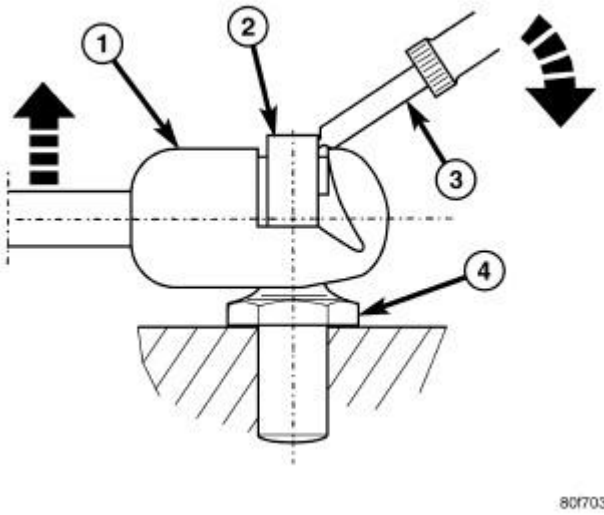

Fig. 760: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

22. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) with the tool number facing up.
23. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).
24. Remove the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1).
25. Remove the oil control valve (2) from the left side exhaust cam phaser.
26. Pull the left side exhaust cam phaser off of the camshaft and remove the left side cam chain.
27. If required, remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

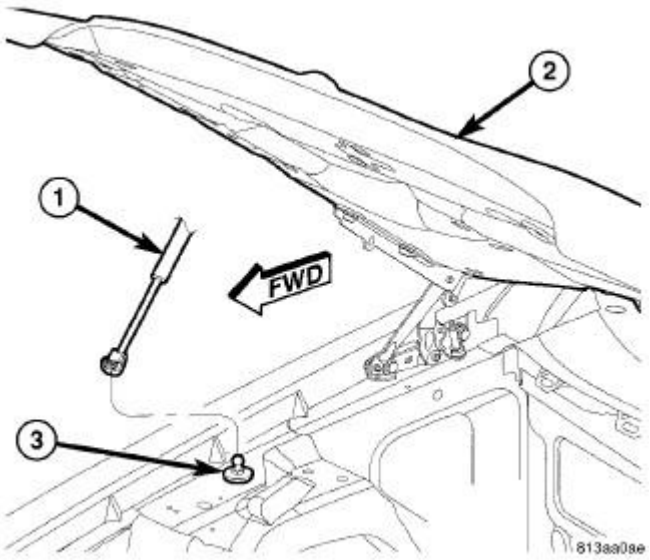

Fig. 761: Primary Chain Tensioner, Tensioner Pin, Primary Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

28. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Remove two T30 bolts (4) and remove the primary chain tensioner.
29. Remove the T30 bolt (1) and the primary chain guide (2).

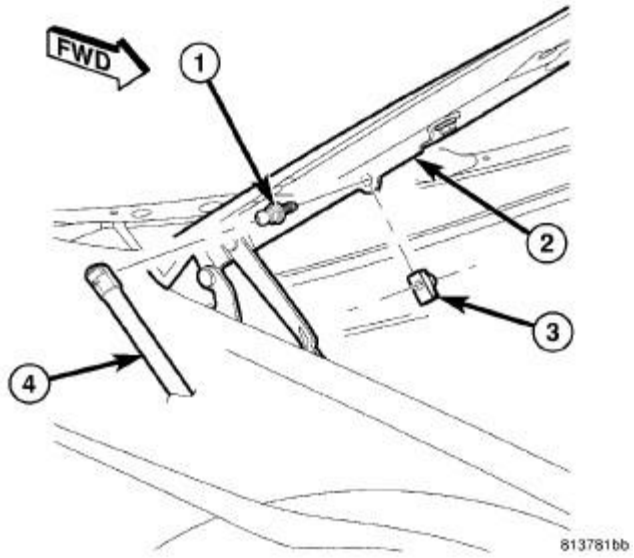

Fig. 762: Timing Chain Plated Link At 12 O'Clock, Washer, Retaining Bolt, Block/Bearing Cap Junction & Dimple
Courtesy of CHRYSLER GROUP, LLC

30. Remove the idler sprocket T45 retaining bolt (2) and washer (3).

31. Remove the primary chain, idler sprocket and crankshaft sprocket as an assembly.

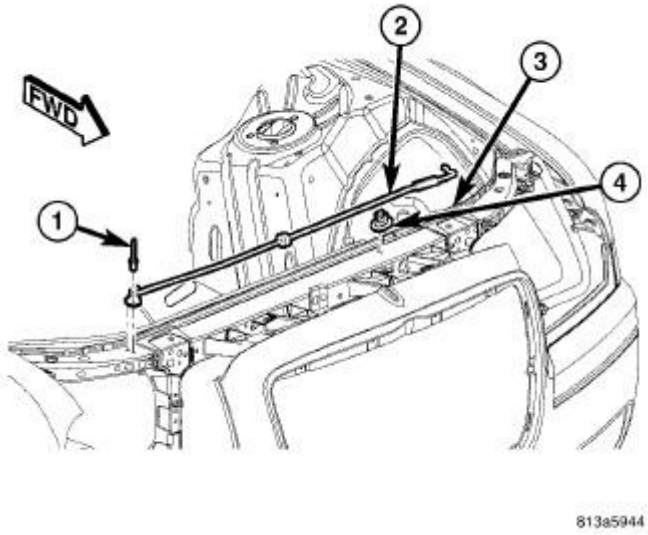

Fig. 763: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

32. If required, remove two T30 bolts (6) and the left side cam chain tensioner (5).
33. If required, remove two T30 bolts (4) and the left side cam chain guide (2) and tensioner arm (1).

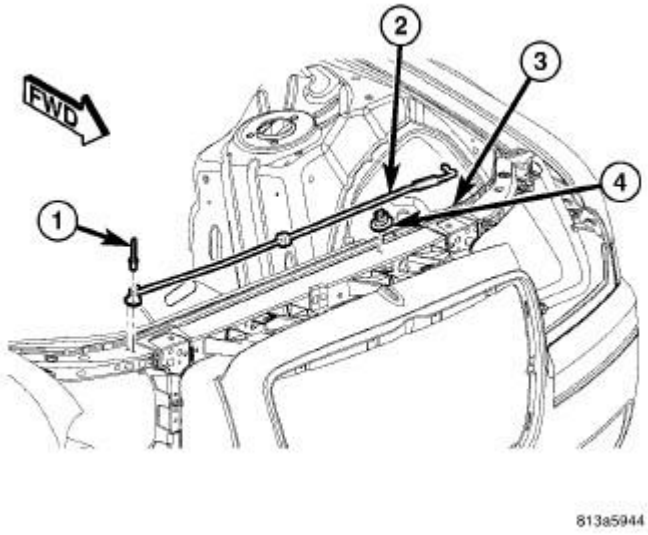

Fig. 764: Right Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

34. If required, remove two T30 bolts (4) and the right side cam chain tensioner (3).

35. If required, remove three T30 bolts (2) and the right side cam chain guide (1) and tensioner arm (6).
36. Inspect all sprockets and chain guides. Replace if damaged.

INSPECTION

INSPECTION

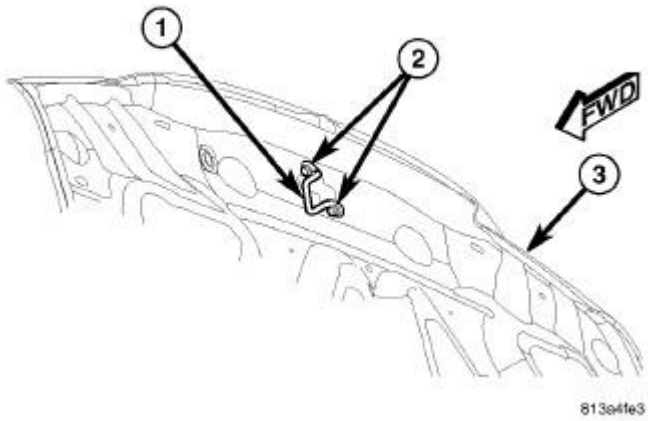

Fig. 765: Piston Extension & RH Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

Prior to disassembly of the timing chains and sprockets, measure the timing chain wear (1). Refer to **Engine/Valve Timing - Standard Procedure**.

Inspect the following valve timing components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner arm and chain should be replaced.
- Primary chain tensioner plastic faces. Replace as required.

INSTALLATION

INSTALLATION

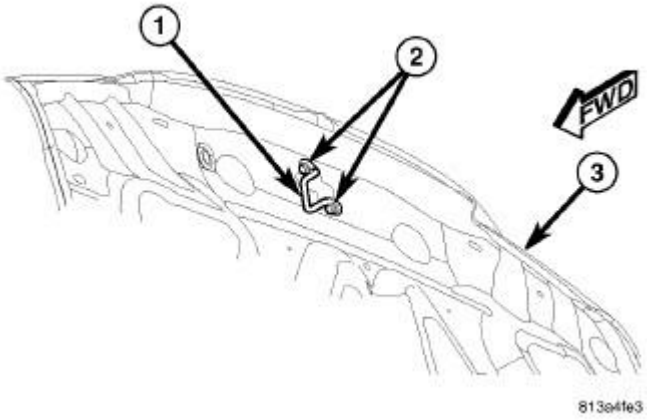

Fig. 766: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

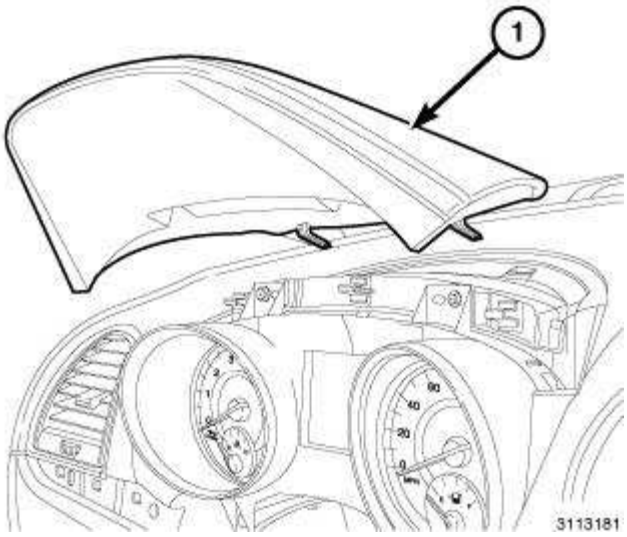

Fig. 767: Right Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Inspect all sprockets and chain guides. Replace if damaged.
2. If removed, install the right side cam chain guide (1) and tensioner arm (6). Tighten attaching T30 bolts (2) to 12 N.m (106 in. lbs.).
3. If removed, install the right side cam chain tensioner (3) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N.m (106 in. lbs.).
4. Reset the right side cam chain tensioner (3) by pushing back the tensioner piston and installing

Tensioner Pin (special tool #8514, Pins, Tensioner) (5).

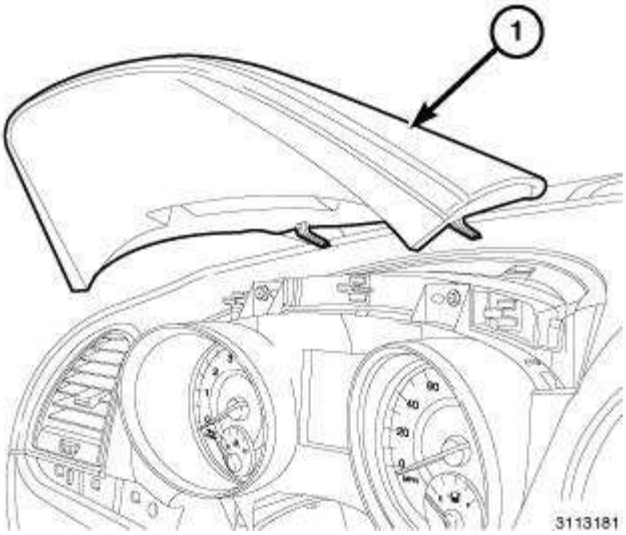

Fig. 768: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. If removed, install the left side cam chain guide (2) and tensioner arm (1). Tighten attaching T30 bolts (4) to 12 N.m (106 in. lbs.).
6. If removed, install the left side cam chain tensioner (5) to the cylinder head with two bolts (6). Tighten the T30 bolts (6) to 12 N.m (106 in. lbs.).
7. Reset the left side cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (7). Refer to **Engine/Valve Timing - Standard Procedure**.

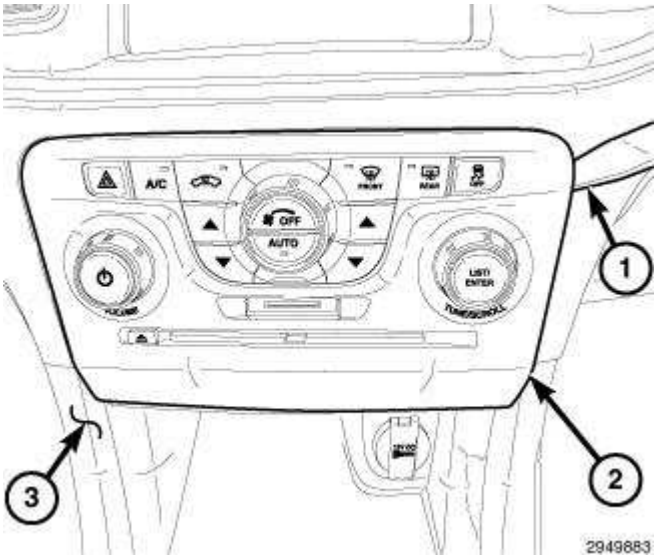

Fig. 769: Crankshaft Key, Dimple & Block/Bearing Cap Junction
Courtesy of CHRYSLER GROUP, LLC

8. Verify that the key (3) is installed in the crankshaft.

CAUTION: Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts. Refer to CAMSHAFT, ENGINE, REMOVAL.

9.

10. Verify that the number one cylinder piston is positioned at top-dead-center by aligning the dimple (2) on the crankshaft with the block/bearing cap junction (1).

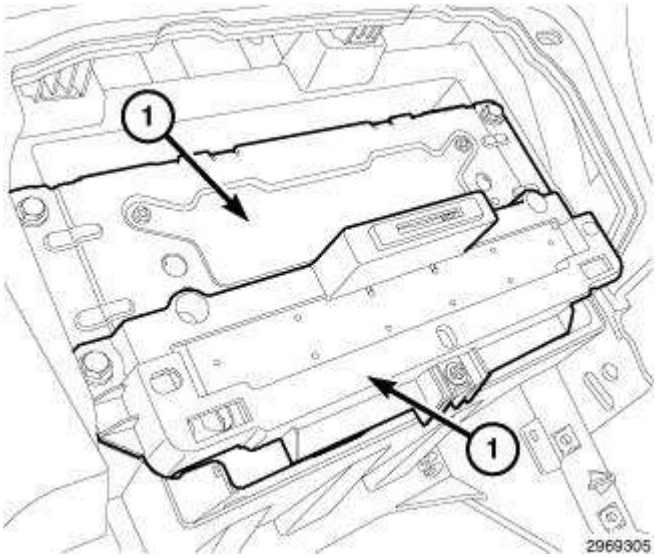

Fig. 770: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

11.

12. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

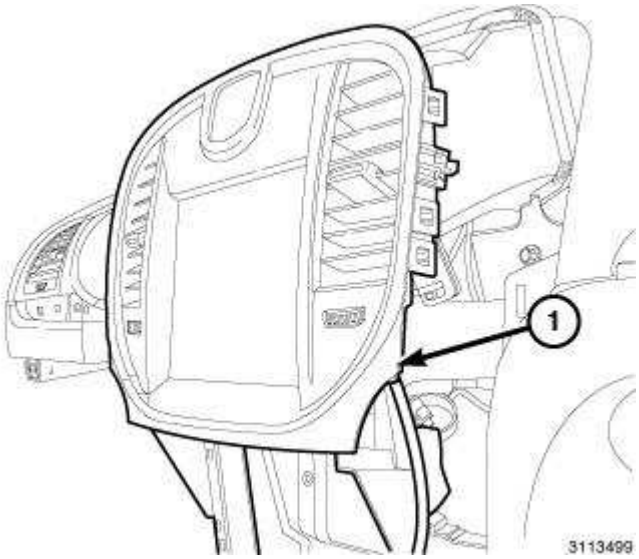

Fig. 771: Aligning Arrow With Plated Link On Primary Chain
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

13. Place the primary chain onto the crankshaft sprocket (3) so that the arrow (2) is aligned with the plated link (1) on the timing chain.

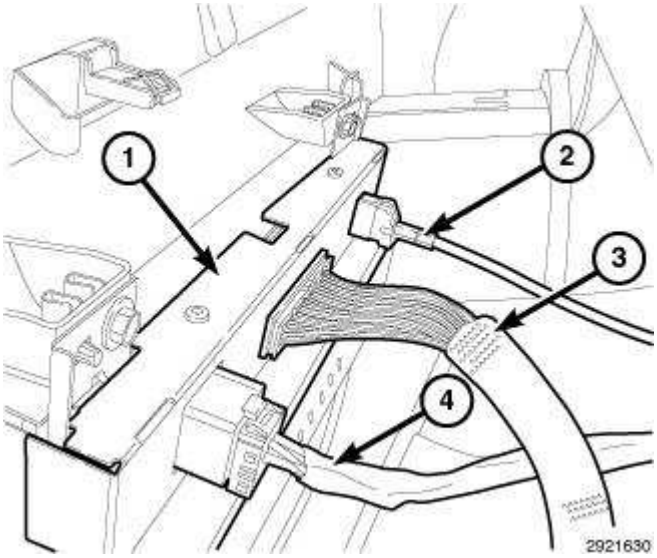

Fig. 772: Placing Idler Sprocket Into Timing Chain So That Dimple Is Aligned With Plated Link On Timing Chain
Courtesy of CHRYSLER GROUP, LLC

14. While maintaining this alignment, invert the crankshaft sprocket and timing chain and place the

idler sprocket (4) into the timing chain so that the dimple (2) is aligned with the plated link (1) on the timing chain.

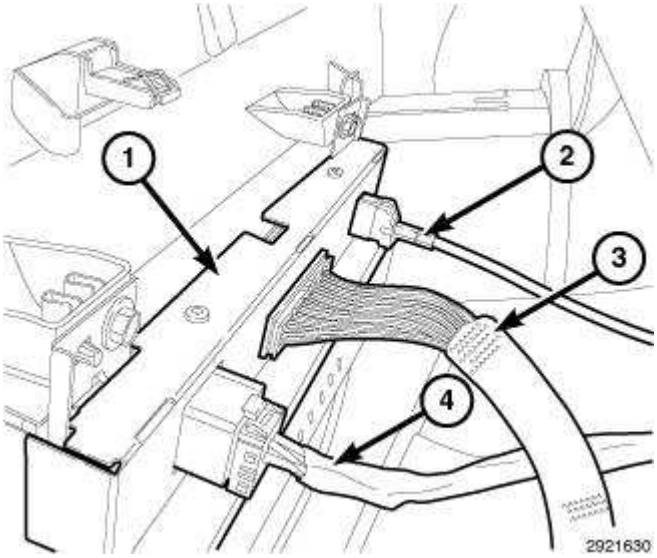

Fig. 773: Timing Chain Plated Link At 12 O'Clock, Washer, Retaining Bolt, Block/Bearing Cap Junction & Dimple
Courtesy of CHRYSLER GROUP, LLC

15. While maintaining this alignment, lubricate the idler sprocket bushing with clean engine oil and install the sprockets and timing chain on the engine. To verify that the timing is still correct, the timing chain plated link (6) should be located at 12:00 (1) when the dimple (5) on the crankshaft is aligned with the block/bearing cap junction (4).
16. Install the idler sprocket retaining bolt (2) and washer (3). Tighten the T45 bolt (2) to 25 N.m (18 ft. lbs.).

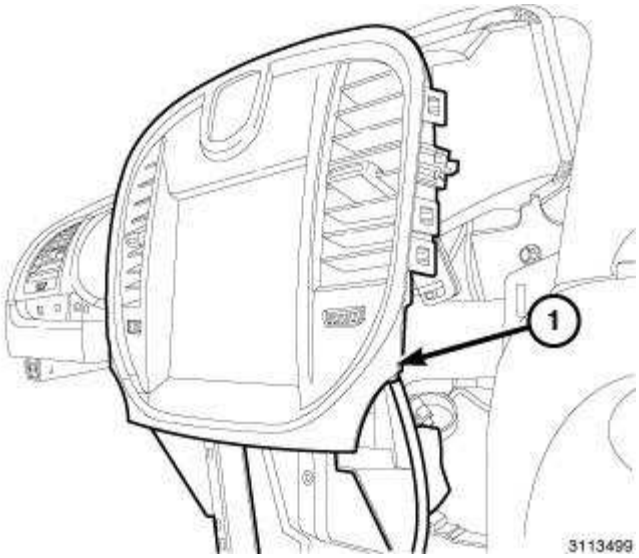

Fig. 774: Primary Chain Tensioner, Tensioner Pin, Primary Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Install the primary chain guide (2). Tighten attaching T30 bolt (1) to 12 N.m (106 in. lbs.).
18. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3).
19. Install the primary chain tensioner (5) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N.m (106 in. lbs.) and remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (3).

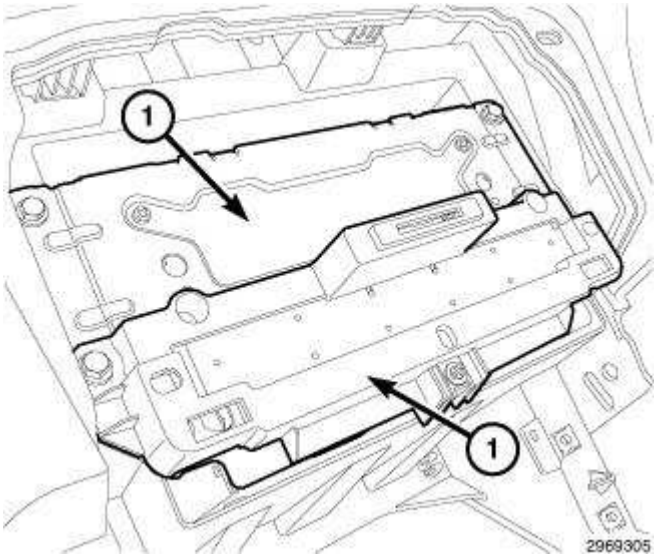

Fig. 775: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

20. Press the left side intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (6).

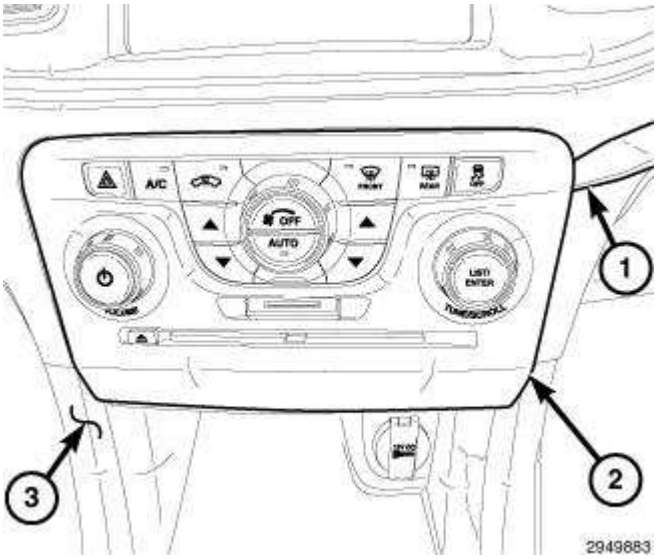

Fig. 776: Idler Sprocket, Plated Link & Arrow
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The left side and right side cam chains are identical.**

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

21. Drape the left side cam chain over the left side intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

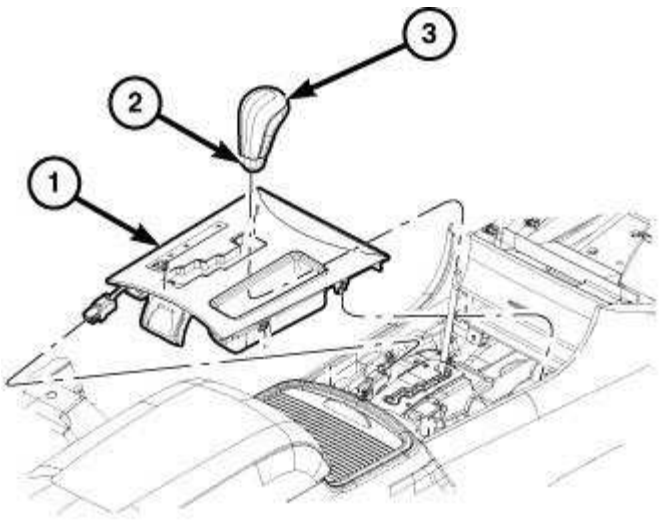

Fig. 777: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

22. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the cylinder head cover mounting surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

NOTE: **Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.**

23. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (4) with the tool number facing up.
24. Tighten the oil control valves (2) and (6) to 150 N.m (110 ft. lbs.).
25. Remove the Camshaft Phaser Lock (4).

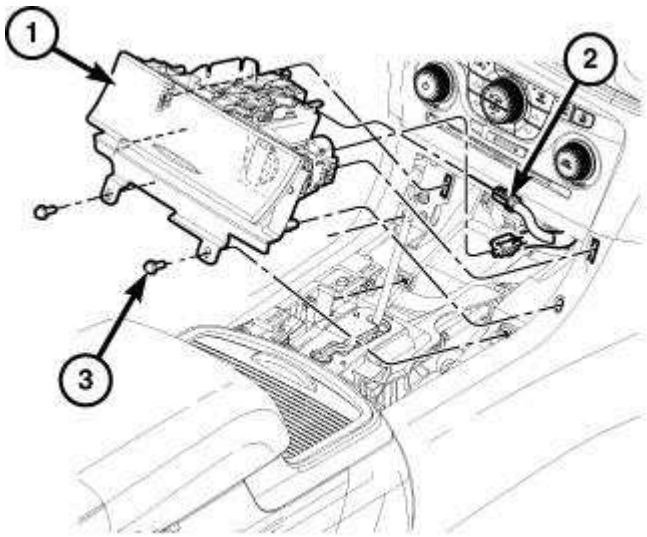

Fig. 778: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

26. Press the right side exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve (7).

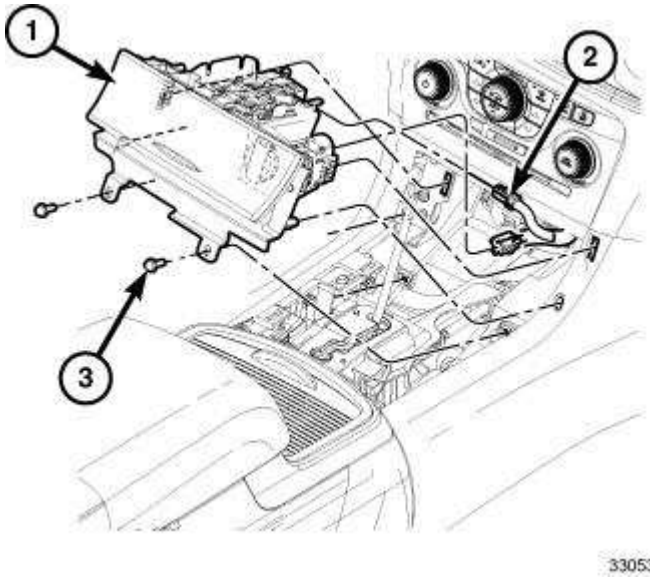

Fig. 779: Idler Sprocket, Dimple & Plated Link
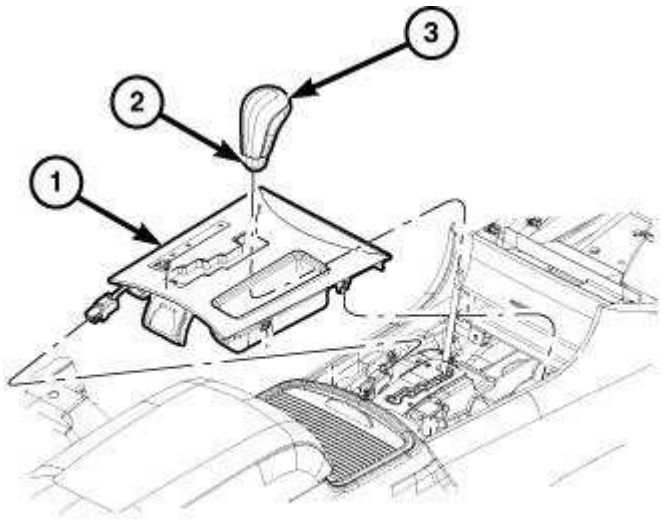
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

27. Drape the right side cam chain over the right side exhaust cam phaser and onto the idler

sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.



2964689

Fig. 780: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

28. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the cylinder head cover mounting surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

    NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

29. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (5) with the tool number facing up.
30. Tighten the oil control valves (2) and (7) to 150 N.m (110 ft. lbs.).
31. Remove the Camshaft Phaser Lock (5).

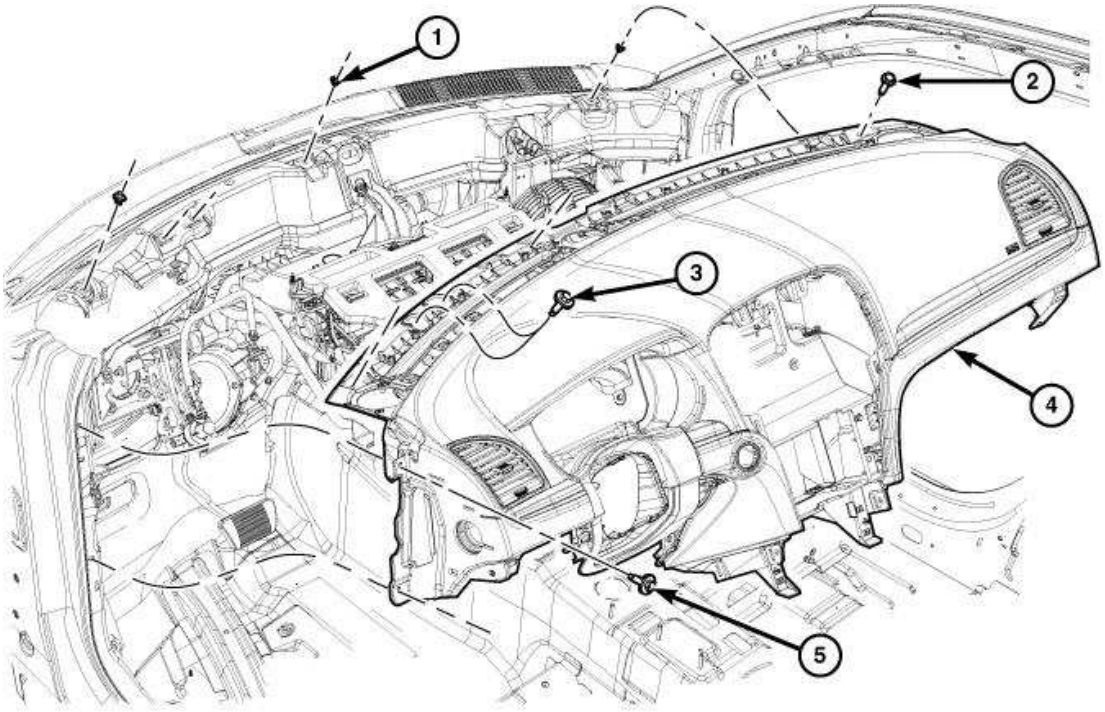


Fig. 781: Oil Pump Chain Tensioner, Spring, Retaining Bolt, Dowel Pin, Oil Pump Sprocket & Oil Pump Chain
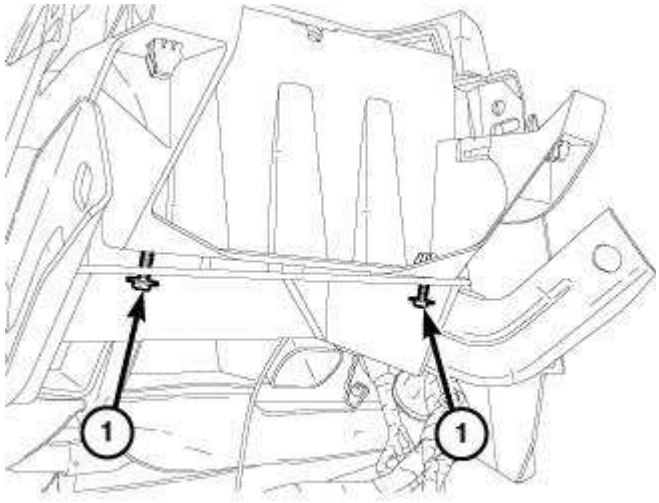
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are no timing marks on the oil pump gear or chain.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

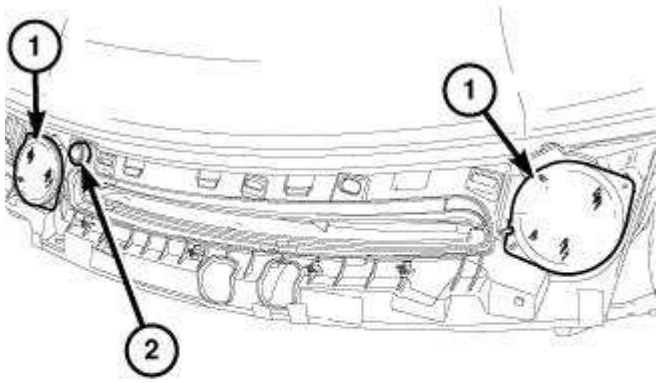
32. Place the oil pump sprocket (5) into the oil pump chain (6). Place the oil pump chain onto the crankshaft sprocket while aligning the oil pump sprocket with the oil pump shaft. Install the oil pump sprocket T45 retaining bolt (4) and tighten to 25 N.m (18 ft. lbs.).
33. Install the oil pump chain tensioner (1). Insure that the spring (3) is positioned above the dowel pin (2).



2970272

Fig. 782: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

34. Remove the Tensioner Pins (special tool #8514, Pins, Tensioner) (1) and (6) from the right side and left side cam chain tensioners.
35. Rotate the crankshaft clockwise (as viewed from the front) two complete revolutions stopping when the dimple (4) on the crankshaft is aligned with the block/bearing cap junction (5).
36. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).



2969377

Fig. 783: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

37. There should be 12 chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
38. If the engine timing is not correct, repeat this procedure.
39. Install the engine timing cover, crankshaft vibration damper, accessory drive belts and oil pan. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
40. Install the spark plugs. Tighten to 17.5 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION** .
41. Install the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
42. Install the upper intake manifold and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
43. Fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
44. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
45. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
46. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

COVER(S), ENGINE TIMING

REMOVAL

REMOVAL

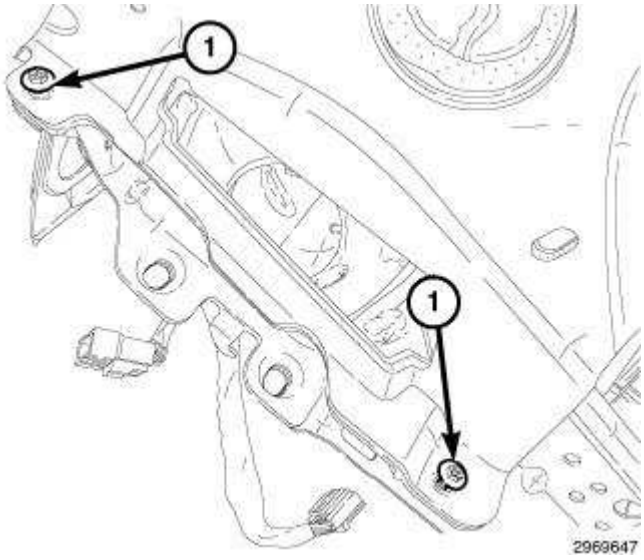


Fig. 784: Upper Radiator Hose & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
3. Remove the upper radiator hose (2) and thermostat housing (1). Refer to **THERMOSTAT, REMOVAL** .

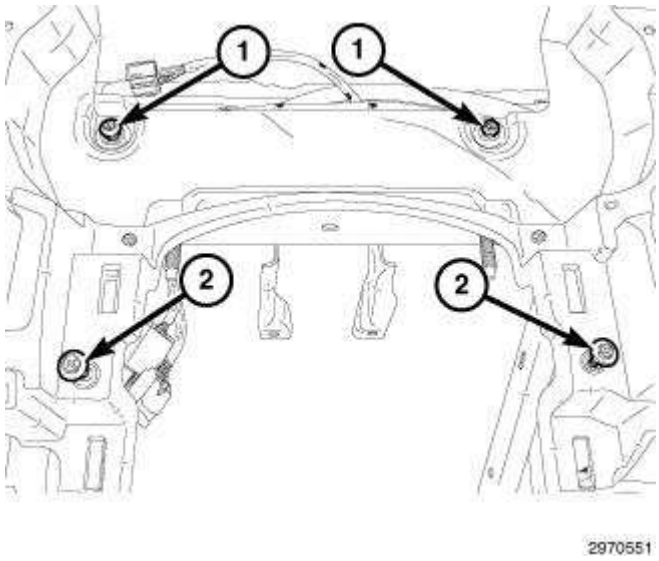

Fig. 785: Radiator Hose & Heater Hose
Courtesy of CHRYSLER GROUP, LLC

4. Remove the heater core return hose (1) from the water pump housing.
5. Remove the lower radiator hose (2) from the water pump housing.

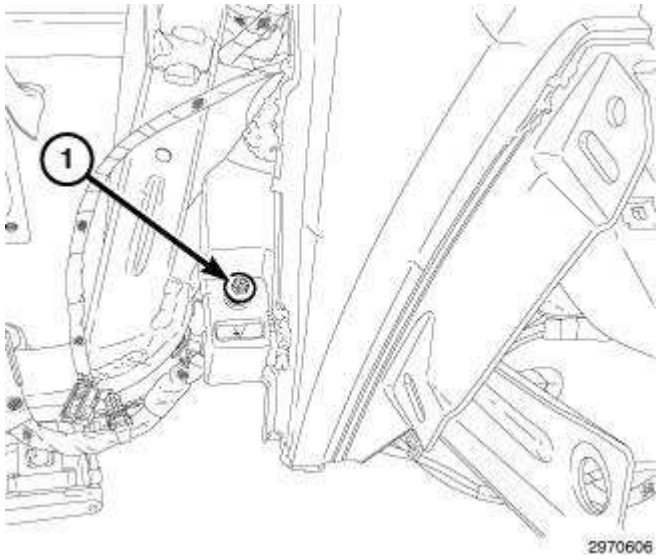

Fig. 786: Heater Core Supply Hose & Coolant Outlet Housing
Courtesy of CHRYSLER GROUP, LLC

6. Remove the heater core supply hose (1) from the coolant outlet housing (2).

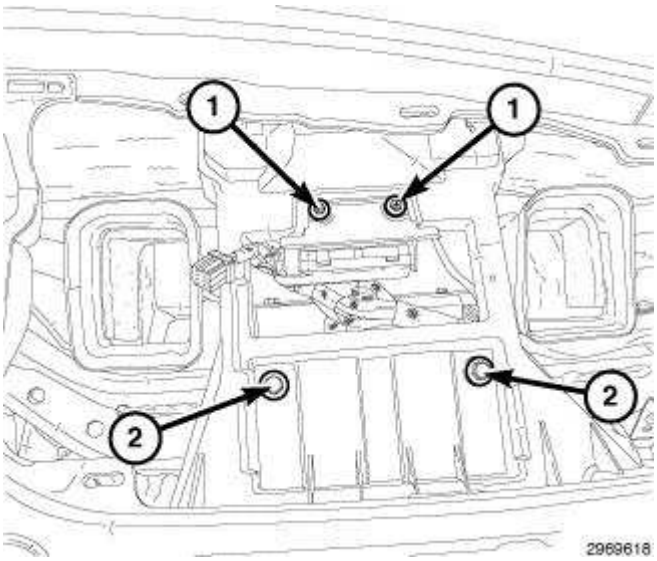

Fig. 787: Heater Core Supply Tube Support Bracket & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolt (2) and reposition the heater core supply tube (1).

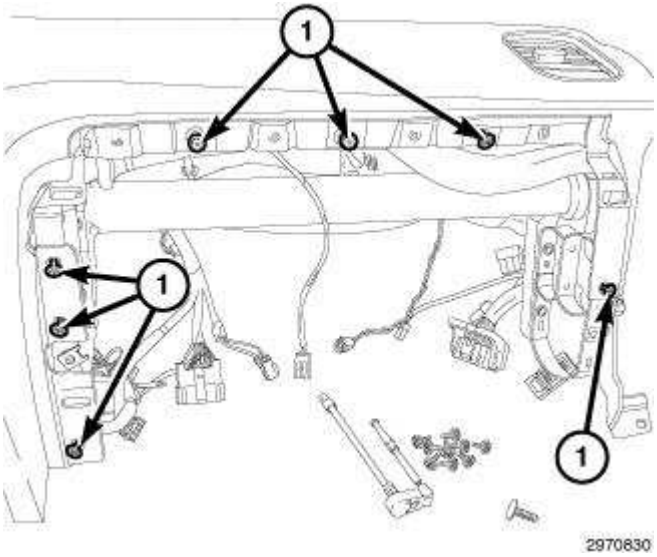

Fig. 788: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

8. Remove the accessory drive belt (3). Refer to **BELT, SERPENTINE, REMOVAL** .
9. Remove the accessory drive belt tensioner (7). Refer to **TENSIONER, BELT, REMOVAL** .
10. Remove the accessory idler pulley (2). Refer to **PULLEY, IDLER, REMOVAL** .
11. Remove the crankshaft vibration damper (6). Refer to **DAMPER, VIBRATION, REMOVAL**.
12. Remove the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD,**

REMOVAL.

13. Remove the upper and lower oil pans. Refer to **PAN, OIL, REMOVAL**.

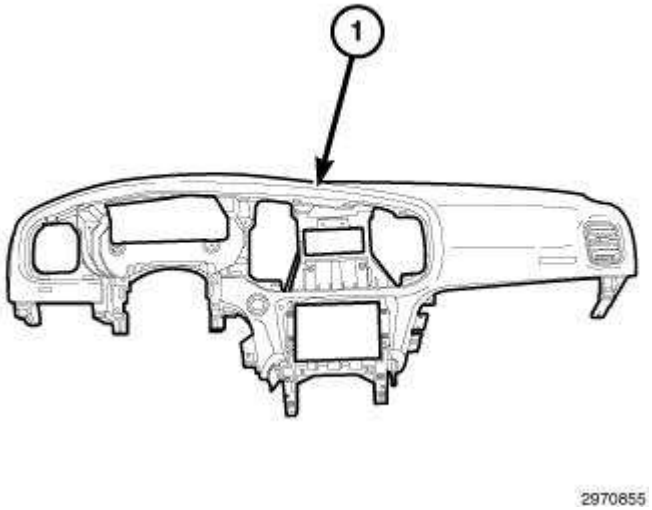

Fig. 789: Timing Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the water pump or the coolant outlet housing for engine timing cover removal.

14. Remove the following timing cover attaching bolts:
    - Three M10 bolts (1)
    - Two M8 bolts (2)
    - Twenty-two M6 bolts (3)

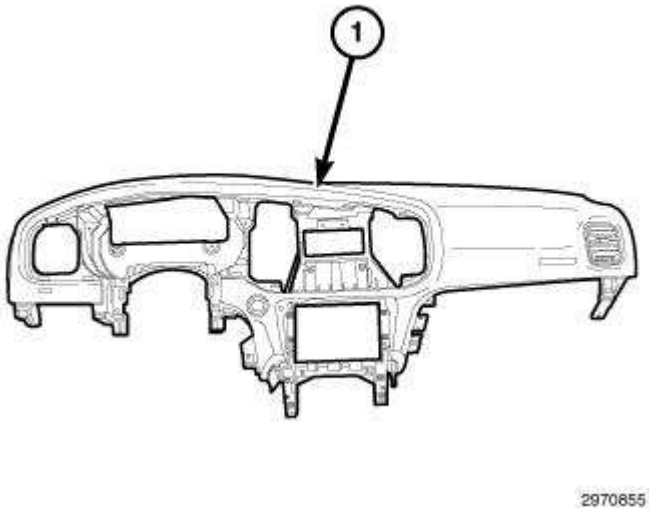

Fig. 790: Timing Cover Removal Pry Points

Courtesy of CHRYSLER GROUP, LLC

15. Using the seven indicated pry points, carefully remove the timing cover.

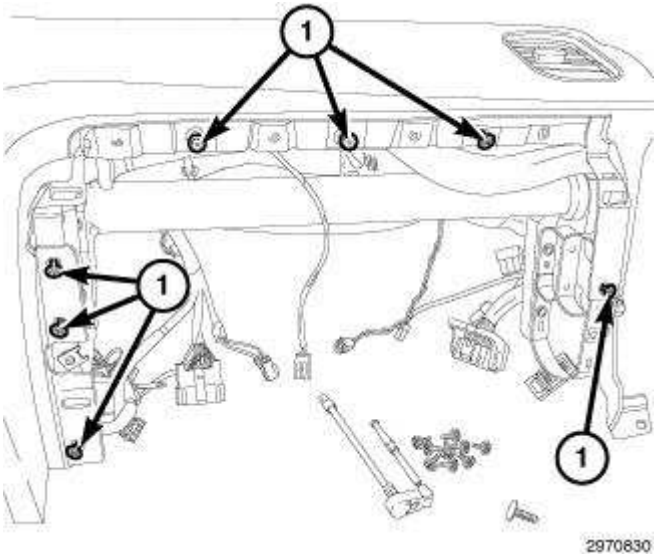

Fig. 791: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

16. If required, remove the remaining four M6 bolts (2) and the coolant outlet housing (1) from the engine timing cover.
17. If required, remove the remaining four M6 bolts (4) and the water pump (3) from the engine timing cover.

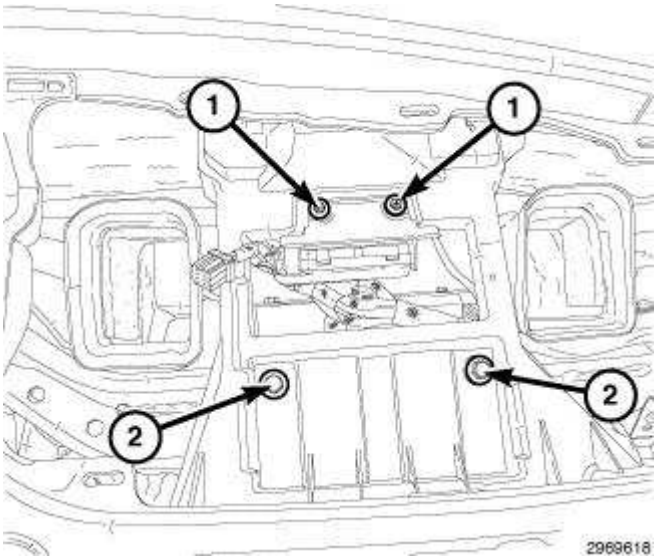

Fig. 792: Sealant At Cylinder Head Bosses, Right & Left Flanges, Cylinder Head-To-Engine Block T-Joints & Cover To Right Cam Chain Tensioner Gap
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

18. Remove all residual sealant from the timing chain cover, cylinder head and engine block mating surfaces. Refer to **Engine - Standard Procedure**.

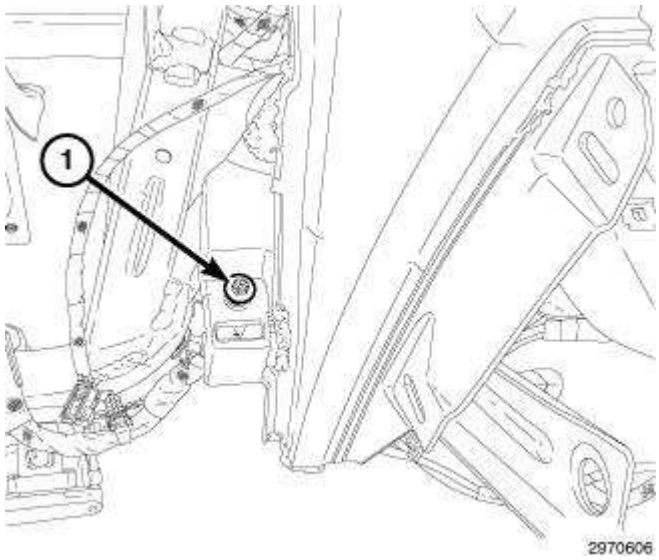

Fig. 793: Coolant Outlet Housing Gasket & Water Pump Gasket
Courtesy of CHRYSLER GROUP, LLC

19. Remove and discard the coolant outlet housing gasket (1) and the water pump gasket (2).

INSTALLATION

INSTALLATION

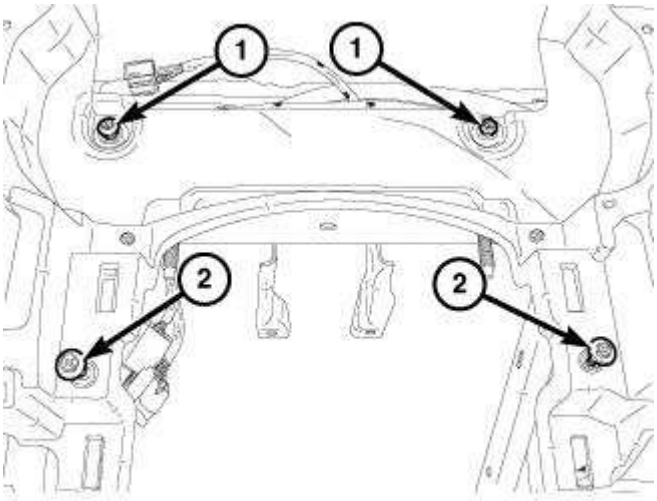

Fig. 794: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the coolant outlet housing (1) to the timing cover with a new gasket using only the four bolts (2) shown in illustration, tightened to 12 N.m (106 in. lbs.).
2. If removed, install the water pump (3) to the timing cover using only the four bolts (4) shown in illustration, tightened to 12 N.m (106 in. lbs.). Refer to **PUMP, WATER, INSTALLATION** .

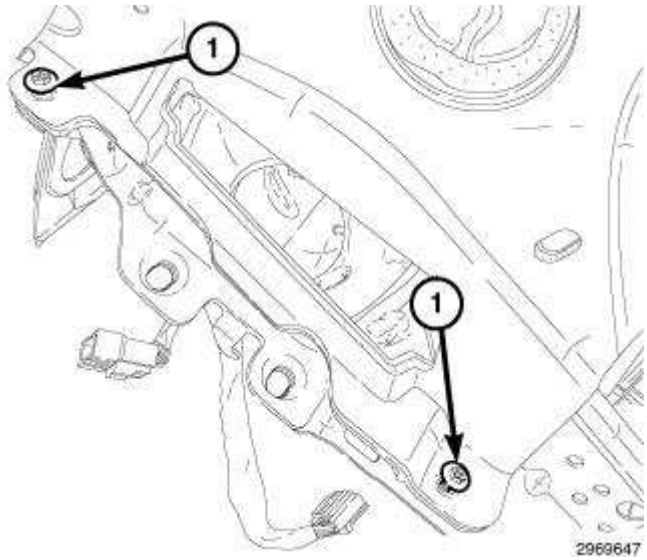

Fig. 795: Coolant Outlet Housing Gasket & Water Pump Gasket
Courtesy of CHRYSLER GROUP, LLC

3. Install the coolant outlet housing gasket (1) and the water pump gasket (2).

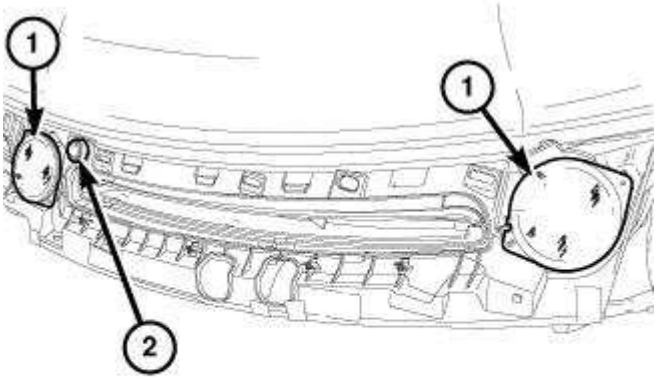

Fig. 796: Sealant At Cylinder Head Bosses, Right & Left Flanges, Cylinder Head-To-Engine Block T-Joints & Cover To Right Cam Chain Tensioner Gap
Courtesy of CHRYSLER GROUP, LLC

4. Clean the engine timing cover, cylinder head and block mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the front cover as shown in illustration, in the following locations:
   - Three cylinder head bosses (1)
   - Right and left flanges (2)
   - Four cylinder head to engine block T-joints (3)
   - Cover to right cam chain tensioner gap (4)

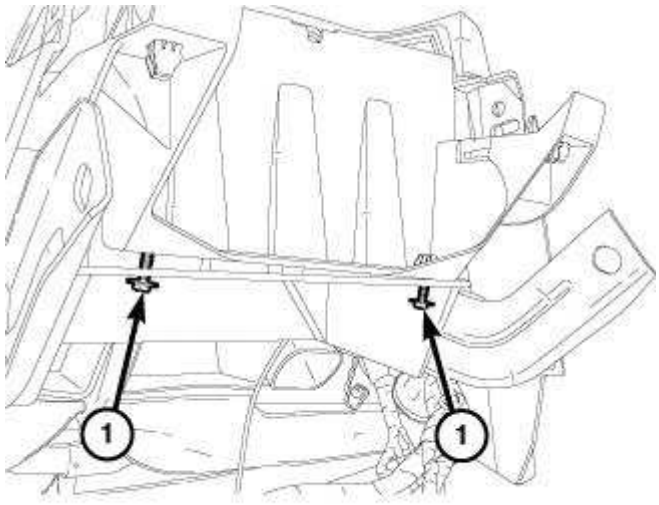

Fig. 797: Timing Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins (4) on the engine block to the engine timing cover and install the cover.
7. Install and tighten the timing cover attaching bolts:
   - Twenty-two M6 bolts (3) to 12 N.m (106 in. lbs.).
   - Two M8 bolts (2) to 25 N.m (18 ft. lbs.).
   - Three M10 bolts (1) to 55 N.m (41 ft. lbs.)

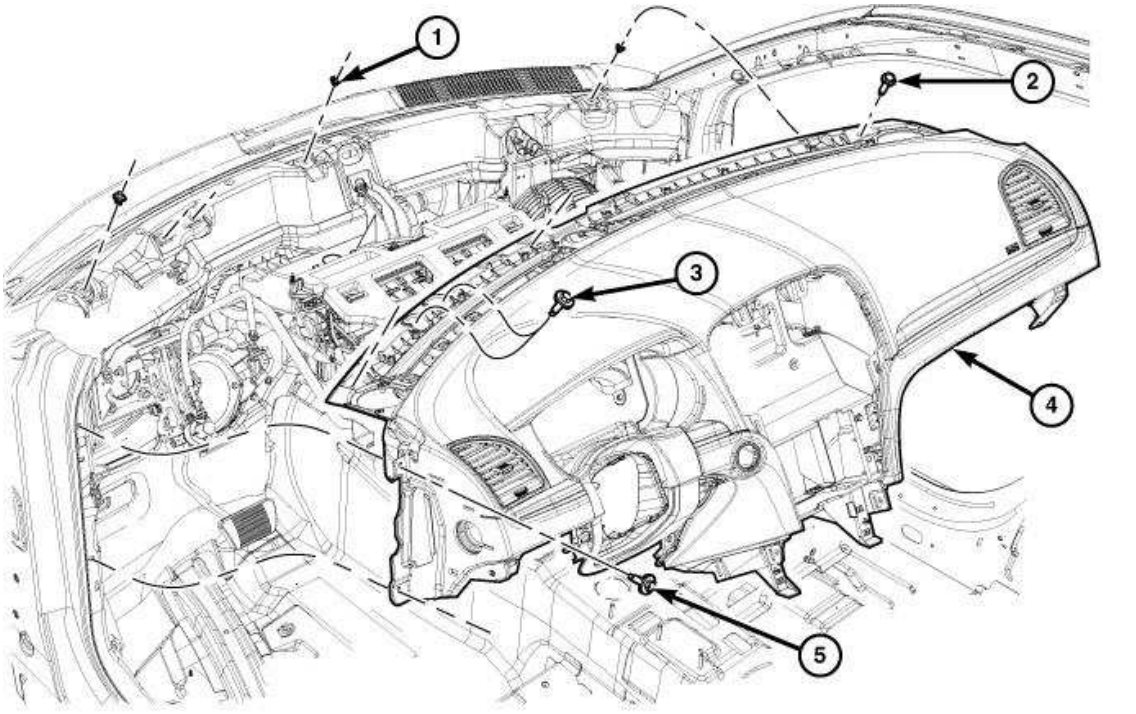

Fig. 798: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

8. Install the upper and lower oil pans. Refer to **PAN, OIL, INSTALLATION**.
9. Install the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
10. Install the crankshaft vibration damper (6). Refer to **DAMPER, VIBRATION, INSTALLATION**.
11. Install the accessory idler pulley (2). Refer to **PULLEY, IDLER, INSTALLATION** .
12. Install accessory drive belt tensioner (7). Refer to **TENSIONER, BELT, INSTALLATION** .
13. Install the accessory drive belt (3). Refer to **BELT, SERPENTINE, REMOVAL** .

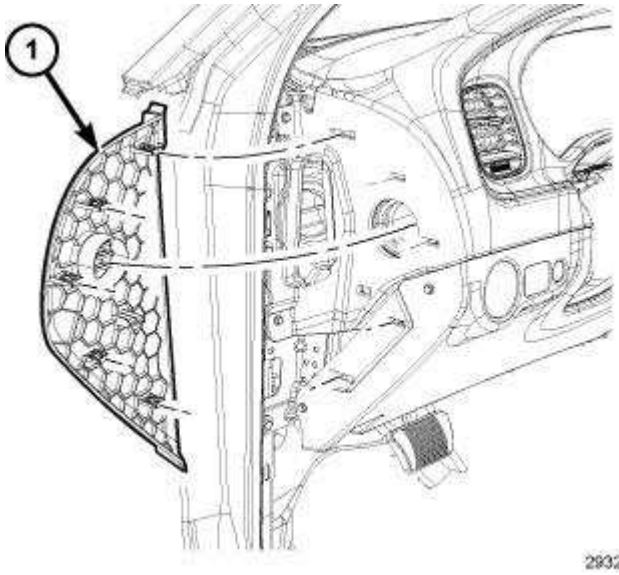

Fig. 799: Heater Core Supply Tube Support Bracket & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

14. Install the heater core supply tube (1) with one bolt (2) tightened to 12 N.m (106 in. lbs.).

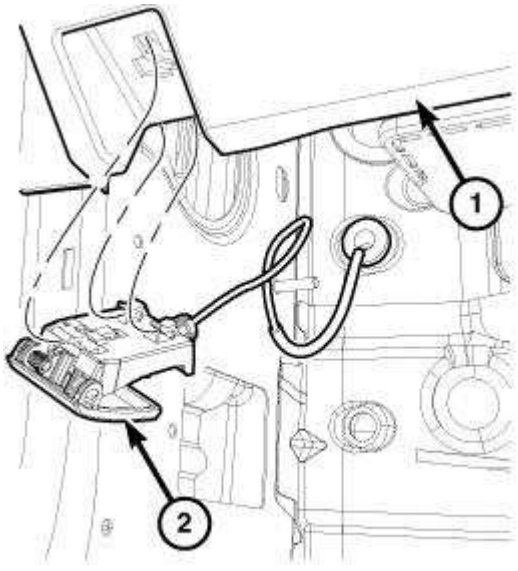

Fig. 800: Heater Core Supply Hose & Coolant Outlet Housing
Courtesy of CHRYSLER GROUP, LLC

15. Install the heater core supply hose (1) to the coolant outlet housing (2).

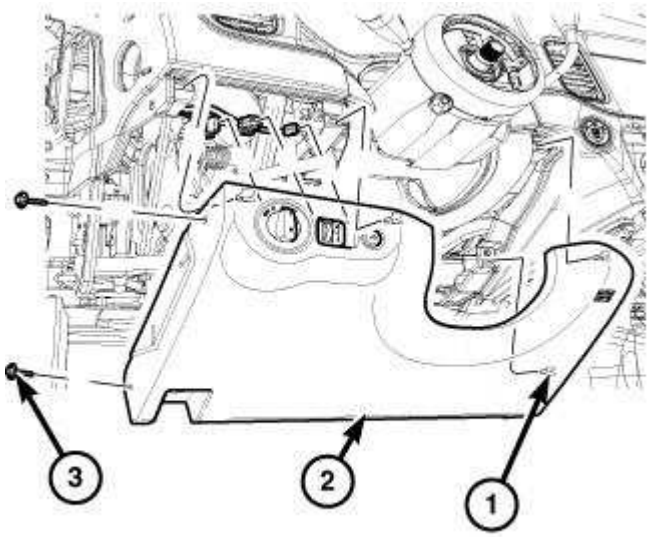

Fig. 801: Radiator Hose & Heater Hose
Courtesy of CHRYSLER GROUP, LLC

16. Install the lower radiator hose (2) to the water pump housing.
17. Install the heater core return hose (1) to the water pump housing.

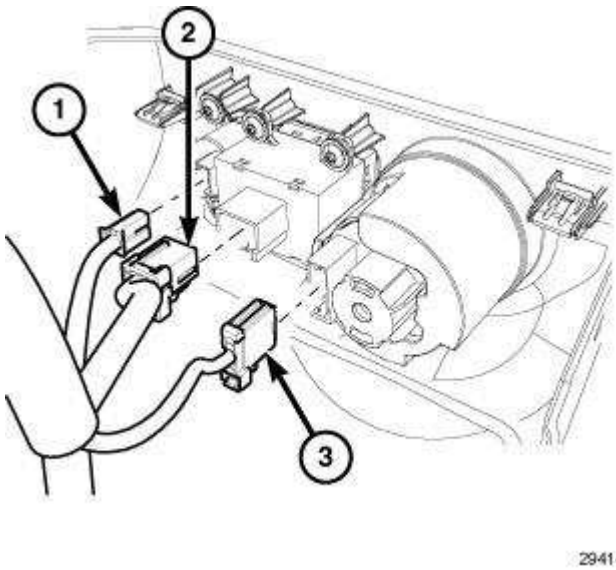

Fig. 802: Upper Radiator Hose & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

18. Install the thermostat housing (1) and upper radiator hose (2). Refer to **THERMOSTAT, REMOVAL** .
19. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
20. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

21. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
22. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

ENGINE

5.7L - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

The 5.7L engine (345 CID) eight-cylinder engine is a 90° V-Type lightweight, deep skirt cast iron block, aluminum heads, single cam, overhead valve engine with hydraulic roller tappets. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2.

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

For possible causes and corrections of malfunctions. Refer to **PERFORMANCE** and **MECHANICAL**.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage Test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Engine Cylinder Head Gasket Failure Diagnosis. Refer to **DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE**.
- Intake Manifold Leakage Diagnosis. Refer to **DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE**.

PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION	
ENGINE WILL NOT START	1. Weak battery.	1. Charge or replace as	

		necessary.	
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals.	
	3. Faulty starter.	3. Refer to **DIAGNOSIS AND TESTING** .	
	4. Incorrect spark plug gap.	4. Refer to **SPECIFICATIONS** .	
	5. Dirt or water in fuel system.	5. Clean system and replace fuel filter.	
	6. Faulty fuel pump, relay or wiring.	6. Refer to **FUEL SYSTEM** article.	
ENGINE STALLS OR ROUGH IDLE	1. Idle speed set to low.	1. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.	
	2. Vacuum leak.	2. Inspect intake manifold and vacuum hoses, repair or replace as necessary.	
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. Replace spark plugs.	
	2. Dirt or water in fuel system.	2. Clean system and replace fuel filter.	
	3. Blown cylinder head gasket.	3. Replace cylinder head gasket.	
	4. Low compression.	4. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.	
	5. Burned, warped or pitted valves.	5. Replace as necessary.	
	6. Plugged or restricted exhaust	6. Inspect and replace as	

	system.	necessary.	

MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. Replace cylinder head.
	8. Excessive runout of valve seats on valve faces.	8. Refer to **Engine/Cylinder Head/SEAL(S), Valve Guide - Description**.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
	2. Low oil pressure.	2. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of round.	6. Replace crankshaft.

	7. Loose flywheel or torque converter.	7. Tighten to correct torque

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system and perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

   NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

   NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

1. Check the coolant level and fill as required. DO NOT install the radiator cap.
2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
3. Remove the spark plugs.
4. Remove the oil filler cap.
5. Remove the air cleaner hose.
6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1, 379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression, While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES	Stuck or broken piston rings; cracked piston; worn rings	Inspect for broken rings or piston. Measure ring gap and

THROUGH OIL FILLER CAP OPENING ONLY	and/or cylinder wall	cylinder diameter, taper and out-of-round. Replace defective part as necessary

LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-Rings.	1. Replace as necessary.
	a. Misaligned or damaged.	a. Replace as necessary.
	b. Loose fasteners, broken or porous metal parts.	b. Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear seal.	2. Replace as necessary.
	3. Crankshaft seal flange. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan.
	5. Front cover seal, damaged or misaligned.	5. Replace seal.
	6. Scratched or damaged vibration damper hub.	6. Polish or replace damper.
	7. Crankshaft Rear Flange Microporosity.	7. Replace Crankshaft.
OIL PRESSURE DROP	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure sending unit.	2. Replace sending unit.
	3. Low oil pressure.	3. Check pump and bearing clearance.
	4. Clogged oil filter.	4. Replace oil filter.
	5. Worn oil pump.	5. Replace as necessary.
	6. Thin or diluted oil.	6. Change oil and filter.
	7. Excessive bearing clearance.	7. Replace as necessary.
	8. Oil pump relief valve stuck.	8. Replace oil pump.
	9. Oil pickup tube loose or damaged.	9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings.
	2. Carbon in oil ring slots.	2. Replace rings.
	3. Incorrect ring size installed.	3. Replace rings.
	4. Worn valve guides.	4. Ream guides and replace valves.
	5. Leaking intake gasket(s).	5. Replace intake gasket(s).

	6. Leaking valve guide seals.	6. Replace valve guide seals.

ENGINE DIAGNOSIS - MECHANICAL

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase	1. Check for correct oil level. Adjust oil level by draining or adding as needed
	2. Thin or diluted oil	2. Change oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	3. Low oil pressure	3. Check engine oil level. If ok, Perform oil pressure test. for engine oil pressure test/specifications. Refer to **Engine/Lubrication - Diagnosis and Testing**.
	4. Dirt in tappets/lash adjusters	4. Clean/replace hydraulic tappets/lash adjusters
	5. Bent push rod(s)	5. Install new push rods
	6. Worn rocker arms	6. Inspect oil supply to rocker arms and replace worn arms as needed
	7. Worn tappets/lash adjusters	7. Install new hydraulic tappets/lash adjusters
	8. Worn valve guides	8. Inspect all valve guides and replace as necessary
	9. Excessive runout of valve seats or valve faces	9. Grind valves and seats
CONNECTING ROD NOISE	1. Insufficient oil supply	1. Check engine oil level.
	2. Low oil pressure	2. Check engine oil level. If ok, Perform oil pressure test. engine oil pressure test/specifications. Refer to **Engine/Lubrication - Diagnosis and Testing**.
	3. Thin or diluted oil	3. Change oil to correct viscosity. for correct procedure/engine oil specifications. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	4. Excessive connecting rod bearing clearance	4. Measure bearings for correct clearance with plasti-gage. Repair as necessary
	5. Connecting rod journal out of round	5. Replace crankshaft or grind journals
	6. Misaligned connecting	6. Replace bent connecting rods

	rods	
MAIN BEARING NOISE	1. Insufficient oil supply	1. Check engine oil level.
	2. Low oil pressure	2. Check engine oil level. If ok, Perform oil pressure test. Refer to **Engine/Lubrication - Diagnosis and Testing**.
	3. Thin or diluted oil	3. Change oil to correct viscosity.
	4. Excessive main bearing clearance	4. Measure bearings for correct clearance. Repair as necessary
	5. Excessive end play	5. Check crankshaft thrust bearing for excessive wear on flanges
	6. Crankshaft main journal out of round or worn	6. Grind journals or replace crankshaft
	7. Loose flywheel or torque converter	7. Inspect crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque
LOW OIL PRESSURE	1. Low oil level	1. Check oil level and fill if necessary
	2. Faulty oil pressure sending unit	2. Install new sending unit
	3. Clogged oil filter	3. Install new oil filter
	4. Worn oil pump	4. Replace oil pump assembly.
	5. Thin or diluted oil	5. Change oil to correct viscosity.
	6. Excessive bearing clearance	6. Measure bearings for correct clearance
	7. Oil pump relief valve stuck	7. Remove valve to inspect and verify, replace oil pump assembly.
	8. Oil pickup tube loose, broken, bent or clogged	8. Inspect oil pickup tube and pump, and clean or replace if necessary
	9. Oil pump cover warped or cracked	9. Install new oil pump
OIL LEAKS	1. Misaligned or deteriorated gaskets	1. Replace gasket
	2. Loose fastener, broken or porous metal part	2. Tighten, repair or replace the part
	3. Front or rear crankshaft oil seal leaking	3. Replace seal
	4. Leaking oil gallery plug or cup plug	4. Remove and reseal threaded plug. Replace cup style plug
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. CCV System malfunction	1. Refer to **OPERATION** .
	2. Defective valve stem seal (s)	2. Repair or replace seal(s)
	3. Worn or broken piston rings	3. Hone cylinder bores. Install new rings

	4. Scuffed pistons/cylinder walls	4. Hone cylinder bores and replace pistons as required
	5. Carbon in oil control ring groove	5. Remove rings and de-carbon piston
	6. Worn valve guides	6. Inspect/replace valve guides as necessary
	7. Piston rings fitted too tightly in grooves	7. Remove rings and check ring end gap and side clearance. Replace if necessary

OIL CONSUMPTION TEST AND DIAGNOSIS

Diagnostic Procedures

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the owner's manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.

- **Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.**
- **Verify that the engine has the correct oil level dipstick and dipstick tube installed.**
- **Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.**

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.

2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with oil consumption diagnosis.

OIL CONSUMPTION DIAGNOSIS

1. Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a **CYLINDER COMPRESSION PRESSURE LEAKAGE** test and **CYLINDER-TO-CYLINDER LEAKAGE TEST** using the standard leak down gauge following manufacturers suggested best practices.

   NOTE: Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. **Tapered and Out-of-Round Cylinders**

   The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. **Distorted Cylinders**

   This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. **Improper operation of "PCV "system**

The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. **Worn Piston Ring Grooves**

   For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. **Worn, Broken or Stuck Piston Rings**

   When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. **Cracked or Broken Ring Lands**

   Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. **Worn Valve Stems and Guides**

   When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. **Bent or Misaligned Connecting Rods**

   Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. **Fuel Dilution**

   If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

   - Excess fuel can enter and mix with the oil via a leaking fuel injector
   - Gasoline contaminated with diesel fuel
   - Restricted air intake
   - Excessive idling

10. **Contaminated Cooling Systems**

    Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus leading to higher oil consumption.

11. **Oil Viscosity**

    The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle owner's manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. **Dirty Engine Oil**

    Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. **Crankcase Overfull**

    Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. **Excessively High Oil Pressure**

    A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. **Aftermarket Performance Chips and Modification**

Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. **Lugging Engine**

    Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. **Turbocharged Engines**

    There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. **Restricted Air Intake**

    Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

STANDARD PROCEDURE

ENGINE GASKET SURFACE PREPARATION

Fig. 1: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

Fig. 2: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc.

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

DUST COVERS AND CAPS

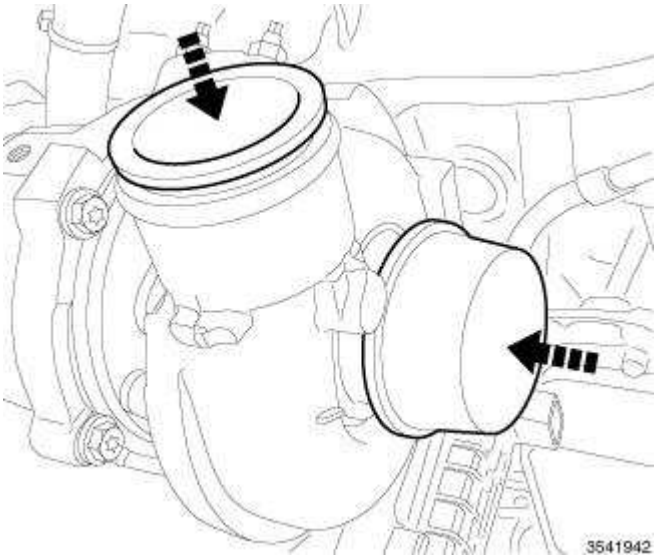

Fig. 3: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures cased by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

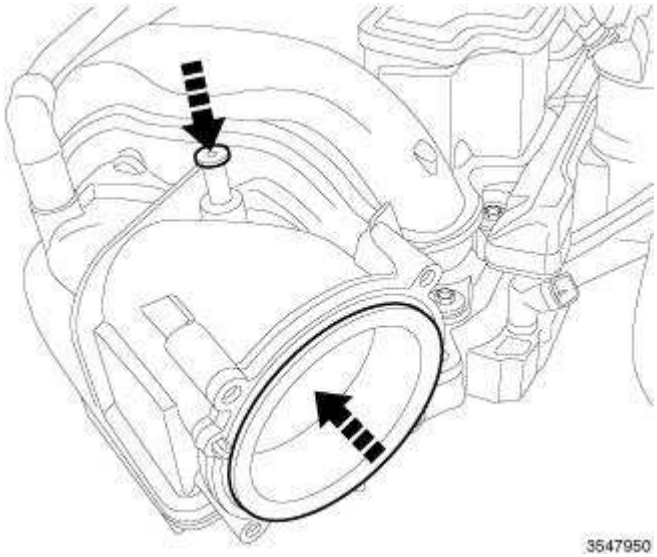

Fig. 4: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

HYDROSTATIC LOCK

CAUTION: Do not attempt to run engine. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

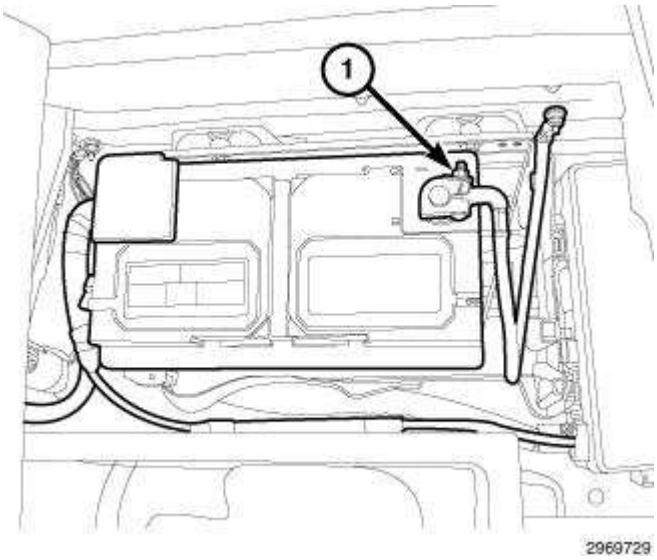

Fig. 5: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

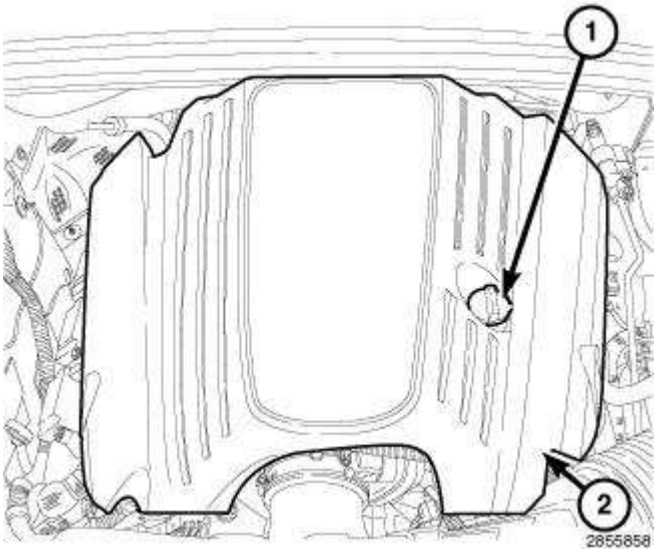

Fig. 6: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).
3. Place a shop towel around the fuel supply line Quick Connect Fitting to catch any fuel that may be under pressure and disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT** .

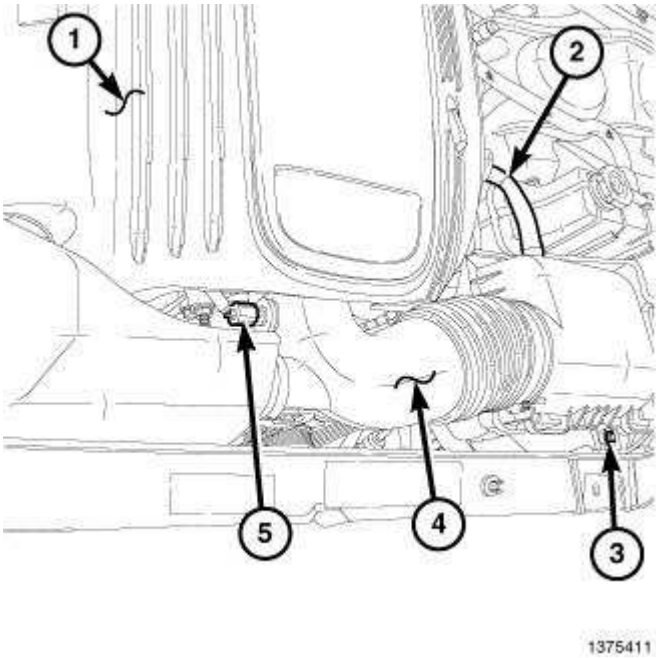

Fig. 7: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the intake air temperature (IAT) sensor (5) electrical connector.
5. Loosen the air duct retaining clamps at the throttle body and the air cleaner housing and remove the air duct (4).

6. Disconnect the make up air hose (MUA) (2).
7. Remove the air cleaner housing retaining bolt (3).
8. Remove the air cleaner housing from the vehicle.
9. Inspect the air duct, air cleaner housing and the intake manifold to make sure the system is dry and clear of any foreign material.
10. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head.
11. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
12. With the spark plugs removed, rotate the crankshaft using a breaker bar and socket.
13. Identify the fluid in the cylinders (coolant, fuel, oil).
14. Make sure all fluid has been removed from the cylinders.
15. Repair engine or components as necessary to prevent this problem from occurring again.
16. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will help prevent engine damage on restart.
17. Install new spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
18. Perform the Engine Oil Service procedure. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
19. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
20. Start the engine and check for leaks.

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: All sealants mentioned below are not used on every engine, they are listed as general reference guide. See service information for specific sealer usage.

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results.**Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin of a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers must be free of grease or oil. Clean surfaces with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, assemble the parts within 10 minutes.

Numerous types of form-in-place gasket materials are used in the engine area. Mopar® Sealant RTV Silicone Rubber Adhesive, MOPAR® Silicone Rubber RTV, Mopar® ATF-RTV and Mopar® Gasket Maker gasket materials, each have different properties and cannot be used in place of the other.

MOPAR® SEALANT RTV SILICONE RUBBER ADHESIVE is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® SILICONE RUBBER RTV is used to seal components exposed to engine oil, gear lubricant, and coolant. This material is a specially designed gray silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil, gear lubricant and coolant. Excellent adhesion even on oily surfaces, withstands temperatures to 330° C (626° F). Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF-RTV is a specially designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. It can be used on threaded and machined parts under all temperatures. This material also prevents corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or in a 4 oz. or 6 oz. can with applicator.

SEALER APPLICATION

Apply 1 mm (0.040 in.) diameter or less of Mopar® Gasket Maker material to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Tighten the components in place within 15 minutes. Use a locating dowel during assembly to prevent smearing material off the location.

Apply Mopar® RTV or ATF-RTV gasket material in a continuous bead approximately 3 mm (0.120 in.) in diameter. For corner sealing and "T-Joint" locations and waffle pad area, a 0.635 mm (0.025 in.) drop is placed in the center of the gasket contact area. Remove uncured sealant with a shop towel. Tighten the components in place while the sealant is still wet to the touch (within 10 minutes). Use a locating dowel during assembly to prevent smearing material off the location.

Camshaft End Play	.080 - 0.290 mm	0.0031 - 0.0114 in.

VALVE TIMING

VALVE TIMING

DESCRIPTION	SPECIFICATION
Intake	
Opens (BTDC)	21.7°
Closes (ATDC)	236.3°
Duration	258°
Exhaust	
Opens (BTDC)	270.2°

Closes (ATDC)	17.8°
Duration	288°
Valve Overlap	39.5°

CYLINDER HEAD

CYLINDER HEAD

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Valve Seat Angle	44.5° - 45.0°	
Valve Seat Runout (MAX)	0.05 mm	0.0019 in.
Valve Seat Width (finish)		
Intake	1.18 - 1.62 mm	.0638 in.
Exhaust	1.48 - 1.92 mm	0.0583 - 0.0756 in.
Guide Bore Diameter (Std.)	7.975 - 8.00 mm	0.3134 - 0.315 in.

HYDRAULIC TAPPETS

HYDRAULIC TAPPETS

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Body Diameter	21.387 - 21.405 mm	0.8420 - 0.8427 in.
Clearance (to bore)	0.020 - 0.063 mm	0.0008 - 0.0025 in.
Dry Lash	3.0 mm (at the valve)	0.1181 in. (at the valve)

VALVES

VALVES

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Face Angle	45.0° - 45.5°	
Head Diameter		
Intake	50.67 - 50.93 mm	1.99 - 2.01 in.
Exhaust	39.27 - 39.53 mm	1.55 - 1.56 in.
Length (overall)		
Intake	123.38 - 123.76 mm	4.857 - 4.872 in.
Exhaust	120.475 - 120.855 mm	4.743 - 4.758 in.
Stem Diameter		
Intake	7.935 - 7.953 mm	0.312 - 0.313 in.
Exhaust	7.932 - 7.950 mm	0.312 - 0.313 in.
Stem - to - Guide Clearance		
Intake	0.022 - 0.065 mm	0.0008 - 0.0025 in.

Exhaust	0.025 - 0.065 mm	0.0009 - 0.0025 in.
Valve Lift (@ zero lash)		
Intake	12.0 mm	0.472 in.
Exhaust	11.70 mm	0.460 in.

VALVE SPRING

VALVE SPRING

DESCRIPTION	SPECIFICATION	
	Metric	**Standard**
Spring Force (valve closed)	520.0 N @ 50.50 mm	116.9 lbs @ 1.99 in.
Spring Force (valve open)	1475.0 N @ 37.25 mm.	331.6 lbs. @ 1.47 in.
Free Length (approx).	60.2 mm	2.37 in.
Number of Coils	8.35	
Wire Diameter	5.65 X 4.51 mm	0.222 - 0.178 in.
Installed Height (spring seat to bottom of retainer)	50.50 mm	1.99 in.

OIL PUMP

OIL PUMP

DESCRIPTION	SPECIFICATION	
	Metric	**Standard**
Clearance Over Rotors (MAX)	0.095 mm	0.0038 in.
Outer Rotor to Pump Body Clearance (MAX)	.235 mm	0.009 in.
Tip Clearance Between Rotors (MAX)	0.150 mm	0.006 in.

OIL PRESSURE

OIL PRESSURE

DESCRIPTION	SPECIFICATION	
	Metric	**Standard**
At Curb Idle Speed (MIN)*	25 kPa	4 psi
@ 3000 rpm	170 - 758 kPa	25 - 110 psi
*** CAUTION: If pressure is zero at curb idle, DO NOT run engine.**		

TORQUE SPECIFICATIONS

Case Cover Bolts	28	21	-

REMOVAL

REMOVAL

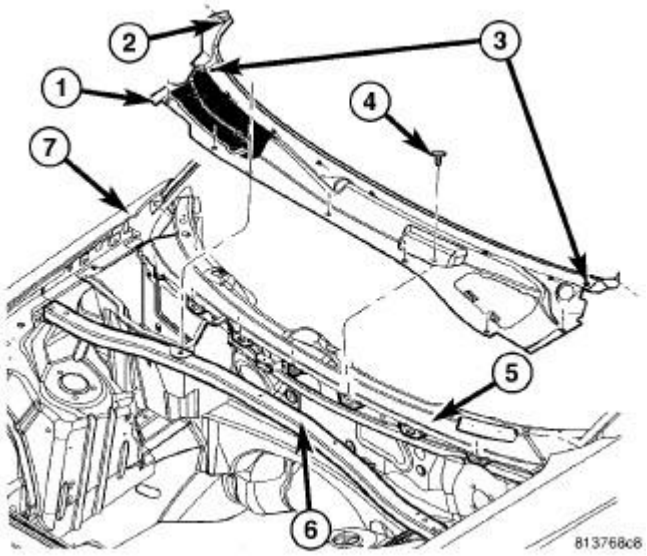

Fig. 8: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the hood. Refer to **HOOD, REMOVAL** .
2. Remove the cowl panel cover (1). Refer to **COVER, COWL PANEL, REMOVAL** .
3. Remove the strut tower support (6).

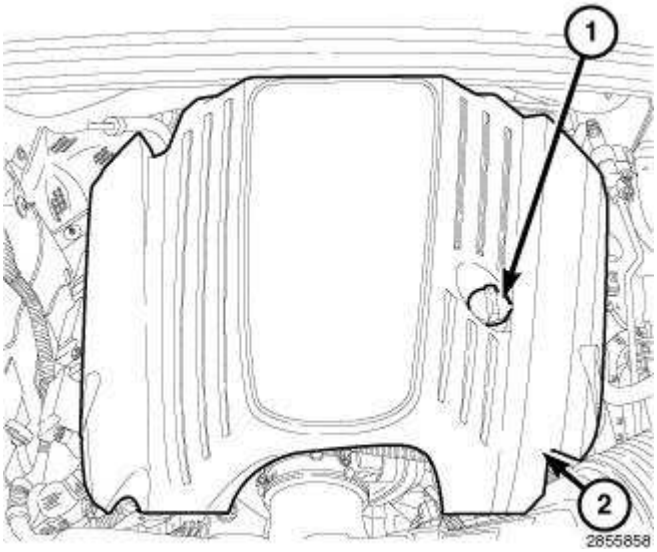

Fig. 9: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

4. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).
5. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

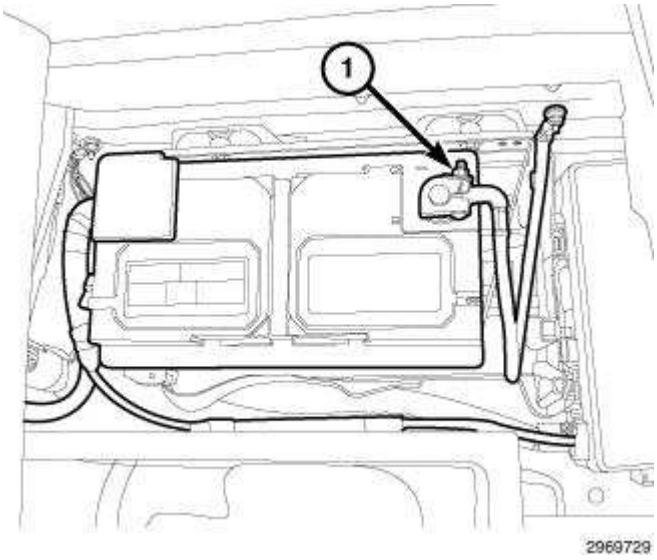

Fig. 10: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect and isolate the negative battery cable (1).

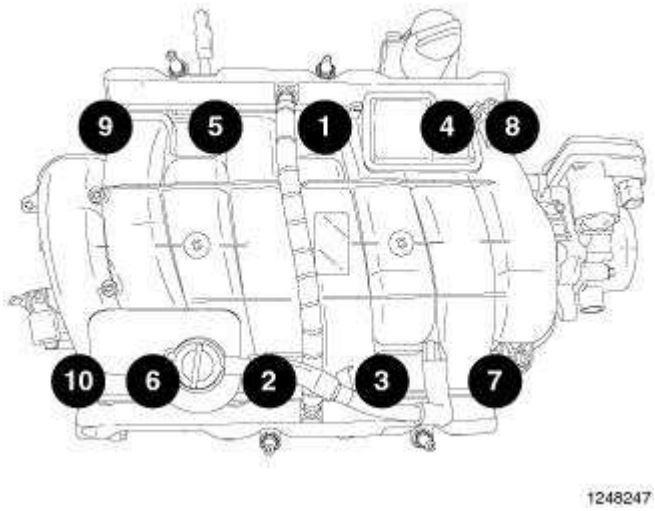

Fig. 11: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

7. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.

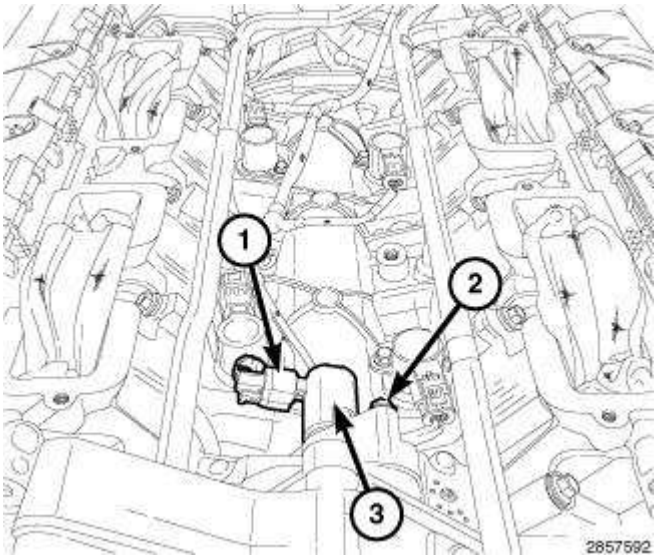

Fig. 12: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The engine must be at room temperature before removing the oil control valve.

8. Disconnect the oil control valve electrical connector (1).
9. Remove the oil control valve retaining bolt (2).

10. Rotate the oil control valve (3) to break the seal then pull the oil control valve straight out.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

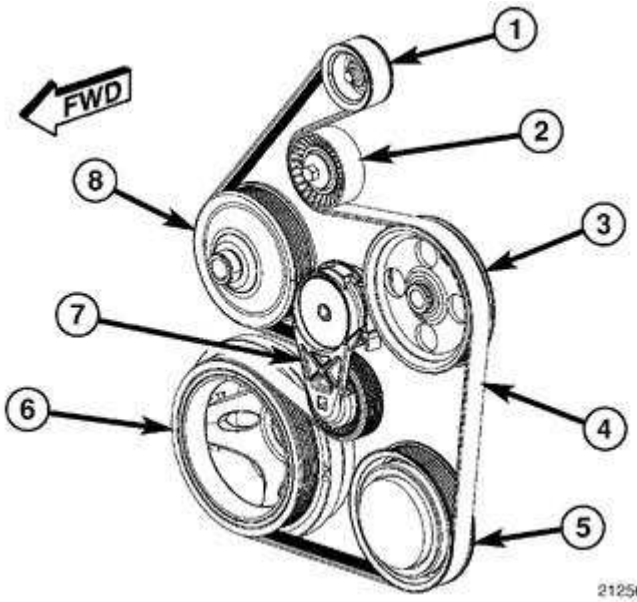

Fig. 13: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.

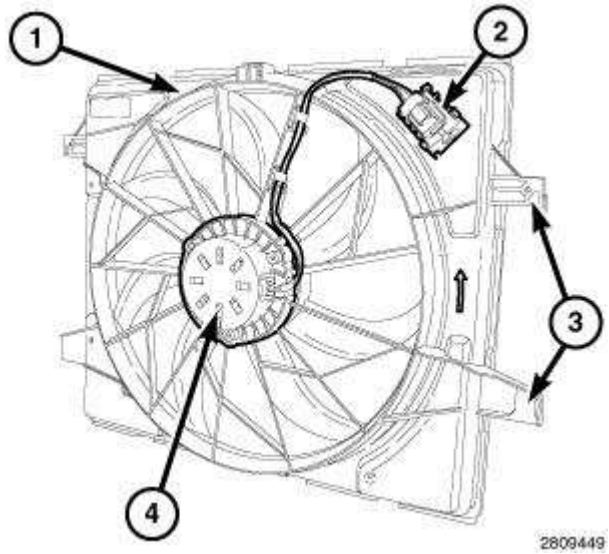

Fig. 14: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

12. Remove the cooling fan (1). Refer to **FAN, COOLING, REMOVAL** .

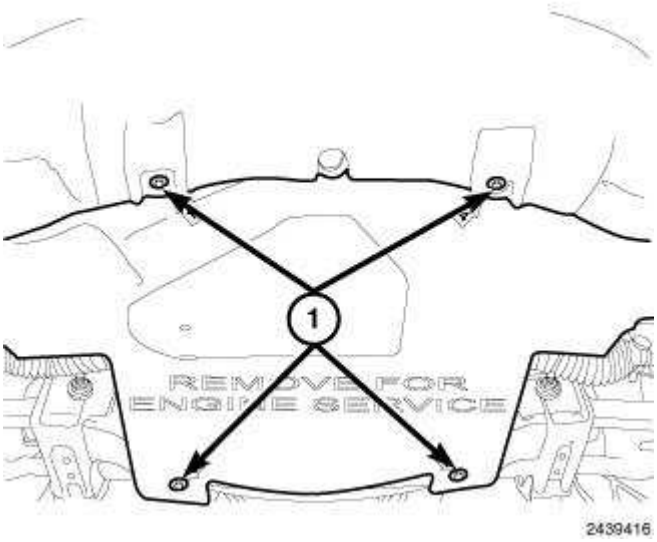

Fig. 15: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

13. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
14. Remove the belly pan retainers (1) and remove the belly pan.
15. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
16. Drain the engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

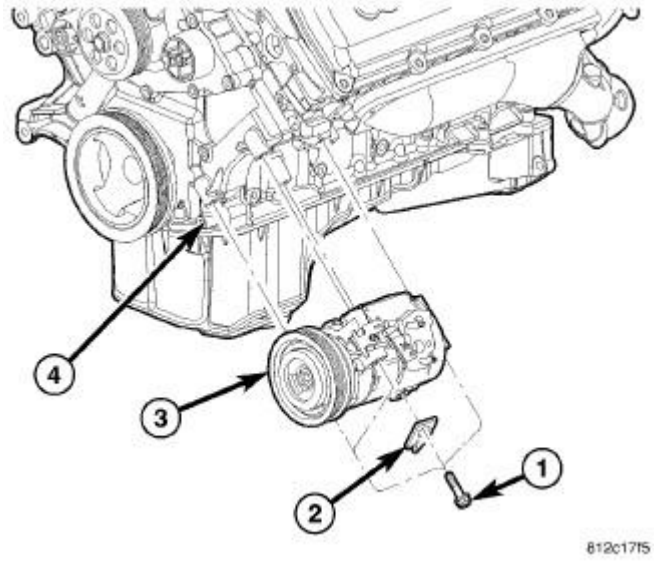

Fig. 16: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

17. Remove the A/C compressor (3). Refer to **COMPRESSOR, A/C, REMOVAL** .

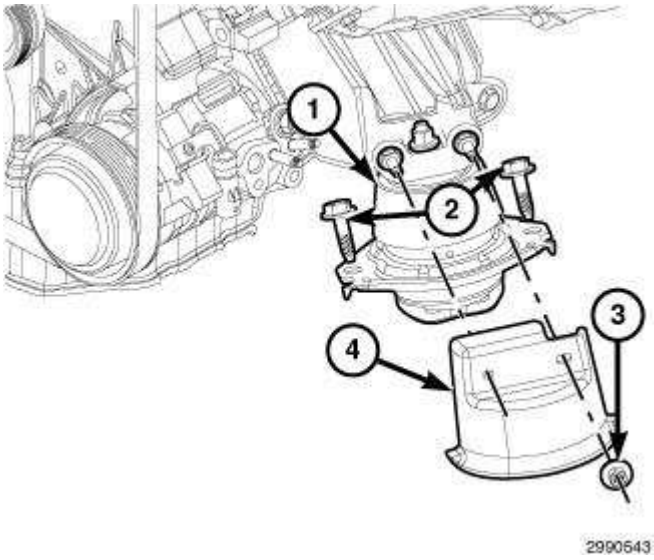

Fig. 17: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

18. Remove both left/right engine mount heat shield (4) retaining nuts (3) and remove the heat shields.
19. Remove both left/right engine mount to frame retaining bolts (2).
20. Disconnect the transmission oil cooler lines from their retainers at the oil pan.

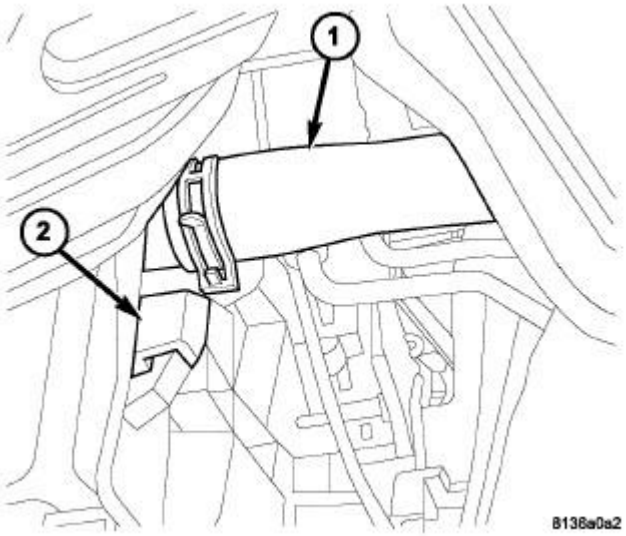

Fig. 18: Lower Radiator Hose & Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY

21. Remove the lower radiator hose (1).

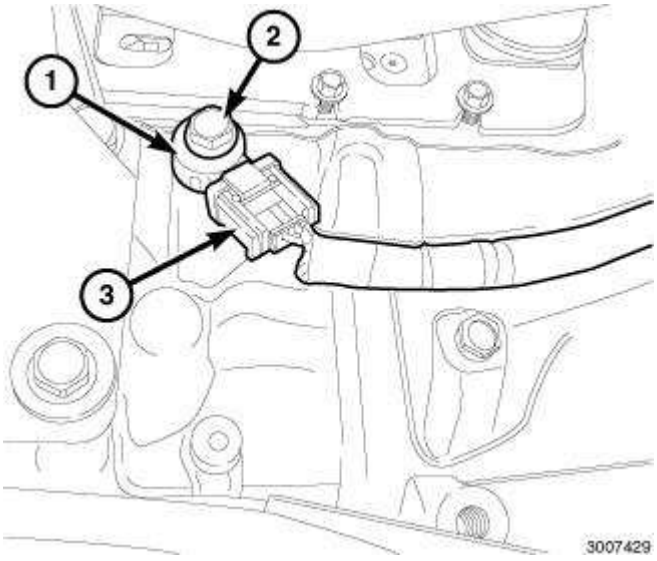

Fig. 19: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Two knock sensors are used. Each sensor is bolted to the outside of the engine block below the exhaust manifold.

NOTE: Left side shown in illustration, right side similar.

22. Remove the heat shields from both knock sensors (shield snaps on/off sensor).
23. Disconnect the knock sensor electrical connectors (3).

CAUTION: When separating the catalytic converters from the manifolds, disconnect the oxygen sensor connectors. Allowing the catalytic converters hanging from the oxygen sensor wires damages the harness and/or sensors.

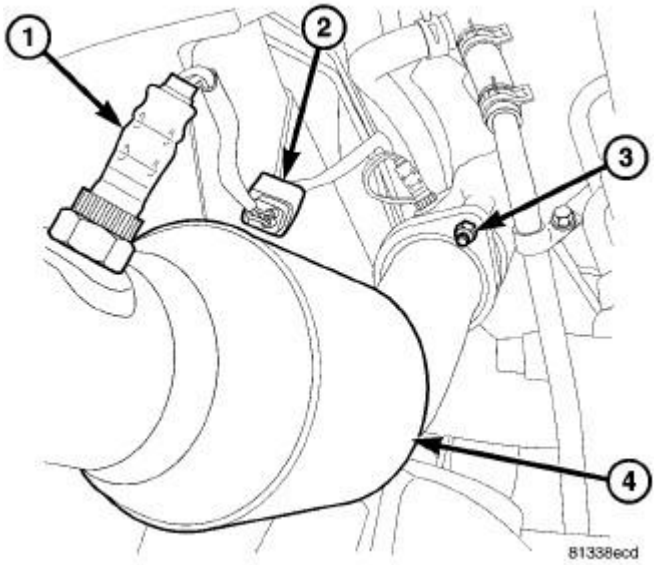

Fig. 20: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

24. Disconnect all oxygen sensor electrical connectors (2).
25. Saturate all exhaust bolts and nuts (3) with Mopar® Rust Penetrant. Allow five minutes for penetration.
26. Remove the both catalytic converter to manifold flange nuts (3) and separate the catalytic converters (4) from the exhaust manifolds.

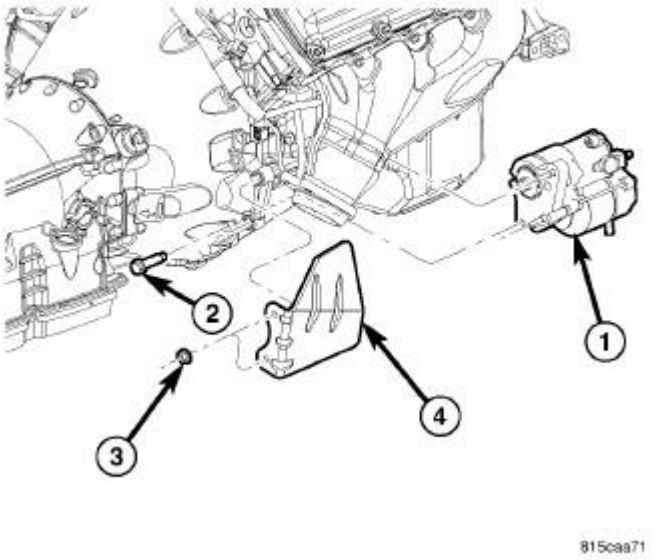

Fig. 21: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

27. Remove the starter motor (1) heat shield (4).
28. Disconnect the starter wires, remove the starter motor retaining bolts (2) and remove the starter (1). Refer to **STARTER, REMOVAL** .

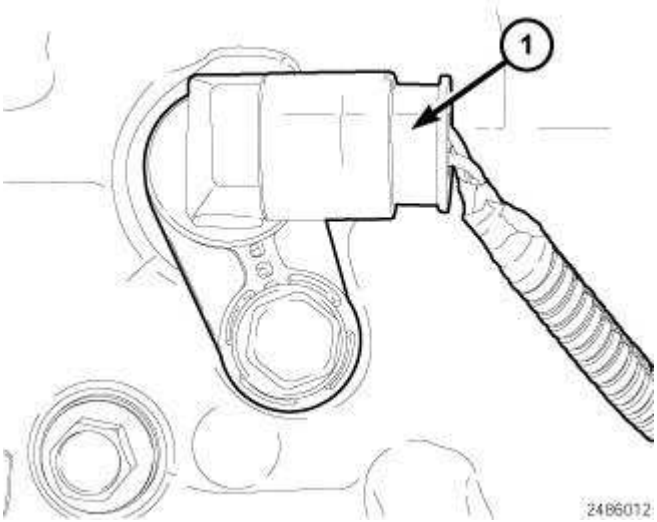

Fig. 22: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block.

29. Remove the CKP sensor electrical connector (1).

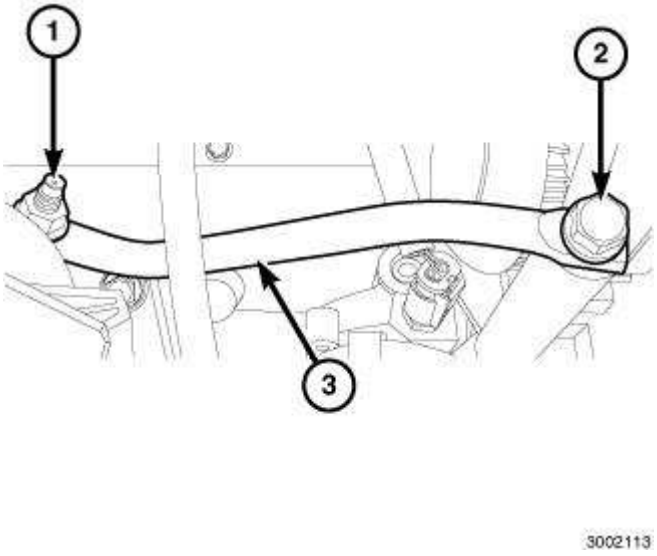

Fig. 23: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

30. Remove the generator support bracket to engine mount retaining nut (1).
31. Remove the generator support bracket retaining bolt (2) and remove the support bracket (3).
32. Lower the vehicle.

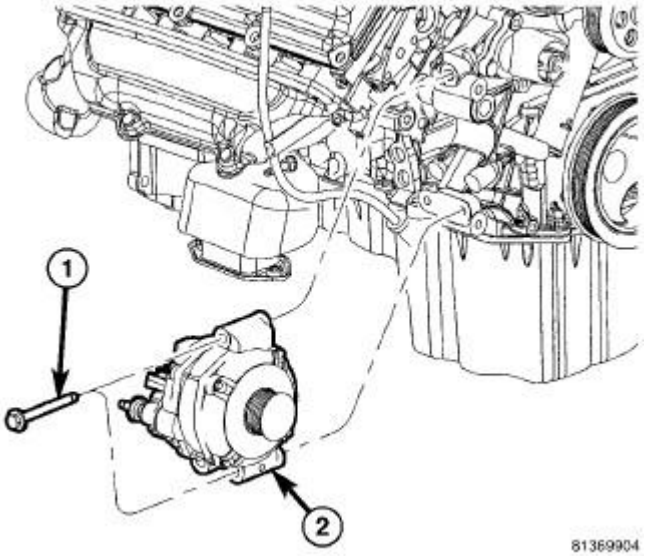

Fig. 24: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

33. Unsnap the plastic insulator cap from the B+ output terminal.
34. Remove the B+ terminal mounting nut at the rear of the generator and remove the B+ terminal.

35. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector.
36. Remove the two generator retaining bolts (1) and remove the generator (2).

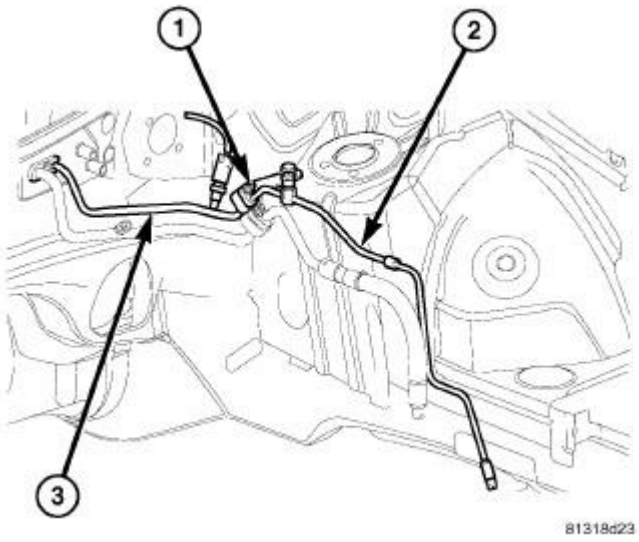

Fig. 25: Removing/Installing A/C Liquid Line
Courtesy of CHRYSLER GROUP, LLC

37. Remove the nut (1) from the front section of the A/C liquid line (2) to the rear section of the liquid line (3), separate the lines, remove and discard the dual plane seal.
38. Install plugs or tape over the opened liquid line fittings.
39. Remove the front section of the A/C liquid line (2) from the engine compartment.

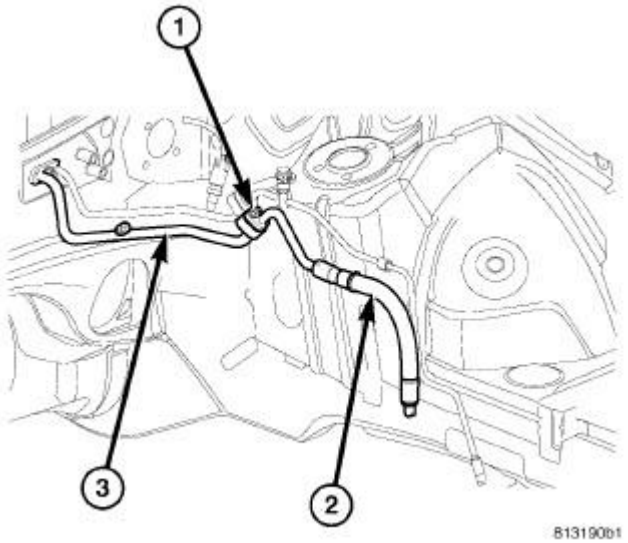

Fig. 26: Removing/Installing A/C Suction Lines

Courtesy of CHRYSLER GROUP, LLC

40. Remove the nut (1) from the front section of the A/C suction line (2) to the rear section of the suction line (3), separate the lines, remove and discard the dual plane seal.
41. Install plugs or tape over the opened suction line fittings.
42. Remove the front section of the A/C suction line (2) from the engine compartment.

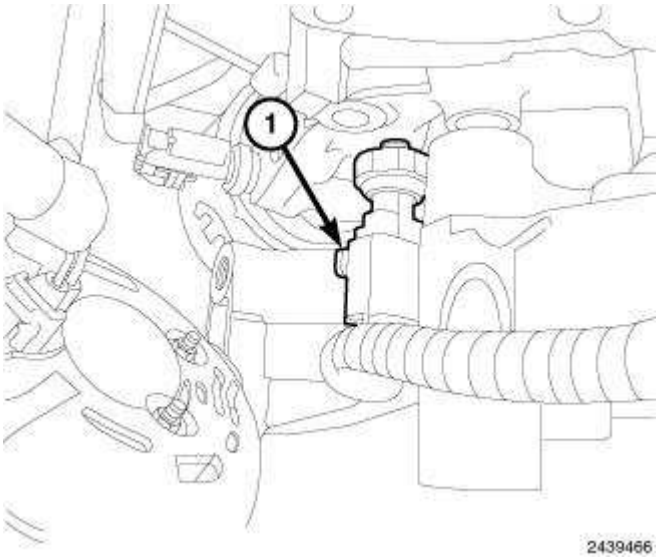

Fig. 27: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

43. Remove the oil pressure sensor electrical connector (1).
44. Remove the oil temperature sensor electrical connector.

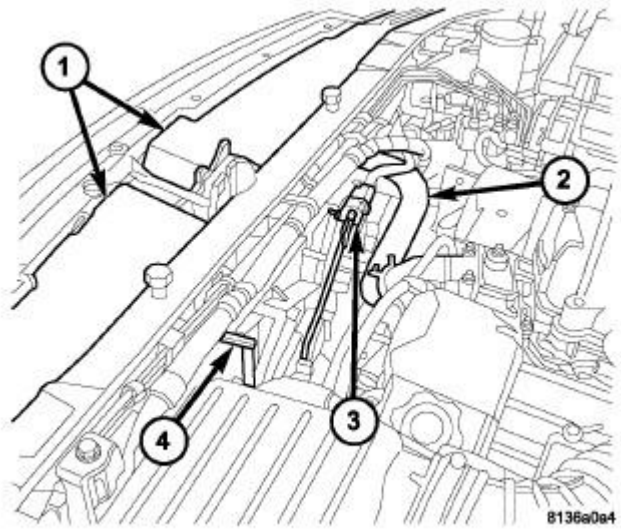

Fig. 28: Upper Radiator Closure Panel, Hose, Radiator Fan Electrical Connector & Fan

Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - UPPER RADIATOR CLOSURE PANELS
2 - UPPER RADIATOR HOSE
3 - RADIATOR FAN ELECTRICAL CONNECTOR
4 - RADIATOR FAN ASSEMBLY

45. Remove upper radiator hose (2).

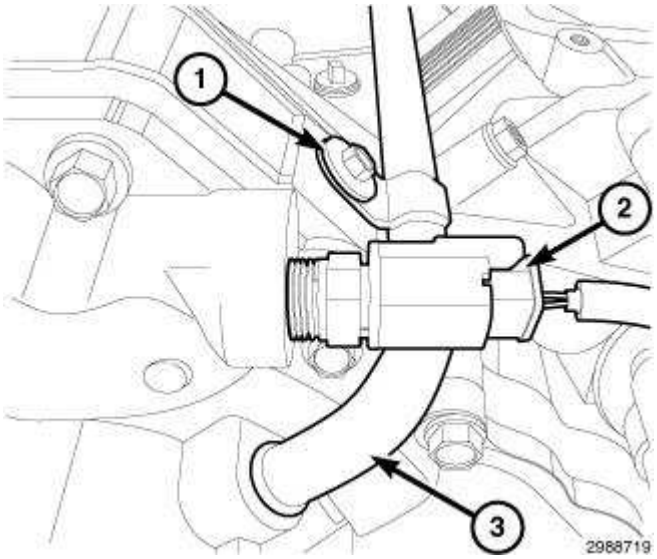

Fig. 29: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

46. Remove the heater tube retaining bolt (1).
47. Remove the coolant temperature (ECT) sensor electrical connector (2).
48. Lift the heater tube (3) out of the water pump and remove the heater tube from the vehicle.

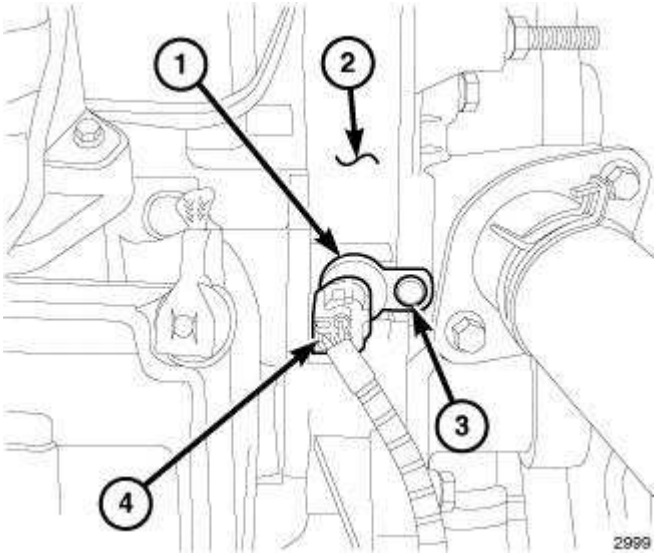

Fig. 30: Camshaft Position Sensor, Connector, Bolt & Timing Cover
Courtesy of CHRYSLER GROUP, LLC

49. Disconnect the camshaft position (CMP) sensor electrical connector (4).

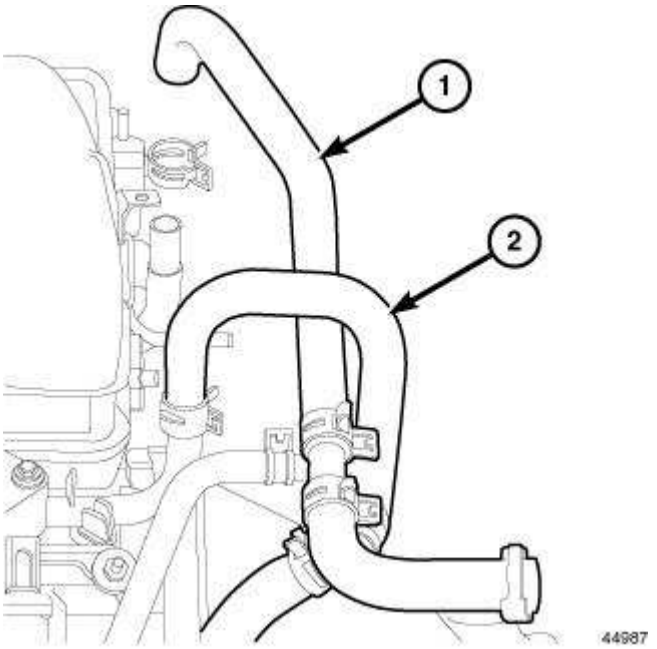

Fig. 31: Heater Hose Supply
Courtesy of CHRYSLER GROUP, LLC

50. Remove the heater hoses (1, 2).

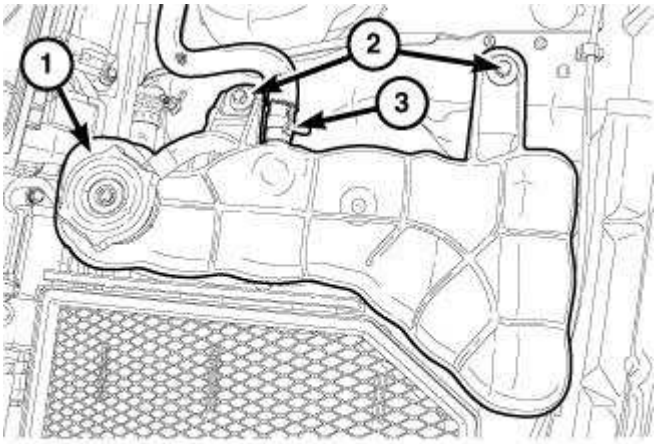

Fig. 32: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the hoses from the coolant bottle for coolant bottle removal.

51. Remove the coolant bottle retaining bolts (2) and position the coolant bottle (1) aside.

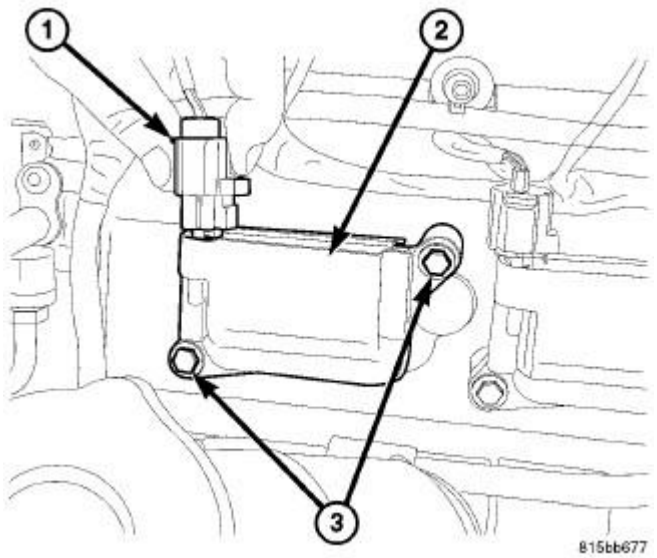

Fig. 33: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

52. Remove all ignition coil electrical connectors (1) and position the harness aside.

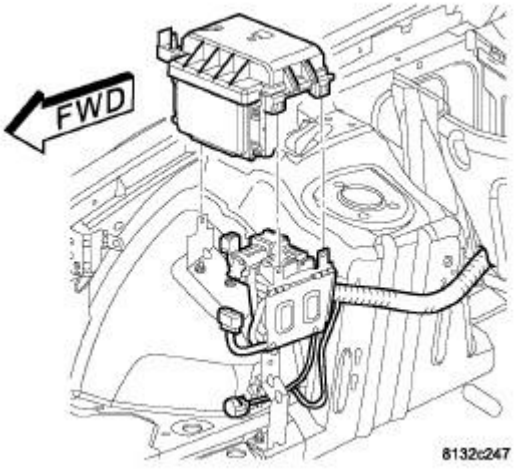

Fig. 34: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

53. Remove the Power Distribution Center (PDC) and mounting bracket.
54. Unfasten the wire harness mounted on the right hand inner fender panel and position aside.

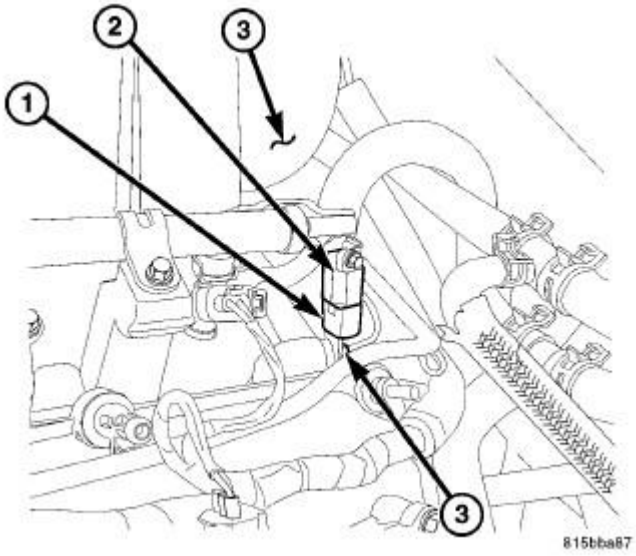

Fig. 35: Ignition Capacitor, Electrical Connector & Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

NOTE: The ignition capacitor (2) is attached to the left rear corner of the intake manifold (3).

55. Remove the ignition capacitor (2) electrical connector (1).
56. Remove the ground wires from the rear of each cylinder head.
57. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

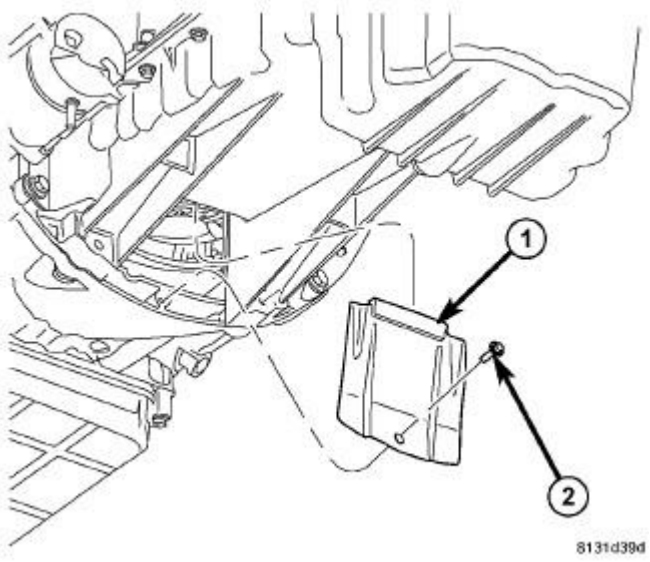

Fig. 36: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER GROUP, LLC

58. Remove the inspection cover (1).

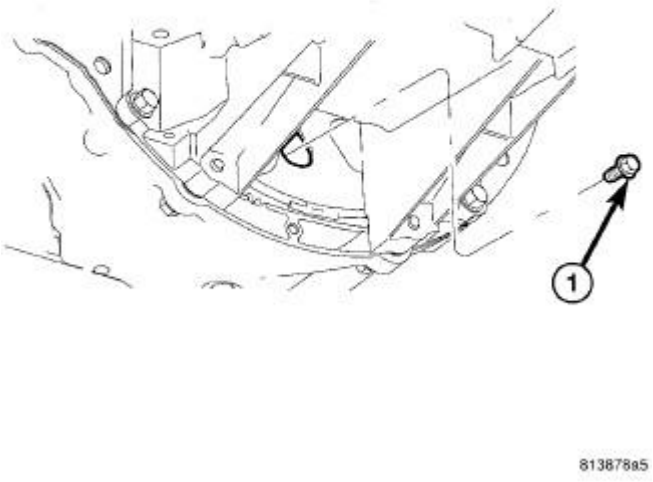

Fig. 37: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

59. Rotate the crankshaft in clockwise direction until converter bolts (1) are accessible and remove the flexplate to converter bolts (1).

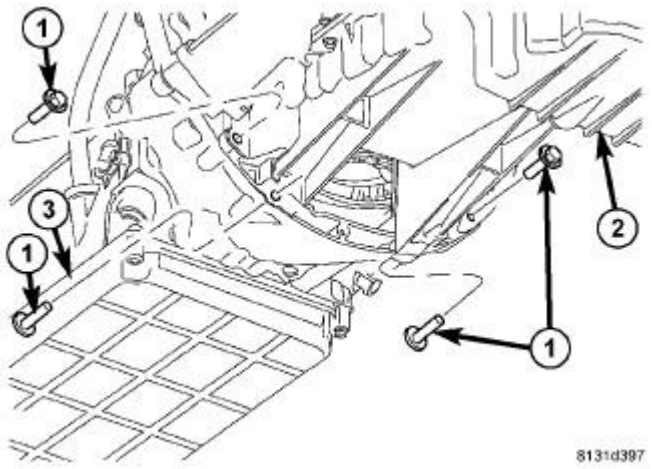

Fig. 38: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

60. Remove the oil pan to transmission bolts (1).

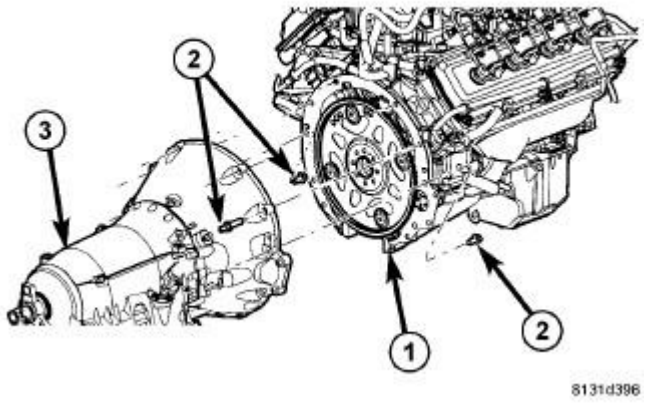

Fig. 39: Remove/Install Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

61. Remove the transmission bell housing to engine block bolts (2).

CAUTION: While carefully separating the engine from the transmission and removing the engine from the vehicle, constant checks must be made to ensure no damage to other components or wiring harnesses occur throughout the removal procedure.

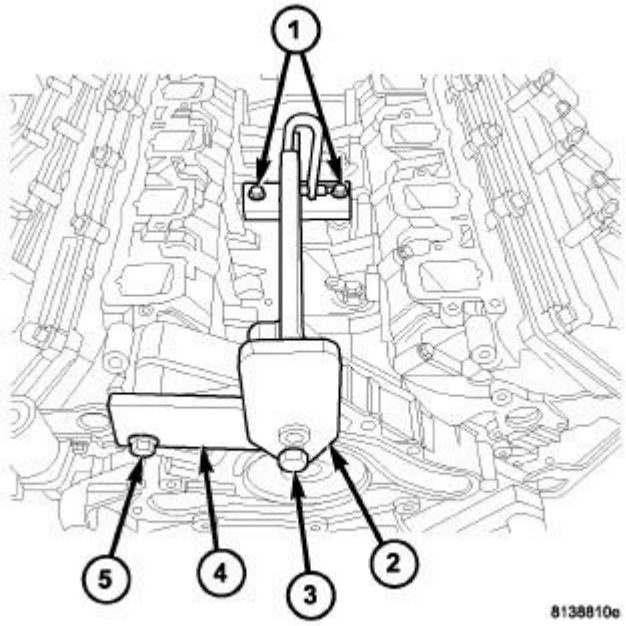

Fig. 40: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

62. Lower the vehicle.
63. Using a suitable jack, support the transmission.

NOTE: Do not use air tools to install engine lift fixture.

64. Install the engine lift fixture (special tool #8984B, Fixture, Engine Lifting) (2) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
65. Using a suitable engine hoist, separate the engine from the transmission and carefully remove the engine from the engine compartment.
66. Secure the engine onto a suitable engine stand.

INSTALLATION

INSTALLATION

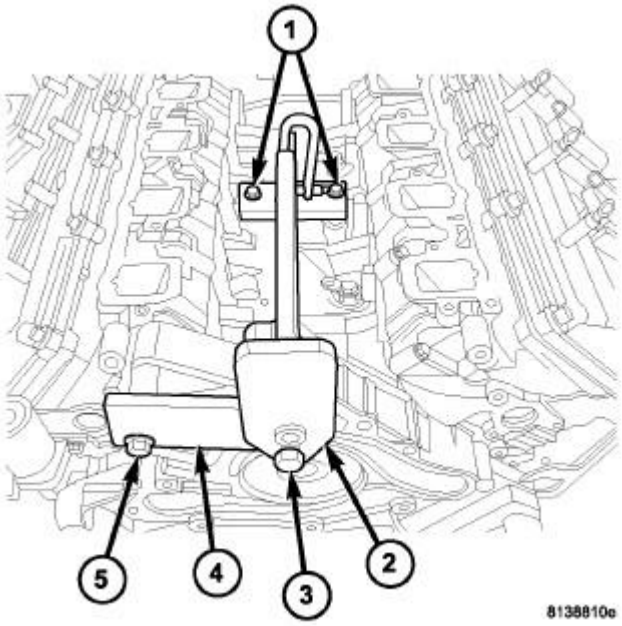

Fig. 41: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install Engine Lift Fixture and Adapter (special tool #8984B, Fixture, Engine Lifting) (2, 3).

1. Install the engine lift fixture (special tool #8984B, Fixture, Engine Lifting) (2) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
2. Using a suitable engine hoist, lower the engine into in the engine compartment.
3. Align the engine with the transmission.
4. Install two transmission to engine block mounting bolts finger tight.
5. Lower the engine assembly until the engine mounts rest in the engine cradle crossmember.

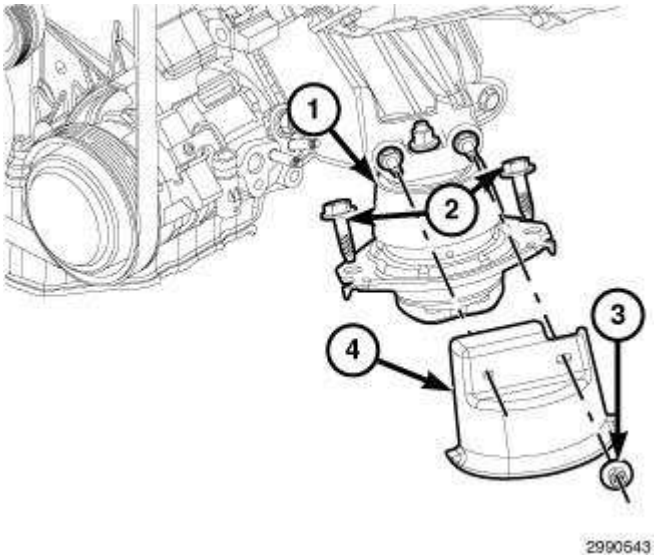

Fig. 42: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

6. Align the engine mounts, install both left and right engine mount to frame retaining bolts (2) and tighten to 68 N.m (50 ft. lbs.).
7. Position both left and right engine mount heat shields (4), install the retaining nuts (3) and tighten to 27 N.m (20 ft. lbs.).
8. Remove the engine hoist and the jack supporting the transmission.
9. Raise and support the vehicle.

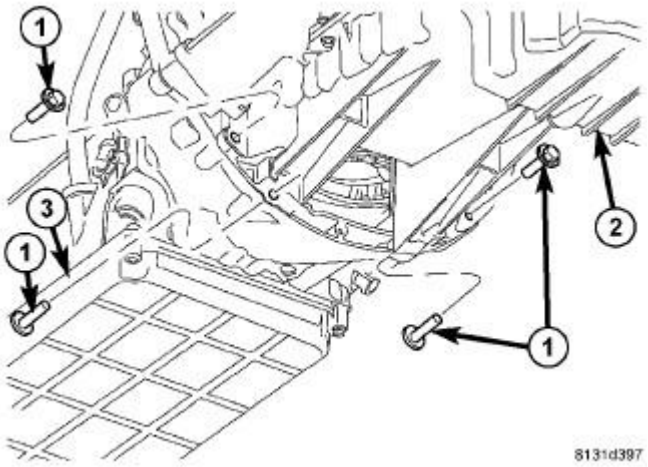

Fig. 43: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the transmission to oil pan bolts (1) and tighten to 54 N.m (40 ft. lbs.).

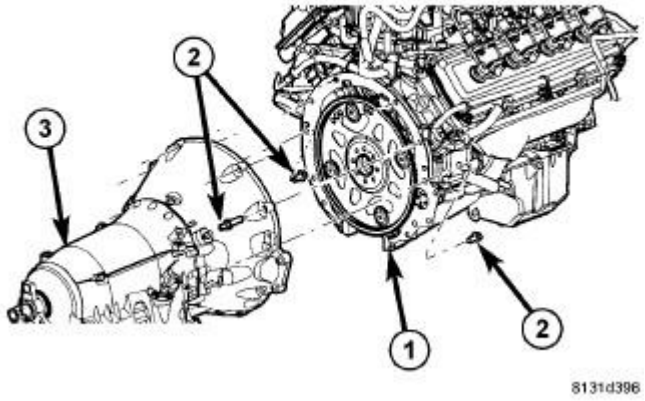

Fig. 44: Remove/Install Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the remaining transmission bell housing to engine block bolts (2) and tighten to 68 N.m (50 ft. lbs.).

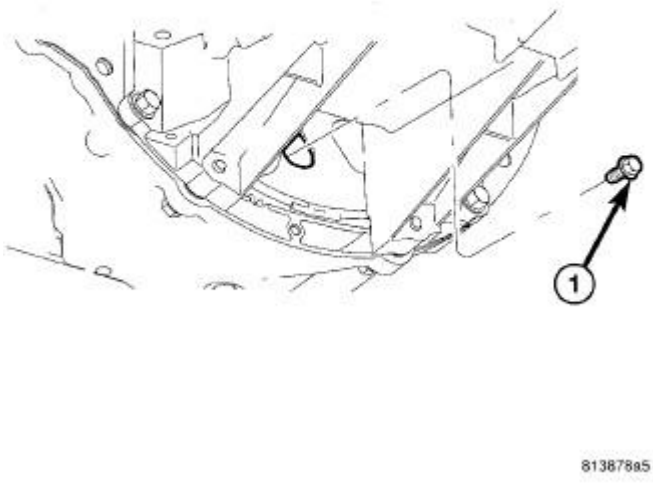

Fig. 45: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the clutch surface inside the torque converter.

12. Rotate the crankshaft in clockwise direction and install all torque converter to flexplate bolts (1) finger tight.
13. Verify that the torque converter is pulled flush to the flexplate and tighten bolts to 88 N.m (65 ft. lbs.).

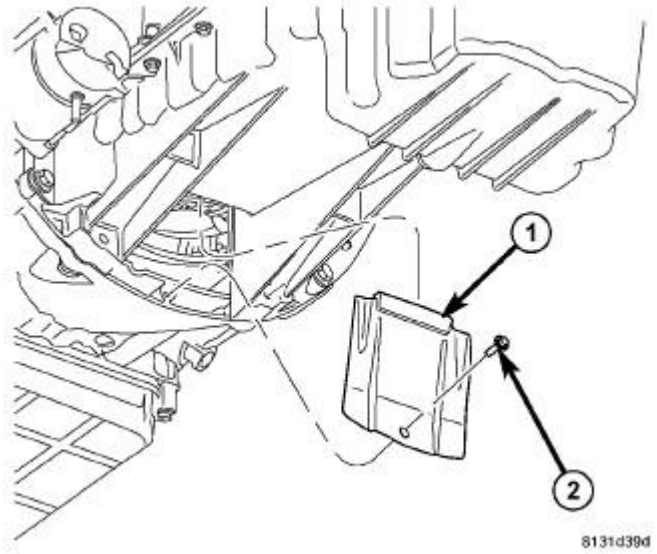

Fig. 46: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER GROUP, LLC

14. Install the inspection cover (1) and tighten the retaining bolt (2) to 11 N.m (8 ft. lbs.).

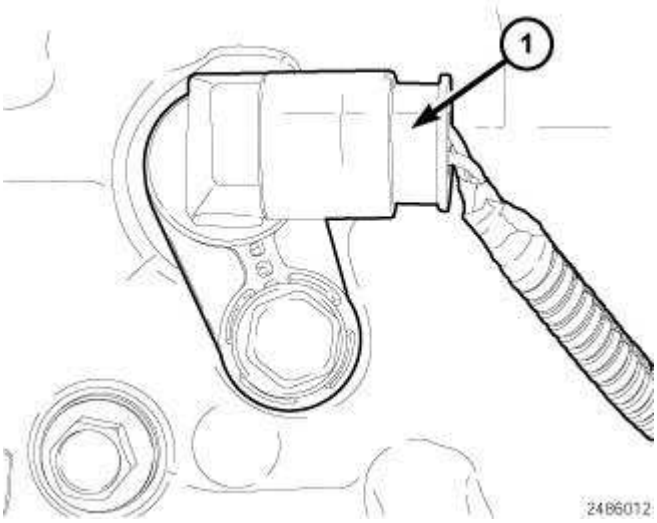

Fig. 47: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right rear side of

the engine block.

15. Connect the CKP sensor electrical connector (1).

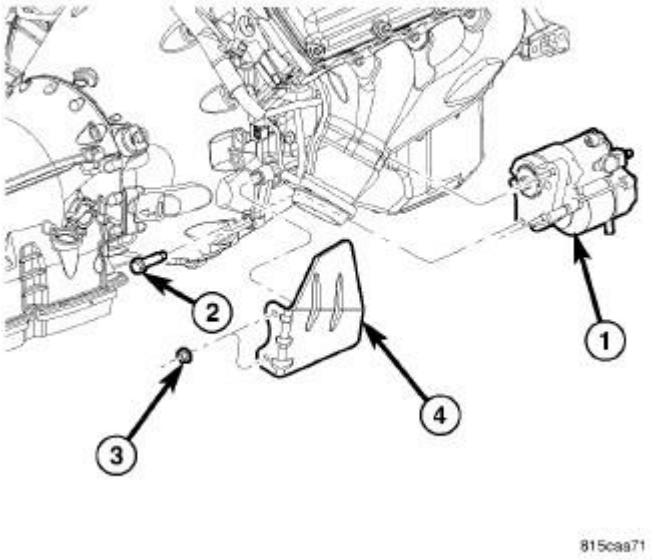

Fig. 48: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

16. Position the starter motor (1) into the transmission.
17. Install the three starter motor retaining bolts (2) and tighten to 54 N.m (40 ft. lbs.).
18. Connect the solenoid wire to the starter motor (snaps in place).
19. Position the battery cable to the solenoid stud, install the battery cable eyelet nut and tighten to 11 N.m (8 ft. lbs.).
20. Position the starter heat shield (4) and install the retaining nuts (3).

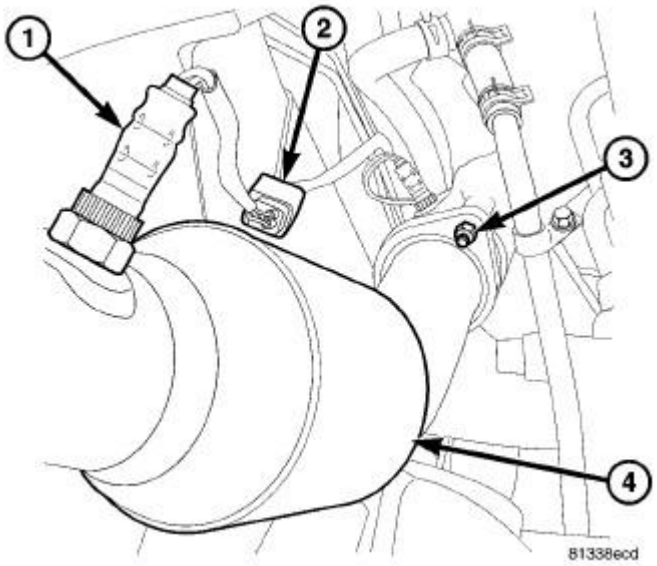

Fig. 49: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

21. Position the catalytic converters (4) onto the exhaust manifold flanges, install the flange nuts (3) and tighten to 41 N.m (30 ft. lbs.).
22. Connect the oxygen sensor electrical connectors (2).

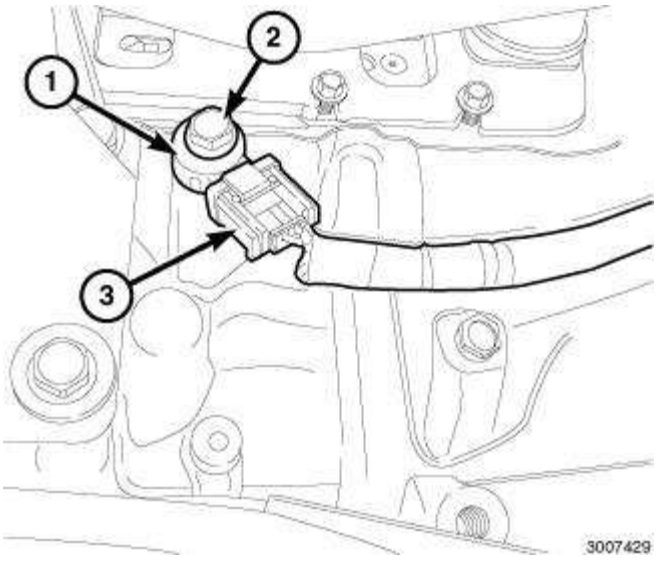

Fig. 50: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

23. Connect the right and left knock sensor (1) electrical connectors (5).
24. Install the heat shields onto both knock sensors (shield snaps on/off sensor).

25. Connect the transmission oil cooler lines to their retainers at the oil pan.

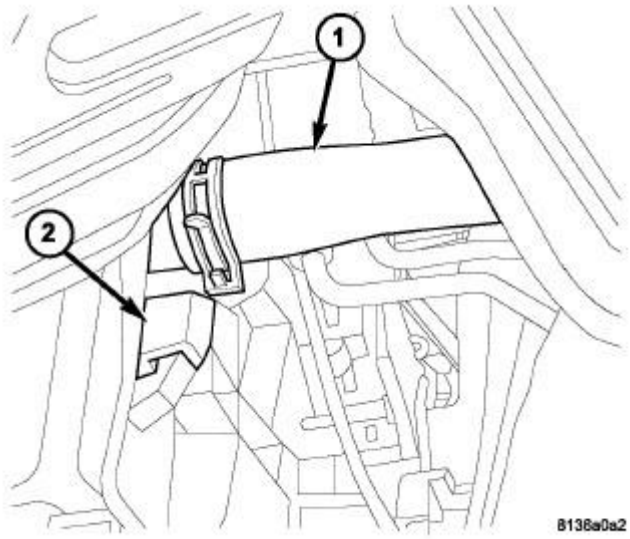

Fig. 51: Lower Radiator Hose & Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY

26. Install the lower radiator hose (1).
27. Lower the vehicle.

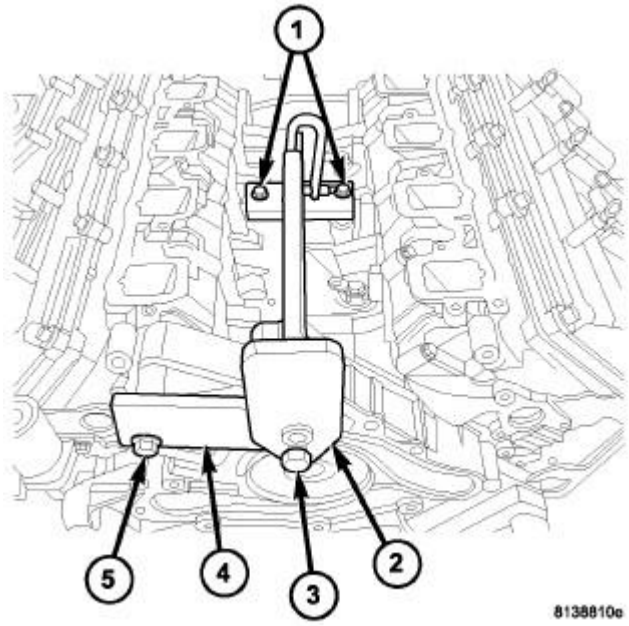

Fig. 52: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

28. Remove the engine lift fixture (special tool #8984B, Fixture, Engine Lifting) (2) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
29. Position the left and right side wiring harness.

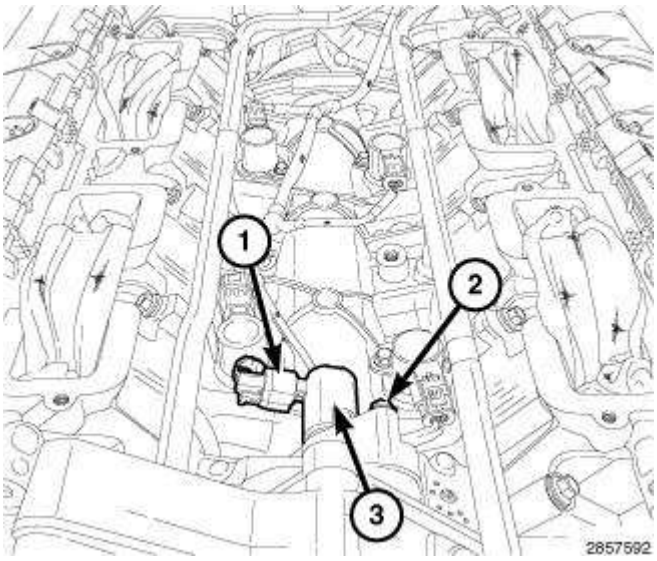

Fig. 53: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

30. Lubricate the oil control valve (OCV) rubber O-ring seal with clean engine oil.
31. Install the OCV (3) and rotate into position.

32. Install the OCV retaining bolt (2) and tighten to 11 N.m (8 ft. lbs.).
33. Connect the OCV electrical connector (1).

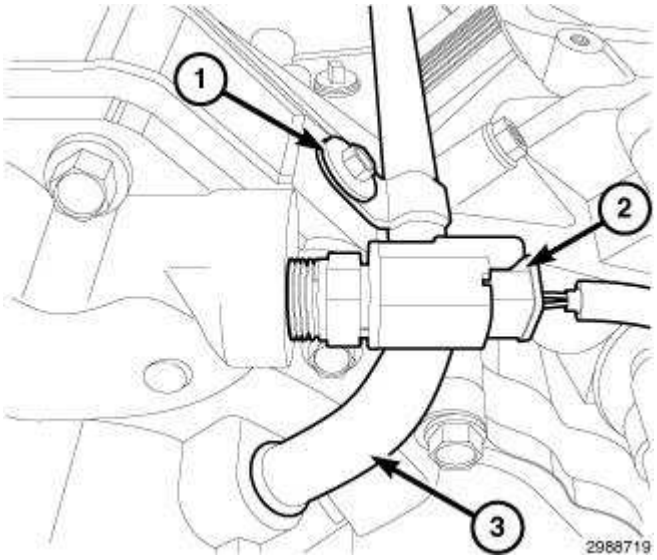

Fig. 54: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

34. Install the heater core tube (3) into the water pump.
35. Install the heater core tube retaining bolt (1) and tighten to 11 N.m (8 ft. lbs.).
36. Connect the electrical connector to the coolant temperature (ECT) sensor (2).

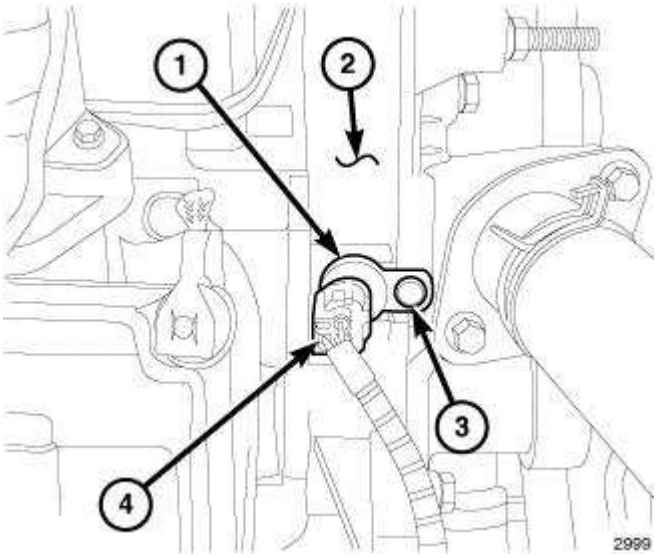

Fig. 55: Camshaft Position Sensor, Connector, Bolt & Timing Cover
Courtesy of CHRYSLER GROUP, LLC

37. Connect the camshaft position sensor electrical connector (4).

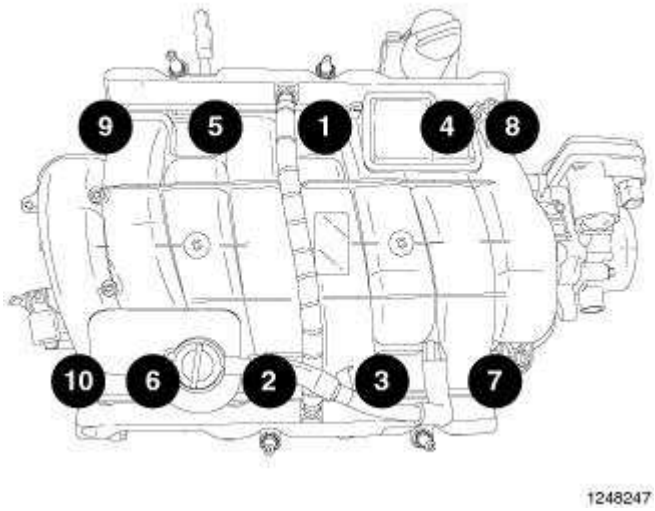

Fig. 56: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the intake manifold and throttle body as an assembly.

38. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.

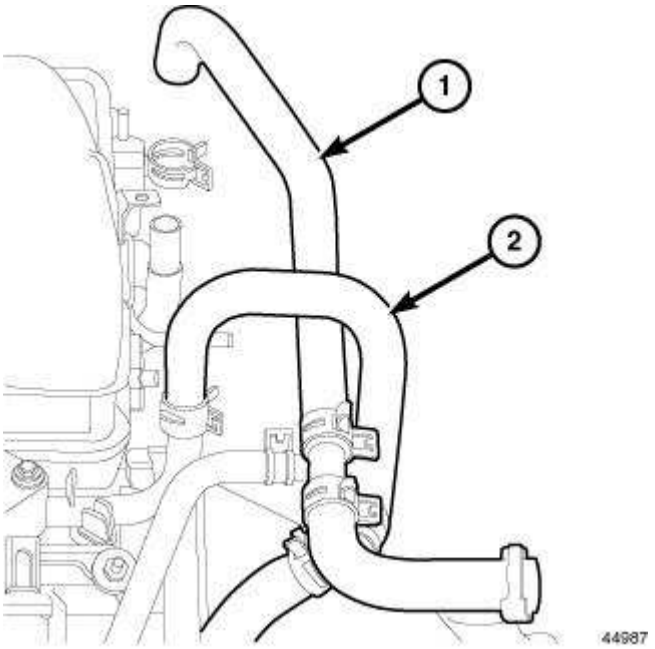

Fig. 57: Heater Hose Supply
Courtesy of CHRYSLER GROUP, LLC

39. Connect the heater hoses (1, 2).
40. Connect the ground wires to the rear of each cylinder head.

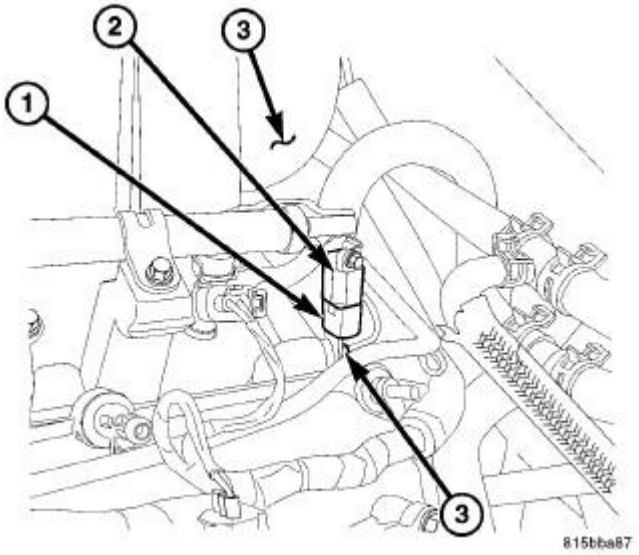

Fig. 58: Ignition Capacitor, Electrical Connector & Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

NOTE: The ignition capacitor (2) is attached to the rear of the left cylinder head.

41. Connect the ignition capacitor (2) electrical connector (1).

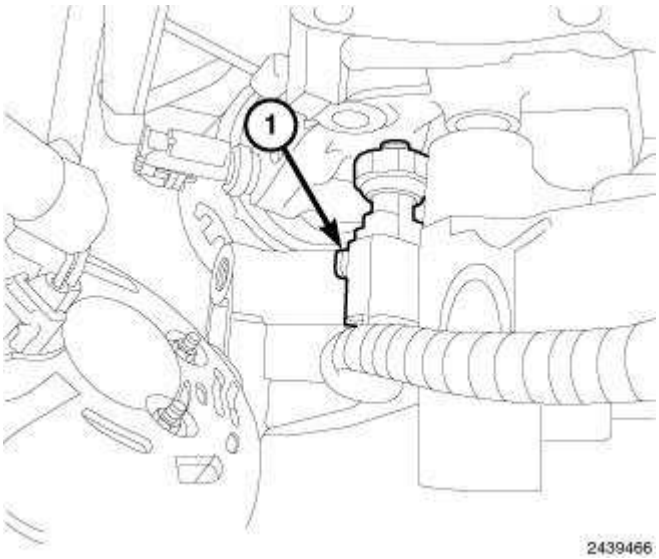

Fig. 59: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

42. Connect the oil pressure sensor electrical connector (1).
43. Connect the oil temperature sensor electrical connector.

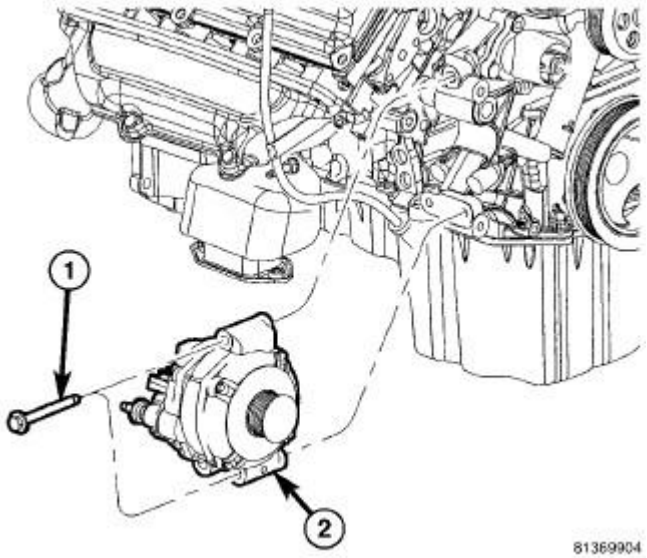

Fig. 60: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

44. Position the generator (2) and install two generator mounting bolts (1) finger tight.
45. Raise and support the vehicle.

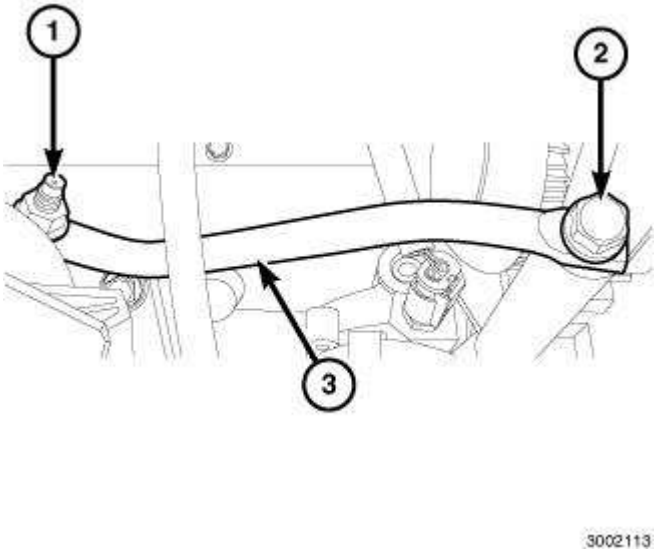

Fig. 61: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

46. Position the generator support bracket (3) to the engine mount, install the retaining nut (1) finger tight.
47. Position the generator support bracket (3) to the generator, install the retaining bolt (2) and tighten to 65 N.m (48 ft. lbs.).
48. Tighten the generator support bracket (3) to engine mount retaining nut (1) to 28 N.m (21 ft.

lbs.).

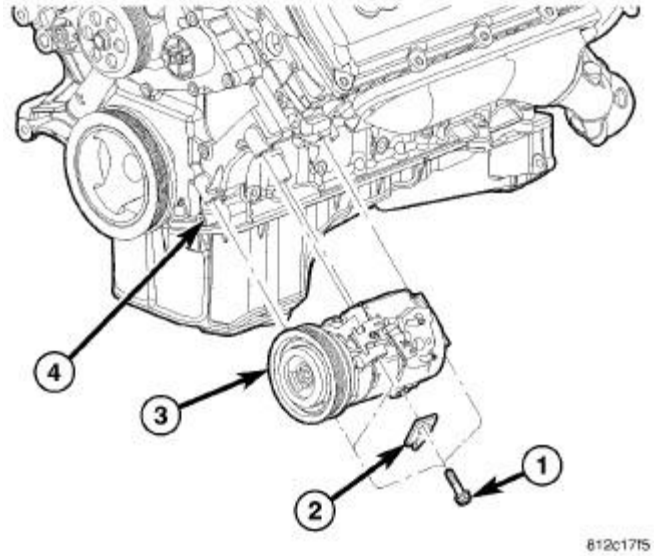

Fig. 62: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

49. Install the A/C compressor (3). Refer to **COMPRESSOR, A/C, REMOVAL** .

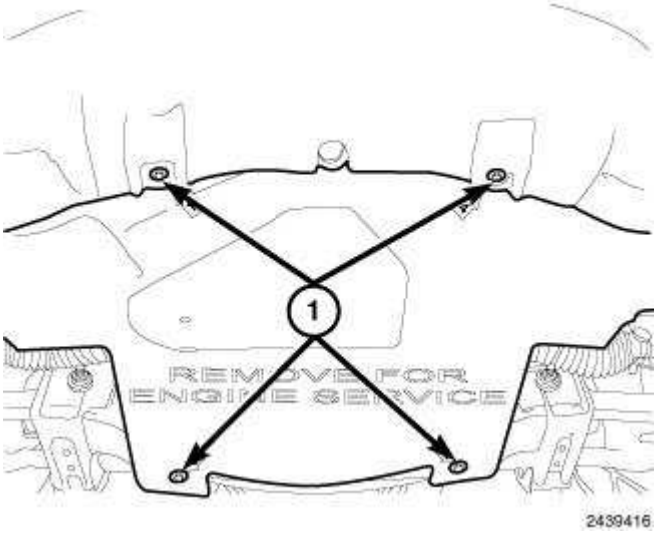

Fig. 63: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

50. Position the belly pan and install the belly pan retainers (1).
51. Lower the vehicle.

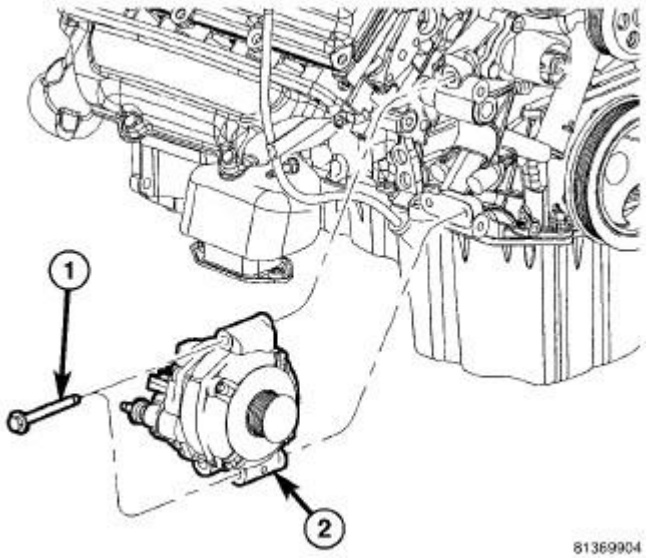

Fig. 64: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

52. Tighten two generator mounting bolts (1) to 65 N.m (48 ft. lbs.).
53. Snap the field wire connector into the rear of the generator.
54. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut and tighten to 13 N.m (10 ft. lbs.).
55. Snap the plastic insulator cap onto the B+ output terminal.

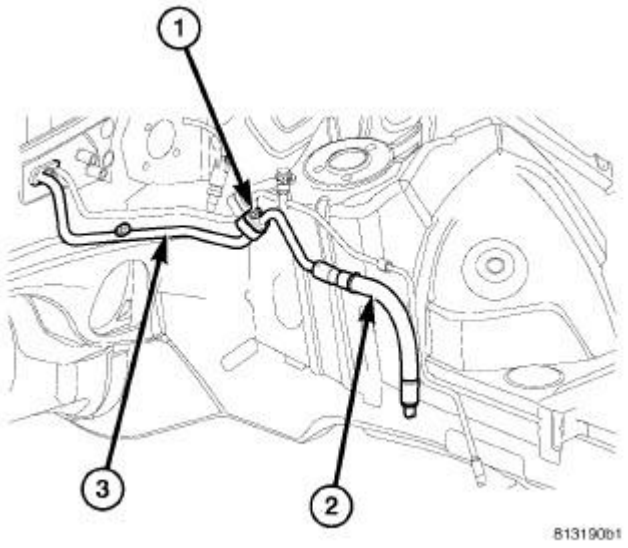

Fig. 65: Removing/Installing A/C Suction Lines
Courtesy of CHRYSLER GROUP, LLC

56. Position the front section of the A/C suction line (2) into the engine compartment.

57. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).

NOTE: Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

58. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
59. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
60. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line and tighten the nut to 22 N.m (16 ft. lbs.).

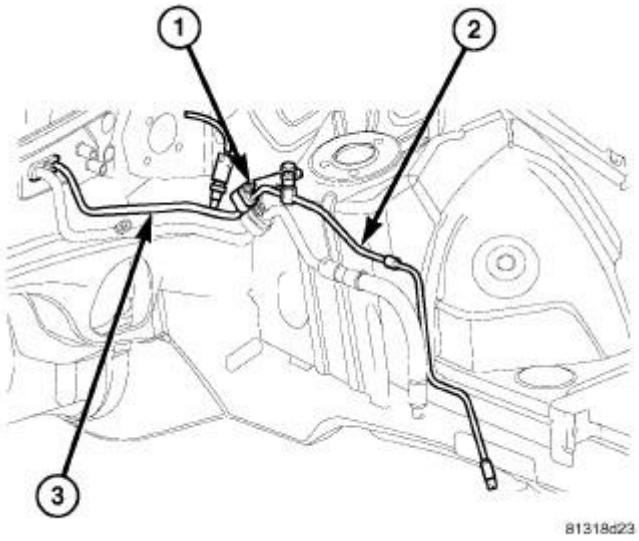

Fig. 66: Removing/Installing A/C Liquid Line
Courtesy of CHRYSLER GROUP, LLC

61. Position the front section of the A/C liquid line into the engine compartment.
62. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).

NOTE: Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

63. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
64. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.

65. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line and tighten the nut to 22 N.m (16 ft. lbs.).

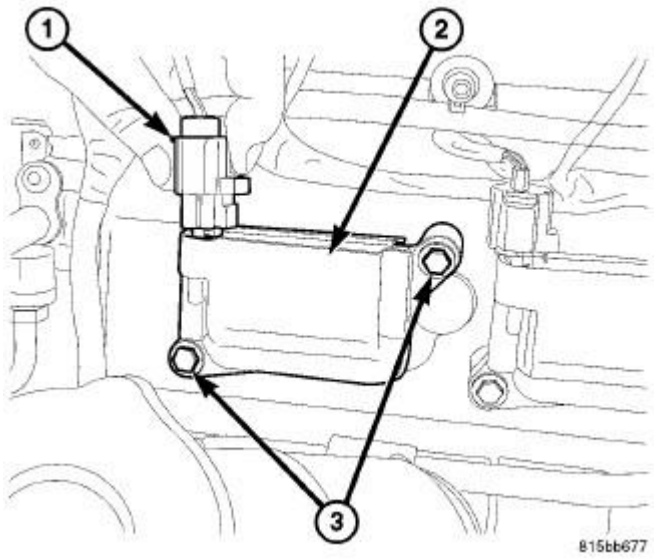

Fig. 67: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

66. Position the ignition coil electrical harness and connect all ignition coil electrical connectors (1).

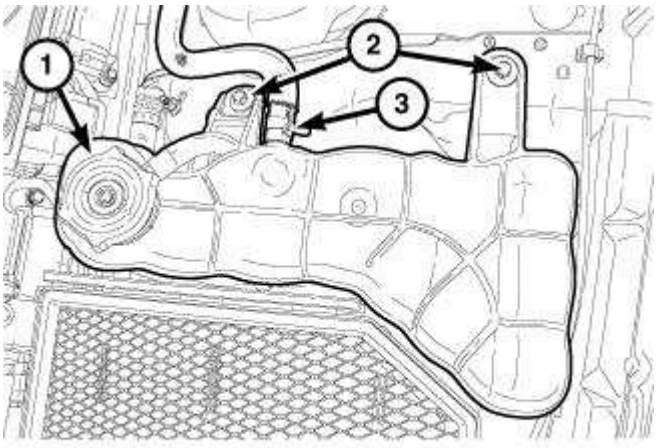

Fig. 68: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

67. Position the coolant bottle (1) and install the coolant bottle retaining bolts (2).

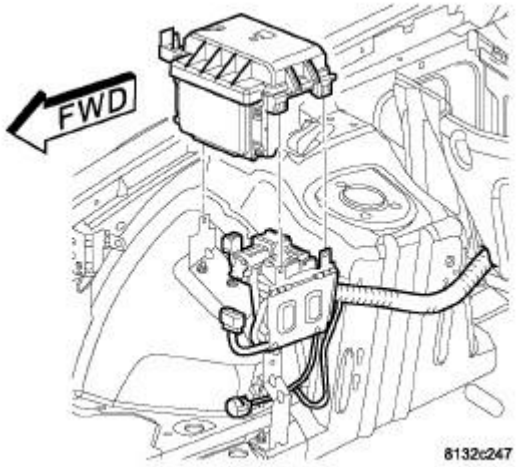

Fig. 69: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

68. Install the Power Distribution Center (PDC) and mounting bracket.
69. Position the wire harness and secure to the right hand inner fender panel.

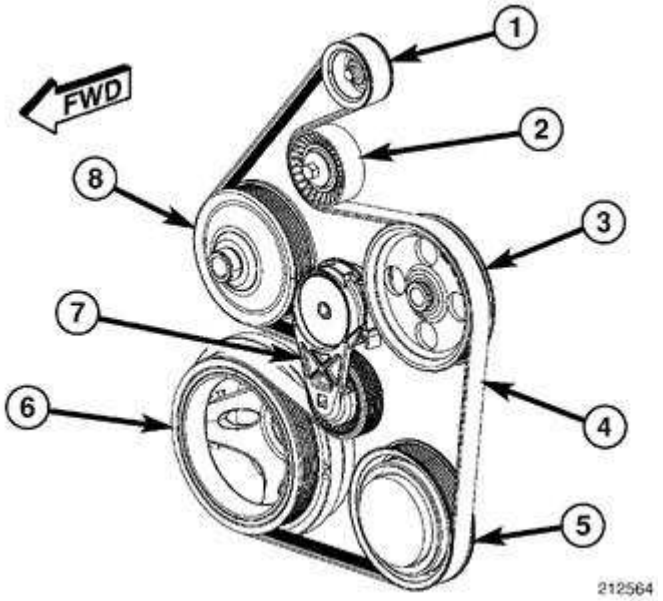

Fig. 70: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

70. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and install the accessory drive belt (2) onto the pulleys, then slowly release the tensioner.

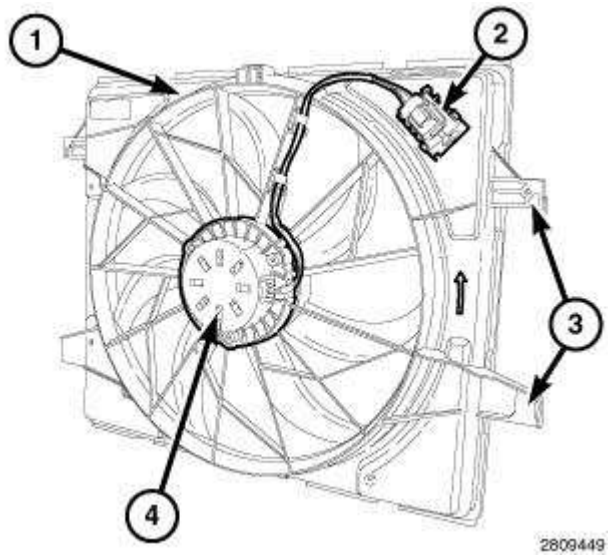

Fig. 71: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

71. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

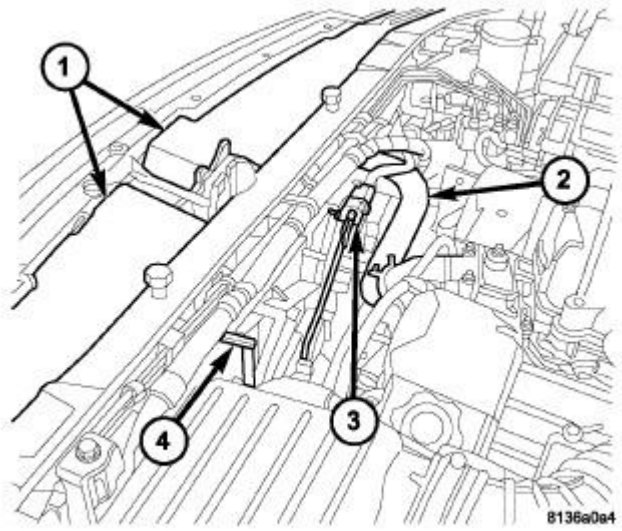

Fig. 72: Upper Radiator Closure Panel, Hose, Radiator Fan Electrical Connector & Fan Assembly

1 - UPPER RADIATOR CLOSURE PANELS
2 - UPPER RADIATOR HOSE
3 - RADIATOR FAN ELECTRICAL CONNECTOR
4 - RADIATOR FAN ASSEMBLY

72. Install the upper radiator hose (2).

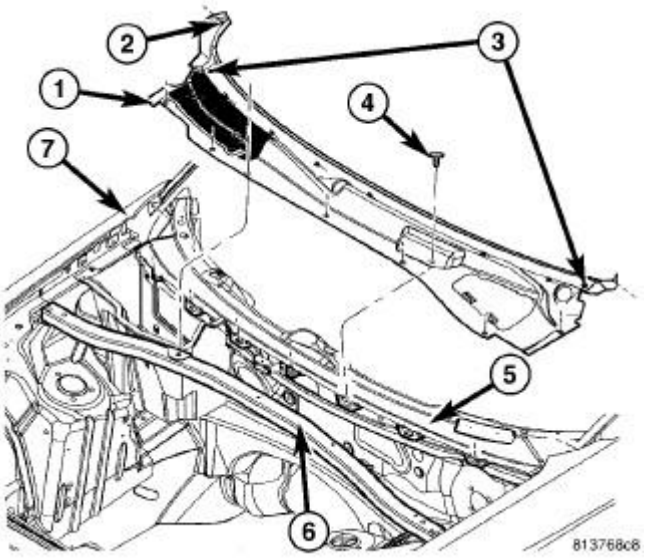

Fig. 73: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

73. Install the strut tower support (6) and tighten bolts to 38 N.m (28 ft. lbs.).
74. Install the cowl panel cover (1). Refer to **COVER, COWL PANEL, INSTALLATION** .
75. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
76. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

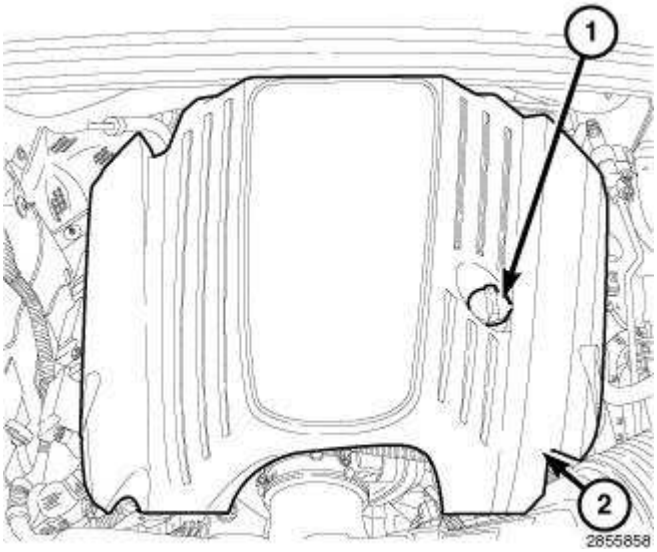

Fig. 74: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

77. Position the engine cover (2) and secure the retaining grommets onto the ball studs.

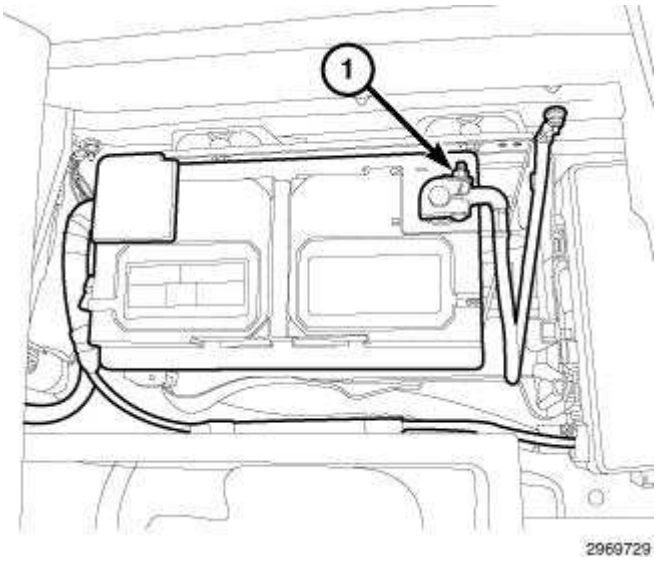

Fig. 75: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

78. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).
79. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD PROCEDURE** .
80. Start the engine and check for leaks.

MDS SYSTEM

DESCRIPTION

DESCRIPTION

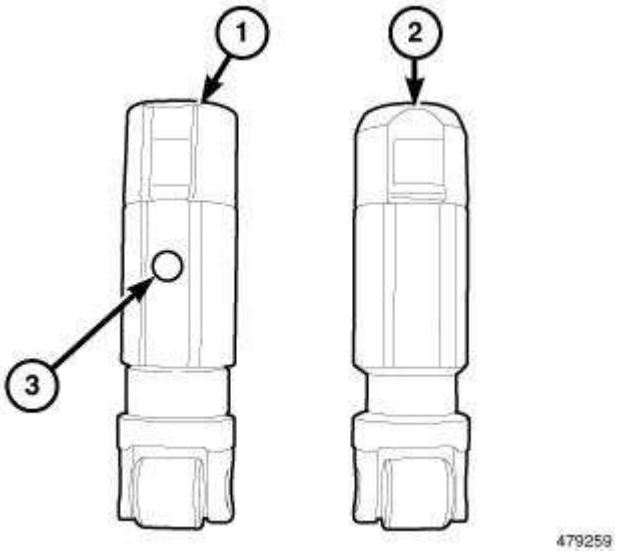

Fig. 76: MDS Lifter
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) selectively deactivates cylinders 1, 4, 6 and 7 during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

The MDS can provide a 5 to 20% fuel economy benefit when operating in four-cylinder mode. Depending on driving habits and vehicle usage. For EPA rating purposes the fuel economy is 8 to 15% higher than if the engine was operating on eight-cylinders at all times.

The MDS deactivating lifter (1) can be distinguished from the non-MDS lifter (2) by the disconnecting pin (3) on the side of the MDS lifter.

MDS is integrated into the basic engine architecture requiring these additional components:

- Unique MDS camshaft
- 8 deactivating roller lifters
- 4 MDS control valve solenoids
- MDS control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

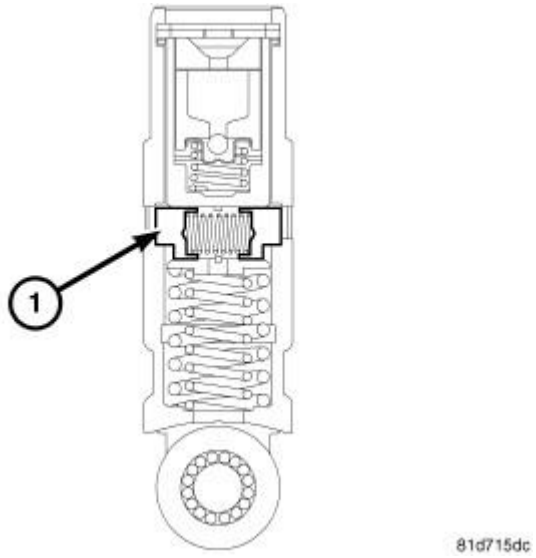

Fig. 77: MDS Lifter Cross Section
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals to provide smooth operation. The MDS selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. All deactivated cylinders have unique hydraulic lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. Oil is delivered through special oil passages

drilled into the cylinder block. The MDS solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each MDS lifter which becomes a lost motion link. The base of the MDS lifter follows the camshaft while the top remains stationary. The MDS lifter is held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No fuel/air enters or leaves during subsequent piston strokes, this high pressure gas is repeatedly compressed and expanded like an air spring.

MDS SYSTEM

DESCRIPTION

DESCRIPTION

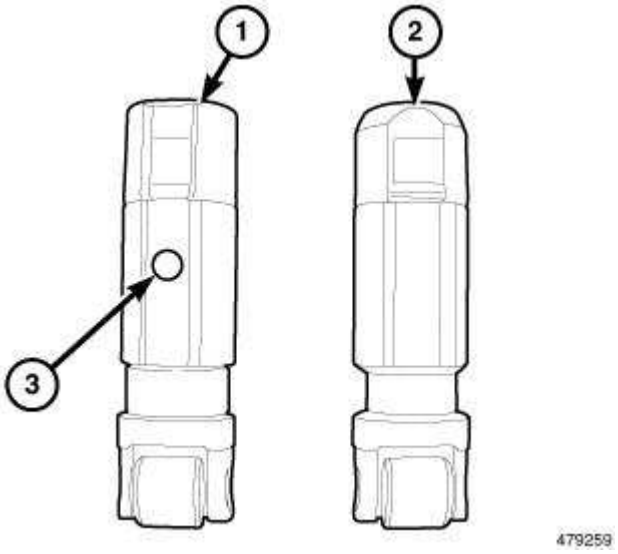

Fig. 78: MDS Lifter

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals to provide smooth operation. The MDS selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. All deactivated cylinders have unique hydraulic lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. Oil is delivered through special oil passages drilled into the cylinder block. The MDS solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each MDS lifter which becomes a lost motion link. The base of the MDS lifter follows the camshaft while the top remains stationary. The MDS lifter is held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition occurs, but the combustion products remain trapped in the cylinder under high

pressure, because the valves no longer open. No fuel/air enters or leaves during subsequent piston strokes, this high pressure gas is repeatedly compressed and expanded like an air spring.

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

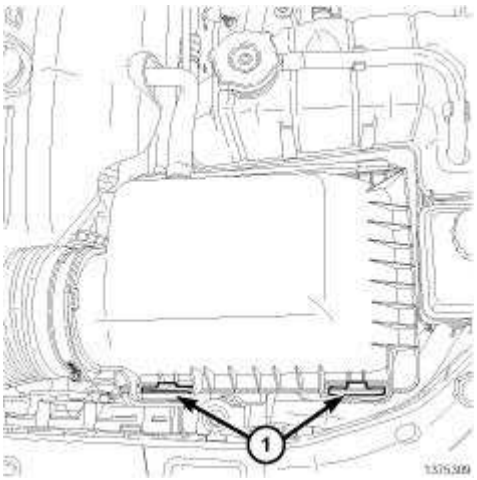

Fig. 80: Air Cleaner Retaining Clamps
Courtesy of CHRYSLER GROUP, LLC

1. Disengage the two retaining clamps (1) and lift the cover upwards.
2. Remove the air cleaner element from the inside of the air cleaner housing.

INSTALLATION

INSTALLATION

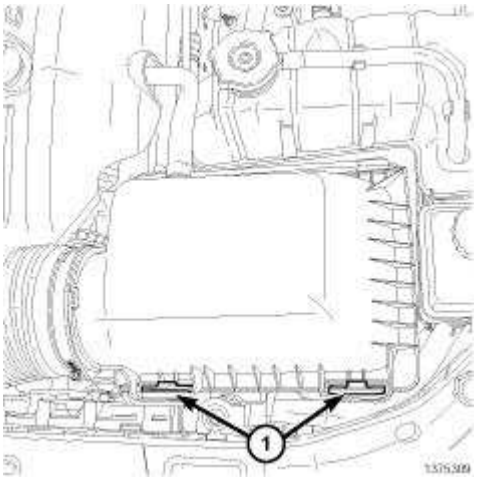

Fig. 81: Air Cleaner Retaining Clamps
Courtesy of CHRYSLER GROUP, LLC

1. Clean any dirt or foreign matter from the inside of the air cleaner housing.

NOTE: The air cleaner element must be properly seated for the air cleaner housing cover to fit correctly.

2. Install the air cleaner element into the air cleaner housing.
3. Position the air cleaner housing cover in place and secure the two retainer clips (1).

BODY, AIR CLEANER

REMOVAL

REMOVAL

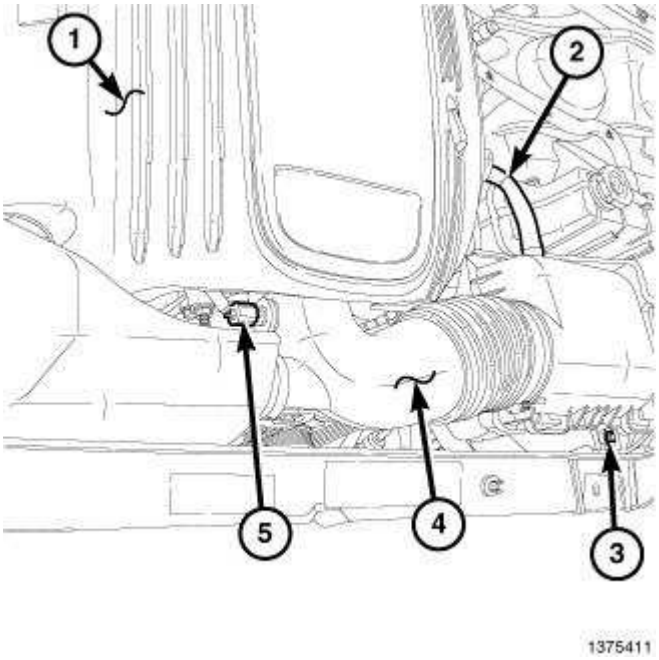

Fig. 82: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).
2. Disconnect the intake air temperature (IAT) sensor (5) electrical connector.
3. Loosen the air duct retaining clamps at the throttle body and the air cleaner housing and remove the air duct (4).
4. Disconnect the make up air hose (MUA) (2).
5. Remove the air cleaner housing retaining bolt (3).
6. Remove the air cleaner housing from the vehicle.

INSTALLATION

INSTALLATION

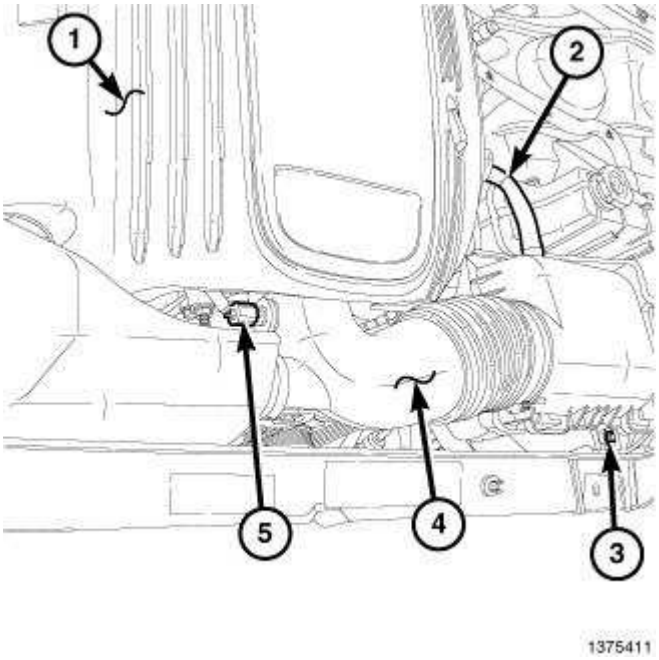

Fig. 83: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the air cleaner housing into the engine compartment.
2. Install the air cleaner housing retaining bolt (3) and tighten to 5 N.m (44 in. lbs.).
3. Connect the air duct to the throttle body and the air cleaner housing and tighten clamps to 3 N.m (30 in. lbs.).
4. Connect the make up air hose (MUA) (2).
5. Connect the intake air temperature (IAT) sensor (5) electrical connector.
6. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

CYLINDER HEAD

OPERATION

OPERATION

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
  - Loss of engine power
  - Engine misfiring
  - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
  - Engine overheating
  - Loss of coolant
  - Excessive steam (white smoke) emitting from exhaust
  - Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in the **CYLINDER COMPRESSION PRESSURE LEAKAGE** Test in this information. An engine cylinder head gasket leaking between adjacent cylinders will results in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: Use extreme care when the engine is operating with the coolant pressure cap removed. Failure to follow these instructions may result in possible serious or fatal injury.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

CAUTION: With the cooling system tester in place, pressure builds up fast. Excessive pressure built up by continuous engine operation must be released to a safe pressure point. Never permit pressure to exceed 138 Kpa (20 psi).

Install the Cooling System Tester (special tool #7700, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If the gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using the Bloc-Chek Kit (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform the test following the procedures supplied with the tool kit.

REMOVAL

REMOVAL

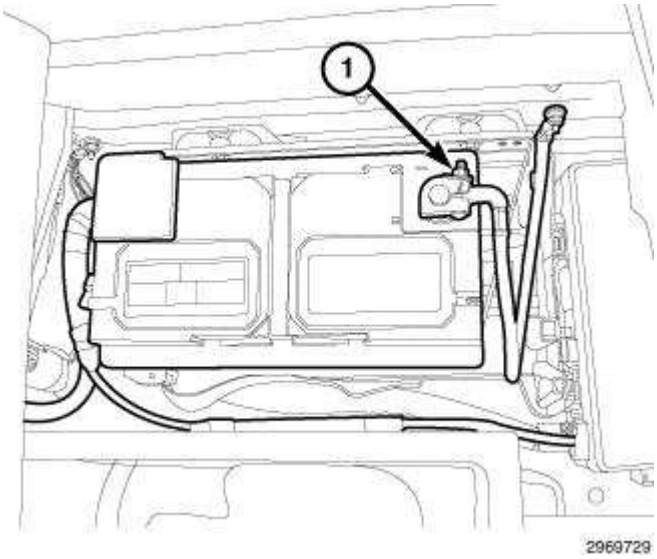

Fig. 84: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the negative battery cable (1).

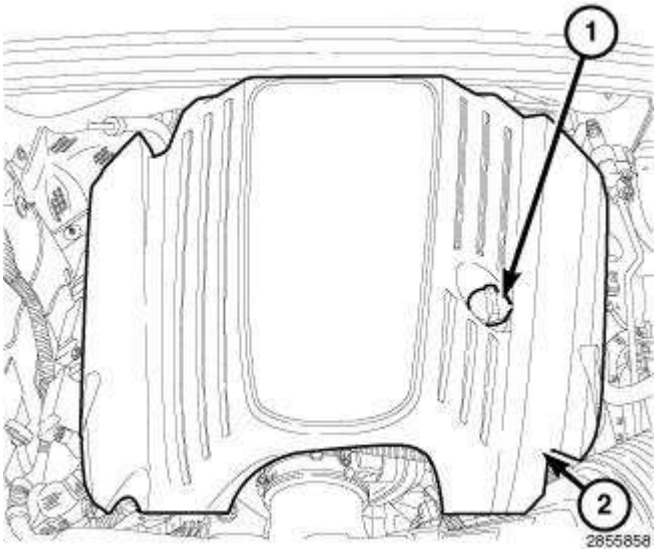

Fig. 85: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).

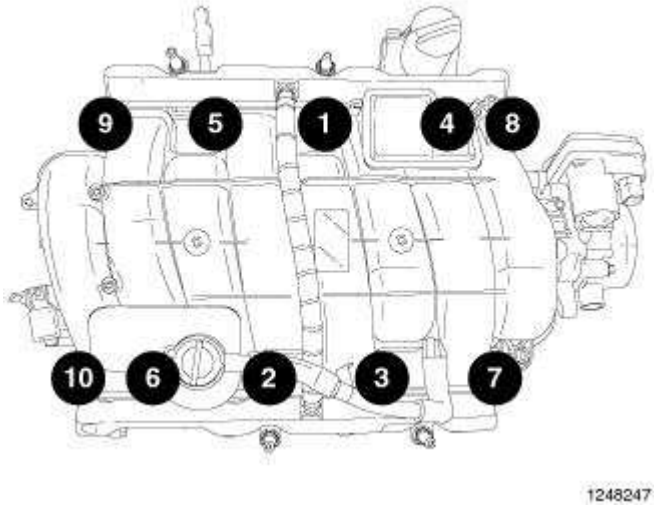

Fig. 86: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

3. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.

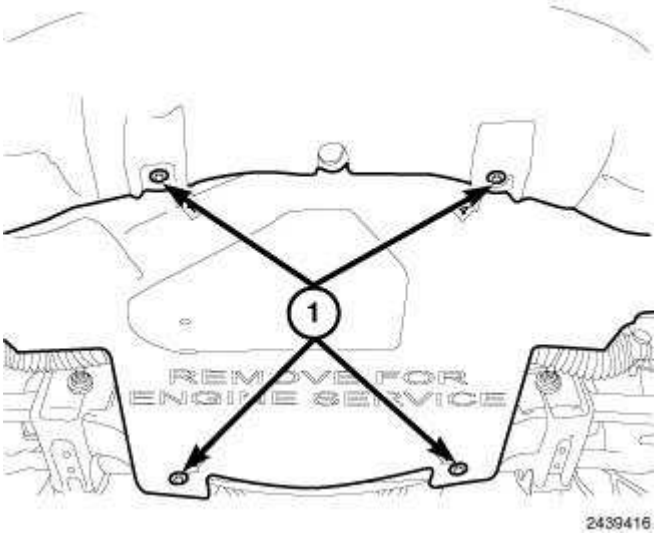

Fig. 87: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

5. Remove the belly pan retainers (1) and remove the belly pan.
6. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

CAUTION: When separating the catalytic converters from the manifolds, disconnect the oxygen sensor connectors. Allowing the catalytic converters hanging from the oxygen sensor wires damages the harness and/or sensors.

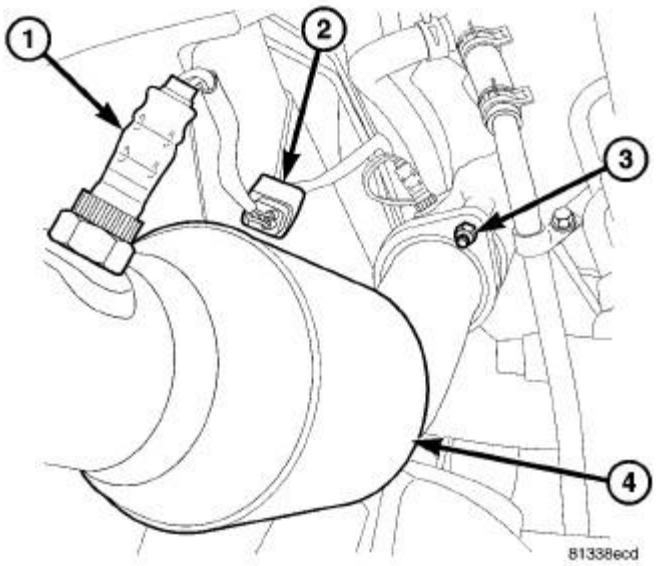

Fig. 88: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

7. Disconnect all oxygen sensor electrical connectors (2).
8. Saturate all exhaust bolts and nuts (3) with Mopar® Rust Penetrant. Allow five minutes for penetration.
9. Remove the both catalytic converter to manifold flange nuts (3) and separate the catalytic converters (4) from the exhaust manifolds.
10. Lower the vehicle.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

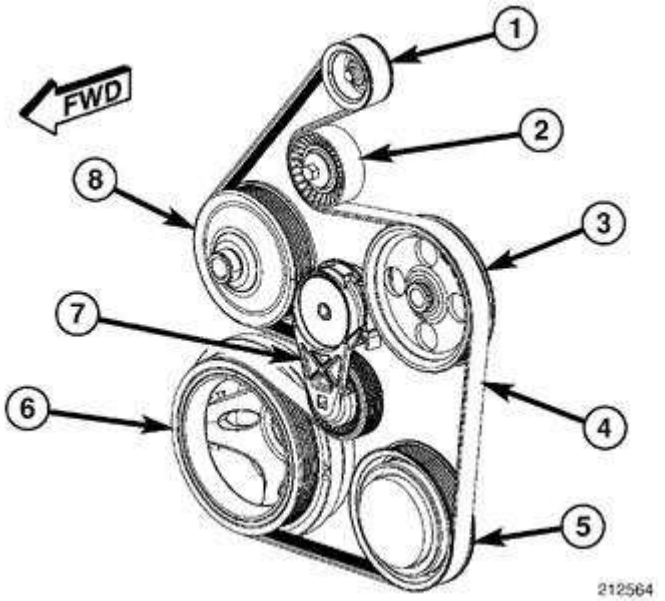

Fig. 89: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.

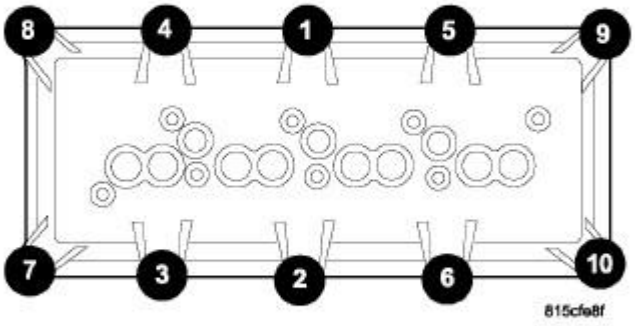

Fig. 90: Cylinder Head Cover Removal/Tightening Sequence
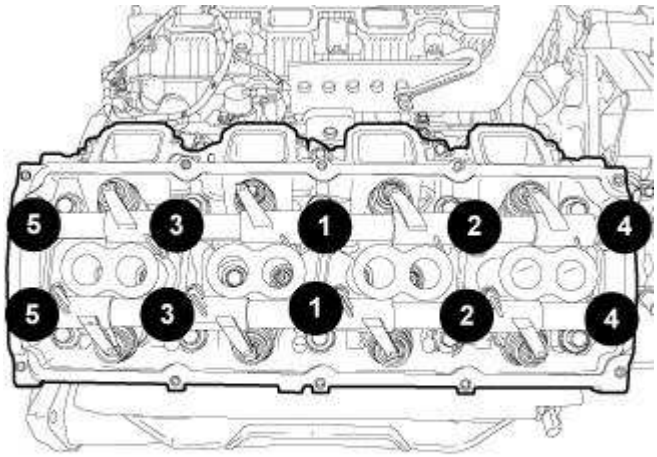
Courtesy of CHRYSLER GROUP, LLC

12. Using the sequence shown in illustration, remove the cylinder head cover retaining bolts and remove cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL, 5.7L**.

13. If removing the right cylinder head, remove the engine oil dip stick tube retaining nut at the exhaust manifold and remove the oil dip stick tube.



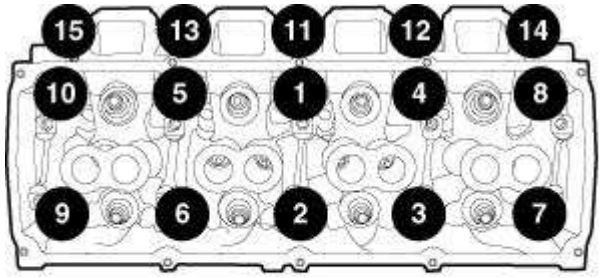
921225

Fig. 91: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Pushrods and rocker arm assemblies must be installed in their original locations or engine damage could result.

NOTE: Make sure to identify the original location of the rocker arms and push rods for correct assembly.

14. Remove the rocker arms and pushrods. Refer to **ROCKER ARM, VALVE, REMOVAL, 5.7L**.



88745

Fig. 92: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

NOTE: It is not necessary to remove the exhaust manifolds to remove the cylinder heads.

15. Using the sequence shown in illustration, remove the cylinder head bolts and remove the cylinder head(s).
16. Discard the cylinder head gasket (1).
17. Inspect and clean the cylinder head (2) mating surface.

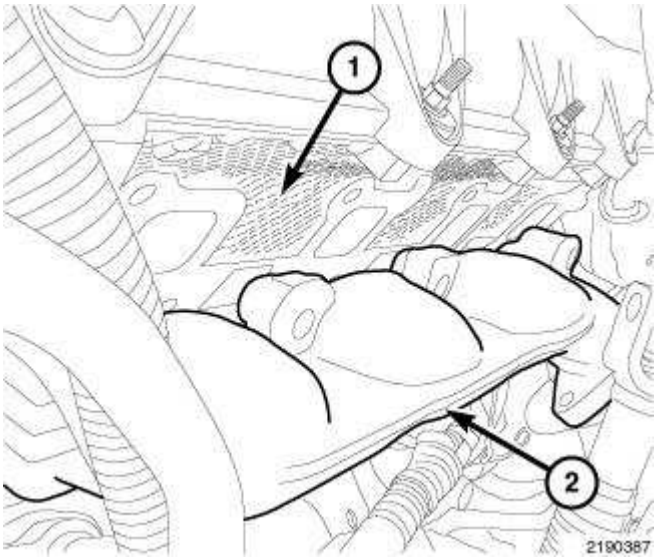


Fig. 93: Locating Exhaust Manifold & Gasket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

18. If necessary, using the sequence shown in illustration, remove the exhaust manifold bolts and remove the manifold.

CLEANING

CLEANING

Clean all sealing surfaces of the cylinder block and cylinder heads using Mopar® Brake Parts Cleaner (or equivalent).

INSPECTION

INSPECTION

1. Inspect the cylinder head for out-of-flatness using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.

3. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
4. Inspect the pushrods. Replace worn or bent pushrods.

INSTALLATION

INSTALLATION

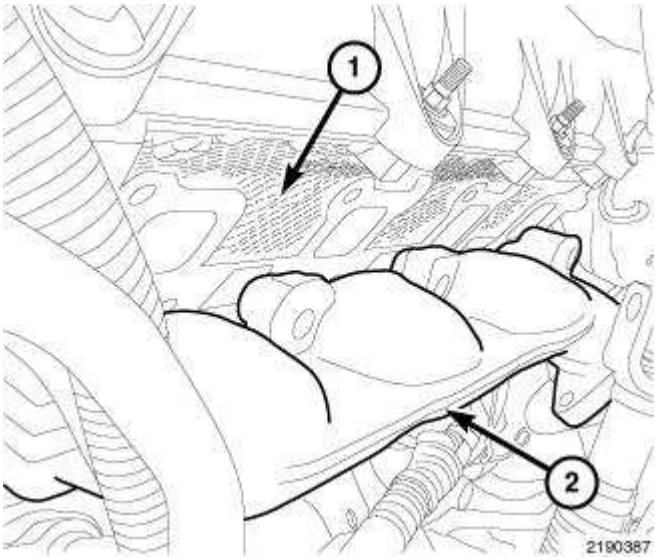

Fig. 94: Locating Exhaust Manifold & Gasket
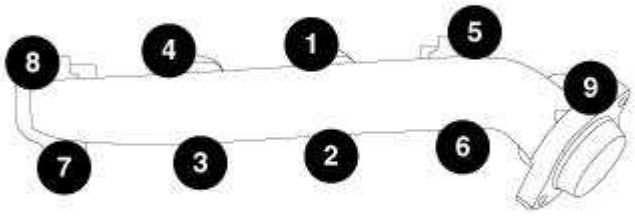
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

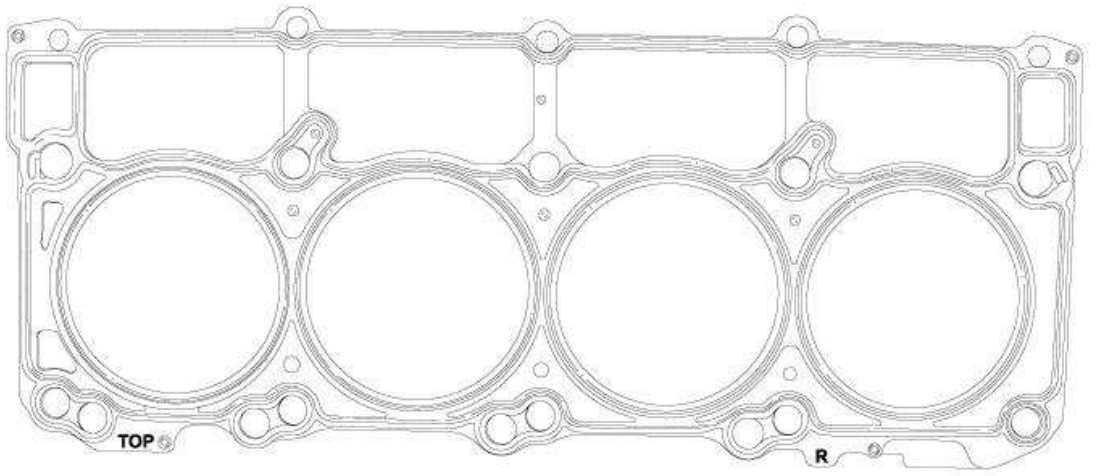
1. If replacing the cylinder head, transfer the valves, valve seals and valve springs to the new cylinder head. Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION, 5.7L**. If valve refacing is necessary, refer to **Engine/Cylinder Head/VALVES, Intake and Exhaust - Standard Procedure**.
2. If replacing the cylinder head, transfer the spark plugs to the new cylinder head. Refer to **SPARK PLUG, INSTALLATION** .



2463854

Fig. 95: Removing/Installing Bolts/Studs From Exhaust Manifold In Sequence
Courtesy of CHRYSLER GROUP, LLC

3. If replacing the cylinder head, transfer the exhaust manifold to the new cylinder head using a new gasket.
4. Using the sequence shown in illustration, tighten the exhaust manifold bolts/studs to 25 N.m (18 ft. lbs.).



983987

Fig. 96: Cylinder Head Gasket Markings
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head gaskets are not interchangeable between the left and right sides. They are marked with an "L" and "R" to indicate the left or right side and they are marked "TOP" to indicate which side goes up.

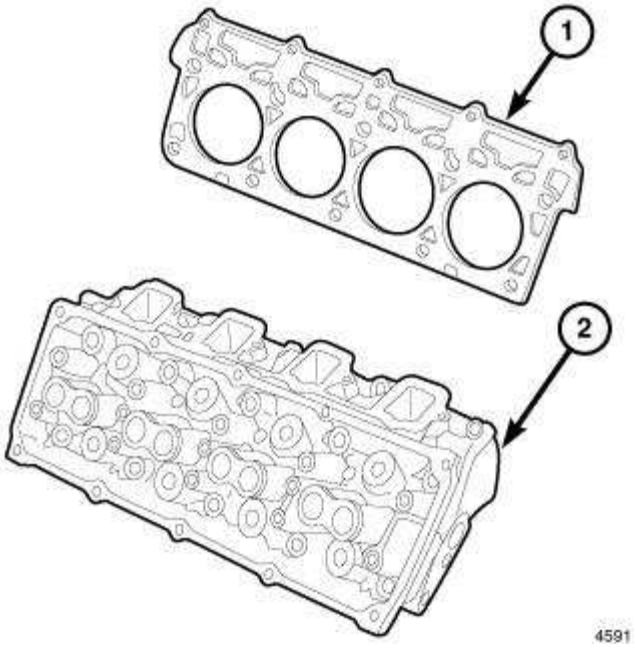


Fig. 97: Cylinder Head & Gasket
Courtesy of CHRYSLER GROUP, LLC

5. Clean all gasket sealing surfaces of the cylinder block and cylinder heads using a suitable solvent.

NOTE: Left side shown in illustration, right side similar.

6. Position the new cylinder head gaskets (5) onto the cylinder block.
7. Position the cylinder heads (4) onto the head gaskets (5) and the cylinder block.

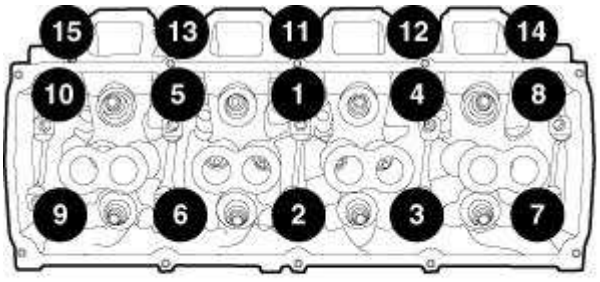

Fig. 98: Cylinder Head Bolt Removal & Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

8. Using the sequence shown in illustration, tighten the cylinder head bolts 1 through 10 to 34 N.m (25 ft. lbs.).
9. Using the sequence shown in illustration, tighten the cylinder head bolts 11 through 15 to 20 N.m (15 ft. lbs.).
10. Using the sequence shown in illustration, tighten the cylinder head bolts 1 through 10 to 54 N.m (40 ft. lbs.).
11. Using the sequence shown in illustration, tighten the cylinder head bolts 11 through 15 to 20 N.m (15 ft. lbs.).
12. Using the sequence shown in illustration, rotate the cylinder head bolts 1 through 10 an additional 90° turn.
13. Using the sequence shown in illustration, tighten the cylinder head bolts 11 through 15 to 34 N.m (25 ft. lbs.).

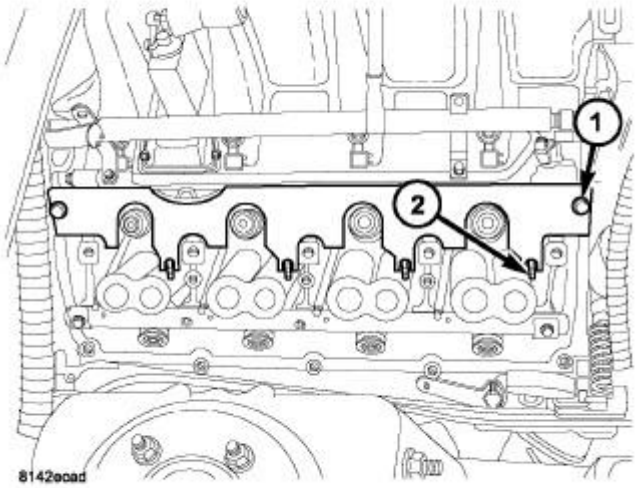

Fig. 99: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

14. Install the push rods and rocker arm assemblies in their original position, using Pushrod Retainer (special tool #9070, Retainer, Push Rod) (1). Refer to **ROCKER ARM, VALVE, INSTALLATION, 5.7L**.
15. If Install the right cylinder head, position the engine oil dip stick tube and install the retaining nut at the exhaust manifold.

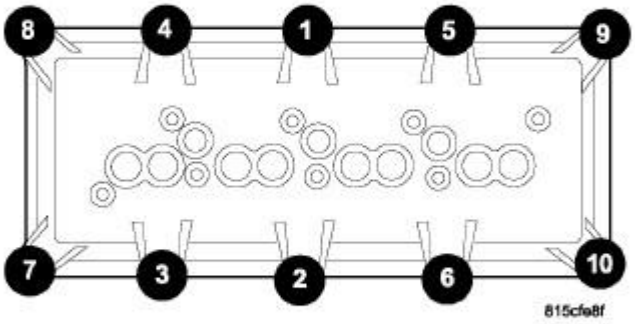

Fig. 100: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

16. Position the cylinder head covers (1), using the sequence shown in illustration, tighten the retaining bolts to 8 N.m (70 in. lbs.).

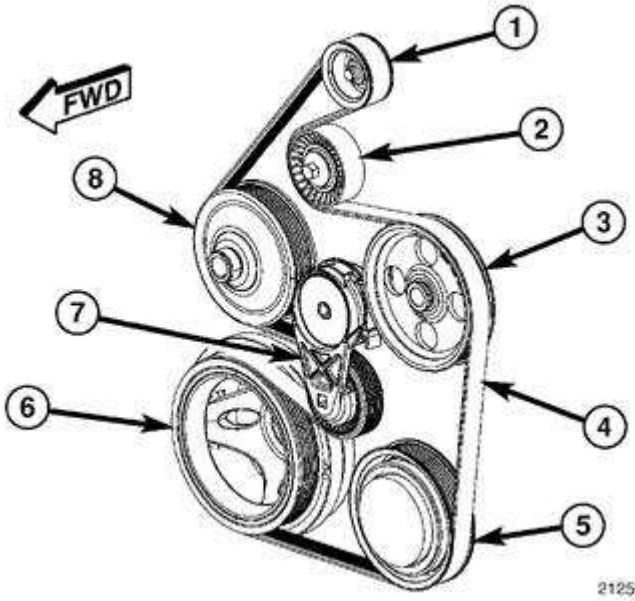

Fig. 101: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

17. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and install the accessory drive belt (2) onto the pulleys, then slowly release the tensioner.

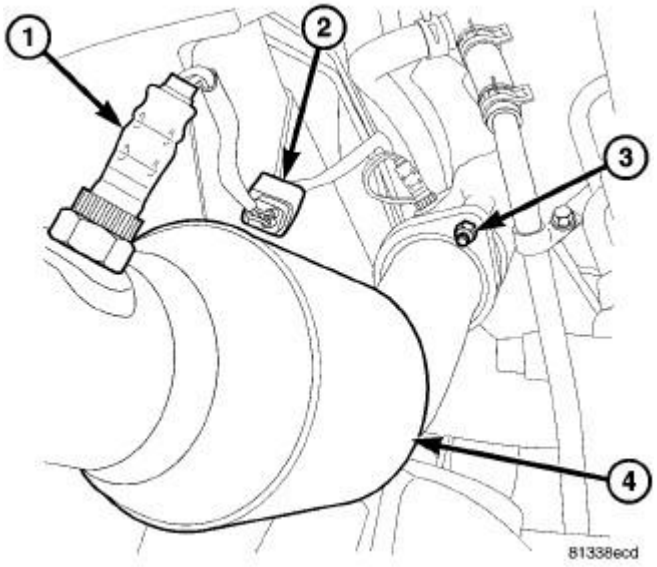

Fig. 102: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

18. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
19. Position the catalytic converters (4) onto the exhaust manifold flanges, install the flange nuts (3) and tighten to 41 N.m (30 ft. lbs.).
20. Connect the oxygen sensor electrical connectors (2).

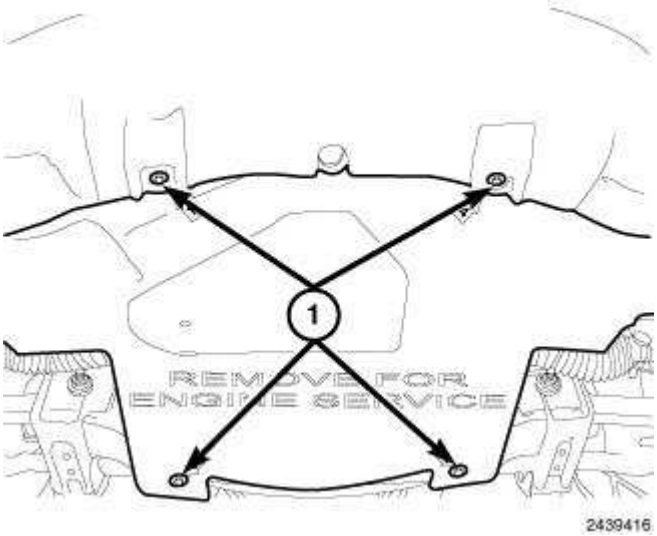

Fig. 103: Lower Splash Shield & Fasteners

Courtesy of CHRYSLER GROUP, LLC

21. Position the belly pan and install the belly pan retainers (1).
22. Lower the vehicle.

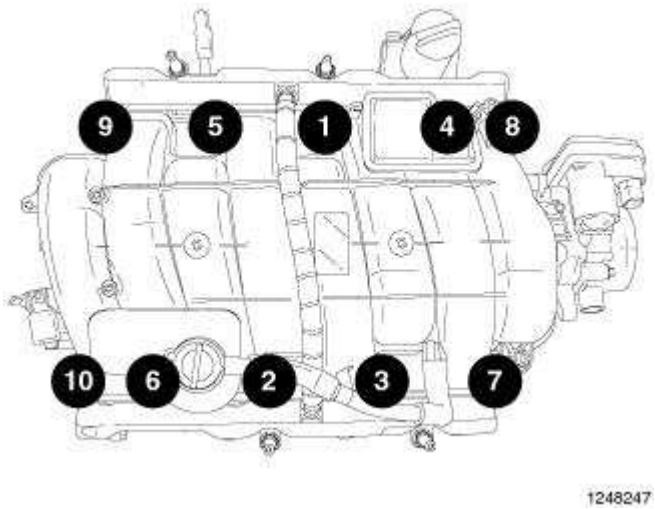

Fig. 104: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the intake manifold and throttle body as an assembly.

23. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.
24. Change the engine oil and oil filter. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
25. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

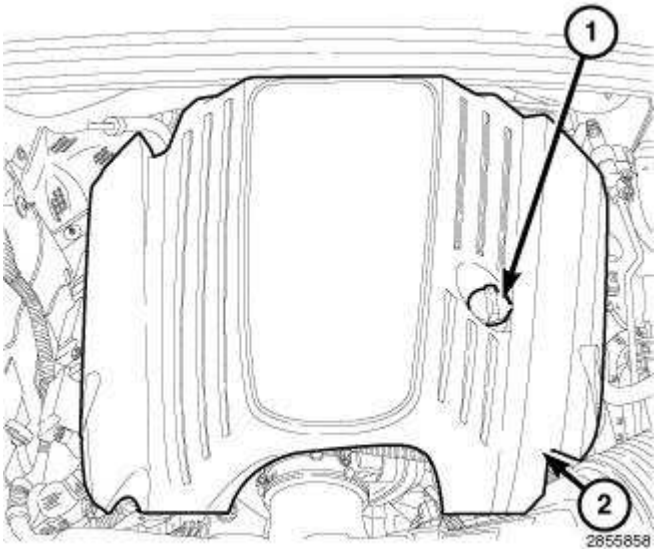

Fig. 105: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

26. Position the engine cover (2) and secure the retaining grommets onto the ball studs.

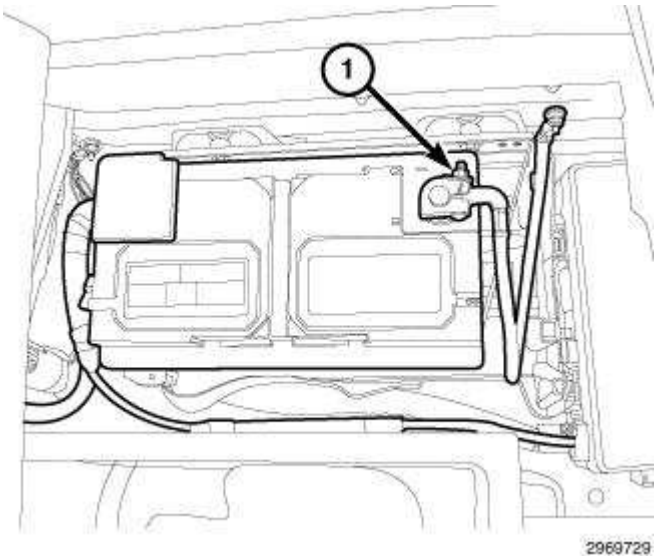

Fig. 106: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

27. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).
28. Start the engine and check for leaks.

COVER(S), CYLINDER HEAD

REMOVAL

REMOVAL

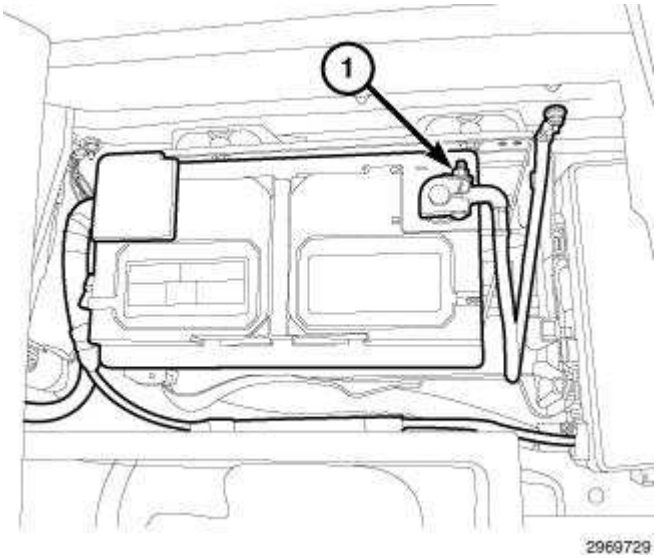

Fig. 107: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Remove the engine cover.

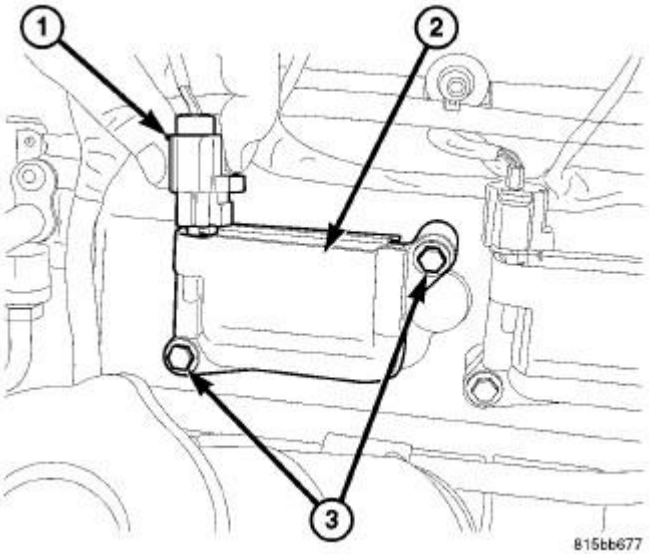

Fig. 108: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the ignition coil electrical connectors (1).
4. Remove the ignition coil retaining bolts (3) and remove the ignition coils (2).

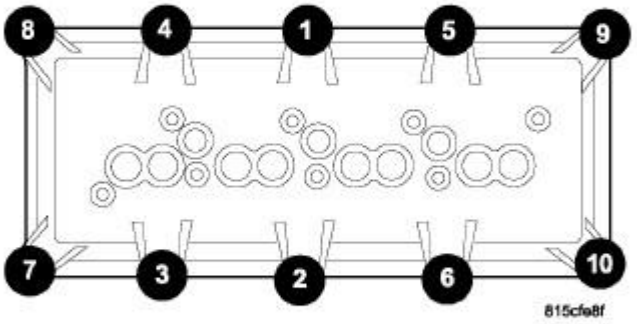

Fig. 109: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Using the sequence shown in illustration, remove the cylinder head cover retaining bolts.

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

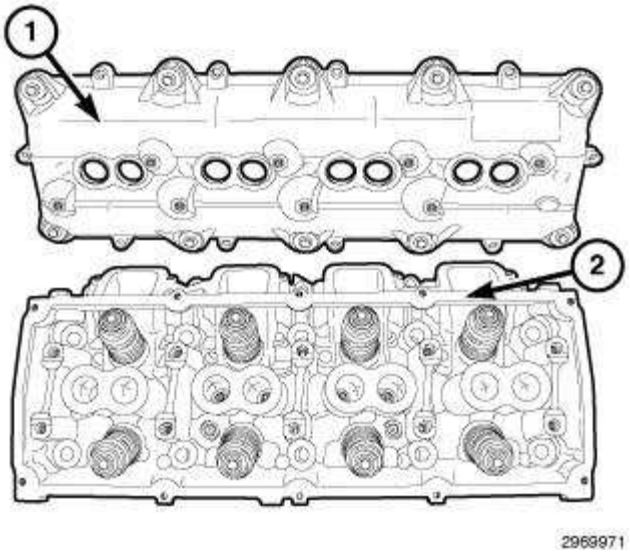

Fig. 110: Cylinder Head & Cover
Courtesy of CHRYSLER GROUP, LLC

6. Remove the cylinder head cover (1).

7. Clean the sealing surface of the cylinder head (2).

NOTE: The cylinder head cover gasket may be used again, provided no cuts, tears, or deformation have occurred.

INSTALLATION

INSTALLATION

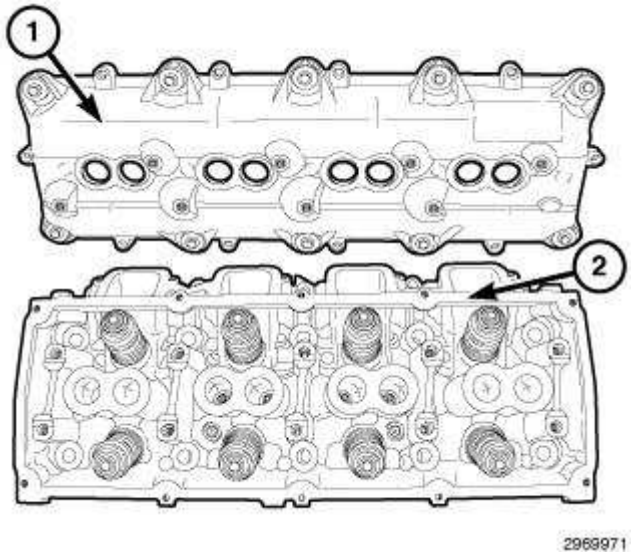

Fig. 111: Cylinder Head & Cover
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: Do not allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

NOTE: The cylinder head cover gasket may be used again, provided no cuts, tears, or deformation have occurred.

1. Clean cylinder head cover (1) and sealing surfaces (2). Inspect and replace the cylinder head cover gasket if necessary.
2. Install cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location.

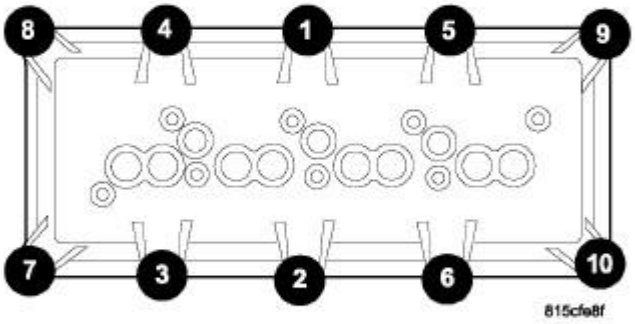

Fig. 112: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Using the sequence shown in illustration, tighten the cylinder head cover bolts and double ended studs to 8 N.m (70 in. lbs.).

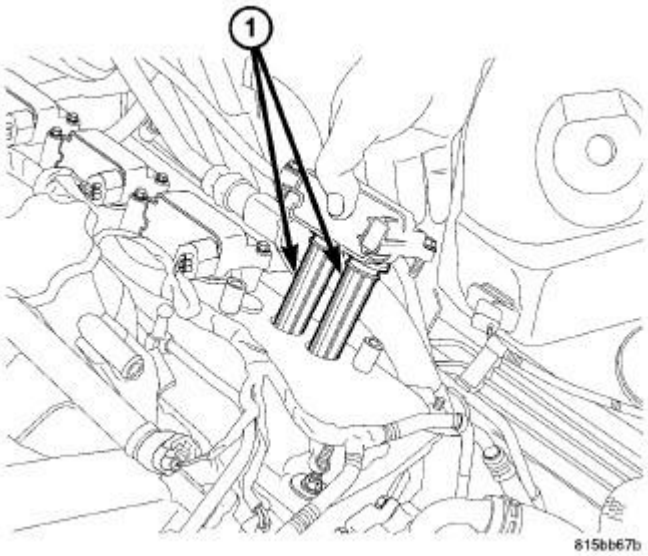

Fig. 113: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

4. Before installing the ignition coils, apply dielectric grease to the inside of spark plug boots (1).
5. Install the ignition coils.

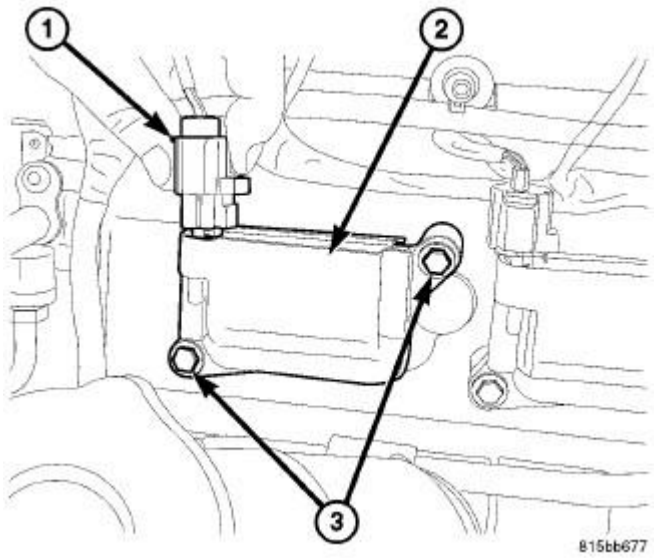

Fig. 114: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the ignition coil retaining bolts (3) to 7 N.m (62 in. lbs.).
7. Connect the ignition coil electrical connectors (1).

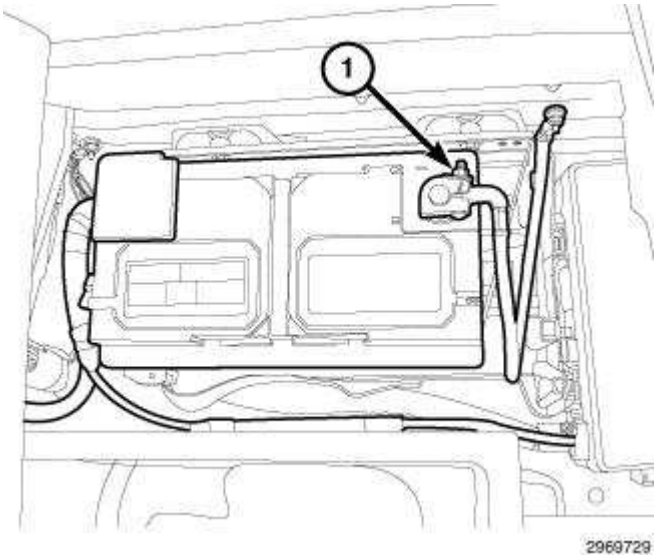

Fig. 115: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

8. Install the engine cover.
9. Connect the negative battery cable (1).

ROCKER ARM, VALVE

REMOVAL

REMOVAL

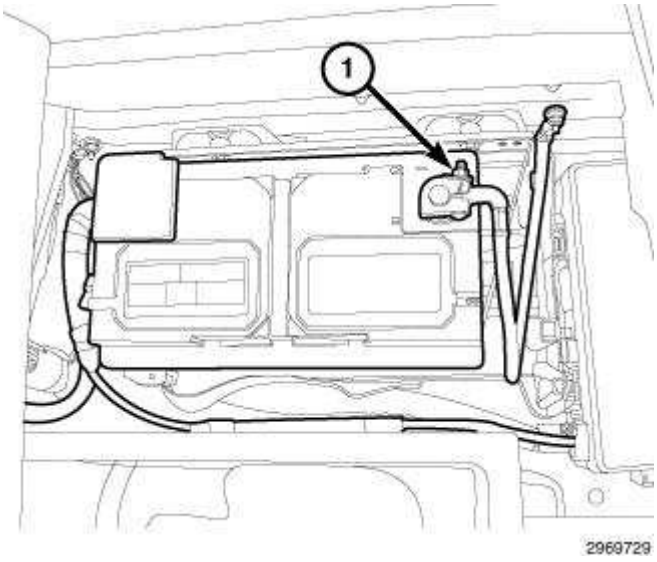

Fig. 116: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).

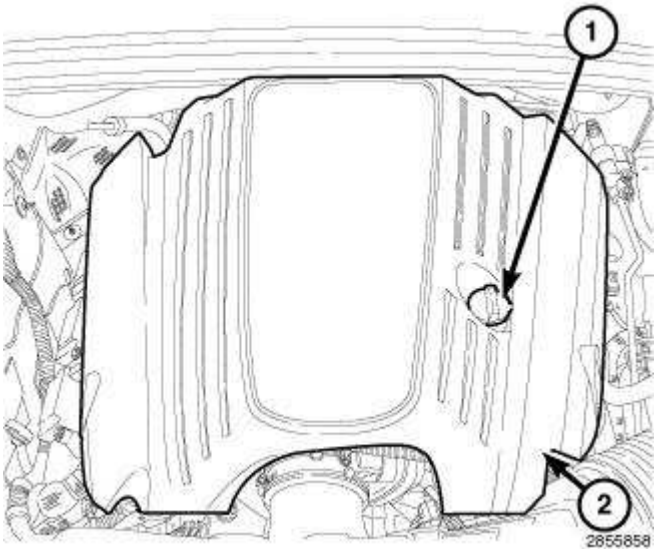

Fig. 117: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (2).

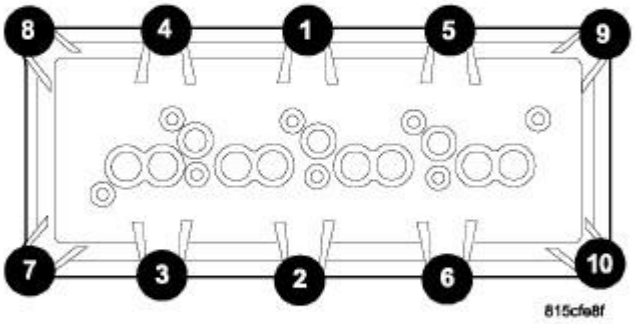

Fig. 118: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL, 5.7L**.

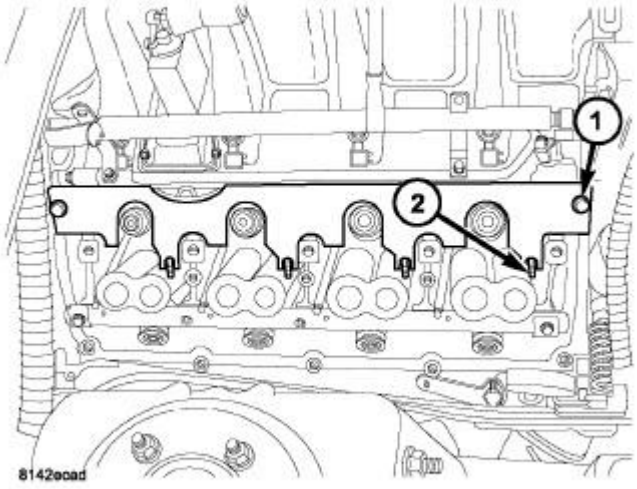

Fig. 119: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

4. Install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1).

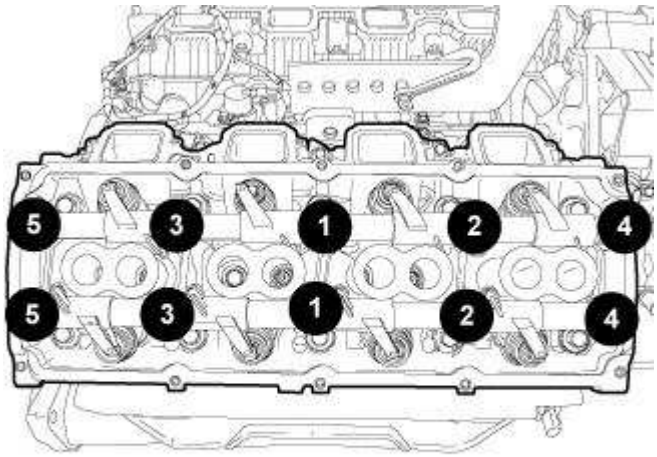

Fig. 120: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Using the sequence shown in illustration, loosen the rocker shafts retaining bolts.

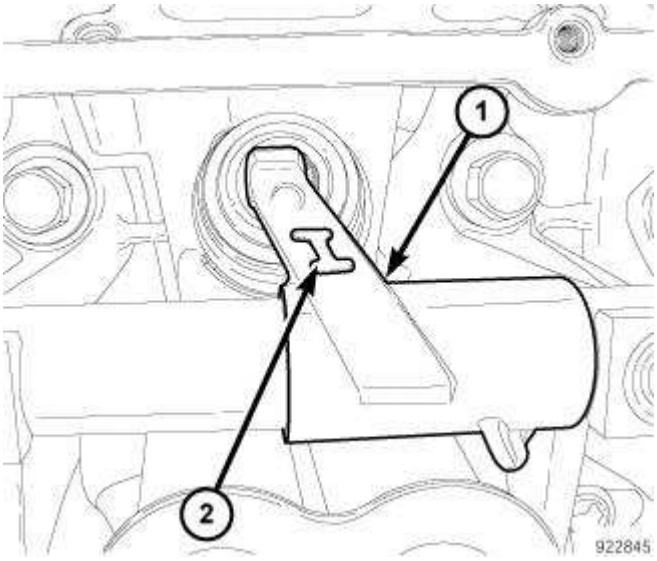

Fig. 121: Intake Rocker Arm Marking
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between the intake and the exhaust, failure to install them in the correct location could result in engine damage. The intake rocker arms (1) are marked with the letter "I" (2).

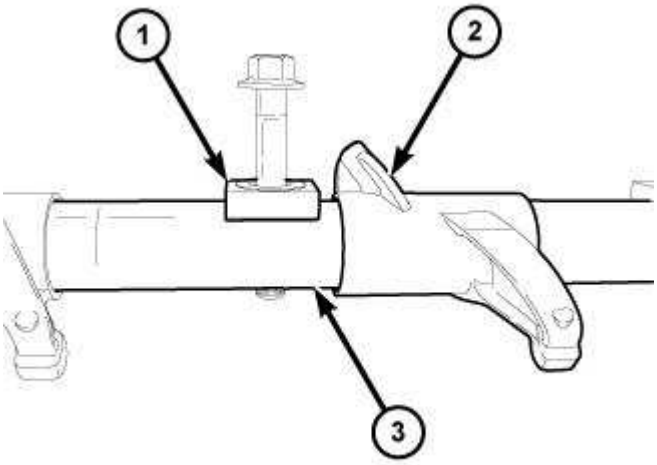

Fig. 122: Retainers, Rocker Arm & Rocker Shaft
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove the retainers (1) from the rocker shaft (3).

6. Remove the rocker shaft (3). Note the rocker shaft location for reassembly.

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

7. Remove the pushrods. Note the pushrod location for reassembly.

INSTALLATION

INSTALLATION

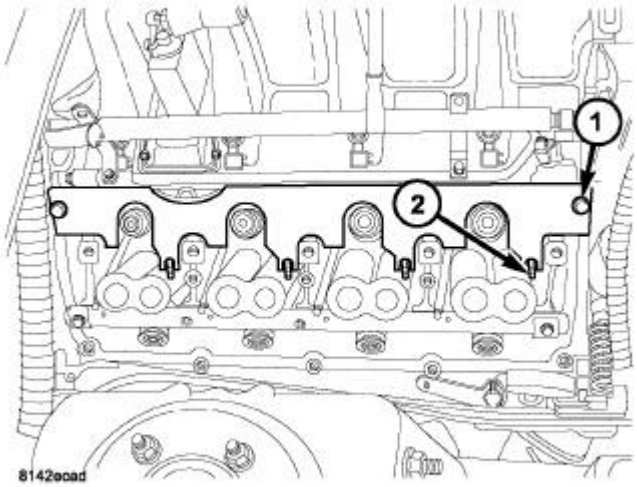

Fig. 123: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

1. Install the pushrods in the same order as removed.
2. Install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1).

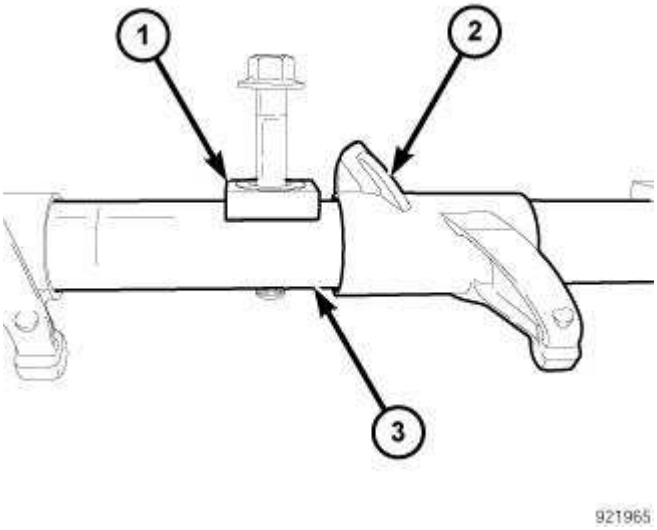

Fig. 124: Retainers, Rocker Arm & Rocker Shaft
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Make sure that the retainers (1) and the rocker arms (2) are not overlapped when tightening bolts or engine damage could result.

CAUTION: Due to the changes in the pushrod clearance holes in the Eagle 5.7L cylinder heads, close attention must be given when installing the pushrod(s) into the tappet(s). Once the pushrod(s) have been installed, use a suitable light to look down through the pushrod hole (s). This will allow you to verify the pushrod(s) are centered properly in the tappet(s) and avoid engine damage. Recheck after the rocker shaft assembly has been installed and tightened to specification.

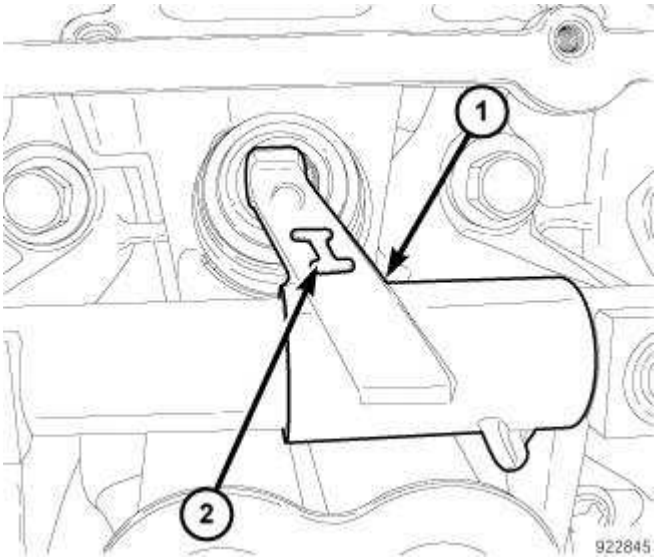

Fig. 125: Intake Rocker Arm Marking
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between the intake and the exhaust, failure to install them in the correct location could result in engine damage. The intake rocker arms (1) are marked with the letter "I" (2).

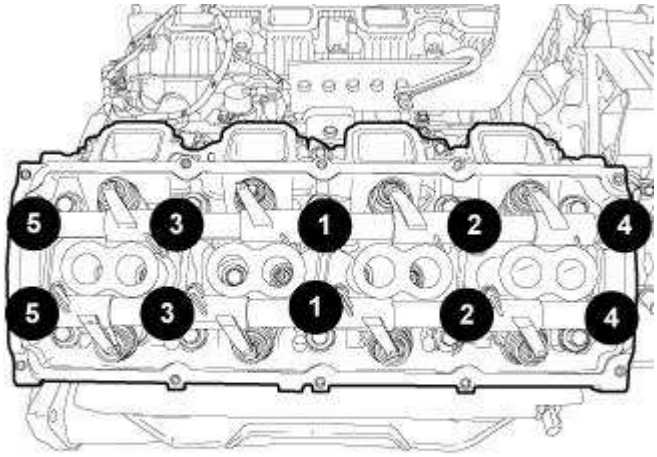

Fig. 126: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Install the rocker shaft assemblies in the same order as removed.
4. Using the sequence shown in illustration, tighten the rocker shaft bolts to 22 N.m (16 ft. lbs.).

CAUTION: Do Not rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about five minutes).

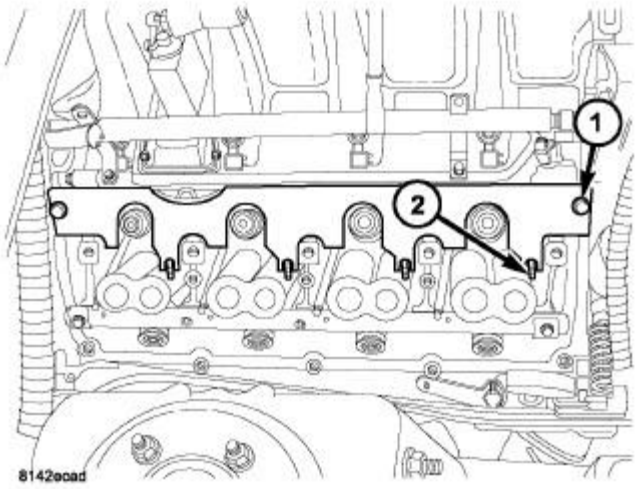

Fig. 127: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

5. Remove pushrod retainer (special tool #9070, Retainer, Push Rod) (1).

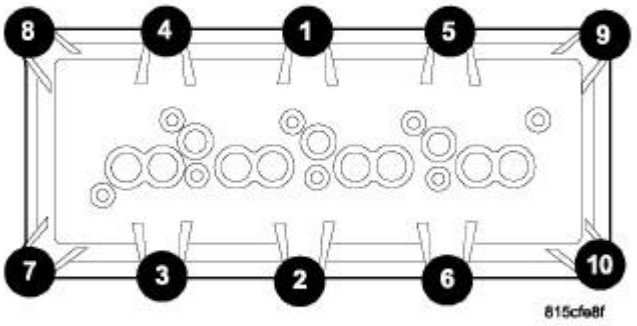

Fig. 128: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION, 5.7L**.

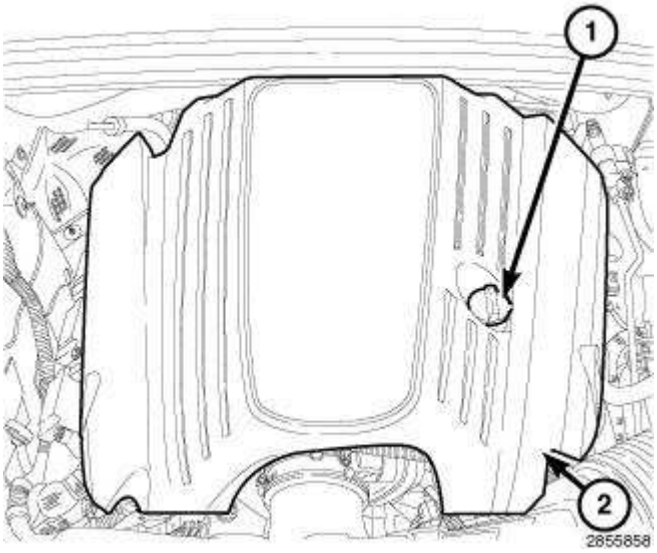

Fig. 129: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine cover (2).

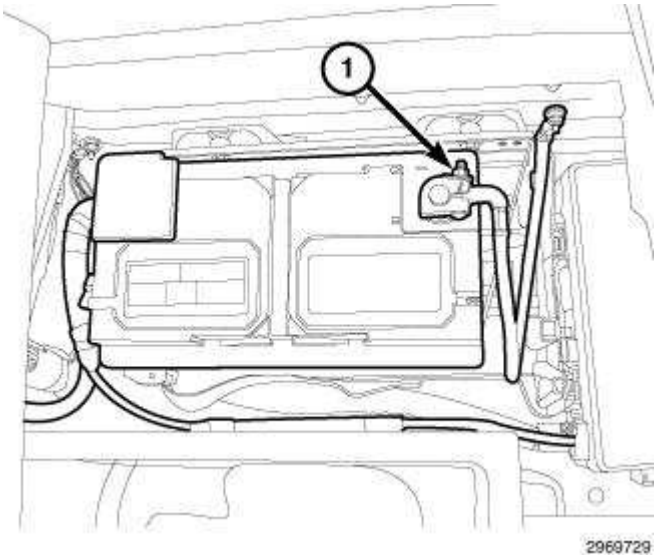

Fig. 130: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

8. Connect the negative battery cable (1).

SEAL(S), VALVE GUIDE

DESCRIPTION

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

SPRING(S), VALVE

REMOVAL

REMOVAL

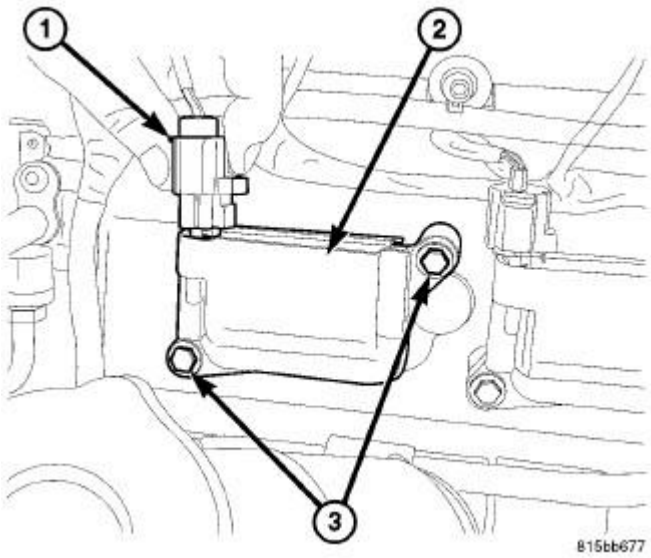

Fig. 131: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the air cleaner assembly and the air intake resonator. Refer to **BODY, AIR CLEANER, REMOVAL, 5.7L**.
3. Remove the ignition coil electrical connectors (1).
4. Remove the ignition coils (2).
5. Remove the spark plugs.

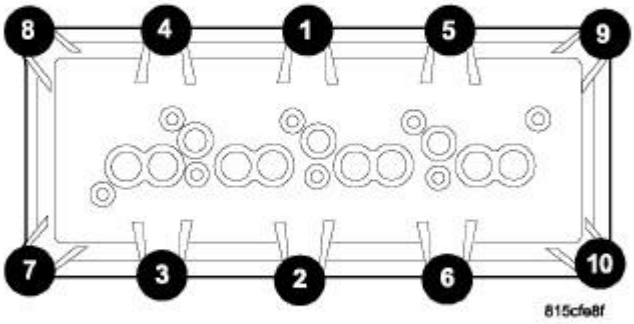

Fig. 132: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Using the sequence shown in illustration, remove the cylinder head cover retaining bolts and remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL, 5.7L**.

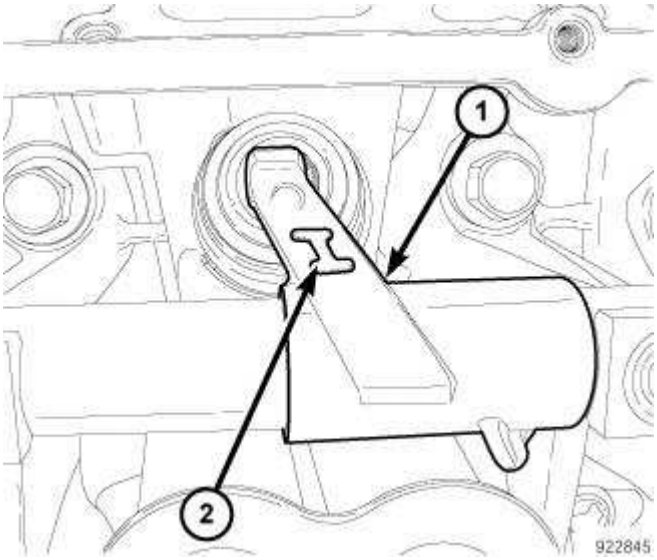

Fig. 133: Intake Rocker Arm Marking
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between the intake and the exhaust, failure to install them in the correct location could result in engine damage. The intake rocker arms (1) are marked with the letter "I" (2).

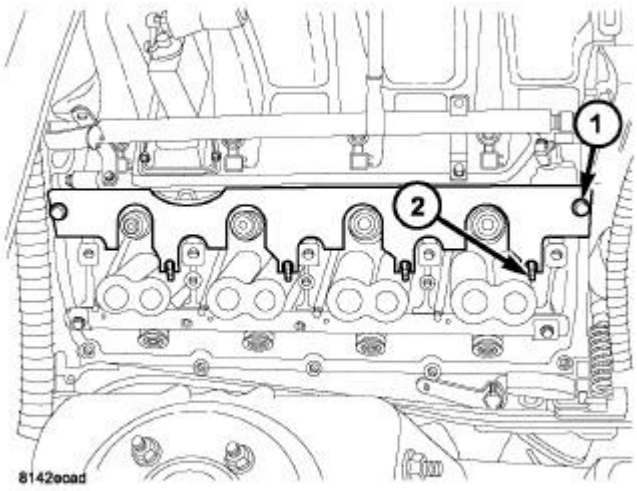

Fig. 134: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The piston must be at TDC and both valves closed on the cylinder to be serviced.

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

NOTE: Pushrods must be installed in the same order as removed.

NOTE: If removing the intake valve spring, install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1).

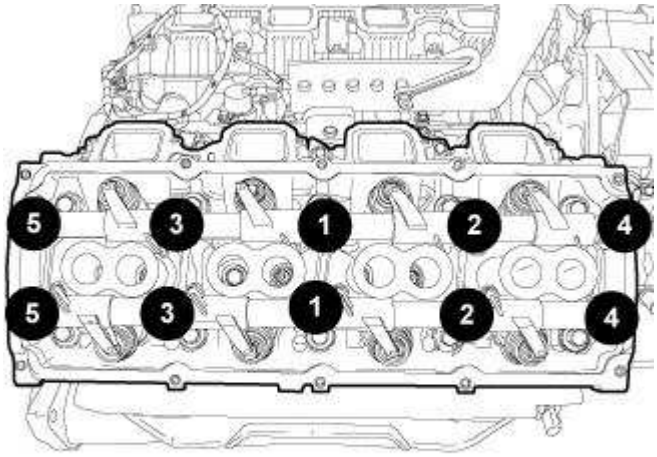

Fig. 135: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Using the sequence shown in illustration, remove the exhaust/intake rocker arm shaft retaining bolts.

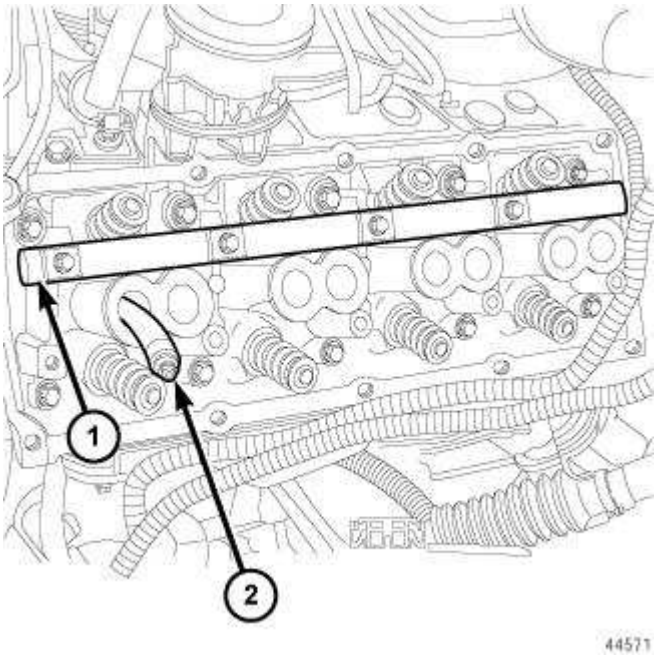

Fig. 136: Rocker Arm Valve Spring Compressor Shaft & Air Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: Tap the top of the valve spring retainer to loosen the spring retainers locks.

8. Install the rocker arm valve spring compressor shaft (special tool #9065B, Compressor, Valve

Spring) (1).

9. Install the spring compressor adapter arm (special tool #9065B, Compressor, Valve Spring) if needed.
10. Insert an air hose (2) into the spark plug hole and charge the cylinder with air.

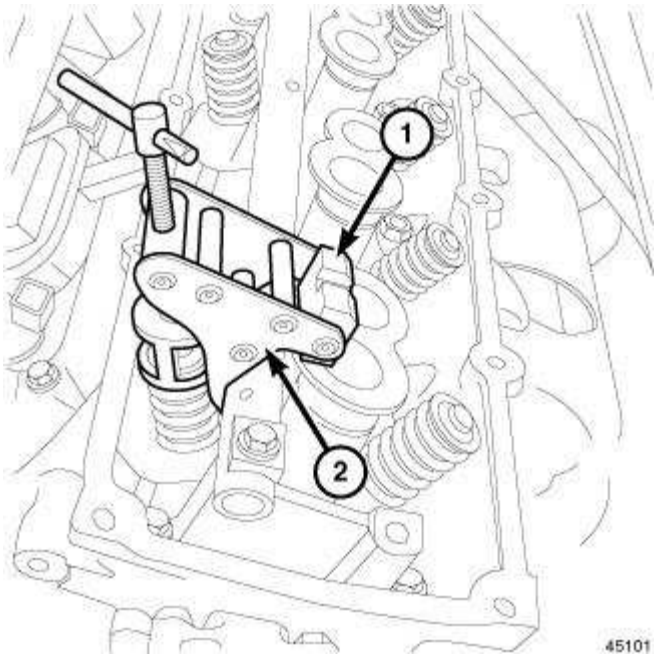

Fig. 137: Intake Valve Spring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: A fulcrum assembly (1) must be rotated to the appropriate setting as marked on the tool for proper valve spring alignment.

NOTE: Tap the top of the valve spring retainer to loosen the spring retainers locks.

11. Compress the valve spring with valve spring compressor (1) and remove the valve retainer locks.
12. Release the spring compressor and remove valve spring.

NOTE: All valve springs and seals are removed in the same manner and are interchangeable between intake and exhaust.

13. Remove the valve seal.

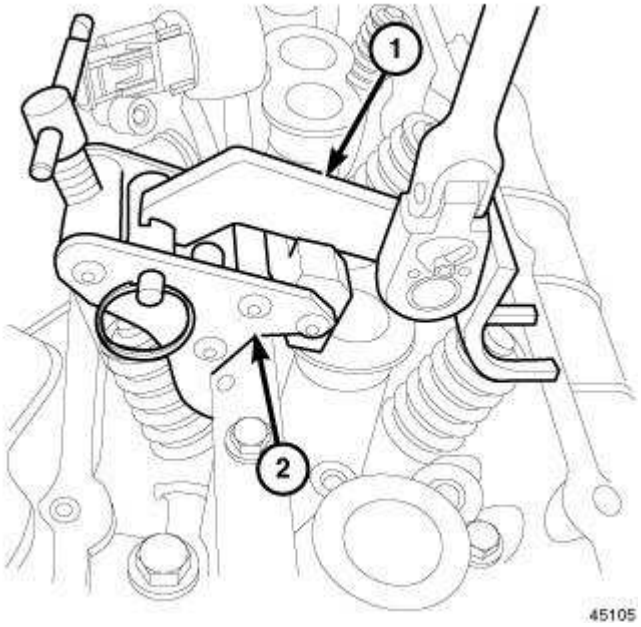

Fig. 138: Valve Spring Tool & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the exhaust spring, seal or valve needs servicing. The exhaust adapter arm (1) must be installed to the spring compressor clamp (3).

14. Install tool (special tool #9065B, Compressor, Valve Spring), exhaust adapter arm (1) to the spring compressor (3) for servicing the exhaust side.

INSTALLATION

INSTALLATION

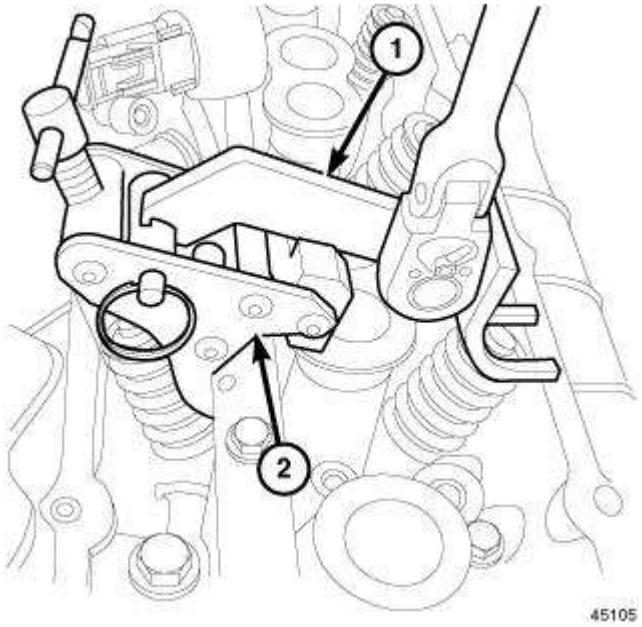

Fig. 139: Valve Spring Tool & Adapter
Courtesy of CHRYSLER GROUP, LLC

1. Install the valve seal.
2. Install the valve spring.
3. Using the valve spring compressor (special tool #9065B, Compressor, Valve Spring) (1), compress the valve spring and install the valve spring retainer and locks.
4. Remove the exhaust extension arm (1).

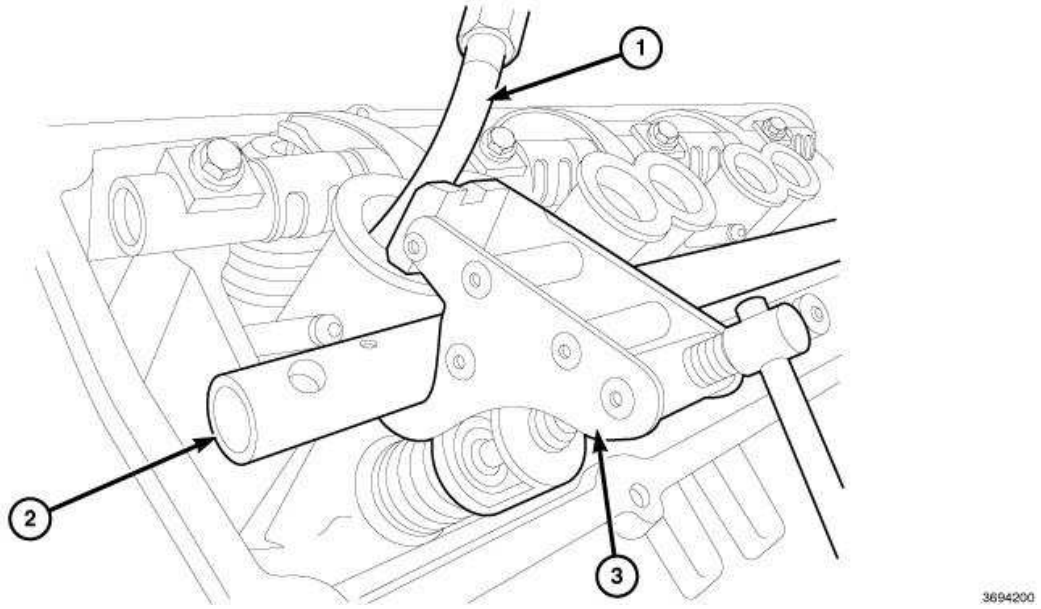

Fig. 140: Air Charge, Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

5. Remove the spring compressor (3).
6. Remove the air hose from the spark plug hole.

NOTE: All valve springs and seals are installed in the same manner.

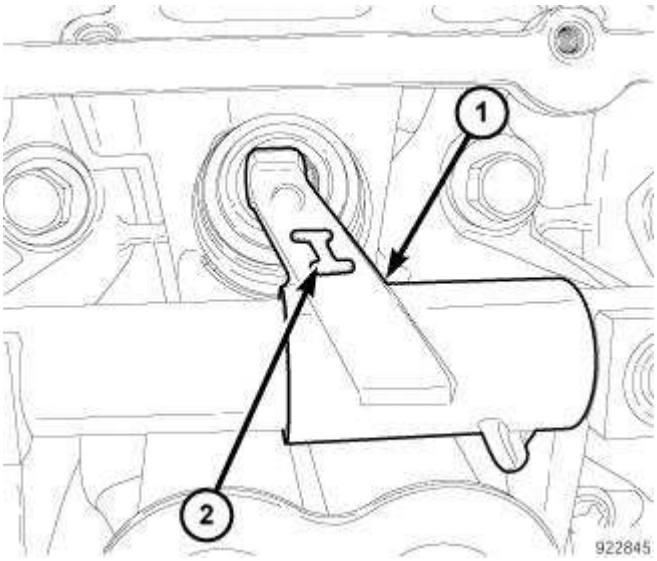

Fig. 141: Intake Rocker Arm Marking
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between the intake and the exhaust, failure to install them in the correct location could result in engine damage. The intake rocker arms (1) are marked with the letter "I" (2).

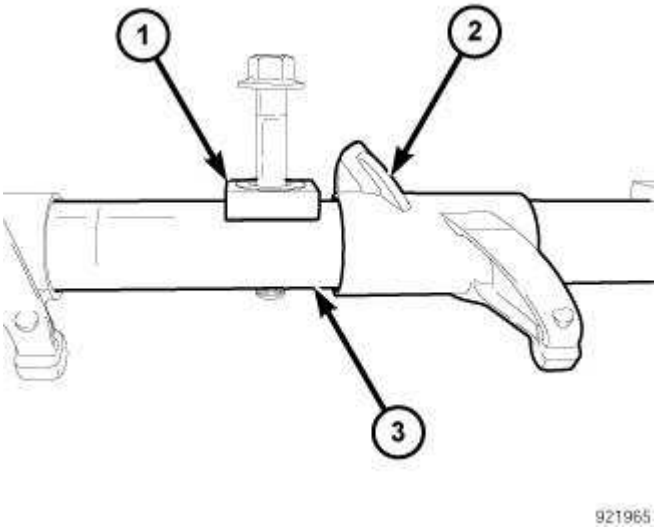

Fig. 142: Retainers, Rocker Arm & Rocker Shaft
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Make sure that the retainers (1) and the rocker arms (2) are not overlapped when tightening bolts or engine damage could result.

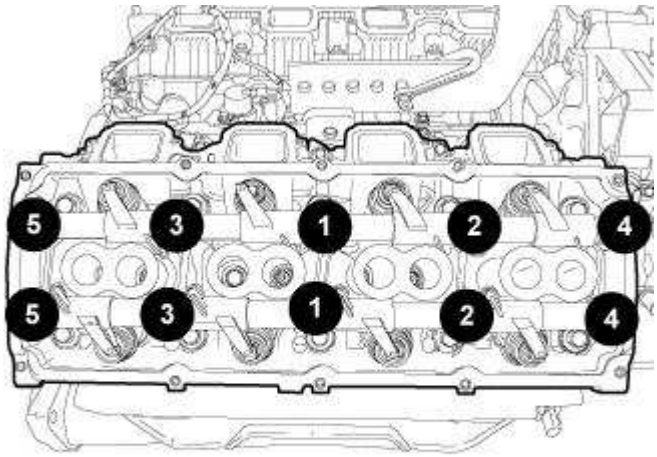

Fig. 143: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Due to the changes in the pushrod clearance holes in the Eagle 5.7L cylinder heads, close attention must be given when installing the pushrod(s) into the tappet(s). Once the pushrod(s) have been installed, use a suitable light to look down through the pushrod hole (s). This will allow you to verify the pushrod(s) are centered properly in the tappet(s) and avoid engine damage. Recheck after the rocker shaft assembly has been installed and tightened to specification.

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

NOTE: Pushrods must be installed in the same order as removed.

7. Install the rocker arm shaft and pushrods. Refer to **ROCKER ARM, VALVE, INSTALLATION, 5.7L**.
8. Using the sequence shown in illustration, tighten the rocker shaft bolts to 22 N.m (16 ft. lbs.).

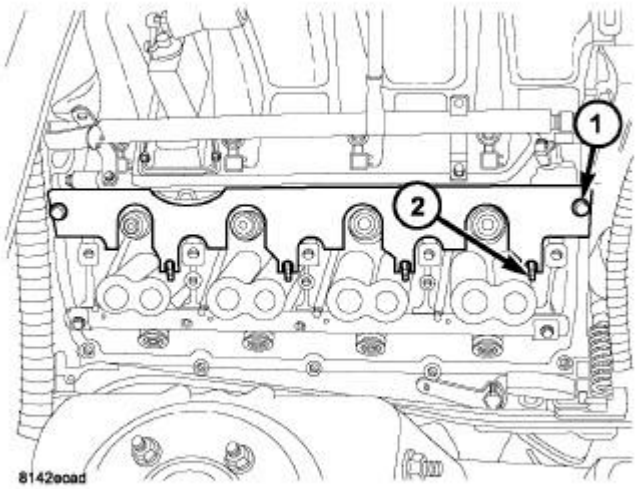

Fig. 144: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

9. If used, remove the pushrod retainer (special tool #9070, Retainer, Push Rod) (1).

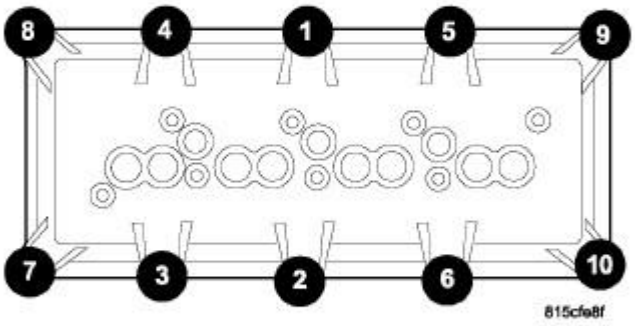

Fig. 145: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: Do not allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

10. Clean the cylinder head cover and both sealing surfaces, inspect and replace the gasket as necessary.
11. Install the cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location.
12. Using the sequence shown in illustration, tighten the cylinder head cover retaining bolts to 8 N.m (71 in. lbs.).
13. Install the spark plugs.

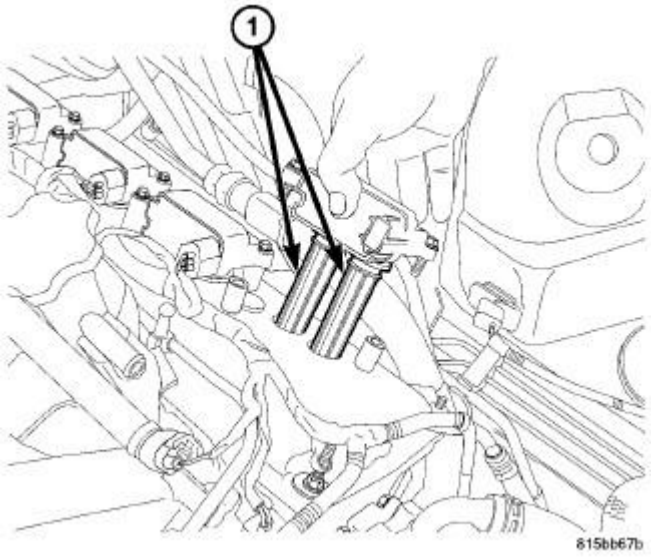

Fig. 146: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

14. Before installing the ignition coils, apply dielectric grease to the inside of the spark plug boots.

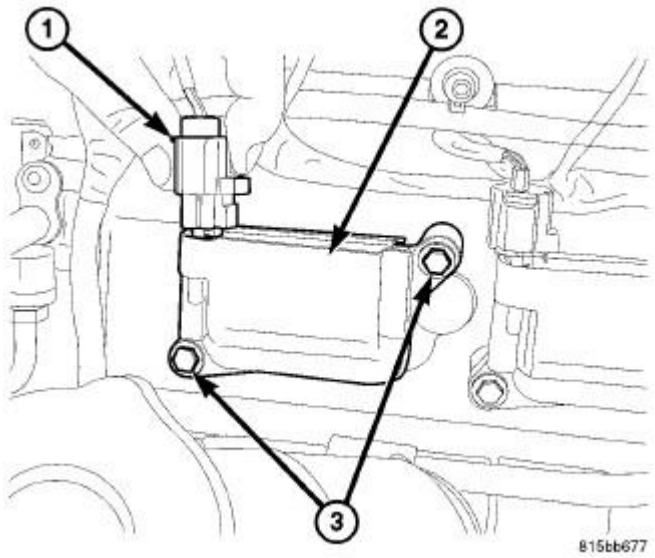

Fig. 147: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Install the ignition coil (2) on the plugs and tighten the fasteners (3) to 7 N.m (62 in. lbs).
16. Connect the ignition coil electrical connectors (1).
17. Install the air intake resonator and the air cleaner assembly. Refer to **BODY, AIR CLEANER, INSTALLATION, 5.7L**.
18. Connect the negative battery cable.

VALVES, INTAKE AND EXHAUST

DESCRIPTION

VALVE GUIDES

The valve guides are made of powdered metal and pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

VALVES

Both the intake and the exhaust valves are made of steel. The intake valve is 50.93 mm (2.00 inches) in diameter and the exhaust valve is 39.53 mm (1.55 inches) in diameter. All valves use three-bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE

STANDARD PROCEDURE - REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that correct

angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Using a suitable dial indicator measure the center of the valve seat Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.18 - 1.62 mm (0.0464 - 0.0637 in.) and the exhaust seat must be 1.48 - 1.92 mm (0.058 - 0.075 in.).
4. Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 46.0 mm (1.81 in.).

VALVE FACE AND VALVE SEAT ANGLE CHART

DESCRIPTION	SPECIFICATION
SEAT WIDTH	
INTAKE	1.18 - 1.62 mm
	(0.0464 - 0.0637 in.)
EXHAUST	1.48 - 1.92 mm
	(0.058 - 0.075 in.)
FACE ANGLE	
(INT. AND EXT.)	45° - 45 1/2 °
SEAT ANGLE	
(INT. AND EXT.)	44 1/2 ° - 45°

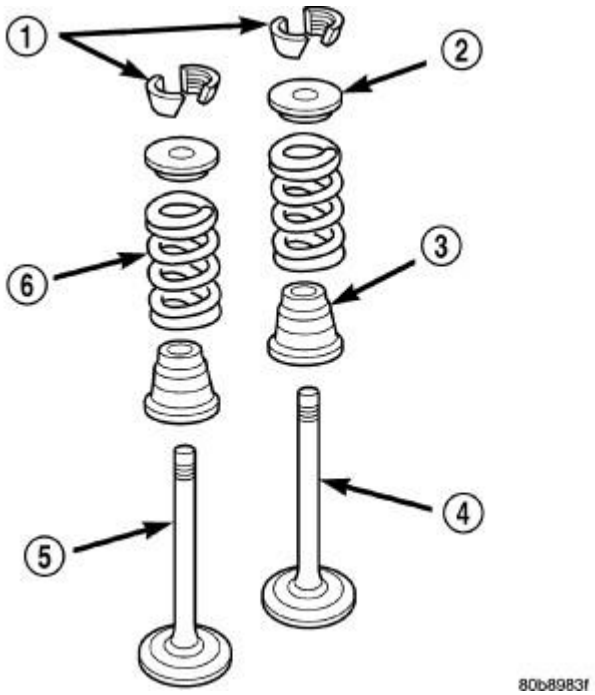

Fig. 148: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE LOCKS (3-BEAD)
2 - RETAINER
3 - VALVE STEM OIL SEAL
4 - INTAKE VALVE
5 - EXHAUST VALVE
6 - VALVE SPRING

5. The valve seat must maintain an angle of 44.5 - 45.0 degrees angle.
6. The valve face must maintain a face angle of 45.0 - 45.5 degrees angle. Refer to **Fig. 148**.

REMOVAL

REMOVAL

1. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.

2. Compress valve springs using Valve Spring Compressor Tool (special tool #C-3422-D, Compressor, Valve Spring) and Adapter (special tool #8464, Adapter, Valve Spring).
3. Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.
4. Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

INSTALLATION

INSTALLATION

1. Clean valves thoroughly. Discard burned, warped and cracked valves.
2. Remove the carbon and varnish deposits from the inside of the valve guides with a reliable guide cleaner.
3. Measure the valve stems for wear. If the wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat the valve stems with clean engine oil and insert them into the cylinder head.
5. If the valves or seats are ground, check the valve stem height. If the valve stem is too long, replace the cylinder head.
6. Install new seals on all valve guides. Install the valve springs and valve retainers.
7. Compress the valve springs with the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) and Valve Spring Adapter (special tool #8464, Adapter, Valve Spring). Install the locks and release the tool. If the valves and/or seats are ground, measure the installed height of the springs. Make sure the measurement is taken from the bottom of the spring seat in the cylinder head to the bottom surface of the spring retainer.
8. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION, 5.7L**.

ENGINE BLOCK

CLEANING

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean:

- Gallery at the oil filter adaptor hole
- Front and rear oil gallery holes
- Multiple Displacement System (MDS) oil gallery holes in the valley
- Oil feed holes for the crankshaft main bearings

Drilled and tapped holes should be free of debris upon assembly.

Once the block has been completely cleaned, apply Loctite® PST pipe sealant with Teflon 592 to the

threads of the front and rear oil gallery plugs and coolant drain plugs. Tighten the oil gallery 1/4 inch x 18 NPT plugs to 20 N.m (15 ft. lbs.). Tighten the coolant drain 1/4 inch x 18 NPT plugs to 34 N.m (25 ft. lbs.). Tighten the 3/8 inch x 18 NPT plugs to 27 N.m (20 ft. lbs.).

INSPECTION

INSPECTION

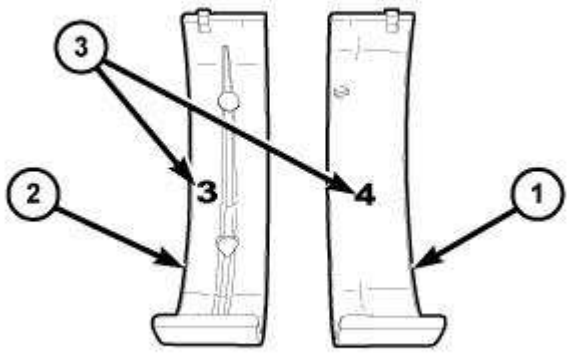

Fig. 149: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the main bearing inserts (1, 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage, replace the engine block.

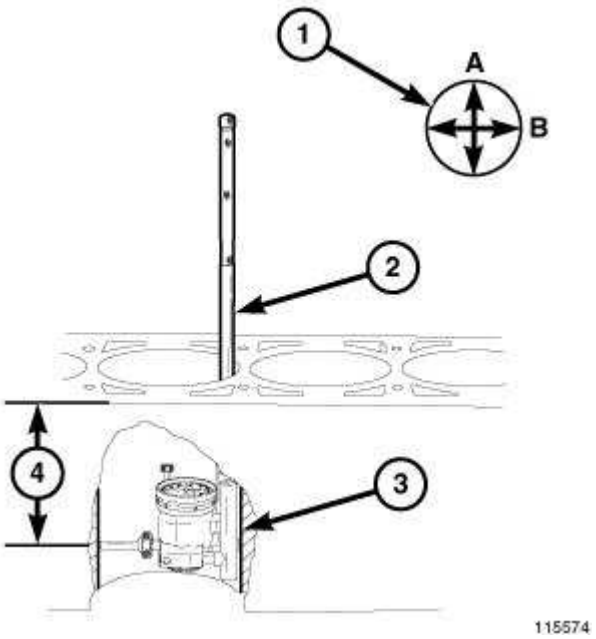

Fig. 150: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

9. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) Increments is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90°) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore then repeat the measurement near the bottom of the bore.
12. Determine the taper by subtracting the smaller diameter from the larger diameter.
13. Rotate the measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specifications.
14. Determine out-of-roundness by comparing the difference between each measurement.
15. If the cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.015 mm (0.0006 inch) then the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds the maximum limits, replace the cylinder block.

NOTE: A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

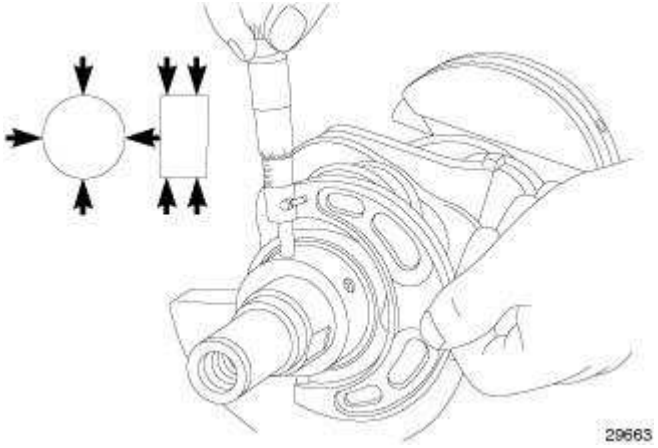

Fig. 151: Measuring Main Bearing Journal Diameter
Courtesy of CHRYSLER GROUP, LLC

With the crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch.) and maximum out of round is 0.005 mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select the inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

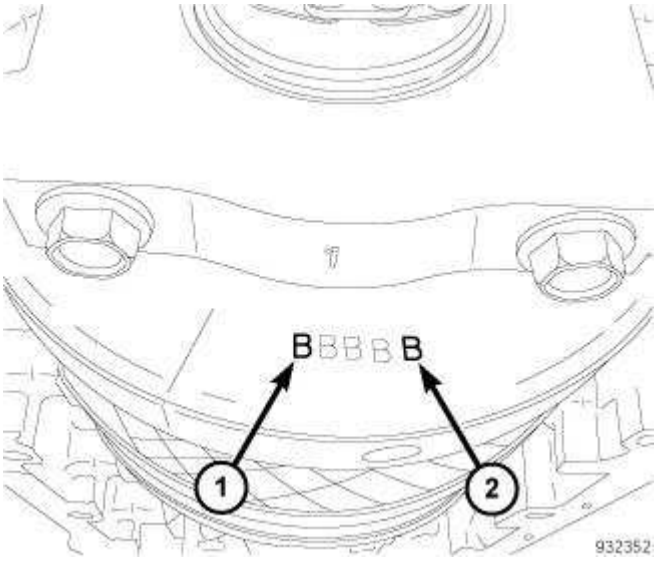

Fig. 152: Crankshaft Counterweight Stamped Grade Identification Marks
Courtesy of CHRYSLER GROUP, LLC

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right. The left letter (1) refers to the number one main journal and the right letter (2) refers to the number 5 journal.

NOTE: Service main bearings are coded. These codes identify what size or grade of the bearing.

MAIN BEARING SELECTION CHART - 5.7L

GRADE MARKING	BEARING SIZE		FOR USE WITH JOURNAL SIZE	
	METRIC	STANDARD	METRIC	STANDARD
A	0.008 mm U/S	0.0004 in. U/S	64.988 - 64.995 mm	2.5585 - 2.5588 in.
B	NOMINAL		64.996 - 65.004 mm	2.5588 - 2.5592 in.
C	0.008 mm O/S	0.0004 in. O/S	65.005 - 65.012 mm	2.5592 - 2.5595 in.

INSPECTION

INSPECTION

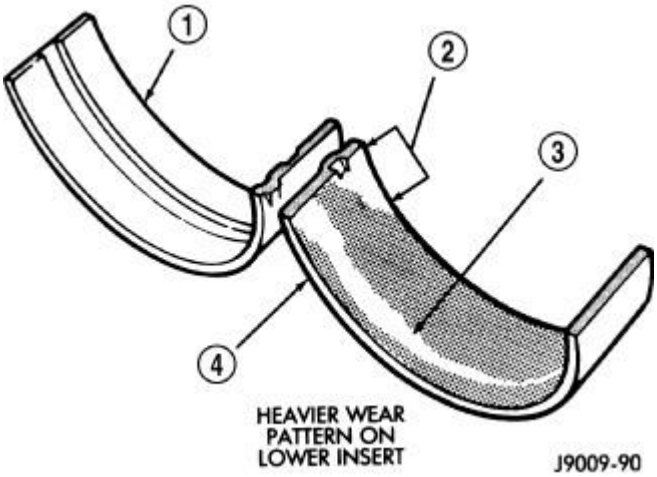

Fig. 153: Main Bearing Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

NOTE: If any crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CAMSHAFT, ENGINE

REMOVAL

5.7L / 6.4L - CAMSHAFT CORE HOLE PLUG

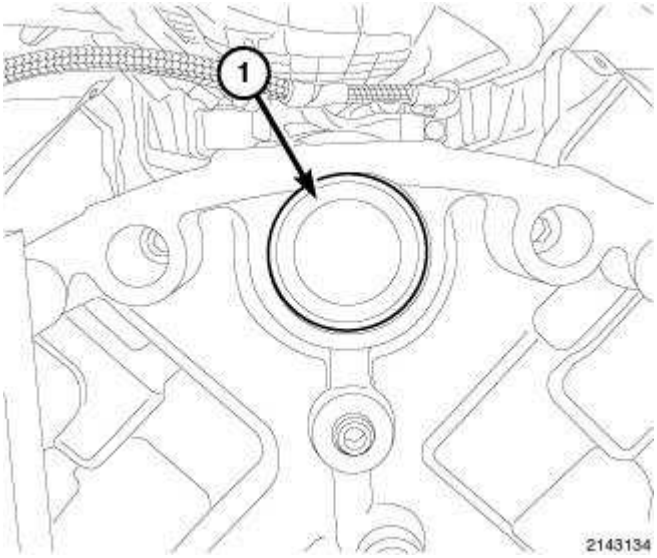

Fig. 154: Camshaft Core Hole Plug
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Remove the engine from the vehicle. Refer to **REMOVAL, 5.7L**.
3. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL, 5.7L**.

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

4. Using a suitable sharp punch, punch a small hole in the camshaft core hole plug (1).
5. Insert a short sheet metal screw into the small hole in the camshaft core hole plug.
6. Using a suitable slide hammer puller, remove the rear camshaft core hole plug.

CAMSHAFT

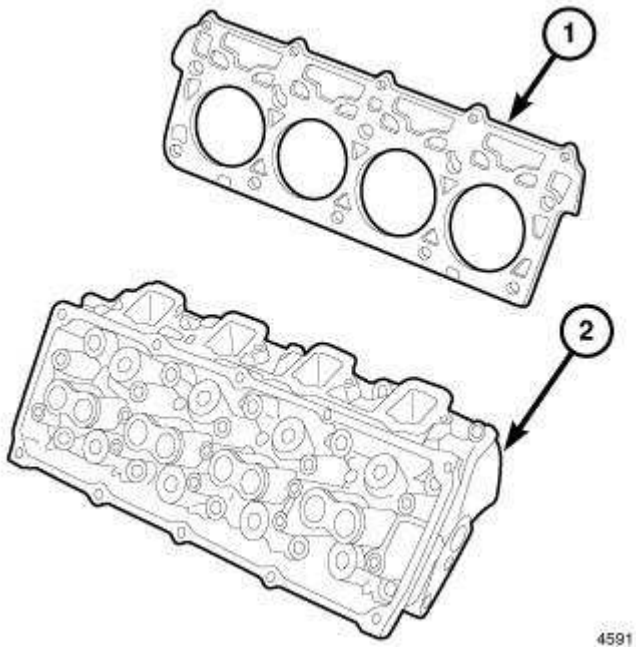

Fig. 155: Cylinder Head & Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Remove both cylinder heads (2). Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.

CAUTION: The 5.7L Multi Displacement System (MDS) engine uses both standard roller lifters and deactivating roller lifters. The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: Whenever the camshaft is replaced, all lifters must be replaced. If the lifter and retainer assemblies are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

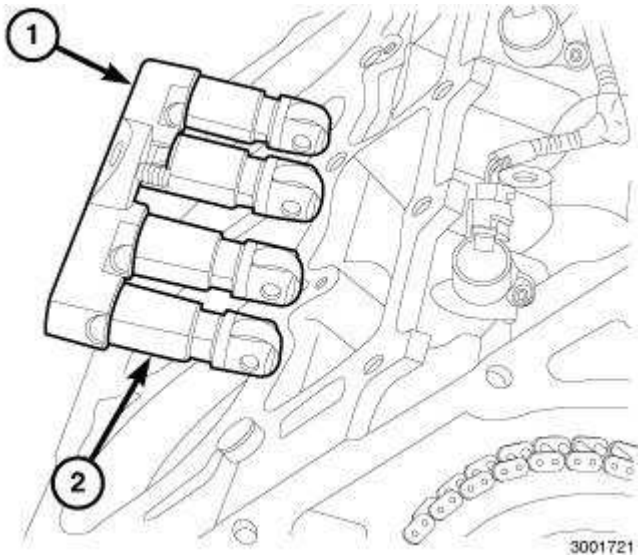

Fig. 156: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

2. Remove the lifters (2) and retainer (1) as an assembly. Refer to **LIFTER(S), HYDRAULIC, ROLLER, REMOVAL, 5.7L**.

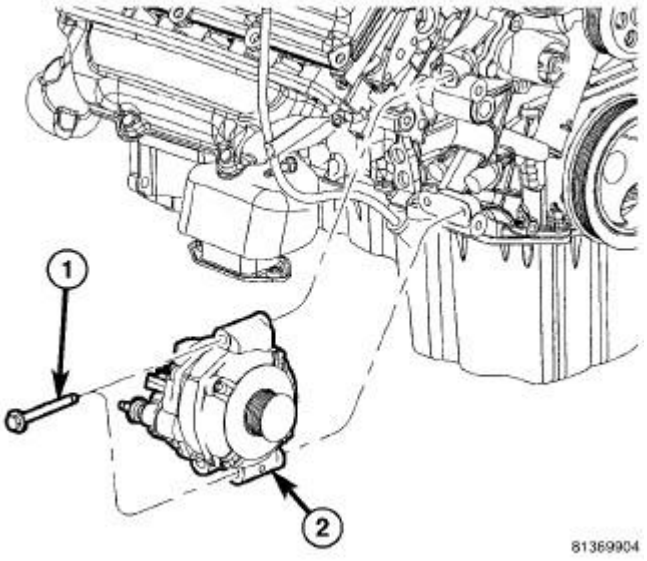

Fig. 157: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove the generator. Refer to **GENERATOR, REMOVAL** .

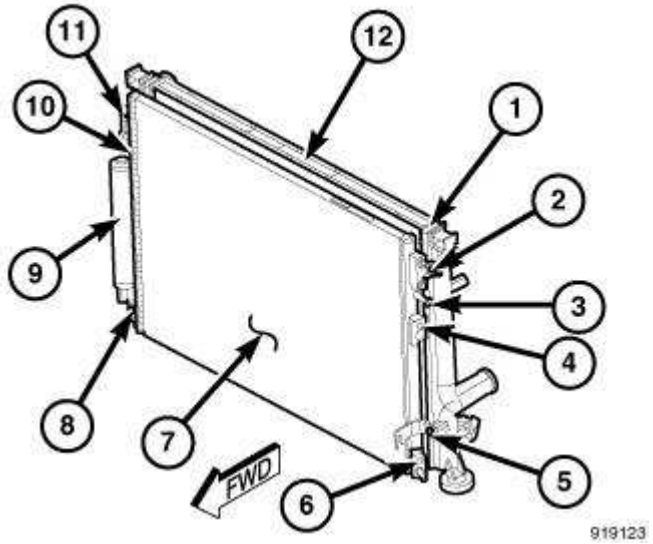

Fig. 158: A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

4. Remove the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .
5. Remove the radiator (12). Refer to **RADIATOR, ENGINE COOLING, REMOVAL** .
6. Remove the A/C condenser (7). Refer to **CONDENSER, A/C, REMOVAL** .
7. Raise and support vehicle.

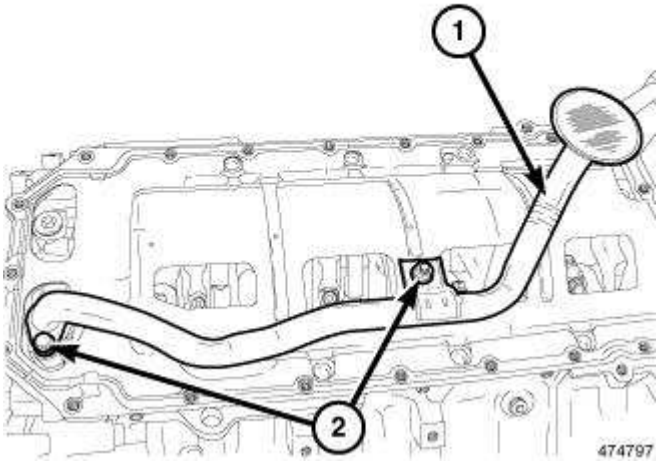

Fig. 159: Oil Pick Up Tube
Courtesy of CHRYSLER GROUP, LLC

8. Remove the oil pan and oil pump pickup tube (1). Refer to **PAN, OIL, REMOVAL, 5.7L** and **PAN, OIL, AWD, REMOVAL, 5.7L**.

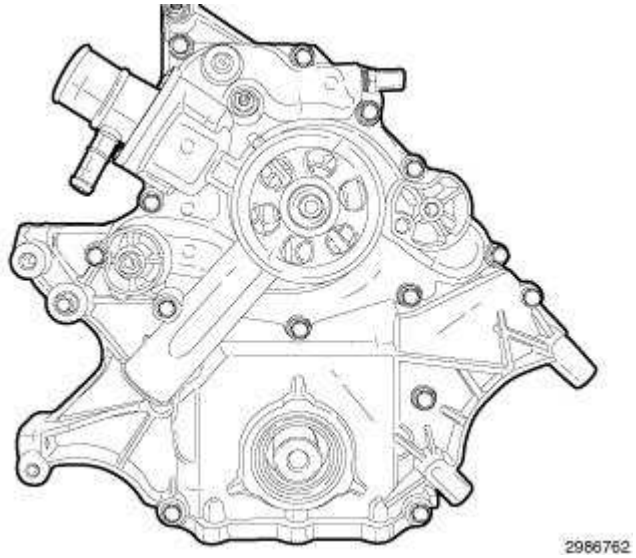

Fig. 160: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the water pump for timing cover removal.

9. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL, 5.7L**.

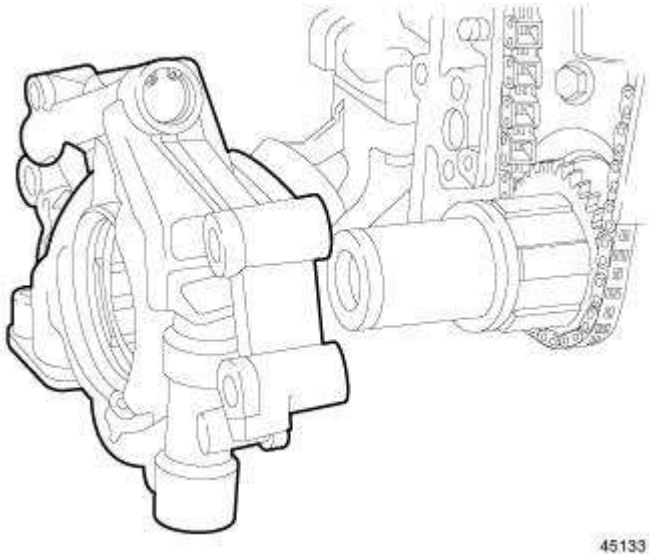

Fig. 161: Remove/Install Oil Pump
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL, 5.7L**.

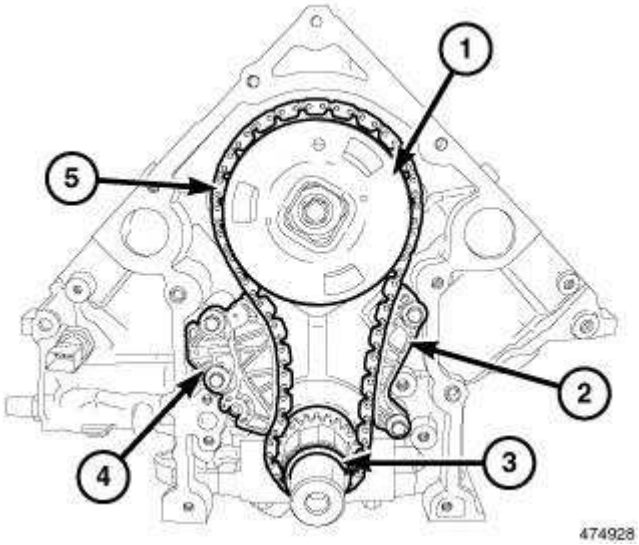

Fig. 162: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
Courtesy of CHRYSLER GROUP, LLC

11. Remove the timing chain (5) and camshaft phaser (1). Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL, 5.7L**.

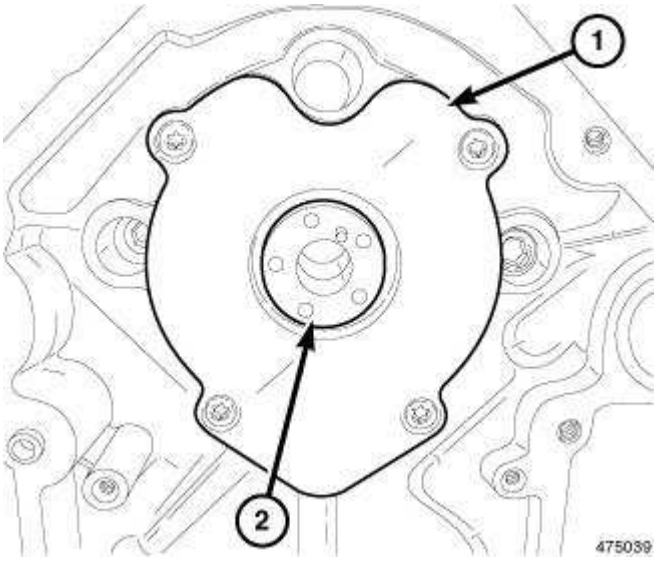

Fig. 163: Camshaft Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

12. Remove the camshaft thrust plate (1).

CAUTION: Use care when removing the camshaft, do not damage the camshaft bearings with the camshaft lobes.

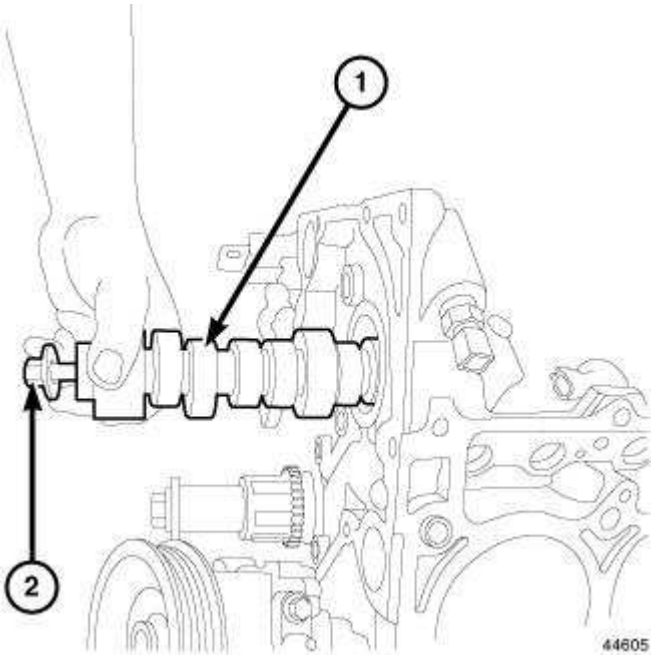

Fig. 164: Removing/Installing Camshaft
Courtesy of CHRYSLER GROUP, LLC

13. Install a long bolt (2) into the front of the camshaft to aid in removal.
14. Remove the camshaft using care not to damage the camshaft bearings with the camshaft lobes (1).

INSPECTION

INSPECTION

The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason. If the cam bearings are damaged, the cylinder block must be replaced.

INSTALLATION

5.7L / 6.4L - CAMSHAFT CORE HOLE PLUG

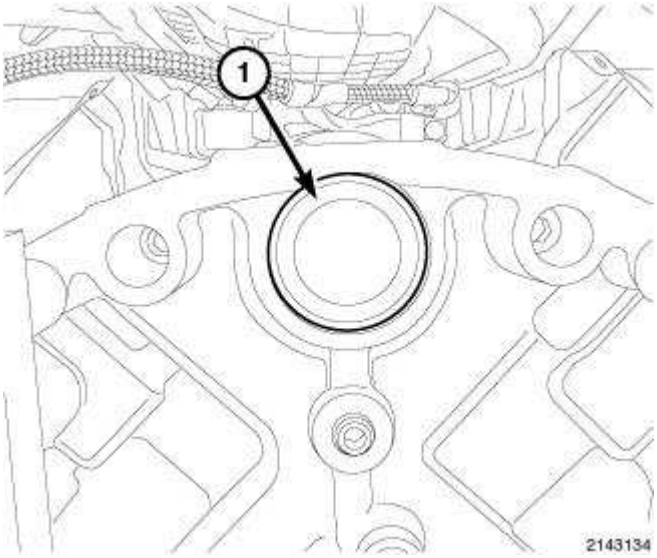

Fig. 165: Camshaft Core Hole Plug
Courtesy of CHRYSLER GROUP, LLC

1. Clean the core hole in the cylinder block.

NOTE: Do not apply adhesive to the new camshaft core hole plug. A new plug has adhesive pre-applied.

2. Install a new camshaft core hole plug (1) located at the rear of cylinder block, using a suitable flat faced tool. The plug must be fully seated on the cylinder block shoulder.
3. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION, 5.7L**.
4. Install the engine. Refer to **INSTALLATION, 5.7L**.

CAMSHAFT

CAUTION: The 5.7L engine uses a unique camshaft for use with the Multi Displacement System (MDS). When installing a new camshaft, the replacement camshaft must be compatible with MDS.

CAUTION: Use care when installing the camshaft into the engine block, do not damage the camshaft bearings with the camshaft lobes.

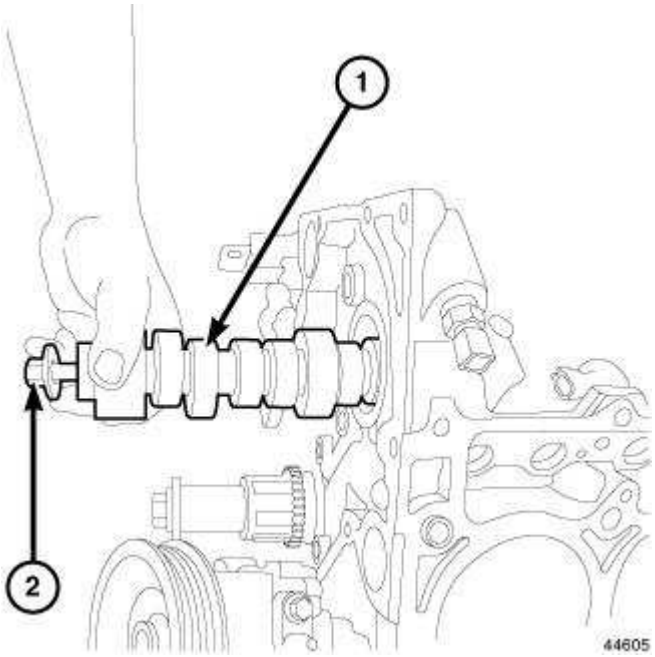

Fig. 166: Removing/Installing Camshaft
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft lobes (1) and the camshaft bearing journals with clean engine oil.
2. Install a long bolt (2) into the front of the camshaft to aid in the installation, carefully install the camshaft into the engine block.

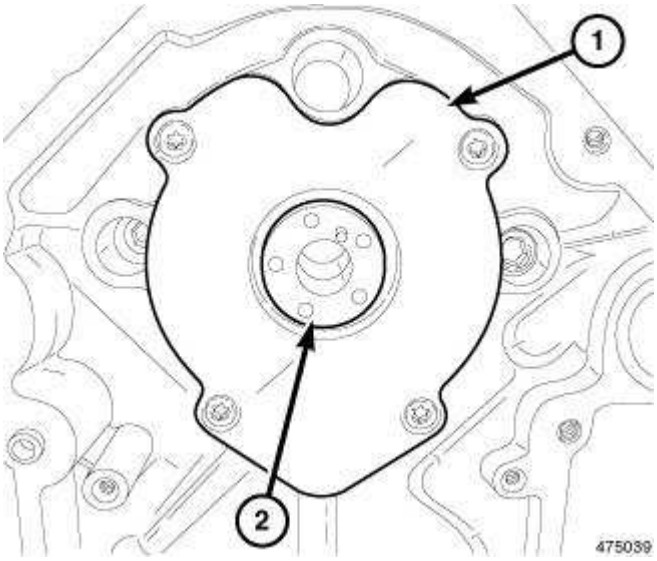

Fig. 167: Camshaft Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

3. Install the camshaft thrust plate (1) and tighten retaining bolts to 12 N.m (106 in. lbs.).

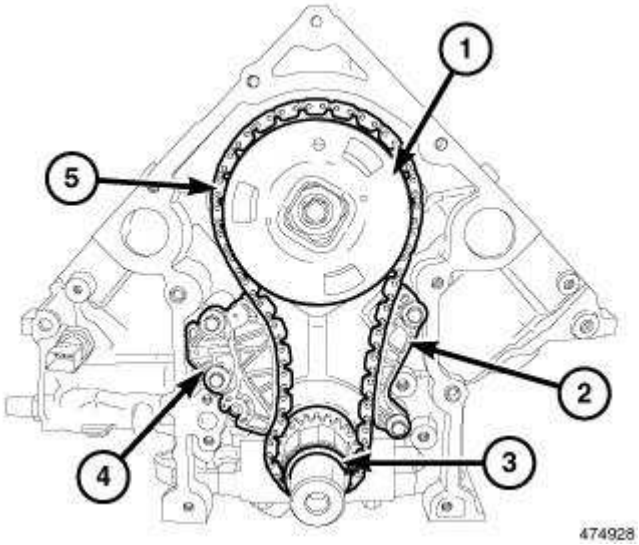

Fig. 168: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
Courtesy of CHRYSLER GROUP, LLC

4. Install the timing chain (5) and camshaft phaser (1). Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION, 5.7L**.
5. Using a suitable dial indicator, measure the camshaft end play. Refer to **Engine - Specifications**. If not within specification, install a new thrust plate.

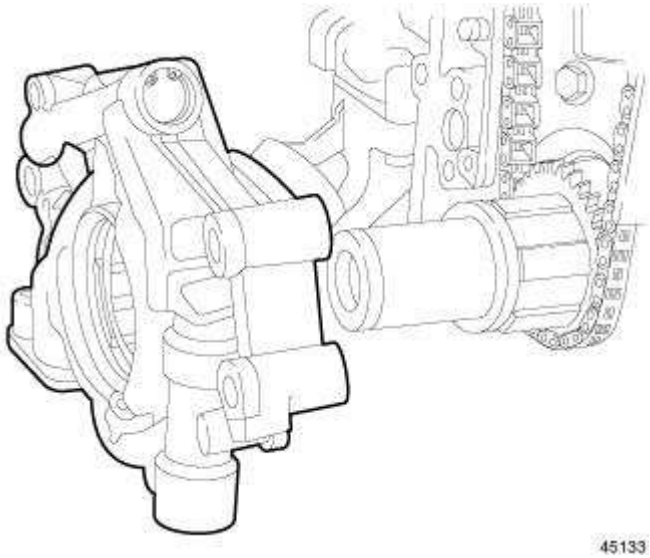

Fig. 169: Remove/Install Oil Pump
Courtesy of CHRYSLER GROUP, LLC

6. Install the oil pump. Refer to **PUMP, ENGINE OIL, INSTALLATION, 5.7L**.

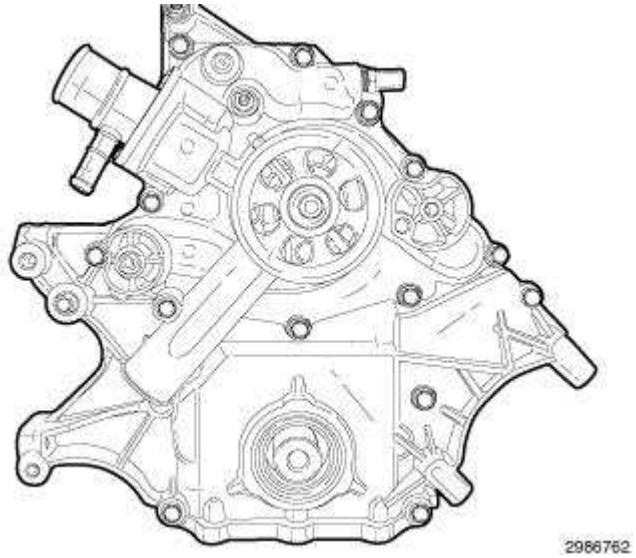

Fig. 170: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION, 5.7L**.
8. Raise and support vehicle.

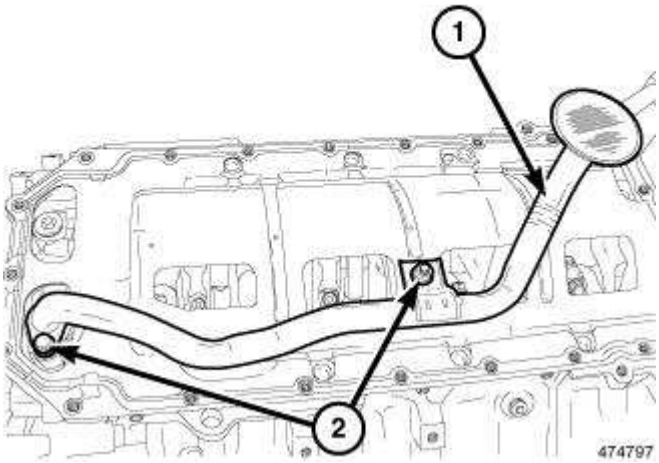

Fig. 171: Oil Pick Up Tube
Courtesy of CHRYSLER GROUP, LLC

9. Install the oil pump pickup tube (1) and oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L** and **PAN, OIL, AWD, INSTALLATION, 5.7L**.

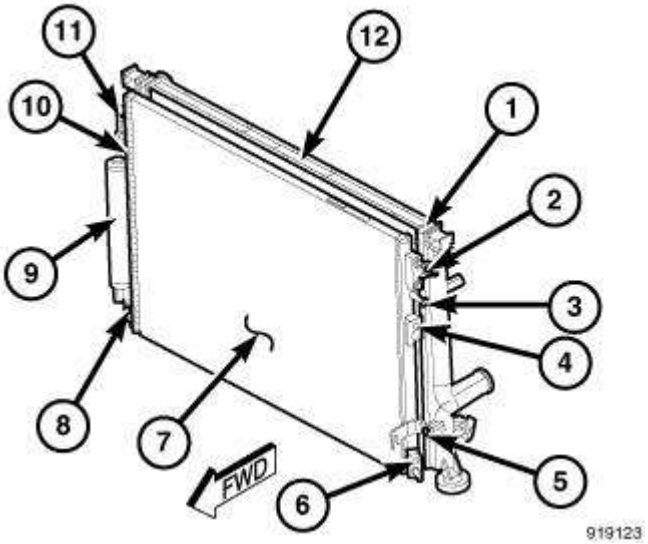

Fig. 172: A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

10. Install the A/C condenser (7). Refer to **CONDENSER, A/C, INSTALLATION** .
11. Install the radiator (12). Refer to **RADIATOR, ENGINE COOLING, INSTALLATION** .
12. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .

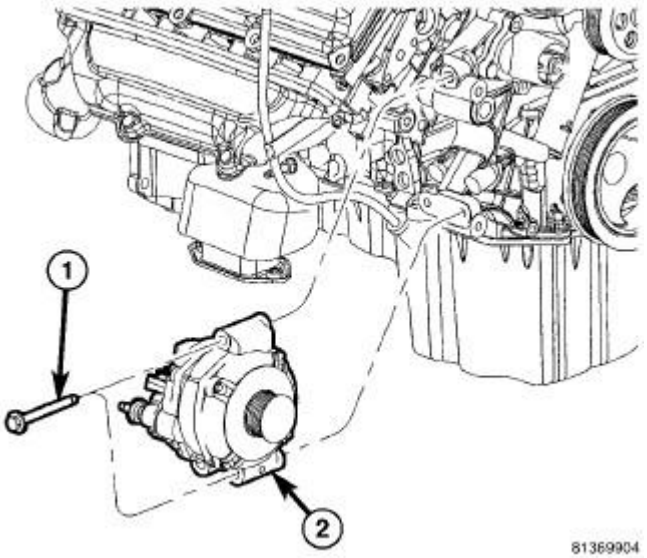

Fig. 173: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

13. Install the generator. Refer to **GENERATOR, INSTALLATION** .

CAUTION: The 5.7L Multi Displacement System (MDS) engine uses both standard roller lifters and deactivating roller lifters. The deactivating

roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: Whenever the camshaft is replaced, all lifters must be replaced. If the lifter and retainer assemblies are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

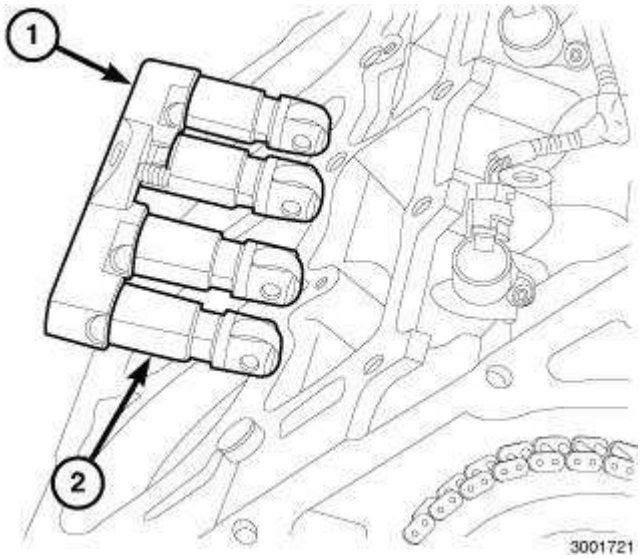

Fig. 174: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

14. Install the lifters (2) and retainer (1) as an assembly into their original location. Refer to **LIFTER (S), HYDRAULIC, ROLLER, INSTALLATION, 5.7L**.

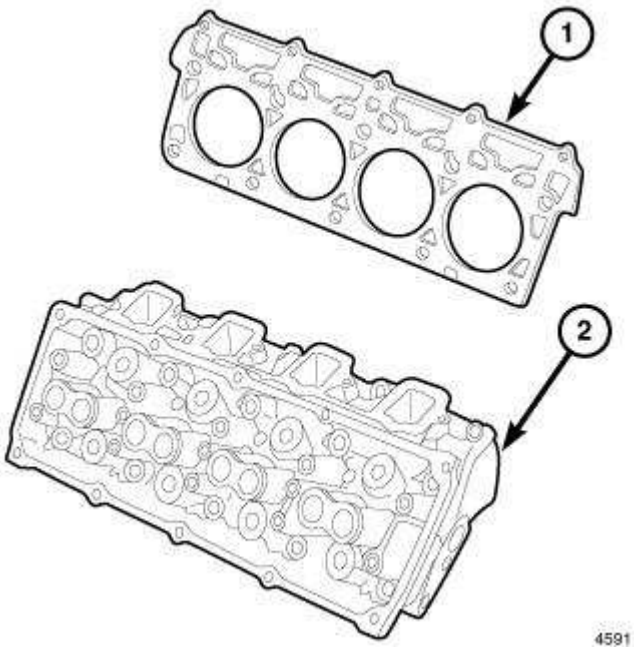

Fig. 175: Cylinder Head & Gasket
Courtesy of CHRYSLER GROUP, LLC

15. Install both cylinder heads (2). Refer to **CYLINDER HEAD, INSTALLATION, 5.7L**.
16. Install the pushrods in the same location as removed.
17. Install the rocker arms. Refer to **ROCKER ARM, VALVE, INSTALLATION, 5.7L**.

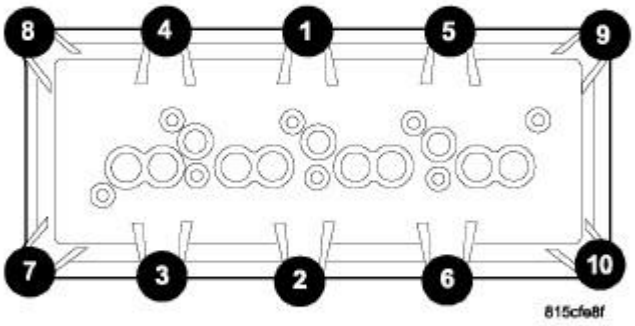

Fig. 176: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

18. Install the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION, 5.7L**.

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

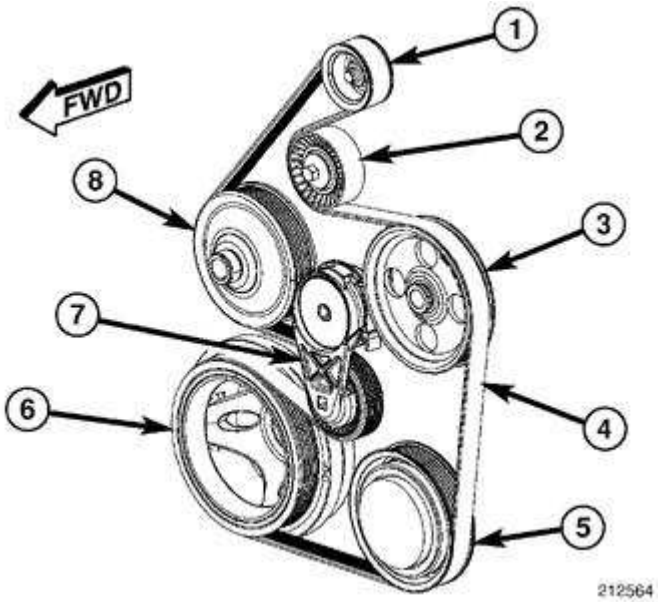

Fig. 177: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

19. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop, install the accessory drive belt (2) onto the pulleys and slowly release the tensioner.

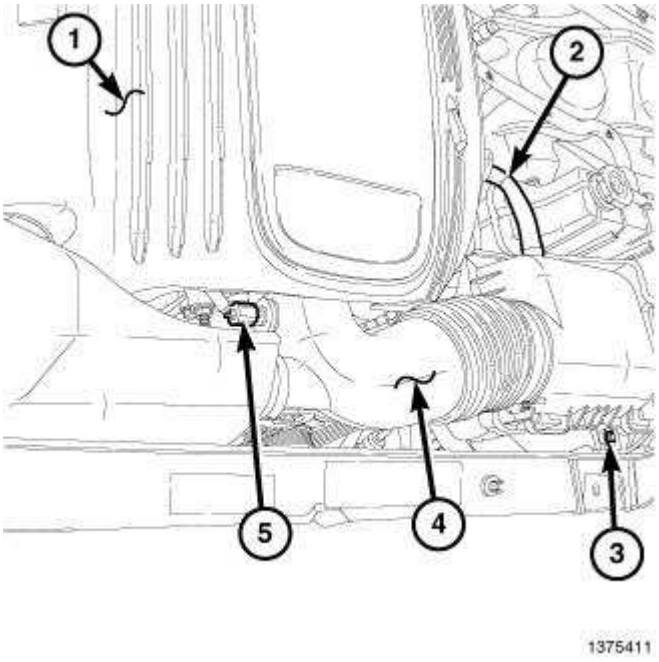

Fig. 178: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

20. Position the air filter housing into the engine compartment.
21. Install the air filter housing retaining bolt (3) and tighten to 5 N.m (44 in. lbs.).
22. Connect the clean air tube to the throttle body and the air filter assembly and tighten clamps to 3 N.m (30 in. lbs.).
23. Connect the make up air hose (MUA) (2).
24. Connect the intake air temperature (IAT) sensor (5) connector.

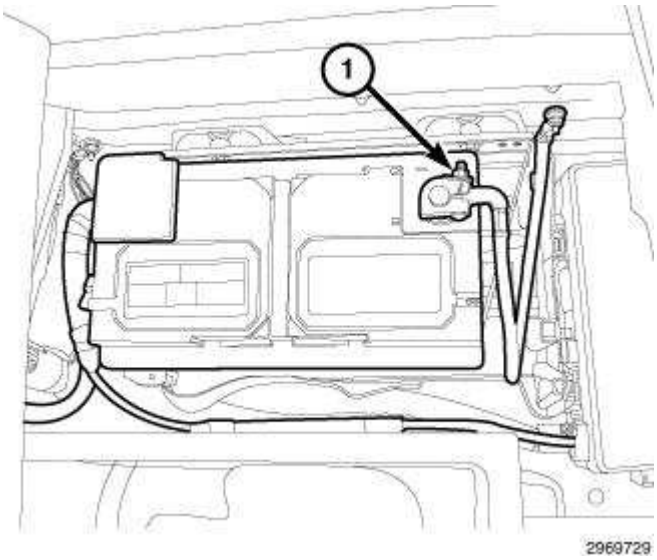

Fig. 179: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

25. Connect the negative battery cable and tighten the nut (1) to 5 N.m (45 in. lbs.).
26. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

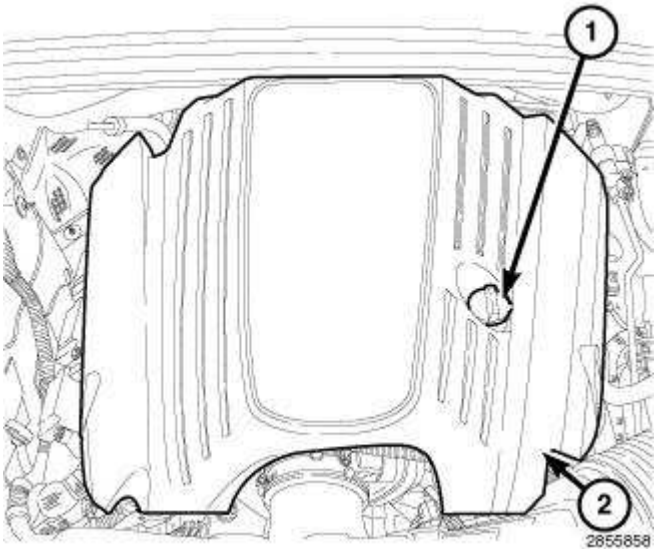

Fig. 180: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

27. Fill the crankcase with the specified type and amount of engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
28. Position the engine cover (2) and secure the retaining grommets onto the ball studs.
29. Start the engine and check for leaks.

COVER, STRUCTURAL DUST

DESCRIPTION

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine.

OPERATION

OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

REMOVAL

REMOVAL

1. Raise and support the vehicle.

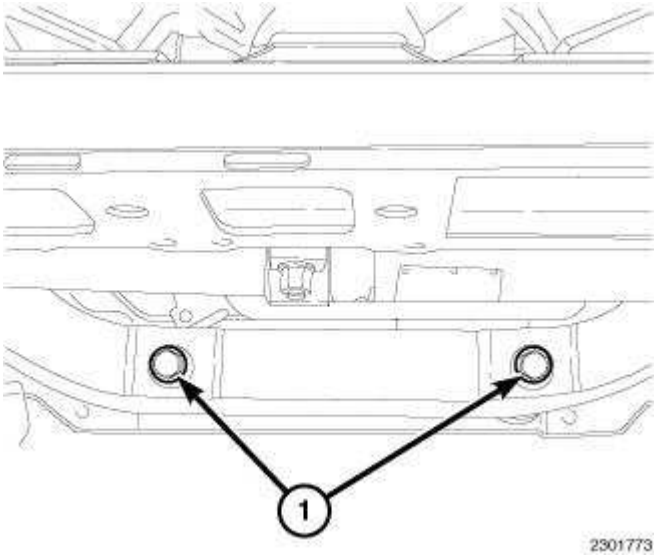

Fig. 181: Steering Rack To Frame Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the steering rack to frame mounting bolts (1) and lower the steering rack enough to gain clearance for the structural dust cover removal.

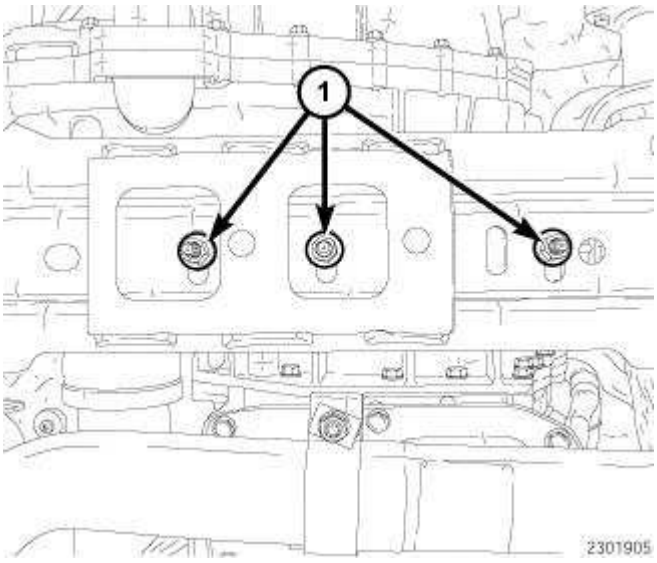

Fig. 182: Transmission Mount To Crossmember Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the transmission mount to crossmember retaining nuts (1).
4. Using a suitable jack, lift the transmission enough to gain clearance for the structural dust cover removal.

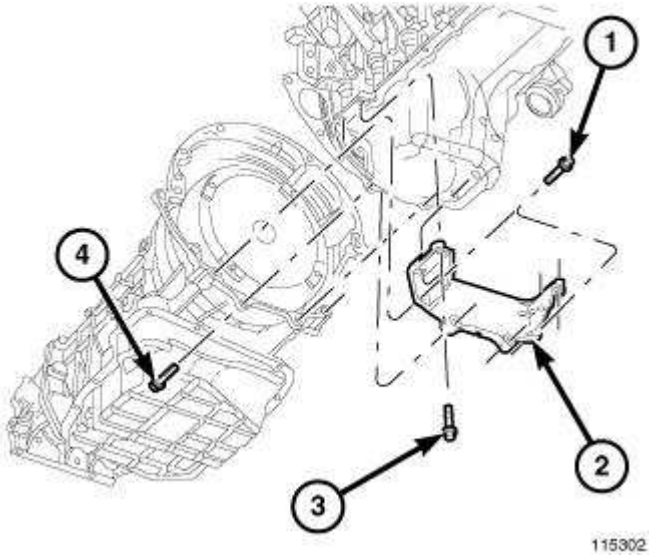

Fig. 183: Structural Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the structural dust cover retaining bolts (1, 3 & 4).
6. Remove the structural dust cover (2).

INSTALLATION

INSTALLATION

CAUTION: The structural dust cover must be installed as described in the following steps. Failure to do so may cause severe damage to the cover.

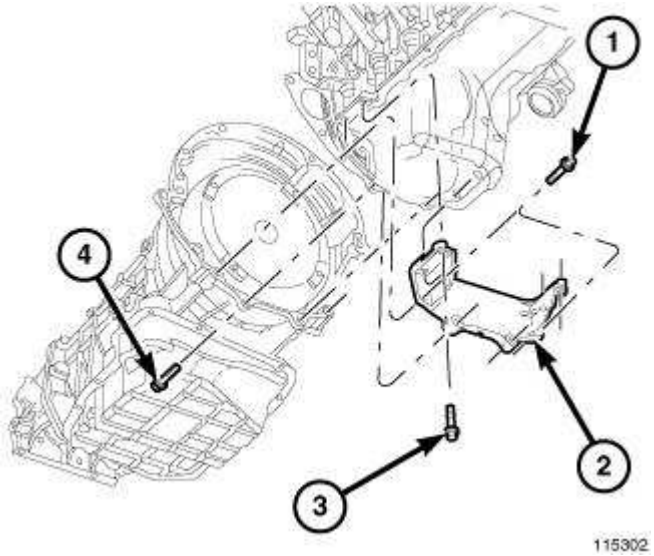

Fig. 184: Structural Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the structural dust cover in the vehicle
2. Install all four bolts retaining the structural dust cover to the engine (3) hand tight.
3. Install the four cover to transmission bolts (1, 2 & 4) hand tight.

CAUTION: The structural dust cover must be held tightly against both the engine and the transmission bell housing during the tightening sequence. Failure to do so may cause severe damage to the cover.

4. Tighten the structural dust cover-to-transmission bolts (1, 2 & 4) to 9 N.m (80 in. lbs.).
5. Tighten the structural dust cover-to-engine block bolts (3) to 9 N.m (80 in. lbs.).
6. Retighten the structural dust cover-to-transmission bolts to 54 N.m (40 ft. lbs.).
7. Retighten the structural dust cover-to-engine block bolts to 54 N.m (40 ft. lbs.).

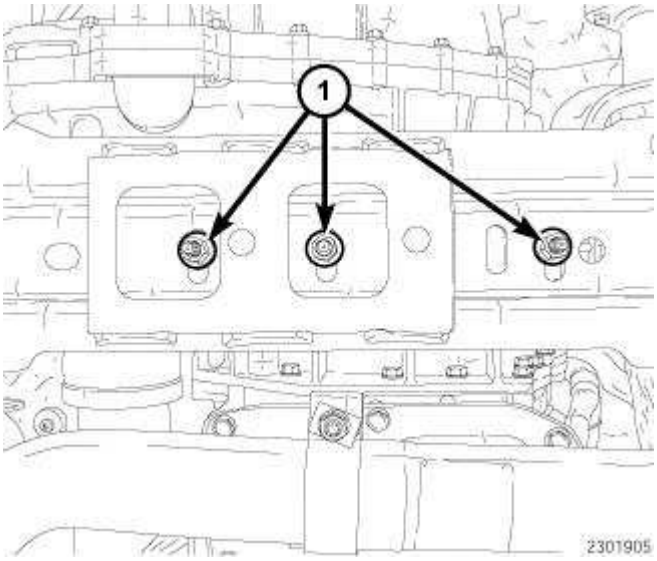

Fig. 185: Transmission Mount To Crossmember Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

8. Lower the transmission onto the crossmember and remove the jack.
9. Install the transmission mount to crossmember retaining nuts (1) and tighten to 54 N.m (40 ft. lbs.).

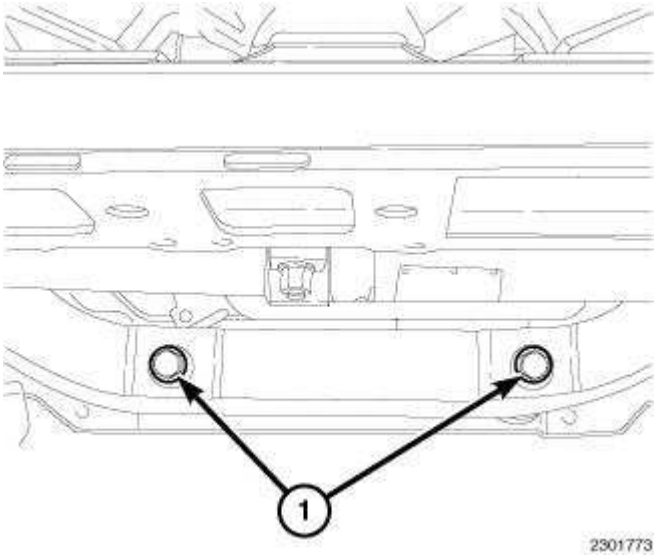

Fig. 186: Steering Rack To Frame Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Position the steering rack to the frame, install the bolts (1) and tighten bolts/nuts to 258 N.m (190 ft. lbs.).
11. Lower the vehicle.

CRANKSHAFT

REMOVAL

REMOVAL

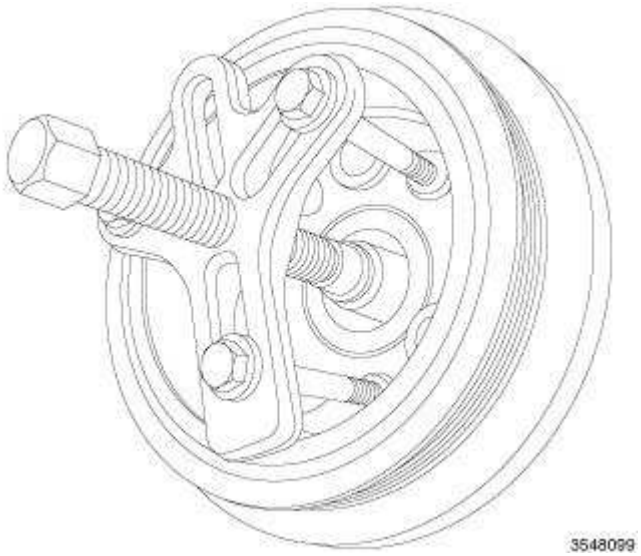

Fig. 187: Removing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the vibration damper (1). Refer to **DAMPER, VIBRATION, REMOVAL, 5.7L**.

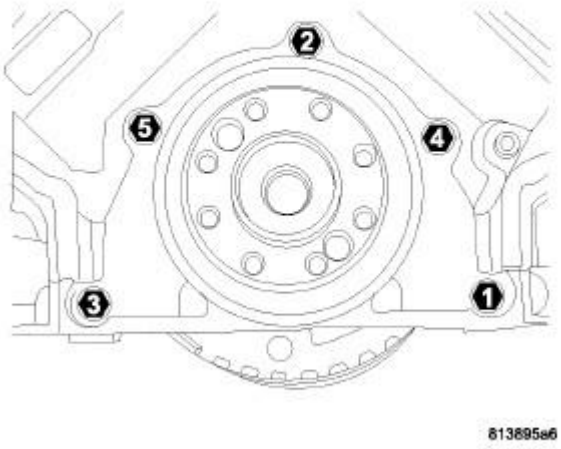

Fig. 188: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Remove the rear oil seal retainer. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL, 5.7L**.
4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L** and **PAN, OIL, AWD, REMOVAL, 5.7L**.
5. Remove the oil pump pickup.
6. Remove the windage tray/oil pan gasket.

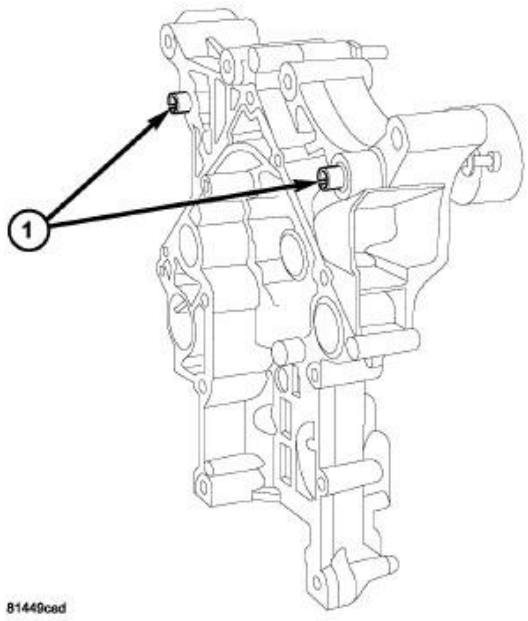

Fig. 189: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

7. Remove the timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL, 5.7L**.

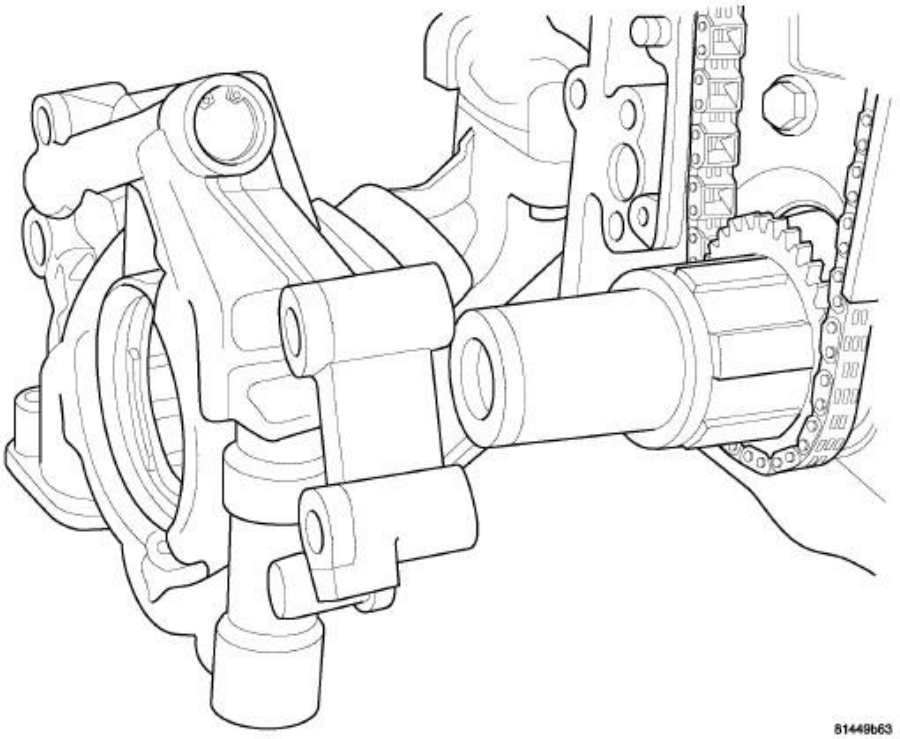

Fig. 190: Removing/Installing Oil Pump
Courtesy of CHRYSLER GROUP, LLC

8. Remove the oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL, 5.7L**.

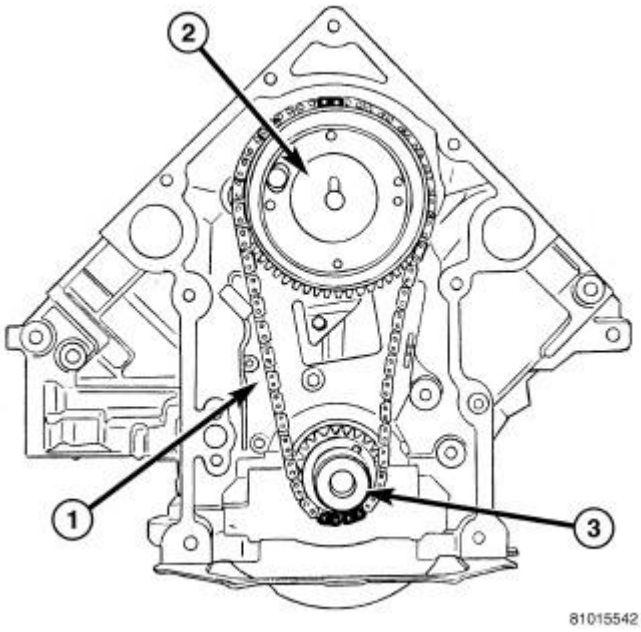

Fig. 191: Crankshaft Sprocket, Camshaft Sprocket & Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

13. Remove the thrust washers.
14. Remove the crankshaft out of the block.

INSTALLATION

INSTALLATION

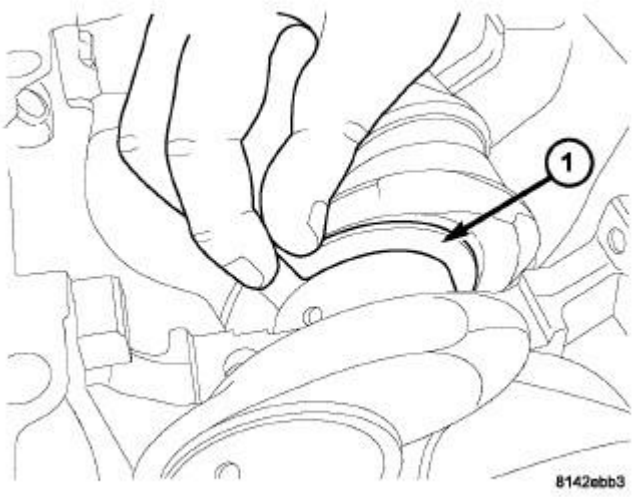

Fig. 195: Removing/Installing Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

1. Select the proper main bearings. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
2. Install main bearings in block and caps, and lubricate bearings.
3. Position the crankshaft into the cylinder block.
4. Install the thrust washers (1).

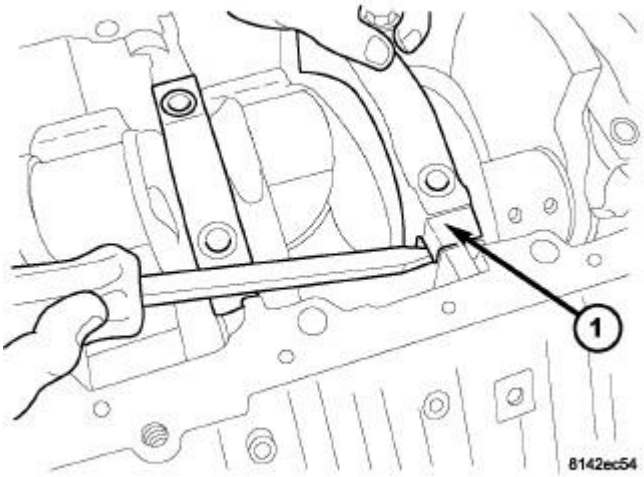

Fig. 196: Removing/Installing Main Cap
Courtesy of CHRYSLER GROUP, LLC

1 - MAIN CAP

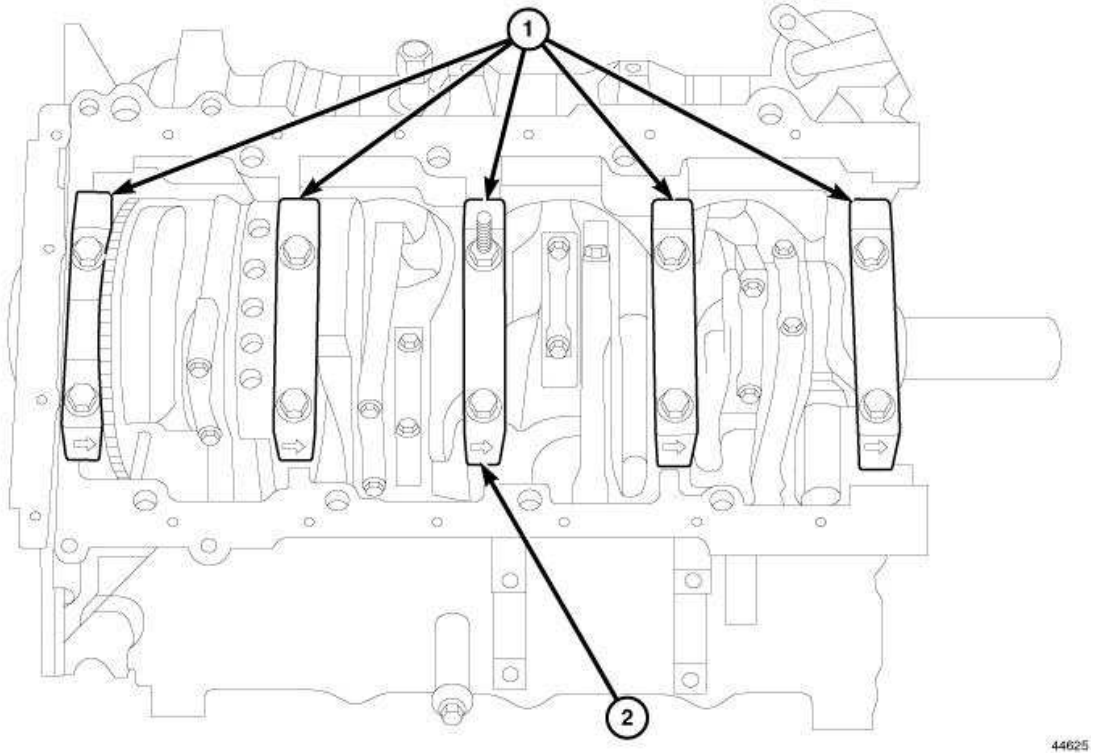

Fig. 197: Main Bearing Caps & Arrows

Courtesy of CHRYSLER GROUP, LLC

1 - MAIN BEARING CAPS

CAUTION: The overuse of oils on the threads may cause a Hydro-Lock condition at which may cause inaccurate readings. Incorrect torque values may occur.

NOTE: The main cap crossbolts are torqued after final torque of the main cap bolts. Always use a new crossbolts.

5. Clean and apply a light oil film to all cap bolts. Install all main bearing caps (1). Install all M12 cap bolts and alternately tighten in two steps using the following sequence.

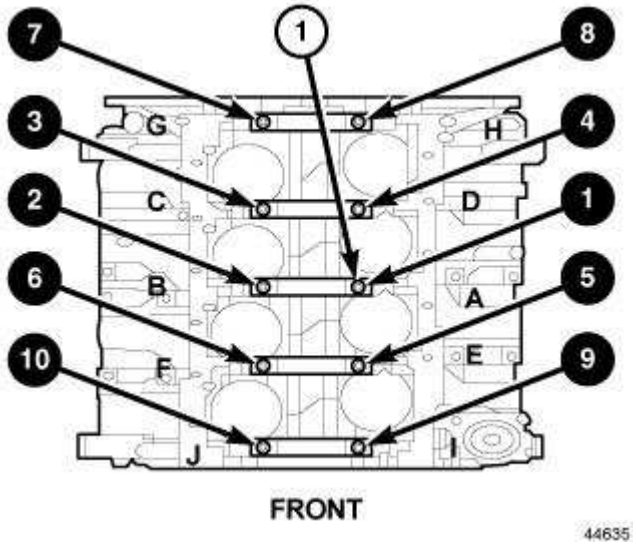

Fig. 198: Main Cap Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. • Step 1 - 28 N.m (20 ft. lbs.).
7. • Step 2 - Turn main cap bolts an additional 90°.
8. Install the M8 crossbolts with attached washer/gasket. Starting with crossbolt A, tighten each crossbolt to 31 N.m (23 ft. lbs.).
9. Repeat crossbolt tightening procedure.
10. Measure crankshaft end play. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.

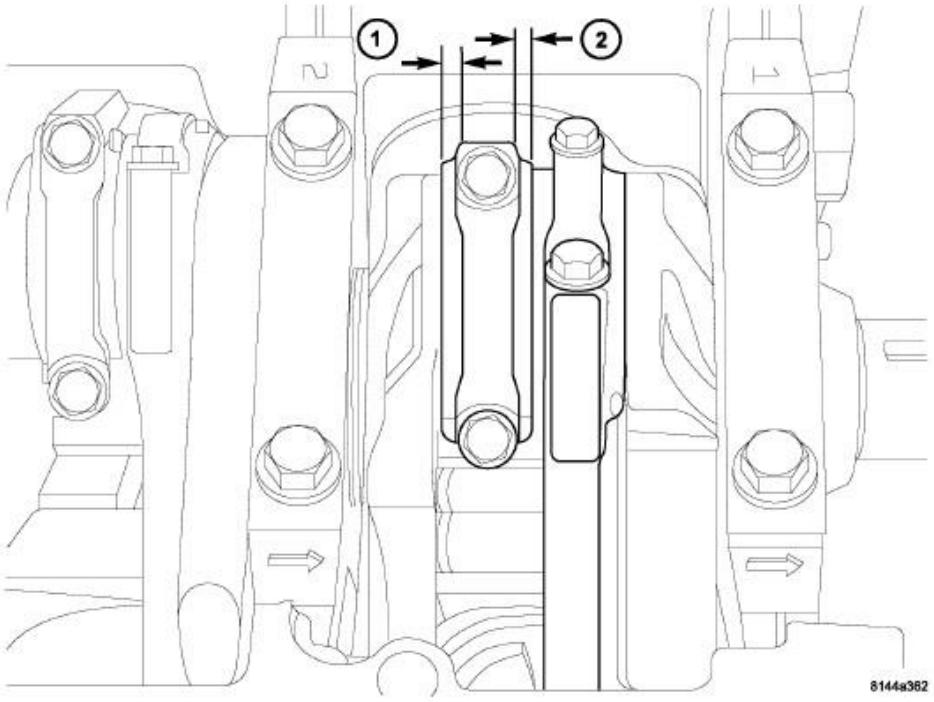

Fig. 199: Connecting Rod Proper Installation
Courtesy of CHRYSLER GROUP, LLC

11. Position the connecting rods onto the crankshaft and install the rod bearing caps. Refer to **ROD, PISTON AND CONNECTING, INSTALLATION, 5.7L**.

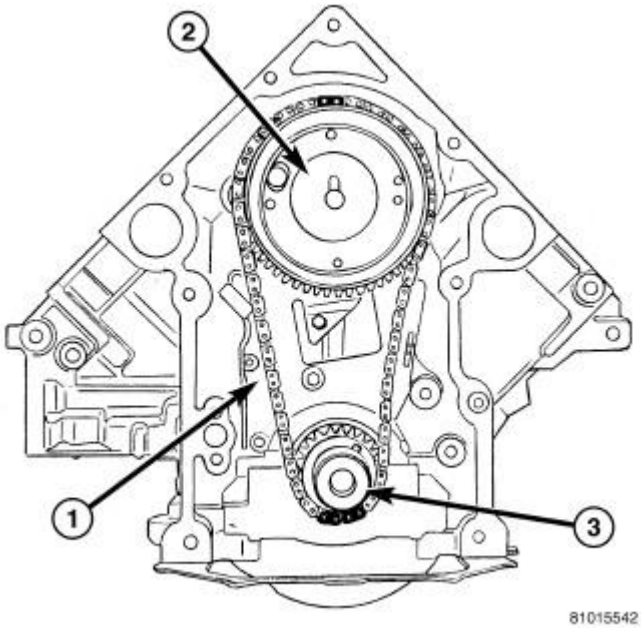

Fig. 200: Crankshaft Sprocket, Camshaft Sprocket & Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

1 - Chain Tensioner
2 - Camshaft Sprocket
3 - Crankshaft Sprocket

12. Install timing drive (2). Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION, 5.7L**.

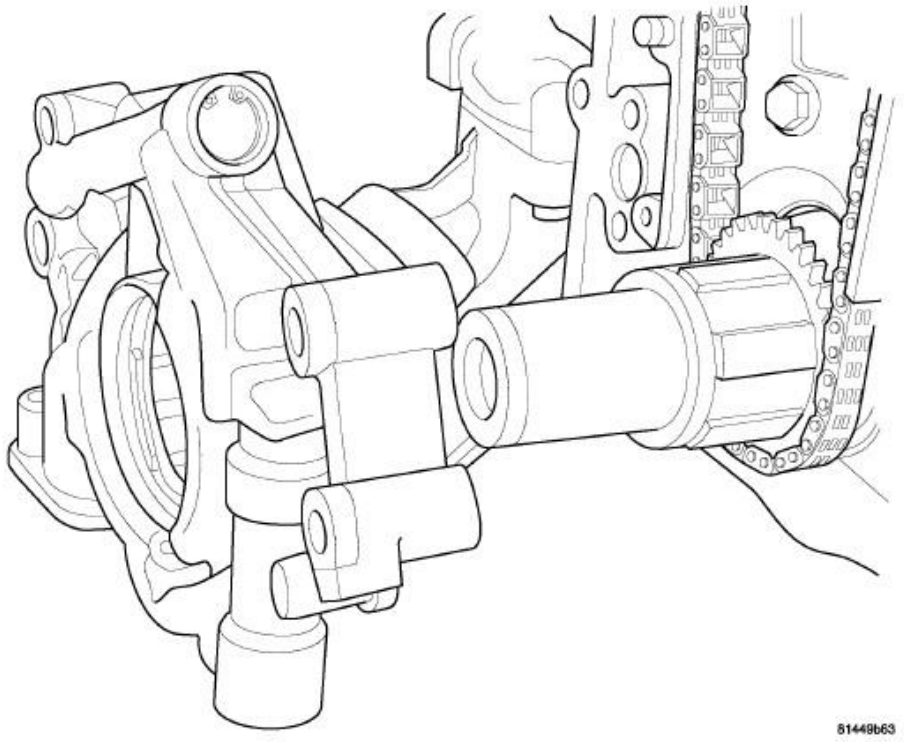

Fig. 201: Removing/Installing Oil Pump
Courtesy of CHRYSLER GROUP, LLC

13. Install oil pump. Refer to **PUMP, ENGINE OIL, INSTALLATION, 5.7L**.

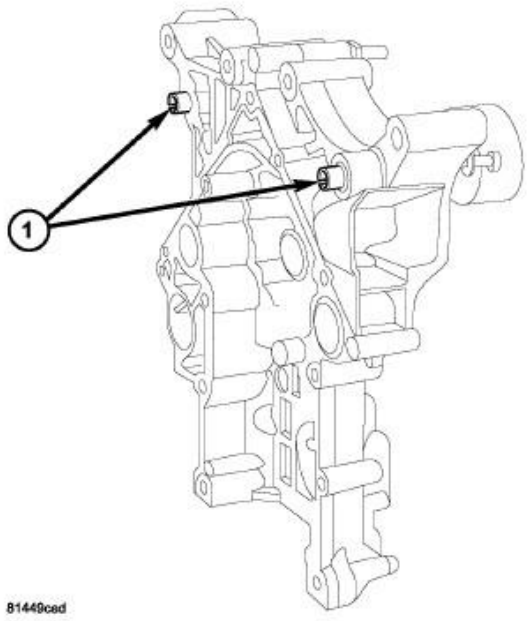

Fig. 202: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

14. Install the timing chain case cover (1). Refer to **COVER(S), ENGINE TIMING, INSTALLATION, 5.7L**.

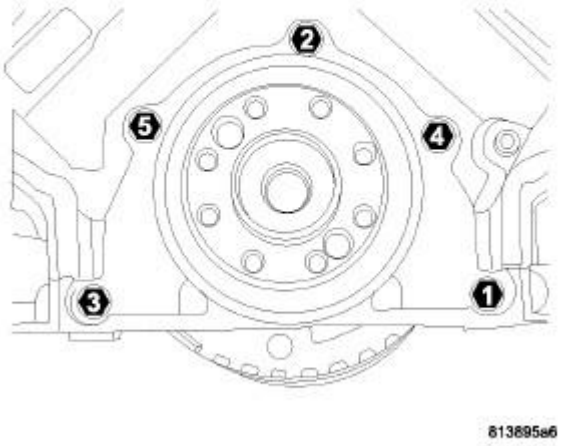

Fig. 203: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

15. Install the rear main seal and retainer. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL,**

INSTALLATION, 5.7L.

16. Install the windage tray/oil pan gasket.
17. Install the oil pick up tube.
18. Install the oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L** and **PAN, OIL, AWD, INSTALLATION, 5.7L**.

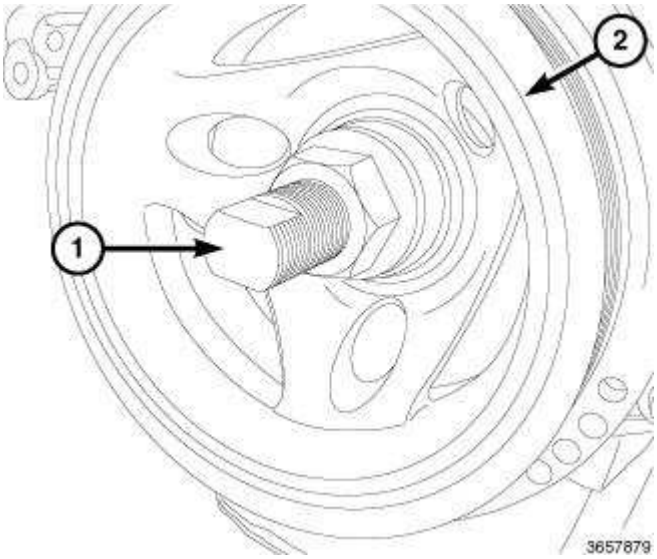

Fig. 204: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

19. Install the vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION, 5.7L**.
20. Install the engine. Refer to **INSTALLATION, 5.7L**.
21. Connect the negative battery cable.

DAMPER, VIBRATION

DESCRIPTION

DESCRIPTION

The crankshaft damper is used to control the resonance that is produced by the engine. The Noise, Vibration, and Harshness (NVH) created from the crankshaft can be controlled by dissipating the torque energy through the damper.

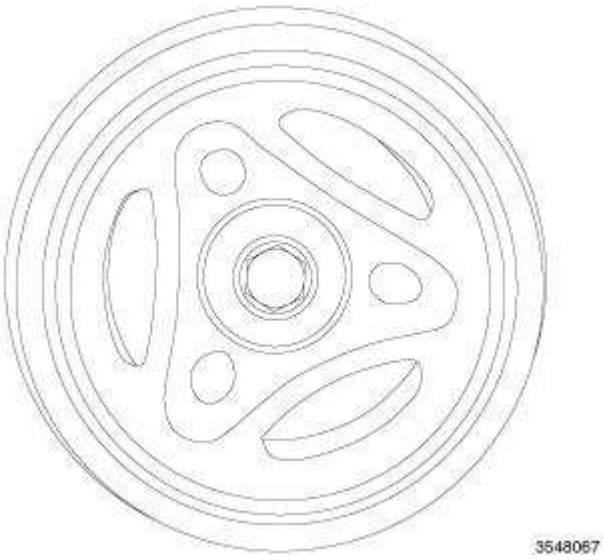

Fig. 205: Crankshaft Damper & Harden Steel Bolt
Courtesy of CHRYSLER GROUP, LLC

The crankshaft damper on the engines is held to the crankshaft by means of a harden steel bolt. The damper is pressed onto a specific machined surface of the crankshaft.

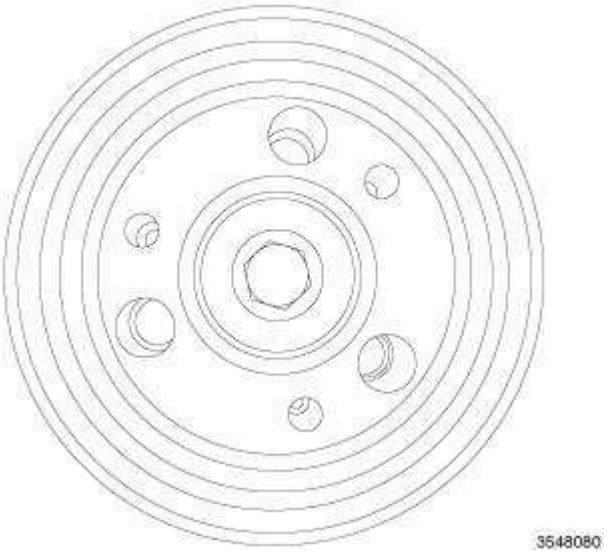

Fig. 206: HEMI® Engine Crankshaft Damper
Courtesy of CHRYSLER GROUP, LLC

The HEMI® Engines incorporate various crankshaft vibration dampers depending on the engine application. And can be removed depending on the application used.

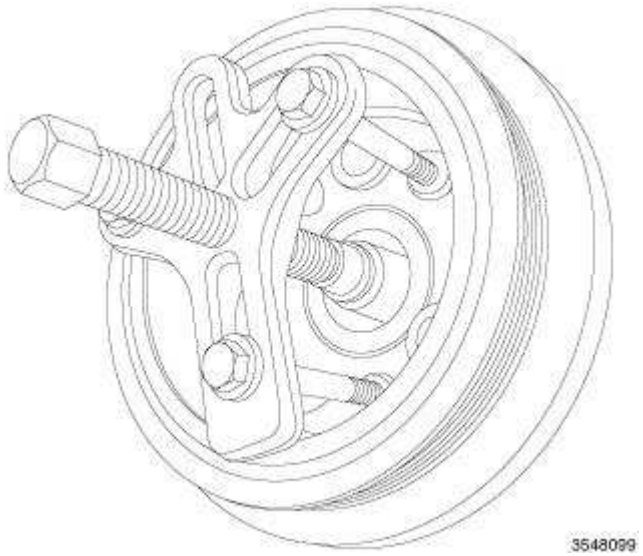

Fig. 207: Removing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

Finding the proper puller for the application will ensure no damage will come to the damper. The flange puller is used by installing 3 bolts into the pre-tapped holes in the damper.

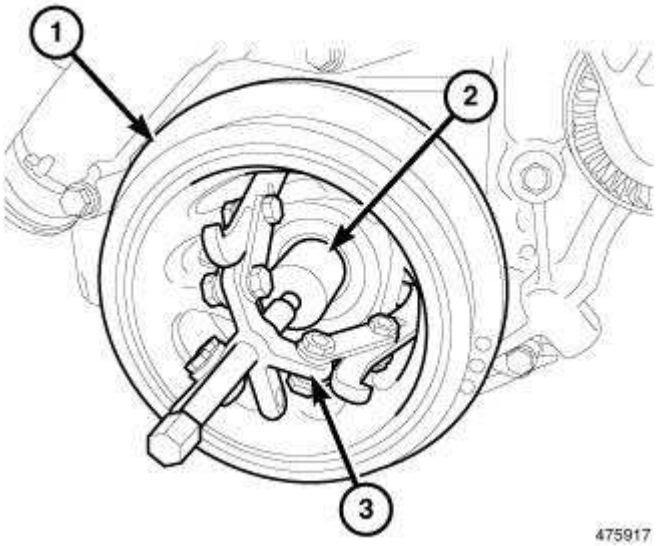

Fig. 208: Removing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

Some pulleys that do not have bolt holes can be removed with a three jaw style (special tool #1023, Puller).

REMOVAL

REMOVAL

1. Disconnect negative cable from battery.

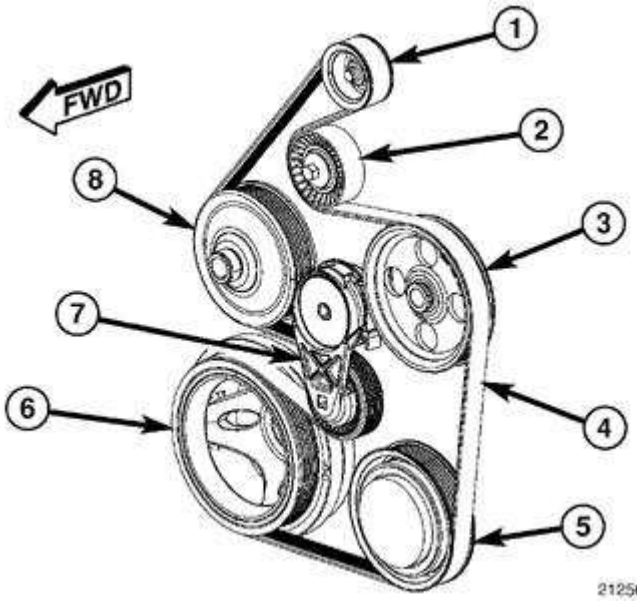

Fig. 209: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

2. Remove accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

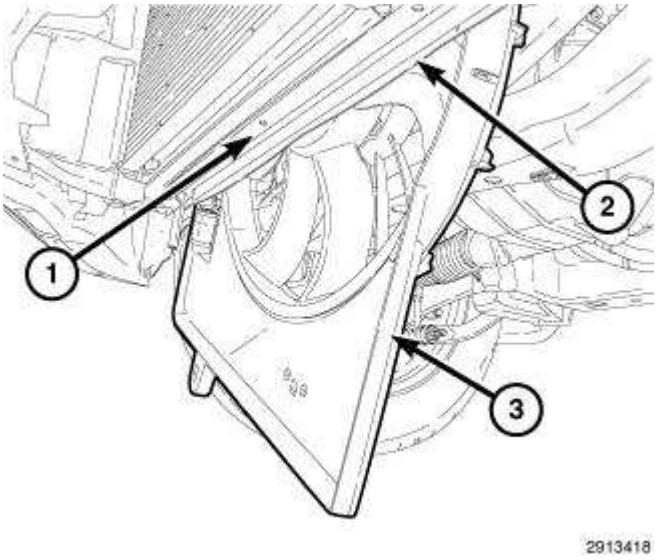

Fig. 210: Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cooling fan. Refer to **FAN, COOLING, REMOVAL** .

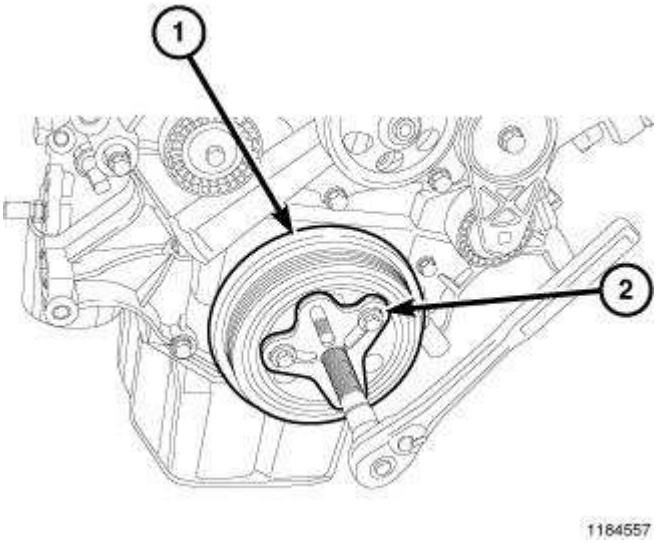

Fig. 211: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

4. Remove crankshaft damper bolt.
5. Install a flange puller (2) and remove the damper (1).

INSTALLATION

INSTALLATION

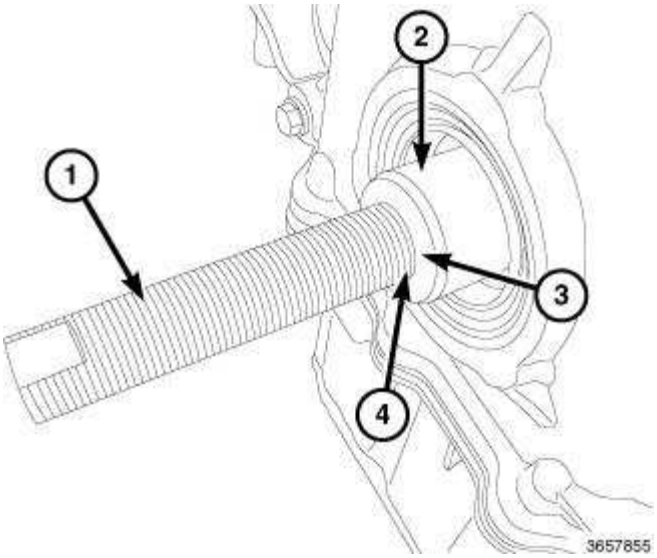

Fig. 212: Installing Vibration Damper Onto Crankshaft Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Position damper onto crankshaft.
2. Using (special tool #10387, Installer, Vibration Damper), install the threaded rod (1) onto the crankshaft (2).

3. Tighten the threaded rod (4) until it is seated to the face (3) of the crankshaft.
4. Install the press washer, bearing, washer, and the press nut onto the threaded rod.
5. Press the vibration damper on till seated.

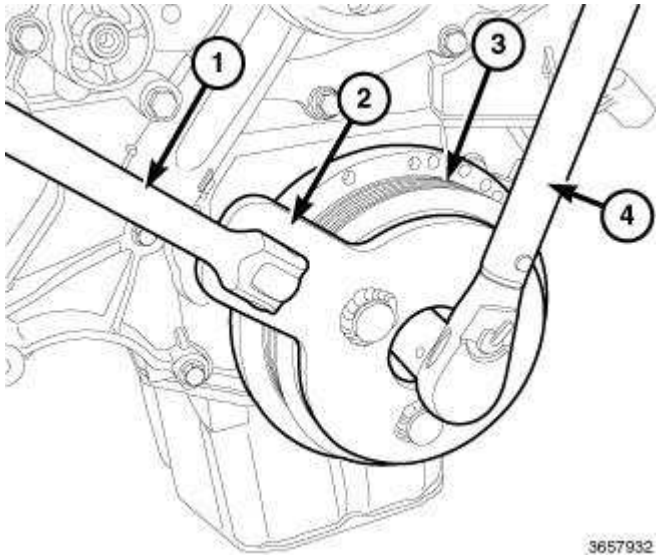

Fig. 213: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

6. Install crankshaft damper bolt.
7. Position the (special tool #10386, Holder, Vibration Damper) (2), onto the vibration damper (3).
8. Tighten bolt to 176 N.m (129 ft. lbs.).

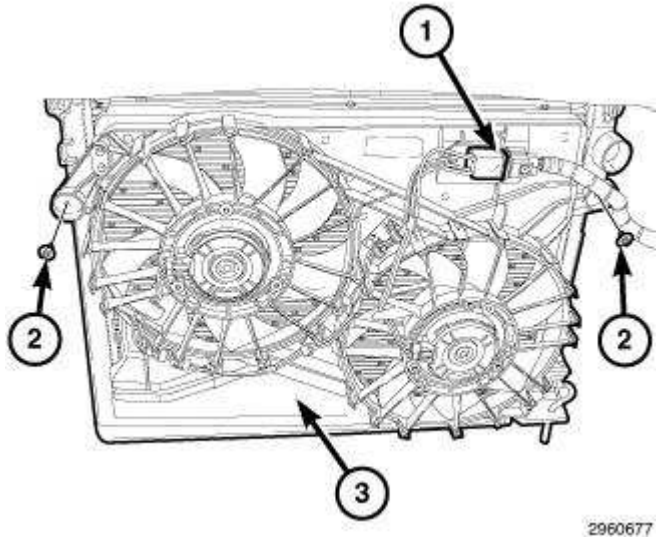

Fig. 214: Cooling Fan Electrical Connector, Bolts & Radiator Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

9. Install cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

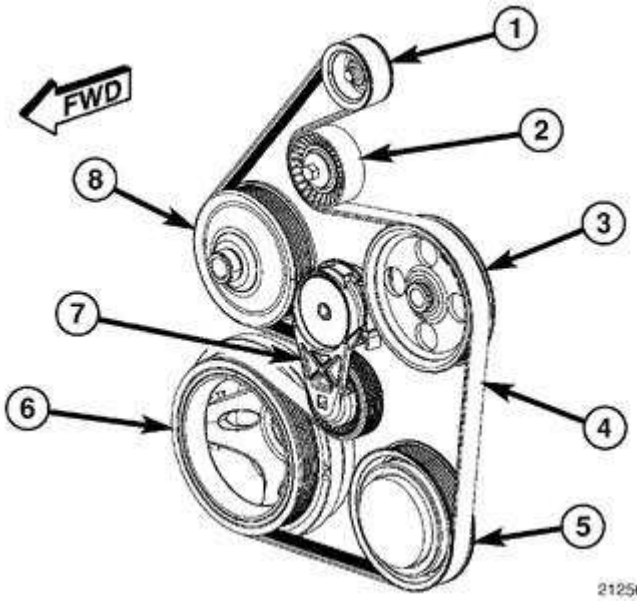

Fig. 215: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

10. Install accessory drive belt (1). Refer to **BELT, SERPENTINE, INSTALLATION** .
11. Refill cooling system. Refer to **STANDARD PROCEDURE** .
12. Connect negative cable to battery.

FLEXPLATE

REMOVAL

REMOVAL

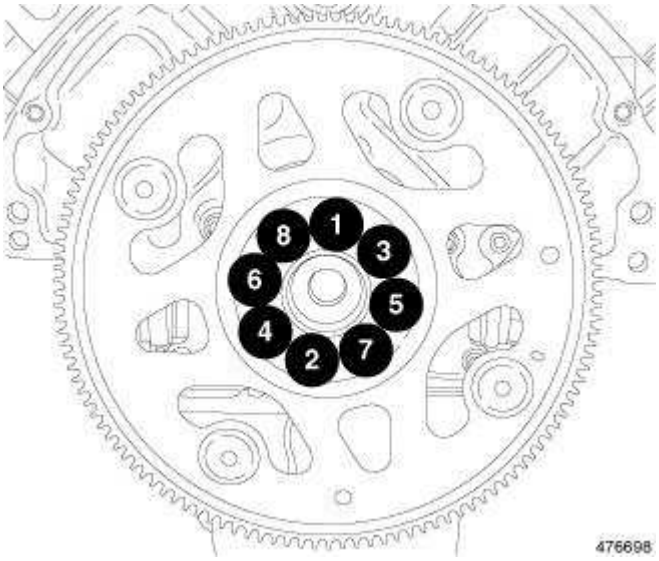

Fig. 216: Flexplate Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .
2. Using the sequence shown in illustration, remove the flexplate retaining bolts.
3. Remove the flexplate.

INSTALLATION

INSTALLATION

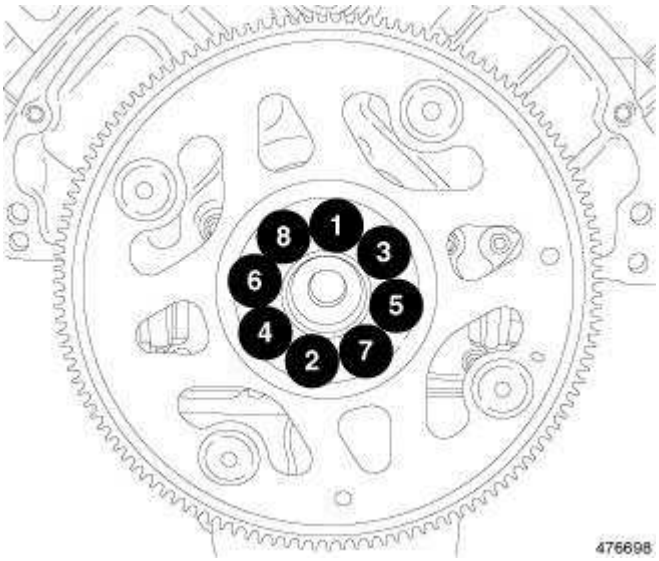

Fig. 217: Flexplate Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Position the flexplate onto the crankshaft and install the retaining bolts hand tight.
2. Using the sequence shown in illustration, tighten the flexplate retaining bolts to 95 N.m (70 ft. lbs.).
3. Install the transmission. Refer to **INSTALLATION** .

LIFTER(S), HYDRAULIC, ROLLER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC TAPPETS

Check the oil pressure before disassembling any part of the engine to correct tappet noise. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3, 000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow five minutes for the oil level to stabilize before checking the oil level. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on the dipstick. Either of these two conditions could be responsible for noisy tappets.

HIGH

If the oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in the oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow the valves to seat noisily.

LOW

Low oil level may allow the oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on the intake side of the oil pump through which air can be drawn creates the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When the oil level and leaks have been corrected, operate the engine at fast idle. Run the engine for a sufficient amount of time to allow all of the air inside the tappets to be bleed out.

TAPPET NOISE DIAGNOSIS

1. To determine the source of tappet noise, crank the engine over with the cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect the noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

   NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm pushrod sockets and pushrod ends for wear.

3. Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.

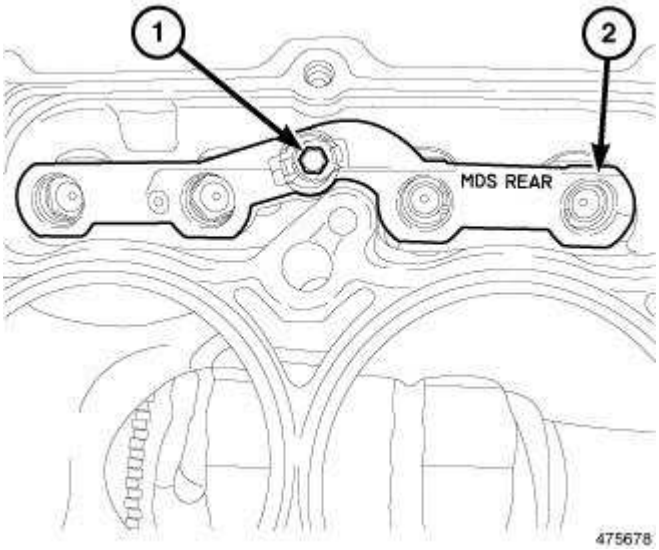

Fig. 218: Rear MDS Lifter Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Remove the tappet guide holder retaining bolt (1) from the tappet guide holder assembly (2).

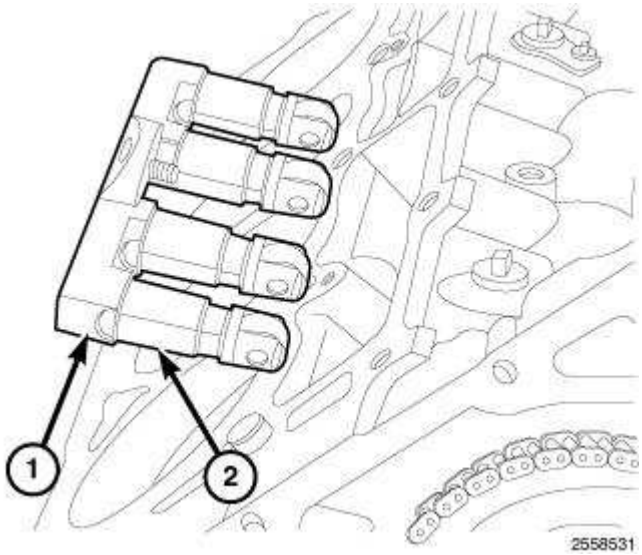

Fig. 219: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The lifter and retainer assembly must be installed as a unit.

CAUTION: If the lifter and retainer assembly are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

4. Remove the tappet guide holder (1) and tappets (2) as an assembly.
5. Check the camshaft lobes for abnormal wear.

INSTALLATION

INSTALLATION

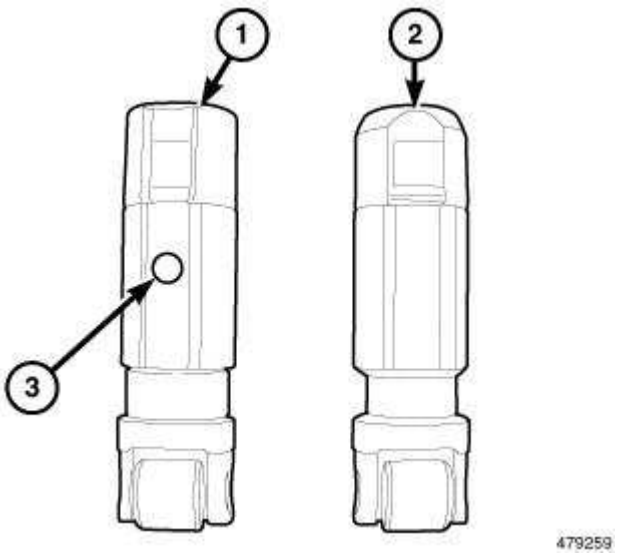

Fig. 220: MDS Lifter
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

CAUTION: Engines equipped with MDS use both standard roller lifters (2) and deactivating roller lifters (1). The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body (3), for the latching pins.

CAUTION: The lifter and retainer assembly must be installed as a unit.

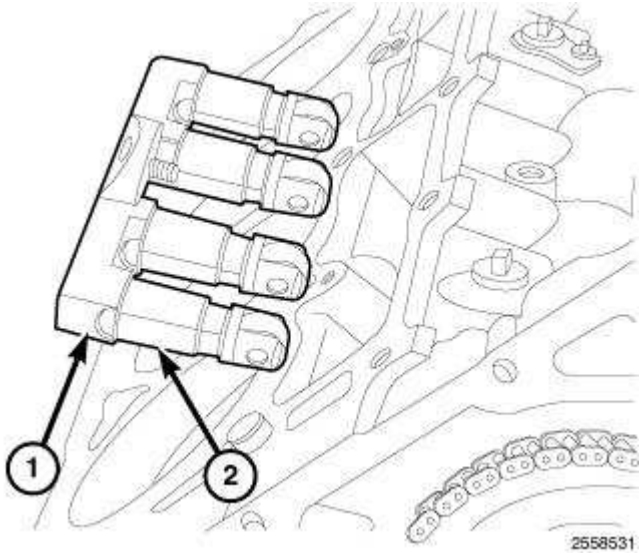

Fig. 221: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the tappet guide holder (1) and tappets (2).

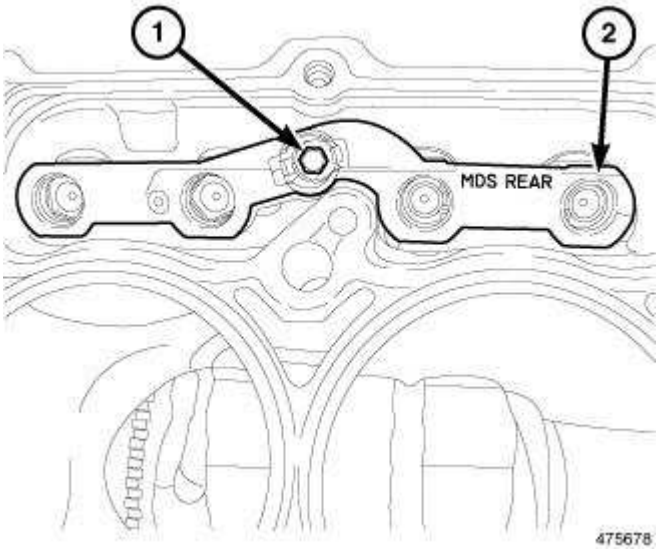

Fig. 222: Rear MDS Lifter Assembly
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the lifters and guide holder assembly are to be reused, they must me installed in their original location.

2. Install the tappet guide holder (2) and tappets.
3. Tighten the tappet retainer bolt (1) to 12 N.m (9 ft. lbs.).
4. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION, 5.7L**.
5. Connect the negative battery cable.

CAUTION: To prevent damage to valve assemblies, do not run the engine above fast idle until all hydraulic lifters have filled with oil and have become quiet.

6. Start the engine and check for leaks.
7. Road test the vehicle.

RETAINER, CRANKSHAFT REAR OIL SEAL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and cannot be serviced separately.

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Raise and support the vehicle.
2. Remove the transmission inspection/torque converter access cover.
3. Inspect the rear of the cylinder block for evidence of oil leakage, note the following:
   - Circular spray pattern generally indicates seal leakage or crankshaft damage.
   - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil gallery pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See appropriate Engine information, for proper repair procedures of these items.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**.

   CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out using an emery cloth.

   CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL, 5.7L**.

REMOVAL

REMOVAL

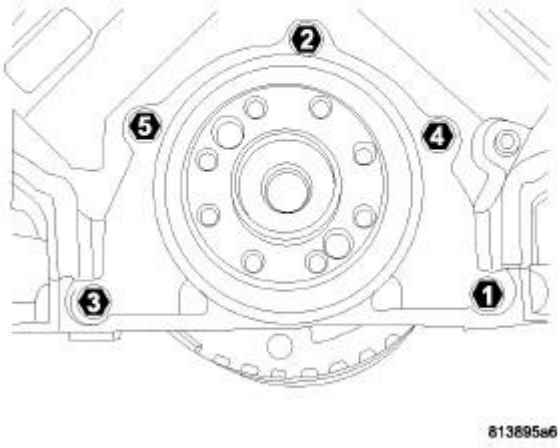

Fig. 223: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

NOTE: This procedure can be performed in vehicle.

1. Disconnect the negative battery cable.
2. Remove the transmission. Refer to appropriate Transmission article.
3. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL, 5.7L**.
4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L** and **PAN, OIL, AWD, REMOVAL, 5.7L**.
5. Using the sequence shown in illustration, remove the rear oil seal retainer mounting bolts.
6. Carefully remove the retainer from the engine block.

INSTALLATION

INSTALLATION

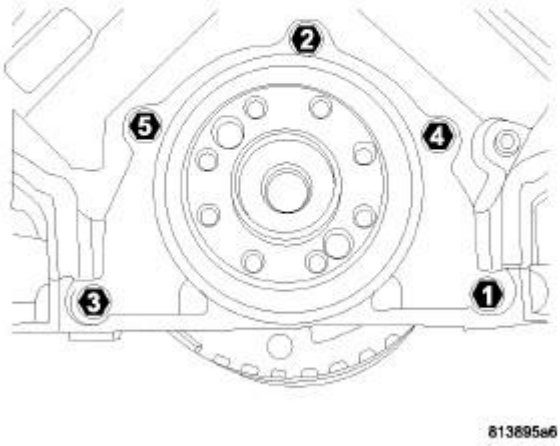

Fig. 224: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

1. Thoroughly clean all gasket residue from the engine block.
2. Position the gasket onto the new crankshaft rear oil seal retainer.
3. Position the crankshaft rear oil seal retainer onto the engine block.
4. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).
5. Install the oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L** and **PAN, OIL, AWD, INSTALLATION, 5.7L**.
6. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION, 5.7L**.
7. Install the transmission. Refer to appropriate Transmission article.
8. Fill the engine with oil.
9. Start the engine and check for leaks.

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

PISTON RING END GAP

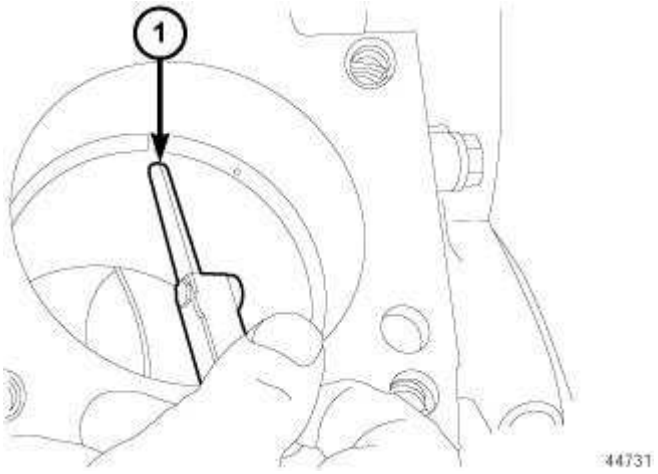

Fig. 225: Checking Piston Ring End Gap Using Feeler Gauge
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

1. Wipe the cylinder bore clean.
2. Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12 mm (0.50 inch.) from bottom of cylinder bore.

3. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.
4. Using a feeler gauge check the ring end gap. Replace any rings not within specification.

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

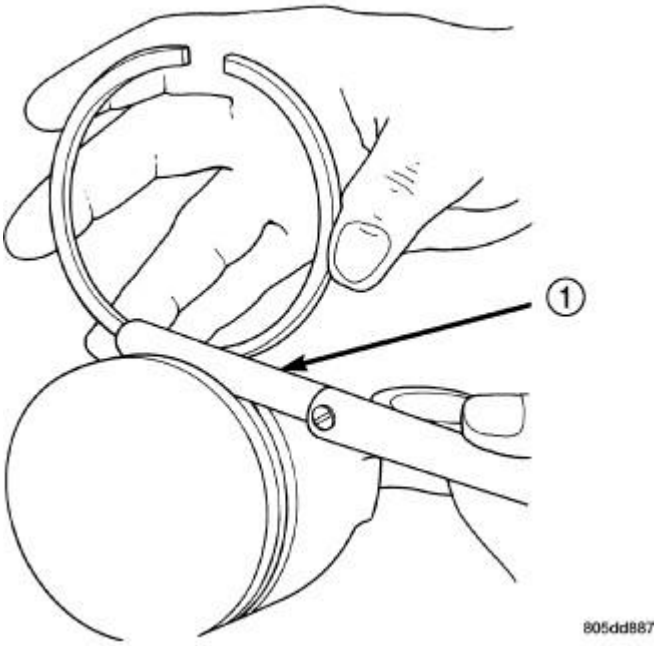

Fig. 226: Measuring Piston Ring Side Clearance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the ring side clearance as shown in illustration make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.
2. Rotate the ring around the piston, the ring must rotate in the groove with out binding.

PISTON RING SPECIFICATION CHART

Piston Ring Position	Piston Ring Side Clearance	Maximum Clearance
Upper Ring		
Metric	0.04 - 0.09 mm	0.11 mm
Standard	0.0015 - 0.0035 in.	0.004 in.
Intermediate Ring		
Metric	0.04 - 0.08 mm	0.10 mm
Standard	0.0015 - 0.0031 in.	0.004 in.
Piston Ring Position	**Piston Ring End Gap**	**Wear Limit**
Upper Ring		
Metric	0.40 - 0.55 mm	0.43 mm
Standard	0.0157 - 0.0216 in.	0.017 in.
Intermediate Ring		
Metric	0.24 - 0.51 mm	0.74 mm
Standard	0.0094 - 0.0200 in.	0.029 in.
Oil Control Ring (Steel Rail)		
Metric	0.015 - 0.66 mm	0.76 mm
Standard	0.0059 - 0.0259 in.	0.030 in.

PISTON RING INSTALLATION

Fig. 227: Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

- **Oil ring expander.**
- **Lower oil ring side rail.**
- **Upper oil ring side rail.**
- **No. 2 Intermediate piston ring.**
- **No. 1 Upper piston ring.**

1. Install the oil ring expander.
2. Install upper side rail by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

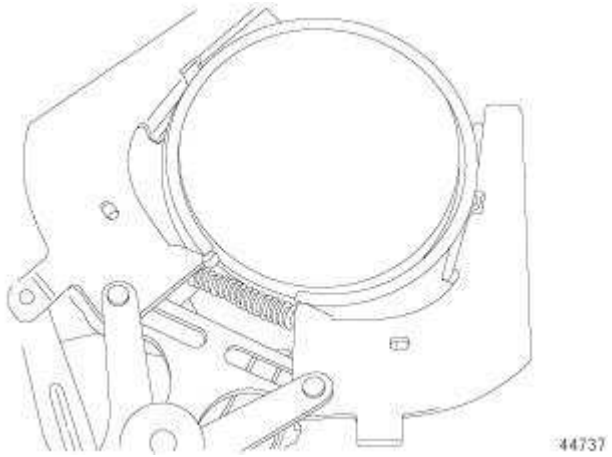

Fig. 228: Installing Upper & Intermediate Rings
Courtesy of CHRYSLER GROUP, LLC

3. Install No. 2 intermediate piston ring using a piston ring installer.
4. Install No. 1 upper piston ring using a piston ring installer.

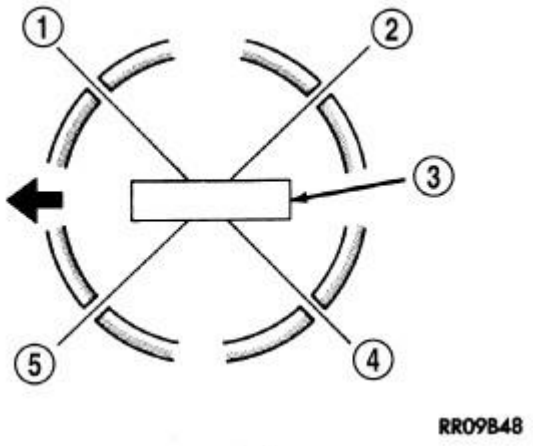

Fig. 229: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the piston rings so the gaps positioned as indicated with the piston viewed from the top.

NOTE: Staggering ring gap is important for oil control.

5. Install the oil expander so the ring gap is located in the (1) position.
6. Install the oil ring rails so the ring gap is located in the (2, 4) position.
7. Install the second compression ring so the ring gap is located in the (3) position.
8. Install the top compression so the ring gap is located in the (1) position.

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote®) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal, with a fractured cap design.

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON FITTING

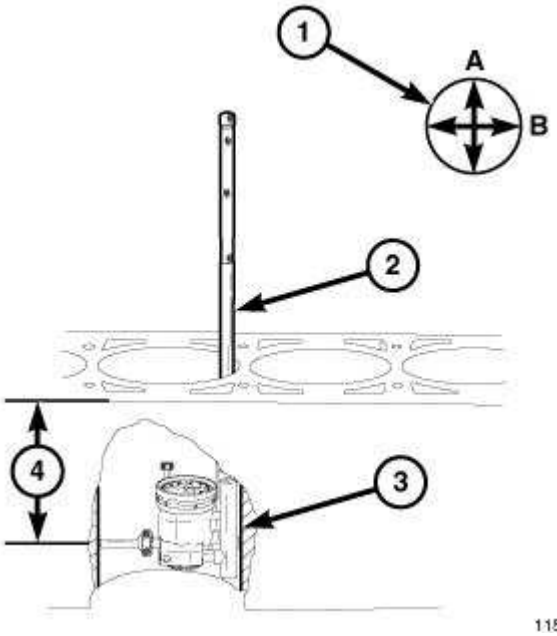

Fig. 230: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

1. To correctly select the proper size piston, use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) Increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below the top of bore (4). Start perpendicular (across or at 90°) to the axis of the crankshaft at point A (1) and then take an additional bore reading 90° at point B (1).
3. The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. The piston-rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder

bank (even numbered) and must not be interchanged.

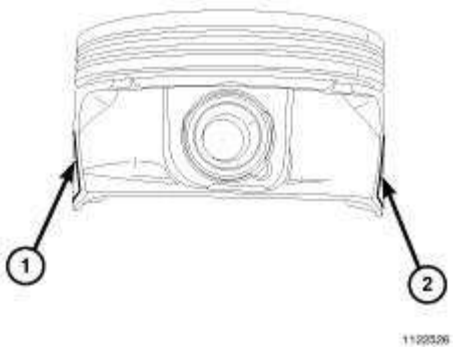

Fig. 231: Piston Diameter Measuring Points
Courtesy of CHRYSLER GROUP, LLC

4. Measure the piston diameter with a micrometer at points (1, 2).

REMOVAL

REMOVAL

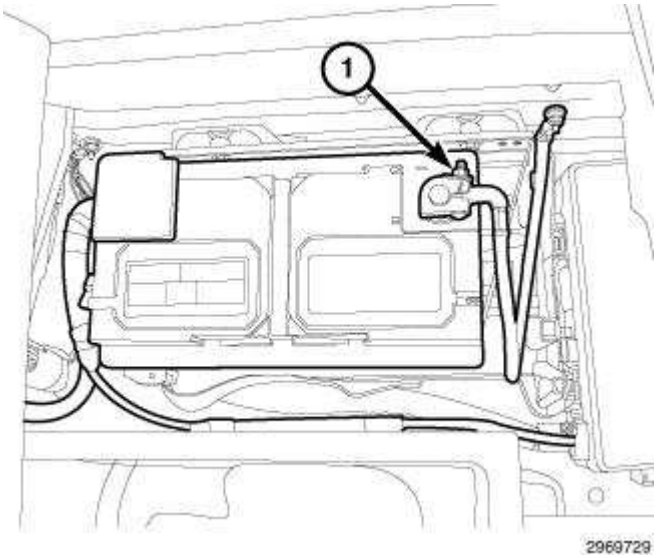

Fig. 232: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable (1).

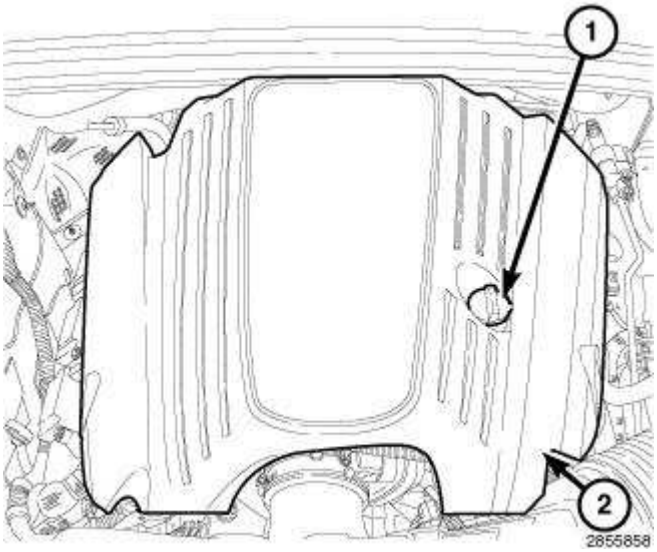

Fig. 233: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine cover (2).

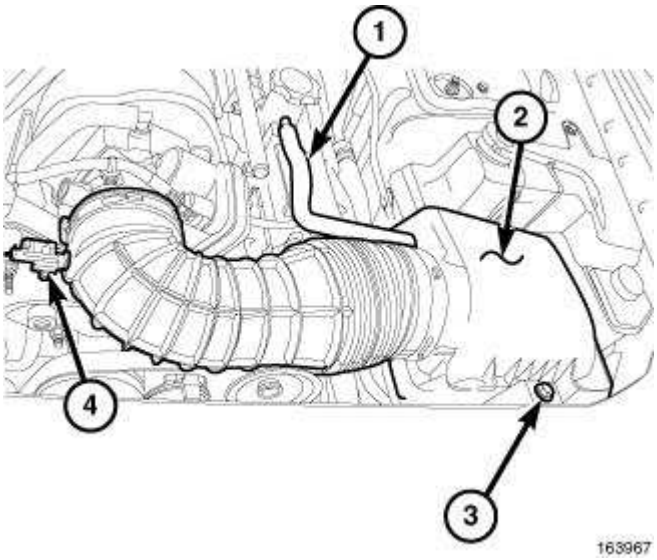

Fig. 234: Makeup Air Hose, Air Cleaner Housing, Retaining Bolt & Intake Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Loosen clamp and disconnect the air duct at throttle body.
5. Disconnect the intake air temperature sensor (4) electrical connector.
6. Remove the makeup air hose (1).
7. Remove the air cleaner housing retaining bolt (3) and remove the air cleaner housing (2).
8. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL, 5.7L**.
9. Raise and support the vehicle.

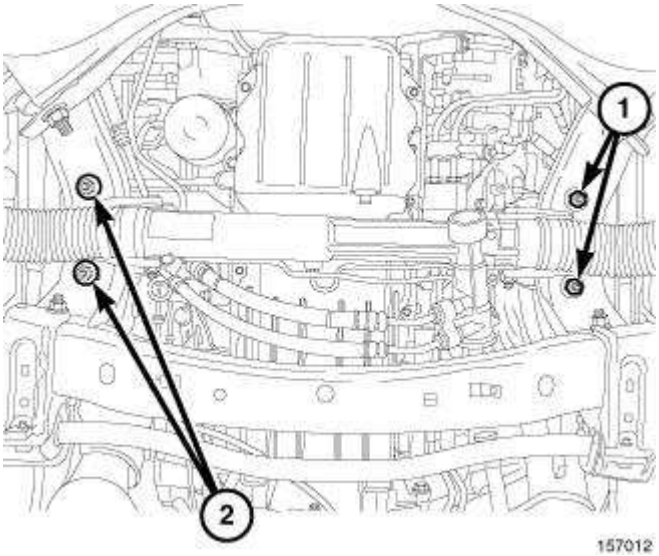

Fig. 235: Engine Mount Nuts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the engine mount nuts (1, 2).

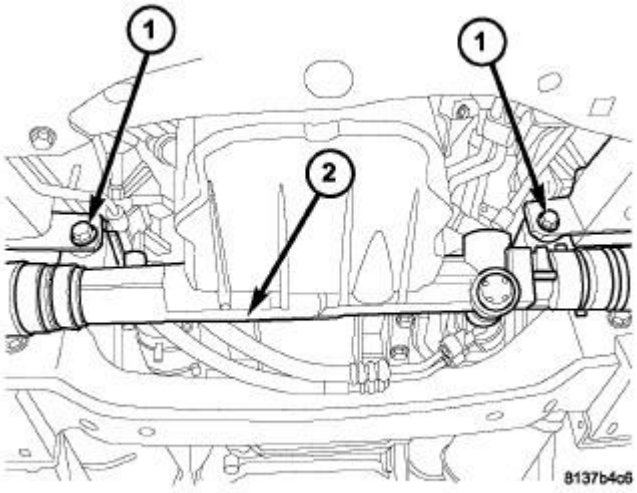

Fig. 236: Gear Mounting Bolts & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

11. Remove the steering gear mounting bolts (1) and position the steering gear (2) aside.
12. Remove the engine oil dipstick and tube from the oil pan.
13. Lower the vehicle.

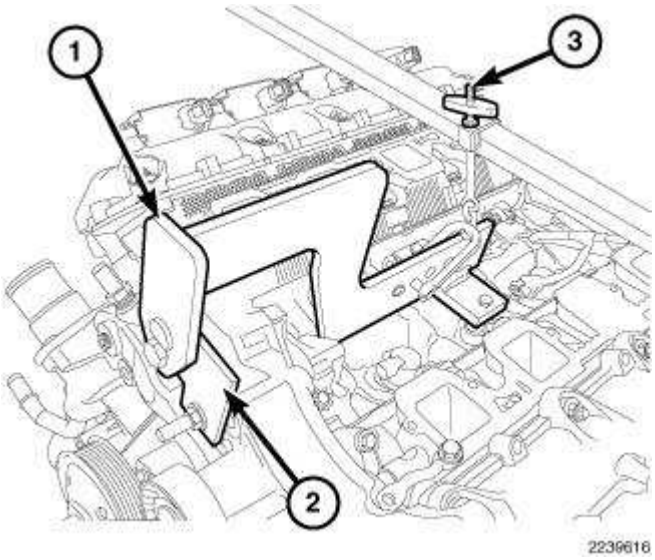

Fig. 237: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install engine lift fixture.

14. Install the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).
15. Raise the engine to provide clearance to remove the oil pan.
16. Raise and support the vehicle.
17. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L** and **PAN, OIL, AWD, REMOVAL, 5.7L**.
18. Lower the vehicle.
19. Remove the timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL, 5.7L**.
20. If necessary, remove the ridge on top of the cylinder bores with a reliable ridge reamer before removing the pistons from the cylinder block. **Be sure to keep the tops of the pistons covered during this operation.**

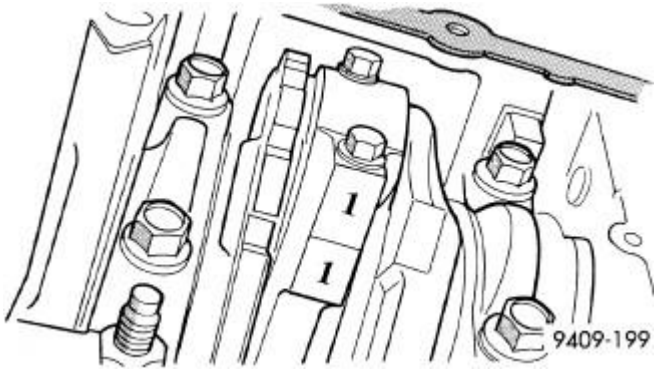

Fig. 238: Mark On Connecting Rod & Bearing Cap
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removal to ensure correct reassembly.

21. Raise and support the vehicle.
22. Mark the connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

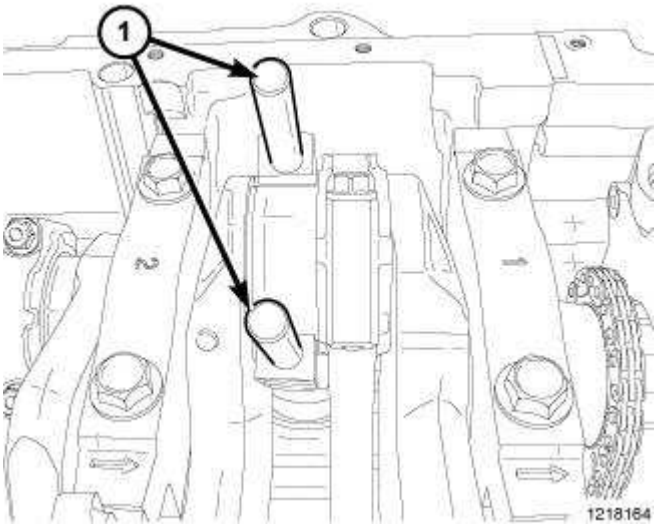

Fig. 239: Connecting Rod Guides
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

NOTE: Pistons and connecting rods assemblies must be removed from the top of cylinder block. When removing the piston and connecting rod assemblies from the engine, rotate the crankshaft so each connecting rod is centered in the cylinder bore.

23. Remove the connecting rod cap, install the Connecting Rod Guides (special tool #8507, Guides, Connecting Rod) (1) and carefully remove the piston from the cylinder bore, repeat this procedure for each piston being removed.
24. Immediately after removing the piston and connecting rod, install the bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

25. Carefully remove the piston rings from the piston(s), starting from the top ring down.

CLEANING

CLEANING

CAUTION: Do not use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent, clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

INSPECTION

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

INSTALLATION

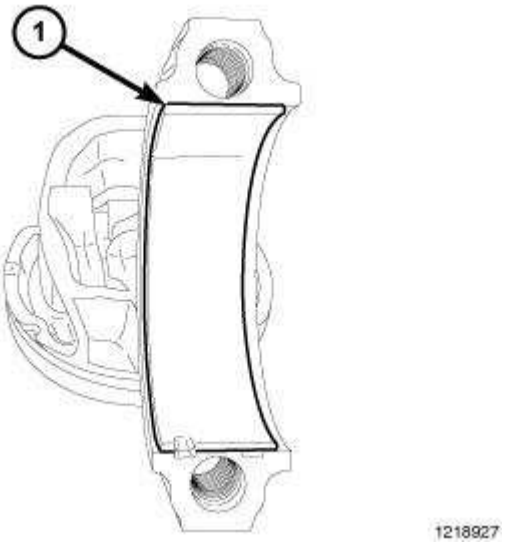

Fig. 240: Rod Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Check piston ring clearance. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
2. Before installing piston and connecting rod assemblies into the bore, install the piston rings. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
3. Immerse the piston head and rings in clean engine oil and position a ring compressor over the piston and rings and tighten the ring compressor. **Ensure the position of rings do not change during this operation.**
4. Position the rod bearing (1) onto the connecting rod and lubricate bearing surface with clean engine oil.

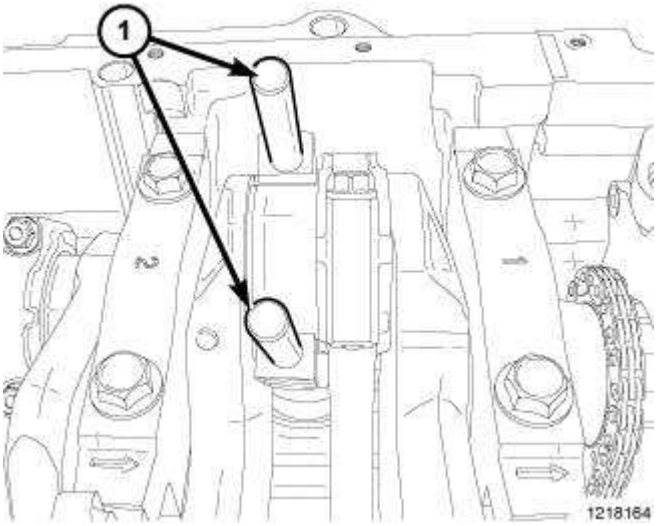

Fig. 241: Connecting Rod Guides
Courtesy of CHRYSLER GROUP, LLC

5. Install Connecting Rod Guides (special tool #8507, Guides, Connecting Rod) (1) into the connecting rod bolt threads.

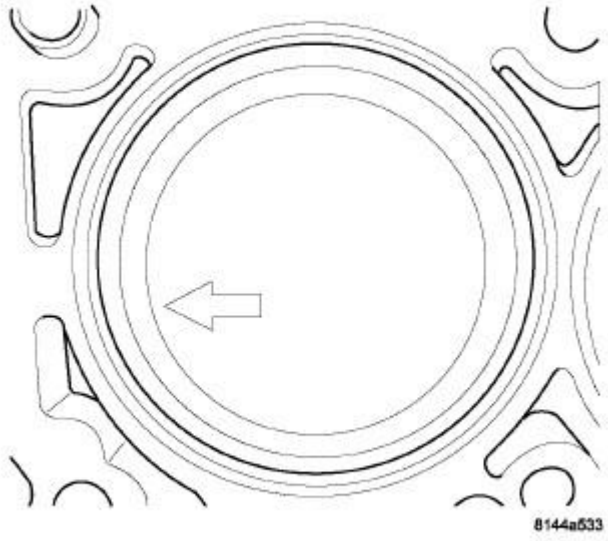

Fig. 242: Piston Direction Arrow
Courtesy of CHRYSLER GROUP, LLC

6. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks.

7. Wipe cylinder bore clean and lubricate with clean engine oil.
8. Rotate the crankshaft until the connecting rod journal is centered with the cylinder bore.
9. Insert the piston and rod assembly into the cylinder bore and carefully position the connecting rod over the crankshaft journal.
10. Tap the piston down into the cylinder bore using a hammer handle while guiding the connecting rod into position on the rod journal.

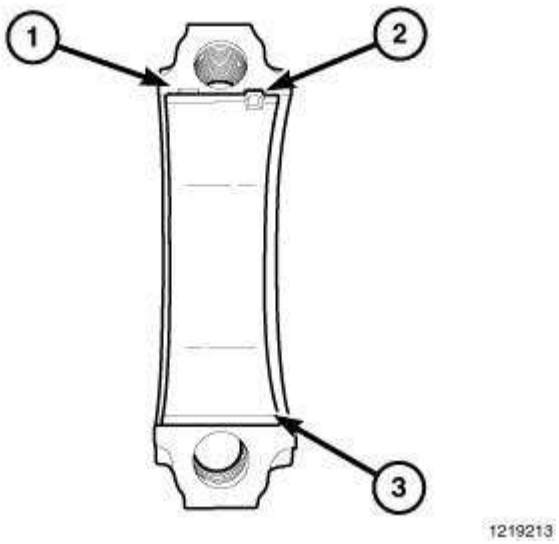

Fig. 243: Connecting Rod Cap & Bearing
Courtesy of CHRYSLER GROUP, LLC

11. Remove the Connecting Rod Guides (special tool #8507, Guides, Connecting Rod).
12. Wipe the connecting rod cap (1) clean and lubricate with clean engine oil and install the bearing (3).

NOTE: The connecting rods and bearing caps are not interchangeable, line up the previously marked bearing caps and connecting rods to ensure assembly to their original location.

13. Lubricate the bearing surfaces with clean engine oil and position the rod cap in place.

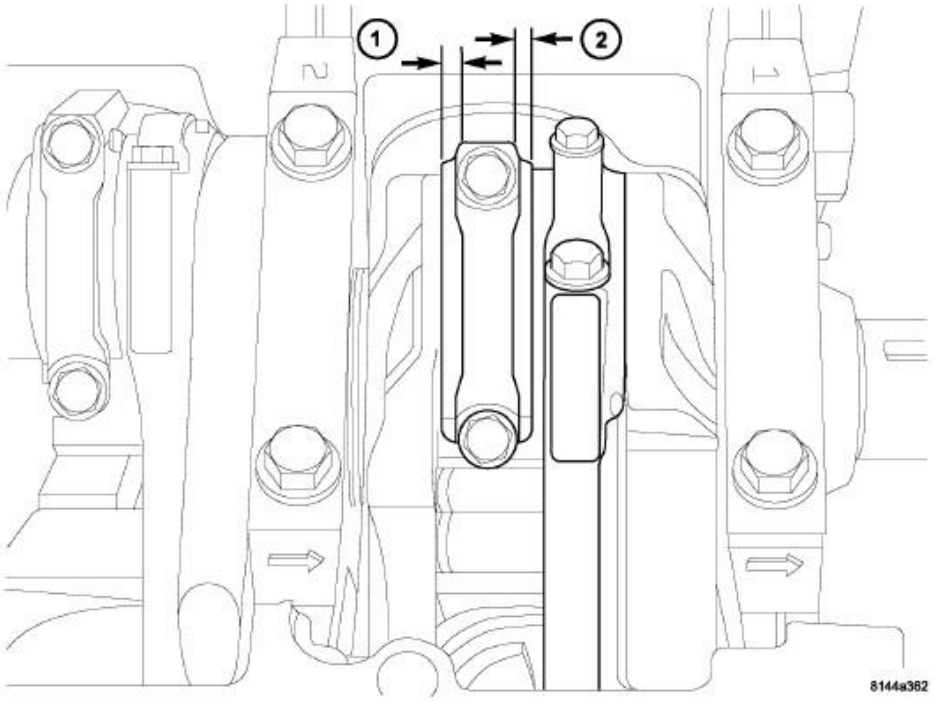

Fig. 244: Connecting Rod Proper Installation
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing the connecting rods, make sure the wide side of the connecting rod faces the crankshaft and the narrow sides face each other.

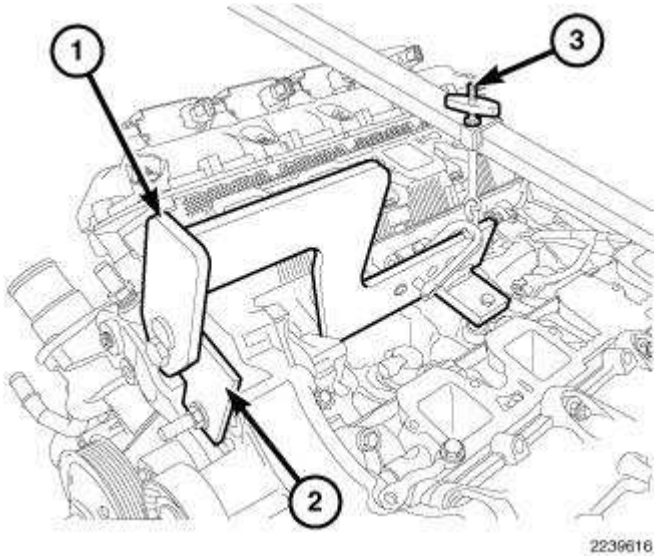

Fig. 245: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always replace the connecting rod bolts whenever they are loosened or removed.

14. Lubricate the new rod cap bolts with clean engine oil, install and tighten to 21 N.m (15 ft. lbs.) plus 90°.
15. Install the timing chain cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION, 5.7L**.
16. Install the new oil pan gasket/windage tray and oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L** and **PAN, OIL, AWD, INSTALLATION, 5.7L**.
17. Install the engine oil dipstick tube and dipstick.
18. Lower the vehicle.
19. Using the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) lower the engine into position and remove.
20. Raise and support the vehicle.

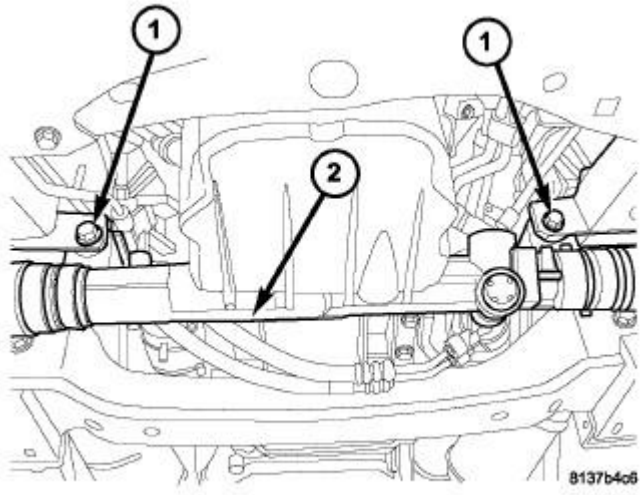

Fig. 246: Gear Mounting Bolts & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

21. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).

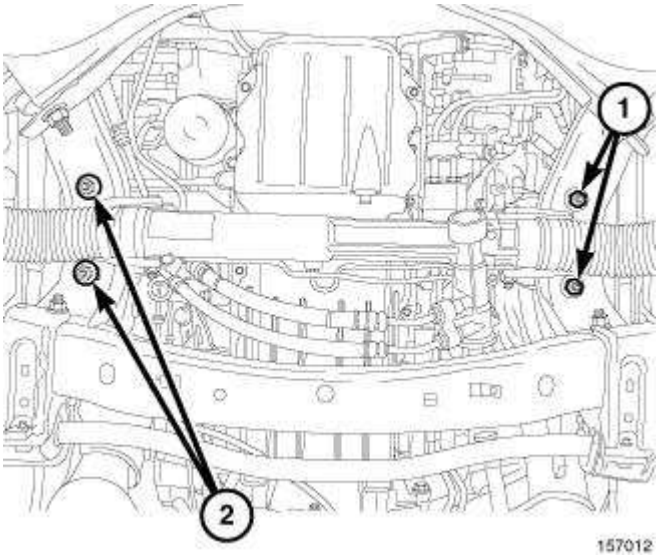

Fig. 247: Engine Mount Nuts
Courtesy of CHRYSLER GROUP, LLC

22. Install the engine mount nuts (1, 2) and tighten to 95 N.m (70 ft. lbs.).
23. Lower the vehicle.
24. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION, 5.7L**.

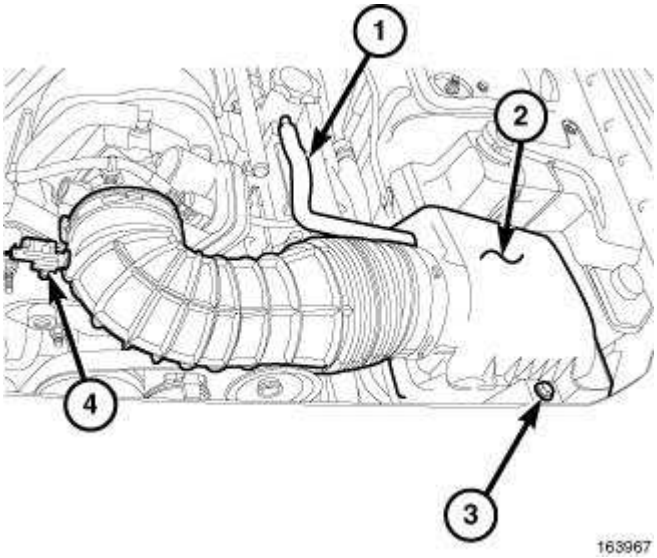

Fig. 248: Makeup Air Hose, Air Cleaner Housing, Retaining Bolt & Intake Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

25. Position the air cleaner housing (2), install the air cleaner housing retaining bolt (3) and securely tighten.
26. Connect the makeup air hose (1).
27. Connect the intake air temperature sensor (4) electrical connector.

28. Connect the air duct to the throttle body and tighten clamp to 3 N.m (30 in. lbs.).
29. Fill the engine with oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

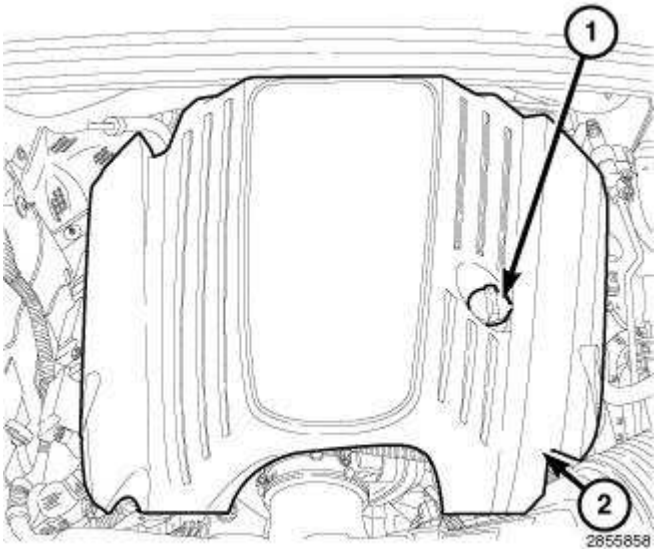

Fig. 249: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

30. Install the engine cover (2).

REMOVAL

REMOVAL

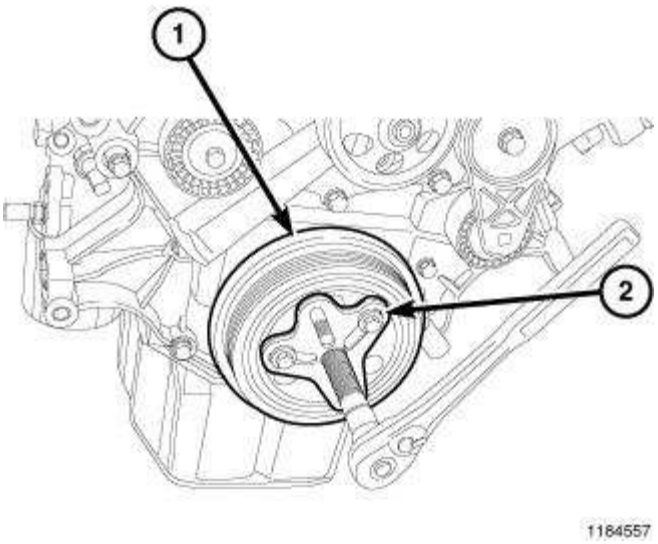

Fig. 251: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative cable from battery.
2. Remove radiator cooling fan. Refer to **FAN, COOLING, REMOVAL** .
3. Remove the vibration damper (1). Refer to **DAMPER, VIBRATION, REMOVAL, 5.7L**.

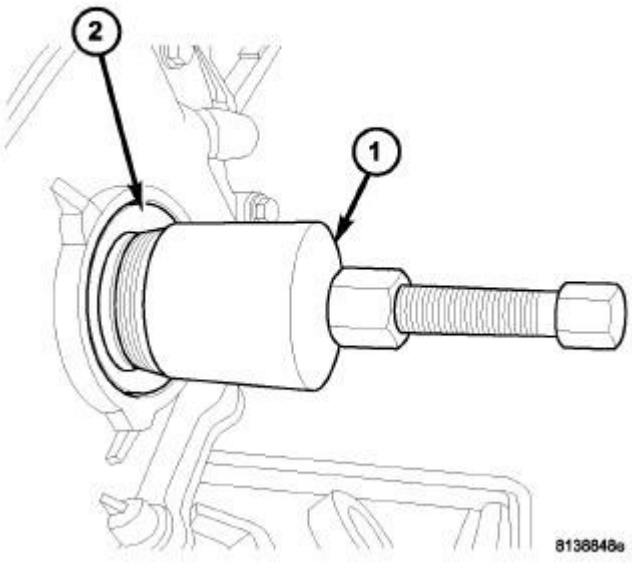

Fig. 252: Front Crankshaft Seal Removal
Courtesy of CHRYSLER GROUP, LLC

4. Using Seal Remover (special tool #9071, Remover, Seal) (1), remove crankshaft front seal (2).

INSTALLATION

INSTALLATION

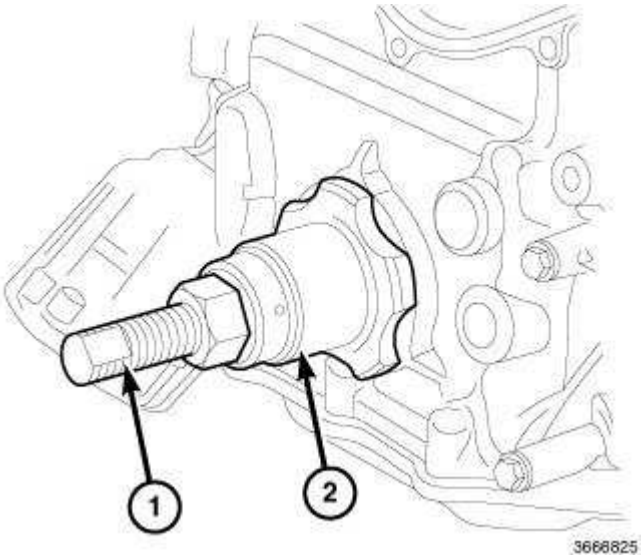

Fig. 253: Front Seal Installation
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The front crankshaft seal must be installed dry. Do not apply lubricant to the sealing lip or the outer edge.

1. Using Crankshaft Front Oil Seal Installer (special tool #9072, Installer, Seal) (2) and (special tool #10387, Installer, Vibration Damper) (1), install crankshaft front seal.

CAUTION: To prevent severe damage to the crankshaft or damper, thoroughly clean the damper bore and the crankshaft nose before installing damper.

2. Install vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION, 5.7L**.
3. Install radiator cooling fan. Refer to **FAN, COOLING, INSTALLATION** .
4. Refill cooling system. Refer to **STANDARD PROCEDURE** .
5. Connect negative cable to battery.

SEAL, CRANKSHAFT OIL, REAR

DESCRIPTION

DESCRIPTION

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer. For more information, refer to the following;

- **Diagnosis and Testing:** Refer to **Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Diagnosis and Testing**.
- **Removal:** Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL, 5.7L**.
- **Installation:** Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, INSTALLATION, 5.7L**.

SOLENOID, MULTIPLE DISPLACEMENT

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MDS SOLENOID

The Multi-Displacement System (MDS) has the following detectable issues:

- solenoid circuit
- fail to deactivate a cylinder(s)
- fail to reactivate a cylinder(s)
- low oil pressure

CONDITION	POSSIBLE CAUSES	CORRECTION
MDS does not activate	1. Low oil pressure.	1. Check for proper oil pressure.
	2. Bad oil temperature sensor.	2. Replace the oil temperature sensor.
	3. Malfunctioning MDS solenoid.	3. Replace the solenoid.
	4. Malfunctioning MDS tappet.	4. Replace tappet (s).
MDS does not deactivate	1. Low oil pressure.	1. Check or proper oil pressure.
	2. Bad oil temperature sensor.	2. Replace the oil temp sensor.
	3. Malfunctioning MDS solenoid.	3. Replace the solenoid.
	4. Malfunctioning MDS tappet.	4. Replace tappet(s).

REMOVAL

REMOVAL

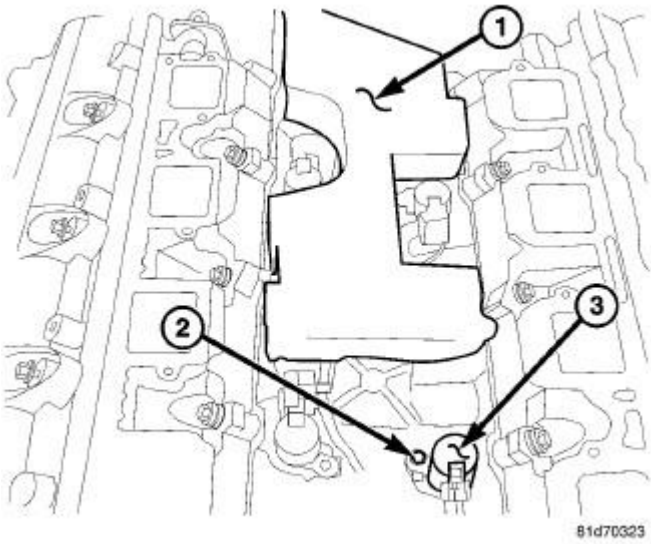

Fig. 254: Intake Manifold Foam Insulator Pad, MDS Solenoids & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.
3. Remove foam insulator pad (1).

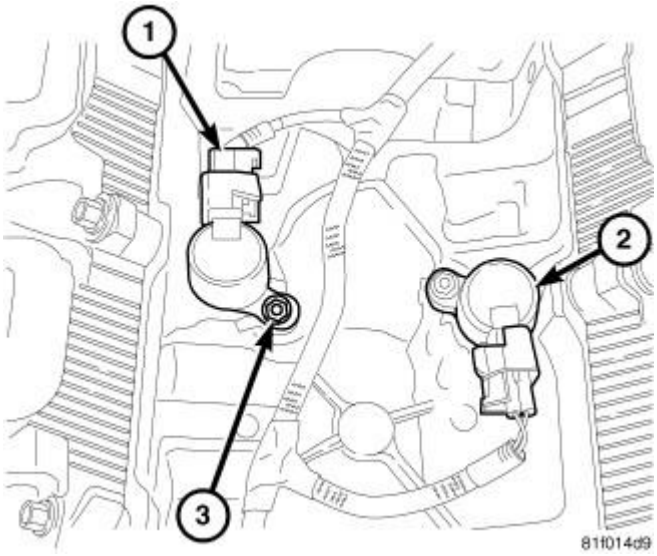

Fig. 255: MDS Solenoids, Electrical Connectors & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the Multiple Displacement Solenoid (MDS) (2) electrical connector(s) (1).
5. Remove the MDS solenoid (2) retaining bolt(s) (3).

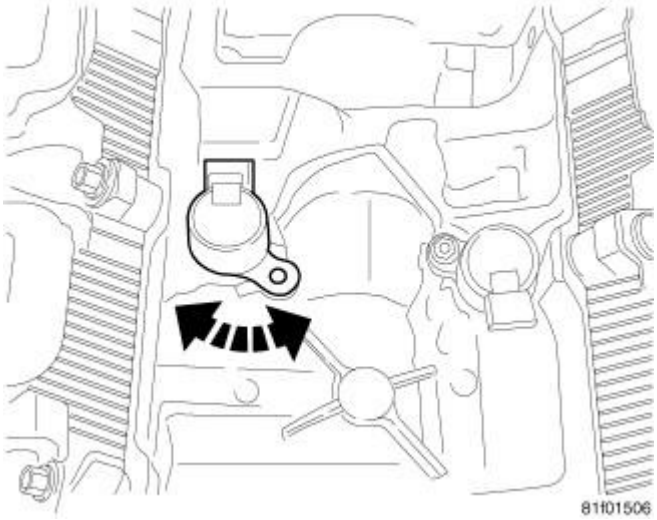

Fig. 256: MDS Solenoid Removal
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not try to pry the solenoid out. This could lead to breakage and contamination of the lubrication system.

6. Lightly tap on the MDS solenoid(s) with a rubber mallet. Rotate the MDS solenoid(s) from side to side to break the seal.
7. Remove the MDS solenoid(s).

INSTALLATION

INSTALLATION

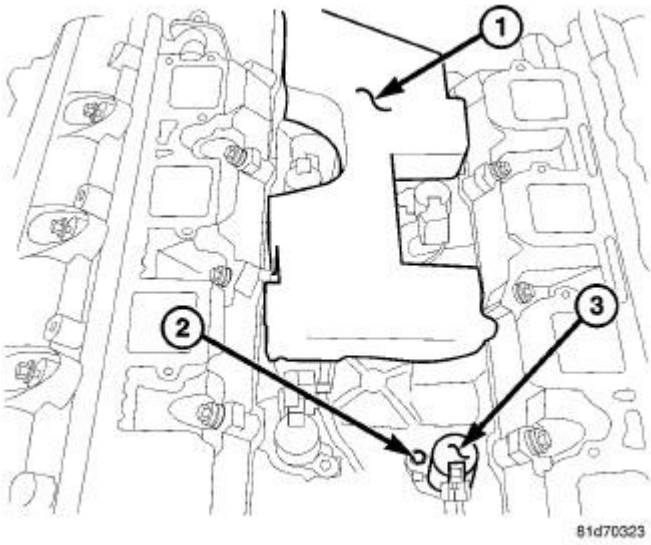

Fig. 257: Intake Manifold Foam Insulator Pad, MDS Solenoids & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Verify the MDS solenoid bores are free of debris before installing the MDS solenoid into the engine block.
2. Install the MDS solenoid(s) (3), ensure the seal is fully seated into the engine block.
3. Install the retaining bolt(s) (2) and tighten to 11 N.m (8 ft. lbs.).
4. Connect the MDS electrical connector to the solenoid(s) (3).
5. Install the foam insulator pad (1).
6. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.

ENGINE MOUNTING

INSULATOR, ENGINE MOUNT, FRONT

REMOVAL

REMOVAL

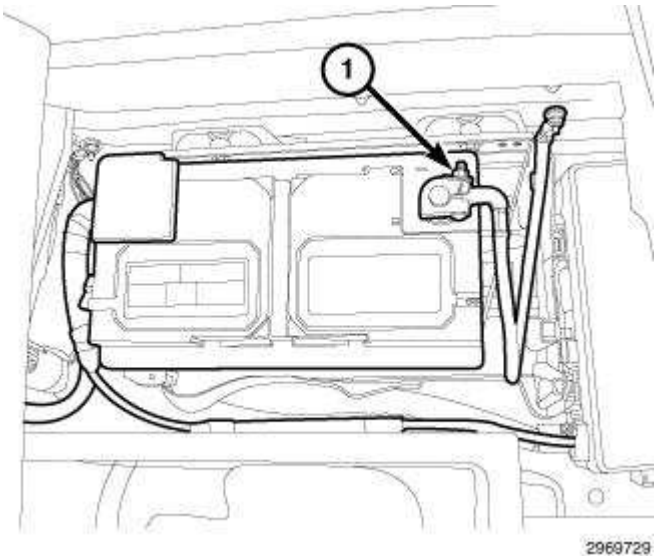

Fig. 258: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.

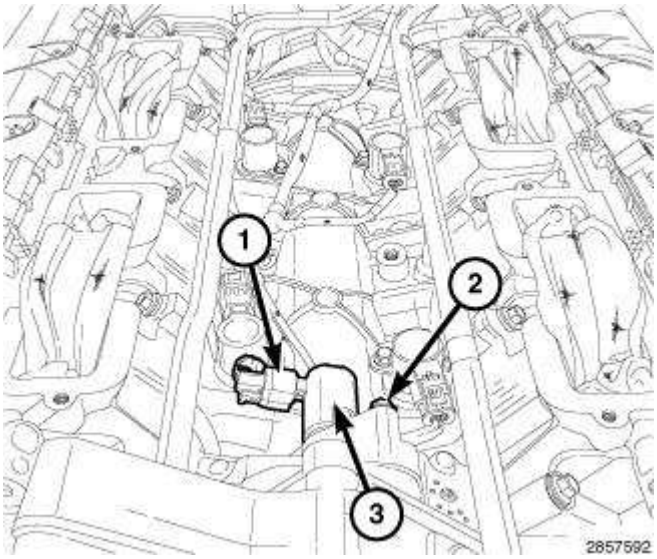

Fig. 259: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Oil Control Valve (OCV) (3) is located under the intake manifold.

3. Disconnect OCV electrical connector (1).
4. Remove OCV retaining bolt (2).

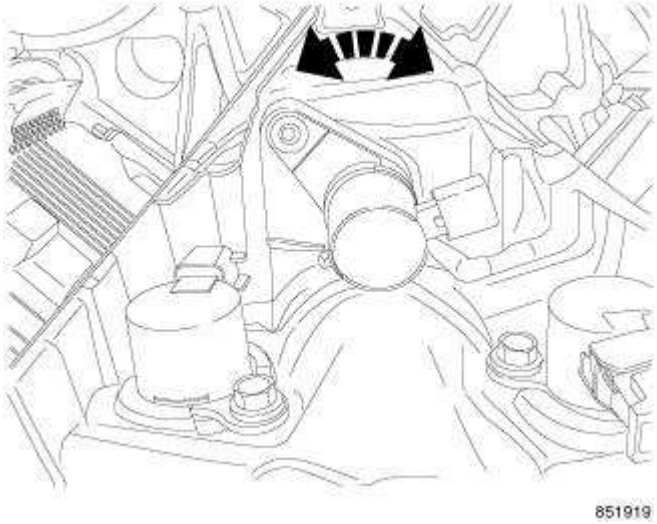

Fig. 260: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the OCV, the engine must be at room temperature.

5. While rotating the OCV back and forth to break the seal, remove the OCV.
6. Remove the engine oil dipstick tube retaining nut at the right exhaust manifold and remove the

dipstick tube.

7. Raise and support the vehicle.

2. Position the rear cross member, install the retaining bolts (2) finger tight.
3. Install the rear transmission mount isolator nuts (1) finger tight.
4. Tighten the transmission crossmember retaining bolts (2) to 68 N.m (50 ft. lbs.).
5. Lower the transmission and remove the jack.
6. Tighten the rear transmission mount isolator retaining nuts (1) to 47 N.m (35 ft. lbs.).

LUBRICATION

DESCRIPTION

DESCRIPTION

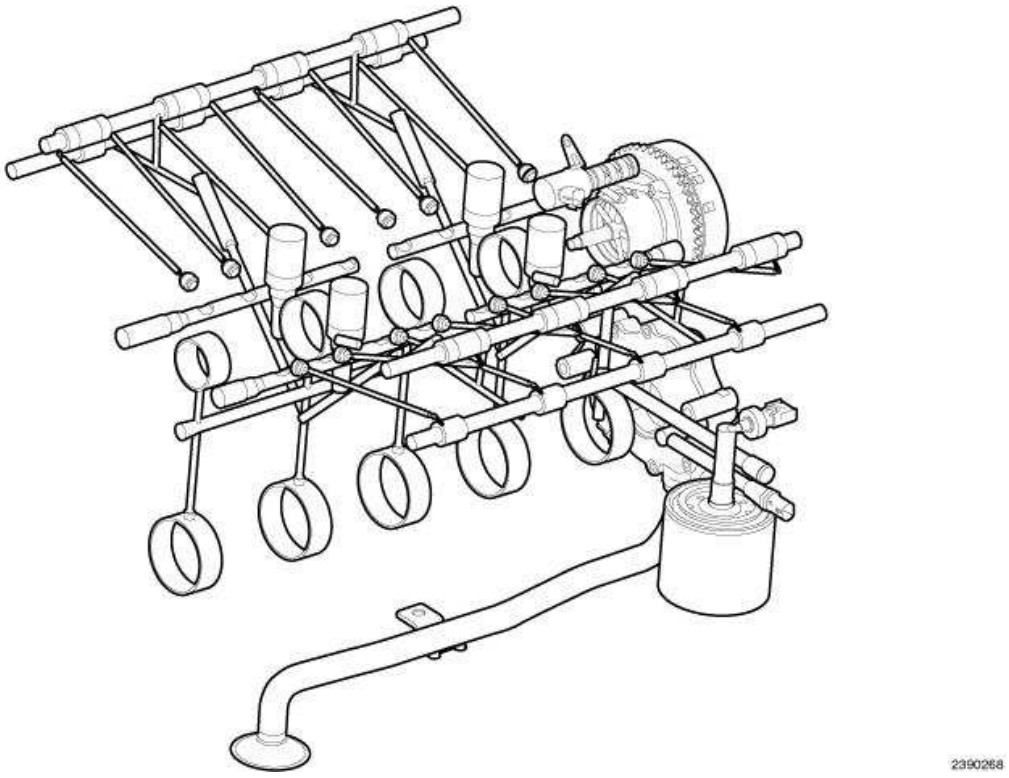

Fig. 308: 5.7L MDS Lubrication System
Courtesy of CHRYSLER GROUP, LLC

The 5.7L MDS lubrication system is a full flow filtration pressure feed type.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Remove the oil pressure sending unit and install gauge assembly (special tool #C-3292A,

Gauge, Pressure).

2. Run the engine until thermostat opens.
3. Oil Pressure:
   - Curb Idle-25 kPa (4 psi) minimum
   - 3000 rpm-170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of the oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

   If the oil leak source is not positively identified at this time , proceed with the AIR LEAK DETECTION TEST METHOD below.

AIR LEAK DETECTION TEST METHOD

1. Remove the PCV valve from the IAFM. Cap or plug the PCV valve grommet.
2. Attach an air hose with a pressure gauge and regulator to the dipstick tube.

   CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

3. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.
4. If the leakage occurs at the rear oil seal area, refer to the information, INSPECTION FOR REAR SEAL AREA LEAK below.
5. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve.
6. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various

speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
    1. Circular spray pattern generally indicates seal leakage or crankshaft damage.
    2. Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil gallery pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**.

    CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

    CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

CONTROL VALVE, OIL INTAKE

DESCRIPTION

DESCRIPTION

The 5.7L engine is equipped with Variable Valve Timing (VVT). This system uses an oil control valve to direct oil pressure into the camshaft phaser assembly. The camshaft phaser assembly advances

and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The oil control valve is located under the intake manifold.

OPERATION

OPERATION

The Variable Valve Timing (VVT) assembly is actuated with engine oil pressure. The oil flow to the VVT assemblies are controlled by an Oil Control Valve (OCV). The OCV consist of a Pulse Width Modulated (PWM) solenoid and a spool valve. The PCM actuates the OCV to control oil flow through the spool valve into the VVT assemblies. The VVT assembly consists of a rotor, stator, and sprocket. The stator is connected to the timing chain through the sprocket. The rotor is connected to the camshaft. Oil flow in to the VVT assembly rotates the rotor with respect to the stator, thus rotating the exhaust camshaft with respect to the timing chain and intake camshaft. An infinitely variable valve timing position can be achieved within the limits of the hardware. The CMP monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

REMOVAL

REMOVAL

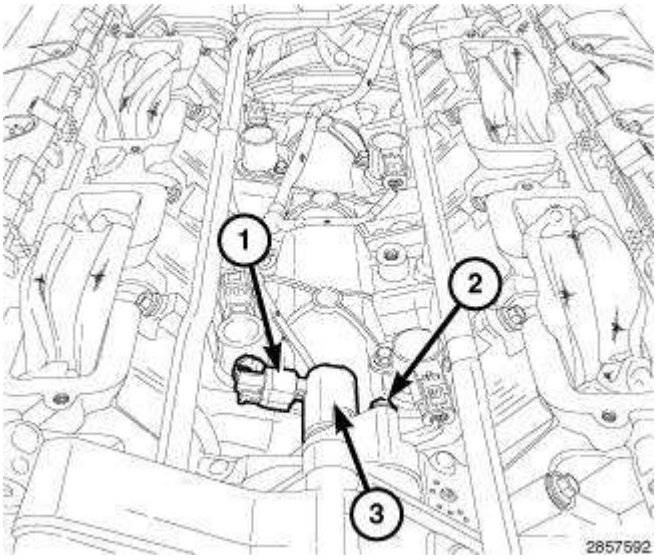

Fig. 309: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Oil Control Valve (OCV) (3) is located under the intake manifold.

1. Remove intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.
2. Disconnect OCV electrical connector (1).
3. Remove OCV retaining bolt (2).

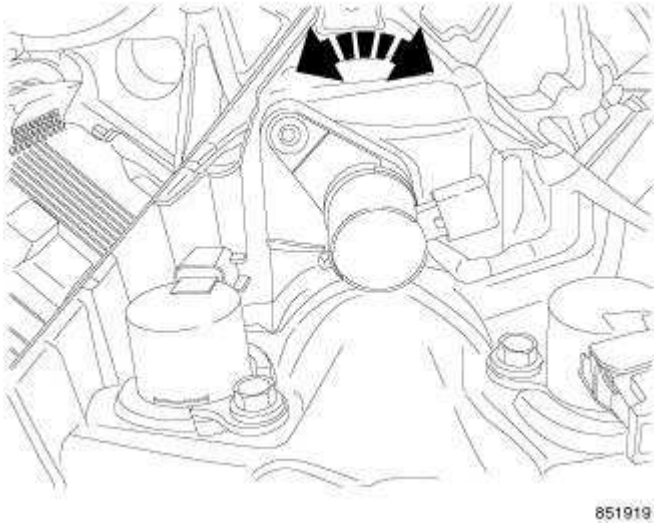

Fig. 310: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the oil control valve, the engine must be at room temperature.

4. Rotate the OCV to break the seal and remove.

INSTALLATION

INSTALLATION

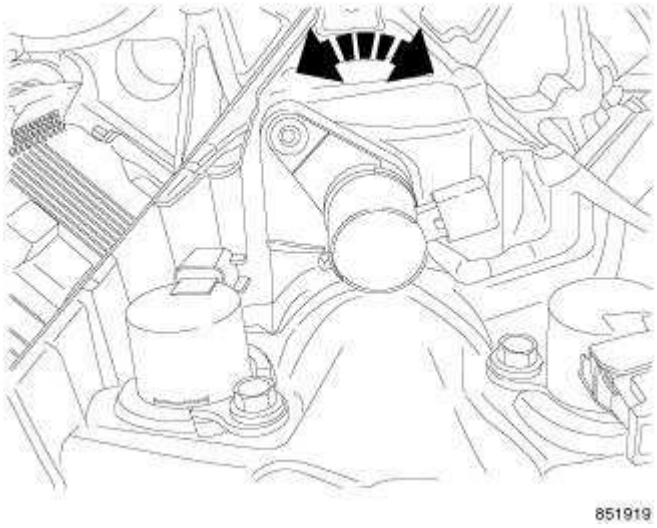

Fig. 311: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the oil control valve (OCV) rubber O-ring seal with clean engine oil.
2. Install the OCV and rotate into position.

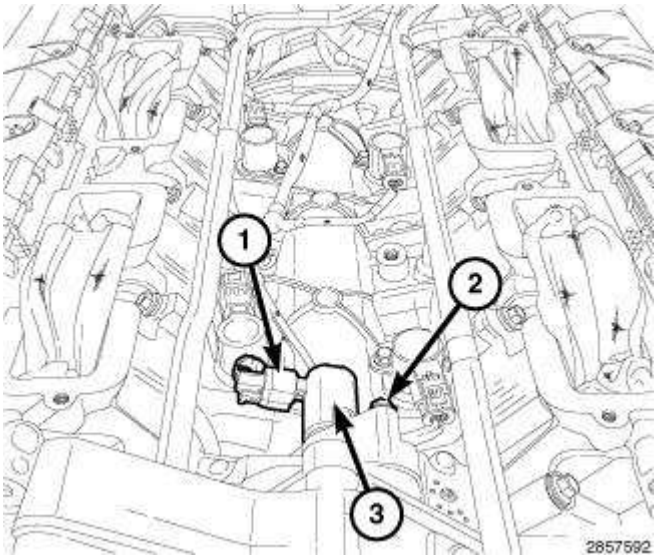

Fig. 312: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the OCV (3) retaining bolt (2) and tighten to 11 N.m (8 ft. lbs.).
4. Connect the OCV electrical connector (1).
5. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.

COOLER AND LINES, OIL

DESCRIPTION

DESCRIPTION

An engine oil cooler is used on the 5.7L engine, equipped with the police package. The cooler is a coolant-to-oil type and mounted between the oil filter and oil filter adapter.

REMOVAL

REMOVAL

1. Raise vehicle on hoist.
2. Drain cooling system. Refer to **STANDARD PROCEDURE** .
3. Disconnect oil cooler coolant hoses.
4. Remove oil filter.
5. Remove oil cooler connector bolt.
6. Remove oil cooler.

INSTALLATION

INSTALLATION

1. Replace oil cooler seal.
2. Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab.
3. Install oil cooler connector bolt. Torque connector bolt to 55 N.m (41 ft. lbs.).
4. Install oil filter.
5. Connect oil cooler coolant hoses.
6. Lower vehicle.
7. Fill cooling system. Refer to **STANDARD PROCEDURE** .

FILTER, ENGINE OIL

REMOVAL

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter.

1. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .
2. Position a drain pan under the oil filter.
3. Using a suitable oil filter wrench loosen filter.
4. Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss.
5. When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: Make sure filter gasket was removed with filter.

6. With a wiping cloth, clean the gasket sealing surface of oil and grime.

INSTALLATION

INSTALLATION

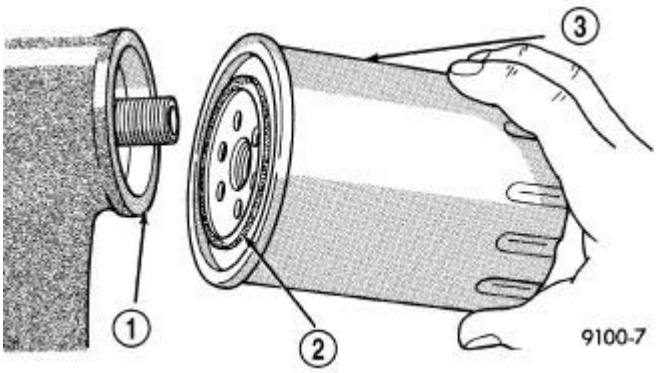

Fig. 313: Installing Engine Oil Filter
Courtesy of CHRYSLER GROUP, LLC

1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

1. Lightly lubricate oil filter gasket (2) with engine oil.
2. Thread filter onto adapter nipple. When gasket makes contact with sealing surface, hand tighten filter one half turn, or 180°, do not over tighten.
3. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.
4. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL SERVICE

The engine oil level indicator is located at the right hand of the engine on the 5.7L engines.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

1. Position vehicle on level surface.
2. With engine OFF, allow approximately five minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
3. Wipe dipstick clean.
4. Install dipstick and verify it is seated in the tube.
5. Remove dipstick, with handle held above the tip, take oil level reading.
6. Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

Run engine until achieving normal operating temperature.

1. Position the vehicle on a level surface and turn engine off.
2. Remove oil fill cap.
3. Hoist and support vehicle on safety stands.
4. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
5. Place a suitable drain pan under crankcase drain.
6. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
7. Install drain plug in crankcase. Torque to 27 N.m (20 ft. lbs.).
8. Lower vehicle and fill crankcase with specified type and amount of engine oil described in this information.
9. Install oil fill cap.
10. Start engine and inspect for leaks.
11. Stop engine and inspect oil level.
12. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this information.

PAN, OIL

REMOVAL

REMOVAL

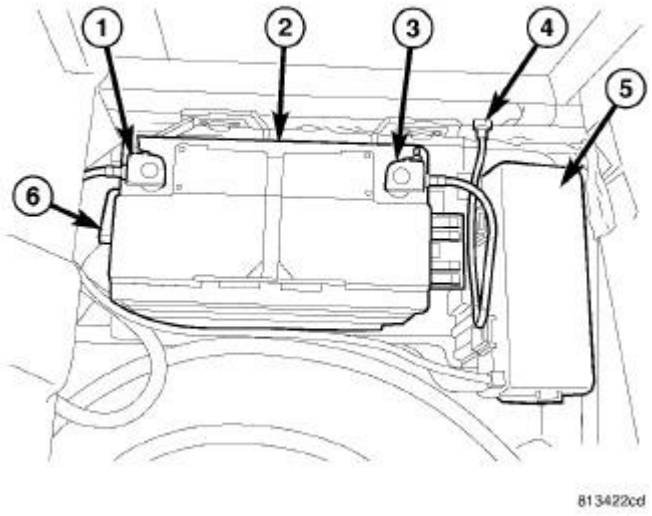

Fig. 314: Battery System Components & PDC Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (3).
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.
3. Raise and support the vehicle.

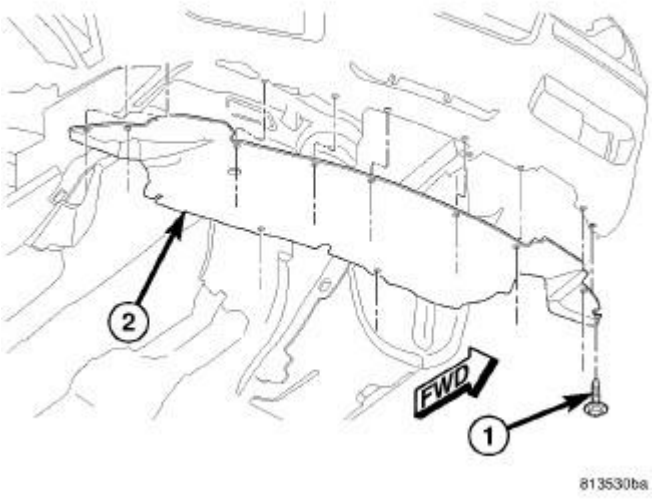

Fig. 315: Front Belly Pan & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the belly pan (2).
5. Drain the engine oil and remove the oil filter.

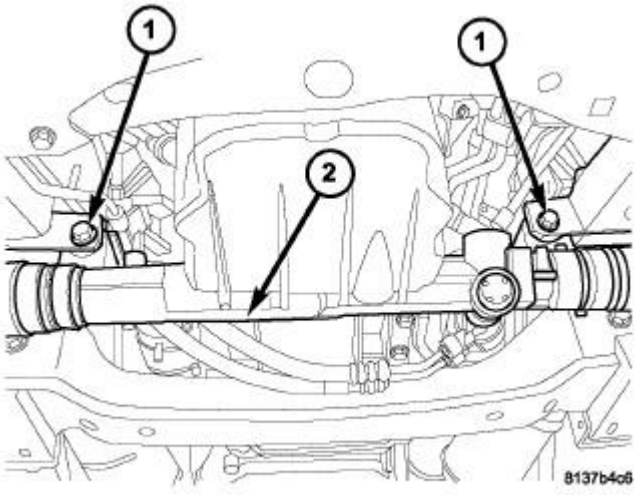

Fig. 316: Gear Mounting Bolts & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not remove P/S hoses, tie rod ends or disconnect steering column coupler.**

6. Remove the steering gear mounting bolts (1) and position the steering gear (2) aside.

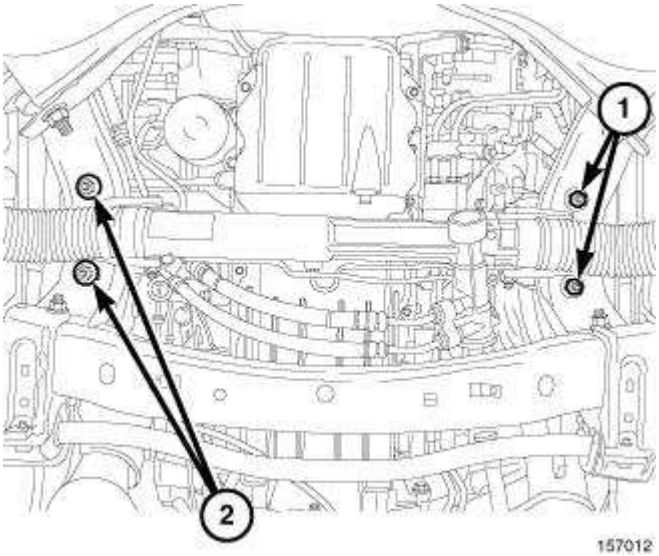

Fig. 317: Engine Mount Nuts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the engine mount nuts (1, 2).
8. Remove the engine oil dipstick and tube from the oil pan.
9. Lower the vehicle.

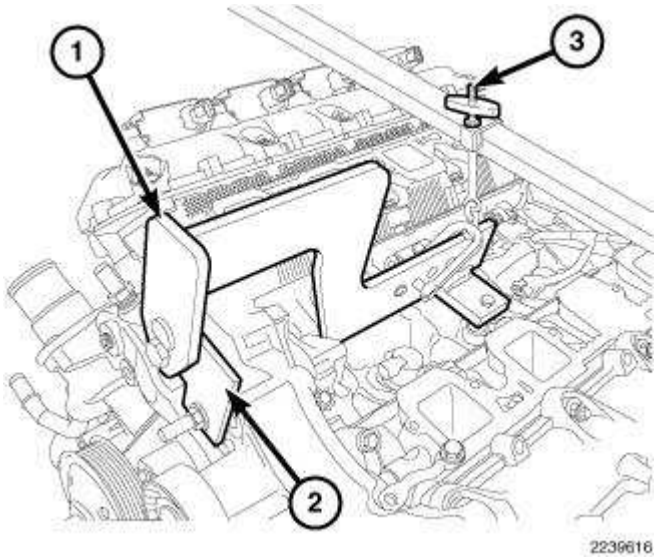

Fig. 318: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install engine lift fixture.

10. Install the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).
11. Raise the engine to provide clearance to remove the oil pan.

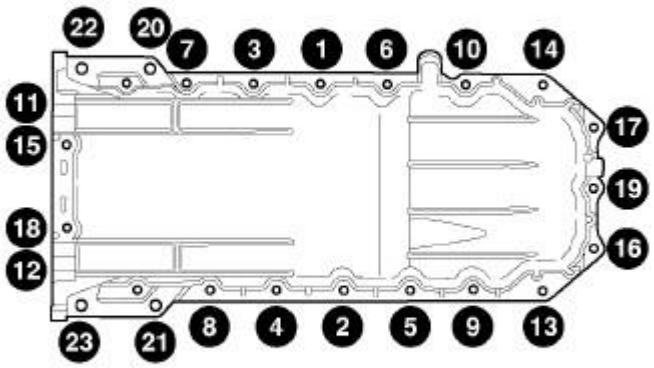

Fig. 319: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not pry on oil pan or oil pan gasket. The gasket is integral to engine windage tray and does not come out with oil pan.

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

12. Remove the M10 fasteners (vertical and horizontal) from the rear of the oil pan to the transmission.
13. Using the sequence shown in illustration, the oil pan mounting bolts and remove the oil pan.

NOTE: When the oil pan is removed a new oil pan gasket/windage tray assembly must be installed, the old gasket cannot be reused.

14. Remove and discard the integral windage tray and gasket.

INSTALLATION

INSTALLATION

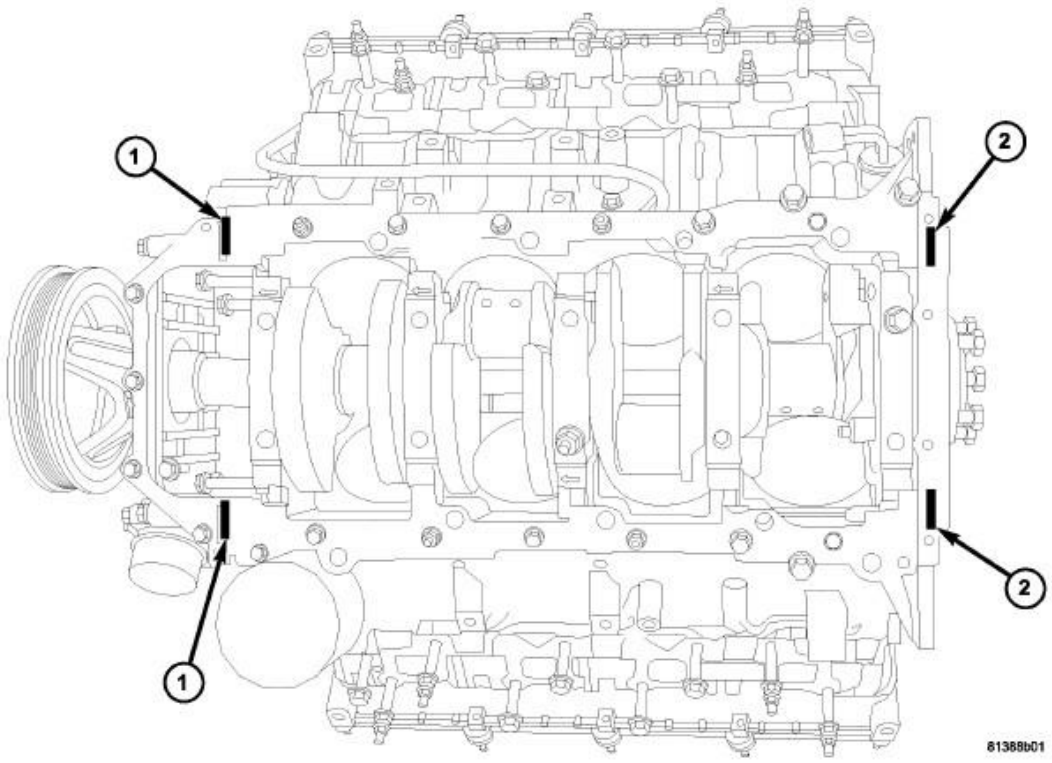

Fig. 320: T-Joint RTV Sealant Application Locations
Courtesy of CHRYSLER GROUP, LLC

1 - Front Cover T-Joints
2 - Rear Oil Retainer T-Joints

1. Clean the oil pan gasket mating surface of the engine block and oil pan.

   NOTE: Mopar® Engine RTV must be applied to the 4 T-joints, (area where the front cover, rear retainer and oil pan gasket meet). The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

2. Apply Mopar® Engine RTV at the 4 T- joints (1, 2).

   NOTE: When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed, the old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray assembly.
4. If removed, reinstall the oil pump pickup tube with a new O-ring and tighten the pickup tube retainers to 28 N.m (21 ft. lbs.).

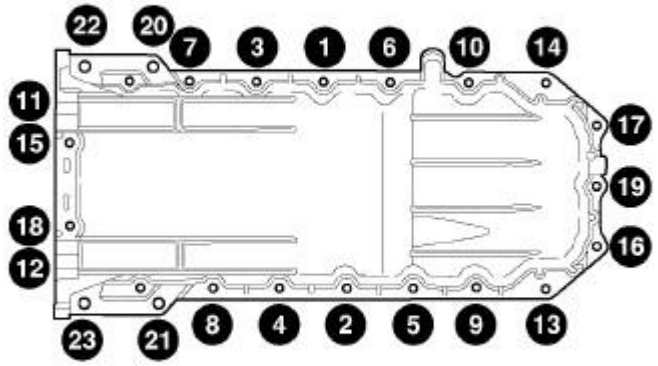

Fig. 321: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

NOTE: New M6 fasteners must be used when reinstalling the oil pan. Do not reuse the old M6 fasteners.

5. Align the rear of the oil pan with the rear face of the engine block and install the M10 and M6 oil pan retainers finger tight.
6. Using the sequence shown in illustration, tighten the M6 bolts to 5 N.m (44 in. lbs.).
7. Using the sequence shown in illustration, tighten the M10 bolts to 54 N.m (39 ft. lbs.).
8. Using the sequence shown in illustration, tighten the M6 bolts to 12 N.m (9 ft. lbs.).
9. Lower the vehicle.

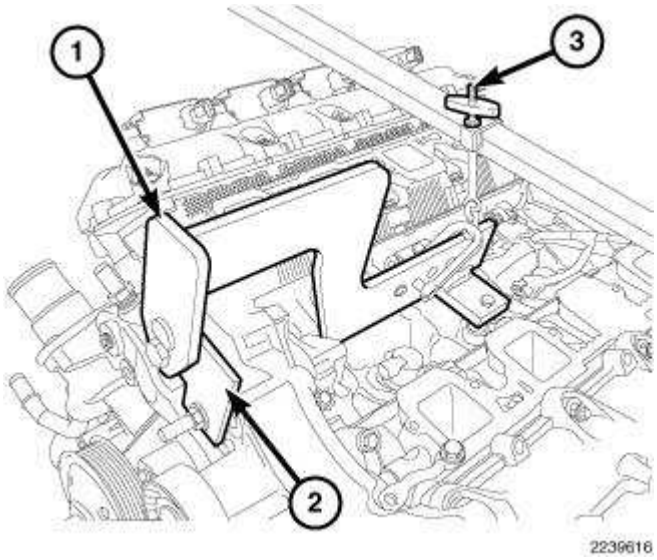

Fig. 322: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

10. Using the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) lower the engine into position and remove.

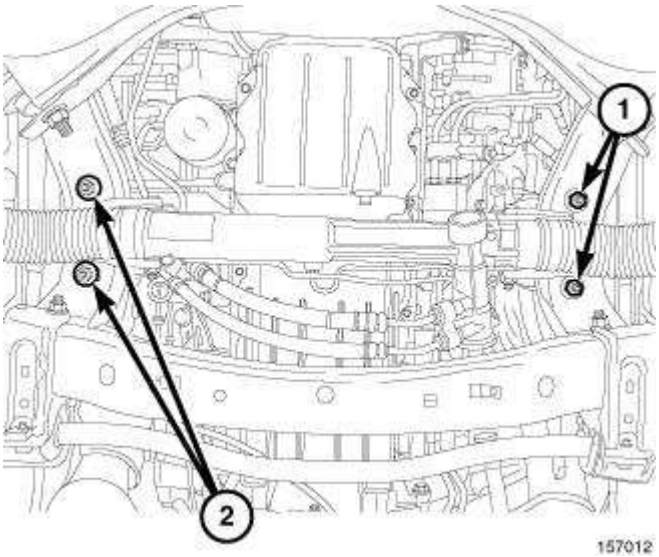

Fig. 323: Engine Mount Nuts
Courtesy of CHRYSLER GROUP, LLC

11. Raise and support the vehicle.
12. Install the engine mount nuts (1, 2) and tighten to 95 N.m (70 ft. lbs.).
13. Install the engine oil dipstick and tube.

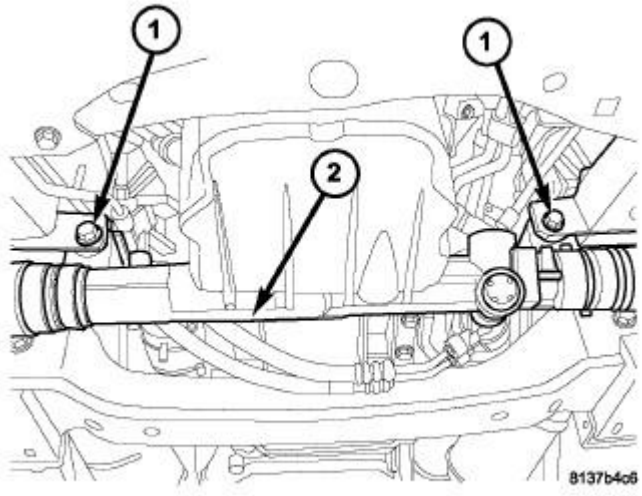

Fig. 324: Gear Mounting Bolts & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

14. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).
15. Lower the vehicle.
16. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.
17. Fill the engine oil.
18. Install the oil filter.

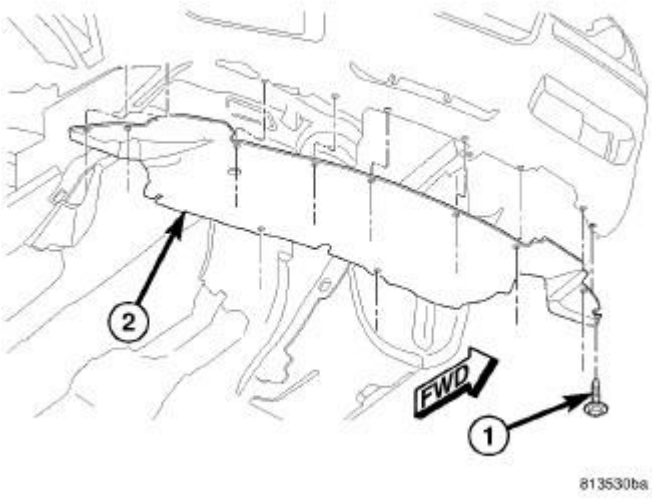

Fig. 325: Front Belly Pan & Screws
Courtesy of CHRYSLER GROUP, LLC

19. Install the belly pan (2).

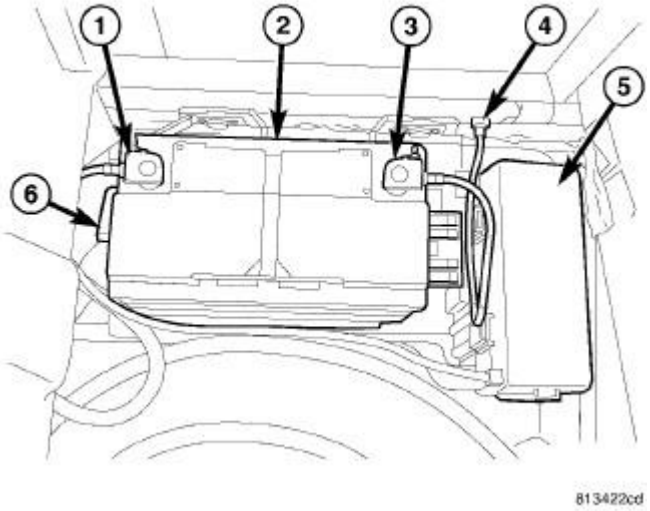

Fig. 326: Battery System Components & PDC Cover
Courtesy of CHRYSLER GROUP, LLC

20. Connect the negative battery cable (3).
21. Start engine and check for leaks.

PAN, OIL, AWD

REMOVAL

REMOVAL

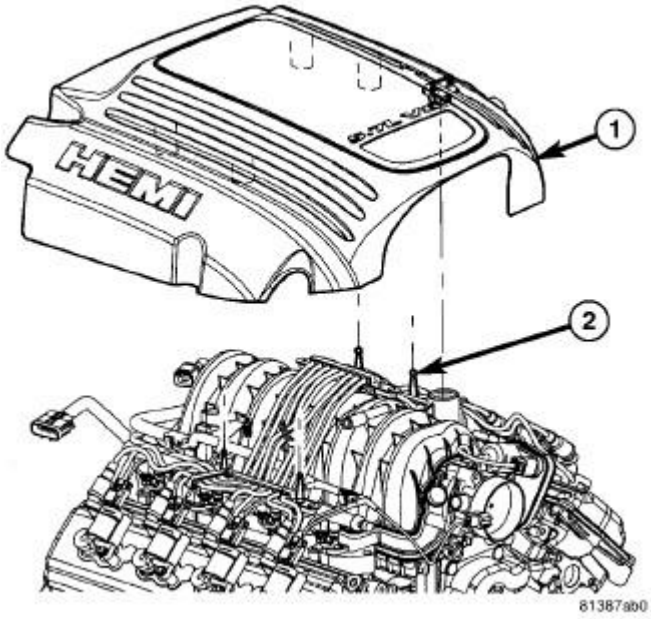

Fig. 327: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1 - Engine Cover
2 - Attaching Studs

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.

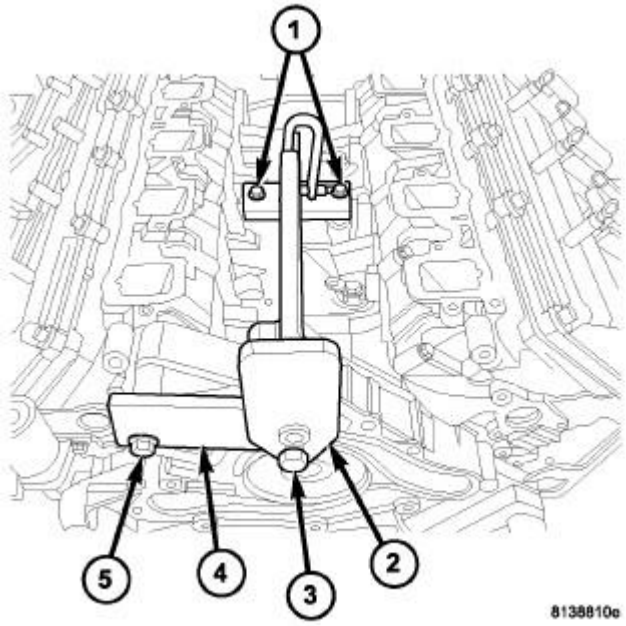

Fig. 328: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

1 - Bolts
2 - Engine Lift Fixture
3 - Adapter Bolt
4 - Adapter
5 - Adapter Nut

CAUTION: Never use air tools when installing fasteners to engine.

4. Install the engine lift fixture (2) special tool (special tool #8984B, Fixture, Engine Lifting) and adapter (special tool #8984-UPD, Adapter, Engine Lift).
5. Raise and support the vehicle.

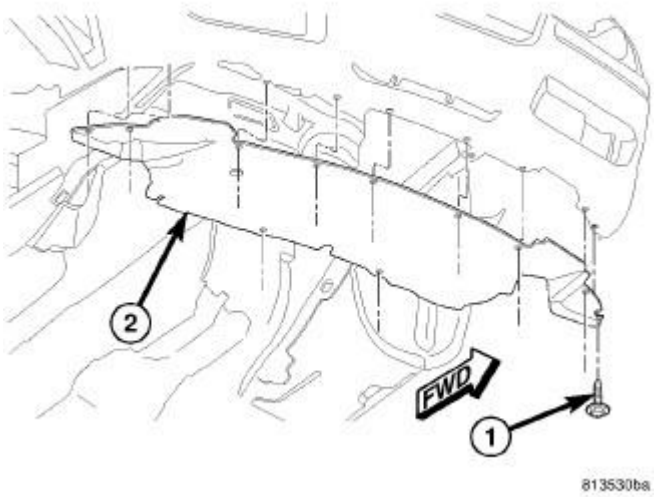

Fig. 329: Front Belly Pan & Screws
Courtesy of CHRYSLER GROUP, LLC

6. Remove the belly pan (2). Refer to **BELLY PAN, REMOVAL** .
7. Drain the engine oil and remove the oil filter.

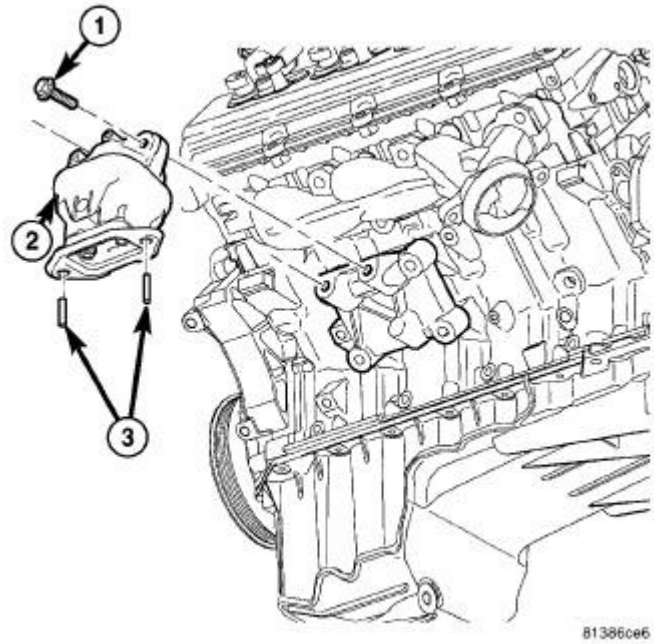

Fig. 330: LH Engine Hydromount & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1 - Bolt

2 - Hydromount
3 - Studs

NOTE: Left side engine mount shown in illustration, right side similar.

8. Remove both left and right side engine mount to frame fasteners.

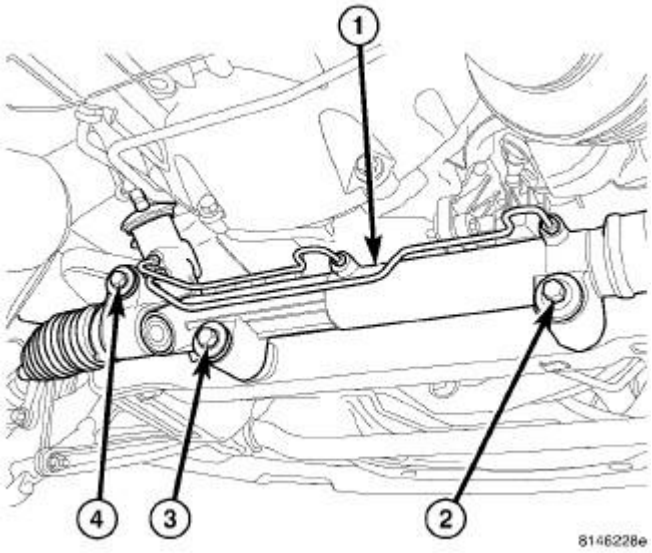

Fig. 331: Steering Gear & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not remove the P/S hoses, tie rod ends or disconnect steering column.

9. Remove the steering rack mounting bolts (2, 3, 4) and lower the steering rack (1).
10. Remove the engine oil dipstick and tube from the oil pan.
11. Remove the left and right side exhaust pipes at the exhaust manifolds. Refer to **CONVERTER, CATALYTIC, REMOVAL** .

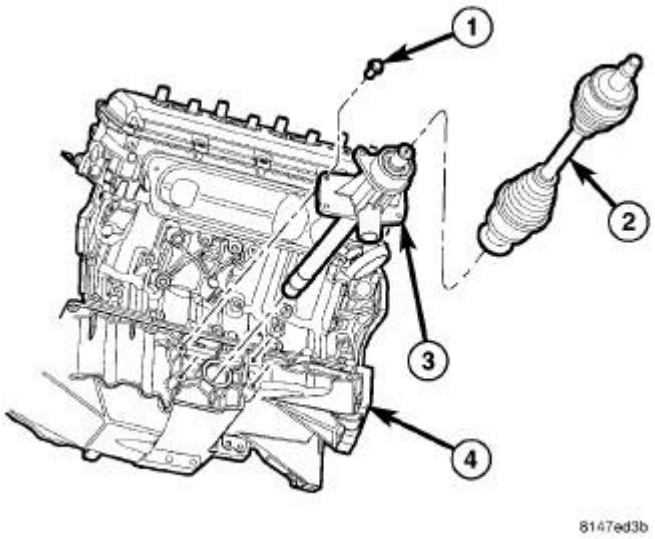

Fig. 332: Left Drive Axle & Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

1 - FASTENER
2 - LEFT FRONT DRIVE AXLE
3 - INTERMEDIATE SHAFT HOUSING
4 - OIL PAN

12. Mark the front driveshaft to the flange at both ends to ensure correct installation.
13. Remove the front drive shaft fasteners from the differential and transfer case and remove the driveshaft from the vehicle.
14. Remove the left (2) and right front drive axles.

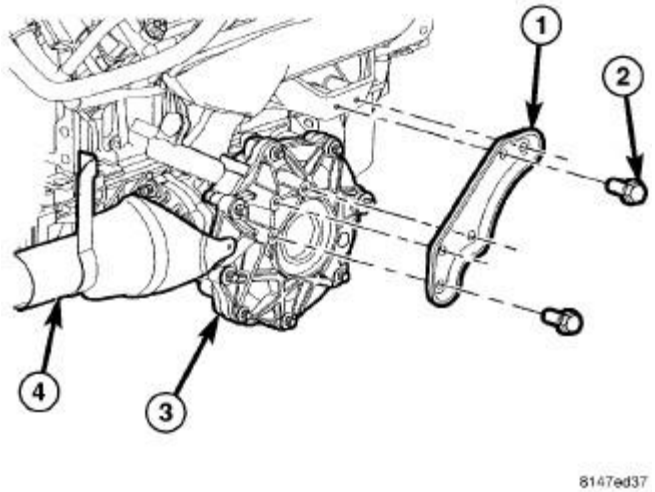

Fig. 333: Front Drive Axle Housing
Courtesy of CHRYSLER GROUP, LLC

1 - BRACKET
2 - BOLT
3 - DRIVE AXLE HOSING
4 - FRONT DRIVE SHAFT SHIELD

15. Remove the differential support bracket (1) from the differential to engine block.

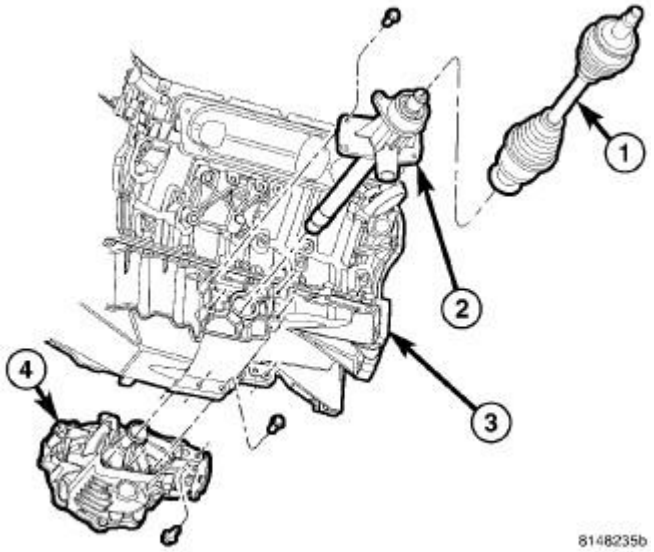

Fig. 334: Front Drive Axle Assembly

1 - LEFT FRONT DRIVE AXLE
2 - INTERMEDIATE SHAFT
3 - OIL PAN
4 - FRONT DRIVE AXLE HOUSING

16. Remove the differential retaining bolts from the oil pan (3).
17. Rotate the differential (4) so the drive flange is facing forward and the oil pan side is facing up and remove the differential out through the opening at the rear of the cradle.

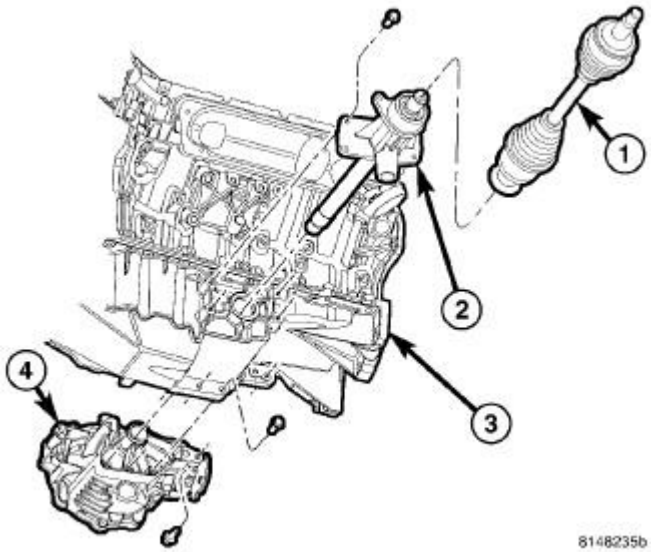

Fig. 335: Front Drive Axle Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LEFT FRONT DRIVE AXLE
2 - INTERMEDIATE SHAFT
3 - OIL PAN
4 - FRONT DRIVE AXLE HOUSING

18. Remove the intermediate shaft (2) from the oil pan (3).
19. Lower the vehicle.

NOTE: Do not attempt to fasten the engine support fixture to vehicle body, or attach the third support leg to the radiator support.

20. Raise the engine using the engine support fixture (special tool #8534B, Fixture, Driveline Support) and adapter (special tool #8984-UPD, Adapter, Engine Lift) to gain clearance to remove oil pan.
21. Raise and support the vehicle.

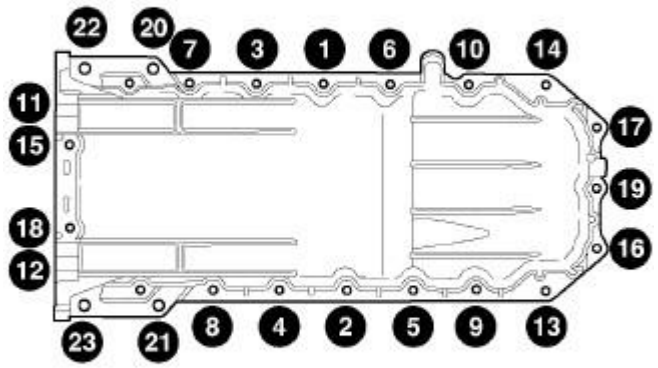

Fig. 336: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not pry on oil pan or oil pan gasket. Gasket is integral to the engine windage tray and does not come out with oil pan.

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in the original locations.

22. Using the sequence shown in illustration, remove the M10 fasteners (vertical and horizontal) from the rear of the oil pan to the transmission and engine.
23. Using the sequence shown in illustration, remove the oil pan mounting bolts and oil pan.

NOTE: When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed. The old gasket cannot be reused.

24. Discard the integral windage tray and gasket.

INSTALLATION

INSTALLATION

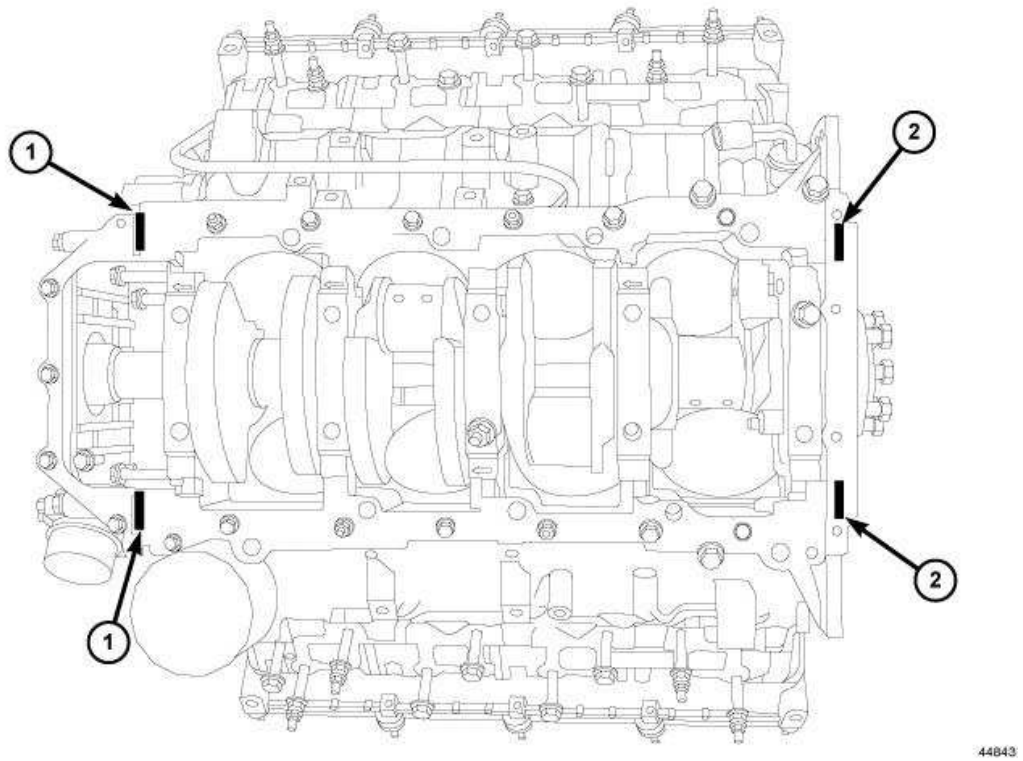

Fig. 337: T-Joint RTV Sealant Application Locations
Courtesy of CHRYSLER GROUP, LLC

1 - Front Cover T-Joints
2 - Rear Oil Retainer T-Joints

1. Clean the oil pan gasket mating surface of the block and oil pan.

NOTE: **Mopar® Engine RTV must be applied to the 4 T-joints, (area where front cover, rear retainer, block, and oil pan gasket meet). The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.**

2. Apply Mopar® Engine RTV at the 4 T- joints (1, 2).

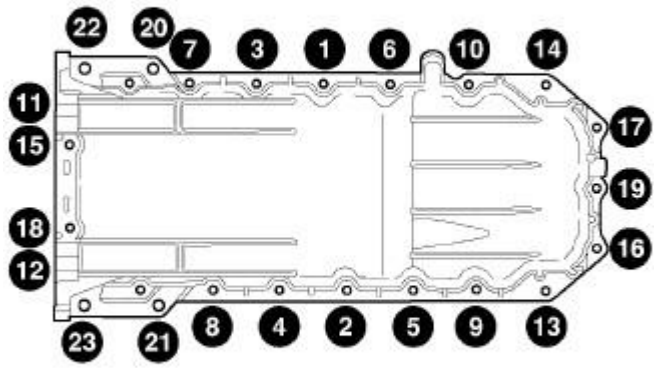

Fig. 338: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed. The old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray assembly.
4. If removed, install the oil pump pickup tube with a new O-ring and tighten retainers to 28 N.m (21 ft. lbs.).

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

NOTE: New M6 fasteners must be used when reinstalling the oil pan. Do not reuse the old M6 fasteners.

5. Align the rear of the oil pan with the rear face of the engine block, and install the M10 and M6 oil pan retainers finger tight. Using the sequence shown in illustration, tighten the M6 mounting bolts to 5 N.m (44 in. lbs.).
6. Using the sequence shown in illustration, tighten the M10 oil pan retainers to 54 N.m (40 ft. lbs.).
7. Using the sequence shown in illustration, tighten the M6 oil pan retainers to 12 N.m (9 ft. lbs.).

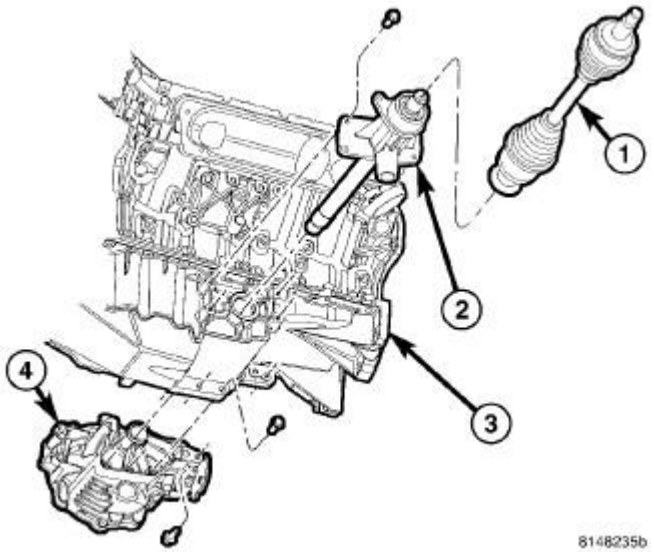

Fig. 339: Front Drive Axle Assembly

2 - LEFT FRONT DRIVE AXLE
3 - INTERMEDIATE SHAFT HOUSING
4 - OIL PAN

12. Install the left (2) and right front drive axles. Refer to **INSTALLATION** and **INSTALLATION** .
13. Install the front drive shaft into the differential and transfer case. Refer to **INSTALLATION** .
14. Install the engine oil dipstick and tube.

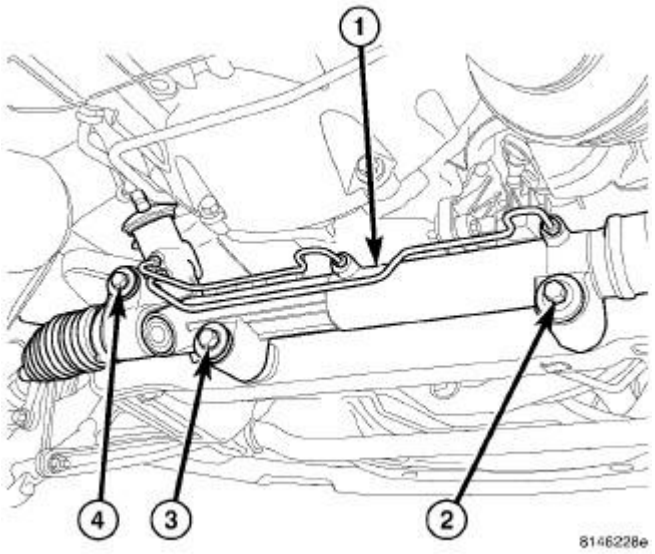

Fig. 343: Steering Gear & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Install the steering gear (1). Refer to **GEAR, INSTALLATION** .
16. Lower the engine into the mounts using engine lift fixture (special tool #8534B, Fixture, Driveline Support).
17. Install both the left and right side engine mount studs and nuts.

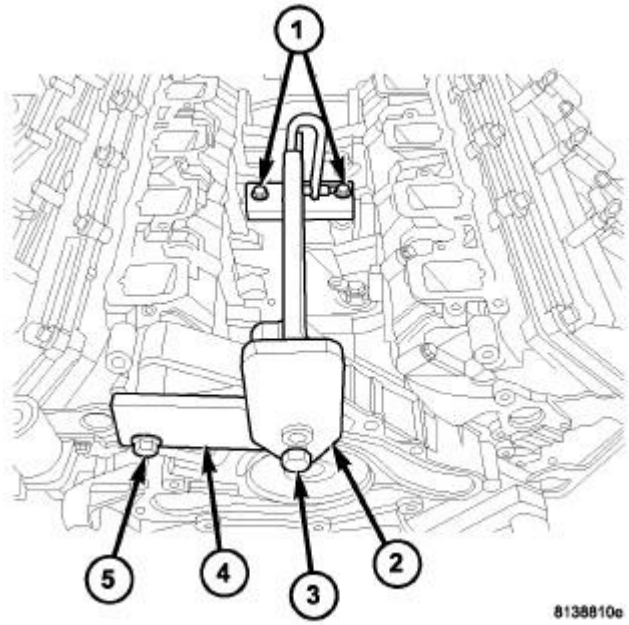

Fig. 344: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

1 - Bolts
2 - Engine Lift Fixture
3 - Adapter Bolt
4 - Adapter
5 - Adapter Nut

18. Remove the engine lift fixture (special tool #8534B, Fixture, Driveline Support) and adapter (special tool #8984-UPD, Adapter, Engine Lift).
19. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.
20. Install the left and right side exhaust pipes at the manifolds. Refer to **CONVERTER, CATALYTIC, INSTALLATION** .
21. Fill the engine with oil.
22. Install the oil filter, if removed.
23. Connect the negative battery cable.

24. Start the engine and check for leaks.

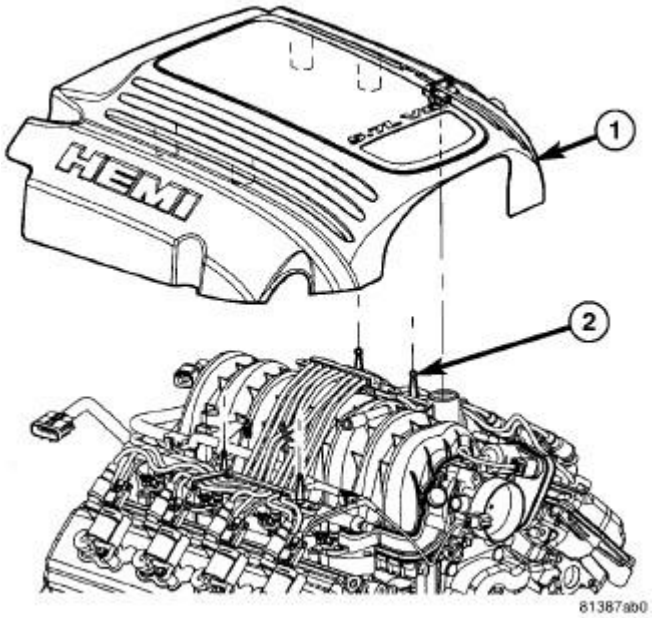

Fig. 345: Engine Cover

PUMP, ENGINE OIL

REMOVAL

REMOVAL

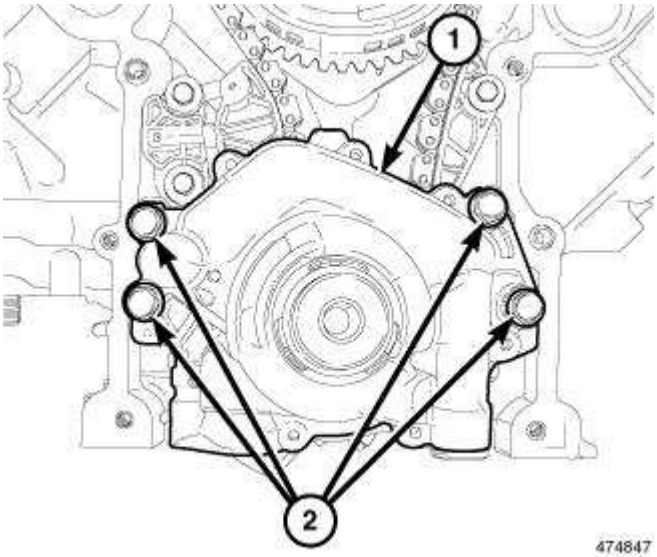

Fig. 347: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L** and **PAN, OIL, AWD, REMOVAL, 5.7L**.
2. Remove the timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL, 5.7L**.
3. Remove the four bolts (2) and the oil pump (1).

CLEANING

CLEANING

1. Wash all parts in a suitable solvent.

INSPECTION

INSPECTION

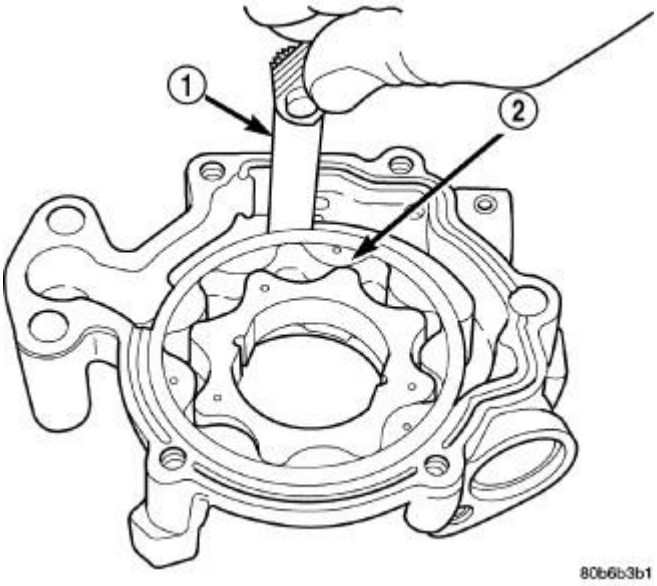

Fig. 348: Measuring Clearance Between Outer Rotor & Body Of Oil Pump
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Remove the pump cover.
2. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
3. Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor (2) and the body. If the measurement is 0.235 mm (0.009 in.) or more the oil pump assembly must be replaced.

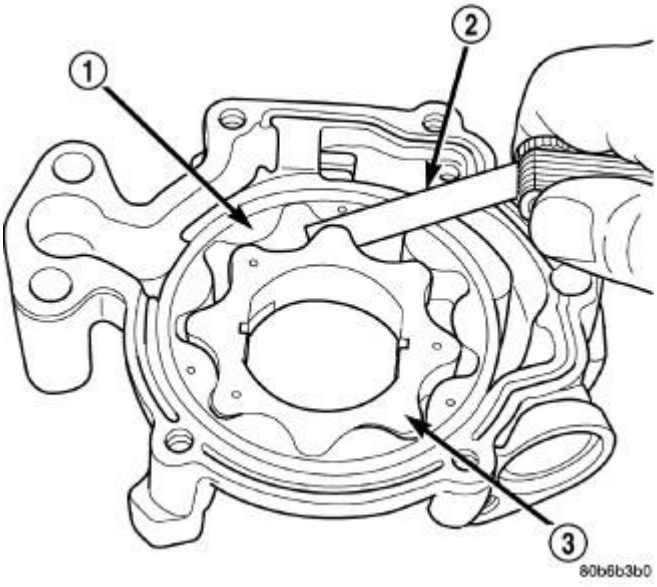

Fig. 349: Measuring Clearance Between Inner & Outer Rotors
Courtesy of CHRYSLER GROUP, LLC

4. Install the inner rotor into the oil pump body. Measure the clearance between the inner (3) and outer rotors (1). If the clearance between the rotors is 0.150 mm (0.006 in.) or more the oil pump assembly must be replaced.

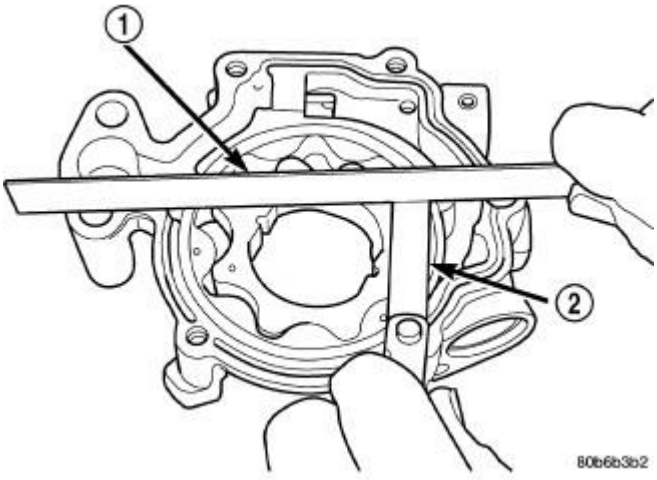

Fig. 350: Measuring Clearance Over Rotors
Courtesy of CHRYSLER GROUP, LLC

5. Place a straight edge (1) across the body of the oil pump (between the bolt holes), if a feeler gauge (2) of 0.095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced.
6. Reinstall the pump cover. Tighten fasteners to 15 N.m (132 in. lbs.).

NOTE: **The 5.7 Oil pump is serviced as an assembly. In the event the oil pump is not functioning or out of specification, it must be replaced as an assembly.**

INSTALLATION

INSTALLATION

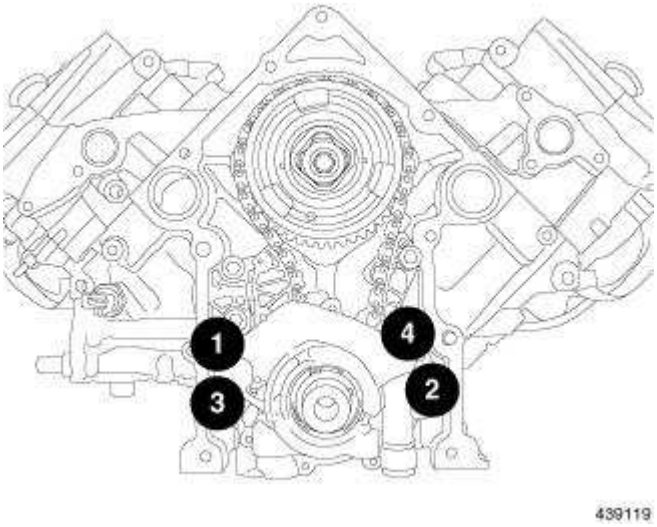

Fig. 351: Oil Pump Retaining Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Position the oil pump on the crankshaft and install the oil pump retaining bolts finger tight.
2. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).
3. Install the timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION, 5.7L**.
4. Install the oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L** and **PAN, OIL, AWD, INSTALLATION, 5.7L**.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

The oil pressure sensor uses the following three circuits:

- Signal circuit to the PCM
- Sensor ground circuit through the PCM
- 5 volt reference circuit from the PCM

The oil pressure sensor returns a voltage signal back to the PCM with reference to oil pressure. Ground for the sensor is supplied by the PCM.

The oil pressure sensor is located on the right side of the engine block. The sensor screws into the engines main oil gallery.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Remove the upper generator mounting bolt.
4. Raise and support the vehicle.

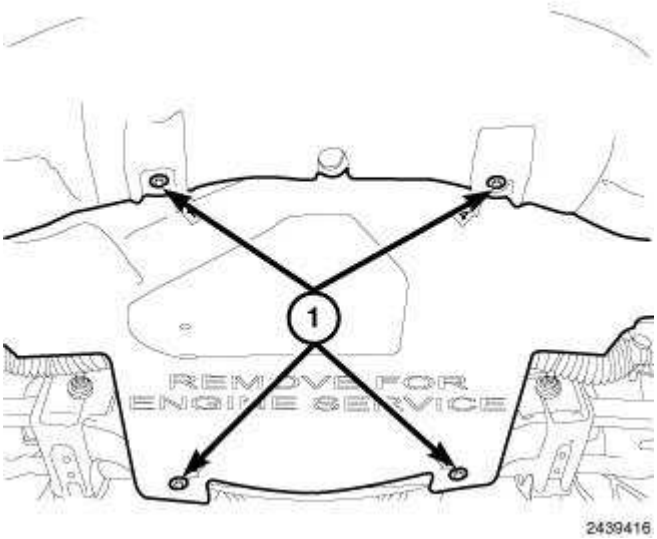

Fig. 352: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the lower splash shield retaining bolts (1) and the splash shield.

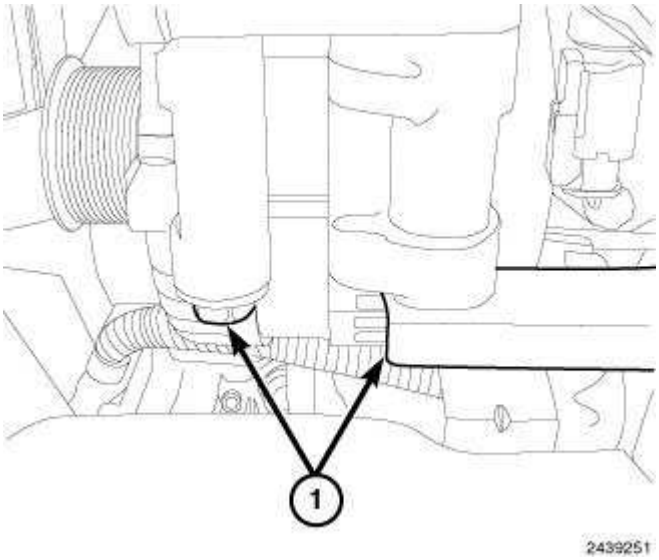

Fig. 353: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower generator retaining bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil pressure sensor.

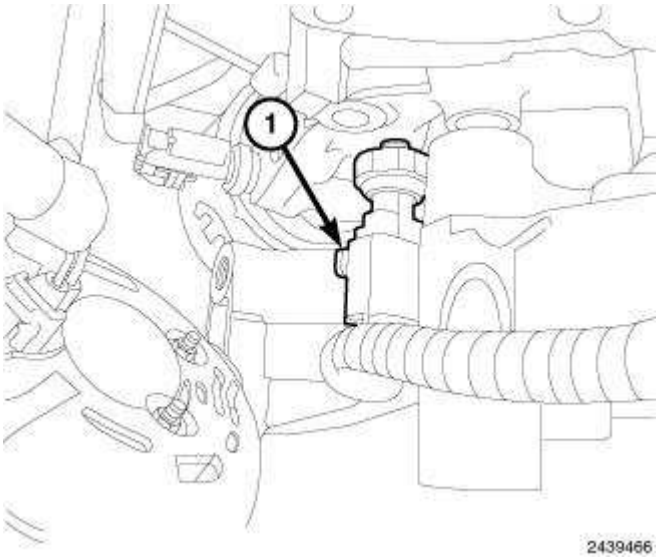

Fig. 354: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the oil pressure sensor electrical connector (1).

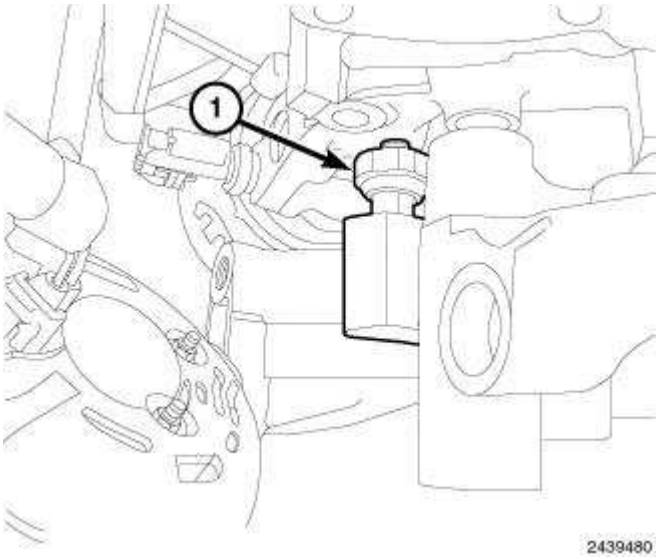

Fig. 355: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil pressure sensor (1).

INSTALLATION

INSTALLATION

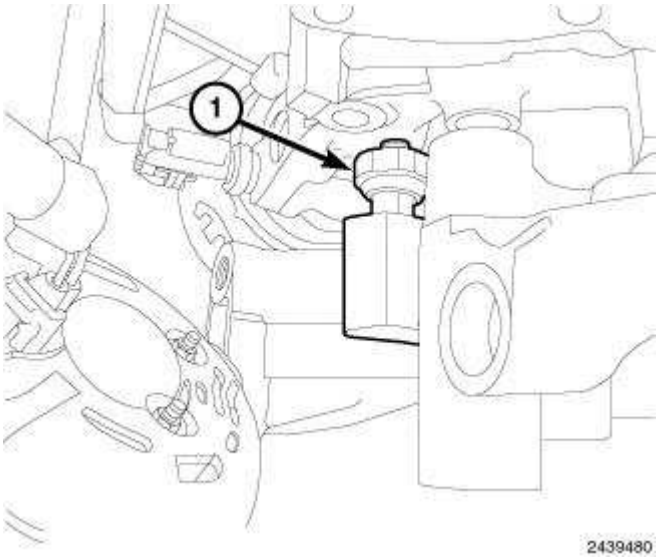

Fig. 356: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil pressure sensor (1).

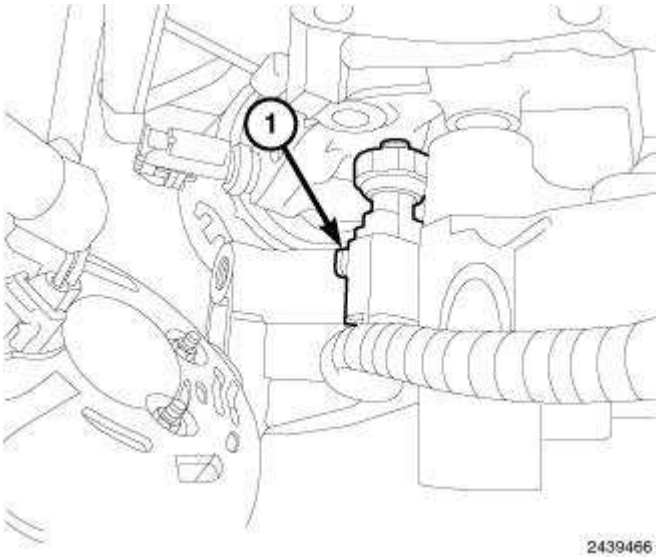

Fig. 357: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil pressure sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

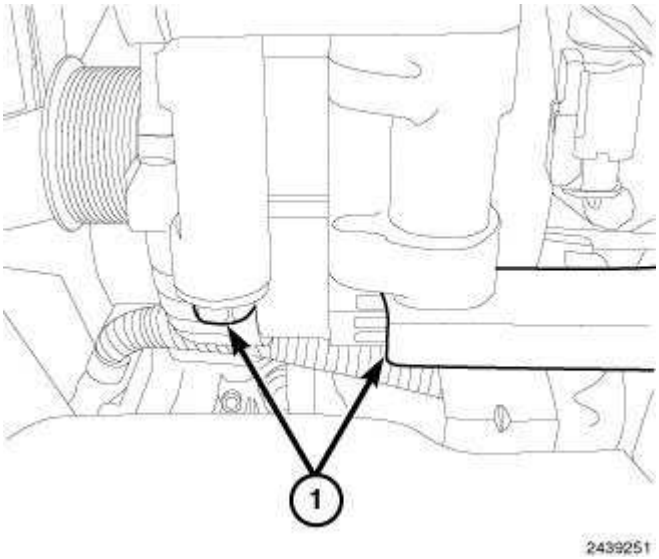

Fig. 358: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs).

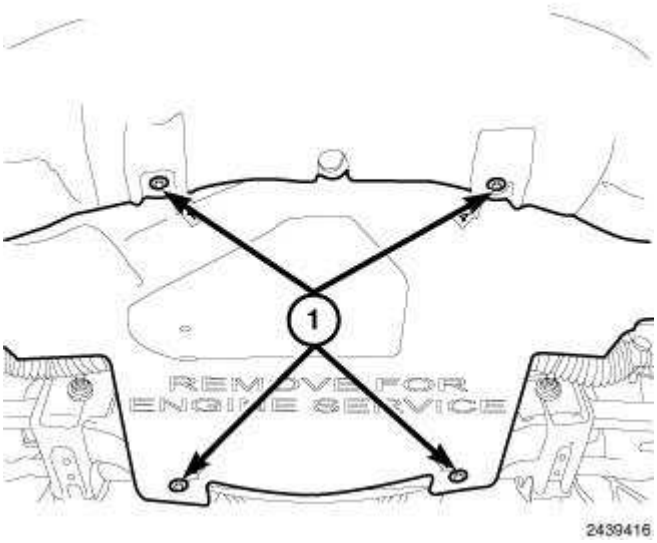

Fig. 359: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Position the lower splash shield and install the retaining bolts (1).
7. Lower the vehicle
8. Tighten the upper generator mounting bolt to 55 N.m (41 ft. lbs).

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
10. Connect the negative battery cable.

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

The oil temperature sensor uses the following two circuits:

- Signal circuit to the PCM
- Ground circuit from the PCM

The oil temperature sensor is a Negative Thermal Coefficient sensor. The resistance of the sensor changes as oil temperature changes. This results in different output voltages back to the PCM.

The oil temperature sensor is located on the right side of the engine block.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Remove the generator upper mounting bolt.
4. Raise and support the vehicle.

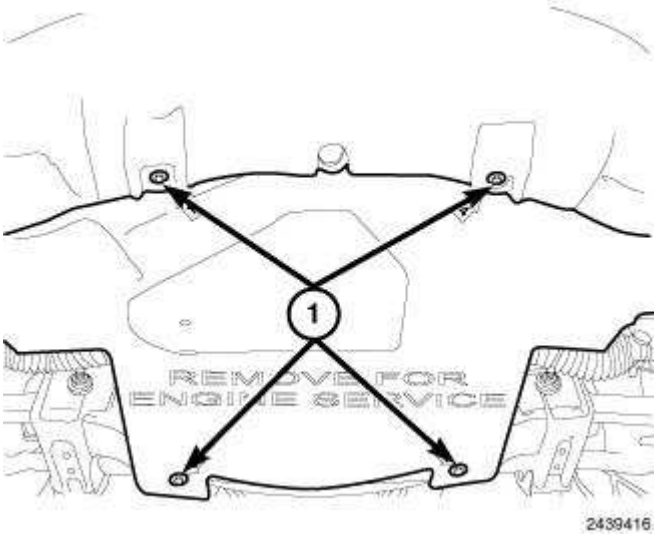

Fig. 360: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the lower splash shield retaining bolts (1) and the splash shield.

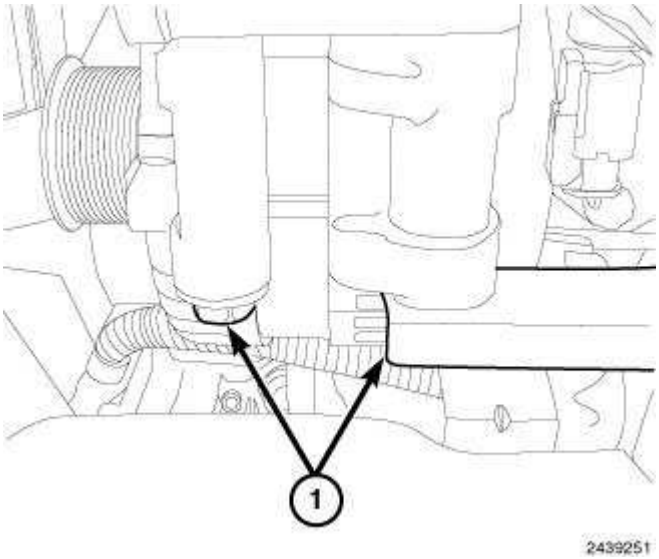

Fig. 361: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the generator lower mounting bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil temperature sensor.

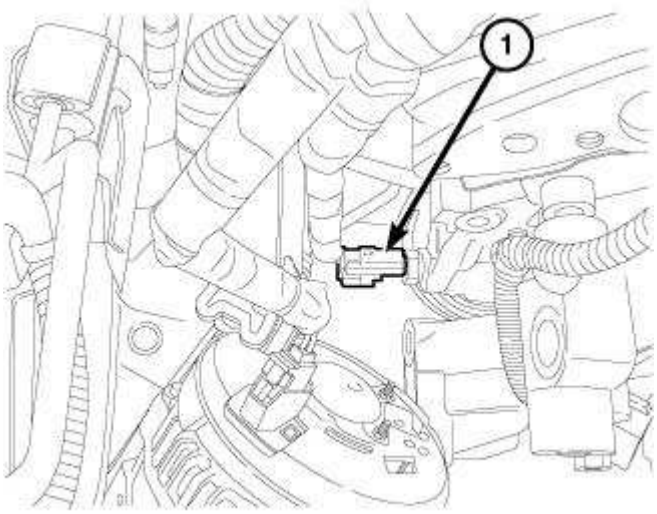

Fig. 362: Oil Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the oil temperature sensor electrical connector (1).

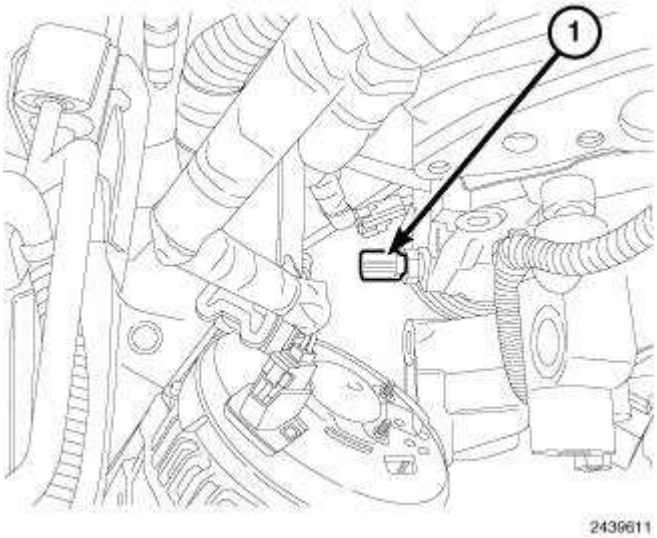

Fig. 363: Oil Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil temperature sensor (1).

INSTALLATION

INSTALLATION

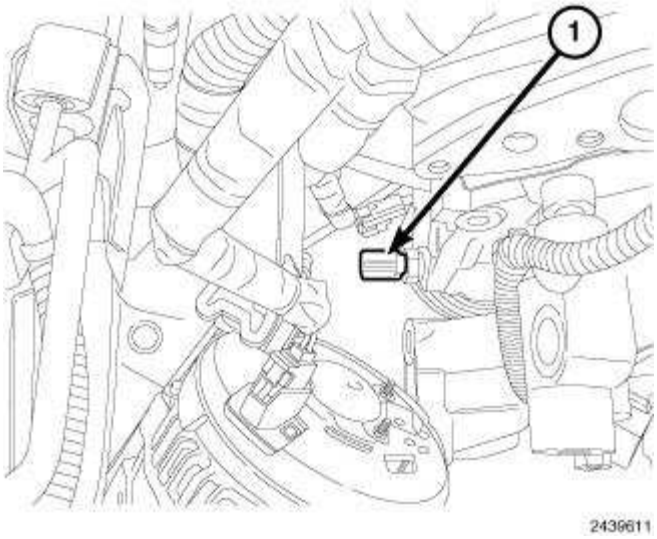

Fig. 364: Oil Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil temperature sensor (1).

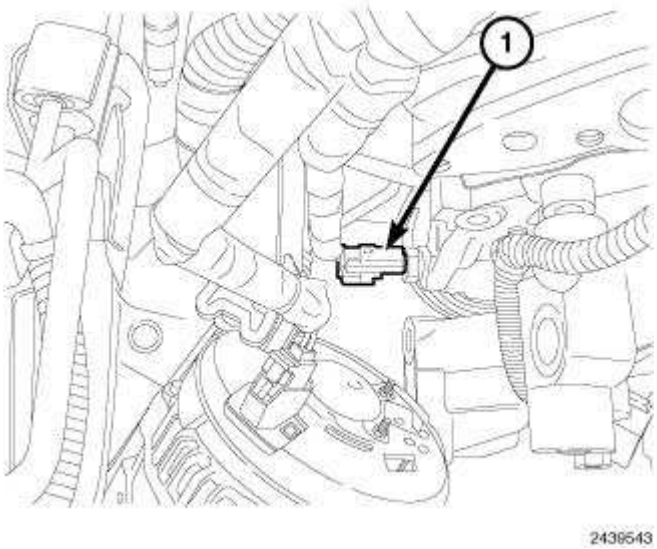

Fig. 365: Oil Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil temperature sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

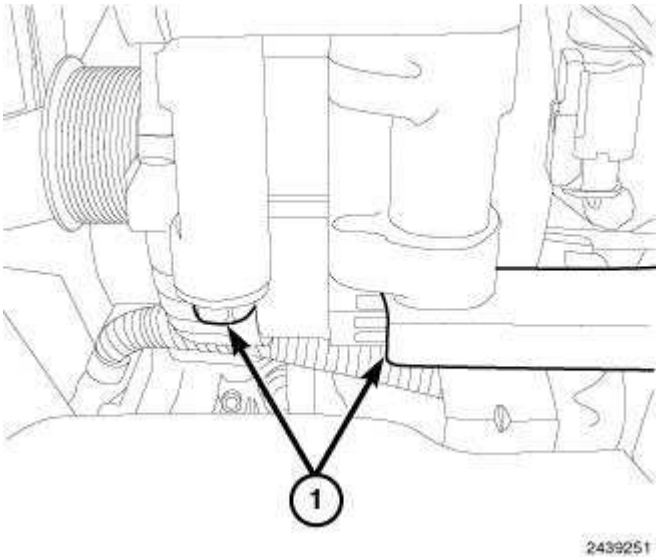

Fig. 366: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the generator lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs.).

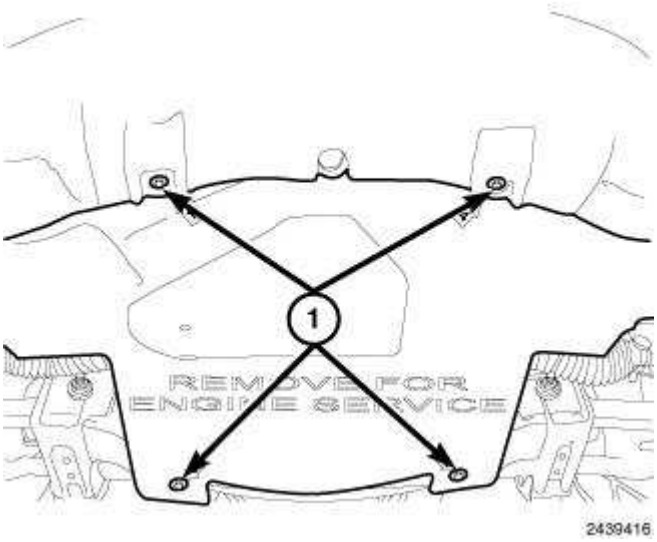

Fig. 367: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Position the lower splash shield and install the splash shield retaining bolts (1).
7. Lower the vehicle.
8. Tighten the generator upper mounting bolt to 55 N.m (41 ft. lbs.).

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to

overheat.

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
10. Connect the negative battery cable.

MANIFOLDS

MANIFOLD, EXHAUST

REMOVAL

REMOVAL

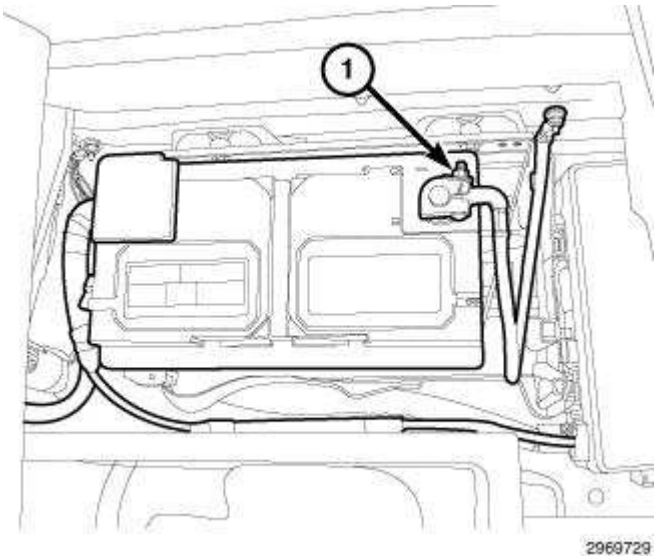

Fig. 368: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

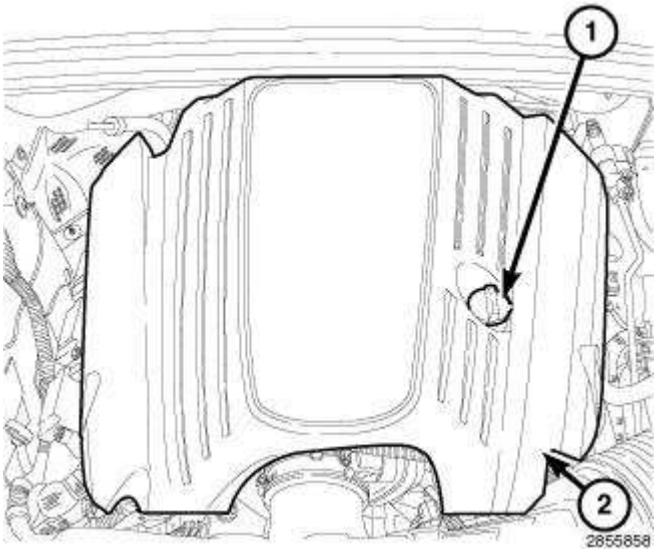

Fig. 369: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (2).

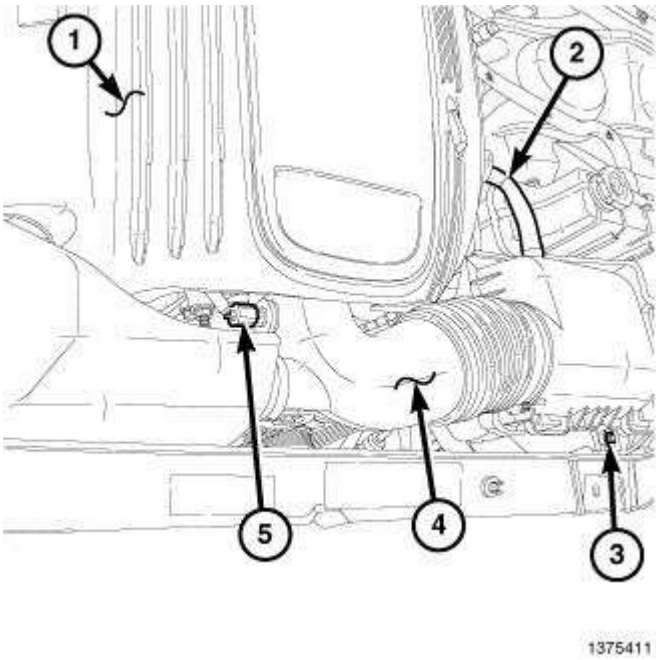

Fig. 370: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the intake air temperature (IAT) sensor (5) connector.
4. Loosen the clamps at the throttle body and the air filter housing and remove the air tube (4).
5. Disconnect the make up air hose (MUA) (2).
6. Remove the air filter housing retaining bolt (3).
7. Remove the air filter housing.

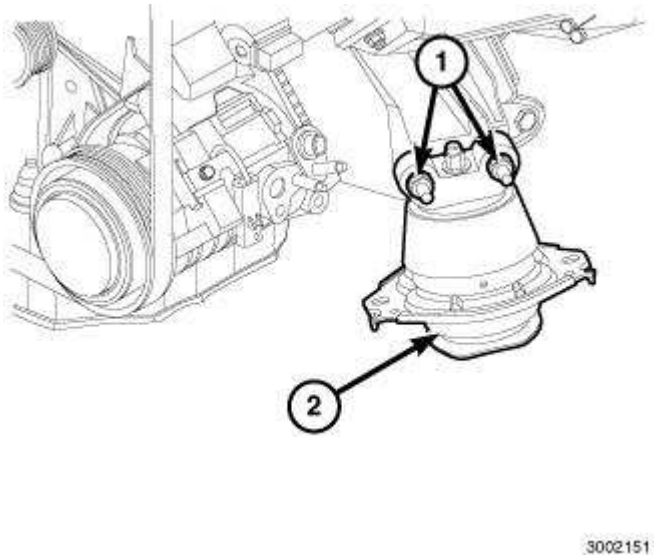

Fig. 371: Engine Mount & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove both front engine mounts (2) and mounting brackets. Refer to **INSULATOR, ENGINE MOUNT, FRONT, REMOVAL, 5.7L** and **INSULATOR, ENGINE MOUNT, REAR, REMOVAL, 5.7L**.

CAUTION: When separating the catalytic converters from the manifolds, disconnect the oxygen sensor connectors. Allowing the catalytic converters hanging from the oxygen sensor wires damages the harness and/or sensors.

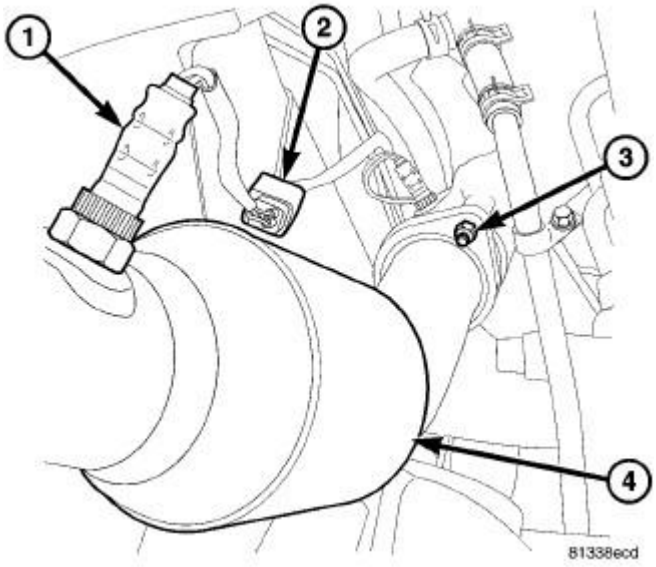

Fig. 372: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

9. Raise and support the vehicle.
10. Disconnect the oxygen sensor electrical connectors (2).
11. Saturate the front exhaust pipe/catalytic converter retaining bolts and nuts with Mopar® Rust Penetrant or equivalent and allow 5 minutes for penetration.
12. Remove both catalytic converters (4). Refer to **CONVERTER, CATALYTIC, REMOVAL** .

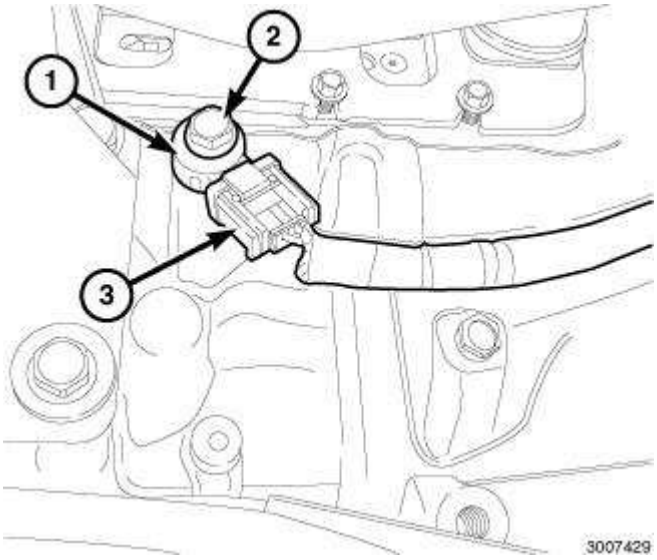

Fig. 373: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Two knock sensors (1) are used, they are bolted to each side of the cylinder block under each exhaust manifold (3).

13. Remove the heat shields from the appropriate knock sensor (shield snaps onto sensor).
14. Disconnect the appropriate knock sensor electrical connector (3).

NOTE: Note the foam strip on the knock sensor retaining bolt threads. This foam is only used to retain the bolts to the knock sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

15. Remove the appropriate knock sensor retaining bolt (2) and remove knock sensor (1).
16. Lower the vehicle.

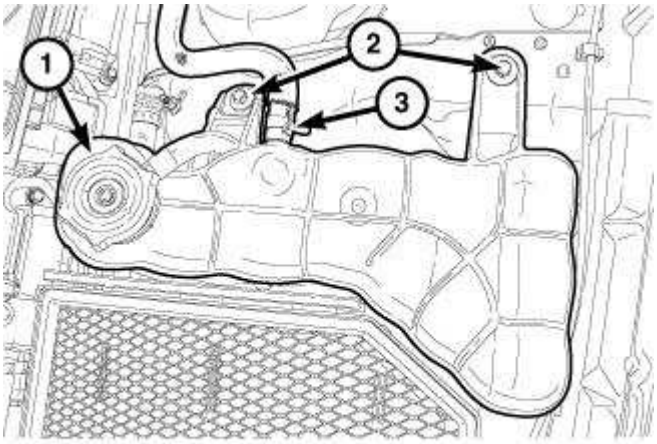

Fig. 374: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

LEFT SIDE:

NOTE: It is not necessary to remove the hoses from the coolant bottle for coolant bottle removal.

17. Remove coolant bottle retaining bolts (2) and position aside.

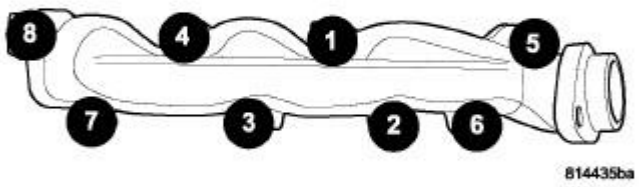

Fig. 375: Exhaust Manifold Bolt Removal/Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

18. Using the sequence shown in illustration, remove the exhaust manifold retaining bolts.

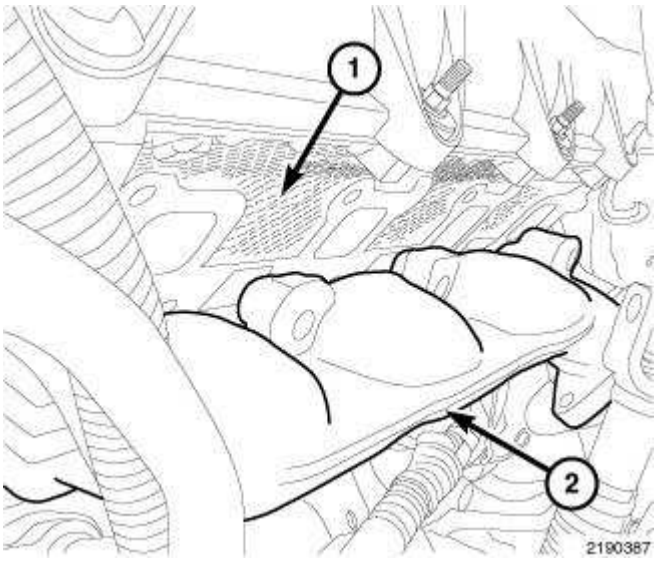

Fig. 376: Locating Exhaust Manifold & Gasket
Courtesy of CHRYSLER GROUP, LLC

19. Remove the exhaust manifold (2) and gasket.
20. Inspect the exhaust manifold for any damage. Refer to **Engine/Manifolds/MANIFOLD, Exhaust - Inspection**.
21. Clean the exhaust manifold mating surfaces (1, 2).

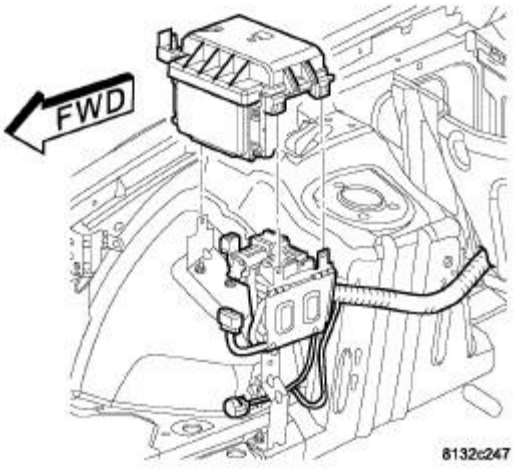

Fig. 377: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

RIGHT SIDE:

22. Remove the Power Distribution Center (PDC) and mounting bracket.
23. Unfasten the wire harness mounted on the right hand inner fender panel and position aside.

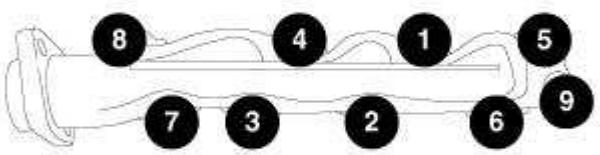

Fig. 378: Exhaust Manifold Bolt Removal/Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

24. Remove the exhaust manifold heat shields.
25. Using the sequence shown in illustration, remove the exhaust manifold retaining bolts.
26. Remove the exhaust manifold (2) and gasket.
27. Inspect the exhaust manifold for any damage. Refer to **Engine/Manifolds/MANIFOLD, Exhaust - Inspection**.
28. Clean the exhaust manifold mating surfaces.

CLEANING

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

INSTALLATION

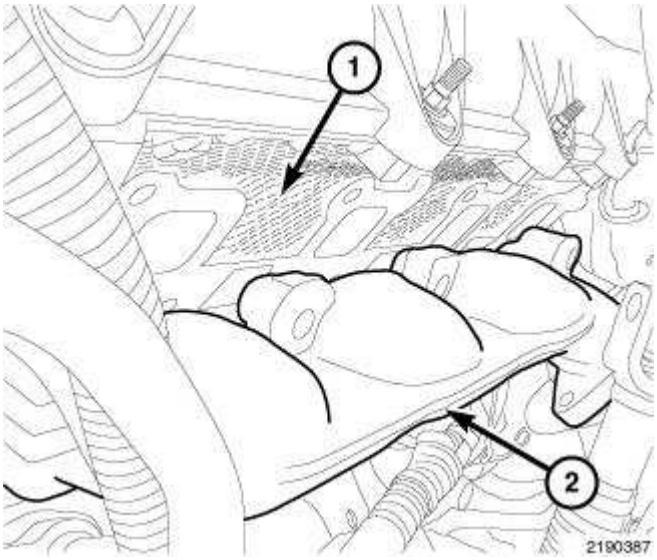

Fig. 379: Locating Exhaust Manifold & Gasket
Courtesy of CHRYSLER GROUP, LLC

LEFT SIDE:

1. Prior to installation, make sure all gasket mating surfaces (1, 2) are clean and free of any debris.
2. Using a new exhaust manifold gasket, position the exhaust manifold to the cylinder head, align the gasket and start two upper retaining blots finger tight.

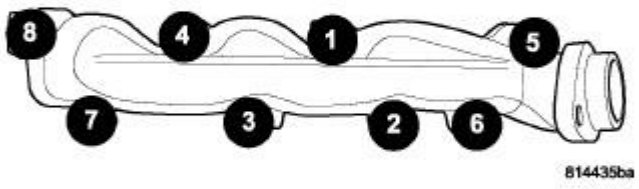

Fig. 380: Exhaust Manifold Bolt Removal/Tightening Sequence - Left
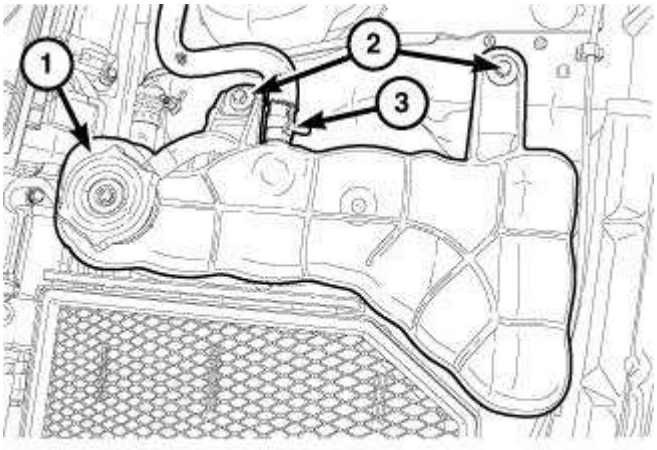
Courtesy of CHRYSLER GROUP, LLC

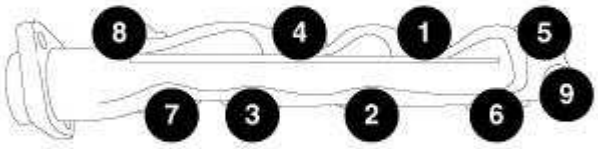
3. Using the sequence shown in illustration, Install the remaining exhaust manifold retaining bolts and tighten to 25 N.m (18 ft. lbs.).
4. Install the heat shield and tighten nuts to 8 N.m (70 in. lbs.).



2912996

Fig. 381: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

5. Position the coolant bottle (1) and install the retaining bolts (2).



44921

Fig. 382: Exhaust Manifold Bolt Removal/Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

RIGHT SIDE:

6. Prior to installation, make sure all gasket mating surfaces are clean and free of any debris.
7. Using a new exhaust manifold gasket, position the exhaust manifold to the cylinder head, align the gasket and start two upper retaining blots finger tight.
8. Using the sequence shown in illustration, install the remaining exhaust manifold retaining bolts and tighten to 25 N.m (18 ft. lbs.).
9. Install the heat shield and tighten nuts to 8 N.m (70 in. lbs.).

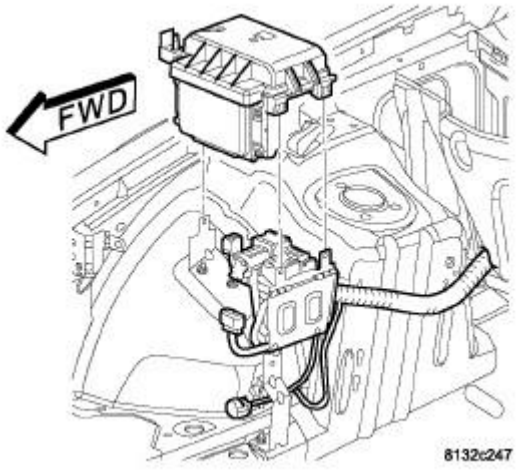


Fig. 383: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Position the wire harness mounted onto the right hand inner fender panel and secure fasteners.
11. Install the Power Distribution Center (PDC) and mounting bracket.

CAUTION: Over or under tightening the knock sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control.

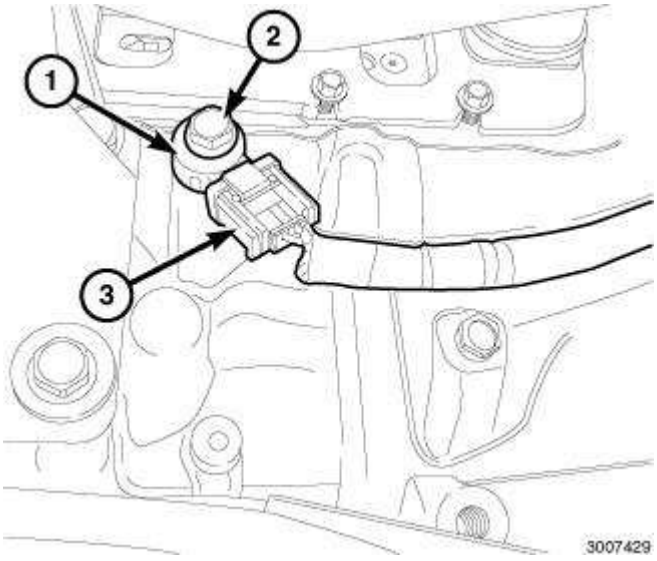

Fig. 384: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Raise and support the vehicle.
13. Position the appropriate knock sensor (1) onto the engine block.

NOTE: The foam strip used on bolt threads is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

14. Install the appropriate knock sensor retaining bolt (2) and tighten to 20 N.m (15 ft. lbs.).
15. Connect the appropriate knock sensor electrical connector (3).
16. Snap the heat shield onto the appropriate knock sensor.

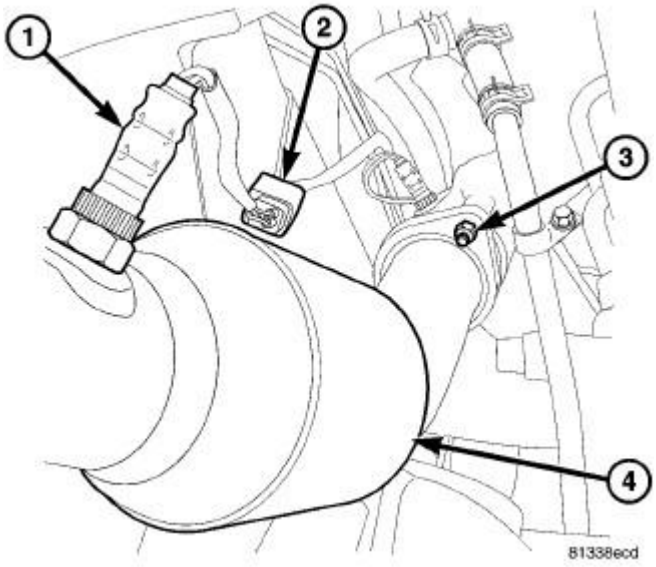

Fig. 385: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

17. Install both catalytic converters (4). Refer to **CONVERTER, CATALYTIC, INSTALLATION** .

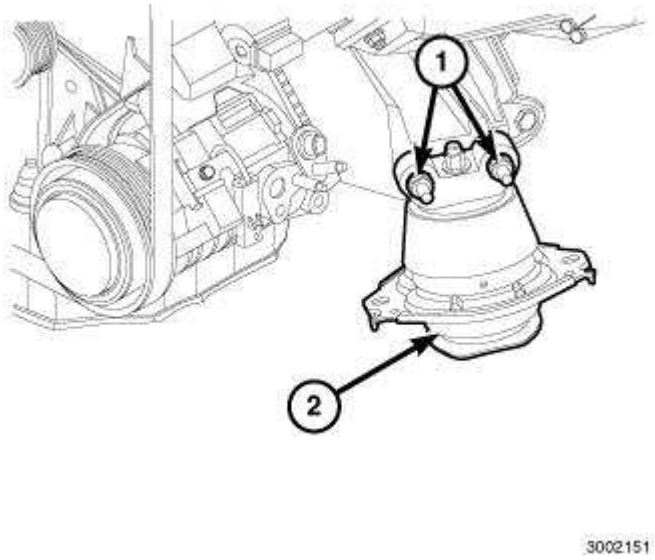

Fig. 386: Engine Mount & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Install both front engine mounts (2) and mounting brackets. Refer to **INSULATOR, ENGINE MOUNT, FRONT, INSTALLATION, 5.7L** and **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION, 5.7L**.

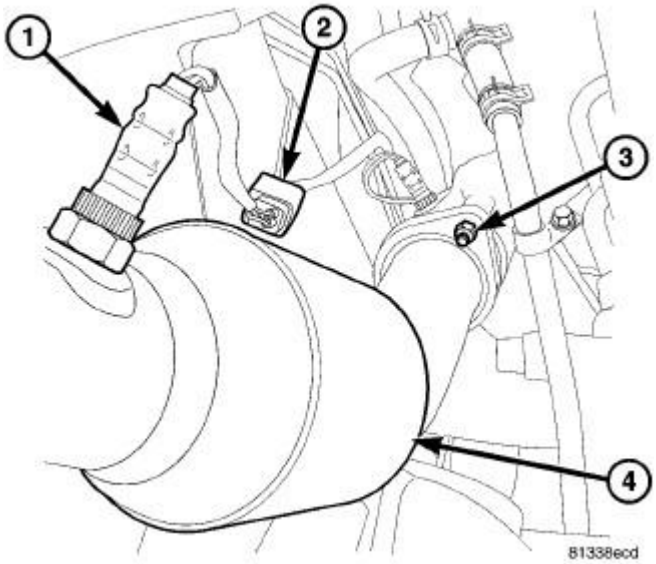

Fig. 387: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

19. Install both catalytic converters (4). Refer to **CONVERTER, CATALYTIC, INSTALLATION** .
20. Connect the oxygen sensor electrical connectors (2).
21. Lower the vehicle.

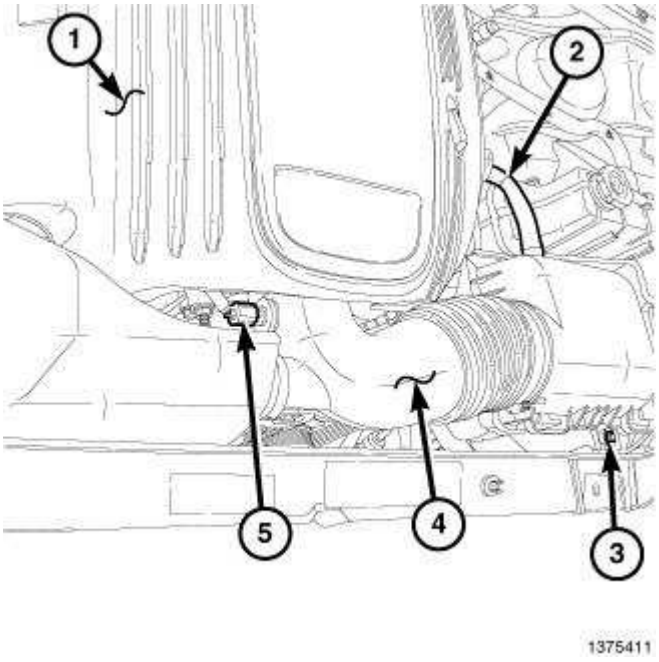

Fig. 388: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

22. Position the air filter housing into the engine compartment.
23. Install the air filter housing retaining bolt (3) and tighten to 5 N.m (44 in. lbs.).
24. Connect the clean air tube to the throttle body and the air filter housing and tighten clamps to 3 N.m (30 in. lbs.).
25. Connect the make up air hose (MUA) (2).
26. Connect the intake air temperature (IAT) sensor (5) connector.

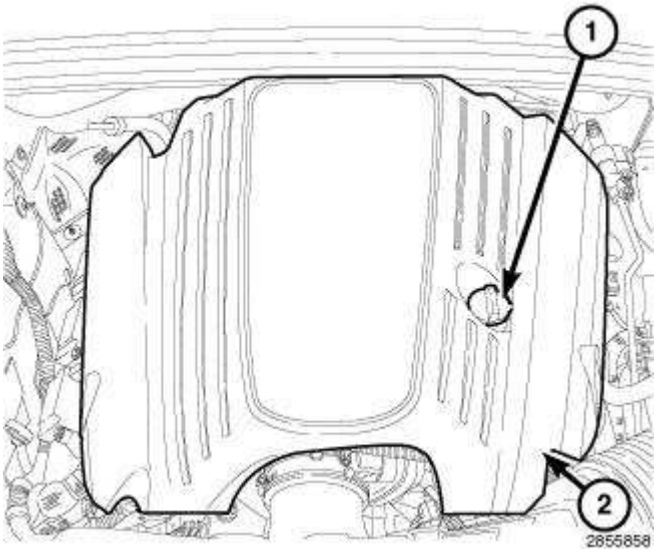

Fig. 389: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

27. Position the engine cover (2) and secure the retaining grommets onto the ball studs.

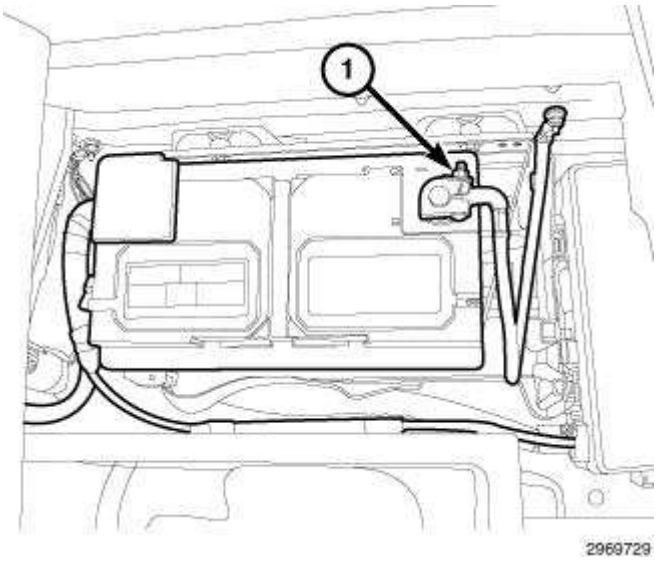

Fig. 390: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

28. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).
29. Start the engine and check for leaks.

MANIFOLD, INTAKE

DESCRIPTION

DESCRIPTION

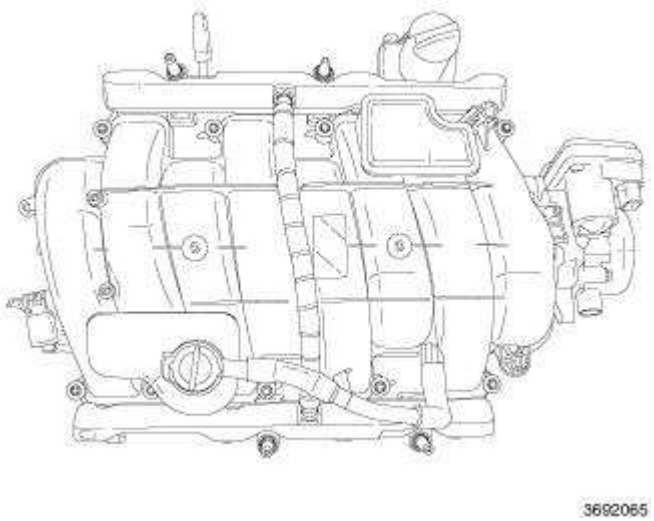

Fig. 391: Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

The intake manifold is made of a composite material with the runners tuned to give the best balance of power and torque. The manifold uses a single plane sealing system and separate PCV port seals to prevent leaks. The screws connecting the manifold to the head use a thread lock patch, and must be replaced when the manifold is serviced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or the fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Start the engine.
2. Spray a small stream of water at the suspected leak area.
3. If a change in RPM is observed the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

REMOVAL

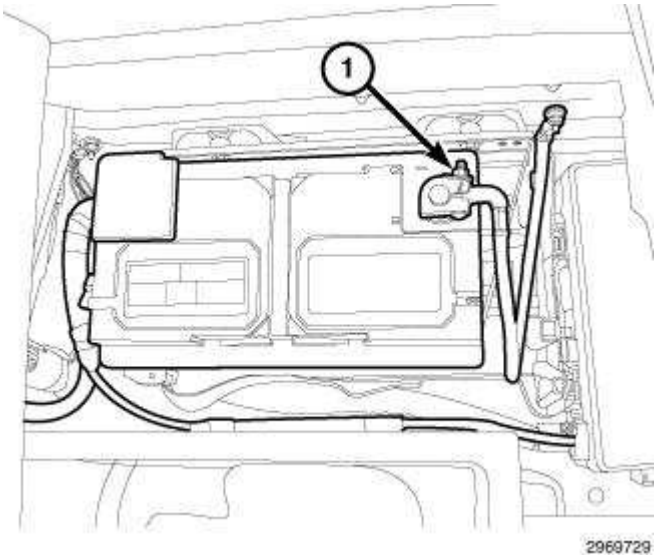

Fig. 392: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

2. Disconnect and isolate the negative battery cable (1).

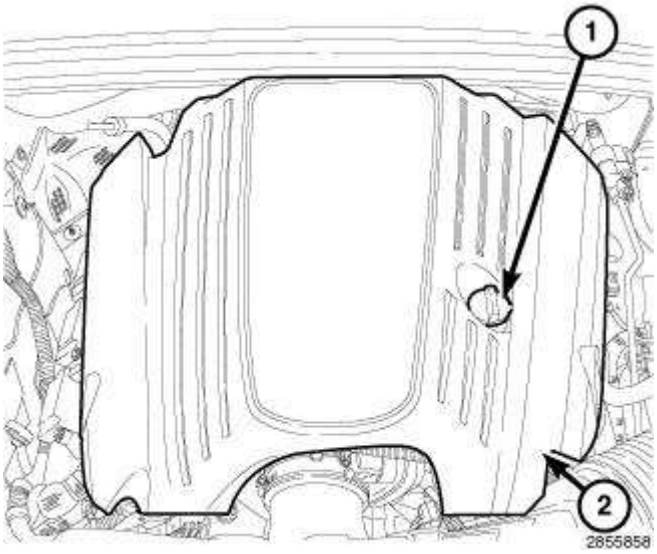

Fig. 393: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).
4. Disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT** .

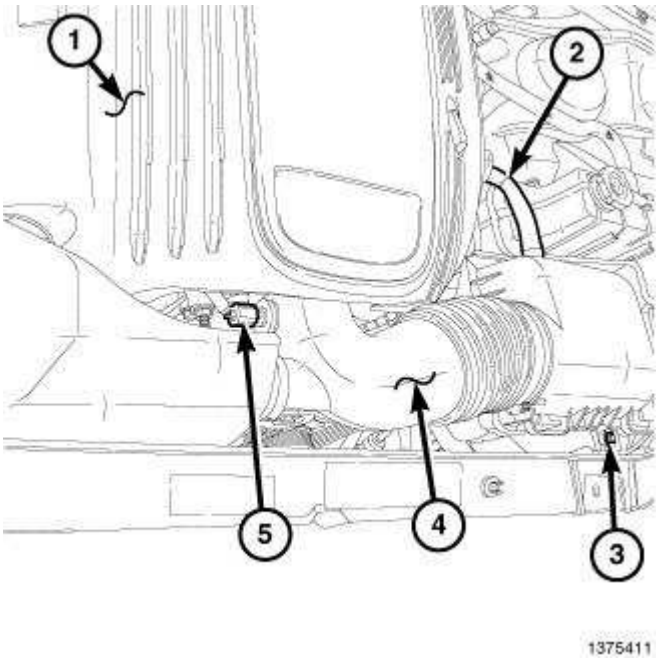

Fig. 394: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the intake air temperature (IAT) sensor (5) electrical connector.
6. Loosen the clamps at the throttle body and the air filter housing and remove the air tube (4).

7. Disconnect the make up air hose (MUA) (2).
8. Remove the air filter housing retaining bolt (3).
9. Remove the air filter housing from the vehicle.
10. Disconnect the brake booster hose and the EVAP purge line.

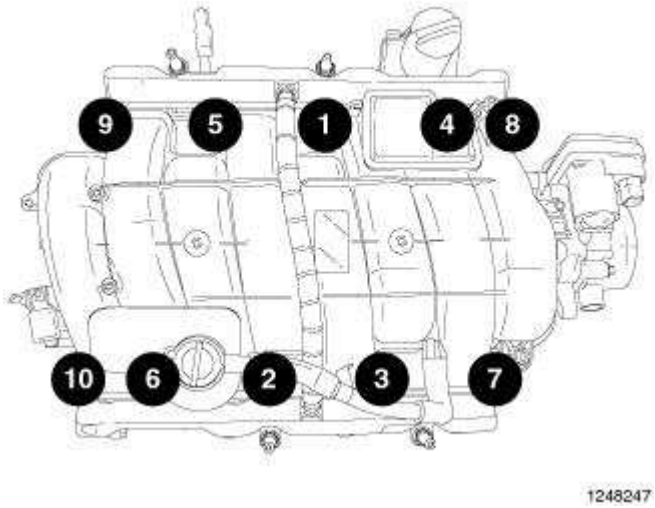

Fig. 395: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the electrical connectors from the following components:
    - Manifold Absolute Pressure (MAP) Sensor
    - Fuel Injectors
    - Electronic Throttle Control (ETC)

NOTE: Remove the intake manifold and throttle body as an assembly.

12. Using the sequence shown in illustration, remove the intake manifold retaining bolts.
13. Remove the intake manifold and throttle body as an assembly from the vehicle.

CLEANING

CLEANING

NOTE: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

INSPECTION

INSPECTION

1. Inspect the intake sealing surface for cracks, nicks and distortion.
2. Inspect the intake manifold vacuum hose fittings for looseness or blockage.

INSTALLATION

INSTALLATION

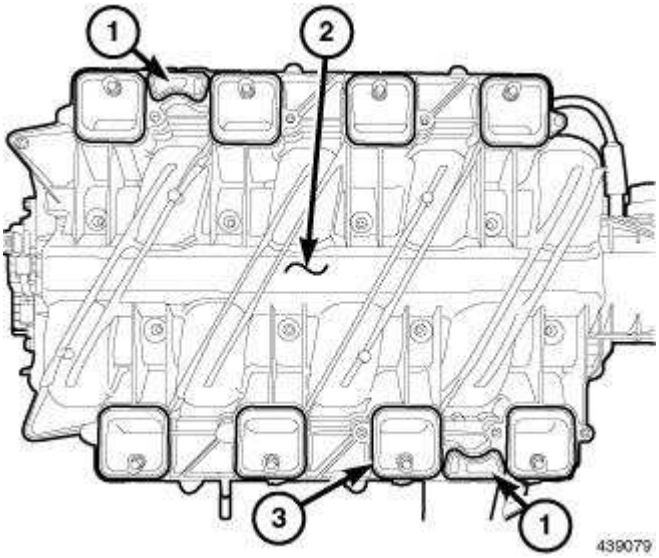

Fig. 396: Intake Manifold & PCV Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: The intake manifold seals (1, 3) may be used again, provided no cuts, tears, or deformation have occurred.

1. Inspect the intake manifold seals and replace if necessary.

NOTE: If reinstalling the original manifold, apply Mopar® Lock & Seal Adhesive to the intake manifold bolts. Not required when installing a new manifold.

2. If required, apply Mopar® Lock & Seal Adhesive to the intake manifold bolts.
3. Position the intake manifold (2).

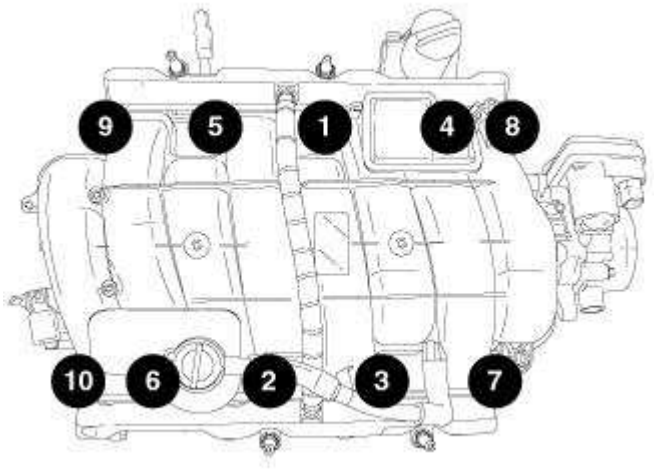

Fig. 397: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Using the sequence shown in illustration, install the intake manifold retaining bolts and tighten to 12 N.m (9 ft. lbs.).
5. Connect the fuel supply line. Refer to **FITTING, QUICK CONNECT** .
6. Connect the brake booster hose and the EVAP purge line.
7. Connect the electrical connectors to the following components:
    - Manifold Absolute Pressure (MAP) Sensor
    - Fuel Injectors
    - Electronic Throttle Control (ETC)

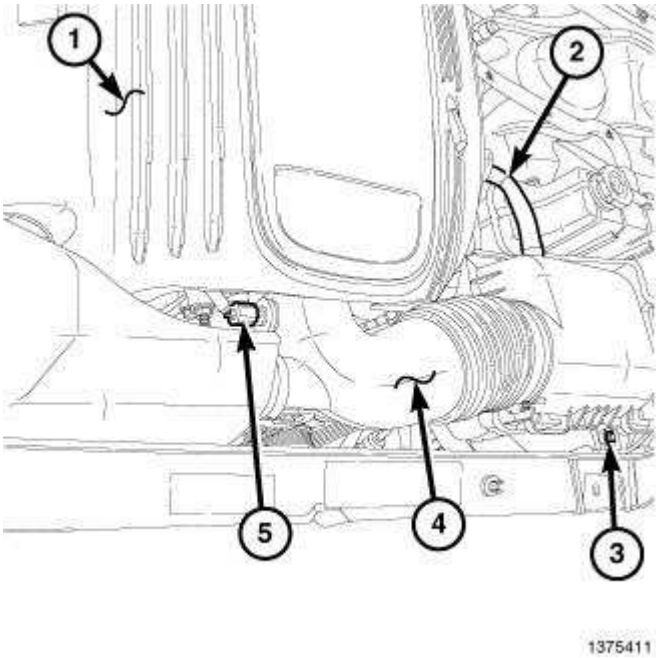

Fig. 398: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

8. Position the air filter housing into the engine compartment.
9. Install the air filter housing retaining bolt (3) and tighten to 5 N.m (44 in. lbs.).
10. Connect the clean air tube to the throttle body and the air filter housing and tighten clamps to 3 N.m (30 in. lbs.).
11. Connect the make up air hose (MUA) (2).
12. Connect the intake air temperature (IAT) sensor (5) electrical connector.

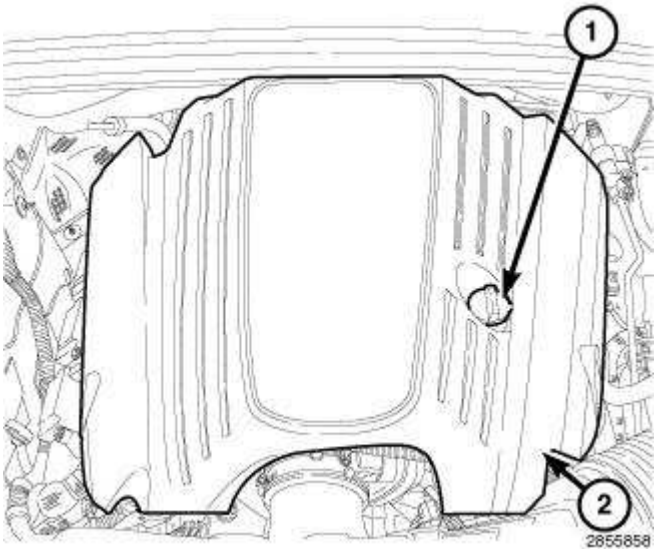

Fig. 399: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

13. Position the engine cover (2) and secure the retaining grommets onto the ball studs.

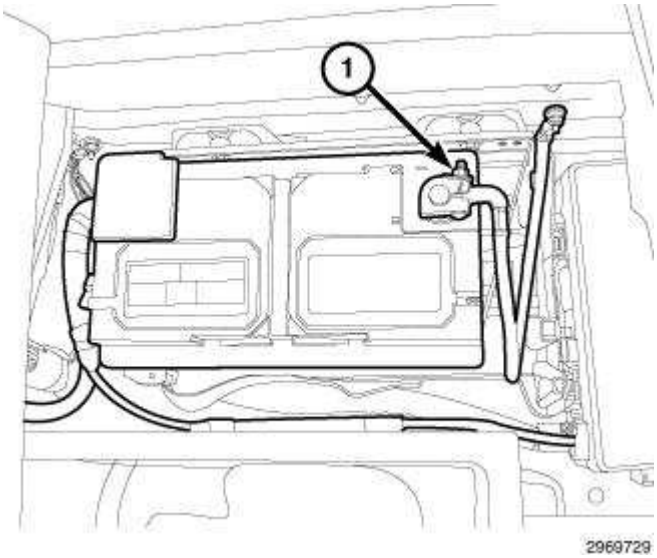

Fig. 400: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

14. Connect the negative battery cable (1).
15. Start the engine and check for leaks.

VALVE TIMING

CHAIN AND SPROCKETS, TIMING

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

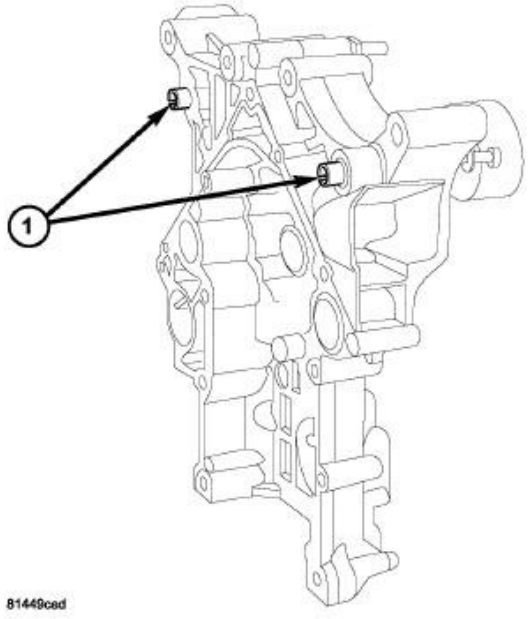

Fig. 401: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove water pump for timing chain cover removal.

3. Remove the timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL, 5.7L**.
4. Verify the slide bushings (1) remain installed in the timing chain cover during removal.

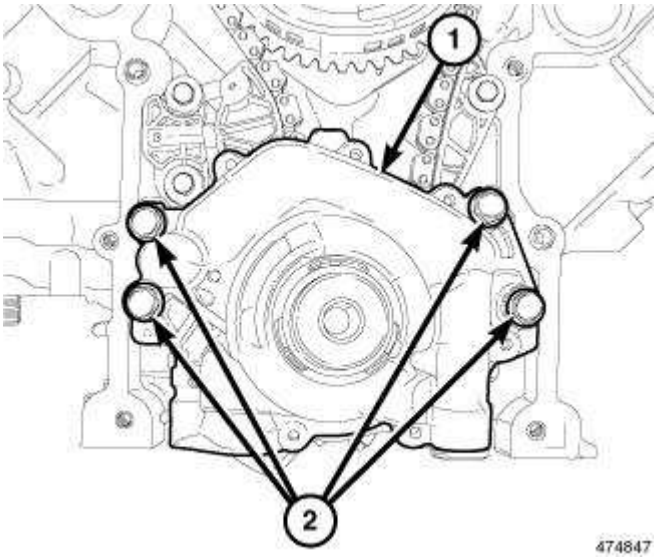

Fig. 402: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

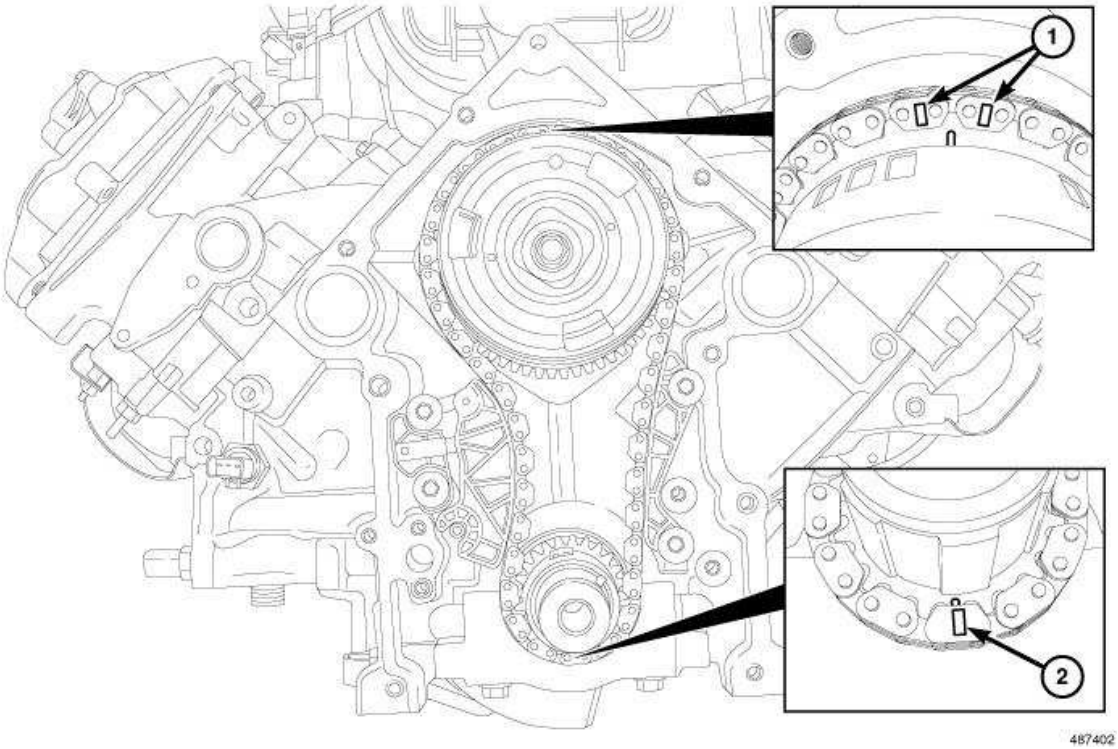

Fig. 403: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER GROUP, LLC

6. Install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align the timing marks with the timing chain sprockets (1, 2).

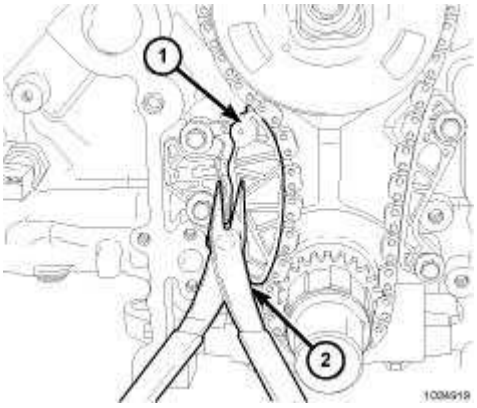

Fig. 404: Retracting Tensioner Shoe Using Pliers
Courtesy of CHRYSLER GROUP, LLC

7. Retract the chain tensioner arm (1) until the hole in the arm lines up with the hole in the bracket.

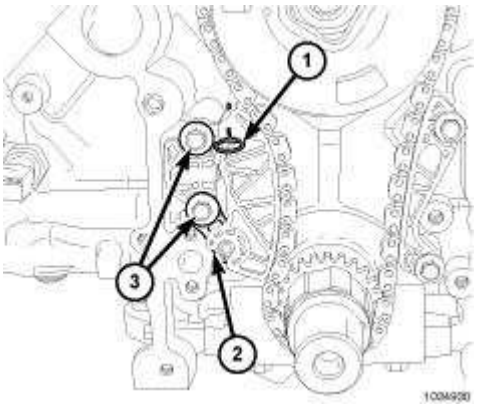

Fig. 405: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) into the chain tensioner holes.

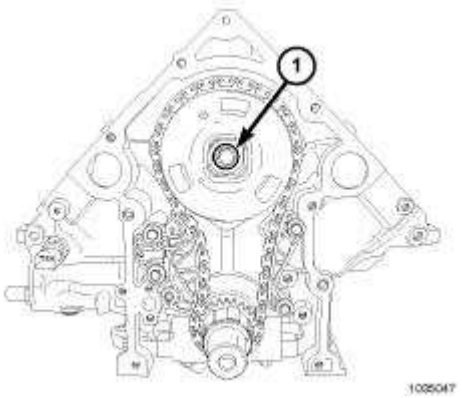

Fig. 406: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

9. Remove the camshaft phaser retaining bolt (1) and remove the timing chain with the camshaft phaser and crankshaft sprocket.

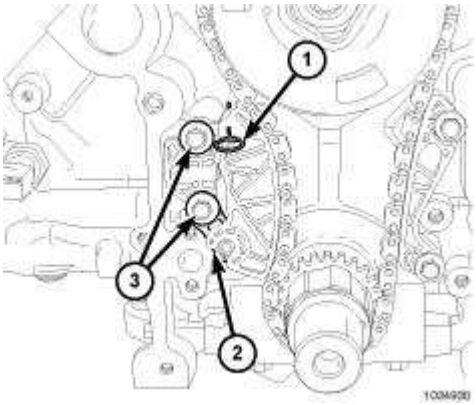

Fig. 407: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect the timing chain tensioner and timing chain guide shoes for wear and replace as necessary.

10. If the timing chain tensioner is being replaced, remove the retaining bolts (3) and remove the timing chain tensioner (2).

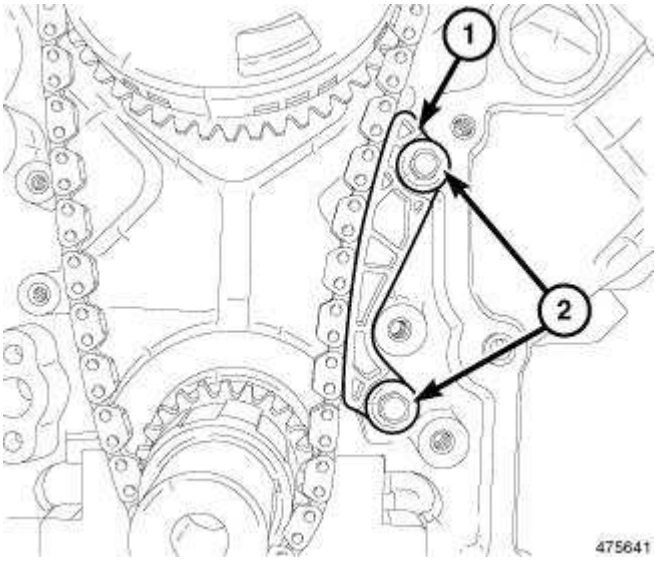

Fig. 408: Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. If the timing chain guide (1) is being replaced, remove the retaining bolts (2) and remove the timing chain guide.

INSTALLATION

INSTALLATION

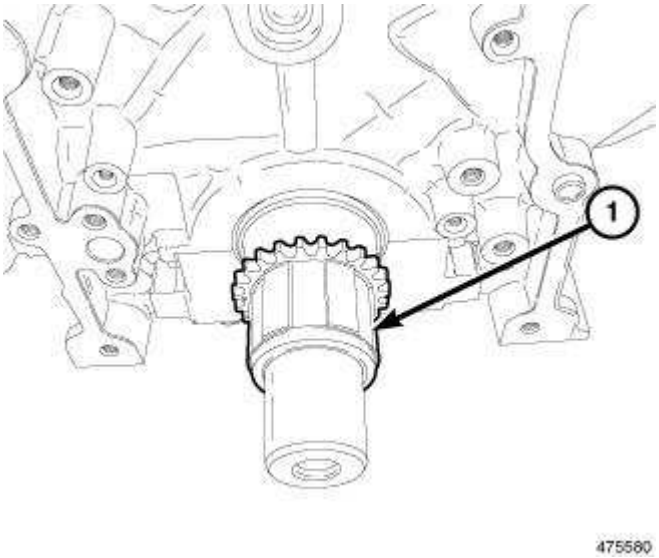

Fig. 409: Crankshaft Sprocket
Courtesy of CHRYSLER GROUP, LLC

1. Install the crankshaft sprocket (1) and position halfway onto the crankshaft.

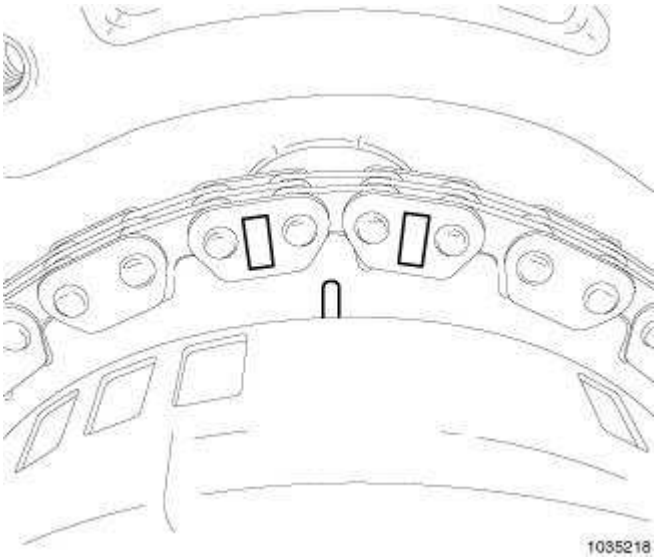

Fig. 410: Aligning Timing Chain & Camshaft Phaser Marks
Courtesy of CHRYSLER GROUP, LLC

2. While holding the camshaft phaser in hand, position the timing chain on the camshaft phaser and align the timing marks as shown in illustration.

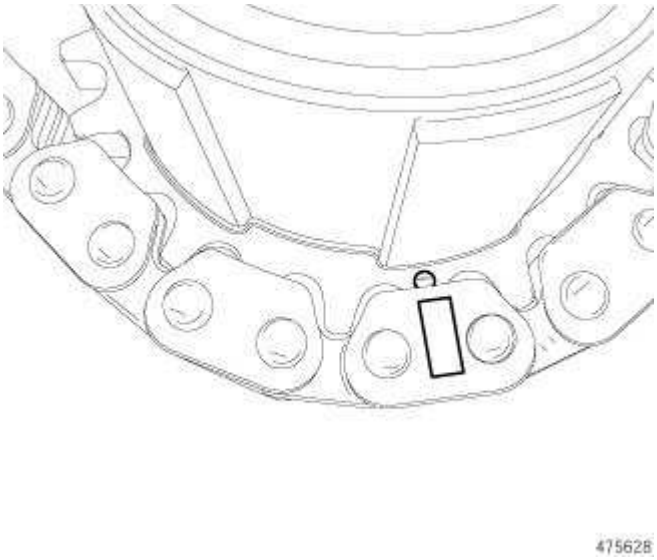

Fig. 411: Aligning Timing Chain & Crankshaft Sprocket Marks
Courtesy of CHRYSLER GROUP, LLC

3. While holding the camshaft phaser and timing chain in hand, position the timing chain on the crankshaft sprocket and align the timing mark as shown in illustration.

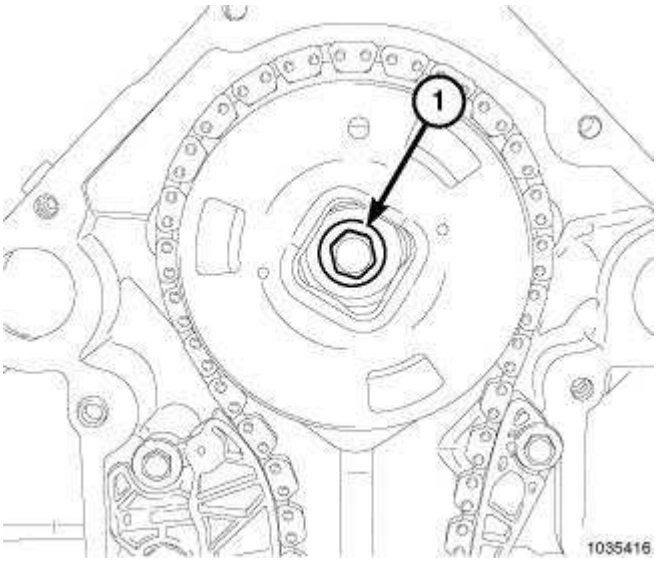

Fig. 412: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Align the slot in the camshaft phaser with the dowel on the camshaft and position the camshaft phaser on the camshaft while sliding the crankshaft sprocket into position.
5. Install the camshaft phaser retaining bolt (1) finger tight.

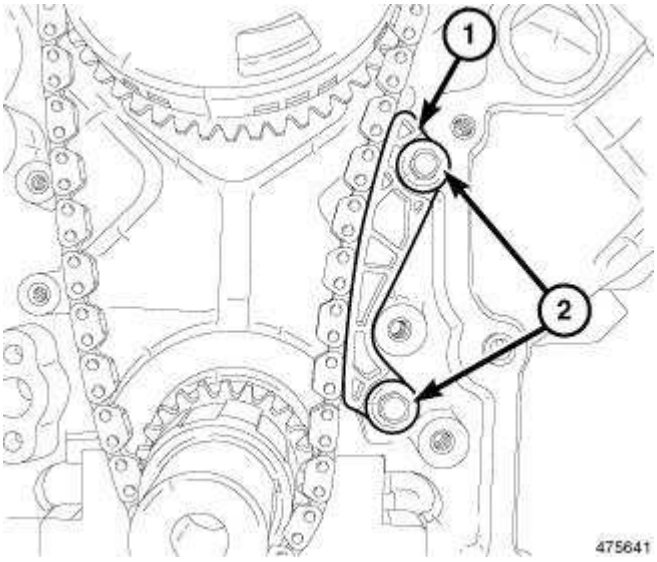

Fig. 413: Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. If removed, install the timing chain guide (1) and tighten the bolts (2) to 11 N.m (8 ft. lbs.).

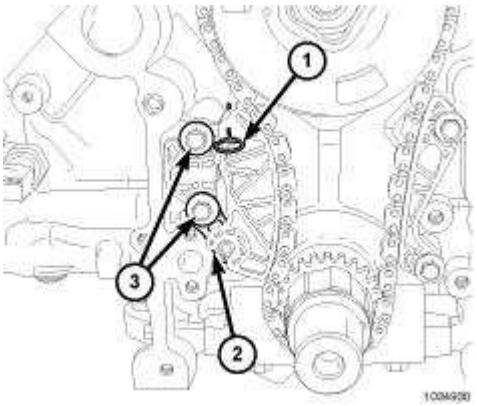

Fig. 414: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. If removed, install the timing chain tensioner (2) and tighten the bolts (3) to 11 N.m (8 ft. lbs.).
8. Remove the tensioner pin (special tool #8514, Pins, Tensioner) (1).

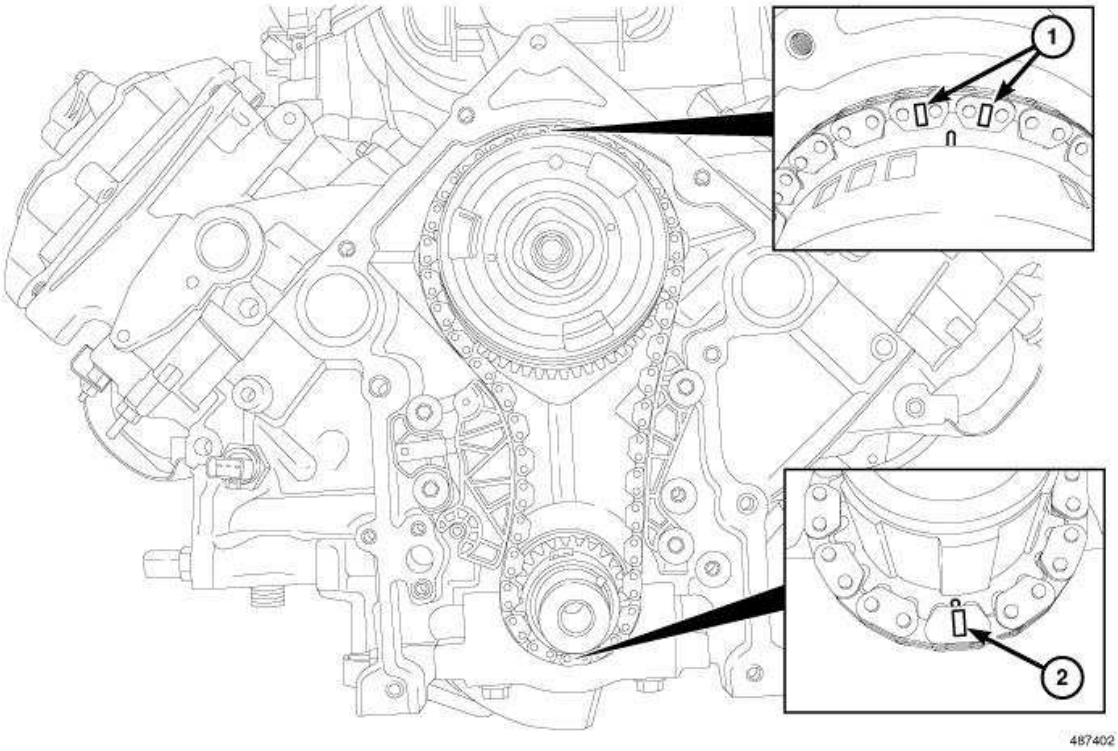

Fig. 415: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the crankshaft two revolutions and verify the alignment of the timing marks (1, 2). If the timing marks do not line up, remove the camshaft sprocket and realign.

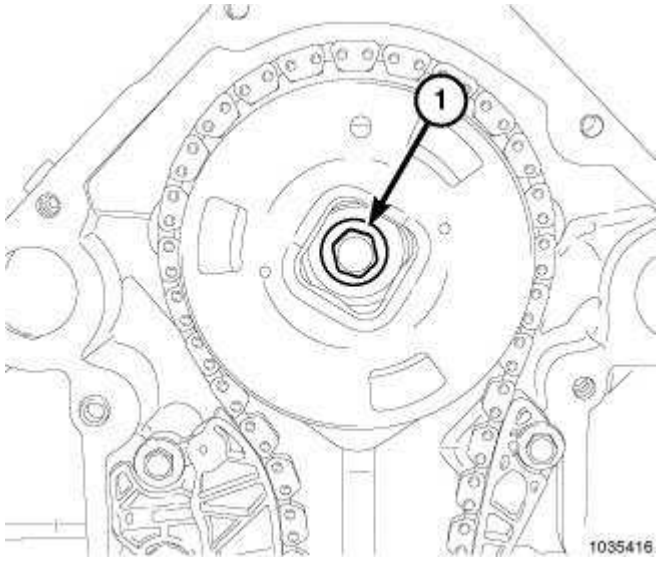

Fig. 416: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the camshaft phaser bolt (1) to 85 N.m (63 ft. lbs.).

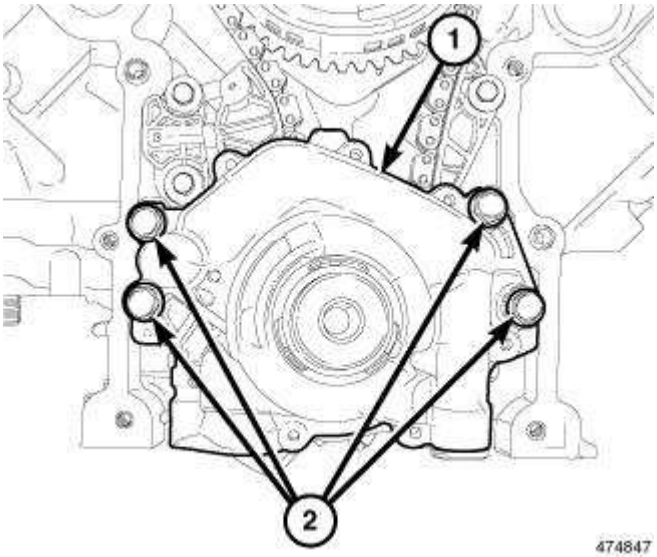

Fig. 417: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Position the oil pump (1) onto the crankshaft and install the oil pump retaining bolts (2) finger tight.

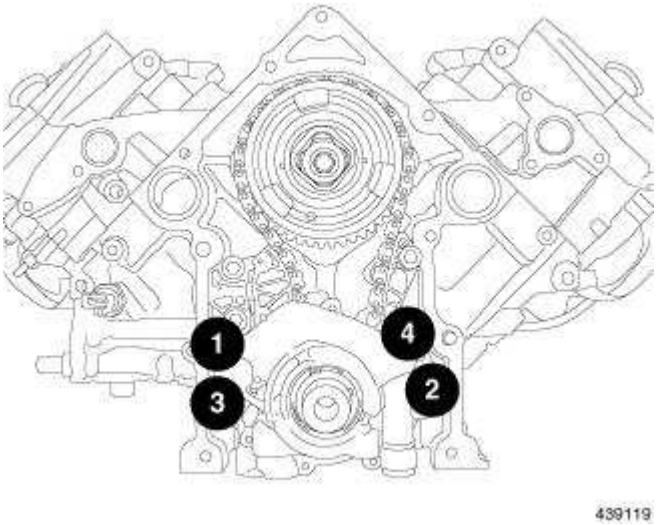

Fig. 418: Oil Pump Retaining Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

12. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).

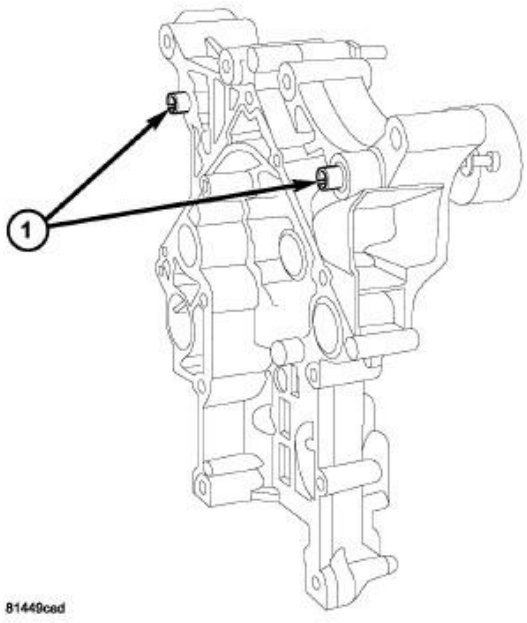

Fig. 419: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

13. Verify the slide bushings (1) are installed in the timing chain cover.
14. Install the timing chain cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION, 5.7L**.
15. Fill the engine with oil.
16. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
17. Connect the negative battery cable.
18. Start the engine and check for leaks.

COVER(S), ENGINE TIMING

REMOVAL

REMOVAL

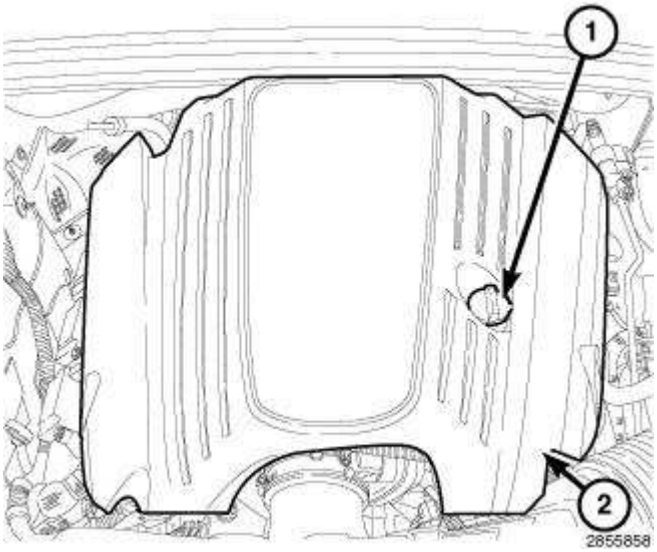

Fig. 420: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).
2. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

WARNING: Do not remove the radiator pressure cap, cylinder block drain plugs or loosen the radiator draincock with the system hot and under pressure. Serious burns from coolant can occur.

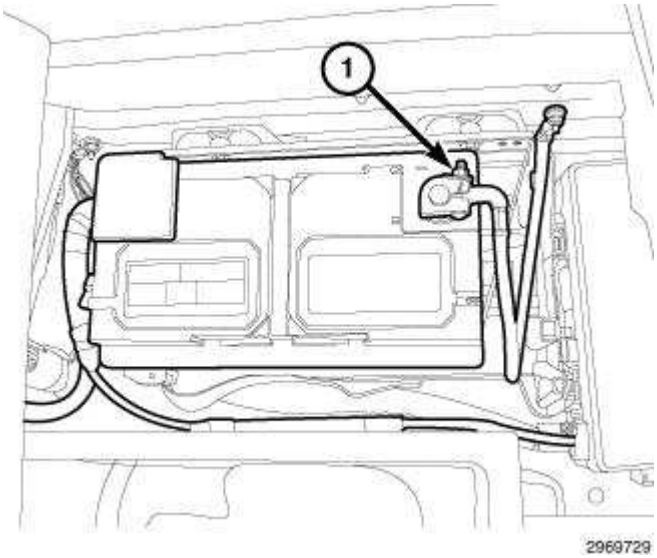

Fig. 421: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect and isolate the negative battery cable (1).
4. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

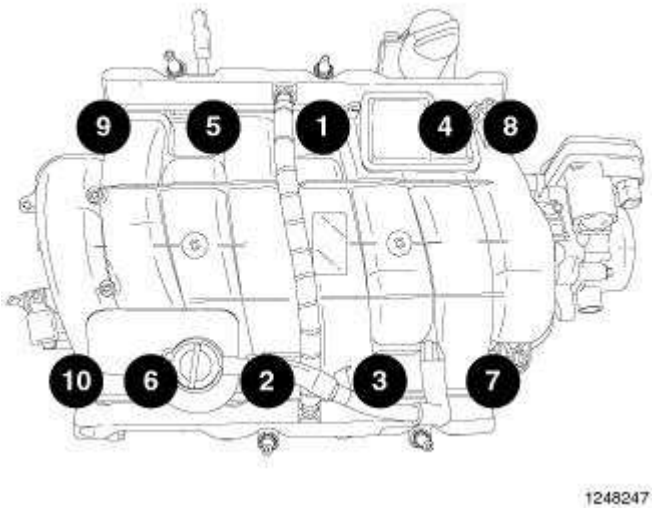

Fig. 422: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

5. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL, 5.7L**.

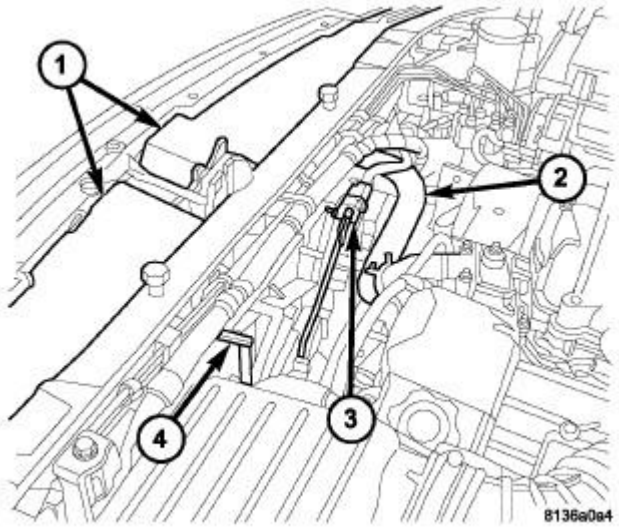

Fig. 423: Upper Radiator Closure Panel, Hose, Radiator Fan Electrical Connector & Fan Assembly

4 - RADIATOR FAN ASSEMBLY

6. Remove upper radiator hose (2).

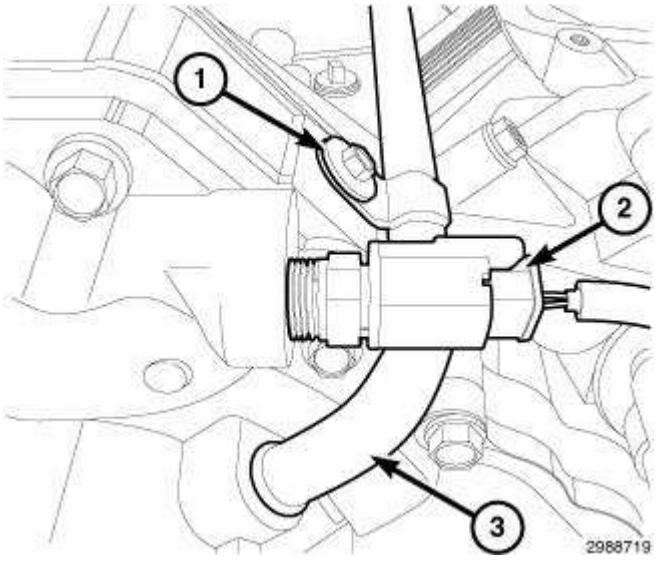

Fig. 424: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the coolant temperature sensor electrical connector (2).
8. Remove the heater tube retaining bolt (1).
9. Lift the heater tube (3) out of the water pump.

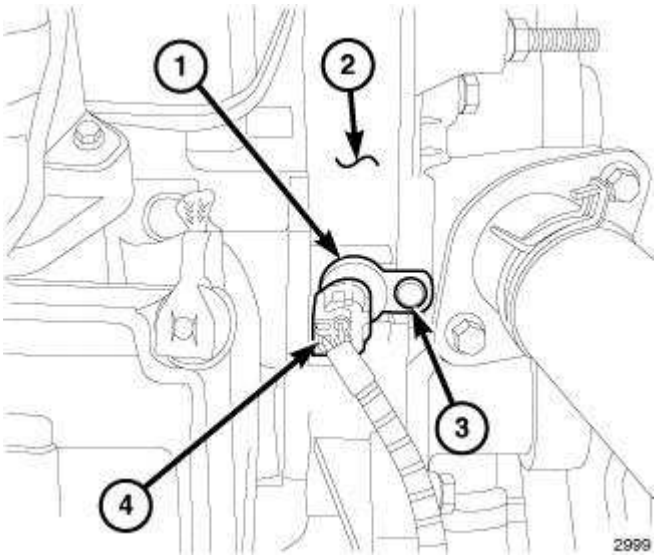

Fig. 425: Camshaft Position Sensor, Connector, Bolt & Timing Cover
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the camshaft position (CMP) sensor electrical connector (4).

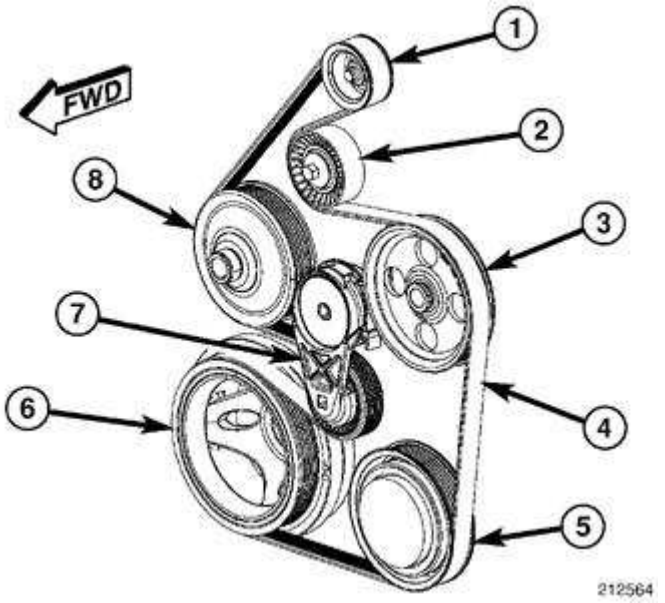

Fig. 426: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.
12. Remove accessory drive belt tensioner (8) and the idler pulley (6).
13. Remove the radiator. Refer to **RADIATOR, ENGINE COOLING, REMOVAL** .
14. Remove the A/C condenser. Refer to **CONDENSER, A/C, REMOVAL** .
15. Remove A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .
16. Remove the generator. Refer to **GENERATOR, REMOVAL** .

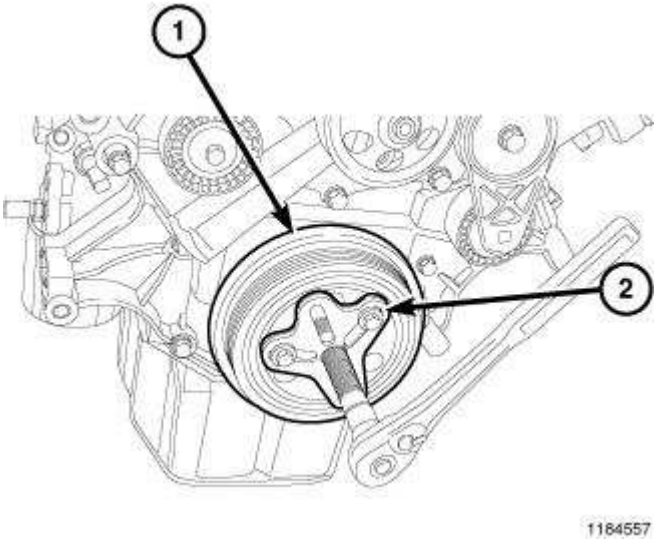

Fig. 427: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.**

17. Remove the crankshaft damper retaining bolt.
18. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper and remove the crankshaft damper (1).

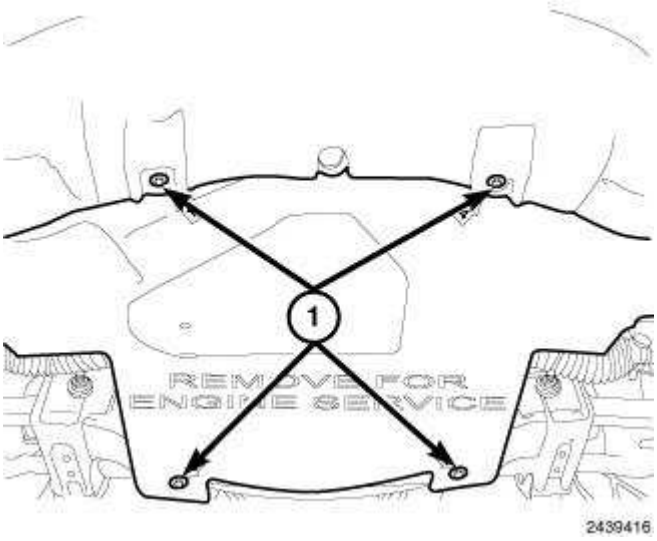

Fig. 428: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

19. Raise and support the vehicle
20. Remove the belly pan retainers (1) and remove the belly pan.
21. Remove the lower radiator hose clamp and remove the lower radiator hose.
22. Drain the engine oil.

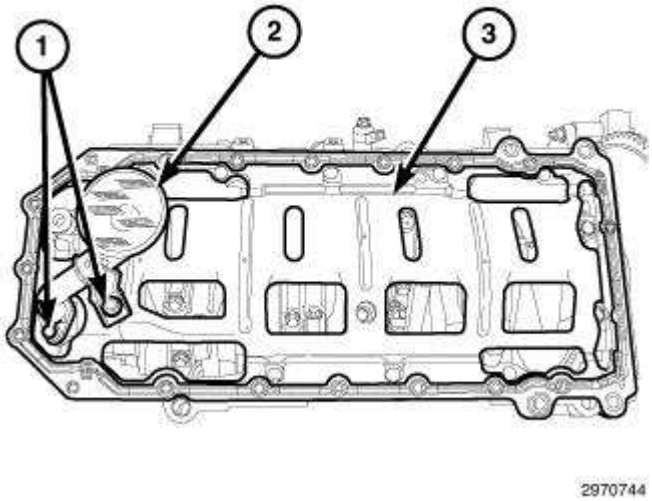

Fig. 429: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

23. Remove the oil pan. Refer to **PAN, OIL, REMOVAL, 5.7L** and **PAN, OIL, AWD, REMOVAL, 5.7L**.
24. Remove the oil pump pickup tube retaining bolt and nut (1).
25. Remove the oil pump pickup tube (2).
26. Remove and discard the oil pan gasket/windage tray (3).

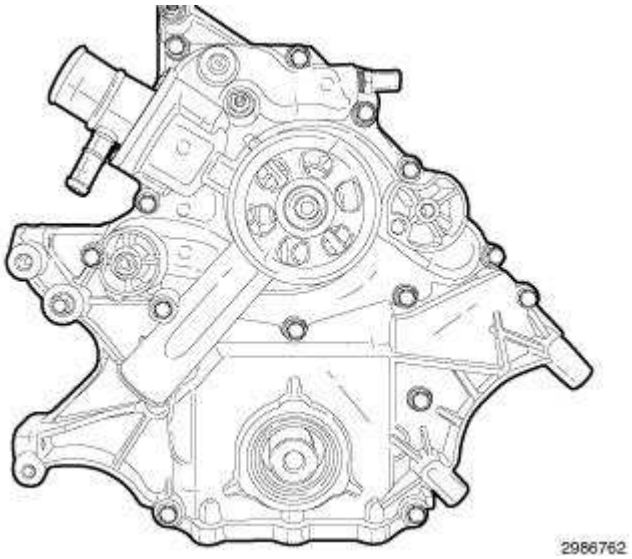

Fig. 430: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove water pump for timing cover removal.

NOTE: 6.4L timing cover shown in illustration, 5.7L timing cover similar.

27. Lower the vehicle.
28. Remove the engine timing cover retaining bolts and remove the engine timing cover.

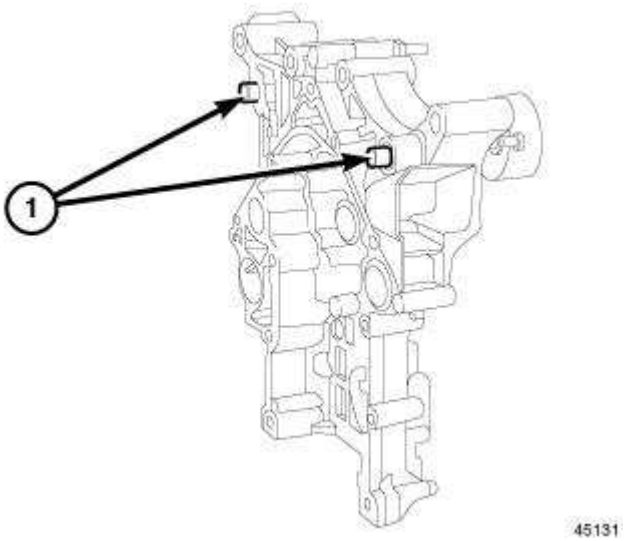

Fig. 431: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

29. Verify that the engine timing cover slide bushings (1) remain located in the engine timing cover.

INSTALLATION

INSTALLATION

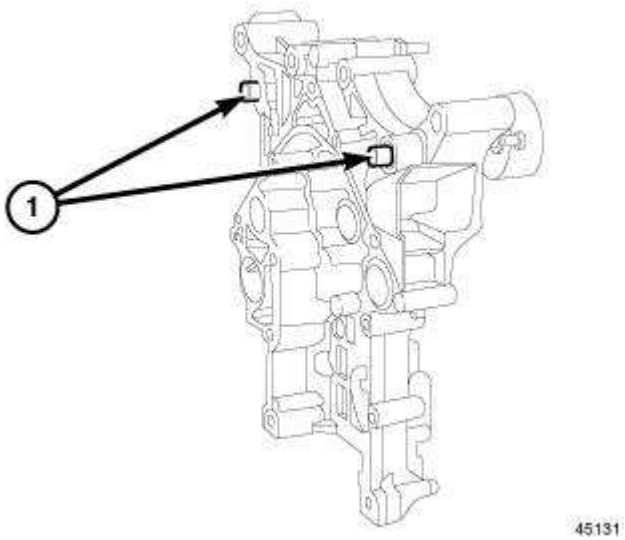

Fig. 432: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

1. Clean the engine timing cover and engine block surface.

NOTE: Always install a new gasket when servicing the engine timing cover.

2. Verify that the engine timing cover slide bushings (1) remain located in the engine timing cover.

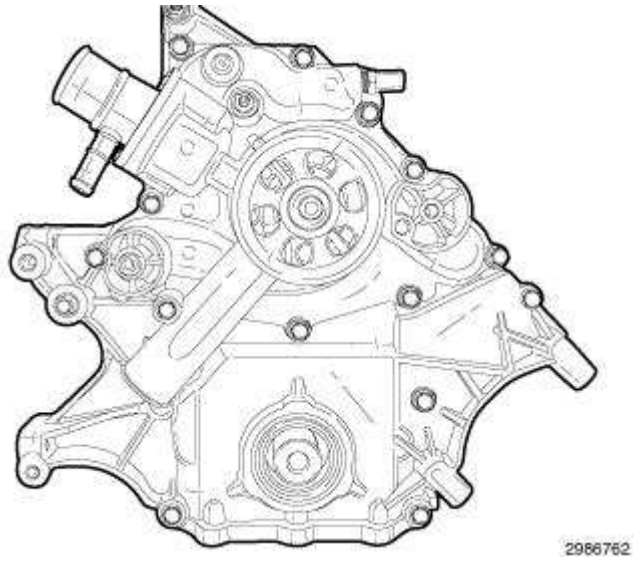

Fig. 433: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: 6.4L timing cover shown in illustration, 5.7L timing cover similar.

3. Using a new gasket, install the engine timing cover and tighten the retaining bolts to 28 N.m (21 ft. lbs.).

NOTE: The large lifting stud is torqued to 55 N.m (40 ft. lbs.).

4. Tighten the large lifting stud to 55 N.m (40 ft. lbs.).

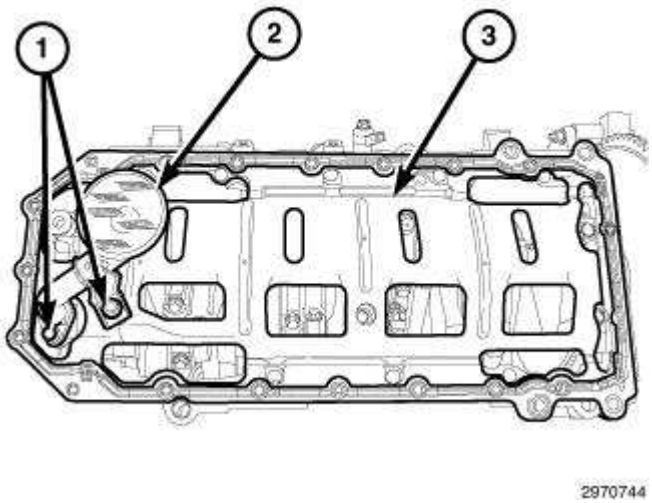

Fig. 434: Integral Windage Tray, Oil Pump Pickup Tube & Bolts

Courtesy of CHRYSLER GROUP, LLC

5. Raise and support the vehicle.
6. Install the oil pump pickup tube (2) and the oil pan. Refer to **PAN, OIL, INSTALLATION, 5.7L** and **PAN, OIL, AWD, INSTALLATION, 5.7L**.
7. Install the lower radiator hose and clamp.

CAUTION: The Damper Installer (special tool #8512A, Installer, Damper) is assembled in a specific sequence. Failure to assemble this tool in this sequence may result in tool failure and severe damage to either the tool or the crankshaft.

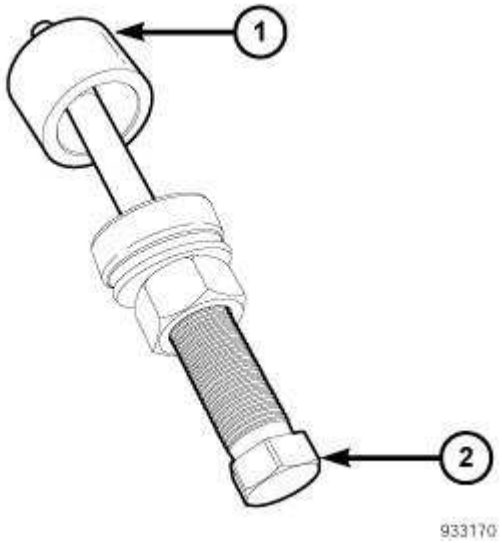

Fig. 435: Pressing Cup & Damper Installer
Courtesy of CHRYSLER GROUP, LLC

8. Assemble the Damper Installer (special tool #8512A, Installer, Damper) (2) as follows:
    1. Install the nut onto the threaded shaft.
    2. Install the roller bearing onto the threaded shaft making sure the hardened bearing surface is facing the nut.
    3. Install the pressing cup (2) from the A/C Hub Installer (special tool #6871, Installer, A/C Hub) onto the threaded shaft.
    4. Coat the threaded shaft with MOPAR® Nickel Anti-Seize or equivalent.

CAUTION: To prevent severe damage to the crankshaft Damper Installer (special tool #8512A, Installer, Damper), thoroughly clean the damper bore and the crankshaft nose before installing damper.

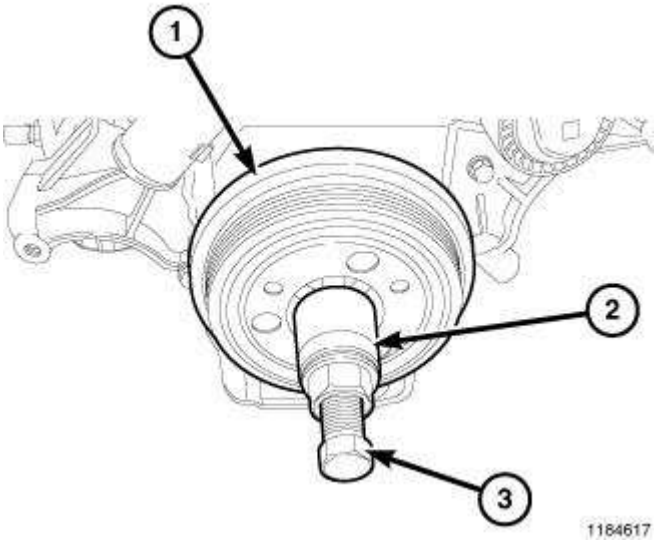

Fig. 436: Pressing Damper Onto Crankshaft
Courtesy of CHRYSLER GROUP, LLC

9. Position the crankshaft damper (1) onto the crankshaft.
10. Using the crankshaft Damper Installer (special tool #8512A, Installer, Damper) (3) and the pressing cup (2) from A/C Hub Installer (special tool #6871, Installer, A/C Hub), press the crankshaft damper (1) onto the crankshaft.
11. Install the crankshaft damper bolt and tighten to 176 N.m (129 ft. lbs.).

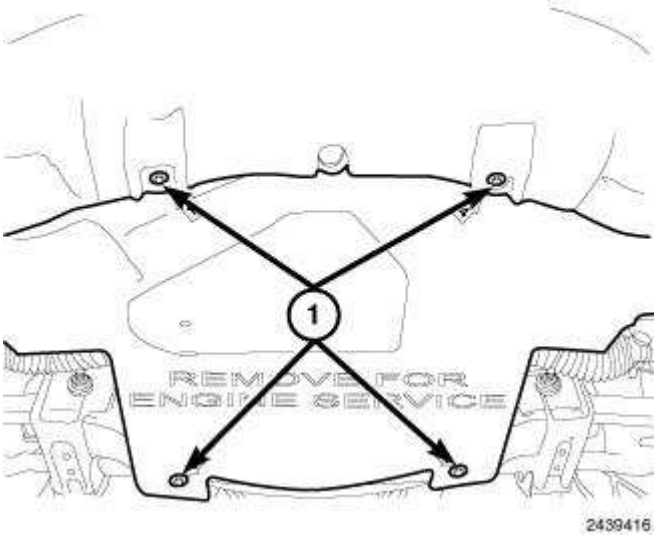

Fig. 437: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

12. Position the belly pan and install the belly pan retainers (1).
13. Lower the vehicle.
14. Install the generator. Refer to **GENERATOR, INSTALLATION** .

15. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .
16. Install the A/C condenser. Refer to **CONDENSER, A/C, INSTALLATION** .
17. Install the radiator. Refer to **RADIATOR, ENGINE COOLING, INSTALLATION** .

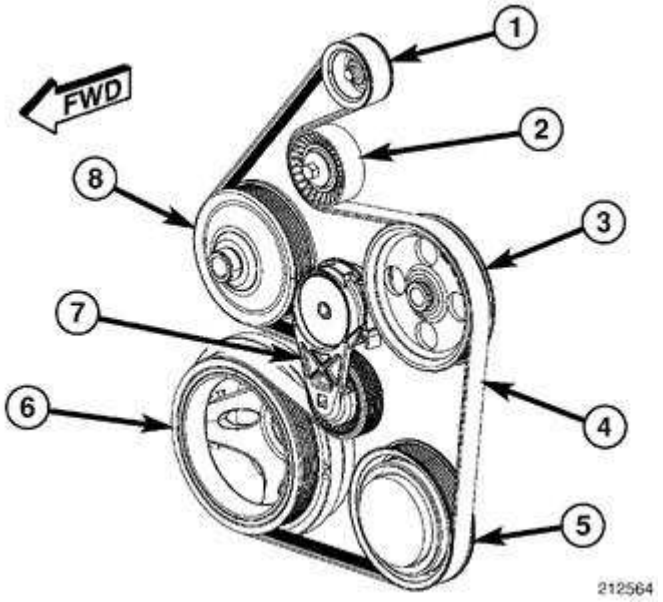

Fig. 438: Drive Belt Tensioners & Assembly With Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

18. Install the accessory drive belt tensioner assembly (8) and idler pulley (6).
19. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.
20. Install the oil dipstick tube and retaining nut.

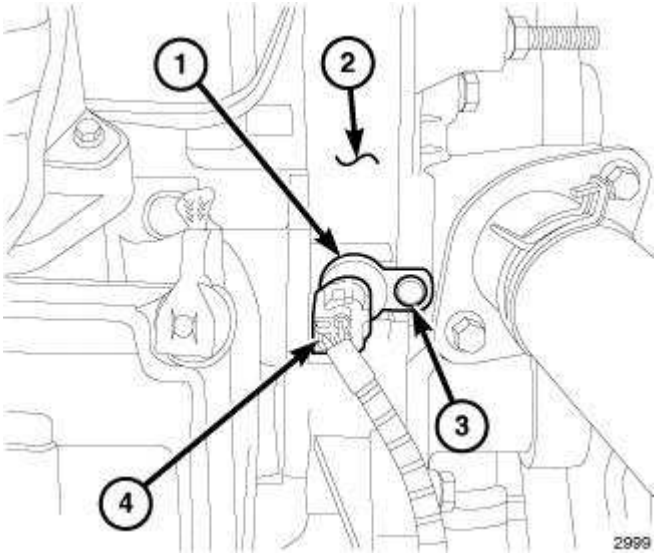

Fig. 439: Camshaft Position Sensor, Connector, Bolt & Timing Cover
Courtesy of CHRYSLER GROUP, LLC

21. Connect the camshaft position (CMP) sensor electrical connector (4).

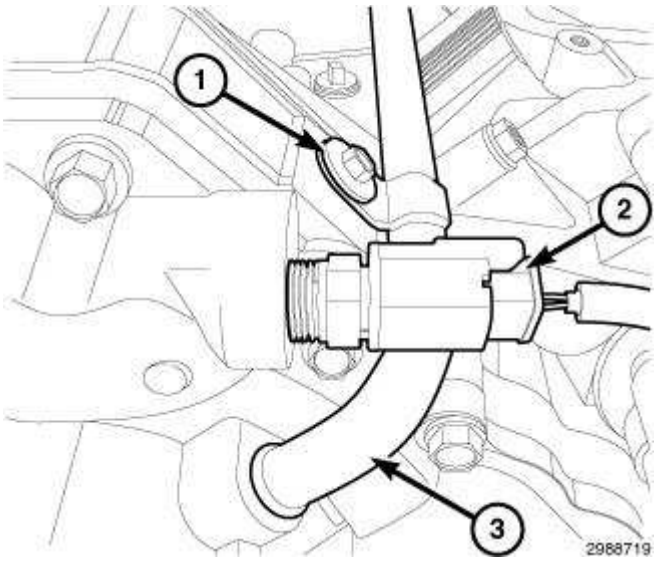

Fig. 440: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Install the heater tube (3) into of the water pump.
23. Install the heater tube retaining bolt (1) and tighten to 12 N.m (9 ft. lbs.).
24. Connect the coolant temperature sensor electrical connector (2).

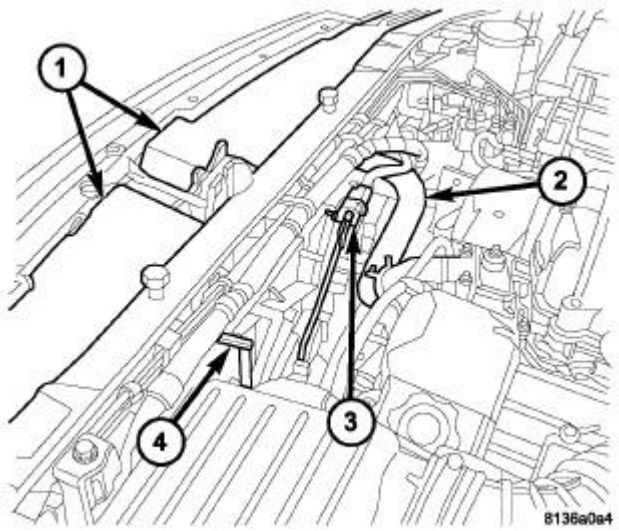

Fig. 441: Upper Radiator Closure Panel, Hose, Radiator Fan Electrical Connector & Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - UPPER RADIATOR CLOSURE PANELS
2 - UPPER RADIATOR HOSE
3 - RADIATOR FAN ELECTRICAL CONNECTOR
4 - RADIATOR FAN ASSEMBLY

25. Install the upper radiator hose (2) and clamp.

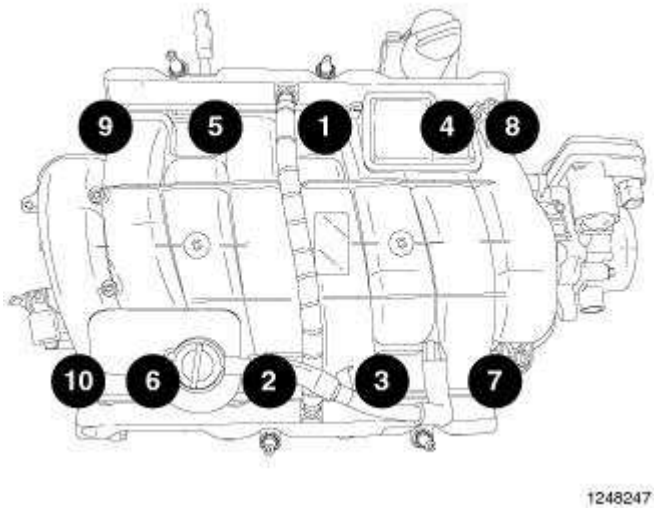

Fig. 442: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

26. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION, 5.7L**.
27. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .
28. Fill the crankcase with the specified type and amount of engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

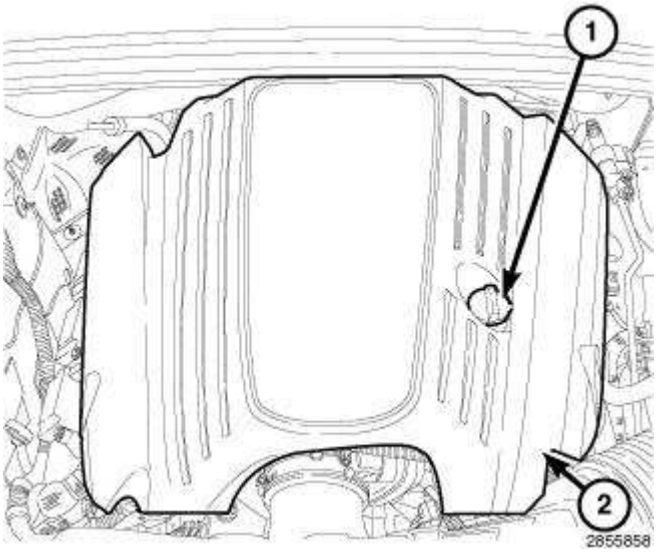

Fig. 443: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

29. Position the engine cover (2) and secure the retaining grommets onto the ball studs.

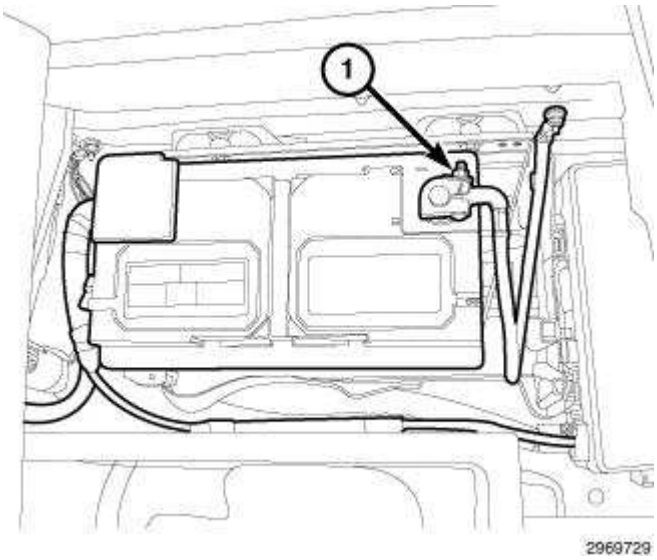

Fig. 444: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

30. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).
31. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD PROCEDURE** .
32. Start the engine and check for leaks.

TENSIONER, ENGINE TIMING

STANDARD PROCEDURE

STANDARD PROCEDURE - RESETTING TIMING CHAIN TENSIONER

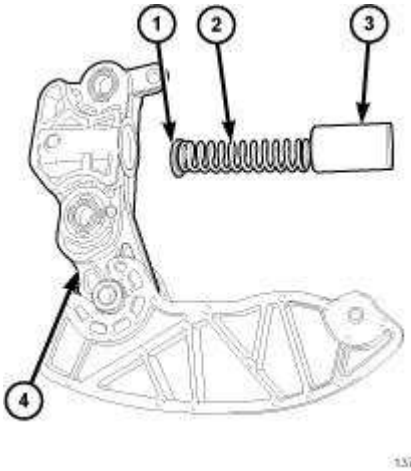

Fig. 445: Tensioner Body, Washer, Spring & Plunger
Courtesy of CHRYSLER GROUP, LLC

NOTE: Verify that the tensioner is assembled correctly.

1. Install the washer (1), spring (2), and plunger (3) inside the tensioner body (4).

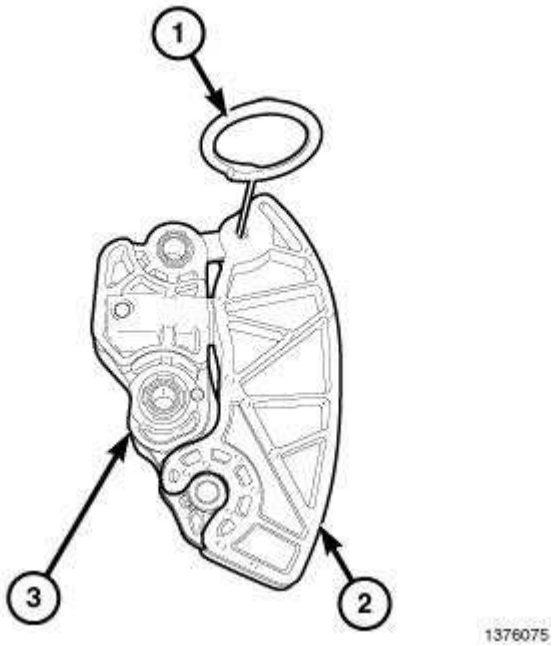

Fig. 446: Tensioner Pin, Guide Shoe & Tensioner Body
Courtesy of CHRYSLER GROUP, LLC

2. Squeeze the tensioner body (3) and movable guide shoe (2) together and install the Tensioner Pin (special tool #8514, Pins, Tensioner) (1).

ENGINE

6.4L - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

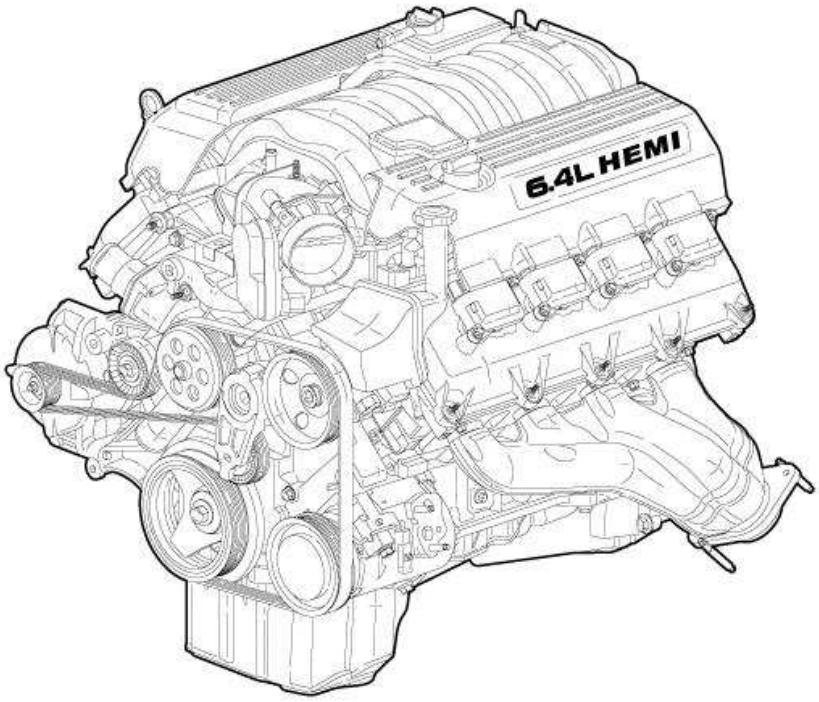

Fig. 1: 6.4L HEMI V-8 Engine
Courtesy of CHRYSLER GROUP, LLC

The 6.4L HEMI eight-cylinder SRT high performance engine is a 90° V-Type, deep skirt, lightweight cast iron block with aluminum heads, single cam, overhead valves, and hydraulic roller lifters. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2. The 6.4L HEMI engine is a bored and stroked version of the 5.7L HEMI engine developed for SRT high performance vehicles. This engine shares the same architecture as the 2009 5.7L HEMI with the following Performance Upgrades:

- Increased Bore
- Increased Stoke
- Increased Valve Sizing

The 6.4L HEMI engine also has improved horsepower, torque and fuel economy as compared with the 6.1L HEMI engine. This is achieved with the larger displacement and the following Technical

Improvements:

- Variable Cam Timing (VCT) Cam Phasing System
- Multi-Displacement System (MDS)
- High Flow Ports
- Increased Maximum RPM
- Combustion Chamber Shape
- Higher Compression Ratio

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance e.g., (engine idles rough and stalls) or mechanical e.g., (a strange noise). For possible causes and corrections of malfunctions, refer to **ENGINE MECHANICAL DIAGNOSIS CHART**.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. For additional Information on diagnosis and testing, refer to the following tests:

- Cylinder Compression Pressure Leakage. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Checking Engine Oil Pressure. Refer to **CHECKING ENGINE OIL PRESSURE**.
- Cylinder Head Gasket Failure. Refer to **DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE**.
- Intake Manifold Leakage. Refer to **DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE**.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket
- Any causes for combustion and/or compression pressure loss

1. Check the coolant level and fill as required. Do not install the radiator cap.
2. Start and operate the engine until it reaches normal operating temperature, then turn the engine OFF.
3. Remove the spark plugs.
4. Remove the oil filler cap.
5. Remove the air cleaner hose.
6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1, 379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Position the piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe, and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage between cylinders.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Air escapes through the throttle body	Intake valve bent, burnt, or not seated properly.	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
Air escapes through the tailpipe	Exhaust valve bent, burnt, or not seated properly.	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
Air escapes through the radiator	Cylinder head gasket leaking or cracked in cylinder head or engine block.	Remove cylinder head and inspect. Replace cylinder head gasket, cylinder head or engine block as necessary.
More than 50% leakage from adjacent cylinders	Cylinder head gasket leaking or crack in cylinder head or engine block between adjacent cylinders.	Remove cylinder head and inspect. Replace cylinder head gasket, cylinder head or engine block as necessary.
More than 25% leakage and air escapes through the oil filler cap opening only	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall.	Remove cylinder head and inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary.

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase.	1. Check for correct oil level. Adjust oil level by draining or adding as needed.
	2. Thin or diluted oil.	2. Change oil. Refer to

		Engine/Lubrication/OIL - Standard Procedure.
	3. Low oil pressure.	3. Check engine oil level. If OK, perform oil pressure test. Refer to **Engine/Lubrication - Diagnosis and Testing**.
	4. Dirt in hydraulic lifters.	4. Clean/replace hydraulic lifters.
	5. Bent push rod(s).	5. Install new push rods.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms and replace worn arms as needed.
	7. Worn hydraulic lifters.	7. Install new hydraulic lifters.
	8. Worn valve guides.	8. Inspect all valve guides and replace as necessary.
	9. Excessive runout of valve seats or valve faces.	9. Grind valves and seats.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. If OK, perform oil pressure test. Refer to **Engine/Lubrication - Diagnosis and Testing**.
	3. Thin or diluted oil.	3. Change oil to correct viscosity. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	4. Excessive connecting rod bearing clearance.	4. Measure bearings for correct clearance with plasti-gage. Repair as necessary.
	5. Connecting rod journal out of round.	5. Replace crankshaft or grind journals.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. If OK, perform oil pressure test. Refer to **Engine/Lubrication - Diagnosis and Testing**.
	3. Thin or diluted oil.	3. Change oil to correct viscosity. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	4. Excessive main bearing clearance.	4. Measure bearings for correct clearance. Repair as necessary.
	5. Excessive end play.	5. Check crankshaft thrust bearing for excessive wear on flanges.
	6. Crankshaft main journal out of round or worn.	6. Grind journals or replace crankshaft.

	7. Loose flexplate, flywheel or torque converter.	7. Inspect crankshaft, flexplate, flywheel and bolts for damage. Tighten to correct torque.
LOW OIL PRESSURE	1. Low oil level.	1. Check oil level and fill if necessary.
	2. Faulty oil pressure sending unit.	2. Install new sending unit.
	3. Clogged oil filter.	3. Install new oil filter.
	4. Worn oil pump.	4. Replace oil pump assembly.
	5. Thin or diluted oil.	5. Change oil to correct viscosity. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
	6. Excessive bearing clearance.	6. Measure bearings for correct clearance.
	7. Oil pump relief valve stuck.	7. Remove valve to inspect, clean and reinstall.
	8. Oil pickup tube loose, broken, bent or clogged.	8. Inspect oil pickup tube and pump, and clean or replace if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Faulty or missing piston cooling jets.	10. Replace piston cooling jets.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket.
	2. Loose fastener or broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Front or rear crankshaft oil seal leaking.	3. Replace seal.
	4. Leaking oil gallery plug or cup plug.	4. Remove and reseal threaded plug. Replace cup style plug.
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. PCV System malfunction.	1. Refer to **VALVE, POSITIVE CRANKCASE VENTILATION (PCV), REMOVAL** .
	2. Defective valve stem seal (s).	2. Repair or replace seal(s).
	3. Worn or broken piston rings.	3. Hone cylinder bores. Install new rings.
	4. Scuffed pistons/cylinder walls.	4. Hone cylinder bores and replace pistons as required.
	5. Carbon in oil control ring groove.	5. Remove rings and de-carbon piston.
	6. Worn valve guides.	6. Inspect/replace valve guides as necessary.
	7. Piston rings fitted too tightly in grooves.	7. Remove rings and check ring end gap and side clearance. Replace if

		necessary.

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-rings a. Misaligned or damaged b. Loose fasteners, broken or porous metal parts 2. Crankshaft rear seal 3. Crankshaft seal flange damaged 4. Oil pan flange cracked 5. Front cover seal damaged/misaligned 6. Damaged vibration damper 7. Crankshaft rear flange microporosity	1. Verify condition a. Replace as necessary b. Tighten fasteners, repair or replace metal parts 2. Replace as necessary 3. Polish or replace crankshaft 4. Replace oil pan 5. Replace seal 6. Polish or replace damper 7. Replace crankshaft
OIL PRESSURE DROP	1. Low oil level 2. Faulty oil pressure sending unit 3. Low oil pressure 4. Clogged oil filter 5. Worn oil pump 6. Thin or diluted oil 7. Excessive bearing clearance 8. Oil pump relief valve stuck 9. Oil pickup tube loose or damaged 10. Faulty or missing piston cooling jets	1. Check and correct oil level 2. Replace sending unit 3. Check pump and bearing clearance 4. Replace oil filter 5. Replace as necessary 6. Change oil and filter 7. Replace as necessary 8. Replace oil pump 9. Replace as necessary 10. Replace piston cooling jets
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings 2. Carbon in oil ring slots 3. Incorrect ring size installed 4. Worn valve guides 5. Leaking intake gasket 6. Leaking valve guide seals	1. Hone cylinder bores and replace rings 2. Replace rings 3. Replace rings 4. Ream guides and replace valves 5. Replace intake gaskets 6. Replace valve guide seals

LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-rings.	1. Replace as necessary.
	a. Misaligned or damaged.	a. Replace as necessary.
	b. Loose fasteners, broken or porous metal parts.	b. Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear seal.	2. Replace as necessary.
	3. Crankshaft seal flange. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan.
	5. Front cover seal, damaged or misaligned.	5. Replace seal.
	6. Scratched or damaged vibration damper hub.	6. Polish or replace damper.
	7. Crankshaft Rear Flange Microporosity.	7. Replace Crankshaft.
OIL PRESSURE DROP	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure sending unit.	2. Replace sending unit.
	3. Low oil pressure.	3. Check pump and bearing clearance.
	4. Clogged oil filter.	4. Replace oil filter.
	5. Worn oil pump.	5. Replace as necessary.
	6. Thin or diluted oil.	6. Change oil and filter.
	7. Excessive bearing clearance.	7. Replace as necessary.

	9. Oil pickup tube loose or damaged.	9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings.
	2. Carbon in oil ring slots.	2. Replace rings.
	3. Incorrect ring size installed.	3. Replace rings.
	4. Worn valve guides.	4. Ream guides and replace valves.
	5. Leaking intake gasket(s).	5. Replace intake gasket(s).
	6. Leaking valve guide seals.	6. Replace valve guide seals.

OIL CONSUMPTION TEST AND DIAGNOSIS

Diagnostic Procedures

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the owner's manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.

- **Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.**
- **Verify that the engine has the correct oil level dipstick and dipstick tube installed.**
- **Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.**

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with oil consumption diagnosis.

OIL CONSUMPTION DIAGNOSIS

1. Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a **CYLINDER COMPRESSION PRESSURE LEAKAGE** test and **CYLINDER-TO-CYLINDER LEAKAGE TEST** using the standard leak down gauge following manufacturers suggested best practices.

   NOTE: Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. **Tapered and Out-of-Round Cylinders**

   The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. **Distorted Cylinders**

   This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. **Improper operation of "PCV "system**

   The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

   The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. **Worn Piston Ring Grooves**

   For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not

flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. **Worn, Broken or Stuck Piston Rings**

   When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. **Cracked or Broken Ring Lands**

   Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. **Worn Valve Stems and Guides**

   When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. **Bent or Misaligned Connecting Rods**

   Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. **Fuel Dilution**

   If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

   - Excess fuel can enter and mix with the oil via a leaking fuel injector
   - Gasoline contaminated with diesel fuel
   - Restricted air intake
   - Excessive idling

10. **Contaminated Cooling Systems**

    Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus

leading to higher oil consumption.

11. **Oil Viscosity**

    The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle owner's manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. **Dirty Engine Oil**

    Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. **Crankcase Overfull**

    Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. **Excessively High Oil Pressure**

    A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. **Aftermarket Performance Chips and Modification**

    Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. **Lugging Engine**

    Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. **Turbocharged Engines**

    There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated

plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. **Restricted Air Intake**

    Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

STANDARD PROCEDURE

ENGINE GASKET SURFACE PREPARATION

Fig. 2: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

Fig. 3: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc.

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

DUST COVERS AND CAPS

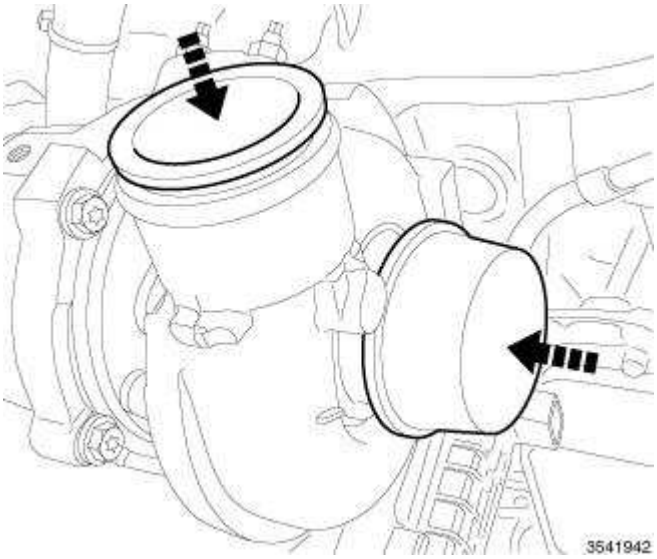

Fig. 4: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures cased by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

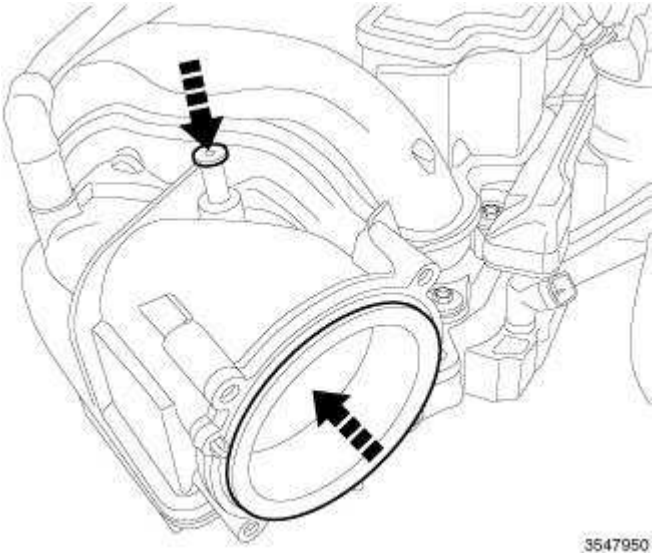

Fig. 5: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Always maintain the original center line when drilling and/or tapping holes.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads
- Tapping the hole with a special Heli-Coil Tap or equivalent
- Installing a Heli-Coil insert into the tapped hole to bring the hole back to its original thread size

HYDROSTATIC LOCK

CAUTION: Do not attempt to run engine. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

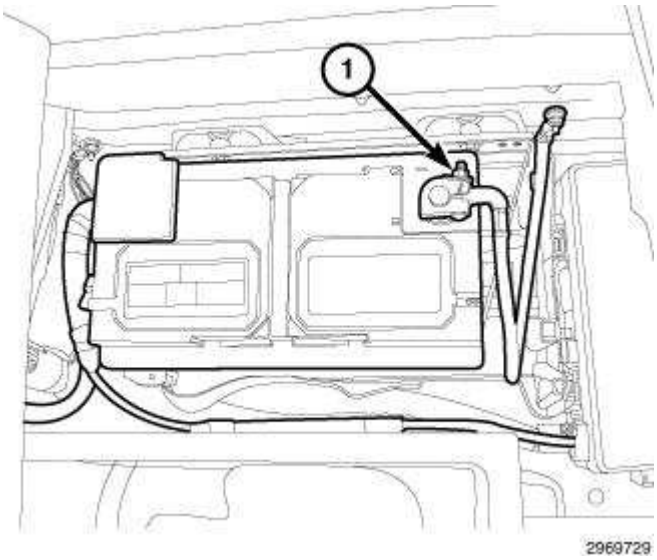

Fig. 6: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

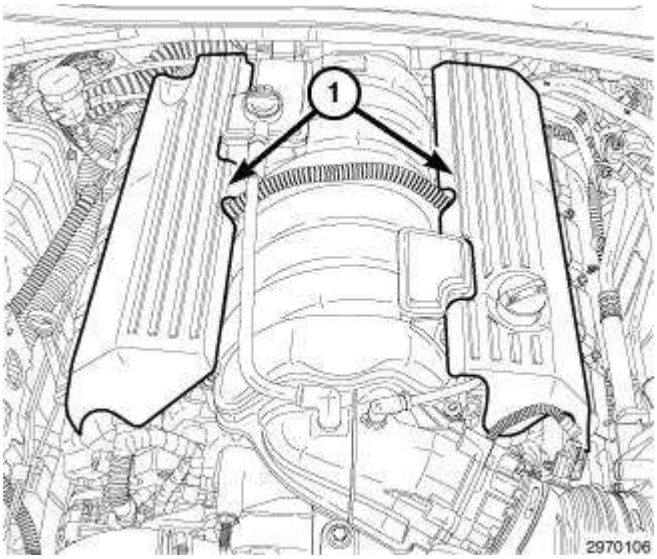

Fig. 7: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).
3. Place a shop towel around the fuel supply line Quick Connect Fitting to catch any fuel that may be under pressure and disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT** .

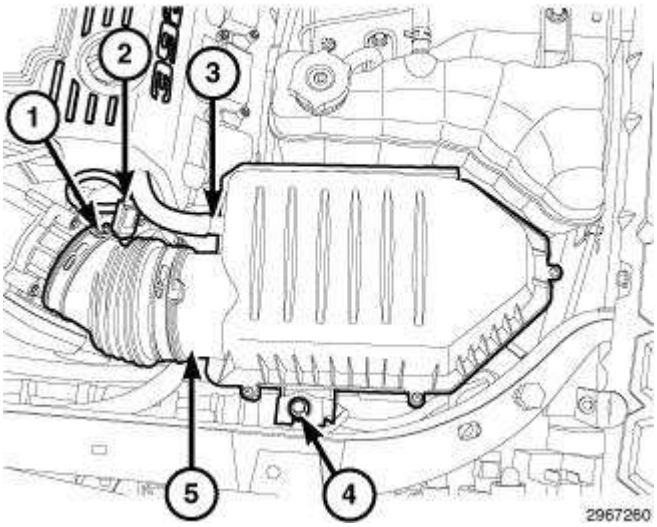

Fig. 8: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

4. Loosen the air duct retaining clamp (1) at the throttle body.
5. Disconnect the intake air temperature sensor electrical connector (2).
6. Remove the makeup air hose (3) at the air cleaner housing.
7. Remove the air cleaner housing retaining bolt (4).
8. While lifting up the air cleaner housing (5), slide the air duct off the throttle body and remove the air cleaner housing from the vehicle.
9. Inspect the air duct, air cleaner housing and the intake manifold to make sure the system is dry and clear of any foreign material.
10. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head.
11. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
12. With the spark plugs removed, rotate the crankshaft using a breaker bar and socket.
13. Identify the fluid in the cylinders (coolant, fuel, oil, etc.).
14. Make sure all fluid has been removed from the cylinders.
15. Repair engine or components as necessary to prevent this problem from occurring again.
16. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will help prevent engine damage on restart.
17. Install new spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
18. Perform the Engine Oil Service procedure. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
19. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
20. Start the engine and check for leaks.

SPECIFICATIONS

SPECIFICATIONS

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION
Engine Type	90° V-8 OHV
Displacement	6.4 Liters 392 (Cubic Inches)
Bore	103.9 mm (4.09 in.)
Stroke	94.6 mm (3.72 in.)
Compression Ratio	10.9:1
Firing Order	1-8-4-3-6-5-7-2
Lubrication	Pressure Feed - Full Flow Filtration
Cooling System	Liquid Cooled - Forced Circulation
Cylinder Block	Cast Iron
Cylinder Head	Aluminum
Crankshaft	Forged Steel
Camshaft	Cast Iron
Pistons	Aluminum Alloy
Connecting Rods	Powdered Metal

Clearance Over Rotors (MAX)	0.095 mm	0.0038 in.
Outer Rotor to Pump Body Clearance (MAX)	0.235 mm	0.009 in.
Tip Clearance Between Rotors (MAX)	0.150 mm	0.006 in.

OIL PRESSURE

SPECIFICATION	SPECIFICATION
At Curb Idle Speed (min.)*	25 kPa (4 psi)
@ 3000 rpm	170 - 758 kPa (25 - 110 psi)
*** CAUTION: If pressure is zero at curb idle, DO NOT run engine**	

TORQUE SPECIFICATIONS

6.4L ENGINE

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Air Cleaner Housing - Bolt	5	-	44
Block Pipe Plugs			
(1/4 NPT)	20	15	-
(3/8 NPT)	27	20	-
Water Drain Plugs	34	25	-
Camshaft Sprocket - Bolt	122	90	-
Camshaft Thrust Plate - Bolts	12	-	106
Lifting Stud	55	40	-
Connecting Rod Cap - Bolts	45 Plus 60°	33 Plus 60°	-

	Turn	Turn	
Main Bearing Cap - Bolts M-12 Bolts	28 Plus 90° Turn	21 Plus 90° Turn	-
M-8 Bolts (Crossbolts)	31	23	-
Cylinder Head - Bolts (M-12)	Specific torque and fastener pattern required; follow installation sequence. Refer to **CYLINDER HEAD, INSTALLATION**.		
Cylinder Head Cover - Bolts	8	-	70
Engine Mount Bracket to Engine Block - Bolts	61	45	-
Engine Mount Heat Shield - Nuts	27	20	-
Engine Timing Cover - Bolts	28	21	-
Exhaust Manifold to Cylinder Head - Bolts	31	23	-
Flexplate to Crankshaft - Bolts	95	70	-
Flywheel to Crankshaft - Bolts	75	55	-
Front Isolator to Engine Mount Bracket- Bolts	60	44	-
Front Isolator to Engine Cradle Crossmember - Bolts	61	45	-
Generator to Engine Block - Bolts	65	48	-
Generator Support Bracket-to-Engine Mount Nut	28	21	-
Heater Tube - Bolt	11	8	-
Intake Manifold - Bolts	Specific torque and fastener pattern required; follow installation sequence. Refer to **MANIFOLD, INTAKE, INSTALLATION**.		
Lifter Guide Holder - Bolts	12	9	-
MDS Solenoid - Bolts	11	8	-
Oil Control Valve - Bolt	11	8	-
Piston Oil Cooler Jet - Bolts	13	10	-
Power Steering Pump to Engine Block - Bolts	28	21	-
Oil Dipstick Tube - Nut	31	23	-
Oil Pan - Drain Plug	27	20	-
Oil Pan - Bolts	Specific torque and fastener pattern required; follow installation sequence. Refer to **PAN, OIL, INSTALLATION**.		
Oil Pump - Bolts	28	21	-
Oil Pump Pickup Tube - Bolt and Nut	28	21	-
Rear Seal Retainer - Bolts	15	11	-
Rear Isolator Bracket to Transmission - Bolts (Automatic)	33	24	-
Rear Isolator to Bracket - Bolts (Automatic)	54	40	-

Rear Isolator to Crossmember - Bolts (Automatic)	61	45	-
Rear Isolator to Transmission - Bolts (Manual)	56	41	-
Rear Isolator to Crossmember - Bolts (Manual)	54	40	-
Rocker Arm - Bolts	22	16	-
Strut Tower Support - Bolts	32	28	-
Thermostat Housing - Bolts	28	21	-
Throttle Body - Bolts	12	9	-
Torque Converter to Flexplate - Bolts	68	50	-
Transmission to Engine Block - Bolts	68	50	-
Vibration Damper - Bolt	250	184	-
Water Pump to Engine Timing Cover - Bolts	28	21	-

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

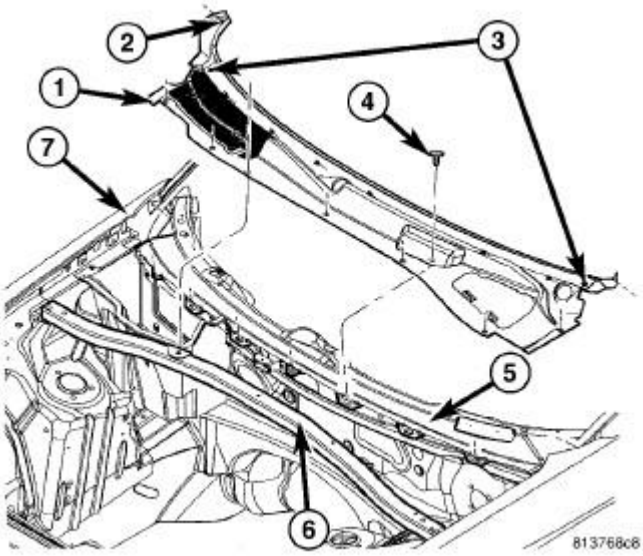

Fig. 9: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the hood. Refer to **HOOD, REMOVAL** .
2. Remove the cowl panel cover (1). Refer to **COVER, COWL PANEL, REMOVAL** .
3. Remove the strut tower support (6).

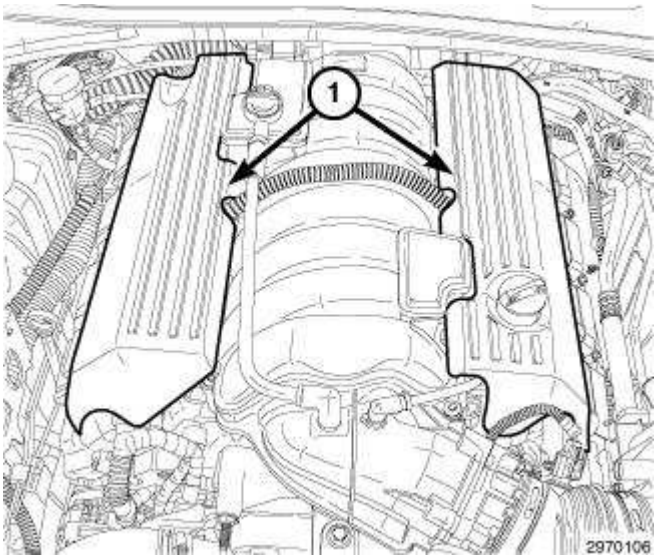

Fig. 10: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

4. Lift the engine cover retaining grommets off the ball studs and remove the engine covers (1).
5. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

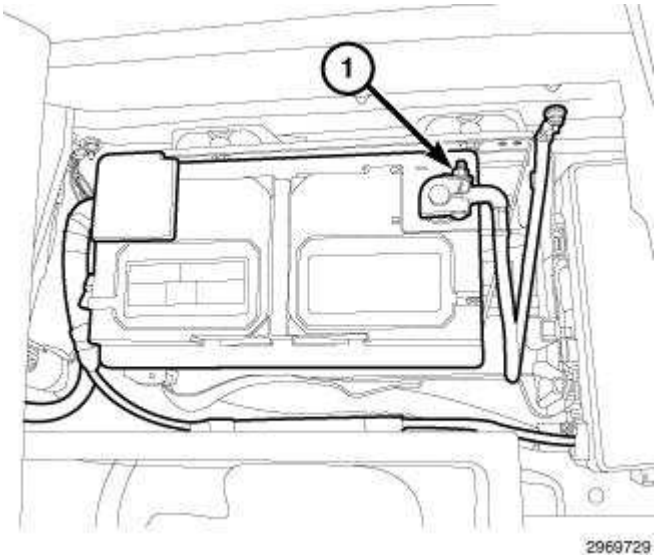

Fig. 11: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect and isolate the negative battery cable (1).

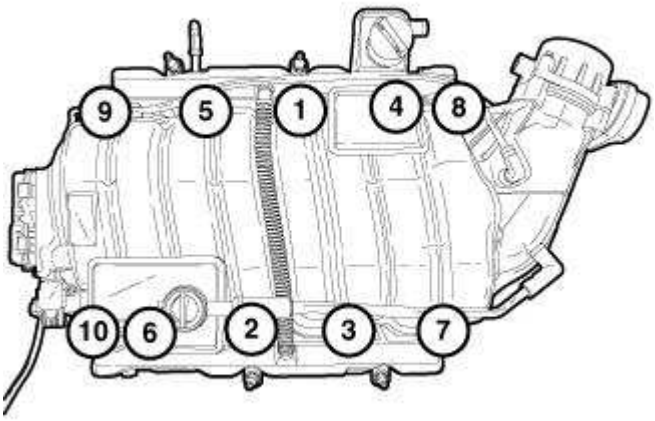

Fig. 12: Intake Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

7. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

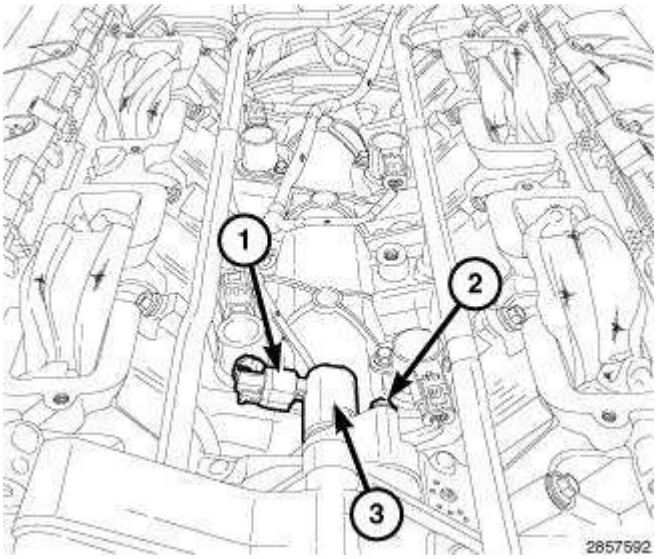

Fig. 13: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The engine must be at room temperature before removing the oil control valve.

8. Disconnect the oil control valve electrical connector (1).
9. Remove the oil control valve retaining bolt (2).

10. Rotate the oil control valve (3) to break the seal then pull the oil control valve straight out.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

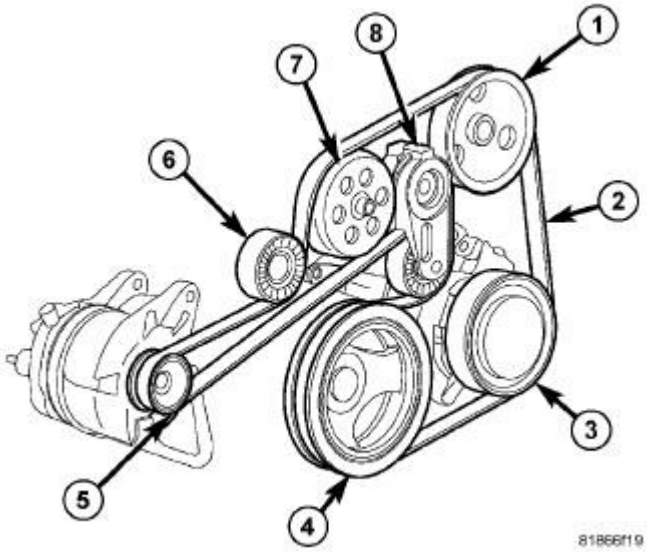

Fig. 14: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.

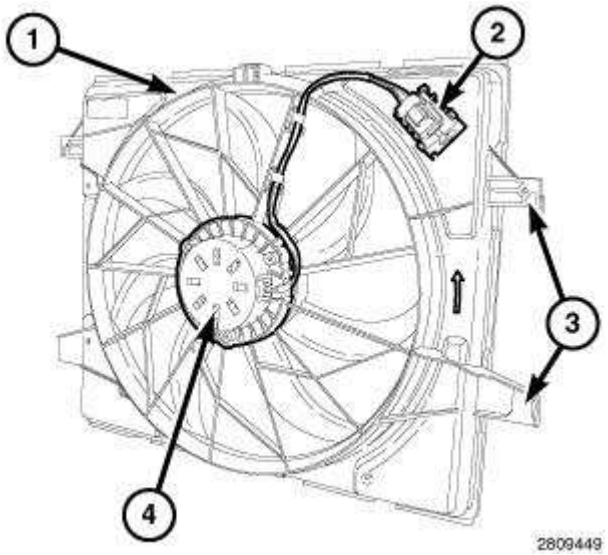

Fig. 15: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

12. Remove the cooling fan (1). Refer to **FAN, COOLING, REMOVAL** .
13. Raise and support the vehicle.

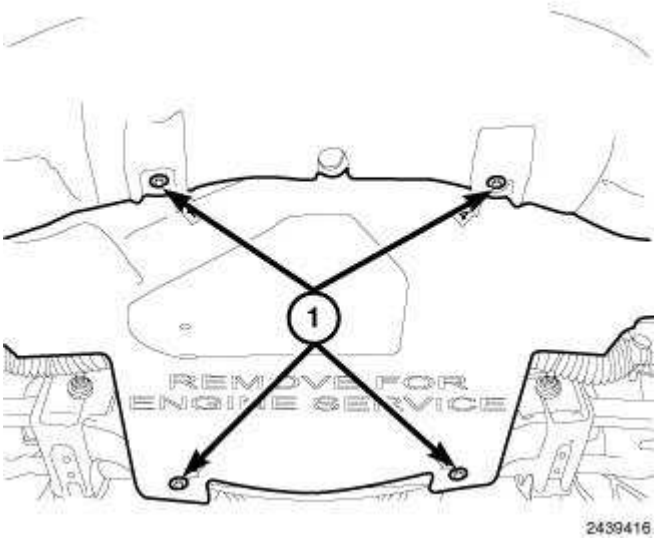

Fig. 16: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Remove the belly pan retainers (1) and remove the belly pan.
15. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
16. Drain the engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

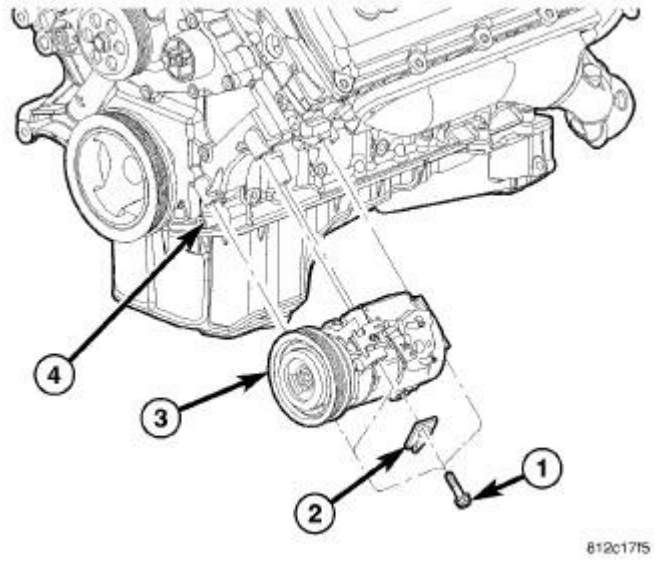

Fig. 17: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

17. Remove the A/C compressor (3). Refer to **COMPRESSOR, A/C, REMOVAL** .

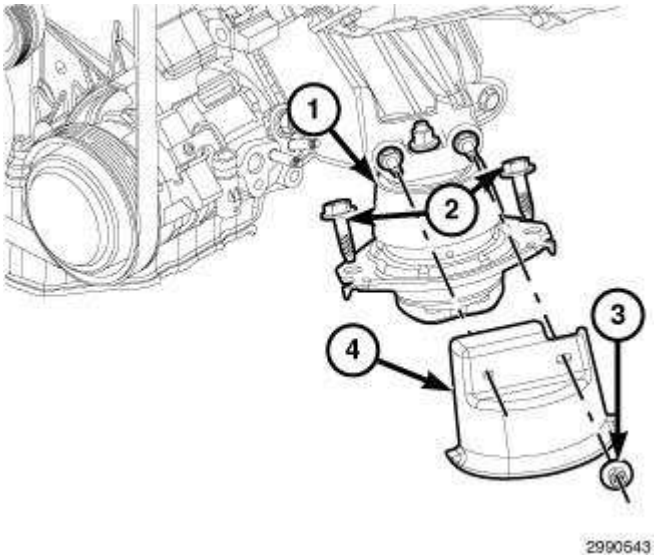

Fig. 18: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

18. Remove both left/right engine mount heat shield (4) retaining nuts (3) and remove the heat shields.
19. Remove both left/right engine mount to frame retaining bolts (2).
20. Disconnect the transmission oil cooler lines from their retainers at the oil pan.

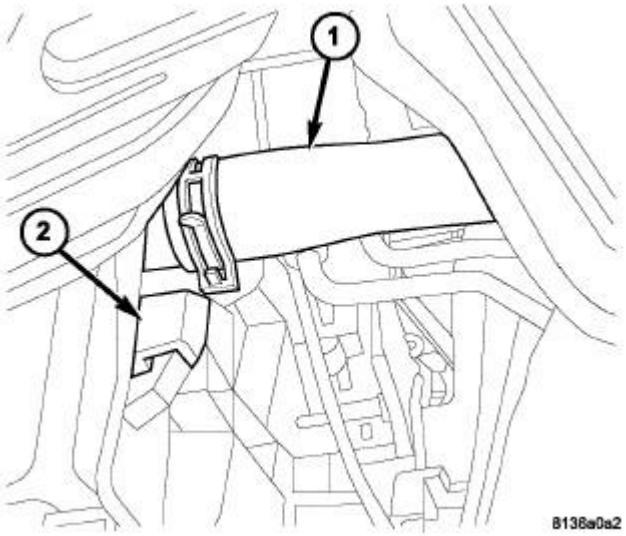

Fig. 19: Lower Radiator Hose & Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY

21. Remove the lower radiator hose (1).

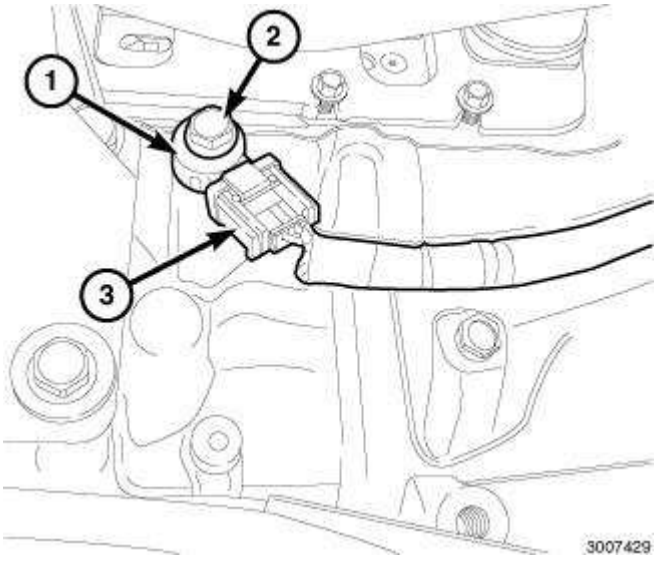

Fig. 20: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Two knock sensors are used. Each sensor is bolted to the outside of the engine block below the exhaust manifold.

NOTE: Left side shown in illustration, right side similar.

22. Remove the heat shields from both knock sensors (shield snaps on/off sensor).
23. Disconnect the knock sensor electrical connectors (3).

CAUTION: When separating the catalytic converters from the manifolds, disconnect the oxygen sensor connectors. Allowing the catalytic converters hanging from the oxygen sensor wires damages the harness and/or sensors.

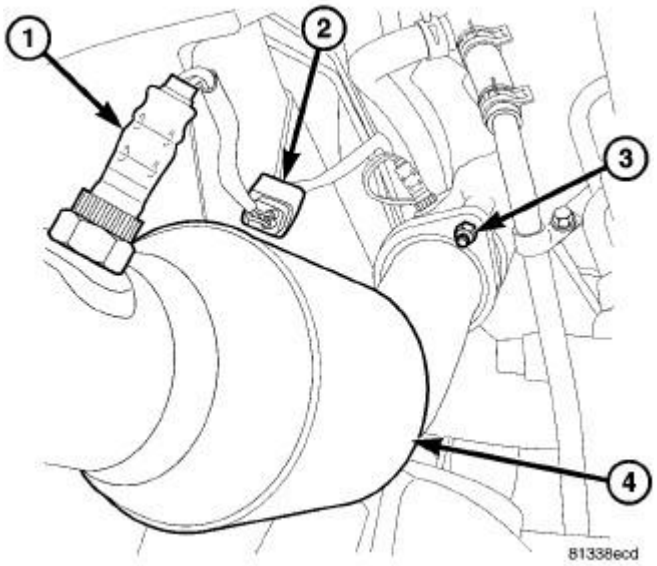

Fig. 21: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

24. Disconnect all oxygen sensor electrical connectors (2).
25. Saturate all exhaust bolts and nuts (3) with Mopar® Rust Penetrant. Allow five minutes for penetration.
26. Remove the both catalytic converter to manifold flange nuts (3) and separate the catalytic converters (4) from the exhaust manifolds.

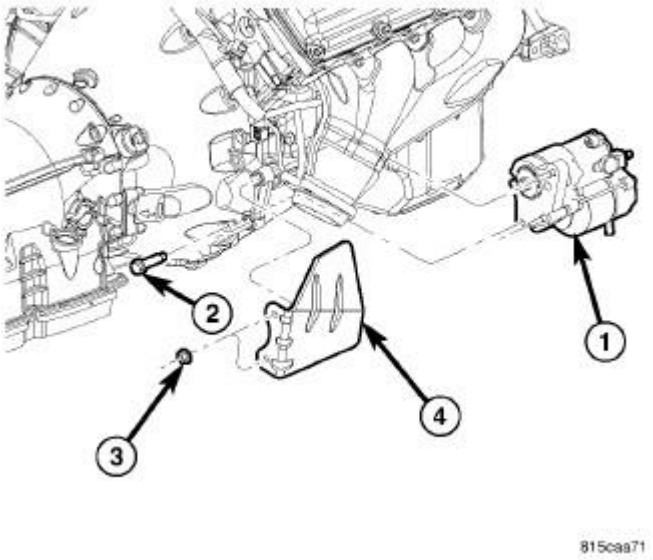

Fig. 22: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

27. Remove the starter motor (1) heat shield (4).
28. Disconnect the starter wires, remove the starter motor retaining bolts (2) and remove the starter (1). Refer to **STARTER, REMOVAL** .

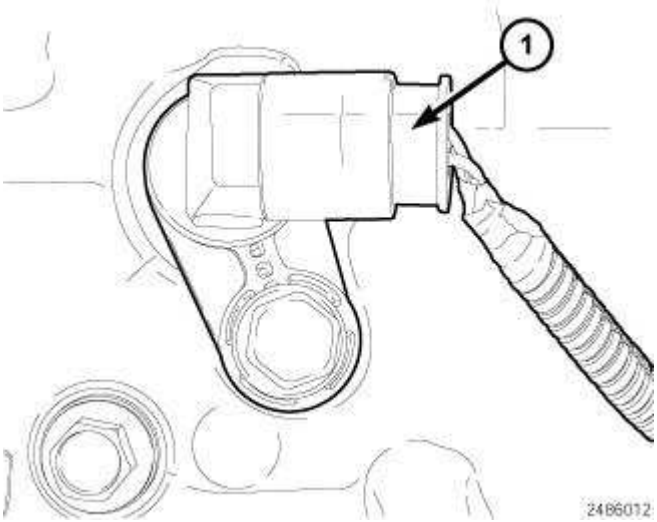

Fig. 23: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block.

29. Remove the CKP sensor electrical connector (1).

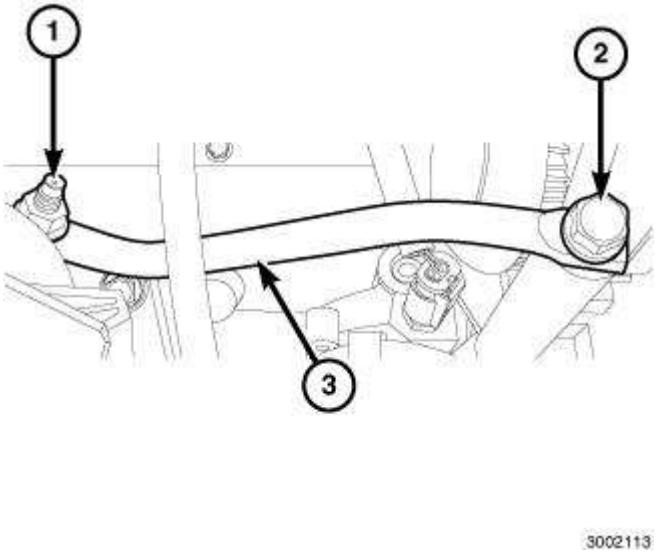

Fig. 24: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

30. Remove the generator support bracket to engine mount retaining nut (1).
31. Remove the generator support bracket retaining bolt (2) and remove the support bracket (3).
32. Lower the vehicle.

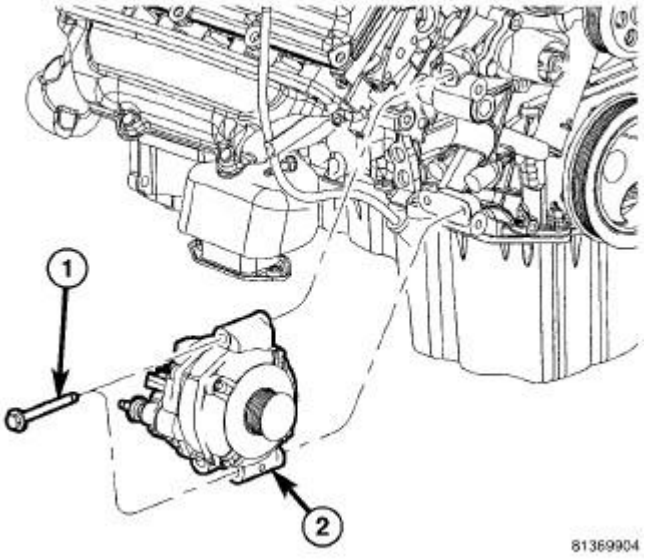

Fig. 25: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

33. Unsnap the plastic insulator cap from the B+ output terminal.
34. Remove the B+ terminal mounting nut at the rear of the generator and remove the B+ terminal.

35. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector.
36. Remove the two generator retaining bolts (1) and remove the generator (2).

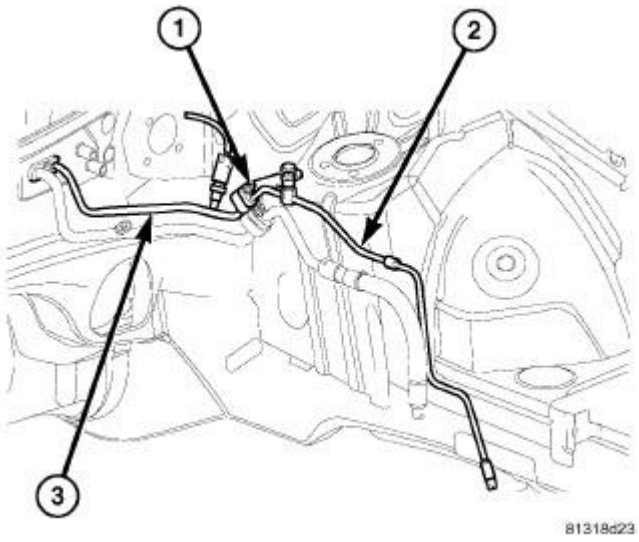

Fig. 26: Removing/Installing A/C Liquid Line
Courtesy of CHRYSLER GROUP, LLC

37. Remove the nut (1) from the front section of the A/C liquid line (2) to the rear section of the liquid line (3), separate the lines, remove and discard the dual plane seal.
38. Install plugs or tape over the opened liquid line fittings.
39. Remove the front section of the A/C liquid line (2) from the engine compartment.

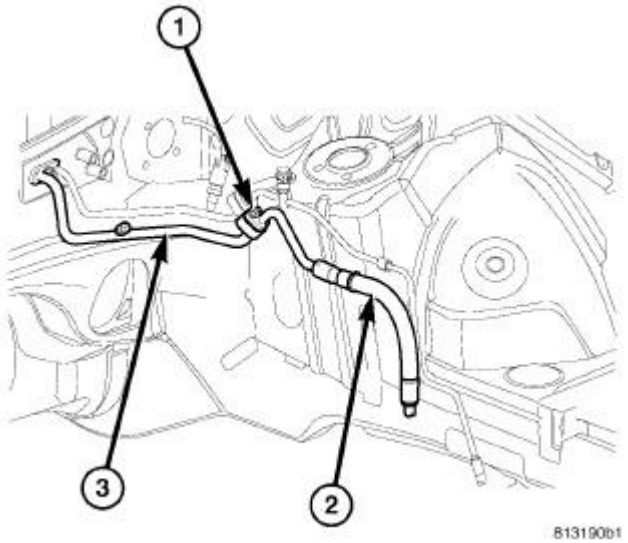

Fig. 27: Removing/Installing A/C Suction Lines

Courtesy of CHRYSLER GROUP, LLC

40. Remove the nut (1) from the front section of the A/C suction line (2) to the rear section of the suction line (3), separate the lines, remove and discard the dual plane seal.
41. Install plugs or tape over the opened suction line fittings.
42. Remove the front section of the A/C suction line (2) from the engine compartment.

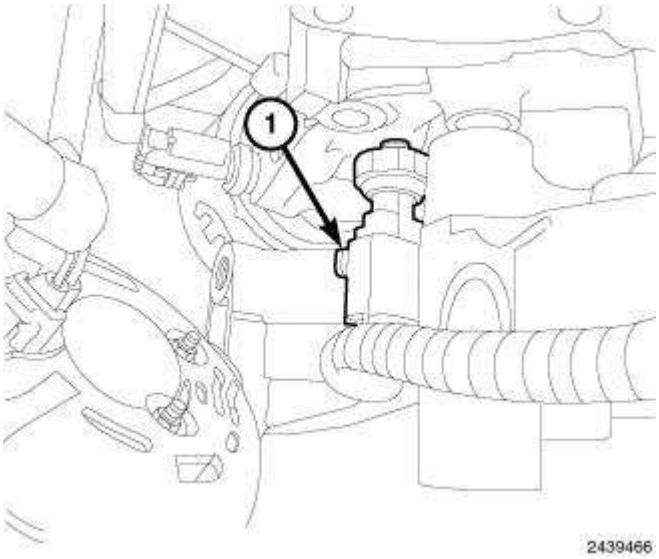

Fig. 28: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

43. Remove the oil pressure sensor electrical connector (1).
44. Remove the oil temperature sensor electrical connector.

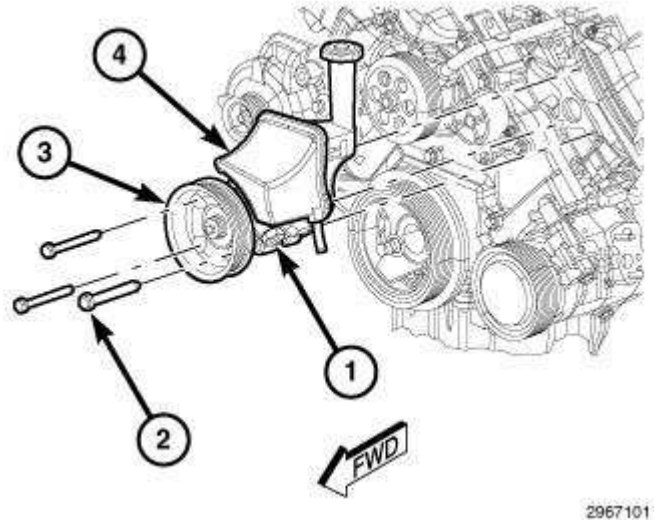

Fig. 29: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to disconnect power steering pump hoses from power steering pump for power steering pump removal.**

45. Remove the three power steering pump (4) mounting bolts (2) through the access holes in the pulley (3) and position the pump aside.

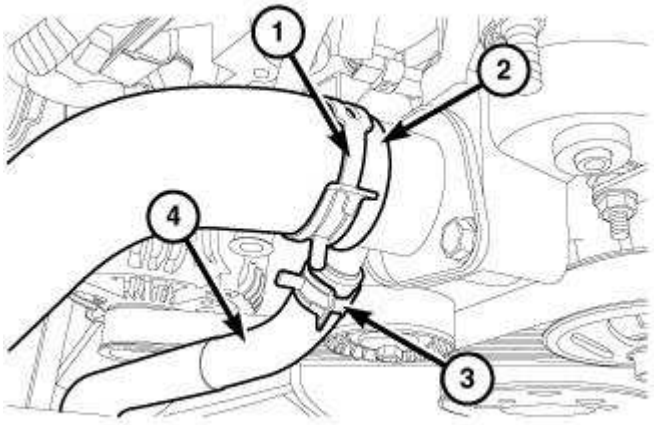

Fig. 30: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

46. Remove the upper radiator hose clamp (1) and remove the upper radiator hose (2).
47. Remove the oil cooler hose clamp (3) and remove the oil cooler hose (4).

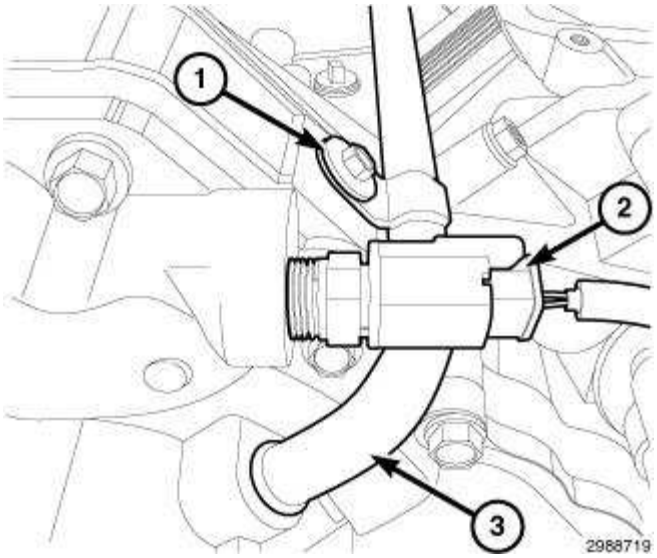

Fig. 31: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

48. Remove the heater tube retaining bolt (1).
49. Remove the coolant temperature sensor electrical connector (2).
50. Lift the heater tube (3) out of the water pump.

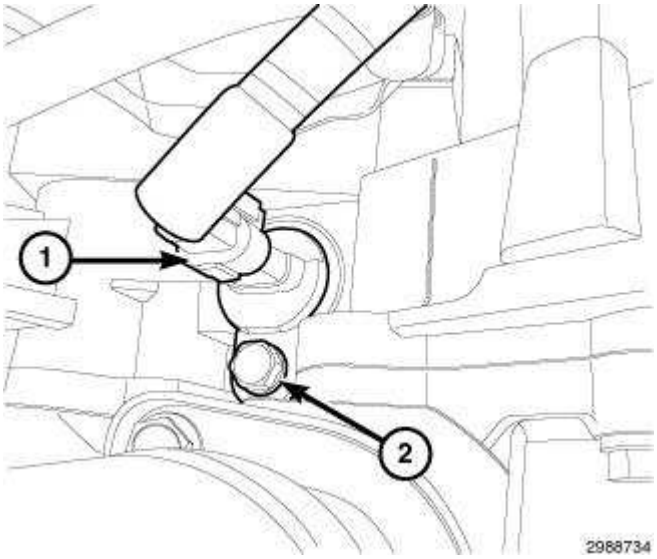

Fig. 32: Camshaft Position Sensor Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

51. Disconnect the camshaft position sensor electrical connector (1).

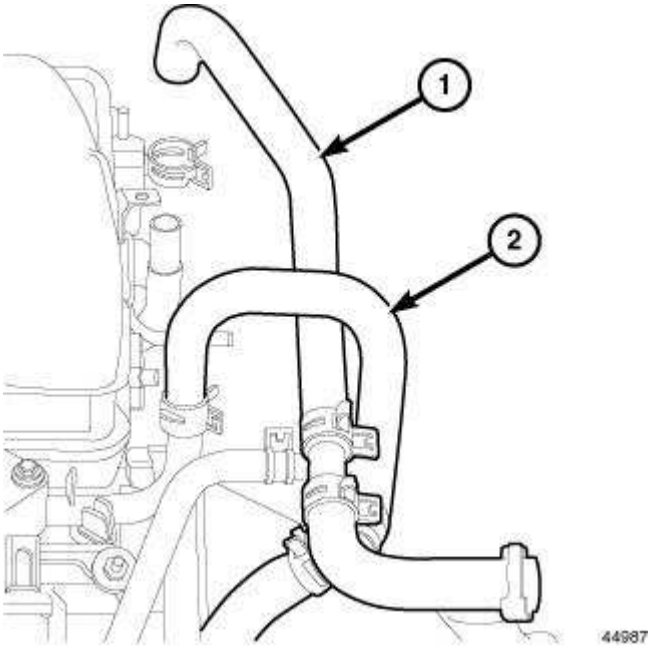

Fig. 33: Heater Hose Supply
Courtesy of CHRYSLER GROUP, LLC

52. Remove the heater hoses (1, 2).

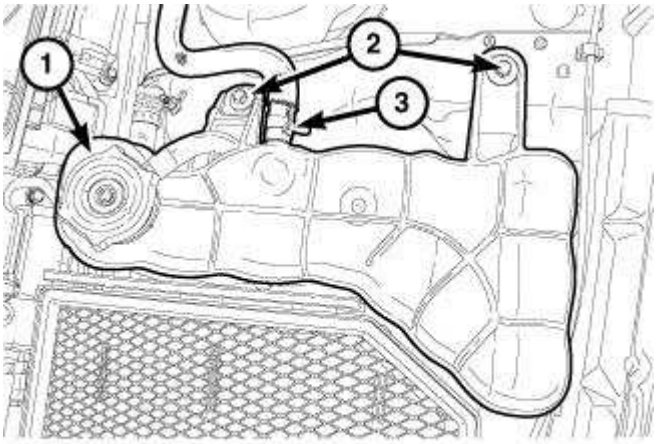

Fig. 34: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the hoses from the coolant bottle for coolant bottle removal.

53. Remove the coolant bottle retaining bolts (2) and position the coolant bottle (1) aside.

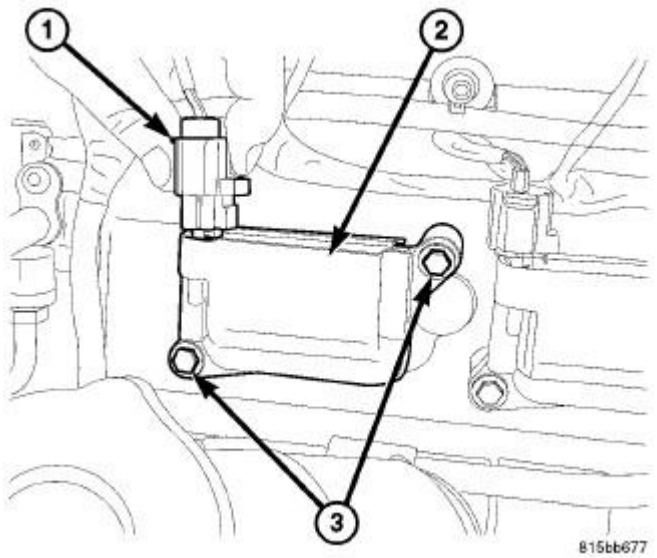

Fig. 35: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

54. Remove all ignition coil electrical connectors (1) and position the harness aside.

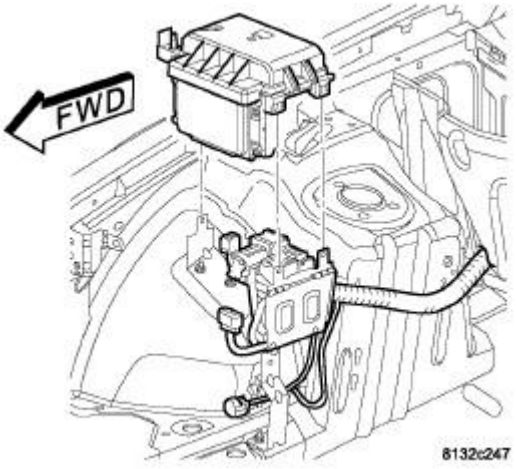

Fig. 36: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

55. Remove the Power Distribution Center (PDC) and mounting bracket.
56. Unfasten the wire harness mounted on the right hand inner fender panel and position aside.

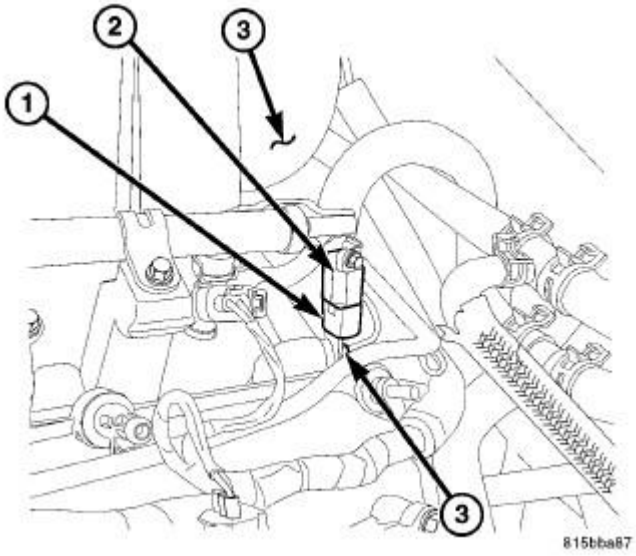

Fig. 37: Ignition Capacitor, Electrical Connector & Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

NOTE: The ignition capacitor (2) is located near the left rear corner of the intake manifold (3).

57. Remove the ignition capacitor (1) electrical connector (2).
58. Remove the ground wires from the rear of each cylinder head.
59. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

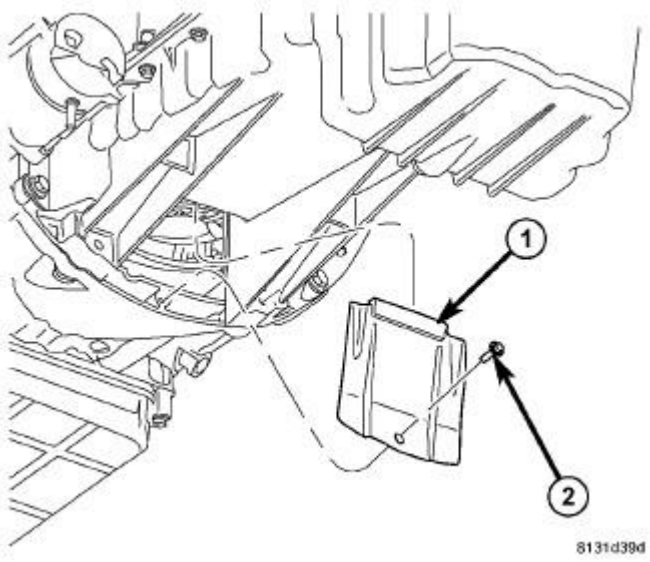

Fig. 38: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER GROUP, LLC

60. Remove the transmission inspection cover retaining bolt (2) and remove the inspection cover (1).

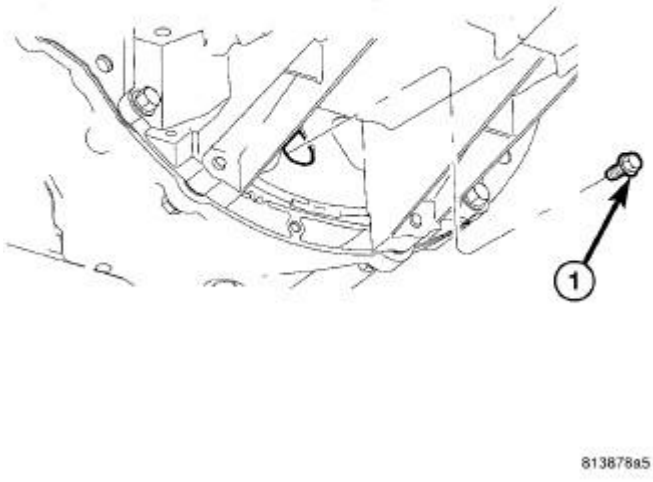

Fig. 39: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

61. Automatic transmission equipped vehicles, rotate the crankshaft in clockwise direction until the torque converter bolts (1) are accessible and remove the flexplate to torque converter bolts (1).

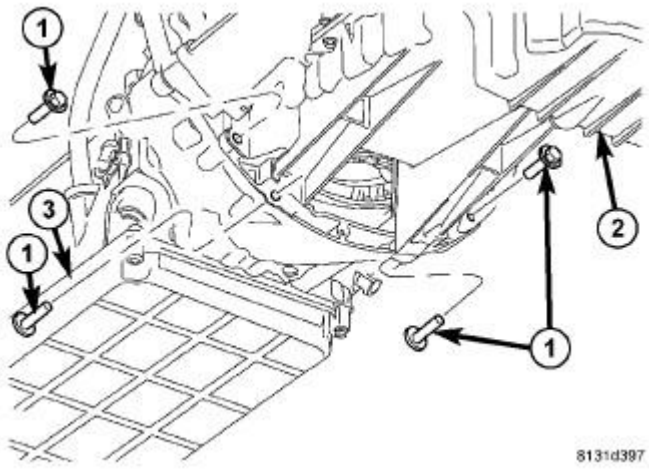

Fig. 40: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

62. Remove the oil pan to transmission bolts (1).

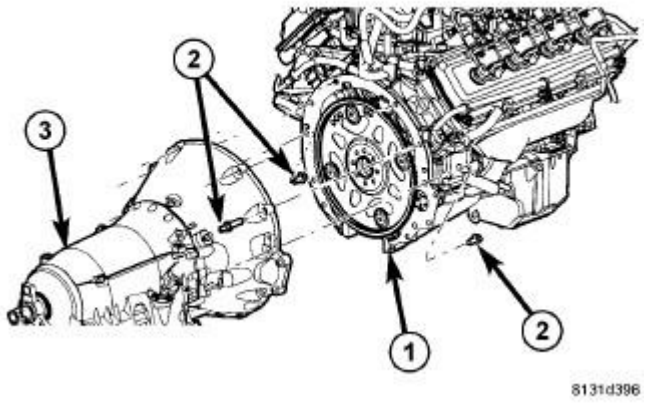

Fig. 41: Remove/Install Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

63. Remove the transmission bell housing to engine block bolts (2).

CAUTION: While carefully separating the engine from the transmission and removing the engine from the vehicle, constant checks must be made to ensure no damage to other components or wiring harnesses occur throughout the removal procedure.

64. Lower the vehicle.

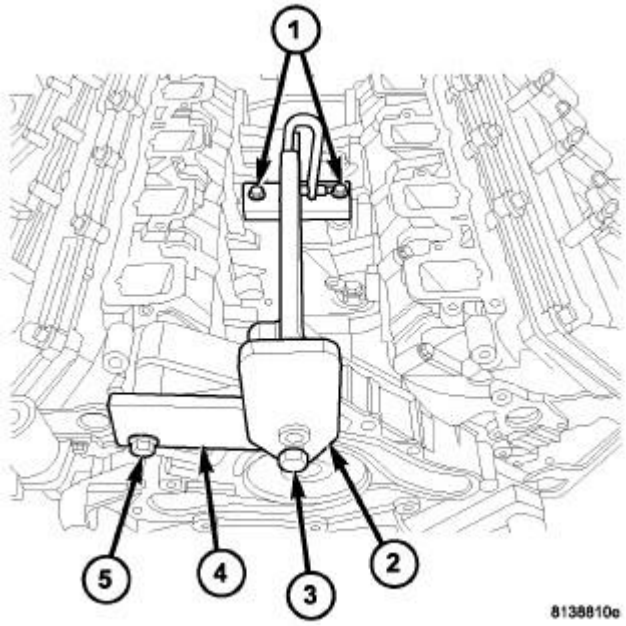

Fig. 42: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

65. Using a suitable jack, support the transmission.

NOTE: Do not use air tools to install engine lift fixture.

66. Install the (special tool #8984B, Fixture, Engine Lifting) (2) and (special tool #8984-UPD, Adapter, Engine Lift) (4).
67. Using a suitable engine hoist, separate the engine from the transmission and remove the engine from the engine compartment.
68. Secure the engine onto a suitable engine stand.

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

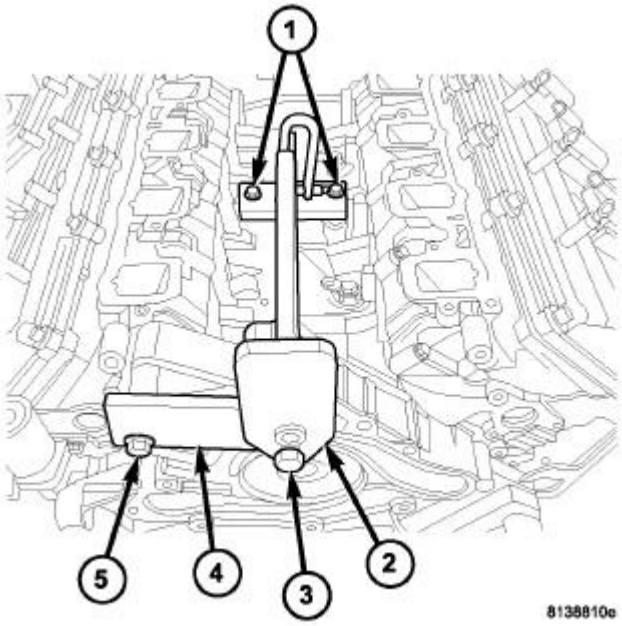

Fig. 43: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install (special tool #8984B, Fixture, Engine Lifting) (2, 3).

1. Install the engine lift fixture (2) (special tool #8984B, Fixture, Engine Lifting) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
2. Using a suitable engine hoist, lower the engine into the engine compartment.
3. Automatic transmission equipped vehicles, align the engine with the transmission.
4. Install two transmission bell housing to engine block bolts finger tight.
5. Lower the engine assembly until the engine mounts rest in the engine cradle crossmember.

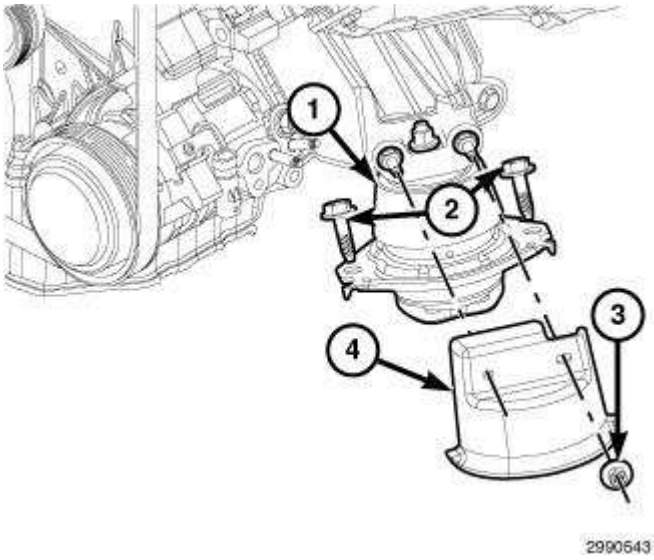

Fig. 44: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

6. Align the engine mounts, install both left/right engine mount to frame retaining bolts (2) and tighten to 68 N.m (50 ft. lbs.).
7. Position both left and right engine mount heat shields (4), install the retaining nuts (3) and tighten to 27 N.m (20 ft. lbs.).
8. Remove the engine hoist and the jack supporting the transmission.
9. Raise and support the vehicle.

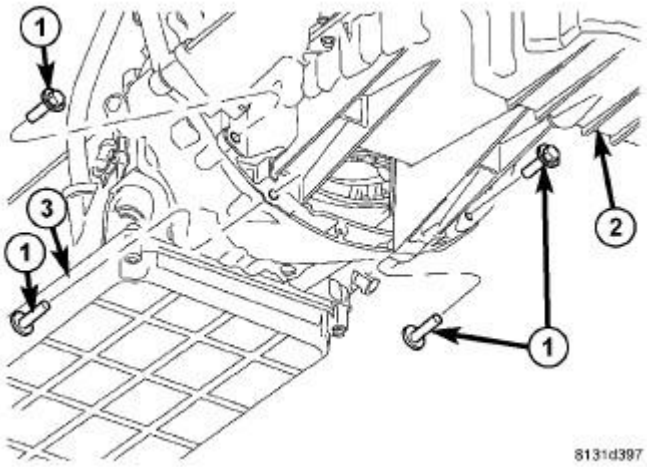

Fig. 45: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Automatic transmission equipped vehicles, install the oil pan to transmission bolts (1) and

tighten to 54 N.m (40 ft. lbs.).

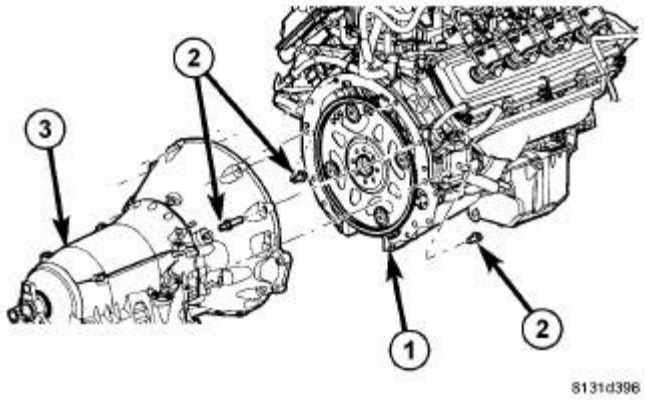

Fig. 46: Remove/Install Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the remaining transmission bell housing to engine block bolts (2) and tighten to 68 N.m (50 ft. lbs.).

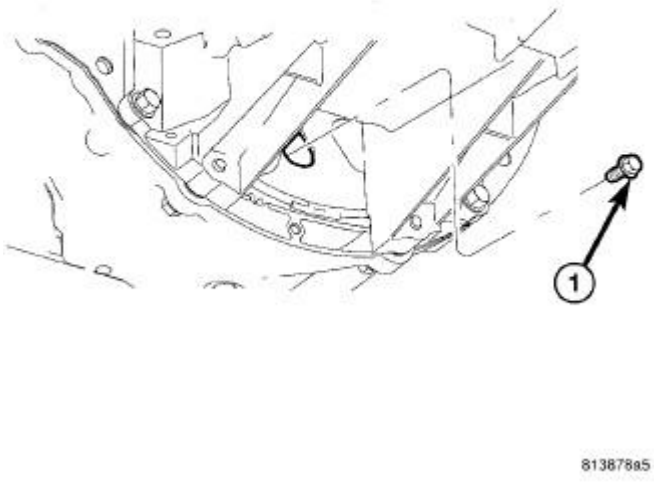

Fig. 47: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the

clutch surface inside the torque converter.

12. Rotate the crankshaft in clockwise direction and install all torque converter to flexplate bolts (1) finger tight.
13. Verify that the torque converter is pulled flush to the flexplate and tighten bolts to 88 N.m (65 ft. lbs.).

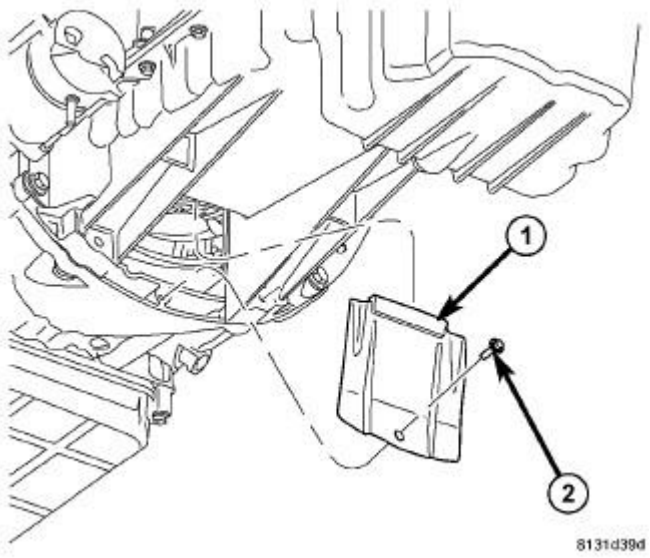

Fig. 48: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER GROUP, LLC

14. Install the inspection cover (1) and tighten the retaining bolt (2) to 11 N.m (8 ft. lbs.).

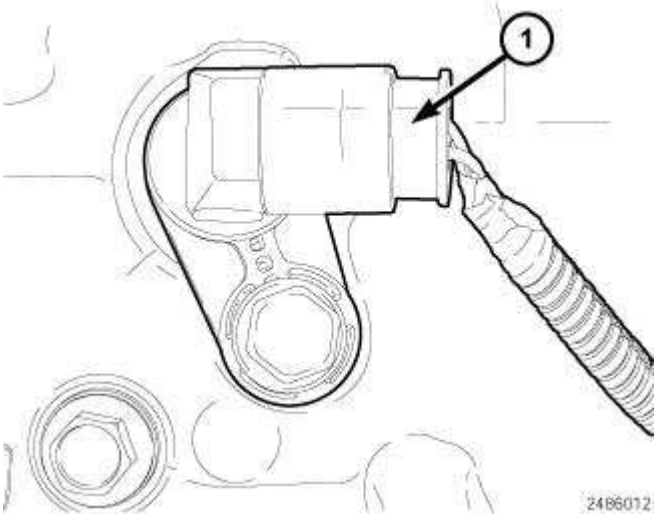

Fig. 49: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Crankshaft Position (CKP) sensor is located at the right rear side of the engine block.**

15. Connect the CKP sensor electrical connector (1).

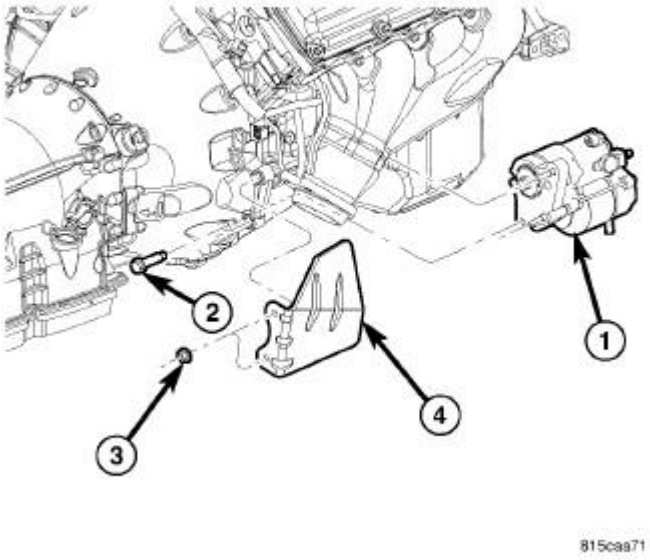

Fig. 50: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

16. Position the starter motor (1) into the transmission.
17. Install the three starter motor retaining bolts (2) and tighten to 54 N.m (40 ft. lbs.).
18. Connect the solenoid wire to the starter motor (snaps in place).
19. Position the battery cable to the solenoid stud, install the battery cable eyelet nut and tighten to 11 N.m (8 ft. lbs.).
20. Position the starter heat shield (4) and install the retaining nuts (3).

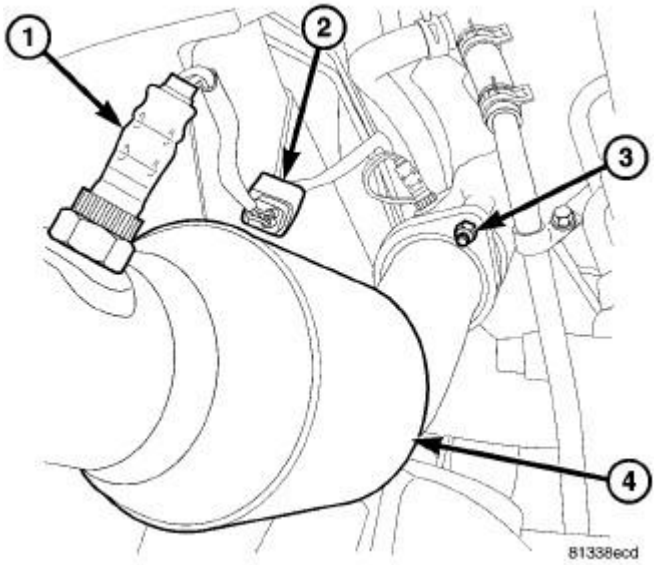

Fig. 51: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

21. Position the catalytic converters (4) onto the exhaust manifold flanges, install the flange nuts (3) and tighten to 41 N.m (30 ft. lbs.).
22. Connect the oxygen sensor electrical connectors (2).

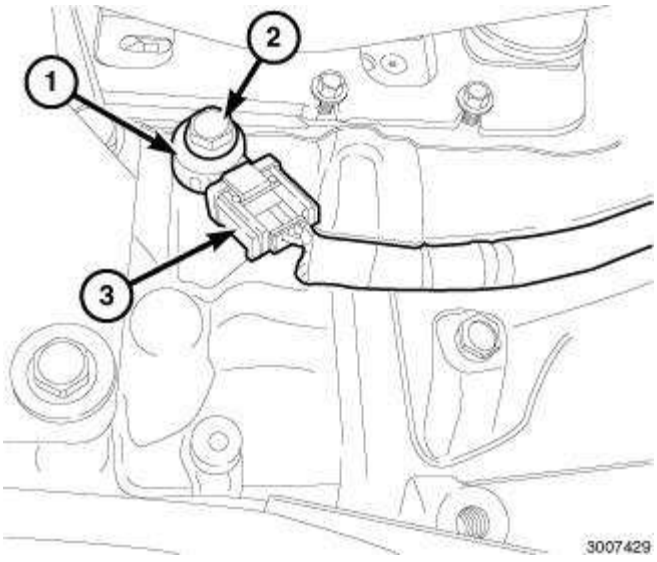

Fig. 52: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

23. Connect the right and left knock sensor (1) electrical connectors (5).
24. Install the heat shields onto both knock sensors (shield snaps on/off sensor).

25. Connect the transmission oil cooler lines to their retainers at the oil pan.

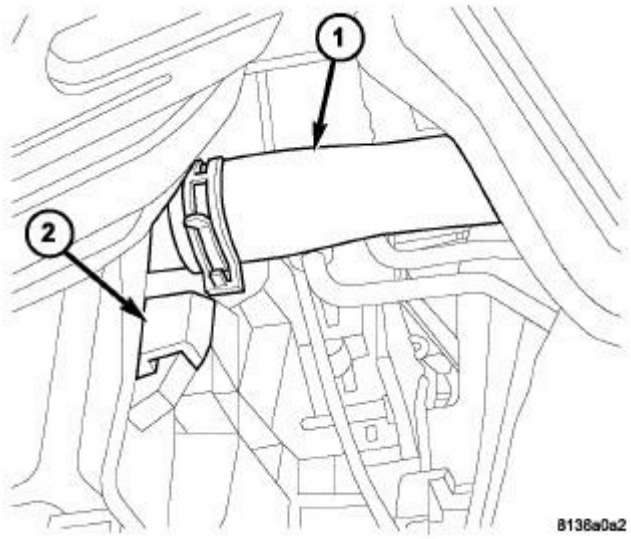

Fig. 53: Lower Radiator Hose & Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY

26. Install the lower radiator hose (1).
27. Lower the vehicle.

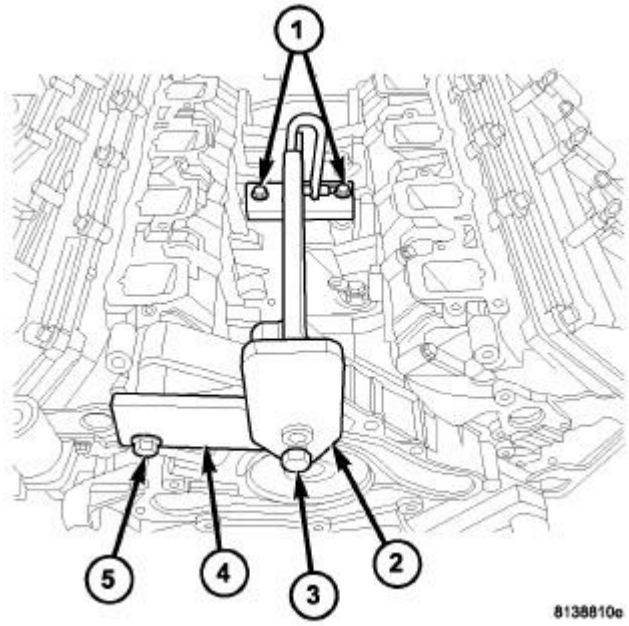

Fig. 54: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

28. Remove the engine lift fixture (special tool #8984B, Fixture, Engine Lifting) (2) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
29. Position the left and right side wiring harness.

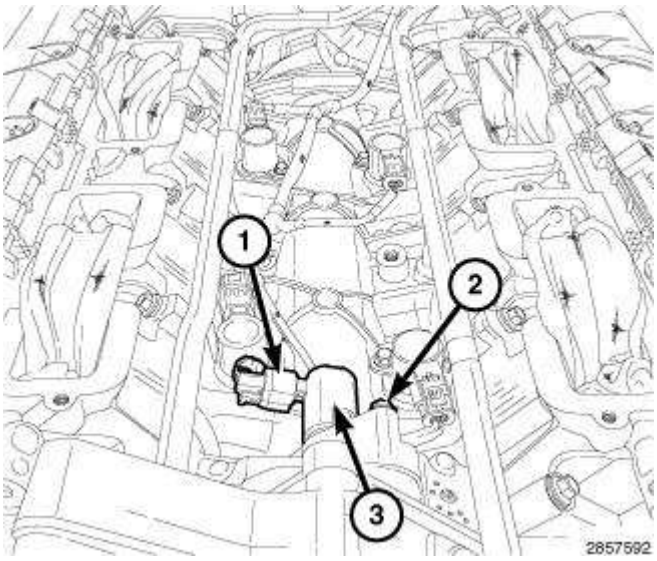

Fig. 55: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

30. Lubricate the oil control valve (OCV) rubber O-ring seal with clean engine oil.
31. Install the OCV (3) and rotate into position.

32. Install the OCV retaining bolt (2) and tighten to 11 N.m (8 ft. lbs.).
33. Connect the OCV electrical connector (1).

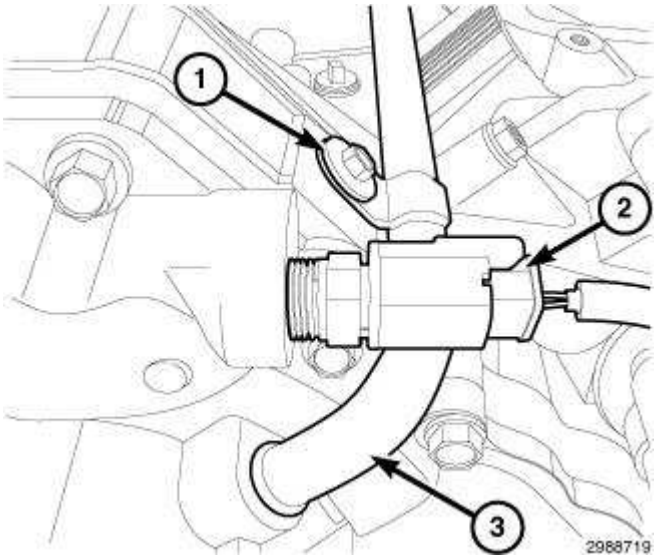

Fig. 56: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

34. Position the heater core tube (3) into the water pump.
35. Install the heater core tube retaining bolt (1) and tighten to 11 N.m (8 ft. lbs.).
36. Connect the electrical connector to the coolant temperature (ECT) sensor (2).

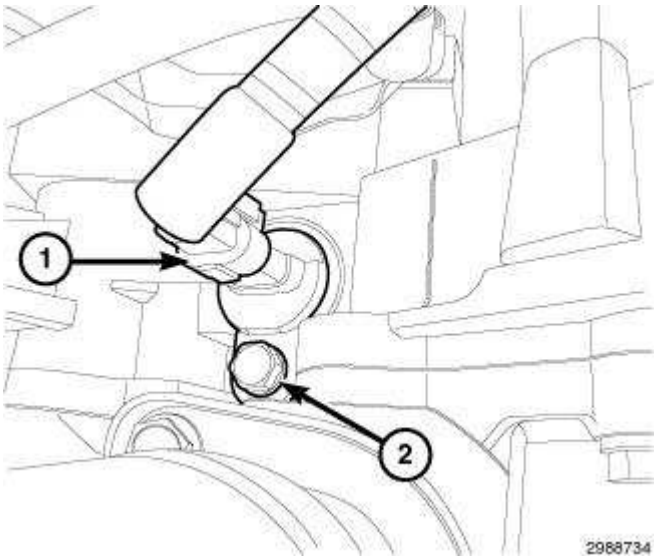

Fig. 57: Camshaft Position Sensor Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

37. Connect the camshaft position sensor electrical connector (1).

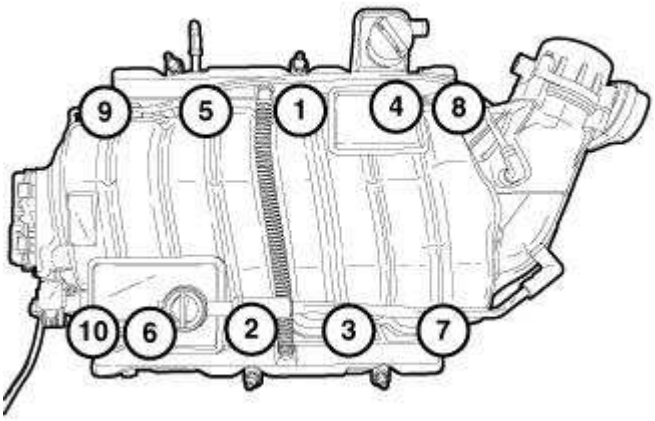

Fig. 58: Intake Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the intake manifold and throttle body as an assembly.

38. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

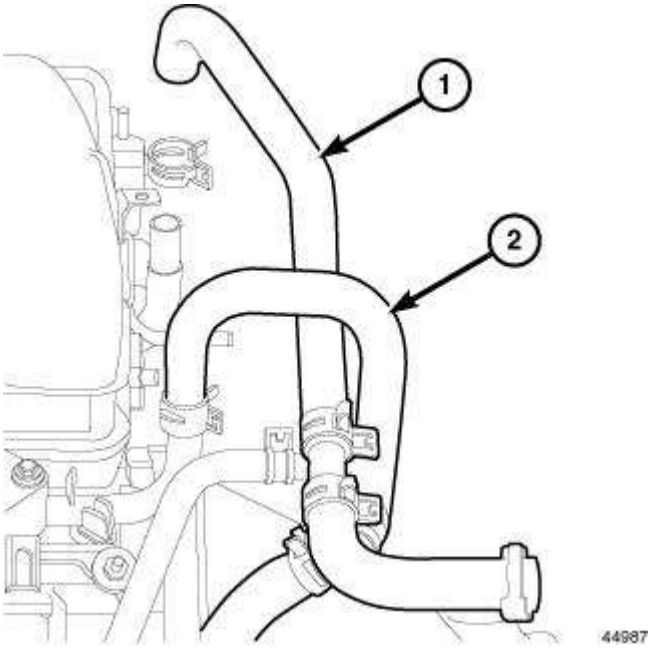

Fig. 59: Heater Hose Supply
Courtesy of CHRYSLER GROUP, LLC

39. Connect the heater hoses (1, 2).
40. Connect the ground wires to the rear of each cylinder head.

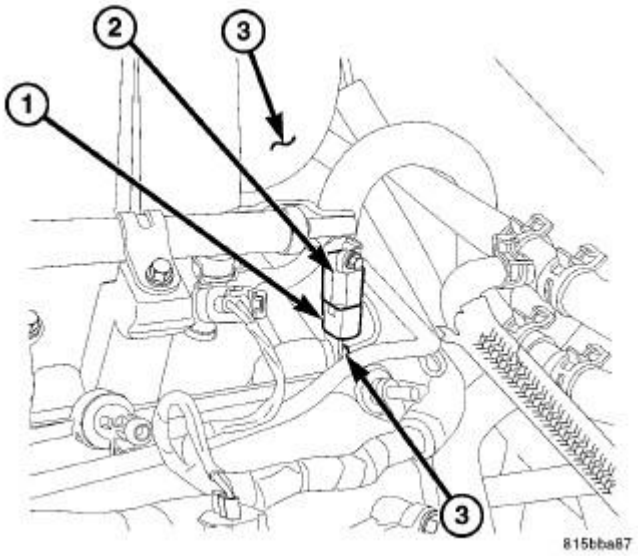

Fig. 60: Ignition Capacitor, Electrical Connector & Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

NOTE: The ignition capacitor (2) is attached to the rear of the left cylinder head.

41. Connect the ignition capacitor (2) electrical connector (1).

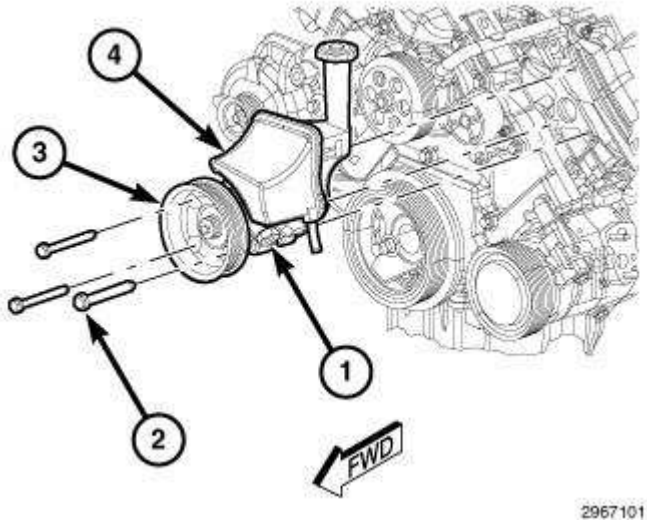

Fig. 61: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

42. Position the power steering pump (4).
43. Install the three power steering pump (4) mounting bolts (2) through the access holes in the pulley and tighten the bolts to 28 N.m (21 ft. lbs.).

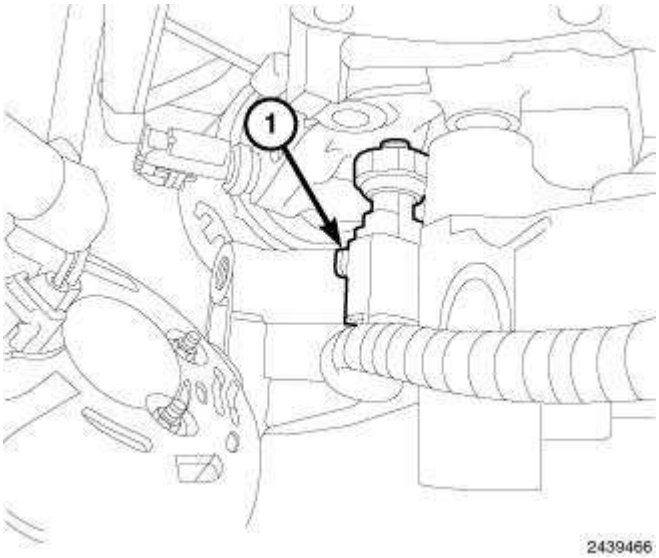

Fig. 62: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

44. Connect the oil pressure sensor electrical connector (1).
45. Connect the oil temperature sensor electrical connector.

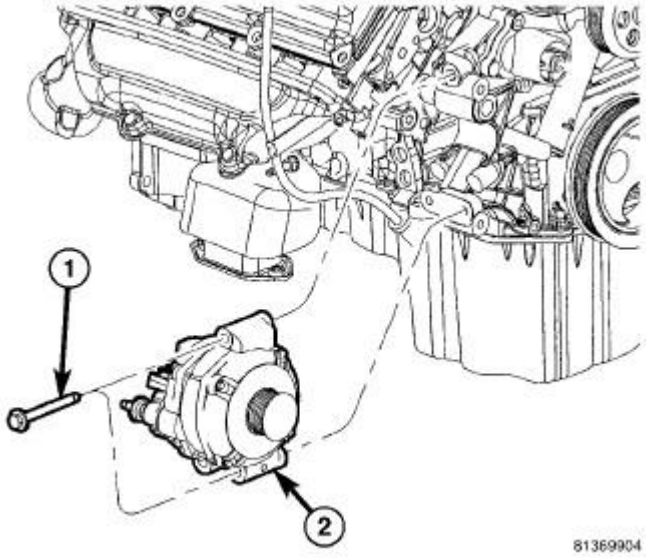

Fig. 63: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

46. Position the generator (2) and install two generator mounting bolts (1) finger tight.
47. Raise and support the vehicle.

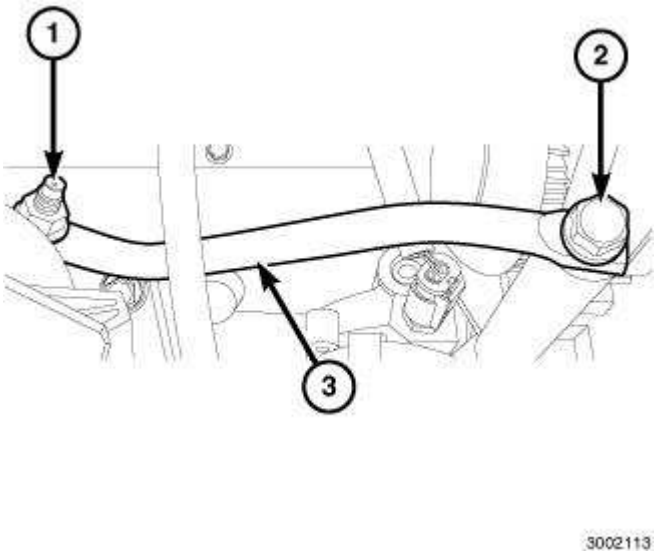

Fig. 64: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

48. Position the generator support bracket (3) to the engine mount, install the retaining nut (1) finger tight.
49. Position the generator support bracket (3) to the generator, install the retaining bolt (2) and tighten to 65 N.m (48 ft. lbs.).
50. Tighten the generator support bracket (3) to engine mount retaining nut (1) to 28 N.m (21 ft. lbs.).

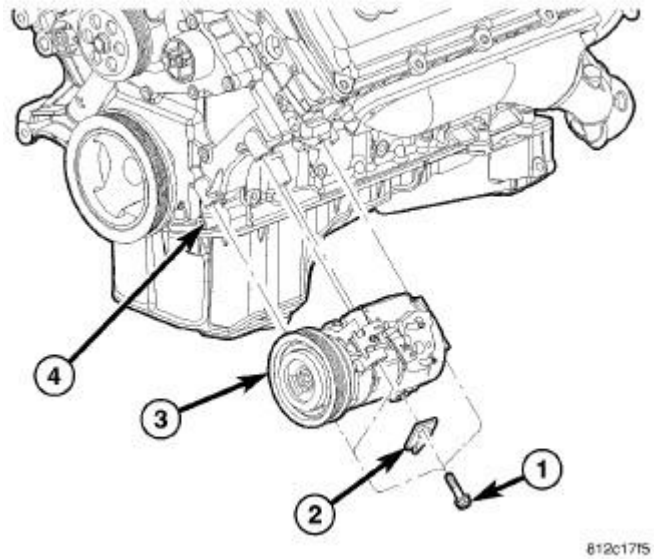

Fig. 65: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

51. Install the A/C compressor (3). Refer to **COMPRESSOR, A/C, REMOVAL** .

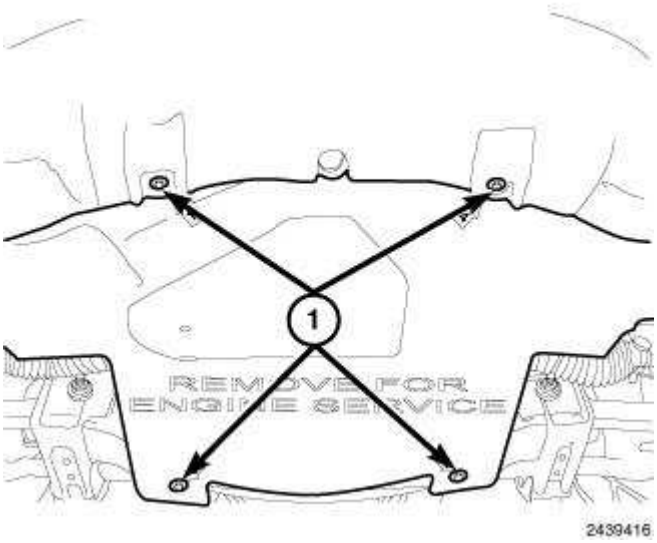

Fig. 66: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

52. Position the belly pan and install the belly pan retainers (1).
53. Lower the vehicle.

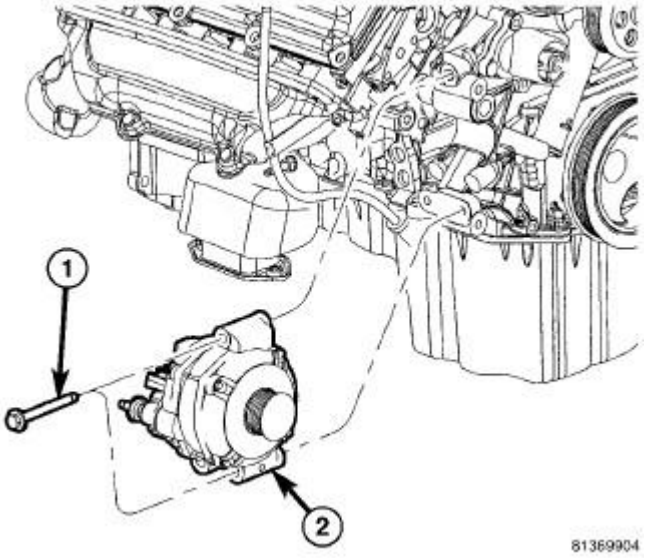

Fig. 67: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

54. Tighten two generator mounting bolts (1) to 65 N.m (48 ft. lbs.).
55. Snap the field wire connector into the rear of the generator.
56. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut and tighten to 13 N.m (10 ft. lbs.).
57. Snap the plastic insulator cap onto the B+ output terminal.

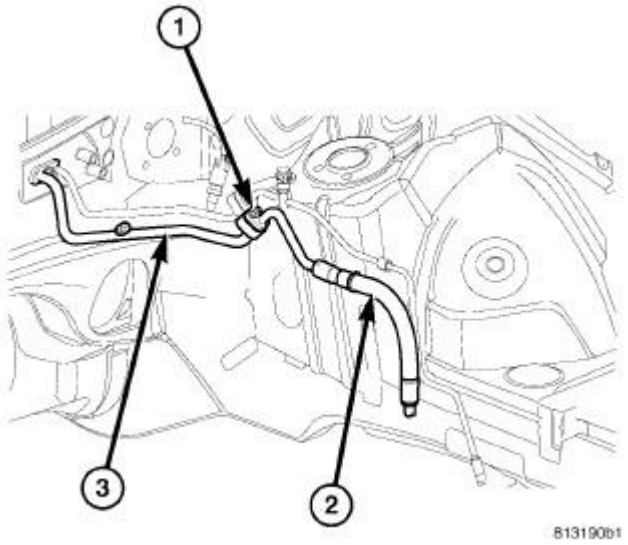

Fig. 68: Removing/Installing A/C Suction Lines
Courtesy of CHRYSLER GROUP, LLC

58. Position the front section of the A/C suction line (2) into the engine compartment.
59. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).

NOTE: Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

60. Lubricate the new dual plane seal with clean refrigerant oil and position the seal onto the suction line fitting.
61. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
62. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line and tighten the nut to 22 N.m (16 ft. lbs.).

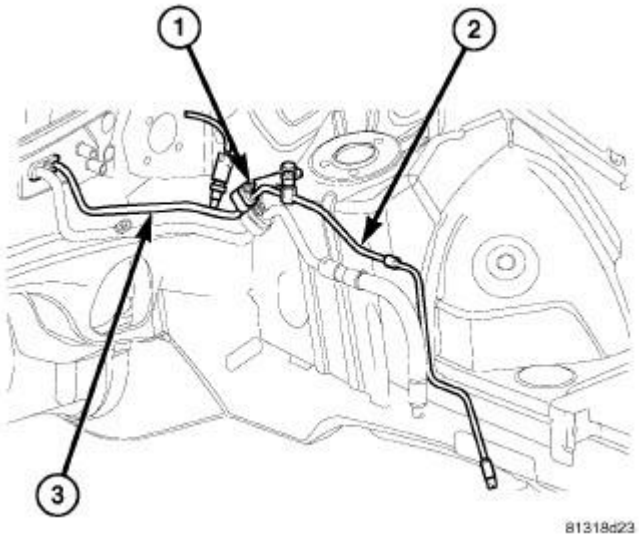

Fig. 69: Removing/Installing A/C Liquid Line
Courtesy of CHRYSLER GROUP, LLC

63. Position the front section of the A/C liquid line into the engine compartment.
64. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).

NOTE: Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

65. Lubricate the new dual plane seal with clean refrigerant oil and position the seal onto the liquid line fitting.
66. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
67. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line and tighten the nut to 22 N.m (16 ft. lbs.).

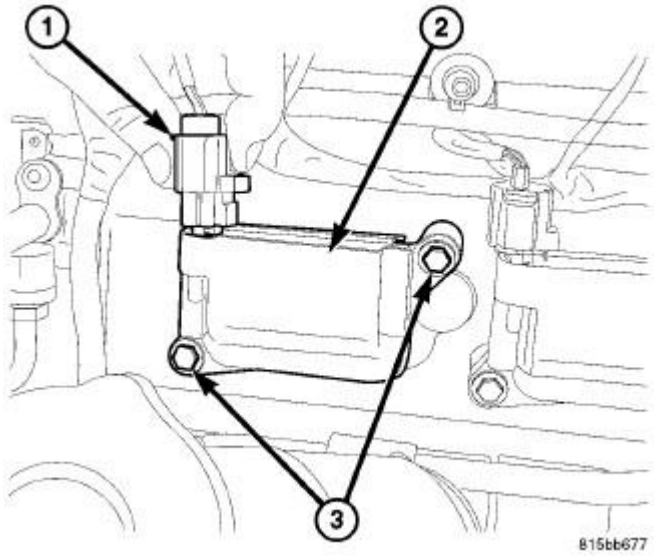

Fig. 70: Ignition Coil Connector, Ignition Coil & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

68. Position the ignition coil electrical harness and connect all ignition coil electrical connectors (1).

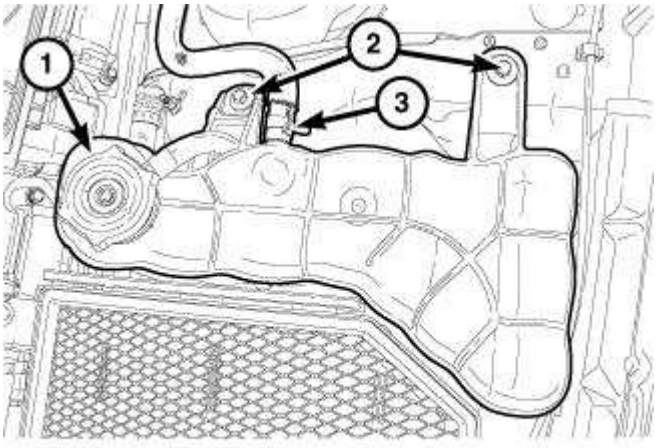

Fig. 71: Coolant Recovery Container Pressure Cap, Tube & Screws
Courtesy of CHRYSLER GROUP, LLC

69. Position the coolant bottle (1) and install the coolant bottle retaining bolts (2).

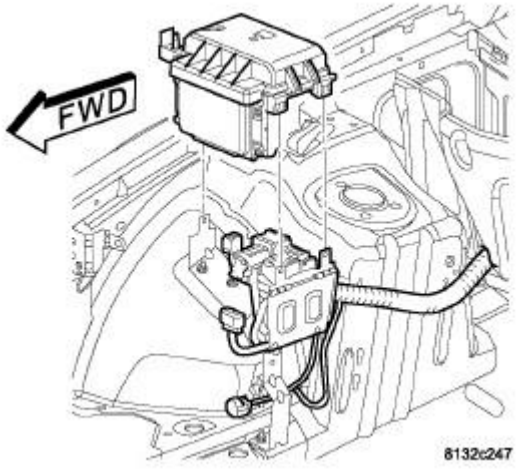

Fig. 72: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

70. Install the Totally Integrated Power Module (TIPM) mounting bracket.
71. Install the PDC bracket.
72. Position the wire harness and secure to the right hand inner fender panel.
73. Secure the PDC to the bracket.

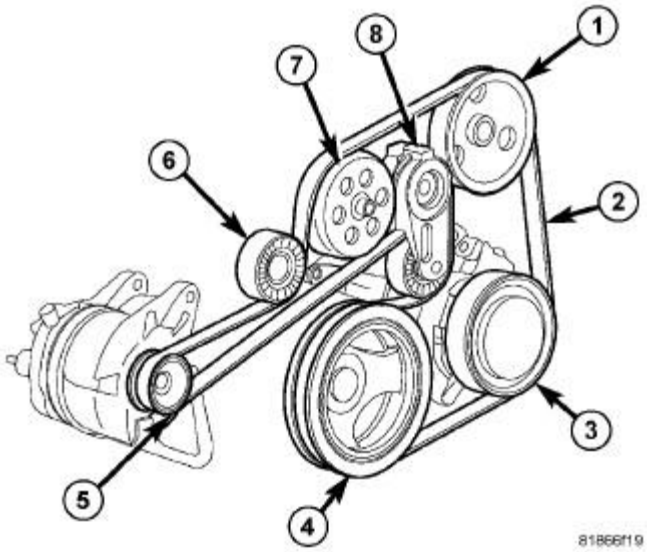

Fig. 73: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

74. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and install the

accessory drive belt (2) onto the pulleys, then slowly release the tensioner.

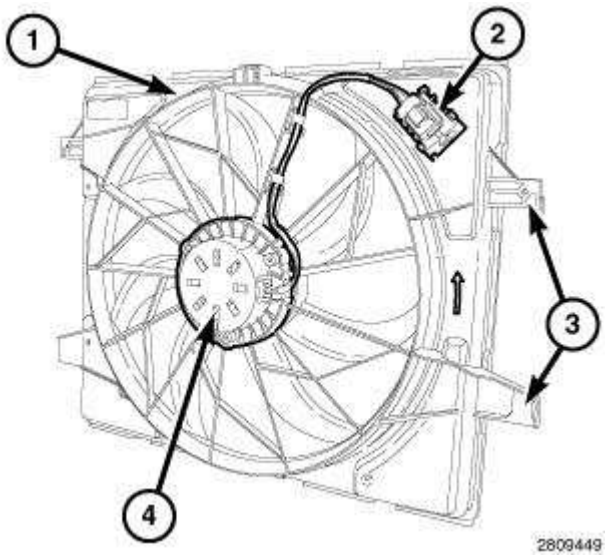

Fig. 74: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

75. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

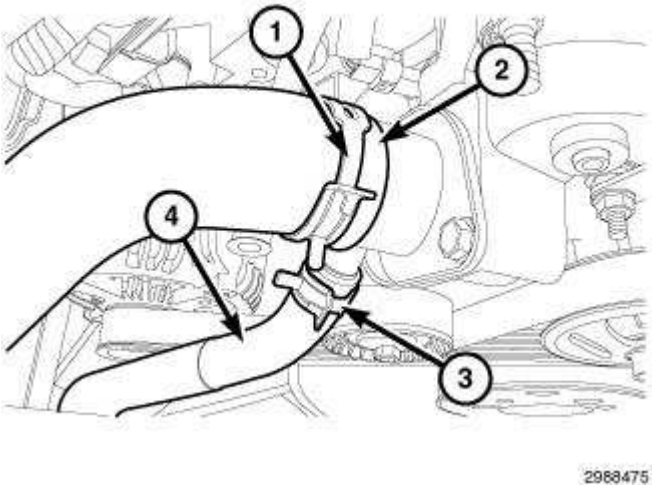

Fig. 75: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

76. Position the oil cooler hose (4) and Install oil cooler hose clamp (3).
77. Position the upper radiator hose (2) and Install the upper radiator hose clamp (1).

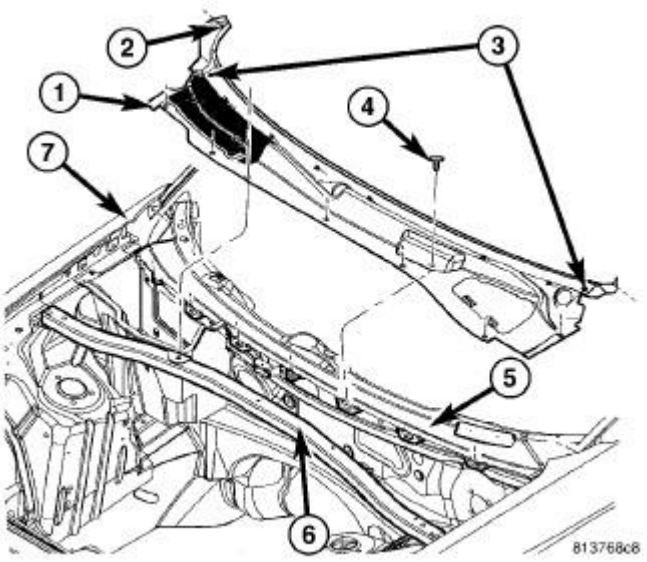

Fig. 76: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

78. Install the strut tower support (6) and tighten bolts to 38 N.m (28 ft. lbs.).
79. Install the cowl panel cover (1). Refer to **COVER, COWL PANEL, INSTALLATION** .
80. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
81. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

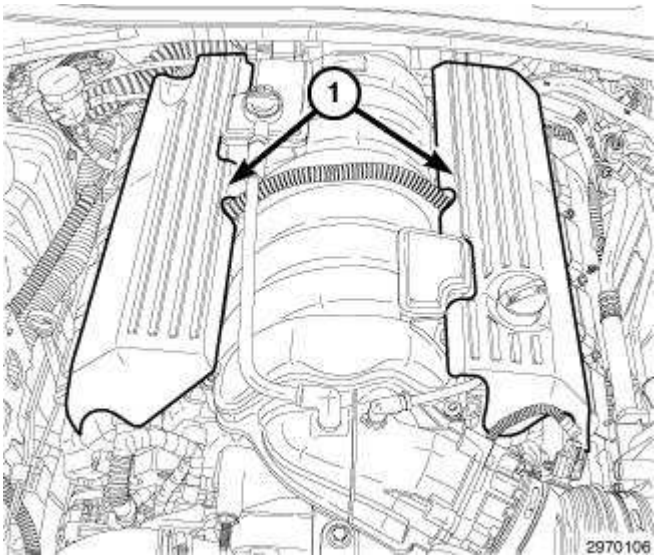

Fig. 77: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

82. Install the engine covers (1) onto the ball studs.

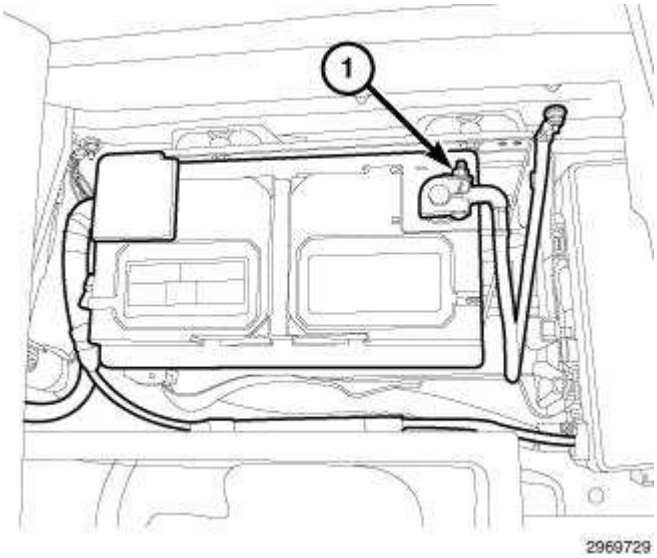

Fig. 78: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

83. Connect the negative battery cable (3).
84. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD PROCEDURE** .
85. Start the engine and inspect for leaks.

MDS SYSTEM

DESCRIPTION

DESCRIPTION

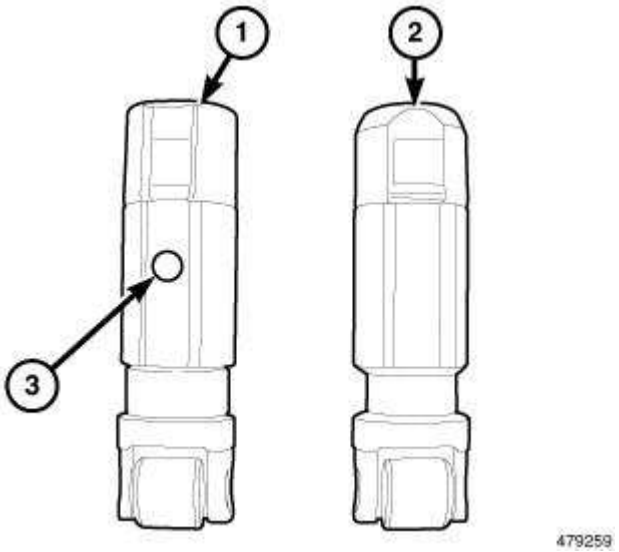

Fig. 79: MDS Lifter
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) selectively deactivates cylinders 1, 4, 6 and 7 during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

The MDS can provide a 5 to 20% fuel economy benefit when operating in four-cylinder mode. Depending on driving habits and vehicle usage. For EPA rating purposes the fuel economy is 8 to 15% higher than if the engine was operating on eight-cylinders at all times.

The MDS deactivating lifter (1) can be distinguished from the non-MDS lifter (2) by the disconnecting pin (3) on the side of the MDS lifter.

MDS is integrated into the basic engine architecture requiring these additional components:

- Unique MDS camshaft
- 8 deactivating roller lifters
- 4 MDS control valve solenoids
- MDS control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

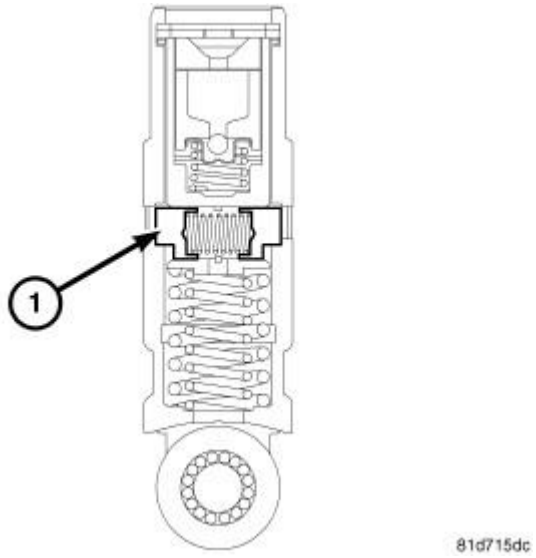

Fig. 80: MDS Lifter Cross Section
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals to provide smooth operation. The MDS selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. All deactivated cylinders have unique hydraulic lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. Oil is delivered through special oil passages

drilled into the cylinder block. The MDS solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each MDS lifter which becomes a lost motion link. The base of the MDS lifter follows the camshaft while the top remains stationary. The MDS lifter is held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No fuel/air enters or leaves during subsequent piston strokes, this high pressure gas is repeatedly compressed and expanded like an air spring.

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

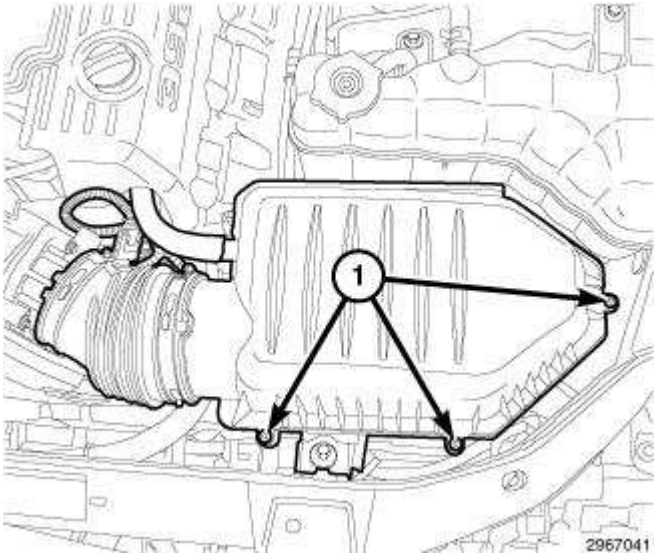

Fig. 81: Air Cleaner Housing Cover Retaining Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the air cleaner housing cover retaining screws (1).

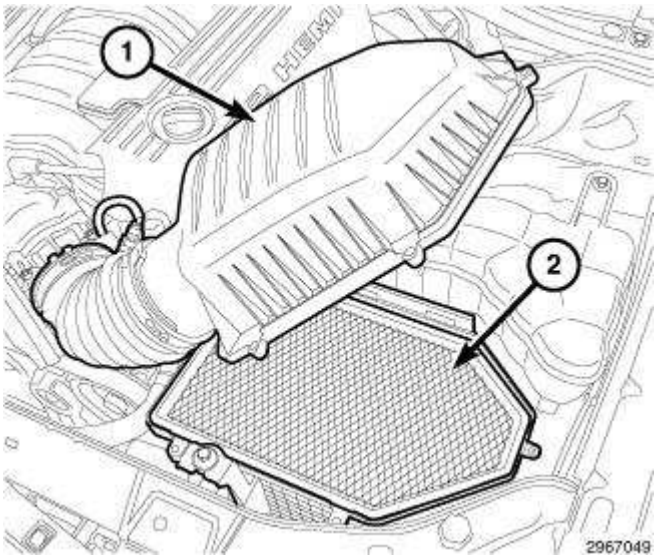

Fig. 82: Air Cleaner Housing Cover & Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

2. Lift the air cleaner housing cover (1) while separating the locating tabs from the housing.
3. Remove air cleaner element (2) from the housing.
4. Clean the inside of air cleaner housing before replacing element.

INSTALLATION

INSTALLATION

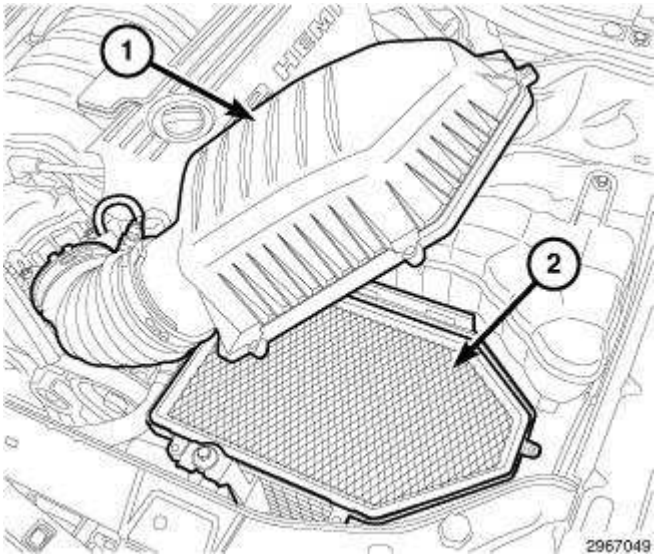

Fig. 83: Air Cleaner Housing Cover & Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

1. Install the air cleaner element (2) into the housing.
2. Align the air cleaner housing cover (1) locating tabs into the housing while lowering the cover

into position.

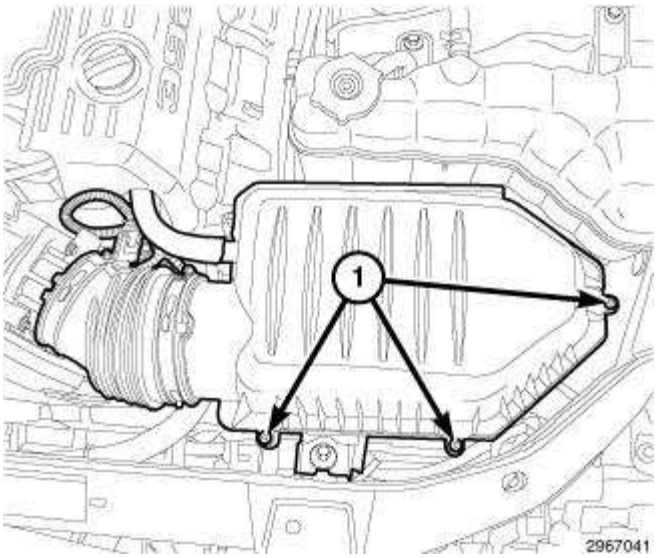

Fig. 84: Air Cleaner Housing Cover Retaining Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install the air cleaner housing cover retaining screws (1) and tighten to 3 N.m (30 in. lbs.).

BODY, AIR CLEANER

REMOVAL

REMOVAL

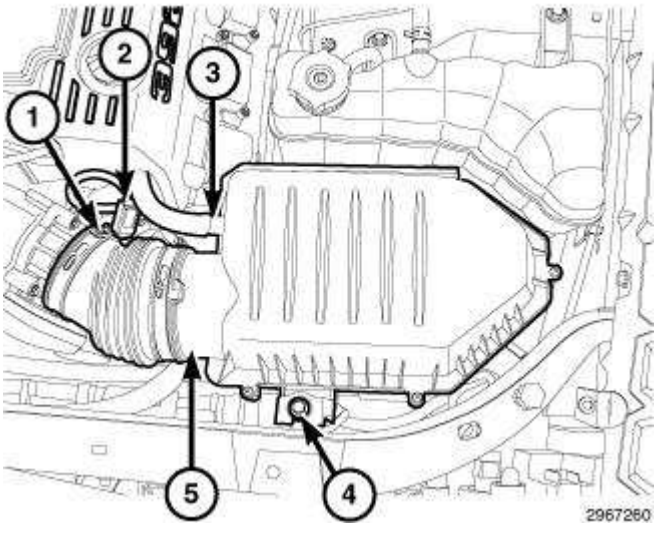

Fig. 85: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

1. Loosen the air duct retaining clamp (1) at the throttle body.
2. Disconnect the intake air temperature sensor electrical connector (2).
3. Remove the makeup air hose (3) at the air cleaner housing.
4. Remove the air cleaner housing retaining bolt (4).
5. While lifting up the air cleaner housing (5), slide the air duct off the throttle body and remove the air cleaner housing from the vehicle.

INSTALLATION

INSTALLATION

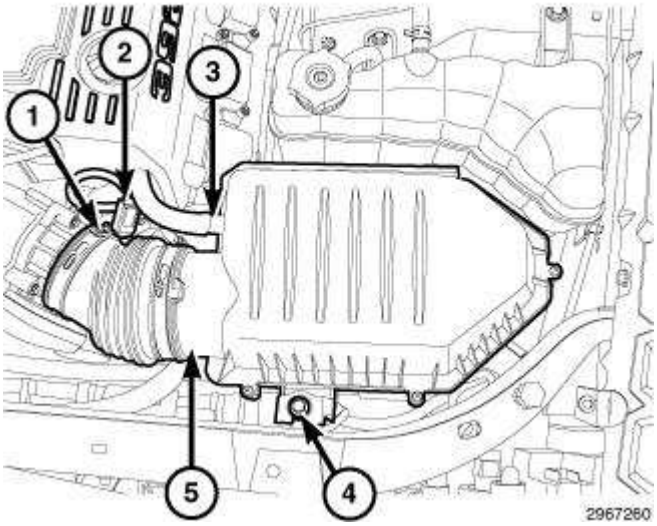

Fig. 86: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

1. While sliding the air duct onto the throttle body, lower the air cleaner housing (5) into position and align the locating pin on the bottom of the housing.
2. Install the air cleaner housing retaining bolt (4) and tighten to 5 N.m (44 in. lbs.).
3. Install the makeup air hose (3) at the air cleaner housing.
4. Connect the intake air temperature sensor electrical connector (2).
5. Position the air duct retaining clamp (1) at the throttle body and tighten to 3 N.m (30 in. lbs.).

CYLINDER HEAD

OPERATION

OPERATION

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to

either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
  - Loss of engine power
  - Engine misfiring
  - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
  - Engine overheating
  - Loss of coolant
  - Excessive steam (white smoke) emitting from exhaust
  - Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in **CYLINDER COMPRESSION PRESSURE LEAKAGE** test in this information. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50-70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: Use extreme caution when the engine is operating with coolant pressure cap removed. Failure to follow this warning may result in serious or fatal injury.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: With cooling system tester in place, pressure will build up fast. Excessive pressure built up, by continuous engine operation, must be released to a

safe pressure level. Never permit pressure to exceed 138 kpa (20 psi). Failure to follow this warning may result in serious or fatal injury.

Install Cooling System Tester (special tool #7700, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

REMOVAL

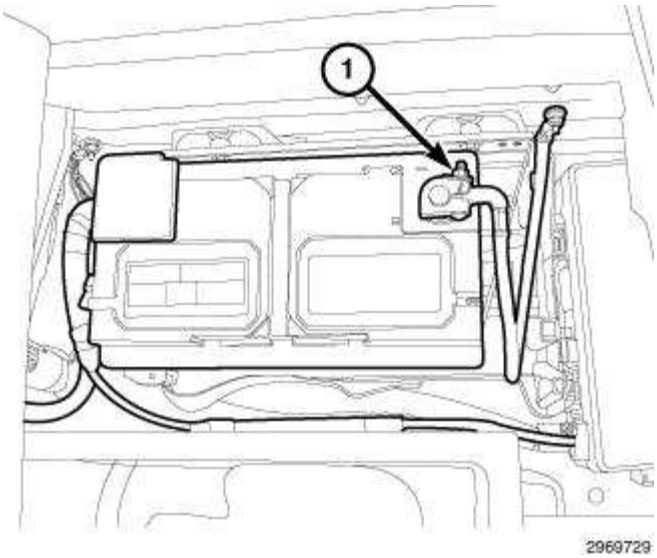

Fig. 87: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the negative battery cable (1).

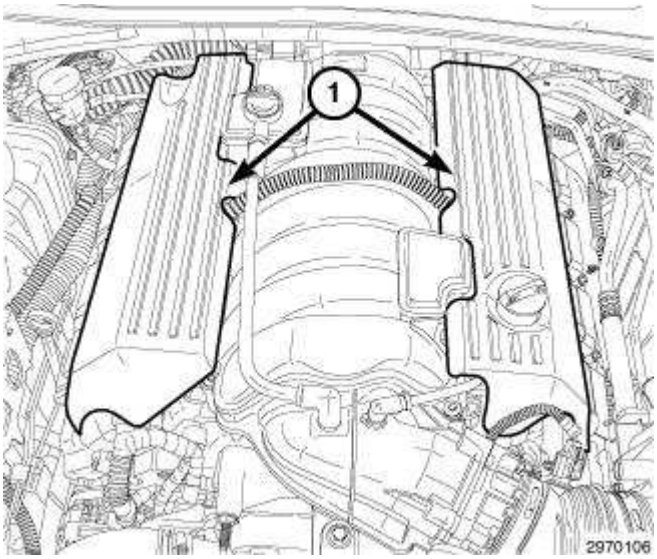

Fig. 88: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine covers (1).
4. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
5. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

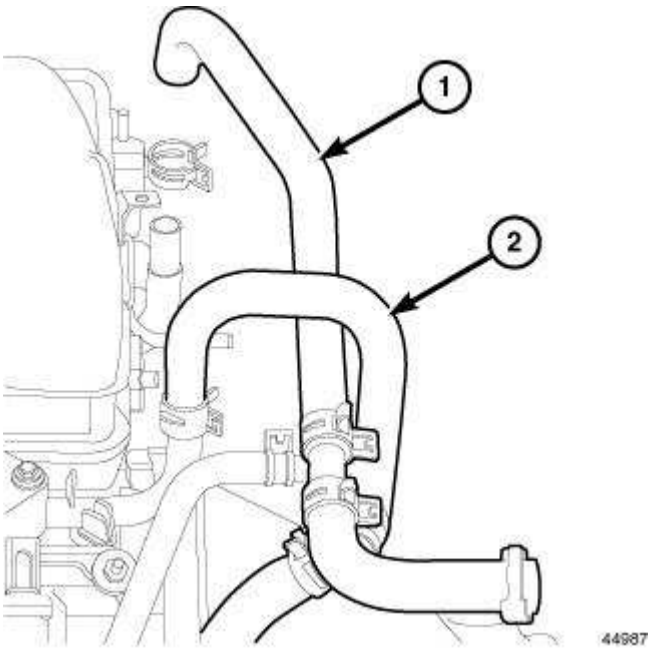

Fig. 89: Heater Hose Supply
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the heater hoses (1, 2).

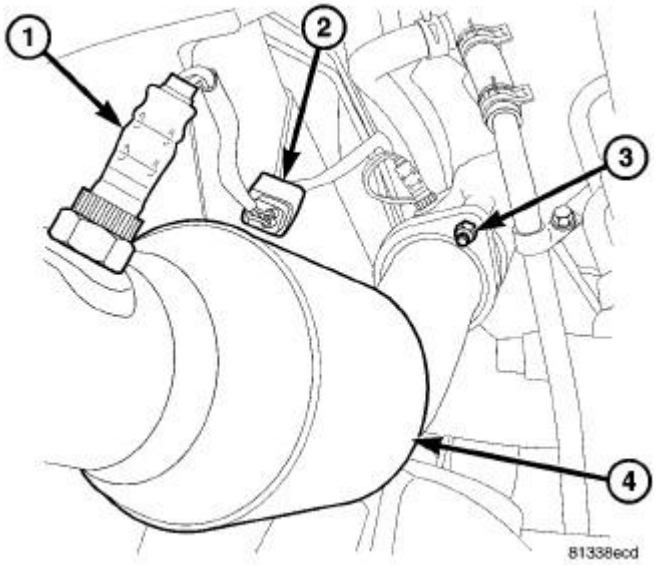

Fig. 90: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

7. Remove the catalytic converters. Refer to **CONVERTER, CATALYTIC, REMOVAL** .
8. Lower the vehicle.

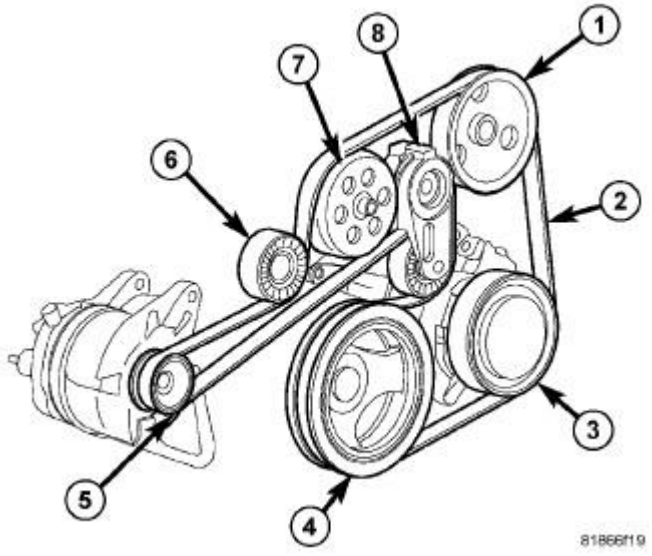

Fig. 91: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever

damage may occur to the tensioner.

9. Rotate the accessory drive belt tensioner (8) clockwise until it contacts it's stop. Remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position. Refer to **BELT, SERPENTINE, REMOVAL** .

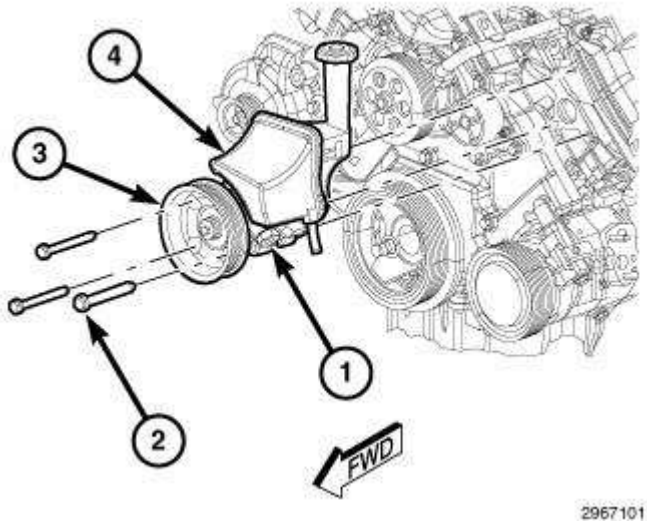

Fig. 92: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to disconnect the power steering pump hoses from the pump, for power steering pump removal.

10. Remove the three power steering pump (1) retaining bolts (2) through the access holes in the pulley (3).
11. Remove the power steering pump (1) and secure out of the way.

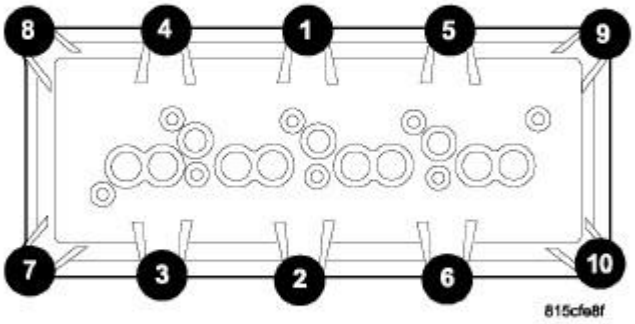

Fig. 93: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

12. Using the sequence shown in illustration, remove the cylinder head cover retaining bolts and remove cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
13. If removing the right cylinder head, remove the engine oil dip stick tube retaining nut at the exhaust manifold and remove the oil dip stick tube.

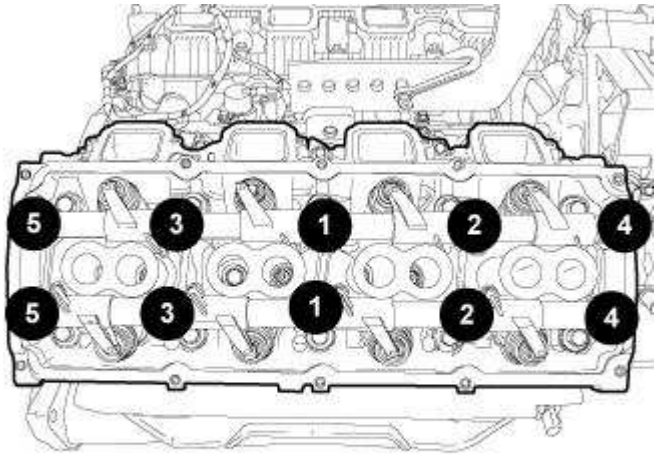

Fig. 94: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Pushrods and rocker arm assemblies must be installed in their

original locations or engine damage could result.

NOTE: **Make sure to identify the original location of the rocker arms and push rods for correct assembly.**

14. Remove the rocker arms and pushrods. Refer to **ROCKER ARM, VALVE, REMOVAL**.

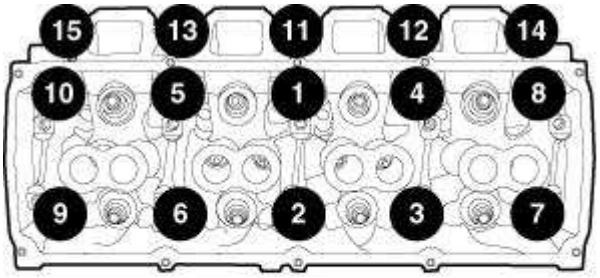

Fig. 95: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left side shown in illustration, right side similar.**

NOTE: **It is not necessary to remove the exhaust manifolds to remove the cylinder heads.**

15. Using the sequence shown in illustration, remove the cylinder head bolts and remove the cylinder head(s).

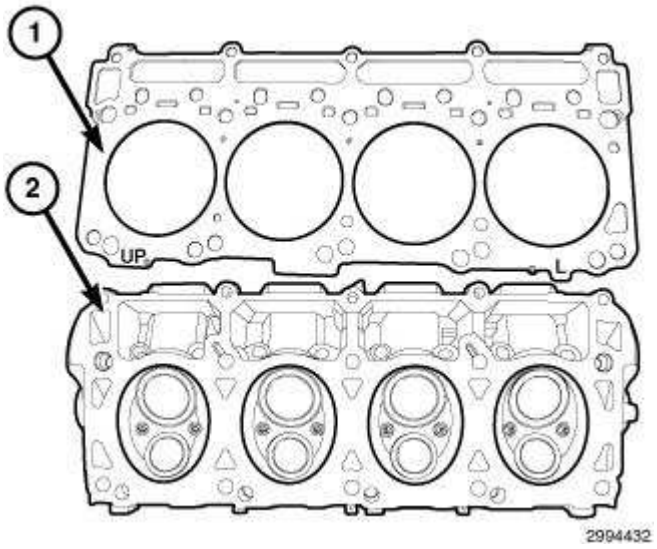

Fig. 96: Cylinder Head Gasket & Cylinder Head

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

16. Discard the cylinder head gasket (1).
17. Inspect and clean the cylinder head (2) mating surface.

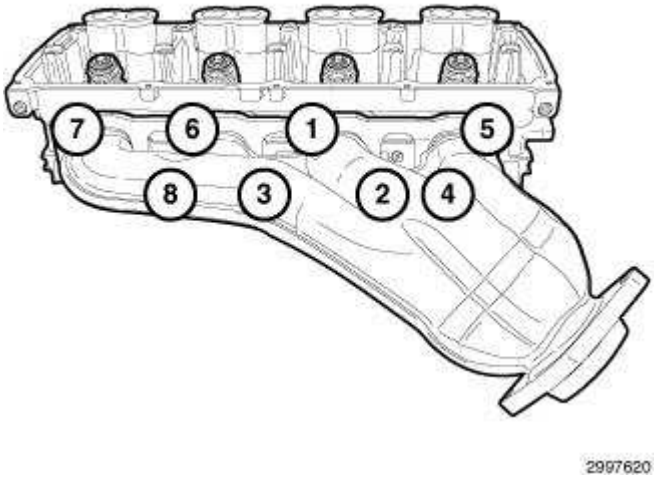

Fig. 97: Exhaust Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

18. If necessary, using the sequence shown in illustration, remove the exhaust manifold bolts and remove the manifold.

CLEANING

CLEANING

Clean all surfaces of the cylinder block and cylinder heads.

Clean the cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

INSPECTION

1. Inspect the cylinder head for flatness using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.

3. Inspect the valve guides for wear, cracks or looseness. If any of these conditions exist, replace the cylinder head.
4. Inspect push rods. Replace worn or bent push rods.

INSTALLATION

INSTALLATION

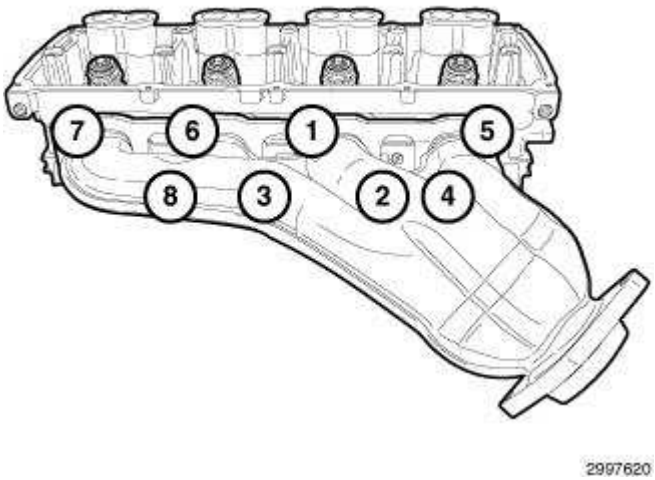

Fig. 98: Exhaust Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

1. If removed, using a new exhaust manifold gasket, position the exhaust manifold and install the retaining bolts finger tight.
2. Using the sequence shown in illustration, tighten the retaining bolts to 31 N.m (23 ft. lbs.).

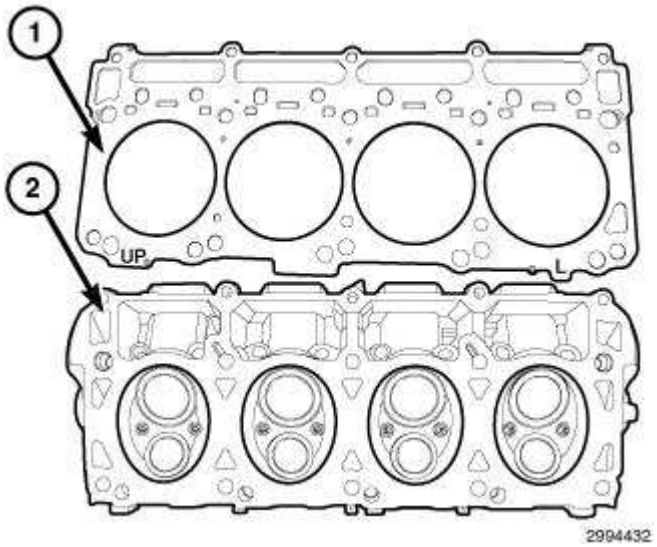

Fig. 99: Cylinder Head Gasket & Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head gaskets (1) are not interchangeable between left and right sides. They are marked "UP" to indicate direction to face up and "L" or "R" to indicate left side or right side of engine block.

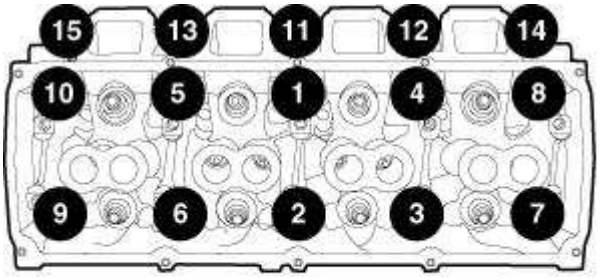
NOTE: Left side shown in illustration, right side similar.

3. Clean all sealing surfaces of the engine block and the cylinder head(s) (2).

NOTE: Rotate crankshaft 45° so that all pistons are 1/2 the way down the cylinder bore to avoid piston to valve contact.

4. Position the new cylinder head gasket(s) (1) onto the engine block.
5. Position the cylinder head(s) (2) onto the engine block.
6. Install the cylinder head bolts finger tight.

CAUTION: The 6.4L engine uses a unique 4 layer steel head gasket that must be compressed evenly and completely across the deck surface for proper sealing. The tightening sequence must be followed to ensure all layers are compressed before applying the additional 90 degree turn.



88745

Fig. 100: Cylinder Head Bolt Removal & Tightening Sequence

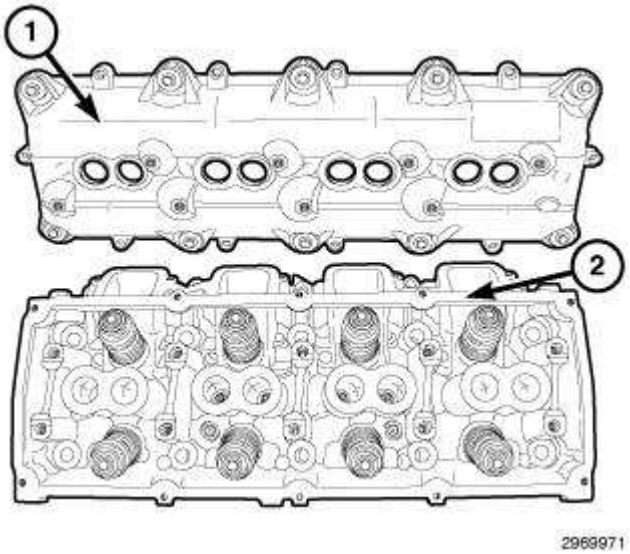

Fig. 114: Cylinder Head & Cover
Courtesy of CHRYSLER GROUP, LLC

8. Remove the cylinder head cover (1).
9. Clean the sealing surface of the cylinder head (2).

NOTE: The cylinder head cover gasket may be used again, provided no cuts, tears, or

deformation have occurred.

INSTALLATION

INSTALLATION

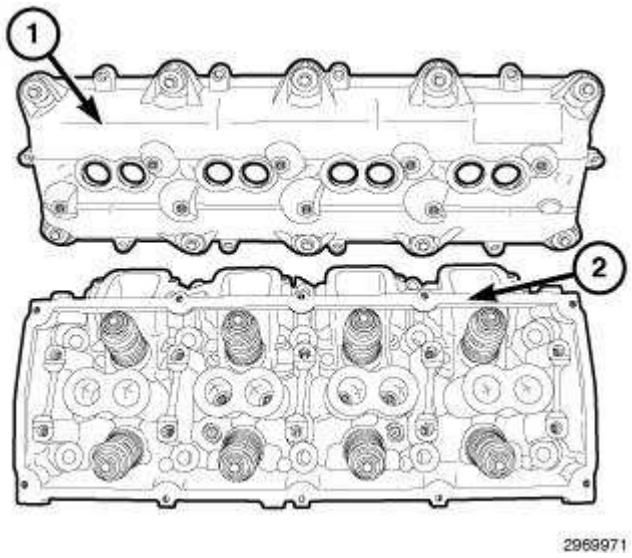

Fig. 115: Cylinder Head & Cover
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: DO NOT allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

NOTE: The cylinder head cover gasket may be used again, provided no cuts, tears, or deformation have occurred.

1. Clean the cylinder head cover (1) and the sealing surface of the cylinder head (2). Inspect and replace gasket if necessary.
2. Install the cylinder head cover and hand start all fasteners.

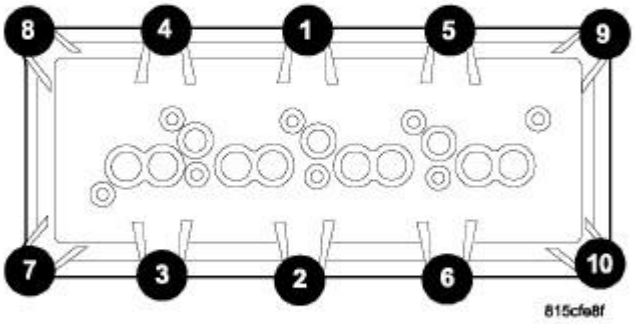

Fig. 116: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Using the sequence shown in illustration, tighten the cylinder head cover bolts to 8 N.m (70 lbs in.).

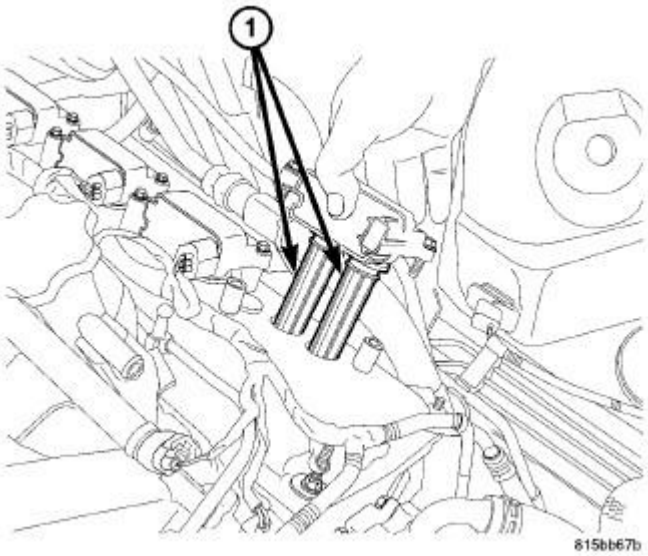

Fig. 117: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

4. Before installing the ignition coils, apply dielectric grease to the inside of the spark plug boots (1).

5. Install the ignition coils.

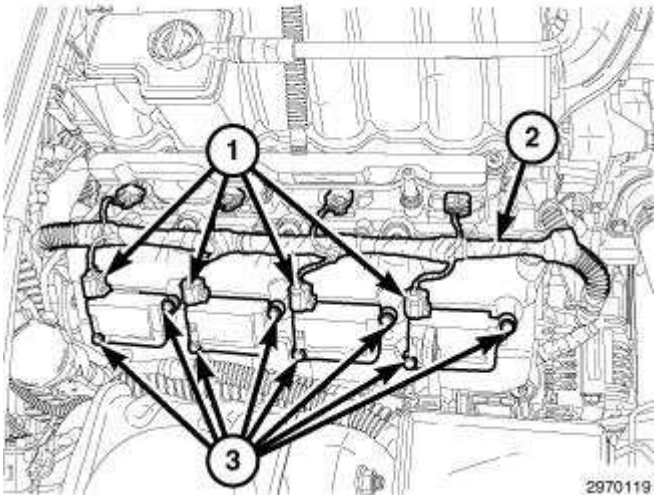

Fig. 118: Ignition Coil Electrical Connectors, Harness & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

6. Tighten the ignition coil retaining bolts (3) to 7 N.m (62 in. lbs.).
7. Position the electrical harness (2).
8. Connect the ignition coil electrical connectors (1).

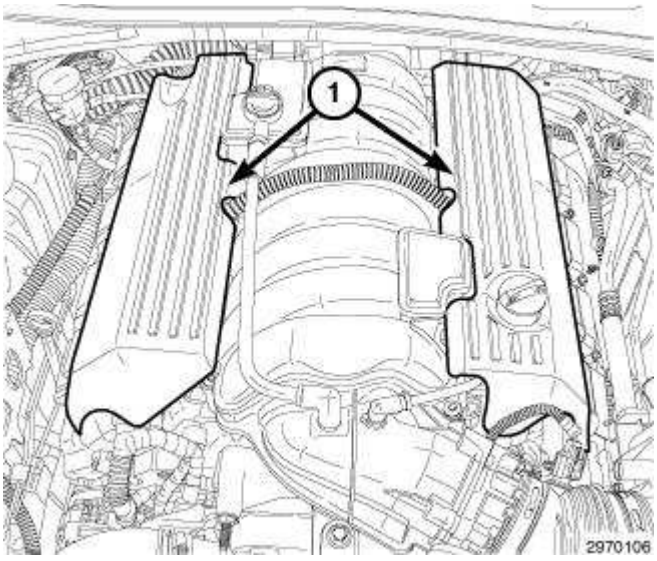

Fig. 119: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

ROCKER ARM, VALVE

REMOVAL

REMOVAL

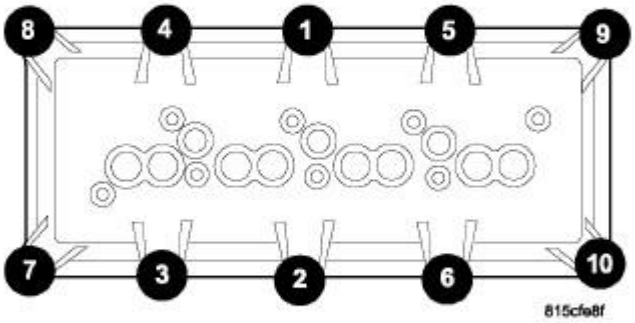

Fig. 121: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

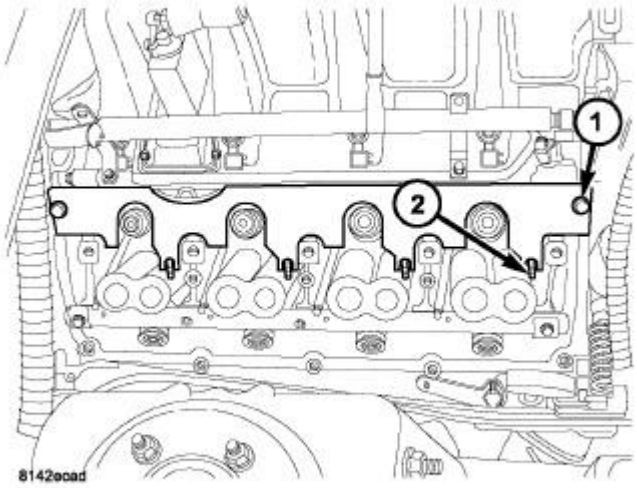

Fig. 122: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

2. Install Push Rod Retainer (special tool #9070, Retainer, Push Rod) (1).

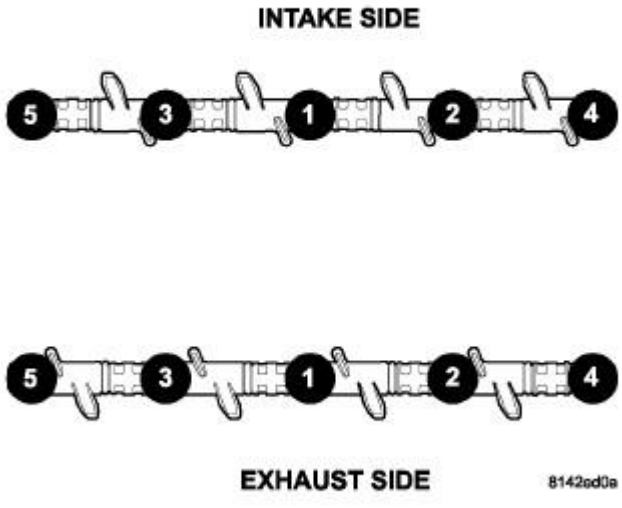

Fig. 123: Rocker Shaft Removal/Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

3. Using the sequence shown in illustration, loosen the rocker shaft assemblies.

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".

4. Remove the rocker shaft assemblies. Note the location for reassembly.

CAUTION: The longer pushrods are for the exhaust side, and the shorter pushrods are for intake side.

5. Remove the pushrods. Note the pushrod location for reassembly.

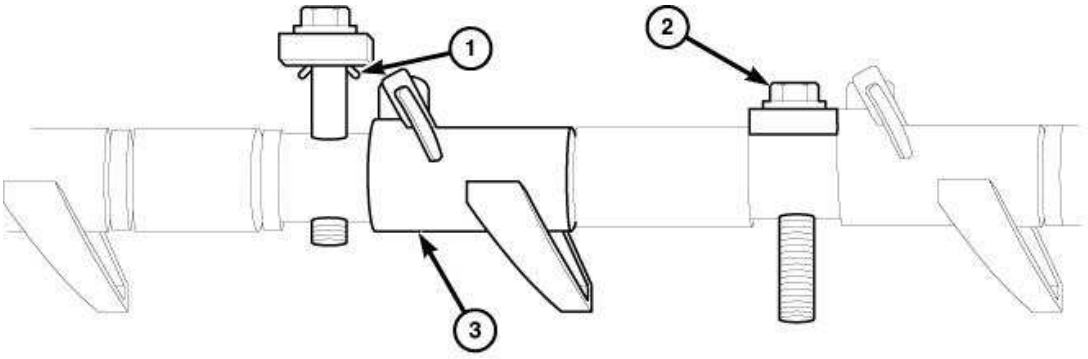

Fig. 124: Rocker Arm Retainers
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove the retainers from the rocker shaft assemblies. The assembly tangs (1) at the bottom of the retainers can be damaged, causing the assembly tangs to break off and get into the engine.

INSTALLATION

INSTALLATION

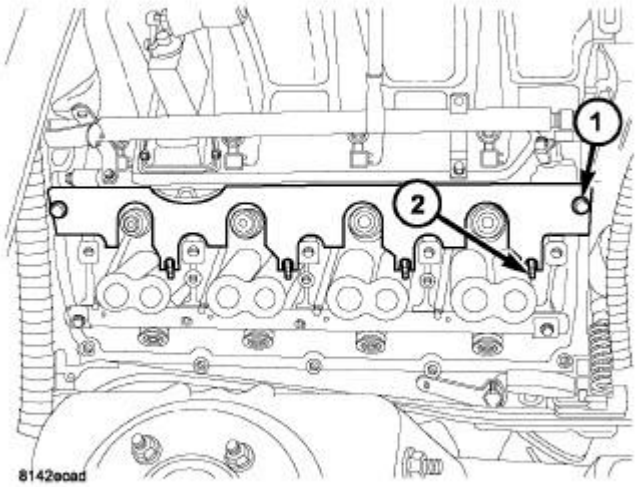

Fig. 125: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The longer pushrods are for the exhaust side, and the shorter pushrods are for intake side.

1. Install the pushrods in the same order as removed.
2. Install the Push Rod Retainer (special tool #9070, Retainer, Push Rod) (1).

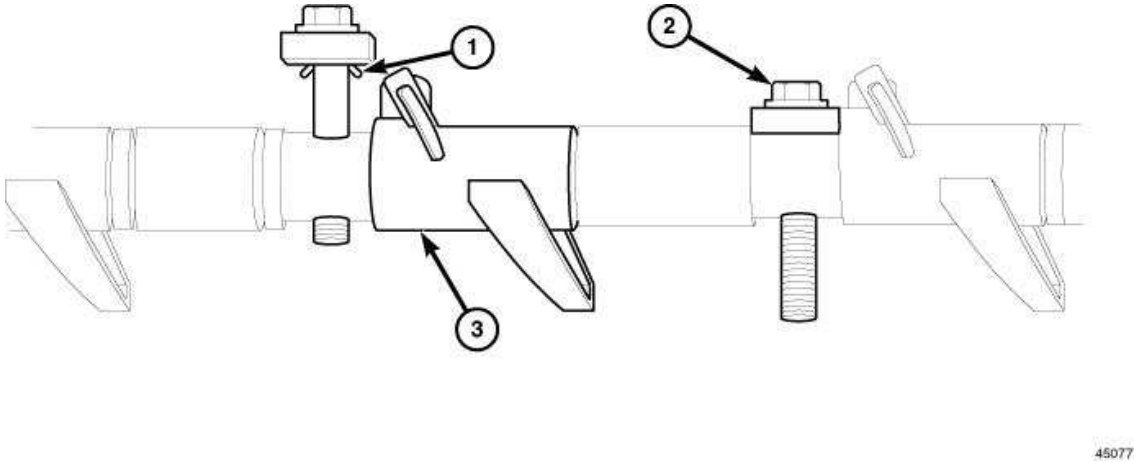

Fig. 126: Rocker Arm Retainers
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Ensure the retainers (1) and rocker arms (3) are not overlapped when torquing bolts.

CAUTION: Verify the push rods are installed into the rocker arms (3) and lifters correctly while installing the rocker shaft assembly. Recheck after the rocker shaft assembly has been torqued to specification.

3. Install the rocker shaft assemblies in the same order as removed.

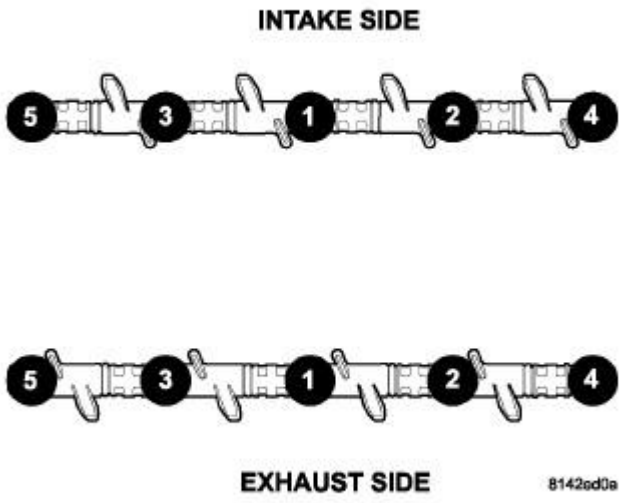

Fig. 127: Rocker Shaft Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with the letter "I".

4. Verify the rocker arms are installed in the correct location.

NOTE: Repeat torque sequence several times to ensure rocker shaft assembly is firmly seated.

5. Using the sequence shown in illustration, tighten the rocker shaft bolts to 22 N.m (16 ft. lbs.).

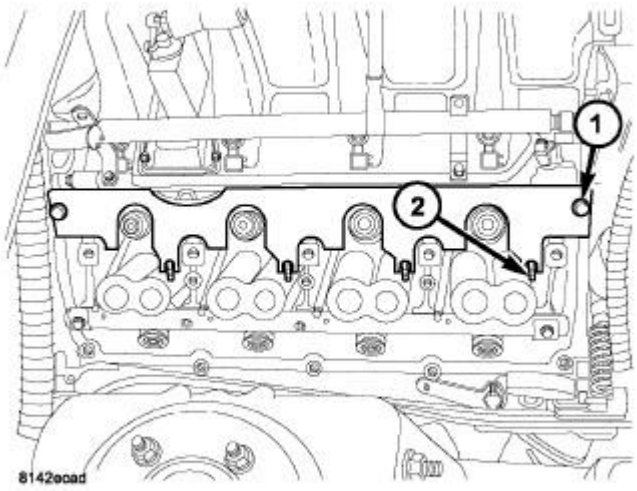

Fig. 128: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller lifters adequate time to bleed down (about 5 minutes).

6. Remove the Push Rod Retainer (special tool #9070, Retainer, Push Rod) (1).

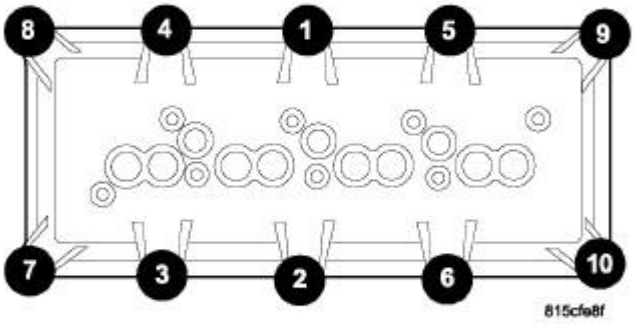

Fig. 129: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

SEAL(S), VALVE GUIDE

DESCRIPTION

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems. The intake valve stem seal has a smaller valve spring seat compared to the exhaust valve stem seal. The intake and exhaust valve stem seals are identified by different colors.

SPRING(S), VALVE

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable (1).

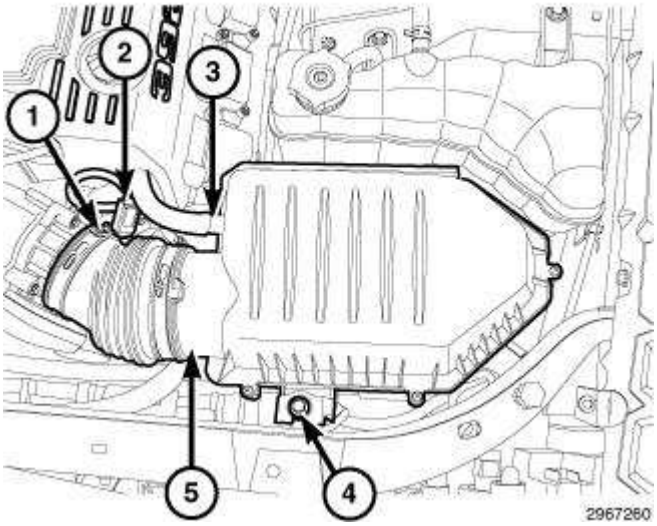

Fig. 131: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

2. Remove the air cleaner housing (5) and clean air tube (1). Refer to **BODY, AIR CLEANER, INSTALLATION**.

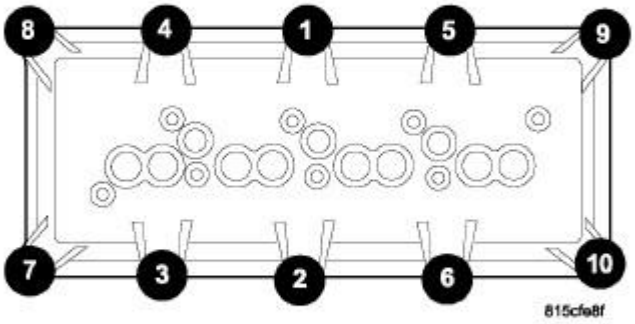

Fig. 132: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

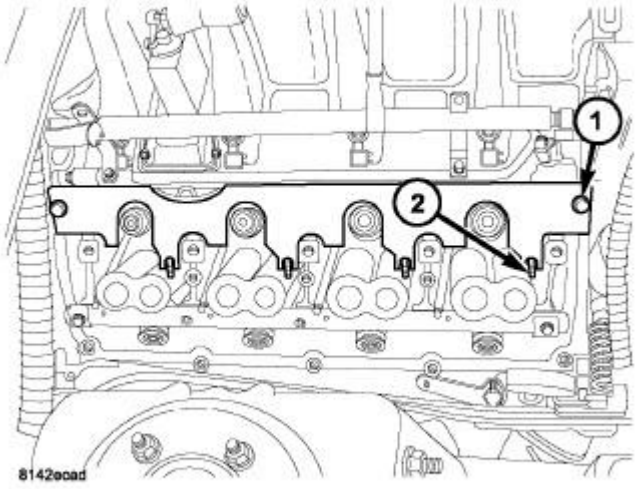

Fig. 133: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The piston must be at TDC, and both valves closed on the cylinder to be serviced.

NOTE: The intake push rods can fall into the engine and become lodged in the oil pan, if removing intake rocker arm shaft, install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1) to retain the intake push rods (2).

4. Install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1) onto the cylinder head.
5. Clip the pushrods (2) into the pushrod retainer (1).

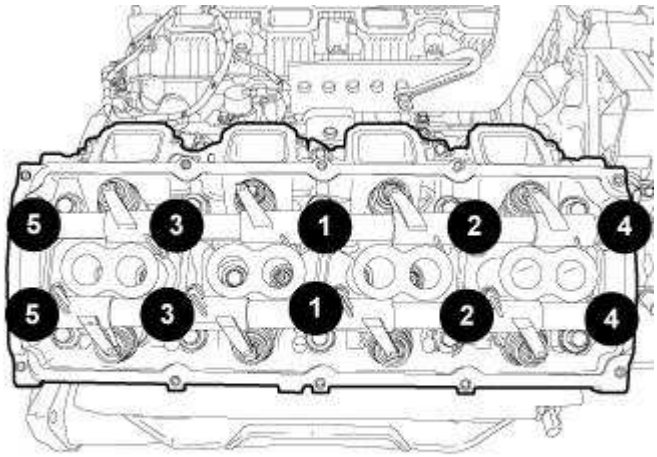

Fig. 134: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".

6. Using the sequence shown in illustration, remove the rocker arm shaft bolts and remove the rocker arm shaft.

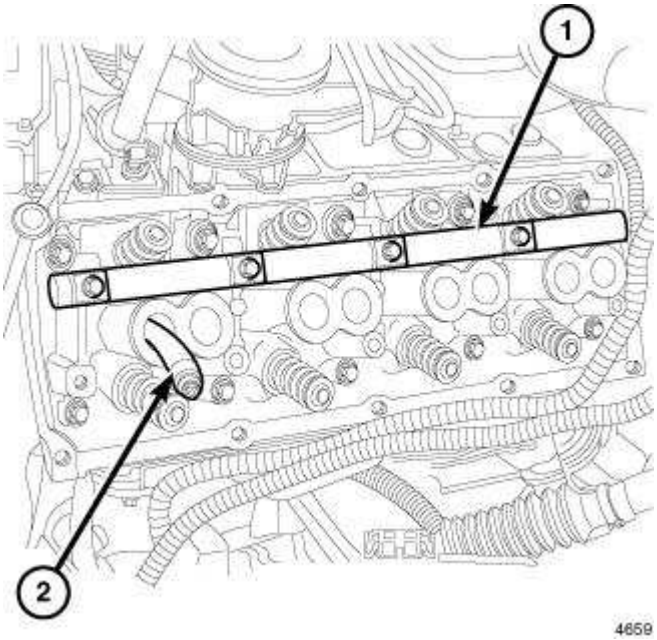

Fig. 135: Rocker Arm Shaft Adapter & Air Hose
Courtesy of CHRYSLER GROUP, LLC

7. Install the rocker arm shaft adapter (special tool #9065B, Compressor, Valve Spring) (1).
8. Insert an air hose (2) into the spark plug hole and charge the cylinder with air.

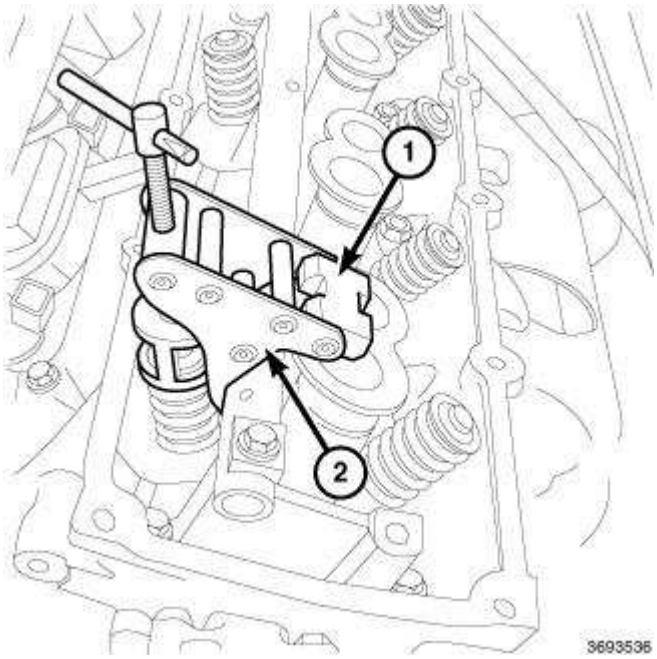

Fig. 136: Intake Valve Spring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: A fulcrum assembly (1) must be rotated to the appropriate setting as marked on the tool for proper valve spring alignment.

NOTE: All valve springs and seals are removed in the same manner.

NOTE: Tap the top of the valve spring retainer to loosen the spring retainer locks.

9. Install the valve spring compressor (special tool #9065B, Compressor, Valve Spring) (1) and remove the intake valve retainer locks.
10. Release the valve spring compressor and remove the valve springs.

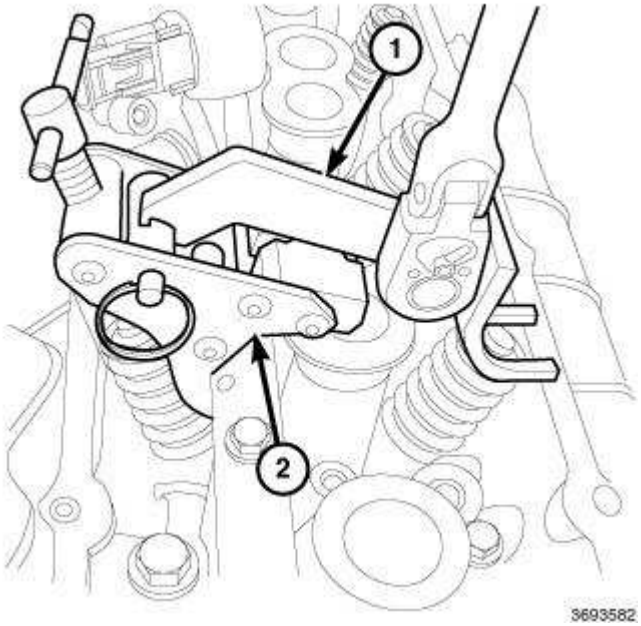

Fig. 137: Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

11. Install the valve spring compressor (special tool #9065B, Compressor, Valve Spring) (2) and the rocker arm adapter (special tool #9065-3, Adapter, Valve Spring Compressor) (1) and remove the exhaust valve retainer locks.
12. Release the valve spring compressor and remove the valve spring.

NOTE: The valve springs are interchangeable between intake and exhaust.

13. Remove and discard the valve guide seal.

INSTALLATION

INSTALLATION

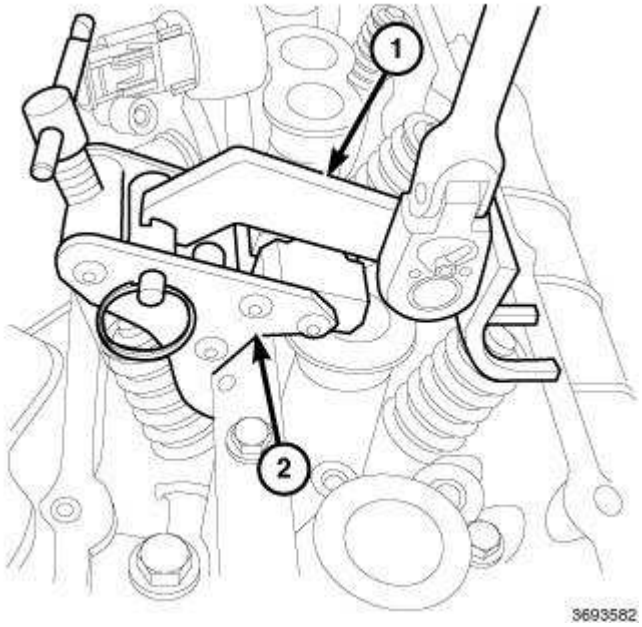

Fig. 138: Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: All valve springs and seals are installed in the same manner.

NOTE: The intake seal has a smaller spring seat diameter compared to the exhaust seal.

1. Install a new valve guide seal.

   NOTE: The intake spring retainer has a longer free length compared to the exhaust spring retainer.

2. Install the valve spring.
3. Install the valve spring retainer.
4. Using the valve spring compressor (special tool #9065B, Compressor, Valve Spring) (3) and the rocker arm adapter (special tool #9065-3, Adapter, Valve Spring Compressor) (1), compress the valve spring and install the valve spring retainer locks.

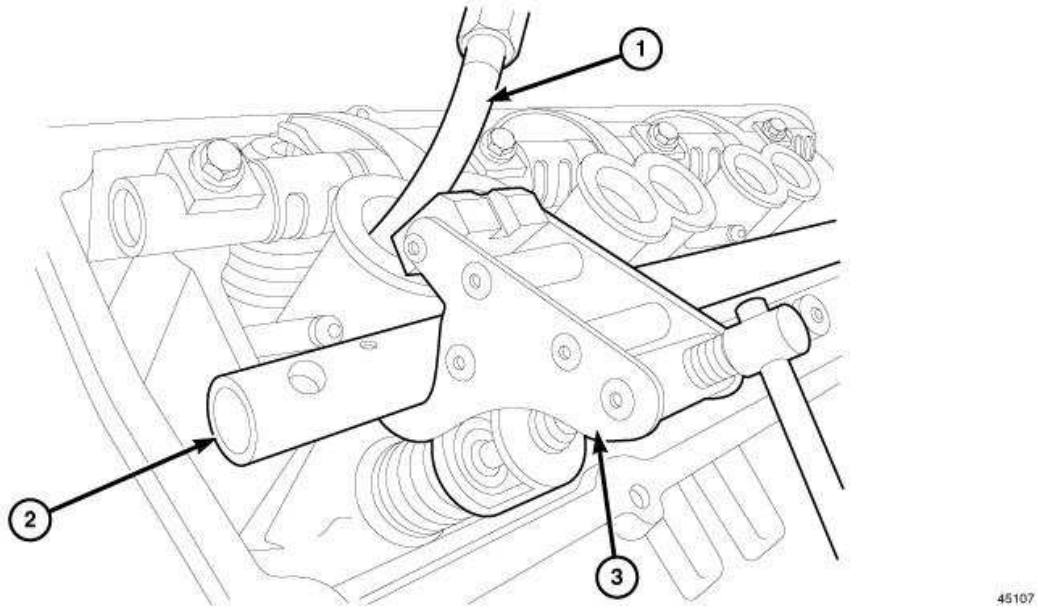

Fig. 139: Air Charge, Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

5. Remove the valve spring compressor (special tool #9065B, Compressor, Valve Spring) (3) and the rocker arm adapter (special tool #9065-3, Adapter, Valve Spring Compressor).
6. Release the air charge (1) in the cylinder.

CAUTION: Verify that the pushrods are fully seated into the lifters and the rocker arms. Recheck after rocker arm shaft has been torqued to specification.

7. Install the rocker arm shaft and push rods. Refer to **ROCKER ARM, VALVE, INSTALLATION**.

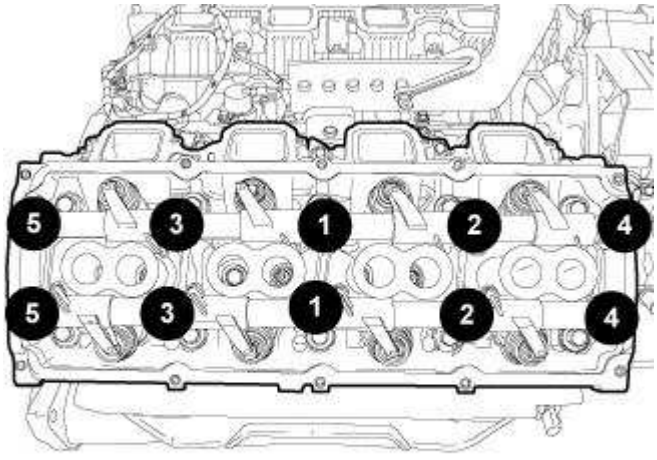

Fig. 140: Rocker Shafts Retaining Bolt Removal & Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

NOTE: Repeat torque sequence several times to ensure rocker shaft assembly is firmly seated.

8. Using the sequence shown in illustration, tighten the rocker arm shaft bolts to 22 N.m (16 ft. lbs.).

13. Connect the negative battery cable.
14. Road test the vehicle.

VALVES, INTAKE AND EXHAUST

DESCRIPTION

VALVES

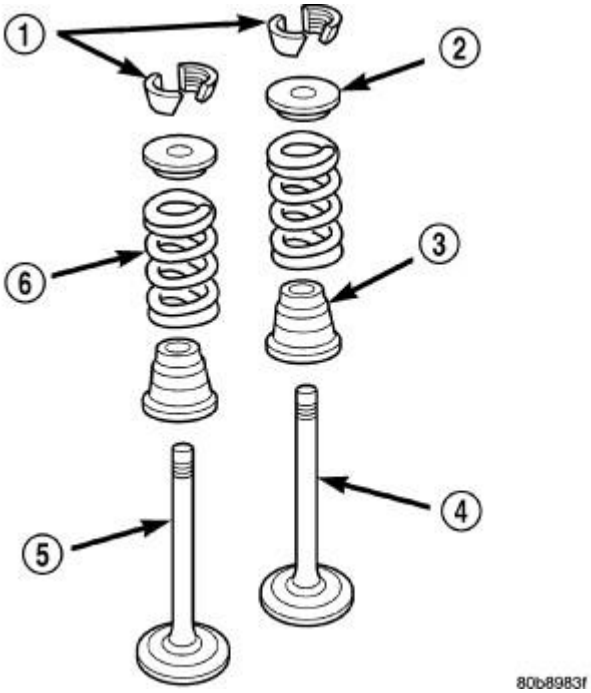

Fig. 145: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

Both the intake (4) and exhaust (5) valves are made of steel with full chrome plate on valve stems. The intake valve is 54.3 mm (2.14 in.) diameter and the exhaust valve is 42.0 mm (1.65 in.) diameter. All valves use three bead lock keepers (1) and retainers (2) to retain the springs (6) and promote valve rotation.

VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

STANDARD PROCEDURE

STANDARD PROCEDURE - REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.

2. Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat the valve seat with Prussian blue then set the valve in place. Rotate the valve using light pressure. If the blue is transferred to the center of the valve face, contact is satisfactory. If the blue is transferred to the top edge of the valve face, lower the valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat with a 65 degree stone.
3. Refer to the chart below for the proper valve seat width, valve seat angle, valve face angle and valve spring height.

VALVE SEAT, VALVE FACE AND SPRING HEIGHT CHART

DESCRIPTION	SPECIFICATION	
SEAT WIDTH		
INTAKE	0.94 - 1.04 mm	0.037 - 0.041 in.
EXHAUST	1.16 - 1.26 mm	0.046 - 0.050 in.
SEAT ANGLE		
(INT. AND EXT.)	44.5° - 45°	
FACE ANGLE		
INTAKE	45.5° - 46°	
EXHAUST	45° - 45.5°	
SPRING HEIGHT		
INTAKE	52.1 mm	2.051 in.
EXHAUST	51.2 mm	2.016 in.

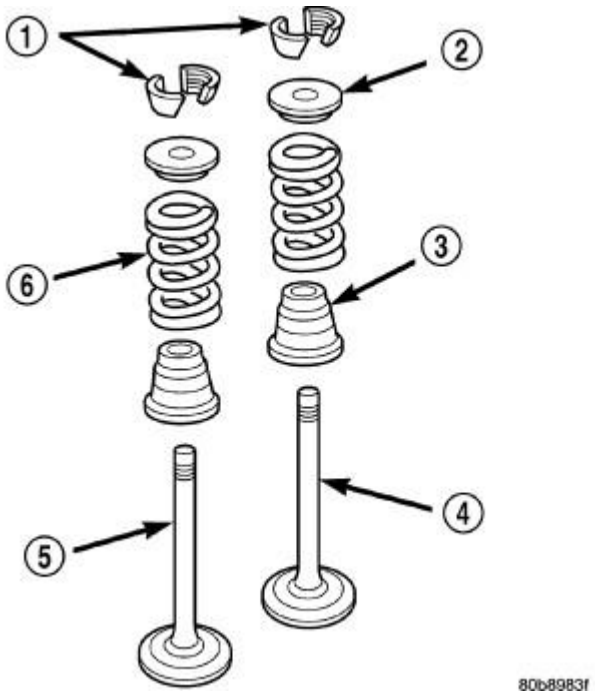

Fig. 146: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

4. The valve seat must maintain an angle of 44.5° - 45.0°.
5. The valve face must maintain an angle of 45.5° - 46.0° for the Intake and 45° - 45.5° for the exhaust.

REMOVAL

REMOVAL

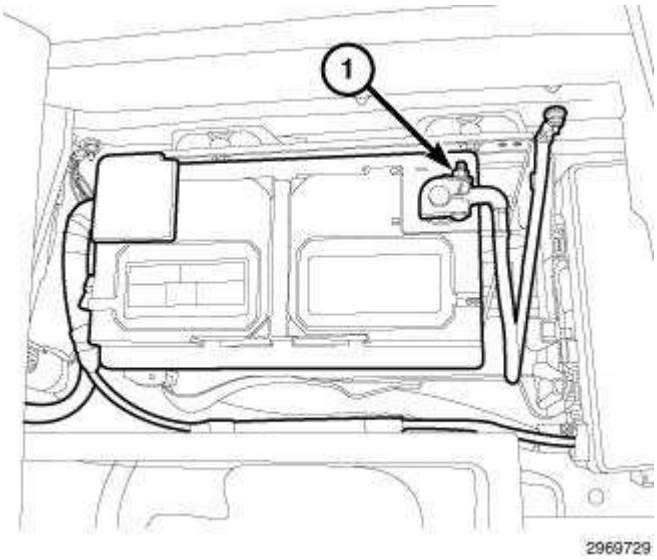

Fig. 147: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

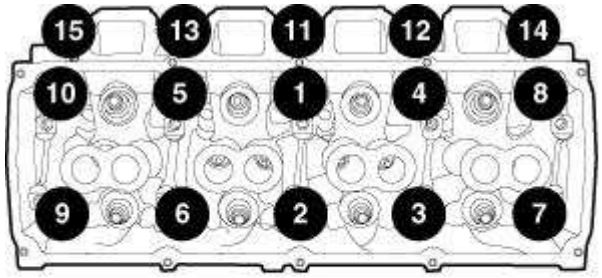

Fig. 148: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL**.

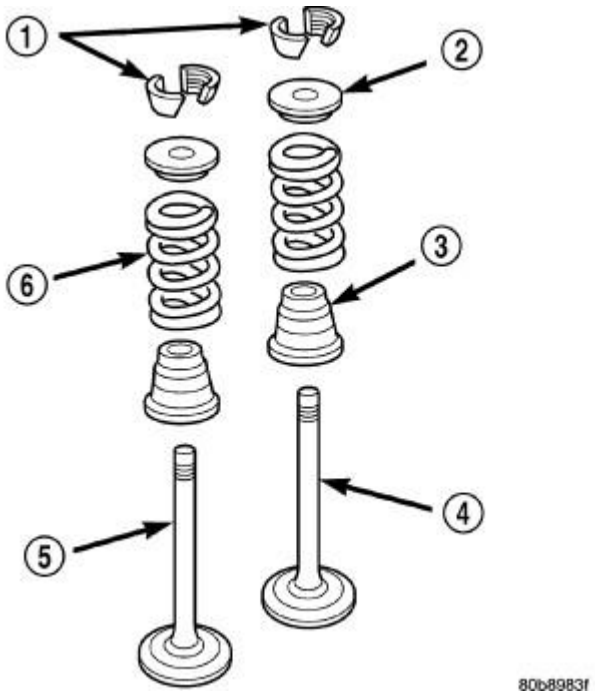

Fig. 149: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

3. Compress the valve springs using the valve spring compressor (special tool #C-3422-D, Compressor, Valve Spring) and adapter (special tool #8464, Adapter, Valve Spring).
4. Remove the valve spring retainer locks (1), valve spring retainers (2), valve stem seals (3) and valve springs (6).
5. Before removing the valves, remove any burrs from the valve spring retainer lock grooves in the valve stems (4) to prevent damage to the valve guides. Identify the valves to ensure installation in their original location.
6. Remove the valves (4, 5).

INSTALLATION

INSTALLATION

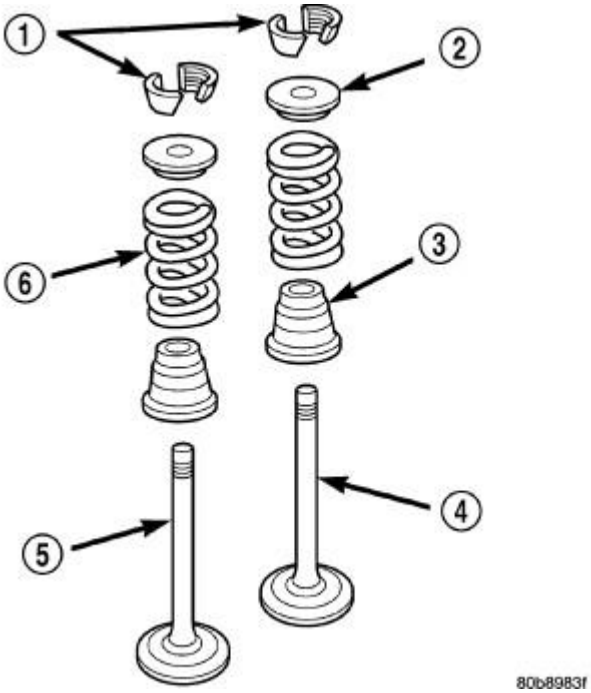

Fig. 150: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

1. Clean the valves thoroughly. Discard burned, warped, and cracked valves.
2. Remove carbon and varnish deposits from inside the valve guides with a reliable guide cleaner.
3. Measure the valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat the valve stems (4, 5) with clean engine oil and insert them into the cylinder head.
5. If the valves or seats have been reground, check valve stem height. If the valve is too long, replace the cylinder head.
6. Install new seals (3) on all valve guides. Install the valve springs (6) and valve spring retainers (2).

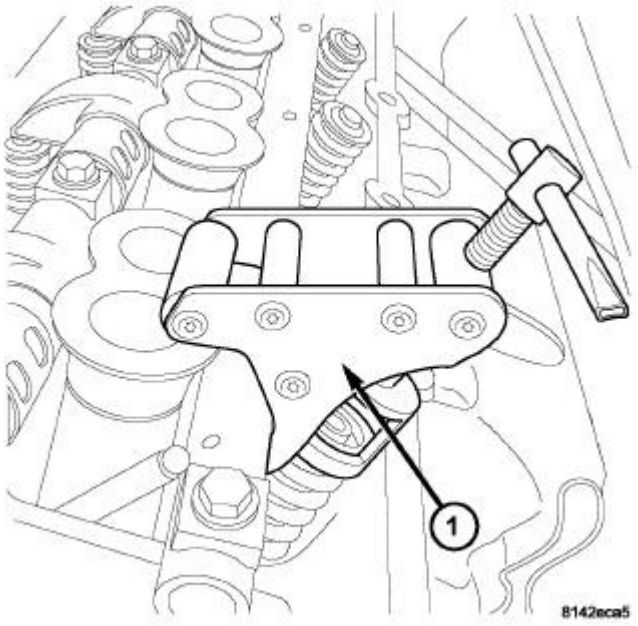

Fig. 151: Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

7. Compress the valve springs with the valve spring compressor (special tool #C-3422-D, Compressor, Valve Spring) (1) and adapter (special tool #8464, Adapter, Valve Spring), install the valve spring retainer locks and release the tool. If the valves and/or seats have been ground, measure the installed height of the springs. Make sure the measurement is taken from the bottom of spring seat in the cylinder head to the bottom surface of valve spring retainer.

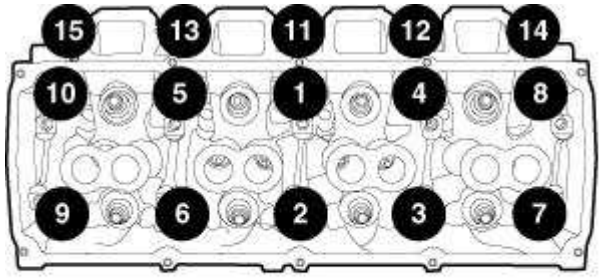

Fig. 152: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. Install the cylinder head (2). Refer to **CYLINDER HEAD, INSTALLATION**.

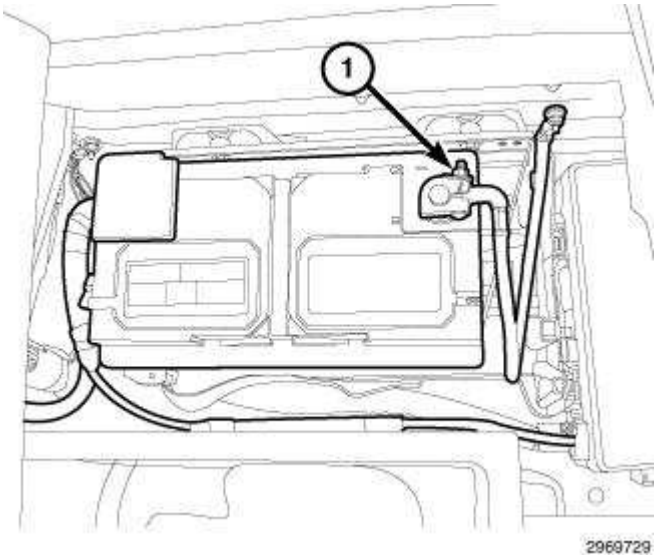

Fig. 153: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

9. Connect the negative battery cable (1).

ENGINE BLOCK

CLEANING

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean the following:

- Gallery at the oil filter adaptor hole.
- Front and rear oil gallery holes.
- Feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil gallery plugs. Tighten the 1/4 inch NPT plugs to 20 N.m (15 ft. lbs.). Tighten the 3/8 inch NPT plugs to 27 N.m (20 ft. lbs.) and the coolant drain plugs to 34 N.m (25 ft. lbs.).

INSPECTION

INSPECTION

ENGINE BLOCK

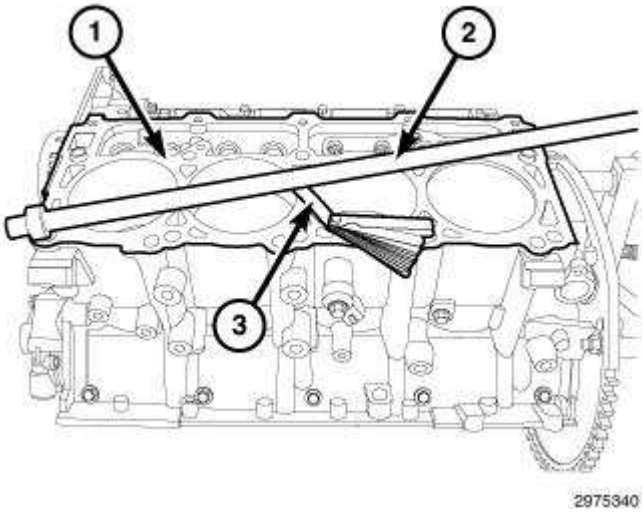

Fig. 154: Checking Engine Block Deck Surface With Precision Straightedge & Feeler Gauge
Courtesy of CHRYSLER GROUP, LLC

1. Clean the engine block thoroughly and check all core hole plugs for evidence of leaking and repair if necessary.
2. Examine the engine block and cylinder bores for cracks or fractures.

NOTE: Check the engine block deck surface with a precision straightedge and feeler gauge. The surface irregularities should not exceed 0.09 mm (0.0035 in.). Check the deck surface from one end to the other with the precision straightedge positioned across corners and parallel to the block centerline up and down the deck.

3. Check the engine block deck (1) surfaces for flatness using a precision straightedge (2) and feeler gauge (3).

CYLINDER BORE

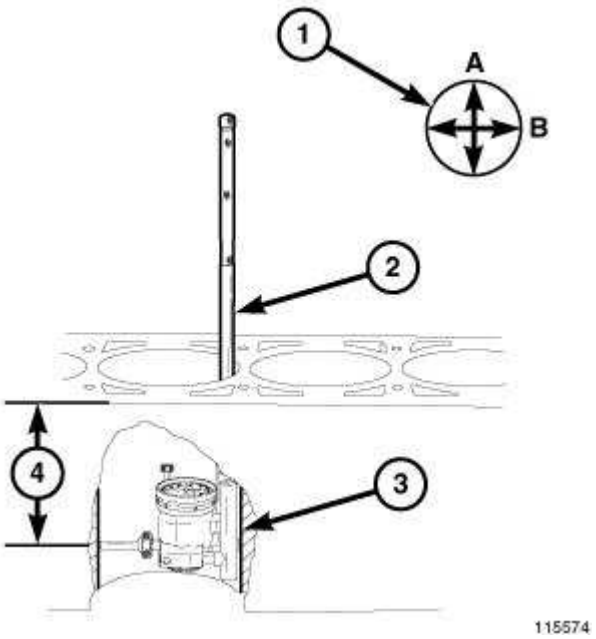

Fig. 155: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

1. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90°) to the axis of the crankshaft at point A (1).
3. Repeat the measurement near the middle of the bore then repeat the measurement near the bottom of the bore.
4. Determine the taper by subtracting the smaller diameter from the larger diameter.
5. Rotate the measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specifications.
6. Determine out-of-roundness by comparing the difference between each measurement.
7. If the cylinder bore taper does not exceed 0.0127 mm (0.0005 inch) and out-of-roundness does not exceed 0.008 mm (0.0003 inch) then the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds the maximum limits, replace the engine block.

NOTE: A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

MAIN BEARINGS

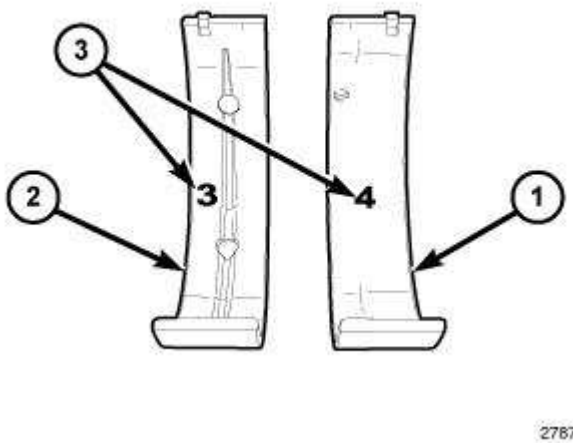

Fig. 156: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the main bearing inserts (1, 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the engine block main bearing bores show damage, replace the engine block.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch). The maximum out-of-round is 0.005 mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5.

NOTE: Service main bearings are coded. These codes identify what size (color) the bearing is.

MAIN BEARING SELECTION CHART - 6.4L

GRADE	COLOR	mm	In	FOR USE WITH JOURNAL SIZE
	LOWER			64.988-64.995 mm
A	**ORANGE**	0.008 mm U/S	(0.0004 in.) U/S	(2.5585- 2.5588 in.)
	LOWER			64.996-65.004 mm
B	**BLACK**	NOMINAL	NOMINAL	(2.5588-2.5592 in.)
	LOWER			65.005-65.012 mm
C	**GREEN**	0.008 mm O/S	(0.0004 in.) O/S	(2.5592-2.5595 in.)

INSPECTION

INSPECTION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

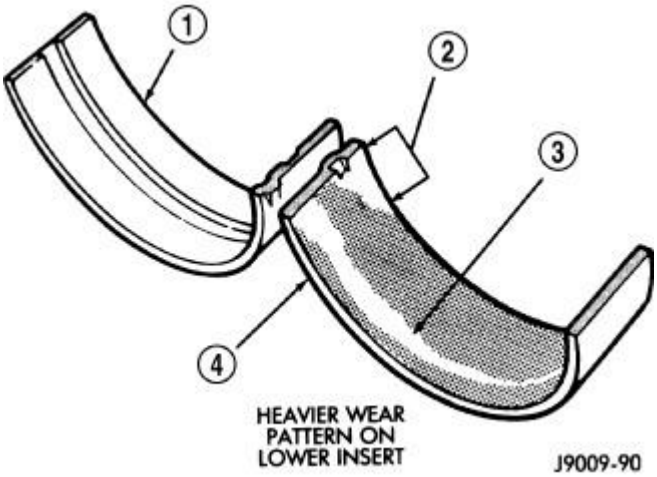

Fig. 157: Main Bearing Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

NOTE: If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scoring or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CAMSHAFT, ENGINE

REMOVAL

5.7L / 6.4L - CAMSHAFT CORE HOLE PLUG

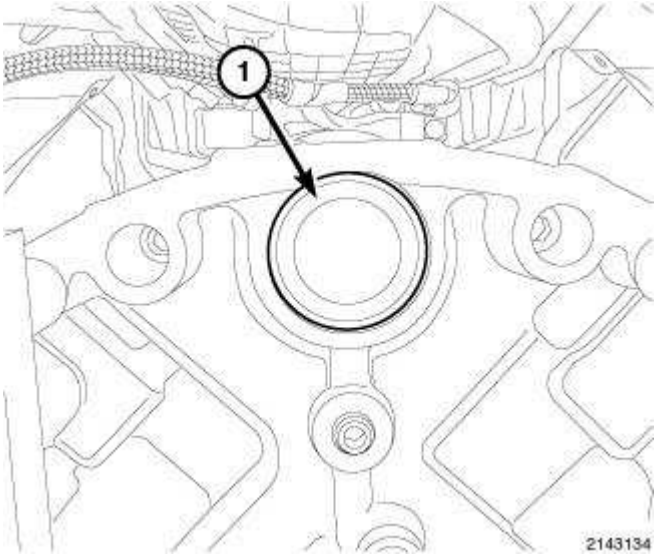

Fig. 158: Camshaft Core Hole Plug
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Remove the engine from the vehicle. Refer to **REMOVAL**.
3. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL**.

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

4. Using a suitable sharp punch, punch a small hole in the camshaft core hole plug (1).

5. Insert a short sheet metal screw into the small hole in the camshaft core hole plug.
6. Using a suitable slide hammer puller, remove the rear camshaft core hole plug.

CAMSHAFT

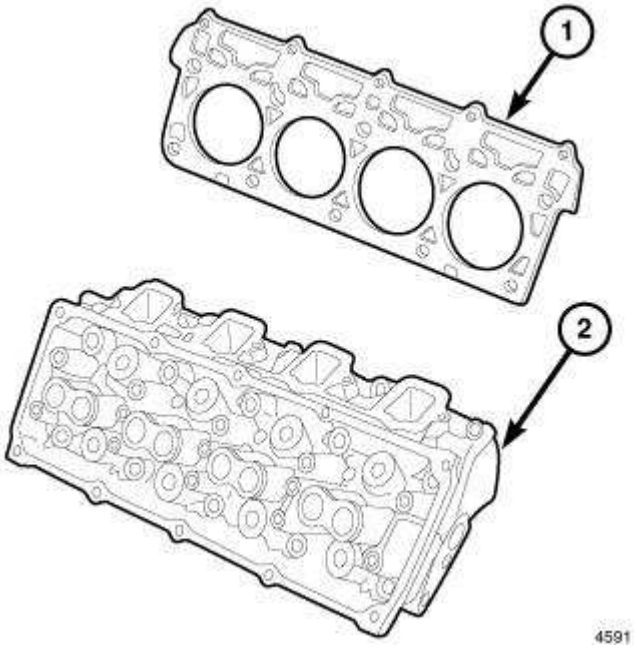

Fig. 159: Cylinder Head & Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Remove both cylinder heads (2). Refer to **CYLINDER HEAD, REMOVAL**.

CAUTION: The 6.4L Multi Displacement System (MDS) engine uses both standard roller lifters and deactivating roller lifters. The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: Whenever the camshaft is replaced, all lifters must be replaced. If the lifter and retainer assemblies are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

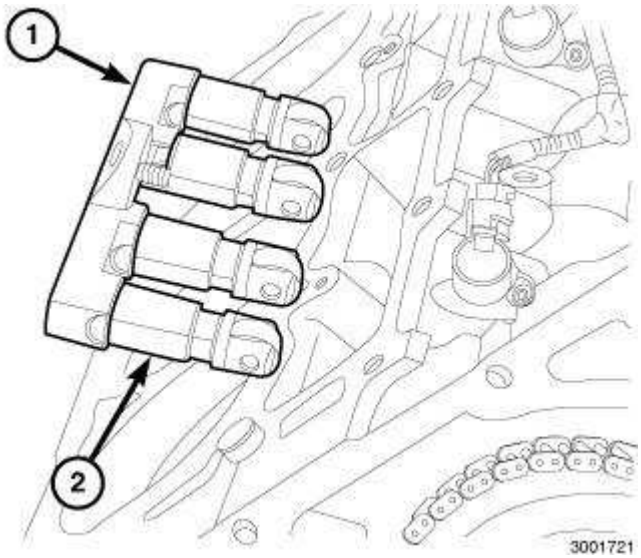

Fig. 160: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

2. Remove the lifters (2) and retainer (1) as an assembly. Refer to **LIFTER(S), HYDRAULIC, ROLLER, REMOVAL**.

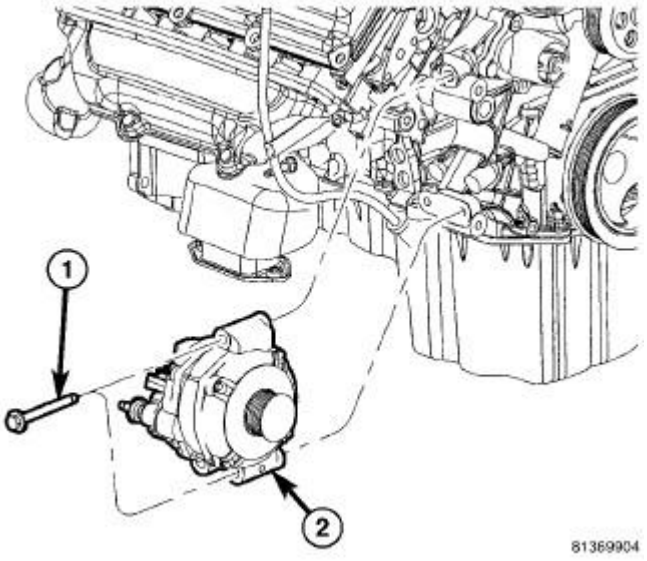

Fig. 161: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove the generator. Refer to **GENERATOR, REMOVAL** .

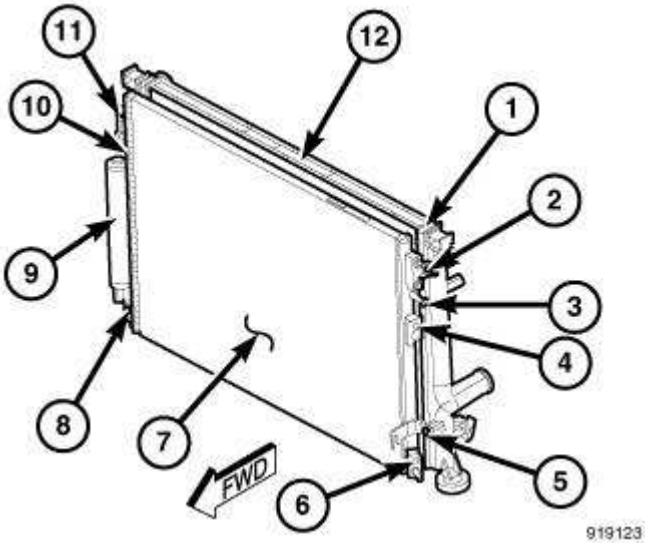

Fig. 162: A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

4. Remove the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .
5. Remove the radiator (12). Refer to **RADIATOR, ENGINE COOLING, REMOVAL** .
6. Remove the A/C condenser (7). Refer to **CONDENSER, A/C, REMOVAL** .
7. Raise and support vehicle.

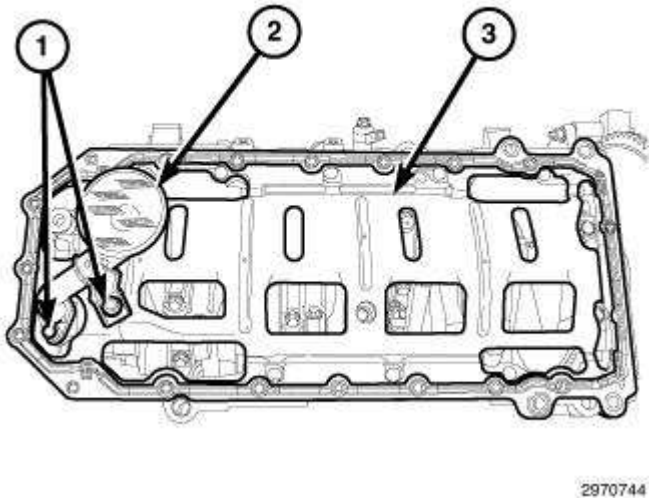

Fig. 163: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the oil pan and oil pump pickup tube (2). Refer to **PAN, OIL, REMOVAL**.

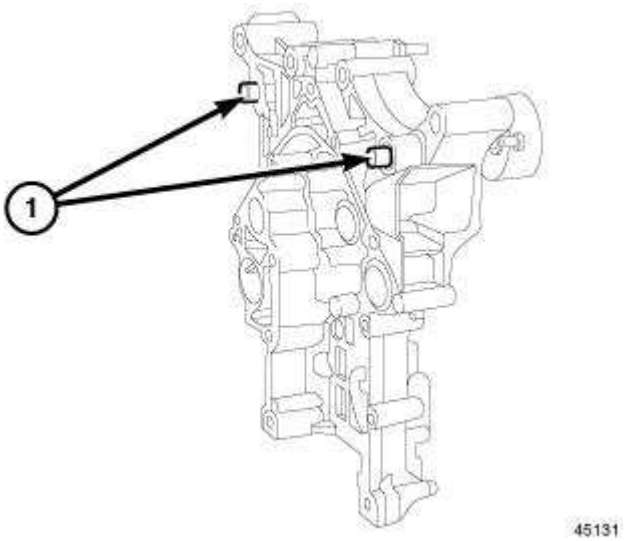

Fig. 164: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the water pump for timing cover removal.

9. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

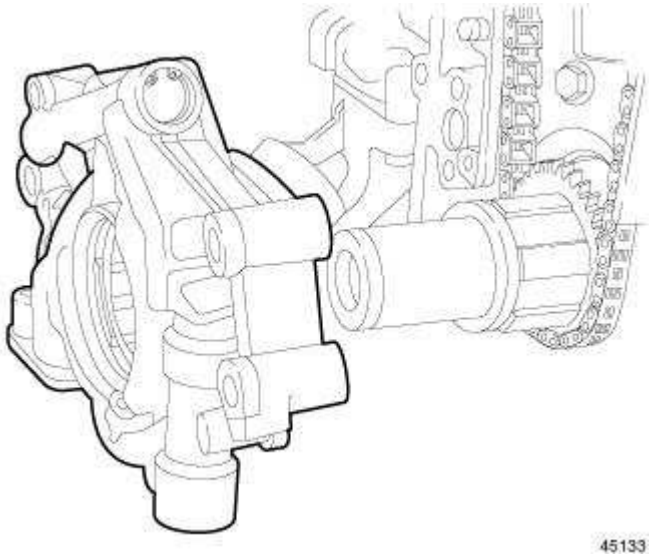

Fig. 165: Remove/Install Oil Pump
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.

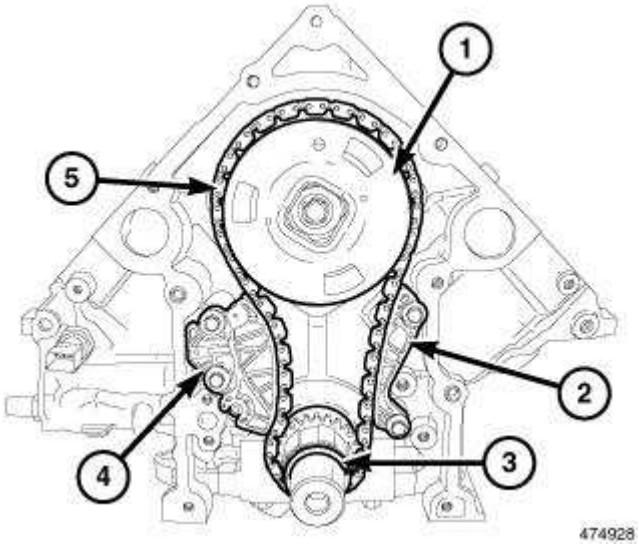

Fig. 166: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
Courtesy of CHRYSLER GROUP, LLC

11. Remove the timing chain (5) and camshaft phaser (1). Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

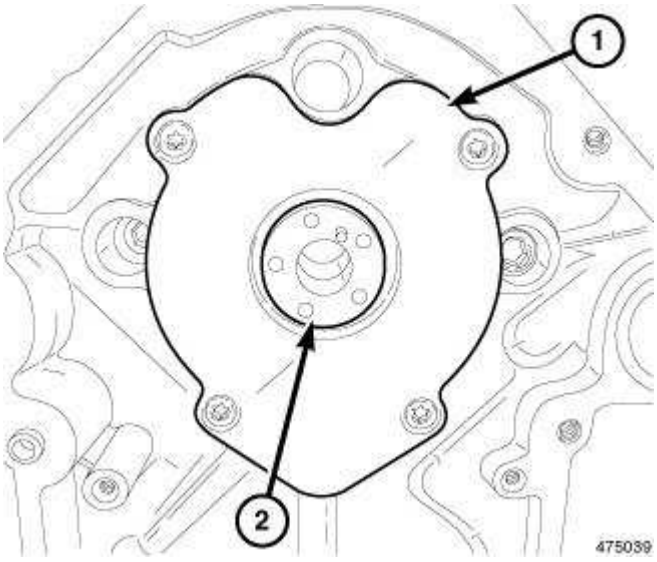

Fig. 167: Camshaft Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

12. Remove the camshaft thrust plate (1).

CAUTION: Use care when removing the camshaft, do not damage the camshaft bearings with the camshaft lobes.

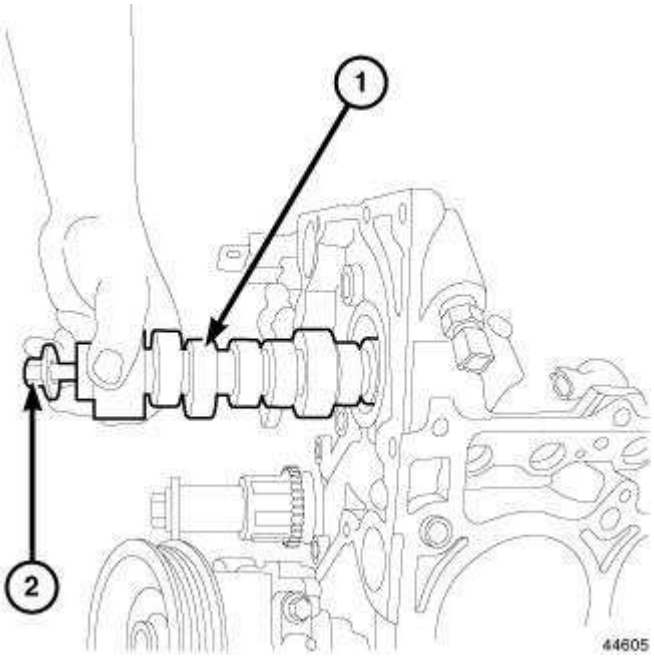

Fig. 168: Removing/Installing Camshaft
Courtesy of CHRYSLER GROUP, LLC

13. Install a long bolt (2) into the front of the camshaft to aid in removal.
14. Remove the camshaft using care not to damage the camshaft bearings with the camshaft lobes (1).

INSPECTION

INSPECTION

1. The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason.

INSTALLATION

5.7L / 6.4L - CAMSHAFT CORE HOLE PLUG

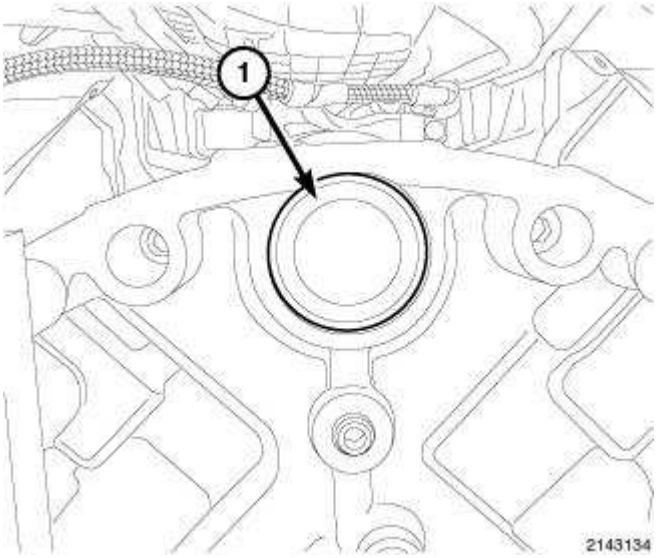

Fig. 169: Camshaft Core Hole Plug
Courtesy of CHRYSLER GROUP, LLC

1. Clean the core hole in the cylinder block.

NOTE: Do not apply adhesive to the new camshaft core hole plug. A new plug has adhesive pre-applied.

2. Install a new camshaft core hole plug (1) located at the rear of cylinder block, using a suitable flat faced tool. The plug must be fully seated on the cylinder block shoulder.
3. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION**.
4. Install the engine. Refer to **INSTALLATION**.

CAMSHAFT

CAUTION: The 6.4L engine uses a unique camshaft for use with the Multi Displacement System (MDS). When installing a new camshaft, the replacement camshaft must be compatible with MDS.

CAUTION: Use care when installing the camshaft into the engine block, do not damage the camshaft bearings with the camshaft lobes.

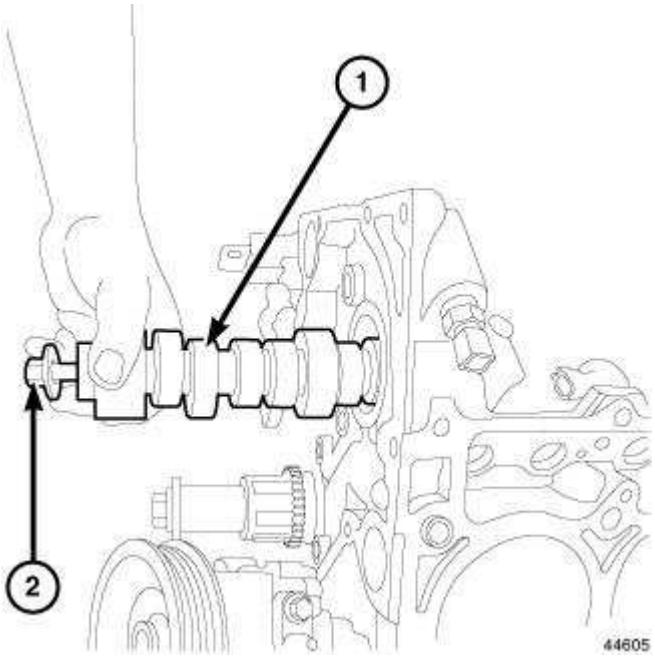

Fig. 170: Removing/Installing Camshaft
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft lobes (1) and the camshaft bearing journals with clean engine oil.
2. Install a long bolt (2) into the front of the camshaft to aid in the installation, carefully install the camshaft into the engine block.

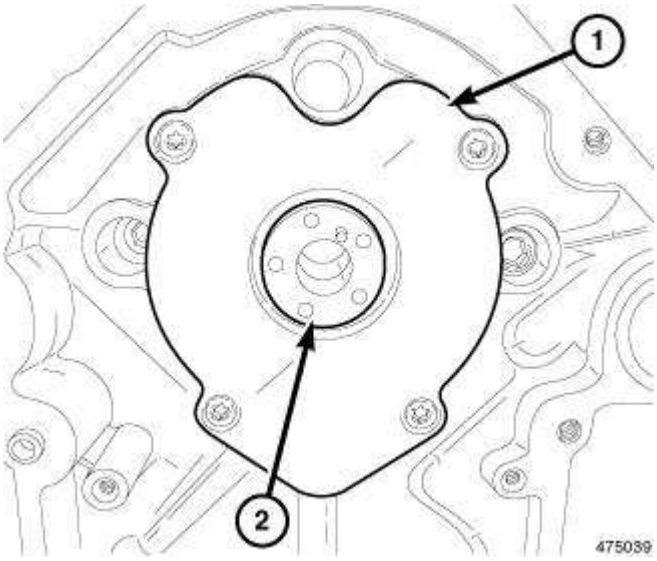

Fig. 171: Camshaft Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

3. Install the camshaft thrust plate (1) and tighten retaining bolts to 12 N.m (106 in. lbs.).

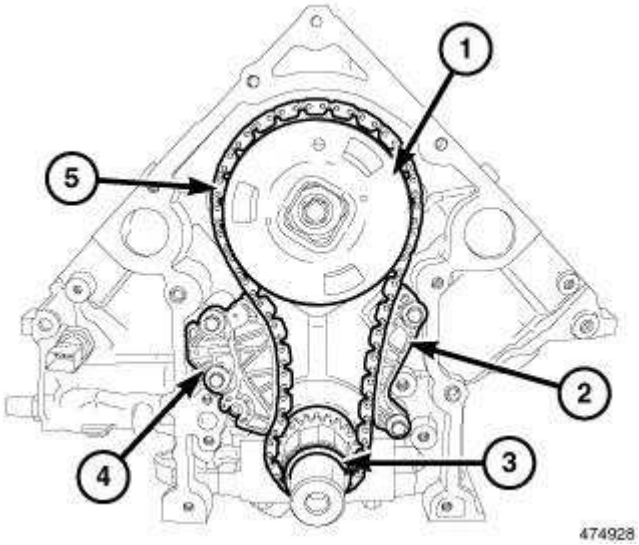

Fig. 172: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
Courtesy of CHRYSLER GROUP, LLC

4. Install the timing chain and camshaft phaser. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.
5. Using a suitable dial indicator, measure the camshaft end play. Refer to **Engine - Specifications**. If not within specification, install a new thrust plate.

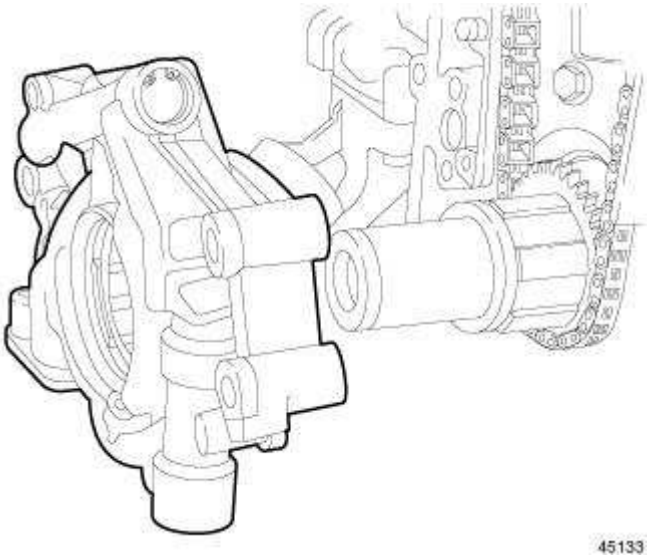

Fig. 173: Remove/Install Oil Pump
Courtesy of CHRYSLER GROUP, LLC

6. Install the oil pump. Refer to **PUMP, ENGINE OIL, INSTALLATION**.

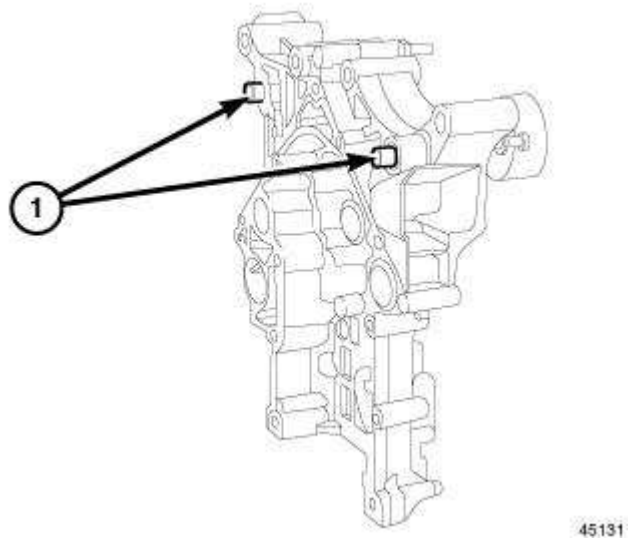

Fig. 174: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
8. Raise and support vehicle.

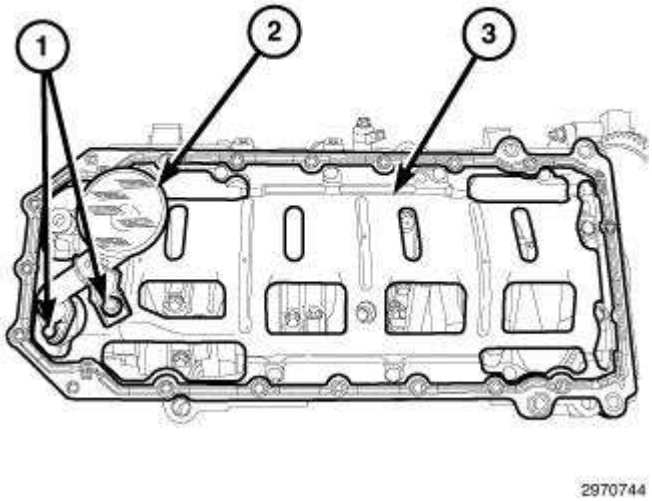

Fig. 175: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.

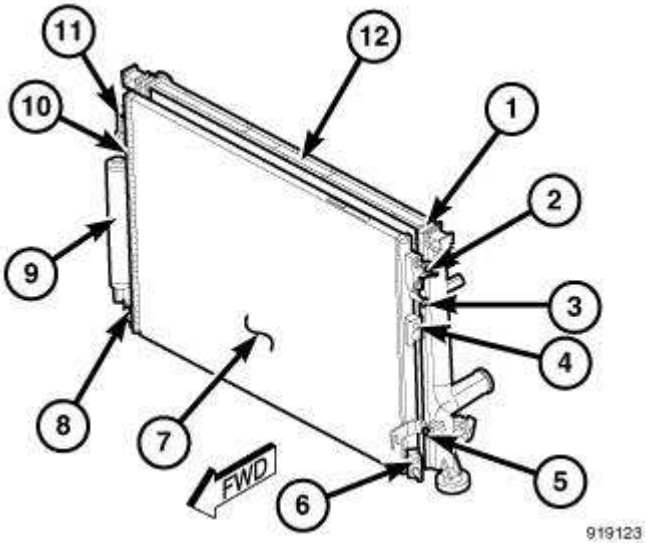

Fig. 176: A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

10. Install the A/C condenser (7). Refer to **CONDENSER, A/C, INSTALLATION** .
11. Install the radiator (12). Refer to **RADIATOR, ENGINE COOLING, INSTALLATION** .
12. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .

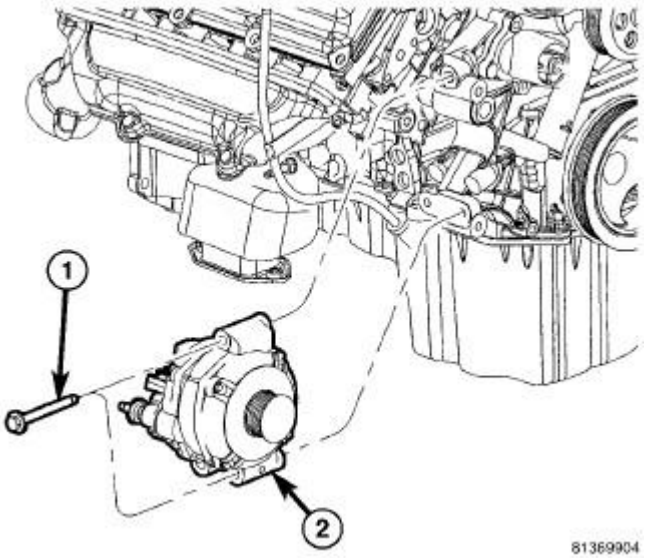

Fig. 177: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

13. Install the generator. Refer to **GENERATOR, INSTALLATION** .

CAUTION: The 6.4L Multi Displacement System (MDS) engine uses both standard roller lifters and deactivating roller lifters. The deactivating

roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: Whenever the camshaft is replaced, all lifters must be replaced. If the lifter and retainer assemblies are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

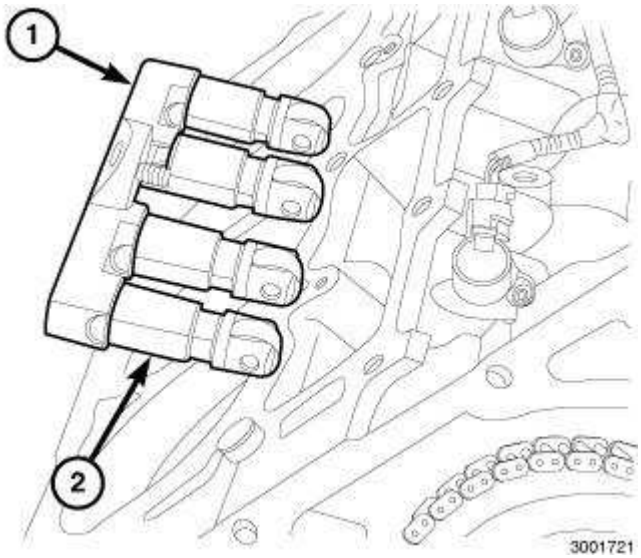

Fig. 178: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

14. Install the lifters (2) and retainer (1) as an assembly into their original location. Refer to **LIFTER (S), HYDRAULIC, ROLLER, INSTALLATION**.

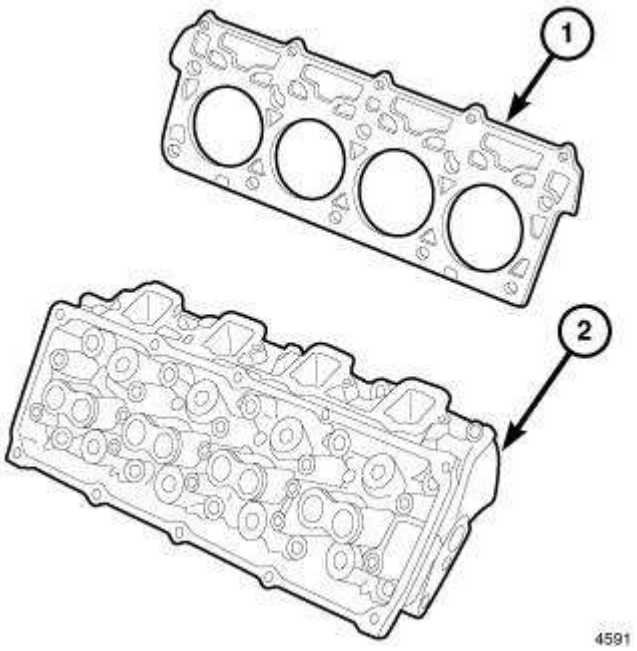

Fig. 179: Cylinder Head & Gasket
Courtesy of CHRYSLER GROUP, LLC

15. Install both cylinder heads (2). Refer to **CYLINDER HEAD, INSTALLATION**.
16. Install the pushrods in the same location as removed.
17. Install the rocker arms. Refer to **ROCKER ARM, VALVE, INSTALLATION**.

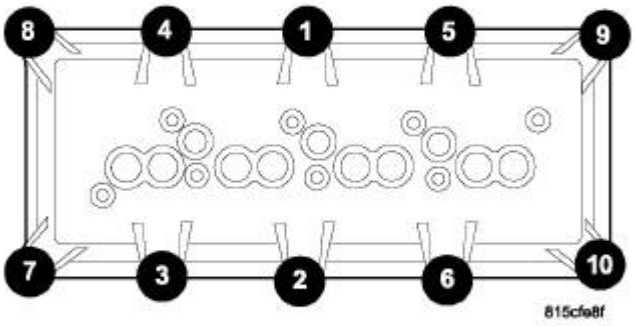

Fig. 180: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

18. Install the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

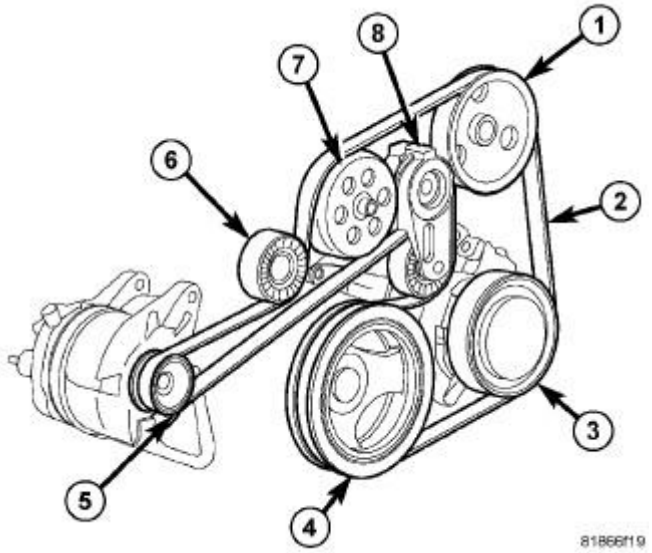

Fig. 181: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

19. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

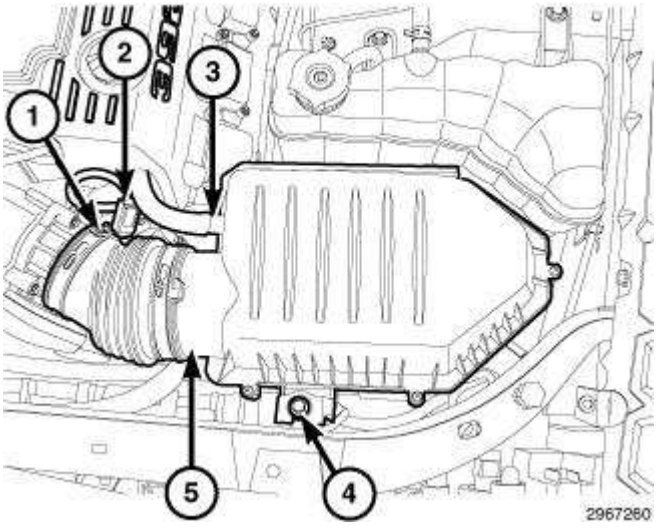

Fig. 182: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

20. Install the air cleaner housing (5) and clean air tube (1).

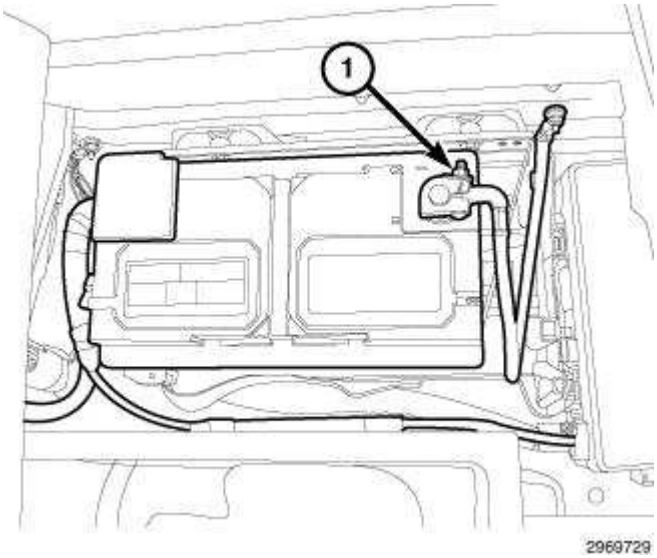

Fig. 183: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

21. Install the negative battery cable.
22. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

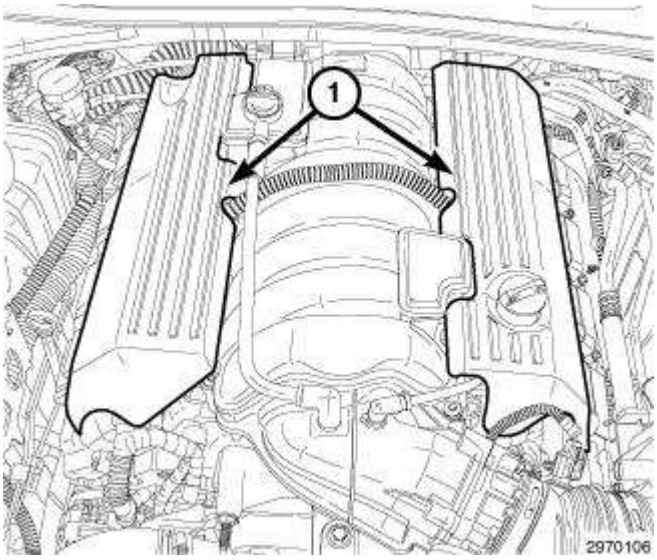

Fig. 184: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

23. Fill the crankcase with the specified type and amount of engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
24. Install engine covers (1).
25. Start the engine and check for leaks.

CRANKSHAFT

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

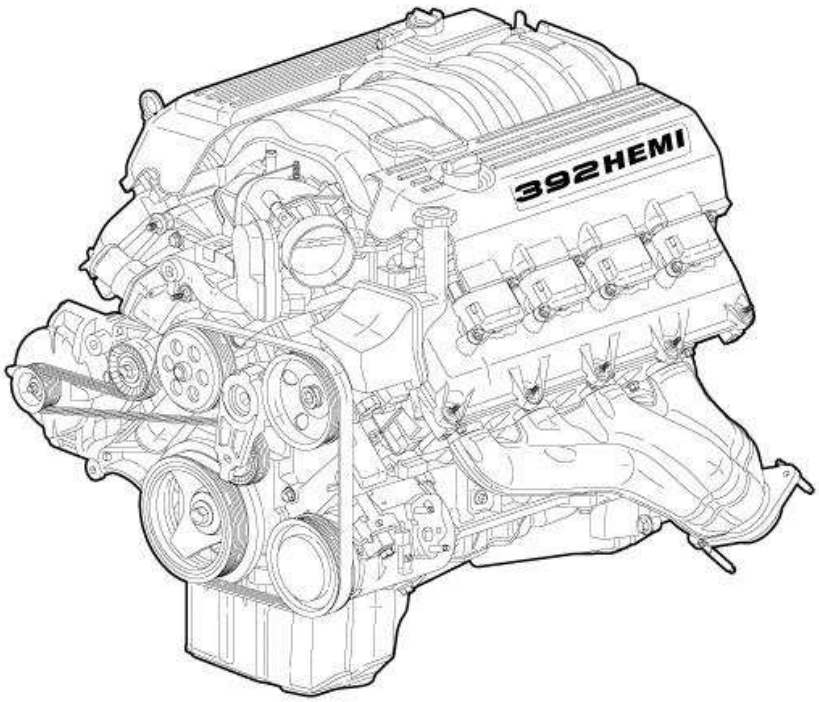

Fig. 185: 6.4L HEMI V-8 Engine
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine. Refer to **REMOVAL**.
2. Secure the engine onto a suitable engine stand.

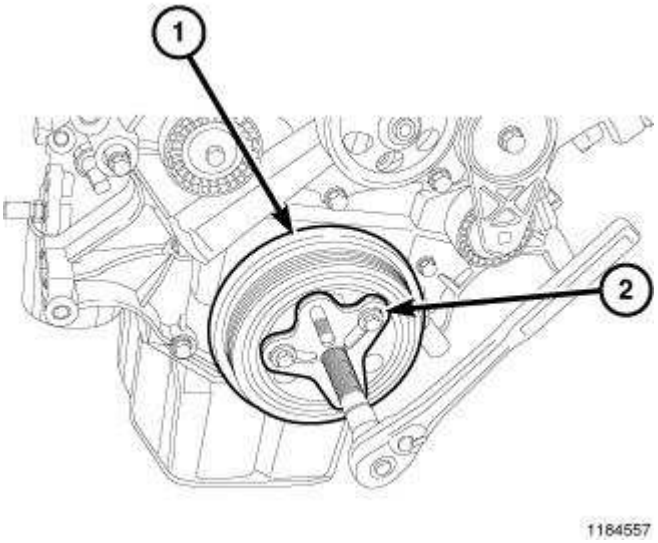

Fig. 186: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

3. Remove the crankshaft damper retaining bolt.
4. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper.
5. Remove the crankshaft damper (1).

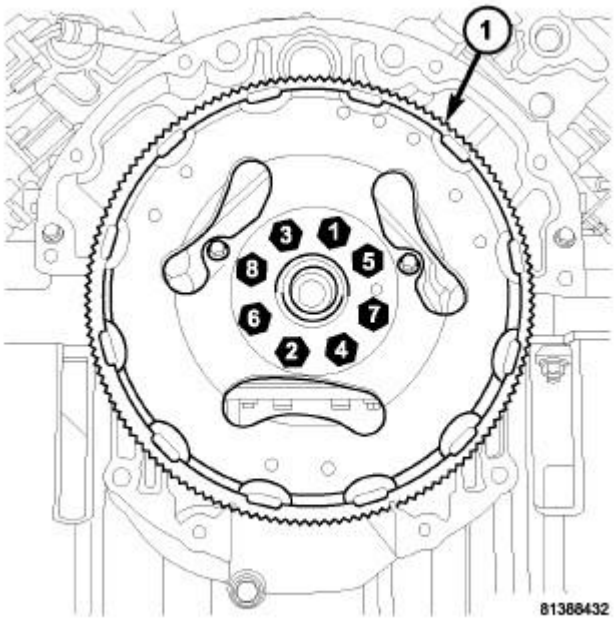

Fig. 187: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Remove the flexplate (1). Refer to **FLEXPLATE, REMOVAL**.

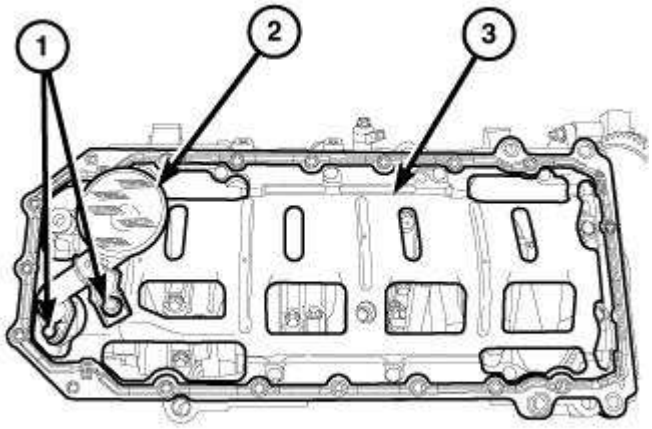

Fig. 188: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

7. Remove the oil pan and the oil pump pickup tube (2). Refer to **PAN, OIL, REMOVAL**.
8. Remove and discard the oil pan gasket/windage tray (3).

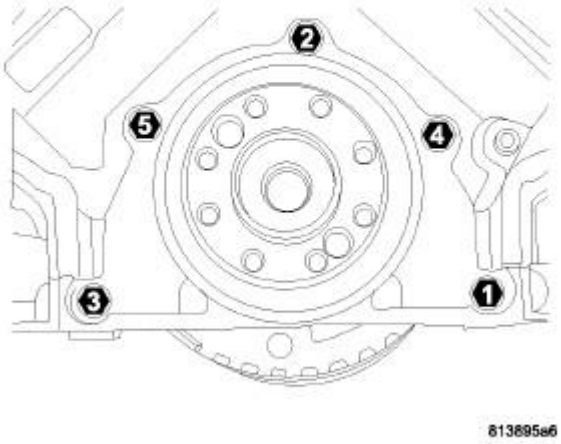

Fig. 189: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

9. Remove the crankshaft rear oil seal retainer. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL**.

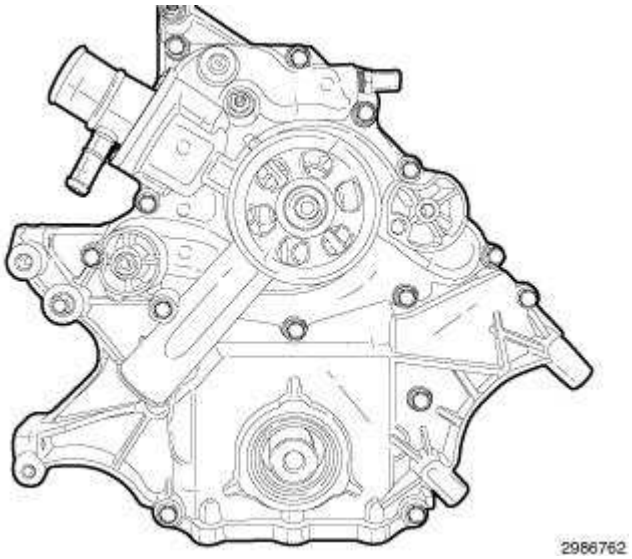

Fig. 190: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

10. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

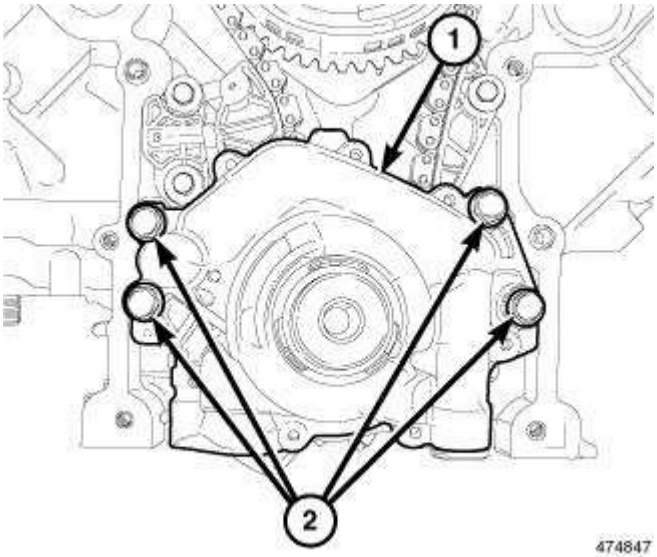

Fig. 191: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

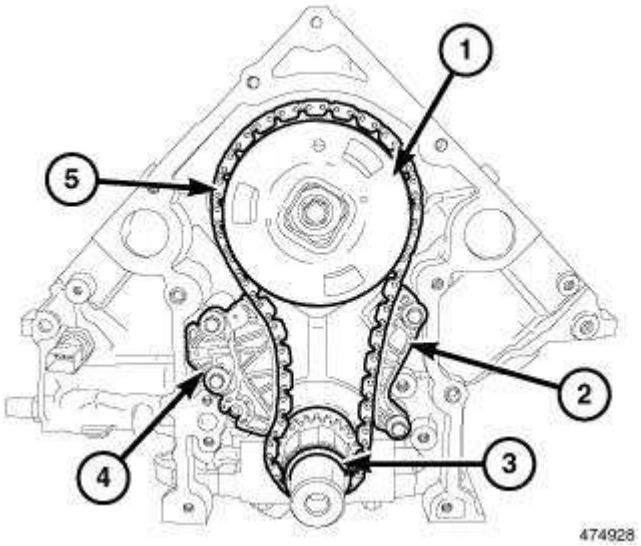

Fig. 192: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
Courtesy of CHRYSLER GROUP, LLC

12. Remove the timing chain (5), camshaft phaser (1) and crankshaft sprocket (3). Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

CAUTION: Do not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

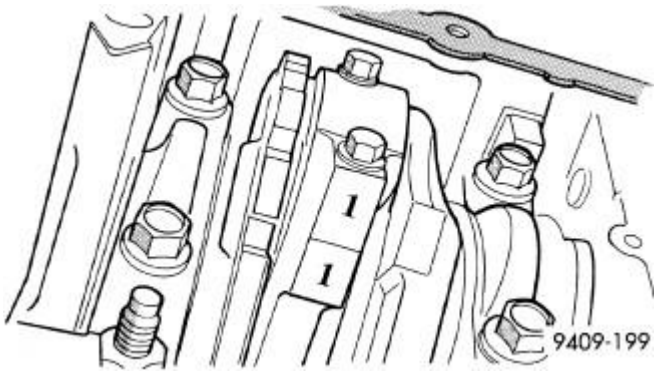

Fig. 193: Mark On Connecting Rod & Bearing Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removal to ensure correct reassembly.

13. Mark the connecting rod and bearing cap location using a permanent ink marker or scribe tool.
14. Remove the rod bearing caps and bearings.

CAUTION: Do not use a number stamp or a punch to mark main bearing caps as damage to bearing caps and/or bearings could occur.

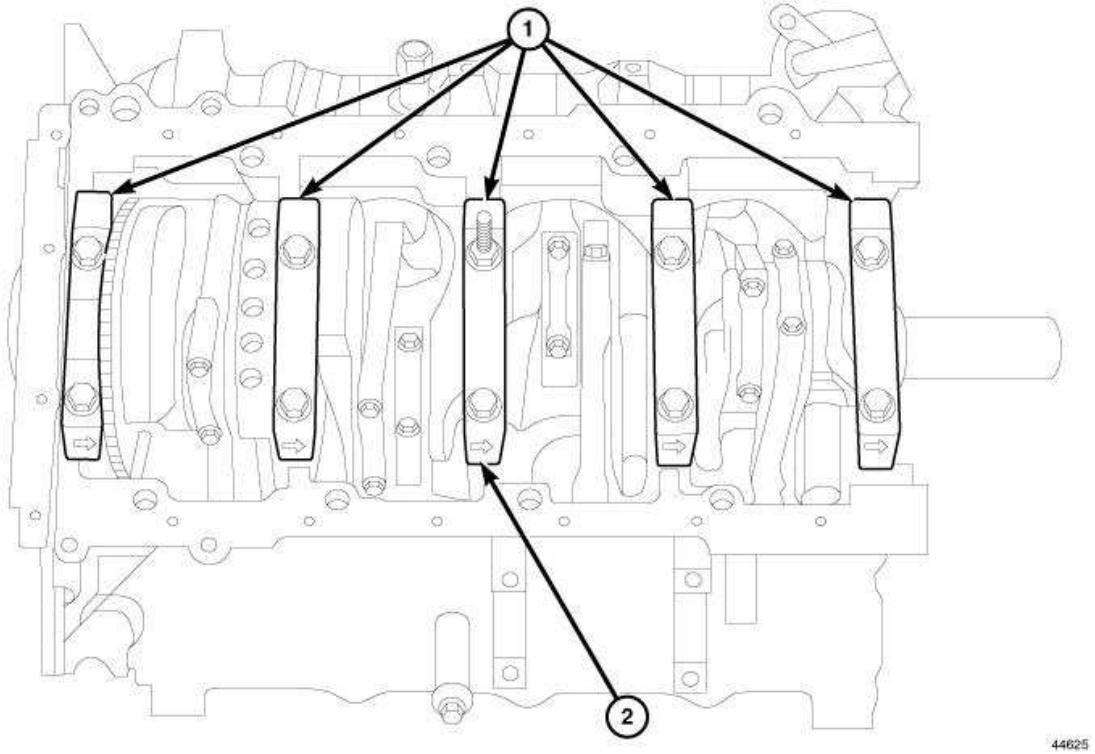

Fig. 194: Main Bearing Caps & Arrows
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Main bearing caps are not interchangeable and should be marked before removal to ensure correct reassembly.**

15. Mark the main bearing caps (1) using a permanent ink marker or scribe tool.

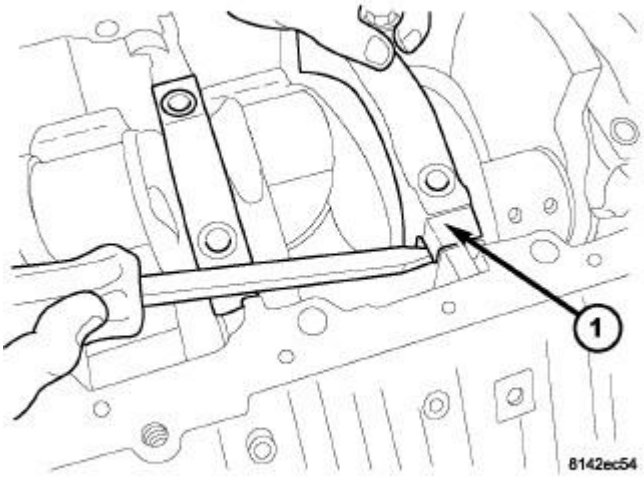

Fig. 195: Main Bearing Cap Removal
Courtesy of CHRYSLER GROUP, LLC

16. Remove the main bearing cap bolts.
17. Remove the main bearing cap crossbolts.
18. Remove main bearing caps (1) and bearings one at a time.

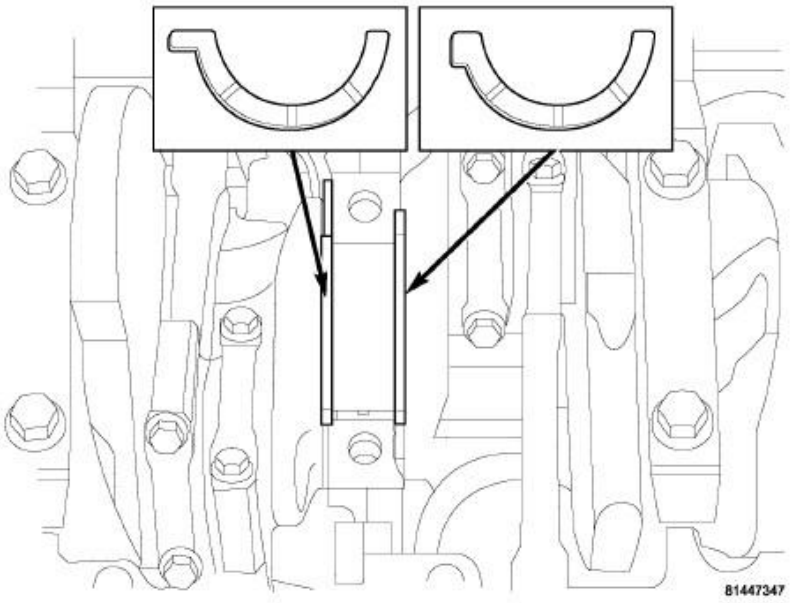

Fig. 196: Thrust Washer Locations
Courtesy of CHRYSLER GROUP, LLC

19. Remove the thrust bearings.

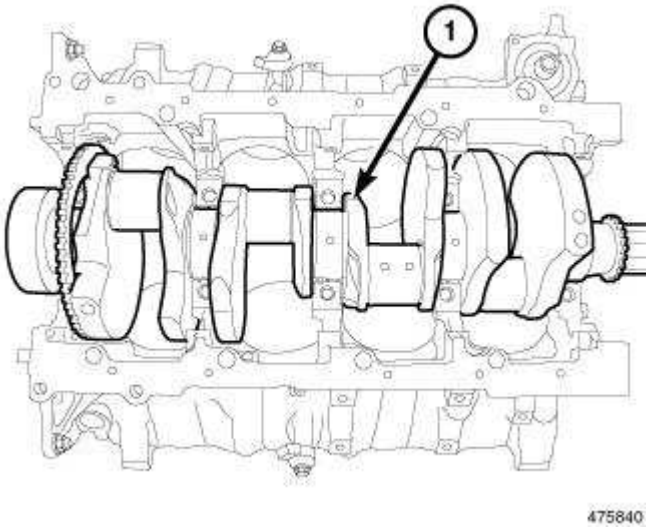

Fig. 197: Crankshaft
Courtesy of CHRYSLER GROUP, LLC

20. Remove the crankshaft (1) out of the engine block.

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

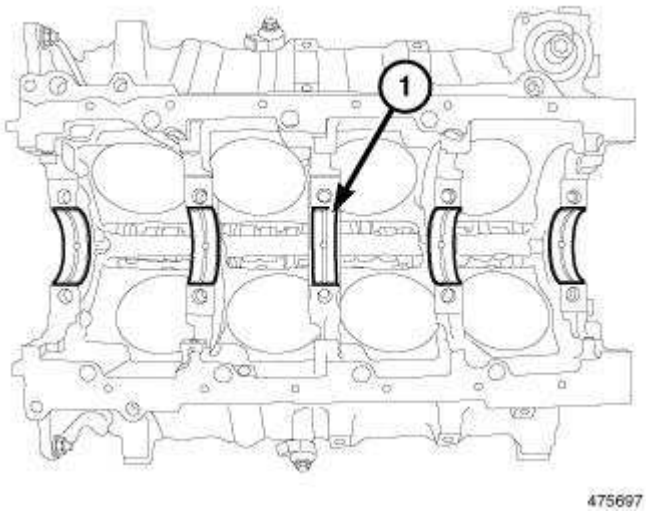

Fig. 198: Main Bearings
Courtesy of CHRYSLER GROUP, LLC

1. Select the proper main bearings (1). Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
2. Lubricate the main bearing shells with clean engine oil.
3. Install the main bearings into the engine block.

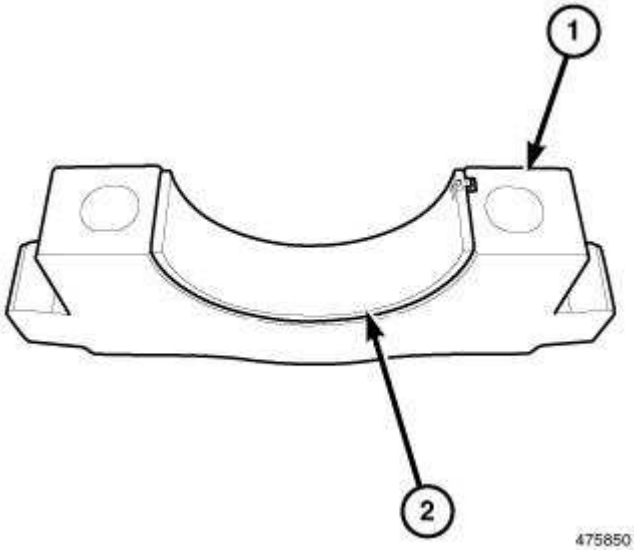

Fig. 199: Main Bearing Shells In The Bearing Caps
Courtesy of CHRYSLER GROUP, LLC

4. Install the main bearing shells (2) into the bearing caps (1).

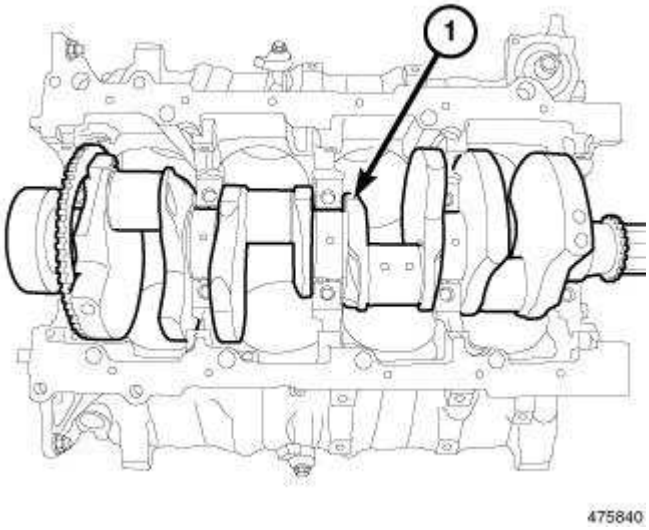

Fig. 200: Crankshaft
Courtesy of CHRYSLER GROUP, LLC

5. Position the crankshaft (1) into the engine block.

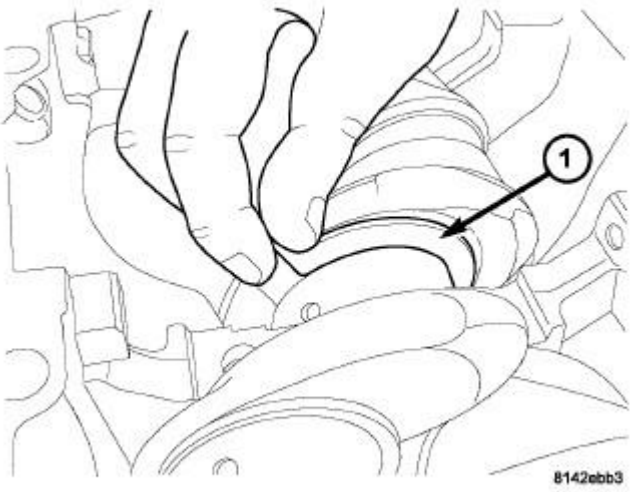

Fig. 201: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

6. Lubricate and install the thrust bearings (1).

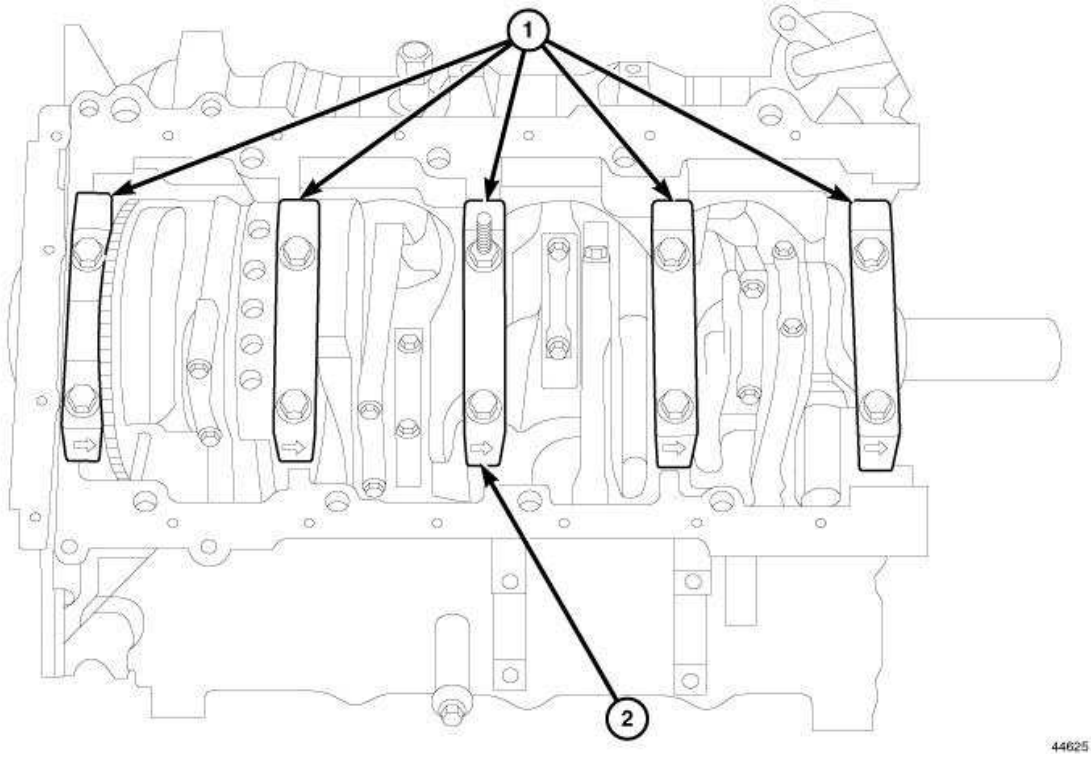

Fig. 202: Main Bearing Caps & Arrows
Courtesy of CHRYSLER GROUP, LLC

7. Install all main bearing caps (1) in the location as noted during removal making sure the arrow (2) faces forward.

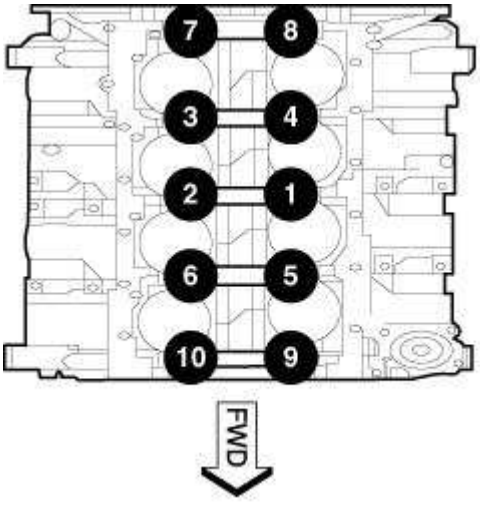

Fig. 203: Main Bearing Cap Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. Clean and oil all main cap bolts and install finger tight.
9. Using the sequence shown in illustration, tighten the main bearing cap bolts to 13 N.m (10 ft.

lbs.).

10. Again, using the sequence shown in illustration, tighten the main bearing cap bolts to 28 N.m (21 ft. lbs.).
11. Using the sequence shown in illustration, rotate the main bearing cap bolts an additional 90°.

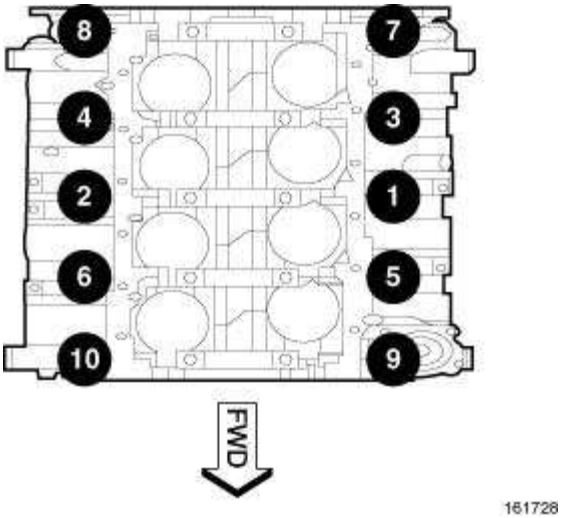

Fig. 204: Crossbolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The main bearing cap crossbolts are torqued after the final torque of the main cap bolts. Always use a new seal washers on crossbolts.

12. Install the crossbolts with new seal washers finger tight.
13. Using the sequence shown in illustration, tighten the crossbolts to 31 N.m (23 ft. lbs.).
14. Again, using the sequence shown in illustration, repeat the crossbolt tightening procedure.
15. Measure the crankshaft end play. Refer to **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

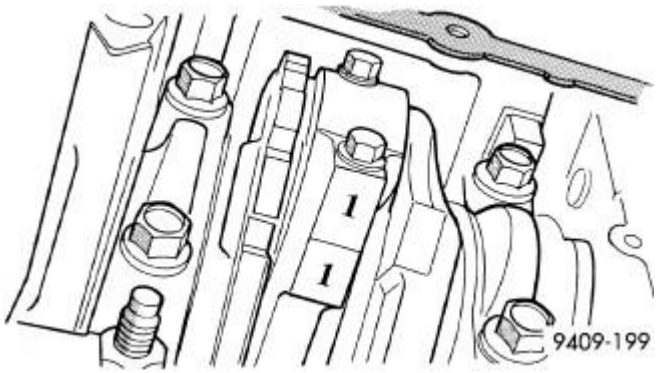

Fig. 205: Mark On Connecting Rod & Bearing Cap
Courtesy of CHRYSLER GROUP, LLC

16. Wipe the connecting rod caps clean and install the rod bearings.
17. Lubricate the bearing surfaces with clean engine oil and install the bearings and connecting rod caps onto the connecting rod journals in the same location as noted during removal.
18. Lubricate the new connecting rod bolts with clean engine oil and install the bolts finger tight.
19. Tighten the connecting rod bolts to 21 N.m (15 ft. lbs.) plus an additional 90° turn.

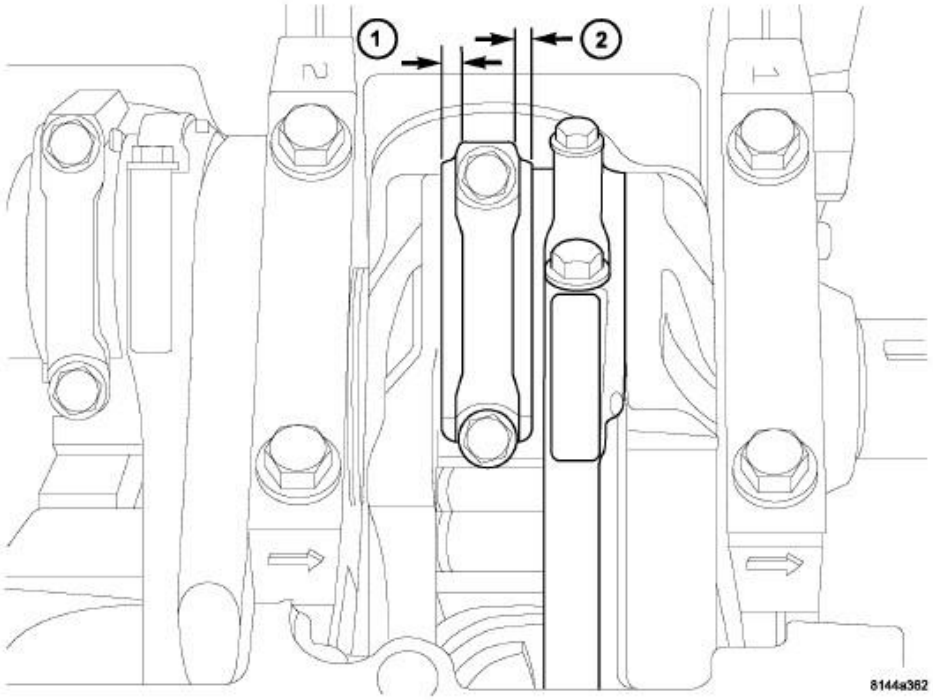

Fig. 206: Connecting Rod Proper Installation
Courtesy of CHRYSLER GROUP, LLC

20. If required, measure the connecting rod side clearance (1, 2). Refer to **Engine - Specifications**.

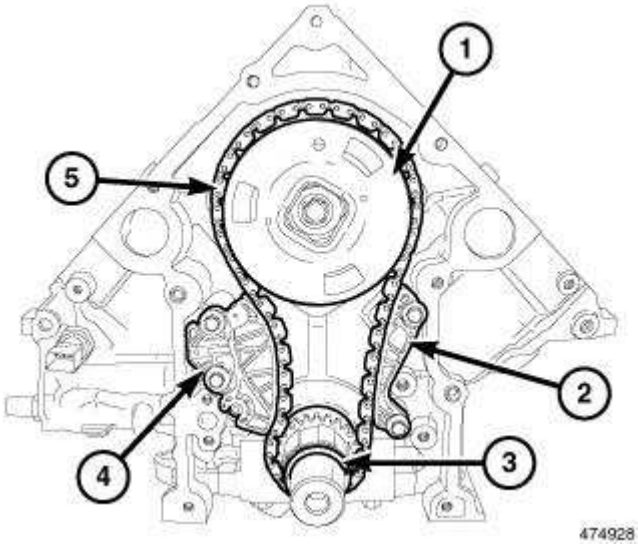

Fig. 207: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
Courtesy of CHRYSLER GROUP, LLC

21. Install the timing chain (5), camshaft phaser (1) and crankshaft sprocket (3). Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.

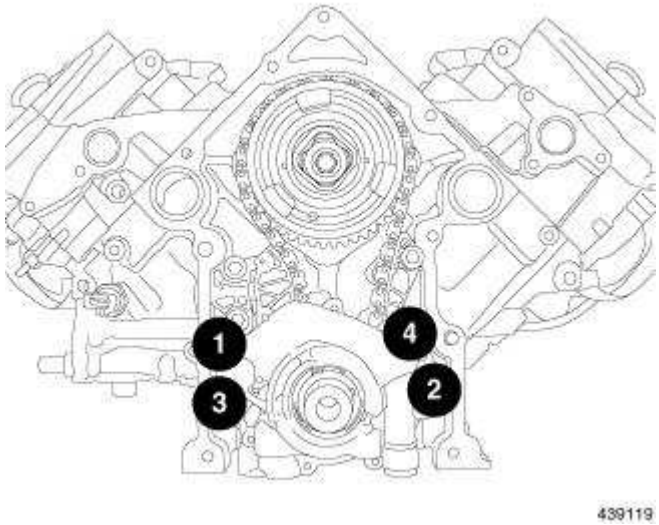

Fig. 208: Oil Pump Retaining Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

22. Position the oil pump on the crankshaft and install the oil pump retaining bolts finger tight.
23. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).

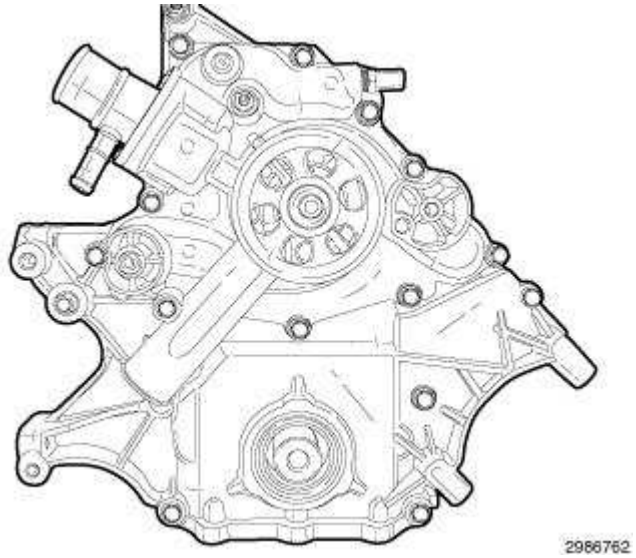

Fig. 209: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

24. Install the engine timing cover (1). Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.

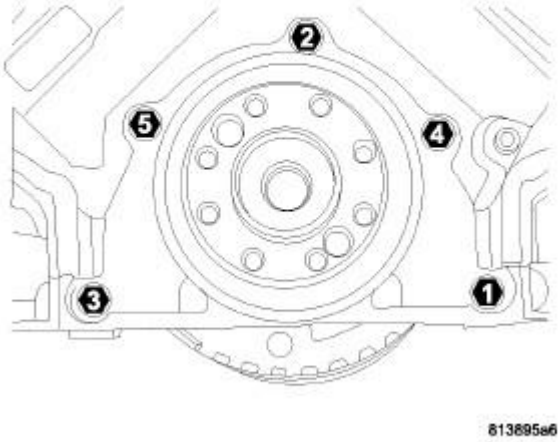

Fig. 210: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

25. Thoroughly clean all gasket residue from the engine block.
26. Position the gasket onto the new crankshaft rear oil seal retainer.
27. Position the crankshaft rear oil seal retainer onto the engine block.
28. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).

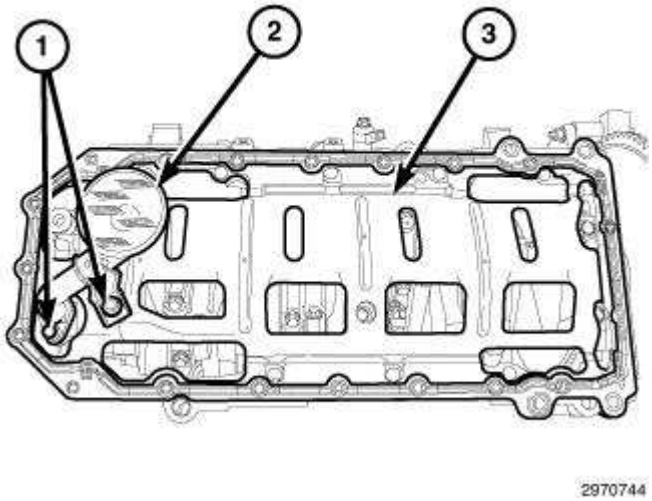

Fig. 211: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Install the oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.

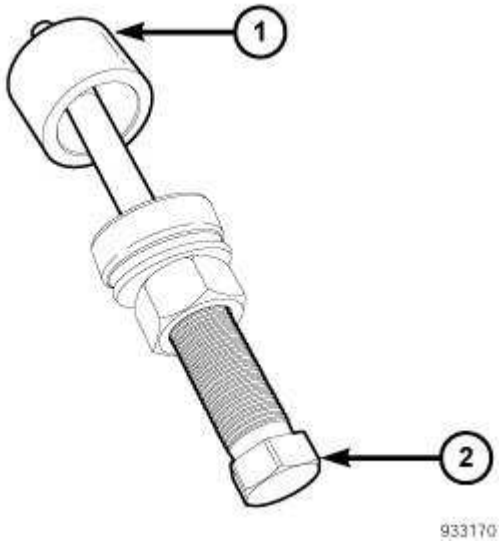

Fig. 212: Pressing Cup & Damper Installer
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To prevent severe damage to the crankshaft Damper Installer (special

tool #8512A, Installer, Damper), thoroughly clean the damper bore and the crankshaft nose before installing damper.

30. Position the damper on the crankshaft.

CAUTION: The Damper Installer (special tool #8512A, Installer, Damper) is assembled in a specific sequence. Failure to assemble this tool in this sequence may result in tool failure and severe damage to either the tool or the crankshaft.

31. Assemble the Damper Installer (special tool #8512A, Installer, Damper) (2) as follows:
    1. Install the nut onto the threaded shaft.
    2. Install the roller bearing onto the threaded shaft making sure the hardened bearing surface is facing the nut.
    3. Install the pressing cup (2) from the A/C Hub Installer (special tool #6871, Installer, A/C Hub) onto the threaded shaft.
    4. Coat the threaded shaft with MOPAR® Nickel Anti-Seize or equivalent.

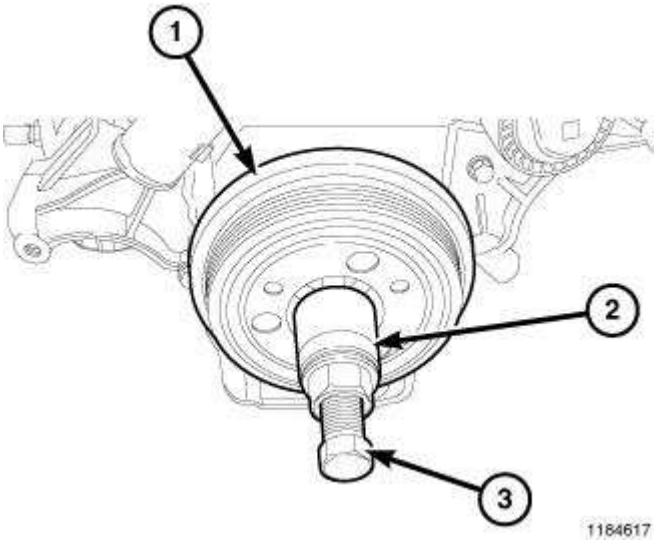

Fig. 213: Pressing Damper Onto Crankshaft
Courtesy of CHRYSLER GROUP, LLC

32. Using the Damper Installer (special tool #8512A, Installer, Damper) (3) and the pressing cup (2) from A/C Hub Installer (special tool #6871, Installer, A/C Hub), press the crankshaft damper (1) onto the crankshaft.
33. Install the crankshaft damper bolt and tighten to 176 N.m (129 ft. lbs.).

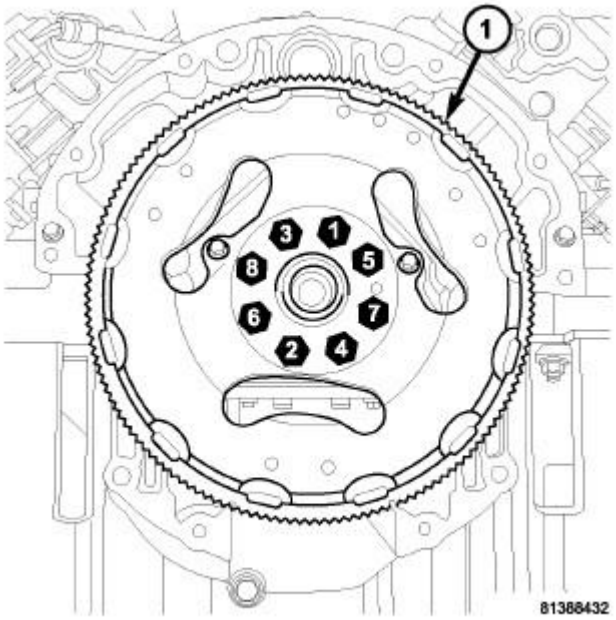

Fig. 214: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

34. Install the flexplate (1). Refer to **FLEXPLATE, INSTALLATION**.

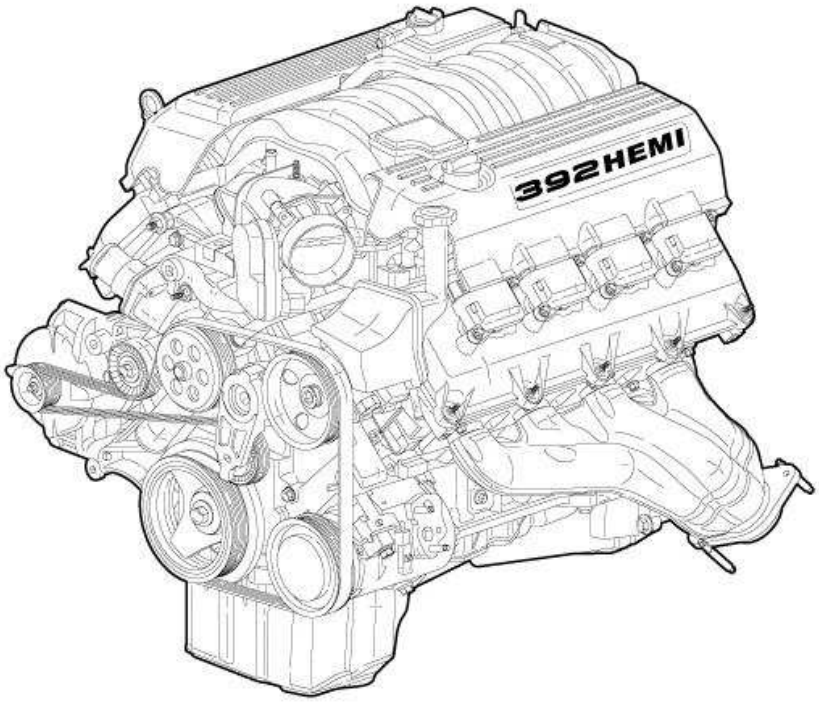

Fig. 215: 6.4L HEMI V-8 Engine

Courtesy of CHRYSLER GROUP, LLC

35. Install the engine. Refer to **INSTALLATION**.
36. Start the engine and check for leaks.

DAMPER, VIBRATION

DESCRIPTION

DESCRIPTION

The crankshaft damper is used to control the resonance that is produced by the engine. The Noise, Vibration, and Harshness (NVH) created from the crankshaft can be controlled by dissipating the torque energy through the damper.

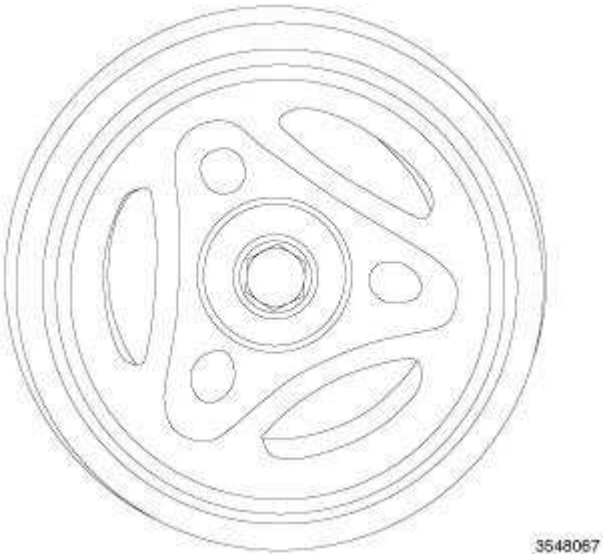

Fig. 216: Crankshaft Damper & Harden Steel Bolt
Courtesy of CHRYSLER GROUP, LLC

The crankshaft damper on the engines is held to the crankshaft by means of a harden steel bolt. The damper is pressed onto a specific machined surface of the crankshaft.

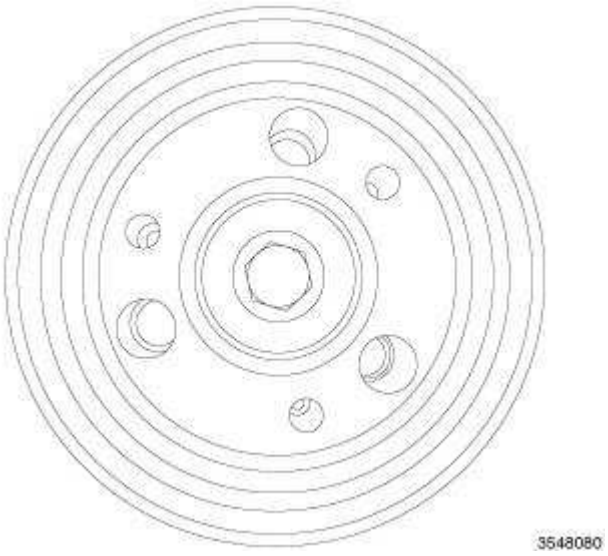

Fig. 217: HEMI® Engine Crankshaft Damper
Courtesy of CHRYSLER GROUP, LLC

The HEMI® Engines incorporate various crankshaft vibration dampers depending on the engine application. And can be removed depending on the application used.

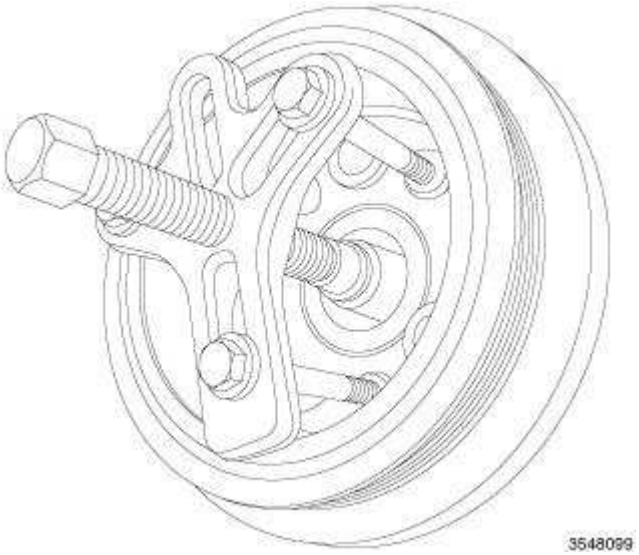

Fig. 218: Removing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

Finding the proper puller for the application will ensure no damage will come to the damper. The flange puller is used by installing 3 bolts into the pre-tapped holes in the damper.

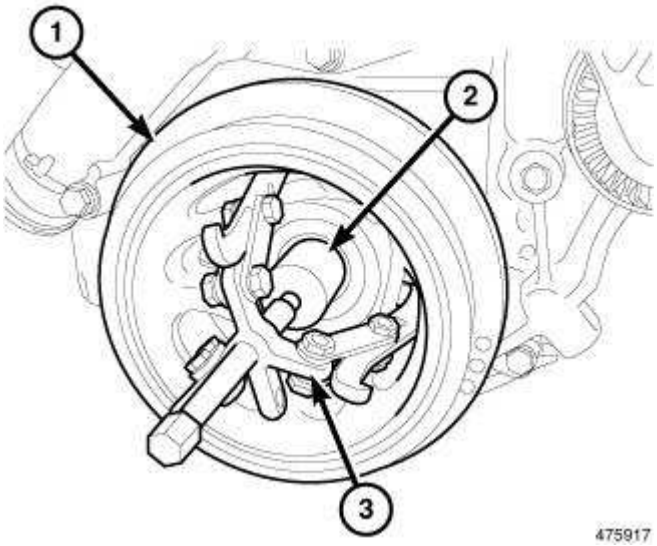

Fig. 219: Removing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

Some pulleys that do not have bolt holes can be removed with a three jaw style (special tool #1023, Puller).

REMOVAL

REMOVAL

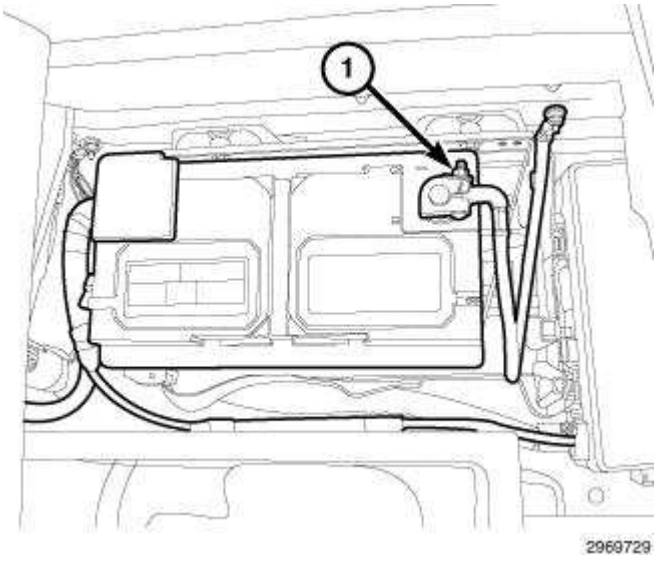

Fig. 220: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

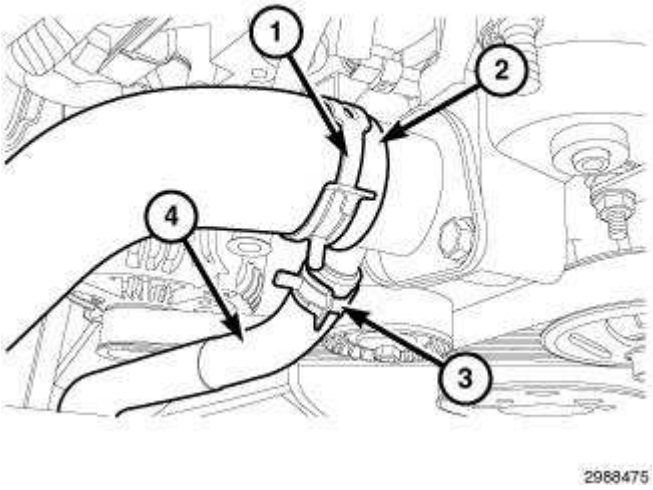

Fig. 221: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper radiator hose clamps (1) and remove the upper radiator hose (2).
4. Remove the oil cooler hose clamp (3) and remove oil cooler hose (4) and position aside.

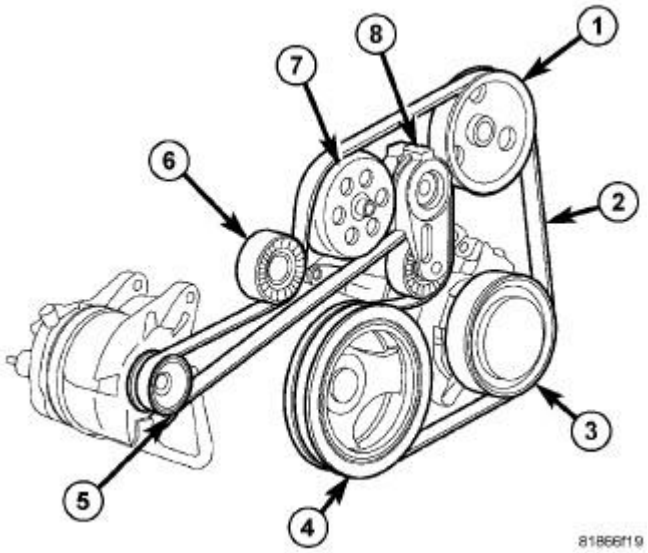

Fig. 222: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

5. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

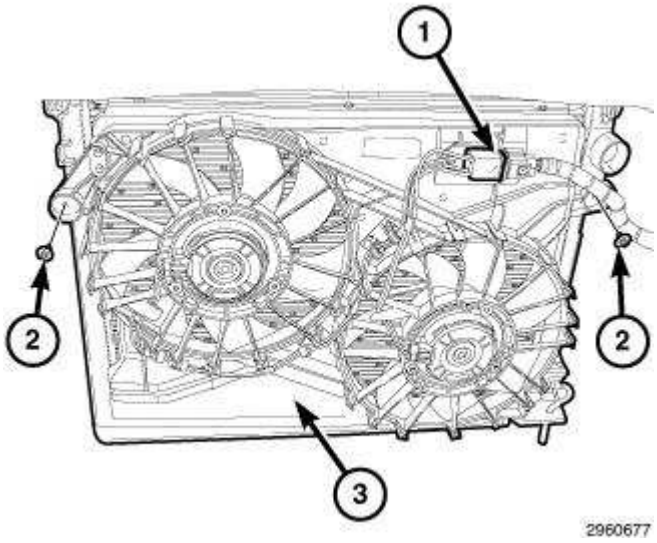

Fig. 223: Cooling Fan Electrical Connector, Bolts & Radiator Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Remove the cooling fan assembly. Refer to **FAN, COOLING, REMOVAL** .

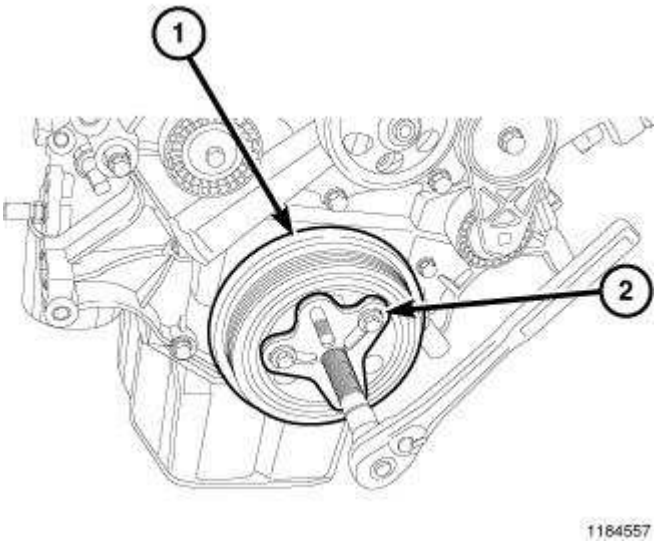

Fig. 224: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

7. Remove the vibration damper bolt.
8. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper.
9. Remove the crankshaft damper (1).

INSTALLATION

INSTALLATION

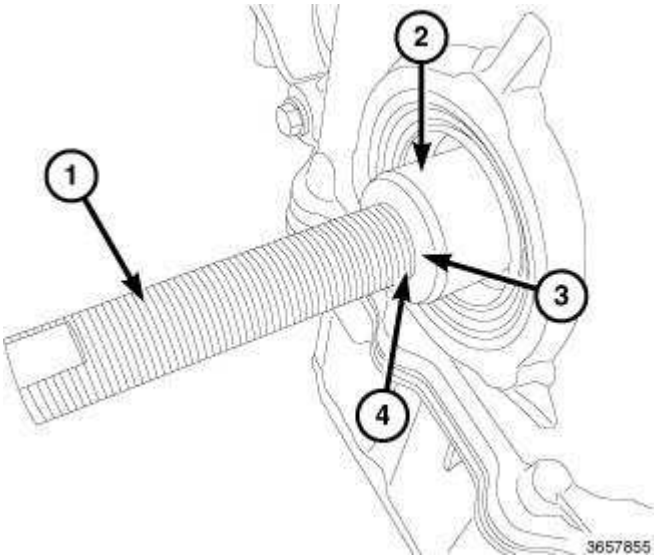

Fig. 225: Installing Vibration Damper Onto Crankshaft Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #10387, Installer, Vibration Damper), install the threaded rod (1) onto the crankshaft (2).
2. Tighten the threaded rod (4) until it is seated to the face (3) of the crankshaft.

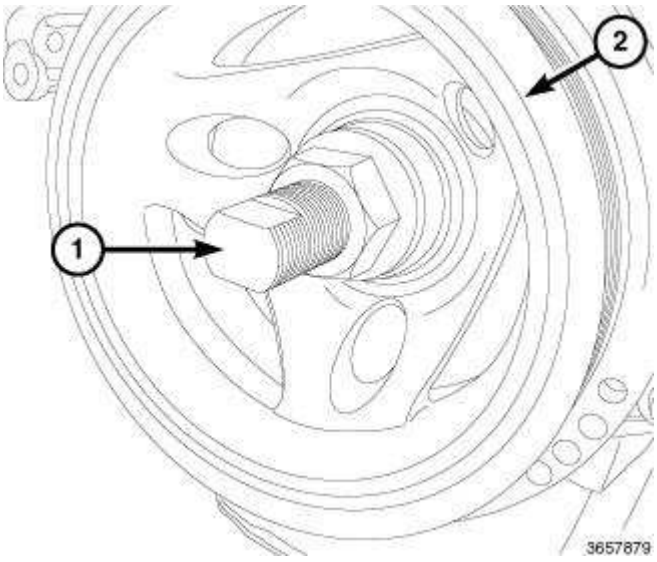

Fig. 226: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

3. Position the damper (2) on the crankshaft.
4. Install the press washer, bearing, washer, and the press nut onto the threaded rod.

5. Using Damper Installer (1) and a deep well socket, press the damper onto the crankshaft till seated.

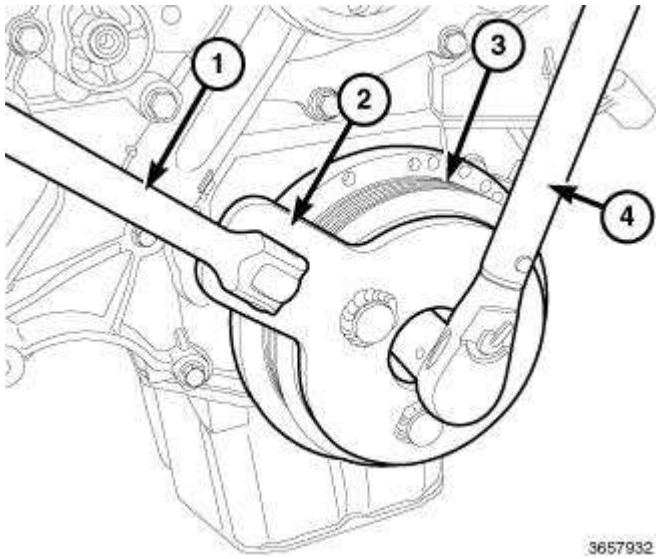

Fig. 227: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

6. Install the vibration damper bolt.
7. Position the (special tool #10386, Holder, Vibration Damper) (2), onto the vibration pulley (3).
8. Tighten the bolt to 250 N.m (184 ft. lbs.).

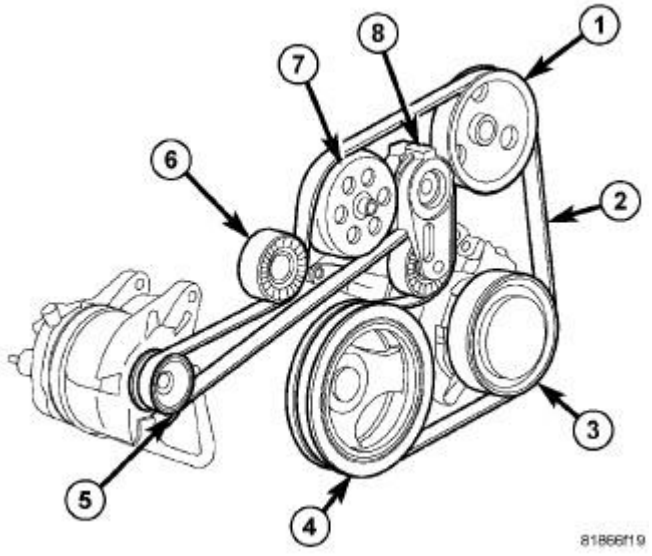

Fig. 228: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

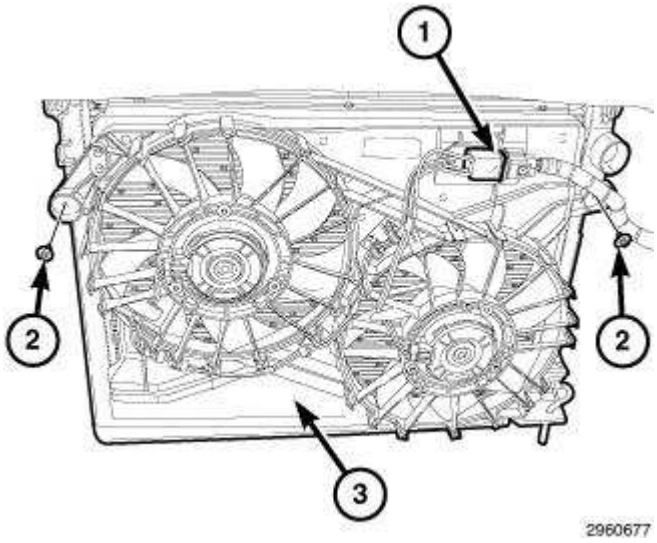

Fig. 229: Cooling Fan Electrical Connector, Bolts & Radiator Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

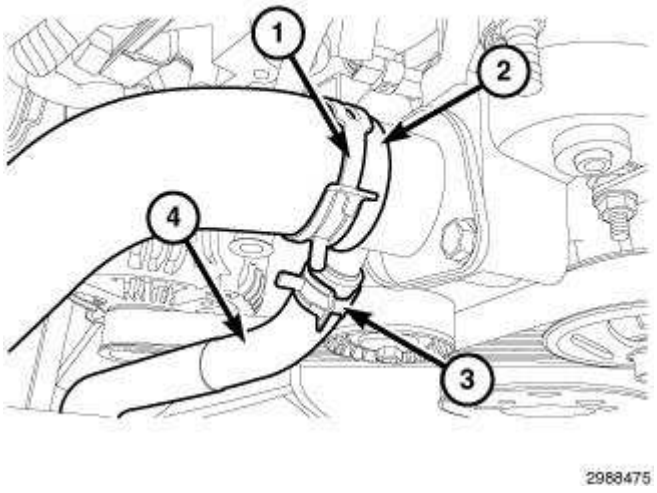

Fig. 230: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

11. Install the oil cooler hose (4) and clamp (3).
12. Install the upper radiator hose (2) and clamp (1).
13. Refill the cooling system. Refer to **STANDARD PROCEDURE** .

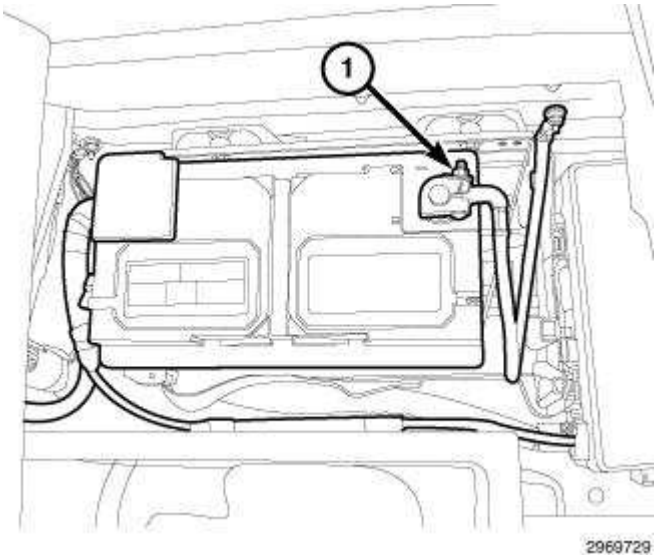

Fig. 231: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

14. Connect the negative battery cable (1).

FLEXPLATE

REMOVAL

REMOVAL

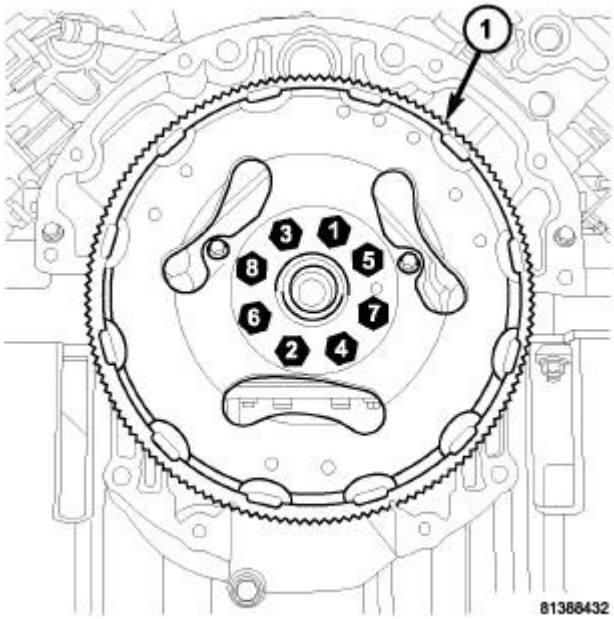

Fig. 232: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .
2. Using the sequence shown in illustration, remove the flexplate (1) retaining bolts.
3. Remove the flexplate.

INSTALLATION

INSTALLATION

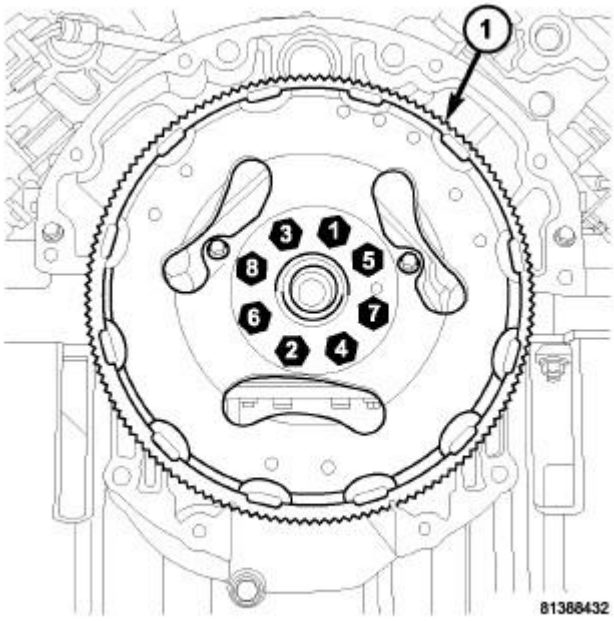

Fig. 233: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Position the flexplate (1) onto the crankshaft and install the bolts finger tight.
2. Using the sequence shown in illustration, tighten the flexplate retaining bolts to 95 N.m (70 ft. lbs.).
3. Install the transmission. Refer to **INSTALLATION** .

LIFTER(S), HYDRAULIC, ROLLER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC ROLLER LIFTERS

Before disassembling any part of the engine to correct lifter noise, check the oil pressure. If the vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-70 psi) at 3, 000 rpm.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to

stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on the dipstick. Either of these two conditions could be responsible for noisy lifters.

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic lifters by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the lifters, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same lifter action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When lifter noise is due to aeration, it may be intermittent or constant, and usually more than one lifter will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the lifters to be bled out.

LIFTER NOISE DIAGNOSIS

1. To determine source of lifter noise, crank the engine with cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect noisy lifter. The noisy lifter will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

   NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy lifters. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not noticeably reduced, it can be assumed the noise is in the lifter. Inspect the rocker arm push rod sockets and push rod ends for wear.

3. Valve lifter noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger or by the plunger partially sticking in the lifter body cylinder. The lifter should be replaced. A heavy click is caused by a lifter check valve not seating or by foreign particles wedged between the plunger and the lifter body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as the valve closes. In either case, lifter assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light lifter noise during normal operation. Care must be taken to ensure that lifters are making the noise. If more than one lifter seems to be noisy, it's probably not the lifters.

REMOVAL

REMOVAL

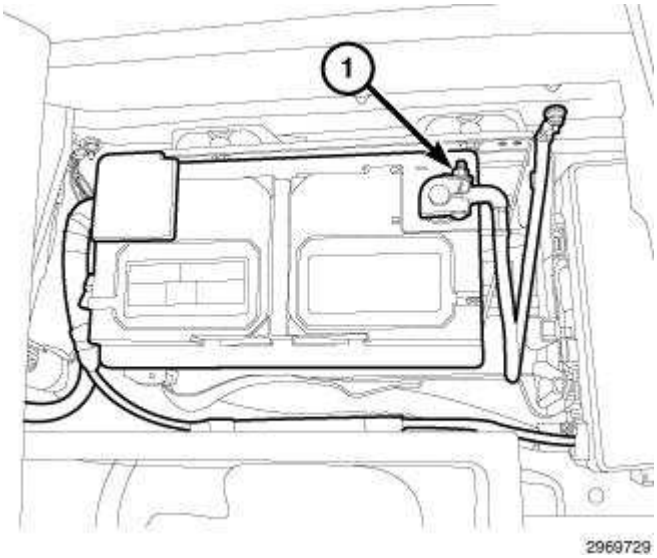

Fig. 234: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL**.

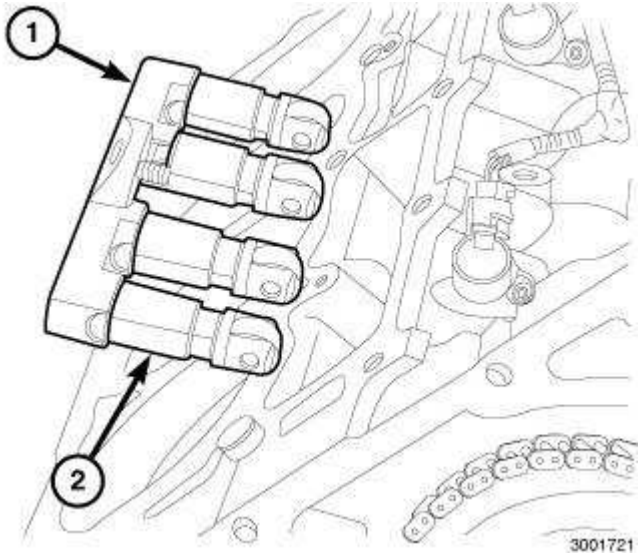

Fig. 235: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the lifter and retainer assembly are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

3. Remove the lifters (2) and retainer (1) as an assembly.
4. Check the camshaft lobes for abnormal wear.

INSTALLATION

INSTALLATION

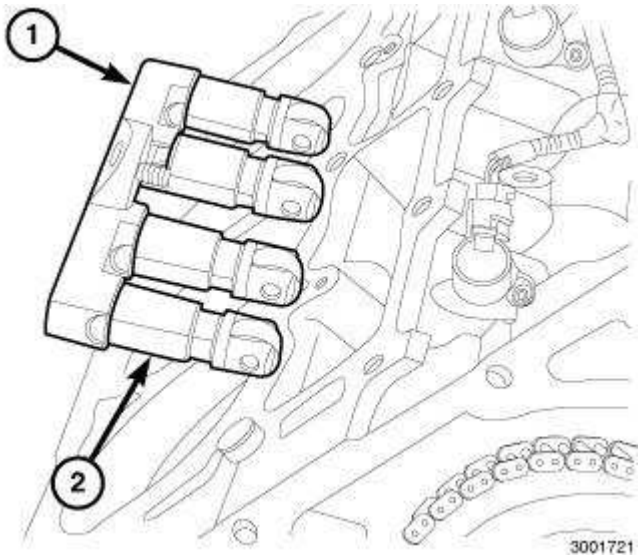

Fig. 236: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the lifters (2) and retainer (1) assembly with clean engine oil.

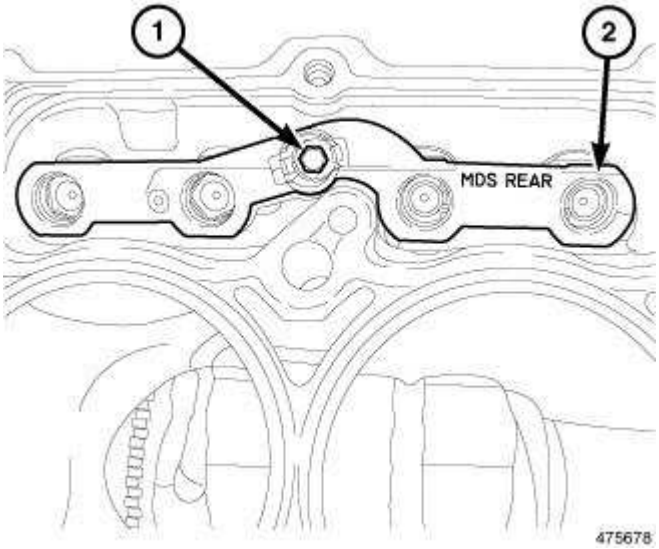

Fig. 237: Rear MDS Lifter Assembly
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The 6.4L Multi Displacement System (MDS) engine uses both

standard roller lifters and deactivating roller lifters. The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: If the lifter and retainer assembly are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer must be installed as an assembly.

2. Install the lifters (2) and retainer (1) as an assembly into their original location.
3. Tighten the lifter retainer bolt (1) to 12 N.m (9 ft. lbs.).
4. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.

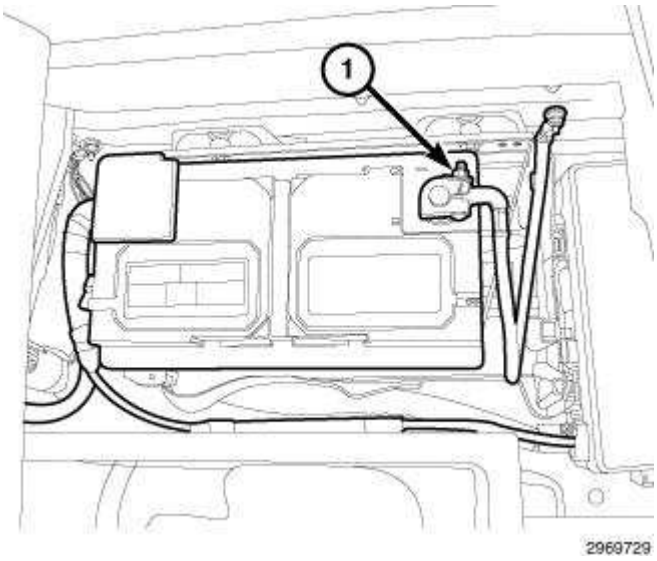

Fig. 238: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

5. Connect the negative battery cable.

CAUTION: To prevent damage to valve assemblies, do not run the engine above fast idle until all hydraulic lifters have filled with oil and have become quiet.

6. Start the engine and check for leaks.
7. Road test the vehicle.

RETAINER, CRANKSHAFT REAR OIL SEAL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and is serviced as an assembly.

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Raise and support the vehicle.
2. Remove the transmission inspection/torque converter access cover.
3. Inspect the rear of the cylinder block for evidence of oil leakage and note the following:
   - Circular spray pattern generally indicates seal leakage or crankshaft damage.
   - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil gallery pipe plugs, oil filter runoff and main bearing cap to cylinder block mating surfaces. See appropriate Engine information, for proper repair procedures of these items.
4. If no leaks are detected, pressurize the crankcase **"Engine Oil Leak"** . Refer to **ENGINE OIL LEAK**.

   CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out using an emery cloth.

   CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL**.

REMOVAL

REMOVAL

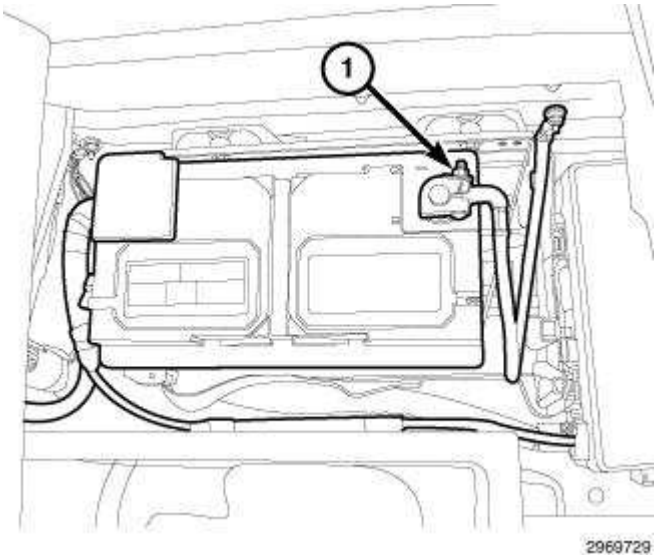

Fig. 239: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

NOTE: This procedure can be performed in vehicle.

1. Disconnect the negative battery cable (1).
2. Remove the transmission. Refer to **REMOVAL** .

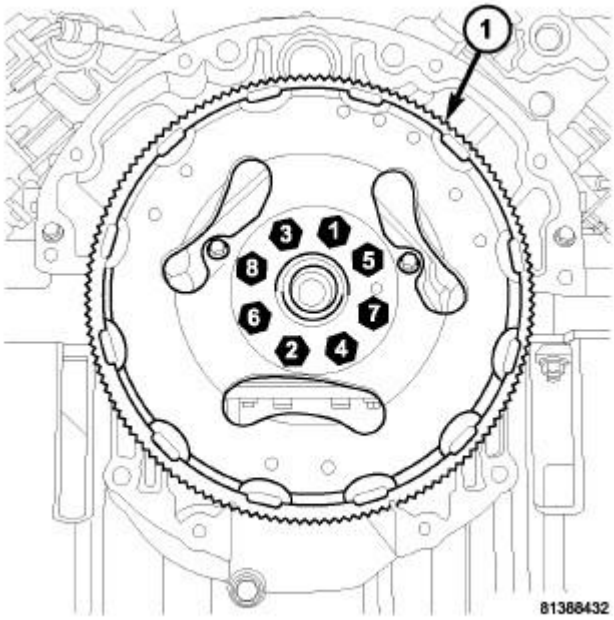

Fig. 240: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Remove the flexplate (1). Refer to **FLEXPLATE, REMOVAL**.
4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.

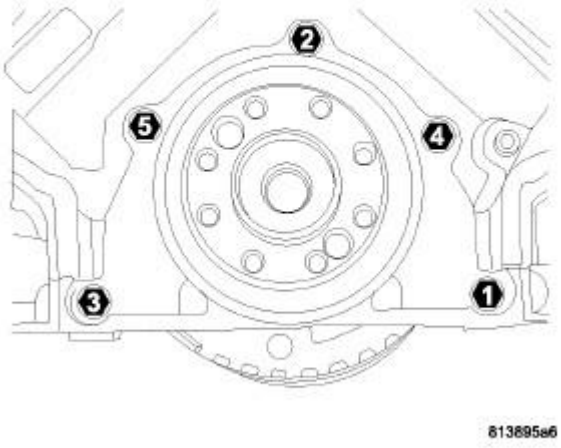

Fig. 241: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Using the sequence shown in illustration, remove the rear oil seal retainer mounting bolts.
6. Remove and discard the rear oil seal retainer.

INSTALLATION

INSTALLATION

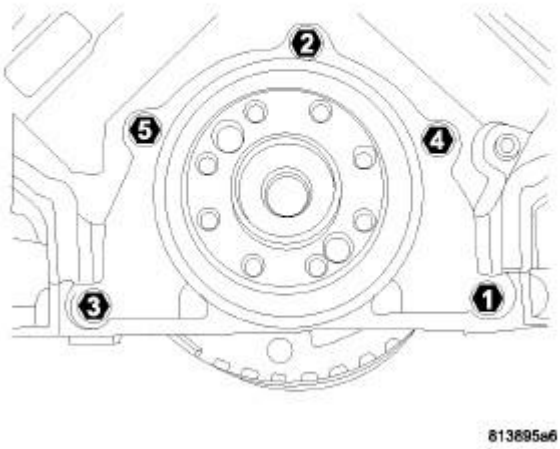

Fig. 242: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

1. Thoroughly clean all gasket residue from the engine block.
2. Position the gasket onto the new crankshaft rear oil seal retainer.
3. Position the crankshaft rear oil seal retainer onto the engine block.
4. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).
5. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.

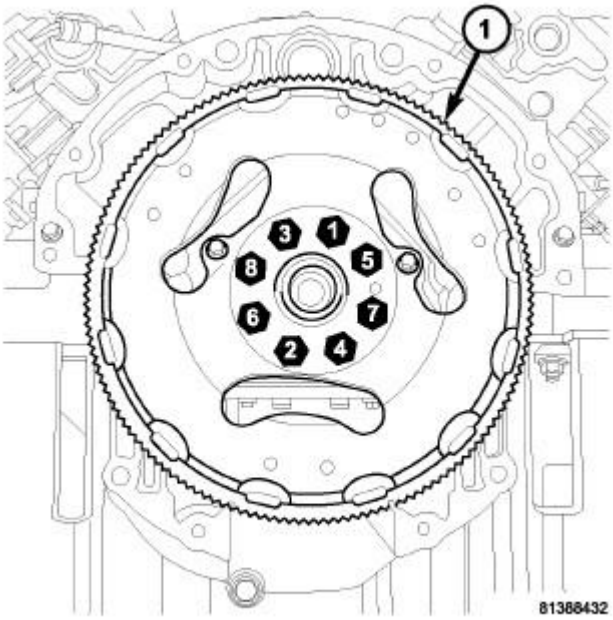

Fig. 243: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Install the flexplate (1). Refer to **FLEXPLATE, INSTALLATION**.
7. Install the transmission. Refer to **INSTALLATION** .
8. Fill the crankcase with the specified type and amount of engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

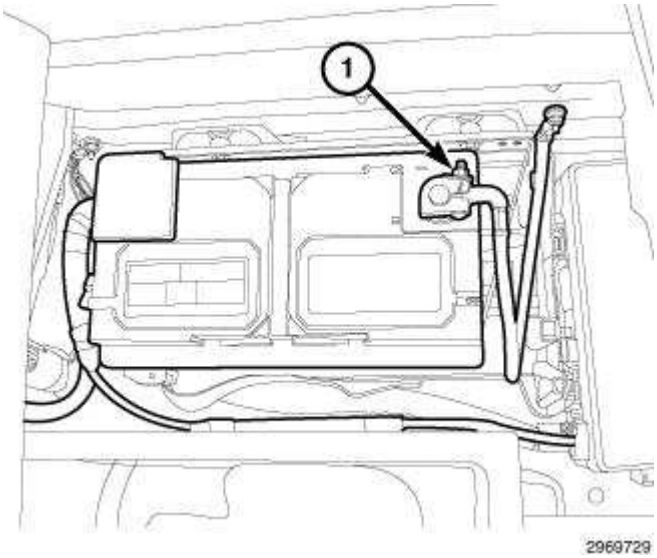

Fig. 244: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

9. Connect the negative battery cable (1).

10. Start the engine and check for leaks.

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

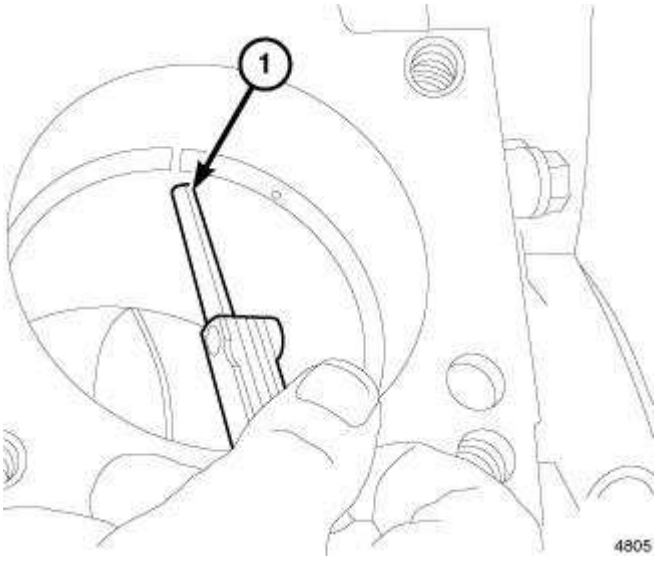

Fig. 245: Using Feeler Gauge To Check Ring End Gap
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before reinstalling used piston rings or installing new piston rings, the piston ring clearances must be checked or engine damage may result.

1. Wipe the cylinder bore clean.
2. Insert the piston ring into the cylinder bore.

NOTE: The piston ring gap measurement must be made with the piston ring positioned at least 12 mm (0.50 inch) from bottom of cylinder bore.

3. Using a piston, make sure that the piston ring is squared in the cylinder bore. Slide the piston ring downward into the cylinder.
4. Using a feeler gauge (1), check the piston ring end gap, replace any rings not within specification.

PISTON RING SIDE CLEARANCE

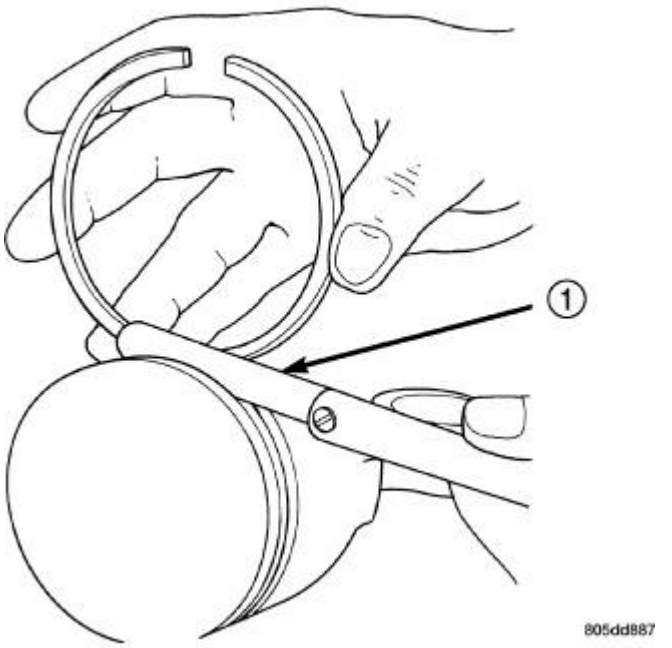

Fig. 246: Measuring Piston Ring Side Clearance
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Measure the piston ring side clearance with a feeler gauge (1) as shown in illustration. Make sure the feeler gauge fits snugly between the piston ring land and the piston ring, replace any ring not within specification.

   NOTE: Make sure the marks on the compression rings face upward.

2. Rotate the ring around the piston. The ring must rotate in the groove with out binding.

PISTON RING INSTALLATION

Fig. 247: Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

1. Install the oil ring expander.
2. Install the lower side rail by placing one end between the piston ring groove and the expander ring (1). Hold the lower side rail end firmly and press down the portion to be installed until the side rail is in position. Repeat this step for the upper side rail.

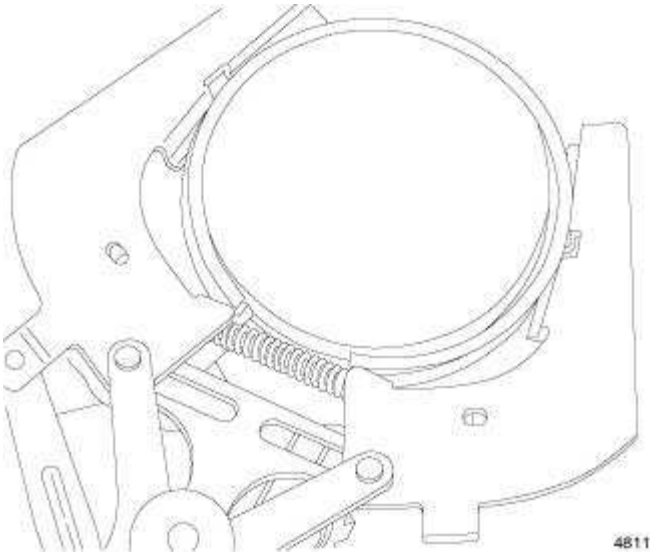

Fig. 248: Installing Upper & Intermediate Rings
Courtesy of CHRYSLER GROUP, LLC

3. Using a piston ring installer, install the No. 2 intermediate piston ring.
4. Using a piston ring installer, install the No. 1 upper piston ring.

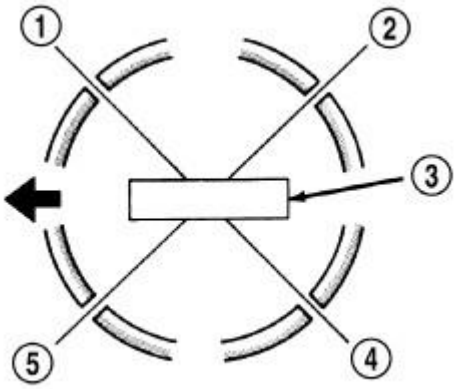

Fig. 249: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

5. Install the oil ring expander gap at the (5) position.
6. Install the oil ring lower side rail gap at the (4) position.
7. Install the oil ring upper side rail gap at the (1) position.
8. Install the second compression ring gap at the (5) position.
9. Install the top compression ring gap at the (2) position.

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high-strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal with a "fractured cap" design. A floating piston pin is used to attach the piston and connecting rod.

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON FITTING

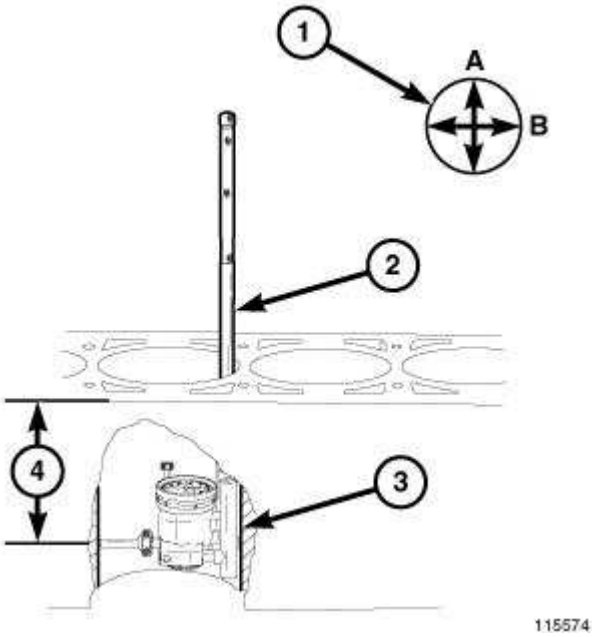

Fig. 250: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

1. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder indicator capable of reading in 0.003 mm (0.0001 in.) increments is required. If a cylinder indicator is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore (4). Start perpendicular (across or at 90°) to the axis of the crankshaft at point A and then take an additional bore reading 90° to that at point B.

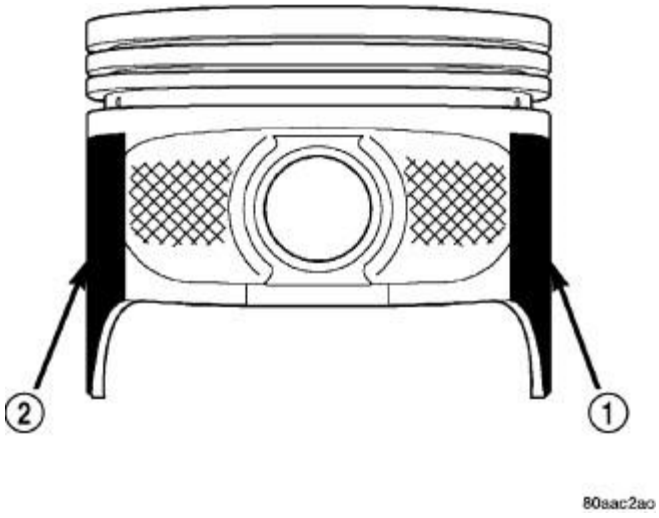

Fig. 251: Moly Coated Piston
Courtesy of CHRYSLER GROUP, LLC

NOTE: The coated pistons, piston pins and connecting rods are pre-assembled

and serviced as an assembly.

3. The piston and rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder bank (even numbered) and must not be interchanged.
4. The coating material (1, 2) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a cylinder indicator is **MANDATORY** . To correctly select the proper size piston, a cylinder indicator capable of reading in 0.003 mm (0.0001 in.) increments is required.
5. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

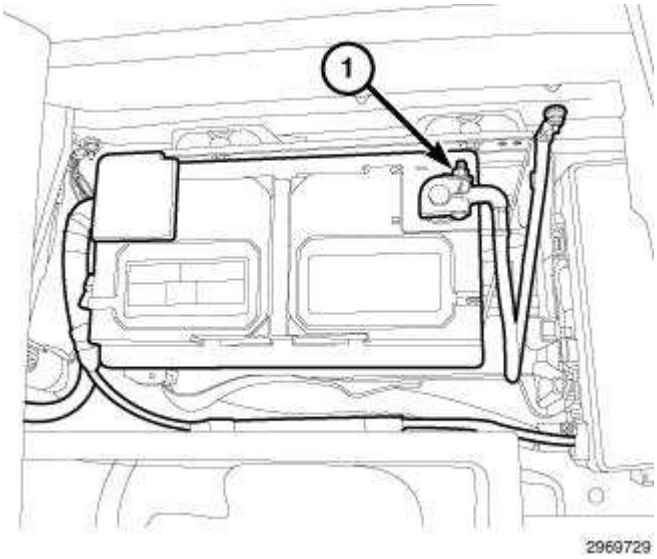

Fig. 252: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect and isolate the negative battery cable (1).

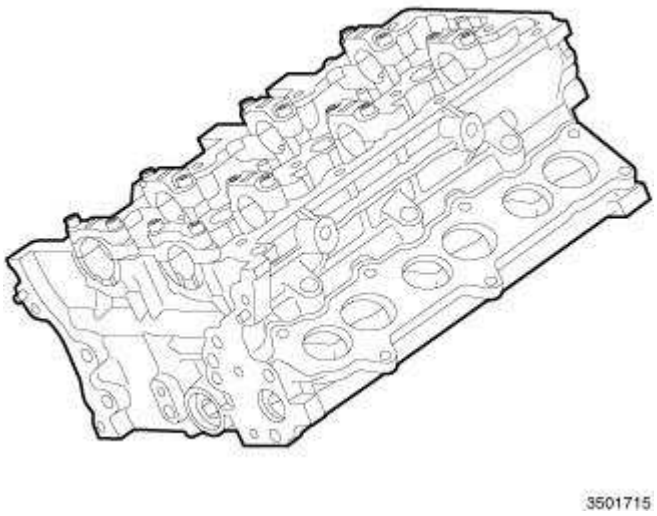

Fig. 253: Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL**.

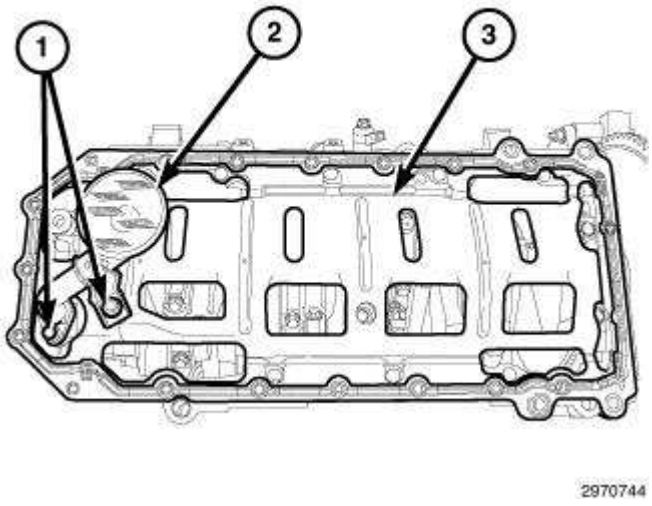

Fig. 254: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.
5. Remove and discard the oil pan gasket/windage tray (3).
6. If necessary, remove the ridge on top of the cylinder bores with a reliable ridge reamer before removing pistons from engine block. **Be sure to keep the tops of the pistons covered during this operation.**

CAUTION: When removing and installing the pistons and connecting rods, do not damage the piston oil cooler jets. If the jets are bent, engine damage may occur.

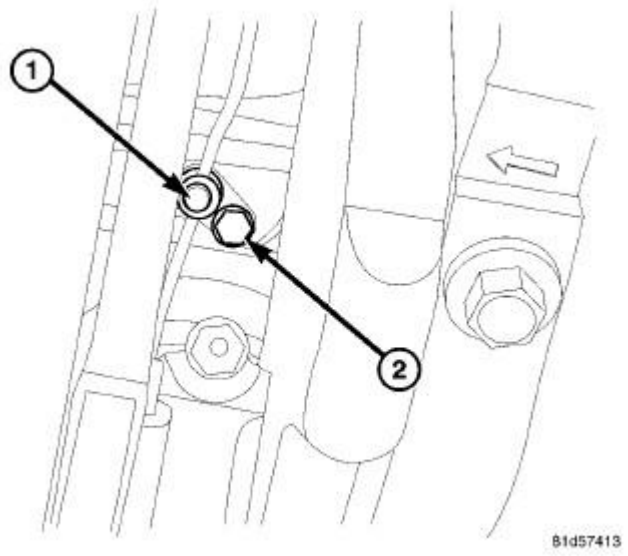

Fig. 255: Piston Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the piston oil cooler jet(s) retaining bolt(s) (2) and remove the piston oil cooler jet(s) (1).

CAUTION: Do not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces as engine damage may occur.

CAUTION: Care must be taken not to nick crankshaft journals as engine damage may occur.

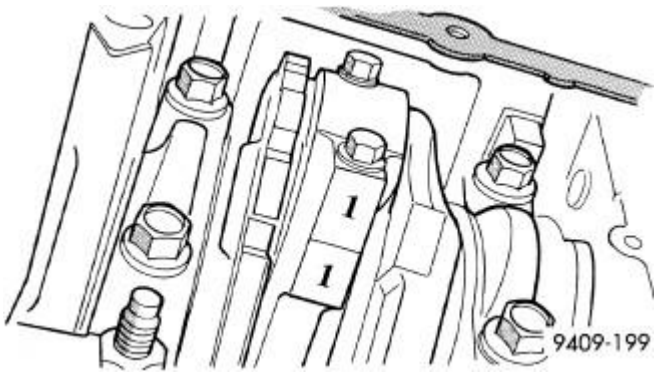

Fig. 256: Mark On Connecting Rod & Bearing Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

8. Mark the connecting rod and bearing cap position using a permanent ink marker or scribe tool.

NOTE: Pistons and connecting rod assemblies must be removed from the top of the engine block. When removing the piston and connecting rod assemblies from the engine, rotate the crankshaft so each connecting rod is centered in the cylinder bore.

9. Remove the connecting rod cap and carefully remove the piston from the cylinder bore, repeat this procedure for each piston being removed.
10. Immediately after removing the piston and connecting rod, install the bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
11. Carefully remove the piston rings from the piston(s), starting from the top ring down.

CLEANING

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

INSPECTION

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. Refer to **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the piston for scoring, or scraping marks on the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Check piston ring clearance. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
2. Before installing piston and connecting rod assemblies into the bore, install the piston rings. Refer to **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
3. Immerse the piston head and rings in clean engine oil and position a ring compressor over the piston and rings and tighten the ring compressor. **Make sure the position of rings do not change during this operation.**

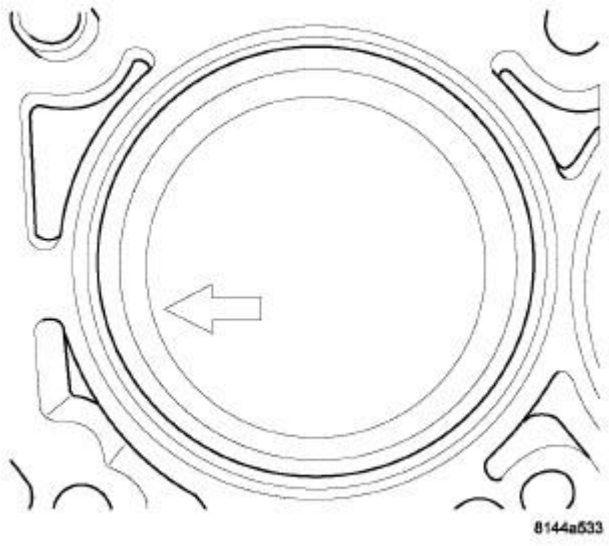

Fig. 257: Piston Direction Arrow
Courtesy of CHRYSLER GROUP, LLC

4. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of the engine on both cylinder banks.
5. Wipe the cylinder bore clean and lubricate with clean engine oil.

6. Rotate the crankshaft until the connecting rod journal is centered with the cylinder bore.
7. Insert the piston and rod assembly into the cylinder bore and carefully position the connecting rod over the crankshaft journal.
8. Tap the piston down in cylinder bore using a hammer handle. While at the same time, guide the connecting rod into position on crankshaft rod journal.
9. Perform the measure bearing clearance procedure. Refer to **ENGINE BLOCK**.

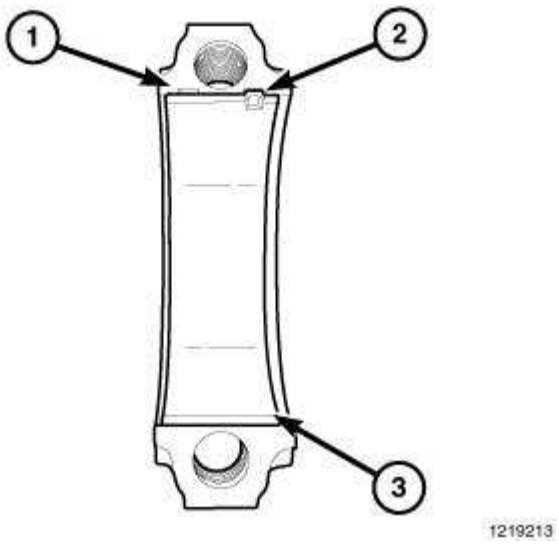

Fig. 258: Connecting Rod Cap & Bearing
Courtesy of CHRYSLER GROUP, LLC

10. Wipe the connecting rod cap (1) clean and lubricate with clean engine oil and install the bearing (3).

NOTE: The connecting rods and bearing caps are not interchangeable, line up the previously marked bearing caps and connecting rods to ensure assembly to their original location.

11. Lubricate the bearing surfaces with clean engine oil and position the rod cap onto the connecting rod.

CAUTION: When installing the connecting rods, make sure the wide side of the connecting rod faces the crankshaft and the narrow sides face each other.

CAUTION: Always replace the connecting rod bolts whenever they are loosened or removed.

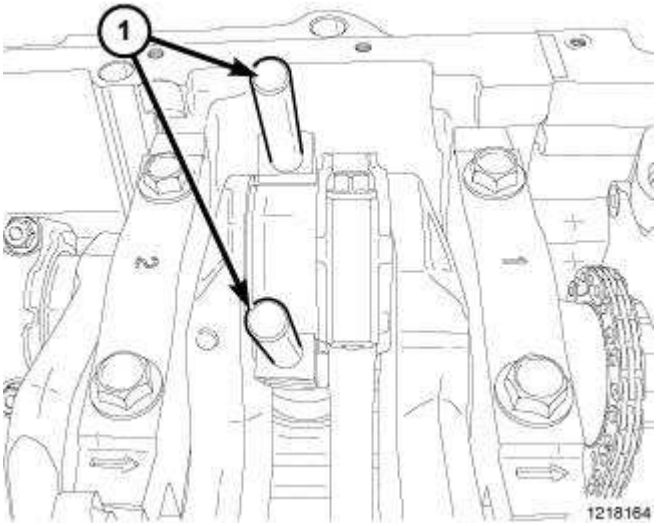

Fig. 259: Connecting Rod Guides
Courtesy of CHRYSLER GROUP, LLC

12. Install the (special tool #8507, Guides, Connecting Rod) (1) into the connecting rod bolt threads.

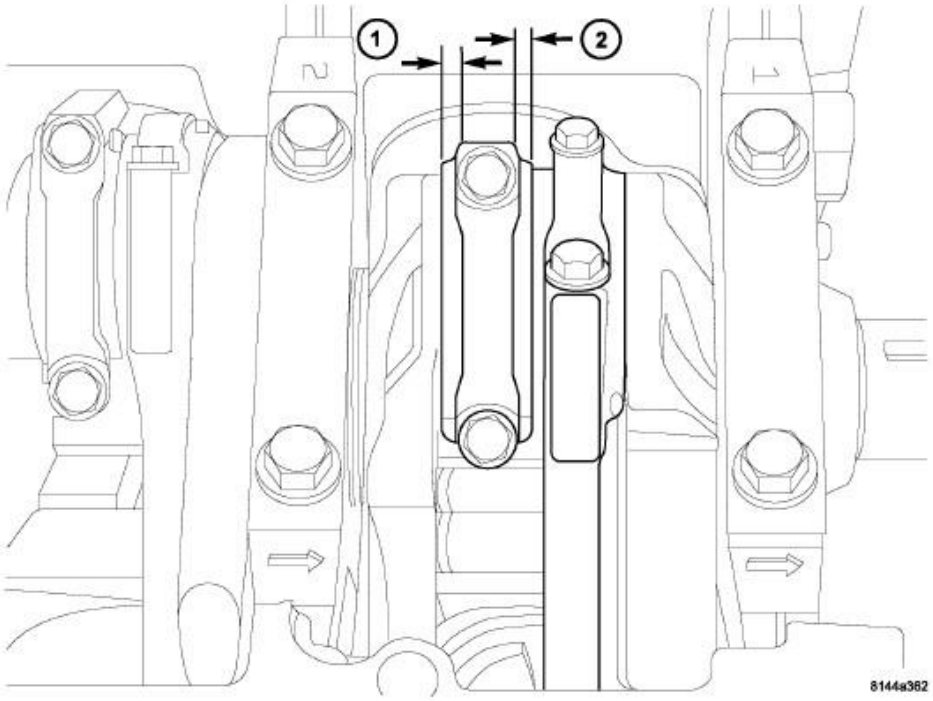

Fig. 260: Connecting Rod Proper Installation
Courtesy of CHRYSLER GROUP, LLC

13. Verify the connecting rods are properly installed, the wide side (1) of the connecting rod is facing towards the crankshaft and the narrow sides (2) of the connecting rods face each other.

14. Lubricate the new rod cap bolts with clean engine oil, install and tighten to 45 N.m (33 ft. lbs.) plus an additional 60° turn.

CAUTION: When removing and installing the pistons and connecting rods, do not damage the piston oil cooler jets. If the jets are bent, engine damage may occur.

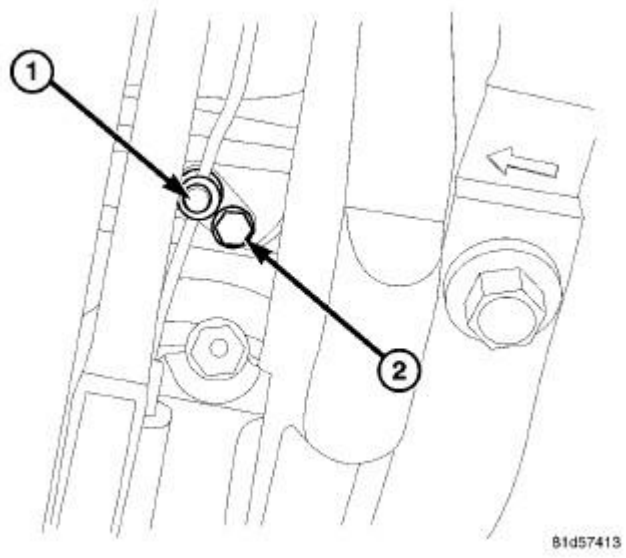

Fig. 261: Piston Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

15. Position the piston oil cooler jet(s) (1).
16. Install the piston oil cooler jet retaining bolt(s) (2) and tighten to 13 N.m (10 ft. lbs.).

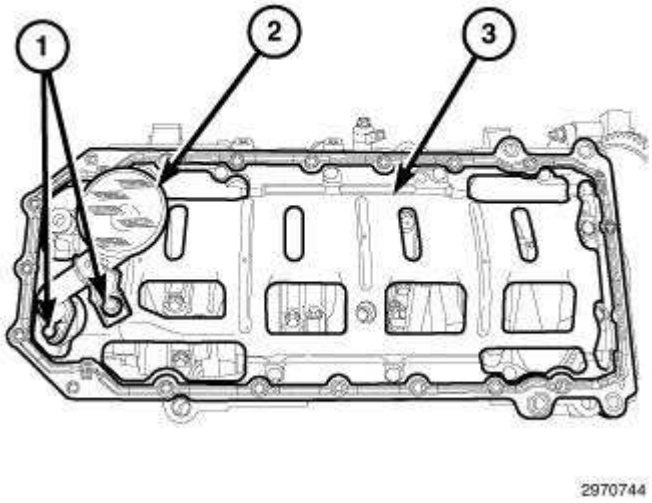

Fig. 262: Integral Windage Tray, Oil Pump Pickup Tube & Bolts

Courtesy of CHRYSLER GROUP, LLC

17. Install the new oil pan gasket/windage tray (3), oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.
18. Install the engine oil dipstick tube and dipstick.
19. Lower the vehicle.

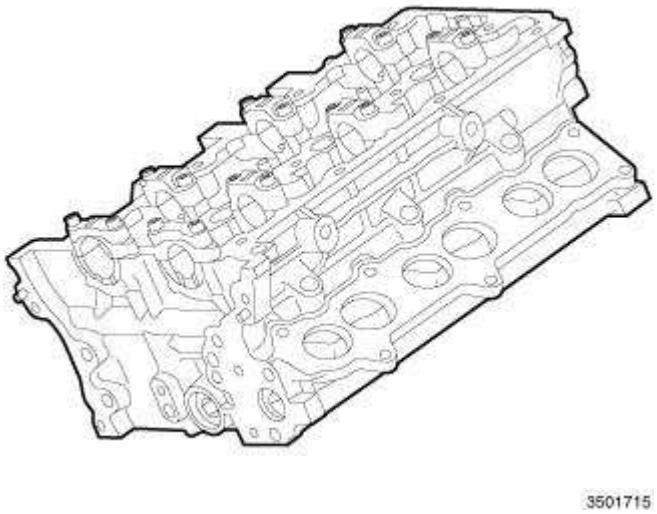

Fig. 263: Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

20. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION**.

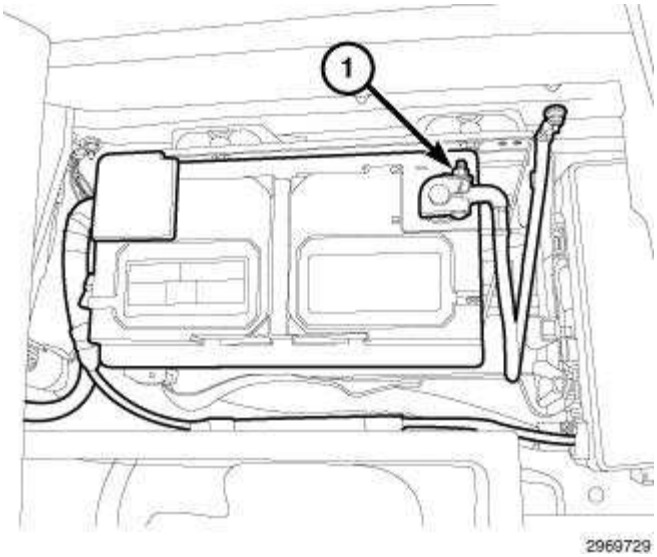

Fig. 264: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

21. Connect the negative battery cable (3).

22. Start the engine and check for leaks.

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

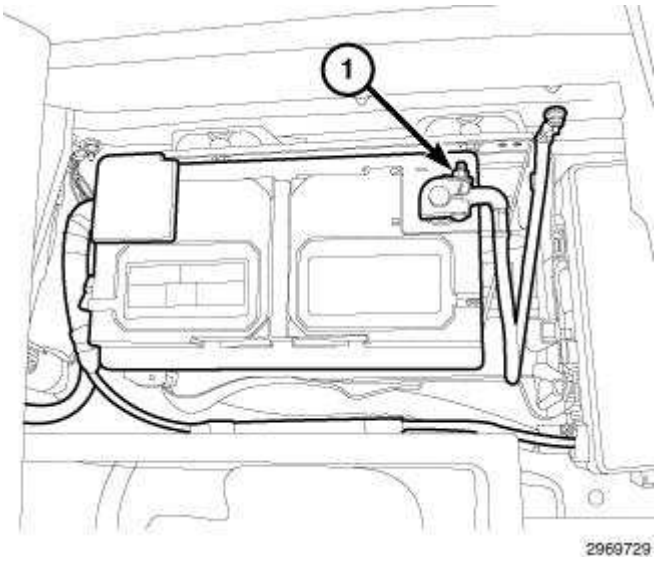

Fig. 265: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

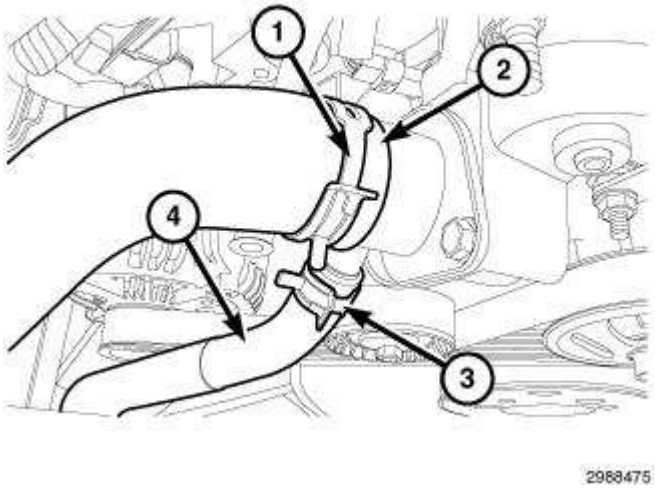

Fig. 266: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper radiator hose clamp (1) and remove the upper radiator hose (2).
4. Remove the oil cooler hose clamp (3) and remove oil cooler hose (4).

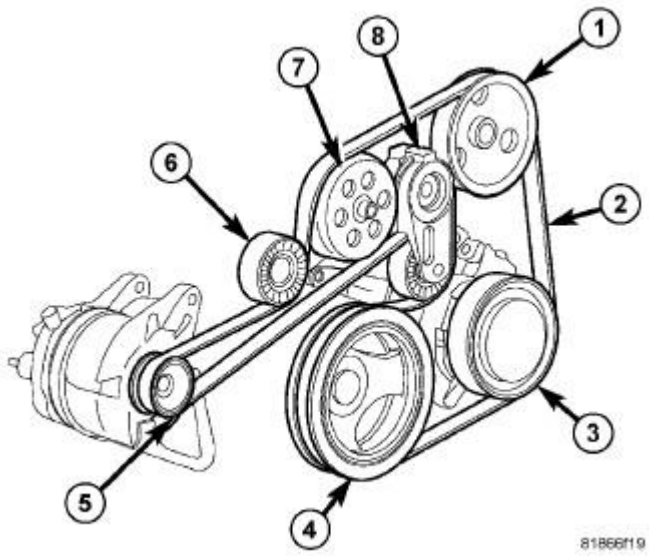

Fig. 267: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

5. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

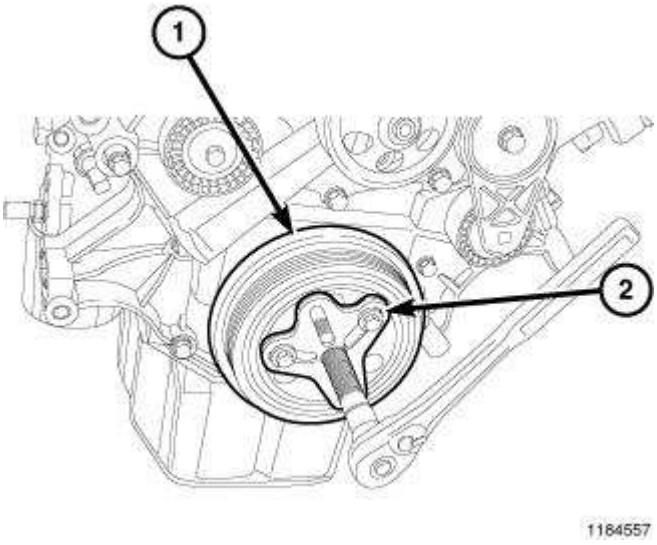

Fig. 268: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

6. Remove the crankshaft damper retaining bolt.
7. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper.
8. Remove the crankshaft damper (1).

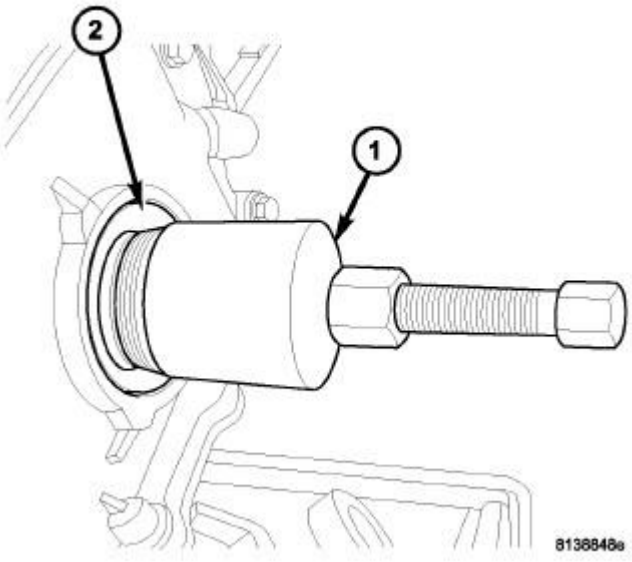

Fig. 269: Front Crankshaft Seal Removal
Courtesy of CHRYSLER GROUP, LLC

9. Using Seal Remover (special tool #9071, Remover, Seal) (1), remove the crankshaft front seal (2).

INSTALLATION

INSTALLATION

CAUTION: The front crankshaft seal must be installed dry. Do not apply lubricant to sealing lip or to outer edge.

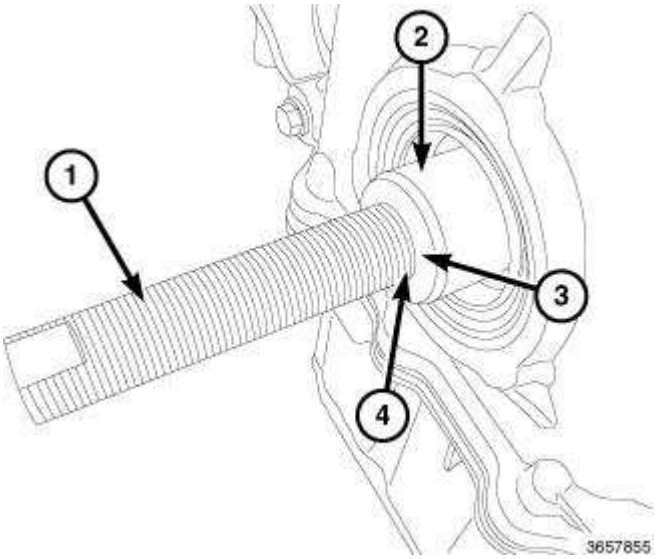

Fig. 270: Installing Vibration Damper Onto Crankshaft Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Install the threaded rod (1) from the (special tool #10387, Installer, Vibration Damper) into the crankshaft (2) till seated.

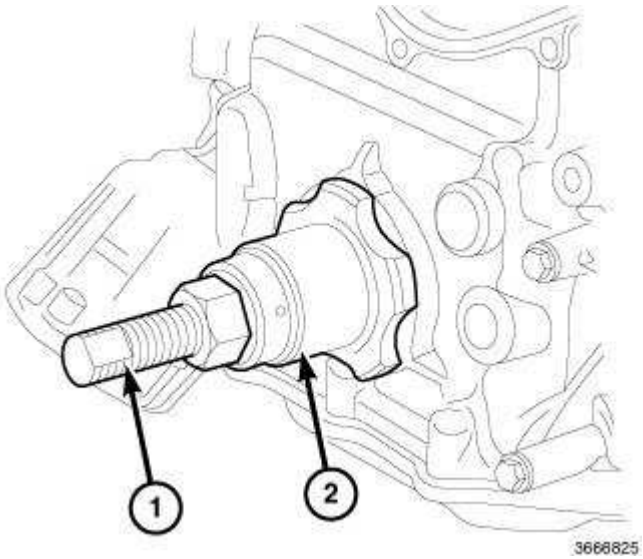

Fig. 271: Front Seal Installation
Courtesy of CHRYSLER GROUP, LLC

2. Using Seal Installer (special tool #9072, Installer, Seal) and (special tool #10387, Installer, Vibration Damper) (2), install the crankshaft front oil seal.

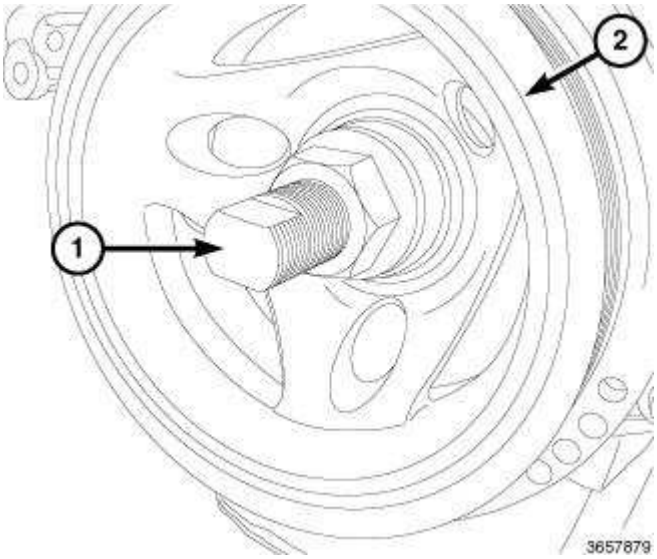

Fig. 272: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

3. Position the damper (2) on the crankshaft.
4. Install the press washer, bearing, washer, and the press nut onto the threaded rod.
5. Using Damper Installer (1) and a deep well socket, press the damper onto the crankshaft till seated.

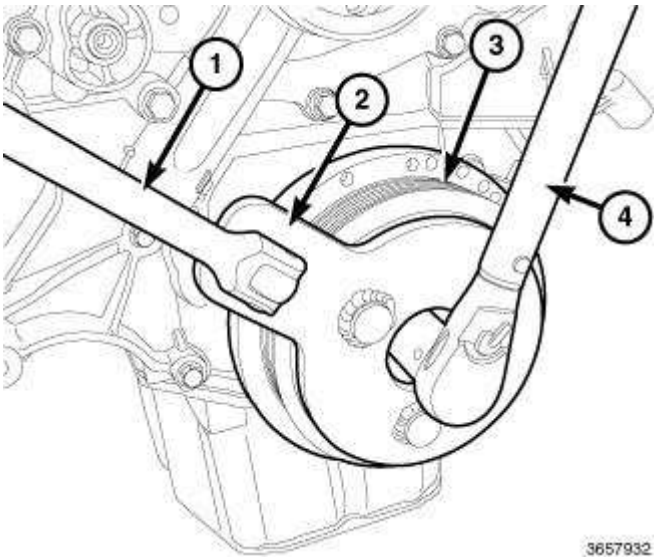

Fig. 273: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

6. Install the vibration damper bolt.
7. Position the (special tool #10386, Holder, Vibration Damper) (2), onto the vibration pulley (3).
8. Tighten the bolt to 250 N.m (184 ft. lbs.).

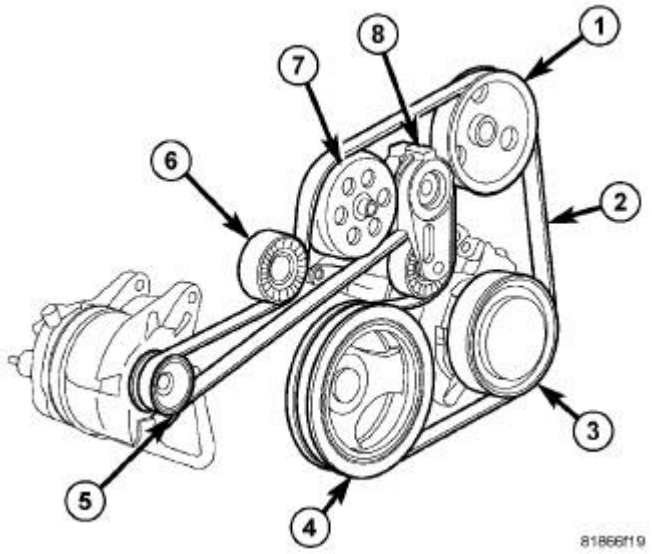

Fig. 274: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

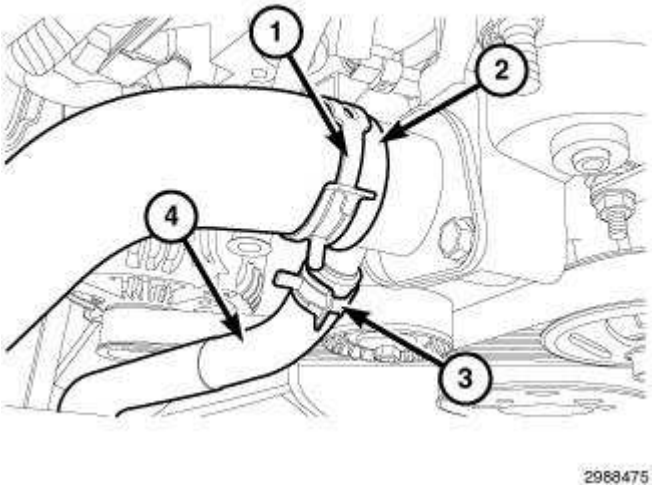

Fig. 275: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp

10. Install the upper radiator hose (2) and clamp (1).
11. Install the oil cooler hose (4) and clamp (3).

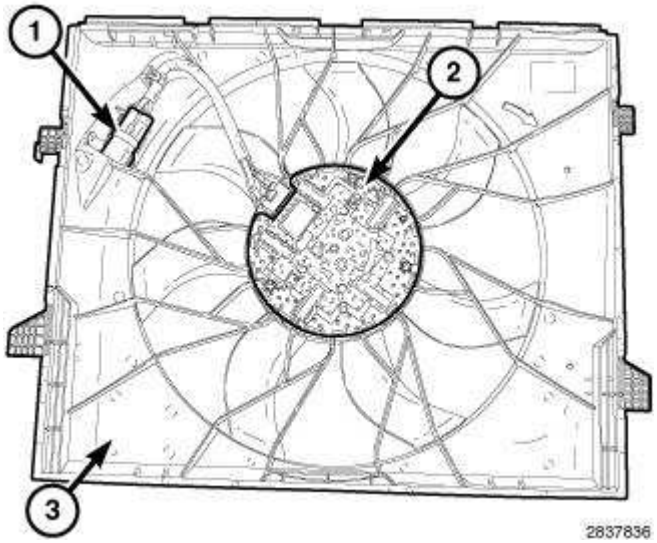

Fig. 276: Cooling Fan Motor Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .
13. Refill the cooling system. Refer to **STANDARD PROCEDURE** .

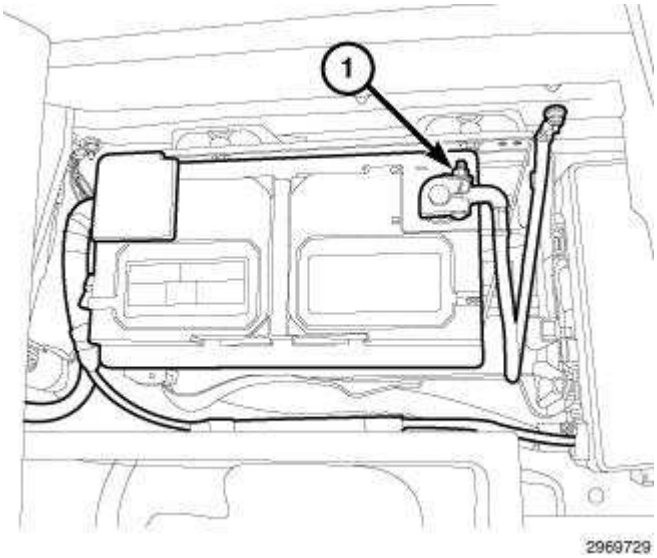

Fig. 277: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

14. Connect the negative battery cable (1).

SEAL, CRANKSHAFT OIL, REAR

DESCRIPTION

DESCRIPTION

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer, for more information, refer to the following;

- **Diagnosis and Testing:** Refer to **Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Diagnosis and Testing**.
- **Removal:** Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL**.
- **Installation:** Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, INSTALLATION**.

SOLENOID, MULTIPLE DISPLACEMENT

DESCRIPTION

DESCRIPTION

The Multi Displacement System (MDS) selectively deactivates cylinders 1, 4, 6, and 7 to improve fuel economy. It has two modes of operation:

- 8 cylinders for acceleration and heavy loads
- 4 cylinders for cruising and city traffic

The main components of the Multi Displacement System are:

- Unique MDS camshaft
- Deactivating roller lifters
- 4 control valve solenoids
- Control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

Cylinder Deactivation

- Trap an exhaust charge from a normal combustion event
- Normal combustion event
- Deactivate the exhaust valve
- Deactivate the intake valve
- Piston is an air spring
- Cylinders deactivated in firing sequence

Cylinder Reactivation

- Normal combustion event

- Activate the exhaust valve
- Activate the intake valve
- Empty the cylinder
- Cylinders reactivated in firing sequence

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 6.4L - MDS SOLENOID

The Multi-Displacement System (MDS) has the following detectable issues:

- Solenoid circuit
- Fail to deactivate a cylinder(s)
- Fail to reactivate a cylinder(s)
- Low oil pressure

CONDITION	POSSIBLE CAUSES	CORRECTION
MDS does not activate	1. Low oil pressure	1. Check for proper oil pressure
	2. Bad oil temperature sensor	2. Replace the oil temperature sensor
	3. Malfunctioning MDS solenoid	3. Replace the MDS solenoid
	4. Malfunctioning MDS lifter	4. Replace lifter(s)
MDS does not deactivate	1. Low oil pressure	1. Check or proper oil pressure
	2. Bad oil temperature sensor	2. Replace the oil temp sensor
	3. Malfunctioning MDS solenoid	3. Replace the MDS solenoid
	4. Malfunctioning MDS lifter(s)	4. Replace lifter(s)

REMOVAL

REMOVAL

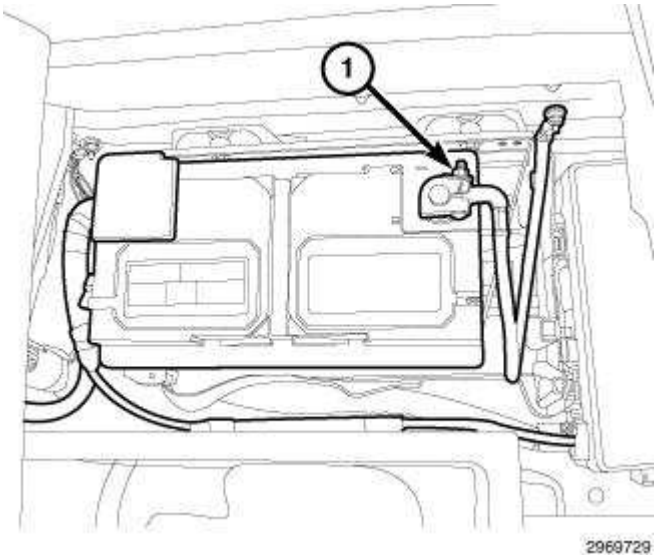

Fig. 278: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

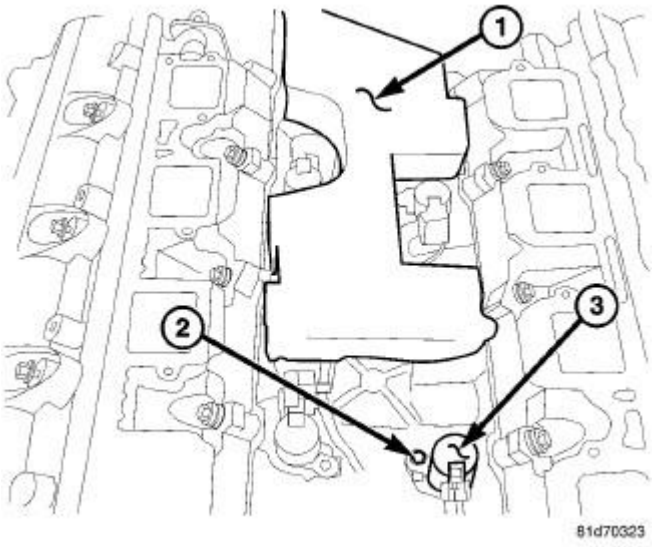

Fig. 279: Intake Manifold Foam Insulator Pad, MDS Solenoids & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove foam insulator pad (1).

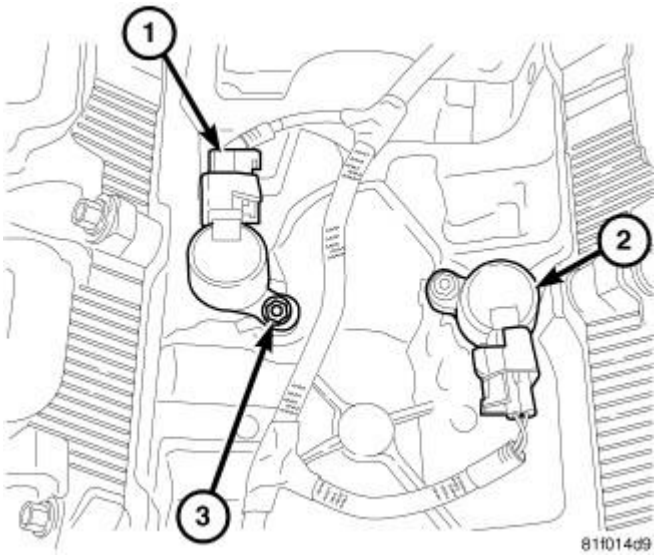

Fig. 280: MDS Solenoids, Electrical Connectors & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the Multiple Displacement Solenoid (MDS) (2) electrical connector(s) (1).
5. Remove the MDS solenoid (2) retaining bolt(s) (3).

CAUTION: Do not try to pry the solenoid out. This could lead to breakage and contamination of the lubrication system.

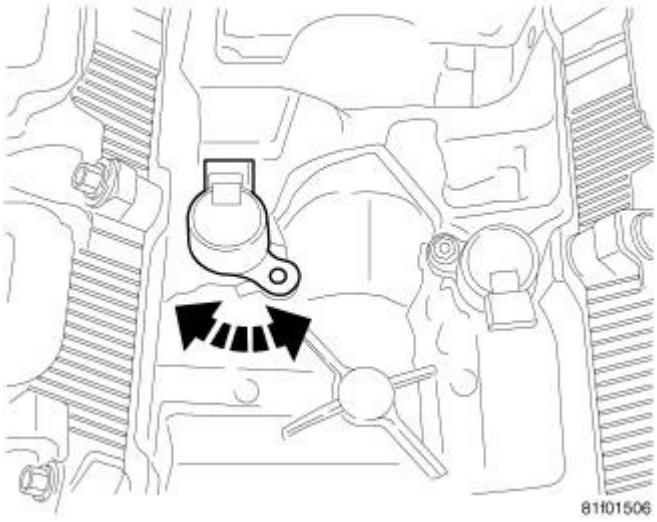

Fig. 281: Removing/Installing MDS Solenoid
Courtesy of CHRYSLER GROUP, LLC

6. Lightly tap on the MDS solenoid(s) with a rubber mallet. Rotate the MDS solenoid(s) from side to side to break the seal.
7. Remove the MDS solenoid(s).

INSTALLATION

INSTALLATION

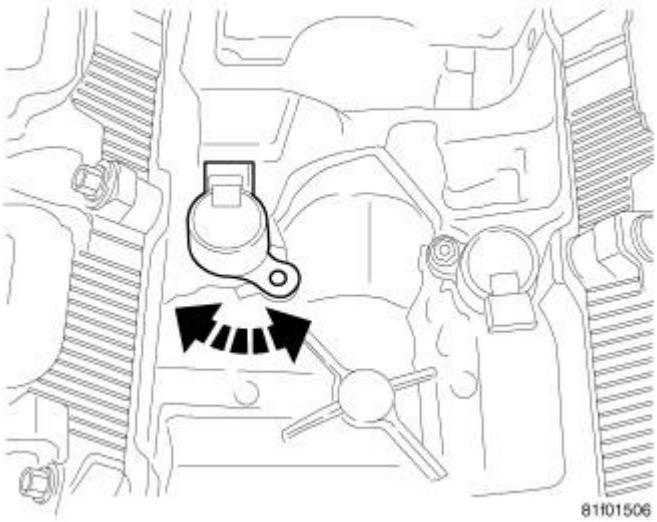

Fig. 282: Removing/Installing MDS Solenoid
Courtesy of CHRYSLER GROUP, LLC

1. Verify the MDS solenoid bores are free of debris before installing the MDS solenoid into the engine block.
2. Install the MDS solenoid(s) (3), ensure the seal is fully seated into the engine block.

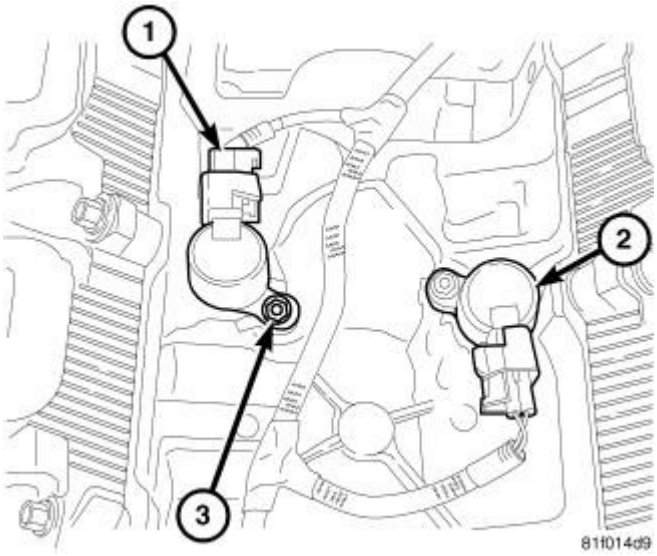

Fig. 283: MDS Solenoids, Electrical Connectors & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the retaining bolt(s) (3) and tighten to 11 N.m (8 ft. lbs.).
4. Connect the MDS electrical connector to the solenoid(s) (1).

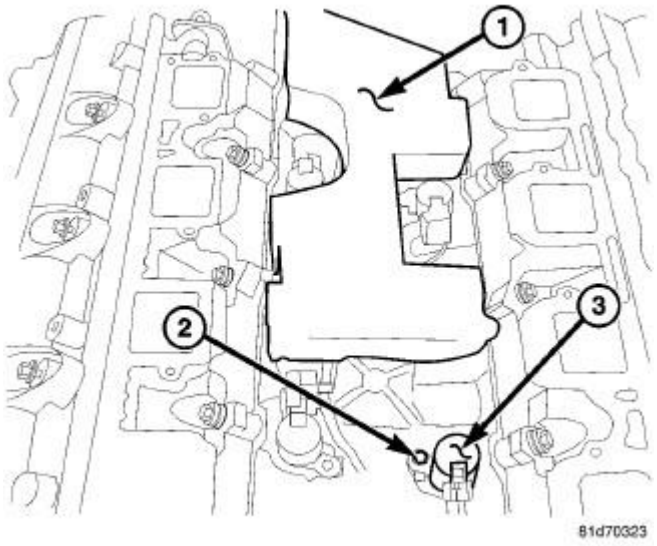

Fig. 284: Intake Manifold Foam Insulator Pad, MDS Solenoids & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the foam insulator pad (1).
6. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

2. Position the rear transmission mount isolator (3) to the rear transmission mount bracket (2), install the retaining bolts (1) and tighten to 33 N.m (24 ft. lbs.).

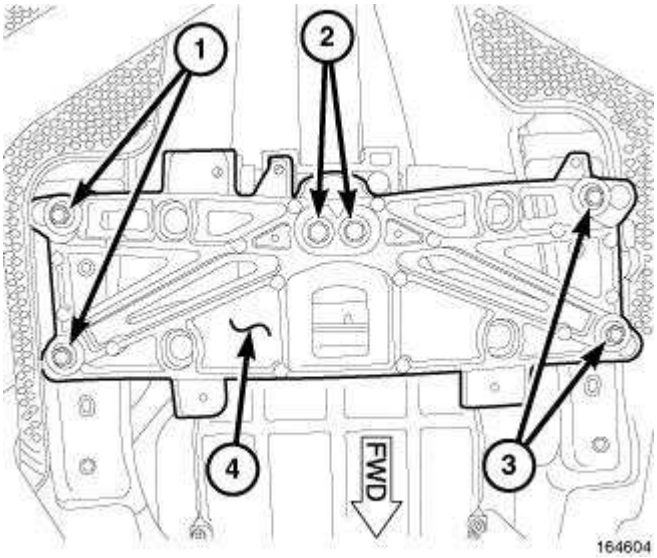

Fig. 293: Rear Cross Member & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Position the transmission crossmember (4), install the retaining bolts (1, 3) finger tight.
4. Install the rear transmission mount isolator retaining bolts (2) finger tight.
5. Tighten the transmission crossmember retaining bolts (1, 3) to 68 N.m (50 ft. lbs.).
6. Lower the transmission and remove the jack.
7. Tighten the rear transmission mount isolator retaining bolts (2) to 47 N.m (35 ft. lbs.).

MANUAL TRANSMISSION

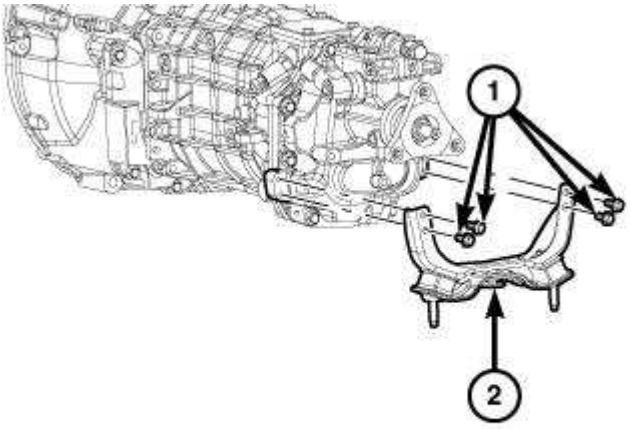

Fig. 294: Rear Transmission Mount Isolator & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear transmission mount isolator (2), install the retaining bolts (1) and tighten to 68

N.m (50 ft. lbs.).

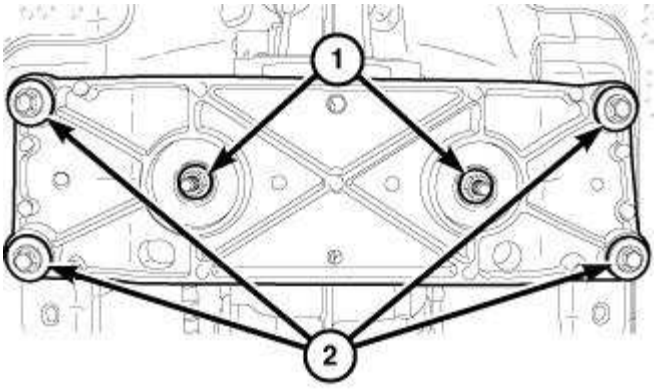

Fig. 295: Rear Cross Member & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the rear cross member, install the retaining bolts (2) finger tight.
3. Install the rear transmission mount isolator nuts (1) finger tight.
4. Tighten the transmission crossmember retaining bolts (2) to 68 N.m (50 ft. lbs.).
5. Lower the transmission and remove the jack.
6. Tighten the rear transmission mount isolator retaining nuts (1) to 47 N.m (35 ft. lbs.).

INSULATOR, ENGINE MOUNT, FRONT

REMOVAL

REMOVAL

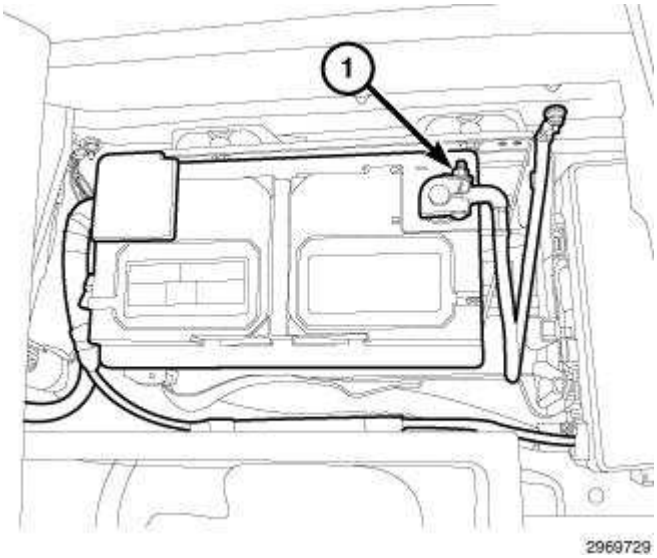

Fig. 296: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Remove the engine oil dipstick tube retaining nut at the right exhaust manifold.
3. Raise and support the vehicle.

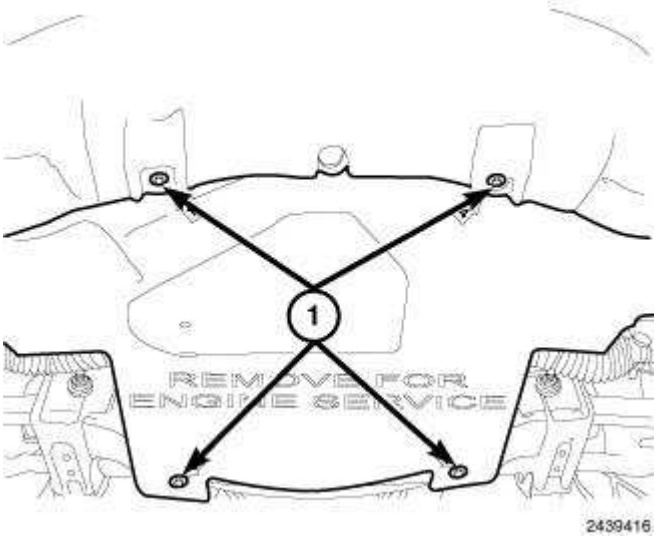

Fig. 297: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the belly pan retainers (1) and remove the belly pan.

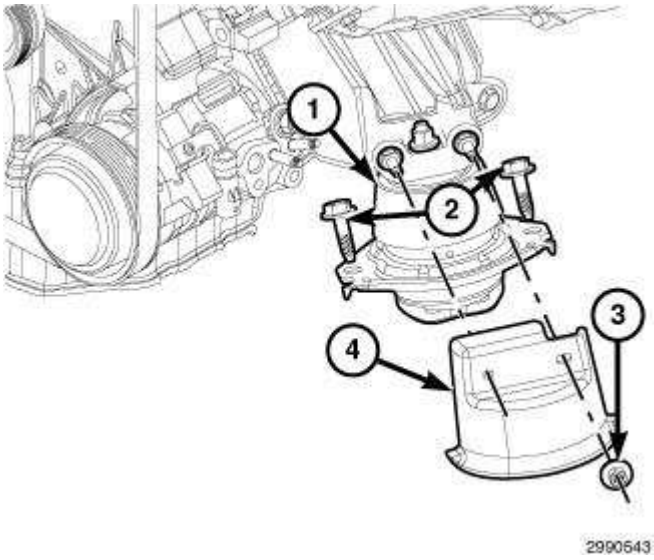

Fig. 298: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields

17. For removing the right side engine mount. Remove the starter (1).

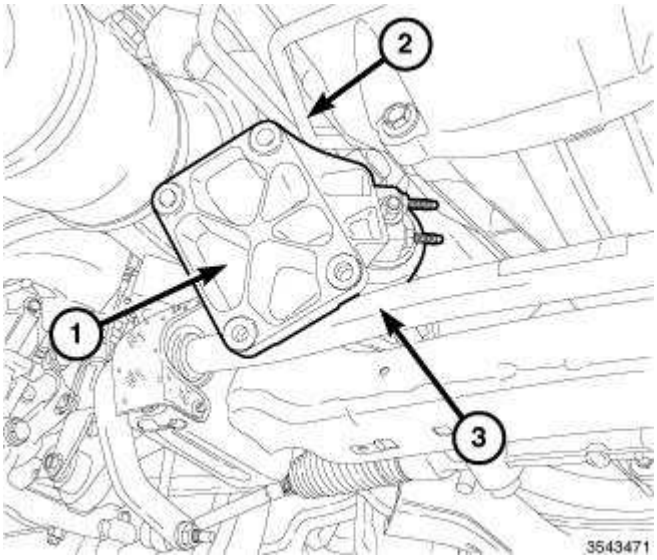

Fig. 306: Engine Mount
Courtesy of CHRYSLER GROUP, LLC

18. Remove the engine mount (1) assembly through the rear side of the engine.

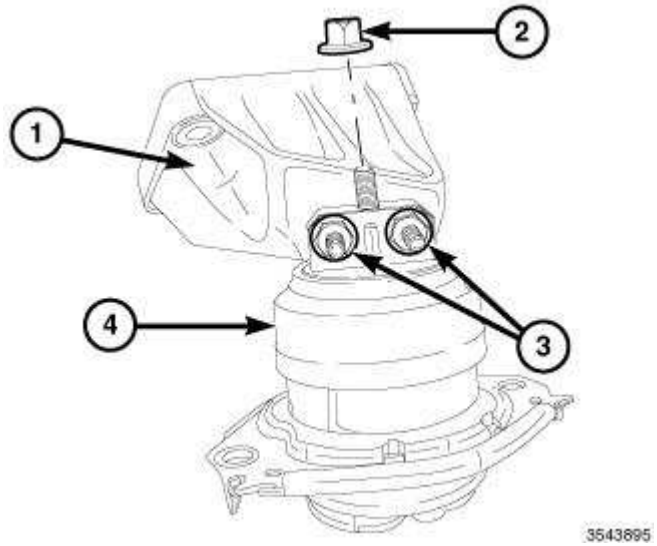

Fig. 307: Engine Mounting Bracket, Engine Mount & Fasteners
Courtesy of CHRYSLER GROUP, LLC

19. Separate the engine mount (4) from the engine mounting bracket (1).

INSTALLATION

INSTALLATION

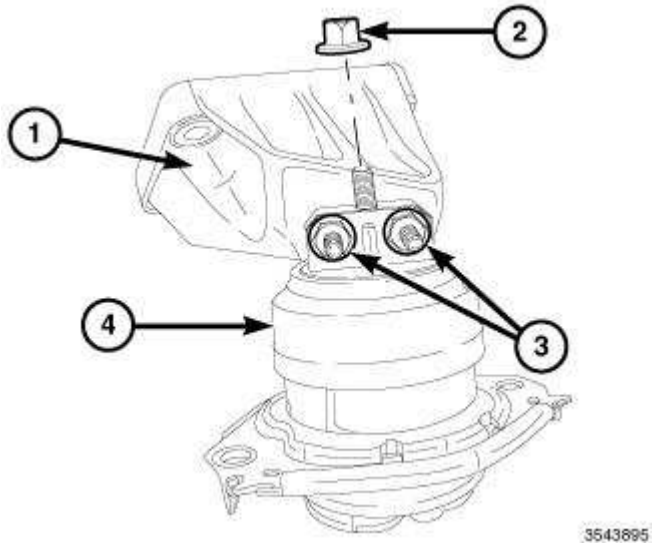

Fig. 308: Engine Mounting Bracket, Engine Mount & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install the engine mount to the engine bracket. Tighten the nut (2) and studs (3) to 60 N.m (44 ft. lbs.)

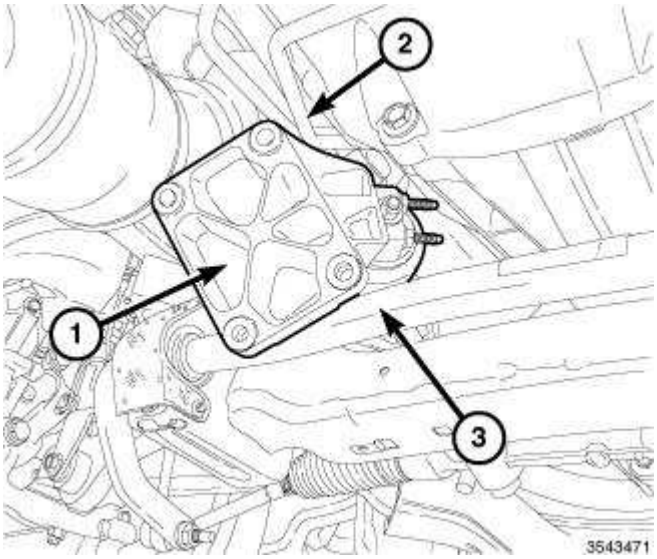

Fig. 309: Engine Mount
Courtesy of CHRYSLER GROUP, LLC

2. Position the engine mount assembly into the vehicle through the rear side of the engine.

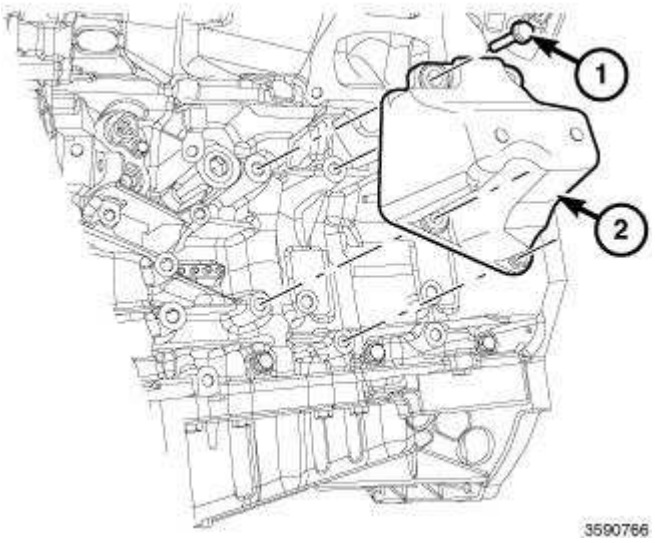

Fig. 310: Left Side Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar. Mounting brackets shown in illustration without the engine mounts.

3. Position the engine mount to engine block. Install the retaining bolts and tighten to 61 N.m (45 ft. lbs.).

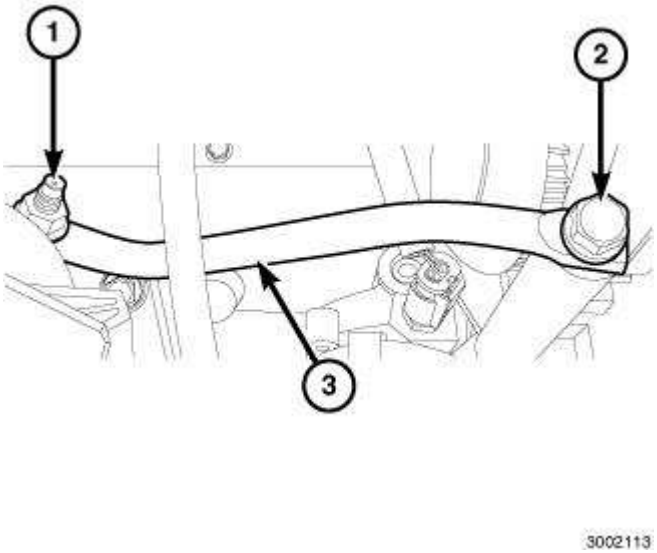

Fig. 311: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Position the generator support bracket (3) to the engine mount, install the retaining nut (1) and tighten finger tight.
5. Position the generator support bracket (3) to the generator, install the retaining bolt (2) and tighten to 65 N.m (48 ft. lbs.).

6. Tighten the generator support bracket (3) to engine mount retaining nut (1) to 28 N.m (21 ft. lbs.).
7. Lower the vehicle.

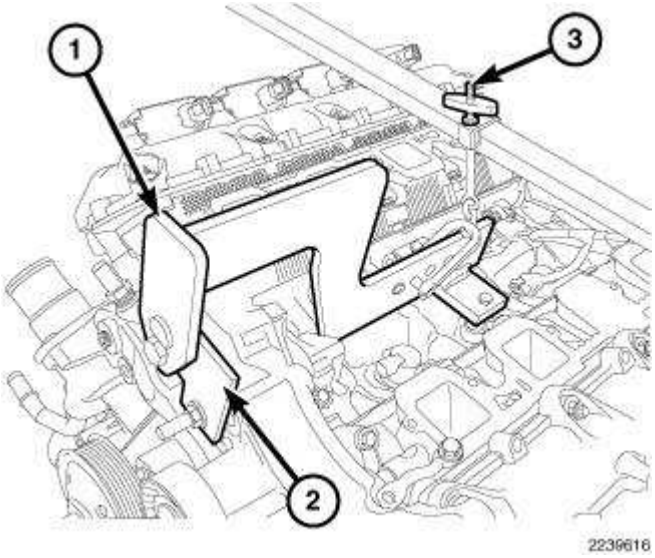

Fig. 312: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

8. Lower the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) until the engine mounts are seated in the engine cradle.
9. Remove the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).

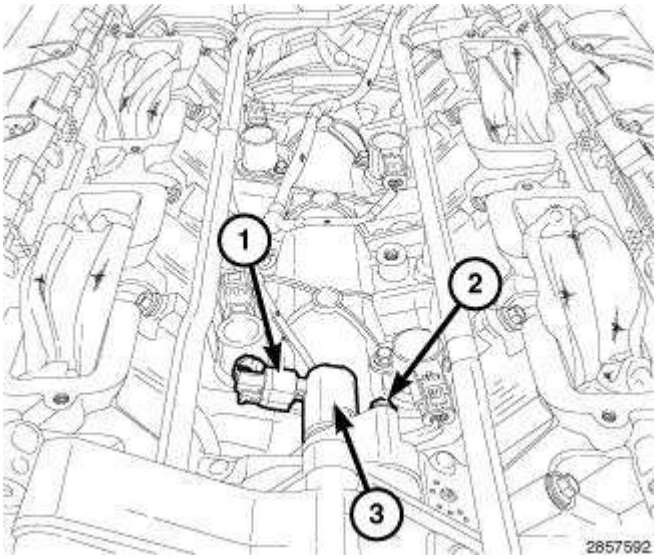

Fig. 313: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Install the Oil Control Valve (OCV). Refer to **CONTROL VALVE, OIL INTAKE, INSTALLATION**.

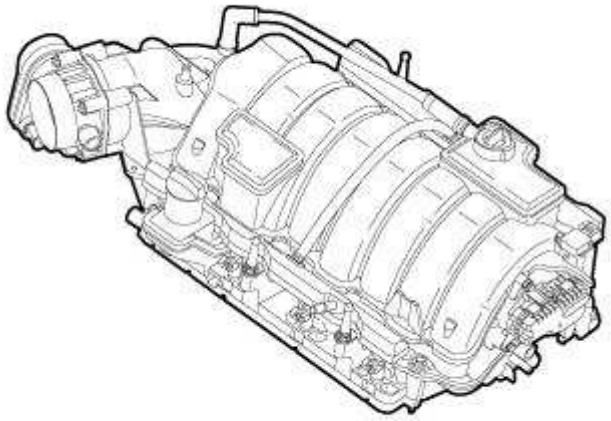

Fig. 314: Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

11. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
12. Raise and support the vehicle.

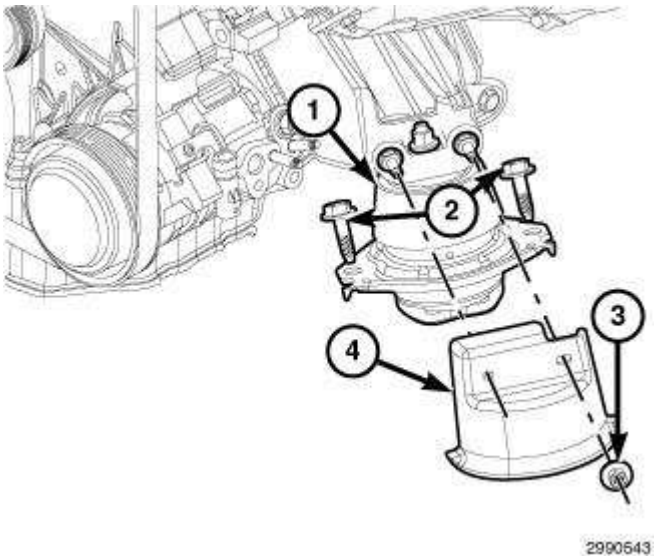

Fig. 315: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

13. Install both left/right engine mount lower retaining bolts (2) and tighten to 61 N.m (45 ft. lbs.).

14. Position both left/right engine mount heat shields (4), install the retaining nuts (3) and tighten to 27 N.m (20 ft. lbs.).

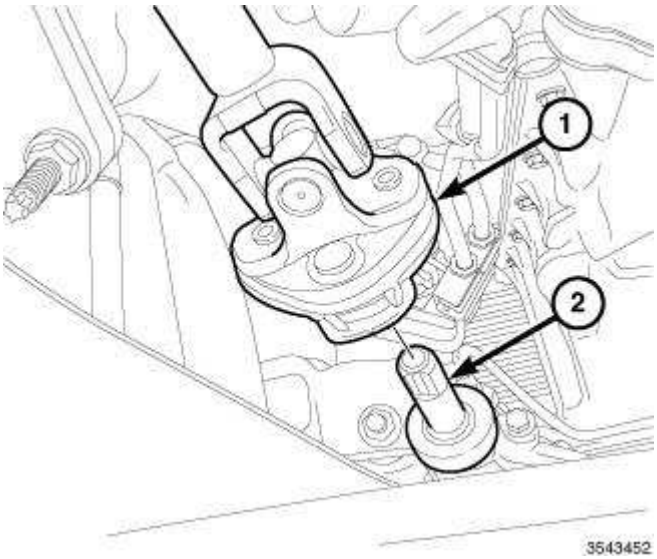

Fig. 316: Intermediate Steering Coupler & Rack And Pinion
Courtesy of CHRYSLER GROUP, LLC

15. If disconnected. Install the intermediate steering coupler to the rack and pinion. Tighten the bolt to 45 N.m (33 ft. lbs.).

19. Position the engine oil dipstick tube, install the retaining nut at the right exhaust manifold.
20. Connect the negative battery cable (1).

LUBRICATION

DESCRIPTION

DESCRIPTION

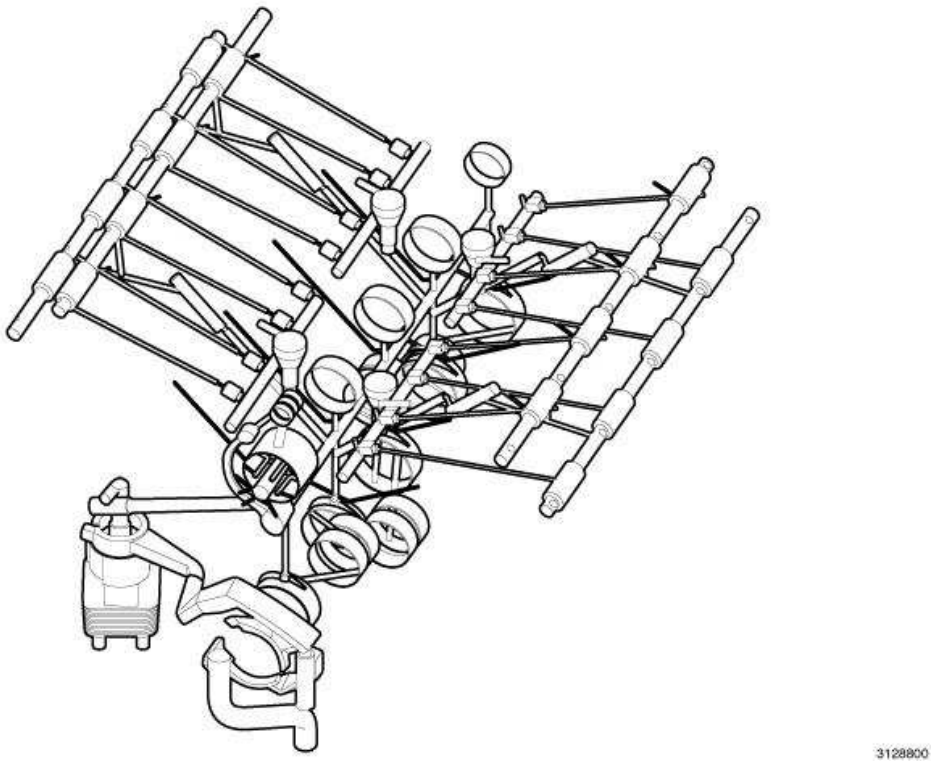

Fig. 320: 6.4L Lubrication System
Courtesy of CHRYSLER GROUP, LLC

The lubrication system is a full flow filtration pressure feed type system.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Remove oil pressure sending unit and install gauge assembly (special tool #C-3292A, Gauge, Pressure).
2. Run engine until thermostat opens.
3. Check oil pressure gauge:
   - Curb Idle - 25 kPa (4 psi) minimum
   - 3000 rpm - 170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell thus temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service information procedures.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

   If the oil leak source is not positively identified at this time, proceed with the **AIR LEAK DETECTION TEST METHOD** below.

AIR LEAK DETECTION TEST METHOD

1. Remove the PCV valve, cap or plug the PCV valve port at the intake manifold.
2. Attach an air hose with a pressure gauge and regulator onto the dipstick tube.

   CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

3. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.
4. If the leakage occurs at the rear oil seal area, proceed with the **INSPECTION FOR REAR SEAL AREA LEAKS** below.
5. If no leaks are detected, turn off the air supply and remove the air hose from the dipstick tube.
6. Remove the PCV port plug or cap at the intake manifold and install the PCV valve.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light. If the oil leak is found and identified, repair per service information procedures.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise and support the vehicle.
3. Remove torque converter or clutch housing inspection cover.

4. Using a black light and inspect the rear of the engine block for evidence of oil.

   Circular spray pattern on the rear of the engine block generally indicates:

   - Rear crankshaft oil seal
   - Damaged crankshaft

   Oil running straight down the back of the engine block generally indicates:

   - Porous engine block
   - Camshaft core hole plug
   - Oil gallery pipe plug
   - Oil pan gasket
5. If no leaks are detected, pressurize the crankcase as outlined in the **AIR LEAK DETECTION TEST METHOD**.

   CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

6. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and crankshaft oil seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

   CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is machined specifically to complement the function of the rear oil seal.

7. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

CONTROL VALVE, OIL INTAKE

DESCRIPTION

DESCRIPTION

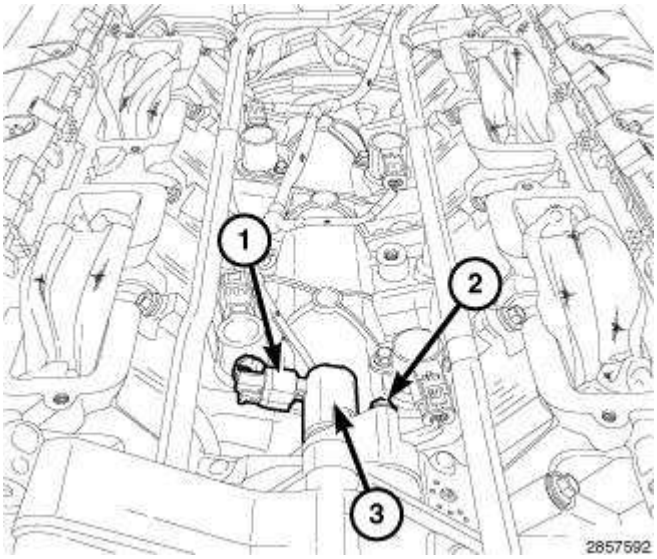

Fig. 321: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

The 6.4L engine is equipped with Variable Valve Timing (VVT). This system uses an Oil Control Valve (OCV) to direct oil pressure to the camshaft phaser assembly. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy and reduce emissions. The OCV (3) is located under the intake manifold.

OPERATION

OPERATION

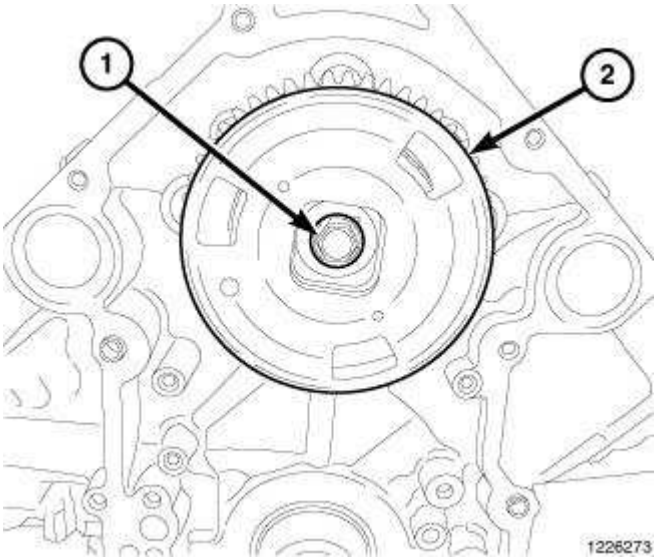

Fig. 322: Camshaft Phaser & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Variable Valve Timing (VVT) assembly is actuated with engine oil pressure. The oil flow to the VVT assemblies are controlled by an Oil Control Valve (OCV). The OCV consist of a Pulse Width

Modulated (PWM) solenoid and a spool valve. The PCM actuates the OCV to control oil flow through the spool valve into the VVT assemblies. The VVT assembly consists of a rotor, stator, and sprocket (Phaser) (2). The stator is connected to the timing chain through the sprocket. The rotor is connected to the camshaft. Oil flow in to the VVT assembly rotates the rotor with respect to the stator, thus rotating the exhaust camshaft with respect to the timing chain and intake camshaft. An infinitely variable valve timing position can be achieved within the limits of the hardware. The CMP monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

REMOVAL

REMOVAL

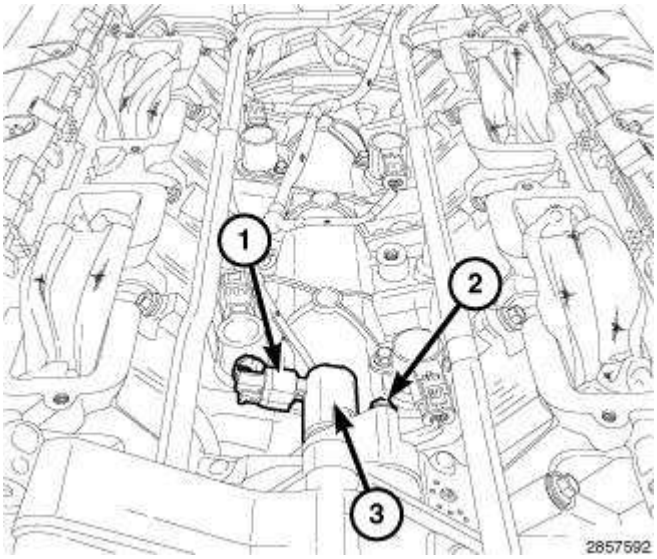

Fig. 323: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Oil Control Valve (OCV) (3) is located under the intake manifold.

1. Remove intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
2. Disconnect OCV electrical connector (1).
3. Remove OCV retaining bolt (2).

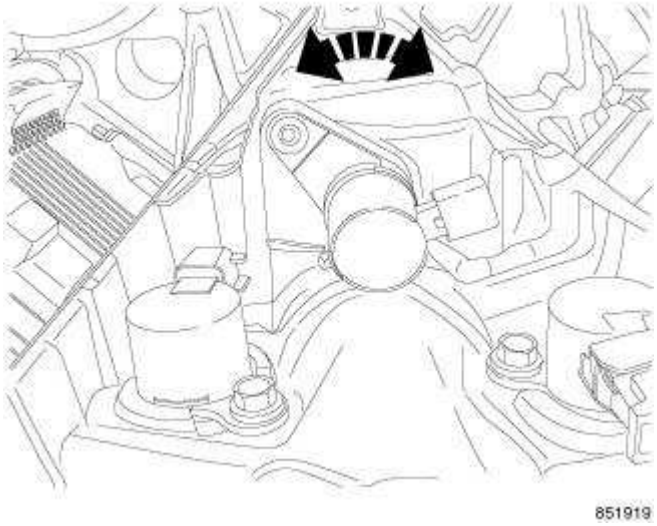

Fig. 324: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the OCV, the engine must be at room temperature.

4. Rotate the OCV to break the seal and remove.

INSTALLATION

INSTALLATION

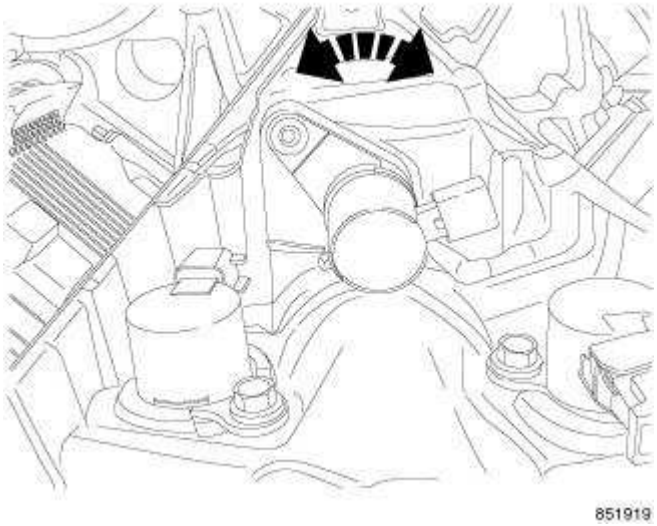

Fig. 325: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the oil control valve (OCV) rubber O-ring seal with clean engine oil.
2. Install the OCV and rotate into position.

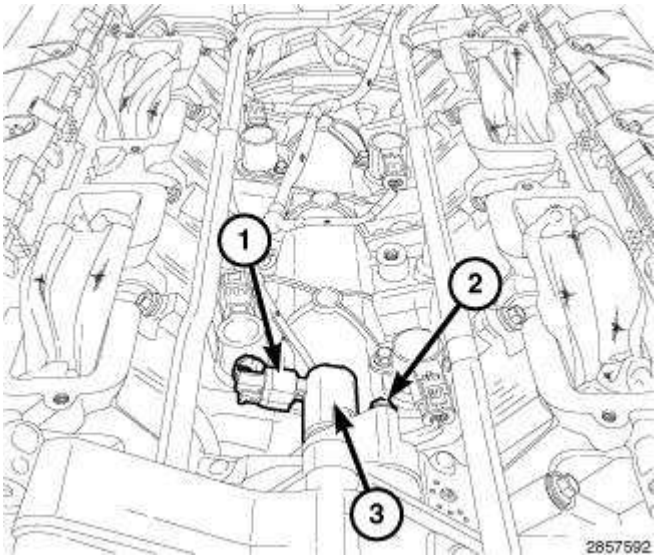

Fig. 326: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the OCV (3) retaining bolt (2) and tighten to 11 N.m (8 ft. lbs.).
4. Connect OCV electrical connector (1).
5. Install intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

COOLER, OIL

DESCRIPTION

DESCRIPTION

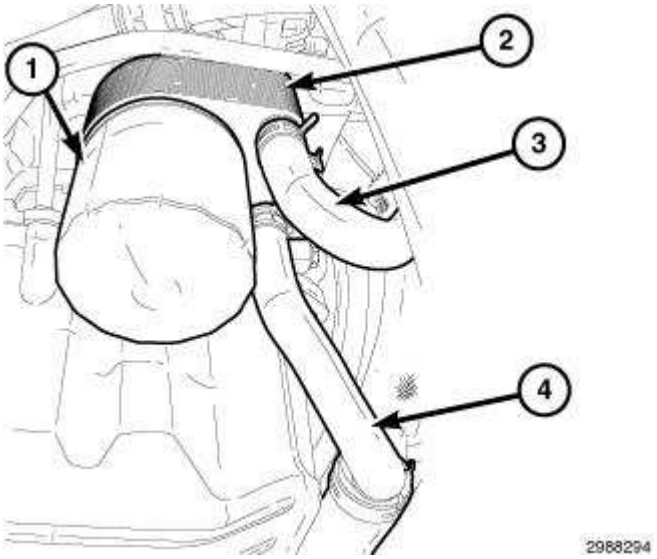

Fig. 327: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

The engine oil cooler (2) is engineered for maximum cooling efficiency with no restriction in oil flow. The oil cooler is a stack plate design coolant-to-oil heat exchanger.

The oil cooler (2) is mounted between the oil filter (1) and the engine block. The oil cooler uses the radiator coolant system; coolant is circulated through two coolant hoses to maintain a consistent engine oil temperature.

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

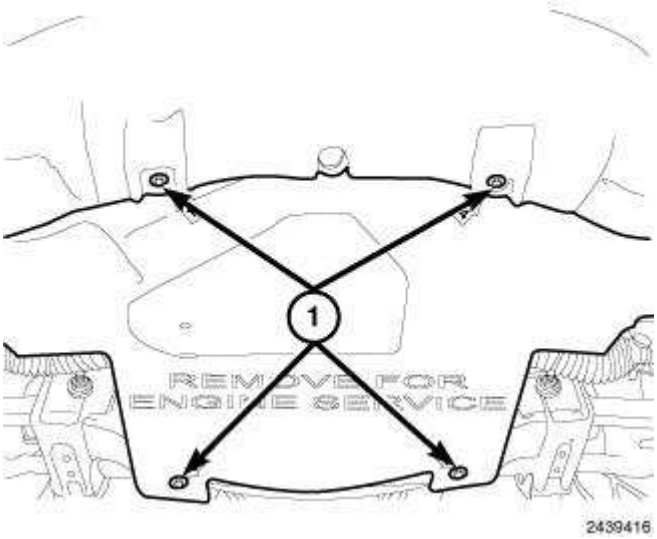

Fig. 328: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the belly pan retainers (1) and remove the belly pan.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

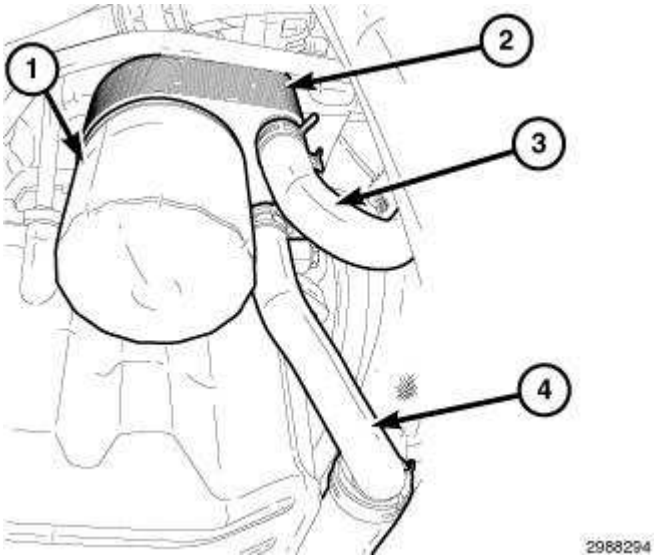

Fig. 329: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

4. Remove the oil filter (1) from the oil cooler (2).

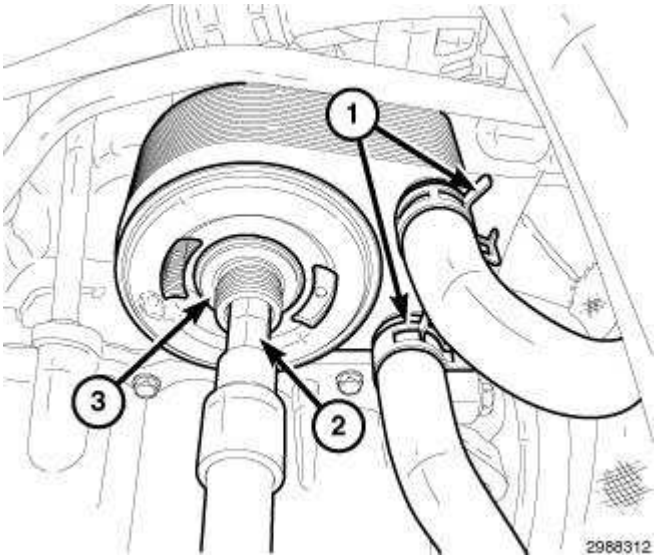

Fig. 330: Clamps, Allen Wrench Socket & Oil Cooler Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the clamps (1) from the cooling hoses at the oil cooler and remove hoses.
6. Using a 12 mm Allen Wrench socket (2), remove the oil cooler retaining bolt (3).

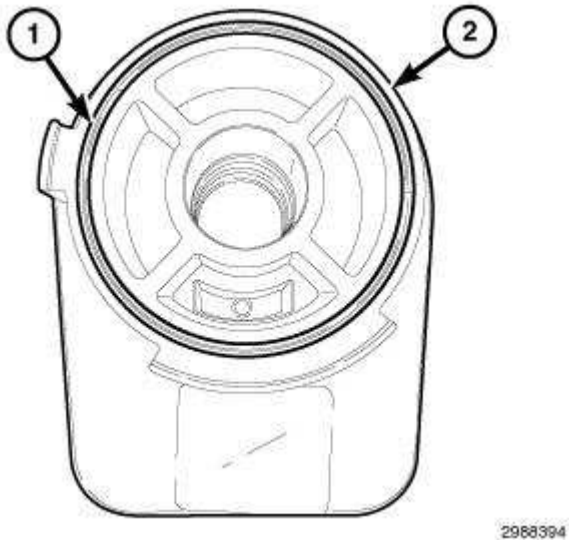

Fig. 331: O-Ring Seal & Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

NOTE: Whenever the oil cooler is serviced, the rubber O-ring seal must be replaced.

7. Remove and discard the oil cooler (2) rubber O-ring seal (1).

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

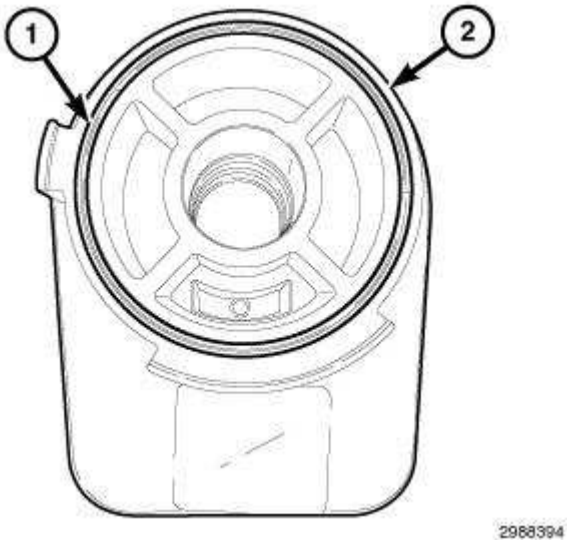

Fig. 332: O-Ring Seal & Oil Cooler

Courtesy of CHRYSLER GROUP, LLC

NOTE: Whenever the oil cooler is serviced, the rubber O-ring seal must be replaced.

1. Clean the sealing surface of the oil cooler (2) and install a new rubber O-ring seal (1).
2. Lightly lubricate the oil cooler rubber O-ring seal (1) with clean engine oil.

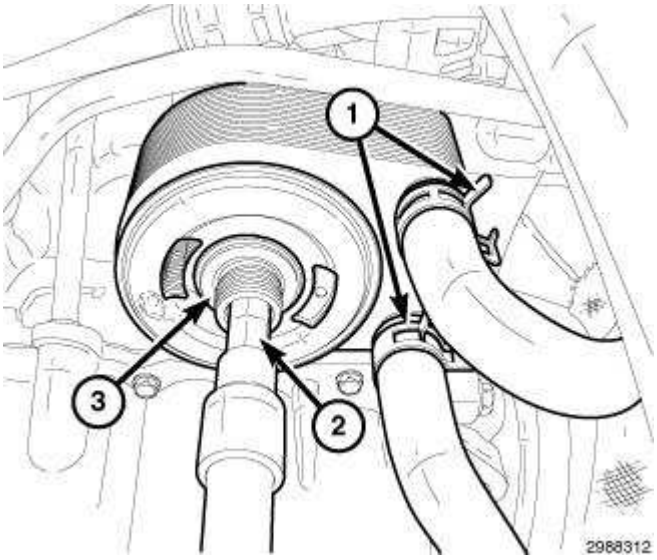

Fig. 333: Clamps, Allen Wrench Socket & Oil Cooler Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a 12 mm Allen Wrench socket (2), install the oil cooler retaining bolt (3) and tighten to 28 N.m (21 ft. lbs.).
4. Position the cooling hoses and install the clamps (1).

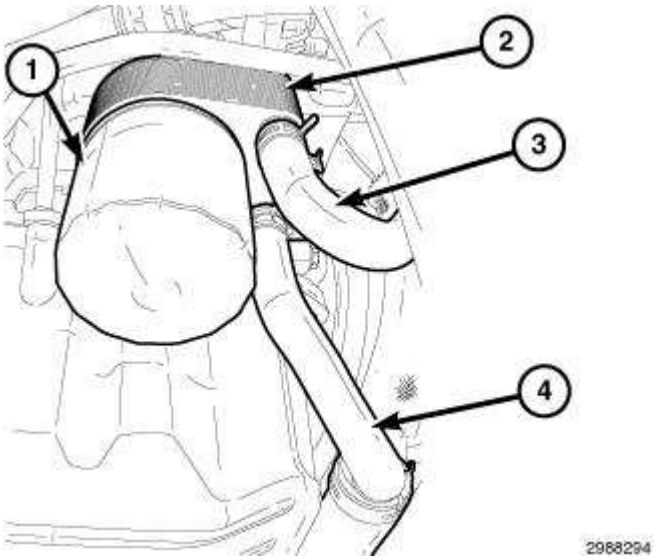

Fig. 334: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

5. Lightly lubricate the oil filter gasket with clean engine oil.

NOTE: Do not over tighten the oil filter.

6. Thread the oil filter (1) onto the oil cooler (2) oil filter boss.
7. When the oil filter gasket makes contact with the oil cooler sealing surface, hand tighten the oil filter one half turn, or 180°.

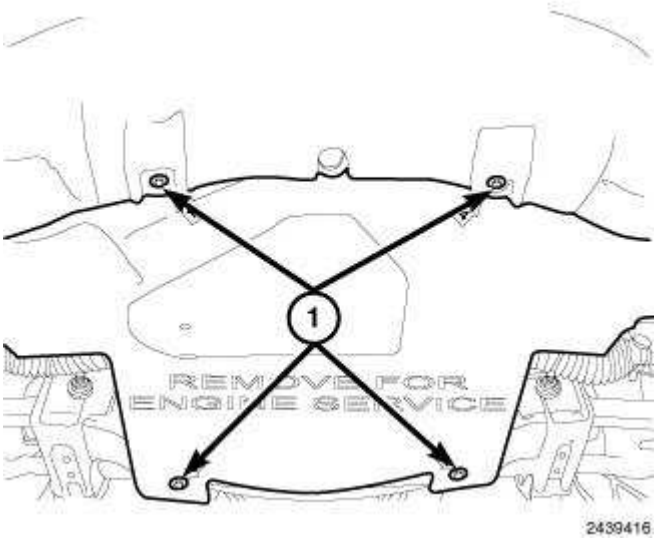

Fig. 335: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Position the belly pan to the under side of the vehicle and install the retainers (1).
9. Lower the vehicle.
10. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
11. Start the engine and check for leaks.
12. Turn the engine off and check the oil level.

FILTER, ENGINE OIL

REMOVAL

REMOVAL

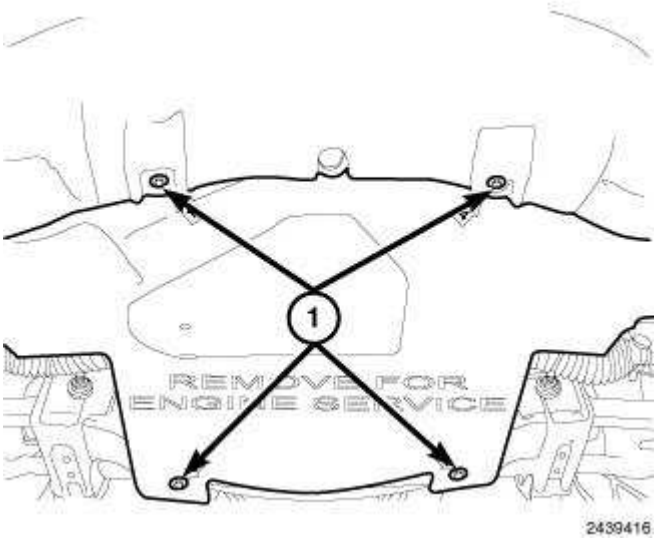

Fig. 336: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

All engines are equipped with a high quality full-flow, disposable type oil filter.

1. Raise and support the vehicle.
2. Remove the belly pan retainers (1) and remove the belly pan.

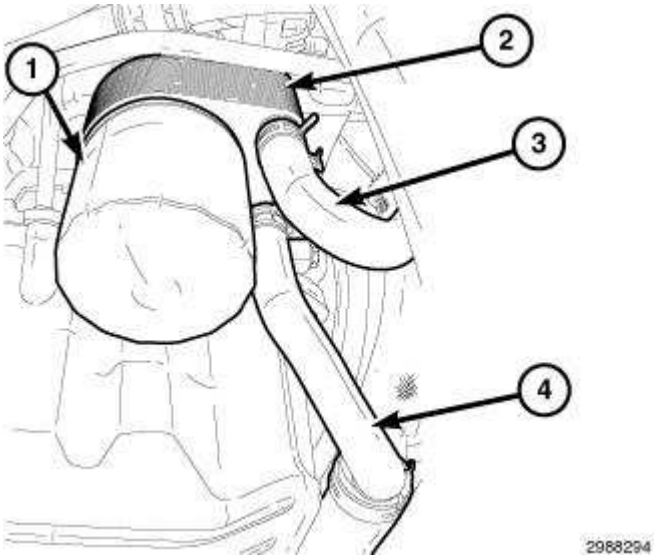

Fig. 337: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

3. Position a drain pan under the oil filter.
4. Using a suitable oil filter wrench, rotate the oil filter (1) counterclockwise to remove it from the oil cooler (2).
5. When the oil filter separates from the oil cooler, keep the gasket end upward to minimize oil spill and remove the oil filter from vehicle.

NOTE: Make sure the oil filter gasket was removed with the oil filter.

6. Using a wiping cloth, clean the oil cooler gasket sealing surface of oil and grime.

INSTALLATION

INSTALLATION

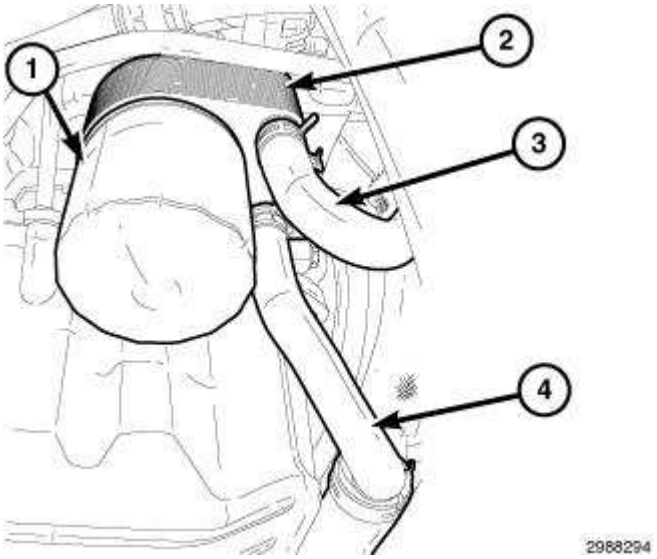

Fig. 338: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

1. Lightly lubricate the oil filter gasket with clean engine oil.

NOTE: Do not over tighten the oil filter.

2. Thread the oil filter (1) onto the oil cooler (2) oil filter boss.
3. When the oil filter gasket makes contact with the oil cooler sealing surface, hand tighten the oil filter one half turn, or 180°.

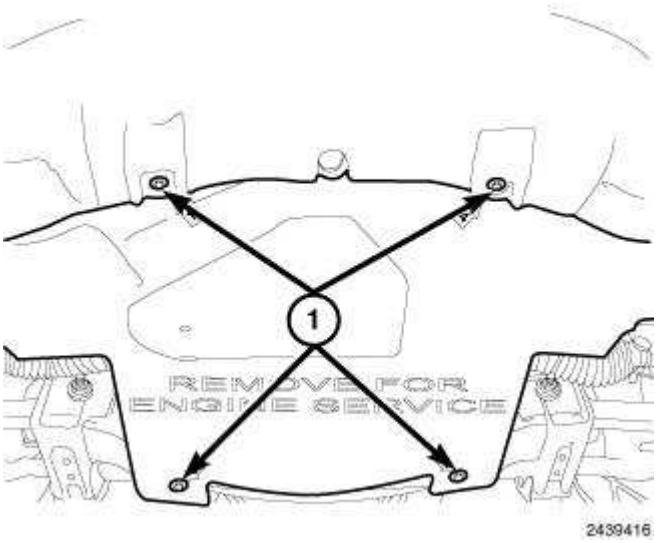

Fig. 339: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the belly pan to the under side of the vehicle and install the retainers (1).
5. Lower the vehicle.
6. Fill the crankcase with the specified type and amount of engine oil as described in this information.
7. Install the oil fill cap.
8. Start the engine and check for leaks.
9. Turn the engine off and check the oil level.

JET, PISTON OIL COOLER

DESCRIPTION

DESCRIPTION

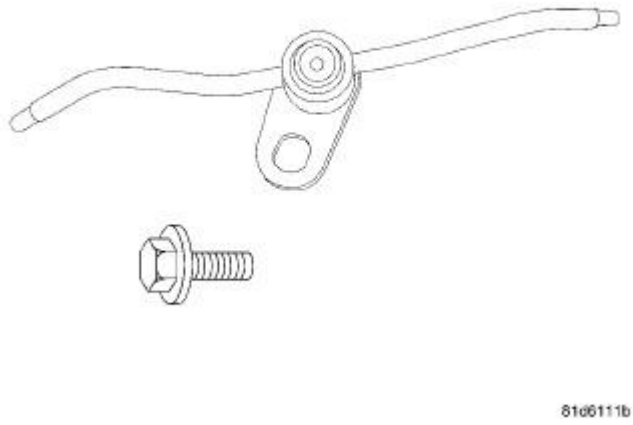

Fig. 340: Engine Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

Four dual-nozzle oil jets are bolted to the cylinder block underneath the main oil gallery. The jets connect with an oil-tight fit to the main gallery through lubrication passages. Each oil jet helps cool the two opposing pistons.

REMOVAL

REMOVAL

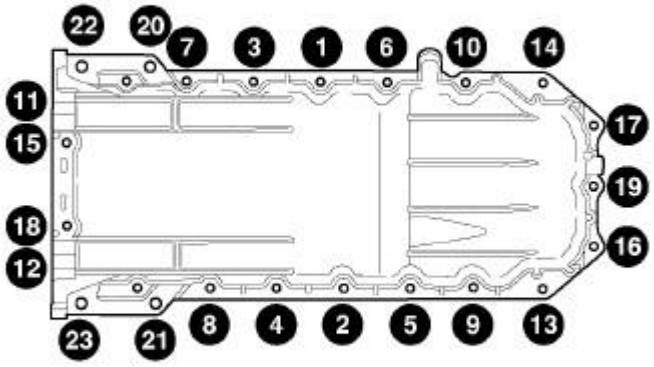

Fig. 341: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Remove the oil pan and oil pump pickup tube. Refer to **PAN, OIL, REMOVAL**.

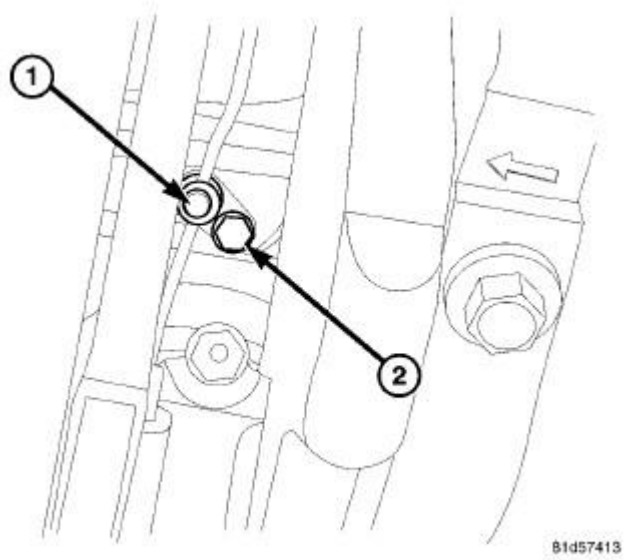

Fig. 342: Piston Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rotate the engine crankshaft to access the piston oil cooler jet retaining bolts.

2. Remove the piston oil cooler jet retaining bolt (2).
3. Remove the piston oil cooler jet (1).

INSTALLATION

INSTALLATION

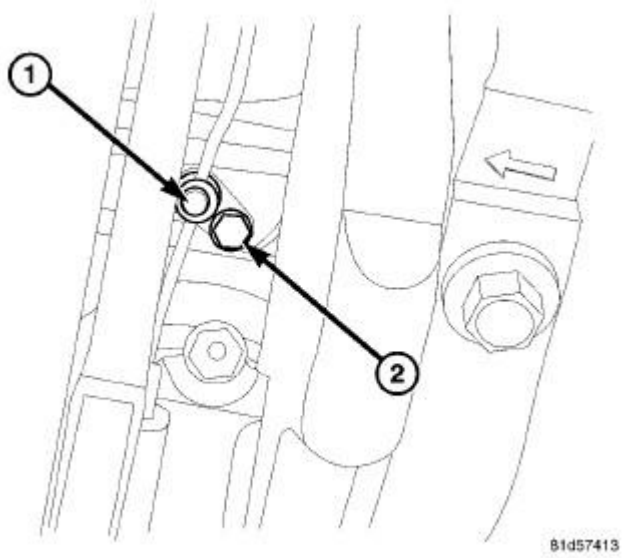

Fig. 343: Piston Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the piston oil cooler jet (1).
2. Install the piston oil cooler jet retaining bolt and tighten to 13 N.m (10 ft. lbs.) (2).

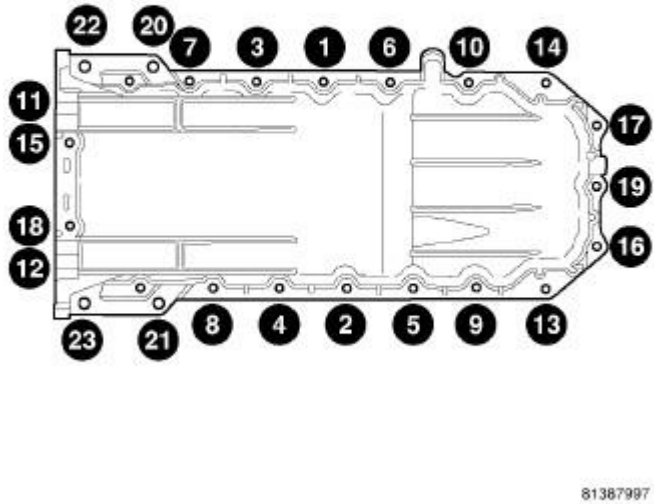

Fig. 344: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Install the engine oil pump pickup tube and oil pan. Refer to **PAN, OIL, INSTALLATION**.

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL SERVICE

CRANKCASE OIL LEVEL INSPECTION

On the 6.4L engine, the oil level indicator is located on the right side of the engine.

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect the engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten minutes before checking the oil level. Checking the engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil level indicator.

1. Position the vehicle on the level surface.
2. With the engine off, allow approximately five minutes for the oil to settle to the bottom of the crankcase and then remove the engine oil level indicator.
3. Wipe the oil level indicator clean.
4. Install the oil level indicator and verify it is seated in the tube.
5. Remove the oil level indicator, with the handle held above the tip, observe the oil level reading.
6. Add oil only if the level is below the ADD mark on the oil level indicator.

ENGINE OIL CHANGE

Change the engine oil at the mileage and time intervals described in the Maintenance Schedules. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

Run the engine until it reaches normal operating temperature.

1. Remove the oil fill cap.
2. Raise and support the vehicle.
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
4. Place a suitable drain pan under the oil pan drain.
5. Remove the drain plug from the oil pan and allow the oil to drain.
6. Inspect the drain plug threads for stretching or other damage and replace if necessary.
7. Install the drain plug and tighten to 27 N.m (20 ft. lbs.).
8. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .

9. Lower the vehicle and fill the crankcase with the specified type and amount of engine oil described in this information.
10. Install the oil fill cap.
11. Start the engine and check for leaks.
12. Stop the engine and check the oil level.

NOTE: Care should be exercised when disposing of used engine oil.

PAN, OIL

REMOVAL

REMOVAL

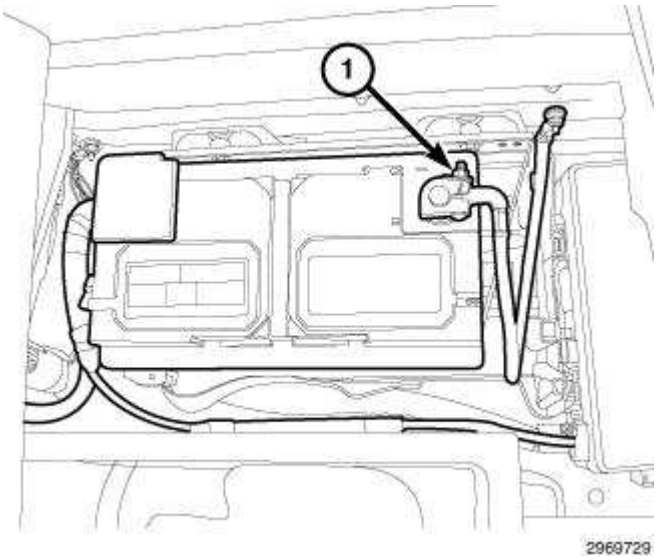

Fig. 345: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove the engine oil dipstick and tube from the oil pan.
4. Raise and support the vehicle.

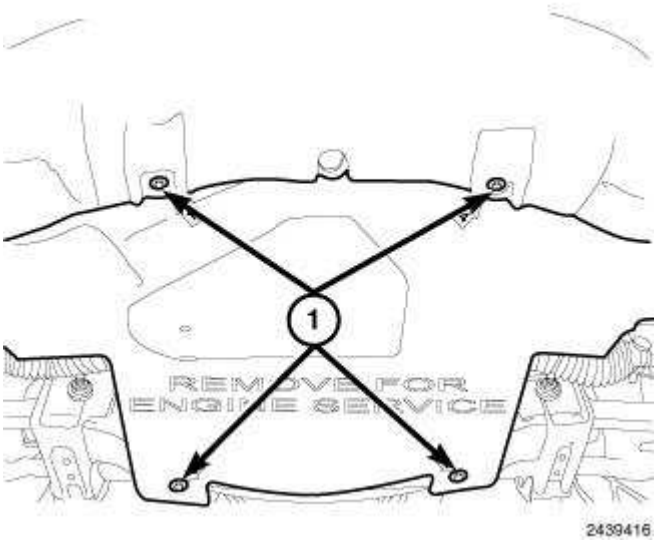

Fig. 346: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan retainers (1) and remove the belly pan.
6. Drain the engine oil and remove the oil filter.

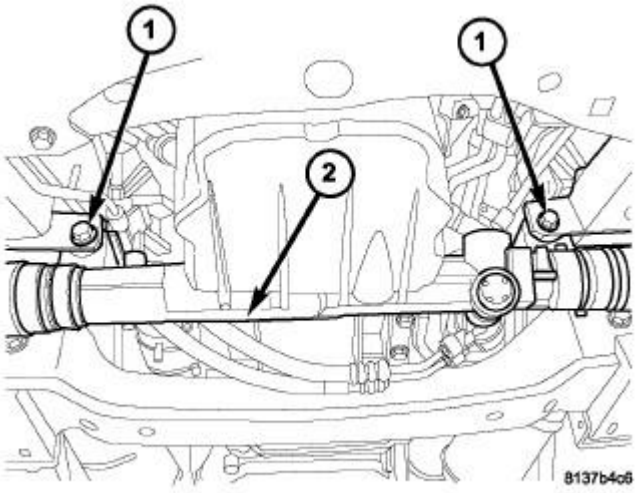

Fig. 347: Gear Mounting Bolts & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not remove P/S hoses, tie rod ends or disconnect the steering column coupler.

7. Remove the steering gear mounting bolts (1) and lower the steering gear (2) to provide clearance to remove the oil pan.

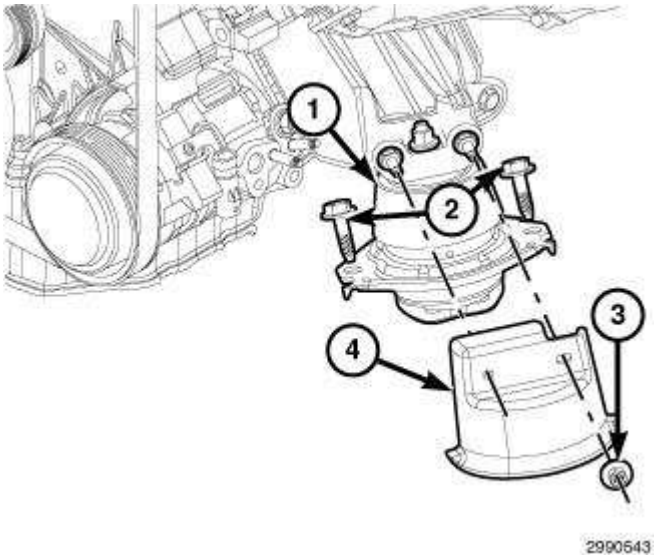

Fig. 348: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

8. Remove both left/right front engine mount heat shield retaining nuts (3) and remove the heat shields (4).
9. Remove both left/right front engine mount lower retaining bolts (2).
10. Lower the vehicle.

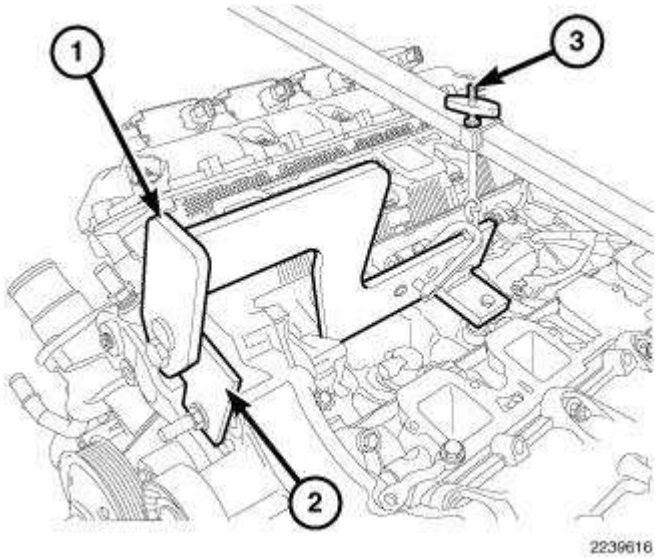

Fig. 349: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install engine lift fixture.

11. Install the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).
12. Raise the engine to provide clearance to remove the oil pan.

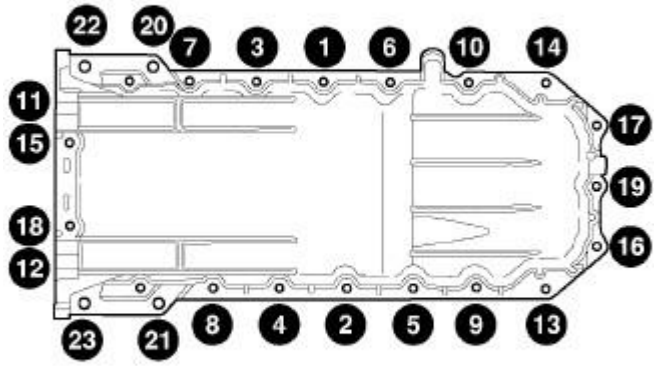

Fig. 350: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not pry on the oil pan or oil pan gasket. The oil pan gasket is integral to the engine windage tray and does not come out with the oil pan.

NOTE: The horizontal M10 retaining bolts (11, 12, 15, 18) are 5 mm longer in length then the vertical M10 retaining bolts (20, 21, 22, 23) and must be reinstalled in their original locations.

13. Raise and support the vehicle.
14. Remove the M10 retaining bolts (horizontal 11, 12, 15, 18 and vertical 20, 21, 22, 23) from the rear of the oil pan to the transmission.
15. Remove the M6 retaining bolts and remove the oil pan.

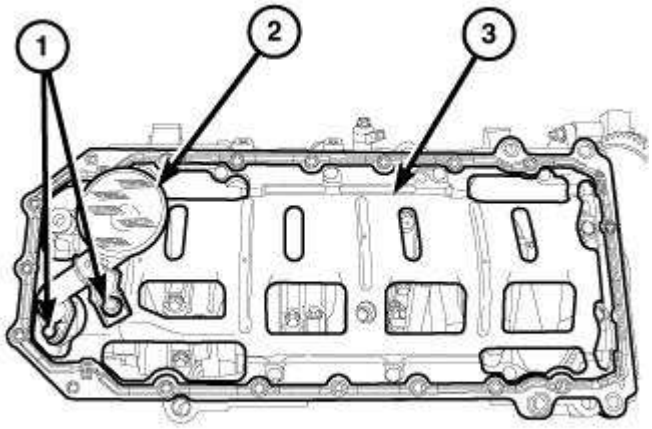

Fig. 351: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

16. Remove the oil pump pickup tube retaining bolt and nut (1).
17. Remove the oil pump pickup tube (2).
18. Remove and discard the oil pan gasket/windage tray (3).

INSTALLATION

INSTALLATION

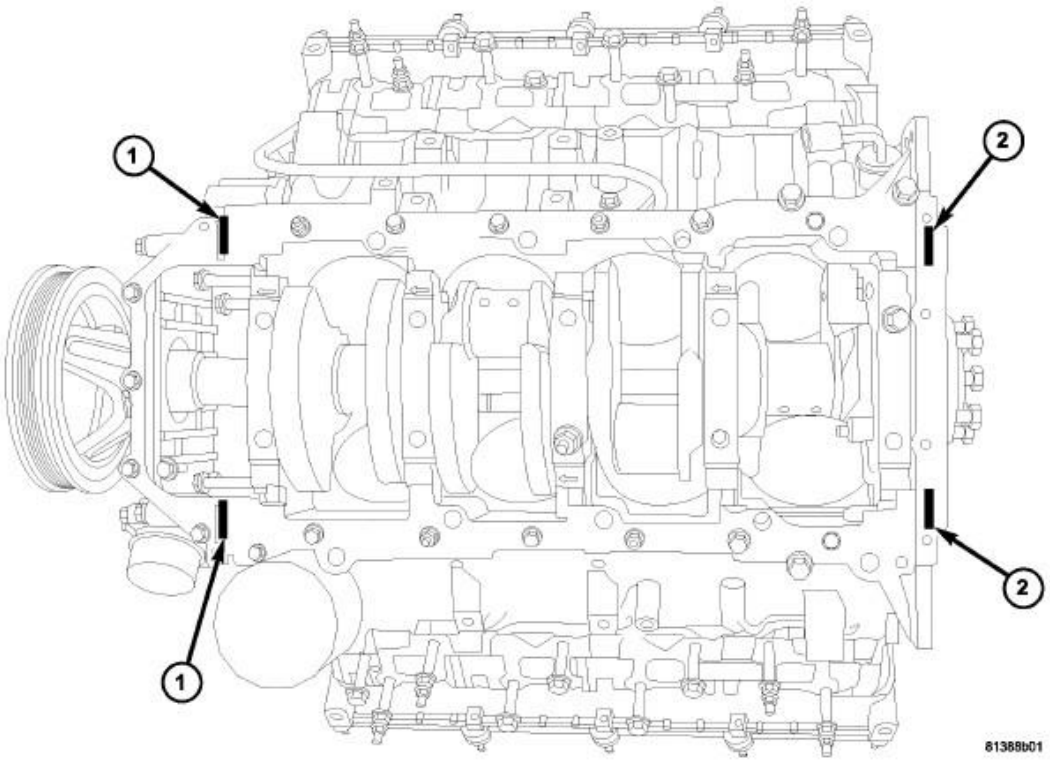

Fig. 352: T-Joint RTV Sealant Application Locations
Courtesy of CHRYSLER GROUP, LLC

1 - Front Cover T-Joints
2 - Rear Oil Retainer T-Joints

NOTE: Mopar® Engine RTV must be applied to the 4 T-joints, the area where the front cover, rear retainer and oil pan gasket meet. The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

1. Clean the oil pan gasket mating surface of the engine block and oil pan.
2. Apply Mopar® Engine RTV at the 4 T- joints (1, 2).

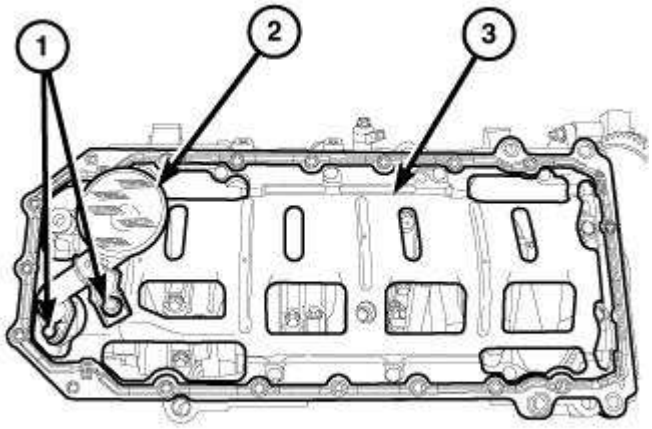

Fig. 353: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray (3).
4. Using a new O-ring, position the oil pump pickup tube (2) into the oil pump.
5. Install the oil pump pickup tube retaining bolt and nut (1) and tighten to 28 N.m (21 ft. lbs.).

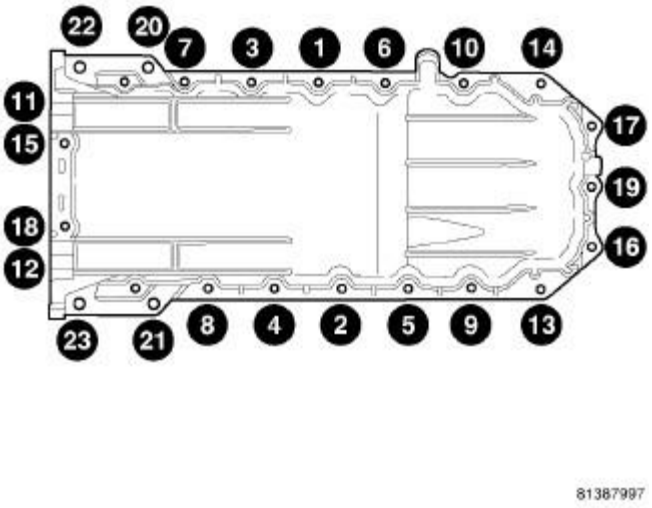

Fig. 354: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The horizontal M10 retaining bolts (11, 12, 15, 18) are 5 mm longer in length then the vertical M10 retaining bolts (20, 21, 22, 23) and must be reinstalled in their original locations.**

NOTE: **New M6 retaining bolts must be used when reinstalling the oil pan. Do not reuse the old M6 retaining bolts.**

6. Align the rear of the oil pan with the rear face of the engine block and install the M10 and M6 retaining bolts finger tight.
7. Using the sequence shown in illustration, tighten the M6 retaining bolts to 5 N.m (44 in. lbs.).
8. Using the sequence shown in illustration, tighten the M10 retaining bolts to 54 N.m (40 ft. lbs.).
9. Using the sequence shown in illustration, tighten the M6 retaining bolts to 12 N.m (9 ft. lbs.).
10. Lower the vehicle.

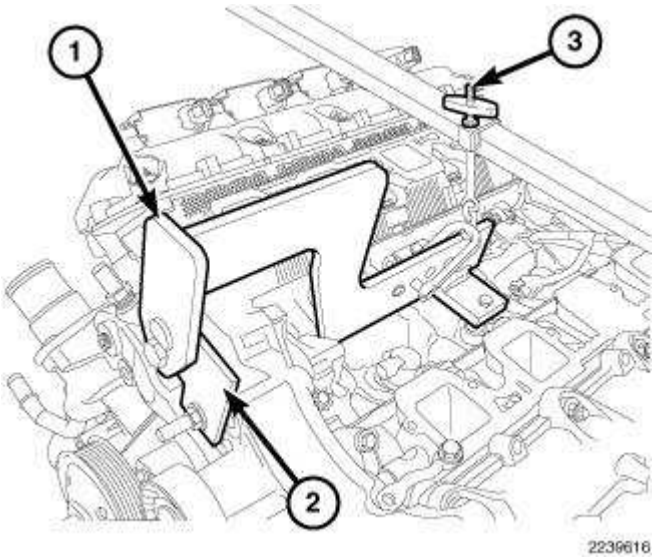

Fig. 355: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

11. Using the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) lower the engine into position and remove.
12. Install the engine oil dipstick tube and dipstick.
13. Raise and support the vehicle.

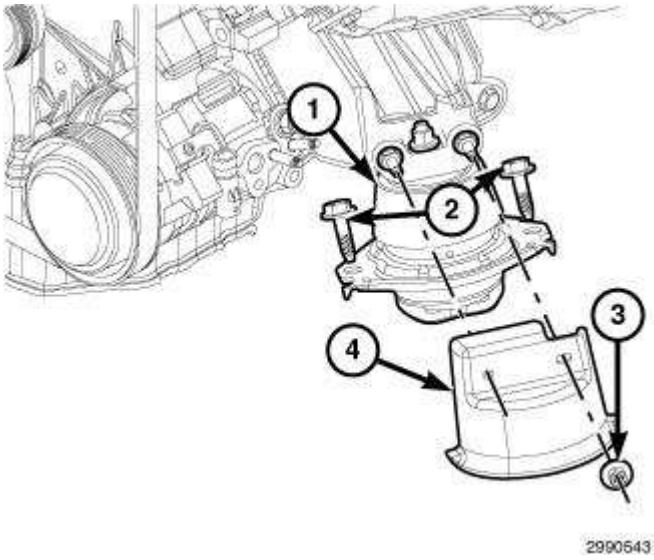

Fig. 356: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

14. Install both engine mount lower retaining bolts (2) and tighten to 61 N.m (45 ft. lbs.).
15. Position both engine mount heat shields (4) and install retaining nuts (3).

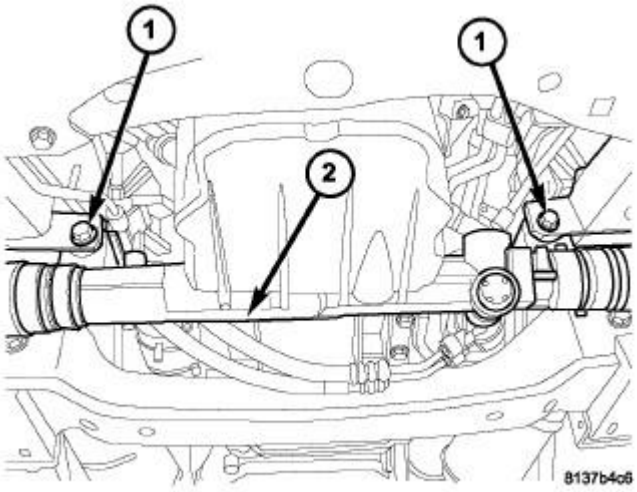

Fig. 357: Gear Mounting Bolts & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

16. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).

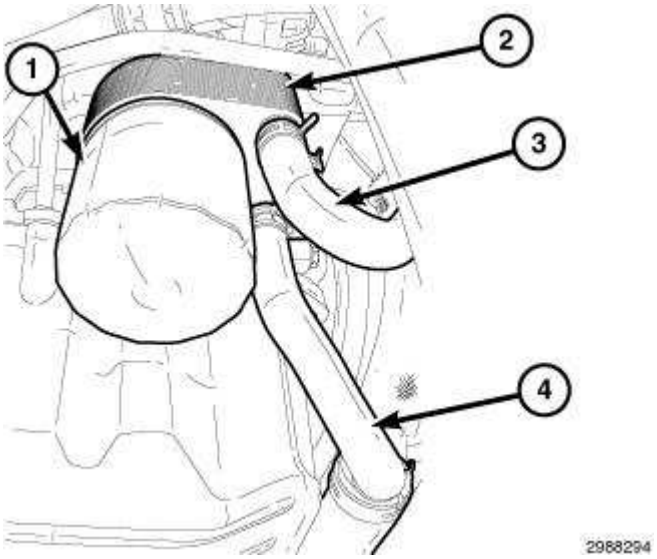

Fig. 358: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

17. Lightly lubricate the oil filter gasket with clean engine oil.

NOTE: Do not over tighten the oil filter.

18. Thread the oil filter (1) onto the oil cooler (2) oil filter boss.
19. When the oil filter gasket makes contact with the oil cooler sealing surface, hand tighten the oil filter one half turn, or 180°.

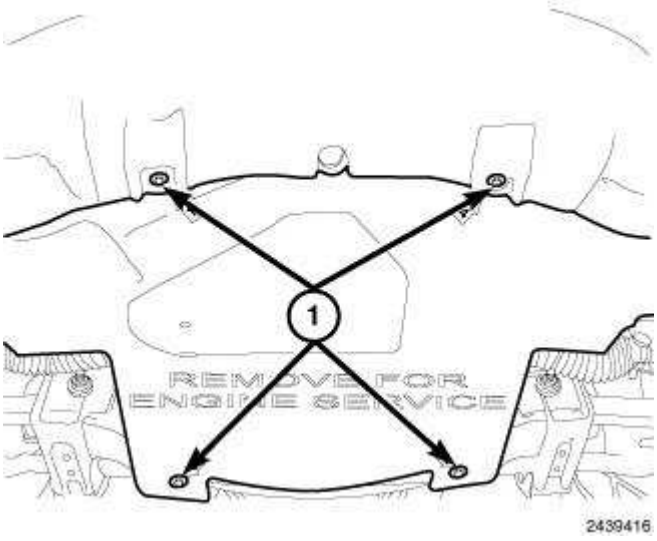

Fig. 359: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

20. Position the belly pan to the under side of vehicle and install belly pan retainers (1).

21. Lower the vehicle.
22. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
23. Fill the engine with oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.

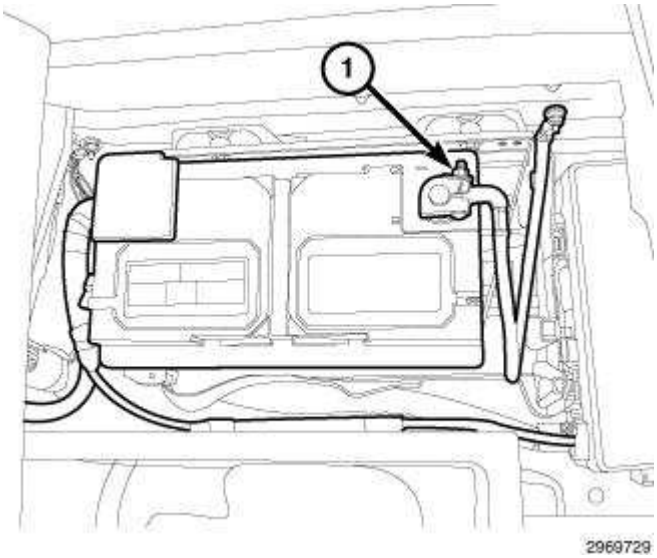

Fig. 360: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

24. Connect the negative battery cable (1).
25. Start the engine and check for leaks.

PUMP, ENGINE OIL

REMOVAL

REMOVAL

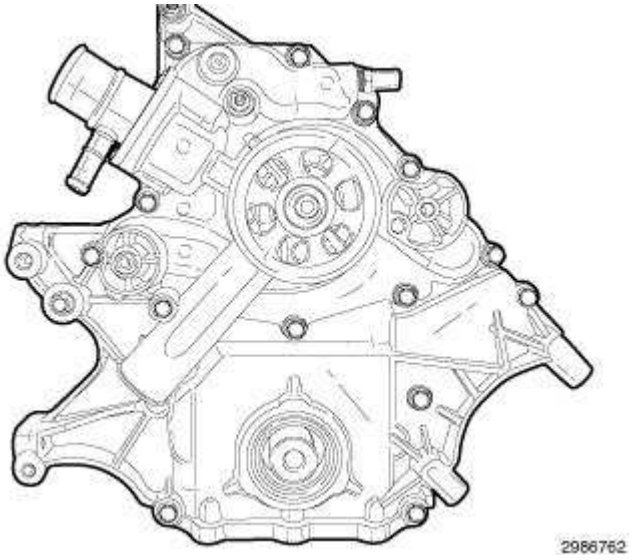

Fig. 361: Engine Timing Cover
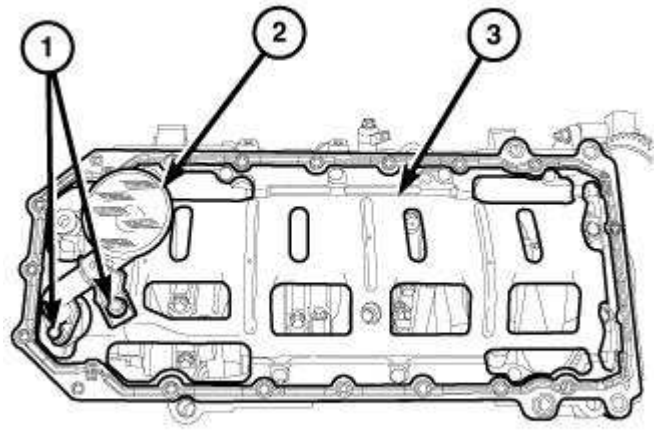
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove water pump for timing cover removal.

1. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

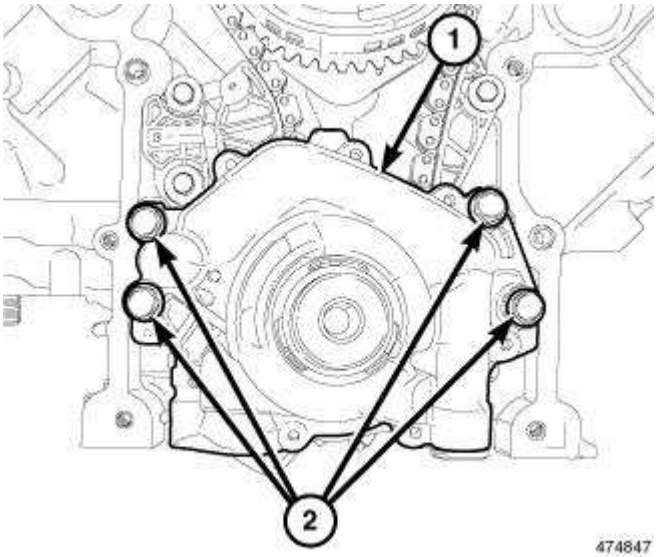


2970744

Fig. 362: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray (3) assembly must be installed, the old gasket cannot be reused.

2. Remove the oil pan and oil pump pickup tube (2). Refer to **PAN, OIL, REMOVAL**.



474847

Fig. 363: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

CLEANING

CLEANING

1. Wash all parts in a suitable solvent.
2. Using compressed air, carefully dry parts.

INSPECTION

INSPECTION

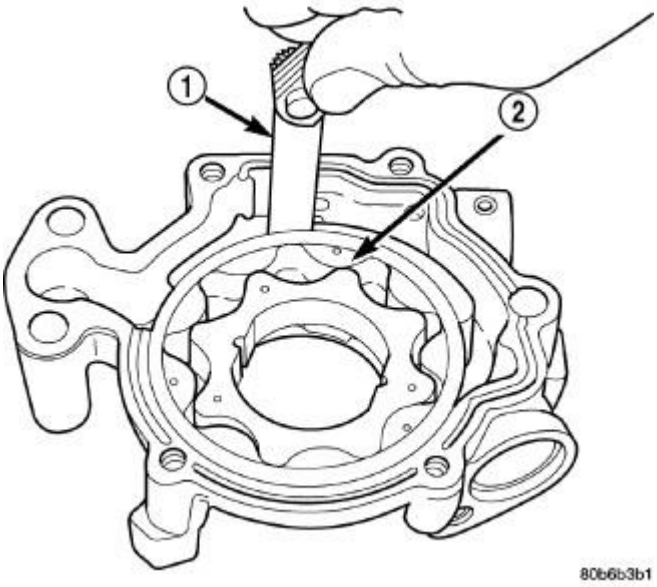


Fig. 364: Measuring Outer Rotor Clearance in Housing
Courtesy of CHRYSLER GROUP, LLC

1 - FEELER GAUGE
2 - OUTER ROTOR

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Remove the pump cover.
2. Clean all parts thoroughly. The mating surface of the oil pump housing should be smooth. If the oil pump cover is scratched or grooved the oil pump assembly should be replaced.
3. Slide the outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil

pump body and measure the clearance between the outer rotor (2) and the body. If the measurement is 0.235 mm (0.009 in.) or greater the oil pump assembly must be replaced.

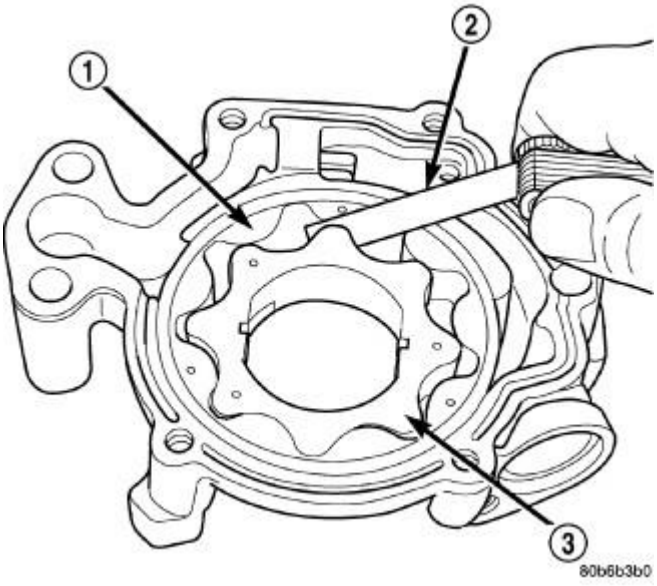

Fig. 365: Measuring Clearance Between Inner & Outer Rotors
Courtesy of CHRYSLER GROUP, LLC

1 - OUTER ROTOR
2 - FEELER GAUGE
3 - INNER ROTOR

4. Install the inner rotor into the oil pump body. Measure the clearance between the inner (3) and outer (1) rotors. If the clearance between the rotors is 0.150 mm (0.006 in.) or greater the oil pump assembly must be replaced.

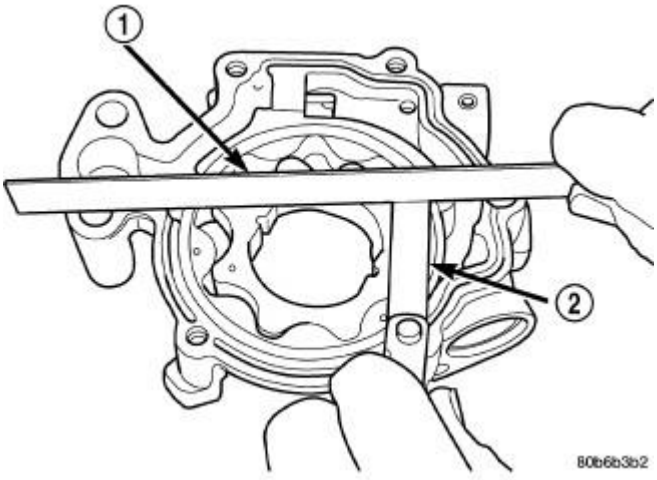

Fig. 366: Measuring Clearance Over Rotors
Courtesy of CHRYSLER GROUP, LLC

1 - STRAIGHT EDGE
2 - FEELER GAUGE

5. Place a straight edge (1) across the body of the oil pump (between the bolt holes), using a feeler gauge (2), measure the clearance between the straightedge and the rotors. If the clearance is 0.095 mm (0.0038 in.) or greater the oil pump must be replaced.
6. Install the pump cover and tighten retainers to 15 N.m (11 ft. lbs.)

NOTE: The 6.4L oil pump is serviced as an assembly. There are no Chrysler part numbers for sub-assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

INSTALLATION

INSTALLATION

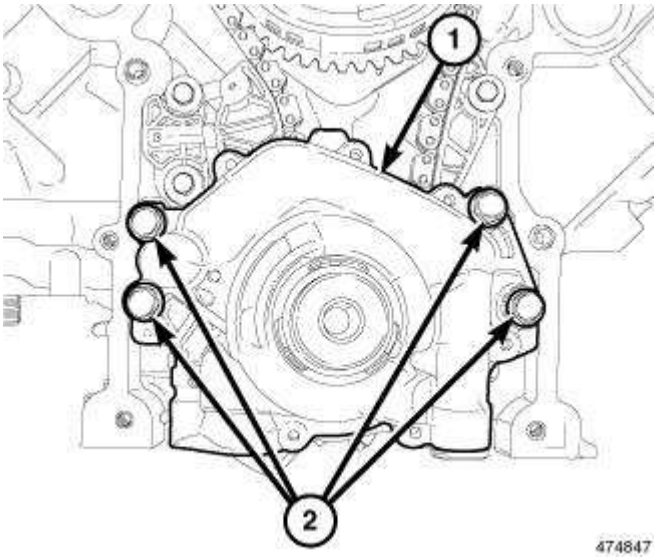

Fig. 367: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the oil pump (1) onto the crankshaft, install the retaining bolts (2) and tighten to 28 N.m (21 ft. lbs.).

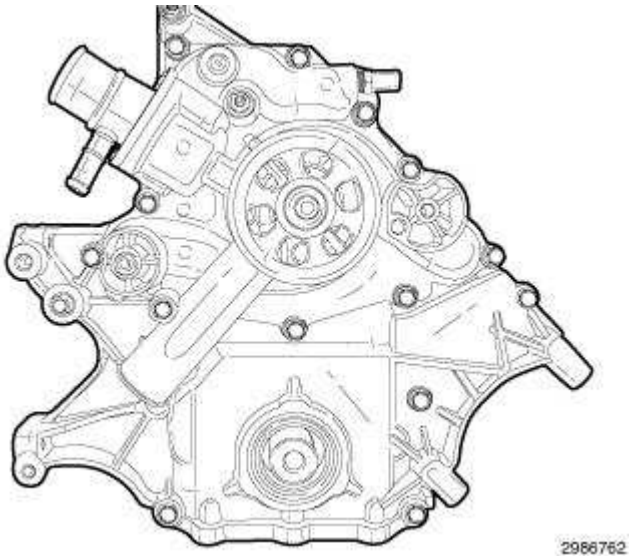

Fig. 368: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

2. Install the timing chain cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.

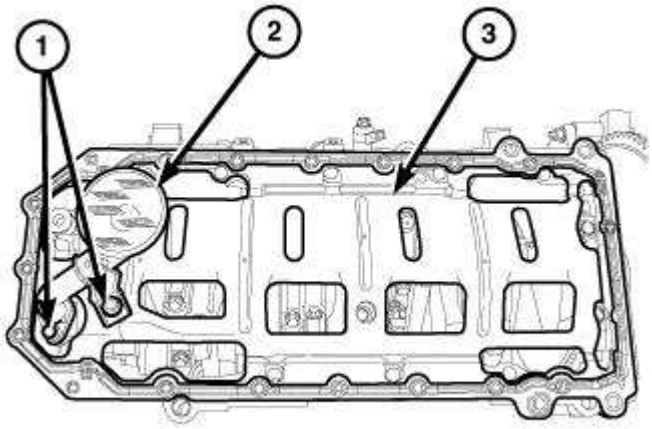

Fig. 369: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

The oil pressure sensor uses the following three circuits:

- Signal circuit to the PCM
- Sensor ground circuit through the PCM
- 5 volt reference circuit from the PCM

The oil pressure sensor returns a voltage signal back to the PCM with reference to oil pressure. Ground for the sensor is supplied by the PCM.

The oil pressure sensor is located on the right side of the engine block. The sensor screws into the engines main oil gallery.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Remove the upper generator mounting bolt.
4. Raise and support the vehicle.

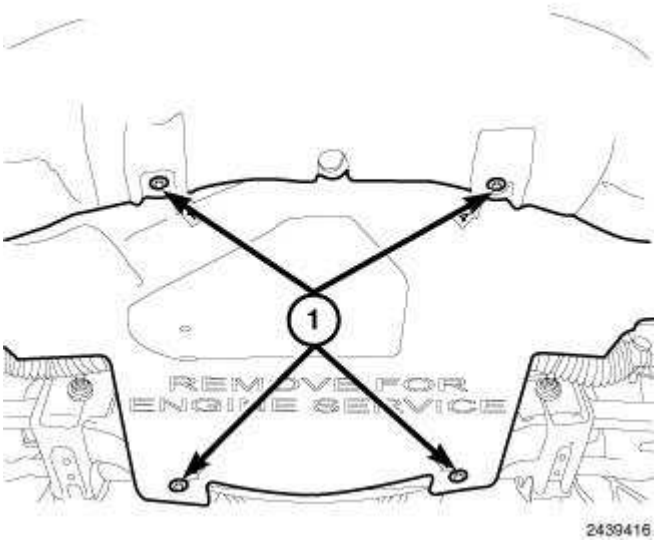

Fig. 370: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan retainers (1) and remove the belly pan.

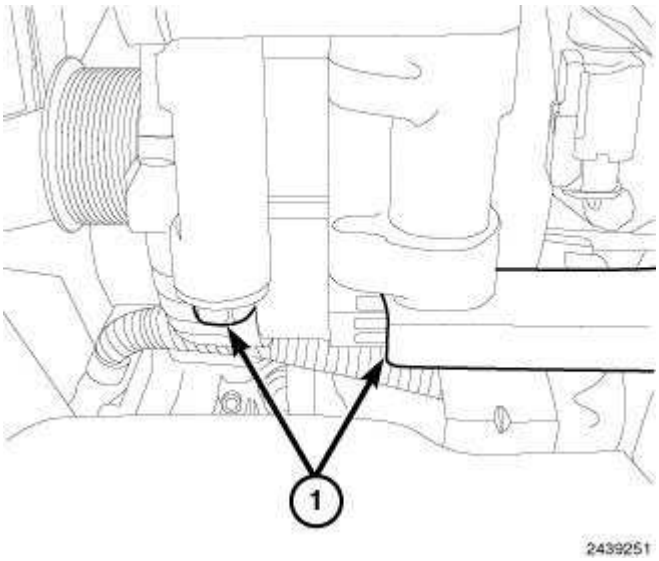

Fig. 371: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower generator retaining bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil pressure sensor.

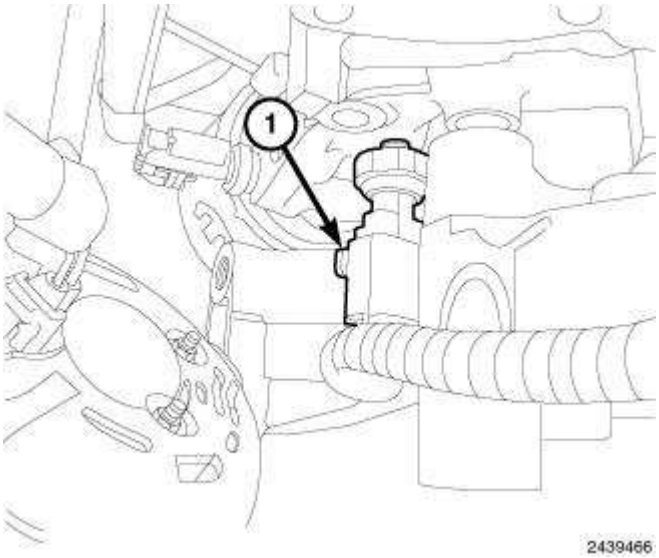

Fig. 372: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the oil pressure sensor electrical connector (1).

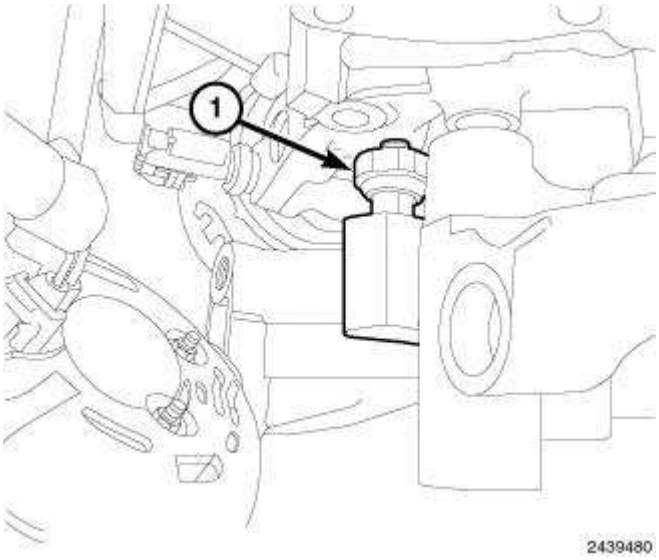

Fig. 373: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil pressure sensor (1).

INSTALLATION

INSTALLATION

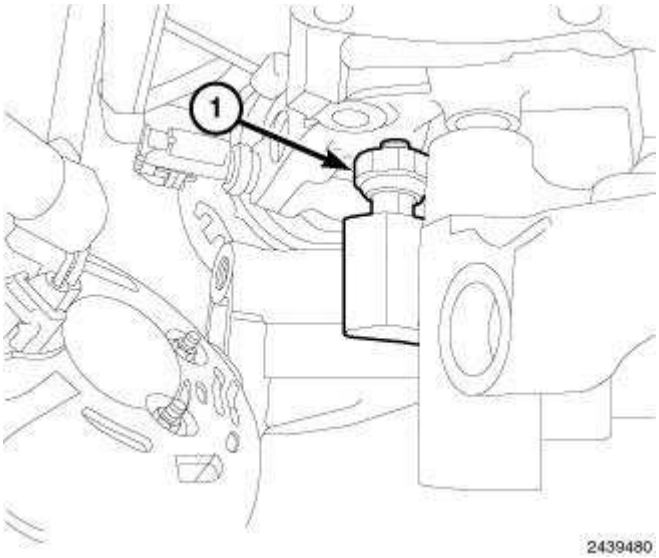

Fig. 374: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil pressure sensor (1).

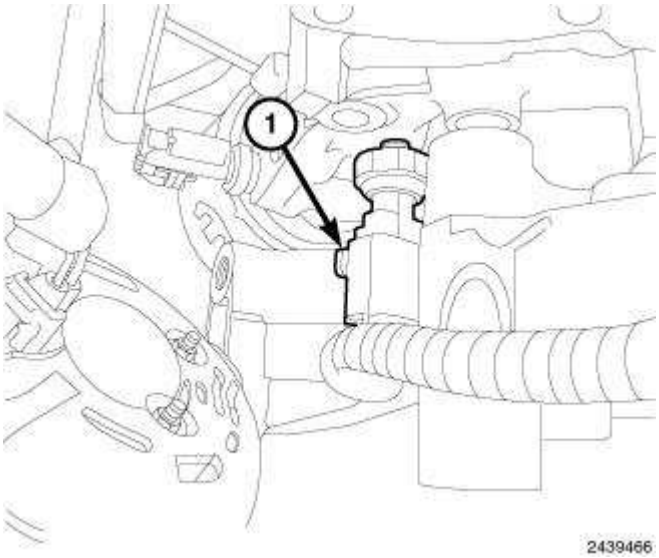

Fig. 375: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil pressure sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

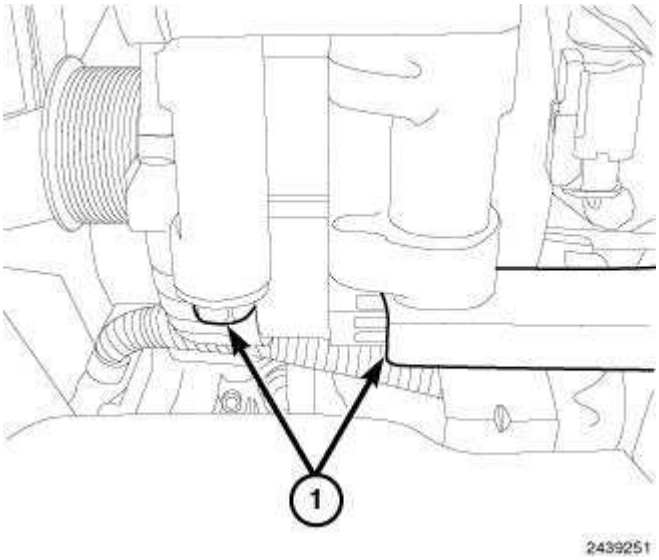

Fig. 376: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs).

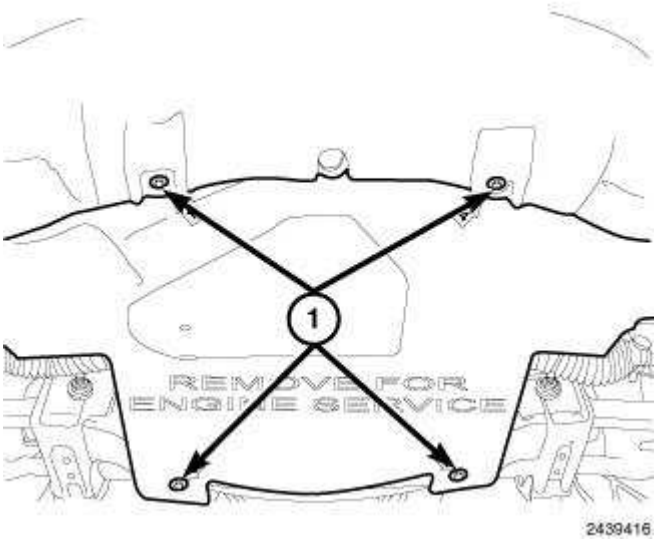

Fig. 377: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Position the lower splash shield and install the retainers (1).
7. Lower the vehicle
8. Tighten the upper generator mounting bolt to 55 N.m (41 ft. lbs).

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to

overheat.

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
10. Connect the negative battery cable.

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

The oil temperature sensor uses the following two circuits:

- Signal circuit to the PCM
- Ground circuit from the PCM

The oil temperature sensor is a Negative Thermal Coefficient sensor. The resistance of the sensor changes as oil temperature changes. This results in different output voltages back to the PCM.

The oil temperature sensor is located on the right side of the engine block.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Remove the generator upper mounting bolt.
4. Raise and support the vehicle.

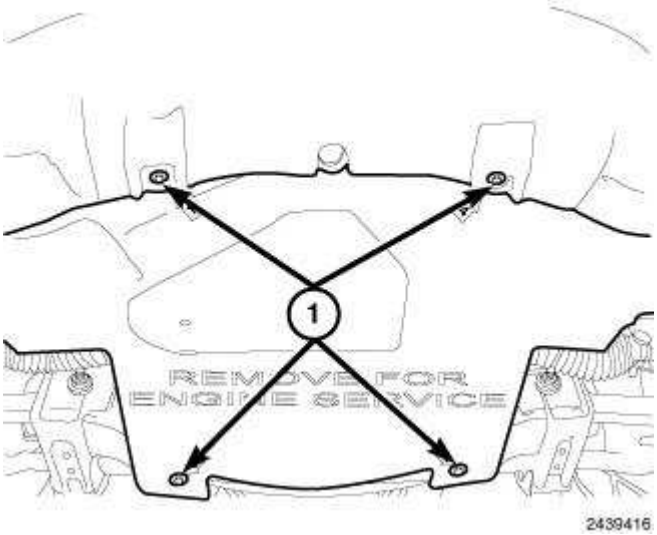

Fig. 378: Lower Splash Shield & Fasteners

Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan retainers (1) and remove the belly pan.

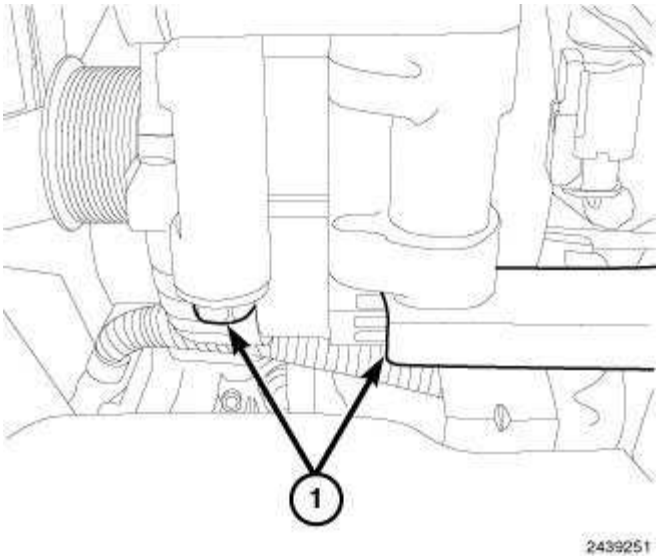

Fig. 379: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the generator lower mounting bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil temperature sensor.

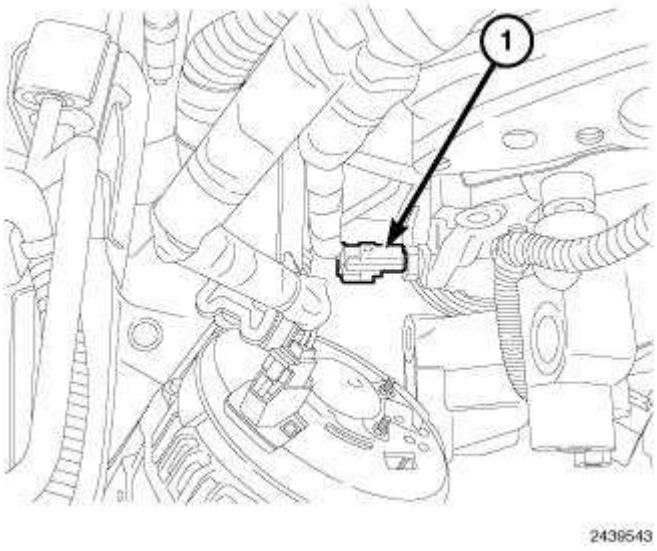

Fig. 380: Oil Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the oil temperature sensor electrical connector (1).

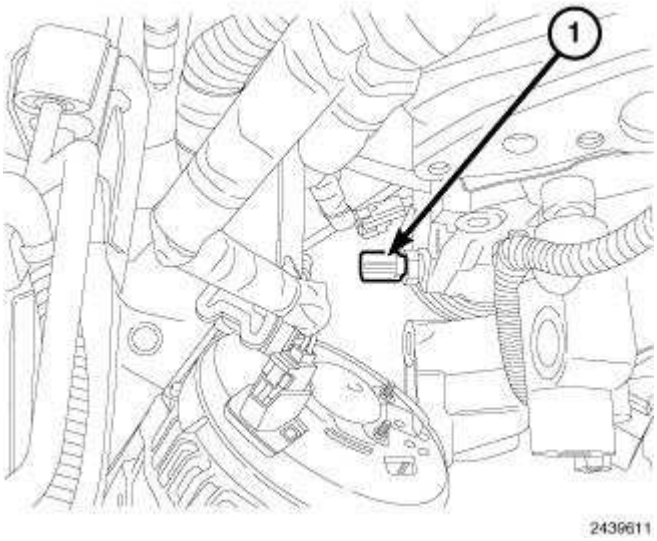

Fig. 381: Oil Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil temperature sensor (1).

INSTALLATION

INSTALLATION

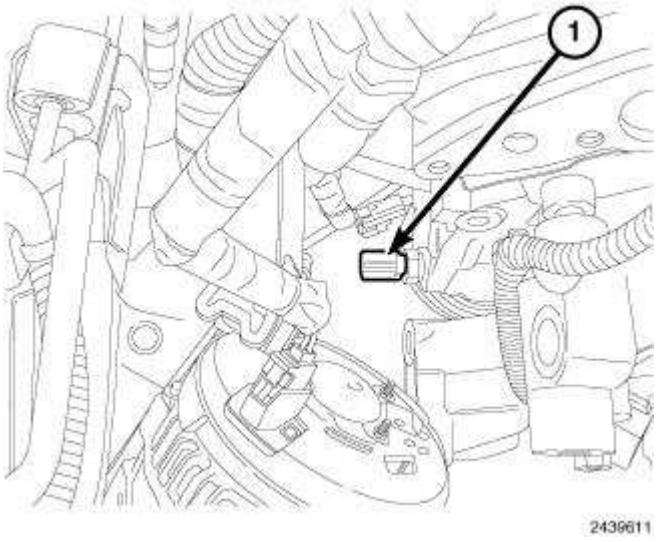

Fig. 382: Oil Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil temperature sensor (1).

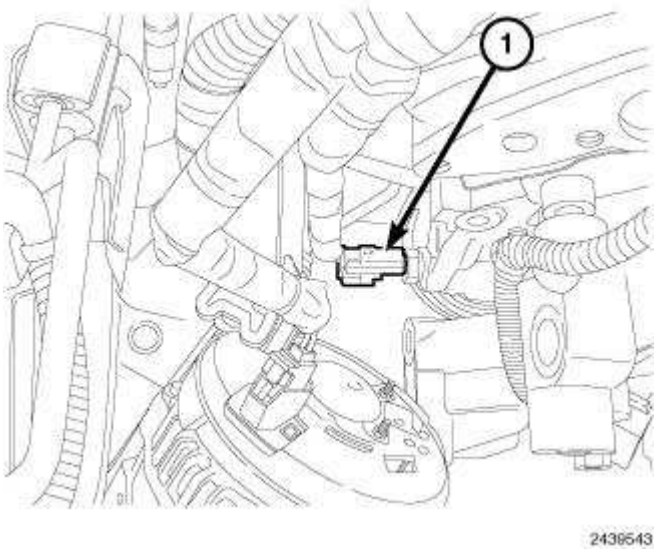

Fig. 383: Oil Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil temperature sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

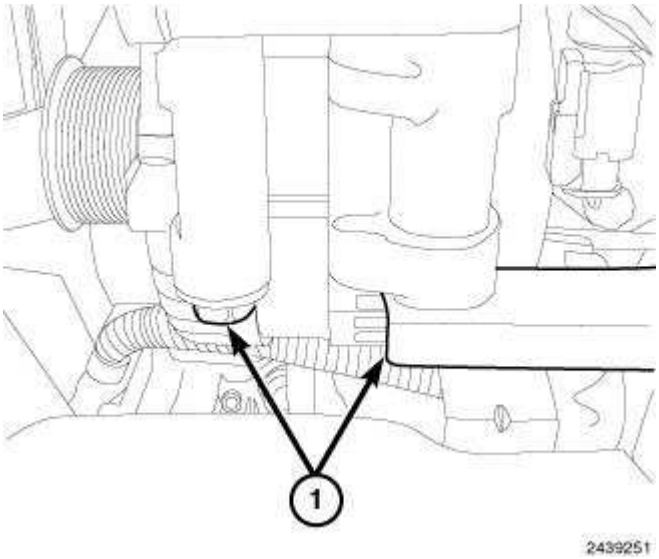

Fig. 384: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the generator lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs.).

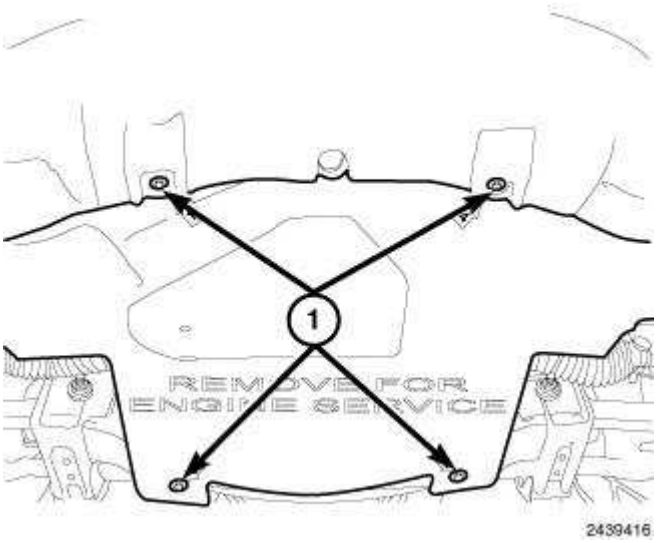

Fig. 385: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Position the belly pan to the under side of the vehicle and install the retainers (1).
7. Lower the vehicle.
8. Tighten the generator upper mounting bolt to 55 N.m (41 ft. lbs.).

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
10. Connect the negative battery cable.

MANIFOLDS

MANIFOLD, EXHAUST

DESCRIPTION

DESCRIPTION

The exhaust manifolds are tube in shell air gap design to maximize durability and performance. The exhaust manifolds are made of stainless steel stamped shells and stainless steel tubes with a powdered metal outlet. A layered graphite over perforated steel manifold gasket is used to provide sealing to the cylinder head.

OPERATION

OPERATION

The exhaust manifolds collect the engine exhaust gases exiting the combustion chambers and then channels the exhaust gases to the exhaust pipes/catalytic converters.

REMOVAL

REMOVAL

EXHAUST MANIFOLDS

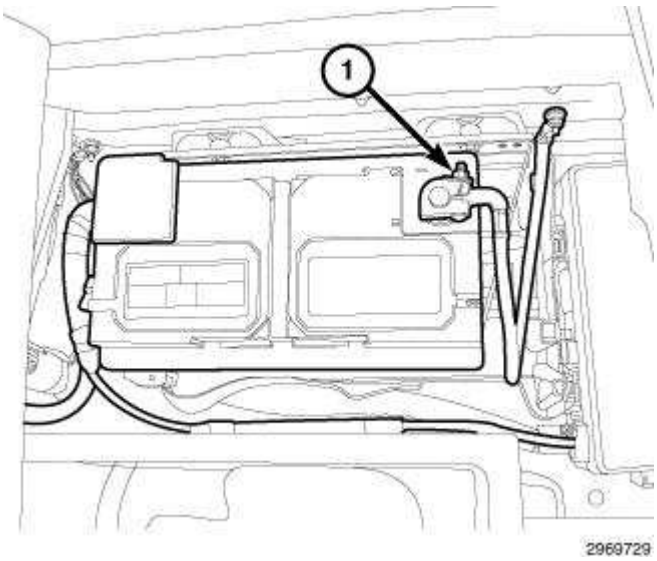

Fig. 386: Negative Battery Cable

NOTE: The left side shown in illustration. Right side similar.

1. Disconnect the negative battery cable (1).

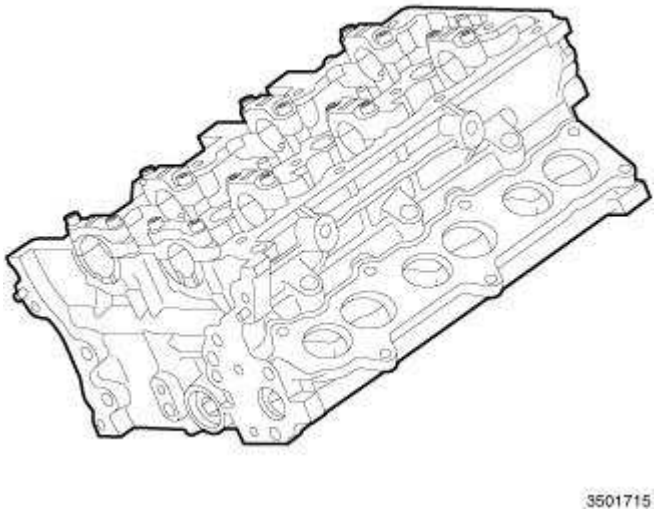

Fig. 387: Cylinder Head

Courtesy of CHRYSLER GROUP, LLC

2. Remove cylinder head. Refer to **CYLINDER HEAD, REMOVAL**.

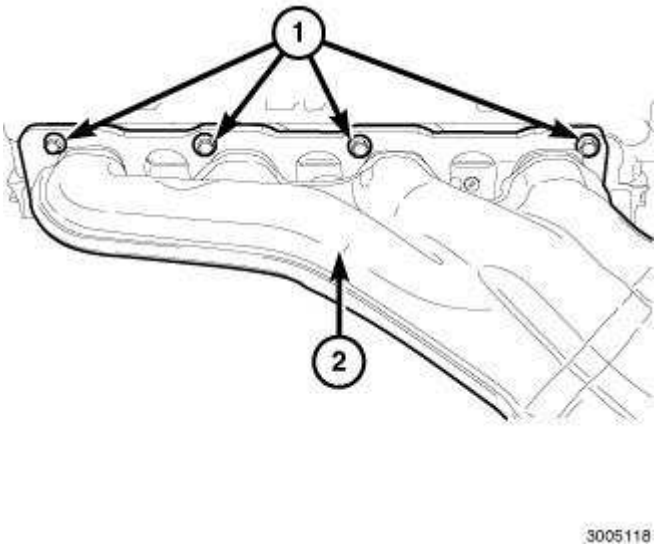

Fig. 388: Exhaust Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the exhaust manifold (2) top row of bolts (1).

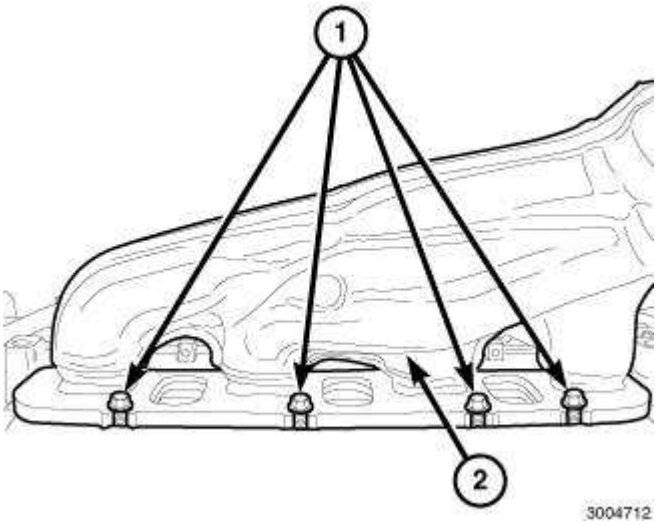

Fig. 389: Exhaust Manifold Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the exhaust manifold heat shield.
5. Remove the exhaust manifold bottom row of bolts (1).

CLEANING

CLEANING

Clean the mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

INSPECTION

Inspect the exhaust manifold for cracks.

Inspect the mating surface of the exhaust manifold for flatness with a straight edge. The exhaust manifold gasket surface must be flat and within 0.67 mm (0.0264 in.) overall.

INSTALLATION

INSTALLATION

EXHAUST MANIFOLDS

NOTE: Left side shown in illustration. Right side similar.

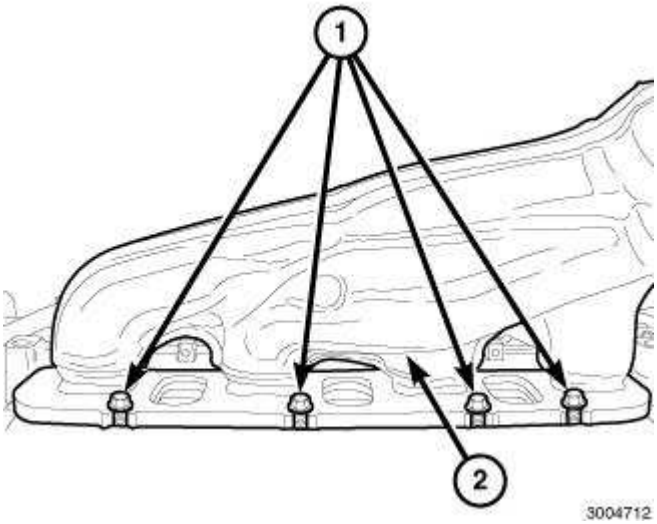

Fig. 390: Exhaust Manifold Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean the sealing surfaces of the exhaust manifold and cylinder head.
2. Using a new exhaust manifold gasket, position the exhaust manifold (2).
3. Install the exhaust manifold bottom row of bolts (1) finger tight.

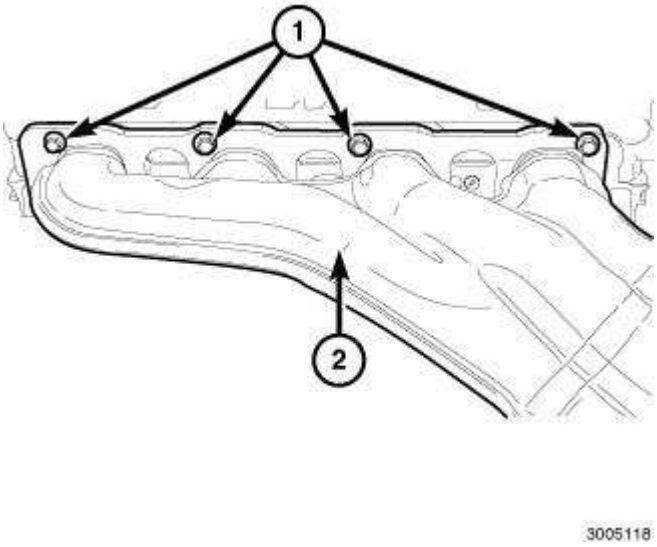

Fig. 391: Exhaust Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the exhaust manifold (2) top row of bolts (1) and tighten to 31 N.m (23 ft. lbs.).
5. Position the coolant bottle (1) and install the retaining bolts (2).
6. Raise and support the vehicle.

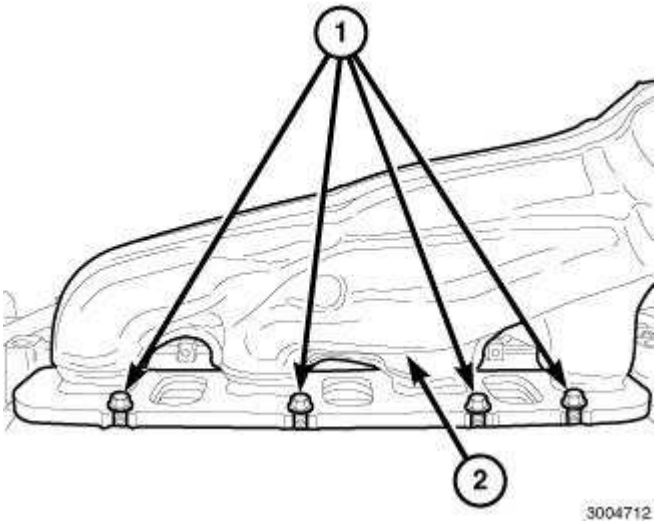

Fig. 392: Exhaust Manifold Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the exhaust manifold bottom row of bolts to 31 N.m (23 ft. lbs.).
8. Install the exhaust manifold heat shield.

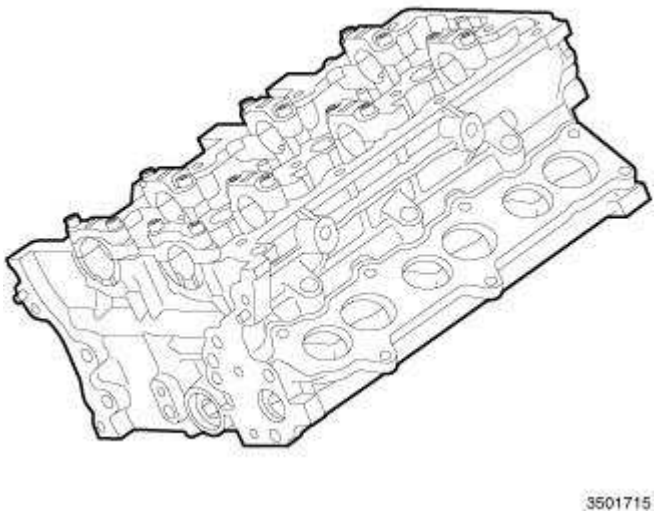

Fig. 393: Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

9. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.

Courtesy of CHRYSLER GROUP, LLC

10. Connect the negative battery cable (1).
11. Start the engine and check for leaks.

MANIFOLD, INTAKE

DESCRIPTION

DESCRIPTION

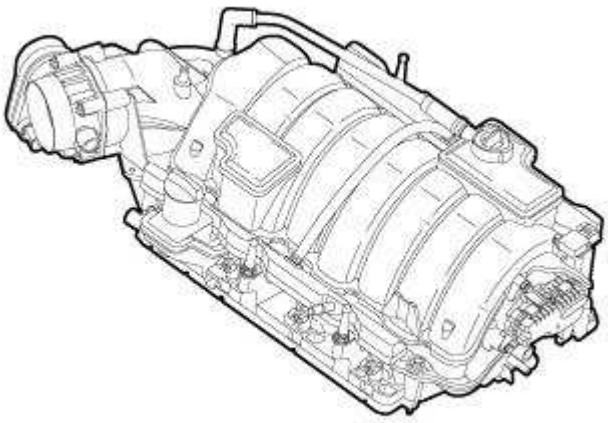

Fig. 395: Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

The intake manifold is made of a composite material and features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold. The manifold uses a single plane sealing system with individual port seals and a separate PCV port seal to prevent leaks.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

> **WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or the fan. Do not wear loose clothing. Failure to follow this warning may result in serious or fatal injury.**

1. Start the engine.
2. Spray a small stream of water at the suspected leak area.
3. If a change in RPM is observed the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

REMOVAL

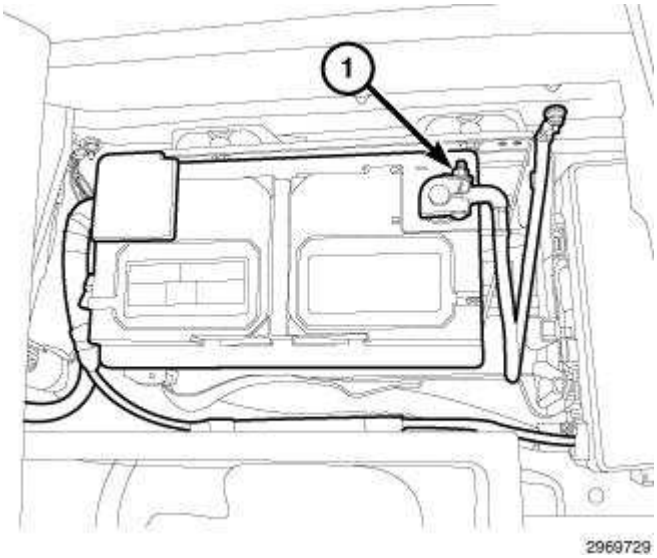

Fig. 396: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the negative battery cable (1).

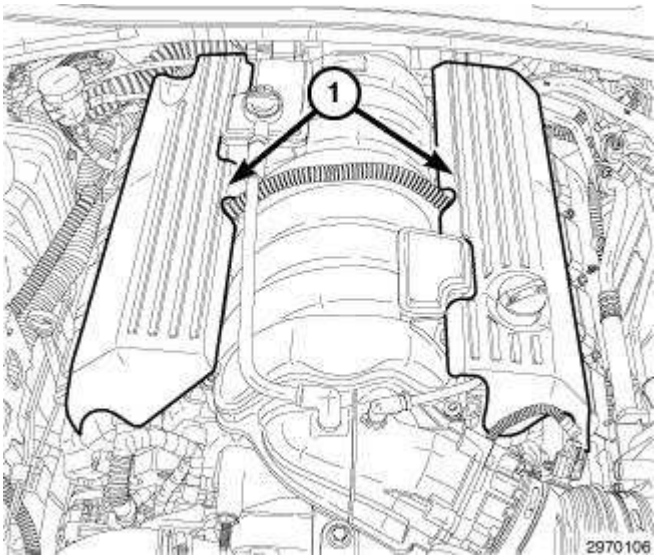

Fig. 397: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine covers (1).
4. Disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT** .

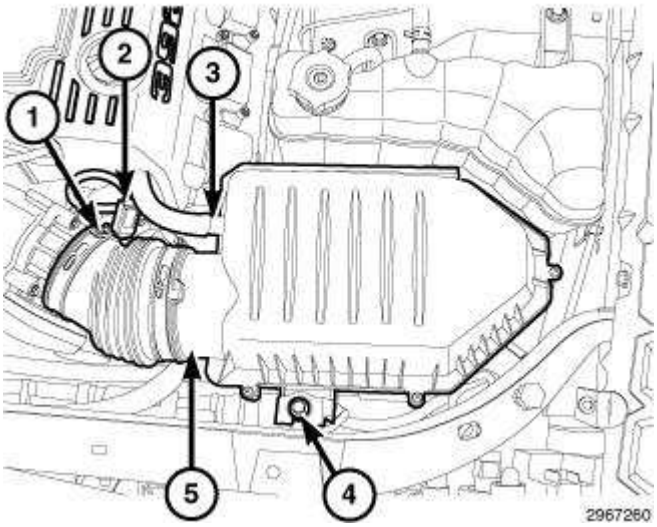

Fig. 398: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

5. Remove the air cleaner housing (5). Refer to **BODY, AIR CLEANER, REMOVAL**.
6. Disconnect the brake booster hose and the EVAP purge hose.

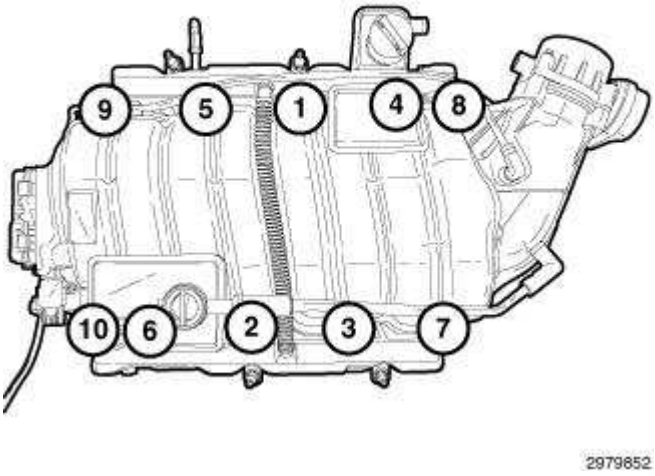

Fig. 399: Intake Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the electrical connectors from the following components:
    - Manifold Absolute Pressure (MAP) Sensor
    - Short Runner Valve (SRV)
    - Fuel Injectors
    - Electronic Throttle Control (ETC)

NOTE: Remove the intake manifold and throttle body as an assembly.

8. Using the sequence shown in illustration, remove the intake manifold retaining bolts.
9. Remove the intake manifold and throttle body as an assembly from the vehicle.

CLEANING

CLEANING

NOTE: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

INSPECTION

INSPECTION

1. Inspect the intake manifold sealing surface for cracks, nicks and distortion.
2. Inspect the intake manifold vacuum hose fittings for looseness or blockage.

INSTALLATION

INSTALLATION

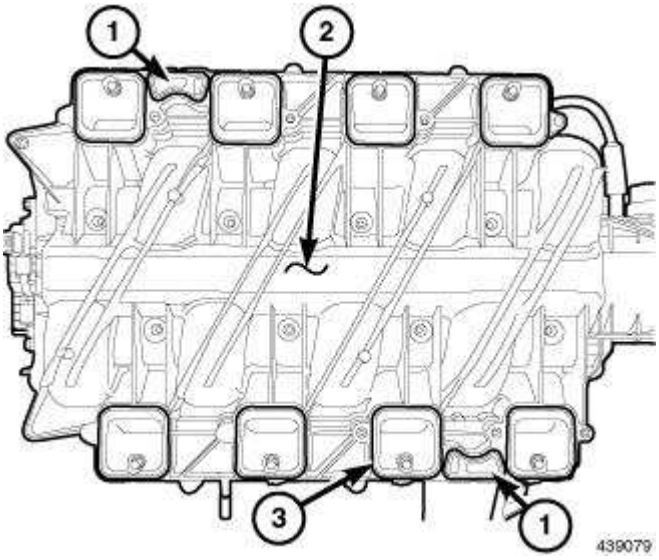

Fig. 400: Intake Manifold & PCV Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: The intake manifold seals (1, 3) may be used again, provided no cuts, tears, or deformation have occurred.

1. Inspect the intake manifold seals and replace if necessary.

NOTE: If reinstalling the original manifold, apply Mopar® Lock & Seal Adhesive to the intake manifold bolts. Not required when installing a new manifold.

2. If required, apply Mopar® Lock & Seal Adhesive to the intake manifold bolts.
3. Position the intake manifold (2).

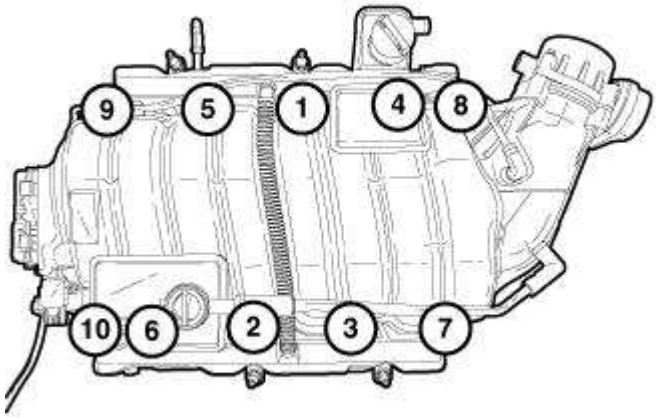

Fig. 401: Intake Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Using the sequence shown in illustration, install the intake manifold retaining bolts and tighten to 12 N.m (9 ft. lbs.).
5. Connect the fuel supply line. Refer to **FITTING, QUICK CONNECT** .
6. Connect the brake booster hose and the EVAP purge hose.
7. Connect the electrical connectors to the following components:
   - Manifold Absolute Pressure (MAP) Sensor
   - Short Runner Valve (SRV)
   - Fuel Injectors
   - Electronic Throttle Control (ETC)

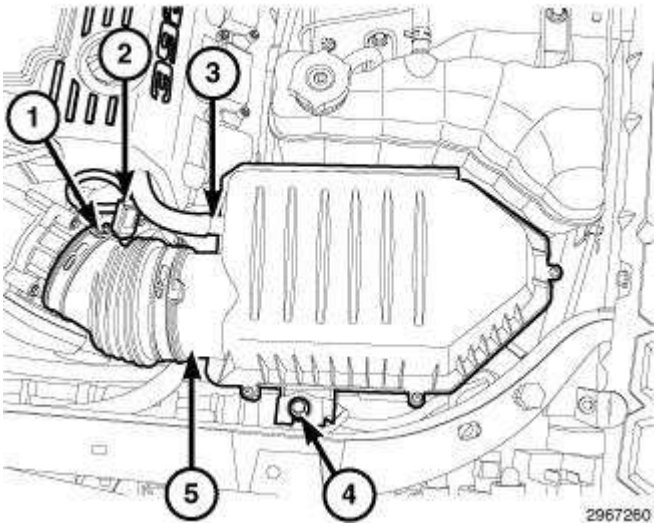

Fig. 402: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

8. While sliding the air duct onto the throttle body, lower the air cleaner housing (5) into position and align the locating pin on the bottom of the housing.
9. Install the air cleaner housing retaining bolt (4) and tighten to 5 N.m (44 in. lbs.).
10. Install the makeup air hose (3) at the air cleaner housing.
11. Connect the intake air temperature sensor electrical connector (2).
12. Position the air duct retaining clamp (1) at the throttle body and tighten to 3 N.m (30 in. lbs.).

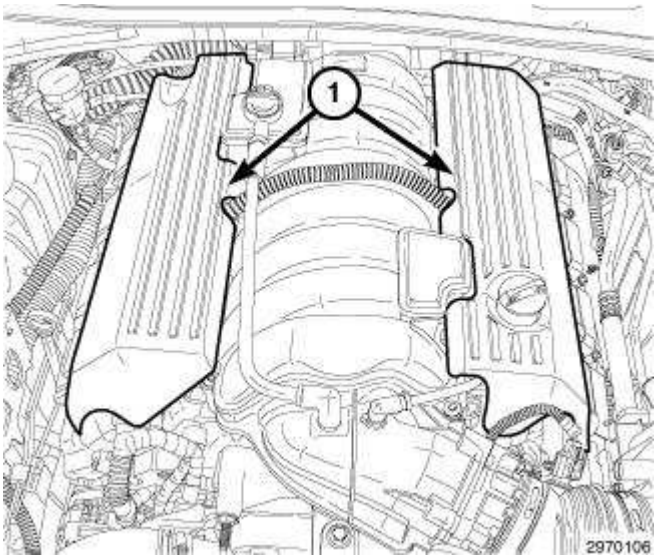

Fig. 403: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

13. Install the engine covers (1) on to the ball studs.

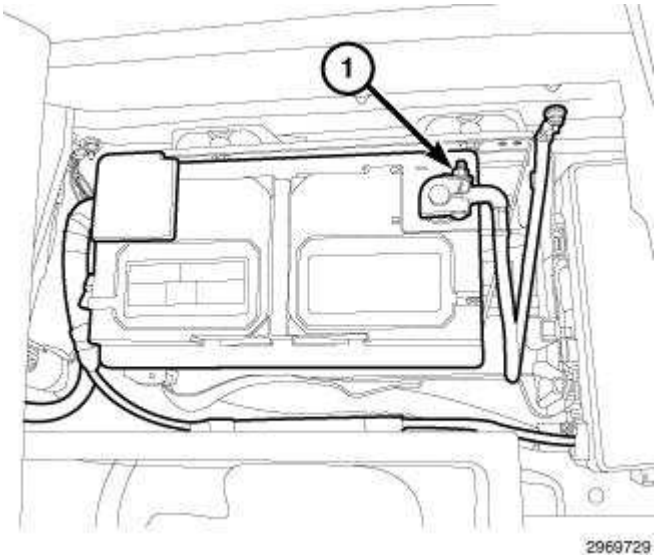

Fig. 404: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

VALVE TIMING

CHAIN AND SPROCKETS, TIMING

REMOVAL

REMOVAL

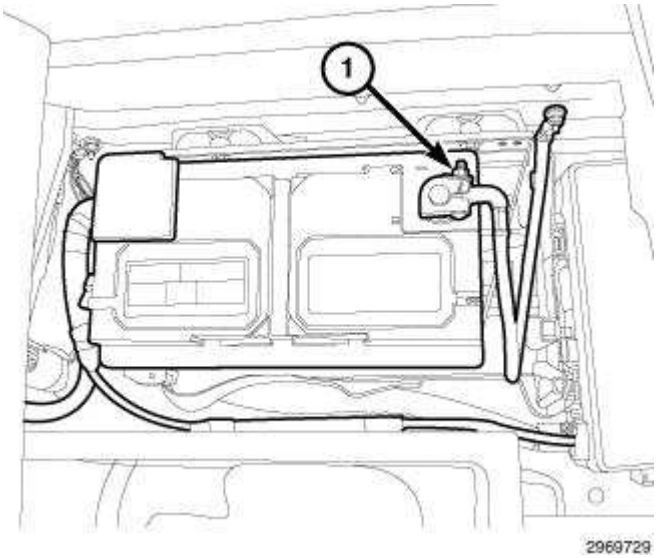

Fig. 405: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Drain the cooling system.

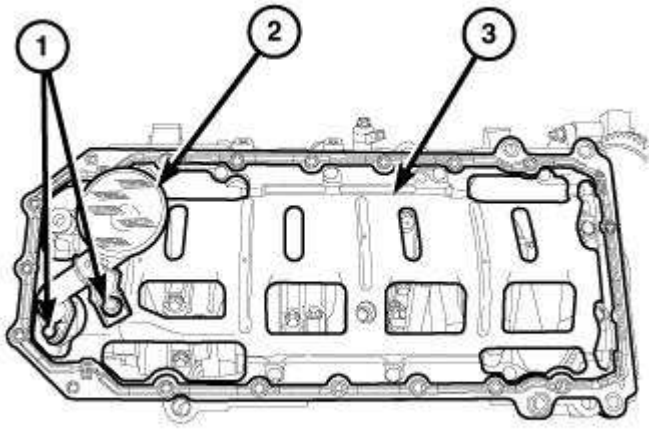

Fig. 406: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the oil pan and oil pump pick up tube (2). Refer to **PAN, OIL, REMOVAL**.

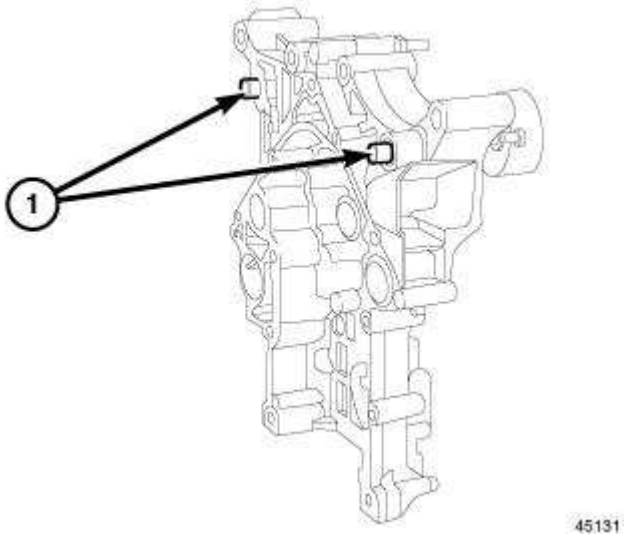

Fig. 407: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

5. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
6. Verify the slide bushings (1) remain located in the engine timing cover during removal.

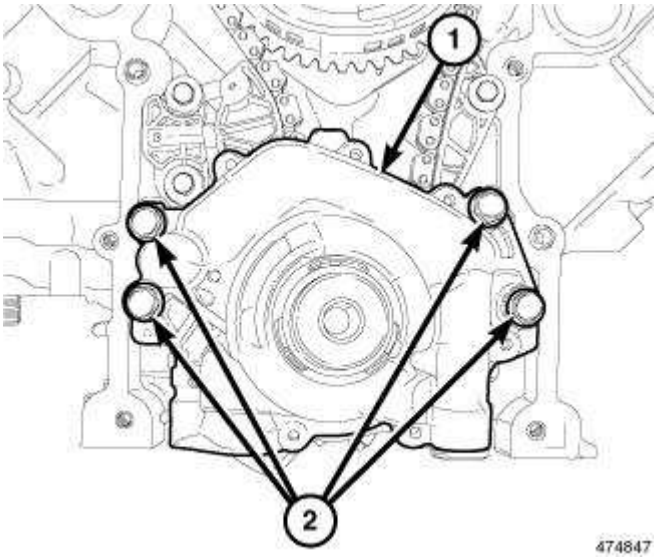

Fig. 408: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

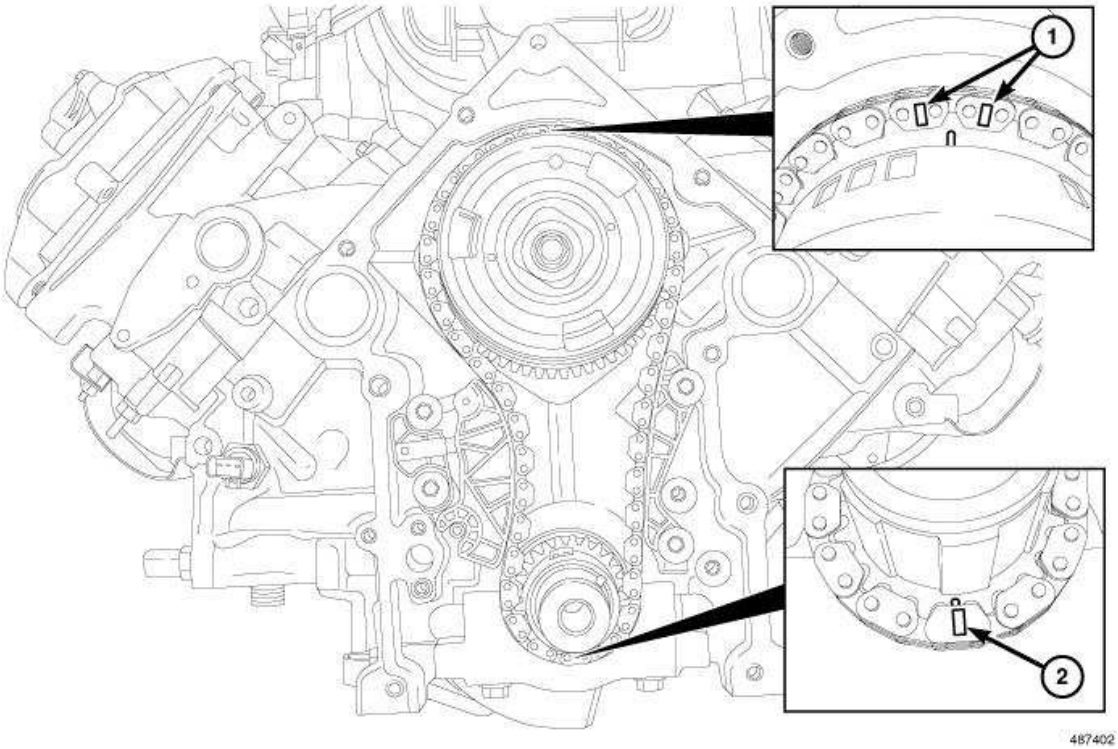

Fig. 409: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER GROUP, LLC

8. Install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align the timing marks with the timing chain sprockets (1, 2).

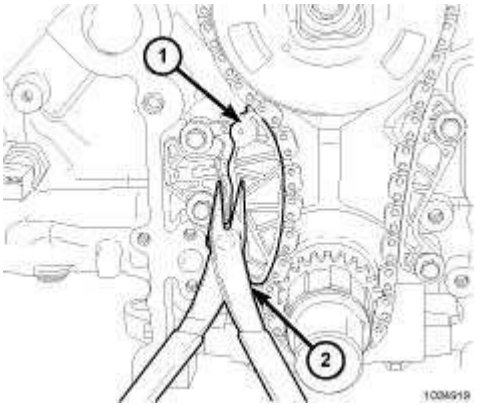

Fig. 410: Retracting Tensioner Shoe Using Pliers
Courtesy of CHRYSLER GROUP, LLC

9. Retract the chain tensioner arm (1) until the hole in the arm lines up with the hole in the bracket.

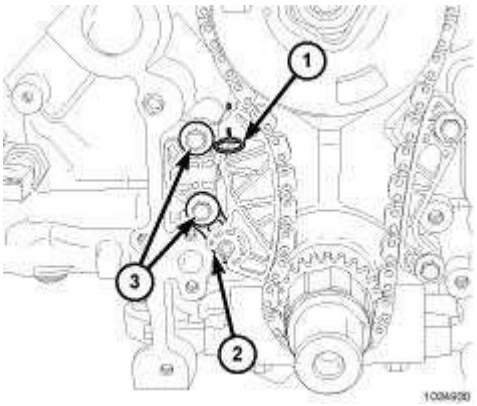

Fig. 411: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) into the chain tensioner holes.

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

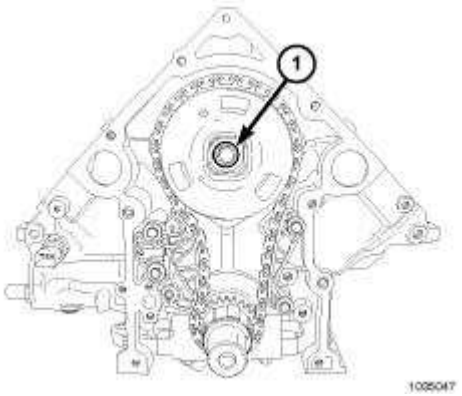

Fig. 412: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Remove the camshaft phaser retaining bolt (1) and remove the timing chain with the camshaft phaser and crankshaft sprocket.

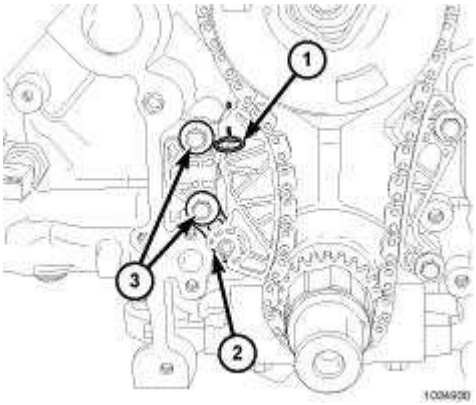

Fig. 413: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect the timing chain tensioner and timing chain guide shoes for wear and replace as necessary.

12. If the timing chain tensioner is to be replaced, remove the retaining bolts (3) and remove the timing chain tensioner (2).

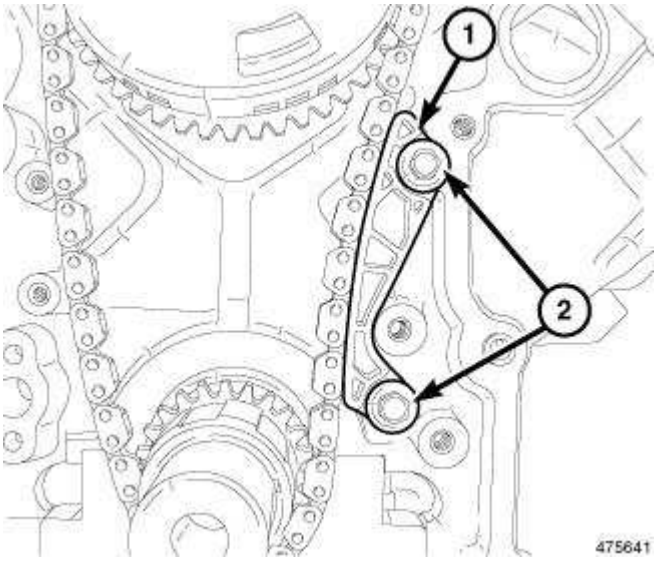

Fig. 414: Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. If the timing chain guide (1) is to be replaced, remove the retaining bolts (2) and remove the timing chain guide (1).

INSTALLATION

INSTALLATION

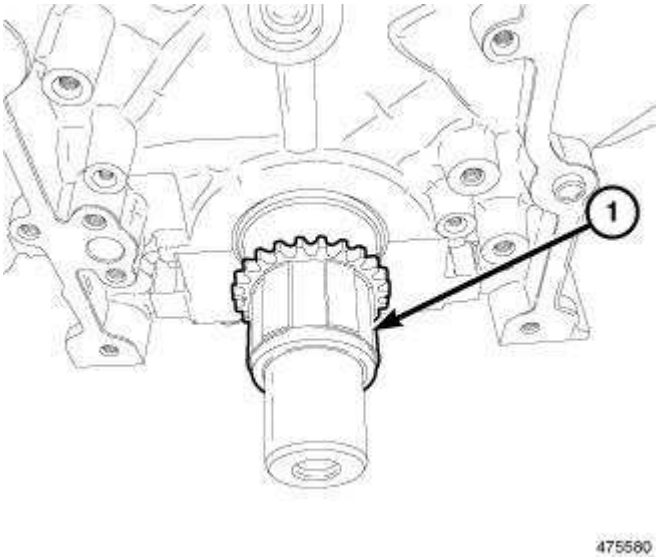

Fig. 415: Crankshaft Sprocket
Courtesy of CHRYSLER GROUP, LLC

1. Install the crankshaft sprocket (1) and position halfway onto the crankshaft.

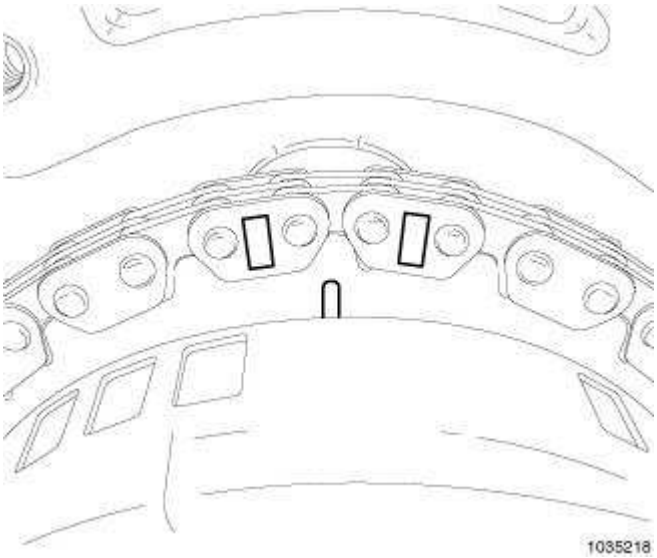

Fig. 416: Aligning Timing Chain & Camshaft Phaser Marks
Courtesy of CHRYSLER GROUP, LLC

2. While holding the camshaft phaser in hand, position the timing chain on the camshaft phaser and align the timing marks as shown in illustration.

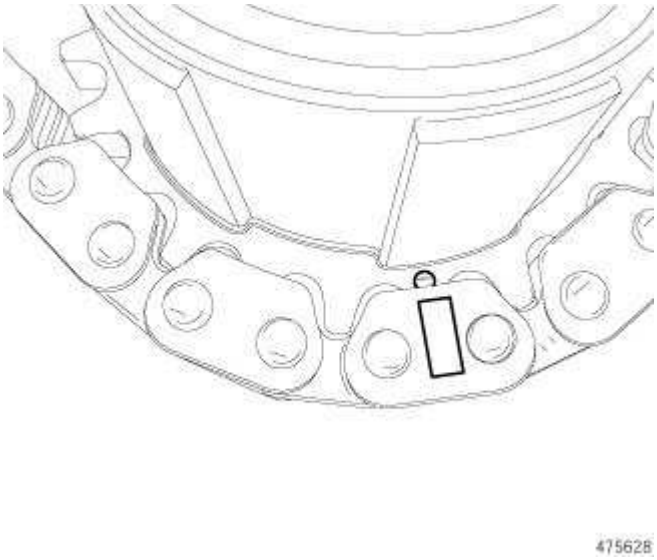

Fig. 417: Aligning Timing Chain & Crankshaft Sprocket Marks
Courtesy of CHRYSLER GROUP, LLC

3. While holding the camshaft phaser and timing chain in hand, position the timing chain on the crankshaft sprocket and align the timing mark as shown in illustration.

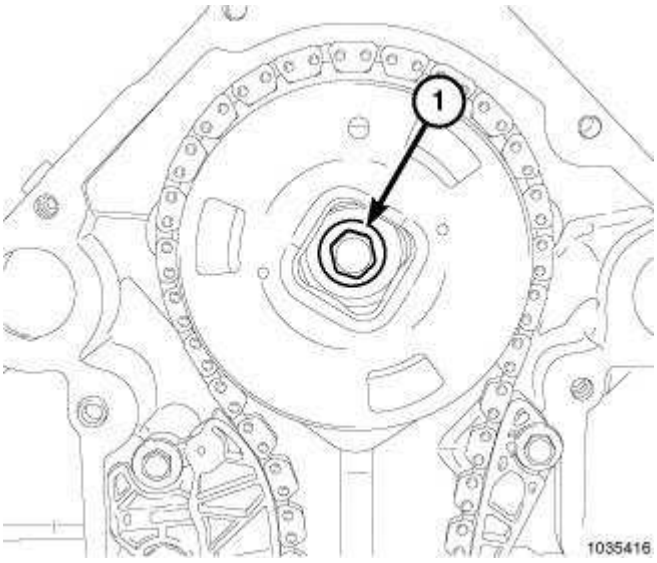

Fig. 418: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Align the slot in the camshaft phaser with the dowel on the camshaft and position the camshaft phaser on the camshaft while sliding the crankshaft sprocket into position.
5. Install the camshaft phaser retaining bolt (1) finger tight.

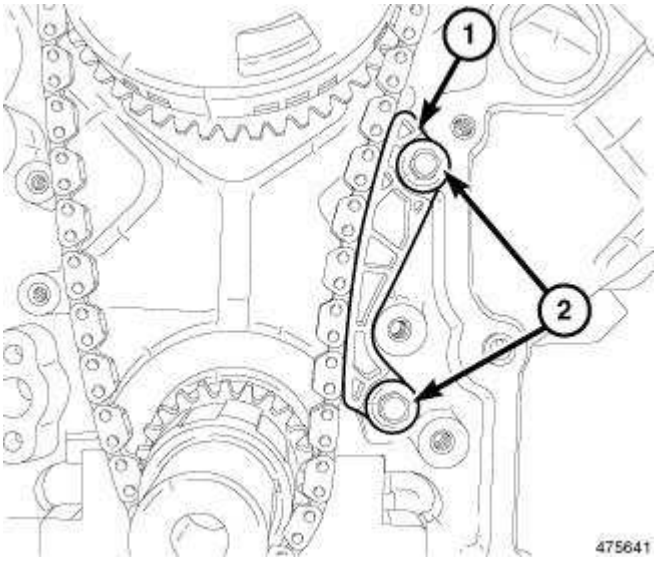

Fig. 419: Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. If removed, install the timing chain guide (1) and tighten the bolts (2) to 11 N.m (8 ft. lbs.).

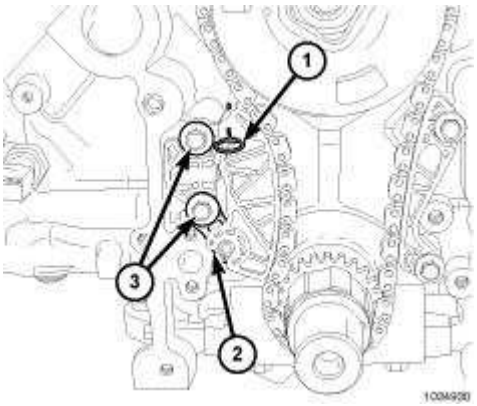

Fig. 420: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. If removed, install the timing chain tensioner (2) and tighten the bolts (3) to 11 N.m (8 ft. lbs.).
8. If required, retract the chain tensioner arm and install the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) into the holes of the chain tensioner arm.

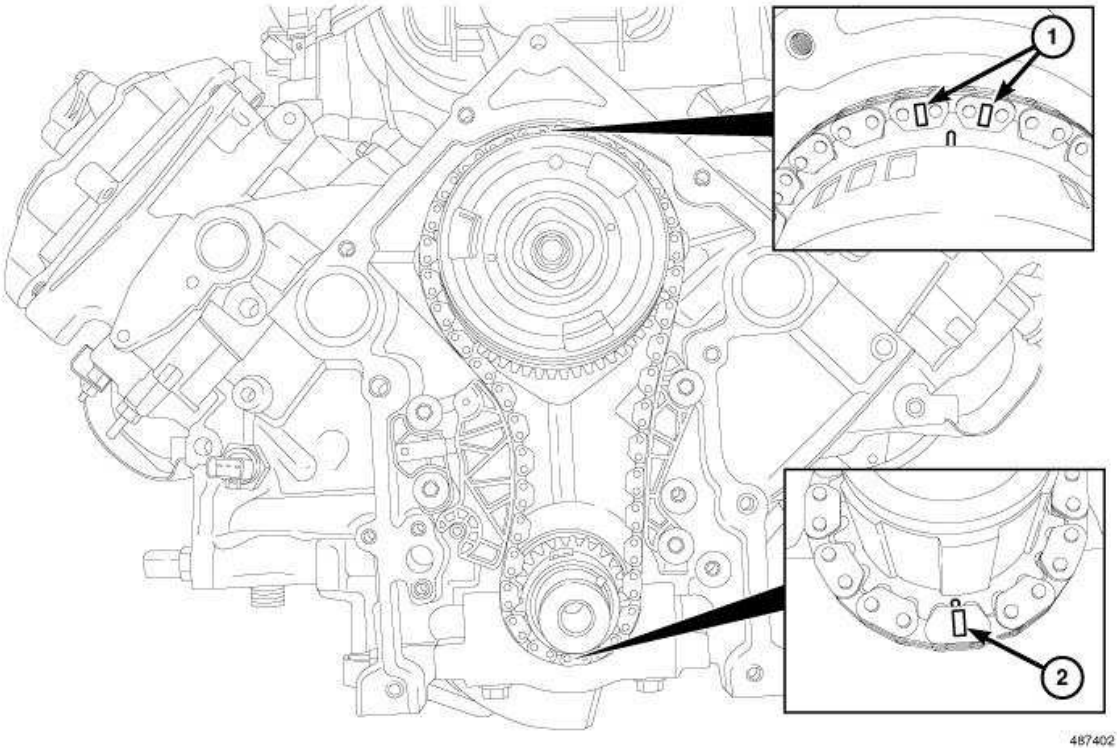

Fig. 421: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the crankshaft two revolutions and verify the alignment of the timing marks (1, 2). If the timing marks do not line up, remove the camshaft sprocket and realign.

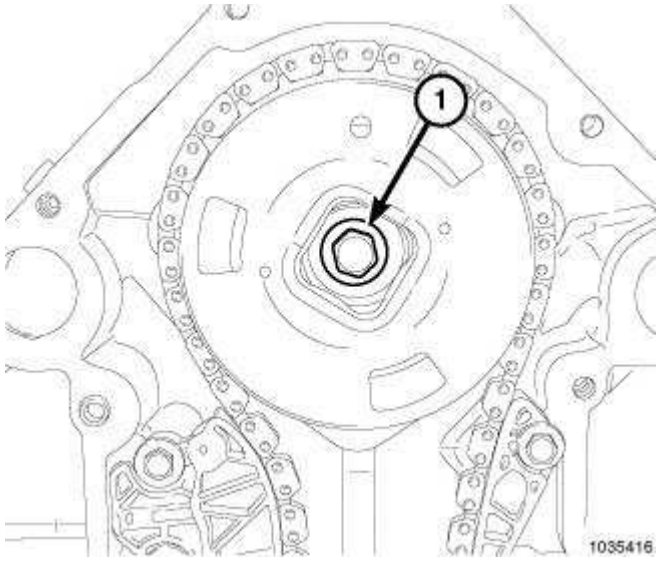

Fig. 422: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the camshaft phaser bolt (1) to 85 N.m (63 ft. lbs.).

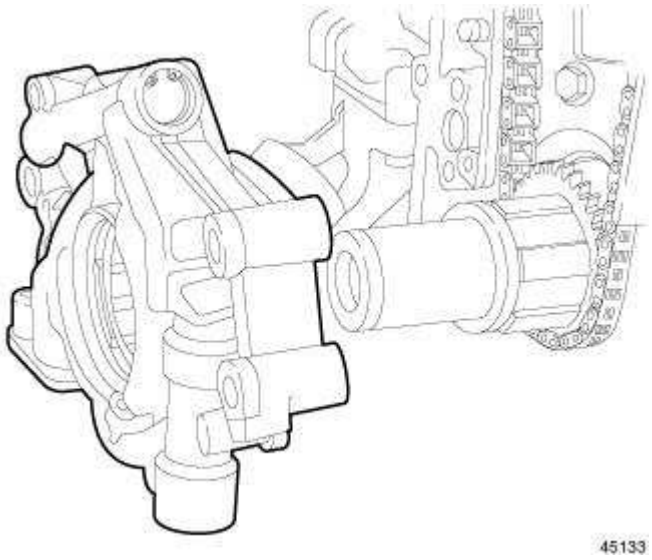

Fig. 423: Remove/Install Oil Pump
Courtesy of CHRYSLER GROUP, LLC

11. Position the oil pump onto the crankshaft and install the oil pump retaining bolts finger tight.

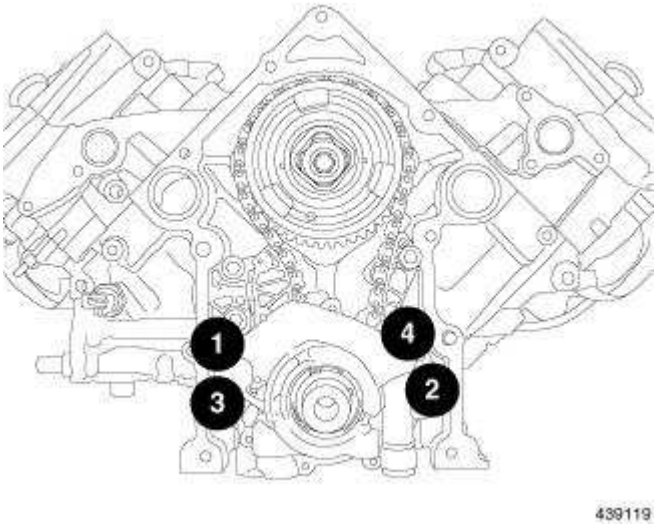

Fig. 424: Oil Pump Retaining Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

12. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).

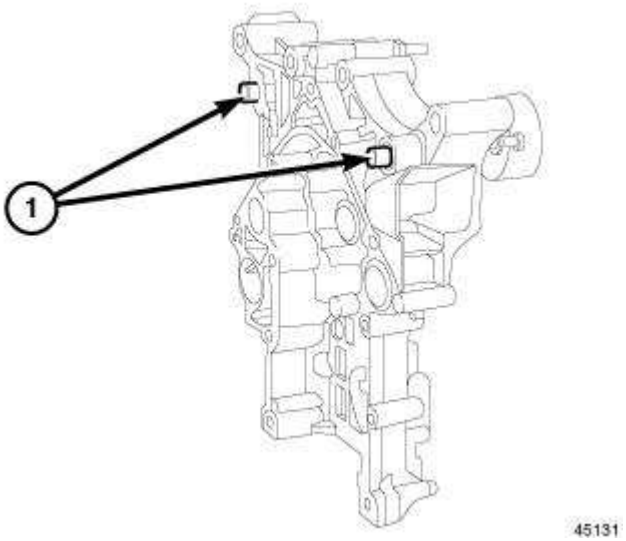

Fig. 425: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

13. Verify the slide bushings (1) remain located in the engine timing cover.

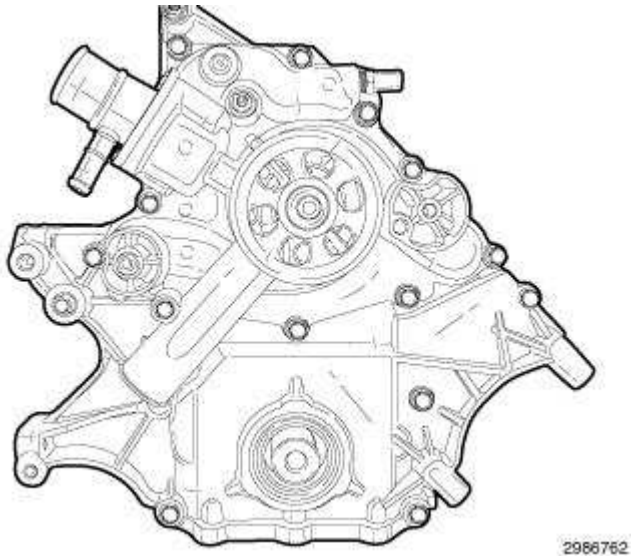

Fig. 426: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

14. Using a new gasket, install the engine timing cover and tighten the retaining bolts to 28 N.m (21 ft. lbs.).

NOTE: The large lifting stud is torqued to 55 N.m (40 ft. lbs.).

15. Tighten the large lifting stud to 55 N.m (40 ft. lbs.).

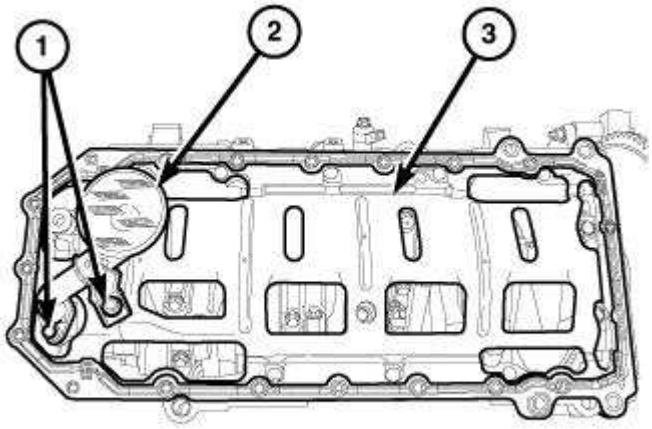

Fig. 427: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Raise and support the vehicle.
17. Install the oil pump pickup tube (2) and the oil pan. Refer to **PAN, OIL, INSTALLATION**.

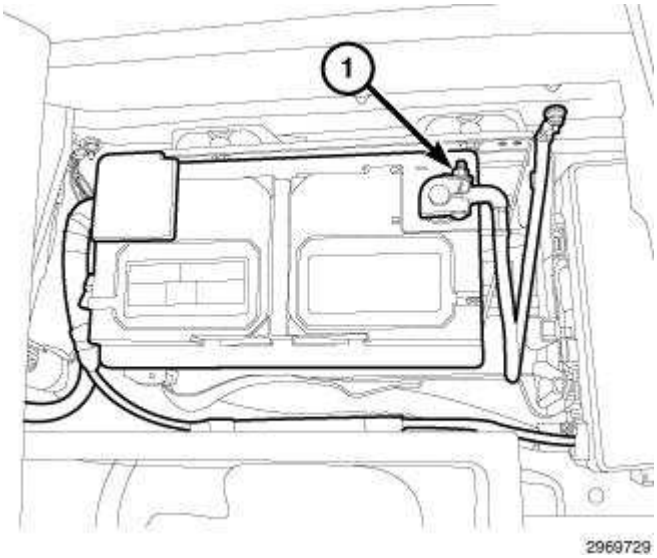

Fig. 428: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

18. Install the negative battery cable.
19. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

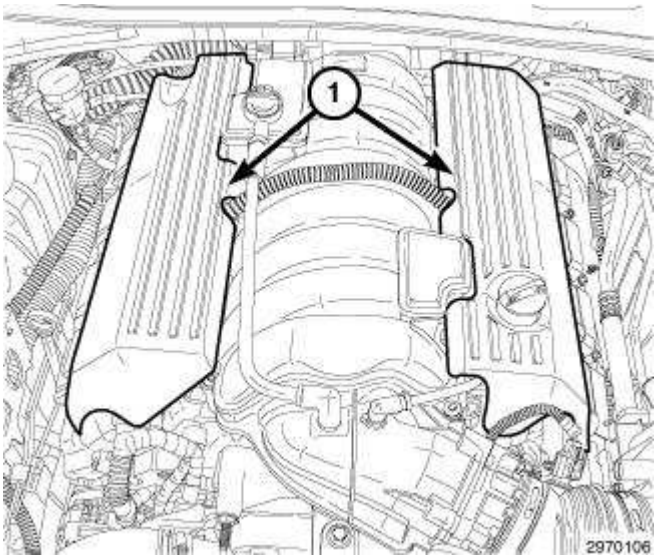

Fig. 429: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

20. Fill the crankcase with the specified type and amount of engine oil. Refer to **Engine/Lubrication/OIL - Standard Procedure**.
21. Install the engine covers (1).
22. Start the engine and check for leaks.

COVER(S), ENGINE TIMING

REMOVAL

REMOVAL

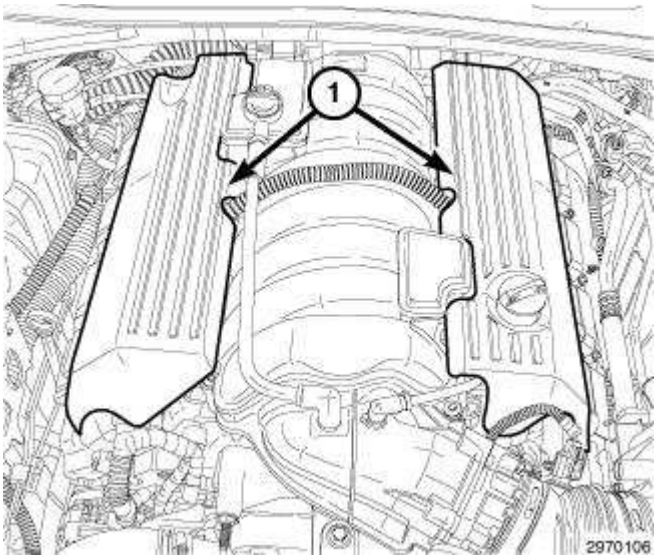

Fig. 430: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine covers (1).
2. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .

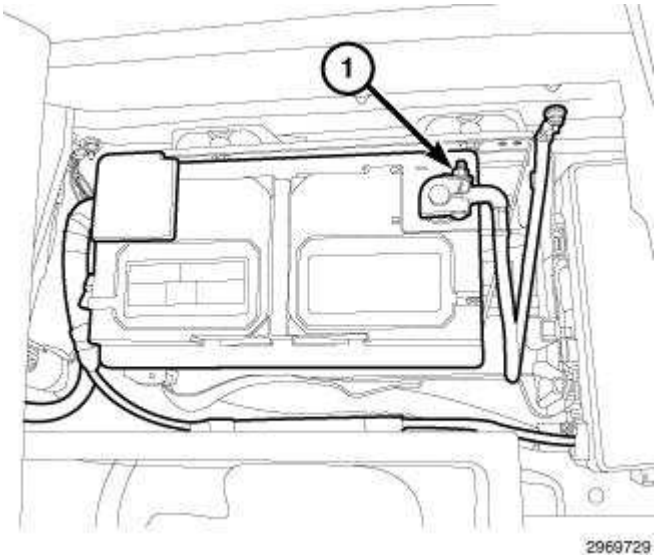

Fig. 431: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the negative battery cable (1).

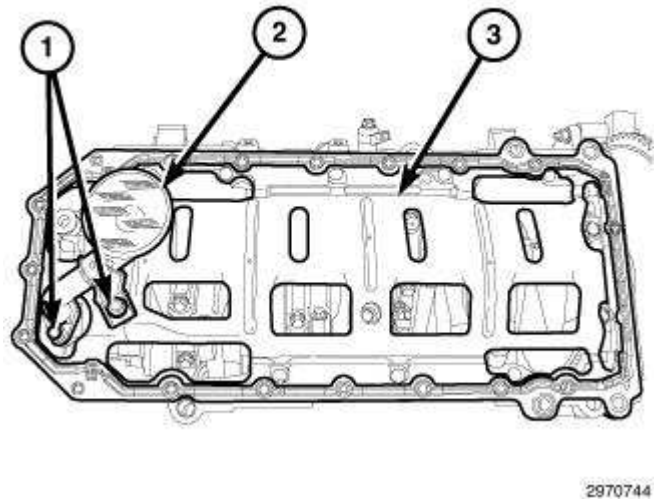

Fig. 432: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.

5. Remove the oil pump pickup tube retaining bolt and nut (1).
6. Remove the oil pump pickup tube (2).
7. Remove and discard the oil pan gasket/windage tray (3).
8. Lower the vehicle.

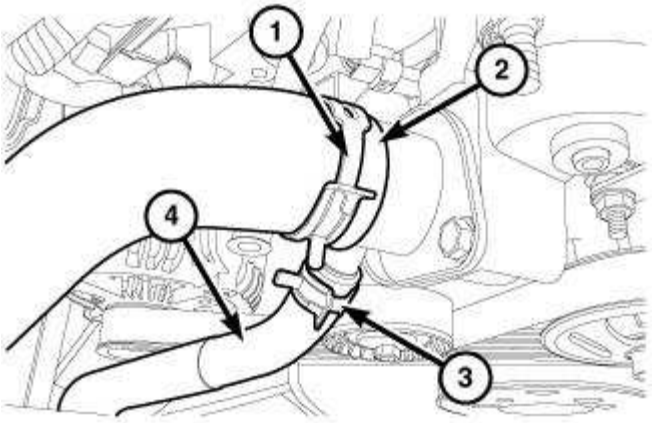

Fig. 433: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper radiator hose clamp (1) and remove the upper radiator hose (2).
10. Remove the oil cooler hose clamp (3) and remove oil cooler hose (4).

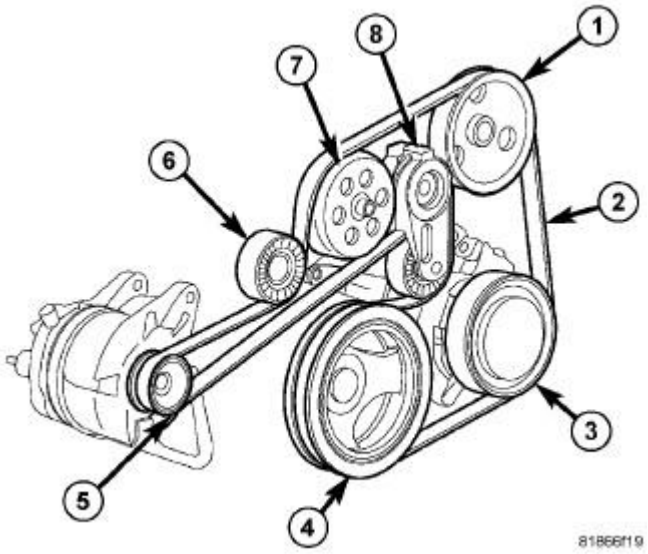

Fig. 437: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

16. Remove the accessory drive belt (2). Refer to **BELT, SERPENTINE, REMOVAL** .
17. Remove the lower radiator hose clamp and remove the lower radiator hose.
18. Remove the idler pulley (6).
19. Remove the belt tensioner (8).

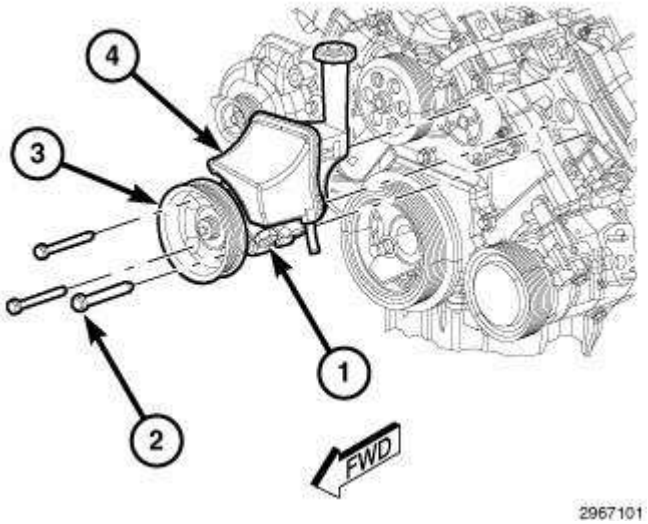

Fig. 438: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to remove the power steering pump hoses for power steering pump removal.**

20. Remove the three power steering pump mounting bolts (2) through the access holes in the pulley (3).
21. Remove the power steering pump (1) from the engine and position aside.

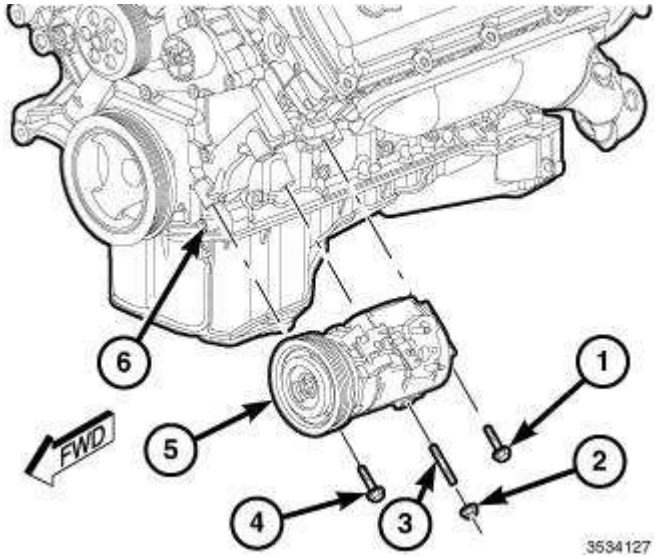

Fig. 439: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

22. Remove A/C compressor from the front timing chain cover and position aside. Refer to **COMPRESSOR, A/C, REMOVAL** .

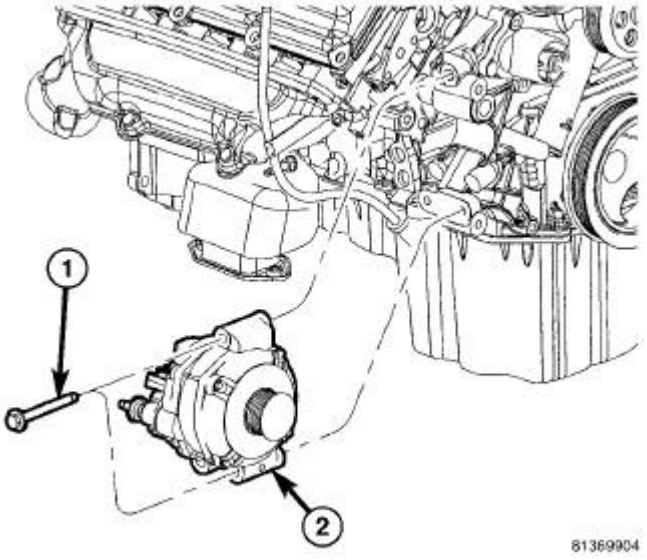

Fig. 440: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

23. Remove the generator from the front timing chain cover and position aside. Refer to **GENERATOR, REMOVAL** .

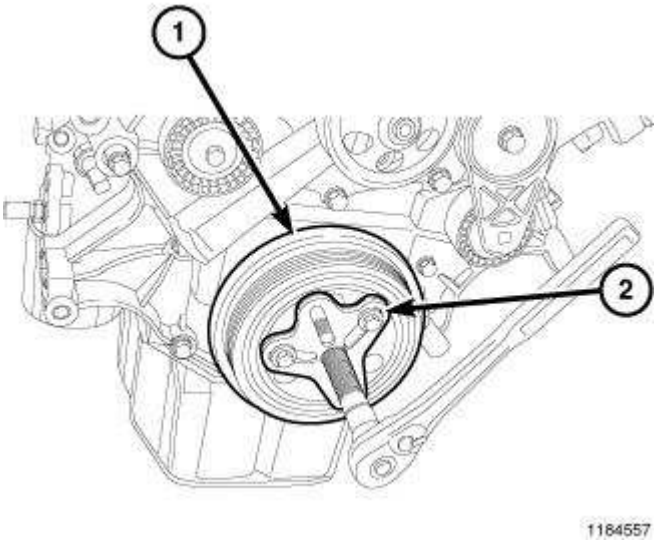

Fig. 441: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

24. Remove the vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.
25. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper and remove the crankshaft damper (1).

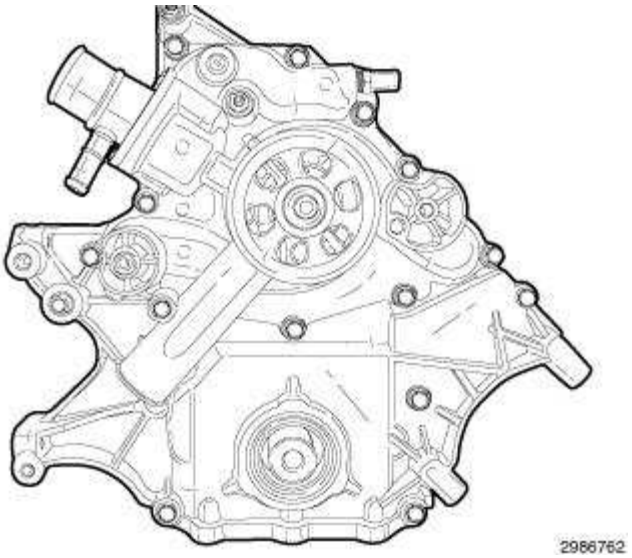

Fig. 442: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove water pump for timing cover removal.

26. Remove the engine timing cover retaining bolts and remove the engine timing cover.

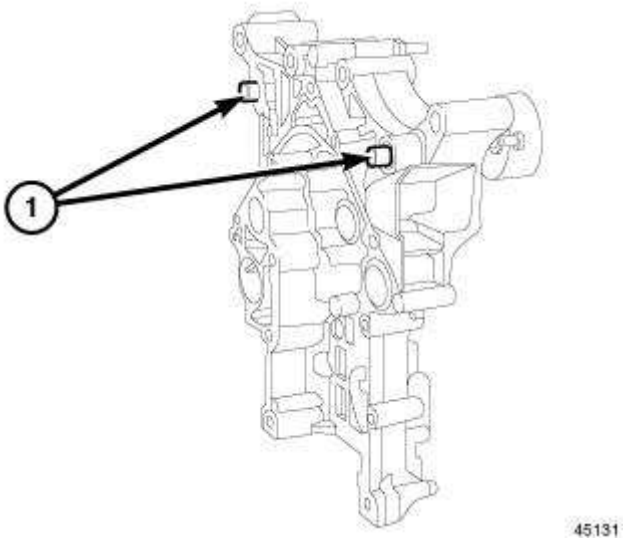

Fig. 443: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

27. Verify that the engine timing cover slide bushings (1) remain located in the engine timing cover.

INSTALLATION

INSTALLATION

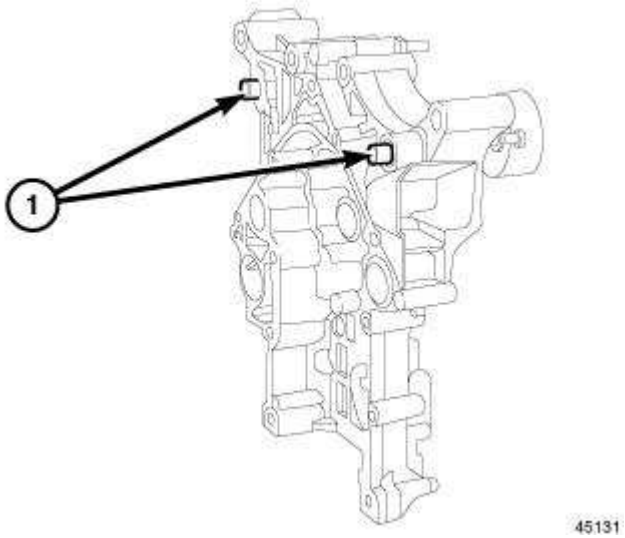

Fig. 444: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

1. Clean the engine timing cover and engine block surface.

NOTE: Always install a new gasket when servicing the engine timing cover.

2. Verify that the engine timing cover slide bushings (1) remain located in the engine timing cover.

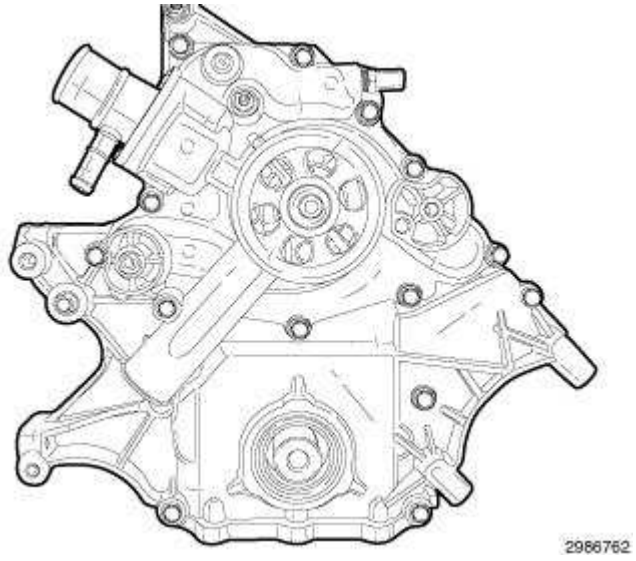

Fig. 445: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

3. Using a new gasket, install the engine timing cover and tighten the retaining bolts to 28 N.m (21 ft. lbs.).

NOTE: The large lifting stud is torqued to 55 N.m (40 ft. lbs.).

4. Tighten the large lifting stud to 55 N.m (40 ft. lbs.).

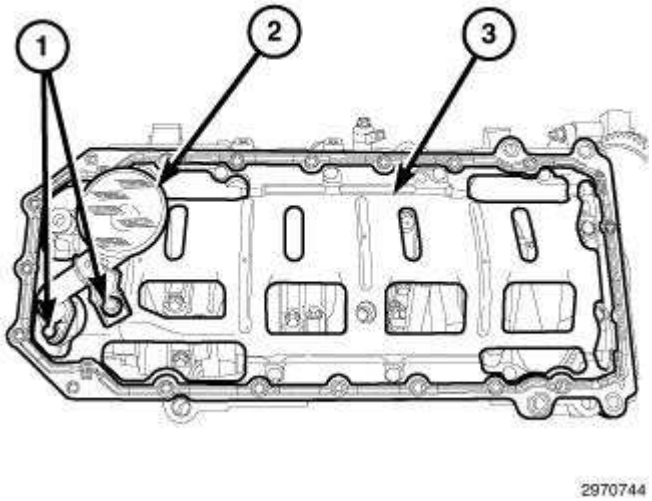

Fig. 446: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Raise and support the vehicle.
6. Install the oil pump pickup tube (2) and the oil pan. Refer to **PAN, OIL, INSTALLATION**.
7. Install the lower radiator hose and clamp.

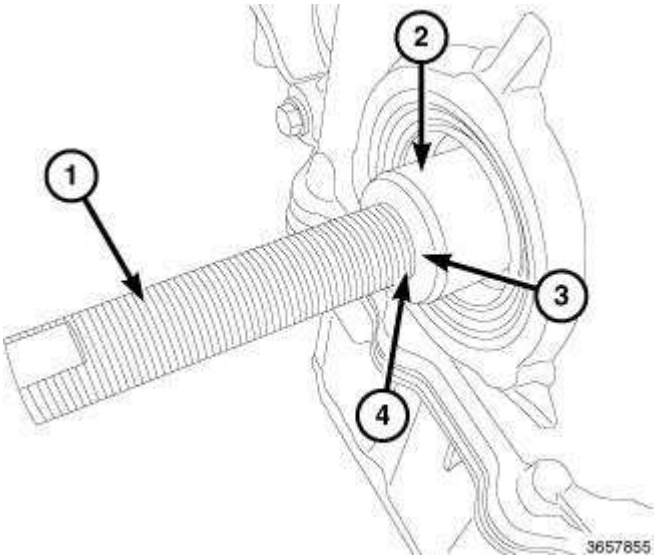

Fig. 447: Installing Vibration Damper Onto Crankshaft Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

8. Assemble the (special tool #10387, Installer, Vibration Damper) as follows:
    1. Install the threaded shaft (1) onto the crankshaft (3) till its seated.
    2. Position the crankshaft damper onto the crankshaft.
    3. Install the thrust washer.
    4. Install the roller bearing onto the threaded shaft making sure the hardened bearing surface is facing away from the crankshaft.
    5. Install the washer.
    6. Install the nut onto the threaded shaft.

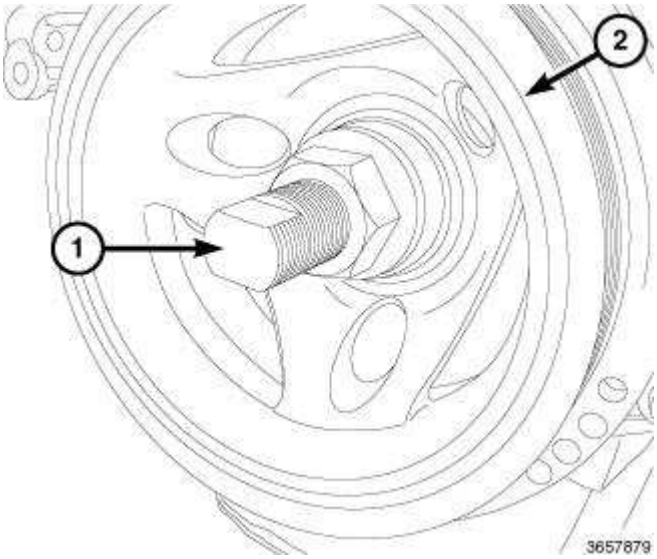

Fig. 448: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

9. Using the crankshaft Damper Installer (1) press the vibration damper (2) onto the crankshaft. Refer to **DAMPER, VIBRATION, INSTALLATION**.
10. Install the crankshaft damper bolt and tighten to 176 N.m (129 ft. lbs.).

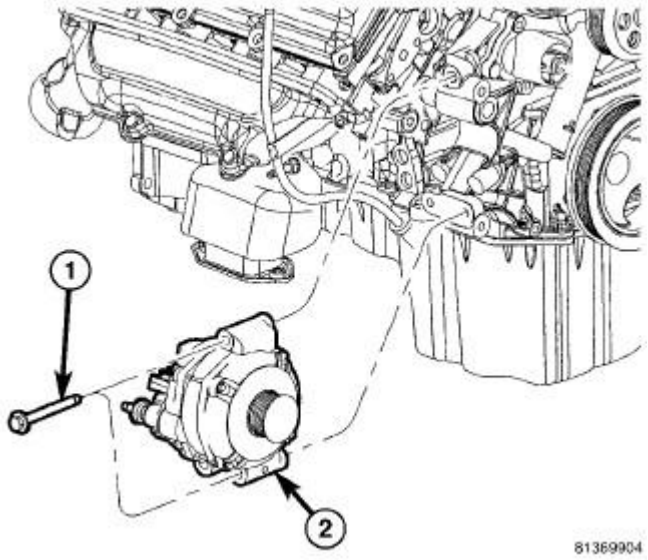

Fig. 449: Generator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Install the generator. Refer to **GENERATOR, INSTALLATION** .

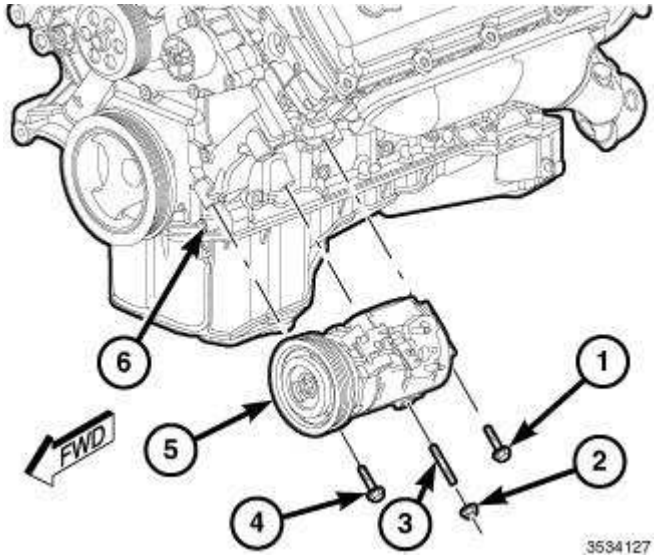

Fig. 450: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

12. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .

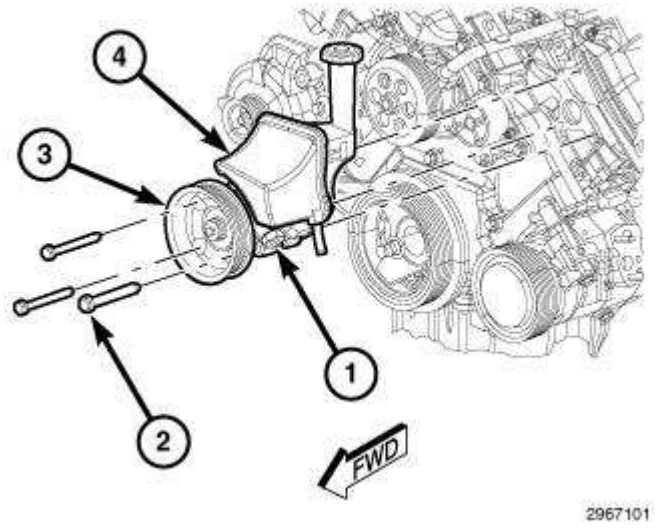

Fig. 451: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Position the power steering pump, align the pump (1) with the mounting holes on the engine.
14. Install the three power steering pump mounting bolts (2) through access holes in the pulley (3) and tighten to 28 N.m (21 ft. lbs.).

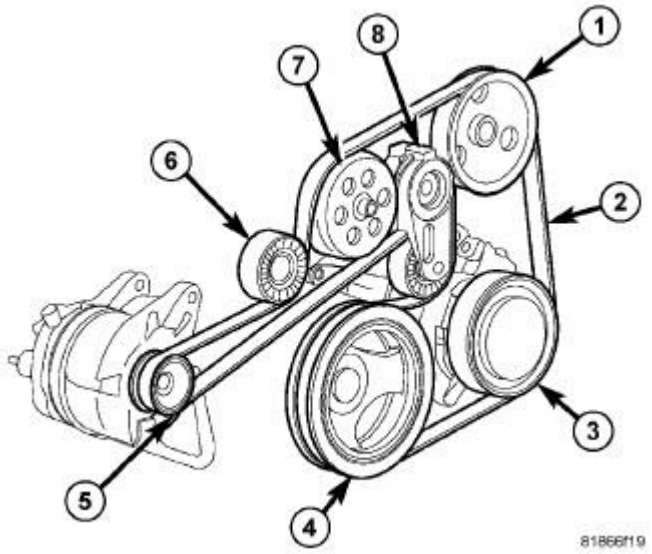

Fig. 452: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

15. Install the accessory drive belt tensioner assembly (8) and idler pulley (6).
16. Install the accessory drive belt (2). Refer to **BELT, SERPENTINE, INSTALLATION** .
17. Install the oil dipstick tube and retaining nut.

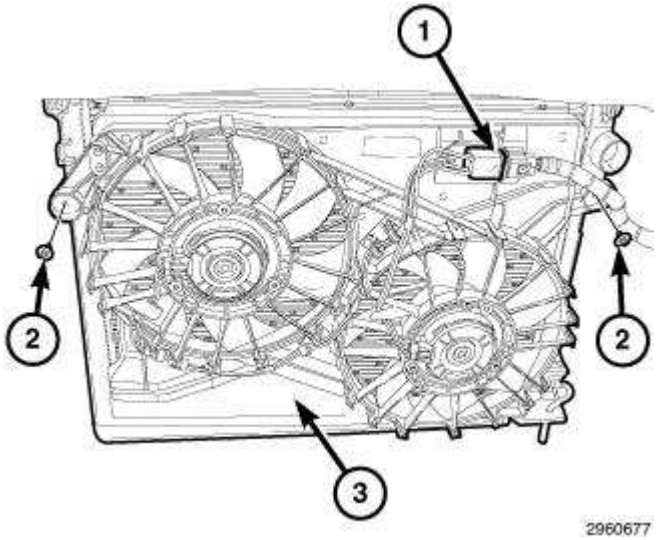

Fig. 453: Cooling Fan Electrical Connector, Bolts & Radiator Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

18. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

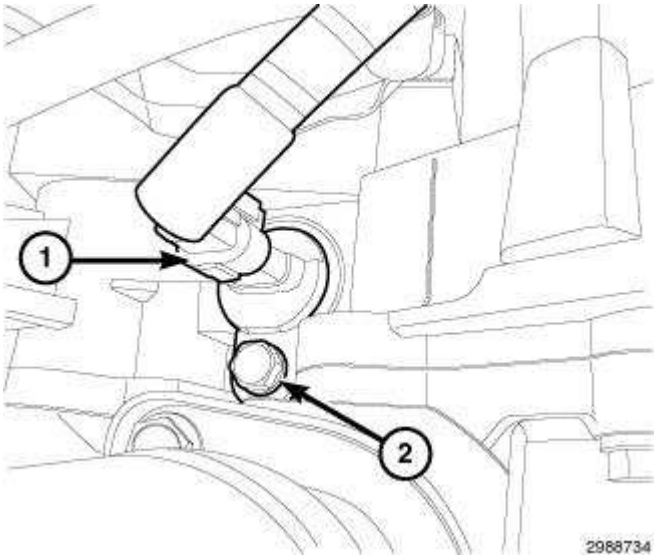

Fig. 454: Camshaft Position Sensor Electrical Connector & Bolt

TENSIONER, ENGINE TIMING

DESCRIPTION

DESCRIPTION

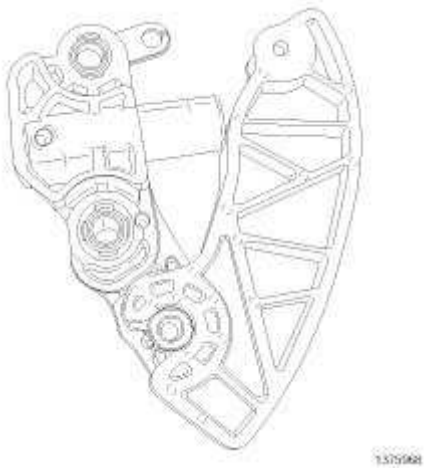

Fig. 460: Timing Chain Tensioner Arm
Courtesy of CHRYSLER GROUP, LLC

The timing chain tensioner is a spring loaded design. It consists of two chain guide shoes. One shoe is fixed in place and the other is spring loaded to keep tension on the chain.

OPERATION

OPERATION

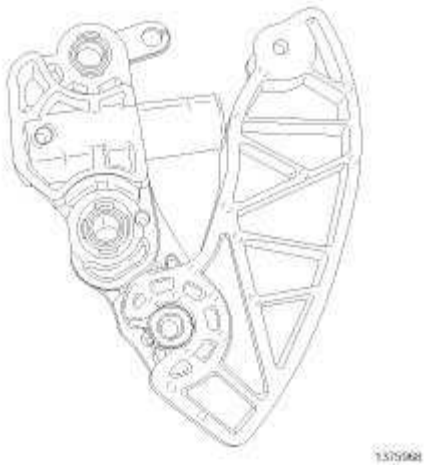

Fig. 461: Timing Chain Tensioner Arm
Courtesy of CHRYSLER GROUP, LLC

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. The tensioner assembly consists of two chain guide shoes. One shoe is fixed in place and the other is spring loaded to maintain the correct timing chain tension.

Antilock Brake System (ABS) - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

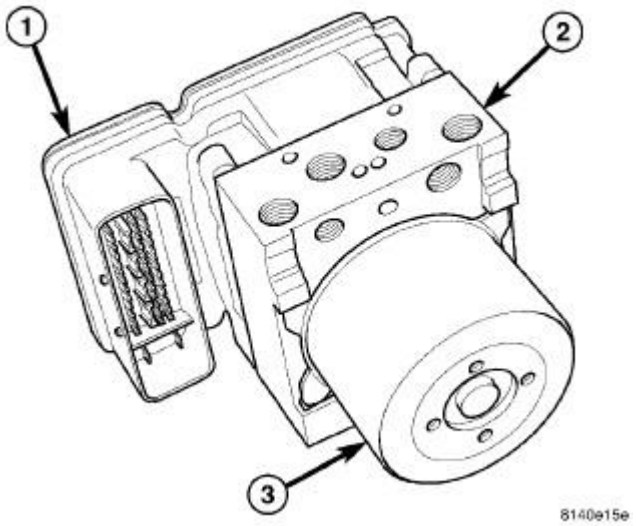

Fig. 1: Integrated Control Unit
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

This vehicle uses an electronic brake control system designated MK25e. This system includes ABS (Antilock Brake System), TCS (Traction Control System), BAS (Brake Assist System), EVBP (Electronic Variable Brake Proportioning) and ESC (Electronic Stability Control). All of these systems work together to enhance vehicle stability and control in various driving conditions and are commonly referred to as ESC.

This system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Includes Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (1)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)
- Dynamics Sensor - Includes a yaw rate sensor and a lateral accelerometer.
- Steering Angle Sensor (SAS) - The SAS is part of the Steering Column Control Module

(SCCM).

- Brake Pressure Sensor - The brake pressure sensor is located in the HCU and is not serviceable separate from the HCU.

ABS

The purpose of the Antilock Brake System (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

ALL-SPEED TRACTION CONTROL

The traction control system (TCS) is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

With rear-wheel drive, All-Speed Traction Control is effective up to 85 mph (137 km/h); with AWD, All-Speed Traction Control is effective up to 45 mph (72 km/h), which is common among competitive AWD vehicles with traction control.

ELECTRONIC STABILITY CONTROL

The Electronic Stability Control (ESC) enhances control and stability of the vehicle under various driving conditions. ESC corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESC uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESC applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition.

- Oversteer - When the vehicle is turning more that appropriate for the steering wheel position.
- Understeer - When the vehicle is turning less than appropriate for the steering wheel position.

The "ESC/TCS" indicator light located in the instrument cluster starts to flash as soon as the tires lose traction and the ESC system becomes active. The "ESC/TCS" indicator light also flashes when TCS is active.

The ESC can be turned off by using the ESC Off switch. When the ESC Off switch is depressed, it does not completely turn the system off. The ESC system shuts off engine management but retains brake activations for yaw control.

BRAKE ASSIST SYSTEM

The Brake Assist System (BAS) is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the

rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the antilock brake system (ABS). Applying the brakes very quickly results in the best BAS assistance.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Electronic Variable Brake Proportioning (EVBP) is used to balance front-to-rear braking in place of a traditional rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

OPERATION

OPERATION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a front/rear split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3-5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the

highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3-4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber

ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

ELECTRONIC STABILITY CONTROL

To determine whether the car is responding properly to cornering commands, ESC uses steering

wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESC operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESC system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the electronic shuttle valve.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

STANDARD PROCEDURE

STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

NOTE: During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add Mopar® DOT 3 brake fluid as required.

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under

the lower steering column cover to the left of the steering column.

3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

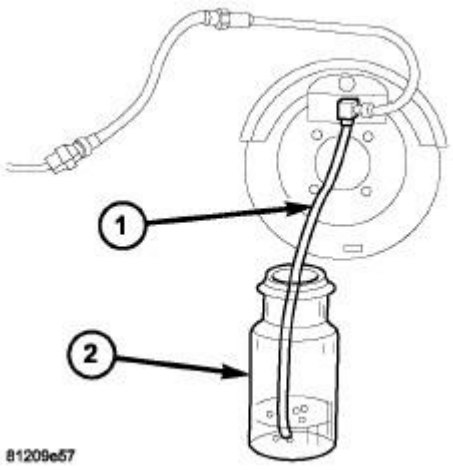

Fig. 2: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

WARNING: When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.

NOTE: Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

4. Bleed the base brake system. Refer to **STANDARD PROCEDURE** .
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

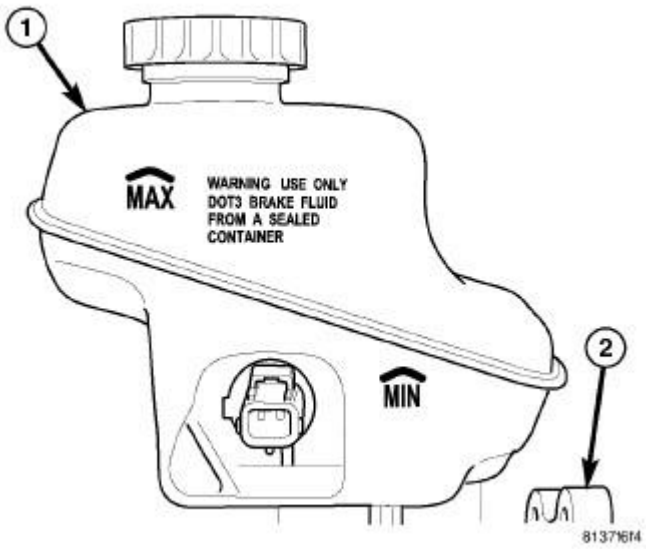

Fig. 3: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

7. Fill the master cylinder fluid reservoir (1) to the MAX level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

TORQUE

For ABS fastener torque specifications, see Brake Fastener Torque. Refer to **SPECIFICATIONS** .

ELECTRICAL

SENSOR, DYNAMICS

DESCRIPTION

DESCRIPTION

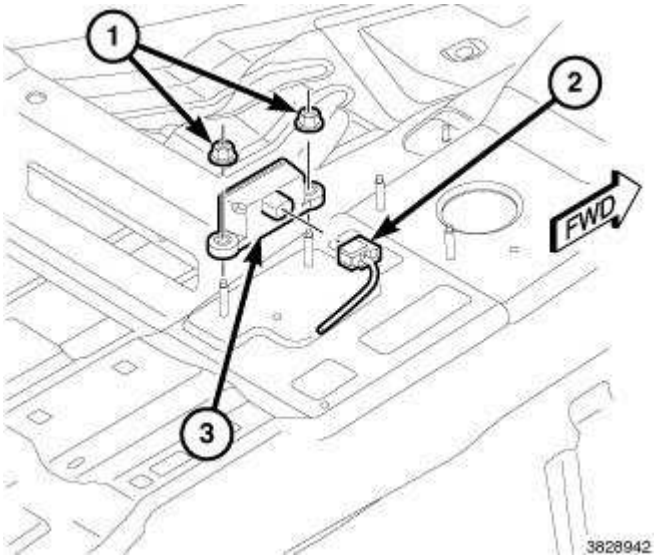

Fig. 4: Dynamics Sensor
Courtesy of CHRYSLER GROUP, LLC

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (3). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

REMOVAL

REMOVAL

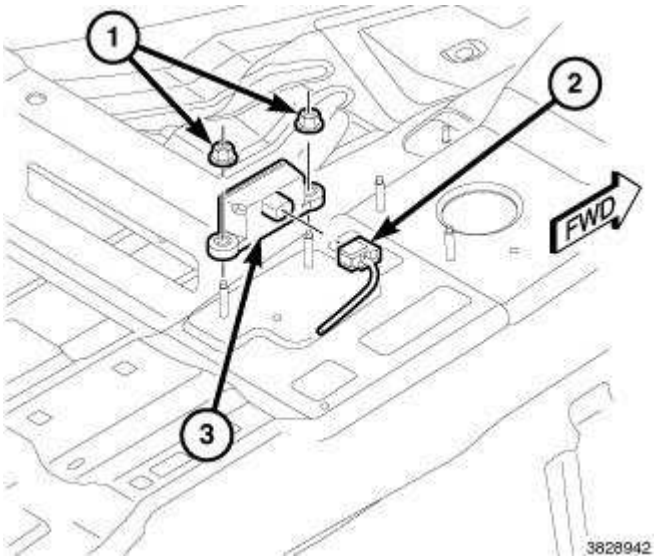

Fig. 5: Dynamics Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable from battery post.
2. Remove floor console. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Disconnect wiring harness (2) connector at sensor (3).
4. Remove nuts (1) mounting sensor (3) to floor pan tunnel.
5. Remove dynamics sensor (3) from vehicle.

INSTALLATION

INSTALLATION

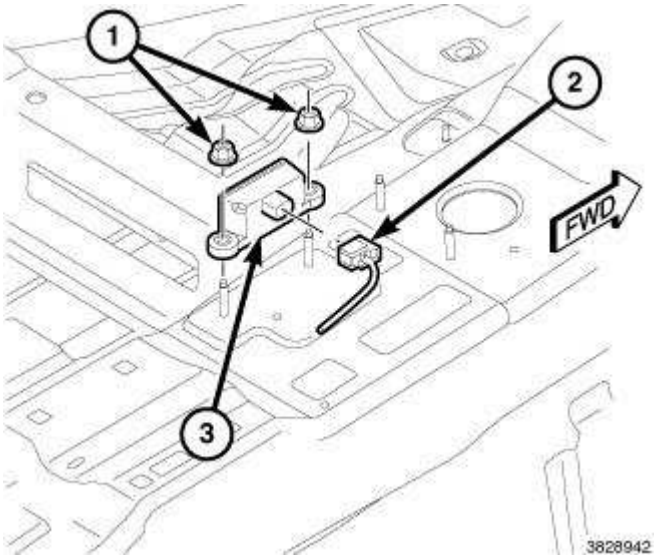

Fig. 6: Dynamics Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Install dynamics sensor (3) over studs mounted to floor pan tunnel.
2. Install mounting nuts (1) and tighten to 7 N.m (62 in. lbs.).
3. Connect wiring harness (2) connector to sensor (3).
4. Install floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Connect battery negative cable to battery post. It is important that this is performed properly.
6. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, STEERING WHEEL ANGLE

REMOVAL

REMOVAL

The steering angle sensor is serviced as an assembly with the steering column control module (SCCM). Refer to **MODULE, STEERING COLUMN, REMOVAL** .

INSTALLATION

INSTALLATION

The steering angle sensor is serviced as an assembly with the steering column control module (SCCM). Refer to **MODULE, STEERING COLUMN, INSTALLATION** .

SENSOR, WHEEL SPEED, FRONT

DESCRIPTION

DESCRIPTION

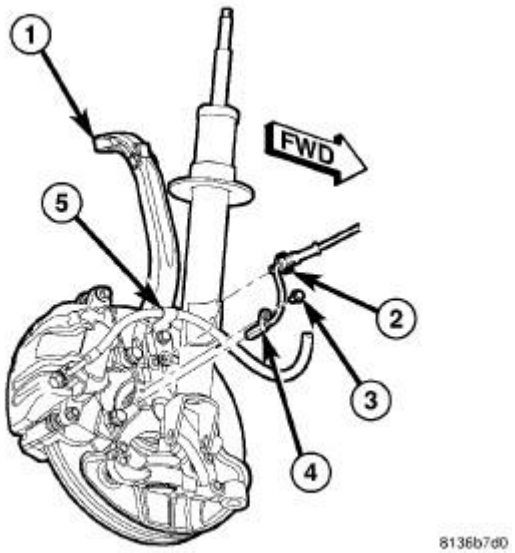

Fig. 7: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

One wheel speed sensor is mounted to each knuckle. The wheel speed sensor, using a tone wheel attached to the hub and bearing (RWD) or front half shaft (AWD) as a trigger mechanism, communicates with the Antilock Brake Module, informing it of that wheel's speed.

The head of the front wheel speed sensor used on Rear-Wheel-Drive (RWD) vehicles mounts to the inside of the knuckle.

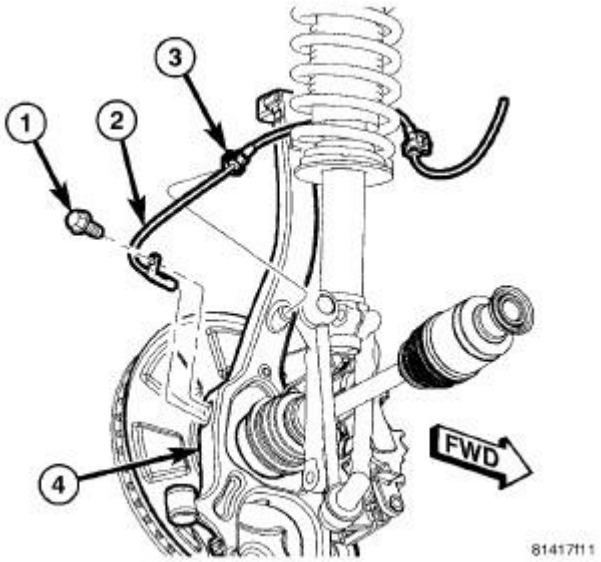

Fig. 8: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

The head of the front wheel speed sensor used on All-Wheel-Drive (AWD) vehicles mounts to the rear of the knuckle.

Vehicles without antilock brakes are equipped with one front wheel speed sensor. It is attached to the right front knuckle and is used to provide wheel speed sense to various vehicle systems.

REMOVAL

ALL-WHEEL-DRIVE

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

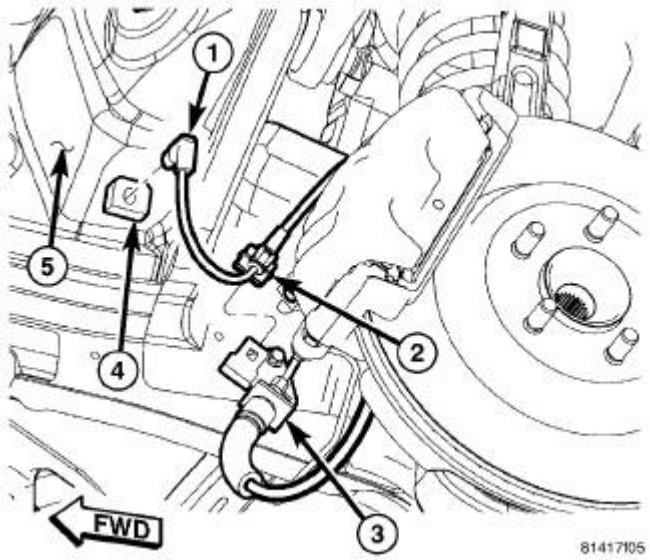

Fig. 9: Wheel Speed Sensor AT Body - AWD
Courtesy of CHRYSLER GROUP, LLC

2. Remove sensor cable routing clip (2) from brake hose bracket (3).

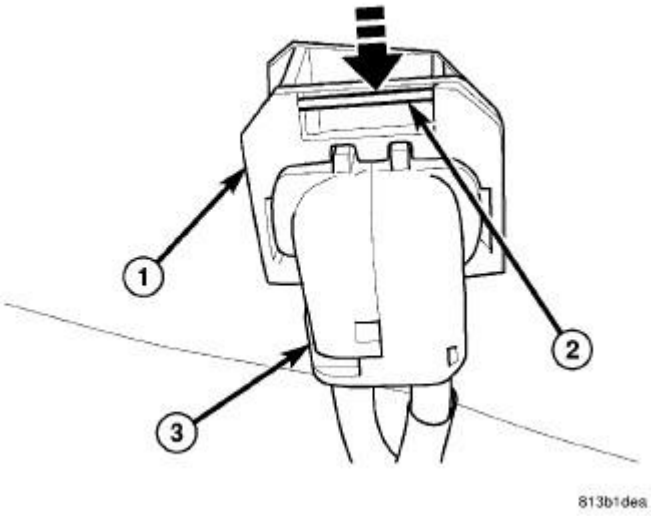

Fig. 10: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor connector (3) outward.

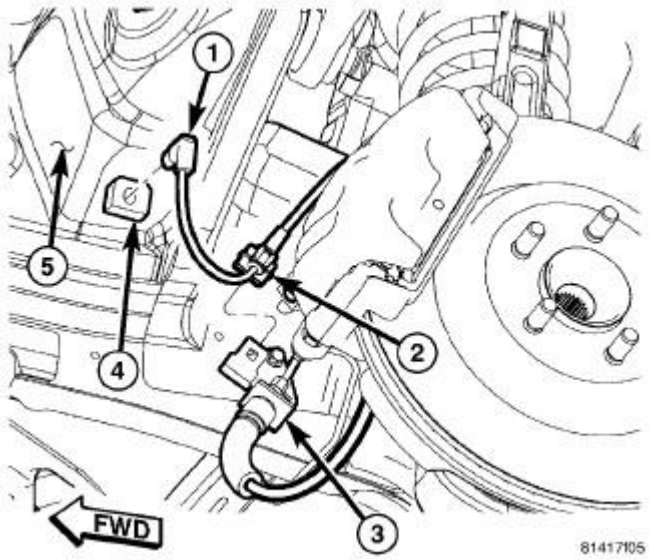

Fig. 11: Wheel Speed Sensor AT Body - AWD
Courtesy of CHRYSLER GROUP, LLC

3. Remove sensor connector (1) from body wiring harness connector (4).

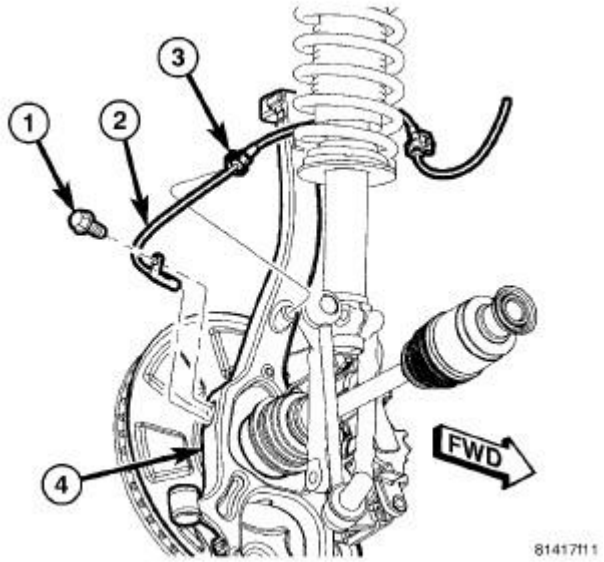

Fig. 12: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (1) fastening wheel speed sensor (2) to knuckle (4). Pull sensor head out of knuckle.
5. Remove wheel speed sensor cable routing clip (3) from knuckle (4).
6. Remove wheel speed sensor (2).

REAR-WHEEL-DRIVE

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor

connector (3) outward.

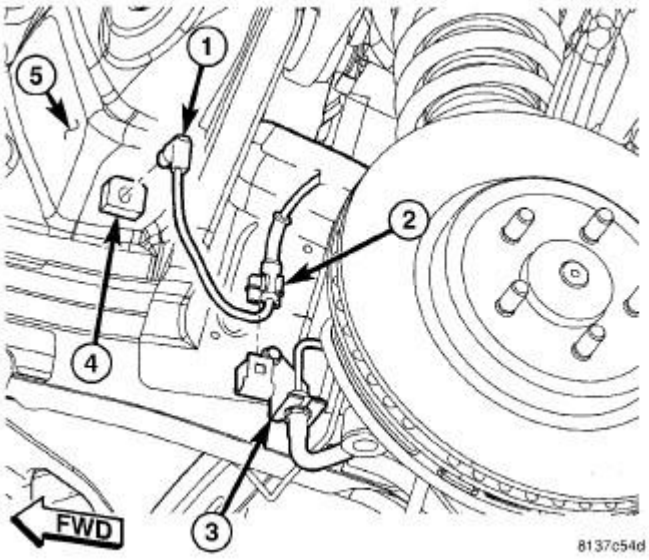

Fig. 15: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Remove sensor connector (1) from body wiring harness connector (4).

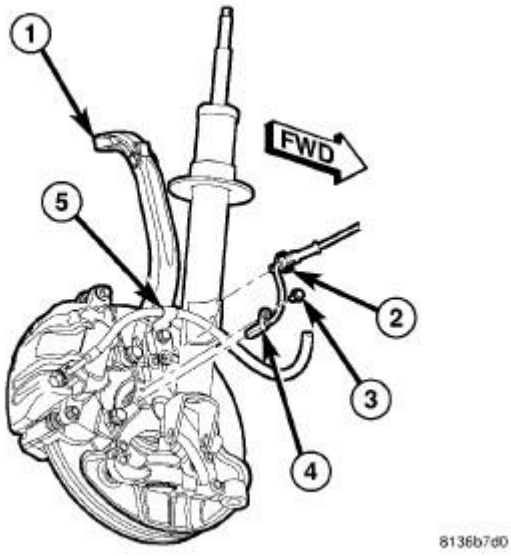

Fig. 16: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
5. Remove wheel speed sensor cable routing clip (2) from brake hose routing bracket (5).

INSTALLATION

ALL-WHEEL-DRIVE

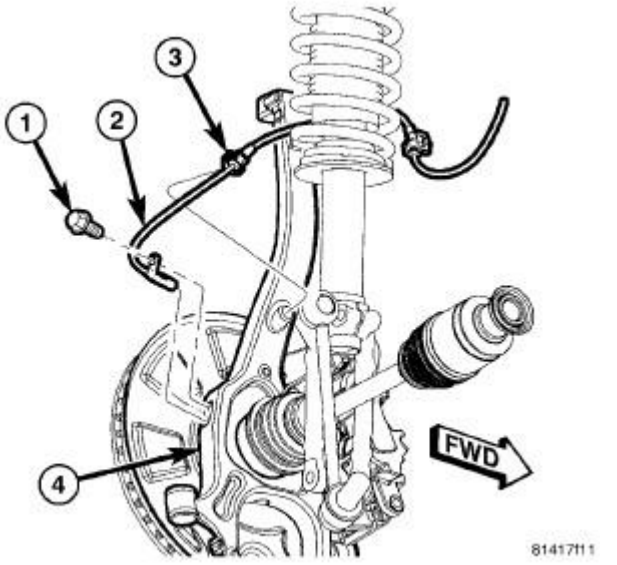

Fig. 17: Wheel Speed Sensor AT Front Knuckle - AWD
Courtesy of CHRYSLER GROUP, LLC

1. Install wheel speed sensor (2) head into knuckle (4) and install mounting screw (1). Tighten screw to 11 N.m (97 in. lbs.).
2. Attach wheel speed sensor cable and routing clip (3) to knuckle (4).

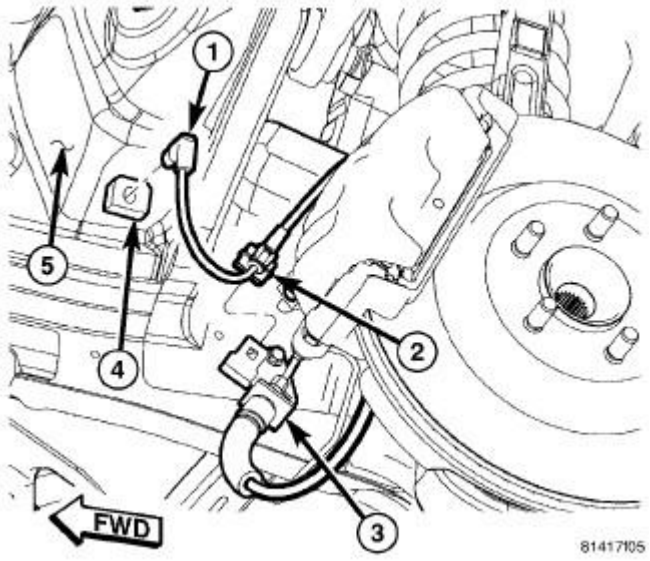

Fig. 18: Wheel Speed Sensor AT Body - AWD
Courtesy of CHRYSLER GROUP, LLC

3. Attach sensor cable routing clip (2) to brake hose bracket (3).
4. Connect sensor connector (1) to body wiring harness connector (4). When installing connector, make sure retaining clip on body connector is properly in place and sensor connect cannot be pulled out.
5. Lower vehicle.
6. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

REAR-WHEEL-DRIVE

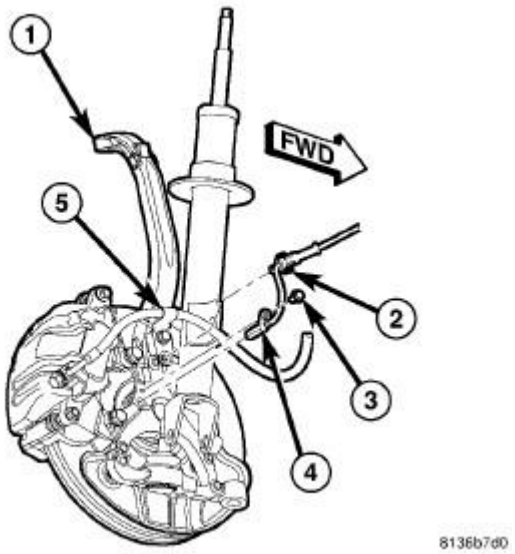

Fig. 19: Wheel Speed Sensor AT Front Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (97 in. lbs.).
2. Attach wheel speed sensor cable and routing clip (2) to brake hose routing bracket (5).

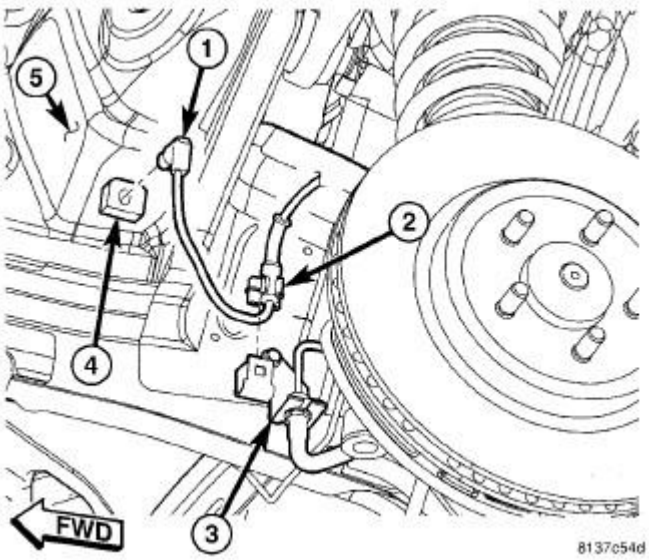

Fig. 20: Locating Speed Sensor Cable Routing Clip AT Brake Tube Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Attach sensor cable routing clip (2) to brake hose bracket (3).
4. Connect sensor connector (1) to body wiring harness connector (4). When installing connector, make sure retaining clip on body connector is properly in place and sensor connect cannot be pulled out.
5. Lower vehicle.
6. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, WHEEL SPEED, REAR

DESCRIPTION

DESCRIPTION

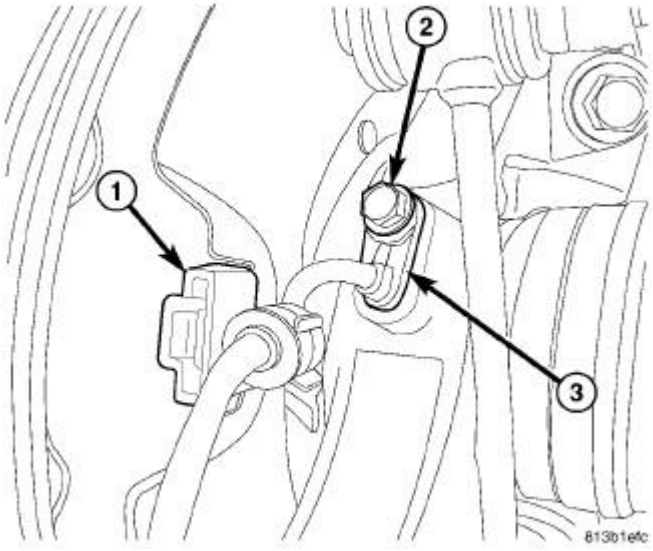

Fig. 21: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

One wheel speed sensor (3) is mounted to the rear of each rear knuckle. The wheel speed sensor, using a tone wheel attached to the rear axle half shaft as a trigger mechanism, communicates with the Antilock Brake Module, informing it of that wheel's speed.

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

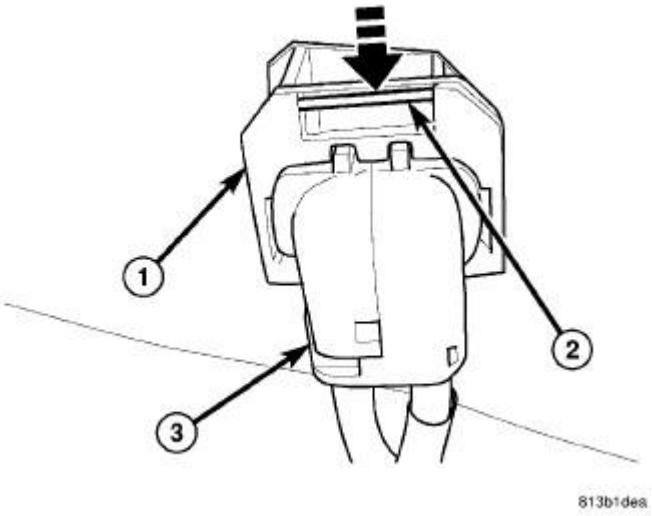

Fig. 22: Releasing Wheel Speed Sensor Connector

Courtesy of CHRYSLER GROUP, LLC

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor connector (3) outward.

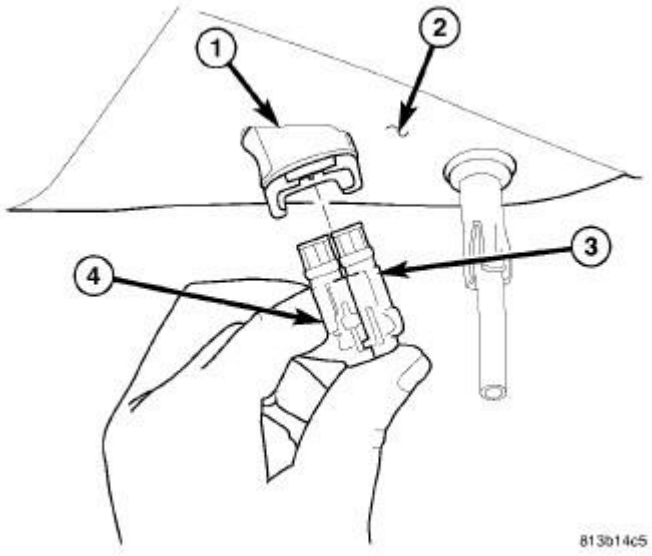

Fig. 23: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

2. Remove sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).
3. Separate left sensor connector (4) from right sensor connector (3).

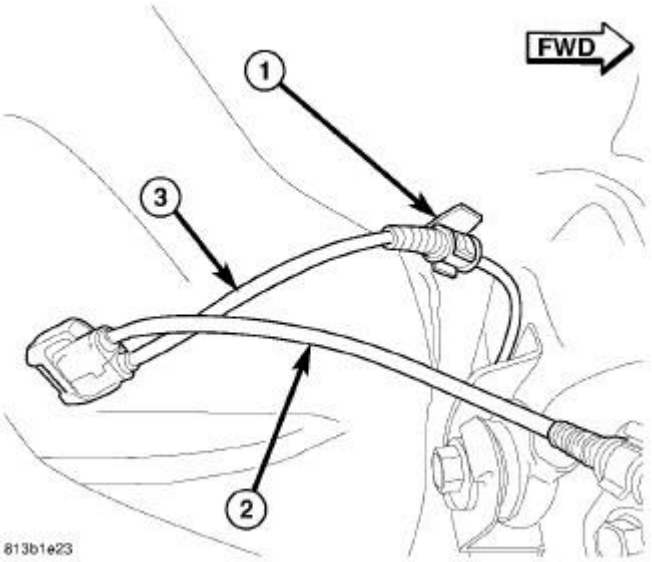

Fig. 24: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

4. If removing left sensor, unclip sensor cable (3) from routing clip near body connector (1).

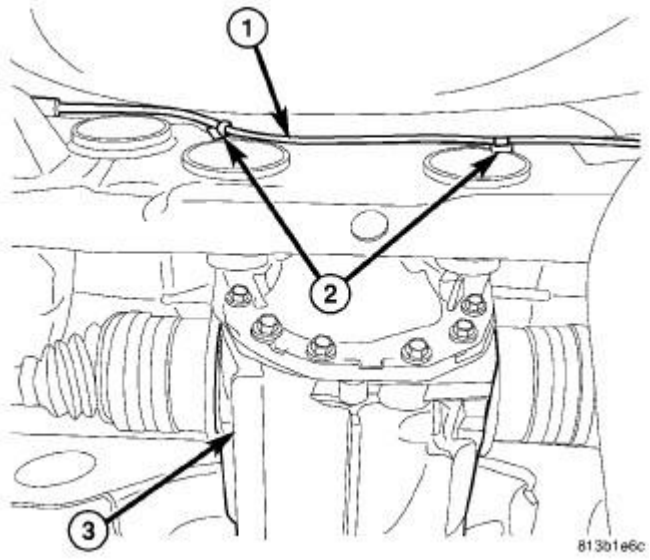

Fig. 25: Left Wheel Speed Sensor Routing Over Rear Differential
Courtesy of CHRYSLER GROUP, LLC

5. If removing left sensor, unclip sensor cable (1) from routing clips (2) along rear of crossmember near rear differential (3).

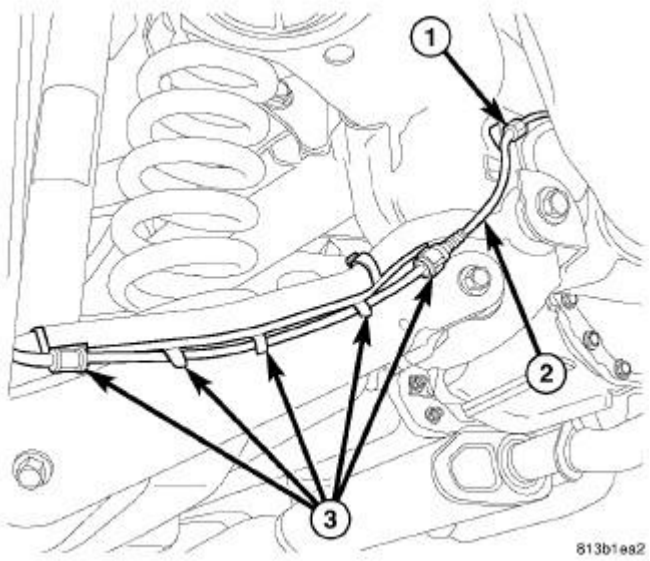

Fig. 26: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

6. If removing left sensor, unclip sensor cable (2) from routing clip (1) above toe link mount on rear crossmember.
7. Unclip sensor cable (2) from routing clips (3) along toe link.

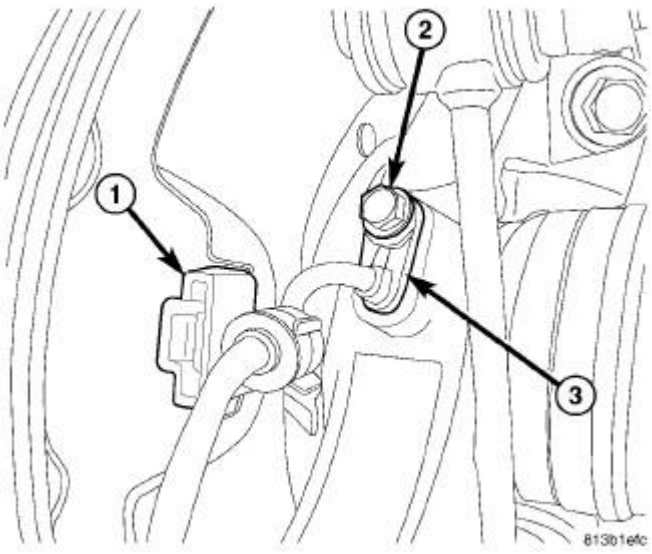

Fig. 27: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

8. Unclip sensor cable at rear brake rotor shield (1).
9. Remove screw (2) fastening sensor head (3) to rear knuckle.
10. Remove wheel speed sensor.

INSTALLATION

INSTALLATION

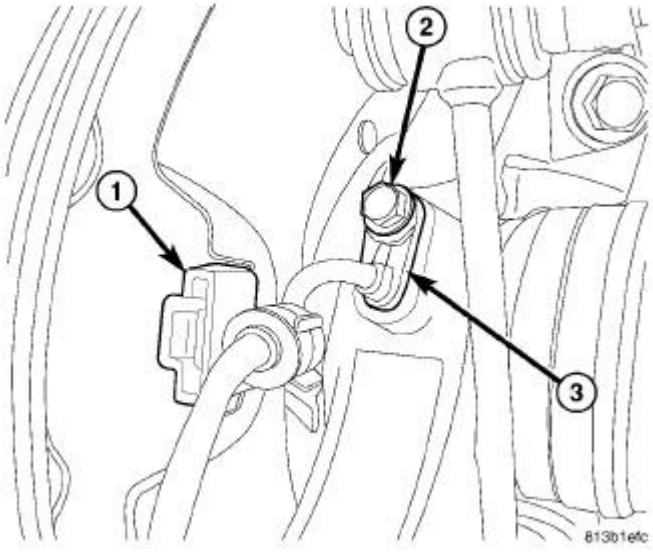

Fig. 28: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
2. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
3. Install sensor cable at rear brake rotor shield (1).

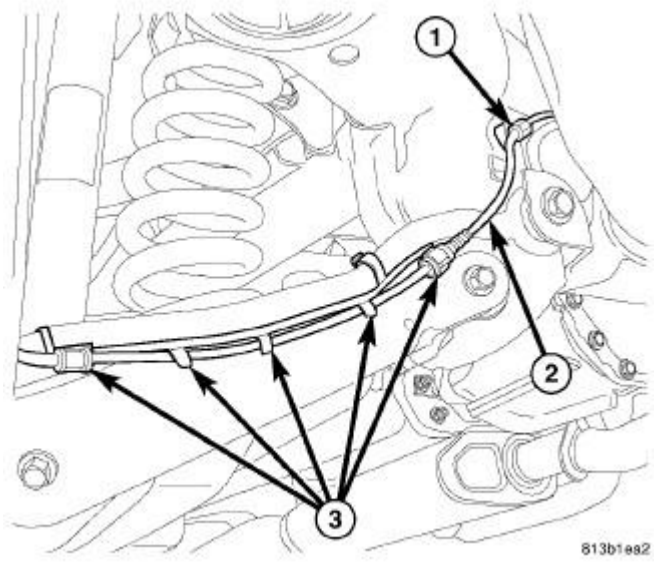

Fig. 29: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

4. Clip sensor cable (2) to routing clips (3) along toe link.
5. If installing left sensor, clip sensor cable (2) to routing clip (1) above toe link mount on rear crossmember.

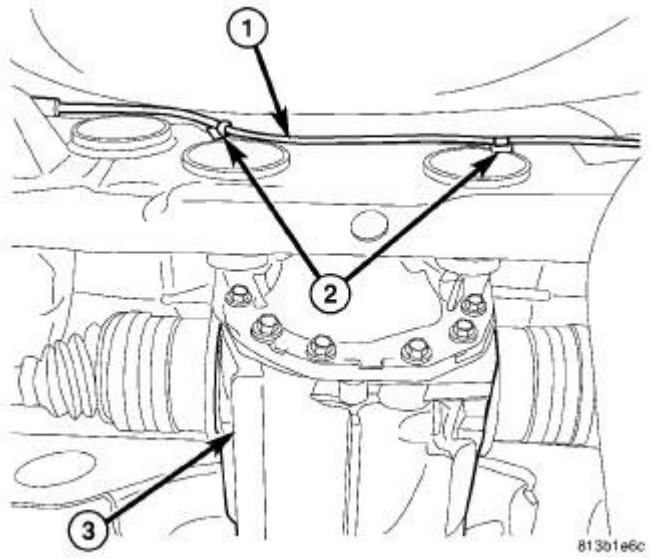

Fig. 30: Left Wheel Speed Sensor Routing Over Rear Differential
Courtesy of CHRYSLER GROUP, LLC

6. If installing left sensor, clip sensor cable (1) to routing clips (2) along rear of crossmember near rear differential (3).

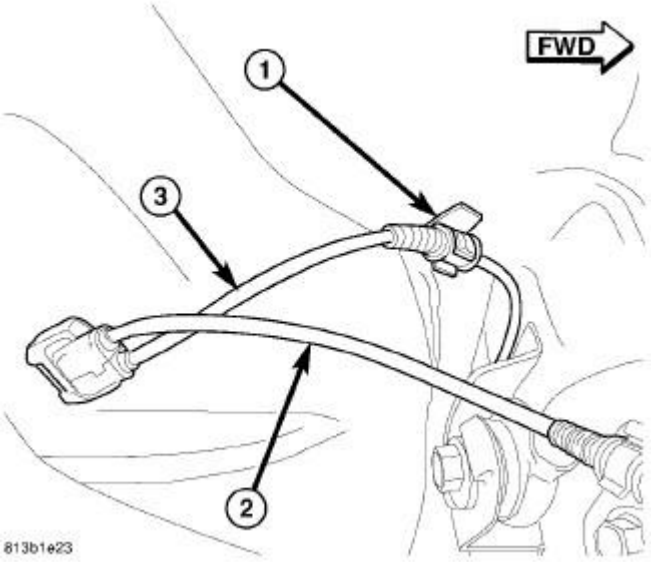

Fig. 31: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

7. If installing left sensor, clip sensor cable (3) to routing clip near body connector (1).

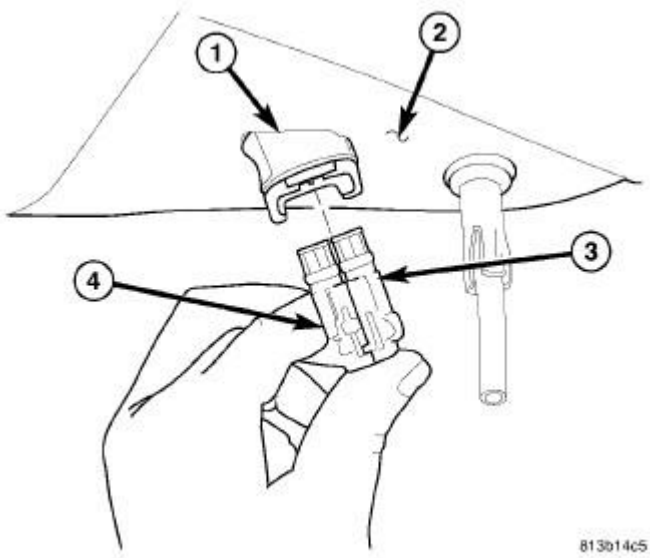

Fig. 32: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

8. Match left sensor connector (4) to right sensor connector (3) to make one connector.
9. Insert sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.
10. Lower vehicle.
11. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)

DESCRIPTION

DESCRIPTION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC Off Switch is located in the Instrument Panel Switch Pod in the center of the instrument panel. The ESC Off switch turns the Electronic Stability Control off whenever the switch is depressed. Depressing the switch a second time turns the ESC back on. The switch resets itself each time the ignition is cycled.

When the ESC Off switch is depressed and released, turning ESC off, it does not completely turn the system off. The ESC system reduces torque management to a lesser amount, but ESC function can still occur if the system perceives the need.

The ESC Off switch is serviced as part of the Instrument Panel Switch Pod.

REMOVAL

REMOVAL

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC Off switch is serviced as part of the Instrument Panel Switch Pod. Refer to **POD, SWITCH BANK, REMOVAL** .

INSTALLATION

INSTALLATION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC Off switch is serviced as part of the Instrument Panel Switch Pod. Refer to **POD, SWITCH BANK, INSTALLATION** .

HYDRAULIC/MECHANICAL

HYDRAULIC CONTROL UNIT (HCU)

REMOVAL

REMOVAL

To remove the HCU, the ICU must be removed and disassembled. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL**.). Refer to **INTEGRATED CONTROL UNIT (ICU), DISASSEMBLY**.

INSTALLATION

INSTALLATION

To install the HCU, assemble and install the ICU. Refer to **INTEGRATED CONTROL UNIT (ICU), ASSEMBLY** & **INTEGRATED CONTROL UNIT (ICU), INSTALLATION**.

INTEGRATED CONTROL UNIT (ICU)

DESCRIPTION

DESCRIPTION

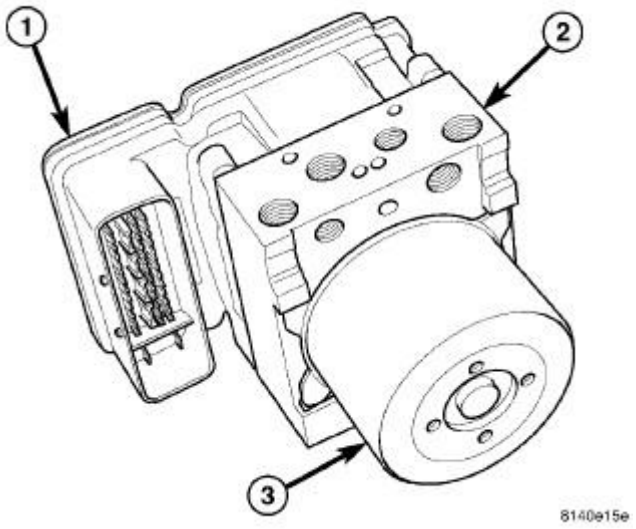

Fig. 33: Integrated Control Unit
Courtesy of CHRYSLER GROUP, LLC

The Hydraulic Control Unit (HCU) (2) and the Antilock Brake Module (ABM) (1) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU).

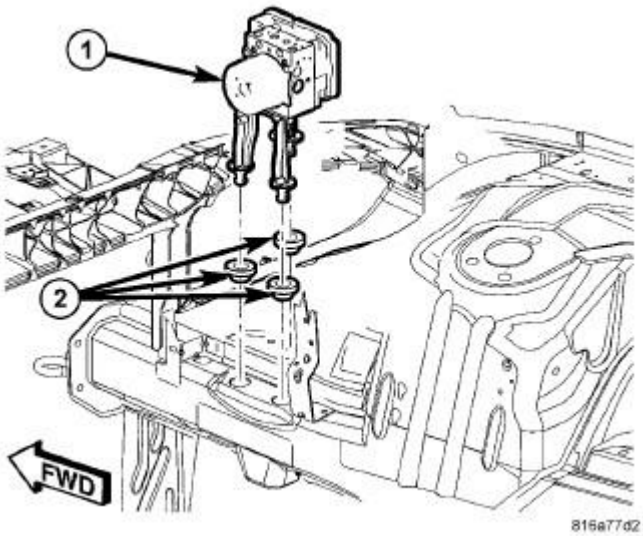

Fig. 34: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

The ICU (1) is located in the engine compartment, mounted to a bracket that is attached to the right side rail through the use of isolation grommets (2).

The ABS with traction control ICU consists of the following components: the ABM, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), two traction control solenoid valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The replaceable components of the ICU are the HCU and the ABM. No attempt should be made to service any components of the HCU or ABM. For replacement of the ABM. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

For additional information on the ABM. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .

REMOVAL

REMOVAL

NOTE: Before proceeding. Refer to CAUTION & WARNING .

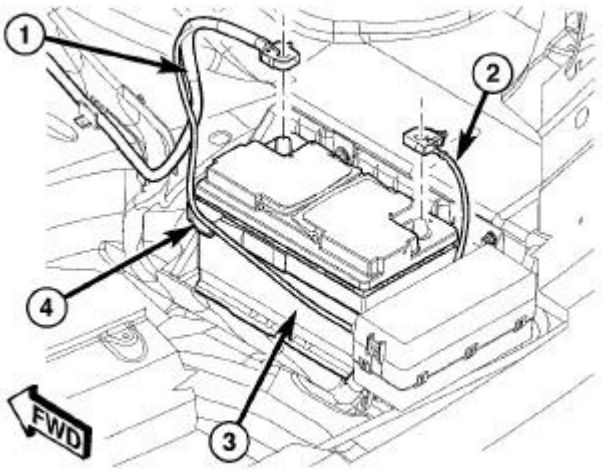

Fig. 35: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

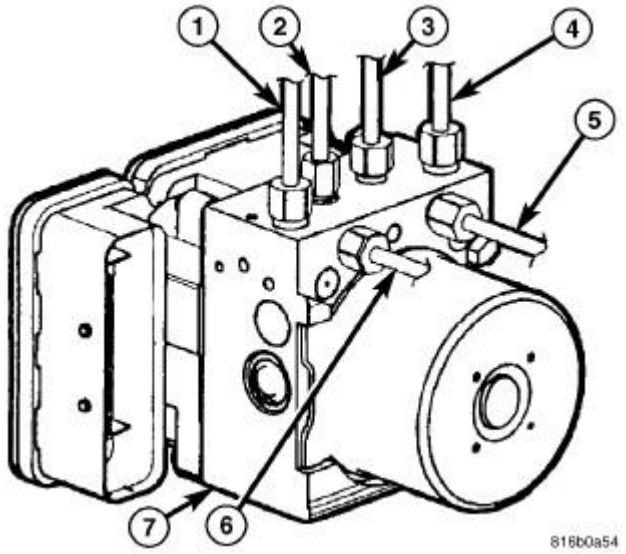

Fig. 36: Brake Tubes AT ICU - Mk25e
Courtesy of CHRYSLER GROUP, LLC

3. Remove primary (4) and secondary (1) brake tubes (from master cylinder) at hydraulic control unit (7).
4. Remove remaining brake tubes (2, 3, 5, 6) at hydraulic control unit (7).

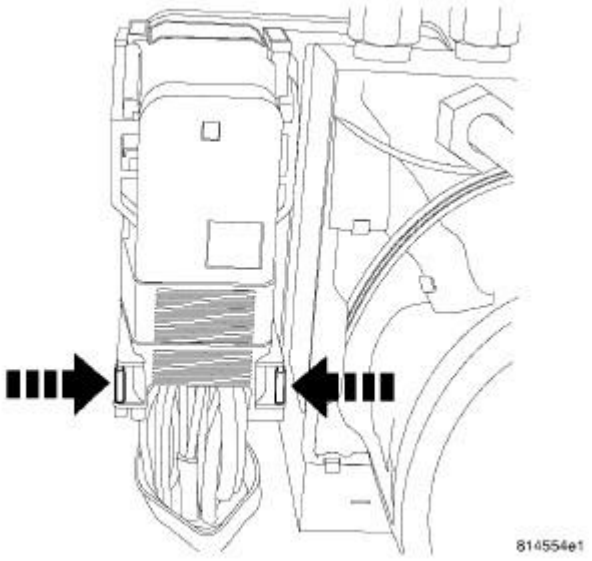

Fig. 37: ABM Connector Release Tabs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use this figure in the following step to release the ABM harness connector cover. It shows the location of the release tabs.

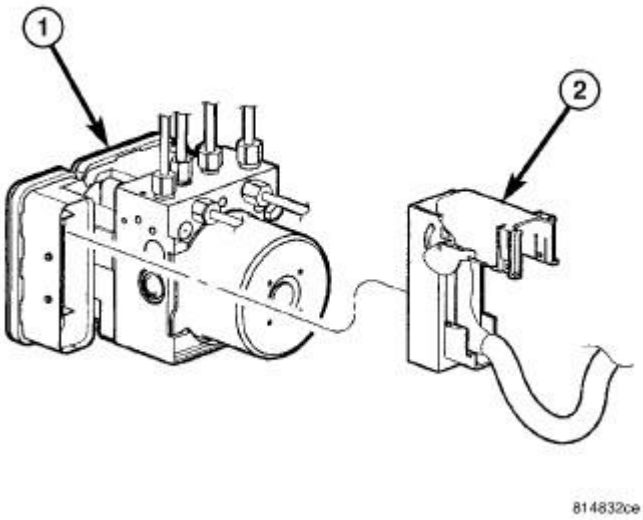

Fig. 38: Anti-Lock Brake Module Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect ABM harness connector from antilock brake module (ABM). To do so:
    1. Depress tabs on each side of connector cover, then
    2. Pull outward and upward on lower half of cover until it locks into position pointing straight outward (2). Connector can then be pulled straight outward off ABM (1).

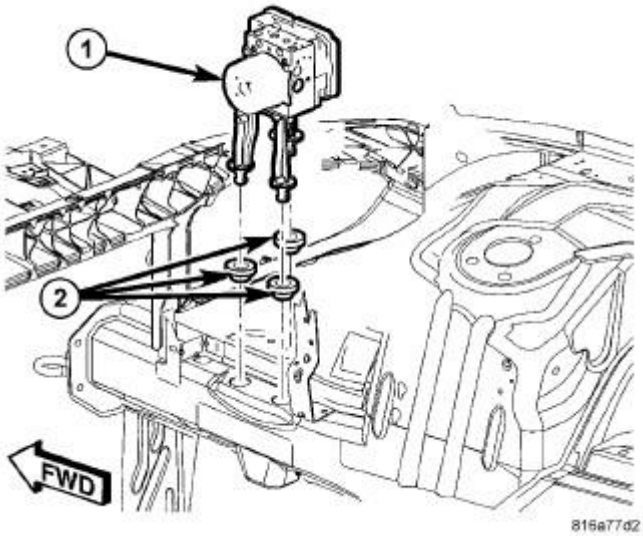

Fig. 39: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Pull up on unit (1) and remove from mounting grommets (2) in body side rail.

DISASSEMBLY

DISASSEMBLY

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

1. Remove two screws attaching the mounting bracket to the HCU. Remove the bracket.

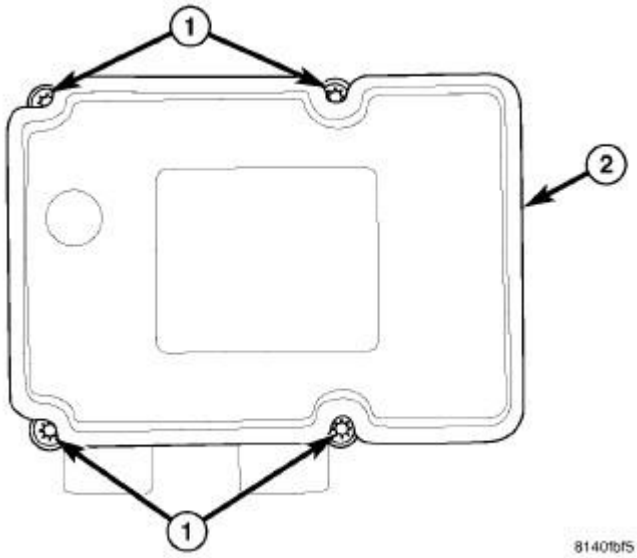

Fig. 40: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

2. Remove four screws (1) attaching ABM (2) to HCU.

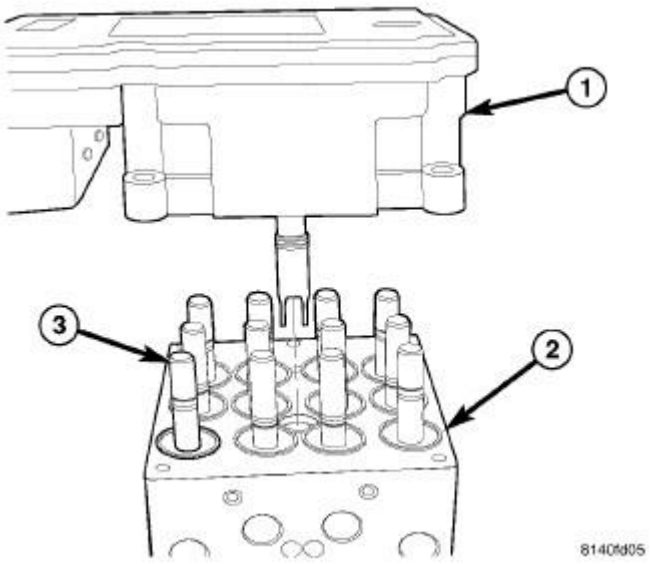

Fig. 41: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

3. Separate ABM (1) from HCU (2).

ASSEMBLY

ASSEMBLY

1. Clean any debris off the mating surfaces of the HCU and ABM.

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

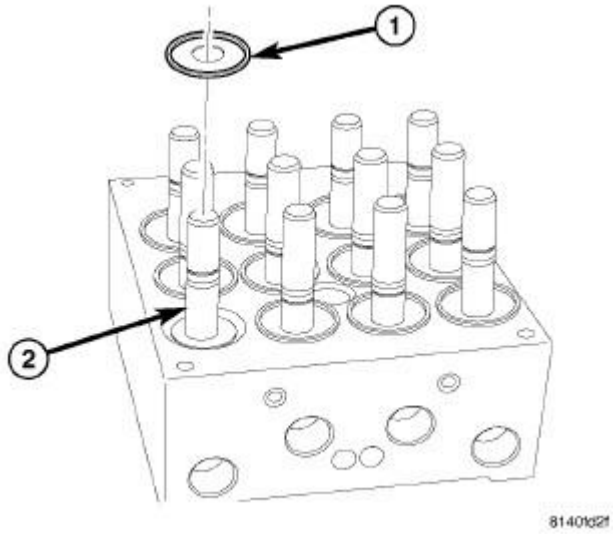

Fig. 42: Solenoid Valve Seal
Courtesy of CHRYSLER GROUP, LLC

2. If the seals (1) on the solenoid valve stems (2) are not new, replace them all. Each of the solenoid valve stem seals must be new to keep out moisture and debris; **do not reuse solenoid valve stem seals** .

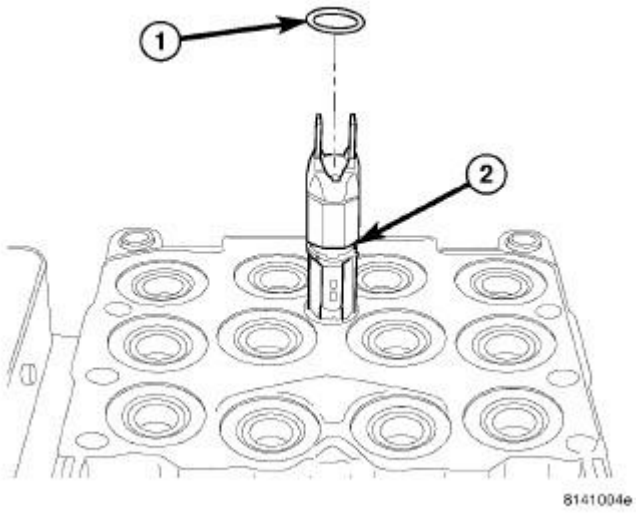

Fig. 43: Internal Pump Connector O-Ring
Courtesy of CHRYSLER GROUP, LLC

3. Replace the pump/motor connector O-ring (1) if it is not new. Be sure the O-ring is properly seated in the mounting groove (2).

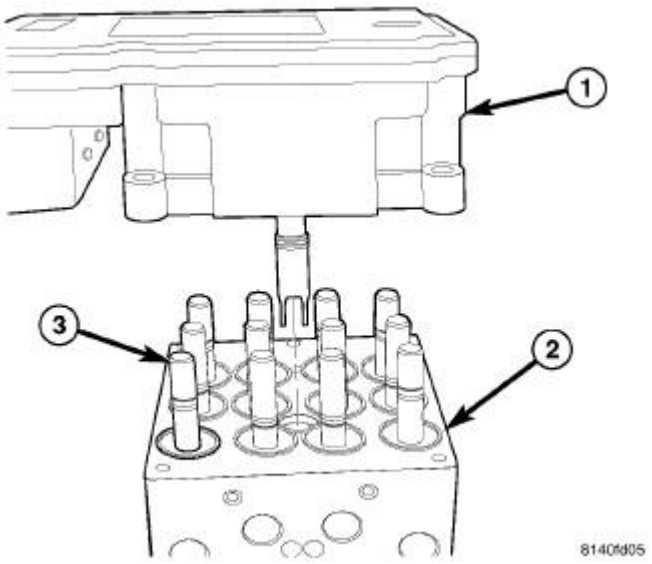

Fig. 44: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

4. Align components and install the ABM (1) on the HCU (2).

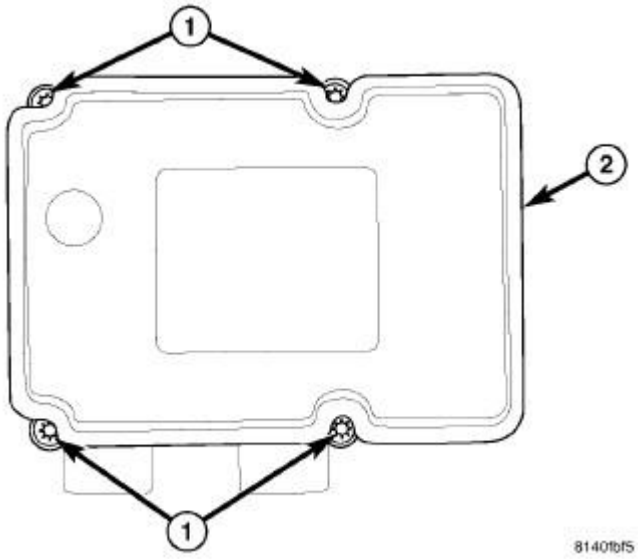

Fig. 45: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

5. Install the four screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2 N.m (17 in. lbs.).
6. Attach the mounting bracket to the HCU. Install two mounting bracket attaching screws and tighten to 11 N.m (97 in. lbs.).
7. Install the ICU in the vehicle. Refer to **INTEGRATED CONTROL UNIT (ICU), INSTALLATION**.

INSTALLATION

INSTALLATION

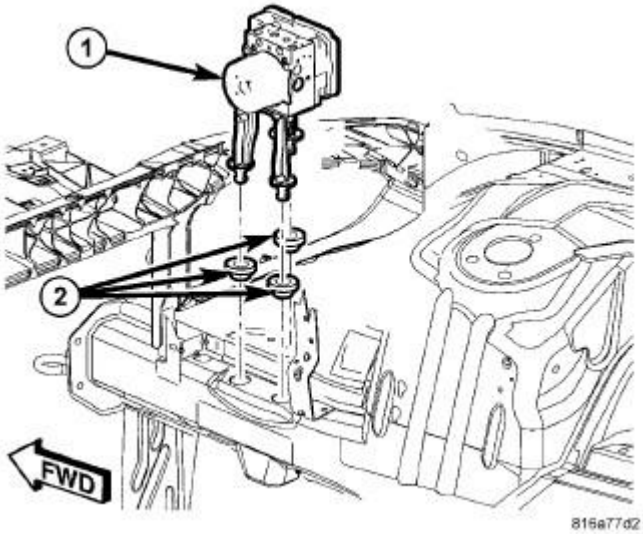

Fig. 46: ICU Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install unit (1), pushing mounting bracket down into mounting grommets (2) located in body side rail.

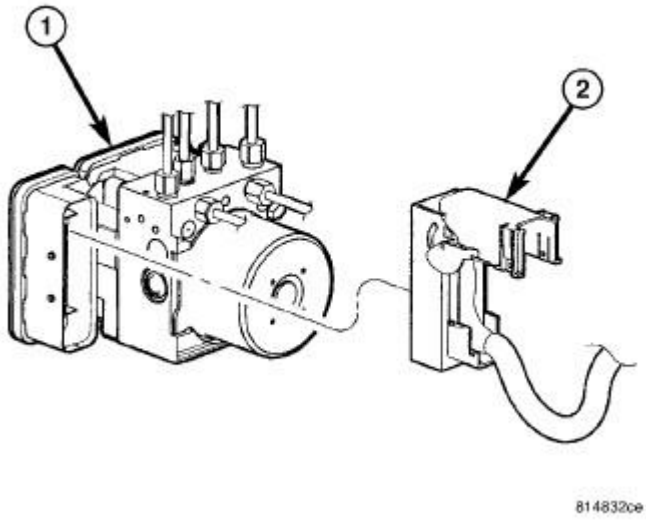

Fig. 47: Anti-Lock Brake Module Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before installing the ABM harness connector (2) on the ABM (1), be

sure the seal is properly installed in the connector.

2. Insert ABM harness connector (2) into socket of ABM (1) and close cover, locking connector in place.

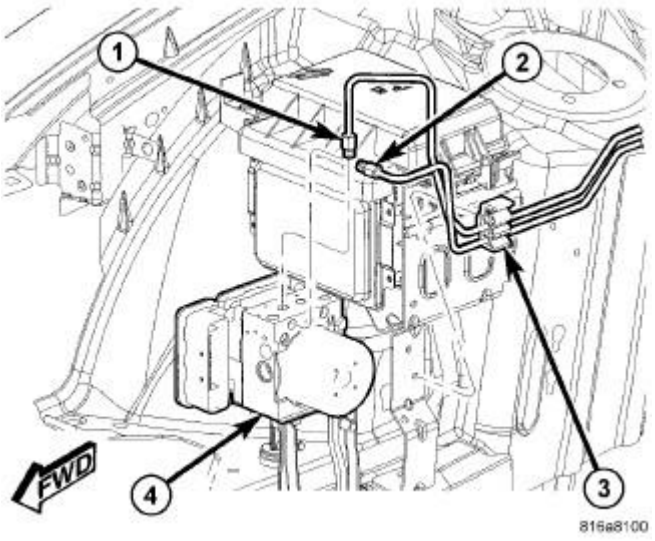

Fig. 48: Left Rear And Right Rear Brake Tubes AT ICU
Courtesy of CHRYSLER GROUP, LLC

3. Install left (2) and right (1) rear brake tubes at hydraulic control unit (4). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

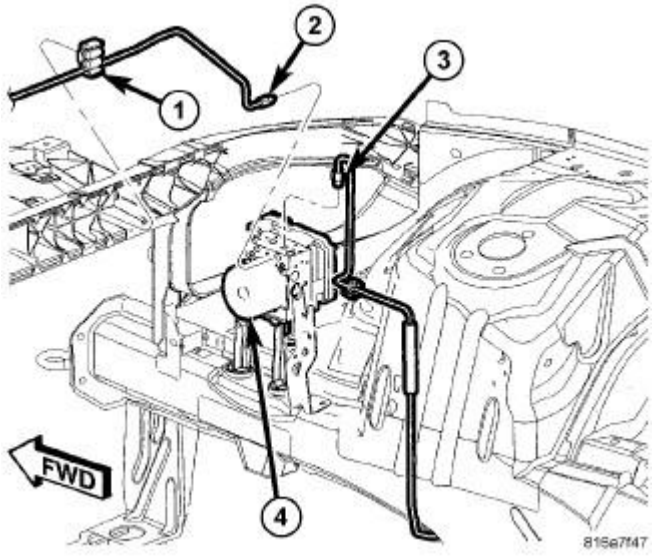

Fig. 49: Left Front And Right Front Brake Tubes AT ICU
Courtesy of CHRYSLER GROUP, LLC

4. Install left (2) and right (3) brake tubes at hydraulic control unit (4). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

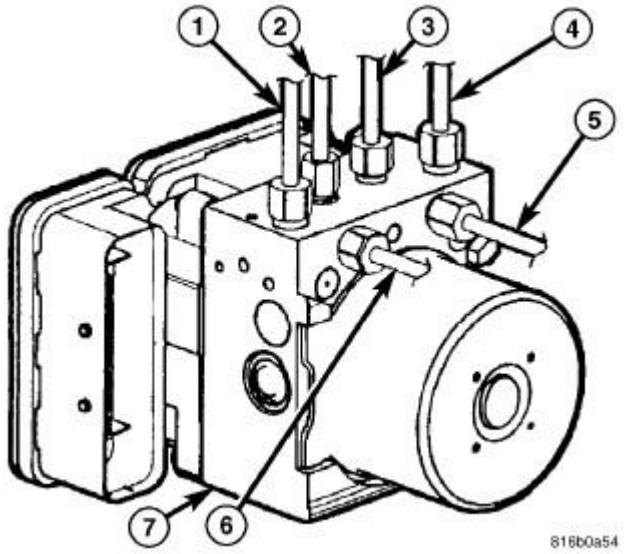

Fig. 50: Brake Tubes AT ICU - Mk25e
Courtesy of CHRYSLER GROUP, LLC

5. Install primary (4) and secondary (1) brake tubes at hydraulic control unit (7). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.
6. Remove brake pedal holding tool.

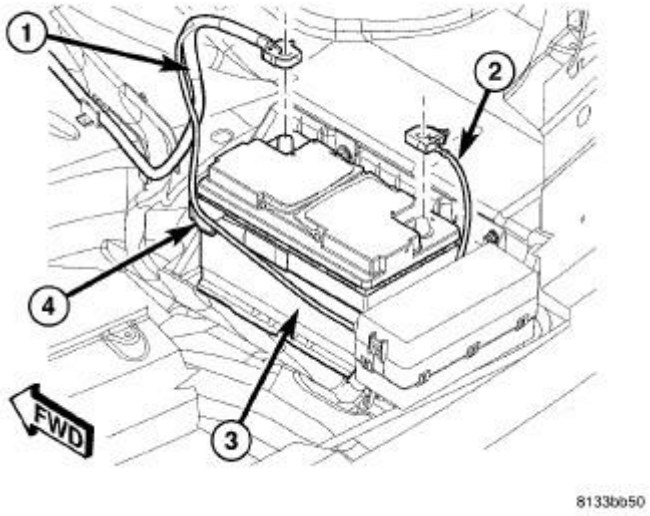

Fig. 51: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

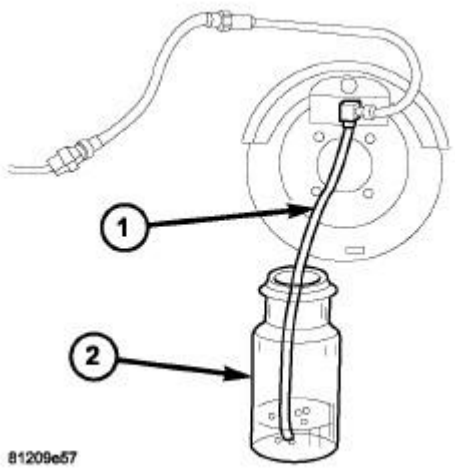

Fig. 52: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

8. Fill and bleed (1) base brake hydraulic system and ABS. Refer to **STANDARD PROCEDURE** .
9. Perform Diagnostic Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING

C15AF-1F-LOW SIDE DRIVER - CIRCUIT INTERMITTENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on and no system undervoltage or overvoltage condition present.

SET CONDITION:

The Active Damping Control Module (ADCM) detects excessive voltage fluctuation on the Mode Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.

2. With the scan tool, record and erase DTCs.
3. With the scan tool, read the DTCs in the ADCM.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 20.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance between ground and the (S130) Left Front Damper Valve (+) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S130) Left Front Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S130) Left Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S130) Left Front Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 5.

5. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (S131) Left Front Damper Valve (-) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 6.

6. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S131) Left Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 7.

7. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (S132) Right Front Damper Valve (+) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 8.
8. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S132) Right Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 9.
9. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (S133) Right Front Damper Valve (-) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

- Repair the (S133) Right Front Damper Valve (-) circuit for a short ground.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 10.

10. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S133) Right Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S133) Right Front Damper Valve (-) circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Go To 11.

11. **CHECK THE (S134) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Measure the resistance between ground and the (S134) Left Rear Damper Valve (+) circuit.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S134) Left Rear Damper Valve (+) circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Go To 12.

12. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S134) Left Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 13.

13. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
    1. Measure the resistance between ground and the (S135) Left Rear Damper Valve (-) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S135) Left Rear Damper Valve (-) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 14.

14. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S135) Left Rear Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 15.

15. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Measure the resistance between ground and the (S136) Right Rear Damper Valve (+) circuit.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (S136) Right Rear Damper Valve (+) circuit for a short ground.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 16.

16. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S136) Right Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S136) Right Rear Damper Valve (+) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 17.

17. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
    1. Measure the resistance between ground and the (S137) Right Rear Damper Valve (-) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S137) Right Rear Damper Valve (-) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 18.

18. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S137) Right Rear Damper Valve (-) circuit between the

ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (S137) Right Rear Damper Valve (-) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 19.

19. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** and **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

20. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.

5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B1-11-REAR ACCELERATION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Signal circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT OPEN OR HIGH RESISTANCE
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read the DTCs in the ADCM.

      Is the DTC active at this time?

Yes

- Go To 2.

No

- Go To 7.

2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance between ground and the (S168) REAR Acceleration Sensor Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 5.

      No

      - Repair the (S168) Rear Acceleration Sensor Signal circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **CHECK THE (S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT FOR AN OPEN OR**

HIGH RESISTANCE

1. Measure the resistance of the (S168) Rear Acceleration Sensor Signal circuit between the Rear Acceleration Sensor harness connector and the ADCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (S166) Rear Acceleration Sensor Signal circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 5.

5. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S166) Rear Acceleration Sensor Power circuit between the Rear Acceleration Sensor harness connector and the ADCM C2 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S166) Rear Acceleration Sensor Power circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 6.

6. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

7. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B1-12- REAR ACCELERATION - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Signal is shorted to voltage while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes

WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
(S167) REAR ACCELERATION SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.

2. Disconnect the Rear Acceleration Sensor harness connector.
3. Disconnect the ADCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (S168) Rear Acceleration Sensor Signal circuit.

   Is the voltage above 5.25 volts?

   Yes

   - Repair the (S168) Rear Acceleration Sensor Power circuit for a short battery.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (S167) REAR ACCELERATION SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (S167) Rear Acceleration Sensor Return circuit between the Rear Acceleration Sensor harness connector and the ADCM C2 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S167) Rear Acceleration Sensor Return circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 5.

5. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B2-11-LEFT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Signal circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 7.
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Go To 3.

3. **CHECK THE (S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Acceleration Sensor harness connector.
    2. Disconnect the ADCM C1 harness connector.
    3. Measure the resistance between ground and the (S162) Left Front Acceleration Sensor Signal circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Go To 5.

    No

    - Repair the (S162) Left Front Acceleration Sensor Signal circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
4. **CHECK THE (S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S162) Left Front Acceleration Sensor Signal circuit between the Left Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S160) Left Front Acceleration Sensor Signal circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 5.
5. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S160) Left Front Acceleration Sensor Power circuit between the Left Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

- Repair the (S160) Left Front Acceleration Sensor Power circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 6.

6. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
7. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B2-12-LEFT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Signal is shorted to voltage while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
(S161) LEFT FRONT ACCELERATION SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

1. Turn the ignition off.
2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Left Front Acceleration Sensor harness connector.
   3. Disconnect the ADCM C1 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S162) Left Front Acceleration Sensor Signal circuit.

      Is the voltage above 5.25 volts?

      Yes

      - Repair the (S162) Left Front Acceleration Sensor Power circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **CHECK THE (S161) LEFT FRONT ACCELERATION SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (S161) Right Front Acceleration Sensor Return circuit between the Left Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

Yes

- Repair the (S161) Right Front Acceleration Sensor Return circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 5.

5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B3-11-RIGHT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Signal circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT OPEN OR HIGH RESISTANCE
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

No

- Go To 7.

2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C1 harness connector.
   3. Measure the resistance between ground and the (S165) Right Front Acceleration Sensor Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 5.

      No

      - Repair the (S165) Right Front Acceleration Sensor Signal circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **CHECK THE (S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S165) Right Front Acceleration Sensor Signal circuit between the Right Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

Is the resistance above 5.0 Ohms?

Yes

- Repair the (S163) Right Front Acceleration Sensor Signal circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 5.

5. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S163) Right Front Acceleration Sensor Power circuit between the Right Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S163) Right Front Acceleration Sensor Power circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 6.

6. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

7. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B3-12-RIGHT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Signal is shorted to voltage while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
(S164) RIGHT FRONT ACCELERATION SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE

RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Right Front Acceleration Sensor harness connector.
    3. Disconnect the ADCM C1 harness connector.

4. Turn the ignition on.
5. Measure the voltage between ground and the (S165) Right Front Acceleration Sensor Signal circuit.

   Is the voltage above 5.25 volts?

   Yes

   - Repair the (S165) Right Front Acceleration Sensor Power circuit for a short battery.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 4.

4. **CHECK THE (S164) RIGHT FRONT ACCELERATION SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (S164) Right Front Acceleration Sensor Return circuit between the Right Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S164) Right Front Acceleration Sensor Return circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 5.

5. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-04-LEFT FRONT DAMPING VALVE LOW SIDE 1 - SYSTEM INTERNAL FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects the Low Side 1 Damping Valve has an internal failure while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
AIR SUSPENSION CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 3.
2. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Test complete.

3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-11-LEFT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance between ground and the (S130) Left Front Damper Valve (+) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

- Repair the (S130) Left Front Damper Valve (+) circuit for a short ground.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-12-LEFT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is

connected correctly.

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S130) Left Front Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S130) Left Front Damper Valve (+) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

Does the DTC remain active?

Yes

- Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-13-LEFT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve

circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Go To 3.

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance of the (S130) Left Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S130) Left Front Damper Valve (+) circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Go To 4.
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

       Does the DTC remain active?

       Yes

       - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.

2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-08-LEFT FRONT DAMPING VALVE LOW SIDE 2 - BUS SIGNAL/MESSAGE FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Left Front Damper Valve (-) circuit is not communicating with the Active Damping Control Module (ADCM).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance of the (S131) Left Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

- Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-11-LEFT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is

connected correctly.

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance between ground and the (S131) Left Front Damper Valve (-) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

Yes

- Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-12-LEFT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO**

BATTERY

1. Turn the ignition off.
2. Disconnect the Damping Valve Shock Assembly harness connector.
3. Disconnect the ADCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (S131) Left Front Damper Valve (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (S131) Left Front Damper Valve (-) circuit for a short battery.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-13-LEFT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Front Damping Valve (-) circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read the DTCs in the ADCM.

Is the DTC active at this time?

Yes

- Go To 2.

No

- Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S131) Left Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B6-11-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance between ground and the (S132) Right Front Damper Valve (+) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S132) Right Front Damper Valve (+) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 4.
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B6-12-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY

ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Damping Valve Shock Assembly harness connector.
    3. Disconnect the ADCM C2 harness connector.

4. Turn the ignition on.
5. Measure the voltage between ground and the (S132) Right Front Damper Valve (+) circuit.

   Is there any voltage present?

   Yes

   - Repair the (S132) Right Front Damper Valve (+) circuit for a short battery.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B6-13-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

No

- Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S132) Right Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the vehicle.
6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B7-11-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance between ground and the (S133) Right Front Damper Valve (-) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S133) Right Front Damper Valve (-) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 4.
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B7-12-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Damping Valve Shock Assembly harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S133) Right Front Damper Valve (-) circuit.

    Is there any voltage present?

Yes

- Repair the (S133) Right Front Damper Valve (-) circuit for a short battery.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B7-13-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S133) Right Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S133) Right Front Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.

4. With the scan tool, erase the DTCs.
5. Start the vehicle.
6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-11-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Adaptive Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

       Is the DTC active at this time?

       Yes

       - Go To 2.

       No

       - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

       Were any problems found?

       Yes

       - Repair as necessary.

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S134) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance between ground and the (S134) Left Rear Damper Valve (+) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**

1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-12-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.
3. With the scan tool, read the DTCs in the ADCM.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S134) Left Rear Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

- Repair the (S134) Left Rear Damper Valve (+) circuit for a short battery.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-13-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is

connected correctly.

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S134) Left Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

Does the DTC remain active?

Yes

- Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-14-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit

is shorted to ground or open while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S134) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance between ground and the (S134) Left Rear Damper Valve (+) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.
4. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S134) Left Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 5.
5. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.

4. With the scan tool, erase the DTCs.
5. Start the vehicle.
6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-11-LEFT REAR DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S135) LEFT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance between ground and the (S135) Left Rear Damper Valve (-) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S135) Left Rear Damper Valve (-) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative

to this circuit.

3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-12-LEFT REAR DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read the DTCs in the ADCM.

Is the DTC active at this time?

Yes

- Go To 2.

No

- Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Damping Valve Shock Assembly harness connector.
3. Disconnect the ADCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (S135) Left Rear Damper Valve (-) circuit.

Is there any voltage present?

Yes

- Repair the (S135) Left Rear Damper Valve (-) circuit for a short battery.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-13-LEFT REAR DAMPING VALVE LOW SIDE 2 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance of the (S135) Left Rear Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 4.
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-18-LEFT REAR DAMPING VALVE LOW SIDE 2 - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Left Rear Damping Valve Solenoid Low Side 2 (rebound stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR

(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

1. Disconnect the Left Rear Damping Valve Shock Assembly harness connector.
2. Disconnect the ADCM C2 harness connector.
3. Connect a jumper wire between Ground and the (S135) Left Rear Damper Valve (-) circuit in the Left Rear Damping Valve Shock Assembly harness connector.
4. Using a 12-volt test light connected to B+, check the (S135) Left Rear Damper Valve (-) circuit in the ADCM C2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.

2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-11-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

3. With the scan tool, read the DTCs in the ADCM.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance between ground and the (S136) Right Rear Damper Valve (+) circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S136) Right Rear Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present

at this time.

C15BA-12-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.

2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S136) Right Rear Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S136) Right Rear Damper Valve (+) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

- Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-13-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes

WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.

3. Measure the resistance of the (S136) Right Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (S136) Right Rear Damper Valve (+) circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.

5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-1C-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT VOLTAGE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects when the Right Rear Damper Valve voltage is out of range while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read the DTCs in the ADCM.

      Is the DTC active at this time?

      Yes

- Go To 2.

No

- Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S136) Right Rear Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S136) Right Rear Damper Valve (+) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**

1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the vehicle.
6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BB-11-RIGHT REAR DAMPING VALVE LOW SIDE 2-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right rear Damping Valve circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

       Is the DTC active at this time?

       Yes

       - Go To 2.

       No

       - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

       Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance between ground and the (S137) Right Rear Damper Valve (-) circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S137) Right Rear Damper Valve (-) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 4.
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BB-12-RIGHT REAR DAMPING VALVE LOW SIDE 2-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is shorted to battery voltage while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Damping Valve Shock Assembly harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S137) Right Rear Damper Valve (-) circuit.

    Is there any voltage present?

Yes

- Repair the (S137) Right Rear Damper Valve (-) circuit for a short battery.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BB-13-RIGHT REAR DAMPING VALVE LOW SIDE 2-CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is open while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S137) Right Rear Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S137) Right Rear Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.

6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BC-11-LEFT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Power circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO GROUND
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO (S161) LEFT FRONT ACCELERATION SENSOR RETURN
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Acceleration Sensor harness connector.
    2. Disconnect the ADCM C1 harness connector.
    3. Measure the resistance between ground and the (S160) Left Front Acceleration Sensor Power circuit.

       Is the resistance above 5.0 Ohms?

       Yes

       - Go To 4.

       No

       - Repair the (S160) Left Front Acceleration Sensor Power circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
4. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO THE (S161) LEFT FRONT ACCELERATION SENSOR RETURN**
    1. Measure the resistance between the (S160) Left Front Acceleration Sensor Power circuit and the (S161) Left Front Acceleration Sensor Return circuit.

       Is the resistance above 5.0 Ohms?

       Yes

       - Go To 5.

       No

       - Repair the (S160) Left Front Acceleration Sensor Power circuit for a short to the (160) Acceleration Sensor Return circuit.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.

6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BC-12-LEFT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Power circuit is shorted to battery voltage while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO BATTERY
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Go To 3.

3. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Left Front Acceleration Sensor harness connector.
    3. Disconnect the ADCM C1 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S160) Left Front Acceleration Sensor Power circuit.

       Is the voltage above 5.25 volts?

       Yes

       - Repair the (S160) Left Front Acceleration Sensor Power circuit for a short battery.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Go To 4.
4. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

       Does the DTC remain active?

       Yes

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and

connectors.

2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BD-11-RIGHT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Power circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO GROUND
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO (S164) RIGHT FRONT ACCELERATION SENSOR RETURN
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Acceleration Sensor harness connector.
    2. Disconnect the ADCM C1 harness connector.
    3. Measure the resistance between ground and the (S160) Left Front Acceleration Sensor Power circuit.

    Is the resistance above 5.0 Ohms?

    Yes

- Go To 4.

No

- Repair the (S160) Left Front Acceleration Sensor Power circuit for a short ground.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **CHECK THE (S163) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO (S164) ACCELERATION SENSOR RETURN**
   1. Measure the resistance between the (S163) Right Front Acceleration Sensor Power circuit and the (S164) Right Front Acceleration Sensor Return circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 5.

      No

      - Repair the (S163) Right Front Acceleration Sensor Power circuit for a short to the (164) Right Front Acceleration Sensor Return circuit.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
5. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete.
6. **INTERMITTENT WIRING AND CONNECTORS**

1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BD-12-RIGHT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Power circuit is shorted to battery voltage while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO BATTERY
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.
3. With the scan tool, read the DTCs in the ADCM.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.

2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

   1. Turn the ignition off.
   2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 3.

3. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Acceleration Sensor harness connector.
   3. Disconnect the ADCM C1 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S163) Right Front Acceleration Sensor Power circuit.

      Is the voltage above 5.25 volts?

      Yes

- Repair the (S163) Right Front Acceleration Sensor Power circuit for a short battery.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BE-11-REAR ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Power circuit is shorted to ground while ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT SHORT TO GROUND
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT SHORT TO (S167) REAR ACCELERATION SENSOR RETURN
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

1. Turn the ignition off.
2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C1 harness connector.
   3. Measure the resistance between ground and the (S166) Rear Acceleration Sensor Power circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 4.

      No

      - Repair the (S166) Rear Acceleration Sensor Power circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO THE (S167) REAR ACCELERATION SENSOR RETURN**
   1. Measure the resistance between the (S166) Rear Acceleration Sensor Power circuit and the (S167) Rear Acceleration Sensor Return circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 5.

No

- Repair the (S166) Rear Acceleration Sensor Power circuit for a short to the (160) Acceleration Sensor Return circuit.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BE-12- REAR ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Power circuit is shorted to battery voltage while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT SHORT TO BATTERY
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

1. Turn the ignition off.
2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Rear Acceleration Sensor harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S166) Rear Acceleration Sensor Power circuit.

      Is the voltage above 5.25 volts?

      Yes

      - Repair the (S166) Rear Acceleration Sensor Power circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BF-2A-DAMPING MODE BUTTON - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Active Damping Control Module (ADCM) detects the Damping Mode button switch information by receiving messages from the CAN communications bus. Specifically the UP button is wired to the cluster, the cluster sends this information via CAN I to the TIPM, and TIPM sends it onto the ADCM via CAN C.

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

Damping suspension button has been pressed continuously for more than 17 seconds while the ignition is in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING SUSPENSION SWITCH STUCK IN THE PRESSED POSITION
INSTRUMENT CLUSTER
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

       Is the DTC active at this time?

       Yes

       - Go To 2.

       No

       - Go To 5.
2. **DAMPING SUSPENSION SWITCH IN THE PRESSED POSITION**
    1. Turn the ignition off.
    2. Inspect the Damping Mode switch for foreign material which could keep it from returning back to the not pushed state.
    3. Turn the ignition on.
    4. Using the scan tool, monitor the Damping Mode Switch status in the ADCM while pressing and releasing the switch.

       Does the Damping Mode Switch function correctly?

       Yes

       - Test complete, the condition or conditions that originally set this DTC are not present at this time.

       No

- Go To 3.

3. **DAMPING MODE SWITCH**
    1. Turn the ignition off.
    2. Replace the Damping Mode Switch in accordance with the Service Information.

       Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    3. Turn the ignition on.
    4. With the scan tool, record and erase DTCs.
    5. With the scan tool, read the DTCs in the ADCM.

       Does the DTC remain active?

       Yes

       - Go To 4.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time.
4. **INSTRUMENT CLUSTER**
    1. Turn the ignition off.
    2. Replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
    3. Turn the ignition on.
    4. With the scan tool, record and erase DTCs.
    5. With the scan tool, read the DTCs in the ASCM.

       Does the DTC remain active?

       Yes

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and

connectors.

2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C2-19-LEFT FRONT DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Left Front Damping Valve Solenoid Low Side 1 (compression stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Left Front Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S130) Left Front Damper Valve (+) circuit in the Left Front Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S130) Left Front Damper Valve (+) circuit in the ADCM C2 harness connector.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Repair the (S130) Left Front Damper Valve (+) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C3-19-LEFT FRONT DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Left Front Damping Valve Solenoid Low Side 2 (rebound stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

Yes

- Go To 2.

No

- Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

1. Disconnect the Left Front Damping Valve Shock Assembly harness connector.
2. Disconnect the ADCM C2 harness connector.
3. Connect a jumper wire between Ground and the (S131) Left Front Damper Valve (-) circuit in the Left Front Damping Valve Shock Assembly harness connector.
4. Using a 12-volt test light connected to B+, check the (S131) Left Front Damper Valve (-) circuit in the ADCM C2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present

at this time.

C15C4-19-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Right Front Damping Valve Solenoid Low Side 1 (compression stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Right Front Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S132) Right Front Damper Valve (+) circuit in the Right Front Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S132) Right Front Damper Valve (+) circuit in the ADCM C2 harness connector.

      NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

      Does the test light illuminate brightly?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the vehicle.
6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C5-19-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Right Front Damping Valve Solenoid Low Side 2 (rebound stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Right Front Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S133) Right Front Damper Valve (-) circuit in the Right Front Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S133) Right Front Damper Valve (-) circuit in the ADCM C2 harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (S133) Right Front Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C6-19-LEFT REAR DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Left Rear Damping Valve Solenoid Low Side 1 (compression stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Left Rear Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S134) Left Rear Damper Valve (+) circuit in the Left Rear Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S134) Left Rear Damper Valve (+) circuit in the ADCM C2 harness connector.

        NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

        Does the test light illuminate brightly?

        Yes

        - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
        - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

        No

        - Go To 4.
4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

        Does the DTC remain active?

        Yes

        - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
        - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

        No

        - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**

1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C7-19-LEFT REAR DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Left Rear Damping Valve Solenoid Low Side 2 (rebound stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Go To 3.
3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Left Rear Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S135) Left Rear Damper Valve (-) circuit in the Left Rear Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S135) Left Rear Damper Valve (-) circuit in the ADCM C2 harness connector.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C8-19-RIGHT REAR DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Right Rear Damping Valve Solenoid Low Side 1 (compression stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

Yes

- Go To 2.

No

- Go To 5.

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

1. Disconnect the Right Rear Damping Valve Shock Assembly harness connector.
2. Disconnect the ADCM C2 harness connector.
3. Connect a jumper wire between Ground and the (S136) Right Rear Damper Valve (+) circuit in the Right Rear Damping Valve Shock Assembly harness connector.
4. Using a 12-volt test light connected to B+, check the (S136) Right Rear Damper Valve (+) circuit in the ADCM C2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Repair the (S136) Right Rear Damper Valve (+) circuit for an open or high resistance.

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete.
5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C9-19-RIGHT REAR DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the Right Rear Damping Valve Solenoid Low Side 2 (rebound stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly with the ignition in the Run position.

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

1. Turn the ignition off.
2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Go To 3.

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Right Rear Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S137) Right Rear Damper Valve (-) circuit in the Right Rear Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S137) Right Rear Damper Valve (-) circuit in the ADCM C2 harness connector.

      NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

      Does the test light illuminate brightly?

      Yes

      - Repair the (S137) Right Rear Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.

4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the vehicle.
6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C211B-92-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuous.

SET CONDITION:

The Ignition Status reported on the CAN Bus does not match the state of the Ignition Input.

POSSIBLE CAUSES

Possible Causes
FUSE M15 (20A)
(F943) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE
(F943) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(A206) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM) INTERNAL

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, erase the DTCs.
   4. Start the engine.
   5. With the scan tool, read and record the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.
2. **CHECK THE FUSE**
   1. Ignition on, engine not running.
   2. Using a 12-volt test light connected to ground, check the fuse for power.

Is the fuse good?

Yes

- Go To 3.

No

- If the related fuse is open, check the (F943) Fused Ignition Switch Output (RUN/START) circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(F943) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE**
    1. Turn ignition off to the lock position.
    2. Disconnect the ADCM harness connector.
    3. With a test light connected to ground check the (F943) Fused Ignition Switch Output (RUN/START) circuit at the ADCM harness connector.

    NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

    Does the test light illuminate brightly?

    Yes

    - Go To 4.

    No

    - Repair the (F943) Fused Ignition Switch Output (RUN/START) circuit for an open or high resistance.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Ignition on, engine not running.
    2. With a test light connected to ground check (A206) Fused B+ and (F943) Fused Ignition Switch Output (RUN/START) circuits at the ADCM harness connector.

    NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

    Does the test light illuminate brightly?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Repair the Power circuits for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C211B-92-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuous.

SET CONDITION:

The Ignition Status reported on the CAN Bus does not match the state of the Ignition Input.

POSSIBLE CAUSES

Possible Causes

FUSE M15 (20A)
(F943) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE
(F943) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(A206) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM) INTERNAL

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, erase the DTCs.
   4. Start the engine.
   5. With the scan tool, read and record the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 5.
2. **CHECK THE FUSE**
   1. Ignition on, engine not running.
   2. Using a 12-volt test light connected to ground, check the fuse for power.

   Is the fuse good?

   Yes

   - Go To 3.

   No

   - If the related fuse is open, check the (F943) Fused Ignition Switch Output

(RUN/START) circuit for a short to ground.

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(F943) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE**
    1. Turn ignition off to the lock position.
    2. Disconnect the ADCM harness connector.
    3. With a test light connected to ground check the (F943) Fused Ignition Switch Output (RUN/START) circuit at the ADCM harness connector.

    NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

    Does the test light illuminate brightly?

    Yes

    - Go To 4.

    No

    - Repair the (F943) Fused Ignition Switch Output (RUN/START) circuit for an open or high resistance.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Ignition on, engine not running.
    2. With a test light connected to ground check (A206) Fused B+ and (F943) Fused Ignition Switch Output (RUN/START) circuits at the ADCM harness connector.

    NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

    Does the test light illuminate brightly?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Repair the Power circuits for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**

1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2129-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the battery voltage has dropped below 10 Volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
(A206) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**

1. Ignition on, engine not running.
2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

   Are there any Charging System or related voltage DTCs present?

   Yes

   - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** .

   No

   - Go To 2.

2. **VERIFY THE DTC IS ACTIVE**
   1. With the scan tool, record and erase DTCs.
   2. With the scan tool, read the DTCs in the ADCM.

      Is the DTC active at this time?

      Yes

      - Go To 3.

      No

      - Go To 5.
3. **CHECK THE (A206) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the ADCM C2 harness connector.
   2. Ignition on, engine not running.
   3. With a 12-volt test light connected to ground, check the (A206) Fused B+ circuit in the ADCM C2 harness connector.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 4.

      No

- Repair the (A206) Fused B(+) circuit for an open circuit or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **CHECK THE (Z916) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position
   2. With a 12-volt test light connected to B+, check the (Z916) Ground circuit in the ADCM C2 harness connector.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Repair the (Z916) Ground circuit for an open circuit or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2129-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the battery voltage has increased above 16 Volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

       Are there any Charging System or related voltage DTCs present?

       Yes

       - Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** or **3.6L - DIAGNOSTIC CODE INDEX** or **5.7L - DIAGNOSTIC CODE INDEX** or **6.4L - DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2.
2. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, read DTCs in the ADCM.

       Is the status Active for this DTC?

       Yes

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212A-16-SYSTEM VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the battery voltage has dropped below 10 Volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
(A206) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE
(F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: Repair all other DTCs first before continuing with this test.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, record and erase DTCs.
    2. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 4.
2. **CHECK THE (A206) FUSED B(+) AND THE (F943) FUSED IGNITION SWITCH OUTPUT CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn ignition off to the lock position.
    2. Disconnect the ADCM C2 harness connector.
    3. Ignition on, engine not running.
    4. With a test light connected to ground check (A206) Fused B+ circuit and the (F943) Fused Ignition Switch Output circuit at the ADCM C2 harness connector.

    NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

    Does the test light illuminate brightly?

    Yes

    - Go To 3.

    No

    - Repair the Power circuits for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
3. **CHECK THE (Z916) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off to the lock position
    2. With a 12-volt test light connected to B+, check the (Z916) Ground circuit in the ADCM C2 harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Repair the (Z916) Ground circuit for an open circuit or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212A-17-SYSTEM VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) detects the system voltage has increased above 16 Volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
(F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE (A206) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE (Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: Repair all other DTCs first before continuing with this test.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, record and erase DTCs.
    2. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 4.
2. **CHECK THE POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn ignition off to the lock position.
    2. Disconnect the ADCM C2 harness connector.
    3. Ignition on, engine not running.
    4. With a test light connected to ground check the (A206) Fused B(+) circuit and the (F941) Fused Ignition Switch Output circuit at the ADCM C2 harness connector.

    NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

    Does the test light illuminate brightly?

    Yes

- Go To 3.

No

- Repair the Power circuits for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

3. **CHECK THE (Z916) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position
   2. With a 12-volt test light connected to B+, check the (Z916) Ground circuit in the ADCM C2 harness connector.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Repair the (Z916) Ground circuit for an open circuit or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212A-84-SYSTEM VOLTAGE-SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

The Active Damping Control Module (ADCM) receives a low charging system voltage message over the CAN Bus or detects voltage under 10 volts on the Fused B(+) circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
(A206) FUSED B(+) CIRCUIT
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTC**
    1. With the scan tool, read the PCM DTCs.

       Are there any Charging System DTCs set in the PCM?

       Yes

       - Perform the Charging System diagnostic procedure. Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** .

       No

       - Go To 2.
2. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, read the active ADCM DTCs.

       Is the DTC active at this time?

       Yes

- Go To 3.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY CONTROL MODULE (BCM) - BODY VERIFICATION TEST** .

3. **CHECK THE VOLTAGE AT THE (A206) FUSED B(+) CIRCUIT**
    1. Disconnect the ADCM C2 harness connector.
    2. Turn the ignition on.
    3. Measure the voltage between the (A206) Fused B(+) circuit and ground. Compare this value to the voltage measured at the vehicle battery.

       Is the voltage measured at the ADCM C2 harness connector the same as measured at the battery?

       Yes

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Repair the (A206) Fused B(+) circuit as necessary.
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

C212A-85-SYSTEM VOLTAGE-SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on.

SET CONDITION:

The Active Damping Control Module (ADCM) receives a high charging system voltage message over the CAN Bus or detects voltage over 16 volts on the Fused B(+) circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTC**
    1. With the scan tool, read the PCM DTCs.

       Are there any Charging System DTCs set in the PCM?

       Yes

       - Perform the Charging System diagnostic procedure. Refer to **CHARGING SYSTEM - DIAGNOSIS AND TESTING** .

       No

       - Go To 2.
2. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, read the active ADCM DTCs.

       Is the DTC active at this time?

       Yes

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY CONTROL MODULE (BCM) - BODY VERIFICATION TEST** .

C212C-11-SUSPENSION VALVE POWER SUPPLY VOLTAGE - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects that too much current is being used when the on-board 12 volt power supply is turned on.

POSSIBLE CAUSES

Possible Causes
(S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

       Is the DTC active at this time?

       Yes

       - Go To 2.

       No

       - Go To 6.
2. **CHECK THE (S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the ADCM C1 harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Disconnect the Left Front Damper Valve harness connector.
    5. Measure the resistance between ground and the (S170) Left Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

- Repair the (S170) Left Front Damper Valve Power Supply circuit for a short to ground.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Right Front Damper Valve harness connector.
   2. Measure the resistance between ground and the (S171) Right Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (S171) Right Front Damper Valve Power Supply circuit for a short to ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.
4. **CHECK THE (S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Left Rear Damper Valve harness connector.
   2. Measure the resistance between ground and the (S172) Left Rear Damper Valve Power Supply circuit at the ADCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (S172) Left Rear Damper Valve Power Supply circuit for a short to ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 5.
5. **CHECK THE (S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Right Rear Damper Valve harness connector.

2. Measure the resistance between ground and the (S173) Right Rear Damper Valve Power Supply circuit at the ADCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (S173) Right Rear Damper Valve Power Supply circuit for a short to ground.
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

   No

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212C-12-SUSPENSION VALVE POWER SUPPLY VOLTAGE - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on. Battery voltage between 9 and 16 volts.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects that too much current is being used when the on-board 12 volt power supply is turned on.

POSSIBLE CAUSES

Possible Causes
(S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 6.
2. **CHECK THE (S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the ADCM C1 harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Disconnect the Left Front Damper Valve harness connector.
    5. Turn the ignition on.
    6. Measure the voltage of the (S170) Left Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

    Is there any voltage present?

    Yes

- Repair the (S170) Left Front Damper Valve Power Supply circuit for a short to voltage.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK THE (S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Right Front Damper Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (S171) Right Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (S171) Right Front Damper Valve Power Supply circuit for a short to voltage.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Go To 4.
4. **CHECK THE (S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Left Rear Damper Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (S172) Left Rear Damper Valve Power Supply circuit at the ADCM C1 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (S172) Left Rear Damper Valve Power Supply circuit for a short to voltage.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

- Go To 5.

5. **CHECK THE (S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Right Rear Damper Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (S173) Right Rear Damper Valve Power Supply circuit at the ADCM C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (S173) Right Rear Damper Valve Power Supply circuit for a short to voltage.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Replace the Active Damping Control Module (ADCM) at accordance with the Service formation. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.
6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2202-00-ORIGINAL VIN MISMATCH / MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Active Damping Control Module (ADCM) continuously monitors the vehicle's VIN (from the CAN bus) and compares it to the VIN which is internally stored within the ADCM when the vehicle was first assembled. When they do not match this fault sets.

WHEN MONITORED:

Continuously.

SET CONDITION:

When the vehicle's VIN (being transmitted on the CAN bus) does not match the current VIN stored within the Active Damping Control Module (ADCM).

POSSIBLE CAUSES

Possible Causes
COMMUNICATIONS DTC(S) PRESENT
POWERTRAIN CONTROL MODULE (PCM)
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, erase DTCs.
    3. Turn ignition off to the lock position.
    4. Ignition on, engine not running.
    5. Wait ten seconds.
    6. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2.

    No

    - Go To 3.

2. **WRONG VIN PROGRAMMED IN PCM**
    1. Ignition on, engine not running.
    2. With the scan tool, read the VIN in the PCM.
    3. Compare VIN in the PCM to the vehicle VIN.

    Is the correct VIN programmed in the PCM?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the PCM VERIFICATION TEST. Refer to **3.0L DIESEL - PCM VERIFICATION TEST** or **3.6L - POWERTRAIN VERIFICATION TEST** or **5.7L - POWERTRAIN VERIFICATION TEST** or **6.4L - POWERTRAIN VERIFICATION TEST** .
3. **COMMUNICATION DTCS PRESENT**
    1. Turn ignition off to the lock position.
    2. With the scan tool, read DTCs in all other modules. If any communications DTCs are present, perform the appropriate diagnostic procedure. Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .
    3. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition on.

SET CONDITION:

This DTC will set if any of the learned Vehicle Configuration data from the CAN Bus has changed.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
ACTIVE DAMPING CONTROL MODULE (ADCM)

NOTE: If the BCM has been serviced make sure that the Restore Vehicle Configuration is performed before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read TIPM DTCs.

       Are there any BCM CAN BUS DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .

       No

       - Go To 2.
2. **POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
    1. With the scan tool, read Powertrain Control Module (PCM) DTCs.

       Are there any PCM DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** or **3.6L - DIAGNOSTIC CODE INDEX** or **5.7L - DIAGNOSTIC CODE INDEX** or **6.4L - DIAGNOSTIC CODE INDEX** .

No

- Using the schematics as a guide, check the ADCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) Module in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

C220C-00-ACTIVE SUSPENSION MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Active Damping Control Module (ADCM) continuously monitors internal hardware circuitry for defects. The Service Air Suspension Message will be displayed on the cluster when this fault is first active.

WHEN MONITORED:

Continuously.

SET CONDITION:

Detection of RAM, ROM, EEPROM, Watchdog, no current calibration, or high side switch defect recognized.

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **ACTIVE DAMPING CONTROL MODULE (ADCM) INTERNAL CONDITION**
    1. The ASCM is reporting internal errors.

        NOTE: Before continuing, check the Air Suspension Control Module (ASCM) harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

    2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
    3. Perform any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

SET CONDITION:

The controller detects an open, short to ground or a short to voltage on the CAN C Bus circuit.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

1. Turn the ignition on.

2. With the scan tool, read active DTCs.

   Is the DTC active at this time?

   Yes

   - Perform the U0002-CAN C Bus Off Performance diagnostic procedure. **Refer to U0002-00-CAN C BUS OFF PERFORMANCE** .

   No

   - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Turn the ignition on.
2. With a scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Perform the U0002-00-Can C Bus Off Performance diagnostic procedure in the Body Control Module (BCM).**Refer to U0002-00-CAN C BUS OFF PERFORMANCE** .

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure.**Refer to COMMUNICATION - DIAGNOSIS AND TESTING** .

U0100-00-LOST COMMUNICATION WITH PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10 and 16 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULES POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (PCM)
ANY MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. Using the scan tool, read the active DTCs.

   Does the scan tool display: U0100-00-LOST COMMUNICATION WITH PCM?

   Yes

   - **Refer to U0100-00-LOST COMMUNICATION WITH ECM/PCM** and perform the U0100-Lost Communication with PCM diagnostic procedure.

   No

   - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0101-00-LOST COMMUNICATION WITH TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Transmission Control Module (TCM) for approximately 500ms.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TRANSMISSION CONTROL MODULE (TCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
TRANSMISSION CONTROL MODULE (TCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0101-00-LOST COMMUNICATION WITH TCM?

   Yes

   - **Refer to U0101-00-LOST COMMUNICATION WITH TCM** and perform the U0101-Lost Communication with TCM diagnostic procedure.

   No

   - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0102-00-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION:

Bus messages not received from the Drive Train Control Module (DTCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
MODULE THAT SET THIS DTC

NOTE: If present, diagnose and repair DTC U0002-88-CAN C BUS OFF

PERFORMANCE- BUS OFF before diagnosing this DTC.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read and record the DTCs.
    3. With the scan tool, erase the DTCs.
    4. Cycle the ignition from off to on.
    5. With the scan tool, read the DTCs.

    Is the DTC Active at this time?

    Yes

    - **Refer To U0102-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD** and perform the U0102-Lost Communication with Transfer Case Control Module / AWD diagnostic procedure.

    No

    - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0114-00-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE (DTCM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery Voltage between 10 and 16 Volts.

Ignition Off Draw (IOD) fuse installed.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

The Active Damping Control Module (ADCM) doesn't receive a Final Drive Control Module (FDCM) (DTCM) message over the CAN C BUS circuit for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes

CAN INTERIOR OR CAN C BUS CIRCUITS OPEN OR SHORTED
DIAGNOSTIC TROUBLE CODES (DTC) RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES PRESENT
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM) POWER AND GROUND
BODY CONTROL MODULE (BCM)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery Voltage is between 10 and 16 Volts before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, read DTCs.

      Is the DTC active at this time?

      Yes

      - Perform the appropriate diagnostic procedure. **Refer to BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING or BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .

      No

      - Perform the Stored Lost Communication DTCs diagnostic procedure. **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** .

U0121-00-LOST COMMUNICATION WITH ANTILOCK BRAKE SYSTEM (ABS) CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Antilock Brake System (ABS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
ANTI LOCK BRAKE MODULE (ABS) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
ANTI LOCK BRAKE MODULE (ABS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display: U0121-00-LOST COMMUNICATION WITH ANTILOCK BRAKE SYSTEM (ABS) CONTROL MODULE?

      Yes

      - **Refer to U0121-00-LOST COMMUNICATION WITH ANTILOCK BRAKE SYSTEM (ABS) CONTROL MODULE** and perform the U0121-00-Lost Communication with Antilock Brake System (ABS) Control Module diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0126-00-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Steering Angle Sensor (SAS) communicates with other controllers over the CAN C bus. The Active Damping Control Module (ADCM) continuously monitors the bus activity and receives the messages it needs. If the ADCM does not receive messages from the Steering Angle Sensor (SAS), this fault will set.

WHEN MONITORED:

SET CONDITION:

If the Active Damping Control Module (ADCM) Pump fails to receive bus messages from the Steering Angle Sensor (SAS) for approximately 500 ms.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
STEERING ANGLE SENSOR POWER AND GROUND
ANTILOCK BRAKE MODULE (ABS) NOT CONFIGURED CORRECTLY
STEERING ANGLE SENSOR (SAS)
ACTIVE DAMPING CONTROL MODULE (ADCM)
ANTILOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With a scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - **Refer to U0126-00-LOST COMMUNICATION WITH STEERING ANGLE SENSOR** and perform the U0126-00-LOST COMMUNICATION WITH STEERING ANGLE SENSOR diagnostic procedure.

    No

    - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

U0141-00-LOST COMMUNICATION WITH IPM (BCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Integrated Power Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Perform the U0140-00-Lost Communication with (BCM) diagnostic procedure.**Refer to U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE (BCM)** .

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Instrument Cluster (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
INSTRUMENT CLUSTER POWER AND GROUND
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (CCN)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read the DTCs.

      Is the DTC active at this time?

      Yes

      - Perform the U0155-Lost Communication with Cluster/CCN diagnostic procedure. **Refer to U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN** .

      No

      - Perform the Stored Lost Communication DTCs diagnostic procedure. **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** .

U0168-00-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION:

Bus messages not received from the Intrusion Transceiver Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
INTRUSION TRANSCEIVER MODULE POWER AND GROUND
INTRUSION TRANSCEIVER MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTCs.

       Does the scan tool display; U0168-00-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER MODULE as Active?

       Yes

       - **Refer to U0168-00-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER MODULE** and perform the U0168-00-Lost Communication with Intrusion Transceiver Module.

       No

       - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects an incorrect CAN message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS
ENGINE DTCS
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 2.

      No

      - Go To 4.
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

      Are there any BCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **BCM, DTC'S B10B3 -**

B1ED2-11 - DIAGNOSIS AND TESTING or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .

No

- Go To 3.

3. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read Engine DTCs.

      Are there any Engine DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** or **3.6L - DIAGNOSTIC CODE INDEX** or **5.7L - DIAGNOSTIC CODE INDEX** or **6.4L - DIAGNOSTIC CODE INDEX** .

      No

      - Using the schematics as a guide, check the ADCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present

at this time.

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects an incorrect CAN message from the Transmission Control Module (TCM).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS
TRANSMISSION DTCS
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2.

   No

   - Go To 4.
2. **CHECK IF BODY CONTROL (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

Are there any BCM CAN BUS DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Go To 3.

3. **CHECK IF TRANSMISSION DTCS ARE PRESENT**
    1. With the scan tool, read Transmission DTCs.

    Are there any Transmission DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **TRANSMISSION CONTROL MODULE (TCM) - DIAGNOSTIC CODE INDEX - 8HP45 AUTOMATIC TRANSMISSION** or **NAG1 - DIAGNOSTIC CODE INDEX** .

    No

    - Using the schematics as a guide, check the ADCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

U0403-00-IMPLAUSIBLE DATA RECEIVED FROM T-CASE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects an incorrect CAN message from the Drive Train Control Module (DTCM).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS
DRIVE TRAIN CONTROL MODULE (DTCM) DTCS
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2.

No

- Go To 4.

2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

       Are there any BCM CAN BUS DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .

       No

       - Go To 3.

3. **CHECK IF TRANSFER CASE DTCS ARE PRESENT**
    1. With the scan tool, read DTCM DTCs.

       Are there any DTCM DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **DTCM - DIAGNOSIS AND TESTING** .

       No

       - Using the schematics as a guide, check the ADCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

U0415-00-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on for four seconds, no CAN BUS circuit error condition present, no lost communication with ABS condition present, and no system undervoltage or overvoltage condition present.

SET CONDITION:

The Active Damping Control Module (ADCM) is receiving implausible data for vehicle speed, wheel speeds, brake switch status, longitudinal acceleration, yaw rate, or lateral acceleration from the ABS Module.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **ABS MODULE DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs in the ABS Module.

    Are there any DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **ABS - DIAGNOSIS AND TESTING** .

No

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

U0427-00-IMPLAUSIBLE DATA RECEIVED FROM VEHICLE SECURITY CONTROL MODULE (RF HUB)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on for four seconds, no CAN BUS circuit error condition present, no lost communication with Radio Frequency (RF Hub) condition present, and no system undervoltage or overvoltage condition present.

SET CONDITION:

The Active Damping Control Module (ADCM) is receiving implausible data for sensor status from the Radio Frequency (RF Hub).

POSSIBLE CAUSES

Possible Causes
RADIO FREQUENCY (RF HUB) DTCS PRESENT ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **RADIO FREQUENCY (RF HUB) DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs in the RF Hub.

    Are there any DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **RF HUB - DIAGNOSIS AND TESTING** .

    No

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

U0429-00-IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION:

When the Active Damping Control Module (ADCM) detects an incorrect CAN message from the Steering Control Module (SCM).

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) DTCS PRESENT ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **STEERING ANGLE SENSOR (SAS) DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read the DTCs in the SAS.

       Are there any DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **SCM - DIAGNOSIS AND TESTING** .

       No

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

U0431-00-IMPLAUSIBLE DATA RECEIVED FROM IPM (BCM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

With the ignition on for four seconds, no CAN BUS circuit error condition present, no lost

communication with BCM condition present, and no system undervoltage or overvoltage condition present.

SET CONDITION:

The Active Damping Control Module (ADCM) is receiving no message or implausible data for ambient temperature or the transfer case selector switch.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **BODY CONTROL MODULE (BCM) DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read the DTCs in the BCM.

       Are there any DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** .

       No

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

U110A-00-LOSS OF COMMUNICATIONS WITH SCM - CAN-C

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Active Damping Control Module (ADCM) communicates with other controllers over the CAN C bus. The ADCM continuously monitors the bus activity and receives the messages it needs. If the ADCM does not receive messages from the SAS, then this fault will set.

WHEN MONITORED:

Ignition on for more than 5 seconds and battery voltage between 10 and 16 volts.

SET CONDITION:

The Active Damping Control Module (ADCM) no longer detects any messaging from the Steering Angle Sensor (SAS) for more than 0.5 of a second after monitoring conditions have been fulfilled.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
STEERING ANGLE SENSOR (SAS)
ACTIVE DAMPING CONTROL MODULE (ADCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If present, diagnose and repair DTC U0001-00-CAN C BUS before diagnosing this DTC.

   1. Ignition on, engine not running.
   2. With the scan tool, read and record ADCM DTCs.
   3. With the scan tool, erase ADCM DTCs.
   4. Cycle the ignition switch.
   5. With the scan tool, read ADCM DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 2.

      No

      - Perform the Stored Lost Communication diagnostic procedure. Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all CAN C Bus modules.

      NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTCs. Refer to the appropriate Electrical Diagnostic Information.

No

- Go To 3.

3. **VERIFY THAT THE SAS IS ACTIVE ON THE BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the SAS is active on the bus.

    Is the SCM active on the bus?

    Yes

    - Go To 4.

    No

    - Perform the Stored Lost Communication diagnostic procedure. Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** .
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs**
    1. With the scan tool, select Network View and select Advanced.

    Is there more than one module with active DTCs "Logged Against" the SAS?

    Yes

    - Replace the Steering Column Control Module (SCCM) in accordance with the service information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

    No

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **ADCM VERIFICATION TEST**.

STANDARD PROCEDURE

ADCM VERIFICATION TEST

DIAGNOSTIC TEST

1. **ADCM VERIFICATION TEST**

    1. Turn the ignition off.
    2. Connect all previously disconnected components and connectors.
    3. Verify all accessories are turned off and the battery is fully charged.
    4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes (DTCs) from All modules. Start the engine and allow it to run for two minutes and fully operate the system that was indicating the failure.
    5. Turn the ignition off and wait five seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
    6. If any Diagnostic Trouble Codes are present, Refer to **DIAGNOSIS AND TESTING** and perform the diagnostic procedure.
    7. If there are no DTCs present after turning ignition on, road test the vehicle for at least five minutes.
        - Test drive the vehicle by turning the vehicle left or right in a curving manner at a speed above 25 km/h (15 mph).
    8. Again, with the scan tool read DTCs. If any DTCs are present, Refer to **DIAGNOSIS AND TESTING** for the diagnostic procedure and troubleshoot the new or recurring DTC.
    9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

        Are any DTCs present or is the original concern still present?

        Yes

        - Repair is not complete, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

        No

        - Repair is complete.

RESTRAINTS

Service Information - Chrysler 300

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.
