WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

NOTE: When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: **A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.**

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ACRONYMS USED IN THE FOLLOWING SERVICE INFORMATION	
Adaptive Front Lighting System	AFLS
Adaptive Front Lighting System Module	AFLSM
Automatic High Beam Module	AHBM
Body Control Module	BCM
Center High-Mounted Stop Lamp	CHMSL
Controller Antilock Brake	CAB
Controller Area Network	CAN
Daytime Running Lamps	DRL
Diagnostic Trouble Code	DTC
Instrument Cluster	IC
Integrated Center Stack	ICS
Light-Emitting Diode	LED
Local Interface Network	LIN
Steering Angle Sensor	SAS
Steering Column Control Module	SCCM
Steering Control Module	SCM
Transmission Range Sensor	TRS

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace backup lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open backup lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open backup lamp

		feed circuit if required.
	4. Ineffective switch.	4. Test and replace backup lamp switch (manual transmission) or TRS (automatic transmission) if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
BACKUP LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted backup lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace backup lamp switch (manual transmission) or TRS (automatic transmission) if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

NOTE: **The rear lamp units and the CHMSL are illuminated by several LED units that are soldered to the electronic circuit boards within the lamp housings. The brake lamps are powered by high side drivers within the BCM based upon an input to the CAB from the brake pedal position sensor. If all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamp LED units in the rear lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the rear lamp or CHMSL LED units operate and others do not, the outer rear lamp or CHMSL assembly must be replaced with a new unit.**

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective ground circuit.	1. Test and repair open brake lamp ground circuit if required.
	2. Ineffective fuse.	2. Test and replace the fuse if required.
	3. Ineffective feed circuit.	3. Test and repair open stop lamp output circuit if required.
	4. Ineffective brake pedal position sensor.	4. Test and replace brake pedal position sensor if required.
	5. Ineffective CAB inputs or outputs.	5. Use a diagnostic scan tool to test the CAB inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective BCM inputs or	6. Use a diagnostic scan tool to test

	outputs.	the BCM inputs and outputs. Refer to the appropriate diagnostic information.
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted stop lamp output circuit if required.
	2. Ineffective brake pedal position sensor.	2. Test and replace brake pedal position sensor if required.
	3. Ineffective CAB inputs or outputs.	3. Use a diagnostic scan tool to test the CAB inputs and outputs. Refer to the appropriate diagnostic information.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

DAYTIME RUNNING LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect BCM configuration.	1. Use a diagnostic scan tool to check and configure BCM if required.
	2. Automatic transmission in PARK position.	2. Place the transmission gear selector lever in any position except PARK.
	3. Parking brake applied.	3. Release the parking brake.
	4. Engine not running.	4. Start the engine.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective LED units.	6. Replace the front lamp unit if required.

FRONT FOG LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace front fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open front fog lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit if required.
	4. Ineffective switch.	4. Test and replace headlamp switch if required.
	5. Ineffective BCM inputs or	5. Use a diagnostic scan tool to test

	outputs.	the BCM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace the headlamp switch if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: The hazard switch is integral to the instrument panel switch bank, which provides a hard wired output to the BCM. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the hazard warning lamps system.

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective instrument panel switch bank (lower ICS module). 2. Ineffective BCM inputs or outputs.	1. Test and replace instrument panel switch bank (lower ICS module) if required. 2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective instrument panel switch bank (lower ICS module). 2. Ineffective BCM inputs or outputs.	1. Test and replace instrument panel switch bank (lower ICS module) if required. 2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition ON all exterior park lamps and the headlamp low beams will illuminate regardless of the headlamp switch control knob position if the IC cannot detect an input from the headlamp switch, or if there is a loss of communication between the multi-function

switch/SCM and the BCM. Diagnose and repair those problems before attempting to repair the headlamps. In addition, the BCM will store a DTC for an open or shorted headlamp circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit if required.
	4. Ineffective switch.	4. Test and replace the headlamp switch if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required.
	2. Ineffective switch.	2. Test and replace headlamp switch if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate diagnostic information.
HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective SCM inputs or outputs.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

PARK LAMPS

NOTE: **As part of the exterior lighting failsafe feature, upon ignition ON all exterior park lamps and the headlamp low beams will illuminate regardless of the headlamp switch control knob position if the IC cannot detect an input from the headlamp switch, or if there is a loss of communication between the multi-function**

switch/SCM and the BCM. Diagnose and repair those problems before attempting to repair the Park Lamps. In addition, the BCM will store a DTC for an open or shorted park lamps circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace park lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

SMARTBEAM®

NOTE: For SmartBeam® to operate, the Auto High Beam option must be enabled using the customer programmable features function of the Electronic Vehicle Information Center (EVIC). Also, the BCM must be properly configured for the automatic headlamps option using a diagnostic scan tool. Refer to the appropriate diagnostic information.

CONDITION	POSSIBLE CAUSES	CORRECTION
SMARTBEAM® INEFFECTIVE AND RED LED ON INSIDE REAR VIEW MIRROR NOT ON	1. Feature not enabled.	1. Enable **Auto Dim High Beams** using the customer programmable features function of the Electronic Vehicle Information Center (EVIC).
	2. Automatic headlamps are not turned ON.	2. Turn automatic headlamps ON using the control knob of the headlamp switch.
	3. Headlamp high beams are not selected.	3. Turn high beam headlamps ON using the beam selector function of the multi-function switch control stalk.
	4. Vehicle speed is below 34 kilometers-per-hour (18 miles-per-hour).	4. Increase vehicle speed. SmartBeam® is not designed to operate at speeds below 34 kilometers-per-hour (18 miles-per-

		hour).
	5. Ineffective ElectroChromic (EC) mirror inputs or outputs.	5. Use a diagnostic scan tool and the appropriate diagnostic information for further EC mirror diagnosis.
	6. Incorrect Body Control Module (BCM) configuration.	6. Use a diagnostic scan tool to check and correct the BCM configuration settings if required. Refer to the appropriate diagnostic information.
	7. SmartBeam® imager lens dirty or obstructed.	7. Clean imager lens and windshield or remove obstructions from the windshield glass if required.
	8. Ineffective ground circuit.	8. Test and repair open ground circuit to inside rear view mirror as required.
	9. Ineffective feed circuit.	9. Test and repair open fused run relay output circuit to inside rear view mirror if required.
	10. Loss of CAN data bus or LIN data bus communication.	10. Use a diagnostic scan tool and the appropriate diagnostic information for further CAN data bus or LIN data bus diagnosis.
	11. Internal faults in imager camera or EC mirror circuitry.	11. Use a diagnostic scan tool and the appropriate diagnostic information for further imager camera and EC mirror (AHBM) diagnosis.
SMARTBEAM® INEFFECTIVE AND RED LED ON INSIDE REAR VIEW MIRROR FLASHING CONTINUALLY	1. SmartBeam® calibration required (slow flash - once-per-second).	1. Perform the SmartBeam® Calibration procedure.
SMARTBEAM® INEFFECTIVE AND RED LED ON INSIDE REAR VIEW MIRROR ON CONTINUOUSLY	1. SmartBeam® failed calibration procedure due to improper set up. 2. SmartBeam® failed calibration procedure due to a mechanical misalignment.	1. Perform the SmartBeam® Calibration procedure properly. 2. Use a diagnostic scan tool to retrieve the Diagnostic Trouble Code (DTC). Refer to the appropriate diagnostic information.

TURN SIGNAL LAMPS

NOTE: The turn signal switch is integral to the multi-function switch/SCM, which communicates with the BCM over the CAN data bus. Before performing any of the following tests, determine whether the other functions of the multi-function switch/SCM are operational. If the other multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS (OR BOTH SIDES) DO NOT FLASH	1. Ineffective feed circuit.	1. Test and repair open right or left turn signal feed circuit if required.
	2. Ineffective SCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE)	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open bulb ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL	1. Ineffective cancel cam.	1. Inspect and replace the turn signal cancel cam (SCCM) if required.
	2. Ineffective cancel actuator.	2. Inspect and replace the turn signal cancel actuator (SCCM) if required.

STANDARD PROCEDURE

STANDARD PROCEDURE - FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. Repair or replace any faulty, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.

6. The fuel tank should be Full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
7. Verify correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

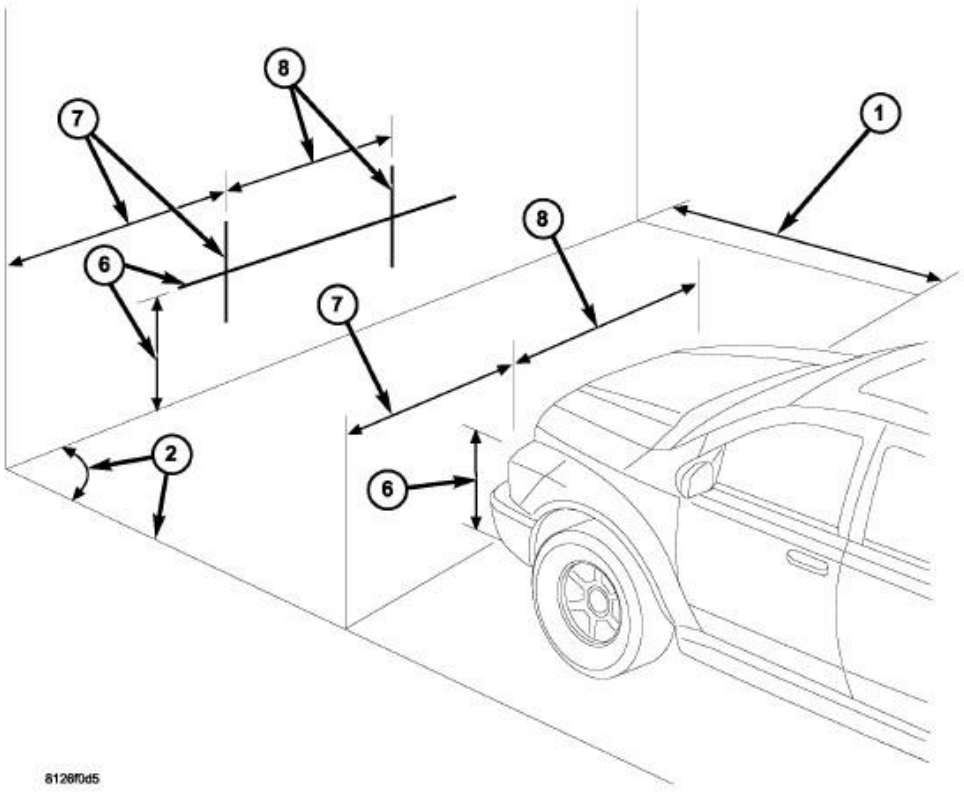

Fig. 1: Lamp Alignment Screen Preparation
Courtesy of CHRYSLER GROUP, LLC

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and

so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.

4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. There is a small circle mark on the lamp lens indicating the optical center. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.
8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

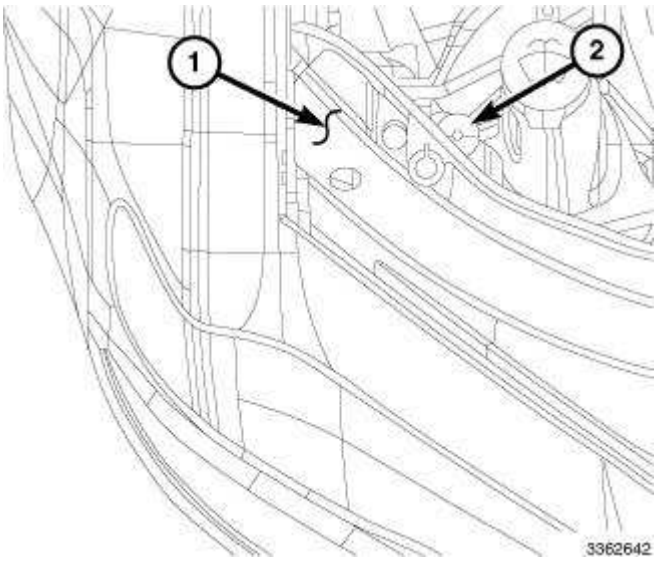

Fig. 2: Domestic
Courtesy of CHRYSLER GROUP, LLC

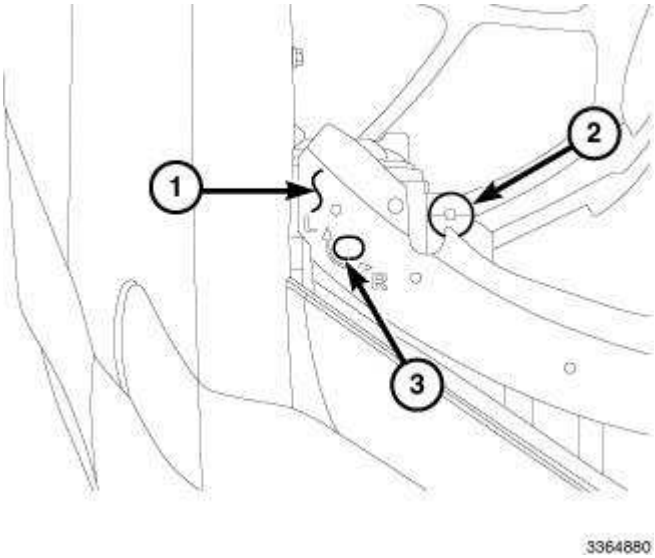

Fig. 3: Export
Courtesy of CHRYSLER GROUP, LLC

The headlamp vertical adjustment screws are accessed through funnel-like formations (2) integral to the back of each front lamp unit housing, located just rearward of the upper member of the headlamp mounting cross member (1). Export market vehicles have a second horizontal (right/left) adjustment screw (3) provided. The high beam pattern will be correct when the low beams are properly aimed.

HALOGEN HEADLAMPS

1. Turn the headlamps ON and select the LOW beams.
2. Block the light of the right headlamp.
3. Rotate the left headlamp vertical adjustment screw to adjust the right side of the beam pattern to the lamp horizontal reference height as required.
4. Block the light of the left headlamp.
5. Rotate the right headlamp vertical adjustment screw to adjust the right side of the beam pattern to the lamp horizontal reference height as required.

HIGH INTENSITY DISCHARGE HEADLAMPS

NOTE: Vehicles equipped with the High Intensity Discharge (HID) headlamps are also equipped with the Adaptive Front Lighting System (AFLS). If the AFLS module or either front or rear axle (also known as leveling) sensor has been replaced, the AFLS module must store the leveling sensor at the 0 (zero) position first, before the headlamps can be correctly and successfully aimed.

1. Create a second lamp horizontal reference line 5.3 centimeters (2.1 inches) below the initial line created in Step 6 of the Lamp Alignment Screen Preparation procedure. This line will be the High Intensity Discharge (HID) horizontal reference height.
2. Turn the headlamps ON and select the LOW beams.

3. Block the light of the right headlamp.
4. Rotate the left headlamp vertical adjustment screw to adjust the left side of the beam pattern to the HID horizontal reference height as required.
5. Block the light of the left headlamp.
6. Rotate the right headlamp vertical adjustment screw to adjust the left side of the beam pattern to the HID horizontal reference height as required.
7. For export markets only, use a screwdriver to rotate the headlamp horizontal adjustment screw on the back of each front lamp unit housing to adjust the beam horizontally to the right or left as required.

FOG LAMP ALIGNMENT

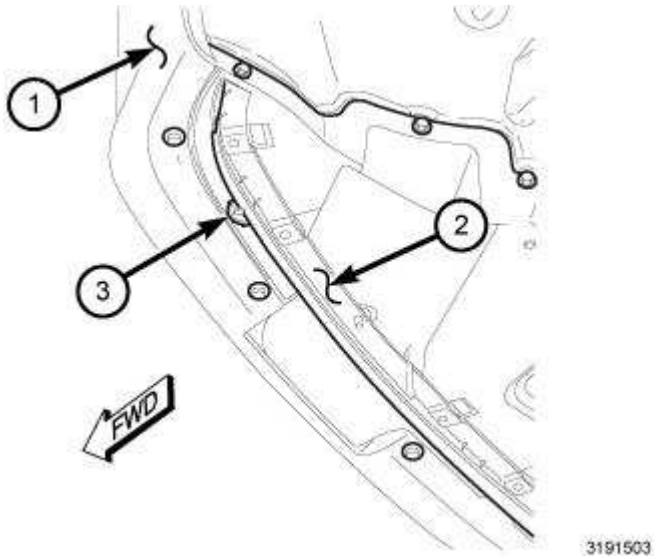

Fig. 4: Clearance Holes, Belly Pan & Fascia
Courtesy of CHRYSLER GROUP, LLC

The fog lamp adjustment screw is accessed through clearance holes (3) near the right and left outboard ends of the belly pan (2) below the front fascia (1). A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp.

1. Turn the fog lamps ON.
2. Rotate the fog lamp vertical adjustment screw on each lamp to adjust the beam height as required.

BALLAST, HIGH INTENSITY DISCHARGE (HID)

DESCRIPTION

DESCRIPTION

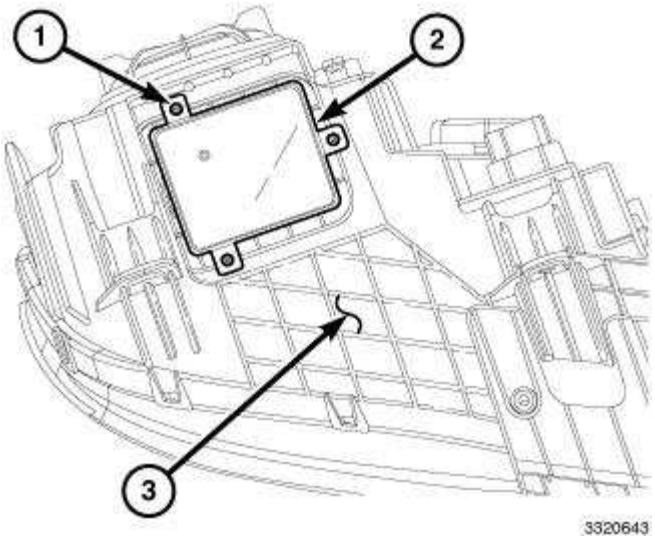

Fig. 5: Ballast Module, Front Lamp Unit & Screws
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional High Intensity Discharge (HID) headlamps have an electronic ballast module (2) mounted to the bottom of each front lamp unit (3). The electronic circuitry of the module is contained within a die cast aluminum module housing, which is secured by three screws (1) through integral mounting tabs to the molded plastic front lamp unit housing.

The sealed connector receptacle of the module is integral to the side of the housing that mates to the front lamp unit. The connector receptacle contains terminal pins that connect the module to the vehicle electrical system, to the high tension HID cable and to the front lamp unit through dedicated take outs and connectors of the front lamp unit wire harness.

The electronic ballast module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The electronic ballast module operates on battery current and ground received directly from the Body Control Module (BCM) (also known as the Common Body Controller/CBC). Each module controls operation of the High Intensity Discharge (HID) igniter and lighting element for the front lamp unit on which it is installed. The BCM monitors a hard wired input from the headlamp switch to determine the proper control outputs to the electronic ballast module, which then provides a controlled voltage to operate the HID lamp igniter as appropriate.

The BCM also monitors electronic message inputs received from the Steering Control Module (SCM) over the Controller Area Network (CAN) Interior High Speed (IHS) data bus based upon multi-function switch inputs and, if the vehicle is so equipped, from the SmartBeam® (also known as the Automatic

High Beam Module/AHBM) and the Light/Rain Sensor Module (LRSM) (also known as the Rain Sensor Module/RSM or Rain/Light Sensor Module/RLSM) to determine the proper lighting outputs to provide to the ballast module.

When a proper 12 volt Direct Current (DC) control output is received from the BCM, the HID electronic ballast module activates the HID igniter integral to the lighting element through a high-tension cable to provide a high voltage (up to about 800 volts Alternating Current/AC) surge. The igniter further steps up this AC voltage to up to about 25, 000 volts, which creates a light arc between the lighting element electrodes. Once the igniter and electronic ballast module detect a suitably stable light arc, they switch over to a power-limiting mode to sustain the light arc, which requires only about 85 volts to sustain proper lighting element output.

The hard wired electronic ballast module circuits may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic ballast module or the electronic controls and communication that provide some features of the HID lamp system. Proper diagnosis of the electronic ballast module, the BCM, the SCM, the SmartBeam®, the LRSM, the CAN data bus and the electronic communication related to electronic ballast module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

NOTE: Before replacing a High Intensity Discharge (HID) ballast due to an inoperative HID lamp, be certain that the HID lamp is receiving power from the Body Control Module (BCM). See the appropriate wiring information.

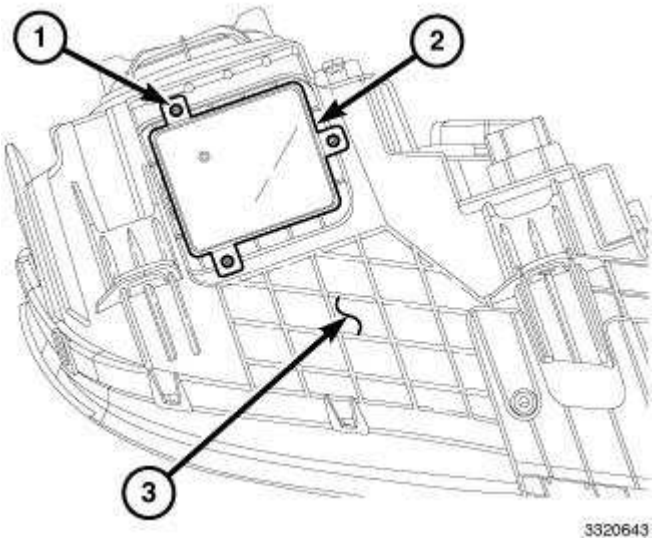

Fig. 6: Ballast Module, Front Lamp Unit & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front lamp unit (3) from the vehicle. Refer to **UNIT, FRONT LAMP, REMOVAL**.
3. Remove the three screws (1) that secure the electronic ballast module (2) to the bottom of the front lamp unit housing.
4. Pull the ballast module away from the front lamp unit far enough to access and disconnect the wire harness connections within the front lamp unit.
5. Remove the electronic ballast module from the lamp.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials

and ensure sufficient ventilation in the working area.

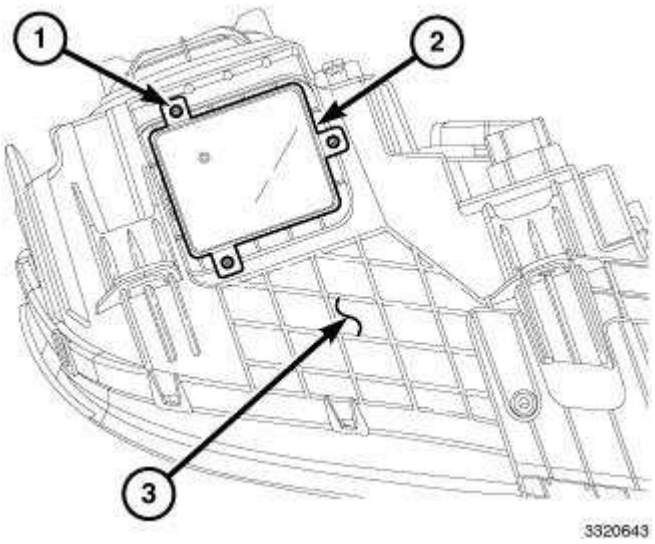

Fig. 7: Ballast Module, Front Lamp Unit & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the electronic ballast module (2) to the bottom of the front lamp unit housing (3).
2. Reconnect the wire harness connections within the front lamp unit to the module connector receptacles.
3. Install and tighten the three screws (1) that secure the module to the housing. Tighten the screws securely.
4. Reinstall the front lamp unit into the vehicle. Refer to **UNIT, FRONT LAMP, INSTALLATION**.
5. Reconnect the battery negative cable.

CAM, TURN SIGNAL CANCEL

DESCRIPTION

DESCRIPTION

The turn signal cancel cam is concealed within the clockspring integral to the Steering Column Control Module (SCCM) on the steering column. The turn signal cancel cam consists of integral eccentrics on the outer circumference of the molded plastic clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the rotating electrical components on the steering wheel and the instrument panel wire harness on the steering column. The SCCM and the housing of the clockspring are secured to the steering column and remain stationary. The rotor of the clockspring, including the turn signal cancel cam lobes, rotates with the steering wheel.

The turn signal cancel cam is serviced as a unit with the SCCM and cannot be repaired. If ineffective or damaged, the entire SCCM must be replaced. Refer to **MODULE, STEERING COLUMN,**

REMOVAL .

OPERATION

OPERATION

When the multi-function switch control stalk is moved to a latched turn signal ON position, a turn signal cancel actuator is extended from the inside surface of the switch housing through a small opening on the left side of the clockspring case toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, one of the cam eccentrics will contact the actuator, automatically cancelling the turn signal event and releasing the latched multi-function switch control stalk to the neutral or OFF position.

LAMP, CENTER HIGH MOUNTED STOP

REMOVAL

REMOVAL

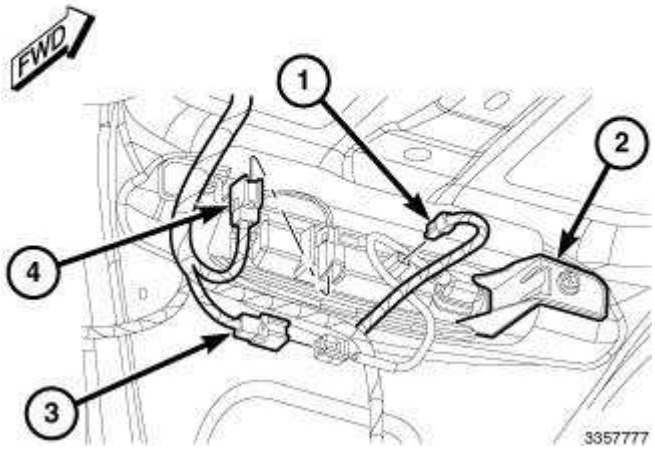

Fig. 8: Wire Harness Connector, Center High Mounted Stop Lamp (CHMSL) & Housing Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim cover from the inside of the deck lid.
3. From the inside of the deck lid, disconnect the body wire harness connector (1) from the connector receptacle integral to the back of the Center High Mounted Stop Lamp (CHMSL) housing (2).
4. If the vehicle is so equipped, disconnect the body wire harness connector (3) from the Passive Entry (PE) deck lid release switch pigtail wire connector on the back of the CHMSL housing.
5. If the vehicle is so equipped, disconnect the body wire harness connector (4) from the rear view

camera connector receptacle on the back of the CHMSL housing.

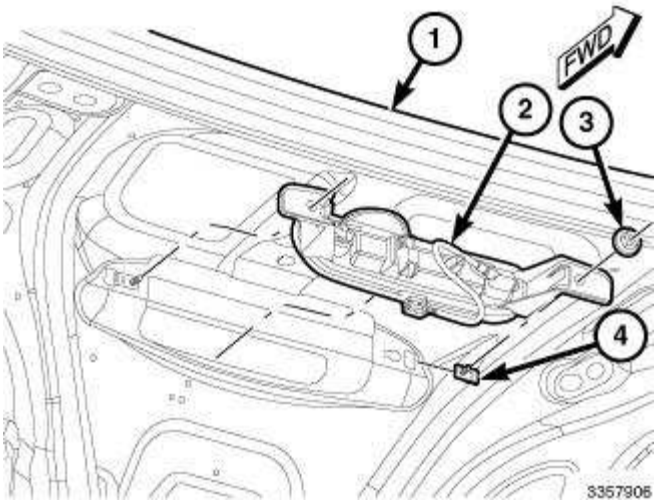

Fig. 9: Two Nuts, CHMSL, Retainer Units & Deck Lid
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two nuts (3) that secure the CHMSL (2) mounts to the two screw and retainer units (4) installed in the deck lid (1) inner reinforcement.
7. Push the integral latch tabs on both CHMSL mounts inboard far enough to enable pulling the CHMSL free from the deck lid inner reinforcement mounting hole.
8. Remove the CHMSL from the vehicle.

INSTALLATION

INSTALLATION

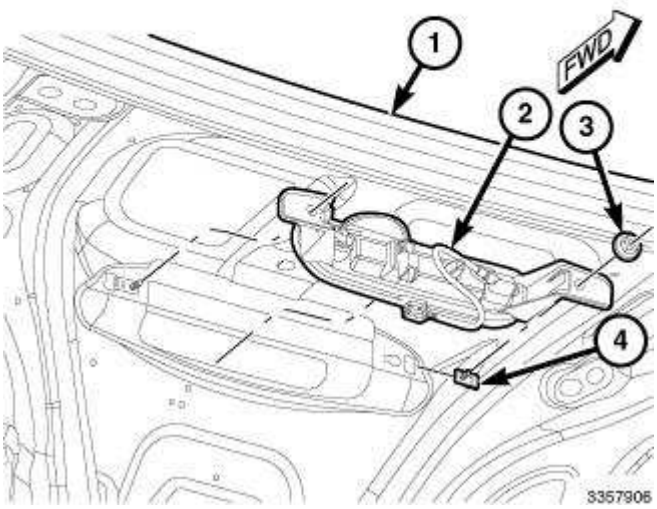

Fig. 10: Two Nuts, CHMSL, Retainer Units & Deck Lid
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the two screw and retainer units (4) are properly installed and in good condition in the deck lid (1) inner reinforcement.
2. Position the Center High Mounted Stop Lamp (CHMSL) (2) to the mounting hole on the inside of the deck lid inner reinforcement.
3. Push the CHMSL into the mounting hole until the two integral latch tabs snap into place and the two screws extend from the two CHMSL mounts.
4. Install and tighten the two nuts (3) that secure the CHMSL to the two screw and retainer units in the inner deck lid reinforcement. Tighten the nuts securely.

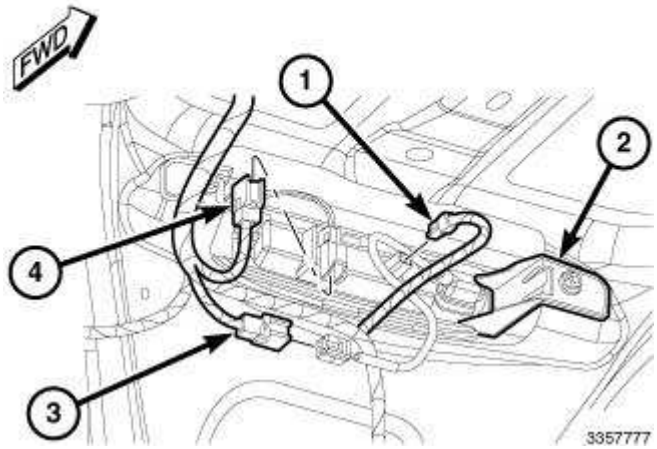

Fig. 11: Wire Harness Connector, Center High Mounted Stop Lamp (CHMSL) & Housing

Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Reconnect the body wire harness connector (1) to the connector receptacle integral to the back of the CHMSL housing (2).
6. If the vehicle is so equipped, reconnect the body wire harness connector (3) to the Passive Entry (PE) deck lid release switch pigtail wire connector on the back of the CHMSL housing.
7. If the vehicle is so equipped, reconnect the body wire harness connector (4) to the rear view camera connector receptacle on the back of the CHMSL housing.
8. Reinstall the trim cover onto the inside of the deck lid.
9. Reconnect the battery negative cable.

LAMP, FOG

REMOVAL

BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

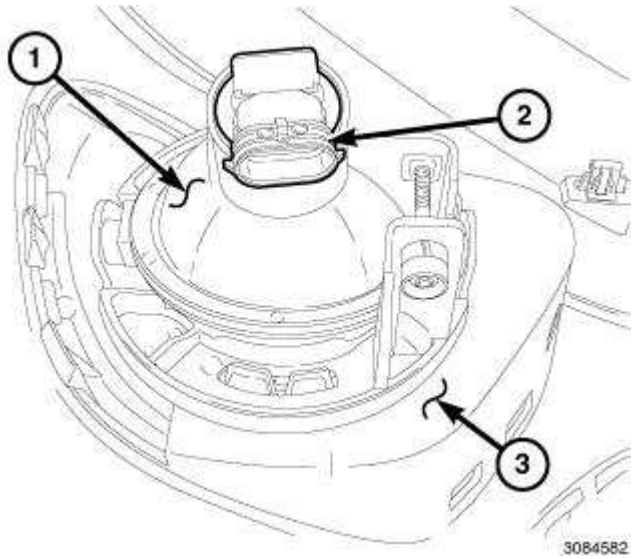

Fig. 12: Fascia Fog Lamp Seat, Connector Receptacle & Front Fog Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Loosen the front belly pan from the underbody far enough to access the back of the fog lamp on the back of the fascia fog lamp seat (3). Refer to **BELLY PAN, REMOVAL** .
4. Reach behind the front fascia to access and disconnect the headlamp and dash wire harness

connector from the front fog lamp bulb connector receptacle (2).

5. Firmly grasp the bulb on the back of the front fog lamp housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
6. Pull the bulb straight out from the keyed opening in the housing.

LAMP

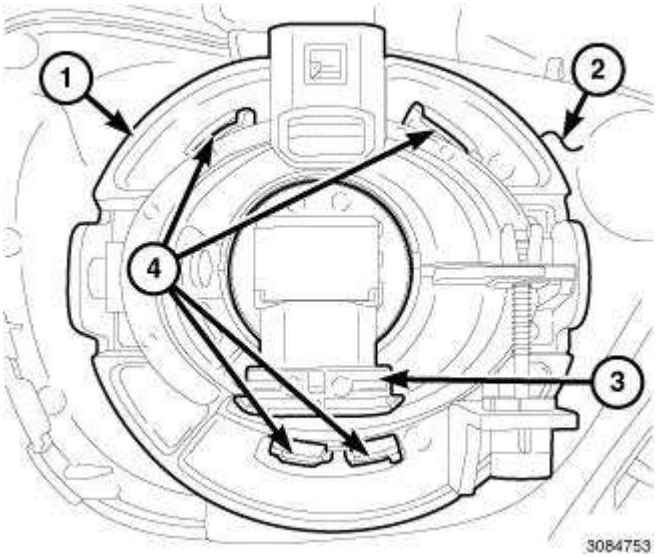

Fig. 13: Fascia, Connector Receptacle, Four Latch Features & Front Fog Lamp Mounting Ring
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Remove the front belly pan from the underbody. Refer to **BELLY PAN, REMOVAL** .
4. Reach behind the front fascia (2) to access and disconnect the headlamp and dash wire harness connector from the front fog lamp bulb connector receptacle (3).
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry between the front fog lamp mounting ring (1) and the back of the front fascia as necessary to disengage the four latch features (4) integral to the back of the fog lamp seat in the fascia from the slots in the mounting ring.
6. Remove the front fog lamp unit from the back of the fascia.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by

allowing it to contact other oily surfaces. Shortened bulb life will result.

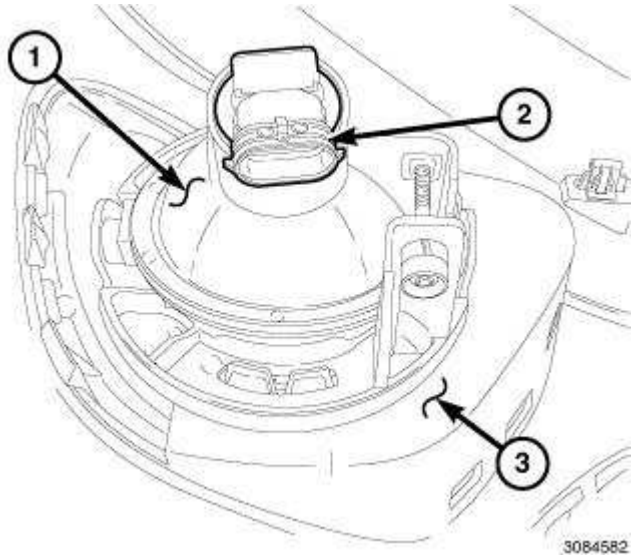

Fig. 14: Fascia Fog Lamp Seat, Connector Receptacle & Front Fog Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. From behind the front fascia fog lamp seat (3), align the front fog lamp bulb with the keyed opening on the back of the front fog lamp housing (1).
2. Insert the bulb into the housing until the base is firmly seated.
3. Rotate the bulb clockwise about 30 degrees to lock it into place. The bulb connector receptacle (2) should be pointed straight downward.
4. Reconnect the headlamp and dash wire harness connector to the bulb connector receptacle.
5. Reinstall the front belly pan to the underbody. Refer to **BELLY PAN, INSTALLATION** .
6. Lower the vehicle.
7. Reconnect the battery negative cable.

LAMP

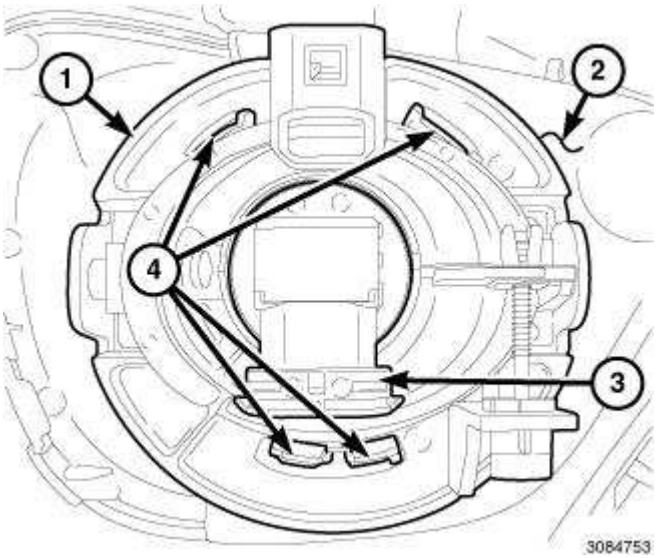

Fig. 15: Fascia, Connector Receptacle, Four Latch Features & Front Fog Lamp Mounting Ring
Courtesy of CHRYSLER GROUP, LLC

1. Reach behind the front fascia to position the front fog lamp and mounting ring unit (1) to the back of the fog lamp seat in the front fascia (2).
2. Align the four slots in the front fog lamp mounting ring with the four latch features (4) integral to the back of the fog lamp seat.
3. Press firmly and evenly on the fog lamp mounting ring until the four latch features snap into place through the mounting ring slots.
4. Reconnect the headlamp and dash wire harness connector to the front fog lamp bulb connector receptacle (3).
5. Reinstall the front belly pan to the underbody. Refer to **BELLY PAN, INSTALLATION** .
6. Lower the vehicle.
7. Reconnect the battery negative cable.
8. Confirm proper front fog lamp alignment. Refer to **STANDARD PROCEDURE**.

LAMP, LICENSE PLATE

REMOVAL

BULB

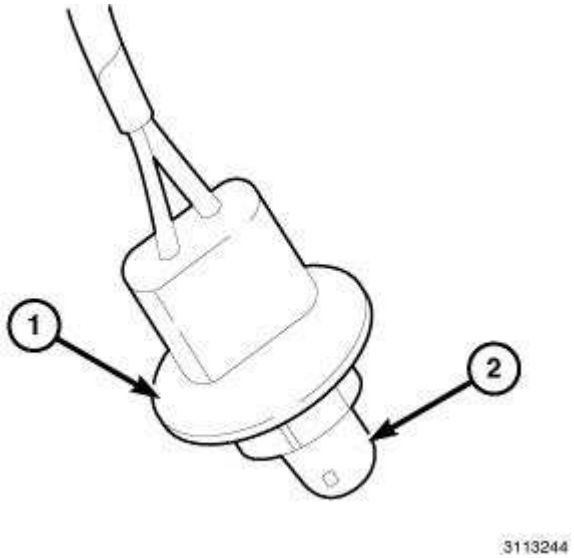

Fig. 16: Bulb & Socket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the license plate lamp from the rear fascia. Refer to **LAMP, LICENSE PLATE, REMOVAL**.
3. Pull the base of the bulb (2) straight out of the socket (1).

LAMP

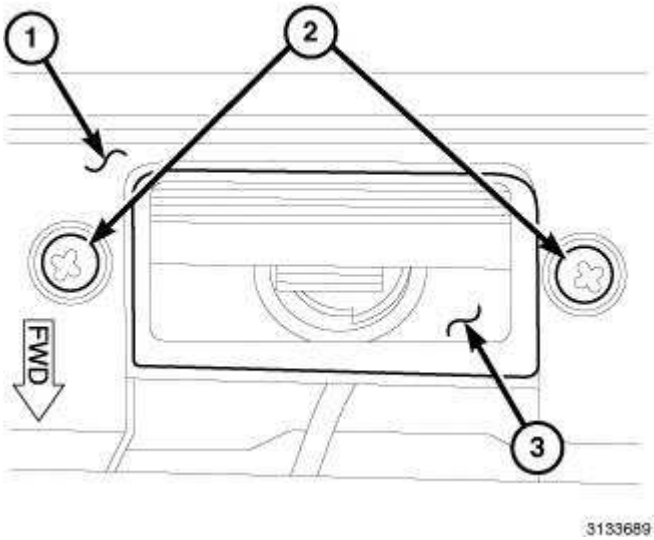

Fig. 17: Two Screws, License Plate Lamp & Rear Fascia
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (2) that secure the license plate lamp (3) to the rear fascia (1).

3. Slide the license plate lamp to one side of the fascia opening far enough to lower one end of the lamp through the opening, then lower the opposite end through the opening.

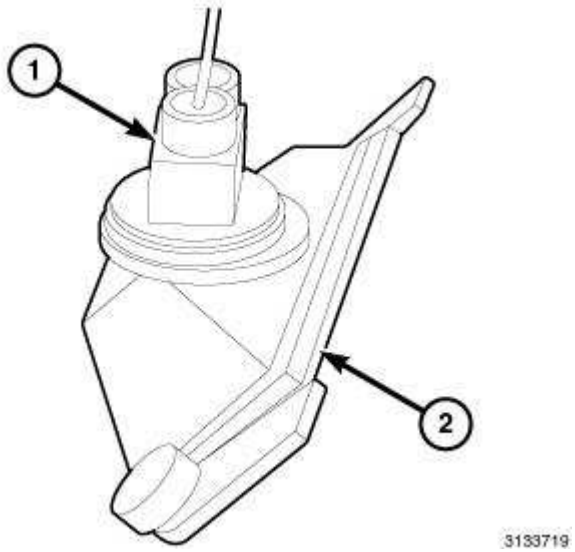

Fig. 18: Bulb Socket & Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

4. Firmly grasp the bulb socket (1) on the top of the lamp housing (2) and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the socket and bulb straight out of the lamp housing.
6. Remove the lamp lens and housing from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

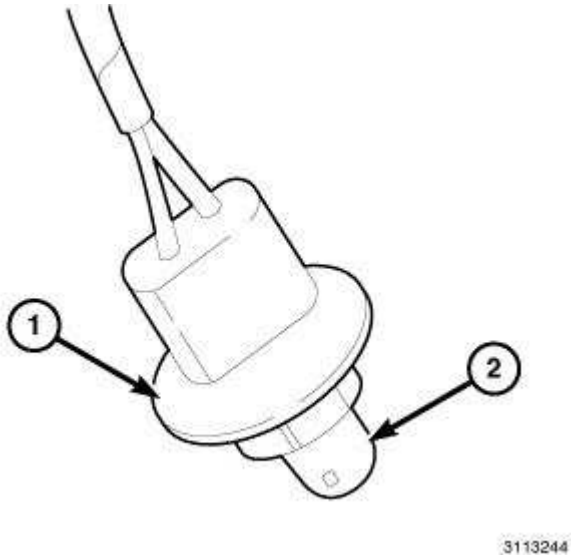

Fig. 19: Bulb & Socket
Courtesy of CHRYSLER GROUP, LLC

1. Align the base of the license plate lamp bulb (2) with the socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Reinstall the license plate lamp into the rear fascia. Refer to **LAMP, LICENSE PLATE, INSTALLATION**.
4. Reconnect the battery negative cable.

LAMP

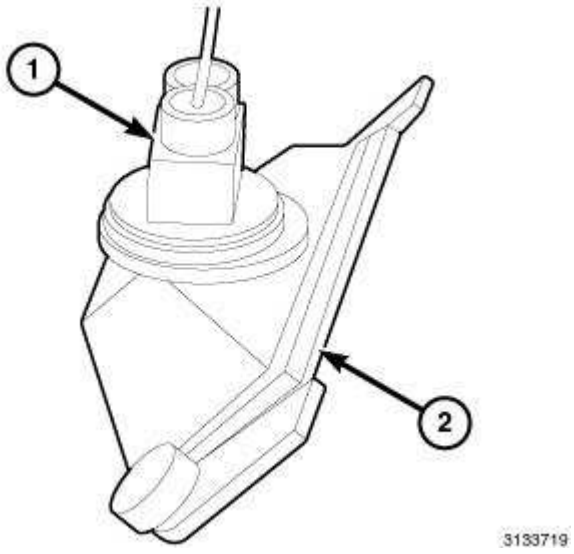

Fig. 20: Bulb Socket & Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the license plate lamp lens and housing (2) close enough to the rear fascia mounting hole to align the socket (1) and bulb with the keyed opening on the top of the housing.

2. Insert the socket and bulb into the housing until the socket is firmly seated.
3. Rotate the socket clockwise about 30 degrees to lock it into place.

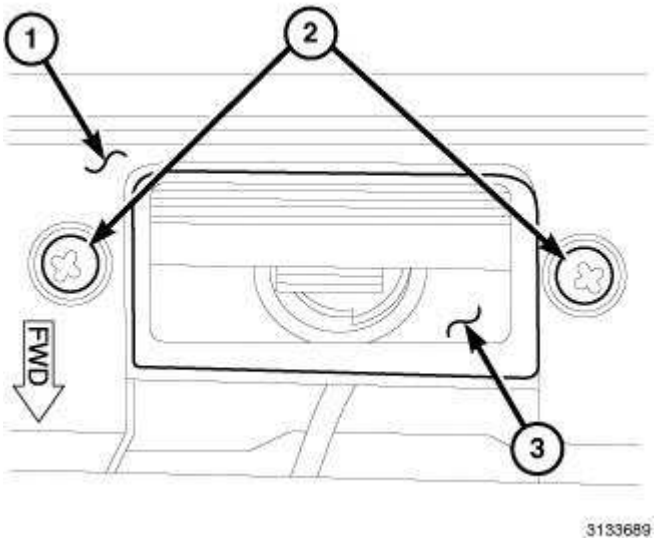

Fig. 21: Two Screws, License Plate Lamp & Rear Fascia
Courtesy of CHRYSLER GROUP, LLC

4. Insert one end of the license plate lamp (3) into one side of the rear fascia (1) mounting hole and slide it to that side far enough to insert the opposite end through the opening.
5. Center the lamp in the opening.
6. Install and tighten the two screws (2) that secure the lamp to the rear fascia. Tighten the screws securely.
7. Reconnect the battery negative cable.

LAMP, MIRROR

REMOVAL

REMOVAL

APPROACH LAMP

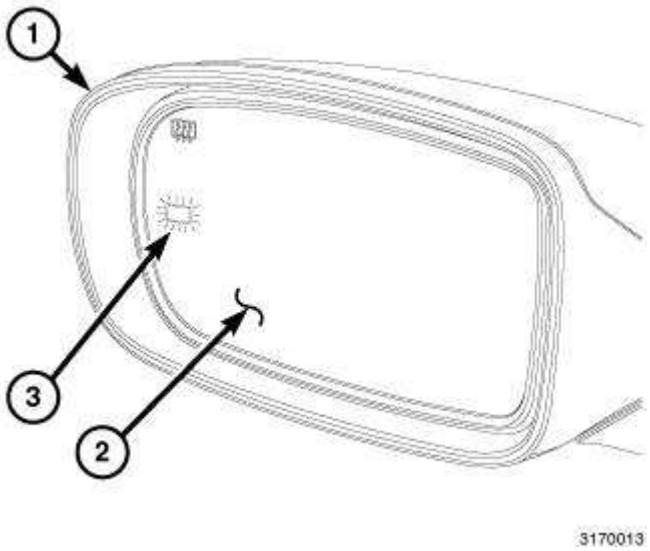

Fig. 22: Lamps, Rear View Mirrors, Mirror Glass And Case
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) system have approach lamps (3) located in the outside rear view mirrors (1). This lamp consists of a clear Light Emitting Diode (LED) unit integral to the mirror glass and case (2) that illuminates through the mirror glass whenever the interior courtesy lamps are active, such as when a door is ajar or with the illuminated entry feature. This lamp is serviced only as a unit with the mirror glass and case. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

SIGNAL LAMP

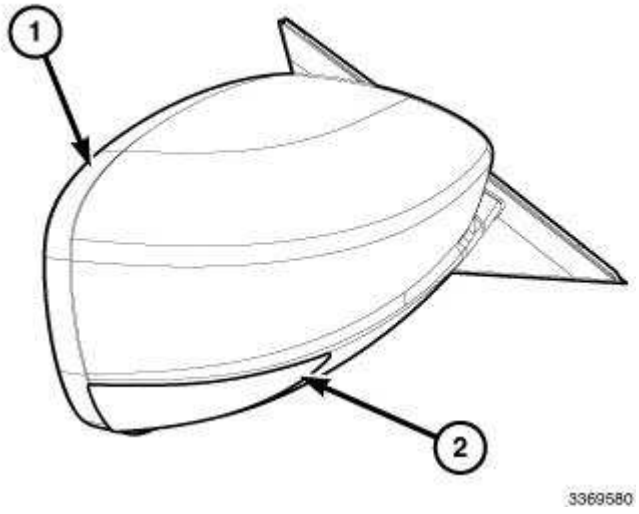

Fig. 23: Lamps & Rear View Mirrors
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional signal lamps (2) located in the outside rear view mirrors (1) have three amber Light Emitting Diode (LED) units that illuminate through a clear lens on the lower,

forward facing surface of the mirror shell cap. Illumination of these lamps is coordinated with the illumination of the turn signals for the same side of the vehicle.

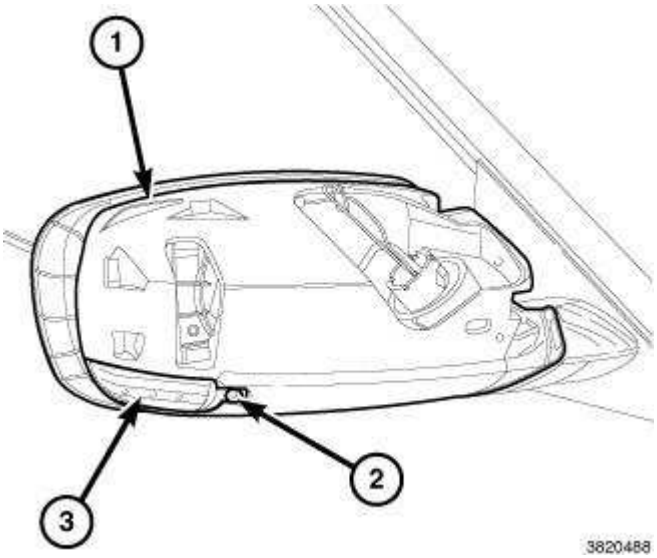

Fig. 24: Rear View Mirror, Screw & Signal Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the cap from the shell of the outside rear view mirror (1). Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
3. Remove the screw (2) that secures the inboard end of the signal lamp (3) to the mirror shell.
4. Pull the inboard end of the signal lamp away from the mirror shell far enough to disengage the stepped tab on the outboard end of the lamp from the shell.
5. Carefully pull the signal lamp away from the mirror shell far enough to access and disconnect the lamp pigtail wire connector from the mirror wire harness connector.
6. Remove the signal lamp from the mirror.

INSTALLATION

INSTALLATION

APPROACH LAMP

Vehicles equipped with the optional signal lamps (2) located in the outside rear view mirrors (1) have

three amber Light Emitting Diode (LED) units that illuminate through a clear lens on the lower, forward facing surface of the mirror shell cap. Illumination of these lamps is coordinated with the illumination of the turn signals for the same side of the vehicle.

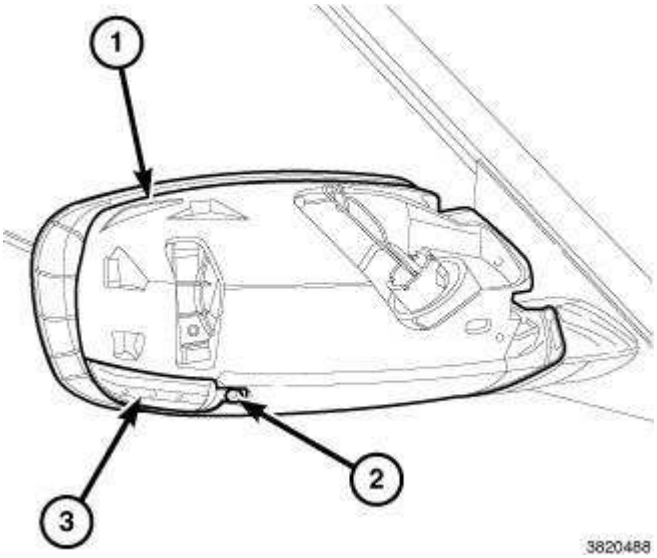

Fig. 27: Rear View Mirror, Screw & Signal Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Position the signal lamp (3) close enough to the outside rear view mirror shell (1) to access and reconnect the lamp pigtail wire connector to the mirror wire harness connector.
2. Engage the stepped tab on the outboard end of the signal lamp into the opening on the outboard edge of the mirror shell.
3. Position the mounting tab on the inboard end of the signal lamp against the mirror shell.
4. Install and tighten the screw (2) that secures the signal lamp mounting tab to the mirror shell. Tighten the screw securely.
5. Reinstall the cap onto the mirror shell. Refer to **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** .
6. Reconnect the battery negative cable.

LAMP, TAIL STOP TURN

REMOVAL

BULB

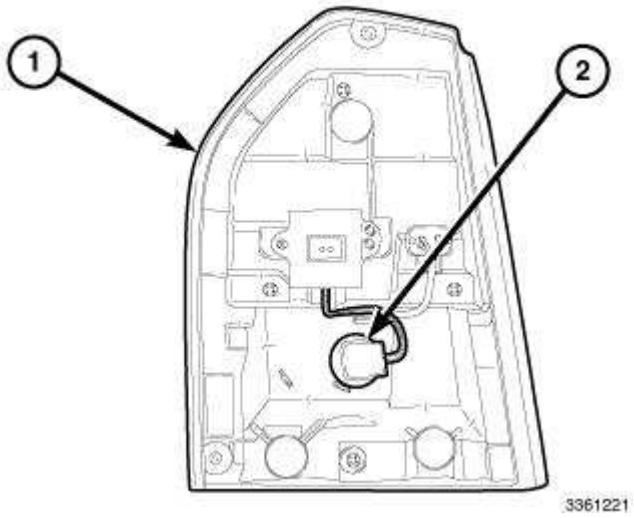

Fig. 28: Domestic Market
Courtesy of CHRYSLER GROUP, LLC

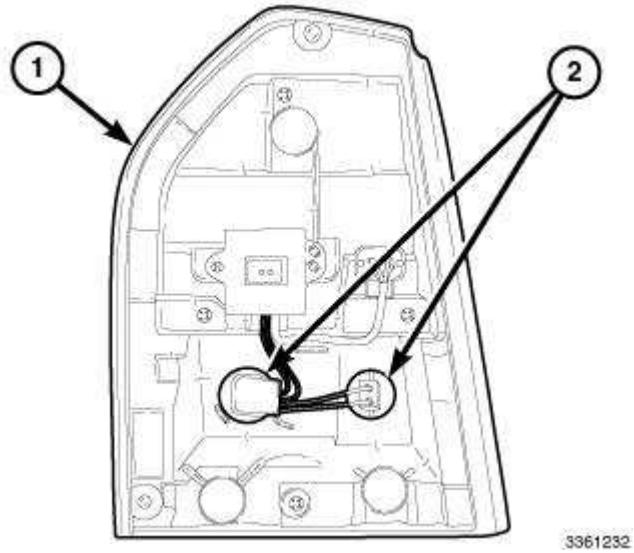

Fig. 29: Export Market
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The rear lamp unit for this vehicle includes multiple Light-Emitting Diode (LED) units for the park (or tail) lamps, the brake (or stop) lamps, the turn signal lamps (domestic market vehicles only) and the rear fog lamps (export market or if equipped only). All rear lamp units have one clear incandescent bulb for the backup (or reverse) lamps. Export market vehicles also have an amber incandescent bulb in each rear lamp for turn signals. The LED units are service only as a unit with their respective rear lamp unit. The backup lamp bulbs and amber turn signal bulbs (export only) are serviced individually. The service procedures for each bulb are the same only the bulb sizes and types are different.**

1. Disconnect and isolate the battery negative cable.
2. Remove the rear lamp unit (1) from the vehicle. Refer to **LAMP, TAIL STOP TURN, REMOVAL**.
3. Firmly grasp the appropriate bulb socket (2) on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out of the lamp.
5. Pull the base of the bulb straight out of the socket.

LAMP

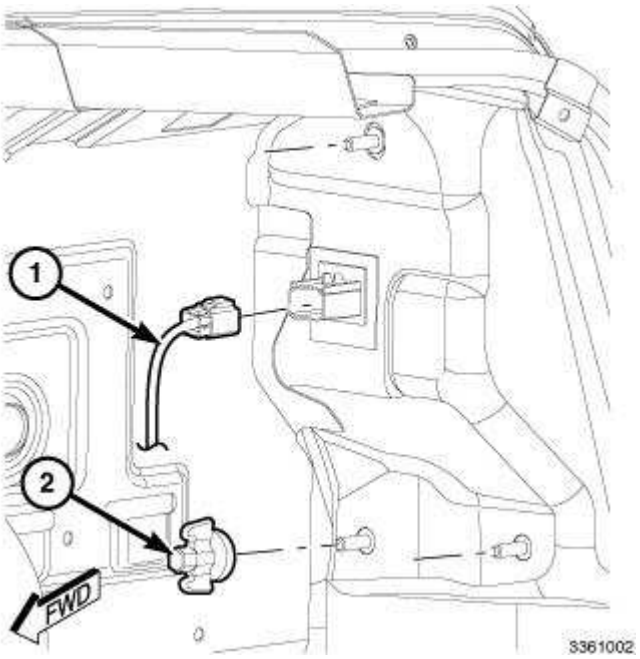

Fig. 30: Wire Harness Connector & Plastic Wing Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. From inside the trunk, peel back the trunk trim from over the lamp seat.
3. Disconnect the body wire harness connector (1) from the rear lamp unit connector receptacle.
4. Remove the three plastic wing nuts (2) that secure the lamp studs on the inside of the lamp seat.

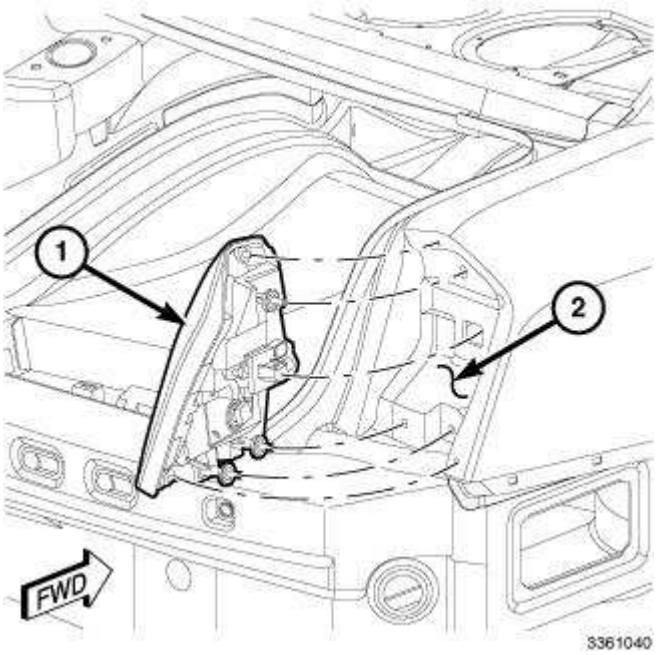

Fig. 31: Rear Lamp Unit & Lamp Seat
Courtesy of CHRYSLER GROUP, LLC

5. From the outside of the vehicle, pull the rear lamp unit (1) straight out of the lamp seat (2) in the end of the quarter panel.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

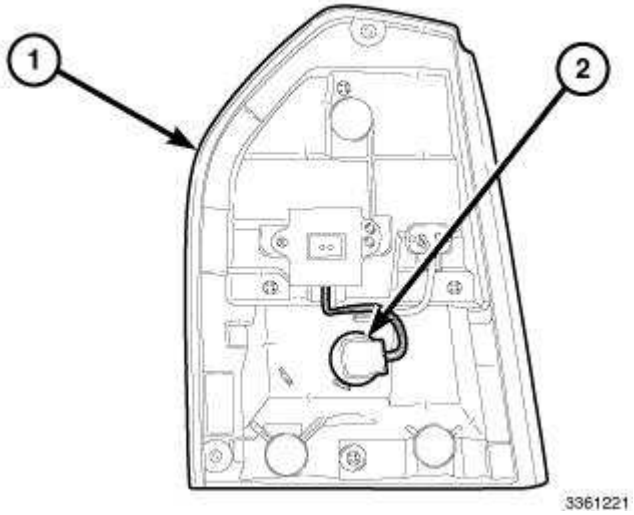

Fig. 32: Domestic Market
Courtesy of CHRYSLER GROUP, LLC

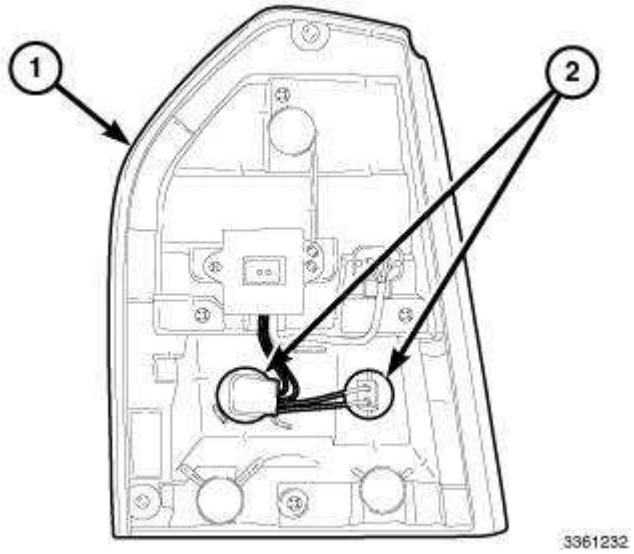

Fig. 33: Export Market
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The rear lamp unit for this vehicle includes multiple Light-Emitting Diode (LED) units for the park (or tail) lamps, the brake (or stop) lamps, the turn signal lamps (domestic market vehicles only) and the rear fog lamps (export market or if equipped only). All rear lamp units have one clear incandescent bulb for the backup (or reverse) lamps. Export market vehicles also have an amber incandescent bulb in each rear lamp for turn signals. The LED units are service only as a unit with their respective rear lamp unit. The backup lamp bulbs and amber turn signal bulbs (export only) are serviced individually. The service procedures for each bulb are the same only the bulb sizes and types are different.**

1. Align the base of the bulb with the appropriate bulb socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the rear lamp unit (1) housing.
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the rear lamp unit onto the vehicle. Refer to **LAMP, TAIL STOP TURN, INSTALLATION**.
7. Reconnect the battery negative cable.

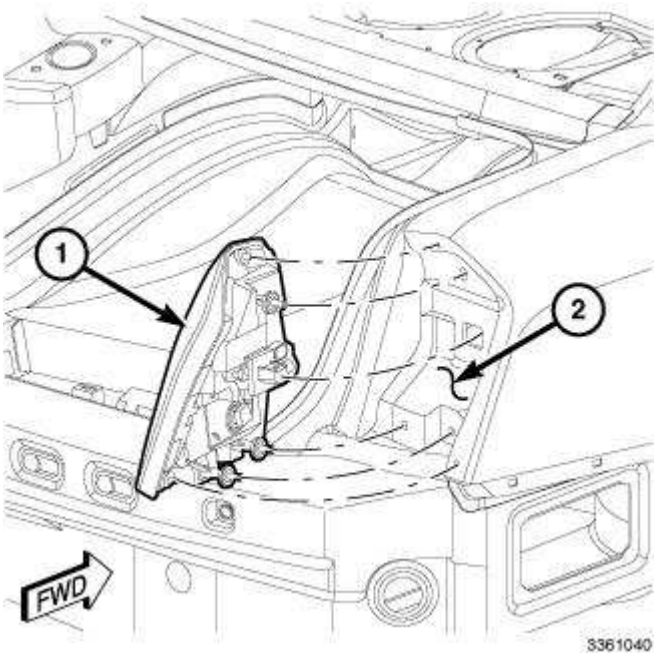

Fig. 34: Rear Lamp Unit & Lamp Seat
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear lamp unit (1) into the lamp seat (2) in the end of the quarter panel.

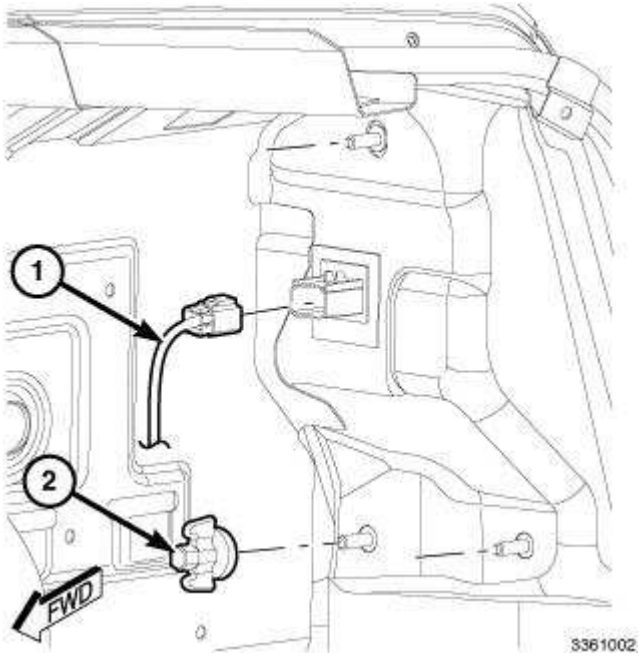

Fig. 35: Wire Harness Connector & Plastic Wing Nuts
Courtesy of CHRYSLER GROUP, LLC

2. From inside the trunk, install and tighten the three plastic wing nuts (2) that secure the rear lamp unit studs on the inside of the lamp seat. Tighten the nuts securely.
3. Reconnect the body wire harness connector (1) to the lamp connector receptacle.

4. Restore the trunk trim over the inside of the lamp seat.
5. Reconnect the battery negative cable.

MOTOR, HEADLAMP LEVELING

DESCRIPTION

DESCRIPTION

Two intelligent stepper motors are located within each front lamp unit on vehicles equipped with Adaptive Forward Lighting System (AFLS), which is standard equipment when this vehicle is equipped with High Intensity Discharge (HID) headlamps. The stepper motor that adjusts the headlamp beams up or down is referred to as a leveling motor. The stepper motor that adjusts the headlamp beams right or left is referred to as the swiveling motor.

The motors are enclosed within the front lamp unit housing for protection and are connected to the vehicle electrical system through the front lamp unit wire harness. Within each motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission.

The headlamp leveling and swiveling motors are serviced as a unit with the front lamp unit. These motors cannot be repaired and, if ineffective or damaged, the entire front lamp unit must be replaced.

OPERATION

OPERATION

The controller board and logic circuitry of the headlamp leveling and swiveling motors control motor operation based upon electronic message inputs received from the Adaptive Front Lighting System (AFLS) module over the Local Interface Network (LIN) data bus. The AFLS module is a LIN master node, while each of the leveling and swiveling motors is a LIN slave node. The AFLS module sends commands to the stepper motors based upon many external hard wired and electronic message inputs. The microprocessor in each stepper motor drives the motor and monitors the positioning of the lamp.

The headlamp leveling and swiveling motors have a path to ground at all times. The AFLS module and the stepper motors operate on battery voltage received through a fused ignition (run) circuit; however, the system will only operate when the headlamps are turned ON. The AFLS module monitors the condition and positioning of the leveling and swiveling stepper motors and circuits, and will store a Diagnostic Trouble Code (DTC) for any motor fault that is detected. Any DTC related to the AFLS can be retrieved from the AFLS module over the Controller Area Network (CAN) data bus.

The hard wired circuits for the headlamp leveling and swiveling motors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the active electronic elements within the headlamp leveling and swiveling motors or the electronic controls and communication between other modules and devices that provide some features of the AFLS. The

most reliable, efficient, and accurate means to diagnose the headlamp leveling and swiveling motors or the electronic controls and communication related to AFLS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SENSOR, AXLE

DESCRIPTION

DESCRIPTION

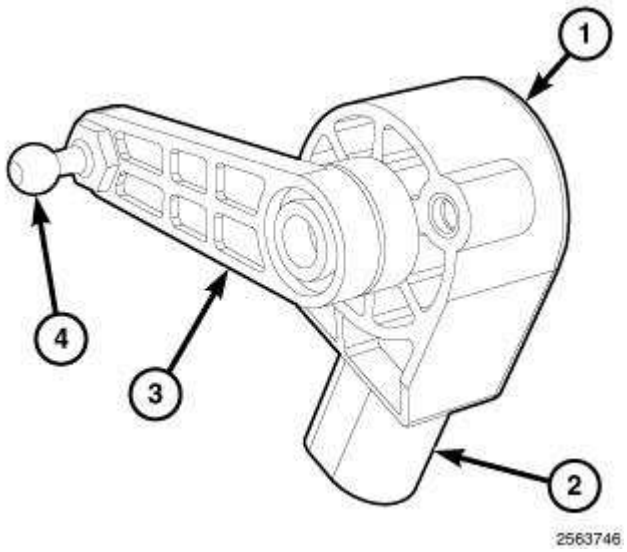

Fig. 36: Axle Sensors
Courtesy of CHRYSLER GROUP, LLC

Two axle sensors (1) are used on vehicles equipped with the optional High Intensity Discharge (HID) headlamps. One sensor is used to monitor the front suspension and another to monitor the rear suspension of the vehicle. The sensors are located at the right front and right rear.

In all applications the front and rear sensors are identical, but are secured by screws to unique fixed brackets that are mounted to a frame member above the front or rear suspension control arm. Each sensor has a mechanical lever arm (3) that rotates a sensor input shaft. The opposite end of the lever arm is secured by a ball stud (4) to a unique linkage that is connected to another ball stud on the nearest suspension member and is articulated by the changing positions of the front or rear suspension in relationship to the body of the vehicle.

The axle sensor housing has an integral connector receptacle (2) and integral mounting hole. A cavity in the center of the molded plastic axle sensor housing contains the electronic circuitry of the sensor. The sensor housing is sealed to enclose and protect the internal electronic circuitry and components. The axle sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the vehicle underbody wire harnesses.

The axle sensor, the unique mounting brackets and the linkage are serviced only as a complete unit. The sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

The ball stud mounted on the front or rear suspension control arm is available for separate service replacement.

OPERATION

OPERATION

The front and rear axle sensors monitor changes in the relative distance between the vehicle body and the front or rear suspension members. The sensor circuitry is energized by the Adaptive Front Lighting System (AFLS) module and both sensors provide hard wired analog (potentiometer) inputs back to the AFLS module. The AFLS module uses these sensor inputs as logic for calculating when and how much to adjust the headlamp beams as part of the automatic headlamp leveling feature.

The body of each sensor is mounted in a fixed position, while the sensor lever arm is attached to a linkage arranged between the vehicle chassis and the front or rear suspension members. Each sensor is capable of either analog or digital outputs. The output type is determined by the wiring connections to the pins in the sensor connector receptacle. The sensor circuitry is energized by the AFLS module. As the sensor lever arm is moved, it rotates an input shaft. The input shaft rotation is monitored by the sensor circuitry, which causes changes in the output signal of the sensor. The AFLS module evaluates the output signals from the sensors to determine what changes are occurring in the front and rear suspension height of the vehicle.

The hard wired circuits for the axle sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the axle sensors or the electronic controls and communication that provide the features of the AFLS system. The most reliable, efficient, and accurate means to diagnose the axle sensors or the electronic controls and communication related to AFLS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

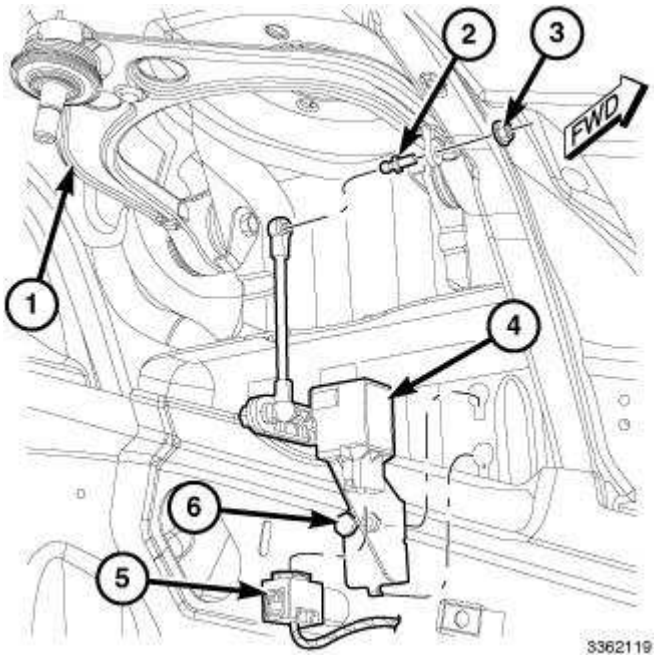

Fig. 37: Front Axle Sensor, Wire Harness Connector & Ball Stud
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Locate the front axle sensor (4) within the right front fender wheel house.
4. Disconnect the underbody wire harness connector (5) from the sensor connector receptacle.
5. Carefully unsnap the upper end of the front axle sensor link from the ball stud (2) on the forward-facing side of the front suspension upper control arm (1).
6. Loosen the two nut (6) that secures the sensor mounting bracket to the keyed hole in the inner wheel house sheet metal.
7. Lift the sensor and bracket upward far enough to disengage the head of the fastener from the keyed hole.
8. Remove the front axle sensor, bracket and link from the vehicle as a unit.

REAR

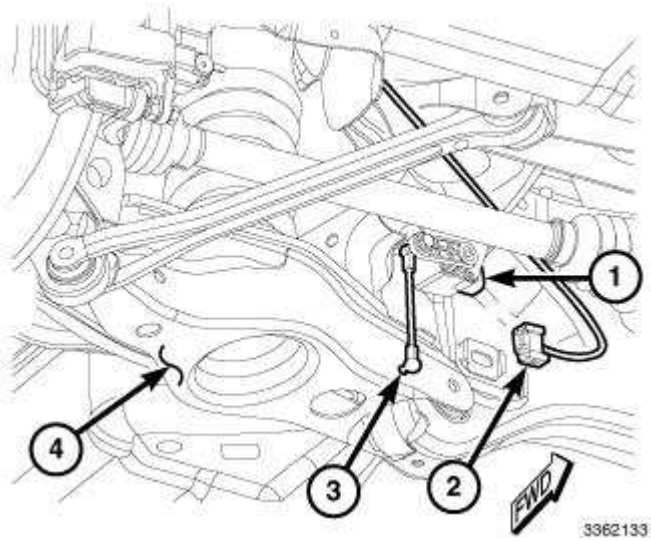

Fig. 38: Rear Axle Sensor, Wire Harness Connector & Ball Stud
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Locate the rear axle sensor (1) on a bracket between the rear suspension cradle and the rear suspension lower control arm (4).
4. Disconnect the underbody wire harness connector (2) from the rear axle sensor connector receptacle.
5. Carefully unsnap the lower end of the rear axle sensor link from the ball stud (3) on the forward-facing side of the rear suspension lower control arm.
6. Remove the screw that secures the sensor to the bracket on the rear suspension cradle.
7. Remove the rear axle sensor, bracket and link from the vehicle as a unit.

INSTALLATION

FRONT

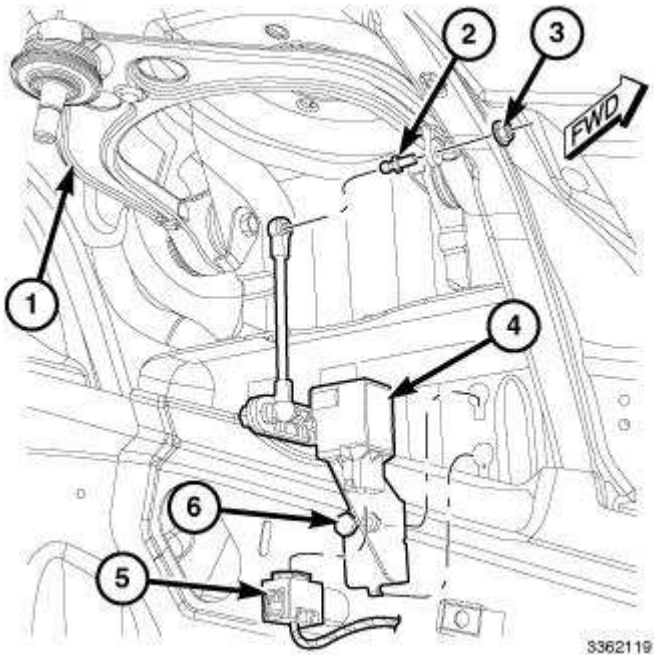

Fig. 39: Front Axle Sensor, Wire Harness Connector & Ball Stud
Courtesy of CHRYSLER GROUP, LLC

1. Position the front axle sensor, bracket and link unit (4) to the keyed holes in the inner wheel house sheet metal as a unit.
2. Engage the head of the sensor bracket fastener into the upper keyed hole and the anti-rotation tab into the lower keyed hole.
3. Tighten the nut (6) that secures the mounting bracket to the inner wheel house. Tighten the nut to 6.7 N.m (60 in. lbs.).
4. Align the socket formation on the upper end of the front axle sensor link with the ball stud (2) on the forward-facing side of the front suspension upper control arm (1). Press the link socket formation firmly and evenly over the ball stud until it snaps into place.
5. Reconnect the underbody wire harness connector (5) to the sensor connector receptacle.
6. Lower the vehicle.
7. Reconnect the battery negative cable.

NOTE: **Whenever the front or rear axle (leveling) sensor is removed and reinstalled or replaced with a new unit, it is necessary for the AFLSM to learn the sensor using a calibration procedure. Follow the programming steps outlined in the diagnostic scan tool for the "AFLS Module Calibrate" routine under "Miscellaneous Functions" for the "AFLS Module" menu item as appropriate.**

REAR

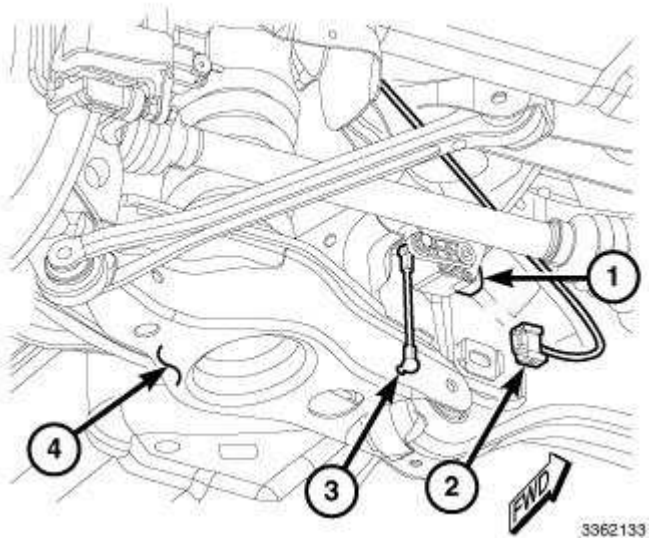

Fig. 40: Rear Axle Sensor, Wire Harness Connector & Ball Stud
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear axle sensor, bracket and link (1) to the rear suspension cradle.
2. Move the sensor lever arm as needed to access, install and tighten the screw that secures the sensor to the mounting bracket. Tighten the screw to 6 N.m (53 in. lbs.).
3. Move the sensor lever arm so that it is pointed toward the outboard side of the vehicle before positioning the sensor link to the ball stud (3) on the rear lower control arm (4).
4. Align the socket formation on the lower end of the rear axle sensor link with the ball stud on the forward-facing side of the rear suspension lower control arm. Press the link socket formation firmly and evenly over the ball stud until it snaps into place.
5. Reconnect the underbody wire harness connector (2) to the sensor connector receptacle.
6. Lower the vehicle.
7. Reconnect the battery negative cable.

NOTE: Whenever the front or rear axle (leveling) sensor is removed and reinstalled or replaced with a new unit, it is necessary for the AFLSM to learn the sensor using a calibration procedure. Follow the programming steps outlined in the diagnostic scan tool for the "AFLS Module Calibrate" routine under "Miscellaneous Functions" for the "AFLS Module" menu item as appropriate.

SMART BEAM

DESCRIPTION

DESCRIPTION

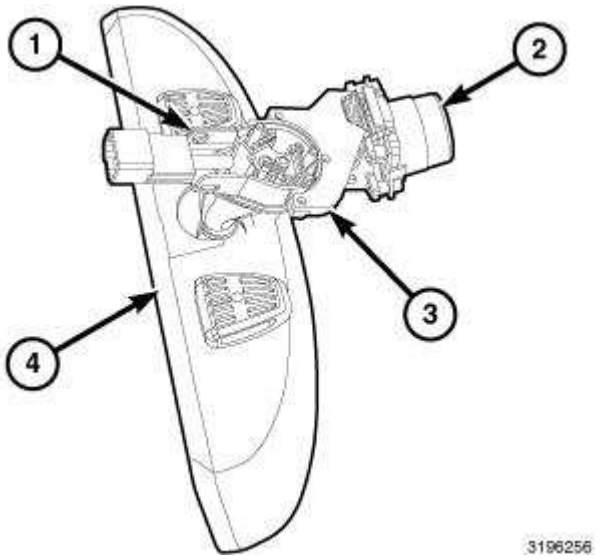

Fig. 41: Rear View Mirror, Camera Pod, Bracket
Courtesy of CHRYSLER GROUP, LLC

SmartBeam® automatic high beam headlamp control is an available option on this vehicle when it is also equipped with the automatic headlamps, automatic wipers and the electrochromic inside rear view mirror (4) options. SmartBeam® enhances the headlamp system of the vehicle by assisting the driver with the task of turning the headlamp high beams ON and OFF according to surrounding traffic conditions. The only visible component of SmartBeam® is the camera pod (2) and the rectangular forward-facing clear lens. Because the SmartBeam® camera looks through the windshield, the system may not function properly if this area of the glass is covered with ice, dirt, haze or any other obstruction.

The camera pod is secured to a bracket (3) that extends from the integral mounting bracket (1) of the electrochromic inside rear view mirror. Within the camera pod is the circuit board and circuitry of the camera. The camera pod and bracket as well as the Light Rain Sensor Module (LRSM) (also known as the Rain Sensor Module/RSM or Light Sensor Module/LSM) are located just below the rear view mirror mounting button on the inside of the windshield glass, where they are both concealed from view within the vehicle interior behind a two piece clamshell-like mirror bracket trim cover.

The digital imager camera is aimed so as to view a predetermined area in the path directly ahead of the vehicle. If the camera is not properly aimed the system performance may be diminished or altered. For optimal system performance, the SmartBeam® camera must be calibrated (aimed) by the dealer to insure that the camera aim is properly centered on the road ahead of the vehicle whenever the inside rear view mirror, the SmartBeam® camera, the windshield glass or the mirror mounting button are replaced or reinstalled.

The microprocessor-based electronics of SmartBeam® (also known as the Auto High Beam Module/AHBM) are integral to the circuit board contained within the electrochromic mirror. A short pigtail wire connects the camera circuit board directly to the electrochromic mirror circuit board, and a connector receptacle secured to the mount of the electrochromic mirror connects the mirror to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness.

The SmartBeam® is serviced as a unit with the electrochromic inside rear view mirror. If the SmartBeam® camera, lens, circuitry or bracket is damaged or ineffective, the entire electrochromic inside rear view mirror must be replaced.

OPERATION

OPERATION

The SmartBeam® automatic high beam control system uses digital light-sensing technology to monitor the lighting and traffic conditions in front of the vehicle. It helps improve forward visibility during nighttime driving by initiating high beam usage as ambient lighting and traffic conditions warrant. SmartBeam® is also a Local Interface Network (LIN) slave node and communicates over a LIN data bus with the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which is a LIN master node. The BCM is also a gateway to the Controller Area Network (CAN) data bus, which allows bus communication with other electronic modules in the vehicle and the diagnostic scan tool.

SmartBeam® may be enabled or disabled by using the customer programmable features function of the EVIC and selecting or deselecting the **AUTO DIM HIGH BEAMS** feature. Then the headlamp switch control knob, located on the instrument panel, must be in the **AUTO** (Automatic) position and the high beams must be selected using the beam selector function of the multi-function switch control stalk for SmartBeam® to be operational. An **AUTO HIGHBEAM ON** or **AUTO HIGHBEAM OFF** textual message will temporarily appear in the Integrated Center Stack (ICS) display to confirm the current system status.

When the SmartBeam® system is enabled, ambient light levels are low enough to require the use of high beams, the vehicle is moving over 34 kilometers-per-hour (21 miles-per-hour) and no other traffic is present; SmartBeam® will automatically turn the high beams ON. When the system detects the headlamps of an approaching vehicle or the tail lamps of a preceding vehicle, the high beams will automatically turn OFF. If the high beams are ON while decelerating and approaching a full stop, the system will turn them OFF automatically at below approximately 30 kilometers-per-hour (18 miles-per-hour).

SmartBeam® will switch the high beams ON or OFF instantaneously. The high beam indicator in the instrument cluster will illuminate as soon as the high beams come ON, and will remain illuminated until the high beams are OFF. SmartBeam® will instantaneously turn the high beams OFF if the system detects the sudden presence of vehicle lights ahead. The vehicle operator can also override the SmartBeam® selection at any time manually using the beam selection function of the multi-function switch control stalk to select the low beams, and the flash-to-pass (optical horn) feature is still functional with SmartBeam®.

SmartBeam® senses lighting conditions directly ahead of the vehicle. In certain situations, such as hills or winding roads, it may be more comfortable manually overriding the system because the vehicles in front may not be in the SmartBeam® imaging camera field of view. However, it is not likely that your high beams will cause discomforting glare to other drivers in this situation.

SmartBeam® may not function properly if its field of view is obscured. Because it looks through the windshield, the system may not function properly if this area is covered with ice, dirt, haze or any

other obstruction. For optimal system performance, the lens of the imager camera must be cleaned periodically, as it may haze over due to the air quality in the vehicle passenger compartment. Spray a small amount of glass cleaner onto a soft cloth and gently clean the lens. Do not spray the glass cleaner directly onto the lens.

SmartBeam® uses a red Light Emitting Diode (LED) unit to indicate certain faults it detects in the imager camera and circuitry. A slow (once-per-second) continual flashing of this LED indicates the SmartBeam® camera requires aiming. A constantly (solid) illuminated LED indicates the camera has failed factory aim. The LED is located to the right of the rearward facing ElectroChromic (EC) inside rear view mirror photo sensor, behind the top center of the mirror glass. This LED is only clearly visible when it is illuminated.

The BCM will store a DTC for any SmartBeam® fault that is detected. The hard wired inputs and outputs of the EC mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SmartBeam® unit, the EC mirror or the electronic controls or communication between modules and other devices that provide some features of the automatic high beam system. The most reliable, efficient, and accurate means to diagnose the SmartBeam®, the EC mirror or the electronic controls and communication related to automatic high beam system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - SMART BEAM CALIBRATION

SmartBeam® calibration must be performed after the inside rear view mirror is replaced with a new unit, and may also be required following any rear view mirror mounting button or windshield replacement procedure. The calibration procedure ensures that the field of vision for the SmartBeam® imager is aimed at the proper path directly ahead of the vehicle. New and unused replacement SmartBeam® units are shipped in calibration mode, which will be indicated by a slow (once-per-second) continuously flashing electrochromic mirror Light Emitting Diode (LED) while the ignition switch is in the ON position. Complaints of poor or improper system performance following mirror mounting button or windshield replacement indicate the need for SmartBeam® calibration.

VEHICLE PREPARATION FOR SMARTBEAM® CALIBRATION

1. Be certain that the imager lens and the windshield glass in front of the imager lens are clean and free from obstructions.
2. Be certain that the inside rear view mirror mounting is properly tightened and secure.
3. Repair or replace any ineffective, worn or damaged suspension components that could hinder proper SmartBeam® calibration.
4. Verify proper tire inflation pressures.
5. Remove any accumulations of mud, snow or ice from the vehicle underbody.
6. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.

7. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
8. Verify correct vehicle suspension height.
9. Verify that the vehicle has at least 16 kilometers (10 miles) showing on the odometer.

MARK IMAGER CENTERLINE ON WINDSHIELD

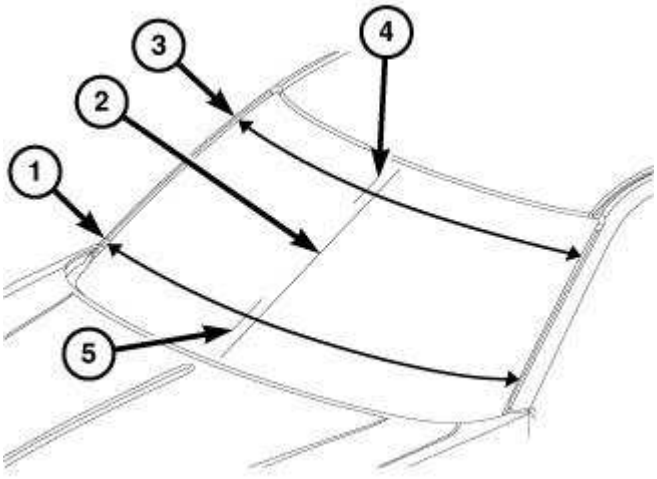

Fig. 42: Measurement, Glass, Measurement & Glass
Courtesy of CHRYSLER GROUP, LLC

1. Take a measurement (3) across the top of the windshield using the lower edge of the tint band on each side of the glass as the reference points.
2. Divide the upper measurement in half and mark that dimension near the lower edge of the tint band on the glass (4) using a grease pencil. This is the upper centerline of the glass.
3. Take a measurement (1) across the base of the windshield using the inside corner where the side blackout area intersects the lower blackout area on each side of the glass as the reference points.
4. Divide the lower measurement in half and mark that dimension near the upper edge of the lower blackout area on the glass (5) using a grease pencil. This is the lower centerline of the glass.
5. Measure and mark 27.5 millimeters (1.084 inches) toward the driver side of the windshield from the upper and lower glass centerline marks and draw a line (2) between these marks. This is the centerline of the SmartBeam® imager.

NOTE: Be certain to clean the centerline marks from the area of the glass in front of the imager lens before attempting to calibrate the SmartBeam® unit.

MARK IMAGER CENTERLINE ON BACK GLASS

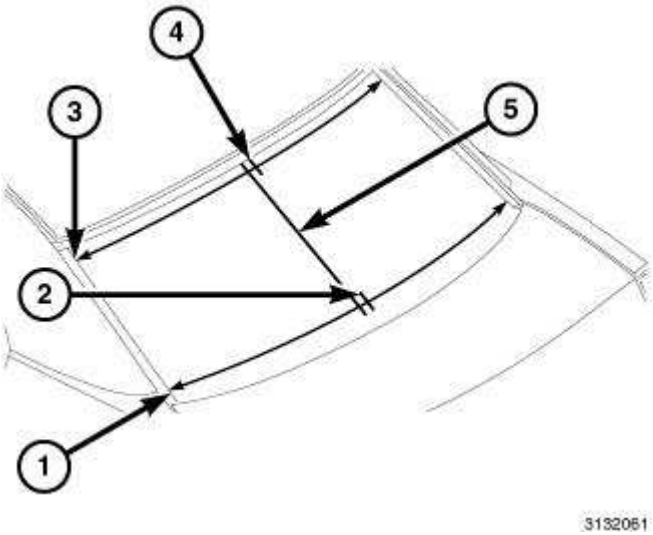

Fig. 43: Measurement, Glass, Measurement, Glass
Courtesy of CHRYSLER GROUP, LLC

1. Take a measurement (3) across the upper edge of the back glass using the vertical edges of the body back glass opening as the reference points.
2. Divide the upper measurement in half and mark that dimension on the glass (4) using a grease pencil. This is the upper centerline of the back glass.
3. Take a measurement (1) across the lower edge of the back glass using the vertical edges of the body back glass opening as the reference points.
4. Divide the lower measurement in half and mark that dimension on the glass (2) using a grease pencil. This is the lower centerline of the back glass.
5. Measure and mark 27.5 millimeters (1.084 inches) toward the driver side of the back glass from the upper and lower glass centerline marks and draw a line (5) between these marks. This is the centerline of the imager.

SET UP AIM BOARD AND TRIPOD

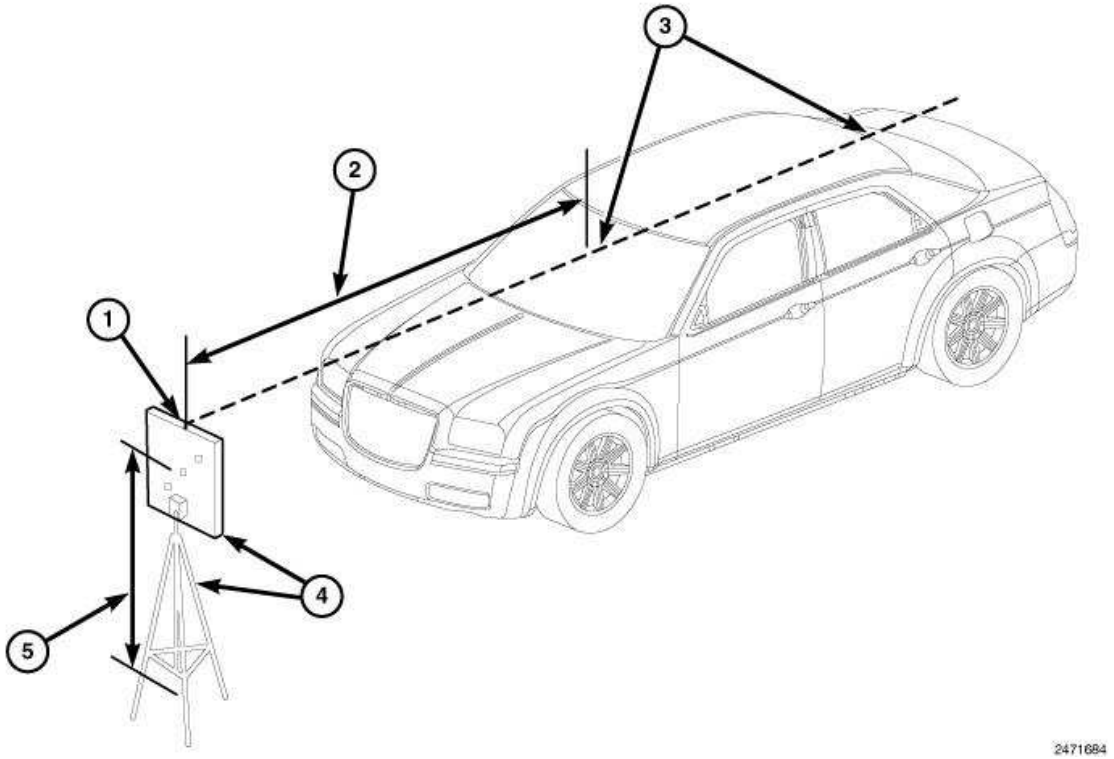

Fig. 44: Positioning Aim Board And Tripod
Courtesy of CHRYSLER GROUP, LLC

1. Position the vehicle on a level surface in a dimly lit area.
2. Place the aim board and tripod (4) (Special Tool (special tool #9649, Alignment Device, Smart Beam)) 304 centimeters (10 feet) ahead (2) of the imager camera lens.
3. Sight through the V-notch (1) in the upper edge of the aim board to align and center the board to the imager centerline marks on both the windshield and the back glass (3).
4. Adjust the tripod so that the center Light Emitting Diode (LED) on the aim board is 131 centimeters (51.5 inches) from the level floor (5).

CALIBRATION PROCEDURE

1. Connect a diagnostic scan tool to the Data Link Connector (DLC) below the driver side end of the instrument panel.
2. Turn the ignition switch to the ON position.
3. Use the diagnostic scan tool to enter the SmartBeam unit into calibration mode. Look in the diagnostic scan tool under the **SmartBeam®** or **AUTOMATIC HIGH BEAM MODULE/AHBM** menu item as appropriate. When the SmartBeam® unit has entered calibration mode, it will be indicated by a continual flashing of the ElectroChromic (EC) mirror red LED at a slow rate of once-per-second.
4. Connect the aim board transformer to illuminate the aim board LED units. The EC mirror red LED will continue to flash for five to ten seconds, then will stop flashing to indicate that it has completed calibration. If the LED illuminates continually (solid), it indicates that the calibration has failed and a Diagnostic Trouble Code (DTC) has been recorded. Use the diagnostic scan

tool to retrieve the DTC, then refer to the appropriate diagnostic information.

SWITCH, BACKUP LAMP

DESCRIPTION

DESCRIPTION

Vehicles with an electronic automatic transmission have a Transmission Range Sensor (TRS) that is used to perform several functions, including that of the backup lamp switch. The TRS may be a separate component, or it may be an integral part of an electronic automatic transmission solenoid pack or of a transmission gear selector module. The specific TRS details vary by the model of the transmission installed in the vehicle. The TRS is described in further detail elsewhere in this service information. Refer to the service and diagnostic information for the automatic transmission type installed in the vehicle.

SWITCH, HAZARD WARNING

DESCRIPTION

DESCRIPTION

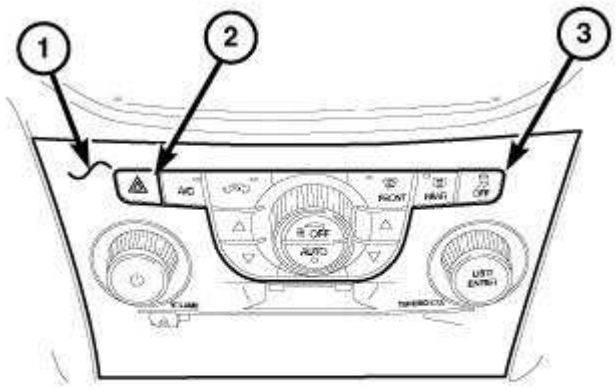

Fig. 45: Guide Pins & Switch-Bank Panel
Courtesy of CHRYSLER GROUP, LLC

The hazard switch (2) is integral to the instrument panel switch bank (3) in the vehicle feature controls module (1) (also known as the Integrated Center Stack/ICS), which is secured to the lower instrument panel center stack just below the U-Connect Touch™ screen module. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard switch button. The remainder of the hazard switch circuitry is concealed within the instrument panel switch bank.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button latches to a slightly lowered position when the hazard warning system is activated and unlatches to a position flush with the other push buttons in the switch bank when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within the molded plastic vehicle feature controls module. A single connector receptacle is integral to the back of the module. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch bank and vehicle features control module unit must be replaced. Refer to **POD, SWITCH BANK, REMOVAL** .

OPERATION

OPERATION

The status of the hazard switch is continually monitored by the circuitry within the instrument panel switch bank in the vehicle features control module (also known as the Integrated Center Stack/ICS). The switch receives battery voltage at all times through a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness.

Whenever the hazard switch is in its latched and lowered position, the hazard warning system is selected and the switch bank circuitry provides a hard wired output to the Body Control Module (BCM) (also known as the Common Body Controller/CBC). When the BCM receives a hazard switch input, it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left, front and rear turn signal feed circuits.

The BCM also sends the appropriate electronic messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

The hard wired circuits for the instrument panel switch bank may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the hazard warning switch or the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, HEADLAMP

DESCRIPTION

DESCRIPTION

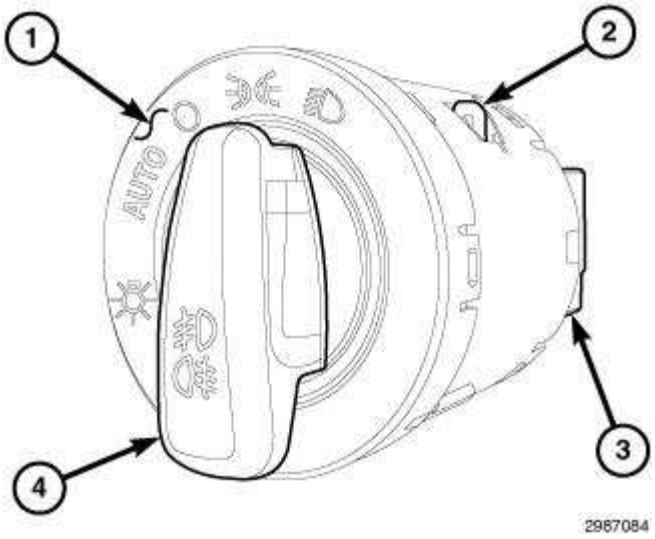

Fig. 46: Headlamp Switch, Retainers & Receptacle
Courtesy of CHRYSLER GROUP, LLC

The headlamp switch (1) is located on the instrument panel, in a cylinder-like mounting hole molded into the steering column opening cover to the left of the steering column. Several different switches are used, depending upon equipment and market requirements. The standard switch features a three-position rotary knob (4) for exterior lighting control. An optional switch has a fourth position added to the rotary knob for automatic headlamps and a momentary PUSH function added to the rotary knob for front fog lamp control.

Each of these switches is constructed of molded plastic. On vehicles with optional fog lamps the rotary knob also has the International Control and Display Symbol icon for **Front Fog Light** applied to it. The switch face plate is also labeled with graphics and icons to clearly identify the many functions of the rotary knob.

The switch housing is secured within the mounting hole of the instrument panel bezel by two spring loaded, pivoting pawl-like retainers (2), one near the bottom and another near the top. These pawls can be retracted for removal of the switch from the face of the instrument panel using a specific rotary knob actuation sequence. Refer to **SWITCH, HEADLAMP, REMOVAL**.

The back of the switch housing has an integral connector receptacle (3) containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. A panel dimmer controlled Light Emitting Diode (LED) unit soldered to the circuit board within the switch provides back lighting for visibility at night, but is not serviceable.

The headlamp switch cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The headlamp switch uses a single resistor multiplexed output to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) on a headlamp switch MUX return circuit. The BCM then reads the switch outputs using an internal pull up on the headlamp/fog lamp switch signal circuit to control the exterior lighting functions.

The switch illumination circuit receives a path to ground at all times through an instrument panel ground circuit. The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the interior lighting thumbwheel switch in the dimmer module. Refer to **SWITCH, DIMMER, OPERATION** .

The headlamp switch operates as follows:

- **Front Fog Lamps Control** - For vehicles so equipped, the rotary knob on the headlamp switch is depressed to activate or deactivate the optional front fog lamps. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM reads and responds to this input by energizing or de-energizing the right and left front and rear fog lamp control circuits through internal High Side Drivers (HSD) and by sending an electronic confirmation message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus, which controls the front and rear fog lamp indicators as appropriate.
- **Exterior Lighting Control** - The rotary knob on the headlamp switch is rotated to a detent position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM responds by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal HSDs and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the multi-function switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the **AUTO** (Automatic) position is selected, the BCM also monitors an electronic **ambient light level** message received over the CAN data bus from the air conditioner - heater control module based upon a hard wired input from the sun sensor to turn the exterior lighting ON and OFF automatically while the ignition switch is in the ON position.

The headlamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate

the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

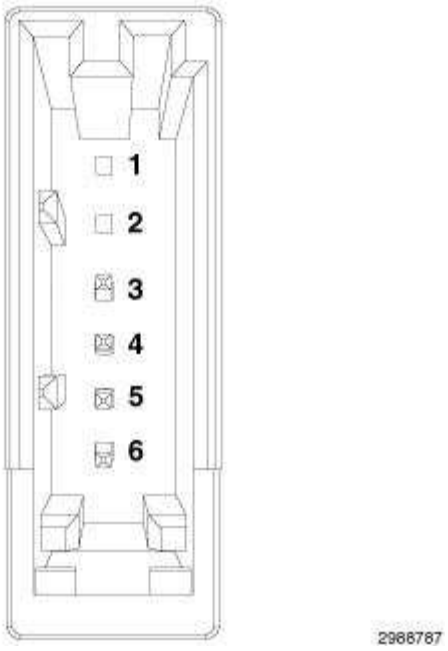

Fig. 47: Terminals Of The Switch
Courtesy of CHRYSLER GROUP, LLC

1. Remove the headlamp switch from the instrument panel. Refer to **SWITCH, HEADLAMP, REMOVAL**.
2. Disconnect the instrument panel wire harness connector from the back of the headlamp switch.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the Headlamp Switch Tests table.

HEADLAMP SWITCH TESTS	
SWITCH POSITION (PINS)	***RESISTANCE RANGE (OHMS)**
AUTO (3 and 6)	4028.0 - 4452.0
OFF (3 and 6)	1938.0 - 2142.0
PARK (3 and 6)	1073.5 - 1186.5
HEADLAMP (3 and 6)	627.0 - 693.0
FOG LAMP - AUTO (3 and 6)	347.2 - 383.8
FOG LAMP - OFF (3 and 6)	317.7 - 351.1
FOG LAMP - PARK (3 and 6)	280.6 - 310.1
FOG LAMP - HEADLAMP	

(3 and 6)	236.6 - 261.5
SWITCH ILLUMINATION (4 and 5)	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 4 TO PLUS (+), CONNECT PIN 5 TO MINUS (-) - LEDs SHOULD BARELY GLOW
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective headlamp switch as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

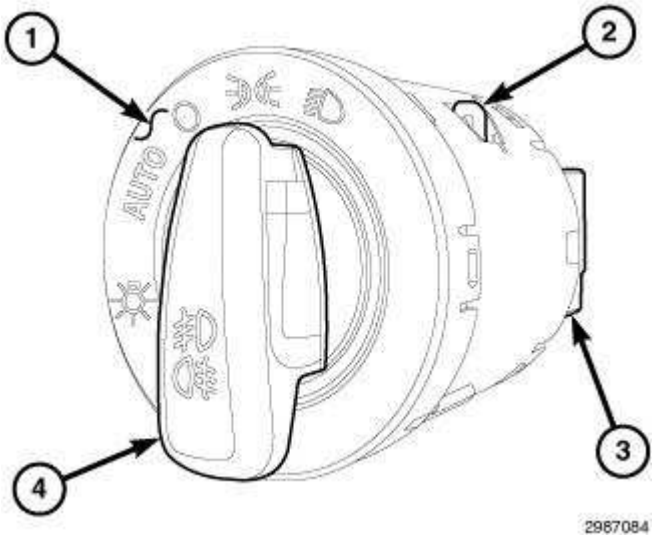

Fig. 48: Headlamp Switch, Retainers & Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Place the headlamp switch (1) rotary knob (4) in the OFF (**O**) position.
3. Push in on the rotary knob to engage the switch retainer (2) retractor mechanism.

4. Still holding the switch rotary knob depressed, rotate the knob clockwise toward the park lamps ON position to retract the two switch retainers. The retainers will be fully retracted before the rotary knob actually reaches the park lamps ON position.
5. With the switch rotary knob still in the retainer retractor position, pull the switch out of the cylinder-like mounting hole far enough to access and disconnect the instrument panel wire harness connector from the connector receptacle (3) on the back of the switch housing.
6. Remove the headlamp switch from the instrument panel steering column opening cover.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

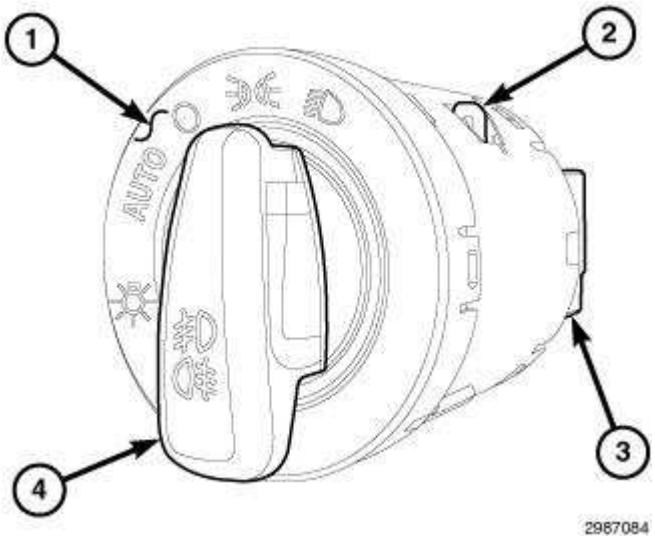

Fig. 49: Headlamp Switch, Retainers & Receptacle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before attempting to install the headlamp switch (1), be certain that both pawl-like retainers (2) are extended outward from the body of the switch. If the retainers are in the retracted position, rotating the headlamp switch rotary knob (4) to the OFF (O) position should disengage the retainer retractor mechanism causing the retainers to spring outward from the switch body.

1. Position the headlamp switch (1) close enough to the cylinder-like switch mounting hole in the

instrument panel steering column opening cover to reconnect the instrument panel wire harness connector to the connector receptacle (3) on the back of the switch housing.

2. Position and align the switch in the center of the switch mounting hole of the steering column opening cover on the instrument panel.
3. Using hand pressure, press the switch firmly and evenly into the mounting hole until it is fully seated. An indication that the switch is fully seated will be a light audible click as each of the two pawl-like retainers (2) snap into place within the mounting hole.
4. Reconnect the battery negative cable.

SWITCH, MULTIFUNCTION

DESCRIPTION

DESCRIPTION

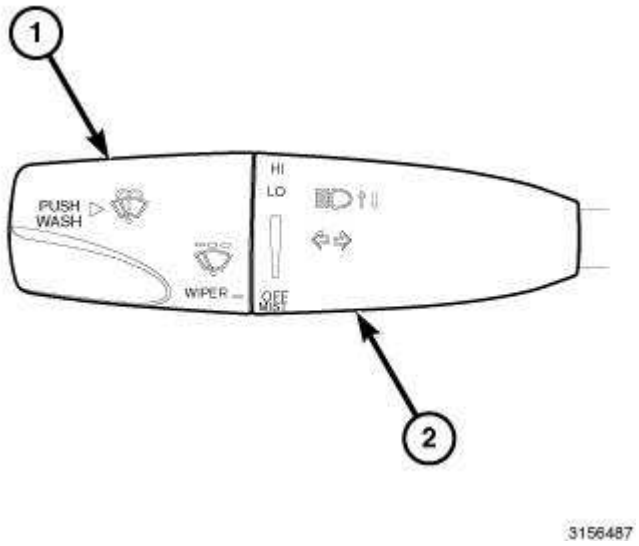

Fig. 50: Control Knob & Control Stalk
Courtesy of CHRYSLER GROUP, LLC

The multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the front wiper and washer systems, the turn signals and headlamp beam selection. The only visible components of the switch are the control stalk (2) and control knob (1) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connections and the turn signal cancel actuator are concealed beneath the shrouds.

The switch housing and controls are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. The multi-function switch for this vehicle is integral to the Steering Column Control Module (SCCM).

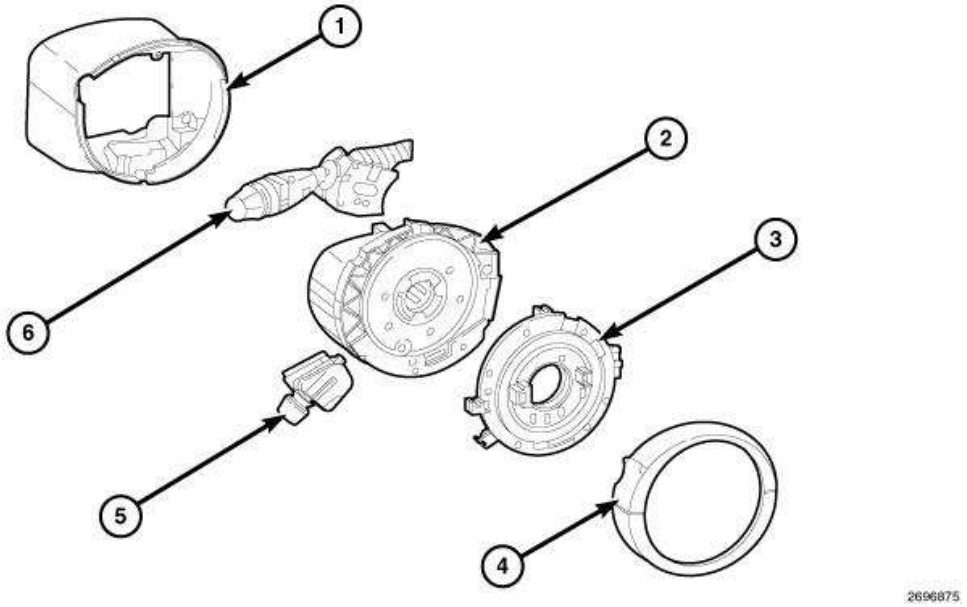

Fig. 51: Steering Column Shroud, Steering Angle Sensor (SAS), Clockspring, Telescope Switch & Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the steering column shroud (1), the Steering Angle Sensor (SAS) (2), the clockspring (3), the multi-function switch (6), a steering column power tilt and telescope switch (5) for vehicles so equipped, a trim cover (4) and the Steering Control Module (SCM). The SCCM includes an integral connector receptacle that faces toward the instrument panel and is connected to the vehicle electrical system through a single take out and connector of the instrument panel wire harness.

The multi-function switch provides the vehicle operator with a control interface for the following functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary WASH position for washer system operation.
- **Front Wiper Control** - The multi-function switch control knob provides detent switching for two continuous wipe switch positions, LO speed or HI speed, and an intermittent wipe mode with four delay interval positions. The four delay positions become four sensitivity positions for vehicles equipped with the optional automatic wiper system. The control knob also has a momentary MIST or pulse wipe feature switch position.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp HIGH or LOW beams.
- **Headlamp Optical Horn** - The multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Turn Signal Control** - The multi-function switch control stalk provides both momentary non-detent (lane change) switching or detent switching with automatic cancellation for both the left

and right turn signals.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

OPERATION

OPERATION

The multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) and to other electronic modules in the vehicle.

If the SCM detects no inputs from the multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals other electronic modules to implement a fail-safe or default mode of operation. For the exterior lighting system, the multi-function switch fail-safe mode automatically selects LOW beams when the headlamps are turned ON. For the wiper system, the multi-function switch fail-safe mode will maintain the last selected wiper system operation for the remainder of the current ignition cycle, after which the wiper system will default to OFF.

Some of the hard wired inputs and outputs of the SCCM, SCM and multi-function switch unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose the SCCM, the SCM and the multi-function switch requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the multi-function switch is operated to control the functions and features it provides:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed toward the steering column to the momentary WASH detent position to activate the washer pump/motor in the FRONT WASH mode. The washer pump/motor will continue to operate for as long as the control knob is held in this position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **front washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the two continuous wiper detents (LO or HI), to one of four intermittent delay or sensitivity wiper detents, or to the OFF position to select the FRONT WIPER mode. The SCM reads the resistor multiplexed input from the multi-function switch and sends electronic **front wiper switch status** messages over the CAN data bus to the BCM and to other electronic

modules in the vehicle.

- **Front Wiper Mist Mode** - The control knob on the end of the multi-function switch control stalk is rotated to the momentary MIST position to activate the wiper MIST mode. The wiper motor will continue to operate, one complete cycle at a time, for as long as the control knob is held in this position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **front wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp HIGH beams will remain illuminated for as long as the control stalk is held in this momentary position and the LOW beams will be restored when the control stalk is released. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Turn Signal Control** - The turn signals are requested when the multi-function switch control stalk is moved downward (LEFT signal) or upward (RIGHT signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends from the multi-function switch housing through an opening in the side of the clockspring case toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the LEFT turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **turn signal switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.

REMOVAL

REMOVAL

NOTE: The multi-function switch for this vehicle is integral to the Steering Column

Control Module (SCCM). If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM unit must be replaced. Refer to MODULE, STEERING COLUMN, REMOVAL .

INSTALLATION

INSTALLATION

NOTE: The multi-function switch for this vehicle is integral to the Steering Column Control Module (SCCM). If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM unit must be replaced. Refer to MODULE, STEERING COLUMN, INSTALLATION .

SWITCH, PARKING BRAKE

DESCRIPTION

DESCRIPTION

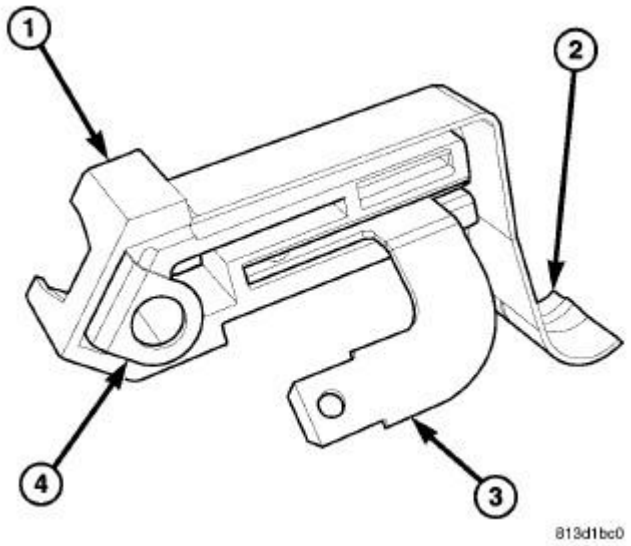

Fig. 52: Identifying Park Brake Switch
Courtesy of CHRYSLER GROUP, LLC

The park brake switch (1) is located on the park brake lever mechanism on the left cowl side inner panel below the instrument panel, outboard of the steering column. This switch includes a spade-type output terminal (3) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. The output terminal is integral to the stationary contact within a molded plastic insulator.

A locating tab on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact with an integral grounding lug (4) on one

end and an integral actuating lever and follower (2) on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.

The park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The park brake switch is a normally closed, mechanically actuated leaf contact switch that is operated by the park brake lever mechanism. The switch is grounded through its mounting to the park brake lever mechanism and provides a ground input to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) on a park brake switch sense circuit whenever the park brake is applied, and opens this circuit whenever the park brake is released. The park brake switch sense input to the IC is used as an additional logic input by the IC for control of the brake indicator and may also be used as a logic input for other electronic features in the vehicle.

The park brake switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that rely upon inputs from the park brake switch. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to park brake switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: If the brake indicator stays ON with the ignition switch in the ON position and the park brake released, or comes ON while driving, the brake system must be diagnosed and repaired prior to performing the following tests. If no brake system problem is found, the following procedures will help to locate a shorted or open park brake switch sense circuit, or an ineffective park brake switch.

PARKING BRAKE SWITCH

INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector for the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavities of the body wire harness connector for the park brake switch and the instrument panel wire harness connector for the IC. There should be continuity. If not OK, repair the open park brake switch sense circuit between the park brake switch and the IC as required.

INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OKAY

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity with the park brake applied. If OK, go to 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector for the IC from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavity of the body wire harness connector for the park brake switch and a good ground. There should be no continuity. If not OK, repair the shorted park brake switch sense circuit between the park brake switch and the IC as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

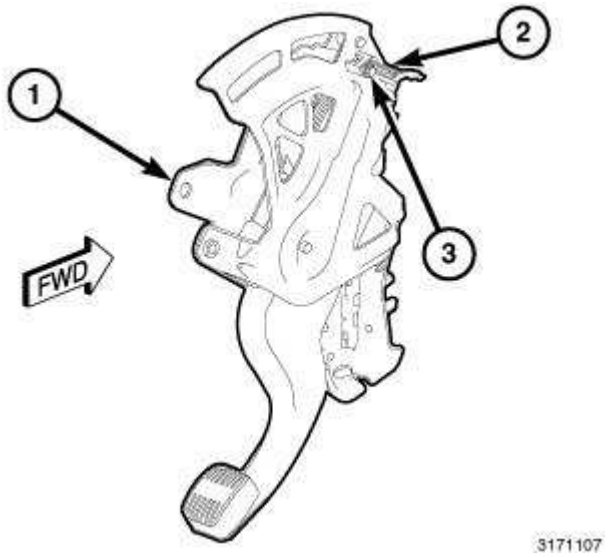

Fig. 53: Park Brake Switch, Park Brake Lever Mechanism & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Apply the parking brake.
3. Reach under the left end of the instrument panel to access and disconnect the body wire harness connector from the terminal of the park brake switch (2) located on the park brake lever mechanism (1) on the left cowl side inner panel.
4. Remove the screw (3) that secures the park brake switch to the park brake lever mechanism.
5. Remove the switch from the park brake lever mechanism.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

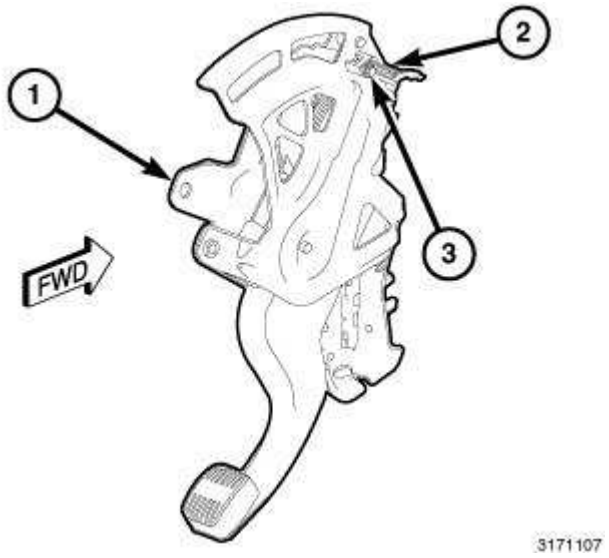

Fig. 54: Park Brake Switch, Park Brake Lever Mechanism & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the left end of the instrument panel to position the park brake switch (2) onto the park brake lever mechanism (1) on the left cowl side inner panel. Be certain to engage the locating pin on the back of the switch insulator into the locating slot in the lever mechanism bracket.
2. Install and tighten the screw (3) that secures the park brake switch to the park brake lever mechanism. Tighten the screw securely.
3. Reconnect the body wire harness connector to the terminal of the park brake switch.
4. Reconnect the battery negative cable.
5. Turn the ignition switch to the ON position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.

SWITCH, STOP LAMP

DESCRIPTION

DESCRIPTION

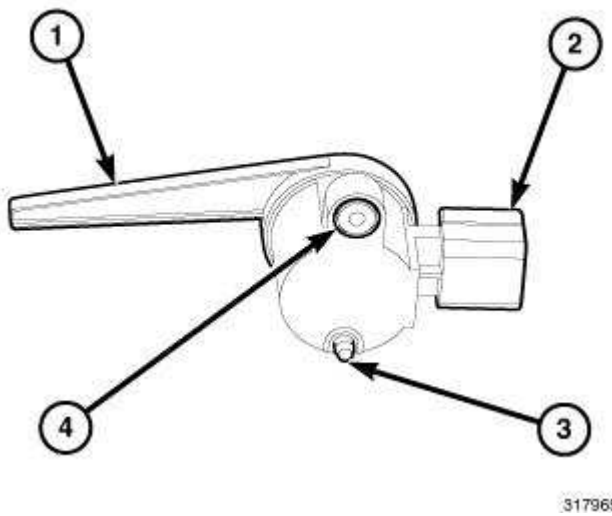

Fig. 55: Spring-Loaded Mechanical Lever Arm, Pin, Mounting Tab & Receptacle
Courtesy of CHRYSLER GROUP, LLC

A brake pedal position sensor is used in place of the brake (or stop) lamp switch in this vehicle. This sensor has a spring-loaded mechanical lever arm (1) that is actuated by a pin integral to the brake pedal arm. The sensor is secured by an integral locating pin (3) and a single screw through a metal insert in an integral mounting tab (4) to the brake pedal support bracket under the instrument panel on the driver side of the vehicle.

The molded plastic sensor housing has an integral connector receptacle (2) containing three terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the body wire harness. A cavity in the center of the molded plastic sensor housing contains the electronic circuitry of the sensor. The sensor housing is sealed to enclose and protect the internal electronic circuitry and components.

The brake pedal position sensor cannot be repaired. If the sensor is damaged or ineffective it must be replaced with a new unit.

OPERATION

OPERATION

The brake pedal position sensor monitors changes in the brake pedal position relative to the brake pedal mounting bracket. The sensor circuitry is energized by the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM or Antilock Brake System/ABS module) and provides hard wired analog (potentiometer) inputs back to the CAB. The CAB uses the sensor inputs directly as additional logic for many of the Antilock Brake System (ABS), Electronic Stability Control (ESC) and Brake Assist System (BAS) features.

The CAB also sends electronic **brake lamp switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other electronic modules use this information as an additional logic input for controlling many other vehicle functions and features,

including the Body Control Module (BCM) (also known as the Common Body Controller/CBC) for control of the brake (or stop) lamps.

The hard wired circuits between the brake pedal position sensor and the CAB may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the brake pedal position sensor or the electronic controls and communication that provide some features related to brake pedal position sensor operation. The most reliable, efficient and accurate means to diagnose the brake pedal position sensor or the electronic controls and communication related to sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

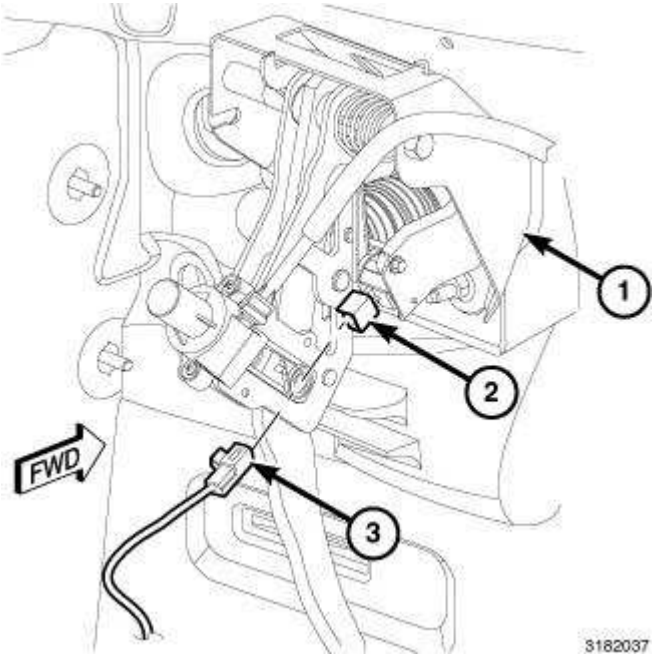

Fig. 56: Brake Pedal Position Sensor, Brake Pedal Support Bracket & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.

2. If equipped, remove the silencer pad from below the steering column. Refer to **PANEL, SILENCER, REMOVAL** .
3. Locate the brake pedal position sensor (2) on the brake pedal support bracket (1) under the instrument panel.
4. Disconnect the body wire harness connector (3) from the sensor.

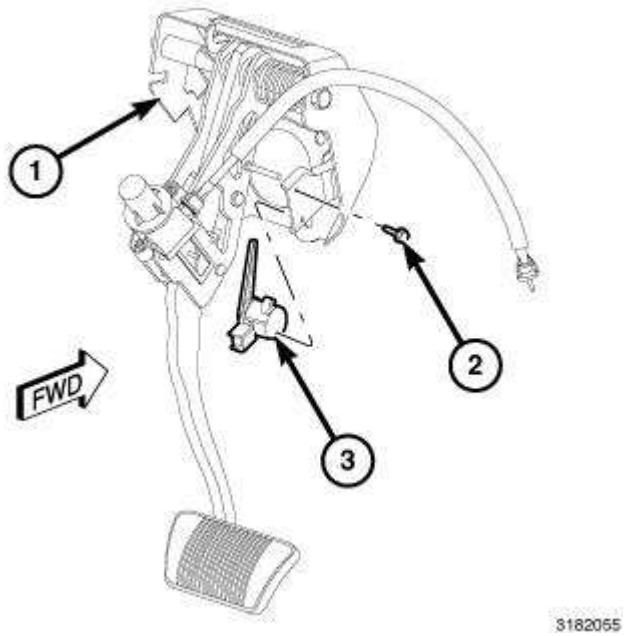

Fig. 57: Screw, Brake Pedal Position Sensor & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Depress and hold the brake pedal in the depressed position.
6. Remove the screw (2) that secures the brake pedal position sensor (3) to the sensor bracket on the brake pedal support bracket (1).
7. Disengage the sensor locating pin from the locating hole in the sensor bracket.
8. Pull the sensor straight rearward from the pedal support bracket to remove it from the sensor bracket.
9. Release the brake pedal.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service.

This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

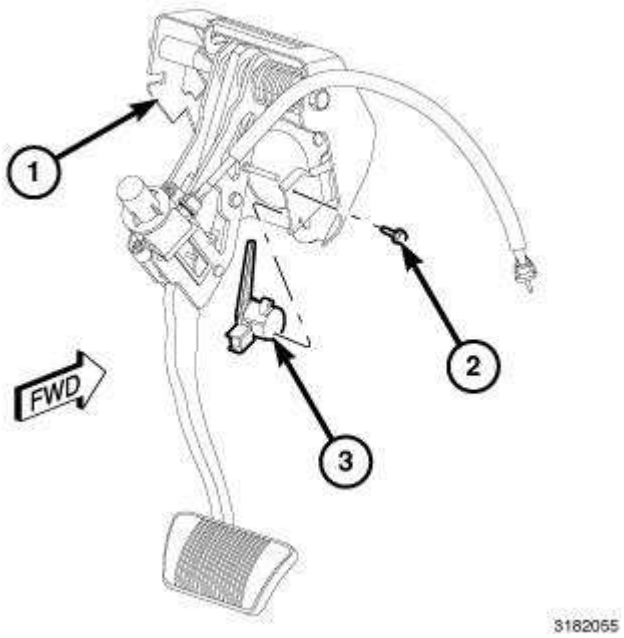

Fig. 58: Screw, Brake Pedal Position Sensor & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Depress and hold the brake pedal in the depressed position.
2. Position the brake pedal position sensor (3) to the sensor bracket on the brake pedal support bracket (1).
3. Engage the sensor locating pin into the locating hole in the sensor bracket.
4. Install and tighten the screw (2) that secures the sensor to the sensor bracket. Tighten the screw securely.

CAUTION: Brake booster damage may occur if the brake pedal pull exceeds about 9 kilograms (20 pounds).

5. Release the brake pedal. Then pull the pedal lightly upward to be certain the pedal is in its normal at-rest position.

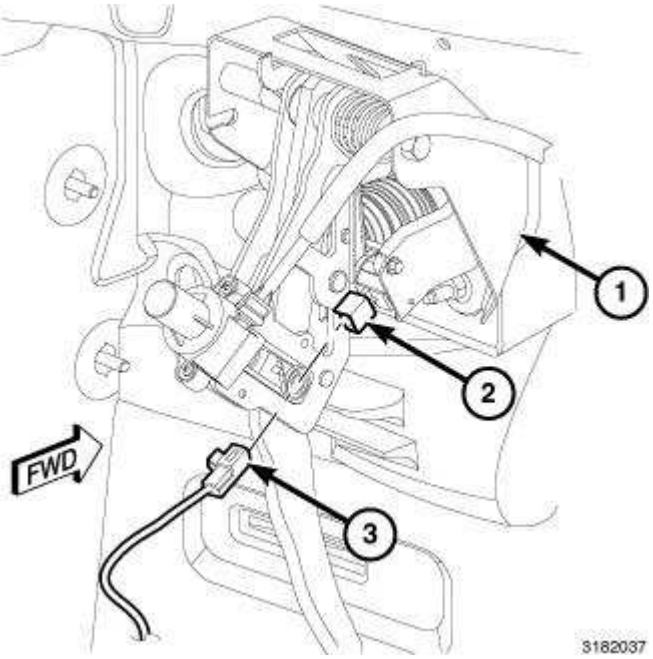

Fig. 59: Brake Pedal Position Sensor, Brake Pedal Support Bracket & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain the brake pedal position sensor is fully seated in the sensor bracket before completing the electrical connection.

6. Reconnect the body wire harness connector (3) to the connector receptacle on the sensor (2).
7. If equipped, reinstall the silencer pad below the steering column. Refer to **PANEL, SILENCER, INSTALLATION** .
8. Reconnect the battery negative cable.

NOTE: Whenever the brake pedal position sensor is removed and reinstalled or replaced with a new unit, it is necessary for the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM or Antilock Brake System/ABS module) to calibrate the reinstalled or the new sensor. Follow the programming steps outlined in the diagnostic scan tool for the "ABS Initialize" routine under "Miscellaneous Functions" for the "ABS Module" menu item as appropriate.

UNIT, FRONT LAMP

STANDARD PROCEDURE

STANDARD PROCEDURE - LAMP LENS DEFOGGING

Some occasional moisture accumulation inside a vented front lamp unit is normal and appears as a fogging on the inside of the lamp lens, similar to the fog that sometimes appears on the inside of a windshield. This condition is caused by rapidly changing temperature and humidity levels between the air internal and external to the lamp, and will usually dissipate once the temperature and humidity

conditions have been allowed to stabilize. Accelerated removal of such moisture may be accomplished by activating the headlamps on HIGH beam for about 15 minutes.

However, water droplets larger than 1 millimeter (0.039 inch) in size accumulated on the inside of the lamp lens, water droplets visible on most internal lamp surfaces or large quantities of water within the lamp indicates a problem with the lamp sealing that has allowed excessive amounts of water to enter the lamp. Once such excessive moisture has entered the lamp, it will always be present and will never disappear. A lamp with permanent internal moisture should be replaced.

REMOVAL

BULB - FRONT PARK AND TURN SIGNAL

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

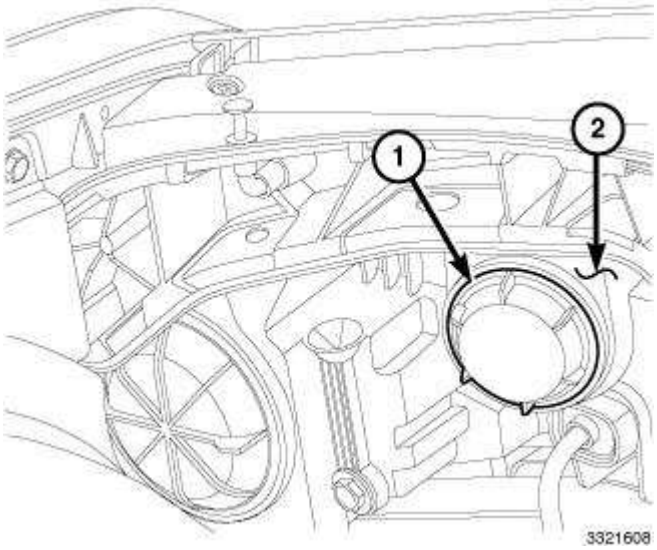

Fig. 60: Front Lamp Unit Housing & Signal Bulb Access Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. For the left hand side only, remove the fastener that secures the engine air cleaner assembly to the Front End Module (FEM) structural support and move the air cleaner assembly far enough to access the bulbs on the back of the front lamp unit housing (2).
3. Firmly grasp the park and turn signal bulb access cover (1) on the inboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.

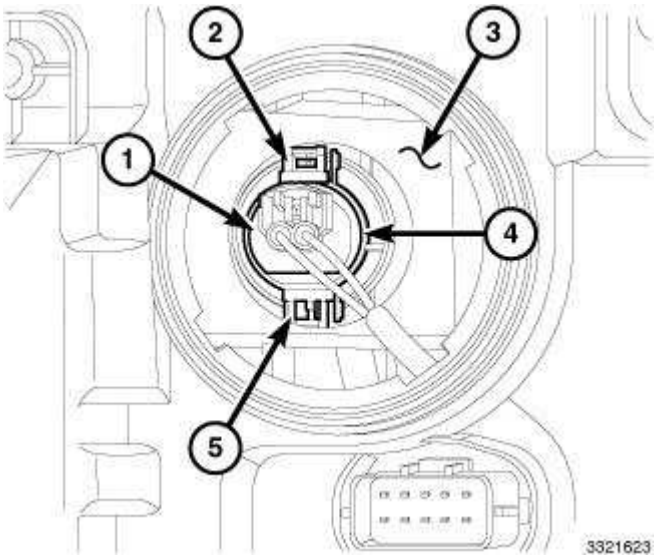

Fig. 61: Wire Harness Connector, Bulb Connector Receptacle & Two Latch Features
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the front lamp unit wire harness connector (1) from the bulb connector receptacle (4).
6. Firmly grasp the bulb by the two latch features (2 and 5) and squeeze them together to unlock the bulb from the back of the front lamp unit reflector (3).
7. Pull the bulb straight out from the keyed opening in the reflector.

BULB - HEADLAMP

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

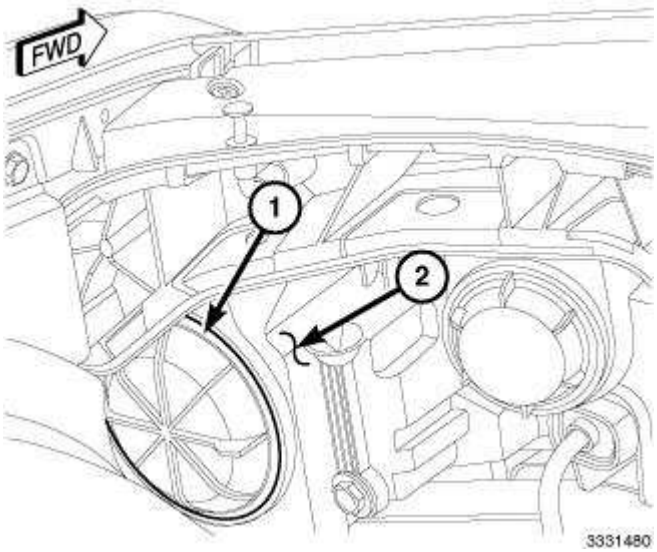

Fig. 62: Front Lamp Unit Housing & Headlamp Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. For the left hand side only, remove the fastener that secures the engine air cleaner assembly to the Front End Module (FEM) structural support and move the air cleaner assembly far enough to access the back of the front lamp unit housing (2).
3. Firmly grasp the headlamp bulb access cover (1) on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.

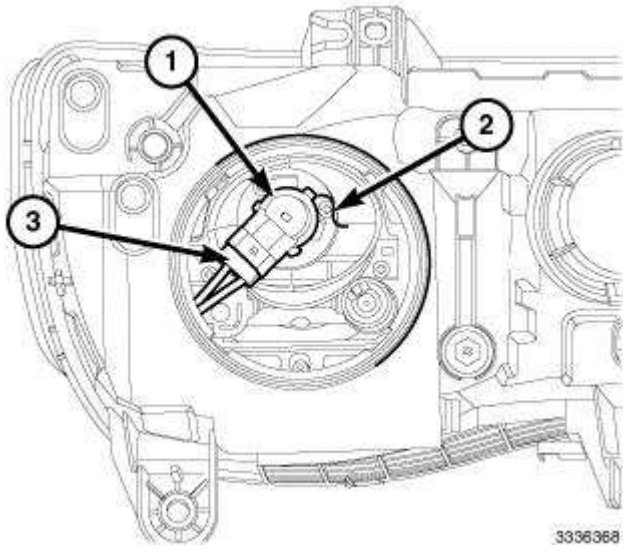

Fig. 63: Bulb Base & Reflector
Courtesy of CHRYSLER GROUP, LLC

5. Firmly grasp the bulb base (1) on the back of the reflector (2) within the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.

6. Pull the bulb and base straight out from the keyed opening in the reflector.

NOTE: Take care to prevent the wire harness and connector from falling back into the headlamp housing after disconnecting it from the headlamp bulb.

7. Disconnect the front lamp unit wire harness connector (3) from the bulb connector receptacle.
8. Remove the bulb from the back of the front lamp unit.

LAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

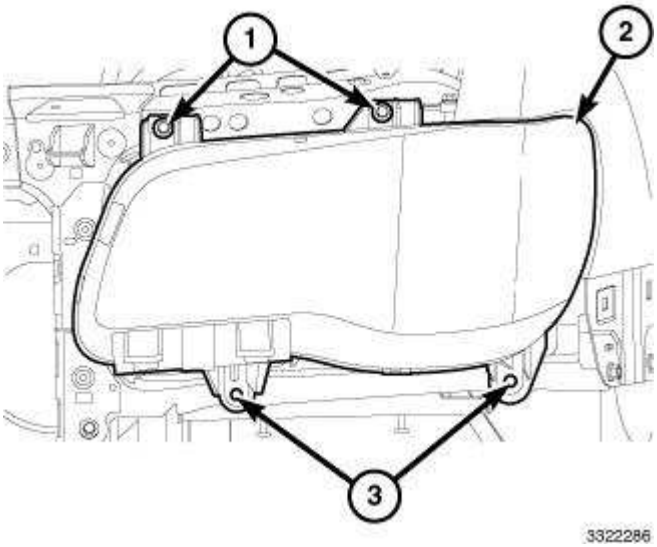

Fig. 64: Four Screws & Two Upper Front Lamp Unit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia from the Front End Module (FEM). Refer to **FASCIA, FRONT, REMOVAL** .
3. Remove the four screws (1 and 3) that secure the two lower and two upper front lamp unit (2) mounting brackets to the FEM support structure.

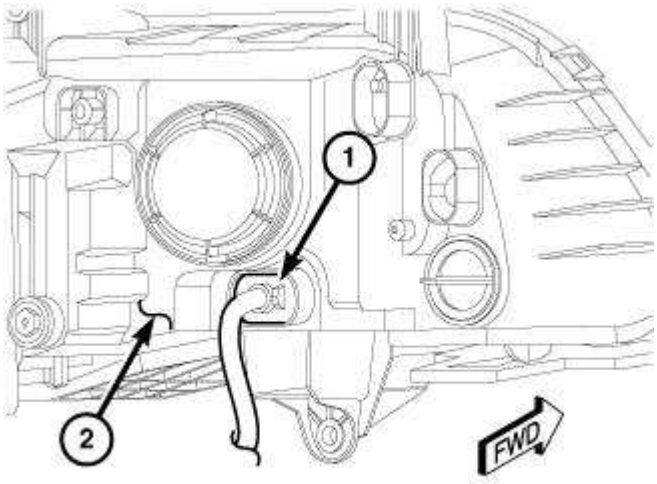

Fig. 65: Lamp & FEM Wire Harness Connection
Courtesy of CHRYSLER GROUP, LLC

4. Pull the lamp (2) away from the front of the vehicle far enough to access and disconnect the FEM wire harness connection (1) on the back of the lamp housing.
5. Remove the front lamp unit from the vehicle.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials

and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.

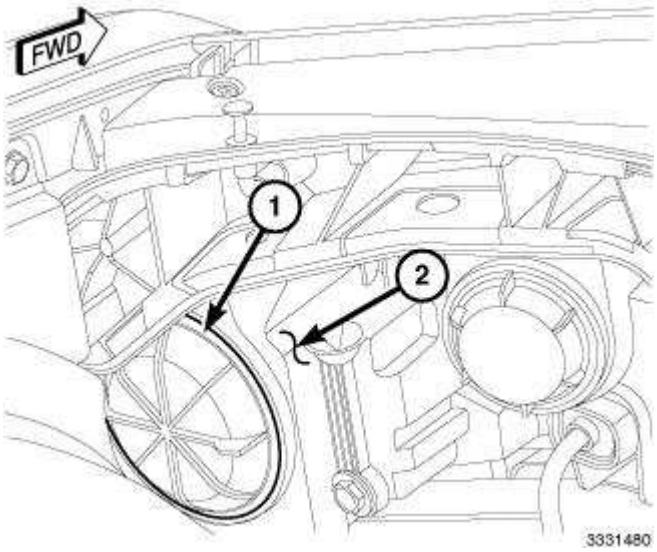

Fig. 66: Front Lamp Unit Housing & Headlamp Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative battery cable.
2. For the left hand side only, remove the fastener that secures the engine air cleaner assembly to the Front End Module (FEM) structural support and move the air cleaner assembly far enough to access the bulbs on the back of the front lamp unit housing (2).
3. Firmly grasp the High Intensity Discharge (HID) igniter and lighting element access cover (1) on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.

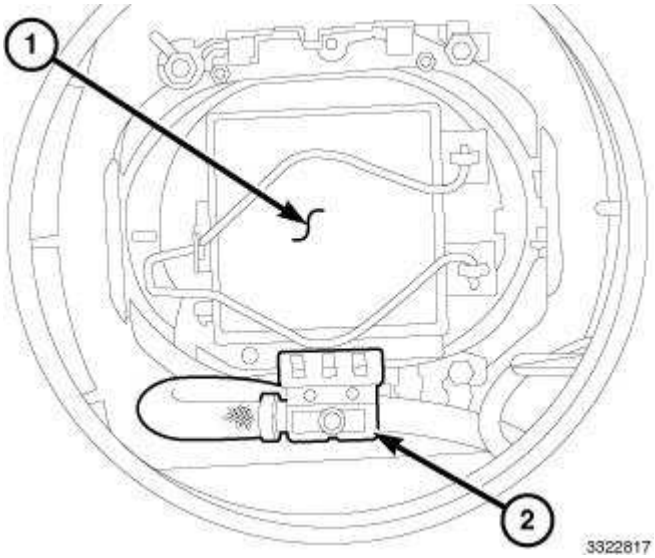

Fig. 67: High Tension Cable Wire Harness Connector & HID Igniter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Take care to prevent the high tension cable from falling back into the lamp housing after disconnecting it from the HID igniter.

5. Disconnect the high tension cable wire harness connector (2) from the HID igniter (1) connector receptacle.

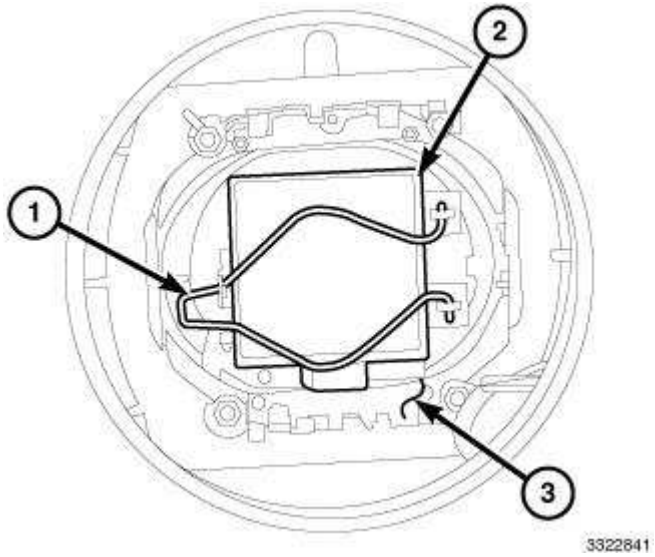

Fig. 68: Wire Retainer Clip, HID Igniter & Front Lamp Unit Reflector
Courtesy of CHRYSLER GROUP, LLC

6. Disengage the wire retainer clip (1) that secures the HID igniter (2) to the back of the front lamp unit reflector (3).
7. Pull the HID igniter and lighting element straight out from the keyed opening in the reflector.
8. Remove the igniter and lighting element from the back of the front lamp unit.

INSTALLATION

BULB - FRONT PARK AND TURN SIGNAL

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

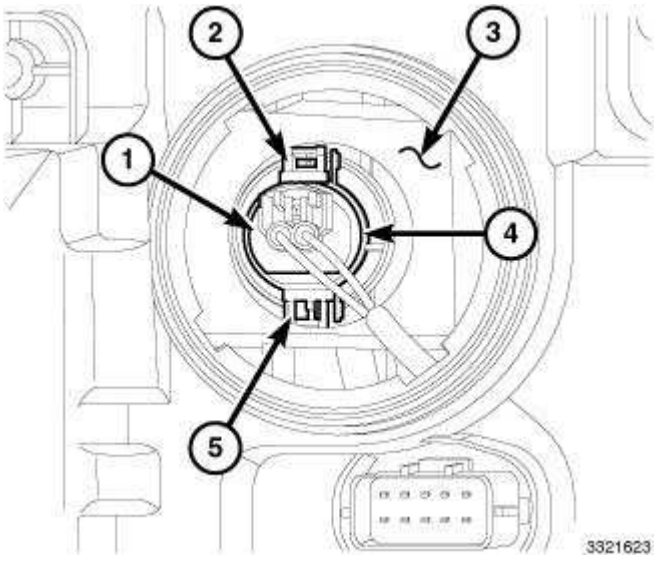

Fig. 69: Wire Harness Connector, Bulb Connector Receptacle & Two Latch Features
Courtesy of CHRYSLER GROUP, LLC

1. Align the index tabs of the front fog lamp bulb with the slots in the collar of the bulb opening on the back of the front lamp unit reflector (3).

2. Insert the bulb into the housing until the index tabs are engaged in the slots of the collar.
3. Firmly and evenly push the bulb straight into the lamp reflector until both bulb latch features (2 and 5) snap into place and are fully engaged.
4. Reconnect the front lamp unit wire harness connector (1) to the bulb connector receptacle (4).

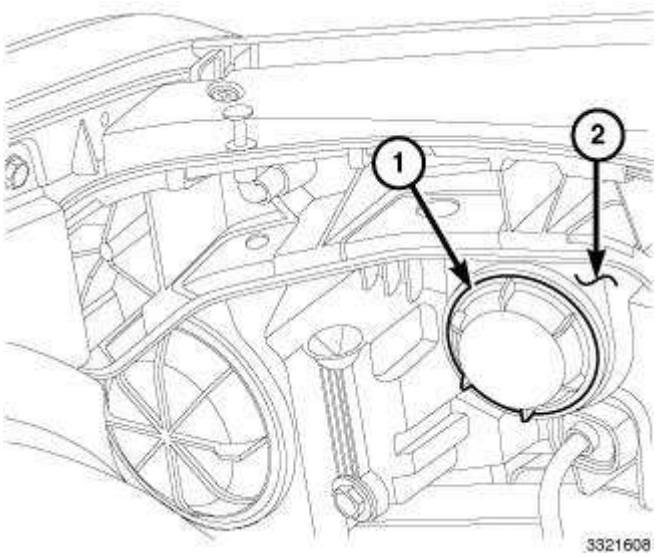

Fig. 70: Front Lamp Unit Housing & Signal Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

5. Position the bulb access cover (1) onto the inboard back of the front lamp unit housing (2) and rotate it clockwise about 30 degrees to lock it into place.
6. For the left hand side only, position the engine air cleaner assembly to the Front End Module (FEM) structural support and reinstall the fastener that secures the air cleaner assembly.
7. Reconnect the battery negative cable.

BULB - HEADLAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

NOTE: Left side shown in illustration. Right side similar.

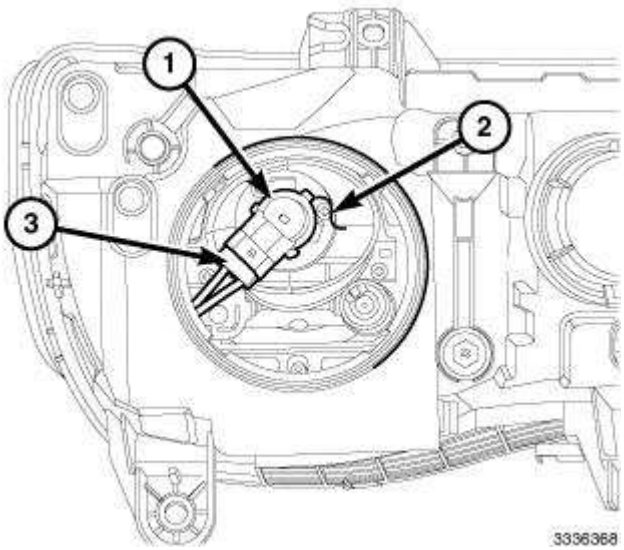

Fig. 71: Bulb Base & Reflector
Courtesy of CHRYSLER GROUP, LLC

1. Position the headlamp bulb (1) close enough to the back of the front lamp unit housing to access and reconnect the lamp wire harness connector (3) to the bulb connector receptacle.
2. Align the bulb with the keyed opening on the back of the front lamp unit reflector (2).
3. Insert the bulb into the reflector opening until the base is firmly seated.
4. Rotate the base clockwise about 30 degrees to lock it into place.

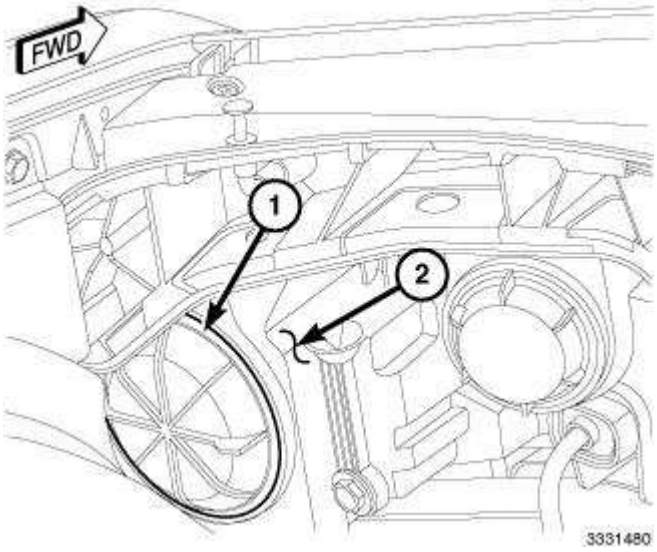

Fig. 72: Front Lamp Unit Housing & Headlamp Bulb Access Cover

There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

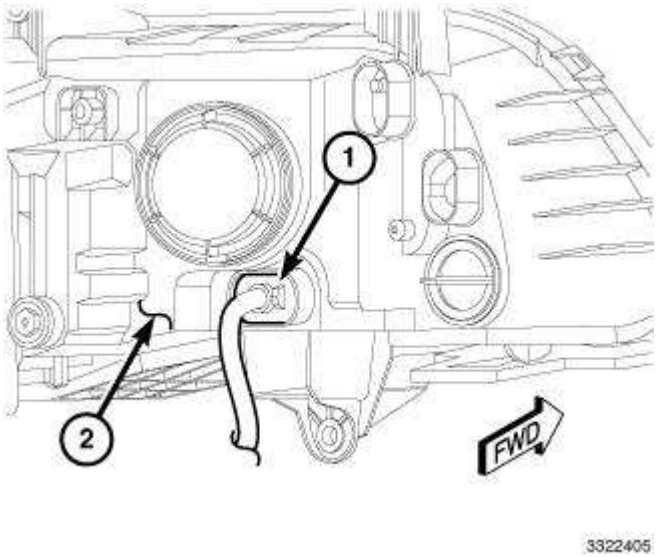

Fig. 73: Lamp & FEM Wire Harness Connection
Courtesy of CHRYSLER GROUP, LLC

1. Position the front lamp unit (2) close enough to the front of the vehicle to reconnect the Front End Module (FEM) wire harness connections (1) to the back of the lamp housing.

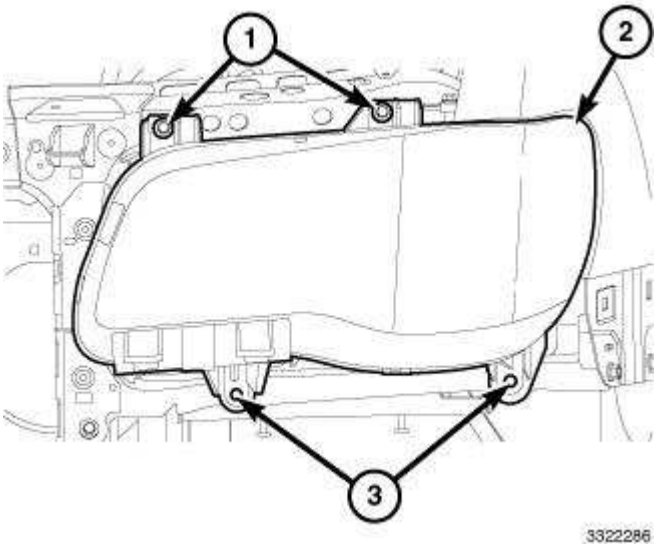

Fig. 74: Four Screws & Two Upper Front Lamp Unit
Courtesy of CHRYSLER GROUP, LLC

2. Position the lamp (2) to the FEM support structure on the front of the vehicle.
3. Install and tighten the four screws (1 and 3) that secure the two lower and the two upper mounting brackets integral to the lamp housing to the FEM. Tighten the screws securely.
4. Reinstall the fascia onto the FEM. Refer to **FASCIA, FRONT, INSTALLATION** .
5. Reconnect the battery negative cable.
6. Confirm proper headlamp alignment. Refer to **STANDARD PROCEDURE**.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Always use the correct lighting element size and type for replacement. An incorrect size or type may overheat and cause damage to the lamp or the lamp wiring.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.

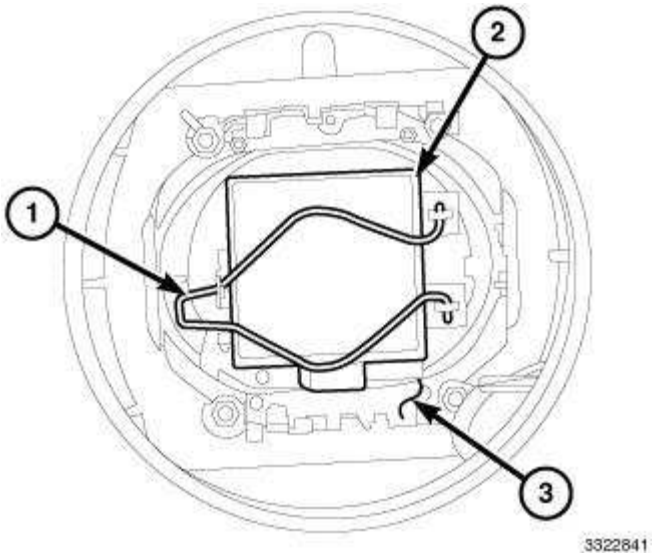

Fig. 75: Wire Retainer Clip, HID Igniter & Front Lamp Unit Reflector
Courtesy of CHRYSLER GROUP, LLC

1. Align and insert the High Intensity Discharge (HID) igniter (2) and lighting element unit straight into the opening in the front lamp unit reflector (3) as a unit.
2. Press the igniter firmly and evenly toward the reflector until the base is firmly seated.
3. Insert the HID igniter into the headlamp reflector. Be sure the igniter is fully seated in the reflector.
4. Pivot the wire retainer clip (1) back over the igniter and engage it under the hook on the back of the reflector.

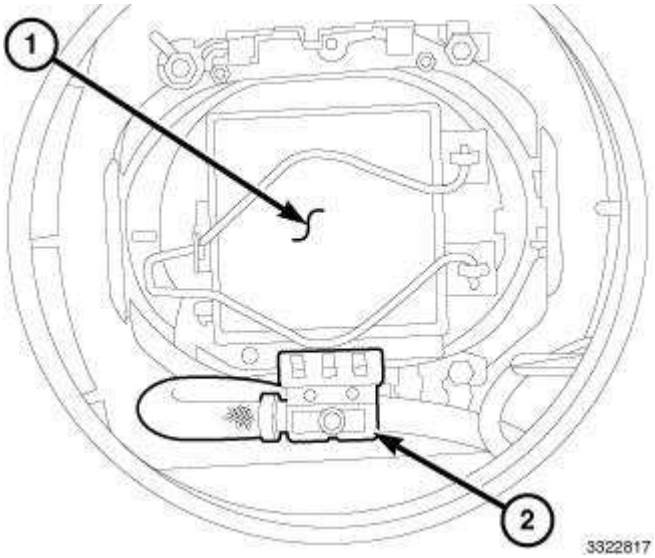

Fig. 76: High Tension Cable Wire Harness Connector & HID Igniter
Courtesy of CHRYSLER GROUP, LLC

5. Reconnect the high tension cable connector (2) to the connector receptacle integral to the lower edge of the igniter (1) housing.

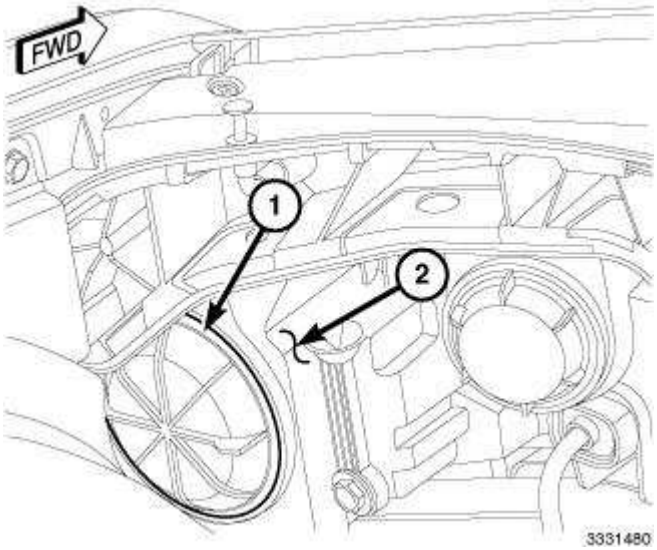

Fig. 77: Front Lamp Unit Housing & Headlamp Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

6. Position the access cover (1) onto the outboard back of the front lamp unit housing (2) and rotate it clockwise about 30 degrees to lock it into place.
7. For the left hand side only, position the engine air cleaner assembly to the Front End Module (FEM) structural support and reinstall the fastener that secures the air cleaner assembly.
8. Reconnect the battery negative cable.

REMINDER INDICATOR RESET PROCEDURES

Chrysler / Dodge / Plymouth / RAM - 1978-14

ASSYST MAINTENANCE COMPUTER

NOTE: **To determine the appropriate reset procedure, refer to ASSYST MAINTENANCE COMPUTER RESET INDEX. Only vehicles listed in this index have an ASSYST Maintenance Computer reset.**

ASSYST MAINTENANCE COMPUTER RESET INDEX

Model & Year	Reset Procedure
Sprinter	
2003-09	Assyst Maintenance Computer Reset - Procedure 1

ASSYST MAINTENANCE COMPUTER RESET - PROCEDURE 1

When a service as been performed, the ASSYST maintenance computer can be reset as follow:

1. Turn the key to position 2 in the ignition lock and immediately press the "mi" ("km") button twice and hold. Keep the "mi" ("km") button pressed.
2. Within 10 seconds, return the key to position 0 in the ignition lock.
3. Continue to press and hold the "mi" ("km") button. Turn the key to position 2 in the ignition lock. Keep the "mi" ("km") button pressed.
4. The maintenance indicator with the current remaining time/distance is shown.
5. After about 10 seconds, an acoustic signal will sound and the maintenance indicator is displayed with the new remaining time/distance.
6. Release the "mi" ("km") button.

EGR/MAINTENANCE REQUIRED WARNING LIGHT

NOTE: **To determine the appropriate reset procedure, refer to EGR/MAINTENANCE REQUIRED WARNING LIGHT RESET INDEX. Only vehicles listed in this index have an EGR/Maintenance Required Warning Light reset.**

EGR/MAINTENANCE REQUIRED WARNING LIGHT RESET INDEX

Model & Year	Reset Procedure
Colt & Colt Vista	
1978-94	EGR/Maintenance Required Warning Light Reset - Procedure 1
Ram-50	
1985-93	EGR/Maintenance Required Warning Light Reset - Procedure 1

EGR/MAINTENANCE REQUIRED WARNING LIGHT RESET - PROCEDURE 1

1. On some models, an EGR or MAINTENANCE REQUIRED warning light in dash will come on as a reminder to have EGR system serviced (each 50,000 miles), oxygen sensor replaced (each 80,000 miles), or evaporative carbon canister replaced (100,000 miles).
2. After servicing or replacing components, reset mileage counter. Reset switch is located on back of instrument cluster. See **Fig. 1**, **Fig. 2** and **Fig. 3** . Slide switch to opposite side to reset indicator light.
3. Remove light bulb after 120,000 mile service on Ram-50.

EMR MILEAGE RESET

NOTE: To determine the appropriate reset procedure, refer to EMR MILEAGE RESET INDEX. Only vehicles listed in this index have a EMR mileage reset.

EMR MILEAGE RESET INDEX

Model & Year	Reset Procedure
Light Duty Trucks & Vans	
1989-92	EMR Mileage Reset - Procedure 1

EMR MILEAGE RESET - PROCEDURE 1

1. Using DRB-II tester, select EMR MEMORY CHECK. DRB-II display will read, EMR MEMORY CHECK ARE YOU SURE? Press YES key.
2. Display will read, WRITE TEST. Display will read, IS INSTRUMENT PANEL MILEAGE BETWEEN XXXXXX AND XXXXXX? If odometer mileage on vehicle is within specification, press YES key. DRB-II will display EMR MEMORY CHECK TEST COMPLETE.

NOTE: DRB-II may display EMR MEMORY WRITE FAILURE or EMR MEMORY CHECK WRITE REFUSED if there is a problem with SMEC/SBEC.

3. If odometer mileage on vehicle is not within specification shown on DRB-II, press NO key. DRB-II will read DO YOU WANT TO CORRECT EMR MILEAGE? Press YES key on DRB-II. DRB-II will display ENTER MILEAGE SHOWN ON INSTRUMENT PANEL.
4. Enter mileage shown on instrument panel. DO NOT enter tenths. Press ENTER key on DRB-II. DRB-II will ask for verification of entry. If mileage entry was correct, DRB-II will display SETTING ENGINE DATA and EMR MEMORY CHECK TEST COMPLETE. Vehicle must be driven for at least 8 miles for mileage reset to be accepted.

MAINT REQD OR CHECK EGR INDICATOR LIGHT

CAUTION: There is no test procedure for this system. Any attempt to test this system will damage system components.

NOTE: To determine the appropriate reset procedure, refer to MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET INDEX. Only vehicles listed in this index have a MAINT REQD OR CHECK EGR INDICATOR LIGHT reset.

MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET INDEX

FWD Vans	
1987-88	Maint REQD Or Check EGR Indicator Light Reset - Procedure 1
Light Duty Trucks	
1988	Maint REQD Or Check EGR Indicator Light Reset - Procedure 1
1989-92	Maint REQD Or Check EGR Indicator Light Reset - Procedure 2
RWD Vans	
1988	Maint REQD Or Check EGR Indicator Light Reset - Procedure 1
1989-92	Maint REQD Or Check EGR Indicator Light Reset - Procedure 2

MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET - PROCEDURE 1

The Service Reminder Indicator (SRI) module is not an emissions warning system. It is only a reminder to perform emissions servicing. Components to be serviced include the EGR system, PCV valve, oxygen sensor, delay valves, and bi-level purge valve.

The SRI module will illuminate the MAINT REQD or CHECK EGR light after a predetermined time. The light will remain on until the SRI module is reset by inserting a small screwdriver into the hole in the module (RWD only) and/or depressing the reset switch (FWD and RWD). Replace 9-volt battery (if equipped).

The SRI module is located on steering column, behind instrument panel on RWD vans and in instrument cluster, under fuel gauge, on FWD vans. See **Fig. 4** or **Fig. 5** . On light trucks except Dakota, SRI module is located behind the far right side of dash panel next to glove box. See **Fig. 6**. On Dakota models, module is located on bracket below headlight switch, on rear of instrument panel. See **Fig. 7**.

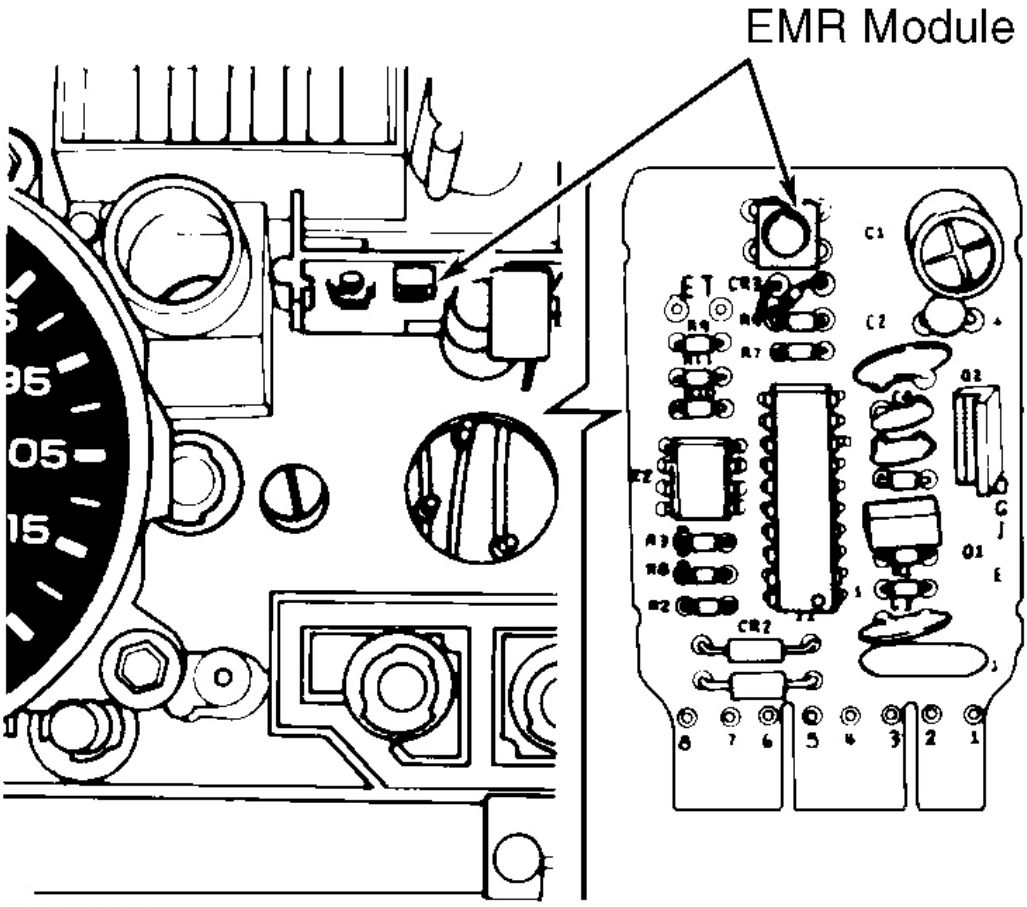

Fig. 4: Locating SRI Module (1987-88 FWD Vans)

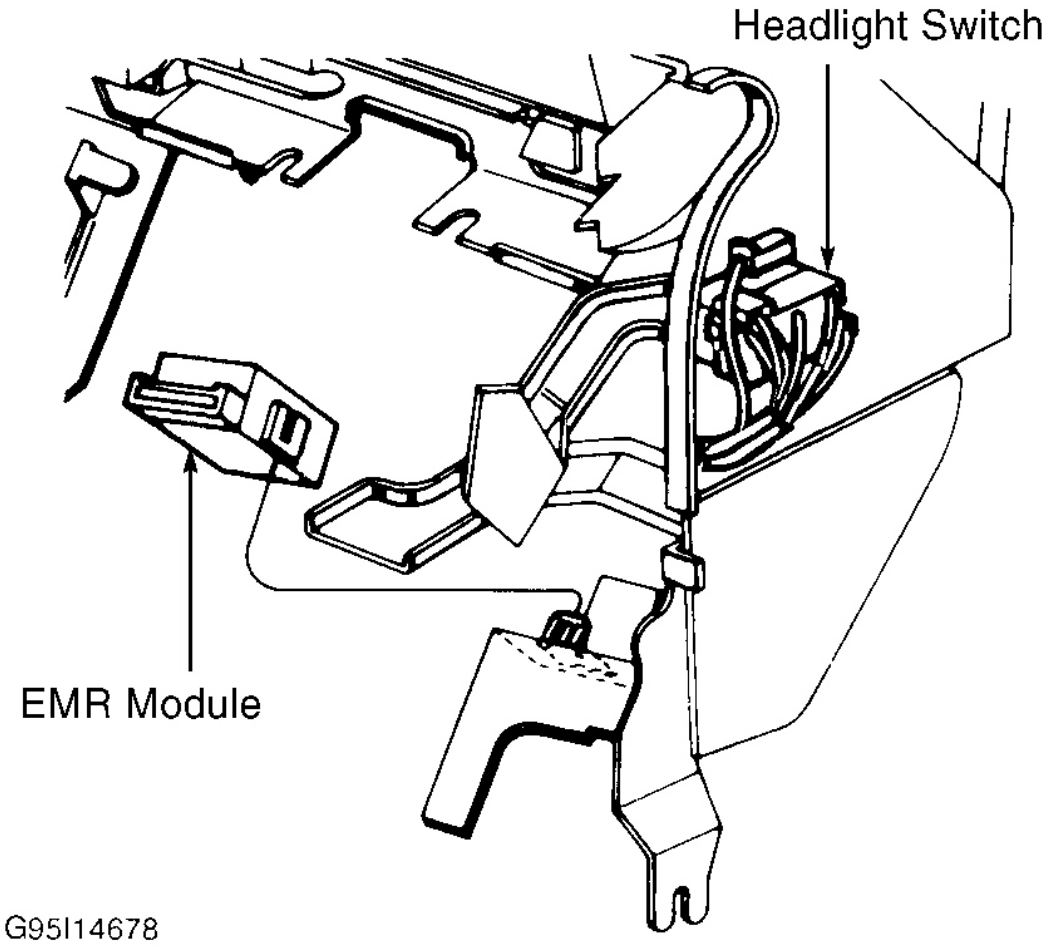

Fig. 7: Locating SRI Module (1988 Dakota)
Courtesy of CHRYSLER CORP.

MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET - PROCEDURE 2

NOTE: If any other scan tool is used, use scan tool manufacturer's instructions.

Attach DRB-II tester to diagnostic connector. Turn ignition on but do not start engine. Access SELECT SYSTEMS function of DRB-II tester. Select appropriate engine. Select with or without A/C. Select FUEL & IGNITION. Select ADJUSTMENTS. Select RESET EMR LIGHT. Reset EMR light. When DRB-II is finished resetting light, DRB-II display will read EMR LIGHT IS RESET.

NOTE: If Single Module Engine Controller (SMEC) or Single Board Engine Controller (SBEC) is replaced, vehicle mileage must be programmed back into the SMEC/SBEC. DRB-II tester MUST be used for this procedure. If the following procedure is not performed, EMR light will not turn on at the proper mileage

intervals.

MAINT REQD OR SERVICE REMINDER INDICATOR (SRI) LIGHT

The components to be serviced include the EGR system, PCV valve, oxygen sensor and some vacuum-operated components. SRI will illuminate after a predetermined mileage. To reset SRI, a Chrysler Diagnostic Readout Box (DRB) Tester or suitable scan tool is required.

NOTE: To determine the appropriate reset procedure, refer to MAINT REQD OR SRI LIGHT RESET INDEX. Only vehicles listed in this index have a MAINT REQD OR SRI LIGHT reset.

MAINT REQD OR SRI LIGHT RESET INDEX

Model & Year	Reset Procedure
Light Duty Trucks & Vans	
1993	Maint REQD Or SRI Light Reset - Procedure 1
Ram Pickup 2500/3500	
1994-02	Maint REQD Or SRI Light Reset - Procedure 2

MAINT REQD OR SRI LIGHT RESET - PROCEDURE 1

1. Attach DRB tester to diagnostic connector. Turn ignition on, but do not start engine. Using DRB, perform Service Reminder Indicator (SRI) memory test. If DRB displays WRITE FAILURE, replace Powertrain Control Module (PCM).
2. If DRB displays WRITE REFUSED, go to step 4. If DRB displays SRI MILEAGE INVALID, update mileage and retest SRI memory. If DRB does not display SRI MILEAGE INVALID, compare SRI mileage stored with instrument panel odometer.
3. If mileage is same, retest SRI memory. If mileage is not same, update mileage and retest SRI memory.
4. PCM was busy. Using DRB, perform SRI memory test. Retest SRI memory 2 or more times, if necessary. If WRITE REFUSED trouble code returns, replace PCM. If WRITE REFUSED does not return, procedure is complete.

MAINT REQD OR SRI LIGHT RESET - PROCEDURE 2

The components to be serviced include the EGR system, PCV valve, and oxygen sensor. The SRI or Maintenance Required will illuminate after a predetermined mileage. To reset the light, a Chrysler Diagnostic Readout Box (DRB) Tester or suitable scan tool is required. Follow scan tool manufacturer's information to reset SRI.

OIL CHANGE REQUIRED MESSAGE

OIL CHANGE REQUIRED MESSAGE RESET - PROCEDURE 1

NOTE: The message can be temporarily turned off by pressing and releasing the Trip Odometer button in instrument cluster.

To reset oil change indicator after performing scheduled maintenance:

1. Turn ignition on, with engine off.

   NOTE: On vehicles with keyless START, without pressing the brake pedal, push the ENGINE START/STOP button and cycle the ignition to the ON/RUN position (Do not start the engine).

2. Fully depress accelerator pedal slowly 3 times within 10 seconds.
3. Turn ignition off.

   NOTE: On vehicles with keyless START, without pressing the brake pedal, push the ENGINE START/STOP button once to return the ignition to the OFF/LOCK position.

4. Start engine. If indicator message illuminates when engine is started, repeat reset procedure.

PERFORM SERVICE MESSAGE

NOTE: To determine the appropriate reset procedure, refer to PERFORM SERVICE MESSAGE RESET INDEX. Only vehicles listed in this index have a perform service message reset.

PERFORM SERVICE MESSAGE RESET INDEX

Model & Year	Reset Procedure
300M	
2001-04	**Perform Service Message Reset - Procedure 1**
Caravan & Grand Caravan	
2003-07	**Perform Service Message Reset - Procedure 2**

2001	**Perform Service Message Reset - Procedure 1**
Dodge Pickup 1500	
2002	**Perform Service Message Reset - Procedure 3**
Town & Country	
2003-07	**Perform Service Message Reset - Procedure 4**

PERFORM SERVICE MESSAGE RESET - PROCEDURE 1

The PERFORM SERVICE message is a warning message delivered from the Electronic Vehicle Information Center (EVIC). This indicates that regular maintenance is due. After regular required maintenance is performed, the counter is reset by pressing and holding the reset button for 3 seconds.

PERFORM SERVICE MESSAGE RESET - PROCEDURE 2

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.
2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last pervious message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

PERFORM SERVICE MESSAGE RESET - PROCEDURE 3

The Vehicle Information Center (VIC) displays a PERFORM SERVICE message. PERFORM SERVICE message is displayed when "miles/kms" to service is zero, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by pressing the STEP button when in this display will select "Yes" or "No".

PERFORM SERVICE MESSAGE RESET - PROCEDURE 4

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and

maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.

2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last pervious message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

SERVICE REMINDER INDICATOR LIGHT

NOTE: To determine the appropriate reset procedure, refer to SERVICE REMINDER INDICATOR LIGHT RESET INDEX. Only vehicles listed in this index have a service reminder indicator light reset.

SERVICE REMINDER INDICATOR LIGHT RESET INDEX

Model & Year	Reset Procedure
Models With Electronic Type Counter	
1980	Service Reminder Indicator Light Reset - Procedure 1
Monaco	
1990-92	Service Reminder Indicator Light Reset - Procedure 2

SERVICE REMINDER INDICATOR LIGHT RESET - PROCEDURE 1

A mileage counter activates the service reminder indicator between 12,000 and 30,000 mile intervals, depending on whether mechanical or electronic type is used. On 1987 Dakota models, mileage counter in the odometer will illuminate reminder light at 52,500, 82,500 and 105,000 miles.

The electronic type uses a 9-volt battery which supplies power to the electronic counter, preventing memory loss when vehicle battery is disconnected.

NOTE: Vehicle battery must be connected during resetting procedure to prevent power loss to memory.

To reset electronic type, locate Green, Red, White or Tan plastic case behind instrument panel in lower left cluster area. Slide case from bracket and open cover. Remove 9-volt battery, and insert a small rod or screwdriver into hole in switch, closing contacts. Replace battery with a new 9-volt alkaline type. Close case. Slide case back into bracket. See **Fig. 8**.

NOTE: **Some models use a non-resettable mileage counter. Replace it with a resettable type.**

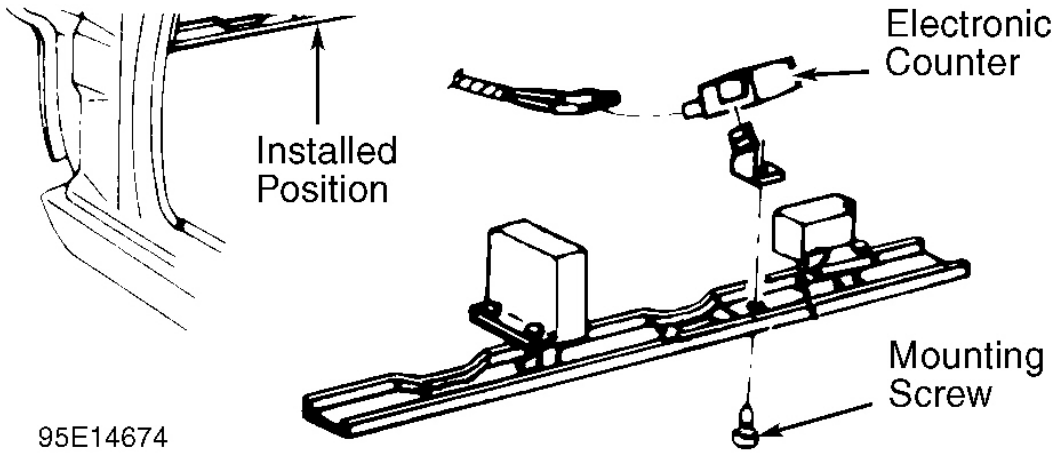

Fig. 8: Chrysler Electronic Type Reset Switch
Courtesy of CHRYSLER CORP.

SERVICE REMINDER INDICATOR LIGHT RESET - PROCEDURE 2

Every 7500 miles, a Vehicle Maintenance Monitor (VMM) will illuminate a SERVICE interval reminder indicator light. This indicates regular maintenance is due. After required service is performed, press RESET button on dash below VMM display. Hold button until a beep is heard. VMM display will now be clear.

SERVICE REMINDER MESSAGE

NOTE: **To determine the appropriate reset procedure, refer to SERVICE REMINDER MESSAGE RESET INDEX. Only vehicles listed in this index have a Service Reminder Message reset.**

SERVICE REMINDER MESSAGE RESET INDEX

Model & Year	Reset Procedure

New Yorker	
1988-89	Service Reminder Message Reset - Procedure 1
1990	Service Reminder Message Reset - Procedure 2

SERVICE REMINDER MESSAGE RESET - PROCEDURE 1

Every 7500 miles or 12 months which ever comes first, a service reminder message on Electronic Vehicle Information Center (EVIC) display will illuminate, indicating an oil change is due. The EVIC is an optional accessory located in the overhead console.

Pressing INFO button with the ignition on will activate a MONITORED SYSTEMS OK message on the display if all systems are operating properly. If service is required, SERVICE REMINDER message will be displayed. Pressing the RESET button after message has been displayed will clear the message.

SERVICE REMINDER MESSAGE RESET - PROCEDURE 2

Every 7500 miles or 12 months which ever comes first, a service reminder message on Electronic Vehicle Information Center (EVIC) display will illuminate, indicating an oil change is due. The EVIC is an optional accessory located in the overhead console.

Pressing INFO button with the ignition on will activate a MONITORED SYSTEMS OK message on the display if all systems are operating properly. If service is required, SERVICE REMINDER message will be displayed. To clear message, press INFO button and within 5 seconds, press SET button.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: To determine the appropriate reset procedure, refer to TPMS RESET INDEX. Only vehicles listed in this index have a TPMS reset.

2013-14	**TPMS Reset - Procedure 1**
(1) Some early Dodge/RAM Pickup 3500 and Cab & Chassis models may not be equipped with TPMS.	

TPMS RESET - PROCEDURE 1

NOTE: In a low tire pressure siuation, the TPMS indicator light (and message) will turn OFF only after the tires are inflated to the vehicles recommended cold placard pressure value. The vehicle may need to be driven for up to 20 minutes above 20 mph (32 km/h) in order for the TPMS to determine that the inflation pressures are correct.

Once a sensor has been replaced and vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

NOTE: The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location (Left Front, Left Rear, Right Front, and Right Rear). Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

TPMS RESET - PROCEDURE 2

TPMS Indicator Reset

Once a sensor has been replaced and vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

Tire Sensors Programming

WARNING: In the following procedure, Relearn Magnet (8821) is used. Death or serious injury can occur if magnetically sensitive devices are exposed to the retraining magnet used in the TPM system. Magnets can affect pacemakers.

NOTE: If a tire is changed (tire rotation), one or more tire pressure sensors fail, or if TPM module is replaced, the TPM system needs to relearn tire pressure sensor IDs. To perform this procedure, a Chrysler DRB-III® scan tool and a Relearn Magnet (8821) must be used.

NOTE: **The vehicle's tires must not have been rotated above 5 mph (8 km/h) in the last 2 minutes prior to programming.**

1. Connect Chrysler DRB-III® scan tool to vehicle's Data Link Connector (DLC), which is located beneath instrument panel, near steering column.
2. Using scan tool, access "CHASSIS SYSTEM".
3. Once in "CHASSIS SYSTEM", select "MISCELLANEOUS FUNCTIONS".
4. Select "TRAIN ALL MODE" from the menu selections. Select "YES" to continue.
5. Place Relearn Magnet (8821) over the valve stem for the left front wheel.
6. Each sensor/transmitter will automatically sense the presence of the magnet and begin transmitting. When the tire pressure sensor on each wheel has been programmed, the DRB-III® will automatically beep and direct you to the next wheel to be programmed. Move the magnet to each of the remaining wheels as directed by scan tool.
7. Remove magnet from last tire to be programmed (left rear wheel).
8. Once "TRAINING COMPLETED" is displayed, exit the program function screen and use the following to verify TPM functionality:
    - Verify TPM module programming is complete by viewing the "INPUT/OUTPUT DISPLAY" selection of the DRB-III® and confirming the tire pressure sensors are trained.
    - Verify TPM module programming is complete by viewing the "SENSOR DISPLAY" selection of the DRB-III® and confirming the tire pressure sensor pressure readings are accurate.

TPMS RESET - PROCEDURE 3

NOTE: **If a tire is changed (tire rotation), one or more tire pressure sensors fail, or if TPM module is replaced, the TPM system needs to relearn tire pressure sensor IDs. The procedure is similar to Tire Sensors Programming in TPMS RESET - PROCEDURE 2.**

When tire pressure is low, the "Low Tire" Pressure Indicator Lamp signal circuit will be pulsed to ground by the TPM module for two seconds on and then two seconds off, over and over. The BCM will then illuminate the "Low Tire" Pressure Indicator Lamp at the same rate and sound the audible chime as one single long tone.

When tire pressure is critical, the low tire pressure warning lamp signal circuit will be pulsed to ground by the low tire pressure warning module for one second on and then one second off, over and over. The BCM will then illuminate the "Low Tire" Pressure Indicator Lamp and sound the audible chime at the rate of one second on and one second off.

In either case, the TPM module will continue to pulse to ground the "Low Tire" Pressure Indicator Lamp signal circuit until the sensor/transmitter(s) transmits a pressure above the calibrated thresholds (and car is then driven above 20 mph (32 km/h)) or the ignition is turned off. If the conditions has not been corrected when the ignition is turned off, the indicator lamp will remain off when the ignition is turned on again until the vehicle reaches a speed of approximately 20 mph (32

km/h).

NOTE: In the event a diagnostic trouble code (DTC) is set, the "Low Tire" Pressure Indicator Lamp will illuminate continuously until the ignition is turned off. A low tire pressure condition cannot set a diagnostic trouble code (DTC).

TPMS RESET - PROCEDURE 4

The TPMS will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

NOTE: If a tire pressure sensor has been replaced, the TPM system needs to relearn tire pressure sensor IDs.

Wireless Control Module (WCM): The WCM automatically learns and stores new sensor IDs while driving "within 10-20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more then 20 minutes.

A new sensor ID can also be programmed directly into the WCM by using an RKE-TPM Analyzer in conjunction with a Scan Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (Left Front, Left Rear, Right Front, and Right Rear) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool"

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPMS RESET - PROCEDURE 5

There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does indicate which tire is low. Sensor types are the Tire Pressure Monitoring (TPM) module for the 2500/3500 series, or the Wireless Ignition Node (WIN) for the 1500 series.

Base Tire Pressure Monitoring System:

The TPMS will not turn off the indicator lamp until the tire pressure is at or above specified tire pressure. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

Premium Tire Pressure Monitoring System:

If the TPMS detects that the tire pressure in any road tire is going low, a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value (s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the specified tire pressure, and the TPM module receives

a valid transmission from the sensor the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System" text message will be displayed in the instrument cluster, and the tire pressure graphic display will display "- -" in place of the pressure value. After the flash sequence the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

Base and Premium Systems:

NOTE: If a tire pressure sensor has been replaced, the TPM system needs to relearn tire pressure sensor IDs.

The WIN or TPM automatically learns and stores the sensor IDs while driving "within 10-20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate after the vehicle has been stopped for more than 20 minutes.

A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).

NOTE: The matching full size spare wheel and tire assembly (if equipped) has a TPM sensor. The spare can be used in place of any of the four road tires. The TPMS will only monitor the pressure in the full size spare when it is used in place of a road tire. Otherwise, a spare with pressure below the low-pressure limit will not cause the TPMS indicator light to illuminate or the chime to sound.

TPMS RESET - PROCEDURE 6

NOTE: If tires have been rotated or a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. Refer to the following procedure to program the module for identification of one new or all tire pressure sensor/transmitters.

NOTE: The vehicle's tires must not have been rotated above 5 mph (8 km/h) in the last two minutes prior to programming.

1. Connect a DRBIII® scan tool to the vehicle's diagnostic connector beneath the instrument panel, to the right of the steering column.
2. Access the Chassis System using the DRBIII.
3. Once in the Chassis System, select Tire Pressure Monitor, followed by Miscellaneous.
4. Select the appropriate function from the next screen displaying the following options:
    - Program LF Pressure Sensor
    - Program RF Pressure Sensor

- Program RR Pressure Sensor
- Program LR Pressure Sensor
- Program Module (4 Sensors)
- Monitor

5. Place a magnet (or special tool 8821), at the valve stem for that wheel as directed by the DRBIII. If the Program Module function has been chosen, the DRBIII will direct you to the left front wheel pressure sensor/transmitter first.

NOTE: **When programming the module (all four sensor/transmitters), the magnet should be moved from wheel to wheel in a clockwise direction starting at the left front wheel.**

6. When that wheels pressure sensor/transmitter has been programmed, the DRBIII will display Program Transmitter Complete or will automatically direct you to the next wheel sensor/transmitter to be programmed.
7. Remove the magnet and if programming the entire module, move the magnet to each of the remaining wheels as directed by the DRBIII. Each sensor/transmitter will automatically sense the presence of the magnet and begin programming.
8. Once Program Transmitter Complete is displayed, exit the program function screen.
9. Verify that the module programming is complete by looking at the tire pressure sensor/transmitter ID's in the Sensor Display using the DRBIII.

ACCESSORIES AND EQUIPMENT

Message Center - Service Information - Chrysler 300

CENTER, ELECTRONIC VEHICLE INFORMATION

DESCRIPTION

DESCRIPTION

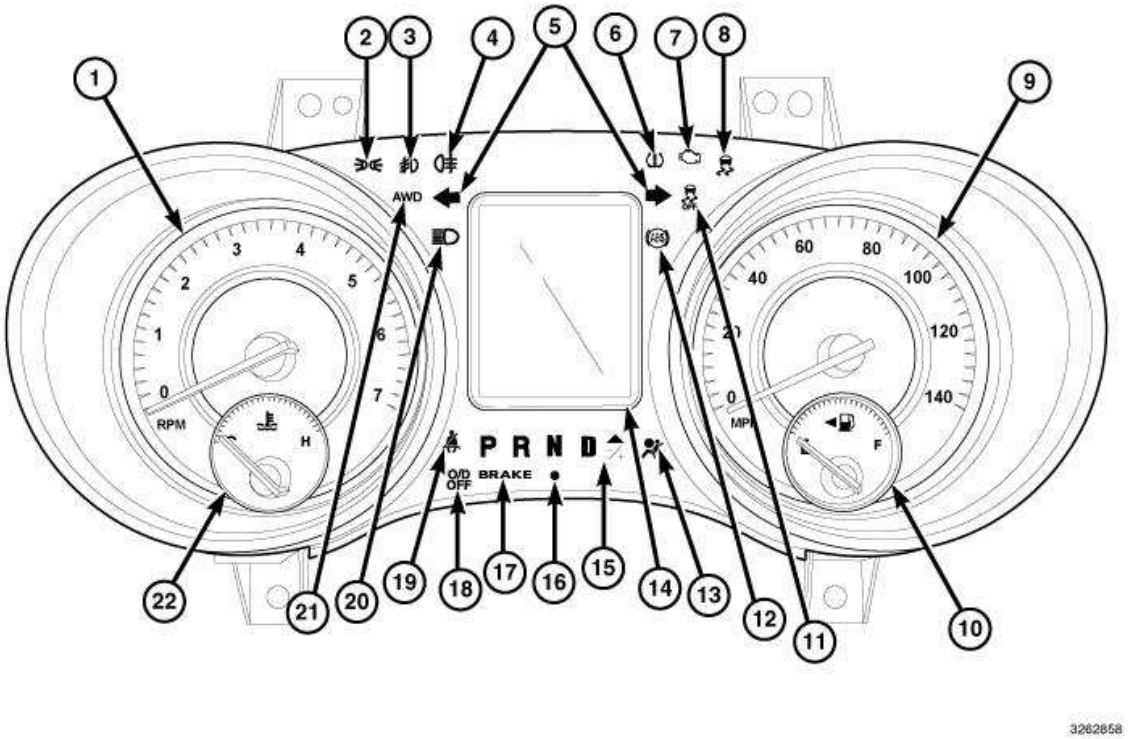

Fig. 1: Identifying Electronic Vehicle Information Center (EVIC) Components
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display (14). The display is a Liquid Crystal Display (LCD), and is located directly in the center of the Instrument Cluster (IC) between the two gauge pods.

The EVIC displays many textual messages for vehicle systems support as well as your more common vehicle features, and options. These features and options include: Odometer (ODO), Trip A and Trip B odometer readouts, PRNDL, and compass heading, and ambient temperature readouts. The EVIC function buttons; located on the left spoke of the steering wheel can be used to scroll through the different features.

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster (IC)

- Ambient Temperature Sensor
- Remote Compass Module (RCM)
- Body Control Module (BCM)
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative the complete Instrument Cluster assembly must be replaced. Refer to **REMOVAL** .

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the "ON" position. When the ignition switch is turned to the "ON" position, the EVIC display will return to the last function being displayed before the ignition was turned to the "OFF" position.

The EVIC system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Buses. **If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system.**

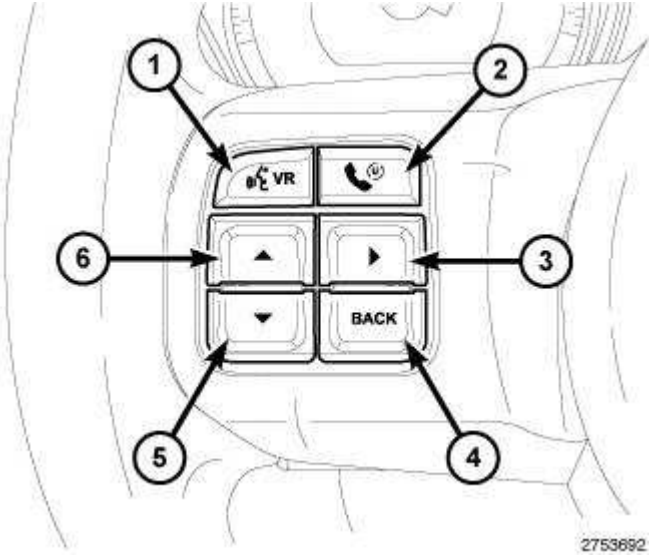

Fig. 2: EVIC SWITCHES
Courtesy of CHRYSLER GROUP, LLC

The EVIC function buttons are used to operate the different functions of the EVIC system. Pressing and releasing the **MENU** buttons (5 & 6) allows the driver to scroll though and select the Compass/Temperature, Trip Computer, Personal Settings or System Status functions. The **STEP** button (3) allows the selection of setting or resetting of the function currently displayed at that time.

Pressing and releasing the **BACK** button (4) will cause the EVIC to return to the main menu.

EVIC DISPLAY MODES

SYSTEM STATUS MODE

Displays warnings and user interaction messages. Initial warnings will be displayed accompanied by a series of audible beeps. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages by using the menu buttons.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime if the vehicle is driven more than 1 mile [1.6 km] with either turn signal on)
- Left Front Turn Signal Lamp Out (with a single chime)
- Left Rear Turn Signal Lamp Out (with a single chime)
- Right Front Turn Signal Lamp Out (with a single chime)
- Right Rear Turn Signal Lamp Out (with a single chime)
- Remote Keyless Entry (RKE) Battery Low (with a single chime)
- Low Fuel
- Cal (if equipped with a compass module)
- Oil Change Required (with a single chime)
- Low Washer Fluid
- Coolant Low
- Key in Ignition
- Lights On
- Exhaust Service Required - See Dealer Now (diesel models only)
- Exhaust System - Regeneration Required Now (diesel models only)

COMPASS/TEMPERATURE/TRIP COMPUTER

Compass heading and outside temperature are displayed on the Instrument Cluster (IC) Liquid Crystal Display (LCD) display. One of eight compass headings to indicate the direction the vehicle is facing (N, S, E, W, NE, NW, SE, SW) and one of 15 compass variance settings can be programmed. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit).

Press and release the **MENU** button until one of the following Trip Functions displays in the EVIC:

- Fuel Economy
- Trip Info
- Vehicle Speed

Press the **STEP** button to cycle through all the Trip Computer functions.

The Trip Functions mode displays the following information:

- **Average Fuel Economy** Displays the average fuel economy since the last reset. When the fuel economy is reset, the display will read "RESET" or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from the last fuel average reading before the reset.
- **Distance To Empty (DTE)** Displays the estimated distance that can be traveled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. DTE cannot be reset through the **RESET** button. When the DTE value is less than 30 miles (48 km) estimated driving distance, the DTE display will change to a text display of "LOW FUEL." This display will continue until the vehicle runs out of fuel. Adding a significant amount of fuel to the vehicle will turn off the "LOW FUEL" text and a new DTE value will display.
- **Elapsed Time** Displays the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.
- **Trip-A or Trip-B** Displays trip mileage accumulated since the last reset when the ignition switch is in the ON or ACC position.
- **Display Units of Measure in:** To make your selection, press and release the **RESET** button until "MPH" or "km/h" appears.

To Reset The Display Reset will only occur while a resettable function is being displayed. Press and release the **RESET** button once to clear the resettable function being displayed. To reset all resettable functions, press and release the **RESET** button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will display during this 3 second window).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) Data Bus circuit. The EVIC will not function properly if the bus messages from any of these components is not received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the Instrument Cluster functions and the Body Control Module (BCM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC and the CAN Data Bus circuit. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

MODULE, COMPASS

DESCRIPTION

DESCRIPTION

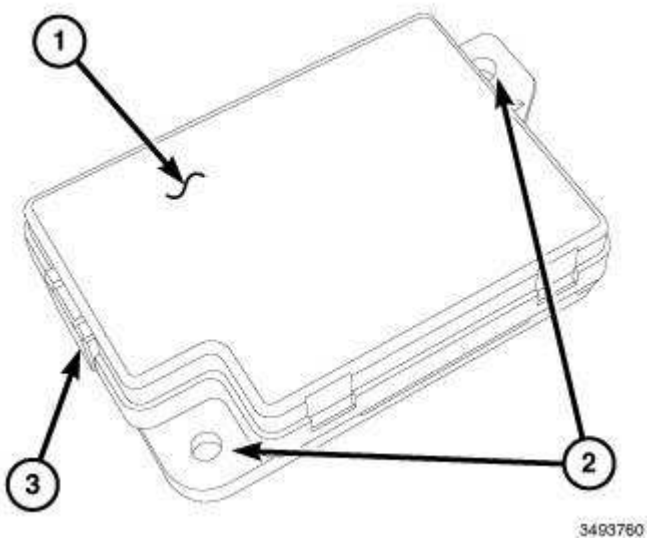

Fig. 3: Remote Compass Module (RCM), Mounting Tabs, And Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The Remote Compass Module (RCM) (1) is secured through two integral mounting tabs (2) to a mounting bracket that is secured to the upper center of the instrument panel support structure, behind the Integrated Center Stack (ICS) display module. A connector receptacle (3) integral to one side of the molded black plastic RCM housing is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The RCM cannot be repaired. If the module is ineffective or damaged, the entire unit must be replaced.

OPERATION

OPERATION

The Compass Temperature Display system uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the ON position. When the ignition switch is turned to the ON position, the display will return to the last function being displayed before the ignition was turned to the OFF position.

The Compass Temperature Display system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Bus circuits. If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system and related data buses.

STANDARD PROCEDURE

COMPASS VARIANCE ADJUSTMENT

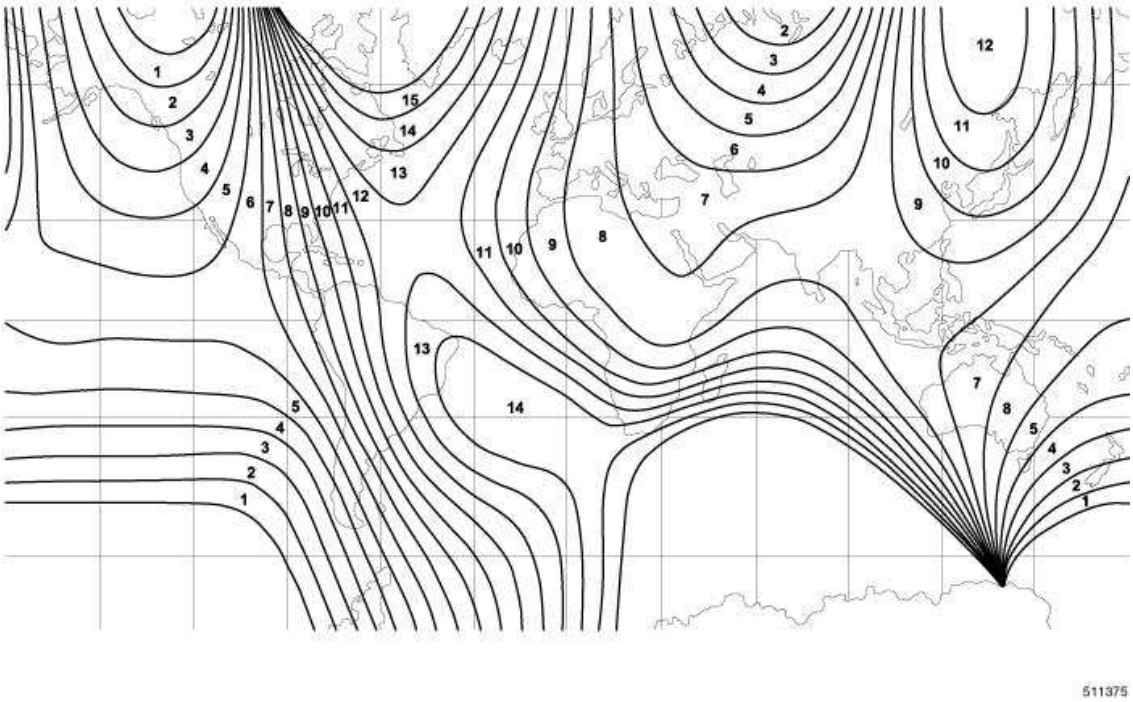

Fig. 4: Magnetic And Geographic North MAP
Courtesy of CHRYSLER GROUP, LLC

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance must be set.

NOTE: **If the vehicle is taken on long trips into a new variance zone the compass function may be effected. Compass variance will need to be updated to the new zone number to function properly.**

NOTE: **The default for the compass variance from the factory is 8.**

SET THE COMPASS VARIANCE MANUALLY AS FOLLOWS:

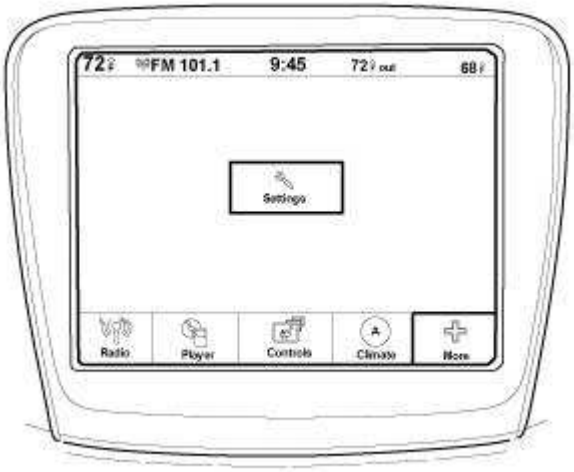

Fig. 5: U-Connect Touch Display (Settings)
Courtesy of CHRYSLER GROUP, LLC

1. Using the Variance Settings Map, find your geographic location and note the zone number.
2. Turn the ignition switch to the ON/RUN position.
3. Using the U-Connect Touch ™ screen, select **SETTINGS** either from the hard controls on the side of the screen, or from the menu selections at the bottom of the screen, depending on model.
4. Scroll through the menu, and select **COMPASS VARIANCE** .
5. Once selected, toggle through the zone numbers (1-15), until the zone number for your geographic location appears in the display. The zone number will set automatically.

NOTE: The default for the compass variance from the factory is 8. During programming, the Zone value will wrap around from Zone 15 to Zone 1.

6. Press the **BACK** button to return to the main menu.
7. Confirm that the correct direction is now indicated by the compass.

MANUAL COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the Remote Compass Module (RCM) located under the instrument panel center stack hood. Do not place any electronic devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the instrument panel as the RCM performance may be effected. Do not use magnetic tools when servicing the RCM.

NOTE: Confirmation that the proper variance zone is programmed, is recommended whenever manual compass calibration is performed, for the appropriate

procedure. Refer to MODULE, COMPASS, STANDARD PROCEDURE.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Electronic Vehicle Information Center (EVIC) displays "CAL", perform the following manual calibration procedure. Also, any time EVIC service replacement components are installed, they must be calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

NOTE: Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

CALIBRATE THE COMPASS MANUALLY AS FOLLOWS:

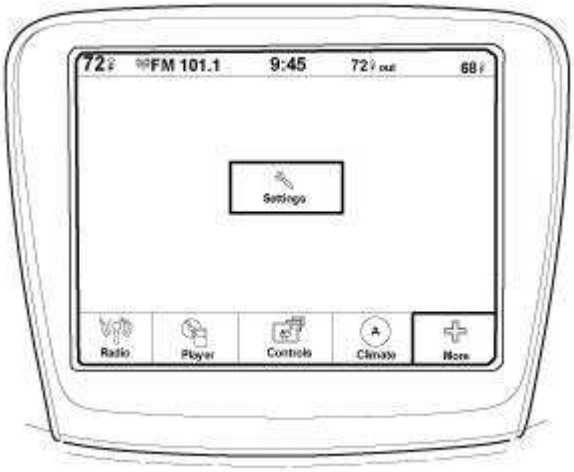

Fig. 6: U-Connect Touch Display (Settings)
Courtesy of CHRYSLER GROUP, LLC

1. Start the engine but leave the vehicle in "PARK".
2. Using the U-Connect Touch ™ screen, select **SETTINGS** either from the hard controls on the sides of the screen, or from the menu selections at the bottom of the screen, depending on model.
3. Scroll through the menu, and select **CALIBRATE COMPASS** .
4. Select **ON** , the "CAL" symbol will come on solid in the EVIC display next to the compass direction that is displayed.
5. Slowly drive the vehicle on a level surface, away from large metal objects and power lines, through one or two **complete** circles not exceeding 8 km/h (5 mph). The "CAL" message will disappear from the display to indicate successful compass calibration.

6. Confirm that the correct direction is now indicated by the compass.
7. Press the **BACK** button to return to the main menu.

NOTE: **If the compass display indicates an inaccurate compass heading or the display is locked up, the RCM (if equipped) may be inoperative and require replacement.**

NOTE: **If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the EVIC is inoperative. Attempt the calibration procedure at least one more time before performing EVIC diagnosis.**

NOTE: **If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the manual calibration procedure in another location.**

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

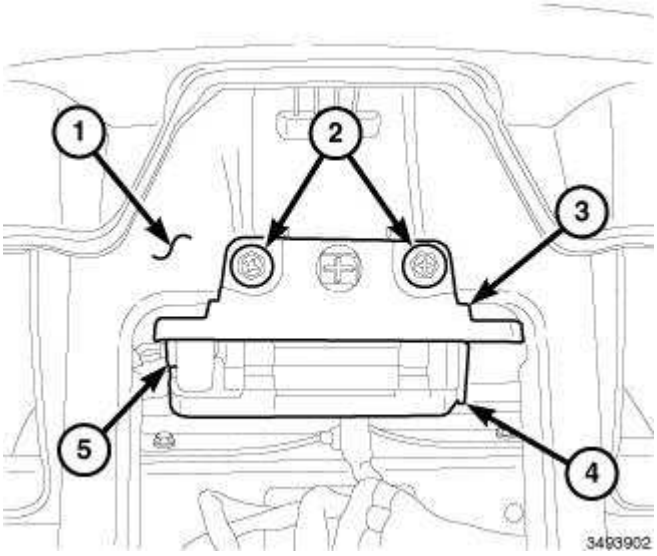

Fig. 7: Instrument Panel Structural Support, Screws, And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel from the instrument panel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL** .
3. Remove the two screws (2) that secure the Remote Compass Module (RCM) mounting bracket (3) near the top of the instrument panel structural support (1).
4. Pull the RCM (4) and mounting bracket out from the instrument panel structural support far enough to access and disconnect the instrument panel wire harness connector (5) from the RCM connector receptacle.
5. Remove the RCM and mounting bracket unit from the vehicle.

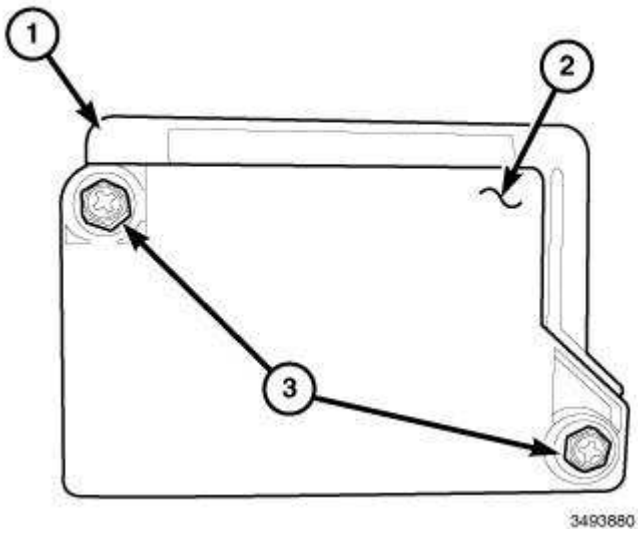

Fig. 8: RCM, Screws, And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two screws (3) that secure the RCM (2) to the mounting bracket (1).
7. Remove the RCM from the mounting bracket.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

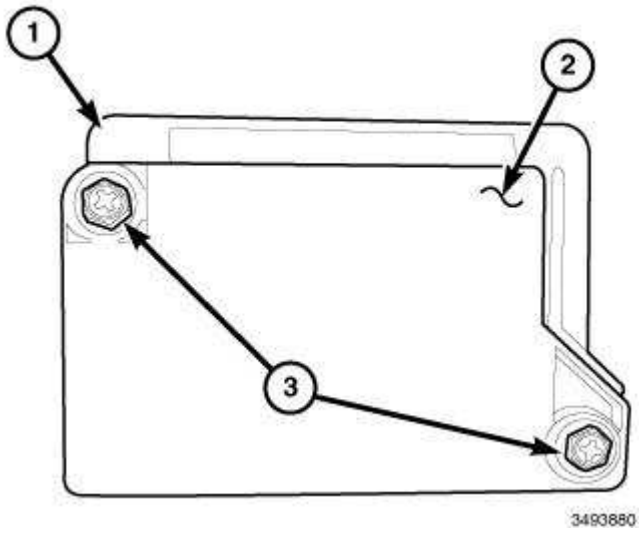

Fig. 9: RCM, Screws, And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the Remote Compass Module (RCM) (2) to the mounting bracket (1).
2. Install and tighten the two screws (3) that secure the RCM to the mounting bracket. Tighten the screws securely.

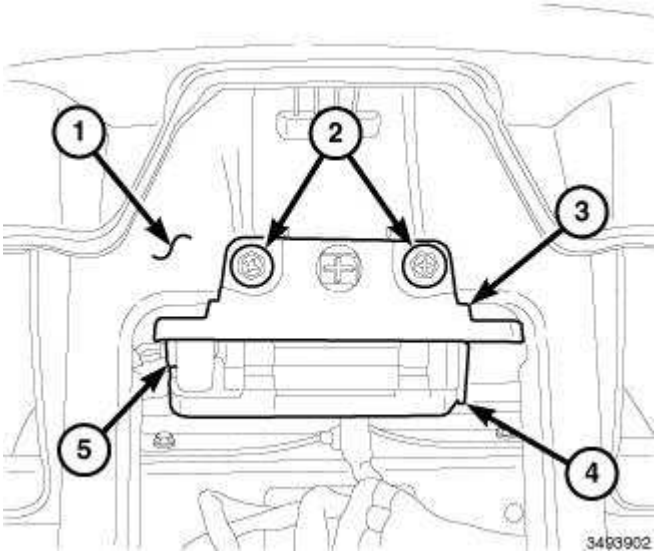

Fig. 10: Instrument Panel Structural Support, Screws, And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

3. Position the RCM (4) and mounting bracket (3) as a unit close enough to the top of the instrument panel structural support (1) to reconnect the instrument panel wire harness connector (5) to the RCM connector receptacle.
4. Position the RCM and mounting bracket unit to the structural support.
5. Install and tighten the two screws (2) that secure the RCM mounting bracket to the structural support. Tighten the screws securely.

6. Reinstall the center bezel onto the instrument panel. Refer to **BEZEL, INSTRUMENT PANEL, CENTER, INSTALLATION** .
7. Reconnect the battery negative cable.
8. Perform both the Manual Compass Calibration and the Compass Variance Adjustment standard procedures. Refer to **MODULE, COMPASS, STANDARD PROCEDURE**.
9. Verify proper compass operation.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

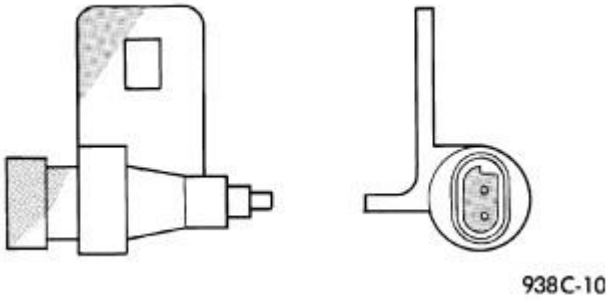

Fig. 11: Ambient Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient temperature sensor is a variable resistor type sensor. it is mounted to the front bumper beam behind the radiator grille and in front of the engine compartment.

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

OPERATION

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent by the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the BCM. Based upon the resistance in the sensor, the BCM senses a specific voltage on the temperature sensor signal circuit. The BCM then translates the voltage into a temperature reading that it sent over the Controller Area Network (CAN) data bus to other modules utilizing temperature information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR

The temperature function is supported by the ambient temperature sensor, a wiring circuit and the Body Control Module (BCM) (also known as the Common Body Controller/CBC). If any portion of the ambient temperature sensor circuit fails or if the Controller Area Network (CAN) data bus information is missing, a (- -) will appear in the Electronic Vehicle Information Center (EVIC) display in place of the temperature. When the sensor is exposed to temperatures above 55° C (130° F), or if the sensor circuit is shorted, 55° C (130° F) will appear in the EVIC display in place of the temperature. When the sensor is exposed to temperatures below - 40° C (- 40° F) or if the sensor circuit is open, - 40° C (- 40° F) will appear in the EVIC display.

NOTE: **The system displays the last known temperature when starting the vehicle and may take a minimum time or mileage to update to an accurate current reading, up to 5 minutes at a maintained speed above 40 mph (64.3 kph). Customers with very short commutes may not get an updated reading before their destination is reached, or if the ignition does not remain in the OFF status for more than 255 minutes (4hrs., 15min.). This strategy was intended to eliminate wildly fluctuating readings and may cause some customer confusion leading to unnecessary diagnosis and parts replacements.**

SENSOR TEST

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor harness connector.
2. Measure the resistance of the ambient temperature sensor. At - 40° C (- 40° F), the sensor resistance is 336 kilohms. At 55° C (130° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If OK, refer to **SENSOR CIRCUIT TEST**. If not OK, replace the inoperative ambient temperature sensor.

SENSOR CIRCUIT TEST

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

1. Transition the ignition switch to the OFF status. Disconnect and isolate the battery negative cable. Disconnect the wire harness connectors from the ambient temperature sensor and the BCM.
2. Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor harness connector.
3. Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the BCM harness connector. There should be continuity. If OK, go to 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.
4. Check for continuity between the ambient temperature sensor signal circuit cavity of the BCM harness connector and a good ground. There should be no continuity. If OK, test the EVIC operation. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION**. If not OK, repair the shorted ambient temperature sensor signal circuit as required.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .

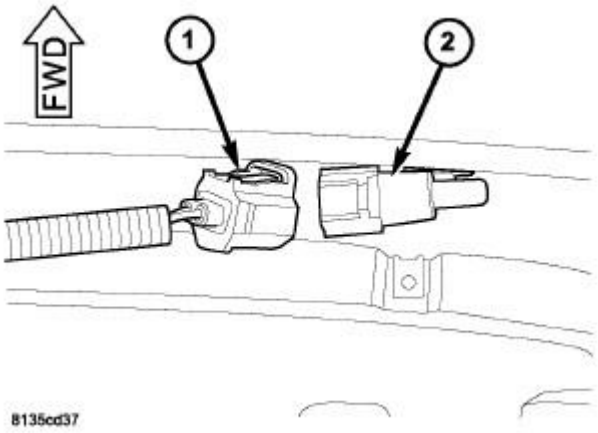

Fig. 12: Ambient Temperature Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector (1) from the ambient temperature sensor (2).

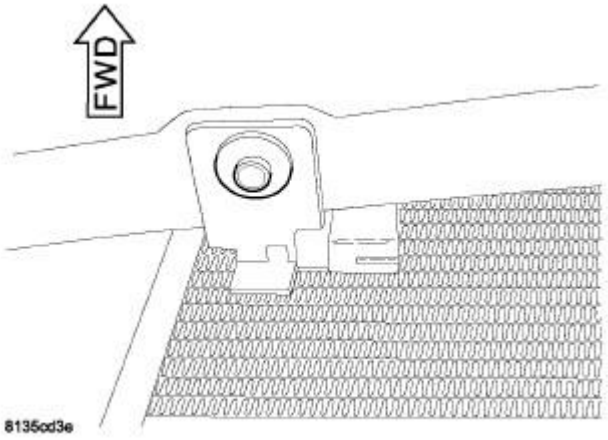

Fig. 13: Ambient Temperature Sensor Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Remove the fastener that secures the ambient temperature sensor bracket to the front bumper beam.
5. Remove the ambient temperature sensor from the vehicle.

INSTALLATION

INSTALLATION

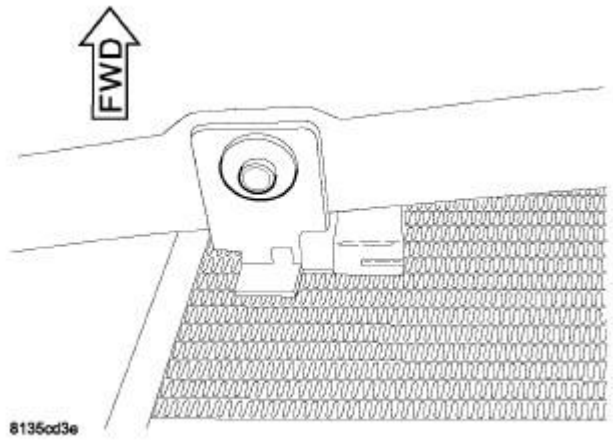

Fig. 14: Ambient Temperature Sensor Fastener
Courtesy of CHRYSLER GROUP, LLC

1. Position the ambient temperature sensor in the vehicle.
2. Install the fastener that secures the ambient temperature sensor to the front bumper beam.

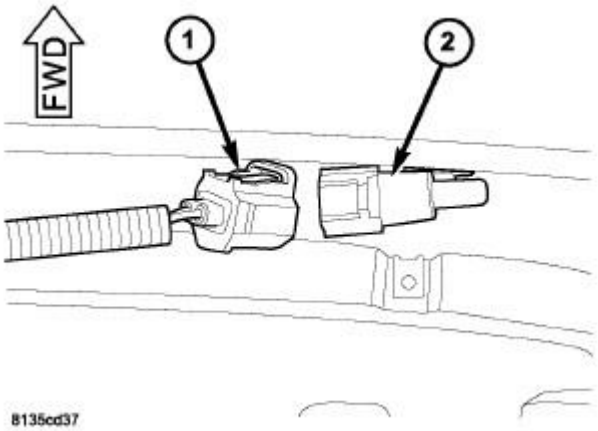

Fig. 15: Ambient Temperature Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect the wire harness connector (1) to the ambient temperature sensor (2).
4. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
5. Connect the battery negative cable.

SWITCH, EVIC CONTROL

DESCRIPTION

DESCRIPTION

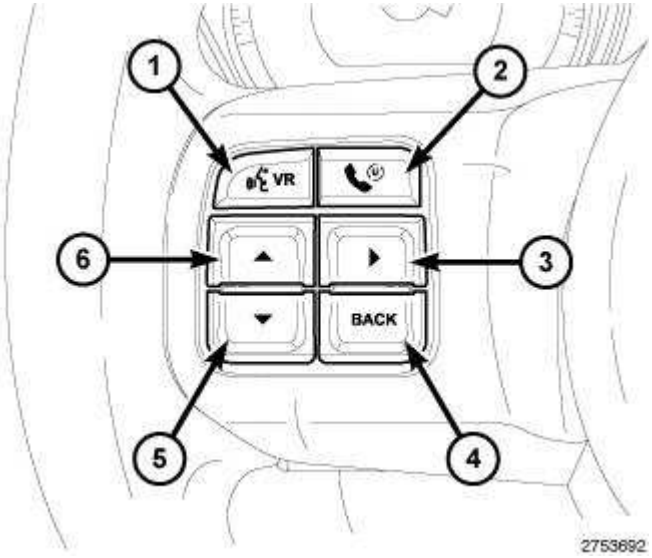

Fig. 16: EVIC Switches
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) control switch pod is located in the left spoke of the steering wheel spoke bezel. This switch has up to six push buttons. Four of the push buttons (3 through 6) are used on all vehicles equipped with the EVIC. Two additional push buttons (1 and 2) are found on vehicles equipped with the optional Uconnect™ Hands-Free Communication System. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the EVIC control switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The EVIC control switch pod cannot be adjusted or repaired. If any function of the switch is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) control switch pod is a resistor multiplexed unit that

receives source current from and provides hard wired inputs to the Local Interface Network (LIN) slave node integral to the speed control switch pod in the right spoke of the steering wheel spoke bezel. The LIN slave node communicates the switch states of the EVIC control switch pod, the remote radio switches, the paddle shifter switches (if equipped), the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the Steering Control Module (SCM), which is the LIN master node.

The EVIC control switch pod contains four switch push buttons whose functions are:

- **Back** - Pressing and releasing the Back push button returns you to the previous sub menu or main menu.
- **Down Arrow** - Pressing and releasing the Down Arrow push button allows the operator to scroll downward through the various EVIC main menus and sub menus.
- **Right Arrow** - Pressing and releasing the Right Arrow (Select) push button allows the operator to navigate, select and reset items or settings in the currently displayed EVIC main menu or sub menu. Pressing and holding the Right Arrow (Select) push button for two seconds provides a global reset of all of those EVIC features that can be reset, whether currently displayed or not.
- **Up Arrow** - Pressing and releasing the Up Arrow push button allows the operator to scroll upward through the various EVIC main menus and sub menus.

For vehicles equipped with the Uconnect™ Hands-Free Communication System, the EVIC control switch pod contains two additional switch push buttons whose functions are:

- **VR (Voice Recognition)** - This switch button activates the Uconnect™ Voice Command system.
- **Phone** - This switch push button activates the Uconnect™ Hands-Free Phone system.

The SCM LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The SCM continually monitors the LIN bus data and will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the EVIC control switch pod as well as the hard wired circuits between the switch pod and the LIN slave node within the speed control switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM or the electronic controls and communication between modules and other devices that provide some features of the EVIC system. The most reliable, efficient, and accurate means to diagnose the EVIC control switch pod, the LIN slave or master nodes, the SCM or the

electronic controls and communication related to EVIC system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

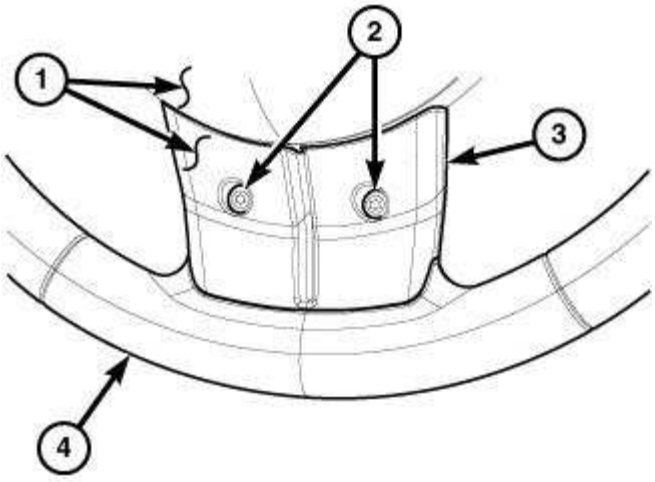

Fig. 17: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag assembly from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
3. From the back of the steering wheel (4), remove the screws (2) that secure the front bezel to the rear cover (1) of the steering wheel.

NOTE: Depending on model, there may be additional screws securing the bezel to the steering wheel.

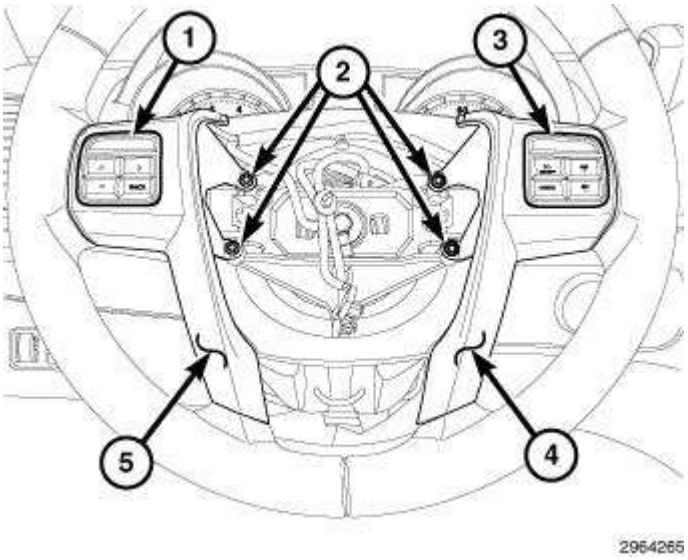

Fig. 18: Electronic Vehicle Information Center (EVIC) Switch Pod, Spoke Bezel And Screws
Courtesy of CHRYSLER GROUP, LLC

4. From the face of the steering wheel, remove the screws (2) as needed, that secure the front spoke bezel (5) to the steering wheel armature within the steering wheel hub cavity.
5. Using a trim stick (special tool # (special tool #C-4755, Trim Stick)) or equivalent, carefully pry at the parting line between the front spoke bezel and the steering wheel rear cover enough to unsnap the two horizontal members of the bezel from those of the rear cover.
6. Pull the front spoke bezel away from the steering wheel far enough to access and disconnect the steering wheel wire harness connections from the Electronic Vehicle Information Center (EVIC) switch pod (1).

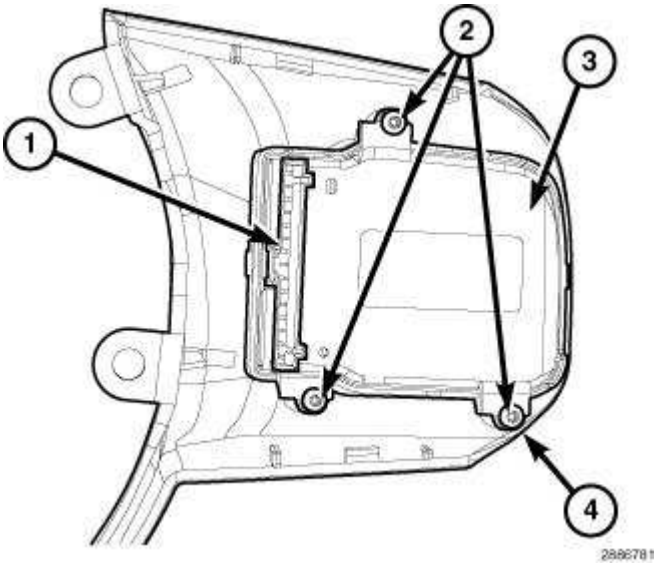

Fig. 19: Steering Wheel Spoke Front Bezel, Screws, EVIC Switch Pod And Mounting Tabs
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel spoke front bezel (4), remove the three screws (2) that secure the EVIC switch pod (3) mounting tabs to the bezel.
8. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

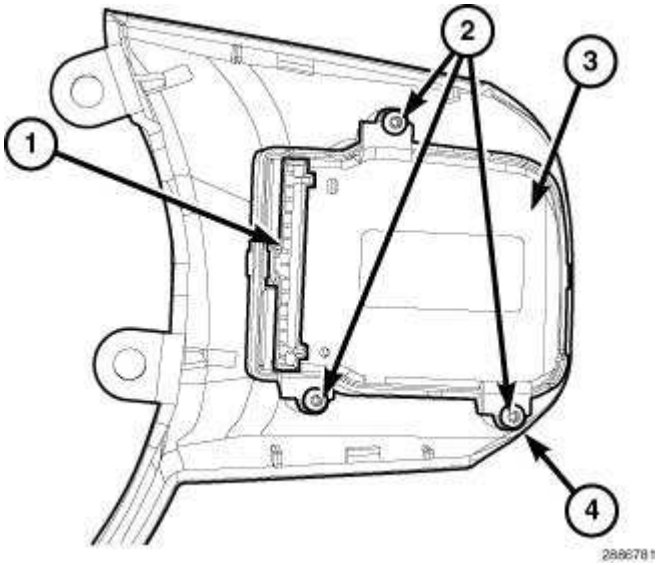

Fig. 20: Steering Wheel Spoke Front Bezel, Screws, EVIC Switch Pod And Mounting Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the Electronic Vehicle Information center (EVIC) switch pod (3) to the back of the steering wheel spoke front bezel (4).
2. Install and tighten the three screws (2) that secure the switch mounting tabs to the bezel. Tighten the screws securely.
3. Position the front spoke bezel close enough to the steering wheel to reconnect the steering wheel wire harness connections to the Electronic Vehicle Information Center (EVIC) switch pod and the speed control switch pod connector receptacles (3).

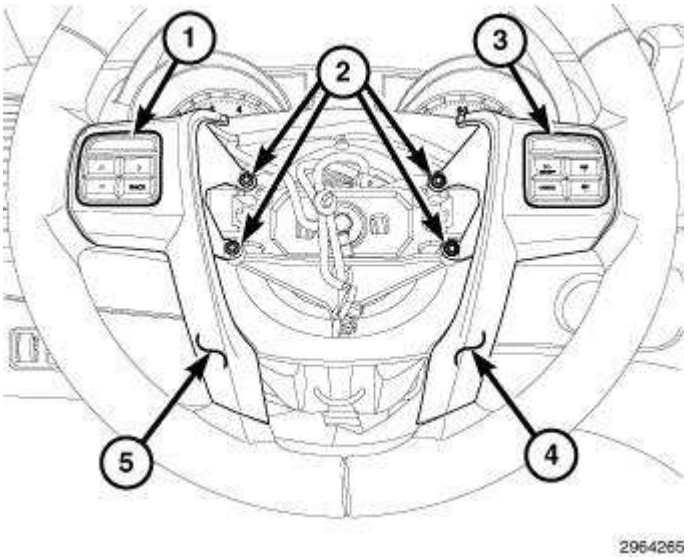

Fig. 21: Electronic Vehicle Information Center (EVIC) Switch Pod, Spoke Bezel And Screws
Courtesy of CHRYSLER GROUP, LLC

4. Position the front spoke bezel (5), EVIC switch pod (1) to the steering wheel. Be certain that the steering wheel wire harness is routed between the upper bezel stanchions and the inside circumference of the steering wheel hub cavity so that the wiring will not be pinched when the driver airbag is reinstalled.
5. Use hand pressure to squeeze the horizontal spokes of both the front spoke bezel and the steering wheel rear cover together until all of the snap features are fully engaged.
6. Install and tighten the screws as needed that secure the stanchions of the front spoke bezel to the steering wheel armature within the steering wheel hub cavity. Tighten the screws securely.

NOTE: Depending on model, there may be additional screws securing the bezel to the steering wheel.

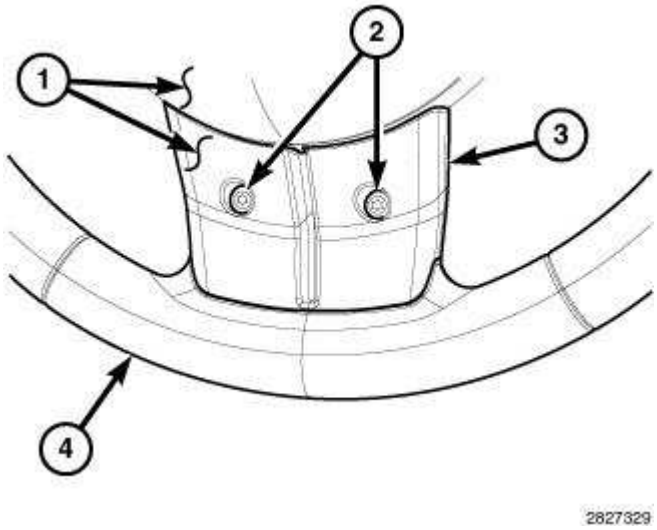

Fig. 22: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel (4), install and tighten the lower screws (2) as needed that secure the spoke of the rear cover (1) to the lower spoke of the steering wheel front bezel (3). Tighten the screws securely.
8. Install the driver airbag assembly (2). Refer to **AIR BAG, DRIVER, INSTALLATION** .
9. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE** .
10. Connect the negative battery cable.

Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the negative battery cable. (2)

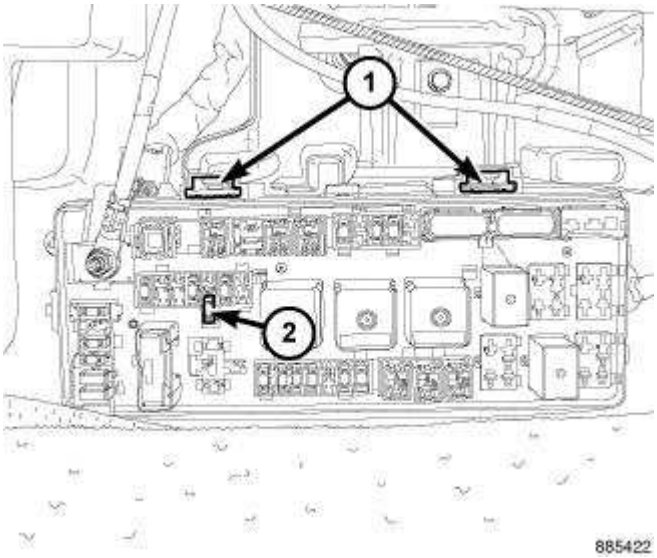

Fig. 3: Removing/Installing Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the Power Distribution Center (PDC) by pressing the releasing tabs (1) and pulling the PDC straight up.

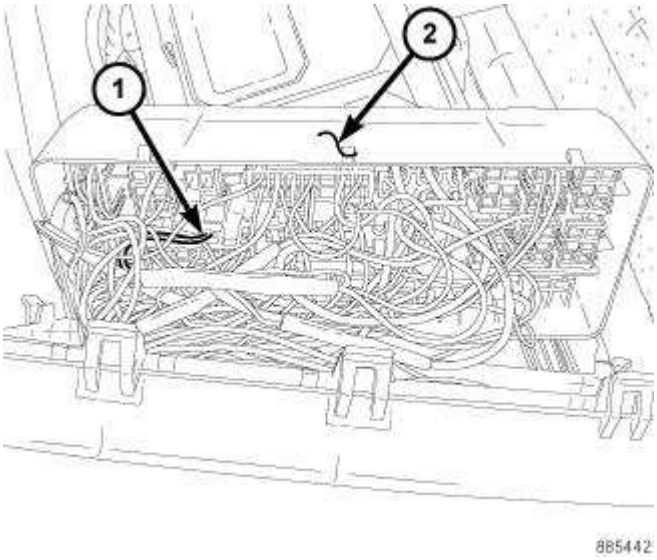

Fig. 4: Locating Circuit
Courtesy of CHRYSLER GROUP, LLC

4. Remove the back cover of the PDC (2).

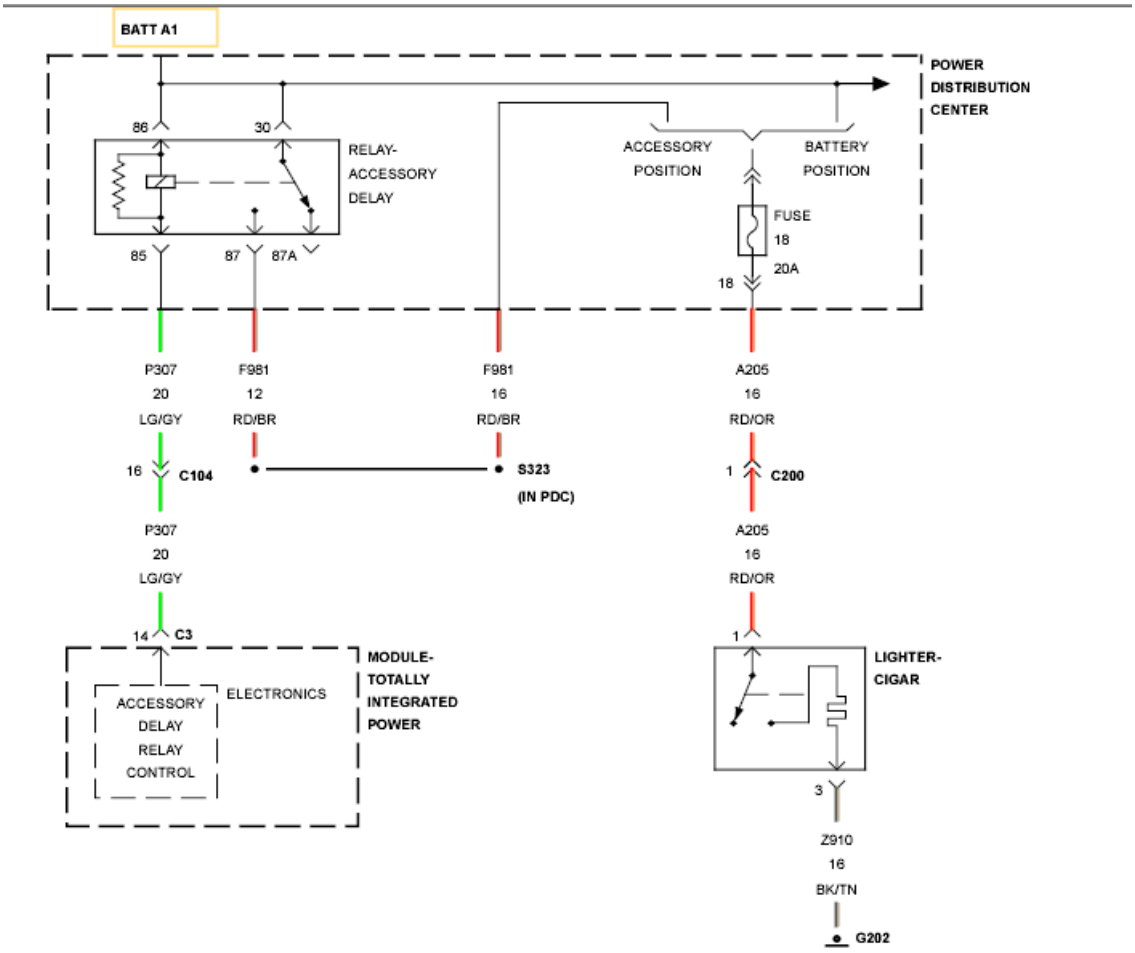

Fig. 5: Wire Schematic
Courtesy of CHRYSLER GROUP, LLC

5. Locate the F981 (RD/BR) circuit (1) going to fuse 18. Refer to the wire schematic above.
6. Measure the appropriate length of wire so that the wire harness will reach the router from the PDC.

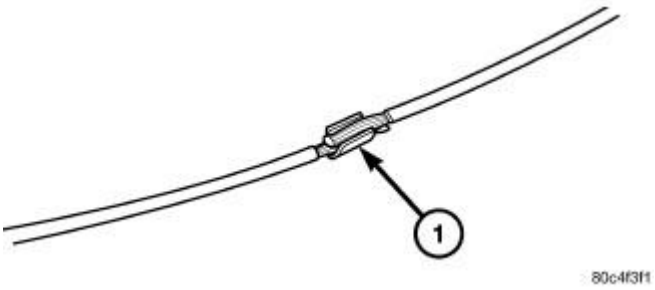

Fig. 6: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1 - SPLICE BAND

7. Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.
8. Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.
9. Place the strands of wire overlapping each other inside of the splice clip (1).

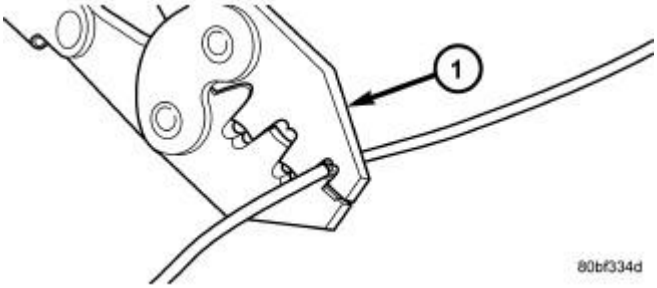

Fig. 7: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

1 - CRIMPING TOOL

10. Using crimping tool (1), Mopar p/n 05019912AA, crimp the splice clip and wires together.

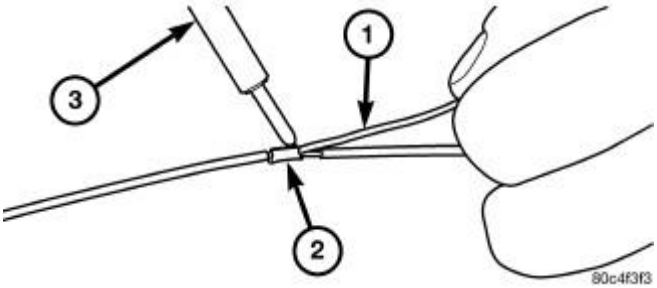

Fig. 8: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

1 - SOLDER
2 - SPLICE BAND
3 - SOLDERING IRON

11. Solder (3) the connection (2) together using rosin core type solder (1) only.

CAUTION: Do not use acid core solder.

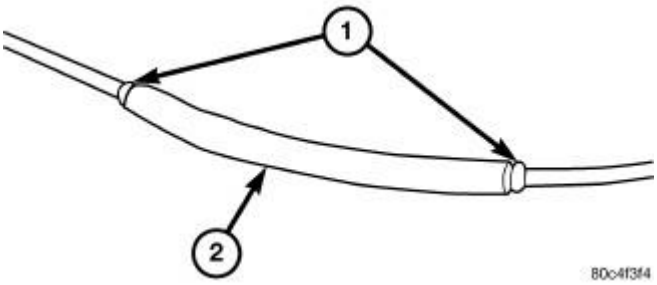

Fig. 9: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

1 - SEALANT
2 - HEAT SHRINK TUBE

12. Center the heat shrink tubing (2) over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) comes out of both ends of the tubing.
13. Attach the black wire to the negative battery terminal stud.
14. Install the PDC back cover, being careful not to pinch any wires between the PDC and the PDC cover.
15. Install the PDC.
16. Connect the negative battery cable.
17. Install the spare tire cover.

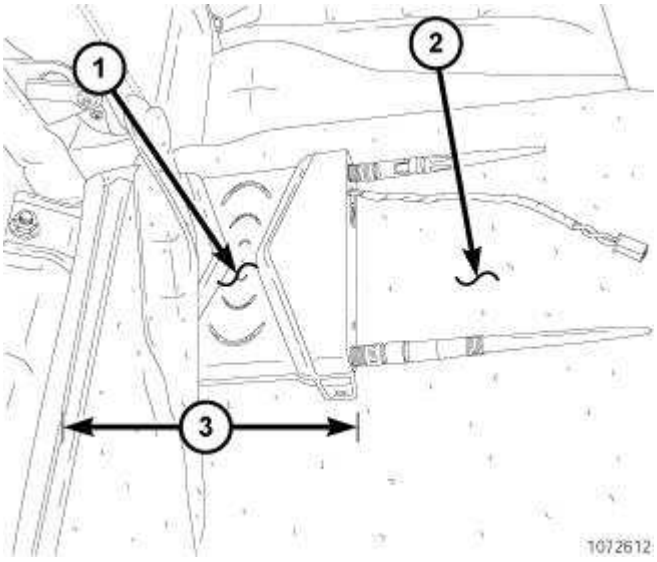

Fig. 10: Securing Wi-Fi Router
Courtesy of CHRYSLER GROUP, LLC

18. Secure the Wi-Fi Router (1) with the supplied fasteners on the back of the passenger rear seat (2). Measure 230 mm (9.1 in.) from the bottom of the seat back (3) to the top of the Wi-Fi Router.

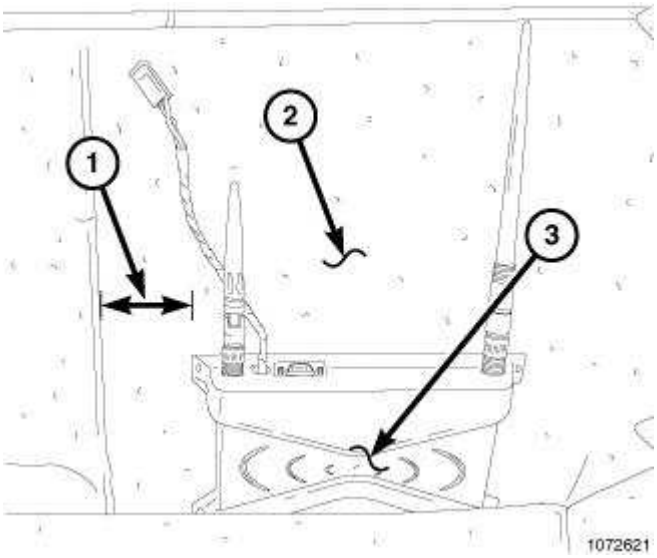

Fig. 11: Wi-Fi Router Position
Courtesy of CHRYSLER GROUP, LLC

19. The Wi-Fi Router (3) should be 50 mm (2 in.) from the left edge (1) of the seat back (2).
20. Route and secure the twisted pair wire harness from the PDC to the Wi-Fi Router along the passenger side trunk.
21. Connect the twisted pair wire harness to the router.
22. Verify system operation.

SDARS ANTENNA

CHRYSLER 300, DODGE CHARGER

PROCEDURE STEPS

NOTE: Verify that the radio is satellite compatible. Look for the SIRIUS® logo on the radio.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

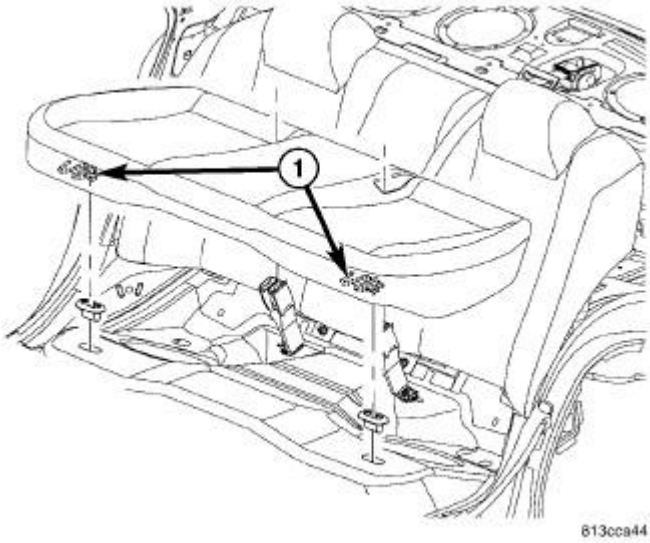

Fig. 12: Rear Seat Cushion
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat cushion (1).
3. Remove the rear seat back.

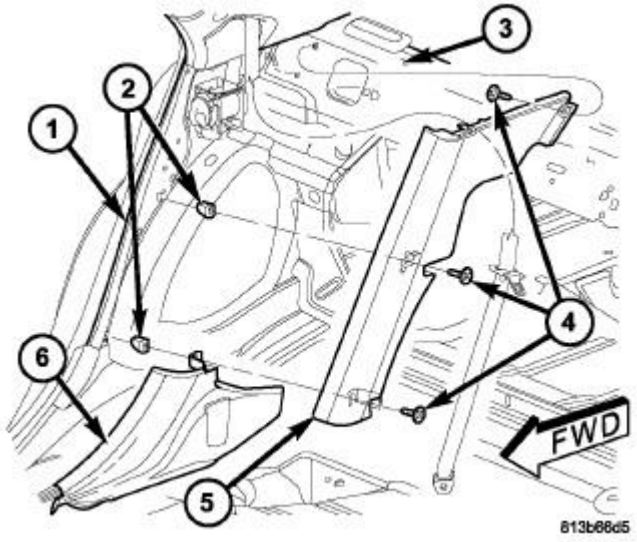

Fig. 13: Upper/Lower Pillar Trim Panels
Courtesy of CHRYSLER GROUP, LLC

4. Remove both upper C-pillar trim panels.
5. Remove the left lower C-pillar trim.
6. Remove both door opening scuff plates on the left side of the vehicle.

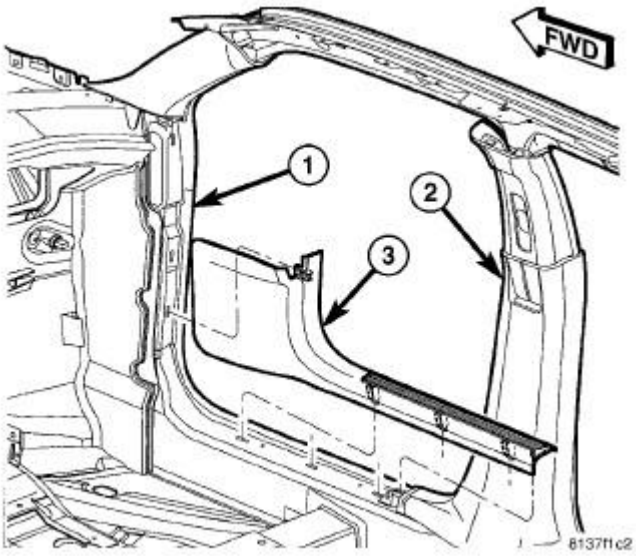

Fig. 14: Lower Cowl Trim
Courtesy of CHRYSLER GROUP, LLC

7. Remove the left upper cowl trim panel.
8. Remove the left lower cowl trim panel (3).
9. Remove the vehicle left side carpet retainers.

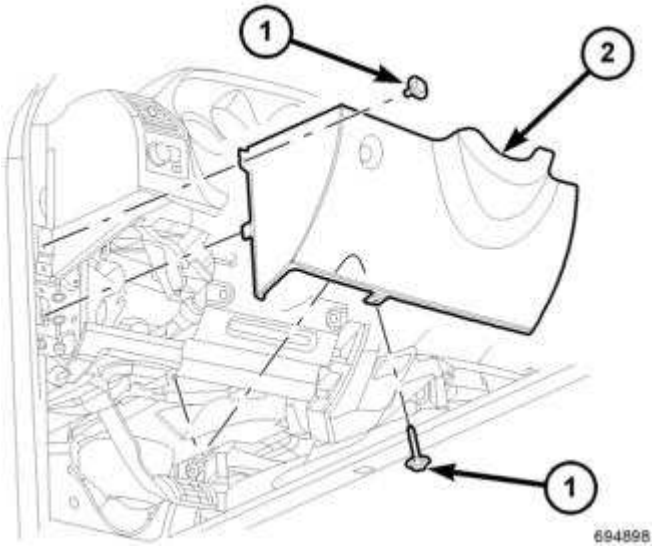

Fig. 15: Steering Column Cover
Courtesy of CHRYSLER GROUP, LLC

10. Remove the steering column cover (1) and disconnect the electrical switch.
11. Remove the sound insulator.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on

the locking antenna connector could damage the cable or radio.

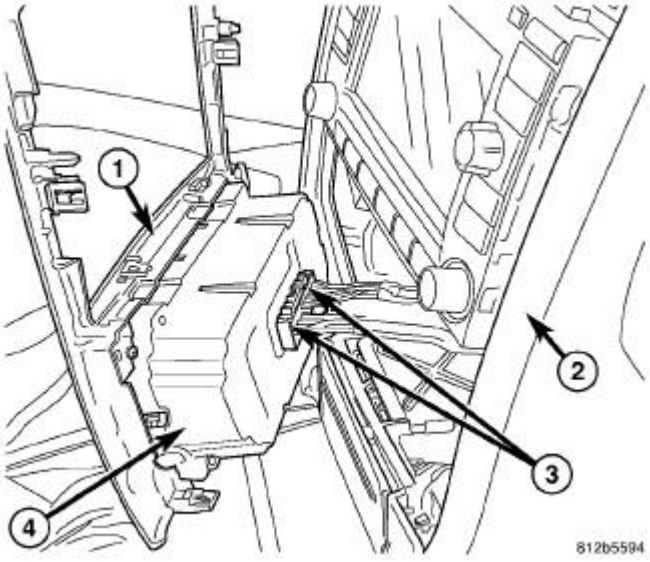

Fig. 16: Removing/Installing A/C Heater Control Center Bezel
Courtesy of CHRYSLER GROUP, LLC

12. Remove the instrument panel center bezel (1) and disconnect electrical connectors (3).
13. Remove and disconnect the radio.

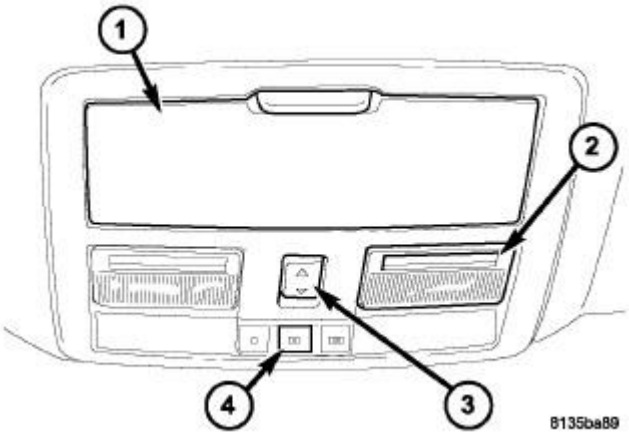

Fig. 17: Identifying Overhead Console Components
Courtesy of CHRYSLER GROUP, LLC

14. Remove the overhead console assembly and disconnect the electrical connectors.
15. Remove the sun visor assemblies and disconnect the electrical connectors.
16. Remove the assist handle assembly.

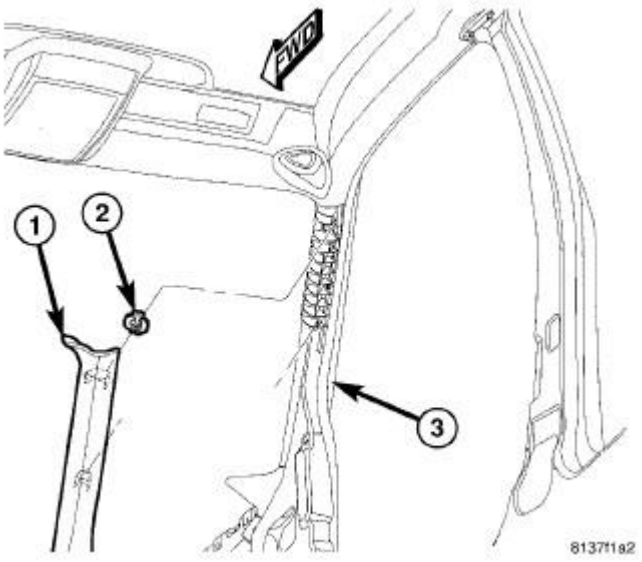

Fig. 18: A-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

17. Remove the upper A-pillar trim panels (2).
18. Remove the lower B-pillar trim panels.
19. Remove the upper B-pillar trim panels.
20. Release clips and lower the headliner.

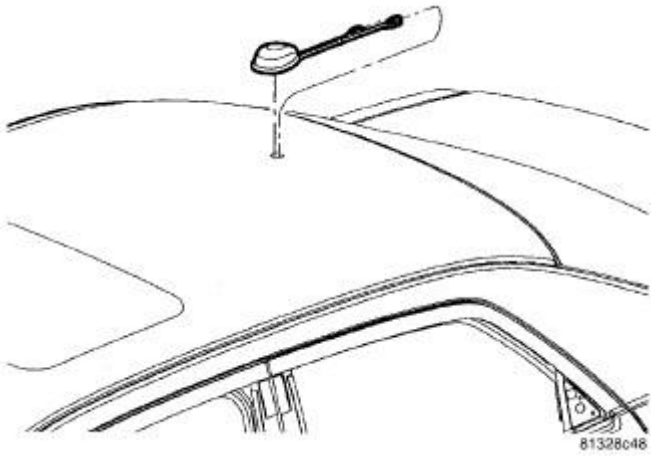

Fig. 19: Satellite Radio Antenna
Courtesy of CHRYSLER GROUP, LLC

21. Locate center line of roof, cut out template as indicated, center template and tape in place.
22. Carefully center punch at the two locations for the antenna mounting holes. Remove and discard template.

CAUTION: Do not drill more than a 6 mm (1/4 in.). Failure to do so results in damage to the vehicles headliner.

23. Drill a 3mm (1/8 in.) pilot hole at the marked locations.
24. Drill a 5mm (13/64 in.) diameter hole at the mark closest to the vehicles rear glass.
25. Using a hole saw, drill a 19mm (3/4 in.) hole at the mark forward of the previous hole drilled at the second mark.
26. Deburr holes and remove rough edges.
27. Apply Mopar® Corrosion Inhibitor, p/n 82300508, to the bare metal surface of the drilled holes.
28. Clean and prepare bare metal surfaces.
29. Apply primer to bare metal surfaces.
30. Route harness and set antenna in place.
31. Install fastener and tighten to spec.
    - Tighten to 9Nm (80in.lbs.)
32. Connect hard-shell connector.

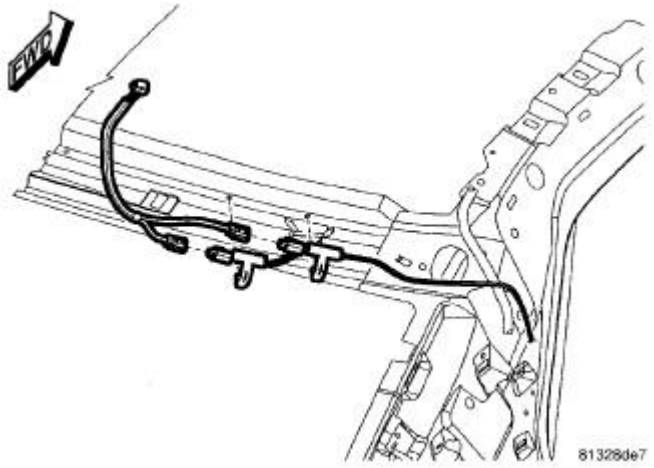

Fig. 20: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

33. Route the antenna cable down the left C-pillar, along the left inner apron along the lower instrument panel brace and up to the radio opening. Secure to the vehicles body electrical harness and lower instrument panel brace.
34. Raise headliner and secure clips.
35. Connect and install both sun visor assemblies.
36. Install the assist handle assembly.

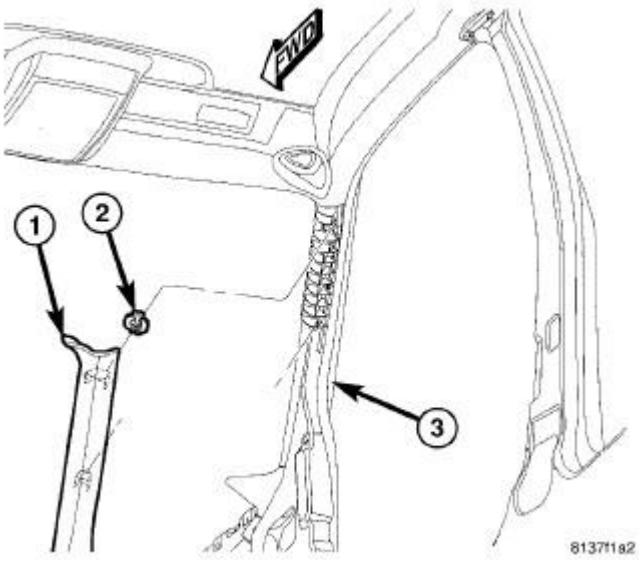

Fig. 21: A-Pillar Trim
Courtesy of CHRYSLER GROUP, LLC

37. Install the upper A-pillar trim panels.
38. Connect electrical and install the overhead console.

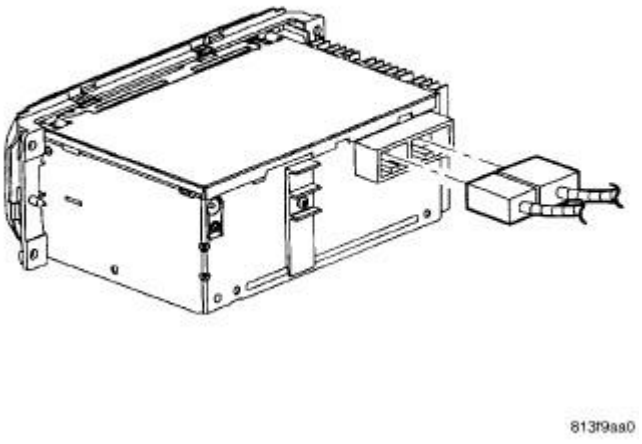

Fig. 22: Removing/Installing Radio Harness Connector
Courtesy of CHRYSLER GROUP, LLC

39. Connect the antenna cable into the open antenna port on the radio.

NOTE: The antenna ports are keyed and color coded for there specific antenna connection.

NOTE: All SDARS antenna connections are Yellow.

40. Connect electrical and install the radio.
41. Connect electrical and install the center bezel assembly.

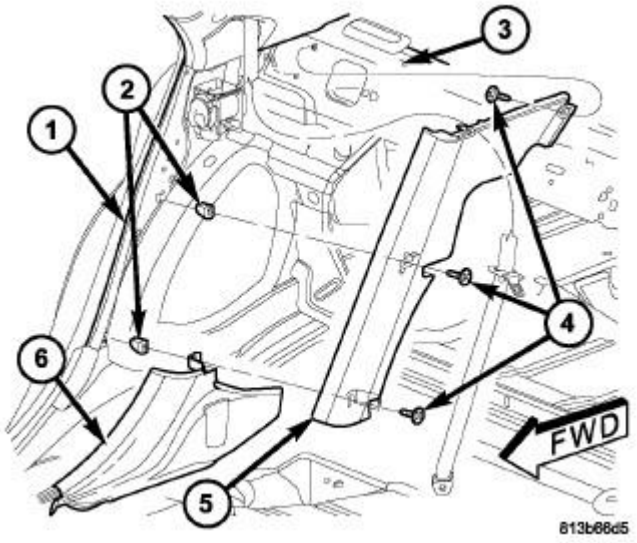

Fig. 23: Upper/Lower Pillar Trim Panels
Courtesy of CHRYSLER GROUP, LLC

42. Install the lower C-pillar trim panel.
43. Install the upper C-pillar trim panels.
44. Install the upper B-pillar trim panels.
45. Install the lower B-pillar trim panels.

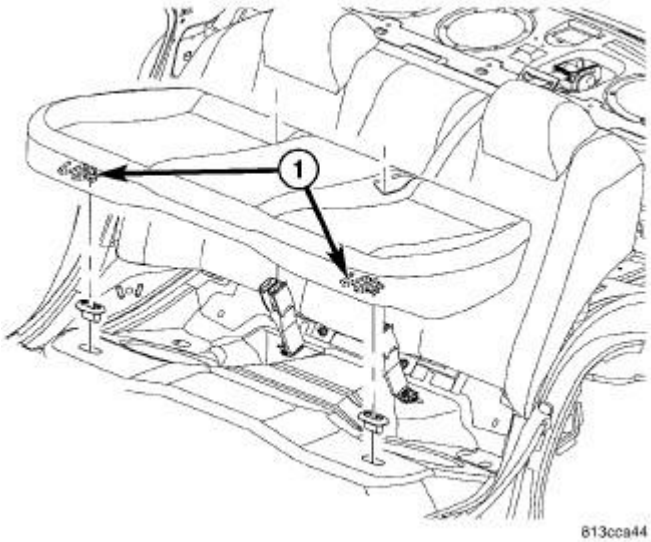

Fig. 24: Rear Seat Cushion
Courtesy of CHRYSLER GROUP, LLC

46. Install the rear seat back.
47. Install rear seat cushion.

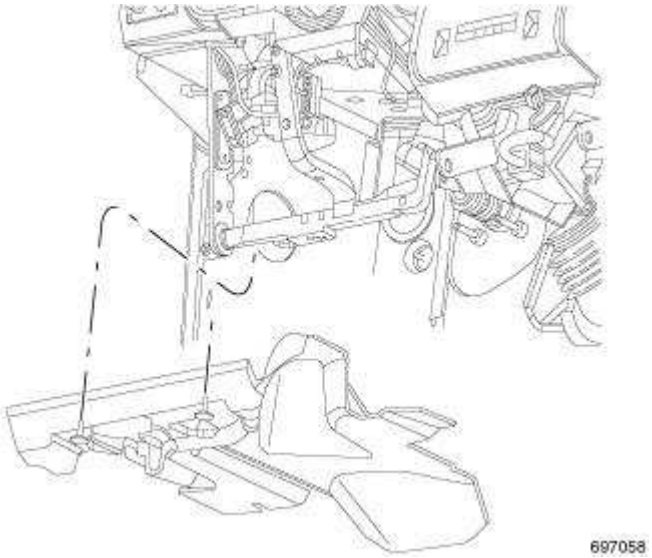

Fig. 25: Sound Insulator
Courtesy of CHRYSLER GROUP, LLC

48. Install the sound insulator.
49. Connect electrical and install the steering column cover.

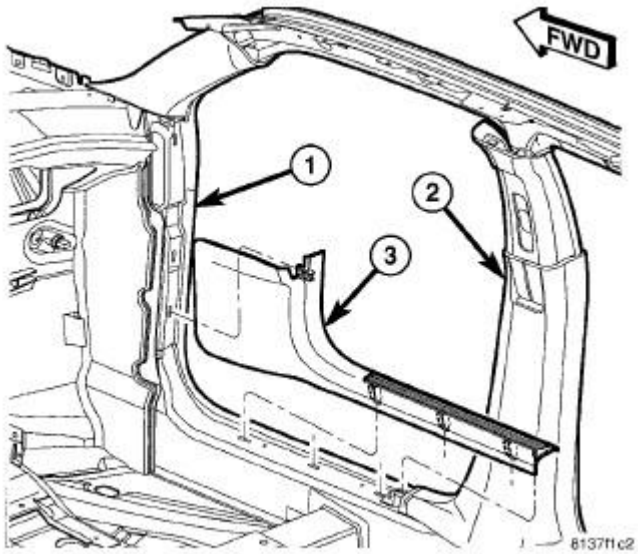

Fig. 26: Lower Cowl Trim
Courtesy of CHRYSLER GROUP, LLC

50. Install the vehicle left side carpet retainers.
51. Install the lower cowl trim panel.
52. Install the upper cowl trim panel
53. Install the door opening scuff plates.
54. Connect the negative battery cable.

SDARS VEHICLE CONFIGURATION

Vehicle VIN must be updated with the sales code of the added accessory in order to enable system functionality.

Using the DealerCONNECT website and a scantool, complete the procedure below.

- Log on to Http://dealerconnect.chrysler.com.
- In the "Vehicle Options" screen under the "Global Claims System" category in the "Service tab, enter the vehicle VIN and add the sales code **RSC (SIRIUS SATELLITE RADIO)** as a "Dealer Installed option".
- Confirm the new sales code has been successfully added to the VIN.

With the ScanTool connected to both the internet (via Ethernet port or wireless connection) and the vehicle, follow the steps below:

- In the "Initial Start Up" screen select **VEHICLE PREPARATION**
- Toggle down and highlight **RESTORE VEHICLE CONFIGURATION**
- Press **START**
- Press **NEXT**
- If necessary, select proper vehicle line and model year and press **NEXT**
- Confirm correct selection and press **NEXT**
- Enter vehicle VIN using the on screen keyboard or confirm that the Auto Filled VIN plate is correct and press **NEXT**
- Press **OK**
- Enter the user ID, password and dealer code using the one screen keyboard and press **OK**

NOTE: At this point the ScanTool is downloading the vehicle configuration from the network.

- Confirm that the new vehicle configuration has been successfully programmed, follow the on screen instructions and press **FINISH**

VALIDATION PROCESS

from the "Initial Start up" screen on the ScanTool follow the steps below:

- Using a ScanTool follow the menu to **ECU VIEW** , select either **TPIMCGW CENTRAL GATEWAY** or **FCMCGW CENTRAL GATEWAY** depending on the vehicle.
- Select **MORE OPTIONS, ECU DETAILS,** and then **CONFIG INFO** .
- Verify **SDARV - - - - SET** is present.
- Drive the vehicle outside for a clear satellite signal to the antenna and verify system operation.

REMOTE START

CHRYSLER 300C / DODGE CHARGER

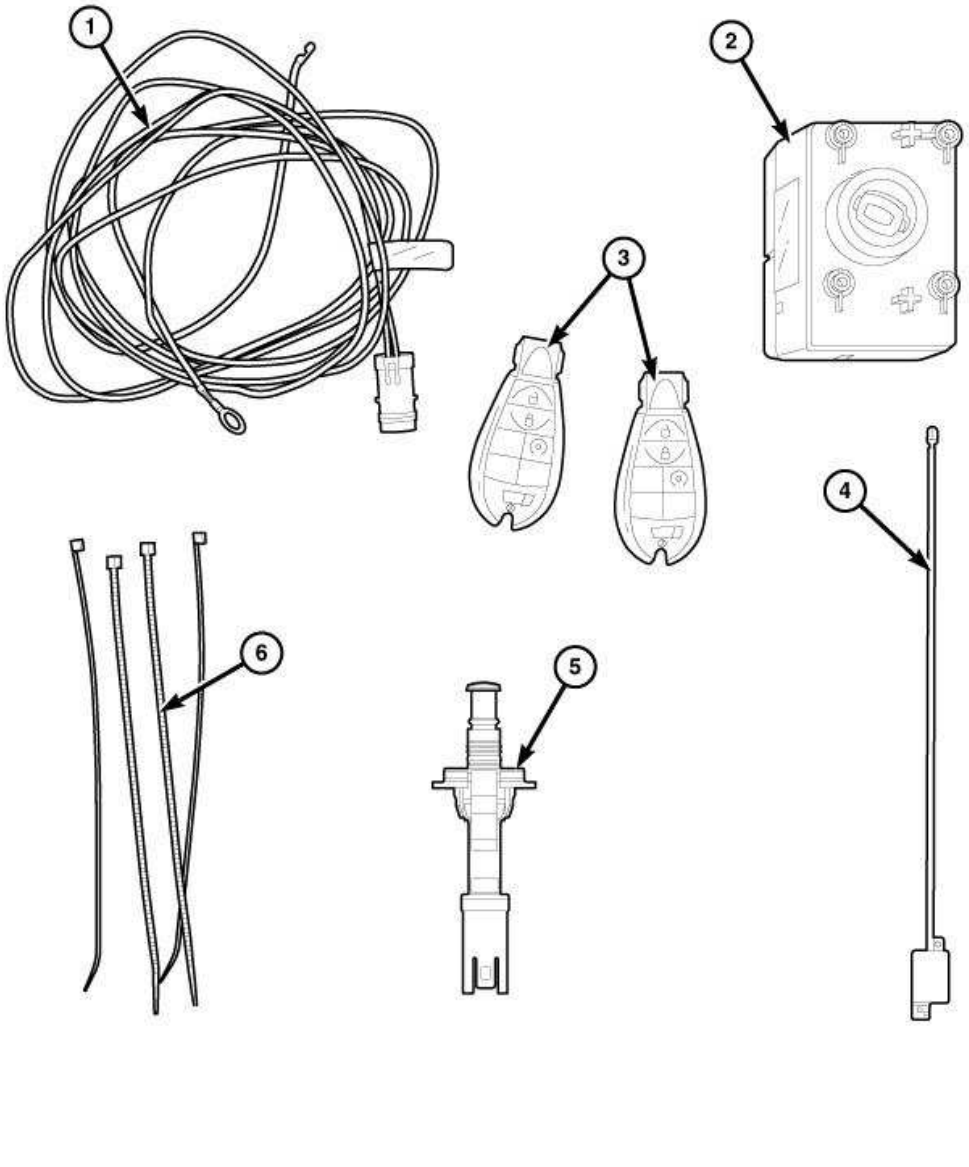

Fig. 27: Remote Start Components
Courtesy of CHRYSLER GROUP, LLC

CALL OUT	DESCRIPTION	QUANTITY
1	Hood Switch Harness	1
2	Wireless Ignition Module (WIN)	1
3	FOBIK	2
4	WIN Antenna	1
5	Hood Ajar Switch	1
6	Zip Ties	10

CAUTION: XBM remote start can ONLY be installed on vehicles that have the following factory options: Automatic Transmission, Remote Keyless Entry and Immobilizer.

WinFobik based vehicles, the sales code must be added to the database and the Restore Vehicle Configuration (using a diagnostic scan tool) must be performed prior to installing the new WIN module. Failure to do so will render the WIN module's remote start function inoperative.

The technician should wait 1/2 hour between adding XBM sales code in DealerConnect before installing the WIN module & restoring vehicle configuration. In the interim, the technician can install all other components except the WIN module.

NOTE: Prior to installation, obtain the four digit PIN from the dealership's parts department.

RESTORE VEHICLE CONFIGURATION

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

1. VIN must be updated with the sales code of the added accessory in order to enable system functionality. Using the DealerCONNECT website and the wiTECH diagnostic application, complete the vehicle configuration.
2. Log on to https://dealerconnect.chrysler.com.
3. In the "Vehicle Option" screen under the "Global Claims System" category in the "Service" tab, enter the vehicle VIN, four digit pin number obtained from the dealership parts department and add sales code(s) noted below as a "Dealer Installed Option".

XBM (REMOTE START)

1. Confirm that the new sales code has been successfully added to the VIN.
2. With the wiTECH diagnostic application, perform the following steps form the Initial Start Up Screen:

- Select the "DIAGNOSTIC PROCEDURES" tab
- Highlight "RESTORE VEHICLE CONFIGURATION"
- Select the "Run Diagnostic" button
- Select "CONTINUE"
- Verify that the vehicle VIN number is correct
- Once verified, select the "Correct VIN" button
- Note On-Screen instructions and select the "Close" button

PROCEDURE STEPS

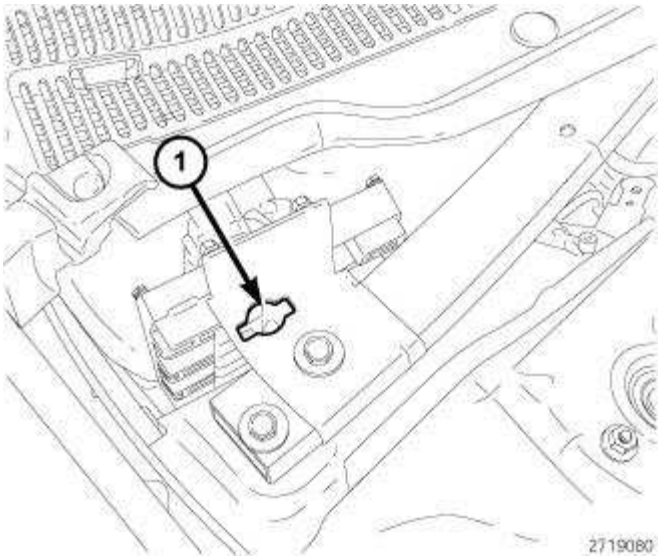

Fig. 28: Opening For Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

1. **Disconnect and isolate the negative battery cable.**
2. Open the hood.
3. Locate the opening (1) designated for the hood ajar switch on the brace near the rear passenger side of the engine compartment.

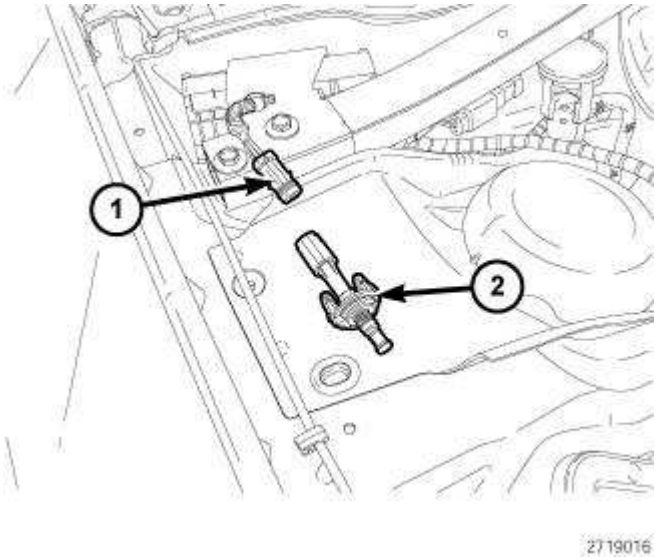

Fig. 29: Identifying Hood Switch And Hood Switch Harness
Courtesy of CHRYSLER GROUP, LLC

4. Route the hood switch harness (1) underneath the brace and through the opening designated for the hood switch.
5. Connect the hood switch (2) to the hood switch harness (1).
6. Once connected, insert the hood switch (2) into the opening, turn the hood switch (2) until properly seated.

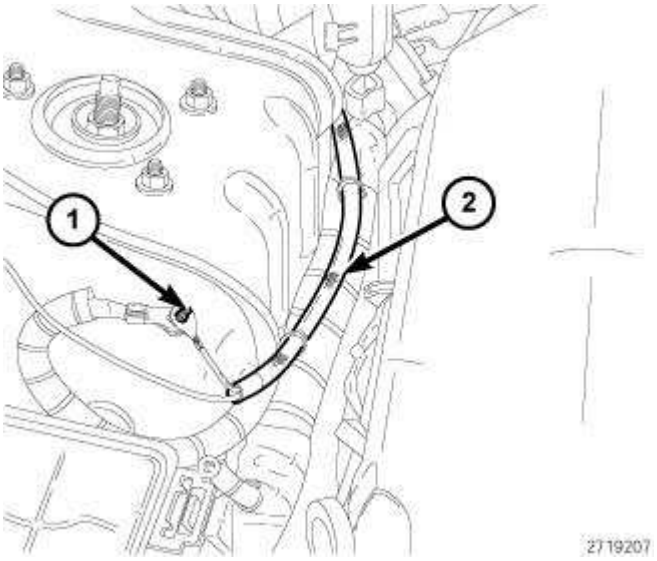

Fig. 30: Identifying Factory Ground Lug And Hood Switch Harness
Courtesy of CHRYSLER GROUP, LLC

7. Route the hood switch harness (2) into the engine compartment.
8. Locate the factory ground lug (1) on the passenger wheel well/shock tower. Remove the nut.
9. Install the hood switch ground terminal onto the factory ground lug and reinstall the nut.

10. Secure the hood switch harness (2) to the vehicle harness using the tie straps supplied in the kit.

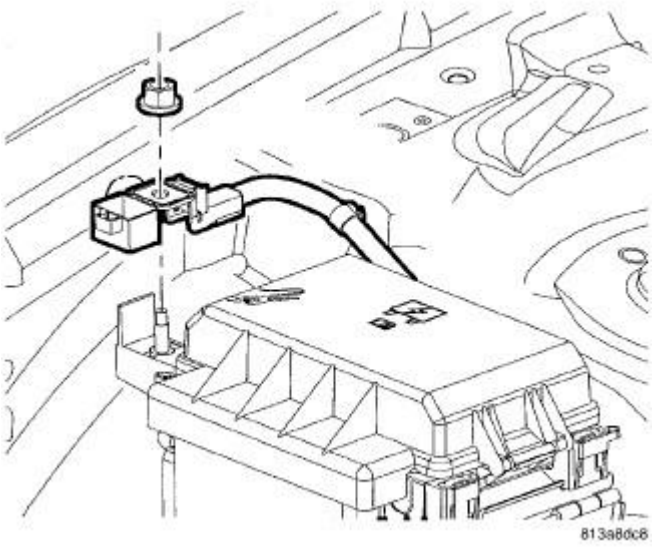

Fig. 31: Disconnecting/Connecting Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

11. Open the positive battery cable nut cover on the TIPM to expose nut.
12. Remove the battery cable nut and the battery cable from the Totally Integrated Power Module (TIPM).

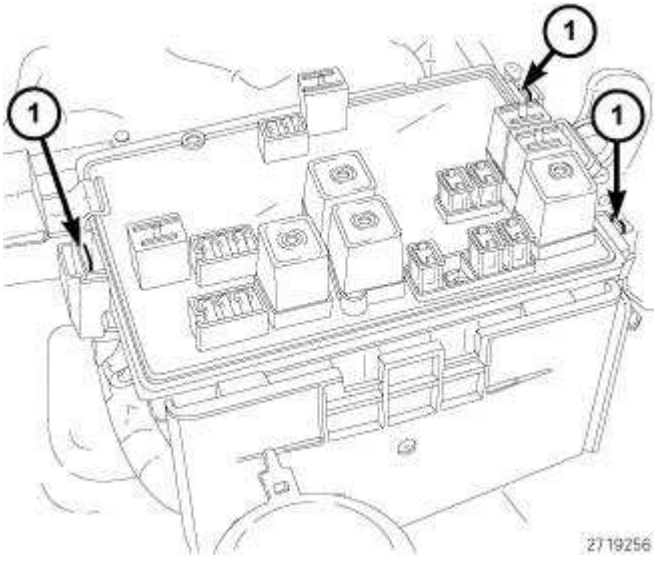

Fig. 32: Locating TIPM Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

13. Remove the TIPM cover.

14. Disengage the three retaining tabs (1) to remove the TIPM from it's mounting bracket.

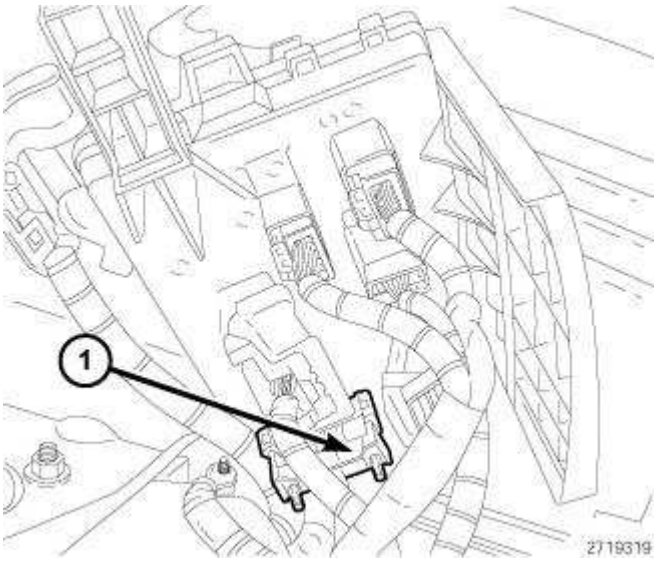

Fig. 33: Locating Connector Labeled B
Courtesy of CHRYSLER GROUP, LLC

15. Lift the TIPM to gain access to the connectors.
16. Locate the connector labeled B (1).
17. Disconnect the connector labeled B (1) from the TIPM.

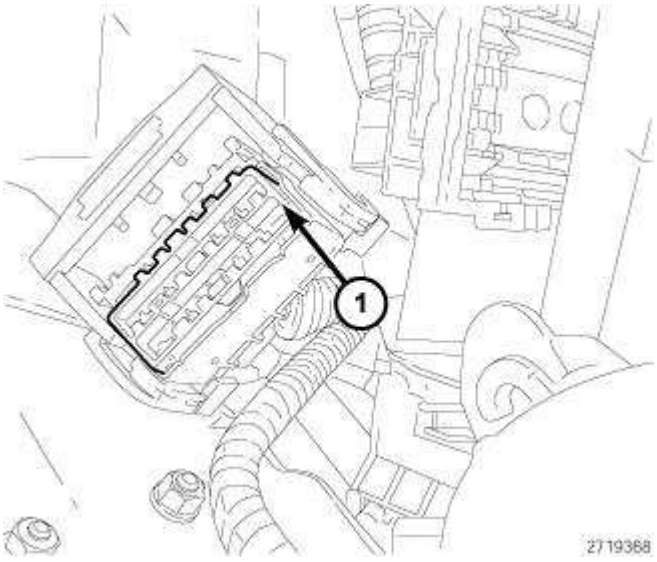

Fig. 34: Identifying Secondary Lock To Front Of Connector
Courtesy of CHRYSLER GROUP, LLC

18. Remove the secondary lock from the front of the connector (1).

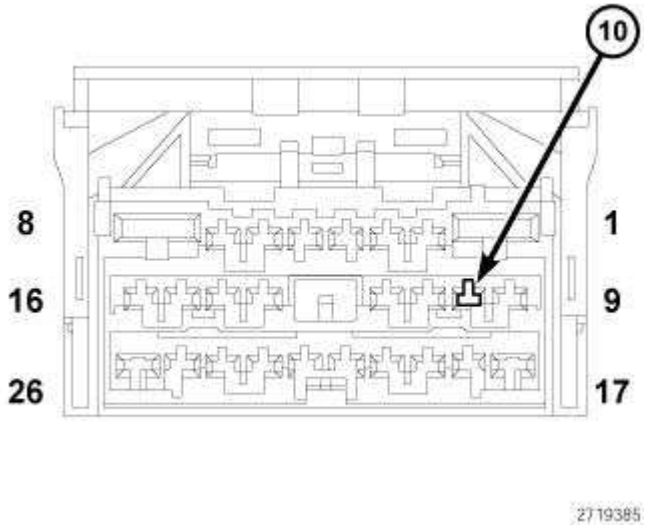

Fig. 35: Locating Pin Cavity 10
Courtesy of CHRYSLER GROUP, LLC

19. Locate pin cavity 10 (10) on the connector's mating side.

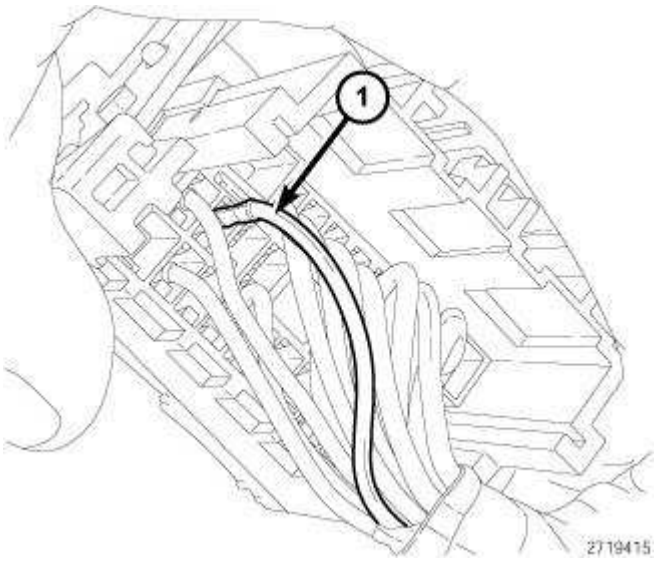

Fig. 36: Identifying Violet/Light Blue Wire
Courtesy of CHRYSLER GROUP, LLC

20. Looking into the connector's rear/wire side view, insert the violet/light blue wire (1) from the hood switch harness into the pin 10 cavity.

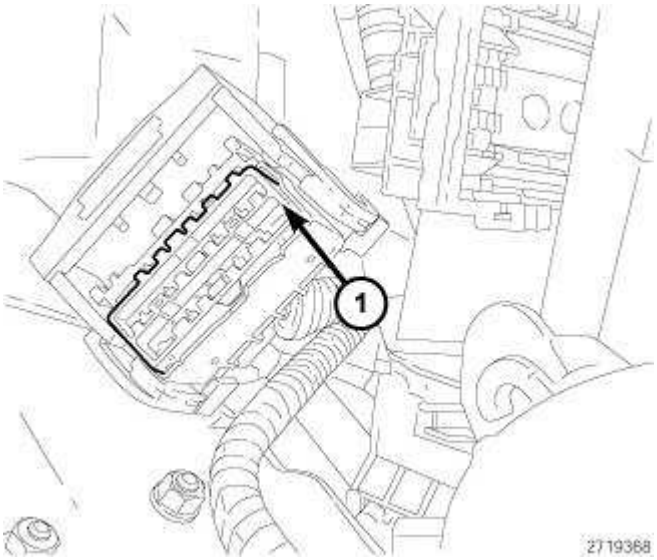

Fig. 37: Identifying Secondary Lock To Front Of Connector
Courtesy of CHRYSLER GROUP, LLC

21. Install the secondary lock to the front of the connector (1).

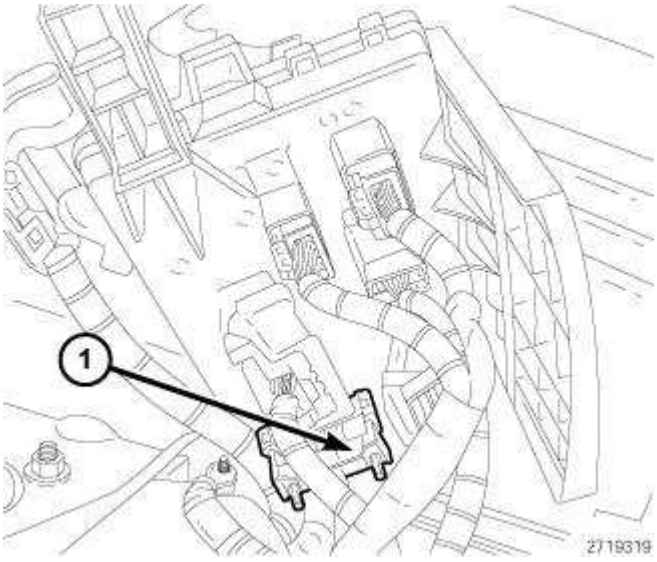

Fig. 38: Locating Connector Labeled B
Courtesy of CHRYSLER GROUP, LLC

22. Connect the connector labeled B (1) to the TIPM.

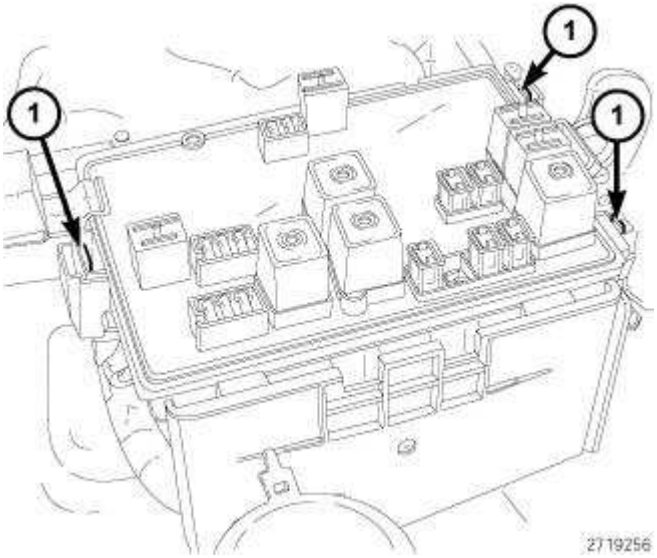

Fig. 39: Locating TIPM Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

23. Position the TIPM over the mounting bracket.
24. Engage the three retaining tabs (1) by pushing down on the TIPM. Make sure the three retaining tabs (1) snap into place.
25. Install the cover to the TIPM.

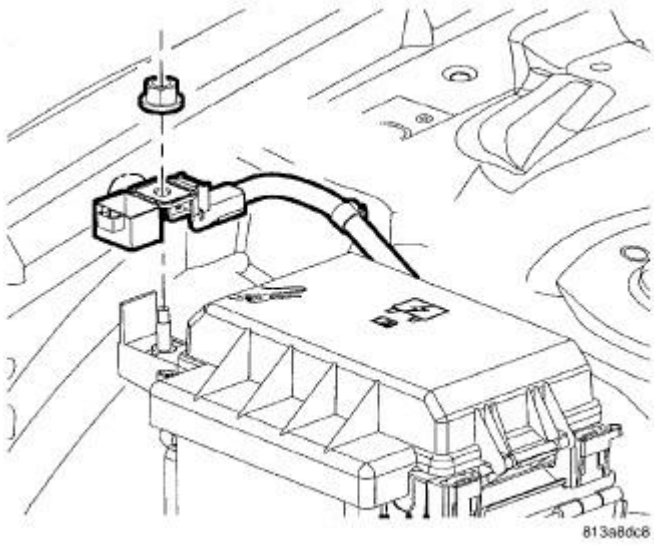

Fig. 40: Disconnecting/Connecting Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

26. Install the battery cable nut and the battery cable to the Totally Integrated Power Module (TIPM).
27. Close the positive battery cable nut cover on the TIPM.

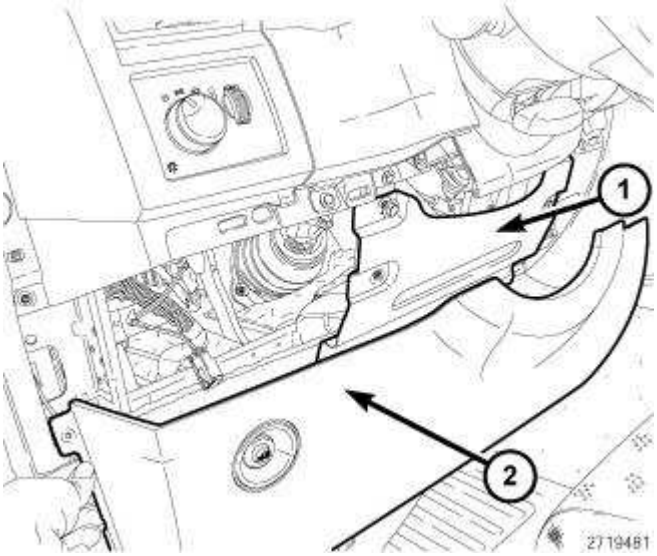

Fig. 41: Identifying Steering Column Cover Reinforcement And Lower Instrument Panel Cover
Courtesy of CHRYSLER GROUP, LLC

28. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, remove the center trim/radio bezel.
29. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, remove the trim panel located on the left side door opening.
30. Remove the screw securing the lower instrument panel cover to the left side door opening.
31. Remove the screw securing the lower instrument panel cover near the hood latch switch.
32. Remove the lower instrument panel cover (2) and disconnect the trunk release switch.
33. Remove the bolts that secure the instrument panel steering column cover reinforcement (1) to the bracket and remove the reinforcement (1) from the vehicle.

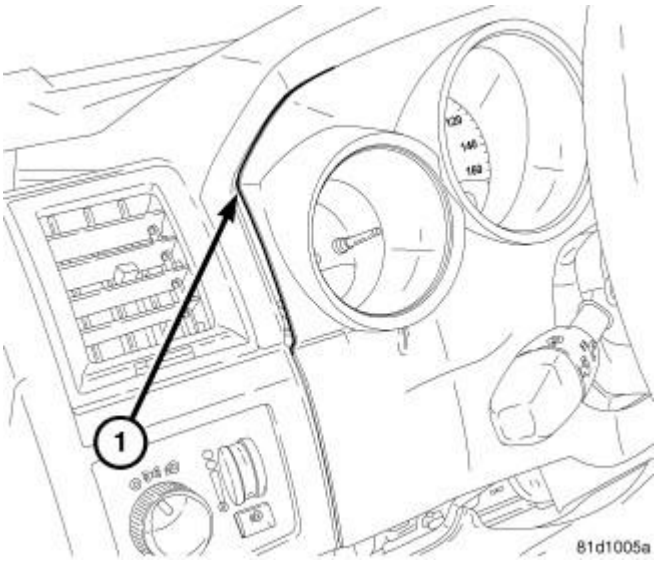

Fig. 42: Edge Of The Trim

Courtesy of CHRYSLER GROUP, LLC

34. Using a trim stick or equivalent, gently pry along the edge of the trim (1) to remove the instrument cluster trim.

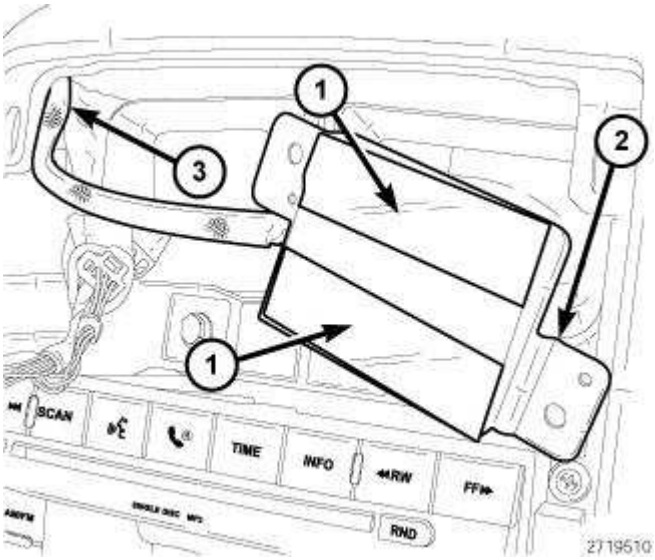

Fig. 43: Identifying Two Sided Tape, Remote Start Antenna, And Antenna Harness
Courtesy of CHRYSLER GROUP, LLC

35. Remove adhesive backing on one side and apply the two sided tape (1) to the bottom of the remote start antenna (2).
36. Press the tape (1) firmly for 30 seconds.
37. Using a fish tape or equivalent, route the antenna harness (3) down through the opening near the air conditioner ducts.

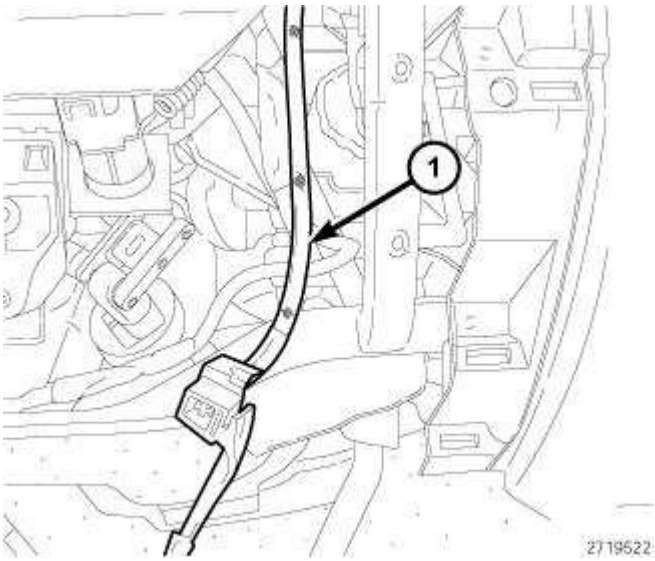

Fig. 44: Routing The Remote Start Antenna Harness
Courtesy of CHRYSLER GROUP, LLC

38. Finish routing the remote start antenna harness to the dash area near the ignition WIN module.

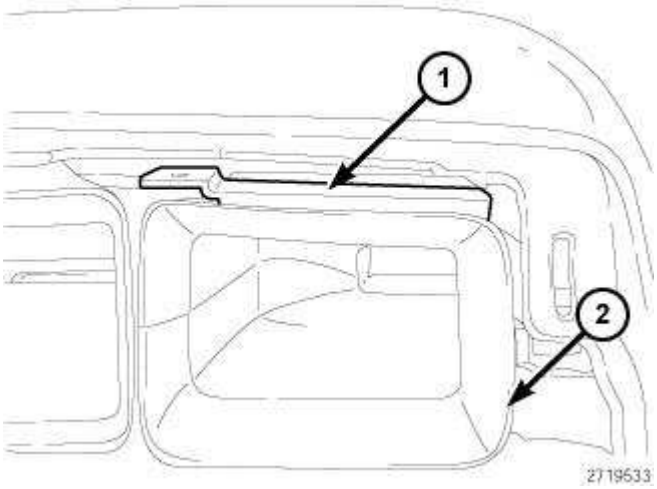

Fig. 45: Identifying Remote Start Antenna And A/C Heating Duct
Courtesy of CHRYSLER GROUP, LLC

39. Remove the remaining adhesive backing from the two sided tape and place the remote start antenna to the top of the air conditioner/heating duct. Press firmly for 30 seconds.

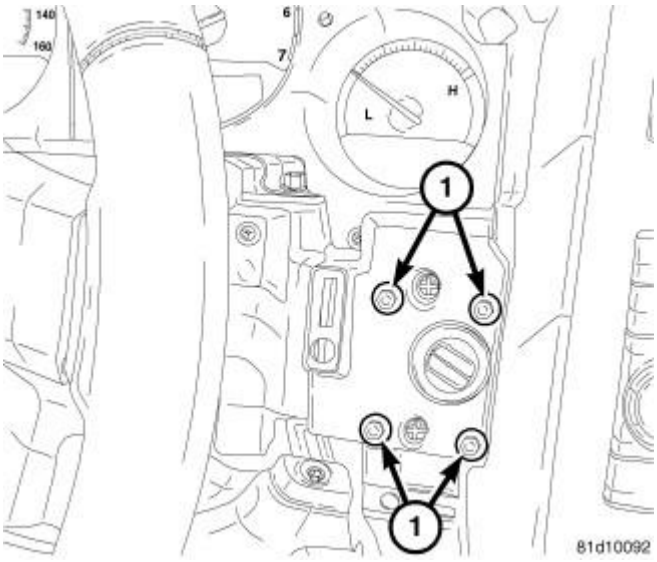

Fig. 46: Wireless Ignition Node Screws
Courtesy of CHRYSLER GROUP, LLC

40. Remove the 4 screws from the WIN (1).

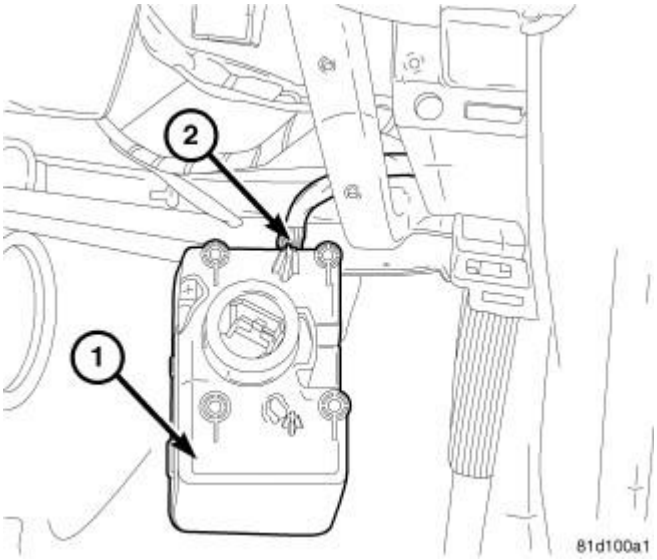

Fig. 47: Wireless Ignition Node
Courtesy of CHRYSLER GROUP, LLC

41. Remove the WIN (1) from the rear of the instrument panel bringing it through the opening below the steering column and disconnect the electrical connector (2) from the WIN. Discard the factory WIN module (1).

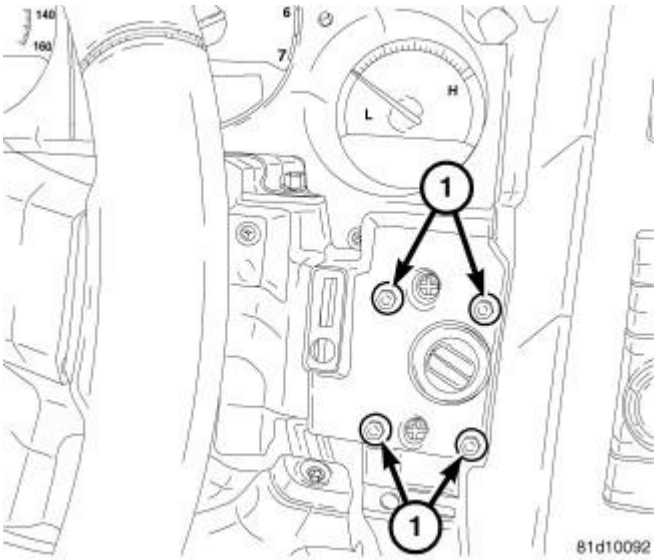

Fig. 48: Wireless Ignition Node Screws
Courtesy of CHRYSLER GROUP, LLC

42. Connect the electrical connector and remote start antenna harness connector to the WIN supplied in the kit.
43. Install the WIN into the instrument panel.
44. Install the four screws (1) securing the WIN to the instrument panel.

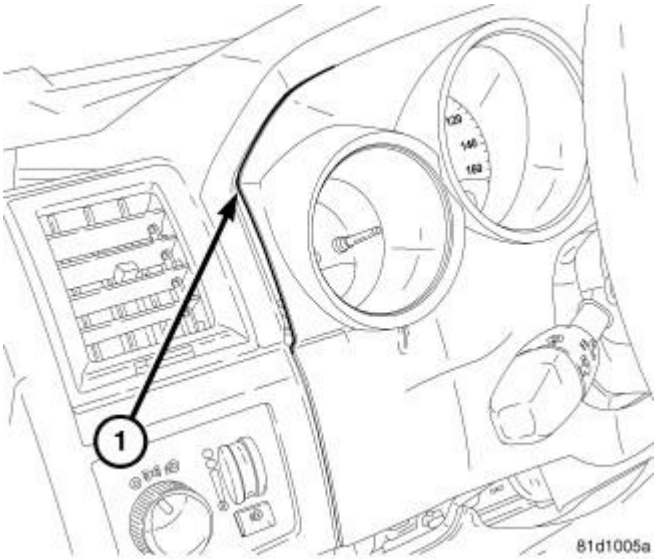

Fig. 49: Edge Of The Trim
Courtesy of CHRYSLER GROUP, LLC

45. Reinstall the center trim/radio bezel.
46. Reinstall the instrument cluster trim.

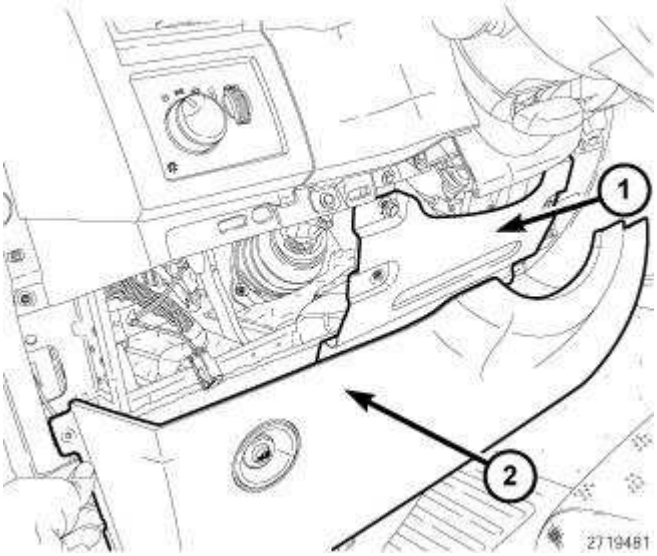

Fig. 50: Identifying Steering Column Cover Reinforcement And Lower Instrument Panel Cover
Courtesy of CHRYSLER GROUP, LLC

47. Install the screws that secure the instrument panel steering column cover reinforcement (1) to the bracket. Tighten the screws securely.
48. Connect the trunk release switch and install the lower instrument panel cover (2).
49. Install and tighten the screw securing the lower instrument panel cover near the hood latch switch.

50. Install and tighten the screw securing the lower instrument panel cover to the left side door opening.
51. Install the trim panel located on the left side door opening.

PROGRAMMING THE WIN

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have the vehicle PIN readily available before running the routine

CAUTION: If the PCM and WIN are replaced at the same time, the PCM MUST be programmed before the WIN.

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select "WIRELESS CONTROL MODULE (WCM)"
   - Select the "MISCELLANEOUS FUNCTIONS" tab
   - Highlight "WIN REPLACED"
   - Select the "Start Misc Function" button
   - Select "NEXT"
   - Enter the PIN when prompted.
   - Select "NEXT"
   - Verify that the PIN number is correct
   - Once verified select "NEXT"
   - Select "NEXT"
   - Note On-Screen instructions and select the "FINISH" button
   - Cycle ignition key after the successful routine completion.

PROGRAMMING IGNITION KEYS TO THE WIN

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have the vehicle PIN readily available before running the routine

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select "WIRELESS CONTROL MODULE (WCM)"
   - Select the "MISCELLANEOUS FUNCTIONS" tab

- Highlight "PROGRAMMING IGNITION KEYS OR KEY FOBS"
- Select "NEXT"
- Enter the PIN when prompted.
- Select "NEXT"
- Verify that the PIN number is correct
- Once verified select "NEXT"
- Note On-Screen instructions and select the "FINISH" button
- Cycle ignition key after the successful routine completion.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned by the WIN. Once a key is learned by a WIN, that key has acquired the Secret Key for that WIN and cannot be transferred to any other vehicle.

ECU RESET

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select "WIRELESS CONTROL MODULE (WCM)"
   - Select the "MISCELLANEOUS FUNCTIONS" tab
   - Highlight "RESET ECU"
   - Note On-Screen instructions and select the "NEXT" button
   - Select "FINISH"

WINDOW CALIBRATION

NOTE: Vehicles equipped with the auto up feature must have the windows calibrated after a battery disconnect.

NOTE: The door must be completely closed when starting this step.

1. Sit in the driver seat and close the door.

2. Lower the window part of the way down.
3. Run the window to the full up position and continue to hold the switch for an additional two seconds.
4. Run the window to the full down position and continue to hold the switch for an additional two seconds.
5. Raise the window to the full up position.
6. Repeat the steps for the remaining windows.

UPDATE PRESSURE THRESHOLDS

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

NOTE: The vehicle must be driven before the TPMS light will turn off.

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have the vehicle PIN readily available before running the routine

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
    - Select the "TIPMCGW"
    - Select the "MISCELLANEOUS FUNCTIONS" tab
    - Highlight and select "UPDATE PRESSURE THRESHOLDS"
    - Note On-Screen instructions and select the "NEXT" button
    - Verify current settings, select the "NEXT" button to change settings
    - Select "NEXT"
    - Enter the PIN when prompted.
    - Select "NEXT"
    - Verify that the PIN number is correct
    - Once verified, select "NEXT"
    - Select "NEXT"
    - Wait for the WCM/WIN to update it's configuration
    - Once the WCM/WIN configuration is complete, select "NEXT"
    - Note On-Screen instructions and select the "FINISH" button

TEMPORARY REMOTE START DISABLE

NOTE: The wiTECH software level must be at the latest release to perform this

procedure.

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. With the wiTECH diagnostic application, perform the following steps:
   - Select the "TIPMCGW"
   - Select the "MISCELLANEOUS FUNCTIONS" tab
   - Highlight and select "TEMPORARY REMOTE START DISABLE"
   - Note On-Screen instructions and select the "NEXT" button
   - Select the "DISABLE" button to activate the remote start function
   - Select "YES" to reset the module and exit the routine, select "NO" to toggle the value back
   - Select "FINISH"

CLEAR ALL DTC'S

NOTE: The wiTECH diagnostic application is the preferred method for clearing all DTC's.

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

ACTIVATE THE REMOTE START

To activate the remote start the vehicle must have been driven at least 35 MPH.

With the vehicle off, and the doors closed and locked, verify the remote start is functioning properly.

CARRIERS AND CARGO HAULING

INSTRUCTION SHEET

TRAILER TOW HARNESS

CHRYSLER 300

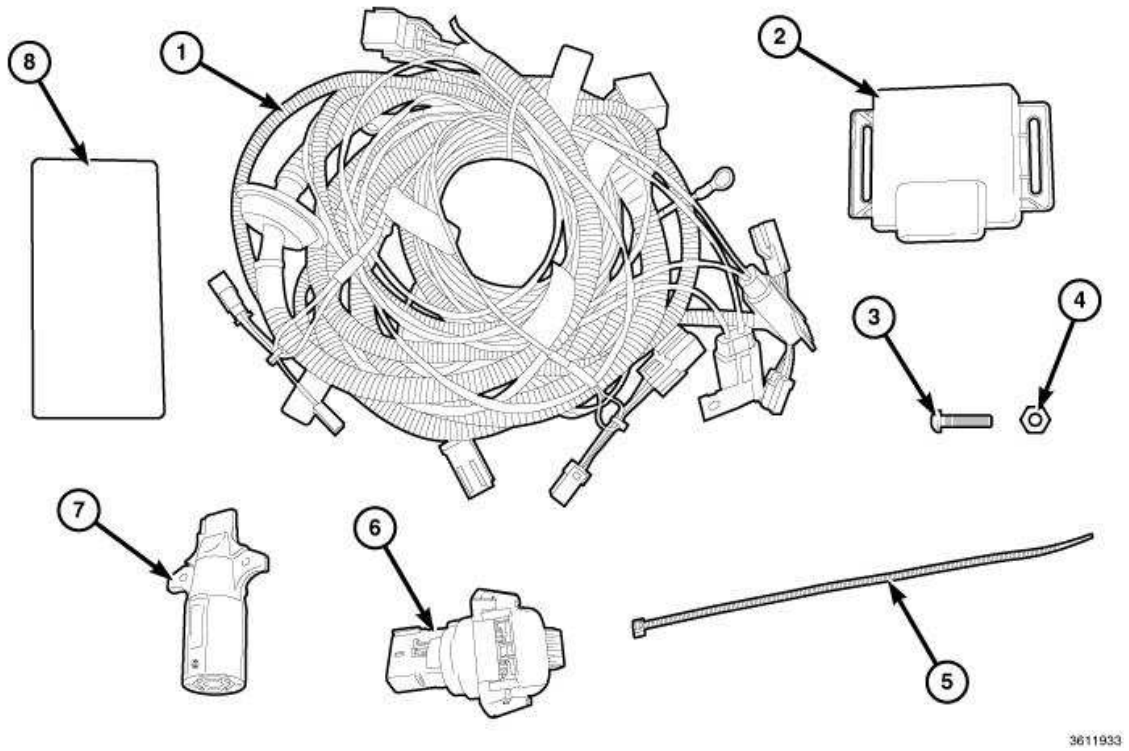

Fig. 51: Trailer Tow Wiring Harness & Other Items
Courtesy of CHRYSLER GROUP, LLC

CALL OUT	DESCRIPTION	QUANTITY
1	Trailer tow wiring harness	1
2	Control Module	1
3	Ten way adapter retaining screw	4
4	Ten way adapter retaining nut	4
5	Tie straps	31
6	Ten way adapter	1
7	7-pin to 4-pin harness adapter	1
8	Foam tape	3

Tools Required			
		41mm (1 5/8	

7mm, 10 mm Socket and Ratchet	Drill	in.) hole saw	RTV silicone
7 mm (9/32 in.) Drill Bit	Small Flat Blade Screwdriver	T20 Torx® Driver	Trim Panel Tool

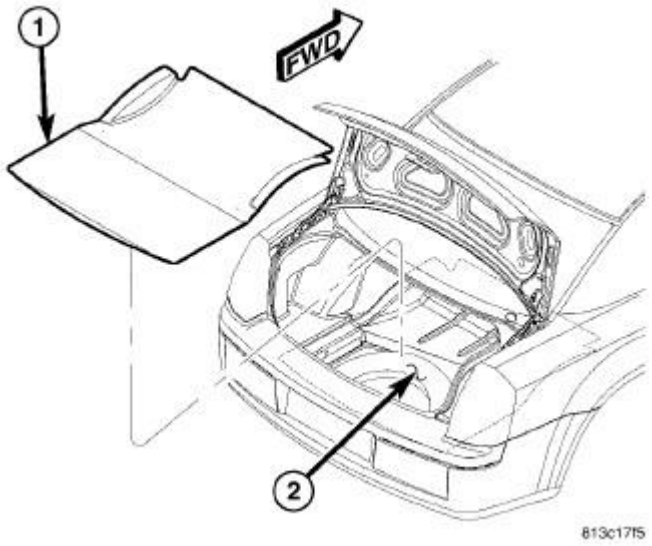

Fig. 52: Spare Tire Cover/Trunk Floor Carpet
Courtesy of CHRYSLER GROUP, LLC

1. Open the vehicle trunk.
2. Remove the spare tire cover/trunk floor carpet (1) from the spare tire well (2).

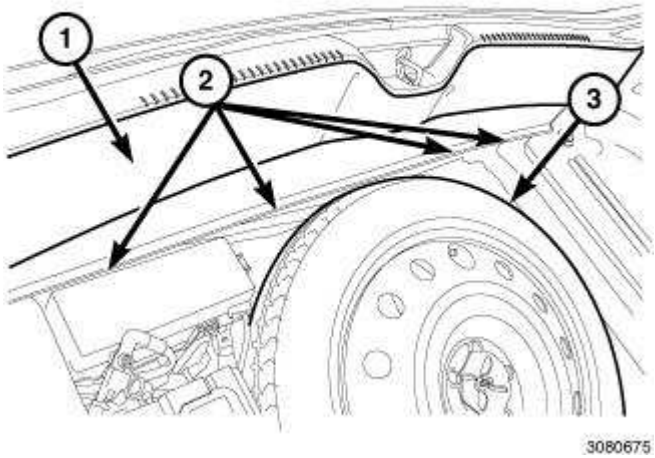

Fig. 53: Spare Tire, Trunk Rear Trim Panel, Four Lower Fasteners & Panel

Courtesy of CHRYSLER GROUP, LLC

3. Remove the spare tire (3).
4. Remove the trunk rear trim panel (1) as follows:
    1. Firmly grasp the bottom of the panel (1) on both sides and pull inward to disconnect the four lower fasteners (2, under panel).
    2. With the bottom fasteners disconnected pull up on the panel (1) to disconnect the upper fasteners and remove the panel from the vehicle.

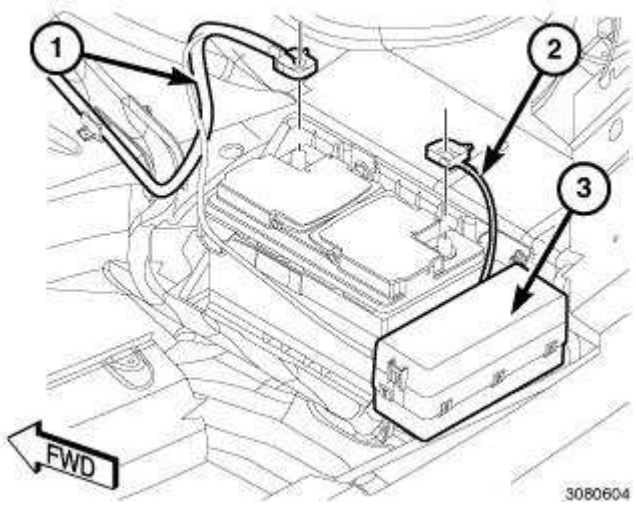

Fig. 54: Battery Negative & Positive
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect both the battery negative (2) and positive (1) cables.

DECKLID COVER REMOVAL

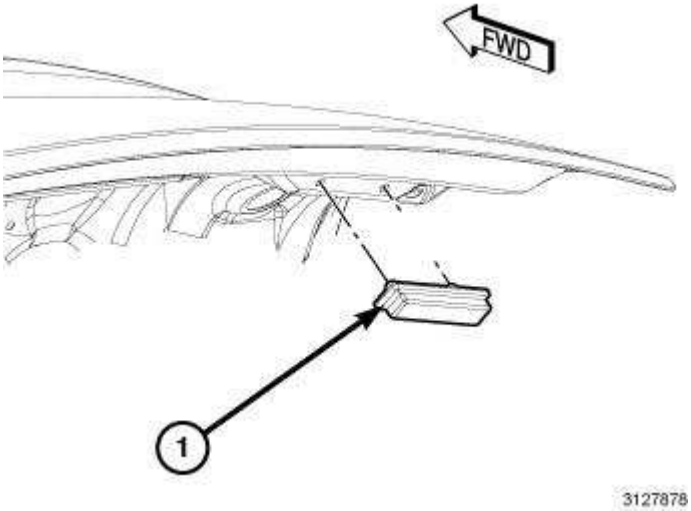

Fig. 55: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two screws from the trunk lid handle (1) and remove the handle from the decklid.

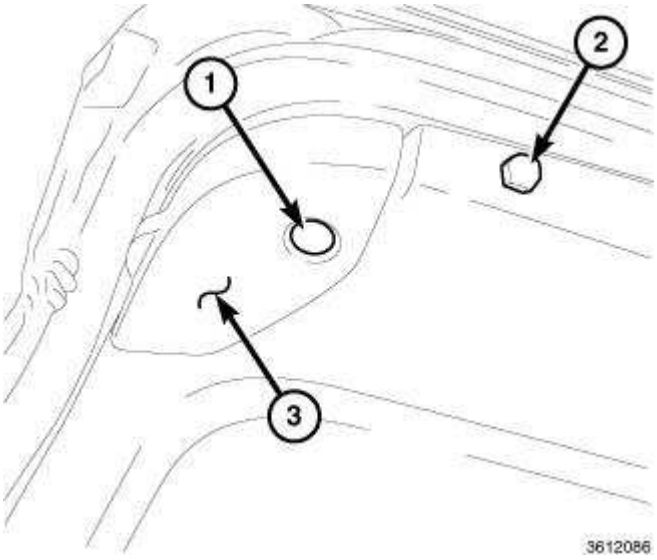

Fig. 56: Pushpin, Decklid Corner Trim Piece & Decklid Corner Trim Piece
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform 7 and8 on both sides of the decklid.

7. Remove the pushpin (1) and remove the decklid corner trim piece (2).
8. Unscrew the decklid bumper (2) and remove from the vehicle.

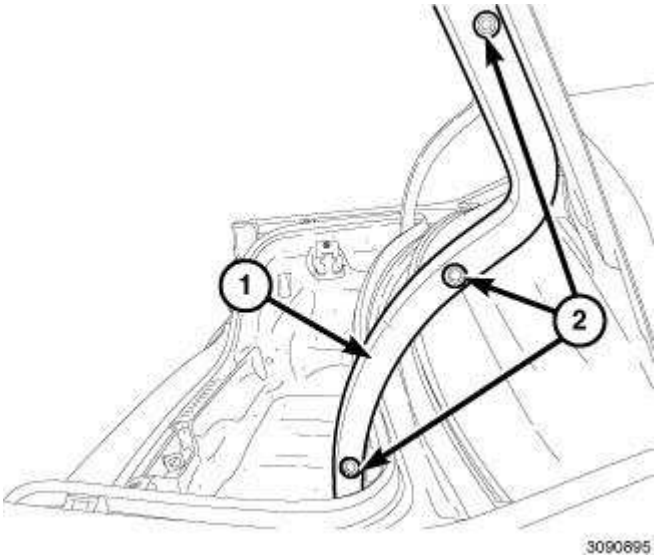

Fig. 57: RH Hinge Trim Push-In Fasteners & Hinge Trim
Courtesy of CHRYSLER GROUP, LLC

9. Remove the hinge trim push-in fasteners (2) and remove the hinge trim (1) on the right hand side of the trunk.

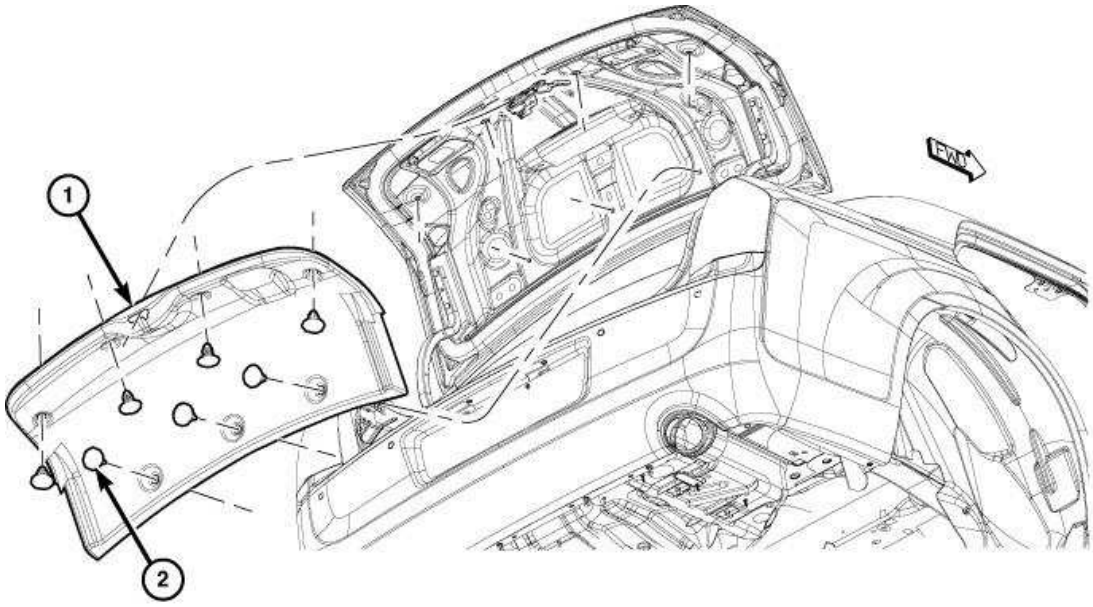

Fig. 58: Push-In Retainers & Decklid Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle must be routed through the decklid cover.

10. Remove the push-in retainers (2) securing the decklid cover (1) to the decklid.

INNER TRUNK PANELS: RIGHT REMOVED AND LEFT LOOSENED

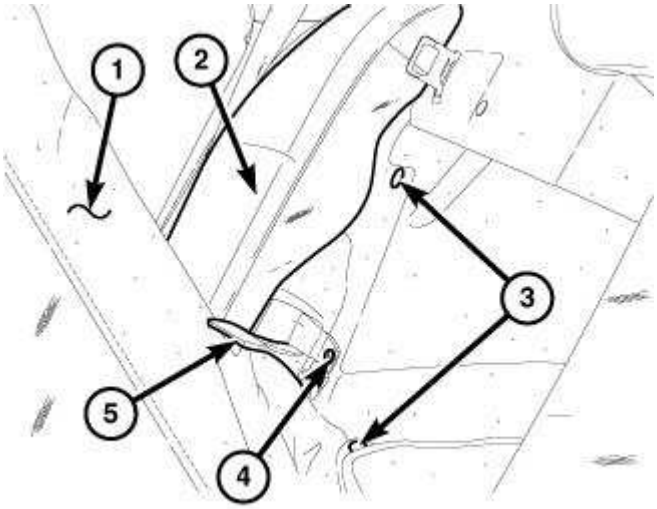

Fig. 59: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Pull the right hand rear seat back (1) forward, exposing the luggage compartment.
12. Behind the right hand rear seat, pull the carpet tab (5) up, exposing the rear seat back side bolster bracket retaining bolt (4).
13. Remove the right hand rear seat back side bolster bracket bolt (4).
14. Remove the push-in fasteners (3) that secure the trunk side trim.

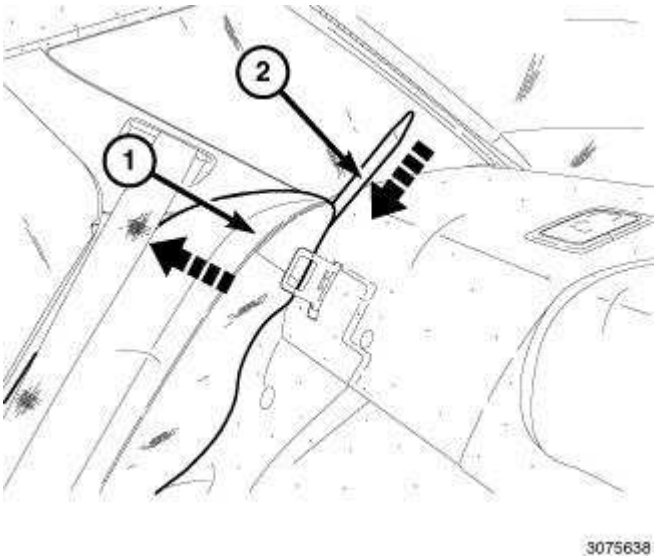

Fig. 60: Trim Stick & Seat Back Bolster
Courtesy of CHRYSLER GROUP, LLC

15. Using (special tool #C-4755, Trim Stick) (2), push down between the rear shelf and the right hand rear seat back bolster (1) to release the retaining clip, and pull out on the seat back bolster (1) to remove.

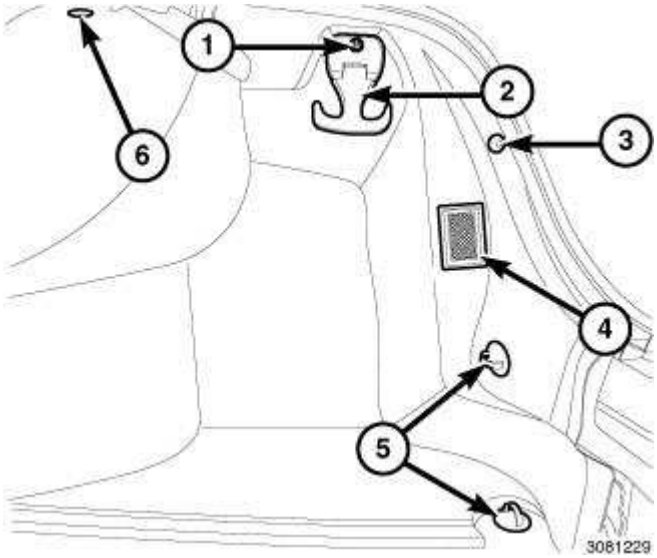

Fig. 61: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

16. Remove the cargo net hook screw (1) and upper cargo hook (2) on both sides.
17. Remove the push-in retainers (3) for the wheel well cover on both sides.
18. On the right hand side only, remove the forward push-in retainer (6) for the wheel well cover.
19. Remove the cargo net lower hooks (5) on both sides.
20. Carefully pull back the wheel well cover enough to disconnect the trunk lamp (4) harness connector and expose the tail light connectors on both sides.
21. On the right hand side, remove the wheel well cover.

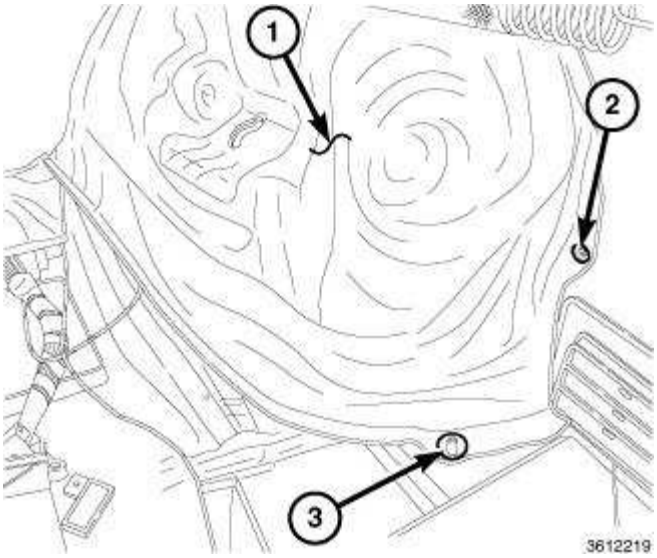

Fig. 62: Push-In Retainer, Inner Trunk Insulator & Plastic Retainer
Courtesy of CHRYSLER GROUP, LLC

22. Remove the push-in retainer (2) securing the inner trunk insulator (1) to the body.

23. Unscrew the plastic retainer (3) from the floor of the trunk.
24. Remove the inner trunk panel (1) from the vehicle.

DRILLING THE PASS THROUGH HOLE

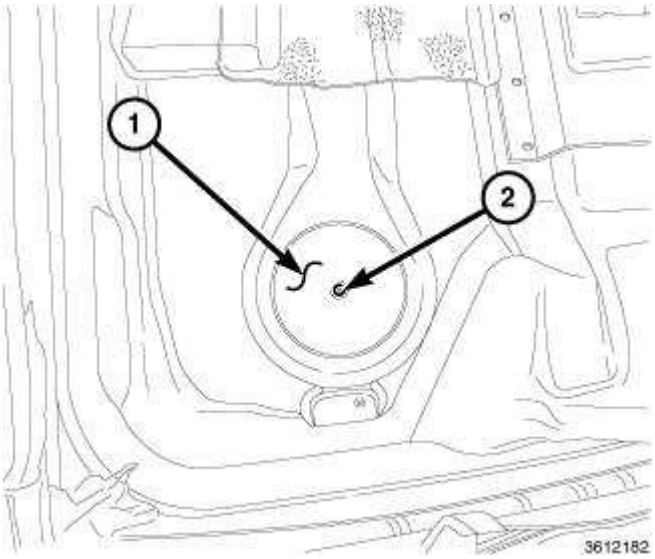

Fig. 63: Center Of The Plug & Identify The Plug
Courtesy of CHRYSLER GROUP, LLC

NOTE: The center of the plug (2) will be used in to center the hole saw to drill the required hole. Refer to 26.

25. Identify the plug (1) in the left hand rear corner of the trunk.

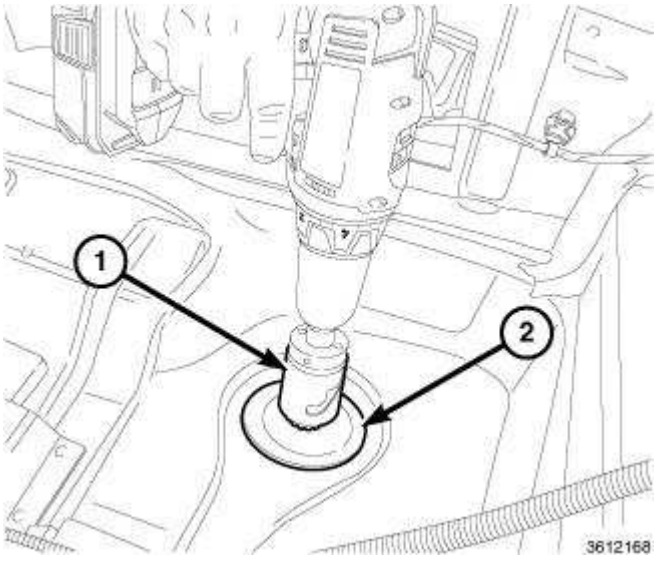

Fig. 64: Hole Saw & Plug
Courtesy of CHRYSLER GROUP, LLC

26. Using a 41mm (1 5/8 in.) hole saw (1), drill a hole in the plug (2) in the rear left hand corner of the trunk.
27. De-burr the hole.

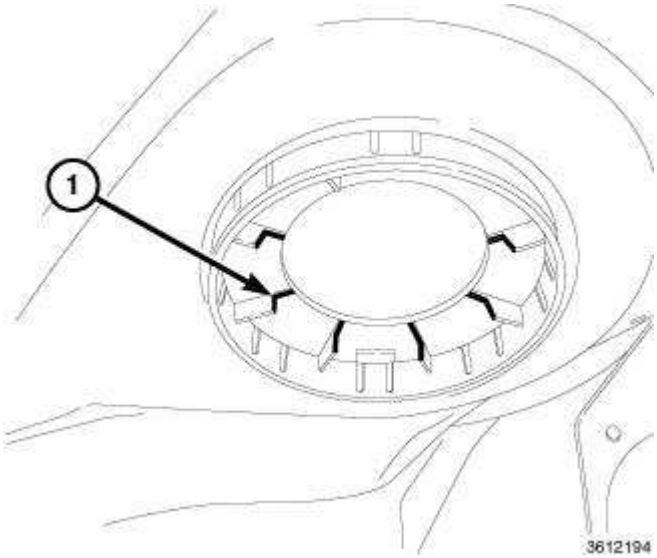

Fig. 65: Tabs
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the tabs (1) are not trimmed and made flush with the bottom of the plug, the wiring harness grommet will not seal and water may get into the trunk.

28. Raise and support the vehicle.
29. On the underside of the plug, cut each tab (1) back 8 mm (3/16 inch) and make flush with the bottom side of the plug.
30. Lower the vehicle.

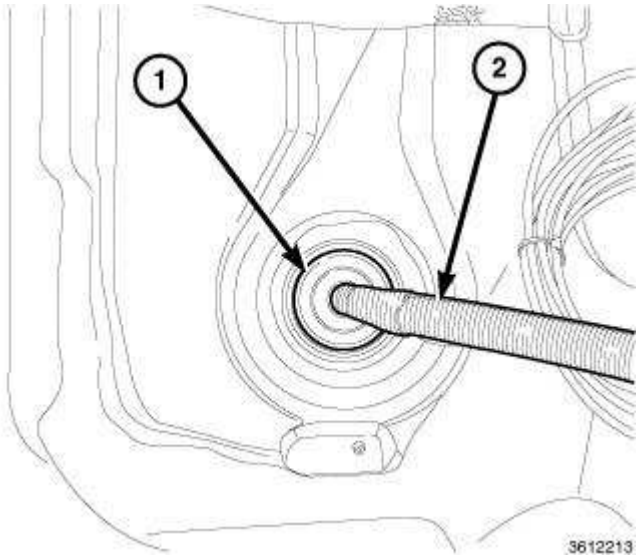

Fig. 66: Grommet, Connector And Harness
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply RTV silicone to sealing area of grommet just before seating.

31. From inside the trunk, feed the connector and harness (2) through the drilled hole and seat the grommet (1).

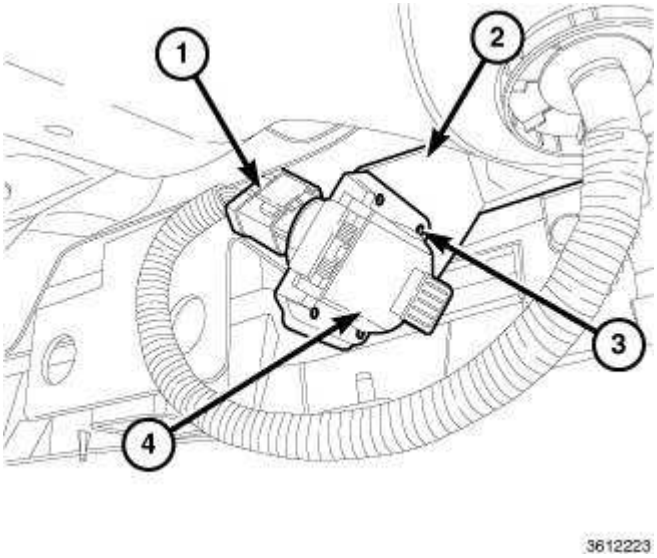

Fig. 67: Ten Way Adapter, Hitch Bracket & Retaining Screws
Courtesy of CHRYSLER GROUP, LLC

32. Raise and support the vehicle.
33. Position and secure the ten way adapter (4) to the trailer hitch bracket (2) with the four adapter retaining screws (3) and nuts (not shown).
34. Install the wiring harness connector (1) to the ten way adapter (4).

MODULE MOUNTING

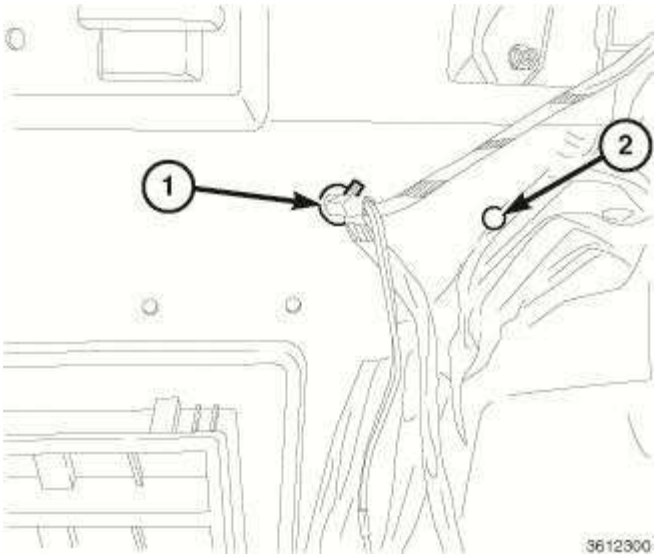

Fig. 68: Clip & Hole
Courtesy of CHRYSLER GROUP, LLC

35. On the right side of the trunk, remove the clip (1) from the body using an appropriate tool.
36. Drill a 7 mm (9/32 in.) hole in the location shown in illustration (2).

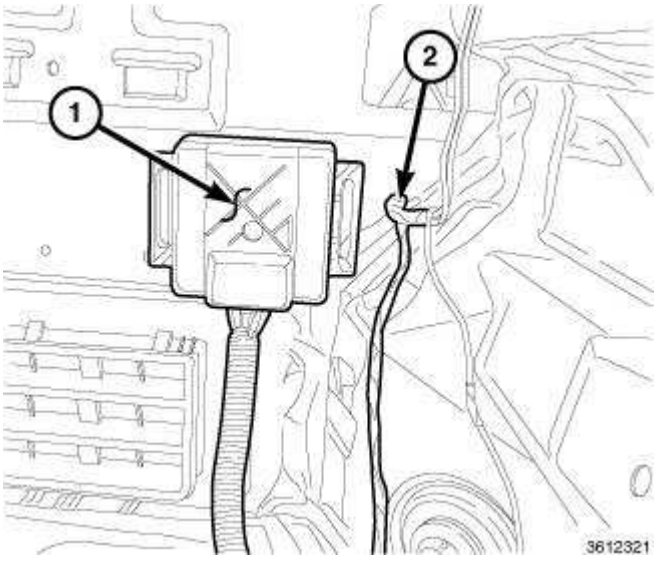

Fig. 69: Wiring Clip & Control Module
Courtesy of CHRYSLER GROUP, LLC

37. Route the trailer tow wiring harness along the back of the spare tire tub and secure with tie straps to the existing wiring harness.
38. Install the wiring clip (2) in the hole that was drilled in the previous step.
39. Remove the adhesive backing from the control module (1) and install in the location shown in illustration.

40. Press firmly on the control module to make sure it is secured to the right trunk wall.

HARNESS ROUTING AND CONNECTIONS

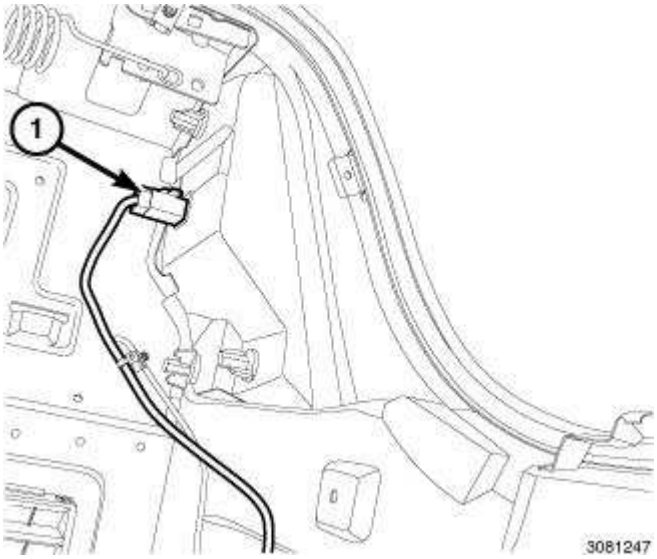

Fig. 70: Tail Lamp Connector
Courtesy of CHRYSLER GROUP, LLC

41. Disconnect the tail lamp connector (1) on both sides.

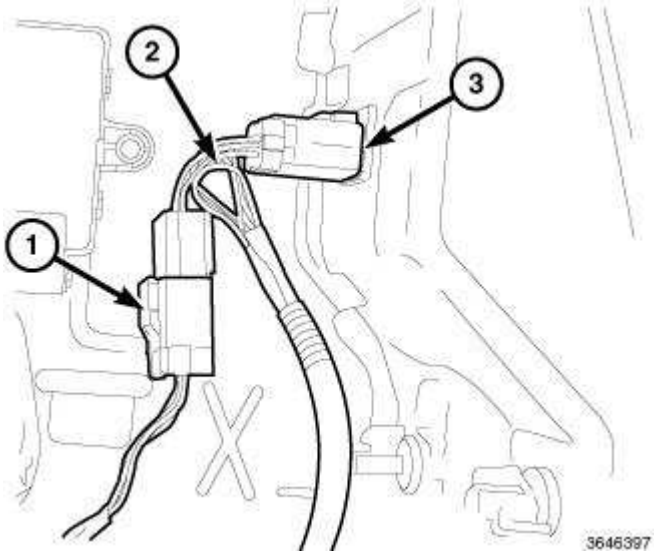

Fig. 71: Trailer Tow Harness, Tail Lamp Connector & Factory Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform 42 through45on both sides of the vehicle.

42. Route the trailer tow harness (2) to the tail lamp.

43. Connect the factory harness connector (1) to the trailer tow wiring harness.
44. Install the trailer tow harness connector to the tail lamp connector (3).
45. After making the connections, place a piece of foam tape over the connection of the factory wiring to the trailer tow harness. This will prevent any noise or chafing issues.

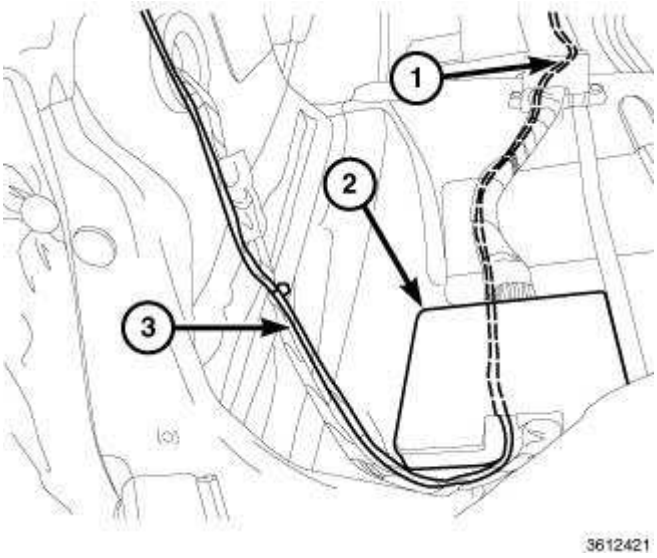

Fig. 72: Lids & Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

46. Remove the lids (1, 2) from the junction boxes on the trunk floor.
47. Route the trailer tow wiring harness (3) around the battery and through the junction boxes.
48. Continue to route the trailer tow harness along the existing harness and secure with tie straps.
49. Replace the lids of the junction boxes and snap into place.

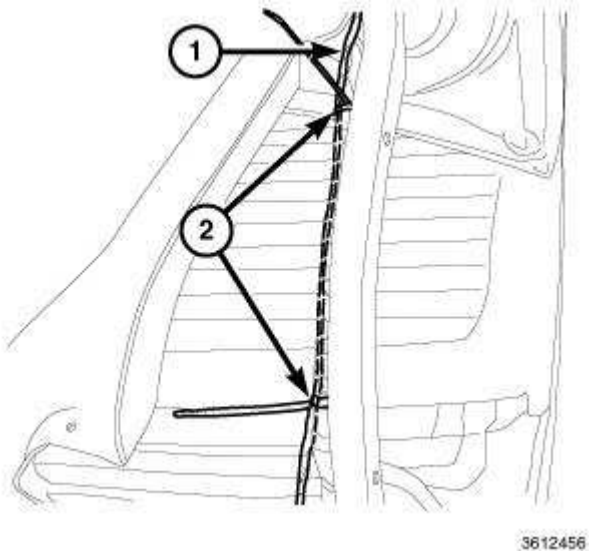

Fig. 73: Trailer Tow Harness & Tie Straps
Courtesy of CHRYSLER GROUP, LLC

50. Route the trailer tow harness (1) up the trunk support beam and secure with tie straps (2). Do not fully tighten the tie straps until the wiring harness has been fully routed in case the location needs to be adjusted.

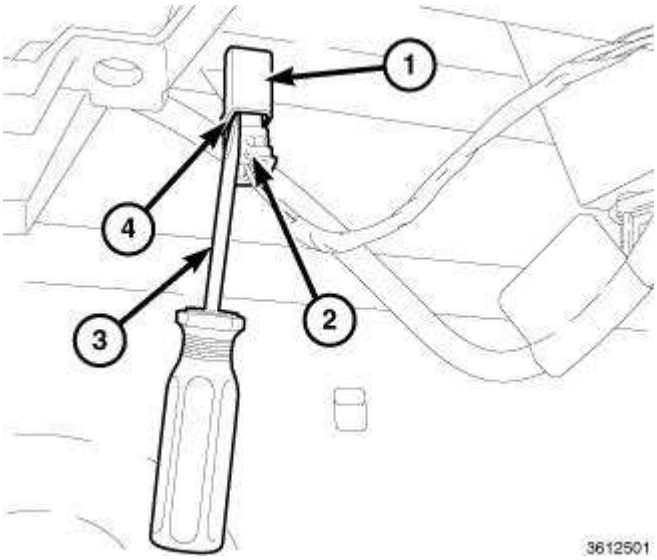

Fig. 74: Flat Screwdriver & Tab
Courtesy of CHRYSLER GROUP, LLC

51. Disconnect the center high mount stop lamp (CHMSL) connector (2) from the lamp (1). It may be necessary to use a small, flat screwdriver (3) between the tab (4) and connector to separate the connector from the lamp.

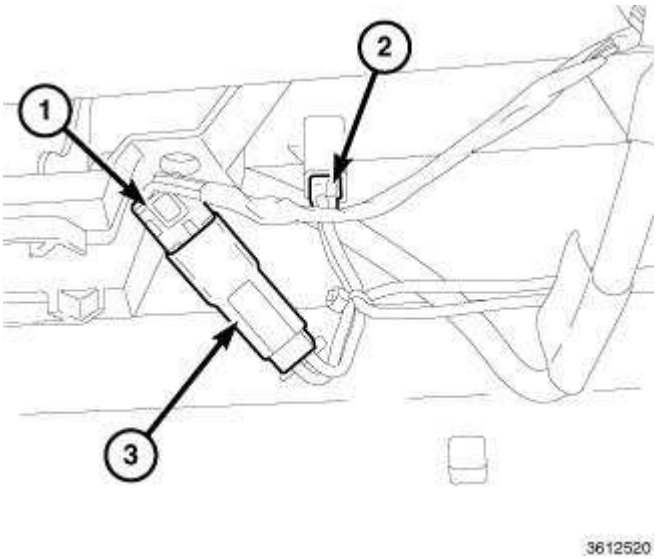

Fig. 75: Stop Lamp (CHMSL) Connector & Lamp
Courtesy of CHRYSLER GROUP, LLC

52. Connect the CHMSL factory wiring (1) to the trailer tow wiring harness (3).
53. Install the trailer tow connector (2) to the CHMSL.

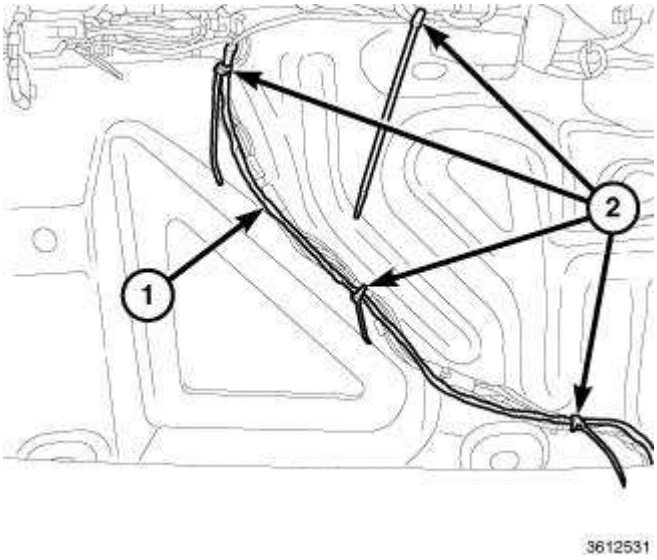

Fig. 76: Trailer Tow Harness & Tie Straps
Courtesy of CHRYSLER GROUP, LLC

54. Secure the trailer tow harness (1) to the existing harness with tie straps (2). After final wire routing, trim tie straps.

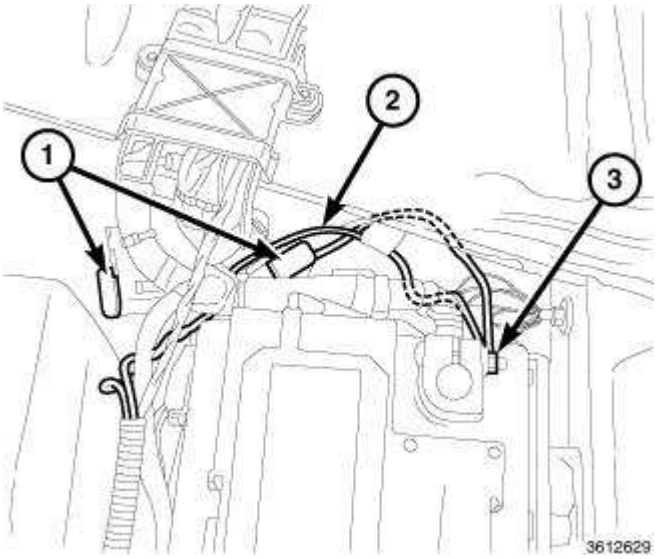

Fig. 77: Power Wires, Nut & Fuse Holders
Courtesy of CHRYSLER GROUP, LLC

55. Route the power wires (2) to the battery and secure the wires to the positive terminal with the nut (3).
56. Route the fuse holders (1) and secure to the existing harness with tie straps.

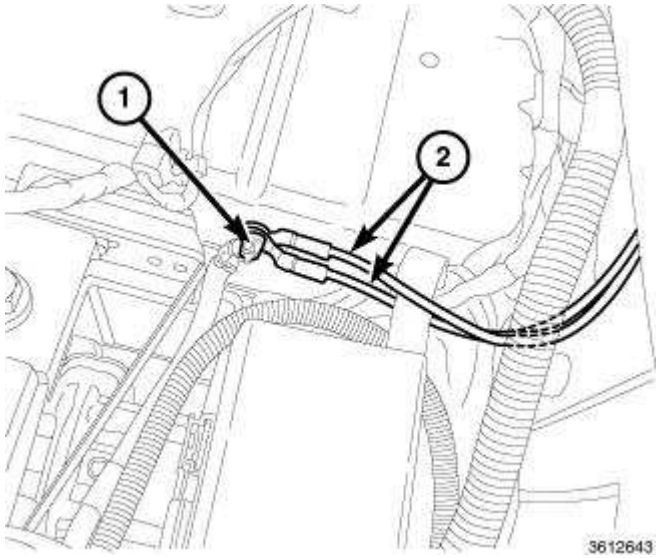

Fig. 78: Ground Wires & Existing Nut
Courtesy of CHRYSLER GROUP, LLC

57. Route the ground wires (2) from the trailer tow harness to the ground stud near the battery.
58. Secure the ground wires to the stud with the existing nut (1).

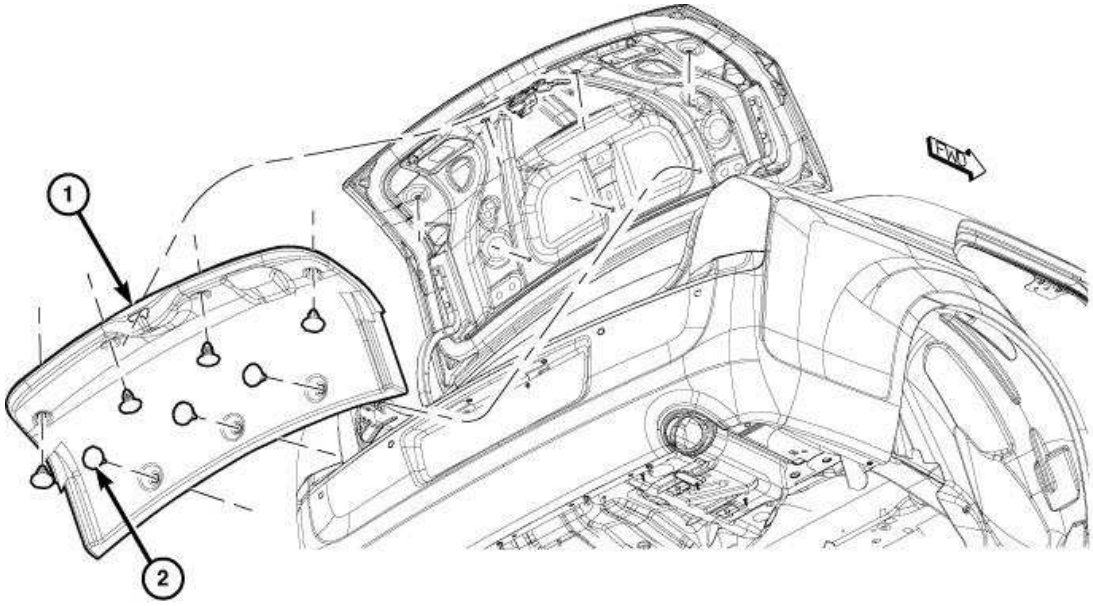

Fig. 79: Push-In Retainers & Decklid Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The manual trunk release handle must be routed through the decklid cover.

59. Position the decklid cover (1).
60. Install the push-in retainers (2) securing the decklid cover (1) to the decklid.

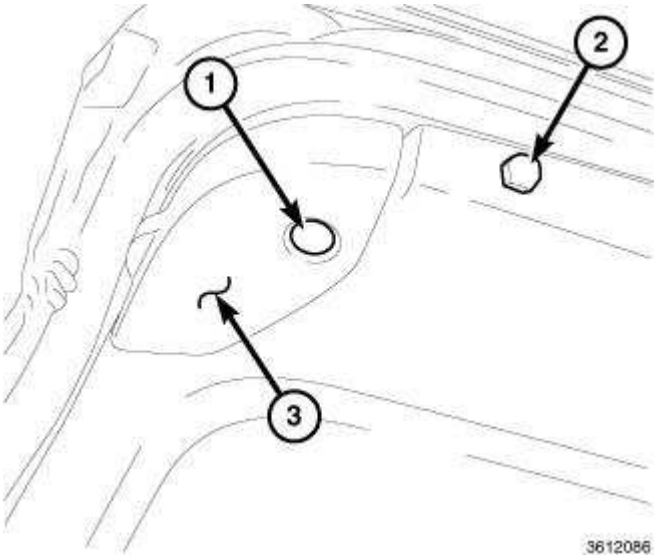

Fig. 80: Pushpin, Decklid Corner Trim Piece & Decklid Corner Trim Piece
Courtesy of CHRYSLER GROUP, LLC

61. Install decklid corner trim piece (3) and secure with the push pin (1).
62. Screw on the decklid bumper (2).

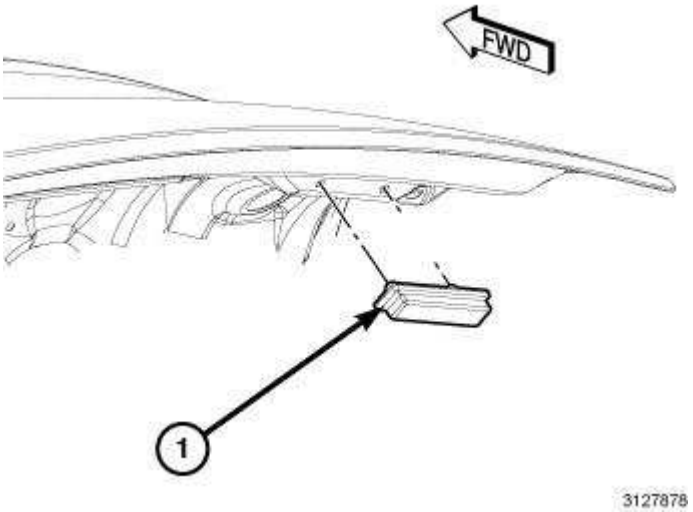

Fig. 81: Trunk Lid Handle
Courtesy of CHRYSLER GROUP, LLC

63. Install the decklid handle (1) and install the two retaining screws.

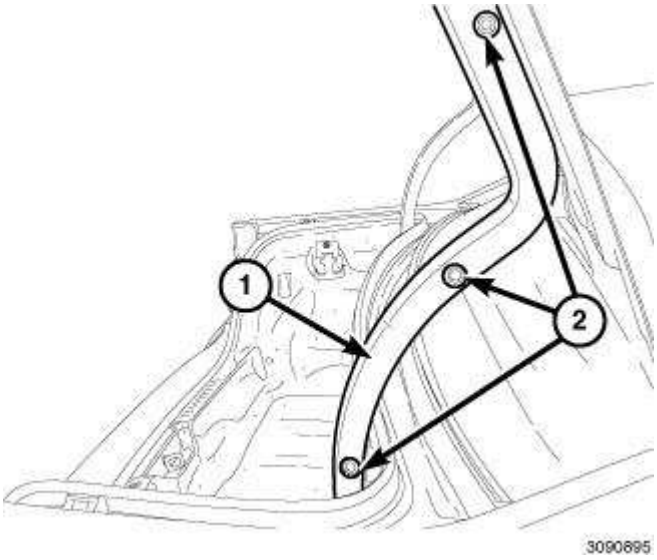

Fig. 82: RH Hinge Trim Push-In Fasteners & Hinge Trim
Courtesy of CHRYSLER GROUP, LLC

64. Install the decklid hinge trim piece (1) and secure with push pin fasteners (2).

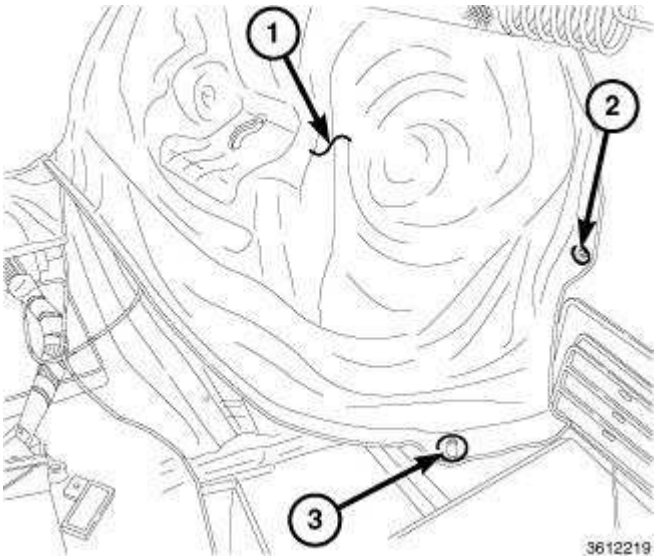

Fig. 83: Push-In Retainer, Inner Trunk Insulator & Plastic Retainer
Courtesy of CHRYSLER GROUP, LLC

65. Install the inner trunk panel (1) into the vehicle.
66. Install the push-in retainer (2) securing the inner trunk insulator (1) to the body.
67. Tighten the plastic retainer (3) to the stud on the floor of the trunk.

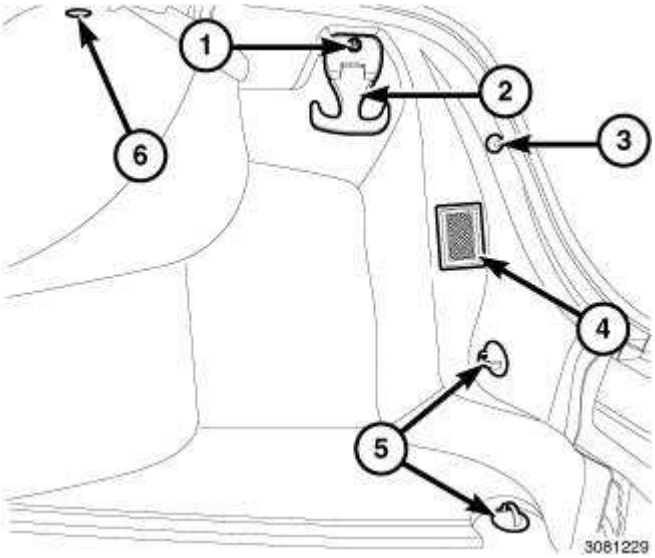

Fig. 84: Hook Screw, Upper Cargo Hook & Push-In Retainer, Hooks & Trunk Lamp
Courtesy of CHRYSLER GROUP, LLC

68. Carefully position the wheel well cover on both sides and connect the trunk lamp (4) connectors.
69. Install the cargo net lower hooks (3) on both sides.
70. Install the cargo net hook screw (1) and upper cargo hook (2) on both sides.
71. Install the push-in retainers (3) for the wheel well cover on both sides.

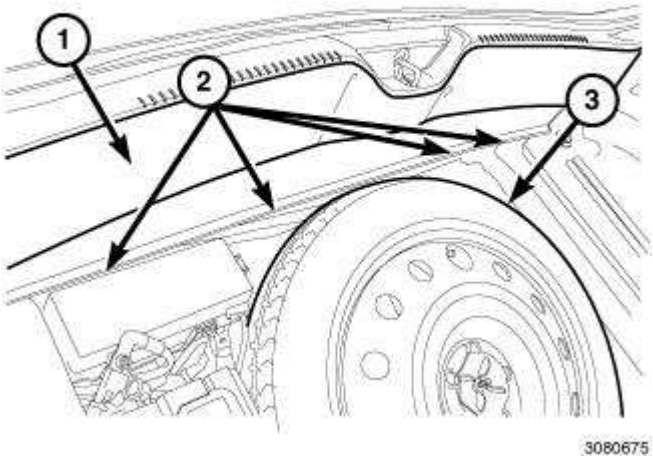

Fig. 85: Spare Tire, Trunk Rear Trim Panel, Four Lower Fasteners & Panel
Courtesy of CHRYSLER GROUP, LLC

72. Install the rear trunk trim panel (1) as follows:
    1. Position the rear trunk trim panel (1) and push down to engage the upper fasteners (not shown).
    2. With the four lower fasteners (2, under panel) aligned, firmly push on each to properly

seat.

73. Install the spare tire (3).

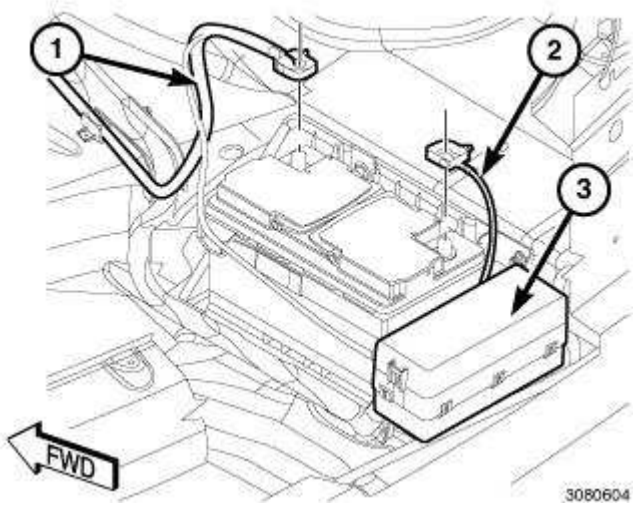

Fig. 86: Battery Negative & Positive
Courtesy of CHRYSLER GROUP, LLC

74. Connect both the battery negative (2) and positive (1) cables.

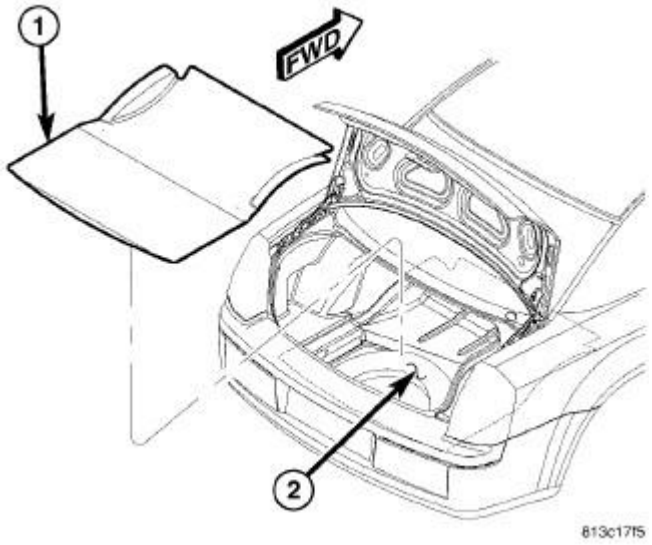

Fig. 87: Spare Tire Cover/Trunk Floor Carpet
Courtesy of CHRYSLER GROUP, LLC

75. Install the spare tire cover/trunk floor carpet (1) into the spare tire well (2).

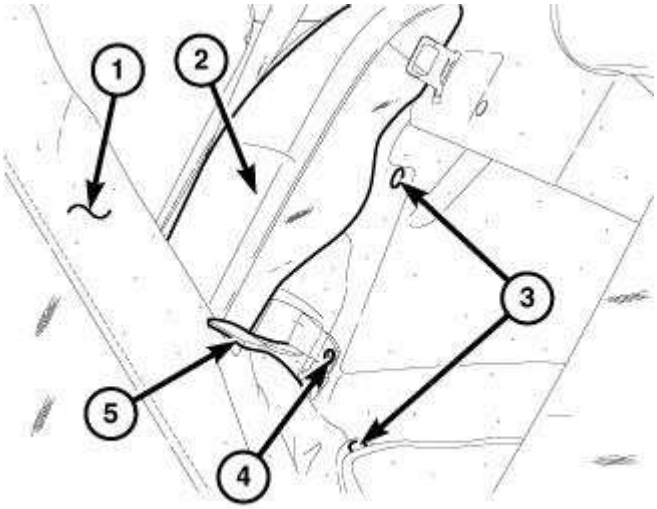

Fig. 88: RH Rear Seat Back, Carpet Tab, Bolt & Fasteners
Courtesy of CHRYSLER GROUP, LLC

76. Position the rear seat bolster (2), push rearward to engage the retaining clip between the rear shelf and the bolster.
77. Install the push-in fasteners (3) that secure the trunk side trim.
78. Install the right hand rear seat back side bolster bracket bolt (4).
79. Verify the system operates correctly.

DRIVING CONVENIENCE

INSTRUCTION SHEET

3.6L ENGINE BLOCK HEATER

CHRYSLER 300C / DODGE CHARGER

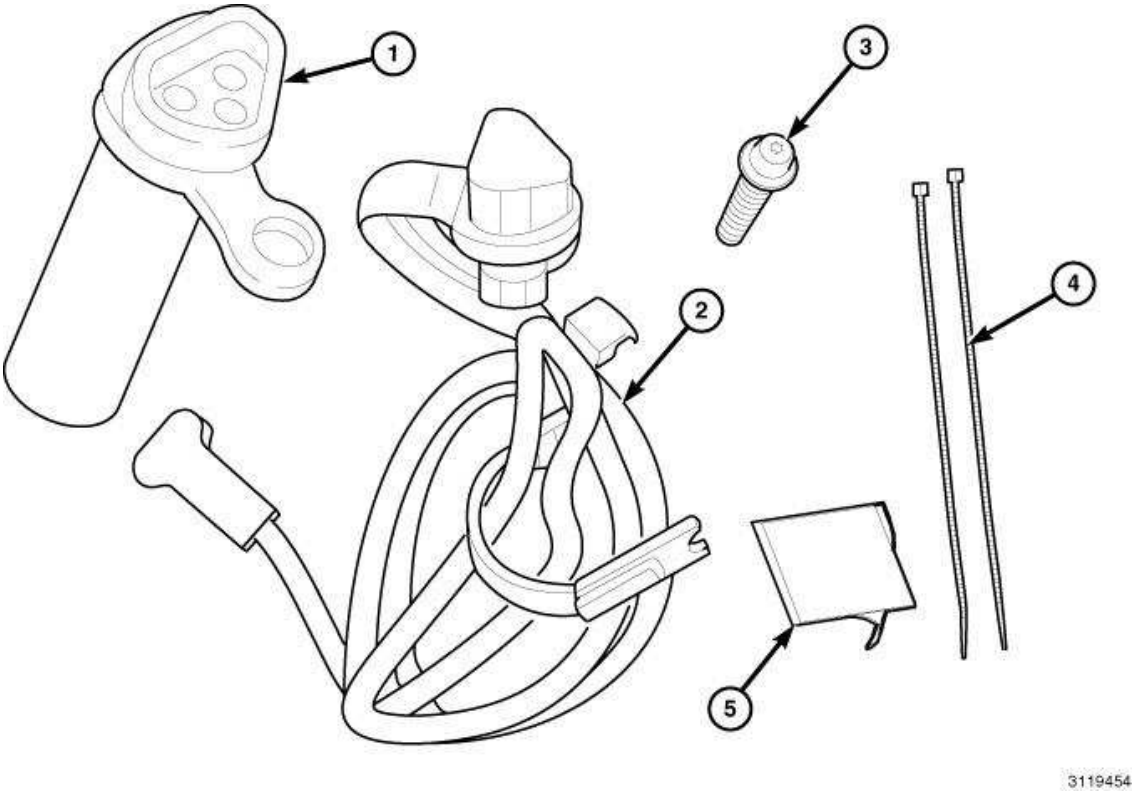

Fig. 89: Engine Block Heater, Cord, Bolt, Tie Straps & Tape Patch
Courtesy of CHRYSLER GROUP, LLC

CALL OUT	DESCRIPTION	QUANTITY
1	Engine Block Heater	1
2	Cord	1
3	Bolt	1
4	Tie Straps	2
5	Tape Patch	2

TOOLS REQUIRED		
Front End Cutters	T-30, 8mm, 13mm, 17mm Socket/Rachet/Wrench	Hoist
Flat Bladed, Phillips Screwdrivers	Trim Pad Pry Tool	Small Pick Tool

NOTE: It is recommended the installer/technician read the instructions thoroughly prior to installation of this product.

PROCEDURE STEPS

The heater block is located on the driver side towards the front of the engine.

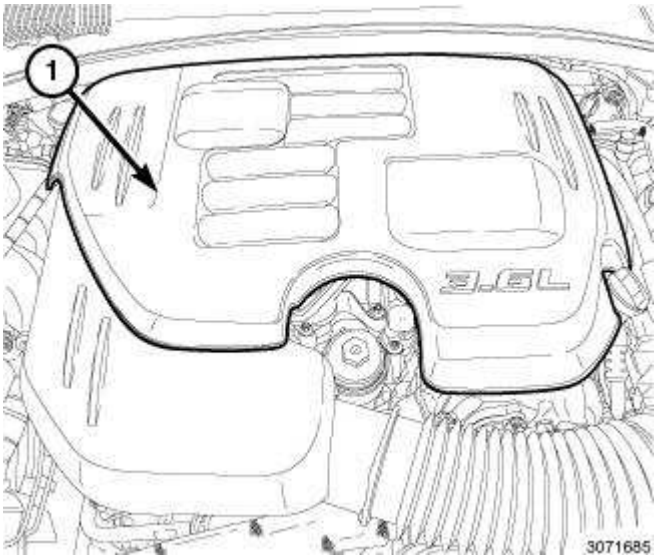

Fig. 90: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable located in the trunk near the spare tire.
2. Open the hood.
3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

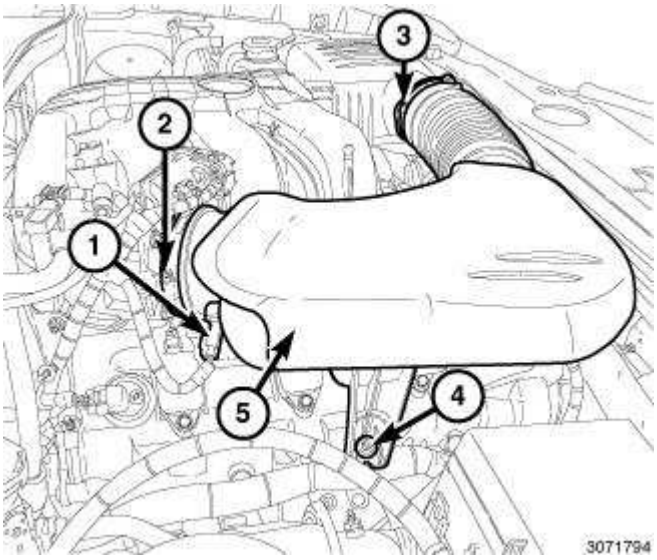

Fig. 91: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) Sensor.
5. Using a screwdriver, loosen the clamp (2) at the throttle body.
6. Using a screwdriver, loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).

8. Remove the air inlet hose assembly (5).

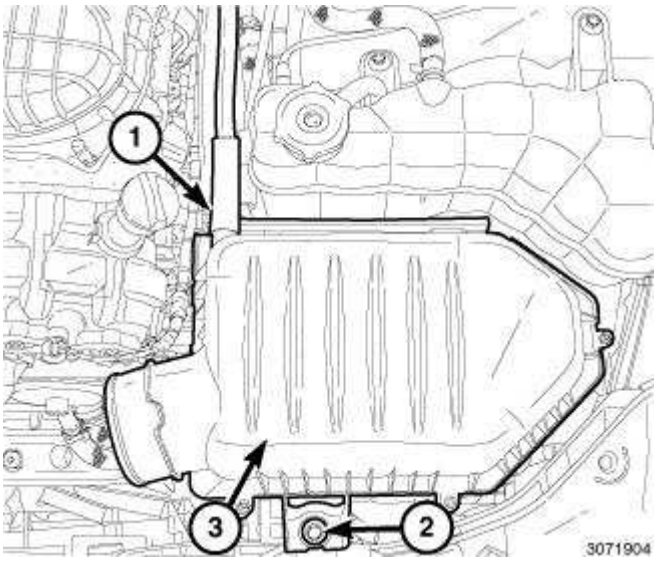

Fig. 92: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the hose (1) from the air cleaner housing.
10. Using a 8mm socket/ratchet, remove the air cleaner housing retaining bolt (2).
11. Remove the air cleaner housing (3).

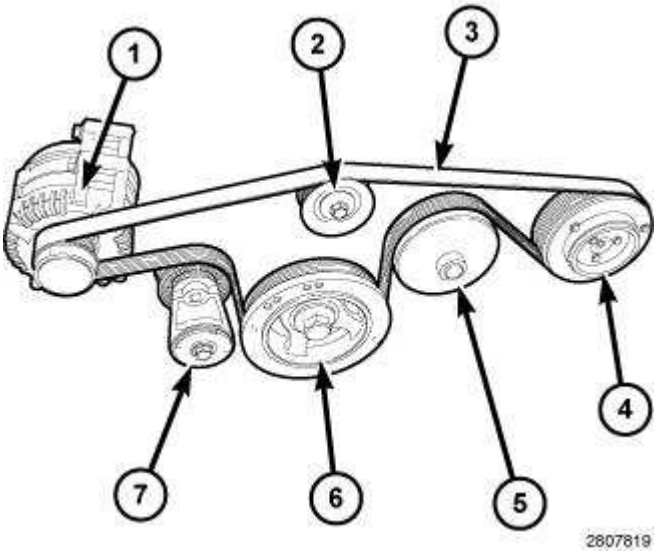

Fig. 93: New Belt, Idler Pulley, Tensioner Arm, Belt, Idler & Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

12. Rotate the belt tensioner (7) until it contacts its stop. Remove the belt (3) from the A/C compressor pulley (4), then slowly rotate the tensioner (7) into the freearm position.

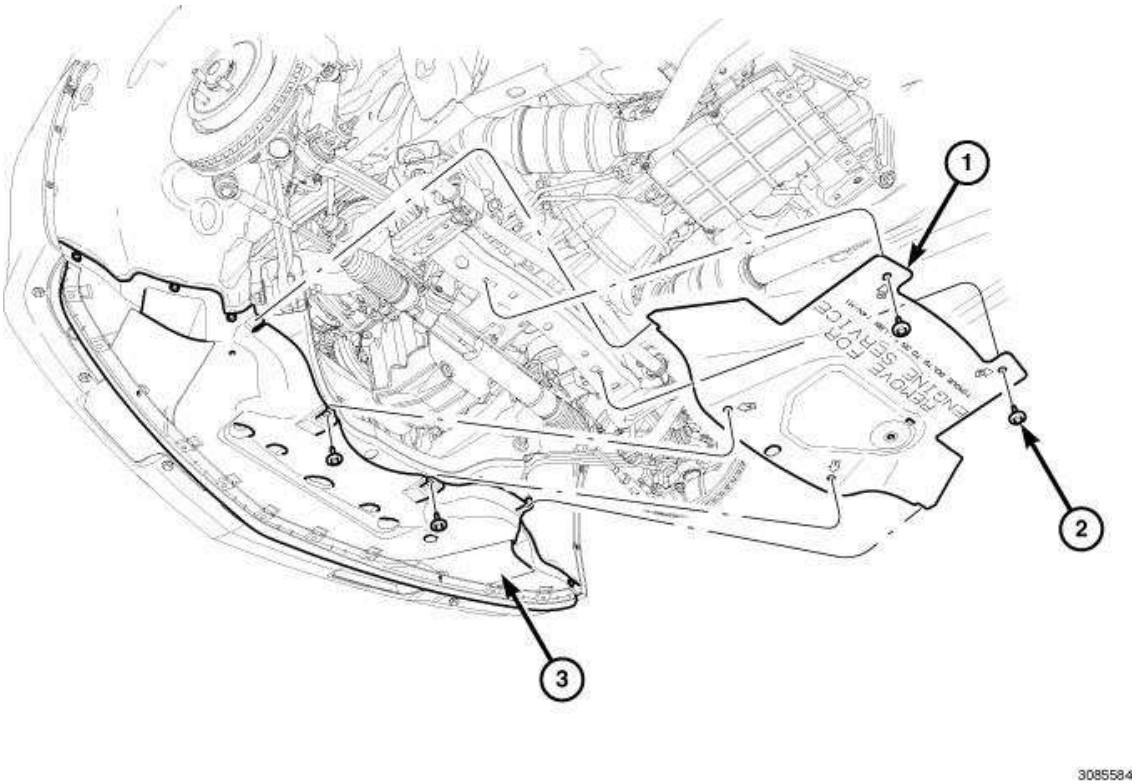

Fig. 94: Four Fasteners, Rear Belly Pan & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

13. Raise and support the vehicle.
14. Using a 17mm socket/ratchet, remove the four fasteners (1) that secure the rear belly pan (1) to the underside of the vehicle.
15. Pull the rear belly pan (1) rearward out of the from the front belly pan (3) to remove from the vehicle.

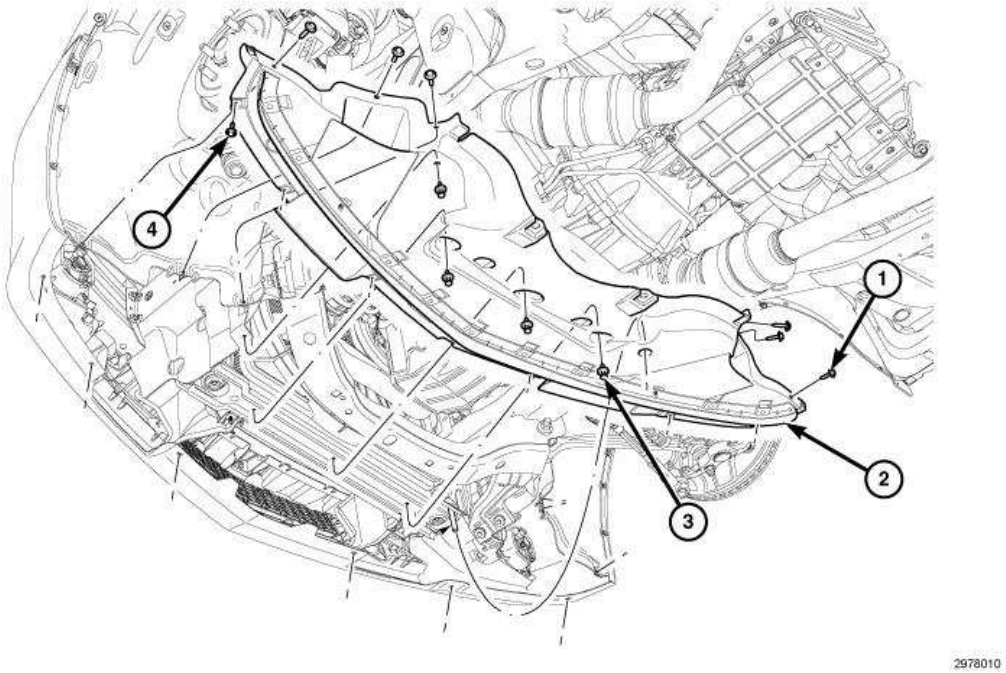

Fig. 95: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

16. Using a phillips screwdriver, remove the six screws (4) that secure the front belly pan (2) to the underside of the vehicle's front fascia.
17. Using a phillips screwdriver, remove the three screws (1) that secure the front belly pan (2) to the lower edge of the vehicle's wheelhouse/wheelwell splash shield. Repeat for the other side.
18. Using a small pick tool and pry tool, remove the four push pin fasteners (3) that secure the front belly pan (2) to the underside of the vehicle's lower crossmember. Repeat for the other side.
19. Remove the front belly pan (2) from the underside of the vehicle.

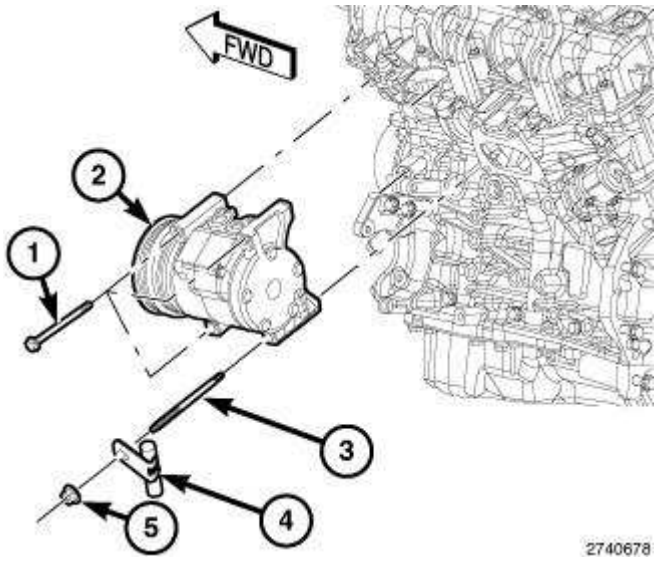

Fig. 96: A/C Compressor, Nut, Stud & Three Bolts
Courtesy of CHRYSLER GROUP, LLC

20. Disconnect the engine wire harness from the A/C compressor (2).
21. Using a 13mm socket/ratchet/wrench, remove the nut (5) and position the heater tube bracket (4) out of the way.
22. Support the A/C compressor, remove the stud (3) and the three bolts (1) using a 13mm socket/ratchet/wrench.
23. Reposition the A/C compressor (2) away from the engine.

NOTE: The A/C compressor may be repositioned without disconnecting the refrigerant lines or discharging the refrigerant system.

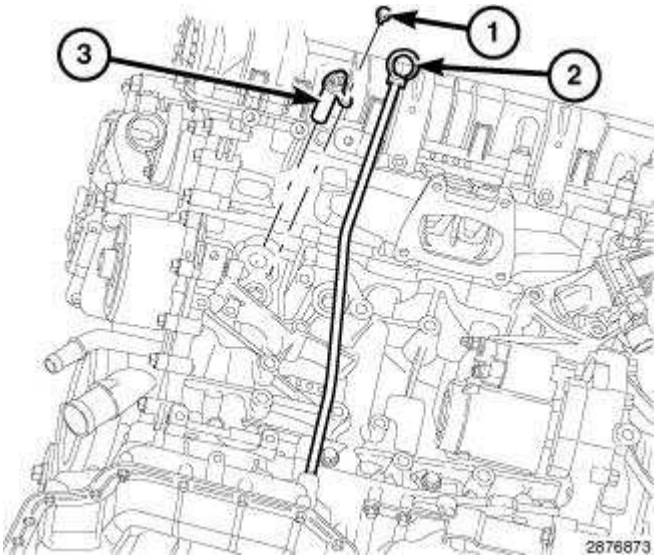

Fig. 97: Engine Block Heater Element, Bolt & Fluid Level Indicator/Dipstick
Courtesy of CHRYSLER GROUP, LLC

24. Position and install the engine block heater element (3) and bolt (1) into the opening under the rear of the exhaust manifold forward of the fluid level indicator/dipstick (2).
25. Using a T-30 socket/driver/ratchet, tighten the bolt (1) to 9 N-m (80 in-lbs).

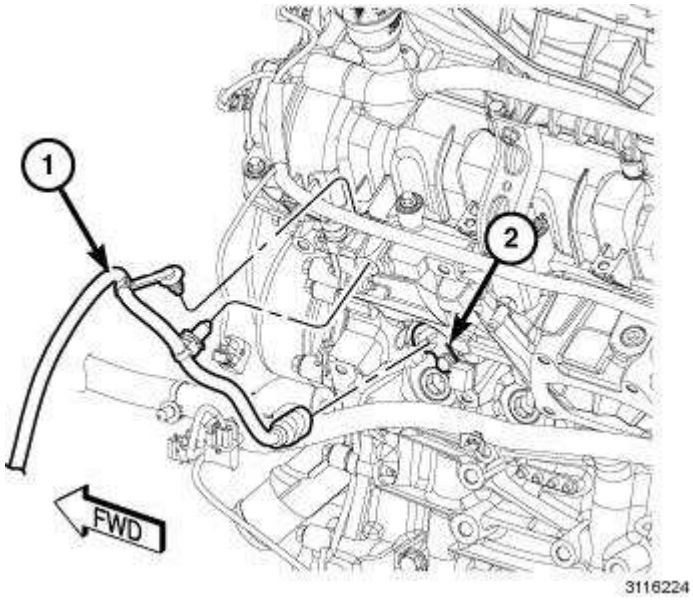

Fig. 98: Engine Block Heater Cord & Element
Courtesy of CHRYSLER GROUP, LLC

26. Plug in the engine block heater cord (1) to the element (2).
27. Lower the vehicle enough to access the top of the engine.
28. Begin routing the cord (1) upward towards the front of the engine and install the harness retainers into the driver valve cover holes.

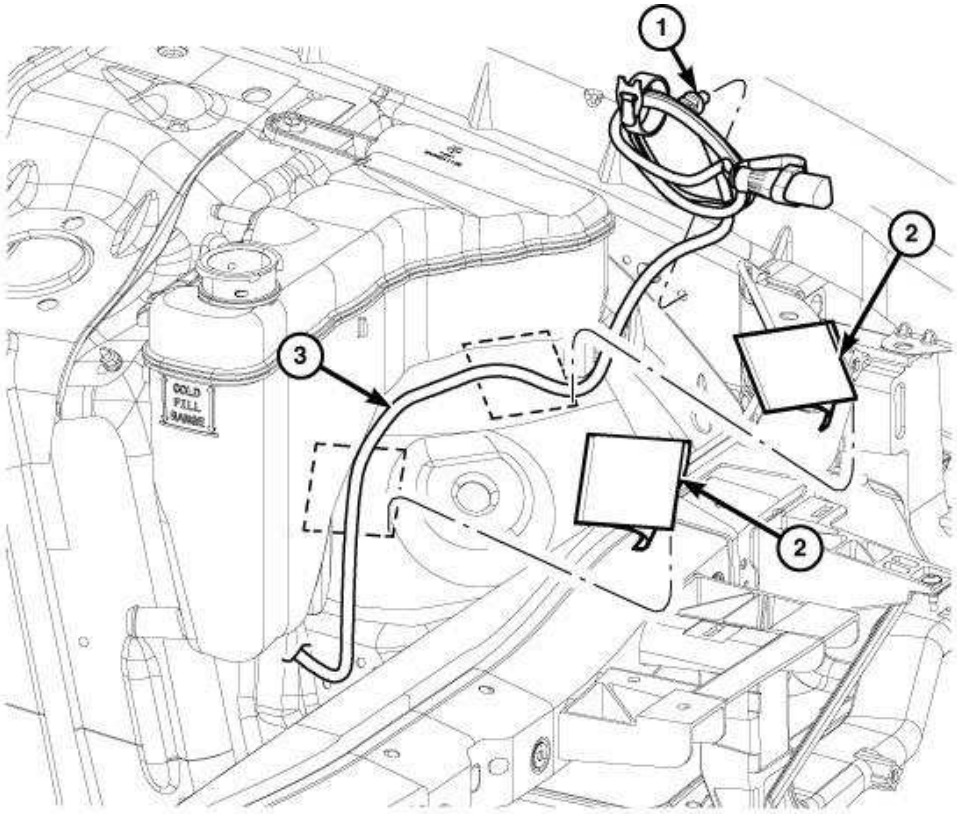

Fig. 99: Cord, Retainer & Tape Patches
Courtesy of CHRYSLER GROUP, LLC

29. Route the cord (3) under the coolant recovery bottle towards to the front of the driver side inner fender.
30. Install the retainer (1) into the hole on the inner front fender.
31. Using the kit supplied tape patches (2), remove the adhesive backing and secure the cord (3) to the fender panel.

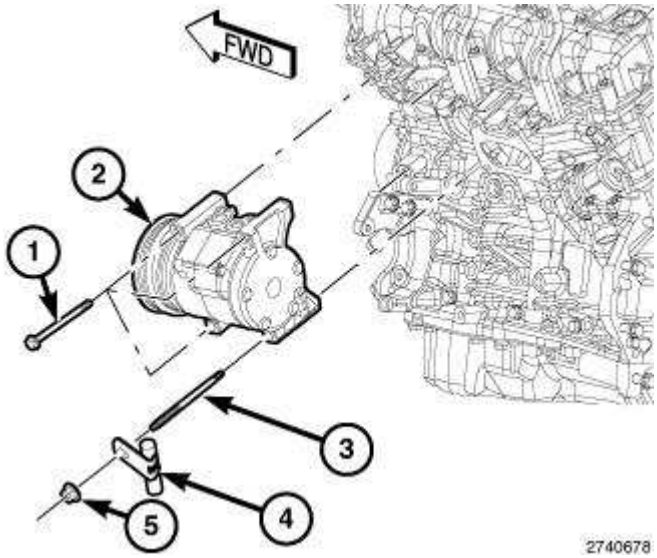

Fig. 100: A/C Compressor, Nut, Stud & Three Bolts
Courtesy of CHRYSLER GROUP, LLC

32. Raise the vehicle as necessary.
33. Reposition the A/C compressor (2) to the engine.
34. Using a 13mm socket/ratchet/wrench, install the stud (3) and the three bolts (1) that secure the A/C compressor (2) to the engine. Tighten the bolts to 28 N.m (21 ft. lbs.).
35. Reposition the bracket (4) onto the stud and install the retaining nut (5). Tighten the nut to 40 N.m (30 ft. lbs.).
36. Connect the engine wire harness to the A/C compressor (2).

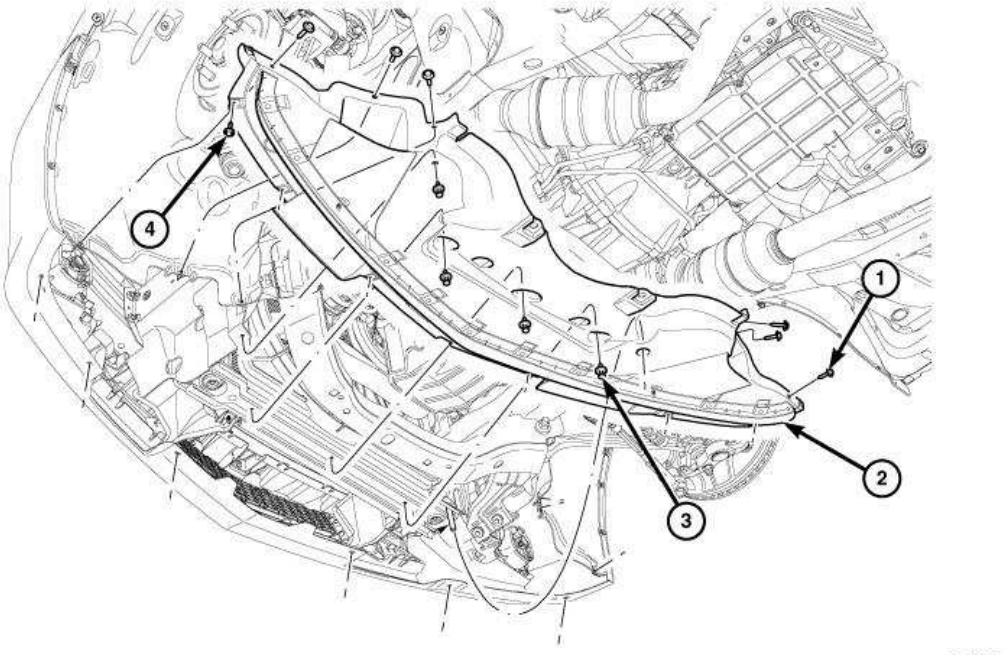

Fig. 101: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

37. Position the front belly pan (2) to the underside of the vehicle.
38. Install the four push pin fasteners (3) that secure the front belly pan (2) to the underside of the vehicle's lower crossmember.
39. Using a phillips screwdriver, install the six screws (4) that secure the front belly pan (2) to the underside of the vehicle's front fascia.
40. Using a phillips screwdriver, install the three screws (1) that secure the front belly pan (2) to the underside of the vehicle's wheelhouse/wheelwell splash shield. Tighten the screws securely. Repeat for the other side.

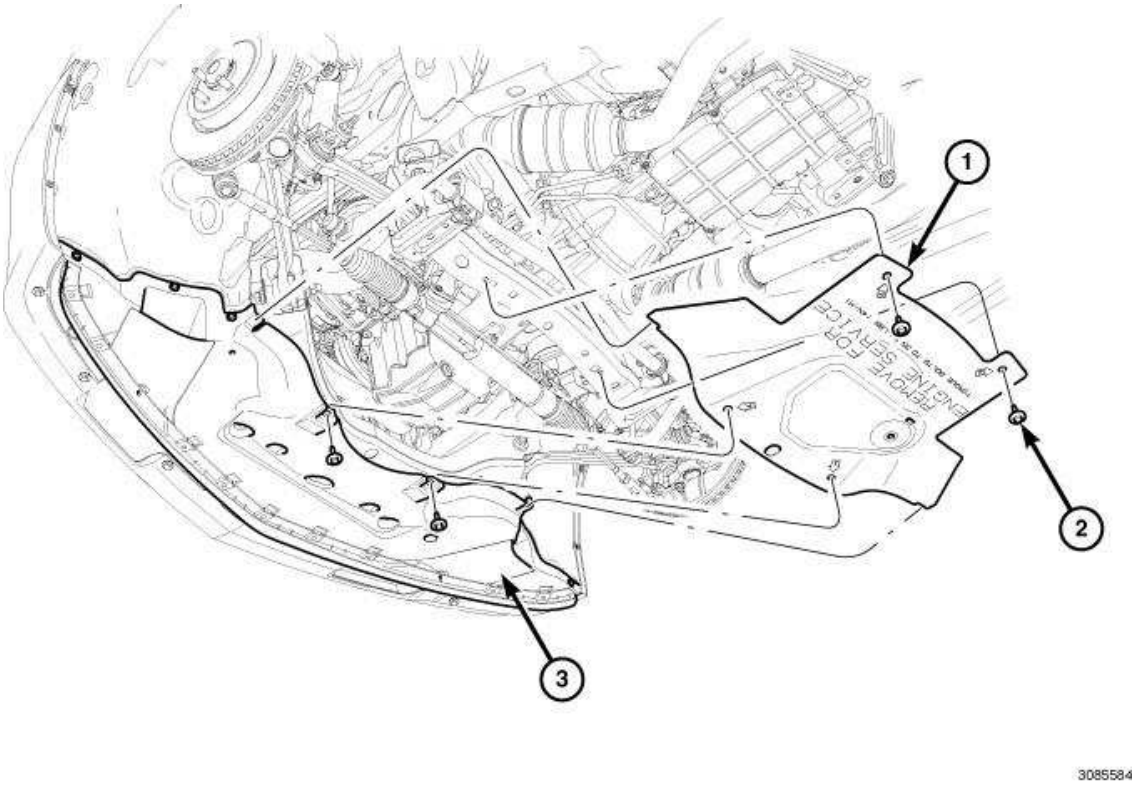

Fig. 102: Four Fasteners, Rear Belly Pan & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: During installation, ensure rear belly pan is shingled underneath the front belly pan. Failure to do so may result in damage to belly pan.

41. Position the rear belly pan (1) to the underside of the vehicle and to the front fascia (3).
42. Using a 17mm socket/ratchet, install the fasteners (2) that secure the rear belly pan (1) to the underside of the vehicle. Tighten the fasteners securely.
43. Lower the vehicle.

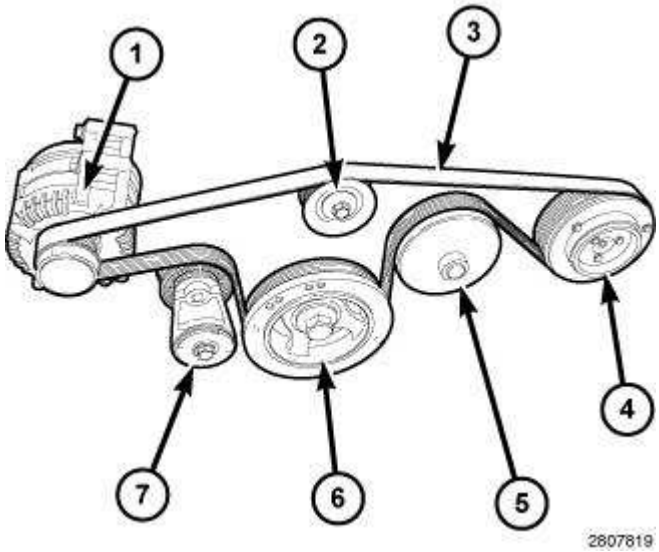

Fig. 103: New Belt, Idler Pulley, Tensioner Arm, Belt, Idler & Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

44. Rotate the belt tensioner (7) until it contacts its stop. Install the belt (3) to the A/C compressor pulley (4), then slowly rotate the tensioner (7) into the freearm position.
45. Secure the engine block heater cord (1) to an existing vehicle harness with the kit supplied tie straps.

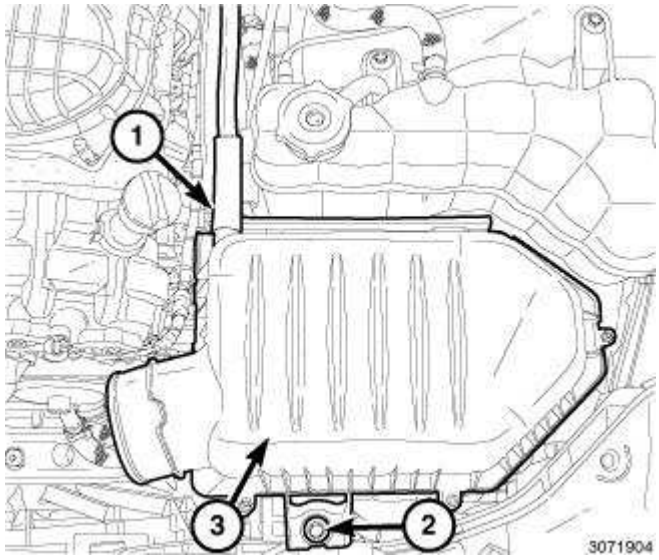

Fig. 104: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
Courtesy of CHRYSLER GROUP, LLC

46. Position the air cleaner housing (3) into the engine compartment of the vehicle.

47. Using a 8mm socket/ratchet, install the air cleaner housing retaining bolt (2) and tighten to 4 N.m (35 in. lbs.).
48. Connect the hose (1) onto the air cleaner housing.

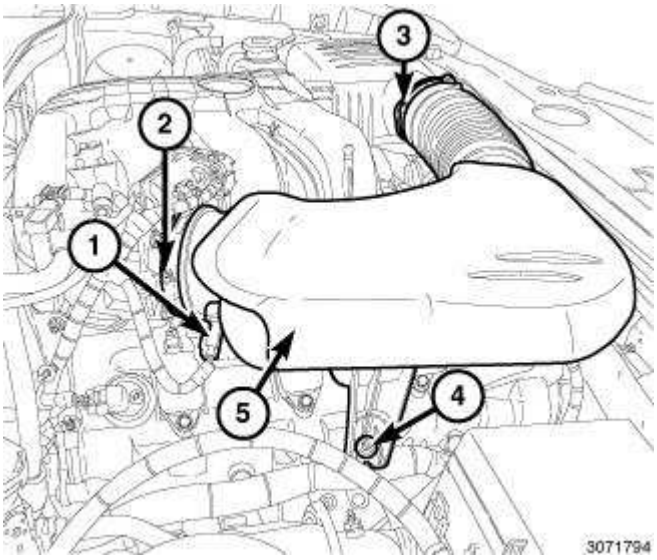

Fig. 105: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

49. Position the air inlet hose assembly (5), connect the air inlet hose to the throttle body and the air cleaner housing.
50. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
51. Using a screwdriver, tighten the clamp (3) at the air cleaner housing to 4 N.m (35 in. lbs.).
52. Using a screwdriver, tighten the clamp (2) at the throttle body to 4 N.m (35 in. lbs.).
53. Connect the electrical connector (1) to the Inlet Air Temperature (IAT) Sensor.

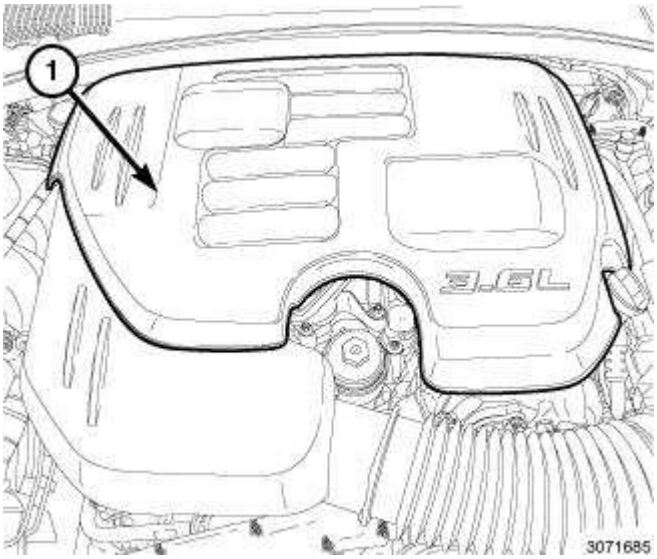

Fig. 106: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

54. Position the engine cover (1) and push down to secure the retaining grommets to the ball studs.
55. Close the hood.
56. Connect the negative cable to the battery located in the trunk near the spare tire.

5.7L ENGINE BLOCK HEATER

CHRYSLER 300C / DODGE CHARGER

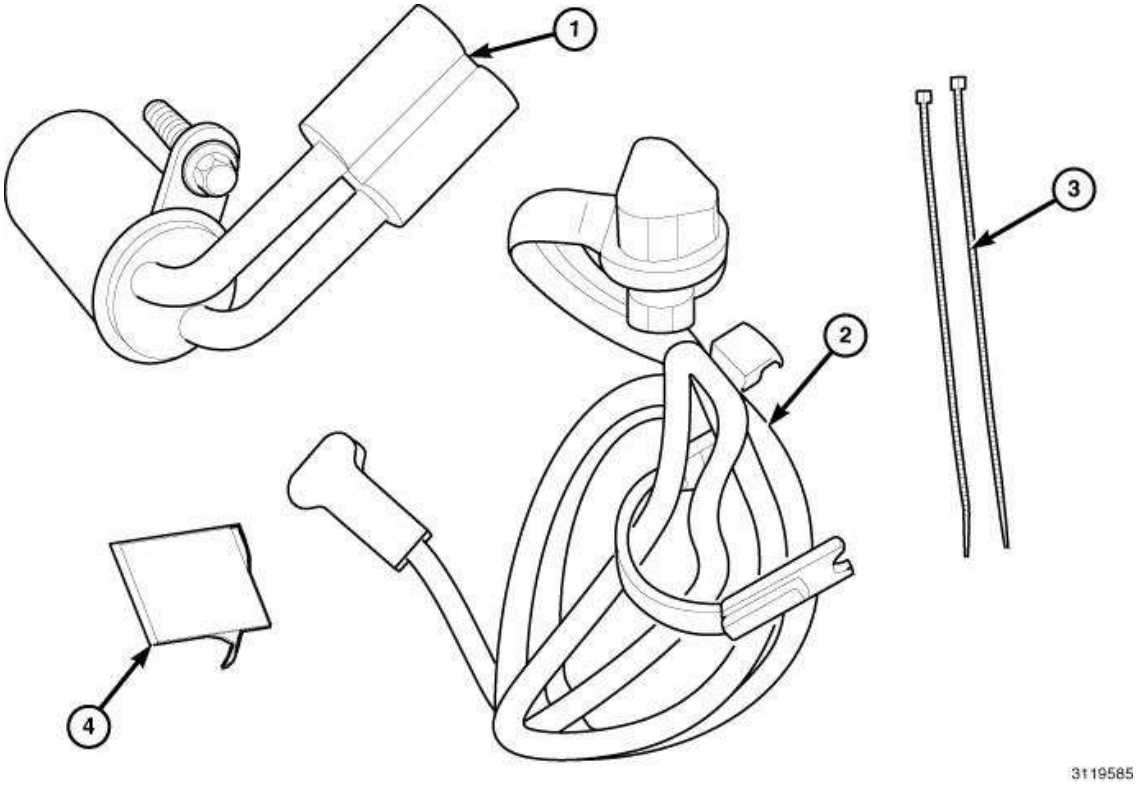

Fig. 107: Engine Block Heater (with PIA Bolt), Cord, Tie Straps & Tape Patch
Courtesy of CHRYSLER GROUP, LLC

CALL OUT	DESCRIPTION	QUANTITY
1	Engine Block Heater (with PIA Bolt)	1
2	Cord	1
3	Tie Straps	2
4	Tape Patch	2

TOOLS REQUIRED		

Front End Cutters	8mm, 10mm, 16mm, 17mm Socket/Ratchet/Wrench	Hoist
Flat Bladed, Phillips Screwdrivers	Heat Valve Lubricant	Pick Tool / Trim Pad Pry Tool

NOTE: It is recommended the installer/technician read the instructions thoroughly prior to installation of this product.

PROCEDURE STEPS

The engine block heater element will locate on the driver side towards the rear of the engine just under the exhaust manifold.

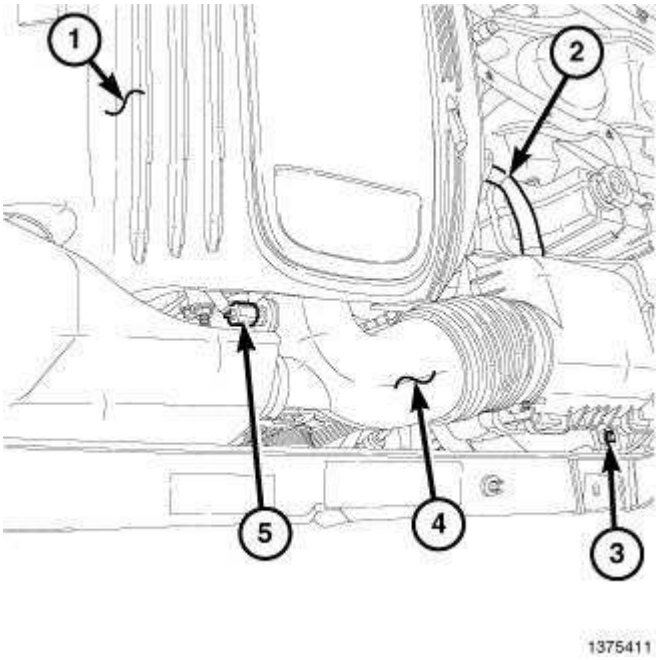

Fig. 108: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove the negative battery cable located in the trunk near the spare tire.
2. Open the hood and remove the oil fill cap.
3. Remove the engine cover (1).
4. Disconnect the Intake Air Temperature (IAT) Sensor (5) connector.
5. Using a screwdriver, loosen the clamps at the throttle body and the air filter assembly and remove the air tube (4).
6. Disconnect the hose (2) at the air filter assembly.
7. Using a 8mm socket/ratchet, remove the air filter assembly retaining bolt (3).
8. Remove the air filter assembly from the vehicle.

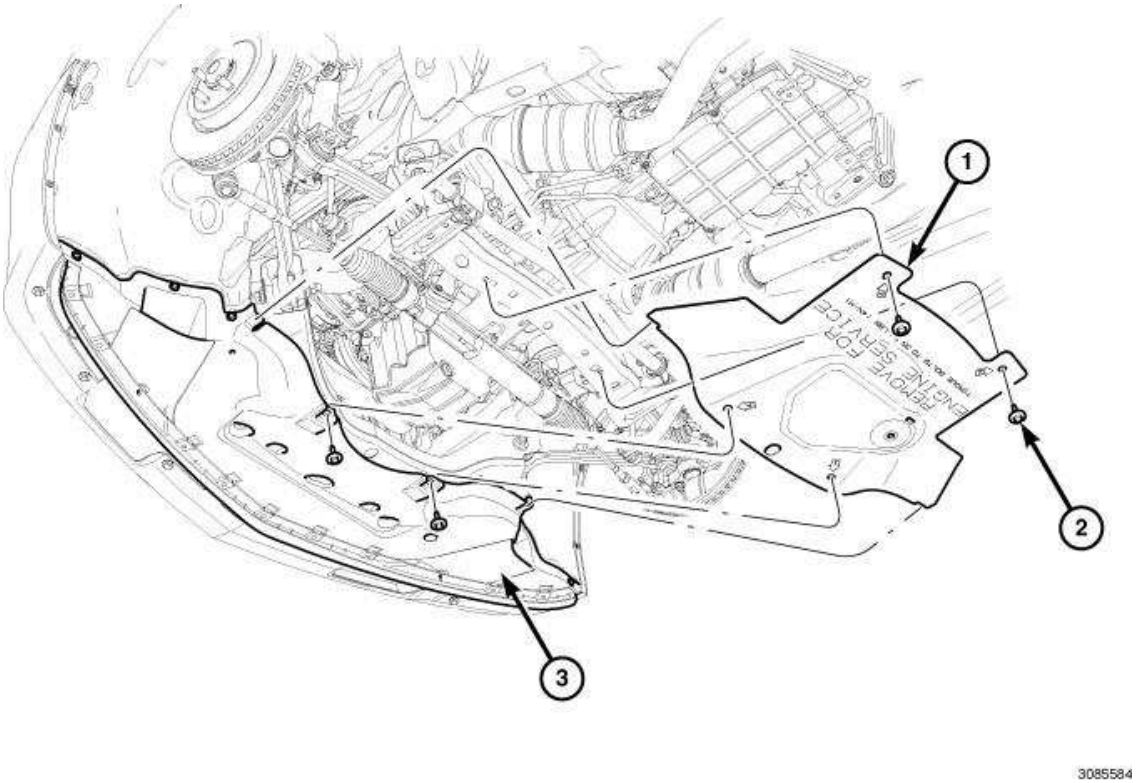

Fig. 109: Four Fasteners, Rear Belly Pan & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

9. Raise and support the vehicle.
10. Using a 17mm socket/ratchet, remove the four fasteners (1) that secure the rear belly pan (1) to the underside of the vehicle.
11. Pull the rear belly pan (1) rearward out of the from the front belly pan (3) to remove from the vehicle.

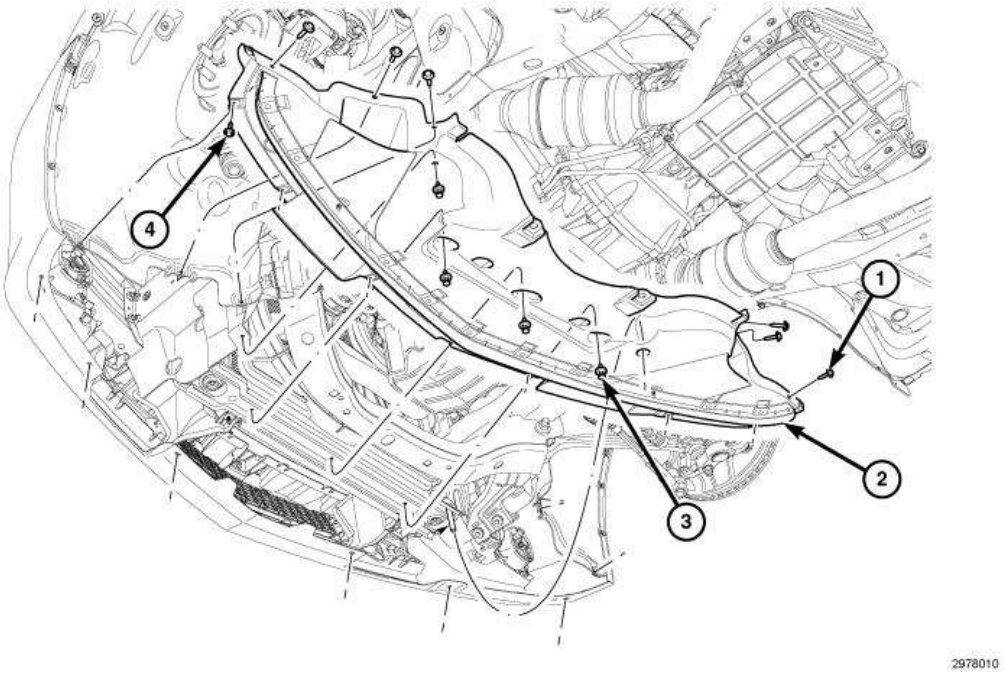

Fig. 110: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

12. Using a phillips screwdriver, remove the six screws (4) that secure the front belly pan (2) to the underside of the vehicle's front fascia.
13. Using a phillips screwdriver, remove the three screws (1) that secure the front belly pan (2) to the underside of the vehicle's wheelhouse/wheelwell splash shield. Repeat for the other side.
14. Using a small pick tool and trim pad pry tool, remove the four push pin fasteners (3) that secure the front belly pan (2) to the underside of the vehicle's lower crossmember. Repeat for the other side.
15. Remove the front belly pan (2) from the underside of the vehicle.

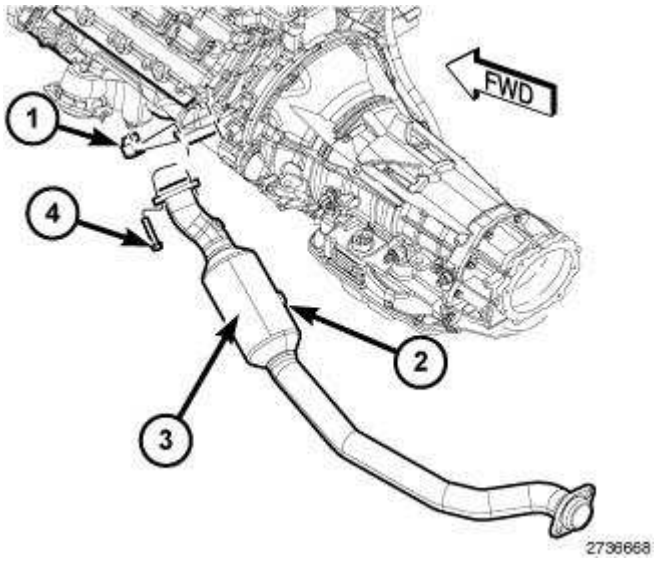

Fig. 111: Exhaust Pipe/Catalytic Converter Assembly, Bolts And Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to reposition the catalytic converter at the exhaust manifold to install this accessory. LET THE VEHICLE COOL DOWN COMPLETELY BEFORE INSTALLATION OF THIS PRODUCT.

16. If necessary, saturate the bolts (4) and nuts (1) with heat valve lubricant. Allow 5 minutes for penetration.
17. If necessary, remove the bolts (4) and flanged nuts (1) at the exhaust manifold using a 16mm socket/ratchet/wrench.
18. If necessary, reposition the front exhaust pipe/catalytic converter assembly (3) away from the exhaust manifold.

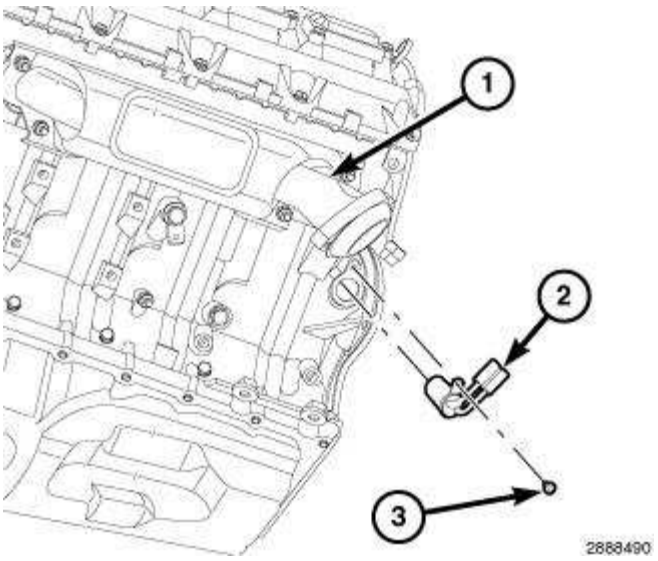

Fig. 112: PIA Bolt, Engine Block Heater Element & PIA Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: PIA Bolt (3) shown in illustration exploded for clarity.

19. Position and install the engine block heater element (2) and PIA bolt (3) into the opening under the rear of the exhaust manifold (1).
20. Using a 10mm socket/driver/ratchet, tighten the PIA bolt (3) to 9 N-m (80 in-lbs).

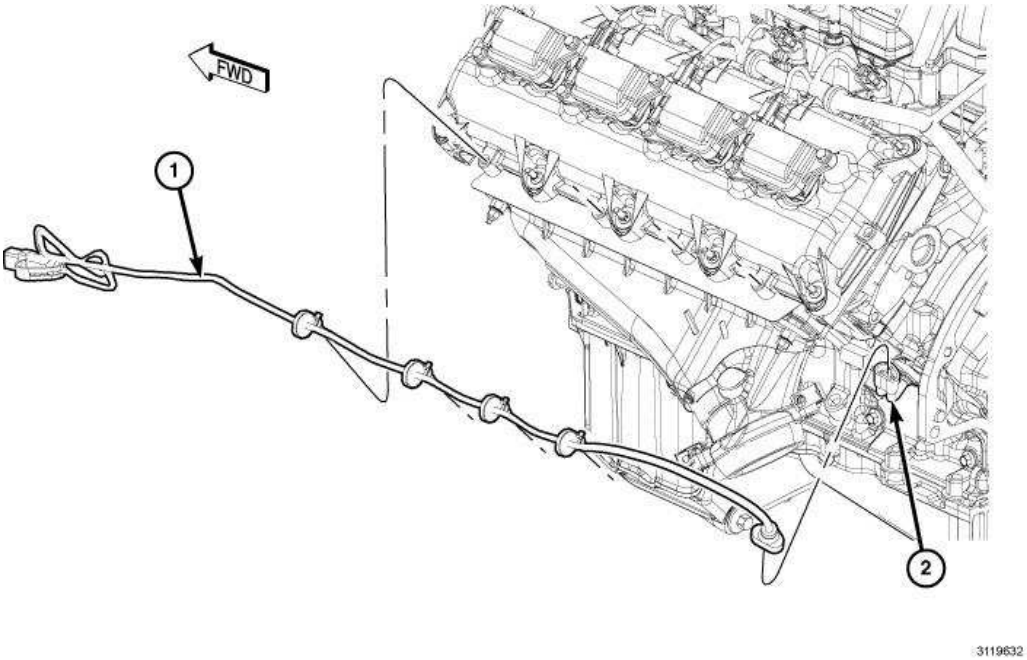

Fig. 113: Engine Block Heater Cord & Element
Courtesy of CHRYSLER GROUP, LLC

21. Plug in the engine block heater cord (1) into the element (2).
22. Lower the vehicle enough to access the top of the engine.
23. Begin routing the cord (1) upward and secure by engaging/installing the cord's retaining clips into the holes located in the valve cover.

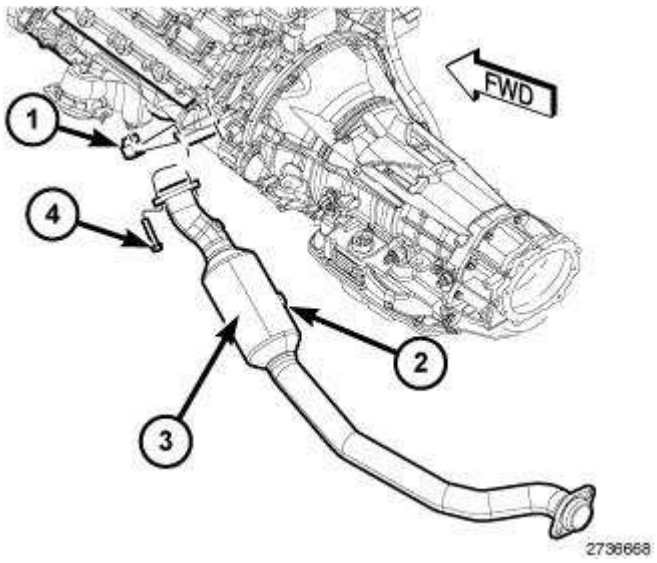

Fig. 114: Exhaust Pipe/Catalytic Converter Assembly, Bolts And Nuts
Courtesy of CHRYSLER GROUP, LLC

24. If necessary, raise the vehicle and position the front exhaust pipe/catalytic converter assembly (3) to the exhaust manifold.

25. Install the bolts (2) at the front exhaust pipe/catalytic converter assembly (4) to exhaust manifold flange.
26. Install the nuts (1) at the front exhaust pipe/catalytic converter assembly to muffler flange at the exhaust manifold using a 16mm socket/ratchet/wrench. Tighten to 47 N.m (35 ft. lbs.) torque.

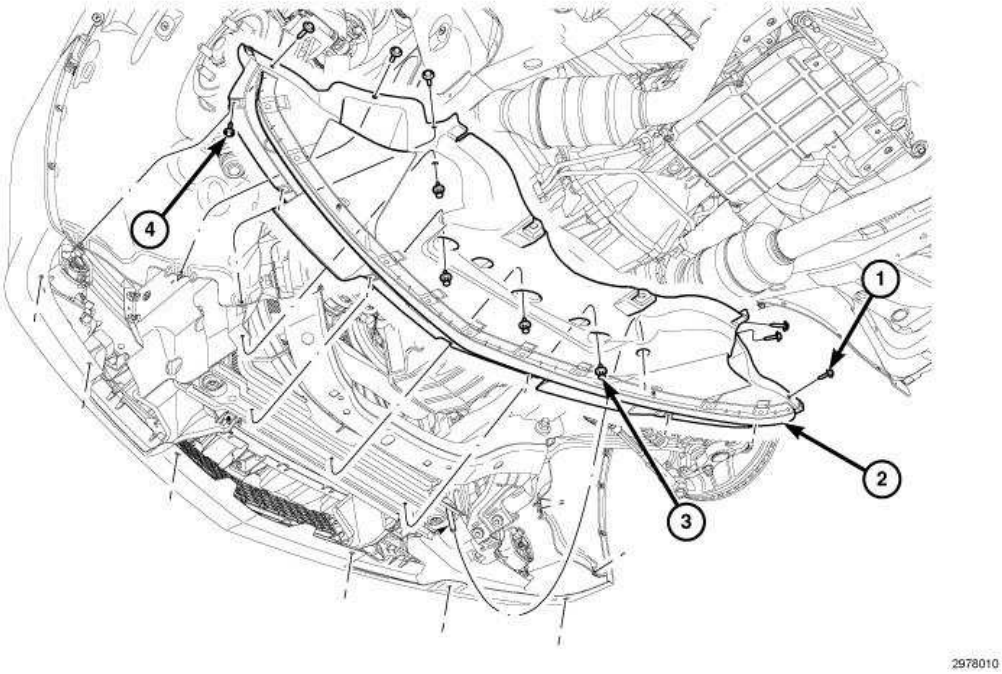

Fig. 115: Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

27. Position the front belly pan (2) to the underside of the vehicle.
28. Install the four push pin fasteners (3) that secure the front belly pan (2) to the underside of the vehicle's lower crossmember.
29. Using a phillips screwdriver, install the six screws (4) that secure the front belly pan (2) to the underside of the vehicle's front fascia.
30. Using a phillips screwdriver, install the three screws (1) that secure the front belly pan (2) to the underside of the vehicle's wheelhouse/wheelwell splash shield. Tighten the screws securely. Repeat for the other side.

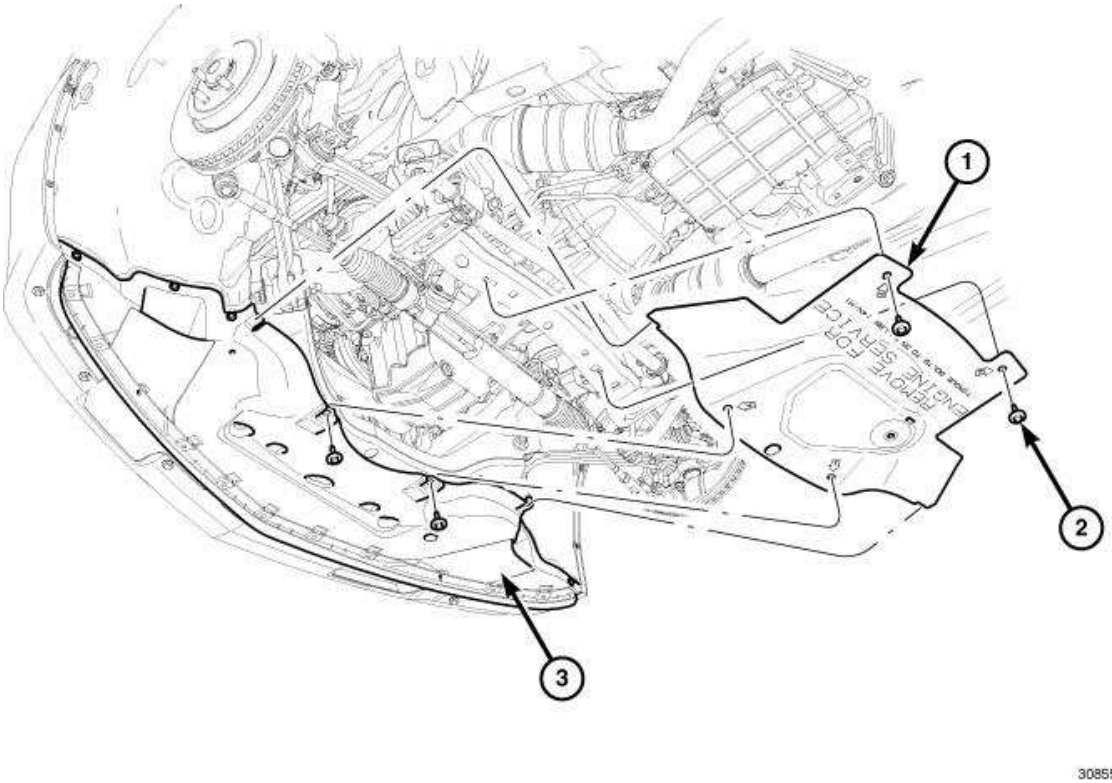

Fig. 116: Four Fasteners, Rear Belly Pan & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: During installation, ensure rear belly pan is shingled underneath front belly pan. Failure to do so may result in damage to belly pan.

31. Position the rear belly pan (1) to the underside of the vehicle and to the front fascia (3).
32. Using a 17mm socket/ratchet, install the fasteners (2) that secure the rear belly pan (1) to the underside of the vehicle. Tighten the fasteners securely.
33. Lower the vehicle.

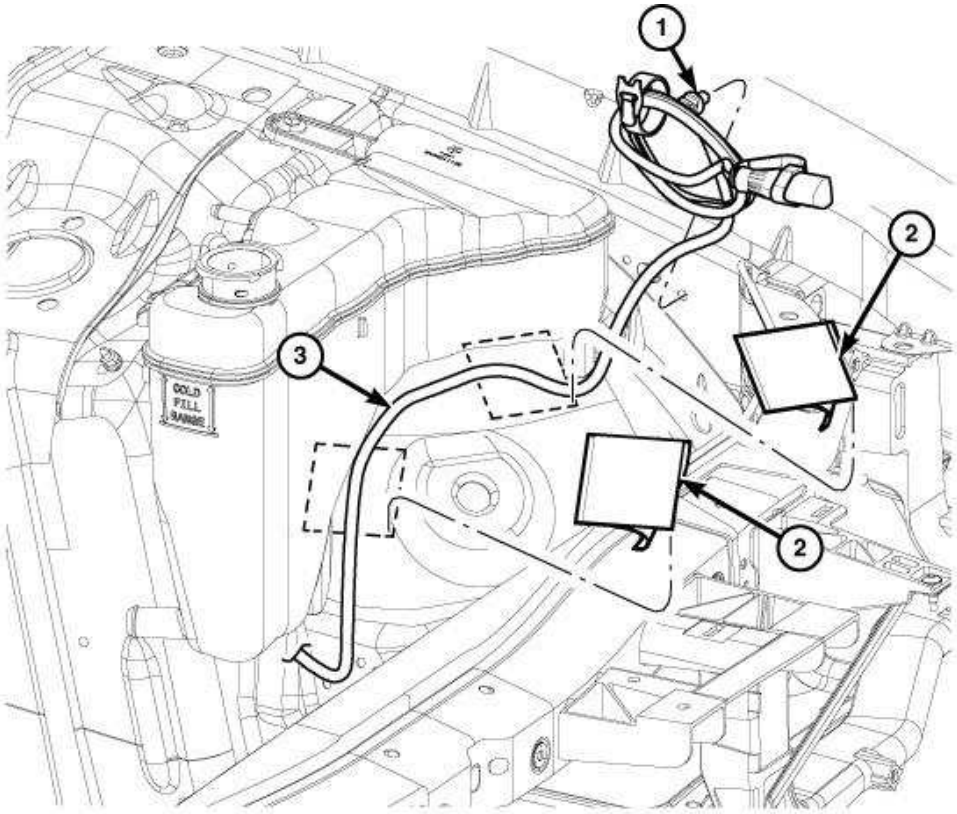

Fig. 117: Cord, Retainer & Tape Patches
Courtesy of CHRYSLER GROUP, LLC

34. Route the cord (3) under the coolant recovery bottle towards to the front of the driver side inner fender.
35. Install the retainer (1) into the hole on the inner front fender.
36. Using the kit supplied tape patches (2), remove the adhesive backing and secure the cord (3) to the fender panel.

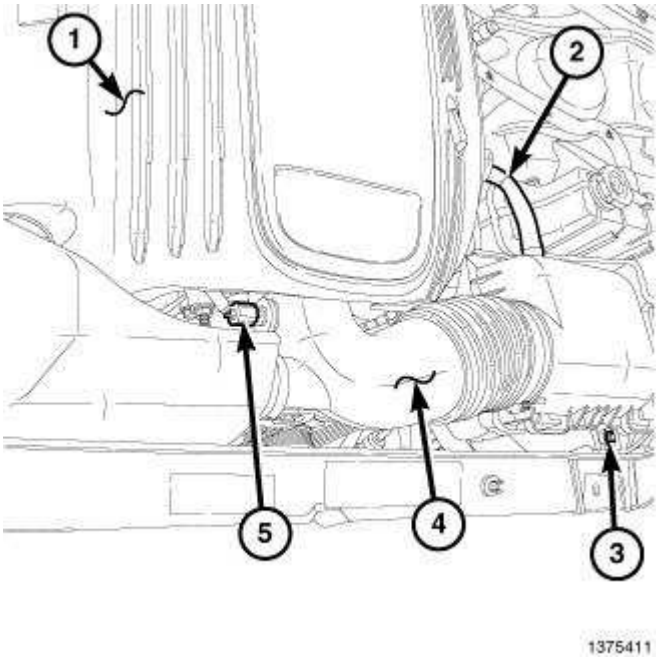

Fig. 118: Air Filter Assembly
Courtesy of CHRYSLER GROUP, LLC

37. Secure the engine block heater cord (1) to an existing vehicle harness with the kit supplied tie straps.
38. Position the air filter assembly into the engine compartment.
39. Using a 8mm socket/ratchet, install the air filter assembly retaining bolt (3) and tighten securely.
40. Connect the clean air tube to the throttle body and the air filter assembly and tighten clamps.
41. Connect the hose (2) to the air filter assembly.
42. Connect the Intake Air Temperature (IAT) Sensor (5) connector.
43. Install the engine cover (1) by aligning the cover's retaining grommets with the ball studs located on the top of the engine. Once aligned, push down to engage/install.
44. Install the oil fill cap and close the hood.
45. Connect the negative battery cable located in the trunk near the spare tire.

ACCESSORIES AND EQUIPMENT

Navigation - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

The navigation system offers several new customer features for expanded usability and convenience with hands-free voice-activated operation in addition to the touch screen buttons. The navigation system uses the Bluetooth microphone in the rear view mirror. Navigation routes can be based on a variety of formats including some of the following:

- Destination entry by street intersection, city, zip code, street name, street address and number, state/province/country and phone number
- Stop/change route
- Save current position
- Personal menu, including Guide Me Home (Go Home), Trip Itinerary, List of Saved Locations, Favorite Points of Interest (from a data base), Manage Personal User and Choose User
- Personal Interests including recent routes, address book, Where Am I Now, Emergency (police stations, Dodge dealerships, fire stations, hospitals and emergency care centers), Trail and geo- coordinates
- Route options include shortest, quickest, maximize freeways, minimize freeways, avoid toll roads and avoid ferries
- Navigation can be put into DEMO mode to enhance trip planning

This navigation system will support Traffic Messaging. Traffic Messaging displays voice and pop up warning messages for medium and high priority situations on the route such as road closures due to accidents/hazardous situations and it can even generate a traffic detour for a traffic event located on the route.

OPERATION

OPERATION

The navigation system collects data from GPS satellites in orbit around the Earth. This information is sent to the radio to be processed and provides the user with present location and is used to provide the route planing and guidance as the vehicle is driven.

ANTENNA, NAVIGATION

DESCRIPTION

DESCRIPTION

The navigation antenna has been integrated into the satellite antenna on the roof of the vehicle. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .

DIAGNOSIS AND TESTING

B128E-11-PTS SENSOR 1 - CIRCUIT SHORT TO GROUND

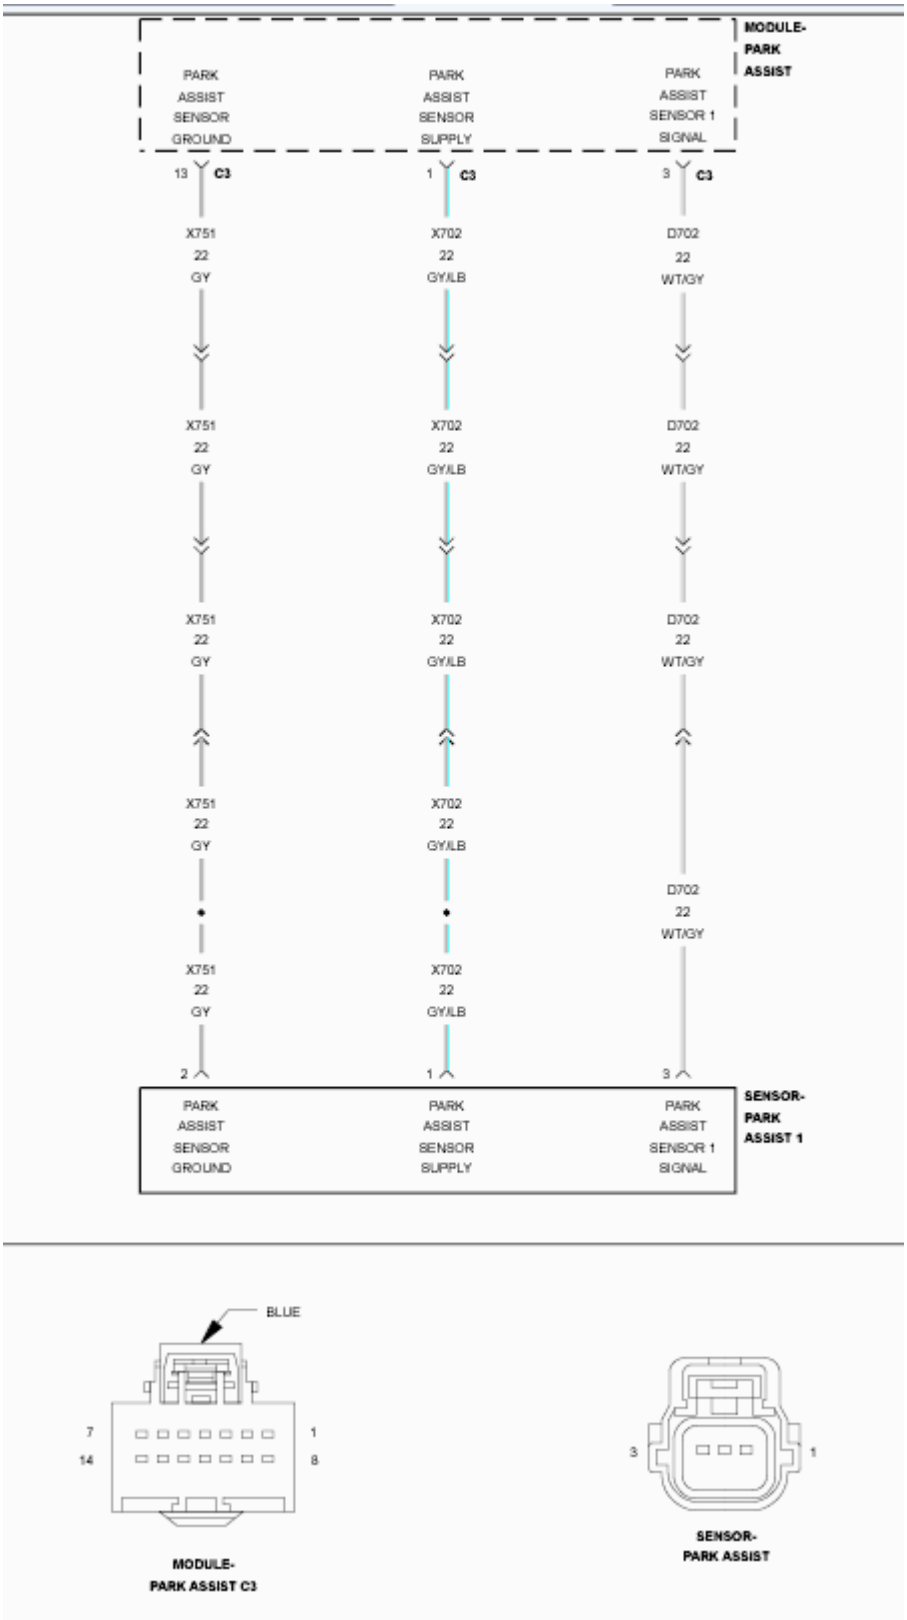

Fig. 1: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

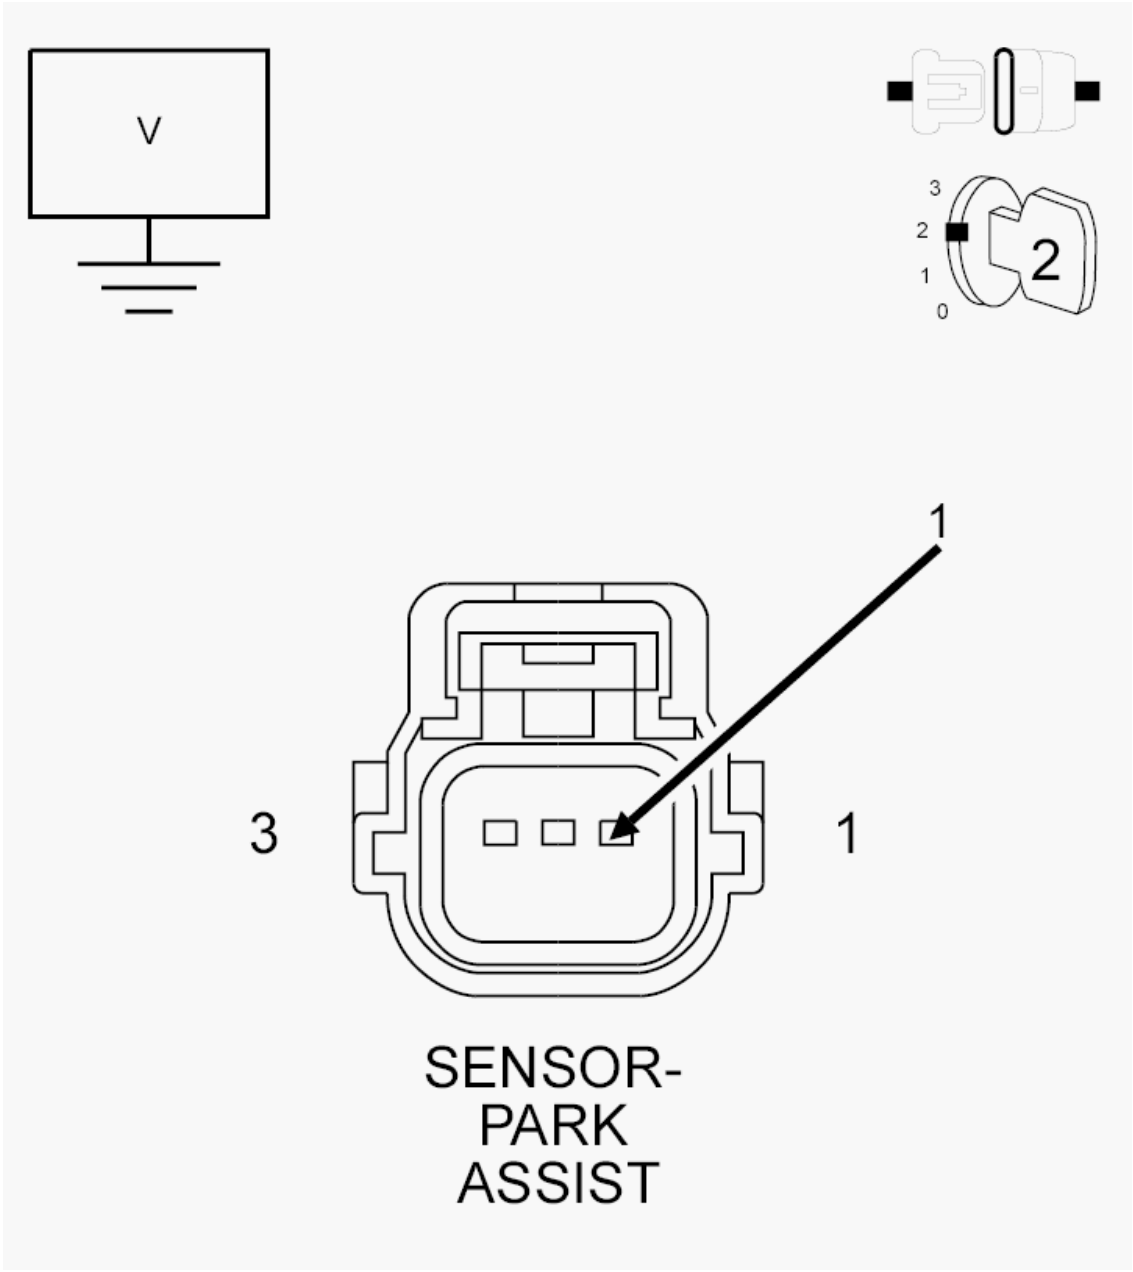

Fig. 2: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

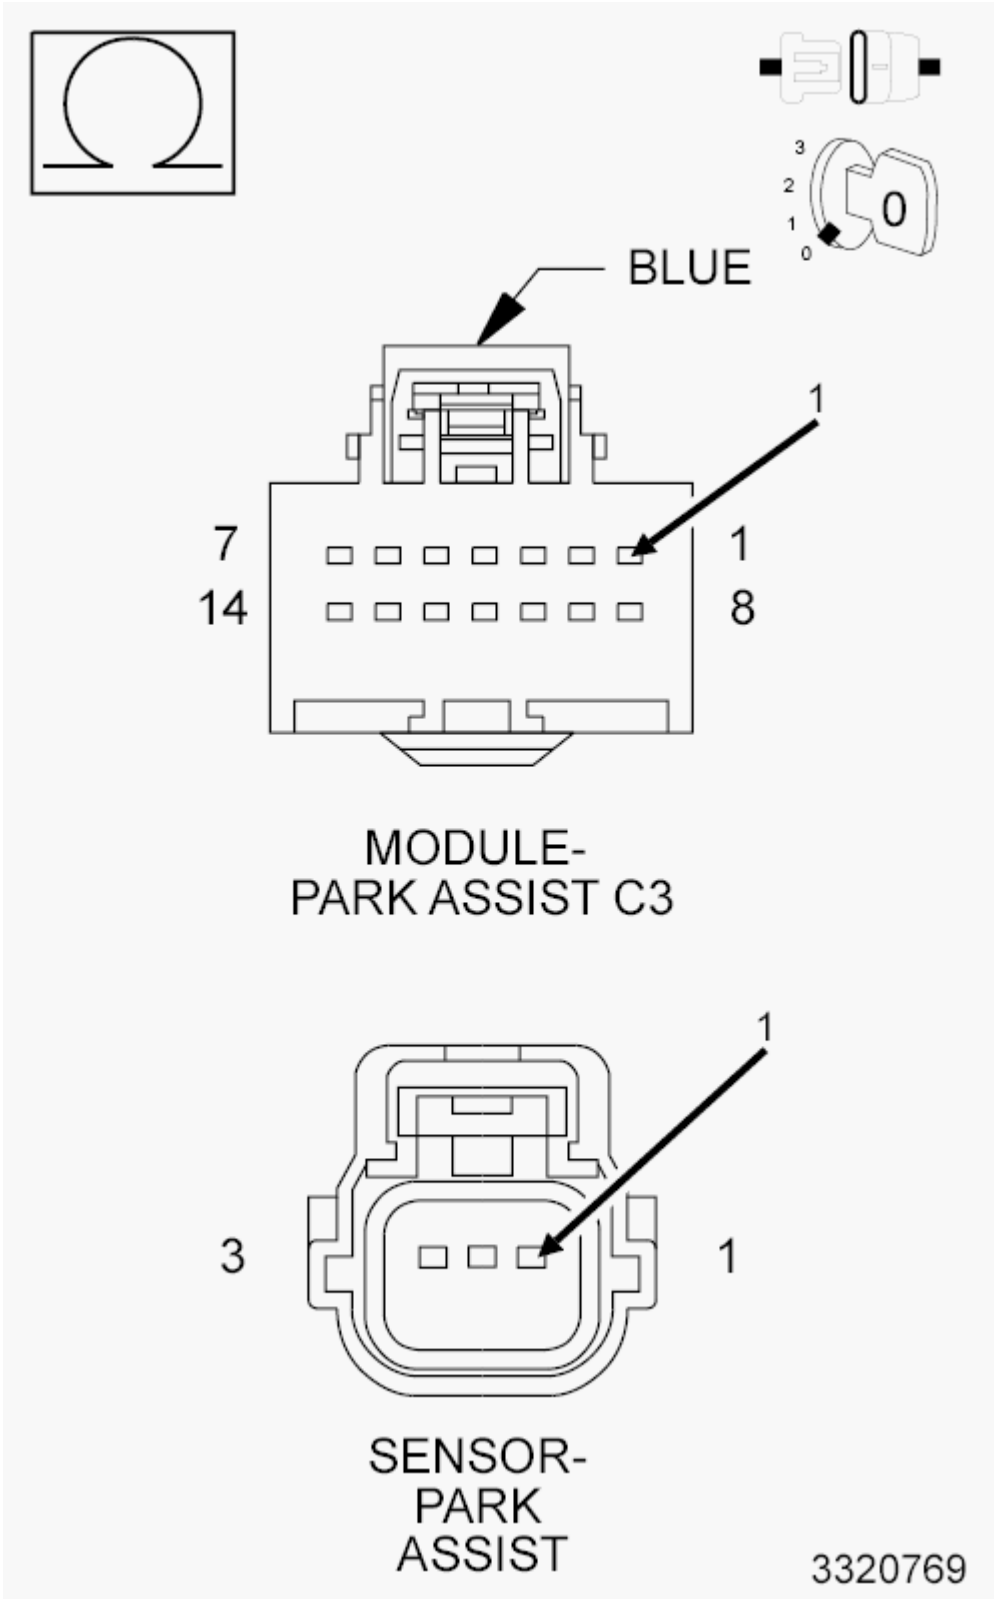

Fig. 3: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

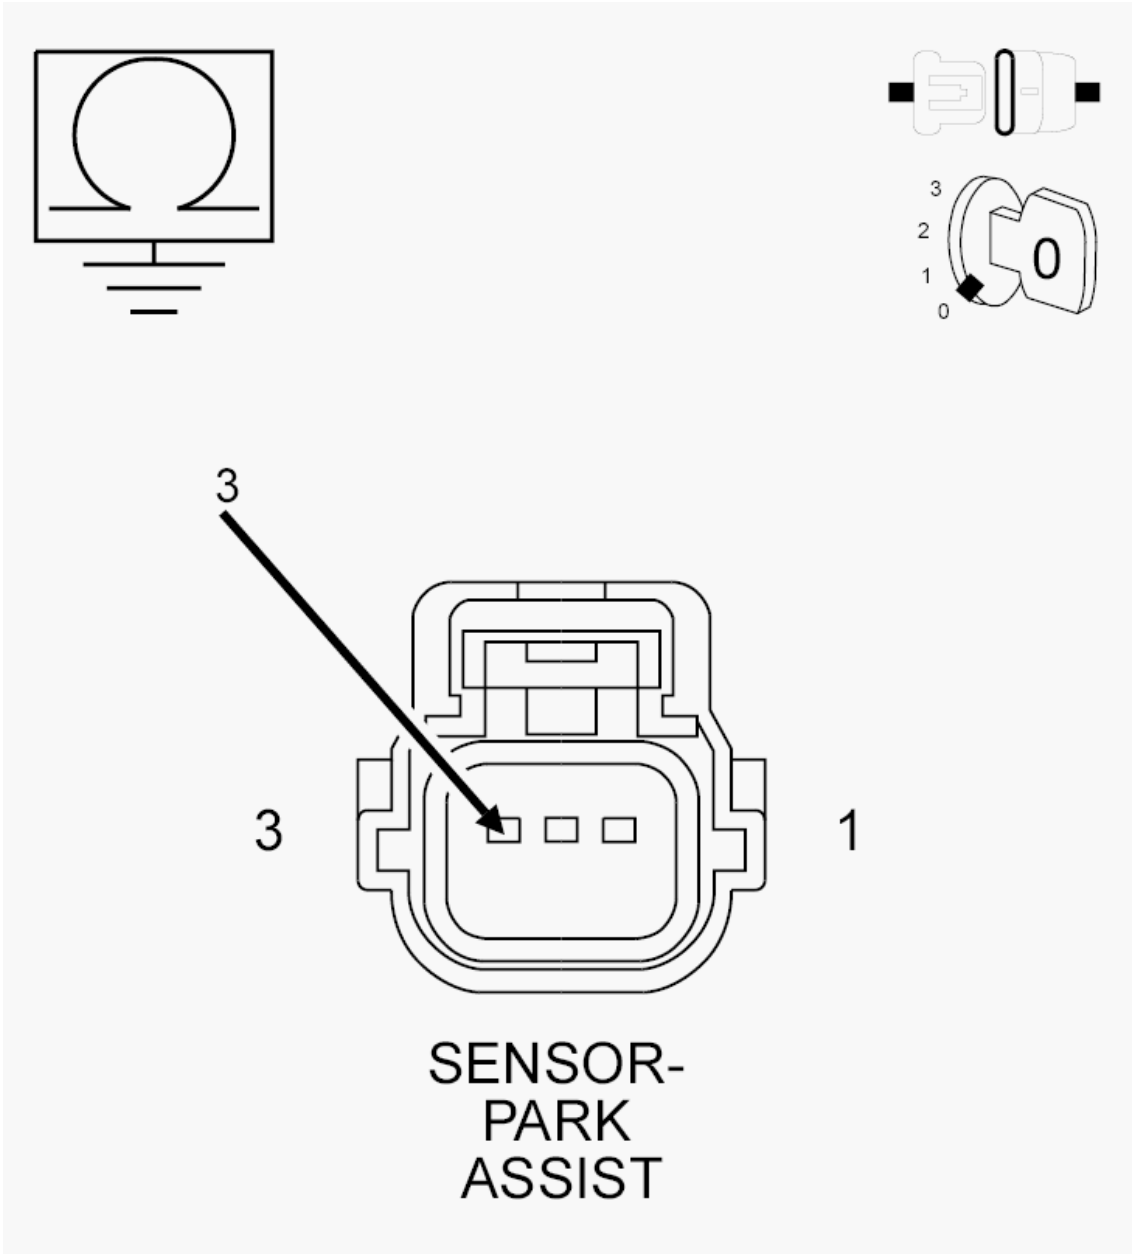

Fig. 4: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module harness connected.

1. Measure the resistance between ground and the (D702) Park Assist Sensor Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Go To 5.

No

- Go To 7.

5. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

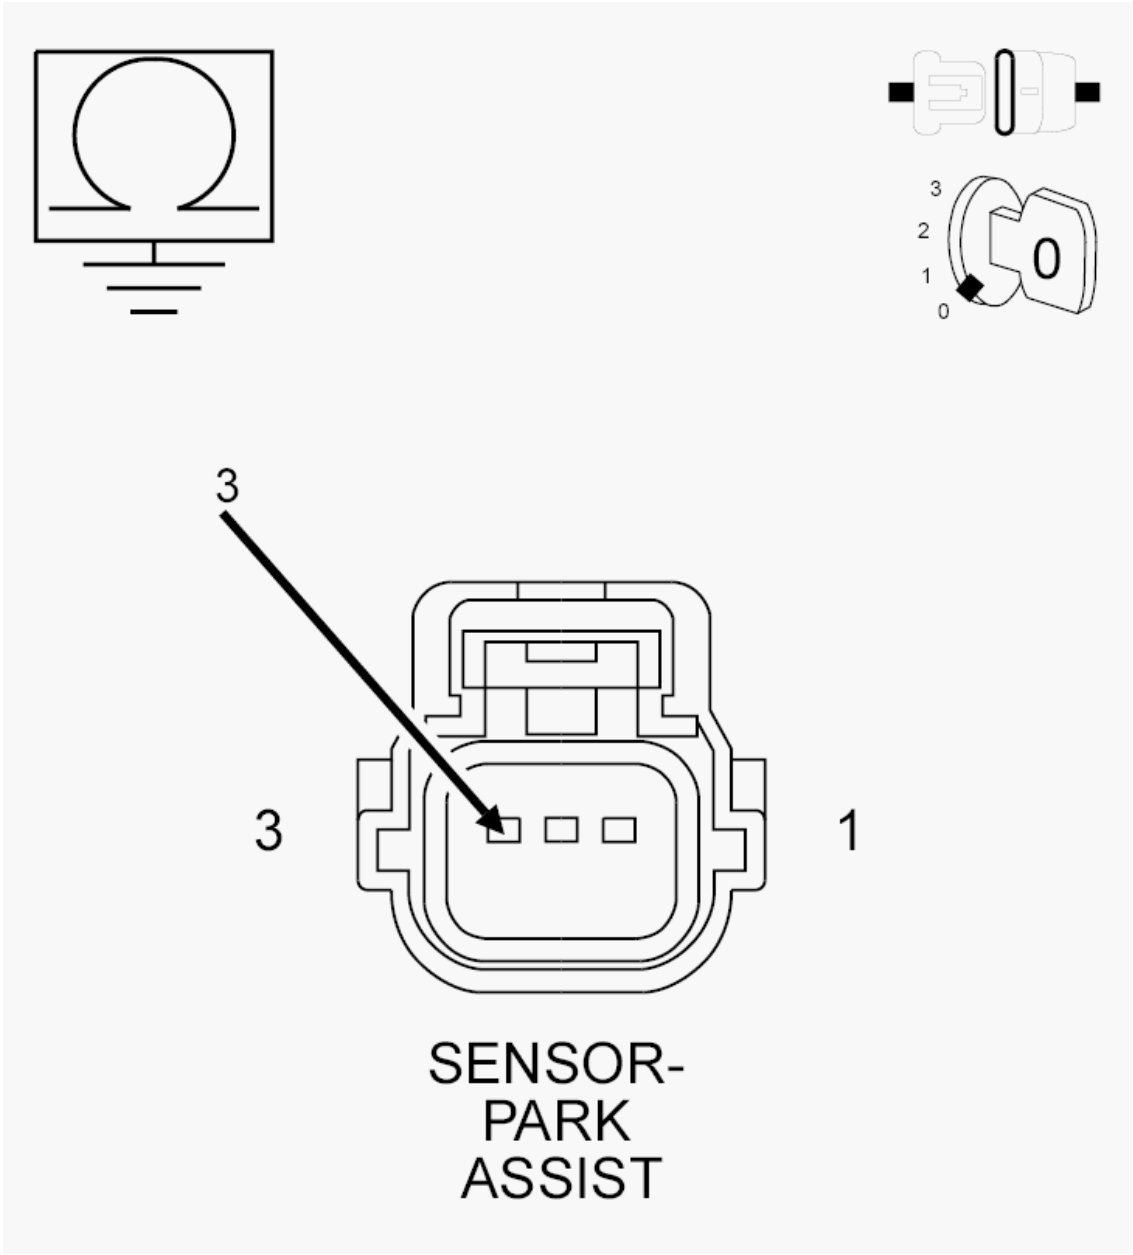

Fig. 5: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (D702) Park Assist Sensor Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the short to ground in the (D702) Park Assist Sensor Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 6.

6. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

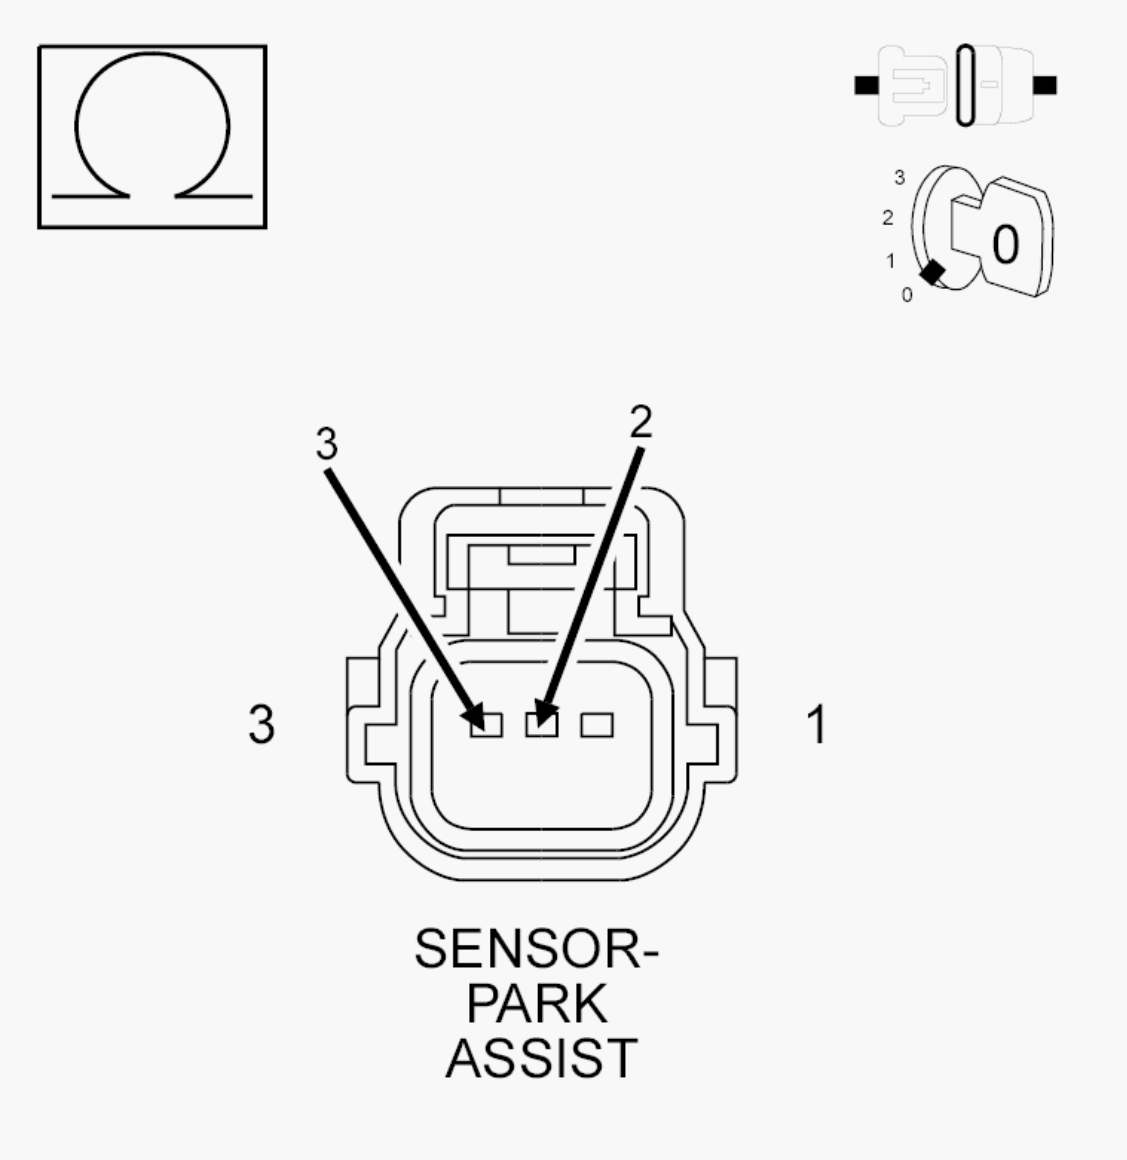

Fig. 6: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist

Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D702) Park Assist Sensor Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D702) Park Assist Sensor Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN**

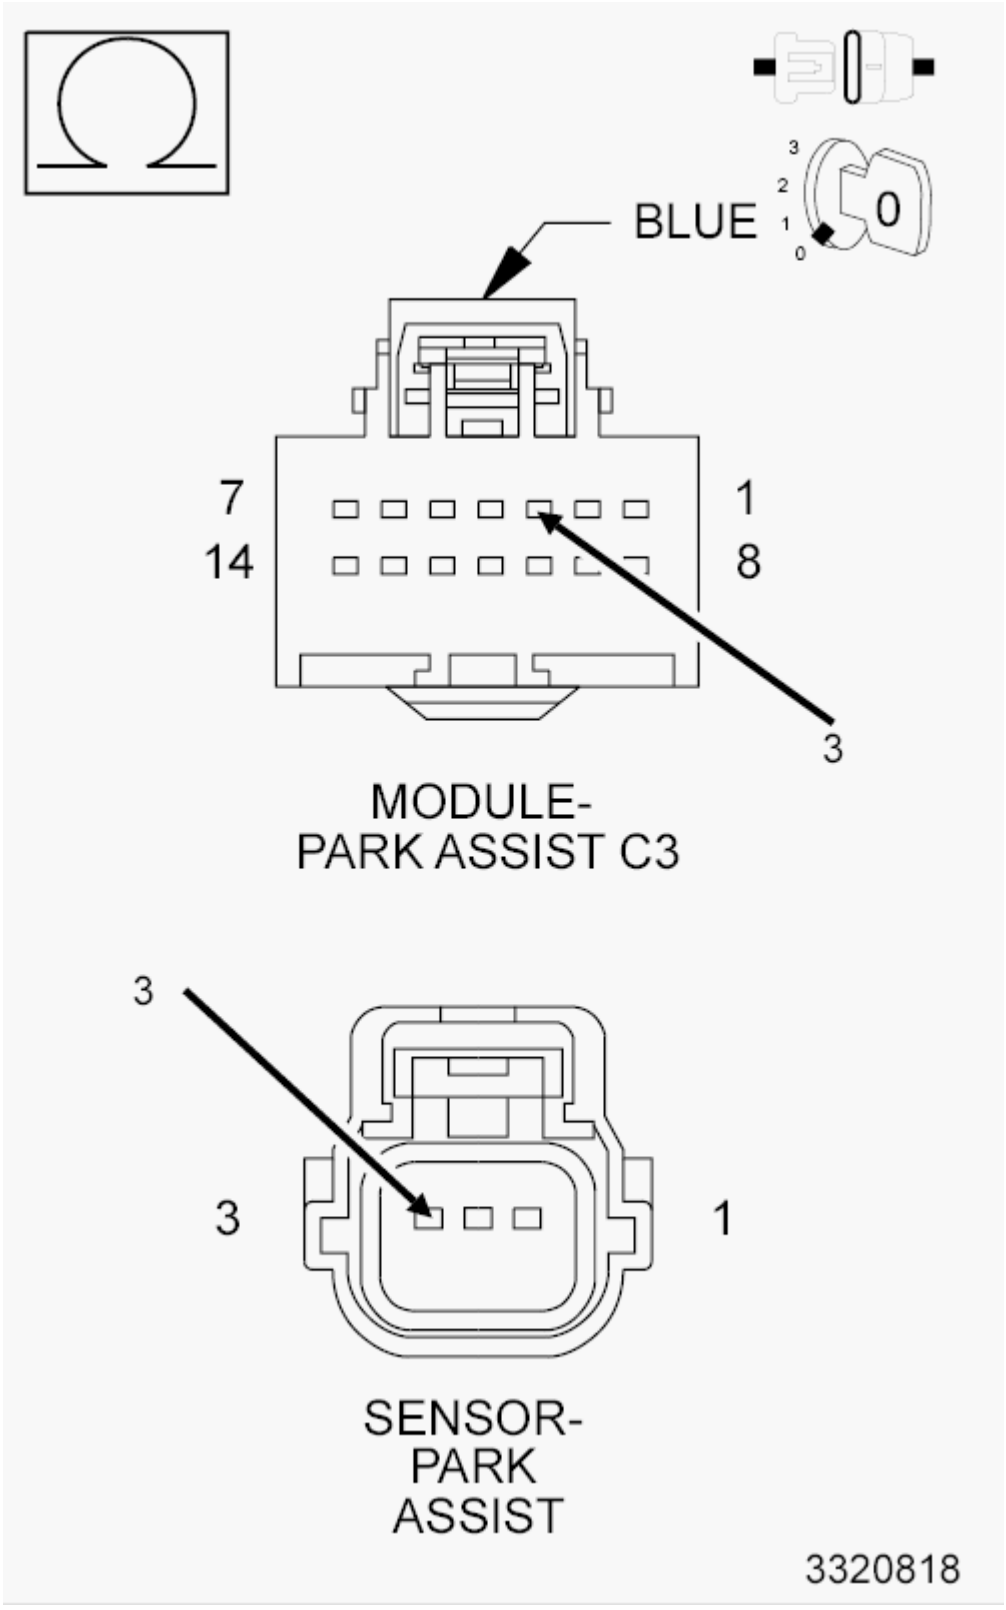

Fig. 7: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D702) Park Assist Sensor Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D702) Park Assist Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

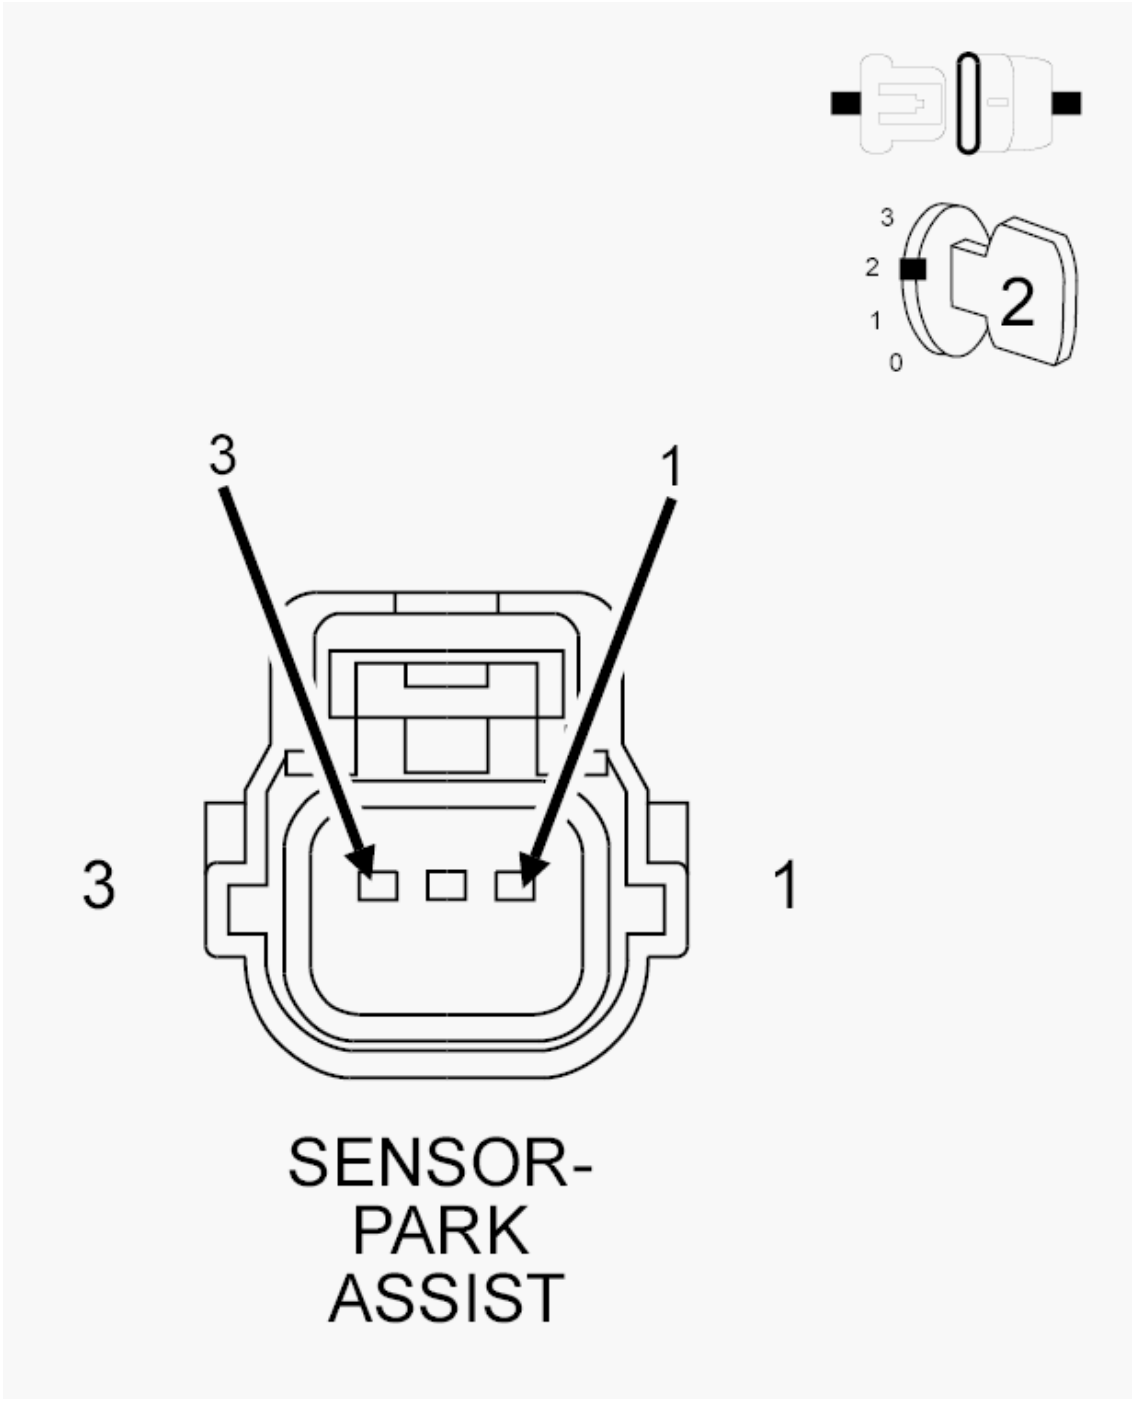

Fig. 8: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D702) Park Assist Sensor Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B128E-12-PTS SENSOR 1 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128E-12-PTS SENSOR 1 - CIRCUIT SHORT TO BATTERY

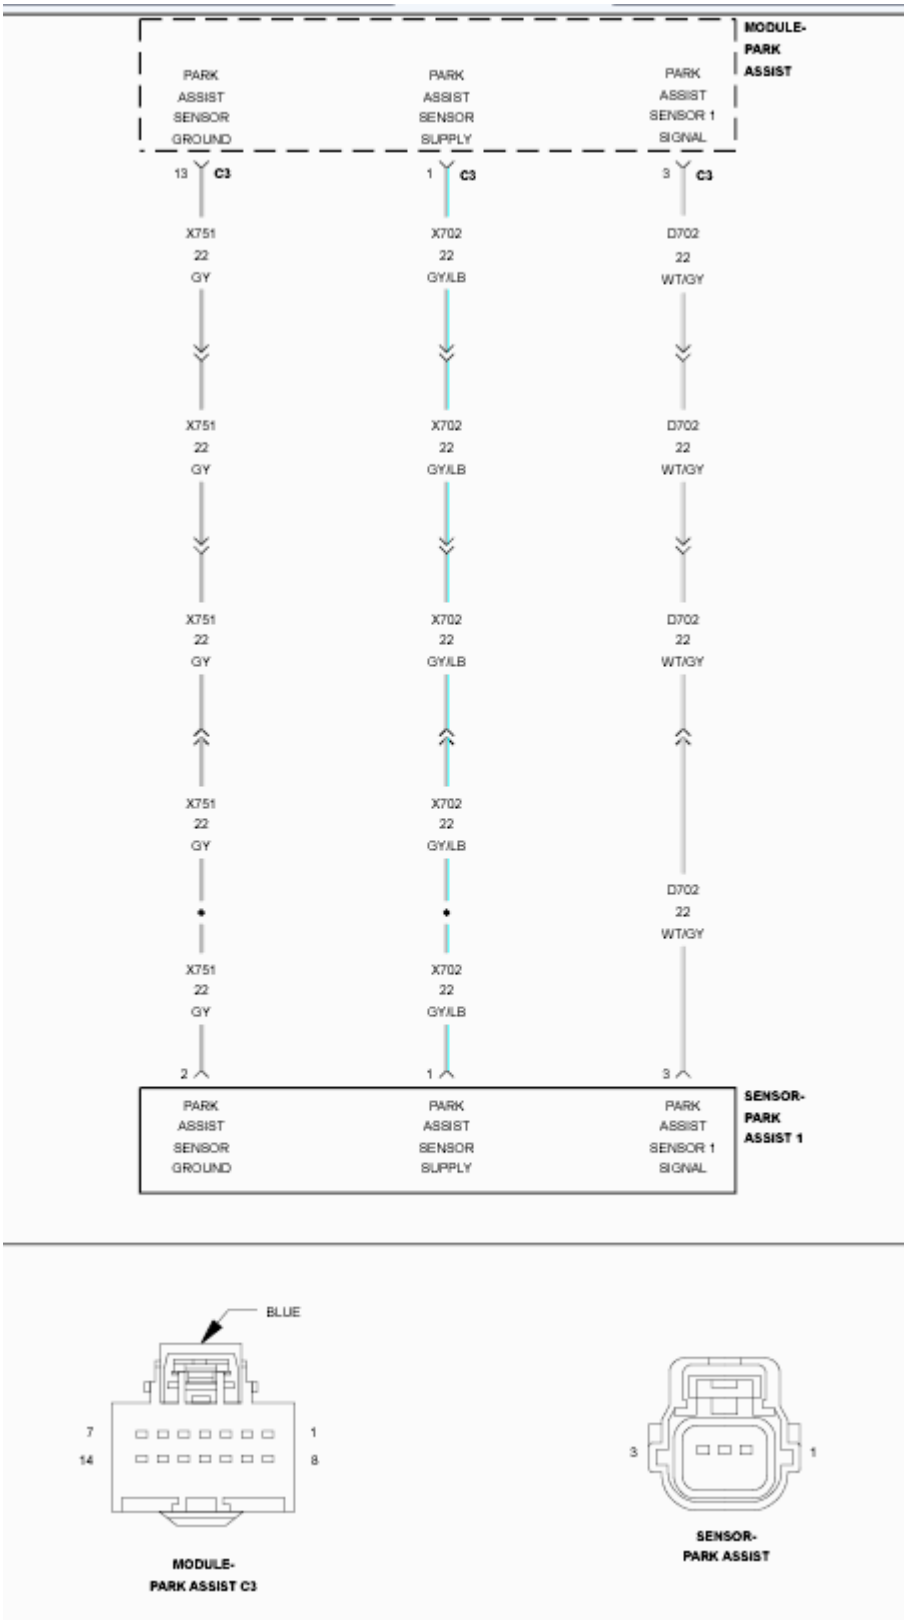

Fig. 9: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

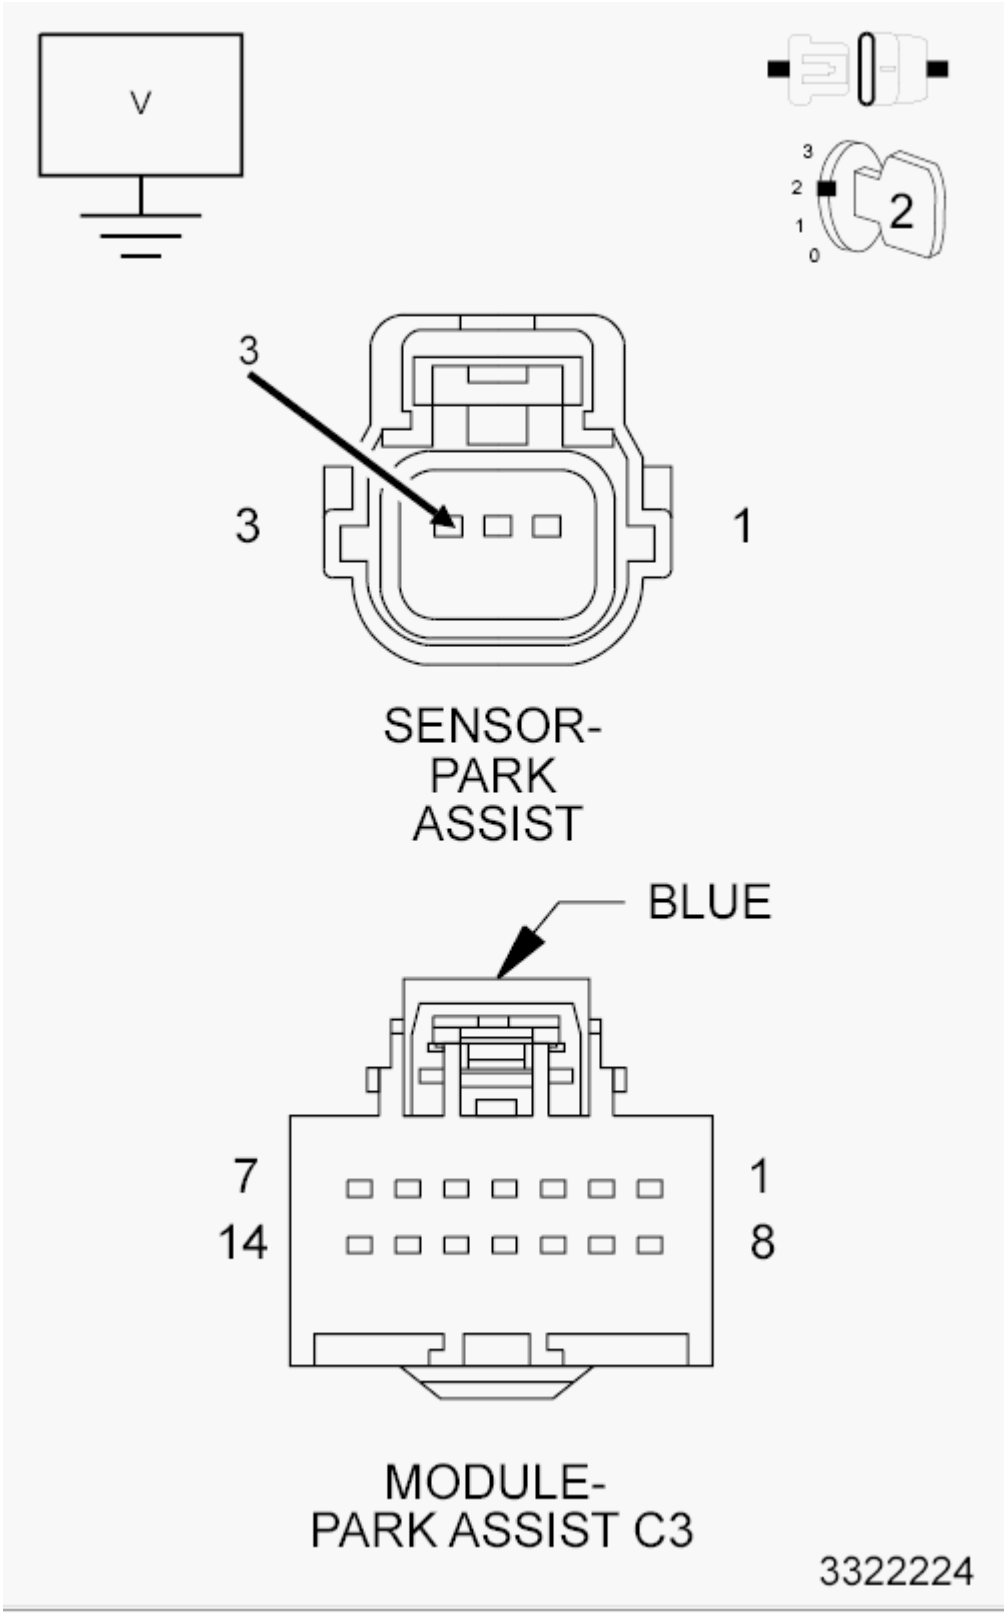

Fig. 10: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D702) Park Assist Sensor Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D702) Park Assist Sensor Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

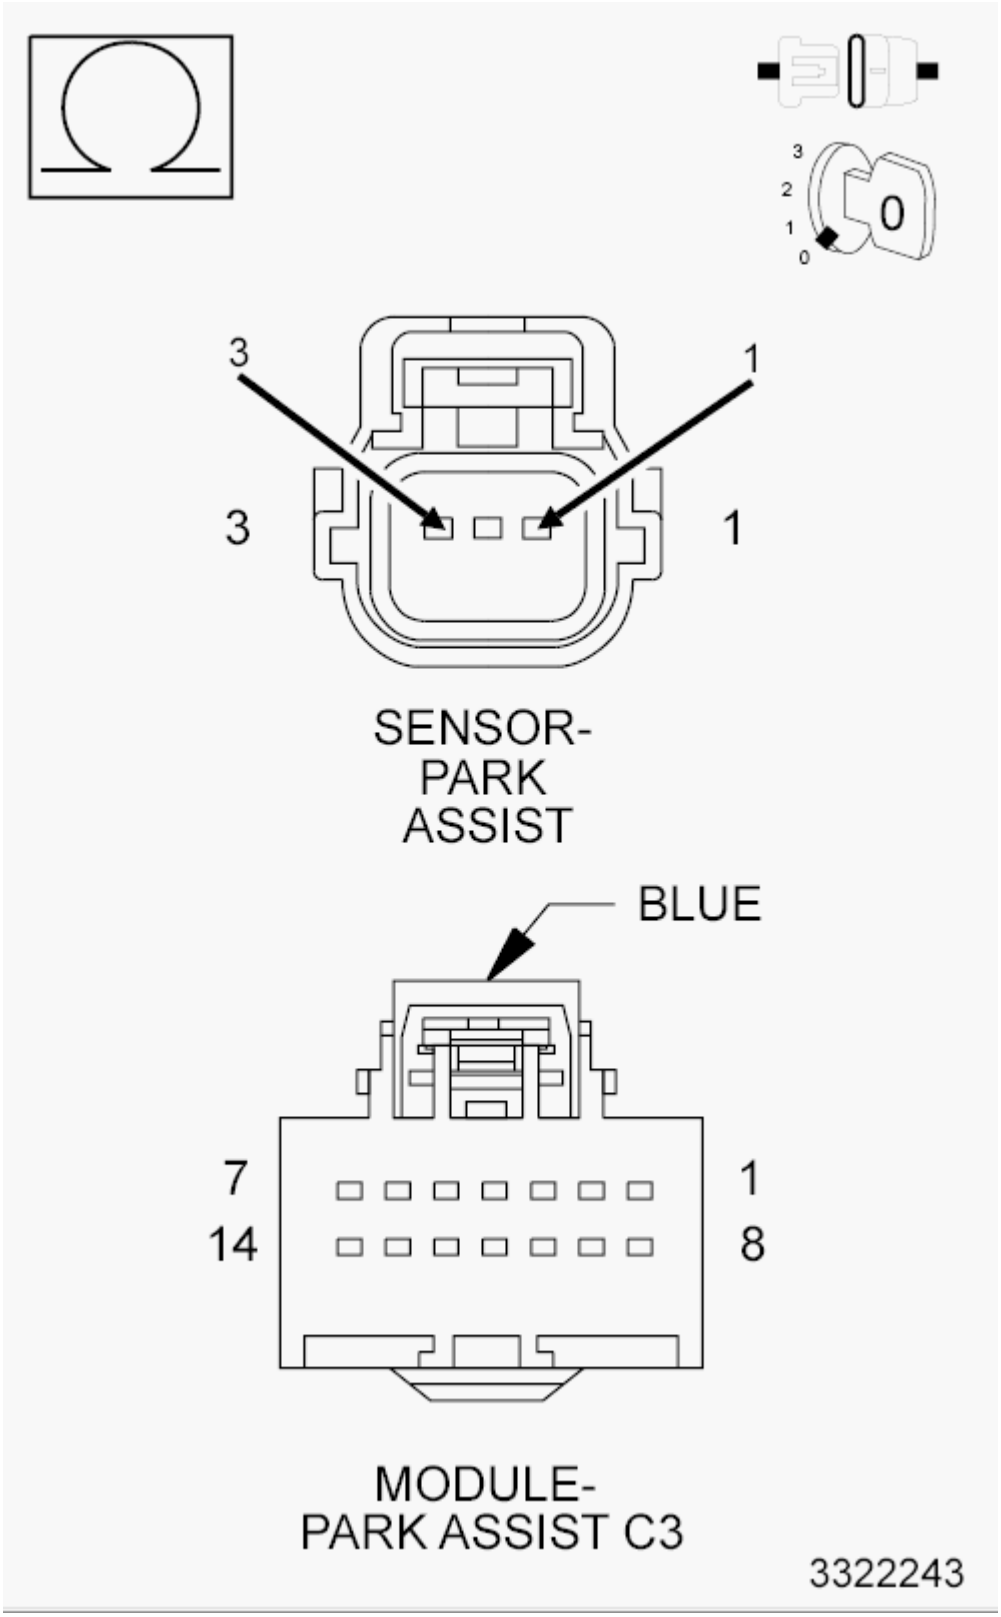

Fig. 11: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (D702) Park Assist Sensor Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D702) Park Assist Sensor Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN**

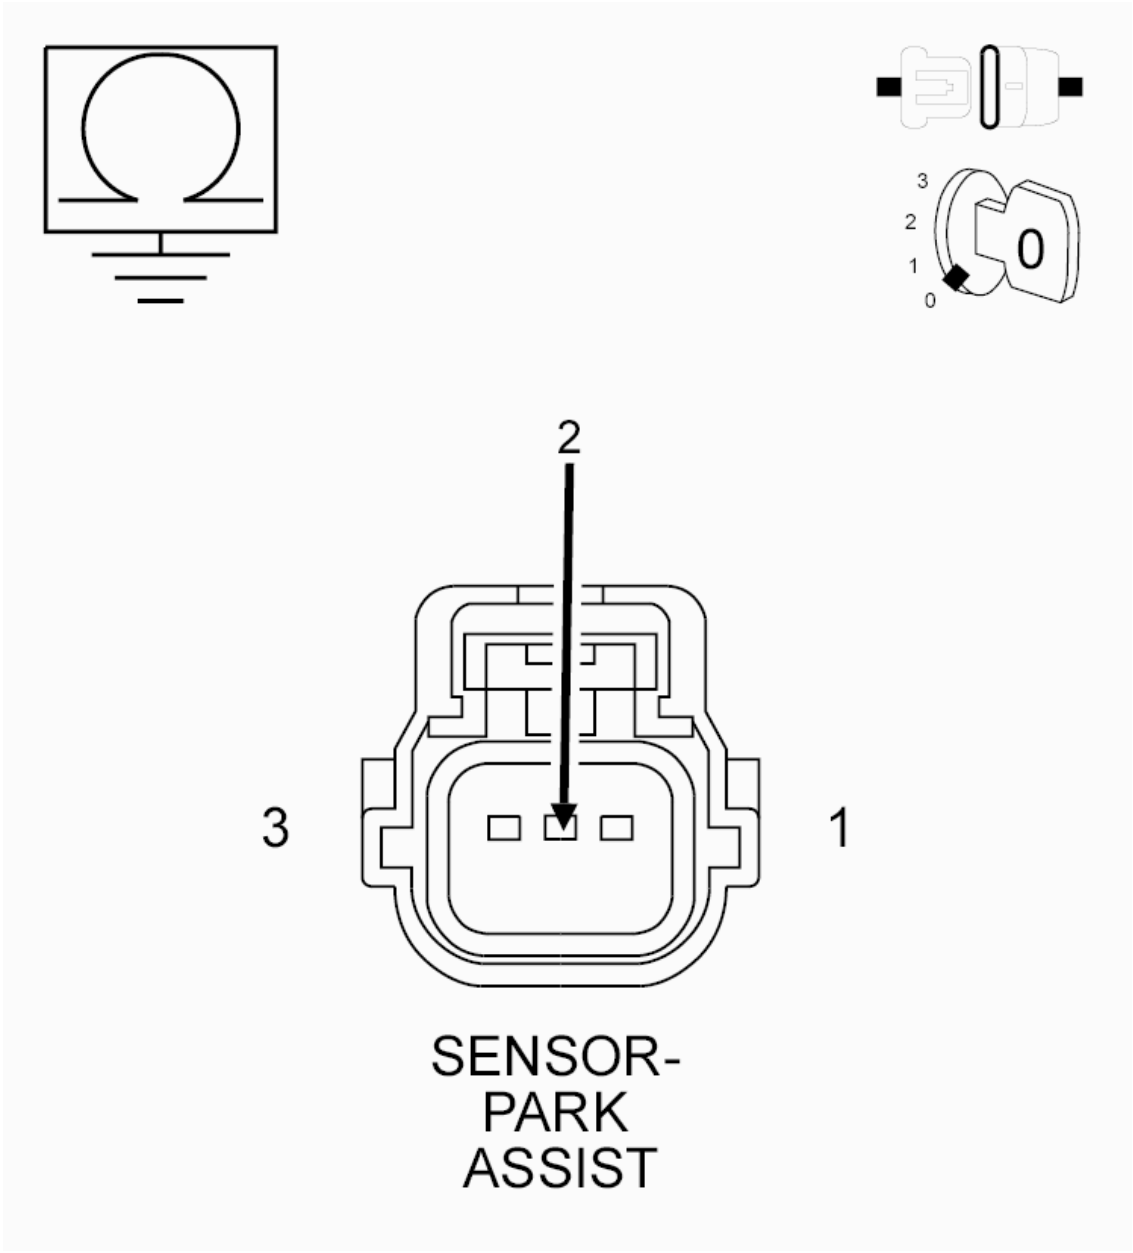

Fig. 12: Checking Front Park Assist Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 20.0 Ohms?

   Yes

   - Go To 5.

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**

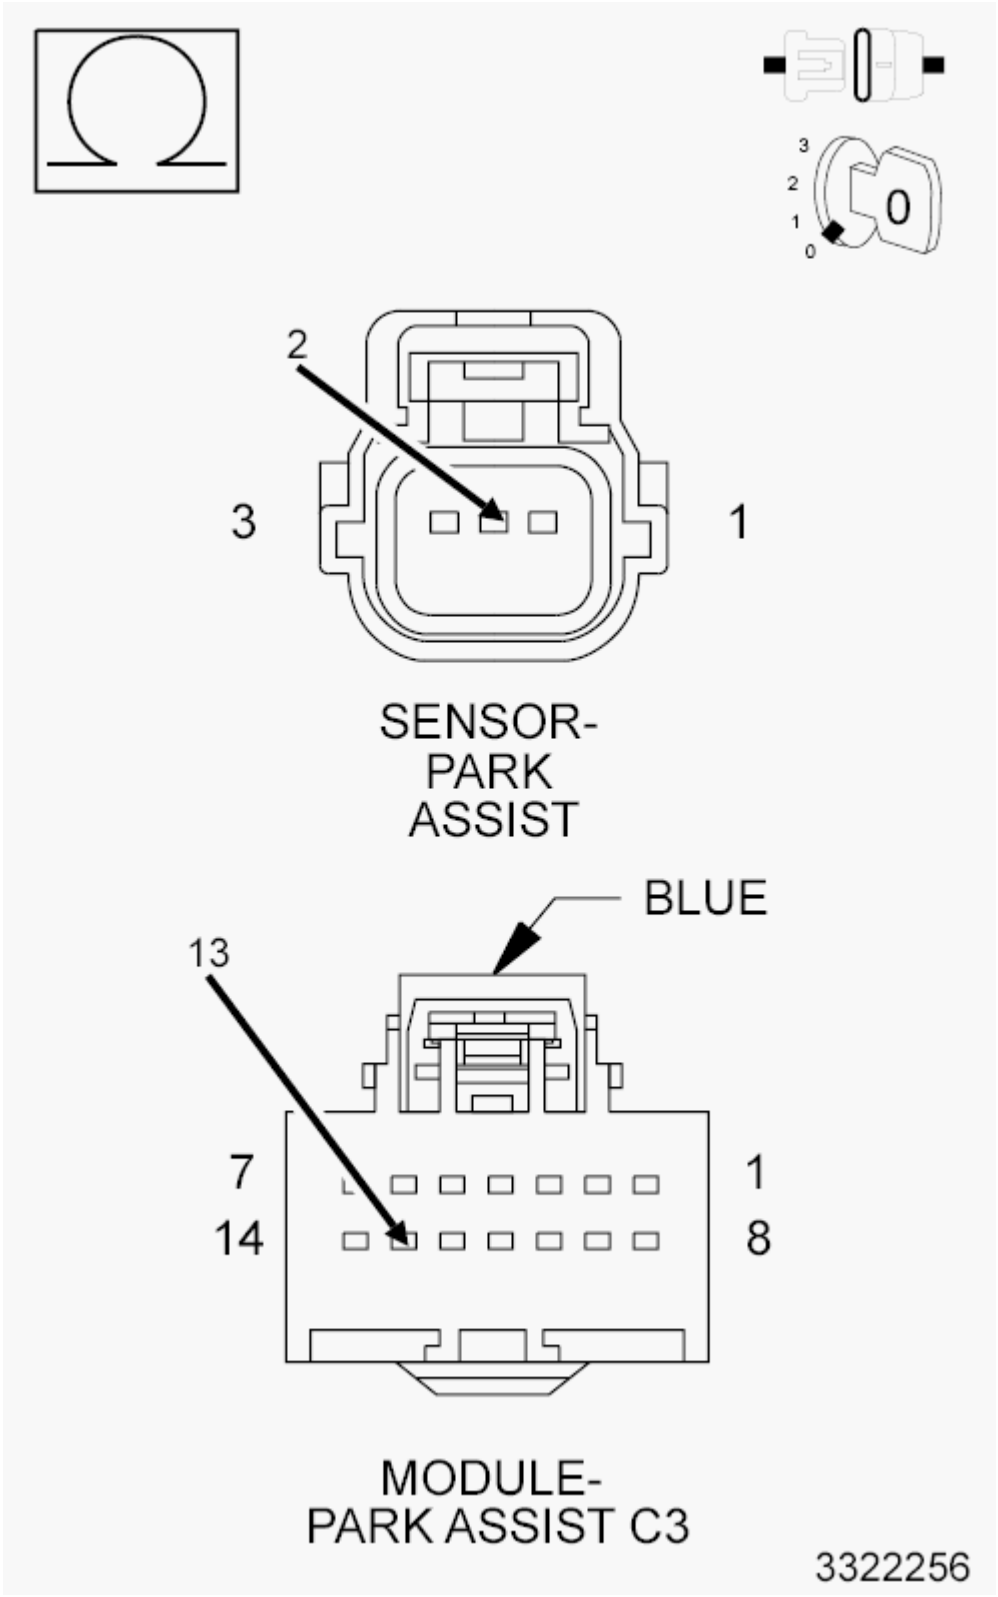

Fig. 13: Checking Front Park Assist Sensor Ground Circuit For An Open Between Park Assist Module & Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128E-25-PTS SENSOR 1 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

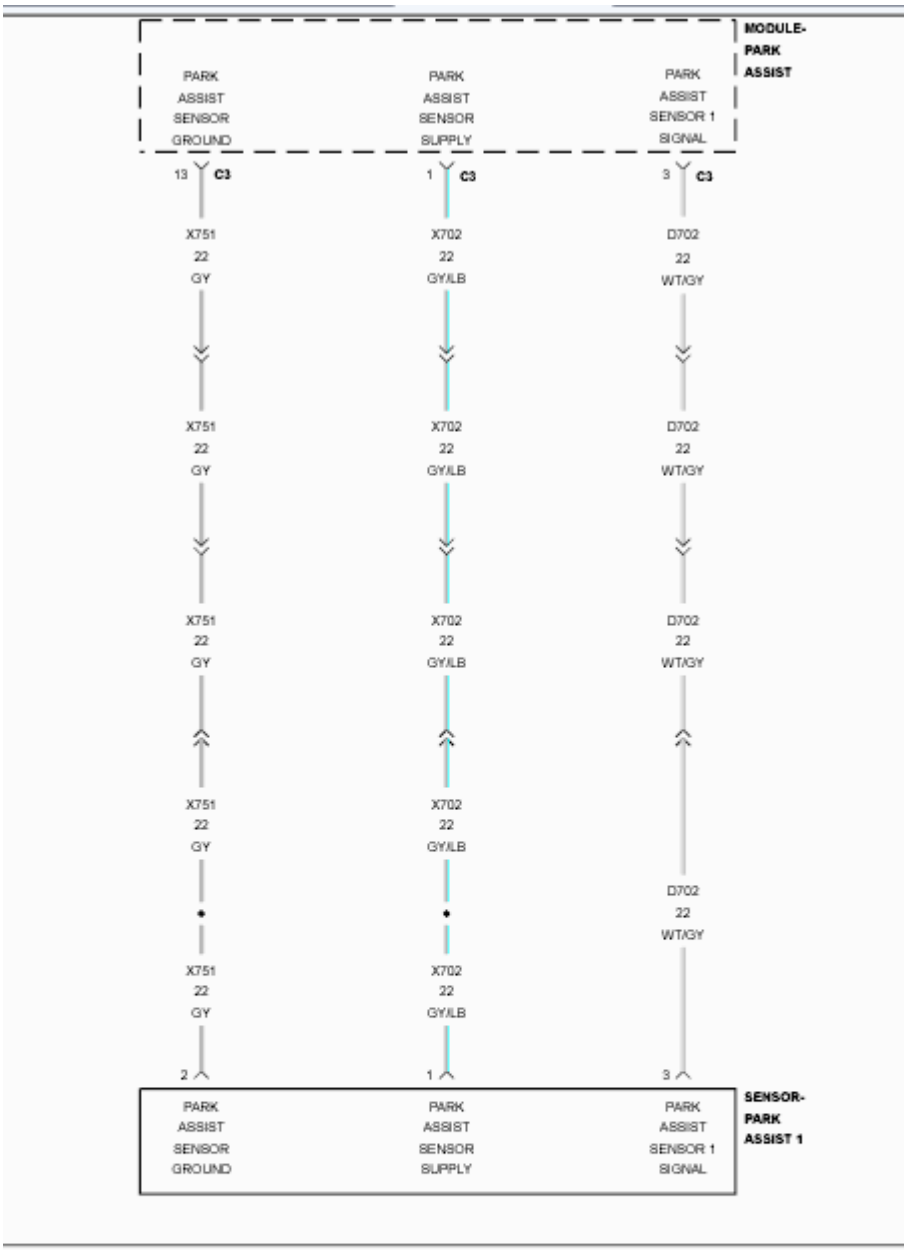
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128E-92-PTS SENSOR 1 - PERFORMANCE OR INCORRECT OPERATION



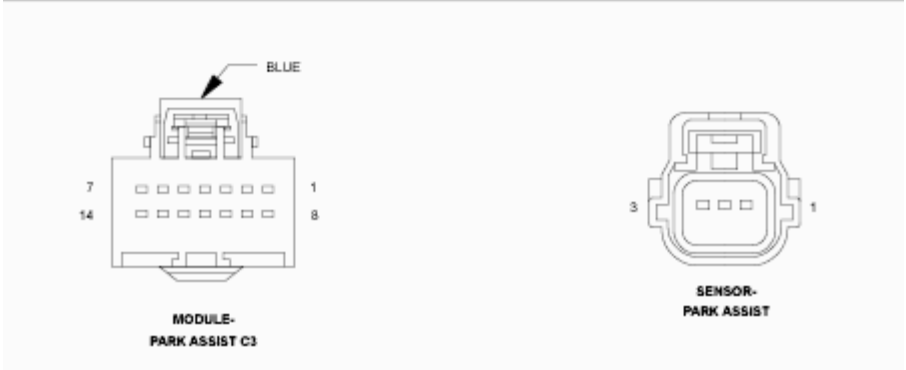


Fig. 14: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

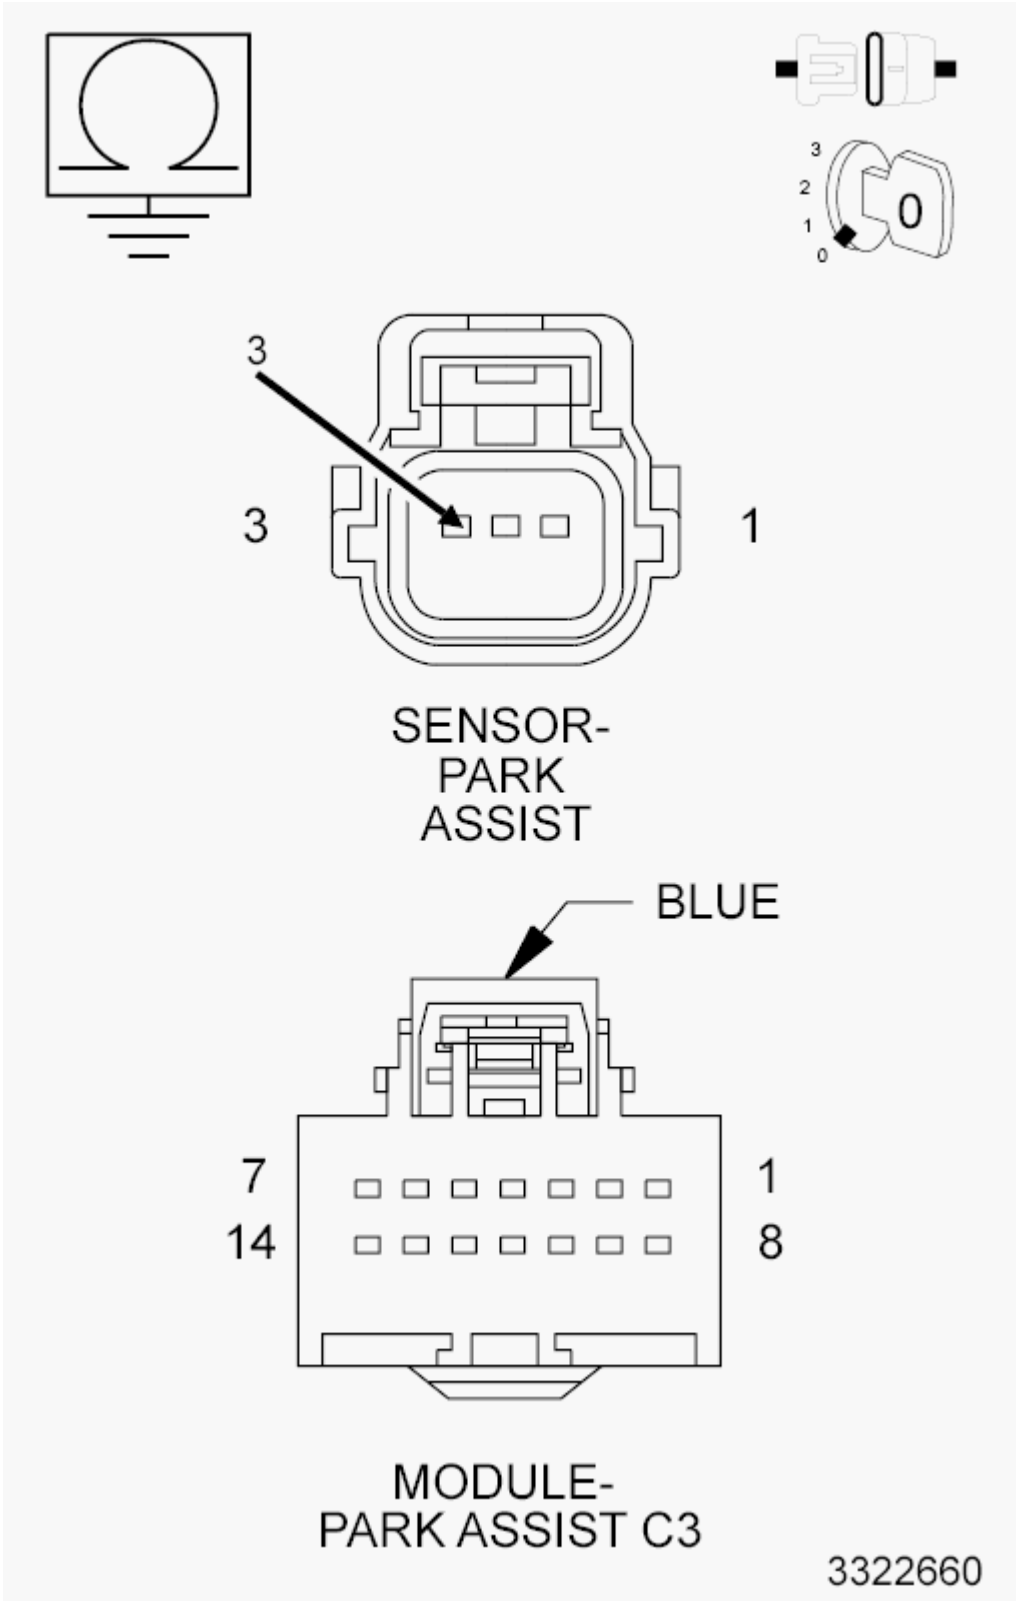

Fig. 15: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance between ground and the (D702) Park Assist Sensor Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D702) Park Assist Sensor Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

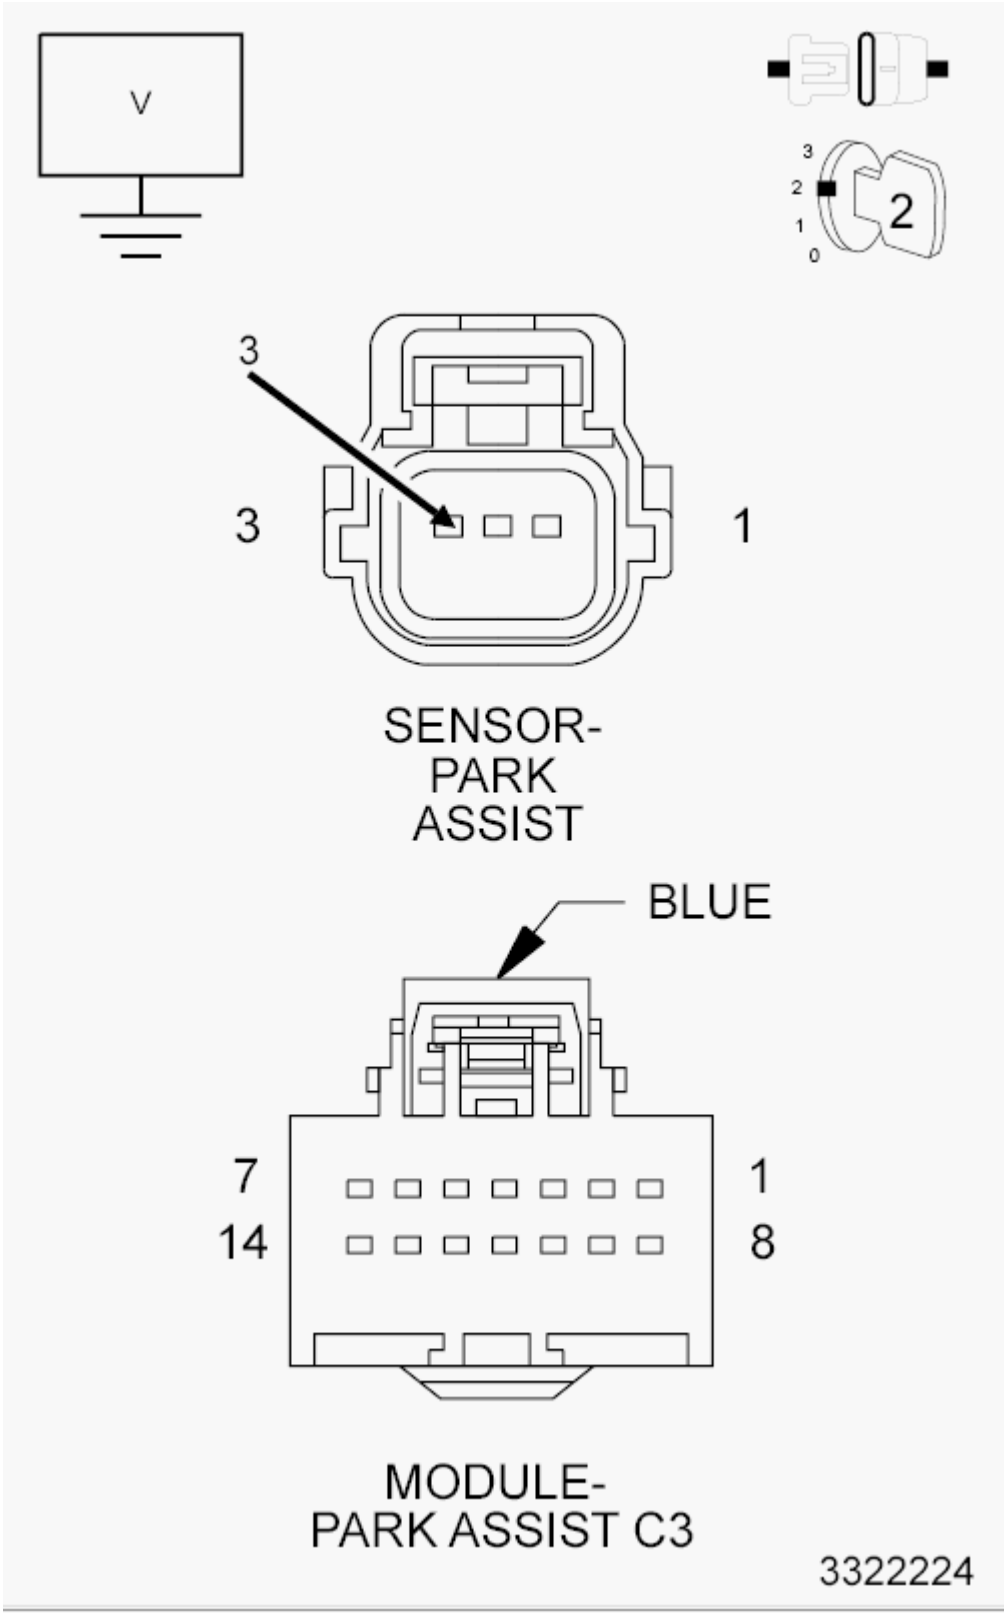

Fig. 16: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (D702) Park Assist Sensor Signal circuit.

   Is voltage present?

   Yes

   - Repair the (D702) Park Assist Sensor Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN**

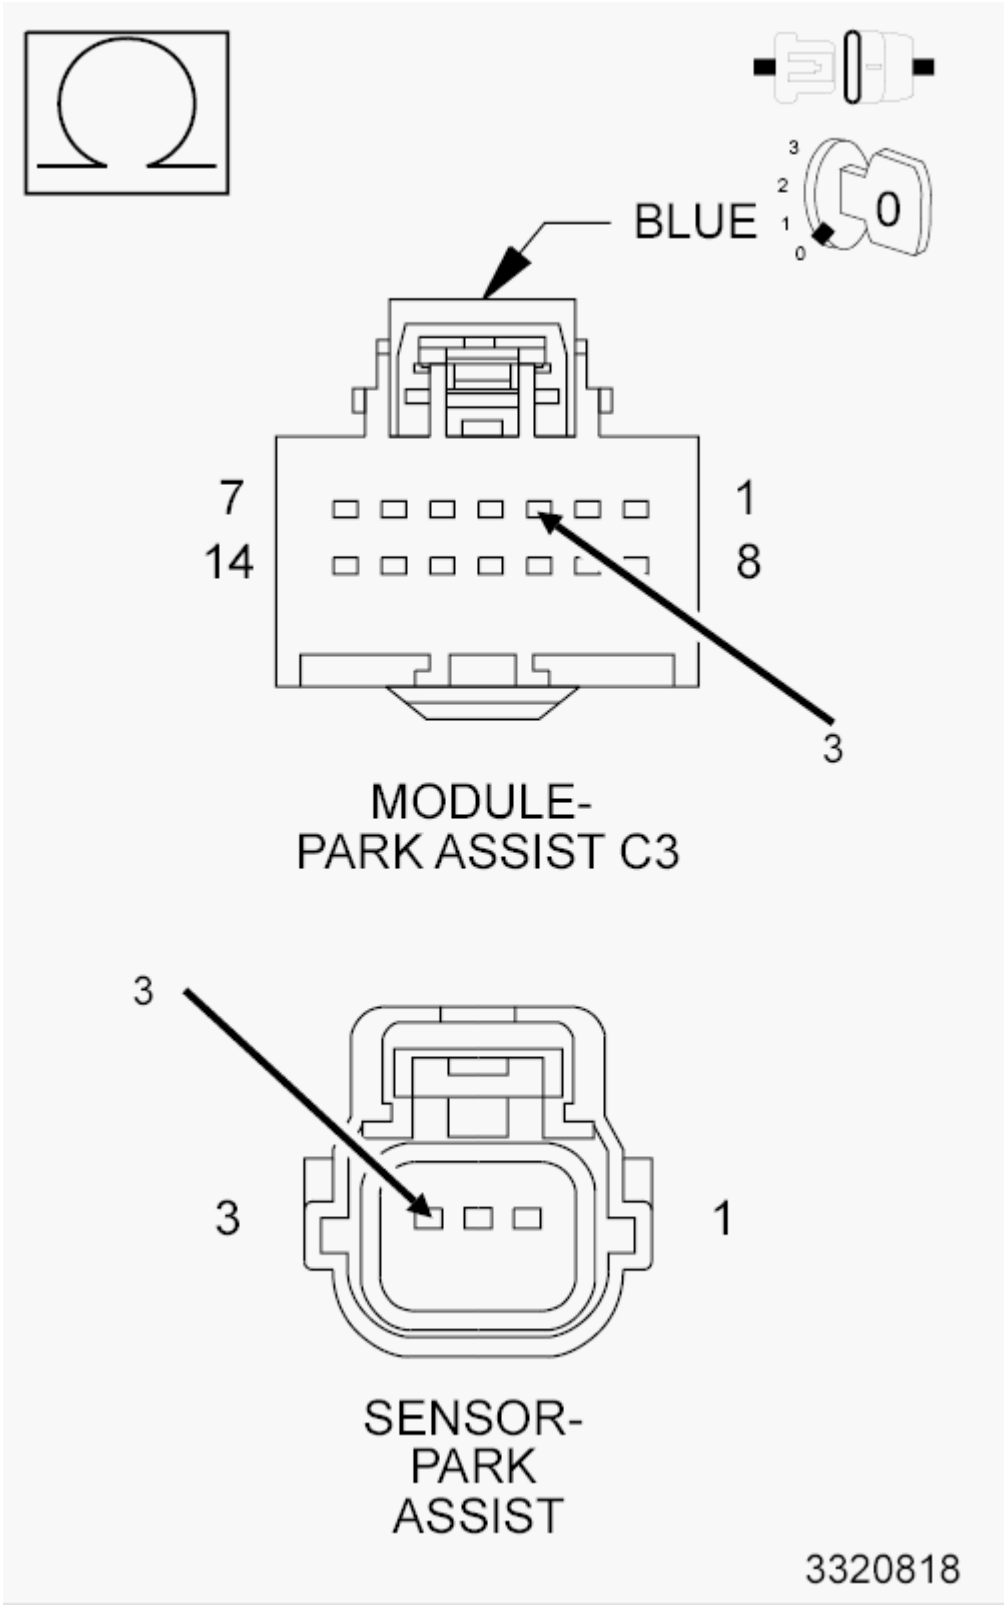

Fig. 17: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D702) Park Assist Sensor Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (D702) Park Assist Sensor Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128F-11-PTS SENSOR 2 - CIRCUIT SHORT TO GROUND

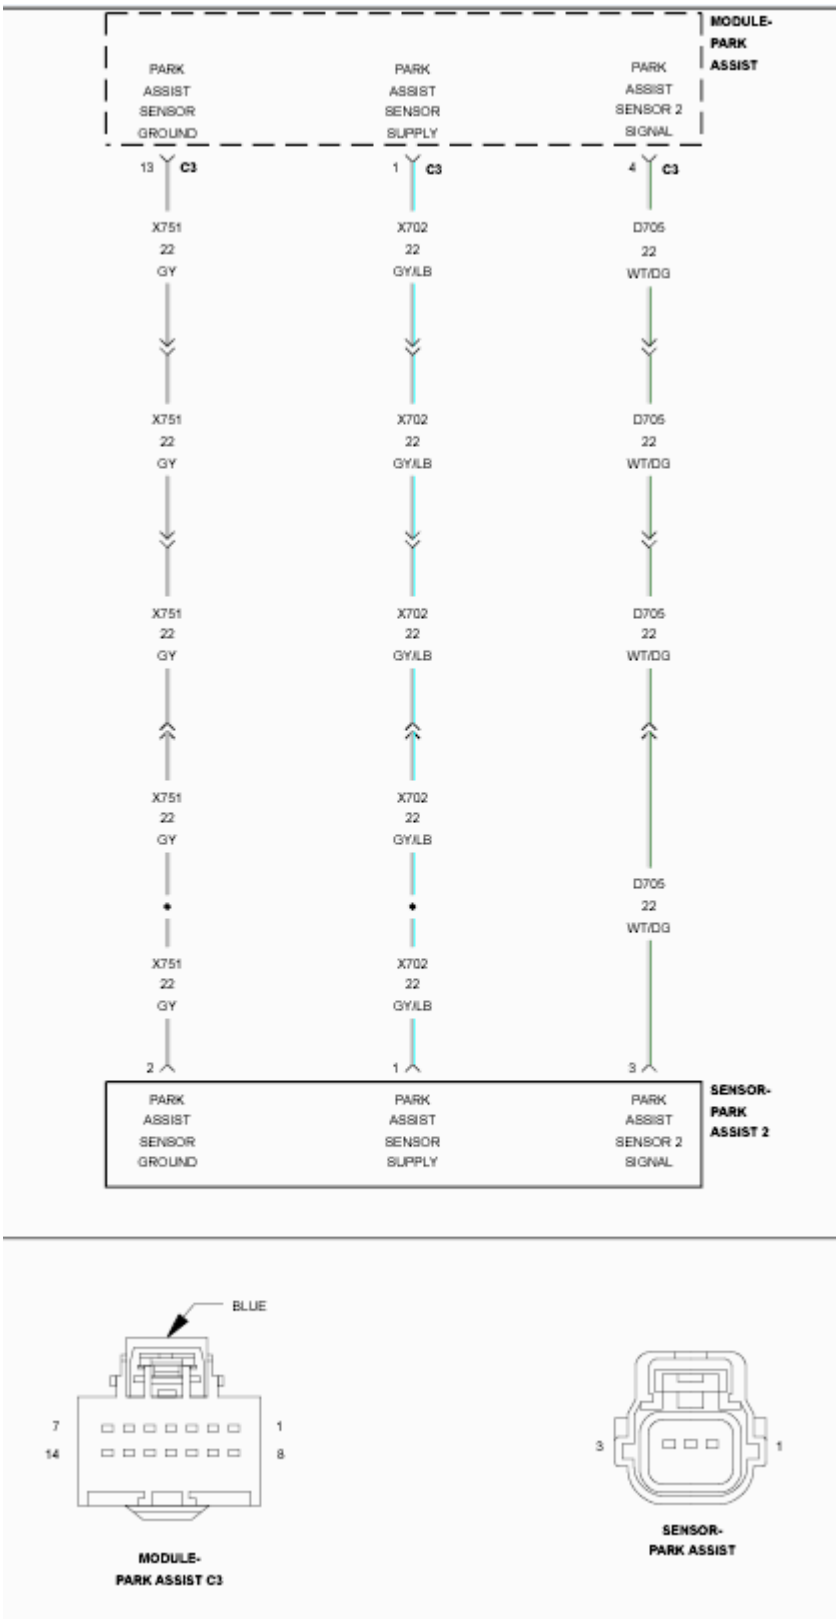

Fig. 18: Park Assist Sensor 2 Wiring Diagram

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

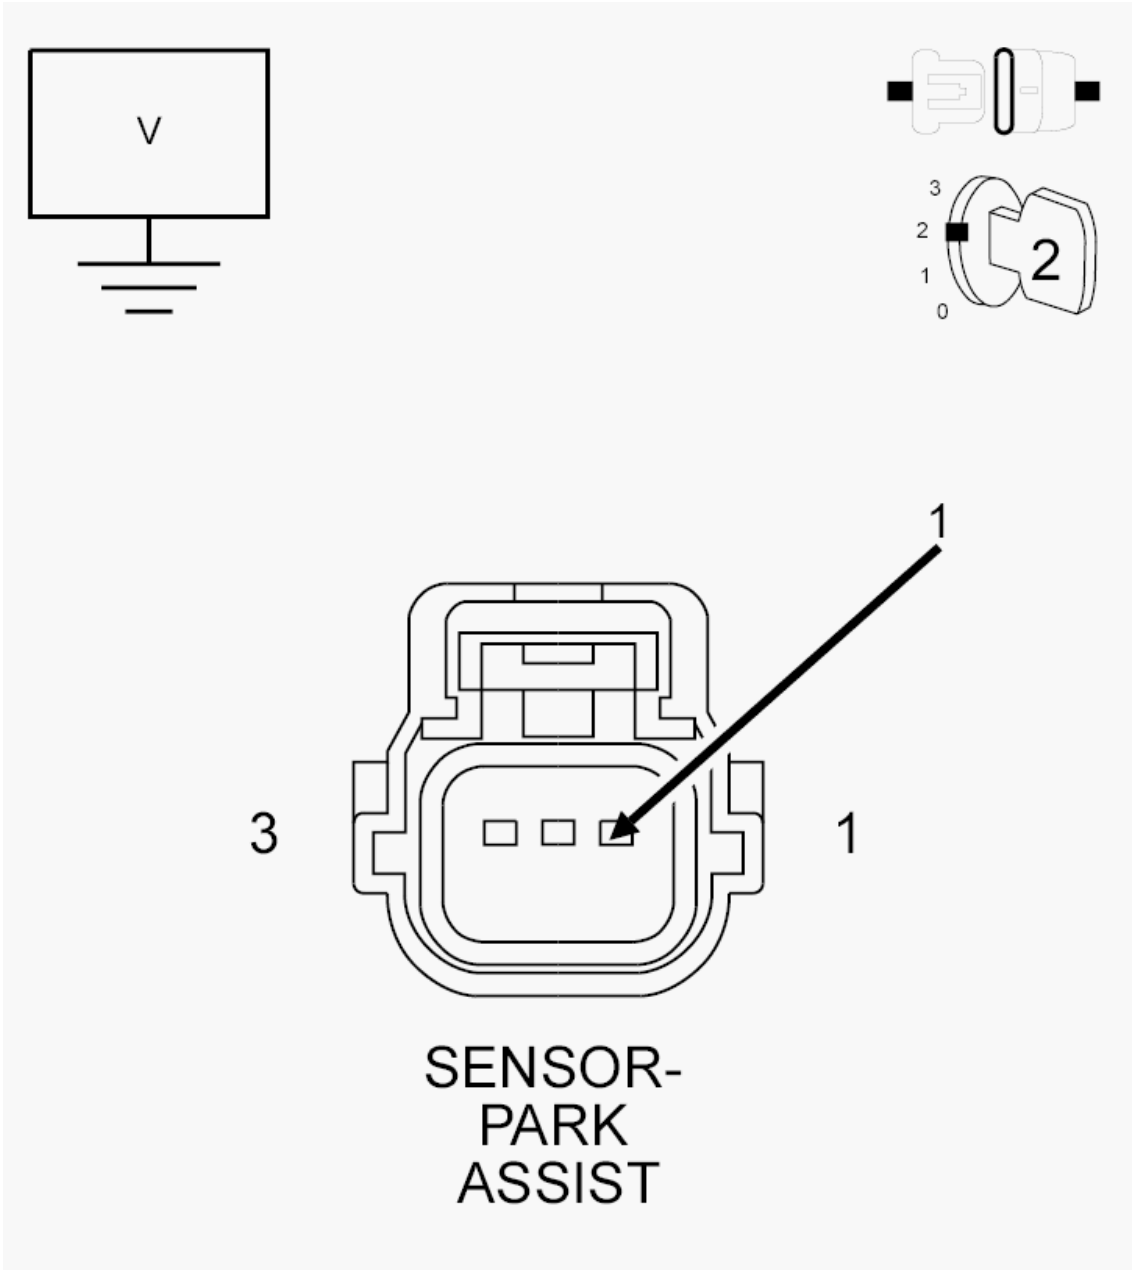

Fig. 19: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

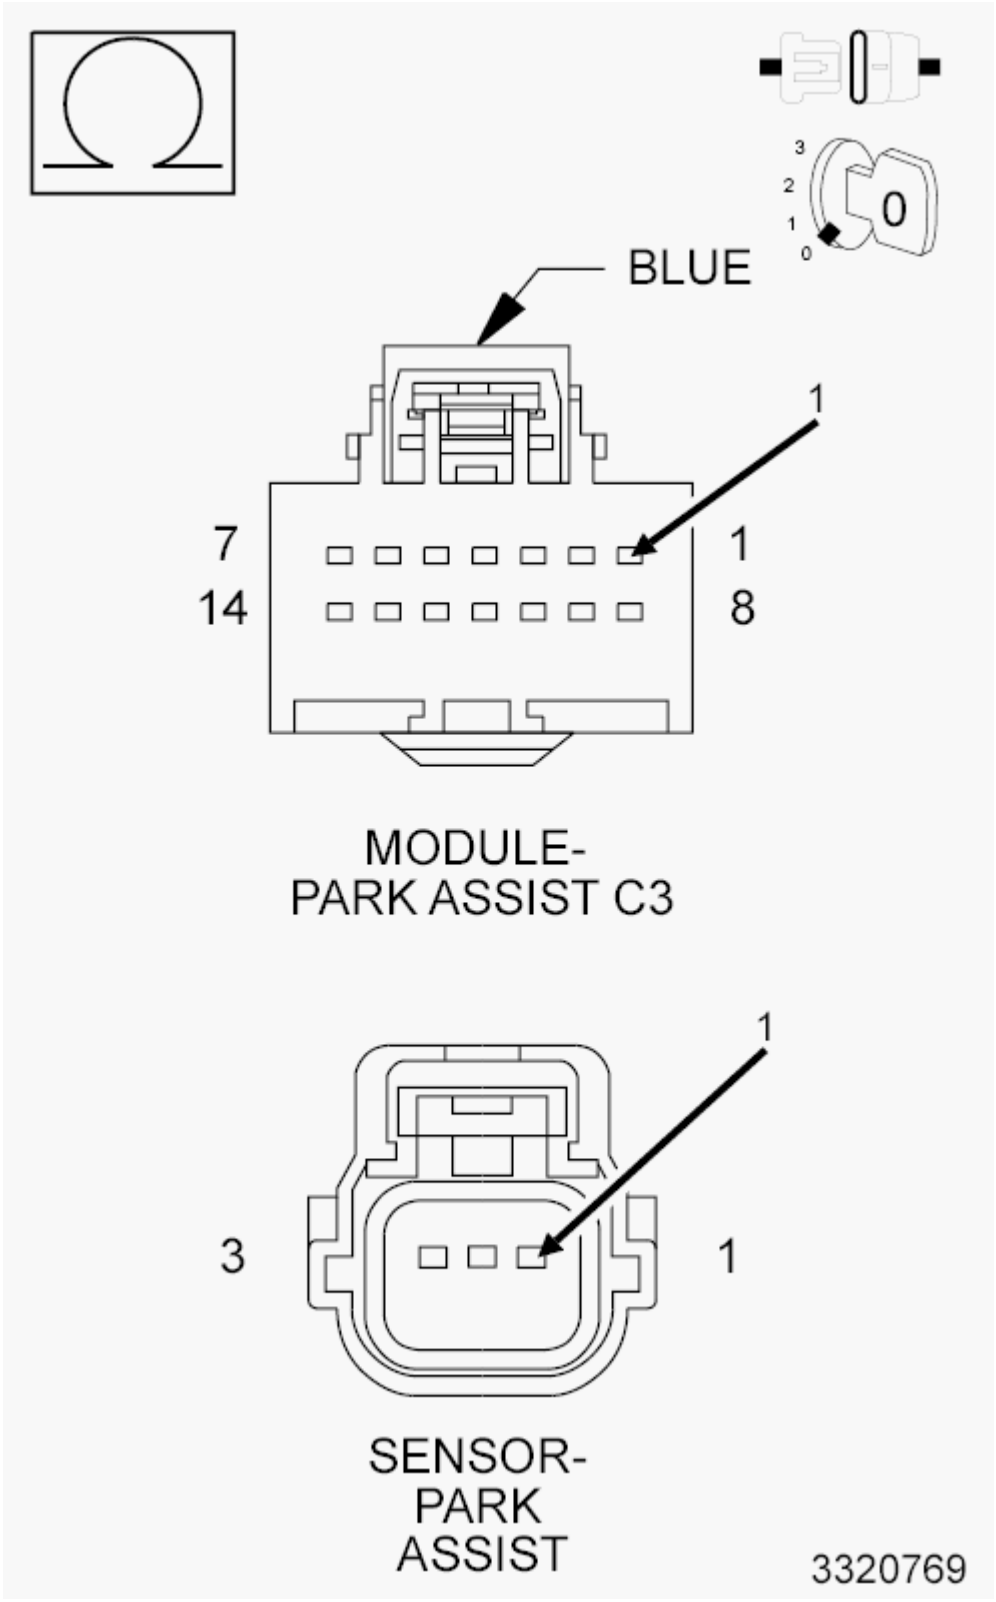

Fig. 20: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

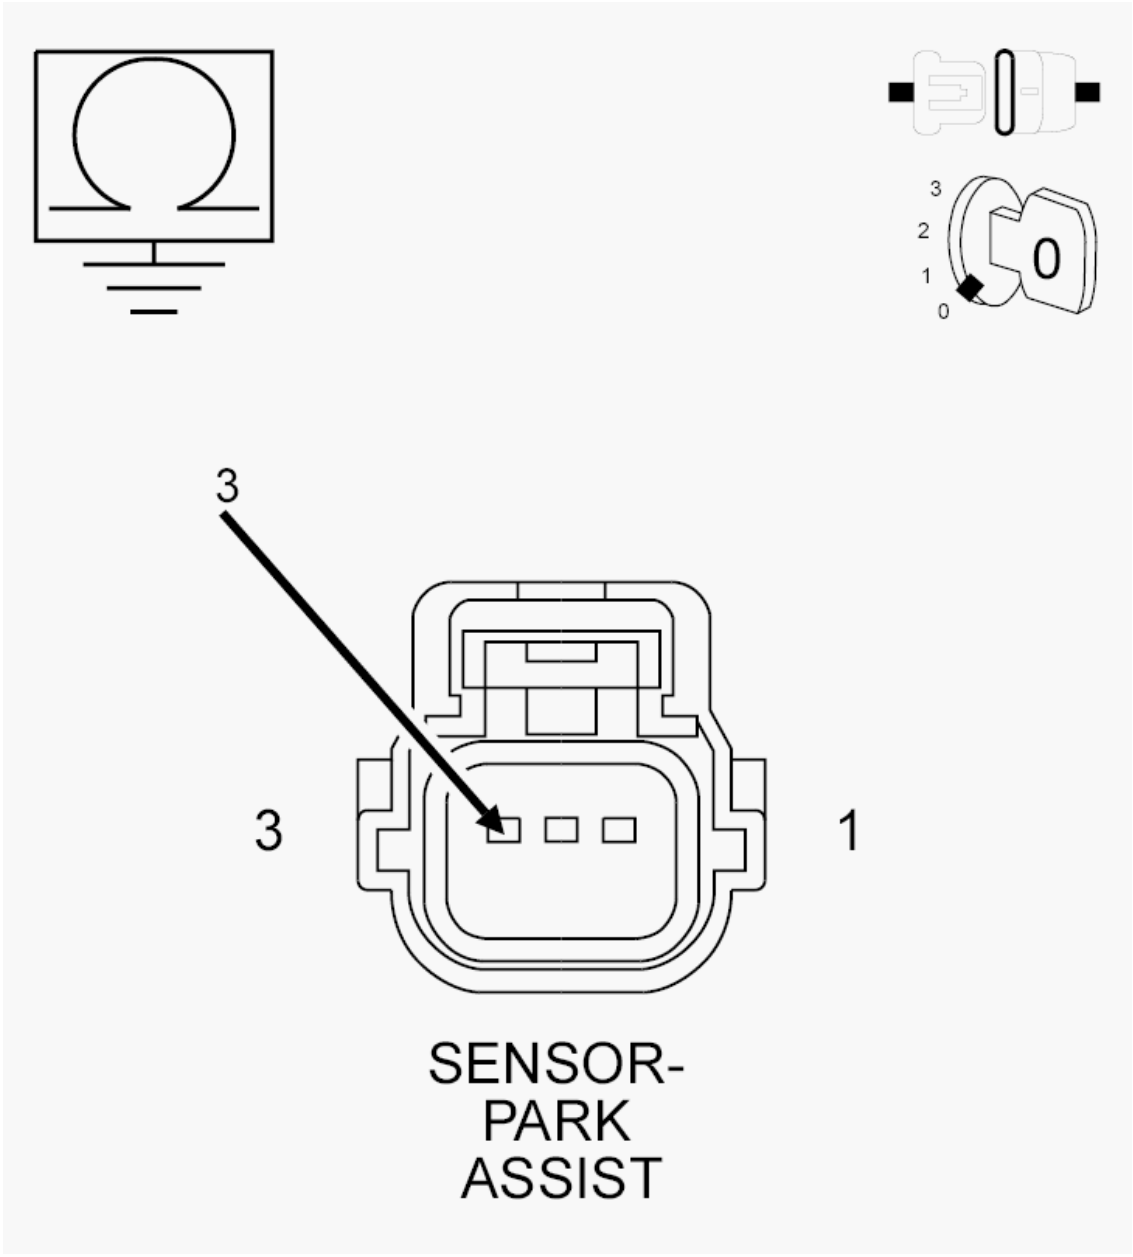

Fig. 21: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

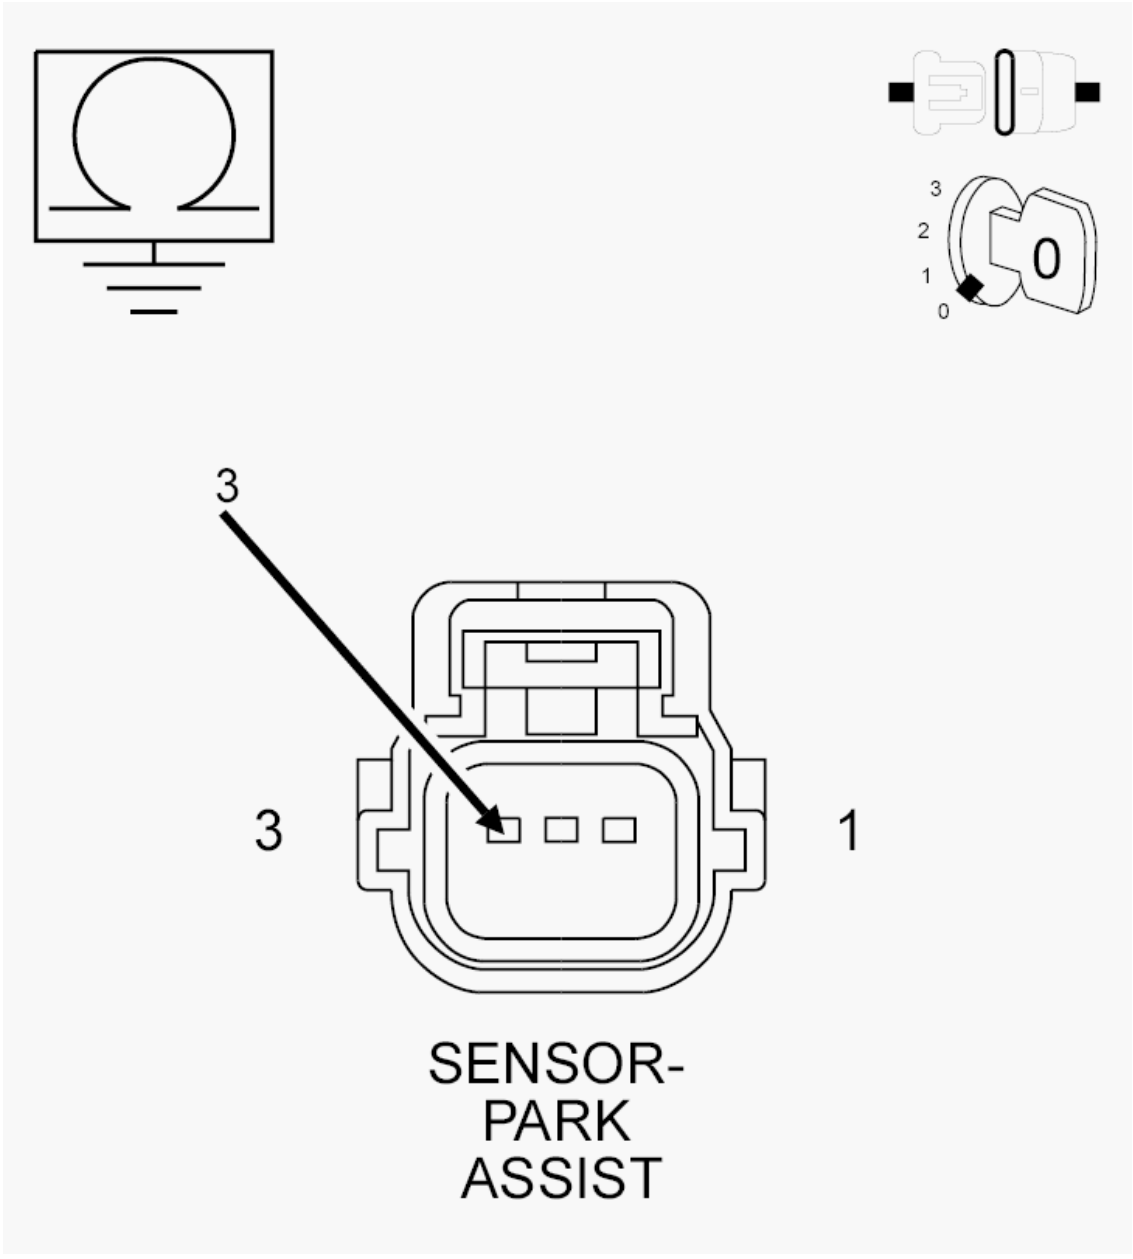

Fig. 22: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance between ground and the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D705) Park Assist Sensor 2 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

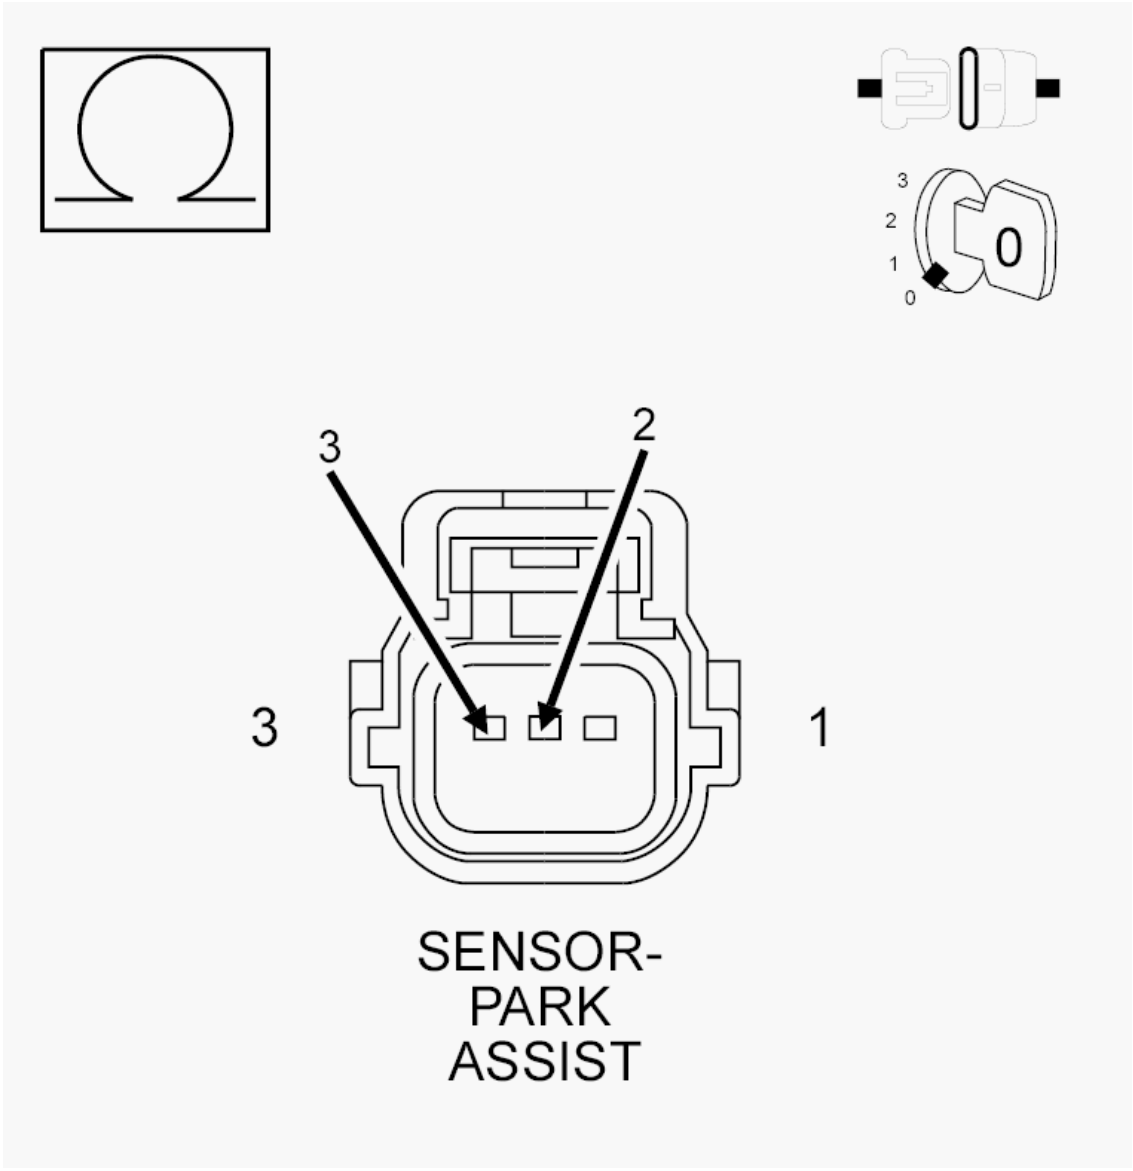

Fig. 23: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D705) Park Assist Sensor 2 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D705) Park Assist Sensor 2 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**

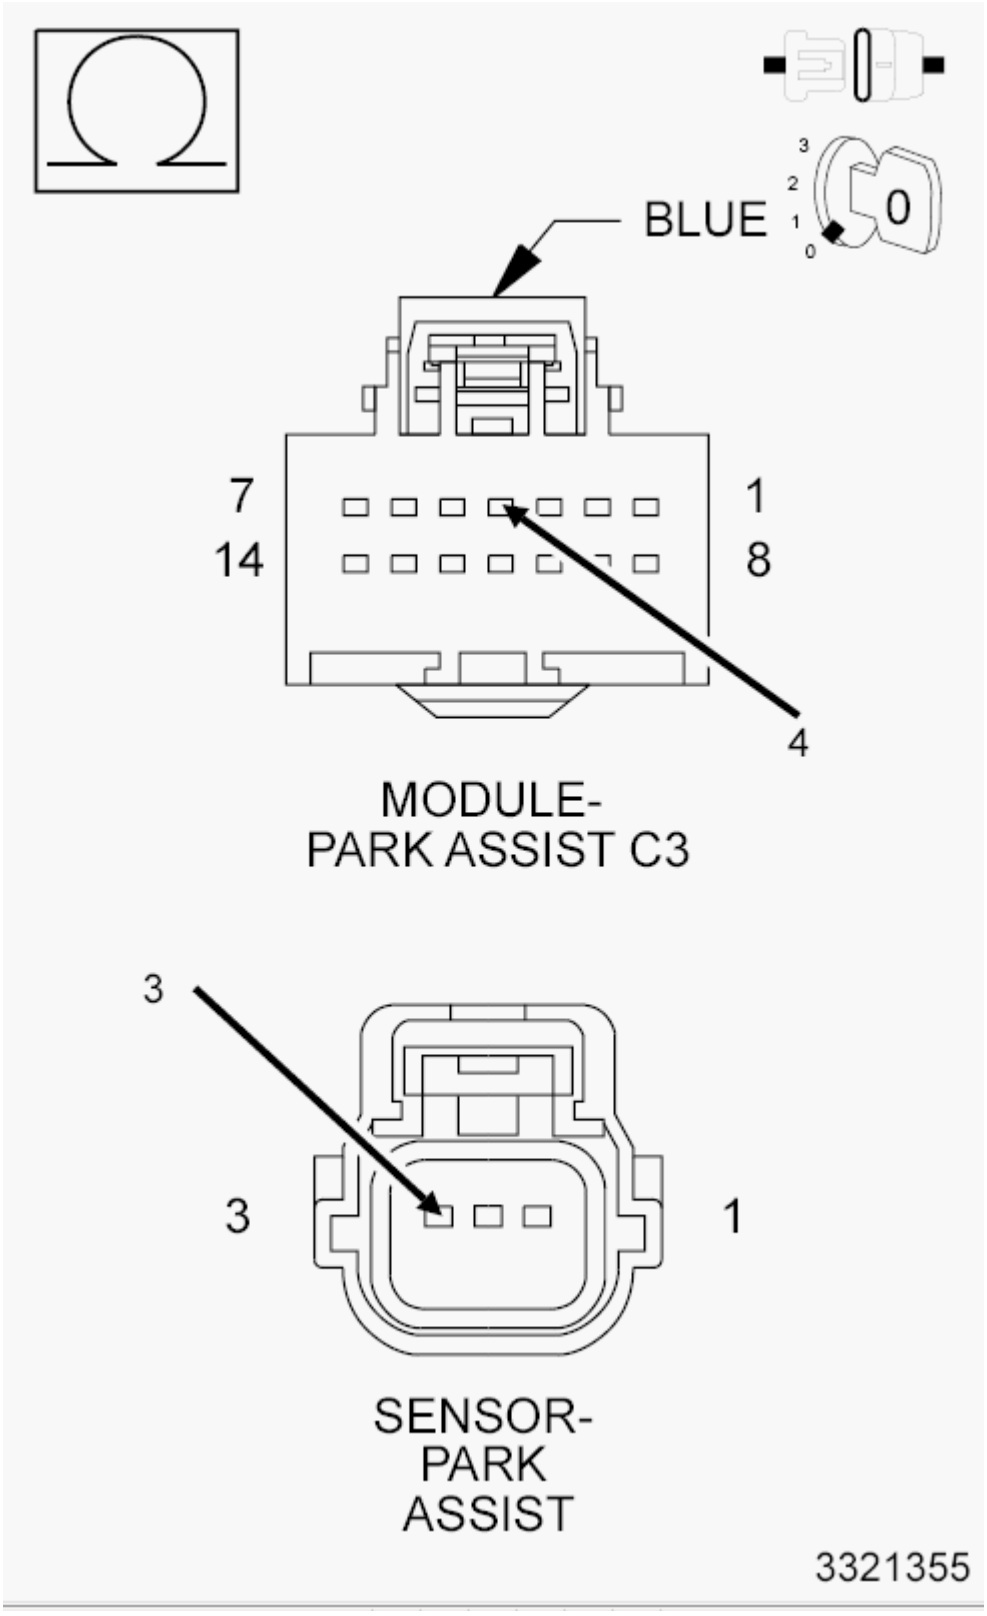

Fig. 24: Checking Park Assist Sensor 2 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D705) Park Assist Sensor 2 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

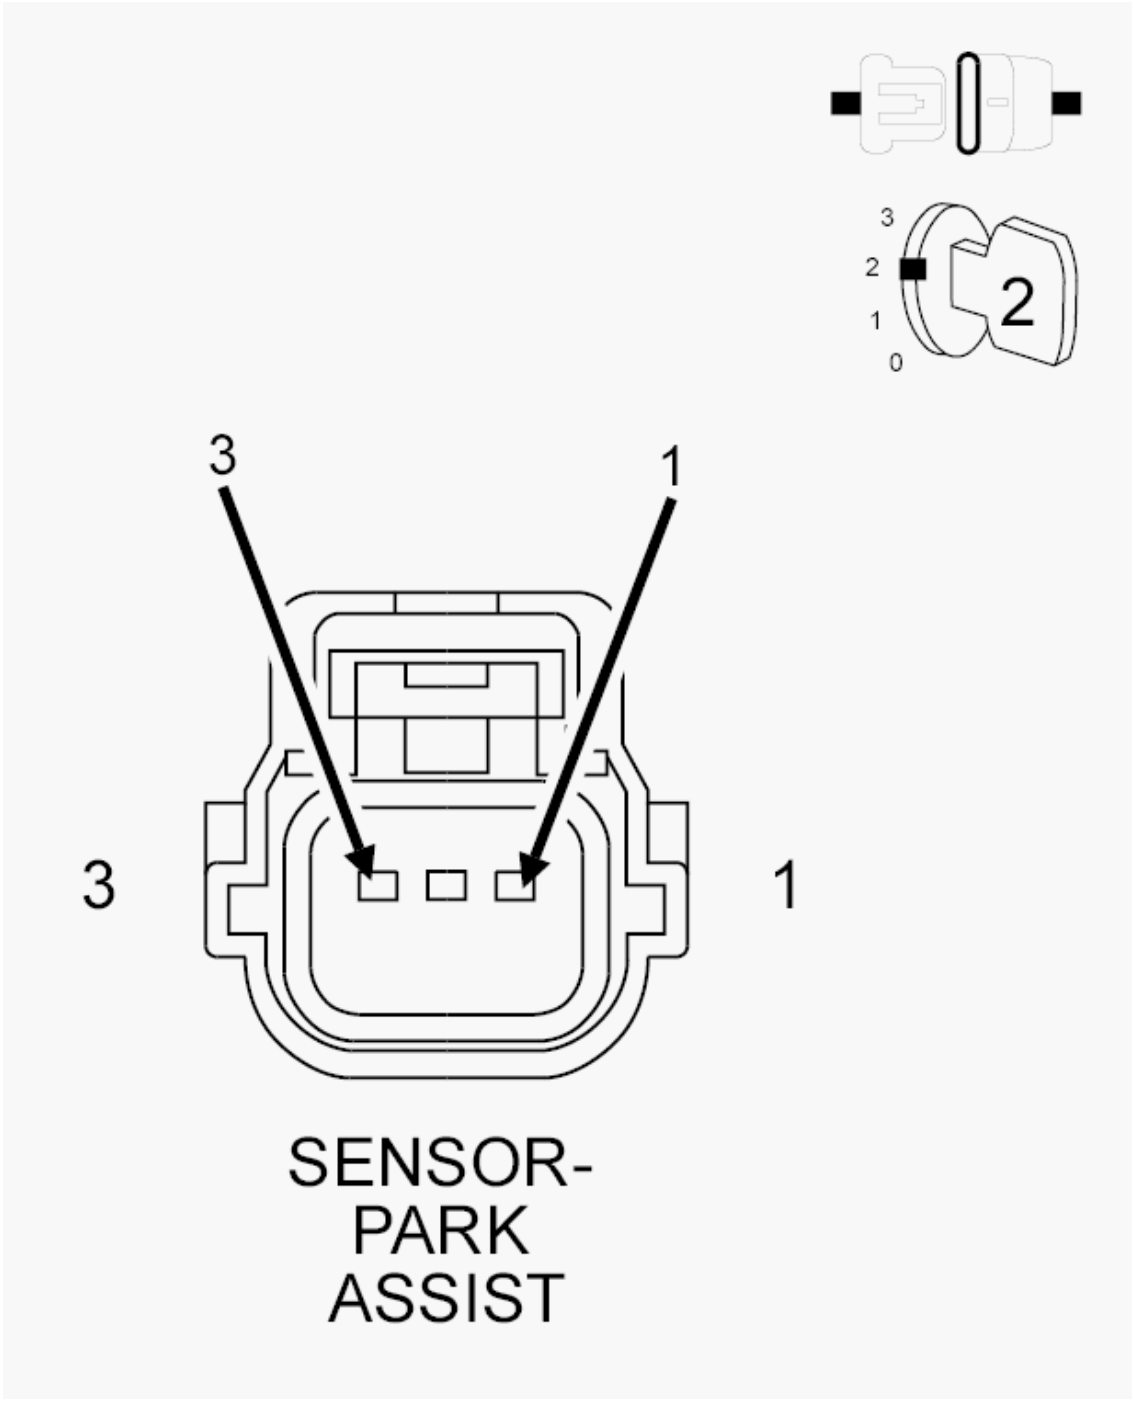

Fig. 25: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D705) Park Assist Sensor 2 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B128F-12-PTS SENSOR 2 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128F-12-PTS SENSOR 2 - CIRCUIT SHORT TO BATTERY

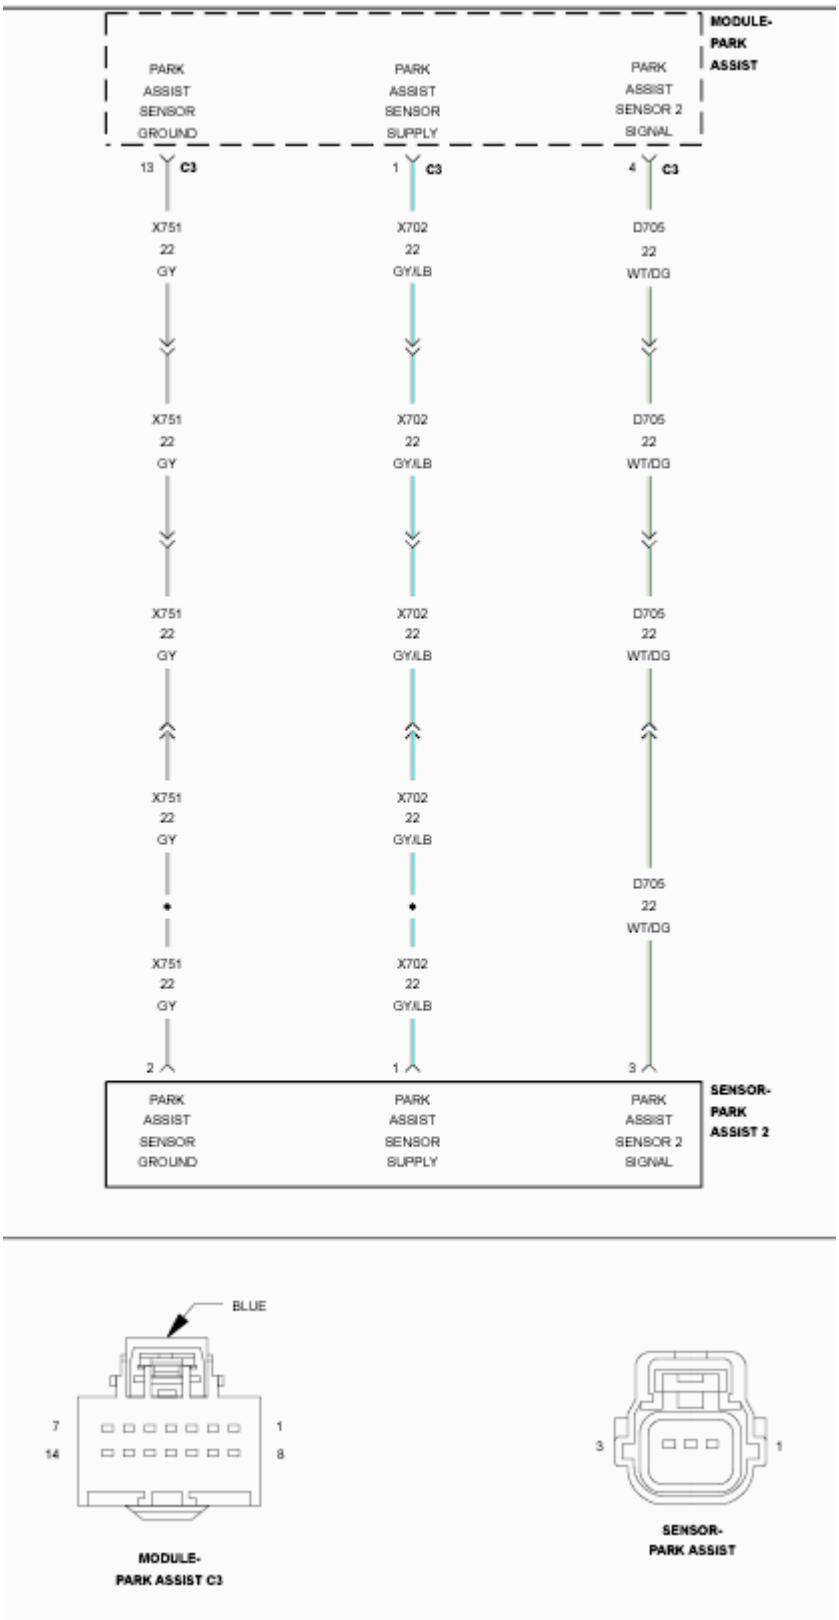

Fig. 26: Park Assist Sensor 2 Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

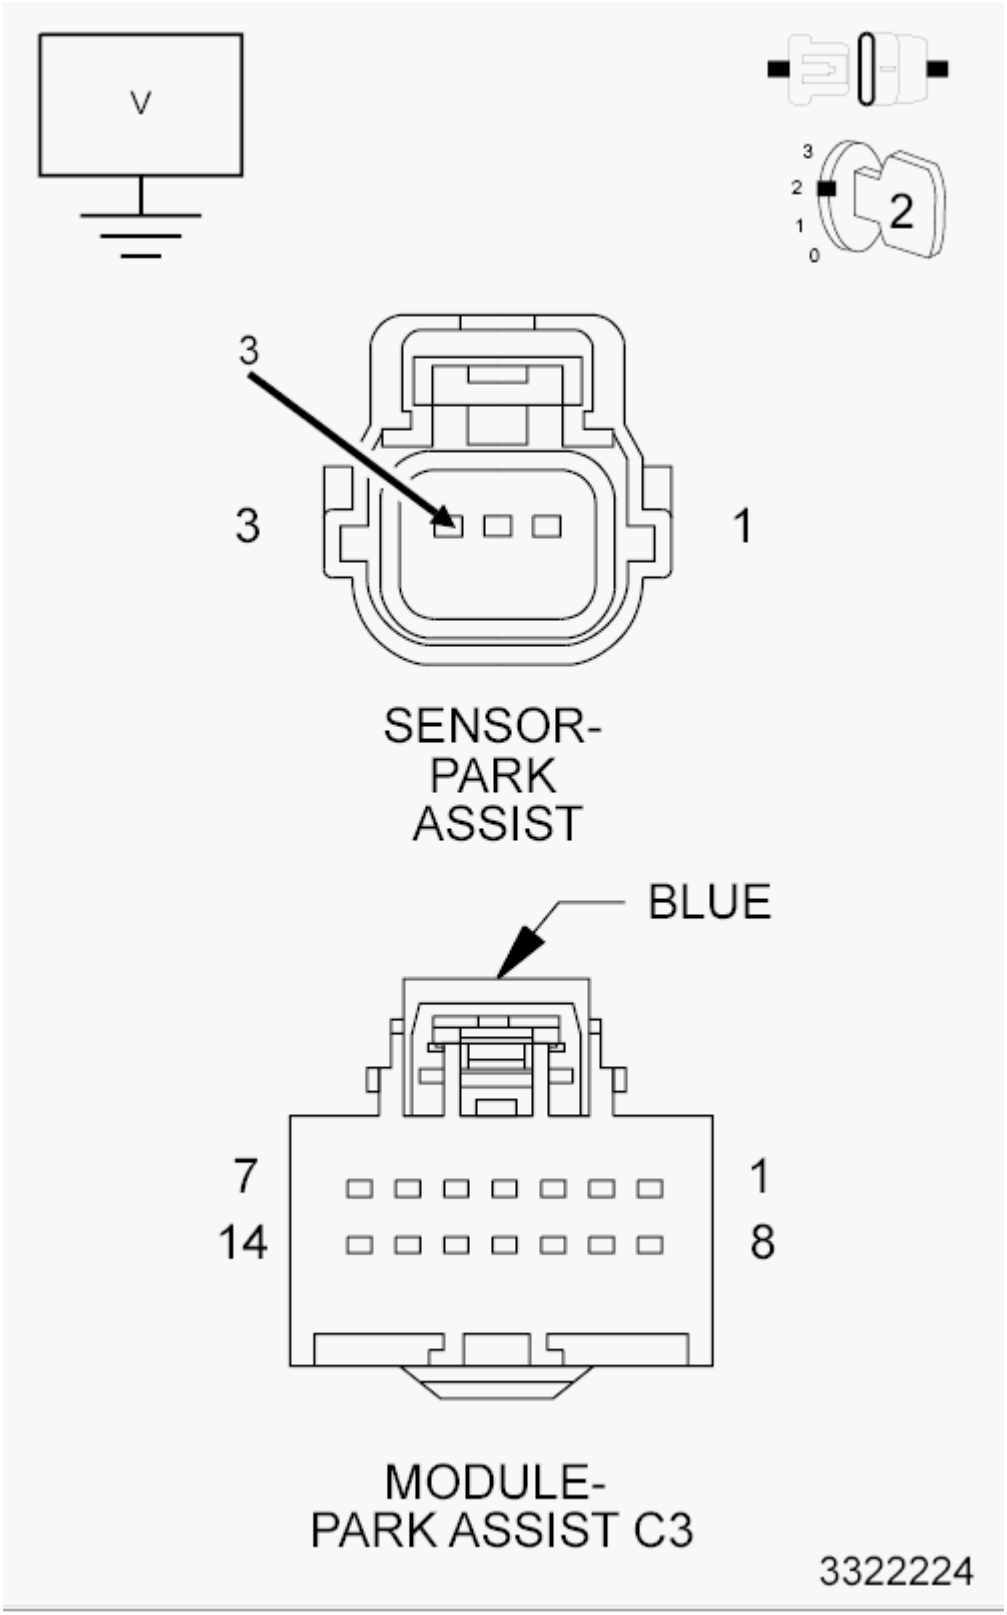

Fig. 27: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D705) Park Assist Sensor 2 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

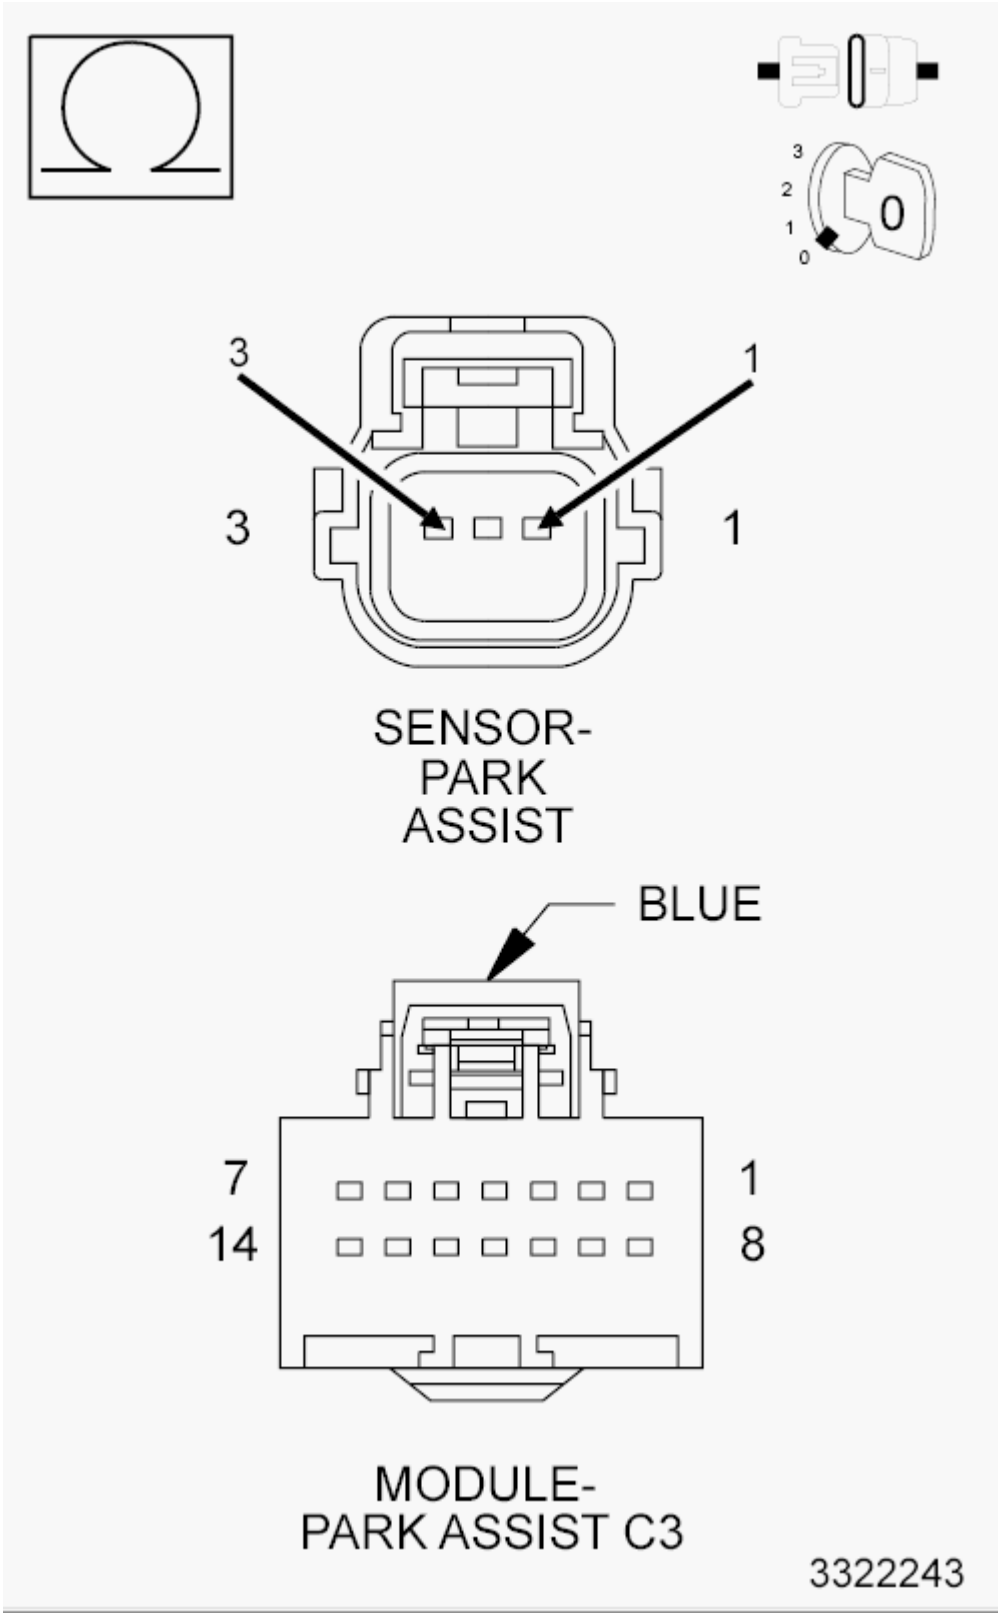

Fig. 28: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Supply Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (D705) Park Assist Sensor 2 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN**

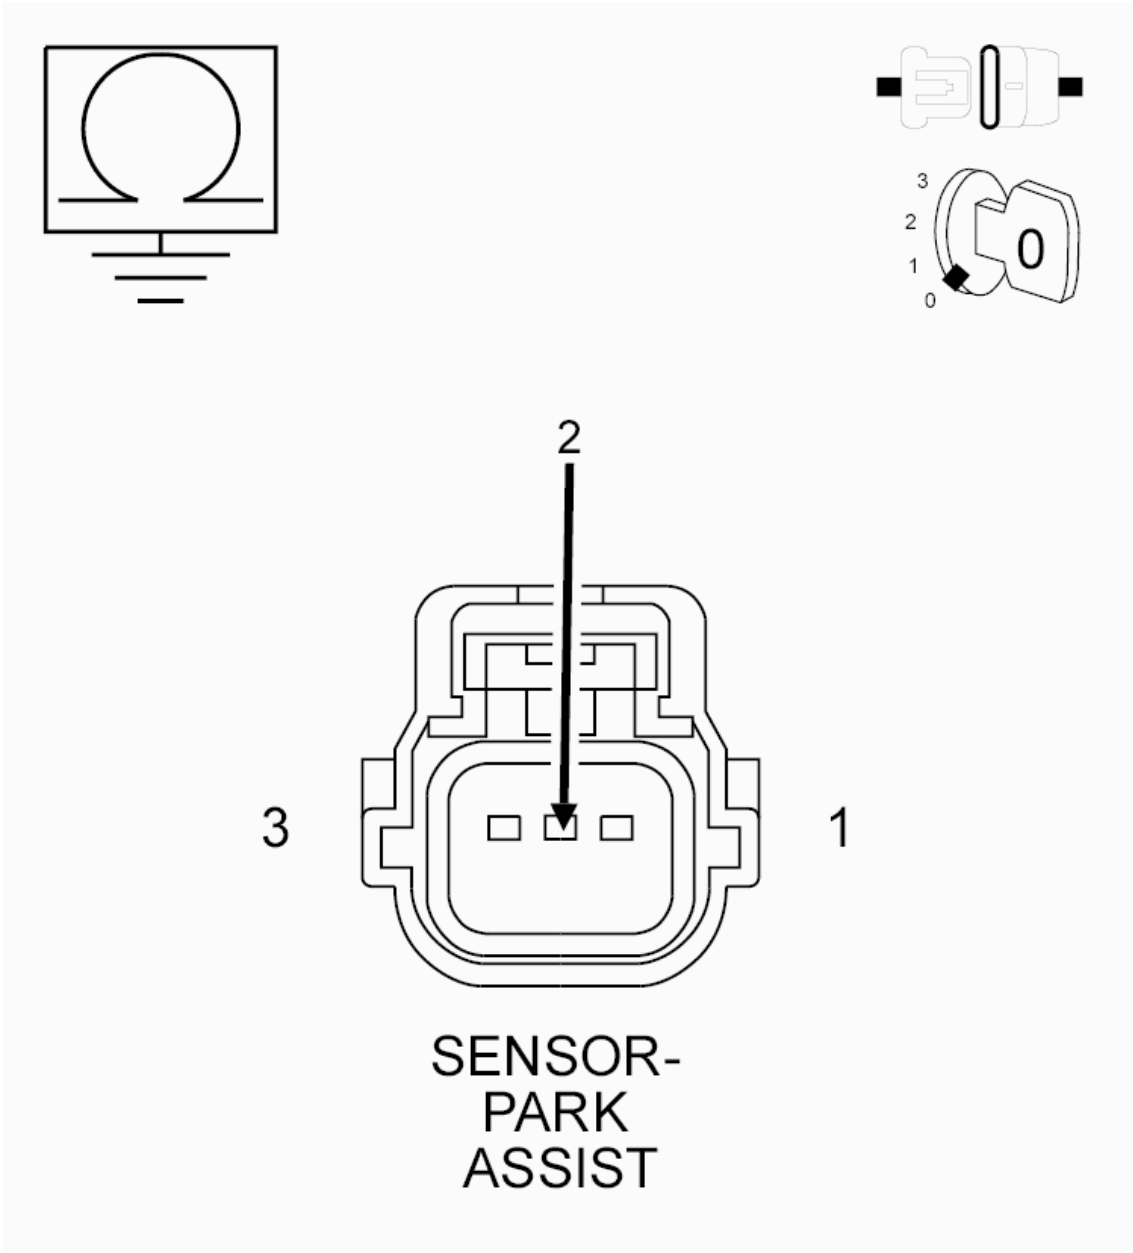

Fig. 29: Checking Front Park Assist Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 20.0 Ohms?

   Yes

   - Go To 5.

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**

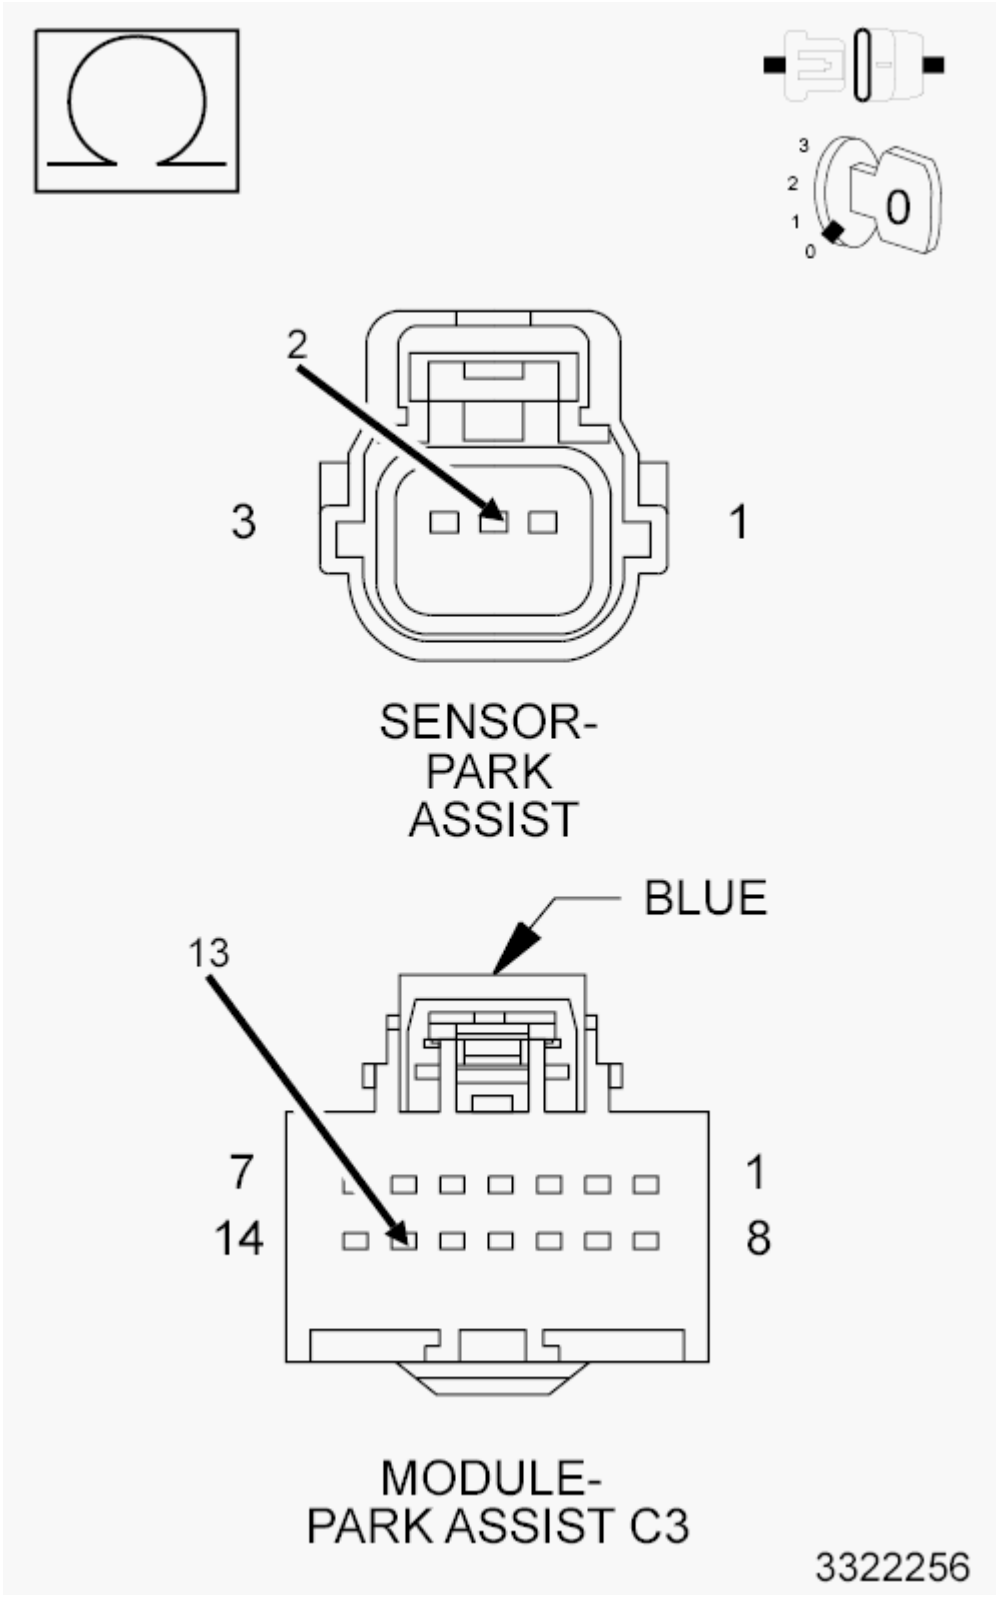

Fig. 30: Checking Front Park Assist Sensor Ground Circuit For An Open Between Park Assist Module & Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128F-25-PTS SENSOR 2- SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B128F-92-PTS SENSOR 2 - PERFORMANCE OR INCORRECT OPERATION

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor 2 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

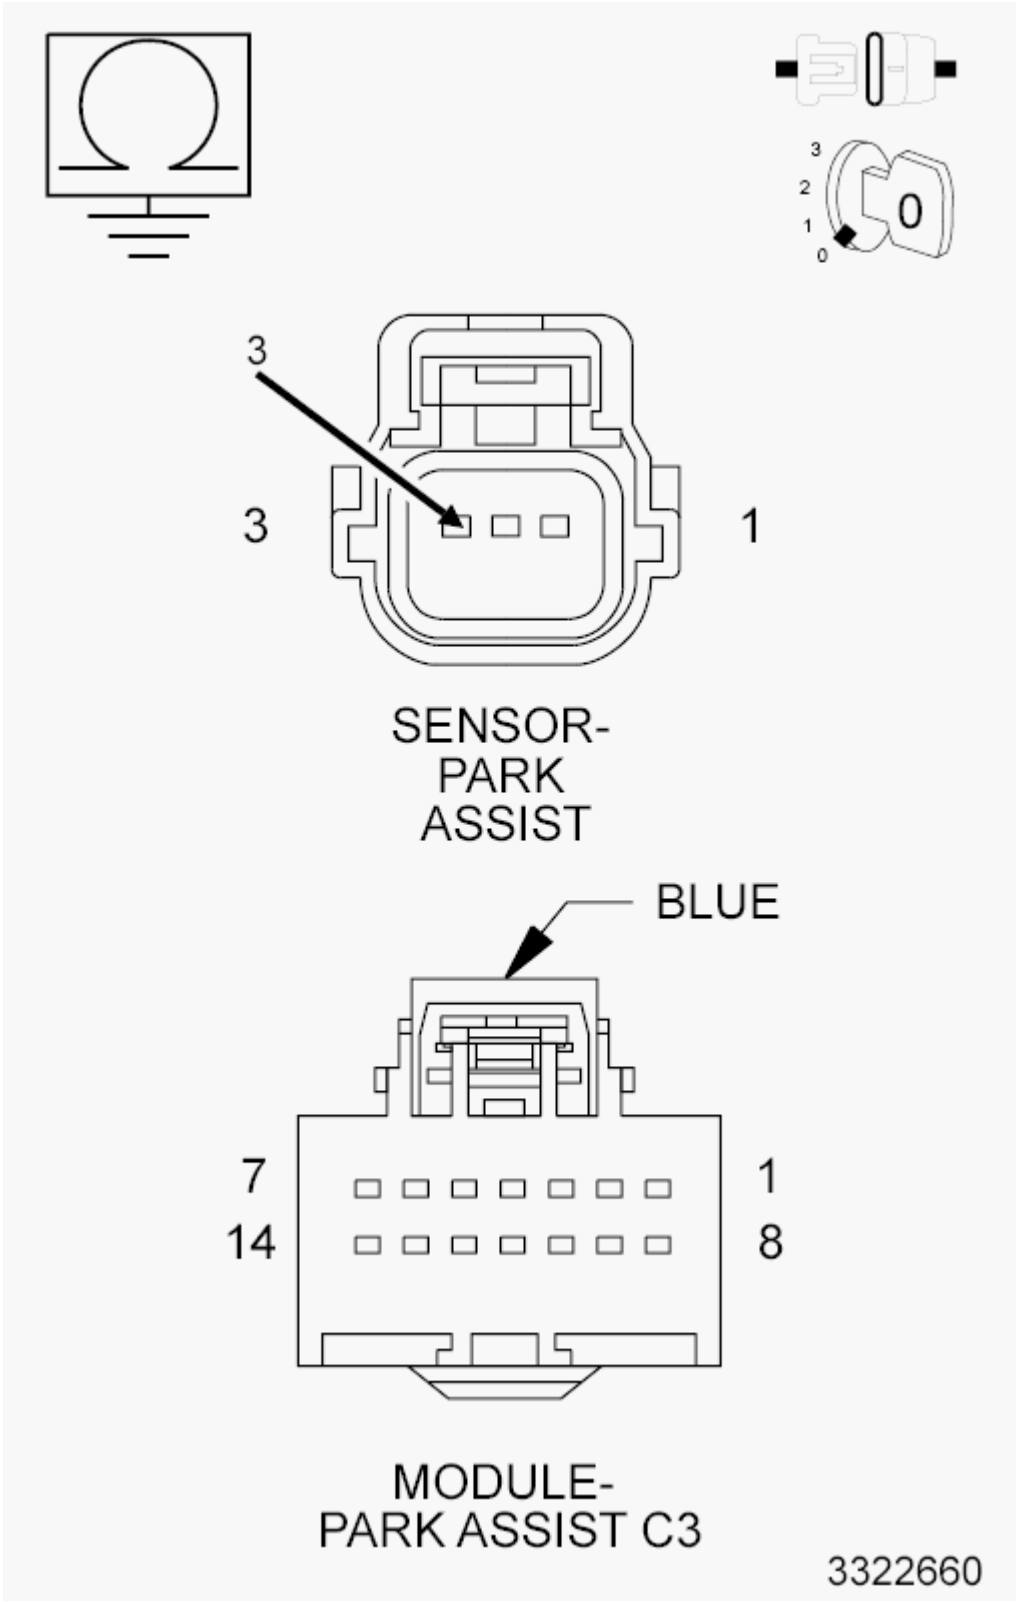

Fig. 32: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance between ground and the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

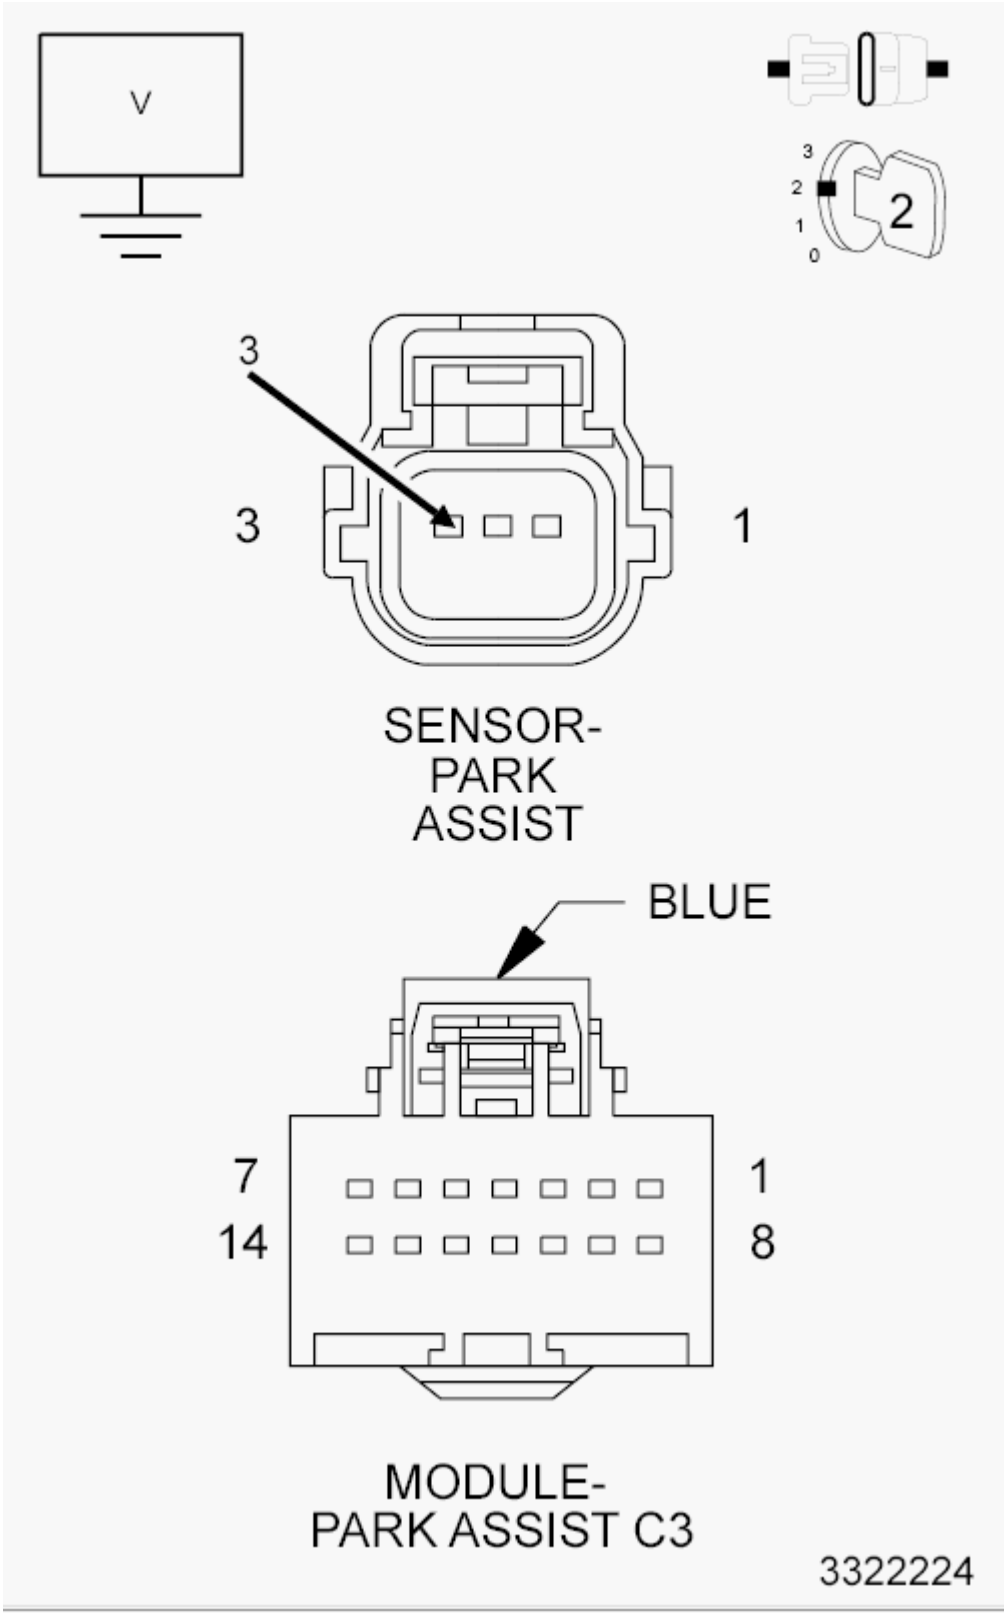

Fig. 33: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (D705) Park Assist Sensor 2 Signal circuit.

   Is voltage present?

   Yes

   - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**

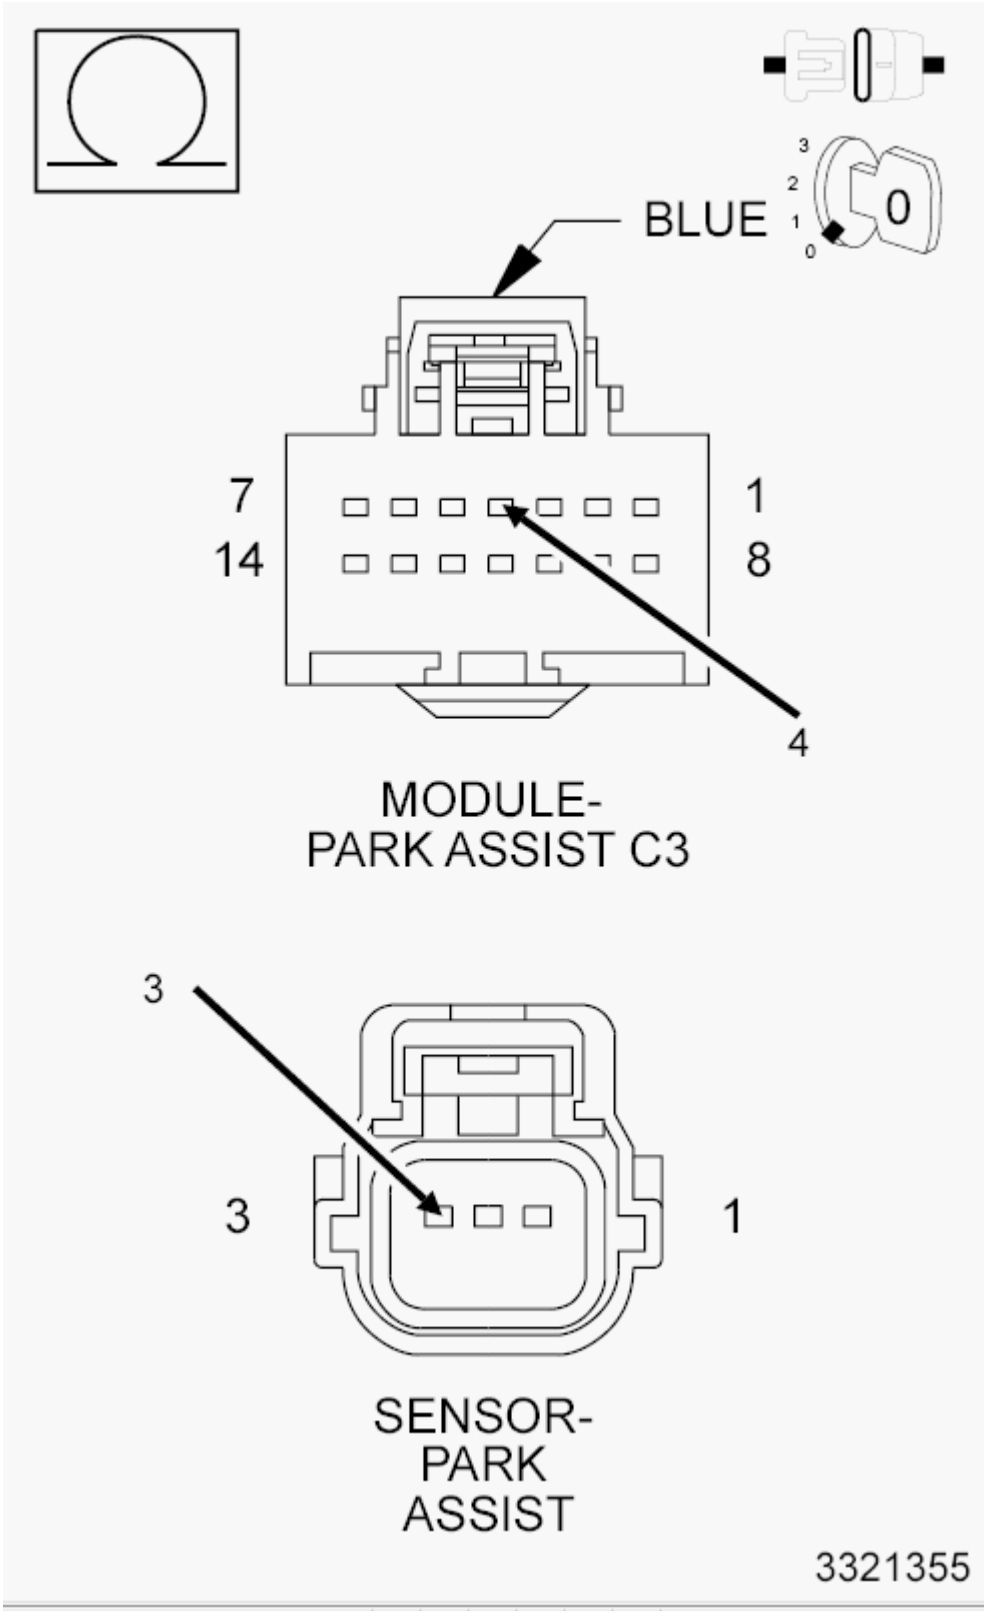

Fig. 34: Checking Park Assist Sensor 2 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (D705) Park Assist Sensor 2 Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1290-11-PTS SENSOR 3 - CIRCUIT SHORT TO GROUND

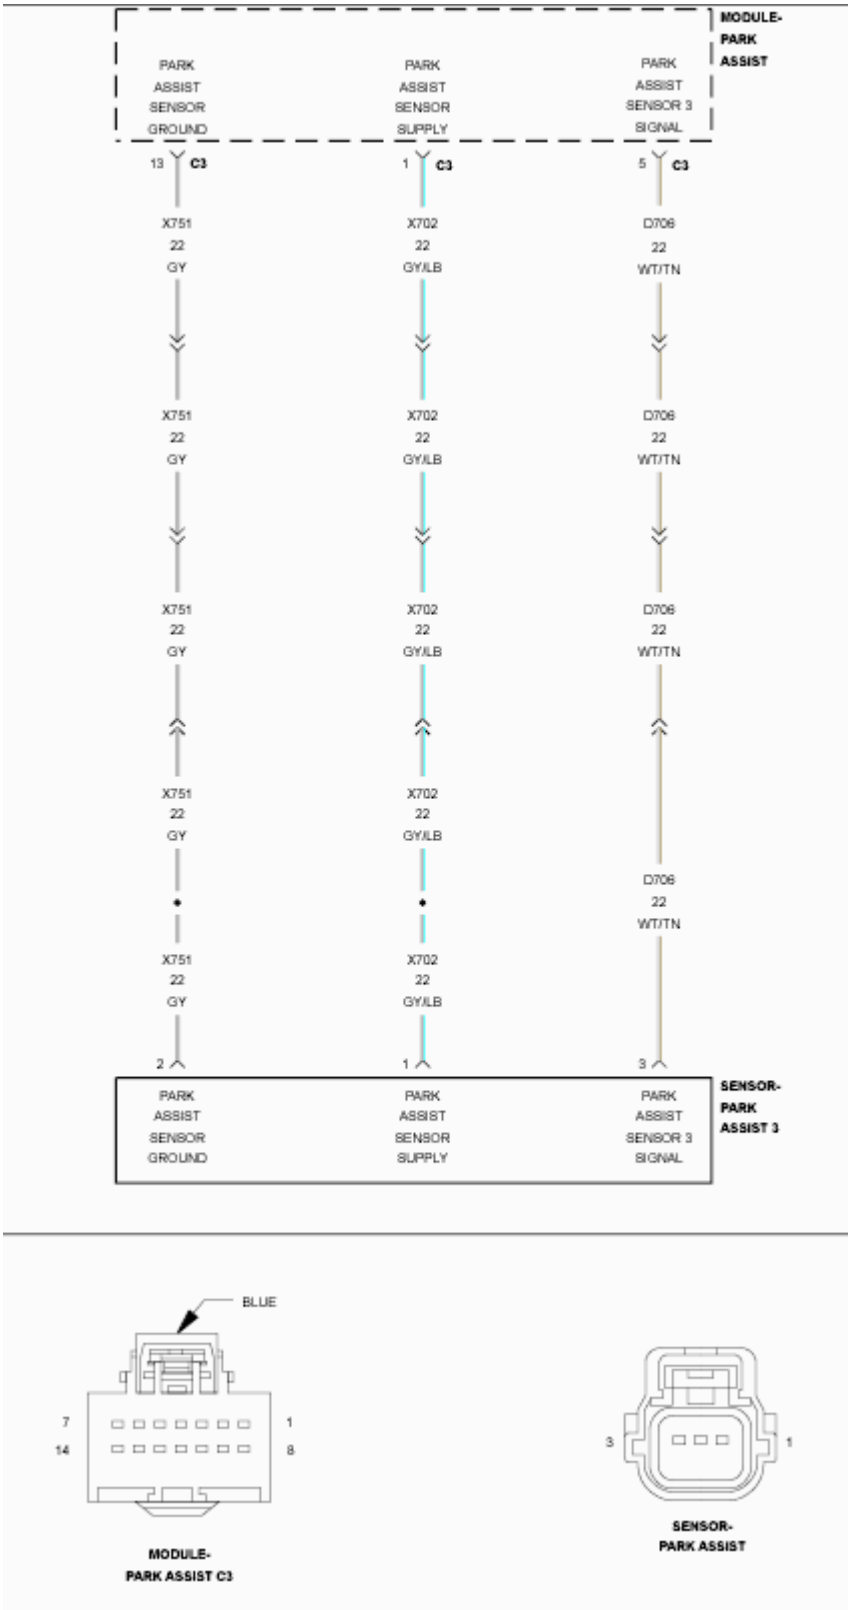

Fig. 35: Park Assist Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR AN OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

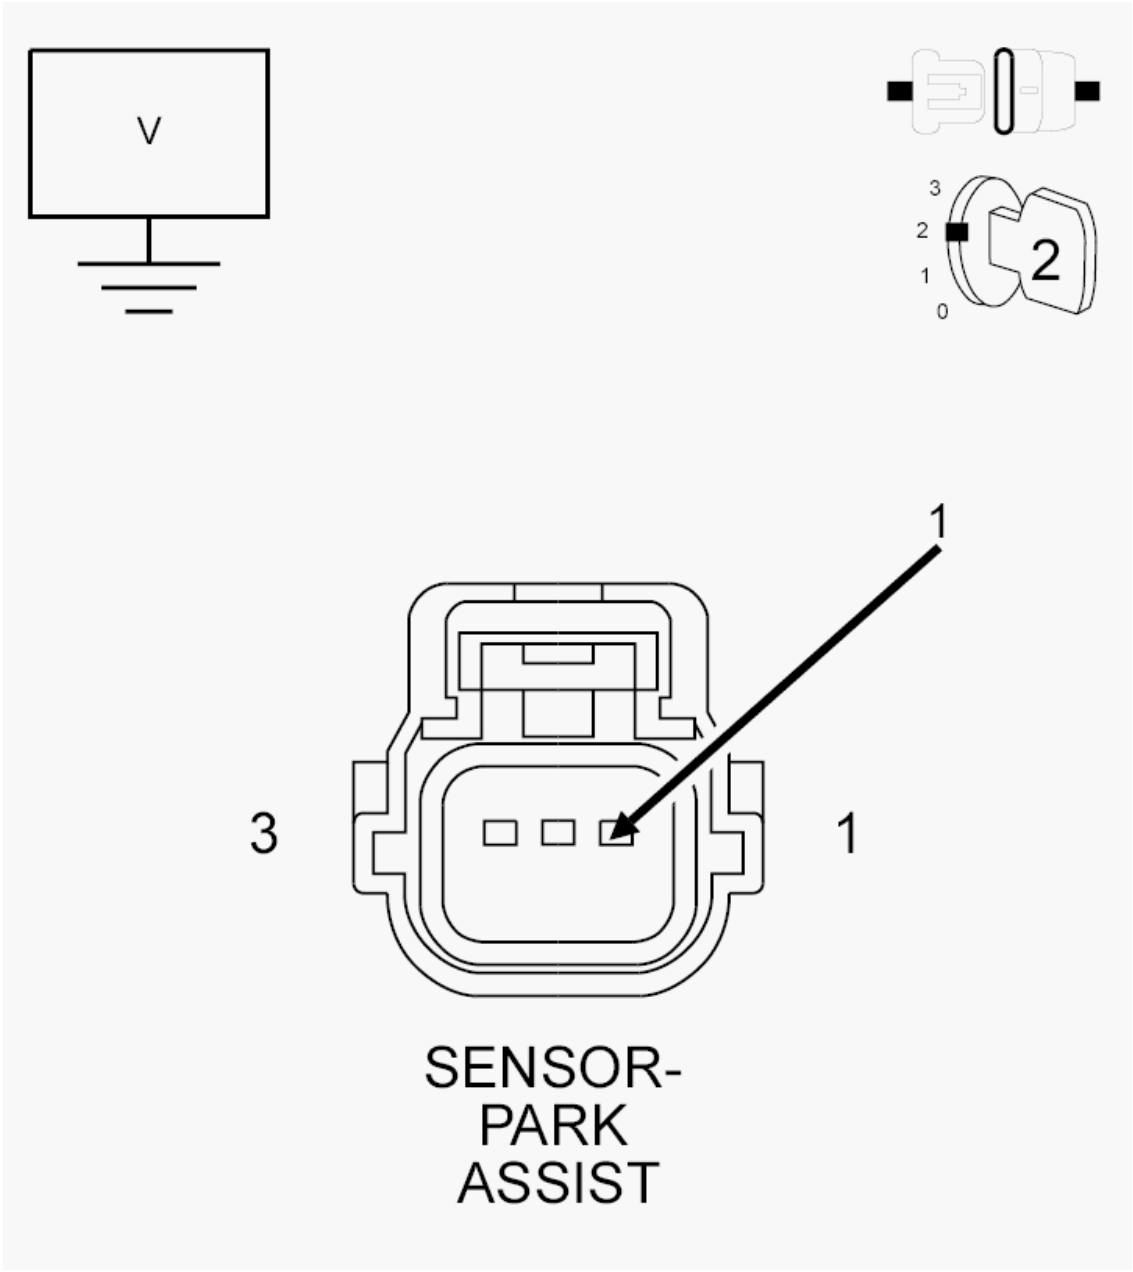

Fig. 36: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

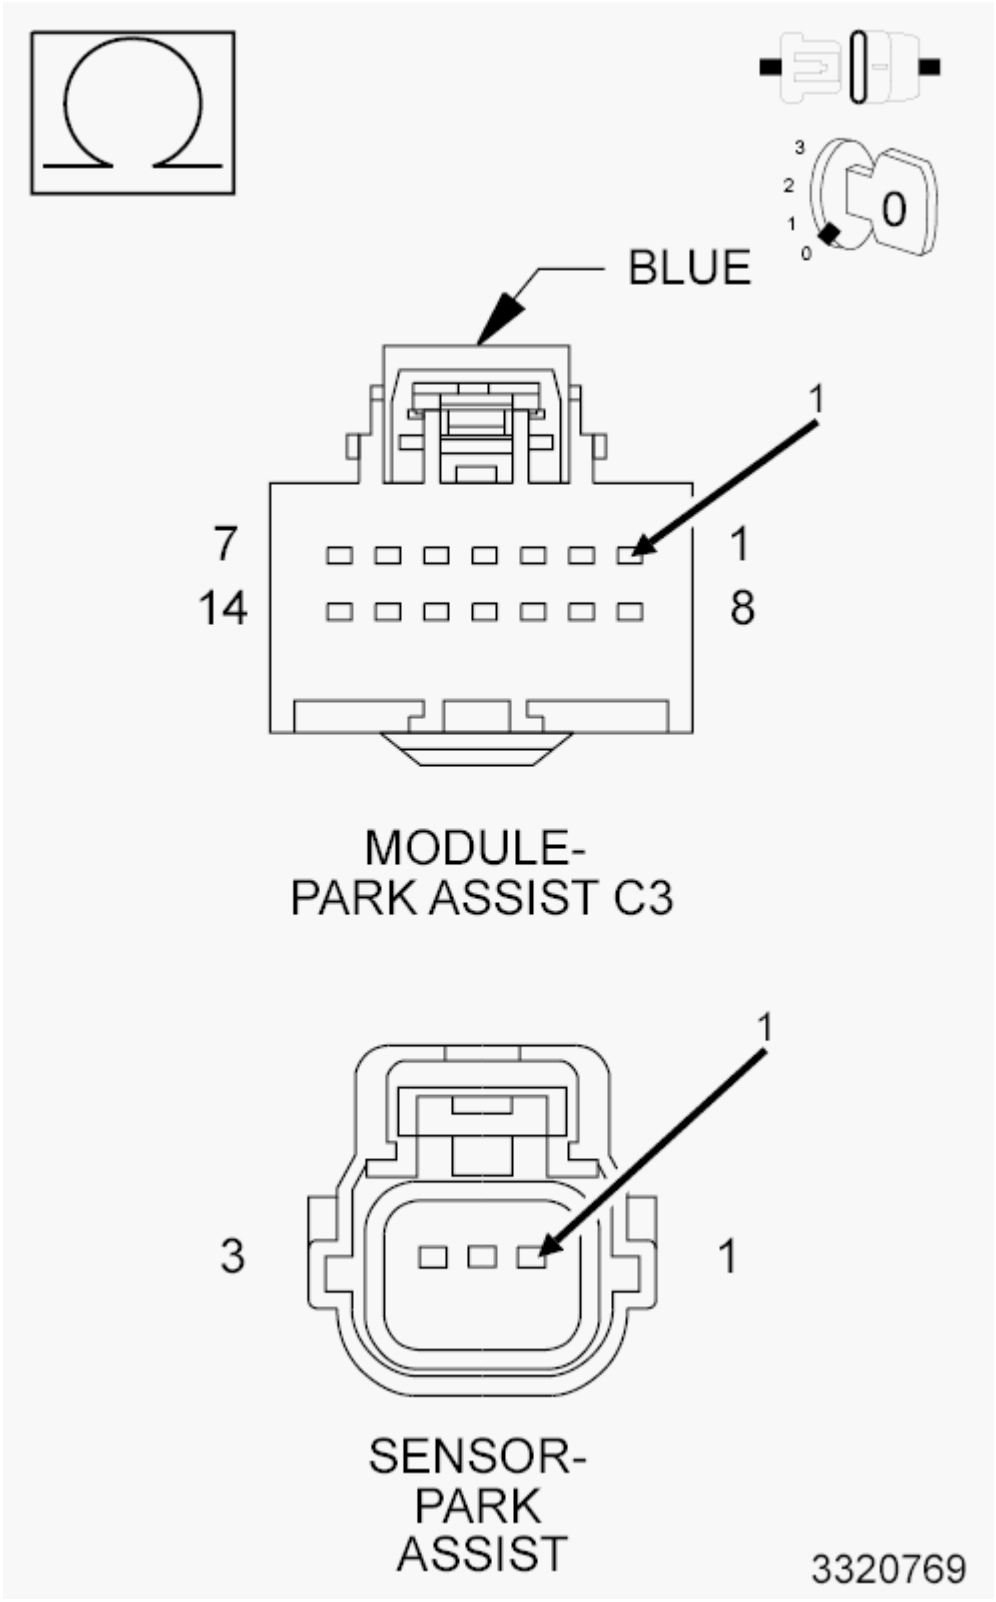

Fig. 37: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

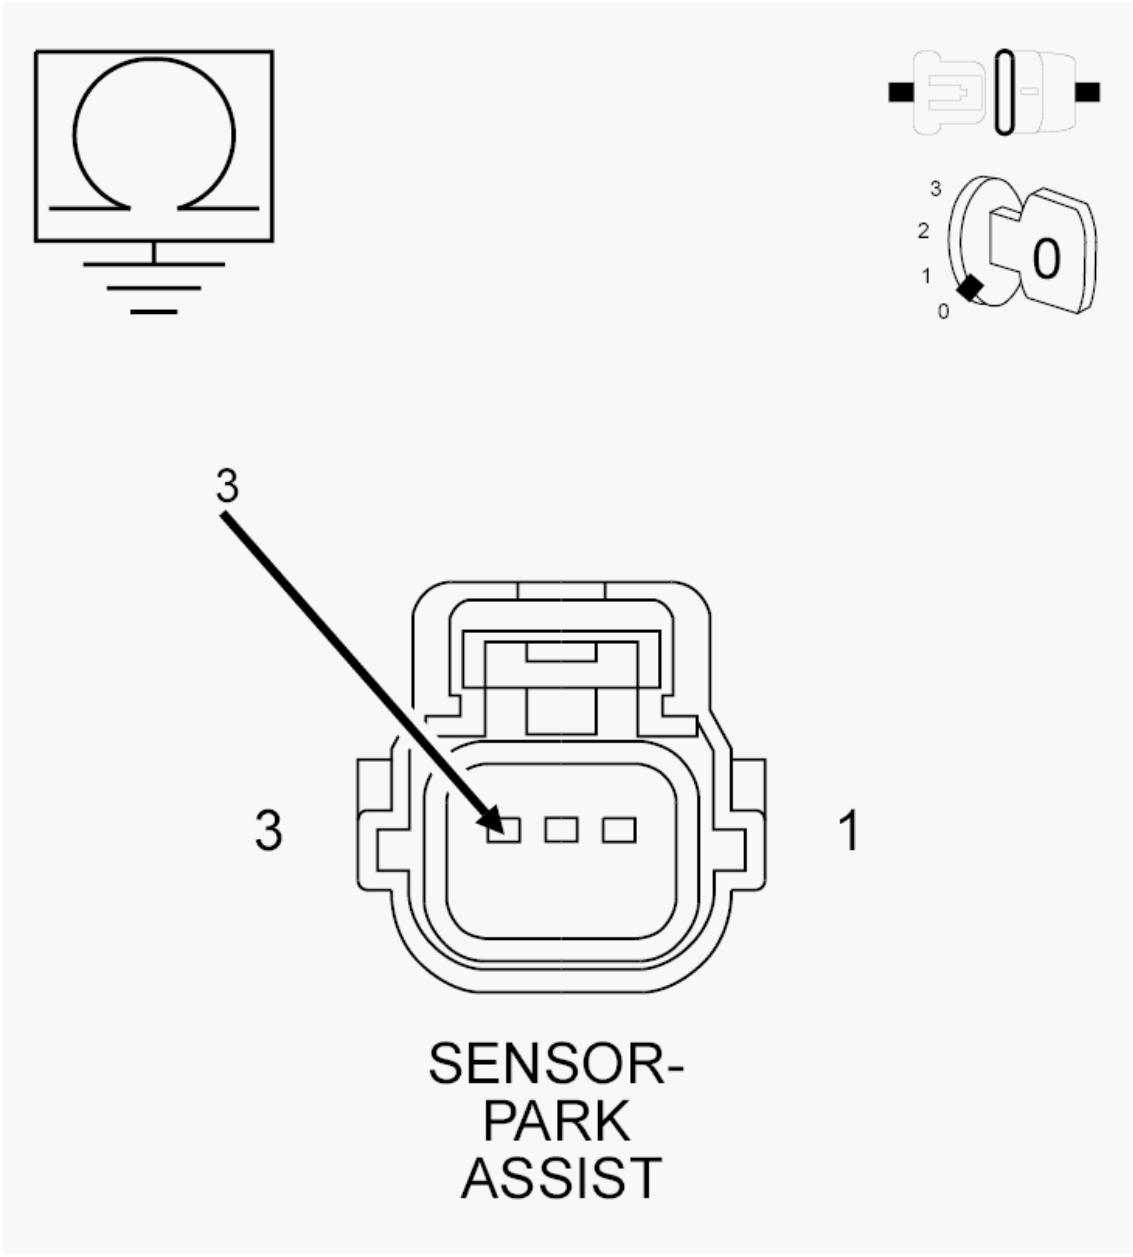

Fig. 38: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

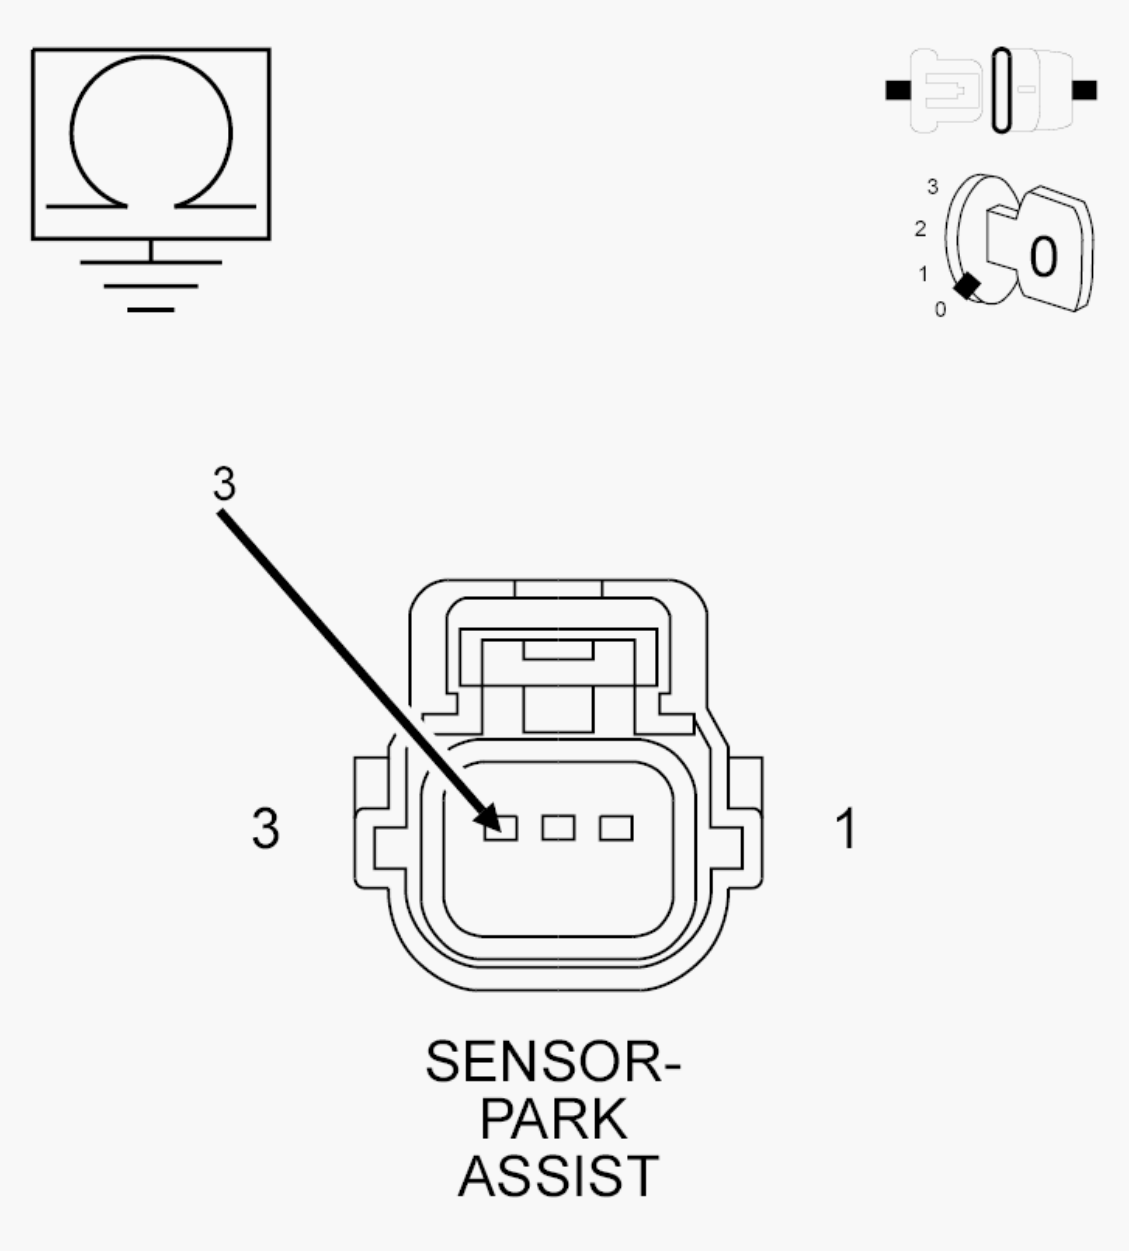

Fig. 39: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance between ground and the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D706) Park Assist Sensor 3 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

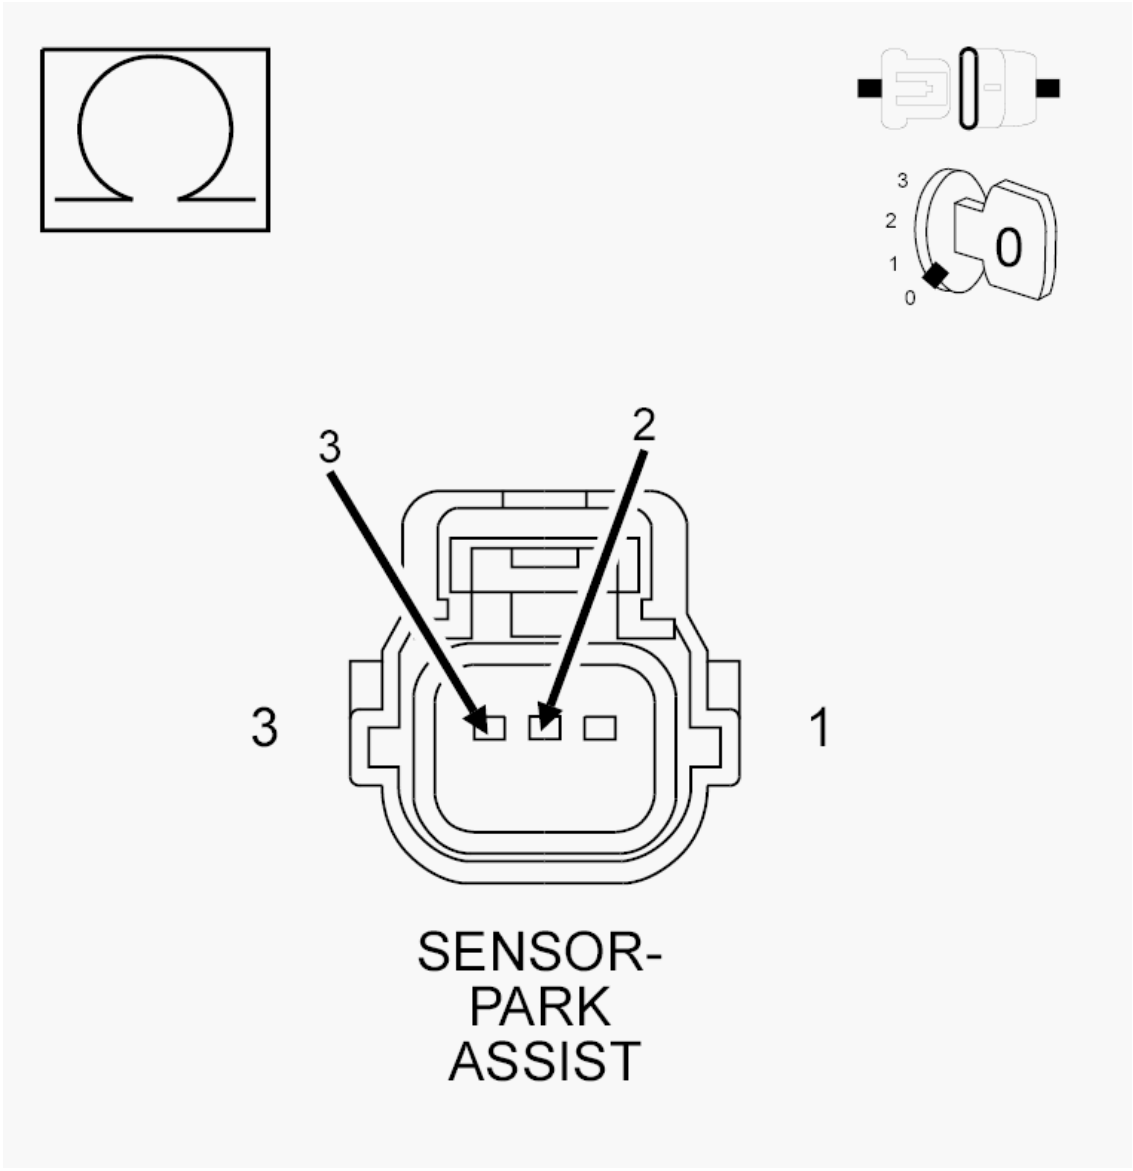

Fig. 40: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D706) Park Assist Sensor 3 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D706) Park Assist Sensor 3 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR AN OPEN**

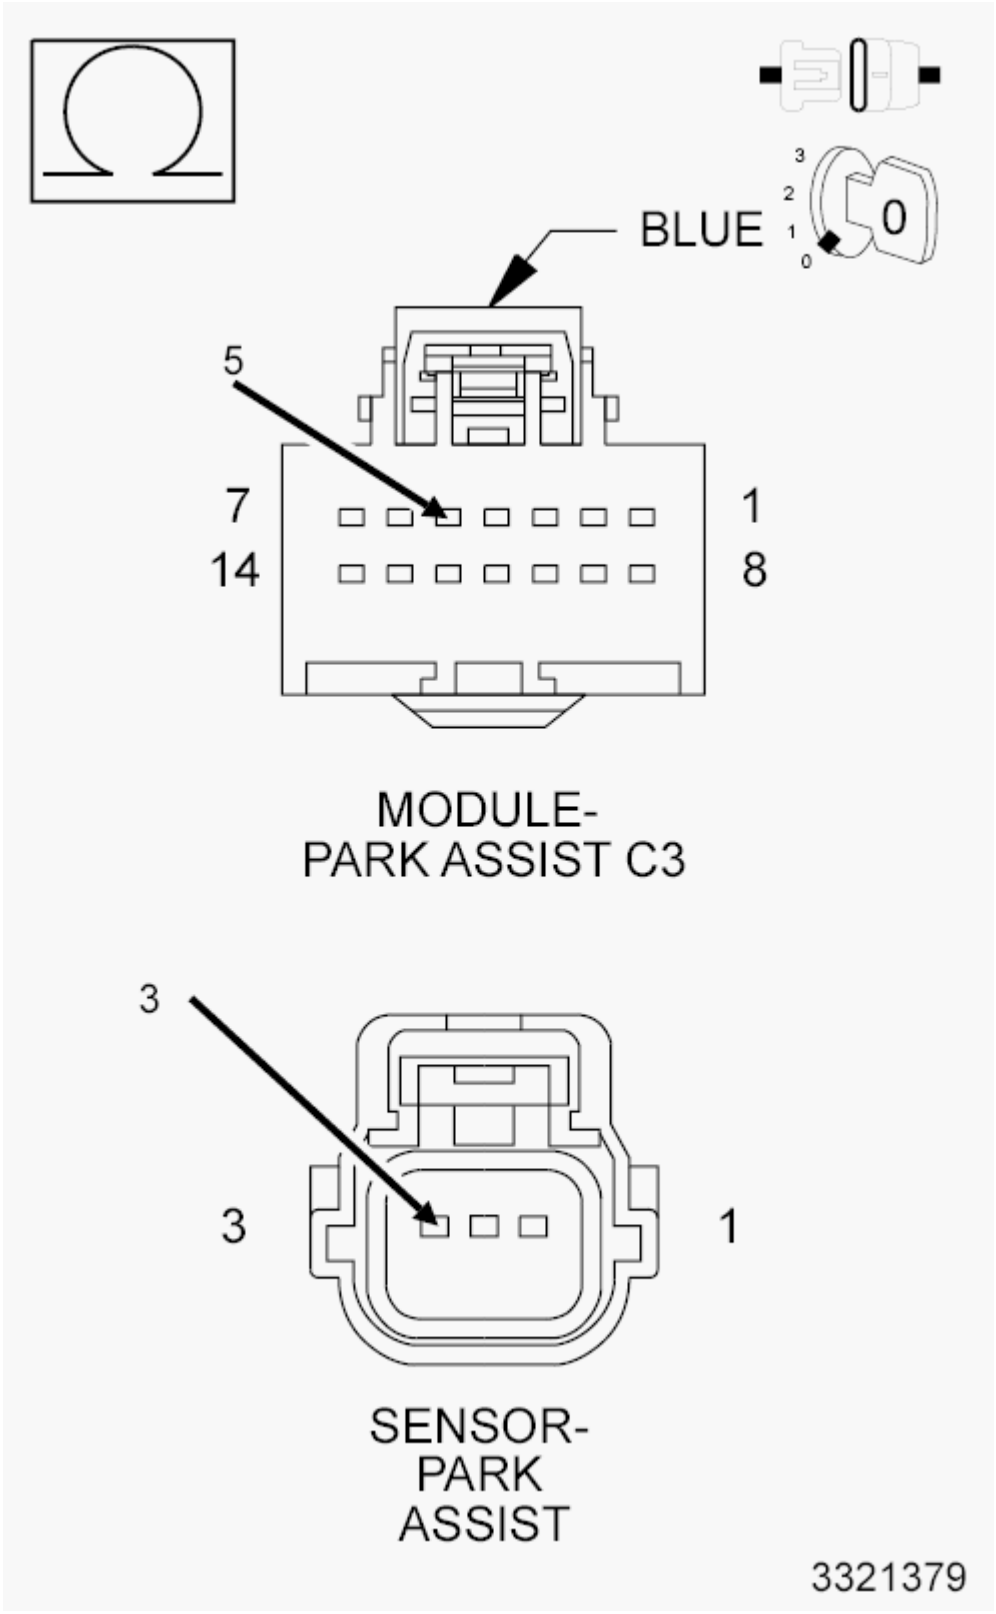

Fig. 41: Checking Park Assist Sensor 3 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D706) Park Assist Sensor 3 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

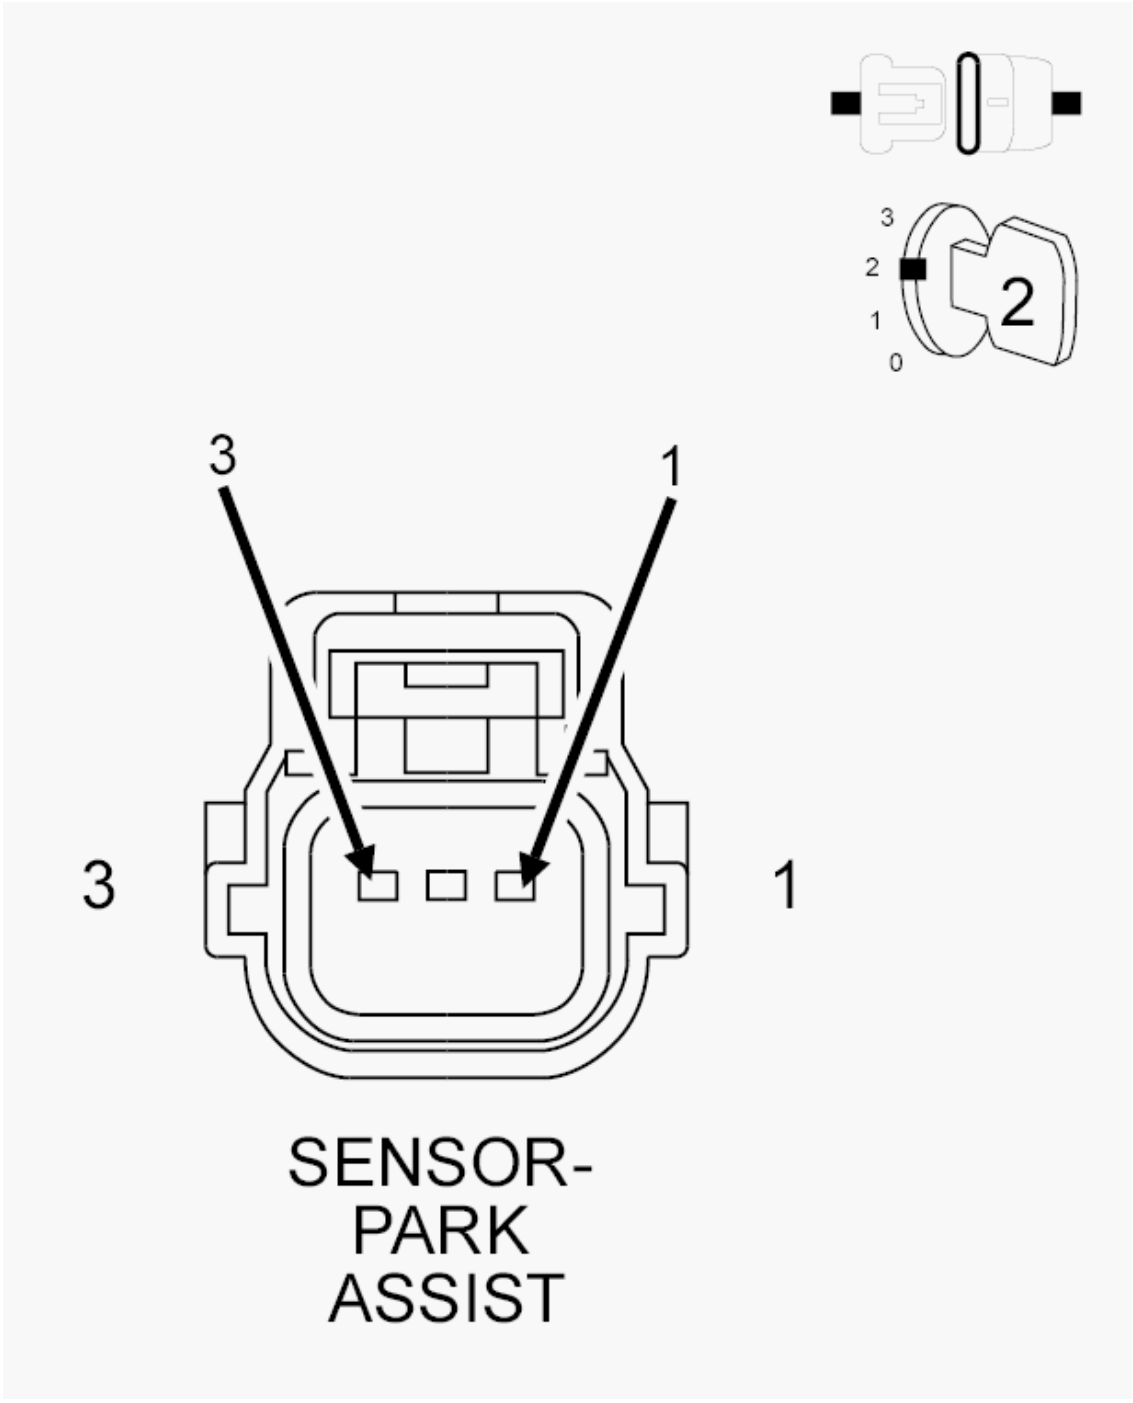

Fig. 42: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D706) Park Assist Sensor 3 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1290-12-PTS SENSOR 3 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1290-12-PTS SENSOR 3 - CIRCUIT SHORT TO BATTERY

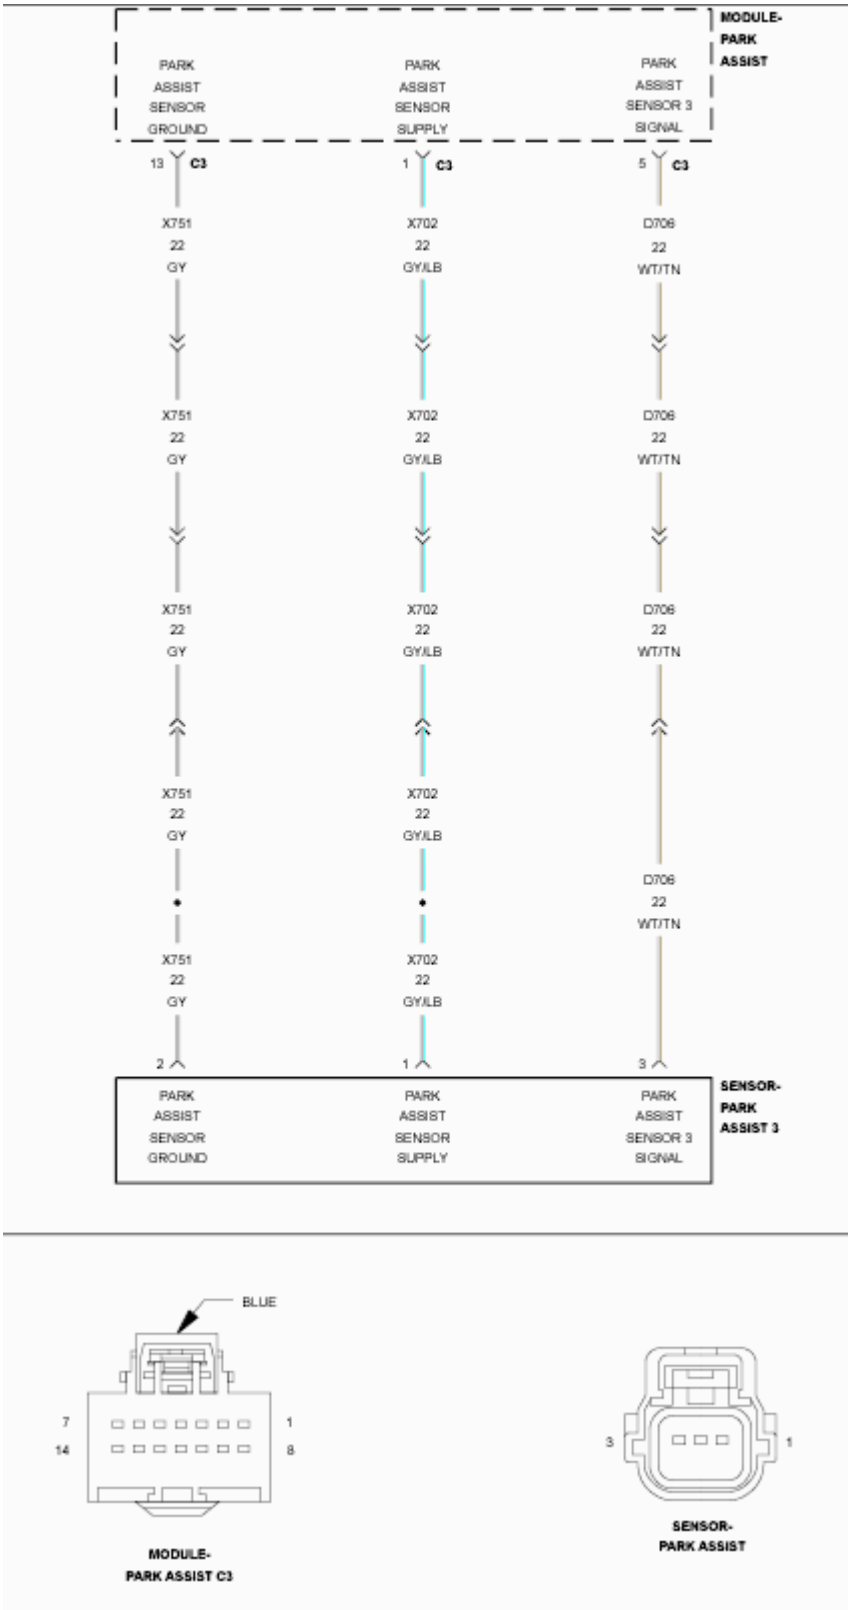

Fig. 43: Park Assist Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

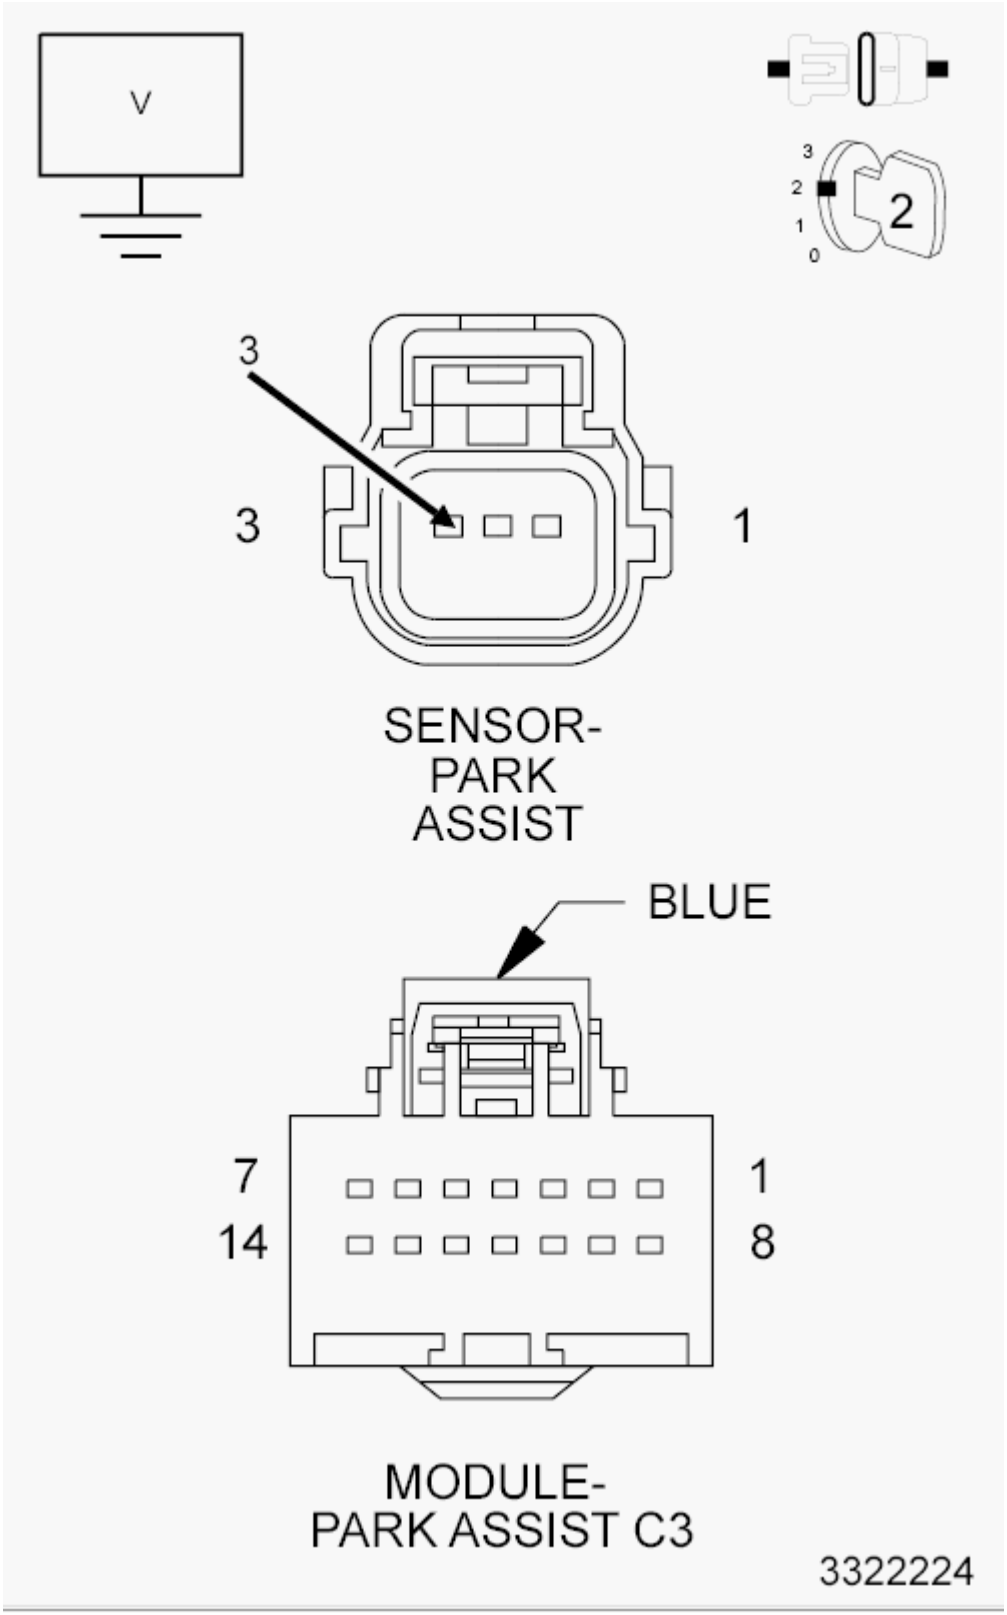

Fig. 44: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D706) Park Assist Sensor 3 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

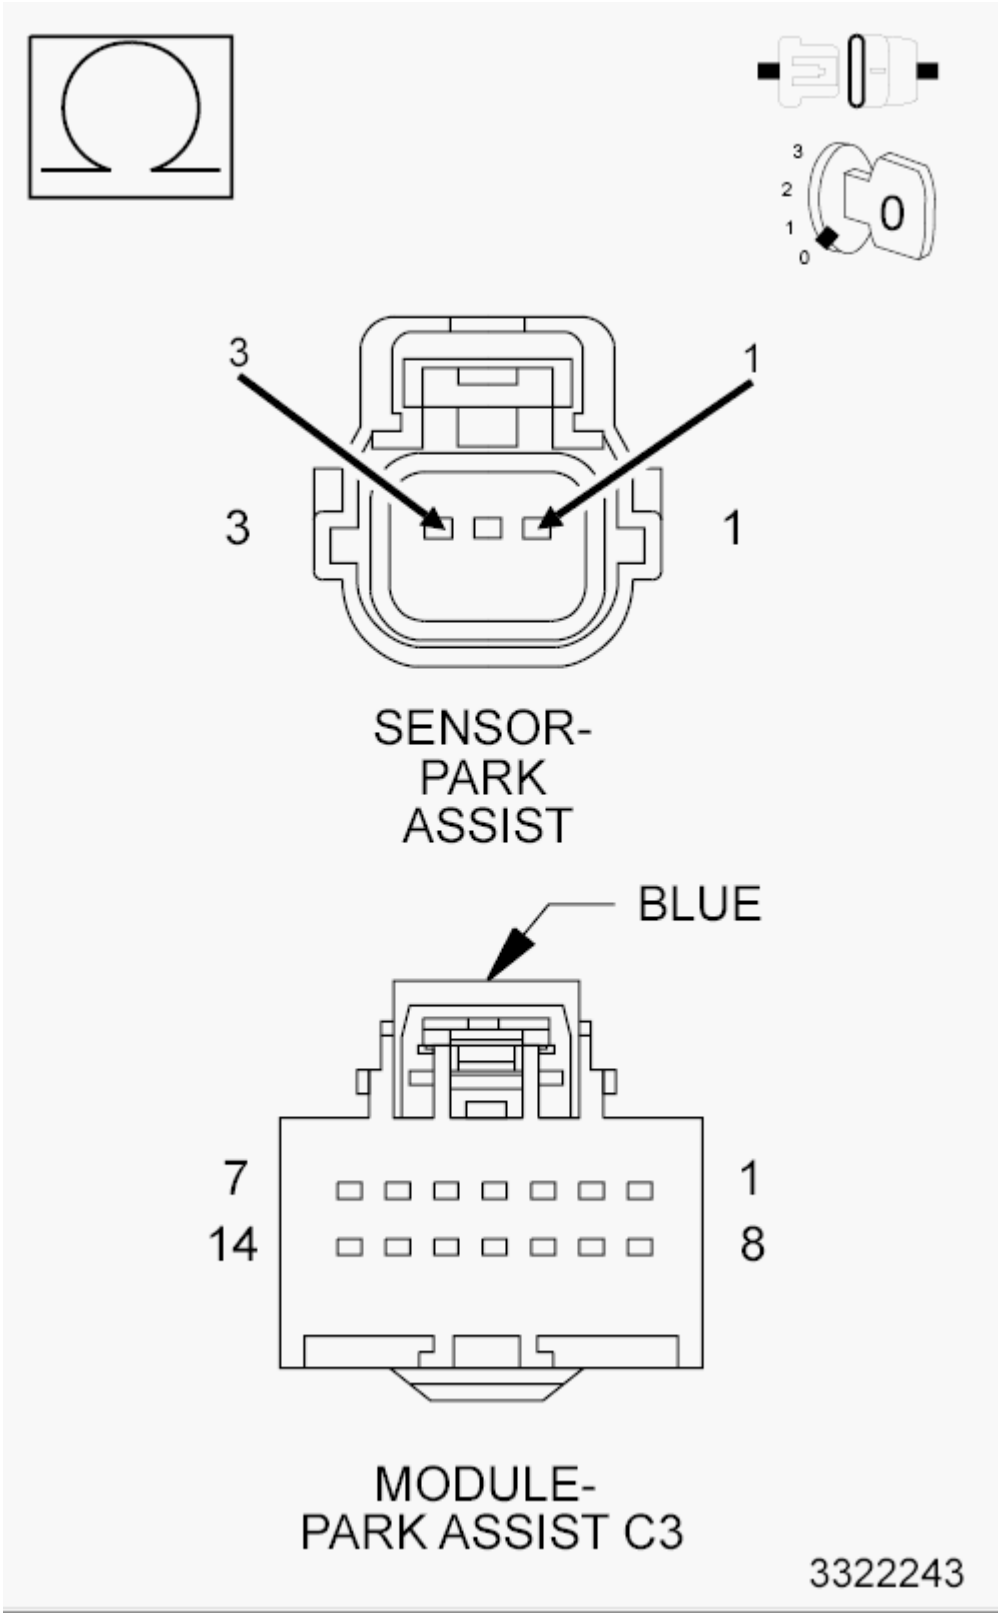

Fig. 45: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Supply Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (D706) Park Assist Sensor 3 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN**

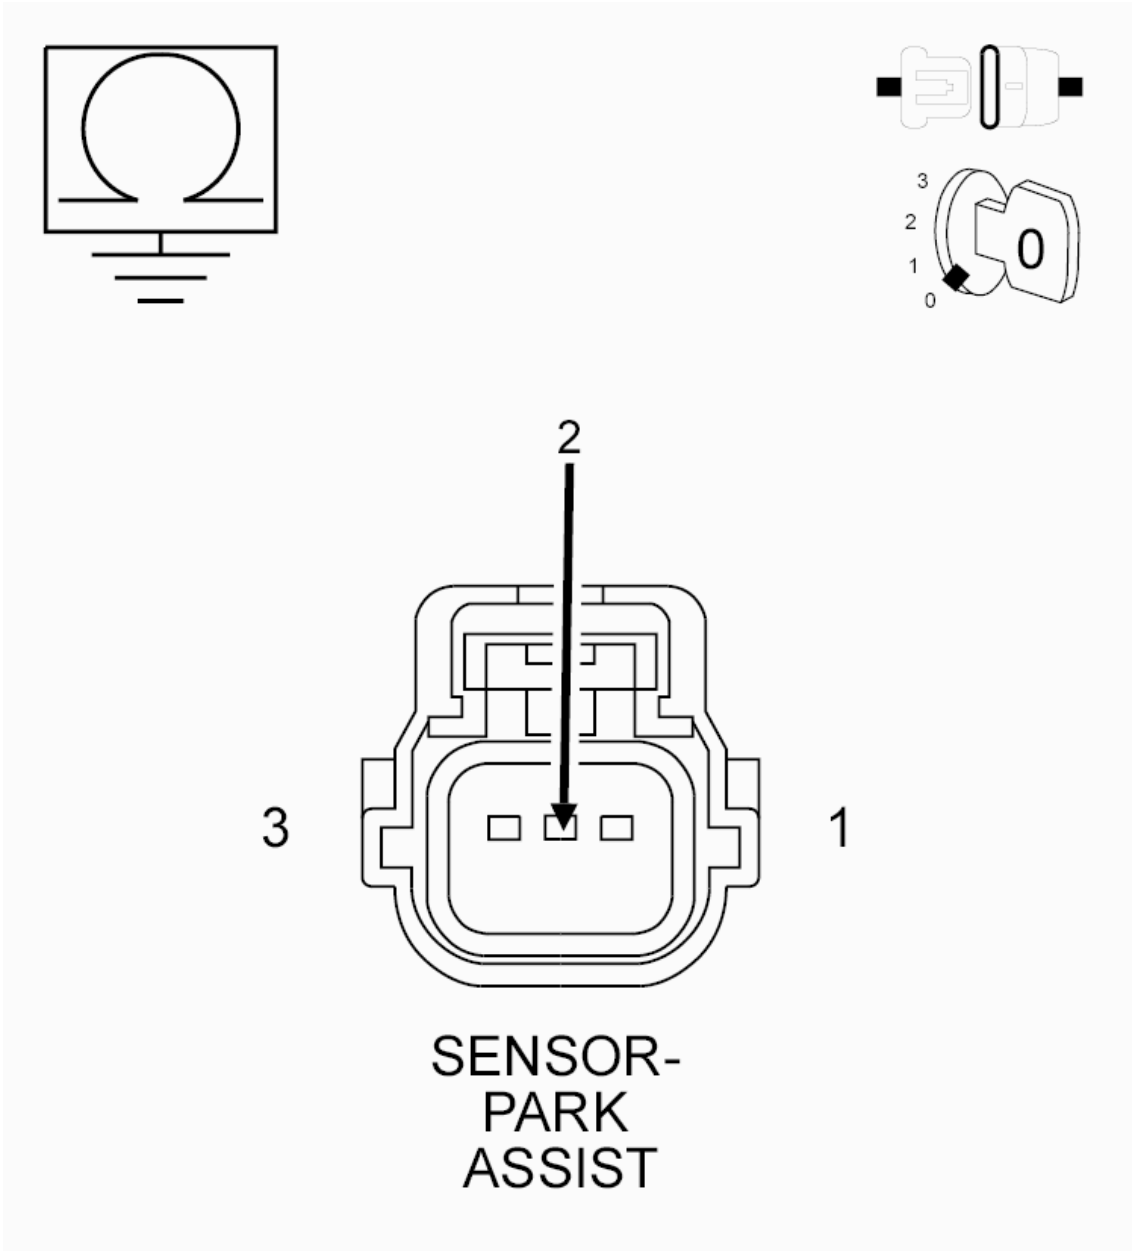

Fig. 46: Checking Front Park Assist Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 20.0 Ohms?

   Yes

   - Go To 5.

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**

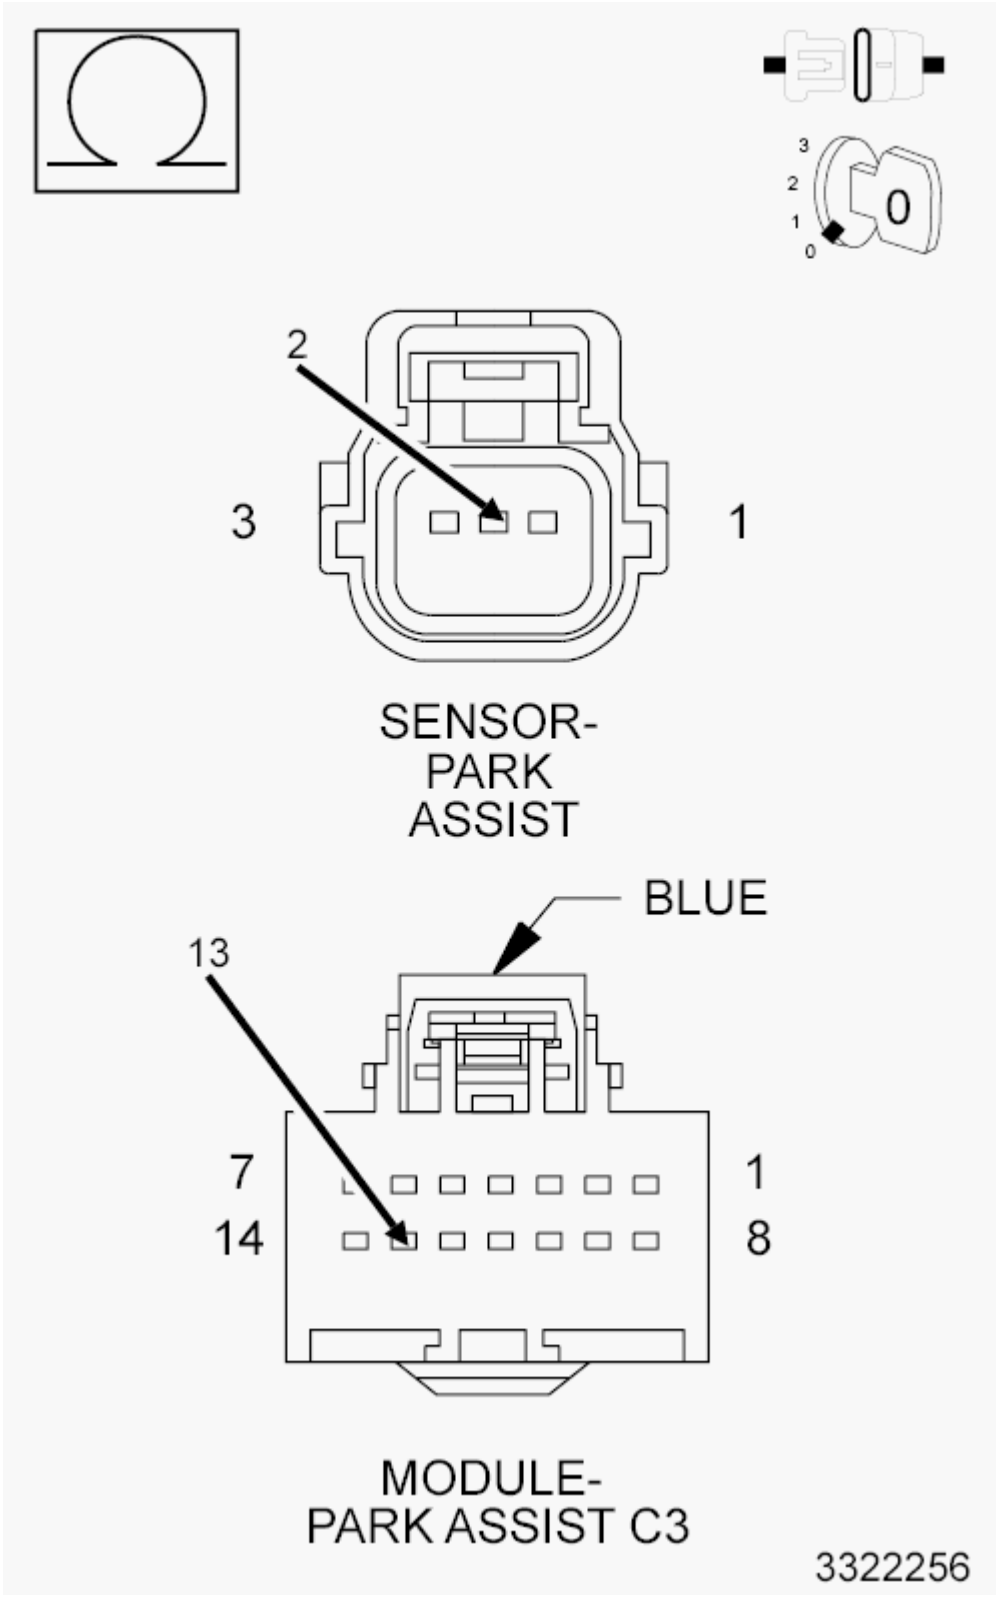

Fig. 47: Checking Front Park Assist Sensor Ground Circuit For An Open Between Park Assist Module & Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1290-25-PTS SENSOR 3 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1290-92-PTS SENSOR 3 - PERFORMANCE OR INCORRECT OPERATION

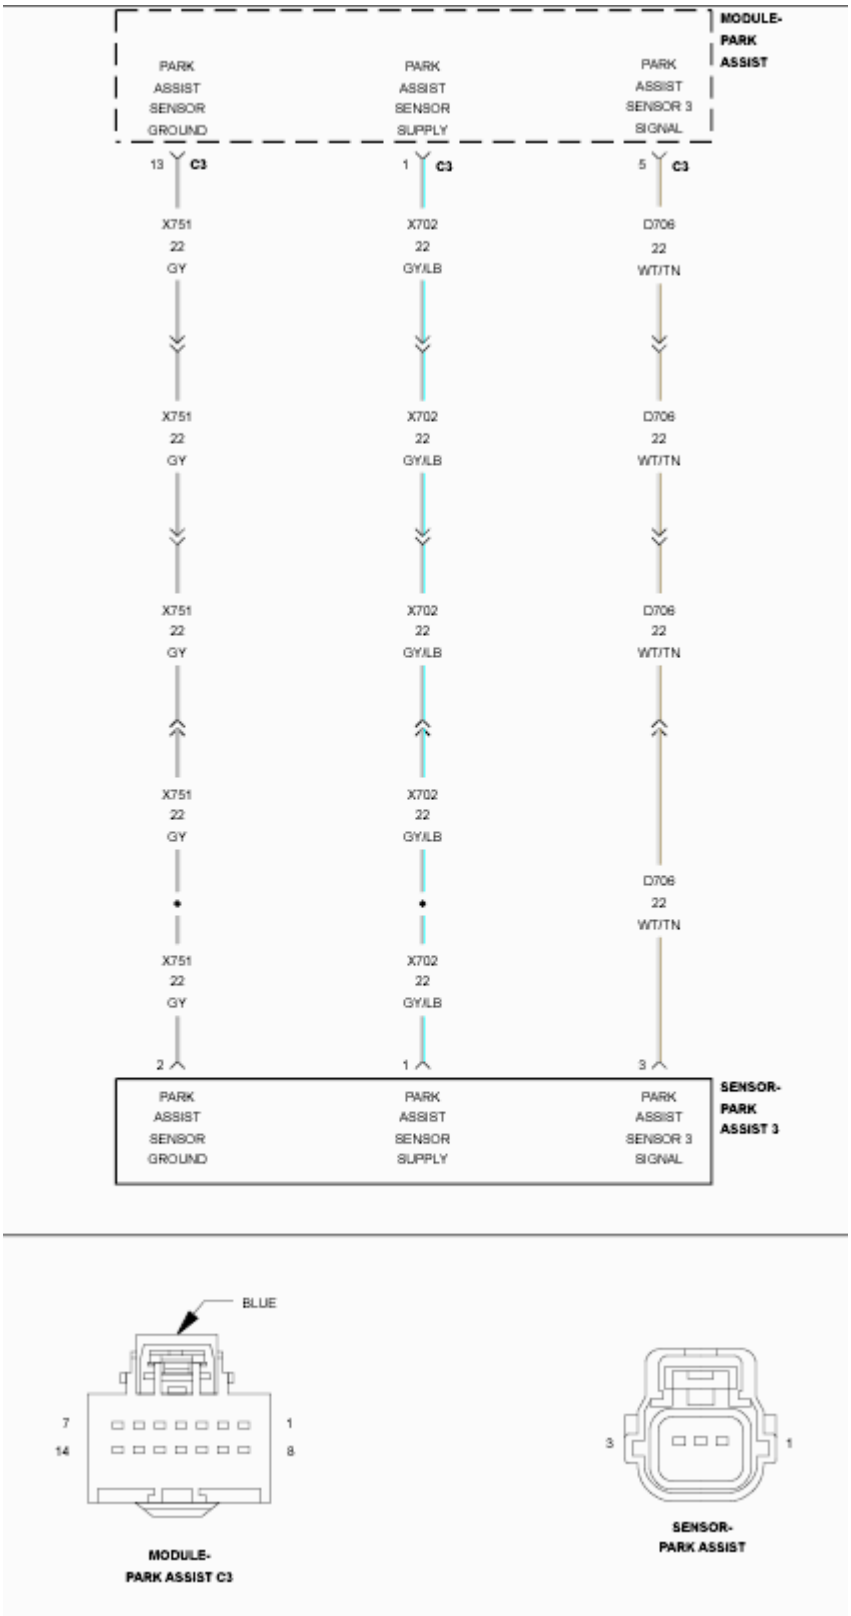

Fig. 48: Park Assist Sensor Circuit Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor 3 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

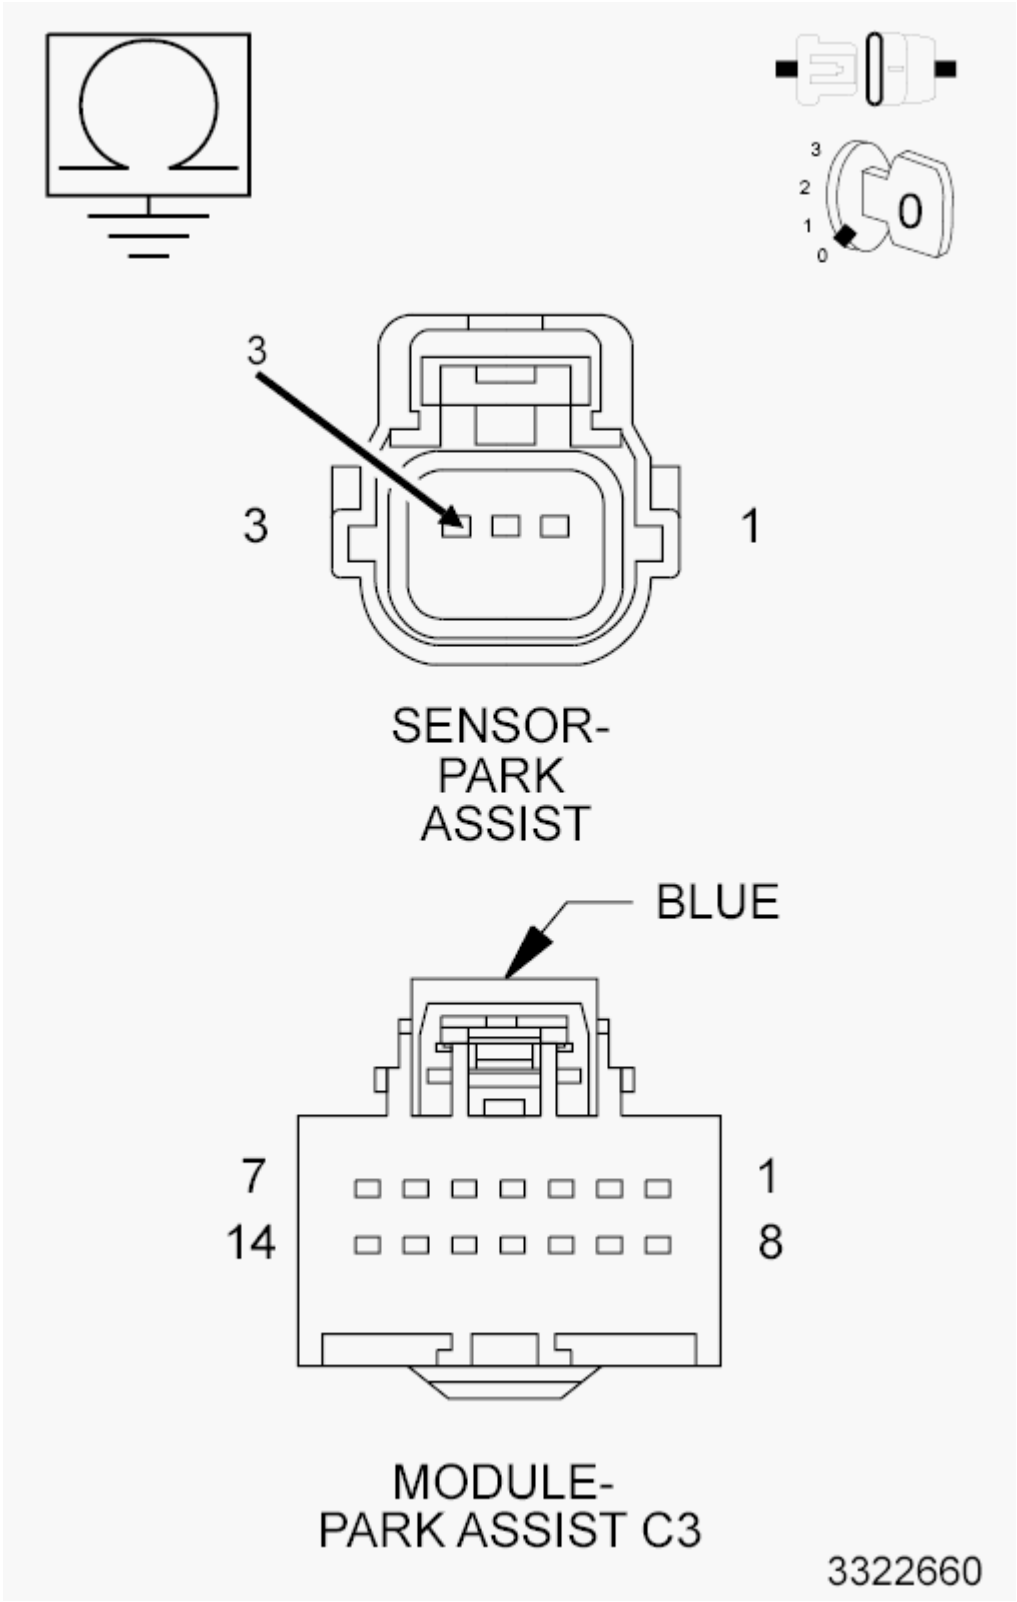

Fig. 49: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance between ground and the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

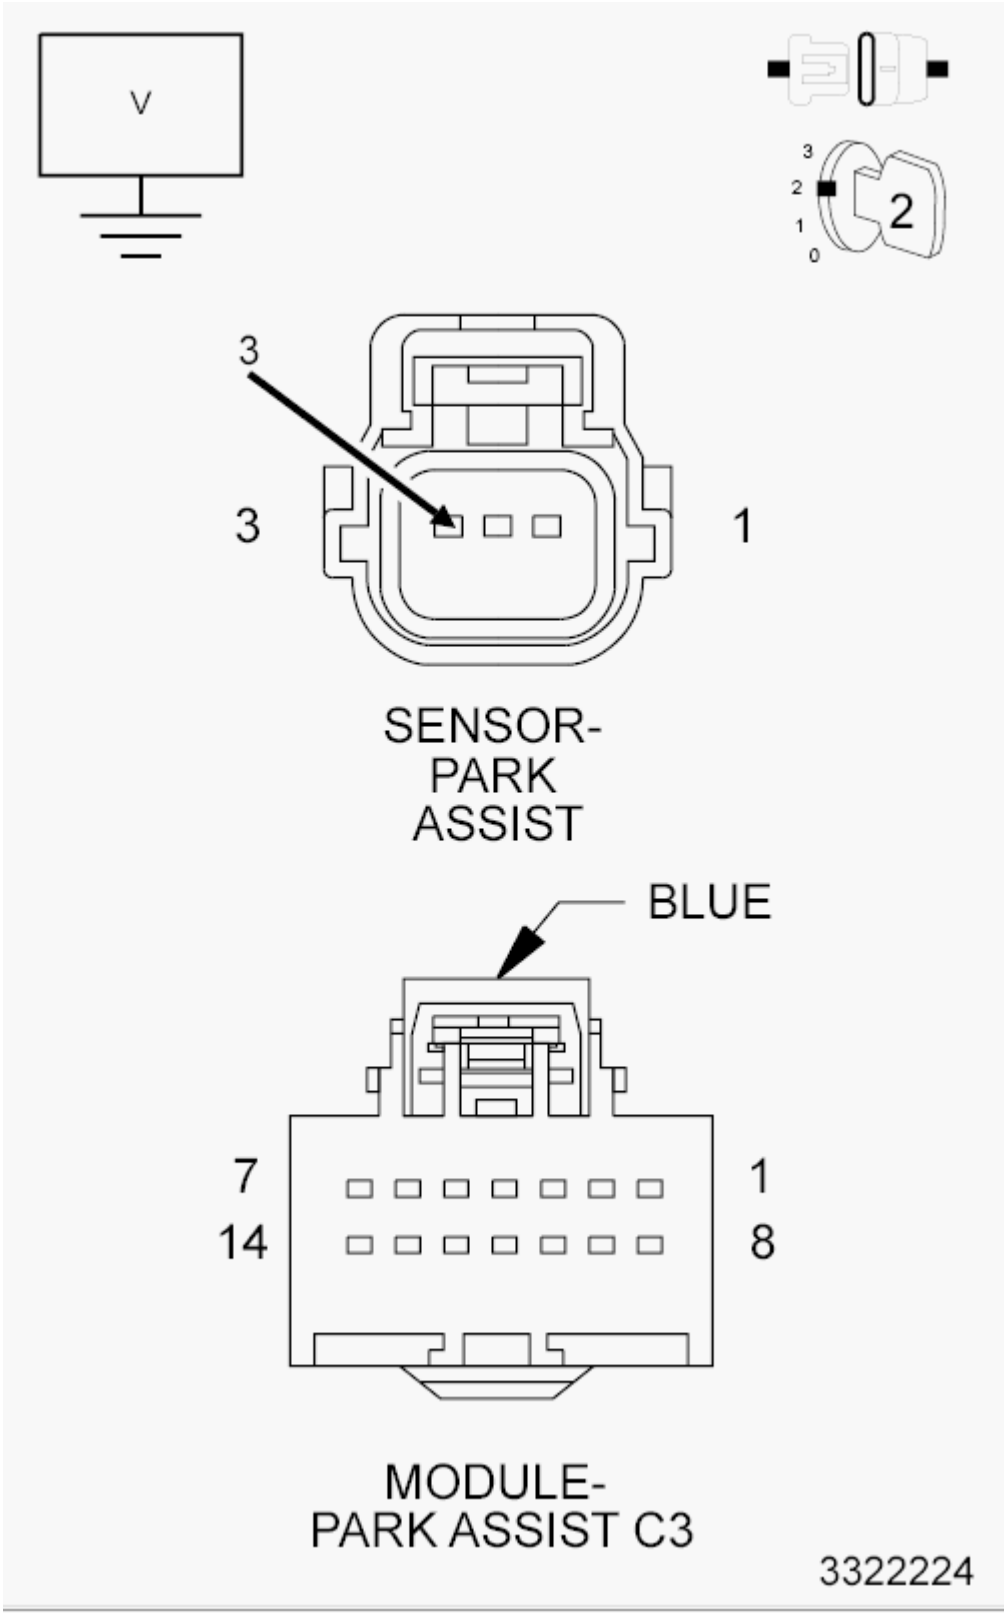

Fig. 50: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (D706) Park Assist Sensor 3 Signal circuit.

   Is voltage present?

   Yes

   - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR AN OPEN**

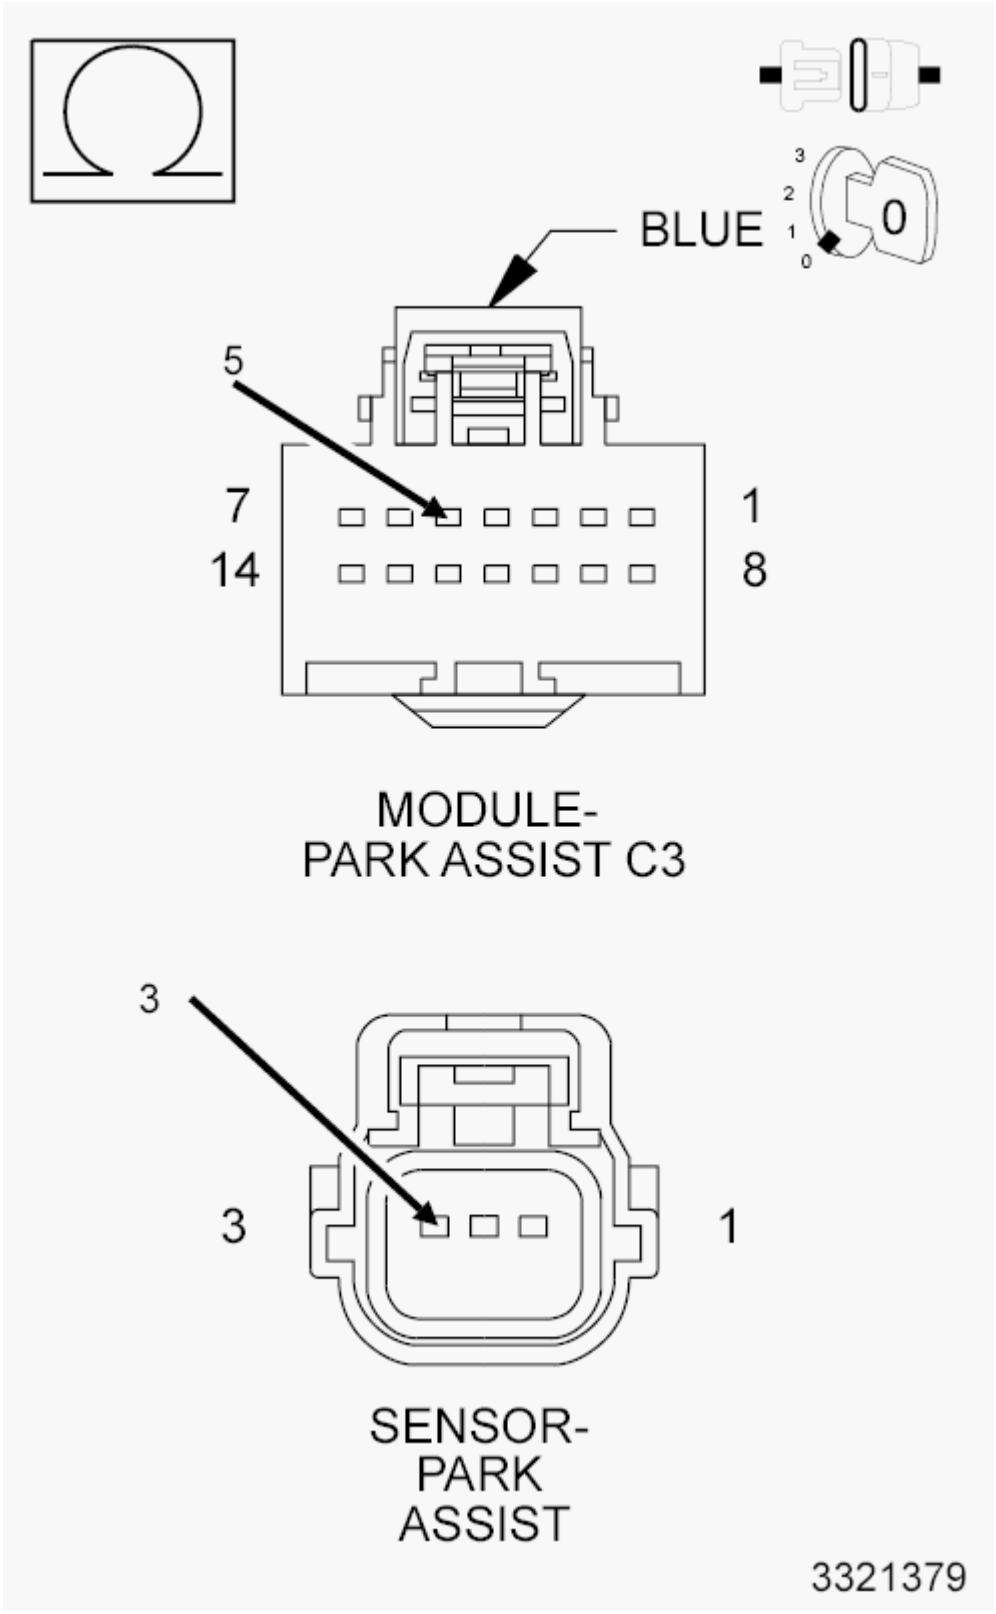

Fig. 51: Checking Park Assist Sensor 3 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (D706) Park Assist Sensor 3 Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1291-11-PTS SENSOR 4- CIRCUIT SHORT TO GROUND

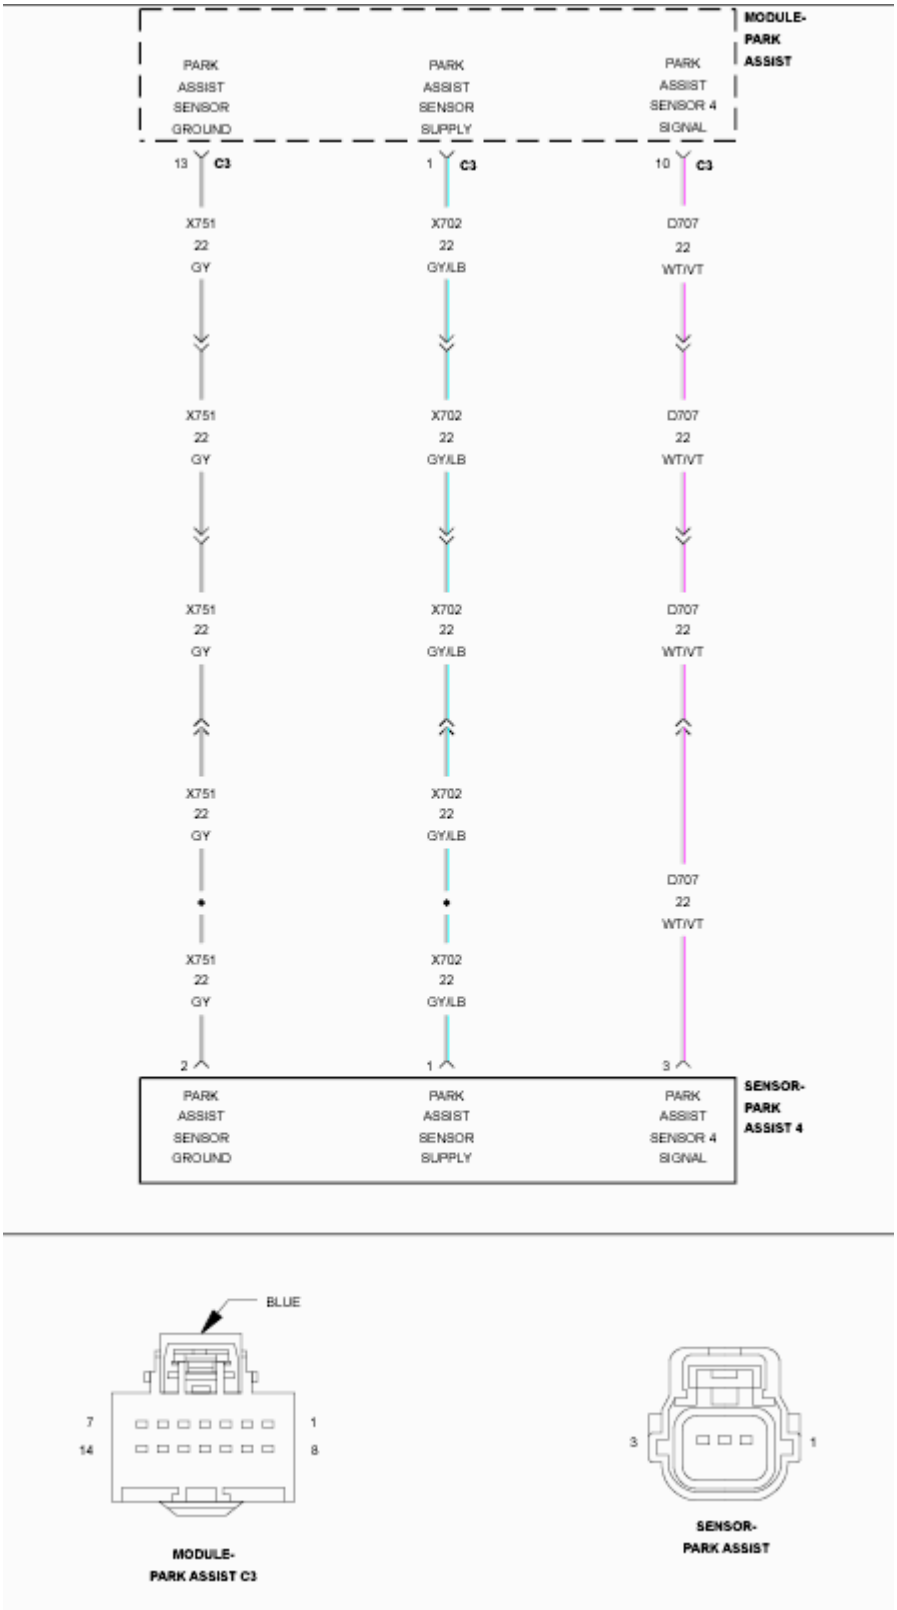

Fig. 52: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR AN OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

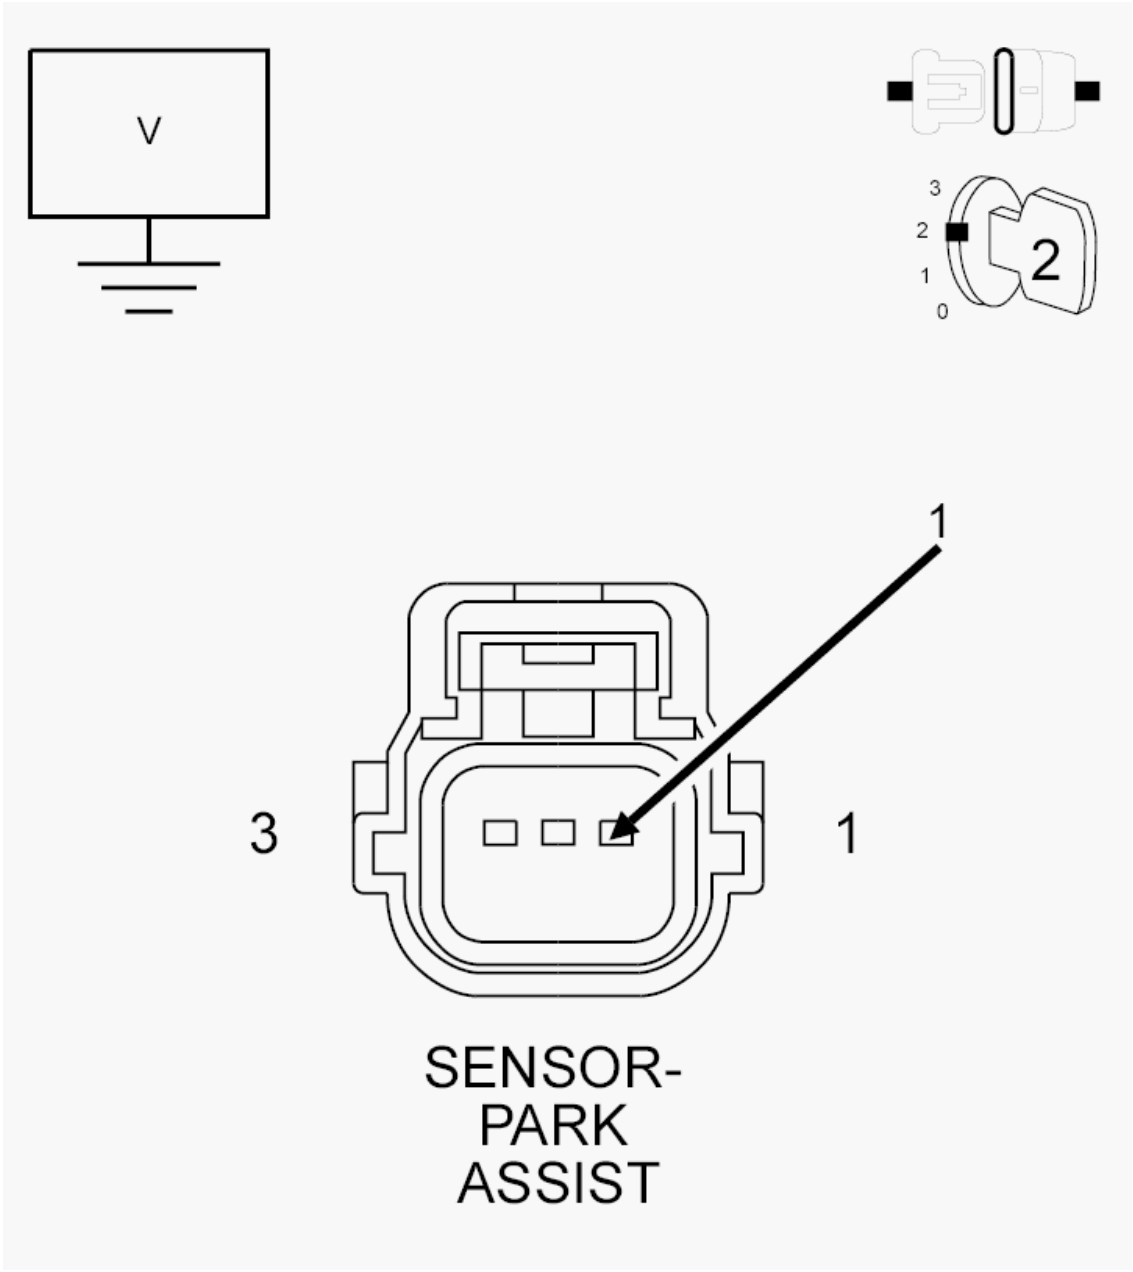

Fig. 53: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

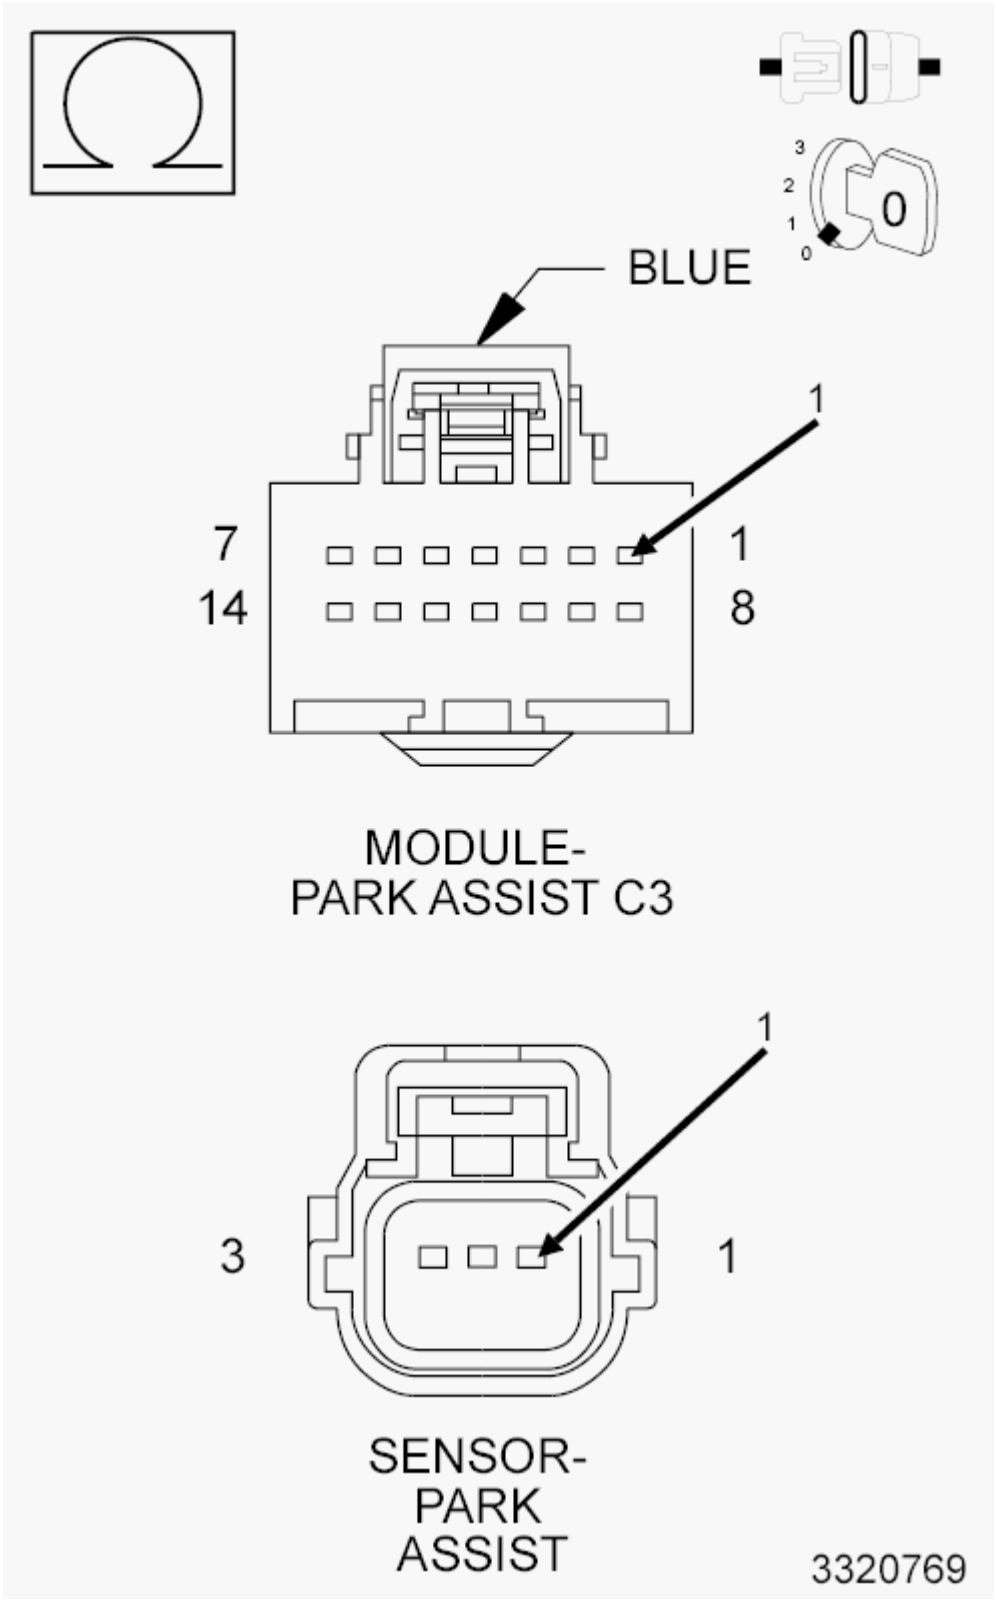

Fig. 54: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

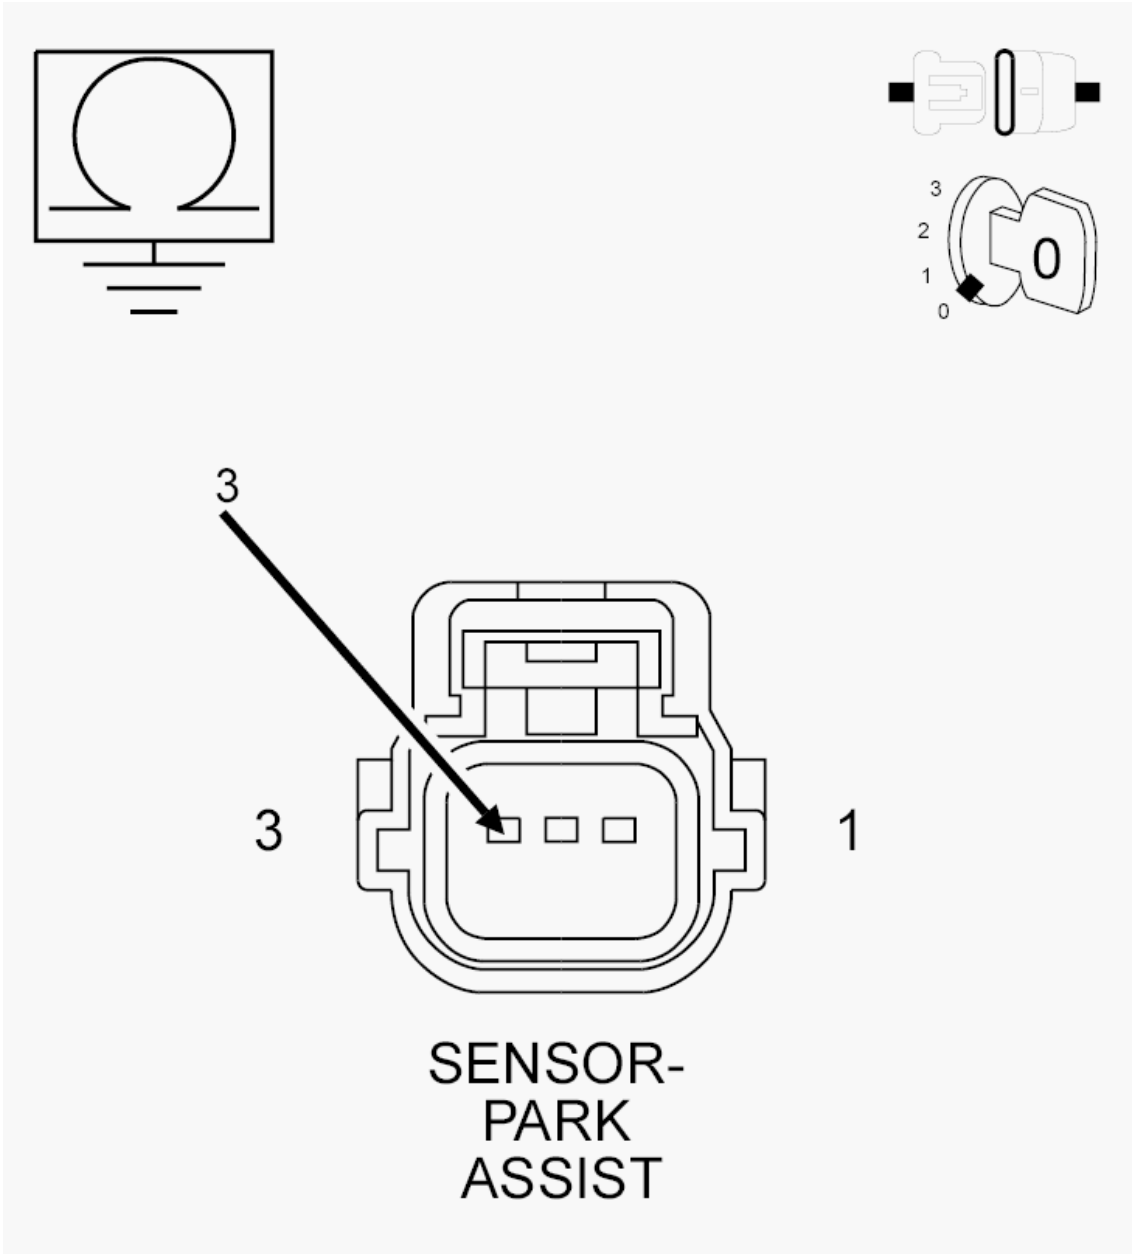

Fig. 55: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

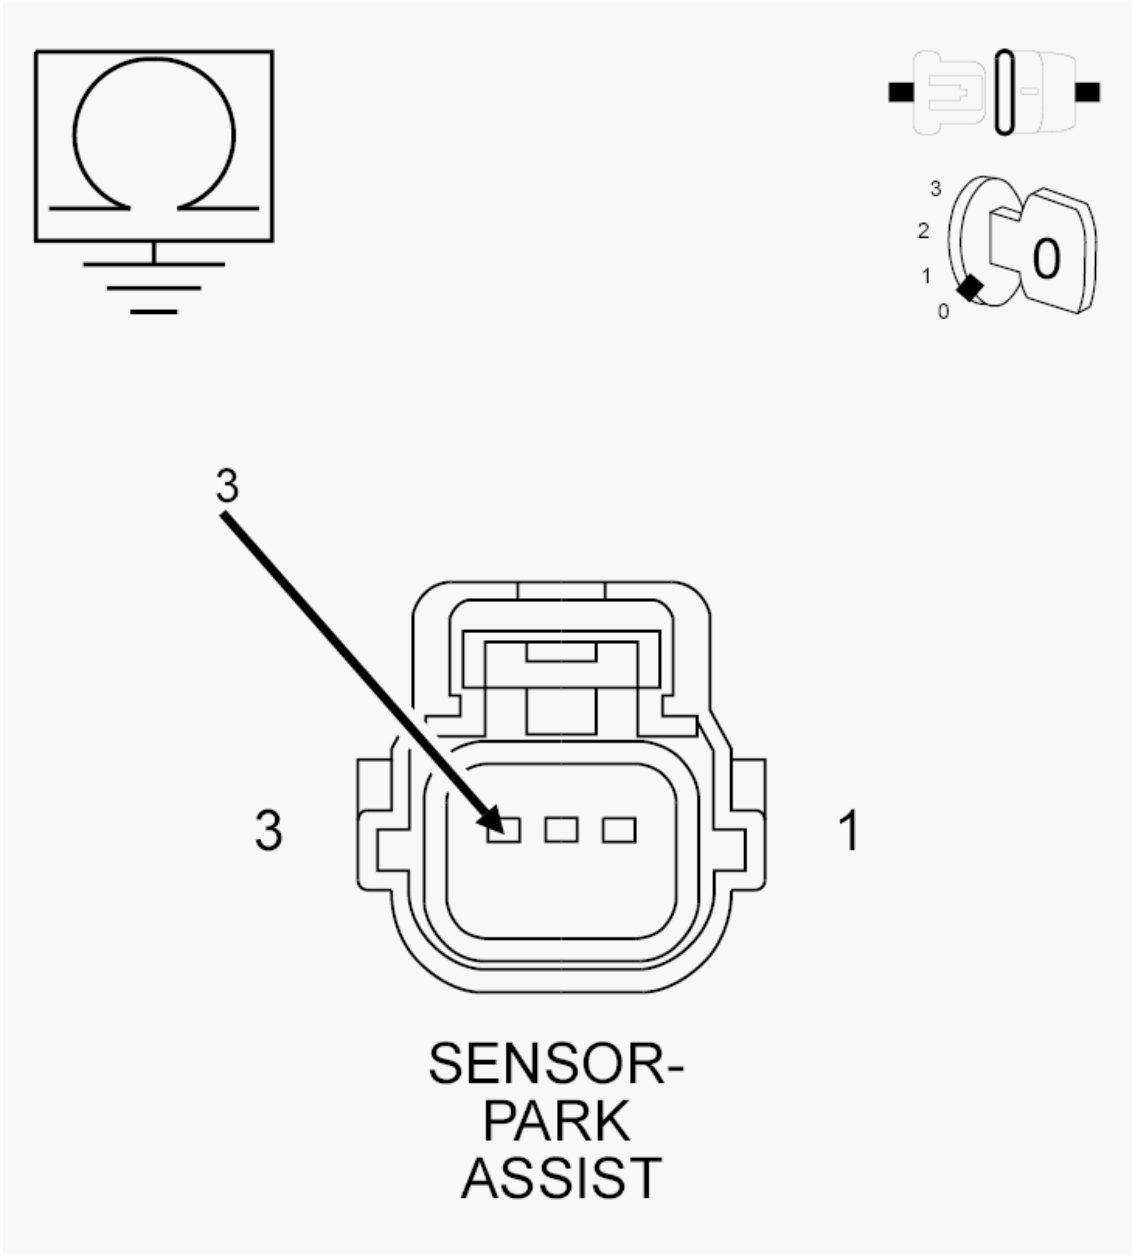

Fig. 56: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance between ground and the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D707) Park Assist Sensor 4 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

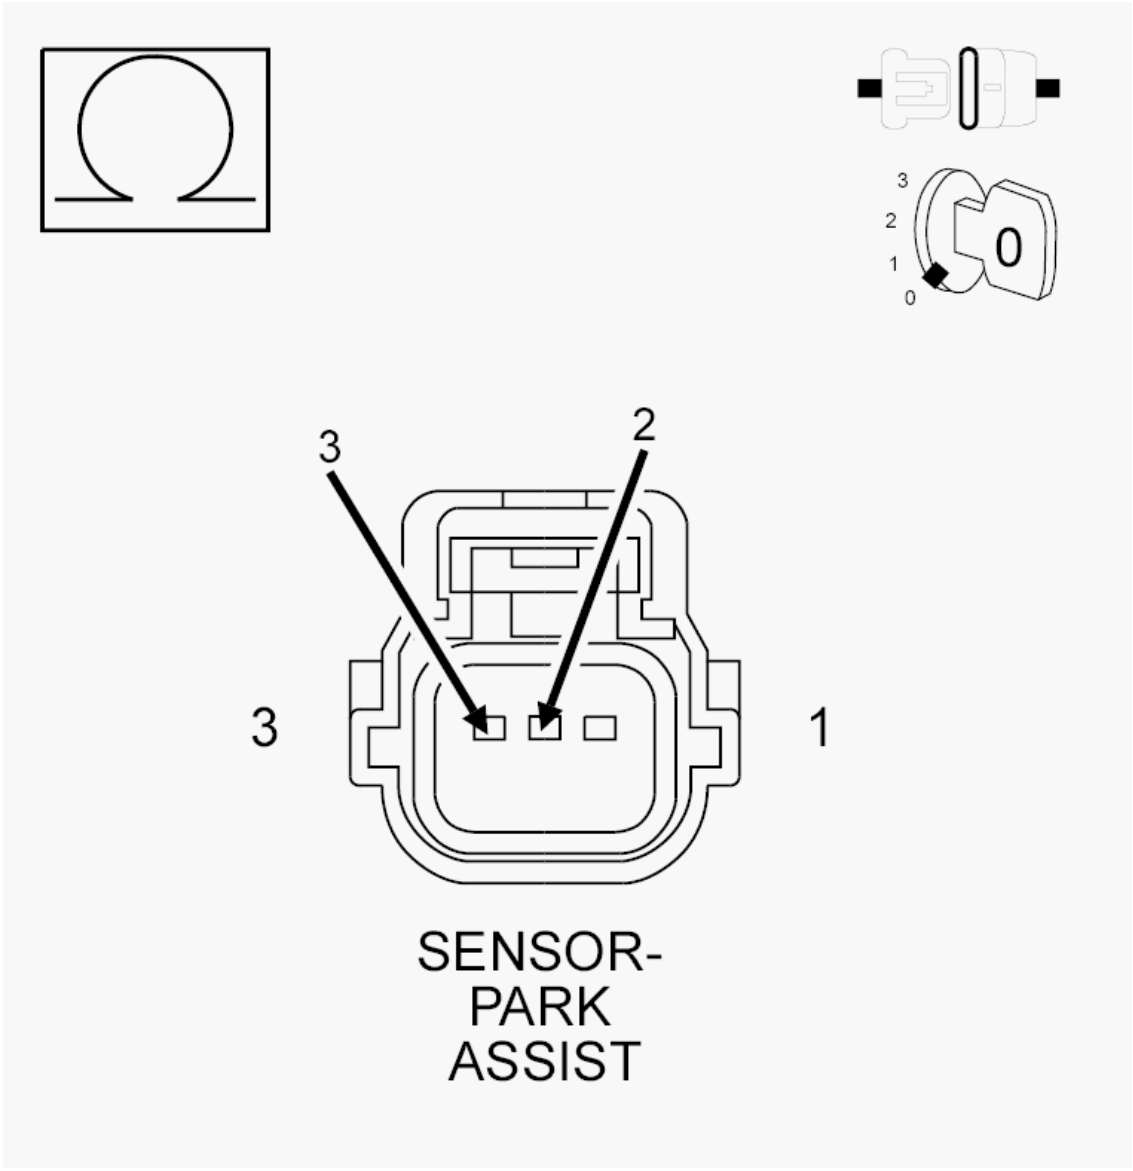

Fig. 57: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D707) Park Assist Sensor 4 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D707) Park Assist Sensor 4 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR AN OPEN**

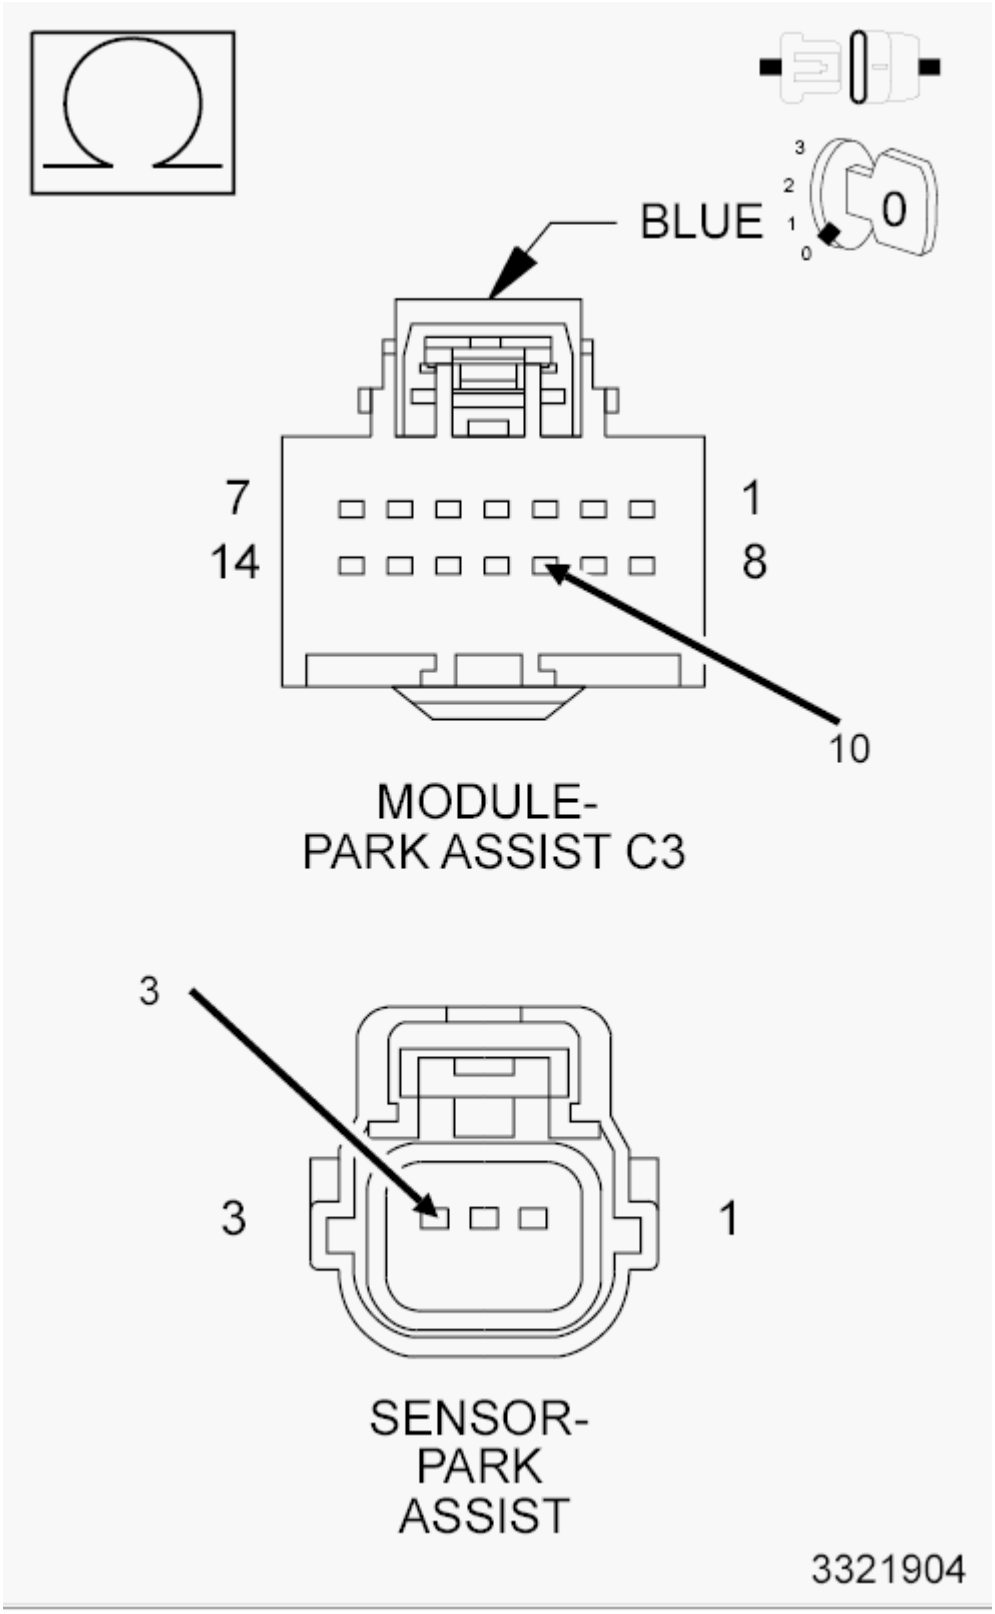

Fig. 58: Checking Park Assist Sensor 4 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D707) Park Assist Sensor 4 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

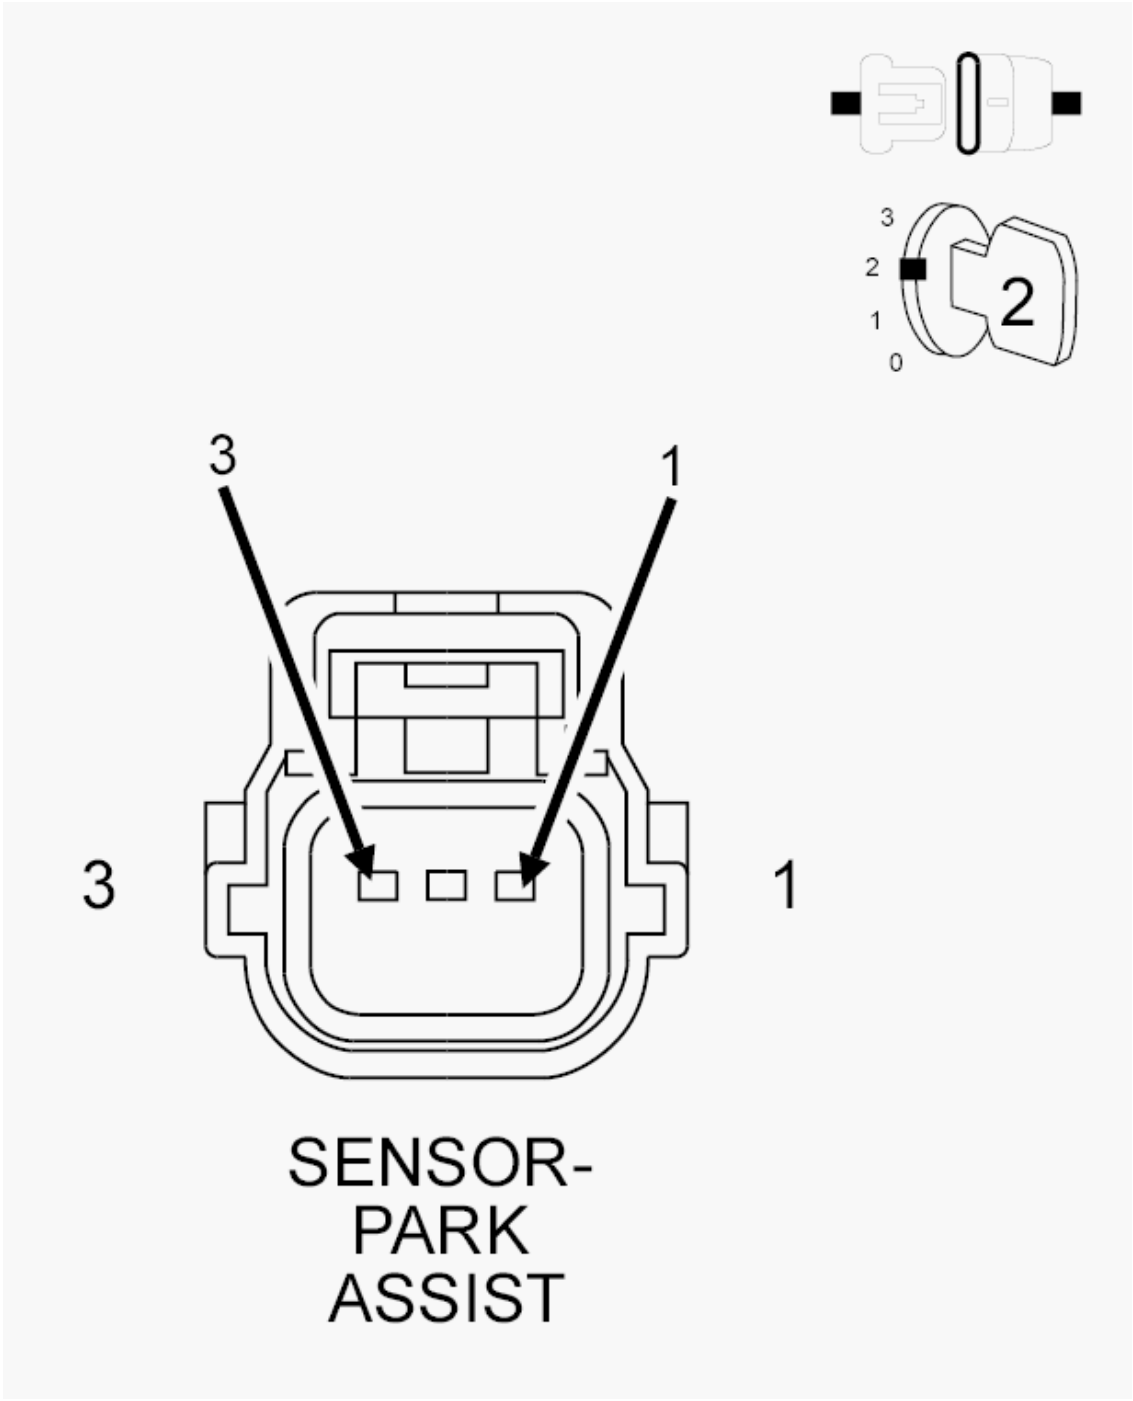

Fig. 59: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D707) Park Assist Sensor 4 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1291-12-PTS SENSOR 4 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1291-12-PTS SENSOR 4 - CIRCUIT SHORT TO BATTERY

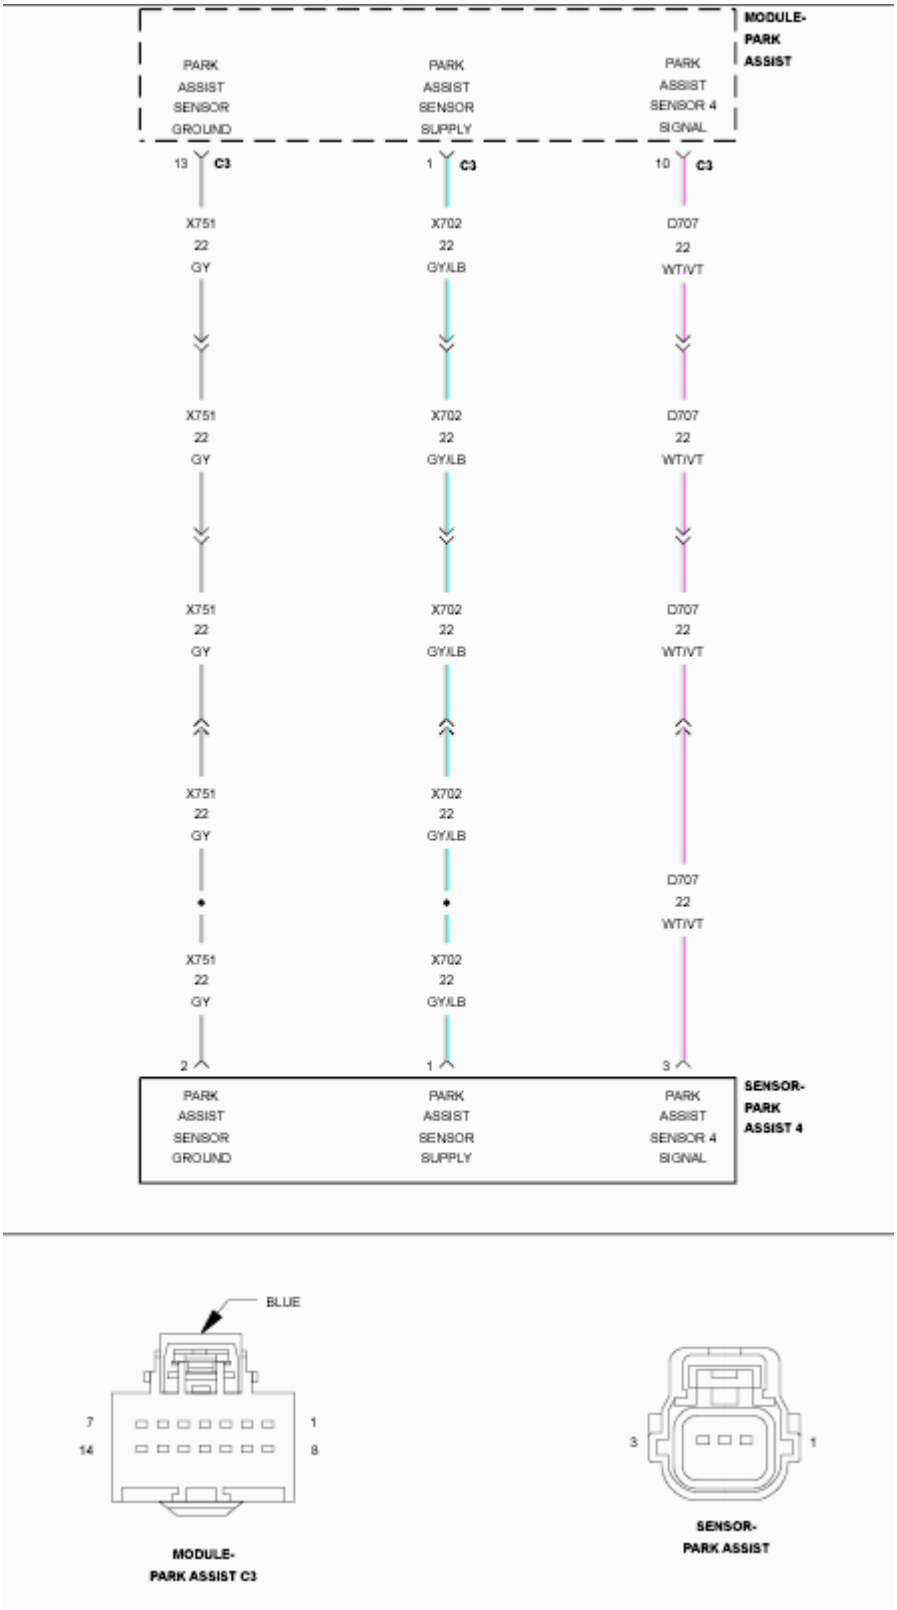

Fig. 60: Park Assist Sensor Wiring Diagram

   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1291-92-PTS SENSOR 4 - PERFORMANCE OR INCORRECT OPERATION

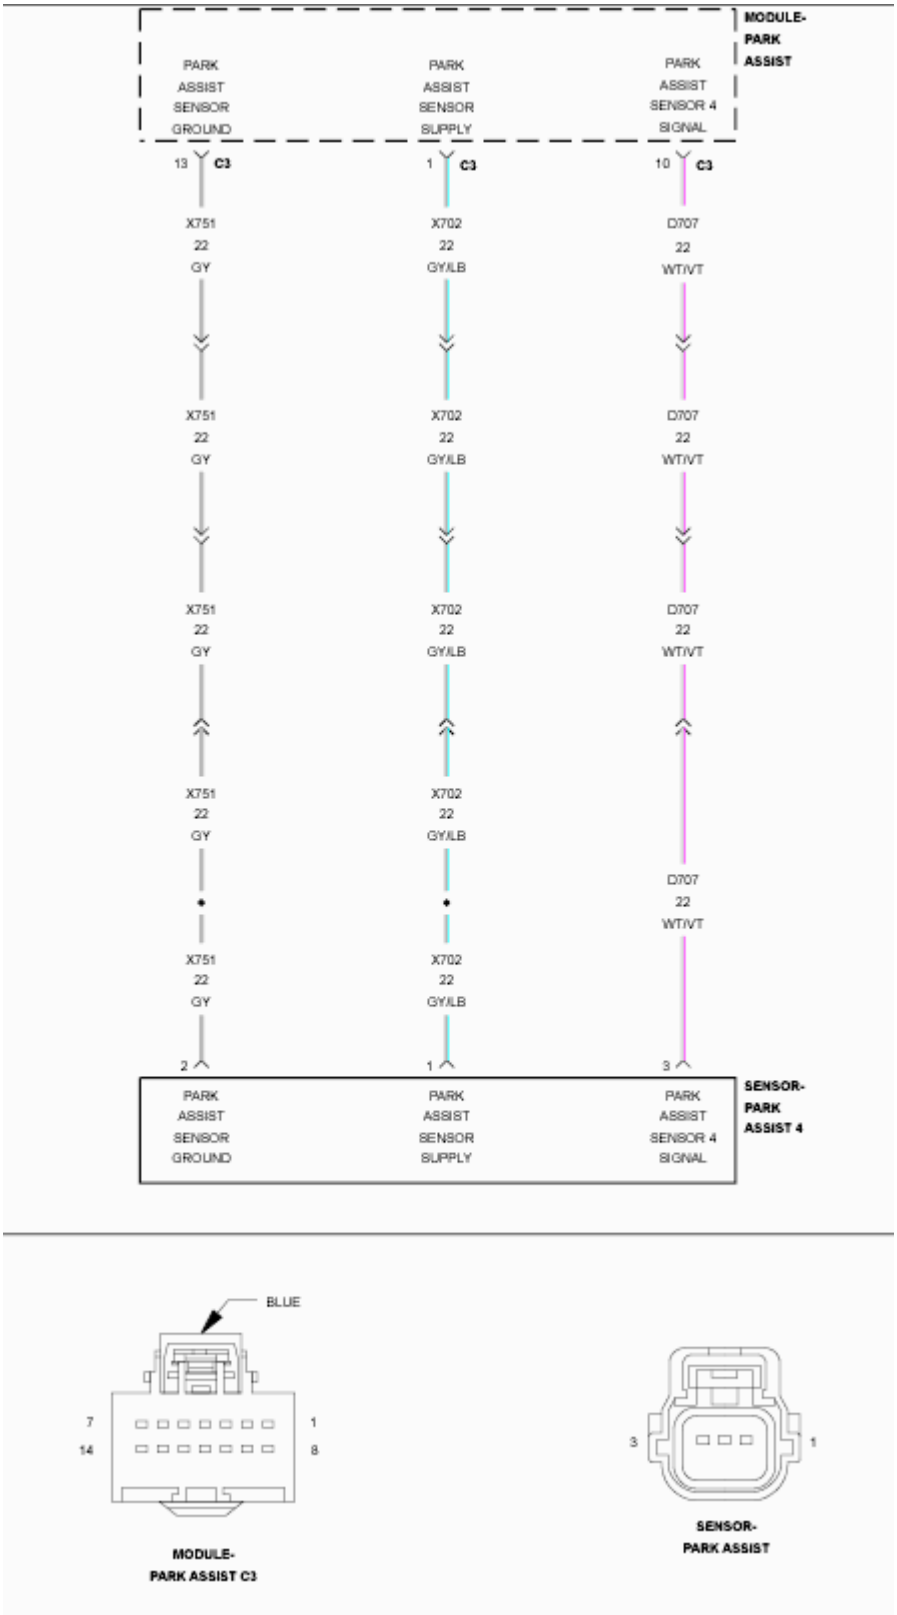

Fig. 65: Park Assist Sensor Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor 4 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

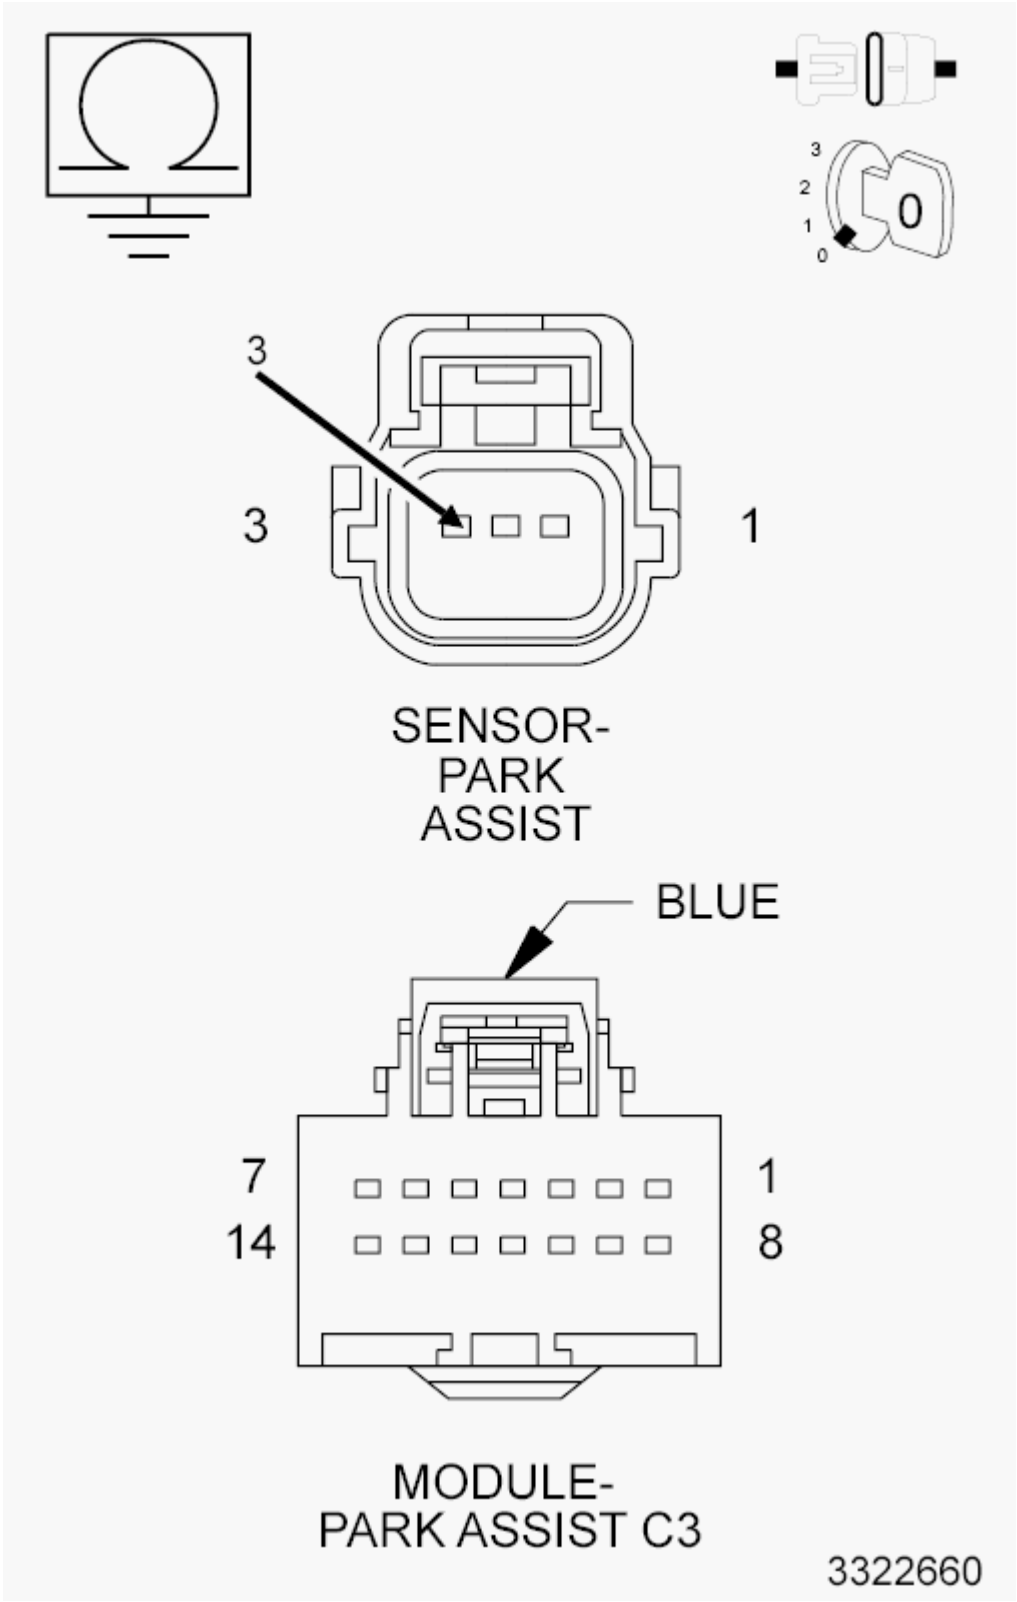

Fig. 66: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance between ground and the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D707) Park Assist Sensor 4 Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

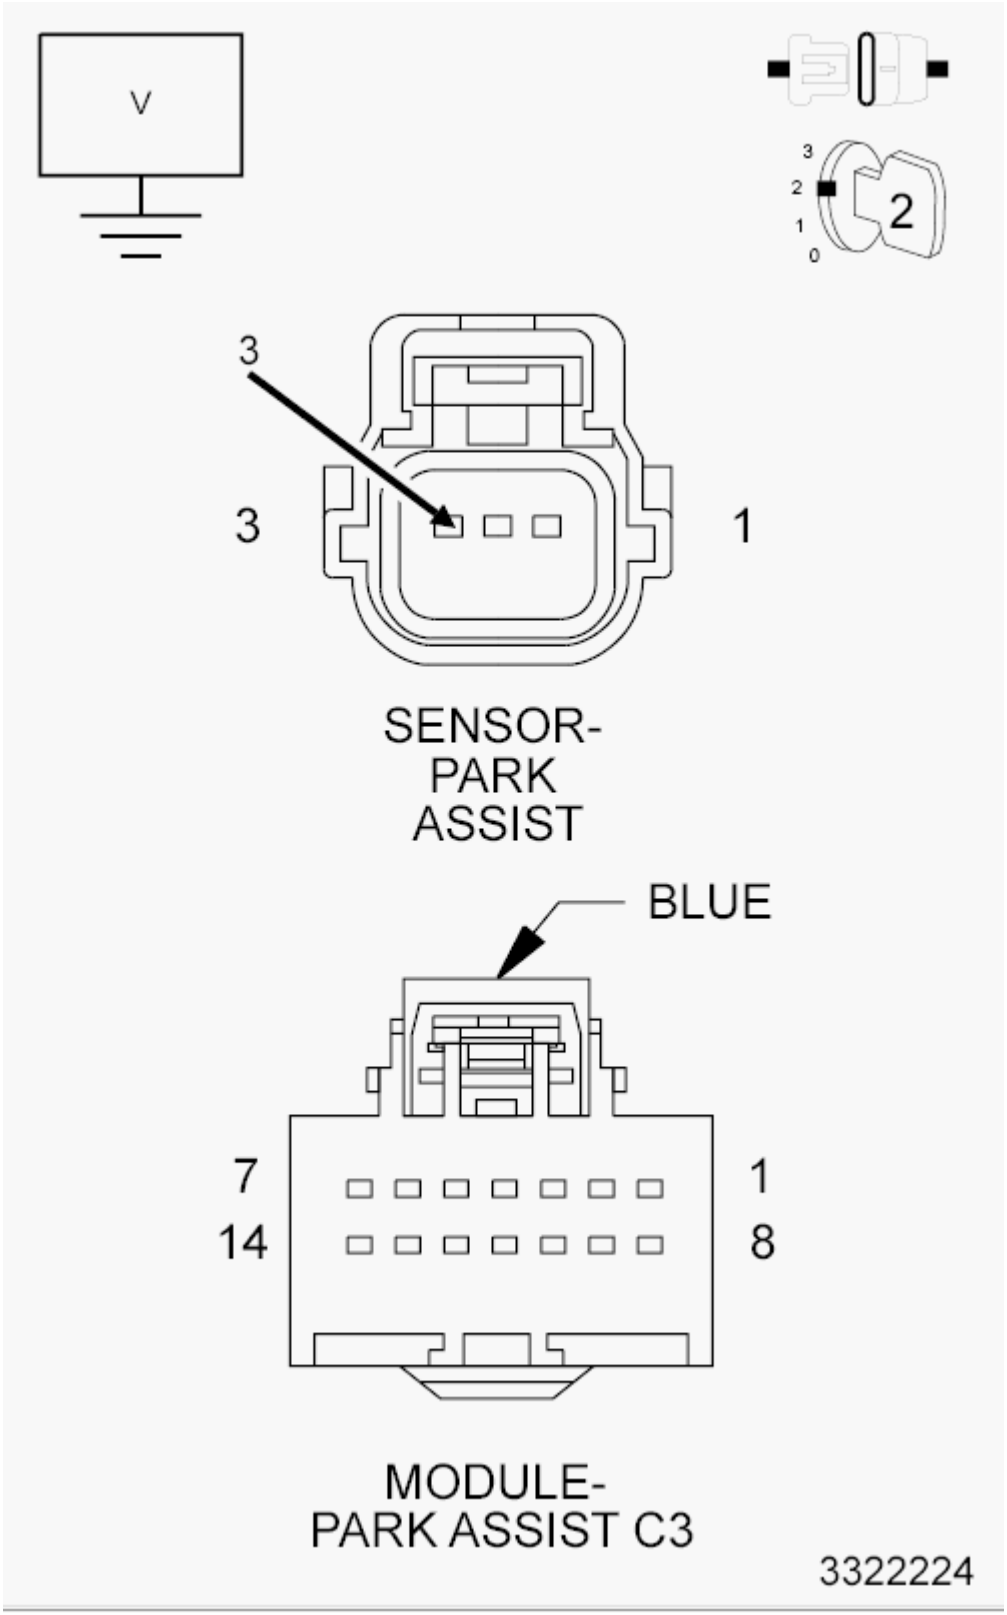

Fig. 67: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (D707) Park Assist Sensor 4 Signal circuit.

   Is voltage present?

   Yes

   - Repair the (D707) Park Assist Sensor 4 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR AN OPEN**

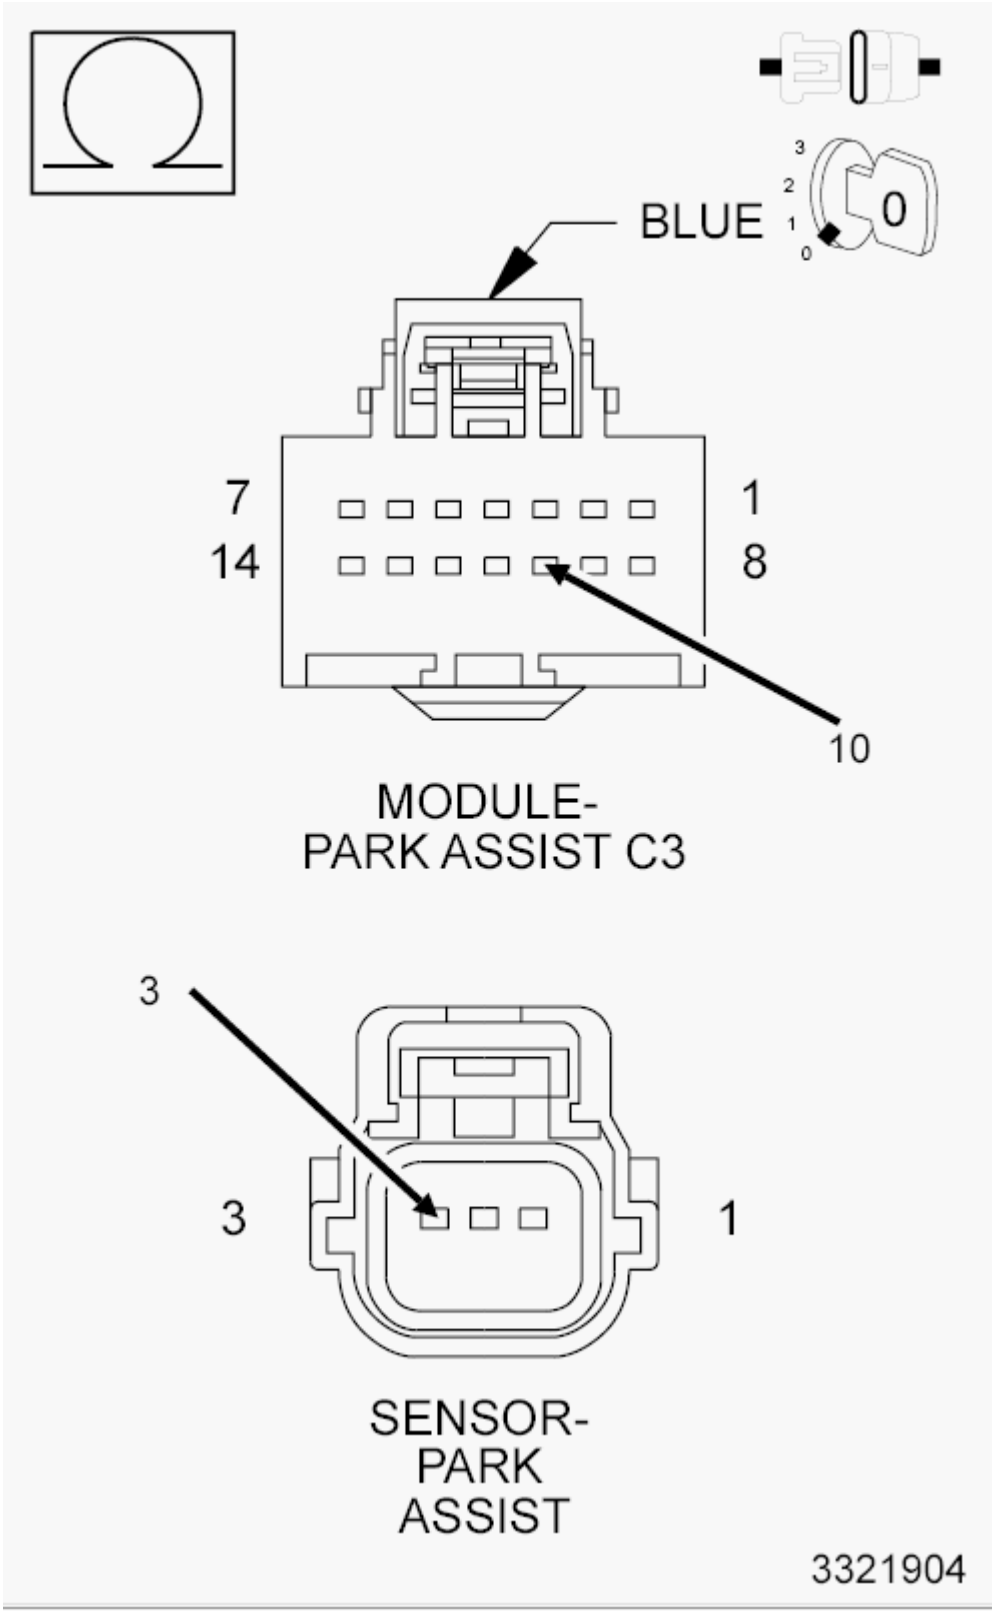

Fig. 68: Checking Park Assist Sensor 4 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (D707) Park Assist Sensor 4 Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1292-11-PTS SENSOR 5 - CIRCUIT SHORT TO GROUND

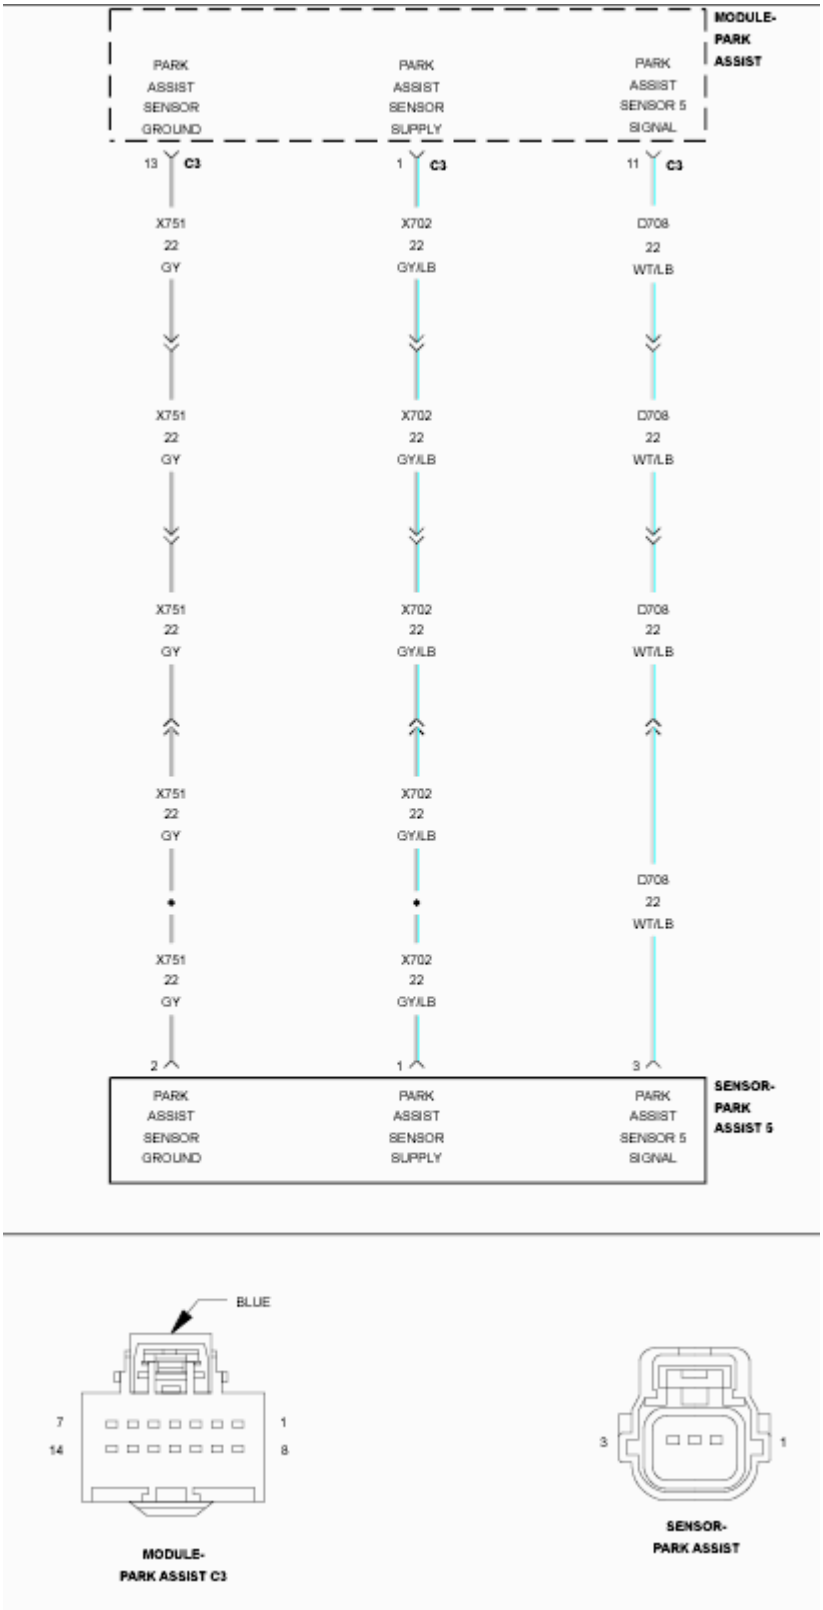

Fig. 69: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR AN OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

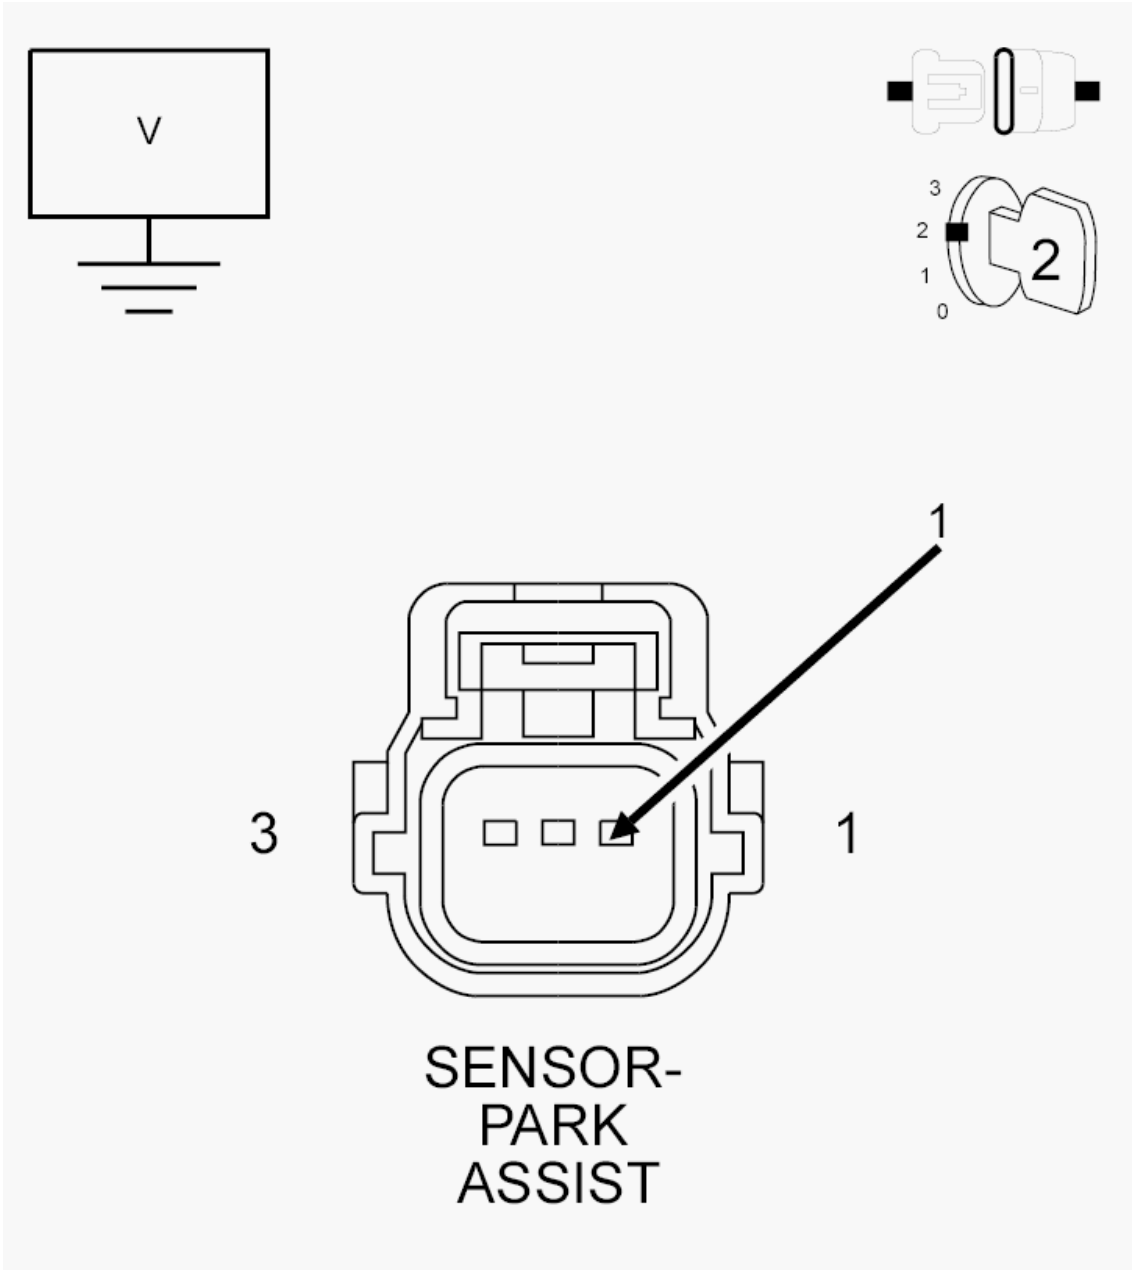

Fig. 70: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

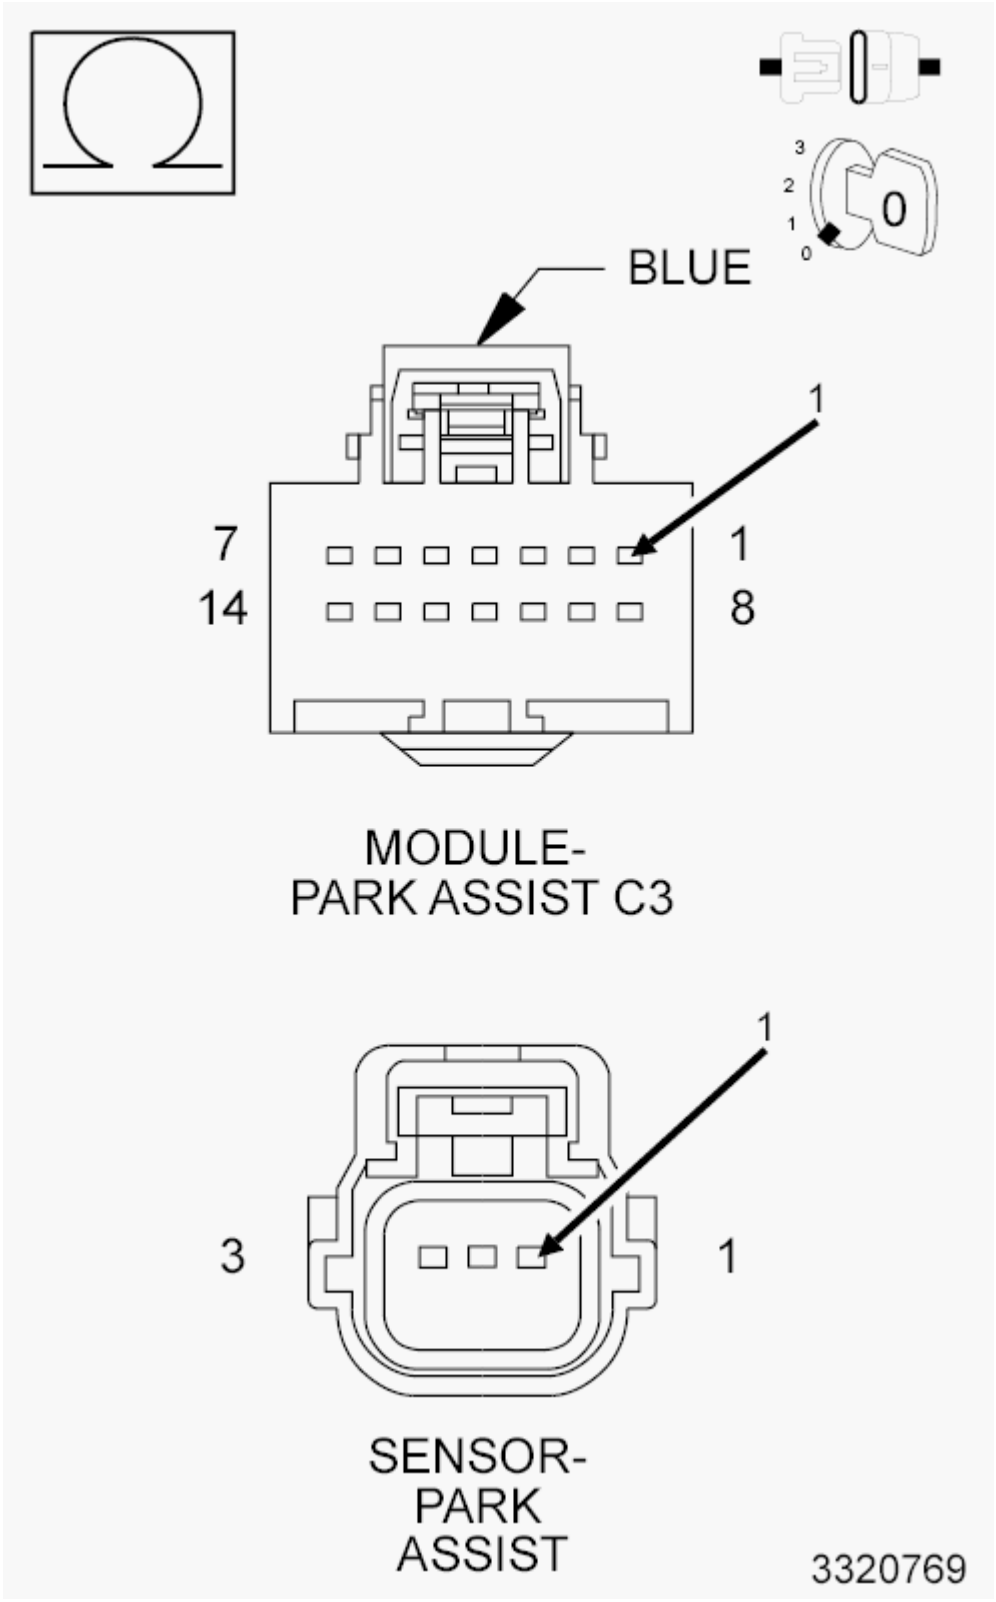

Fig. 71: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

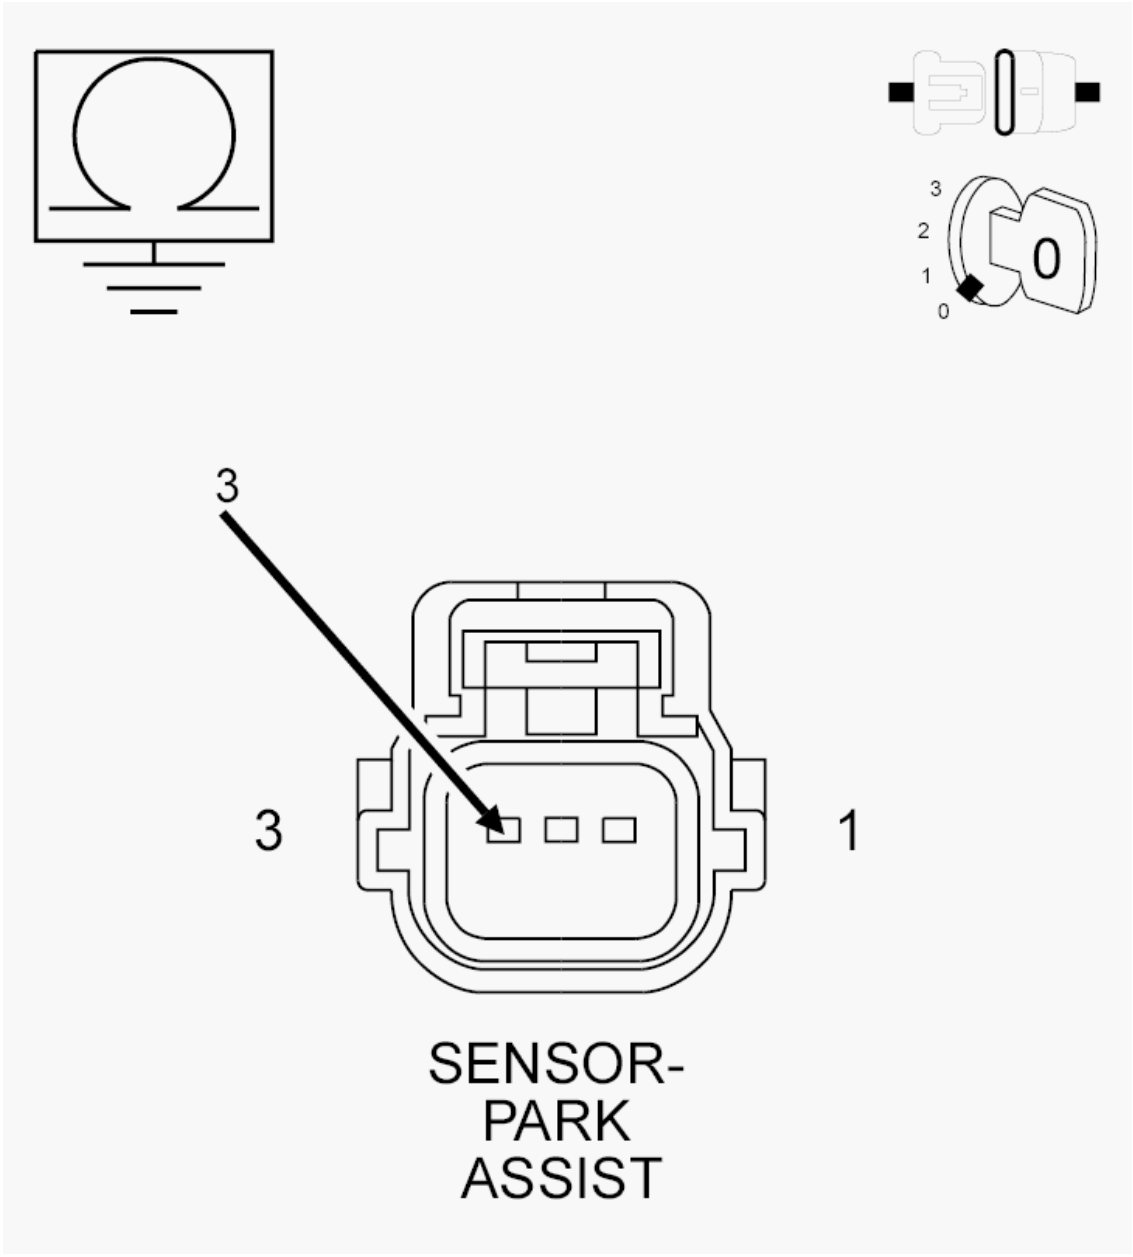

Fig. 72: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

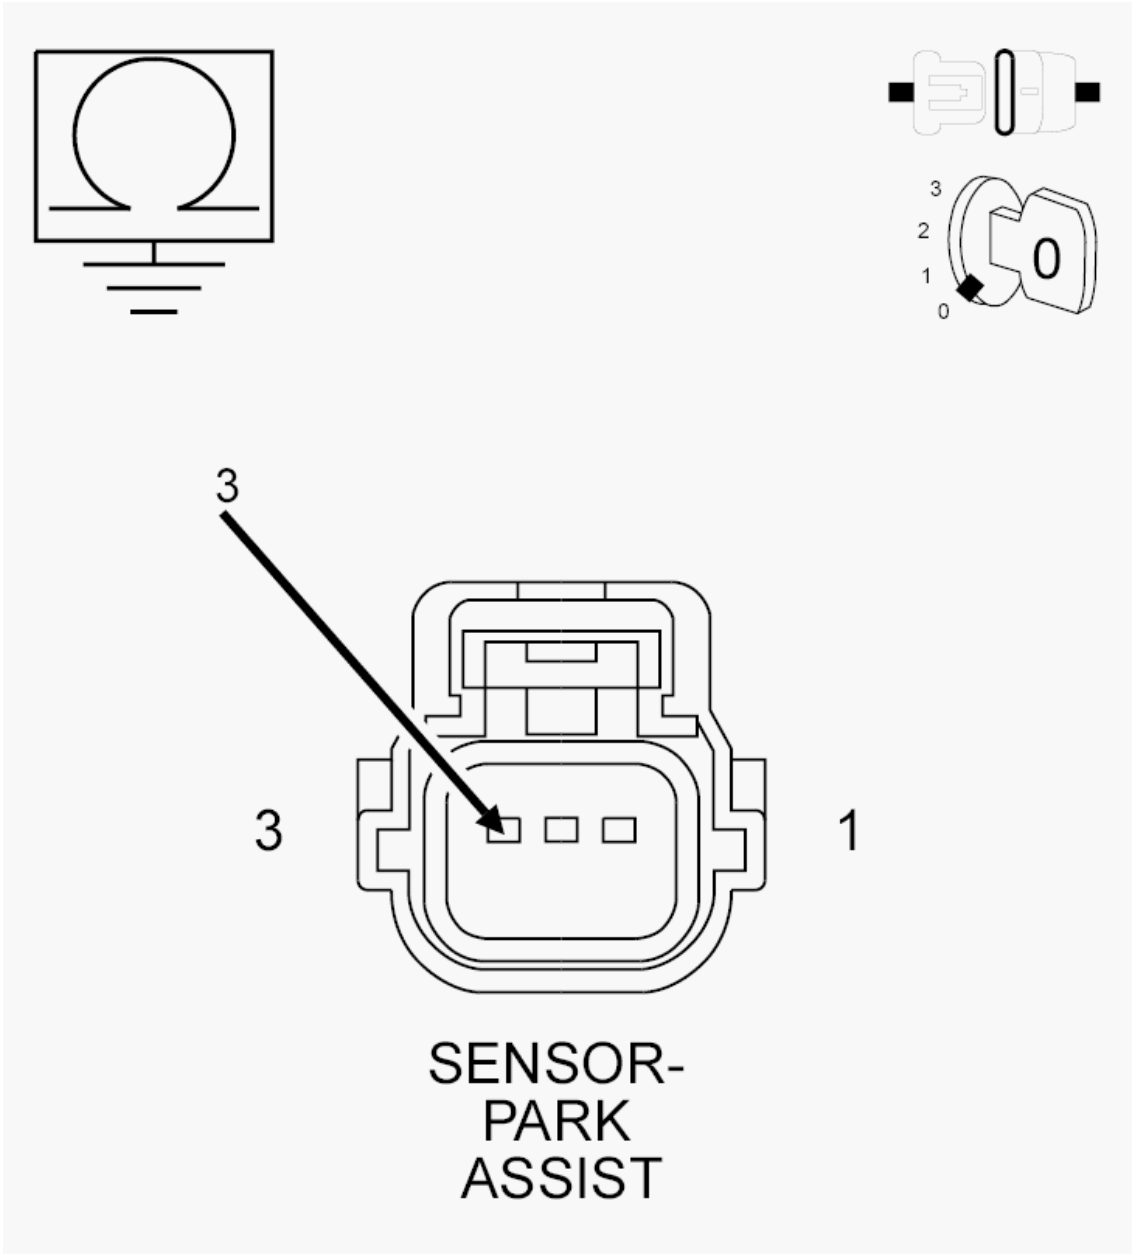

Fig. 73: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance between ground and the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D708) Park Assist Sensor 5 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

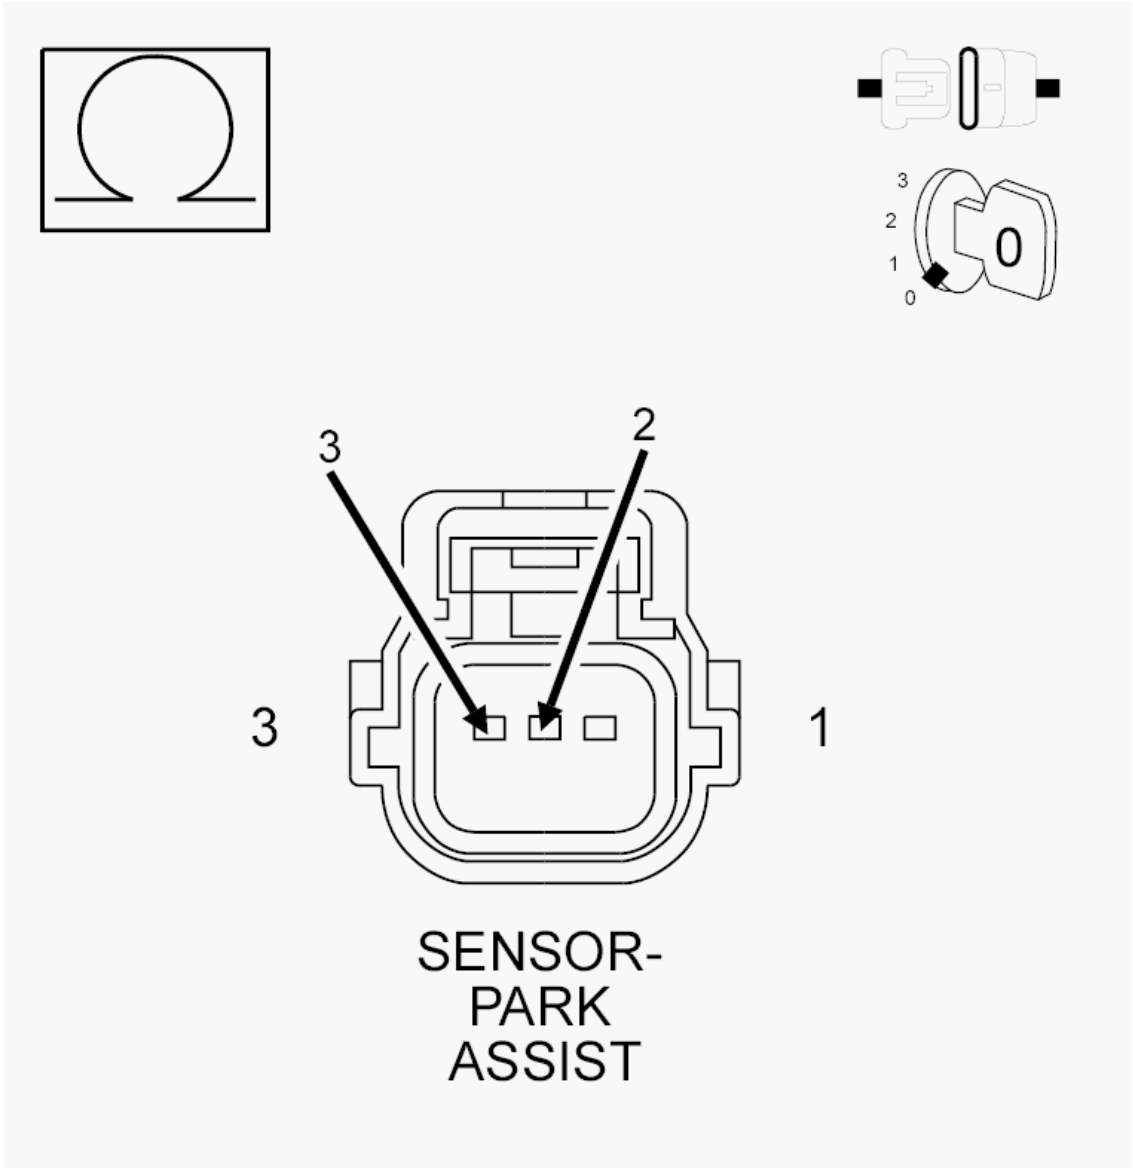

Fig. 74: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D708) Park Assist Sensor 5 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D708) Park Assist Sensor 5 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR AN OPEN**

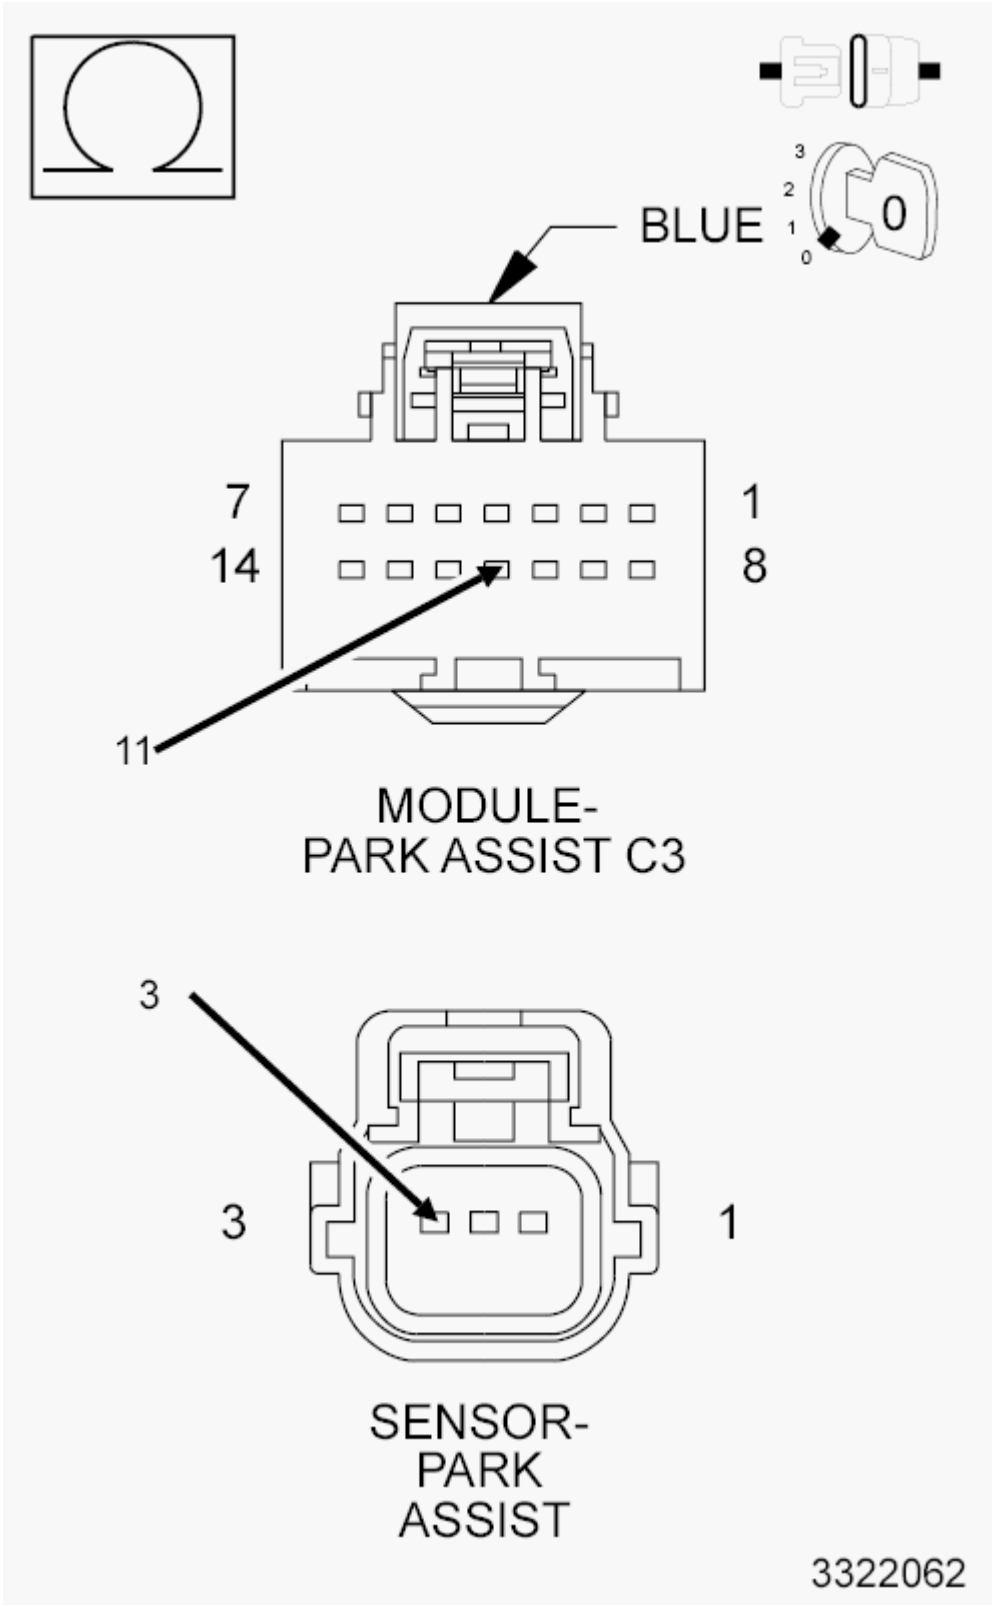

Fig. 75: Checking Park Assist Sensor 5 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D708) Park Assist Sensor 5 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

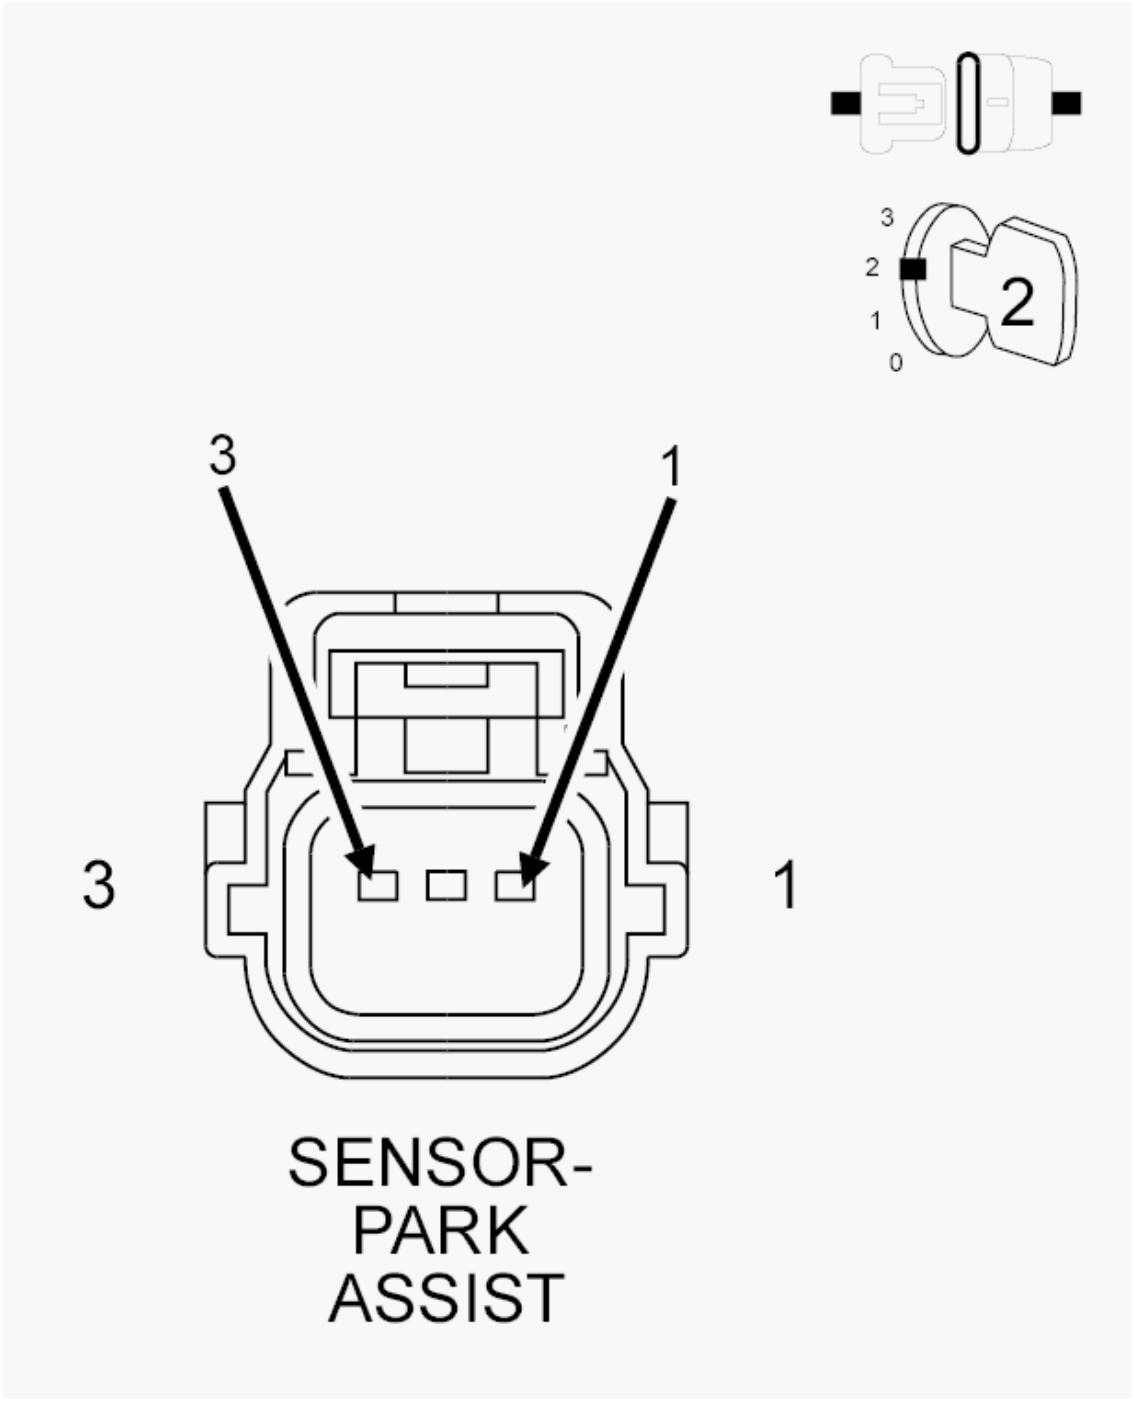

Fig. 76: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D708) Park Assist Sensor 5 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1292-12-PTS SENSOR 5 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1292-12-PTS SENSOR 5 - CIRCUIT SHORT TO BATTERY

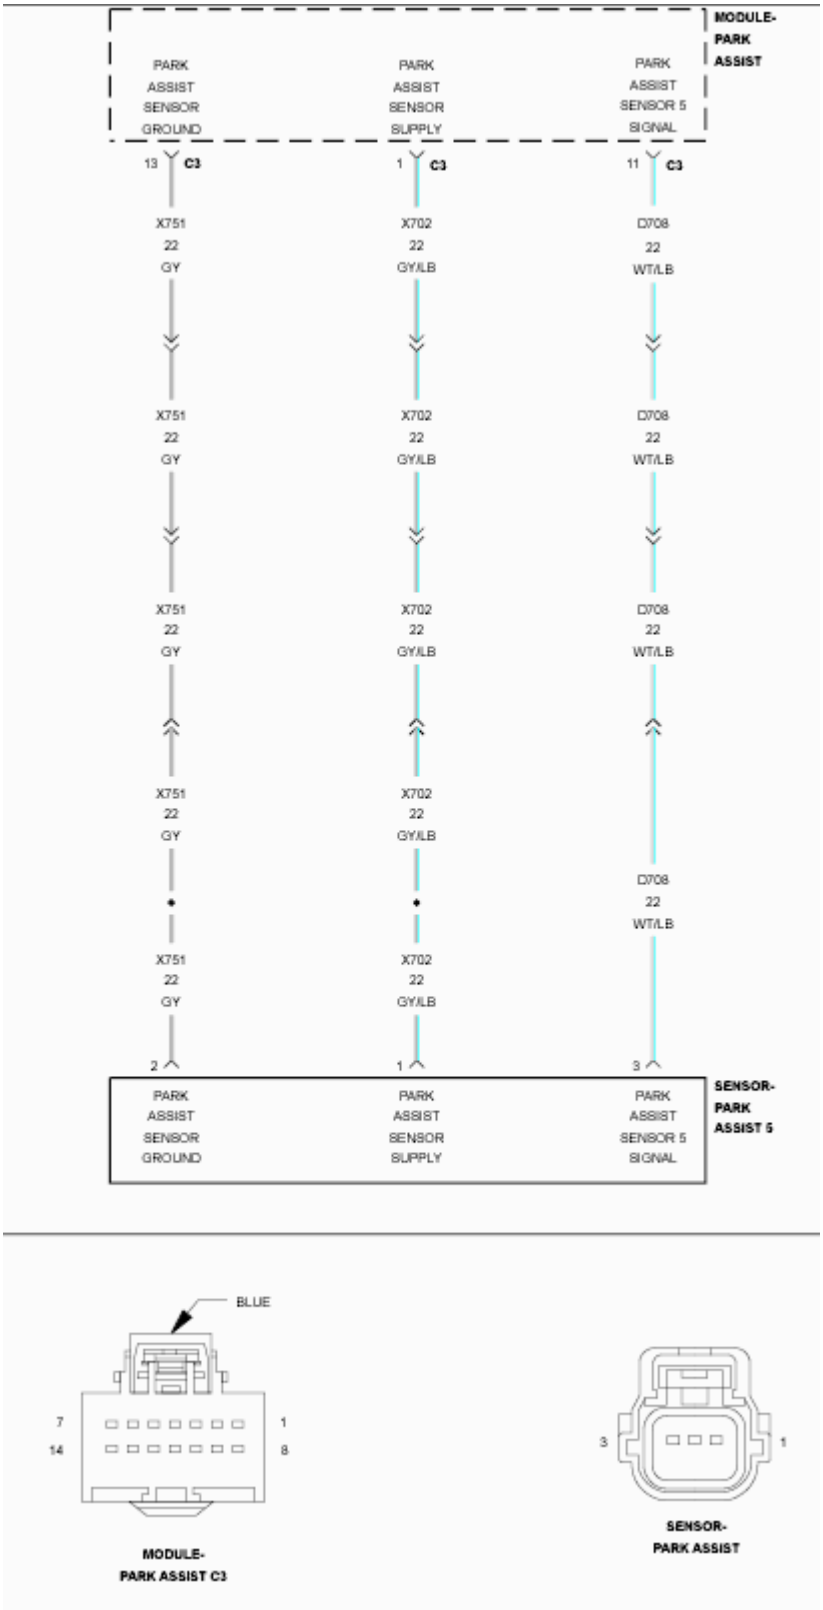

Fig. 77: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

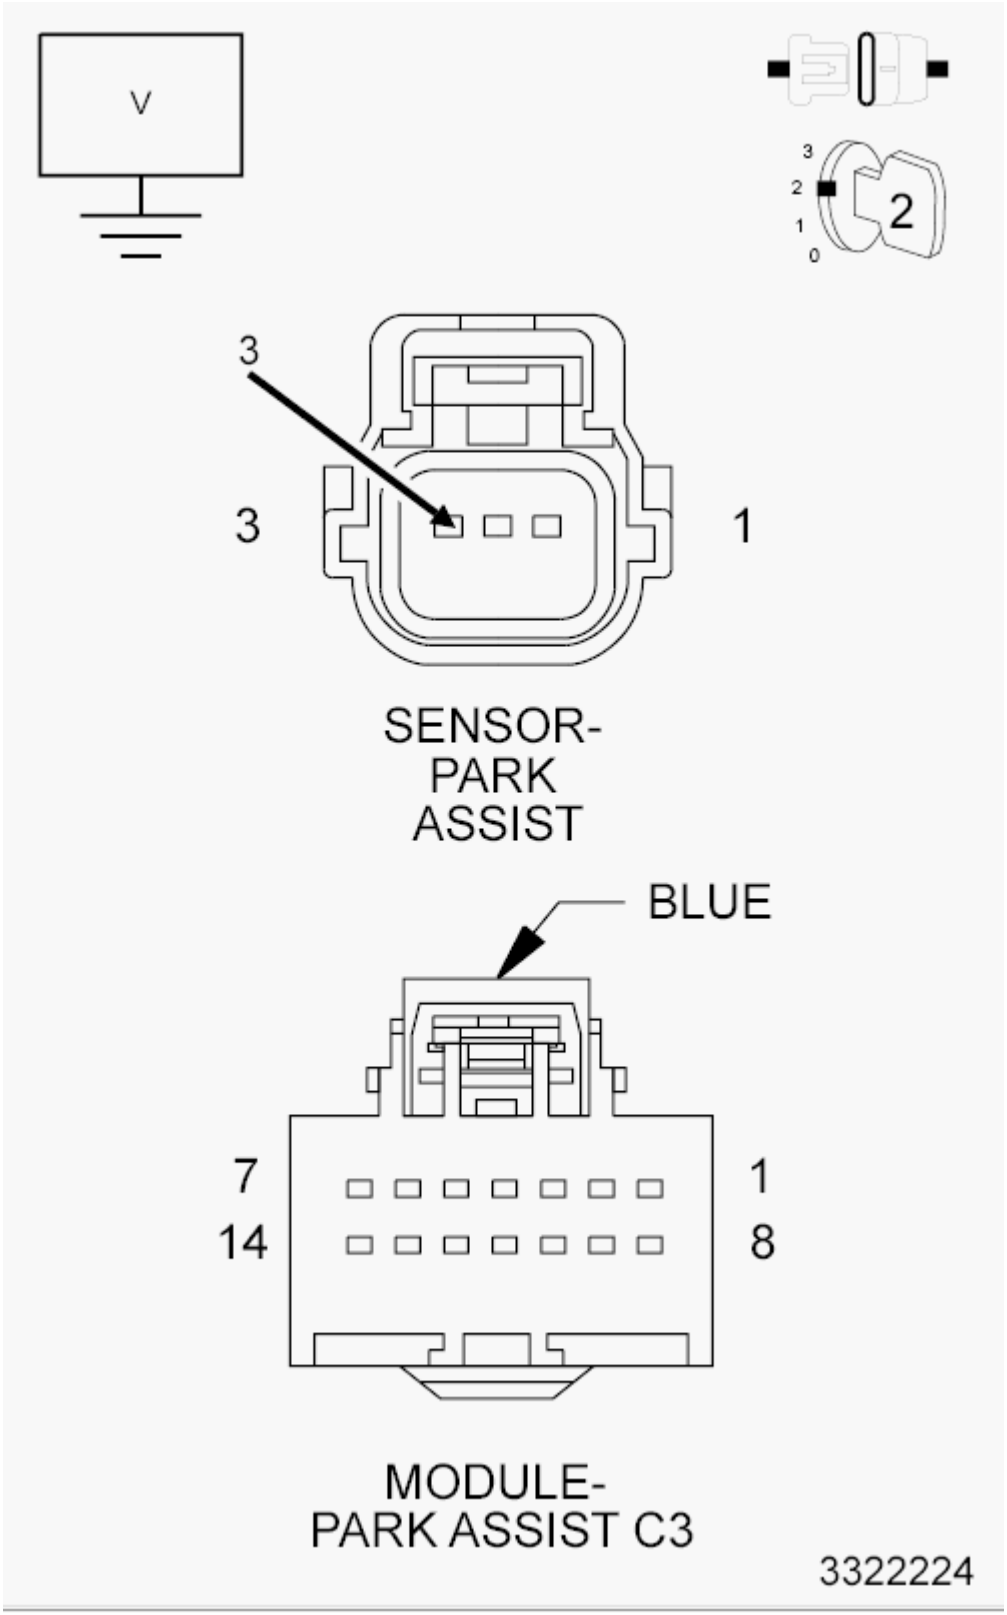

Fig. 78: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D708) Park Assist Sensor 5 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

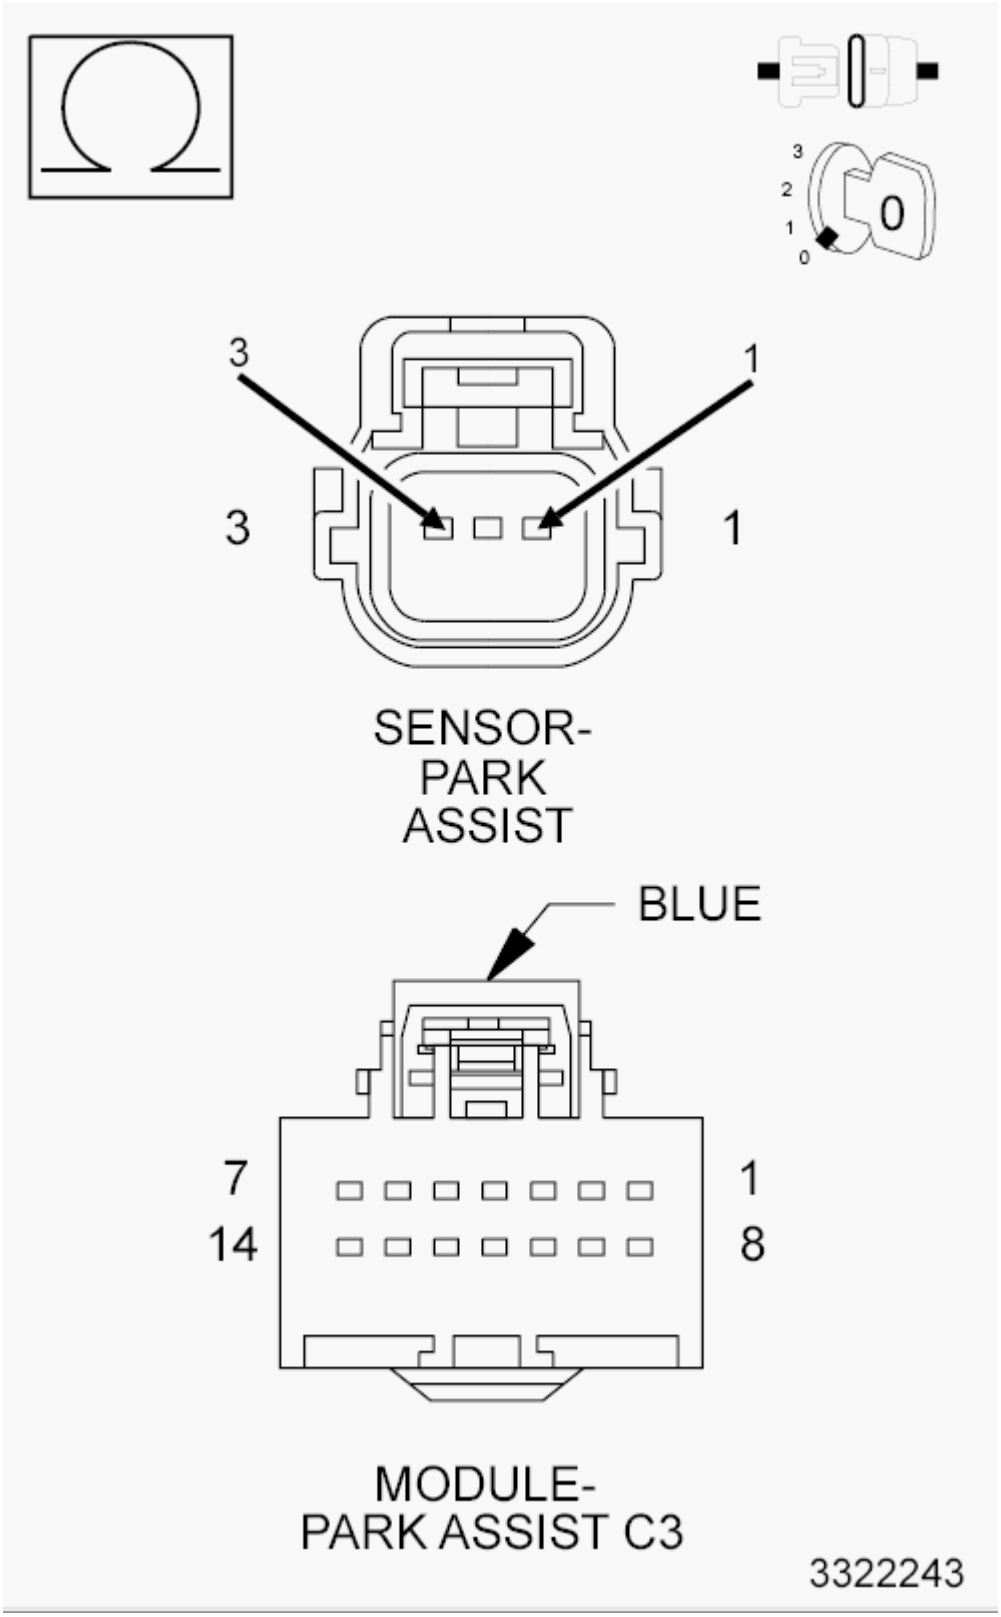

Fig. 79: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (D708) Park Assist Sensor 5 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN**

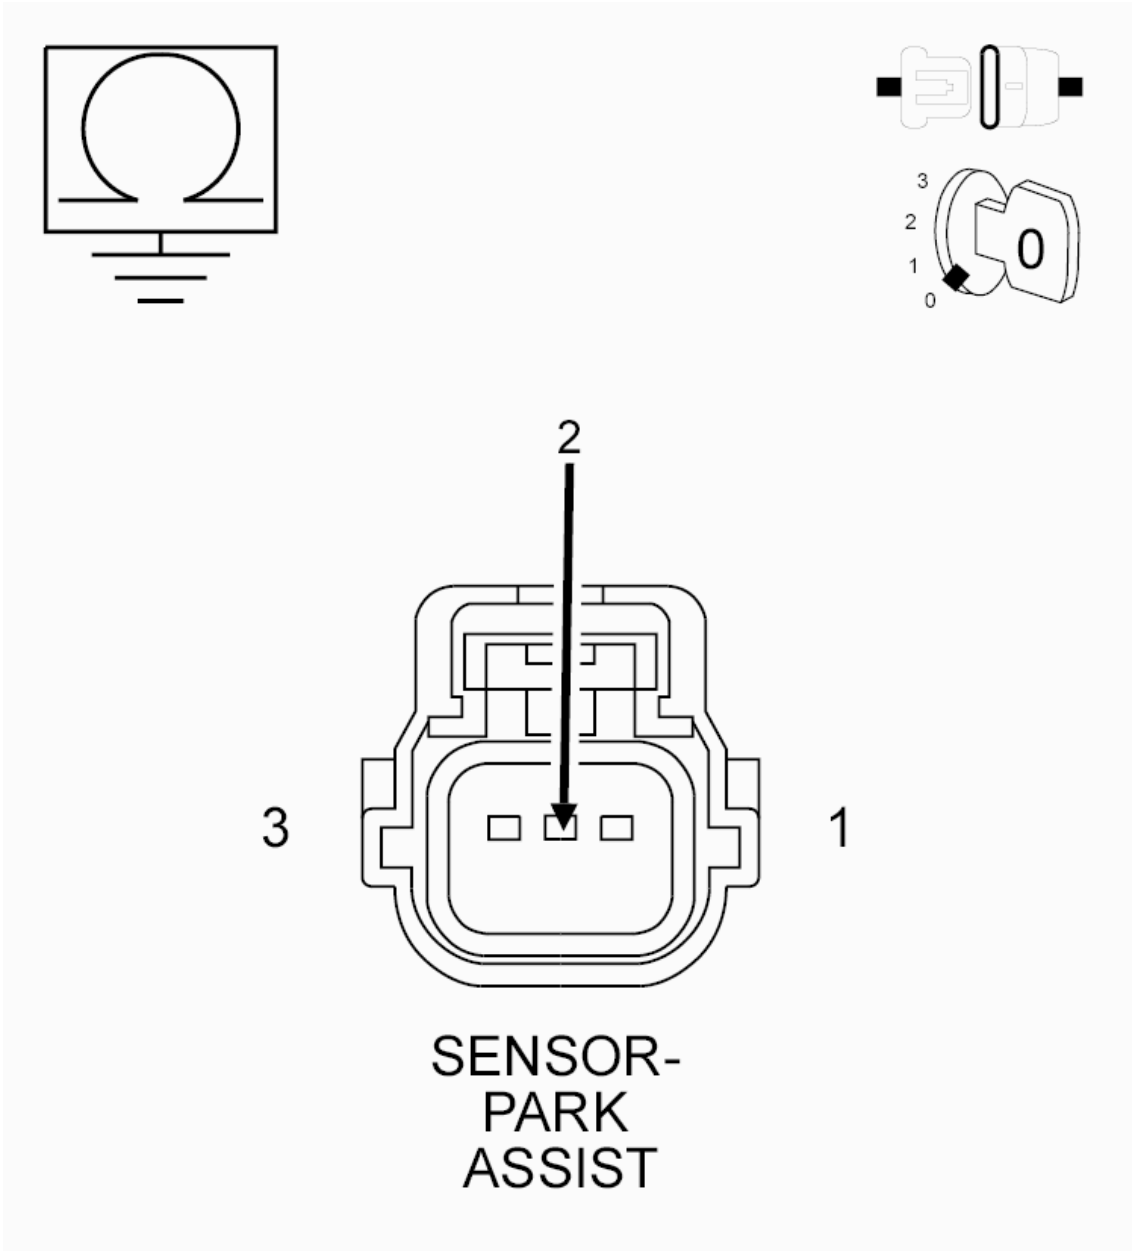

Fig. 80: Checking Front Park Assist Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 20.0 Ohms?

   Yes

   - Go To 5.

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**

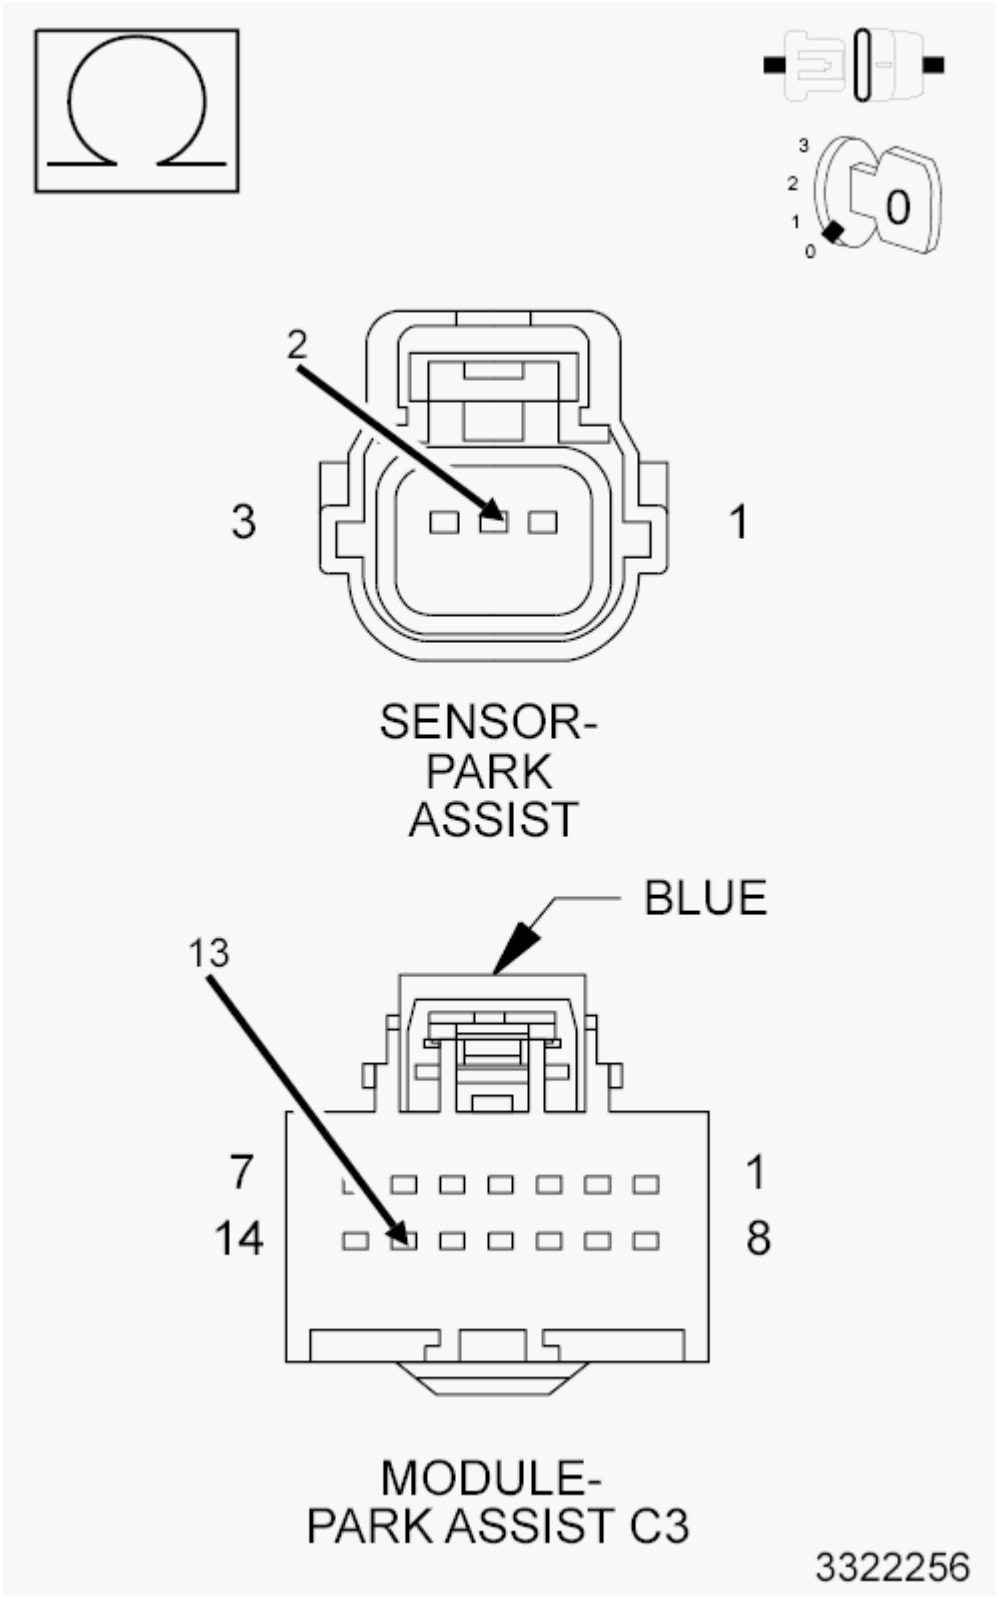

Fig. 81: Checking Front Park Assist Sensor Ground Circuit For An Open Between Park Assist Module & Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1292-25-PTS SENSOR 5 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1292-92-PTS SENSOR 5 - PERFORMANCE OR INCORRECT OPERATION

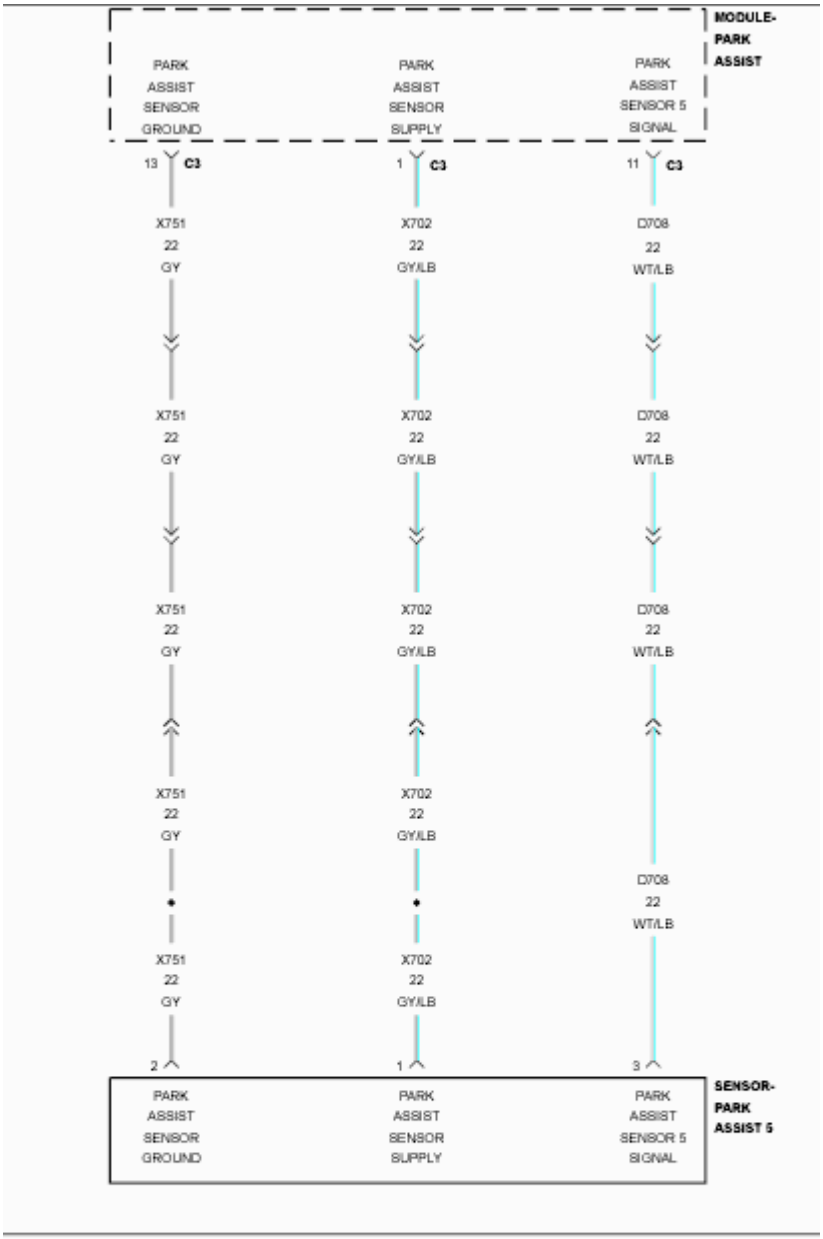

Fig. 82: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor 5 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

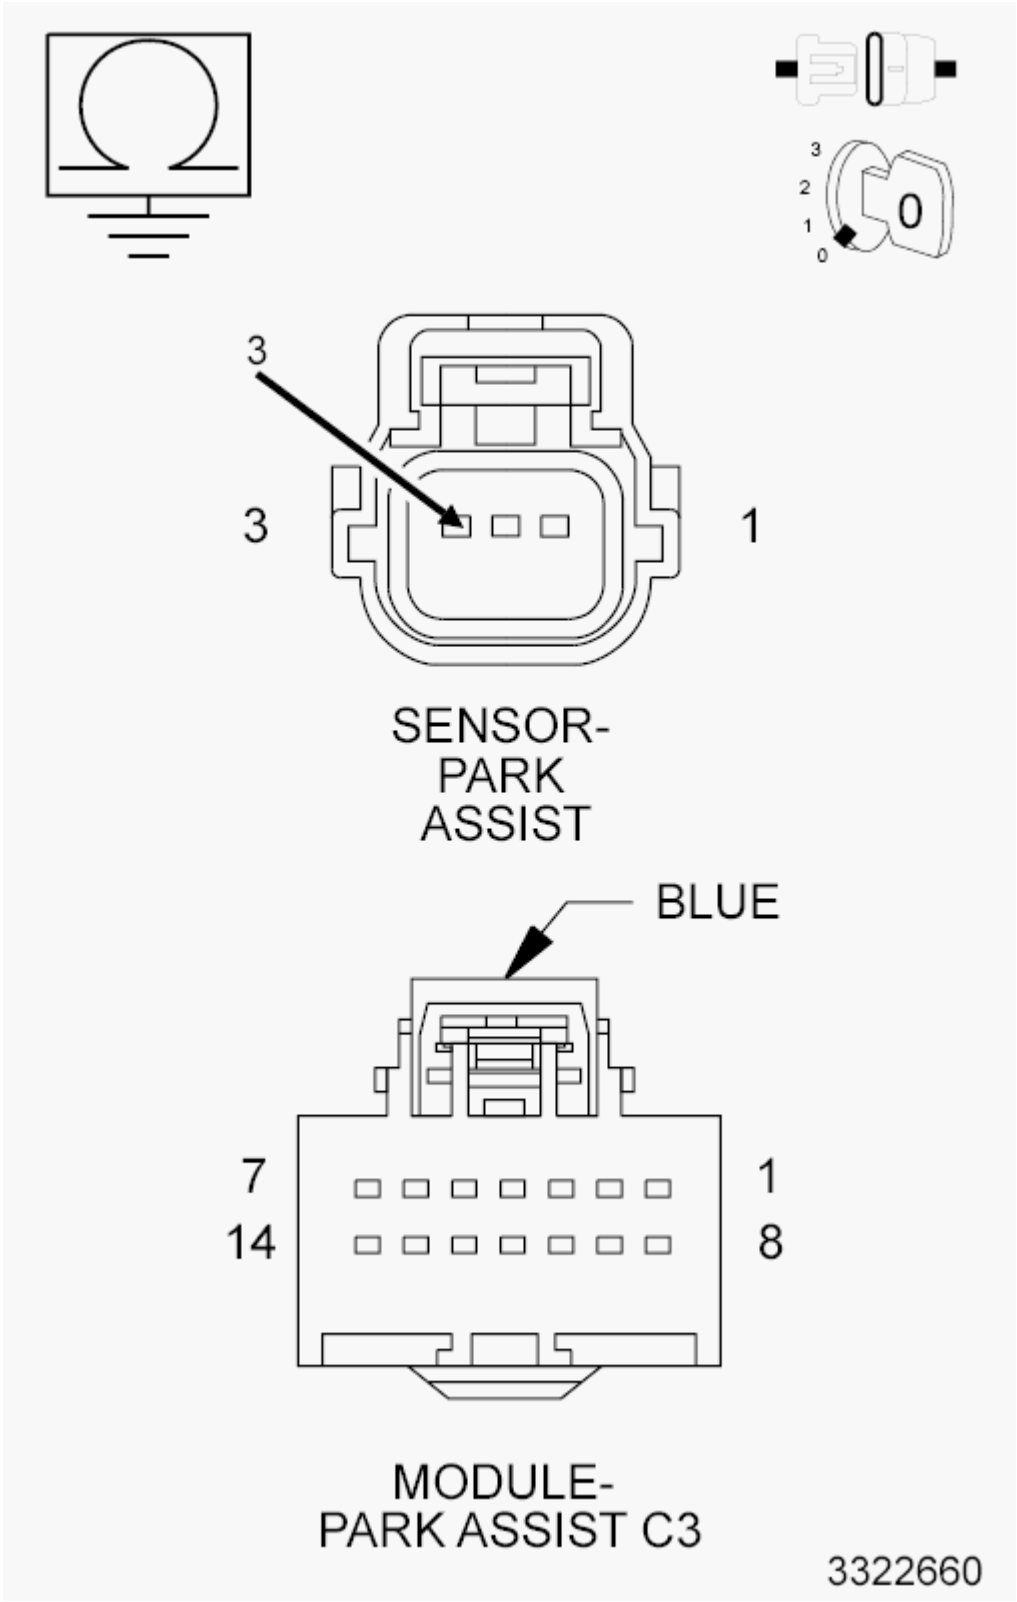

Fig. 83: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance between ground and the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

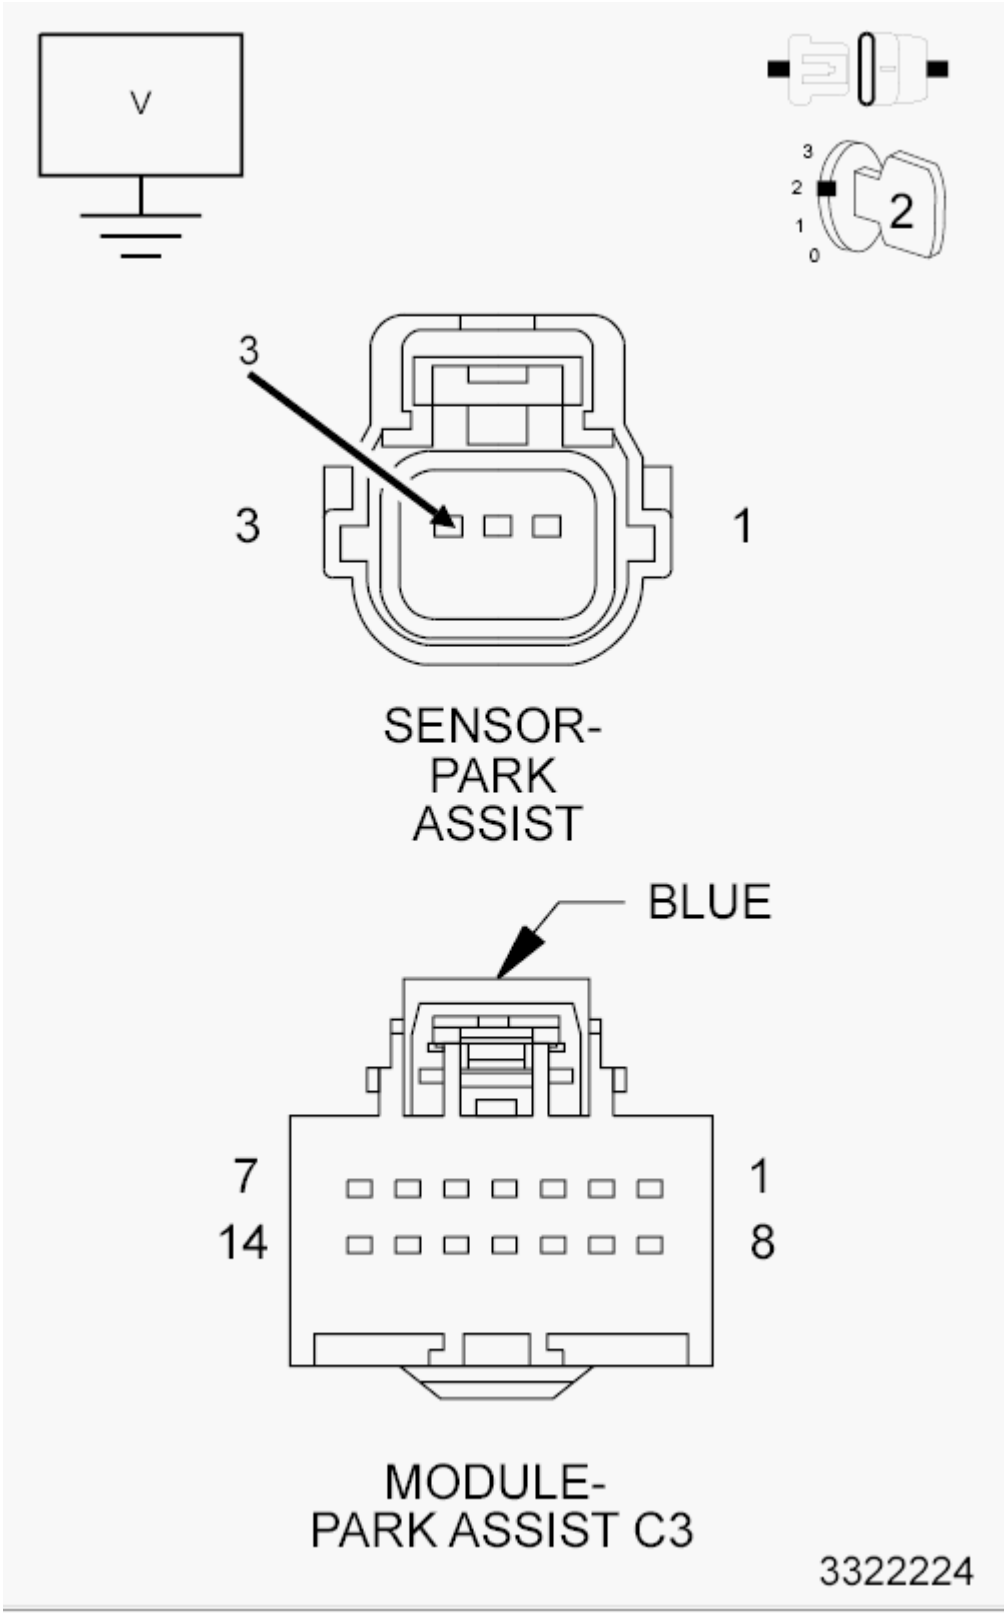

Fig. 84: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (D708) Park Assist Sensor 5 Signal circuit.

   Is voltage present?

   Yes

   - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR AN OPEN**

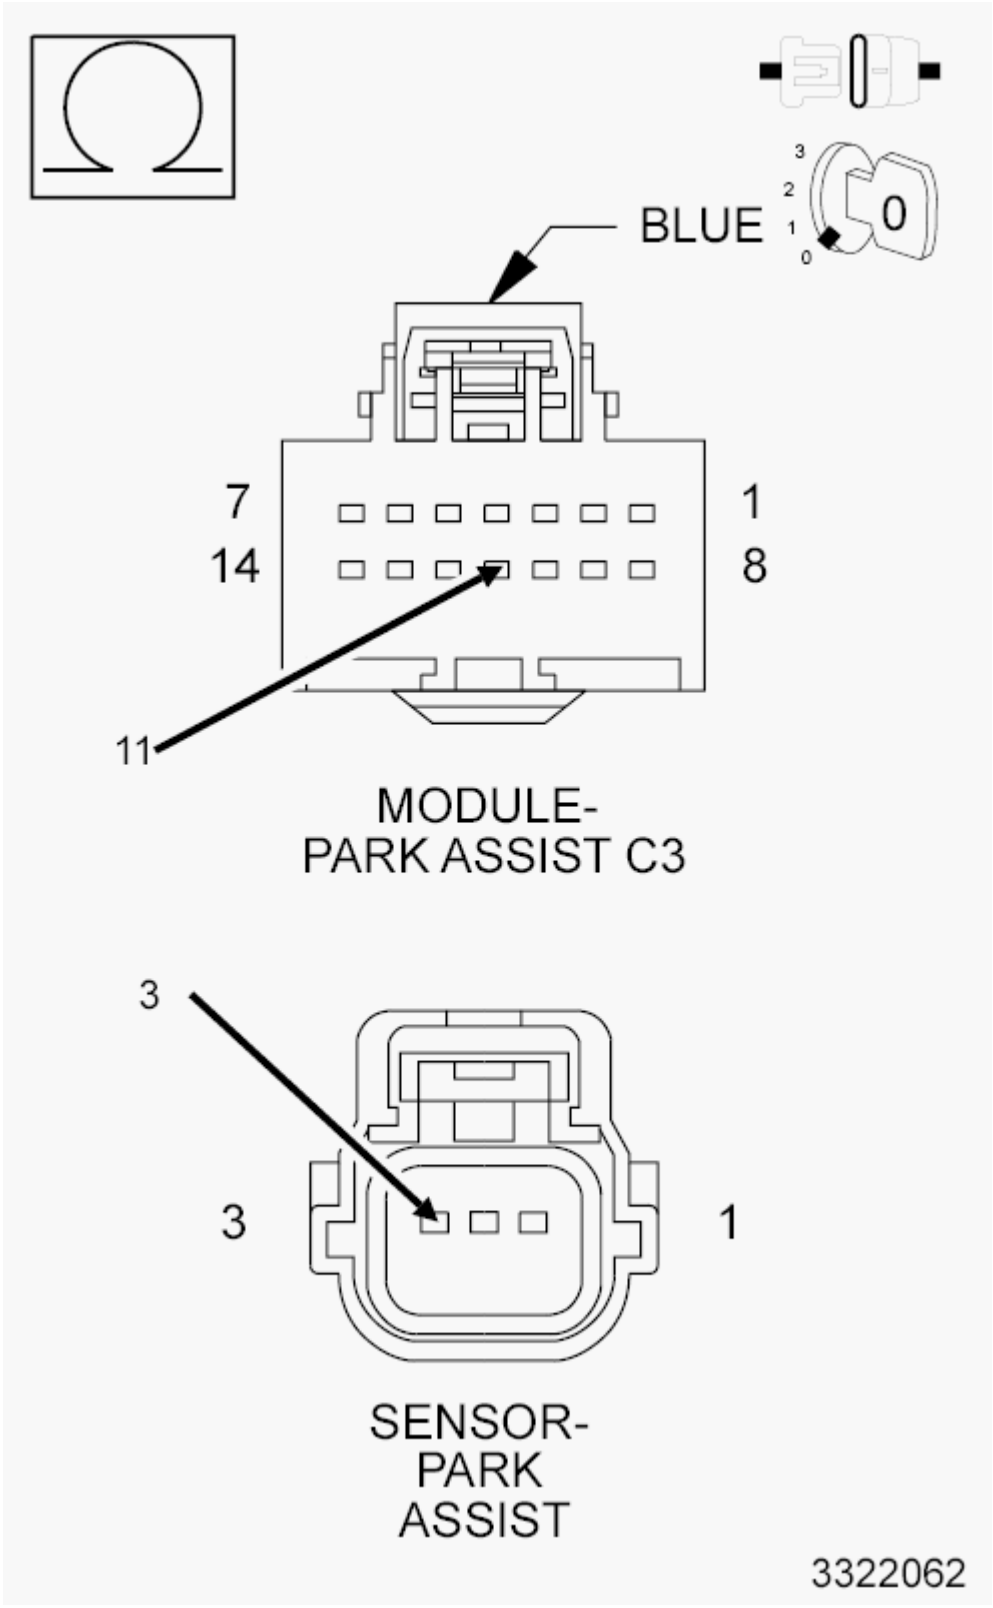

Fig. 85: Checking Park Assist Sensor 5 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (D708) Park Assist Sensor 5 Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1293-11-PTS SENSOR 6 - CIRCUIT SHORT TO GROUND

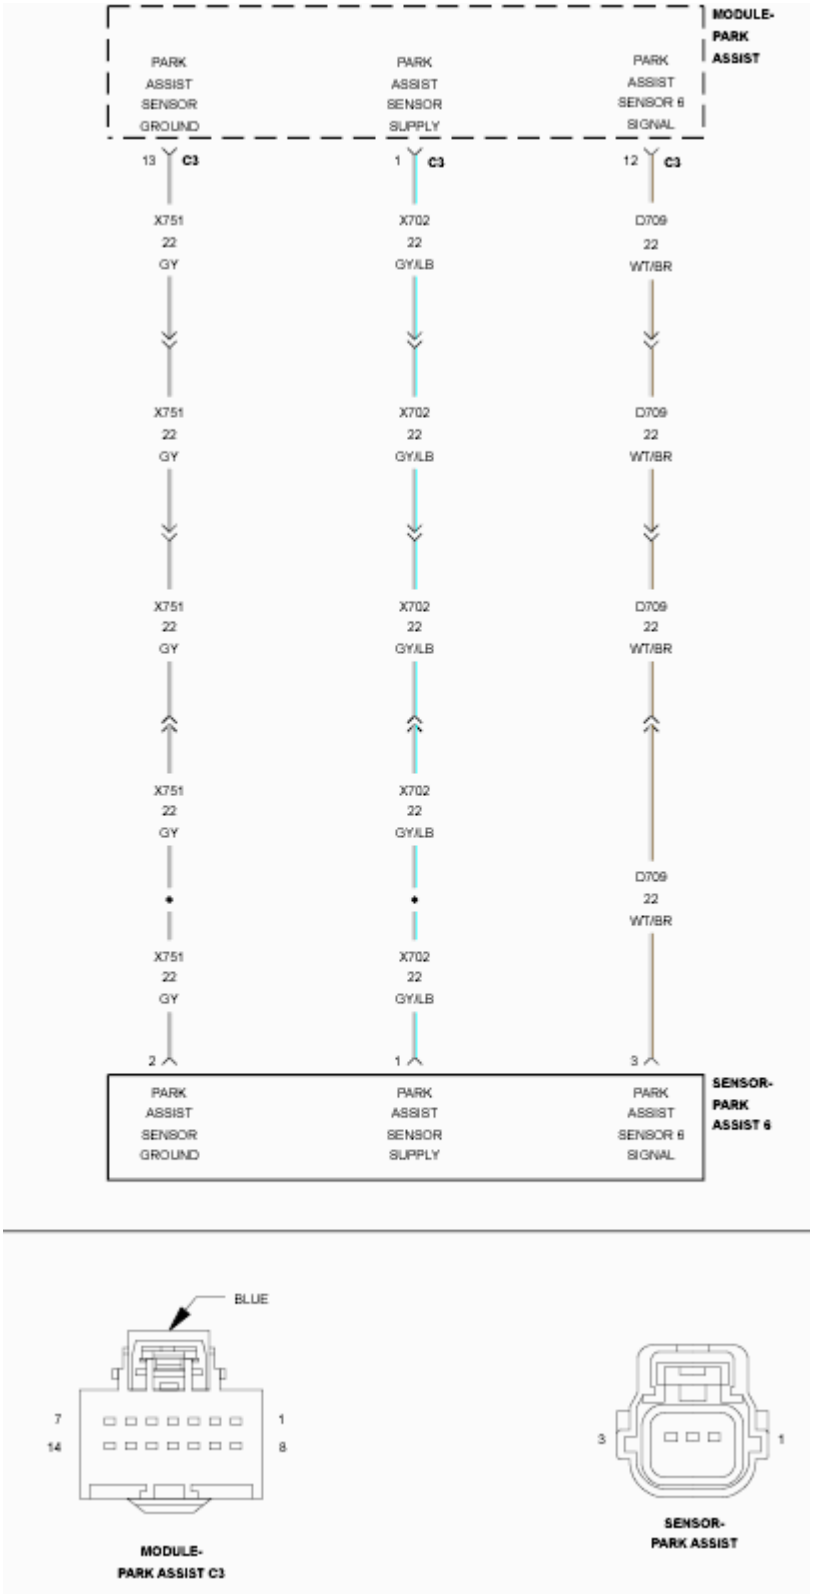

Fig. 86: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR AN OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

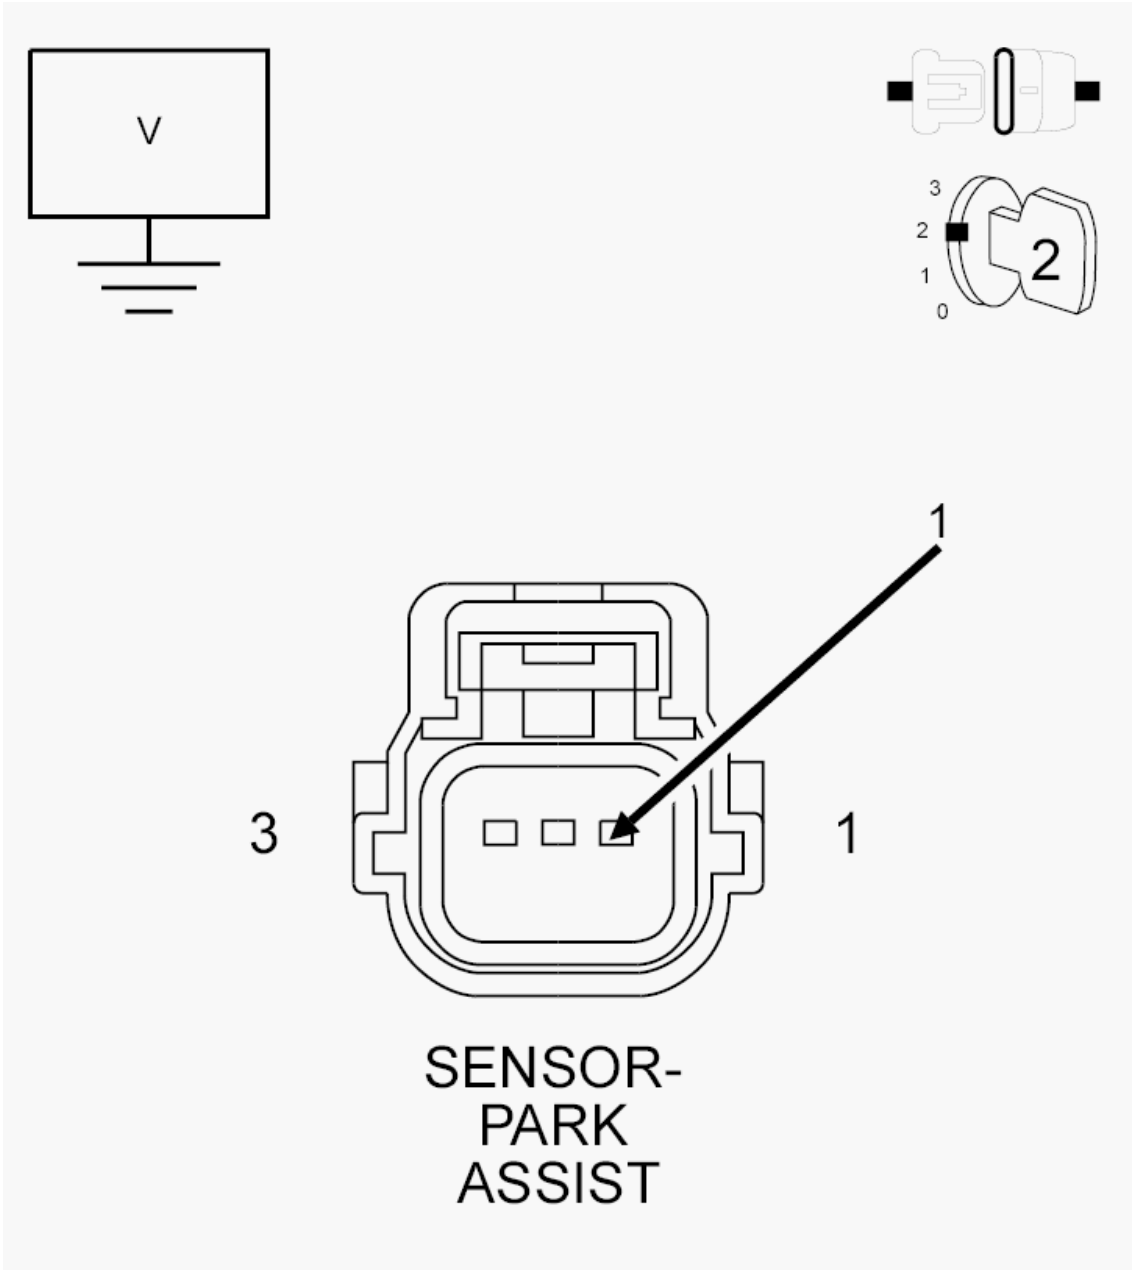

Fig. 87: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

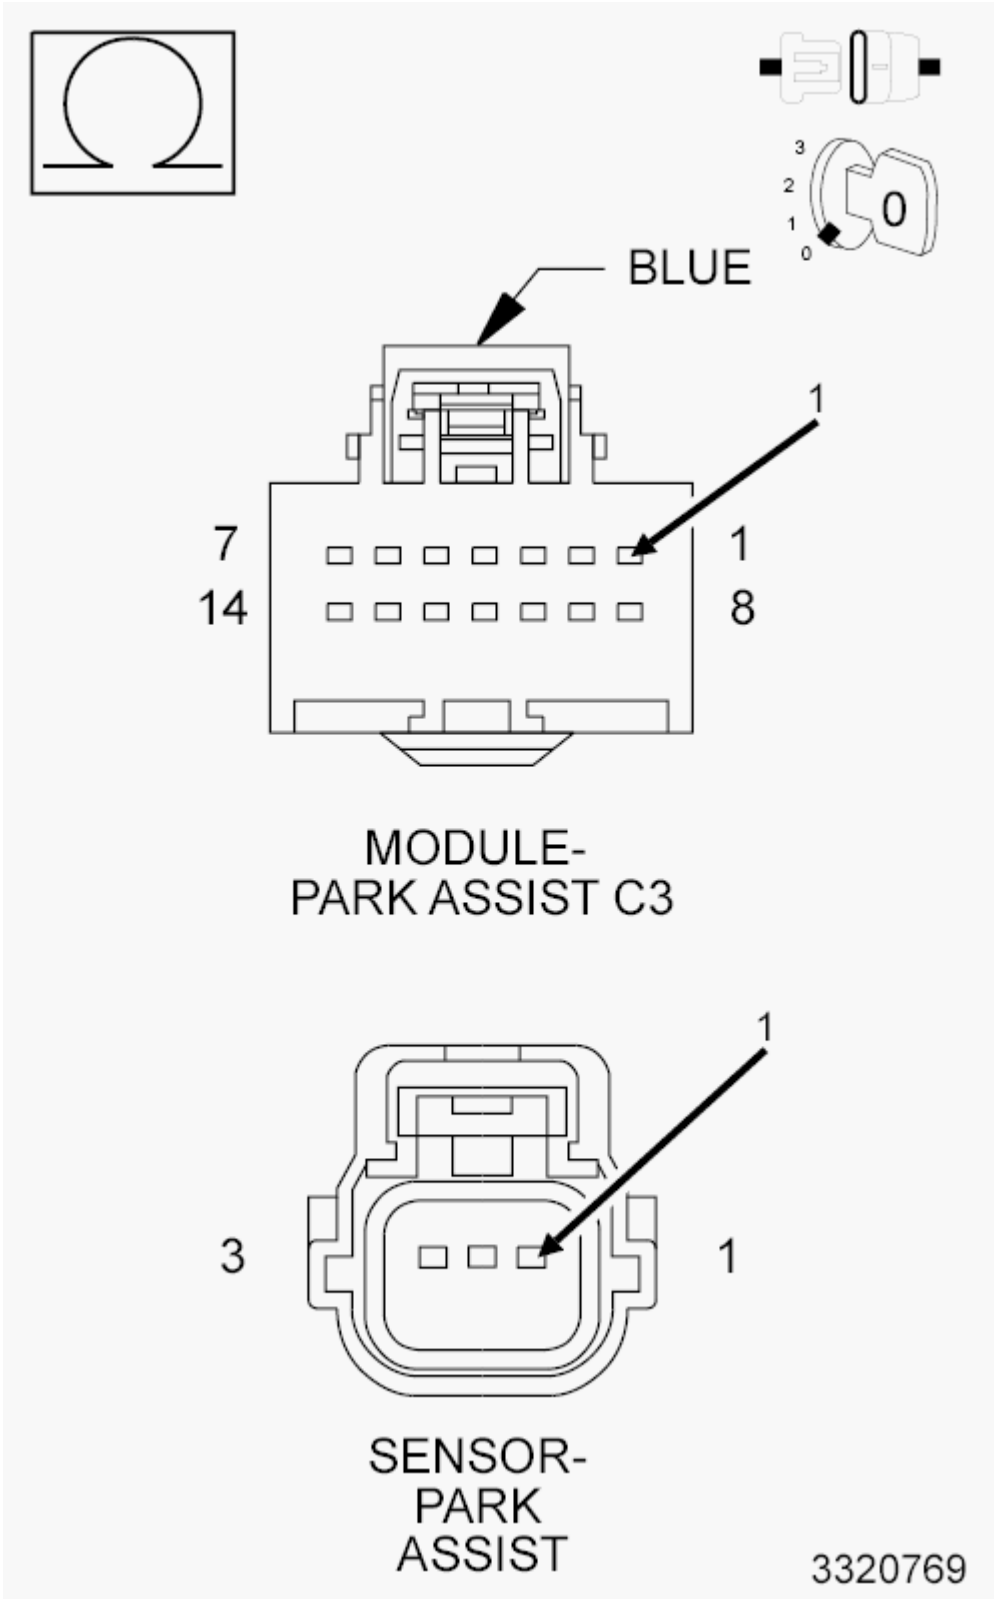

Fig. 88: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

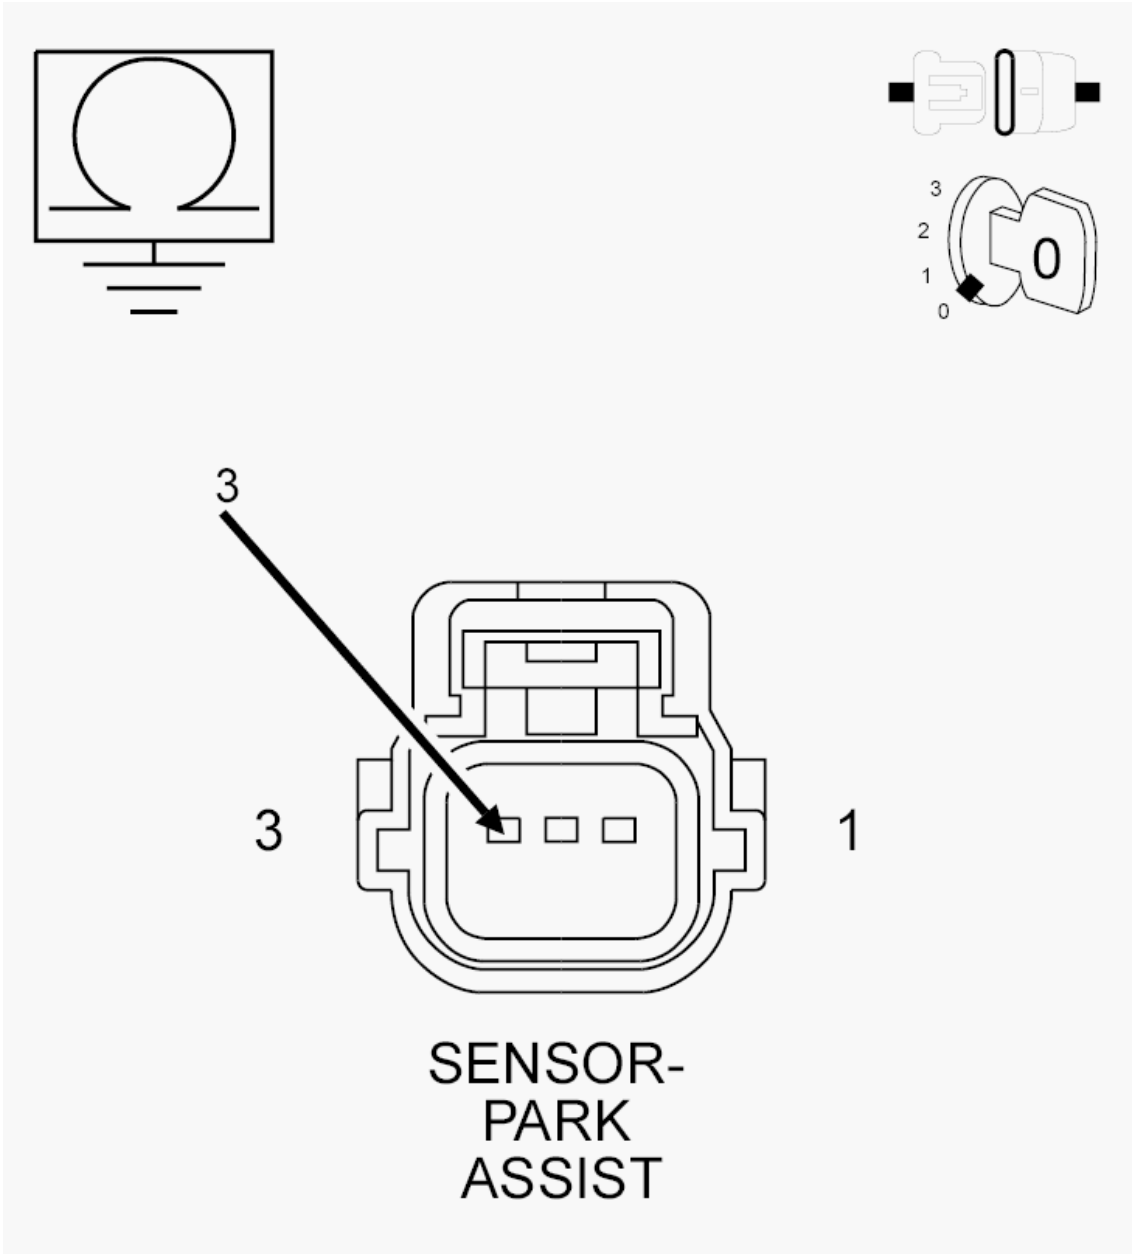

Fig. 89: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

- Go To 5.

No

- Go To 7.

5. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

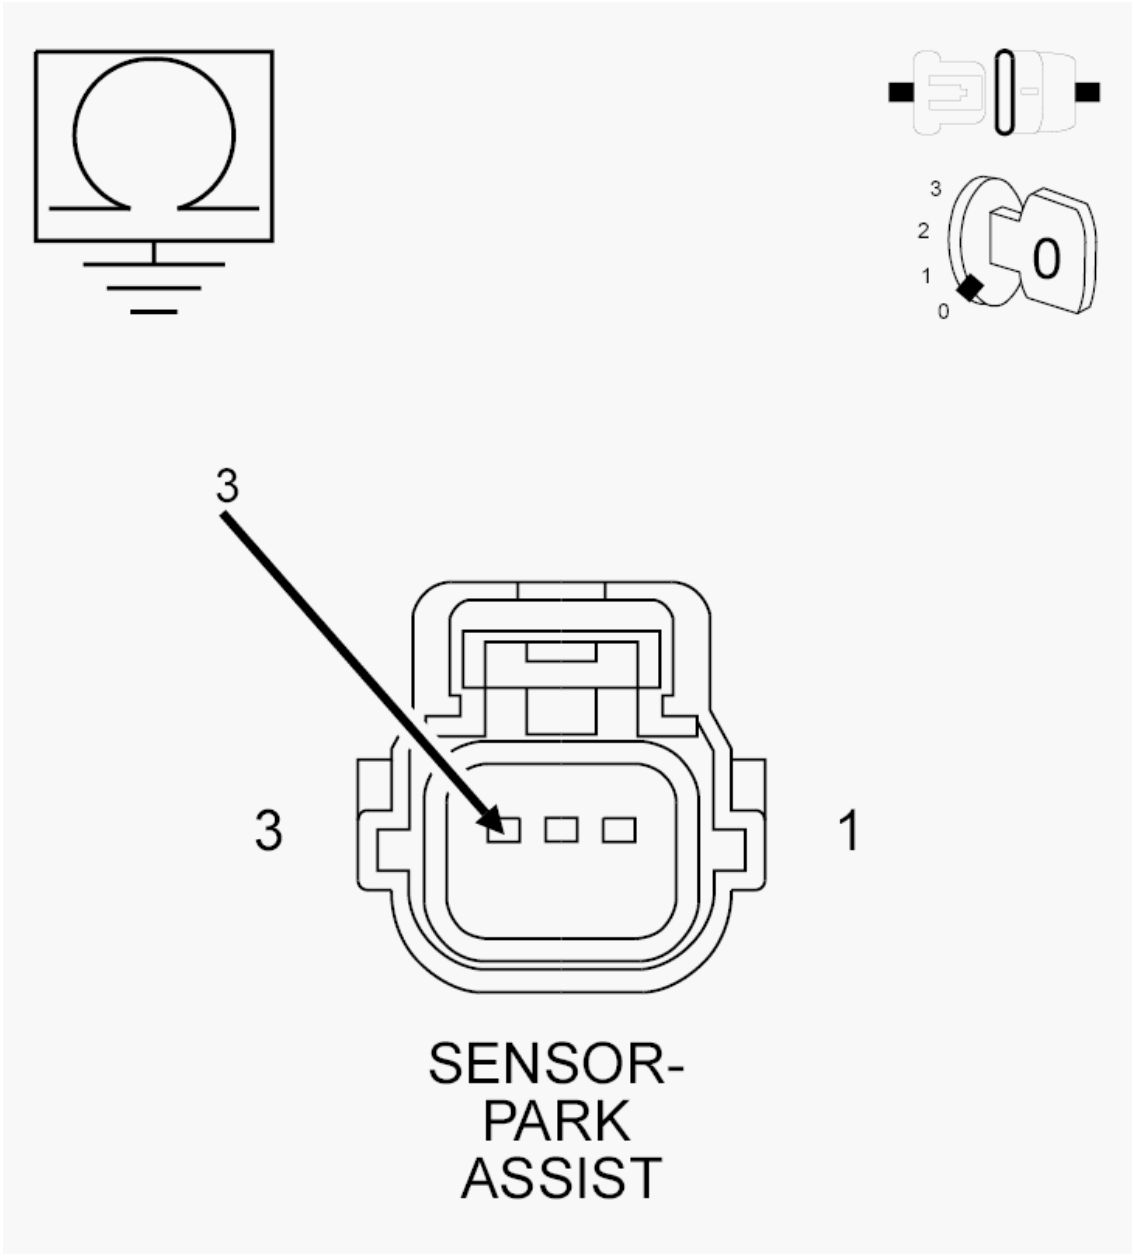

Fig. 90: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance between ground and the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D709) Park Assist Sensor 6 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

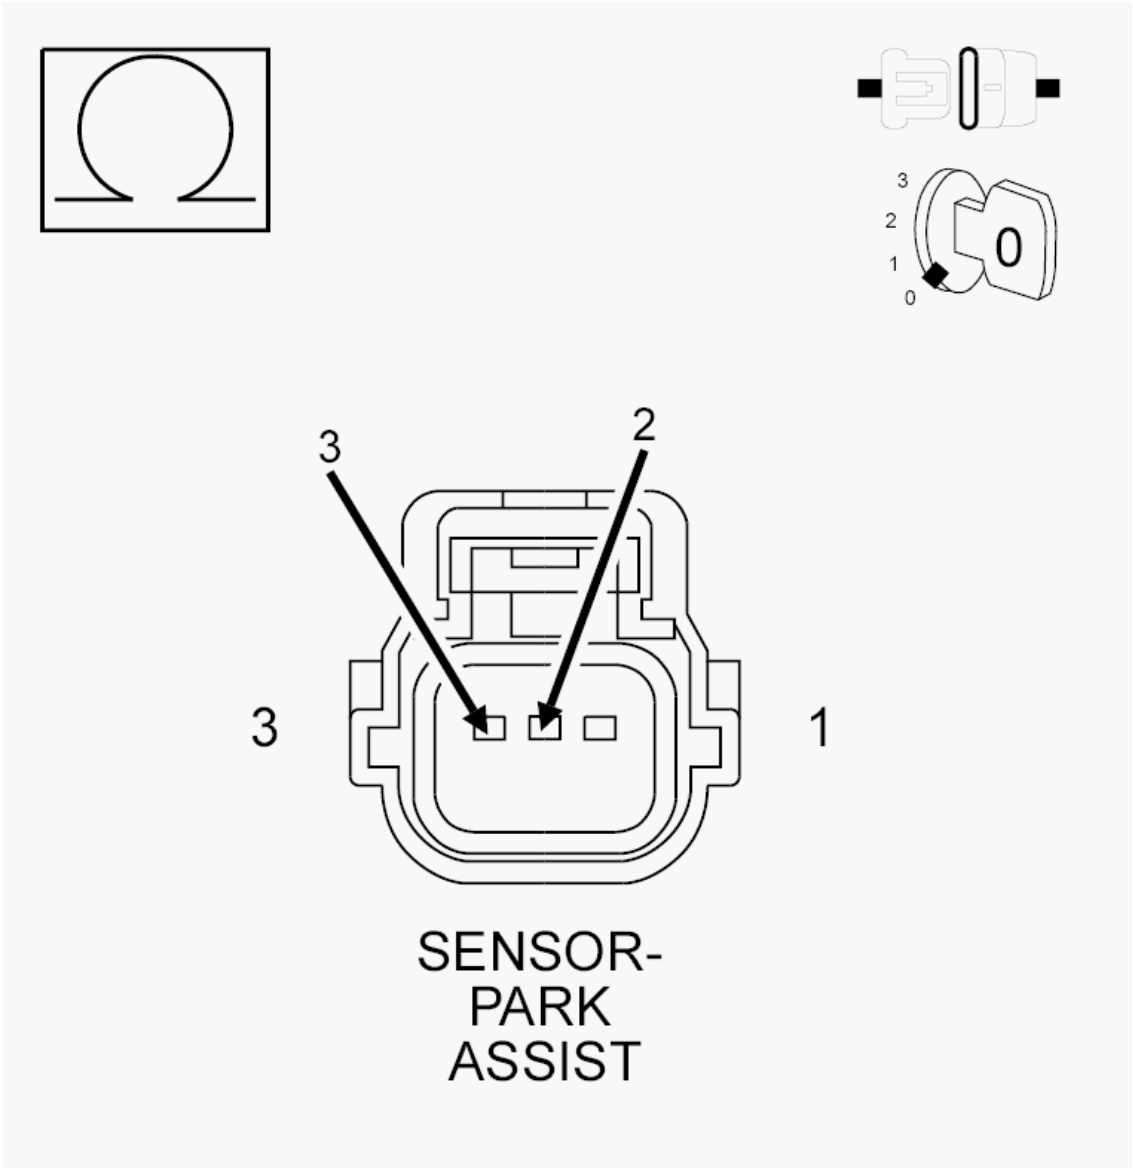

Fig. 91: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D709) Park Assist Sensor 6 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D709) Park Assist Sensor 6 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR AN OPEN**

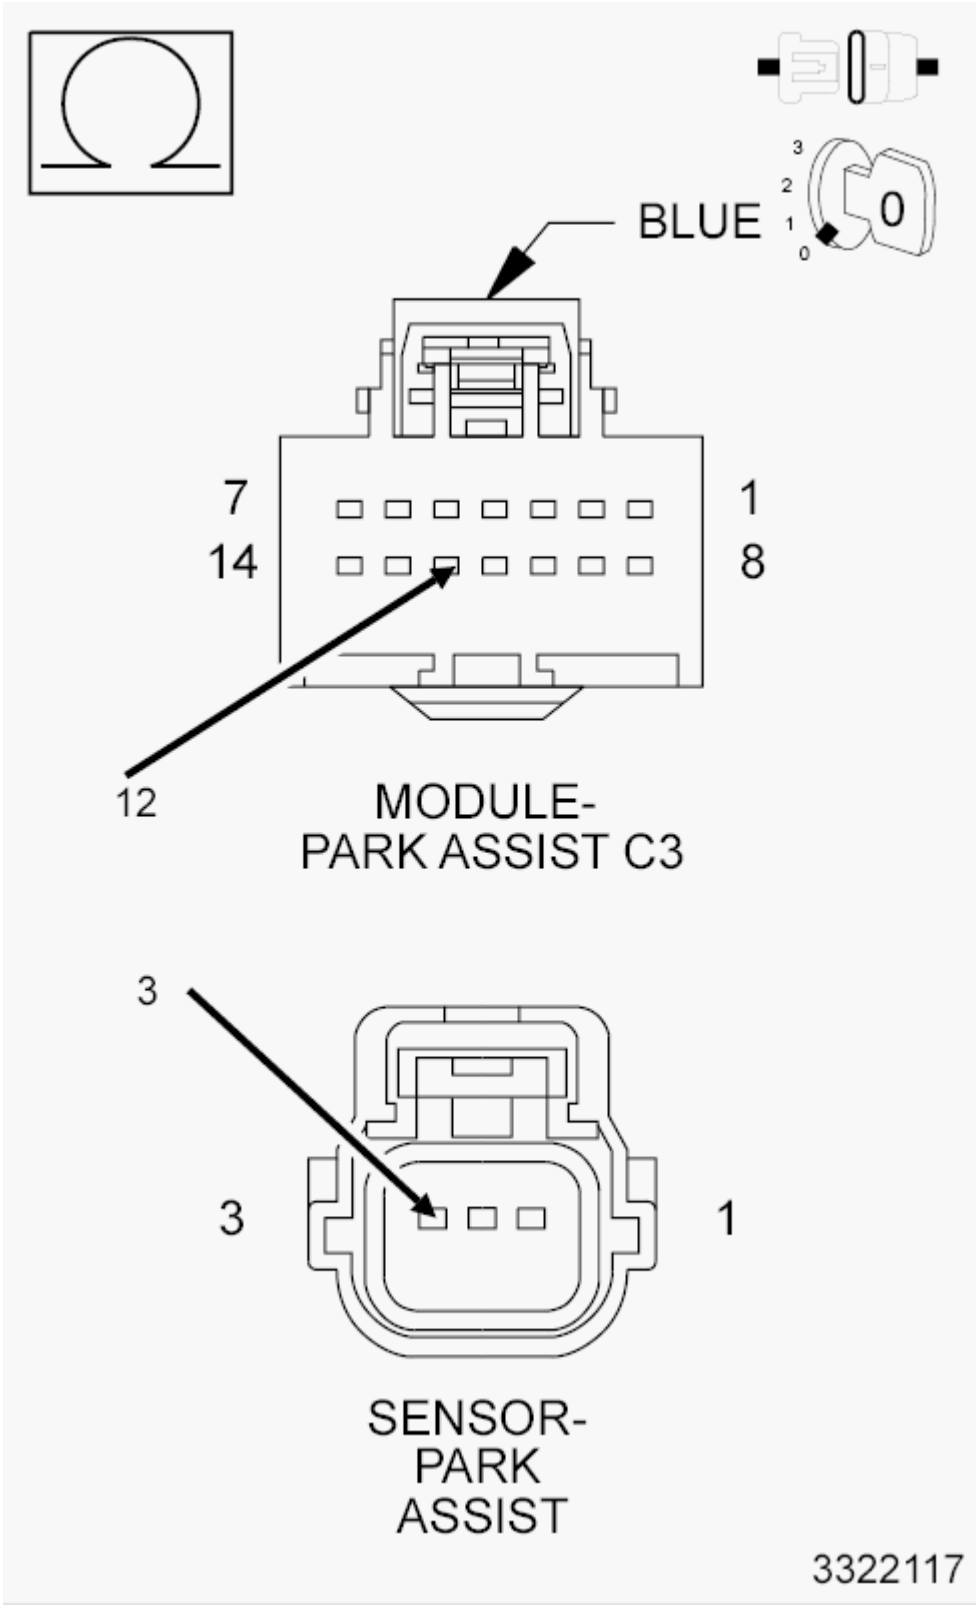

Fig. 92: Checking Park Assist Sensor 6 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D709) Park Assist Sensor 6 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

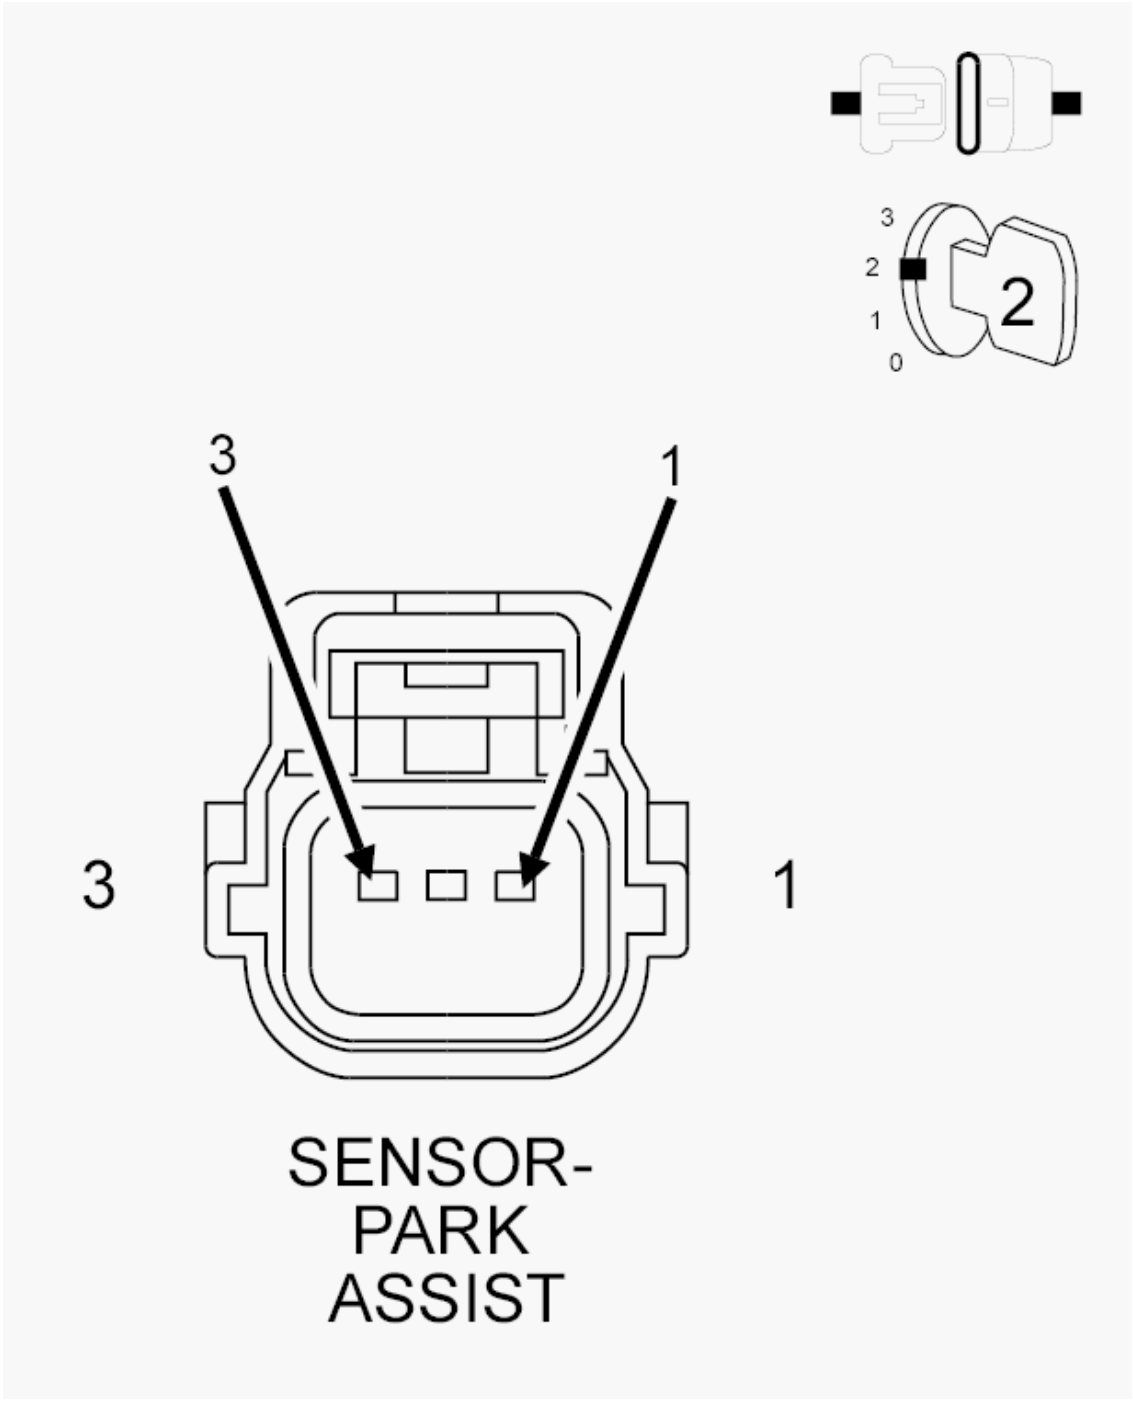

Fig. 93: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D709) Park Assist Sensor 6 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1291-12-PTS SENSOR 6 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1293-12-PTS SENSOR 6 - CIRCUIT SHORT TO BATTERY

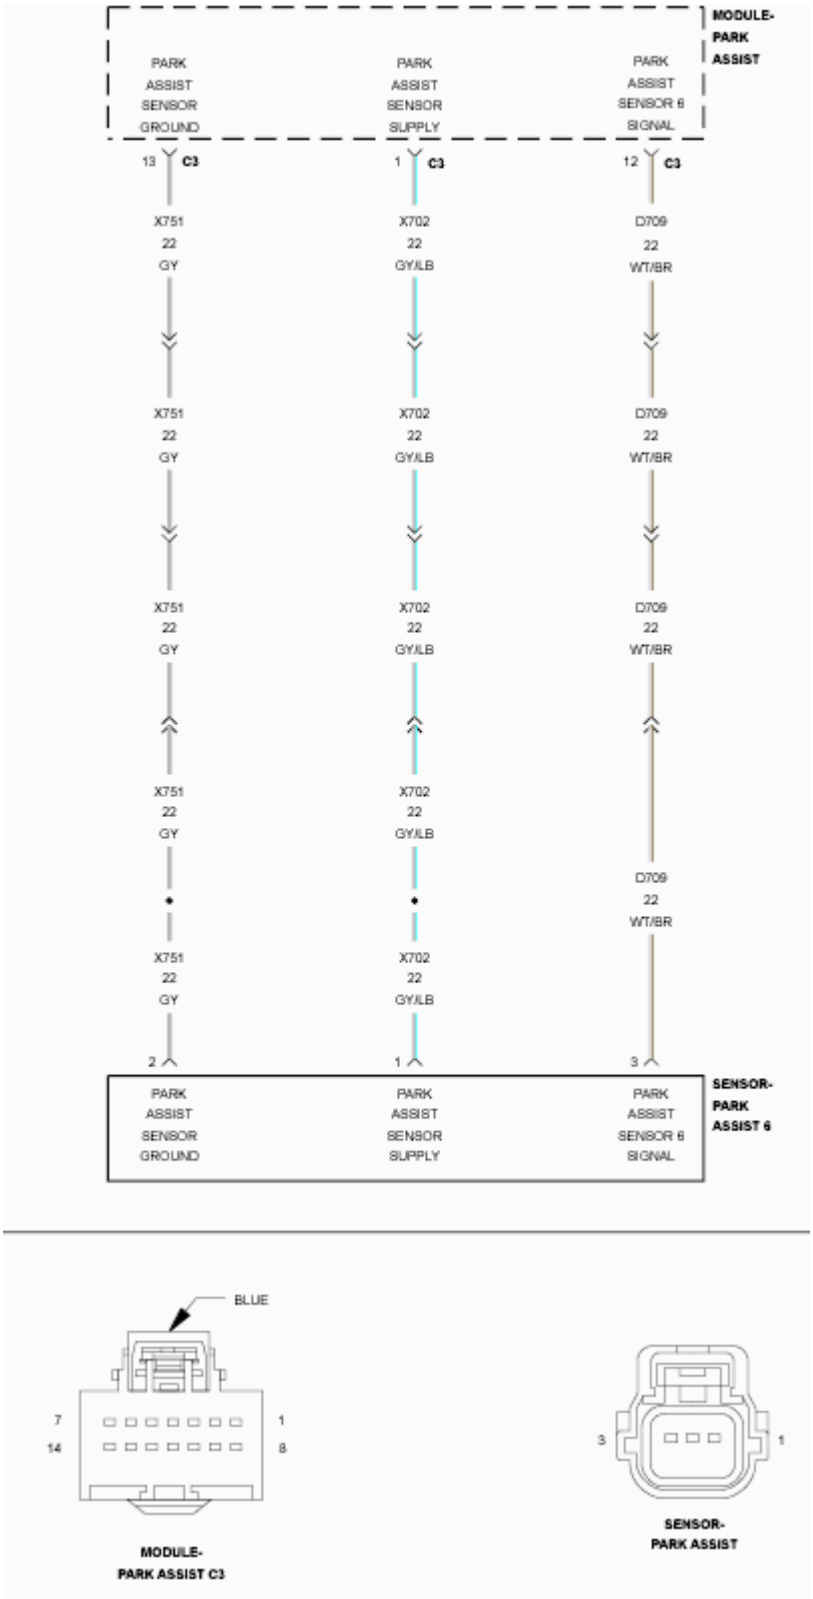

Fig. 94: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

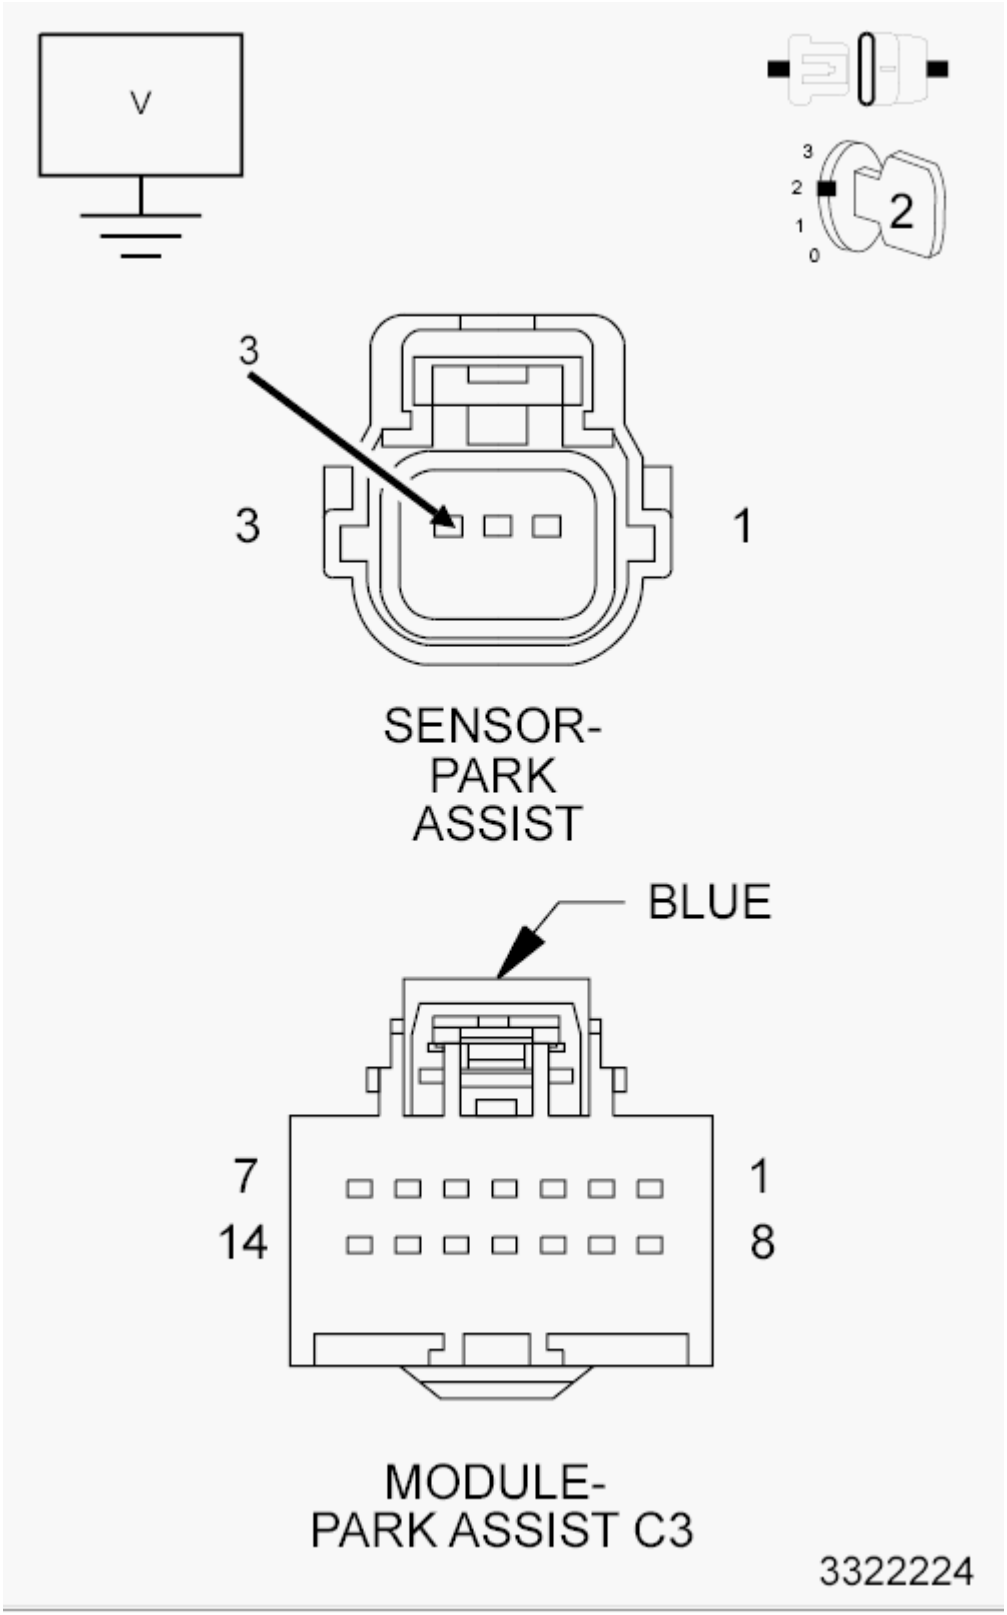

Fig. 95: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D709) Park Assist Sensor 6 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**

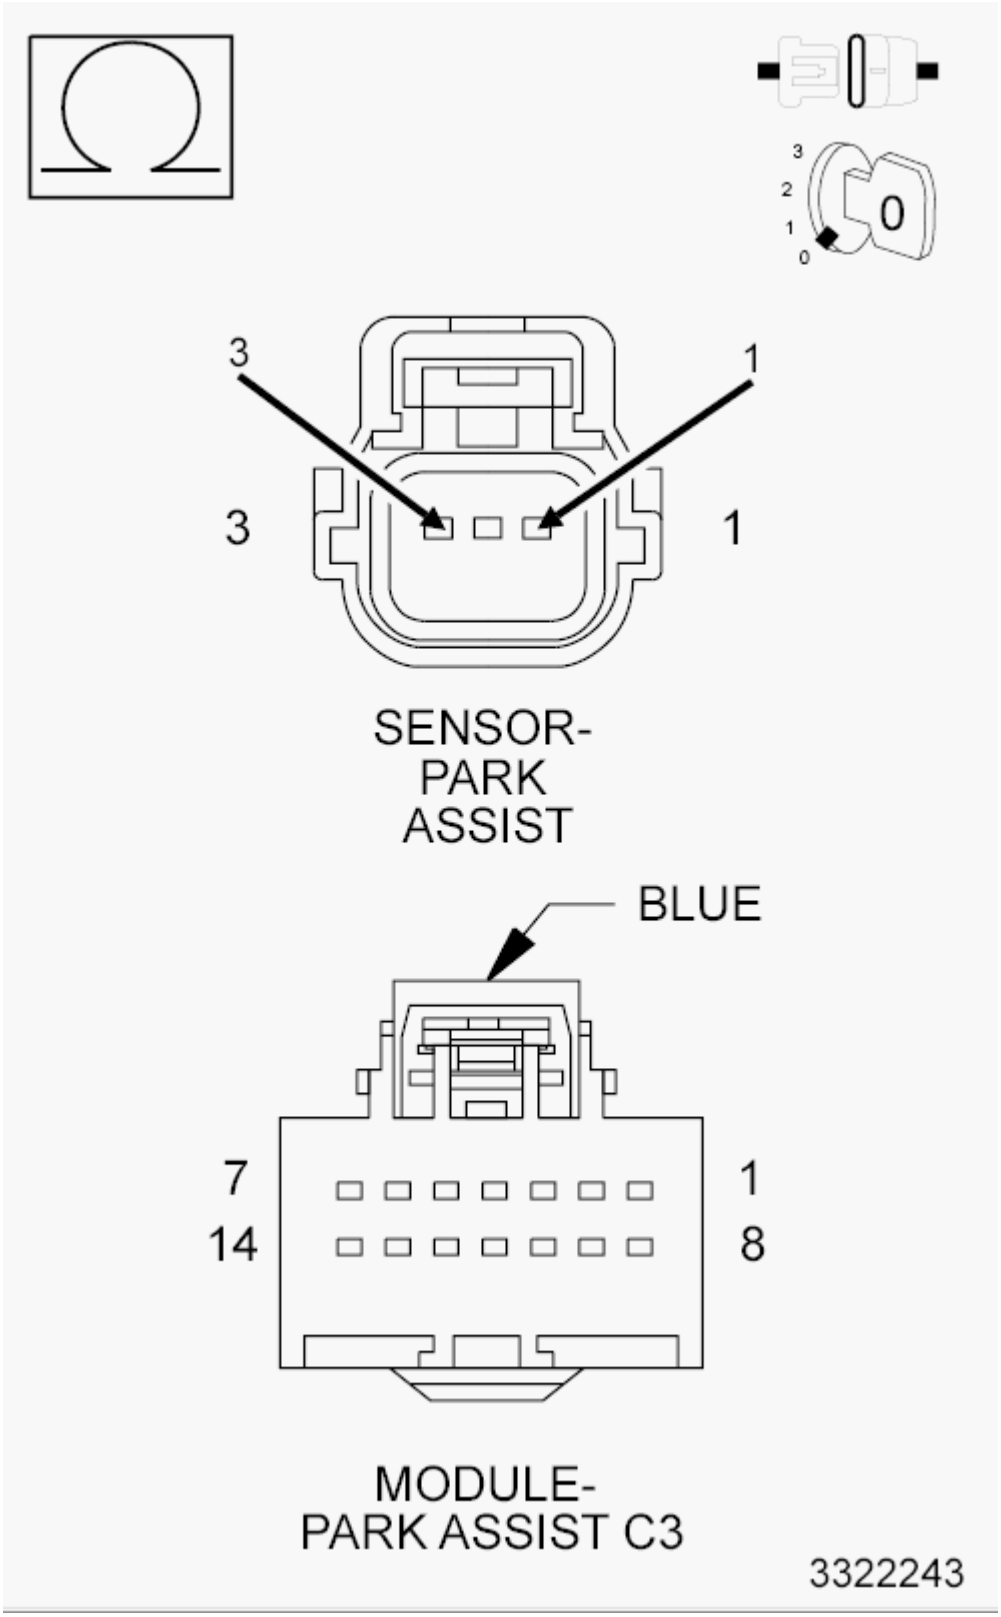

Fig. 96: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (D709) Park Assist Sensor 6 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN**

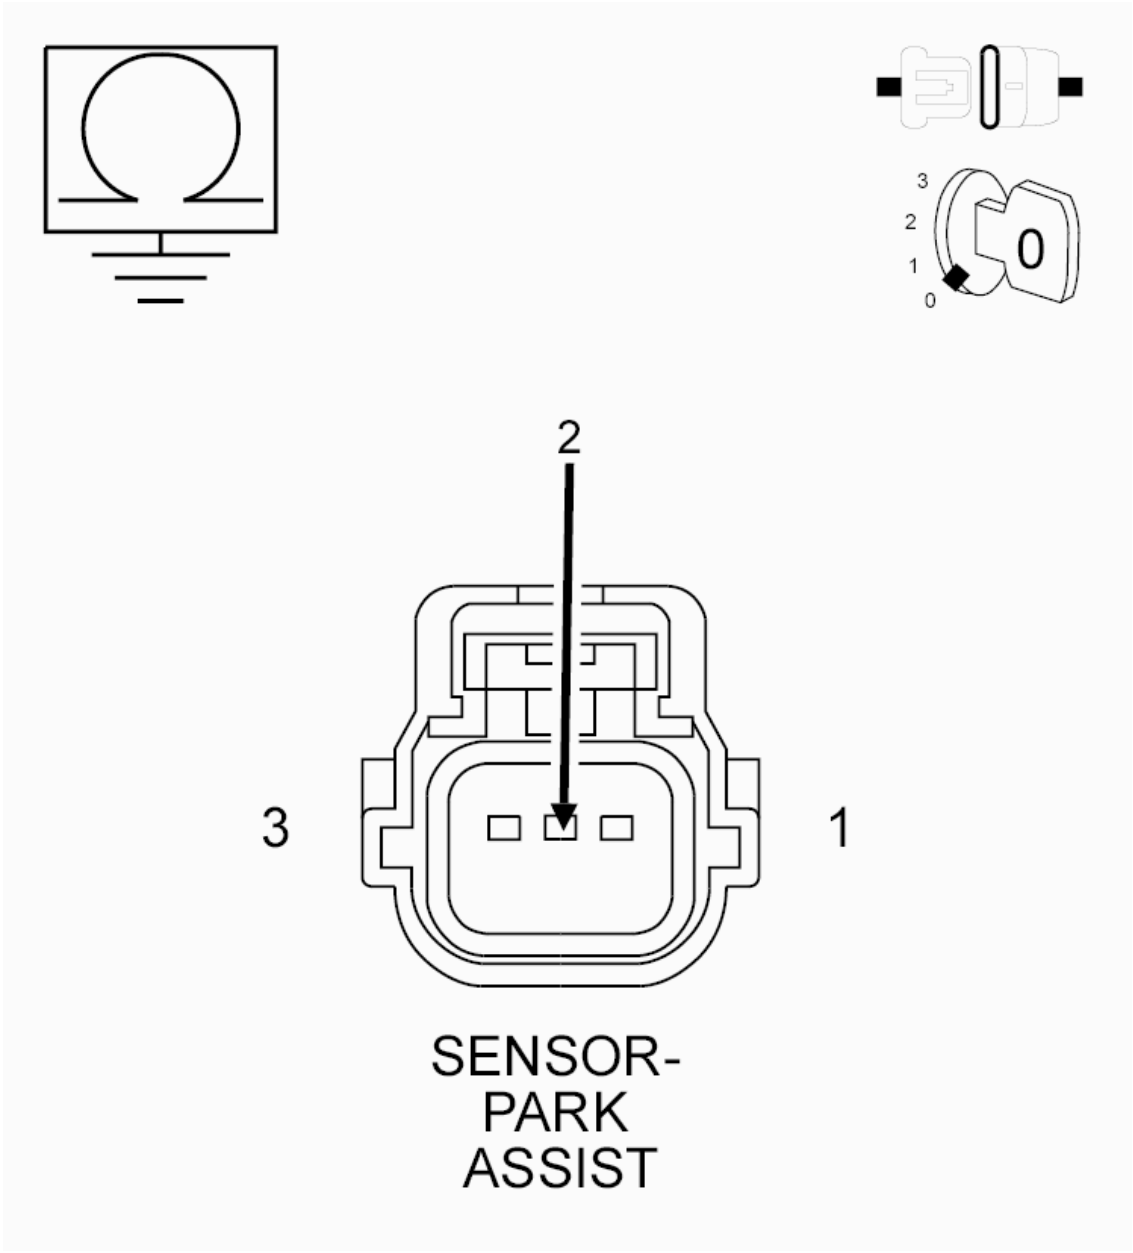

Fig. 97: Checking Front Park Assist Sensor Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 20.0 Ohms?

   Yes

   - Go To 5.

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**

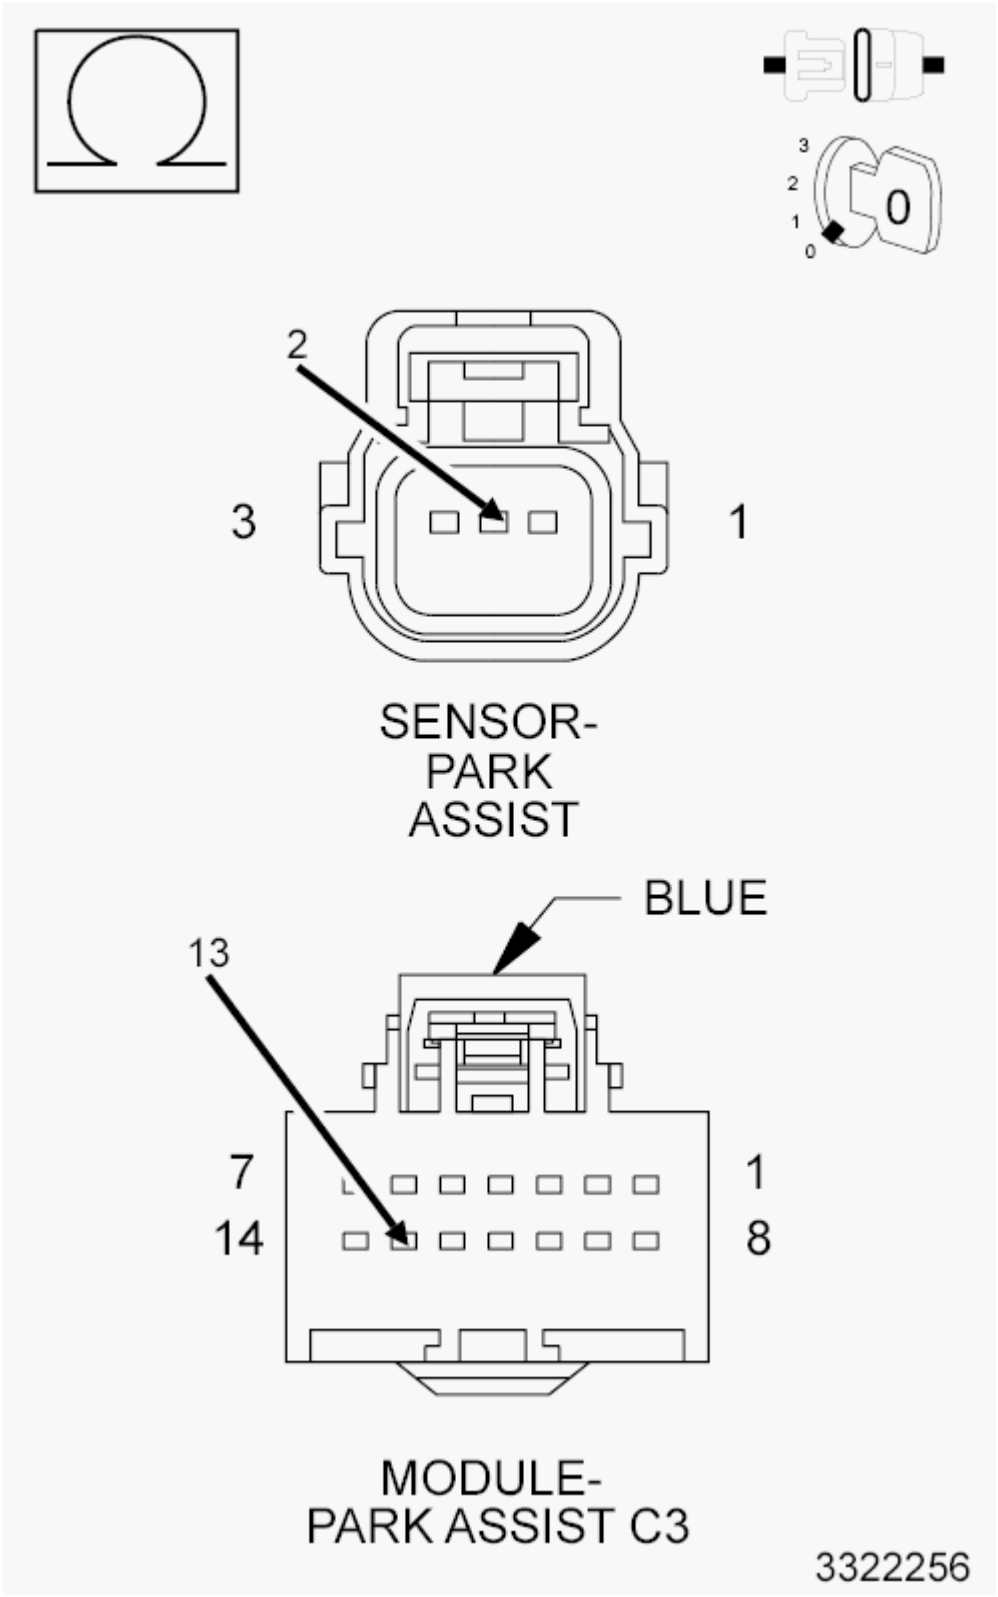

Fig. 98: Checking Front Park Assist Sensor Ground Circuit For An Open Between Park Assist Module & Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1293-25-PTS SENSOR 6 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1293-92-PTS SENSOR 6 - PERFORMANCE OR INCORRECT OPERATION

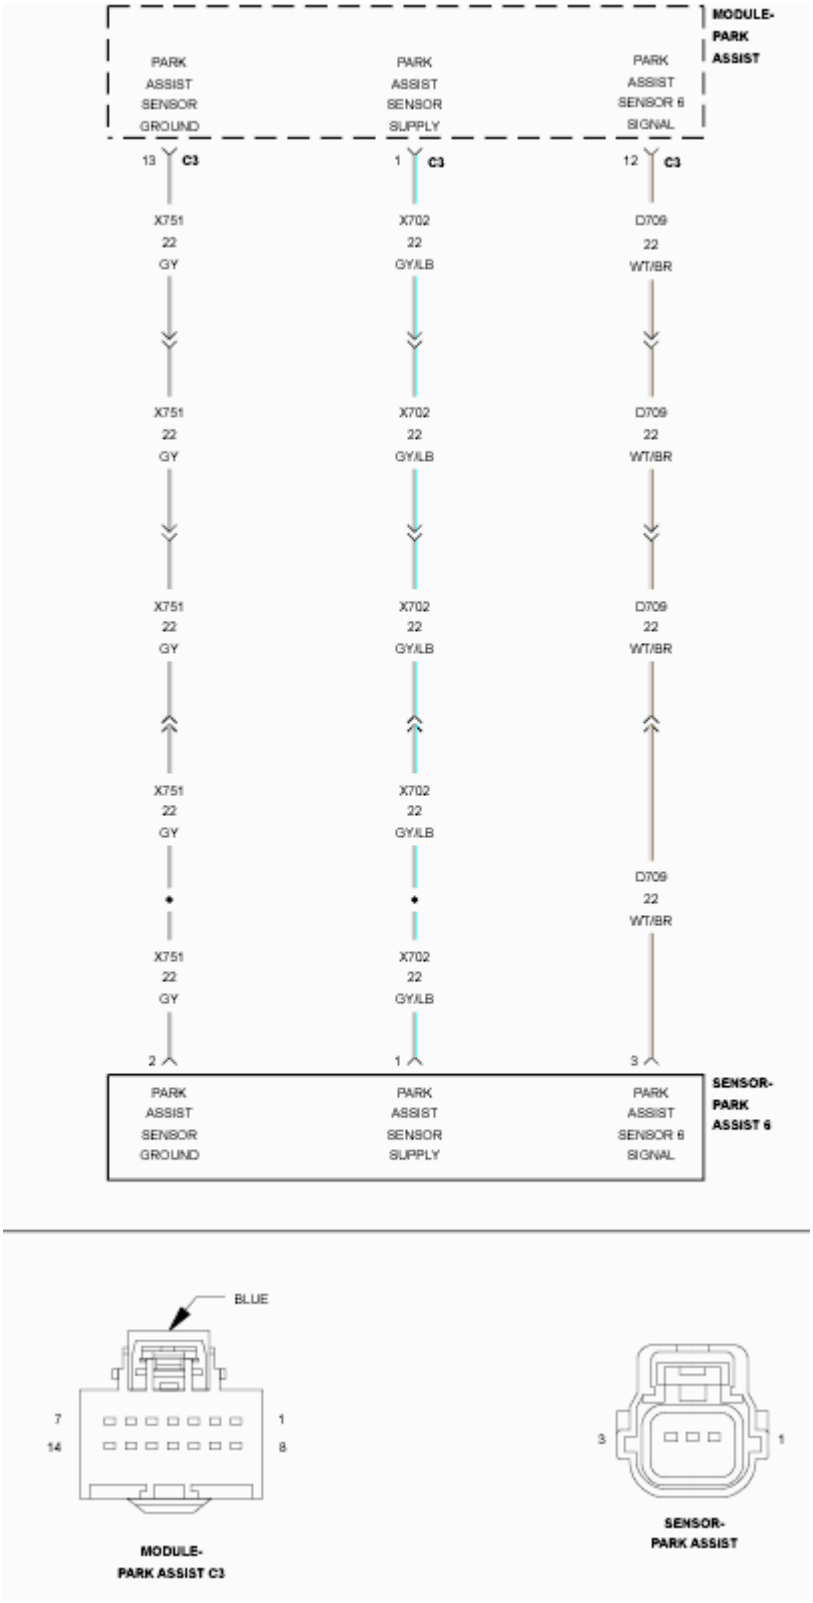

Fig. 99: Park Assist Sensor Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor 6 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

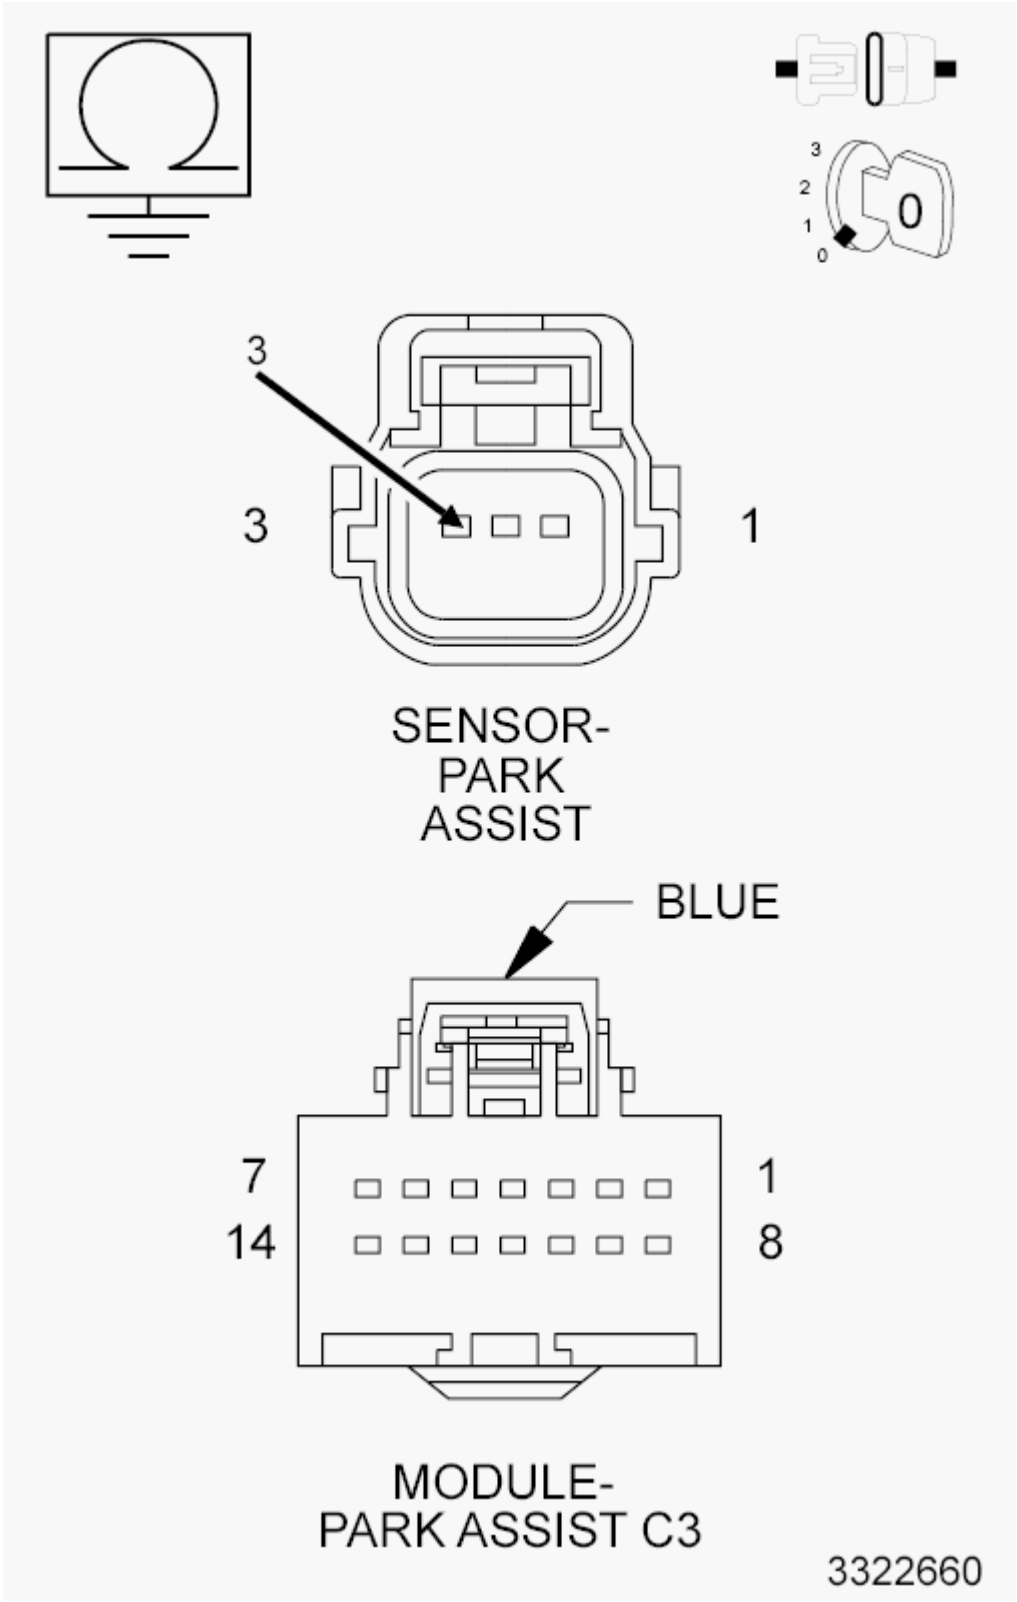

Fig. 100: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Measure the resistance between ground and the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

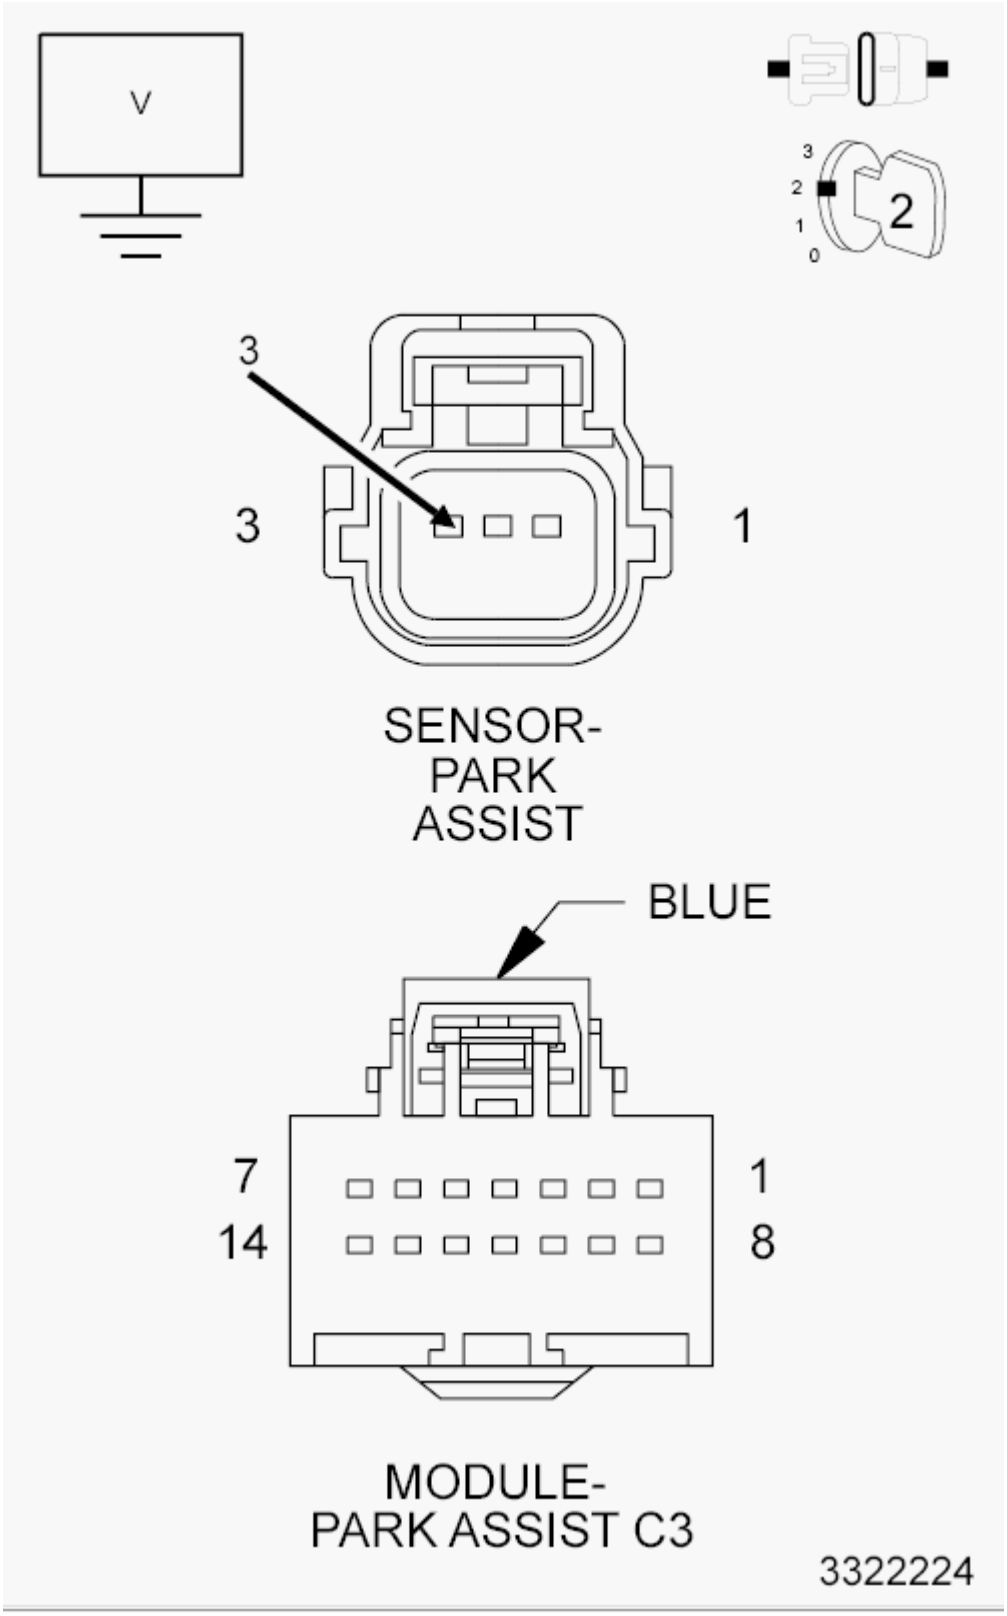

Fig. 101: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (D709) Park Assist Sensor 6 Signal circuit.

   Is voltage present?

   Yes

   - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR AN OPEN**

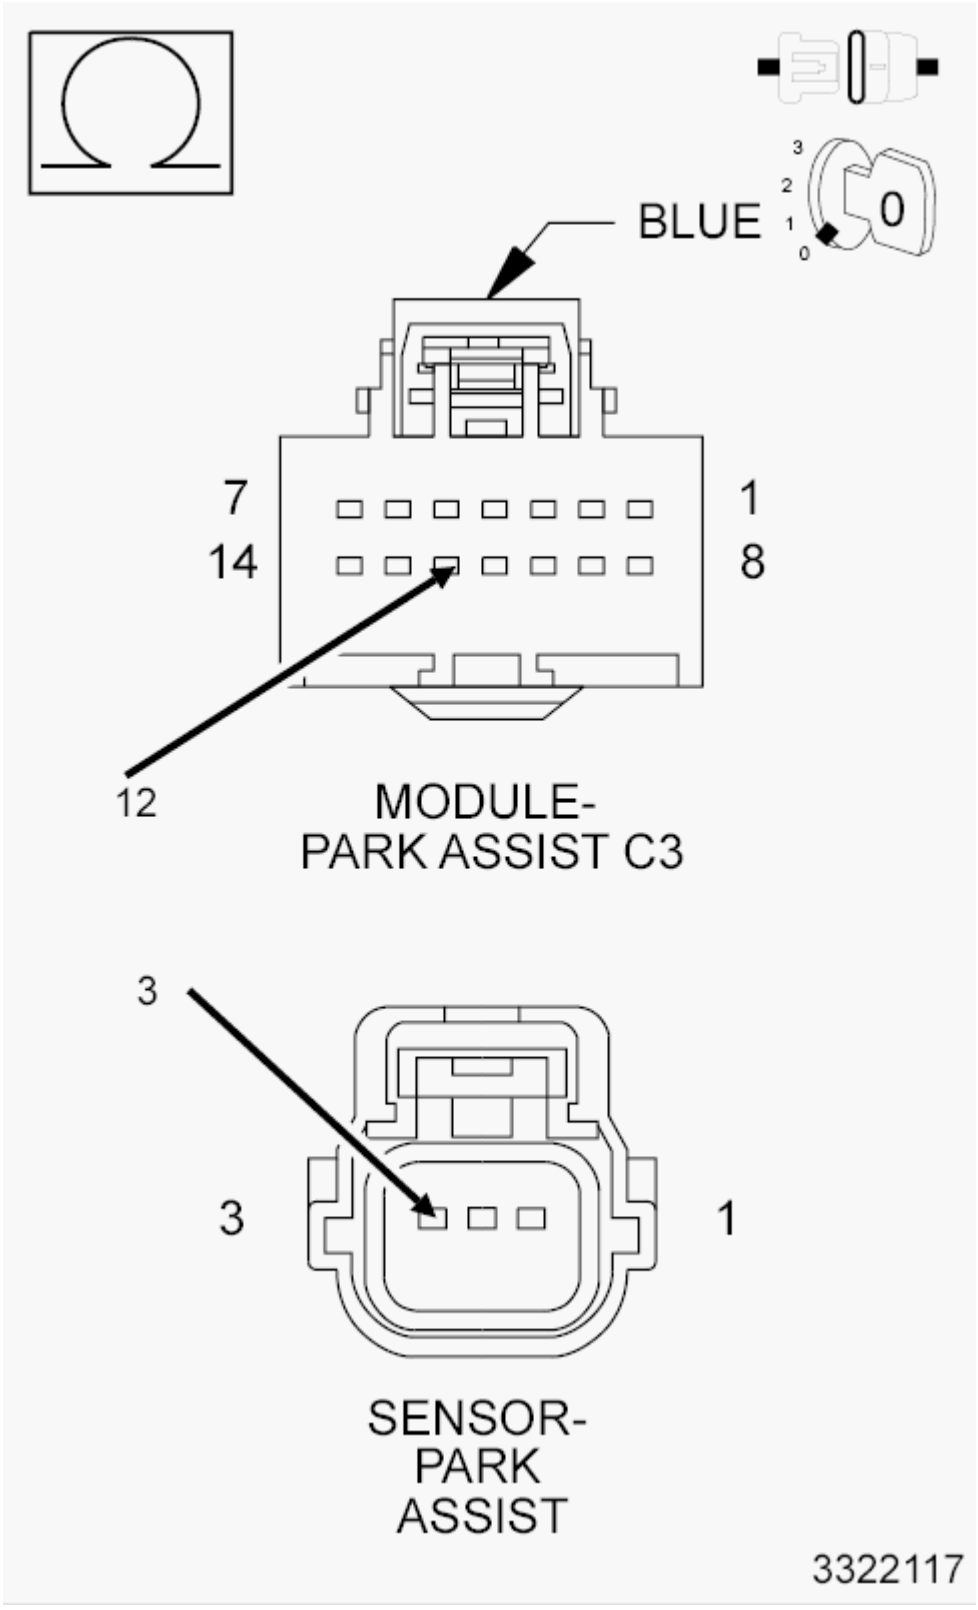

Fig. 102: Checking Park Assist Sensor 6 Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (D709) Park Assist Sensor 6 Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes

(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR 8
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK PARK ASSIST SENSOR 8 FOR INTERNAL SHORT**
    1. Disconnect Park Assist Sensor.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

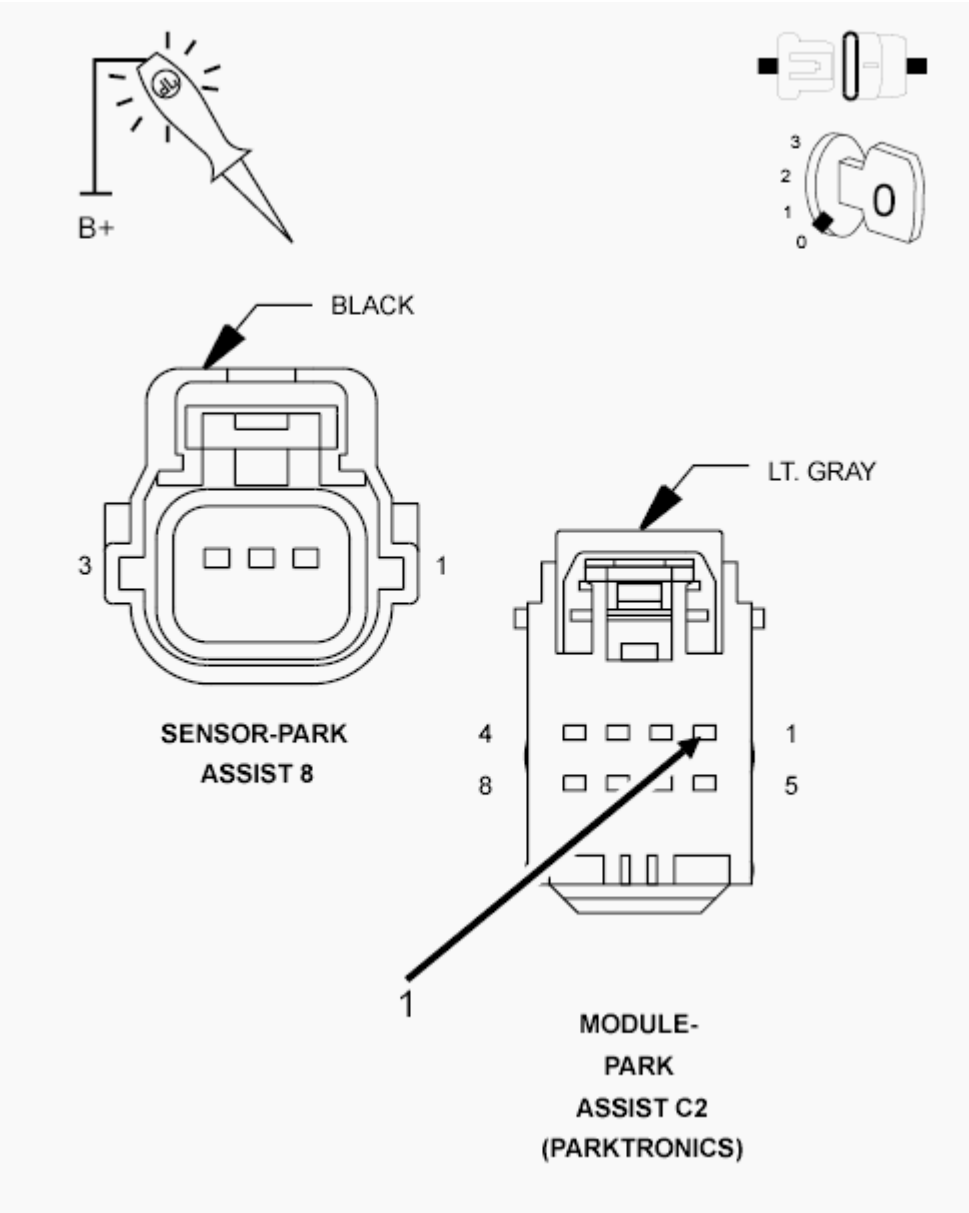

Fig. 117: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Using a 12-volt test light connected to 12-volts check the (D701) Park Assist Sensor Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Repair the (D701) Park Assist Sensor Signal circuit for a short to ground.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

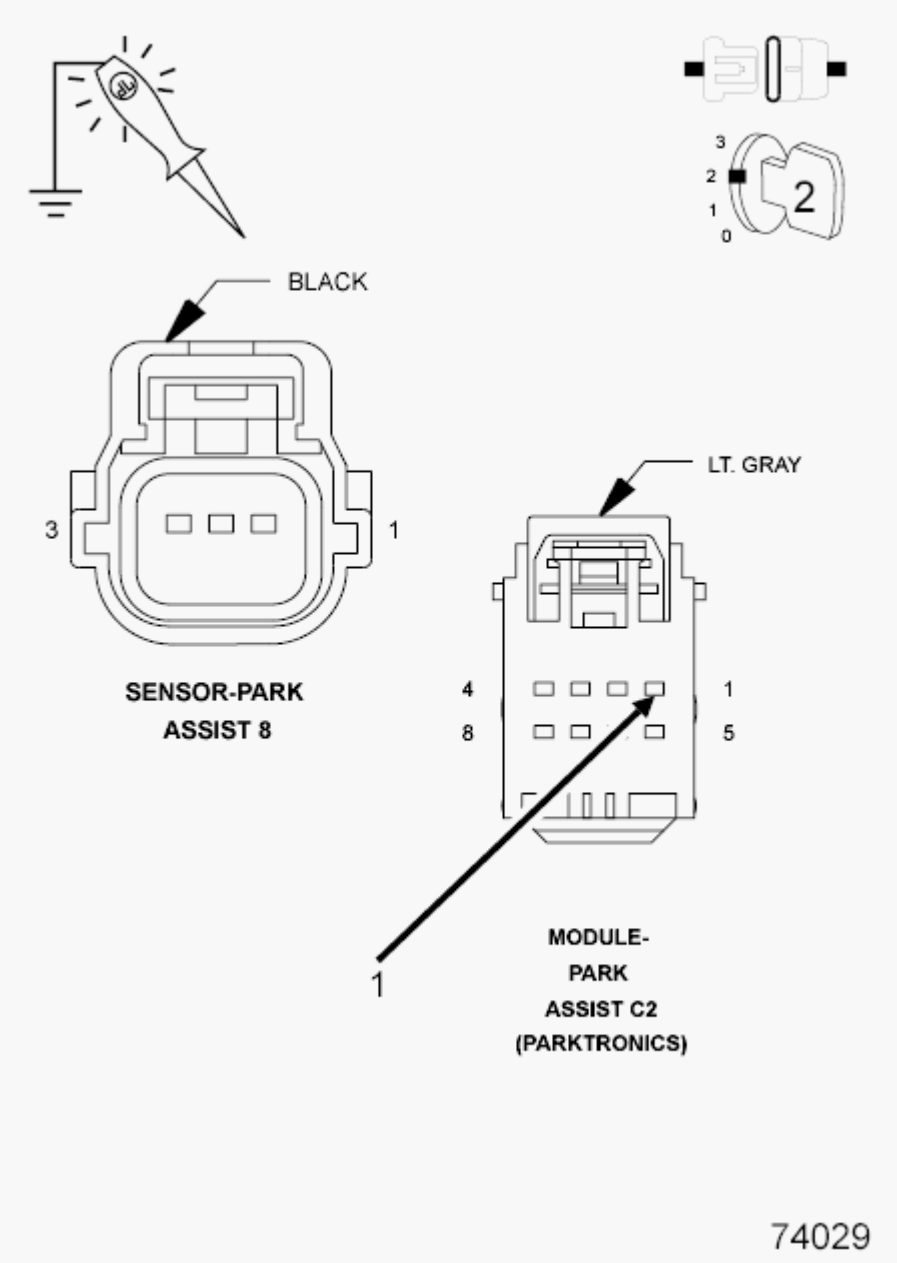

Fig. 118: Checking Park Assist Sensor Signal Circuit For A Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.

2. Using a 12-volt test light connected to ground check the (D701) Park Assist Sensor Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

   Does the test light illuminate brightly?

   Yes

   - Repair the (D701) Park Assist Sensor Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN**

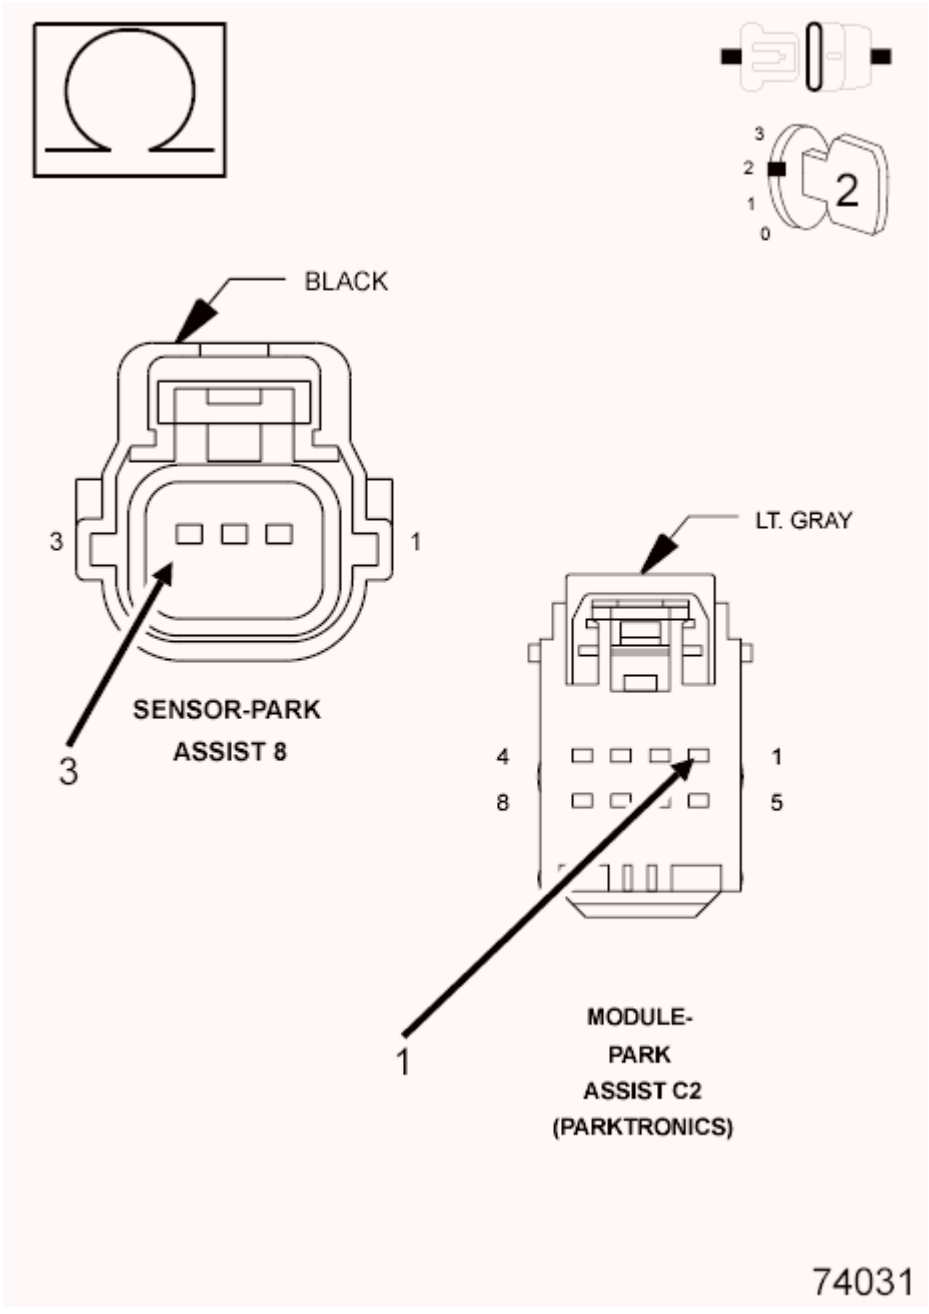

Fig. 119: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D701) Park Assist Sensor Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   No

   - Repair the (D701) Park Assist Sensor Signal circuit for an open.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

Yes

- Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is

connected before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**

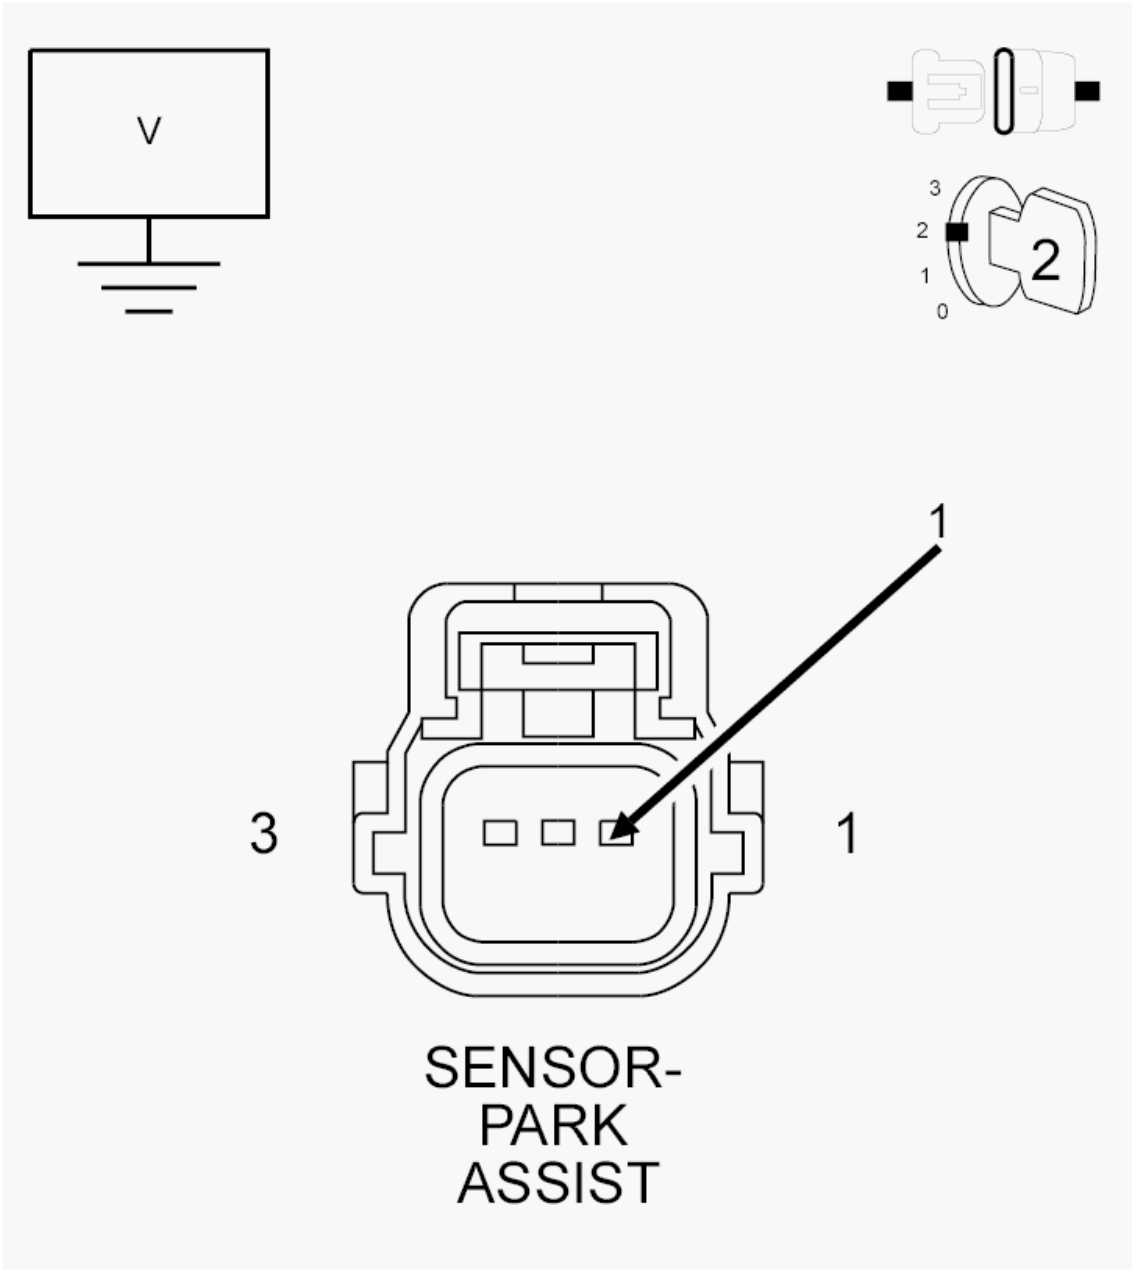

Fig. 121: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor.
3. Turn the ignition on.
4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

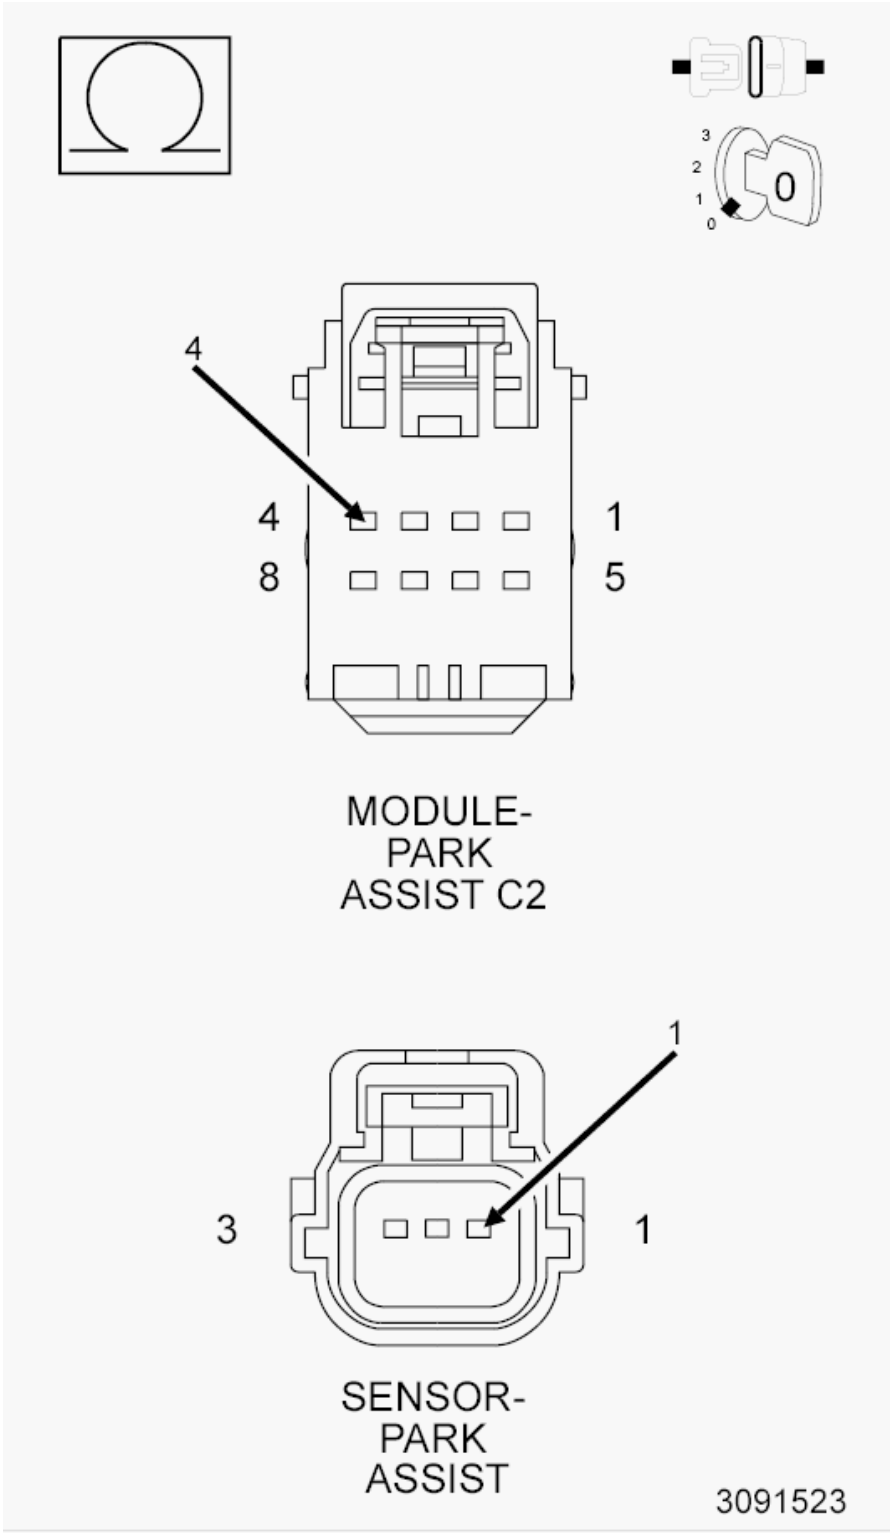

Fig. 122: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.

3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

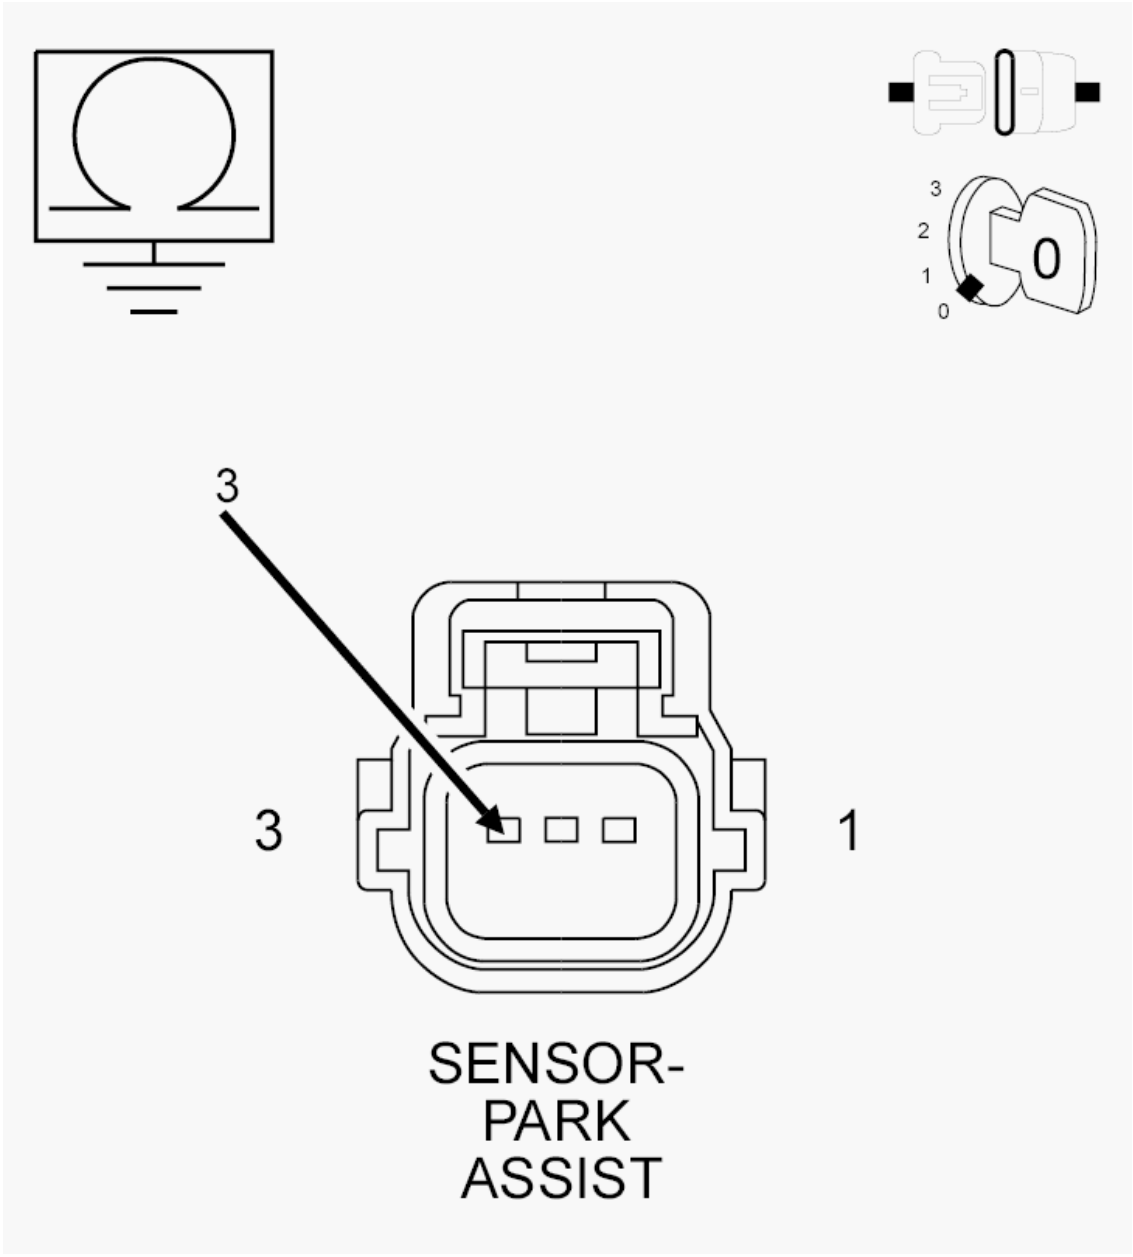

Fig. 123: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D703) Park Assist Sensor 9 Signal circuit.

   Is the resistance below 10K Ohms?

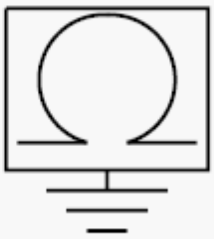
   Yes

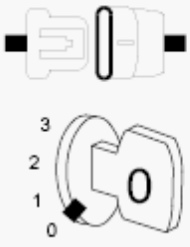
- Go To 5.

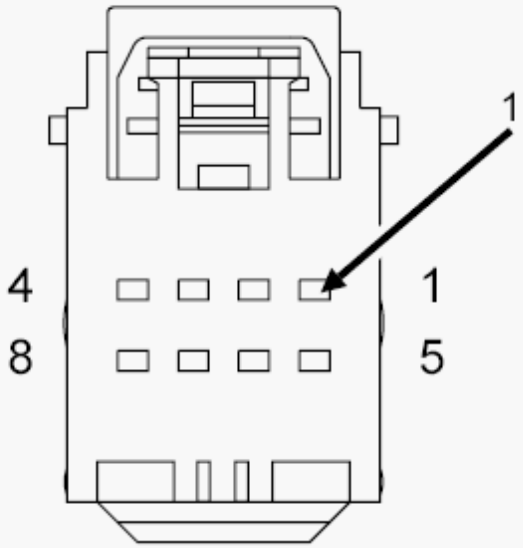
No

- Go To 7.

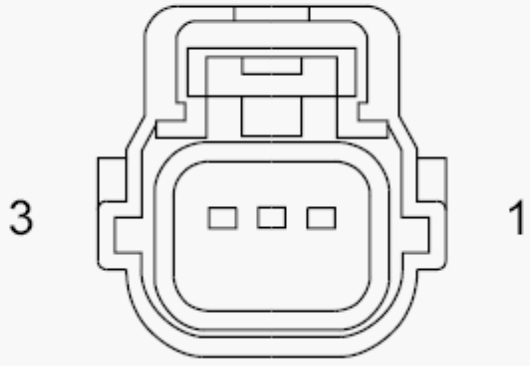
5. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**







MODULE-
PARK
ASSIST C2



SENSOR-
PARK

Fig. 124: Checking Park Assist Sensor Signal Circuit For A Short To Ground

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance between ground and the (D703) Park Assist Sensor 9 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D703) Park Assist Sensor 9 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

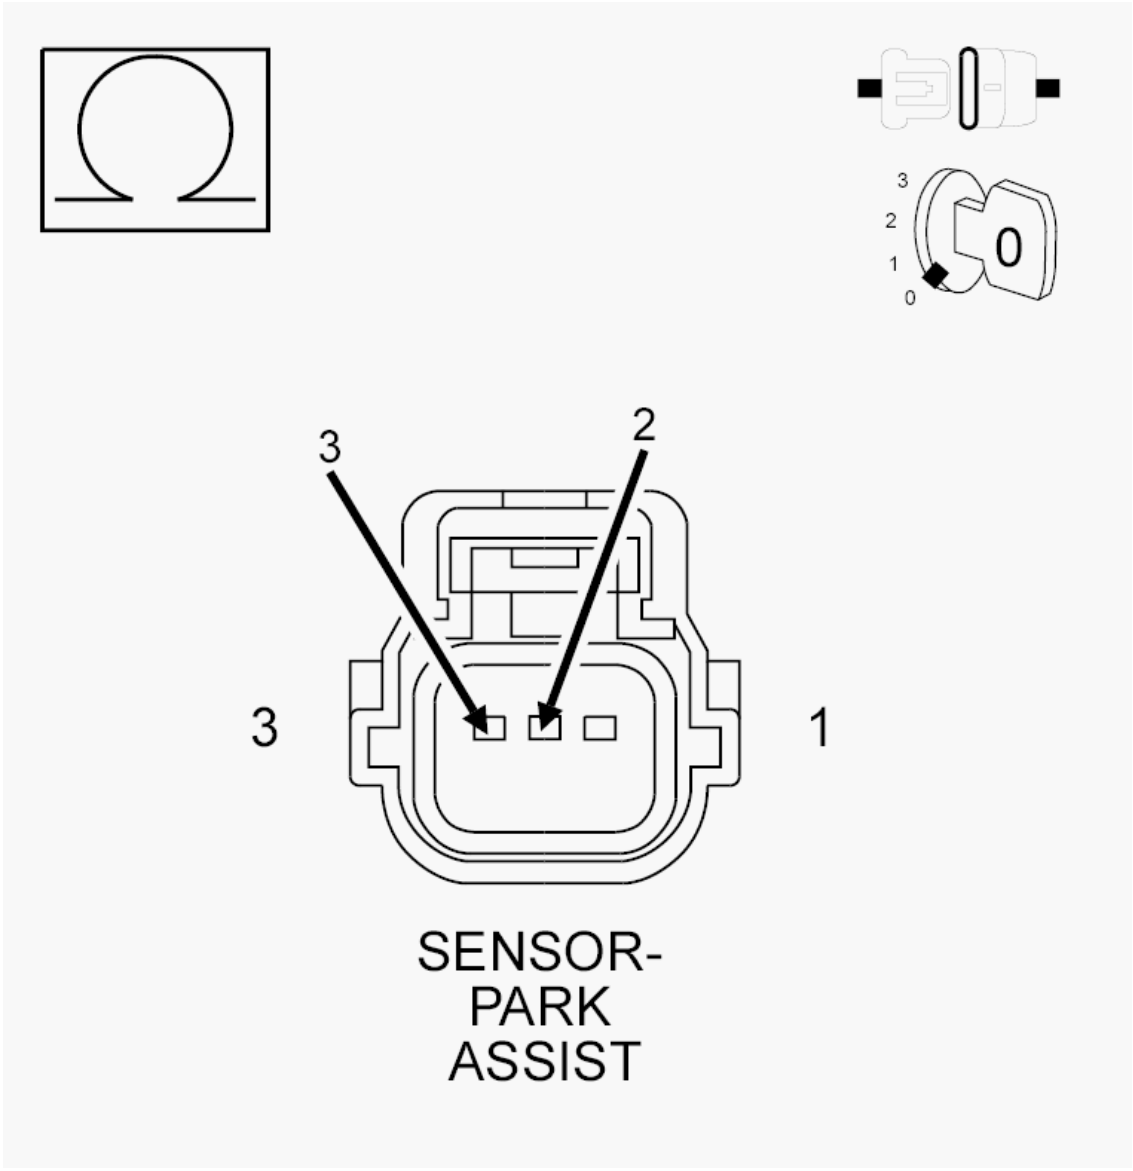

Fig. 125: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D703) Park Assist Sensor 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D703) Park Assist Sensor 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR AN OPEN**

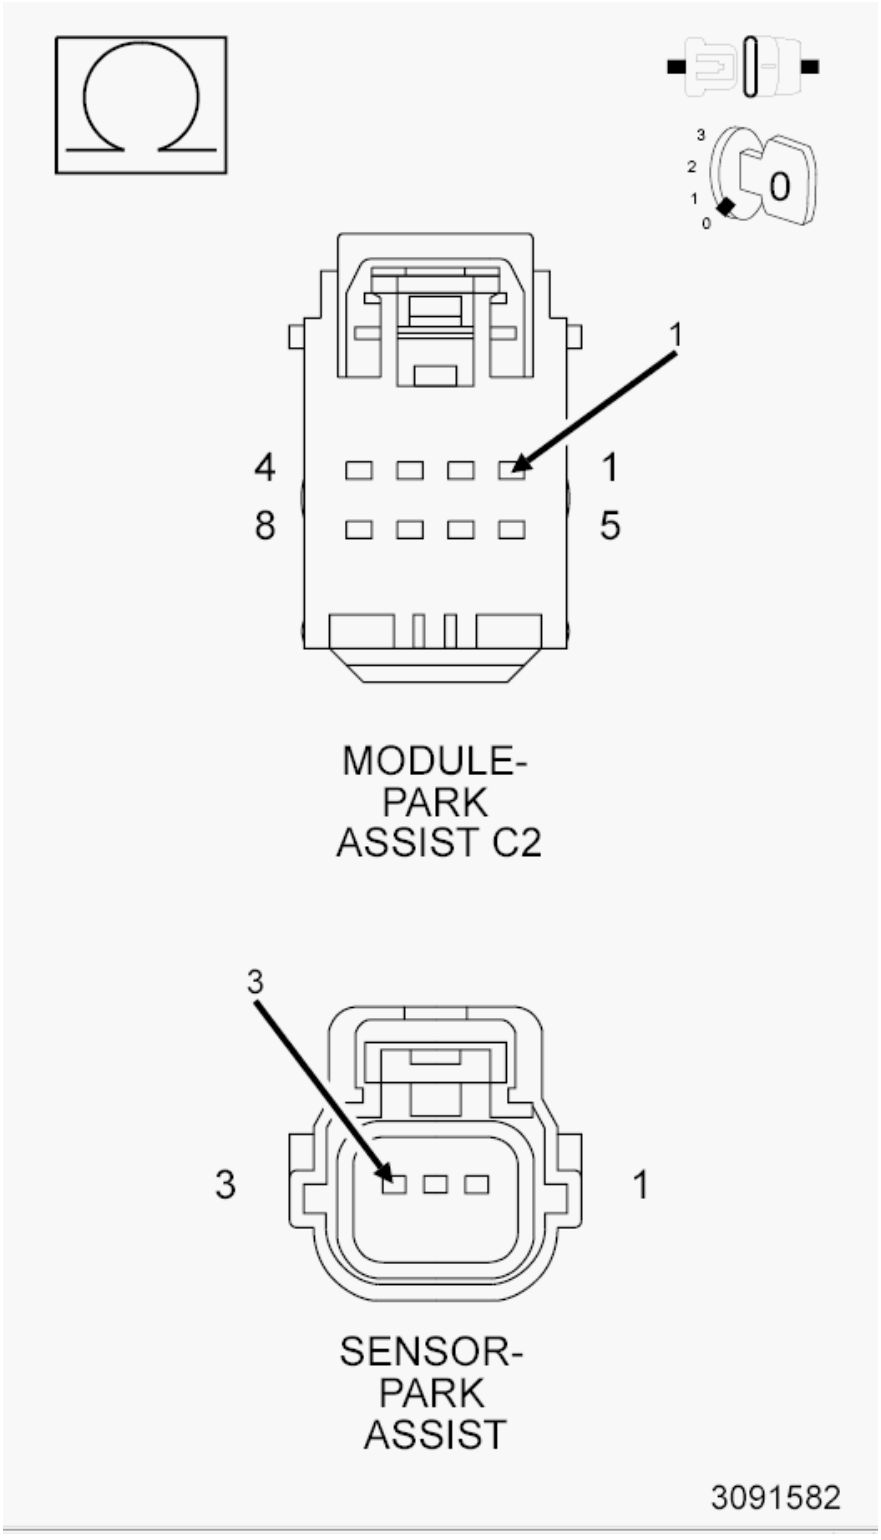

Fig. 126: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D703) Park Assist Sensor 9 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D703) Park Assist Sensor 9 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

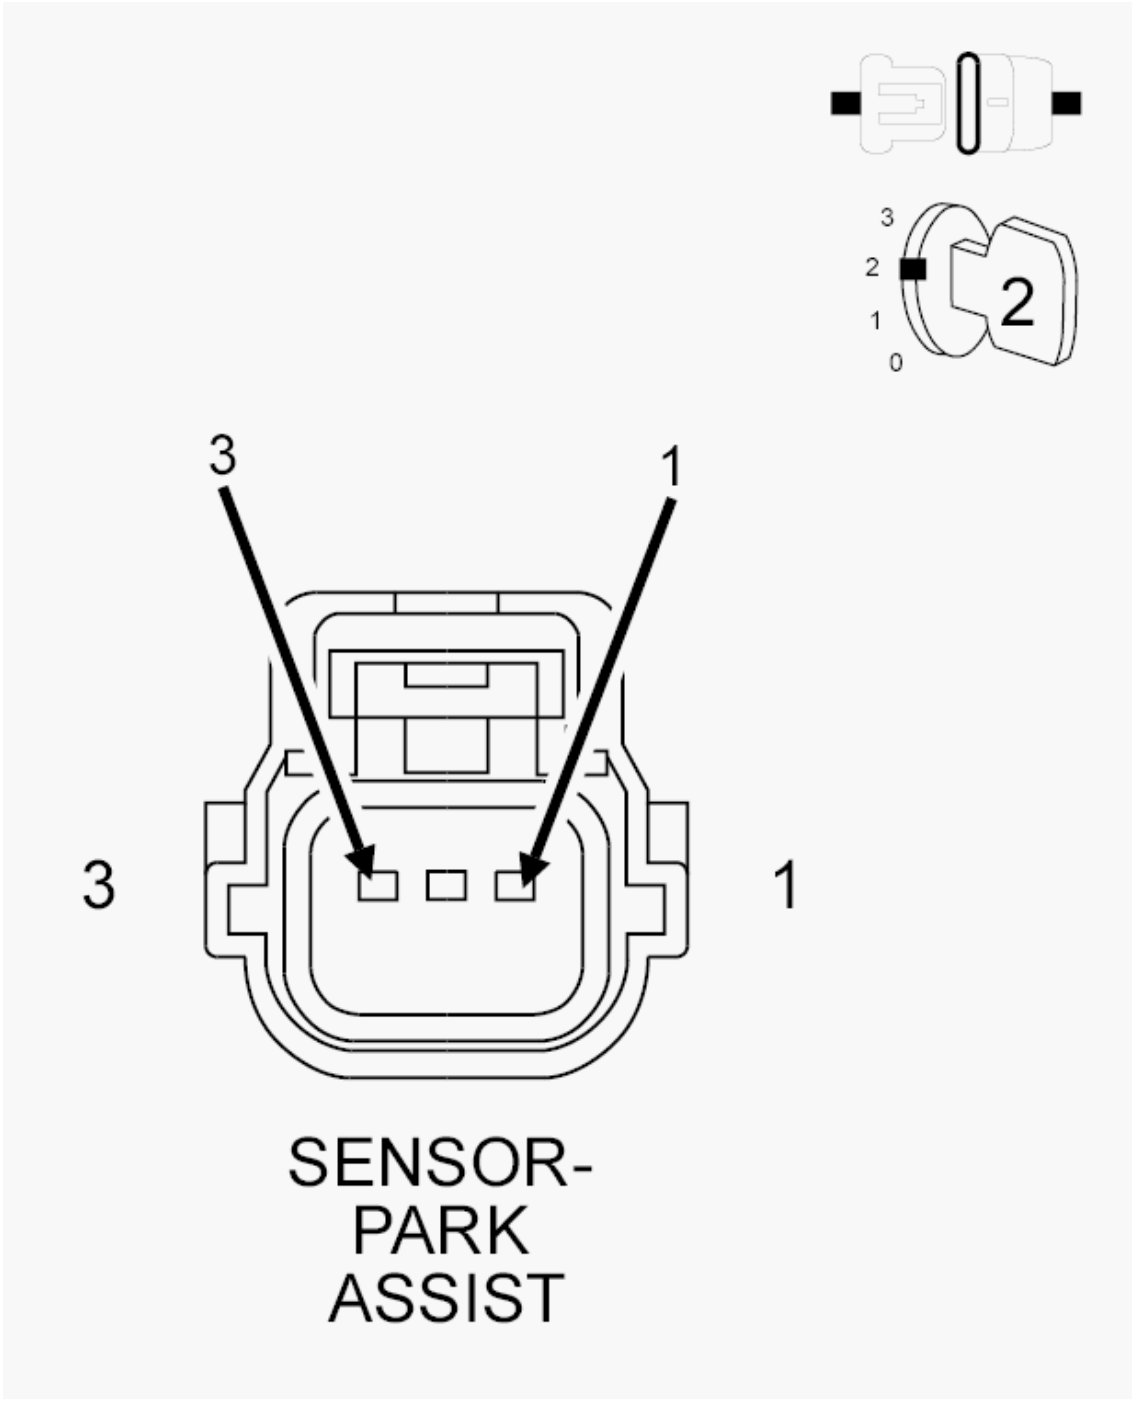

Fig. 127: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C2 harness connector.
3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D703) Park Assist Sensor 9 Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1296-12-PTS SENSOR 9-CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1296-25-PTS SENSOR 9 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is

connected before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**

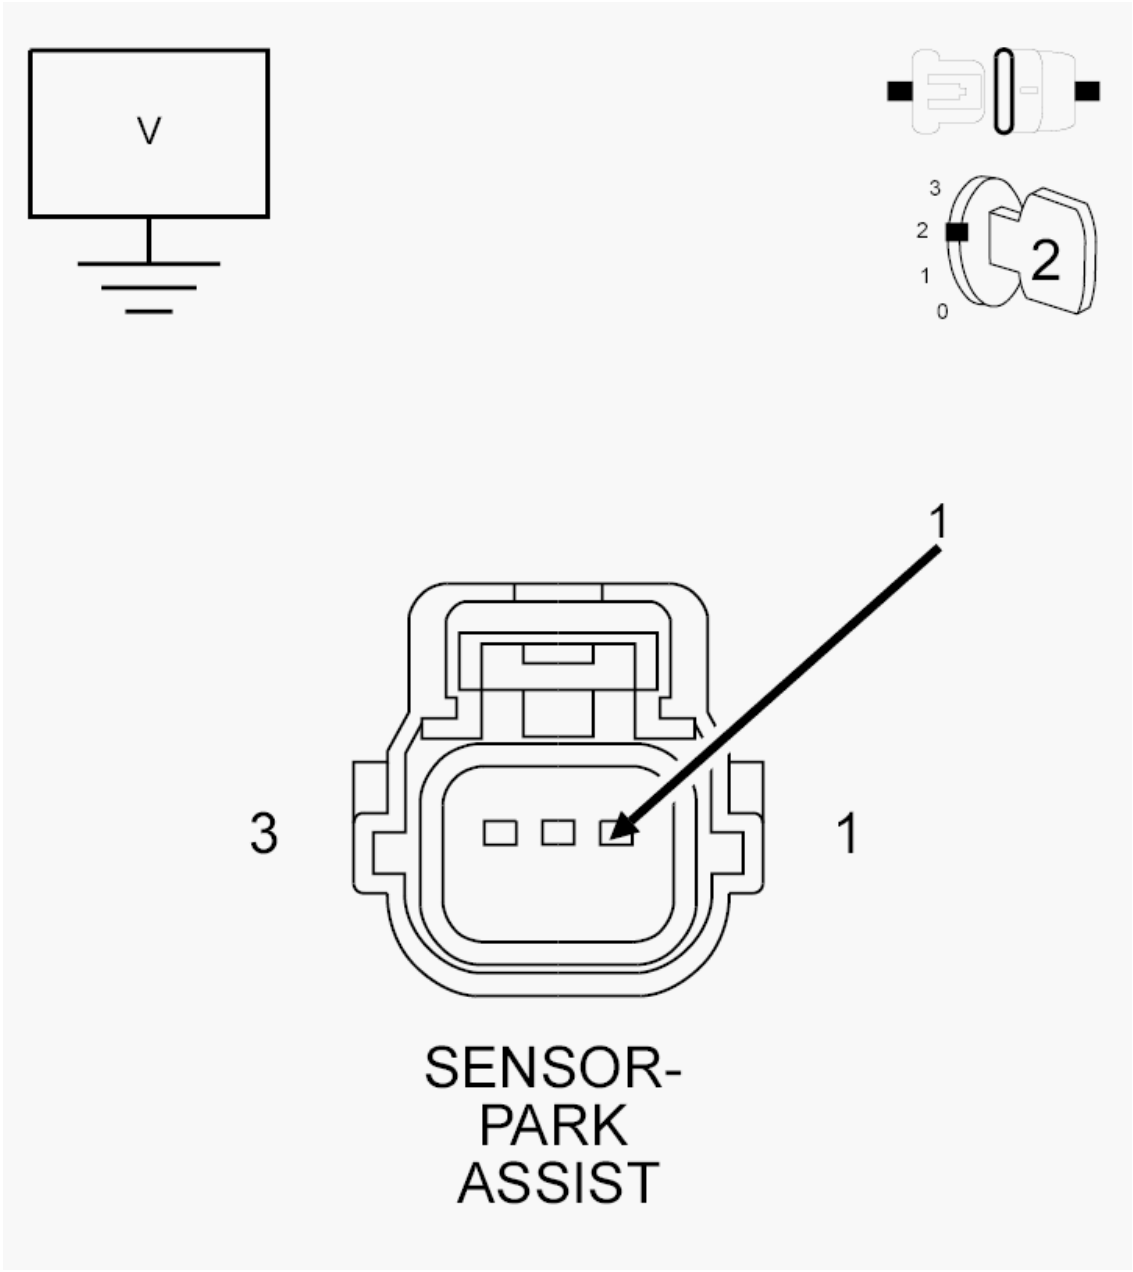

Fig. 138: Measuring Voltage Of Park Assist Sensor Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

- Go To 4.

No

- Go To 3.

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

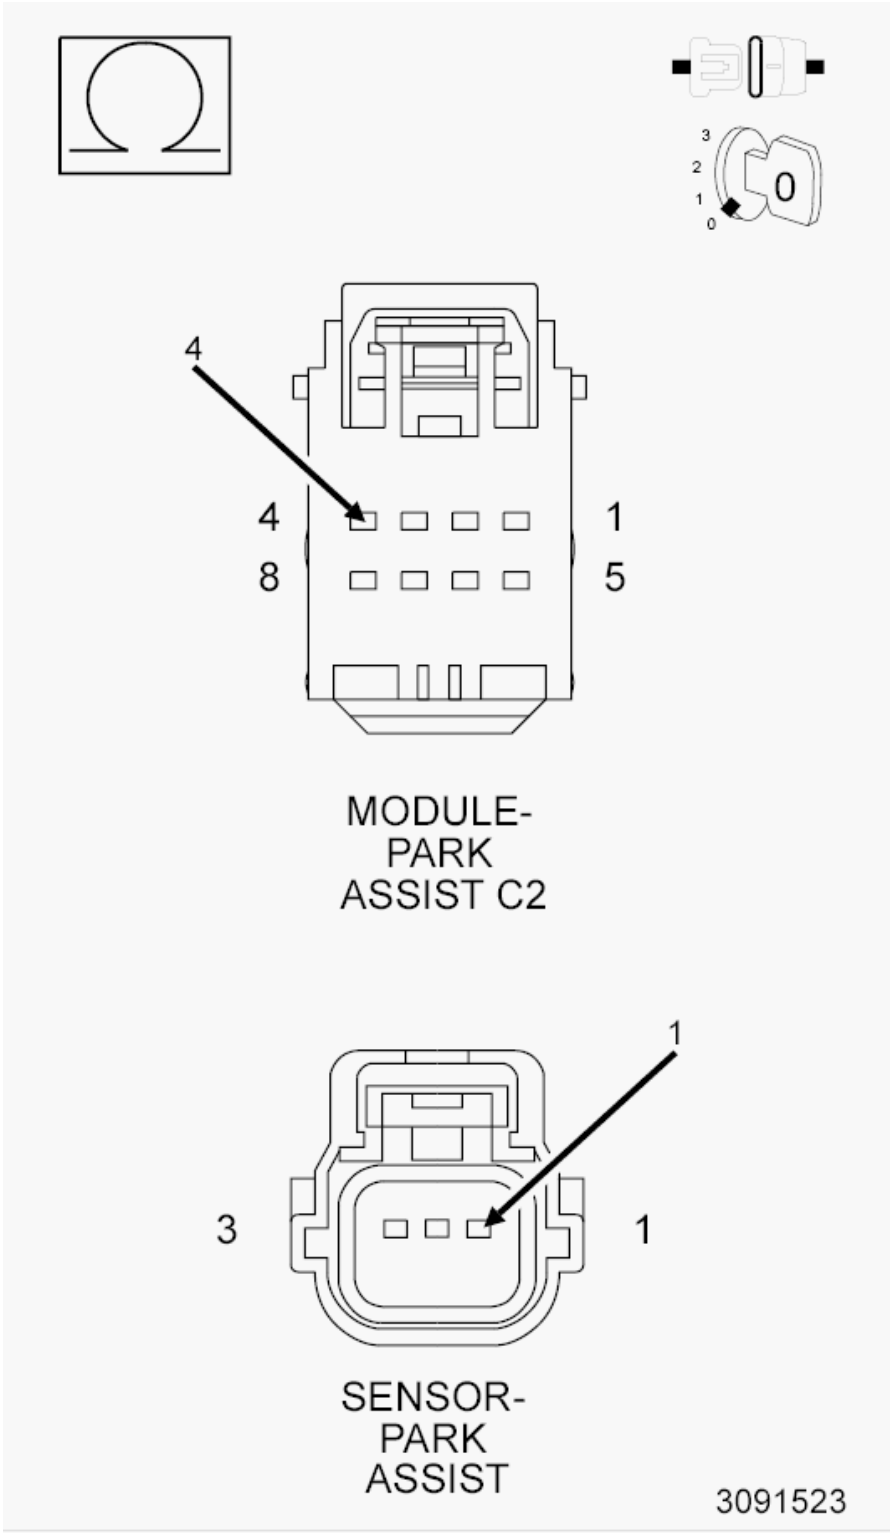

Fig. 139: Checking Park Assist Sensor Supply Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.

3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

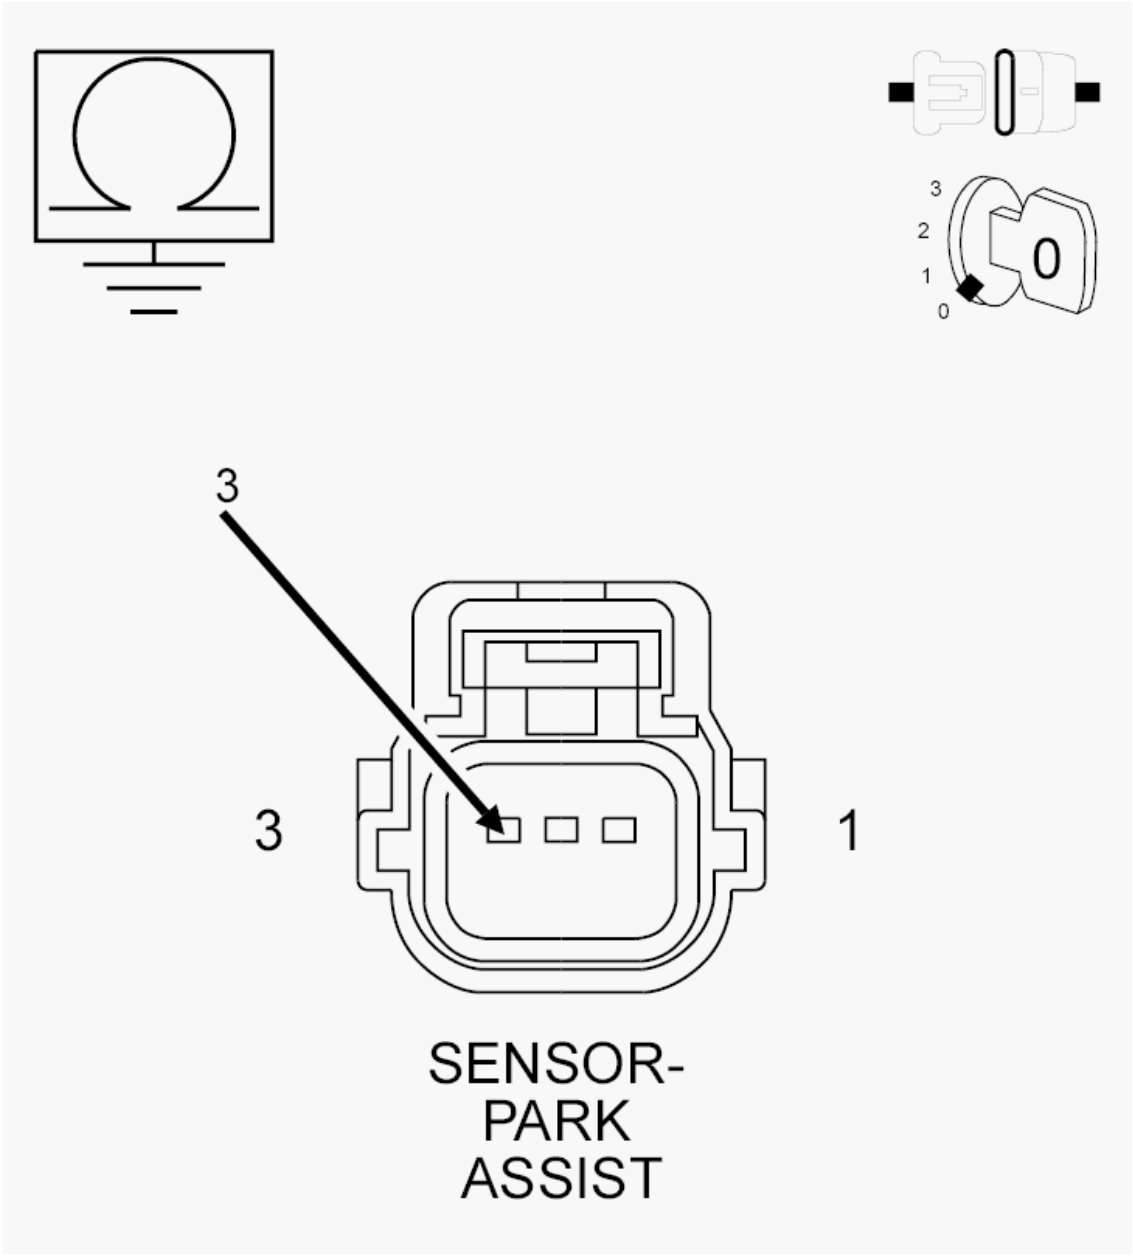

Fig. 140: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this step with the Park Assist Module connected.

1. Measure the resistance between ground and the (D704) Park Assist Sensor Signal circuit.

   Is the resistance below 10K Ohms?

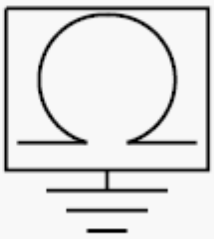
   Yes

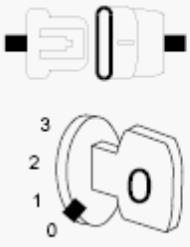
   - Go To 5.

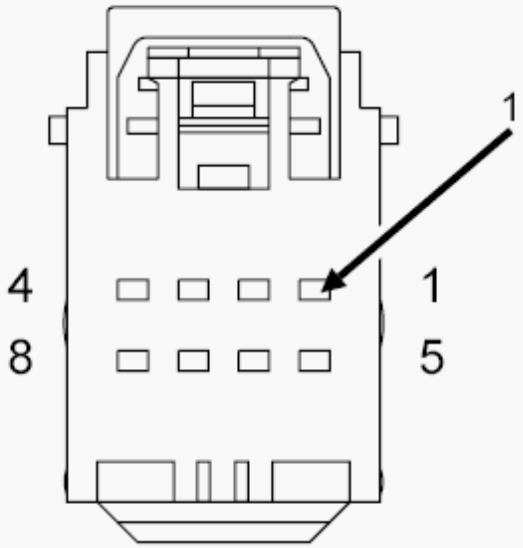
No

- Go To 7.

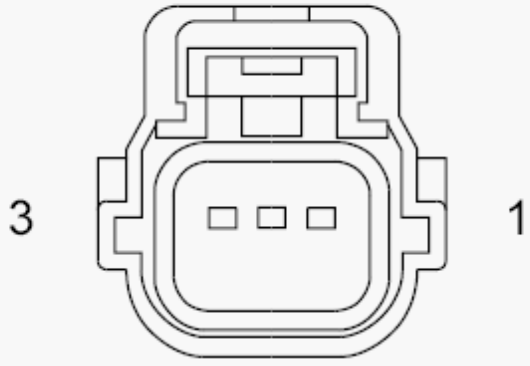
5. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**







MODULE-
PARK
ASSIST C2



SENSOR-
PARK

Fig. 141: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance between ground and the (D704) Park Assist Sensor Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D704) Park Assist Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 6.

6. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

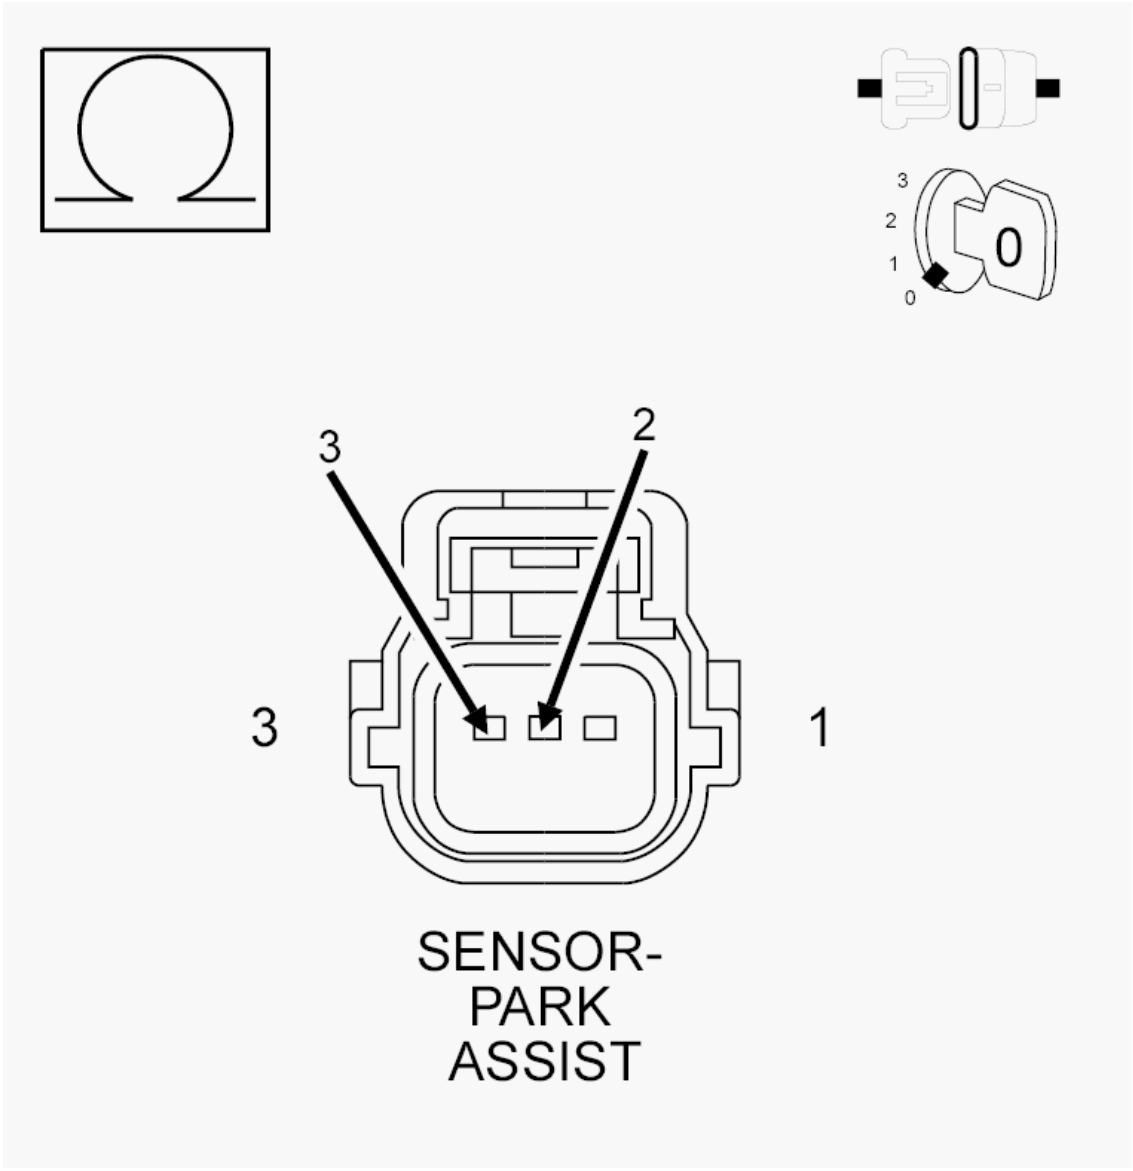


Fig. 142: Checking Park Assist Sensor Signal Circuit For A Short To The Front Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D704) Park Assist Sensor Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D704) Park Assist Sensor Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR AN OPEN**

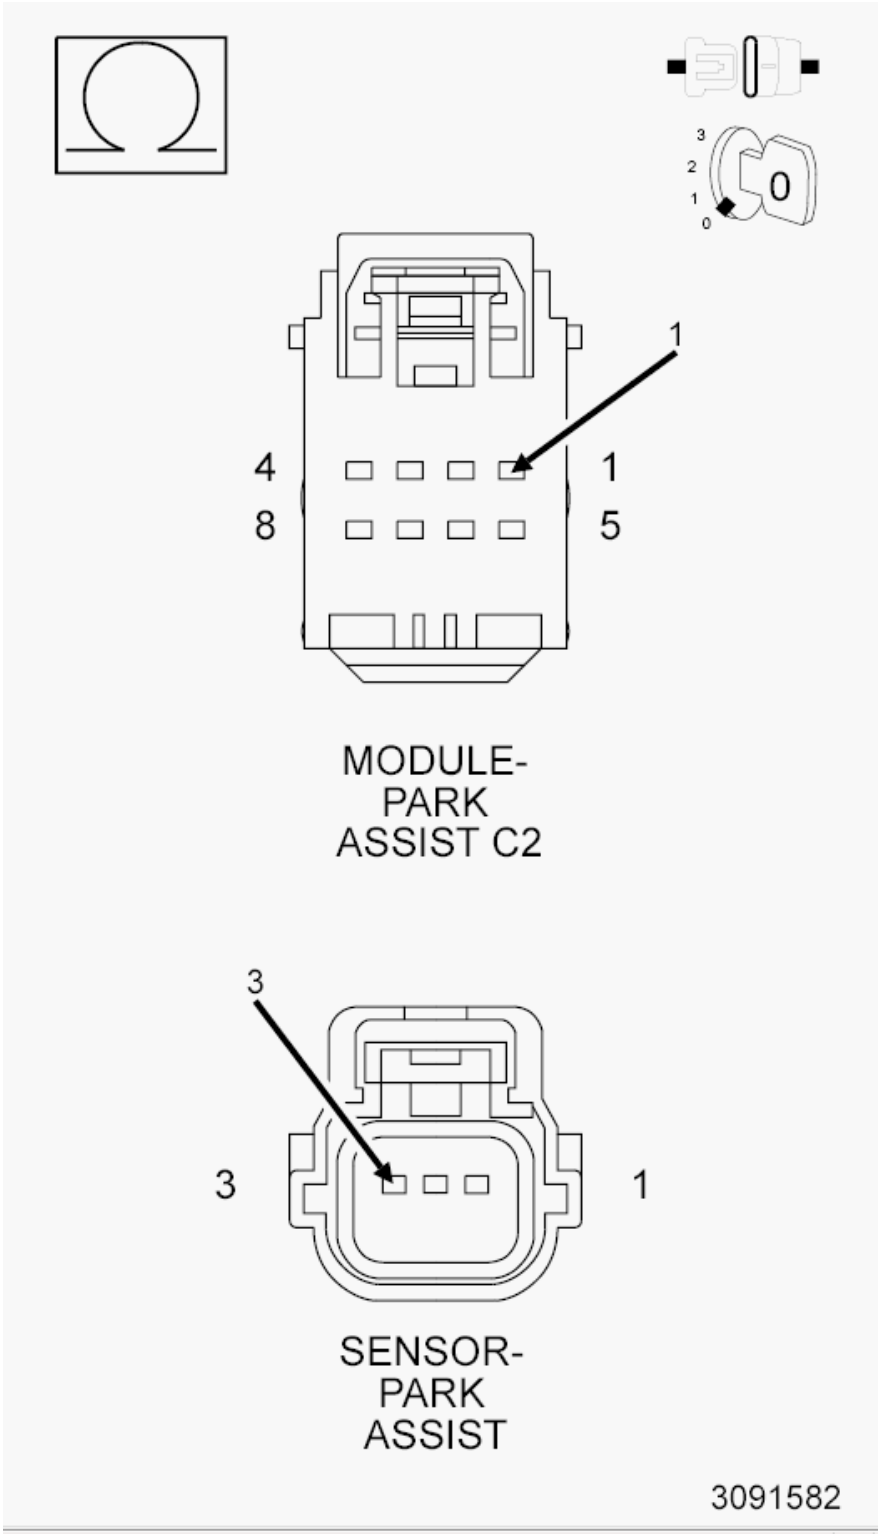

Fig. 143: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D704) Park Assist Sensor Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D704) Park Assist Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **PARK ASSIST SENSOR**

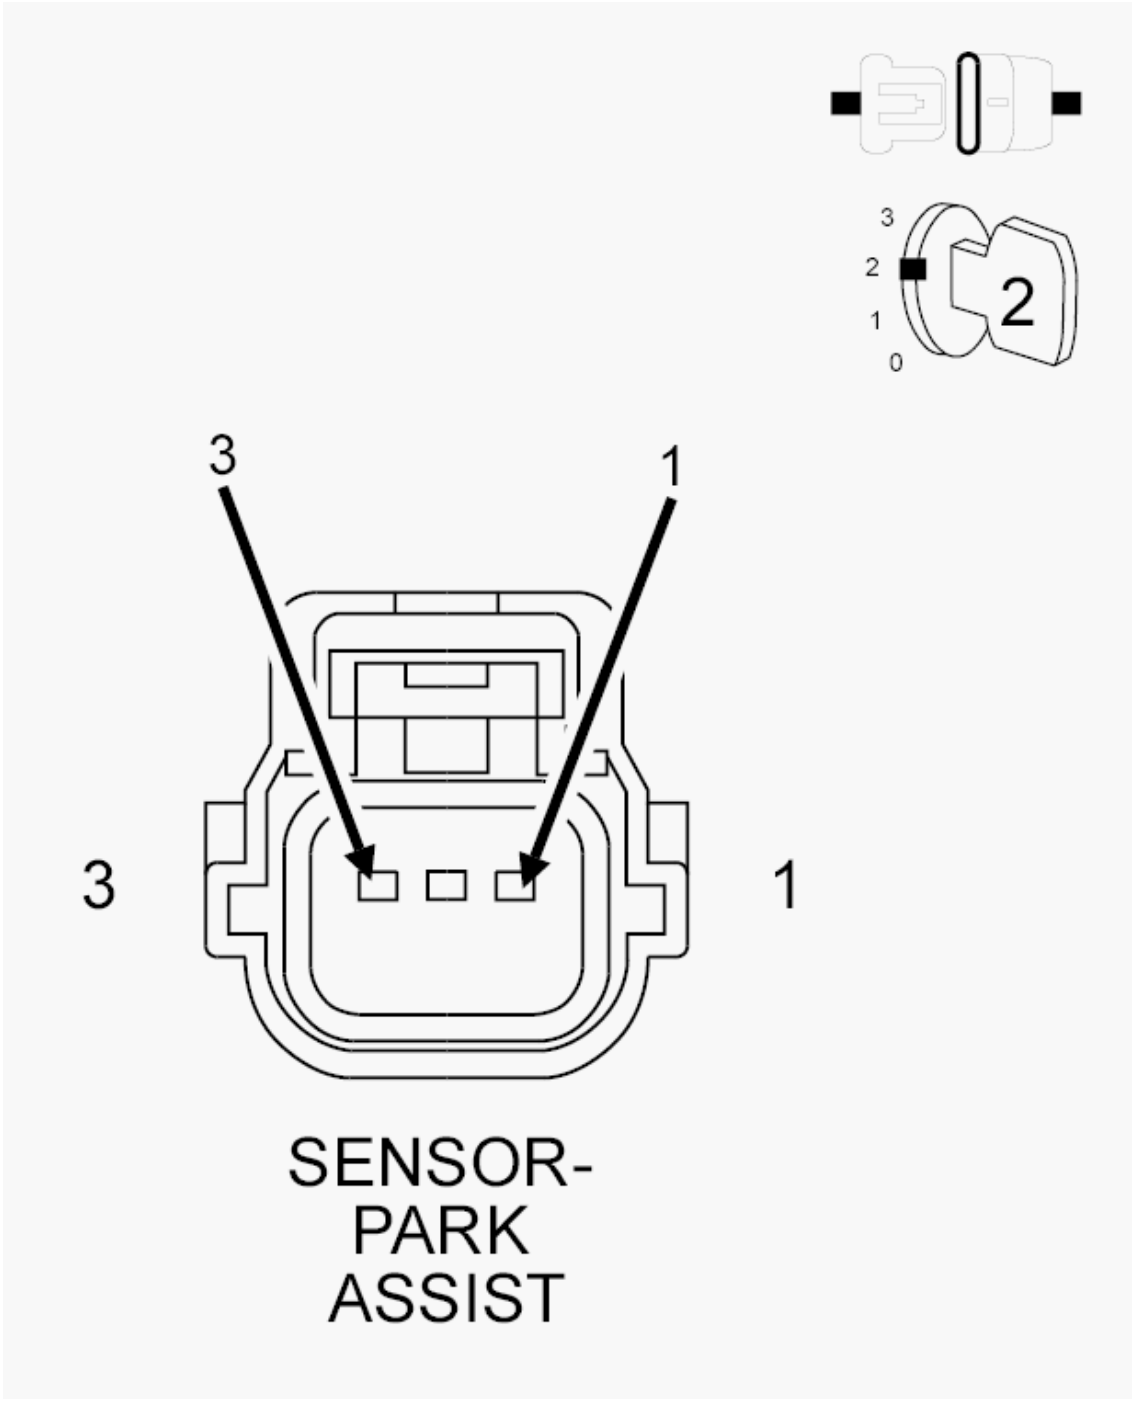

Fig. 144: Park Assist Sensor Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C2 harness connector.
3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D704) Park Assist Sensor Signal circuits.
4. Turn the ignition on.

5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1297-12-PTS SENSOR 10 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

MODULE-
PARK ASSIST C2

SENSOR-
PARK ASSIST 10

Fig. 145: Park Assist Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

B1297-25-PTS SENSOR 10 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1298-25-PTS SENSOR 11 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION:

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1298-92-PTS SENSOR 11 - PERFORMANCE OR INCORRECT OPERATION

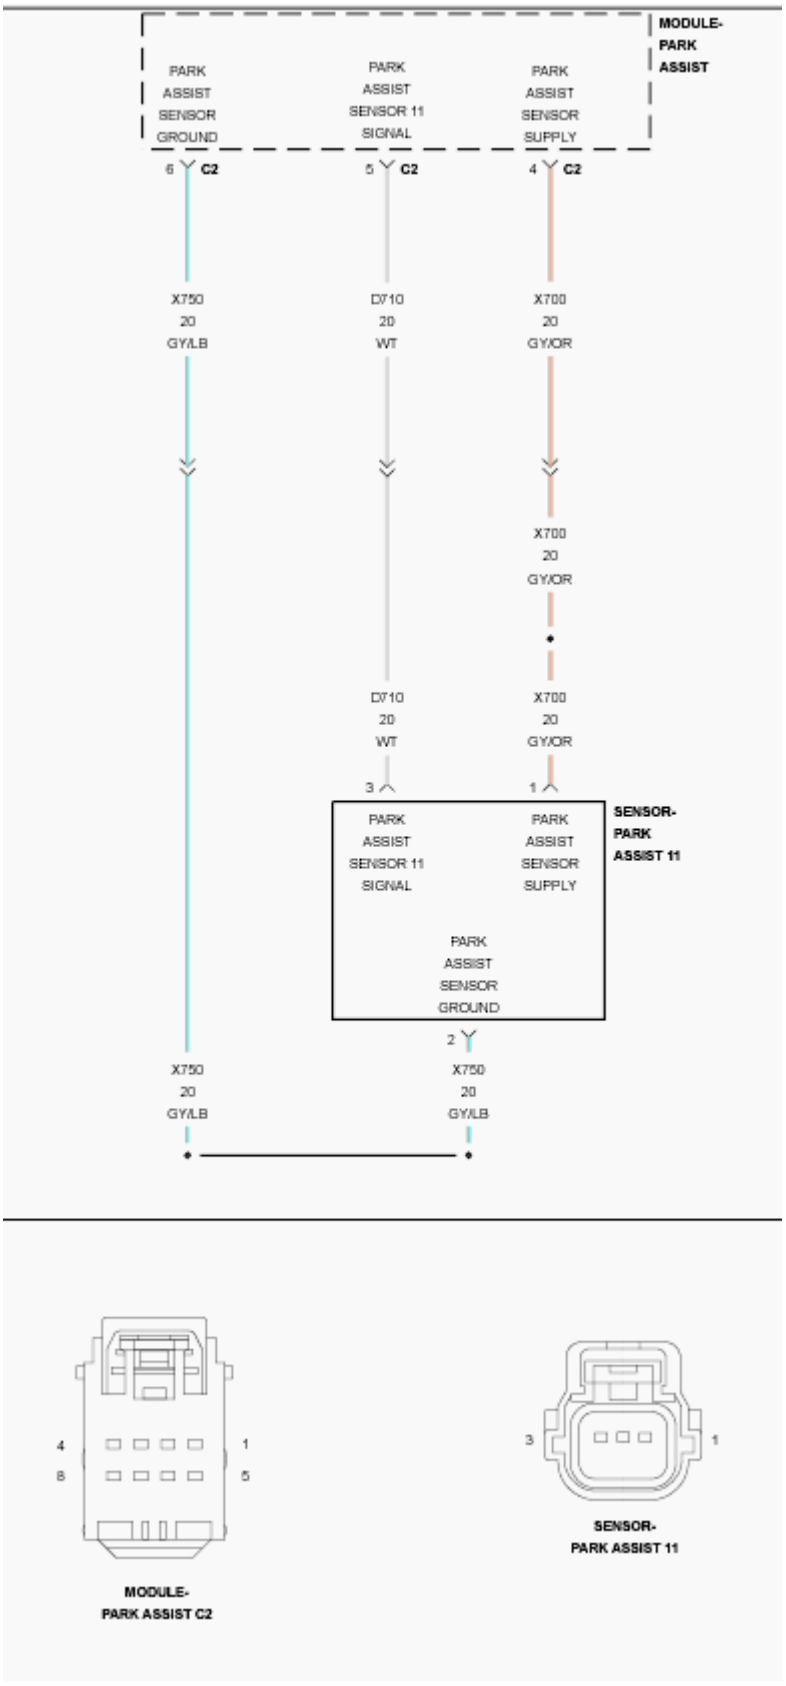

Fig. 167: Park Assist Sensor Wiring Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO BATTERY
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN
PARK ASSIST SENSOR 11
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

       Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **CHECK PARK ASSIST SENSOR 11 FOR INTERNAL SHORT**
    1. Disconnect Park Assist Sensor1 harness connector.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3.

    No

    - Replace Park Assist Sensor1 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

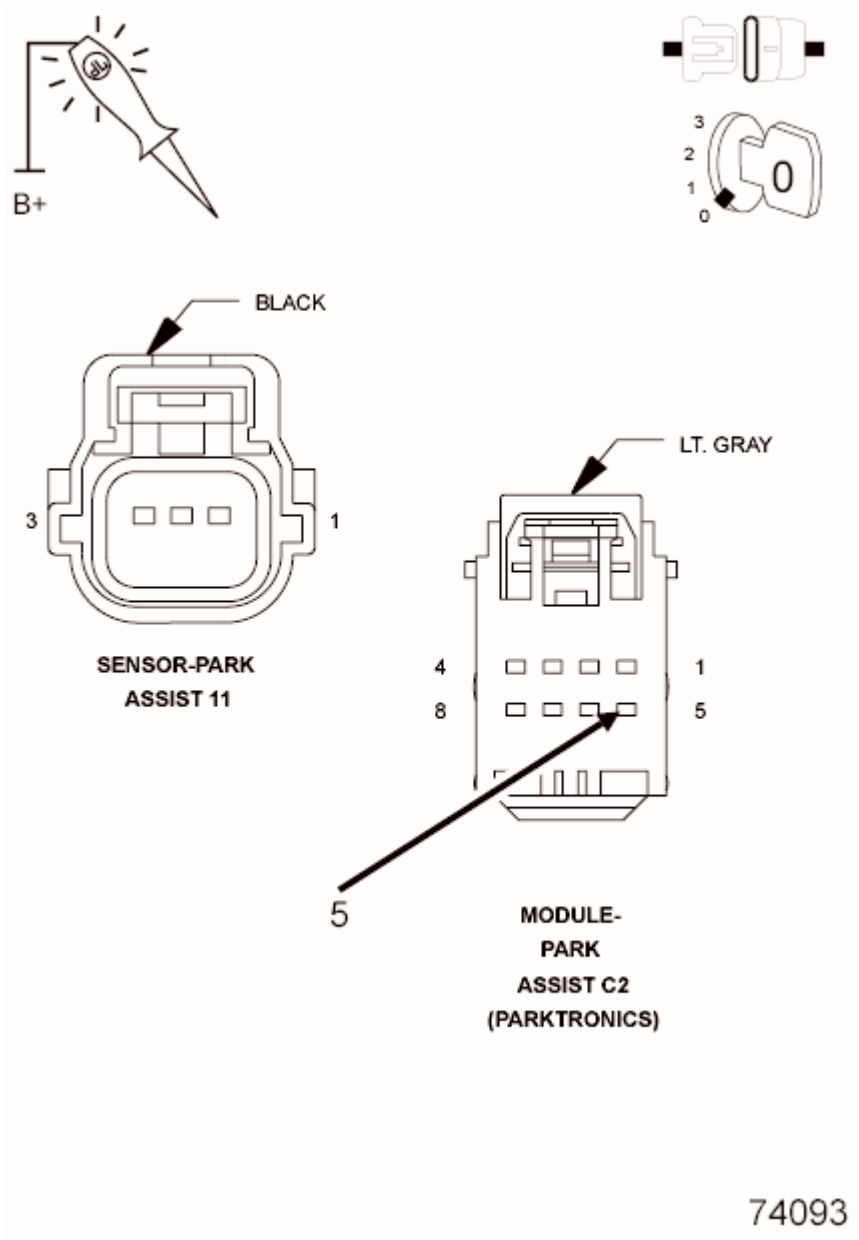

Fig. 168: Checking Park Assist Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Using a 12-volt test light connected to 12-volts check the (D710) Park Assist Sensor1 Signal circuit at the Park Assist Module C2 harness connector.

   Does the test light illuminate brightly?

   Yes

- Repair the (D710) Park Assist Sensor1 Signal circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

1. Turn the ignition on.
2. Using a 12-volt test light connected to ground check the (D710) Park Assist Sensor1 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

   Does the test light illuminate brightly?

   Yes

   - Repair the (D710) Park Assist Sensor1 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**

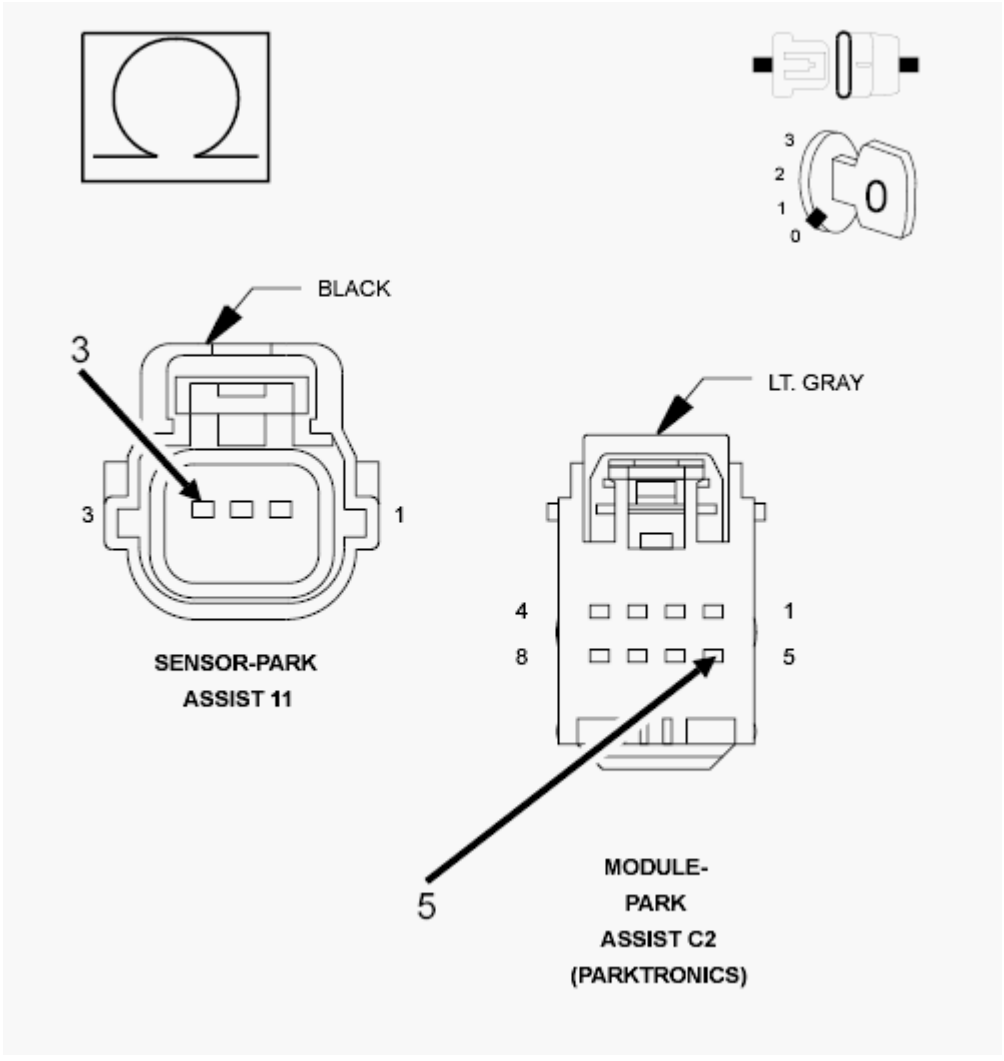

Fig. 170: Checking Park Assist Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D710) Park Assist Sensor1 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor1 harness connector.

   Is the resistance below 5.0 Ohms?

   No

   - Repair the (D710) Park Assist Sensor1 Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   Yes

   - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

Park Assist Module supply voltage less than 6.5 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

       Does the scan tool display this DTC as active?

       Yes

       - Go To 2.

       No

       - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

Are any charging system DTCs present?

Yes

- Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** or **3.6L - DIAGNOSTIC CODE INDEX** or **5.7L - DIAGNOSTIC CODE INDEX** or **6.4L - DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

Park Assist Module supply voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** or **3.6L - DIAGNOSTIC CODE INDEX** or **5.7L - DIAGNOSTIC CODE INDEX** or **6.4L - DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B2128-16-SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

WHEN MONITORED:

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION:

Park Assist Sensor supply voltage less than 7.2 volts.

POSSIBLE CAUSES

Possible Causes
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND (IF EQUIPPED)
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

       Does the scan tool display this DTC as active?

       Yes

       - Go To 2.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **CHECK EACH PARK ASSIST SENSOR FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect one Park Assist Sensor.
    3. Turn the ignition on.
    4. With the scan tool, read Park Assist Module DTCs. If this DTC is still active, repeat this procedure by disconnecting another Park Assist Sensor. However, if this DTC changes from active to stored, or if all sensors have been disconnected, proceed as follows:

       Does the scan tool still display this DTC as active?

Yes

- Go To 3.

No

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND (IF EQUIPPED)**

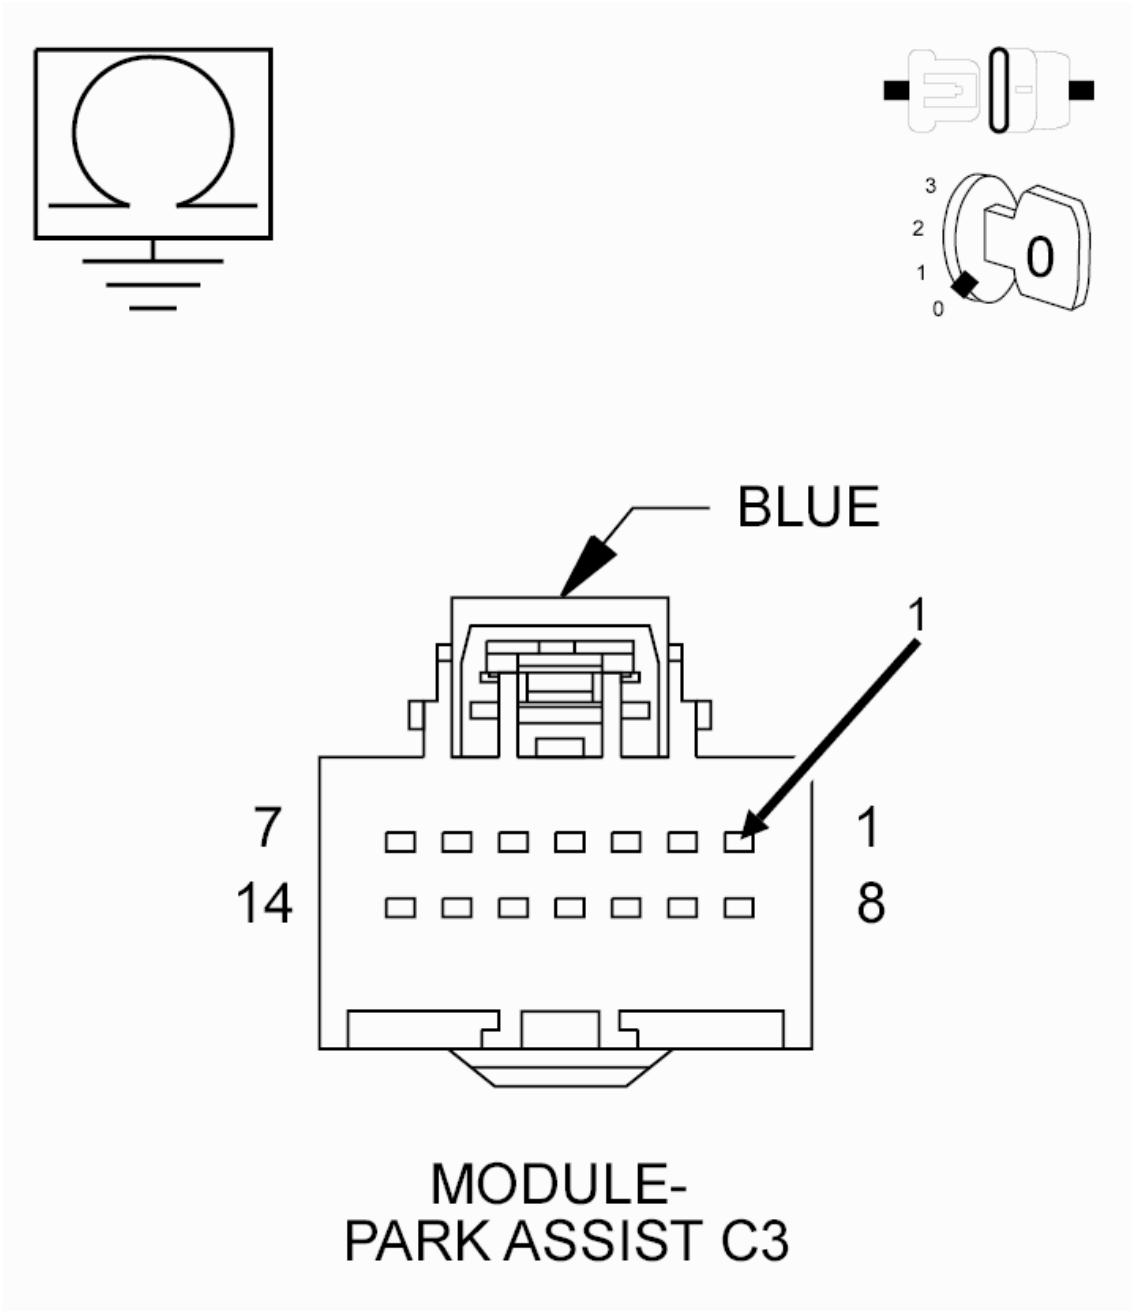

Fig. 171: Checking Front Park Assist Sensor Supply Circuit For A Short To Ground (If Equipped)
Courtesy of CHRYSLER GROUP, LLC

NOTE: If vehicle is not equipped with Front Park Assist, proceed to next test step.

NOTE: Perform this test with all Front Park Assist Sensors disconnected.

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (X702) Front Park Assist Sensor Supply

circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the short to ground in the (X702) Front Park Assist Sensor Supply circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 4.

4. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

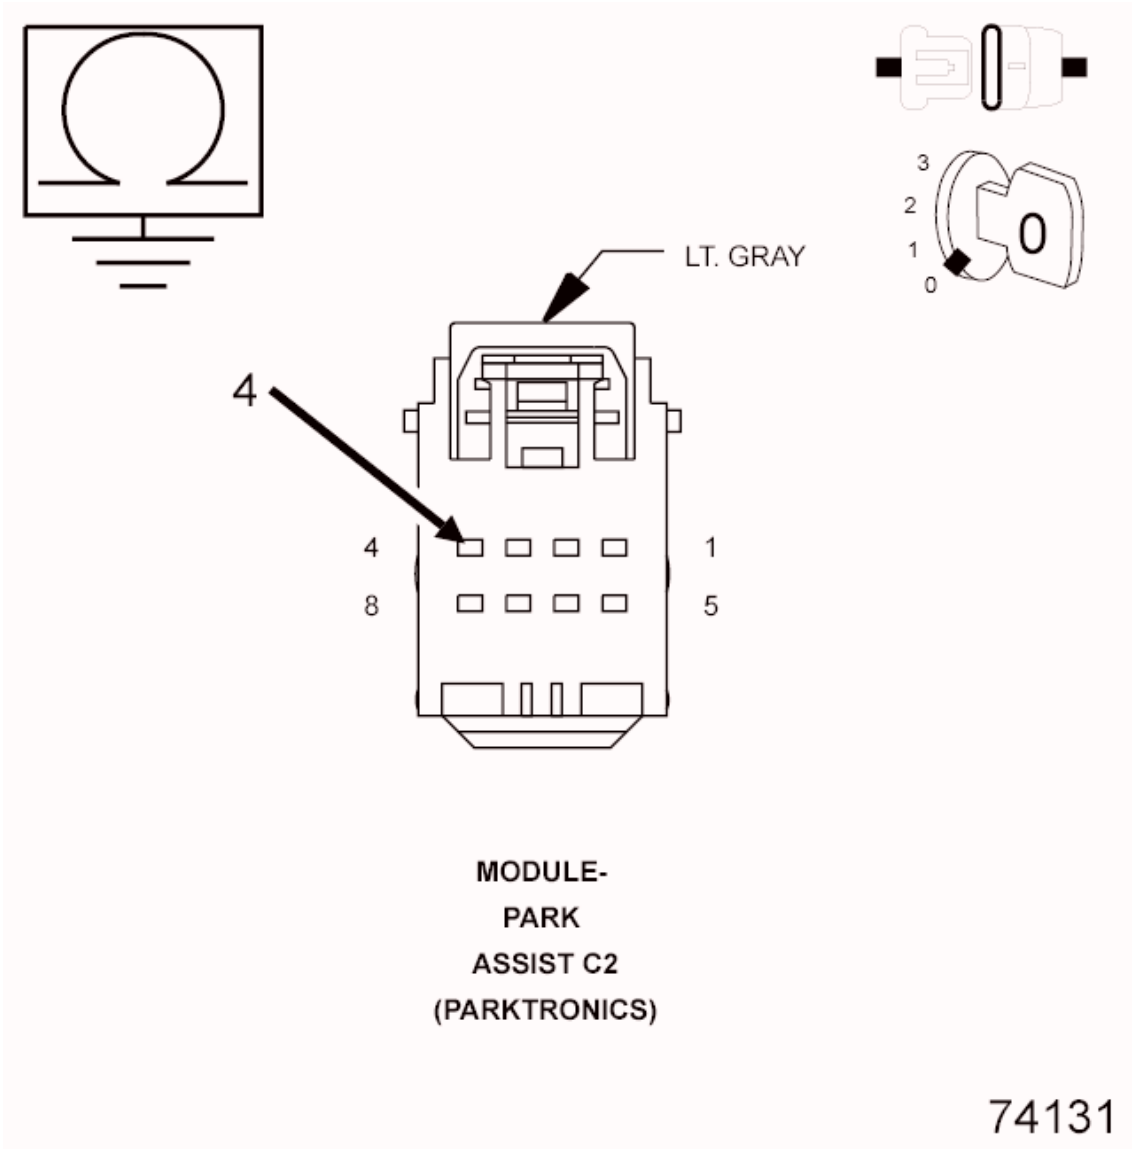

Fig. 172: Checking Park Assist Sensor Supply Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform this test with all Rear Park Assist Sensors disconnected.

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance between ground and the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X700) Park Assist Sensor Supply circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B2128-17-SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display: U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE?

      Yes

      - **Refer to U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE** and perform the U0121-00-Lost Communication with Anti-lock Brake System (ABS) Control Module diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTCs.

       Does the scan tool display; U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE as active?

       Yes

       - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

       No

       - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION:

Bus messages not received from the Instrument Cluster (IC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE
CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND
INSTRUMENT CLUSTER (IC) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (IC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display: U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN?

      Yes

      - **Refer to U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN** and perform the U0155-Lost Communication with Cluster/CCN diagnostic procedure.

      No

      - **Refer to COMMUNICATION - DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Park Assist Module supply voltage between 9-16 volts. Ignition in Run/Start.

SET CONDITION:

Incorrect data received from Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH POWERTRAIN CONTROL MODULE (PCM)

DTCS STORED OR ACTIVE IN THE PCM
ACTIVE COMMUNICATION DTCS IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **VERIFY PCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the PCM is active on the bus.

    Is the PCM active on the bus?

    Yes

    - Go To 3.

    No

    - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from PCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **DTCS STORED OR ACTIVE IN THE PCM**
    1. With the scan tool, read PCM DTCs.

    Are any DTCs active or stored in the PCM?

    Yes

- Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** or **3.6L - DIAGNOSTIC CODE INDEX** or **5.7L - DIAGNOSTIC CODE INDEX** or **6.4L - DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 4.

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
    1. With the scan tool, select ECU View and select BCM.
    2. With the scan tool, read active DTCs.

    Are any Communication DTCs active in the BCM?

    Yes

    - Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

U0418-00-IMPLAUSIBLE DATA RECEIVED FROM BRAKE SYSTEM CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Park Assist Module supply voltage between 9-16 volts. Ignition in Run/Start.

SET CONDITION:

Incorrect data received from Antilock Brake Module (ABS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH ANTILOCK BRAKE MODULE (ABS)
DTCS STORED OR ACTIVE IN THE ANTILOCK BRAKE MODULE (ABS)
ACTIVE COMMUNICATION DTCS IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

       Does the scan tool display this DTC as active?

       Yes

       - Go To 2.

       No

       - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **VERIFY ABS IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the ABS is active on the bus.

       Is the ABS active on the bus?

       Yes

       - Go To 3.

       No

       - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from ABS diagnostic procedure.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **DTCS STORED OR ACTIVE IN THE ANTILOCK BRAKE MODULE (ABS)**
    1. With the scan tool, read ABS DTCs.

       Are any DTCs active or stored in the ABS?

       Yes

       - Refer to **ABS - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

- Go To 4.

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
    1. With the scan tool, select ECU View and select BCM.
    2. With the scan tool, read active DTCs.

       Are any Communication DTCs active in the BCM?

       Yes

       - Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Park Assist Module supply voltage between 9-16 volts. Ignition in Run/Start.

SET CONDITION:

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

       Does the scan tool display this DTC as active?

Yes

- Go To 2.

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the BCM is active on the bus.

    Is the BCM active on the bus?

    Yes

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from BCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

U0423-00-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED:

Park Assist Module supply voltage between 9-16 volts. Ignition in Run/Start.

SET CONDITION:

Incorrect ignition status received from the Cluster

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH CLUSTER

DTCS STORED OR ACTIVE IN THE CLUSTER
ACTIVE COMMUNICATION DTCS IN THE BODY CONTROL MODULE (BCM)
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2.

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **VERIFY CLUSTER IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the Cluster is active on the bus.

    Is the Cluster active on the bus?

    Yes

    - Go To 3.

    No

    - Refer to **COMMUNICATION - DIAGNOSIS AND TESTING** and perform the No Response from Cluster/CCN diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
3. **DTCS STORED OR ACTIVE IN THE CLUSTER**
    1. Check for active DTCs in the Cluster.

    Are any DTCs active or stored in the Cluster?

    Yes

- Refer to **CCN - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4.

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
    1. With the scan tool, select ECU View and select BCM.
    2. With the scan tool, read active DTCs.

    Are any Communication DTCs active in the BCM?

    Yes

    - Refer to **BCM, DTC'S B10B3 - B1ED2-11 - DIAGNOSIS AND TESTING** or **BCM, DTC'S B1ED2-2A - U1433 - DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

ELECTRICAL

Power Distribution - Chrysler 300

DESCRIPTION

DESCRIPTION

The power distribution system for this vehicle consists of the following components:

- Front Power Distribution Center (PDC) - located in the engine compartment
- Rear Power Distribution Center (PDC) - located in trunk
- Power Outlets

Refer to Wiring Diagrams for complete circuit schematics.

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Relays
- Mini fuses

CENTER, POWER DISTRIBUTION (PDC)

DESCRIPTION

DESCRIPTION

The majority of electrical system fuses and relays are housed in the two Power Distribution Centers (PDC). One is located in the engine compartment, the Front Power Distribution Centers (PDC). The PDC is located next to the battery in the rear of the vehicle. Both of the PDC are replaced only as part of the body wiring harness.

For fuse description and layout. Refer to **FUSE LOCATIONS AND TYPES, SPECIFICATIONS** .

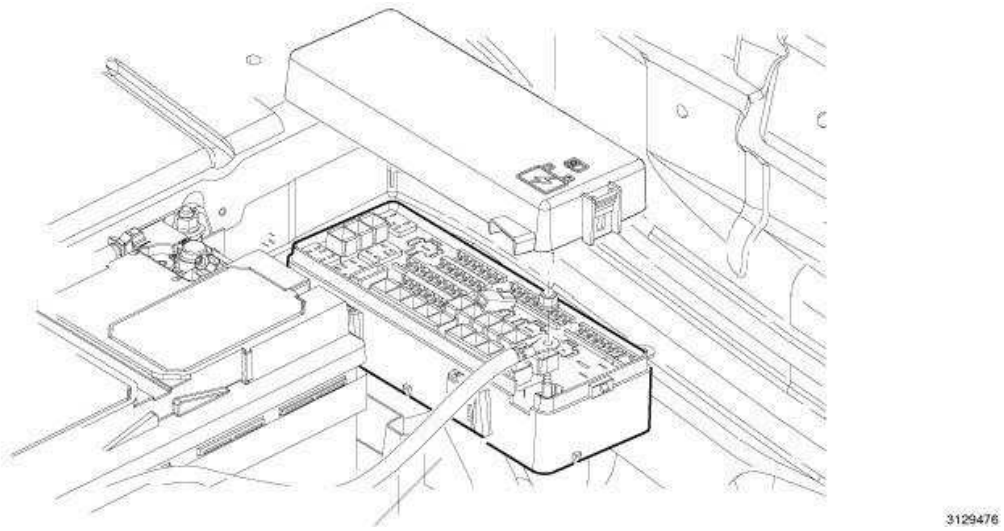

Fig. 1: Identifying Rear PDC
Courtesy of CHRYSLER GROUP, LLC

Rear PDC located in the truck next to the battery.

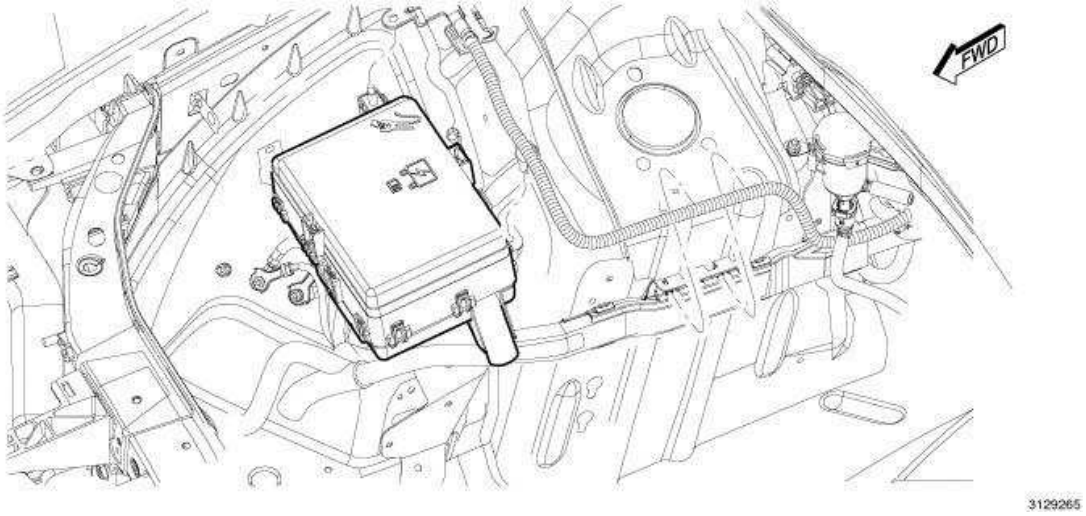

Fig. 2: Identifying Front PDC
Courtesy of CHRYSLER GROUP, LLC

Front PDC located in the engine compartment on the passenger side fender.

OUTLET, POWER, 12 V

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.

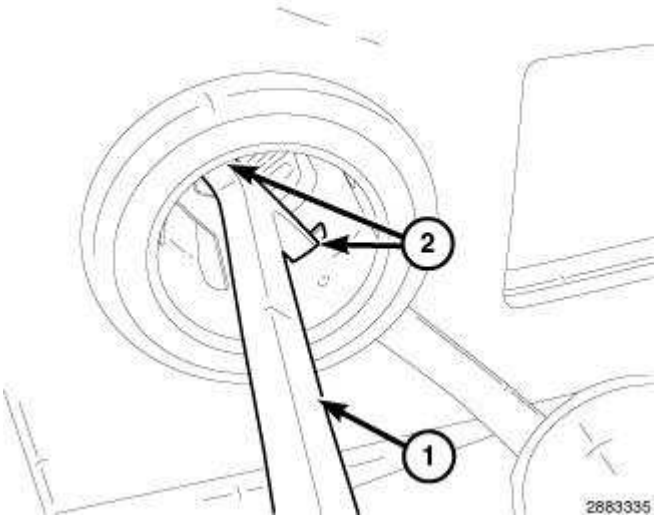

Fig. 3: Inserting Power Outlet Remover
Courtesy of CHRYSLER GROUP, LLC

2. Look inside and note position of the retaining bosses (2).
3. Insert Remover, Power Outlet (special tool #10246, Remover, Power Outlet) (1) into the retaining bosses (2) of the power outlet.
4. Pull out the base through the mounting ring by gently rocking the tool.

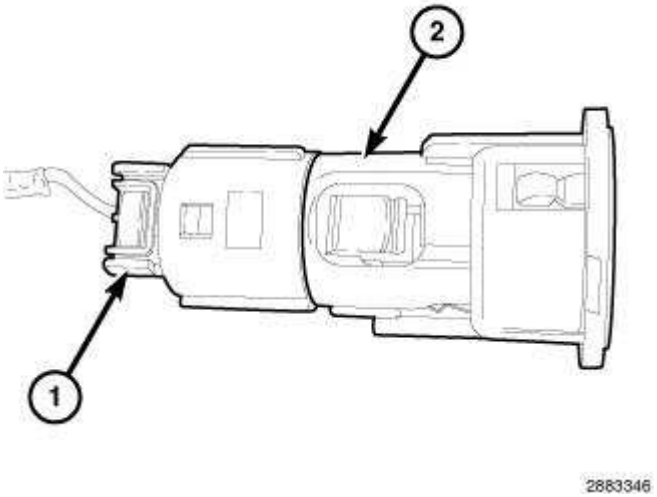

Fig. 4: Power Outlet & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the harness (1) from the power outlet (2).
6. Set the base aside and remove the base mount ring.

INSTALLATION

INSTALLATION

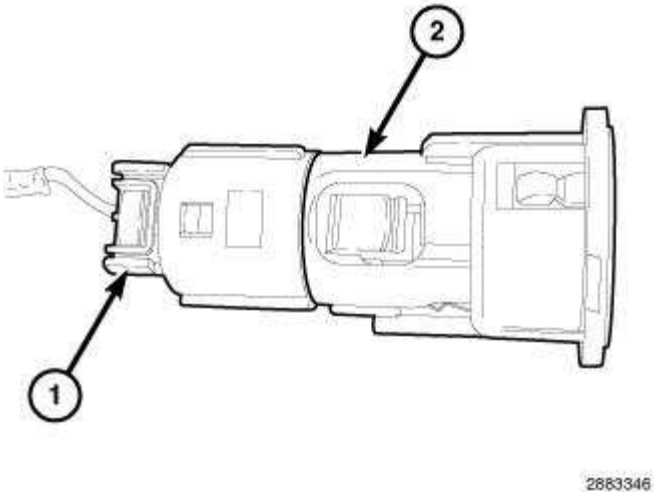

Fig. 5: Power Outlet & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the wire connector (1) to the power outlet receptacle (2).
2. Install the power outlet mount into the panel.
3. Align the splines on the outside of the power outlet receptacle base connector receptacle with the grooves on the inside of the mount.
4. Press firmly on the power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.
5. Connect the battery negative cable.

ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

A power operated door and liftgate lock system is standard factory-installed equipment on this vehicle. The power lock system allows all of the doors and the liftgate to be locked or unlocked electrically. Locking or unlocking the vehicle using the power lock system can be accomplished by up to three different methods:

- **Power Lock System** - Operating a power lock system switch on either front door inside trim panel will lock or unlock the latches of all four doors. Operating a trunk release switch on the instrument panel will unlatch the deck lid.
- **Remote Keyless Entry System** - Depressing the **Lock** or **Unlock** button of the standard equipment Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) can also be used to lock or unlock the latches of the doors. Depressing the **Trunk Release** button of the RKE transmitter will unlatch the deck lid. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Passive Entry System** - Contacting the capacitive **Unlock** switch on the inside of either exterior front door Smart handle pull or depressing the tactile **Lock** button of either front door Smart handle while a valid FOBIK is identified in that same zone can be used to lock or unlock the doors. Also depressing the tactile **Unlock** button on the lens of the deck lid Center High Mounted Stop Lamp (CHMSL) while a valid FOBIK is identified in that same zone can be used to unlatch the deck lid. The specific locks operated varies depending upon the Customer Programmable settings chosen by the vehicle operator.

Additional details of each of these subsystems and their components can be found in the subheadings and paragraphs that follow.

POWER LOCK SYSTEM

The power lock system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Deck Lid Release Switch** - A switch on the instrument panel to the left of the steering column will unlatch the deck lid only when the automatic transmission gear selector is in the PARK position, or when the manual transmission vehicle speed is below 8 kilometers-per-hour (5 miles-per-hour).
- **Door Modules** - The Driver Door Module (DDM) and Passenger Door Module (PDM) are

located on their respective driver and passenger front door hardware module carriers and are concealed behind the front door inside trim panels. Refer to **MODULE, DOOR, DESCRIPTION** .

- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) includes the EVIC switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS) located in the center stack area of the instrument panel. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Power Lock Motors** - A reversible electric power lock motor is integral to the latch of each front and rear door and the deck lid.
- **Power Lock Switches** - A power lock switch is integral to the switch module located on the forward end of the arm rest of each front door inside trim panel.

These components and their controls are combined to provide the following power lock system central locking and unlocking features:

- **Automatic Door Locking** - Automatic door locking (also known as rolling door locks) automatically locks any unlocked door when the vehicle speed exceeds about 25.7 kilometers per hour (15 miles per hour). This is a Customer Programmable feature.
- **Automatic Door Unlocking** - Automatic door unlocking (also known as automatic unlock doors on exit) automatically unlocks the doors after they were automatically locked when the vehicle speed exceeded about 25.7 kilometers per hour (15 miles per hour), the vehicle speed has returned to zero, the transmission shift lever is in the **Neutral** or **Park** positions and the driver side front door is opened. This is a Customer Programmable feature.
- **Customer Programmable Features** - The vehicle operator interfaces with the BCM, which is the power lock system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the power lock system Customer Programmable Features through the U-Connect Touch™ screen module EVIC display.
- **Door Lock Inhibit** - Prevents locking the doors using a power door lock switch or the **Lock** button of the Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) if the key is in the ignition and the driver side front door is open.
- **Enhanced Accident Response System** - In the event of a vehicle impact that causes airbag deployment but leaves vehicle electrical power intact, the Enhanced Accident Response System (EARS) automatically turns OFF the supply of fuel to the engine, turns ON the interior courtesy lamps, turns ON the hazard warning flashers and unlocks the doors after the vehicle speed has returned to zero. This helps emergency responders in their efforts to render the appropriate assistance. The courtesy lamps and hazard flashers remain ON as long as the battery has power or until the key is removed from the ignition.
- **Illuminated Entry** - Automatic illumination of the interior courtesy lamps when the vehicle is unlocked using the power lock system.

Hard wired circuitry connects the power lock system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power lock system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information

includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system is standard factory-installed equipment on this vehicle. The RKE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is a digital display integral to the Integrated Center Stack (ICS). The EVIC includes the EVIC switches and the U-Connect Touch™ screen module located in the center stack area of the instrument panel. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Radio Frequency Hub** - The Radio Frequency Hub (also known as the RF Hub) is the RKE system control module and RF receiver located on the shelf support behind the rear seat and is concealed beneath the package tray interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Remote Keyless Entry System Transmitter** - The RKE system transmitter (also known as the FOB with Integrated Key/FOBIK) is the battery powered, wireless and portable Radio Frequency (RF) user controller for all of the features of the RKE system.

These components and their controls are combined to provide the following RKE system features:

- **Customer Programmable Features** - The vehicle operator interfaces with the RF Hub, which is the RKE system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the RKE system Customer Programmable Features through the U-Connect Touch™ screen module EVIC display.
- **Flash Lights With Lock And Unlock?** - This is a Customer Programmable feature of the RKE system. The first option has the park lamps flash as an optical verification that the RKE system has received a valid **Lock** or **Unlock** request from the FOBIK. The second option disables the optical verification feature.
- **Panic Feature** - In certain markets the FOBIK may also be equipped with a red **Panic** button. Depressing the **Panic** button of the FOBIK while within transmitter range will sound the vehicle signal horn and flash the exterior lighting of the vehicle for about three minutes or until the **Panic** button is depressed a second time, whichever occurs first. Attaining a vehicle speed of about 25.7 kilometers per hour (15 miles per hour) will also cancel the panic event.
- **Programming Additional Transmitters** - Two RKE transmitters are shipped with the vehicle from the factory, but the RKE system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the RKE system controller memory, even if the battery is disconnected. If a FOBIK is ineffective, lost or an additional FOBIK is desired, new transmitter vehicle access codes can be programmed into the system using a diagnostic scan tool.
- **Remote Deck Lid Unlatching** - Depressing the **Trunk Release** button of the FOBIK twice within 5 seconds while within transmitter range will unlatch the deck lid of the vehicle.

- **Remote Engine Start** - On vehicles equipped with the optional Remote Starting System, depressing the **Remote Start** button of the FOBIK twice while within transmitter range will start the engine of the vehicle.
- **Remote Locking** - Depressing the **Lock** button of the FOBIK while within transmitter range will lock all of the vehicle doors.
- **Remote Unlocking** - Depressing the **Unlock** button of the FOBIK while within transmitter range will unlock the vehicle and activate the Illuminated Entry System. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Remote Unlock Sequence** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option allows only the driver side front door to unlock when the FOBIK **Unlock** button is depressed one time, and the remaining doors unlock when the button is depressed a second time within 5 seconds of the first press. The second option allows all doors to unlock upon a single press of the FOBIK **Unlock** button.
- **Sound Horn On Lock?** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option has the signal horn of the vehicle sound a short chirp as an audible verification that the RKE system received a valid **Lock** request from the FOBIK. The second option disables the audible verification feature.
- **Vehicle Theft Security System Arming** - If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), depressing the **Lock** button of the FOBIK while within transmitter range will arm the VTSS in addition to activating the remote locking feature.
- **Vehicle Theft Security System Disarming** - If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), depressing the **Unlock** button of the FOBIK while within transmitter range will disarm the VTSS in addition to activating the remote unlocking feature.

Hard wired circuitry connects many of the RKE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the RKE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

PASSIVE ENTRY SYSTEM

An optional Passive Entry (PE) system is available factory-installed equipment for this vehicle. The PE system allows the vehicle to be unlocked without the use of a key, as long as an authorized FOB with Integrated Key (FOBIK) is in the possession of, or in close proximity to the individual and the aperture of the vehicle that is to be unlocked. All other features and Customer Programmable feature settings of the power lock system and the Remote Keyless Entry (RKE) system function the same as they would on vehicles without the PE system option.

The PE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Deck Lid Latch Release Switch** - A tactile deck lid latch release switch is located on the right side of the lens of the Center High Mounted Stop Lamp (CHMSL) in the center of the vertical rear deck lid surface. Only the resilient black switch push button membrane is visible on the outside of the CHMSL lens.
- **Door Handle Switches** - Each PE door outside handle (also known as a Smart handle) is equipped with three switches and an Integrated Circuit (IC). A tactile Lock switch is located on the outer horizontal surface of each door handle pull, a capacitive Unlock switch membrane is located on the inner vertical surface of the handle pull, while a Hall effect switch and an IC are concealed within the handle pull unit.
- **Low Frequency Antennas** - The PE system includes five Low Frequency (LF) antennas, one mounted on the underside of the center floor console, one on each rear door hardware module carrier concealed behind the inside trim panel, one at the forward edge of the spare tire well within the trunk compartment and one on the rear fascia bracket above the license plate tub and to the right of the license plate lamp concealed behind the rear fascia at the rear of the vehicle.
- **Radio Frequency Hub** - The Radio Frequency Hub (also known as the RF Hub) is the Passive Entry Keyless Go (PEKG) system control module and RF receiver located on the shelf support behind the rear seat and is concealed beneath the package tray interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

Hard wired circuitry connects many of the PE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the PE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

POWER LOCK SYSTEM

The power lock system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) (also known as the Common Body Controller/CBC) so that the system remains operational regardless of the ignition switch position. The BCM is the primary power lock system controller. The power lock switches are hard wired to their respective Driver Door Module (DDM) or Passenger Door Module (PDM). The BCM, the DDM and the PDM all communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

When a door module receives an input from a power lock switch, it sends the appropriate electronic **Lock Request** or **Unlock Request** message to the BCM over the CAN data bus. The BCM responds to these request messages by providing the appropriate outputs to each of the power lock motors to

lock or unlock each of the door latches. The BCM also monitors a hard wired input from the deck lid release switch and electronic message inputs indicating automatic transmission gear selector position and vehicle speed. The BCM uses all of these inputs and internal programming to determine whether or not to provide the output necessary to operate the deck lid latch release motor.

The BCM also stores the power lock system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). The BCM uses these settings and internal programming along with hard wired and electronic message inputs to determine the proper outputs needed to produce each of the appropriate power lock system features.

The power lock system circuits are continually monitored and controlled by the microprocessor and software contained within the BCM, the DDM and the PDM. When one of these modules monitors a problem in any of the power lock system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the power lock system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock system or the electronic controls and communication related to power lock system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) (also known as the Common Body Controller/CBC) so that the system remains operational regardless of the ignition switch position. The Radio Frequency Hub (also known as the RF Hub) is the primary RKE system controller as well as the Radio Frequency (RF) RKE receiver. The RF Hub validates the vehicle access code of each RKE transmitter (also known as FOB with Integrated Key/FOBIK) from which it receives RF signal inputs. It ignores requests from any transmitter for which it has no stored vehicle access code.

The RF Hub communicates and shares resources with the BCM and many other electronic modules in the vehicle over the CAN data bus. The RF Hub also stores the RKE system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). When the RF Hub receives an input from a valid transmitter source, it uses these settings and internal programming to send the appropriate electronic request messages to the BCM and other electronic modules over the CAN data bus to invoke the proper RKE system features and responses.

The RKE system circuits and transmitter inputs are continually monitored by the microprocessor and software contained within the RF Hub. When the RF Hub monitors a problem in any of the RKE system circuits or transmitters, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the RKE system may be diagnosed using

conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RKE system or the electronic controls or communication between other modules and devices that provide features of the RKE system. The most reliable, efficient, and accurate means to diagnose the RKE system or the electronic controls and communication related to RKE system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PASSIVE ENTRY SYSTEM

In the Passive Entry (PE) system the doors are unlocked passively; however, they must still be locked actively after exiting the vehicle using the tactile **Lock** button on either front door handle. When the system senses a hand approaching the capacitive switch in the door handle pull or detects a button press of the deck lid release switch, it sends out challenge messages through the Low Frequency (LF) antennas to authenticate the presence and location of a valid FOB with Integrated Key (FOBIK).

The FOBIK responds by sending a Very High Frequency (VHF) message back to the receiver within the Radio Frequency Hub (also known as the RF Hub). If the RF Hub determines the FOBIK is valid and that it is located outside the vehicle in the same zone or vicinity as the door handle or deck lid switch being activated, it sends an electronic **Unlock Request** message over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) to automatically unlock and allow entry to that aperture.

The PE system circuits and FOBIK inputs are continually monitored by the microprocessor and software contained within the RF Hub. When the RF Hub monitors a problem in any of the PE system circuits or FOBIK inputs, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the PE system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PE system or the electronic controls or communication between other modules and devices that provide features of the PE system. The most reliable, efficient, and accurate means to diagnose the PE system or the electronic controls and communication related to PE system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCKS AND REMOTE KEYLESS ENTRY SYSTEM

POWER LOCK SYSTEM

Following are tests that may help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the Controller Area Network (CAN) data bus and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the power lock motors are receiving the proper hard wired outputs from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) for them to perform their power lock system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter (also known as the FOB with Integrated Key/FOBIK). Then, proceed as follows:

1. If the entire power lock system fails to function with either the power lock switches or the FOBIK, check the fused B(+) fuse for the power lock system.
2. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to **RKE TRANSMITTER** .
3. If the power lock system functions with the FOBIK, but not with one or both power lock switches, proceed to **DIAGNOSIS AND TESTING** of the door lock switches.
4. If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, proceed to **DIAGNOSIS AND TESTING - POWER LOCK MOTOR** .

REMOTE KEYLESS ENTRY SYSTEM

Following are tests that may help to diagnose the Remote Keyless Entry (RKE) system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the RKE system, the Controller Area Network (CAN) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the RKE system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the RKE system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub (also known as the RF Hub) is being sent the proper Radio Frequency (RF) signals by the RKE

transmitters (also known as FOB with Integrated Key/FOBIK) to perform its RKE system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the RKE system, first confirm that the power lock system operates satisfactorily. If the power lock system fails to operate correctly, repair that problem before attempting to diagnose the RKE system. If the problem being diagnosed involves only one or more Customer Programmable features, check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that these programmable features are enabled. If the features are enabled and still fail to operate, the RF Hub and the CAN data bus must be tested. Next, note the RKE system operation while you perform both the Lock and Unlock functions with the FOBIK. Then, proceed as follows:

1. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to **DIAGNOSIS AND TESTING** .
2. If the FOBIK checks okay, proceed to **DIAGNOSIS AND TESTING** of the RF Hub or the CAN data bus. The use of a diagnostic scan tool and the appropriate diagnostic information are required.

PASSIVE ENTRY SYSTEM

As a preliminary diagnosis for the Passive Entry (PE) system, first check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that this Customer Programmable feature is enabled. Next, confirm that the power lock system and the RKE system operate satisfactorily. If the power lock system or the RKE system fails to operate correctly, repair that problem before attempting to diagnose the PE system.

The most reliable, efficient, and accurate means to diagnose the PE system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub (also known as the RF Hub) is sending the proper Radio Frequency (RF) signals to and receiving the proper RF signals from the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its PE system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

ACTUATOR, FUEL DOOR

DESCRIPTION

DESCRIPTION

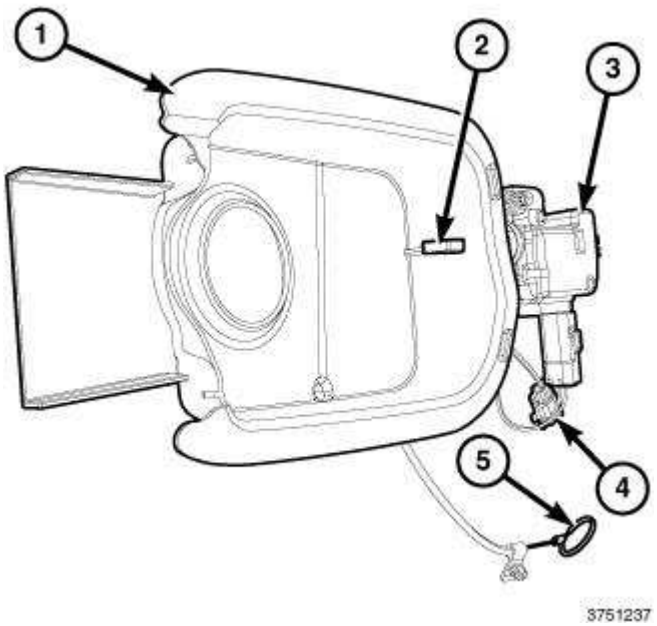

Fig. 1: Fuel Filler Housing, Latch, Electrical Solenoid & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

An electrically actuated fuel door release mechanism is standard equipment in this vehicle. A striker on the fuel door is engaged by a latch (2) and actuator mechanism integral to the fuel filler housing (1) located behind the fuel door opening of the left quarter outer panel. The actuator mechanism is operated by an electrical solenoid (3) that is also integral to the fuel filler housing. A short wire harness (4) connected to the solenoid passes through a rubber grommet and a hole in the body sheet metal into the trunk compartment along with a mechanical emergency release cable (5). The solenoid is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness located on the left side of the trunk.

The fuel door release actuator mechanism cannot be adjusted or repaired. If damaged or ineffective, the entire fuel filler housing unit must be replaced. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .

OPERATION

OPERATION

The fuel filler door actuator solenoid is energized by fused battery feed received from the fuel filler door switch located within the map pocket of the driver side front door inside trim panel whenever the momentary switch button is depressed. The solenoid is connected to a path to ground at all times through a take out of the body wire harness that is secured to the body sheet metal. These connections allow the solenoid to operate regardless of the ignition switch status.

If the vehicle electrical system, the fuel filler release solenoid, the switch or the release solenoid

electrical circuits are damaged or ineffective, pulling the mechanical emergency release cable located on the left side within the trunk compartment will manually release the fuel filler door.

ANTENNA, PASSIVE ENTRY

DESCRIPTION

DESCRIPTION

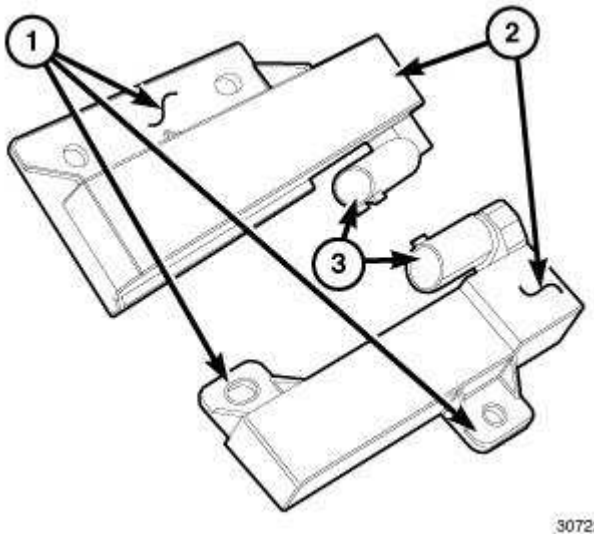

Fig. 2: Integral Connector Receptacle, Ferrite Antenna Units & Flanges
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) and Keyless Go (KG) systems have several Low Frequency (LF), ferrite antenna units (2) located within the vehicle. Each ferrite PE antenna unit is contained within a molded black plastic housing with an integral connector receptacle (3) molded into one end. The connector receptacle contains terminal pins that connect the antenna to the vehicle electrical system through a twisted pair of conductors and a connector that are part of the adjacent wire harness.

Each antenna housing also includes two integral mounting flange or flanges (1) which can be used to mount the unit with screws. However, in some applications the antenna mounting flanges are snapped into a spring steel adapter or retainer, which allows the antenna unit to be securely clipped in place over a body flange rather than being secured with screws. This vehicle platform uses five PE antenna units. One is secured to the underside of the center floor console, one is secured to each rear door hardware module carrier concealed behind the inside door trim panels, one is secured to the forward flange of the spare tire well within the trunk area and one is concealed behind the rear fascia to the right of the license plate lamp.

The antennas are each connected to the Radio Frequency Hub (also known as the RF Hub) on dedicated and sequentially numbered circuits. The left rear door antenna is connected through the antenna 1 circuits, the right rear door antenna is connected through the antenna 2 circuits, the trunk antenna is connected through the antenna 3 circuits, the center floor console is connected through

the antenna 4 circuits and the rear fascia bracket antenna is connected through the antenna 5 circuits.

LD LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	**Antenna And Circuit Number**
Left Rear Door	1
Right Rear Door	2
Trunk	3
Center Floor Console	4
Rear Fascia Bracket	5

An LF antenna unit cannot be adjusted or repaired. If ineffective or damaged, it must be replaced with a new unit. For applications where it is used, the antenna unit adapter or retainer may be serviced only as a unit with the LF antenna.

OPERATION

OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communication with the FOBIK is on 20 kilohertz using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microprocessor continuously monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

CENTER FLOOR CONSOLE

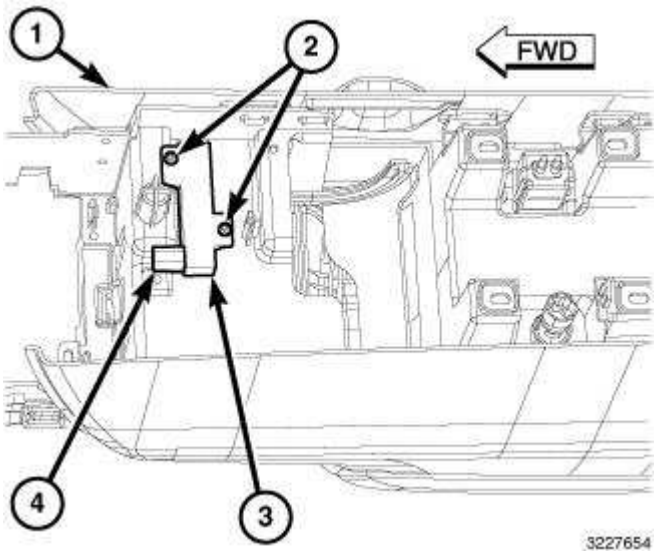

Fig. 3: Center Floor Console, Connector Receptacle & Low Frequency Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center floor console (1) from the vehicle. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Disconnect the wire harness connector from the connector receptacle (4) for the Low Frequency (LF) antenna (3) on the underside of the console.
4. Remove the two screws (2) that secure the antenna to the underside of the console.
5. Remove the antenna from the console.

REAR DOOR

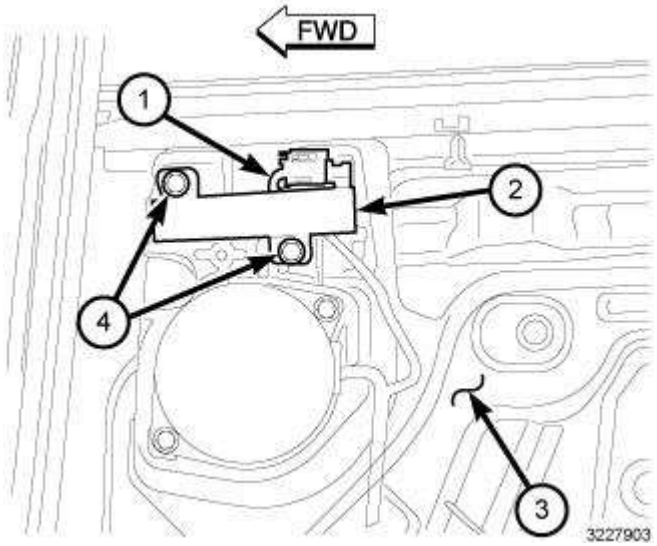

Fig. 4: Wire Harness Connector, Low Frequency (LF) Antenna, Screws & Rear Door Hardware Module Carrier
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, REMOVAL** .
3. Disconnect the door wire harness connector (1) from the Low Frequency (LF) antenna (2) connector receptacle.
4. Remove the two screws (4) that secure the antenna to the inside of the rear door hardware module carrier (3).
5. Remove the antenna from the carrier.

REAR FASCIA BRACKET

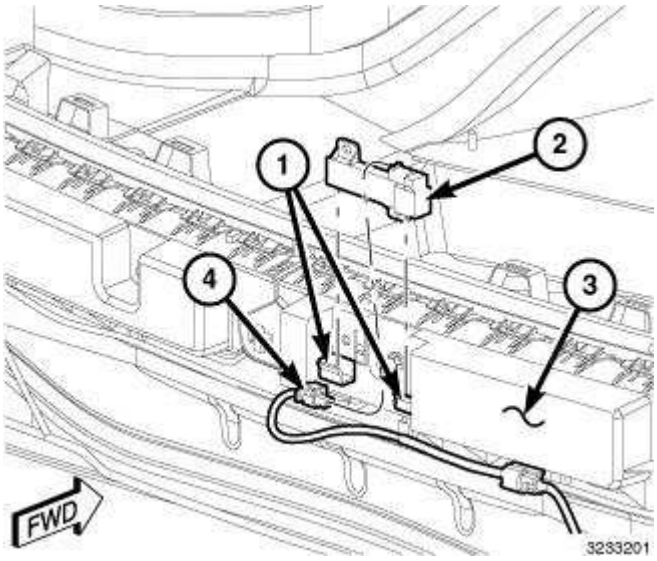

Fig. 5: Wire Harness Connector, Antenna & Rear Fascia Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fascia from the vehicle. Refer to **FASCIA, REAR, REMOVAL** .
3. Disconnect the wire harness connector (4) from the connector receptacle for the Low Frequency (LF) antenna (2) located in a pocket near the center of the rear fascia bracket (3).
4. Unsnap the antenna from the retainers (1) integral to the rear fascia bracket.
5. Remove the LF antenna from the vehicle.

TRUNK

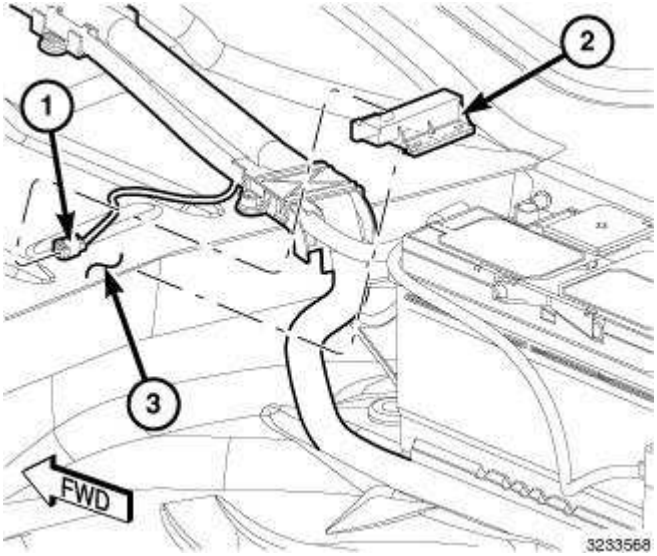

Fig. 6: Wire Harness Connector, Antenna & Trunk Floor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Fold up and move the spare tire cover and trunk carpet aside far enough to access the trunk floor (3) where it meets the forward edge of the spare tire well. Refer to **CARPET, REMOVAL** .
3. Disconnect the body wire harness connector (1) from the Low Frequency (LF) antenna (2) connector receptacle.
4. Pull the antenna and retainer unit rearward off of the flange at the front of the spare tire well.
5. Remove the antenna and retainer from the trunk as a unit.

INSTALLATION

CENTER FLOOR CONSOLE

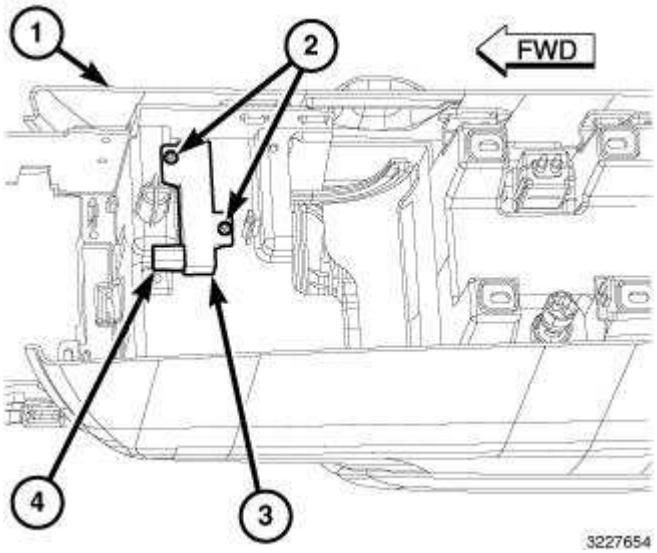

Fig. 7: Center Floor Console, Connector Receptacle & Low Frequency Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (3) to the underside of the center floor console (1).
2. Install and tighten the two screws (2) that secure the antenna to the console. Tighten the screws securely.
3. Reconnect the wire harness connector to the antenna connector receptacle (4).
4. Reinstall the console into the vehicle. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Reconnect the battery negative cable.

REAR DOOR

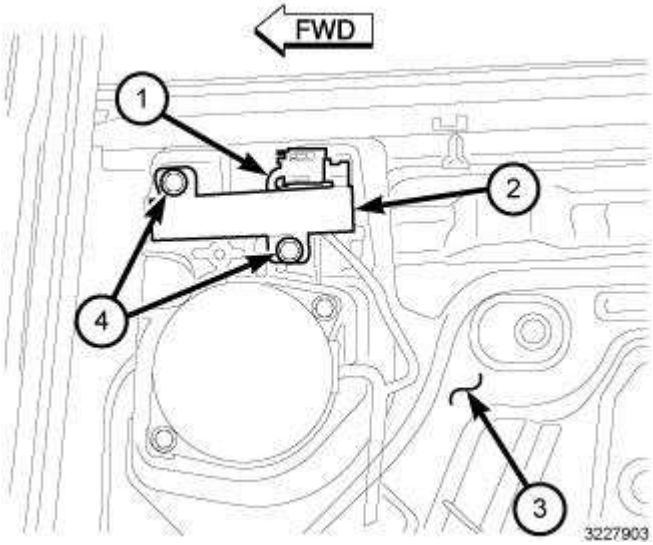

Fig. 8: Wire Harness Connector, Low Frequency (LF) Antenna, Screws & Rear Door Hardware Module Carrier
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (2) to the rear door hardware module carrier (3). Be certain the door wire harness take out for the antenna is routed behind the antenna, but not pinched.
2. Install and tighten the two screws (4) that secure the antenna to the carrier. Tighten the screws securely.
3. Reconnect the door wire harness connector (1) to the antenna connector receptacle.
4. Reinstall the trim panel onto the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.

REAR FASCIA BRACKET

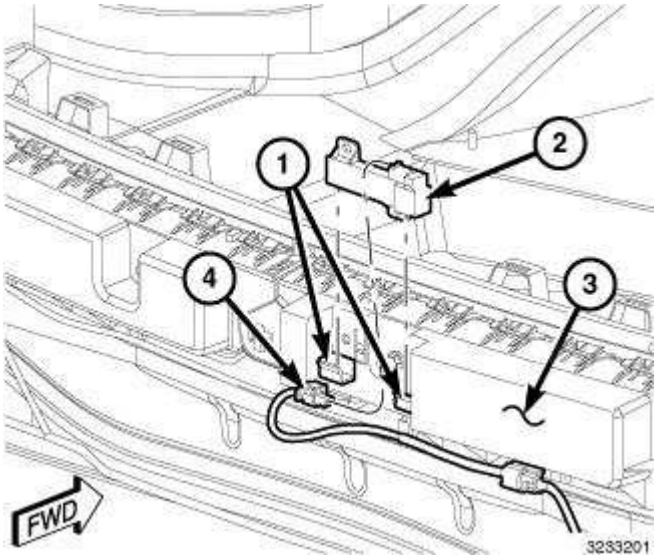

Fig. 9: Wire Harness Connector, Antenna & Rear Fascia Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (2) to the pocket near the center of the rear fascia bracket (3).
2. Reconnect the wire harness connector (4) to the connector receptacle for the antenna.
3. Align the antenna with the retainers (1) integral to the rear fascia bracket, then slide it downward until it snaps into place.
4. Reinstall the rear fascia onto the vehicle. Refer to **FASCIA, REAR, INSTALLATION** .
5. Reconnect the battery negative cable.

TRUNK

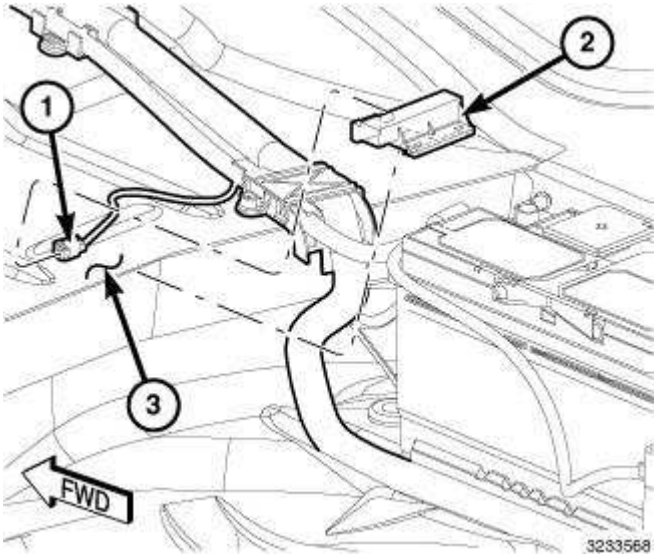

Fig. 10: Wire Harness Connector, Antenna & Trunk Floor
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna and receiver (2) into the trunk as a unit.
2. Align the clip on the underside of the antenna retainer with the flange where the trunk floor (3) meets the forward edge of the spare tire well.
3. Push the antenna and retainer unit forward until the clip is fully seated on the flange.
4. Reconnect the body wire harness connector (1) to the antenna connector receptacle.
5. Reinstall the spare tire cover and trunk carpet over the trunk floor and the spare tire well. Refer to **CARPET, INSTALLATION** .
6. Reconnect the battery negative cable.

MOTOR, DOOR LOCK

DESCRIPTION

DESCRIPTION

Power operated door locking and deck lid latching mechanisms are standard equipment in this vehicle. The lock mechanisms of each door and the deck lid latch are actuated by a reversible electric motor integral to each latch unit. A connector receptacle integral to each latch connects the power lock motor and the integral door or deck lid ajar micro switch to the vehicle electrical system through a dedicated take out and connector of the door or body wire harness.

The power lock motors cannot be adjusted or repaired and, if ineffective or damaged, the entire door or deck lid latch unit must be replaced.

OPERATION

OPERATION

The power lock motors are controlled by outputs received from the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM acts upon programming, hard wired inputs from the driver or passenger door lock switches as well as electronic **lock** or **unlock** command message inputs received over the Controller Area Network (CAN) data bus from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) based upon inputs from the FOB with Integrated Key (FOBIK) transmitters.

A positive and negative battery connection to the two lock motor terminals will cause the motor to move in one direction, locking or unlocking the latch. Reversing the current will cause the motor to move in the opposite direction.

The power lock motors and the hard wired circuits between the motors and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide some features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock motors or the electronic controls and communication related to power lock motor operation requires the use of a diagnostic scan tool. Refer to the

appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCK MOTOR

Remember, the Body Control Module (BCM) (also known as the Common Body Controller/CBC) circuitry controls the outputs to the power lock motors. If both the power lock motors and the circuits between the motors and the BCM test okay, the use of a diagnostic scan tool is required for further power lock system diagnosis. Refer to the appropriate diagnostic information.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the power lock motor for correct operation while moving a power lock switch to both the **Lock** and **Unlock** positions.
2. Disconnect the door or body wire harness connector from the inoperative power lock motor.
3. Apply 12 volts to the lock and unlock driver circuit cavities of the power lock motor connector to check its operation in one direction.
4. Reverse the connection polarity to check the motor operation in the opposite direction.
5. If motor operation is okay in both directions, check both the lock and unlock circuits between the lock motor and the BCM and repair if required. If motor operation is not okay in both directions, replace the latch unit containing the ineffective power lock motor.

SWITCH, DECK LID RELEASE

DESCRIPTION

DECK LID

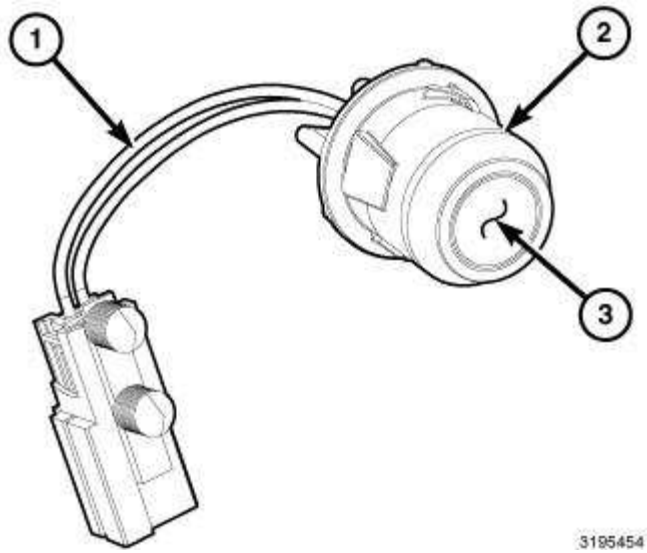

Fig. 11: Wire And Connector, Release Switch & Switch Button
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) system have a PE deck lid release switch (2) integral to the Center High Mounted Stop Lamp (CHMSL). This tactile switch is secured to the back of the right side of the CHMSL housing with a wedge type base connection. The switch button (3) extends through clearance holes in the lamp housing and lens so that it can be accessed on the right end of the CHMSL lens, which is visible on the upper rear vertical face of the deck lid.

The switch has a pigtail wire and connector (1) secured to the back of the CHMSL housing that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. An integral 3.0 kilohm diagnostic resistor is connected in series with the output side of the switch.

The PE deck lid release switch cannot be adjusted or repaired. If the switch is damaged or ineffective, the entire switch unit must be replaced.

INSTRUMENT PANEL

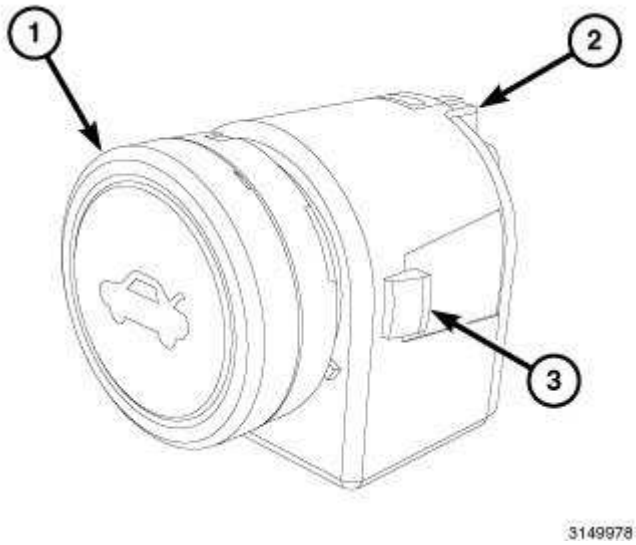

Fig. 12: Release Switch, Receptacle & Single Integral Latch
Courtesy of CHRYSLER GROUP, LLC

The instrument panel deck lid release switch (1) is mounted in the steering column opening cover to the left of the steering column on the instrument panel. Only the switch button is visible on the outer surface of the instrument panel. The black plastic switch button has a white International Control and Display Symbol icon applied to it, which clearly identifies its function.

The black, molded plastic switch housing encloses the switch button mechanism and the switch circuitry including the switch contacts. A connector receptacle (2) is integral to the back of the switch housing, while a single integral latch feature (3) on each side of the housing are used secure the switch by a yoke type retainer and two screws on the back side of the steering column opening cover. The deck lid release switch is connected to the vehicle electrical system through a dedicated take out

and connector of the instrument panel wire harness.

The instrument panel deck lid release switch cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

OPERATION

DECK LID

The Passive Entry (PE) deck lid release switch is a normally open switch that is connected to ground at all times. When the switch button is depressed, it provides a ground signal to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) through a deck lid release switch sense circuit. In response to that input, the BCM sends an electronic **unlock request** message to the Radio Frequency (RF) Hub over the Controller Area Network (CAN) data bus. The RF Hub determines the PE system response based upon the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK).

The diagnostic resistor integral to the output side of the switch enables the BCM to monitor the condition of the deck lid release switch and switch sense circuit. The BCM will store a Diagnostic Trouble Code (DTC) for any fault that is detected in this circuit.

The hard wired circuits between the PE deck lid release switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls and communication between other modules and devices that provide some features of the PE system. The most reliable, efficient, and accurate means to diagnose the PE system or the electronic controls and communication related to deck lid release switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

INSTRUMENT PANEL

The instrument panel deck lid release switch is a normally open switch that is connected to ground at all times. When the switch button is depressed, it provides a ground signal to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) through a deck lid release switch sense circuit.

The BCM uses internal programming and inputs from other sources to determine the appropriate response to an instrument panel deck lid release switch input. If the vehicle has an automatic transmission, the BCM must confirm that the transmission gear selector lever is in the PARK position before activating the deck lid latch motor. If the vehicle is equipped with a manual transmission, the BCM must confirm that the vehicle speed input is less than 8 kilometers-per-hour (5 miles-per-hour) before activating the deck lid latch motor.

The hard wired circuits between the instrument panel deck lid release switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls and communication between other modules and devices that provide the deck lid release feature. The most reliable, efficient, and accurate means to diagnose the

deck lid release feature or the electronic controls and communication related to instrument panel deck lid release switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

DECK LID

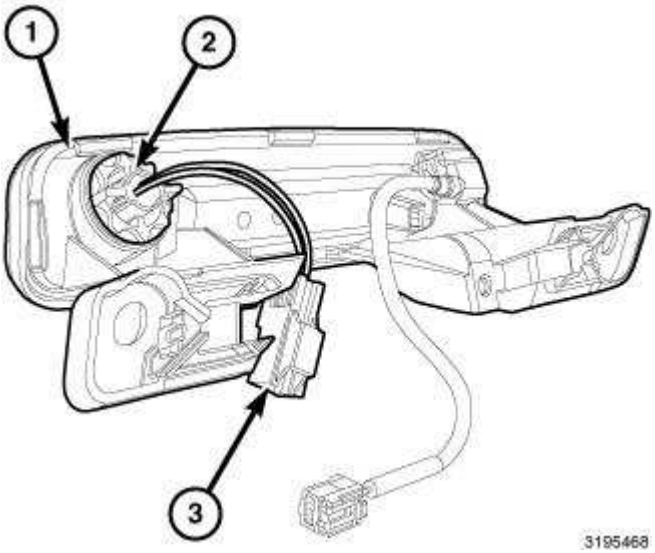

Fig. 13: Center High Mounted Stop Lamp (CHMSL) Unit, Switch Connector & Mounting Flange
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the Center High Mounted Stop Lamp (CHMSL) unit (1) from the deck lid. Refer to **LAMP, CENTER HIGH MOUNTED STOP, REMOVAL** .
3. Disengage the deck lid release switch connector (3) and pigtail wire harness from the retention features on the back of the CHMSL housing.
4. Firmly grasp the tabs of the deck lid release switch mounting flange (2) on the back of the CHMSL housing and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the switch straight out from the clearance hole through the back of the CHMSL housing.

INSTRUMENT PANEL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

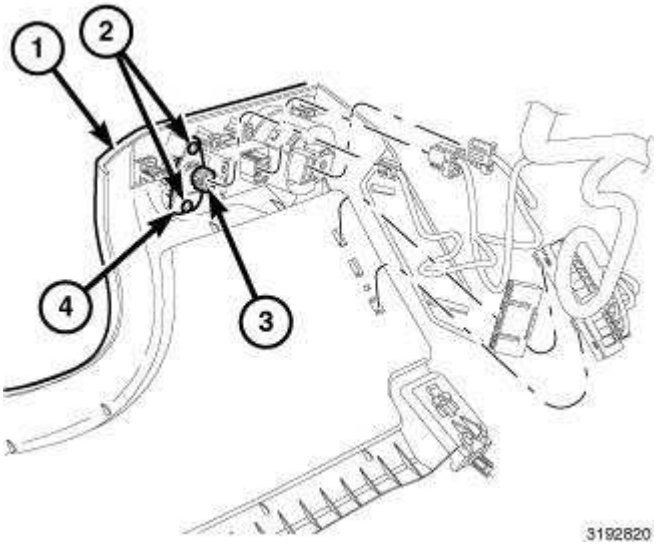

Fig. 14: Steering Column Opening Cover, Release Switch & Retainer Yoke
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column opening cover (1) from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Working from the back of the steering column opening cover, remove the two screws that secure the deck lid release switch (3) retainer yoke (4) to the back of the cover.
4. Remove the switch and retainer from the back of the cover.
5. Remove the switch from the retainer.

INSTALLATION

DECK LID

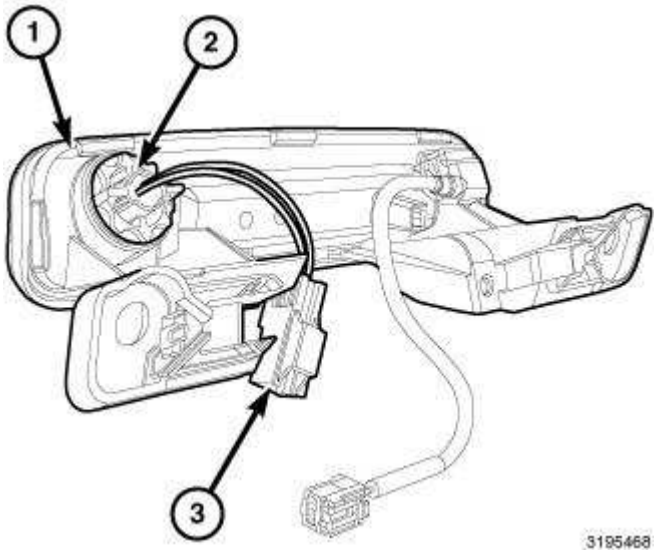

Fig. 15: Center High Mounted Stop Lamp (CHMSL) Unit, Switch Connector & Mounting Flange
Courtesy of CHRYSLER GROUP, LLC

1. Align the deck lid release switch with the clearance hole in the back of the Center High Mounted Stop Lamp (CHMSL) unit housing (1).
2. Insert the switch straight into the clearance hole through the back of the CHMSL housing until the switch mounting flange (2) is firmly seated against the CHMSL housing.
3. Rotate the switch clockwise about 30 degrees to lock it into place.
4. Engage the deck lid release switch connector (3) and pigtail wire harness with the retention features on the back of the CHMSL housing.
5. Reinstall the CHMSL unit into the deck lid. Refer to **LAMP, CENTER HIGH MOUNTED STOP, INSTALLATION** .
6. Reconnect the battery negative cable.

INSTRUMENT PANEL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

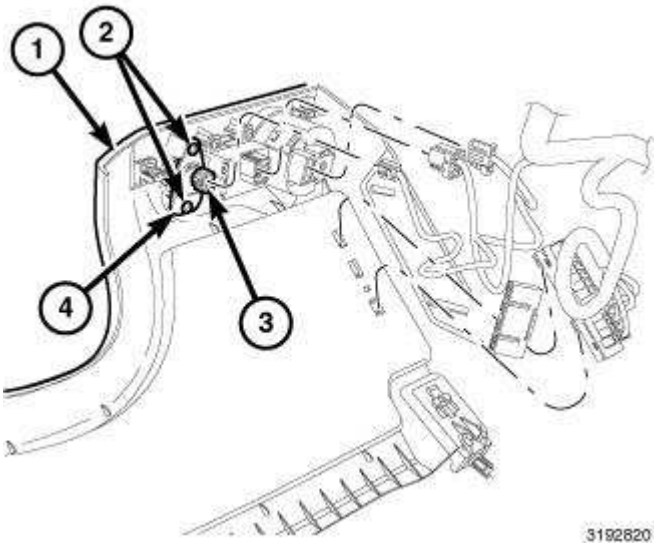

Fig. 16: Steering Column Opening Cover, Release Switch & Retainer Yoke
Courtesy of CHRYSLER GROUP, LLC

1. Position the back of the deck lid release switch (3) through the hole in the retainer yoke (4).
2. Position the switch and retainer to the back of the steering column opening cover (1).

3. Install and tighten the two screws (2) that secure the switch and retainer to the back of the cover. Tighten the screws securely.
4. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
5. Reconnect the battery negative cable.

SWITCH, DOOR HANDLE

DESCRIPTION

DESCRIPTION

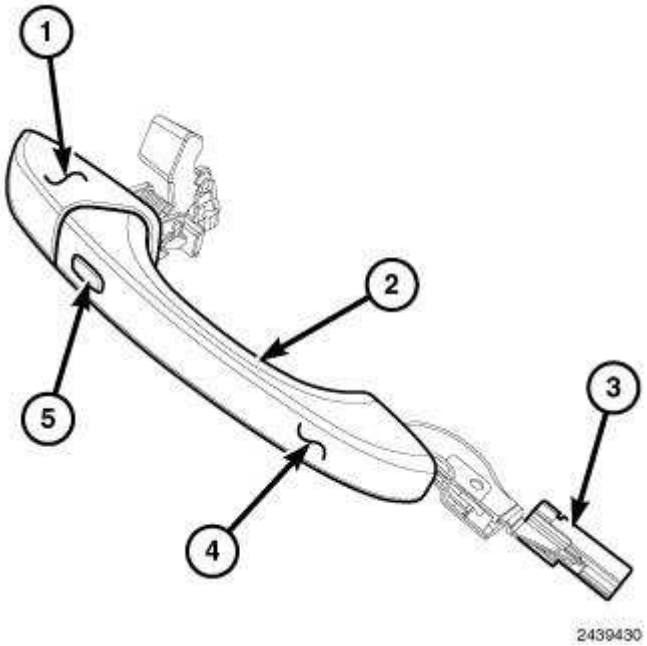

Fig. 17: SWITCH, Door Handle, Front
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Passive Entry (PE) system have unique outside front door handles that incorporate three switches and a logic circuit. These unique PE door handles are sometimes referred to as smart handles. The handle itself is very similar in appearance to those used in conventional non-PE applications, consisting primarily of a grip (4) and a base (1).

The PE door handles can be readily identified by a tactile, resistive membrane lock switch (5) located on the outward facing vertical surface at the rearward end of the handle grip, and by a capacitive sensor or switch membrane patch on the inside surface (2) of the grip. A third, Hall-effect type switch as well as an Integrated Circuit (IC) chip are concealed within the grip near the handle base.

The mechanical functions and mounting provisions of the PE handle are identical to those of a conventional outside door handle. However, an integral connector receptacle (3) is located at the forward end of the handle grip where it is concealed within the door interior. The PE handle is

connected to the vehicle electrical system through a dedicated take out and connector of the PE door jumper wire harness.

The individual switches of the PE outside front door handles cannot be adjusted or repaired. If any one of the switches, the IC or any of the mechanical handle components is damaged or ineffective, the entire handle unit must be replaced. Refer to **HANDLE, EXTERIOR, REMOVAL** .

OPERATION

OPERATION

The three switches of each Passive Entry (PE) outside front door handle are powered by and provide a direct input to the Integrated Circuit (IC) of that door handle. The IC of each PE outside front door handle receives power from the Passive Entry Module (PEM) on a signal circuit, and a clean ground from the PEM on a return circuit. The PE handle IC and the PEM communicate with each other by modulating the current in the signal circuit.

Each PE outside front door handle has three switches. The inputs from those three switches and the handle logic circuit allow each handle to send the PEM up to four different signals: Unlock Request, Hall, Lock Request and Error. The PEM determines the system response based upon the inputs it receives from each handle as well as the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK).

The tactile, mechanical, resistive membrane lock switch allows the user to actively lock the vehicle. The capacitive switch senses a hand approaching the handle grip to passively unlock the vehicle. The Hall-effect switch senses handle grip movement. An adaptation algorithm in the logic circuit of each handle can modify the sensitivity of the capacitive switches as well as system responses to the Hall-effect switch inputs to compensate for sensed repeated or continuous actuations such as might be caused by the switch membrane being wetted, but restores normal sensitivity about one minute after the repeated or continuous actuation input ceases.

The hard wired inputs and outputs of the PE outside front door handle may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, FUEL DOOR

DESCRIPTION

DESCRIPTION

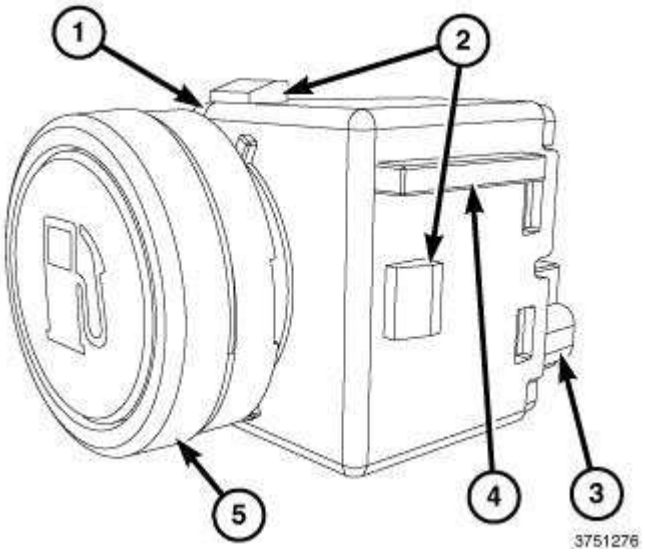

Fig. 18: Switch, Latch Features, Receptacle & Alignment Spline
Courtesy of CHRYSLER GROUP, LLC

The fuel door release switch (1) is mounted in the map pocket of the driver side front door inside trim panel. Only the switch button is visible on the outer surface of the trim panel. The black plastic switch button has a white International Control and Display Symbol icon applied to it, which clearly identifies its function. A Light Emitting Diode (LED) unit within the switch illuminates the icon on the switch button for improved visibility.

The black, molded plastic switch housing encloses the switch button mechanism and the switch circuitry including the switch contacts. A connector receptacle (3) is integral to the back of the switch housing, while integral latch features (2) and an alignment spline (4) on the sides of the housing are used to secure and locate the switch within a mounting receptacle integral to a reinforcement on the back side of the door trim panel. The fuel door release switch is connected to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The fuel door release switch cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

OPERATION

OPERATION

The fuel door release switch is a normally open, momentary switch that is connected to fused battery feed at all times. When the switch button is depressed, it provides a battery feed signal to the fuel door release actuator solenoid on the fuel filler housing through a fuel door control circuit.

The hard wired circuit between the fuel door release switch and the fuel door release actuator solenoid may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

REMOVAL

REMOVAL

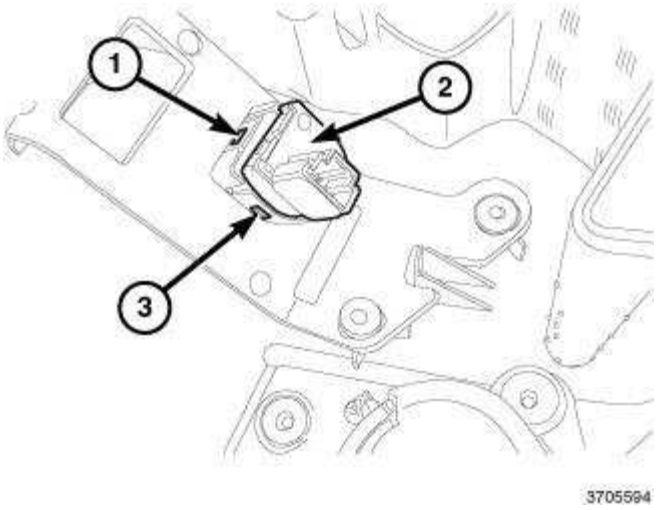

Fig. 19: Latch Tabs & Release Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the driver side front door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Working from the back side of the door trim panel, disengage the latch tabs (1 and 3) that secure the fuel door release switch (2) to the receptacle integral to the trim panel reinforcement.
4. Remove the switch from the door trim panel.

INSTALLATION

INSTALLATION

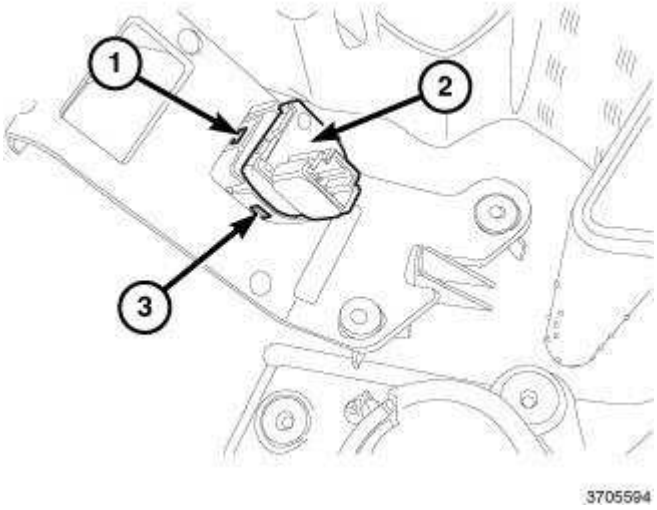

Fig. 20: Latch Tabs & Release Switch
Courtesy of CHRYSLER GROUP, LLC

1. Align the fuel door release switch (2) with the receptacle integral to the reinforcement on the back side of the driver side front door trim panel.
2. Using hand pressure, push the switch into the receptacle until each of the switch latch tabs (1 and 3) are fully engaged.
3. Reinstall the trim panel onto the inside of the driver side front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
4. Reconnect the battery negative cable.

SWITCH, LOCK

DESCRIPTION

DESCRIPTION

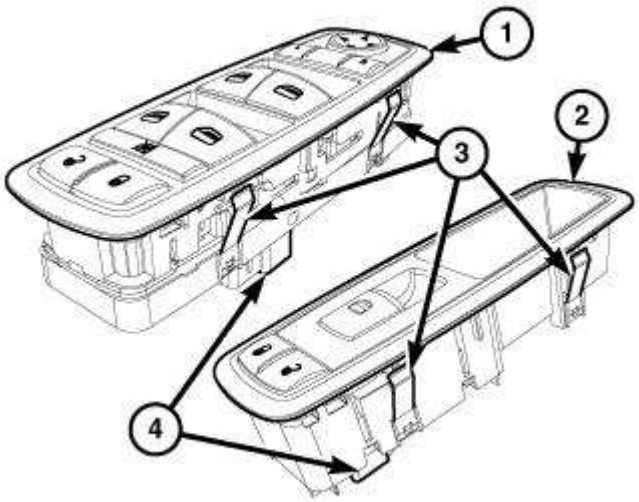

Fig. 21: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Two different modules are used: a driver side module (1), and a passenger side module (2). Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

Each switch module housing is secured within the trim panel armrest by four spring clip retainers (3), two on each side of the switch module housing. The passenger side switch module includes a small cubby bin. A connector receptacle (4) integral to each switch module housing connects the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harnesses.

The front door power switch modules include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - Three mirror selector switch buttons choose the power mirror to be adjusted, **R** (right), **L** (left) or a power fold position (both mirrors).
- **Power Mirror Direction Control Switch (Driver Side Switch Only)** - After a power mirror is selected, pressing down on one of the arrows on the momentary mirror direction switch will move the selected mirror in that direction for as long as it is held down until the limit of the mirror travel is reached.
- **Power Window Lockout Switch (Driver Side Switch Only)** - A latching push-button power window lockout switch allows the vehicle operator to lock out the power window switches on each front and rear passenger door so that those windows may be operated only from the driver side front door master switches. When the lockout switch is engaged, the LED back lighting for each front and rear passenger door power window switch is extinguished.
- **Power Window Switches** - A single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for each passenger door window while the driver side switch module contains four of these power window switches, one switch dedicated to each door window. The switch tab for the driver side front door power window has a second detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. A second detent in the up direction on both front door power window switches activates the **Express-Up** feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door switch module must be replaced as a unit.

OPERATION

OPERATION

The driver side front door power switch module combines a power lock switch, a power window switch for each of the four door windows including auto-down (also known as one-touch down or express down) and express up features for both front door windows, a power window lockout switch, a power mirror selector switch, and a power mirror adjustment switch in a single unit. The passenger side power door switch module combines a power lock switch and a passenger side front door power window switch with the auto-down and express up features.

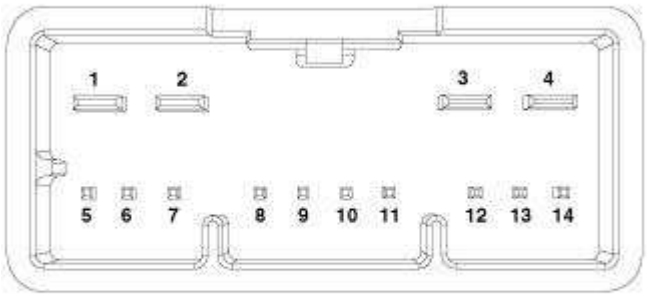
The driver side front door power switch module provides resistor multiplexed outputs to the driver door module indicating the power lock switch selection, hard wired analog outputs indicating the power mirror selector switch and adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection indicating the power window switch selections. The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating both the power lock and power window switch selections.

The hard wired circuits between the driver side front door power switch module and the driver side door module or the rear door power window switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the door module or in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

The hard wired circuits between the passenger side front door power switch module and the passenger side door module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock or power window systems. The most reliable, efficient, and accurate means to diagnose the power switch module or the electronic controls and communication related to power lock or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOCK SWITCH



2851221

Fig. 22: Driver Front Door Switch Module Connector Receptacle

Courtesy of CHRYSLER GROUP, LLC

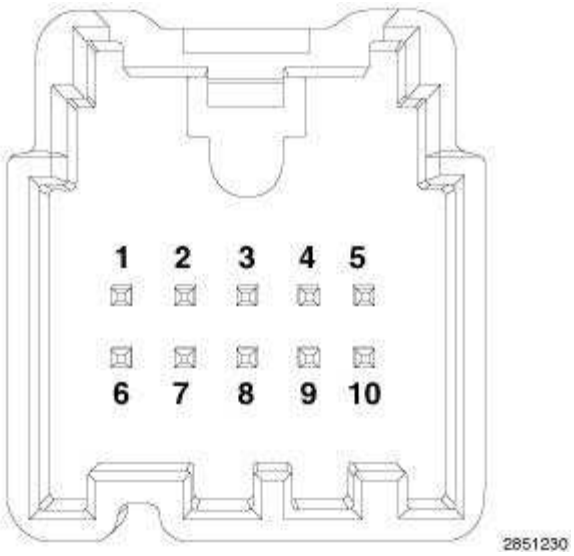


Fig. 23: Passenger Front Door Switch Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the power switch module and bezel unit from the front door trim panel. Refer to **SWITCH, LOCK, REMOVAL**.
2. Disconnect the door wire harness connector from the power switch module.
3. Using an ohmmeter, test the resistance between the terminals of the front door power lock or power window switch as shown in the Power Lock or Power Window Switch Tests table.

NOTE: **The switches in the driver front door switch module not listed in the Switch Test Tables provide inputs to the Driver Door Module (DDM) over a Local Interface Network (LIN) data bus and cannot be resistance tested. The use of a diagnostic scan tool and the appropriate diagnostic information is required for further testing of those switches.**

POWER LOCK SWITCH TESTS - PASSENGER DOOR	
SWITCH POSITION (PINS)	**RESISTANCE RANGE (OHMS)**
LOCK (4 and 8)	326 - 341
UNLOCK (4 and 8)	99 - 103
NEUTRAL (4 and 8)	>1 megohm
POWER WINDOW	

SWITCH TESTS - DRIVER DOOR	
SWITCH POSITION (PINS)	**RESISTANCE (OHMS)**
MASTER LEFT REAR WINDOW UP SWITCH - NEUTRAL (2 and 5)	>1 megohm
UP SWITCH - UP (2 and 5)	<2
DOWN SWITCH - NEUTRAL (2 and 7)	>1 megohm
DOWN SWITCH - DOWN (2 and 7)	<2
MASTER RIGHT REAR WINDOW UP SWITCH - NEUTRAL (2 and 12)	>1 megohm
UP SWITCH - UP (2 and 12)	<2
DOWN SWITCH - NEUTRAL (2 and 14)	>1 megohm
DOWN SWITCH - DOWN (2 and 14)	<2
POWER WINDOW	

SWITCH TESTS - PASSENGER DOOR	
SWITCH POSITION (PINS)	**RESISTANCE RANGE (OHMS)**
UP (4 and 9)	990 - 1022
AUTO UP (4 and 9)	329 - 349
DOWN (4 and 9)	2970 - 3042
AUTO DOWN (4 and 9)	0 - 12
NEUTRAL (4 and 9)	>1 megohm

4. If a switch fails any of the tests, replace the ineffective front door power switch module and bezel unit as required.

REMOVAL

REMOVAL

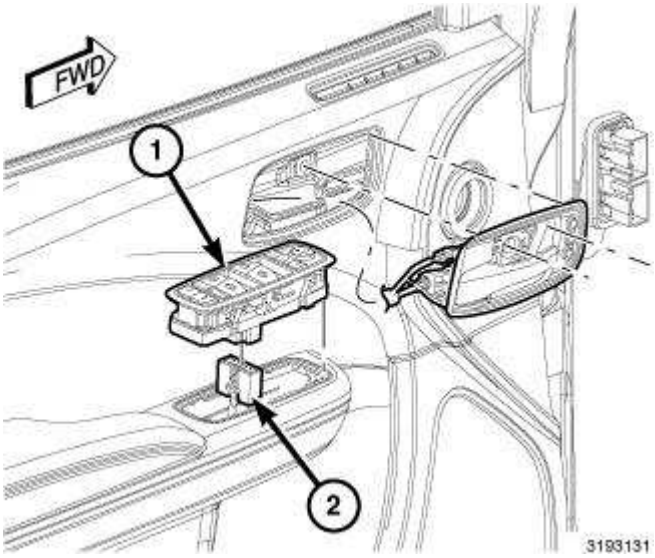

Fig. 24: Front Door Switch Module & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, pry the bezel of the front door switch module (1) up and away from the front door trim panel arm rest far enough to disengage the four spring steel retainers of the switch from the arm rest opening.

3. Pull the switch module away from the mounting hole of the arm rest far enough to access and disconnect the door wire harness connector (2) from the switch connector receptacle.
4. Remove the switch module from the vehicle.

INSTALLATION

INSTALLATION

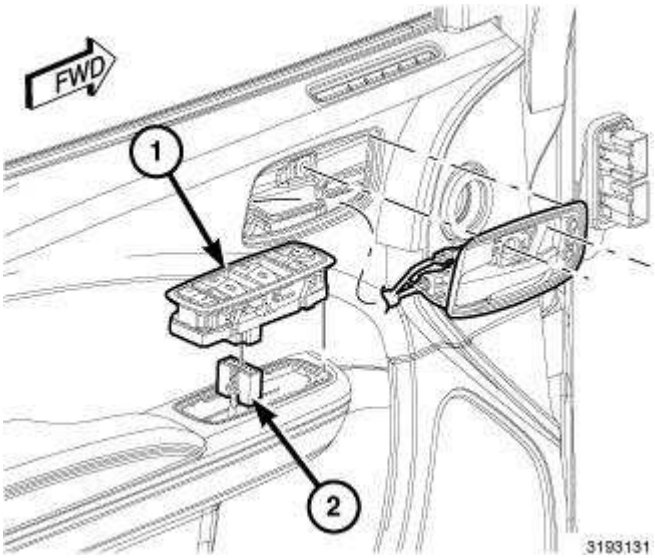

Fig. 25: Front Door Switch Module & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door switch module (1) close enough to the mounting hole in the arm rest of the front door trim panel to access and reconnect the front door wire harness connector (2) to the switch connector receptacle.
2. Align the switch module to the arm rest mounting hole.
3. Using hand pressure, press the switch module firmly and evenly into the mounting hole until the four spring steel retainers of the switch are fully engaged and the switch bezel is fully seated against the arm rest.
4. Reconnect the battery negative cable.

TRANSMITTER, INTEGRATED KEY FOB

DESCRIPTION

DESCRIPTION

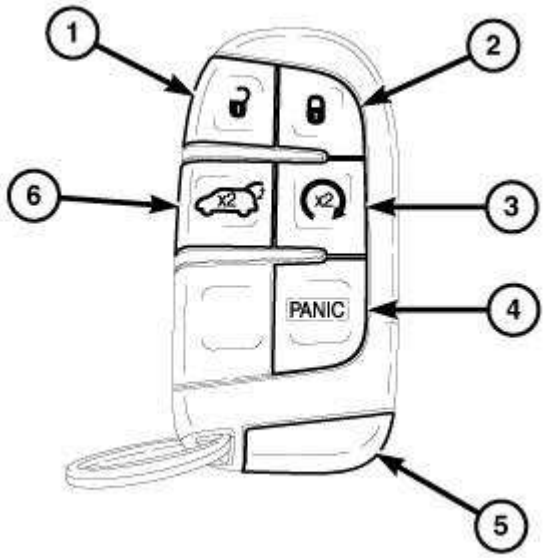

Fig. 26: FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) Transmitters
Courtesy of CHRYSLER GROUP, LLC

Vehicles are shipped from the factory with two FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitters programmed to the vehicle as standard equipment. The FOBIK circuitry is contained and protected within a molded black plastic case with a black soft rubber touch pad on the face divided into six sections. The rearward end of the FOBIK case houses a mechanical, metal, coded emergency key (5) that is released by sliding a latch button on the back of the FOBIK case.

Depending upon vehicle equipment, each FOBIK has at least three and no more than five functional resistive membrane switches located beneath the six touch pad sections. Each functional touch pad section is clearly identified by white icons or white text and icons identifying the specific function obtained by pushing that button. Domestic market vehicles also include a touch pad section on the FOBIK with the red text **PANIC** applied to it. Not counting the **PANIC** touch pad (4), the available switches include:

- **Unlock (1)**

  - Standard equipment.

- **Lock (2)** - Standard equipment.
- **Remote Start (3)** - Only for vehicles equipped with the factory-installed remote start system.
- **Trunk (6)** - Standard equipment.

The FOBIK RKE transmitter is the primary customer active interface for remotely operating the power lock system, the RKE system and the remote start system components and features. However, the FOBIK also has an important passive role in each of the following vehicle systems:

- **Keyless Go System** - Refer to **STARTING - SERVICE INFORMATION** .

- **Passive Entry System** - Refer to **DESCRIPTION**.
- **Sentry Key® Theft Deterrent System** - Refer to **VEHICLE THEFT SECURITY - SERVICE INFORMATION** .
- **Vehicle Theft Security System (VTSS)** - Refer to **VEHICLE THEFT SECURITY - SERVICE INFORMATION** .

Other than battery replacement, the FOBIK cannot be adjusted or repaired. Once a FOBIK has been programmed to a vehicle, it cannot be reprogrammed for use on any other vehicle. If damaged or ineffective, the FOBIK must be replaced with a new unit. A new and unused FOBIK unit must be properly programmed in order to function properly with the systems of the vehicle. The mechanical emergency key of the new FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

OPERATION

OPERATION

The FOB with Integrated Key (FOBIK) incorporates many useful functions into a single, compact unit. The transducer on the internal circuit board of the FOBIK uses low frequency Radio Frequency (RF) communication to ensure vehicle security through an electronic validation or handshake process that is performed with the RF Hub each time the engine is started.

When any one of the Remote Keyless Entry (RKE), liftgate or remote start buttons of the FOBIK is depressed, the on-board transmitter of the FOBIK generates a high frequency RF request signal that is received and validated by the RF Hub. If the RF Hub determines the RF signal was generated by a FOBIK that is valid for the vehicle, the RF Hub relays electronic request messages to the appropriate electronic modules in the vehicle over the Controller Area Network (CAN) data bus to invoke the functions or features associated with the request.

The integrated mechanical emergency key of the FOBIK provides emergency access to the vehicle in case the battery in the vehicle or the transmitter becomes discharged. The emergency key can also be retained to keep any locked on-board vehicle storage compartments such as the glove box secured, for example: While the vehicle is being attended to by a parking valet.

Each vehicle owner is provided with a four-digit Personal Identification Number (PIN) by the dealer at the time of vehicle purchase. This number is required along with a diagnostic scan tool for the dealer to program an additional or replacement FOBIK into the electronics of the vehicle. The emergency key included with a new additional or replacement blank FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Diagnosis of a FOBIK transmitter requires the use of a Radio Frequency Detector such as special tool #(special tool #9001, RF Detector). Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

RKE TRANSMITTER

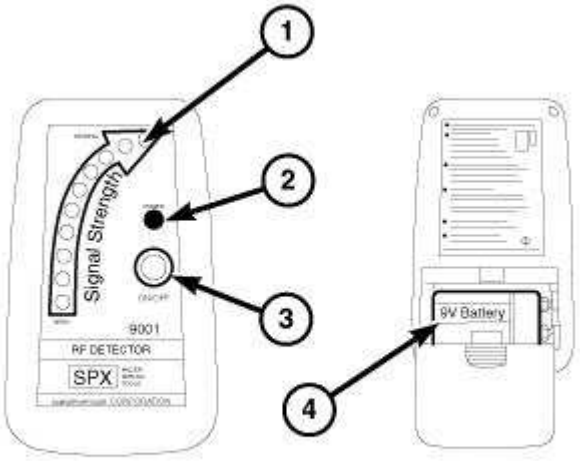

Fig. 27: Radio Frequency Detector
Courtesy of CHRYSLER GROUP, LLC

Use a Radio Frequency Detector such as special tool (special tool #9001, RF Detector) to confirm that the Remote Keyless Entry (RKE) transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for the transmitters of vehicles manufactured for Asian markets, and 30.5 centimeters (12 inches) for all others.

1. Position the transmitter the appropriate distance from the special tool.
2. Depress any transmitter button, then test each button individually. The special tool will issue an audible beep tone if a satisfactory radio signal strength that lights five or more LED units is detected.
3. Repeat Step 2 three times. If the transmitter fails any of the signal strength tests, use a diagnostic scan tool and the appropriate diagnostic information to complete further diagnosis.

STANDARD PROCEDURE

BATTERY REPLACEMENT

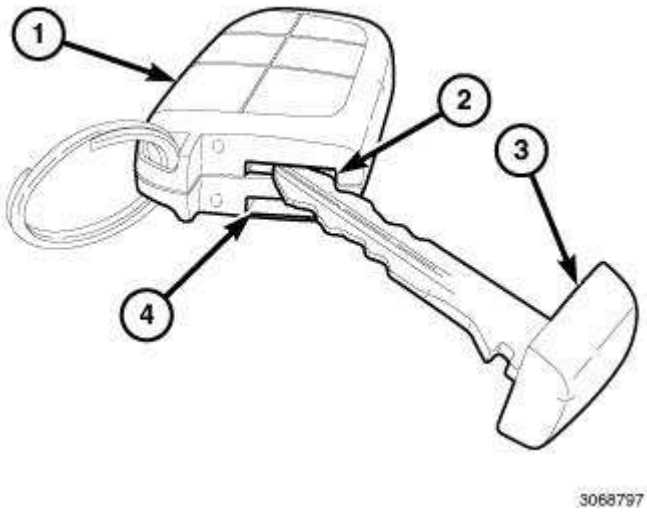

Fig. 28: Emergency Key, Storage Slot & Integrated Key (FOBIK) Case
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the front of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.

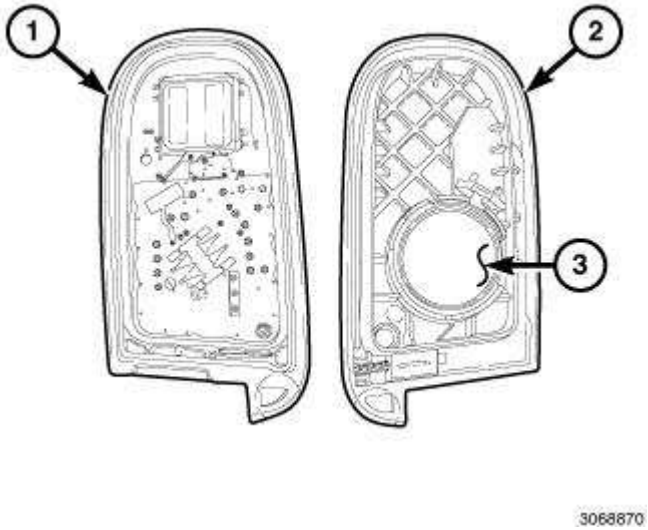

Fig. 29: FOBIK Case & Battery
Courtesy of CHRYSLER GROUP, LLC

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (2).
4. Replace the battery with a recommended replacement battery. Refer to **TRANSMITTER, INTEGRATED KEY FOB, SPECIFICATIONS**.
5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (1) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

FOBIK PROGRAMMING

FOB with Integrated Key (FOBIK) programming may require the use of the Personal Identification Number PIN) for the vehicle, a diagnostic scan tool and the appropriate diagnostic information. Also be certain that the FOBIK and any replaced electronic modules are programmed in the proper sequence. Refer to **STANDARD PROCEDURE** .

SPECIFICATIONS

SPECIFICATIONS

BATTERY

The FOB with Integrated Key (FOBIK) transmitter is powered by a single 3-volt lithium and manganese dioxide button cell battery, which can be removed and replaced without special tools. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE**. The international standard battery type designation is: **CR2032** . This battery type is available at many local retail stores. Typical battery life is approximately three years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal RKE transmitter range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal transmitter range is increased to up to 91 meters (300 feet). Please note that the actual RKE transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any RKE transmission is attempted.

ACCESSORIES AND EQUIPMENT

Power Mirrors - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

Driver and passenger power operated outside rear view mirrors are standard factory-installed equipment. In addition, automatic dimming rear view mirrors, both inside and a driver side outside are available as optional equipment. The power mirror system for this vehicle includes the following major components, which are described in further detail elsewhere in this service information:

- **Automatic Dimming Rear View Mirrors** - The optional automatic dimming inside rear view mirror is secured to a mounting button on the inside of the windshield glass near the upper windshield opening header. This is the same mounting button that is used for mounting the standard prismatic inside rear view mirror. The optional automatic dimming outside rear view mirror is only available for the driver side door. The automatic dimming outside rear view mirror is secured to the same mounting flag on the front door panel and in the same manner that is used to mount the standard equipment outside rear view mirrors.
- **Front Door Control Modules** - Vehicles that use the low current front door power switch configuration also have a front door control module for each front door. The front door control modules are concealed behind the door trim panels on the front door hardware module carrier. Refer to **MODULE, DOOR, DESCRIPTION** .
- **Front Door Power Switch Modules** - Front door power switch modules are used in both primary system configurations: high current and low current. The outputs of the switches will identify the configuration type being used. In the high current configuration the switch outputs are hard wired directly to the power mirror, power window and power lock motors. In the low current configuration the switch outputs are hard wired to the driver or passenger front door control modules, which then control the high current outputs to the power mirror, power window and power lock motors. Refer to **SWITCH, POWER WINDOW, DESCRIPTION** .
- **Power Folding Mirror Switch** - The power folding mirror switch is used only on vehicles manufactured for certain export markets where power foldaway mirrors are required equipment. The power folding mirror switch is integral to the driver front door power switch module located on the driver side front door trim panel and is only serviced as a unit with the switch module.
- **Power Mirror Switches** - The power mirror system includes two selector switches and an adjuster switch that are located on the driver front door trim panel and are only serviced as an integral part of their respective driver front door power switch module. Refer to **SWITCH, POWER WINDOW, DESCRIPTION** .
- **Power Outside Rear View Mirrors** - Power outside rear view mirror units are mounted to the mirror flag at the front belt line of each front door window opening. Many variations of both the driver and passenger mirror are available, depending upon both trim and other optional equipment in the vehicle.

In the low current switch configuration, the front door power switch modules and the front door control modules each contain a microprocessor and programming that allow them to communicate with each

other using a Local Interface Network (LIN) data bus. The front door control modules and the automatic dimming inside rear view mirror each contain a microprocessor and programming that allow them to communicate with each other, with other electronic modules in the vehicle and with a diagnostic scan tool connected to the 16-way Data Link Connector (DLC) using the Controller Area Network (CAN) Interior High Speed (IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the power mirror system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power mirror system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

POWER OPERATED OUTSIDE REAR VIEW MIRRORS

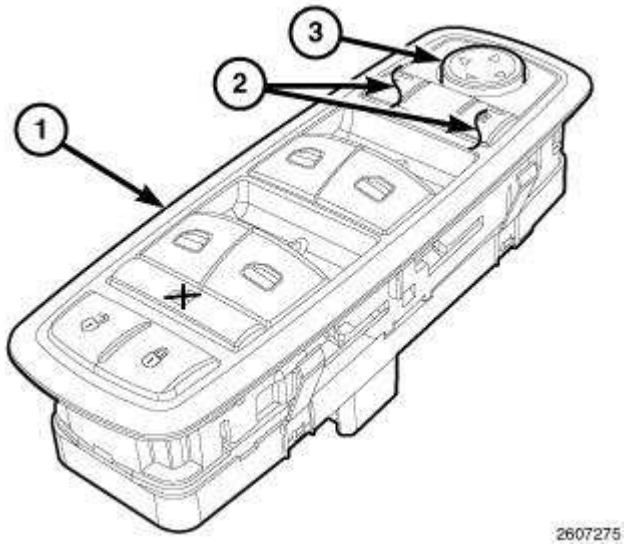

Fig. 1: Driver Front Door Power Switch Module
Courtesy of CHRYSLER GROUP, LLC

The power operated outside rear view mirrors are connected to battery current at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element and the mirror glass. First, a mirror selector switch button (2) is depressed in the driver door power switch module (1) to determine whether the mirror adjuster switch (3) will have control over the right or left mirror. If the vehicle is equipped with the high current door power switch module configuration, hard wired ground and battery current outputs to each power mirror motor determine whether the horizontal or the vertical motor will be operated and the polarity of those outputs control the direction

in which the motor will move the drive unit and mirror glass.

Power mirror and mirror switch functionality is the same with the low current configuration; however, the driver door power switch module sends power mirror switch status messages over the Local Interface Network (LIN) data bus to the driver front door control module. The driver front door control module then controls the high current outputs to the driver door mirror motors or sends electronic request messages over the Controller Area Network (CAN) Interior High Speed (IHS) data bus to the passenger front door control module to control high current outputs to the passenger door mirror motors.

The power mirror switch is diagnosed using a scan tool, for the appropriate information. Refer to **DIAGNOSIS AND TESTING** .

AUTOMATIC DIMMING REAR VIEW MIRRORS

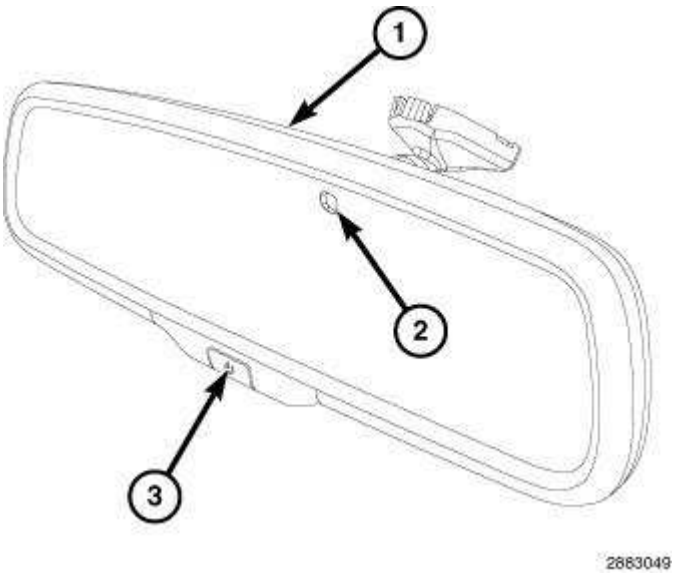

Fig. 2: Automatic Dimming Inside Rear View Mirror
Courtesy of CHRYSLER GROUP, LLC

An automatic dimming inside rear view mirror (1) is an available option. The automatic lighted dimming mirror switch (3) allows the driver a manual control of whether the automatic dimming feature is operational. This switch is a momentary push button switch located on the lower rearward-facing surface of the mirror housing. When ON is selected, the switch illuminates to indicate that the automatic dimming mirror is turned ON. When OFF is selected, the LED is extinguished. If the vehicle is equipped with an optional driver side automatic dimming outside rear view mirror, the operation of that mirror is controlled by the same switch and inputs as the inside rear view mirror.

The automatic dimming mirrors are able to automatically change their reflectance level. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror. Two photocell sensors are used to monitor light levels and adjust the reflectance of both the inside and driver side outside mirrors. This change in reflectance helps to reduce the glare of headlamps approaching the vehicle from the rear.

The ambient photocell light sensor faces forward, to detect the outside light levels. The headlamp photocell light sensor (2) is located on the mirror face to one side of the switch and facing rearward, to detect the light level received at the rear window side of the mirror. When the difference between the two light levels becomes too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), the mirror begins to darken. The mirror also monitors the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the REVERSE position.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER MIRRORS

Any diagnosis of the Power Mirror system should begin with the use of scan tool. For information on the use of the scan tool, refer to DIAGNOSIS AND TESTING.

For complete circuit diagrams, refer to the appropriate wiring information.

1. Check the fuses in the Power Distribution Center (PDC) and the TIPM. If OK, go to 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).
2. Check for battery voltage at the fuse in the TIPM. If OK, go to3. If not OK, repair the open circuit to the PDC as required.
3. Disconnect and isolate the battery negative cable. Remove the driver side power window switch and bezel assembly and unplug the wire harness connector from the power mirror switch. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity in the door wire harness half of the power mirror switch wire harness connector. If OK, go to4. If not OK, repair the open circuit to the TIPM as required.
4. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity in the door wire harness half of the power mirror switch wire harness connector and a good ground. There should be continuity. If not OK, repair open in the ground circuit.

MIRROR, AUTOMATIC DAY AND NIGHT

DESCRIPTION

DESCRIPTION

An automatic dimming (day and night) inside rear view mirror is an available factory-installed option for this vehicle. Vehicles equipped with the automatic dimming inside rear view mirror are also available with an optional factory-installed automatic dimming outside rear view mirror for the driver side of the vehicle. In vehicles so equipped, this system will automatically change the reflectance of the inside and driver side outside rear view mirrors to protect the driver from the unwanted headlight glare of trailing vehicles while driving at night. Following are general descriptions of this optional equipment.

INSIDE

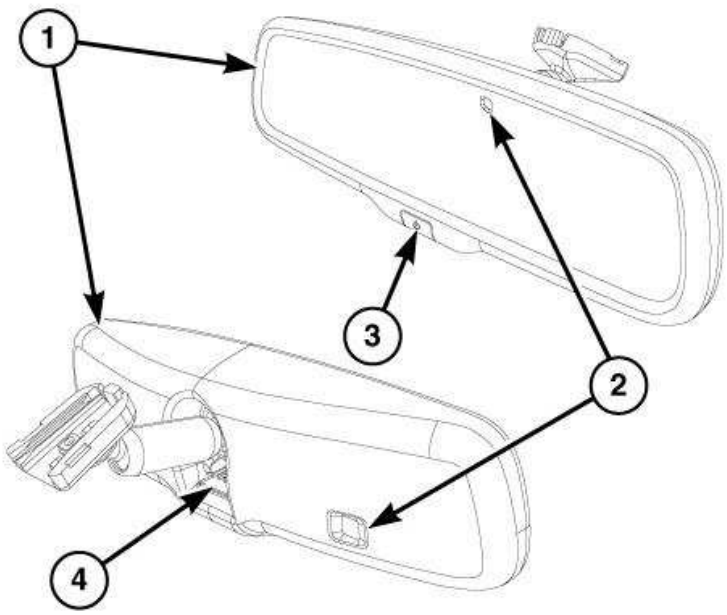

Fig. 3: Inside Rear View Mirror, Two Photocell Light Sensors, Lighted Mirror Switch & Mirror Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The automatic dimming inside rear view mirror (1) is able to automatically change its reflectance. The automatic dimming inside rear view mirror system is a completely self-contained unit that replaces the standard equipment manual prismatic inside rear view mirror. The two layers of conductive mirror glass with a thin layer of electrochromic material between them, the lighted mirror switch (3), two photocell light sensors (2), the mirror connector receptacle (4) and the electronic mirror control circuitry are all self-contained within the inside rear view mirror housing.

The automatic dimming mirror is secured to the same mounting button on the inside of the windshield glass and in the same manner that is used to mount the standard equipment manual prismatic mirrors. The mirror is connected to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness. The automatic dimming inside rear view mirror receives battery current through a fused ignition switch output (run-start) circuit and a fuse in the Totally Integrated Power Module (TIPM), and will only operate when the ignition switch is in the ON or START positions.

The automatic dimming inside rear view mirror sensitivity cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire inside rear view mirror unit must be replaced. For service procedures, refer to **MIRROR, REARVIEW, REMOVAL** and **MIRROR, REARVIEW, INSTALLATION** .

OUTSIDE

The automatic dimming driver side outside rear view mirror is able to automatically change its reflectance. The automatic dimming outside rear view mirror replaces the standard equipment outside rear view mirror. The two layers of conductive mirror glass with a thin layer of electrochromic material between them is contained within the outside rear view mirror glass case. However, this mirror relies upon the photocells and mirror control circuitry of the automatic dimming inside rear view mirror to control its reflectance.

The automatic dimming outside rear view mirror is secured to the same mounting flag on the front door panel and in the same manner that is used to mount the standard equipment outside rear view mirrors. The mirror is connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness. The automatic dimming circuitry of the outside rear view mirror receives current through auto day/night mirror feed (+) and return (-) circuits from the inside rear view mirror, and will only operate when the ignition switch is in the ON or START positions.

The automatic dimming outside rear view mirror sensitivity cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire outside rear view mirror unit must be replaced. For service procedures, refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** .

OPERATION

OPERATION

Both the inside and outside automatic dimming mirrors receive battery current through a fused ignition switch output (run/start) circuit and fuse in the Totally Integrated Power Module (TIPM), and will only operate when the ignition switch is in the ON or START positions.

INSIDE

The lighted switch on the automatic dimming inside rear view mirror provides the vehicle operator with a manual control of whether the automatic dimming feature is operational. When AUTO is selected, the mirror switch is illuminated. However, if the mirror is turned OFF manually, the mirror switch illumination is extinguished. However, the mirror will always turn back ON by default at the onset of a new ignition ON cycle. The automatic dimming mirror circuitry also senses the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the REVERSE position.

The ambient photocell sensor of the mirror faces forward, to detect the outside light levels through the windshield glass. A second headlamp photocell sensor is located in the upper right quadrant of the mirror face, to detect the light level received at the rear window side of the mirror. When the mirror control circuitry detects that the difference between the two sensed light levels has become too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror) the mirror begins to darken. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror.

On vehicles equipped with an optional driver side automatic dimming outside rear view mirror, the signal to control the dimming of that mirror is generated by the automatic dimming inside rear view

mirror circuitry. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

OUTSIDE

The driver side automatic dimming outside mirror is operated by the same controls and circuitry as the automatic inside rear view mirror. When the automatic inside rear view mirror is switched ON or OFF, the automatic dimming outside mirror is likewise switched ON or OFF. Just as in the automatic inside rear view mirror, a thin layer of electrochromic material between two pieces of conductive glass make up the face of the automatic dimming outside mirror. However, the signal to control the dimming of the outside mirror is generated by the automatic dimming inside rear view mirror control circuitry based upon the inputs from the two photocell sensors integral to the inside mirror. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC DIMMING MIRRORS

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the fused ignition switch output (run/start) fuse in the Totally Integrated Power Module (TIPM). If OK, go to2. If not OK, repair the shorted circuit or component as required and replace the ineffective fuse.
2. Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the TIPM. If OK, go to 3. If not OK, repair the open fused ignition switch output (run/start) circuit to the run-start relay in the TIPM as required.
3. Disconnect the overhead wire harness connector from the automatic dimming inside rear view mirror. Check for battery voltage at the fused ignition switch output (run-start) circuit cavity of the overhead wire harness connector for the mirror. If OK, go to 4. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the TIPM as required.
4. Turn the ignition switch to the OFF position. Check for continuity between the ground circuit cavity of the overhead wire harness connector for the automatic dimming inside rear view mirror and a good ground. There should be continuity. If OK, go to 5. If not OK, repair the open circuit to ground as required.
5. Turn the ignition switch to the ON position. Set the parking brake. Place the transmission gear selector lever in the REVERSE position. Check for battery voltage at the backup lamp switch output circuit cavity of the overhead wire harness connector for the automatic dimming inside rear view mirror. If OK, reconnect the overhead wire harness connector to the mirror and go to 6. If not OK, repair the open backup lamp switch output circuit as required.
6. Place the transmission gear selector lever in the NEUTRAL position. Place the automatic dimming inside rear view mirror switch in the ON (green LED indicator illuminated) position. Cover the forward facing ambient photocell light sensor to keep out any ambient light.

NOTE: **The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**

7. Shine a light into the rearward facing headlamp photocell light sensor. The automatic dimming mirror glass should darken within 2 minutes if testing for the first time. For an immediate response, turn the mirror switch to the OFF position and back to the ON position with the forward-facing ambient light sensor still covered. This defeats the daylight detection logic of the mirror. If OK, go to 8. If not OK, replace the ineffective mirror unit.
8. With the mirror darkened, place the transmission gear selector lever in the REVERSE position. The automatic dimming mirror glass should return to its normal reflectance. If not OK, replace the ineffective mirror unit.

BENCH TESTING

Bench testing of both the inside and the driver side outside mirrors can be done if proper care is exercised. Connect the inside mirror ground terminal pin to ground and the fused ignition switch output (run-start) terminal pin to 12 volts. The inside mirror can now be tested by completely blocking the ambient photocell (forward-facing) light sensor and shining a light into the headlight photocell (rearward-facing) light sensor.

CAUTION: **In the following test, 1.2 volts is applied to the outside mirror dimming circuits. DO NOT apply 12 volts to these circuits or the mirror dimming circuitry will be damaged and require replacement.**

For an outside mirror, there are two pigtail wire circuits (auto day/night mirror plus and auto day/night mirror minus) that are normally controlled by the outputs from the inside mirror circuitry. Applying **1.2 volts** to these two circuits should cause the outside mirror glass to darken. If the mirror glass does not darken, the entire mirror glass and case assembly can be replaced just as it is when the glass has been broken. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** or **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

MIRROR, OUTSIDE REARVIEW

DESCRIPTION

DESCRIPTION

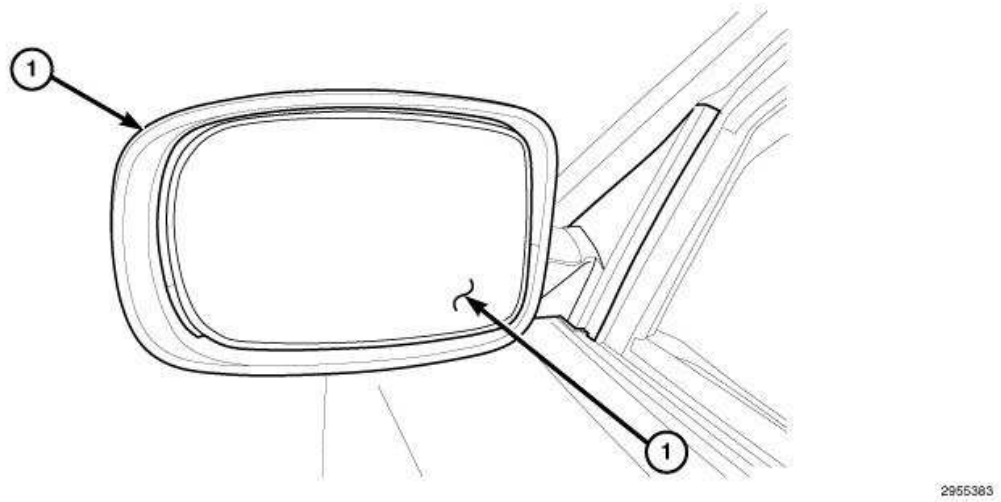

Fig. 4: Power Operated Outside Rear View Mirrors
Courtesy of CHRYSLER GROUP, LLC

The power operated outside rear view mirrors (1) allow the driver to adjust both mirrors electrically from the driver seat position by operating switches integral to the power switch module on the driver side front door trim panel. The power outside mirrors operate on non-switched battery current received through a fuse in the Power Distribution Center (PDC) so that the mirrors remain operational, regardless of the ignition switch position.

Each power mirror housing contains two electric motors, two drive mechanisms, the mirror glass case and the mirror glass (2). One motor and drive controls mirror up-and-down (vertical) movement, and the other controls right-and-left (horizontal) movement. Vehicles manufactured for certain export markets also have a power folding mirror option. These mirrors include a third motor and drive mechanism that allow the mirror to be folded inward and outward from the driver seat position for additional clearance through narrow passages or in tight parking spaces.

A memory system that automatically positions the driver power mirror for two different drivers is an available option. With the memory system, the driver side mirror head also contains two position potentiometers. One position potentiometer monitors the vertical mirror motor, and the other monitors the horizontal mirror motor. Refer to **DESCRIPTION** .

The standard equipment mechanically folding or the optional power folding, power operated outside rear view mirrors are also electrically heated. The mirror heater only operates when the ignition switch is in the ON position and the rear window defogger switch is turned ON. When the rear window defogger switch is in the ON position, electric heater grids on the rear window glass and behind both outside rear view mirror glasses are energized. These electric heater grids produce heat to help clear the rear window glass and outside rear view mirrors of ice, snow, or fog. Refer to **DESCRIPTION** .

On vehicles equipped with the optional automatic dimming inside rear view mirror, an optional driver side automatic dimming outside rear view mirror that darkens the mirror to reduce the glare of bright lights approaching the vehicle from behind is available. This mirror is controlled an output of the automatic dimming inside rear view mirror. Like the automatic dimming inside rear view mirror, a thin layer of electrochromic material between two pieces of conductive glass make up the face of the

mirror glass. Refer to **MIRROR, AUTOMATIC DAY AND NIGHT, DESCRIPTION**.

An optional integrated turn signal mirror is also available that includes a Light Emitting Diode (LED) turn signal module integrated into the lower forward facing surface of each outside rear view mirror. Refer to **DESCRIPTION** .

On vehicles equipped with the optional Blind Spot Monitor (BSM) system, a Light Emitting Diode (LED) display unit is concealed behind the outside rear view mirror glass. This unit illuminates an amber triangle icon through the lower edge of the mirror glass to give the vehicle operator an indication that an object has been detected by the BSM system. Refer to **DESCRIPTION** .

The power outside rear view mirror unit cannot be repaired. Only the LED turn signal modules and the mirror glass and glass case are serviced separately. If any other component of the power mirror unit is ineffective or damaged, the entire power mirror unit must be replaced. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** or **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** for the appropriate service information.

OPERATION

OPERATION

The power operated outside rear view mirrors are connected to battery current at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element and the mirror glass. If the vehicle is equipped with the high current door power switch module configuration, hard-wired ground and battery current outputs to each power mirror motor determine whether the horizontal or the vertical motor will be operated and the polarity of those outputs control the direction in which the motor will move the drive unit and mirror glass.

Power mirror and mirror switch functionality is the same with the low current configuration; however, the driver door power switch module sends power mirror switch status messages over the Local Interface Network (LIN) data bus to the driver front door control module. The driver front door control module then controls the high current outputs to the driver door mirror motors or sends electronic request messages over the Controller Area Network (CAN) Interior High Speed (IHS) data bus to the passenger front door control module to control high current outputs to the passenger door mirror motors.

The standard equipment power outside rear view mirrors are electrically heated. In the high current door power switch module configuration, the heater grid behind each mirror glass is energized whenever the rear window defogger relay is energized by the Totally Integrated Power Module (TIPM) in response to electronic defogger switch status messages received over the CAN data bus from the A/C-heater control. In the low current door power switch configuration each front door control module responds to the electronic defogger switch status messages received over the CAN data bus from the A/C-heater control to control the high current output to the heater grid of the mirror on the same door as appropriate.

On vehicles equipped with the optional driver side automatic dimming outside rear view mirror, the mirror reflectance is controlled by the driver front door control module based upon hard-wired inputs received from the automatic dimming inside rear view mirror. On vehicles equipped with the optional signal mirrors, the turn signal Light Emitting Diode (LED) module in each mirror is controlled by the front door control module on the same door based upon electronic request messages received over the CAN data bus from the TIPM.

Vehicles manufactured for certain export markets are equipped with a power folding mirror option that includes another motor and drive unit in each outside mirror and a power folding mirror switch button located between the right and left power mirror selector buttons in the driver door power switch module. Each time the momentary power folding mirror switch button is depressed, both outside rear view mirrors are cycled from folded to unfolded, or from unfolded to folded. If the vehicle is equipped with the optional memory system, the driver side mirror head also contains both a horizontal and a vertical motor position sensor. When the memory set procedure is carried out, the memory module learns the outputs of the mirror position sensors so that those positions can be recalled later.

If the vehicle is equipped with the optional Blind Spot Monitor (BSM) system, an LED display unit behind the lower edge of each mirror glass illuminates an amber triangle to indicate to the vehicle operator that an object has been detected by the BSM system. The BSM LED display is controlled by the front door control modules based upon electronic messages received from the BSM control module over the CAN data bus.

SWITCH, MIRROR

DESCRIPTION

DESCRIPTION

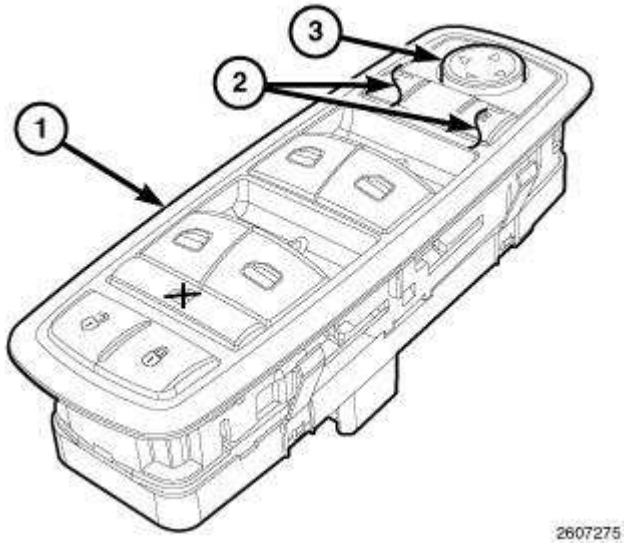

Fig. 5: Driver Front Door Power Switch Module
Courtesy of CHRYSLER GROUP, LLC

The power mirror system includes two selector switches (2) and an adjuster switch (3) that are

located on the driver front door trim panel and are only serviced as an integral part of the driver front door power switch module (1). Refer to **SWITCH, POWER WINDOW, REMOVAL** and **SWITCH, POWER WINDOW, INSTALLATION** for the appropriate service information.

OPERATION

OPERATION

The power operated outside rear view mirrors are connected to battery current at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element and the mirror glass. A mirror selector switch button is depressed in the driver door power switch module to determine whether the mirror adjuster switch will have control over the right or left mirror.

The driver door power switch module sends power mirror switch status messages over the Local Interface Network (LIN) data bus to the driver front door control module. The driver front door control module then controls the high current outputs to the driver door mirror motors or sends electronic request messages over the Controller Area Network (CAN) Interior High Speed (IHS) data bus to the passenger front door control module to control high current outputs to the passenger door mirror motors.

SWITCH, POWER FOLDAWAY MIRROR

DESCRIPTION

DESCRIPTION

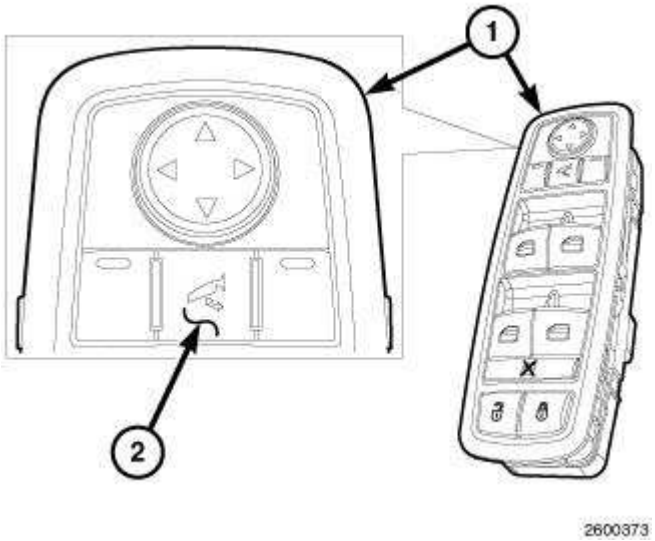

Fig. 6: Driver Door Power Switch Module
Courtesy of CHRYSLER GROUP, LLC

Vehicles manufactured for certain export markets where it is required, are equipped with power foldaway outside rear view mirrors. Vehicles equipped with these power foldaway mirrors have a dedicated power folding mirror switch and switch button (2) identified by an International Standards

Organization (ISO) icon. This switch button is located between the power mirror switch selector buttons just below the power mirror adjusting switch button. The power folding mirror switch is integral to the driver door power switch module (1) as are the other power mirror, window and lock switches.

The power folding mirror switch cannot be repaired and, if ineffective or damaged, it must be replaced as a unit with the driver door power switch module. Refer to **SWITCH, POWER WINDOW, REMOVAL** and **SWITCH, POWER WINDOW, INSTALLATION** for the appropriate service information.

ACCESSORIES AND EQUIPMENT

Power Seats - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

NOTE: Driver seat shown in illustrations. Front passenger seat similar.

POWER SEAT SYSTEM

The power seat system allows the driver and front seat passenger (when equipped) to electrically adjust their seating positions using the power seat switches located on the outboard seat cushion side shield.

The standard driver side six-way power seat includes a six-way adjustable seat cushion track and a manual recline and fold flat feature. The seat can be electrically adjusted forward, rearward, up, down and seat front only, up and down.

The available driver and passenger side twelve-way power seats include a six-way adjustable seat cushion track and two-way power seat back, along with a four-way power lumbar support. The seats can be electrically adjusted forward, rearward, up, down, seat front only up and down, recliner forward and rearward, and lumbar support in, out, up and down. A memory driver seat option is available that automatically positions the twelve-way driver power seat for two different operators.

The power seat contains reversible motors that are connected to worm-drive gearboxes that move the seat through a combination of screw-type drive units. On vehicles equipped with non-memory power seats, each motor contains a self-resetting circuit breaker to protect it from overload. On vehicles equipped with memory seat, the motor overload protection is a function of the Memory Seat Module (MSM). Consecutive or frequent resetting of the circuit breakers may damaged the motors.

The power seating system is also available with heated seat options. Refer to **DESCRIPTION** .

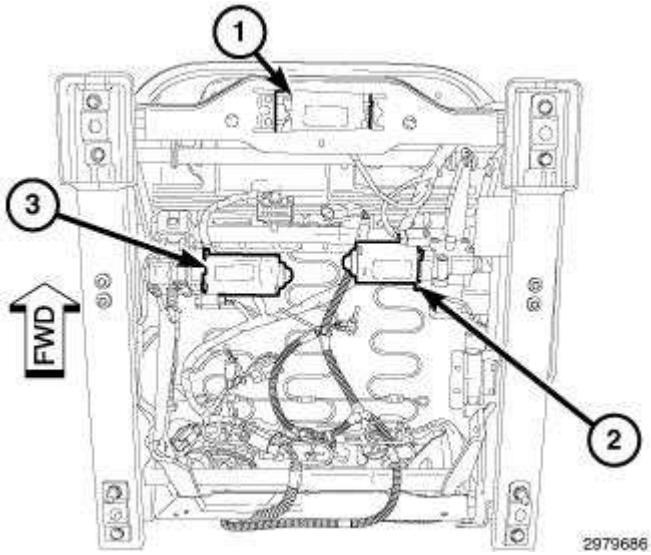

Fig. 1: Fore/Aft Motor, Front Tilt Motor & Rear Tilt Motor
Courtesy of CHRYSLER GROUP, LLC

The power seat track for this vehicle includes the following:

- **Fore/Aft Motor** (1) - located at the front of the seat track.
- **Front Tilt Motor** (2) - located on the left side of the seat track.
- **Rear Tilt Motor** (3) - located on the right side of the seat track.

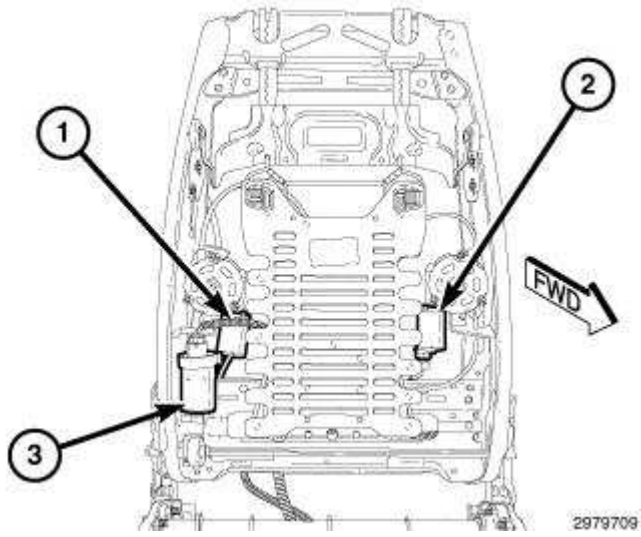

Fig. 2: Lumbar Motors & Recliner Motor
Courtesy of CHRYSLER GROUP, LLC

The power seat back for this vehicle includes the following:

- **Lumbar Motors** (1 and 2) - two motors located on the power lumbar mechanism, in seat back frame.

- **Recliner Motor** (3) - located on the power recline mechanism, on the right side of the seat back frame.

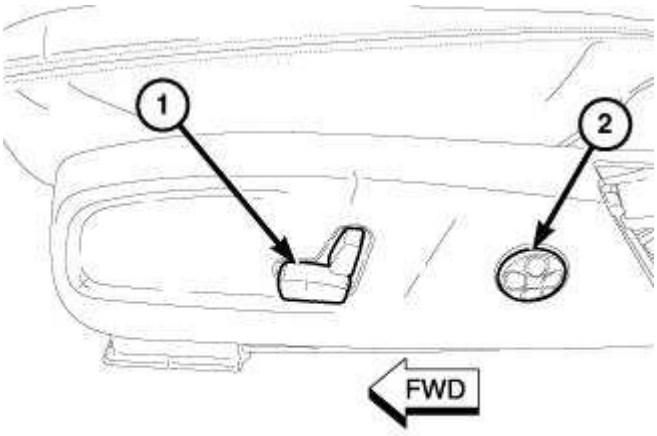

Fig. 3: Seat Position Switch & Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

The power seat for this vehicle can include the following switches:

- **Seat Position Switch** (1) - located at the center of the outboard seat cushion trim panel. Vehicles may be equipped with driver only, or driver and passenger power seats. One seat switch is used for each front seat. The power seat switches are paddle-type levers. Movement of the seat cushions and backs mimics the action of the switch paddles. The driver power seat switch type (memory or non-memory) can be identified by the color of the switch electrical connector receptacle. Memory switches have a light gray connector receptacle and non-memory have a black receptacle.
- **Lumbar Switch** (2) - located at the rear of the outboard seat cushion trim panel. The power lumbar switch is a four-way rocker type switch. Lumbar support can be increased and decreased, and the support area can be lowered or raised for added driver comfort.

MEMORY SEAT SYSTEM

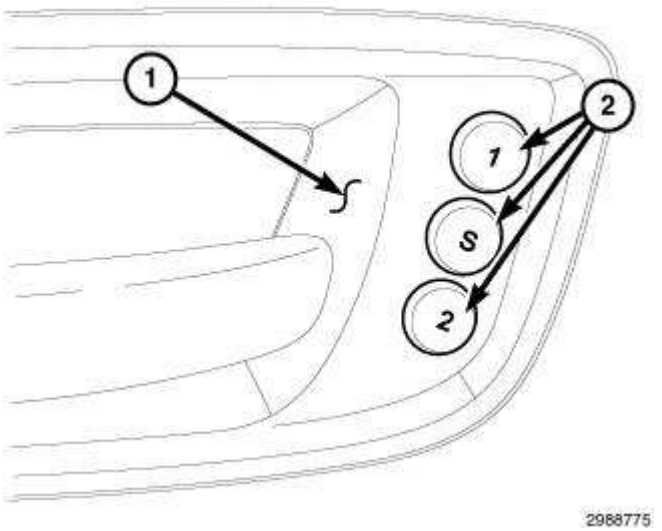

Fig. 4: Memory Switch & Driver Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

An electronic memory seat system is available on certain models. The memory seat system is able to store and recall all driver side power seat positions, driver side power rear view mirror position and power steering column position, when equipped. The system can be set for two different drivers. The memory system is also able to store and recall up to twenty radio station presets for two drivers (ten AM and ten FM). The memory system also will store and recall the last station listened to for each driver, even if it is not one of the twenty preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch (2) located on the driver door trim panel (1) is pressed, or when the doors are unlocked using a FOBIK transmitter (if enabled).

The memory system also has a customer programmable easy exit feature. When the ignition switch is turned off, the driver seat will move rearward 55 millimeters (2.2 inches) or to the end of its travel, whichever occurs first.

The memory system includes the following components:

- **Body Control Module (BCM)** - located behind the passenger side of the instrument panel.
- **FOBIC Transmitter** - located in each key fob.
- **Hall Effect Sensors - Power Drivers Mirror** - located in the two drivers side view mirror motors. Used to provide a reference signal to the memory seat module, letting the module know the exact position of the mirror.
- **Hall Effect Sensors - Power Seat** - located in each of the power seat track and recliner motor. Used to provide a reference signal to the memory seat module, letting the module know the exact position of the seat and recliner.
- **Hall Effect Sensors - Power Adjustable Steering Column** - located in the two steering column motors. They are used to provide a reference signal to the memory seat module, letting the module know the exact position of the column.

- **Memory Seat Module (MSM)** - located underneath the driver seat.
- **Memory Seat Switch** - located in the driver door trim panel.
- **Telematics Gateway (TGW)** - located in the center of the instrument panel.
- **Wireless Ignition Node (WIN)** - located in the instrument panel.

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics and allows the addition of many new feature capabilities. A scan tool is required for diagnosis of the electronic modules and the CAN bus (Refer to appropriate diagnostic information).

OPERATION

OPERATION

POWER SEAT SYSTEM

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat adjuster, seat back or lumbar support (when equipped) in the selected direction until the switch is released, or until the travel limit of the drive unit is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction. Power seats remain operational, regardless of the ignition switch position.

NOTE: **When equipped with memory seat system, anytime a driver power seat motor or seat track is replaced, the Memory Seat Module (MSM) must be cleared of all learned parameters using a scan tool and the Power Seat System Verification test must be performed.**

The motors, gearboxes and linkage for the power seat adjuster, power reclining seat back and power lumbar support cannot be adjusted or serviced separately. If a motor, gearbox or linkage for the power seat adjuster, power recliner or power lumbar becomes inoperative or damaged, the entire power seat adjuster and pan assembly, or the seat back frame assembly must be replaced. Refer to **ADJUSTER, SEAT, FRONT, REMOVAL** or **COVER, SEAT BACK, FRONT, REMOVAL** .

MEMORY SEAT SYSTEM

When one of the two driver memory seat switches is pressed, a resistance signal is sent to the Memory Seat Module (MSM) over the Controller Area Network (CAN) data bus. The MSM is responsible for the 12 volt Direct Current (DC) feed and ground path to the power seat motors. The motors move the power seat through their drive units until the correct preset location is achieved.

NOTE: **When equipped with memory seat system, anytime a Memory Seat Module**

(MSM) is replaced, the MSM must be cleared of all learned parameters using a scan tool and the Power Seat System Verification test must be performed.

The MSM receives the memory seat switch set and selection inputs through the CAN bus circuit, along with input signals from the hall effect sensors in the driver side mirror and power adjustable steering column (when equipped), and hardwired input signals from the hall effect sensors mounted in each of the driver power seat motors. The programmed software in the module allow it to know where the driver seat, driver side mirror and power adjustable steering column (when equipped) are located in their designed travel, by the pulse count generated from each hall effect sensor. This way, when a memory switch is pressed, the MSM powers the driver seat, driver side mirror and power adjustable steering column (when equipped), until each correct preset location is achieved. The MSM will prevent seat memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the driver seat belt is latched. These inputs are monitored by the MSM over the CAN bus.

- A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within five seconds of pressing the "set" button.
- A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

DIAGNOSIS AND TESTING

MEMORY SEAT SYSTEM

In order to obtain conclusive testing of the power seats with and without the memory system option, the Controller Area Network (CAN) data bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. Use a scan tool and the proper diagnostic information to accurately diagnose the power seat and memory seat systems.

NOTE: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off battery power to the power seat system anytime vehicle voltage is below 11 volts. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged. Refer to **BATTERY, STANDARD PROCEDURE** .

POWER SEAT SYSTEM

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Operate the power seat switches and power lumbar support switch. Move the seat, seat back and

power lumbar support in all directions. The seat and lumbar support should move in each of the selected directions. If any of the power seat and/or lumbar support motors fail to operate in more than one direction, proceed as follows:

1. Inspect the power seat and power lumbar motors to ensure the electrical connectors are fully connected to the motors. If OK, go to Step 2. If not OK, reconnect the electrical connector(s).
2. Check the power seat fuse in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, replace the fuse.
3. Remove the power seat switch and/or power lumbar switch from the seat cushion side panel. Check for battery voltage at the fused B(+) circuit cavity of the switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.
4. Check for continuity between the ground circuit cavity of the power seat switch and/or power lumbar switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open circuit to ground as required.
5. Test the power seat switch and/or power lumbar switch. Refer to **SWITCH, SEAT, DIAGNOSIS AND TESTING** and **SWITCH, LUMBAR CONTROL, DIAGNOSIS AND TESTING**. If the switch tests OK, check the wire harness between the switch and the motor(s) (See Wiring information). If the circuits check OK, replace the inoperative power seat track and pan assembly or the seat back assembly (Refer to **SEATS**). If the circuits are not OK, repair the wire harness as required.

STANDARD PROCEDURE

STANDARD PROCEDURE - MEMORY SYSTEM PROGRAMMING

The Memory Seat Module (MSM) interfaces with the Remote Keyless Entry (RKE) system via the Controller Area Network (CAN) bus. The proper procedure of setting and recalling a memory position using the RKE is as follows:

1. Press and release memory switch 1 or 2 to recall memory position 1 or 2.
2. Adjust the seat, recliner, adjustable pedal position, set radio station presets, set HVAC temperature preset, and the side view mirrors to the desired position.
3. Press momentarily and release memory switch S.
4. Within five seconds, press momentarily and release memory switch 1 or 2.
5. To link the RKE transmitter: within ten seconds, press and release the "LOCK" button on one of the RKE transmitters

To program the second driver's position, repeat the above procedure using memory switch 2. The second RKE transmitter can be programmed in the same fashion as indicated. Refer to 5.

NOTE: **The module will abort a recall if the transmission is moved out of park or if any seat movement is activated whether manually or by memory recall. The module will also abort a recall if any movement of the adjustable pedals is detected.**

To recall either of the programmed positions momentarily press and release either memory selector

switch 1 or 2. If using RKE, just press and release the "UNLOCK" button on the proper transmitter for either position 1 or 2.

A recall is possible any time the vehicle transmission is in PARK and the seatbelt is unbuckled. This condition is monitored by the MSM.

SWITCH, LUMBAR CONTROL

DESCRIPTION

DESCRIPTION

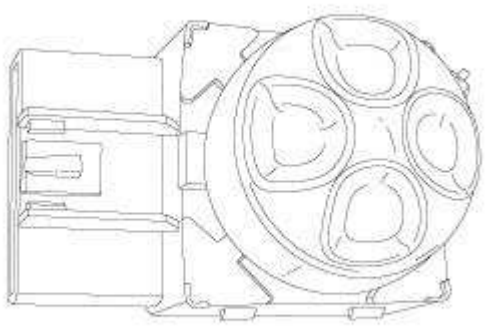

Fig. 5: Power Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

The driver power lumbar can be adjusted in four different ways using the power lumbar switch, located on the outboard seat cushion side shield, on models so equipped. The power lumbar support can be adjusted inward, outward, upward and downward for added driver comfort.

OPERATION

OPERATION

When a power lumbar support switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar support adjuster. The selected lumbar support adjuster motor operates the lumbar support adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the selected power lumbar support adjuster motor to run in the opposite direction.

On vehicles equipped with the memory seat system, the driver memory seat switch provides a

resistive signal/input to the Memory Seat Module (MSM). The MSM is responsible for the 12 volt battery feed and ground path to the power lumbar support adjuster motor.

No power lumbar support switch should be held applied in any direction after the adjuster has reached its travel limit. The power lumbar support adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The power lumbar switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

POWER LUMBAR SWITCH

DRIVER SEAT

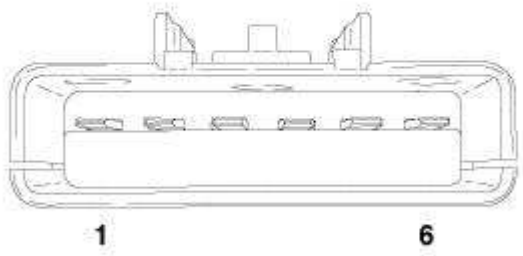

Fig. 6: Power Lumbar Switch Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power lumbar support switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power lumbar support switch using the following

table. If not OK, replace the inoperative power lumbar support switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the power lumbar support adjuster motor(s) as required.

DRIVER SEAT LUMBAR SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	1-2, 1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
UP	1-2, 1-3, 1-4, 2-3, 2-4, 3-4, 5-6
DOWN	1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
IN	1-2, 1-4, 1-5, 2-6, 3-4, 3-5, 4-5
OUT	2-4, 2-5, 3-6, 4-5

PASSENGER SEAT

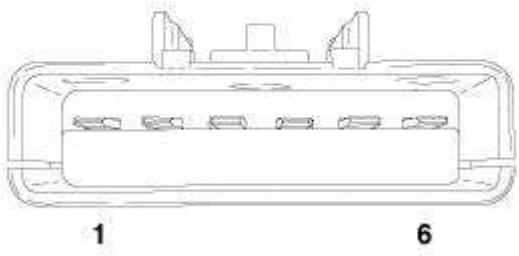

Fig. 7: Power Lumbar Switch Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power lumbar support switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL**.

3. Use an ohmmeter to test the continuity of the power lumbar support switch using the following table. If not OK, replace the inoperative power lumbar support switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the power lumbar support adjuster motor(s) as required.

PASSENGER SEAT LUMBAR SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	1-2, 1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
UP	1-2, 1-3, 1-4, 2-3, 2-4, 3-4, 5-6
DOWN	1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
IN	2-4, 2-5, 3-6, 4-5
OUT	1-2, 1-4, 1-5, 2-6, 3-4, 3-5, 4-5

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Driver seat shown in illustration. Passenger seat similar.

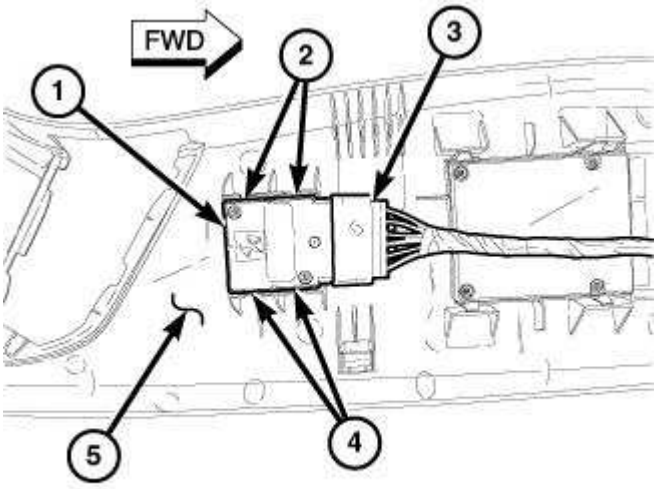

Fig. 8: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when servicing the power lumbar control switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat (Refer to **SEATS**).
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the lumbar control switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the lumbar control switch and remove the switch.

INSTALLATION

INSTALLATION

NOTE: Driver seat shown in illustration. Passenger seat similar.

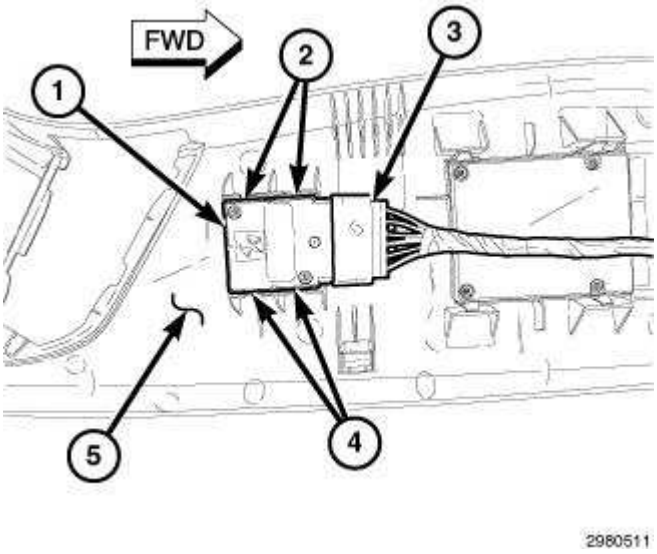

Fig. 9: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power lumbar control switch (1). Make sure the connector is fully engaged to the switch.
2. Position the lumbar control switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel (Refer to **SEATS**).
4. Connect the negative battery cable.
5. Verify proper power lumbar support operation.

SWITCH, MEMORY

DESCRIPTION

DESCRIPTION

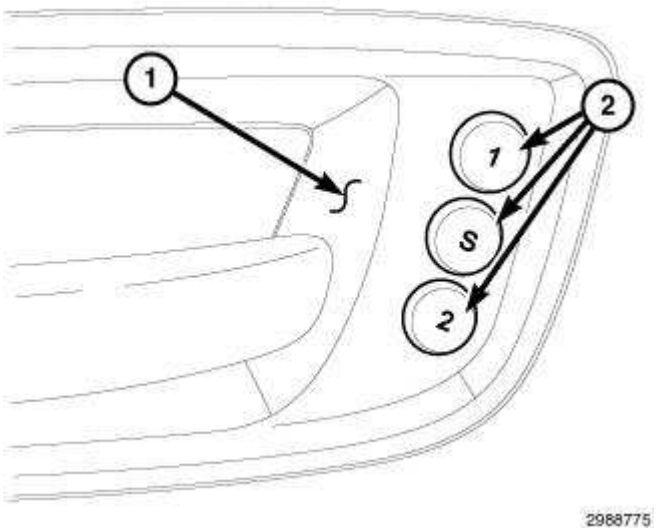

Fig. 10: Memory Switch & Driver Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

When equipped, the memory seat switch (2) is located on the driver door trim panel (1). The driver seating position can be automatically adjusted for two different driver preference settings using the memory seat switch. The memory seat system is able to store and recall all driver power seat positions (fore/aft, up/down, tilt and recline), driver side power rear view mirror position and the power adjustable steering column position, when equipped. The memory system is also able to store and recall up to twenty radio station presets for two drivers (ten AM and ten FM). The memory system also will store and recall the last station listened to for each driver, even if it is not one of the twenty preset stations.

OPERATION

OPERATION

When one of the two driver memory seat switches is pressed, a resistance signal is sent to the Memory Seat Module (MSM) over the Controller Area Network (CAN) data bus. The MSM is responsible for the 12 volt Direct Current (DC) feed and ground path to the power seat motors.

The MSM receives the memory seat switch set and selection inputs through the CAN bus circuit, along with input signals from the hall effect sensors in the driver side mirror and power adjustable steering column (when equipped), and hardwired input signals from the hall effect sensors mounted in each of the driver power seat motors. The programmed software in the module allow it to know where the driver seat, driver side mirror and power adjustable steering column (when equipped) are located in their designed travel, by the pulse count generated from each hall effect sensor. This way, when a memory switch is pressed, the MSM powers the driver seat, driver side mirror and power adjustable steering column (when equipped), until each correct preset location is achieved. The MSM will prevent seat memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the driver seat belt is latched. These inputs are monitored by the MSM over the CAN bus.

- A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within five seconds of pressing the "set" button.
- A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

The memory seat switch is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The memory seat switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

REMOVAL

REMOVAL

NOTE: Take the proper precautions to protect the door handle and bezel from cosmetic damage while performing this procedure.

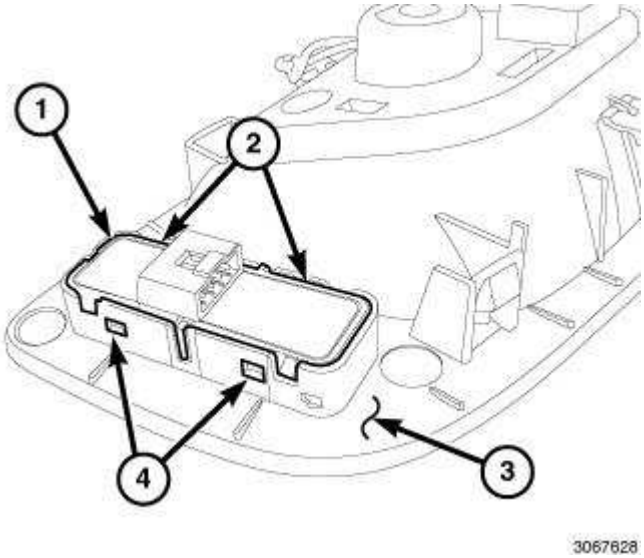

Fig. 11: Memory Seat Switch & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the driver door handle and place it on a workbench. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Using an appropriate flat bladed tool, gently disengage the four retaining tabs (2 and 4) that secure the memory seat switch (1) to the back of the driver door handle bezel (3).
4. Remove the memory seat switch from the driver door handle bezel.

INSTALLATION

INSTALLATION

NOTE: **Take the proper precautions to protect the door handle and bezel from cosmetic damage while performing this procedure.**

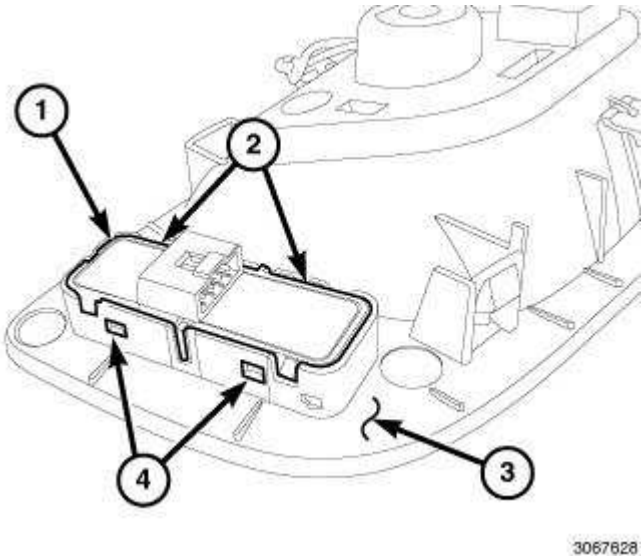

Fig. 12: Memory Seat Switch & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Install the memory seat switch (1) into the driver door handle bezel (3). Push the switch firmly into the bezel until the retaining tabs (2 and 4) are fully engaged.
2. Install the driver door handle and bezel. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
3. Reconnect the negative battery cable.
4. Using a scan tool, perform the Power Seat System Verification test. Refer to **STANDARD PROCEDURE** .
5. Verify proper memory seat system operation.

SWITCH, SEAT

DESCRIPTION

DESCRIPTION

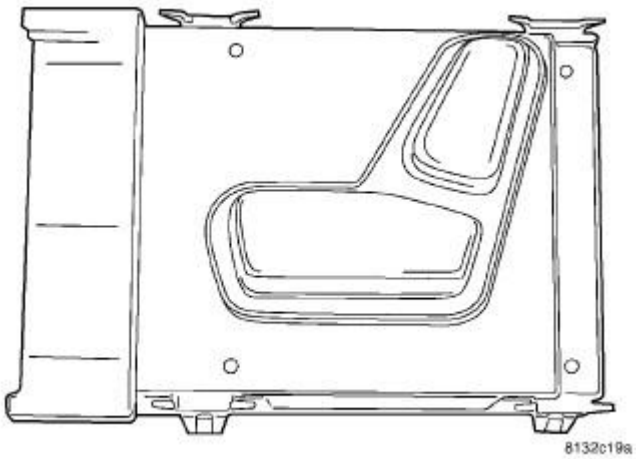

Fig. 13: Power Seat Switches
Courtesy of CHRYSLER GROUP, LLC

NOTE: Driver power seat switch shown in illustration.

The standard driver power seat and available power front passenger seats can be adjusted using the power seat switch located on the outboard seat cushion side shield.

OPERATION

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat adjuster or recliner adjuster motor. The selected seat adjuster motor operates to move the seat or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the seat adjuster motor to run in the opposite direction.

On vehicles equipped with the memory seat system, the driver memory seat switch provides a resistive signal/input to the Memory Seat Module (MSM). The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor. The adjuster motor operates to move the seat adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The individual switches in the power seat switch cannot be adjusted or repaired. If one switch is damaged or inoperative, the entire power seat switch must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SWITCH

6-WAY DRIVER SEAT

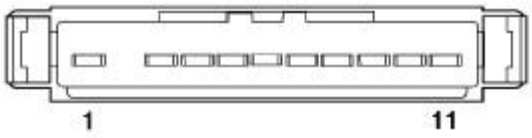

Fig. 14: Power Seat Switch Terminals
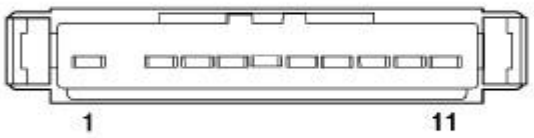
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power seat track and pan assembly. Refer to **ADJUSTER, SEAT, FRONT, REMOVAL** .

6-WAY DRIVER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

8-WAY DRIVER SEAT WITHOUT MEMORY



8132c253

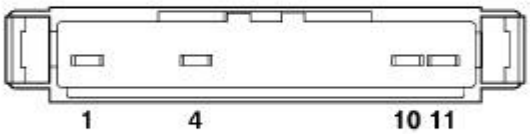
Fig. 15: Power Seat Switch Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power seat track and pan assembly or seat back frame, as required (Refer to **SEATS**).

8-WAY DRIVER SEAT SWITCH CONTINUITY - WITHOUT MEMORY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

8-WAY DRIVER SEAT WITH MEMORY



8132c26a

Fig. 16: Power Seat Switch Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power seat track and pan assembly or seat back frame, as required (Refer to **SEATS**).

8-WAY DRIVER SEAT SWITCH CONTINUITY - WITH MEMORY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
OFF	10-4	OPEN
OFF	10-11	OPEN
OFF	1-4	47 OHMS
OFF	1-11	47 OHMS
REAR TILT UP	10-11	169 OHMS
REAR TILT DOWN	10-11	76 OHMS
HORIZONTAL FORWARD	10-11	43 OHMS
HORIZONTAL REARWARD	10-11	10 OHMS
RECLINER UP	10-4	43 OHMS
RECLINER DOWN	10-4	10 OHMS
FRONT TILT UP	10-4	169 OHMS
FRONT TILT DOWN	10-4	76 OHMS
ALL RESISTANCE VALUES ARE ± FIVE PERCENT		

8-WAY PASSENGER SEAT

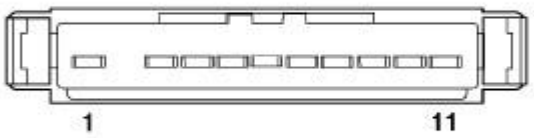


Fig. 17: Power Seat Switch Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. Refer to **SWITCH, SEAT, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power seat track and pan assembly or seat back frame, as required (Refer to **SEATS**).

8-WAY PASSENGER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result

in accidental airbag deployment and possible serious or fatal injury.

NOTE: Driver seat shown in illustration. Passenger seat similar.

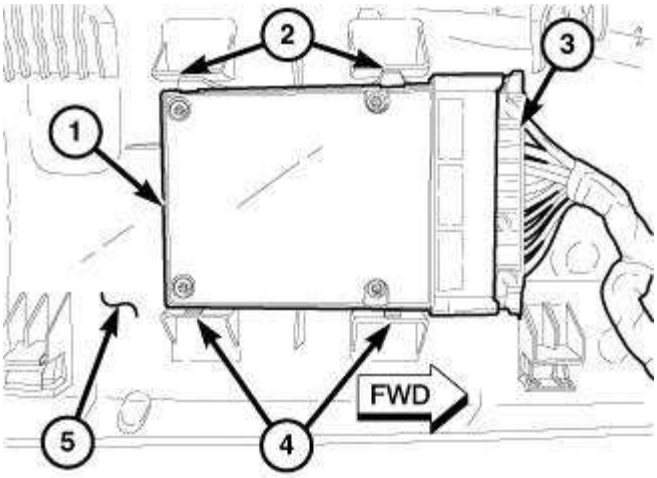

Fig. 18: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when servicing the power seat switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat (Refer to **SEATS**).
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the power seat switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the power seat switch and remove the switch.

INSTALLATION

INSTALLATION

NOTE: Driver seat shown in illustration. Passenger seat similar.

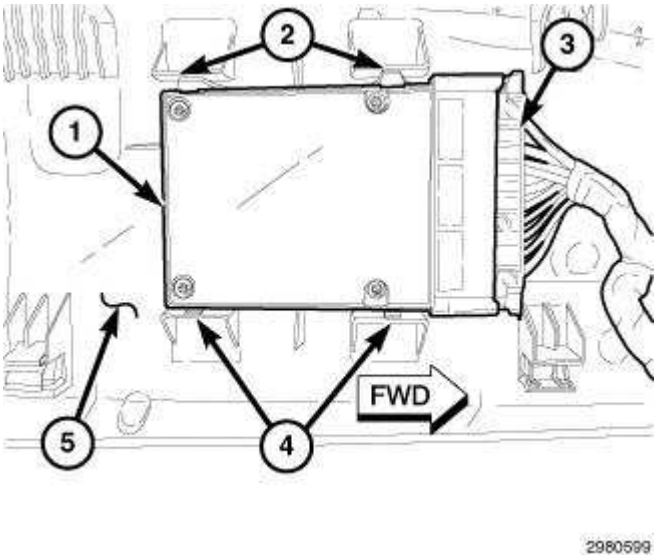

Fig. 19: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power seat switch (1). Make sure the connector is fully engaged to the switch.
2. Position the power seat switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel (Refer to **SEATS**).
4. Connect the negative battery cable.
5. Verify proper power seat operation.

ACCESSORIES AND EQUIPMENT

Power Sunshade, Rear Window - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

The rear window power sunshade system allows each of the rear sunshade to be raised and lowered electrically by actuating an electronic switch within the Integrated Center Stack (ICS) Screen (also known as the U-Connect Touch ™ screen module), or a switch on the rear center trim panel of center floor console. The system consist of the following components:

- **Body Control Module (BCM)** - Located on the right lower "A" pillar behind the instrument panel.
- **Integrated Center Stack (ICS)** - Located in the center stack area of the instrument panel.
- **SunShade Module (SSM)** - located under the rear package tray trim panel, near the sunshade assembly.
- **Sunshade Switch** - Located in the center of the floor console rear center trim panel.
- **Sunshade Motor** - Located on the sunshade assembly drive mechanism.
- **Sunshade assembly** - Located at the rear of the package tray beneath sunshade assembly trim panel.

OPERATION

OPERATION

The front sunshade switch is a soft switch in the Integrated Center Stack (ICS) Screen. The ICS sends the sunshade message to the Body Control Module (BCM) through the Telematics GateWay (TGW). The BCM sends a signal to the SunShade Module (SSM) from its flipper glass output. The SSM will extend or retract the sunshade depending on current position. SSM will stop the sunshade when it reaches the extended or retracted position. If an object is detected in the path of the sunshade, the SSM will stop the sunshade in the current position. If the SSM receives the reverse signal from the BCM, the SSM will wait one second and then drive the sunshade to the down position if it is still receiving the reverse signal. The SSM will determine if the sunshade had been lowered in reverse and return the sunshade to the up position after the reverse signal stops. If either sunshade buttons are pressed in reverse mode, the sunshade will begin to operate as normal operation and ignore the reverse input. It will continue to ignore the reverse input until it detects the reverse signal is gone.

The rear sunshade switch receives a RUN / ACC delay power feed, the same as the sunshade module. A signal from the rear switch will be fed into the BCM flipper switch input. BCM will lockout the rear switch only when the window lockout message is received from the Drivers Door Module (DDM). The cluster will control the illumination circuit and will not indicate if the switch is enabled or disabled.

MODULE, SUNSHADE

REMOVAL

REMOVAL

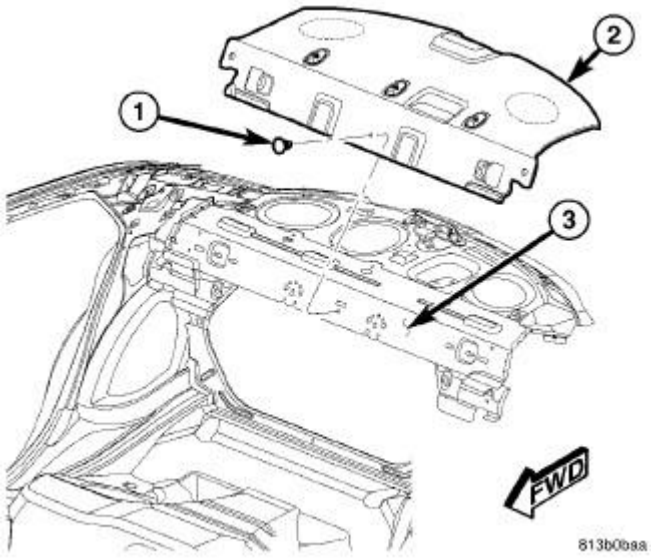

Fig. 1: Rear Shelf Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the package tray trim panel. Refer to **PANEL, REAR SHELF, REMOVAL** .
3. Disconnect the electrical connector at the SunShade Module (SSM).
4. Release the clip and remove the module.

INSTALLATION

INSTALLATION

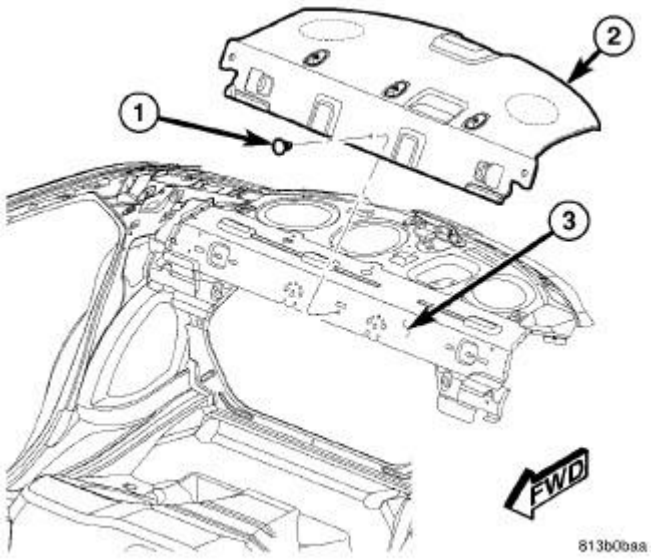

Fig. 2: Rear Shelf Trim Panel
Courtesy of CHRYSLER GROUP, LLC

Position the SunShade Module (SSM) at the rear sunshade assembly.

1. Slide the module onto the mounting bracket and engage the retaining clip.
2. Connect the electrical connector.
3. Install the package tray trim panel. Refer to **PANEL, REAR SHELF, INSTALLATION** .
4. Connect the negative battery cable.

MOTOR, SUNSHADE

DESCRIPTION

DESCRIPTION

The Rear sunshade motor for this vehicle is only serviced as an assembly with the sunshade, for more information. Refer to **SUNSHADE, REAR WINDOW, REMOVAL** .

SWITCH, SUNSHADE

DESCRIPTION

FRONT

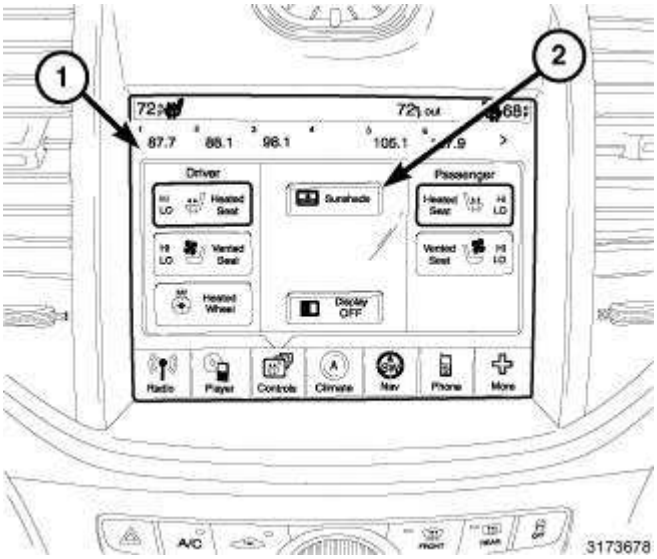

Fig. 3: View Of U-Connect Touch Screen Module And Front Switch
Courtesy of CHRYSLER GROUP, LLC

The front switch (2) for the optional rear window sunshade is located in the Integrated Center Stack (ICS) screen module (also known as the U-Connect Touch ™ screen module) (1), at the center of the instrument panel. The power rear window sunshade system allows the driver, and front seat passenger to raise and lower the rear sunshade for improved passenger comfort. Pressing a sunshade switch once will either raise or lower the shade, depending on position. Pressing the switch a second time will reverse the sunshade motor and return the shade to its original position.

REAR

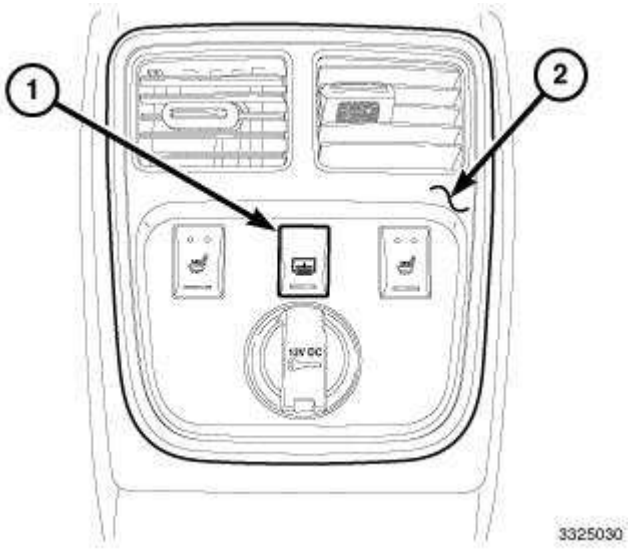

Fig. 4: Floor Console Sunshade Switch
Courtesy of CHRYSLER GROUP, LLC

The rear sunshade switch (1) is a momentary contact push button type switch that is mounted at the rear of the center floor console. This switch allows the rear seat passengers to raise or lower the rear

window sunshade for improved passenger comfort. Pressing a sunshade switch once will either raise or lower the shade, depending on position. Pressing the switch a second time will reverse the sunshade motor and return the shade to its original position.

OPERATION

FRONT

When the front switch for the power rear sunshade, located in the U-Connect Touch ™ screen module is pressed with the ignition on, a signal is sent to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus, signaling the module to raise or lower the rear sunshade. The BCM provide a hard-wired resistance signal to the sunshade control module to raise or lower the sunshade. Pressing the power sunshade switch once will either raise or lower the sunshade, depending on its currant position. Pressing the same switch a second time will reverse the motor, and return the sunshade to its original position before the switch was pressed.

The front switch for the power rear sunshade located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If the switch is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to appropriate service information).

REAR

The rear power sunshade switch is a momentary, push button-type switch, that provide a hard-wired resistance signal to the Body Control Module (BCM), the BCM transfers this signal to the sunshade control module to raise or lower the sunshade. In addition to signaling the module, the BCM sends a message to the Integrated Center Stack (ICS) Screen (also known as the U-Connect Touch ™ screen module) over the Controller Area Network (CAN) data bus.

The rear sunshade switch is diagnosed using a scan tool, for more information. Refer to **DIAGNOSIS AND TESTING** .

The rear heated seat switches cannot be adjusted or repaired and if it becomes damaged or inoperative, the entire switch must be replaced.

REMOVAL

REMOVAL

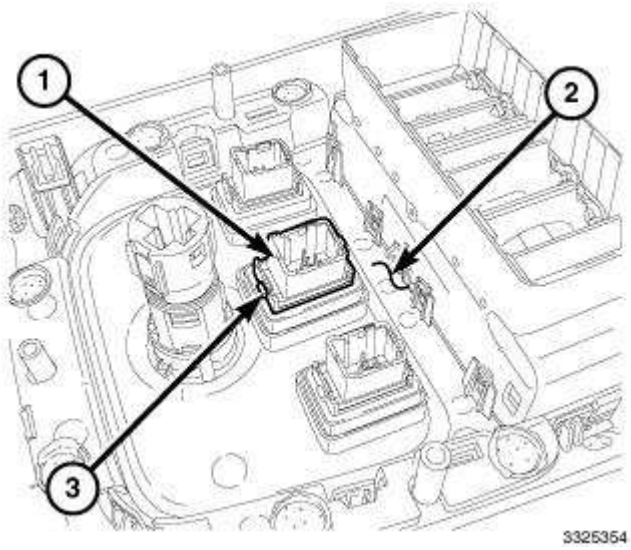

Fig. 5: Sunshade Switch, Trim Panel And Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the trim panel (2) from the back of the floor console using Trim Stick (special tool #C-4755, Trim Stick) or equivalent.
3. Disconnect the electrical connectors and place the trim panel on a workbench.
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, gently disengage the two retaining tabs (3) that secure sunshade switch (1) to the rear trim panel.
5. Remove the sunshade switch from the floor console rear trim panel.

INSTALLATION

INSTALLATION

NOTE: Take the proper precautions to protect the face of the floor console panel from cosmetic damage while performing this procedure.

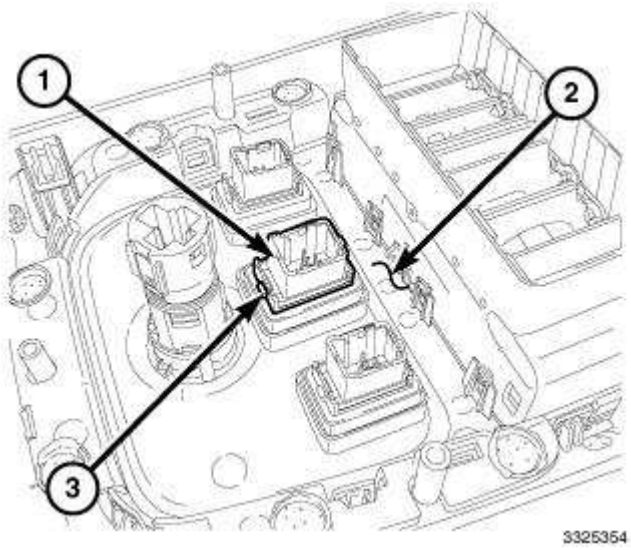

Fig. 6: Sunshade Switch, Trim Panel And Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Align the tabs on each sunshade seat switch (1) with the openings in the floor console rear trim panel (2) and install the switch, as necessary. Push the switches firmly into the trim panel until the two retaining tabs (3) are fully engaged.
2. Install the trim panel onto the back of the center floor console. Be sure to connect any necessary electrical connectors and properly align the console ducts.
3. Connect the negative battery cable.

DRIVELINE/AXLES

Propeller Shaft - Chrysler 300

DESCRIPTION

DESCRIPTION

REAR

WARNING: Due to propeller shaft imbalance concerns, rear propeller shaft service is limited to center support bearing and coupler replacement only. The rear segment single-cardan universal joint is not serviceable.

Both RWD and AWD models utilize a "two-piece" rear propeller shaft design to transmit torque to the rear axle assembly. This two-piece design consists of:

- Front and rear shaft segments
- Center support bearing/bracket assembly
- Single-Cardan u-joint at rear segment/bearing interface
- Rubber couplers at transmission and rear axle flanges
- Fore-mounted vibration damper (V6 Models)

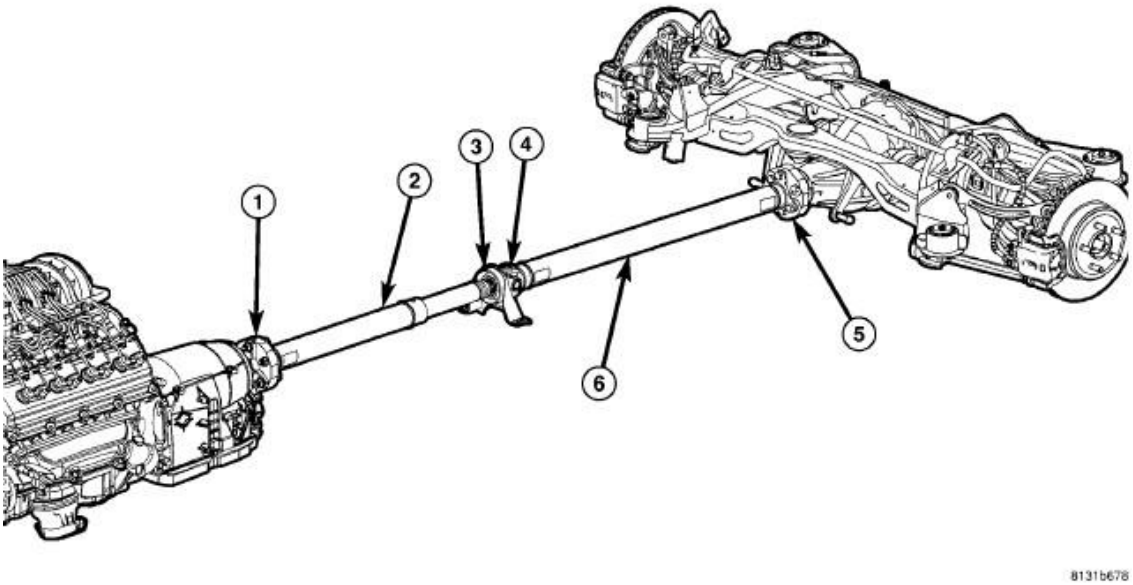

Fig. 1: Rear Propeller Shaft Assembly (V8 System Shown)
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT COUPLER
2 - FRONT SEGMENT

3 - BEARING/BRACKET ASSEMBLY
4 - SINGLE-CARDAN U-JOINT
5 - REAR COUPLER
6 - REAR SEGMENT

The front shaft segment is designed with a collapsing feature, consisting of two concentric tubes secured by shear pins. This feature allows the tubes to telescope up to 200 mm (8 in.) during certain impacts.

The flexible rubber couplers at the transmission and axle flanges absorb vibration. The low-travel Single-Cardan universal joint permits the minimal axial and angular variations that occur with independent rear suspension.

Additionally, models equipped with the V6 engine utilize a vibration damper which is designed to absorb and isolate driveline vibrations and harmonics. This damper is mounted to the front segment, sandwiched between the coupler and propeller shaft.

FRONT

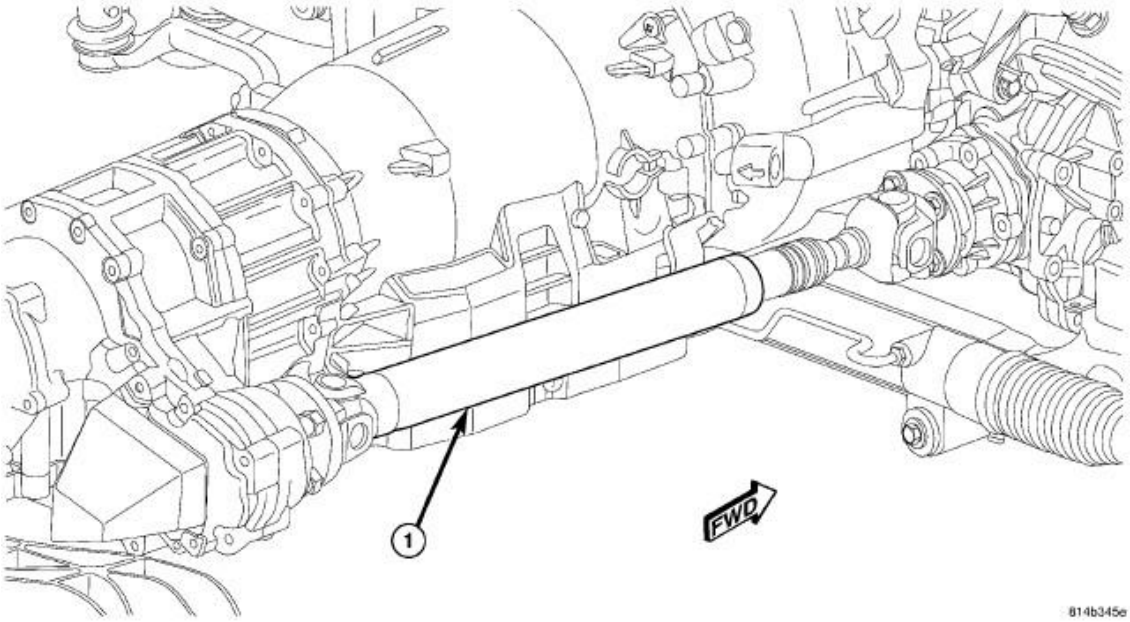

Fig. 2: Front Propeller Shaft Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT PROPELLER SHAFT ASSEMBLY

WARNING: Due to propeller shaft imbalance concerns, front propeller shaft service is limited to rubber coupler and entire shaft replacement. The single-cardan universal joints are not serviceable.

AWD models utilize a "two-piece" front propeller shaft design to transmit torque to the front axle assembly. This two-piece design consists of:

- Front and rear shaft segments
- Single-Cardan u-joints at end flanges
- Rubber boot at front/rear segment interface

1 - PROPELLER SHAFT ASSEMBLY

2 - BOLTS

3. Apply alignment index marks on the propeller shaft and front axle flanges.
4. Remove and discard four front propeller shaft-to-axle flange bolts (2).
5. Apply alignment index marks on the propeller shaft and transfer case flanges.
6. Remove and discard four front propeller shaft-to-transfer case flange bolts (2).
7. Remove propeller shaft assembly (1).

REAR

CAUTION: Propeller shaft removal is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

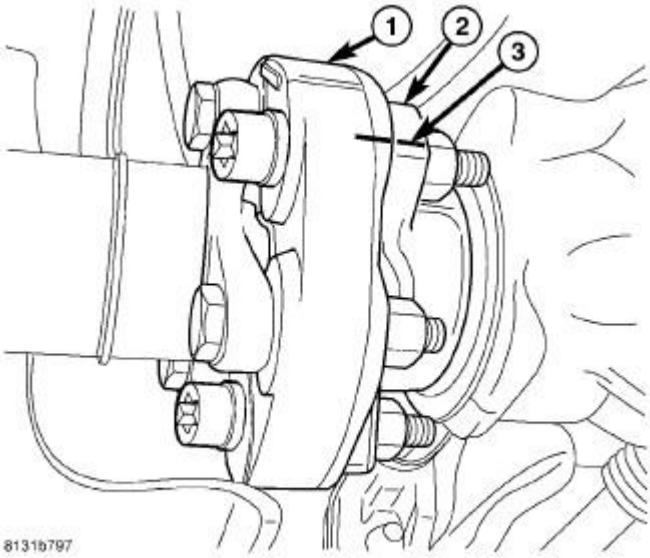

Fig. 5: Alignment Marks AT Shaft And Flange

8. Remove center bearing (1) mounting bolts.

9. With the aid of a helper, remove propeller shaft assembly.

COUPLER/DAMPER SERVICE

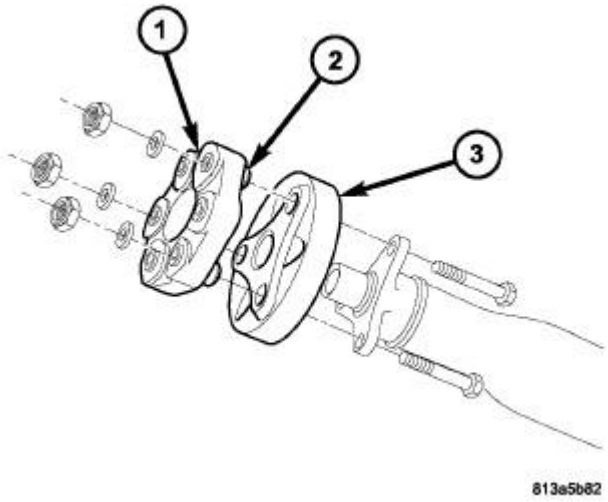

Fig. 12: Removing/Installing Damper
Courtesy of CHRYSLER GROUP, LLC

1. Remove three coupler-to-propeller shaft bolt/nuts.
2. Separate coupler (1) and damper (3) (if equipped) from propeller shaft. Note orientation and direction of components. It is imperative that they are properly reinstalled.

INSTALLATION

FRONT

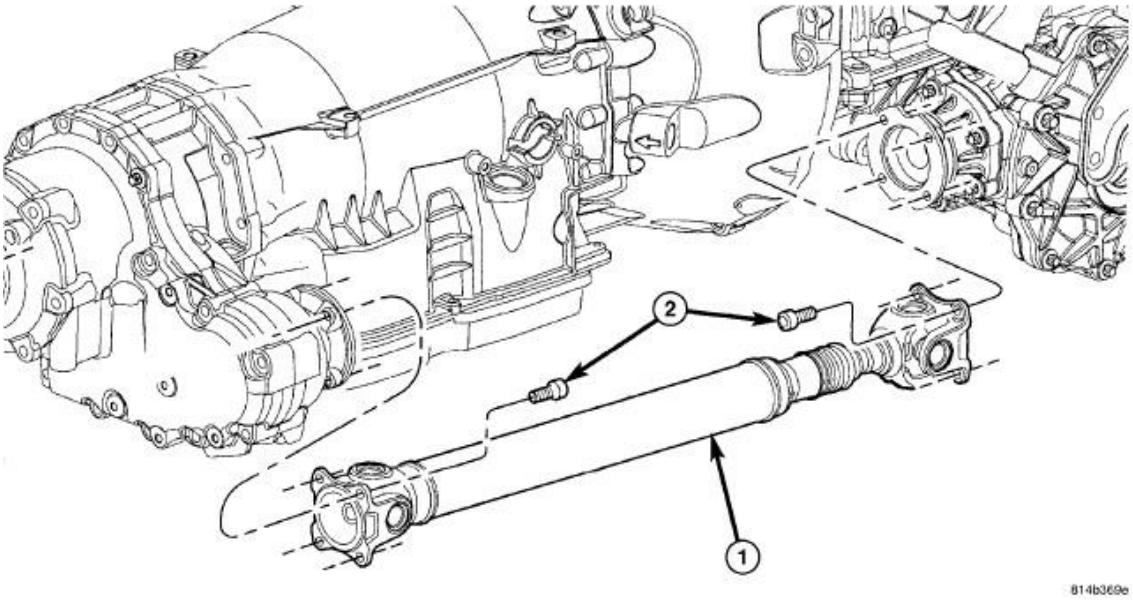

Fig. 13: Front Propeller Shaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1 - PROPELLER SHAFT ASSEMBLY
2 - BOLTS

1. Install propeller shaft (1) into position.
2. Starting at transfer case end, align index marks placed upon removal and loose-install **new** propeller shaft-to-transfer case flange bolts.
3. Align index marks at front axle end of shaft, and loose-install **new** propeller shaft-to-front axle flange bolts.
4. Torque propeller shaft-to-transfer case and axle flange bolts (2) to 64 N.m (48 ft. lbs.).

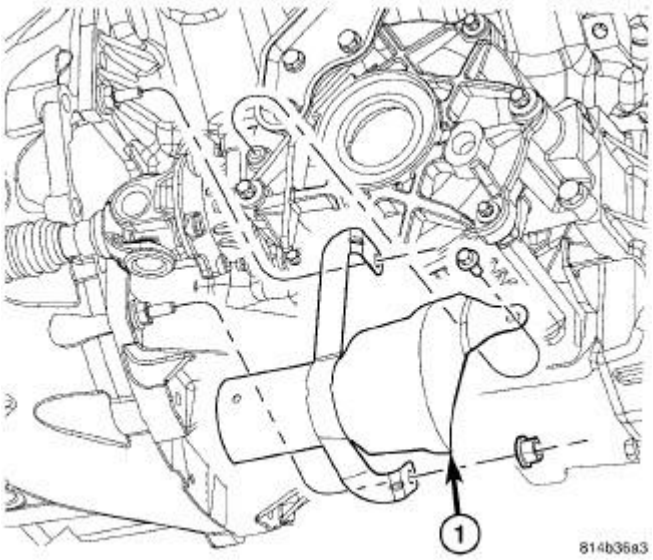

Fig. 14: Removing/Installing Heat Shield
Courtesy of CHRYSLER GROUP, LLC

1 - HEAT SHIELD

5. Install propeller shaft heat shield.
6. Lower vehicle.

REAR

CAUTION: Propeller shaft installation is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

COUPLER/DAMPER SERVICE

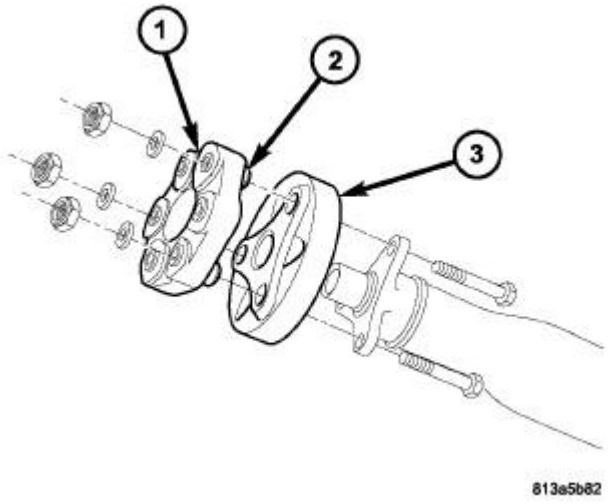

Fig. 15: Removing/Installing Damper
Courtesy of CHRYSLER GROUP, LLC

1. If coupler and/or damper were removed, align index marks and reinstall. **Make sure protruding sleeve (2) is properly seated into propshaft or damper counterbores.**
2. Install three bolts with washers and nuts and torque to 58 N.m (43 ft. lbs.) torque.

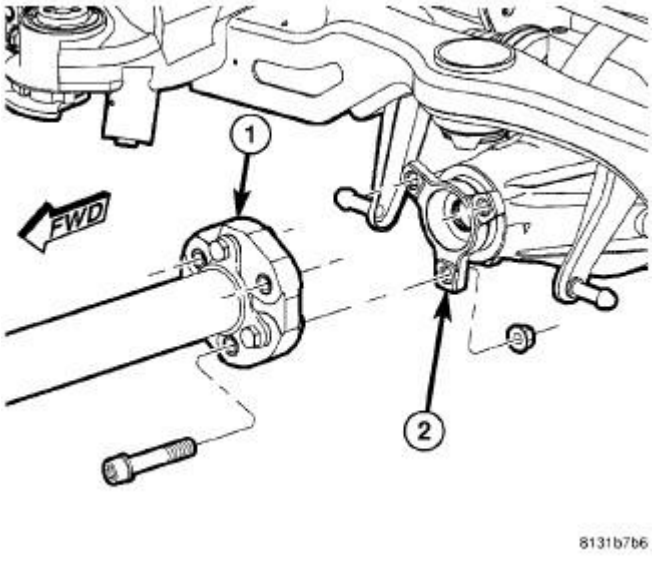

Fig. 16: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

1. Obtain helper and install propeller shaft into position at axle. Align index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolt/nuts by hand. Do not torque at this time.

Courtesy of CHRYSLER GROUP, LLC

4. Press center bearing (1) off of rear shaft segment using arbor press and Bearing Splitter (special tool #1130, Splitter, Bearing/Gear) (2).

INSTALLATION

INSTALLATION

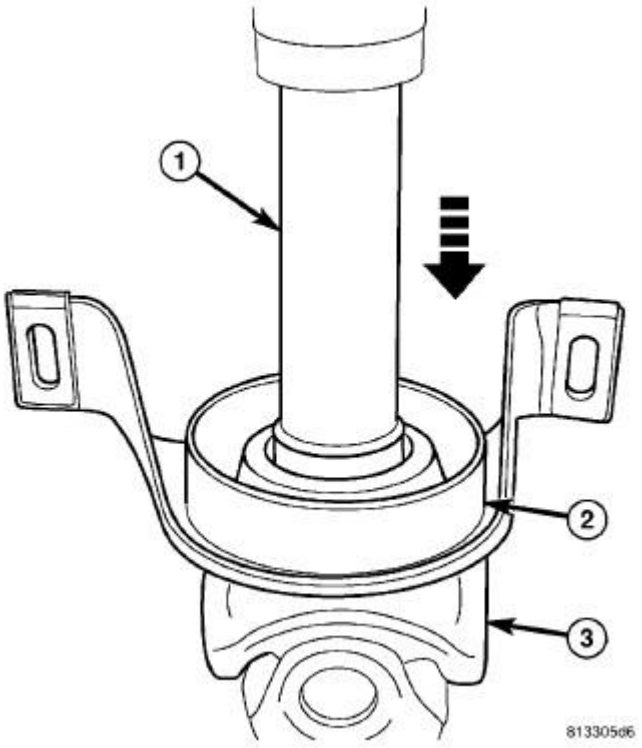

Fig. 29: Installing Center Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Install propeller shaft rear segment into press, supported on joint yoke (3).
2. Install bearing assembly as shown in illustration (2).
3. Using installer (special tool #C-4735, Handle, Driver) (1), press bearing assembly (2) onto shaft.

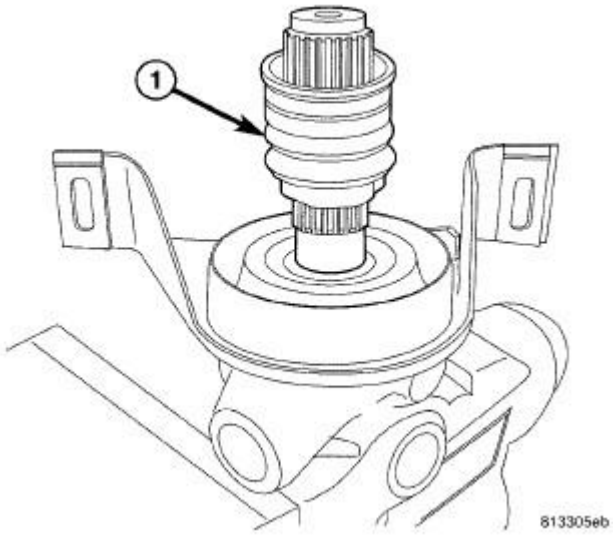

Fig. 30: Installing Plunging Boot
Courtesy of CHRYSLER GROUP, LLC

4. Remove propeller shaft from press.
5. Install boot (1) to rear shaft segment.

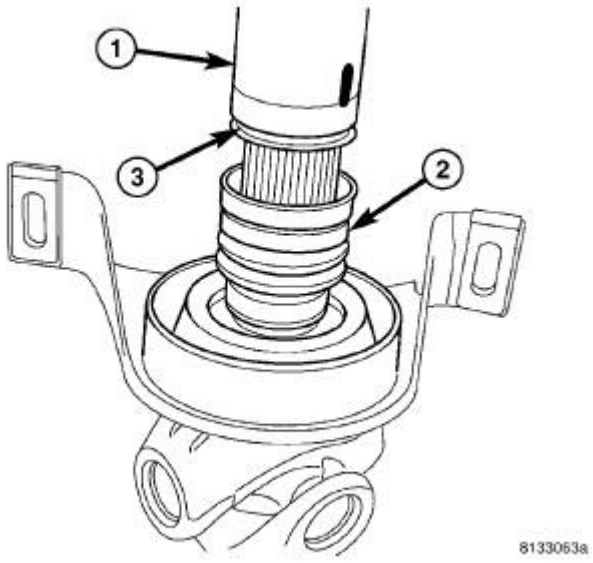

Fig. 31: Front Segment Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: To address propeller shaft imbalance concerns, the propeller shaft spline interface has a "skip-tooth" design allowing only one possible assembly orientation.

6. Align index marks placed upon disassembly and install front segment (1) to rear segment.
7. Install boot (2) to front segment, seating boot into groove (3).
8. Install propeller shaft into vehicle.

DRIVELINE/AXLES

Rear Axle - 200MM - Chrysler 300

DESCRIPTION

DESCRIPTION

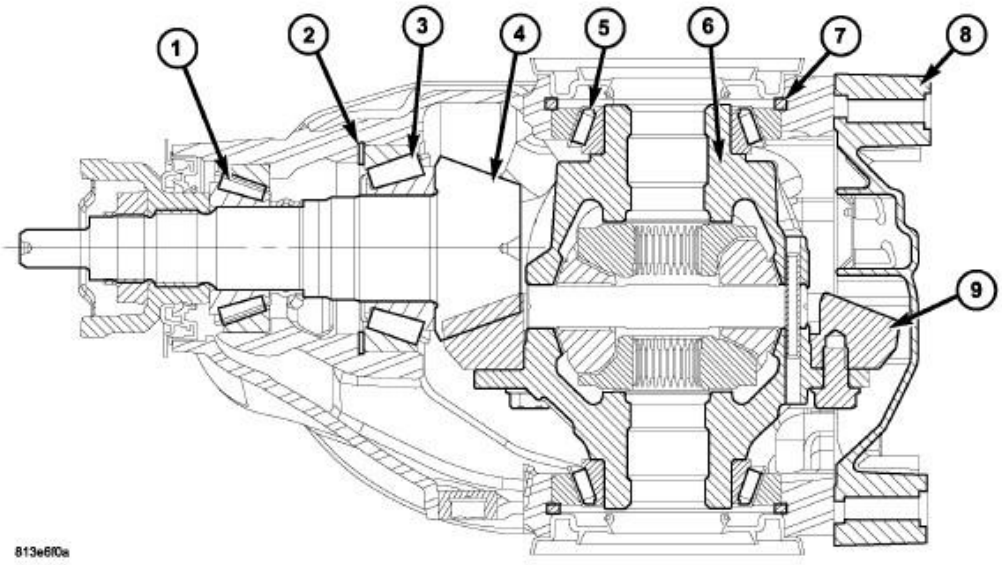

Fig. 1: Axle Section View
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING, PINION TAIL	6 - DIFFERENTIAL
2 - SHIM, PINION DEPTH	7 - RING, SNAP
3 - BEARING, PINION HEAD	8 - COVER, AXLE
4 - GEAR/SHAFT, PINION	9 - GEAR, RING
5 - BEARING, DIFFERENTIAL SIDE	

The 200 MM RII (Rear-Independent-Iron) axle is an independent assembly with a cast iron housing and differential. The 200 MM RII uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select snap-rings located on the outside of the differential bearing cups. Pinion height is set with a select shim located under the rear pinion bearing cup.

The 200 axle is available only in all-wheel-drive (AWD) models, and in V-6 engine-equipped rear-wheel-drive (RWD) models, and is available in a 3.07 gear ratio.

AXLE IDENTIFICATION

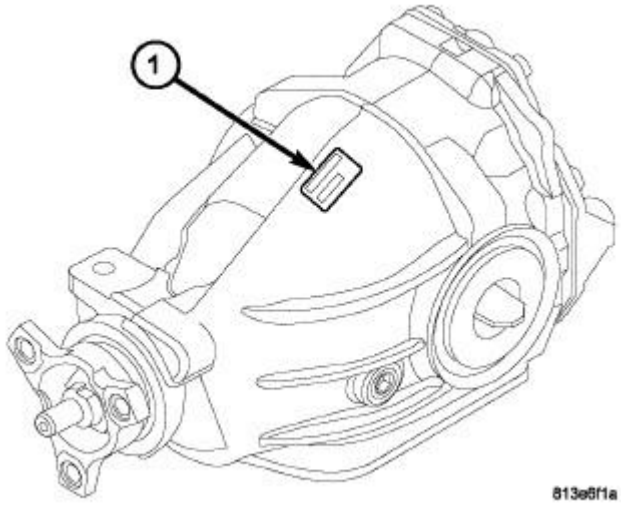

Fig. 2: Axle Identification Tag
Courtesy of CHRYSLER GROUP, LLC

The 200 MM axle utilizes a barcoded label (1) which is adhered to the top of the axle housing as shown in illustration. The following information is found on the identification label:

- Traceability Code (Plant Use)
- Axle Part Number
- Axle Gear Ratio

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AXLE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.

- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or CV joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
DIFFERENTIAL CRACKED	1. Improper differential side bearing preload.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
DIFFERENTIAL GEARS SCORED	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill

		differential with the proper fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
LOSS OF LUBRICANT	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked axle housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored pinion flange journal.	5. Replace pinion flange and seal.
	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.
AXLE OVERHEATING	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing preload too high.	3. Readjust bearing pre-load.
	4. Insufficient ring gear backlash.	4. Re-adjust ring gear backlash.
GEAR TEETH BROKEN	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Ice-spotted pavement.	2. Replace gears and examine remaining parts for damage.
	3. Improper adjustments.	3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
AXLE NOISE	1. Insufficient lubricant.	1. Fill axle with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and/or pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing preload.

	7. Misaligned or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Housing not machined properly.	8. Replace housing.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: Note: The fluid required for use in this axle is Mopar® Synthetic Gear and Axle Lubricant 75W-140.

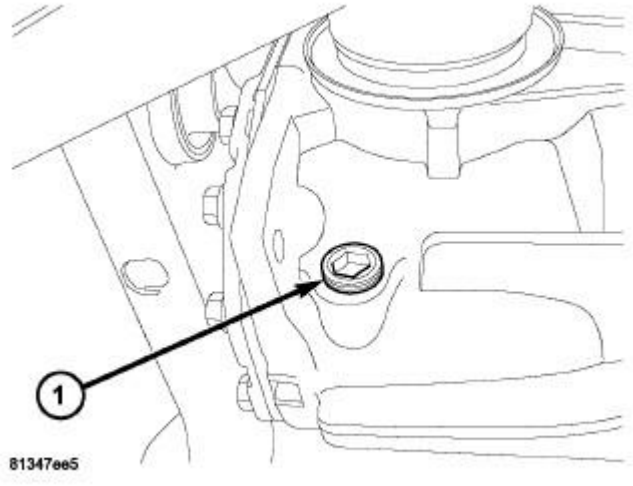

Fig. 3: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.
2. With vehicle in neutral, position and raise vehicle on hoist.
3. Remove rear axle drain plug and drain lubricant completely from the axle.
4. Install drain plug and tighten to 60 N.m (44 ft lbs).

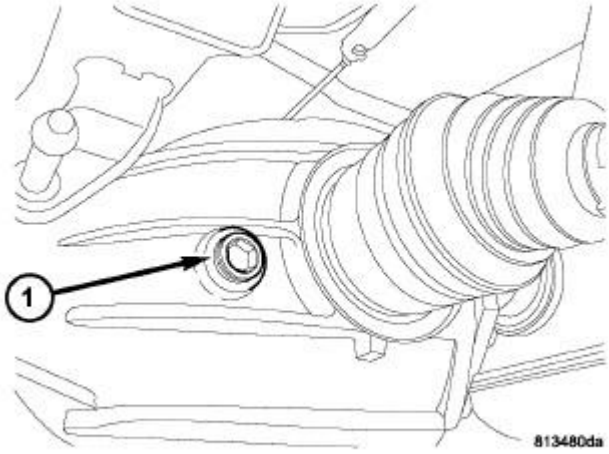

Fig. 4: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

5. Remove fill plug (1) and fill rear axle with 1.4 L (1.5 qts.) Mopar® Synthetic Gear AND Axle Lubricant 75W-140 and insure axle is filled to the bottom of the fill hole.
6. Install fill plug and tighten to 60 N.m (44 ft lbs).

ADJUSTMENTS

PINION DEPTH

PINION DEPTH VARIANCE

Ring gear and pinion are supplied as matched sets.

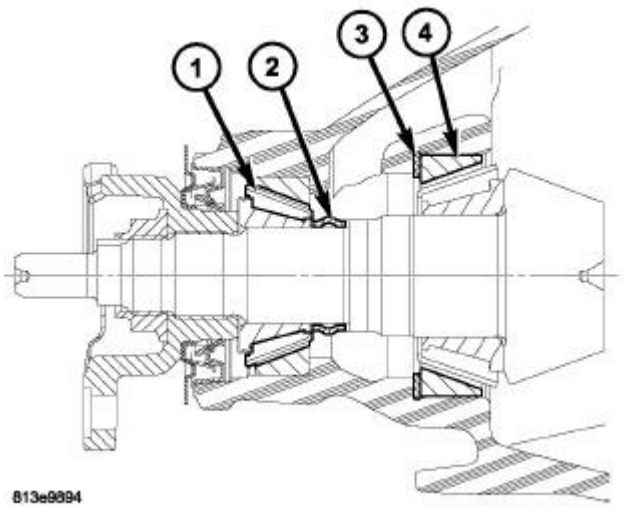

Fig. 5: Pinion Depth Variance
Courtesy of CHRYSLER GROUP, LLC

Compensation for pinion depth variance is achieved with select shims (3). The shims are sandwiched between the pinion head bearing cup (4) and axle housing.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim to compensate for the difference in the depth variances. The numbers represent deviation from the standard in thousandths of an inch. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

PINION DEPTH MEASUREMENT

Pinion depth measurement is taken with the pinion head and tail bearing cups pressed into the axle housing without the shim.

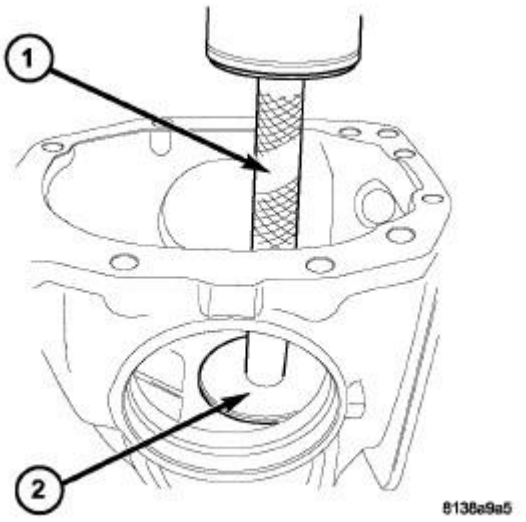

Fig. 6: Pinion Head Bearing Cup Installation
Courtesy of CHRYSLER GROUP, LLC

1. Press pinion head bearing cup into housing using Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #C-4310, Installer, Bearing) (2).

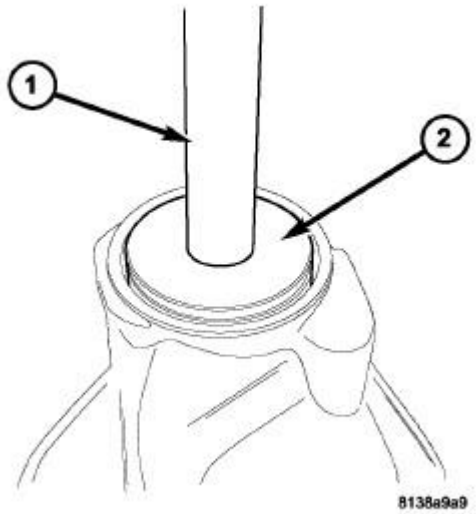

Fig. 7: Installing Pinion Tail Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

2. Press pinion tail bearing cup into housing using Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #D-146, Installer, Bearing Cup) (2).

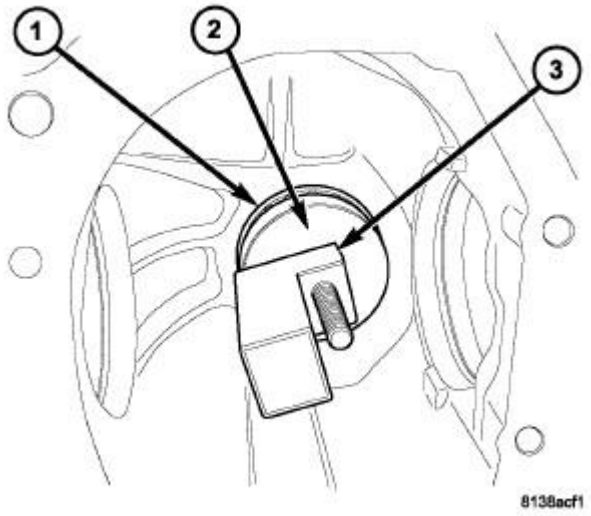

Fig. 8: L-Block, Gage Block & Bearing
Courtesy of CHRYSLER GROUP, LLC

3. Assemble Pinion Height Block (special tool #6739, Block, Height) (3), Pinion Head Bearing Cone (1), Screw (special tool #6741, Screw) (all these can be found in a Pinion Gauge Set such as (special tool #6774, Kit, Jeep Pinion Depth)), and Pinion Height Gage Block (special tool #9227, Gauge, Pinion Height) (2). Install assembly into axle housing and through bearing cups.

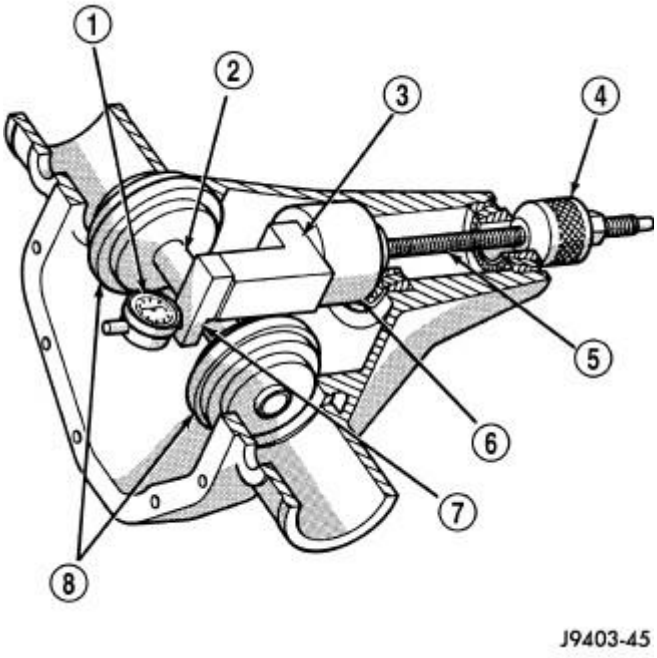

Fig. 9: Pinion Depth Gauge Tools - Typical
Courtesy of CHRYSLER GROUP, LLC

4. Install pinion tail bearing and Cone (special tool #6740, Cone) (4). Tighten Cone (special tool #6740, Cone) by hand until 3.4 N.m (30 in. lbs.) of rotating torque is measured at Screw (special tool #6741, Screw) (5).

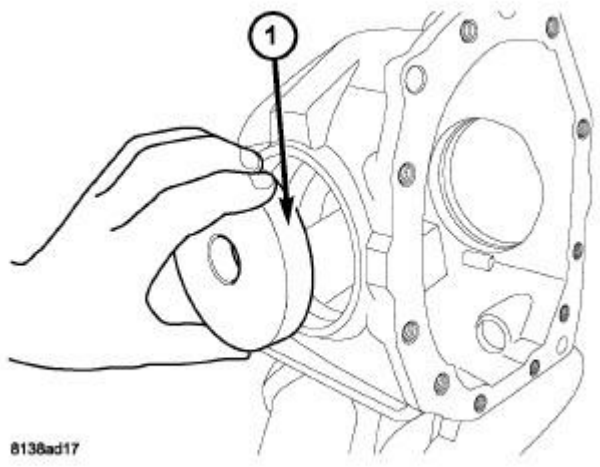

Fig. 10: Removing/Installing Arbor Discs
Courtesy of CHRYSLER GROUP, LLC

5. Install Arbor Discs (special tool #9228, Set, Arbor Disc) (1).

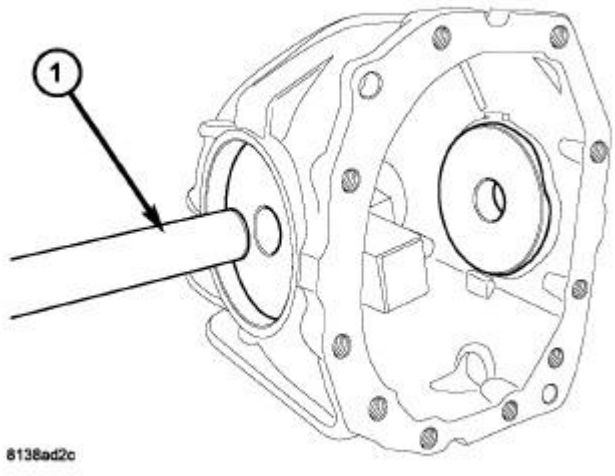

Fig. 11: Remove/Install Arbor Bar
Courtesy of CHRYSLER GROUP, LLC

6. Install Arbor Bar (special tool #D-115-3, Arbor) (1) from a Pinion Gauge Set such as (special

tool #6774, Kit, Jeep Pinion Depth).

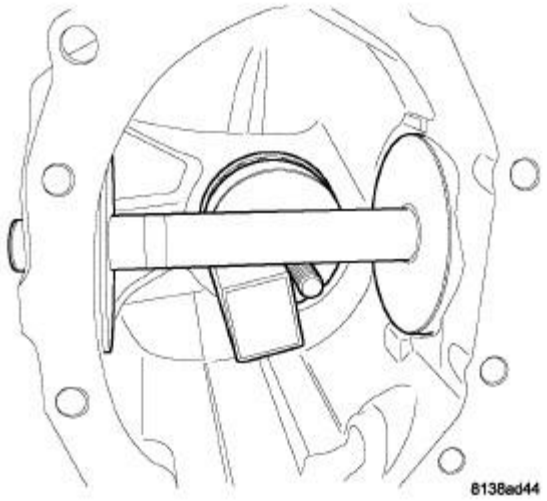

Fig. 12: Pinion Gage Setup
Courtesy of CHRYSLER GROUP, LLC

7. Verify pinion depth setup is as shown in illustration.

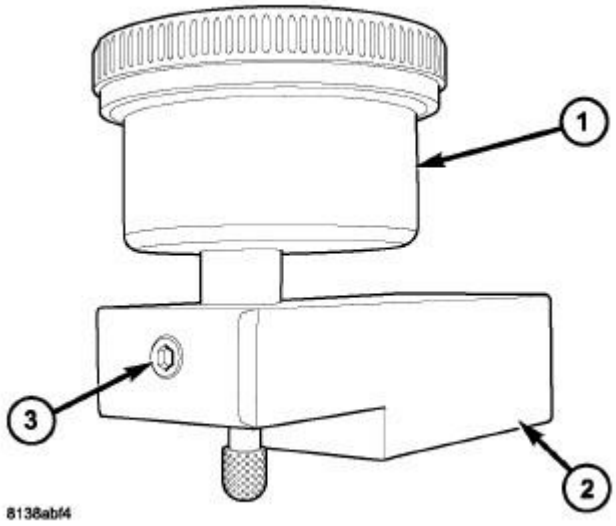

Fig. 13: Indicator/Scooter Block Setup
Courtesy of CHRYSLER GROUP, LLC

8. Install Dial Indicator (special tool #9524, Indicator, Dial) (1) to Scooter Block (special tool #D-115-2A, Block, Scooter) (2) (from a Pinion Gauge Set such as (special tool #6774, Kit, Jeep Pinion Depth)). Secure with set-screw (3).

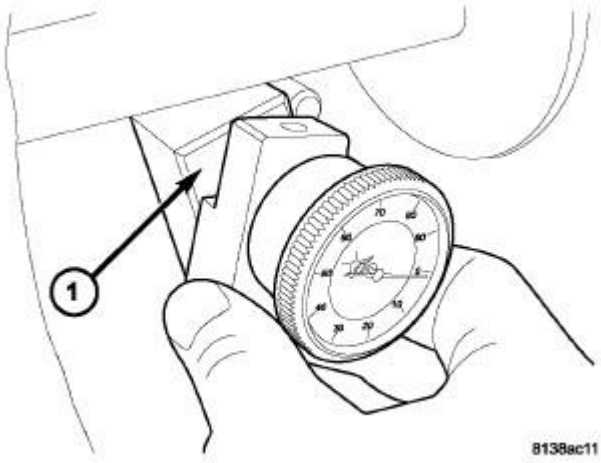

Fig. 14: Zero Dial Indicator On L-Block
Courtesy of CHRYSLER GROUP, LLC

9. Install Indicator/Block assembly to top of Pinion Height Block (special tool #6739, Block, Height) (1). Zero indicator on top surface.

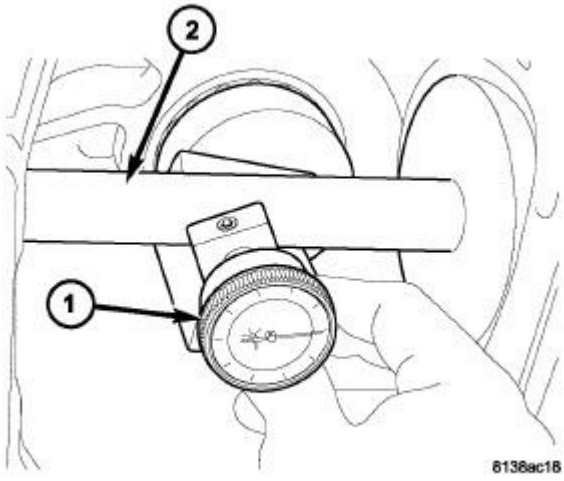

Fig. 15: Measure And Record Required Shim
Courtesy of CHRYSLER GROUP, LLC

10. Slide indicator probe off of height block and onto Arbor Bar (special tool #D-115-3, Arbor) (2). As indicator contacts Arbor Bar (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of the arbor bar and record the highest reading.
11. Select a shim equal to the dial indicator reading minus 2.5 mm (0.09 in.). After shim installation, check the amount of pinion bearing preload, and adjust as required to achieve the correct

turning torque.

ADJUSTMENT - SIDE BEARING PRELOAD AND RING GEAR BACKLASH

DIFFERENTIAL SIDE BEARING PRELOAD MEASUREMENT/CORRECTION

Differential side bearing preload should be measured and adjusted after the following scenarios:

- Differential case replacement
- Differential side bearing replacement
- Axle housing replacement
- Loss or replacement of side bearing snap rings

If none of these situations apply, refer to **RING GEAR BACKLASH MEASUREMENT/CORRECTION** .

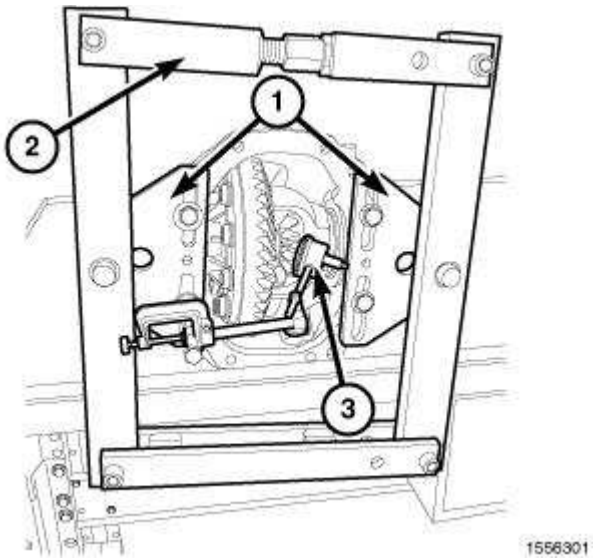

Fig. 16: Universal Spreader Adapter Plates & Spreader
Courtesy of CHRYSLER GROUP, LLC

1. Install Universal Spreader Adapter Plates (special tool #10113, Adapters, Spreader) (1), and Spreader (special tool #W-129-B, Spreader, Differential) (2). Install a stud into the case in the location shown in illustration. Mount Clamp (special tool #SP-5426, Clamp (Less Post)) to the stud, and install Post (special tool #SP-5425-B, Special Post) from Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) into the Clamp (special tool #SP-5426, Clamp (Less Post)). Zero Metric Dial Indicator (special tool #9524, Indicator, Dial) (3) in the location shown in illustration to measure axle housing spread.

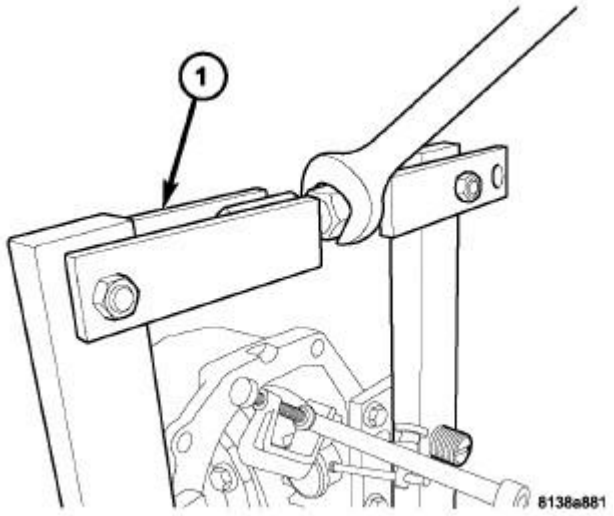

Fig. 17: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

2. If differential side bearing cups and snap rings are removed at this point, skip to Step 6. Otherwise, expand spreader to spread axle housing no more than 0.30 mm (0.012 in.).

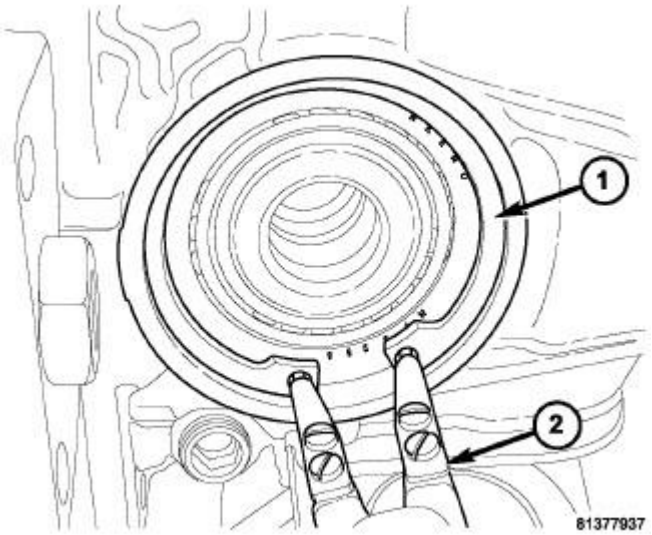

Fig. 18: Snap Ring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

3. Remove both differential side bearing snap rings (1). Tag snap ring to ensure installation in original position.

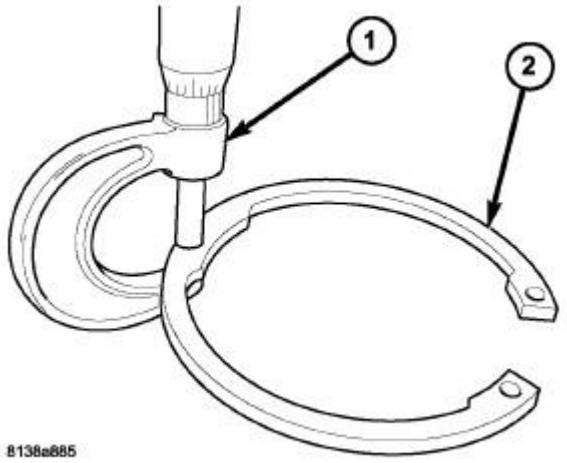

Fig. 19: Measuring Side Bearing Snap Ring
Courtesy of CHRYSLER GROUP, LLC

4. Measure and record snap ring (2) thickness for later use.

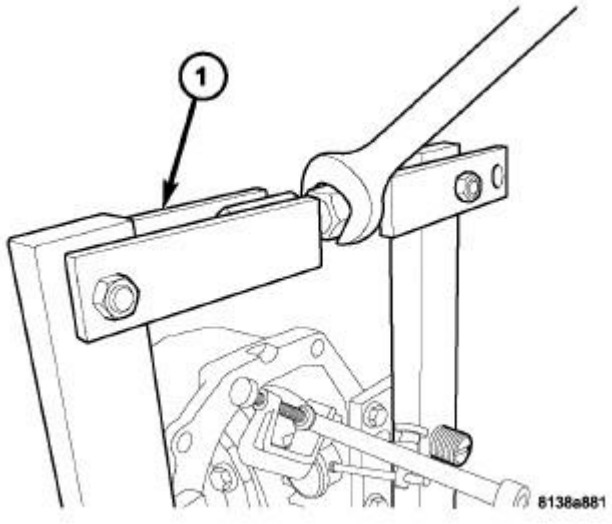

Fig. 20: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

5. Relax spreader (1) to relieve tension on axle housing.

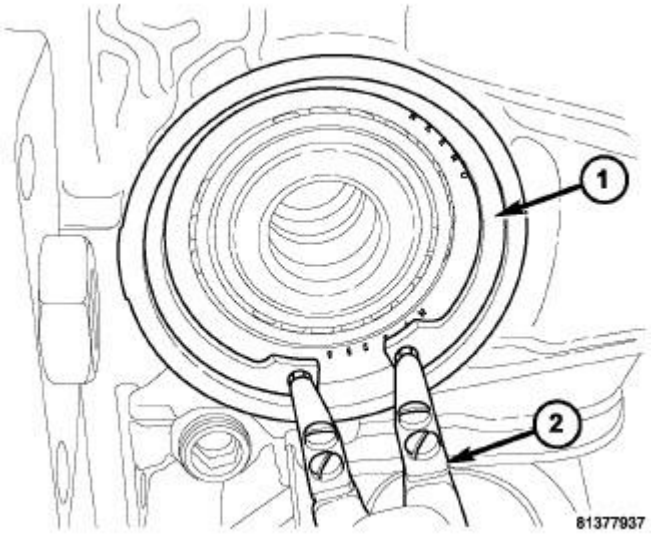

Fig. 21: Snap Ring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

6. Install right (pinion) side bearing cup and snap ring (1).

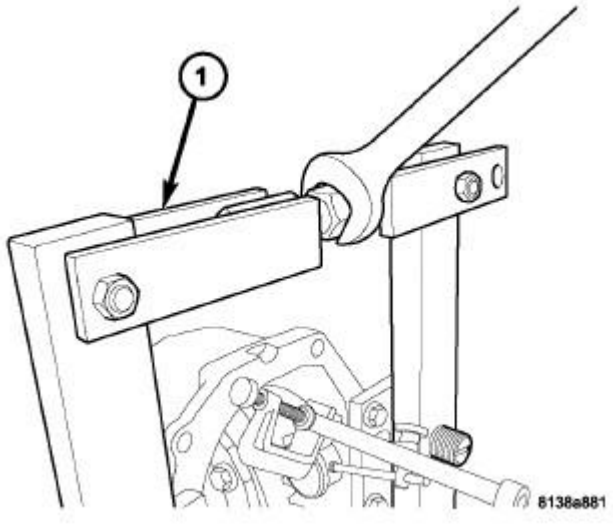

Fig. 22: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

7. Zero dial indicator.
8. Expand spreader (1) to spread axle housing no more than 0.30 mm (0.012 in.).

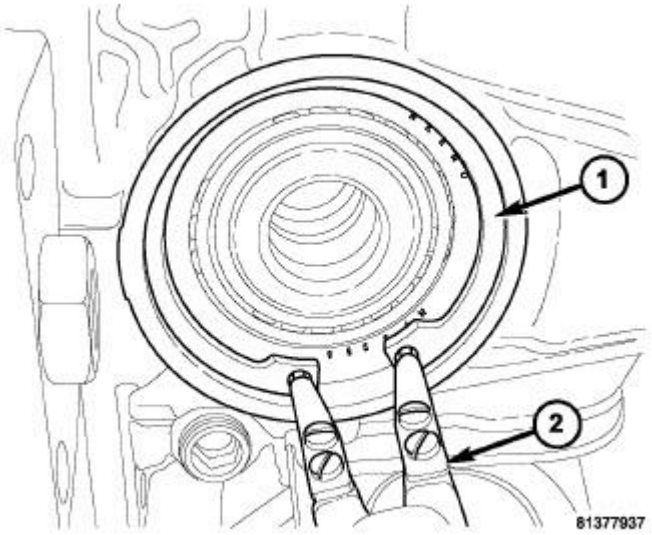

Fig. 23: Snap Ring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

9. Install left (ring gear) side bearing cup and snap ring (1).

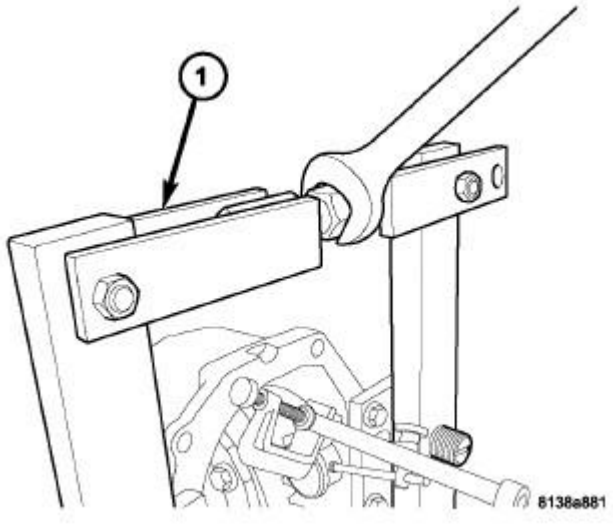

Fig. 24: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

10. Relax spreader (1) to relieve tension on axle housing.
11. Measurement showing on indicator is the axle housing retained spread. Proper differential side bearing preload is achieved with an axle housing retained spread of 0.18-0.23 mm (0.007-0.009 in.).
12. If retained spread is less than 0.18 mm (0.007 in.), increase snap ring thickness at each side in

equal increments.

13. If retained spread is greater than 0.23 mm (0.009 in.), decrease snap ring thickness at each side in equal increments.

RING GEAR BACKLASH MEASUREMENT/CORRECTION

Differential Ring Gear Backlash should be measured and adjusted after the following scenarios:

1. Ring and pinion gear replacement
2. Pinion head bearing replacement
3. Pinion depth (shim) adjustment
4. Differential case replacement
5. Differential side bearing replacement
6. Axle housing replacement

NOTE: If Spreader (special tool #W-129-B, Spreader, Differential) is installed, make sure tension on axle housing is relieved.

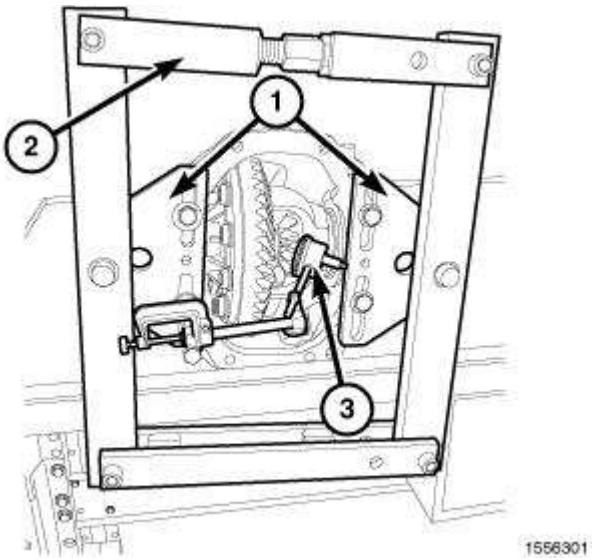

Fig. 25: Universal Spreader Adapter Plates & Spreader
Courtesy of CHRYSLER GROUP, LLC

7. Install Universal Spreader Adapter Plates (special tool #10113, Adapters, Spreader) (1), and Spreader (special tool #W-129-B, Spreader, Differential) (2). Install a stud into the case in the location shown in illustration. Mount Clamp (special tool #SP-5426, Clamp (Less Post)) to the stud, and install Post (special tool #SP-5425-B, Special Post) from Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) into the Clamp (special tool #SP-5426, Clamp (Less Post)). Zero Metric Dial Indicator (special tool #9524, Indicator, Dial) (3) in the location shown in illustration to measure axle housing spread.
8. Rotate ring gear one direction to take up clearance to pinion. Verify indicator tip is in contact with ring gear and zero indicator. Rotate ring gear back and forth and record measurement.

Ring gear backlash should be 0.13-0.18 mm (0.005-0.007 in.). Verify back lash measurement in four positions.

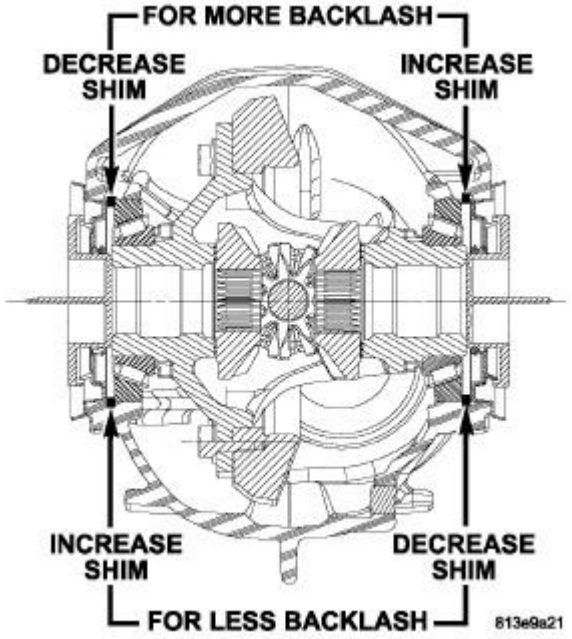

Fig. 26: Backlash Shim Correction
Courtesy of CHRYSLER GROUP, LLC

9. If backlash measurement is less than 0.13 mm (0.005 in.), it is necessary to decrease the snap ring thickness on the ring gear (left) side, and increase the thickness on the pinion (right) side.
10. If backlash measurement is greater than 0.18 mm (0.007 in.), it is necessary to increase the snap ring thickness on the ring gear (right) side, and decrease the thickness on the pinion (left) side.

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on

the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary. Refer to **Fig. 27**.

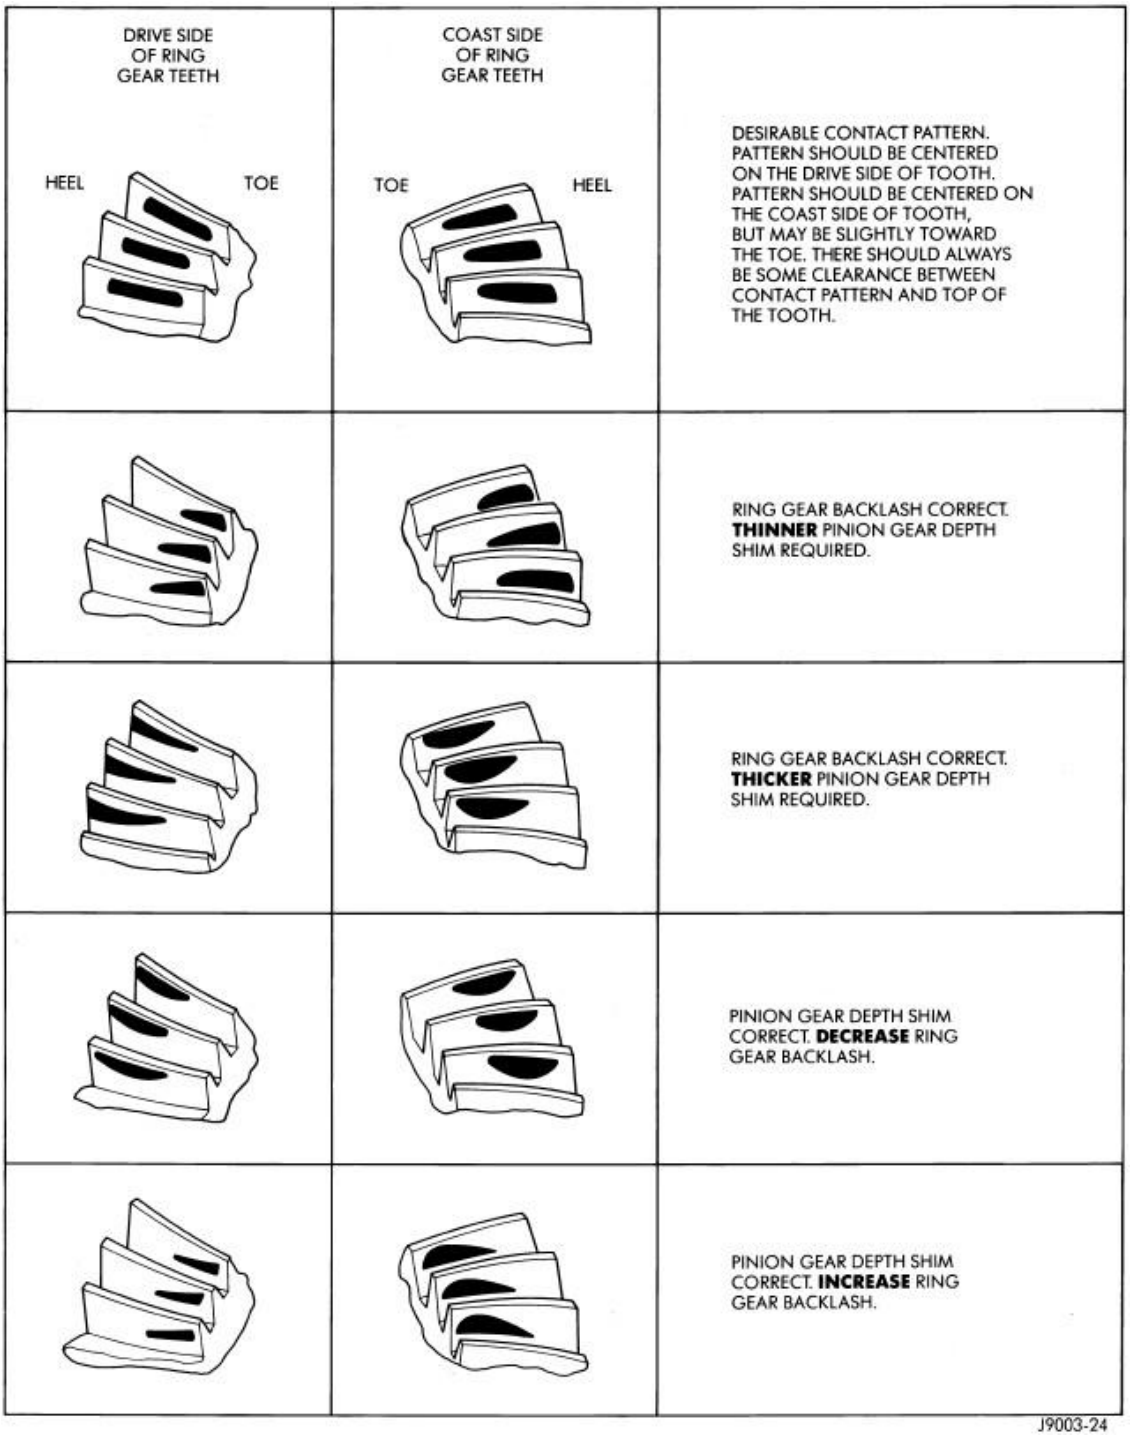

Fig. 27: Gear Tooth Contact Patterns

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Ring Gear Diameter	200 mm (7.87 in.)
Ring Gear Backlash	0.13-0.18 mm (0.005-0.007 in.)
Axle Housing Retained Spread	0.18 mm to 0.23 mm (0.007 in. to 0.009 in.)
Select Snap Ring Size	3.60-4.68 mm (0.14-0.18 in.) In 0.02mm (0.0007 in.) increments
Select Pinion Shim Size	1.40-2.50mm (0.05-0.10 in.) In 0.01mm (0.0004 in.) increments
Pinion Torque To Rotate	2.25N.m (20 in. lbs.)
Total Torque To Rotate (Approx.)	3.38N.m (30 in. lbs.)

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Plug, Rear Axle Drain/Fill	60	44	-
Bolt, Differential Cover	30 +45°	22 + 45°	-
Bolt, Ring Gear-to-Differential Case	85	64	-
Bolt, Axle Housing-to-Crossmember	220	162	-
Bolt/Nut, Axle Front Mount Isolator	65	48	-
Bolt/Nut, Propeller Shaft Coupler-to-Axle Flange	58	43	-

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

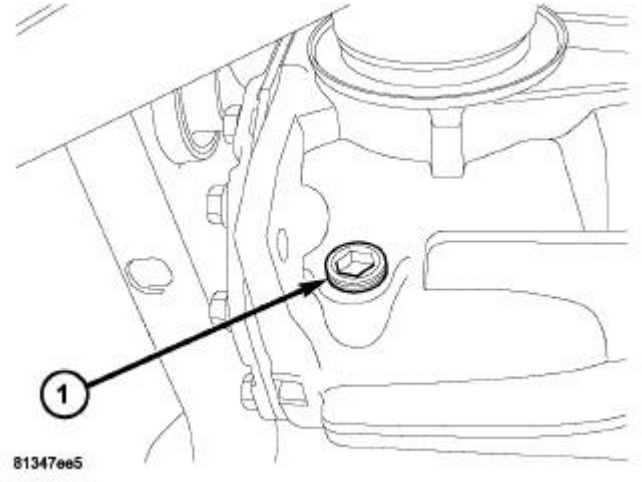

Fig. 28: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 60 N.m (44 ft. lbs.) torque.

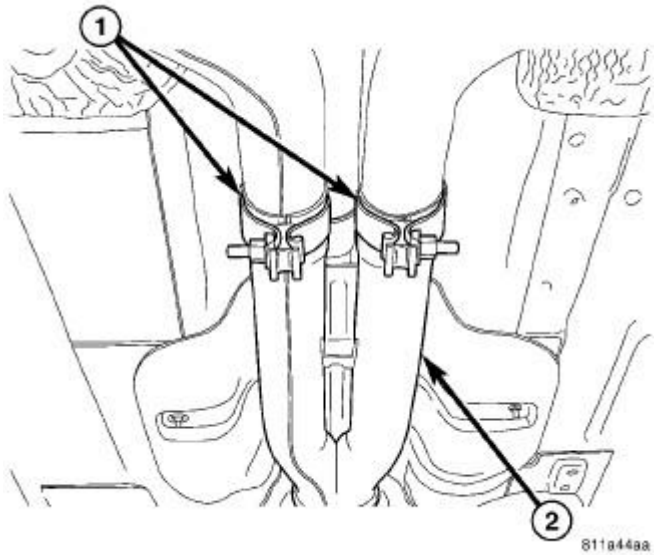

Fig. 29: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

4. Remove rear exhaust system (2) on dual-outlet exhaust models, otherwise, lower exhaust system at rear hanger(s) to provide adequate clearance.

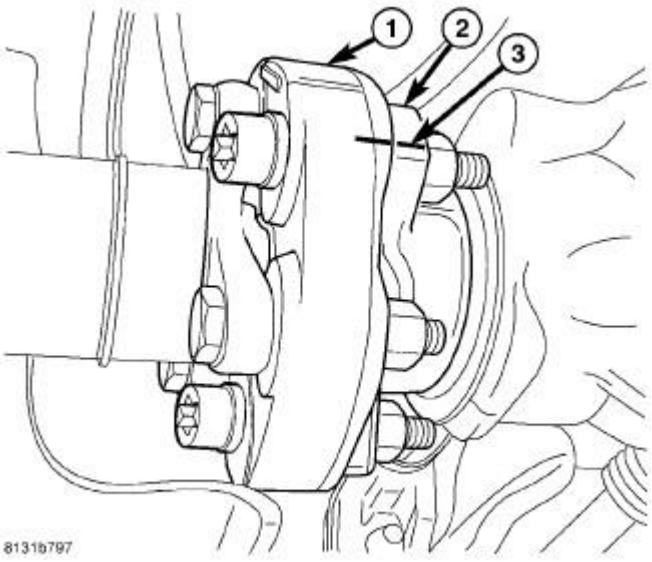

Fig. 30: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

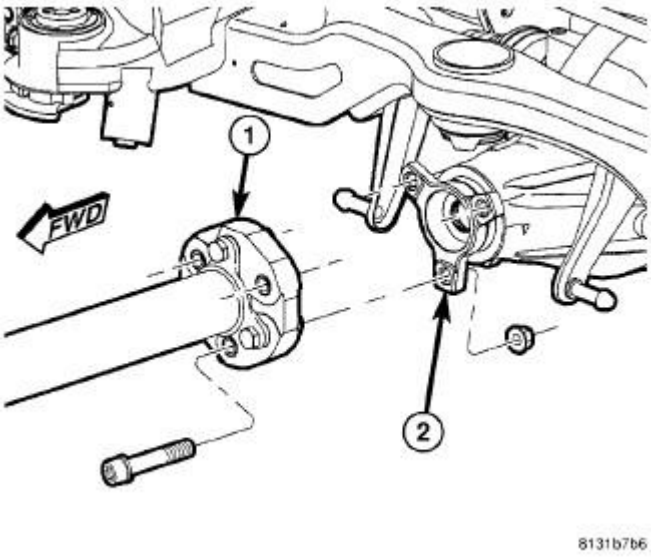

Fig. 31: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three propeller shaft coupler-to-axle flange bolt/nuts.

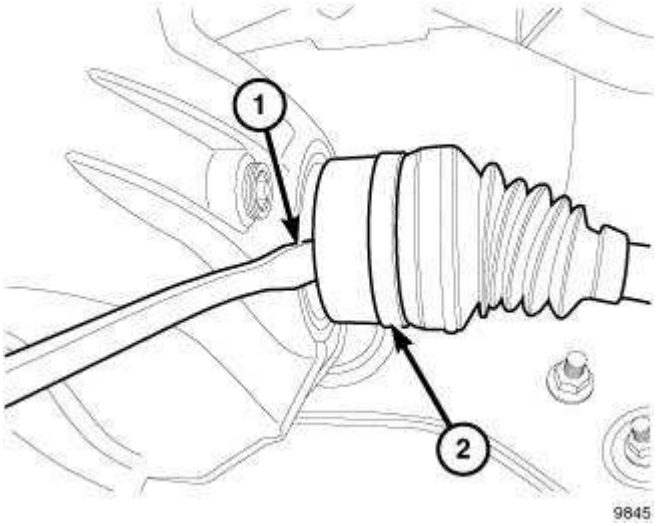

Fig. 32: Halfshaft Removal (V6 Models)
Courtesy of CHRYSLER GROUP, LLC

7. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

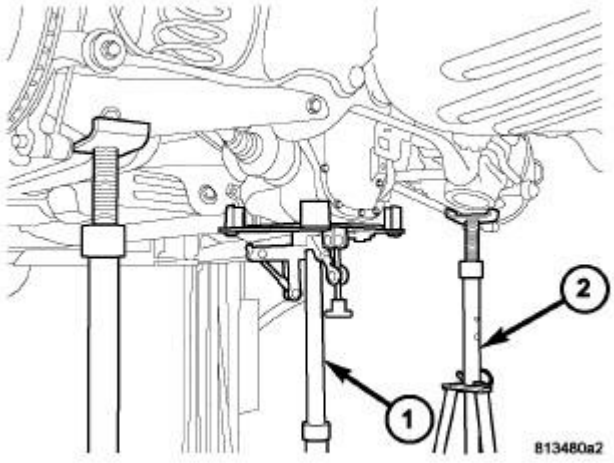

Fig. 33: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

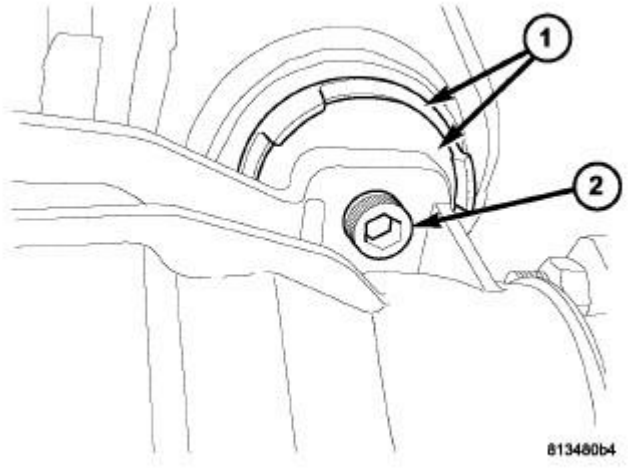

Fig. 34: Rear Axle Forward Mount Isolator & Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove rear axle forward mount isolator (1) bolt/nut (2).
10. Remove two rear axle-to-crossmember bolts (1).

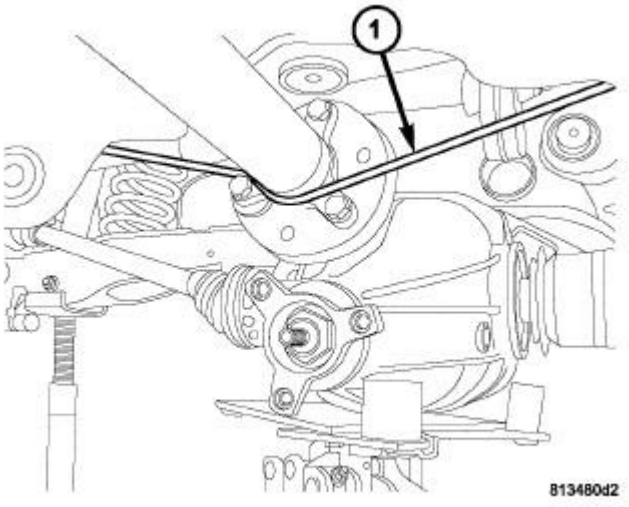

Fig. 35: Propeller Shaft Supported
Courtesy of CHRYSLER GROUP, LLC

11. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

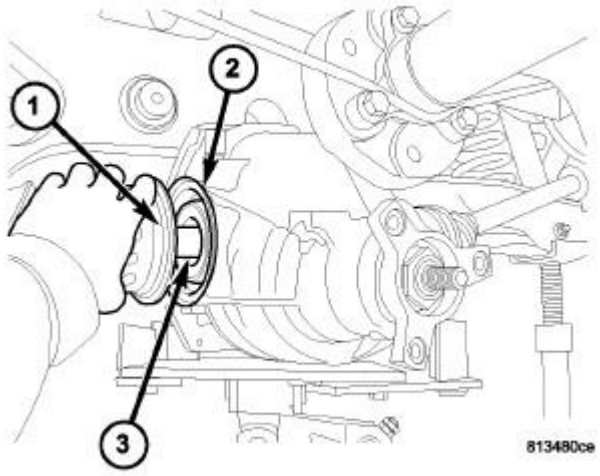

Fig. 36: Halfshaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

12. Lower axle just enough to remove both halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.
13. Remove axle assembly from vehicle and transfer to bench.

INSTALLATION

INSTALLATION

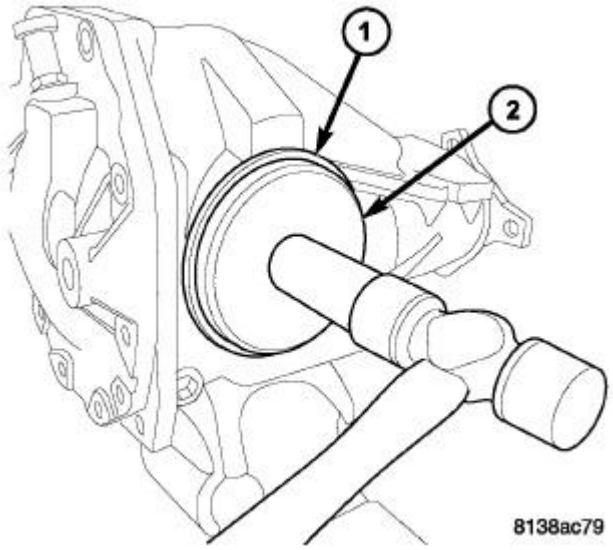

Fig. 37: Axle Seal Installation

Courtesy of CHRYSLER GROUP, LLC

1. Install new axle seal(s) (1) using (special tool #9223A, Drift) (2) if a new seal is required.

NOTE: Always use (special tool #9099, Seal Protector, Differential Output) when installing half shaft into the transaxle. If the Seal Protector is new please split at seam before using.

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

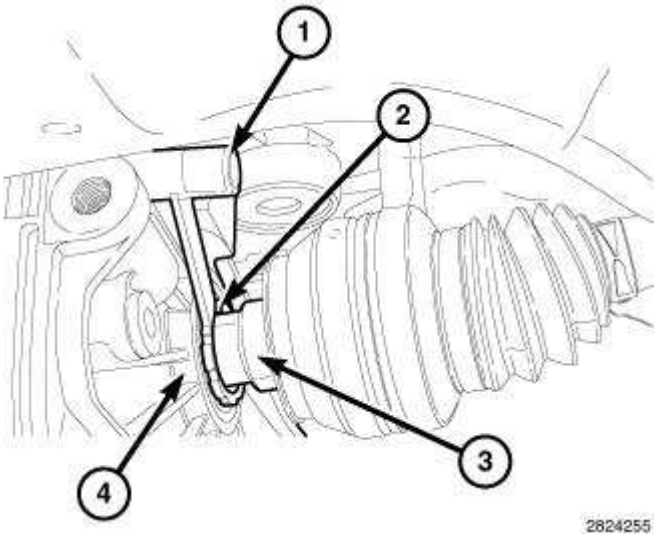

Fig. 38: Identifying Rear Axle, Rear Driveshaft, Rear Axle Flange, and Halfshafts
Courtesy of CHRYSLER GROUP, LLC

NOTE: While raising rear axle reposition rear drive shaft to rear axle flange.

2. Install new circlip(s), on halfshafts (3).
3. Raise axle just enough to install both halfshafts one at a time. Be careful not to damage axle seals using (special tool #9099, Seal Protector, Differential Output) (1). Shift axle assembly in one direction, compressing one halfshaft while installing the other.

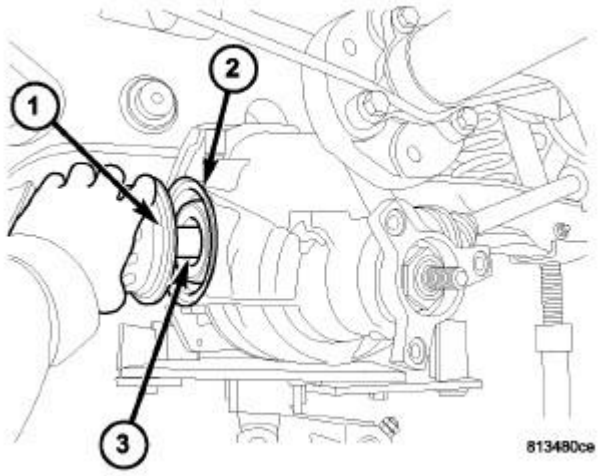

Fig. 39: Halfshaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

4. Verify proper installation by pulling outward on joint by hand.

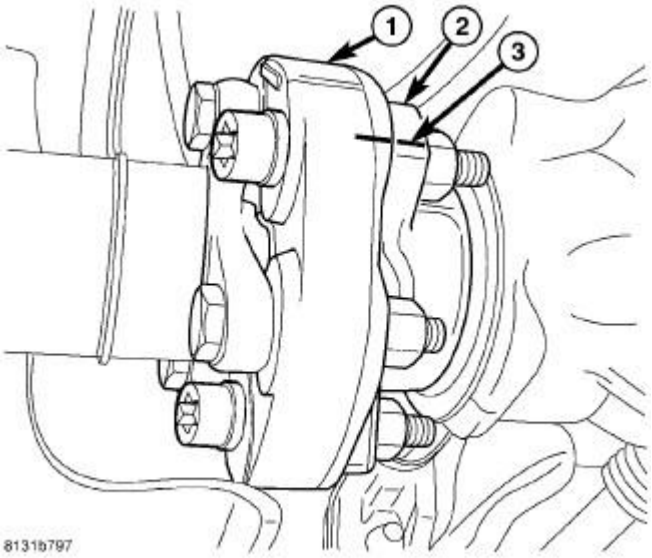

Fig. 40: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

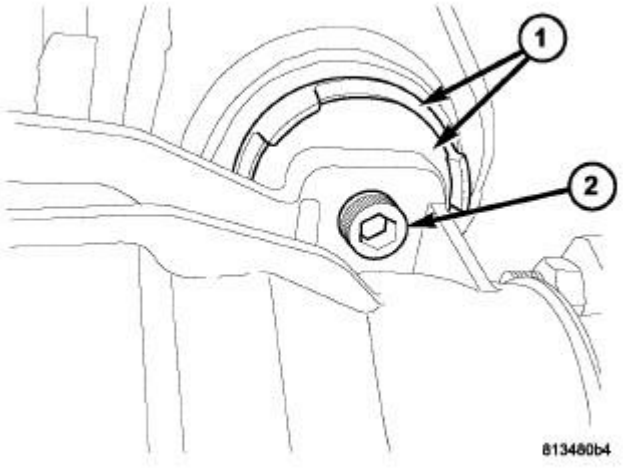

Fig. 41: Rear Axle Forward Mount Isolator & Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

6. Install two rear axle-to-crossmember bolts (1) and torque to 220 N.m (162 ft. lbs.).
7. Install rear axle front mount isolator (1) as shown in illustration and torque bolt/nut to 65 N.m (48 ft. lbs.).

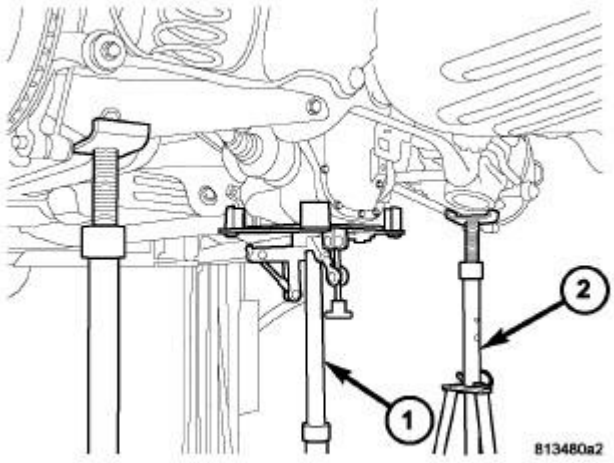

Fig. 42: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. Again verify halfshaft inner joints are fully engaged to axle assembly.
9. Remove transmission jack (1).
10. If used, remove screw-type under-hoist jack stands (2).

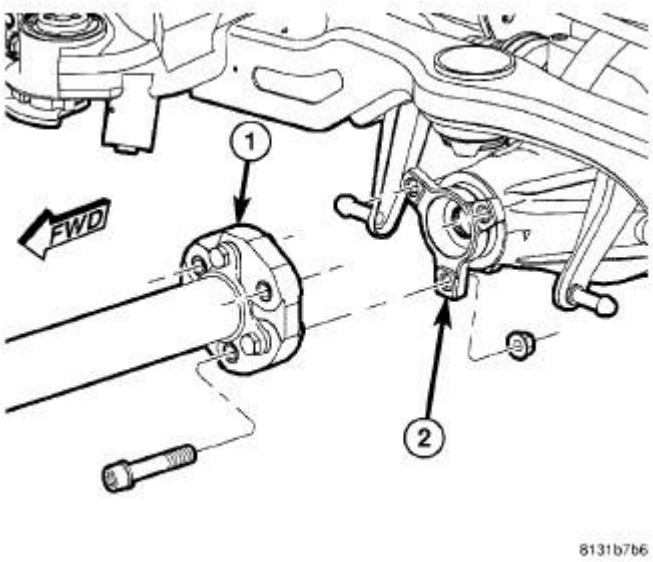

Fig. 43: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

11. Tighten the propeller shaft coupler-to-axle flange bolt/nuts. Refer to **SPECIFICATIONS** .

SPECIAL TOOLS

SPECIAL TOOLS

10113 - Adapters, Spreader (Originally Shipped In Kit Number(s) 9566-SUP2.)
1026 - Puller (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC.)
6448A - Installer, Bearing/Gear (Originally Shipped In Kit Number(s) 6947, 8667, 8837, 8867.)
6739 - Block, Height (Originally Shipped In Kit Number(s) 6730, 9516A-CAN, 9540, 9541.)
6740 - Cone (Originally Shipped In Kit Number(s) 6730, 6731, 9516A-CAN, 9540, 9541.)
6741 - Screw (Originally Shipped In Kit Number(s) 6730, 6731, 9516A-CAN, 9540, 9541.)
6774 - Kit, Jeep Pinion Depth (Originally Shipped In Kit Number(s) 6774.)

(Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)

C-4310 - Installer, Bearing
(Originally Shipped In Kit Number(s) C-4306.)

D-115-2A - Block, Scooter

(Originally Shipped In Kit Number(s) 9329-SUP, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP, 9694, 9926.) D-115-3 - Arbor (Originally Shipped In Kit Number(s) 8667, 9516A-CAN.) D-146 - Installer, Bearing Cup (Originally Shipped In Kit Number(s) 8667.) D-149 - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 8207, 8418, C-4306.) SP-3289 - Extension, Puller (Originally Shipped In Kit Number(s) 9599.) SP-5425-B - Special Post SP-5426 - Clamp (Less Post) W-129-B - Spreader, Differential (Originally Shipped In Kit Number(s) 9975.)

BEARING, DIFFERENTIAL SIDE

REMOVAL

REMOVAL

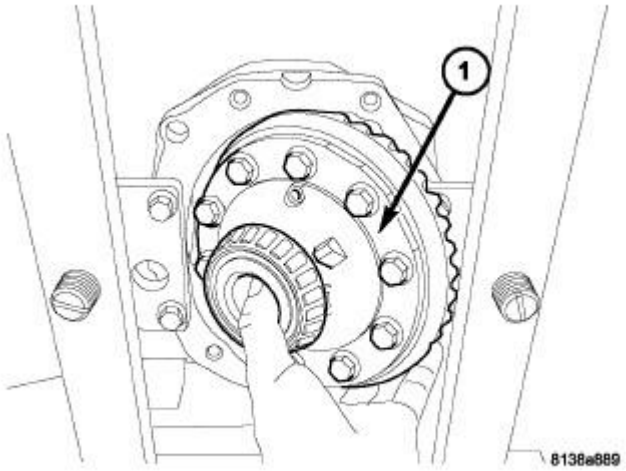

Fig. 44: Removing/Installing Differential
Courtesy of CHRYSLER GROUP, LLC

1. Remove differential assembly from axle. Refer to **CASE ASSEMBLY, DIFFERENTIAL, REMOVAL**.

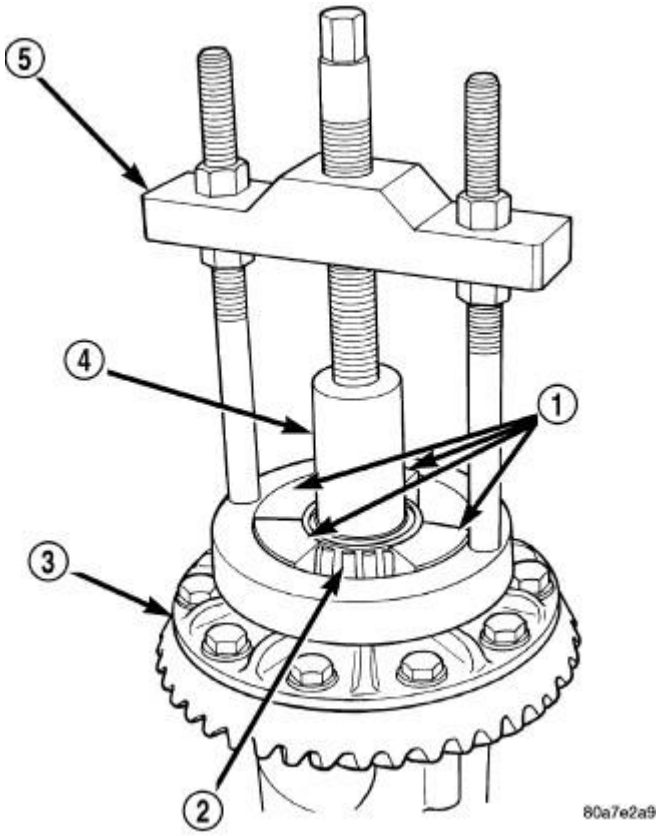

Fig. 45: Bearing Removal
Courtesy of CHRYSLER GROUP, LLC

2. Remove bearings (2) from the differential case (3) with Puller/Press (special tool #C-293-PA, Puller, Press) (5), Adapters (special tool #C-293-37, Block Set, Puller) (1) and Puller Extension (special tool #SP-3289, Extension, Puller) (4).

INSTALLATION

INSTALLATION

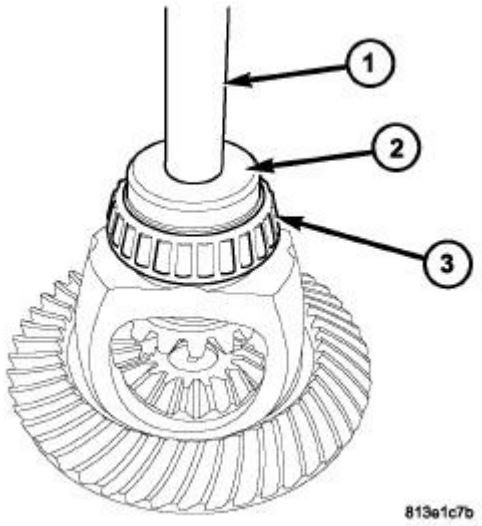

Fig. 46: Installing Differential Side Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #9523A, Installer, Bearing) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (1), press differential side bearings (3) onto differential case.

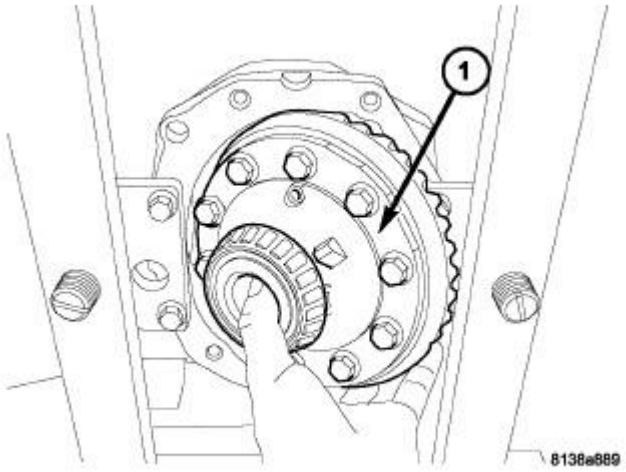

Fig. 47: Removing/Installing Differential
Courtesy of CHRYSLER GROUP, LLC

2. Install differential (1) and reassemble axle assembly.
3. Install the axle assembly. Refer to **INSTALLATION**.

CASE ASSEMBLY, DIFFERENTIAL

REMOVAL

REMOVAL

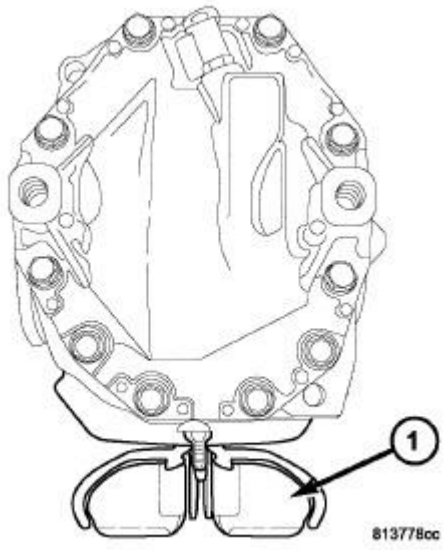

Fig. 48: Axle Clamped In Vise
Courtesy of CHRYSLER GROUP, LLC

1. Remove rear axle from vehicle. Refer to **REMOVAL**.
2. Clamp rear axle assembly into bench vise (1).

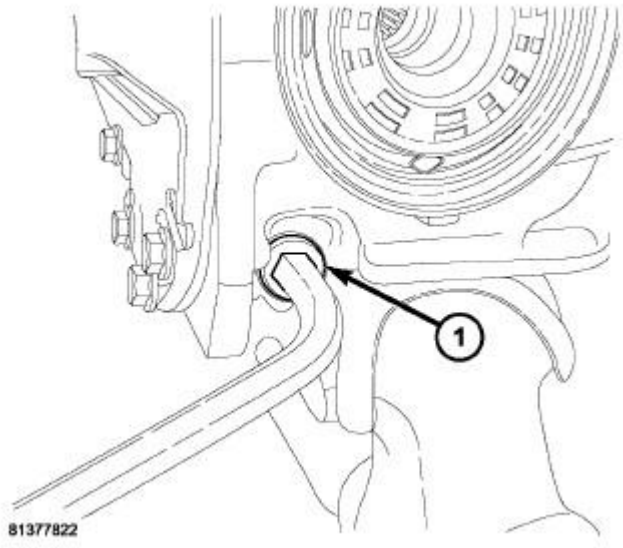

Fig. 49: Removing/Installing Drain Plug
Courtesy of CHRYSLER GROUP, LLC

3. Remove drain plug (1) and drain fluid into container suitable for reuse.

4. Install drain plug and torque to 60 N.m (44 ft. lbs.).

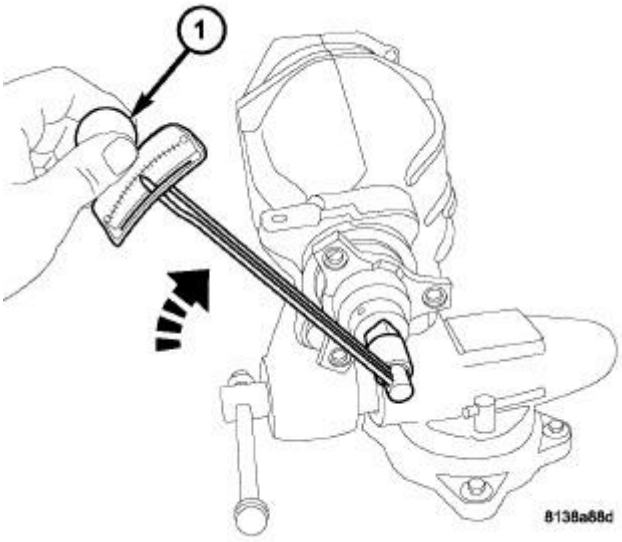

Fig. 50: Measuring Turning Torque
Courtesy of CHRYSLER GROUP, LLC

5. Using suitable torque wrench (1), measure and record rear axle assembly total turning torque.

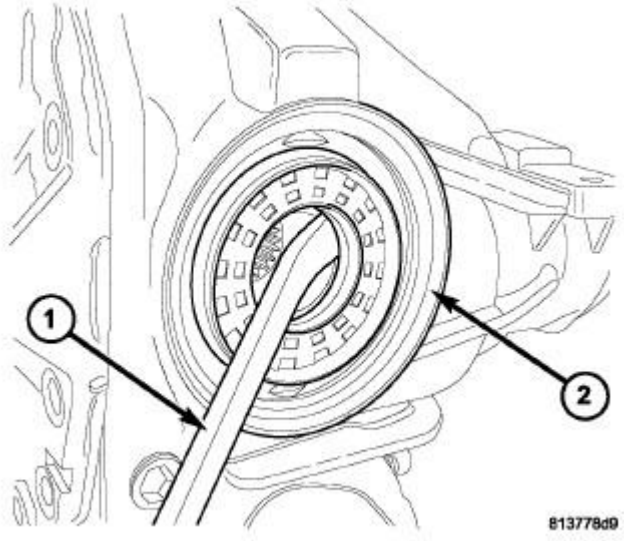

Fig. 51: Axle Seal Removal
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable screwdriver (1), remove both axle seals (2).

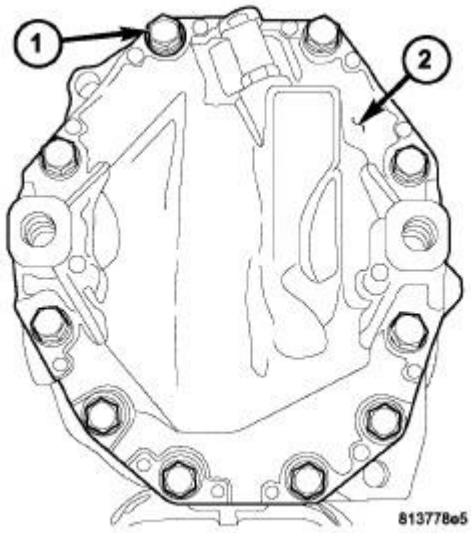

Fig. 52: Axle Housing Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove twelve axle cover-to-housing bolts (1) and remove cover (2).

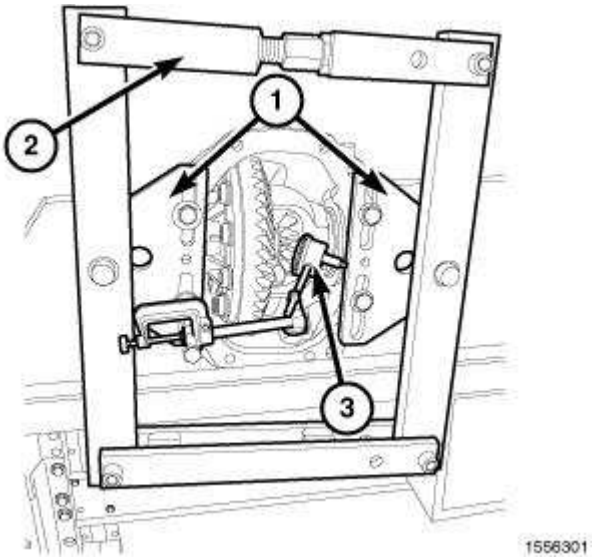

Fig. 53: Universal Spreader Adapter Plates & Spreader
Courtesy of CHRYSLER GROUP, LLC

8. Install Universal Spreader Adapter Plates (special tool #10113, Adapters, Spreader) (1), and Spreader (special tool #W-129-B, Spreader, Differential) (2). Install a stud in the location shown in illustration. Mount Clamp (special tool #SP-5426, Clamp (Less Post)) to the stud, and install Post (special tool #SP-5425-B, Special Post) from dial indicator set (special tool #C-3339A, Set, Dial Indicator) into Clamp (special tool #SP-5426, Clamp (Less Post)). Zero Metric Dial Indicator (special tool #9524, Indicator, Dial) (3) in the location shown in illustration to measure axle housing spread.

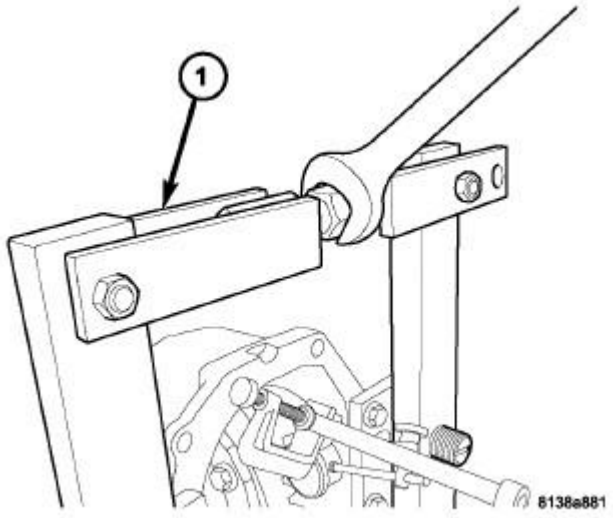

Fig. 54: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

9. Spread axle housing no more than 0.30 mm (0.012 in.).

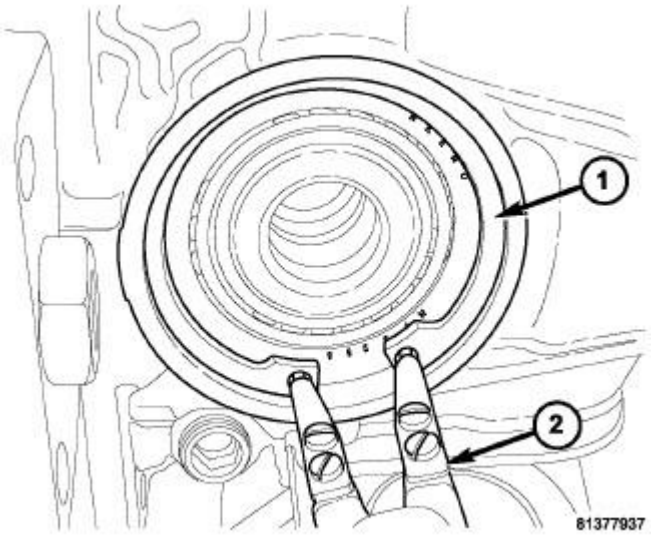

Fig. 55: Snap Ring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: The differential side bearing snap rings are select-fit, and control ring gear backlash and differential side bearing preload. It is important to return original snap rings to their original position.

10. Using suitable snap ring pliers (2), compress and remove differential side bearing snap rings

(1). Identify and tag for proper reuse.

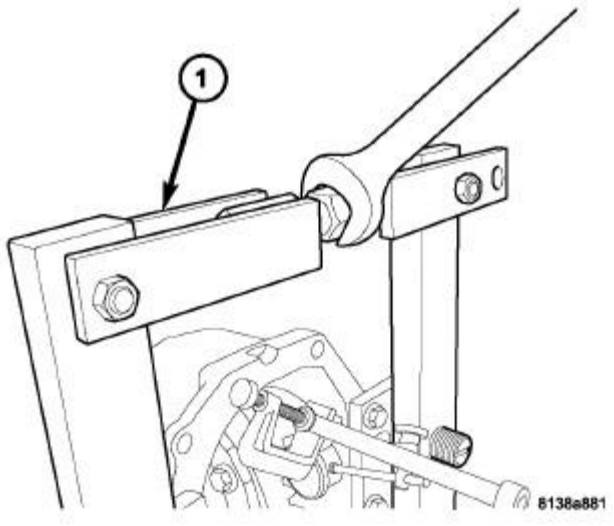

Fig. 56: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

11. Back off Spreader (special tool #W-129-B, Spreader, Differential) (1) to relax tension on housing.

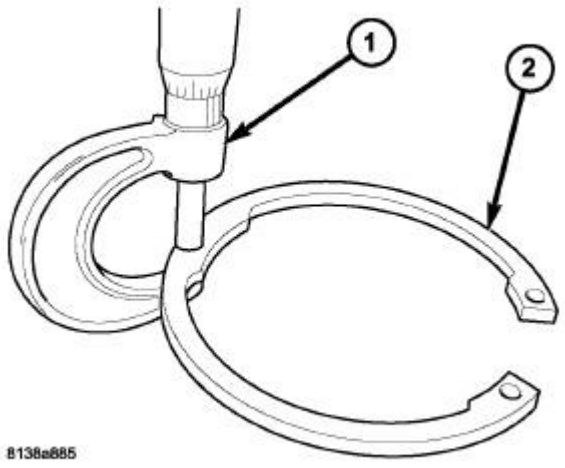

Fig. 57: Measuring Side Bearing Snap Ring
Courtesy of CHRYSLER GROUP, LLC

12. Measure snap ring thickness and record for future use.

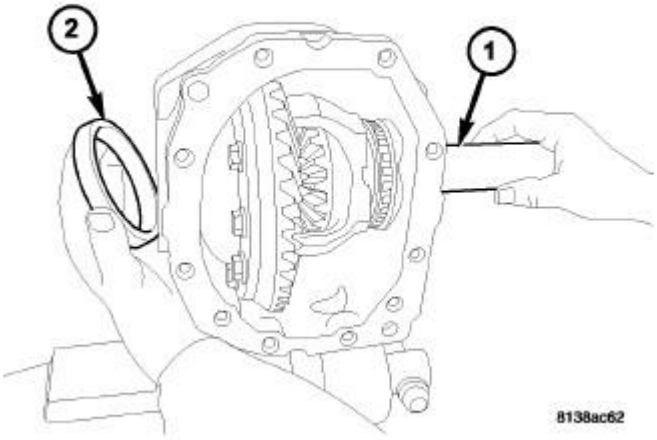

Fig. 58: Removing/Installing Side Bearing Cups
Courtesy of CHRYSLER GROUP, LLC

13. Install Removal/Installation Arbor (special tool #9522, Remover/Installer, Bearing Cup) (1) into one side of housing and push inward to release differential side bearing cup (2) from opposite side. Repeat for other bearing.

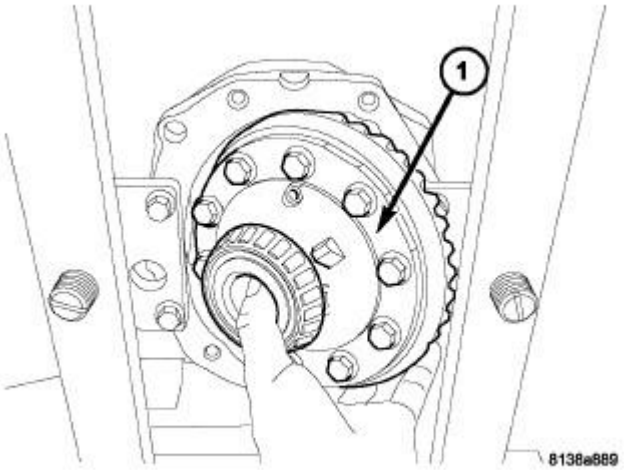

Fig. 59: Removing/Installing Differential
Courtesy of CHRYSLER GROUP, LLC

14. Remove differential assembly from axle housing.

NOTE: Note: If difficulty removing differential is encountered due to interference

with Spreader (special tool #W-129-B, Spreader, Differential) and Spreader Adapter Plates (special tool #9226, Adapters, Spreader), remove spreader and adapter plates to facilitate removal.

DISASSEMBLY

DISASSEMBLY

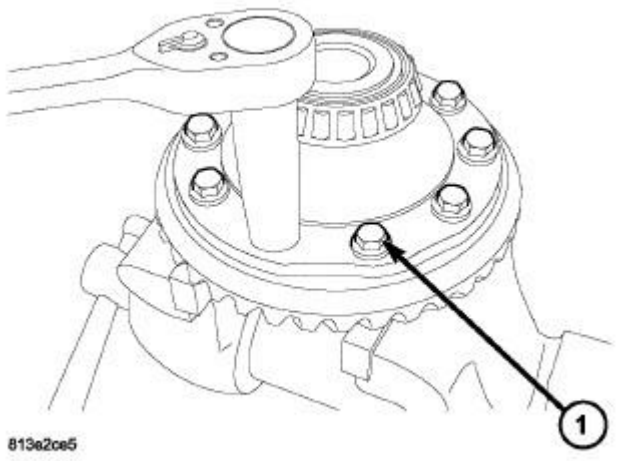

Fig. 60: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove differential ring gear-to-case bolts (1).

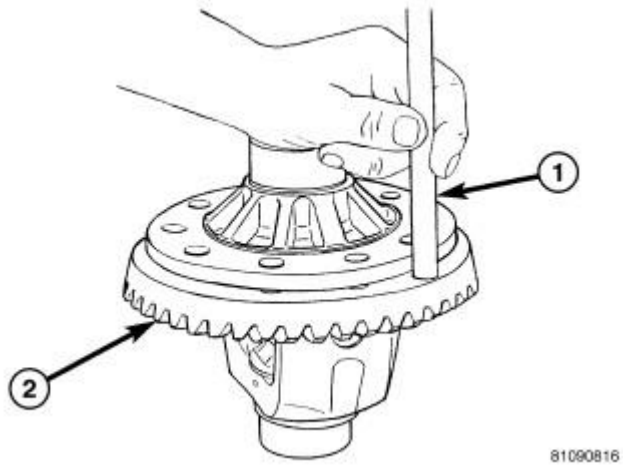

Fig. 61: Removing Ring Gear
Courtesy of CHRYSLER GROUP, LLC

2. Using brass drift (1), remove ring gear (2).

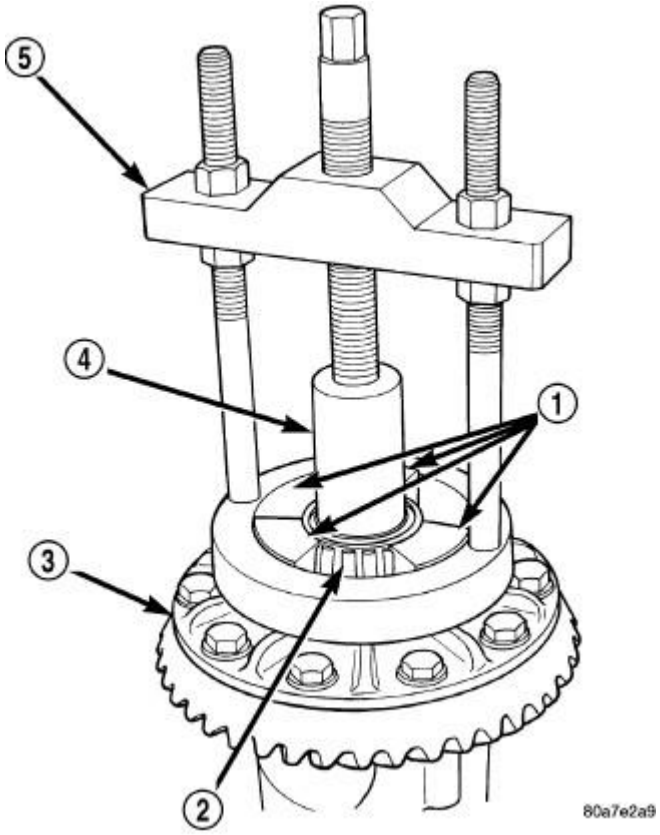

Fig. 62: Bearing Removal
Courtesy of CHRYSLER GROUP, LLC

3. Remove bearings (2) from the differential case (3) with Puller/Press (special tool #C-293-PA, Puller, Press) (5), Adapters (special tool #C-293-37, Block Set, Puller) (1) and Puller Extension (special tool #SP-3289, Extension, Puller) (4).

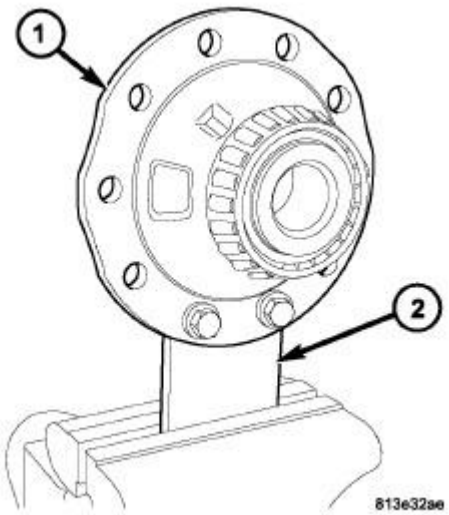

Fig. 63: Differential Mounted
Courtesy of CHRYSLER GROUP, LLC

4. Install the differential to Mounting Plate (special tool #9630, Fixture, Diff. Case Holding) (2) to the differential (1) and then install the assembly into a bench vise.

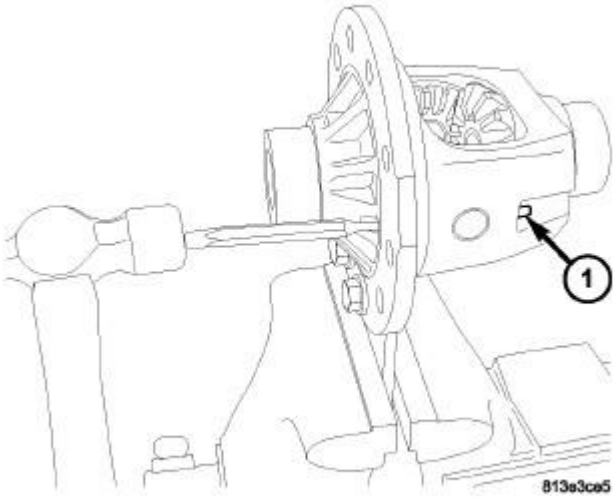

Fig. 64: Roll Pin Removal
Courtesy of CHRYSLER GROUP, LLC

5. Drive out pinion shaft-to-case roll pin using hammer and suitable punch.

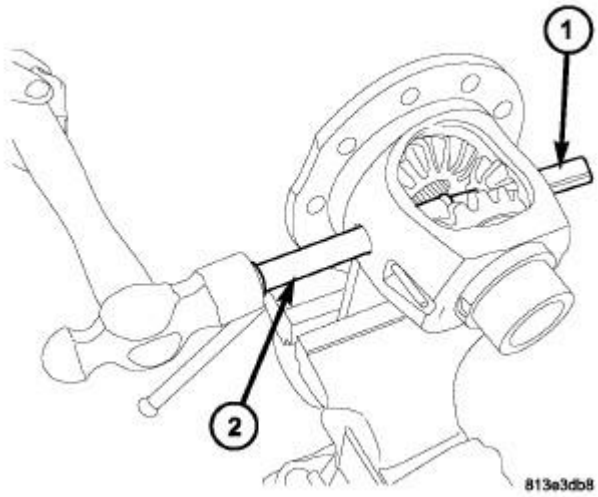

Fig. 65: Removing Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

6. Using brass drift (2), drive out pinion shaft (1).

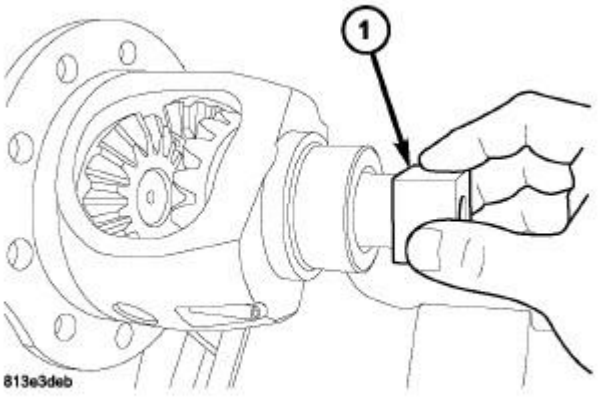

Fig. 66: Installing Fixture
Courtesy of CHRYSLER GROUP, LLC

7. Install Fixture (special tool #9631, Fixture, Holding) (1) into differential side gear.

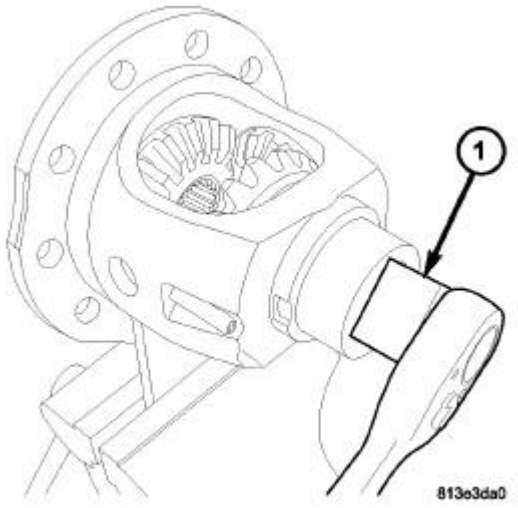

Fig. 67: Rotate Differential Gears
Courtesy of CHRYSLER GROUP, LLC

8. Rotate Fixture (special tool #9631, Fixture, Holding) (1) to gain access to and remove pinion gears and thrust washers.

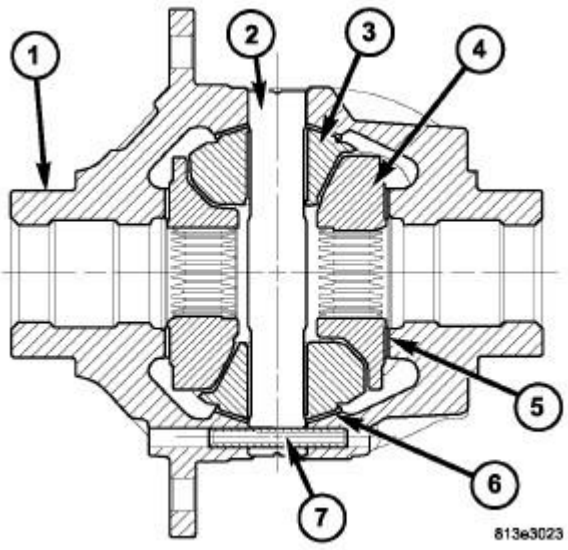

Fig. 68: Side Gears & Thrust Washers
Courtesy of CHRYSLER GROUP, LLC

9. Remove differential side gears (4) and thrust washers (5).

ASSEMBLY

ASSEMBLY

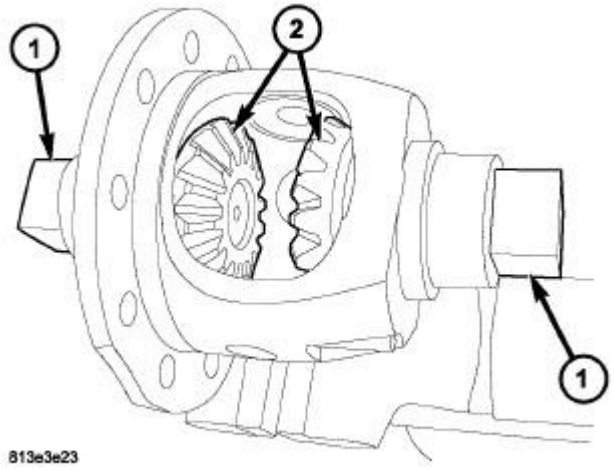

Fig. 69: Installing Side Gears
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate all differential components with hypoid gear lubricant.
2. Install differential side gears (2) and thrust washers to Fixtures (special tool #9631, Fixture, Holding) (1) as shown in illustration.

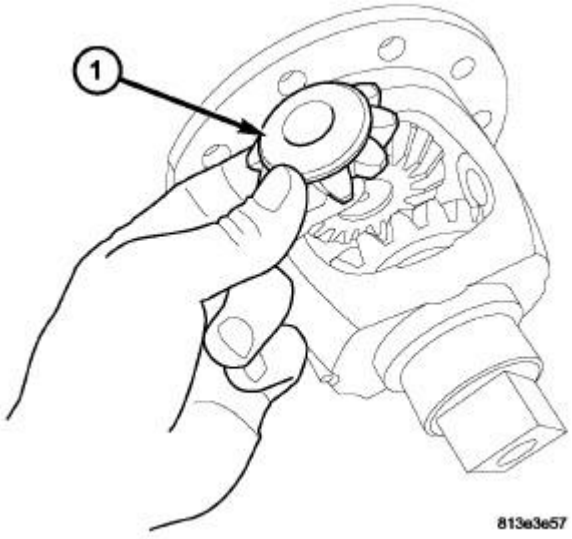

Fig. 70: Removing/Installing Pinion Gear & Washer
Courtesy of CHRYSLER GROUP, LLC

3. Install differential pinion gears (1) and thrust washers into position across from each other.

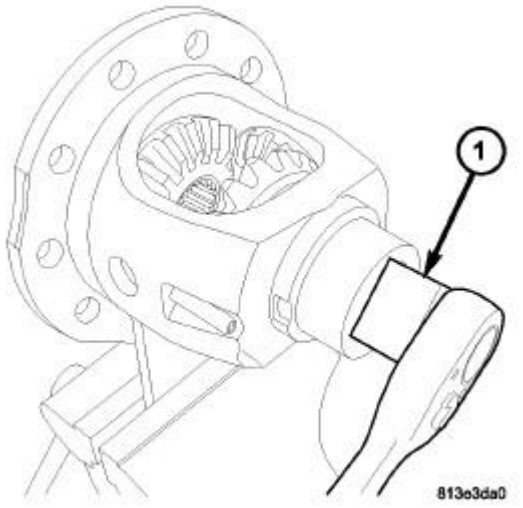

Fig. 71: Rotate Differential Gears
Courtesy of CHRYSLER GROUP, LLC

4. Rotate pinion gears into place using Fixture (special tool #9631, Fixture, Holding) and line up gear centers with pinion shaft bore.

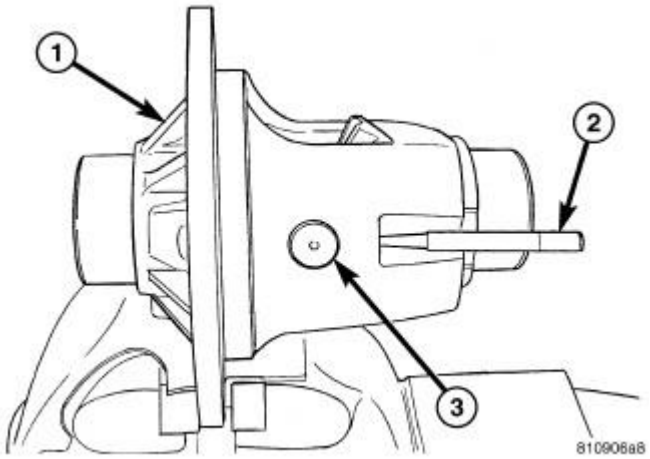

Fig. 72: Roll Pin Installation
Courtesy of CHRYSLER GROUP, LLC

5. Using a brass hammer, drive pinion shaft (3) into differential case (1), making sure to line up roll pin bores.
6. Using suitable punch (2), drive new roll pin into position.

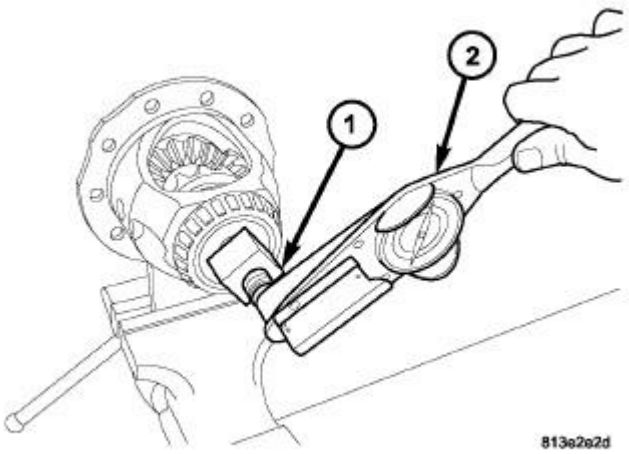

Fig. 73: Measure Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

7. Measure differential gear rotating torque as shown in illustration. Differential gear rotating torque should be 5-30 N.m (44-266 in. lbs.) Rotating torque is adjusted using select side gear thrust washers. Refer to the following chart.

Available Side Gear Thrust Washer Thicknesses
1.25 mm (0.049 in.)
1.30 mm (0.051 in.)
1.35 mm (0.053 in.)
1.40 mm (0.055 in.)
1.45 mm (0.057 in.)
1.50 mm (0.059 in.)
1.55 mm (0.061 in.)
1.60 mm (0.063 in.)
1.65 mm (0.065 in.)

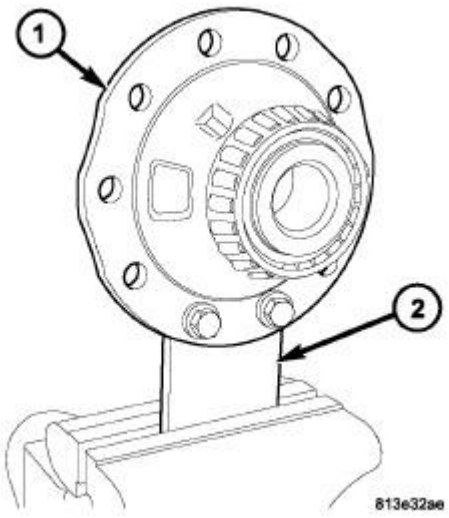

Fig. 74: Differential Mounted
Courtesy of CHRYSLER GROUP, LLC

8. Remove differential case from Mounting Plate (special tool #9630, Fixture, Diff. Case Holding) (2).

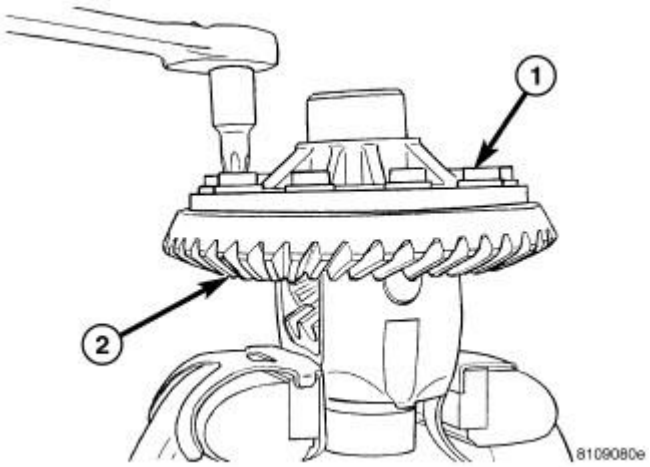

Fig. 75: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install ring gear to case. Lightly tap ring gear into position to facilitate starting of bolts.
10. Install **new** ring gear-to-case bolts and torque to 85 N.m (63 ft. lbs.).

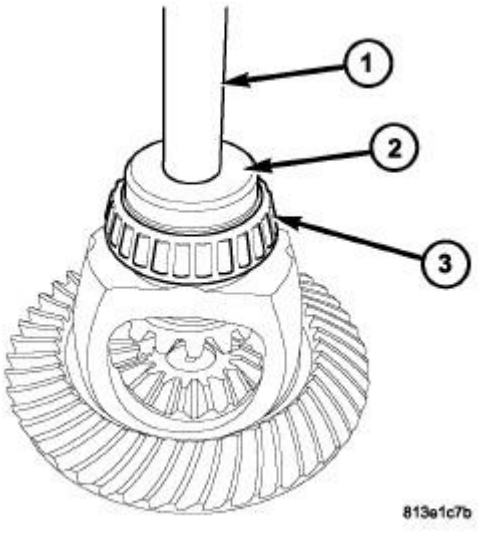

Fig. 76: Installing Differential Side Bearing
Courtesy of CHRYSLER GROUP, LLC

11. Using Installer (special tool #9523A, Installer, Bearing) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (1), press **new** differential side bearings (3) onto differential case.

INSTALLATION

INSTALLATION

NOTE: If replacement differential side bearings or differential case are being installed, it is necessary to measure and adjust Differential Side Bearing Preload and Gear Backlash. to determine proper snap ring selection. Refer to ADJUSTMENTS.

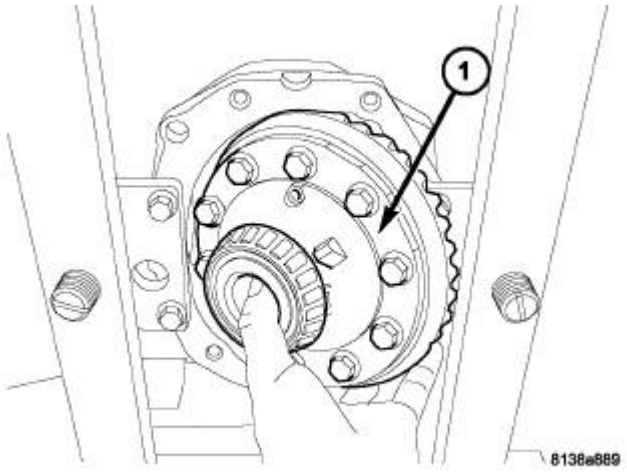

Fig. 77: Removing/Installing Differential
Courtesy of CHRYSLER GROUP, LLC

1. Install differential assembly (1) into axle housing.

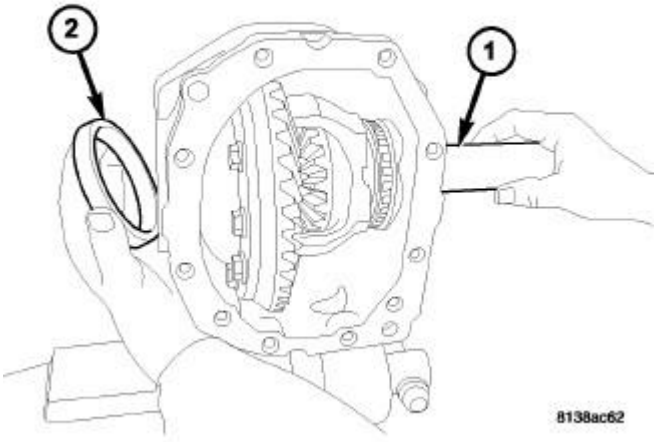

Fig. 78: Removing/Installing Side Bearing Cups
Courtesy of CHRYSLER GROUP, LLC

2. Install differential side bearing cups (2).

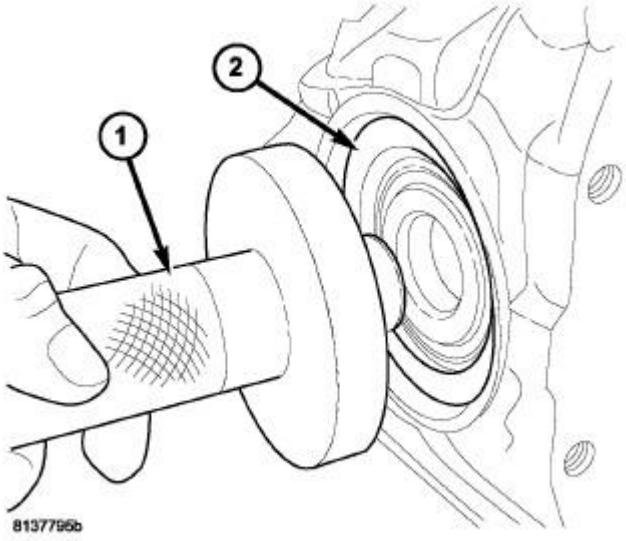

Fig. 79: Arbor & Bearing Cups
Courtesy of CHRYSLER GROUP, LLC

3. Use Removal/Installation Arbor (special tool #9522, Remover/Installer, Bearing Cup) (1) to aid in seating side bearing cups (2).

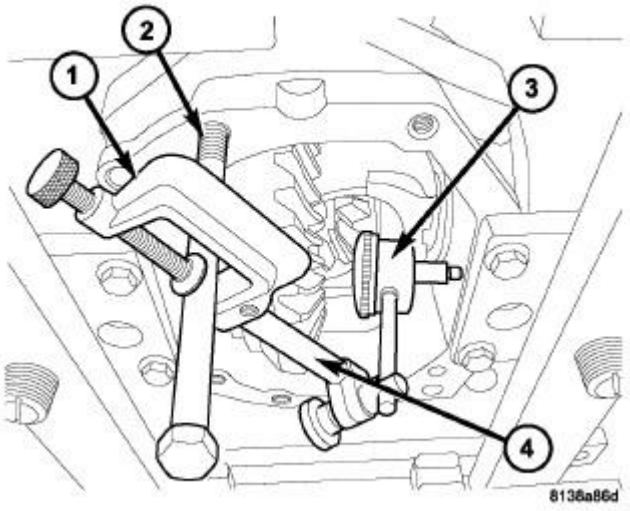

Fig. 80: Measuring Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

4. Set up Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to measure housing spread as shown in illustration:
    1. Clamp (special tool #SP-5426, Clamp (Less Post)) (1)
    2. Post (special tool #SP-5425-B, Special Post) (2)

3. Metric Dial Indicator (special tool #9524, Indicator, Dial) (3)

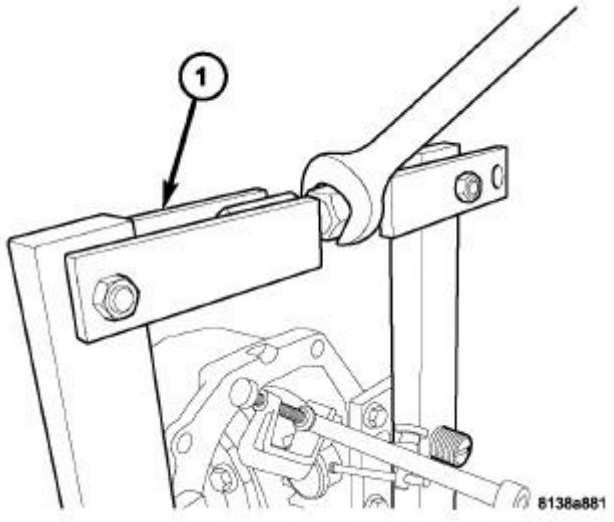

Fig. 81: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

5. Expand Spreader (special tool #W-129-B, Spreader, Differential) (1) to spread axle housing no more than 0.30 mm (0.012 in.).

NOTE: The differential side bearing snap rings are select-fit, and control ring gear backlash and differential side bearing preload. It is necessary to return snap rings to their original position. If replacement differential side bearings or differential case are being installed. to determine proper snap ring selection. Refer to ADJUSTMENTS.

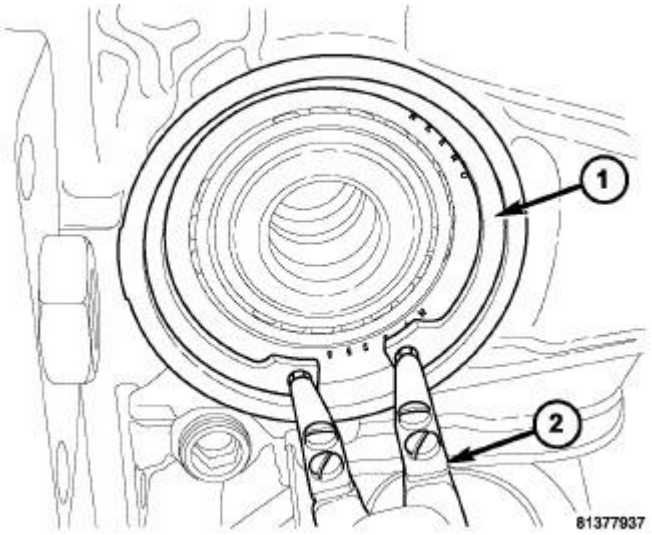

Fig. 82: Snap Ring Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable snap ring pliers (2), install differential side bearing snap rings (1).

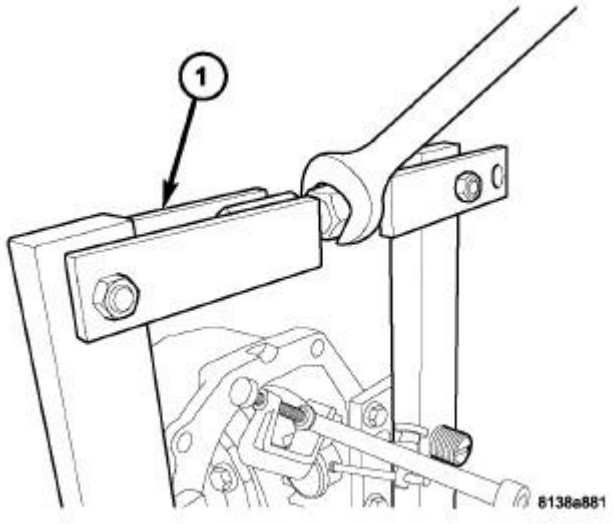

Fig. 83: Expanding/Contracting Spreader
Courtesy of CHRYSLER GROUP, LLC

7. Back off Spreader (special tool #W-129-B, Spreader, Differential) (1) to relax tension on housing.

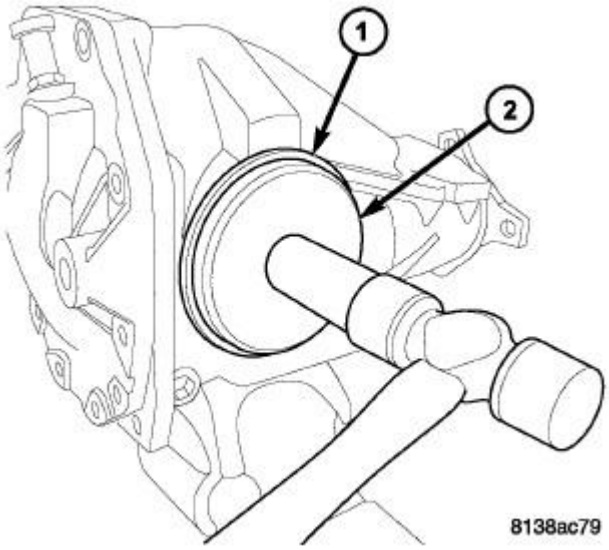

Fig. 84: Axle Seal Installation
Courtesy of CHRYSLER GROUP, LLC

8. Install axle seals (1) using Installer (special tool #9223A, Drift) (2).

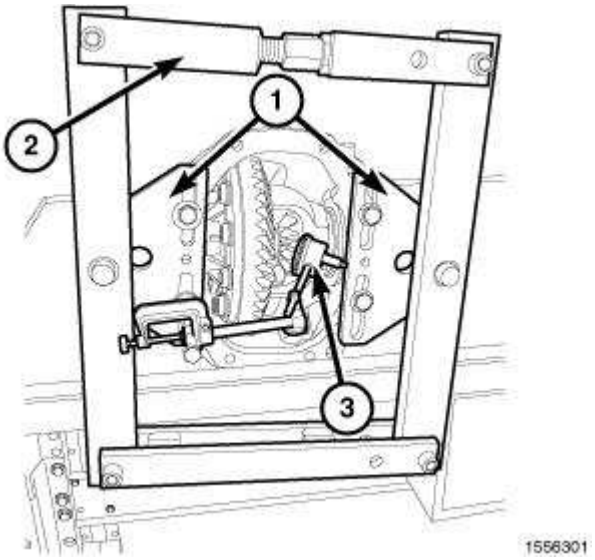

Fig. 85: Universal Spreader Adapter Plates & Spreader
Courtesy of CHRYSLER GROUP, LLC

9. Remove Dial Indicator Kit, Stud, Spreader (special tool #W-129-B, Spreader, Differential) (2) and Universal Spreader Adapter Plates (special tool #10113, Adapters, Spreader) (1).

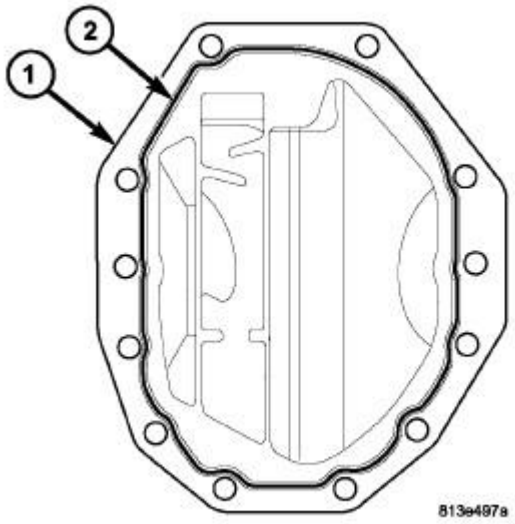

Fig. 86: Sealant Application
Courtesy of CHRYSLER GROUP, LLC

10. Apply 4mm (0.157 in.) bead (2) of Mopar® Axle RTV to axle housing cover (1) as shown in illustration.

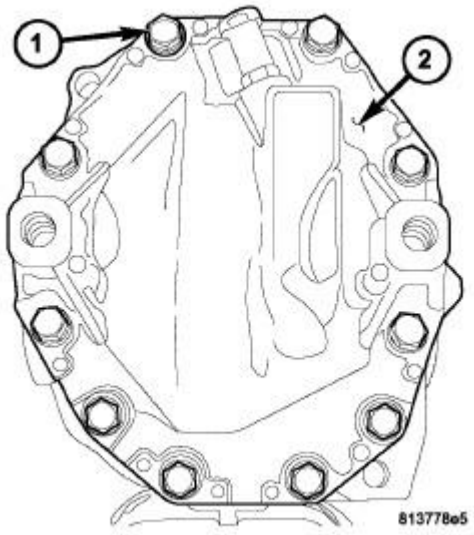

Fig. 87: Axle Housing Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install cover to axle housing. Install and torque cover-to-housing bolts to 30 N.m (22 ft. lbs.) + 45°.
12. Install the rear axle. Refer to **INSTALLATION**.

COVER, DIFFERENTIAL

REMOVAL

REMOVAL

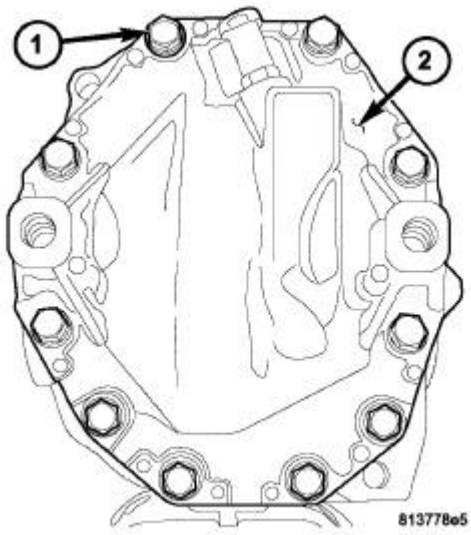

Fig. 88: Axle Housing Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove axle assembly from vehicle. Refer to **REMOVAL**.
2. Remove axle housing cover bolts (1).
3. Using suitable screwdriver, remove axle housing cover (2).

INSTALLATION

INSTALLATION

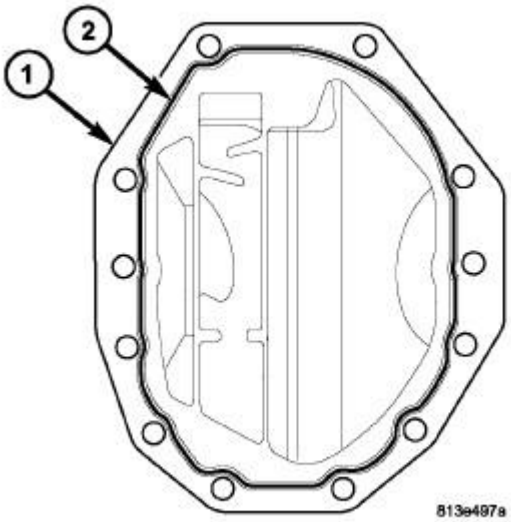

Fig. 89: Sealant Application
Courtesy of CHRYSLER GROUP, LLC

1. After thoroughly cleaning axle housing cover (1), apply a 4 mm (0.157 in.) bead (2) of Mopar® Axle RTV as shown in illustration.

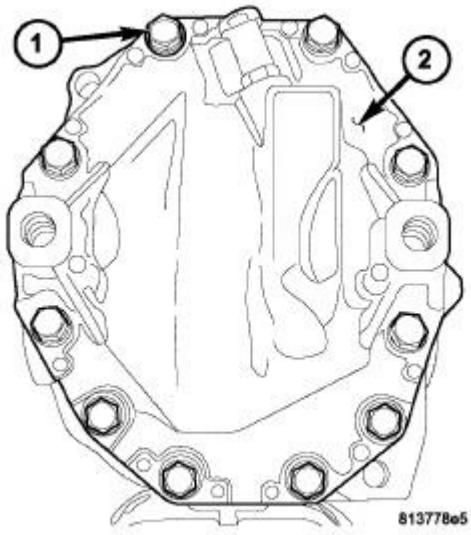

Fig. 90: Axle Housing Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Immediately install cover (2) to axle housing. Install and torque axle housing cover bolts (1) to 30 N.m (22 ft. lbs.) + 45°.
3. Install axle assembly to vehicle. Refer to **INSTALLATION**.

GEAR, RING AND PINION

REMOVAL

REMOVAL

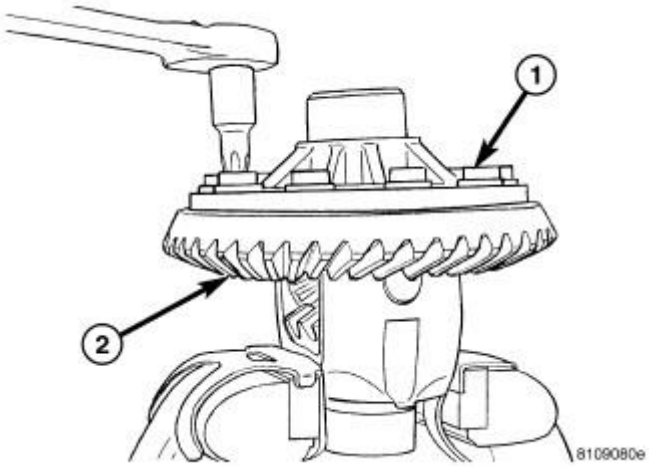

Fig. 91: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove differential assembly. Refer to **CASE ASSEMBLY, DIFFERENTIAL, REMOVAL**.
2. Place differential case in a soft-jawed vise and remove ring gear-to-case bolts.

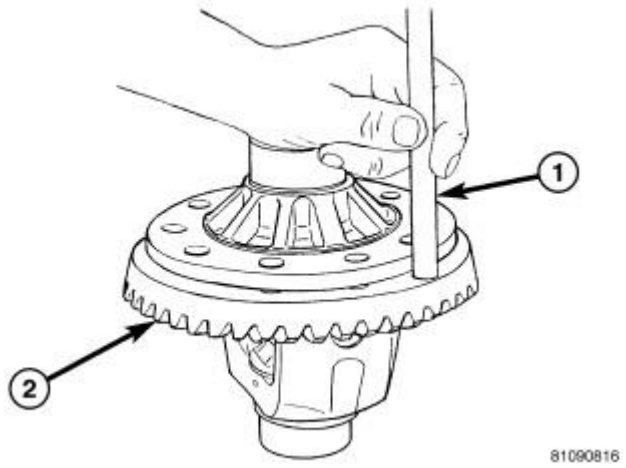

Fig. 92: Removing Ring Gear
Courtesy of CHRYSLER GROUP, LLC

3. Remove ring gear from differential case with a brass drift and hammer.

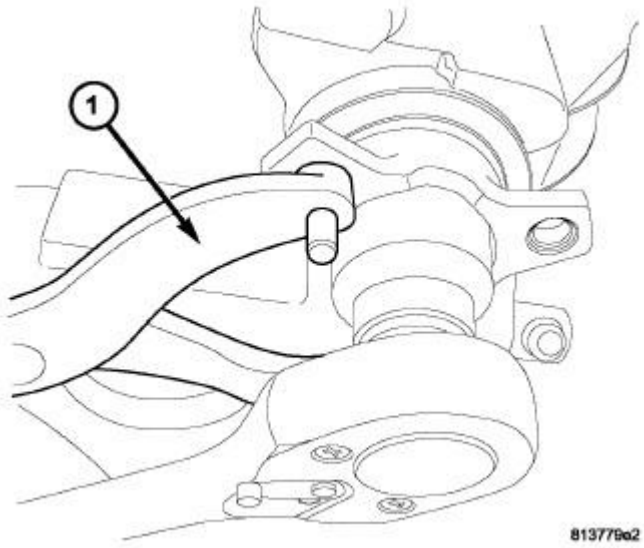

Fig. 93: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

4. Using 41mm socket and Flange Wrench (special tool #C-3281, Holder, Flange) (1), remove pinion nut and discard.

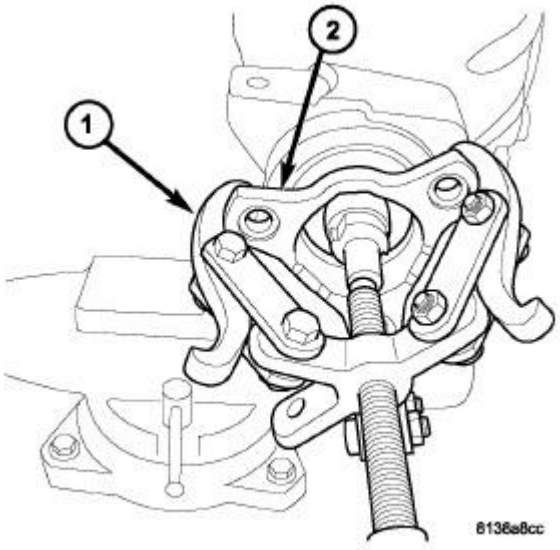

Fig. 94: Removing Pinion Flange With Puller
Courtesy of CHRYSLER GROUP, LLC

5. Using Puller (special tool #1026, Puller) (1), remove pinion flange (2).

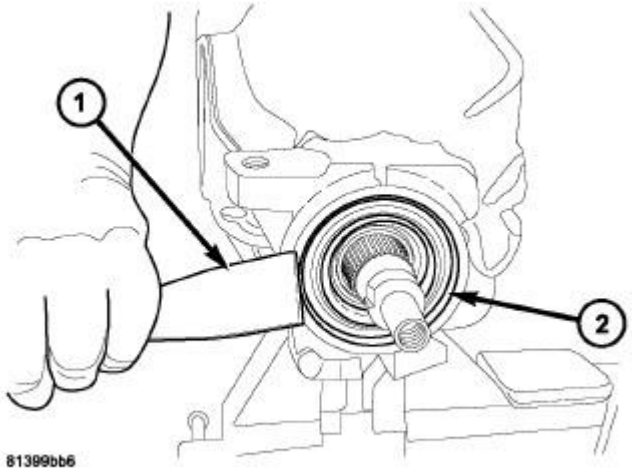

Fig. 95: Pinion Seal Removal
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable screwdriver, remove and discard the pinion seal.
7. Remove pinion tail bearing cone.

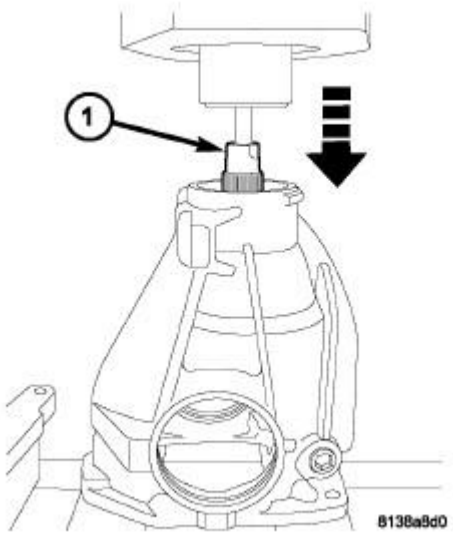

Fig. 96: Pressing Pinion Shaft Out Of Carrier
Courtesy of CHRYSLER GROUP, LLC

8. Move axle housing to press and press out pinion shaft (1) as shown in illustration.

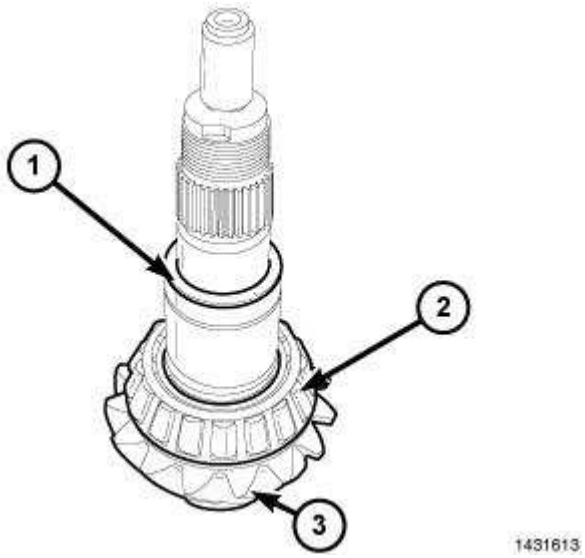

Fig. 97: Washer On Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

9. Remove the washer (1).

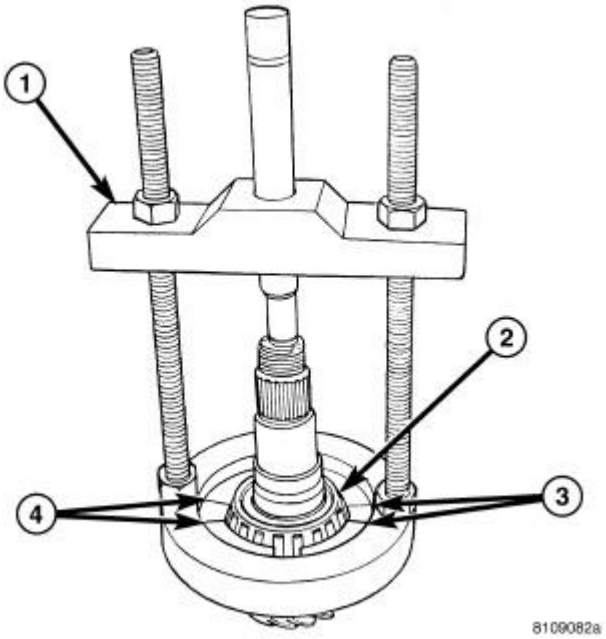

Fig. 98: Removing Pinion Head Bearing
Courtesy of CHRYSLER GROUP, LLC

10. Remove pinion head bearing (2) with Puller/Press (special tool #C-293-PA, Puller, Press) (1) and Adapters (special tool #C-293-37, Block Set, Puller) (3, 4).

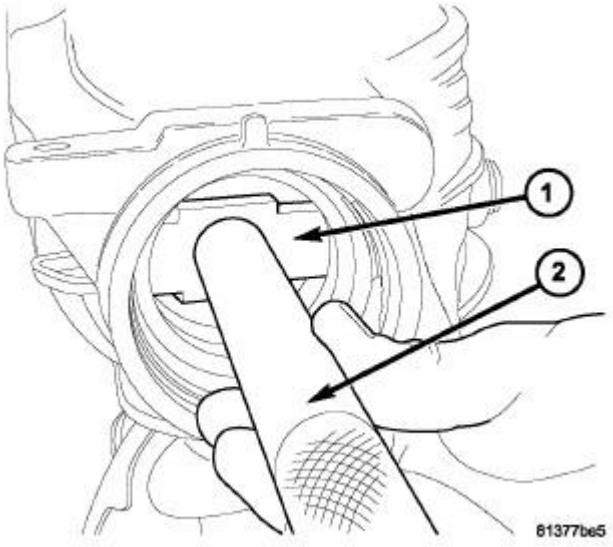

Fig. 99: Removing Pinion Head Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

11. Using Handle (special tool #C-4171, Driver Handle, Universal) (2) and Remover (special tool #9084, Remover, Pinion Bearing Cup) (1), drive out pinion head bearing cup.

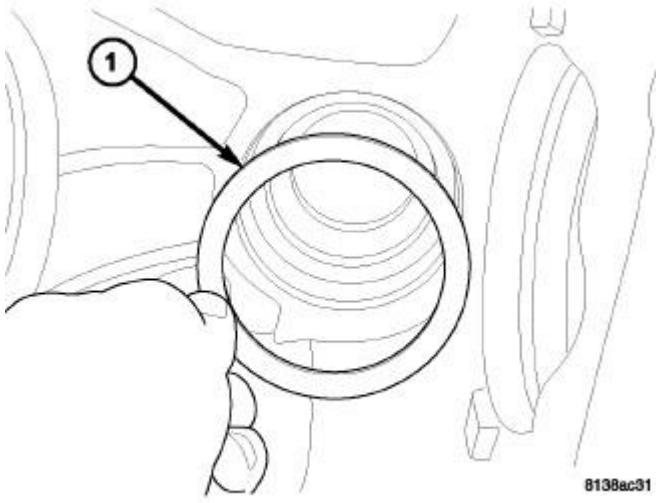

Fig. 100: Removing/Installing Shim
Courtesy of CHRYSLER GROUP, LLC

12. Remove pinion head shim. Measure and record shim thickness.

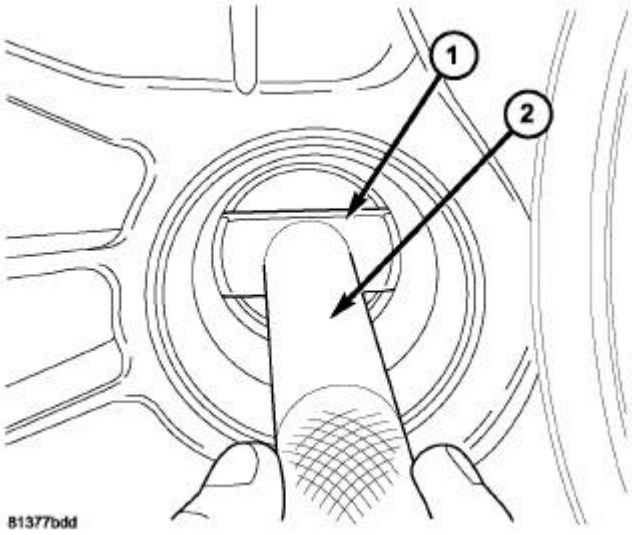

Fig. 101: Removing Pinion Tail Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

13. Using Handle (special tool #C-4171, Driver Handle, Universal) (2) and Remover (special tool #D-149, Remover, Bearing Cup) (1), drive out pinion tail bearing cup.

INSTALLATION

INSTALLATION

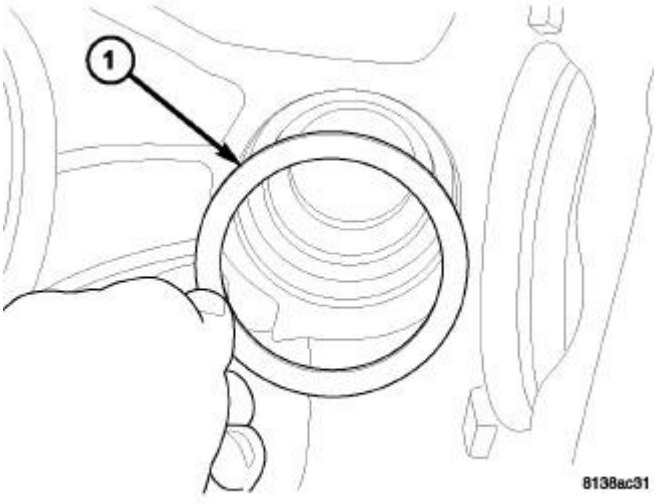

Fig. 102: Removing/Installing Shim
Courtesy of CHRYSLER GROUP, LLC

1. Install selected pinion depth shim (1) into housing.

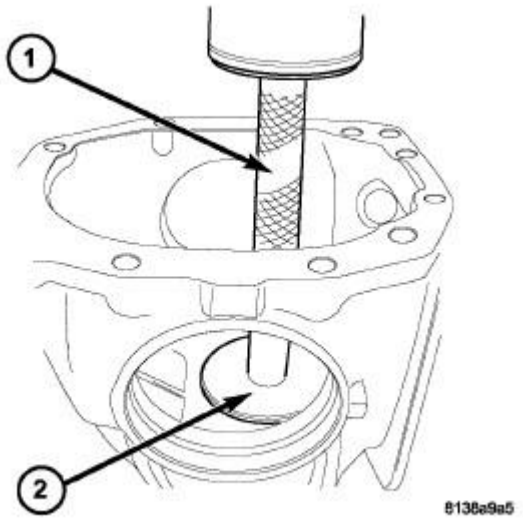

Fig. 103: Pinion Head Bearing Cup Installation
Courtesy of CHRYSLER GROUP, LLC

2. Press pinion head bearing cup into housing using Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #C-4310, Installer, Bearing) (2).

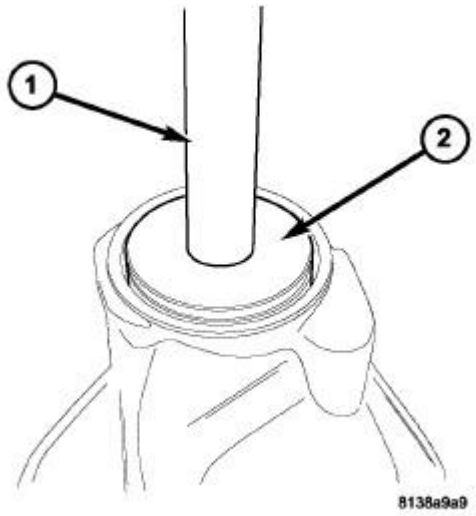

Fig. 104: Installing Pinion Tail Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

3. Press pinion tail bearing cup into housing using Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #D-146, Installer, Bearing Cup) (2).

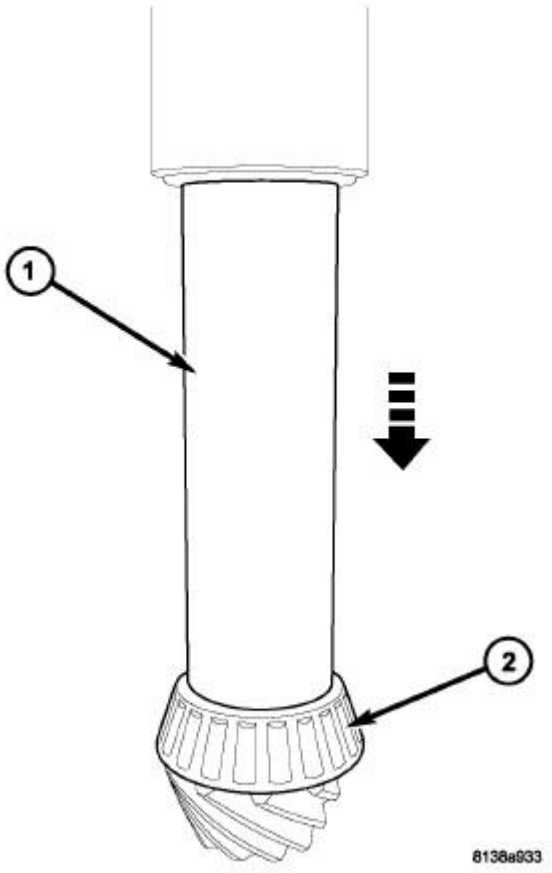

Fig. 105: Installing Pinion Head Bearing
Courtesy of CHRYSLER GROUP, LLC

4. Press **new** pinion head bearing (2) onto pinion shaft using Installer (special tool #C-3095-A, Installer, Bearing) (1).

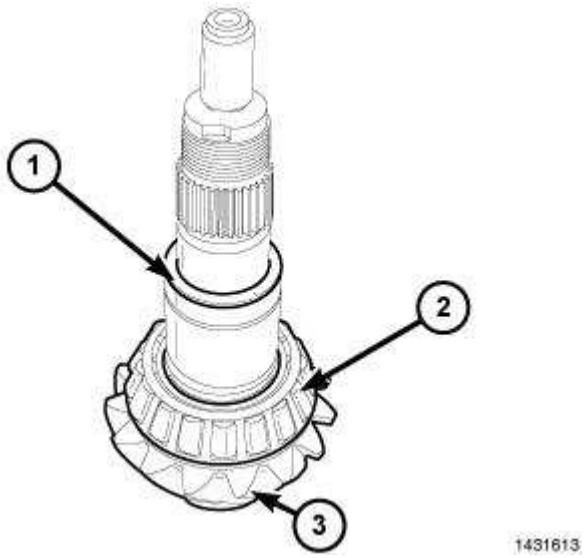

Fig. 106: Washer On Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Install the washer (1).

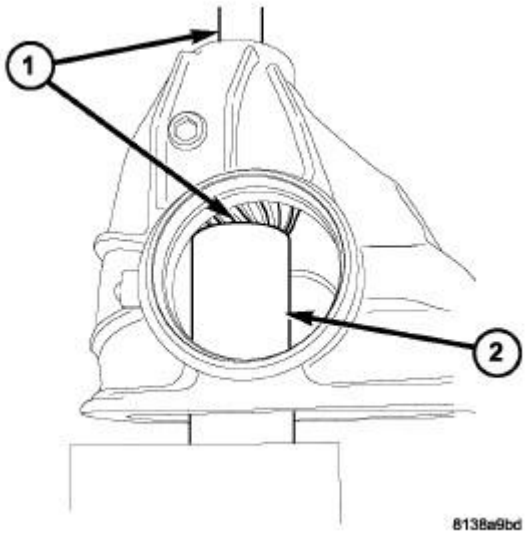

Fig. 107: Support Pinion Head & Carrier
Courtesy of CHRYSLER GROUP, LLC

6. Install pinion shaft (1) into housing and support on press table atop Installer (special tool #8255, Installer) (2). **Ensure pinion gear face is centered atop Installer (special tool #8255, Installer).**

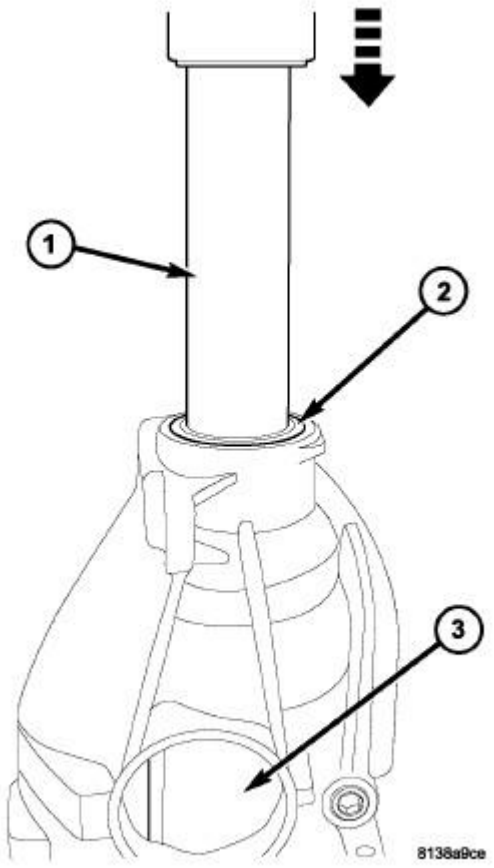

Fig. 108: Pinion Tail Bearing Installation
Courtesy of CHRYSLER GROUP, LLC

7. Using Installer (special tool #C-3095-A, Installer, Bearing) (1), press on **new** pinion tail bearing (2).

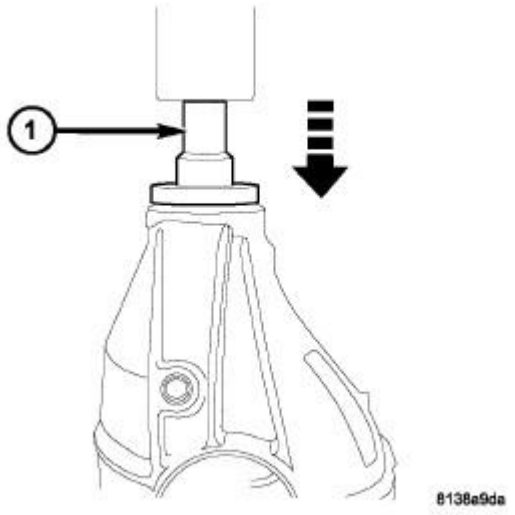

Fig. 109: Installing Pinion Seal
Courtesy of CHRYSLER GROUP, LLC

8. Install new pinion seal into position.
9. Press pinion seal into housing using Installer (special tool #9231A, Installer, Pinion Oil Seal) (1).

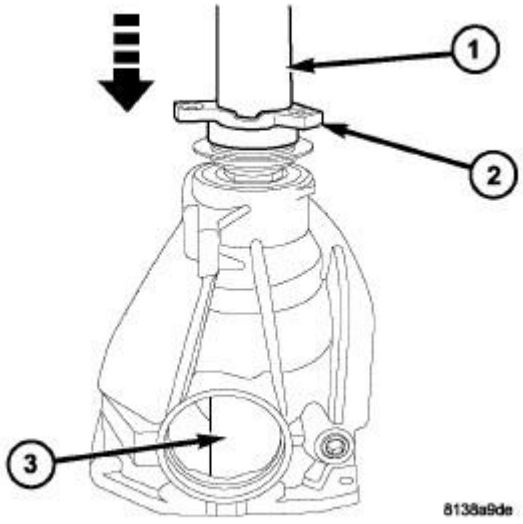

Fig. 110: Installing Pinion Seal
Courtesy of CHRYSLER GROUP, LLC

10. Lightly lubricate pinion flange seal with axle lubricant for flange installation.
11. Align index marks and press pinion flange (2) on using Installer (special tool #C-3095-A, Installer, Bearing) (1).

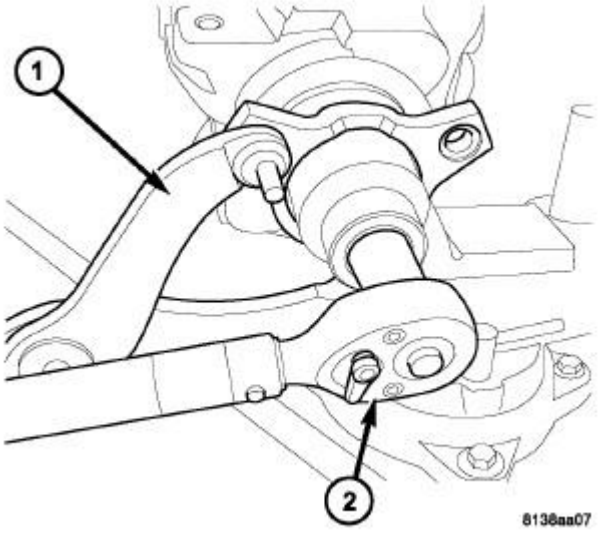

Fig. 111: Torquing Pinion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

12. Install new pinion flange nut by hand.
13. Hold pinion flange with Flange Wrench (special tool #C-3281, Holder, Flange) (1). Using a deep 41 mm socket, tighten pinion flange nut to an initial torque of 203 N.m (150 ft. lbs.).

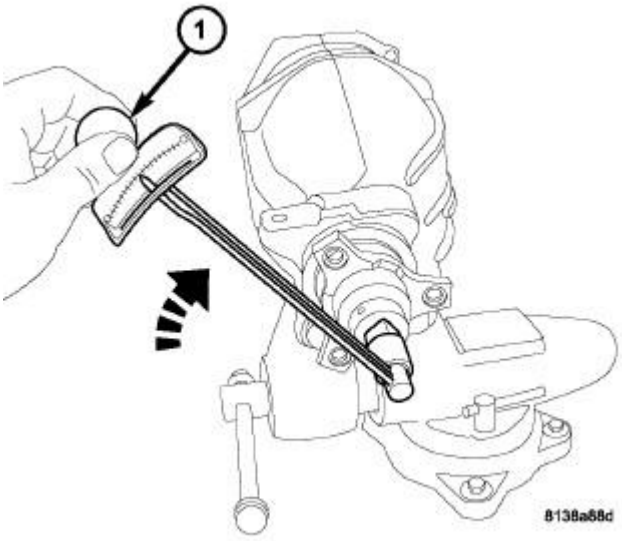

Fig. 112: Measuring Turning Torque
Courtesy of CHRYSLER GROUP, LLC

14. Rotate pinion flange to ensure bearing is properly seated.
15. Measure pinion rotating torque using suitable torque wrench (1). **Pinion rotating torque should be 215-245 N. cm (19-22 in. lbs.).**

16. If pinion rotating torque exceeds the specified range, the pinion shaft must be removed and the crush sleeve replaced.

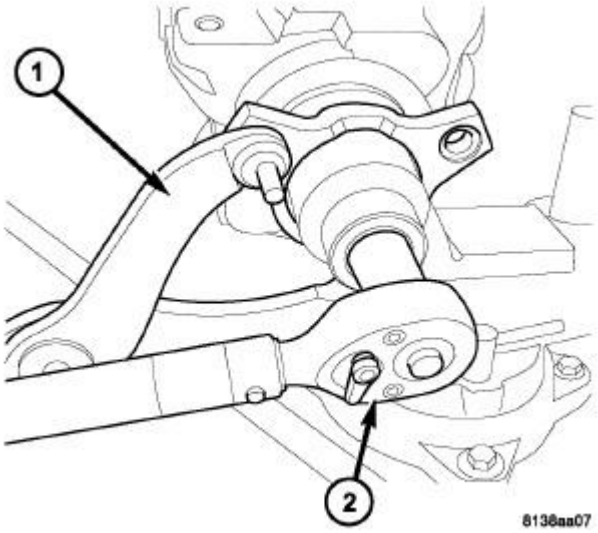

Fig. 113: Torquing Pinion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

17. If pinion rotating torque is below the specified range, increase nut torque by 7 N.m (5 ft. lbs.) increments and recheck turning torque until rotating torque is within range.

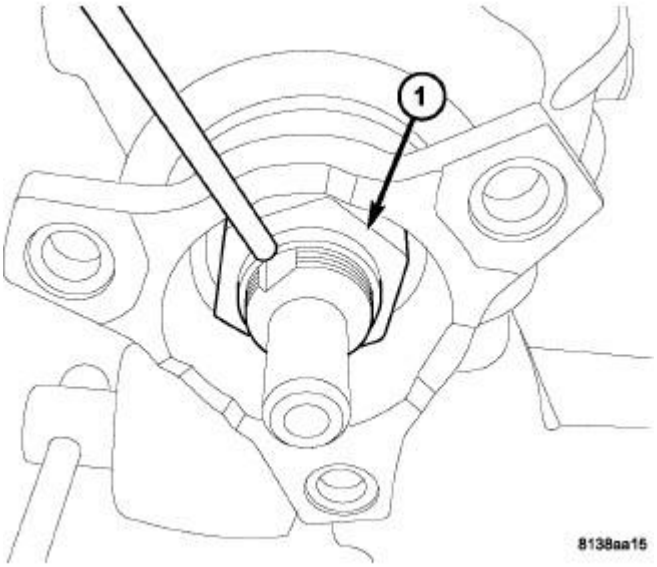

Fig. 114: Staking Pinion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

18. Stake pinion flange nut (1) using hammer and suitable punch.

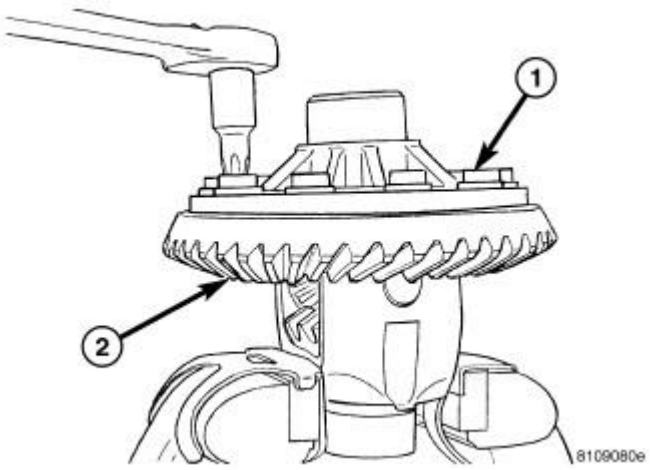

Fig. 115: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Install ring gear to differential case. Loosely install **new** ring-gear-to-differential case bolts.
20. Torque all ring gear-to-case bolts to 85 N.m (64 ft. lbs.)

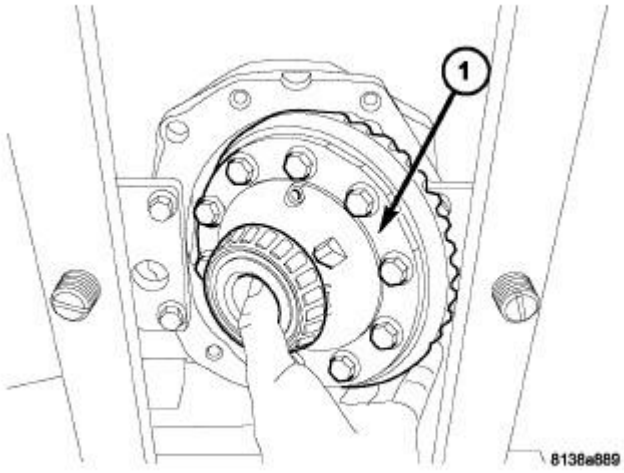

Fig. 116: Removing/Installing Differential
Courtesy of CHRYSLER GROUP, LLC

21. Install differential and reassemble axle assembly. Refer to **CASE ASSEMBLY, DIFFERENTIAL, INSTALLATION**.

SEAL, AXLE DRIVE SHAFT

REMOVAL

REMOVAL

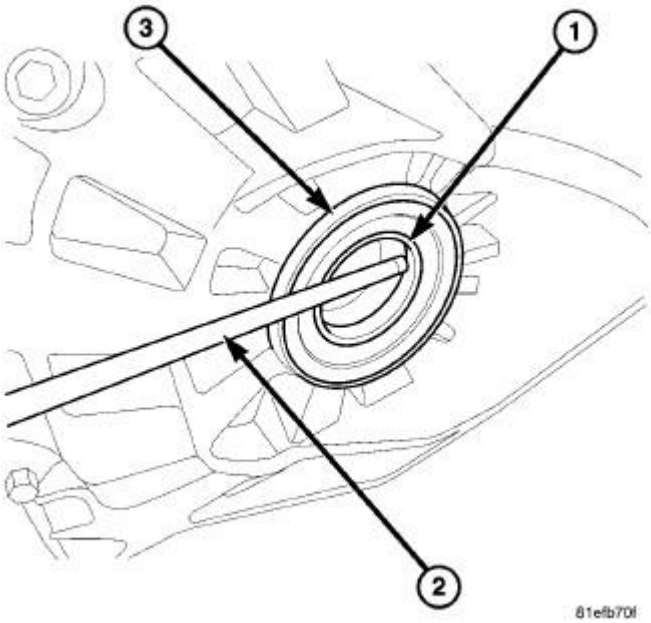

Fig. 117: Remove Lside Seal
Courtesy of CHRYSLER GROUP, LLC

1. Remove halfshaft(s). Refer to **REMOVAL** and **REMOVAL** .
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace halfshaft if necessary.

INSTALLATION

INSTALLATION

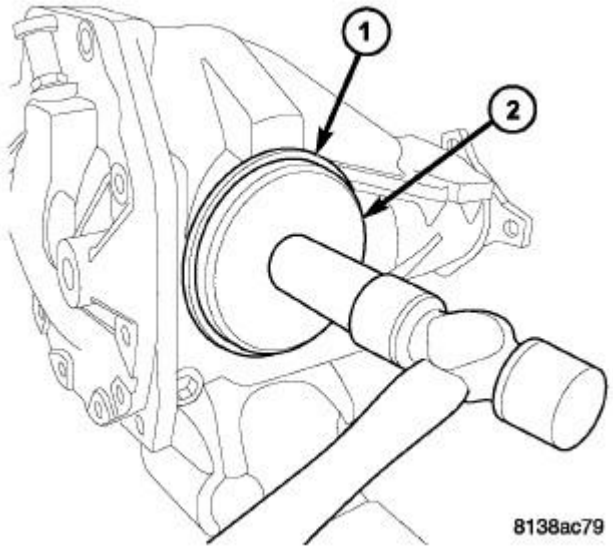

Fig. 118: Axle Seal Installation
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #9223A, Drift) (2), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-140 to protect seal during halfshaft installation.
2. Install halfshaft(s). Refer to **INSTALLATION** and **INSTALLATION** .

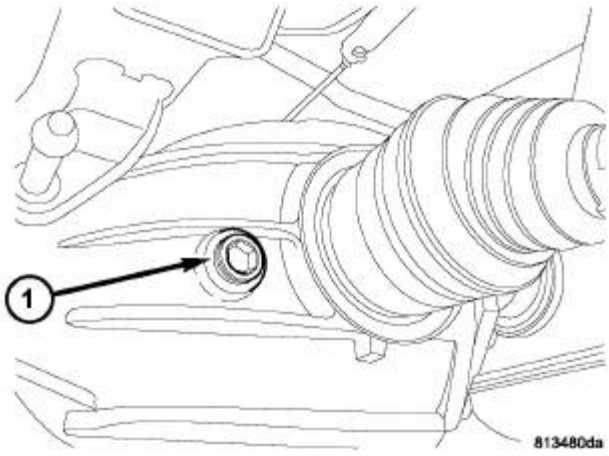

Fig. 119: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

3. Remove fill plug (1) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-140. Reinstall fill plug torque to 60 N.m (44 ft. lbs.) torque.

SEAL, DRIVE PINION

REMOVAL

REMOVAL

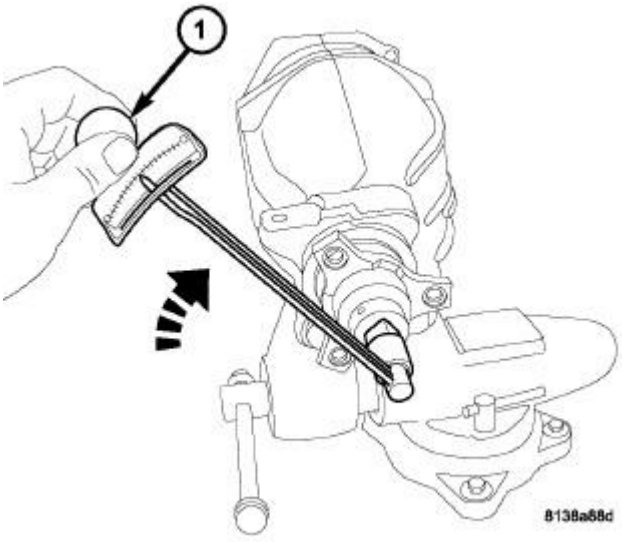

Fig. 120: Measuring Turning Torque
Courtesy of CHRYSLER GROUP, LLC

1. Remove rear axle assembly from vehicle. Refer to **REMOVAL**.
2. Measure axle assembly rotating torque and record measurement for reuse on assembly.

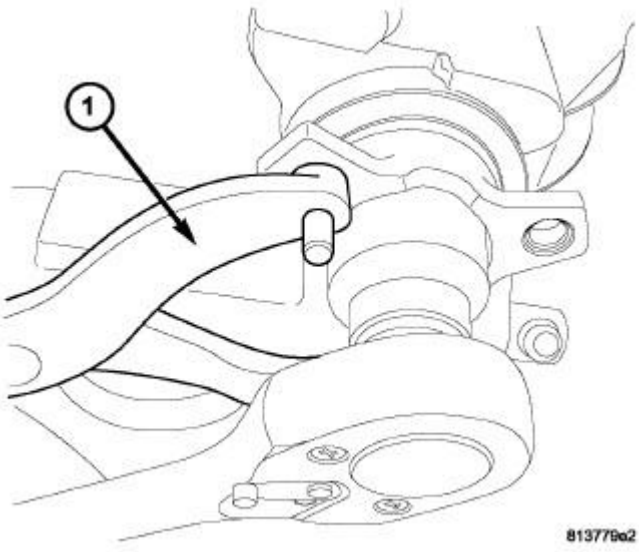

Fig. 121: Pinion Flange Nut Removal/Installation

Courtesy of CHRYSLER GROUP, LLC

3. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 41mm socket, remove pinion flange nut and discard.

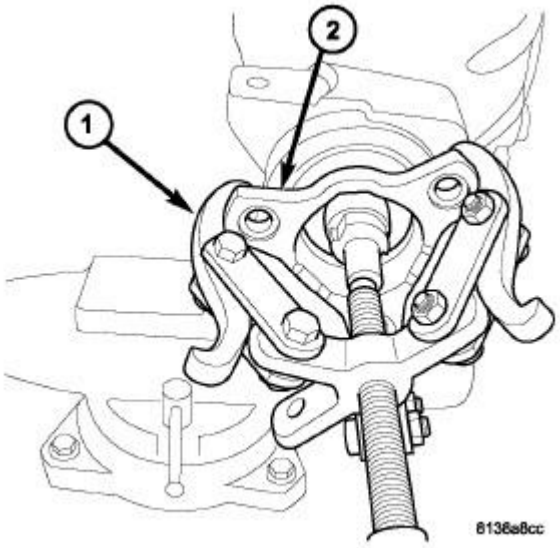

Fig. 122: Removing Pinion Flange With Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.

4. Using Puller (special tool #1026, Puller) (1), remove pinion flange (2) from pinion shaft.

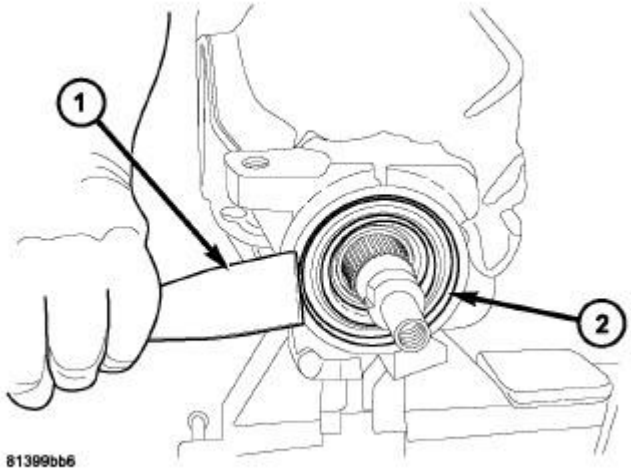

Fig. 123: Pinion Seal Removal
Courtesy of CHRYSLER GROUP, LLC

5. Using suitable tool (1), remove pinion seal (2) and discard.

INSTALLATION

INSTALLATION

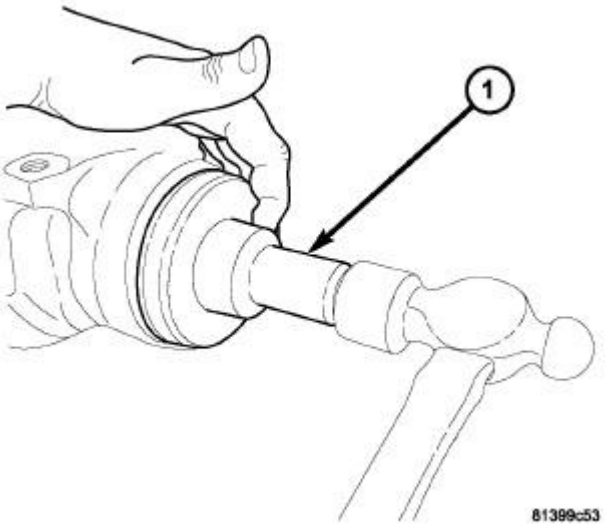

Fig. 124: Installing Pinion Seal
Courtesy of CHRYSLER GROUP, LLC

1. Apply light coating of gear lubricant to the lip of the pinion seal.
2. Using Installer (special tool #9231A, Installer, Pinion Oil Seal) (1), install pinion seal until tool bottoms on carrier.

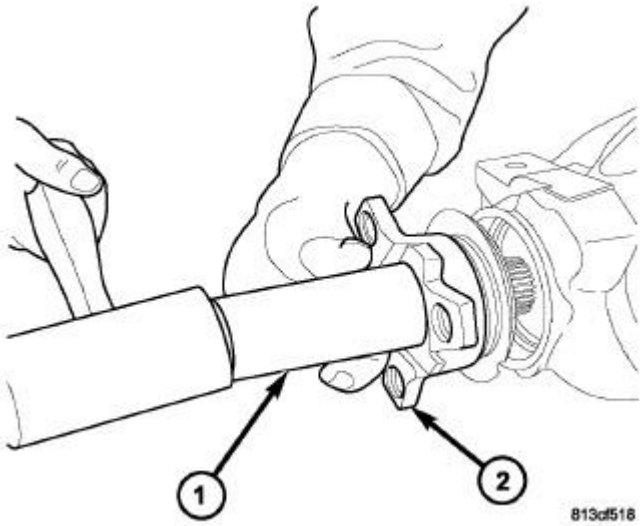

Fig. 125: Installing Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

3. Install pinion flange into position. Align index marks to maintain assembly balance.
4. Using Installer (special tool #6448A, Installer, Bearing/Gear) (1), lightly tap on pinion flange (2) until adequate pinion shaft threads are exposed.

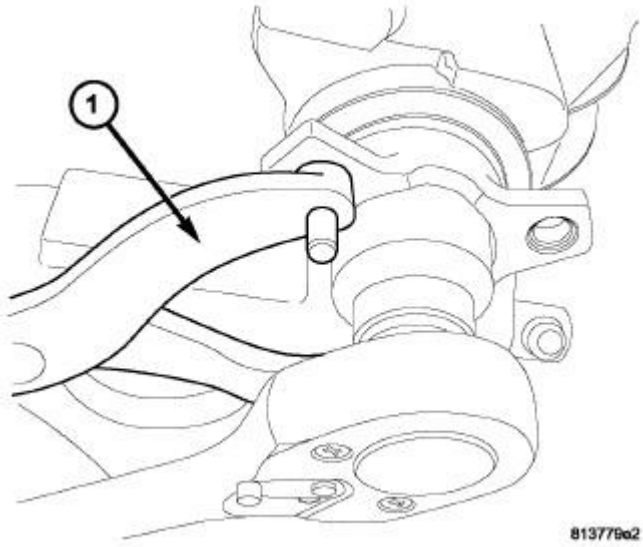

Fig. 126: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

5. Install **new** pinion flange nut. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 41mm socket, torque nut to 136 N.m (100 ft. lbs.).

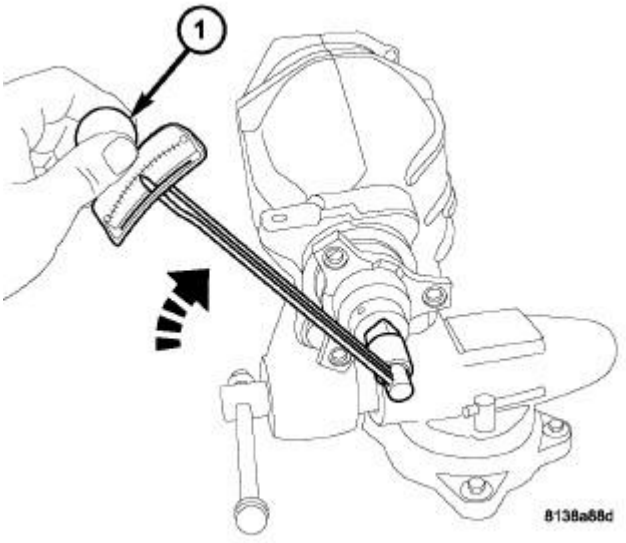

Fig. 127: Measuring Turning Torque
Courtesy of CHRYSLER GROUP, LLC

6. Measure assembly turning torque. Axle assembly rotating torque should be equal to the reading recorded upon seal/flange removal.

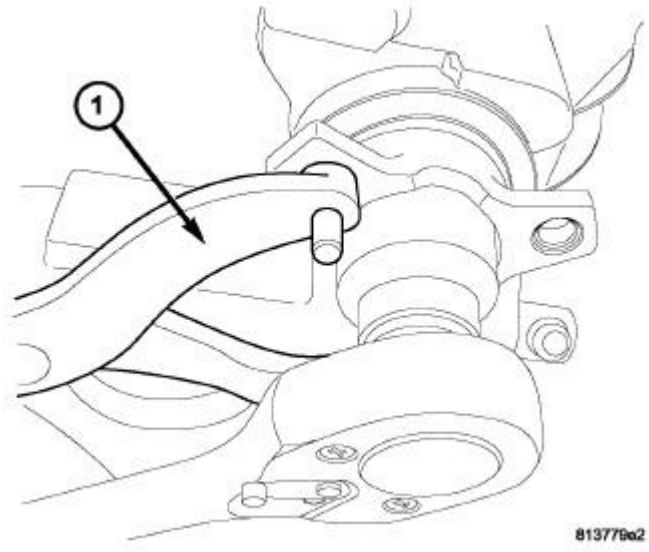

Fig. 128: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

7. If rotating torque is low, increase pinion flange nut torque in 7 N.m (5 ft. lbs.) increments. Repeat until proper rotating torque is received.

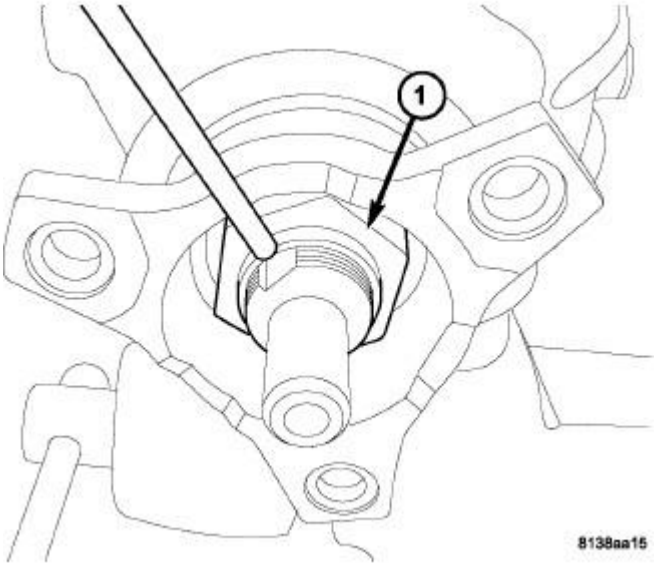

Fig. 129: Staking Pinion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

8. Stake pinion flange nut (1) as shown in illustration.
9. Install rear axle assembly. Refer to **INSTALLATION**.

DRIVELINE/AXLES

Rear Axle - 215RII - Chrysler 300

DESCRIPTION

DESCRIPTION

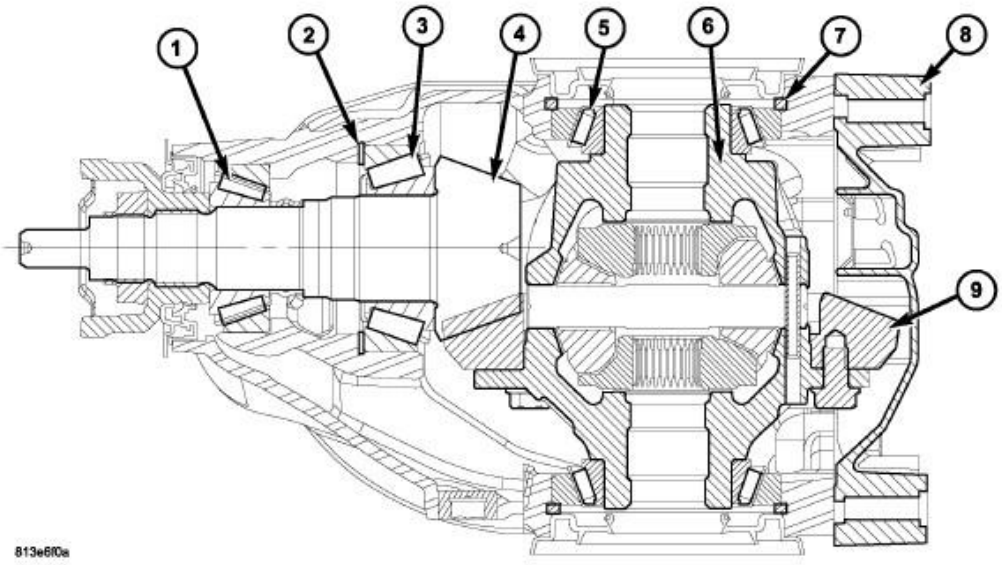

Fig. 1: 198/210 Mm Rii Axle Section View
Courtesy of CHRYSLER GROUP, LLC

1 - BEARING, PINION TAIL	6 - DIFFERENTIAL
2 - SHIM, PINION DEPTH	7 - RING, SNAP
3 - BEARING, PINION HEAD	8 - COVER, AXLE
4 - GEAR/SHAFT, PINION	9 - GEAR, RING
5 - BEARING, DIFFERENTIAL SIDE	

The 215 MM RII (Rear-Independent-Iron) axle is an independent assembly with a cast iron housing and differential. The 215 MM RII uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select snap-rings located on the outside of the differential bearing cups. Pinion height is set with a select shim located under the rear pinion bearing cup.

AXLE IDENTIFICATION

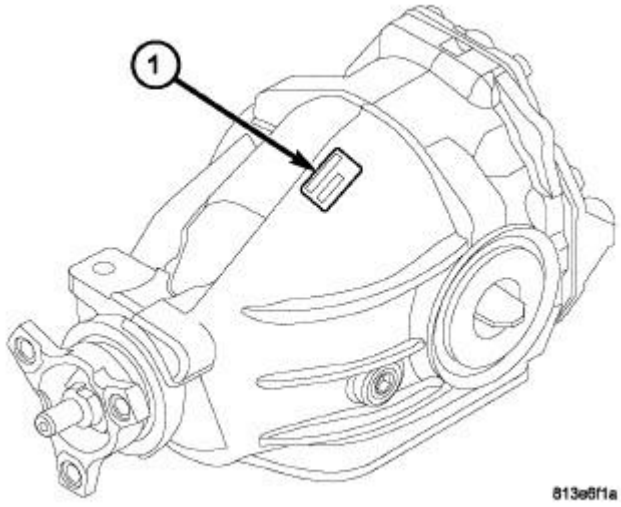

Fig. 2: Axle Identification Tag
Courtesy of CHRYSLER GROUP, LLC

The 215 MM axle utilizes a barcoded label which is adhered to the top of the axle housing as shown. The following information is found on the identification label:

- Traceability Code (Plant Use)
- Axle Part Number
- Axle Gear Ratio

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AXLE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.

- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or CV joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
DIFFERENTIAL CRACKED	1. Improper differential side bearing preload.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
DIFFERENTIAL GEARS SCORED	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill

		differential with the proper fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
LOSS OF LUBRICANT	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked axle housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored pinion flange journal.	5. Replace pinion flange and seal.
	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.
AXLE OVERHEATING	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing preload too high.	3. Readjust bearing pre-load.
	4. Insufficient ring gear backlash.	4. Re-adjust ring gear backlash.
GEAR TEETH BROKE	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Ice-spotted pavement.	2. Replace gears and examine remaining parts for damage.
	3. Improper adjustments.	3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
AXLE NOISE	1. Insufficient lubricant.	1. Fill axle with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and/or pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing preload.

	7. Misaligned or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Housing not machined properly.	8. Replace housing.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: The fluid required for use in this axle is Mopar® Synthetic Gear and Axle Lubricant 75W-140.

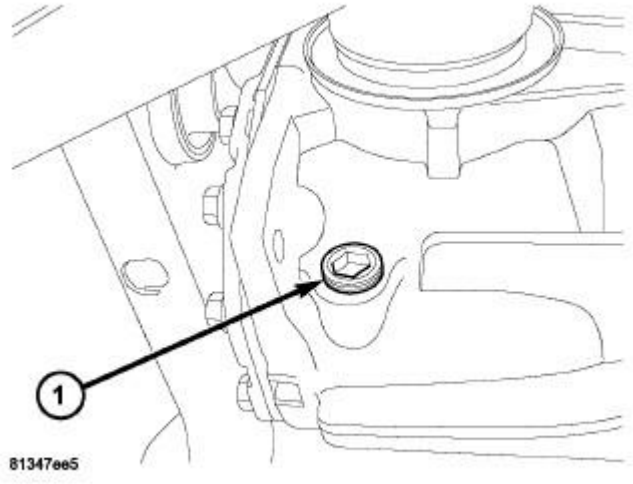

Fig. 3: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.
2. With vehicle in neutral, position and raise vehicle on hoist.
3. Remove rear axle drain plug (1) and drain lubricant completely from the axle.
4. Install drain plug and tighten to 50 N.m (37 ft lbs).

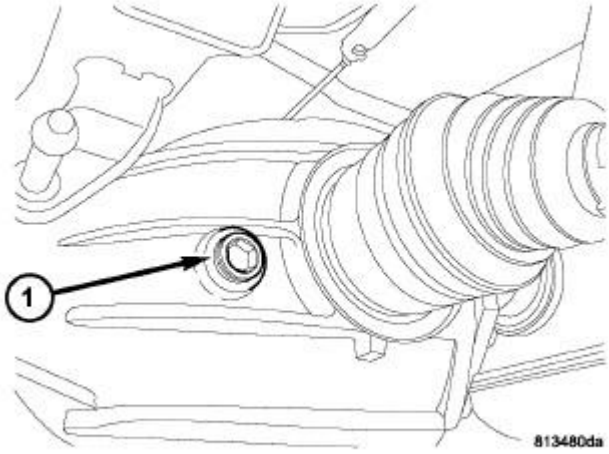

Fig. 4: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

5. Remove fill plug (1) and fill rear axle with 1.2 L (1.3 qts.) Mopar® Synthetic Gear AND Axle Lubricant 75W-140 and insure axle is filled to the bottom of the fill hole.
6. Install fill plug and tighten to 50 N.m (37 ft lbs).

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

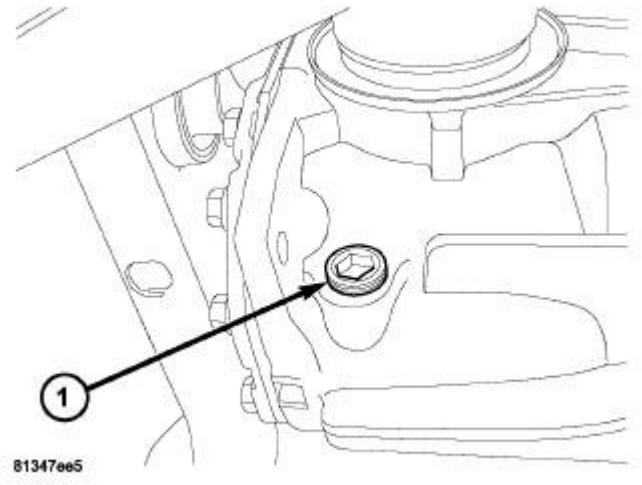

Fig. 5: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 50 N.m (37 ft. lbs.) torque.

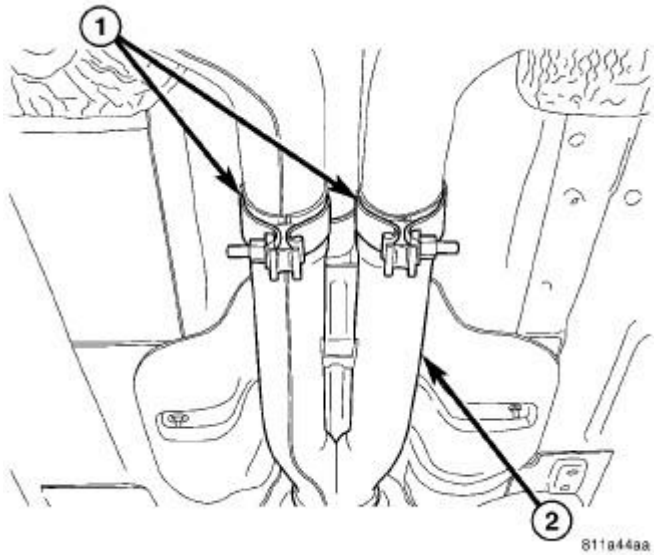

Fig. 6: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

4. Remove rear exhaust system (2) on dual-outlet exhaust models, otherwise, lower exhaust system at rear hanger(s).

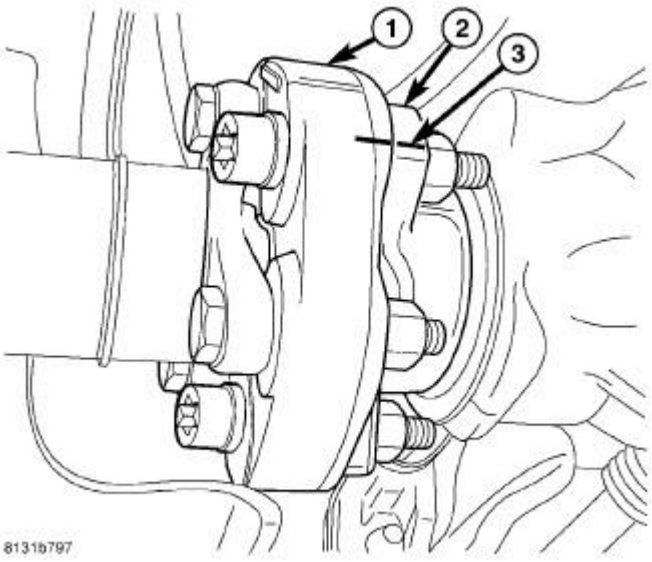

Fig. 7: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

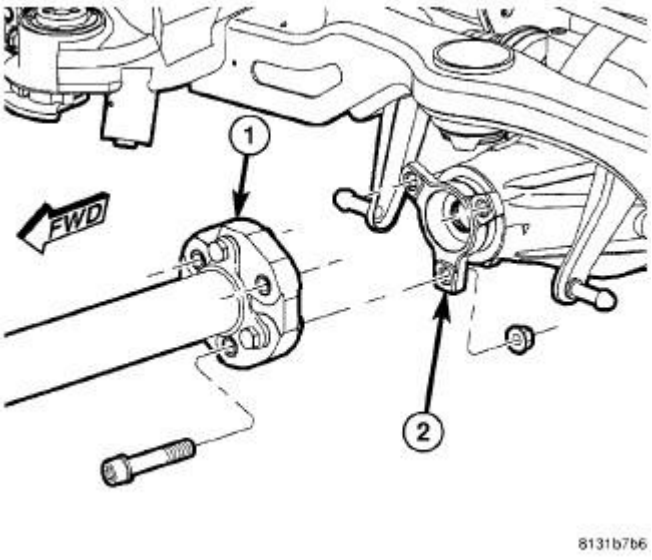

Fig. 8: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three propeller shaft coupler (1)-to-axle flange (2) bolt/nuts.

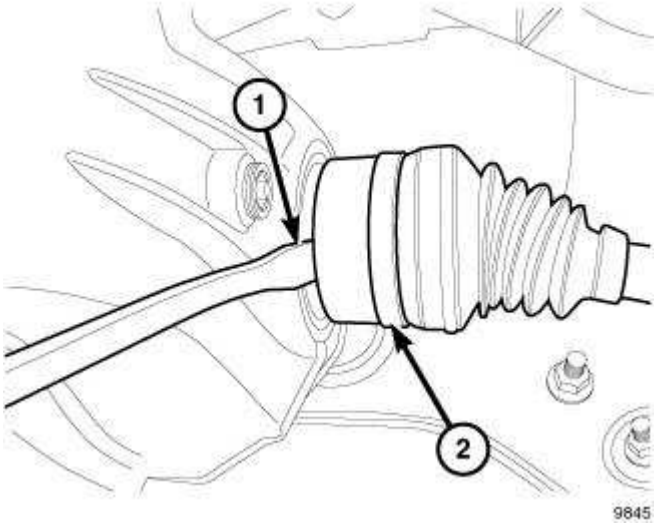

Fig. 9: Halfshaft Removal (V6 Models)
Courtesy of CHRYSLER GROUP, LLC

7. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

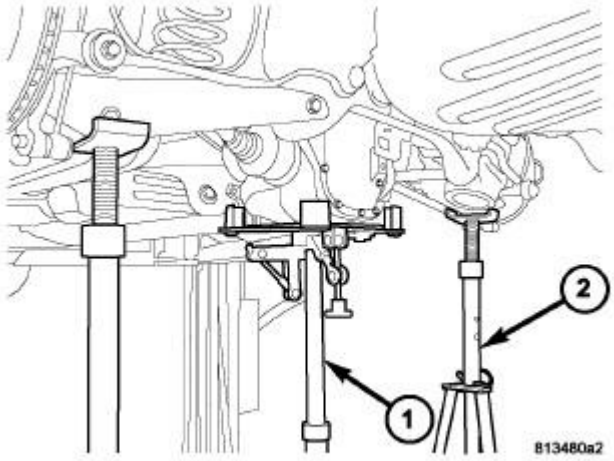

Fig. 10: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

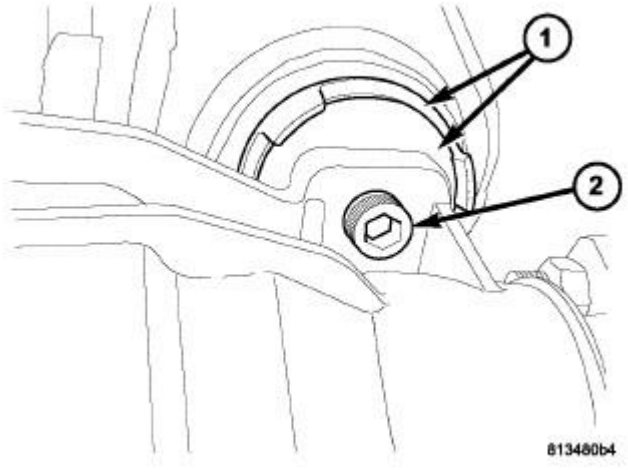

Fig. 11: Rear Axle Forward Mount Isolator & Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove rear axle forward mount isolator (1) bolt/nut (2).
10. Remove two rear axle-to-crossmember bolts (1).

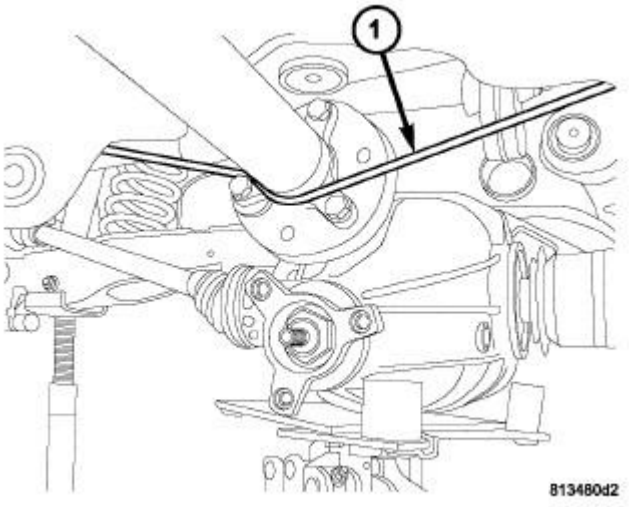

Fig. 12: Propeller Shaft Supported
Courtesy of CHRYSLER GROUP, LLC

11. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

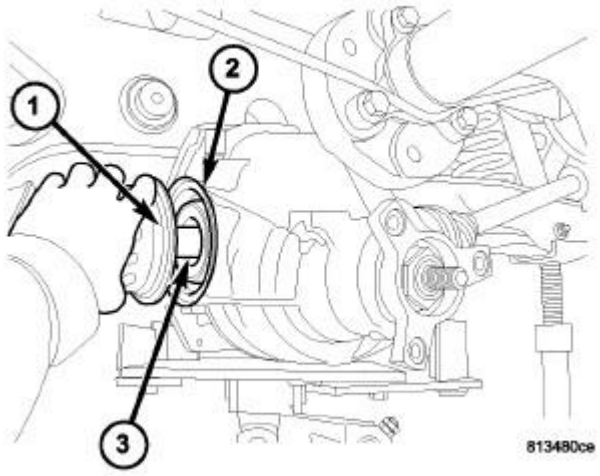

Fig. 13: Halfshaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

12. Lower axle just enough to remove both halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.
13. Remove axle assembly from vehicle and transfer to bench.

INSTALLATION

INSTALLATION

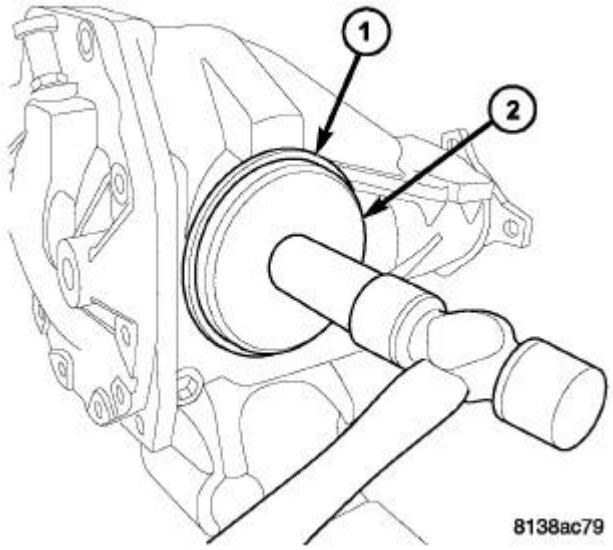

Fig. 14: Axle Seal Installation

Courtesy of CHRYSLER GROUP, LLC

1. Install new axle seal(s) (1) using (special tool #9755, Installer, Seal) (2).

NOTE: Always use (special tool #9099, Seal Protector, Differential Output) when installing half shaft into the transaxle. If the Seal Protector is new please split at seam before using.

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

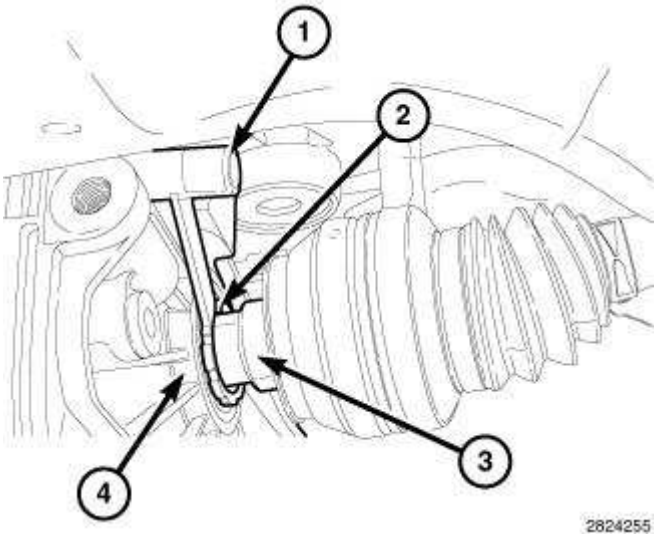

Fig. 15: Identifying Rear Axle, Rear Driveshaft, Rear Axle Flange, and Halfshafts
Courtesy of CHRYSLER GROUP, LLC

NOTE: While raising rear axle reposition rear drive shaft to rear axle flange.

2. Install new circlip(s), on halfshafts (3).
3. Raise axle just enough to install both halfshafts one at a time. Be careful not to damage axle seals using (special tool #9099, Seal Protector, Differential Output) (1). Shift axle assembly in one direction, compressing one halfshaft while installing the other.

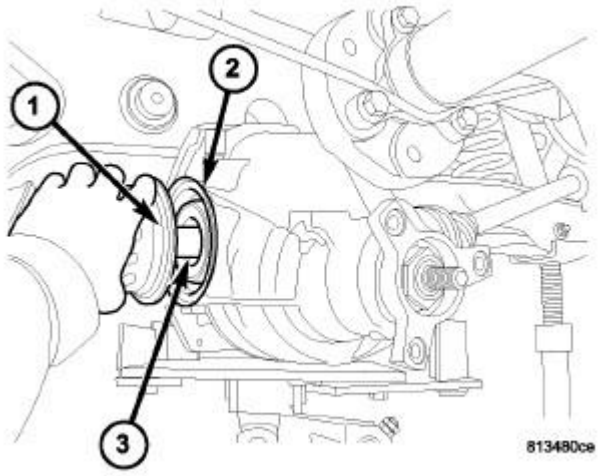

Fig. 16: Halfshaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

4. Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle seals (2). Verify proper installation by pulling outward on joint by hand.

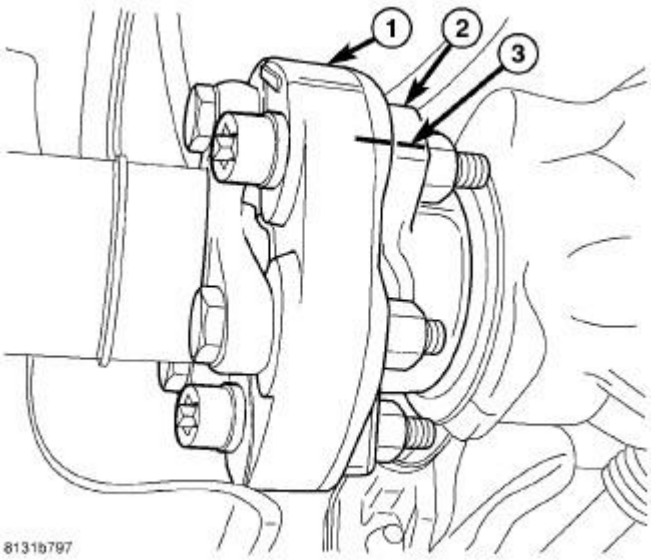

Fig. 17: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

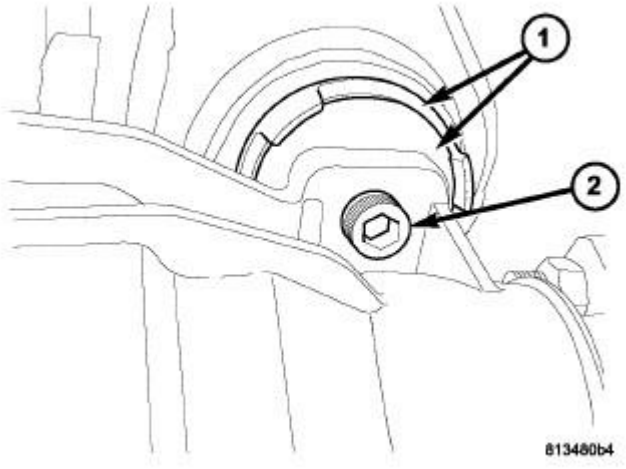

Fig. 18: Rear Axle Forward Mount Isolator & Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

6. Install two rear axle-to-crossmember bolts (1) and torque to 220 N.m (162 ft. lbs.).
7. Install rear axle front mount isolator (1) as shown and torque bolt/nut to 65 N.m (48 ft. lbs.).

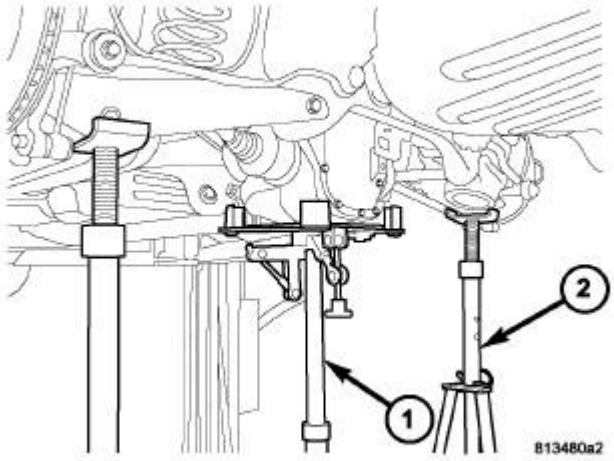

Fig. 19: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. Again verify halfshaft inner joints are fully engaged to axle assembly.

9. Remove transmission jack (1).
10. If used, remove screw-type under-hoist jack stands (2).

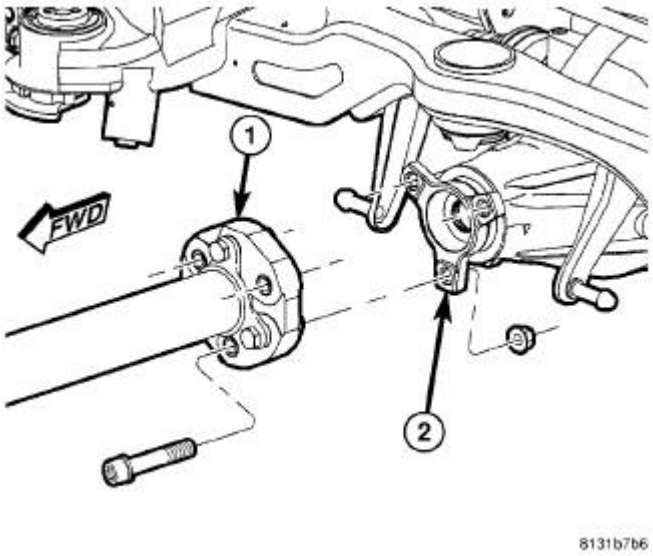

Fig. 20: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

11. Torque propeller shaft coupler-to-axle flange bolt/nuts to 58 N.m (43 ft. lbs.).

SPECIAL TOOLS

SPECIAL TOOLS

	1026 - Puller (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC.) 6448A - Installer, Bearing/Gear (Originally Shipped In Kit Number(s) 6947, 8667, 8837, 8867.) 9099 - Seal Protector, Differential Output (Originally Shipped In Kit Number(s) 9324, 9324CC.) 9754 - Installer, Seal (Originally Shipped In Kit Number(s) 9750.) 9755 - Installer, Seal (Originally Shipped In Kit Number(s) 9750.) C-3281 - Holder, Flange (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)

SEAL, AXLE DRIVE SHAFT

REMOVAL

REMOVAL

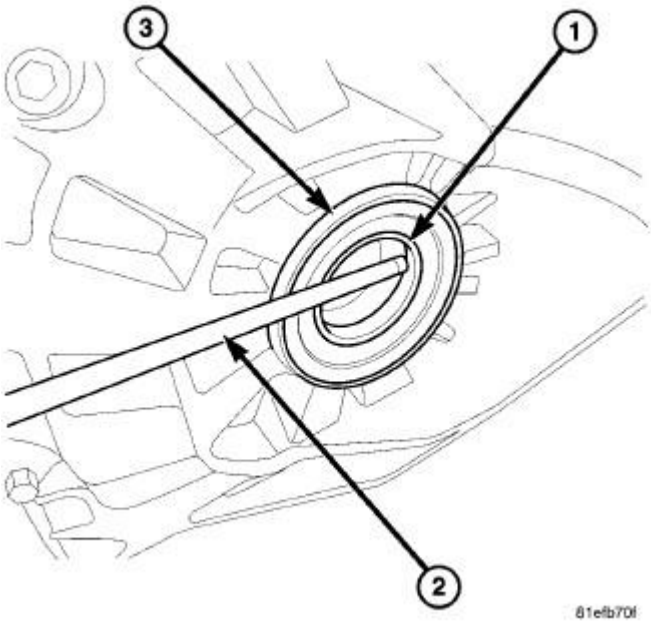

Fig. 21: Remove Lside Seal
Courtesy of CHRYSLER GROUP, LLC

1. Remove halfshaft(s). Refer to **REMOVAL** and **REMOVAL** .
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace halfshaft if necessary.

INSTALLATION

INSTALLATION

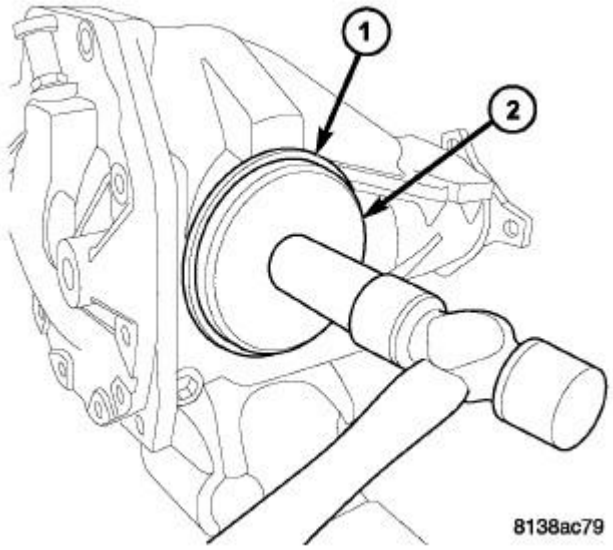

Fig. 22: Axle Seal Installation
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #9755, Installer, Seal) (2), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-140 to protect seal during halfshaft installation.
2. Install halfshaft(s). Refer to **INSTALLATION** and **INSTALLATION** .

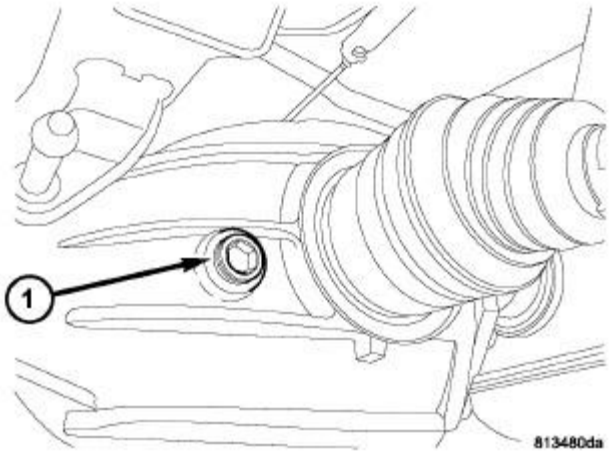

Fig. 23: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

3. Remove fill plug (1) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-140. Reinstall fill plug and torque to 50 N.m (37 ft. lbs.) torque.

SEAL, DRIVE PINION

REMOVAL

REMOVAL

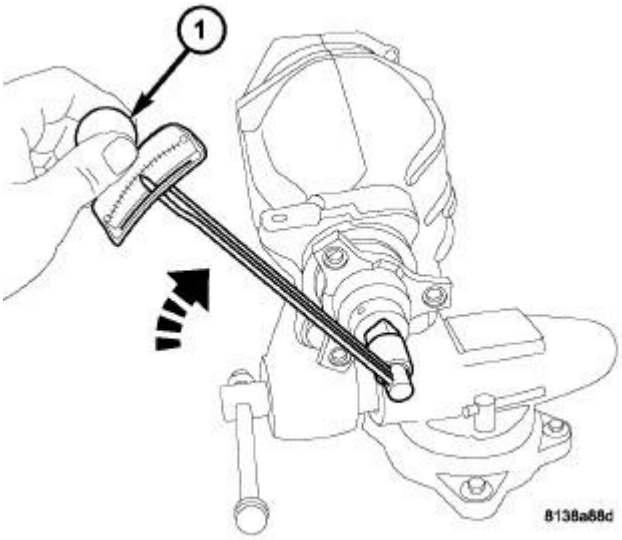

Fig. 24: Measuring Turning Torque
Courtesy of CHRYSLER GROUP, LLC

1. Remove rear axle assembly from vehicle. Refer to Rear Axle Removal.
2. Measure axle assembly rotating torque and record measurement for reuse on assembly.

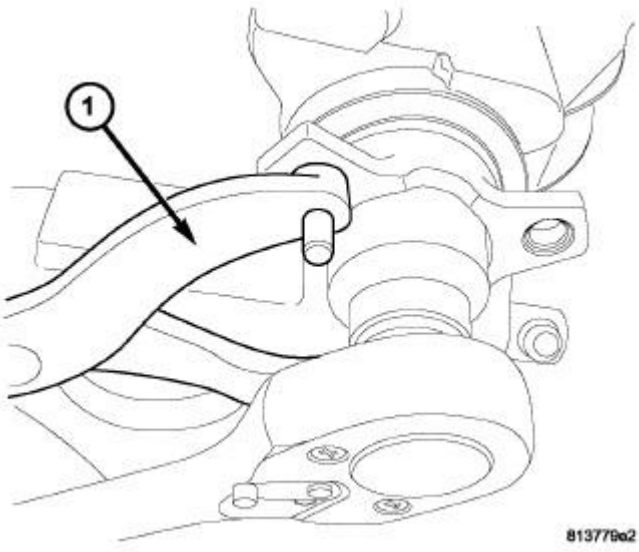

Fig. 25: Pinion Flange Nut Removal/Installation

Courtesy of CHRYSLER GROUP, LLC

3. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 41mm socket, remove pinion flange nut and discard.

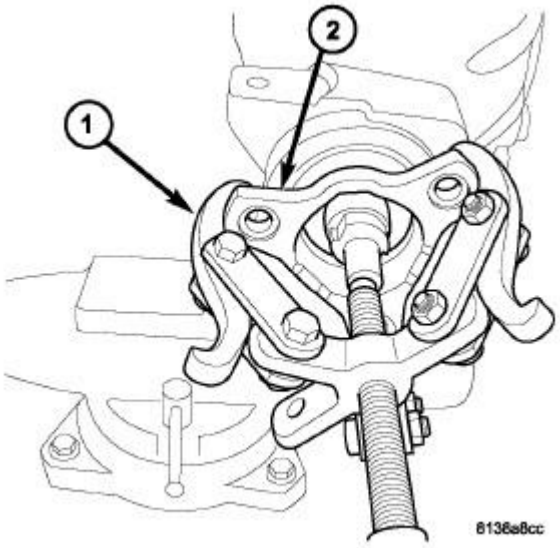

Fig. 26: Removing Pinion Flange With Puller 1026
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.

4. Using Puller (special tool #1026, Puller) (1), remove pinion flange (2) from pinion shaft.

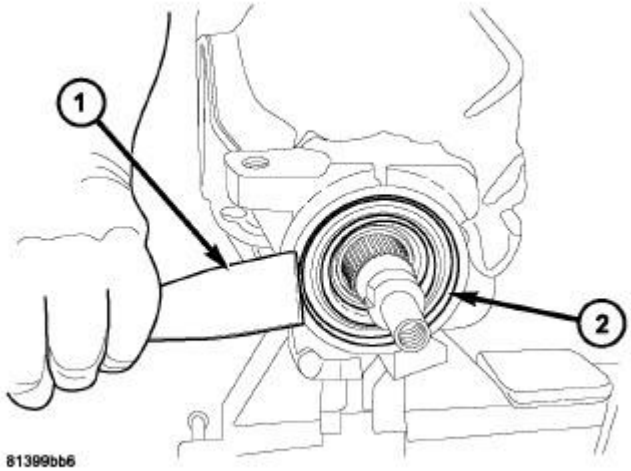

Fig. 27: Pinion Seal Removal
Courtesy of CHRYSLER GROUP, LLC

5. Using suitable tool (1), remove pinion seal (2) and discard.

INSTALLATION

INSTALLATION

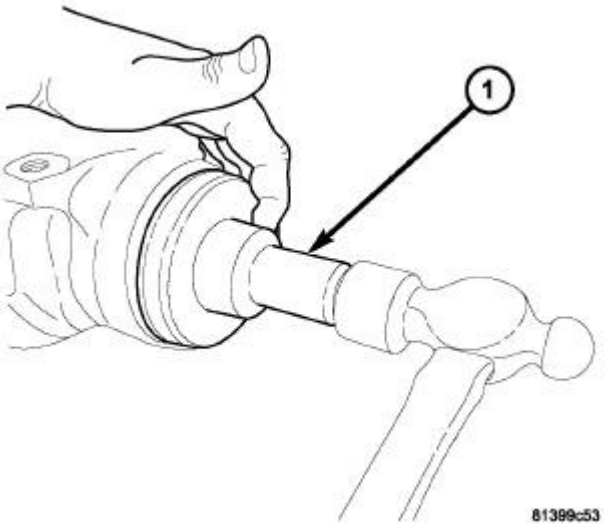

Fig. 28: Installing Pinion Seal
Courtesy of CHRYSLER GROUP, LLC

1. Apply light coating of gear lubricant to the lip of the pinion seal.
2. Using Installer (special tool #9754, Installer, Seal) (1), install pinion seal until tool bottoms on carrier.

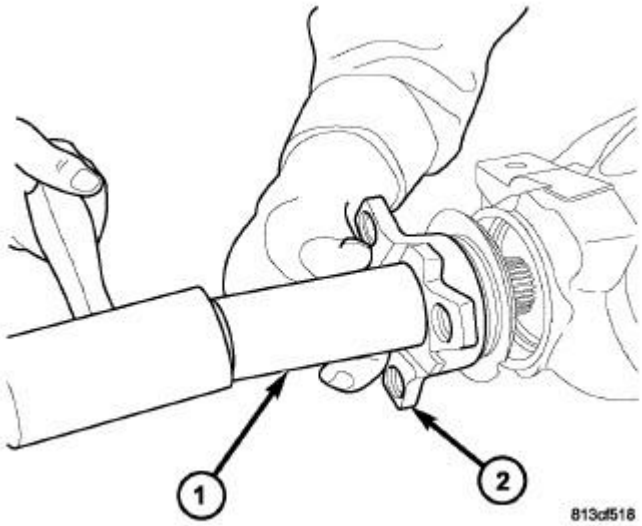

Fig. 29: Pinion Flange Installation
Courtesy of CHRYSLER GROUP, LLC

3. Install pinion flange into position. Align index marks to maintain assembly balance.
4. Using Installer (special tool #6448A, Installer, Bearing/Gear) (1), lightly tap on pinion flange (2) until adequate pinion shaft threads are exposed.

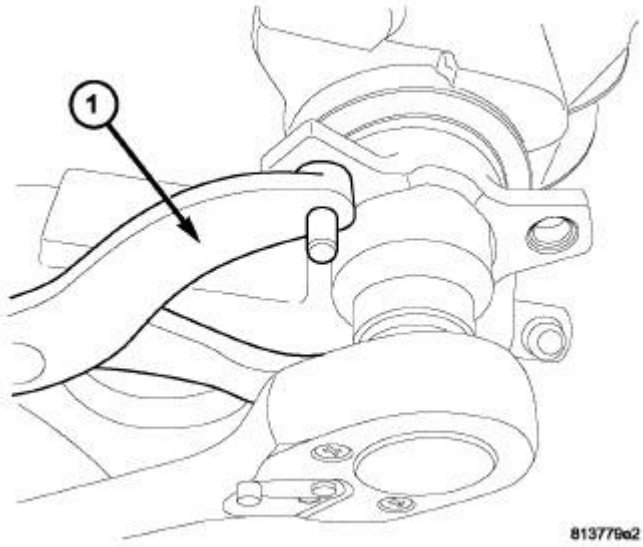

Fig. 30: Pinion Flange Nut Removal
Courtesy of CHRYSLER GROUP, LLC

5. Install **new** pinion flange nut. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 41mm socket, torque nut to 136 N.m (100 ft. lbs.).

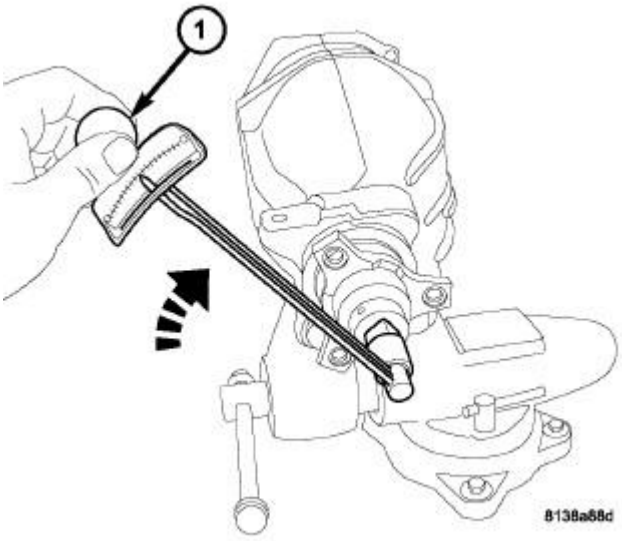

Fig. 31: Measuring Rotating Torque
Courtesy of CHRYSLER GROUP, LLC

6. Measure assembly turning torque. Axle assembly rotating torque must be should be equal to the reading recorded upon seal/flange removal.

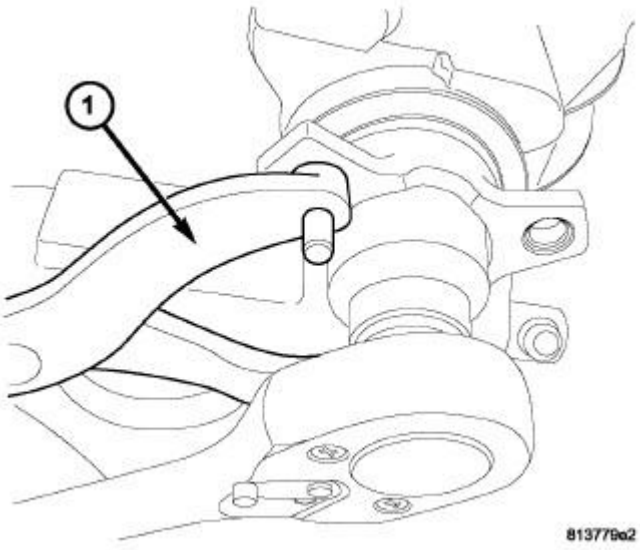

Fig. 32: Pinion Flange Nut Removal
Courtesy of CHRYSLER GROUP, LLC

7. If rotating torque is low, increase pinion flange nut torque in 7 N.m (5 ft. lbs.) increments. Repeat until proper rotating torque is received.

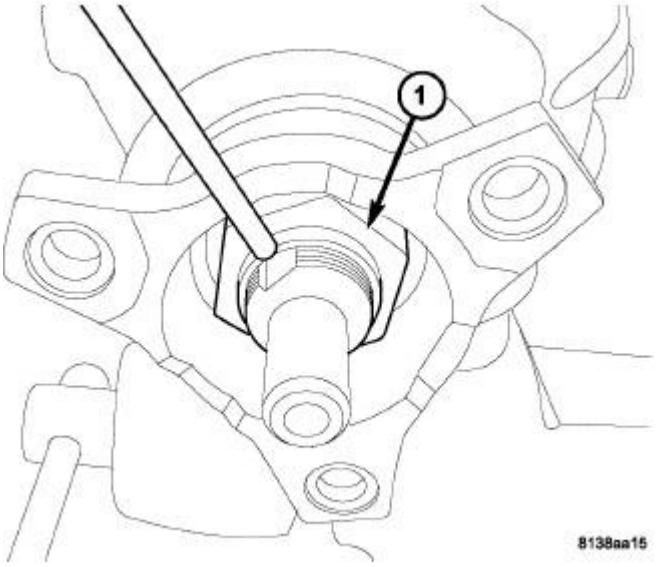

Fig. 33: Staking Pinion Flange Nut
Courtesy of CHRYSLER GROUP, LLC

8. Stake pinion flange nut (1) as shown.
9. Install rear axle assembly. Refer to Rear Axle Installation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - NOISE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Axle mounts damaged, worn, or bottoming out.
- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and

to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints, or CV joints.
- Worn rubber coupler between the propeller shaft and the pinion yoke.
- Washers missing from the fasteners that attach the rubber coupler to the pinion yoke.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- Cradle-to-body isolator worn or damaged.
- Worn or damaged rubber washer between axle hub nut and axle hub.
- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints, or CV joints.
- Worn rubber coupler between the propeller shaft and the pinion yoke.
- Worn or broken axle mount isolators.

- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
DIFFERENTIAL CRACKED	1. Improper differential side bearing preload.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
DIFFERENTIAL GEARS SCORED	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the proper fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
LOSS OF LUBRICANT	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked axle housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored pinion flange journal.	5. Replace pinion flange and seal.
	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.

AXLE OVERHEATING	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing preload too high.	3. Re-adjust bearing pre-load.
	4. Insufficient ring gear backlash.	4. Re-adjust ring gear backlash.
GEAR TEETH BROKE	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Ice-spotted pavement.	2. Replace gears and examine remaining parts for damage.
	3. Improper adjustments.	3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
AXLE NOISE	1. Insufficient lubricant.	1. Fill axle with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and/or pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing preload.
	7. Misaligned or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Housing not machined properly.	8. Replace housing.

ADJUSTMENTS

PINION DEPTH

NOTE: Pinion depth measurement is taken with the pinion head and tail bearing cups pressed into the axle housing without the shim.

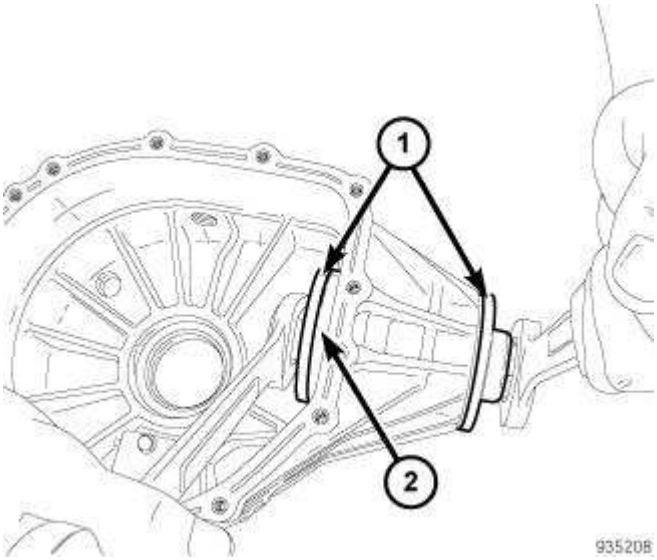

Fig. 1: Pinion Bearing Cup Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not attempt to install the inner and outer pinion bearing cups at the same time.

1. If necessary, install the pinion head bearing cup into housing with Pinion Bearing Cup Installer (special tool #10148, Installer, Pinion Head Bearing Cup) (1).
2. If necessary, press pinion tail bearing cup into housing with Pinion Bearing Cup Installer (special tool #10148, Installer, Pinion Head Bearing Cup) (1).

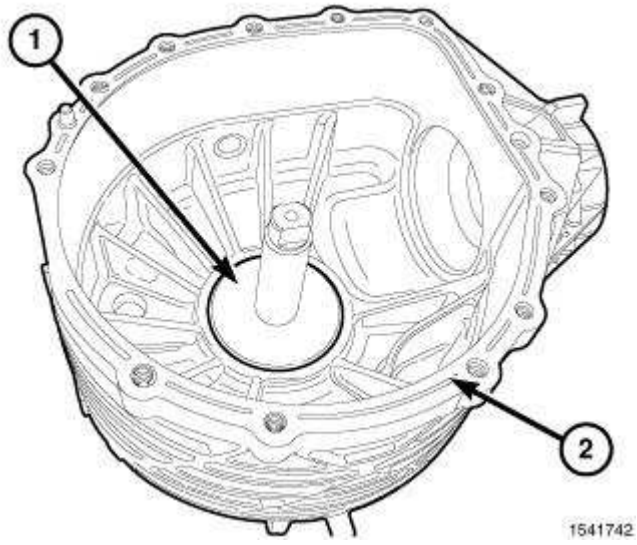

Fig. 2: Arbor Bar
Courtesy of CHRYSLER GROUP, LLC

3. Install Arbor Bar (special tool #10149-2, Arbor) (1) into the case side bearing bore, then secure Arbor (special tool #10149-2, Arbor) in place with Plate (special tool #10149-5, Washer) and

fastener.

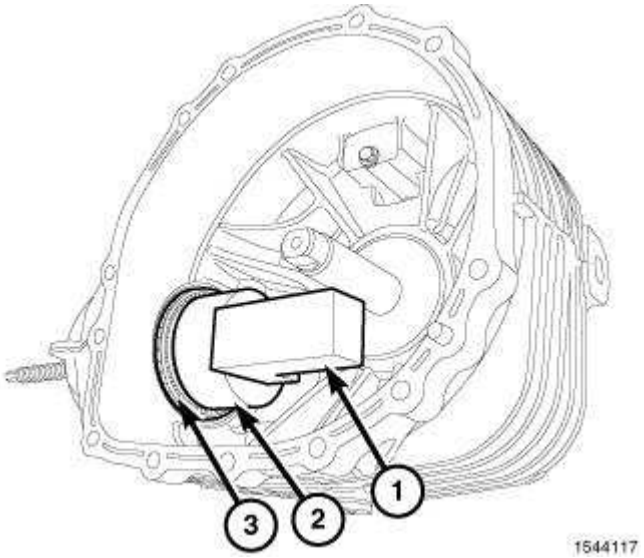

Fig. 3: Pinion Head Bearing
Courtesy of CHRYSLER GROUP, LLC

4. Install the pinion head bearing, tail bearing (3), L-block (special tool #6739, Block, Height) (1), and the Pinion Height Block (special tool #10149-1, Block, Pinion) (2).
5. Verify pinion depth measurement tools are set up as shown in illustration.

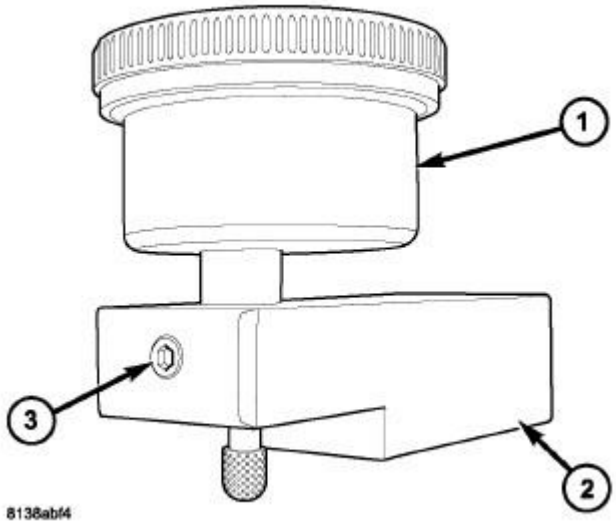

Fig. 4: Indicator/Scooter Block Setup
Courtesy of CHRYSLER GROUP, LLC

6. Install Dial Indicator (special tool #9524, Indicator, Dial) (1) to Scooter Block (special tool #D-115-2A, Block, Scooter) (2). Secure with set-screw (3).

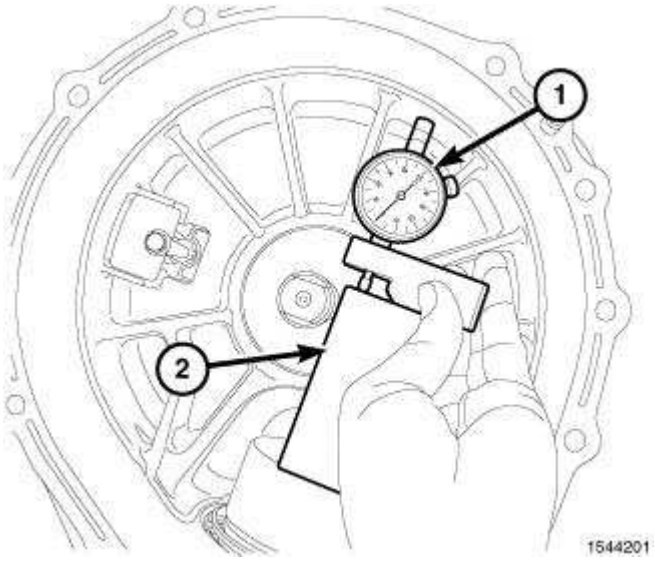

Fig. 5: Zeroing In Dial Indicator On L-Block
Courtesy of CHRYSLER GROUP, LLC

7. Zero Dial Indicator (special tool #9524, Indicator, Dial) (1) on L-block (special tool #6739, Block, Height) (2).

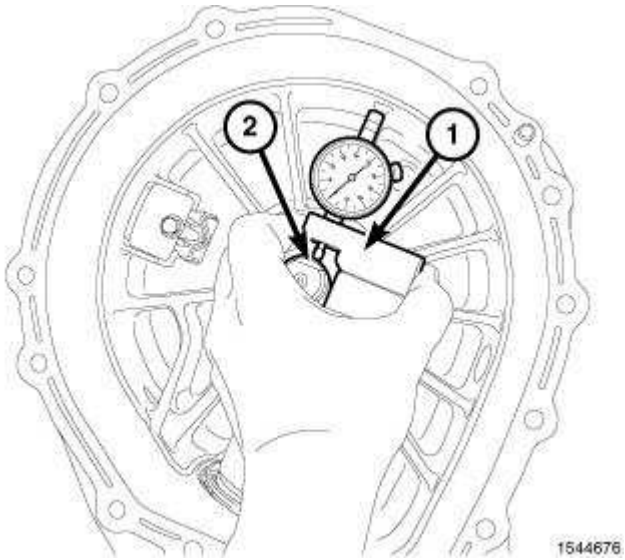

Fig. 6: Slide Indicator Probe Off Of Height Block And Onto Arbor Bar
Courtesy of CHRYSLER GROUP, LLC

8. Slide indicator probe (1) off of height block and onto Arbor Bar (special tool #10149-2, Arbor) (2). As indicator contacts Arbor Bar (special tool #10149-2, Arbor) (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of Arbor Bar (special tool #10149-2, Arbor) and record the highest reading.
9. Rotate Arbor Bar (special tool #10149-2, Arbor) (2) 90°.
10. Repeat steps 7 through 9 and record each measurement until the Arbor Bar (special tool #10149-2, Arbor) has been rotated back to the original location.

11. Average the four measurements taken in steps 7 through 10.
12. Select a shim equal to the average of the measurements, plus 1.5 mm (0.059 in.).

SIDE BEARING PRELOAD ADJUSTMENT

NOTE: Select the pinion shim before performing this procedure.

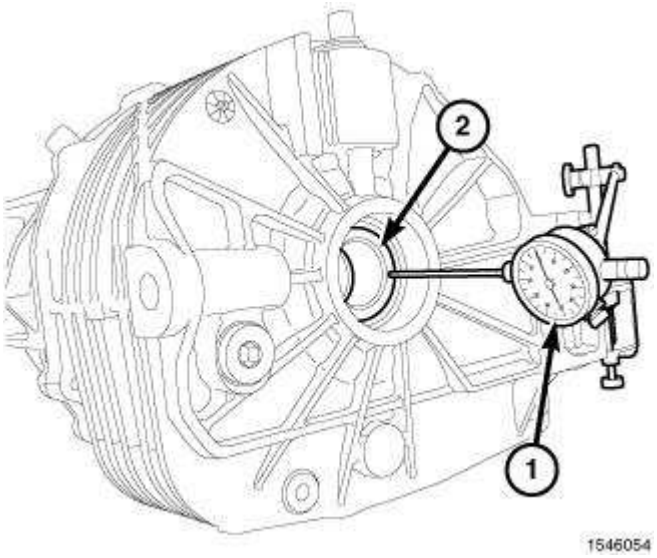

Fig. 7: Side Bearing Preload Adjustment
Courtesy of CHRYSLER GROUP, LLC

1. Clean the differential bearing cup bore in the axle housing.
2. Install Dummy Bearing (special tool #10149-3, Dummy Housing Bearing) in the axle housing.
3. Clean the differential bearing cup bore in the axle housing cover.
4. Install Dummy Bearing (special tool #10149-4, Dummy Cover Bearing) in the axle housing cover.
5. Install the differential into the axle housing.
6. Install the axle housing cover and tighten the bolts to 10 Nm (7 ft. lbs.).
7. Set up the dial indicator (1) to measure endplay on the housing side of the differential (2).
8. From the housing side of the differential, press the differential toward the case cover, then zero the dial indicator (1).
9. From the case cover side, press the differential toward the housing side, and record the measurement.
10. Add 1.33 mm (0.052 in.) to the empty case measurement taken in the previous step and record the results. This is the total dimension of both differential shims when installed.
11. Remove the dial indicator.
12. Remove the axle housing cover.
13. Fully install the pinion.

14. Install the Dummy Bearing (special tool #10149-3, Dummy Housing Bearing) in the axle housing, then install the differential carrier into the axle housing.
15. Install Dummy Bearing (special tool #10149-4, Dummy Cover Bearing) in the axle housing cover, and install the axle housing cover. Tighten the bolts to 10 Nm (7 ft. lbs.).
16. Set up the dial indicator (1) as before.
17. From the housing side of the differential, press the differential toward the case cover, then zero the dial indicator (1).
18. From the case cover side, press the differential toward the housing side, and record the measurement.
19. Subtract 0.27 mm (0.01 in.) from the measurement found in the previous step 10. This is the size of the shim that should be installed in the housing cover.
20. Subtract the size of the selected housing cover shim from the measurement found in. This is the size of the shim that should be installed in the housing.
21. Check ring gear backlash. Final ring gear backlash should be 0.21 mm +/- 0.13 mm (0.008 in. +/- 0.005 in.).

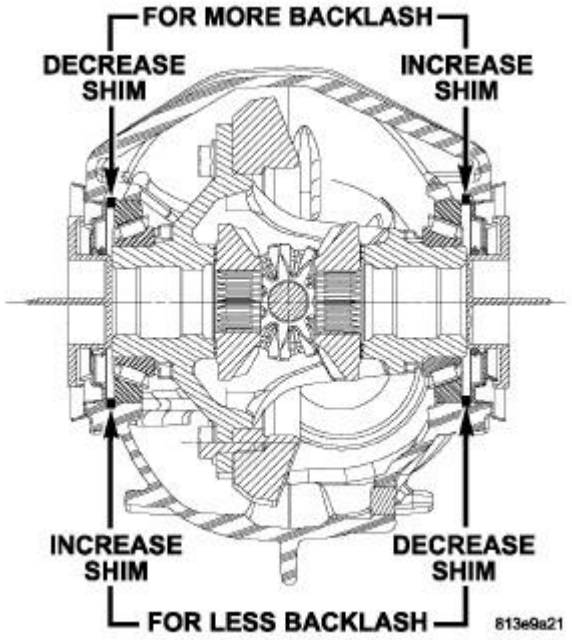

Fig. 8: Backlash Shim Correction
Courtesy of CHRYSLER GROUP, LLC

22. If backlash measurement is less than 0.08 mm (0.003 in.), it is necessary to decrease the shim thickness on the ring gear (left) side, and increase the thickness on the pinion (right) side.
23. If backlash measurement is greater than 0.34 mm (0.013 in.), it is necessary to increase the shim thickness on the ring gear (right) side, and decrease the thickness on the pinion (left) side.
24. Check the gear contact pattern, and adjust as necessary. Refer to **GEAR CONTACT PATTERN**.

GEAR CONTACT PATTERN

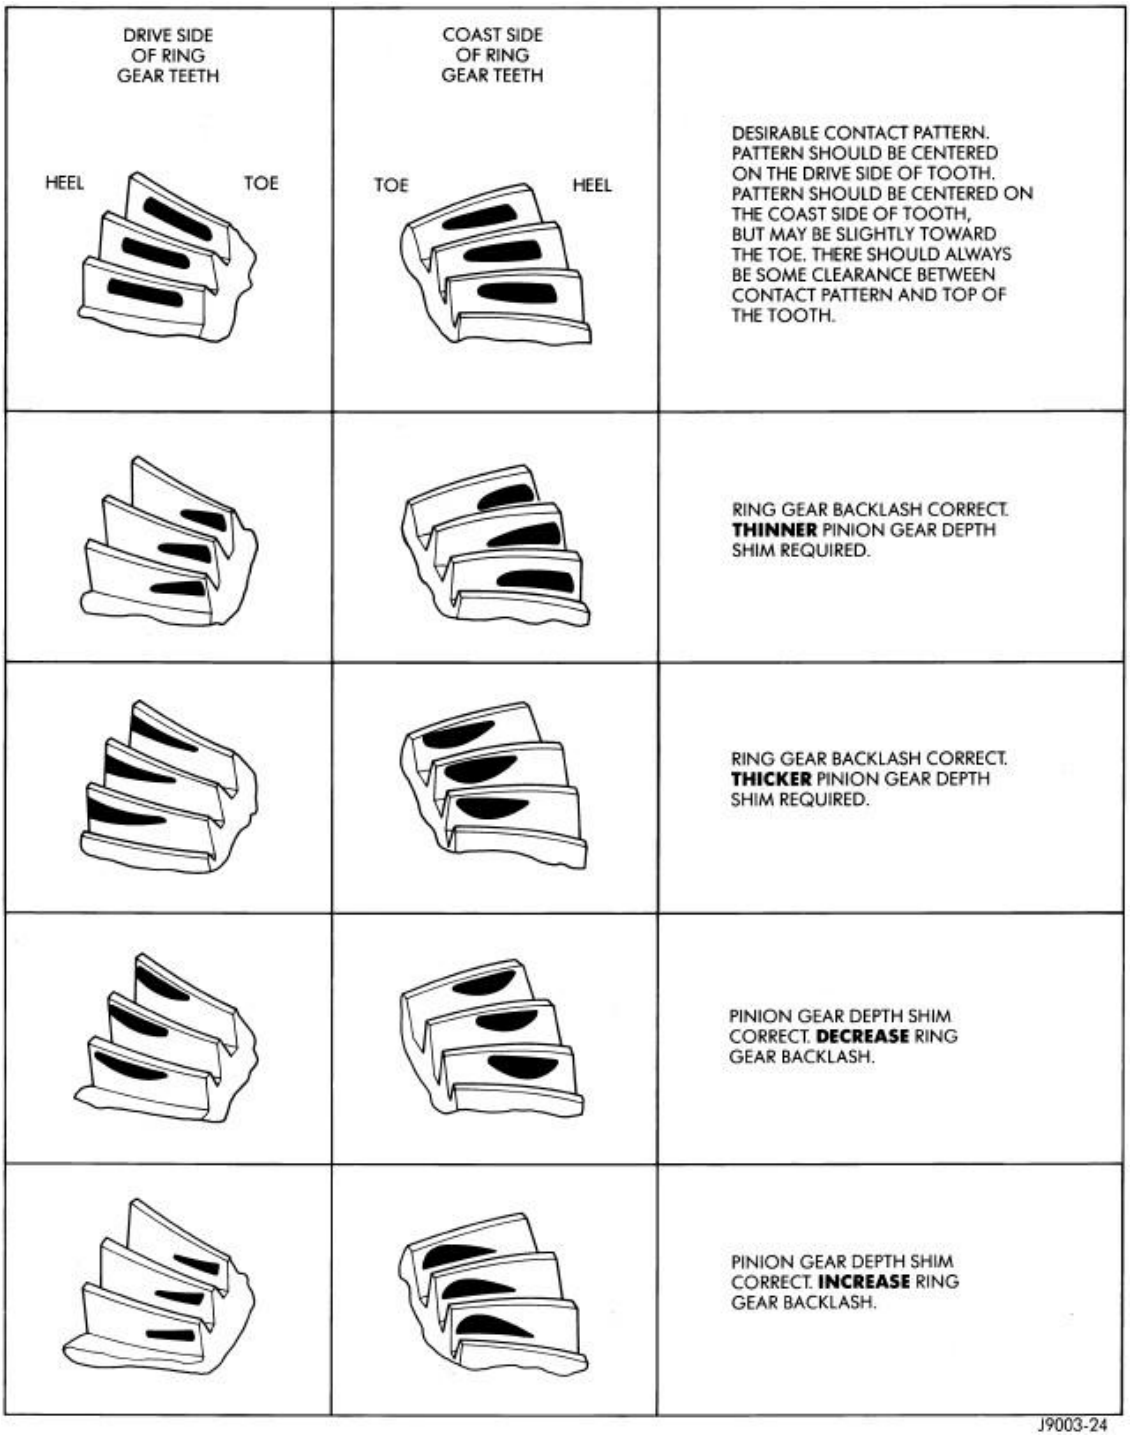

Fig. 9: Gear Tooth Contact Patterns
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been**

adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Install the differential side bearings and pinion bearings.
2. Install the selected differential bearing and pinion shims in the differential housing and cover, and install the bearing cups.
3. Install the differential carrier and pinion in the differential housing.
4. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
5. Install the differential housing cover. Tighten the bolts to 28 Nm (20 ft. lbs.).
6. Make a witness mark on the differential carrier.
7. Hold the differential case from freely rotating. This will provide a more distinct contact pattern.
8. Rotate the pinion until the witness mark on the differential case has made one complete revolution in both directions.
9. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary. The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will push the compound to the areas with the least amount of contact.

SPECIFICATIONS

SPECIFICATIONS

AXLE

ITEM	DESCRIPTION
Fluid	Mopar® Gear and Axle Lubricant 75W-90
Friction Modifier	MOPAR® Limited Slip Additive Friction Modifier

TORQUE

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.

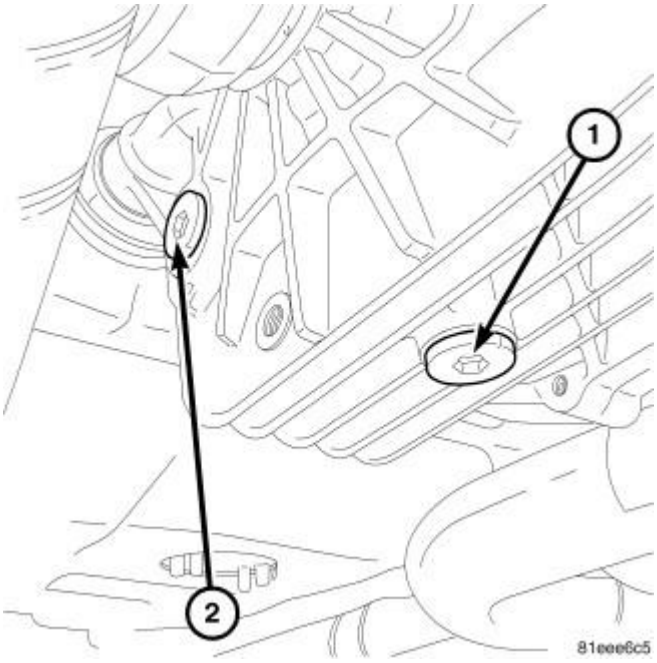

Fig. 10: Drain And Fill Plug
Courtesy of CHRYSLER GROUP, LLC

2. Remove axle drain plug (1) and drain rear axle fluid into suitable container.
3. Install drain plug (1). Do not tighten at this time.
4. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL** .

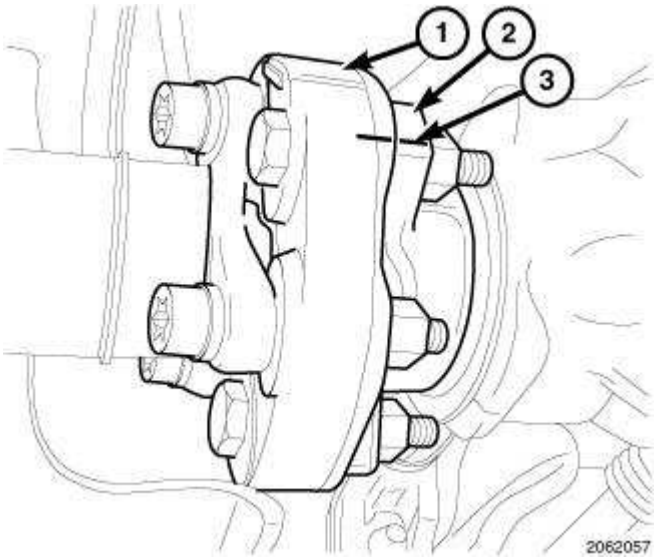

Fig. 11: Marks On Propeller Shaft Rubber Coupler
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

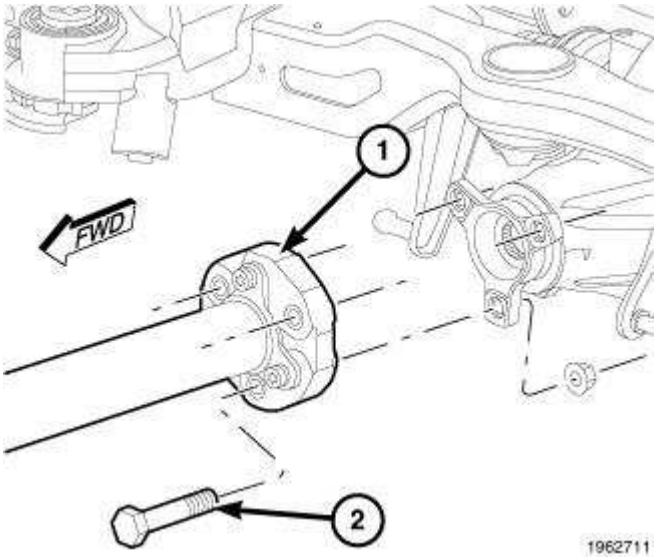

Fig. 12: Propeller Shaft Rear Coupler To Axle Flange
Courtesy of CHRYSLER GROUP, LLC

NOTE: If re-using the propeller shaft coupler-to-axle flange fasteners, save the washers.

6. Remove three propeller shaft coupler (2) -to-axle flange (1) fasteners.

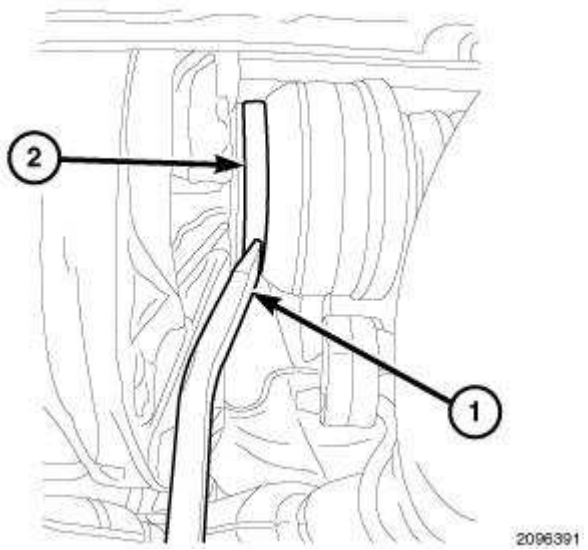

Fig. 13: Using Suitable Pry Bar Partially Disengage Halfshaft From Axle Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not pry on the slinger (2).

7. Using suitable pry bar (1) in the location shown in illustration, partially disengage halfshaft(s) from axle assembly.

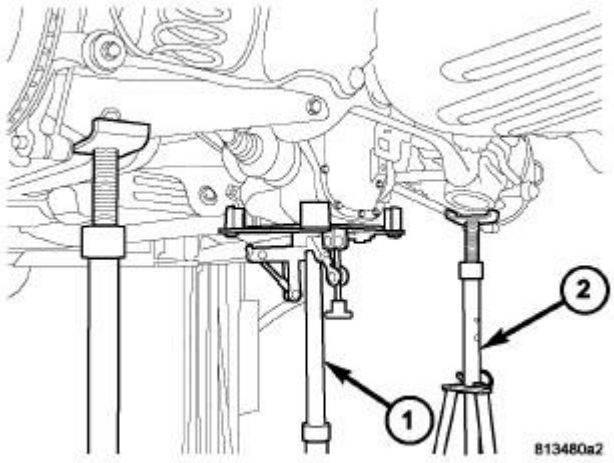

Fig. 14: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

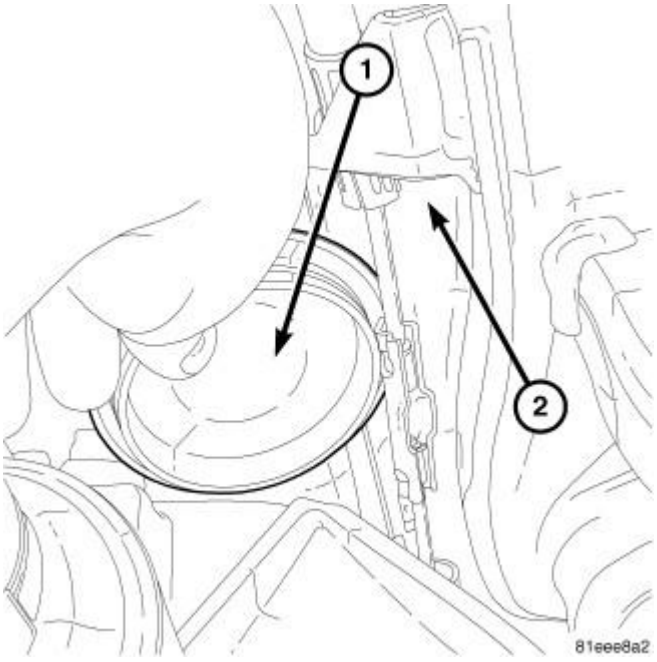

Fig. 15: Front Mount Bolt Cover
Courtesy of CHRYSLER GROUP, LLC

9. Remove the front mount bolt cover (1) located at the top of the axle carrier (2).

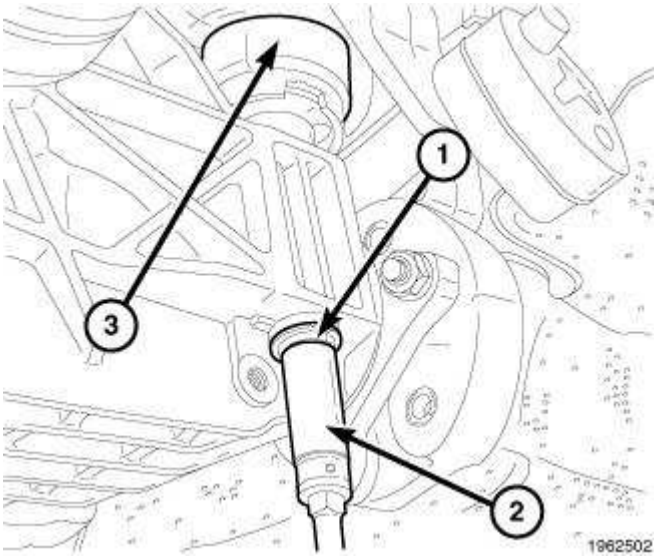

Fig. 16: Rear Axle Front Mount
Courtesy of CHRYSLER GROUP, LLC

NOTE: The nut will turn free at the at the top of the axle carrier, it will need to be held with a deep socket during removal.

10. Remove rear axle front mount bolt (1) and nut (3).

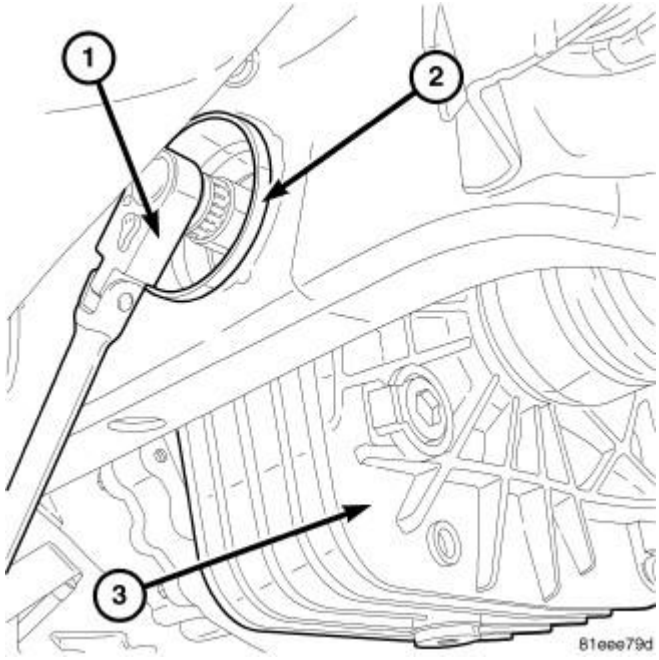

Fig. 17: Right Rear Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Remove right rear axle-to-crossmember bolts (1).

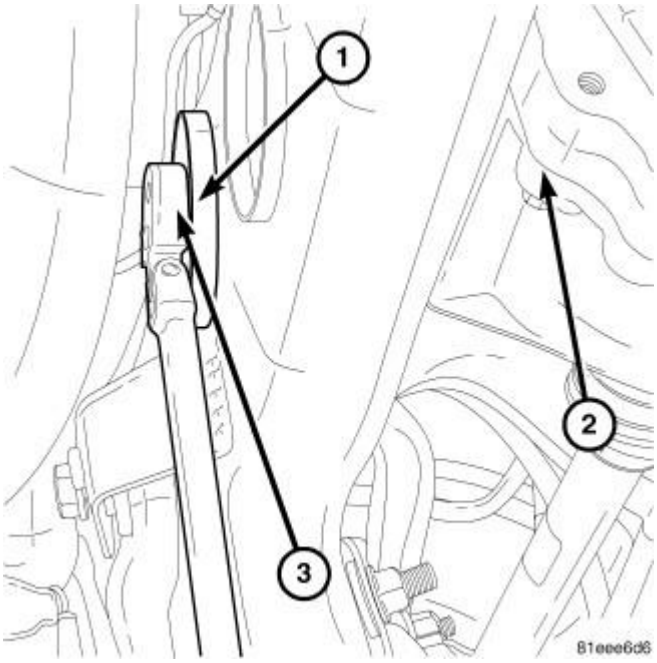

Fig. 18: Left Rear Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Remove the left rear bolt.

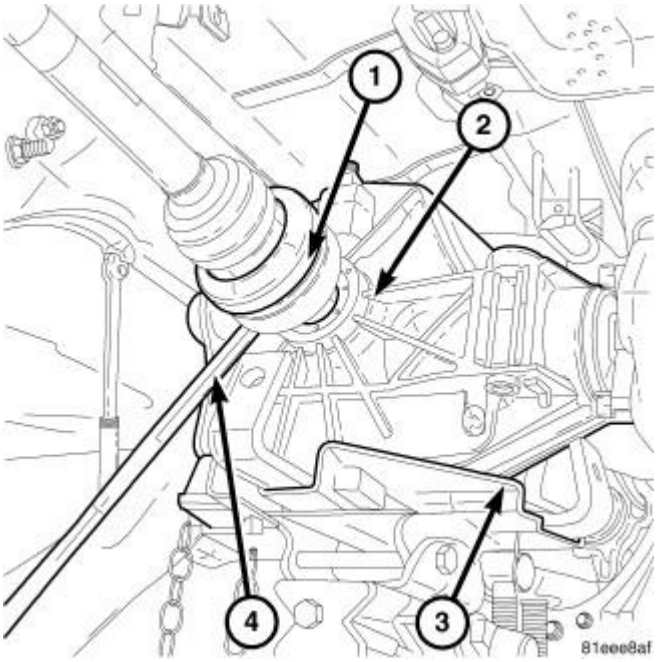

Fig. 19: Lower Rear End
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not pry on the axle halfshaft slinger.

13. Carefully lower rear axle. While lowering axle, separate right halfshaft (1) from axle and support with suitable rope or wire.

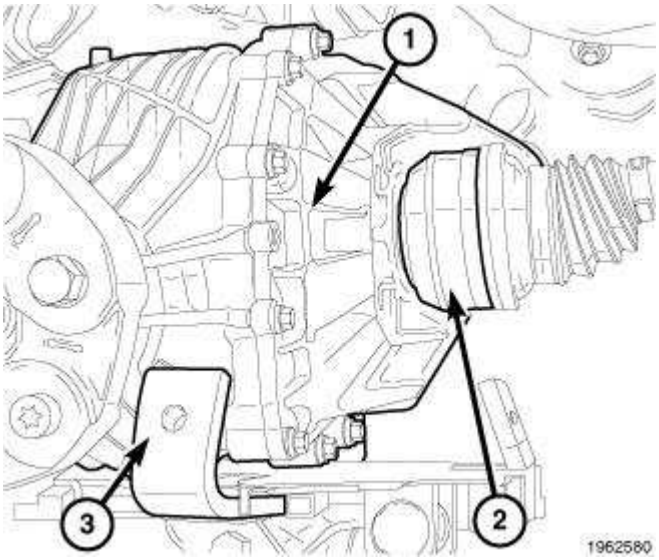

Fig. 20: Left Halfshaft
Courtesy of CHRYSLER GROUP, LLC

14. Remove left halfshaft (2).
15. Remove axle assembly from vehicle and transfer to bench.

INSTALLATION

INSTALLATION

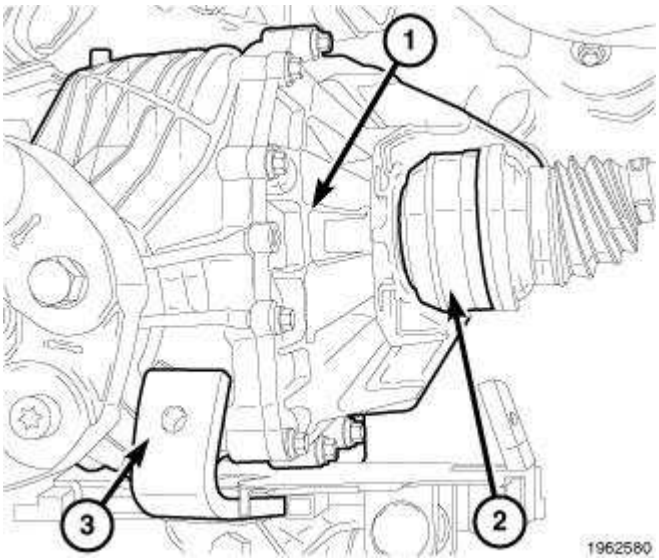

Fig. 21: Left Halfshaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

1. Using new circlip(s), install left halfshaft (2) to rear axle assembly. Do not damage axle seals. Verify proper installation by pulling outward on joint by hand.

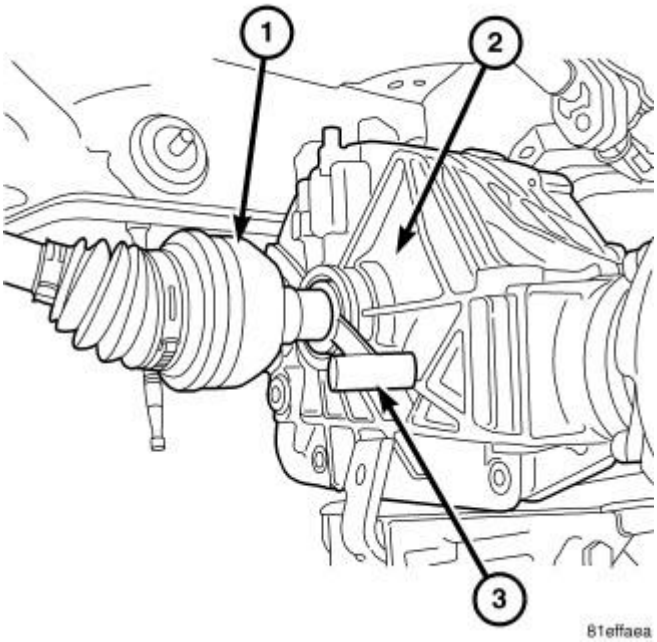

Fig. 22: Seal Protector
Courtesy of CHRYSLER GROUP, LLC

2. Using (special tool #9099, Seal Protector, Differential Output) (3) install the right halfshaft (1) into axle (2).

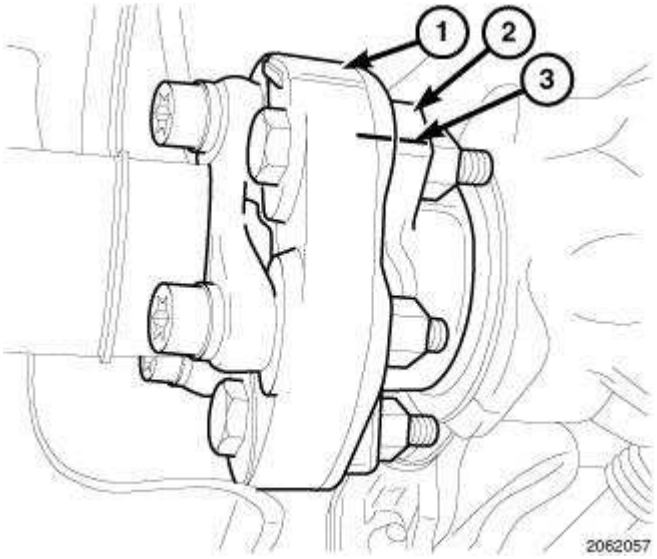

Fig. 23: Marks On Propeller Shaft Rubber Coupler
Courtesy of CHRYSLER GROUP, LLC

NOTE: To prevent damage or imbalance, washers must be placed on fasteners that attach rubber coupler to the pinion yoke.

NOTE: To prevent damage or imbalance, washers must be installed between fastener heads and the rubber coupler.

3. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

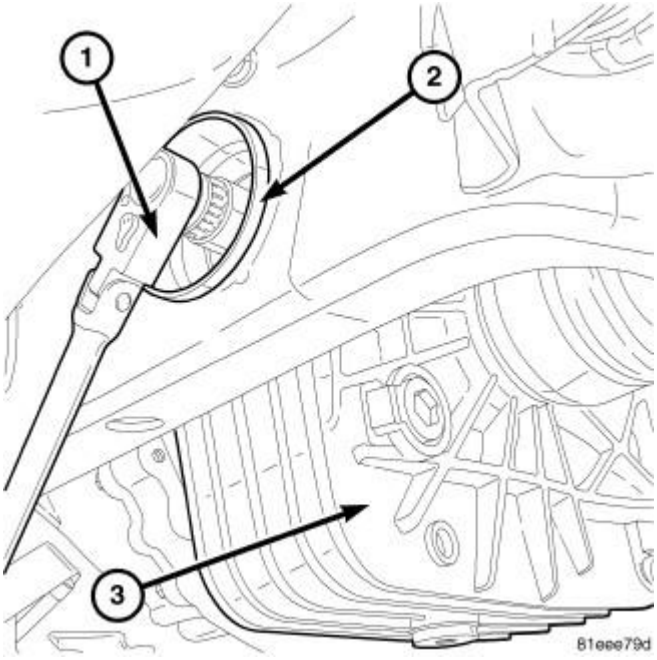

Fig. 24: Right Rear Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Clean the rear axle-to-crossmember bolts and apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the rear axle-to-crossmember bolts.

4. Install right rear axle-to-crossmember bolt (1) and tighten to 220 N.m (162 ft. lbs.).

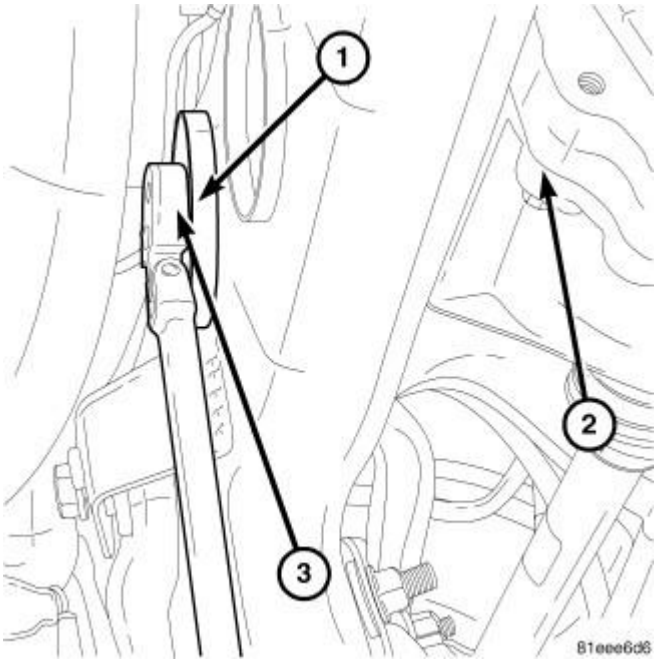

Fig. 25: Left Rear Bolt

Courtesy of CHRYSLER GROUP, LLC

NOTE: Clean the rear axle-to-crossmember bolts and apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the rear axle-to-crossmember bolts.

5. Install left rear axle-to-crossmember bolt (1) and tighten to 220 N.m (162 ft. lbs.).

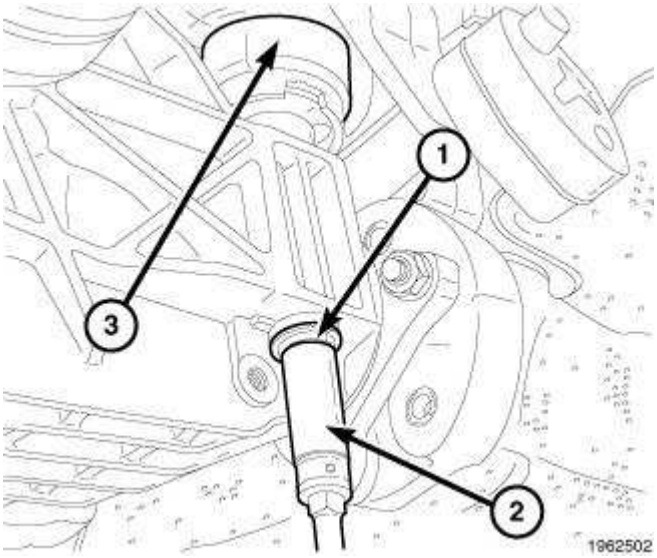

Fig. 26: Rear Axle Front Mount
Courtesy of CHRYSLER GROUP, LLC

NOTE: The rubber part of the axle isolator must face toward the cradle.

6. Install rear axle front mount isolator (3) as shown in illustration and torque fastener to 65 N.m (48 ft. lbs.).

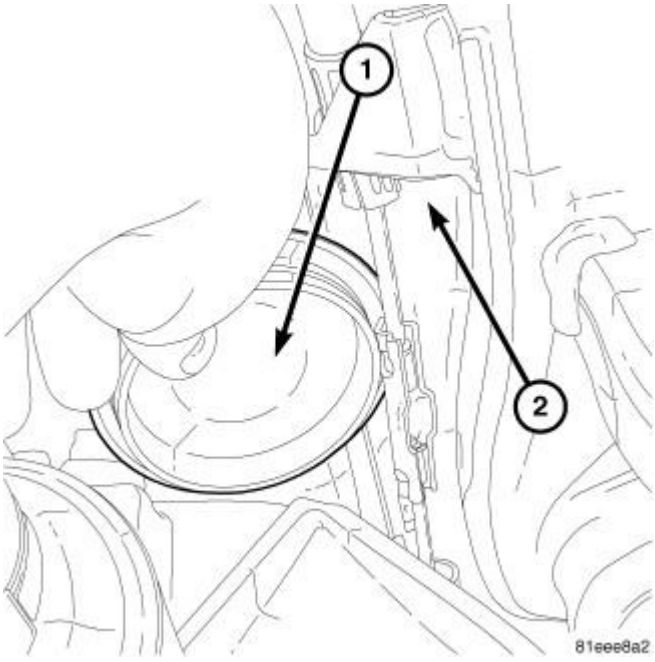

Fig. 27: Front Mount Bolt Cover
Courtesy of CHRYSLER GROUP, LLC

7. Install the front mount bolt cover (1).

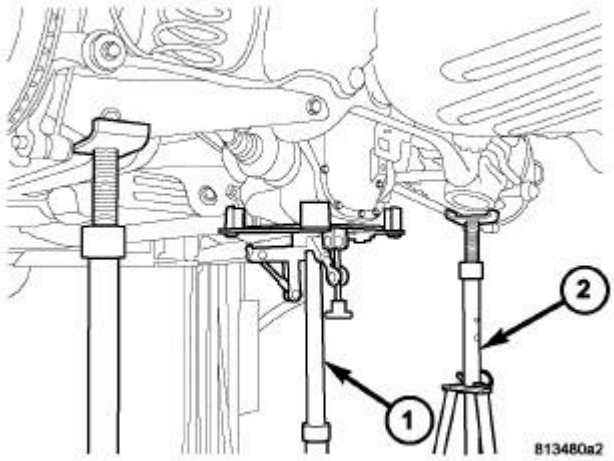

Fig. 28: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. Again verify halfshaft inner joints are fully engaged to axle assembly.
9. Remove transmission jack (1).
10. If used, remove screw-type under-hoist jack stands (2).

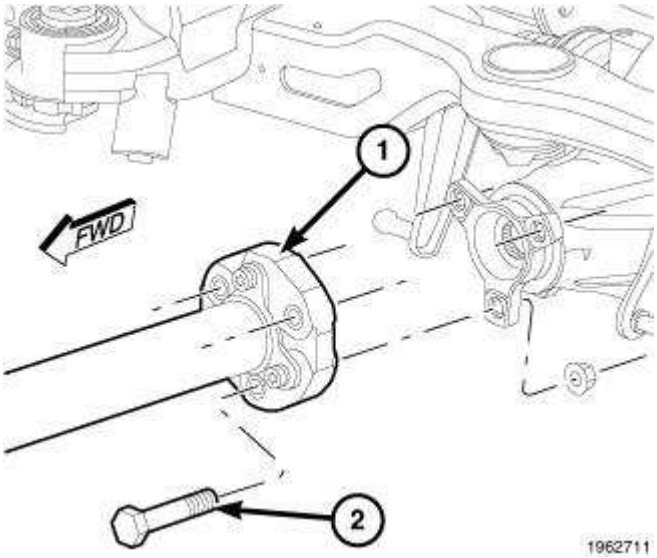

Fig. 29: Propeller Shaft Rear Coupler To Axle Flange
Courtesy of CHRYSLER GROUP, LLC

NOTE: If re-using original fasteners, apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the propeller shaft coupler-to-axle flange fasteners. New fasteners have a thread lock patch, and do not require application of blue MOPAR® Lock & Seal medium strength thread locker.

11. Install the propeller shaft coupler-to-axle flange fasteners. Tighten the propeller shaft coupler-to-axle flange fasteners (2) to 122 N.m (89 ft. lbs.).

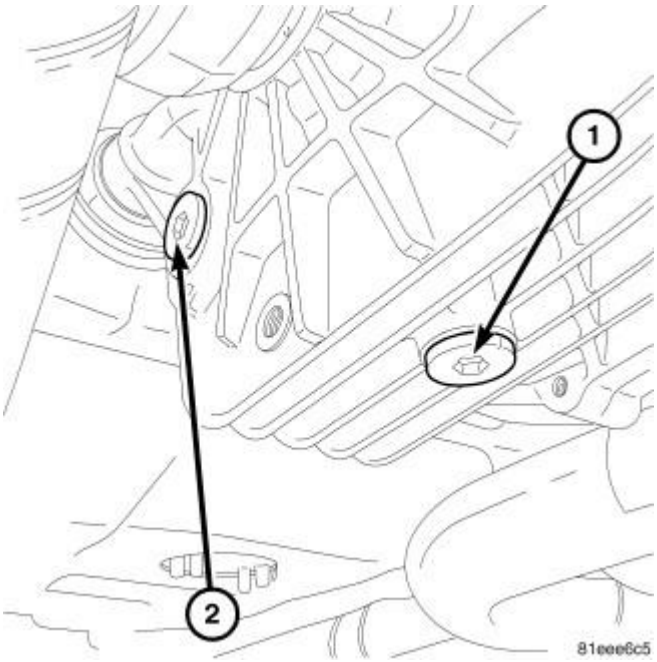

Fig. 30: Drain And Fill Plug
Courtesy of CHRYSLER GROUP, LLC

12. Remove rear axle fill plug (2). Fill axle with 1.2L (1.2 qts.) of Mopar® 75W-90 Synthetic Gear and Axle Lubricant and add one 0.03 L (4 oz.) bottle of MOPAR® Limited Slip Additive Friction Modifier. Install fill plug and torque to 35 N.m (25 ft. lbs.).

SPECIAL TOOLS

SPECIAL TOOLS

	10146 - Installer, Oil Seal (Originally Shipped In Kit Number(s) 10145, 10146.)
	10147 - Installer, Differential Bearing Cup (Originally Shipped In Kit Number(s) 10145.)
	10148 - Installer, Pinion Head Bearing Cup (Originally Shipped In Kit Number(s) 10145.)
	10149-1 - Block, Pinion (Originally Shipped In Kit Number(s) 10145.)
	10149-2 - Arbor (Originally Shipped In Kit Number(s) 10145.)
	10149-3 - Dummy Housing Bearing (Originally Shipped In Kit Number(s) 10145.)
	10149-4 - Dummy Cover Bearing (Originally Shipped In Kit Number(s) 10145.)
	10149-5 - Washer (Originally Shipped In Kit Number(s) 10145.)
	1026 - Puller (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC.)
	1130 - Splitter, Bearing/Gear (Originally Shipped In Kit Number(s) 6745, 6947, 6949, 9202, 9202A-CAN, 9202CC, 9299.)
	6446 - Installer, Bearing (Originally Shipped In Kit Number(s) 6440.)
	6448A - Installer, Bearing/Gear (Originally Shipped In Kit Number(s) 6947, 8667, 8837, 8867.)
	6739 - Block, Height (Originally Shipped In Kit Number(s) 6730, 9516A-CAN, 9540, 9541.)
	7794-A - Remover, Seal (Originally Shipped In Kit Number(s) 6645.)
	8915 - Brace (Originally Shipped In Kit Number(s) 8998, 8998CC, 9763.)
	9099 - Seal Protector, Differential Output (Originally Shipped In Kit Number(s) 9324, 9324CC.)
	9524 - Indicator, Dial (Originally Shipped In Kit Number(s) 9329, 9329-SUP, 9515-SUP2, 9516, 9516-SUP, 9517-SUP2, 9518, 9518-SUP, 9519, 9540-SUP, 9541-SUP, 9694.)
	9593 - Remover, Bearing Cup

	(Originally Shipped In Kit Number(s) 9692.) 9919 - Installer, Bearing (Originally Shipped In Kit Number(s) 9870, 9971.) C-293-3 - Adapter, Bearing/Gear (Originally Shipped In Kit Number(s) 8418, 8837, C-293-M, C-4246-AL, DD-914-CLT-L.) C-293-37 - Block Set, Puller (Originally Shipped In Kit Number(s) 8418, 8562, C-293-M, DD-914-CLT-L.) C-293-PA - Puller, Press (Originally Shipped In Kit Number(s) 8418, 8837, C-293-M.) C-3281 - Holder, Flange (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.) C-4171 - Driver Handle, Universal (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.) C-637 - Slide Hammer, Universal (Originally Shipped In Kit Number(s) 9202.) D-115-2A - Block, Scooter (Originally Shipped In Kit Number(s) 9329-SUP, 9515-SUP, 9516-SUP, 9517-SUP, 9518, 9519, 9540-SUP, 9541-SUP, 9694, 9926.)

BEARING, DIFFERENTIAL SIDE

REMOVAL

REMOVAL

1. Remove the differential case assembly. Refer to **CASE ASSEMBLY, DIFFERENTIAL, REMOVAL**.

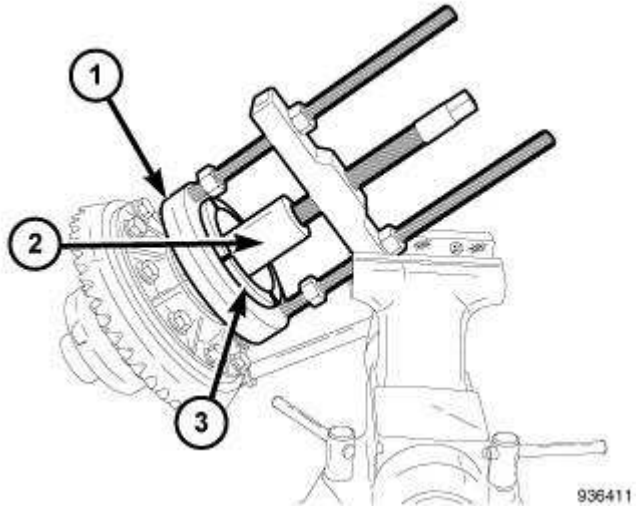

Fig. 31: Removing Differential Bearings From Case

Courtesy of CHRYSLER GROUP, LLC

2. Remove the Differential Bearings from the case with Puller Press (special tool #C-293-PA, Puller, Press) (1), Bearing/Gear Adapter (special tool #C-293-3, Adapter, Bearing/Gear) (2) and Adapter Blocks (special tool #C-293-37, Block Set, Puller) (3).

INSTALLATION

INSTALLATION

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 177 Celsius (212° Min. - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

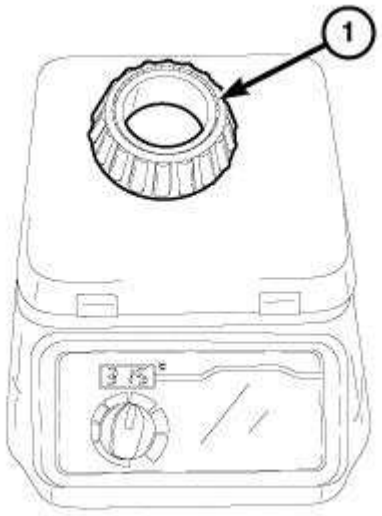

Fig. 32: Heating Differential Bearings With A Bearing Heater
Courtesy of CHRYSLER GROUP, LLC

1. Heat the Differential Bearings with a bearing heater.
2. Immediately after heating, install the Differential Bearings.

CASE ASSEMBLY, DIFFERENTIAL

REMOVAL

REMOVAL

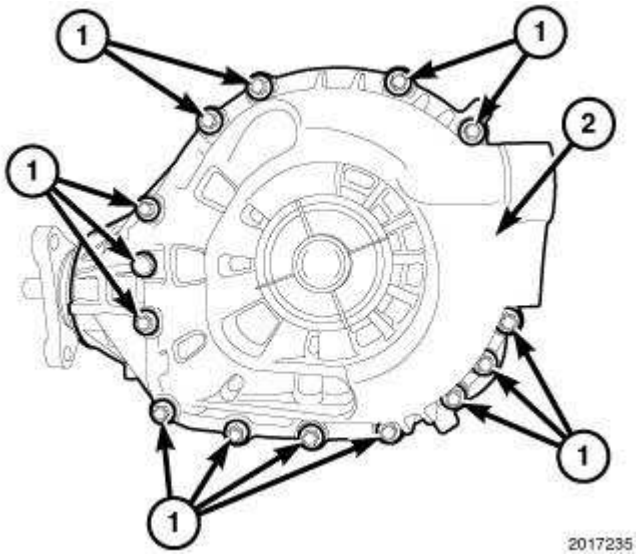

Fig. 33: Removing Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Rear Axle Assembly. Refer to **REMOVAL**.
2. Remove the Case Half Bolts (1) and remove the Case Half (2).

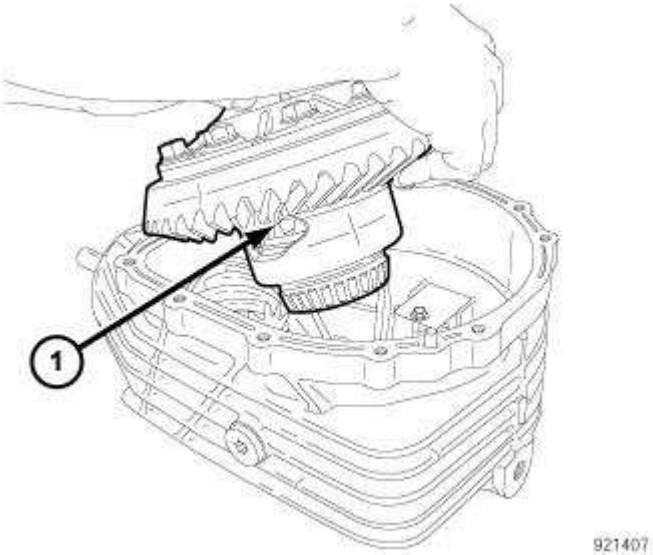

Fig. 34: Remove/Install Differential Case
Courtesy of CHRYSLER GROUP, LLC

3. Remove the Differential Case (1).

DISASSEMBLY

DISASSEMBLY

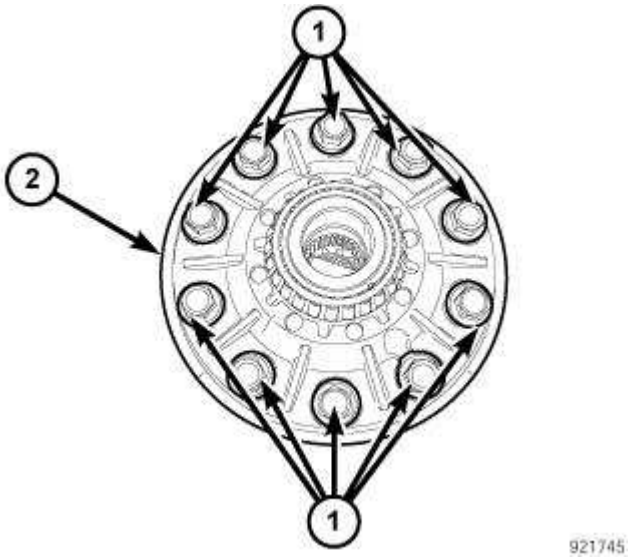

Fig. 35: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the ring gear bolts (1) and tap ring gear (2) off of the differential case with a soft faced hammer.
2. Remove the differential side bearings. Refer to **BEARING, DIFFERENTIAL SIDE, REMOVAL**.

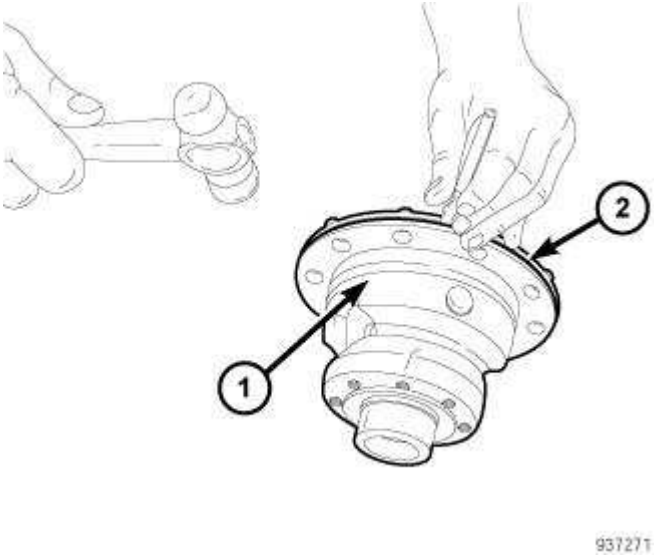

Fig. 36: Splitting Primary And Secondary Differential Case Halves
Courtesy of CHRYSLER GROUP, LLC

3. Split the primary (1) and secondary (2) differential case halves.

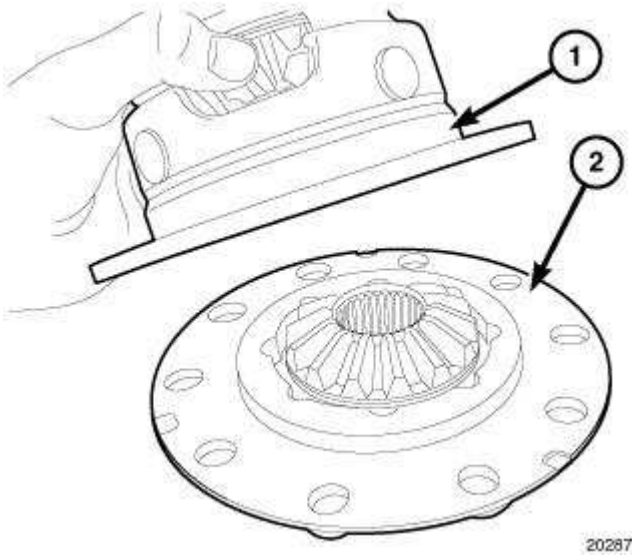

Fig. 37: Separating Primary And Secondary Differential Case Halves
Courtesy of CHRYSLER GROUP, LLC

4. Separate the primary (1) and secondary (2) differential case halves.

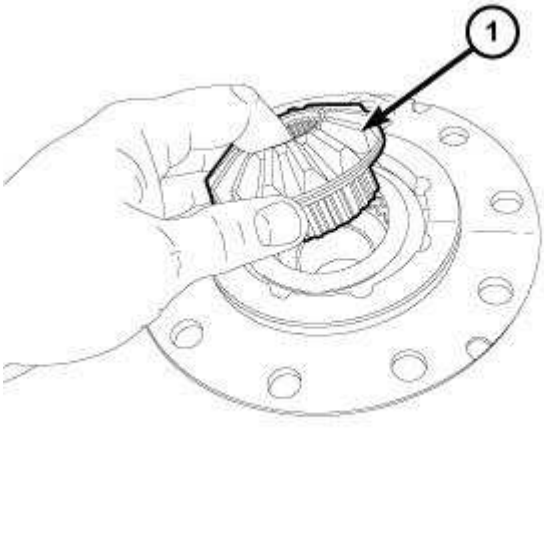

Fig. 38: Remove/Install Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

5. Remove the differential side gear (1).

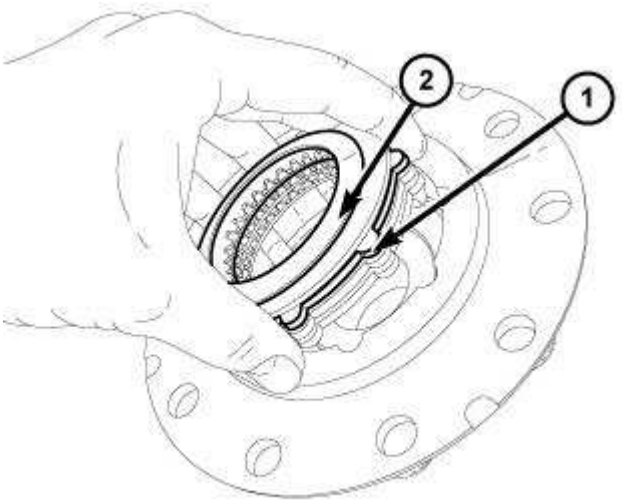

Fig. 39: Remove/Install Clutch Pack & Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

6. Remove the clutch pack (1) and the Belleville spring (2).

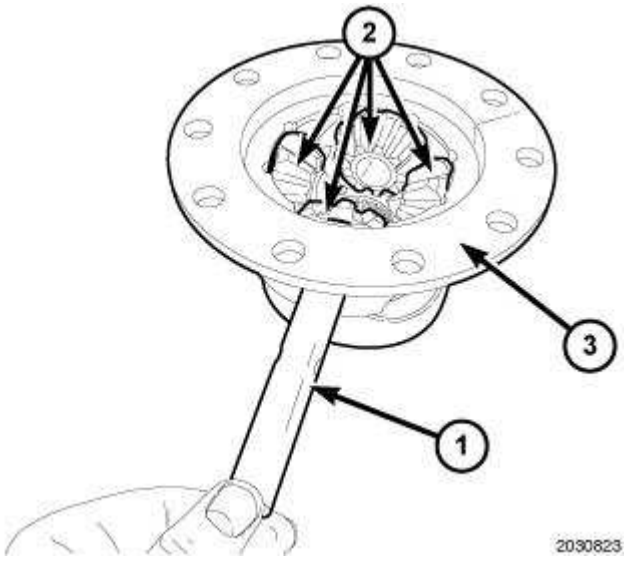

Fig. 40: Remove/Install Primary Differential Pinion Gear Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary use the differential side gear to press downward on the four pinions (2) for primary differential pinion gear shaft (1) removal.

7. Remove the primary differential pinion gear shaft (1).

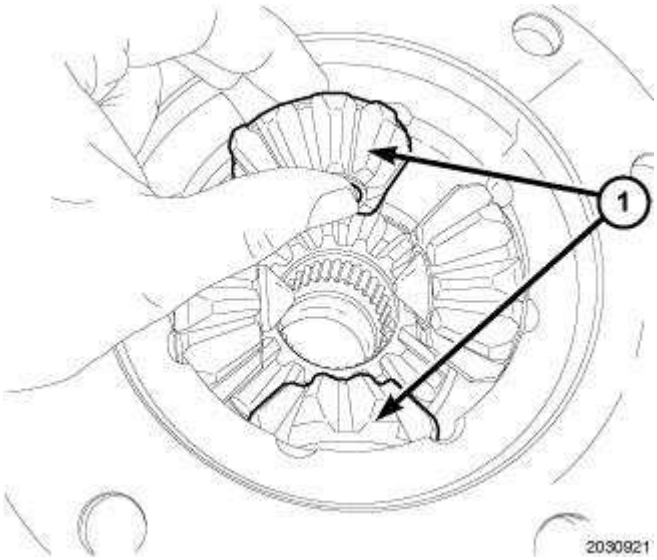

Fig. 41: Remove/Install Primary Differential Pinion Gears
Courtesy of CHRYSLER GROUP, LLC

8. Remove the primary differential pinion gears (1).

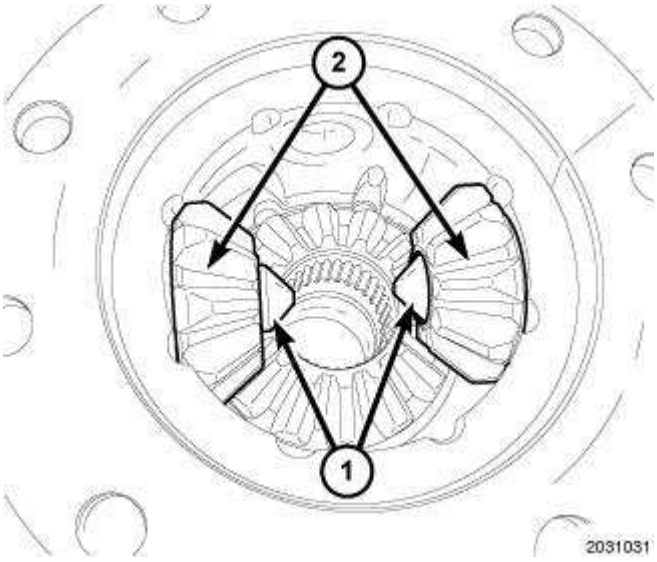

Fig. 42: Secondary Differential Side Gears
Courtesy of CHRYSLER GROUP, LLC

9. Use a brass drift to tap the secondary (split) pinion shafts (1) out of the differential case, then remove the secondary differential side gears (2).

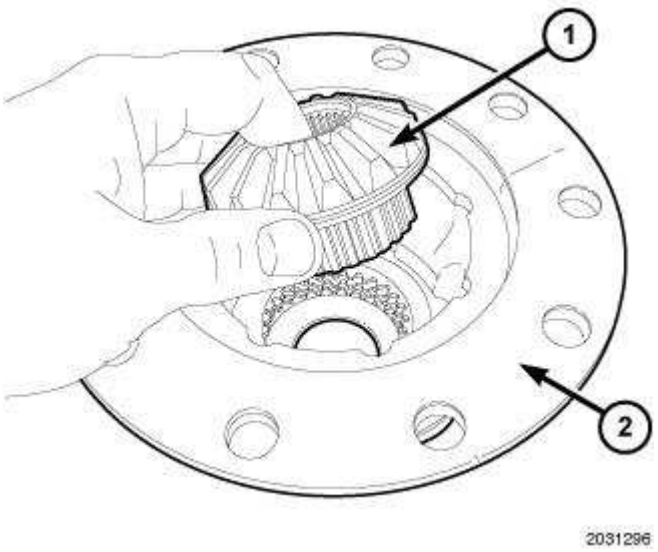

Fig. 43: Remove/Install Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

10. Remove the differential side gear (1) from the primary differential case half (2).

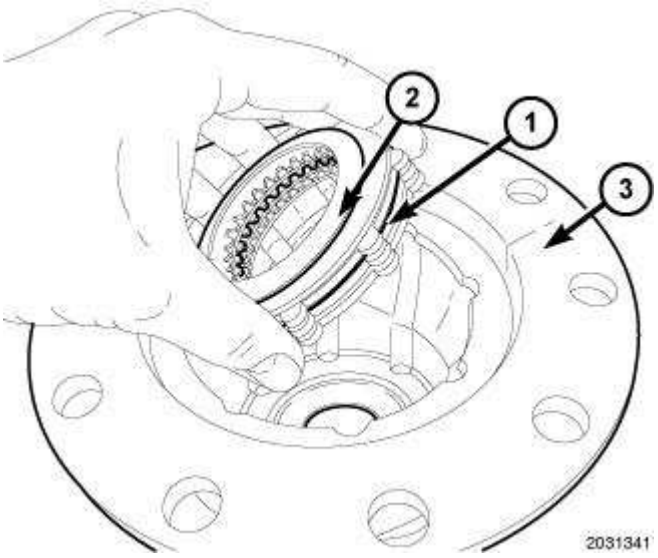

Fig. 44: Identifying Clutch Pack, Belleville Spring & Primary Differential Case Half
Courtesy of CHRYSLER GROUP, LLC

11. Remove the clutch pack (1) and the Belleville spring (2) from the primary differential case half (3).

ASSEMBLY

ASSEMBLY

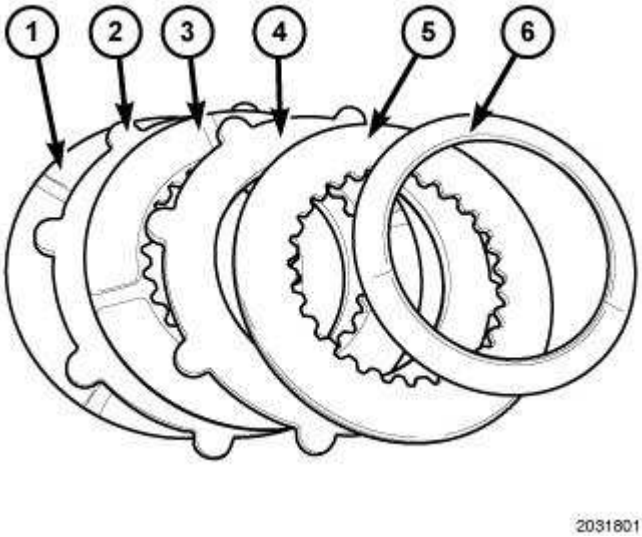

Fig. 45: Clutch Pack
Courtesy of CHRYSLER GROUP, LLC

1. Assemble the clutch pack as follows: Friction disc (1), tabbed plate (2), friction disc (3), tabbed plate (4), large friction disc (5), and Belleville spring (6). Verify the friction surface on the large friction disc (5) is facing the tabbed plate (4).

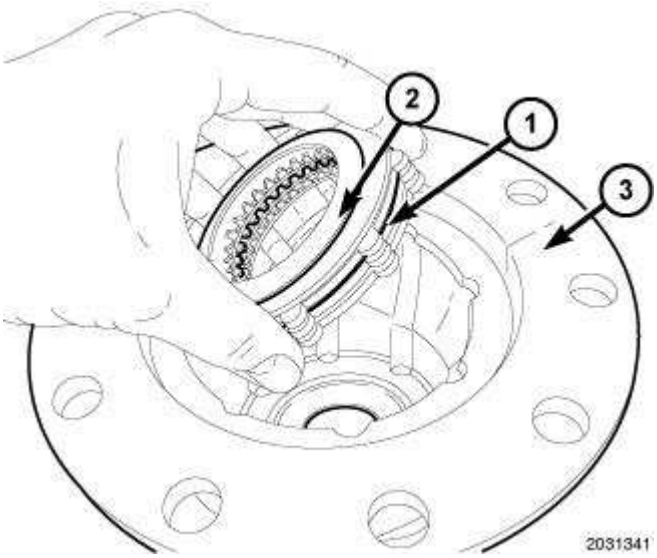

Fig. 46: Identifying Clutch Pack, Belleville Spring & Primary Differential Case Half
Courtesy of CHRYSLER GROUP, LLC

NOTE: Verify the raised edge of the Belleville spring (2) is facing up, or away from the clutch pack (1).

2. Install the clutch pack (1) and the Belleville spring (2) into the primary differential case half (3).

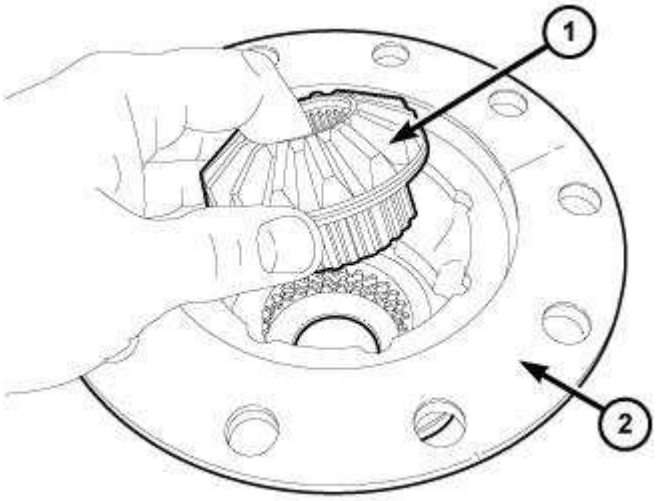

Fig. 47: Remove/Install Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

3. Install the differential side gear (1) into the primary differential case half (2).

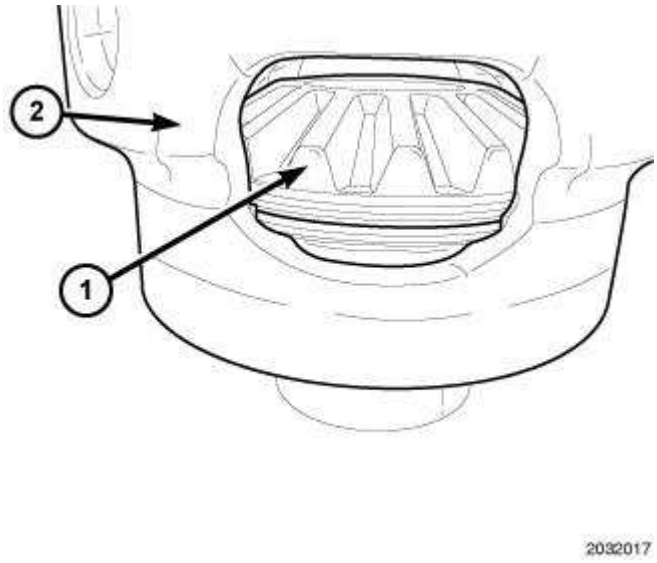

Fig. 48: Splines On Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

4. Verify the differential side gear (1) is fully seated in the primary case half (2). Rotate the side gear as necessary to align the splines on all the friction plates with the splines on the differential side gear (1).

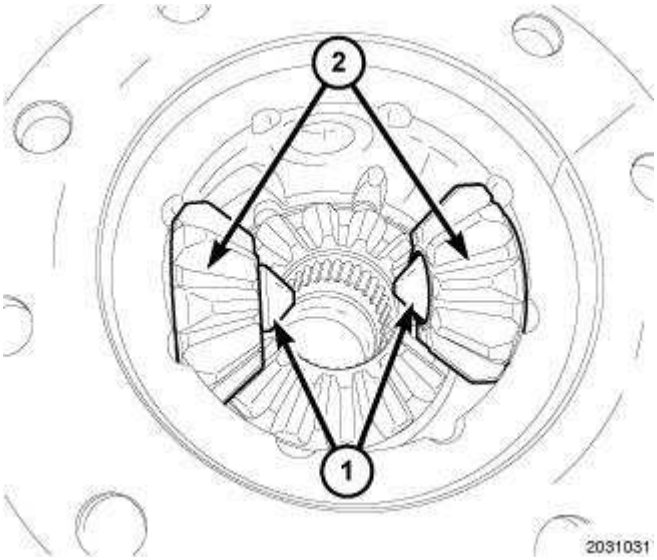

Fig. 49: Secondary Differential Side Gears
Courtesy of CHRYSLER GROUP, LLC

5. Install the secondary differential side gears (2), then slightly compress the Belleville spring by pressing down on the differential side gear, and install the secondary (split) pinion shafts (1).

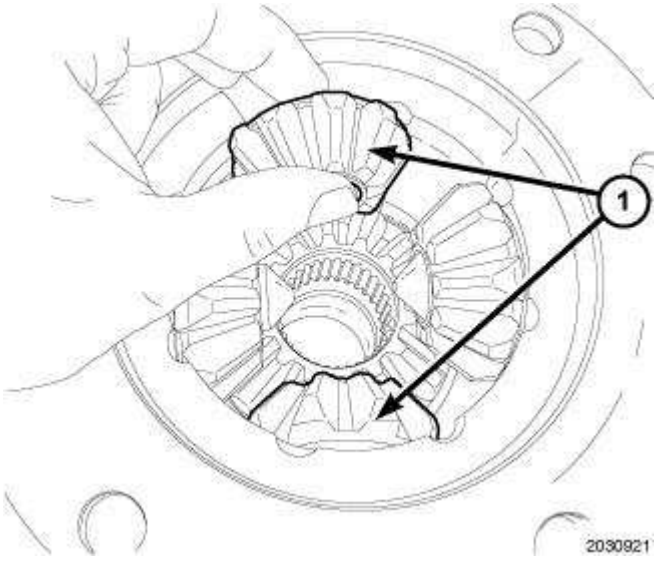

Fig. 50: Remove/Install Primary Differential Pinion Gears
Courtesy of CHRYSLER GROUP, LLC

6. Install the primary differential pinion gears (1).

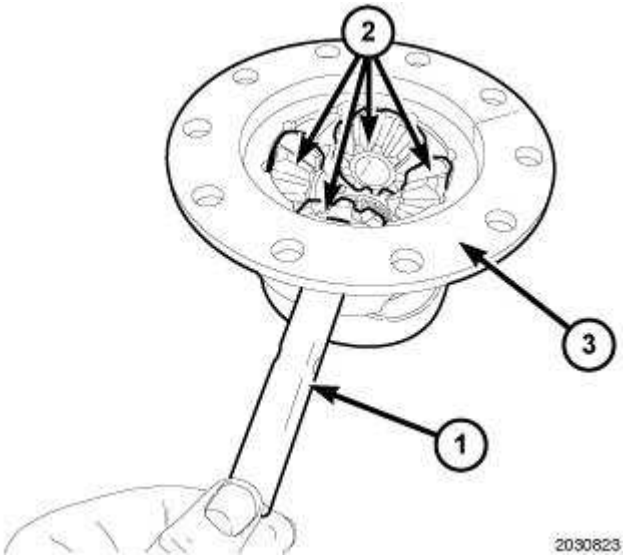

Fig. 51: Remove/Install Primary Differential Pinion Gear Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary use the differential side gear to press downward on the four pinions (2) for primary differential pinion gear shaft (1) removal.

7. Install the primary differential pinion gear shaft (1).

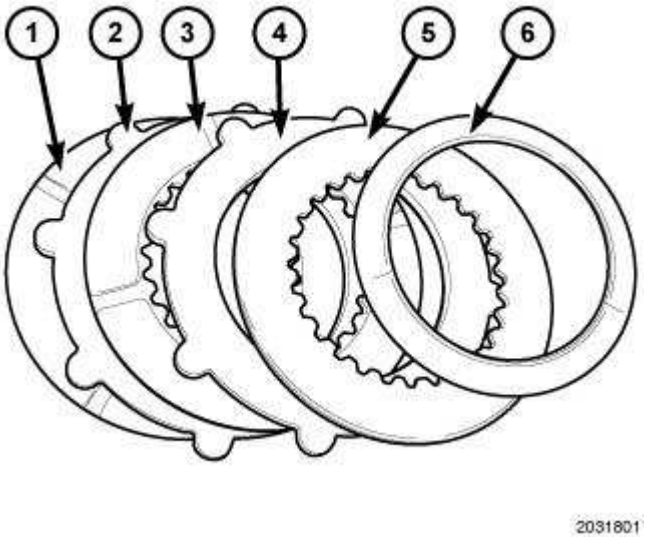

Fig. 52: Clutch Pack
Courtesy of CHRYSLER GROUP, LLC

8. Assemble the clutch pack as follows: Friction disc (1), tabbed plate (2), friction disc (3), tabbed plate (4), large friction disc (5), and Belleville spring (6). Verify the friction surface on the large friction disc (5) is facing the tabbed plate (4).

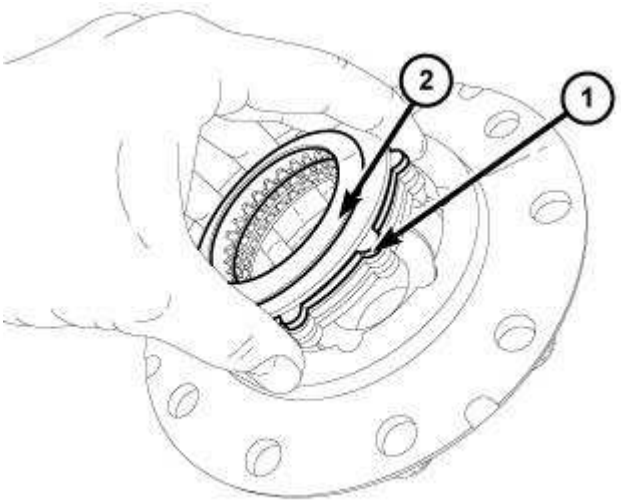

Fig. 53: Remove/Install Clutch Pack & Belleville Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Verify the raised edge of the Belleville spring (2) is facing up, or away from the clutch pack (1).

9. Install the clutch pack (1) and the Belleville spring (2).

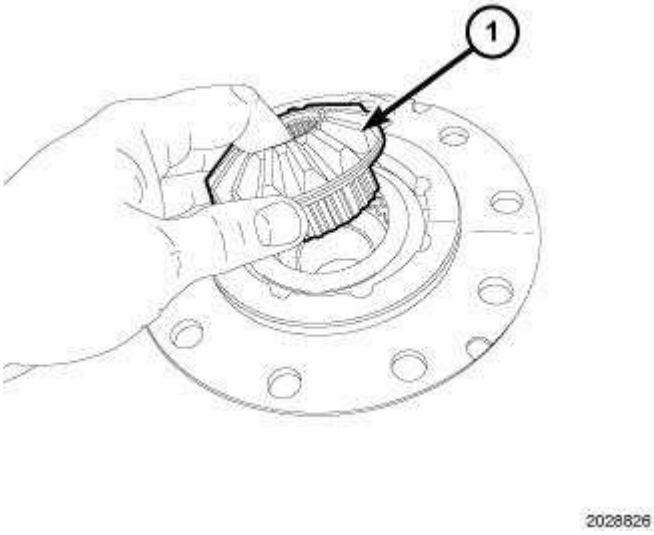

Fig. 54: Remove/Install Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

10. Install the differential side gear (1).

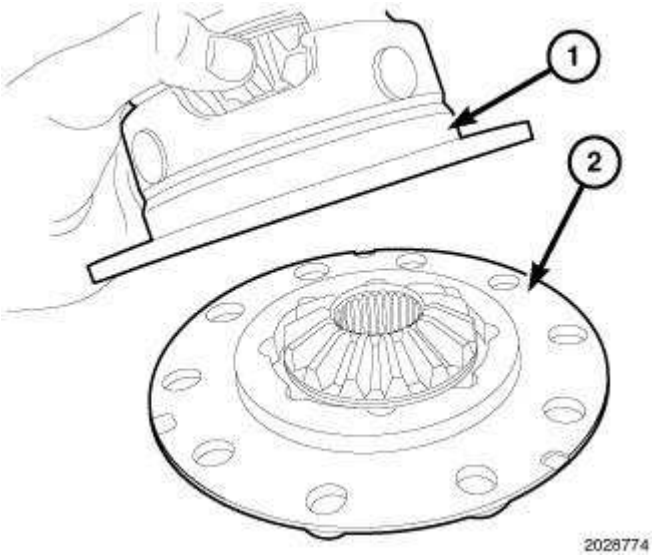

Fig. 55: Separating Primary And Secondary Differential Case Halves
Courtesy of CHRYSLER GROUP, LLC

11. Assemble the primary (1) and secondary (2) differential case halves.

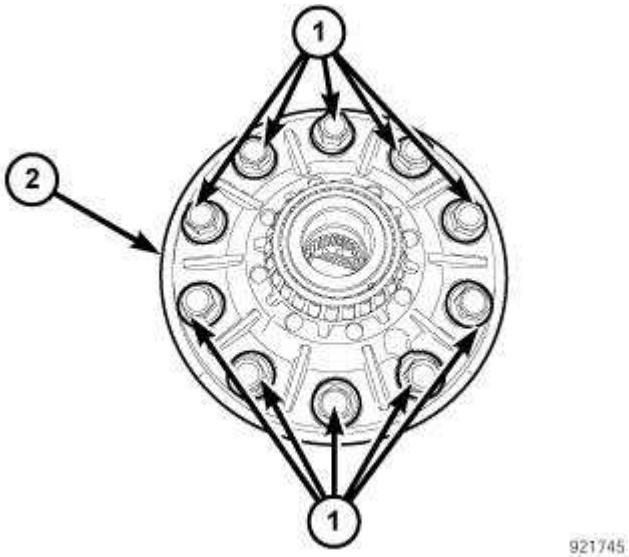

Fig. 56: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the Ring Gear (2), and the Ring Gear Bolts (1). Tighten the ring gear bolts to 185 Nm (136 ft. lbs.).

INSTALLATION

INSTALLATION

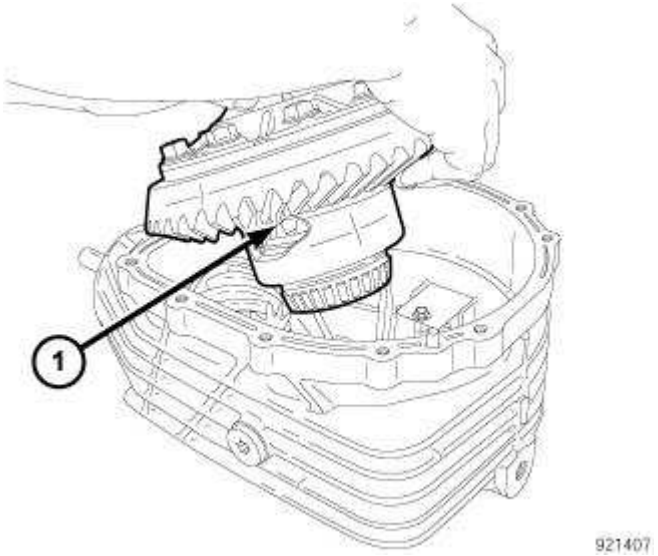

Fig. 57: Remove/Install Differential Case
Courtesy of CHRYSLER GROUP, LLC

1. Apply a light coat of gear lubricant to differential bearings and bearing cups.
2. Install the Differential Case (1).

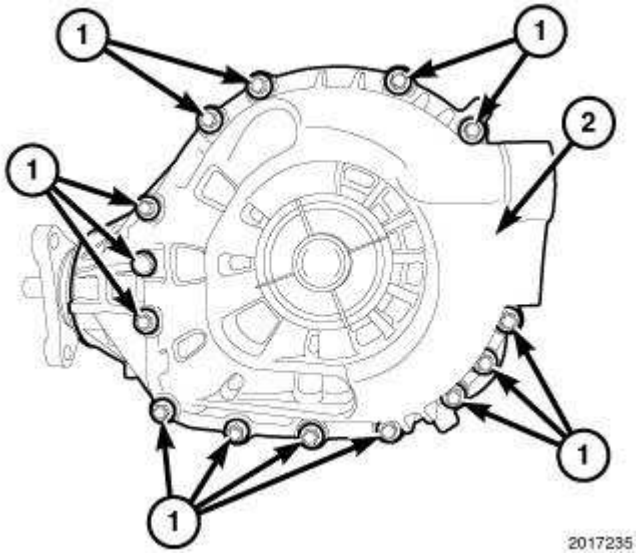

Fig. 58: Removing Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the Case Half (2) and the Case Half Bolts (1).
4. Verify the turning torque and differential bearing preload are within acceptable limits. If the turning torque and differential bearing preload measurements are not within specifications, or if a new ring and pinion gear have been installed, perform the pinion depth adjustment and differential side bearing preload and backlash adjustment procedures. Refer to **ADJUSTMENTS**.
5. Install the Rear Axle Assembly. Refer to **INSTALLATION**.

GEAR, RING AND PINION

REMOVAL

REMOVAL

1. Remove the Rear Axle Assembly. Refer to **REMOVAL**.

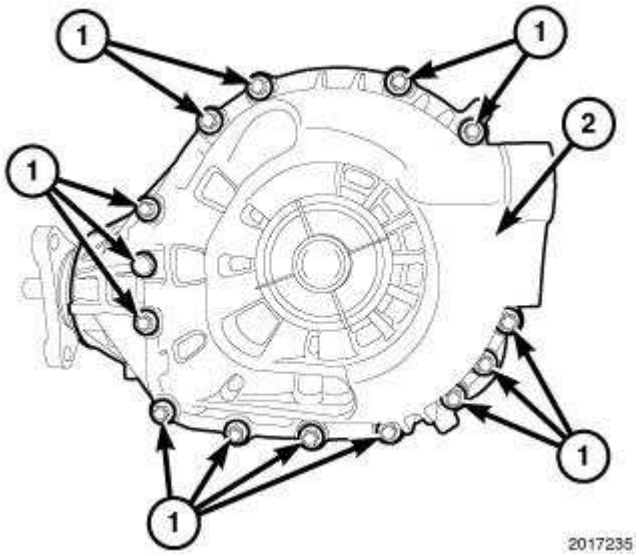

Fig. 59: Removing Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the Case Half Bolts (1) and remove the Case Half (2).

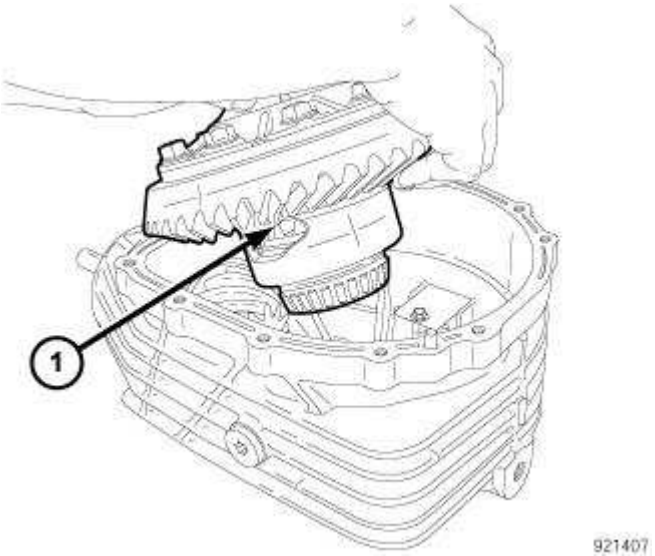

Fig. 60: Remove/Install Differential Case
Courtesy of CHRYSLER GROUP, LLC

3. Remove the Differential Case (1).

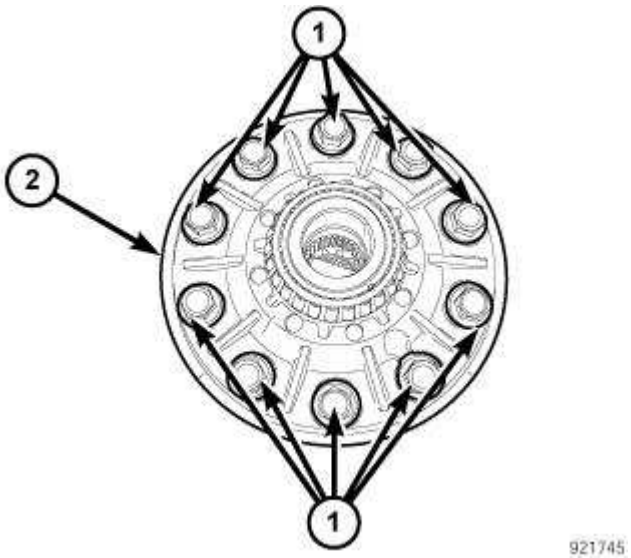

Fig. 61: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the Ring Gear Bolts (1) and tap Ring Gear (2) off of the Differential Case with a dead-blow hammer.

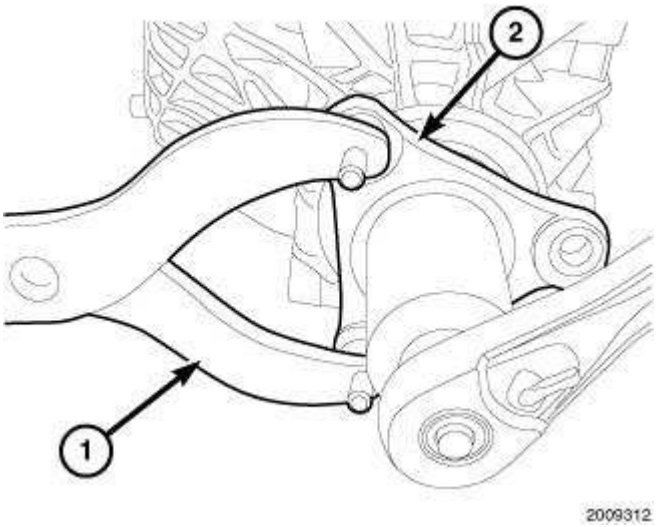

Fig. 62: Remove/Install Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

5. Hold Pinion Flange (2) with Flange Holder (special tool #C-3281, Holder, Flange) (1) and remove the Pinion Nut.

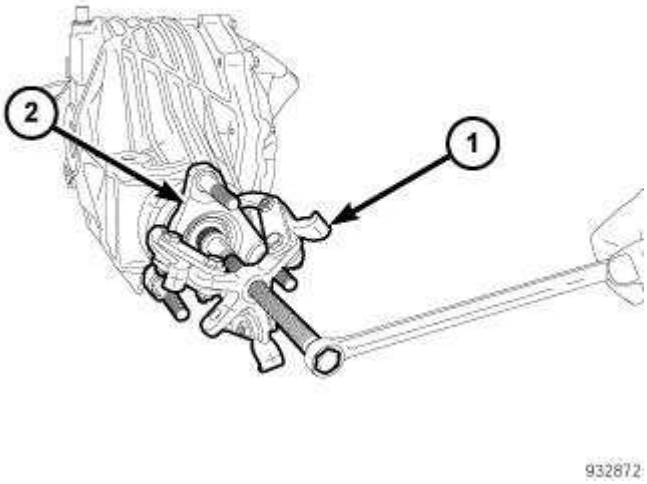

Fig. 63: Removing Pinion Flange From Pinion Shaft Using Puller
Courtesy of CHRYSLER GROUP, LLC

6. Use Puller (special tool #1026, Puller) (1) to remove the Pinion Flange (2) from the Pinion Shaft.

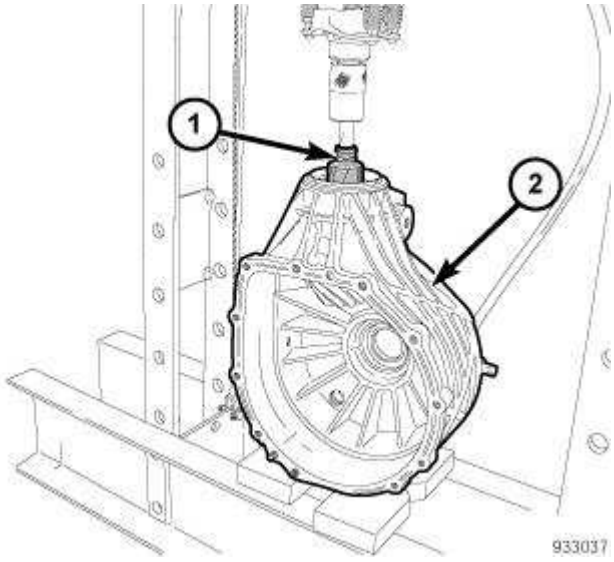

Fig. 64: Pressing Pinion Out Of Case With Arbor Press
Courtesy of CHRYSLER GROUP, LLC

7. Press the Pinion (1) out of the Case (2) with an arbor press.

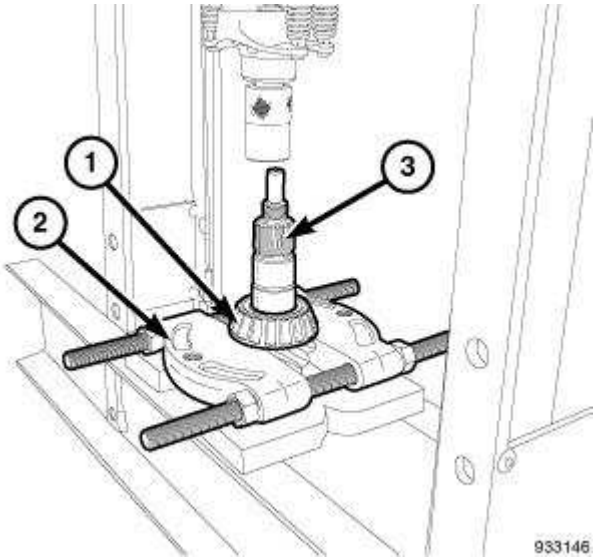

Fig. 65: Using Arbor Press And Bearing Splitter To Press Bearing Off Of Pinion
Courtesy of CHRYSLER GROUP, LLC

NOTE: Tighten Bearing Splitter (special tool #1130, Splitter, Bearing/Gear) enough so that it does not slip off the bearing during removal

8. Use an arbor press and Bearing Splitter (special tool #1130, Splitter, Bearing/Gear) (2) to press the Bearing (1) off of the Pinion (3).

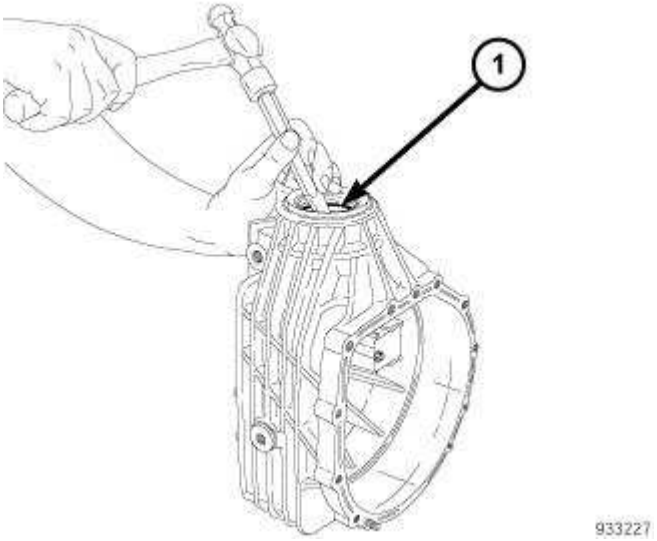

Fig. 66: Removing Pinion Bearing Cup By Tapping It Out Through Pinion Shaft Bore
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use a brass drift only. Otherwise, damage can occur.

9. Remove the Pinion Bearing Cup by tapping it out through the Pinion Shaft Bore (1).

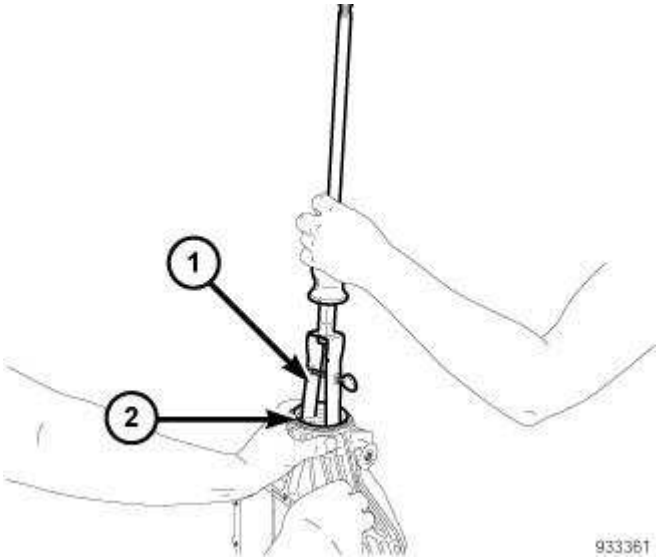

Fig. 67: Removing Pinion Bearing Seal With Slide Hammer And Collet
Courtesy of CHRYSLER GROUP, LLC

10. Remove the Pinion Bearing Seal with Slide Hammer (special tool #C-637, Slide Hammer, Universal) and Collet (special tool #7794-A, Remover, Seal).
11. Remove the Outer Pinion Bearing.

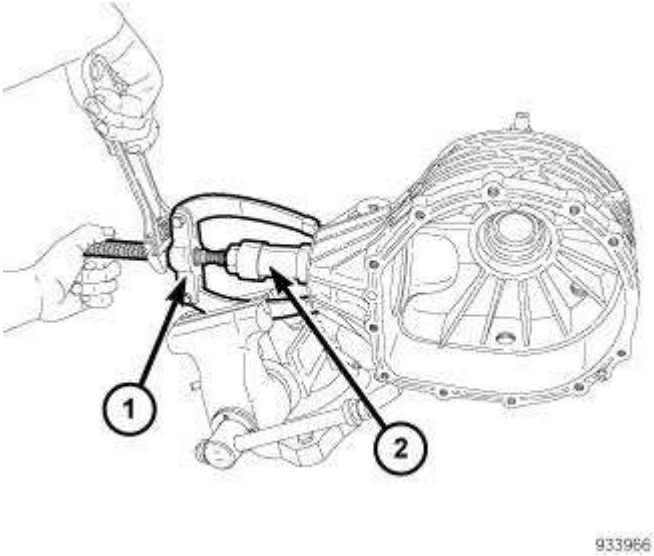

Fig. 68: Using Brace And Bearing Remover To Remove Outer Pinion Cup
Courtesy of CHRYSLER GROUP, LLC

12. Use Brace (special tool #8915, Brace) and Bearing Remover (special tool #9593, Remover, Bearing Cup) to remove the Outer Pinion Cup.

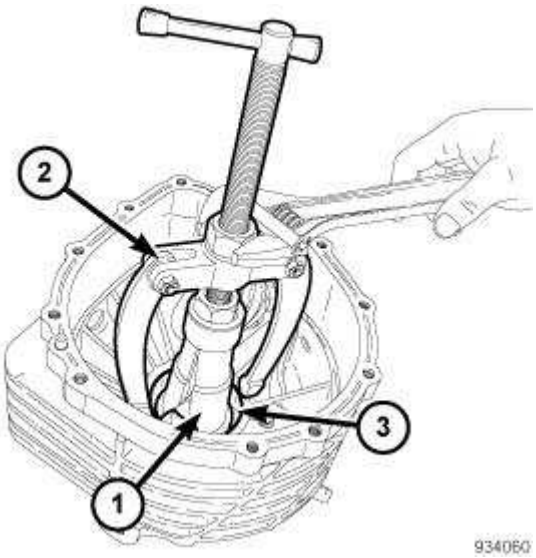

Fig. 69: Using Bearing Cup Remover And Brace To Remove Differential Bearing Cone From Case
Courtesy of CHRYSLER GROUP, LLC

13. Use Bearing Cup Remover (special tool #9593, Remover, Bearing Cup) (1) and Brace (special tool #8915, Brace) (2) to remove the Differential Bearing Cone (3) from the Case.

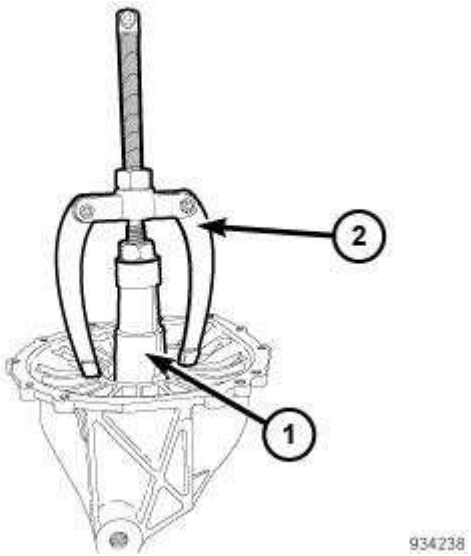

Fig. 70: Removing Differential Bearing Cone From Cover
Courtesy of CHRYSLER GROUP, LLC

14. Use Bearing Cup Remover (special tool #9593, Remover, Bearing Cup) (1) and Brace (special tool #8915, Brace) (2) to remove the Differential Bearing Cone (3) from the Cover.

INSTALLATION

INSTALLATION

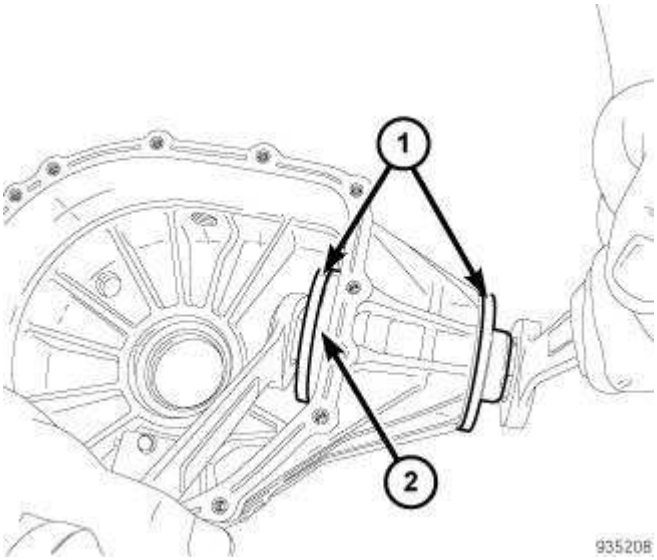

Fig. 71: Pinion Bearing Cup Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not attempt to install the inner and outer pinion bearing cups at the same time.

1. Use Pinion Bearing Cup Installer (special tool #10148, Installer, Pinion Head Bearing Cup) (1) to install the pinion head bearing cup (2).
2. Install the pinion tail bearing cup with pinion bearing cup Installer (special tool #10148, Installer, Pinion Head Bearing Cup) (1).

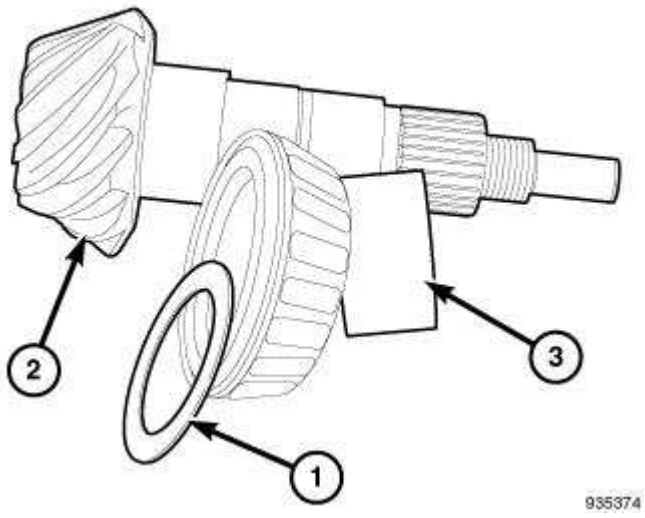

Fig. 72: Pinion Depth Shim Onto Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

3. Determine the correct pinion depth and differential bearing preload. Refer to **ADJUSTMENTS**.

4. Install the pinion depth shim (1) onto the pinion shaft (2).

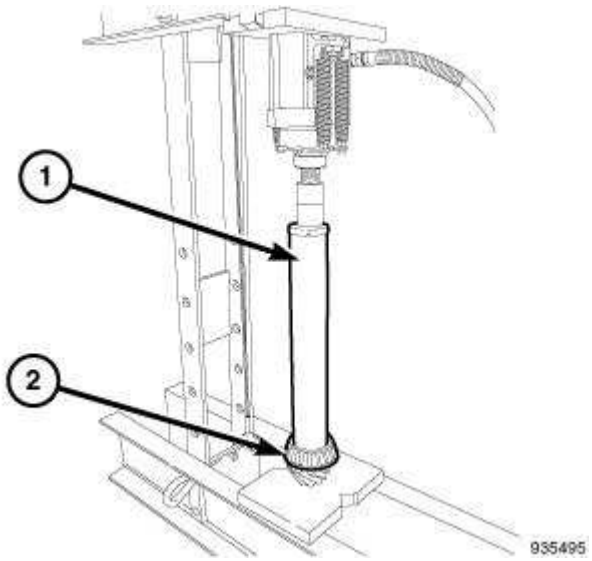

Fig. 73: Pinion Head Bearing
Courtesy of CHRYSLER GROUP, LLC

5. Use an arbor press and Installer (special tool #6446, Installer, Bearing) (1) to install the pinion head bearing (2).

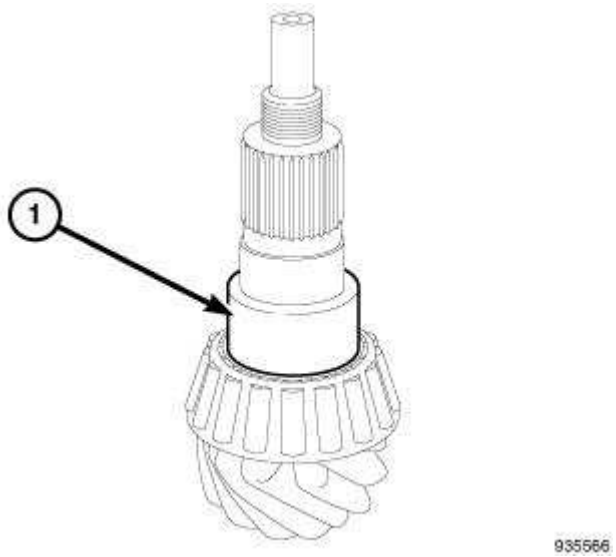

Fig. 74: Spacer On Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

6. Install the spacer (1) onto the pinion shaft.
7. Install the pinion into the case.

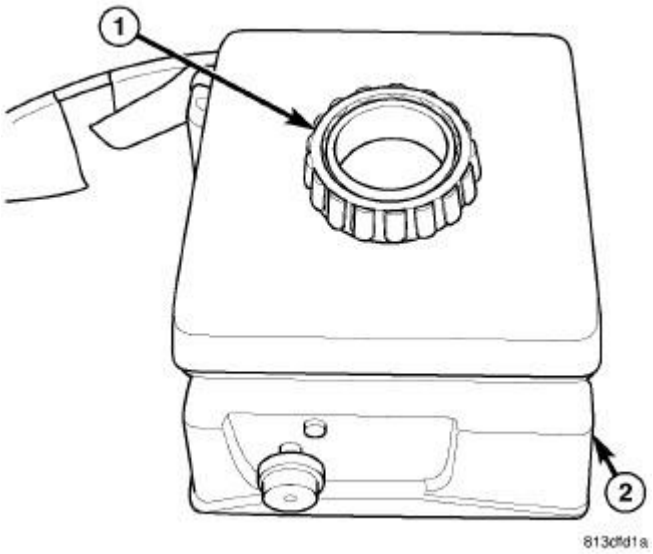

Fig. 75: Bearing Heater
Courtesy of CHRYSLER GROUP, LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

8. Heat pinion tail bearing (1) to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit) and install on pinion with tongs or welding gloves.

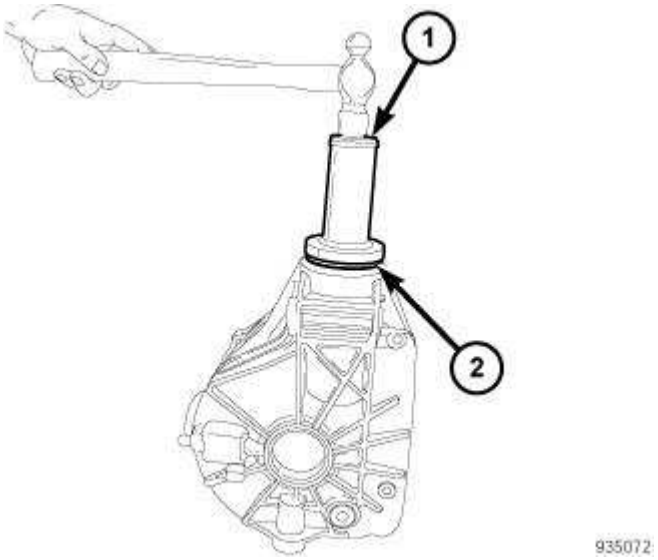

Fig. 76: Using Pinion Oil Seal Installer To Install Pinion Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply a light coating of gear lube to pinion seal.

NOTE: Allow the pinion tail bearing to cool off to room temperature before installing the pinion seal.

9. Use pinion oil seal installer (special tool #10146, Installer, Oil Seal) (1) to install the pinion seal (2).

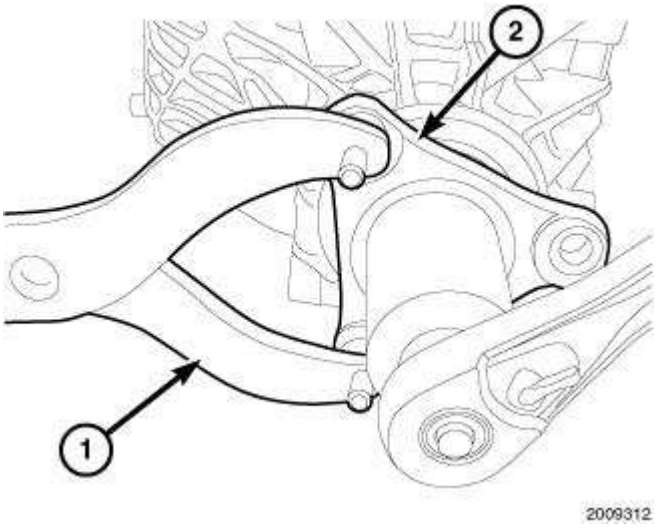

Fig. 77: Remove/Install Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

10. Install the pinion flange (2).

11. Install the original pinion nut. Hold the pinion flange with flange holder (special tool #C-3281, Holder, Flange) (1) and tighten the pinion nut.
12. Remove and discard the original Pinion Nut.
13. Remove the Pinion Flange.
14. Install the pinion flange (2) and a new pinion flange nut. Tighten the pinion flange nut to 245 Nm (180 ft. lbs.).
15. Use an inch pound torque wrench to measure the turning torque of the pinion.
16. If the turning torque is too high, remove the selected shim, and install a larger shim on the pinion shaft, then verify the turning torque is correct. If the turning torque is too low, remove the selected shim, and install a smaller shim on the pinion, then verify the turning torque is correct.

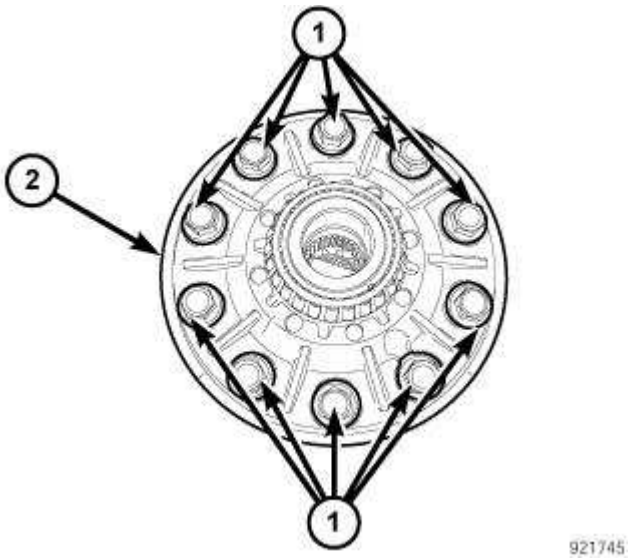

Fig. 78: Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Install the Ring Gear (2), and new Ring Gear Bolts (1). Tighten the bolts to 185 Nm (136 ft. lb.).

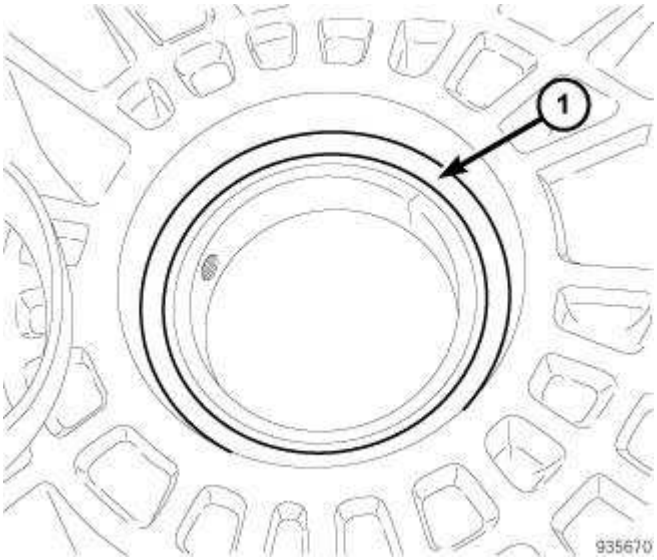

Fig. 79: Shim In Cover
Courtesy of CHRYSLER GROUP, LLC

18. Measure end play of the differential, and determine the size of the required differential shims to get the correct differential side bearing preload and ring gear backlash. Refer to **ADJUSTMENTS**.
19. Install shim (1) in the cover.

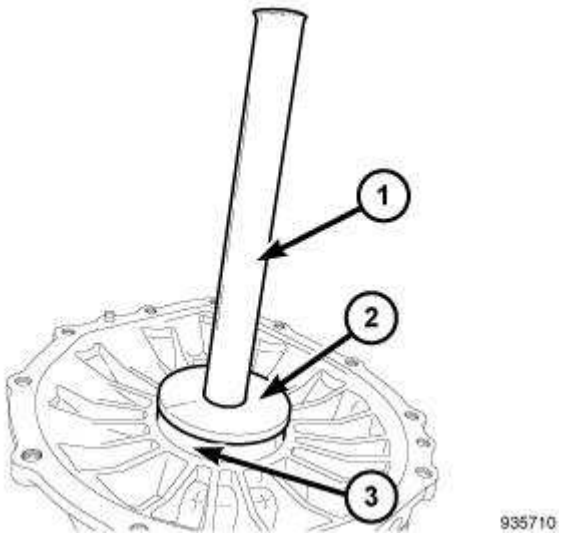

Fig. 80: Installing Differential Side Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

20. Use Differential Bearing Cup Installer (special tool #10147, Installer, Differential Bearing Cup) (2) and Universal Installer Handle (special tool #C-4171, Driver Handle, Universal) (1) to install the differential side bearing cup (3) into the cover (3).

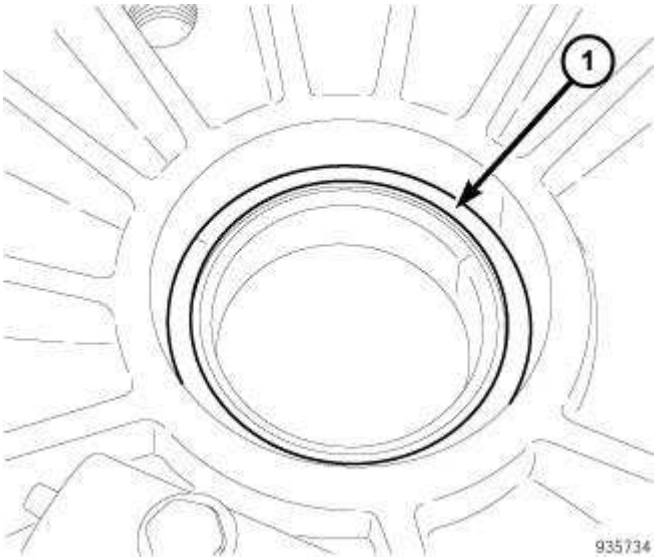

Fig. 81: Shim In Case
Courtesy of CHRYSLER GROUP, LLC

21. Install shim (1) in the case.

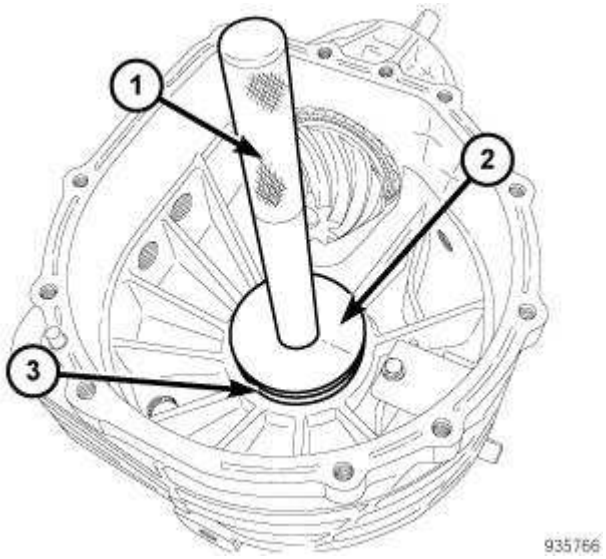

Fig. 82: Installing Differential Side Bearing Cup In Case
Courtesy of CHRYSLER GROUP, LLC

22. Use Differential Bearing Cup Installer (special tool #10147, Installer, Differential Bearing Cup) and Universal Installer Handle (special tool #C-4171, Driver Handle, Universal) to install the Differential Side Bearing Cup into the Case.
23. Install the Differential in the housing.

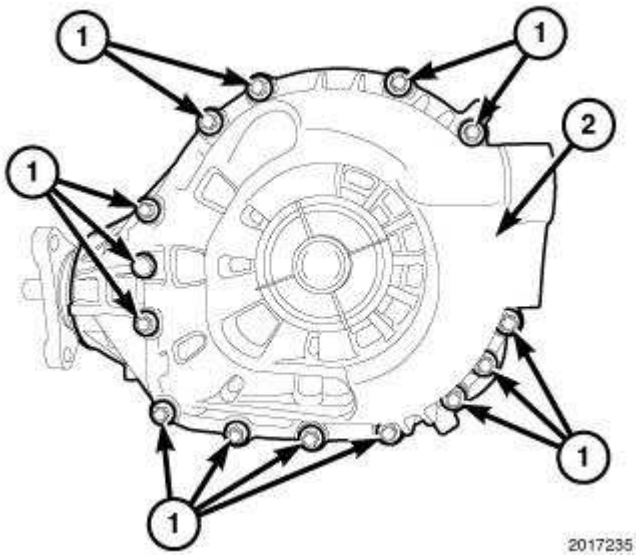

Fig. 83: Removing Case Half Bolts
Courtesy of CHRYSLER GROUP, LLC

24. Temporarily install the cover (2), and the cover bolts (1).
25. Verify the ring and pinion gear contact pattern is within acceptable limits.
26. Tighten the cover bolts to 28 Nm (20 ft. lbs.).
27. Verify the total turning torque of the differential is within 2.5 to 6.0 Nm (22 - 53 in. lbs.). If necessary, adjust the size of the differential shims to bring the turning torque within specifications.
28. Install the rear axle assembly. Refer to **INSTALLATION**.

SEAL, AXLE DRIVE SHAFT

REMOVAL

REMOVAL

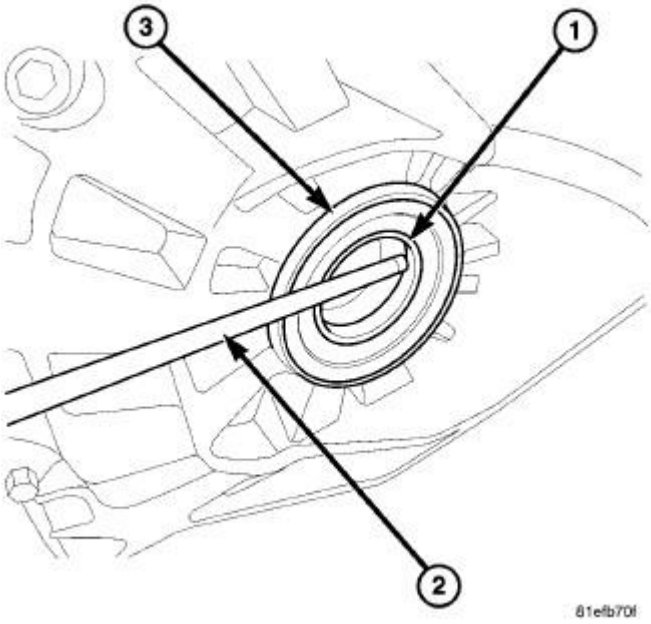

Fig. 84: Remove L Side Seal
Courtesy of CHRYSLER GROUP, LLC

1. Remove halfshaft(s). Refer to **REMOVAL** and **REMOVAL** .
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace halfshaft if necessary.

INSTALLATION

INSTALLATION

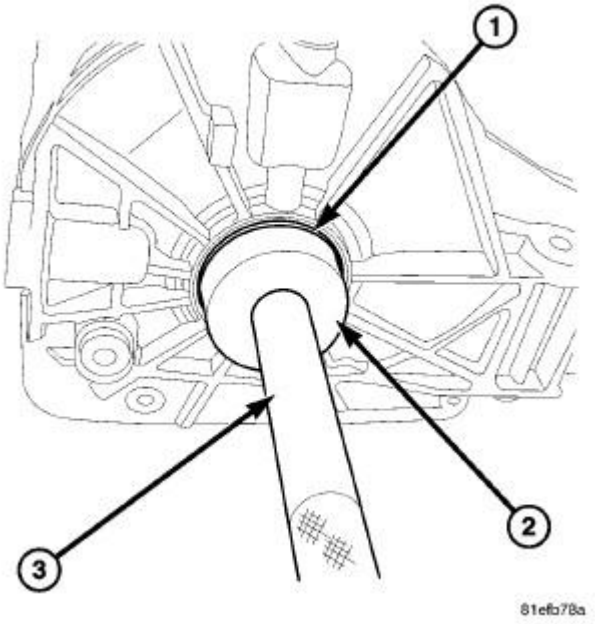

Fig. 85: Install R Side Seal
Courtesy of CHRYSLER GROUP, LLC

1. Using Installer (special tool #9919, Installer, Bearing) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (3), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-90 to protect seal during halfshaft installation.
2. Install halfshaft(s). Refer to **INSTALLATION** and **INSTALLATION** .

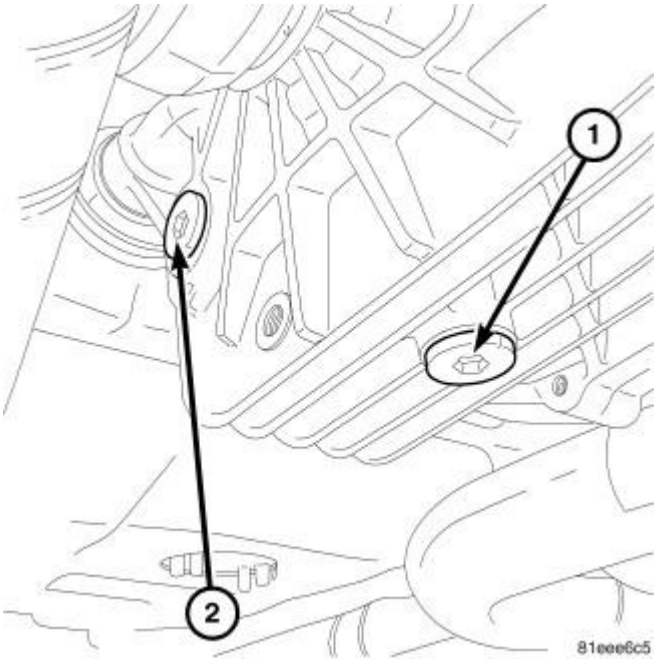

Fig. 86: Drain And Fill Plug

Courtesy of CHRYSLER GROUP, LLC

3. Remove fill plug (2) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-90. Reinstall fill plug and torque to 35 N.m (25 ft. lbs.) torque.

SEAL, DRIVE PINION

REMOVAL

REMOVAL

1. Remove rear axle assembly from vehicle. Refer to Rear Axle **REMOVAL** .

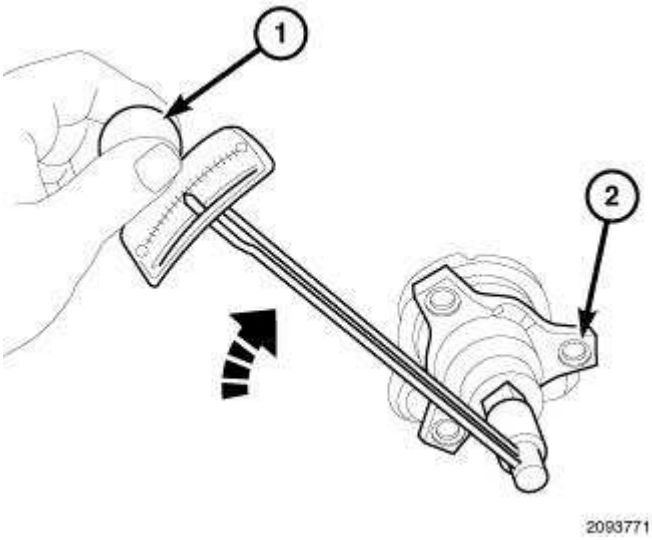

Fig. 87: Using A Torque Wrench Calibrated To Measure Low Torque Values
Courtesy of CHRYSLER GROUP, LLC

2. Use a torque wrench calibrated to measure low torque values (1) to measure rotating torque at the pinion flange (2). Record measurement for reuse on assembly.

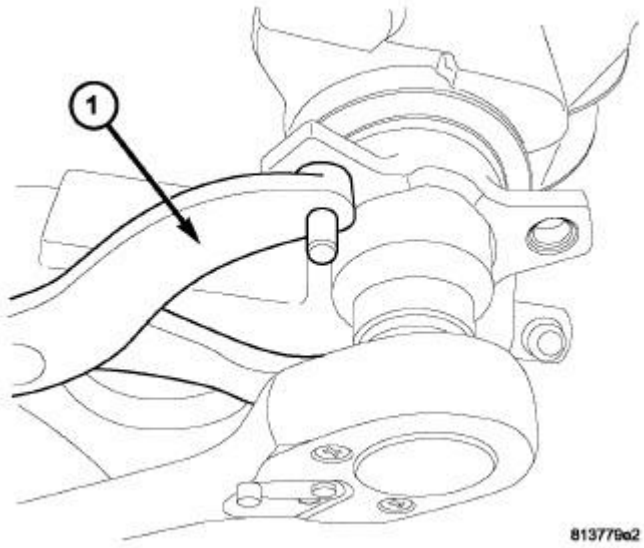

Fig. 88: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

3. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 41mm socket, remove pinion flange nut and discard.

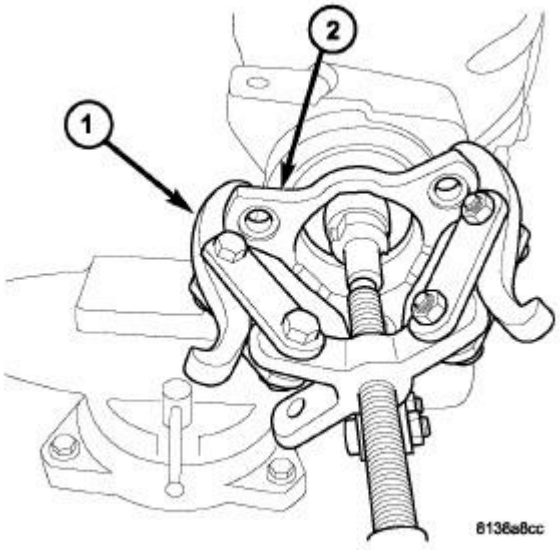

Fig. 89: Removing Pinion Flange With Puller
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.

4. Using Puller (special tool #1026, Puller) (1), remove pinion flange (2) from pinion shaft.

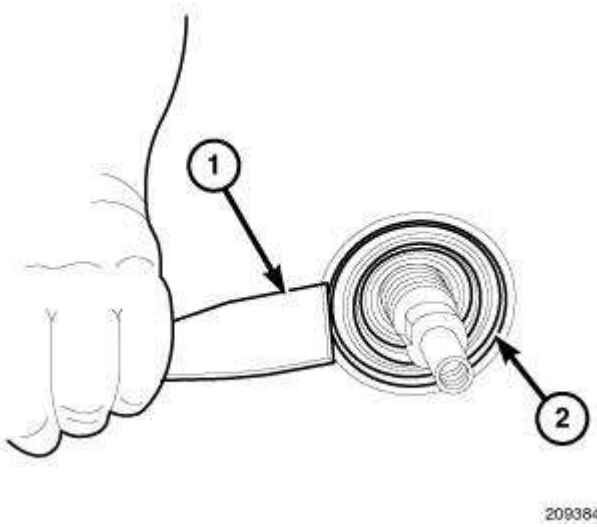

Fig. 90: Removing Pinion Seal Using A Suitable Seal Removal Tool
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable seal removal tool (1), remove pinion seal (2) and discard.

INSTALLATION

INSTALLATION

1. Apply light coating of gear lubricant to the lip of the pinion seal.

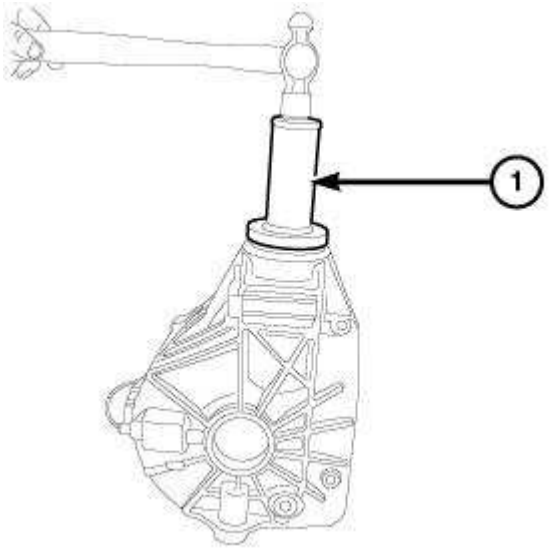

Fig. 91: Installing Pinion Seal Until Tool Bottoms On Carrier Using Installer
Courtesy of CHRYSLER GROUP, LLC

2. Using Installer (special tool #10146, Installer, Oil Seal) (1), install pinion seal until tool bottoms on carrier.

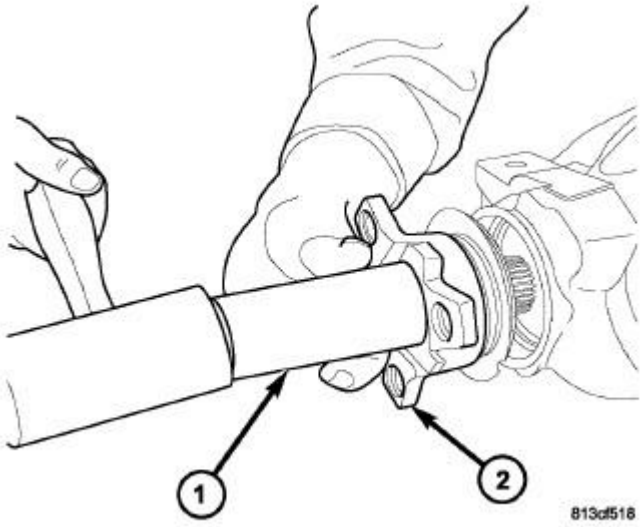

Fig. 92: Pinion Flange Installation
Courtesy of CHRYSLER GROUP, LLC

3. Install pinion flange into position. Align index marks made during disassembly to maintain assembly balance.
4. Using Installer (special tool #6448A, Installer, Bearing/Gear) (1), lightly tap on pinion flange (2) until enough pinion shaft threads are exposed to install the pinion flange, and start the pinion nut.

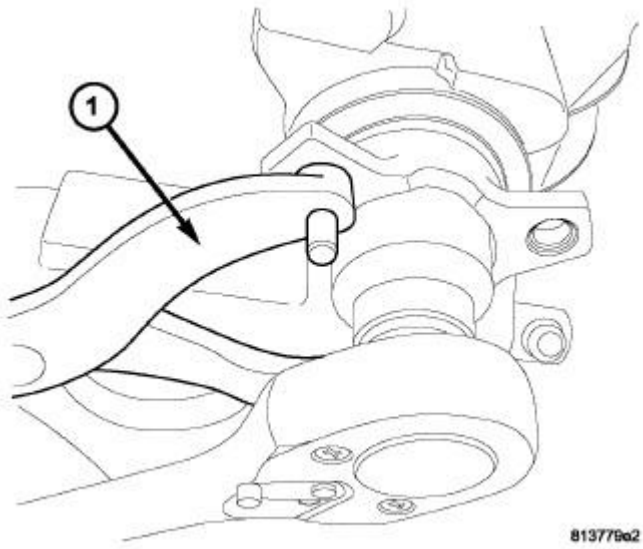

Fig. 93: Pinion Flange Nut Removal/Installation

Courtesy of CHRYSLER GROUP, LLC

5. Install a **new** pinion flange nut. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 41mm socket, torque nut to 245 N.m (181 ft. lbs.).

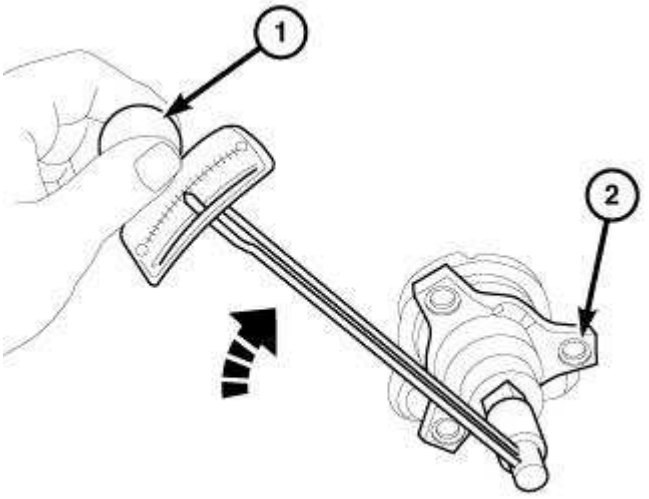

Fig. 94: Using A Torque Wrench Calibrated To Measure Low Torque Values
Courtesy of CHRYSLER GROUP, LLC

6. Use a torque wrench calibrated to measure low torque values (1) to measure rotating torque at the pinion flange (2). Verify the turning torque matches the rotating torque as measured before removal of the original seal.

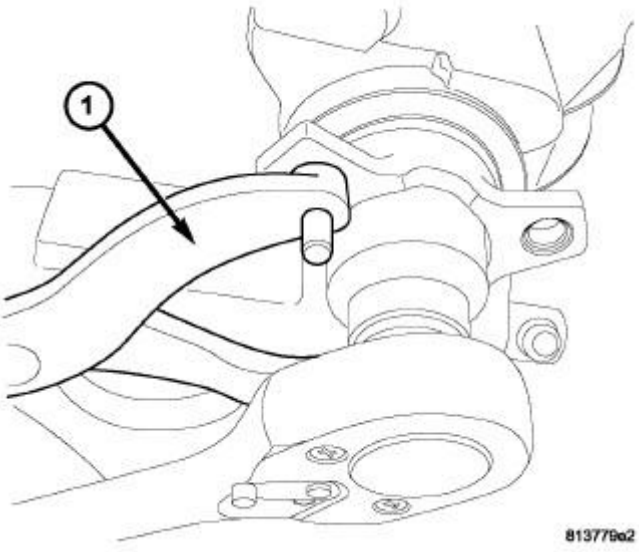

Fig. 95: Pinion Flange Nut Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

7. Install rear axle assembly. Refer to Rear Axle **INSTALLATION** .

Rear Half Shaft - Chrysler 300

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HALF SHAFT

VEHICLE INSPECTION

1. Check for grease in the vicinity of both the inboard and outboard joints. This is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged outer CV or inner cross-groove joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- A torn seal boot on the inner or outer joint of the half shaft assembly.
- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft CV joint.
- A worn intermediate shaft bearing (AWD Models).

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner cross-groove joint.
- A worn intermediate shaft bearing (AWD Models).
- Improper wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. Refer to **STANDARD PROCEDURE** .

- A worn intermediate shaft bearing (AWD Models).
- Improper tire and/or wheel runout. Refer to **DIAGNOSIS AND TESTING** .

SPECIFICATIONS

SPECIFICATIONS

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

NOTE: Halfshaft inner and outer boots are not serviceable separately. Boot replacement requires entire shaft assembly replacement.

CAUTION: Unequal-length halfshafts are used. The left halfshaft is shorter than the right, and it is necessary to identify and tag halfshafts upon removal to ensure proper installation.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

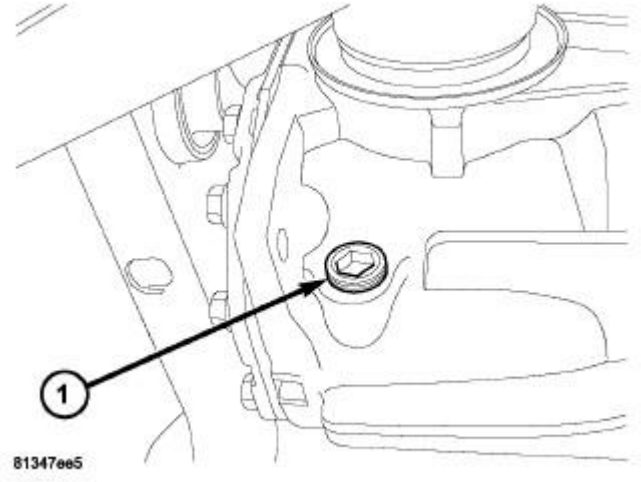

Fig. 1: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to:
    - 198 Axle: 60 N.m (44 ft. lbs.)
    - 210 Axle: 50 N.m (37 ft. lbs.)

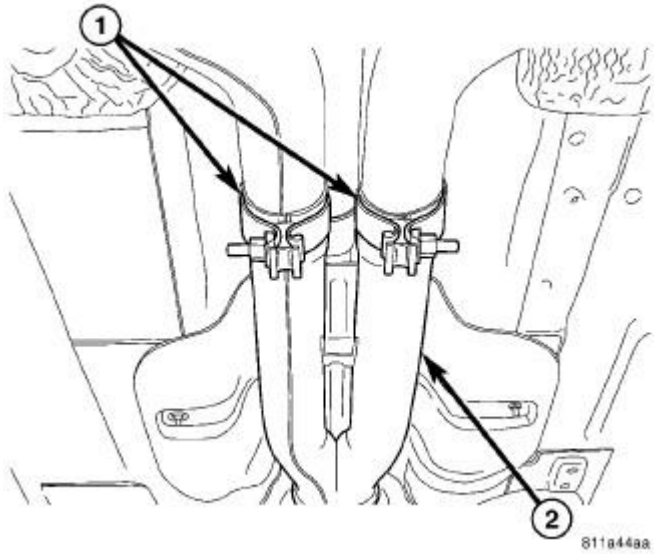

Fig. 2: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

4. Remove rear exhaust system (2) on V8-equipped models.

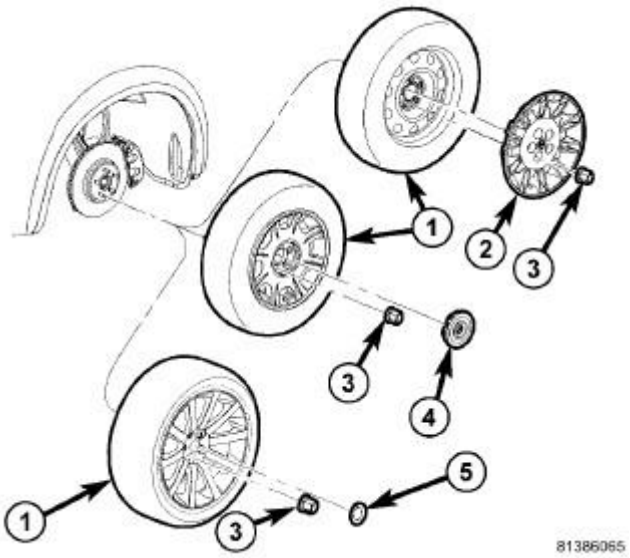

Fig. 3: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Remove wheel/tire assembly (1) from sides that shaft is to be removed.

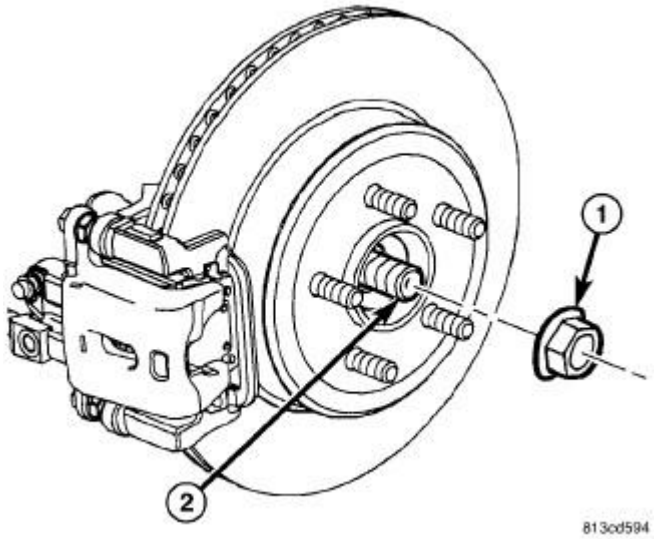

Fig. 4: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

6. Remove wheel hub nut (1) and discard.

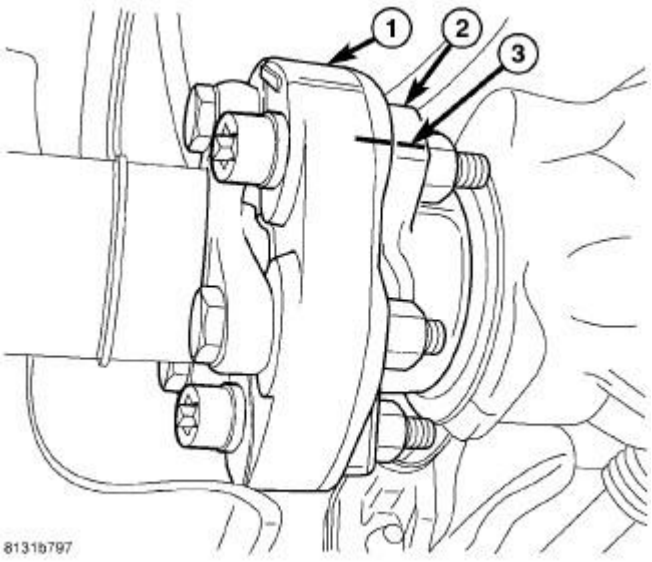

Fig. 5: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

7. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

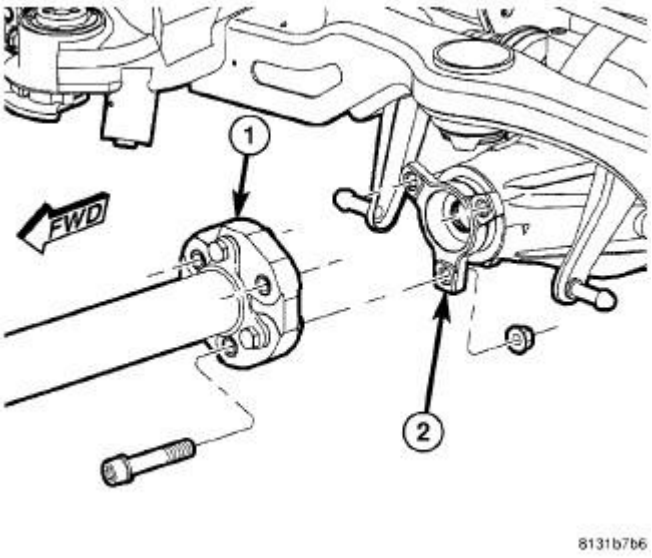

Fig. 6: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

8. Remove three propeller shaft coupler-to-axle flange bolt/nuts.

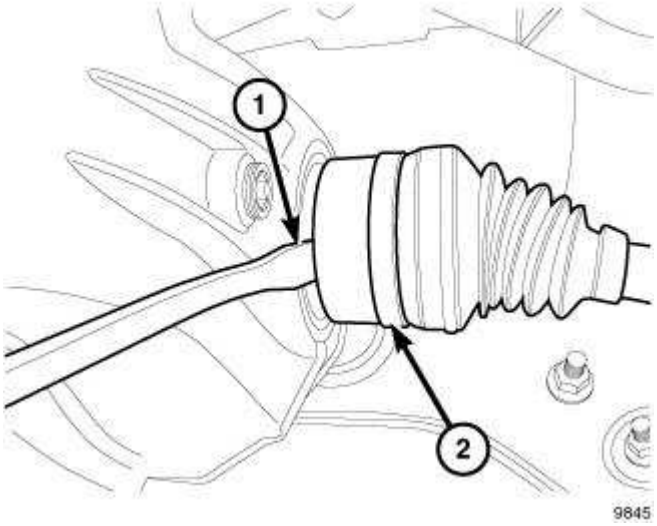

Fig. 7: Halfshaft Removal (V6 Models)
Courtesy of CHRYSLER GROUP, LLC

9. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

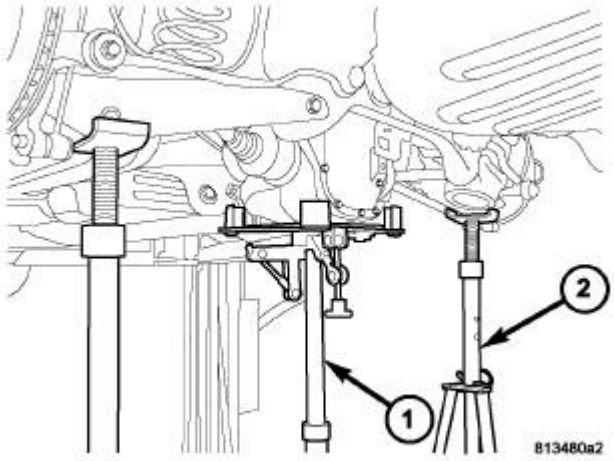

Fig. 8: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

10. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

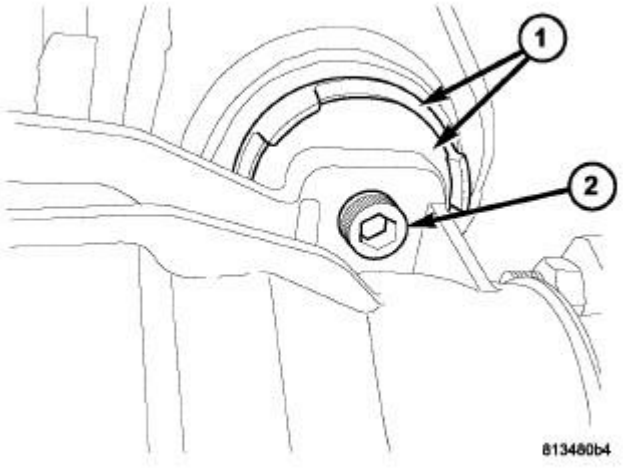

Fig. 9: Rear Axle Forward Mount Isolator & Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

11. Remove rear axle forward mount isolator (1) bolt/nut (2).

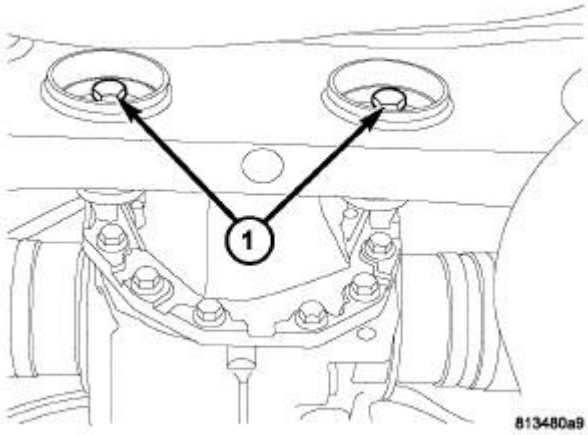

Fig. 10: Rear Axle-To-Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Access to rear axle-to-crossmember bolts is best achieved by use of short socket and a flexible-head ratchet.

12. Remove two rear axle-to-crossmember bolts (1).

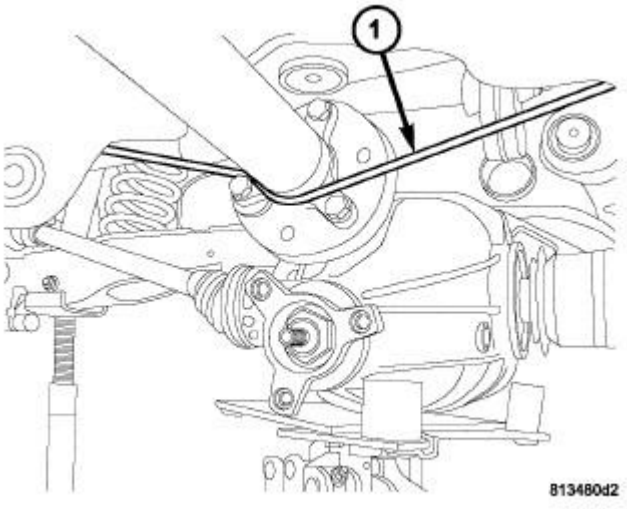

Fig. 11: Propeller Shaft Supported
Courtesy of CHRYSLER GROUP, LLC

13. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

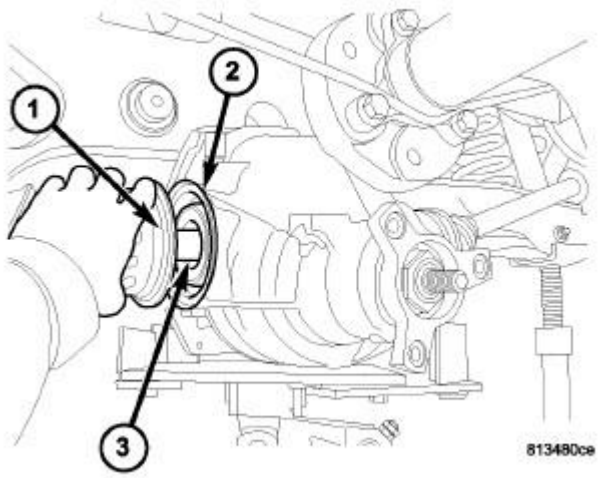

Fig. 12: Halfshaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Unequal-length halfshafts are used. The left halfshaft is shorter than the right, and it is necessary to identify and tag halfshafts upon removal to ensure proper installation.

14. Lower axle just enough to remove halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.

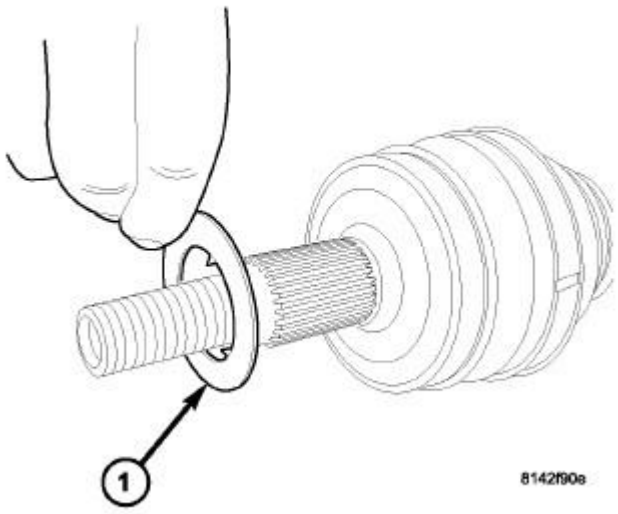

Fig. 13: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

CAUTION: Use care while handling/storing halfshaft assembly. Damage to the slinger can result from improper handling. If slinger gets bent or damaged, straighten slinger to avoid contact with axle seal assembly.

15. Remove halfshaft from hub. Remove and inspect rubber isolation washer (1). Discard washer if rubber surfaces are worn away. Repeat on other side if necessary.

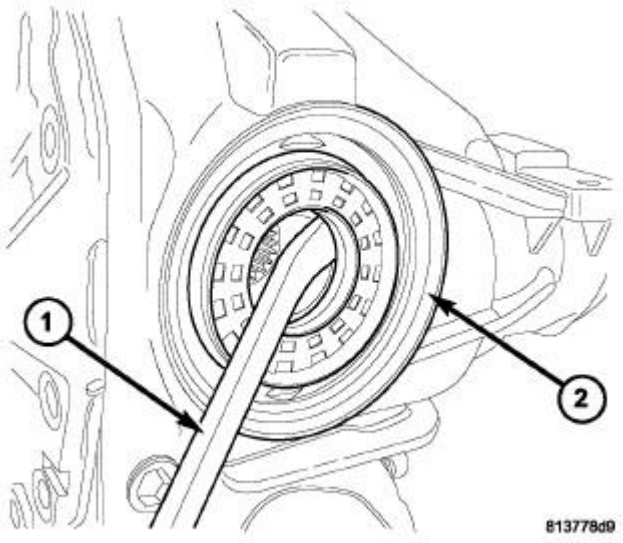

Fig. 14: Axle Seal Removal
Courtesy of CHRYSLER GROUP, LLC

16. Remove axle seals (2) using suitable screwdriver.

INSTALLATION

INSTALLATION

NOTE: Halfshaft inner and outer boots are not serviceable separately. Boot replacement requires entire shaft assembly replacement.

CAUTION: Unequal-length halfshafts are used. The left halfshaft is shorter than the right, and it is necessary to identify and tag halfshafts upon removal to ensure proper installation.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

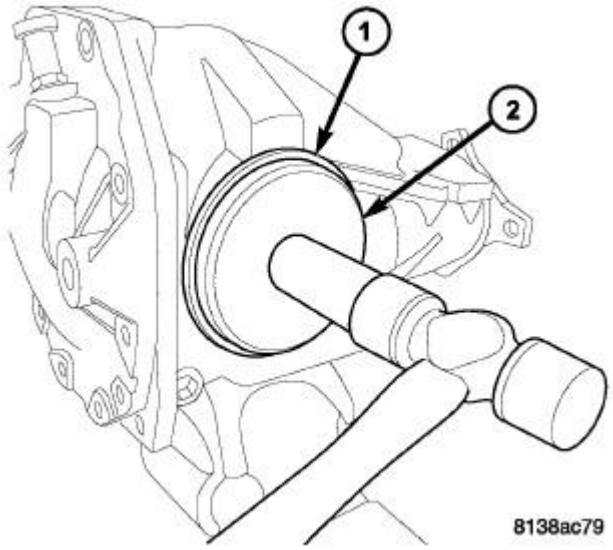

Fig. 15: Axle Seal Installation
Courtesy of CHRYSLER GROUP, LLC

1. Install new axle seal(s) (1) using (special tool #9223A, Drift) (2).

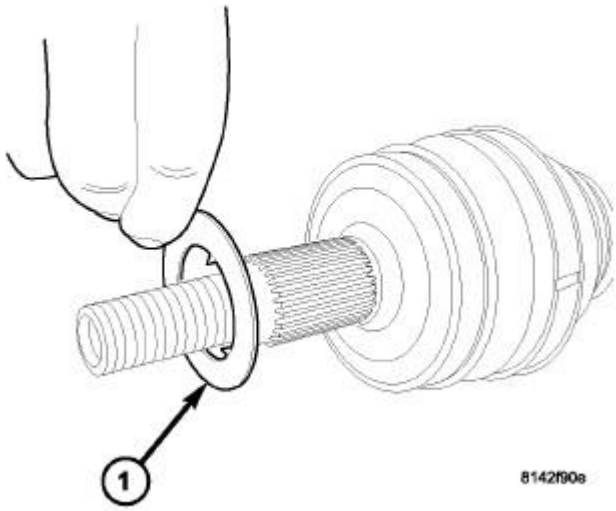

Fig. 16: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

2. Install halfshaft isolation washer (1).

NOTE: Always use (special tool #9099, Seal Protector, Differential Output) when

installing half shaft into the transaxle. If the Seal Protector is new please split at seam before using.

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

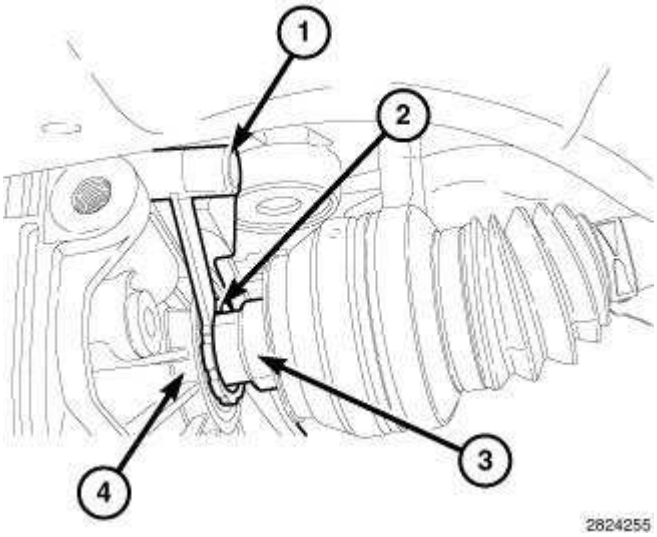

Fig. 17: Identifying Rear Axle, Rear Driveshaft, Rear Axle Flange, and Halfshafts
Courtesy of CHRYSLER GROUP, LLC

NOTE: While raising rear axle reposition rear drive shaft to rear axle flange.

3. Install new circlip(s), on halfshafts (3).
4. Raise axle just enough to install both halfshafts one at a time. Be careful not to damage axle seals using (special tool #9099, Seal Protector, Differential Output) (1). Shift axle assembly in one direction, compressing one halfshaft while installing the other.

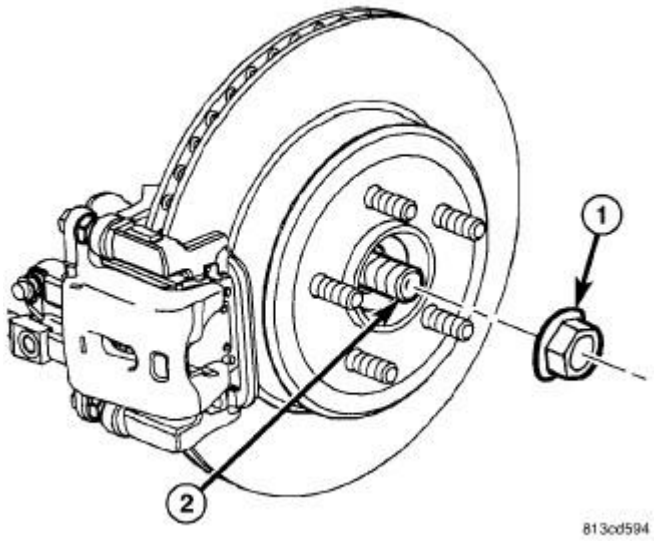

Fig. 18: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

5. Install **new** hub nut (1) by hand.

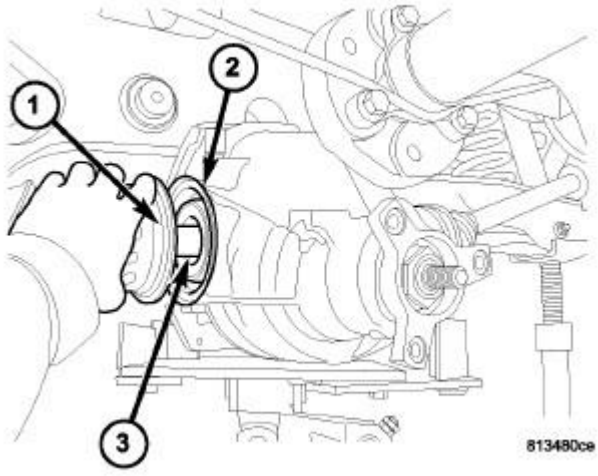

Fig. 19: Halfshaft Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect slinger(s) for handling damage. Straighten as necessary to avoid contact with axle seal.

NOTE: **Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.**

6. Lubricate halfshaft inner joint bearing journal (3) with Mopar® Gear and Axle Lubricant (75W-140). Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle seals (2). Verify proper installation by pulling outward on joint by hand.

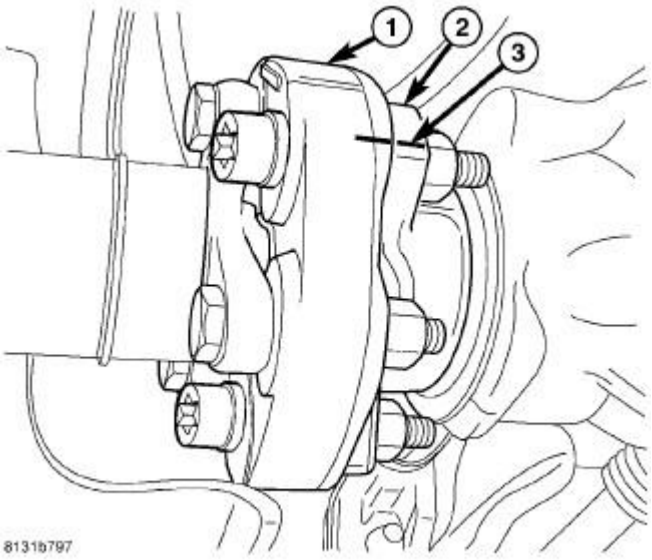

Fig. 20: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

7. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

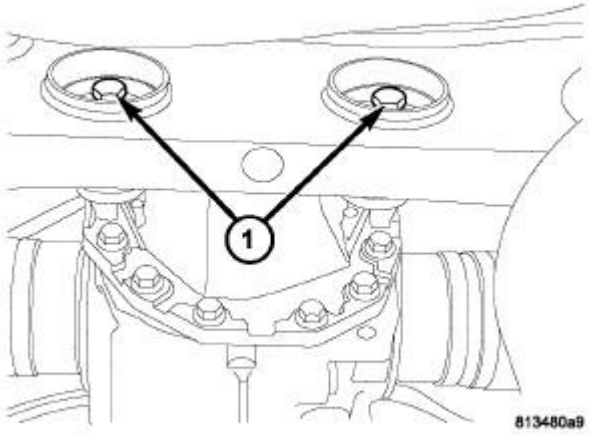

Fig. 21: Rear Axle-To-Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install two rear axle-to-crossmember bolts (1) and torque to 220 N.m (162 ft. lbs.).

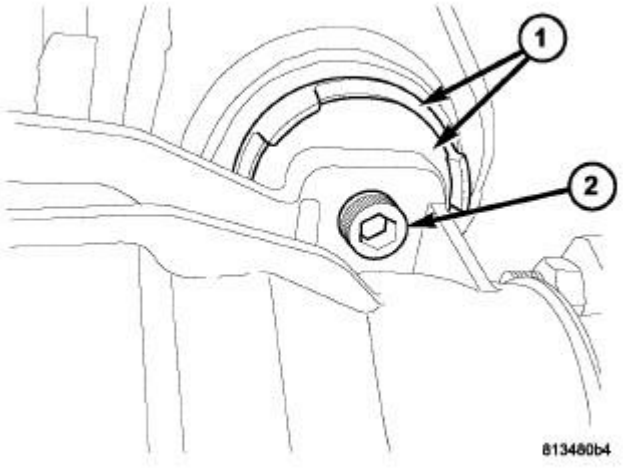

Fig. 22: Rear Axle Forward Mount Isolator & Bolt/Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install rear axle front mount isolator (1) as shown in illustration and torque bolt/nut to 65 N.m (48 ft. lbs.).

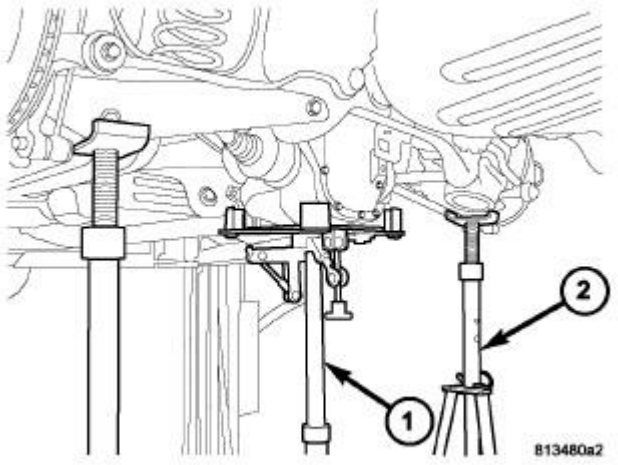

Fig. 23: Supporting Rear Axle With Jack Stands Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

10. Again verify halfshaft inner joints are fully engaged to axle assembly.
11. Remove transmission jack (1).
12. If used, remove screw-type under-hoist jack stands (2).

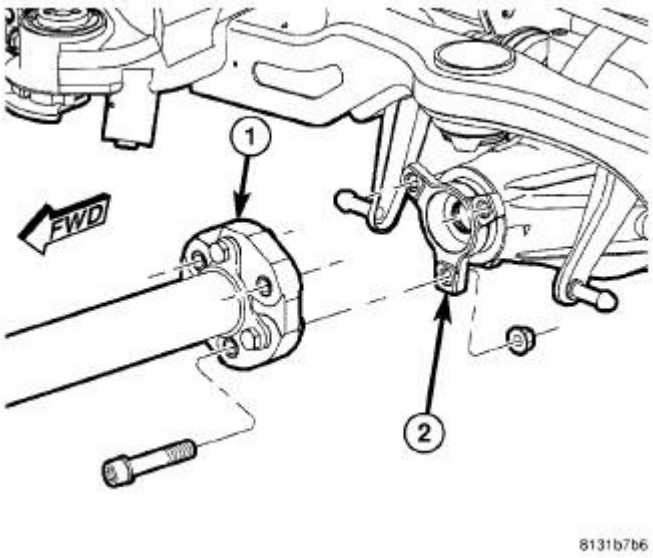

Fig. 24: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

13. Torque propeller shaft coupler-to-axle flange bolt/nuts to 58 N.m (43 ft. lbs.).

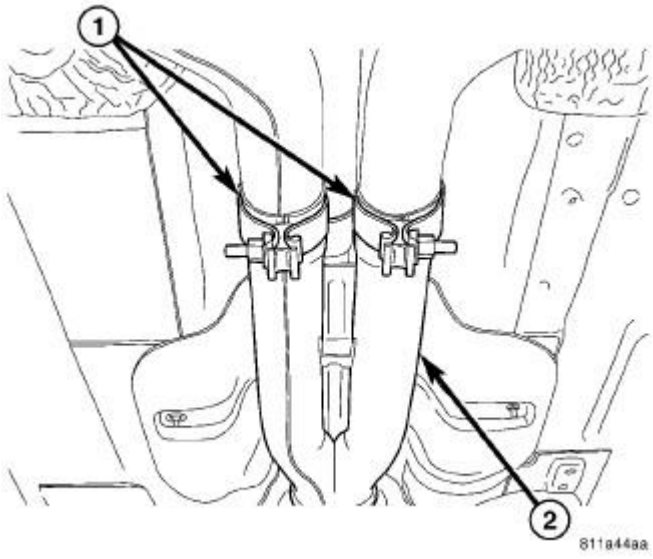

Fig. 25: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

14. V8 Models: Install exhaust system. Tighten band clamps (1) to 61 N.m (45 ft. lbs.).

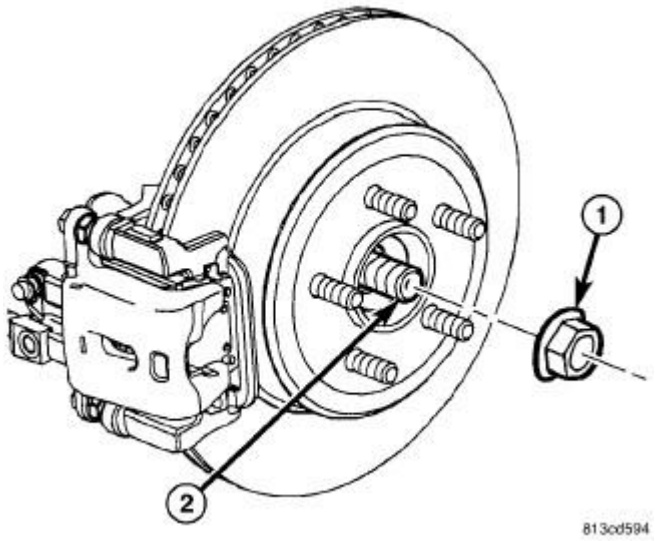

Fig. 26: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

15. Lower vehicle. Torque halfshaft hub nut (1) to 213 N.m (157 ft. lbs.). Install wheel center cap.
16. Install wheel/tire assembly (1) and torque lug nuts to 150 N.m (110 ft. lbs.).

SPECIAL TOOLS

SPECIAL TOOLS

	9099 - Seal Protector, Differential Output (Originally Shipped In Kit Number(s) 9324, 9324CC.) 9223A - Drift (Originally Shipped In Kit Number(s) 9202, 9202CC, 9329-SUP, 9516-SUP, 9518-SUP, 9519-SUP, 9540-SUP.)

SUSPENSION

Rear Suspension - Chrysler 300

DESCRIPTION

NON SRT

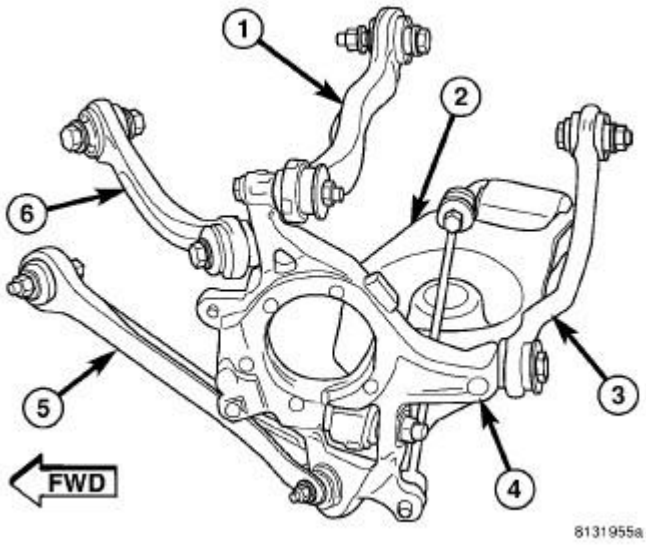

Fig. 1: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

This vehicle utilizes a five-link rear suspension including the following major components:

- Camber Link (1)
- Compression Link (5)
- Spring Link (2)
- Tension Link (6)
- Toe Link (3)
- Coil Spring
- Crossmember
- Hub And Bearing
- Knuckle (4)
- Shock Absorber
- Stabilizer Bar

Service Procedures for the crossmember can be found in Frame And Bumpers. Refer to **CROSSMEMBER, REAR, REMOVAL** .

SRT

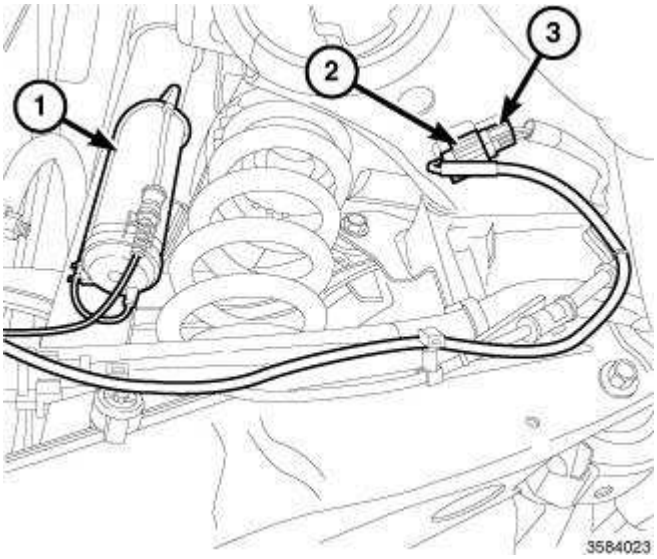

Fig. 2: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

The SRT rear suspension is part of an Active Damping System (ADS). The ADS includes unique shock absorbers, an Active Damping Control Module (ADCM), and three accelerometers that work together to modify the ride of the suspension over varying road conditions.

The Active Damping System (ADS) rear shock is similar to a conventional shock with the addition of a shock solenoid assembly (1) mounted on the side of its body with a three wire harness connector attached to it. The ADS shock assembly is serviced the same as a conventional shock absorber, with the addition of disconnecting the ADS harness connector (2) on the crossmember.

Service of all other rear suspension components remain the same as the standard components. When components differ, be sure to use only SRT components on SRT vehicles.

The rear knuckle for the SRT is different from the standard knuckle. Although similar in appearance and in service, the mounting bosses for the disc brake caliper have been moved downward to allow mounting of the Brembo four-piston brake caliper. Due to this change, an updated special tool is needed to remove the sleeve that retains the lower control arm ball joint to the knuckle.

The rear stabilizer bar diameter has been increased for the SRT but it is serviced in the same manner as the standard bar.

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING

NOTE: The hub and bearing is designed for the life of the vehicle and should require no maintenance.

With wheel and brake rotor removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

To diagnose a bent hub, measure hub runout. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING** .

REMOVAL

NON SRT

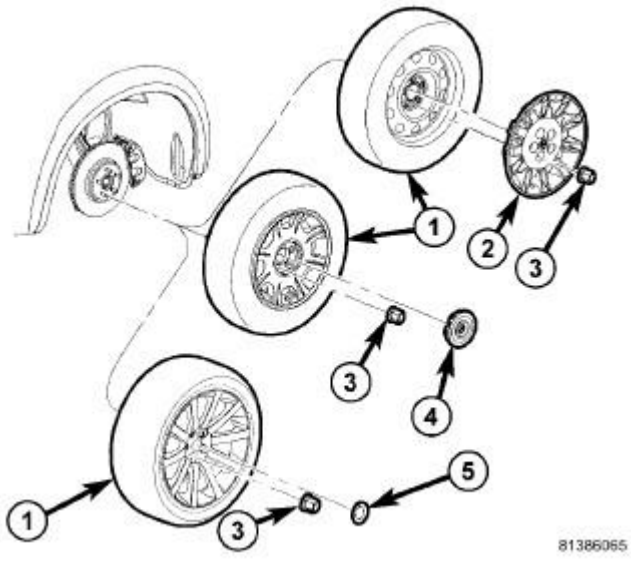

Fig. 3: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

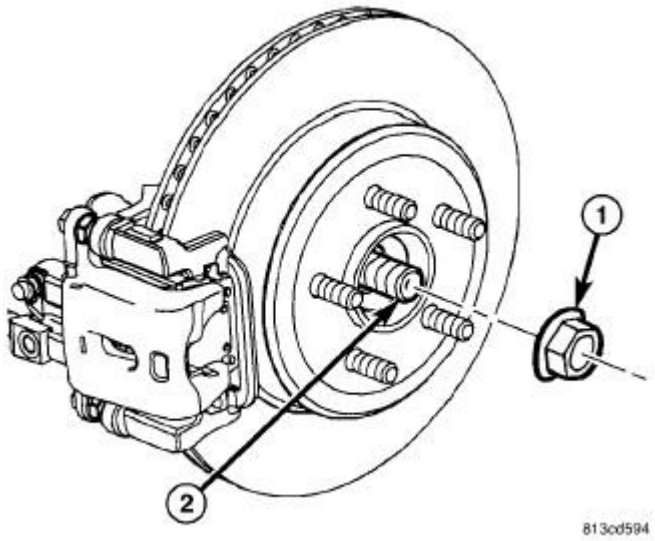

Fig. 4: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

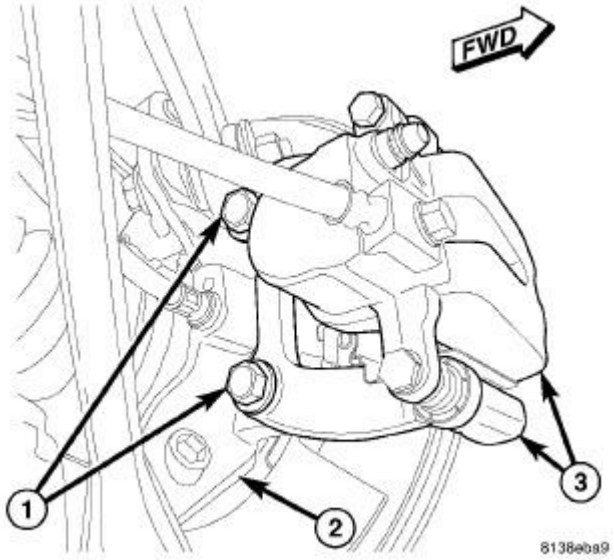

Fig. 5: Rear Caliper & Adapter Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed, by grasping rear of

caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

4. Remove two bolts (1) securing disc brake caliper adapter (3) to knuckle (2).
5. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

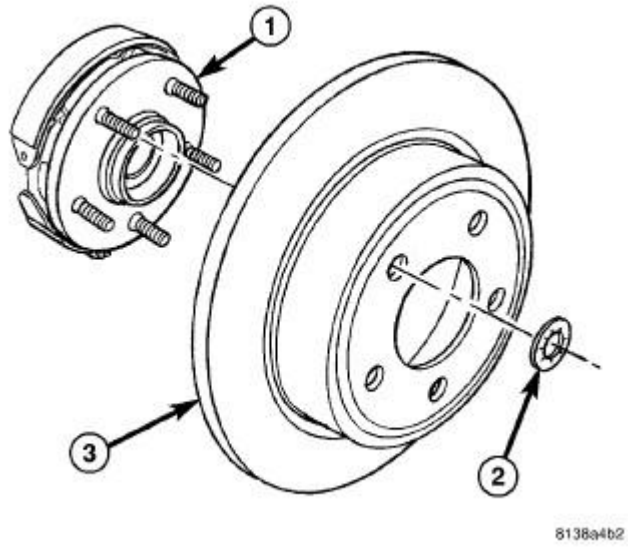

Fig. 6: Solid Brake Rotor Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Remove any clips (2) retaining brake rotor (3) to wheel mounting studs.
7. Slide brake rotor (3) off hub and bearing (1).

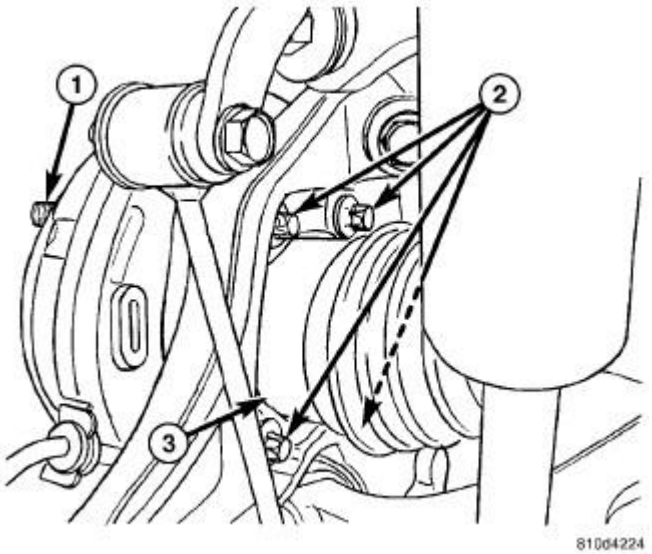

Fig. 7: Hub & Bearing Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - HUB AND BEARING
2 - MOUNTING BOLTS
3 - HALF SHAFT (IF EQUIPPED)

8. Loosen each hub and bearing mounting bolt (2) a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and brake support plate to keep brake support plate in place when hub and bearing is removed.
9. Slide hub and bearing off knuckle and half shaft.

SRT

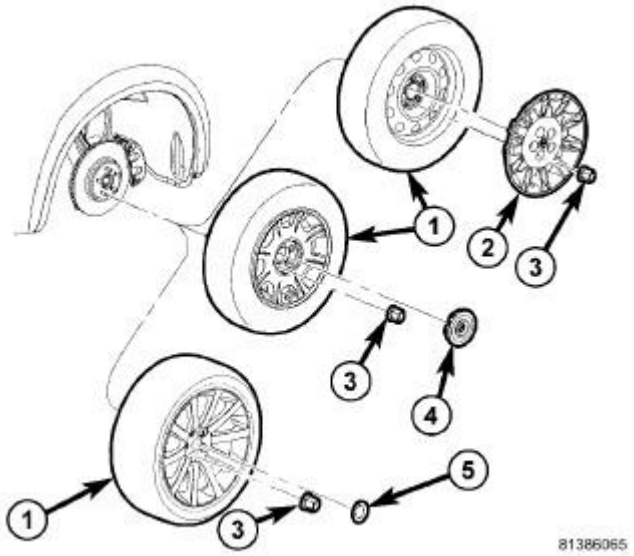

Fig. 8: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

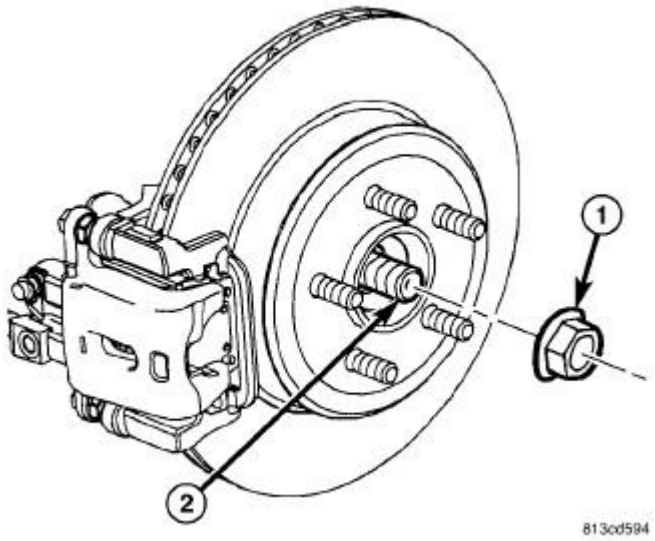

Fig. 9: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

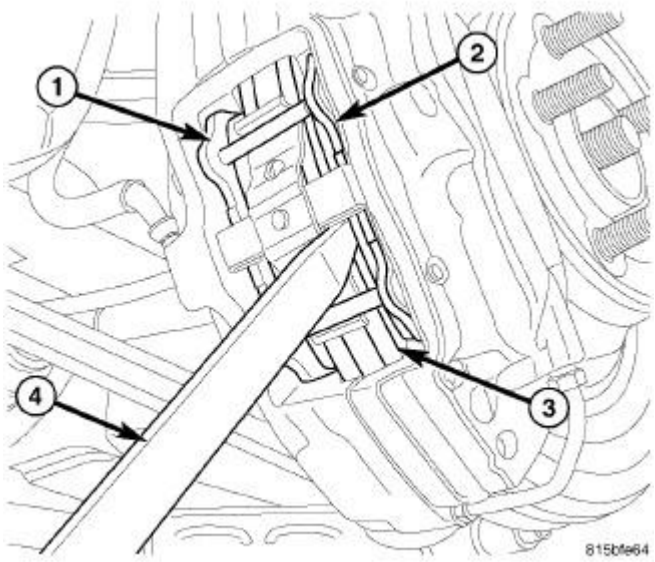

Fig. 10: Pushing Back Pistons In Bore
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

4. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
5. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

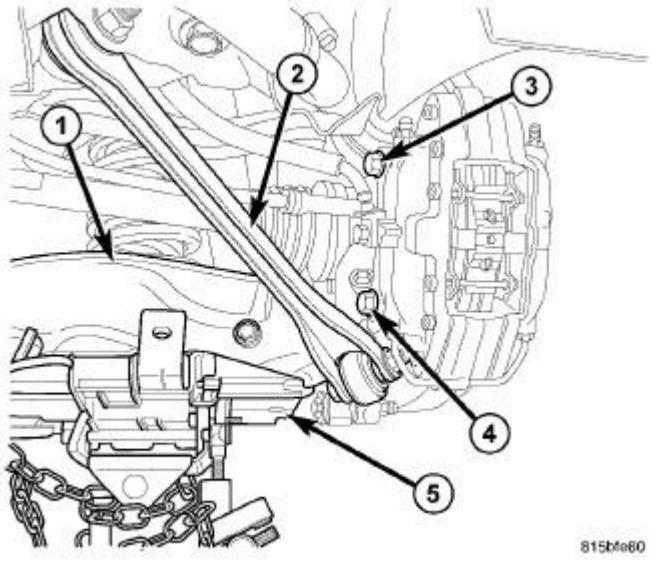

Fig. 11: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

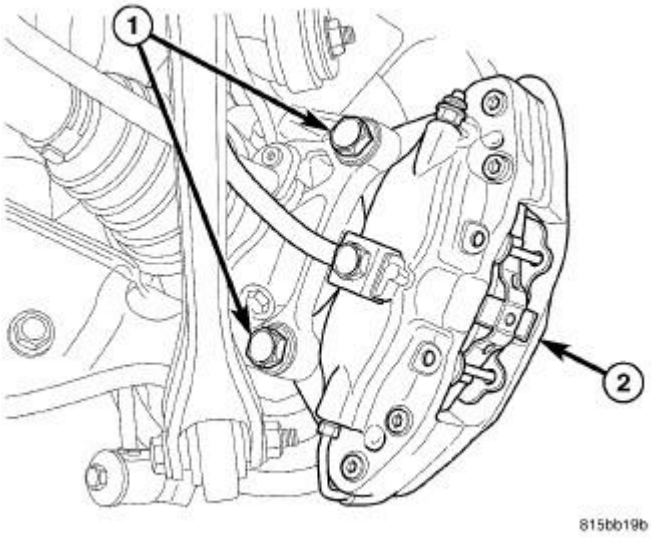

Fig. 12: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the lower and upper caliper mounting bolts (1).
8. Remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

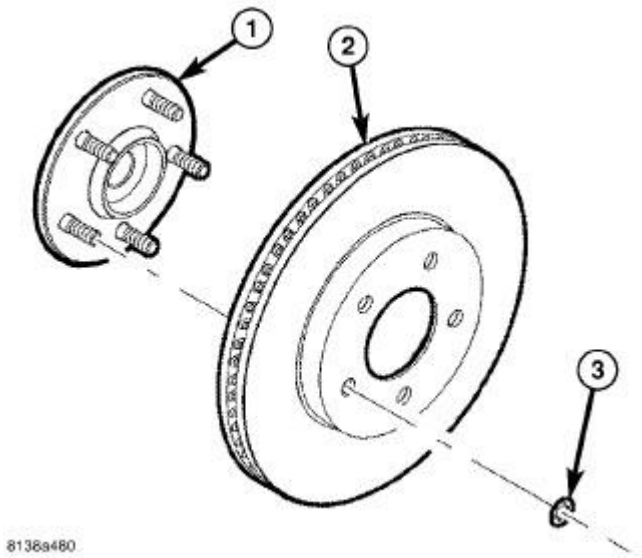

Fig. 13: Locating Clips Retaining Brake Rotor
Courtesy of CHRYSLER GROUP, LLC

9. Remove any clips (3) retaining brake rotor (2) to wheel mounting studs.
10. Slide brake rotor (2) off hub and bearing (1).

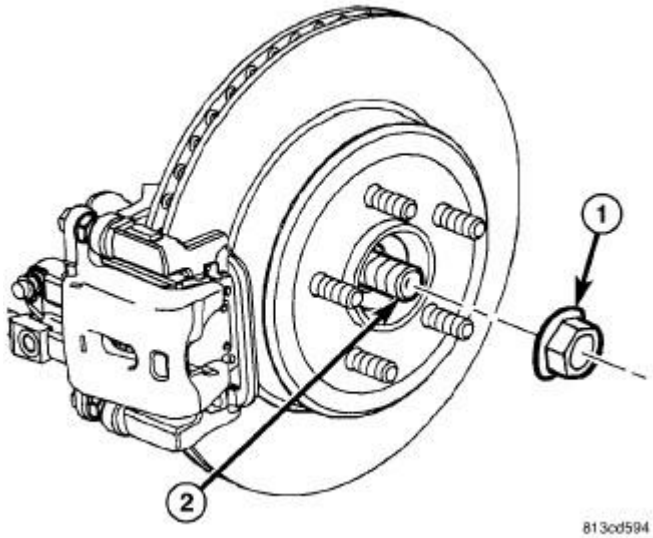

Fig. 14: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

11. Push inward on end of half shaft (2) until C/V joints bottom. This is necessary to give as much access to hub and bearing mounting bolts as possible.

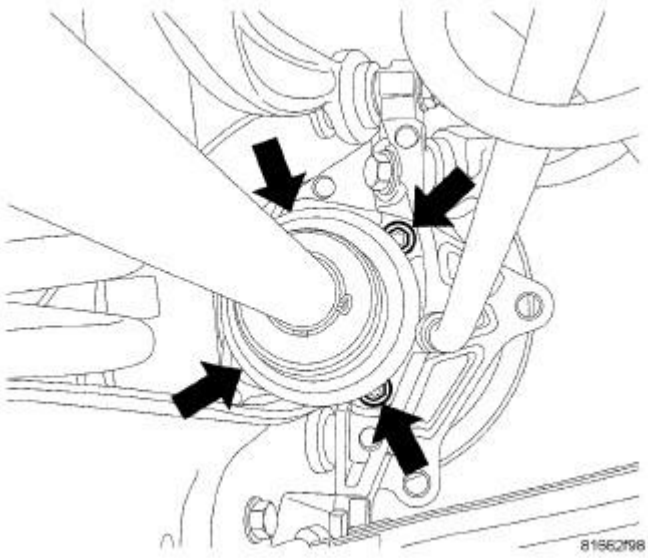

Fig. 15: Hub And Bearing Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is important to keep suspension jacked up as requested in to ease access to lower hub and bearing mounting bolts. Refer to 6.

NOTE: Use a 3/8 inch drive wobble extension along with a Torx® socket to access and remove two top and lower front mounting bolt. Use a standard 3/8 inch drive universal joint along with a Torx® socket to access and remove lower rear mounting bolt.

12. Loosen each (of the four) hub and bearing mounting bolt a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and parking brake adapter to keep brake adapter in place while hub and bearing is off vehicle.
13. Slide hub and bearing out of knuckle and off half shaft.

INSTALLATION

NON SRT

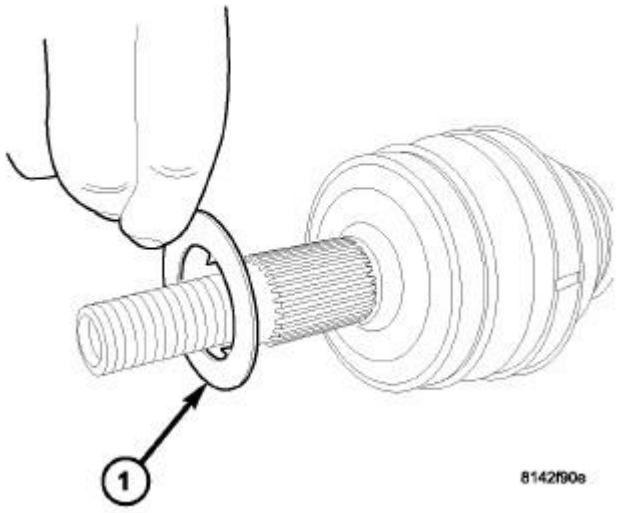

Fig. 16: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

1. Position hub and bearing bolts though rear of knuckle and parking brake support just enough to hold support in place as hub and bearing is installed.
2. Slide hub and bearing onto half shaft. Place hub and bearing through brake support, onto knuckle, lining up mounting bolt holes with bolts.

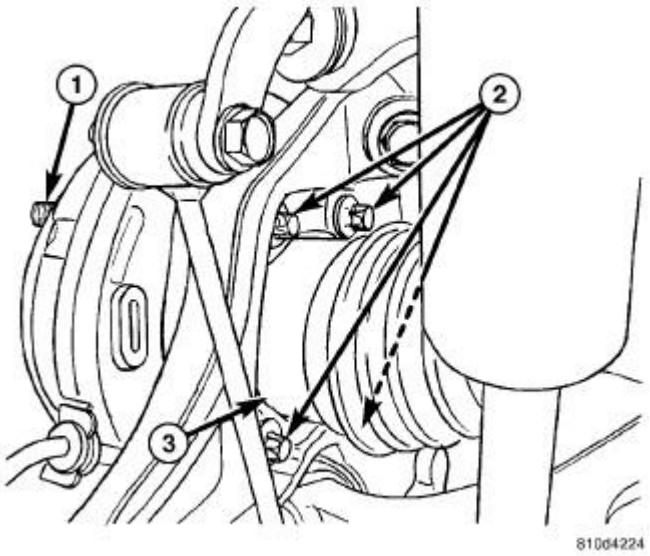

Fig. 17: Hub & Bearing Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1 - HUB AND BEARING
2 - MOUNTING BOLTS
3 - HALF SHAFT (IF EQUIPPED)

3. Install four bolts (2) fastening hub and bearing in place. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

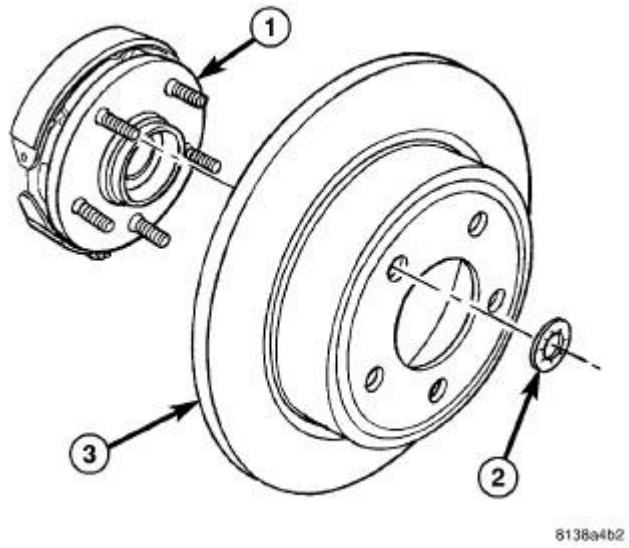

Fig. 18: Solid Brake Rotor Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads and parking brake shoes before brake rotor installation. Refer to HYDRAULIC/MECHANICAL .**

4. Install brake rotor (3) over wheel mounting studs and onto hub (1).

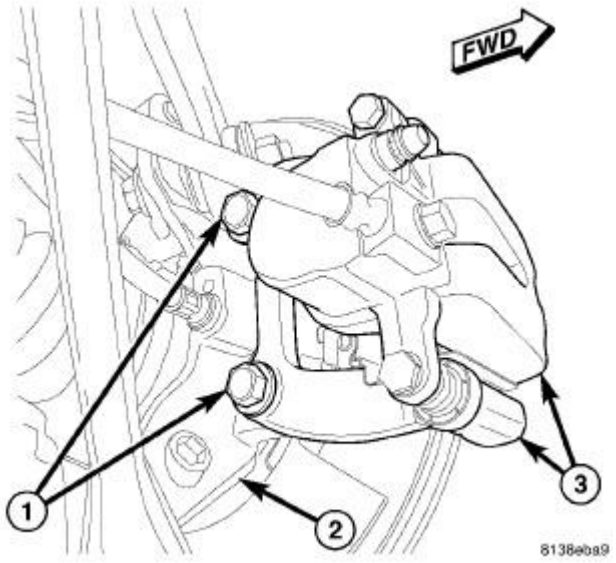

Fig. 19: Rear Caliper & Adapter Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Install disc brake caliper and adapter assembly (3) over brake rotor.
6. Install mounting bolts (1) securing caliper adapter (3) to knuckle (2). Tighten bolts to 115 N.m (85 ft. lbs.).

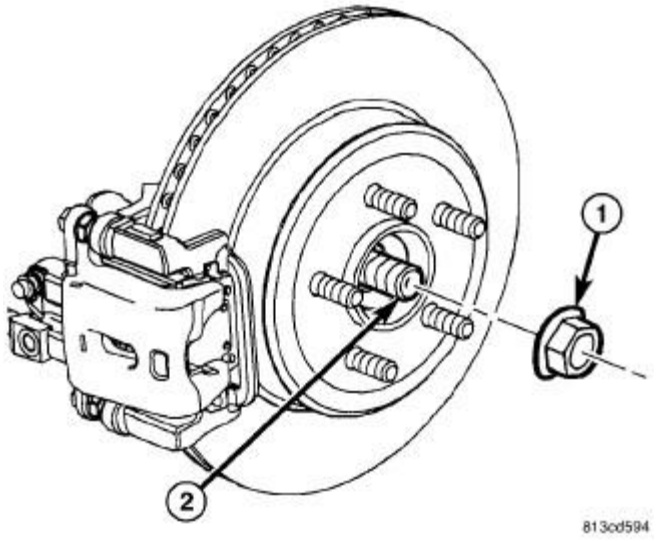

Fig. 20: Identifying Hub Nut

Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

7. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).
8. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .

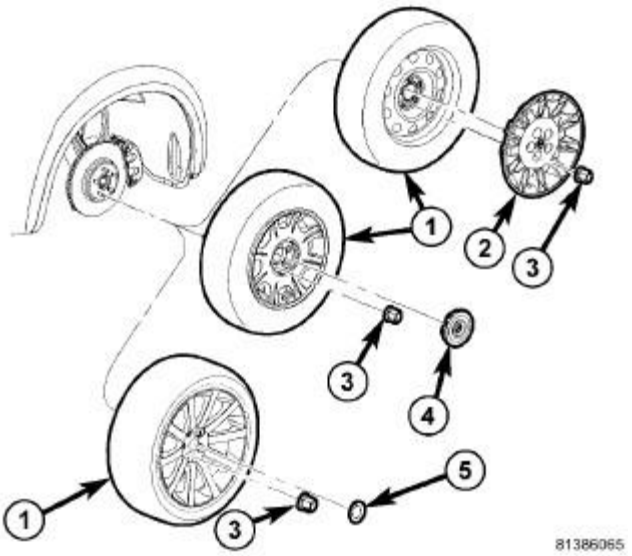

Fig. 21: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

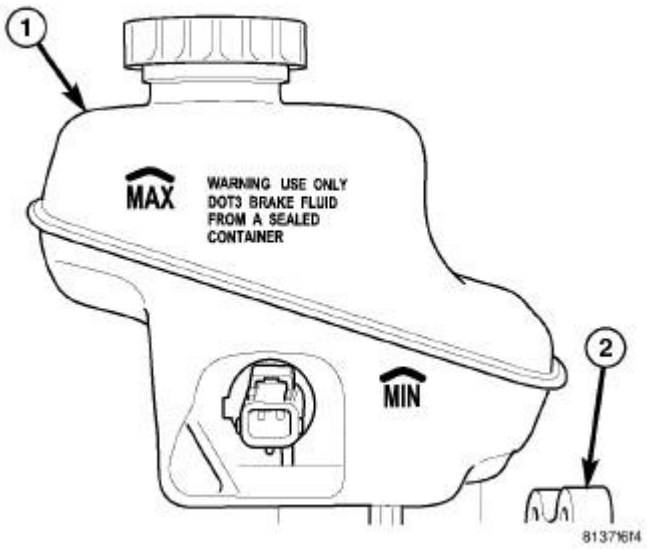

Fig. 22: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

12. Check and adjust brake fluid level in reservoir (1) as necessary.
13. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

SRT

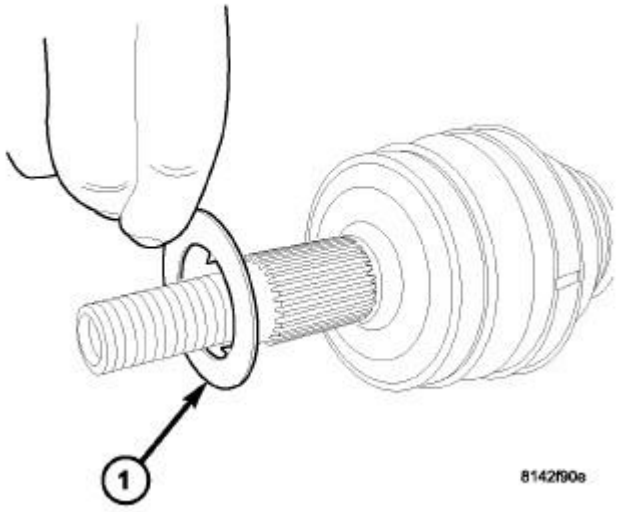

Fig. 23: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before installing hub and bearing on end of axle half shaft, ensure isolation washer (1) is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.**

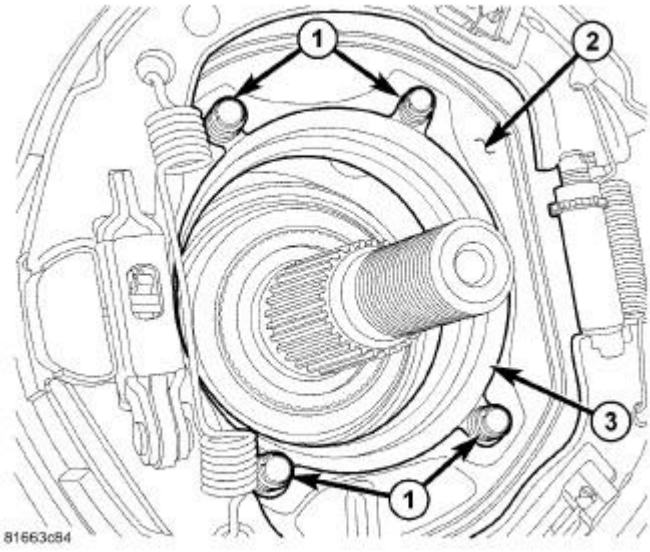

Fig. 24: Mounting Bolts Through Knuckle & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To help upon installation, make sure that hub and bearing mounting bolts (1) extend through knuckle (3) and parking brake adapter (2) to hold adapter in place during hub and bearing installation.**

1. Position hub and bearing mounting bolts (1) though rear of knuckle (3) and parking brake adapter (2) just enough to hold adapter in place.

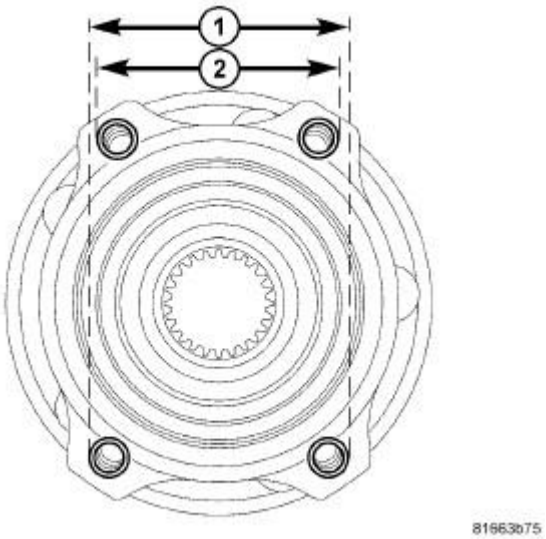

Fig. 25: Hub And Bearing Bolt Hole Pattern
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hub and bearing mounting bolt holes are not evenly spaced. Upper mounting holes (2) are not as far apart as lower mounting holes (1). Make note of this before installing hub and bearing.

2. Slide hub and bearing onto half shaft. Insert hub and bearing through parking brake adapter and knuckle, lining up mounting bolt holes with bolts.

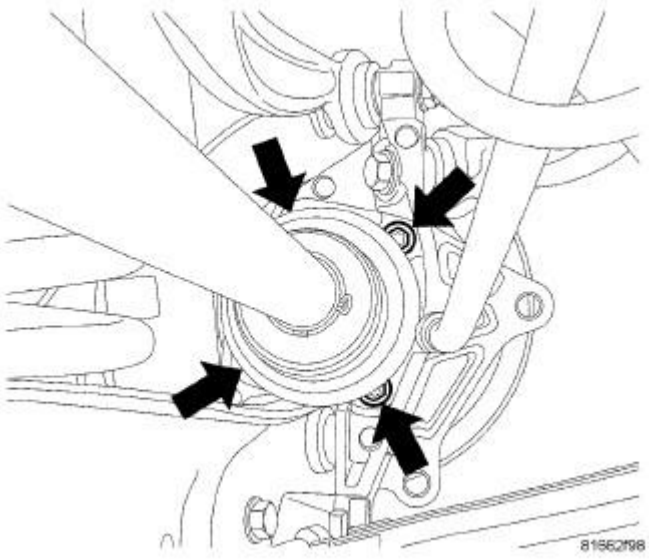

Fig. 26: Hub And Bearing Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure suspension is jacked up as requested during removal to ease access to lower hub and bearing mounting bolts.**

NOTE: **Use a 3/8 inch drive wobble extension along with a Torx® socket to slip past half shaft outer C/V joint and install two top and lower front mounting bolts. Use a standard 3/8 inch drive universal joint along with a Torx® socket to install lower rear mounting bolt.**

3. Carefully start all four mounting bolts into hub and bearing. Using a cross pattern, tighten each hub and bearing mounting bolt a turn or two at a time, slowly drawing hub and bearing into mounted position. Periodically, push in on end of half shaft to give as much room as possible for tools on mounting bolts. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

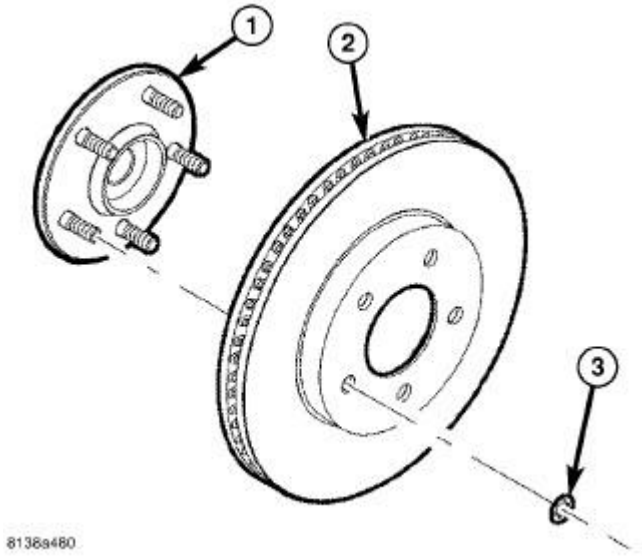

Fig. 27: Locating Clips Retaining Brake Rotor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads and parking brake shoes before brake rotor installation. Refer to HYDRAULIC/MECHANICAL .**

4. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
5. Install brake rotor (2) over studs on hub and bearing (1).

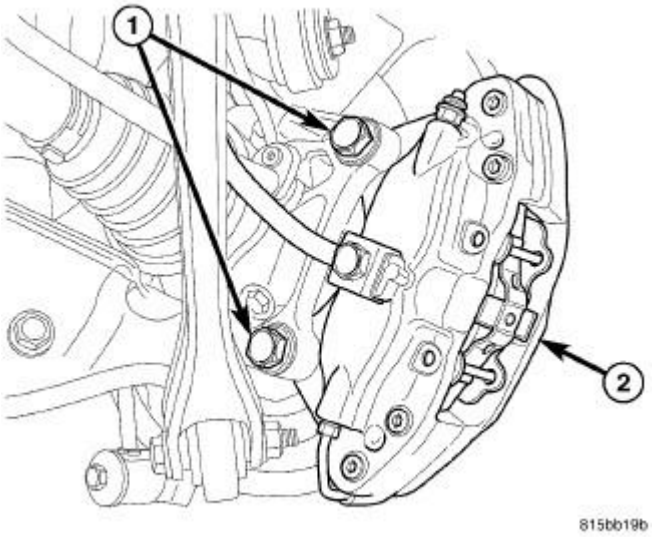

Fig. 28: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Slide caliper with pads (2) over brake rotor and align with knuckle.
7. Install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
8. Remove jack from under spring link.

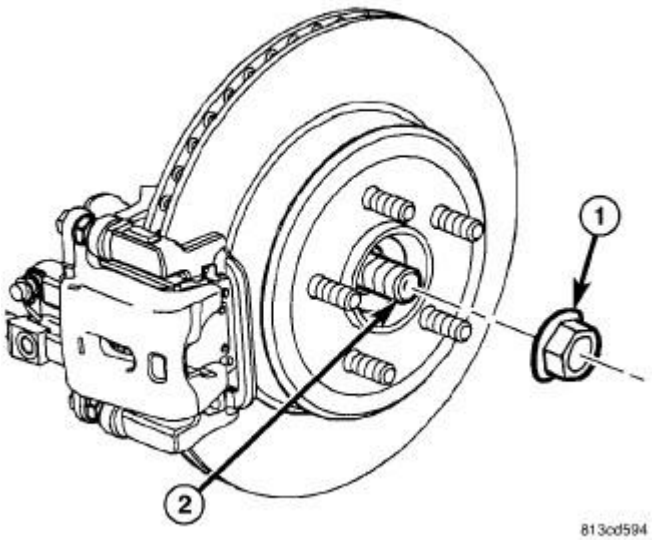

Fig. 29: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

9. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).
10. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .

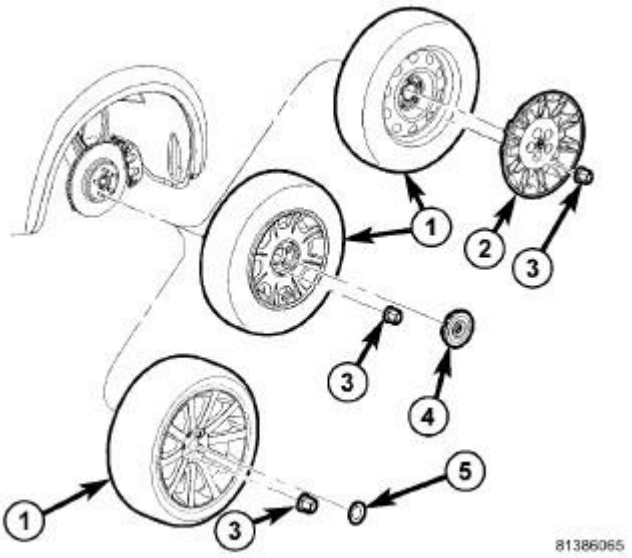

Fig. 30: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Install tire and wheel assembly (1). Refer to **INSTALLATION** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.).
12. Lower vehicle.
13. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

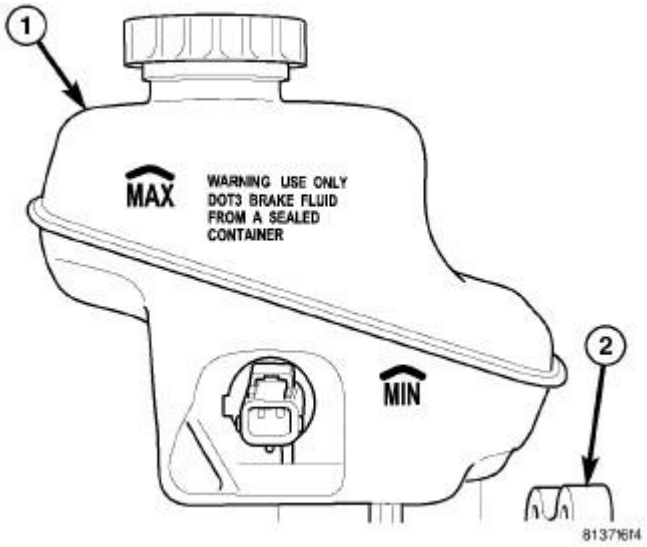

Fig. 31: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

14. Check and adjust brake fluid level in reservoir (1) as necessary.
15. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

KNUCKLE, REAR

REMOVAL

NON SRT

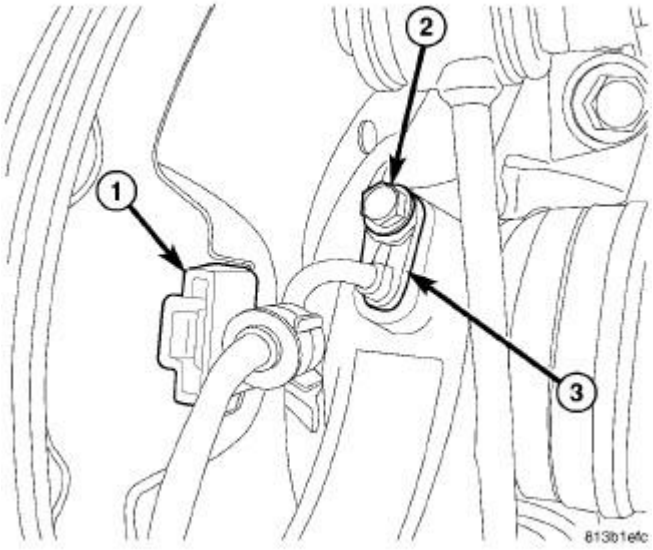

Fig. 32: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Unclip wheel speed sensor cable at rear brake rotor shield (1).
3. Remove screw (2) fastening sensor head (3) to rear knuckle.
4. Remove wheel speed sensor head from knuckle.
5. Access and remove rear hub and bearing. Refer to **HUB AND BEARING, REMOVAL**.
6. Remove parking brake shoes. Refer to **SHOES, PARKING BRAKE, REMOVAL** .

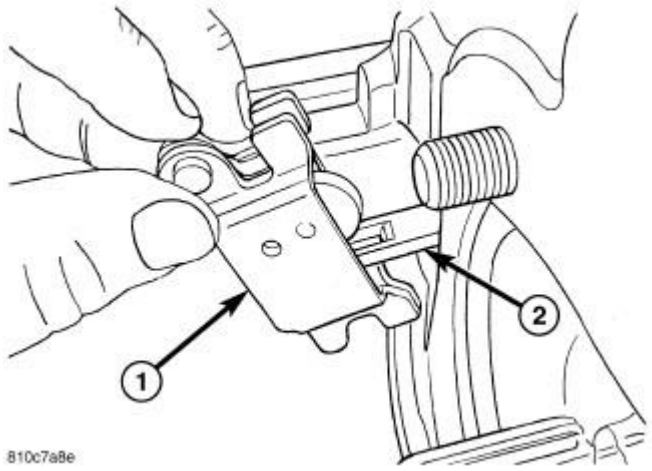

Fig. 33: Removing/Installing Actuator
Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

7. If not removed, remove parking brake shoe actuator lever (1) from end of cable (2).
8. Remove shoe support from knuckle.

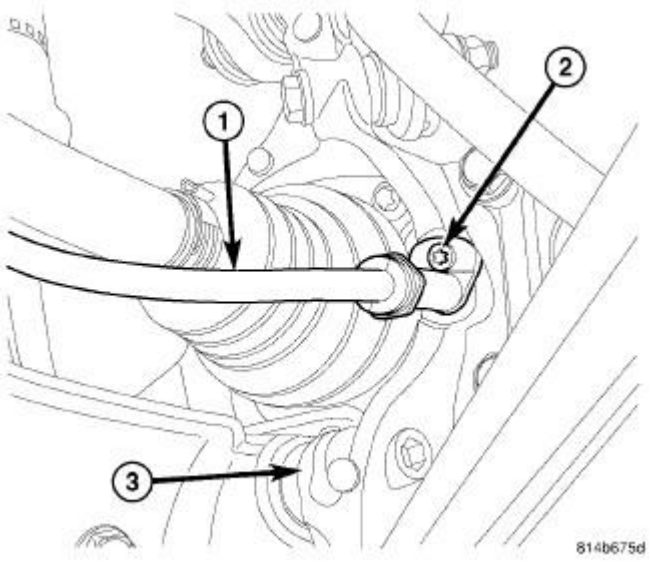

Fig. 34: Parking Brake Cable AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Remove parking brake cable screw (2) at knuckle (3) and pull cable (1) out of knuckle.
10. Position under-hoist utility jack or jack stand under spring link. Raise jack head to contact spring link at shock mount secure in place.

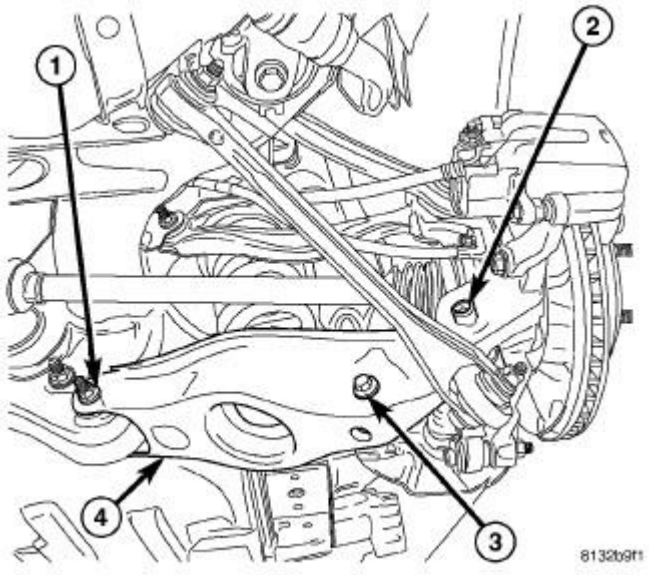

Fig. 35: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Remove spring link-to-knuckle nut and bolt (2).

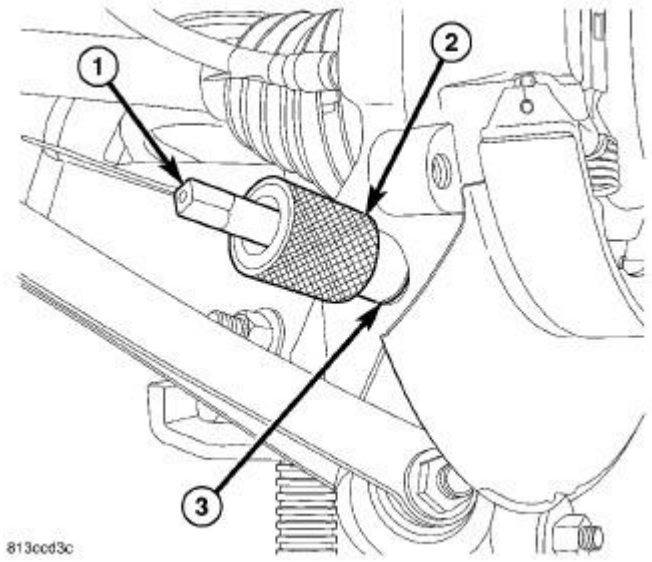

Fig. 36: Using Tap & Guide
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It important to use (special tool #9361-2, Tap Guide) (2), when tapping sleeve in knuckle to help keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1), straight during use or damage to Tap may occur.

12. Place (special tool #9361-2, Tap Guide) (2) against sleeve (3) in knuckle to keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

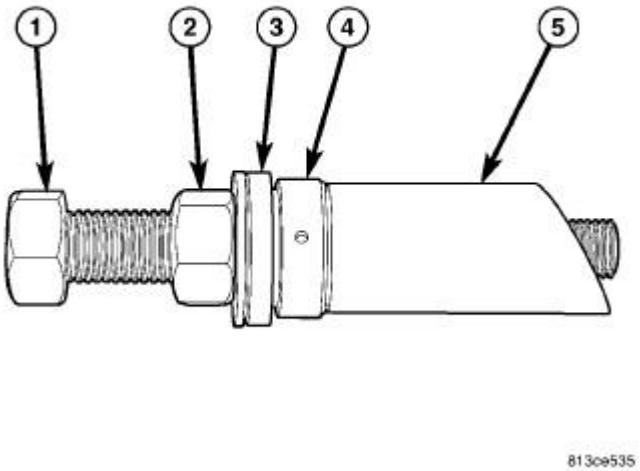

Fig. 37: Lubricate Bolt & Rear Knuckle Sleeve Remover/Installer Kit

Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

13. Assemble (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit) as shown in illustration.
    - (1) (special tool #9361-3, Screw, Forcing)
    - (2) Nut
    - (3) Spherical Washer
    - (4) Thrust Bearing
    - (5) (special tool #9361-4, Cup, Bushing) (RWD)
    - (5) (special tool #9361-5, Cup, Double Angle) (AWD - Left Side)
    - (5) (special tool #9361-6, Cup, Double Angle) (AWD - Right Side)

NOTE: When installing thrust bearing on Remover, be sure to place hardened side against nut. Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve on Remover to provide proper Tool-to-Knuckle contact. RWD sleeve can be used on either side while AWD knuckles require specific left or right side Sleeves.

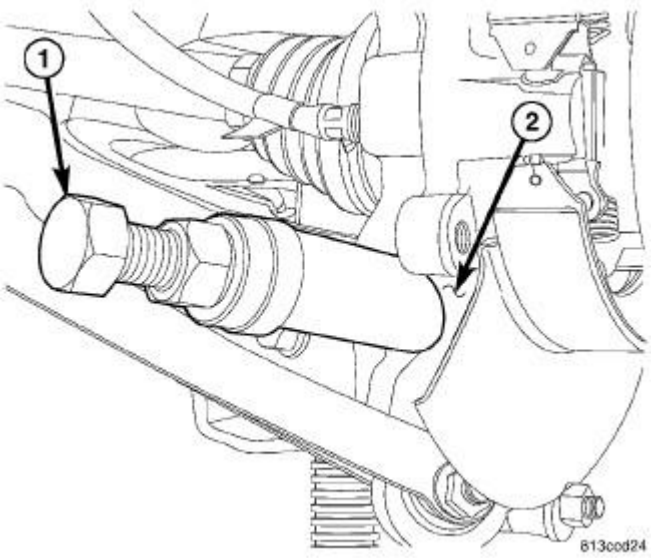

Fig. 38: Sleeve Removal Using
Courtesy of CHRYSLER GROUP, LLC

14. Thread (special tool #9361-3, Screw, Forcing) (1) into tapped knuckle sleeve.

15. Rotate Nut down, matching Sleeve angled end with angled face of knuckle.
16. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

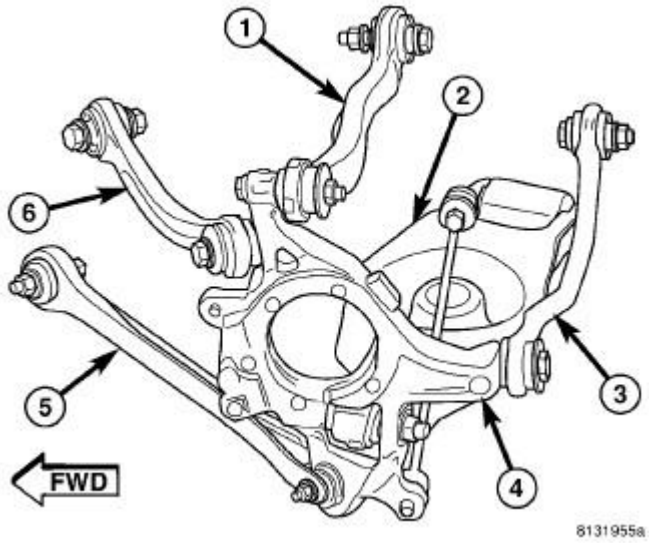

Fig. 39: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

17. Remove bolt and nut fastening compression link (5) to knuckle (4).
18. Remove bolt fastening toe link (3) to knuckle (4).
19. Remove nut and bolt fastening stabilizer link to knuckle (4).
20. Remove nut and bolt fastening tension link (6) to knuckle (4).
21. Remove nut and bolt fastening camber link (1) to knuckle (4).
22. Remove knuckle (4).
23. Remove hub mounting bolts from knuckle.

SRT

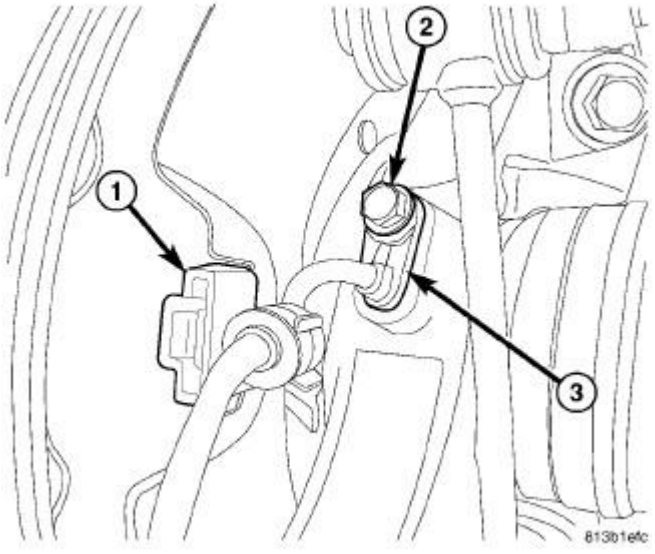

Fig. 40: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Unclip wheel speed sensor cable at rear brake rotor shield (1).
3. Remove screw (2) fastening sensor head (3) to rear knuckle.
4. Remove wheel speed sensor head from knuckle.
5. Access and remove rear hub and bearing. Refer to **HUB AND BEARING, REMOVAL**.
6. Remove parking brake shoes. Refer to **SHOES, PARKING BRAKE, REMOVAL** .

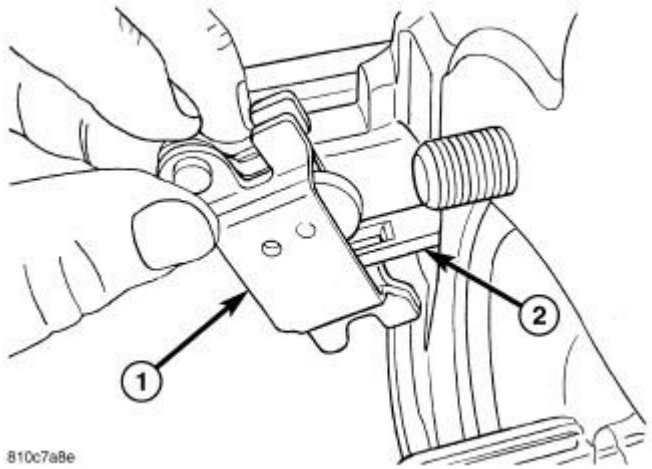

Fig. 41: Removing/Installing Actuator
Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR

2 - CABLE END

7. If not removed, remove parking brake shoe actuator lever (1) from end of cable (2).
8. Remove shoe support from knuckle.

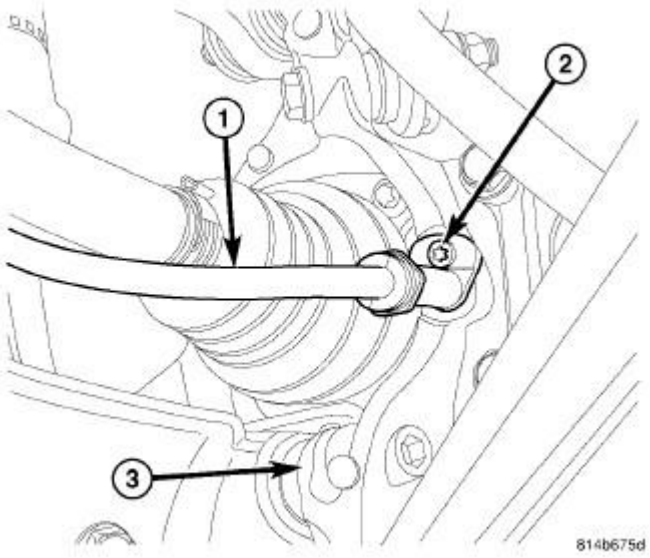

Fig. 42: Parking Brake Cable AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Remove parking brake cable screw (2) at knuckle (3) and pull cable (1) out of knuckle.
10. Position under-hoist utility jack or jack stand under spring link. Raise jack head to contact spring link at shock mount secure in place.

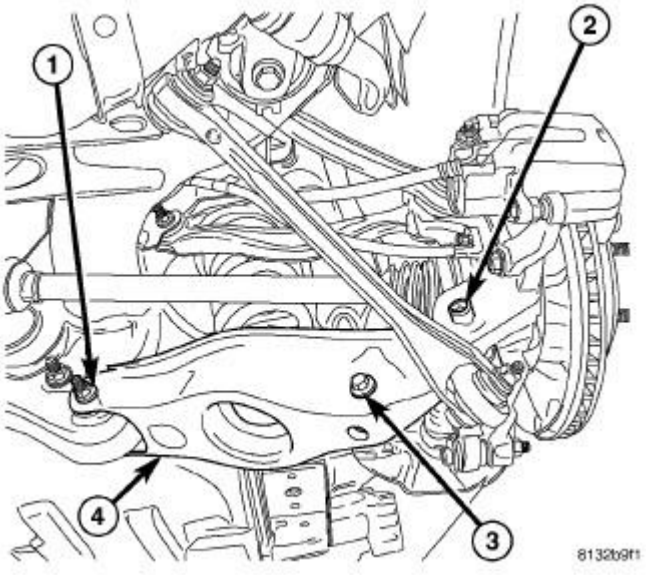

Fig. 43: Spring Link Mounting

Courtesy of CHRYSLER GROUP, LLC

11. Remove spring link-to-knuckle nut and bolt (2).

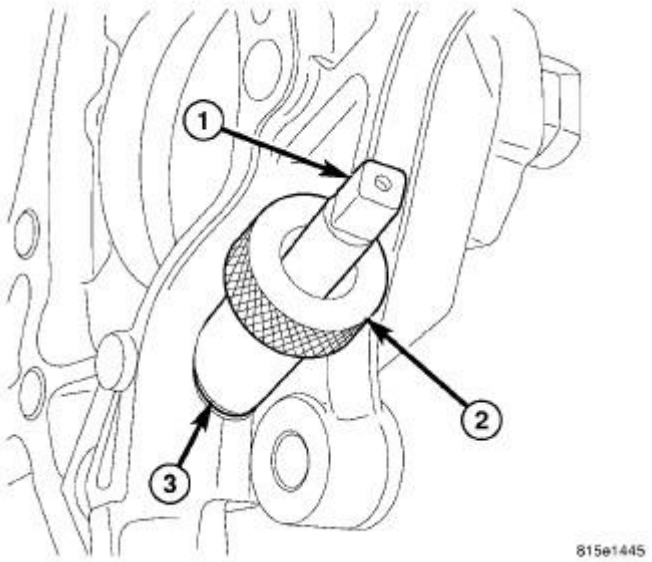

Fig. 44: Using Tap & Guide
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It important to use (special tool #9361-11, Guide, Tap) (2), when tapping sleeve in knuckle to help keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1), straight during use or damage to Tap may occur.

12. Place (special tool #9361-11, Guide, Tap) (2) against sleeve (3) in knuckle to keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

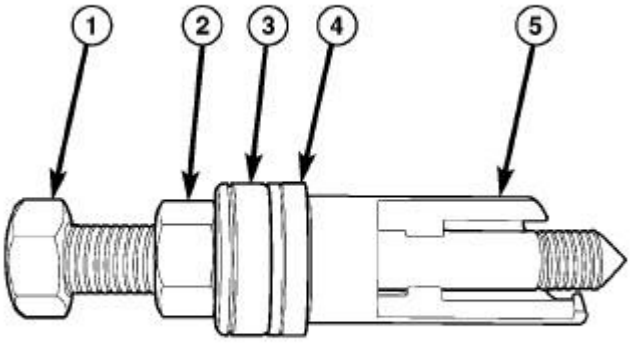

Fig. 45: Rear Knuckle Sleeve Remover/Installer Kit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

13. Assemble (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), as shown in illustration.
    - (1) Bolt (special tool #9361-3, Screw, Forcing)
    - (2) Nut
    - (3) Thrust Bearing
    - (4) Spherical Washer
    - (5) (special tool #9361-9, Cup, Remover, Left Side) (Left Side - Shown in figure)
    - (5) (special tool #9361-10, Cup, Remover, Right Side) (Right Side)

NOTE: When installing thrust bearing (3) on Remover, be sure to place hardened side against nut (2). Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve ((special tool #9361-9, Cup, Remover, Left Side) or (special tool #9361-10, Cup, Remover, Right Side)) on Remover to provide proper Tool-to-Knuckle contact.

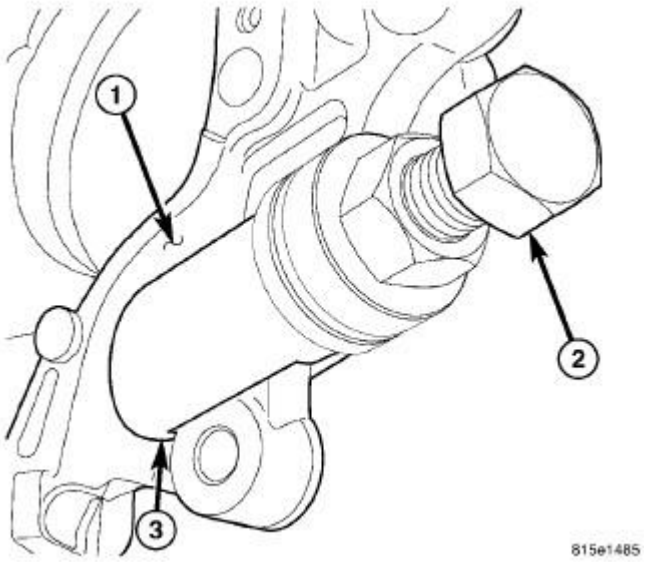

Fig. 46: Thread, knuckle & Sleeve
Courtesy of CHRYSLER GROUP, LLC

14. Thread (special tool #9361-3, Screw, Forcing) (2) into tapped knuckle sleeve.
15. Rotate Nut down, matching Sleeve ((special tool #9361-9, Cup, Remover, Left Side) or (special tool #9361-10, Cup, Remover, Right Side)) angled end with angled face of knuckle (1). **Make sure foot on Sleeve (3) is inserted behind machined brake caliper mounting boss.**
16. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

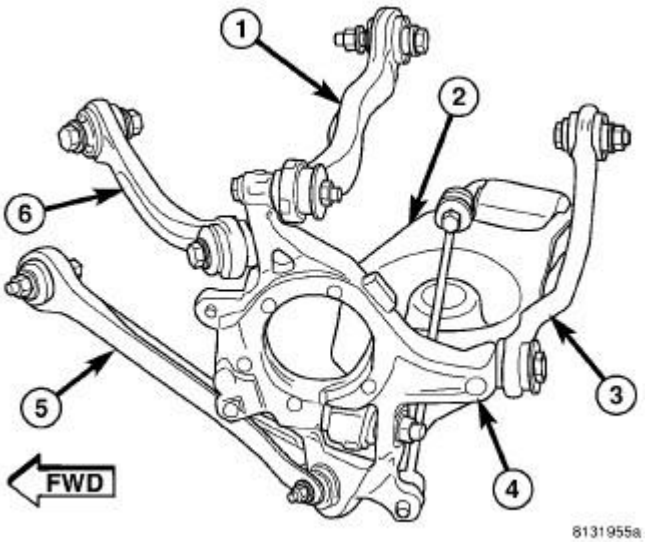

Fig. 47: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

17. Remove bolt and nut fastening compression link (5) to knuckle (4).
18. Remove bolt fastening toe link (3) to knuckle (4).
19. Remove nut and bolt fastening stabilizer link to knuckle (4).
20. Remove nut and bolt fastening tension link (6) to knuckle (4).
21. Remove nut and bolt fastening camber link (1) to knuckle (4).
22. Remove knuckle (4).
23. Remove hub mounting bolts from knuckle.

INSTALLATION

NON SRT

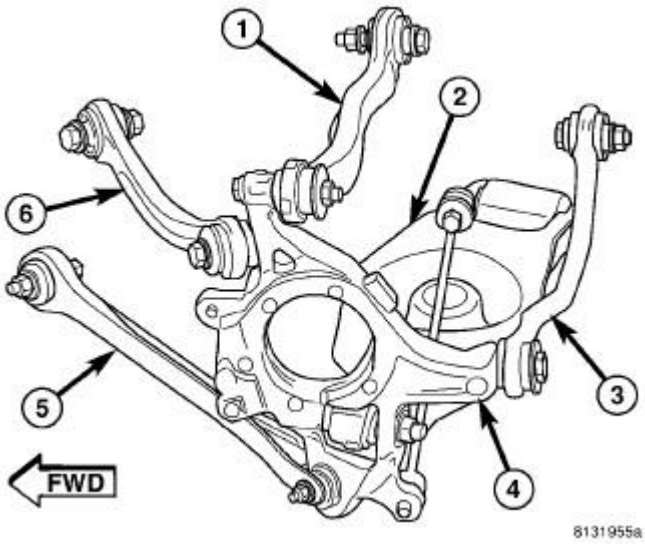

Fig. 48: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Position knuckle on vehicle and install bolt and nut fastening camber link (1) to knuckle (4) as shown in illustration. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown in illustration. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

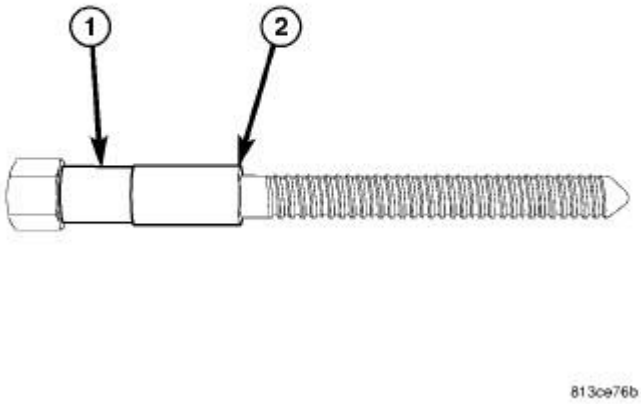

Fig. 49: Bolt & Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If a new knuckle sleeve is not installed in knuckle, perform 7through11.**

NOTE: **Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate bolt (1) threads to provide ease of use and promote tool longevity.**

7. Place NEW knuckle sleeve (2) onto (special tool #9361-7, Screw, Installation) (1), and slide it up to Bolt head.

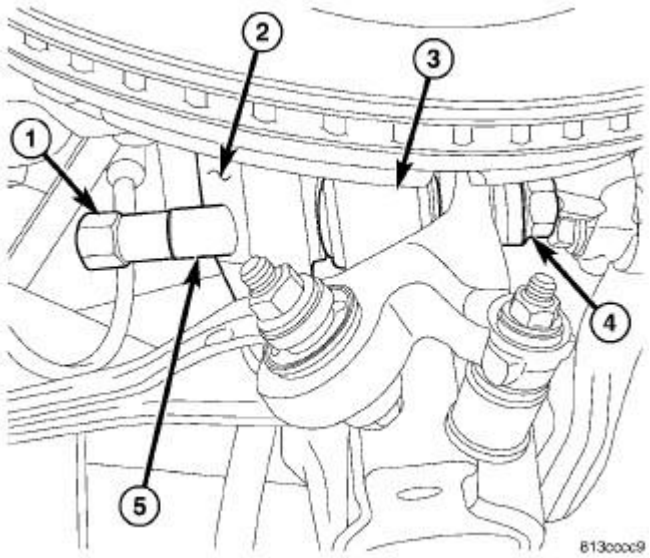

Fig. 50: Slide, Sleeve, Knuckle, Bearing And Nut

Courtesy of CHRYSLER GROUP, LLC

8. Starting from knuckle forward end, slide (special tool #9361-7, Screw, Installation) (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
9. Install thrust bearing and nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
11. Remove special tool.

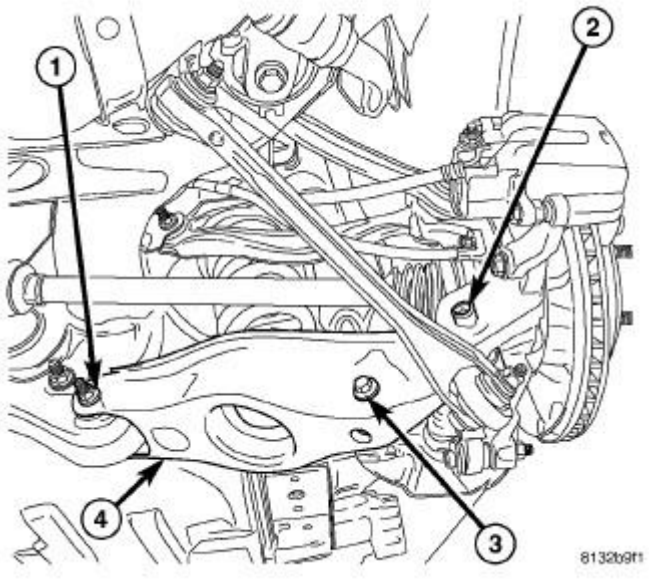

Fig. 51: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
13. Remove under-hoist utility jack or jack stand from under spring link.

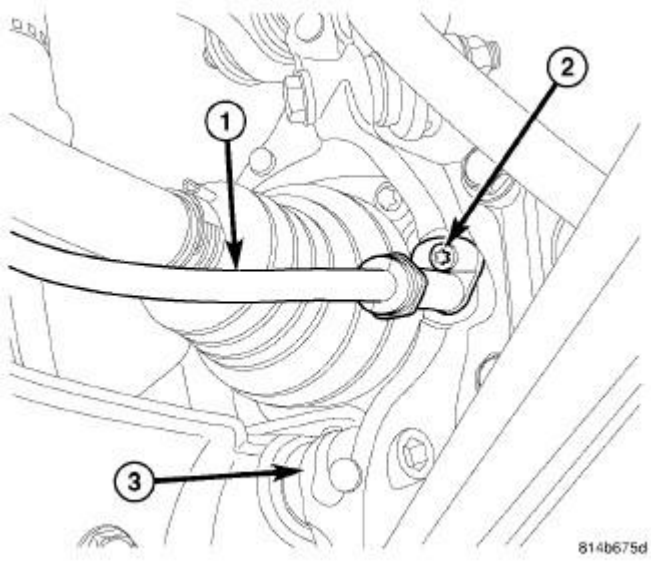

Fig. 52: Parking Brake Cable AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

14. Insert end of cable (1) through rear knuckle (3) and install mounting screw (2). Tighten screw to 8 N.m (71 in. lbs.).
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

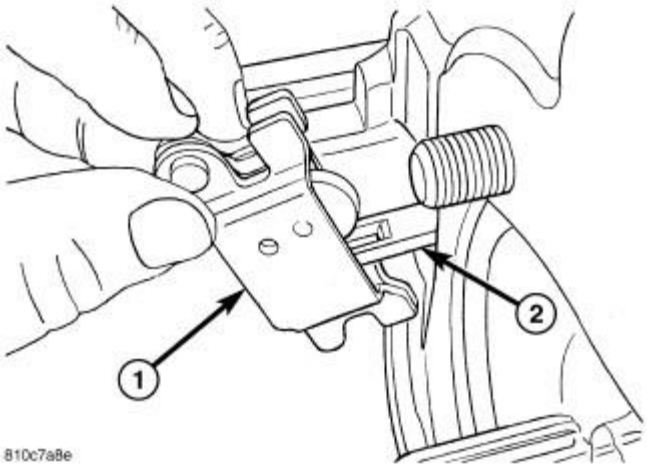

Fig. 53: Removing/Installing Actuator
Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.

17. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION** .

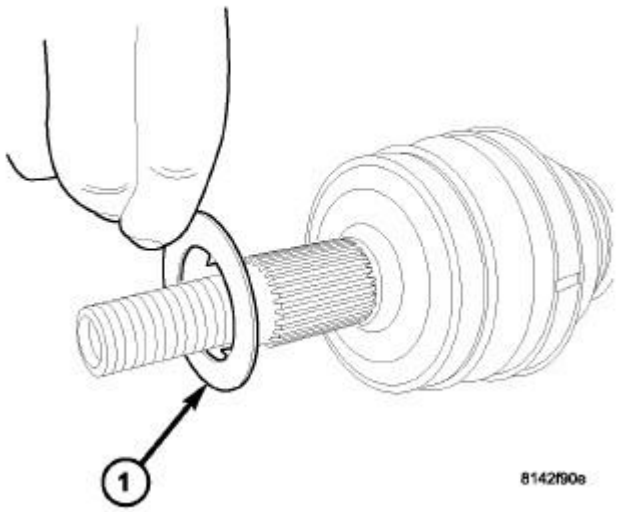

Fig. 54: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

18. Install hub and bearing as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION**.

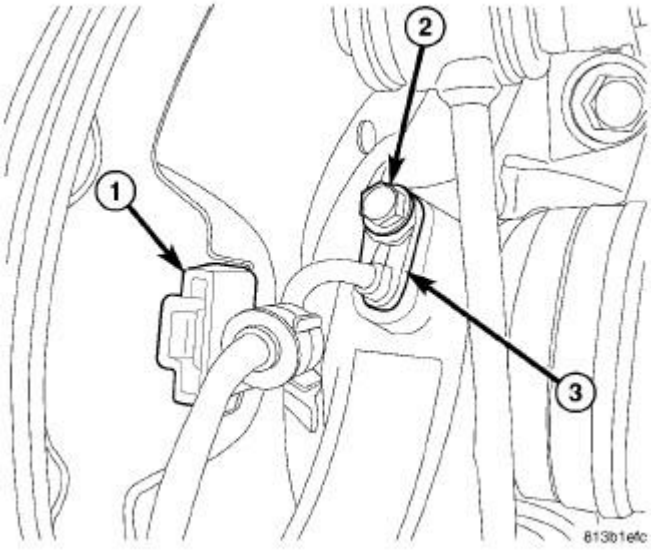

Fig. 55: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

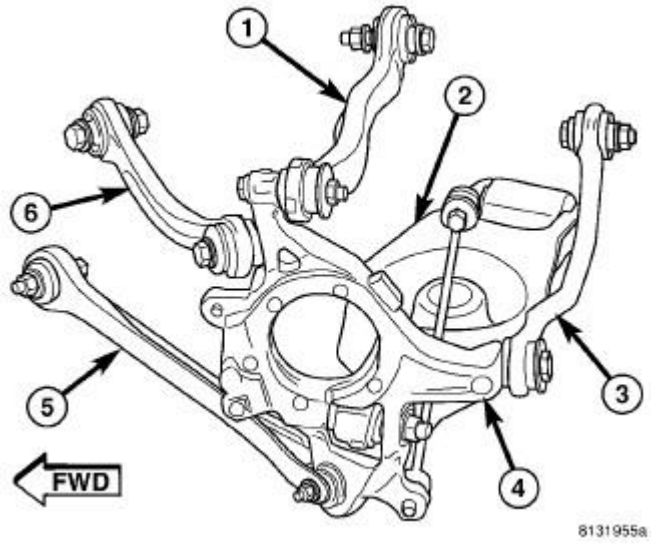

Fig. 56: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:
    - Camber Link (1) - 98 N.m (72 ft. lbs.).
    - Compression Link (5) - 81 N.m (60 ft. lbs.).
    - Stabilizer Link - 61 N.m (45 ft. lbs.).
    - Tension Link (6) - 98 N.m (72 ft. lbs.).
    - Toe Link (3) - 95 N.m (70 ft. lbs.).
26. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SRT

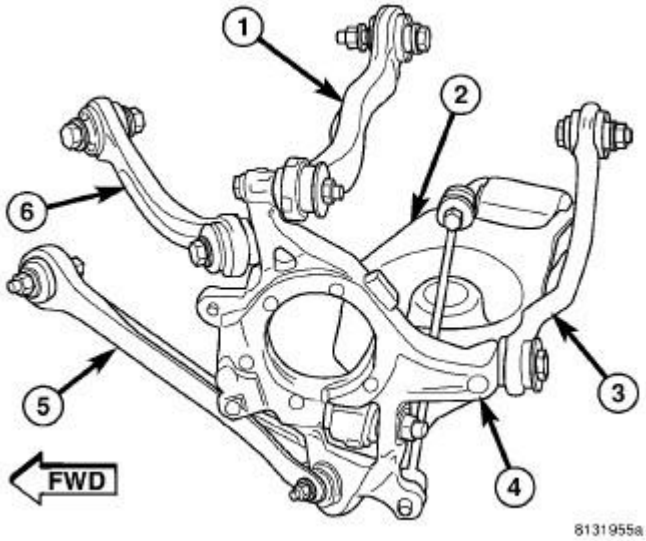

Fig. 57: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Position knuckle on vehicle and install bolt and nut fastening camber link (1) to knuckle (4) as shown in illustration. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown in illustration. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

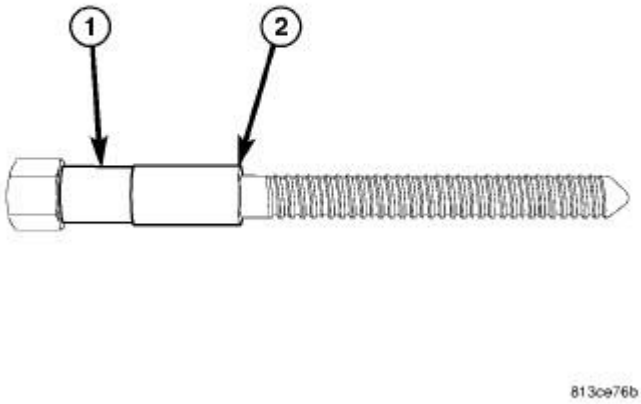

Fig. 58: Bolt & Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: If a new knuckle sleeve is not installed in knuckle, perform 7through 11.

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate bolt (1) threads to provide ease of use and promote tool longevity.

7. Place NEW knuckle sleeve (2) onto (special tool #9361-12, Installer, Bushing) (1), and slide it up to the bolt head.

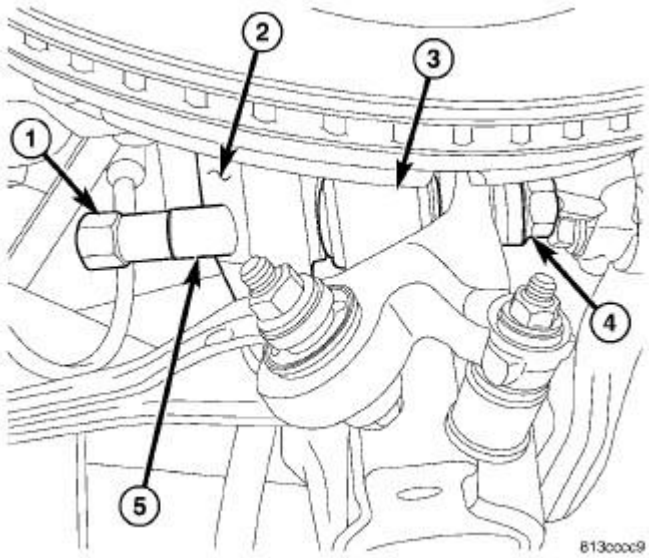

Fig. 59: Slide, Sleeve, Knuckle, Bearing And Nut

Courtesy of CHRYSLER GROUP, LLC

8. Starting from knuckle forward end, slide (special tool #9361-12, Installer, Bushing) (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
9. Install Installation Thrust Bearing (around 3/8 inch thick) and special flange nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
11. Remove special tool.

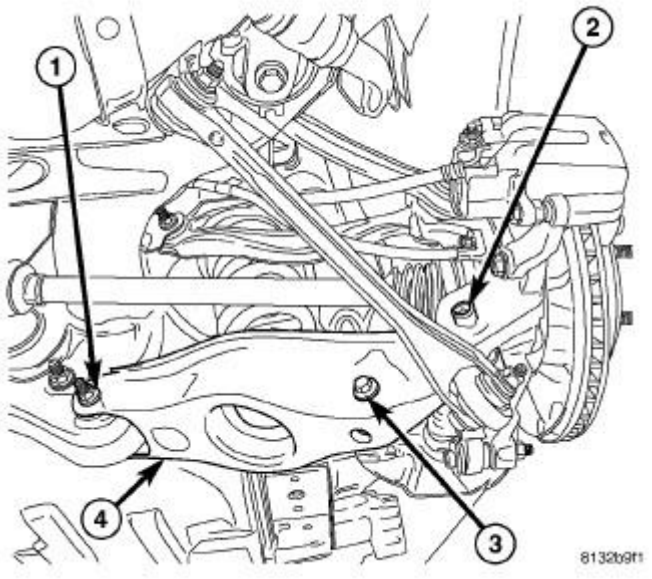

Fig. 60: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
13. Remove under-hoist utility jack or jack stand from under spring link.

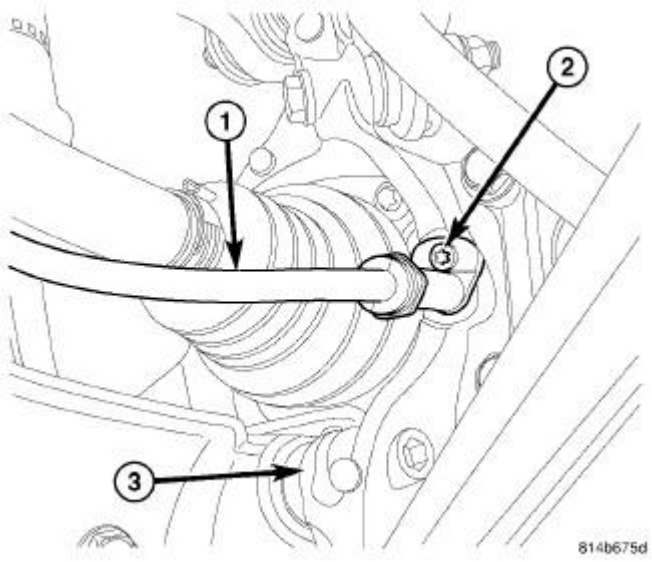

Fig. 61: Parking Brake Cable AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

14. Insert end of cable (1) through rear knuckle (3) and install mounting screw (2). Tighten screw to 8 N.m (71 in. lbs.).
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

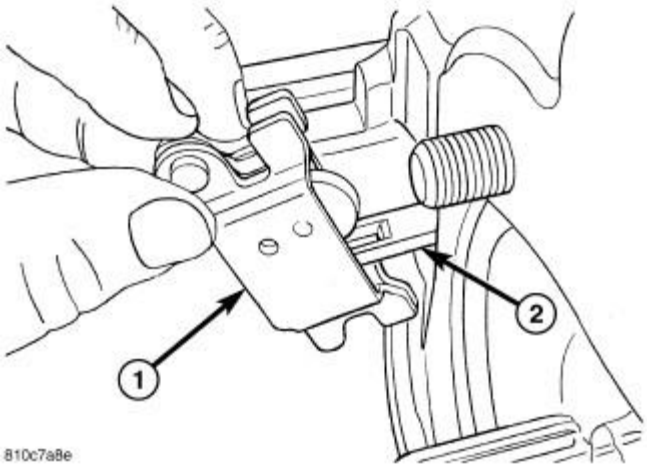

Fig. 62: Removing/Installing Actuator
Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.

17. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION** .

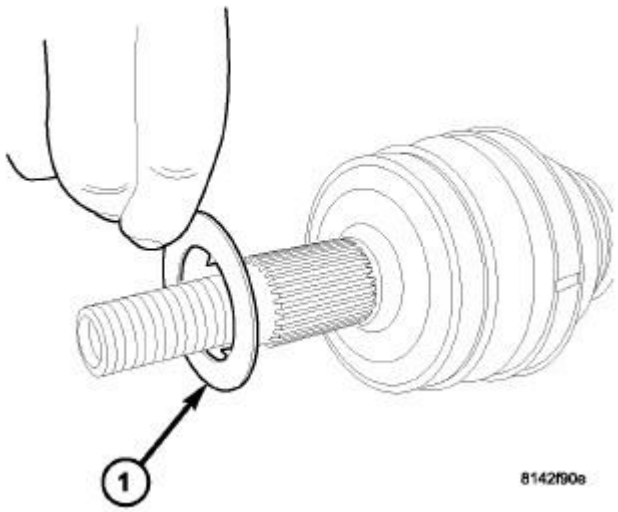

Fig. 63: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

18. Install hub and bearing as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION**.

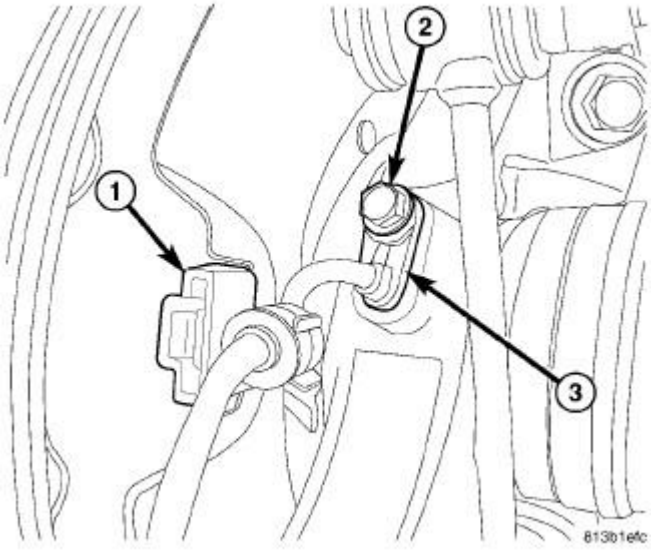

Fig. 64: Wheel Speed Sensor AT Rear Knuckle
Courtesy of CHRYSLER GROUP, LLC

19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

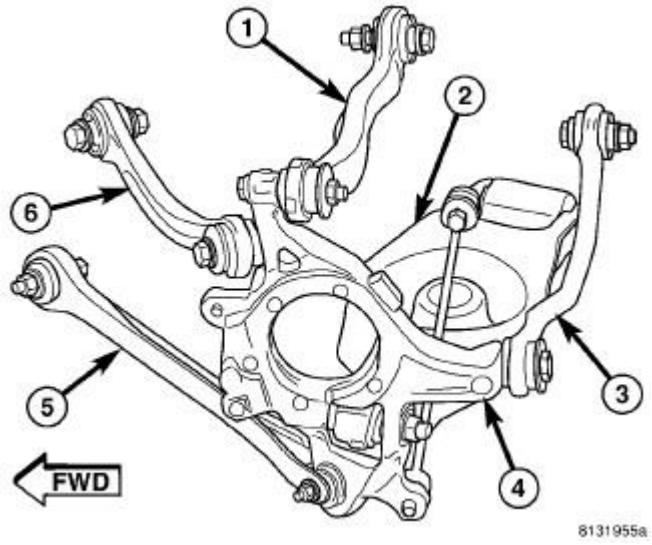

Fig. 65: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:
    - Camber Link (1) - 98 N.m (72 ft. lbs.)
    - Compression Link (5) - 81 N.m (60 ft. lbs.)
    - Stabilizer Link - 61 N.m (45 ft. lbs.)
    - Tension Link (6) - 98 N.m (72 ft. lbs.)
    - Toe Link (3) - 95 N.m (70 ft. lbs.)
26. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, CAMBER

REMOVAL

REMOVAL

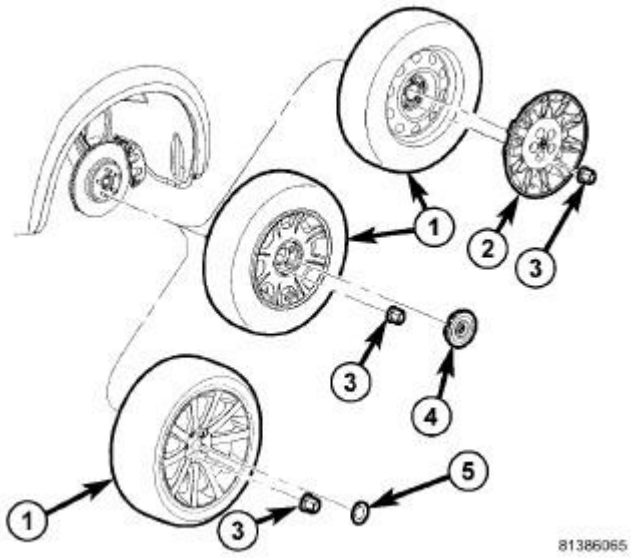

Fig. 66: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

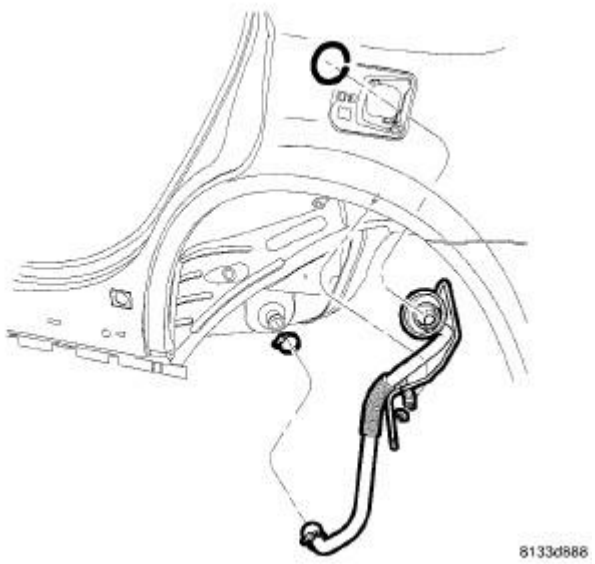

Fig. 67: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
    1. Position under-hoist utility jack or stand several inches below exhaust at muffler.
    2. Disconnect exhaust isolators at muffler and resonators hangers.
    3. Lower exhaust down to rest upon top of jack or stand placed below muffler.

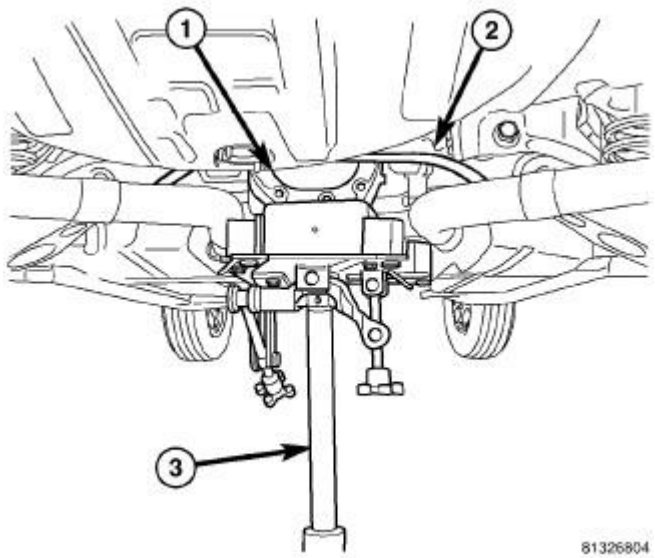

Fig. 68: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

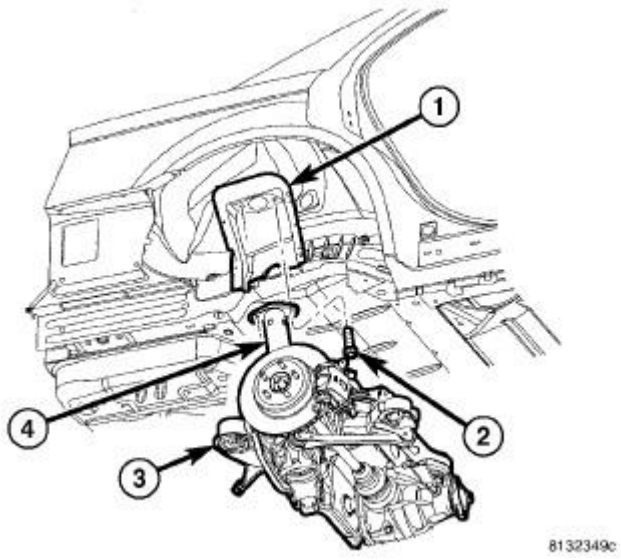

Fig. 69: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

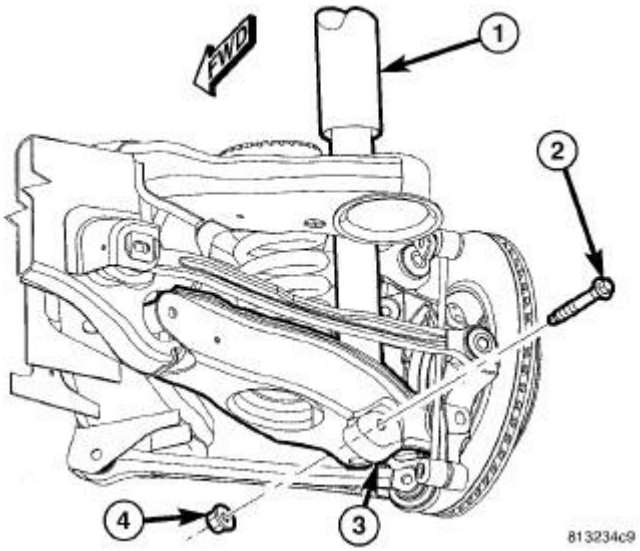

Fig. 70: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

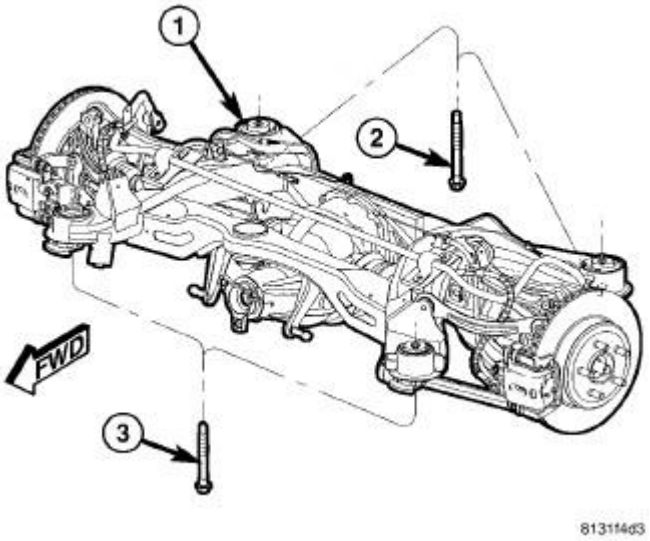

Fig. 71: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.

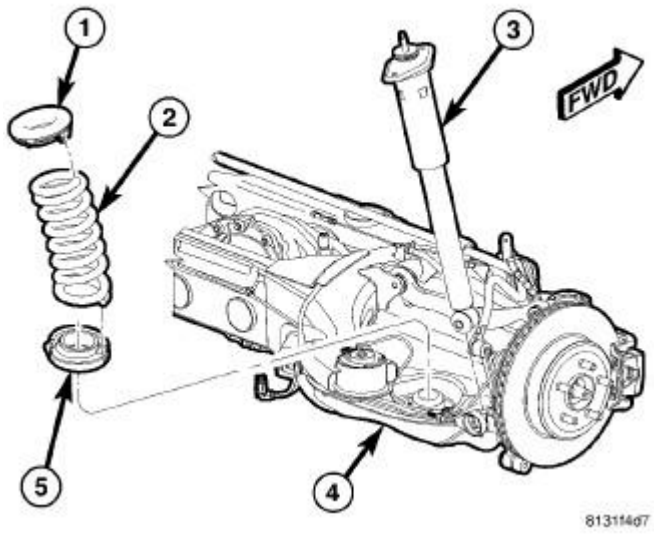

Fig. 72: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

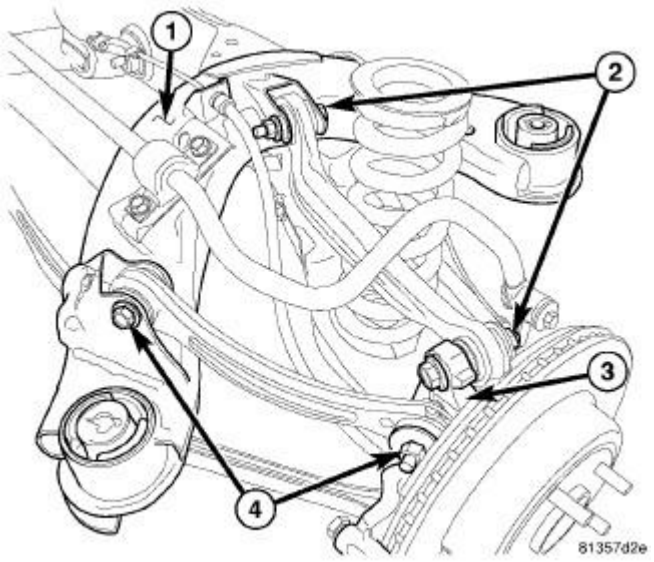

Fig. 73: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (2) mounting link to knuckle (3).
13. Remove nut and bolt (2) mounting link to crossmember (1).
14. Remove link.

INSTALLATION

INSTALLATION

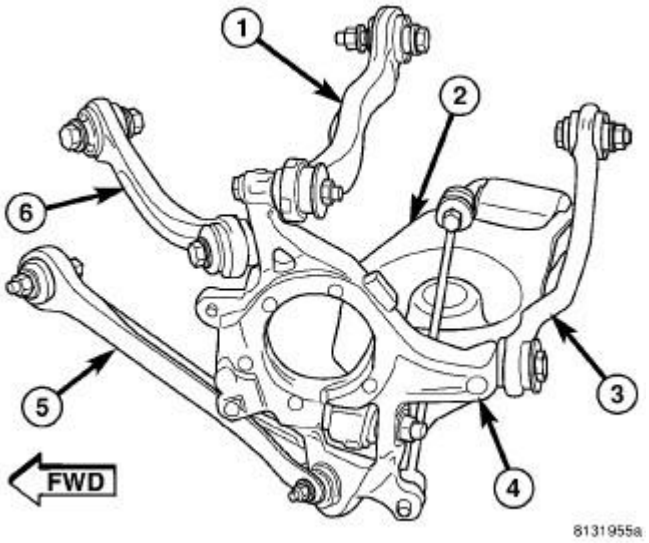

Fig. 74: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing link (1), ensure following to avoid mis-installation:

- **Heavier, thicker end goes toward crossmember.**
- **Fore-or-aft bow faces forward (curves around coil spring).**
- **Up-or-down bow faces downward.**

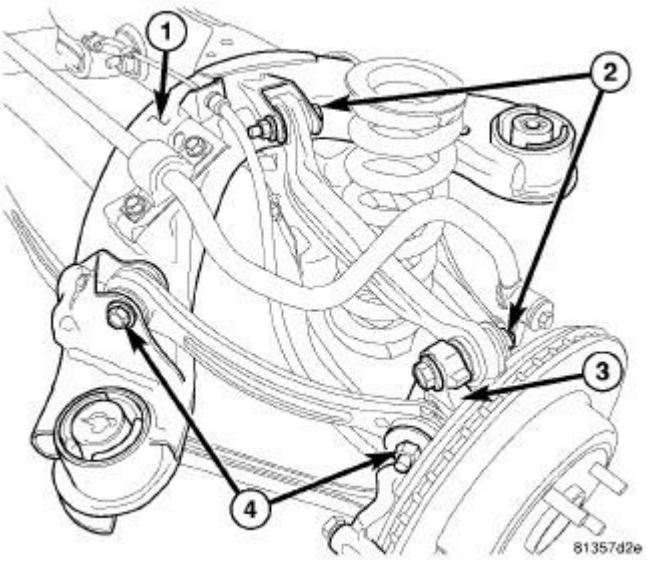

Fig. 75: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

1. Place link in bracket on crossmember (1). Install bolt and nut (2) at crossmember (1) as shown

in illustration. **Do not tighten bolt at this time.**

2. Install bolt and nut (2) mounting link to knuckle (3) as shown in illustration. **Do not tighten bolt at this time.**

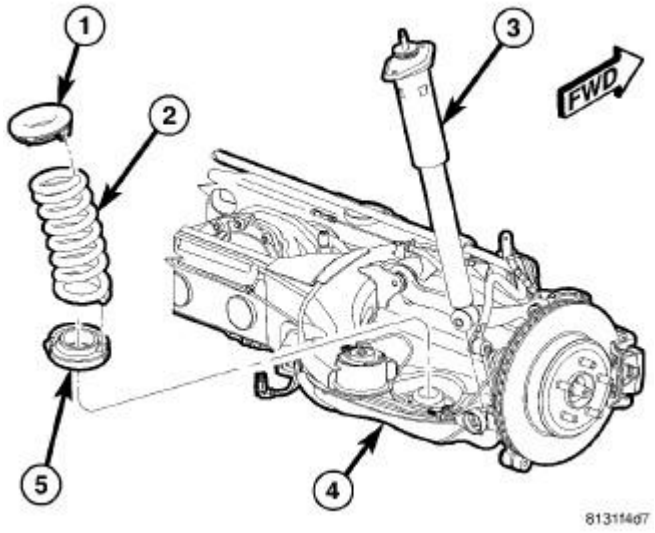

Fig. 76: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

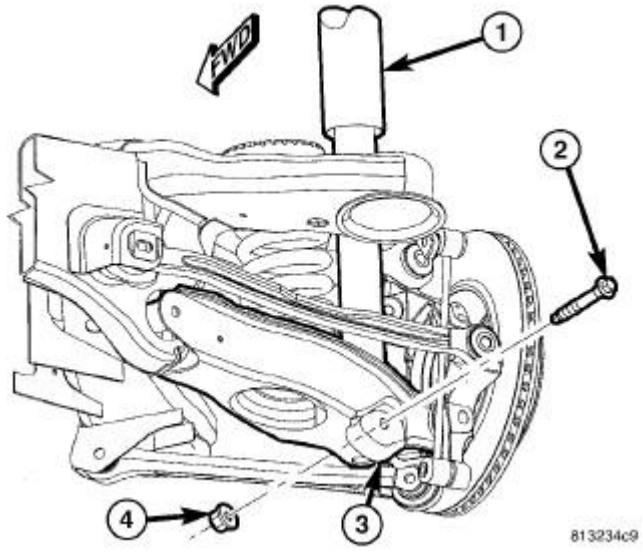

Fig. 77: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

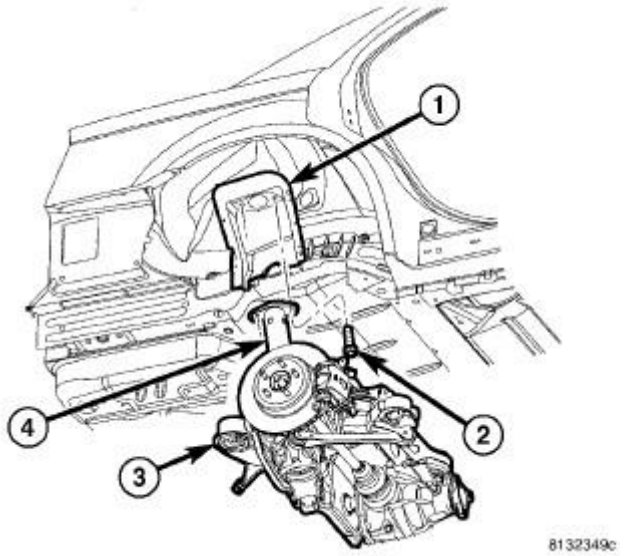

Fig. 78: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

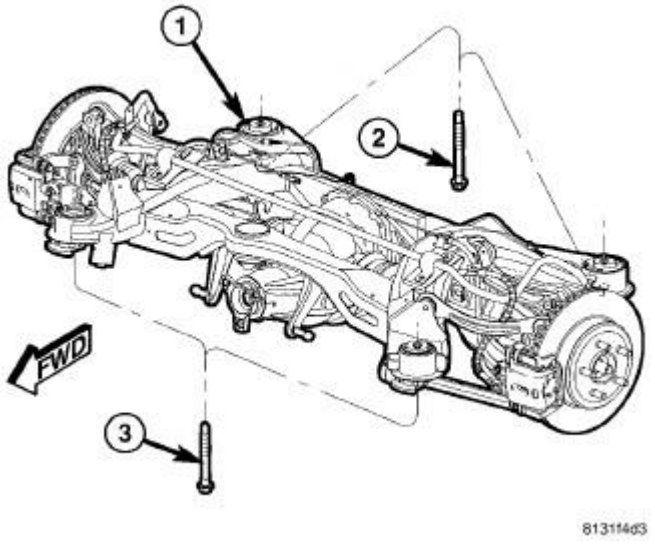

Fig. 79: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.**

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

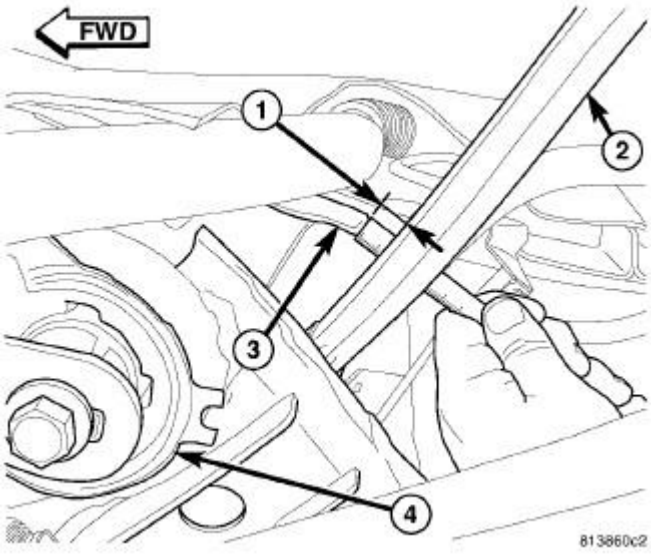

Fig. 80: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

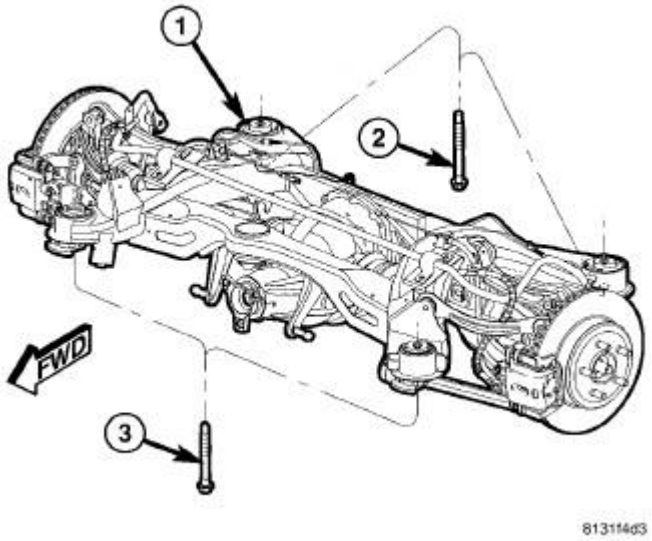

Fig. 81: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

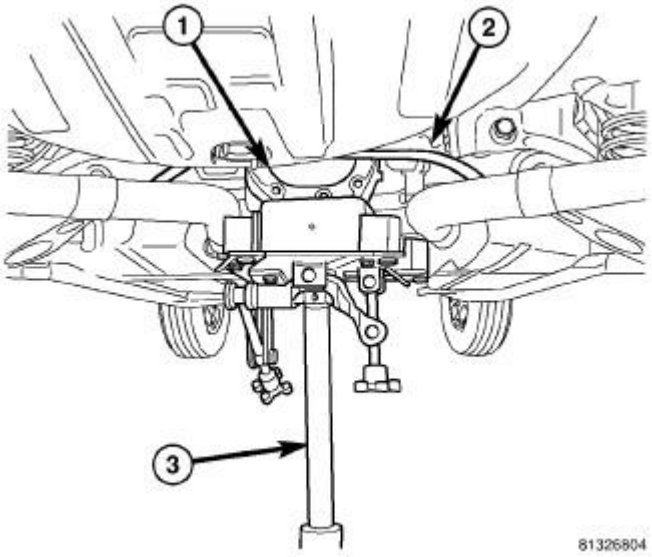

Fig. 82: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

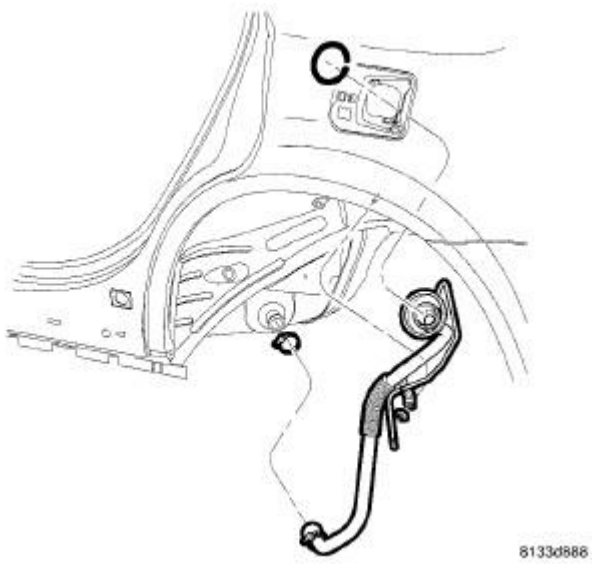

Fig. 83: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

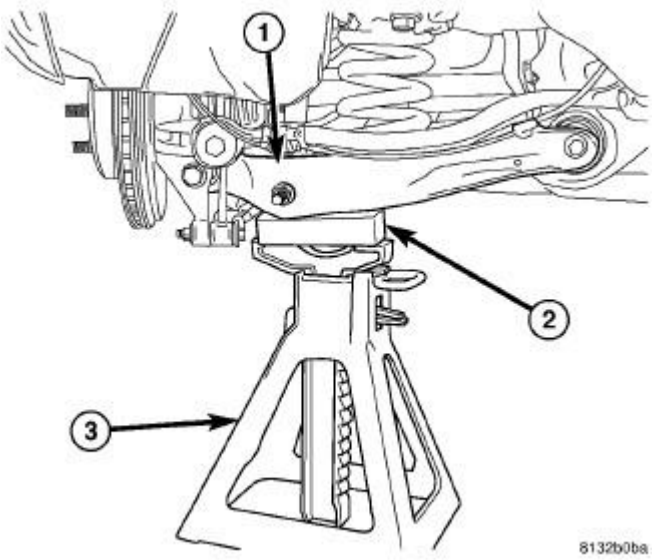

Fig. 84: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

13. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

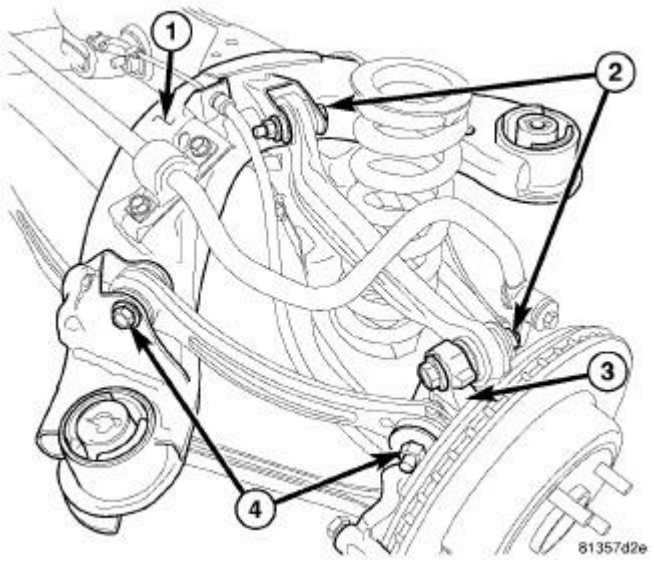

Fig. 85: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

14. Tighten camber link fasteners (2) to:
    - Bolt at crossmember - 85 N.m (63 ft. lbs.).
    - Bolt nut at knuckle - 98 N.m (72 ft. lbs.).

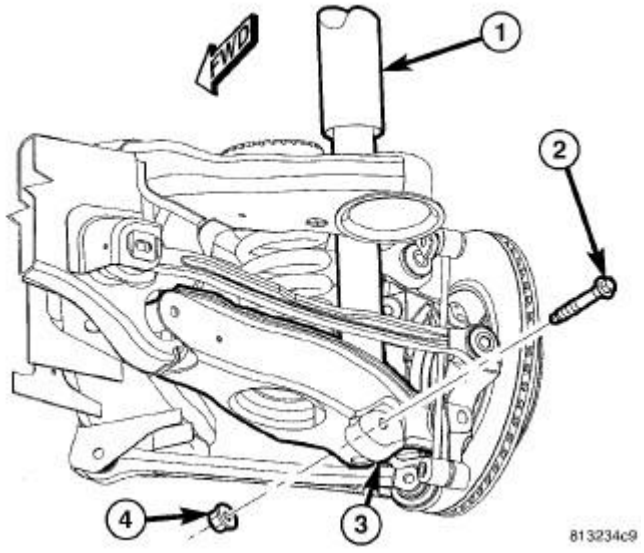

Fig. 86: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

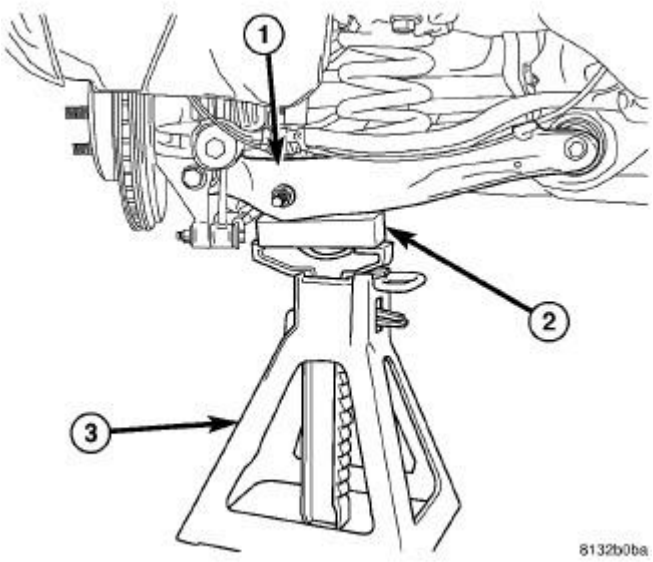

Fig. 87: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

16. Raise vehicle and remove jack stands (3).

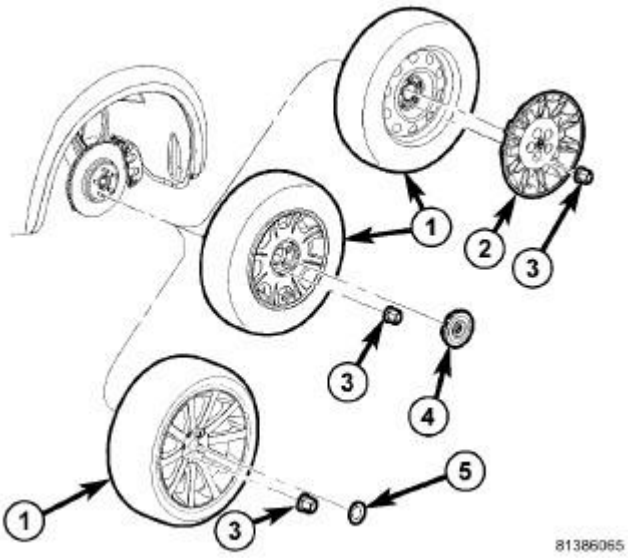

Fig. 88: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
18. Lower vehicle.
19. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, COMPRESSION

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

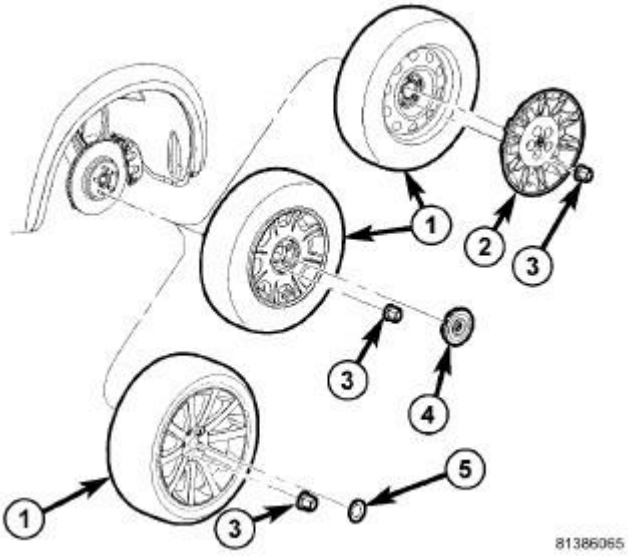

Fig. 89: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

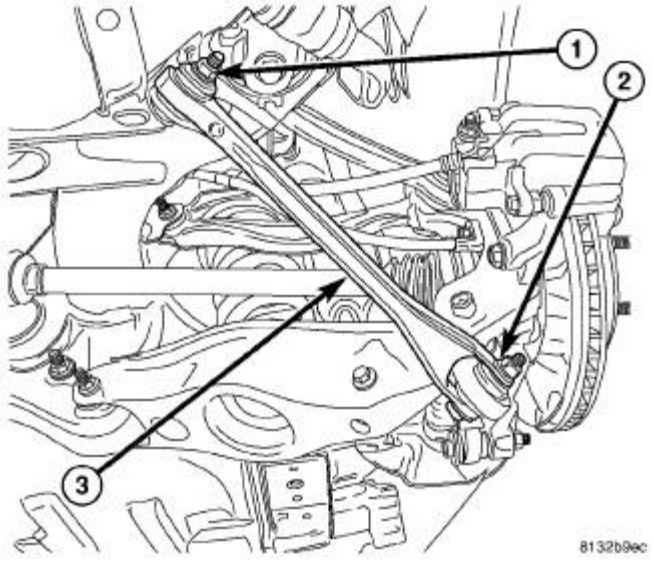

Fig. 90: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolt and nut (2) mounting link (3) at knuckle.
4. Remove bolt and nut (1) mounting link (3) at crossmember.
5. Remove link (3).

INSTALLATION

INSTALLATION

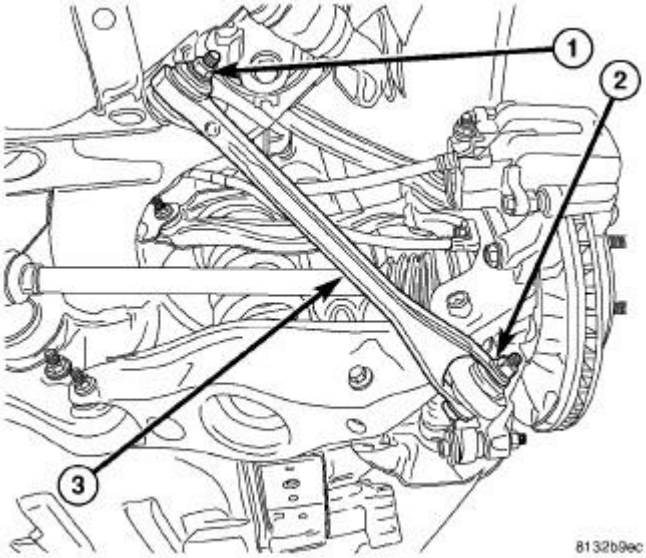

Fig. 91: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: Although the compression link is different end-to-end, there is no top and bottom.

1. Position link and install bolt and nut (1) mounting link (3) at crossmember. **Do not tighten bolt at this time.**
2. Install bolt and nut (2) mounting link (3) at knuckle. **Do not tighten bolt at this time.**

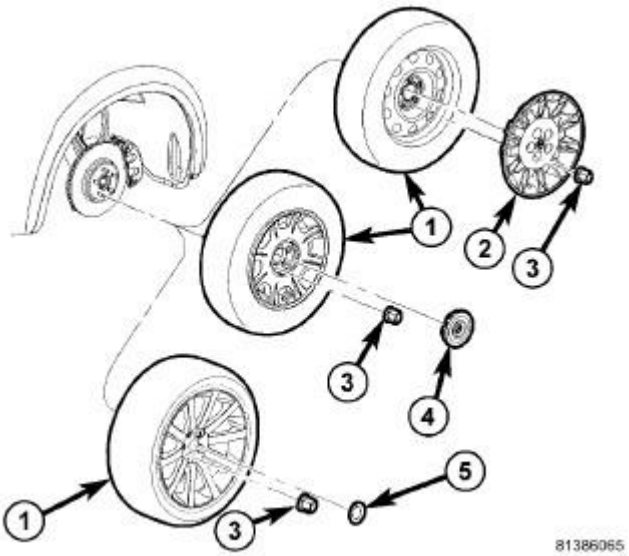

Fig. 92: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
4. Lower vehicle.
5. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access link fasteners.
6. Tighten compression link fasteners to:
   - Bolt at crossmember - 85 N.m (63 ft. lbs.).
   - Bolt at knuckle - 81 N.m (60 ft. lbs.).
7. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, SPRING

REMOVAL

NON SRT

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Access and remove rear spring. Refer to **SPRING(S), REMOVAL**.

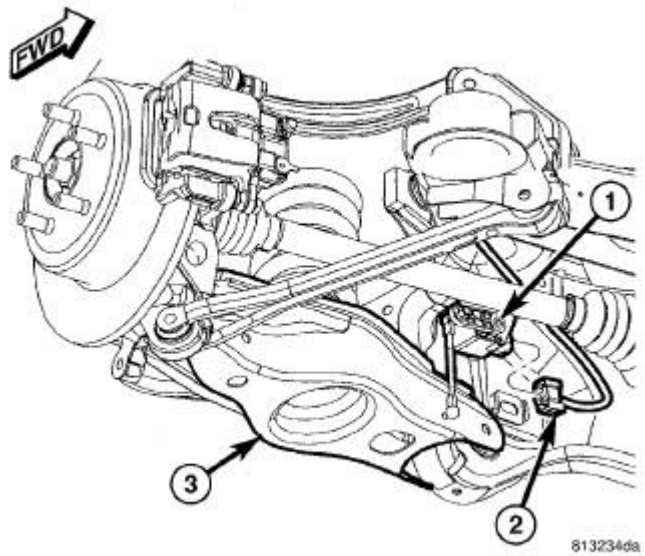

Fig. 93: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Export Only - If servicing right spring link, disconnect headlamp leveling sensor (1) link at spring link (3).

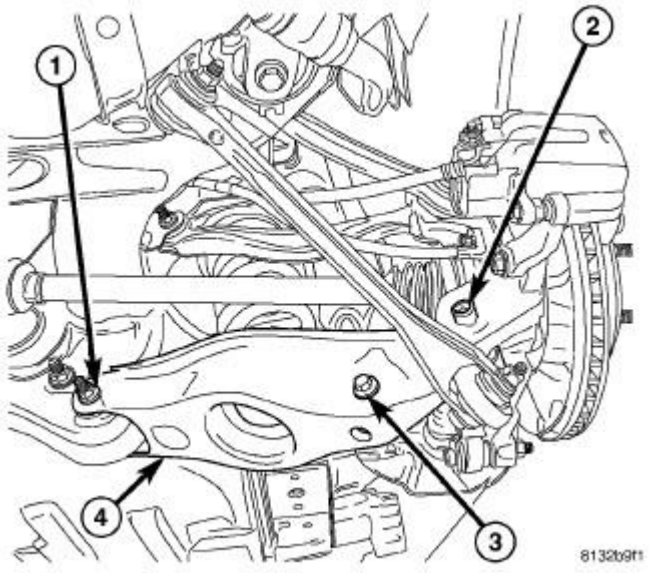

Fig. 94: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove spring link-to-knuckle nut and bolt (2).

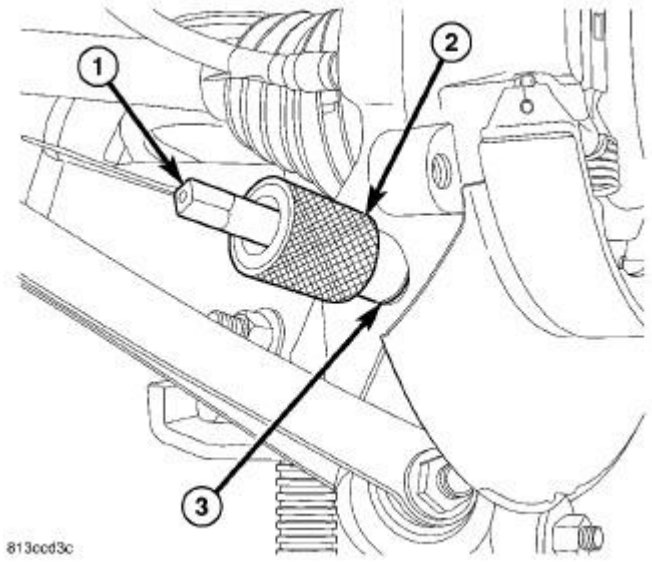

Fig. 95: Using Tap & Guide
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It important to use (special tool #9361-2, Tap Guide) (2) when tapping sleeve in knuckle to help keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1) straight during use or damage to Tap may occur.

5. Place (special tool #9361-2, Tap Guide) (2) against sleeve (3) in knuckle to keep(special tool #9361-1, Tap, Plug M16 X 2.0) (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

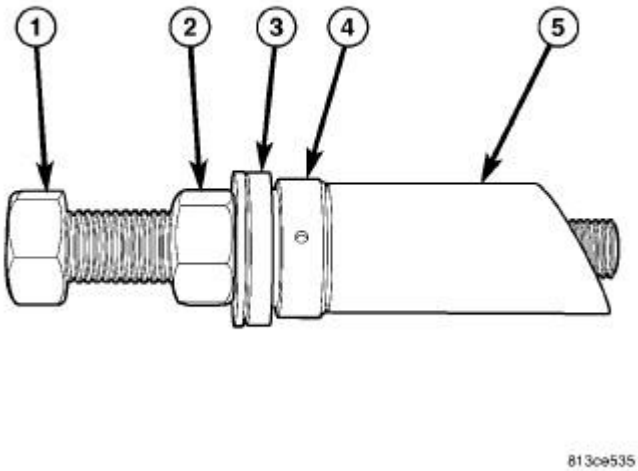

Fig. 96: Lubricate Bolt & Rear Knuckle Sleeve Remover/Installer Kit

Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

6. Assemble (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit) as shown in illustration.
   - (1) (special tool #9361-3, Screw, Forcing)
   - (2) Nut
   - (3) Spherical Washer
   - (4) Thrust Bearing
   - (5) (special tool #9361-4, Cup, Bushing) (RWD)
   - (5) (special tool #9361-5, Cup, Double Angle) (AWD - Left Side)
   - (5) (special tool #9361-6, Cup, Double Angle) (AWD - Right Side)

NOTE: When installing thrust bearing on Remover, be sure to place hardened side against nut. Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve on Remover to provide proper Tool-to-Knuckle contact. RWD sleeve can be used on either side while AWD knuckles require specific left or right side Sleeves.

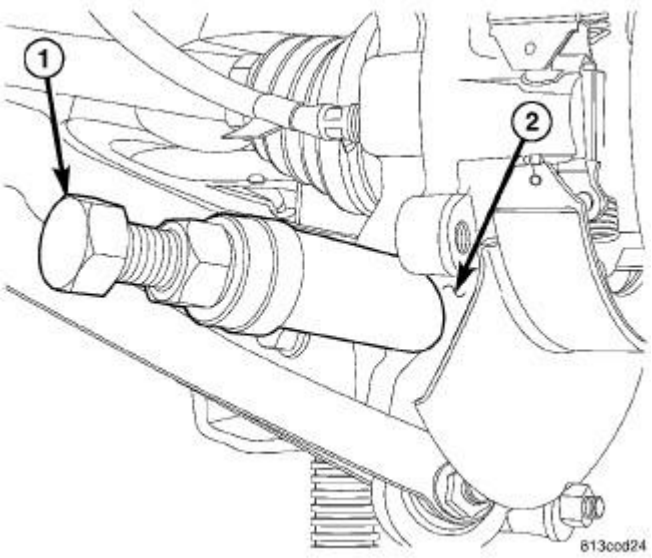

Fig. 97: Sleeve Removal Using
Courtesy of CHRYSLER GROUP, LLC

7. Thread (special tool #9361-3, Screw, Forcing) (1) into tapped knuckle sleeve.

8. Rotate Nut down, matching Sleeve angled end with angled face of knuckle.
9. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

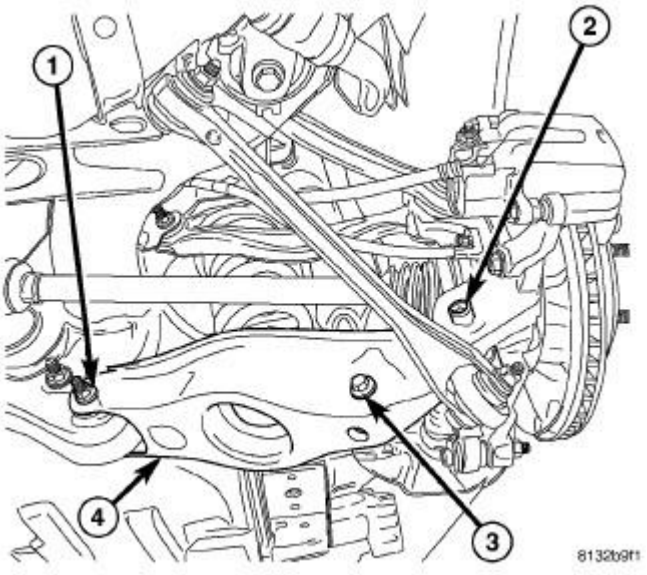

Fig. 98: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Remove bolt and nut (1) fastening spring link (4) to crossmember.
11. Remove spring link (4).

SRT

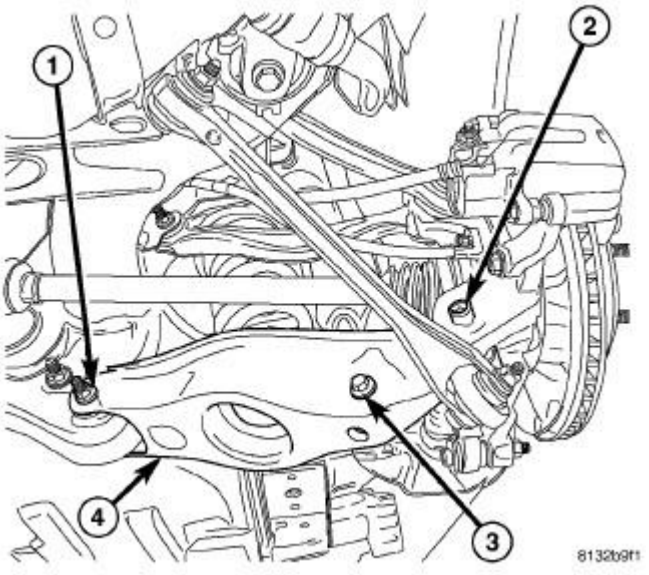

Fig. 99: Spring Link Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Access and remove rear brake rotor on side of repair. Refer to **ROTOR, BRAKE, REMOVAL** .
2. Access and remove rear spring on side of repair. Refer to **SPRING(S), REMOVAL**.
3. Remove spring link-to-knuckle nut and bolt (2).

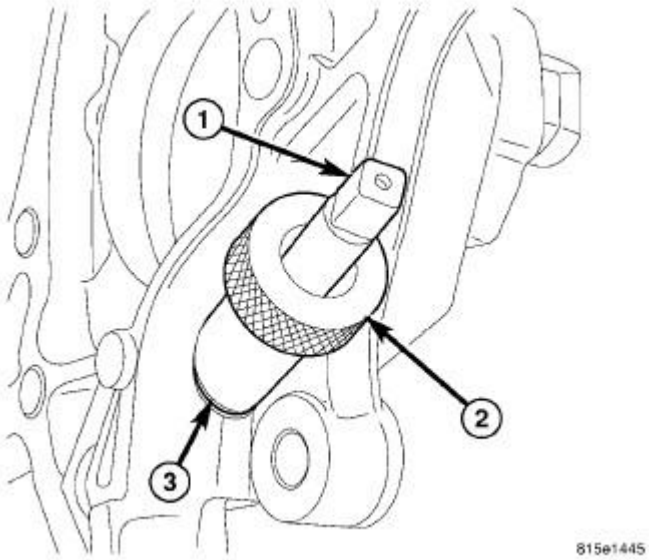

Fig. 100: Using Tap & Guide
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It important to use (special tool #9361-11, Guide, Tap) (2), when tapping sleeve in knuckle to help keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1), straight during use or damage to Tap may occur.

4. Place Guide (special tool #9361-11, Guide, Tap) (2) against sleeve (3) in knuckle to keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

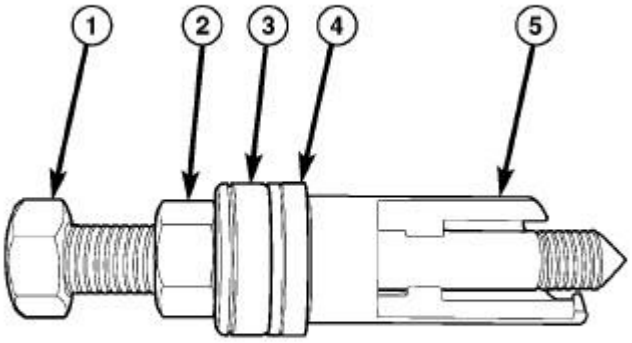

Fig. 101: Rear Knuckle Sleeve Remover/Installer Kit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

5. Assemble Remover, (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), as shown in illustration.
   - (1) (special tool #9361-3, Screw, Forcing)
   - (2) Nut
   - (3) Thrust Bearing
   - (4) Spherical Washer
   - (5) (special tool #9361-9, Cup, Remover, Left Side) (Left Side - Shown in figure)
   - (5) (special tool #9361-10, Cup, Remover, Right Side) (Right Side)

NOTE: When installing thrust bearing (3) on Remover, be sure to place hardened side against nut (2). Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve ((special tool #9361-9, Cup, Remover, Left Side) or (special tool #9361-10, Cup, Remover, Right Side)) on Remover to provide proper Tool-to-Knuckle contact.

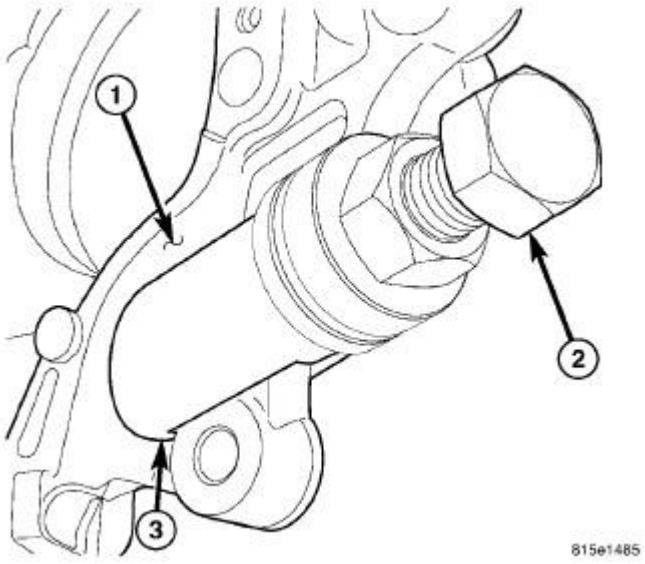

Fig. 102: Thread, knuckle & Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Thread (special tool #9361-3, Screw, Forcing) (2) into tapped knuckle sleeve.
7. Rotate Nut down, matching Sleeve ((special tool #9361-9, Cup, Remover, Left Side) or (special tool #9361-10, Cup, Remover, Right Side)) angled end with angled face of knuckle (1). **Make sure foot on Sleeve (3) is inserted behind machined brake caliper mounting boss.**
8. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

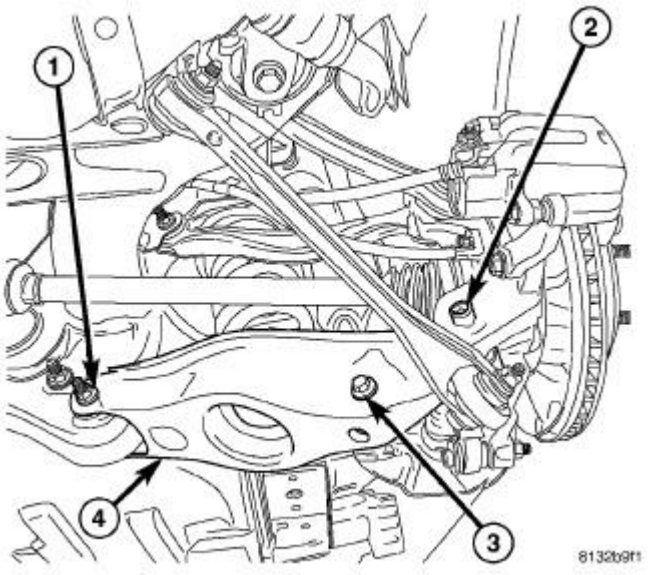

Fig. 103: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt and nut (1) fastening spring link (4) to crossmember.
10. Remove spring link (4).

INSTALLATION

NON SRT

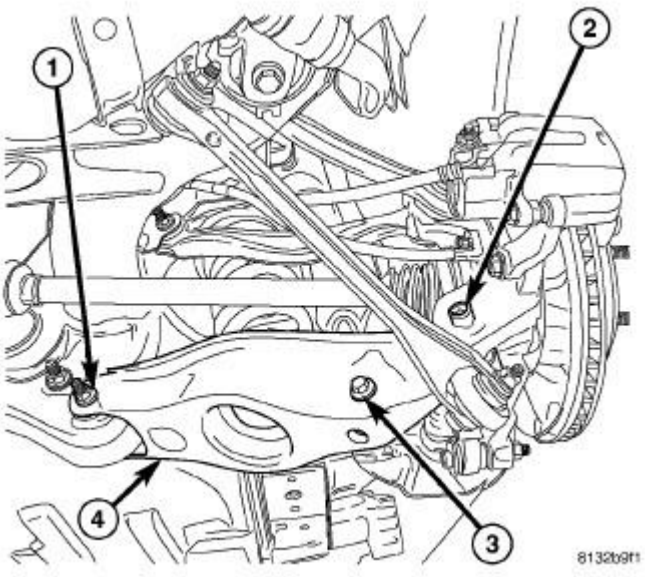

Fig. 104: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Guide ball joint end of spring link (4) into mounting pocket of knuckle, then swing opposite end up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

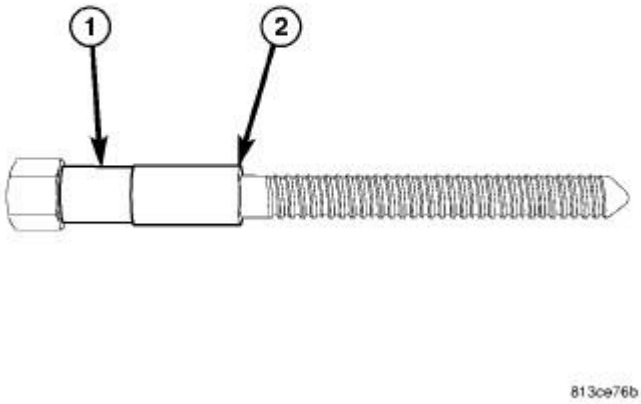

Fig. 105: Bolt & Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto (special tool #9361-7, Screw, Installation) (1), and slide it up to Bolt's head.

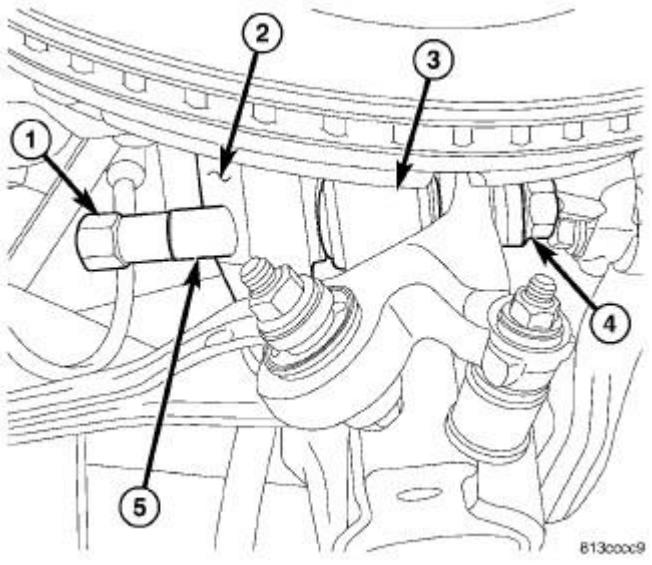

Fig. 106: Slide, Sleeve, Knuckle, Bearing And Nut
Courtesy of CHRYSLER GROUP, LLC

3. Starting from knuckle forward end, slide Bolt (special tool #9361-7, Screw, Installation) (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
4. Install thrust bearing and nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
6. Remove special tool.

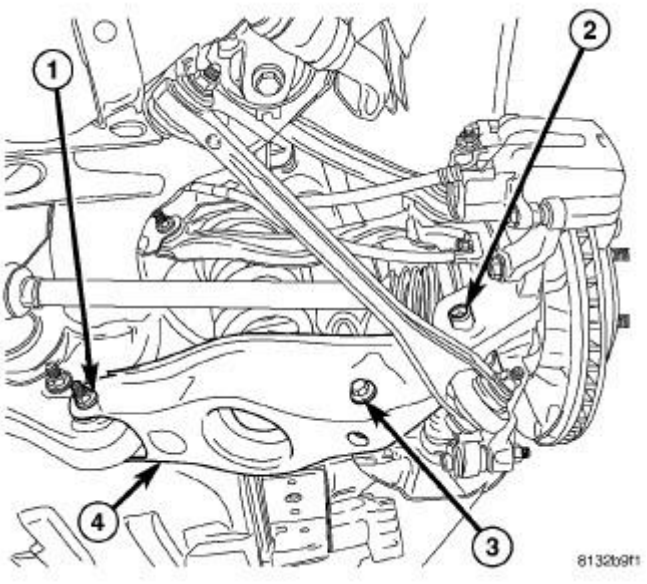

Fig. 107: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).

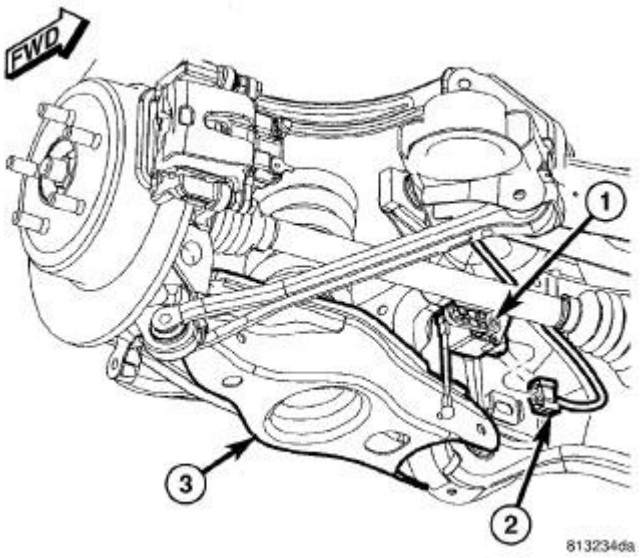

Fig. 108: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

8. Export Only - If servicing right spring link, connect headlamp leveling sensor (1) link at spring link (3).
9. Install rear spring as well as all components necessary to access it. Refer to **SPRING(S), INSTALLATION**.
10. Lower vehicle.
11. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
12. Tighten spring link bolt at crossmember to 108 N.m (80 ft. lbs.).
13. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SRT

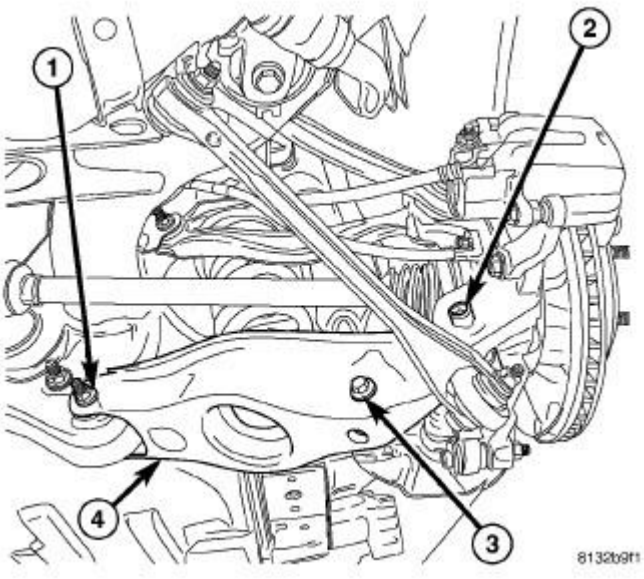

Fig. 109: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Guide ball joint end of spring link (4) into mounting pocket of knuckle, then swing opposite end up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

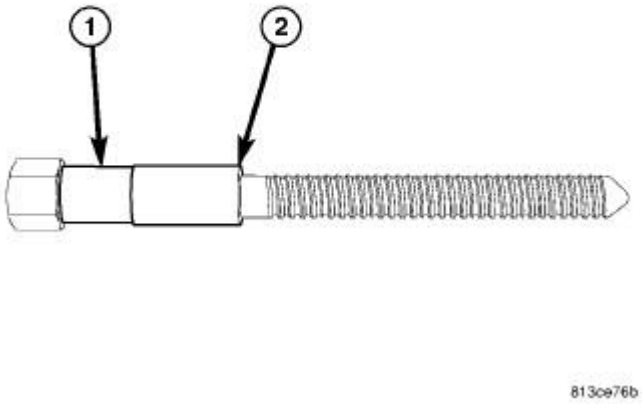

Fig. 110: Bolt & Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto (special tool #9361-12, Installer, Bushing) (1), and slide it up to Bolt's head.

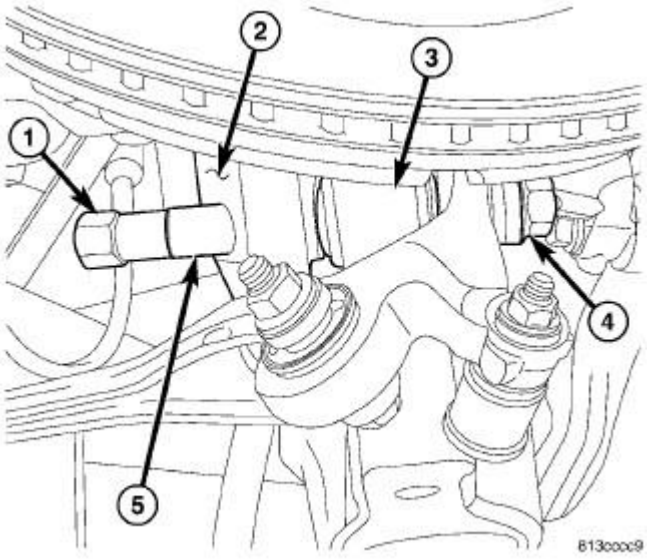

Fig. 111: Slide, Sleeve, Knuckle, Bearing And Nut
Courtesy of CHRYSLER GROUP, LLC

3. Starting from knuckle forward end, slide (special tool #9361-12, Installer, Bushing) (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
4. Install Installation Thrust Bearing (around 3/8 inch thick) and special flange nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
6. Remove special tool.

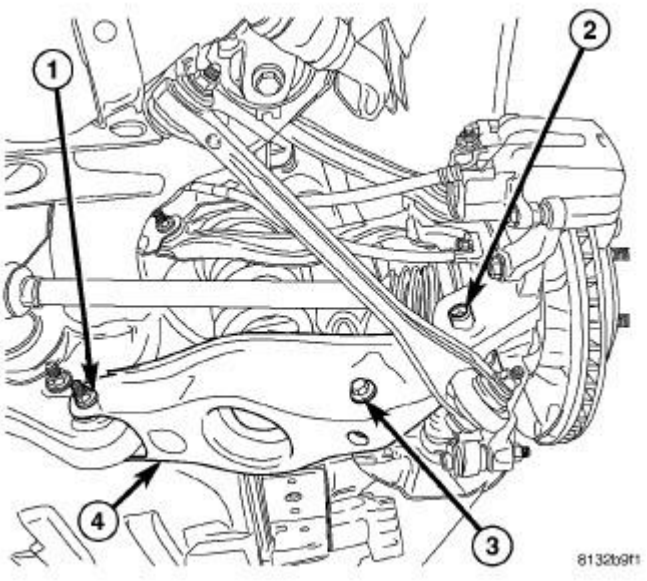

Fig. 112: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
8. Install rear spring and all components necessary to access it, except rear tire and wheel assembly on side of repair. Refer to **SPRING(S), INSTALLATION**.
9. Install rear brake rotor and components necessary to access it. Refer to **ROTOR, BRAKE, INSTALLATION** .
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
12. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
13. Tighten spring link bolt at crossmember to 108 N.m (80 ft. lbs.).
14. Tighten shock absorber lower mounting bolt nut to 72 N.m (53 ft. lbs.).
15. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TENSION

REMOVAL

REMOVAL

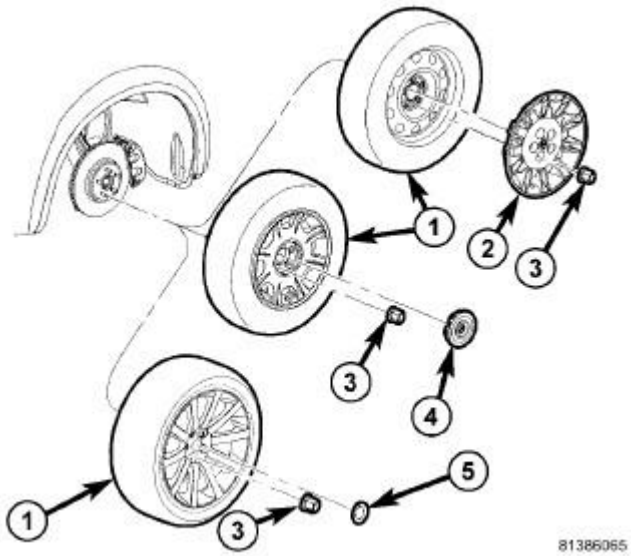

Fig. 113: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

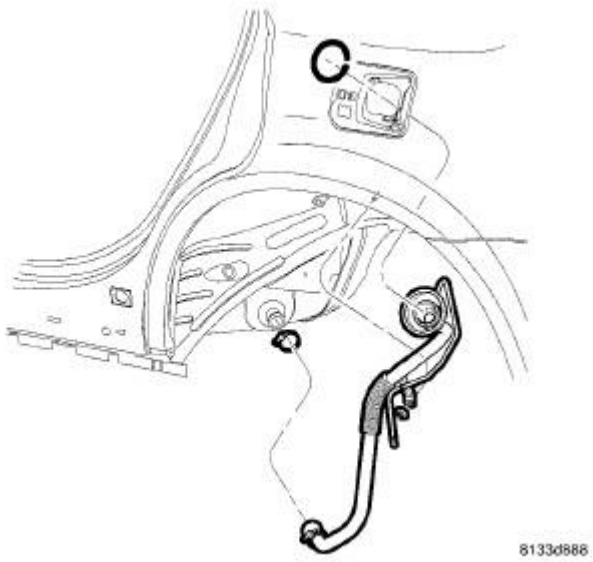

Fig. 114: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
    1. Position under-hoist utility jack or stand several inches below exhaust at muffler.
    2. Disconnect exhaust isolators at muffler and resonators hangers.
    3. Lower exhaust down to rest upon top of jack or stand placed below muffler.

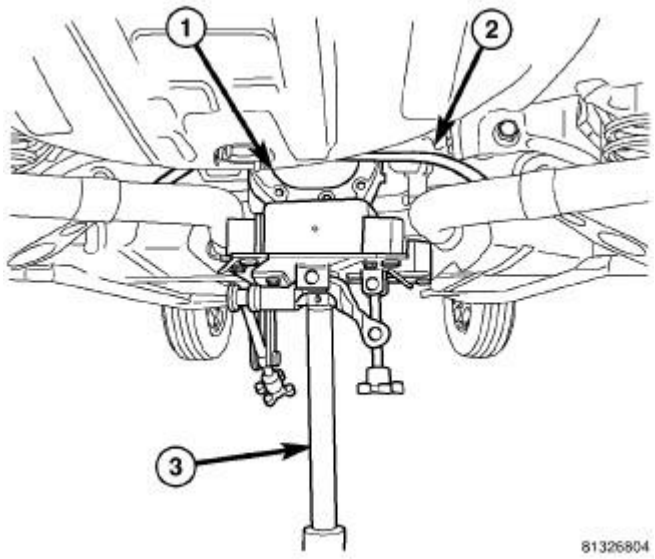

Fig. 115: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

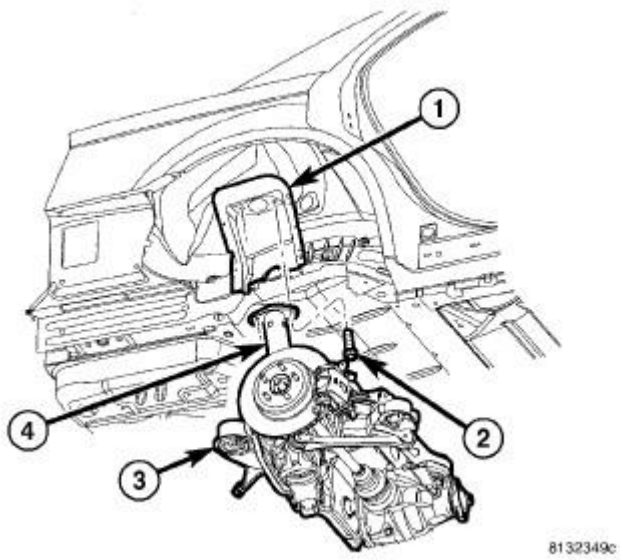

Fig. 116: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

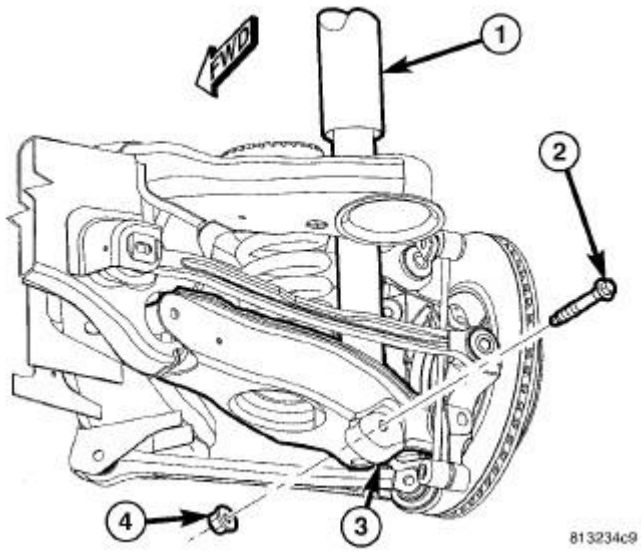

Fig. 117: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

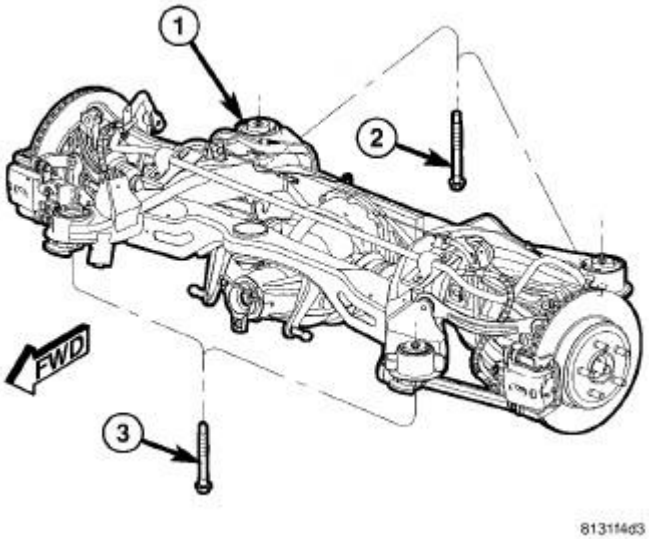

Fig. 118: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.

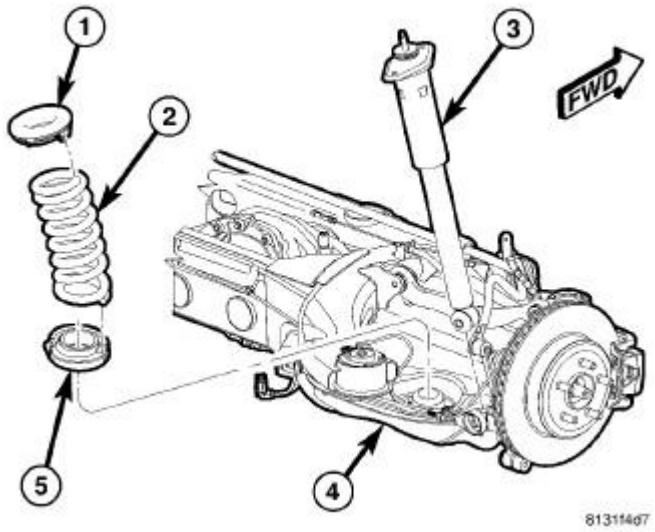

Fig. 119: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

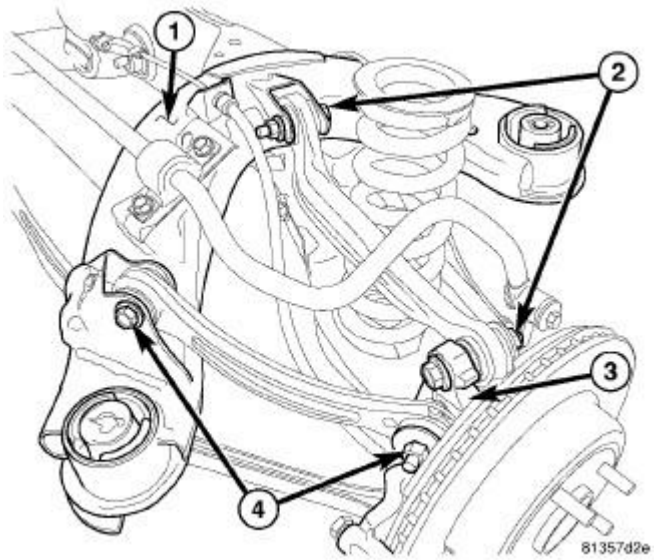

Fig. 120: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (4) mounting link to knuckle (3).

13. Remove nut and bolt (4) mounting link to crossmember (1).
14. Remove link.

INSTALLATION

INSTALLATION

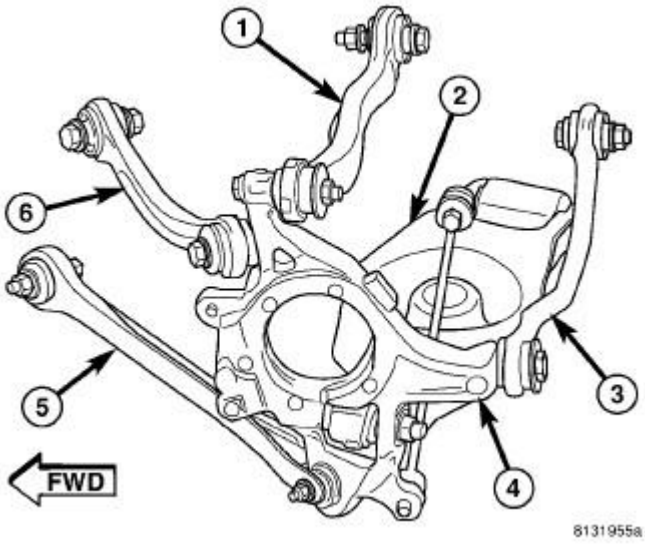

Fig. 121: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing tension link, although link (6) is same end-to-end, make sure that center bow is facing downward.

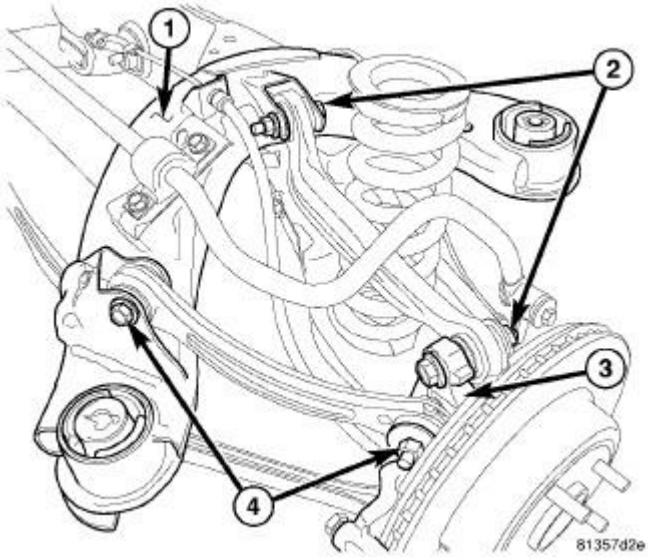

Fig. 122: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

1. Place link in bracket on crossmember (1). Install bolt and nut (4) at crossmember (1) as shown in illustration. **Do not tighten bolt at this time.**
2. Install bolt and nut (4) mounting link to knuckle (3) as shown in illustration. **Do not tighten bolt at this time.**

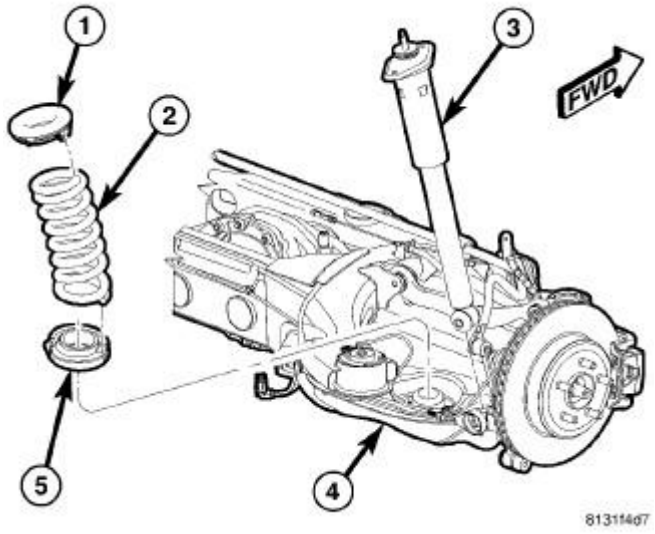

Fig. 123: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

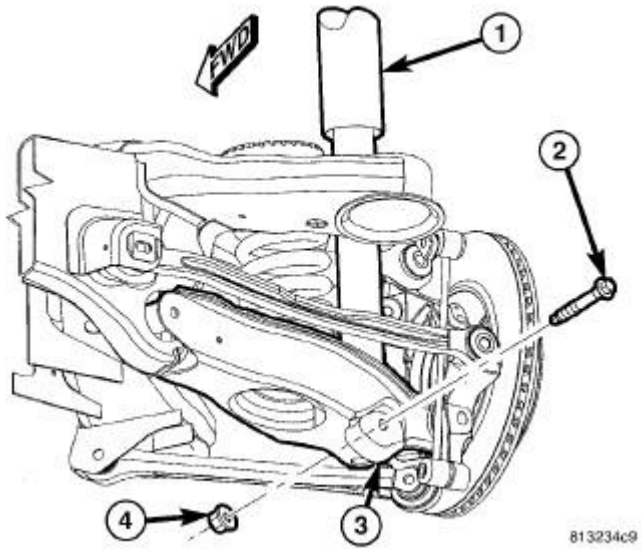

Fig. 124: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

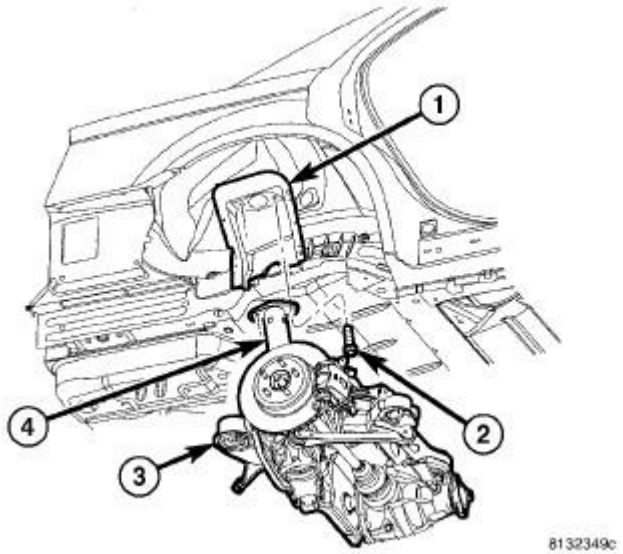

Fig. 125: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

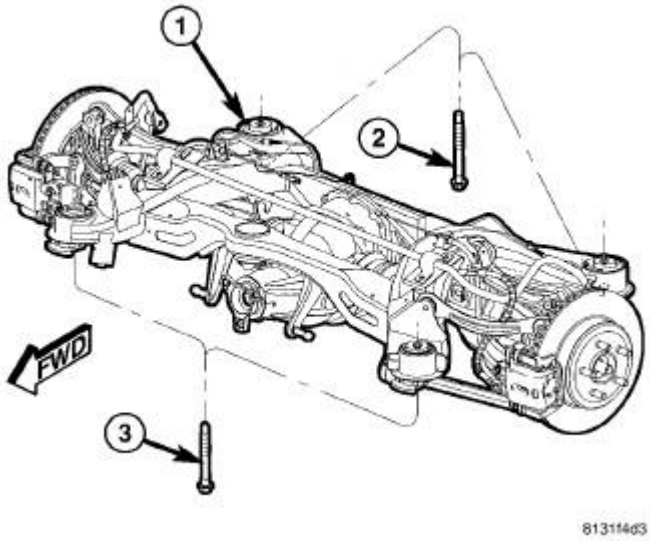

Fig. 126: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

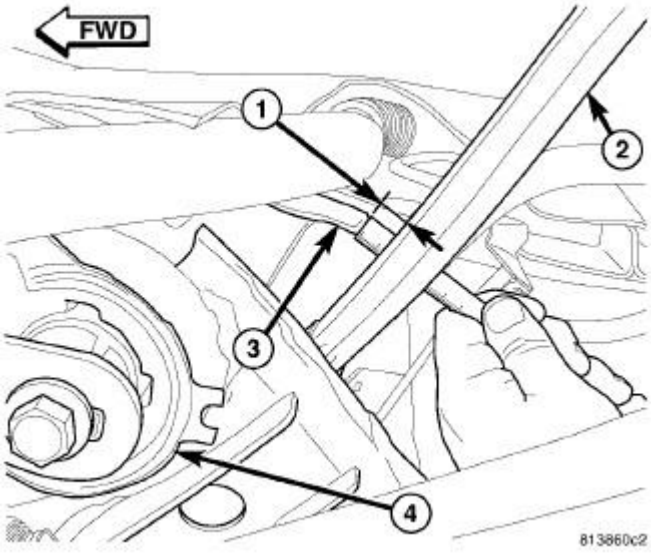

Fig. 127: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

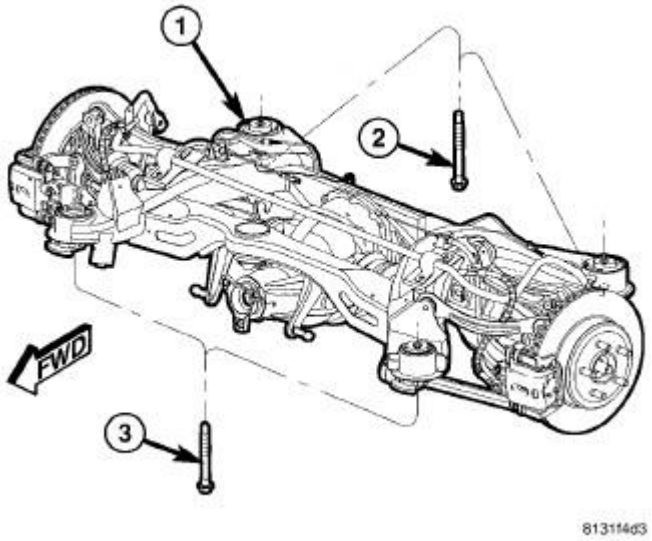

Fig. 128: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

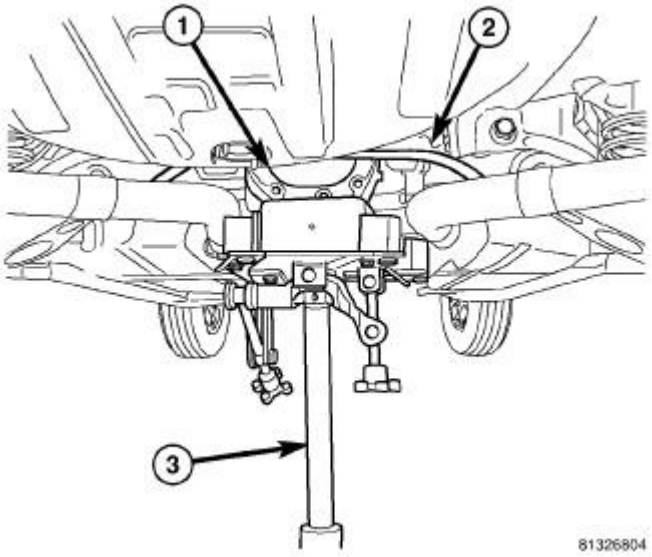

Fig. 129: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

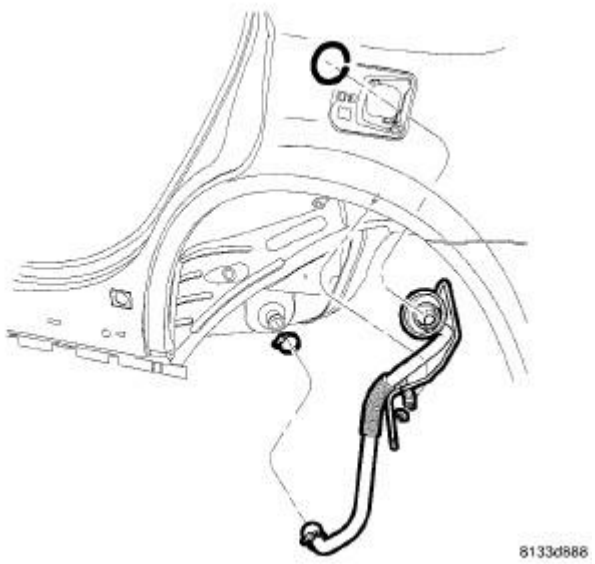

Fig. 130: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

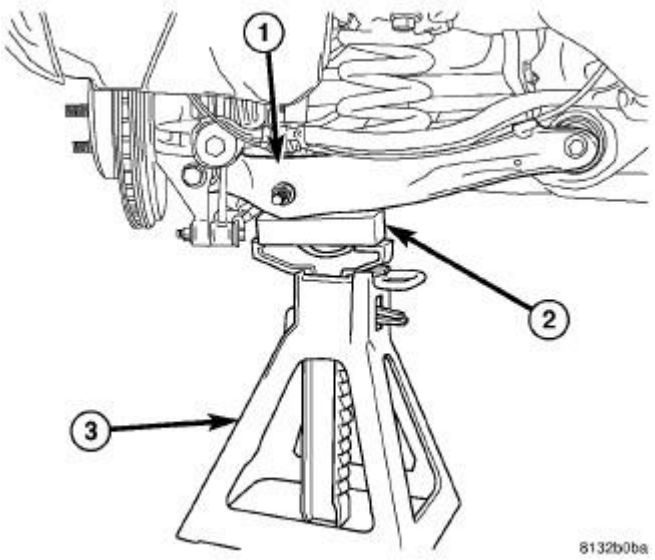

Fig. 131: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

13. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

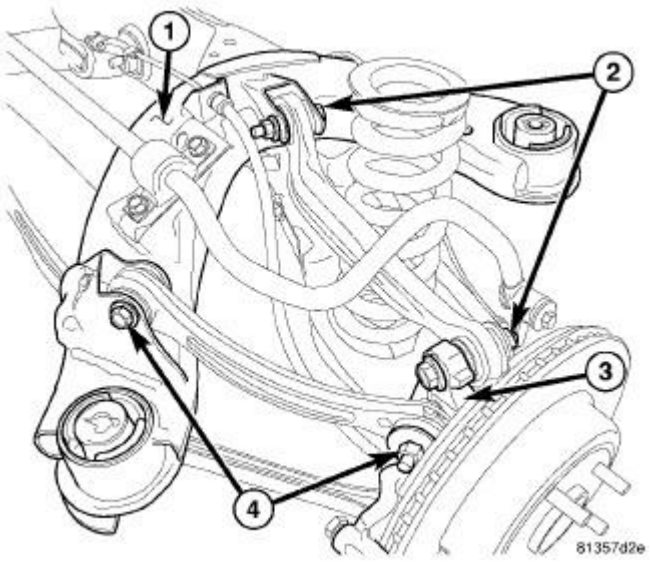

Fig. 132: Camber And Tension Links
Courtesy of CHRYSLER GROUP, LLC

14. Tighten tension link fasteners (4) to:
    - Bolt nut at crossmember - 85 N.m (63 ft. lbs.).
    - Bolt at knuckle - 98 N.m (72 ft. lbs.).

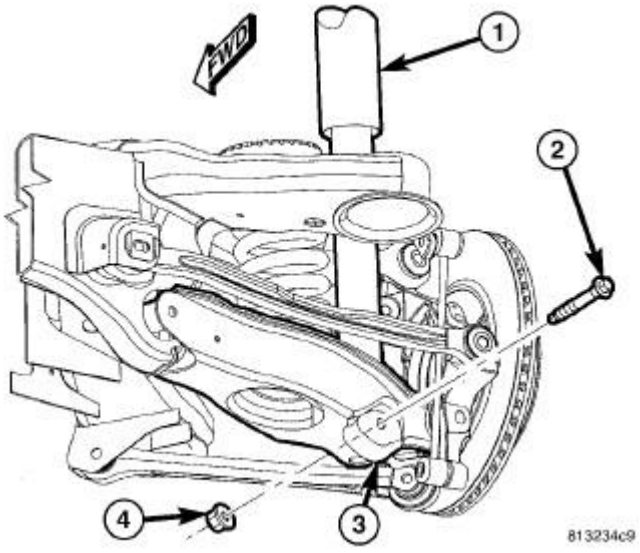

Fig. 133: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

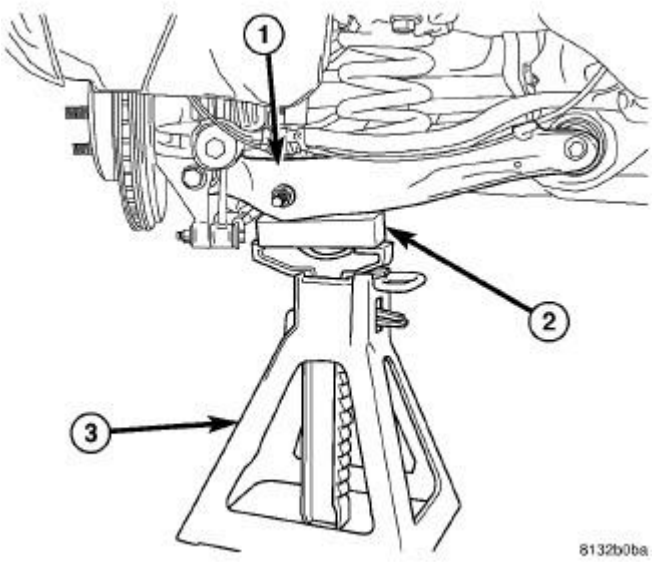

Fig. 134: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

16. Raise vehicle and remove jack stands (3).

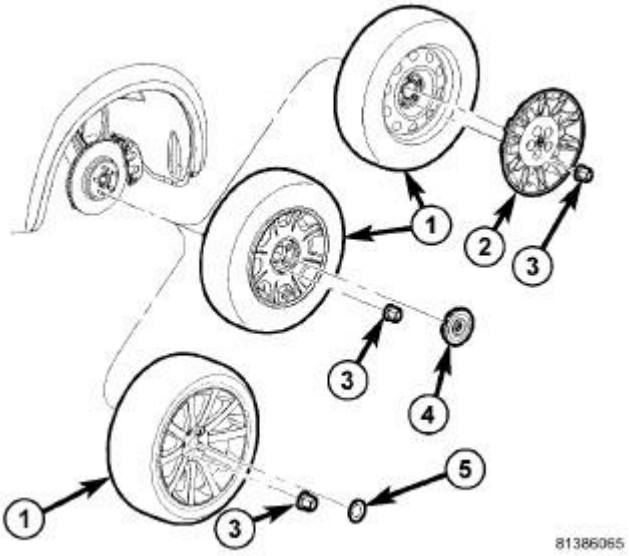

Fig. 135: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
18. Lower vehicle.
19. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TOE

REMOVAL

LEFT LINK

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

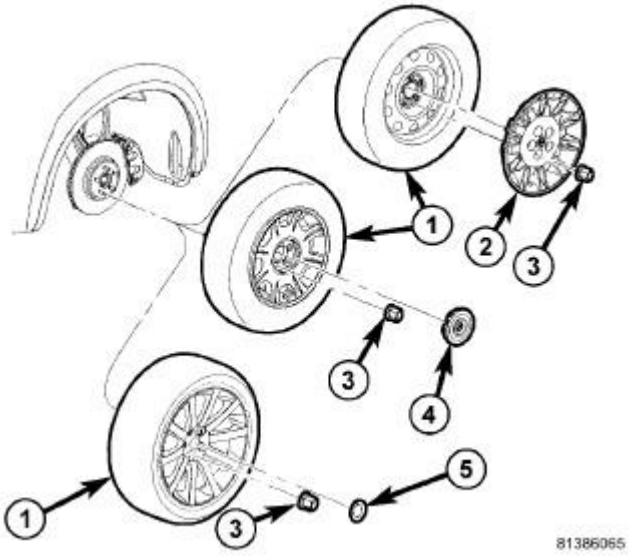

Fig. 136: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 137: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust.
    1. Position under-hoist utility jack or stand several inches below exhaust at muffler.
    2. Disconnect exhaust isolators at muffler and resonators hangers.
    3. Lower exhaust down to rest upon top of jack or stand placed below muffler.

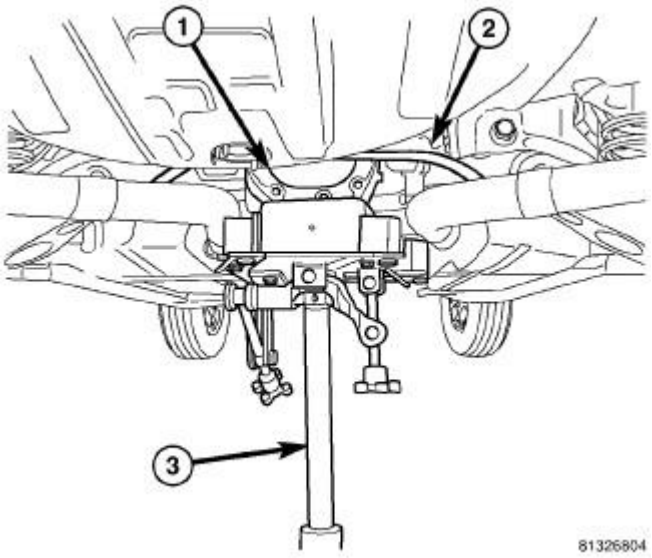

Fig. 138: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place.

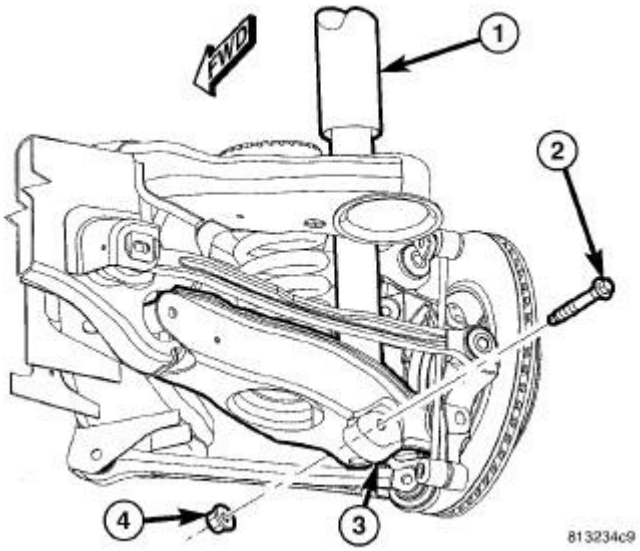

Fig. 139: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

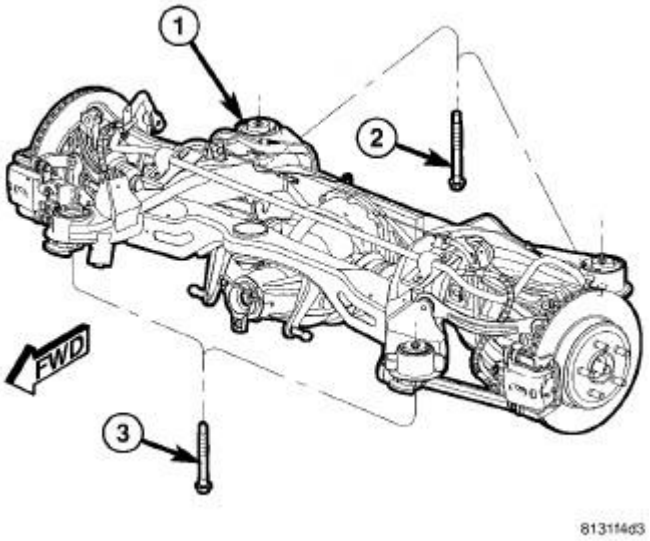

Fig. 140: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

8. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle. **If equipped with AWD, be sure to not to misplace spacers between crossmember mounts and body.**

   CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

9. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow toe link mounting bolt at crossmember.

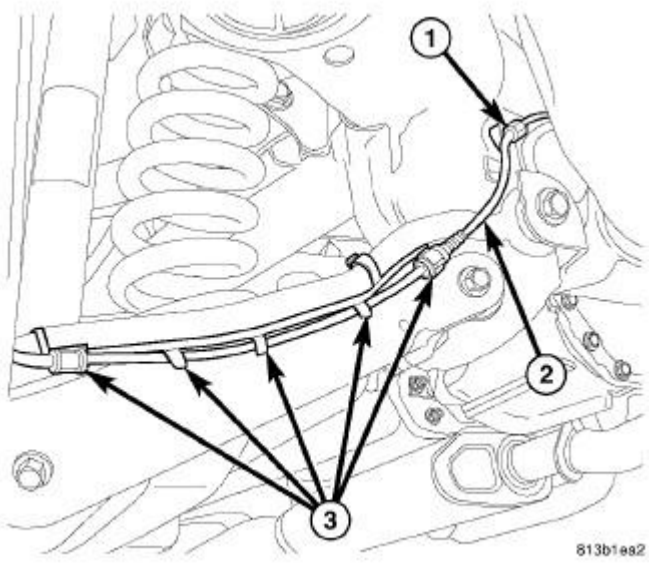

Fig. 141: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

10. If equipped, remove wheel speed sensor cable (2) from toe link.

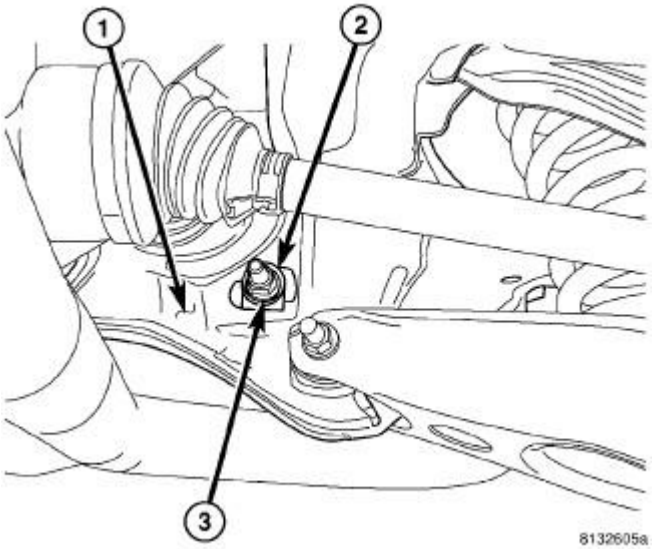

Fig. 142: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

11. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

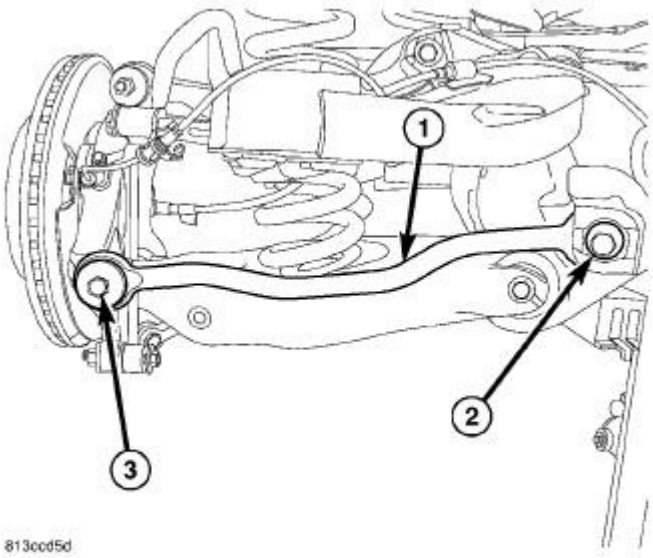

Fig. 143: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Slide cam bolt (2) rearward out of crossmember and link (1).
13. Remove mounting bolt (3) and nut at knuckle.
14. Remove toe link (1).

RIGHT LINK

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

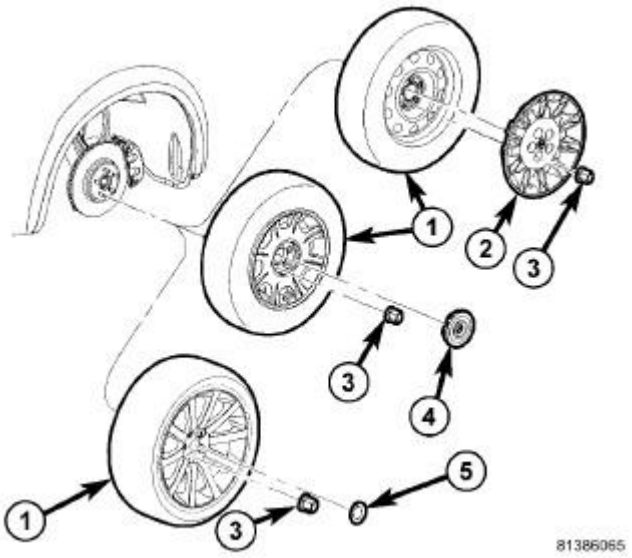

Fig. 144: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

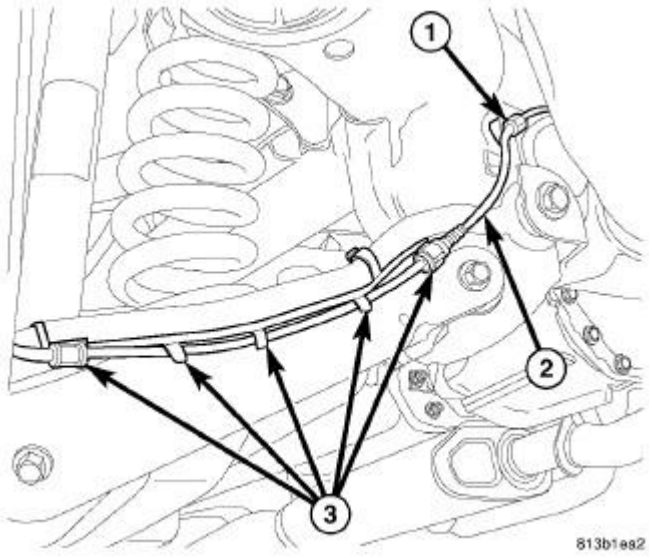

Fig. 145: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, remove wheel speed sensor cable (2) from toe link.

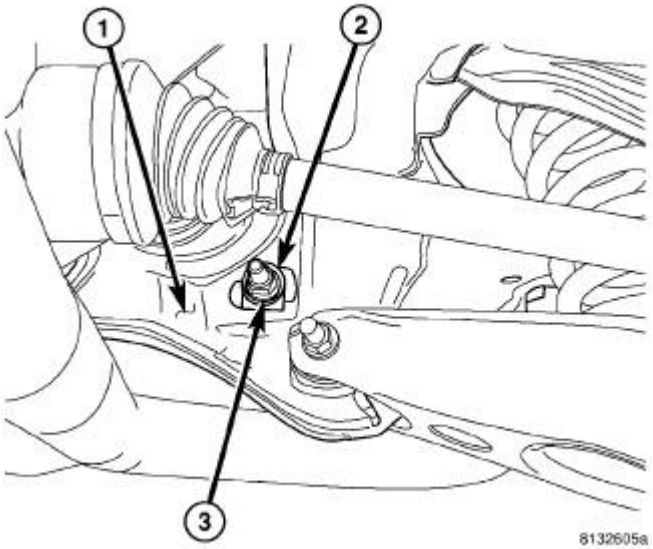

Fig. 146: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

4. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

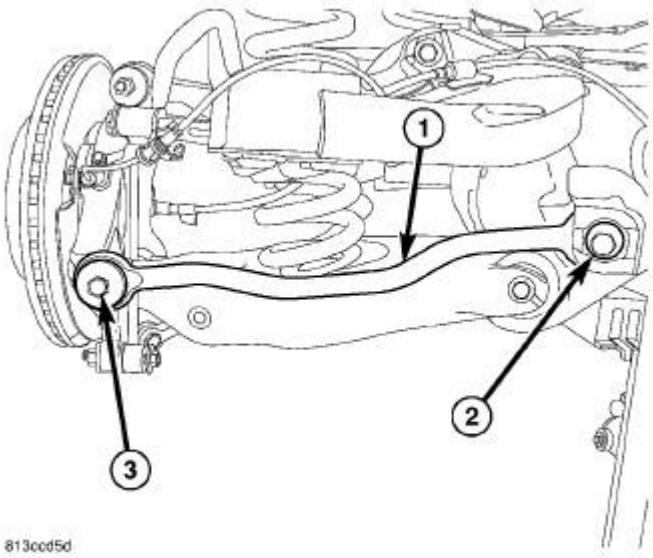

Fig. 147: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Slide cam bolt (2) rearward out of crossmember and link (1).
6. Remove mounting bolt (3) and nut at knuckle.
7. Remove toe link (1).

INSTALLATION

LEFT LINK

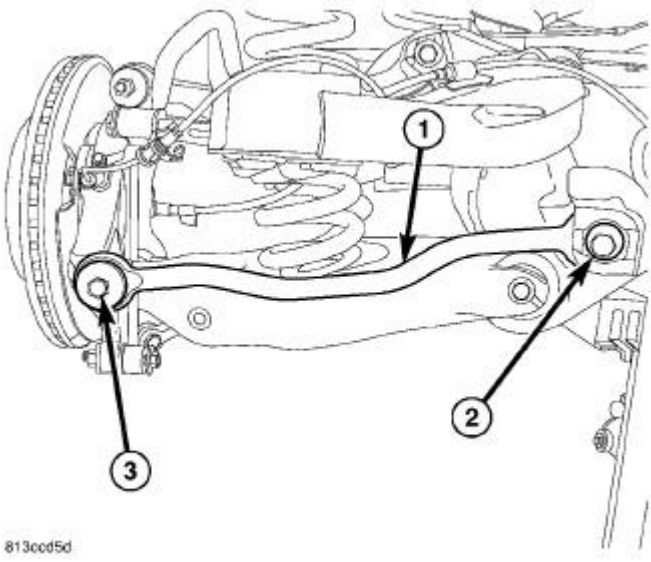

Fig. 148: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

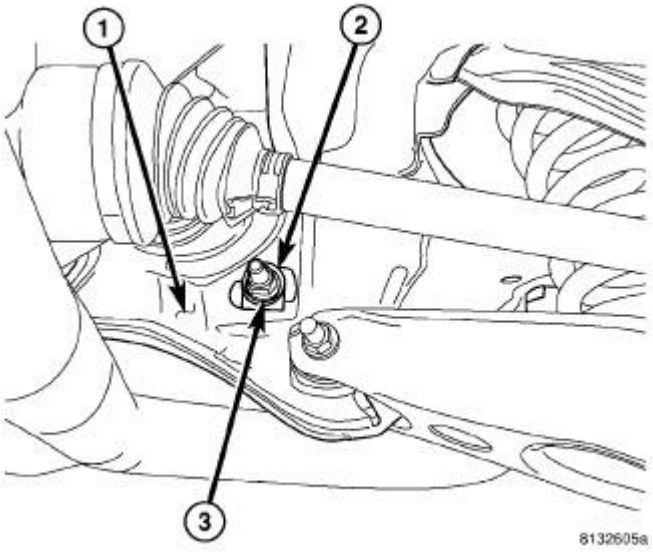

Fig. 149: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

3. While holding toe adjustment cam bolt from rotating (cam facing upward), Install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

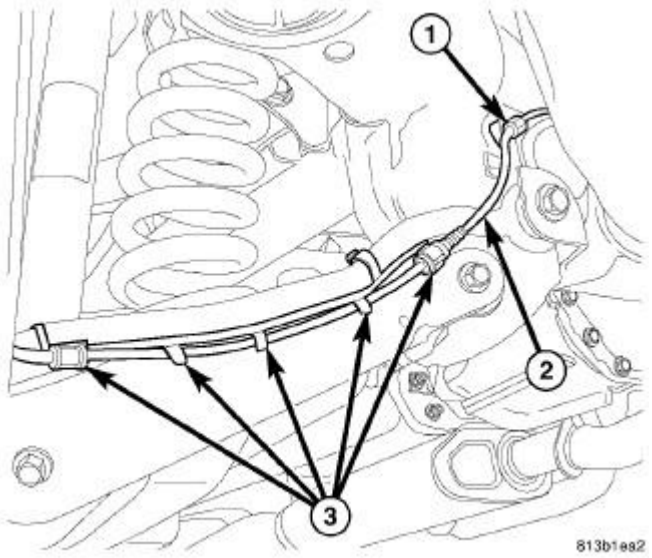

Fig. 150: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, Attach wheel speed sensor cable (2) to toe link.

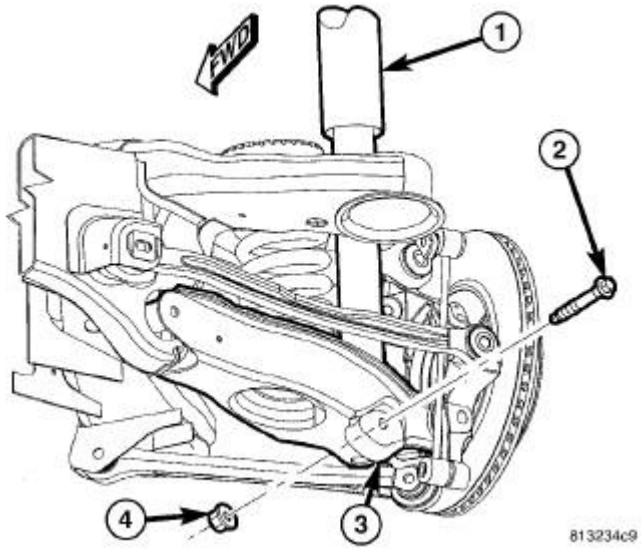

Fig. 151: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and lower end of shock absorber (4) into mounted positions.

6. When lower shock mounting bolt holes line up install bolt (2) and nut (4). **Do not tighten at this time.**

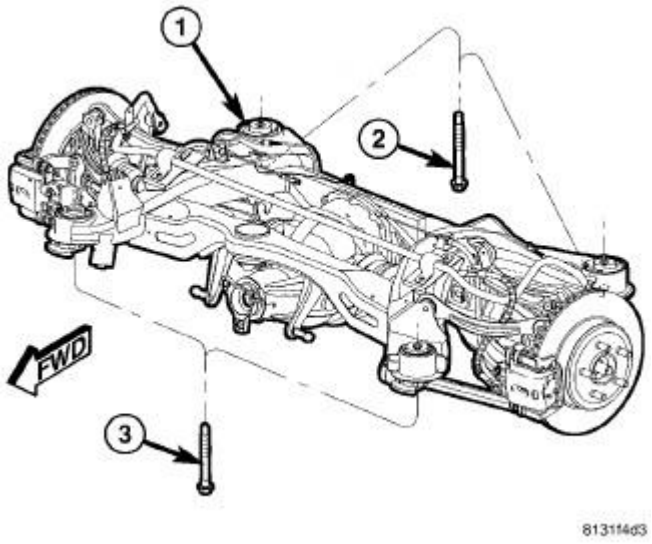

Fig. 152: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Continue to raise crossmember in not already in mounted position, then install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

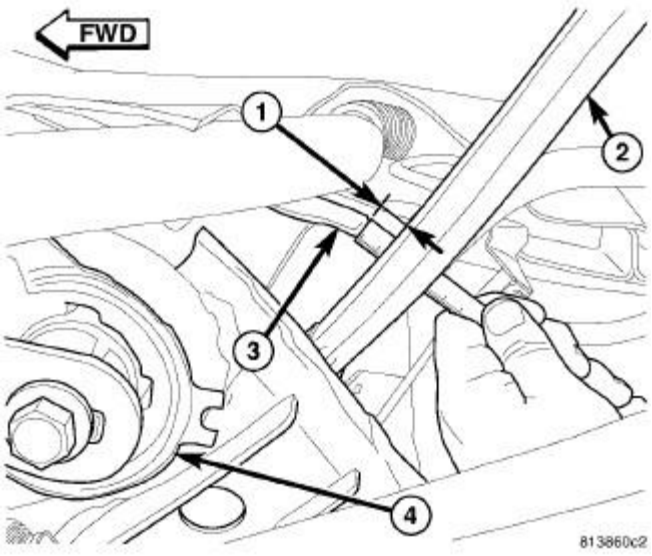

Fig. 153: Measuring Tension Link Clearance

Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

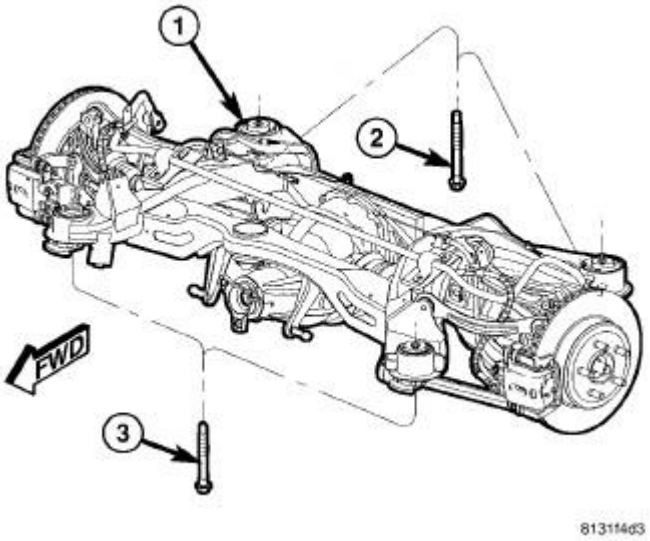

Fig. 154: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

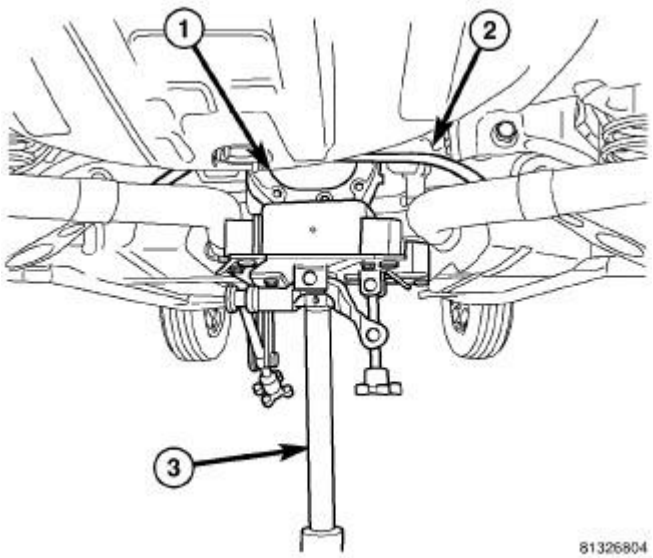

Fig. 155: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

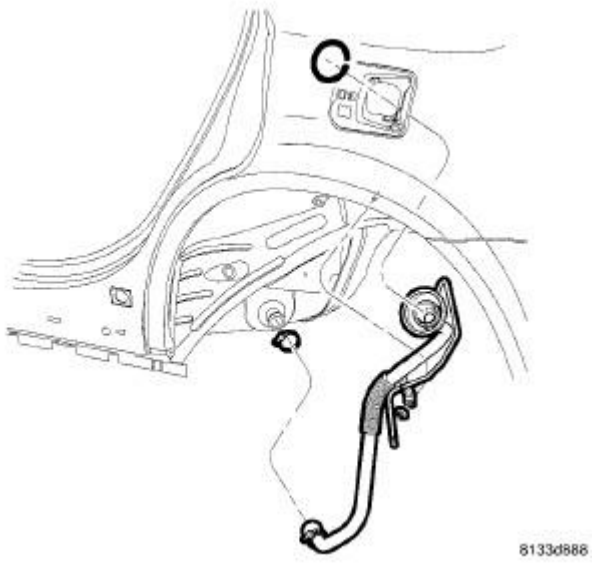

Fig. 156: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

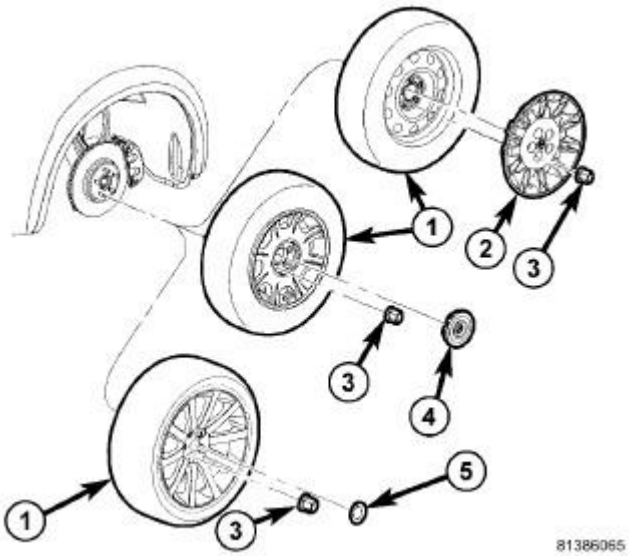

Fig. 157: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

13. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

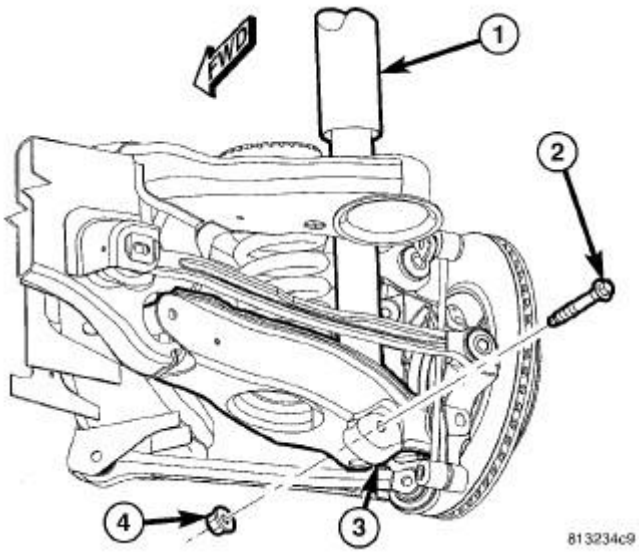

Fig. 158: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

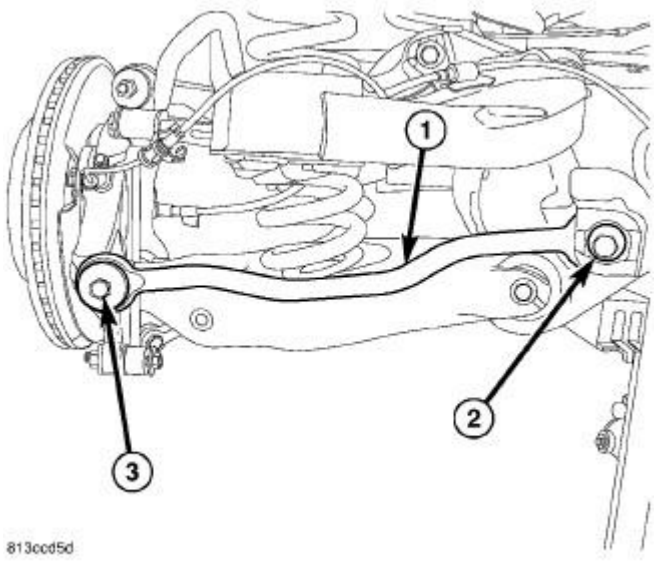

Fig. 159: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Tighten toe link (1) fasteners to:
    - Nut at crossmember - 108 N.m (80 ft. lbs.) (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.).
    - Bolt at knuckle - 95 N.m (70 ft. lbs.).
18. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

RIGHT LINK

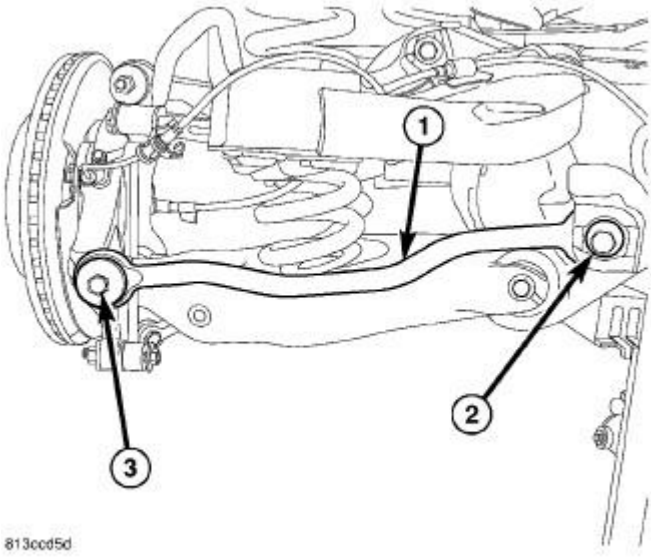

Fig. 160: Toe Link Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear of vehicle.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

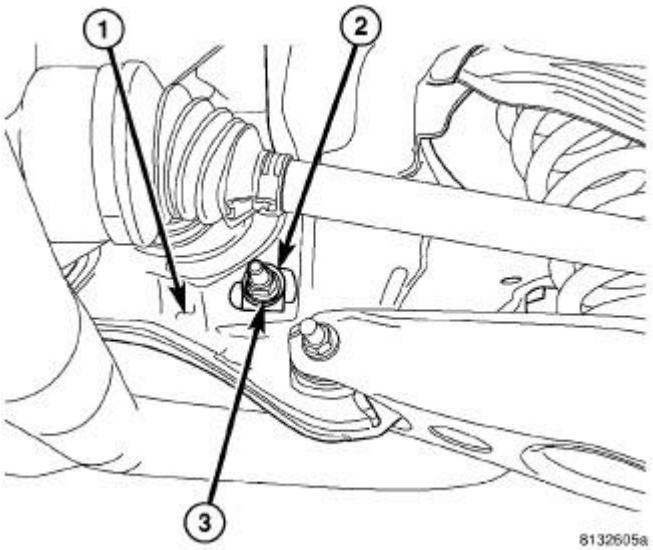

Fig. 161: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

3. While holding toe adjustment cam bolt from rotating (cam facing upward), Install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

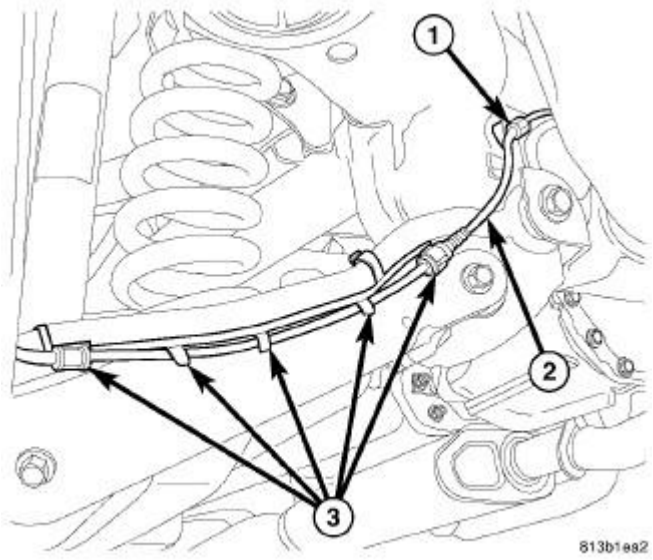

Fig. 162: WSS Routing Along Left Toe Link
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, Attach wheel speed sensor cable (2) to toe link.
5. Raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

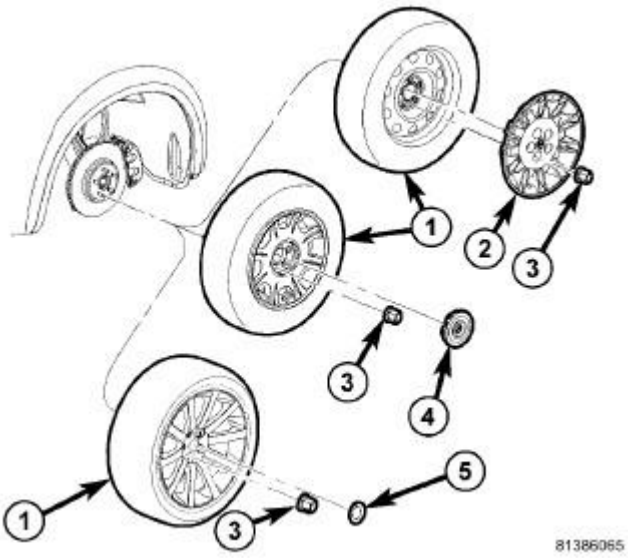

Fig. 163: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
7. Lower vehicle.
8. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

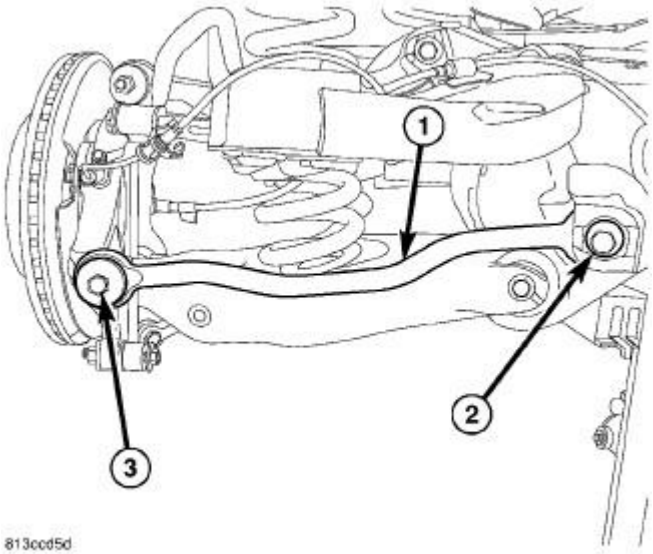

Fig. 164: Toe Link Mounting

Courtesy of CHRYSLER GROUP, LLC

9. Tighten toe link (1) fasteners to:
   - Nut at crossmember - 108 N.m (80 ft. lbs.) (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.).
   - Bolt at knuckle - 95 N.m (70 ft. lbs.).
10. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SHOCK ABSORBER, SUSPENSION

DESCRIPTION

NON SRT

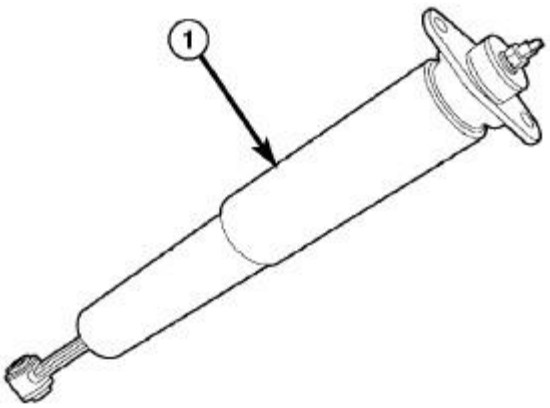

Fig. 165: Nivomat Load-Leveling Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

Non SRT vehicles have standard gas-charged shock absorbers for the rear suspension.

SRT

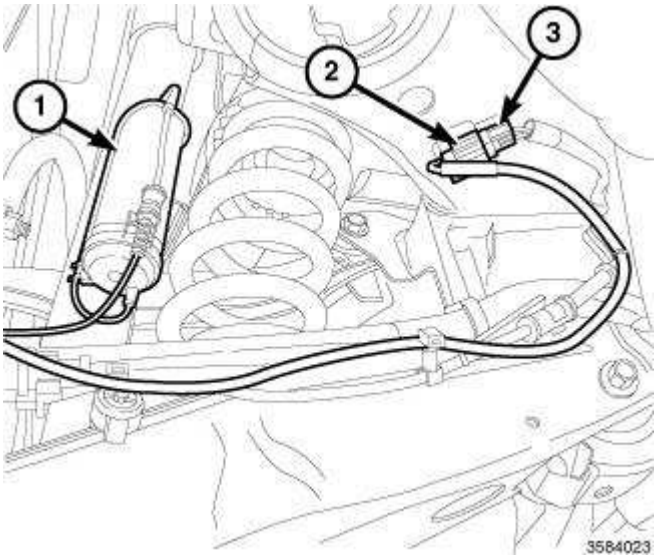

Fig. 166: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

This vehicle has Active Damping System (ADS) shock absorbers for the rear suspension. The ADS shock absorbers are serviced the same as conventional shocks, except the ADS connector (2) must be removed from the harness connector (3). It is important to pay close attention to which direction the shock solenoid assembly (1) is pointing when removing and installing ADS shocks.

REMOVAL

NON SRT

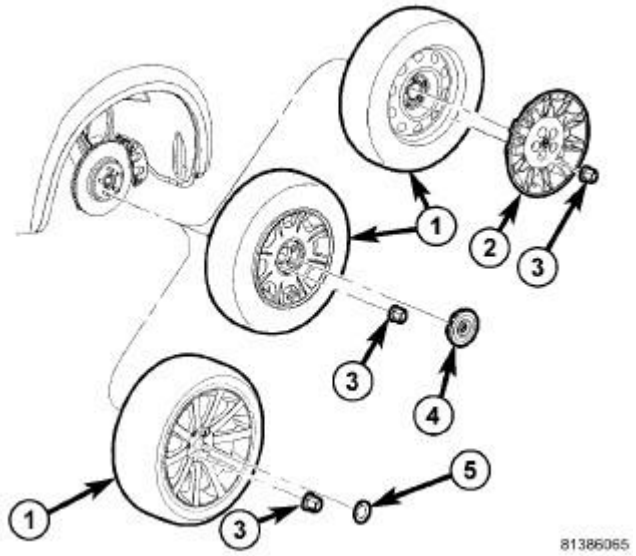

Fig. 167: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Position under-hoist utility jack or jack stand under outer spring link adding just enough support to keep suspension from going into full-rebound when shock absorber mounting bolts are removed.

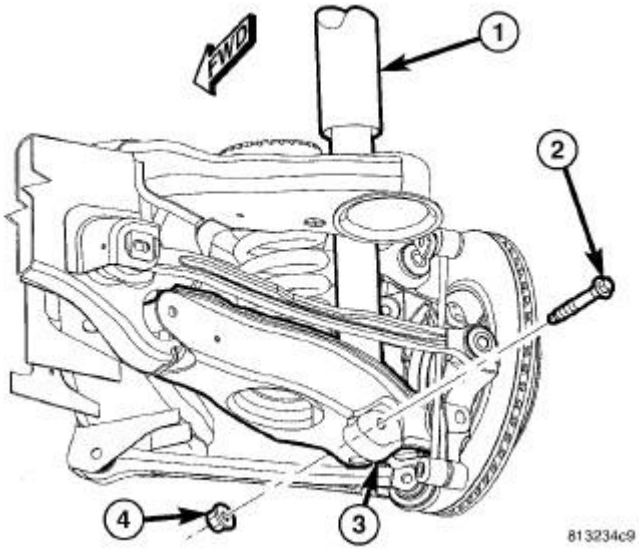

Fig. 168: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

4. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

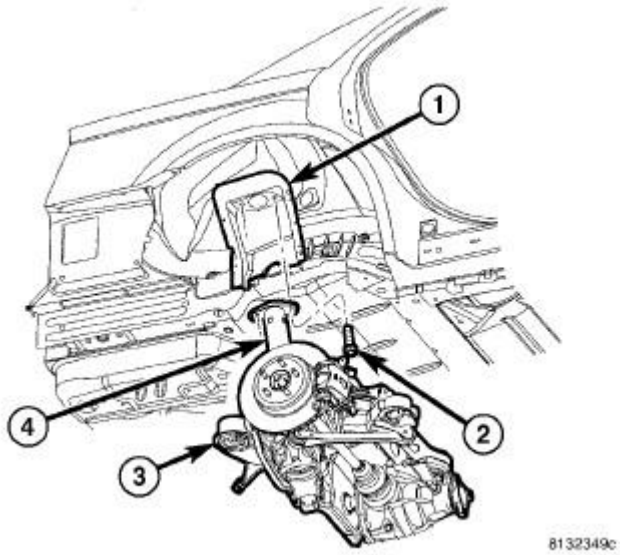

Fig. 169: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

5. Remove shock absorber (1) upper mounting bolts (2).
6. Remove shock absorber (4).

SRT

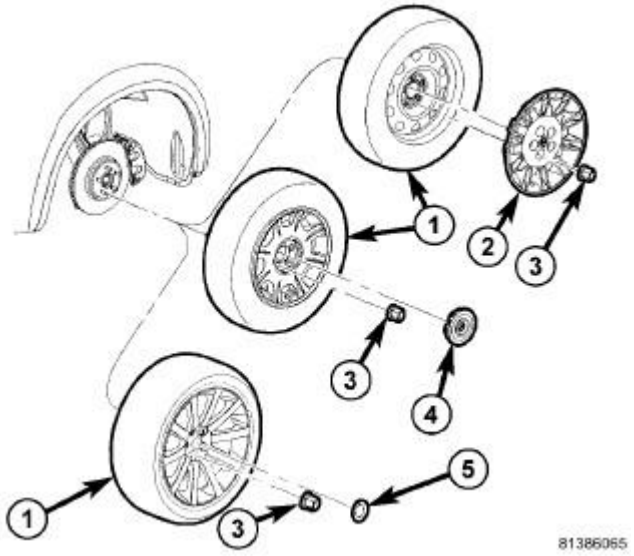

Fig. 170: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Position under-hoist utility jack or jack stand under outer spring link adding just enough support to keep suspension from going into full-rebound when shock absorber mounting bolts are removed.

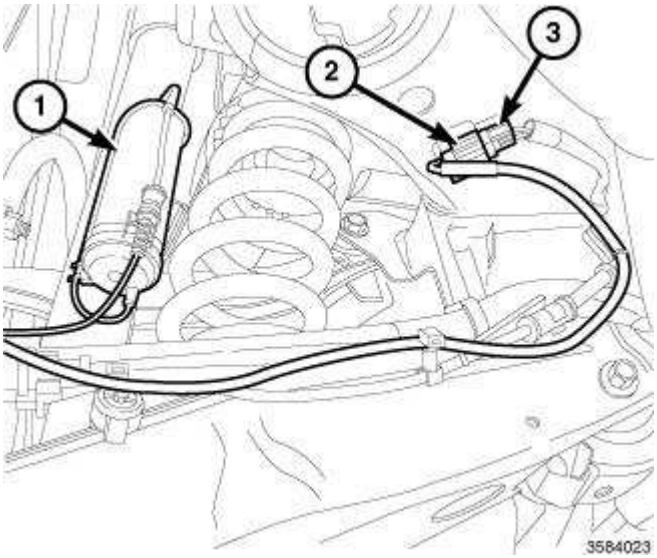

Fig. 171: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

4. Disconnect the Active Damping System (ADS) shock connector (2) from the harness connector (3).

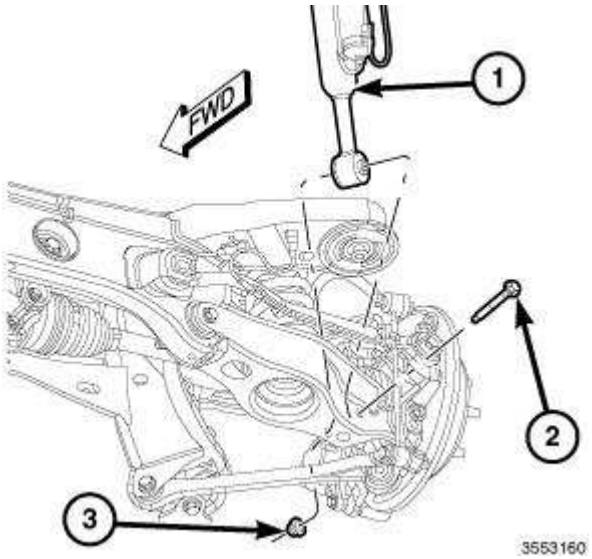

Fig. 172: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

5. Remove lower mounting bolt (2) and nut (3) securing shock absorber (1) to knuckle.

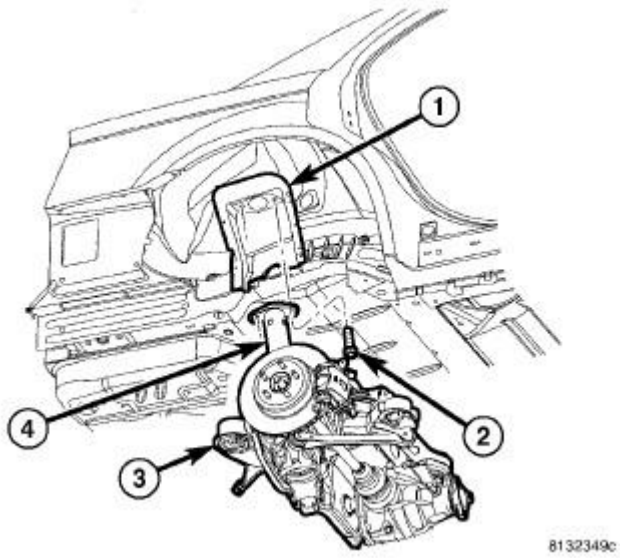

Fig. 173: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

6. Remove shock absorber upper mounting bolts (2).
7. Remove shock absorber (4).

INSTALLATION

NON SRT

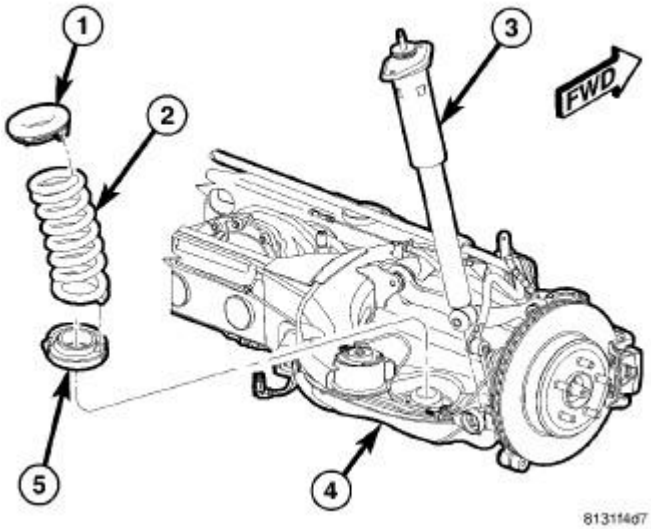

Fig. 174: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

1. Insert lower end of shock absorber (3) into well of spring link (4).

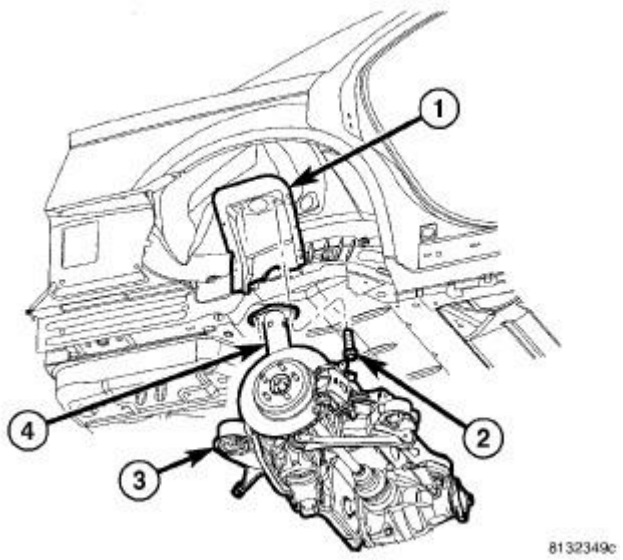

Fig. 175: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

2. Raise upper end of shock absorber (4) up into mounted position on body (1) and install upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

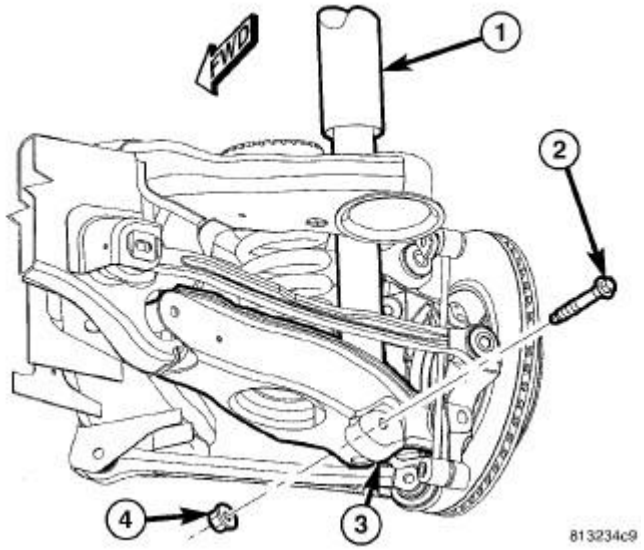

Fig. 176: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

3. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**
4. Remove under-hoist utility jack or jack stand from under spring link.

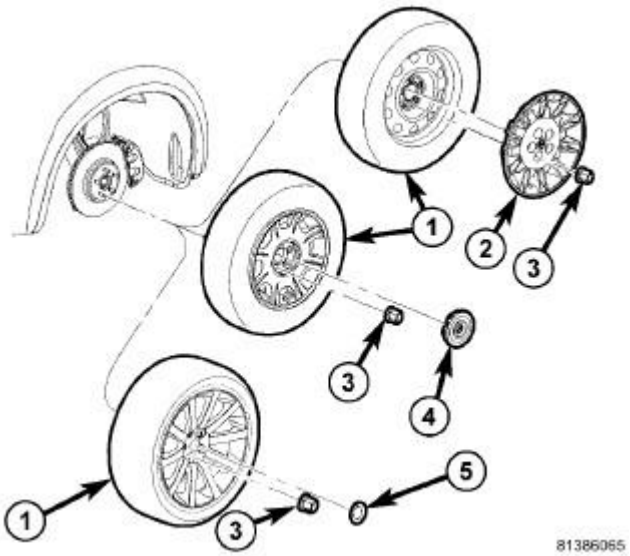

Fig. 177: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
6. Lower vehicle.
7. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.

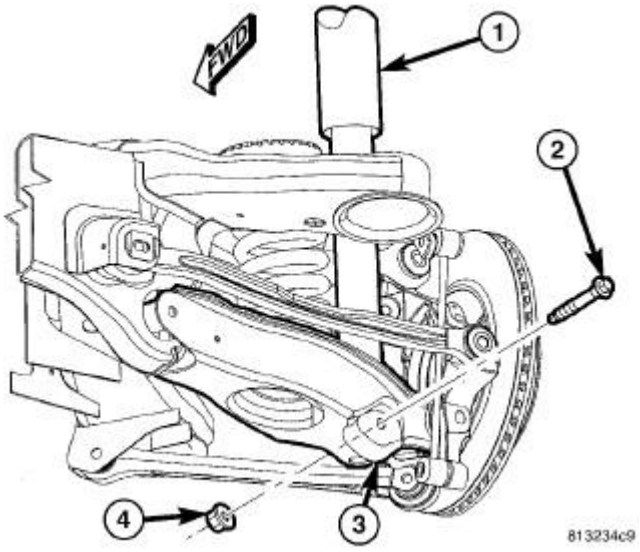

Fig. 178: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

8. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

SRT

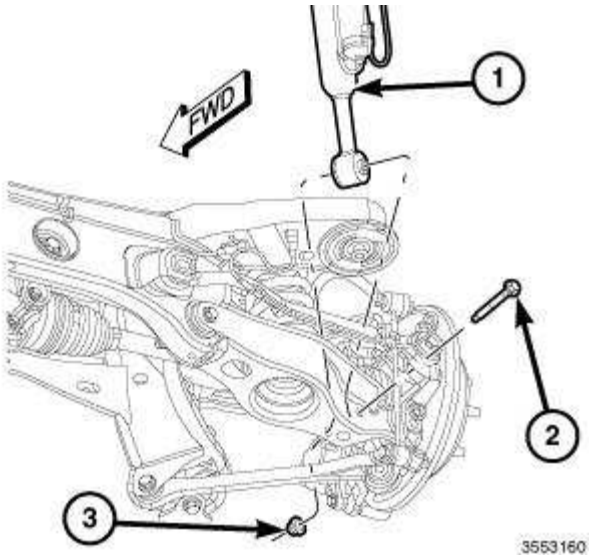

Fig. 179: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

1. Insert lower end of shock absorber (1) into well of spring link.

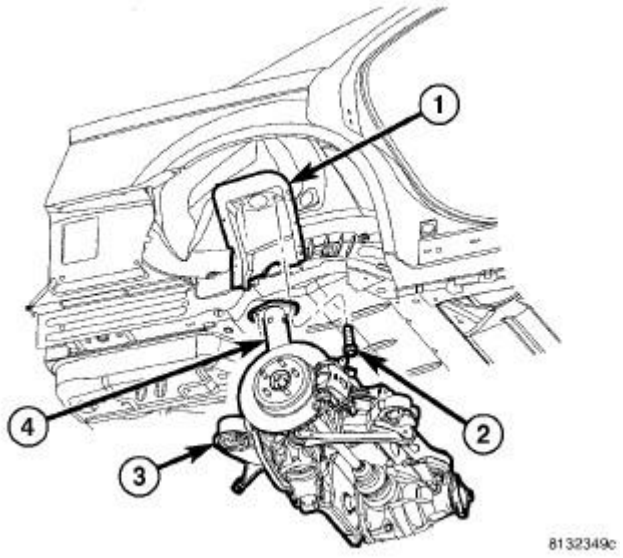

Fig. 180: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

2. Raise upper end of shock absorber (4) up into mounted position on body (1) and install upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

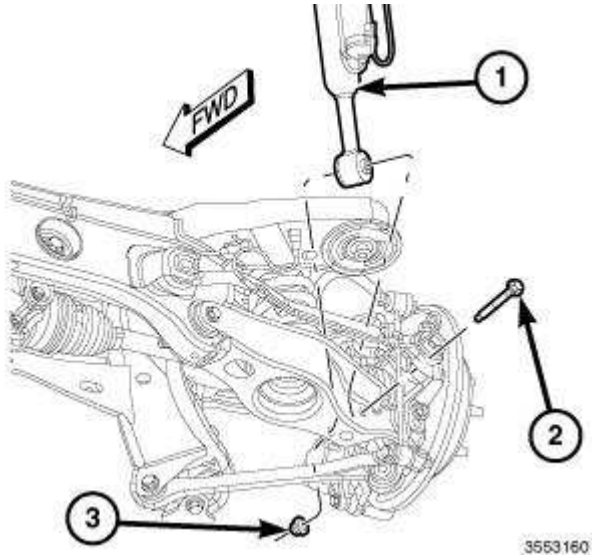

Fig. 181: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

3. Install lower shock mounting bolt (2) and nut (3). **Do not tighten at this time.**
4. Remove under-hoist utility jack or jack stand from under spring link.

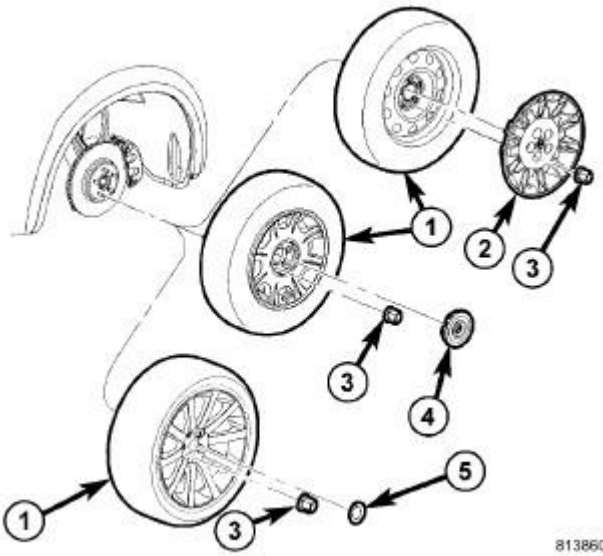

Fig. 182: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
6. Lower vehicle.
7. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.

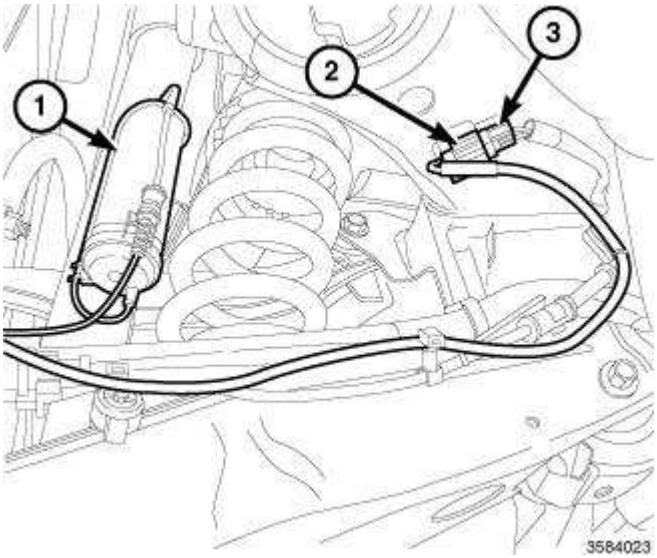

Fig. 183: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Connect the Active Damping System (ADS) connector (2) from the ADS shock (1) to the harness connector (3).

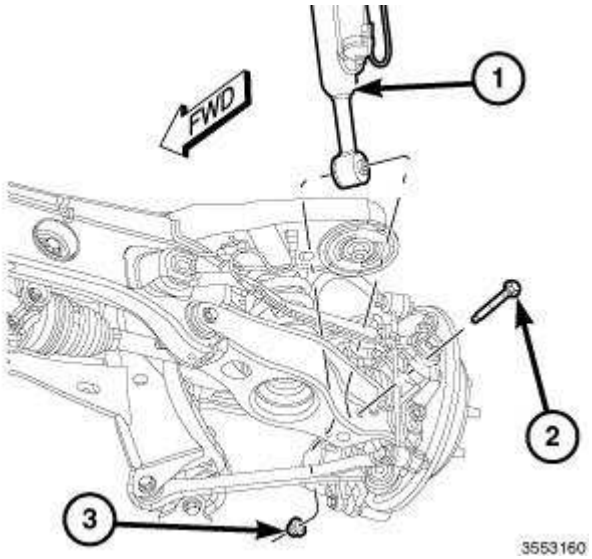

Fig. 184: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

9. Tighten shock absorber lower mounting nut (3) to 72 N.m (53 ft. lbs.).

SPRING(S)

REMOVAL

REMOVAL

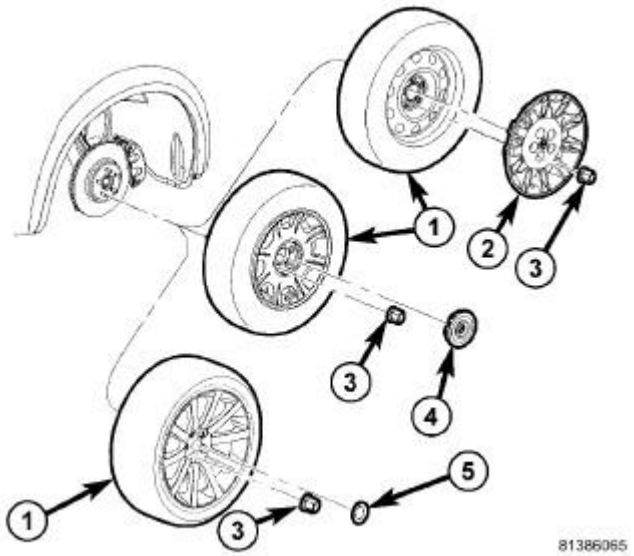

Fig. 185: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

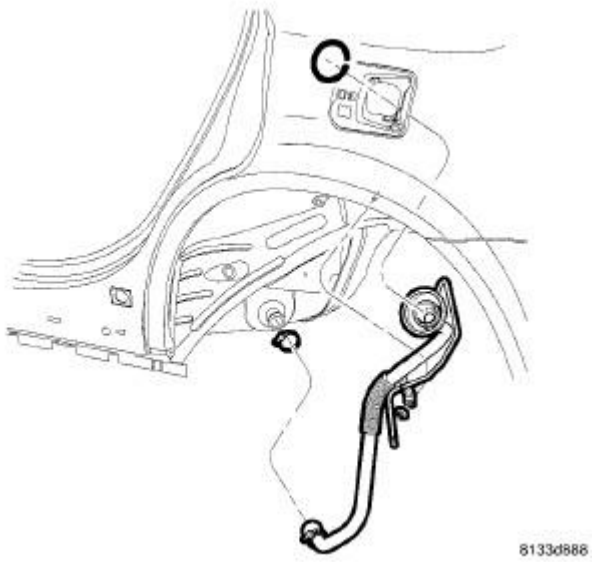

Fig. 186: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side shock absorber, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
    1. Position under-hoist utility jack or stand several inches below exhaust at muffler.
    2. Disconnect exhaust isolators at muffler and resonators hangers.
    3. Lower exhaust down to rest upon top of jack or stand placed below muffler.

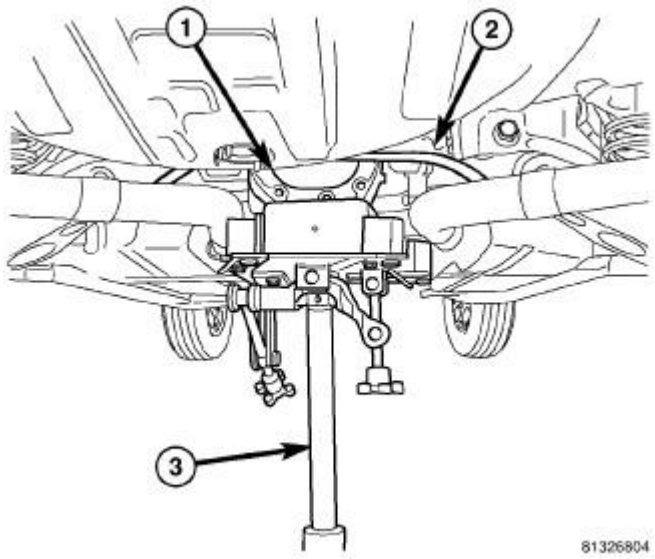

Fig. 187: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

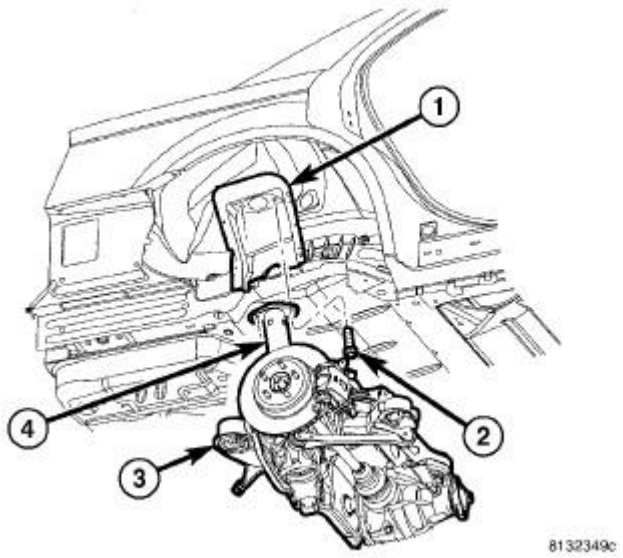

Fig. 188: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

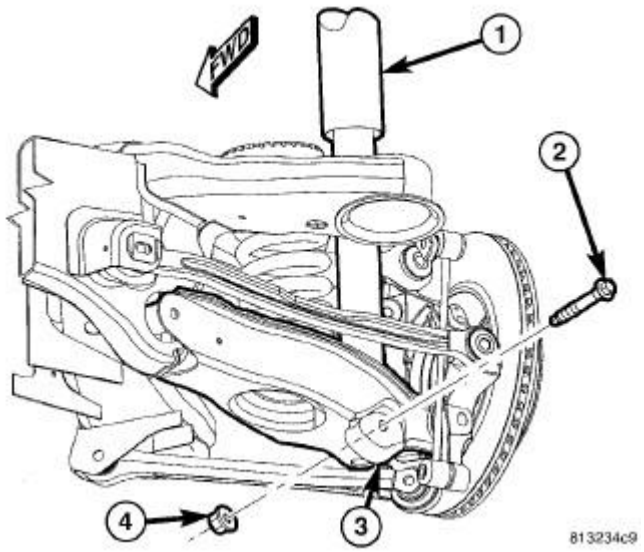

Fig. 189: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

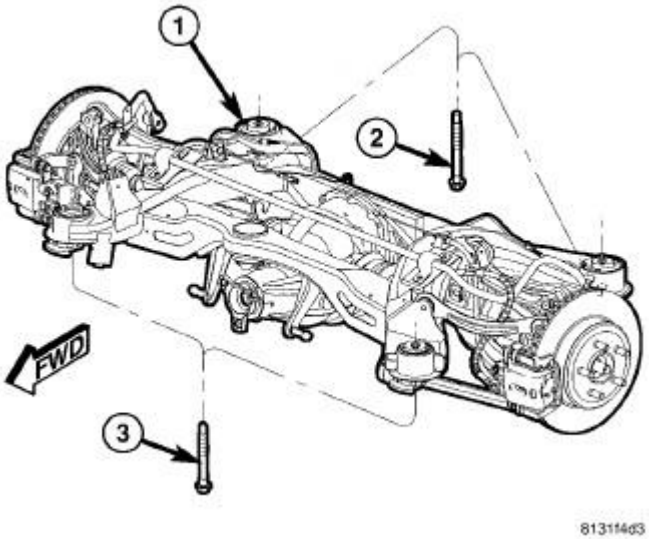

Fig. 190: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.

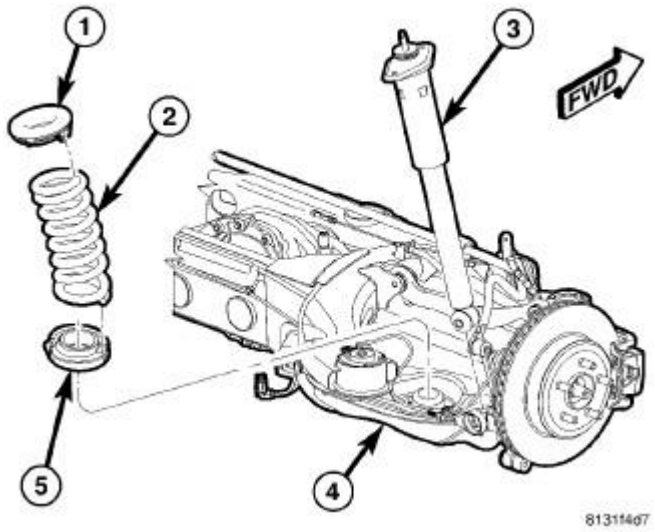

Fig. 191: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

NOTE: Standard suspension shown in illustration, Active Damping System (ADS) similar.

NOTE: If equipped with ADS, disconnect the ADS connector before removing the shock assembly from the vehicle.

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).
12. Disconnect brake hose at bracket mounted to body to allow to avoid overextending hose, damaging it, during following step.
13. Slowly lower jack until crossmember is low enough to remove coil spring. **Do not lower jack any further than necessary to remove spring.**
14. Remove coil spring and isolators (1, 2 and 5).

INSTALLATION

INSTALLATION

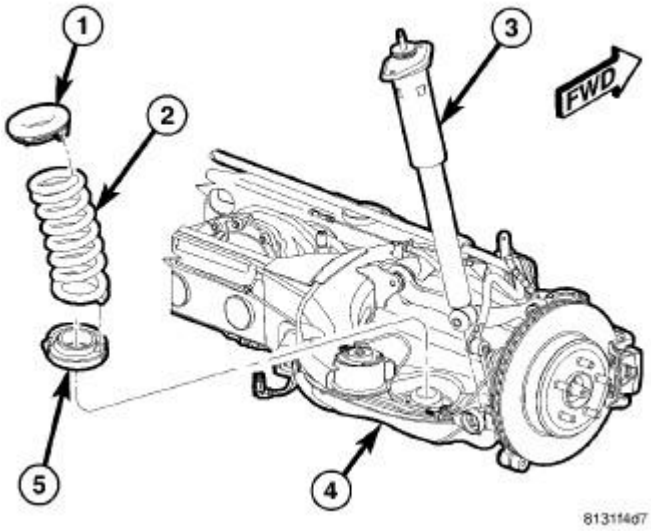

Fig. 192: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

NOTE: Standard suspension shown in illustration, Active Damping Suspension (ADS) similar.

NOTE: Rear coil springs are interchangeable.

1. Install upper (1) and lower (5) isolators on coil spring (2).

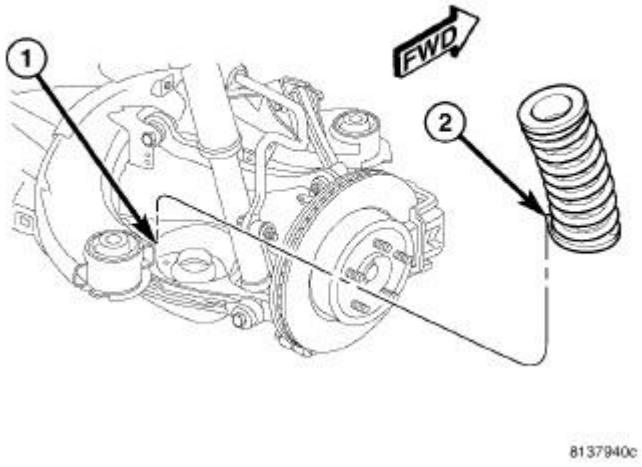

Fig. 193: Matching Spring Isolator To Spring Link
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.**

2. Install coil spring with isolators into spring pocket of spring link (1) fitting lower isolator (2) to shape of pocket, then align top of spring with body mount.

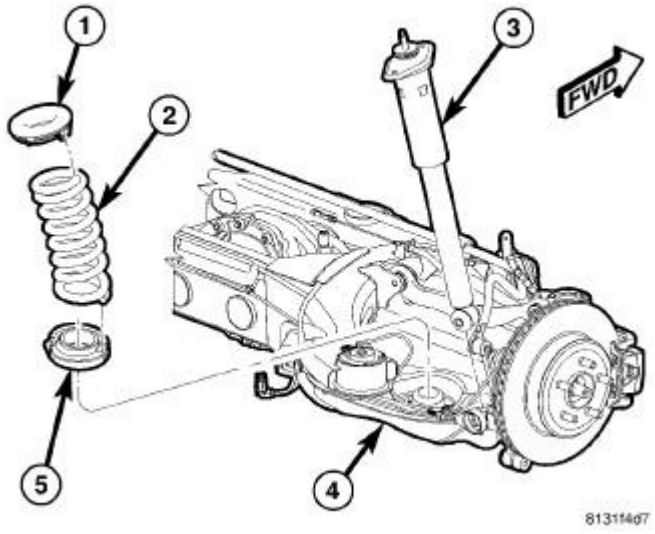

Fig. 194: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Standard suspension shown in illustration, Active Damping Suspension (ADS) similar.**

NOTE: **If equipped with ADS, connect the ADS connector to the shock after installing it in the vehicle.**

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

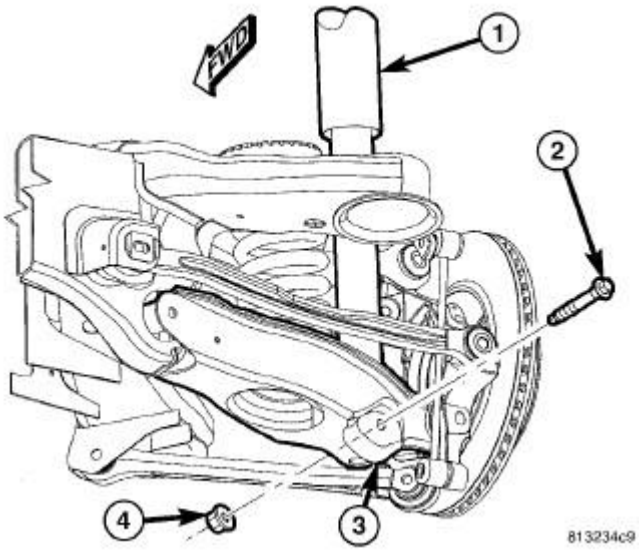

Fig. 195: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

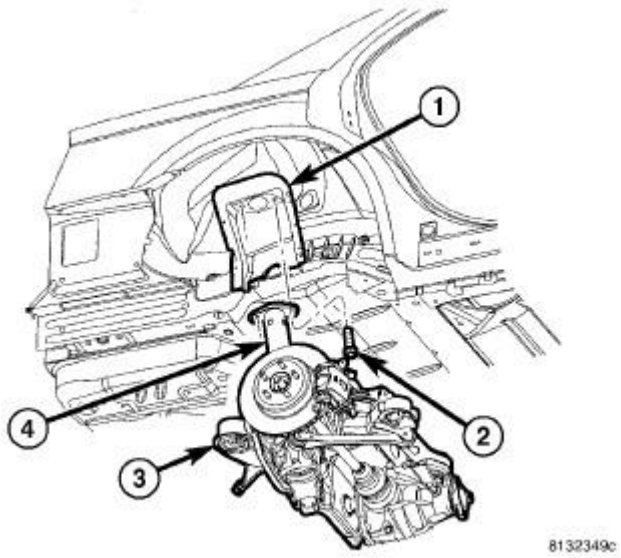

Fig. 196: Shock And Frame Mounting - Upper
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

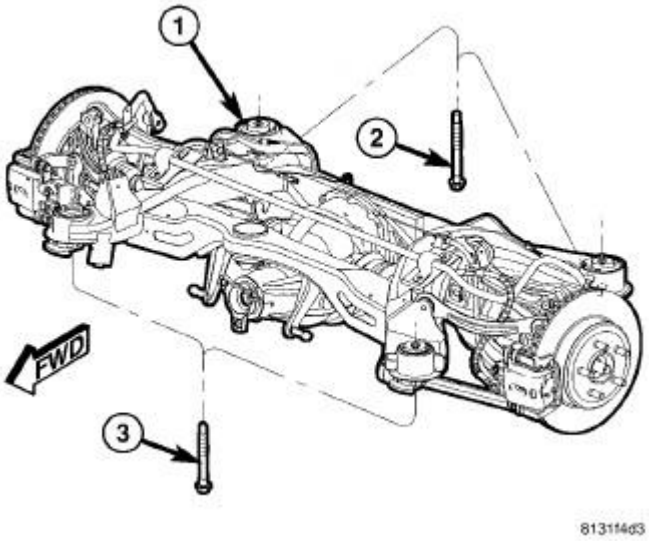

Fig. 197: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

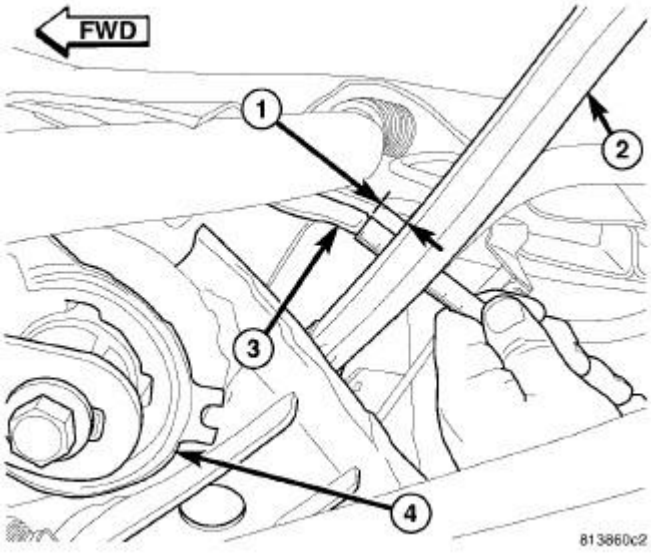

Fig. 198: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it,

just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

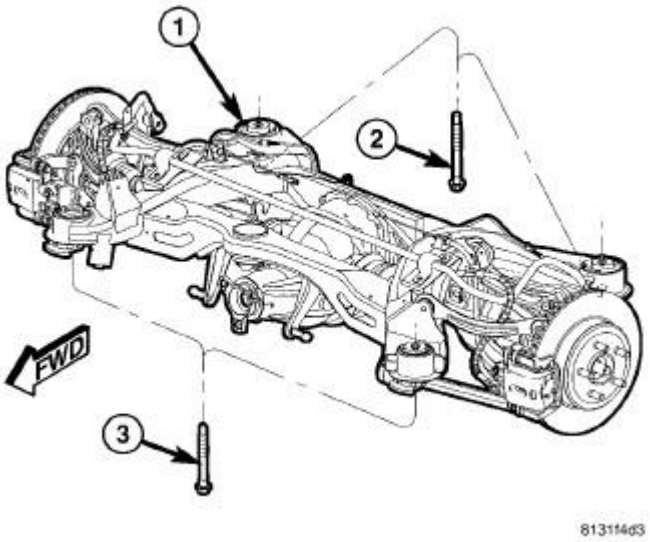

Fig. 199: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

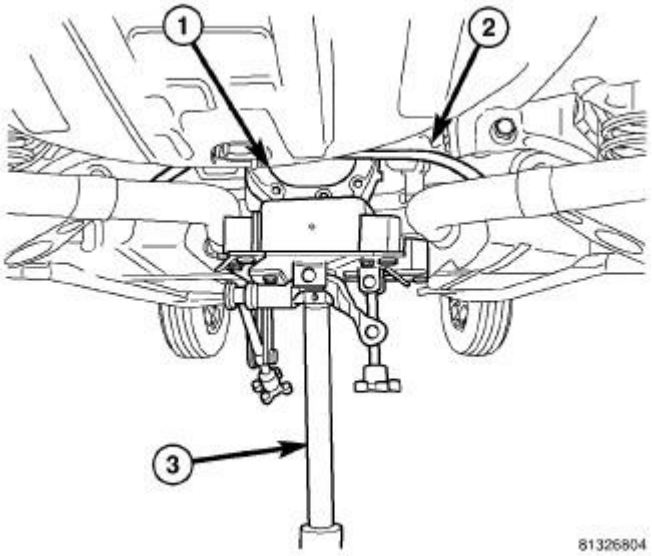

Fig. 200: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 201: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

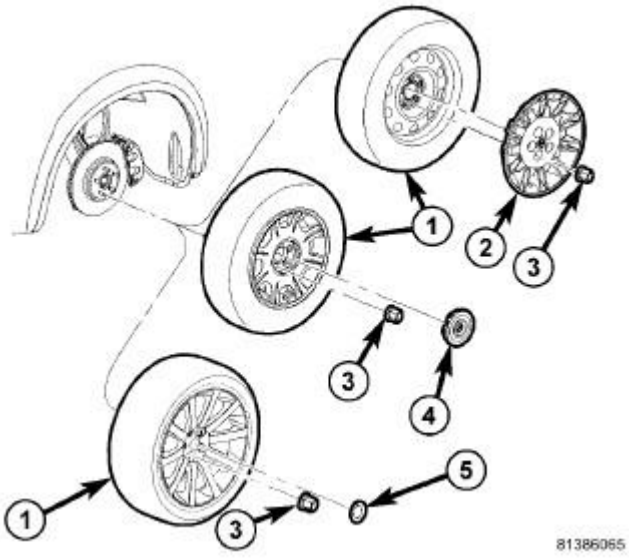

Fig. 202: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

13. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **INSTALLATION** .
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise lift as necessary to access lower mounting bolt.

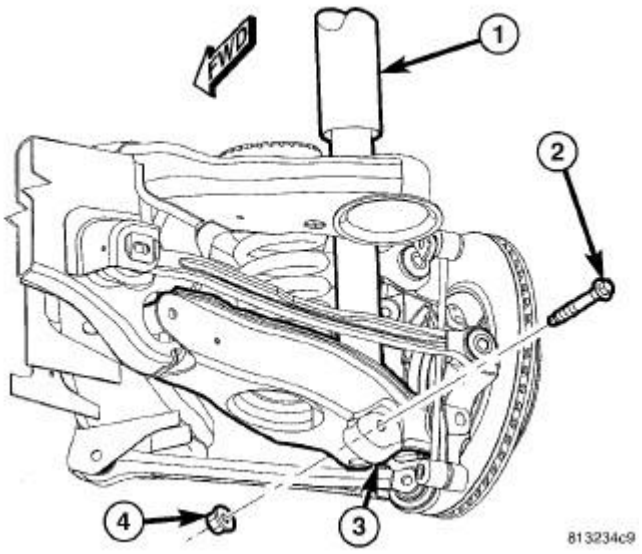

Fig. 203: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

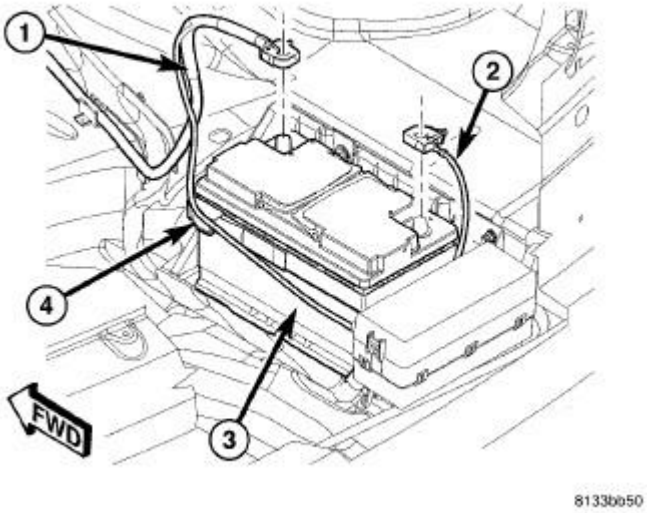

Fig. 204: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.

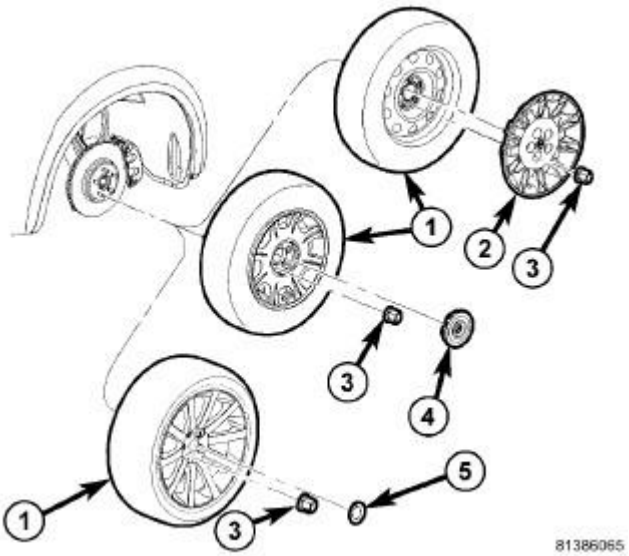

Fig. 205: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

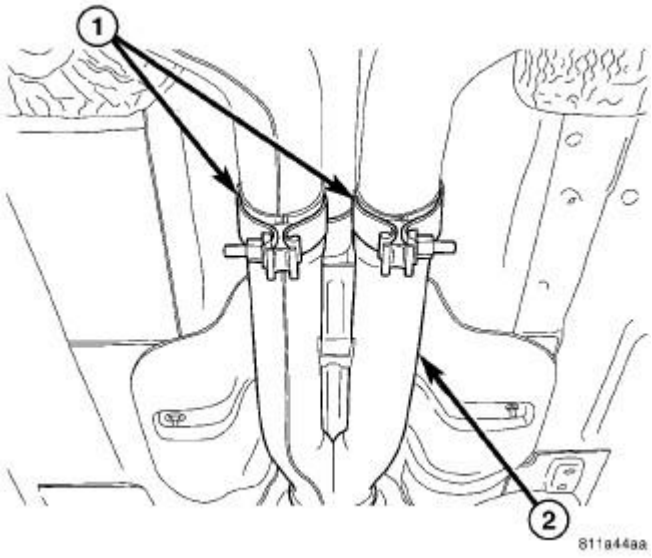

Fig. 206: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

4. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure). Refer to **MUFFLER, EXHAUST, REMOVAL** .

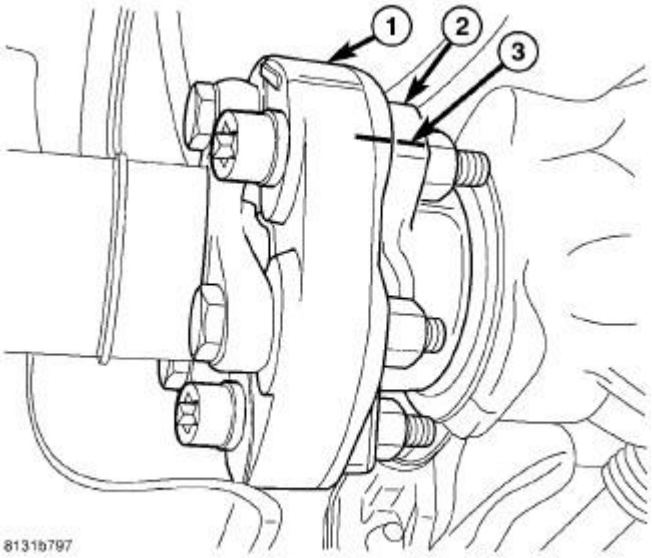

Fig. 207: Alignment Marks AT Shaft And Flange
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

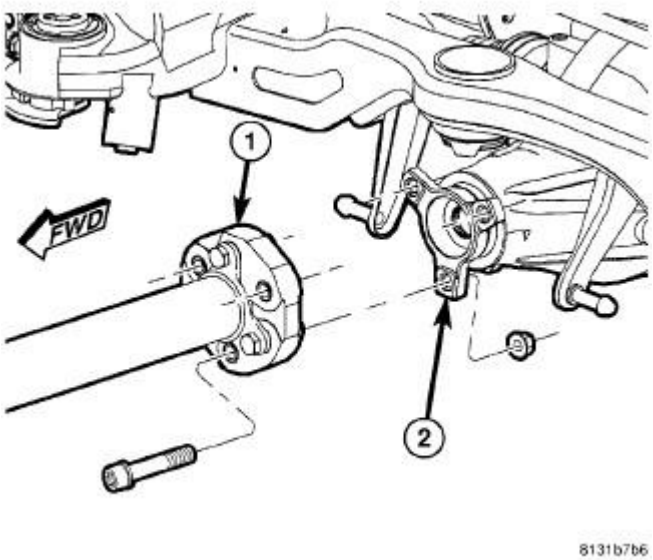

Fig. 208: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three (four if equipped with 215 MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

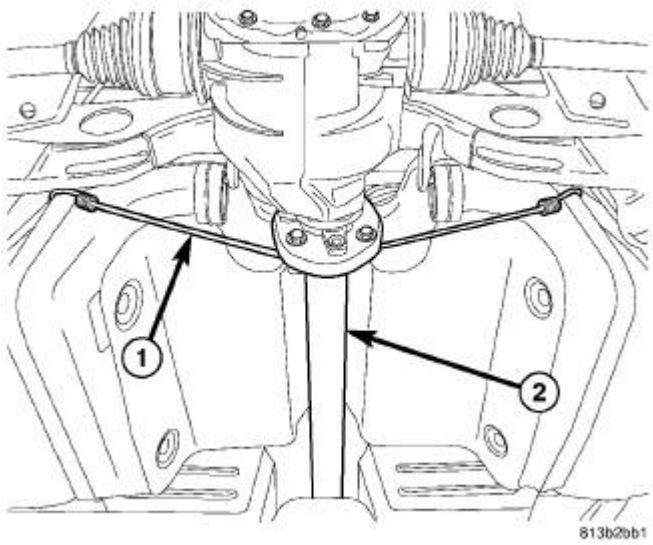

Fig. 209: Prop Shaft Support By Bungee Cord
Courtesy of CHRYSLER GROUP, LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown in illustration.

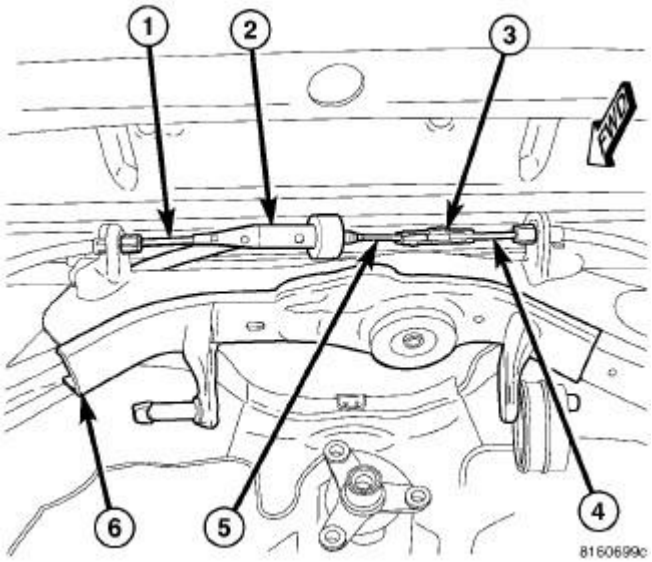

Fig. 210: Cables AT Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

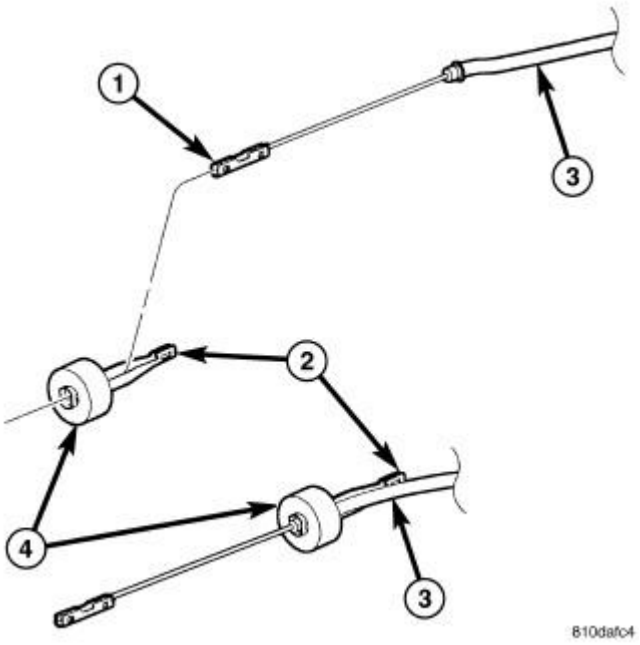

Fig. 211: Front Cable Installation Into Equalizer
Courtesy of CHRYSLER GROUP, LLC

9. Remove front parking brake cable (3) from equalizer (2).

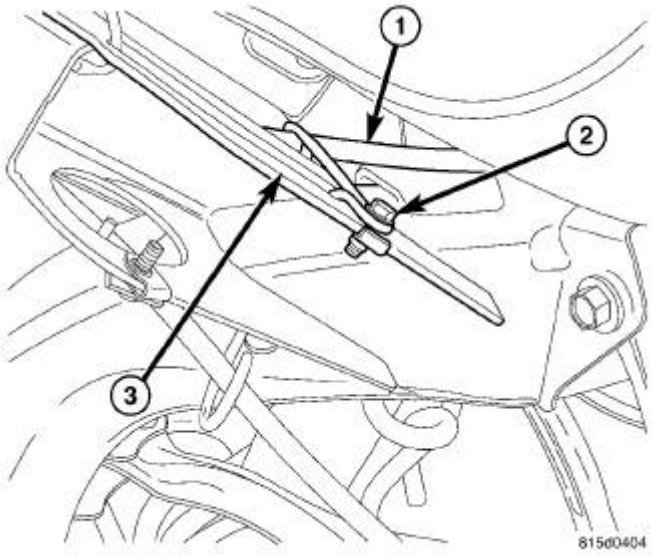

Fig. 212: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

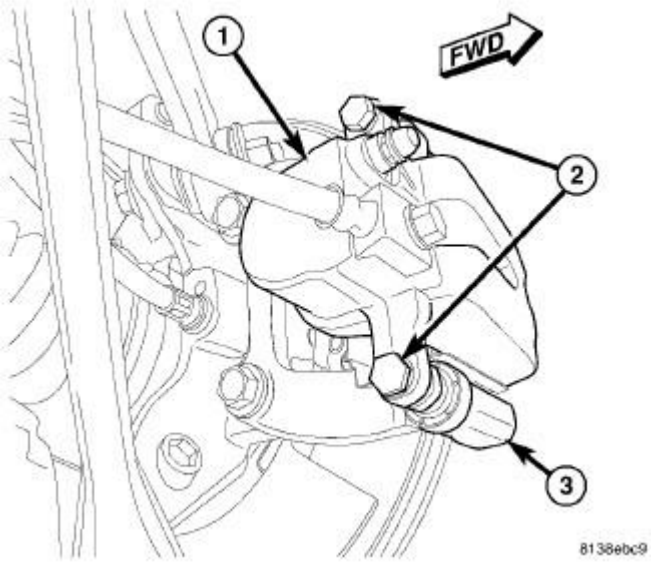

Fig. 213: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).

2. Remove brake caliper (1) from brake adapter (3) and pads.
3. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

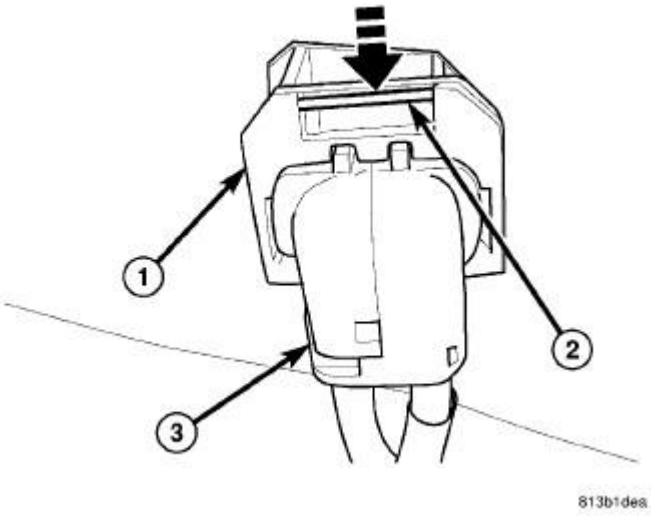

Fig. 214: Releasing Wheel Speed Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

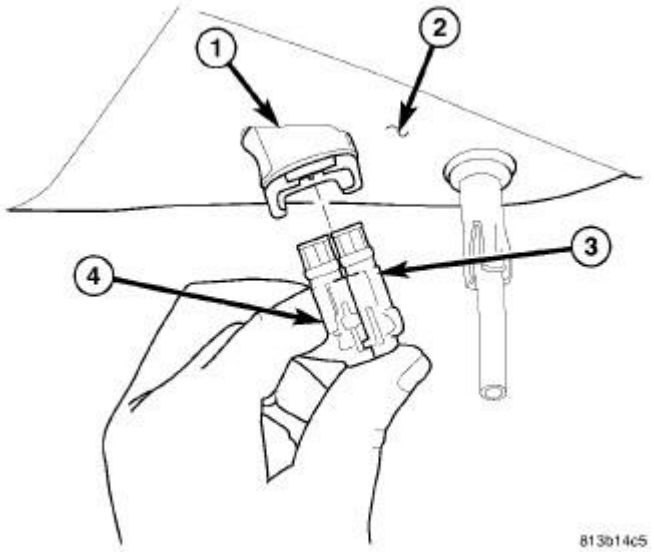

Fig. 215: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

12. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

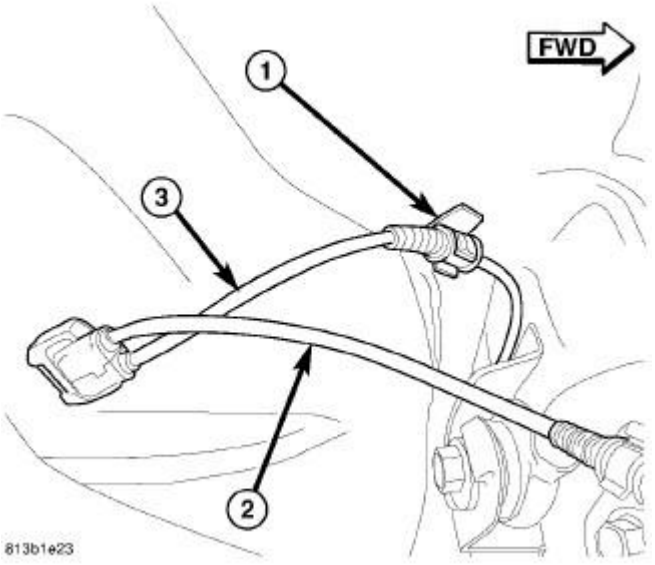

Fig. 216: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

13. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

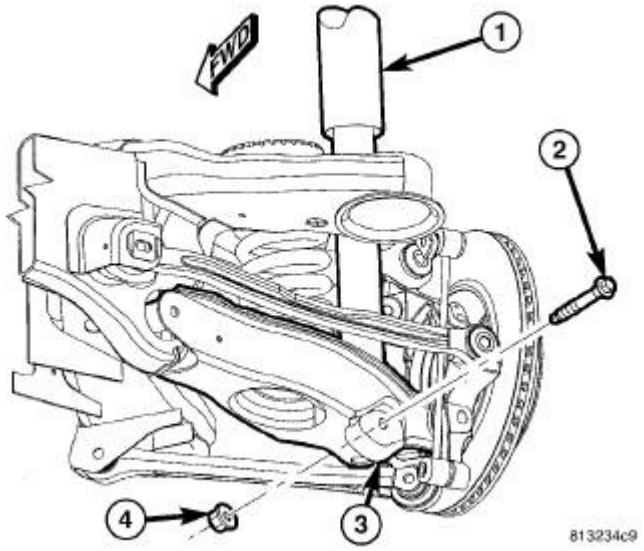

Fig. 217: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

14. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

15. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
16. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

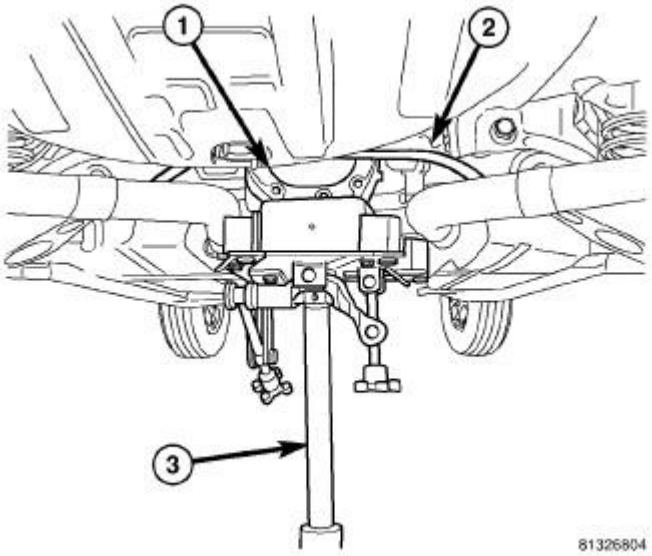

Fig. 219: Support Rear Suspension Using Jack

Courtesy of CHRYSLER GROUP, LLC

17. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

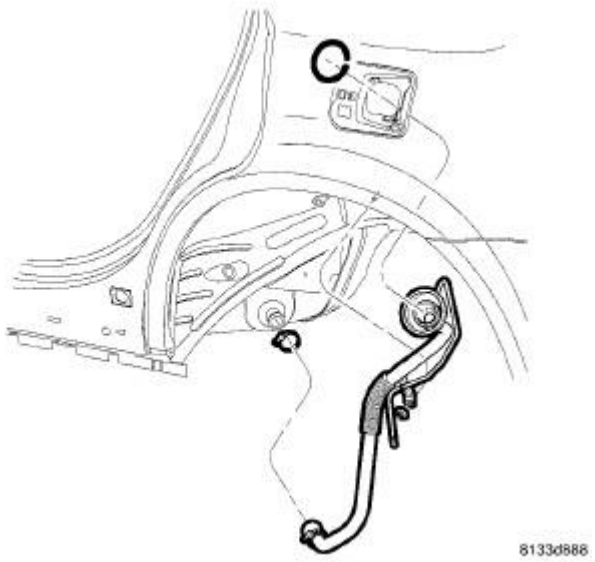

Fig. 220: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

18. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** or **TUBE, FUEL TANK FILLER, REMOVAL** .

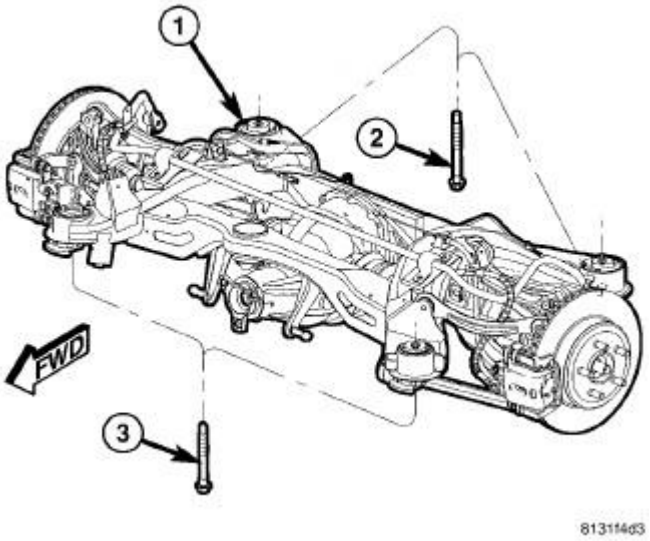

Fig. 221: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
20. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow propeller shaft removal from rear axle differential. **Do not lower jack any further than necessary.** Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.
21. Continue to lower jack until crossmember is at a comfortable working level to access stabilizer bar fasteners.

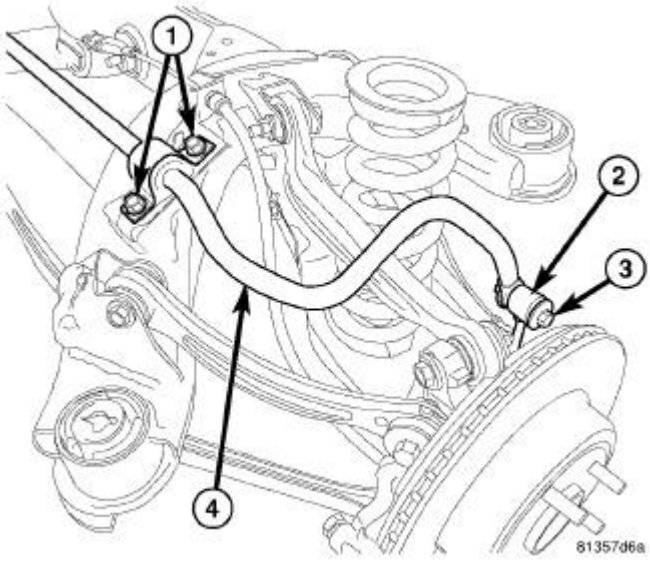

Fig. 222: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

22. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
23. Remove bolts (1) fastening each stabilizer bar isolator retainer to crossmember.
24. Remove stabilizer bar (4) with isolators and retainers.
25. Remove retainers from isolators.
26. Remove isolators from stabilizer bar utilizing slits in bushings.

INSTALLATION

INSTALLATION

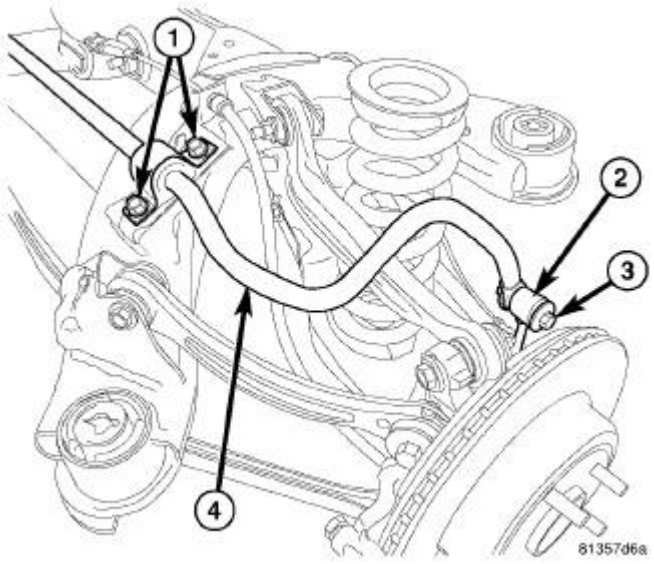

Fig. 223: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install isolators on stabilizer bar utilizing slits in bushings. Install each isolator so its slit faces forward and flat side is positioned toward crossmember once installed.
2. Install retainers on isolators.
3. Install stabilizer bar (4) with isolators and retainers on crossmember.
4. Install isolator retainer mounting bolts (1). **Do not tighten at this time.**
5. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer links (2). **Do not tighten at this time.**
6. Tighten isolator retainer mounting bolts (1) to 61 N.m (45 ft. lbs.).

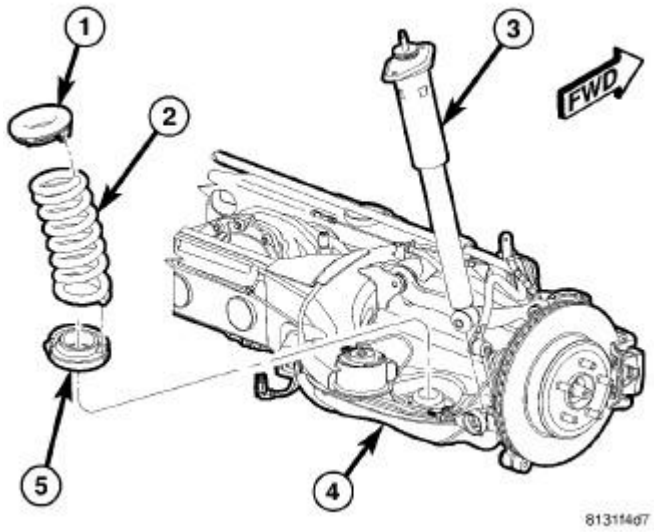

Fig. 224: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

7. Remove coil springs (2) with isolators (1 and 5) from spring links (4).
8. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft onto rear axle differential flange and align shocks with pockets in spring links.

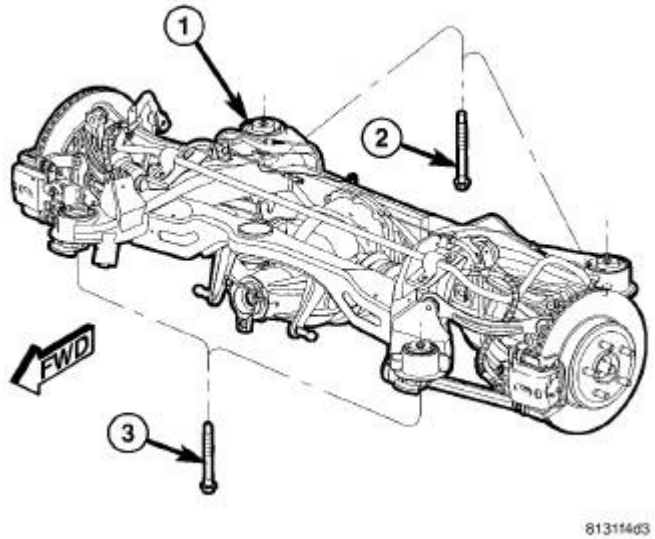

Fig. 225: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

9. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

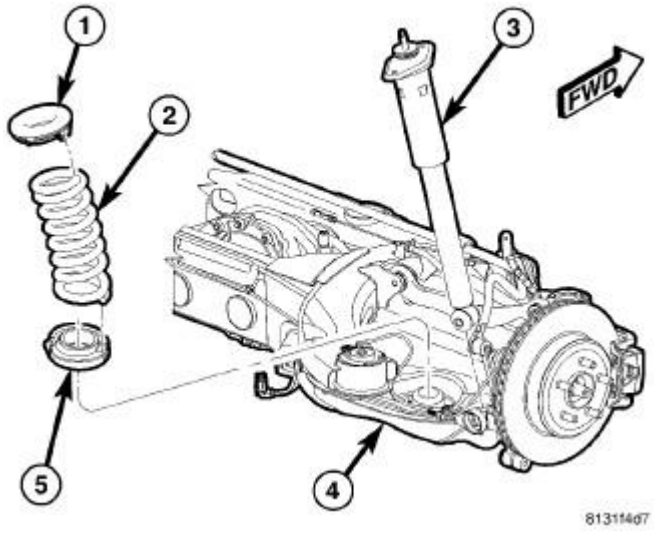

Fig. 226: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

10. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

11. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

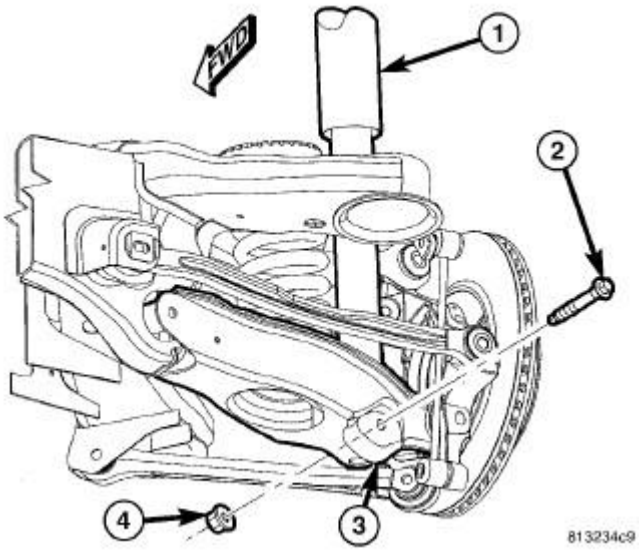

Fig. 227: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

12. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
13. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

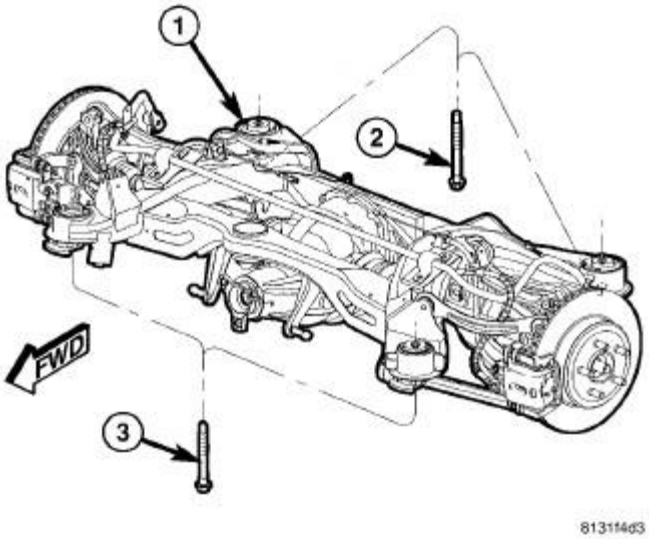

Fig. 228: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

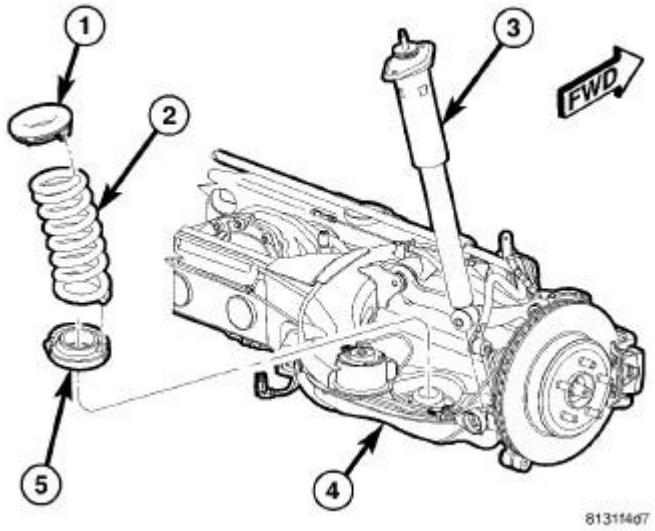

Fig. 229: Coil Spring And Shock Assy.
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

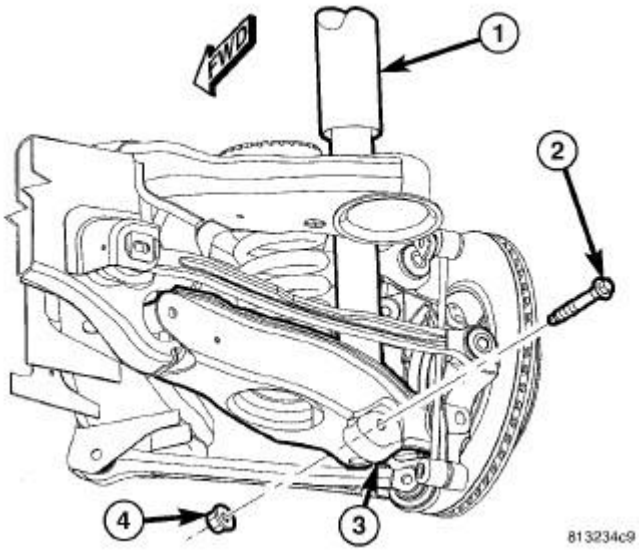

Fig. 230: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

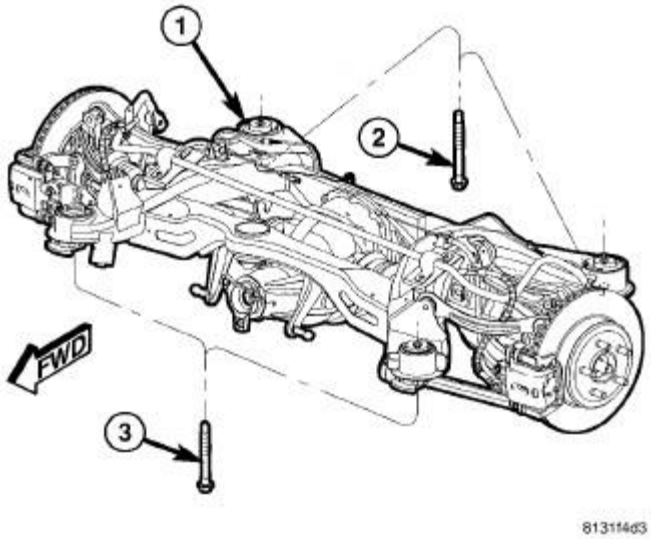

Fig. 231: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

20. Raise left side of crossmember (1) into mounted position. Install left side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

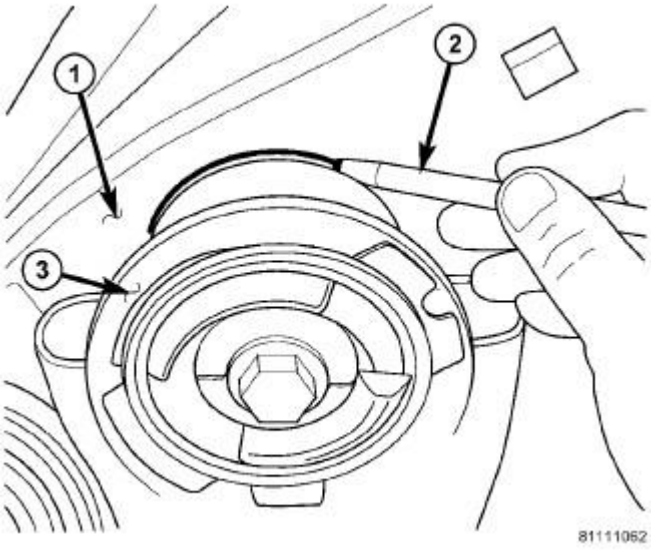

Fig. 232: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

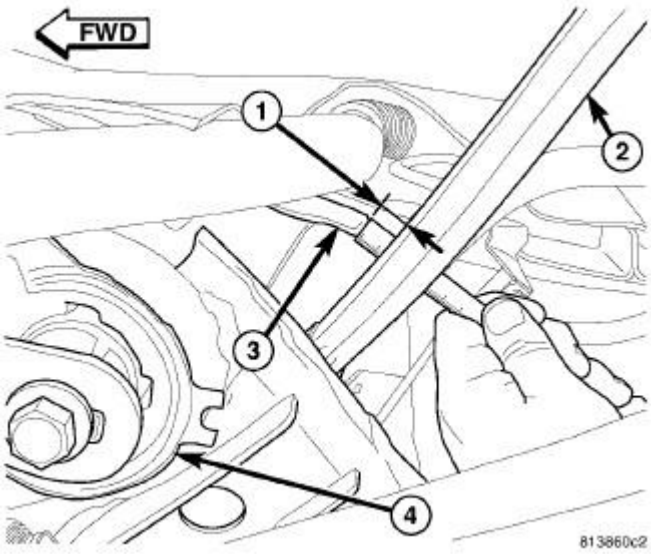

Fig. 233: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

22. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

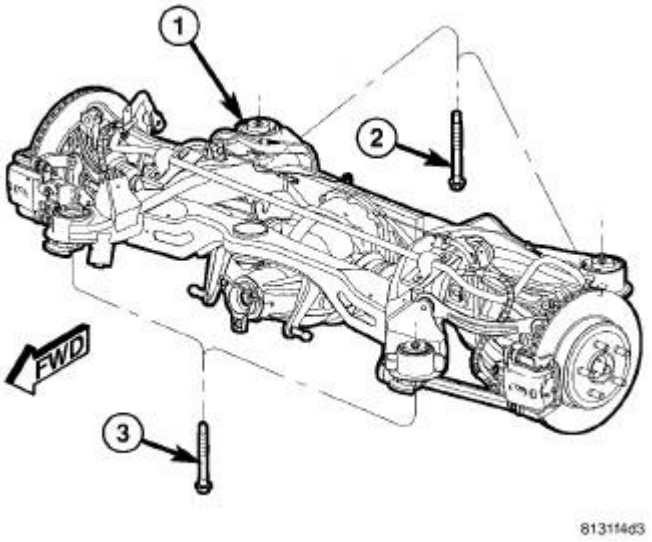

Fig. 234: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

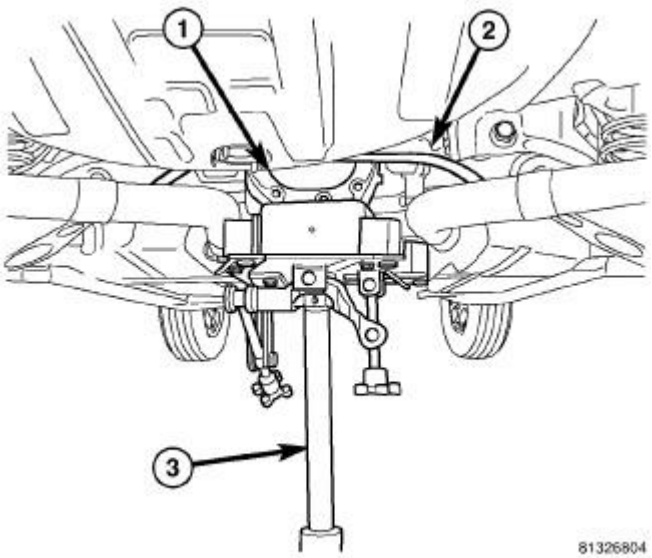

Fig. 235: Support Rear Suspension Using Jack
Courtesy of CHRYSLER GROUP, LLC

24. Remove jack (3) from under rear axle differential.

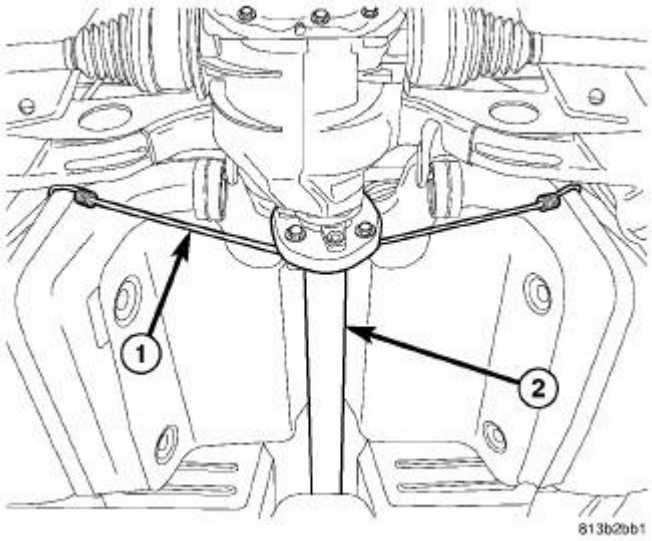

Fig. 236: Prop Shaft Support By Bungee Cord
Courtesy of CHRYSLER GROUP, LLC

25. Remove bungee cord (1) supporting propeller shaft (2).

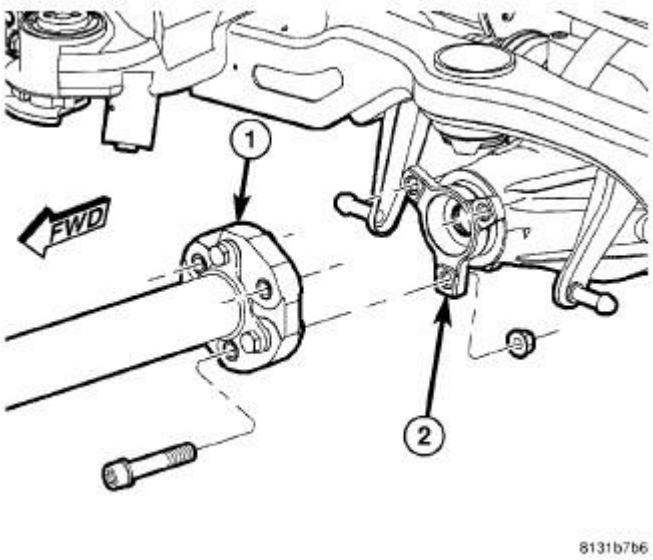

Fig. 237: Propeller Shaft AT Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

26. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

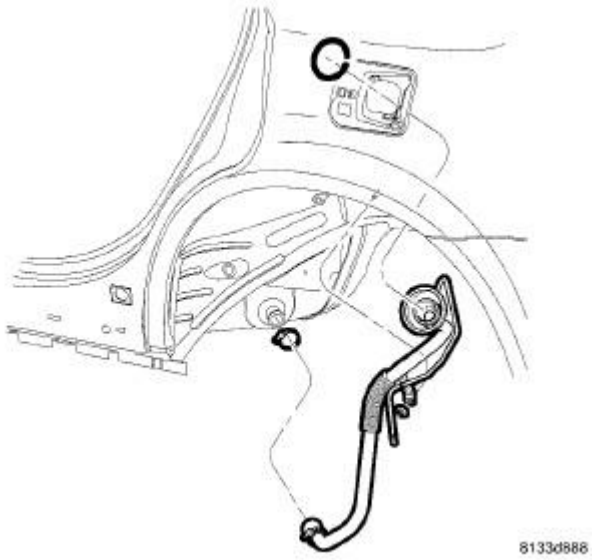

Fig. 238: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

27. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** or **TUBE, FUEL TANK FILLER, INSTALLATION** .

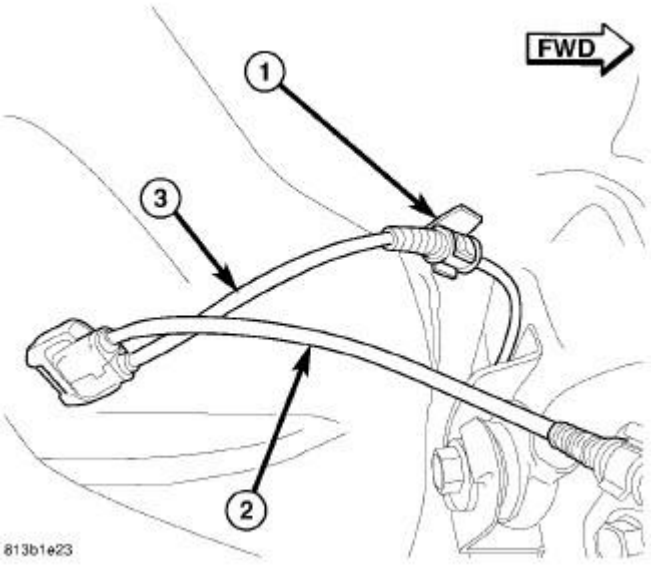

Fig. 239: Left/Right Rear Wheel Speed Sensor Routing
Courtesy of CHRYSLER GROUP, LLC

28. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

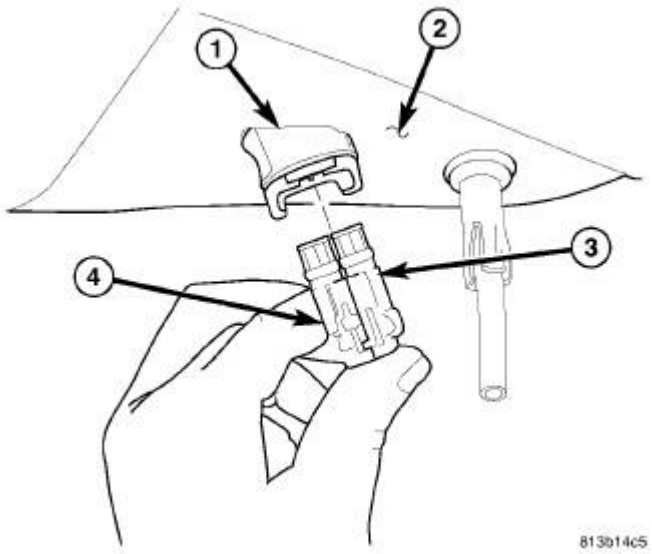

Fig. 240: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

29. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
30. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

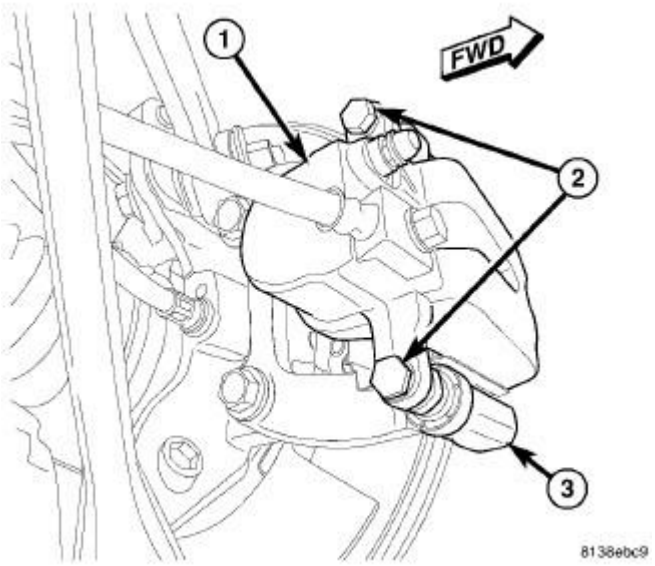

Fig. 241: Rear Caliper Mounting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

31. If equipped with standard or premium disc brakes, on each rear disc brake:
    1. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
    2. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
    3. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.).
    4. Make sure brake hose is properly routed and will not come in contact with suspension components.

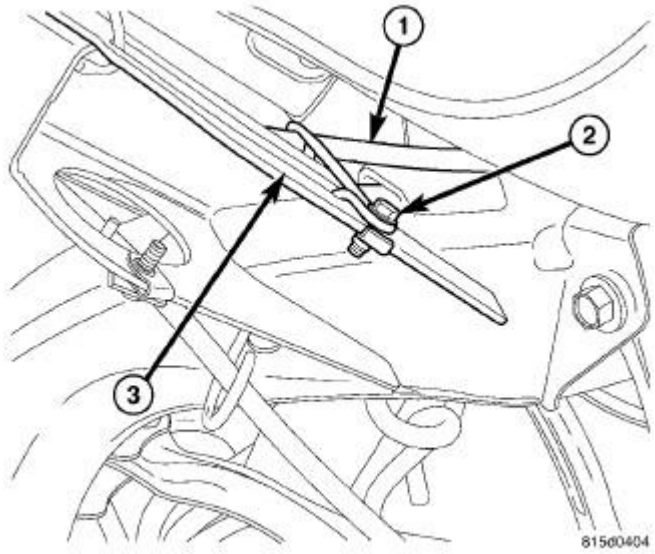

Fig. 242: Front Cable AT Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

32. Insert routing front parking brake cable bracket locating pin in front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

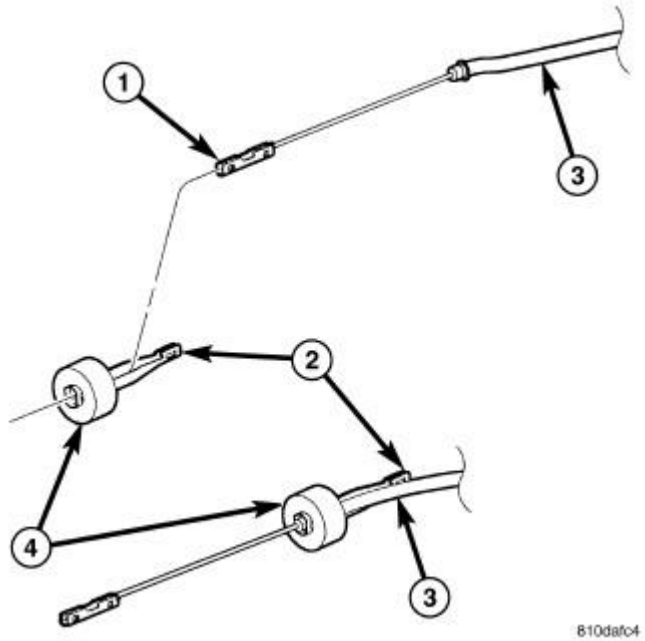

Fig. 243: Front Cable Installation Into Equalizer
Courtesy of CHRYSLER GROUP, LLC

33. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential.

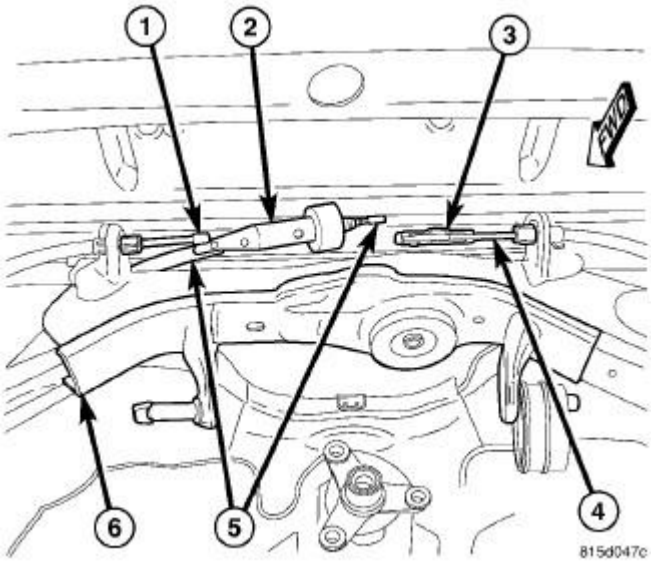

Fig. 244: Parking Brake Cables AT Rear Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

34. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

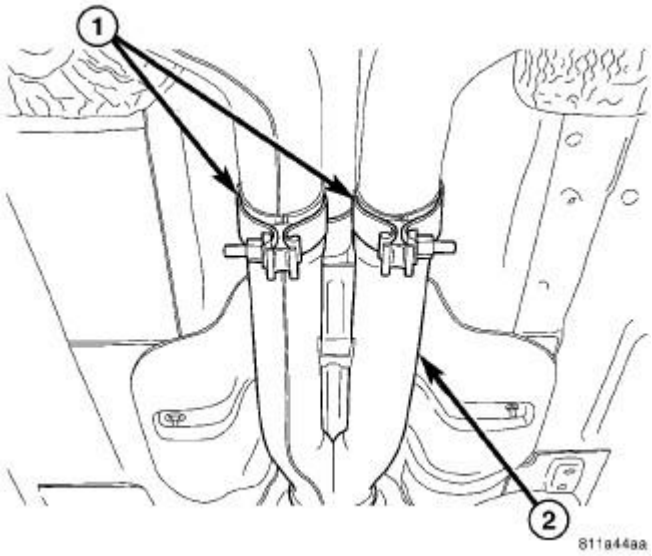

Fig. 245: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

35. Install rear exhaust system (2) (dual-outlet exhaust shown in figure). Refer to **MUFFLER, EXHAUST, INSTALLATION** .

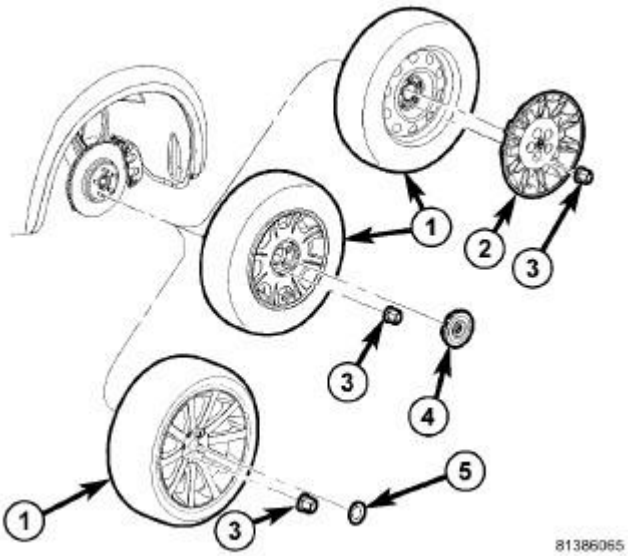

Fig. 246: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

36. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
37. Lower vehicle until rear wheels are just above floor level.
38. Apply parking brake lever. Release lever, then reapply.
39. Check to make sure rear wheels will not rotate with lever applied.
40. Lower vehicle.

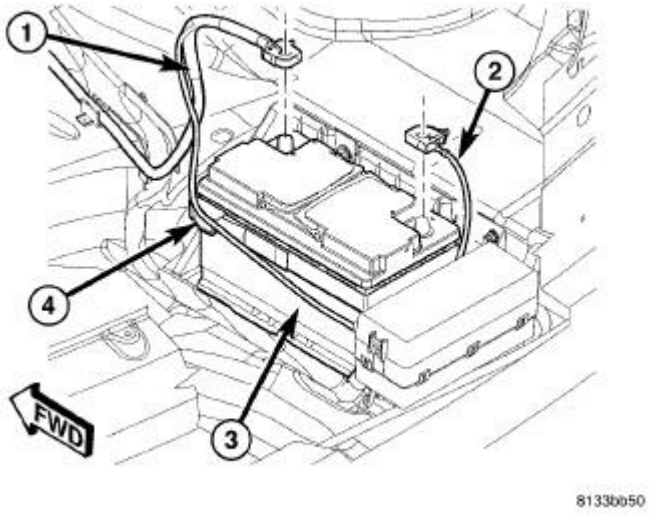

Fig. 247: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

41. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

42. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
43. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

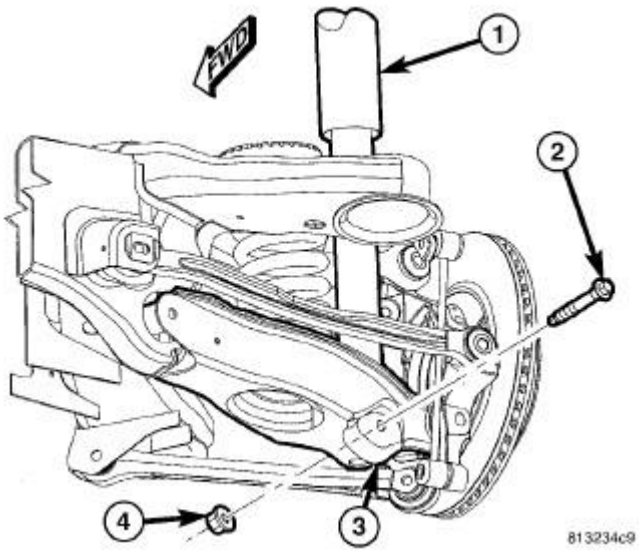

Fig. 248: Lower Shock Mount
Courtesy of CHRYSLER GROUP, LLC

44. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).

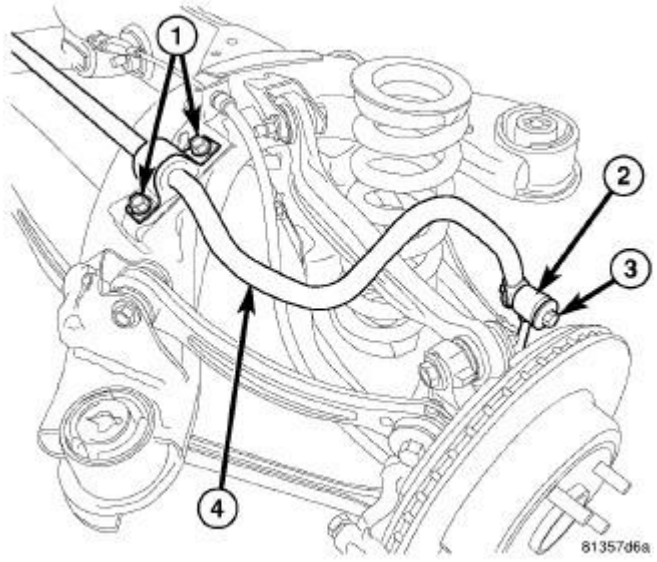

Fig. 249: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

45. Tighten stabilizer link fasteners (3) to 61 N.m (45 ft. lbs.).
46. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (). Refer to 22 and **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

RESTRAINTS

Service Information - Chrysler 300

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain or seat (pelvic and thorax) airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtains or seat airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain and seat airbags

will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System

(SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

OCCUPANT RESTRAINT SYSTEM

An occupant restraint system is standard factory-installed safety equipment on this vehicle. Available occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening and adjusting a seat belt; while passive restraints require no action by the vehicle occupants to be employed.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the rear seating. These upper anchors are integral to the rear shelf panel. Two lower anchors are also provided for each outboard rear seating position. The lower anchors are integral to an isofix cross member welded to the center floor panel beneath the rear seat. These lower anchors are accessed from the front of the rear seat where the seat back meets the seat cushion.
- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing lower B-pillar mounted inertia latch-type emergency locking retractors, height-adjustable upper B-pillar mounted turning loops, a traveling lower seat belt anchor secured to the outboard side of the seat frame, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The passenger side front seat belt retractor is switchable to an automatic locking retractor for compatibility with child seats. The driver and passenger side front seat belt buckles each include an integral seat belt switch that detects whether the front seat belts have been fastened.
- **Rear Seat Belts** - All three rear seating positions are equipped with three-point seat belt systems. The outboard seating position belts employ C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops and fixed

lower seat belt anchors secured to the lower C-pillar. The center position retractor is secured to the rear shelf panel and the fixed lower center seat belt anchor is secured to the floor panel. All three rear seat belts have fixed end-release seat belt buckles secured to the floor panel, a double buckle unit on the right side and a single buckle unit on the left side. Both outboard second row seat belt retractors are switchable to an automatic locking retractor for compatibility with child seats.

PASSIVE RESTRAINTS

Fig. 1: SRS Logo
Courtesy of CHRYSLER GROUP, LLC

The passive restraints available for this vehicle include the following:

- **Active Head Restraints** - Inertia-based Active Head Restraints (AHR) are standard equipment for both front seating positions in this vehicle.
- **Dual Front Airbags** - Multistage driver and front passenger airbags are standard in this model. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) from four to six seconds as a bulb test each time the ignition switch is turned to the ON position. Pyrotechnic-type seat belt tensioners are also integral for the driver and passenger front seat belts of all airbag equipped vehicles to work in conjunction with the dual front and side curtain airbags.
- **Knee Blocker Airbag** - The front airbag system also includes a knee blocker airbag (also known as a Knee AirBag/KAB or an Inflatable Knee Blocker/IKB) that is located just below the steering column, behind the instrument panel steering column opening cover. This airbag is also a passive, inflatable, SRS component and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the steering column opening cover on the instrument panel just beneath the steering column.
- **Seat Airbags** - Front seat integrated pelvic and thorax airbags are standard equipment in all

markets. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.

- **Side Curtain Airbags** - Side curtain airbags are standard equipment for this vehicle when it is also equipped with dual front airbags. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a molded identification trim button with the **SRS - AIRBAG** logo located on the top of each B-pillar upper trim panel near the headliner.

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Head Restraints** - On vehicles with this equipment, one Active Head Restraint (AHR) is located atop each front seat back unit.
- **Airbag Indicator** - The airbag indicator is integral to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Driver Airbag** - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of each vertical member of the headlamp mounting cross member structural support.
- **Knee Blocker Airbag** - This vehicle is equipped with a knee blocker airbag (also known as the Knee AirBag/KAB or Inflatable Knee Blocker/IKB) feature. The knee blocker airbag is mounted behind the instrument panel steering column opening cover in addition to the static driver knee blocker.
- **Occupant Detection Sensor** - An Occupant Detection Sensor (ODS) is located on the top of the seat cushion of the passenger side front seat in domestic market vehicles.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) is located on a mount on the floor panel transmission tunnel forward of the transmission gear selector, and is concealed below the instrument panel.
- **Passenger Airbag** - The passenger airbag is located in the instrument panel, beneath the passenger airbag door on the top of the instrument panel above the glove box on the passenger side of the vehicle.
- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.
- **Seat Airbag** - A seat (also known as pelvic and thorax) airbag unit is secured to each outboard front seat back frame, where it is concealed beneath the seat back trim cover and foam.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractor and both front seat buckle units on vehicles equipped with dual front airbags. The seat belt retractor and

tensioner units are secured to each lower inner B-pillar and are concealed behind the lower B-pillar trim. The seat belt buckle tensioner units are located on the inboard rear corner of each front seat cushion frame.

- **Seat Track Position Sensor** - Certain vehicles may include a seat track position sensor that may be located on the inboard side of one of the seat adjuster tracks on both the driver and the passenger front seats.
- **Side Curtain Airbag** - A standard equipment side curtain airbag is secured to each inside roof side rail above the headliner, and extends from the A-pillar to just beyond the C-pillar.
- **Side Impact Sensor** - Six side impact sensors are standard equipment on vehicles equipped with side curtain airbags, three on each side of the vehicle. One pressure-type sensor is located on each right and left side front door hardware module carrier, while one acceleration-type sensor is located on each B-pillar and C-pillar. These sensors are each concealed behind the adjacent interior trim components.

The ORC and the IC each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

PEDESTRIAN PROTECTION SYSTEM

An Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) is factory-installed safety equipment, which is available only in vehicles manufactured for certain export markets. The EPP system includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Hood Hinge Actuators** - The two pyrotechnic EPP active hood hinge actuators are each secured by a screw within a mounting plate located on each of the two active hood hinges, which are located near each rear corner of the hood panel.
- **Active Hood Hinges** - The active hood hinges have several features and components not found on a conventional hood hinge. In addition to a mounting plate for a pyrotechnic actuator and a reset spring, each active hood hinge includes a mid-strap joined to the hood bracket by a pivot pin at the forward end and a shear rivet at the rearward end. An up-stop pin near the center of the hood bracket fits within a slotted hole near the center of the mid-strap. Refer to **HINGE, HOOD** for hood hinge removal and installation procedures.
- **Front Energy Absorber Foam Material** - The front energy absorber foam material is

sandwiched between the front bumper area of the front fascia and the front bumper support beam. Refer to **FASCIA, FRONT** for front fascia removal and installation procedures.

- **Impact Sensors** - The EPP system includes three dedicated acceleration-type impact sensors to support the EPP feature. The impact sensors are each mounted by a screw to a receptacle with a U-nut located on the back of the front fascia. One sensor and bracket is located near each end just above the bumper support beam, and one is located near the center just below the bumper support beam. The impact sensors and the sensor mounting provisions are concealed behind the front fascia.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) also serves as the Electronic Pedestrian Protection Module (EPPM) in this vehicle. The ORC is located on a mount on the floor panel transmission tunnel near the dash panel just forward of the center instrument panel support.
- **Pedestrian Bar** - A static, tubular metal pedestrian bar (also known as a leg catcher) is concealed just behind the lower end of the front fascia. The pedestrian bar is suspended at each side from the lower end of a stamped metal bracket that is secured at the top near the same brackets that support each end of the front bumper support beam. Refer to **FRAME AND BUMPERS** for the pedestrian bar removal and installation procedures.

The ORC and the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the EPP electronic components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the EPP components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OCCUPANT RESTRAINT SYSTEM

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as Supplemental Restraint System (SRS) components because

they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components. In addition, each front seat occupant must have their Active Head Restraint (AHR) unit properly adjusted in order to obtain its maximum safety benefit.

The SRS electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) illuminates from four to six seconds as a bulb test each time the ignition switch is turned to the ON or START positions. Following the bulb test, the airbag indicator is turned ON or OFF by the ORC to indicate the status of the SRS. If the airbag indicator comes ON at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the acceleration-type impact sensors, or by a pressure wave within a front door as measured by the pressure-type impact sensor. When an impact is severe enough, the microprocessor in the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions.

The front seat belt retractor and buckle tensioners, the knee blocker airbag (also known as the Knee AirBag/KAB or Inflatable Knee Blocker/IKB) are provided with a deployment signal by the ORC in conjunction with the front airbags. The side curtain airbags and the seat airbags (also known as pelvic and thorax airbags) are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle. The ORC also contains a rollover sensor. Should the vehicle roll over and not cause any acceleration-type or pressure-type impact sensor to signal the need for a deployment, the rollover sensor in the ORC will deploy the side curtain air bags, the seat air bags and, under certain conditions, will also actuate the seat belt buckle and retractor tensioners.

During a frontal vehicle impact, the static knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The static knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the IC to turn ON the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

PEDESTRIAN PROTECTION SYSTEM

In the event of a frontal vehicle impact, the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) components are designed and intended to enhance the protection for pedestrians from the hard components found just beneath the hood of the vehicle within the engine compartment. The EPP system has three acceleration-type impact sensors located in the front bumper area of the vehicle, a microcontroller-based Occupant Restraint Controller (ORC) located within the passenger compartment of the vehicle that also serves as the EPP system controller and an active hood hinge with a pyrotechnic-type actuator at each rear corner of the hood panel.

The impact sensors continually transmit sensor data to the ORC that give an indication of the forces of gravity (G force) upon the sensors. The ORC also receives electronic message inputs over the Controller Area Network (CAN) data bus indicating the ignition status, vehicle speed and ambient temperature. If the vehicle has a collision, the ORC uses algorithms to analyze all of the input data to determine whether to deploy the hood. If the algorithm makes a deployment decision and that the vehicle speed is between 22 kilometers-per-hour (14 miles-per-hour) and 52 kilometers-per-hour (32 miles-per-hour), then the ORC will send electrical signals to deploy the actuators on the active hood hinges.

When the micro gas generator in each actuator is energized, it produces a large quantity of expanding gas. The expanding gas moves a piston within the actuator that pushes upward against the hood bracket of the active hood hinge. The force of the actuator on the hinge bracket creates a lever action that shears a rivet between the hood bracket and the mid-strap of both hood hinges, allowing the actuators to lift the rear of the hood at the hinges. Lifting the rear of the hood in this manner provides additional clearance between the hood and the hard components found within the engine compartment.

Each active hood hinge functions normally during routine opening and closing of the hood. However, upon active hood hinge deployment the rear of the hood is lifted to a predetermined height, which is controlled by an up-stop pin on the hinge bracket that is engaged within a slotted hole in the mid-strap

of each hinge.

During a frontal pedestrian impact, the purpose of the pedestrian bar (also known as the leg catcher) that supports the lower front fascia is to reduce the severity of leg injuries and to position the pedestrian onto the hood of the vehicle rather than onto the pavement. These goals are both intended to reduce the severity and debilitating nature of potential pedestrian injuries. It should be noted that the pedestrian bar **must** be inspected and replaced if visually damaged following **any** frontal vehicle impact, regardless of whether or how the active hood is deployed.

The EPP system electrical circuits are continuously monitored and controlled by the ORC microcontroller. If the ORC detects a problem it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic request message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to illuminate the airbag indicator. The airbag indicator may be turned ON or OFF by the ORC to indicate a problem in either the Supplemental Restraint System (SRS) or the EPP system electrical circuits.

The hard wired circuits between components related to the EPP system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the EPP system or the electronic controls or communication between other modules and devices that provide inputs to the ORC. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to EPP system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUPPLEMENTAL RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool

along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

PEDESTRIAN PROTECTION SYSTEM

The hard wired circuits between modules and components related to the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the EPP system or the electronic controls or communication between other modules and devices that provide features of the EPP system. The most reliable, efficient, and accurate means to diagnose the EPP system or the electronic controls and communication related to EPP system operation, as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the EPP system may require the use of the Supplemental Restraint System (SRS) Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-

deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SERVICE AFTER A PEDESTRIAN PROTECTION DEPLOYMENT

COMPONENT REPLACEMENT AND INSPECTION REQUIREMENTS

There are two types of Electronic Pedestrian Protection (EPP) system deployments that may occur: pedestrian and non-pedestrian. Following either type of deployment, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will display a **SERVICE ACTIVE HOOD** message and the airbag indicator will be illuminated. To make sure continued system integrity, certain components must be replaced or inspected following a deployment based upon the deployment type.

PEDESTRIAN DEPLOYMENT

The following components **must** be replaced following a pedestrian deployment:

- Right and left EPP hood hinge actuators
- Right and left active hood hinges
- Hood panel

The following components **must** be closely inspected, then replaced if any damage is visually evident

following a pedestrian deployment:

- EPP impact sensors
- EPP impact sensor wiring
- Front bumper energy absorber foam material (inspect for compression, cracks and any other signs of deformation or deterioration)
- Front bumper support beam (reinforcement)
- Front fascia
- Front fascia brackets
- Hood latch/secondary catch unit
- Hood latch striker
- Pedestrian bar (see **NOTE**)

NOTE: **The pedestrian bar MUST be inspected and replaced if visually damaged following ANY frontal vehicle impact, regardless of whether the active hood is deployed or how the impact occurred.**

NON-PEDESTRIAN DEPLOYMENT

The following components **must** be replaced following a non-pedestrian deployment:

- Right and left EPP hood hinge actuators
- Right and left active hood hinges

The following components **must** be closely inspected, then replaced if any damage is visually evident following a non-pedestrian deployment:

- EPP impact sensors
- EPP impact sensor wiring
- Front bumper energy absorber foam material (inspect for compression, cracks and any other signs of deformation or deterioration)
- Front bumper support beam (reinforcement)
- Front fascia
- Front fascia brackets
- Hood latch/secondary catch unit
- Hood latch striker
- Hood panel
- Pedestrian bar (see **NOTE 2**)

NOTE:

1. **In order to guarantee continued Electronic Pedestrian Protection (EPP) system integrity, the hood panel MUST be replaced following three EPP deployments, regardless of how the active hood is deployed or the results**

of any visual inspection.

2. **The pedestrian bar MUST be inspected and replaced if visually damaged following ANY frontal vehicle impact, regardless of whether the active hood is deployed or how the impact occurred.**

ACTIVE HOOD HINGE RESET PROCEDURE

If the vehicle remains otherwise safely operable following an EPP deployment, a customer reset position for the active hood hinges is provided to restore adequate forward visibility to drive the vehicle to the nearest dealer for service. Proceed as follows to engage the deployed active hood hinges in the reset position:

1. Push downward on one rear corner of the hood panel.

   NOTE: The initial 15 millimeters (0.60 inch) of travel will require significant effort, up to 300 Newtons (68 pounds) of force. After the initial travel, the deployed EPP actuators will vent and the required force to push the hood downward will be reduced.

2. Continue pushing the hood downward until the active hinge reset mechanism engages. The **C** shaped reset spring on the hinge mid-strap will come into contact with the hood bracket and the resistance will increase. Provide an additional downward force (a soft bump downward) on the hood to cause the reset spring to compress, then snap into the detent notch in the hood bracket. The rear edge of the hood will be raised about 5 millimeters (0.20 inch) higher than the fender when the active hood hinge is in the reset position.
3. Repeat Steps 1 and 2 on the opposite rear corner of the hood panel.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, the following guidelines MUST be observed.

- **Following ANY major vehicle impact damage in the vicinity of an impact sensor or the ORC** - It is critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), front impact sensors and side impact sensors located within the proximity of the impact damage be closely inspected and restored to their original conditions. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.
- **If an active head restraint is deployed** - An inertia-based Active Head Restraint (AHR) unit that is undamaged following a deployment automatically resets itself. These units are designed with the intention of reuse.
- **If the driver airbag is deployed** - If the driver airbag has been deployed, the steering wheel, the clockspring and the complete steering column with lower steering column coupler must also be replaced.

- **If the knee blocker airbag is deployed** - If the knee blocker airbag (also known as the Knee AirBag/KAB or Inflatable Knee Blocker/IKB) has been deployed, the instrument panel steering column opening cover must also be replaced.
- **If the passenger airbag is deployed** - If the passenger airbag has been deployed, the instrument panel top pad must also be replaced.
- **If a seat airbag is deployed** - If a seat (pelvic and thorax) airbag has been deployed, the seat back frame, the seat back foam and the seat back trim cover on the same side of the vehicle as the deployed airbag must also be replaced.
- **If a seat belt tensioner is deployed** - The seat belt tensioners are deployed in conjunction with the front airbags, but can also be deployed with seat (pelvic and thorax) or side curtain airbags. The seat belt tensioners must be replaced if either front airbag has been deployed, and must be inspected if either seat or side curtain airbag has been deployed.
- **If a side curtain airbag is deployed** - If a side curtain airbag has been deployed, the headliner as well as the upper A, B and the C-pillar trim on the same side of the vehicle as the deployed airbag must also be replaced. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a side curtain airbag deployment.

The components identified with the deployed SRS components in the preceding list are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

SQUIB CIRCUIT WIRING REPAIRS

In addition to the preceding guidelines, be aware that the heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to the connected wiring (squib circuits) and connector insulators. There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner. This connection method typically requires no additional wiring repair following a deployment.

However, the second connection method involves a wire harness takeout and connector insulator that are connected directly to the airbag or tensioner initiator or squib. These direct-connect type take outs and connector insulators **MUST** be repaired following an airbag or seat belt tensioner deployment using the approved Supplemental Restraint System Wiring Repairs procedure. Refer to **STANDARD PROCEDURE**.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The driver and passenger airbags in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment

event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Turn the ignition switch to the ON position.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **Airbag Squib Status** table to determine the status of both driver and passenger airbag squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	**CONDITIONS**	**SQUIB STATUS**
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other	Both Squib 1 and 2 were used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	**AND** Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

NOTE: **If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.**

CLEANUP PROCEDURE

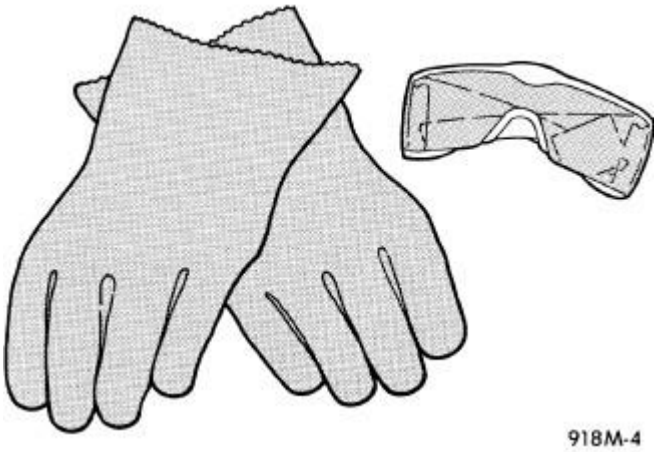

Fig. 2: Safety Glasses & Rubber Gloves
Courtesy of CHRYSLER GROUP, LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: **To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

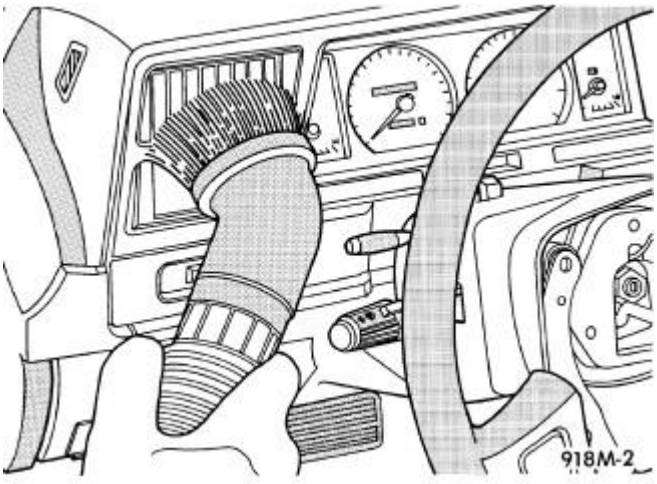

Fig. 3: Vacuum Cleaner
Courtesy of CHRYSLER GROUP, LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to AIRBAG SQUIB STATUS heading within this information. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the

recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp).

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring diagram for the original wire gauge size.

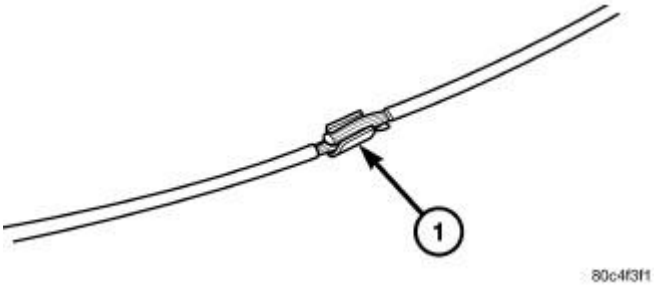

Fig. 4: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

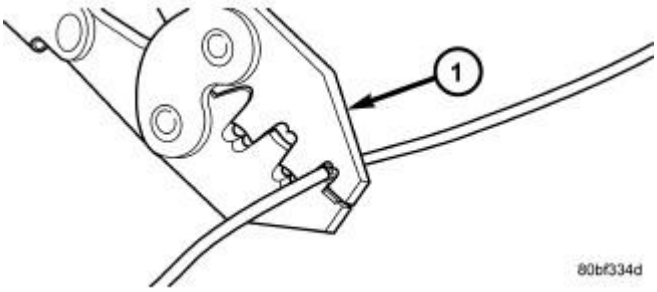

Fig. 5: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

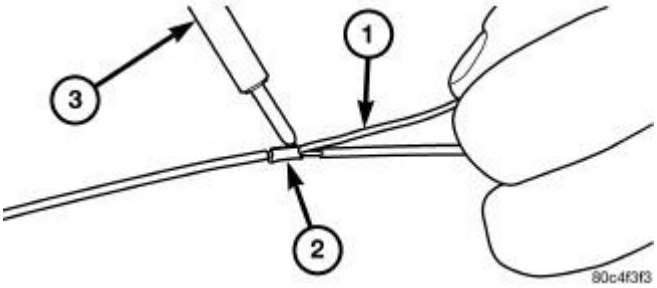

Fig. 6: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

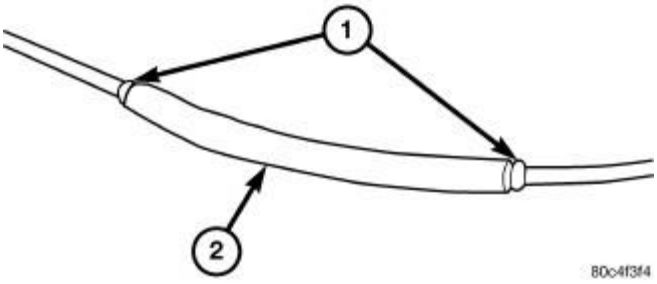

Fig. 7: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of

the tubing.

SUPPLEMENTAL RESTRAINTS VERIFICATION TEST

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the service or replacement of any SRS component. Refer to the appropriate diagnostic procedures.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. During the following test, the battery negative cable remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover and outboard of the steering column.
3. Turn the ignition switch to the ON position and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in 5 or6, refer to the appropriate diagnostic information.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to9.
9. Turn the ignition switch to the OFF position for about 15 seconds, and then back to the ON position. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays ON, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

ACTUATOR, ELECTRONIC PEDESTRIAN PROTECTION HOOD HINGE

DESCRIPTION

DESCRIPTION

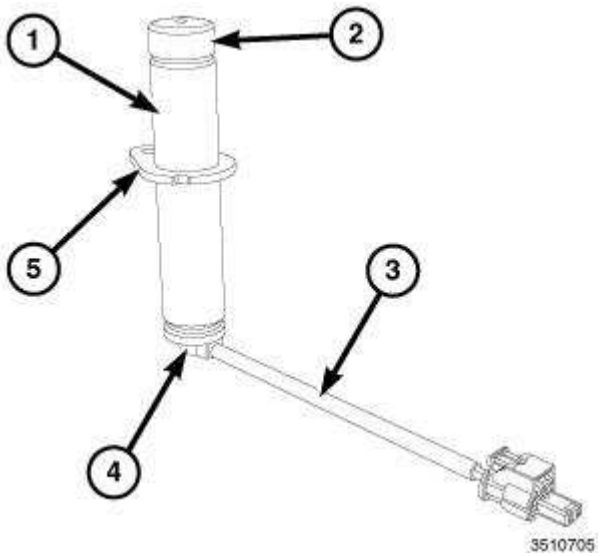

Fig. 8: Integral Bracket, Tubular Metal Housing, Metal Piston, Gas Generator & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

Active hood hinge actuators are found only in vehicles equipped with the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or Active Hood System), which is available only in vehicles manufactured for certain export markets. An EPP active hood hinge actuator is located on each hinge. The actuators are secured by a self-tapping screw through an integral bracket (5) to a mounting plate integral to the lower bracket on each active hood hinge.

The actuator consists primarily of a tubular metal housing (1) containing a metal piston (2) with a molded plastic cap and a small pyrotechnically activated gas generator (4). The actuators are controlled by the Occupant Restraint Controller (ORC). An actuator pigtail wire (3) and connector insulator are routed to a dedicated take out of the headlamp and dash wire harness and connected to the vehicle electrical system by a keyed and latching molded plastic connector insulator to ensure a secure connection.

The EPP active hood hinge actuators cannot be repaired and, if ineffective or damaged, the entire actuator unit must be replaced. The actuators are not intended for reuse and must be replaced following any EPP system deployment.

OPERATION

OPERATION

The Electronic Pedestrian Protection (EPP) active hood hinge actuators are deployed by a signal generated by the Occupant Restraint Controller (ORC) through the right and left hood actuator line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the actuators, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

The gas generator is installed in one end of a steel cylinder tube where the piston is sealed to the inside circumference of the tube. As the gas expands, it pushes the piston up the tube, where it

actuates the leveraging mechanism of the active hood hinge that cuts the hinge shear rivet and raises the rear edge of the hood panel.

Raising the hood panel following a frontal impact of the vehicle creates additional clearance between the hood and the hard components within the engine compartment. This clearance helps to reduce the severity of injuries that a pedestrian might experience in these situations as a result of harmful contact with those hard parts found just beneath the hood panel within the engine compartment.

The ORC monitors the condition of the active hood hinge actuators through circuit resistance, and will register a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC will then request illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC). Proper diagnosis of the active hood hinge actuator gas generator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Electronic Pedestrian Protection (EPP) system active hood hinge actuator. If the actuator is ineffective or damaged, but not deployed, it should be handled in the same manner as is used when handling non-deployed supplemental restraints. Review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the actuator has been deployed, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. .

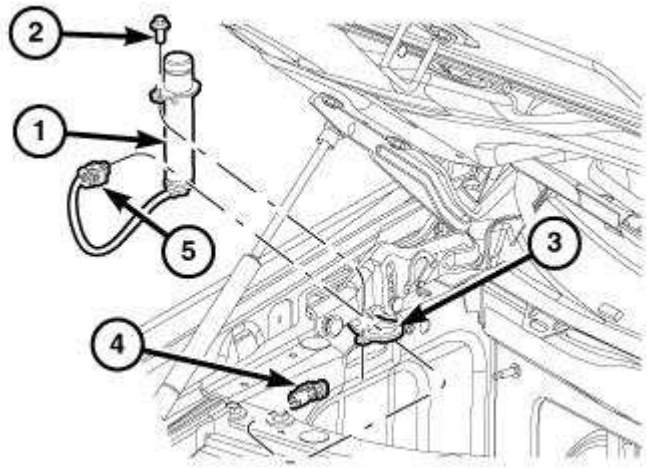

Fig. 9: Pigtail Wire Connector, Electronic Pedestrian Protection (EPP) Active Hood Hinge Actuator & Dash Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. With the ignition switch in the OFF position, disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Disconnect the pigtail wire connector (5) of the Electronic Pedestrian Protection (EPP) active hood hinge actuator (1) from the headlamp and dash wire harness connector (4).
3. Remove the screw (2) that secures the actuator bracket to the mount (3) on the hood hinge lower bracket.
4. Remove the actuator from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Electronic Pedestrian Protection (EPP) system active hood hinge actuator. If the actuator is ineffective or damaged, but not deployed, it should be handled in the same manner as is used when handling non-deployed supplemental restraints. Review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the actuator has been

deployed, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. .

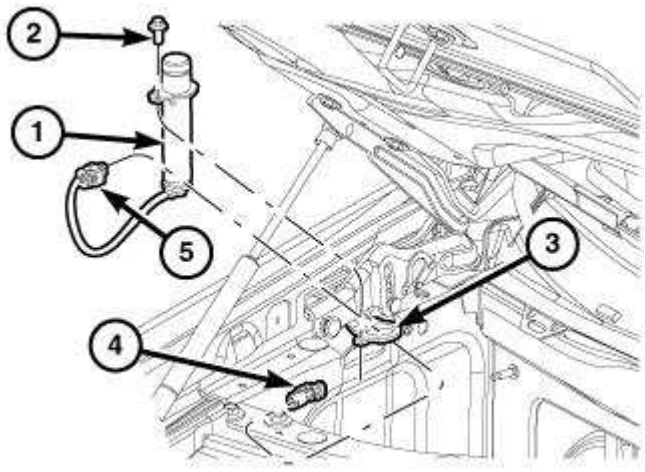

Fig. 10: Pigtail Wire Connector, Electronic Pedestrian Protection (EPP) Active Hood Hinge Actuator & Dash Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Guide the pigtail wire and connector (5) of the Electronic Pedestrian Protection (EPP) active hood hinge actuator (1) through the mount (3) on the hood hinge lower bracket while positioning the actuator to the hinge.
2. Align the hole in the actuator bracket with the hole in the hinge mount.
3. Install and tighten the screw (2) that secures the actuator to the hinge. Tighten the screw to 7.9 N.m (70 in. lbs.).
4. Reconnect the pigtail wire connector of the actuator to the headlamp and dash wire harness connector (4).
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any EPP system component. Refer to **STANDARD PROCEDURE**.

ADJUSTER, SEAT BELT TURNING LOOP, FRONT

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners.

Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

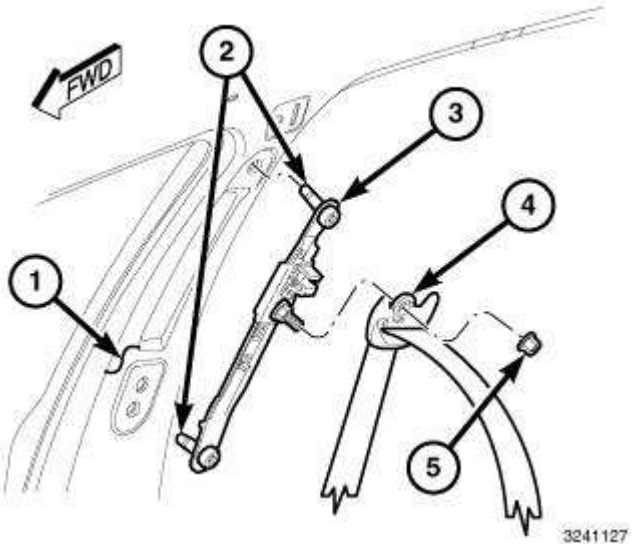

Fig. 11: Nut, Seat Belt Turning Loop, Height Adjuster & Two Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
2. Remove the nut (5) that secures the seat belt turning loop (4) to the stud on the height adjuster (3).
3. Remove the seat belt turning loop from the height adjuster.
4. Remove the two screws (2) that secure the height adjuster to the upper inner B-pillar.
5. Remove the seat belt turning loop adjuster from the B-pillar.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate.

Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

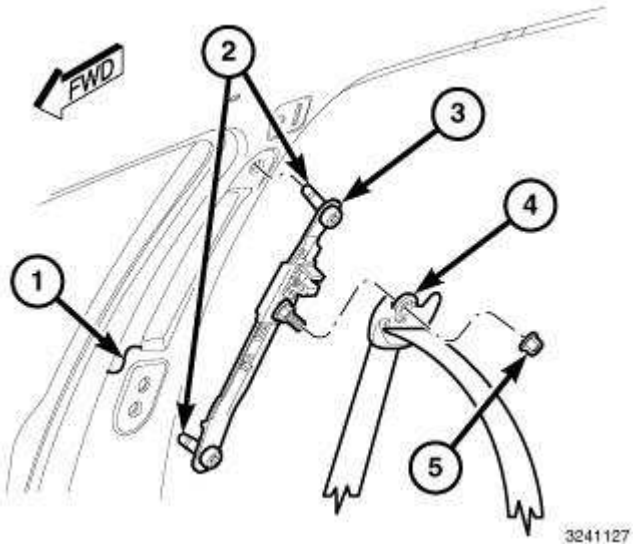

Fig. 12: Nut, Seat Belt Turning Loop, Height Adjuster & Two Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt turning loop height adjuster (3) to the inside of the upper inner B-pillar (1).
2. Install and tighten the two screws (2) that secure the adjuster to the B-pillar. Tighten the screws to 45 N.m (33 ft. lbs.).
3. Position the seat belt turning loop (4) onto the stud of the height adjuster on the B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
4. Install and tighten the nut (5) that secures the turning loop to the height adjuster. Tighten the nut to 45 N.m (33 ft. lbs.).
5. Reinstall the trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

Fig. 13: Except SRT
Courtesy of CHRYSLER GROUP, LLC

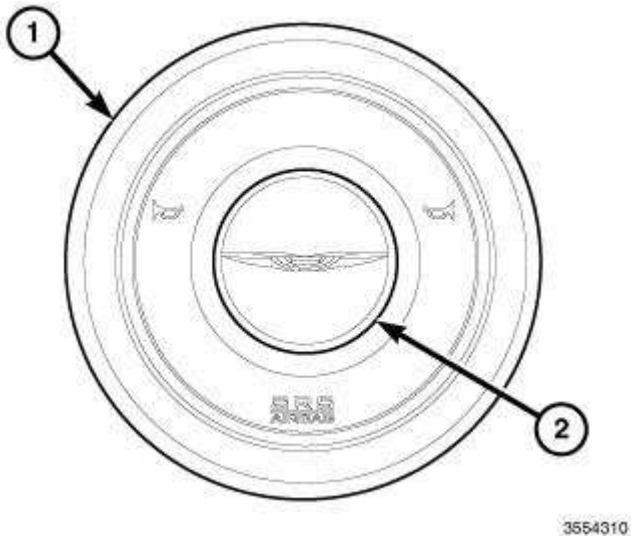

Fig. 14: SRT
Courtesy of CHRYSLER GROUP, LLC

The injection molded, thermoplastic driver airbag protective trim cover (1) is the most visible part of the Driver AirBag (DAB). The DAB is located in the center of the steering wheel, where it is secured with screws to the floating horn switch within the hub cavity of the three-spoke steering wheel. An injection molded, bright emblem with the Chrysler logo (2) is applied to the center of the trim cover.

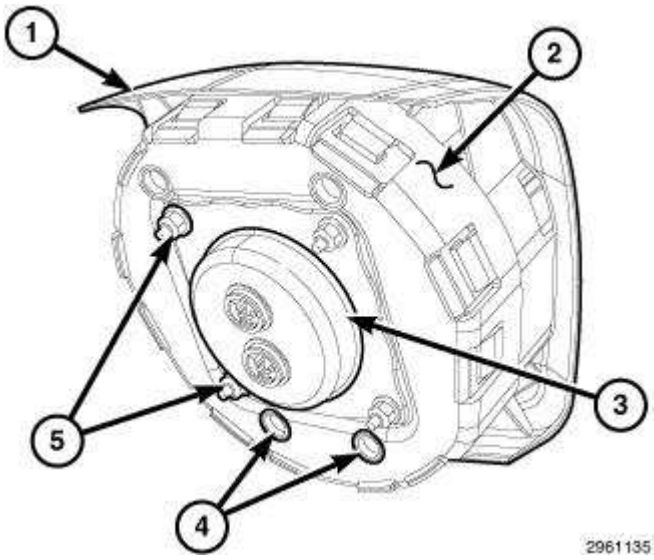

Fig. 15: Except SRT
Courtesy of CHRYSLER GROUP, LLC

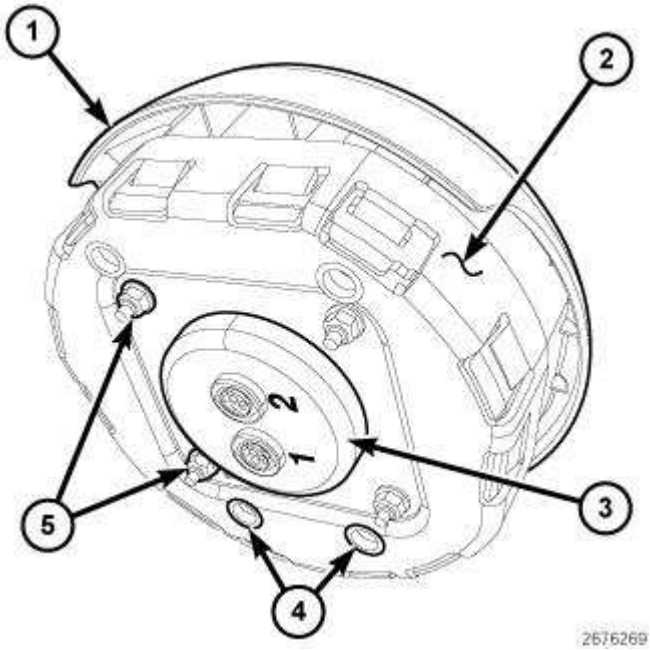

Fig. 16: SRT
Courtesy of CHRYSLER GROUP, LLC

Concealed beneath the DAB trim cover (1) are the folded airbag cushion, the airbag housing (2), the airbag inflator (3) and the retainers (5) that secure the inflator to the housing. The airbag cushion, housing and inflator are secured within an integral receptacle molded into the back of the trim cover. Except for SRT models, the vertical walls of this receptacle have numerous integral window features that are engaged by numerous hook features that are bent outward around the perimeter of the DAB housing. On SRT models, the vertical walls of this receptacle have numerous integral window features that are engaged by numerous tab features that are bent inward around the perimeter of the DAB housing. Once the SRT trim cover is fully seated in the housing, it can only be removed by

cutting it off, and will have to be replaced with a new trim cover. The DAB housing also has four well nuts (4) which are used to secure the floating horn switch to the back of the housing.

The DAB used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying 67 centimeter (26.5 inch) diameter fabric airbag cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the stamped metal airbag housing using four flanged hex nuts. Two keyed and color-coded connector receptacles on the DAB inflator connect the two inflator initiators to the vehicle electrical system through two jacketed, two-wire pigtail harnesses from the clockspring.

The DAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The DAB trim cover and the floating horn switch are available for individual service replacement.

OPERATION

OPERATION

The multistage Driver AirBag (DAB) is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the DAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the DAB housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the DAB trim cover will split at predetermined breakout lines, then fold back out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to a Supplemental Restraint System (SRS) fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. Refer to **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned during a deployment is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these

actions, contact a physician.

Proper diagnosis of the DAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

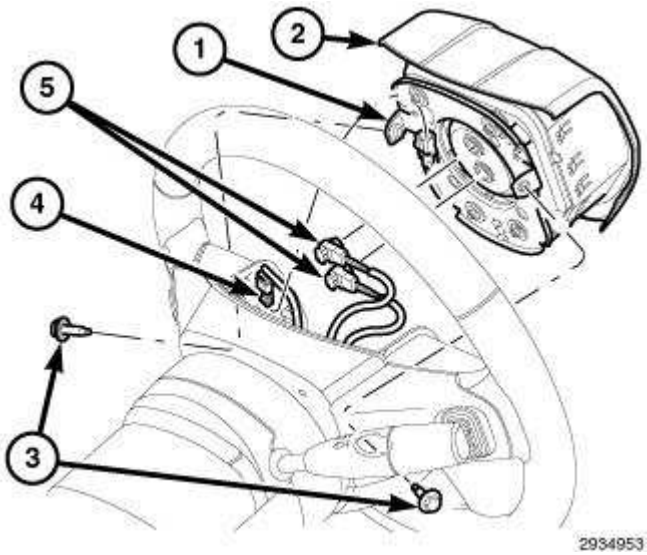

Fig. 17: Two Screws, Floating Horn Switch & Driver Airbag
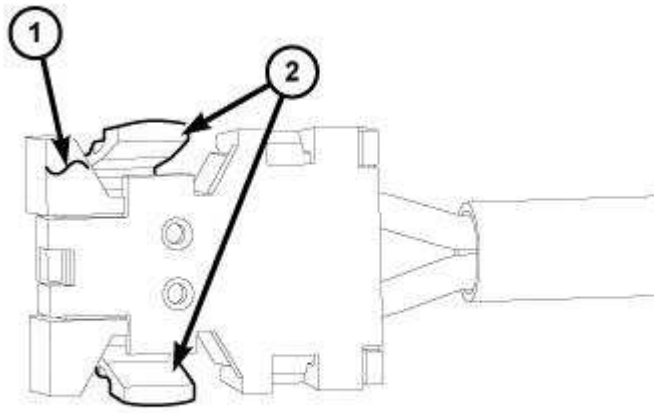
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Working through the access holes in each side of the steering wheel rear trim cover, remove the two screws (3) that secure the floating horn switch (1) and Driver AirBag (DAB) (2) unit to the steering wheel armature.
3. Pull the DAB and floating horn switch unit away from the steering wheel far enough to access the electrical connections (3 and 4) at the back of the airbag housing and switch unit.
4. Disconnect the steering wheel wire harness connector (4) from the floating horn switch connector on the back of the switch.

CAUTION: Do not pull on the clockspring pigtail wires or pry on the connector insulators to disengage them from the Driver AirBag (DAB) inflator initiator connector receptacles. Improper removal of these pigtail wires and their connector insulators can result in damage to the airbag circuits or the connector insulators.



2128307

Fig. 18: Airbag Pigtail Wire Connector Insulators & Integral Latches
Courtesy of CHRYSLER GROUP, LLC

5. The clockspring DAB pigtail wire connector insulators (1) are secured by integral latches (2) to the airbag inflator connector receptacles, which are located on the back of the DAB housing. Pinch both latches firmly, then pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
6. Remove the driver airbag from the steering wheel.
7. If the driver airbag has been deployed, the clockspring and the steering column must be replaced.

DISASSEMBLY

DISASSEMBLY

EXCEPT SRT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit.

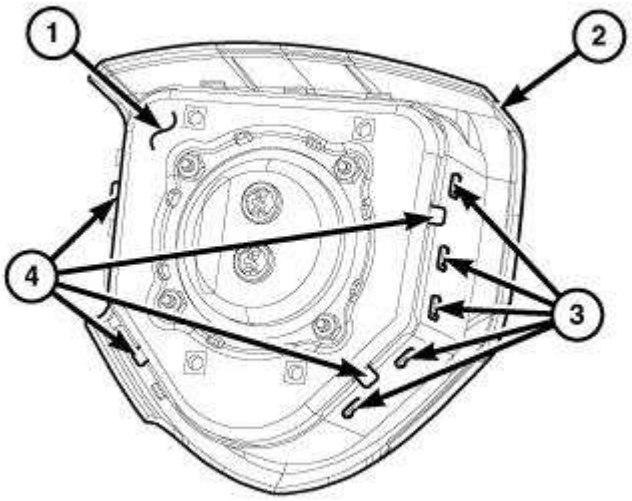


Fig. 19: Trim Cover, Thirteen Hooks, Airbag Housing & Tab
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
3. Place the driver airbag on a suitable clean and dry work surface with the trim cover (2) facing down. If the trim cover will be reused, be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures.
4. Disengage each of the thirteen hooks (3) of the airbag housing (1) from the thirteen windows in the vertical walls of the trim cover receptacle, one wall at a time. Start by disengaging the upper wall, then do each of the two side walls, and finish with the lower wall. To disengage the hooks, use hand pressure to push outward on the upper edge of the receptacle wall far enough to clear the locating tab (4) on the airbag housing, at the same time push the adjacent edge of the airbag housing firmly and evenly downward into the trim cover receptacle.
5. With all of the hooks disengaged, lift the housing, inflator, and cushion as a unit from the receptacle on the back of the driver airbag trim cover.

SRT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper

precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by Chrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the Driver AirBag (DAB) trim cover must never be painted. Replacement trim covers are serviced in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit. The trim cover will be irreparably damaged if it is removed from the DAB housing and MUST be replaced with a new trim cover.

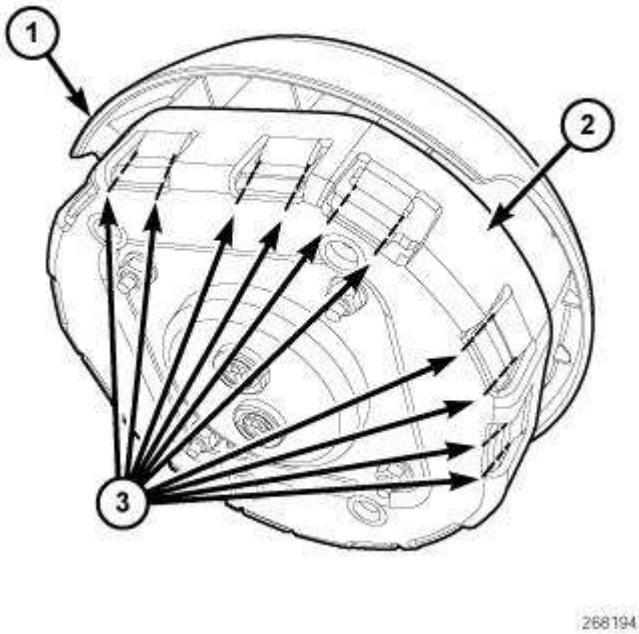

Fig. 20: Twelve Trim Cover, Cut Lines & Airbag Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
3. Place the DAB on a suitable clean and dry work surface.
4. Using a sharp utility knife, carefully cut through the lower edge of each of the twelve trim cover (1) windows at the cut lines (3) on each side of the twelve inward pointing hooks of the airbag housing (2). Use extreme care to prevent any scraps from entering and becoming lost within the airbag housing or cushion.
5. With all of the windows cut open, separate the remainder of the trim cover from the DAB housing by pulling it away from the top of the housing around the perimeter. Discard the removed trim cover.

ASSEMBLY

Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the Driver AirBag (DAB) trim cover for service of cosmetic damage issues. If the DAB is ineffective or deployed, the entire DAB and trim cover must be replaced as a unit. The trim cover will be irreparably damaged if it is removed from the DAB housing and MUST be replaced with a new trim cover.

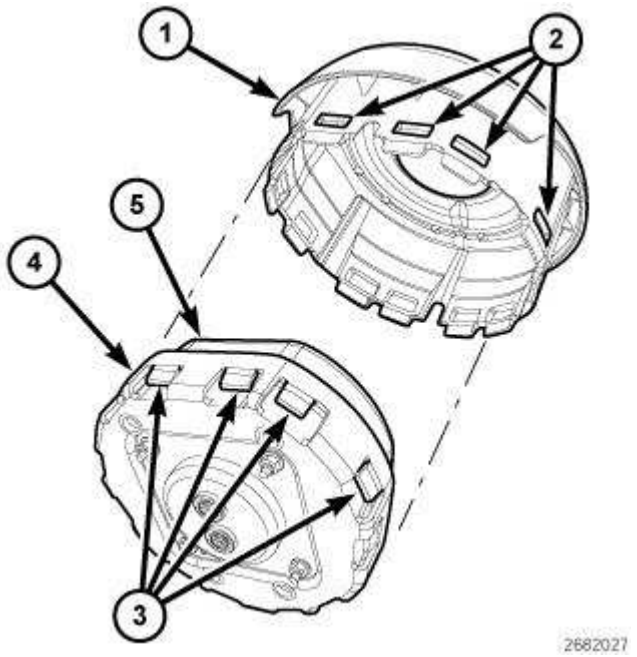

Fig. 23: Driver AirBag Housing, Cushion, DAB Trim Cover, Pointing Hooks & Twelve Windows
Courtesy of CHRYSLER GROUP, LLC

1. Place the Driver AirBag housing (4) on a suitable clean and dry work surface with the cushion (5) facing up.
2. Position the DAB trim cover (1) over the housing. Be certain that the twelve windows (2) of the trim cover are aligned with the twelve inward pointing hooks (3) of the airbag housing. All of the trim cover windows will align with all of the housing hooks correctly only in one position.
3. Insert the edges of the trim cover between the airbag cushion and the airbag housing. Be certain that the trim cover and housing are still properly aligned.
4. Using hand pressure, push the trim cover firmly and evenly down into the housing far enough that each of the inward pointing hooks of the housing is engage through a window in the trim

cover.

5. Inspect around the entire perimeter of the unit being certain each of the twelve hooks on the DAB housing is engaged through the appropriate window in the trim cover.
6. After the DAB has been assembled, try pulling the perimeters of the trim cover and the airbag housing away from each other. This action will fully seat the housing hooks into the trim cover windows.
7. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION**.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the driver airbag trim cover must never be painted. Replacement airbags are serviced with trim covers in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

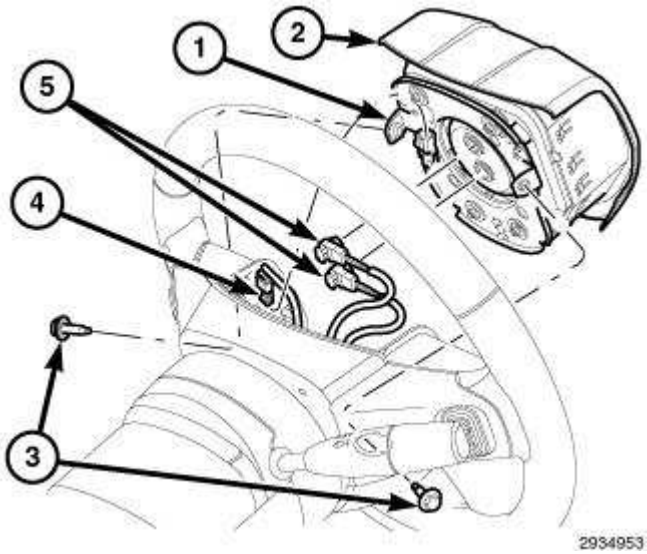

Fig. 24: Two Screws, Floating Horn Switch & Driver Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the Driver AirBag (DAB) (2) and floating horn switch (1) unit close enough to the steering wheel to reconnect the electrical connections to the back of the airbag housing.
2. Reconnect the steering wheel wire harness connector (4) to the floating horn switch connector on the back of the switch.
3. Reconnect the wire connectors (5) to the airbag inflator connector receptacles by pressing straight in on the connector insulator. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
4. Carefully position the DAB and floating horn switch unit into the steering wheel hub. Be certain that none of the steering wheel wiring is pinched between the airbag housing or the horn switch and the steering wheel armature.
5. Working through the access holes in each side of the steering wheel rear trim cover, install and tighten the two screws (3) that secure the floating horn switch and DAB unit to the steering wheel armature. Tighten the screws to 13 N.m (10 ft. lbs.).
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, KNEE BLOCKER

DESCRIPTION

DESCRIPTION

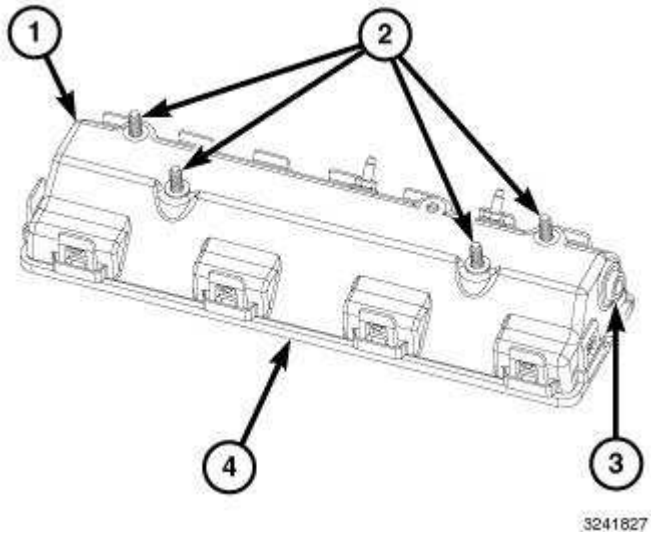

Fig. 25: Airbag Housing, Four Studs, Plastic Protective Cover & Inflator Initiator
Courtesy of CHRYSLER GROUP, LLC

A knee blocker airbag (also known as the Knee AirBag/KAB or the Inflatable Knee Blocker/IKB) is used on vehicles manufactured for domestic markets. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. Vehicles with this equipment may be readily identified by the **SRS - AIRBAG** logo located on the upper outboard corner of the instrument panel steering column opening cover.

The knee blocker airbag is concealed behind the steering column opening cover below the steering column on the driver side lower instrument panel. Located behind the steering column opening cover, the stamped metal airbag housing (1) is secured by four studs (2) with nuts to the stamped metal lower instrument panel reinforcement of the instrument panel support structure. A molded plastic protective cover (4) is secured over the folded airbag cushion by several hook formations stamped into the airbag housing that are engaged through window openings in tabs integral to the outer perimeter of the cover.

The airbag housing contains the airbag inflator and a heat shield. The airbag inflator is a single-initiator, non-azide hybrid-type unit that is secured to the housing by two studs with nuts and sealed within the airbag housing. The airbag is connected to the vehicle electrical system through a dedicated take out and connector insulator of the instrument panel wire harness that connects directly to the inflator initiator (3).

The knee blocker airbag cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the airbag is deployed, the knee blocker and the steering column opening cover must also be replaced.

OPERATION

OPERATION

The knee blocker airbag (also known as the Knee AirBag/KAB or the Inflatable Knee Blocker/IKB) is

deployed by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through a knee blocker line 1 and line 2 (or squib) circuits to the initiator in the airbag inflator. The hybrid-type inflator assembly for the airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemical pellets burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the knee blocker airbag protective cover will split at predetermined tear seam lines concealed on the underside of the cover, then fold open and out of the way.

The cushion protects the lower extremities of the vehicle operator and helps to keep the seat occupant properly positioned for the Driver AirBag (DAB) deployment during a frontal impact collision. Following an airbag deployment, the knee blocker airbag cushion quickly deflates by venting the inert gas through the loose weave of the fabric used to construct the instrument panel side of the airbag cushion, and the deflated cushion hangs down loosely from the lower instrument panel.

Proper diagnosis of the knee blocker airbag inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged Inflatable Knee Blocker (IKB) airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the IKB airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

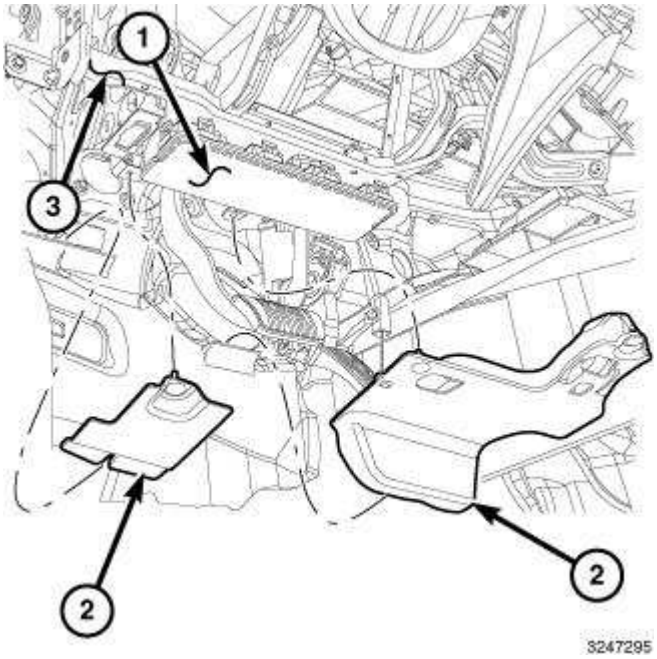

Fig. 26: Panels, Instrument Panel Lower Reinforcement & Knee AirBag (KAB) Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the close out panels (2) from under the driver side of the instrument panel lower reinforcement (3) and surrounding the Knee AirBag (KAB) cover (1) and housing.
3. Remove the steering column opening cover from the instrument panel. Refer to **COVER, INSTRUMENT PANEL, REMOVAL** .

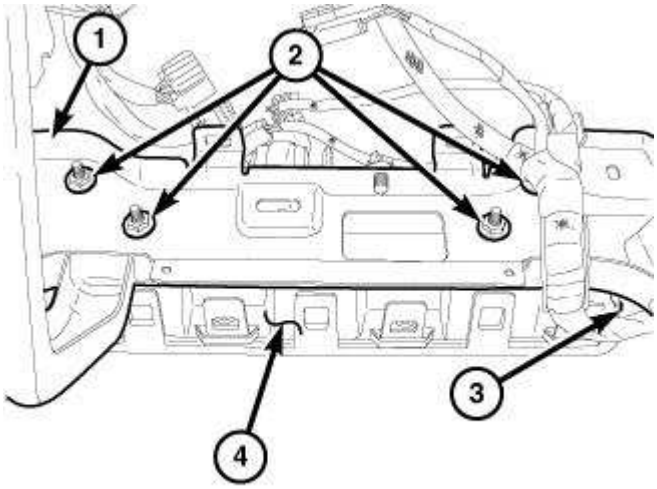

Fig. 27: Four Nuts, Studs, Wire Harness Connection & Instrument Panel Lower Reinforcement
Courtesy of CHRYSLER GROUP, LLC

4. Remove the four nuts (2) that secure the studs of the KAB (4) to the instrument panel lower reinforcement (1).
5. Rotate the outboard end of the KAB downward so that the instrument panel wire harness connection (3) to the KAB inflator faces upward.
6. Disconnect the electrical connection that is secured by integral latches to the KAB inflator initiator connector receptacle on the inboard end of the KAB housing. Depress the latches on each side of the connector insulator and pull the insulator straight out from the inflator initiator to disconnect it from the connector receptacle.
7. Remove the KAB from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Inflatable Knee Blocker (IKB) airbag, or becoming entrapped between the IKB airbag cushion and the IKB cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Inflatable Knee Blocker (IKB) airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the IKB airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

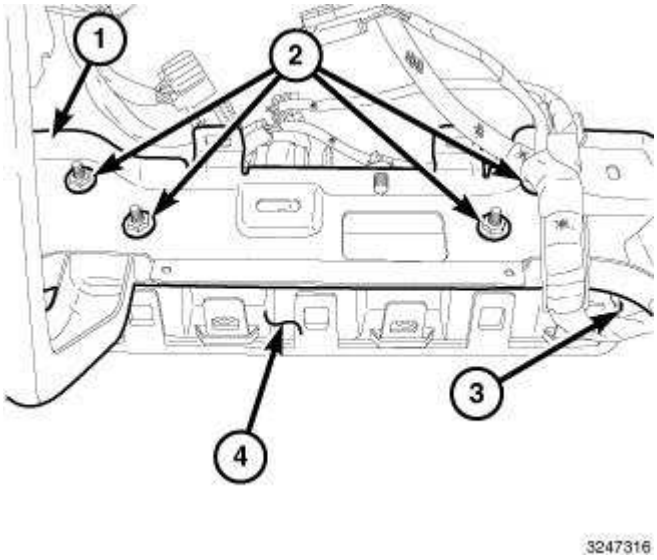

Fig. 28: Four Nuts, Studs, Wire Harness Connection & Instrument Panel Lower Reinforcement
Courtesy of CHRYSLER GROUP, LLC

1. Position the Knee AirBag (KAB) (4) below the steering column opening of the instrument panel in a vertical orientation with the airbag inflator initiator connector receptacle (3) facing upward.
2. Reconnect the connector insulator of the instrument panel wire harness take out for the KAB to the airbag inflator initiator connector receptacle by pressing straight in on the connector. You can be certain that the connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
3. Carefully position the KAB to the instrument panel lower reinforcement (1).
4. Install and tighten the four nuts that secure the studs of the KAB to the instrument panel lower reinforcement. Tighten the nuts to 6 N.m (53 in. lbs.).
5. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, INSTRUMENT PANEL, INSTALLATION** .

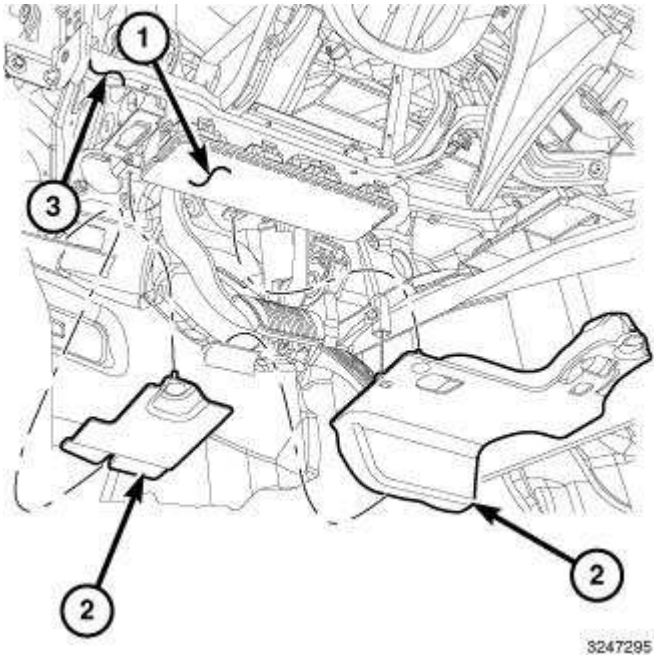

Fig. 29: Panels, Instrument Panel Lower Reinforcement & Knee AirBag (KAB) Cover
Courtesy of CHRYSLER GROUP, LLC

6. Reinstall the close out panels (2) under the driver side of the instrument panel lower reinforcement (3) and surrounding the KAB cover (1) and housing.
7. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

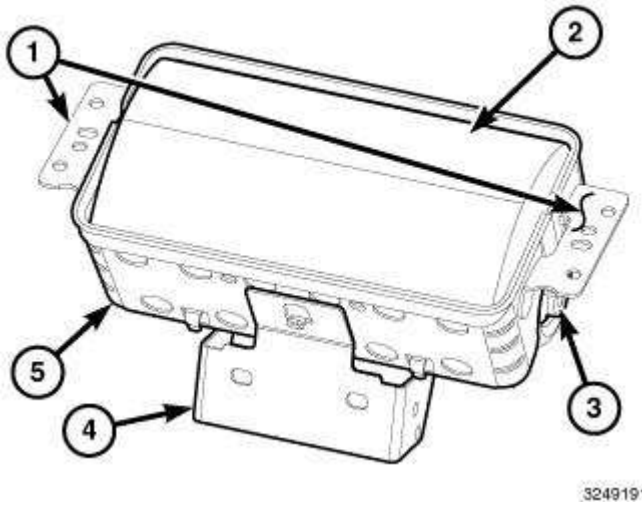

Fig. 30: Upper Bracket, Lower Mounting Bracket, Welded Metal Housing & Airbag Cushion
Courtesy of CHRYSLER GROUP, LLC

The horizontal surface of the instrument panel top pad above the glove box is the most visible part of the Passenger AirBag (PAB). The seamless PAB door is integral to the top of the instrument panel cover above the glove box opening on the instrument panel in front of the front seat passenger seating position. Located below the PAB door area of the instrument panel cover, the PAB retainer or chute is secured to the underside of the instrument panel cover substrate.

The retainer defines the PAB door breakout area of the cover and serves as the receptacle for the PAB cushion and housing. Two U-nuts on each side of the retainer secure the two screws that mount each upper bracket (1) of the PAB housing to the substrate. The PAB is also secured by two screws through a stamped lower mounting bracket (4) to the instrument panel support structure or armature.

The PAB unit used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. The PAB unit consists of a stamped and welded metal housing (5), the airbag cushion (2), and the airbag inflator. The airbag housing contains the airbag inflator and the folded airbag cushion. A rectangular fabric cushion is used.

The passenger airbag used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The PAB unit consists passenger airbag consists of a stamped and welded metal housing, the airbag cushion, the airbag inflator, and a stamped metal airbag cushion retainer plate that is secured to the airbag housing.

The airbag housing contains the airbag inflator and the folded airbag cushion. The airbag inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. A dedicated takeout with keyed and color coded connector insulators directly connects the two inflator initiators (3) to the vehicle electrical system through the instrument panel wire harness. A rectangular fabric cushion is used.

The PAB cannot be repaired and must be replaced if deployed, ineffective or in any way damaged. The PAB door and retainer are serviced only as a unit with the instrument panel cover. If the PAB is deployed, the instrument panel cover must also be replaced.

OPERATION

OPERATION

The multistage Passenger AirBag (PAB) is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the PAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the PAB can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag cushion will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn, ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the cushion, causing the cushion to inflate. As the cushion inflates, the PAB door area of the instrument panel cover will split at predetermined tear seam lines concealed on the underside of the cover, then the door will pivot up over the top of the instrument panel and out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas through vent holes within the fabric used to construct the back (windshield side) of the cushion.

Typically, both initiators are used during a PAB deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. Refer to **STANDARD PROCEDURE**.

Proper diagnosis of the PAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the passenger airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

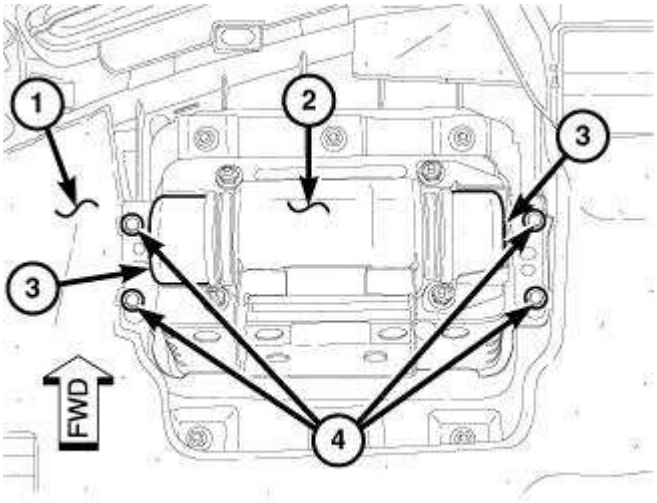

Fig. 31: Two PAB Initiators, Passenger AirBag (PAB), Instrument Panel Cover & Four Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Reach through the instrument panel glove box opening to access and remove the two screws that secure the PAB lower bracket to the instrument panel structural support.
4. Reach through the instrument panel glove box opening to access and disconnect the two instrument panel wire harness connectors from the two PAB initiators (3), one at each side of the PAB inflator canister.
5. Remove the Passenger AirBag (PAB) (2) and instrument panel cover (1) as a unit from the instrument panel support structure or armature. Refer to **COVER, INSTRUMENT PANEL, REMOVAL** .
6. Place the instrument panel cover and passenger airbag unit on a suitable work surface with the top of the cover facing down. If the cover will be reused, be certain to take the proper

precautions to prevent the cover from receiving cosmetic damage during the following procedures.

7. Remove the four screws (4) that secure the two upper airbag mounting brackets to the U-nuts on each side of the PAB retainer or chute (2) on the underside of the instrument panel cover.
8. Remove the PAB from the instrument panel cover.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the instrument panel top pad must never be painted. Replacement top pads are serviced in the original colors. Paint may change the way in which the material of the top pad responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the passenger airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

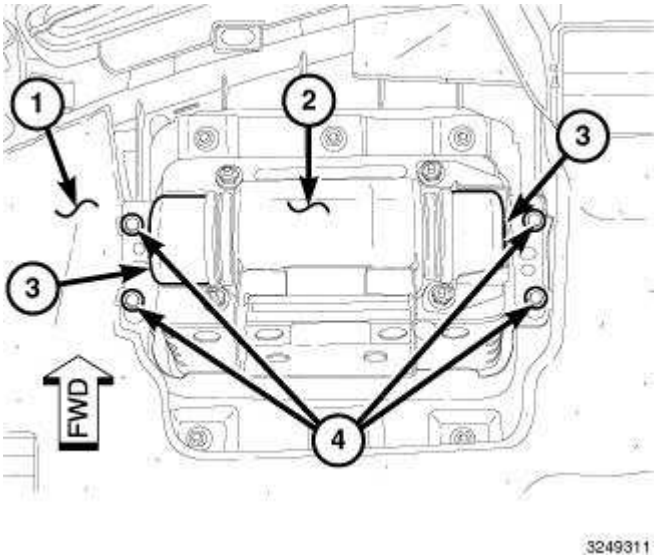

Fig. 32: Two PAB Initiators, Passenger AirBag (PAB), Instrument Panel Cover & Four Screws
Courtesy of CHRYSLER GROUP, LLC

1. Place the instrument panel cover (1) on a suitable work surface with the receptacle of the Passenger AirBag (PAB) retainer or chute facing up. Be certain to take the proper precautions to prevent the cover from receiving cosmetic damage during the following procedures.
2. Carefully position the PAB housing into the airbag retainer receptacle.
3. Install and tighten the four screws that secure the PAB upper mounting brackets to the U-nuts on the retainer. Tighten the screws to 2.8 N.m (25 in. lbs.).
4. Reinstall the PAB and instrument panel cover onto the instrument panel structural support or armature as a unit. Refer to **COVER, INSTRUMENT PANEL, INSTALLATION** .
5. Reach through the instrument panel glove box opening to access and reconnect the two instrument panel wire harness connectors to the two PAB initiators (3), one at each side of the PAB inflator canister. Be certain the connectors are each fully engaged and locked.
6. Reach through the instrument panel glove box opening to install and tighten the two screws that secure the PAB lower bracket to the instrument panel structural support. Tighten the screws to 11.6 N.m (103 in. lbs.).
7. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
8. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SEAT

DESCRIPTION

DESCRIPTION

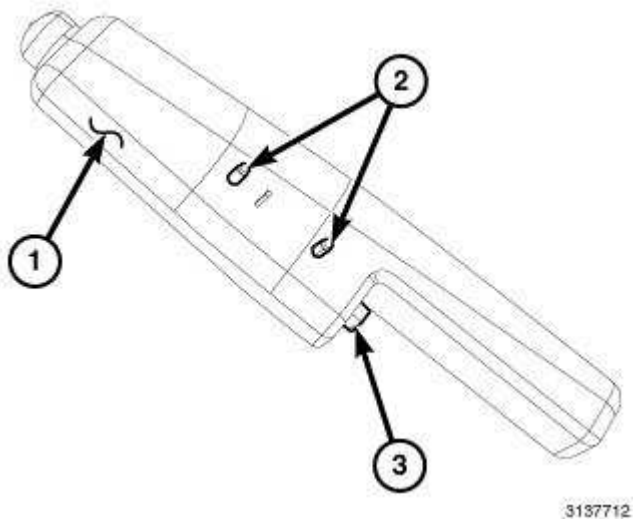

Fig. 33: Seat AirBags (SAB), Two Studs & Inflator Initiator
Courtesy of CHRYSLER GROUP, LLC

Seat AirBags (SAB) (1) (also known as thorax or pelvic airbags) are standard equipment on this model. These airbags are completely concealed beneath the seat back trim cover on the upper outboard sides of both front seat backs. The airbags are inserted into a molded thermoplastic chute on the outside of the seat back frame, then secured to the frame by nuts on two studs (2) on the SAB bracket on the inboard side of the inflator. The SAB is connected to the vehicle electrical system through a dedicated jumper wire harness with a connector insulator that connects directly to the inflator initiator (3). The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the initiator.

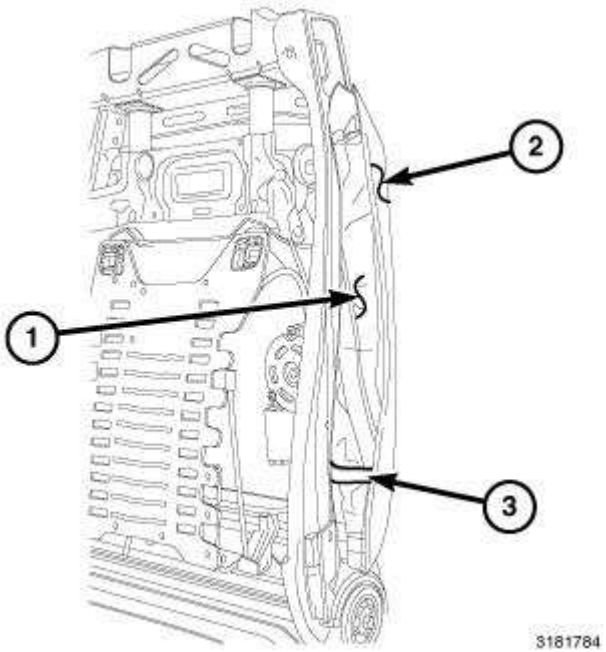

Fig. 34: Folded SAB Cushion, Chute & Fabric Strap
Courtesy of CHRYSLER GROUP, LLC

The folded SAB cushion (1) is contained within and protected by the chute (2). The cushion is constructed of a coated nylon fabric. The folded SAB cushion is tied to the airbag inflator with a fabric strap (3). The inflator consists of the airbag inflator and a high pressure cylinder filled with inert gas. The airbag inflator is a single-initiator, hybrid-type unit that is secured to the SAB bracket.

The SAB cannot be repaired, and must be replaced if deployed, ineffective, or in any way damaged. If the SAB is deployed the thermoplastic chute, the seat back frame, the seat back foam, the seat back trim cover and the seat airbag jumper wire harness must also be replaced.

OPERATION

OPERATION

Each Seat AirBag (SAB) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right SAB line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected so that all of the released gas is directed into the folded SAB cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric retainer strap and the thermoplastic chute will direct the expanding cushion through the outboard side of the seat back trim cover and into the area between the outboard side of the front seat and the front door to protect the front seat occupant during a side impact collision or a vehicle rollover incident.

Following the deployment, the SAB cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the outboard side of the front seat back.

Proper diagnosis of the SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

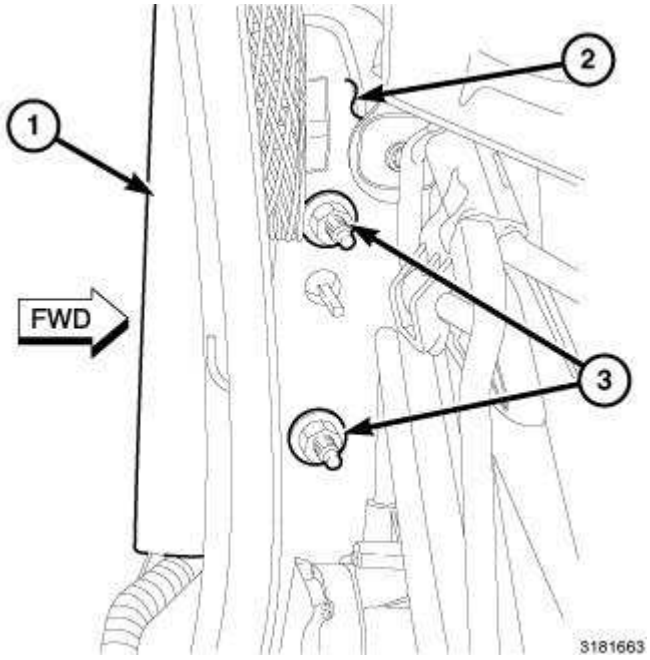

Fig. 35: Front Seat Back Frame, Two Nuts & Seat AirBag (SAB) And Thermoplastic Chute
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front and back of the front seat back frame (2). Refer to **COVER, SEAT BACK, FRONT, REMOVAL** .
5. Remove the two nuts (3) that secure the Seat AirBag (SAB) and thermoplastic chute (1) to the outboard side of the seat back frame.

CAUTION: Do not pull on the Seat AirBag (SAB) jumper wire harness take out or pry on the connector insulator to disengage the connector from the

SAB inflator connector receptacle. Improper removal of this take out and its connector insulator can result in damage to the airbag circuits or the connector insulator.

6. Disengage the two SAB studs from the seat back frame and remove the SAB and chute from the seat back as a unit.

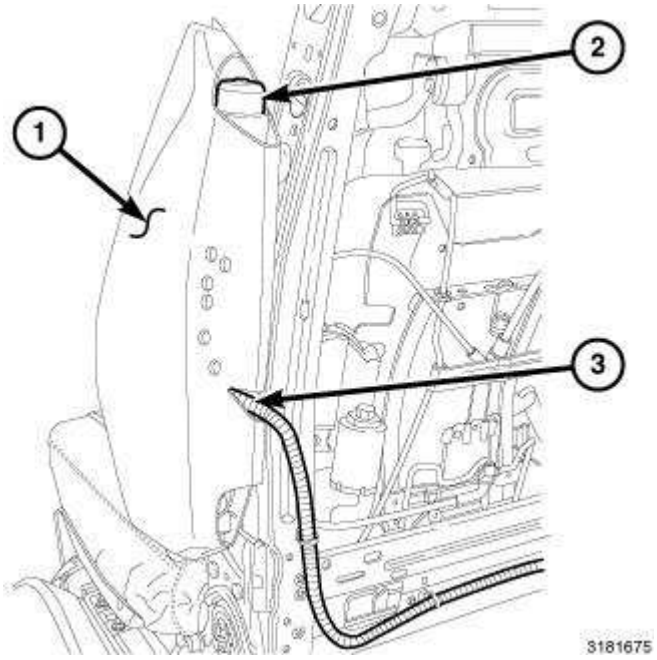

Fig. 36: SAB From The Chute, SAB Jumper Wire Harness & SAB Inflator
Courtesy of CHRYSLER GROUP, LLC

7. Disengage the SAB from the chute (1) to access and disconnect the SAB jumper wire harness (3) connector from the base of the SAB inflator (2). Pull the connector insulator straight out from the inflator to disconnect it from the connector receptacle.
8. Disengage the SAB jumper wire harness from the opening in the back of the chute.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: **The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the SAB is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .**

CAUTION: The Seat AirBag (SAB) must be installed into the nylon pouch integral to the front seat back trim cover before the SAB or the trim cover are installed on the front seat back frame. Failure to do so will adversely affect the function of the SAB system.

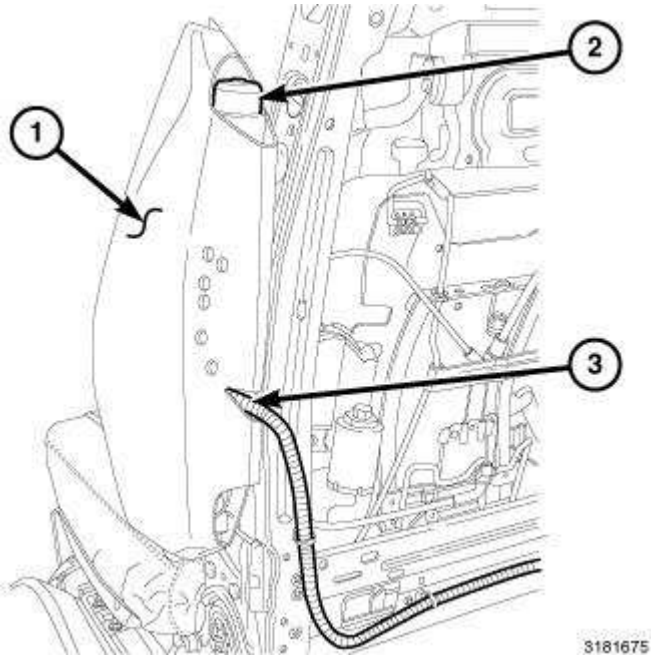

Fig. 37: SAB From The Chute, SAB Jumper Wire Harness & SAB Inflator
Courtesy of CHRYSLER GROUP, LLC

1. Engage the SAB jumper wire harness (3) through the opening in the back of the thermoplastic chute (1).
2. Reconnect the seat jumper wire harness connector to the connector receptacle at the base of the SAB inflator. Be certain that the connector latches and lock are fully engaged.
3. Carefully slide the Seat AirBag (SAB) and inflator (2) into the chute and engage the two SAB studs through the holes provided in the chute. Be certain not to tear or damage the chute.

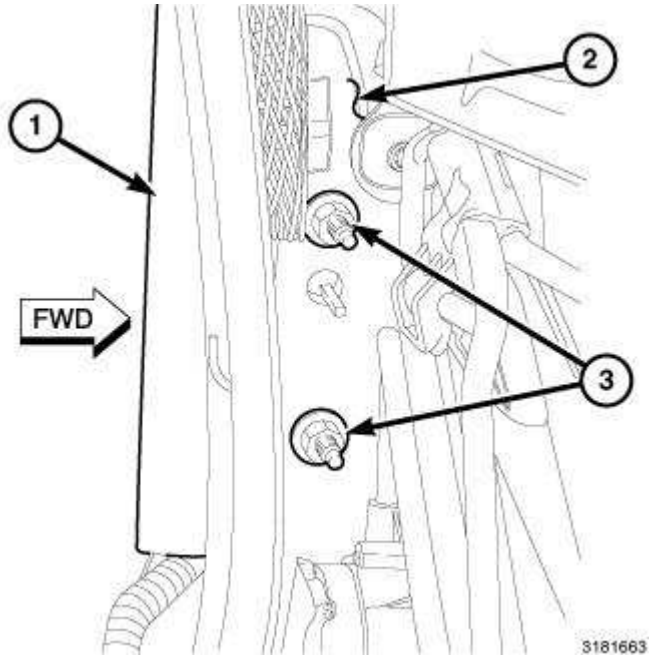

Fig. 38: Front Seat Back Frame, Two Nuts & Seat AirBag (SAB) And Thermoplastic Chute
Courtesy of CHRYSLER GROUP, LLC

4. Position the SAB and chute (1) as a unit to the outboard side of the seat back frame (2) and insert the SAB mounting studs through the mounting holes in the frame.
5. Install and tighten the two nuts (3) that secure the SAB to the outboard side of the seat back frame. Tighten the nuts to 8 N.m (71 in. lbs.).

CAUTION: Be certain that all of the trim is properly reinstalled on the front seat back frame. Failure to do so will adversely affect the function of the Seat AirBag (SAB) system.

6. Reinstall the trim onto the front and back of the front seat back frame. Refer to **COVER, SEAT BACK, FRONT, INSTALLATION** .
7. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
8. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

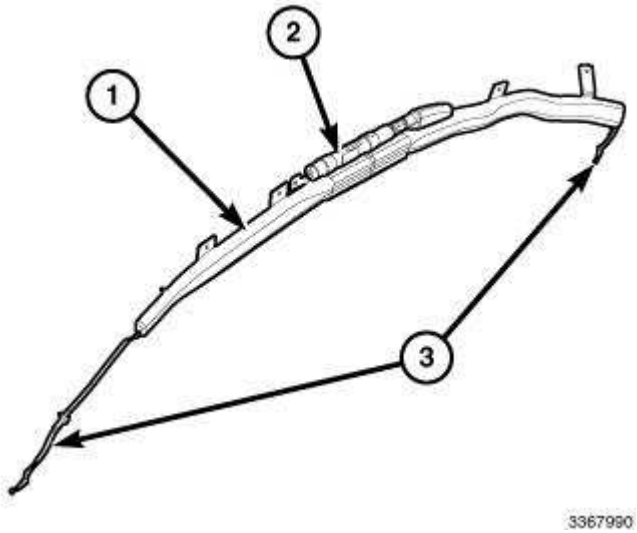

Fig. 39: Side AirBag Inflatable Curtains (SABIC), Tether & Hybrid-Type Inflator
Courtesy of CHRYSLER GROUP, LLC

Side AirBag Inflatable Curtains (SABIC) (1) are standard factory-installed equipment for this vehicle. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. The SABIC system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision or a vehicle rollover incident. Each SABIC cushion provides full coverage of the side glass on the same side of the vehicle as the monitored impact.

Each vehicle is equipped with two individually controlled SABIC units. These SABIC units are concealed and mounted above the headliner where they are each secured to one of the roof side rails. Each folded airbag cushion is contained within a fabric wrap and extruded plastic channels that extend along the roof rail from the A-pillar at the front of the vehicle to the C-pillar at the rear of the vehicle.

A long tether (3) extends down the A-pillar from the front of the SABIC cushion, while a shorter tether extends back to over the C-pillar. The end of each tether is secured to a slot in the sheet metal with a metal T-hook, while an additional plastic push-in fastener secures the T-hook within the slot in the sheet metal of the pillar. A molded airbag support bracket is snapped into the roof rail above the C-pillar.

The hybrid-type inflator (2) for each SABIC is secured to the roof rail above the B-pillar and the front door opening, and is connected to the airbag cushion by a long tubular manifold. The inflator bracket and the extruded cushion channel are secured with both plastic push-in fasteners and a snap-in fastener to the roof rail. The inflator is initially hung from the roof rail by the snap-in fastener, then the push-in fasteners secure the body of the airbag cushion to the roof rail and the support bracket. Finally, the entire assembly is secured with five screws to the roof rail and the airbag support bracket.

The airbag inflator is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness near the top of the B-pillar. The body wire harness connects the SABIC unit to the Occupant Restraint Controller (ORC).

The SABIC units cannot be adjusted or repaired and must be replaced if deployed, ineffective, or in any way damaged. Once a SABIC has been deployed, the complete SABIC unit, the headliner, the upper A, B, and C-pillar trim as well as all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each Side AirBag Inflatable Curtain (SABIC) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through the left or right SABIC line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded airbag cushion, causing the cushion to inflate. As the cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision or a vehicle rollover incident. The cushion features large chambers that inflate adjacent to the head of each front and rear seat occupant.

The front and rear tethers keep the SABIC cushion taut to the side of the vehicle. In addition, ramps integral to the side trim of the interior and integral to the SABIC modules themselves guide the cushion into the proper deployment position. Following the deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and the deflated cushion hangs down loosely from the roof rail.

Proper diagnosis of the SABIC inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There

may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

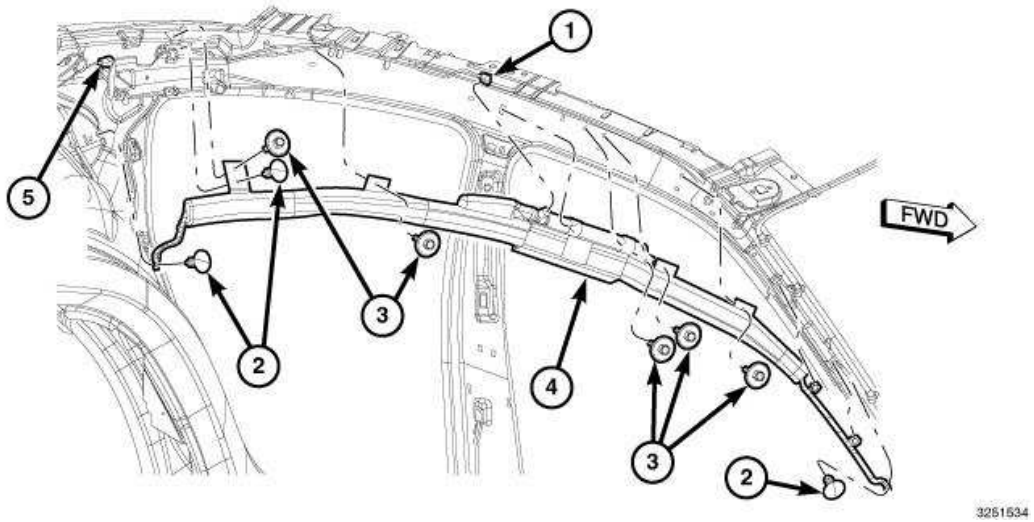

Fig. 40: Wire Harness Connector, Side Air Bag Inflatable Curtain (SABIC), Five Screws & Airbag Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the headliner from the vehicle. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the body wire harness connector (1) for the Side Air Bag Inflatable Curtain (SABIC) (4) from the connector receptacle on the inflator on the inner roof rail above the B-pillar.
4. Remove the five screws (3) that secure the SABIC to the inner roof rail and the airbag support bracket (5).
5. Disengage the plastic push-in fasteners (2), then the T-hook that secures the end of each front and rear SABIC tether in the slots in the inner A-pillar and C-pillar sheet metal.

6. Disengage the remaining plastic push-in fasteners that secure the SABIC to the A-pillar, the inner roof rail and the airbag support bracket at the top of the C-pillar.
7. Grasp the SABIC inflator firmly and pull it away sharply to disengage the snap-in fastener from the inner roof rail above the B-pillar.
8. Remove the SABIC from the vehicle as a unit.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. .

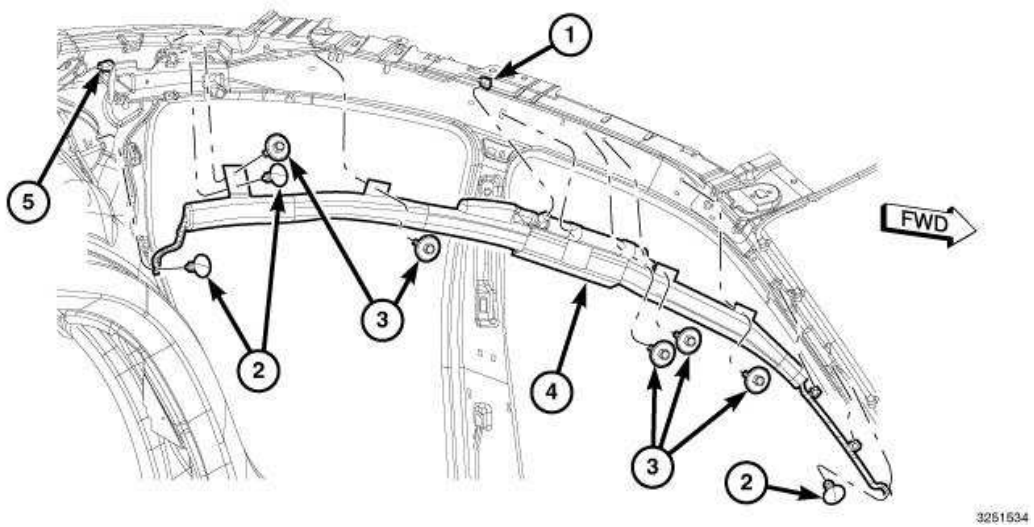

Fig. 41: Wire Harness Connector, Side Air Bag Inflatable Curtain (SABIC), Five Screws & Airbag Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the box nuts and the airbag support bracket (5) for the Side Air Bag Inflatable Curtain (SABIC) (4) are properly installed in the inner roof rail and that they are in good condition.
2. Position the SABIC into the vehicle as a unit.
3. Align the snap-in fastener on the back of the SABIC inflator with the hole in the inner roof rail above the B-pillar and push on the inflator firmly and evenly to snap it into place.
4. Engage the plastic push-in fasteners (2) that secure the airbag cushion to the inner roof rail and the airbag support bracket behind the inflator and the B-pillar.
5. Engage the T-hook that secures the end of each front and rear SABIC tether into the slots in their respective inner A-pillar or C-pillar sheet metal.
6. Engage the plastic push-in fasteners that secure the SABIC front tether to the holes in the inner A-pillar.
7. Engage the plastic push-in fasteners (2) that secure the front and rear SABIC tether T-hooks in their inner A-pillar or C-pillar slots.
8. Install and tighten the five screws (3) that secure the SABIC to the inner roof rail and the airbag support bracket. Tighten the screws to 9 N.m (80 in. lbs.).
9. Reconnect the body wire harness connector (1) to the SABIC inflator connector receptacle.
10. Reinstall the headliner into the vehicle. Refer to **HEADLINER, INSTALLATION** .
11. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

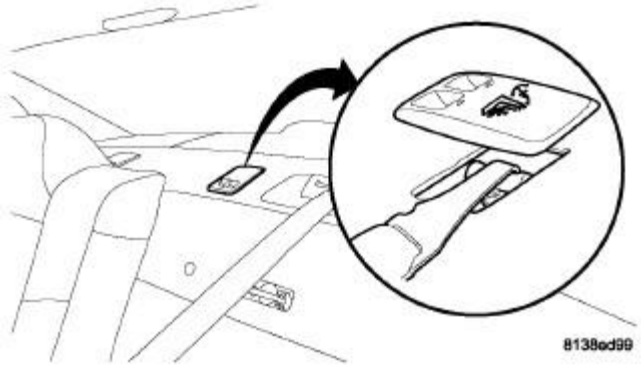

Fig. 42: Lower Anchor & Tether
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system for domestic markets. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seats in these vehicles are equipped with a fixed-position child restraint upper tether anchor for both the center and the two outboard seating positions, and child restraint lower anchors (also known as ISOFIX anchors) for the two outboard seating positions only. Vehicles manufactured for export markets are not equipped with the upper tether anchors, but do have the ISOFIX lower anchors.

The three upper tether anchors are integral to the rear shelf panel. These anchors are each constructed of heavy-gauge steel reinforcement brackets integral to the rear shelf panel and are concealed beneath individual trim cover and bezel units that are integral to the rear shelf trim panel. These upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the rear shelf panel. The upper tether anchor trim covers and bezels are serviced as a unit with the rear shelf trim panel.

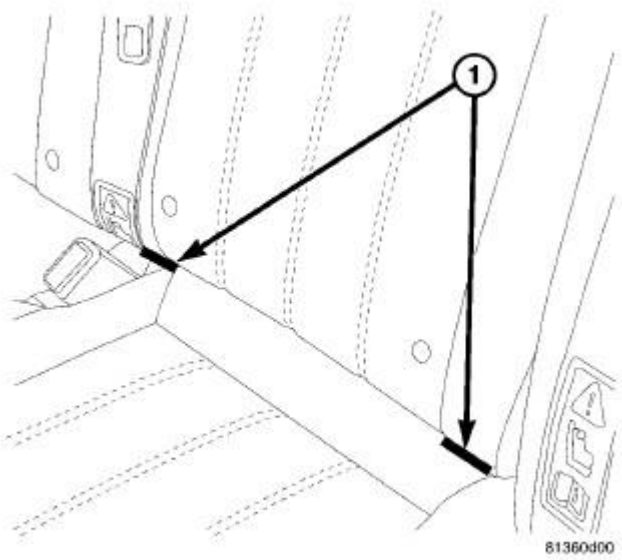

Fig. 43: Lower Anchors
Courtesy of CHRYSLER GROUP, LLC

The lower anchors for all vehicles are integral to an ISOFIX cross member that is permanently mounted to the center floor panel beneath the rear seat cushion. These anchors are constructed from heavy-gauge round steel bar stock that is formed into a U-shape, then securely welded at each end to the cross member.

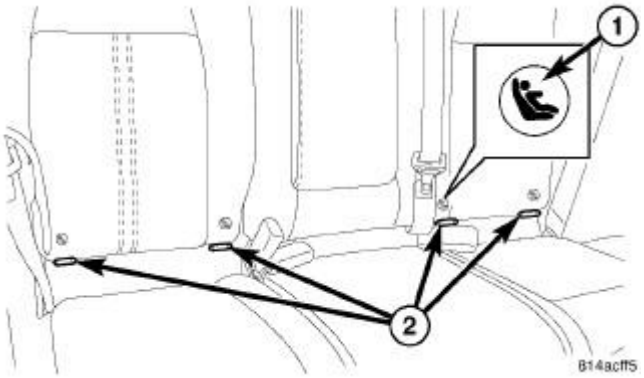

Fig. 44: Identifying Rear Seat Lower Anchors & Markers With An Imprinted Child Seat Icon
Courtesy of CHRYSLER GROUP, LLC

The rear seat lower anchors (2) are each accessed from the front of their respective seats, at each side where the seat back meets the seat cushion. Round markers (1) with an imprinted child seat icon help identify the anchor locations as they may be otherwise difficult to see with the seat back in the upright position. These lower anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the isofix cross member of the center floor panel.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles,

mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

OPERATION

OPERATION

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. The rear seats in this vehicle have two pairs of anchor provisions for installing a LATCH-compatible child seat. A single seat may be mounted in the center seating position, or one in each outboard seating position.

With LATCH, child seats are secured by direct attachment to the vehicle structure, rather than by the seat belts. With LATCH-compatible child seats, lower (also known as ISOFIX) anchors attach to the seat structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

Three upper tether anchors are integral to the rear shelf panel to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap. Vehicles manufactured for export markets are equipped with only the ISOFIX lower anchors, and have no upper tether anchor provisions.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

BUCKLE, SEAT BELT

REMOVAL

FRONT SEAT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in

accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle also includes a seat belt tensioner. If the front seat belt buckle is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

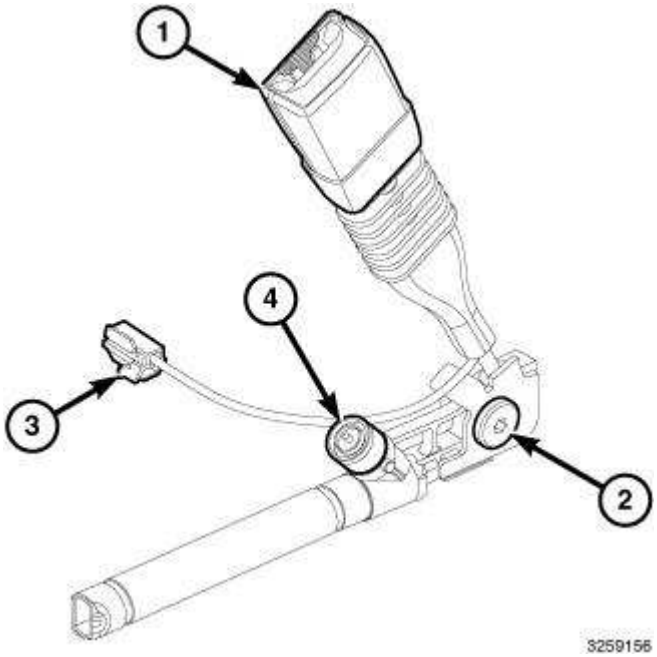

Fig. 45: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
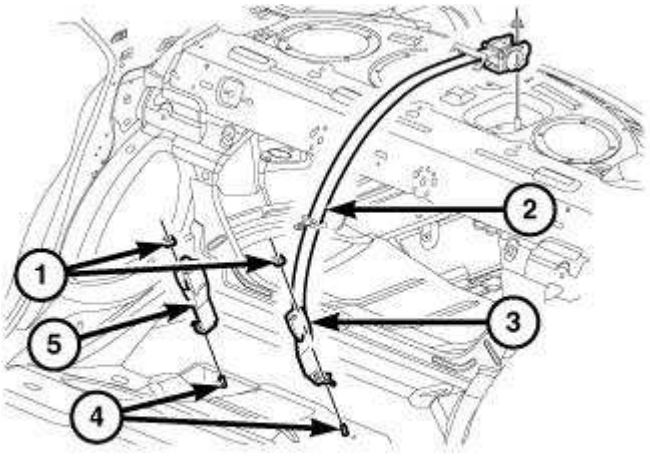
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat for easiest access to the seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Disconnect the seat wire harness connector from the seat belt tensioner initiator (4).
5. Disconnect the seat belt switch pigtail wire connector (3) from the seat wire harness connector.
6. Remove the screw (2) that secures the front seat belt buckle lower anchor to the bracket at the back of the seat cushion frame.
7. Remove the buckle and tensioner (1) from the front seat as a unit.

REAR SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.



3253891

Fig. 46: Center Rear Seating Position Buckles, Left Outboard Rear Seating Position Buckle & Center Rear Seating Position Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right outboard and center rear seating position buckles (5) are serviced

only as a unit. The left outboard rear seating position buckle (3) is integral to the center rear seating position seat belt and retractor (2) lower anchor. Refer to RETRACTOR, SEAT BELT, REMOVAL.

1. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, REMOVAL** .
2. Remove the nut (1) that secures the anchor plate of the right outboard and center rear seating position buckles (5) to the stud (4) on the center floor panel.
3. Remove the buckle unit from the vehicle.

INSTALLATION

FRONT SEAT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle also includes a seat belt tensioner. If the front seat belt buckle is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

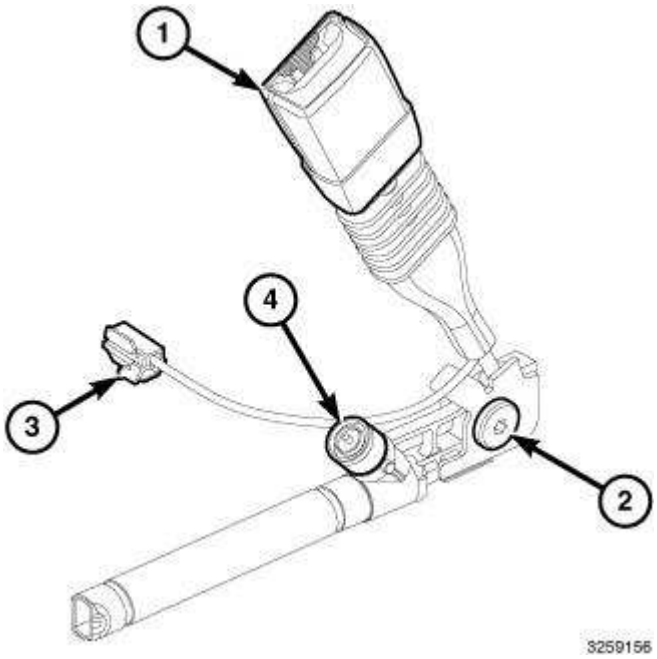


Fig. 47: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
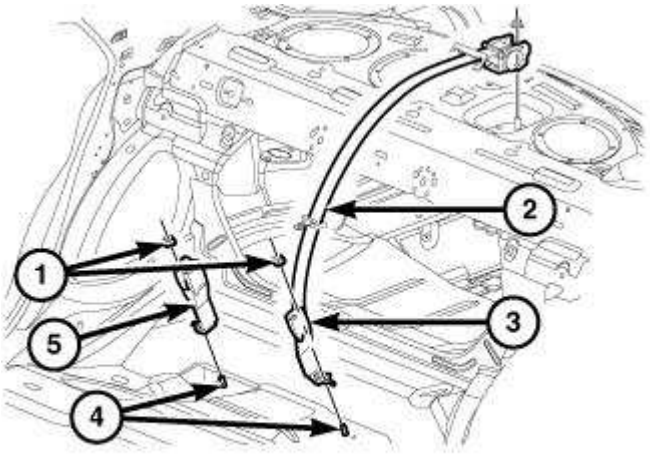
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt buckle and tensioner (1) lower anchor to the bracket at the back of the seat cushion frame.
2. Install and tighten the screw (2) that secures the lower anchor to the seat cushion frame. Tighten the screw to 39 N.m (29 ft. lbs.).
3. Reconnect the seat belt switch pigtail wire connector (3) to the seat wire harness connector.
4. Reconnect the seat wire harness connector to the seat belt tensioner initiator (4).
5. Reinstall the front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and

unused replacement parts listed in the Chrysler Mopar® Parts Catalog.



3253891

Fig. 48: Center Rear Seating Position Buckles, Left Outboard Rear Seating Position Buckle & Center Rear Seating Position Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The right outboard and center rear seating position buckles (5) are serviced only as a unit. The left outboard rear seating position buckle (3) is integral to the center rear seating position seat belt and retractor (2) lower anchor. Refer to RETRACTOR, SEAT BELT, INSTALLATION.

1. Position the anchor plate of the right outboard and center rear seating position buckles (5) onto the stud (4) on the center floor panel. Be certain to engage the anti-rotation tab of the anchor plate into the clearance hole in the floor panel.
2. Install and tighten the nut (1) that secures buckle anchor plate to the floor. Tighten the nut to 40 N.m (30 ft. lbs.).
3. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** .

CLOCKSPRING

DESCRIPTION

DESCRIPTION

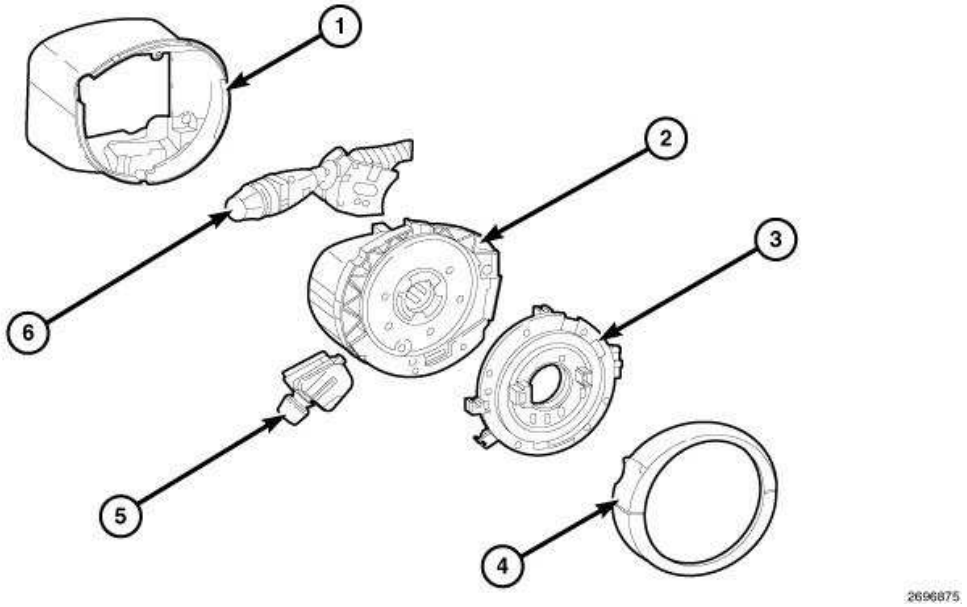


Fig. 49: Steering Column Shroud, Steering Angle Sensor (SAS), Clockspring, Telescope Switch & Trim Cover
Courtesy of CHRYSLER GROUP, LLC

The clockspring (3) for this vehicle is integral to the Steering Column Control Module (SCCM). The clockspring includes an integral, internal turn signal cancel cam. The SCCM is secured near the top of the steering column below the steering wheel. In addition to the clockspring the SCCM includes the steering column shroud (1), the Steering Angle Sensor (SAS) (2), the multi-function switch (6), a power adjustable steering column tilt and telescope switch (5) for vehicles so equipped and a trim cover (4).

Within the plastic clockspring case is a spool-like molded clear plastic rotor with an exposed hub. The upper surface of the rotor hub has a large center hole, two short pigtail wires with connectors, and two connector receptacles that face toward the steering wheel. The inner surface of the clockspring rotor hub has keyway features that are engaged by lug features on the outer circumference of the steering wheel hub. These interlocking features allow the steering wheel to drive the clockspring and SAS and also unlock the clockspring rotor when the steering wheel has been properly installed.

The SCCM includes an integral connector receptacle that faces toward the instrument panel and is connected to the vehicle electrical system through a single takeout and connector of the instrument panel wire harness. The instrument panel wire harness take out has been intentionally provided with additional length to facilitate service removal and installation of the SCCM. However, following SCCM installation, this additional length must be pulled back and secured to the instrument panel structure to prevent undesirable noises while driving.

Wound around the rotor spool within the clockspring case are long ribbon-like tapes that consist of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tapes terminate at the connector receptacle that faces the instrument panel, while the inner end of the tapes terminate at the pigtail wires and connector receptacles on the hub of the clockspring rotor that face the steering wheel. The outer surface of the rotor spool hub within the clockspring case also has the integral lobes of the turn signal cancel cam.

The clear plastic clockspring rotor has an outer band that has a translucent or frosted appearance except for a small, clear inspection window area in the lower right quadrant. The clockspring tape has several black squares that are only visible through the clear inspection window when the clockspring is properly centered. If these squares are not visible through the inspection window, clockspring centering has been compromised and the entire SCCM must be replaced with a new unit.

The service replacement SCCM is shipped with the clockspring pre-centered and with a red molded plastic locking tab installed. The locking tab secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed after the SCCM is installed on the steering column and before the steering wheel can be installed. The clockspring cannot be repaired. If the clockspring is ineffective, damaged, if clockspring centering is compromised or if the Driver AirBag (DAB) has been deployed the entire SCCM unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

OPERATION

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and certain electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the driver airbag, the horn switch, the speed control switch, the remote radio switches, the hands-free communication switches and the Electronic Vehicle Information Center (EVIC) control switches, if the vehicle is so equipped.

The clockspring is integral to the Steering Column Control Module (SCCM) positioned and secured near the top of the steering column. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** . The turn signal cancel cam is integral to the rim of the clockspring rotor hub spool within the clockspring case so it also moves with the rotation of the steering wheel. Two short, sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the Driver AirBag (DAB), while a steering wheel wire harness connected to the connector receptacles on the upper surface of the clockspring rotor completes circuits for the various steering wheel-mounted switches and the heated steering wheel, if the vehicle is so equipped.

Like the clockspring in a timepiece, the clockspring tape and conductors have travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits.

However, if the steering shaft is disconnected from the steering gear the clockspring rotor spool can change position relative to other movable steering components. Clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, clockspring centering has been compromised and the entire SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** .

Service replacement clocksprings are shipped pre-centered within the SCCM and with a plastic

locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the SCCM is installed on a steering column, clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, the SCCM must be replaced with a new unit. Proper clockspring installation may also be confirmed by viewing the Steering Angle Sensor (SAS) data using a diagnostic scan tool.

The hard wired clockspring circuits to the SCCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCCM, the Steering Control Module (SCM) or the electronic controls or communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

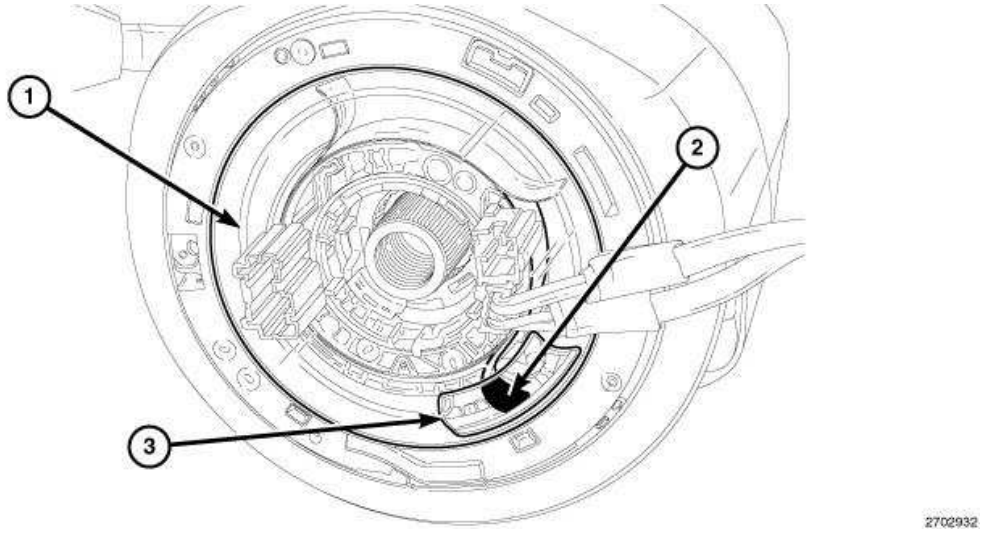

Fig. 50: Inspection Window, Clockspring Rotor & Black Squares
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always turn the steering wheel until the front wheels are in the straight-

ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit MUST be replaced with a new unit.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the steering shaft is disconnected from the steering gear, the clockspring rotor spool can change position relative to the fixed steering components.

Clockspring centering must always be confirmed by viewing the inspection window (3) on the clockspring rotor (1). If the black squares (2) on the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** .

The service replacement SCCM is shipped with the clockspring pre-centered and with a red plastic locking tab installed. This locking tab should not be removed until the SCCM has been properly installed on the steering column. If the locking tab is removed before the SCCM is installed on a steering column, clockspring centering must be confirmed by viewing the black squares on the clockspring tape through the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the SCCM must be replaced with a new unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** . Proper clockspring installation may also be confirmed by viewing the Steering Angle Sensor (SAS) data using a diagnostic scan tool.

MODULE, OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

DESCRIPTION

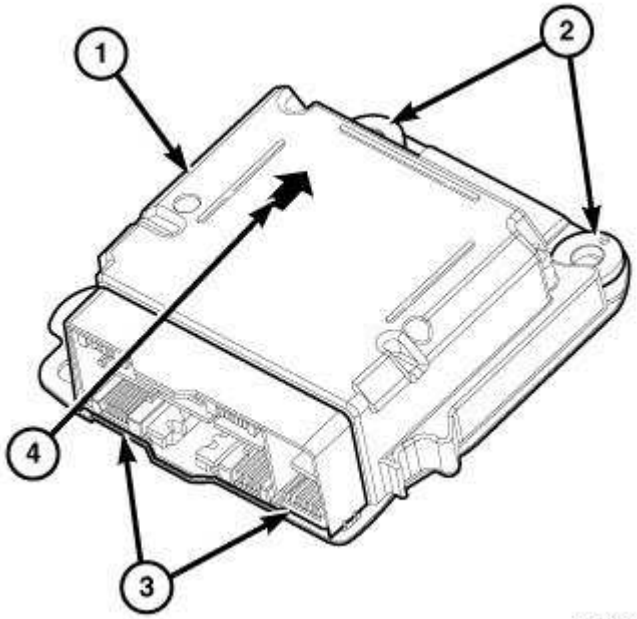

Fig. 51: Occupant Restraint Controller (ORC), Arrow, Integral Mounting Flanges & Electrical Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

The Occupant Restraint Controller (ORC) (1) is secured by three screws to a stamped steel mounting bracket on the top of the floor panel transmission tunnel near the dash panel and beneath the instrument panel center support in the passenger compartment of the vehicle. Concealed within a hollow in the center of the ORC housing is the electronic circuitry of the ORC which includes a microprocessor, an electronic impact sensor, an electronic safing sensor and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing to enclose and protect the internal electronic circuitry and components.

An arrow (4) printed on the label on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has integral mounting flanges (2) on the right and left front and the left rear corner. The stamped metal cover plate has two integral locating pins on its lower surface. Two molded plastic electrical connector receptacles (3) exit the rearward facing side of the ORC housing. These receptacles connect the ORC to the vehicle electrical system through two dedicated take outs and connectors, one from the instrument panel wire harness and the second from the body wire harness.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. In addition, there are unique versions of the ORC for vehicles with or without certain optional Supplemental Restraint System (SRS) components. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced.

PEDESTRIAN PROTECTION SYSTEM

The Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) is available only in vehicles manufactured for certain export markets. In vehicles so

equipped, a unique version of the ORC also serves as the EPP system control module.

OPERATION

OPERATION

The microprocessor in the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microprocessor continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the IC over the CAN data bus to turn ON the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits; a fused ignition switch output (run) circuit through a fuse in the Body Control Module (BCM) (also known as the Common Body Controller/CBC) and a fused ignition switch output (run-start) circuit through a second fuse in the BCM. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness that is secured by a ground screw to the body sheet metal. These connections allow the ORC to be operational whenever the ignition switch is in the START or ON positions.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact.

Various sensors within the ORC are continuously monitored by the ORC logic. These internal sensors, along with several external impact sensor inputs allow the ORC to determine both the severity of an impact and to verify the necessity for deployment of any SRS components. Two remote front impact sensors are located on the back of the right and left vertical members of the radiator support near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors inputs from an internal rollover sensor, seat track position sensors, seat belt switches and six additional remote side impact sensors located on the left and right front door module carriers, on the right and left lower B-pillars and on the right and left C-pillars near the belt line to control deployment of the side curtain airbag units and seat (also known as pelvic and thorax) airbags. On vehicles so equipped, the ORC also uses the passenger side seat belt switch input along

with an input from the Occupant Detection Sensor (ODS) in the passenger front seat cushion to support the passenger belt alert feature, and will send electronic messages to the IC to illuminate the seat belt indicator when appropriate.

The impact sensors within the ORC are electronic accelerometer sensors that provide an additional logic input to the ORC microprocessor. These sensors are used to verify the need for a SRS component deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the SRS components to deploy. On vehicles equipped with side curtain airbags or seat airbags, a separate impact sensor within the ORC provides confirmation to the ORC microprocessor of side impact forces. This separate sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microprocessor determine when the deceleration rate as signaled by the impact sensors indicate an impact that is severe enough to require SRS protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and, if the vehicle is so equipped, the seat airbags and either side curtain airbag unit.

The hard wired SRS inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PEDESTRIAN PROTECTION SYSTEM

In vehicles so equipped, a microcontroller within the ORC also contains the Electronic Pedestrian Protection (EPP) system (also known as the PedPro or the Active Hood System) logic circuits. The EPP system logic of the ORC continuously monitors the three dedicated EPP acceleration-type electronic impact sensors located behind the front bumper area of the fascia at the front of the vehicle. The impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors electronic **ignition status** , **vehicle speed** and **ambient temperature** message inputs received from other electronic modules over the CAN data bus. The EPP system logic of the ORC uses a pre-programmed decision algorithm to analyze all of these inputs, which allows the ORC to determine both the type and severity of an impact.

When the deceleration rate as signaled by the impact sensors indicate an impact that requires the deployment of the pyrotechnic EPP actuator located on each active hood hinge at the rear corners of the hood panel and all other programmed conditions are met, the ORC sends the proper electrical signals to deploy the actuators. As a safing function, the ORC requires confirming sensor inputs from at least two of the three EPP impact sensors before it will issue a deployment signal.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the active hood hinge actuators for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup EPP system protection in case there is a loss of battery current supply to the ORC during an impact event.

An Event Data Recorder (EDR) within the ORC stores EPP near-deployment event records. The ORC microcontroller continuously monitors all of the EPP system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it logs an active DTC. The ORC also stores a DTC after it has been resolved. When the ORC has logged a DTC, it sends electronic request messages over the CAN data bus to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to turn ON the airbag indicator.

The hard wired EPP inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls or communication between other modules and devices that provide features of the EPP system. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to EPP system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant

Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

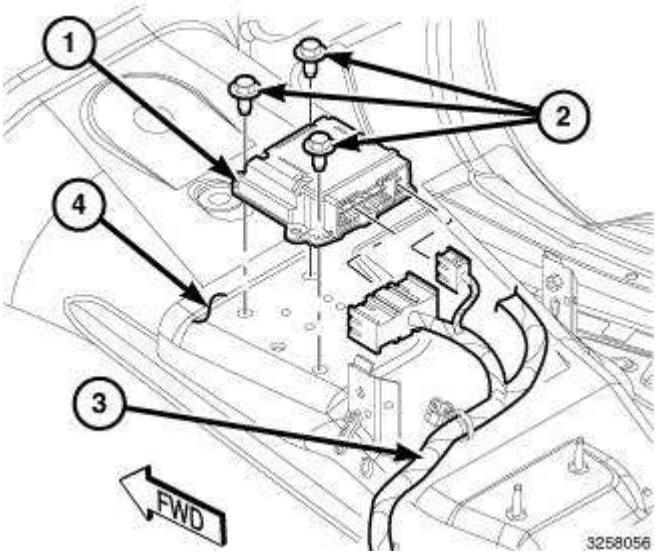

Fig. 52: Floor Panel Transmission Tunnel, Instrument Panel And Body Wire Harness, Three Screws & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the center console from the top of the floor panel transmission tunnel (4). Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Remove the console floor duct from the floor panel transmission tunnel. Refer to **DUCT, FLOOR CONSOLE, REMOVAL** .

   NOTE: If equipped with a cable-type floor shifter, it is not necessary to disconnect the shift cable from the shifter.

4. If equipped with a floor shifter:
   1. Disconnect the wire harness connectors from the shifter.
   2. Remove the four nuts that secure the shifter to the weld studs on the floor panel transmission tunnel.
   3. Remove the shifter from the transmission tunnel. If it is a cable-type shifter, carefully position the shifter and cable out of the way over the right side of the transmission tunnel.
5. Remove the switch bank and bezel from the instrument panel center stack. Refer to **POD, SWITCH BANK, REMOVAL** .

6. Remove the Telematics Gateway Module (TGM) from the instrument panel center stack. Refer to **MODULE, TELEMATICS GATEWAY, REMOVAL** .
7. Disconnect the instrument panel and body wire harness (3) connectors from the Occupant Restraint Controller (ORC) (1) connector receptacles located on the rearward facing side of the module.
8. Reach through the instrument panel center stack openings to access and cut the sound deadening material along the right side of the ORC.
9. Reach around and behind the left side of the instrument panel center stack support structure to access and cut the sound deadening material along the forward-facing side of the ORC.
10. Pull the sound deadening material over the left side of the ORC far enough to access the mounting provisions.
11. Remove the three screws (2) that secure the ORC to the top of the floor panel transmission tunnel.
12. Remove the ORC from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be

scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

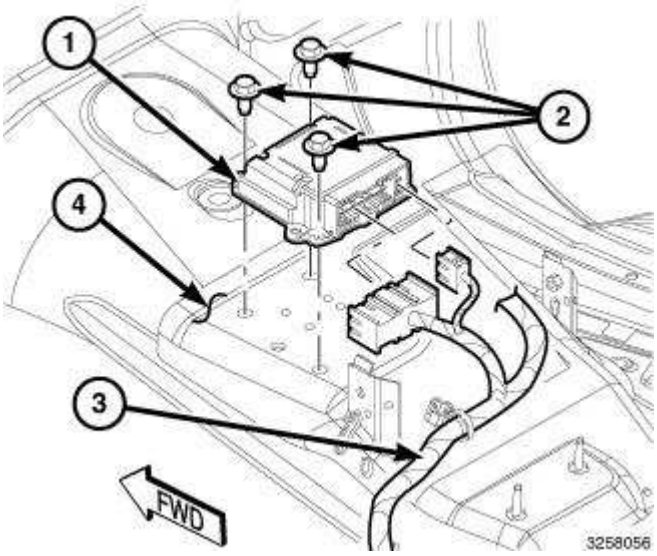

Fig. 53: Floor Panel Transmission Tunnel, Instrument Panel And Body Wire Harness, Three Screws & Occupant Restraint Controller (ORC)
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the Occupant Restraint Controller (ORC) (1) onto the floor panel transmission tunnel (4). When the ORC is correctly positioned, the orientation arrow on the ORC label will be pointed forward in the vehicle.
2. Install and tighten the three screws (2) that secure the ORC to the floor panel transmission tunnel. Tighten the screws to 8 N.m (71 in. lbs.).
3. Restore the flap of sound deadening material that was cut during the removal procedure over and around the ORC.
4. Reconnect the instrument panel and body wire harness (3) connectors to the ORC connector receptacles located on the rearward facing side of the module. Be certain that the latches and the locks on both connectors are each fully engaged.
5. Reinstall the Telematics Gateway Module (TGM) into the instrument panel center stack. Refer to **MODULE, TELEMATICS GATEWAY, INSTALLATION** .
6. Reinstall the switch bank and bezel into the instrument panel center stack. Refer to **POD, SWITCH BANK, INSTALLATION** .
7. If equipped with a floor shifter:
    1. Position the shifter over the four weld studs on the top of the floor panel transmission tunnel.
    2. Install and tighten the four nuts that secure the shifter to the weld studs on the floor panel transmission tunnel. Tighten the nuts securely.
    3. Reconnect the wire harness connectors to the shifter.
8. Reinstall the console floor duct onto the floor panel transmission tunnel. Refer to **DUCT,**

FLOOR CONSOLE, INSTALLATION .

9. Reinstall the center console onto the top of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION** .
10. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

RESTRAINT, ACTIVE HEAD

DESCRIPTION

DESCRIPTION

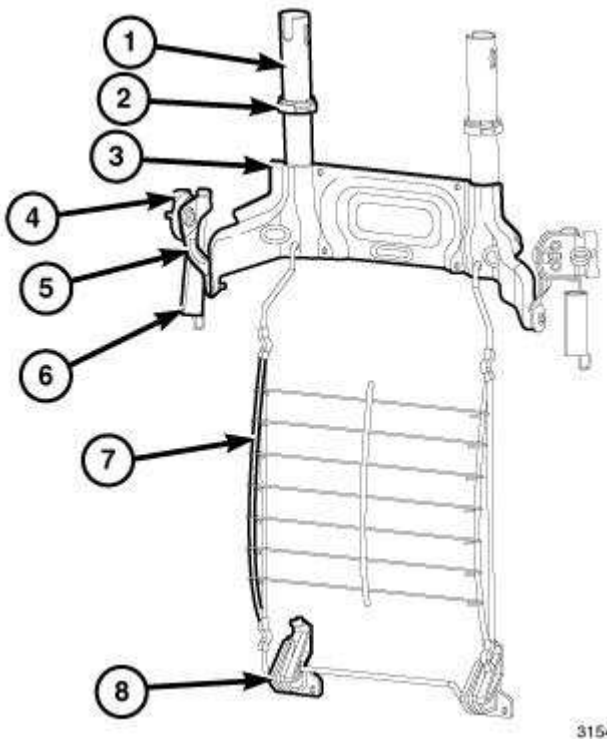

Fig. 54: Steel Headrest Guide Tubes, Fulcrum Bushing, Brackets, Steel Pivot Link, Spring & Static Lumbar Assembly
Courtesy of CHRYSLER GROUP, LLC

Active Head Restraint (AHR) units are standard equipment for both front seating positions in this vehicle. On vehicles so equipped, one inertia-activated AHR unit is located atop each front seat back. Outwardly, an inertia-activated AHR appears the same as a non-active head restraint. The mechanical components that articulate the inertia-activated AHR headrest pad are all concealed within the front seat back frame assembly.

At the top of the seat back frame are two stamped steel headrest guide tubes (1). The guide tubes are each inserted through a molded plastic fulcrum bushing (2) installed in the upper seat back frame member and are permanently fixed to a movable stamped steel armature bracket (3) located just

below the upper frame member near the top of the seat back. The armature bracket is secured to a stamped steel pivot link (5) at each side that pivots on a screw threaded into a mounting bracket (4) welded to each side member of the seat back frame. The pivot links are each have a spring (6) attached to a lever opposite the armature bracket attachment that is anchored to the seat back frame side member below, which provides the spring-loaded return action of the inertia mechanism.

The upper end of the static lumbar assembly (7) is secured at each side to the base of the armature bracket. Each side of the lower end of the lumbar assembly is engaged in a ramp bracket (8) riveted to the lower seat back frame member. The optional power lumbar assembly (not shown) is secured to the armature bracket at the top and the ramp brackets at the bottom in an identical manner as the standard equipment static lumbar assembly.

The inertia-activated AHR linkage cannot be repaired. If damaged or ineffective, it must be replaced as a unit with a new seat back frame unit. However, following an AHR deployment if no physical damage to the unit has occurred, unlike many other Supplemental Restraint System (SRS) components, the spring-loaded inertia-activated AHR linkage will reset itself for reuse.

OPERATION

OPERATION

The inertia-activated Active Head Restraint (AHR) units are deployed and reset automatically by the mechanism contained within each front seat back assembly. During a rear impact, inertia drives the seat occupant rearward into the seat back, loading the seat lumbar assembly. The ramp brackets at the base of the lumbar assembly translate this rearward travel into a vertical motion. The vertical motion of the lumbar assembly is then transmitted to the armature bracket.

Through the rotation of the pivot links at each side of the armature bracket, the vertical motion of the lumbar assembly is converted to a slightly forward and upward arc of the armature bracket, headrest guide tubes and headrest that is designed to reduce the space between the back of the head of the seat occupant and the head restraint pad. Closing this space catches the head of the seat occupant during a low speed rear impact collision event and is important in reducing or eliminating potentially debilitating cervical (also known as whiplash) injuries.

Unless damaged, following the rear impact, the return spring on the pivot link at each side of the armature bracket returns the mechanical components within the seat back and the headrest to their non-loaded positions.

RETRACTOR, SEAT BELT

DESCRIPTION

DESCRIPTION

Both front seating position seat belts are equipped with a Constant Force Retractor (CFR), while the seat belt retractors used in all seating positions include an inertia-type, Emergency Locking Retractor (ELR) mechanism as standard equipment. However, the ELR for all seating positions except the

driver side front are mechanically switchable from an ELR to an Automatic Locking Retractor (ALR).

The CFR, ELR and ALR features are all integral to the seat belt retractor unit mechanism that is concealed beneath a molded plastic cover located on one side of the retractor spool. The CFR, ELR and ALR features cannot be adjusted or repaired and, if ineffective or damaged, the entire seat belt and retractor must be replaced as a unit.

OPERATION

OPERATION

The Constant Force Retractors (CFR) used for both front seating positions provide a constant force load-limiting feature. This load-limiting feature helps to limit the maximum force on the belt webbing to help absorb the energy of the upper torso during an impact event. The CFR feature also helps to offset any extreme torso loading that might occur as the seat belt webbing is automatically retracted by deployment of the belt tensioners in conjunction with a front airbag deployment.

The primary function of the switchable Emergency Locking Retractor (ELR) to Automatic Locking Retractor (ALR) feature is to securely accommodate an infant or child booster seat in any seating position of the vehicle except the driver side front seat without the need for a self-cinching seat belt tip half latch plate unit or another supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type ELR in situations where the minimum inertia locking threshold has not been achieved.

The locked mode of the ALR is engaged and the retractor is switched from operating as a standard inertia-type ELR by first buckling the combination lap and shoulder belt buckle. Then all of the shoulder belt webbing is pulled out from the retractor. Once all of the belt webbing is extracted from the retractor spool, the retractor will automatically become engaged in the pre-locked ALR mode and will make a light, audible clicking or ratcheting sound as the shoulder belt is allowed to retract onto the spool to provide an audible confirmation that the ALR mode is engaged. Once the ALR mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard ELR (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted back onto the retractor spool. The ELR mode is confirmed by the absence of the light, audible clicking or ratcheting sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load threshold is sensed, or until the retractor is again switched to the ALR mode.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

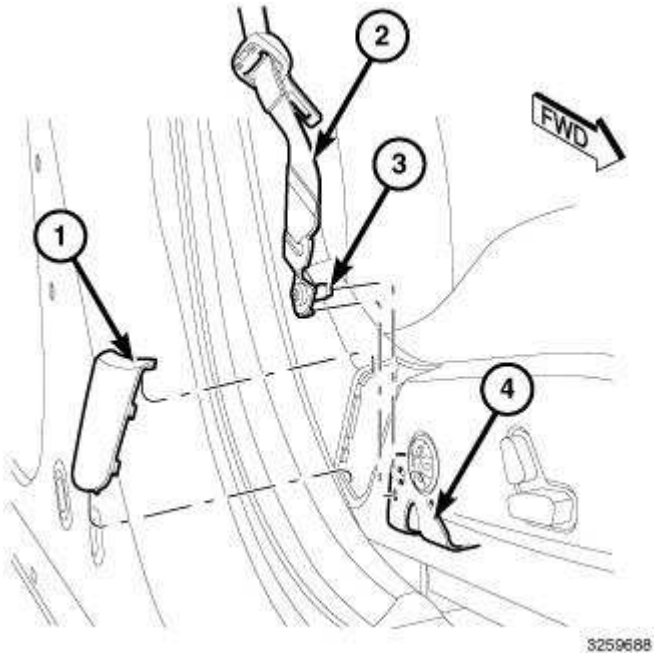

Fig. 55: Front Seat Belt Lower Anchor Cover, Screw, Seat Belt & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the front seat to its most forward position for easiest access to the front seat belt lower anchor cover (1) and the B-pillar trim.
2. Grasp the upper edge of the lower anchor cover and pull it carefully upward and outward to unsnap it from the front seat cushion outboard side shield.
3. Remove the screw (3) that secures the seat belt (2) lower anchor to the bracket (4) on the outboard side of the front seat cushion frame.
4. Remove the trim from the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .

7. Remove the nut (3) that secures the seat belt turning loop (2) to the stud of the height adjuster (1) on the upper inner B-pillar.
8. Remove the seat belt turning loop from the height adjuster.
9. Disengage the two clips that secure the belt web guide (4) to the holes in the inner B-pillar (6).
10. Remove the screw (5) that secures the retractor bracket to the base of the inner B-pillar.
11. Disengage the T-tab on the upper retractor bracket from the T-slot in the inner B-pillar.
12. Remove the front seat belt (7) and retractor from the vehicle as a unit.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate.

Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

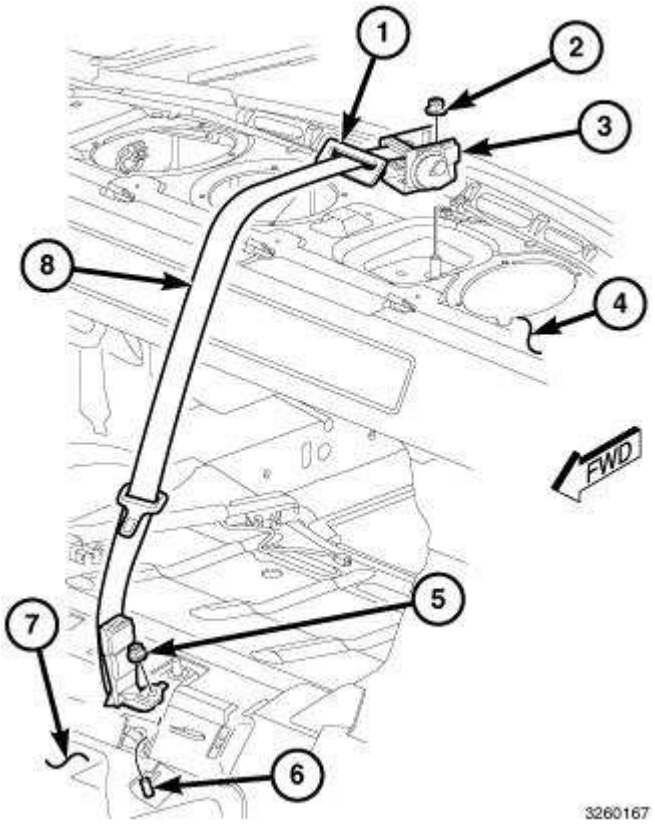

Fig. 58: Nut, Rear Center Seat Belt, Stud, Center Floor Panel, Seat Belt Trim Cover & Rear Shelf Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left outboard rear seating position buckle is integral to the center rear seating position seat belt and retractor lower anchor.

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, REMOVAL** .
3. Remove the nut (5) that secures the rear center seat belt (8) lower anchor and the left outboard seating position buckle anchor to the stud (6) on the center floor panel (7).
4. Remove the seat belt and buckle anchors from the stud.
5. Disengage the seat belt trim cover (1) from the rear shelf panel trim opening.
6. Remove the trim from the rear shelf panel (4). Refer to **PANEL, REAR SHELF, REMOVAL** .

7. Remove the nut (2) that secures the retractor (3) to the stud on the rear shelf panel.
8. Lift the retractor from the stud and disengage the T-tab on the retractor bracket from the T-slot in the rear shelf panel.
9. Remove the seat belt (8) and retractor from the vehicle as a unit.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

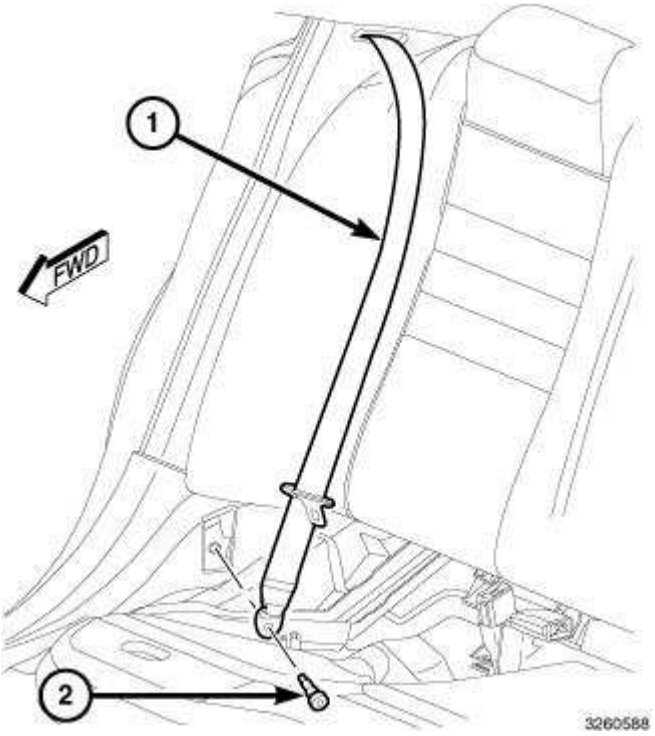

Fig. 59: Screw & Rear Outboard Seat Belt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat cushion from the vehicle. Refer to **COVER, SEAT CUSHION, SECOND**

ROW, REMOVAL .

3. Remove the screw (2) that secures the rear outboard seat belt (1) to the lower inner C-pillar.

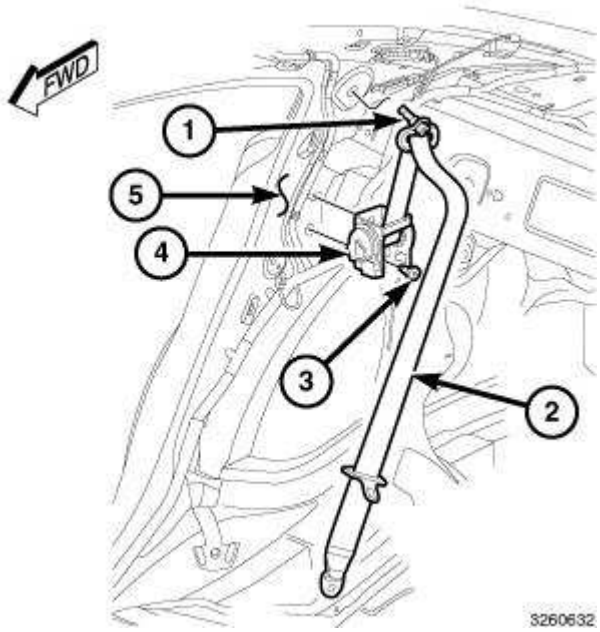

Fig. 60: Seat Belt Webbing, Screw, Seat Belt, Upper C-pillar & Retractor

4. Remove the trim from the inside of the upper C-pillar (5). Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
5. Disengage the seat belt webbing (2) and lower anchor from the seat belt opening in the upper C-pillar trim.
6. Remove the screw (1) that secures the seat belt turning loop to the upper inner C-pillar.
7. Remove the seat belt turning loop from the upper inner C-pillar.
8. Remove the screw (3) that secures the retractor (4) to the inner C-pillar.
9. Disengage the retractor T-tab from the T-slot in the inner C-pillar.
10. Remove the rear outboard seat belt and retractor from the inner C-pillar as a unit.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper

precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front outboard retractors also include a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. .

NOTE: All seat belt retractors except the driver side front retractor include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.

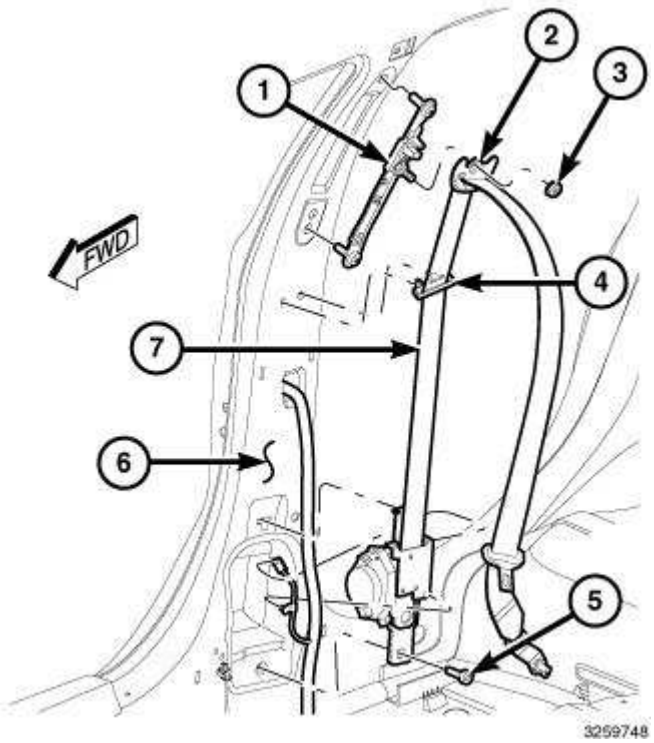

Fig. 61: Nut, Seat Belt Turning Loop, Belt Web Guide, Inner B-Pillar, Front Seat Belt, Screw & Height Adjuster
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt (7) and retractor into the vehicle as a unit.
2. Engage the T-tab on the upper retractor bracket into the T-slot in the inner B-pillar (6).
3. Install and tighten the screw (5) that secures the retractor bracket to the base of the inner B-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
4. Position the belt web guide (4) to the holes in the inner B-pillar and use hand pressure to press it firmly and evenly until the two clips that secure it snap into place. Be certain that the seat belt webbing between the retractor and the web guide is not twisted.
5. Position the seat belt turning loop (2) onto the stud of the height adjuster (1) on the upper inner B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
6. Install and tighten the nut (3) that secures the turning loop to the height adjuster. Tighten the nut to 45 N.m (33 ft. lbs.).

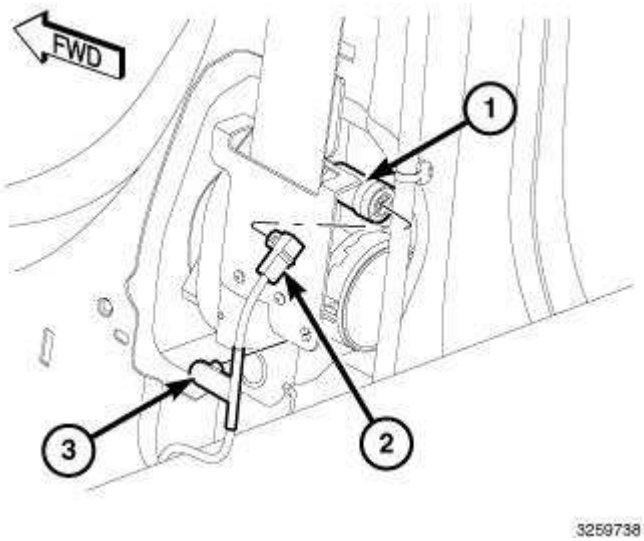

Fig. 62: Body Wire Harness Retainer, Yellow Connector & Seat Belt Tensioner Initiator
Courtesy of CHRYSLER GROUP, LLC

7. Reconnect the yellow connector (2) of the body wire harness to the seat belt tensioner initiator (1) on the retractor.
8. Engage the body wire harness retainer (3) to the retractor bracket.
9. Reinstall the trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

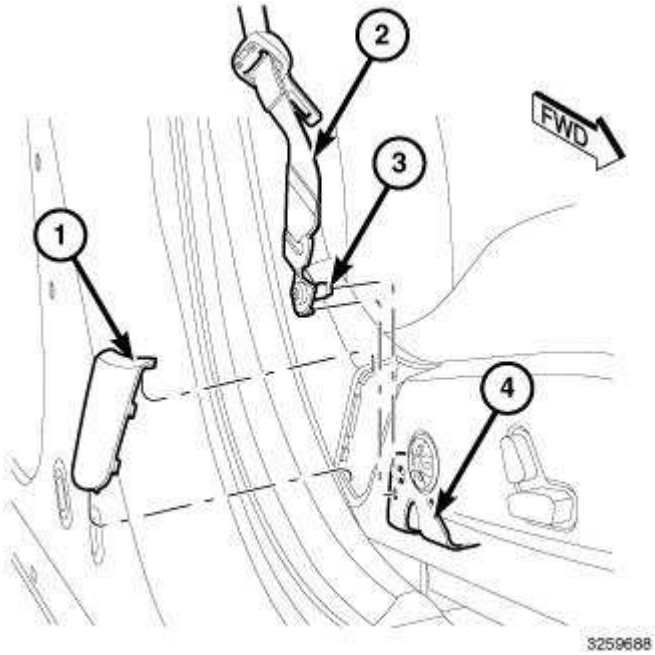

Fig. 63: Front Seat Belt Lower Anchor Cover, Screw, Seat Belt & Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Position the seat belt lower anchor (2) to the mounting bracket (4) on the outboard side of the

front seat cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.

11. Install and tighten the screw (3) that secures the lower anchor to the seat. Tighten the screw to 45 N.m (33 ft. lbs.).
12. Reinstall the lower anchor cover (1) onto the front seat cushion outboard side shield by seating the integral lower tab of the cover into position, then pushing inward using care to avoid breaking any of the cover tabs.
13. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

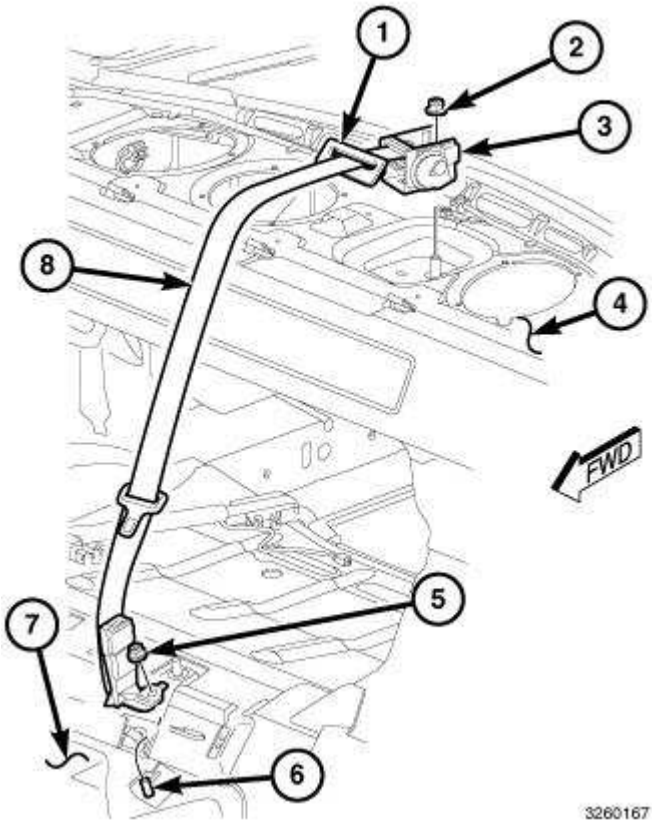

Fig. 64: Nut, Rear Center Seat Belt, Stud, Center Floor Panel, Seat Belt Trim Cover & Rear Shelf Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left outboard rear seating position buckle is integral to the center rear seating position seat belt and retractor lower anchor.

1. Position the center rear seat belt (8) and retractor (3) to the rear shelf panel (4) as a unit.
2. Engage the T-tab on the retractor bracket into the T-slot in the rear shelf panel and lower the retractor over the stud on the rear shelf panel.
3. Install and tighten the nut (2) that secures the retractor to the stud. Tighten the nut to 50 N.m (37 ft. lbs.).
4. Reinstall the trim onto the rear shelf panel. Refer to **PANEL, REAR SHELF, INSTALLATION** .
5. Engage the seat belt trim cover (1) into the rear shelf panel trim opening. Be certain the belt webbing is not twisted between the retractor and the trim cover.
6. Position the rear center seat belt and left outboard seating position buckle anchors over the stud (6) on the center floor panel (7).
7. Install and tighten the nut (5) that secures the seat belt and buckle anchors to the stud. Tighten the nut to 50 N.m (37 ft. lbs.).
8. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION** .

9. Reconnect the battery negative cable.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Courtesy of CHRYSLER GROUP, LLC

1. Position the rear outboard seat belt (2) and retractor (4) to the inner C-pillar (5) as a unit.
2. Engage the T-tab on the retractor bracket into the T-slot in the inner C-pillar.
3. Install and tighten the screw (3) that secures the retractor to the inner C-pillar. Tighten the screw to 32 N.m (24 ft. lbs.).
4. Position the seat belt turning loop to the inner C-pillar. Be certain the seat belt webbing between the retractor and the turning loop is not twisted.
5. Install and tighten the screw (1) that secures the seat belt turning loop to the inner C-pillar. Tighten the screw to 32 N.m (24 ft. lbs.).

6. Insert the seat belt webbing and lower anchor through the seat belt opening in the upper C-pillar trim.
7. Reinstall the trim onto the upper inner C-pillar. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .

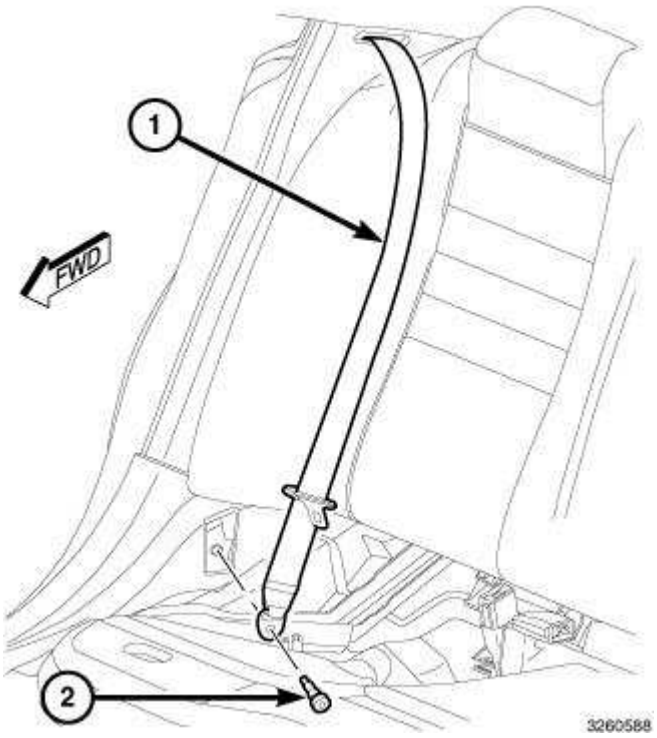

Fig. 66: Screw & Rear Outboard Seat Belt
Courtesy of CHRYSLER GROUP, LLC

8. Position the rear outboard seat belt (1) lower anchor to the lower inner C-pillar. Be certain the seat belt webbing between the turning loop and the lower anchor is not twisted.
9. Install and tighten the screw (2) that secures the seat belt lower anchor to the lower inner C-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
10. Reinstall the rear seat cushion into the vehicle. Refer to **COVER, SEAT CUSHION, SECOND ROW, INSTALLATION** .
11. Reconnect the battery negative cable.

SENSOR, IMPACT

DESCRIPTION

ELECTRONIC PEDESTRIAN PROTECTION

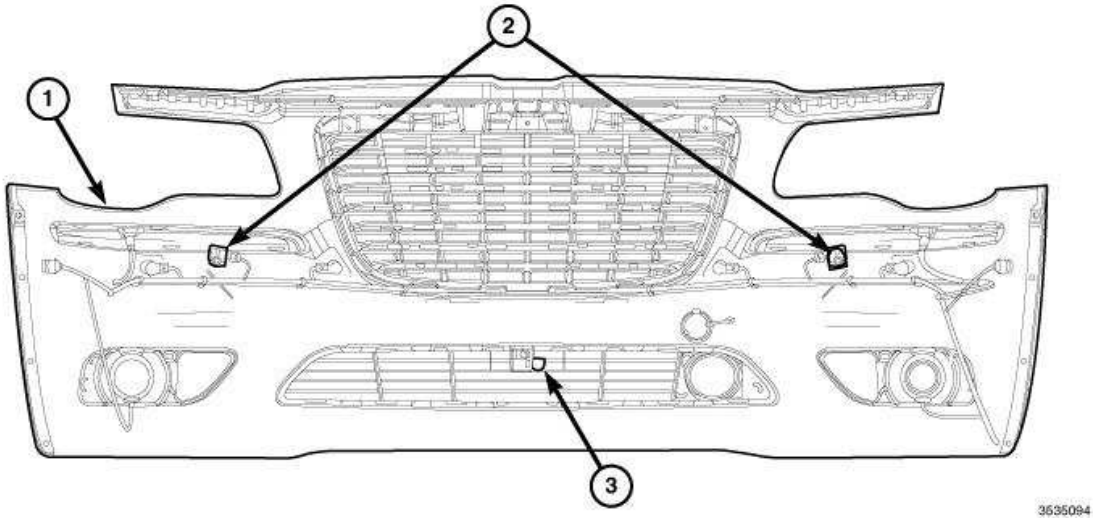

Fig. 67: Electronic Pedestrian Protection (EPP) Impact Sensors & Front Fascia
Courtesy of CHRYSLER GROUP, LLC

Electronic Pedestrian Protection (EPP) impact sensors (2 & 3) are found only in vehicles equipped with the EPP system (also known as the PedPro or Active Hood System), which is available only in vehicles manufactured for certain export markets. These sensors are mounted at the front of the vehicle to provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the pyrotechnic EPP active hood hinge actuators located on each hinge at the rear corners of the hood panel.

The EPP impact sensors are satellite acceleration-type sensors that are mounted to the back of the front fascia (1) in the front bumper area of the vehicle. The two outboard sensors are each secured by a screw to a U-nut within dedicated molded brackets integral to the back of the front fascia above the front bumper support beam. The center sensor is secured by a screw to a U-nut within a molded dedicated bracket integral to the back of the front fascia below the front bumper support beam. The sensors and the front bumper support beam are concealed behind the front fascia.

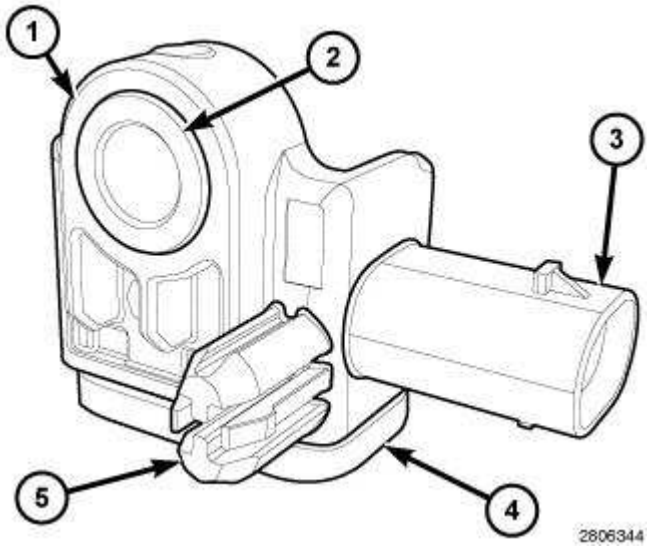

Fig. 68: Satellite Acceleration-Type Impact Sensors, Integral Connector Receptacle, Metal Sleeve & Molded Cover
Courtesy of CHRYSLER GROUP, LLC

Each sensor housing (1) has an integral connector receptacle (3), an integral locator pin with two latch features (5) and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the cavity and a molded cover (4) is laser welded over the cavity to seal and protect the internal electronic circuitry and components.

The EPP impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the headlamp and dash wire harness. These acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OCCUPANT RESTRAINT

Remote or satellite impact sensors are mounted in various strategic locations of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, seat airbags and the seat belt pretensioners. Two types of sensors are used in this vehicle. They are the acceleration-type and the pressure-type, which are described in further detail in the following paragraphs.

ACCELERATION TYPE

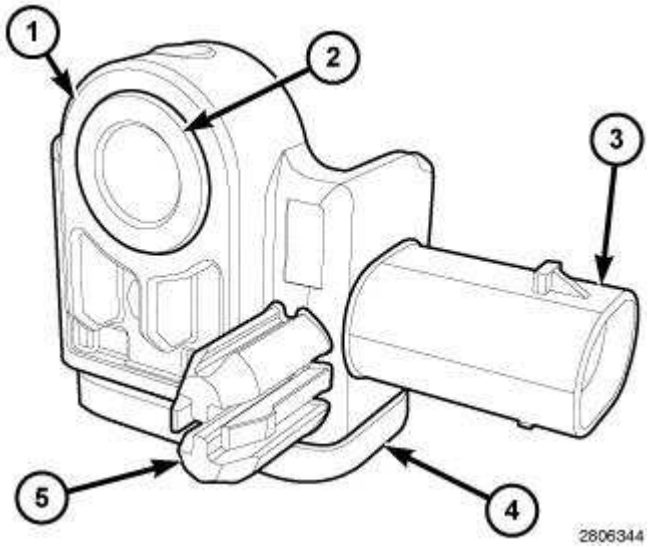

Fig. 69: Satellite Acceleration-Type Impact Sensors, Integral Connector Receptacle, Metal Sleeve & Molded Cover
Courtesy of CHRYSLER GROUP, LLC

Remote or satellite acceleration-type impact sensors (1) are mounted in various locations in the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the ORC to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, the seat belt pretensioners and the seat (also known as pelvic and thorax) airbags.

Although the front and side acceleration-type impact sensors are similar in appearance and construction, they may not be interchangeable. The front impact sensors may monitor acceleration forces on a different axis than those monitored by the side impact sensors. Each sensor is secured with a single screw to its mounting location. The front sensors are located on the back of each vertical support member of the headlamp mounting cross member between the cooling module and the front lamp unit. A side sensor is located near the base of each inner B-pillar and near the belt line of each C-pillar and concealed behind the interior trim.

Each sensor housing has an integral connector receptacle (3), an integral locator pin with two latch features (5), and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the cavity and a molded cover (4) is laser welded over the cavity to seal and protect the internal electronic circuitry and components.

The front impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the headlamp and dash wire harness, while the side impact sensors are connected through dedicated take outs and connectors of the body wire harness.

The acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

PRESSURE TYPE

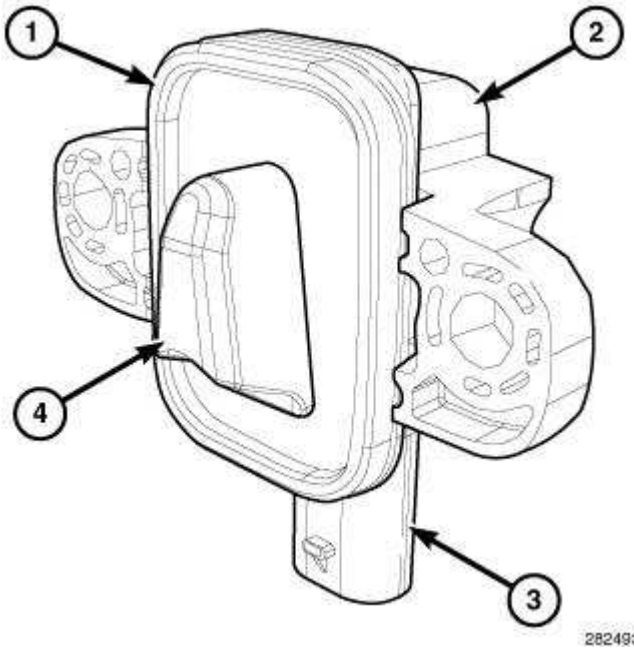

Fig. 70: Sensors, Resilient Gasket, Connector Receptacle & Water Shield
Courtesy of CHRYSLER GROUP, LLC

Two pressure-type front door side impact sensors (2) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws and is sealed by a resilient gasket (1) to the front door hardware module carrier on the front door inner panel. The sensors are concealed behind the front door trim panel within the passenger compartment.

The right and left front door side impact sensors are identical in construction and calibration. The impact sensor housing has an integral connector receptacle (3), two integral mounting tabs, and an integral hood-like water shield (4). The water shield extends through a hole in the front door module carrier into the interior of the door cavity and protects the sensor orifice from contamination. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor, which includes an electronic communication chip and the pressure sensor.

The housing cavity is filled with a potting material to seal and protect the internal electronic circuitry and components. A label on the sensor has a directional arrow and the word **down** imprinted upon it to provide verification of the correct sensor orientation in the vehicle. The pressure-type side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness.

These pressure-type front door side impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION

ELECTRONIC PEDESTRIAN PROTECTION

The acceleration-type Electronic Pedestrian Protection (EPP) impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the EPP system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) then sends electronic messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to control the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through the dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the acceleration-type EPP impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the EPP system. The most reliable, efficient, and accurate means to diagnose the impact sensors or the electronic controls and communication related to acceleration-type EPP impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OCCUPANT RESTRAINT

ACCELERATION-TYPE

The acceleration-type impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide some features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the acceleration-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PRESSURE-TYPE

The pressure-type front door side impact sensors recognize a side impact in the front door area by monitoring changes in pressure within the front door cavity. A sudden pressure wave is created as the door collapses during an impact event. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the current in the sensor plus circuit.

The hard wired circuits between the pressure-type front door side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the pressure-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

ELECTRONIC PEDESTRIAN PROTECTION

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Electronic Pedestrian Protection (EPP) system impact sensor, as it can damage the impact sensor or affect its calibration. The EPP impact sensor enables the system to deploy the EPP system active hood hinge actuators. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper EPP active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged

Electronic Pedestrian Protection (EPP) system impact sensor. Whether the EPP system has been deployed or the vehicle has had a front end collision without EPP system deployment, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.

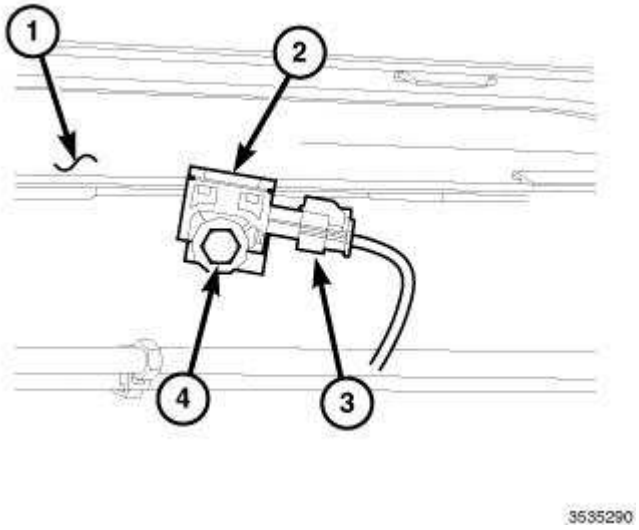

Fig. 71: Outboard Sensors
Courtesy of CHRYSLER GROUP, LLC

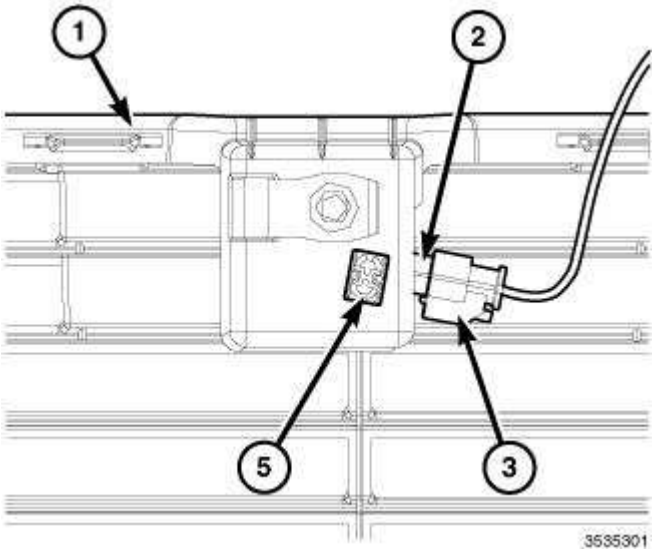

Fig. 72: Center Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the front fascia (1) from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .
3. Disconnect the front fascia wire harness connector (3) from the Electronic Pedestrian Protection

(EPP) center or outboard impact sensor (2) connector receptacle.

4. Remove the screw (4) that secures the EPP impact sensor to the U-nut within the molded bracket integral to the back of the fascia.
5. Disengage the latch features of the integral locator pin (5) on the EPP impact sensor from the locator hole in the fascia bracket.
6. Remove the EPP impact sensor from the front fascia.

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

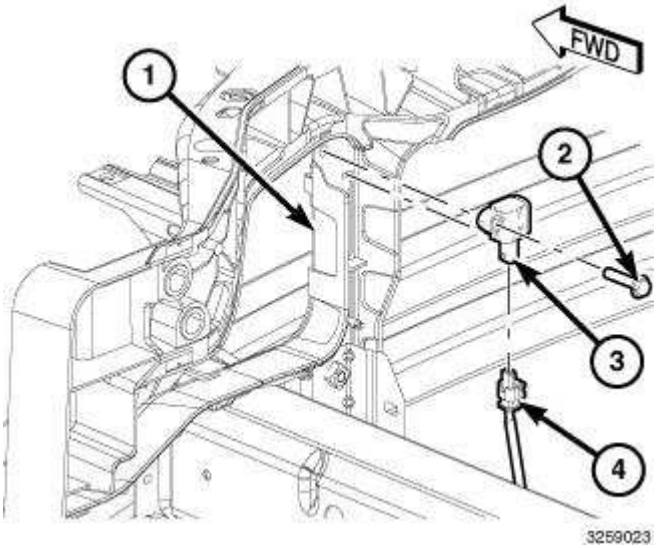

Fig. 73: Front End Module (FEM) Structural Support, Wire Harness Connector, Screw & Left Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. For the left hand side only, remove the fastener that secures the engine air cleaner assembly to the Front End Module (FEM) structural support (1) and move the air cleaner assembly far enough to access the impact sensor connector and fastener on the back of the vertical support member between the cooling module and the front lamp unit opening.
3. Disconnect the headlamp and dash wire harness connector (4) from the right or left front impact sensor (3) connector receptacle.
4. Remove the screw (2) that secures the sensor to the back of the FEM vertical support member.
5. Disengage the locating pin integral to the sensor from the locating hole in the FEM vertical support member.
6. Remove the right or left front impact sensor from the vehicle.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

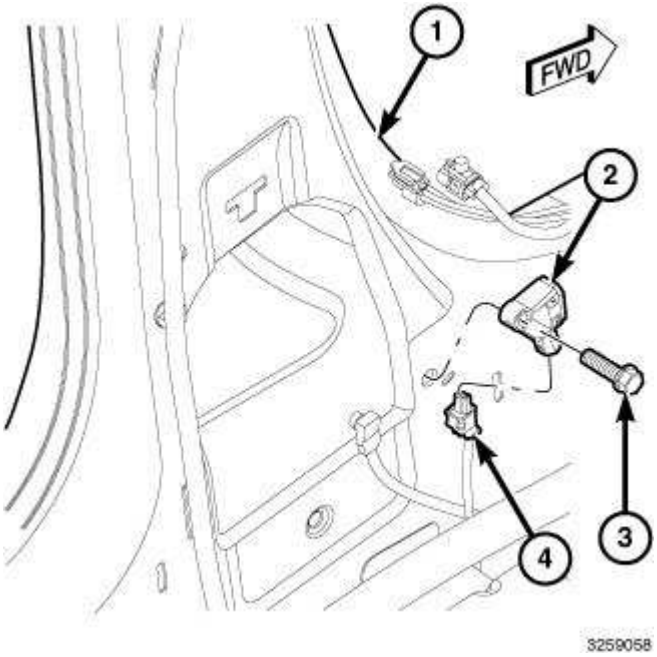

Fig. 74: Lower B-pillar, Body Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the lower B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
4. Disconnect the body wire harness connector (4) from the side impact sensor (2) connector receptacle.
5. Remove the screw (3) that secures the sensor to the lower B-pillar.
6. Gently pry the sensor away from the inner B-pillar far enough to disengage the latch features of the locator pin from the locator hole.
7. Remove the sensor from the inner B-pillar.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

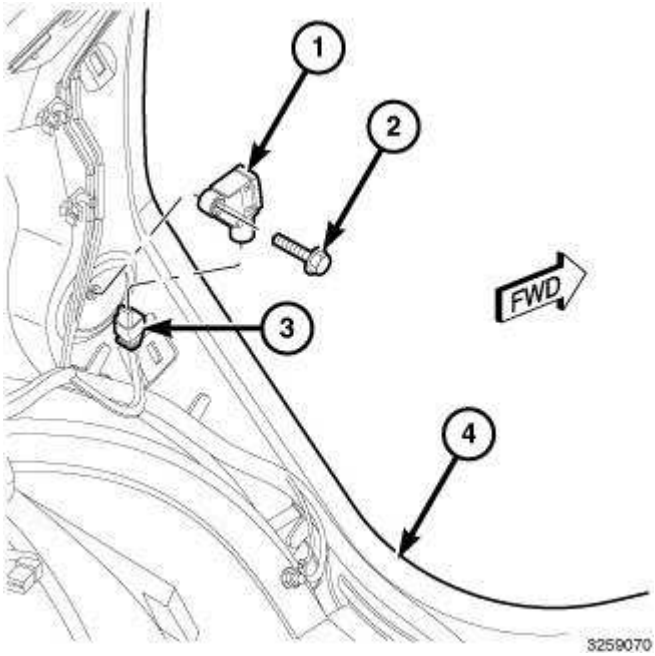

Fig. 75: Lower C-pillar, Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the lower C-pillar (4). Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
3. Disconnect the body wire harness connector (3) from the side impact sensor (1) connector receptacle.
4. Remove the screw (2) that secures the sensor to the inner C-pillar.
5. Gently pry the sensor away from the inner C-pillar far enough to disengage the latch features of the locator pin from the locator hole.
6. Remove the sensor from the inner C-pillar.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or

instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

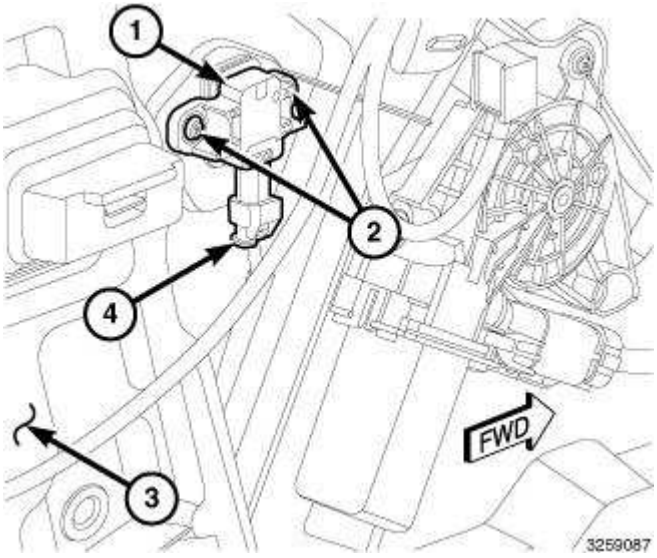

Fig. 76: Front Door Wire Harness Connector, Side Impact Sensor, Two Screws & Front Door Hardware Module Carrier Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim panel from the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect the front door wire harness connector (4) from the side impact sensor (1) connector receptacle.
4. Remove the two screws (2) that secure the side impact sensor to the front door hardware module carrier panel (3).
5. Remove the side impact sensor from the vehicle.

INSTALLATION

ELECTRONIC PEDESTRIAN PROTECTION

WARNING: To avoid serious or fatal injury on vehicles equipped with the Electronic Pedestrian Protection (EPP) system, disable the system before attempting any EPP system component diagnosis or service. With the ignition switch in the OFF position, disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the EPP system. Failure to take the proper precautions could result in accidental active hood hinge actuator deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Electronic Pedestrian Protection (EPP) system impact sensor, as it can damage the impact sensor or affect its calibration. The EPP impact sensor enables the system to deploy the EPP system active hood hinge actuators. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper EPP active hood hinge actuator deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged Electronic Pedestrian Protection (EPP) system impact sensor. Whether the EPP system has been deployed or the vehicle has had a front end collision without EPP system deployment, review the recommended procedures for Service After A Pedestrian Protection Deployment before removing the unit from the vehicle. Refer to STANDARD PROCEDURE.

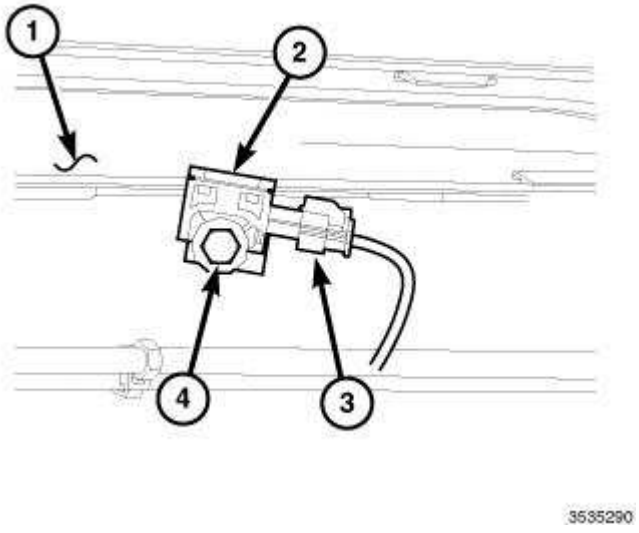

Fig. 77: Outboard Sensors
Courtesy of CHRYSLER GROUP, LLC

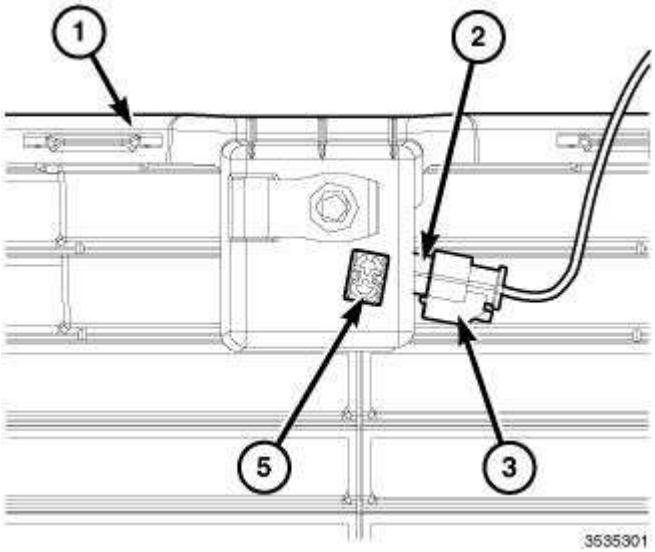

Fig. 78: Center Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Carefully inspect the U-nut for the center or outboard Electronic Pedestrian Protection (EPP) impact sensor to be certain it is good condition and is properly installed in the molded bracket integral to the back of the front fascia (1).
2. Carefully position the EPP impact sensor (2) to the molded bracket. Be certain that the latches of the anti-rotation pin on the back of the sensor are engaged in the clearance hole of the bracket.
3. Install and tighten the screw (4) that secures the sensor to the U-nut in the molded bracket. Tighten the screw to 8 N.m (70 in. lbs.).
4. Reconnect the front fascia wire harness connector (3) to the EPP impact sensor connector receptacle.
5. Reinstall the front fascia onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any EPP system component. Refer to **STANDARD PROCEDURE**.

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact

sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

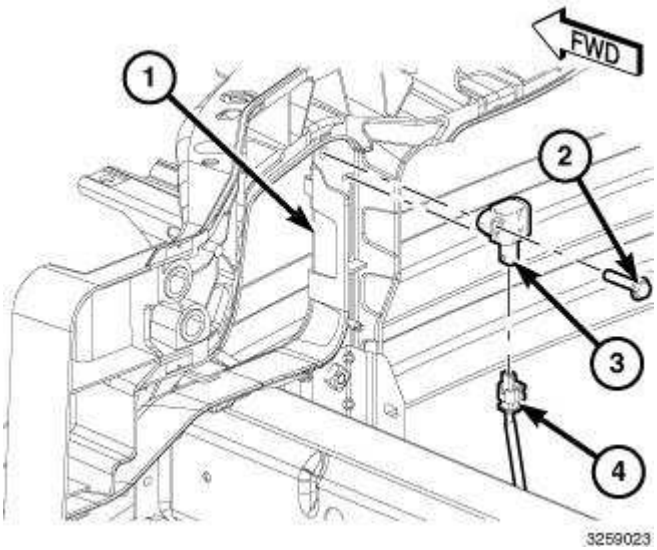

Fig. 79: Front End Module (FEM) Structural Support, Wire Harness Connector, Screw & Left Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the right or left front impact sensor (3) to the back of the Front End Module (FEM) vertical support member (1) between the cooling module and the front lamp unit opening.
2. Be certain to engage the locating pin integral to the sensor into the locating hole in the FEM vertical support member.
3. Install and tighten the screw (2) that secures the sensor to the FEM vertical support member. Tighten the screw to 11 N.m (97 in. lbs.).
4. Reconnect the headlamp and dash wire harness connector (4) to the sensor connector receptacle.
5. For the left hand side only, position the engine air cleaner assembly to the FEM structural support and reinstall the fastener that secures the air cleaner assembly.
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

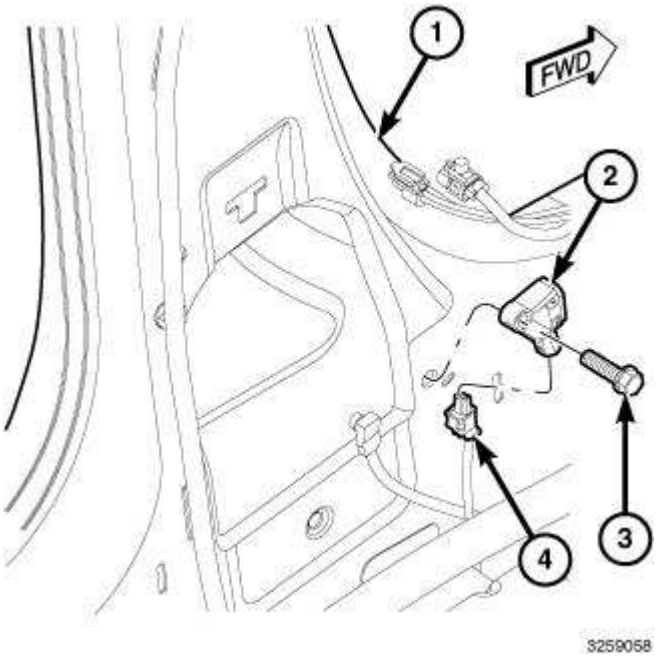

Fig. 80: Lower B-pillar, Body Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (2) onto the inner B-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner B-pillar.
2. Install and tighten the screw (3) that secures the sensor to the inner B-pillar. Tighten the screw to 11 N.m (97 in. lbs.).
3. Reconnect the body wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the lower trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS

component. Refer to **STANDARD PROCEDURE**.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

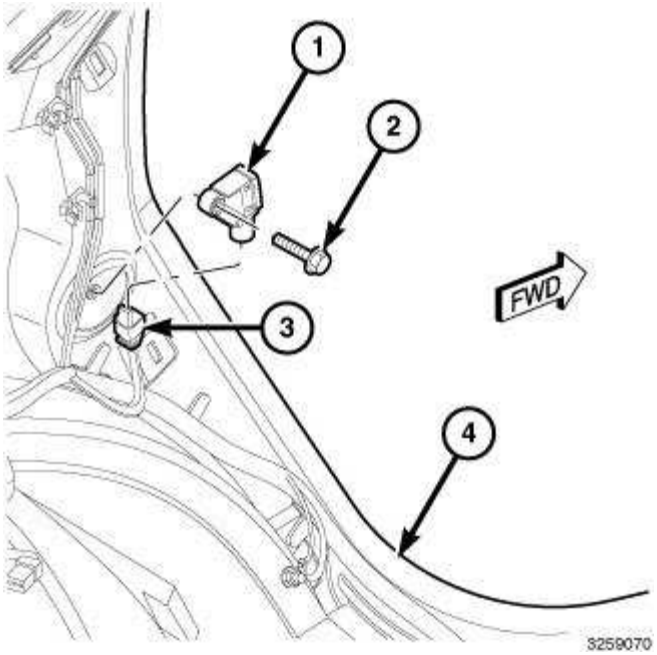

Fig. 81: Lower C-pillar, Wire Harness Connector, Side Impact Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the side impact sensor (1) onto the inner C-pillar (4). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner C-pillar.
2. Install and tighten the screw (2) that secures the sensor to the inner C-pillar. Tighten the screw to 11 N.m (97 in. lbs.).

3. Reconnect the body wire harness connector (3) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the C-pillar. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

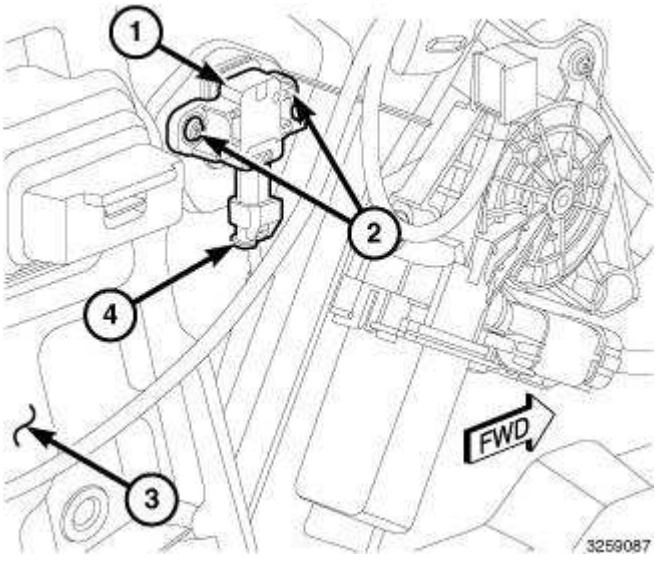

Fig. 82: Front Door Wire Harness Connector, Side Impact Sensor, Two Screws & Front Door Hardware Module Carrier Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain that the gasket between the pressure-type side impact sensor and the front door hardware module carrier panel is in good condition and positioned on the back of the sensor. There MUST be a good seal between the sensor and the hardware module carrier panel for the sensor to operate properly. If the gasket is in poor condition, replace the sensor.**

1. Position the side impact sensor (1) to the right or left front door hardware module carrier panel (3). When the sensor is correctly positioned, the sensor connector receptacle will be pointed toward the bottom of the door.
2. Install and tighten the two screws (2) that secure the side impact sensor to the door hardware module carrier panel. Tighten the screws to 2.4 N.m (21 in. lbs.).
3. Reconnect the front door wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the trim panel onto the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SENSOR, OCCUPANT DETECTION

DESCRIPTION

DESCRIPTION

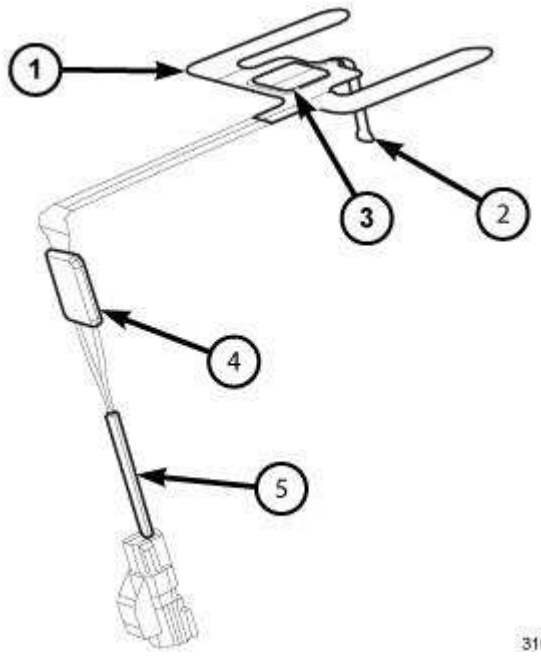

Fig. 83: Plastic Sensor Mat, Locator Tab, Adhesive Patch, Adhesive Block & Connector
Courtesy of CHRYSLER GROUP, LLC

An Occupant Detection Sensor (ODS) is located directly below the passenger side front seat cushion

trim cover. This sensor provides information to the Occupant Restraint Controller (ORC) used for control of the passenger belt alert feature.

The ODS consists of a flexible clear plastic sensor mat (1) containing several resistive membrane, force sensing resistor cells that is secured by either a locator tab (2) and an adhesive patch (3) or by just the adhesive patch to the top surface of the seat cushion foam. The locator tab is still present, but is not used on ventilated seat applications. The adhesive patches on either ODS are a one time only material and cannot be reactivated or reused if removed.

A short, two-conductor pigtail wire and connector (5) connect the sensor to the vehicle electrical system through a dedicated take out and connector of the seat wire harness. A hot melt adhesive block (4) encapsulates and protects the connections between the electrical conductors in the tail of the sensor mat and the pigtail wires as well as a diagnostic resistor.

The ODS cannot be adjusted or repaired, and must be replaced if damaged or ineffective.

OPERATION

OPERATION

The Occupant Detection Sensor (ODS) acts as a simple switch to detect loads placed upon the passenger side front seat cushion. The sensor circuits are connected to and monitored by the Occupant Restraint Controller (ORC) whenever the ignition switch is in the ON position. The ORC uses an algorithm logic in monitoring the changing states of the sensor input to determine whether the seat cushion load is static or dynamic.

The ORC microprocessor continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system status and readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC). However, because the ODS input is only used for control of the passenger belt alert feature, which has no effect on SRS component features or functions, the airbag indicator is **NOT** illuminated in response to a detected ODS circuit fault.

The ODS receives source current and a clean ground through dedicated sensor plus and minus circuits from the ORC. The ORC then sends the appropriate sensor status information to the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which uses this information as an additional logic input used for control of the seat belt indicator and the passenger belt alert feature in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC).

The hard wired circuits between the ODS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ODS or the electronic controls and communication between other modules and devices that provide some features of the passenger belt alert feature. The most reliable, efficient, and accurate means to diagnose the ODS or the electronic controls and communication related to passenger belt alert feature operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

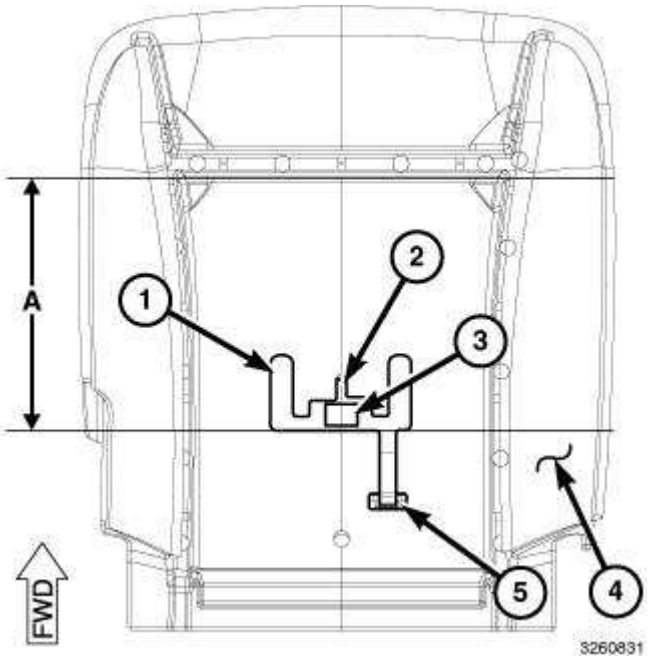

Fig. 84: Occupant Detection Sensor (ODS), Clearance Hole, Seat Cushion Foam, Locator Hole & Adhesive Patch
Courtesy of CHRYSLER GROUP, LLC

1. Position the passenger side front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the passenger side front seat from the vehicle. Refer to **SEAT, FRONT, REMOVAL** .
4. Remove the trim from the front seat cushion foam and frame. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** .
5. If the vehicle is so equipped, remove the heater mat from the seat cushion foam. Refer to **PAD, HEATER, REMOVAL** .
6. Reach under the back of the front seat cushion frame to access and disconnect the Occupant Detection Sensor (ODS) (1) pigtail wire connector from the seat wire harness.
7. Disengage the ODS hot melt block and pigtail wire from the clearance hole (5) near the back of

the seat cushion foam (4).

8. Except on vehicles with the ventilated seat option, disengage the ODS locator tab from the locator hole (2) near the center of the seat cushion foam.
9. Disengage the adhesive patch (3) of the ODS from the top surface of the seat cushion foam.
10. Remove the ODS from the seat cushion.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: When handling a new Occupant Detection Sensor (ODS), it should never be bent, creased, torn, cut or abraded. The ODS should not be handled with or come into contact with hard or sharp-edged tools or objects. Do not allow the ODS to drop more than 2 meters (6.5 feet). Prior to installation, do not sit on, stand on or place boxes, tools or any other foreign object on the ODS. If the ODS adhesive patches become inadvertently adhered to any seat materials or foreign objects prior to proper positioning on the seat cushion, the ODS must be scrapped and replaced with a new unit. Do not modify the seat foam or trim materials of a seat that contains an ODS. Failure to observe these cautions may result in an inoperative ODS, or an ODS that provides inaccurate inputs to the Occupant Restraint Controller (ORC).

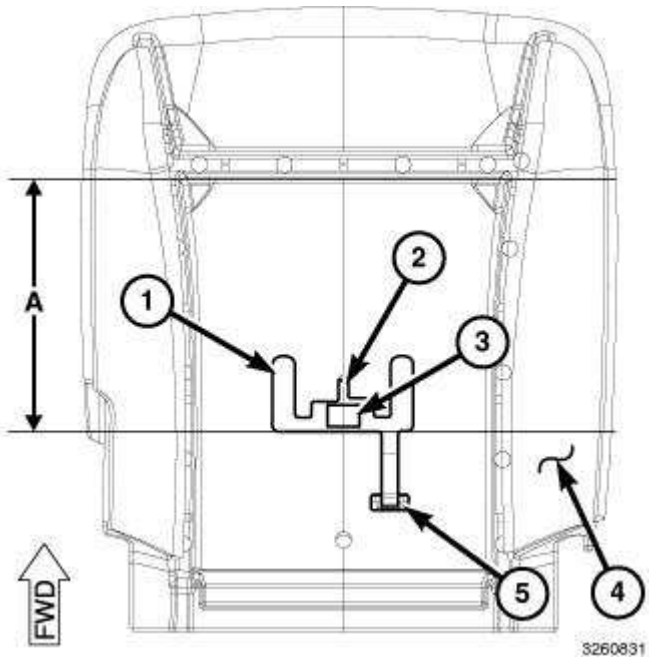

Fig. 85: Occupant Detection Sensor (ODS), Clearance Hole, Seat Cushion Foam, Locator Hole & Adhesive Patch
Courtesy of CHRYSLER GROUP, LLC

1. Except on vehicles equipped with the ventilated seat option, insert the locator tab of the Occupant Detection Sensor (ODS) mat (1) into the locator hole (2) near the center of the seat cushion foam (4) and push the tab all the way through the foam. On vehicles with the ventilated seat option, leave the locator tab flat on the seat cushion and pointed forward in the vehicle.
2. Position the sensor mat on the seat cushion with the two mat sensor cell branches aligned with the sides of the seat and the rear edge of the mat positioned 124 millimeters (4.88 inches) (Distance A) rearward from the back edge of the forward crimp channel in the seat cushion foam.

CAUTION: The adhesive used to secure the ODS to the seat is heat activated and requires that both the adhesive and the material it is applied to be ideally between 21° and 38° C (between 70° and 100° F). Application of the ODS to surfaces below 10° C (50° F) is not recommended as the adhesive becomes too firm to readily adhere. Do not touch or allow the adhesive patches to contact any foreign materials with the release paper removed. Do not attempt to add adhesive materials to the ODS.

3. Peel the release paper off of the adhesive patch (3) on the underside of the ODS mat.
4. Apply hand pressure (0.8 bar or 12 psi) over the adhesive patch of the ODS mat for at least four seconds to activate and adhere the adhesive to the seat cushion foam.
5. Route the ODS pigtail wires through the clearance hole (5) near the back of the seat cushion foam and insert the hot melt block into the recess.
6. Reach under the back of the front seat cushion frame to access, route and reconnect the ODS

pigtail wire and connector to the seat wire harness.

7. If the vehicle is so equipped, reinstall the heater mat onto the seat cushion foam. Refer to **PAD, HEATER, INSTALLATION** .
8. Reinstall the trim onto the front seat cushion foam and frame. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** .
9. Reinstall the passenger side front seat into the vehicle. Refer to **SEAT, FRONT, INSTALLATION** .
10. Reconnect the battery negative cable.

SENSOR, SEAT TRACK POSITION

DESCRIPTION

DESCRIPTION

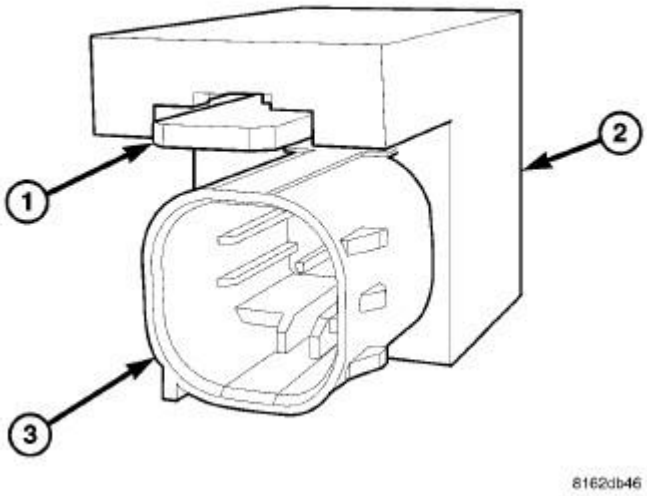

Fig. 86: Identifying Seat Track Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Seat Track Position Sensor (STPS) (2) is a Hall Effect-type sensor used on some vehicles. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing.

The sensor housing has a mounting slot containing an integral latch feature (1) and slides and latches onto a stamped metal blade-type bracket located on the inboard side of one of the upper seat adjuster tracks near the rear of the driver side or passenger side front seat. A molded connector receptacle (3) integral to the sensor housing is connected to the vehicle electrical system through a connector and take out of the front seat wire harness beneath the front seat cushion frame.

The STPS cannot be adjusted or repaired and, if ineffective or damaged, the entire sensor must be

replaced.

OPERATION

OPERATION

The seat track position sensor is designed to provide a seat position data input to the Occupant Restraint Controller (ORC) indicating whether the driver or passenger side front seat is in a full forward or a not full forward position. The ORC uses this data as an additional logic input for use in determining the appropriate deployment force to be used when deploying the multistage driver or passenger airbag.

The seat track position sensor receives a nominal five volt supply from the ORC. The sensor communicates the seat position by modulating the voltage returned to the ORC on a sensor data circuit. The ORC also monitors the condition of the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC sends messages over the CAN data bus to control the illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC).

The hard wired circuits between the seat track position sensor and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the seat track position sensor or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the seat track position sensor or the electronic controls and communication related to seat track position sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

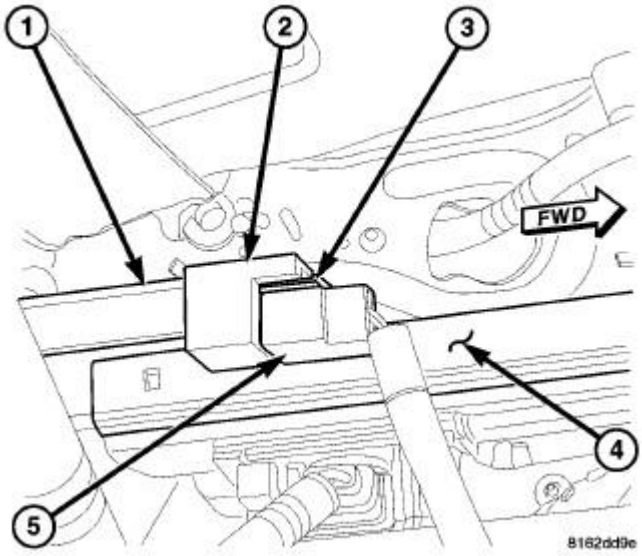

Fig. 87: Seat Track Position Sensor On Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the rear edge of the front seat cushion to access the seat track position sensor (2) on a bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Using a small screwdriver, hold the latch feature (3) depressed while sliding the connector end of the sensor off of the bracket.
4. Disconnect the seat wire harness connector (5) from the sensor connector receptacle.
5. Remove the sensor from under the front seat.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

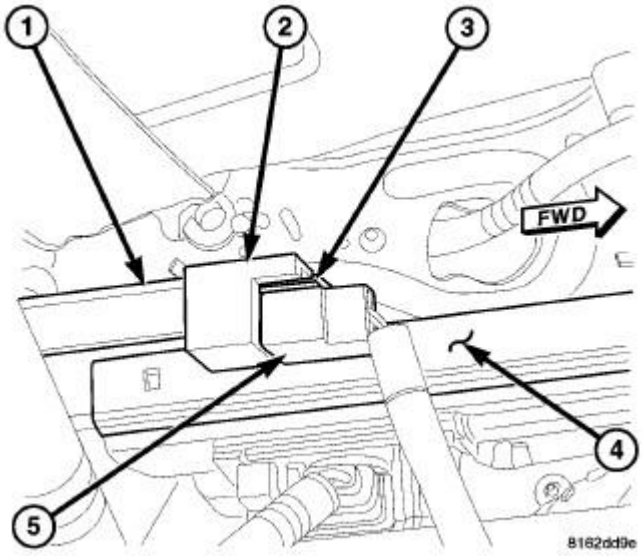

Fig. 88: Seat Track Position Sensor On Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the rear edge of the front seat cushion to reconnect the seat wire harness connector (5) to the seat track position sensor (2) connector receptacle. Be certain that the latch on the connector is fully engaged.
2. Align the open end of the sensor mounting slot to the blade of the sensor bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Push the sensor firmly onto the bracket until the latch feature (3) snaps into place with an audible click.
4. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

SWITCH, SEAT BELT

DESCRIPTION

DESCRIPTION

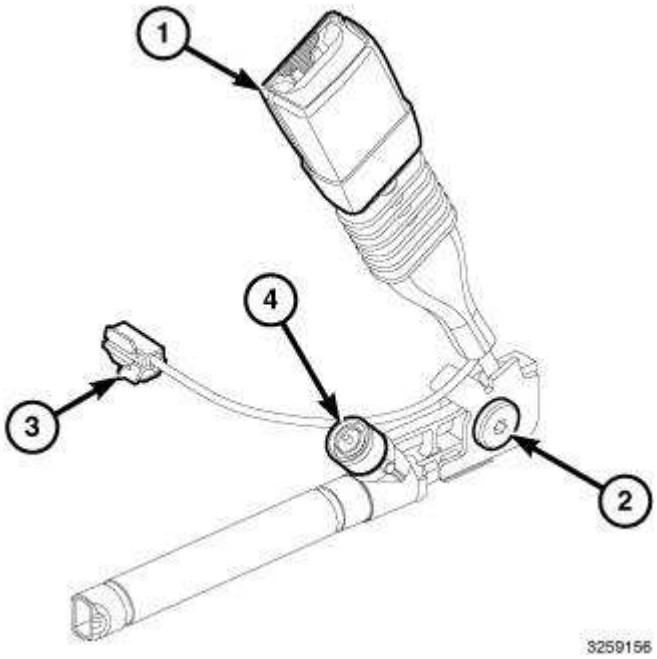

Fig. 89: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

The driver and passenger side front seat belt switches for this vehicle are actually Hall Effect-type sensors. These sensors consist of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that is integral to each front seat belt buckle (1). The front seat belt buckles are located on a molded plastic scabbard and secured by a screw (2) to the inboard side of each front seat cushion frame so that the buckles travel with the seat.

The front seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire and connector (3) on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness. A one kilohm diagnostic resistor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

The seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced.

OPERATION

OPERATION

The front seat belt switches are designed to control a hard wired sense input to the Occupant Restraint Controller (ORC). A spring-loaded slide with a small window-like opening is integral to the buckle latch mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and the window of the slide exposes the Hall Effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced current as an output to the ORC. When the seat belt is unbuckled, the spring-loaded slide moves upward and shields the IC from the field of the permanent magnet, causing

the output current from the seat belt switch to be reduced.

The seat belt switches receive a supply of current from the ORC, and the ORC senses the status of the front seat belt switches through its connection to the seat wire harness. The ORC provides electronic **seat belt switch status** messages to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus. The IC uses these messages as an additional logic input for control of the seat belt indicator. The ORC monitors the condition of the seat belt switch circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between the seat belt switches and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switches or the electronic controls or communication between other modules and devices that provide some features of the seat belt reminder system. The most reliable, efficient, and accurate means to diagnose the seat belt switches or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

TENSIONER, SEAT BELT

DESCRIPTION

DESCRIPTION

In vehicles manufactured for domestic markets, the front seat belt incorporates dual tensioners: one integral to the retractor, and one integral to the buckle.

RETRACTOR TENSIONER

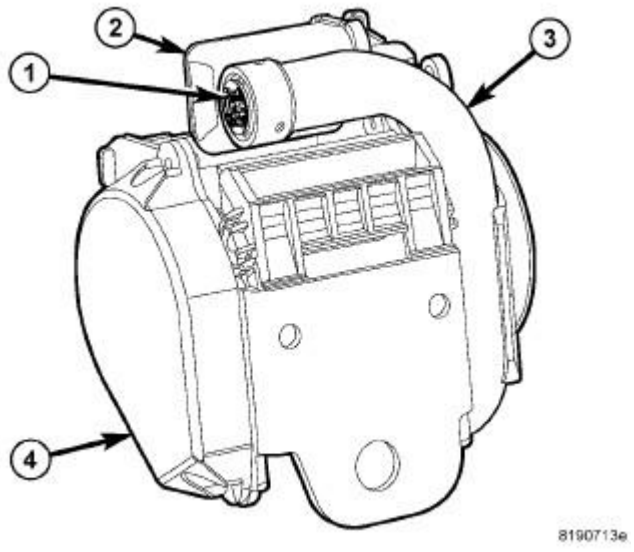

Fig. 90: Seat Belt Tensioner
Courtesy of CHRYSLER GROUP, LLC

Seat belt retractor tensioners supplement the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt and retractor units (4), which are secured to the inner B-pillar on the right and left sides of the vehicle. The retractor is concealed beneath the molded plastic inner B-pillar trim. The seat belt tensioner consists primarily of a sprocket/pinion, a steel tube (3), a cast metal housing, numerous steel balls, a stamped metal ball trap (2), a torsion bar and a small pyrotechnically activated gas generator with a connector receptacle (1).

All of these components are located on one side of the retractor spool on the outside of the retractor housing except for the torsion bar, which serves as the spindle upon which the retractor spool rides. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through a dedicated take outs of the body wire harness by keyed and latching yellow molded plastic connector insulator to ensure a secure connection.

The retractor tensioners cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the seat belt tensioners have also been deployed. The seat belt tensioners are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication that the seat belt tensioner has been deployed and requires replacement. Refer to **RETRACTOR, SEAT BELT, REMOVAL**.

BUCKLE TENSIONER

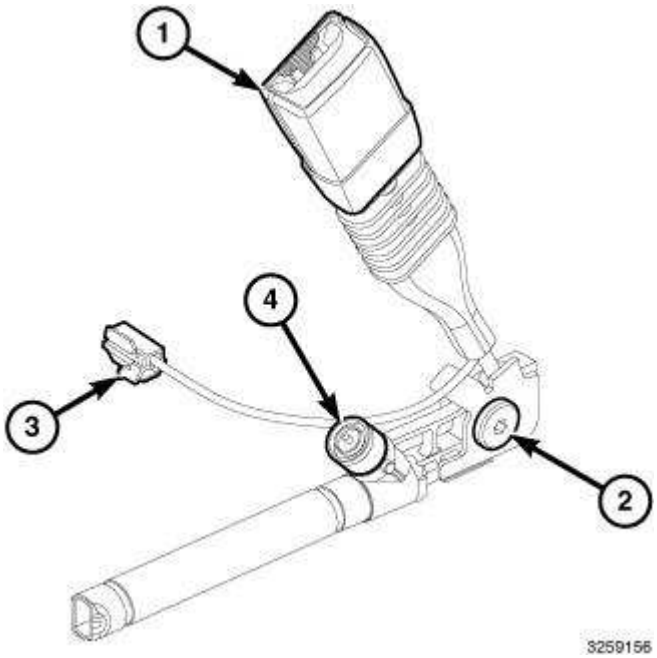

Fig. 91: Seat Belt Tensioner Initiator, Buckle And Tensioner, Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

A seat belt buckle tensioner supplements the dual front airbags for domestic market versions of this vehicle. This tensioner is integral to the front seat belt buckle unit, which is secured by a large screw to the outside of the inboard seat cushion frame of the front seat. The buckle tensioner consists

primarily of a buckle (1), a molded plastic scabbard, a cable and piston, a cable guide and bracket, a metal cylinder tube and a small pyrotechnically activated gas generator (4).

The buckle tensioner is controlled by the Occupant Restraint Controller (ORC) and is connected to the vehicle electrical system through a dedicated take out of the seat wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The buckle tensioner has a single pigtail harness (3) for the integral seat belt switch.

The buckle tensioner cannot be repaired and, if ineffective or damaged, the entire front seat belt buckle unit must be replaced. If the front airbags have been deployed, the buckle tensioners have also been deployed. The buckle tensioners are not intended for reuse and must be replaced following any front airbag deployment. Refer to **BUCKLE, SEAT BELT, REMOVAL**.

OPERATION

OPERATION

The seat belt tensioners are deployed in conjunction with the dual front airbags by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

On the retractor tensioner, the gas generator is installed in one end of a steel tube that contains numerous steel balls. As the gas expands, it pushes the steel balls through the tube into a cast metal housing, where a ball guide directs the balls into engagement with the teeth of a sprocket that is geared to one end of the retractor spool. As the balls drive past the sprocket, the sprocket turns and drives the seat belt retractor spool causing the slack to be removed from the front seat belts. The ball trap captures the balls as they leave the sprocket and are expelled from the housing.

On the buckle tensioner, the gas generator is installed in one end of the tubular metal piston housing, which contains a piston secured to one end of a cable. The cable is routed around an integral guide to the buckle, which is secured to the opposite end of the cable. As the gas expands, it pushes the piston and the cable through the tube and pulls the buckle downward, causing the slack to be removed from the front seat belt.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seats might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel or windshield. The seat belt retractor also has a torsion bar mechanism that is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the seat belt tensioner gas generator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate

Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

ACCESSORIES AND EQUIPMENT

Speed Control - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

Two electronic speed control systems are available factory-installed equipment on this vehicle: a conventional system and an adaptive system. Additional details of these two systems and their components can be found under the subheadings and paragraphs that follow.

CONVENTIONAL SPEED CONTROL

The standard equipment conventional electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) is located below the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch in this vehicle is actually a brake pedal position sensor. This sensor is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION** .
- **Instrument Cluster** - A CRUISE indicator is located in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment. The PCM contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing four momentary switch push buttons is located in the right horizontal spoke of the steering wheel.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ABM, the IC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the SCM to relay the status of the speed control switches to the PCM, and by the PCM for control of the CRUISE indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the conventional electronic speed control system components to the

electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

ADAPTIVE SPEED CONTROL

The optional equipment adaptive electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Adaptive Speed Control Sensor** - An adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module and the radar sensor or module) is located on a bracket secured near the right outboard end of the front bumper support member of the Front End Module (FEM) behind the front fascia. Refer to **SENSOR AND BRACKET, ADAPTIVE SPEED CONTROL, DESCRIPTION** .
- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) is located below the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch in this vehicle is actually a brake pedal position sensor. This sensor is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION** .
- **Instrument Cluster** - A CRUISE indicator is located in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is located in the Integrated Center Stack (ICS) and provides an interface to the vehicle operator for setting the adaptive speed control customer preferences as well as a display of the adaptive speed control and Forward Collision Warning (FCW) system status messages. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment. The PCM contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing six momentary switch push buttons is located in the right horizontal spoke of the steering wheel.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ACC sensor, the ABM, the IC, the EVIC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ACC sensor to provide inputs to the ABM, the EVIC and the PCM, is used by the ABM to provide inputs to the PCM, is used by the SCM to relay the status of the speed control switches to the PCM and is used by the PCM for control of the indicators in the IC and the indications in the EVIC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the adaptive electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

CONVENTIONAL SPEED CONTROL

The vehicle operator controls all conventional speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus. The PCM software continually monitors these inputs as well as electronic **vehicle distance** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) and numerous hard wired inputs, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

The PCM microprocessor continuously monitors all of the speed control system electrical circuits to determine the system readiness. If the PCM detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic

methods will not prove conclusive in the diagnosis of the PCM or the electronic controls or communication between other modules and devices that provide features of the conventional speed control system. The most reliable, efficient, and accurate means to diagnose the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ADAPTIVE SPEED CONTROL

The vehicle operator controls all adaptive speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) and to the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) over the Controller Area Network (CAN) data bus. The PCM and ACC sensor microprocessors continually monitor these inputs as well as electronic **wheel speed** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module), electronic **gear selector** message inputs from the Transmission Control Module TCM and numerous hard wired inputs, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

Using the MODE push button of the speed control switch pod on the face of the right horizontal spoke of the steering wheel, the vehicle operator can choose between adaptive speed control and conventional speed control modes of operation. As the name implies, when in the conventional speed control mode the speed control system is used as and functions exactly like a conventional speed control system. When in the adaptive speed control mode, the vehicle operator can use the DISTANCE push button of the speed control switch pod to select from one of three distance settings for the adaptive cruise system to maintain. These settings equate to the time in seconds separating the vehicle from a preceding vehicle. The ACC sensor then uses electronic message outputs to the ABM, the TCM and the PCM to maintain the selected separation distance. The available distance settings are:

- **1** - 1.0 second
- **2** - 1.5 seconds
- **3** - 2.0 seconds

The PCM and ACC sensor microprocessors continuously monitor all of the speed control system electrical circuits to determine the system readiness. If the PCM or ACC sensor detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM and ACC sensor use On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of

the instrument panel.

The hard wired inputs and outputs for the PCM and the ACC sensor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM, the ACC sensor or the electronic controls or communication between other modules and devices that provide features of the adaptive speed control system. The most reliable, efficient, and accurate means to diagnose the PCM, the ACC sensor or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

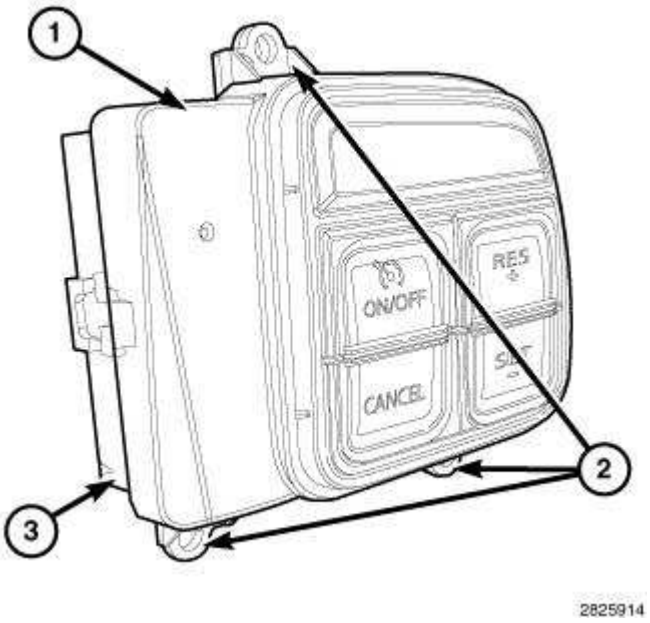

Fig. 1: Except Adaptive Speed Control
Courtesy of CHRYSLER GROUP, LLC

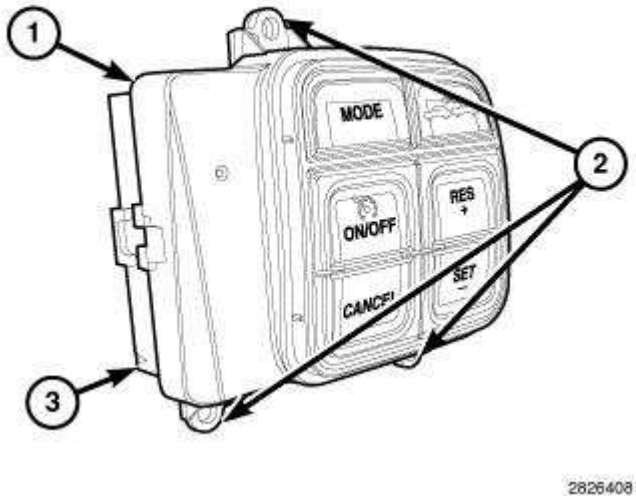

Fig. 2: With Adaptive Speed Control
Courtesy of CHRYSLER GROUP, LLC

The speed control switch pod (1) is located in the right spoke of the steering wheel spoke bezel. Two different switches are used. One switch has four buttons and is used on vehicles not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system. The other switch has six buttons and is used on vehicles equipped with the ACC system option. These switches are the primary control used by the vehicle operator to manage the particular speed control system installed in the vehicle. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs (2) to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle (3) integral to the inboard end of the switch pod housing connects the speed control switch and the Local Interface Network (LIN) slave node circuitry integral to the switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The speed control switch pod cannot be adjusted or repaired. If any function of the switch or the LIN slave node is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The speed control switch pod is a resistor multiplexed unit that provides hard wired inputs to the Steering Control Module (SCM) microprocessor integral to the Steering Column Control Module (SCCM). The speed control switch pod also contains the circuitry of a Local Interface Network (LIN) slave node, which provides source current for and communicates the switch or sensor states of the

Electronic Vehicle Information Center (EVIC) switches, the remote radio switches, the paddle shifter switches (if equipped), the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the SCM, which is the LIN master node.

The speed control switch pod for vehicles equipped with a conventional electronic speed control system and not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system contains four switch push buttons whose functions are:

- **On/Off** - This switch button enables or disables the speed control system and clears any previous speed control set speed from system memory.
- **Resume / +** - This switch button restores the vehicle to a previously stored set speed or accelerates the vehicle from an already attained set speed.
- **Cancel** - This switch button cancels the current speed control event, but does not turn the system OFF or clear the currently stored set speed.
- **Set / -** - This switch button sets the current vehicle speed as the stored set speed or decelerates (coasts) the vehicle to a speed that is slower than the already attained set speed.

The optional adaptive speed control switch pod for vehicles equipped with the ACC system option contains the same four switch push buttons as the conventional speed control switch pod, then adds two buttons whose functions are:

- **Mode** - This switch button toggles the speed control system between adaptive (ACC) or conventional (non-ACC) modes of operation.
- **Distance** - This switch button selects the separation or following distance (in seconds) that the ACC system maintains between this vehicle and any preceding vehicle. The three distance settings available are: **1** - about 1.0 second, **2** - about 1.5 seconds or **3** - about 2.0 seconds.

The SCM LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The SCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCM will set a Diagnostic Trouble Code (DTC) for any problem it detects in the speed control switch circuits, and will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the speed control switch pod as well as the hard wired circuits between the switch pod and the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM, the SCCM or the electronic controls and communication between

modules and other devices that provide some features of the speed control system. The most reliable, efficient, and accurate means to diagnose the speed control switch pod, the LIN slave or master nodes, the SCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

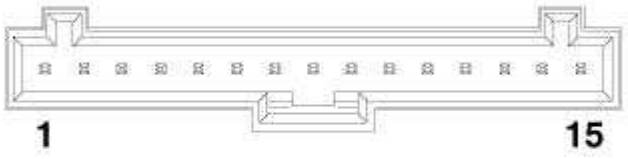

Fig. 3: Speed Control Switch Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following test confirms only correct speed control switch functions. It does not test or confirm any of the Local Interface Network (LIN) slave node inputs, outputs or functions. LIN slave node testing requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Remove the speed control switch pod from the steering wheel. Refer to **SWITCH, SPEED CONTROL, REMOVAL**.
2. Disconnect the steering wheel wire harness connector from the back of the speed control switch pod.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the

Speed Control Switch Tests table.

SPEED CONTROL SWITCH TESTS	
SWITCH POSITION	**PINS (*RESISTANCE - OHMS)**
NO PUSH BUTTONS DEPRESSED	13 and 14 (20708) 14 and 15 (20591)
ON / OFF	13 and 14 (464) 14 and 15 (133)
CANCEL	13 and 14 (896) 14 and 15 (457)
DISTANCE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (1515) 14 and 15 (899)
MODE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (2468) 14 and 15 (1518)
SET / - (DECEL)	13 and 14 (4088) 14 and 15 (2471)
RESUME / + (ACCEL)	13 and 14 (7408) 14 and 15 (4091)
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective speed control switch pod as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

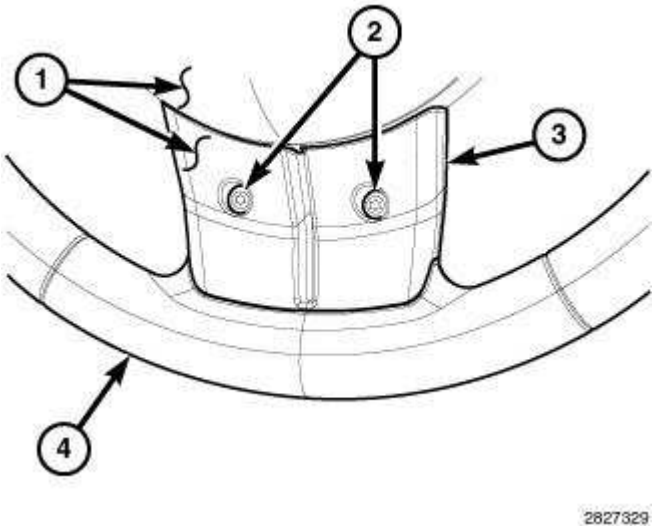

Fig. 4: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
3. From the back of the steering wheel (4), remove the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3).

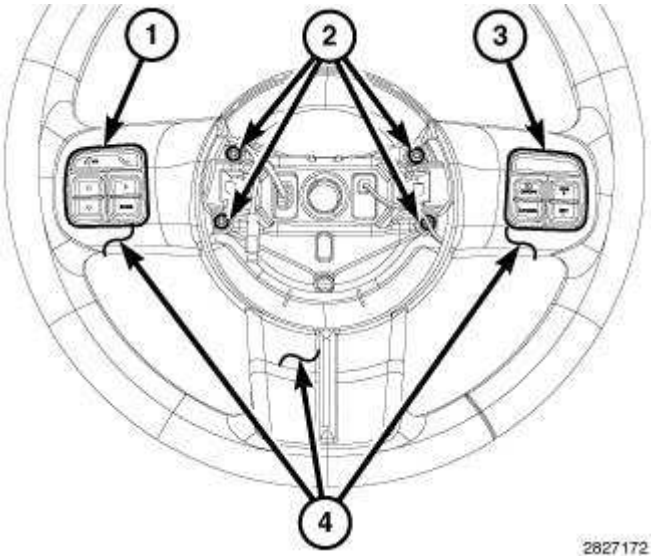

Fig. 5: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. From the face of the steering wheel, remove the four screws (2) that secure the front spoke bezel (4) to the steering wheel armature within the steering wheel hub cavity.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry at the parting line between the front spoke bezel and the steering wheel rear cover enough to unsnap the two horizontal members of the bezel from those of the rear cover.

6. Pull the front spoke bezel away from the steering wheel far enough to access and disconnect the steering wheel wire harness connections from the Electronic Vehicle Information Center (EVIC) switch pod (1) and the speed control switch pod (3).

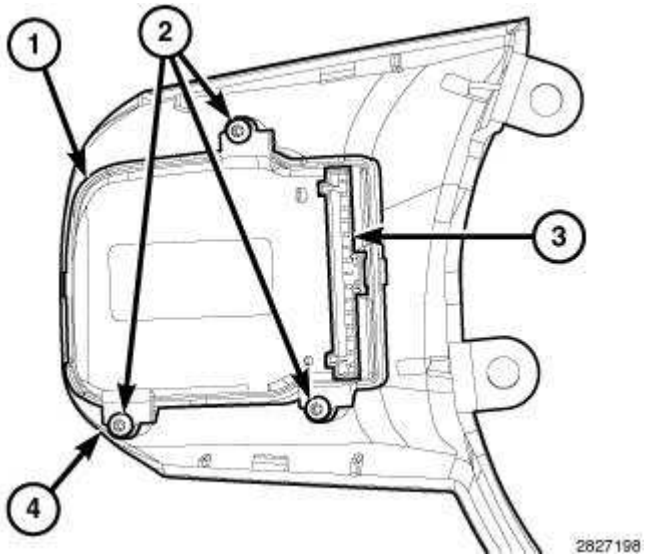

Fig. 6: Steering Wheel Spoke Front Bezel, Screws, Speed Control Switch Pod & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel spoke front bezel (4), remove the three screws (2) that secure the speed control switch pod (1) mounting tabs to the bezel.
8. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

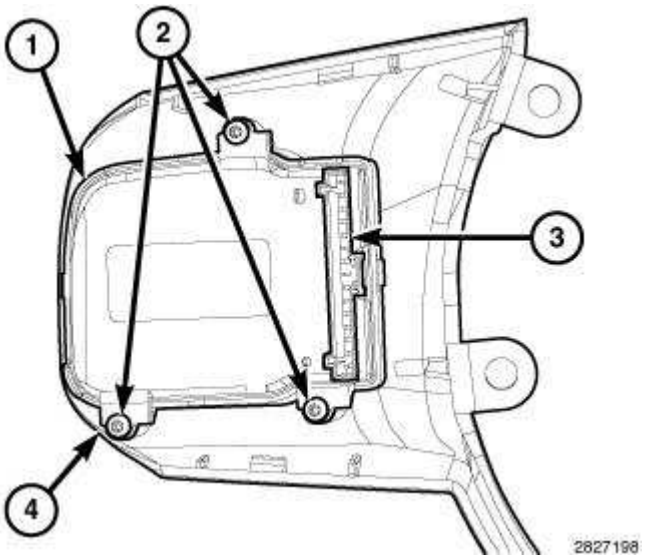

Fig. 7: Steering Wheel Spoke Front Bezel, Screws, Speed Control Switch Pod & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the speed control switch pod (1) to the back of the steering wheel spoke front bezel (4).
2. Install and tighten the three screws (2) that secure the switch mounting tabs to the bezel. Tighten the screws securely.
3. Position the front spoke bezel close enough to the steering wheel to reconnect the steering wheel wire harness connections to the Electronic Vehicle Information Center (EVIC) switch pod and the speed control switch pod connector receptacles (3).

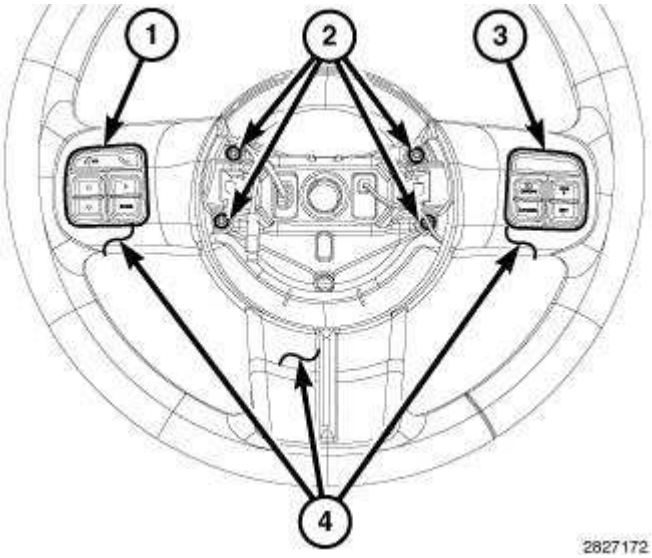

Fig. 8: EVIC Switch Pod, Speed Control Switch Pod, Four Screws & Front Spoke Bezel
Courtesy of CHRYSLER GROUP, LLC

4. Position the front spoke bezel (4), EVIC switch pod (1) and speed control switch pod (3) as a unit to the steering wheel. Be certain that the steering wheel wire harness is routed between the

lower or upper bezel stanchions and the inside circumference of the steering wheel hub cavity so that the wiring will not be pinched when the driver airbag is reinstalled.

5. Use hand pressure to squeeze the horizontal spokes of both the front spoke bezel and the steering wheel rear cover together until all of the snap features are fully engaged.
6. Install and tighten the four screws that secure the stanchions of the front spoke bezel to the steering wheel armature within the steering wheel hub cavity. Tighten the screws securely.

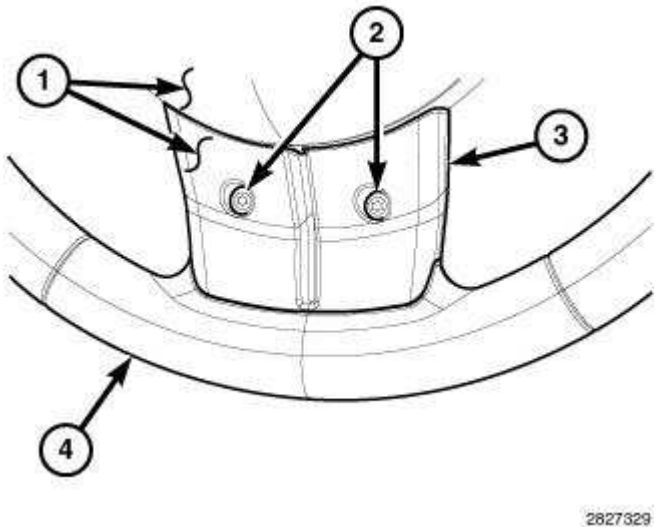

Fig. 9: Rear Cover, Two Screws, Steering Wheel Spoke Front Bezel & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

7. From the back of the steering wheel (4), install and tighten the two screws (2) that secure the center spoke of the rear cover (1) to the center spoke of the steering wheel spoke front bezel (3). Tighten the screws securely.
8. Reinstall the driver airbag onto the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION** .
9. Reconnect the battery negative cable.

OPERATION

REMOTE START SYSTEM

REMOTE START OPERATING CONDITIONS

In order to operate remote start, the following conditions must be met:

- Key fob sequence must be operated within a 100 meter range of the vehicle.
- The vehicle must be in Park.
- Fobik is not in the vehicle.
- The hazard switch off.
- Vehicle Theft Alarm or Panic is not alarming.
- Doors and hood must be closed.
- The battery voltage is normal (11 to 15 volts).

REMOTE START SHUT DOWN/DEACTIVATE CONDITIONS

Engine will NOT start or will shut down/deactivate during any of the following conditions:

- Doors or hood are opened before remote unlock.
- Hazard Switch depressed.
- Panic or theft alarm active.
- Brake applied.
- A prior remote start cranked the engine, but failed to start the engine.
- Battery voltage NOT in the normal range.
- High (run away) or Low Idle (stall) RPM.
- MIL Active.
- High Engine Coolant Temperature.
- Low Engine Oil Pressure.

INITIATE REMOTE START

To Remote Start the vehicle:

1. Press remote button on the Key Fob twice within five (5) seconds.

NOTE: **Engine will run for 15 minutes after a remote start is initiated. After 15 minutes, the engine will shut off. The system allows for only two**

sequential remote starts without a key ignition cycle.

2. Unlock vehicle with Key Fob to enter the vehicle.
3. Put key in ignition, turn key to run position to exit remote start and enter a normal start without engine shut off.

IDENTIFICATION THAT REMOTE START IS ACTIVATED

To identify that Remote Start has been activated the following will occur:

- Horn will sound and lights will flash to acknowledge a start command was received.
- Park Lamps will turn on to indicate that the engine is running in remote start mode.

TERMINATE REMOTE START

To terminate Remote Start, press Remote Start button on the Key Fob once.

NOTE: **In order to avoid inadvertent shut downs, the one-time press to shut down the vehicle will be disabled for two seconds after receipt of a valid remote start request.**

STANDARD STARTING SYSTEM

When you press the Keyless Go button (KIN Button), a request is sent to RF-Hub via the private LIN. Once the RF-Hub receives the request from the KIN it then looks for the valid key via the Passive Entry Module (PEM) antennas. If the RF-Hub detects a valid key, then the RF-Hub sets the ignition position to START/CRANK. The BCM then turns the Ignition status to START/CRANK.

Then the BCM sends a command to turn the vehicle to the "RUN/CRANK" If conditions are correct to start, the PCM turn on the high side of the relay and holds the high side until the PCM turns off the signal allowing the engine to crank.

If the BCM is still in crank and the crank hold signal is true then the BCM turns on the Low side of the relay and the engine will start cranking.

Once the engine has started the PCM deactivates the double start over ride. The BCM will then deactivate the starter either when the engine starts or the maximum time has been reach for the tip start (10 sec for Gas and 25 sec for diesel).

At the same time the engine starts the RF-Hub will put the ignition from "Crank" to "RUN" if the start type is "TIP Start" or the 2 second time expires or the engine controller indicates the vehicle is not in park or neutral

The engine can be manually shut down by the driver with speeds over 5 MPH in any gear.

DIAGNOSIS AND TESTING

REMOTE START SYSTEM

Before attempting to diagnose a problem with the remote starting system, first be sure the starter motor and starter solenoid are working properly. The starter should operate with the use of the keyless go switch. Any starter or solenoid problems must be repaired first.

Also be sure the engine will easily start and run with the use of the keyless go switch. Any engine running, idling or driveability problems must be repaired first.

Also note that the remote start system will automatically be cancelled if any of the following occur:

- IF THE ENGINE STALLS OR RPM EXCEEDS 2500
- NORMAL TIME OUT RUN MODE (15 MINUTES)
- CUSTOMER MOVES IGNITION INTO RUN/START
- ANY VEHICLE DOOR AJAR
- TRUNK/LIFTGATE AJAR
- HOOD AJAR
- FUEL LEVEL LOW
- START COUNTER REACHED
- LOW RPM SHUTDOWN
- FOBIK IN VEHICLE
- BRAKE PRESSED
- THE HAZARD SWITCH IS PRESSED
- NOT IN PARK OR NEUTRAL
- VEHICLE SPEED HIGH
- VTA ALARM TRIGGERED
- PANIC MODE ACTIVATED
- BATTERY VOLTAGE HIGH
- BATTERY VOLTAGE LOW
- LOSS OF BATTERY VOLTAGE
- MIL ON
- LOW OIL PRESSURE
- COOLANT TEMPERATURE HIGH
- CRANK NO START
- RKE OFF MESSAGE
- VEHICLE NOT CONFIGURED
- HOOD SWITCH NOT INSTALLED OR INOPERATIVE
- NO AUTOMATIC TRANSMISSION
- IGNITION SNA

- IGNITION NOT IN LOCK
- VEHICLE IN SHIPPING MODE
- VEHICLE NOT PROGRAMMED

If all of the previous items checked OK, and the remote starting system will not operate. Refer to **DIAGNOSIS AND TESTING** .

STANDARD STARTING SYSTEM

DIAGNOSIS

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these three systems must perform within specifications.

Starting System Diagnosis		
CONDITION	**POSSIBLE CAUSE**	**CORRECTION**
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to **BATTERY, DIAGNOSIS AND TESTING** . Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. See Wiring Information. Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. The starter relay is located within the front Power Distribution Center (PDC). See no crank condition. Refer to **DIAGNOSIS AND TESTING** .
	4. Park/Neutral position switch faulty or misadjusted.	4. Refer to appropriate service information for Park/Neutral Position Switch. Replace park/neutral position switch if required.
	5. Starter solenoid faulty.	5. Refer to **STARTER** Motor. Replace starter motor assembly if required.
	6. Starter motor faulty.	6. If all other starting system components and circuits test OK, replace starter motor.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to **BATTERY, DIAGNOSIS AND TESTING** . Charge or replace battery, if required.
	2. Starting circuit wiring	2. See Wiring Information. Test

	faulty.	and repair starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly.
	4. Engine seized.	4. Refer to appropriate Engine Diagnosis information .
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to **STARTER** Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly.
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to **STARTER** Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	3. The starter relay is located within the front PDC. See no crank condition. Refer to **DIAGNOSIS AND TESTING** .
	3. Ignition switch faulty.	4. Replace KIN module if required.
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor.

INSPECTION

For complete starter wiring circuit diagrams, refer to appropriate Wiring Diagrams. Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: On vehicles equipped with airbags, refer to RESTRAINTS - SERVICE INFORMATION , before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **INSPECTION** in **Battery** . **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness

connections. Refer to appropriate information for **Clutch Pedal Position Switch** .

- **Park/Neutral Position Switch** - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to appropriate information for **Park/Neutral Position Switch** .
- **Starter Relay** - The starter relay is located within the front Power Distribution Center (PDC). Refer to **DIAGNOSIS AND TESTING** .
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to appropriate Wiring Diagrams.

TESTING

COLD CRANKING TEST

NOTE: For complete starter wiring circuit diagrams, refer to appropriate Wiring Diagrams. The battery must be fully-charged and load-tested before proceeding. Refer to BATTERY SYSTEM - SERVICE INFORMATION .

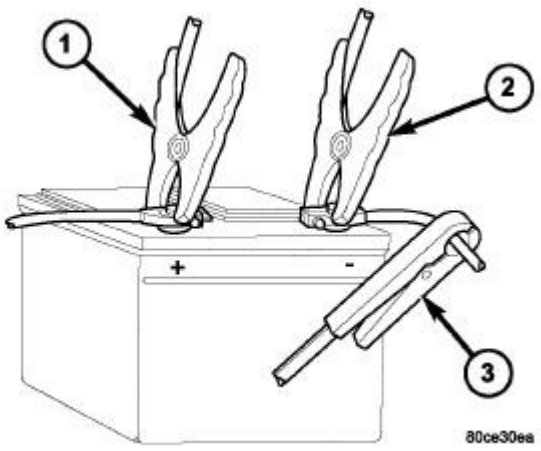

Fig. 1: Connecting Volt-Ampere Tester To Battery Terminals - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - POSITIVE CLAMP
2 - NEGATIVE CLAMP
3 - INDUCTION AMMETER CLAMP

1. Connect volt-ampere tester (1) and (2) to battery terminals. Refer to **Fig. 1**. See instructions provided by manufacturer of volt-ampere tester being used. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, tester should be**

connected to battery on left side of vehicle only. Also, tester current reading must be taken from positive battery cable lead that connects to starter motor.

2. Fully engage parking brake.
3. If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
4. Verify that all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove either the ignition run fuse, or the fuel pump control fuse.

WARNING: Attempt to start engine a few times before proceeding with following step.

NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

6. Press and hold the ignition in **Start** position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.
    1. If voltage reads below 9.6 volts, refer to **REMOTE START SYSTEMStarter Motor** in Diagnosis and Testing. If starter motor is OK, refer to appropriate **Engine Diagnosis** for further testing of engine. If starter motor is not OK, replace faulty starter motor.
    2. If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **FEED CIRCUIT TEST** .
    3. If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **CONTROL CIRCUIT TESTING** .
    4. If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **FEED CIRCUIT TEST** .

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer to Wiring Diagrams.

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **BATTERY SYSTEM - SERVICE INFORMATION** .
- Fully engage parking brake.
- If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. These relays are located in front PDC. Refer to label on PDC cover for relay location.

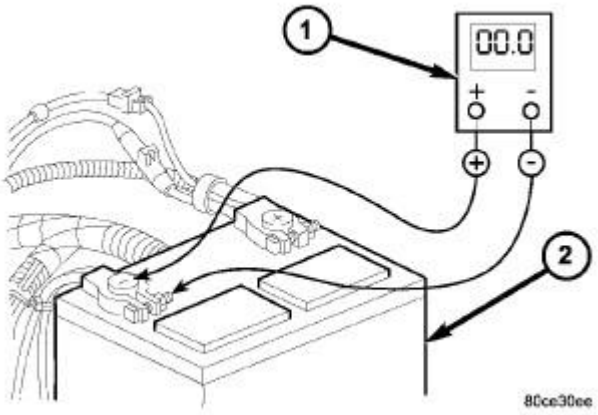

Fig. 2: Testing Battery Negative Connection Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - VOLTMETER
2 - BATTERY

1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. Refer to **Fig. 2**. Press and hold the ignition in **Start** position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, procedure must be performed twice, once for each battery.**

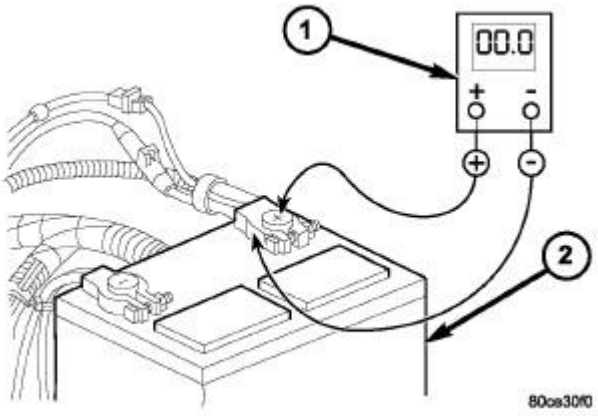

Fig. 3: Testing Battery Positive Connection Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - VOLTMETER
2 - BATTERY

2. Connect positive lead of voltmeter to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. Refer to **Fig. 3**. Press and hold the ignition in **Start** position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

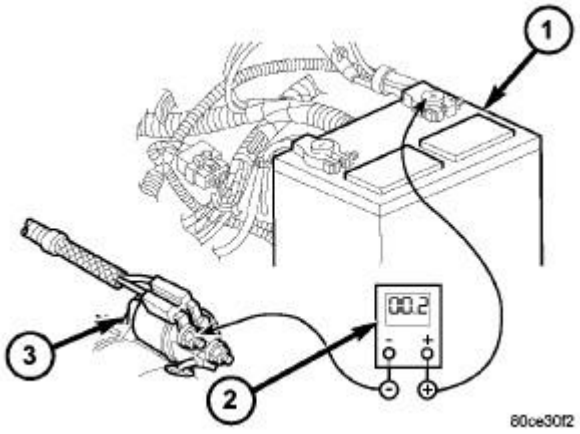

Fig. 4: Testing Battery Positive Cable Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - BATTERY
2 - VOLTMETER
3 - STARTER MOTOR

3. Connect voltmeter to measure between battery positive terminal post and starter solenoid battery terminal stud. Refer to **Fig. 4**. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**

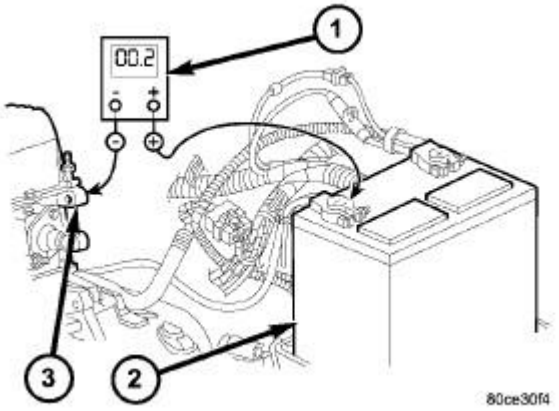

Fig. 5: Testing Ground Circuit Resistance - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - VOLTMETER
2 - BATTERY
3 - ENGINE GROUND

4. Connect voltmeter to measure between negative battery terminal post and a good clean ground on engine block. Refer to **Fig. 5**. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

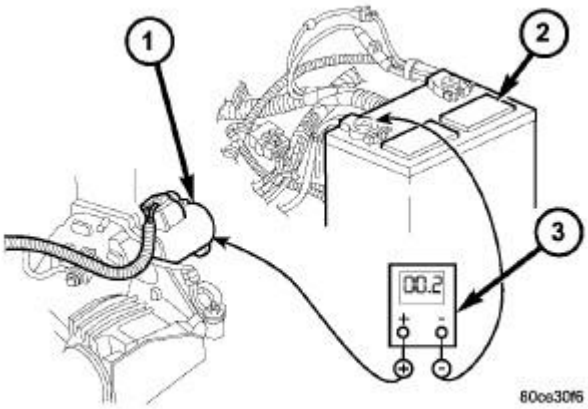

Fig. 6: Testing Starter Ground - Typical
Courtesy of CHRYSLER GROUP, LLC

1 - STARTER MOTOR
2 - BATTERY
3 - VOLTMETER

5. Connect positive lead of voltmeter to starter housing. Connect negative lead of voltmeter to negative battery terminal post. Refer to **Fig. 6**. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**
6. If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Press and hold the ignition in **Start** position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

   If resistance tests detect no feed circuit problems, refer to **STANDARD STARTING SYSTEM** in the Diagnosis and Testing.

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - Refer to **Starter Relay** The starter relay is located within the PDC. Refer to **DIAGNOSIS AND TESTING** .
- **Starter Solenoid** - Refer to **STANDARD STARTING SYSTEM** Diagnosis and Testing.
- **Ignition Switch** - Refer to **SWITCH, IGNITION**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, refer to appropriate

information for **Clutch Pedal Position Switch** .

- **Park/Neutral Position Switch** - If equipped with automatic transmission, refer to appropriate transmission information .
- **Wire harnesses and connections** - Refer to appropriate Wiring Diagrams.

SPECIFICATIONS

STARTER MOTOR

Engine Application	Power Rating	Cranking Amperage Draw Test
3.6L	1.2 Kilowatt / 1.6 Horsepower	100 - 300 Amperes
5.7L	1.4 Kilowatt / 1.87 Horsepower	100 - 300 Amperes
* Test at operating temperature. Cold engine, tight (new) engine, or heavy oil will increase starter amperage draw. Starters are equipped with permanent magnets. Never strike the starter case to attempt to loosen a sticking/stuck armature as permanent magnets may crack or break.

ANTENNA, REMOTE START

DESCRIPTION

DESCRIPTION

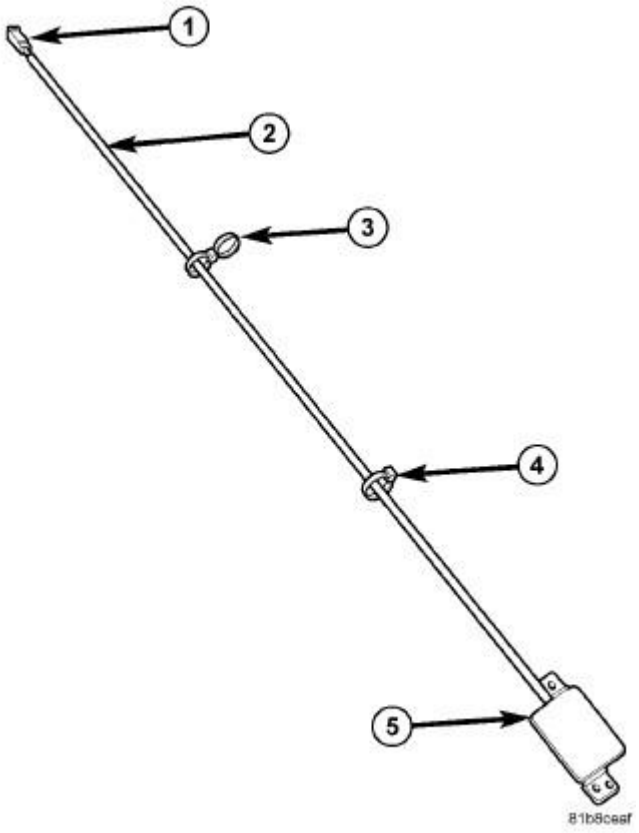

Fig. 7: Remote Start Antenna Module Assembly
Courtesy of CHRYSLER GROUP, LLC

The Remote Start Antenna Module Assembly consists of an electrical connection to the Radio Frequency (RF Hub) - RF Hub (1), a length of coaxial cable (2), two mounting clips (3) and (4), and a control module/antenna (5).

OPERATION

OPERATION

The remote start antenna is located on the roof structure rib above the rear windshield. The antenna interfaces with the Radio Frequency (RF Hub) module through a coaxial electrical cable and electrical connector. The antenna helps to amplify the signal for the Remote Keyless Entry (RKE) key FOBIK.

REMOVAL

REMOVAL

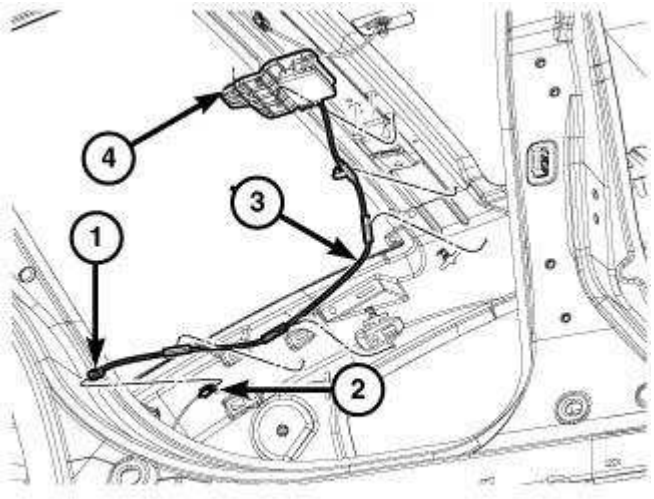

Fig. 8: Remote Start Antenna, RF Hub Module Jump Wire & Remote Start Harness
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the headliner. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the remote start antenna (1) from the RF Hub module jump wire (2) located on the driver side D-pillar.
4. Remove the remote start harness (3) from the D-pillar.
5. Gently pull down on the antenna mounting bracket to remove from the structural support rib.
6. Remove the remote start antenna from the mounting bracket.

INSTALLATION

INSTALLATION

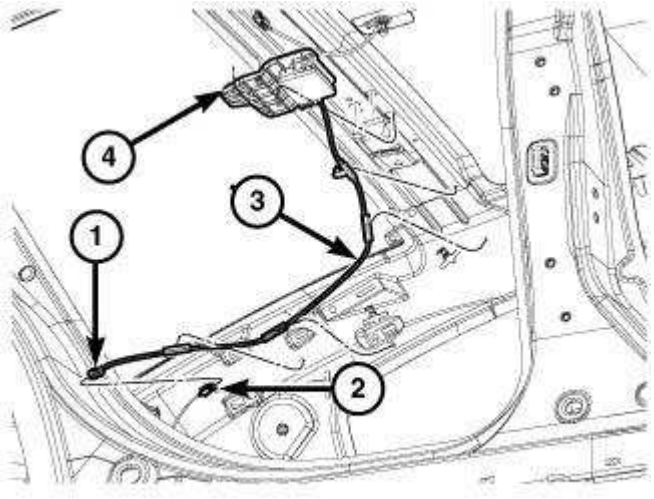

Fig. 9: Remote Start Antenna, RF Hub Module Jump Wire & Remote Start Harness
Courtesy of CHRYSLER GROUP, LLC

1. Mount the remote start antenna (4) to the mounting bracket.
2. Install the antenna and mounting bracket into the structural support rib.
3. Install the remote start harness (3) to the driver side D-pillar.
4. Connect the remote start antenna (1) to the RF Hub module jumper wire (2) located on the D-pillar.
5. Install the headliner. Refer to **HEADLINER, INSTALLATION** .
6. Connect the negative battery cable.

STARTER

REMOVAL

3.0L

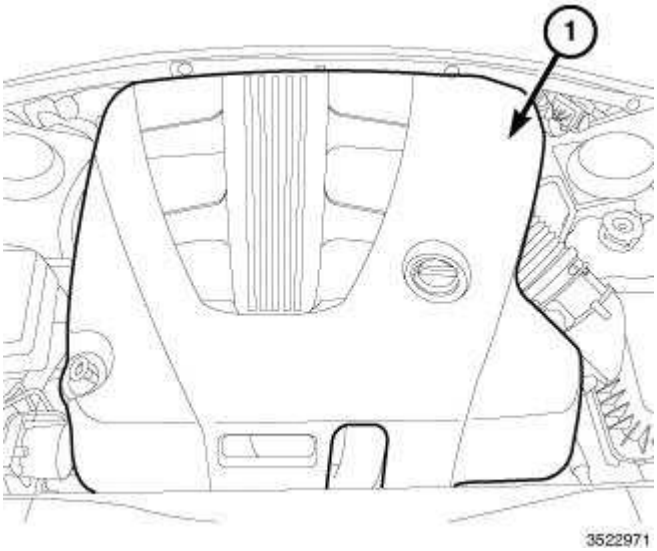

Fig. 10: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

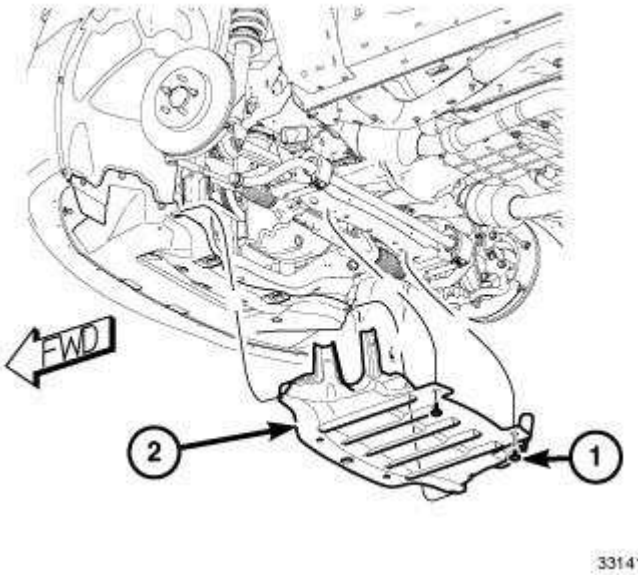

Fig. 11: Rear & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
4. Position aside the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .

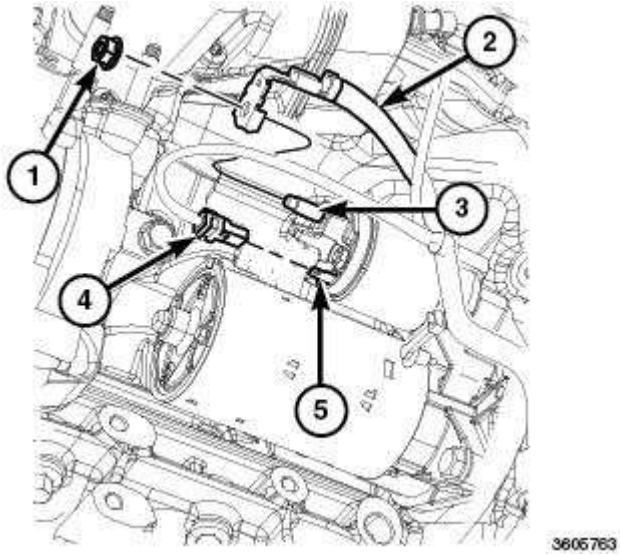

Fig. 12: Nut, B+ Cable, Stud, Wire Harness Connector & Terminal
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (1) and the B+ cable (2) from the stud (3) and position aside.
6. Disconnect the solenoid wire harness connector (4) from the terminal (5).

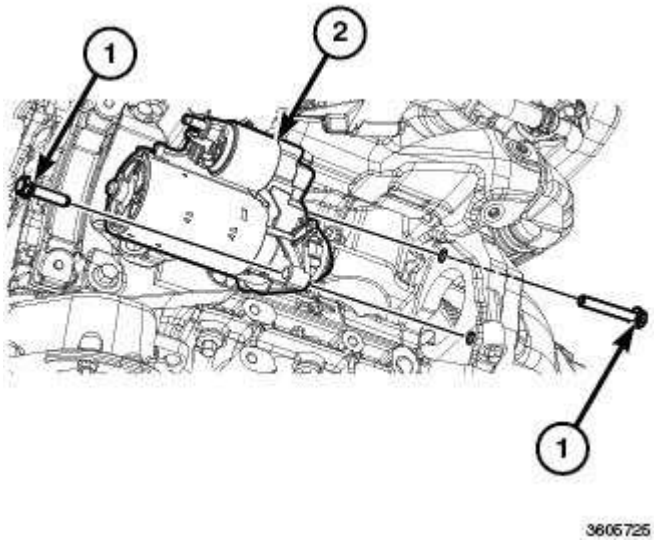

Fig. 13: Bolts & Starter
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (1) the starter (2) from the vehicle.

3.6L

1. Disconnect and isolate the negative battery cable at the battery.

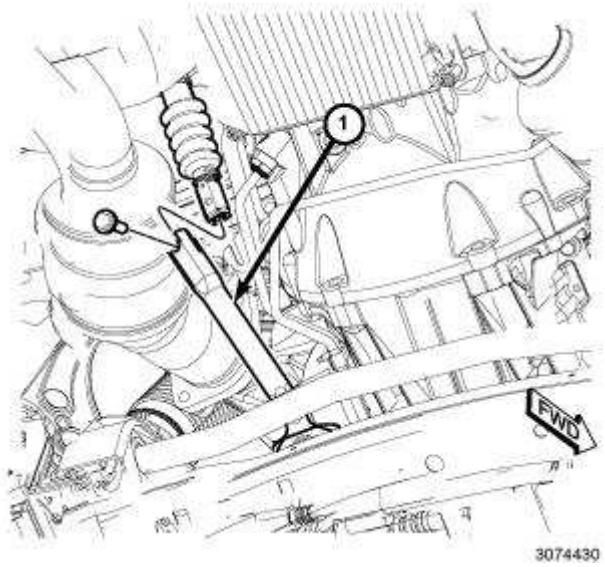

Fig. 14: Steering Gear Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Secure the steering wheel.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Disconnect the steering gear intermediate shaft (1). Refer to **SHAFT, INTERMEDIATE,**

LOWER, REMOVAL or **SHAFT, INTERMEDIATE, UPPER, REMOVAL** .

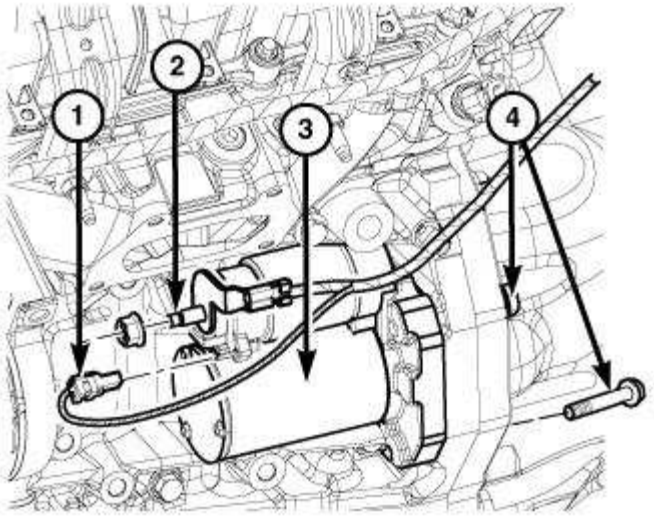

Fig. 15: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove the starter solenoid heat shield.
6. Disconnect the starter solenoid electrical connector (1) from the starter solenoid terminal.
7. Remove the battery cable nut and battery cable from the solenoid stud (2).
8. Remove the starter mounting bolts (4), the electrical harness mounting bracket should remain in position.
9. Rotate and remove the starter assembly (3) from the transmission.

5.7L

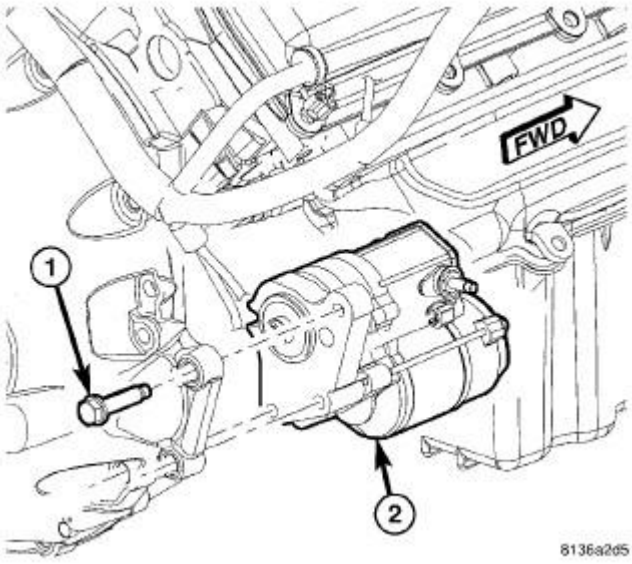

Fig. 16: Starter - 5.7L - RWD
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the three starter mounting bolts (1).
4. Move the starter motor (2) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (2) during this process. Do not let starter motor hang from wire harness.
5. Remove the battery cable-to-solenoid nut.
6. Remove the solenoid wire from solenoid stud.
7. Remove the starter motor.

5.7L ALL WHEEL DRIVE (AWD)

1. Disconnect and isolate negative battery cable.
2. Secure the steering wheel.
3. Raise and support vehicle.

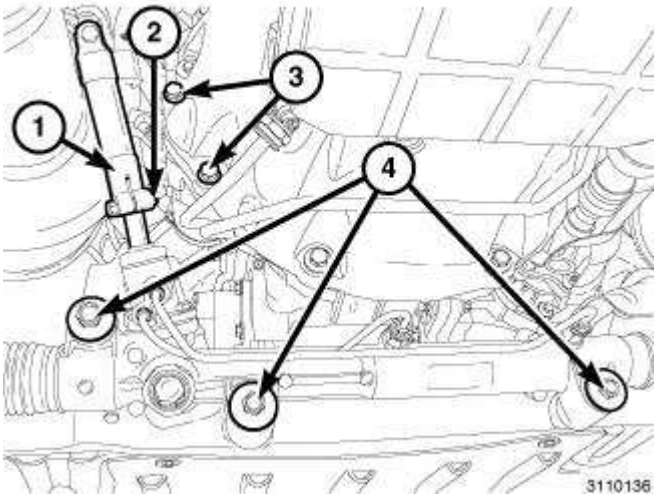

Fig. 17: Steering Gear Intermediate Shaft, Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

The steering gear assembly must be partially lowered to gain access to starter. Do not disconnect any hydraulic hoses or remove any steering linkage. Proceed.

4. Remove the steering gear intermediate shaft (1). Refer to **SHAFT, INTERMEDIATE, LOWER, REMOVAL** or **SHAFT, INTERMEDIATE, UPPER, REMOVAL** .
5. Remove the three steering gear mounting bolts (4) and slightly lower the steering gear. Temporarily support the steering gear.
6. Remove the steering gear heat-shield.

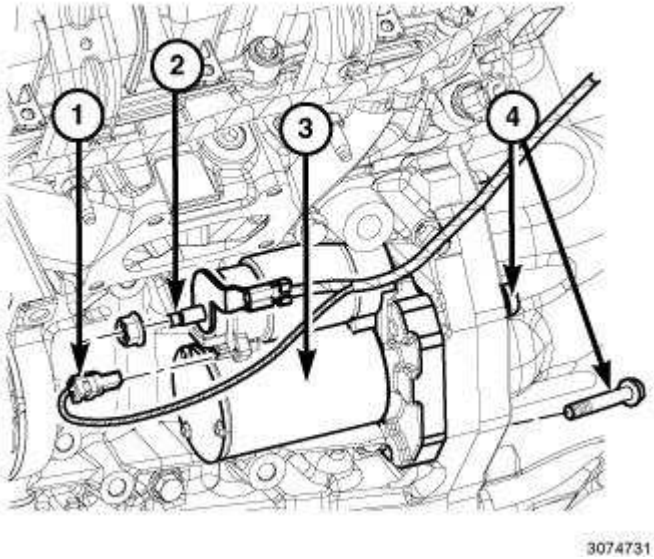

Fig. 18: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly

Courtesy of CHRYSLER GROUP, LLC

7. Remove two starter mounting bolts (4).
8. Move the starter motor (3) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (3) during this process. Do not let starter motor hang from wire harness.
9. Remove battery cable-to-solenoid nut (2)
10. Disconnect the solenoid harness connector (1) from solenoid stud.
11. Remove the starter motor (3).

6.4L

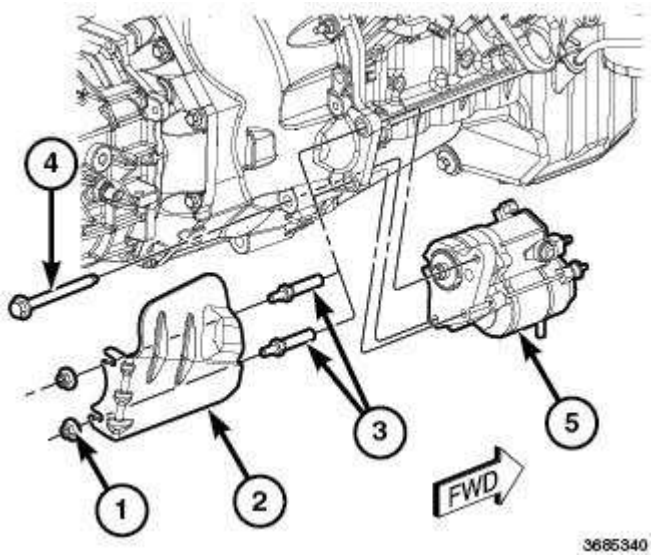

Fig. 19: Two Heat Shield Nuts, Heat Shield, Two Starter Stud Mounting Bolts, Lower Starter Mounting Bolt & Starter Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not let starter motor hang from wire harness.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the two heat shield nuts (1).
4. Remove the heat shield (2).
5. Remove the two starter stud mounting bolts (3).
6. Remove the lower starter mounting bolt (4).
7. Move the starter motor (5) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (5) during this process.
8. Remove the battery cable-to-solenoid nut.
9. Remove the solenoid wire from solenoid stud.

10. Remove the starter motor (5).

INSTALLATION

3.0L

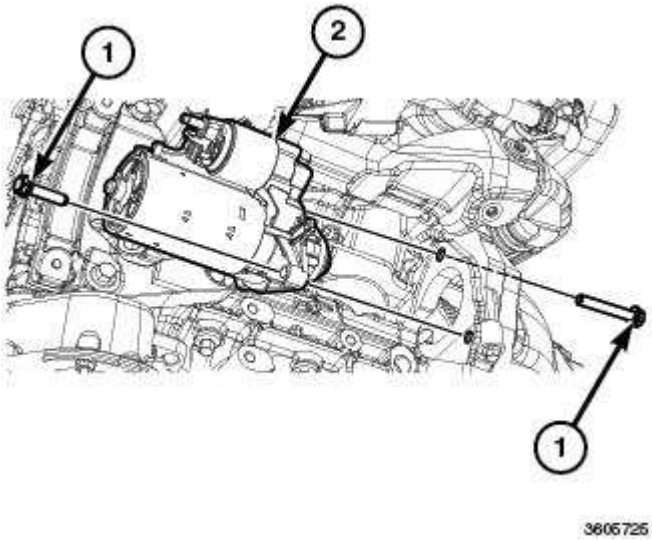

Fig. 20: Bolts & Starter
Courtesy of CHRYSLER GROUP, LLC

1. Install the stater (2). Tighten bolts (1) to 68 N.m (50 ft. lbs.)

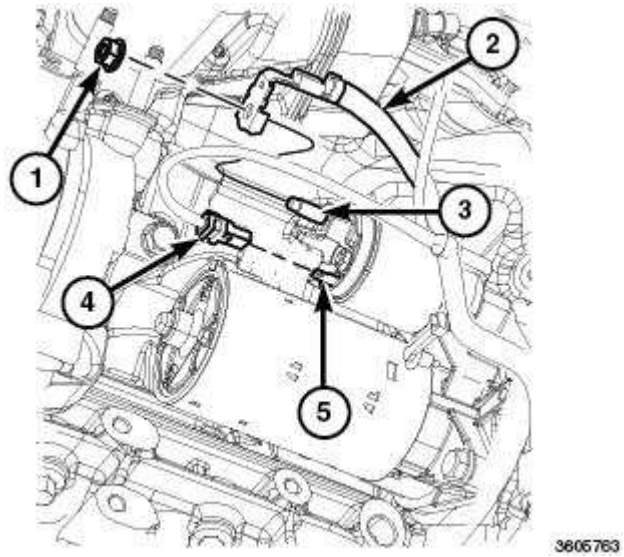

Fig. 21: Nut, B+ Cable, Stud, Wire Harness Connector & Terminal
Courtesy of CHRYSLER GROUP, LLC

2. Connect the solenoid wire harness connector (4) to the solenoid terminal (5).
3. Install the B+ cable (2) to the solenoid stud (3). Tighten nut (1) to 11 N.m (97 in. lbs.).

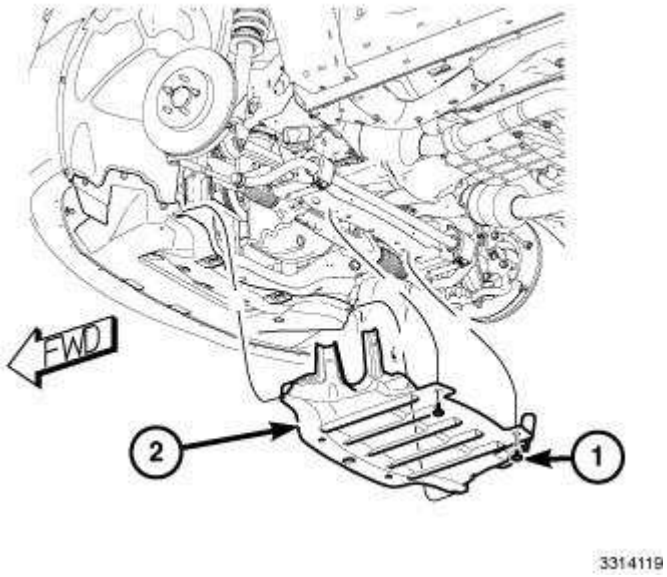

Fig. 22: Rear & Front Belly Pan
Courtesy of CHRYSLER GROUP, LLC

4. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .
5. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .

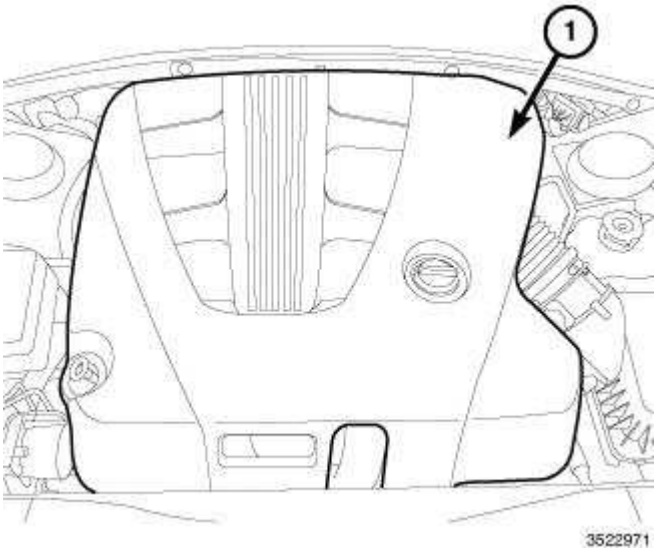

Fig. 23: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

6. Install the engine cover (1).
7. Connect the negative battery cable.

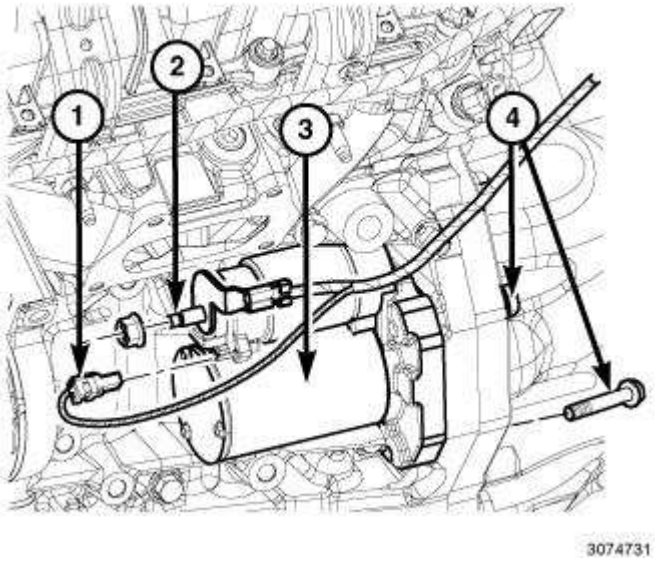

Fig. 24: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the starter (3) inside the transmission.
2. Install the starter mounting bolts (4) and tighten to 55 N.m (41 ft. lbs.).
3. Connect the starter solenoid electrical connector (1) to starter solenoid terminal.
4. Install the battery cable and nut to the solenoid stud (2). Tighten the nut to 11 N.m (97 in. lbs.).
5. Install the starter solenoid heat shield.

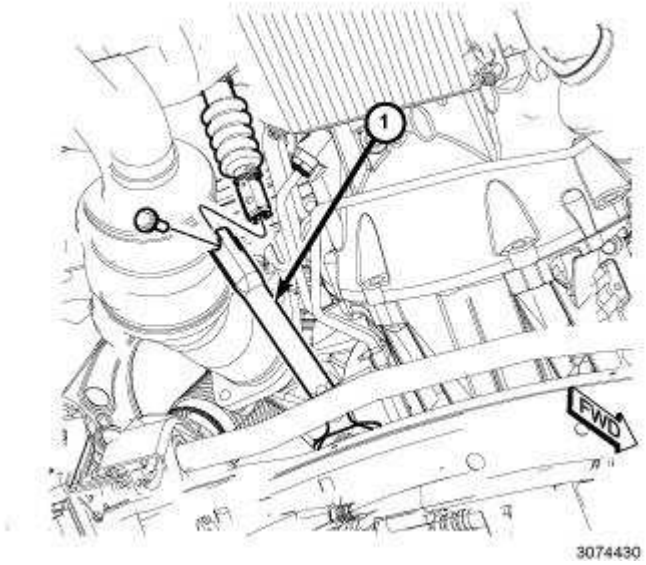

Fig. 25: Steering Gear Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

6. Install the steering gear lower intermediate shaft (1). Refer to **SHAFT, INTERMEDIATE, LOWER, INSTALLATION** or **SHAFT, INTERMEDIATE, UPPER, INSTALLATION** .
7. Remove the steering wheel holder.
8. Connect the negative battery cable and tighten nut to 5 N.m (4.5 in. lbs.).

5.7L

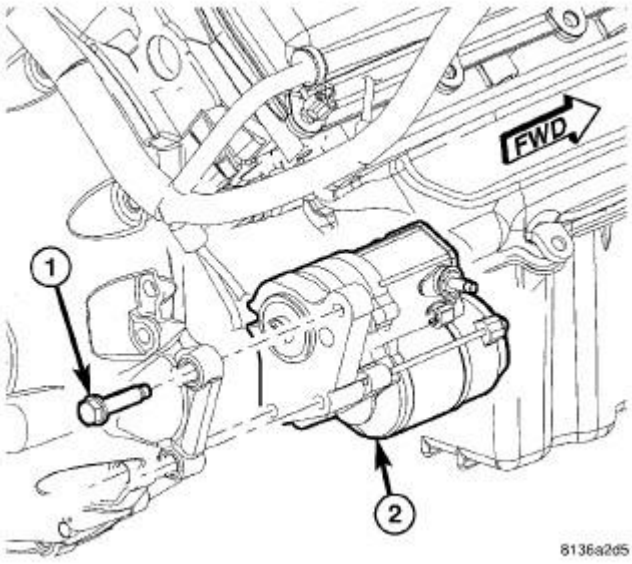

Fig. 26: Starter - 5.7L - RWD
Courtesy of CHRYSLER GROUP, LLC

1. Position the starter (2) into transmission but do not install bolts.
2. Connect the solenoid harness connector to starter motor (snaps on).
3. Position the battery cable to solenoid stud. Install and tighten the battery cable eyelet nut to 11 Nm (97 In.Lbs). Do not allow the starter motor to hang from wire harness.
4. Install and tighten three mounting bolts (1). Tighten the bolts to 54 Nm (40 Ft. Lbs).
5. Lower vehicle.
6. Connect negative battery cable.
7. Start the engine to verify the starter if functioning properly.
8. Turn the ignition off.

5.7L ALL WHEEL DRIVE (AWD)

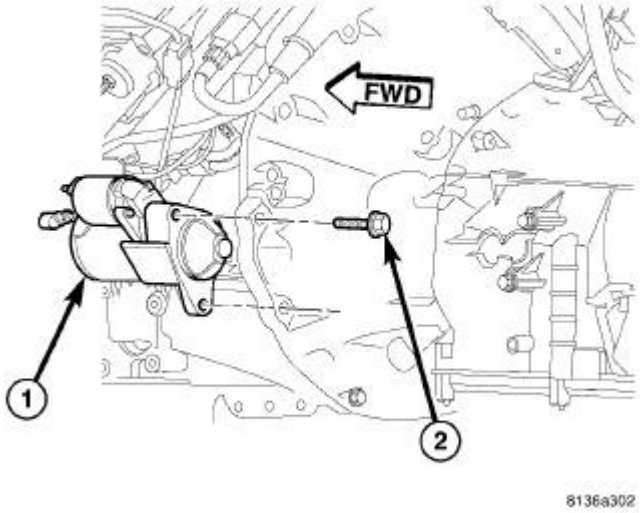

Fig. 27: Starter - 5.7L - AWD
Courtesy of CHRYSLER GROUP, LLC

1. Position starter (1) into transmission but do not install bolts (2).

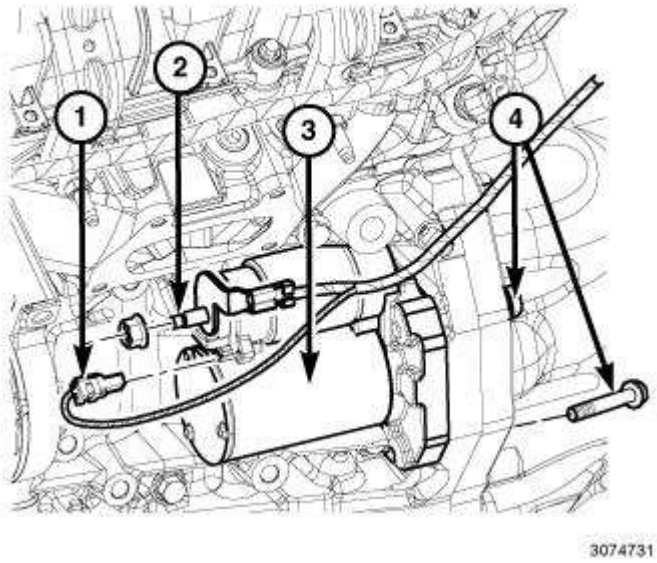

Fig. 28: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Connect the solenoid harness connector (1) to starter motor (snaps on).
3. Position the battery cable to solenoid stud (2). Install and tighten battery cable eyelet nut to 11 Nm (97 In. Lbs). Do not allow starter motor to hang from wire harness.
4. Install and tighten both mounting bolts (4). Tighten the bolts to 54 Nm (40 Ft.Lbs).

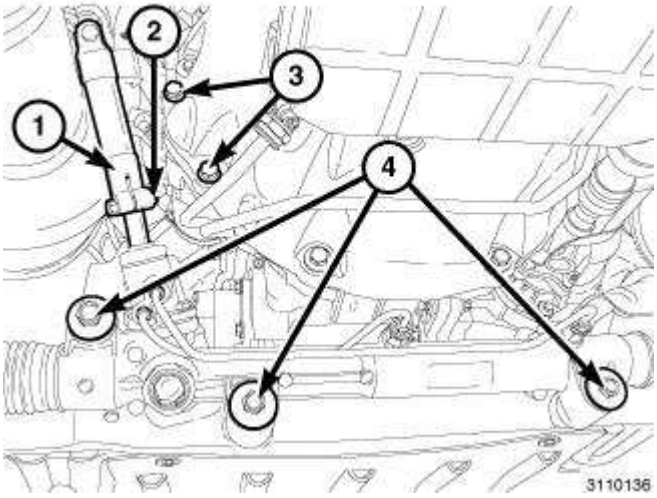

Fig. 29: Steering Gear Intermediate Shaft, Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install steering gear assembly and mounting bolts (4). for torque specifcations. Refer to **SPECIFICATIONS** .
6. Install the steering gear intermediate shaft (1). Refer to **SHAFT, INTERMEDIATE, LOWER, INSTALLATION** or **SHAFT, INTERMEDIATE, UPPER, INSTALLATION** .
7. Install steering gear heat-shield.
8. Lower the vehicle.
9. Connect the negative battery cable.
10. Start the engine to verify the starter is functioning properly.
11. Turn the ignition off.

6.4L

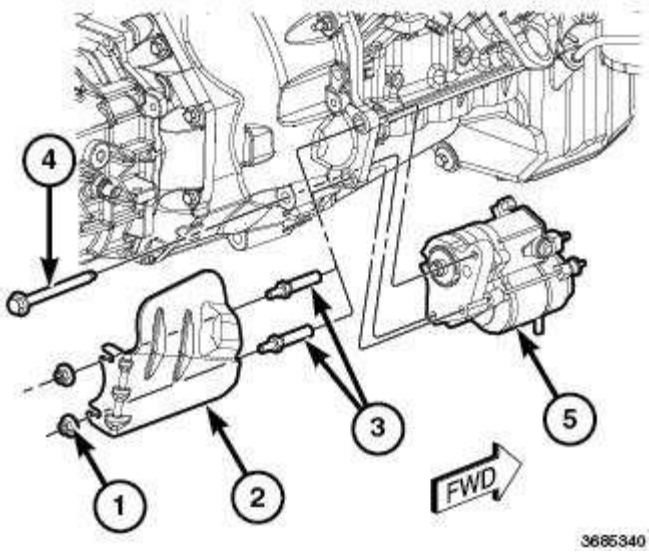

Fig. 30: Two Heat Shield Nuts, Heat Shield, Two Starter Stud Mounting Bolts, Lower Starter Mounting Bolt & Starter Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not allow the starter motor to hang from wire harness.

1. Position the starter (5) into transmission but do not install bolts.
2. Connect the solenoid harness connector to starter motor (snaps on).
3. Position the battery cable to solenoid stud and install the battery cable eyelet nut.

   Tighten to 11 N.m (8 ft. lbs.).

4. Install the lower starter mounting retainer (4).
5. Install the two starter stub mounting bolts (3).
6. Tighten all three starter mounting retainers (3) and (4) to 25 N.m (19 ft. lbs.)
7. Install the heat shield (2).
8. Install the shield nuts (1).

   Tighten to 18 N.m (13 ft. lbs.)

9. Lower the vehicle.
10. Connect negative battery cable.

STEERING

Steering System - Chrysler 300

WARNING

WARNING

WARNING: Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

WARNING: Fluid level should be checked with the engine off to prevent personal injury from moving parts.

CAUTION

CAUTION

CAUTION: Anytime the battery has been disconnected and is reconnected it is important that this be performed properly. The vehicle may be equipped with systems that require special calibration processes.

CAUTION: When the power steering system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

CAUTION: When servicing power steering components, do not pinch off power steering hoses in any way to stop fluid flow. Damage to hoses may result.

CAUTION: If the steering wheel is excessively off-center, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.

DESCRIPTION

DESCRIPTION

NON SRT

Non SRT vehicles have a power steering system consisting of:

- Steering column

- Rack and pinion steering gear
- Electro Hydraulic Power Steering (EHPS) pump
- Return and Pressure Hoses
- Reservoir integrated with EHPS pump
- Inner and Outer tie rod ends

SRT

SRT vehicles have a power steering system consisting of:

- Steering column
- Rack and pinion steering gear
- Belt driven hydraulic steering pump with integrated reservoir
- Pump pressure, return and supply hoses
- Oil Cooler
- Inner and Outer tie rod ends

DIAGNOSIS AND TESTING

POWER STEERING FLOW AND PRESSURE TEST- NON SRT

The following procedure is used to test the operation of the power steering system on this vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform this test anytime a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following test is performed using the Power Steering Analyzer Kit (special tool #6815, Kit, Power Steering) (with appropriate hoses), Adapters from Power Steering Analyzer Adapter Kit (special tool #6893A, Kit, Power Steering), and Power Steering Adapter (special tool #10250, Adapters, Power Steering). Refer to **SPECIAL TOOLS**.

1. Assemble Power Steering Analyzer as follows:
    1. Gauge end (inlet) of Flow Meter And Gauge (special tool #6800, Analyzer, Power Steering) - Hose (special tool #6905, Assembly, Hose), Adapter (special tool #10250-1, Adapters, Power Steering).
    2. Valve end (outlet) of Flow Meter And Gauge (special tool #6800, Analyzer, Power Steering) - Hose (special tool #6959, Assembly, Hose), Adapter (special tool #10250-2, Adapters, Power Steering).

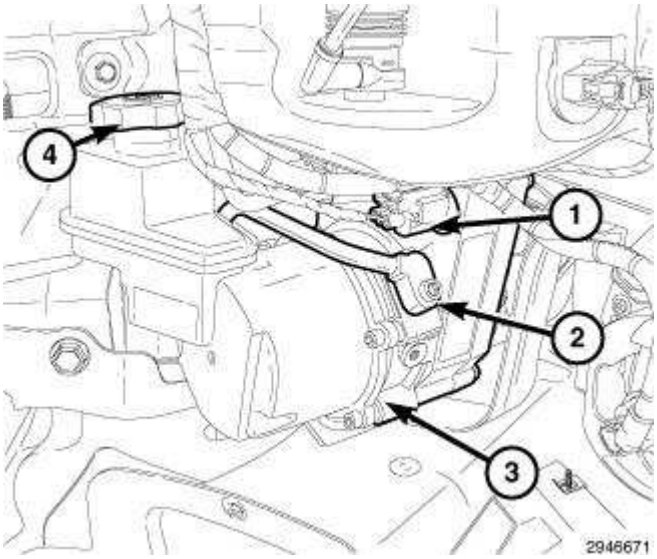

Fig. 1: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

Disconnect and isolate battery negative cable from battery post.

2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the right front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
4. Unthread pressure hose retaining bolt (1) at Electro Hydraulic Power Steering (EHPS) pump (3).
5. Connect Adapter (special tool #10250-1, Adapters, Power Steering) to pressure fitting on power steering pump. Tighten retaining bolt to 10 N.m (89 in. lbs.)
6. Connect power steering pressure hose to Adapter Fitting (special tool #10250-2, Adapters, Power Steering). Tighten retaining bolt to 10 N.m (89 in. lbs.).
7. Open Analyzer test valve completely.
8. Start engine and move the steering wheel back and forth several times to circulate power steering fluid through Analyzer flow meter and hoses.
9. Shut off engine and check fluid level; add fluid as necessary. Repeat 8 and 9until air is bled from system.
10. Start engine and allow to idle.
11. Check Analyzer gauge pressure. Initial pressure reading should be less than 862 kPa (125 psi). If pressure is higher, inspect hoses for restrictions and repair as necessary.

NOTE: Always test for and repair Diagnostic Trouble Codes (DTCs) prior to replacement of the EHPS pump. The EHPS pump will not vary output if there are communication DTCs.

12. Record the flow meter reading (GPM) at idle with no steering wheel movement, and again while turning the wheel as fast as possible. The readings should be within specifications. If the readings are below specifications, replace the power steering pump.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

13. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
    - Power steering pump pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
    - Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

14. Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest recorded output pressure reading against one stop is not within 345 kPa (50 psi) of the highest recorded reading at the other stop, the steering gear is leaking internally and must be replaced.

PUMP SPECIFICATION

SYSTEM	RELIEF PRESSURE ± 75	FLOW RATE (GPM)
EHPS	11721 kPa (1700 psi) at idle with no steering wheel rotation.	1.0 - 2.1 GPM at idle with no steering wheel rotation.
EHPS	11721 kPa (1700 psi) turning steering wheel to wheel stops.	Momentarily raises to between 1.5 - 2.5 GPM at idle with rapid steering wheel rotation.

POWER STEERING FLOW AND PRESSURE TEST - SRT

The following procedure is used to test the operation of the power steering system on this vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform this test anytime a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following test is performed using the Power Steering Analyzer Kit (special tool #6815, Kit, Power Steering) (with appropriate hoses) and Adapters from Power Steering Analyzer Adapter Kit (special tool #6893A, Kit, Power Steering). Refer to **SPECIAL TOOLS**.

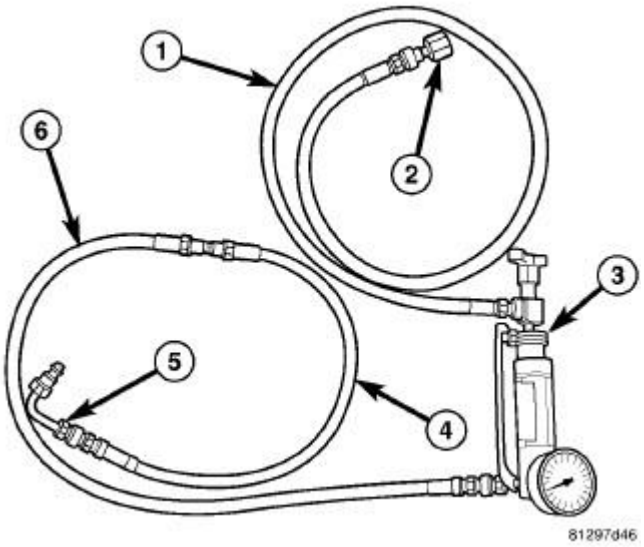

Fig. 2: Analyzer Setup To Test AT Pump
Courtesy of CHRYSLER GROUP, LLC

1. Check power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble Power Steering Analyzer as follows:
    1. Gauge end (inlet) of Flow Meter And Gauge (special tool #6800, Analyzer, Power Steering) (3) - Hose (special tool #6905, Assembly, Hose) (6), Hose (special tool #6713, Hose, Power Steering) (4), Adapter Tube (special tool #6844, Adapter, Power Steering (Truck)) (5)
    2. Valve end (outlet) of Flow Meter And Gauge (special tool #6800, Analyzer, Power Steering) (3) - Hose (special tool #6959, Assembly, Hose) (1), Adapter Fitting (special tool #6826, Adapter, LH P/S Tester) (2)
3. Unthread pressure hose tube nut at power steering pump.
4. Connect Adapter Tube (special tool #6844, Adapter, Power Steering (Truck)) to pressure fitting on power steering pump. Tighten tube nut to specifications. Refer to **SPECIFICATIONS**.
5. Connect power steering pressure hose to Adapter Fitting (special tool #6826, Adapter, LH P/S Tester). Tighten tube nut to specifications. Refer to **SPECIFICATIONS**.
6. Open Analyzer test valve completely.
7. Start engine and allow to idle long enough to circulate power steering fluid through Analyzer flow meter and hoses.
8. Shut off engine and check fluid level; add fluid as necessary. Repeat 7 and 8 until air is bled from system.
9. Start engine and allow to idle.
10. Check Analyzer gauge (3) pressure. Initial pressure reading should be less than 1379 kPa (300 psi). If pressure is higher, inspect hoses for restrictions and repair as necessary.
11. Increase engine speed to 1, 200 RPM for SRT8 and read Analyzer Flow Meter. The reading should be 8.2 LPM (2.2 GPM) minimum. If flow reading is below specification, replace power

steering pump.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

12. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
    - Power steering pump pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
    - Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

13. Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest recorded output pressure reading against one stop is not within 345 kPa (50 psi) of the highest recorded reading at the other stop, the steering gear is leaking internally and must be replaced.

PUMP SPECIFICATIONS

VEHICLE	RELIEF PRESSURE
SRT Vehicles	11307 to 11997 kPa (1640-1740 psi)

STEERING DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES, PERFORMANCE ISSUES, and FLUID ISSUES.

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*()	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.
	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.

	3. Restriction in pressure or return hose.	3. Using an electronic listening tool, determine if noise is coming from either pressure or return hose. Replace hose that noise is present within.
	4. Noisy valve in power steering gear.	4. For evaluation and correction. Refer to **GEAR, DIAGNOSIS AND TESTING**.
RATTLE OR EXCESSIVE CLUNK**()	1. Power steering gear loose on engine cradle/crossmember.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
	2. Loose strut assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
	3. Excessive play in outer tie rod.	3. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
	5. Wheel mounting (lug) nuts loose.	5. Inspect wheel mounting (lug) nuts and studs and repair as necessary. Tighten nuts to specifications.
	6. Power steering hose touching the body or frame of vehicle.	6. For evaluation and correction. Refer to **PUMP, DIAGNOSIS AND TESTING**.
	7. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).	7. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
	8. Loose lower control arm or tension strut mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).	8. Check control arm or tension strut mounting bolts and tighten to specified torque.
	9. Loose intermediate shaft or column.	9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
	10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	10. Inspect bushings for wear and replace lower control arm as necessary.
	11. Internal power steering	11. Drive vehicle on rough road, then

	gear noise.	steer rapidly back and forth when stopped. Replace power steering gear as necessary.
	12. Loose inner tie rod.	12. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	13. Damaged engine cradle/crossmember.	13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
	3. Loose intermediate (steering) shaft coupling at gear input shaft.	3. Make sure coupling is fully seated on gear input shaft. Retighten or re-seat as necessary.
	4. Worn tie rod (outer or inner).	4. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	5. Worn axle half-shaft.	5. For evaluation and correction. Refer to **FRONT HALF SHAFT** or **REAR HALF SHAFT** .
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
	2. Air in power steering fluid.	2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to **STANDARD PROCEDURE**.
	3. Power steering hose touching body or frame of vehicle.	3. For evaluation and correction. Refer to **PUMP, DIAGNOSIS AND TESTING**.
	4. Wear of power steering pump internal components.	4. For evaluation and correction. Refer to **PUMP, DIAGNOSIS AND TESTING**.
COLD START WHINE OR MOAN (POWER STEERING PUMP)***()	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
	2. Extremely low ambient temperature (near -18 C°(0 F°) or below).	2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are

		one second at -18 C°(0 F°) and 15 seconds at -29 C° (-20 F°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
	4. Steering gear outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary.
	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.

NOTE: **() * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at**

a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: **() ** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.**

NOTE: **() *** Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL OR COLUMN HAS FREE-PLAY/LASH/LOOSENESS (CLUNKING OR RATTLING)	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt if equipped with thread locker patch and tighten to specifications.
	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	3. Excessive free-play or noise from steering column bearings.	3. Replace steering column.
	4. Excessive intermediate (steering) shaft coupling U-joint free-play.	4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace intermediate shaft as necessary.
	5. Loose or worn outer tie rod.	5. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	6. Lack of lubrication in lower ball joint or ball joint is damaged.	6. For evaluation. Refer to **BALL JOINT, SUSPENSION, LOWER, DIAGNOSIS AND TESTING** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
	7. Excessive lash inside	7. Disconnect intermediate shaft and

	steering gear.	turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.
	2. Loose steering column to instrument panel fasteners.	2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.
	3. Steering column lower bearing spring retainer slipped on steering column shaft.	3. Pull steering wheel fore-and-aft while observing movement. Replace steering column as necessary.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL)	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to **STANDARD PROCEDURE**.
	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
	3. Excessive engine vibration.	3. Ensure that the engine is tuned properly.
	4. Loose tie rod end jam nut.	4. Check torque and tighten the inner to outer tie rod jam nut to specifications.
	5. Overcharged air conditioning (A/C) system.	5. Turn A/C off and verify issue goes away. Repair A/C as necessary.
	6. Grounded, damaged or loose engine mount.	6. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace, realign or retighten as necessary.
	7. Loose or worn outer tie rod. 8. Steering gear noisy.	7. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**. 8. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions and verify that the noise follows the steering input. Check TSB's for any known issue. Replace steering gear as necessary.
STEERING CATCHES,	1. Low power steering	1. Check fluid level and fill to proper

SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN	fluid level.	level as necessary. Check for leaks. Make sure all air is bled from system.
	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
	3. Loose or slipping power steering/accessory drive belt.	3. Verify belt tension. Replace belt auto-tensioner and belt as necessary.
	4. Lack of lubrication in lower ball joint or ball joint is damaged.	4. For evaluation, refer to **BALL JOINT, SUSPENSION, LOWER, DIAGNOSIS AND TESTING** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
	5. Lack of lubrication in steering gear outer tie rod end(s).	5. For evaluation and correction. Refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	6. Faulty power steering pump.	6. Perform Power Steering Flow and Pressure Test. Refer to **DIAGNOSIS AND TESTING**. Look for low or erratic flow or pressure. Replace power steering pump as necessary.
	7. Excessive friction in intermediate shaft/coupler joint.	7. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
	8. Excessive friction in steering column.	8. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
	9. Worn or binding seat and bearing in front strut assembly.	9. Disconnect outer tie rod ends from knuckles, then turn tire and wheel assembly checking for smooth operation. Replace front strut assembly seat and bearing.
	10. Faulty steering gear.	10. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for

		smooth operation. Replace steering gear (only after all previous components have been checked).
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
	3. Lack of lubrication in lower ball joint or ball joint is damaged.	3. For evaluation. Refer to **BALL JOINT, SUSPENSION, LOWER, DIAGNOSIS AND TESTING** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
	4. Excessive friction in intermediate shaft/coupler joint.	4. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
	5. Excessive friction in steering column.	5. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
	6. Worn or binding seat and bearing in front strut assembly.	6. Disconnect steering gear outer tie rod ends at knuckles, then turn tire and wheel assembly in and out checking for smooth operation. Replace seat and bearing as necessary.
	7. Excessive friction in power steering gear.	7. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. Refer to

		STANDARD PROCEDURE.
	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	3. Steering column, coupling or intermediate shaft worn or loose.	3. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column, coupling or intermediate shaft if necessary.
	4. Power steering pump flow is too low.	4. Perform Power Steering Flow and Pressure Test. Refer to **DIAGNOSIS AND TESTING**. Look for low or erratic flow or pressure. Replace power steering pump as necessary.

FLUID ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK	1. Loose power steering hose fittings or connections.	1. Check torque on all tube nuts (at gear and pump). Inspect clamps at all rubber hose connections for correct position, damage and tension. Tighten tube nuts as required. Reposition or replace clamps at hose connections. Clean joints and reinspect for leaks.
	2. Damaged or missing O-ring at power steering hose tube nuts.	2. Remove tube nut and inspect O-ring. If damaged or missing, replace O-ring. Clean joints and reinspect for leaks.
	3. Power steering line or hose failure.	3. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace hoses as necessary.
	4. Power steering component leaking (reservoir, pump, gear).	4. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace power steering component as necessary.
AERATED FLUID*	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
	2. Air leak at power steering supply hose, reservoir or pump.	2. Inspect components. Place a hand vacuum pump with Adapter 9688 on reservoir and verify that system can sustain vacuum. System should not lose more than 1 psi (7 kPa) in 2 minutes (make sure vacuum pump is sealed well to the

		reservoir). Replace steering component as necessary.
RESERVOIR FLUID OVERFLOW OR FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Inspect fluid for milky appearance. Completely drain power steering fluid. Refill and bleed system. Refer to **STANDARD PROCEDURE**.

NOTE: *** Extremely cold temperatures may cause power steering fluid aeration. The air should work its way out of the system as the fluid warms.**

STANDARD PROCEDURE

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEEDING

WARNING: Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.

CAUTION: There is an Electro-Hydraulic Power Steering (EHPS) pump on some vehicles requiring a different fluid. Do not mix power steering fluid types. Damage may result to the power steering pump and system if any other fluid is used. The mechanical power steering pump systems on this vehicle require the use of Power Steering Fluid +4, which meets material specification MS-9602 or equivalent. The EHPS system uses fluid which meets material specification MS-11655 or equivalent. Do not overfill.

CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

NOTE: **Be sure the vacuum tool used in the following procedure is clean and free of any fluids.**

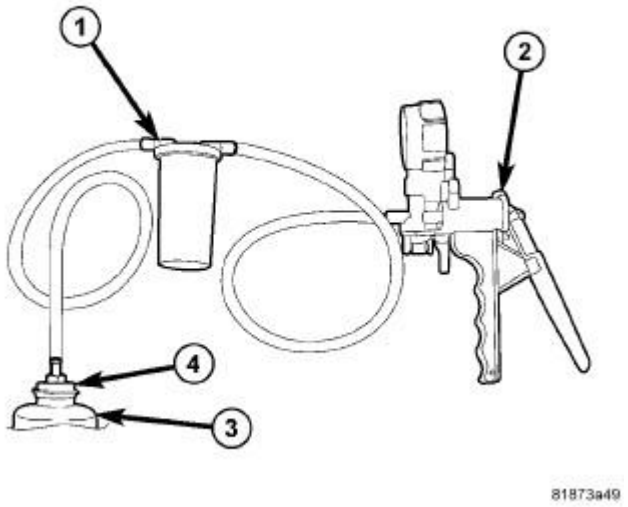

Fig. 3: Hand Vacuum Pump On Reservoir
Courtesy of CHRYSLER GROUP, LLC

1. Check the fluid level. When the fluid is at normal ambient temperature, approximately 21° - 27° C (70° - 80° F), the fluid level should read between the MAX and MIN markings. When the fluid is hot, fluid level is allowed to read up to the MAX line.

   CAUTION: Do not fill fluid beyond the MAX mark. Check cap seal for damage and replace if needed.

2. Remove the cap from the fluid reservoir and fill the power steering fluid reservoir up to the MAX marking with the correct power steering fluid as follows:
   - With a mechanical power steering pump - Mopar® Power Steering Fluid +4 or equivalent, which meets Chrysler Material Standard MS-9602.
   - With an Electro-Hydraulic Power Steering (EHPS) - Mopar® Hydraulic Power Steering Fluid or equivalent, which meets Chrysler Material Standard MS-11655.
3. Tightly insert the (special tool #9688A, Cap Adapter, Power Steering Pump) into the mouth of the reservoir (3).

   CAUTION: Failure to use a vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

4. Attach (special tool #C-4207-A, Vacuum Pump, Hand) (2) or equivalent, with reservoir (1) attached, to the Power Steering Cap Adaptor (4).

   CAUTION: Do not run the vehicle while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: **When performing the following step make sure the vacuum level is maintained during the entire time period.**

5. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
6. Slowly release the vacuum and remove the special tools.
7. Adjust the fluid level as necessary. Refer to 1.
8. Repeat 1 through7 until the fluid no longer drops when vacuum is applied.
9. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: **Do not hold the steering wheel at the stops.**

10. Stop the engine and check for leaks at all connections.
11. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

COLUMN

DESCRIPTION

DESCRIPTION

WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the airbag and possible personal injury. The fasteners, screws, and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the column internally.

NOTE: When servicing the steering wheel after removing the old bolt, a NEW bolt must be used when installing.

NOTE: When servicing the steering coupler a NEW bolt must be used when installing.

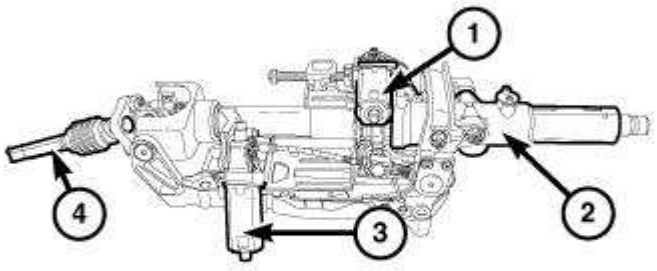

Fig. 4: Electronic Tilt/Telescope, Tilt Motor & Telescoping Motor
Courtesy of CHRYSLER GROUP, LLC

There are two types of columns available: electronic tilt/telescope (2) and manual tilt/telescope (not shown). Each type of column has been designed to be serviced as an assembly less wiring, switches,

steering wheel, etc.

The tilt motor (3) can be replaced separately from the column, but the telescoping motor (1) is serviced with the column. The upper intermediate shaft (4) can also be serviced separately from the column.

The electronic tilt and telescope column is operated by a switch on the column located below the multi-function switch. The movement of the column is controlled by the memory seat module. Refer to **MODULE, MEMORY, OPERATION** .

When servicing any component of the steering column, refer to Restraints and observe all WARNINGS and CAUTIONS. Refer to **WARNING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING COLUMN

If the vehicle is involved in a front end collision or the air bag has deployed or both, the steering column must be replaced.

REMOVAL

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury. Refer to AIR BAG, DRIVER, REMOVAL .

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and

locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

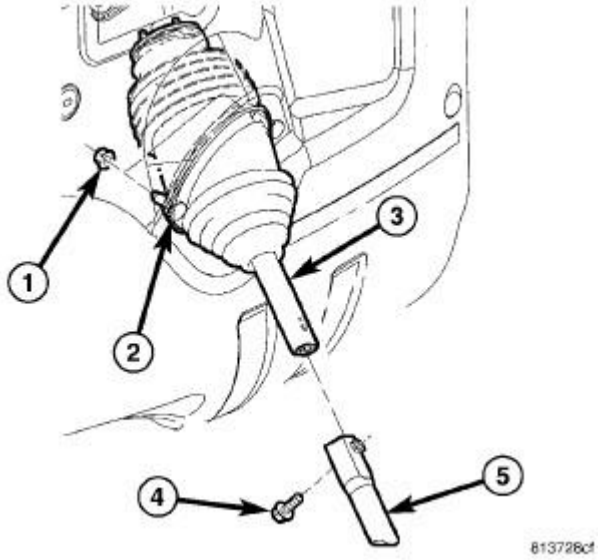

Fig. 5: Shaft Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position front wheels straight ahead.
2. Fully extend the telescoping column.
3. Disconnect and isolate the negative (ground) cable from the battery.
4. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove the pinch bolt (4) connecting the upper intermediate shaft (3) to the lower intermediate shaft (5).
6. Separate the lower intermediate shaft (5) from the upper intermediate shaft (3).

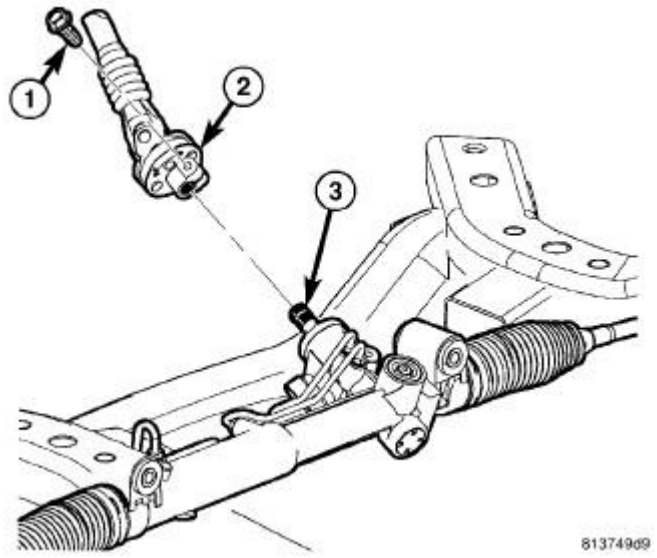

Fig. 6: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

7. Remove the pinch bolt (1) from the lower intermediate shaft (2) at the steering gear (3).
8. Carefully separate the intermediate shaft (2) from the steering gear (3).
9. Remove the intermediate shaft (2) from the vehicle.

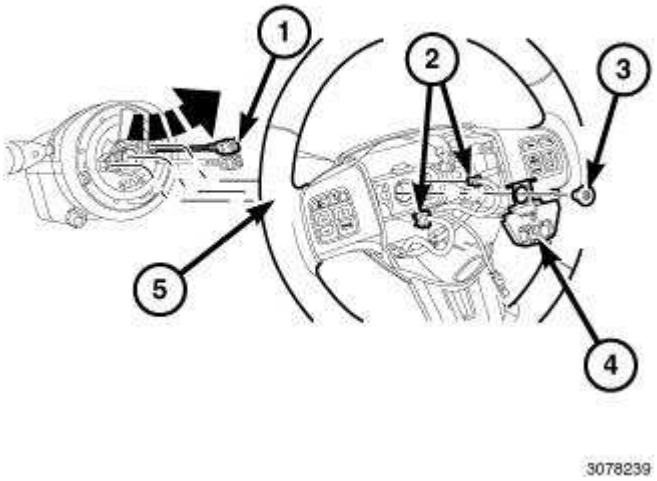

Fig. 7: Pinch Bolt, Steering Wheel Electrical Connectors, Steering Wheel Bolt & Wheel Damper
Courtesy of CHRYSLER GROUP, LLC

10. Lower the vehicle.
11. Remove the airbag. Refer to **AIR BAG, DRIVER, REMOVAL** .
12. Disconnect steering wheel electrical connectors (2) and remove the steering wheel bolt (3).

13. Remove the steering wheel damper (4) and slide the steering wheel (5) off the steering column assembly.
14. Inhibit rotation of the steering column with adhesive tape/or strap.

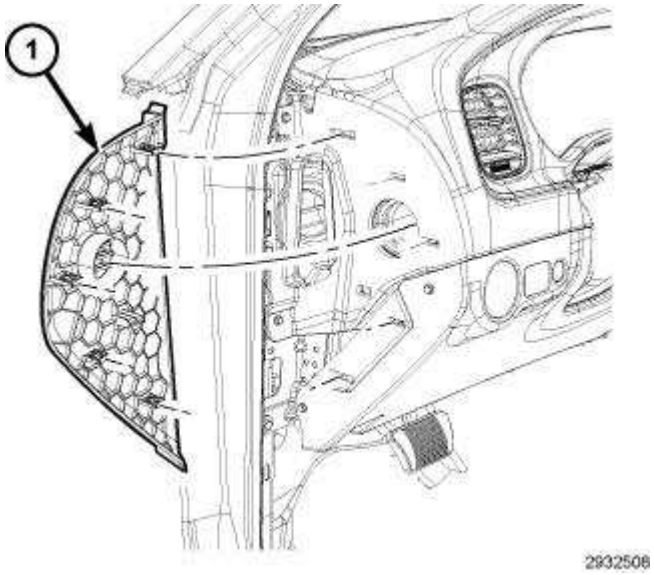

Fig. 8: End Cap
Courtesy of CHRYSLER GROUP, LLC

15. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, gently pry between the end cap (1) and the instrument panel to release the snap retainers that secure the end cap.

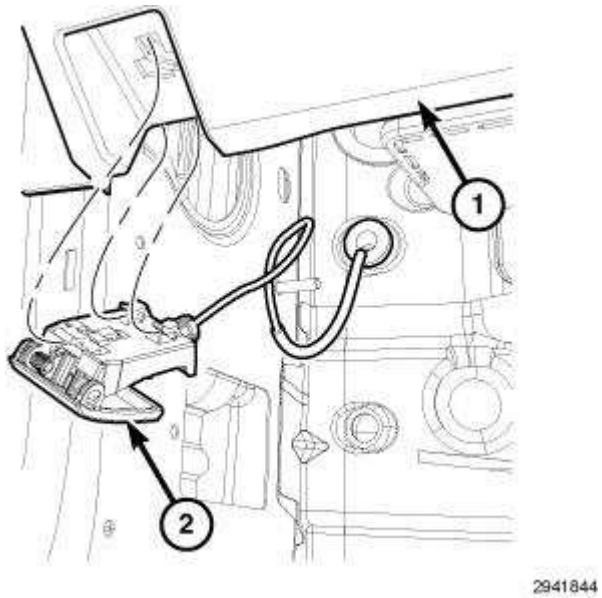

Fig. 9: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

16. Remove the hood release handle (2) from the knee blocker trim by pushing down then pulling

out on the handle.

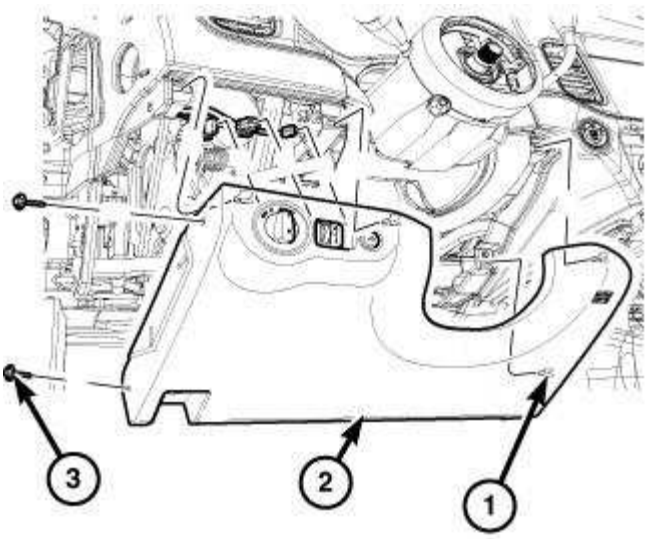

Fig. 10: Two Side Screws, Lower Screw & Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

17. Remove the two side screws (3) and the lower screw (1) securing the knee blocker trim (2) to the instrument panel.
18. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, partially remove the upper portion of the knee blocker trim (2) by gently prying between the knee blocker trim (2) and the instrument panel to release the upper snap retainers.**Do not remove the knee blocker trim or pull with excessive force.**
19. Remove the wood grain pieces of trim on either side of the column, if equipped.

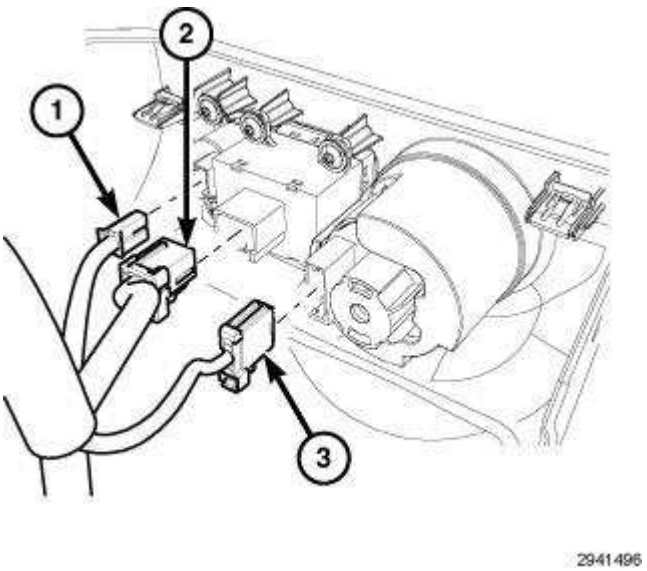

Fig. 11: Light Switch Harnesses

Courtesy of CHRYSLER GROUP, LLC

20. Disconnect the light switch harnesses (1, 2 & 3) from the switch and finish removing the knee blocker trim.

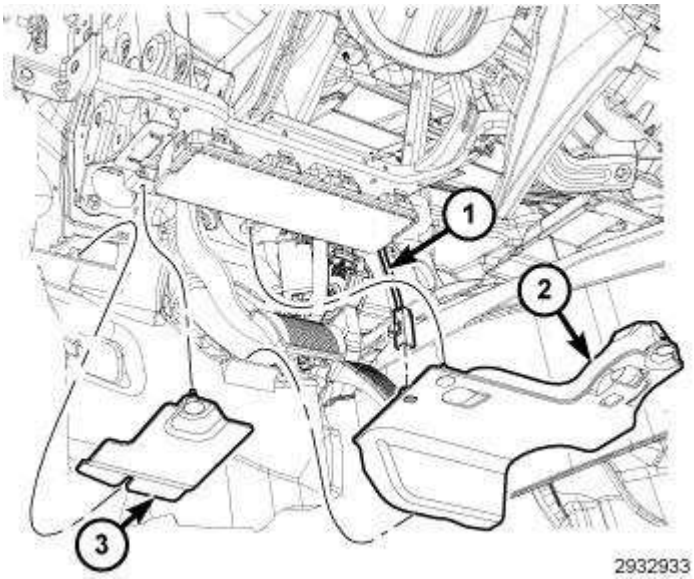

Fig. 12: LED Harness & Left Side Instrument Panel Silencers
Courtesy of CHRYSLER GROUP, LLC

21. Disconnect the LED harness (1) and remove the left side instrument panel silencers (2, 3).
22. Remove the knee blocker air bag (if equipped). Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
23. Remove the steering column module. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

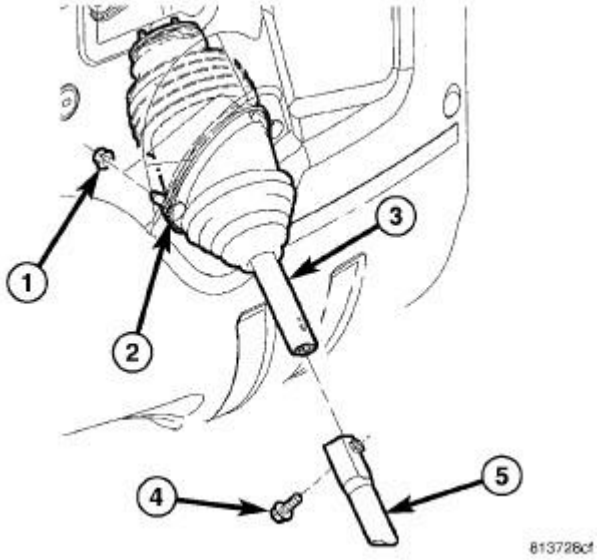

Fig. 13: Shaft Retaining Nuts

Courtesy of CHRYSLER GROUP, LLC

24. Remove two intermediate shaft boot retaining nuts (1) at the bulkhead (2).

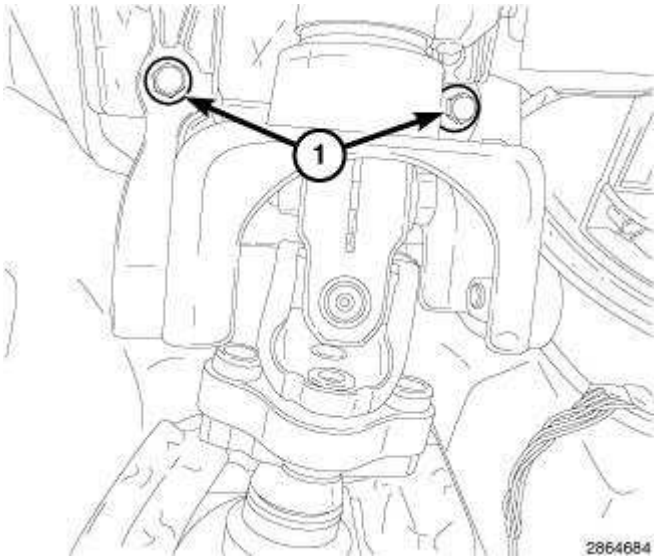

Fig. 14: Front Two Column Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Disconnect electrical connectors for power tilt and telescope motors, if equipped.
26. Remove front two column mounting bolts (1).

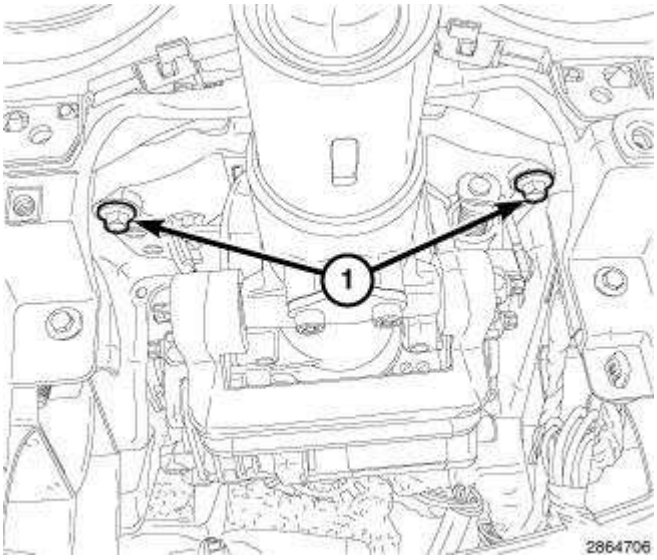

Fig. 15: Two Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

27. Support the column and remove the two mounting nuts (1).
28. Remove column from the vehicle.

INSTALLATION

INSTALLATION

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury. Refer to AIR BAG, DRIVER, INSTALLATION .

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

NOTE: Make sure the front wheels are still in the straight ahead position.

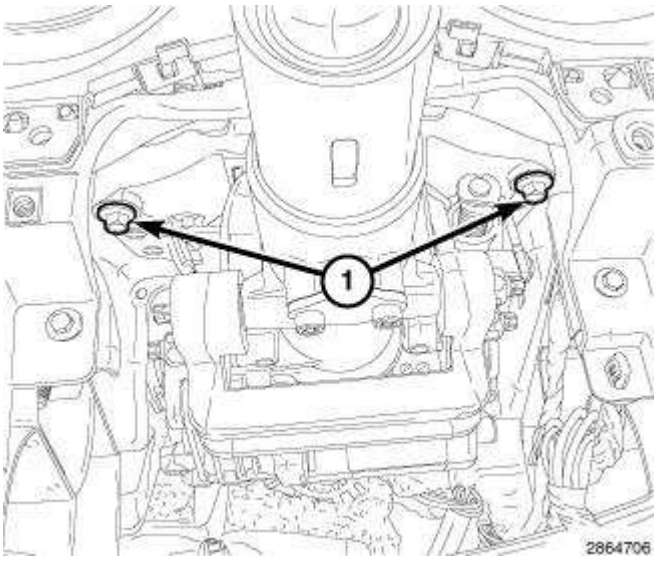

Fig. 16: Two Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Install the column into the vehicle and lift the column up into place. Loosely install the mounting nuts (1), do not tighten at this time.

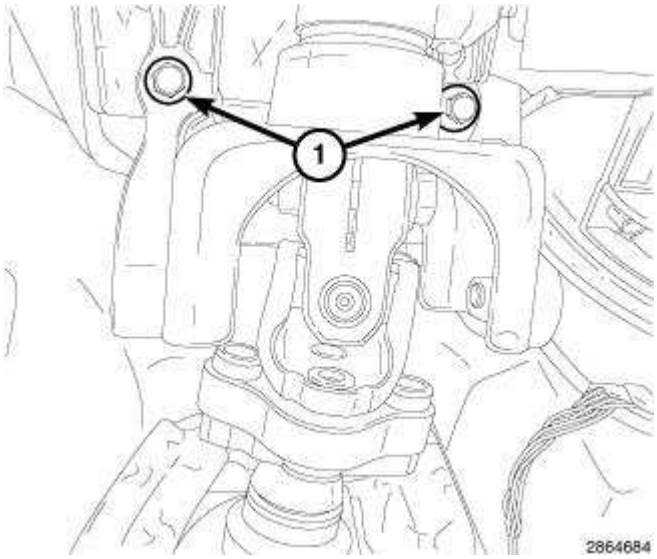

Fig. 17: Front Two Column Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the two mounting bolts (1) and tighten all four mounting fasteners to 27 N.m (20 ft.lbs.).
3. Connect electrical connectors to tilt and telescope motors, if equipped.

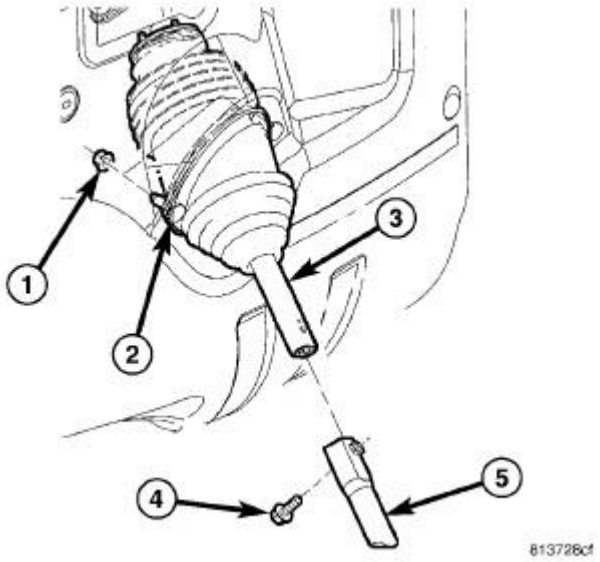

Fig. 18: Shaft Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Center the boot for the steering column at the bulkhead (2). Install and tighten the two mounting nuts (1) to 7 N.m (62 in. lbs.).

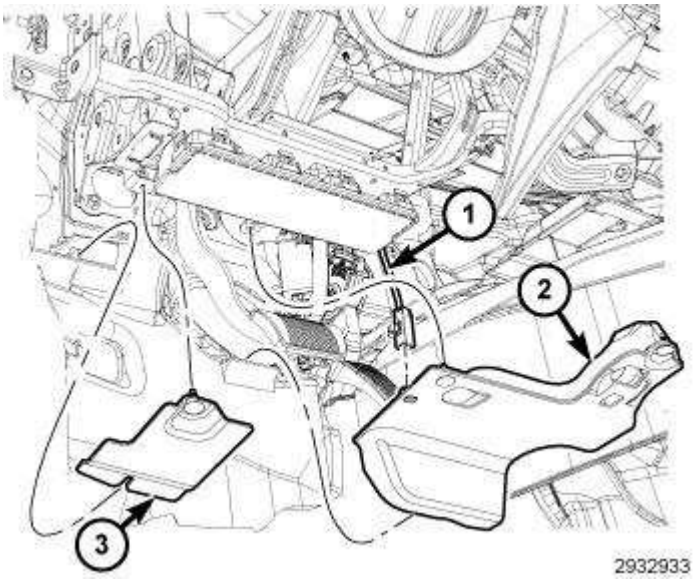

Fig. 19: LED Harness & Left Side Instrument Panel Silencers
Courtesy of CHRYSLER GROUP, LLC

5. Connect the LED harness (1) and install the left side instrument panel silencers (2, 3).

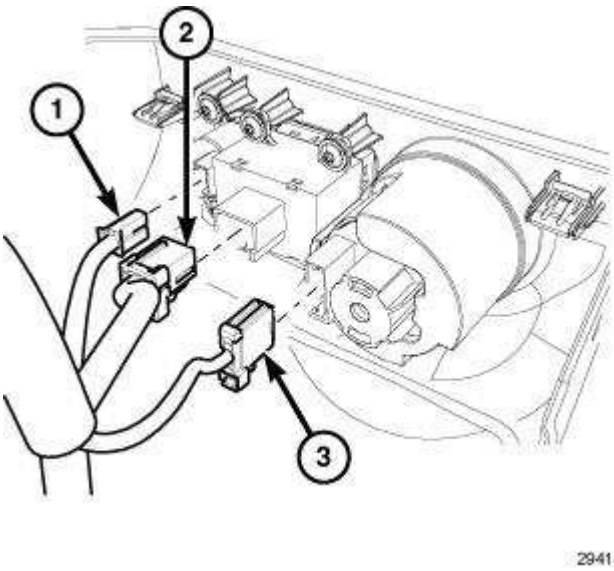

Fig. 20: Light Switch Harnesses
Courtesy of CHRYSLER GROUP, LLC

6. Connect the light switch harnesses (1, 2 & 3) to the switch located on the knee blocker trim.

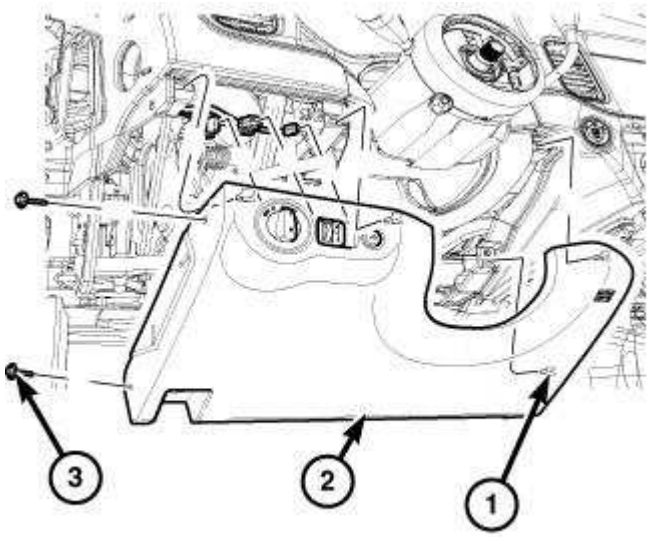

Fig. 21: Two Side Screws, Lower Screw & Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

7. Install the upper portion of the knee blocker trim (2) by pushing on the knee blocker trim (2) to engage the upper snap retainers.
8. Install the two side screws (3) and the lower screw (1) securing the knee blocker trim (2) to the instrument panel. Tighten the screws to 30 in-lbs.

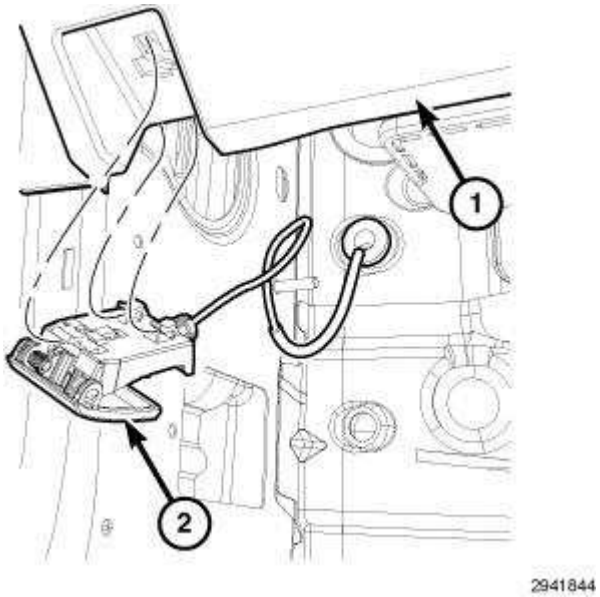

Fig. 22: Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

9. Install the hood release handle (2) to the knee blocker trim by aligning and pushing up.

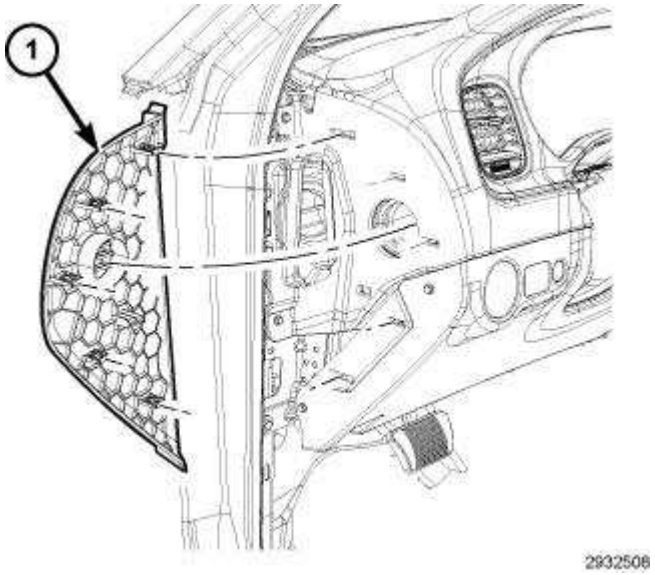

Fig. 23: End Cap
Courtesy of CHRYSLER GROUP, LLC

10. Install the end cap (1) to the instrument panel and engage the snap retainers that secure the end cap. Repeat on opposite side.

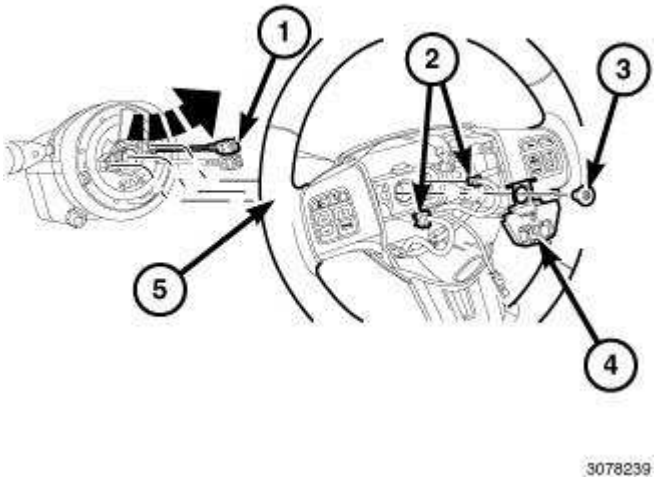

Fig. 24: Pinch Bolt, Steering Wheel Electrical Connectors, Steering Wheel Bolt & Wheel Damper
Courtesy of CHRYSLER GROUP, LLC

11. If removed, install the steering column module. Refer to **MODULE, STEERING COLUMN, INSTALLATION** .
12. Install wood grain trim panels on either side of column, if equipped.
13. Install the steering wheel (5) onto the steering column.
14. Install the steering wheel damper (4) and then install a new steering wheel mounting bolt (3)

and tighten to 75 N.m (55 ft. lbs.).

15. Connect all electrical connectors.
16. Install the drivers airbag. Refer to **AIR BAG, DRIVER, INSTALLATION** .

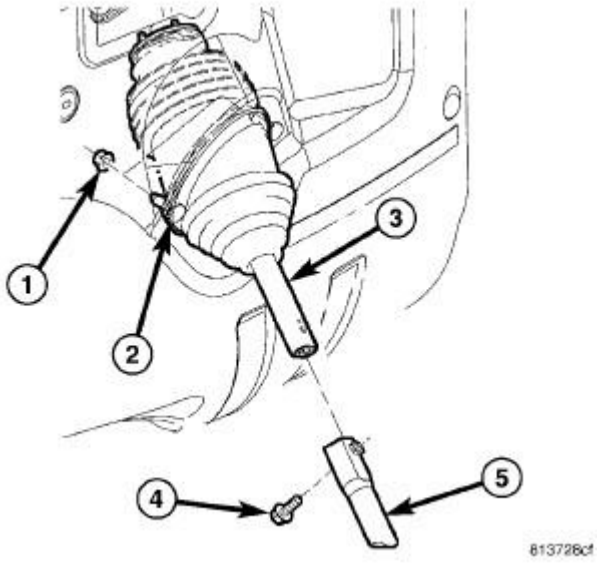

Fig. 25: Shaft Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

17. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
18. Slide the lower intermediate shaft (5) onto the upper intermediate shaft (3). Install a **new** pinch bolt (4) and tighten to 45 N.m (33 ft. lbs.).

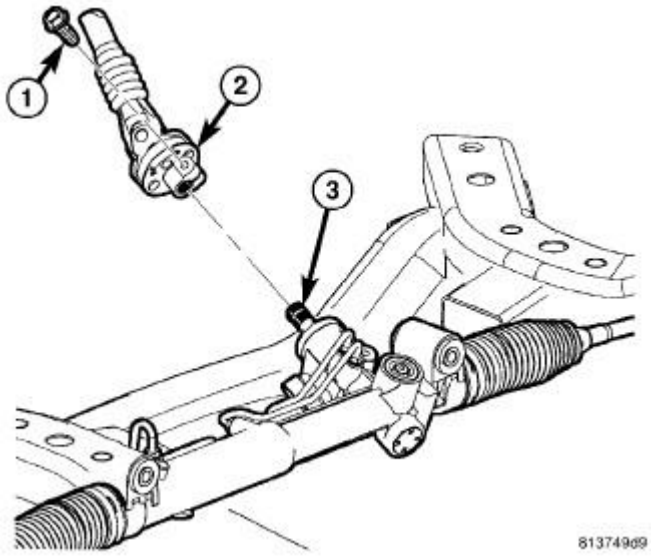

Fig. 26: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

19. Slide the coupler from the lower intermediate shaft (2) onto the steering gear shaft (3) and install a **new** pinch bolt (1). Tighten the pinch bolt to 45 N.m (33 ft. lbs.).
20. Lower the vehicle.
21. Connect the negative (ground) cable to the battery. It is important that this be performed correctly.

LEVER, GEARSHIFT

REMOVAL

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Refer to RESTRAINTS - SERVICE INFORMATION for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

1. Disconnect the negative (ground) cable from the battery.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

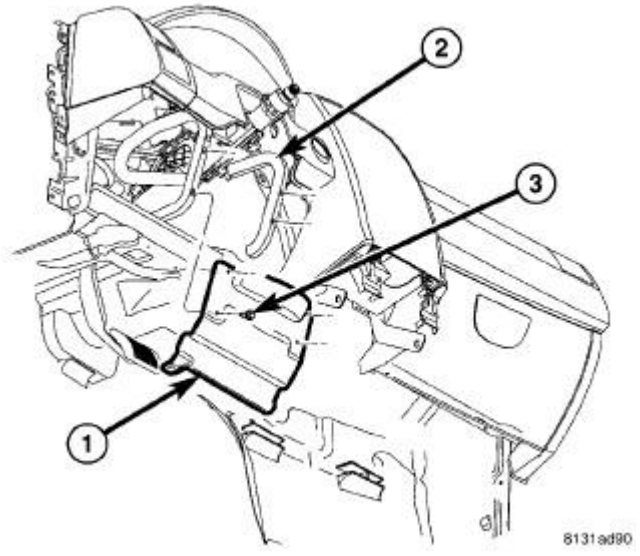

Fig. 27: Reinforcement I/P Steering Column
Courtesy of CHRYSLER GROUP, LLC

3. Remove the steering column opening reinforcement (1).

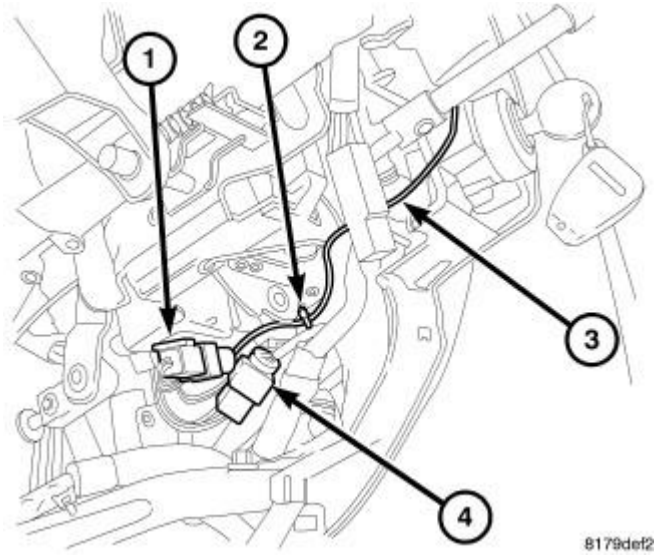

Fig. 28: Auto-Stick Wiring Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the autostick wiring connector (1).
5. Remove the wiring tie strap (2) securing the autostick wiring to the column.

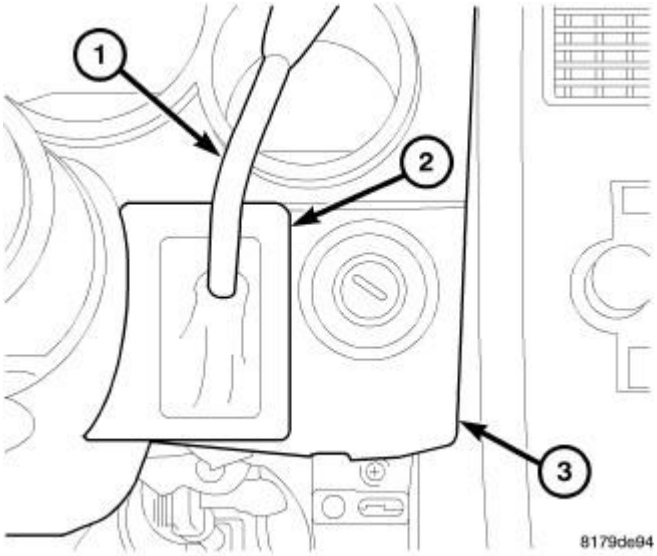

Fig. 29: Gear Shift Lever Boot
Courtesy of CHRYSLER GROUP, LLC

6. Unsnap the gear shift lever boot (2) from the cluster bezel (3). Slide the boot up the gear shift lever (1), away from the bezel.

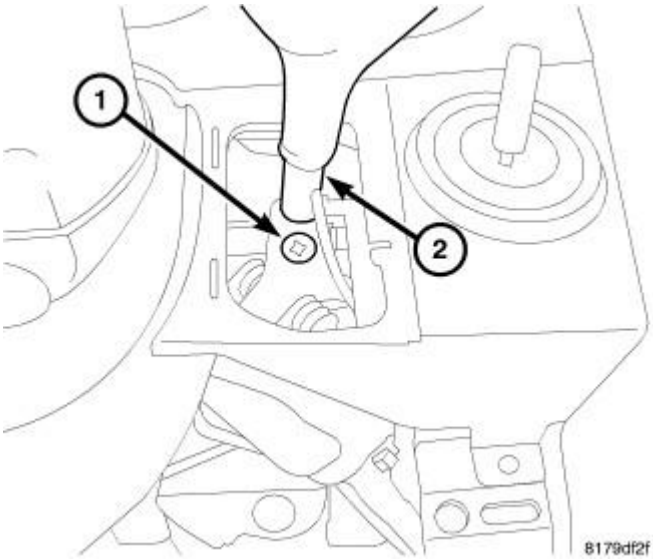

Fig. 30: Gear Shift Lever Mounting Screw
Courtesy of CHRYSLER GROUP, LLC

7. Remove the gear shift lever mounting screw (1).
8. Slide the gear shift lever (2) out of the column shift mechanism and remove the lever with autostick wiring.

INSTALLATION

INSTALLATION

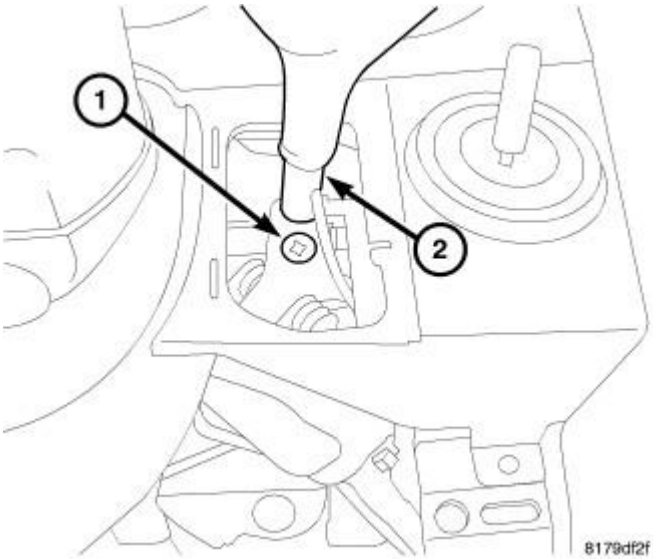

Fig. 31: Gear Shift Lever Mounting Screw
Courtesy of CHRYSLER GROUP, LLC

1. Feed the autostick wiring through the hole in the cluster bezel and slide the gear shift lever (2) into the column shift mechanism.

NOTE: **Before installing gear shift lever mounting screw, clean screw threads and apply Mopar® Lock AND Seal Adhesive.**

2. Line up the threaded hole in the lever with the hole in the shift mechanism and install the gear shift lever mounting screw (1). Tighten the screw to 12 N.m (106 in. lbs.).

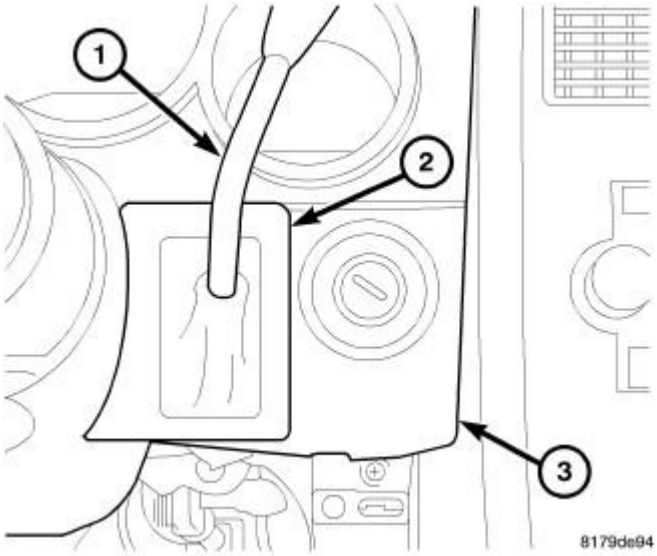

Fig. 32: Gear Shift Lever Boot
Courtesy of CHRYSLER GROUP, LLC

3. Slide the gear shift lever boot down gear shift lever (1) and snap it into place on the cluster bezel (3).

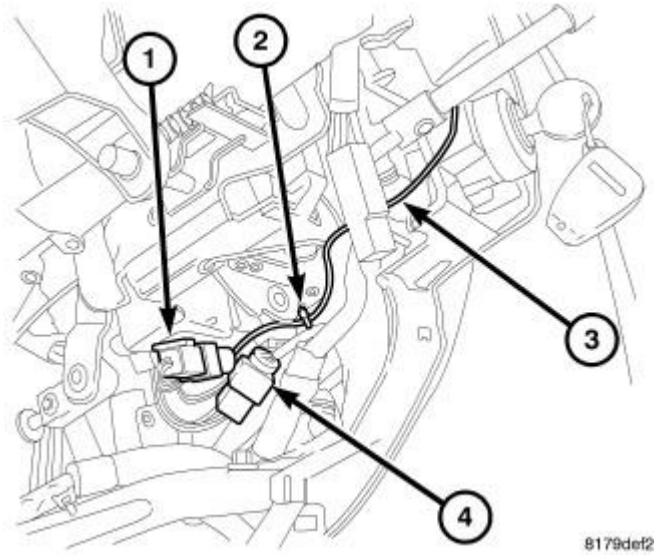

Fig. 33: Auto-Stick Wiring Connector
Courtesy of CHRYSLER GROUP, LLC

4. Route the autostick wiring (3) along the right side of the column gear shift mechanism and

install a wiring tie strap (2) securing the autostick wiring to the column.

5. Connect the autostick wiring connector (1).
6. Check autostick wiring (3), making sure it is routed away from movable portions of shift mechanism.

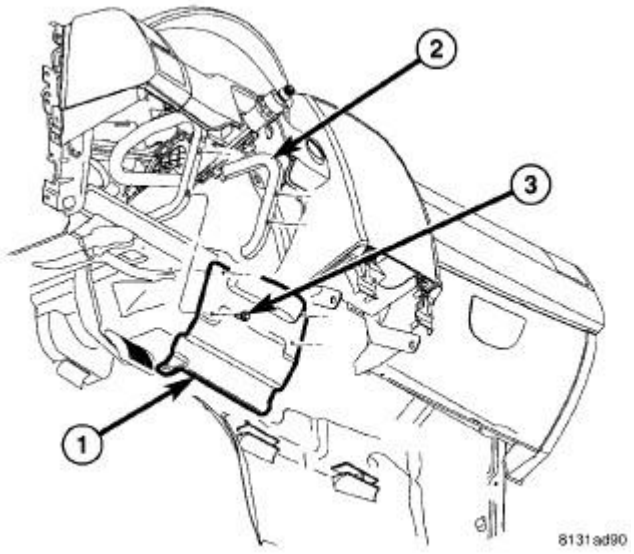

Fig. 34: Reinforcement I/P Steering Column
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.

7. Install the steering column opening reinforcement (1).
8. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
9. Install the negative battery terminal on the battery. It is important that this is performed properly.
10. Test the operation of the gear shift lever and autostick functions.

MOTOR, TILT

REMOVAL

REMOVAL

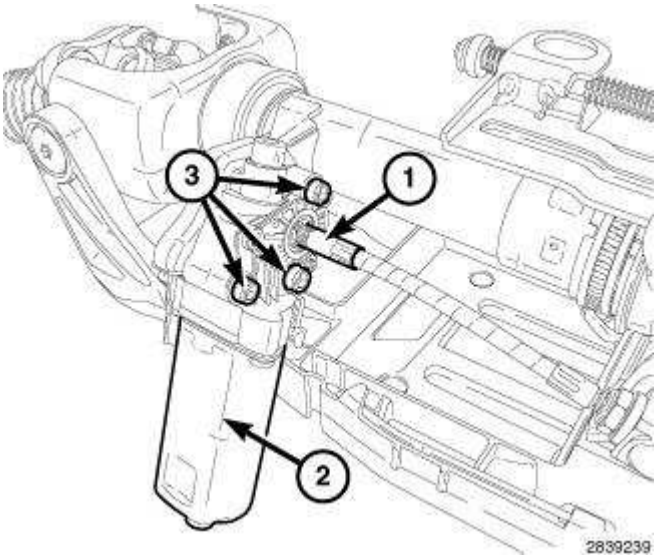

Fig. 35: Tilt Motor, Three Bolts & Flex Drive
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

1. Remove the steering column from the vehicle. Refer to **COLUMN, REMOVAL**.
2. Place steering column on a flat bench, with the tilt motor (2) over the edge.
3. Remove the three bolts (3) that hold the tilt motor to the steering column assembly.
4. Pull the tilt motor (2) away from the steering column assembly and pull off of the flex drive (1).

INSTALLATION

INSTALLATION

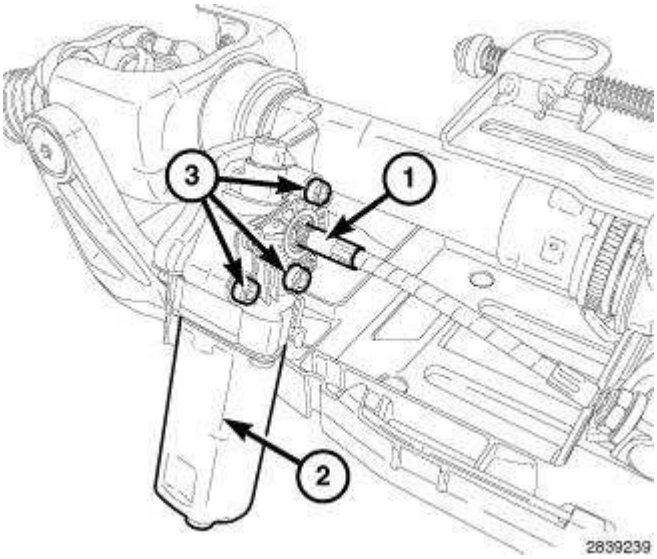

Fig. 36: Tilt Motor, Three Bolts & Flex Drive
Courtesy of CHRYSLER GROUP, LLC

1. With the steering column on a flat bench, insert the flex drive (1) into the tilt motor (2).
2. Rotate the tilt motor into position and install on the steering column assembly.
3. Install the three bolts (3) to attach the tilt motor (2) to the steering column assembly and tighten to 4 N.m (35 in. lbs.)
4. Install the steering column. Refer to **COLUMN, INSTALLATION**.
5. Perform the memory seat module standardization procedure. Refer to **STANDARD PROCEDURE** .

SHAFT, INTERMEDIATE, LOWER

REMOVAL

REMOVAL

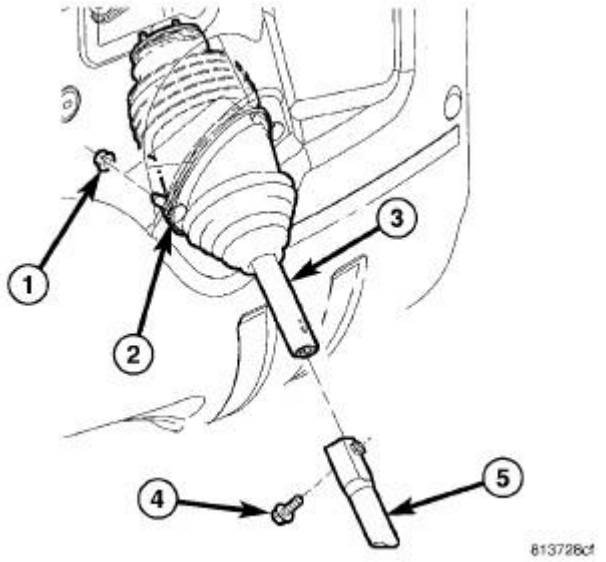

Fig. 37: Shaft Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the pinch bolt (4) connecting the upper intermediate shaft (3) to the lower intermediate shaft (5).
3. Separate the lower intermediate shaft (5) from the upper intermediate shaft (3).

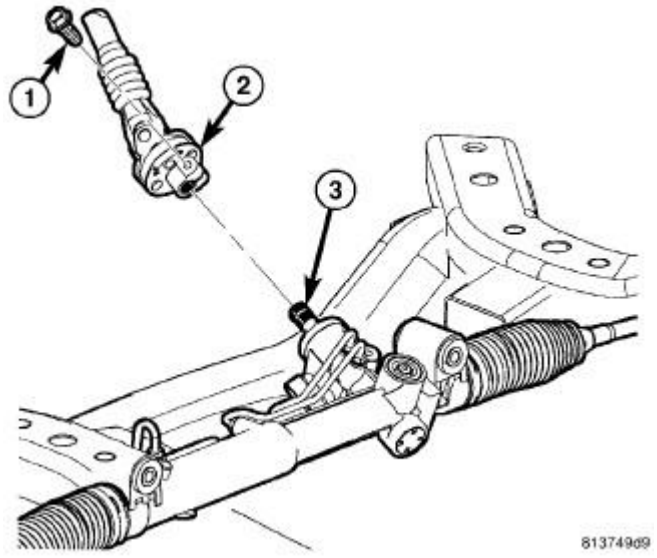

Fig. 38: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

4. Remove the pinch bolt (1) from the lower intermediate shaft (2) at the steering gear (3).
5. Carefully separate the intermediate shaft (2) from the steering gear (3).
6. Remove the lower intermediate shaft (2) from the vehicle.

INSTALLATION

INSTALLATION

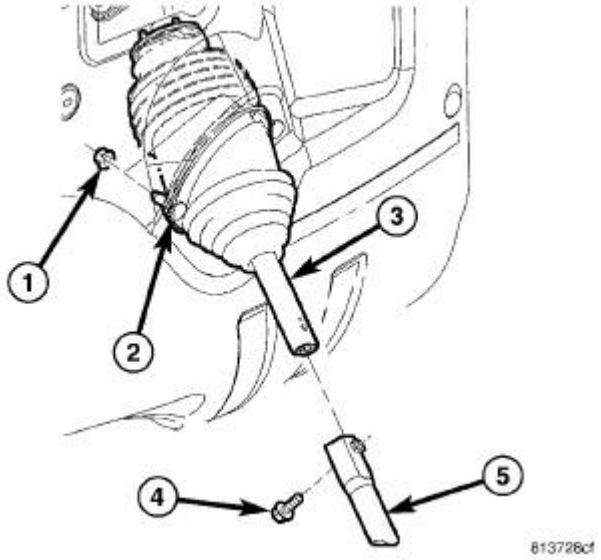

Fig. 39: Shaft Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

1. Slide the lower intermediate shaft (5) onto the upper intermediate shaft (3). Install a **new** pinch bolt (4) and tighten to 45 N.m (33 ft. lbs.).

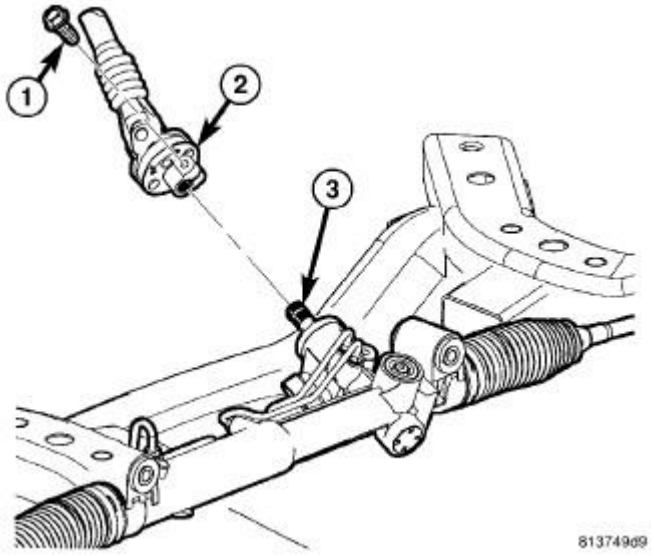

Fig. 40: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

2. Slide the coupler from the lower intermediate shaft (2) onto the steering gear shaft (3) and install a **new** pinch bolt (1). Tighten the pinch bolt to 45 N.m (33 ft. lbs.).
3. Lower the vehicle.
4. Connect the negative (ground) cable to the battery.

SHAFT, INTERMEDIATE, UPPER

REMOVAL

REMOVAL

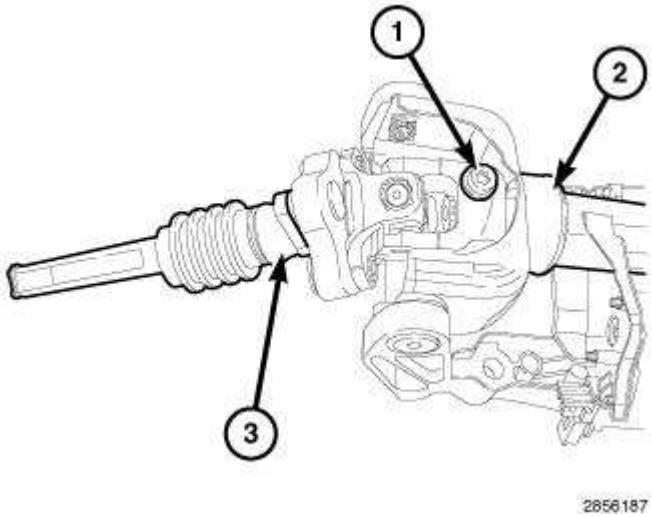

Fig. 41: Coupler Pinch Bolt & Upper Intermediate Shaft

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

NOTE: When removing the column to service the upper intermediate shaft, it is not necessary to remove the steering wheel and Steering Column Control Module; the column can be removed as an assembly.

1. Remove the steering column from the vehicle. Refer to **COLUMN, REMOVAL**.
2. Remove the coupler pinch bolt (1).
3. Slide the upper intermediate shaft (3) off the splines of the steering column.

INSTALLATION

INSTALLATION

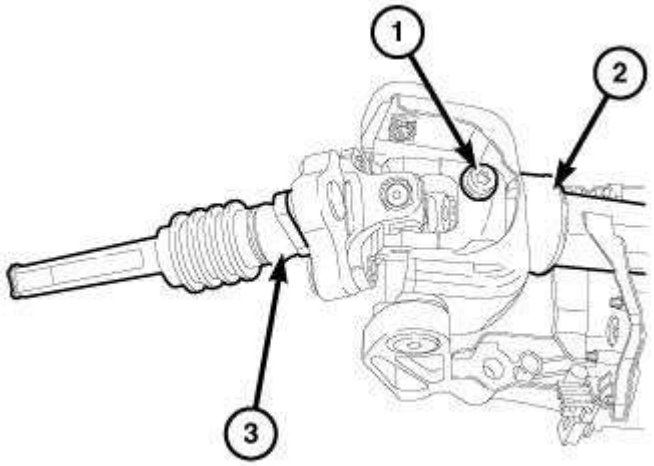

Fig. 42: Coupler Pinch Bolt & Upper Intermediate Shaft
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Steering column module is centered to the vehicles steering system. Failure to keep the system and steering column module centered and locked/inhibited from rotating can result in steering column module damage. Refer to CLOCKSPRING, STANDARD PROCEDURE .

NOTE: When removing and installing the column to service the upper intermediate shaft, it is not necessary to remove the steering wheel and Steering Column Control Module; the column can be removed and installed as an assembly.

1. Slide upper intermediate shaft (3) onto splines of steering wheel assembly (2).
2. Install coupler pinch bolt (1) and tighten to 45 N.m (33 ft. lbs.)
3. Install column in vehicle. Refer to **COLUMN, INSTALLATION**.

SHROUD, STEERING COLUMN

DESCRIPTION

DESCRIPTION

The steering column shroud is serviced with the steering column module. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .

WHEEL, STEERING

REMOVAL

REMOVAL

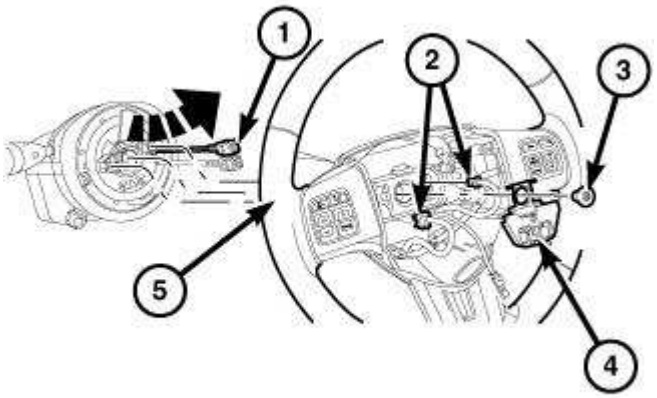

Fig. 43: Pinch Bolt, Steering Wheel Electrical Connectors, Steering Wheel Bolt & Wheel Damper
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before servicing the steering column the airbag system must be disarmed. Refer to RESTRAINTS - SERVICE INFORMATION for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

1. Position the front wheels **straight-ahead** .
2. Fully extend the adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.

4. Remove the driver airbag. Refer to **AIR BAG, DRIVER, REMOVAL** .
5. Disconnect all electrical connectors (2).
6. Remove the steering wheel retainer bolt (3) and the steering wheel damper (4), then slide the steering wheel (5) off the shaft.
7. If wheel is being replaced, transfer attached components as necessary.

INSTALLATION

INSTALLATION

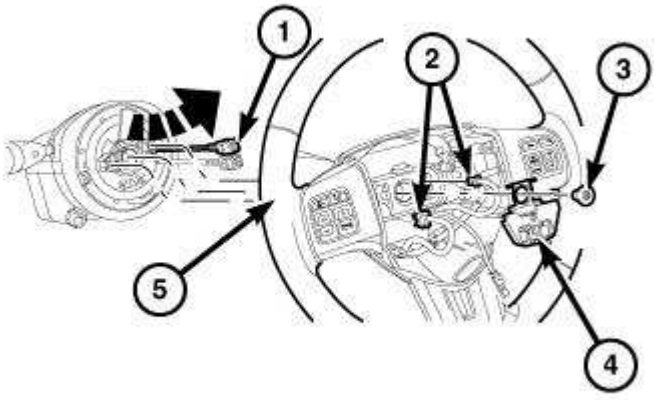

Fig. 44: Pinch Bolt, Steering Wheel Electrical Connectors, Steering Wheel Bolt & Wheel Damper
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.

1. Align the spline on the steering wheel hub to the column shaft, then install the steering wheel (5).
2. Slide the steering wheel damper (4) over the shaft.
3. Install a **NEW** retainer bolt (3) and tighten to 75 N.m (55 ft. lbs.).
4. Connect all electrical connectors (2).
5. Install the airbag. Refer to **AIR BAG, DRIVER, INSTALLATION** .
6. Install the negative battery terminal on the battery. It is important that this is performed properly.
7. Test the operation of the horn, lights and any other functions that are steering column operated.

GEAR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING GEAR

NOTE: This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering information. Refer to DIAGNOSIS AND TESTING.

OBJECTIONABLE HISS OR WHISTLE POSSIBLY CAUSED BY A NOISY STEERING GEAR

1. Check and adjust power steering fluid level in the reservoir as necessary. Refer to **FLUID, STANDARD PROCEDURE**.
2. Start the vehicle and heat system by steering lock-to-lock 5 times with the engine running at 3000 RPM. Do not hold the gear against the stops for more than 15 seconds at a time.
3. Return the engine to idle speed.
4. Listen for the noise when turning the wheel slowly off center during a dry park maneuver.
5. Replace power steering gear if the hiss or whistle is present. Refer to **GEAR, REMOVAL**.

REMOVAL

ALL-WHEEL-DRIVE

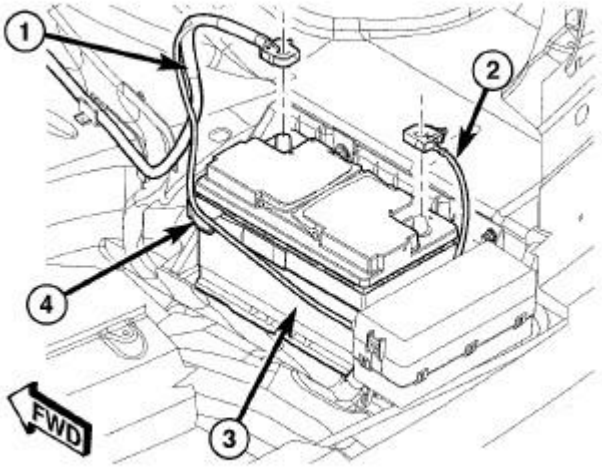

Fig. 45: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

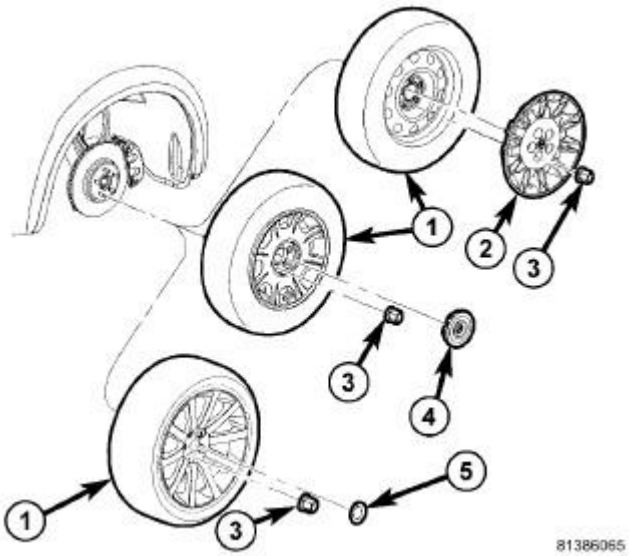

Fig. 46: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then both front tire and wheel assemblies (1).

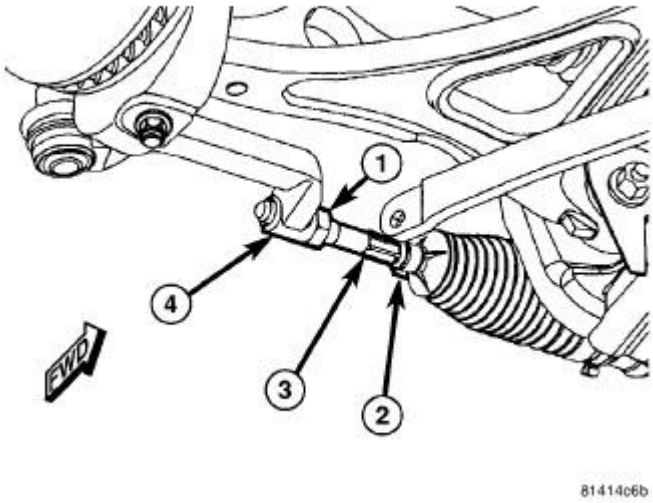

Fig. 47: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp (2) at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

5. Loosen tie rod jam nut (1) at each outer tie rod (4).

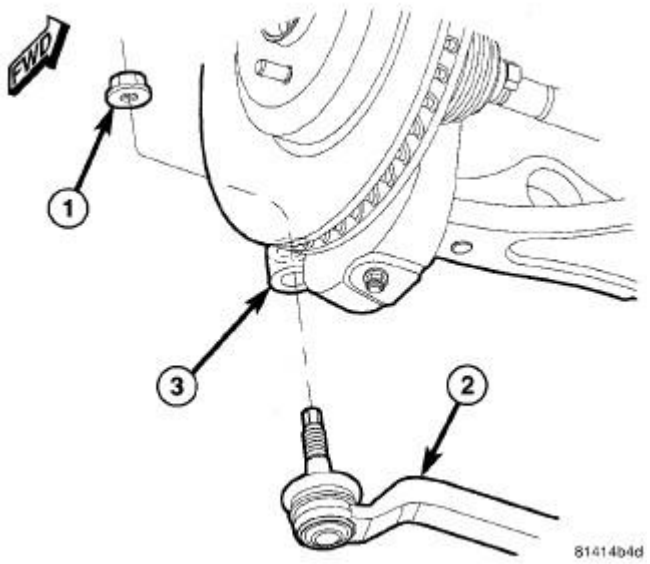

Fig. 48: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

6. Remove outer tie rod (2) end nut (1) at each knuckle (3).

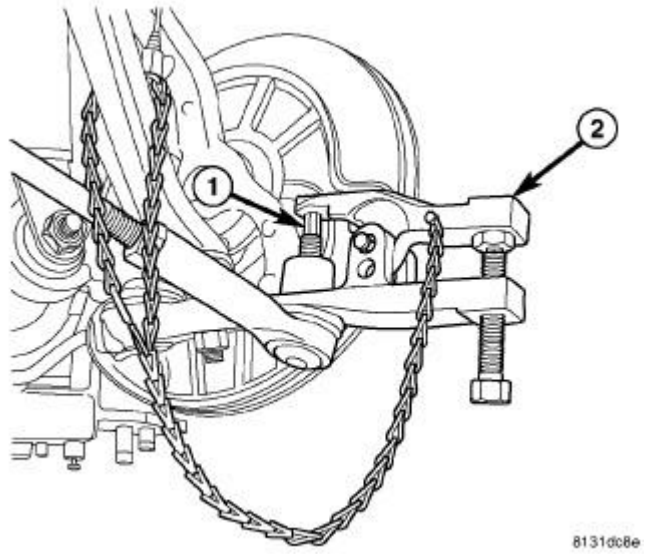

Fig. 49: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

7. Using Remover (special tool #9360, Remover, Ball Joint) (2), separate outer tie rod (1) from each knuckle.

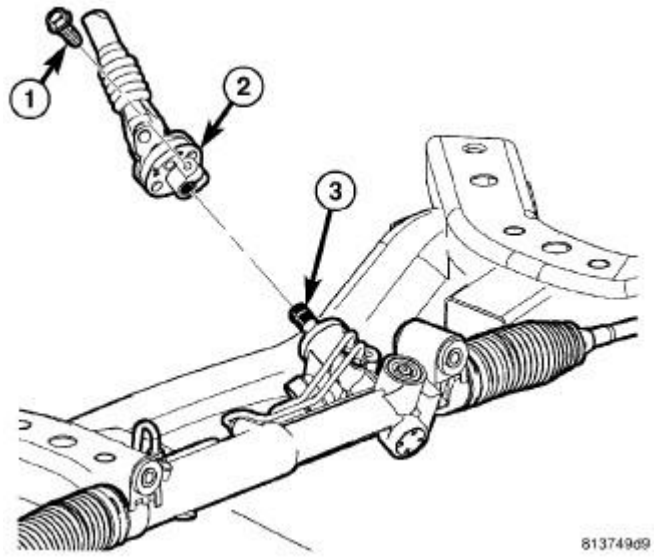

Fig. 50: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

8. Remove lower intermediate shaft coupling pinch bolt (1) at steering gear (3). Separate lower intermediate shaft (2) from steering gear shaft (3).

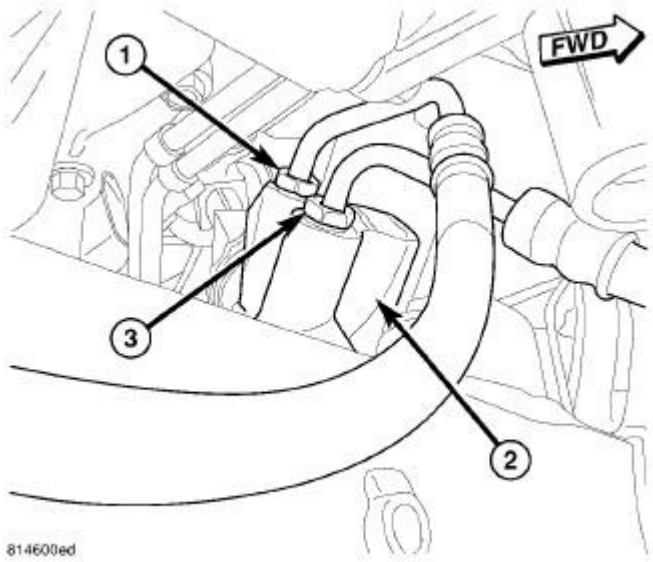

Fig. 51: Hoses AT AWD Gear
Courtesy of CHRYSLER GROUP, LLC

9. Unthread return hose tube nut (1) from steering gear (2). Remove return hose from steering gear.
10. Unthread pressure hose tube nut (3) from steering gear (2). Remove pressure hose from steering gear.

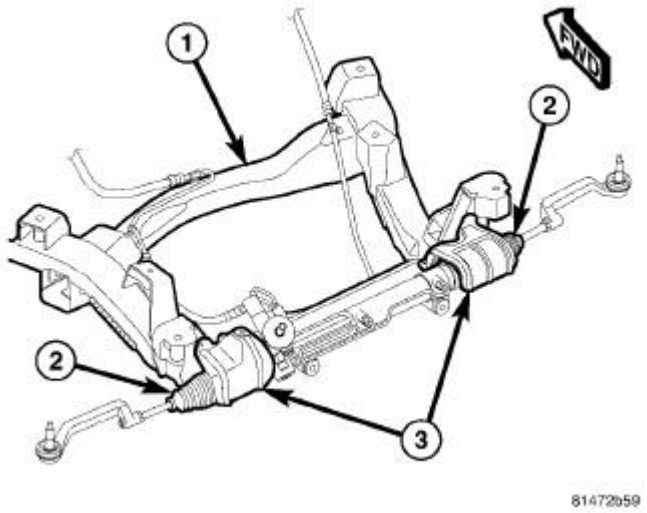

Fig. 52: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

11. Remove mounting screws, then heat shield (3) above each inner tie rod bellows (2).

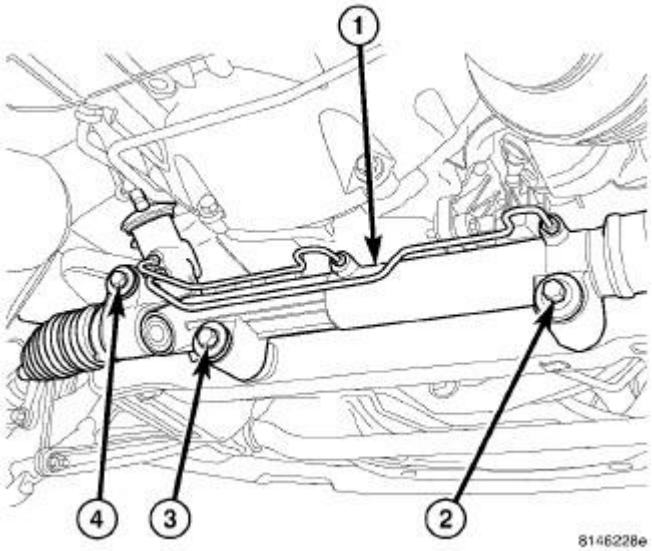

Fig. 53: Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove steering gear upper mounting bolt (4) and nut.
13. Remove steering gear lower mounting bolts (2 and 3).
14. Remove steering gear (1).
15. If necessary, remove outer tie rods from gear. Count number of revolutions off for each tie rod for reference upon installation to replacement gear.

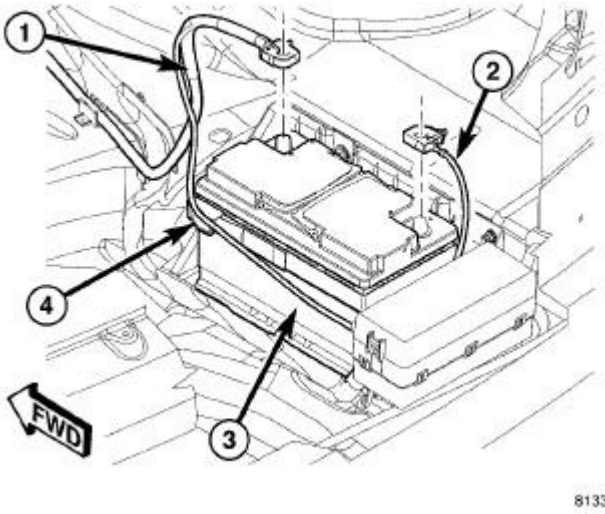

Fig. 54: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

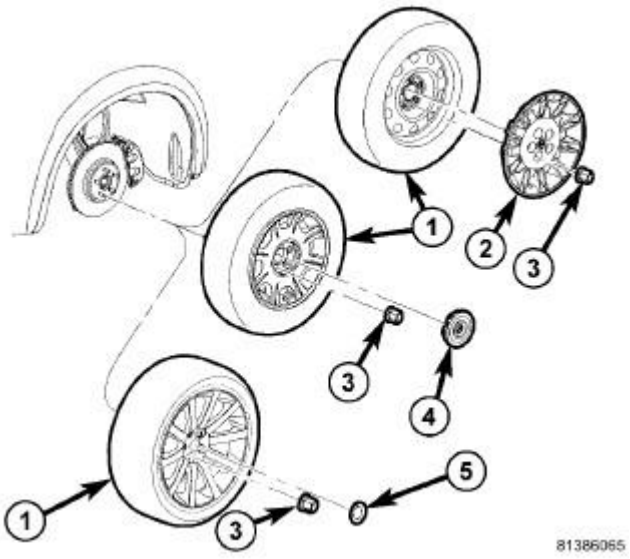

Fig. 55: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

4. Remove wheel mounting nuts (3), then both front tire and wheel assemblies (1).

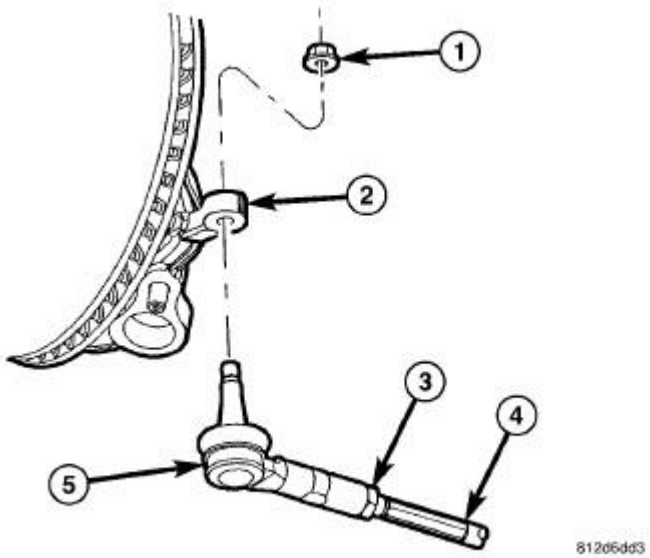

Fig. 56: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

5. Loosen tie rod jam nut (3) at each outer tie rod (5).
6. Remove outer tie rod nut (1) at each knuckle (2).

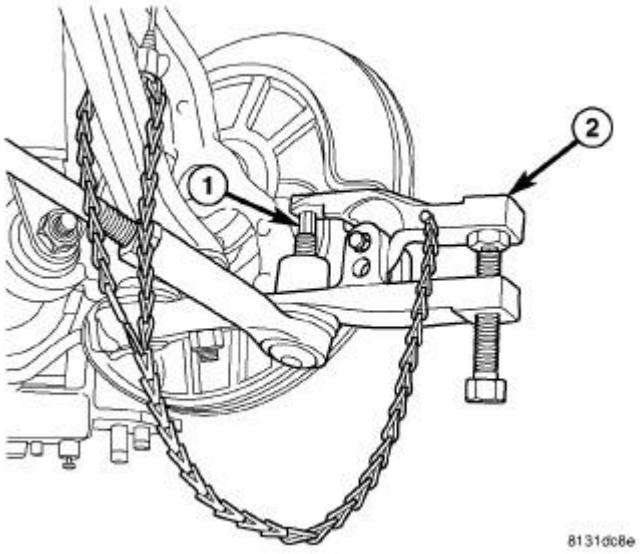

Fig. 57: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

7. Using Remover (special tool #9360, Remover, Ball Joint) (2), separate outer tie rod (1) from each knuckle.

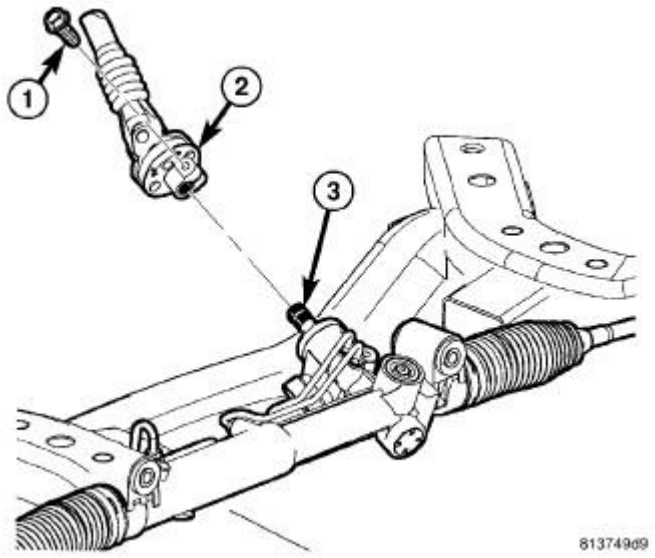

Fig. 58: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

8. Remove lower intermediate coupling pinch bolt (1) at steering gear (3). Separate lower intermediate shaft (2) from steering gear shaft (3).

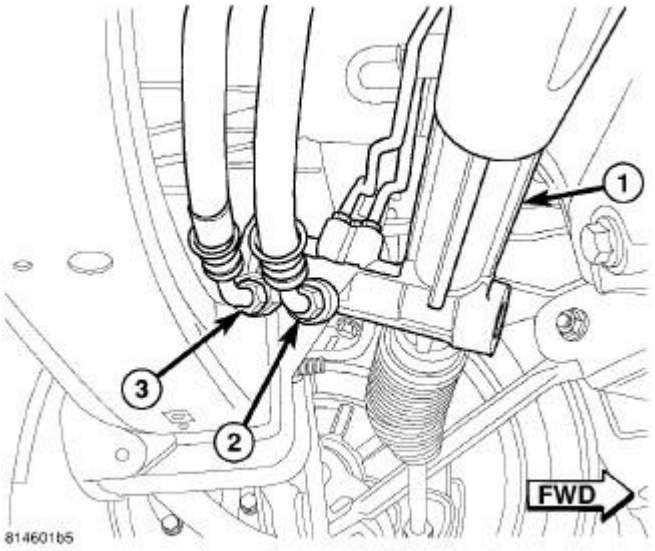

Fig. 59: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

9. Unthread pressure hose tube nut (2) from steering gear (1). Remove pressure hose from

steering gear.

10. Unthread return hose tube nut (3) from steering gear (1). Remove return hose from steering gear.

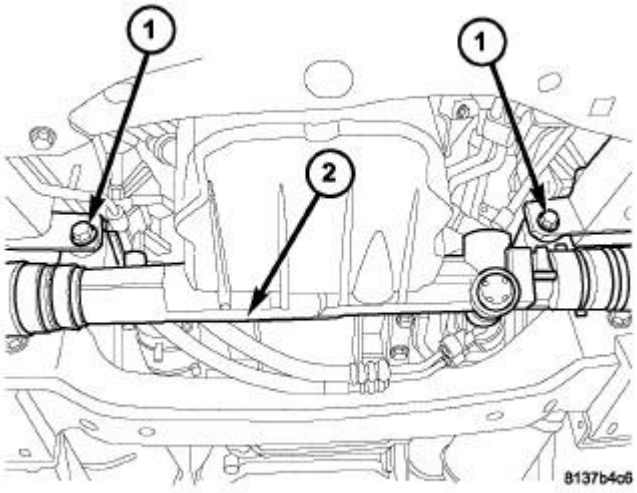

Fig. 60: Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove steering gear mounting bolts (1).
12. If necessary, remove outer tie rods from gear. Count number of revolutions off for each tie rod for reference upon installation to replacement gear.

INSTALLATION

ALL-WHEEL-DRIVE

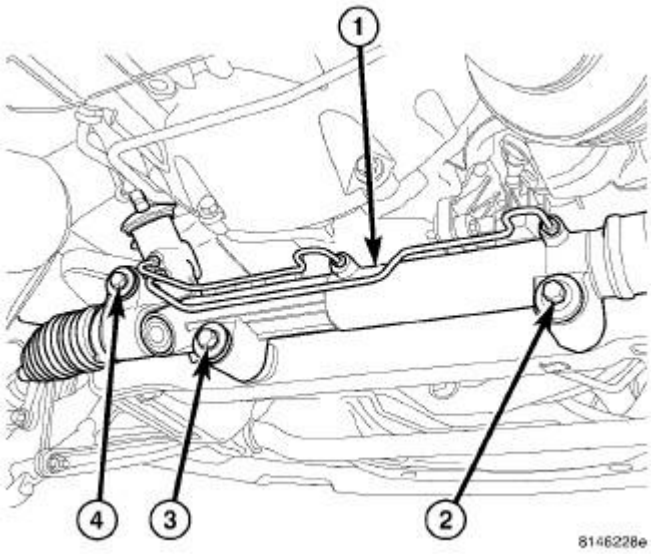

Fig. 61: Steering Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install outer tie rods from original gear to replacement inner tie rods. Install each outer tie rod same amount of threads as it was installed on original gear. This will get toe setting close, saving some time when toe is set later in this procedure.
2. Lift steering gear (1) into mounted position and install steering gear lower mounting bolts (2 and 3). Install upper mounting bolt (4) and nut. Tighten all bolts to 102 N.m (75 ft. lbs.).

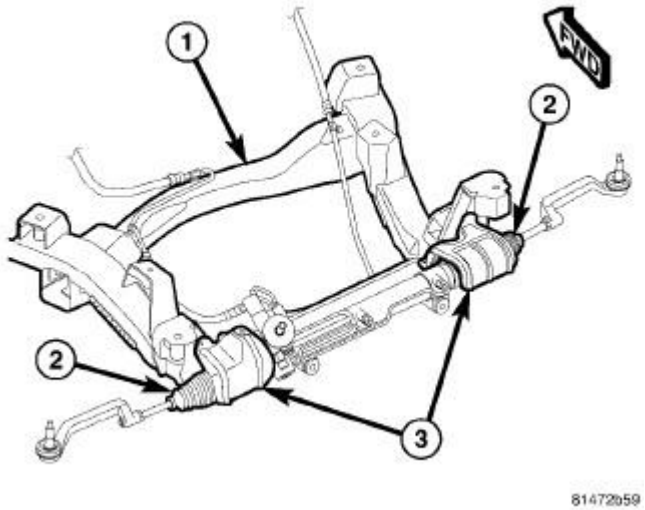

Fig. 62: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

3. Install heat shield (3) above each inner tie rod bellows (2). Tighten screws to 10 N.m (89 in. lbs.).

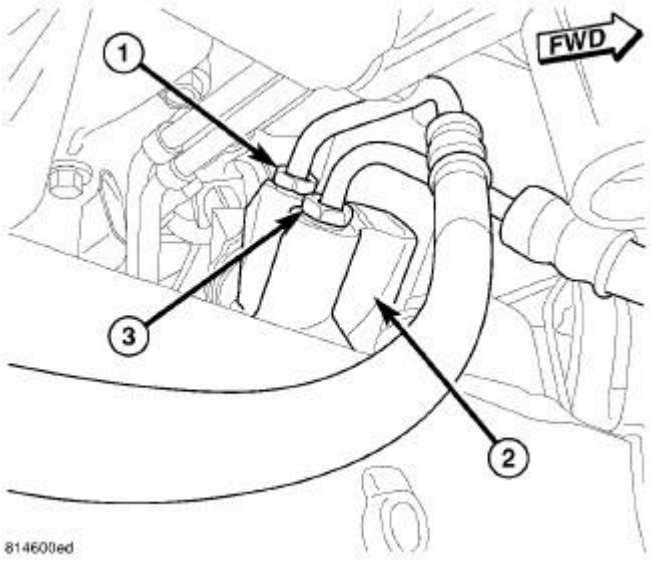

Fig. 63: Hoses AT AWD Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the ends of the steering hoses.

4. Lubricate NEW O-ring on end of pressure hose with clean power steering fluid.
5. Install pressure hose (3) to steering gear (2). Tighten tube nut to 47 N.m (35 ft. lbs.).
6. Lubricate NEW O-ring on end of return hose with clean power steering fluid.
7. Install return hose (1) to steering gear (2). Tighten tube nut to 47 N.m (35 ft. lbs.).

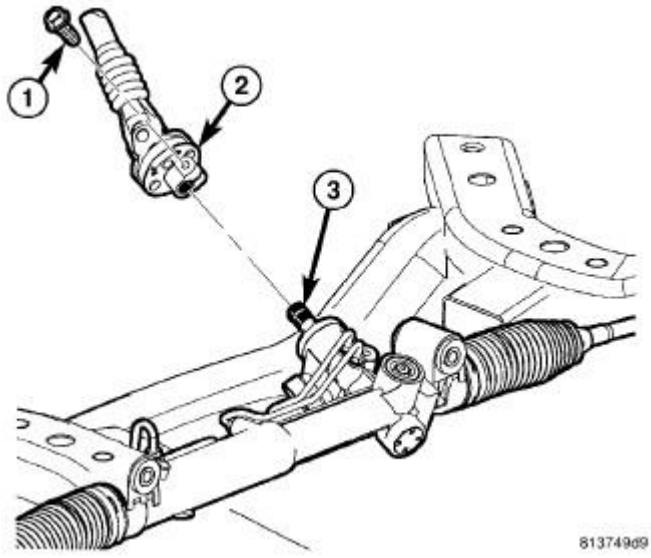

Fig. 64: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

8. Align splines and install lower intermediate shaft coupling (2) to steering gear shaft (3). Install **NEW** pinch bolt and tighten bolt to 45 N.m (33 ft. lbs.).

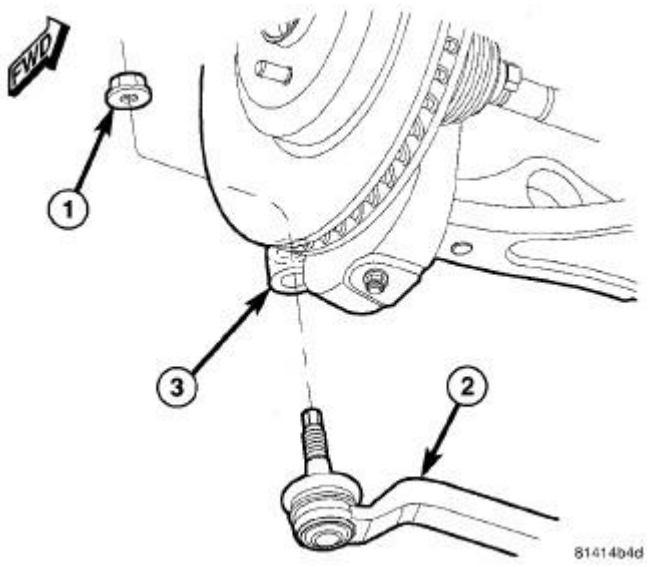

Fig. 65: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

9. Install each outer tie rod (2) end to its knuckle (3). Install nut (1) and tighten to 35 N.m + 90° turn (26 ft. lbs. + 90° turn).

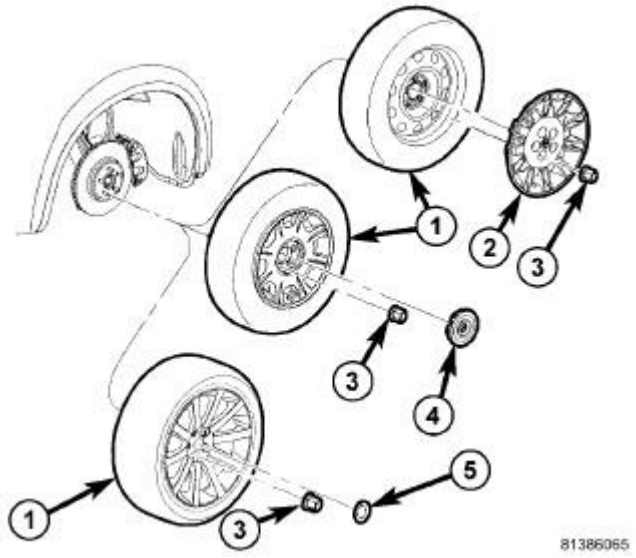

Fig. 66: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

10. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .

11. Lower vehicle.

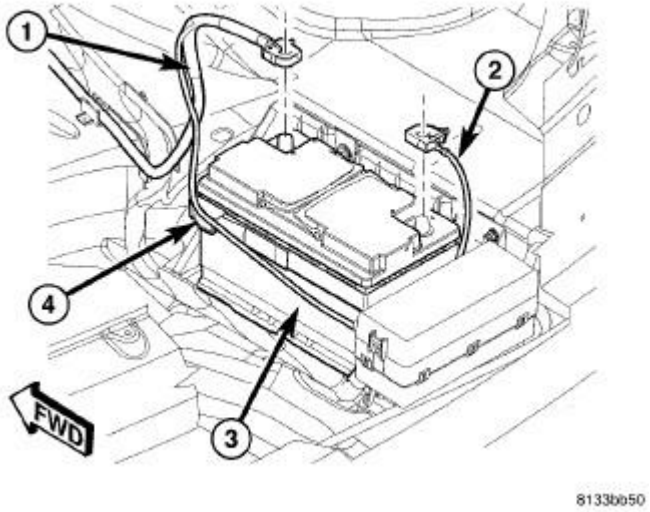

Fig. 67: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

12. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
13. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.
14. Perform wheel alignment setting toe to specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

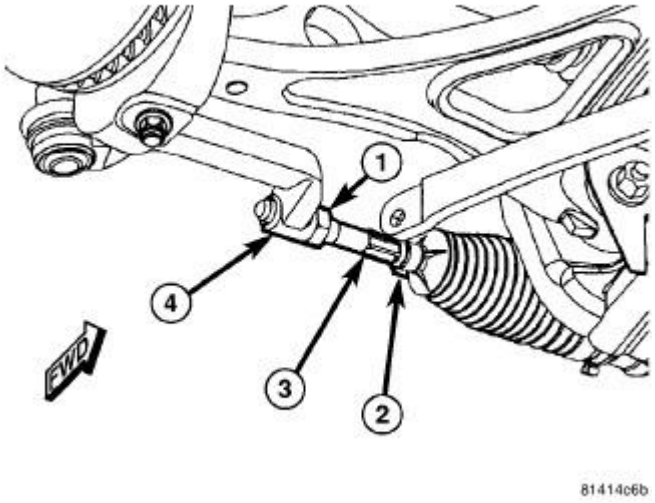

Fig. 68: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

15. Tighten tie rod jam nuts (1) to 75 N.m (55 ft. lbs.).

REAR-WHEEL-DRIVE

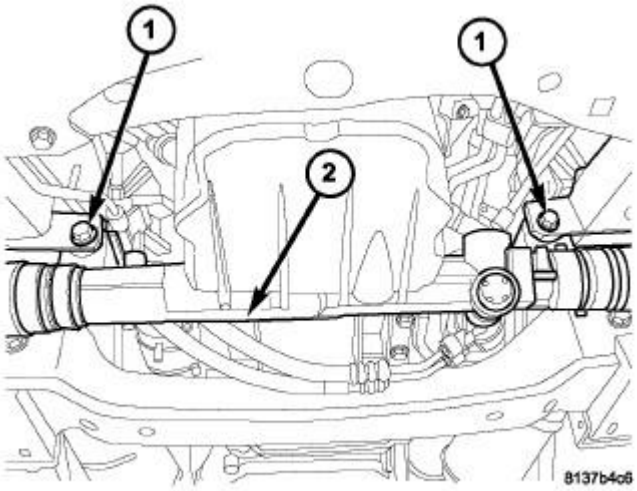

Fig. 69: Gear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install outer tie rods from original gear to replacement inner tie rods. Install each outer tie rod same amount of threads as it was installed on original gear. This will get toe setting close, saving some time when toe is set later in this procedure.
2. Lift steering gear (2) into mounted position and install steering gear mounting bolts (1). Tighten bolts to 95 N.m (70 ft. lbs.).

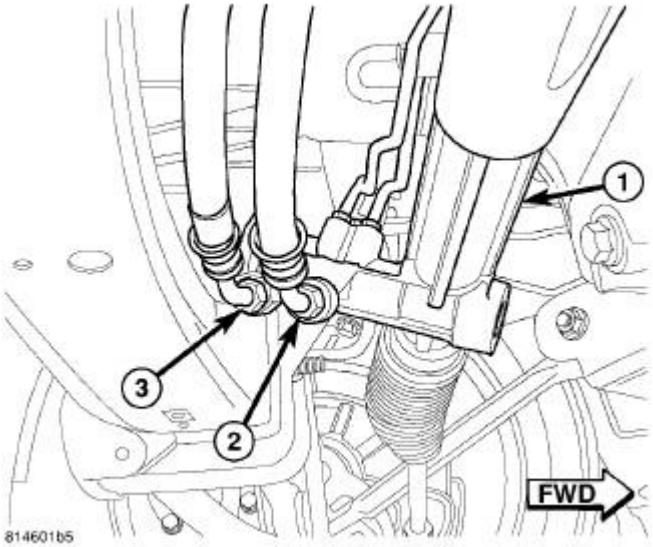

Fig. 70: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the ends of the steering hoses.

3. Lubricate NEW O-ring on end of return hose with clean power steering fluid.
4. Install return hose (3) to steering gear (1). Tighten tube nut to 47 N.m (35 ft. lbs.).
5. Lubricate NEW O-ring on end of pressure hose with clean power steering fluid.
6. Install pressure hose (2) to steering gear (1). Tighten tube nut to 47 N.m (35 ft. lbs.).

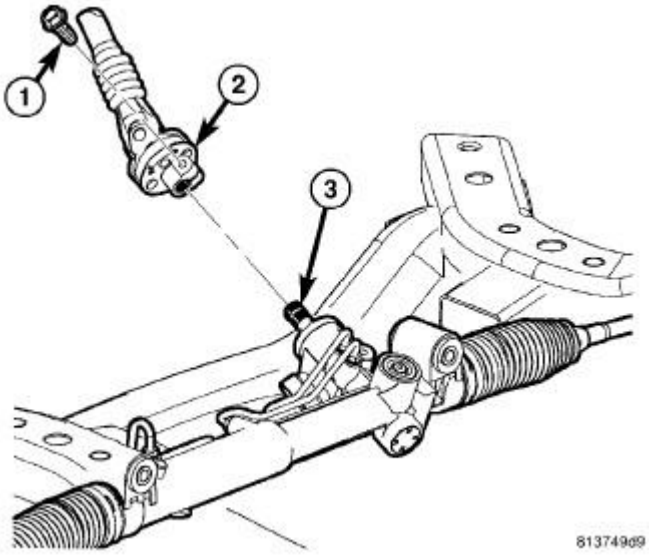

Fig. 71: Steering Coupling
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Prior to coupling installation, make sure gear is centered in its travel to match clockspring centering in steering column.

7. Align lower intermediate shaft (2) with input shaft (3) and install steering coupling. Install NEW pinch bolt and tighten to 45 N.m (33 ft. lbs.).

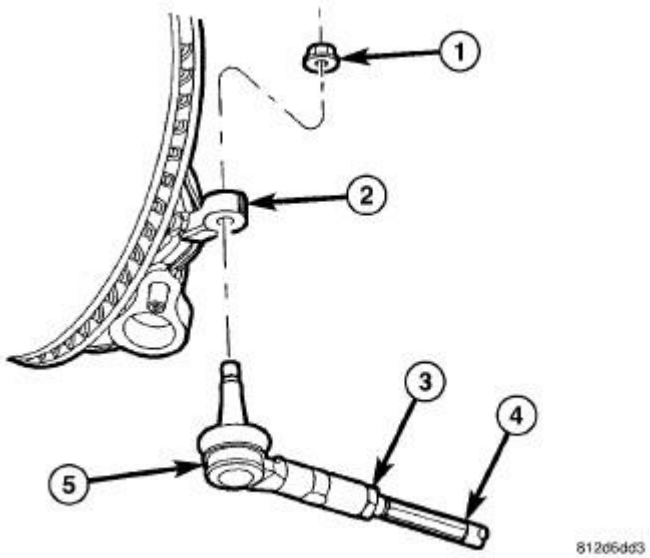

Fig. 72: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

8. Install each outer tie rod end (5) to its knuckle (2). Install nuts (1) and tighten to 35 N.m + 90° turn (26 ft. lbs. + 90° turn).

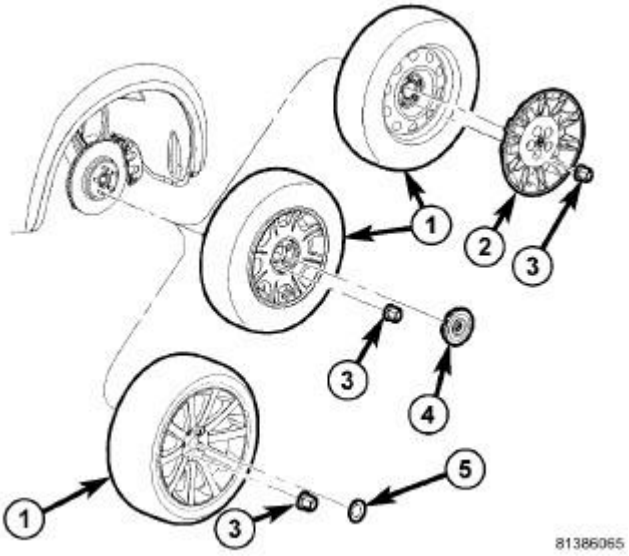

Fig. 73: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
10. Lower vehicle.

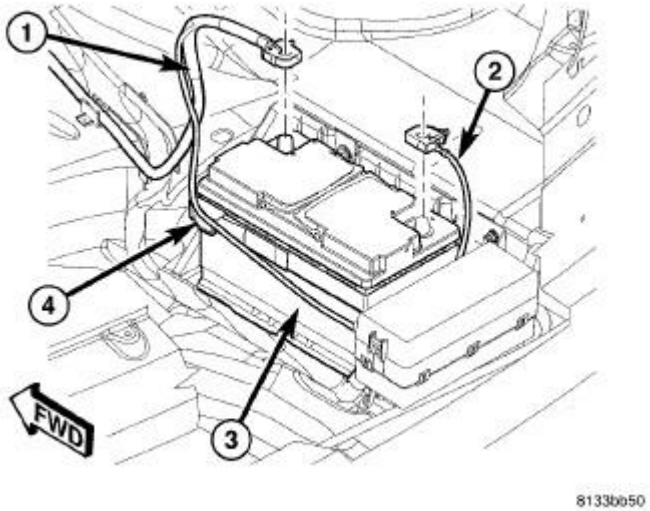

Fig. 74: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

11. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
12. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.
13. Perform wheel alignment setting toe to specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

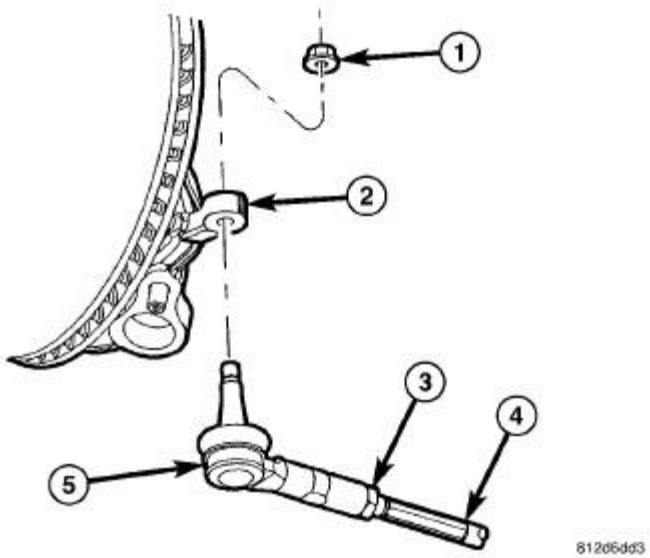

Fig. 75: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

14. Tighten both tie rod jam nuts (3) to 75 N.m (55 ft. lbs.).

TIE ROD, STEERING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIE ROD

Tie rod free-play can be measured using the following methods:

OUTER TIE ROD

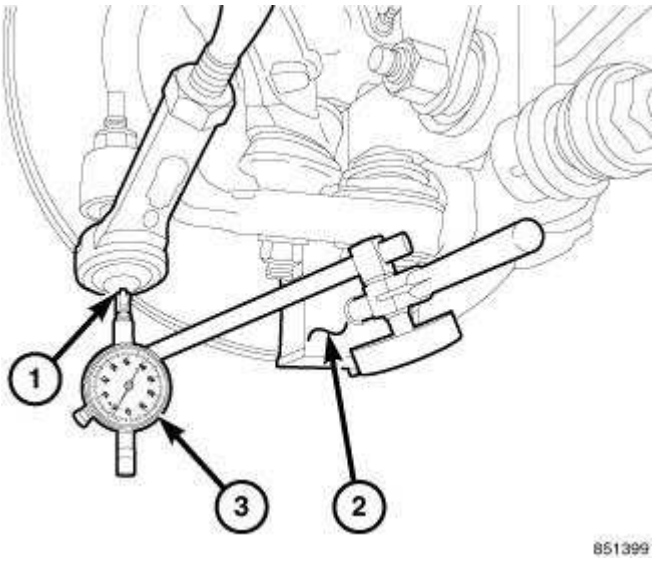

Fig. 76: Magnetic Dial Indicator
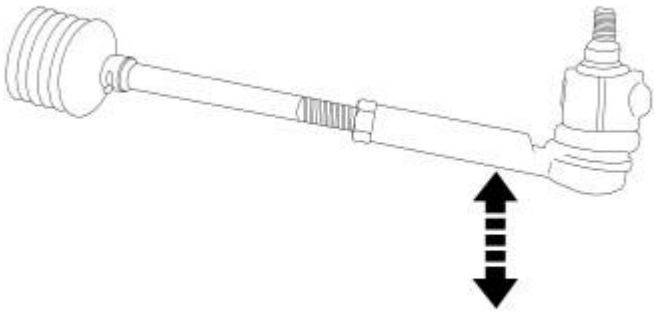
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front wheels. Refer to **REMOVAL** .
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.
4. Attach a magnetic dial indicator (2) to the inside of the brake rotor, then align dial indicator's contact pointer (1) with direction of stud axis and touch outer tie rod.
5. Zero dial indicator (3).



81d2625b

Fig. 77: Checking Outer Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than light hand pressure will result in a false reading.

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light hand pressure. (Less than 10 lbs. of force.)
7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.
10. If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod, check the inner tie rod for free-play. See the following procedure.

INNER TIE ROD

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

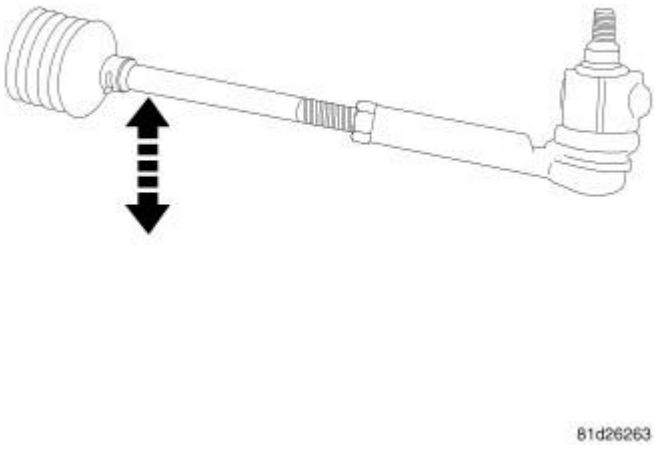


Fig. 78: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. If no free-play is felt, install the front wheels. Refer to **INSTALLATION** .
3. Remove support and lower the vehicle.

REMOVAL

INNER TIE ROD

1. Remove outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. Remove tie rod jam nut from inner tie rod.

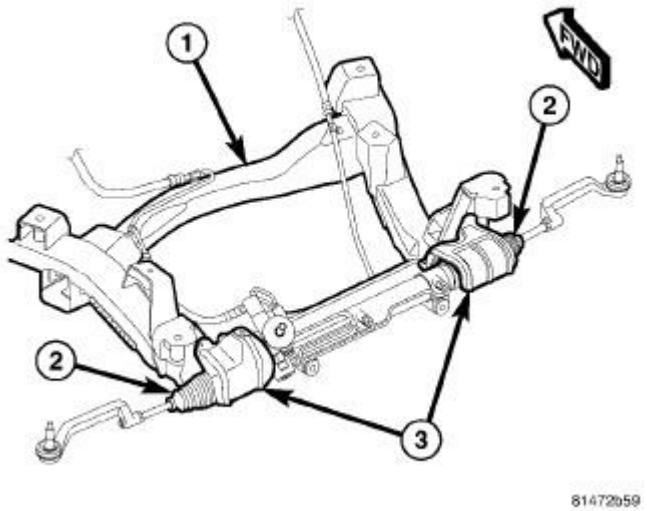

Fig. 79: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If equipped with All-Wheel-Drive, it may be necessary to remove heat shield (3) above inner tie rod bellows (2) to allow better access to bellows clamp.**

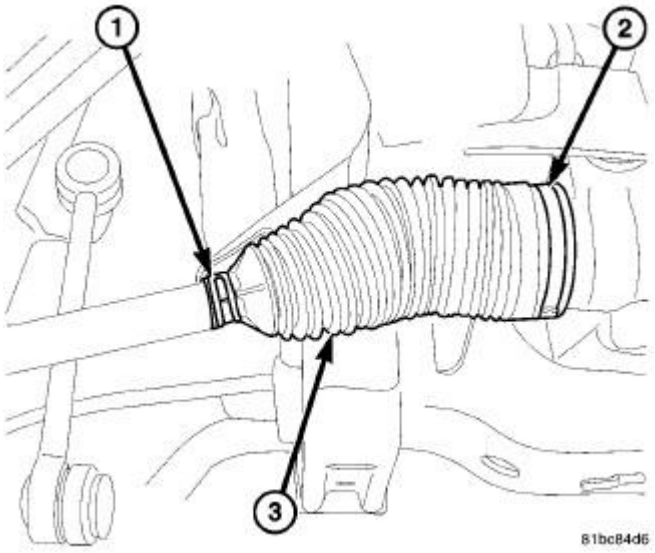

Fig. 80: Bellows Clamps
Courtesy of CHRYSLER GROUP, LLC

3. Remove clamp (1) securing bellows (3) to inner tie rod.
4. Remove clamp (2) securing bellows (3) to steering gear body.
5. Remove bellows (3).

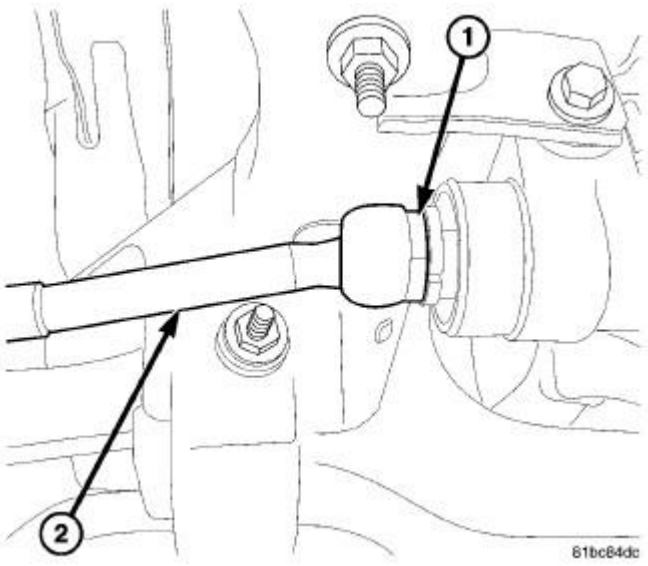

Fig. 81: Inner Tie Rod Hex
Courtesy of CHRYSLER GROUP, LLC

6. Install appropriate inner tie rod removal tool on inner tie rod hex (1).

CAUTION: If inner tie rod cannot be removed using specified tools, do not use a hammer or heat to loosen. Damage to steering gear will occur. Replace entire steering gear.

7. Unthread and remove inner tie rod (2).

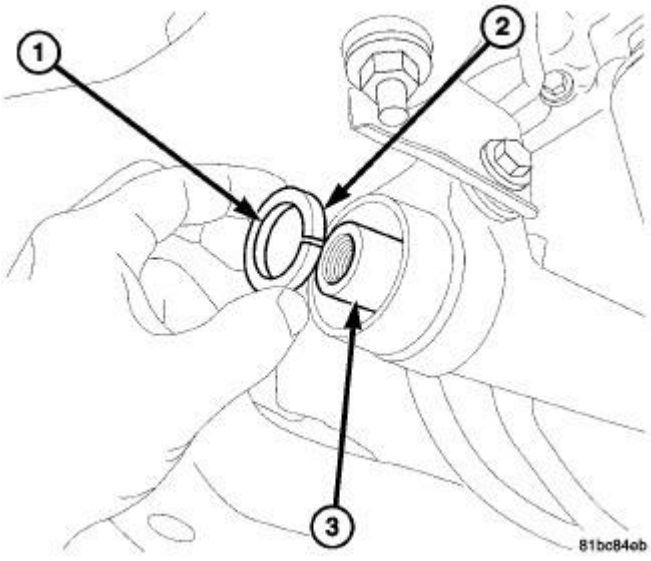

Fig. 82: Restrictor Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

8. Remove travel restrictor (2) from rack gear (3).

OUTER TIE ROD - ALL-WHEEL-DRIVE

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

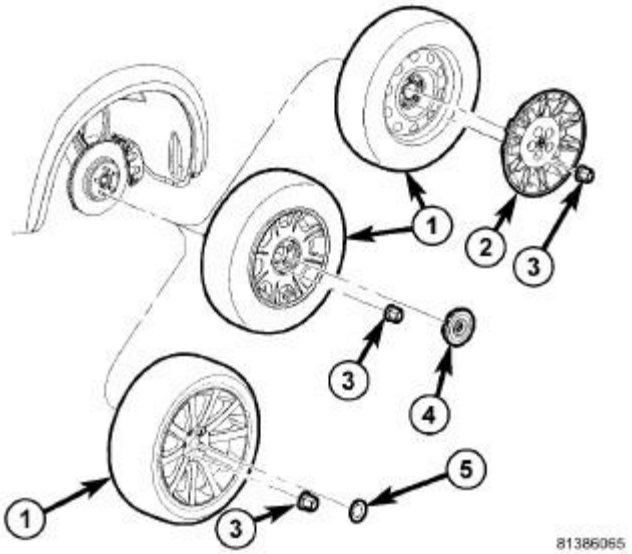

Fig. 83: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then front tire and wheel assembly (1).

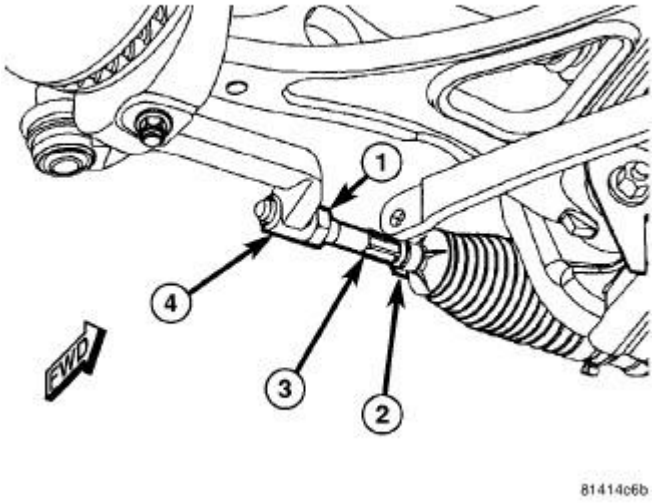

Fig. 84: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp (2) at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

3. Loosen tie rod jam nut (1) at outer tie rod (4).

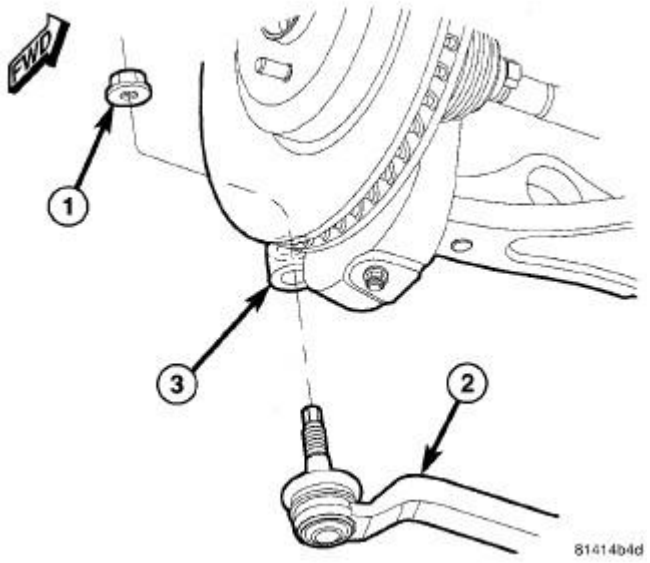

Fig. 85: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

4. Remove outer tie rod end nut (1) at knuckle (3).

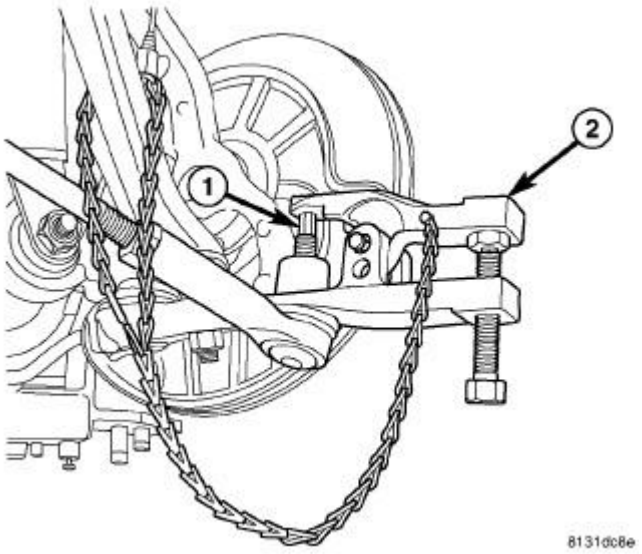

Fig. 86: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

5. Using Remover (special tool #9360, Remover, Ball Joint) (2), separate outer tie rod end (1) from knuckle.
6. Unthread outer tie rod from inner tie rod. **Count number of turns when removing outer tie rod. This will give a good starting point when reassembling and when setting toe.**

OUTER TIE ROD - REAR-WHEEL-DRIVE

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

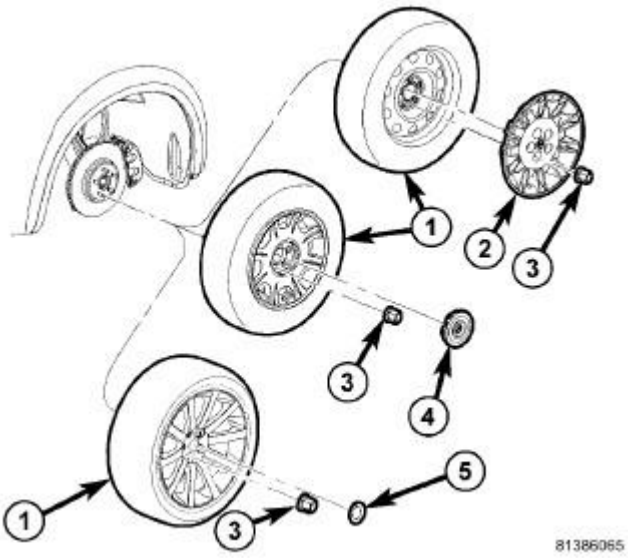

Fig. 87: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then front tire and wheel assembly (1).

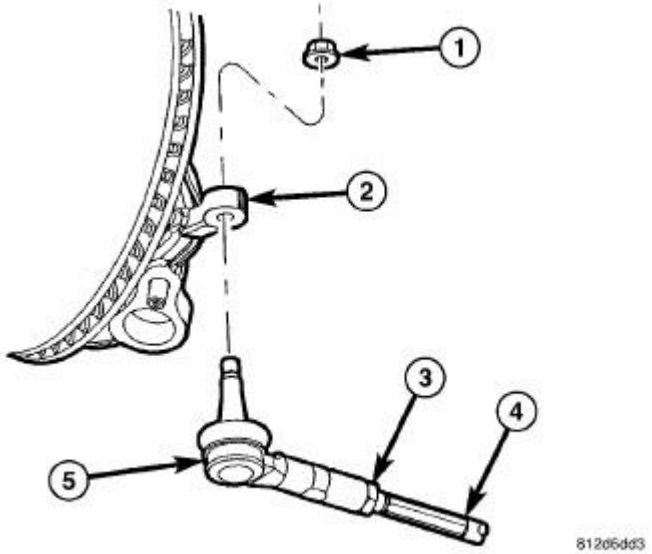

Fig. 88: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

3. Loosen tie rod jam nut (3) at outer tie rod (5).
4. Remove outer tie rod end nut (1) at knuckle (2).

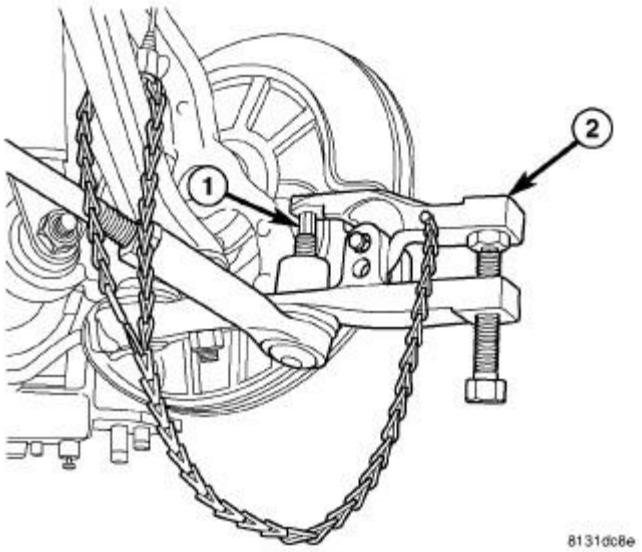

Fig. 89: Using Puller On Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

5. Using Remover (special tool #9360, Remover, Ball Joint) (2), separate outer tie rod end (1) from knuckle.
6. Unthread outer tie rod from inner tie rod. **Count number of turns when removing outer tie rod. This will give a good starting point when reassembling and when setting toe.**

INSTALLATION

INNER TIE ROD

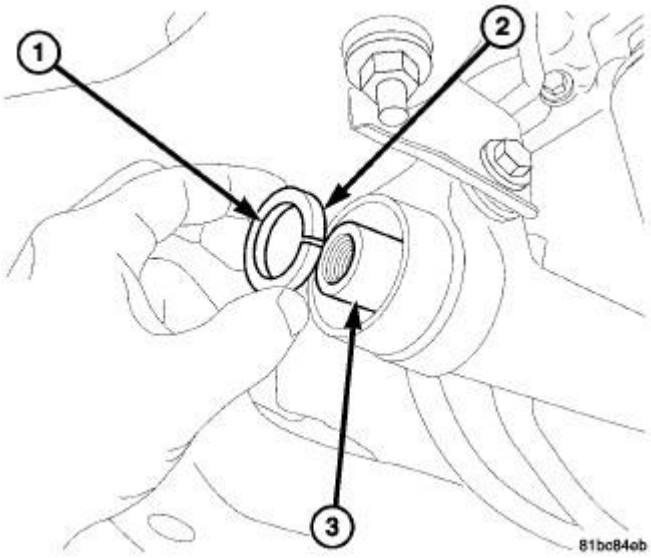

Fig. 90: Restrictor Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: The travel restrictor (2) has a beveled lip (1) on one end of its inside diameter to keep the restrictor from being install too far onto the rack gear. Install the restrictor with the beveled lip side outward (away from gear) to avoid misinstallation and restrictor damage.

1. Install travel restrictor (2), beveled lip (1) side outward, on end of rack gear (3). Once installed, restrictor will be flush with end of rack gear.
2. Apply Mopar® Lock AND Seal Adhesive or equivalent medium thread locker adhesive to inboard end threads of inner tie rod.

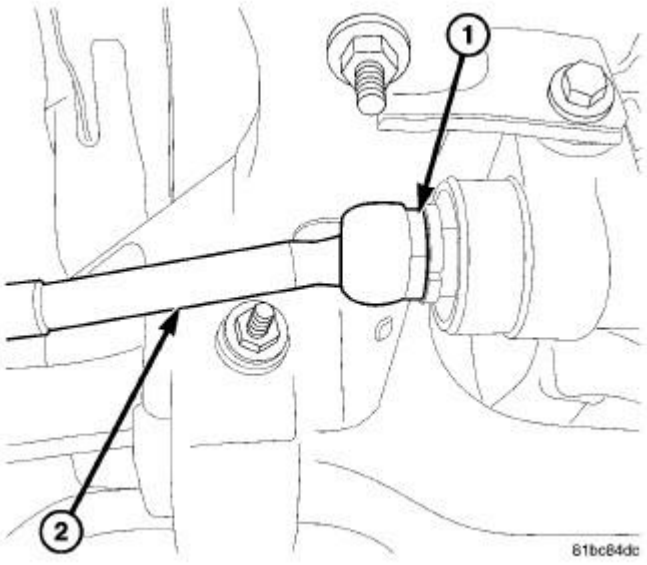

Fig. 91: Inner Tie Rod Hex
Courtesy of CHRYSLER GROUP, LLC

3. Install inner tie rod (2) onto gear using appropriate inner tie rod installer tool or crows foot wrench on hex (1). Tighten inner tie rod to 88 N.m. (65 ft. lbs.).
4. Loosely place new clamp over large end of bellows.

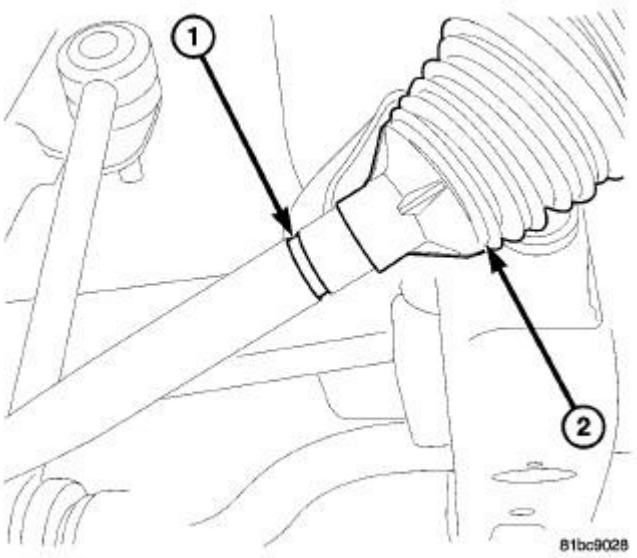

Fig. 92: Groove In Inner Tie Rod
Courtesy of CHRYSLER GROUP, LLC

5. Apply a small amount of Mopar® Lubriplate or equivalent uniformly to groove (1) in inner tie rod shaft. This allows for toe adjustment without twisting bellows.
6. Slide new bellows with clamp over end of inner tie rod and onto gear body.
7. Push small end of bellows (2) until ridge inside bellow engages groove (1) machined into inner tie rod.

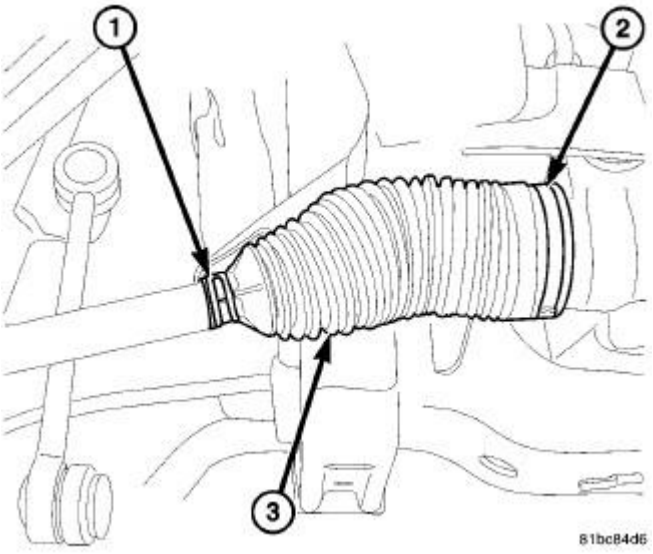

Fig. 93: Bellows Clamps
Courtesy of CHRYSLER GROUP, LLC

8. Install new clamp (1) over small end of bellows (3).

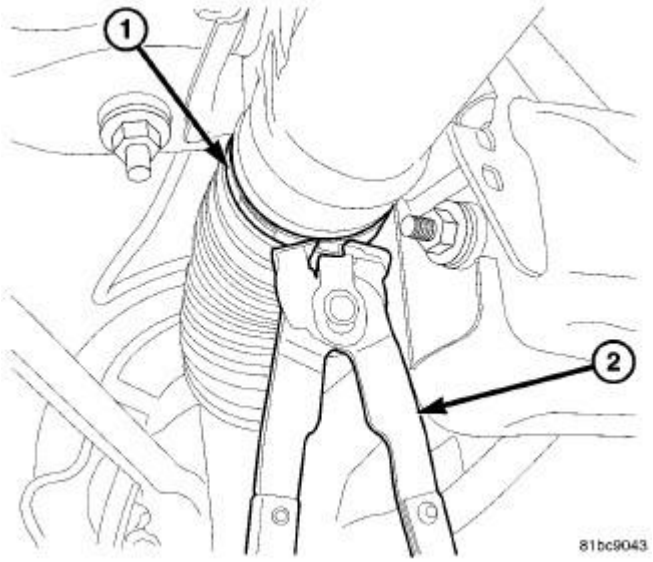

Fig. 94: Crimping Bellows Clamp
Courtesy of CHRYSLER GROUP, LLC

9. Using crimping pliers (2), crimp bellows clamp (1) at gear body.

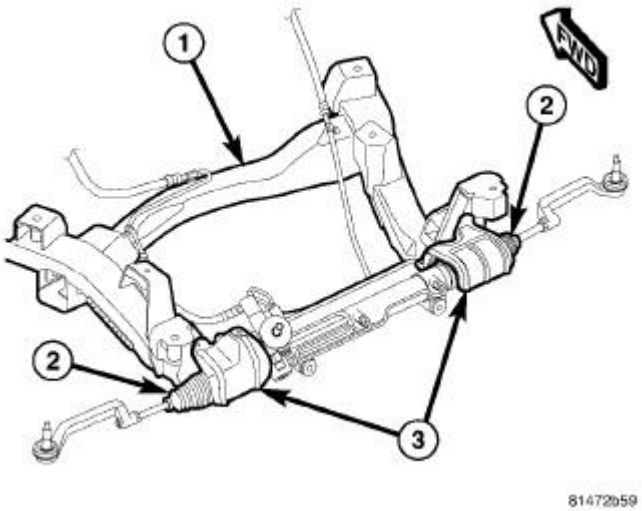

Fig. 95: Rack Assembly And Inner Tie Rod Bellows Heat Shields
Courtesy of CHRYSLER GROUP, LLC

10. If equipped with All-Wheel-Drive and heat shield was removed, install heat shield (3) above inner tie rod bellows (2). Tighten screws to 10 N.m (89 in. lbs.).
11. Thread tie rod jam nut onto inner tie rod far enough to install outer tie rod.
12. Install outer tie rod. Refer to **TIE ROD, STEERING, INSTALLATION**.

OUTER TIE ROD - ALL-WHEEL-DRIVE

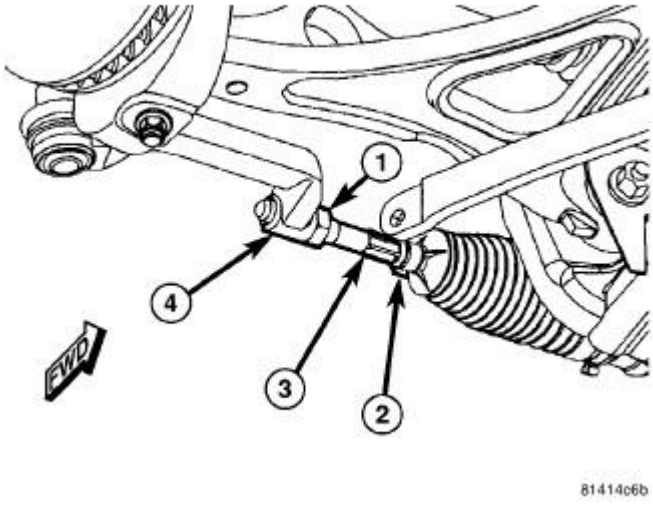

Fig. 96: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp (2) at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

1. Thread outer tie rod (4) onto inner tie rod (3). Install outer tie rod same number of turns as when removed.

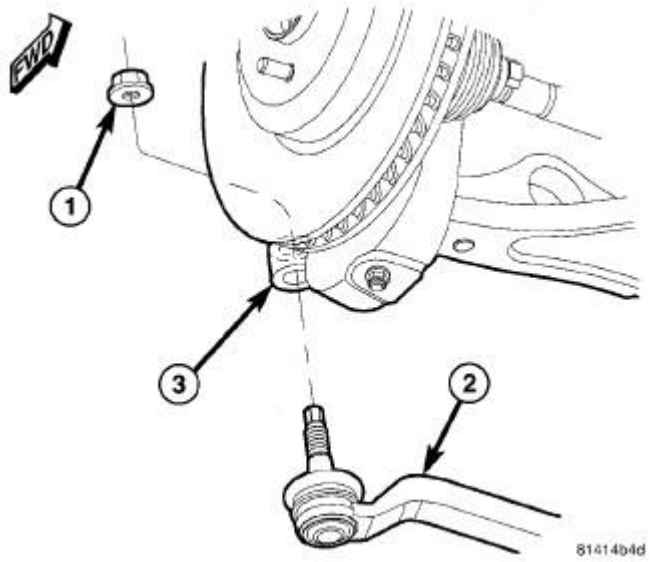

Fig. 97: Tie Rod Attachment AT Knuckle
Courtesy of CHRYSLER GROUP, LLC

2. Install outer tie rod end (2) into steering knuckle (3). Install and tighten nut (1) to 35 N.m + 90° turn (26 ft. lbs. + 90° turn).

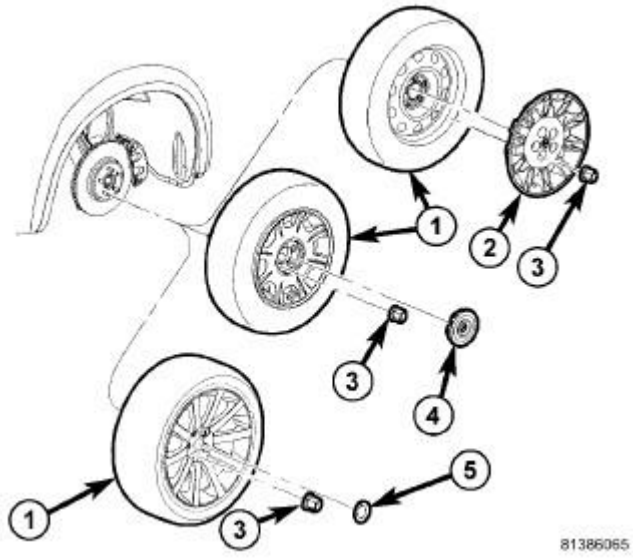

Fig. 98: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
4. Lower vehicle.
5. Perform wheel alignment setting toe to specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

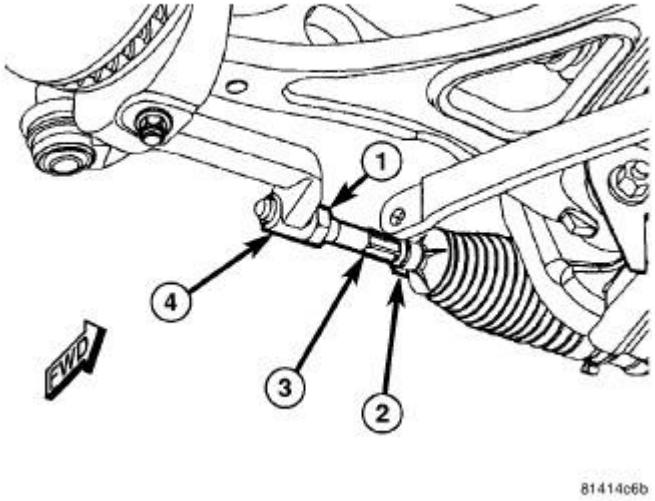

Fig. 99: Removing/Installing Tie Rods (AWD)
Courtesy of CHRYSLER GROUP, LLC

6. Tighten tie rod jam nut (1) to 75 N.m (55 ft. lbs.).

OUTER TIE ROD - REAR-WHEEL-DRIVE

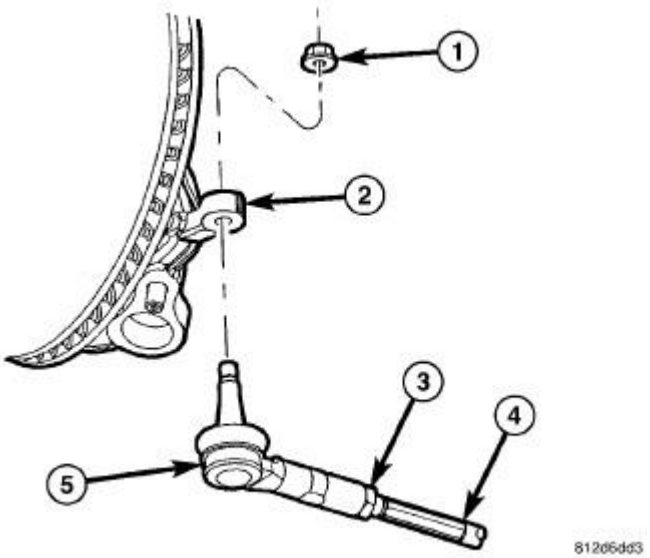

Fig. 100: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

1. Thread outer tie rod (5) onto inner tie rod (4), Install outer tie rod same number of turns as when removed.
2. Install outer tie rod end (5) into steering knuckle (2). Install and tighten nut (1) to 35 N.m + 90° turn (26 ft. lbs. + 90° turn).

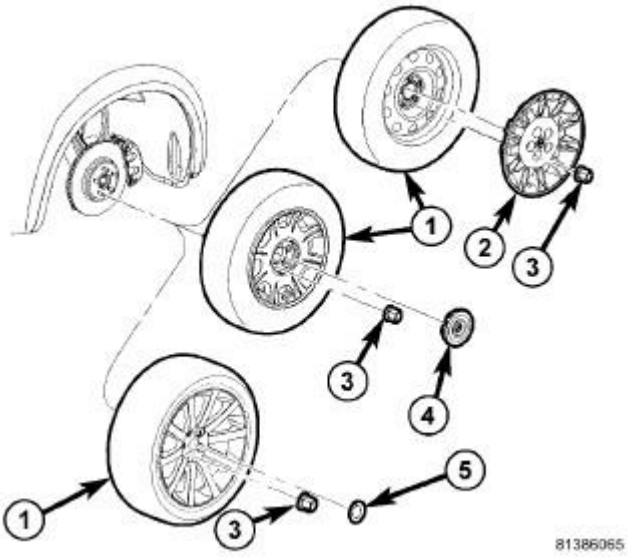

Fig. 101: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

3. Install tire and wheel assemblies (1). Refer to **INSTALLATION** .
4. Lower vehicle.
5. Perform wheel alignment setting toe to specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

6. Tighten tie rod jam nut (3) to 75 N.m (55 ft. lbs.).

PUMP

DESCRIPTION

NON SRT

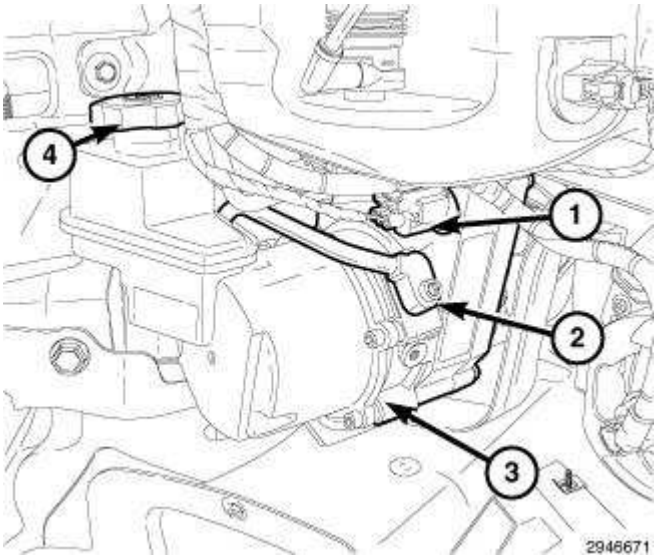

Fig. 103: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

Hydraulic pressure for operation of the power steering gear is provided by an Electro Hydraulic Power Steering (EHPS) pump (3). The EHPS pump is located in front of the right side tire and can be accessed by loosening and positioning aside the front wheelhouse splash shield.

SRT

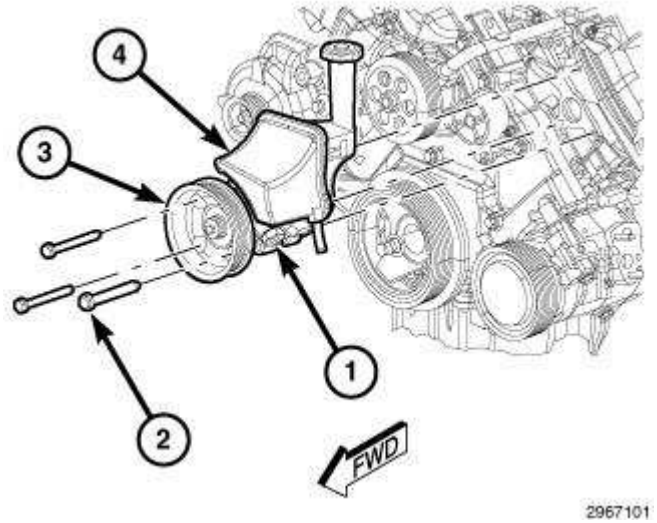

Fig. 104: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

Hydraulic pressure for operation of the power steering gear is provided by a belt-driven all-aluminum power steering pump. SRT vehicles use a constant displacement type pump that is mounted to the left front of engine. The power steering reservoir (4) is integrated with the power steering pump.

DIAGNOSIS AND TESTING

POWER STEERING PUMP AND HOSES

NOTE: This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering information. Refer to DIAGNOSIS AND TESTING.

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS - SRT ONLY

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. Refer to **PUMP, REMOVAL**.

CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

- Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. Refer to **SPECIFICATIONS**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.
- Check fastener torque of hose mounting brackets and tube nuts. Refer to **SPECIFICATIONS**.
- Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. Refer to **SPECIFICATIONS**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.

PUMP LEAKAGE

The pump is serviced as an assembly and should not be disassembled.

Check for leaks in the following areas:

- Pump shaft seal behind the pulley - SRT only.
- Pressure and return lines
- Flow control valve fitting

REMOVAL

NON SRT

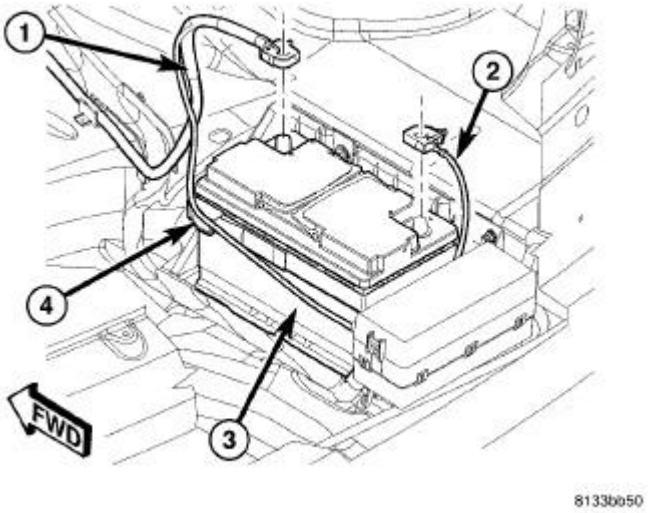

Fig. 105: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove right front wheel mounting nuts, then tire and wheel assembly.
4. Remove right front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

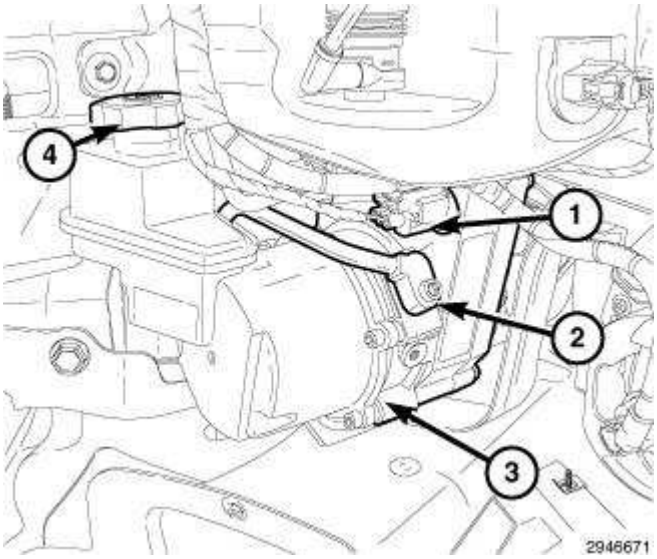

Fig. 106: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

5. Siphon power steering fluid from pump reservoir (4).
6. Disconnect electrical connectors (1) from Electro Hydraulic Power Steering (EHPS) pump body

(3).

7. Remove power steering pressure line bolt (2) and position the pressure line away from the EHPS pump.

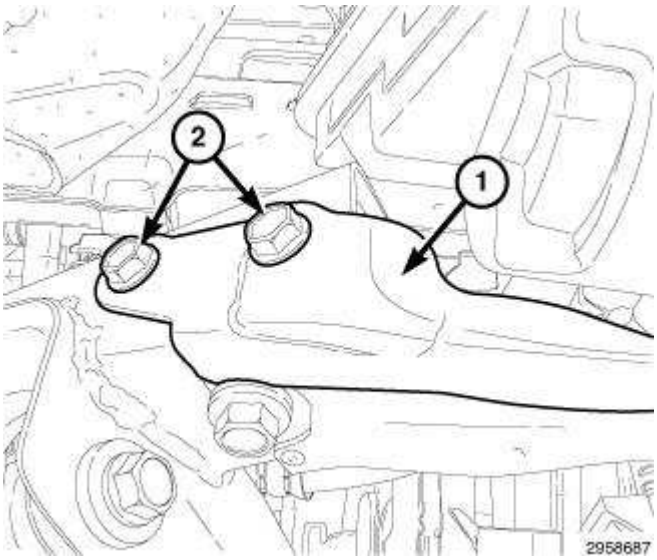

Fig. 107: Two Mounting Bolts & Electro Hydraulic Power Steering (EHPS) Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

8. Remove EHPS pump bracket (1) mounting bolts (2).

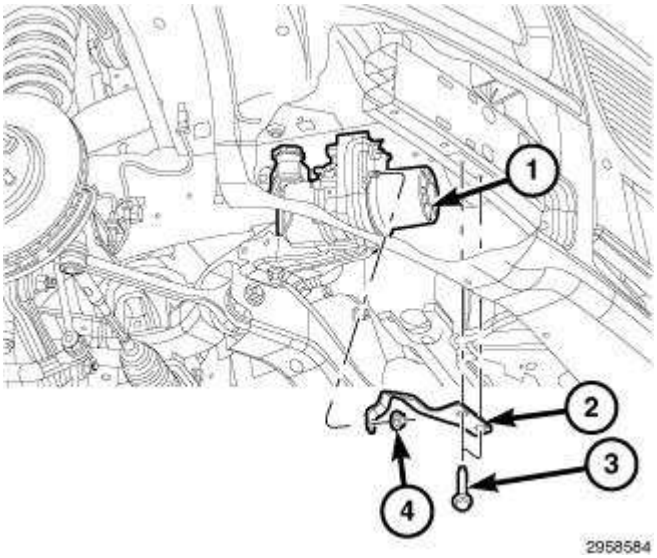

Fig. 108: EHPS Pump Bracket Retaining Nut & EHPS Pump
Courtesy of CHRYSLER GROUP, LLC

9. Remove EHPS pump bracket retaining nut (4) and remove the EHPS pump (1) from the vehicle.

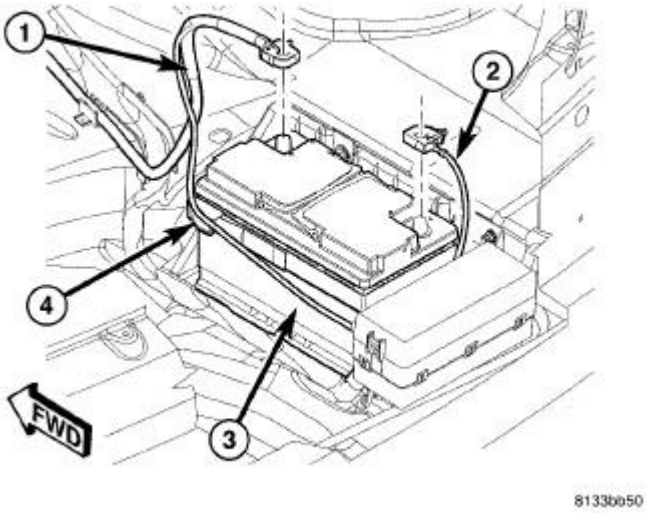

Fig. 109: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.

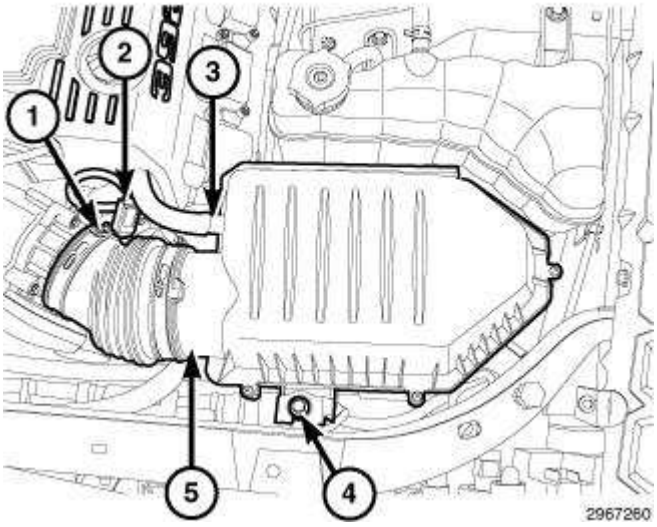

Fig. 110: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

3. Loosen the air duct retaining clamp (1) at the throttle body.
4. Disconnect the intake air temperature sensor electrical connector (2).
5. Remove the makeup air hose (3) at the air cleaner housing.
6. Remove the air cleaner housing retaining bolt (4).

7. While lifting up the air cleaner housing (5), slide the air duct off the throttle body and remove the air cleaner housing from the vehicle.
8. Remove serpentine drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

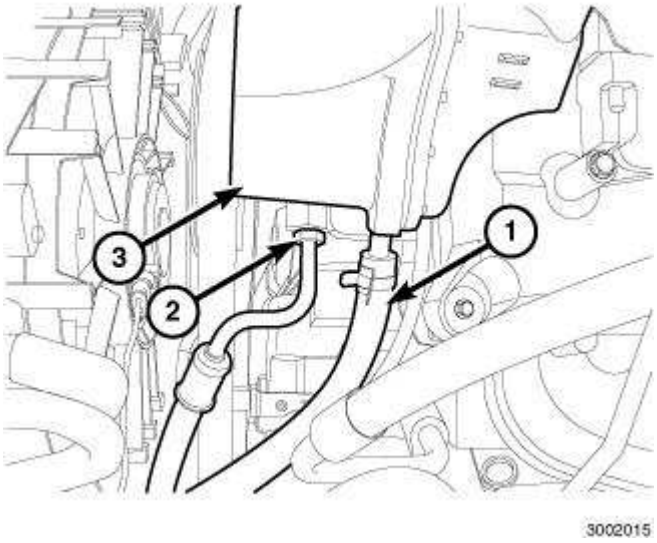

Fig. 111: Supply Hose, Pump, Remove Pressure Hose & Pump
Courtesy of CHRYSLER GROUP, LLC

9. Remove hose clamp, then supply hose (1) from pump (3).
10. Unthread tube nut, then remove pressure hose (2) from pump (3).

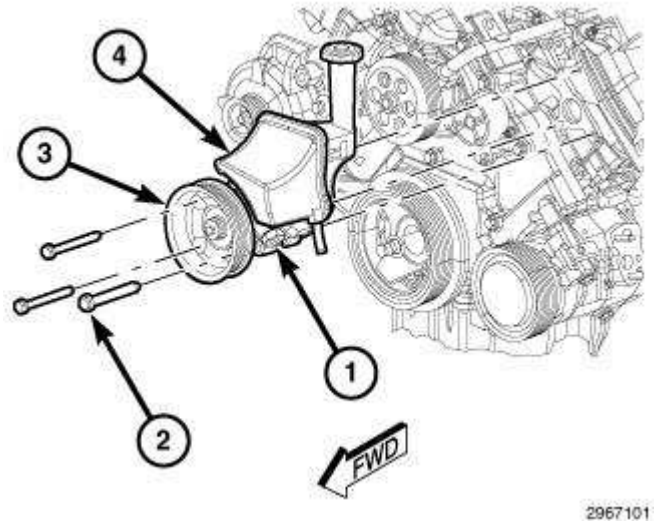

Fig. 112: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove three pump mounting bolts (2) through access holes in pulley (3).
12. Remove pump (1) from engine.

13. If pulley needs removal. Refer to **PULLEY, POWER STEERING PUMP, REMOVAL**.

INSTALLATION

NON SRT

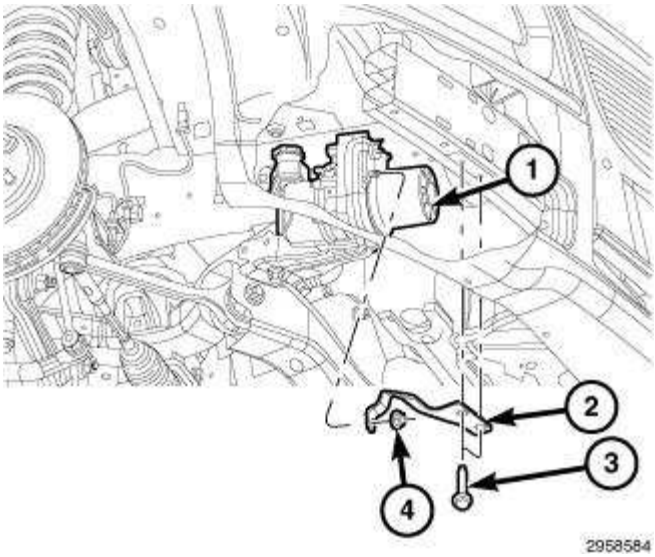

Fig. 113: EHPS Pump Bracket Retaining Nut & EHPS Pump
Courtesy of CHRYSLER GROUP, LLC

1. If Electro Hydraulic Power Steering (EHPS) pump bracket (2) has been removed, install the bracket to the vehicle and tighten fasteners to 12 N.m (9 ft. lbs.).
2. Install EHPS pump (1) into vehicle and install EHPS bracket retaining nut (4). Tighten retaining nut to 12 N.m (9 ft. lbs.).

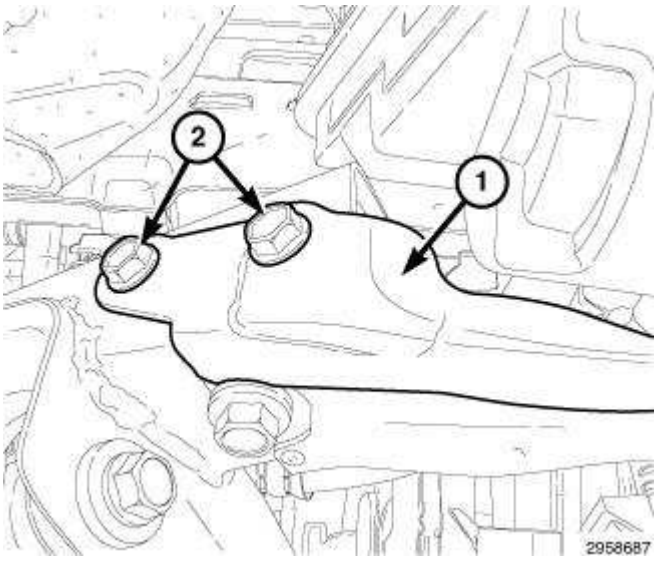

Fig. 114: Two Mounting Bolts & Electro Hydraulic Power Steering (EHPS) Mounting Bracket

Courtesy of CHRYSLER GROUP, LLC

3. Install EHPS pump bracket (1) mounting bolts (2) and tighten to 50 N.m (37 ft. lbs.).

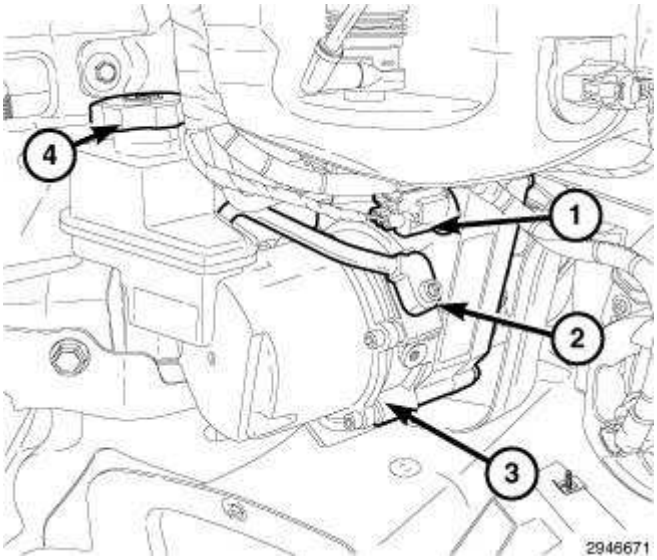

Fig. 115: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a new O-ring on the end of the pressure line.

4. Lubricate the new O-ring on the end of the pressure line with clean power steering fluid.
5. Install power steering pressure line to EHPS Pump (3).
6. Install pressure line retaining bolt (2) and tighten to 10 N.m (89 in. lbs.).
7. Install EHPS pump electrical connectors (1).

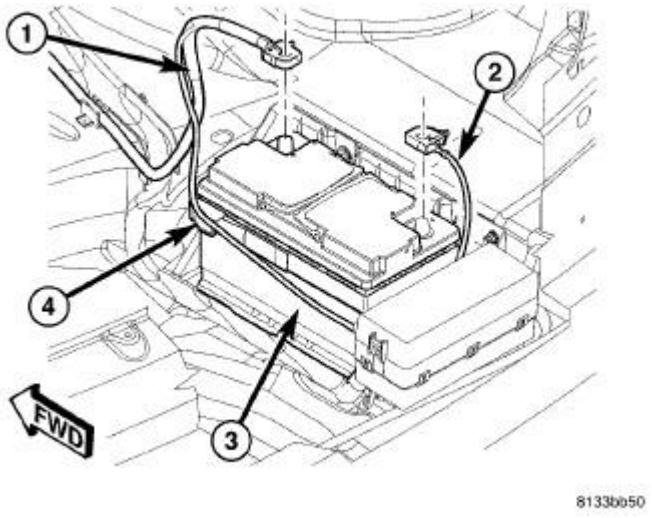

Fig. 116: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

8. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.
9. Install right front wheelhouse splash shield Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
10. Lower vehicle.
11. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

SRT

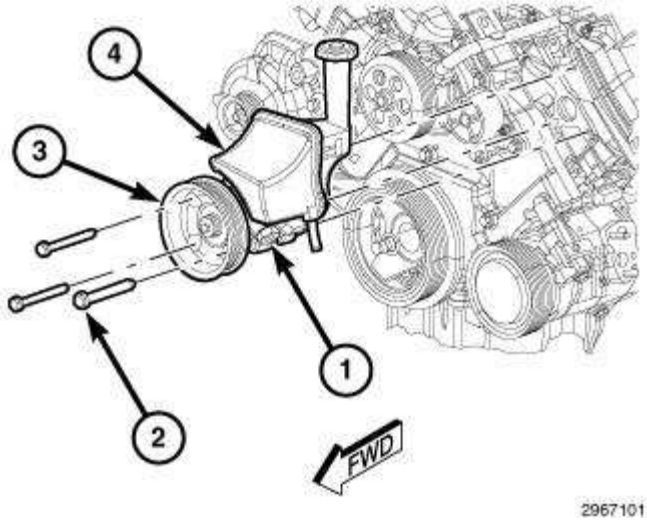

Fig. 117: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Align pump (1) with mounting holes on engine.
2. Install three pump mounting bolts (2) through access holes in pulley. Tighten bolts to 28 N.m (21 ft. lbs.).

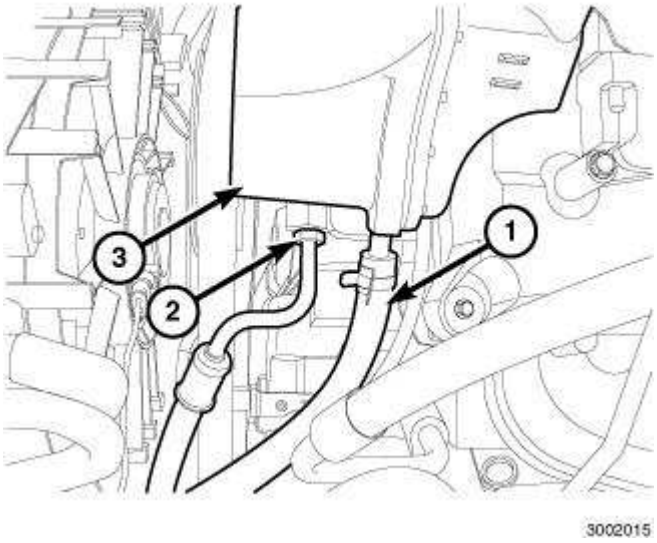

Fig. 118: Supply Hose, Pump, Remove Pressure Hose & Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the end of the pressure hose.

3. Lubricate NEW O-ring on end of pressure hose with clean power steering fluid.
4. Install pressure hose (2) to pump (3). Tighten pressure hose tube nut to 47 N.m (35 ft. lbs.).
5. Install return hose (1) to power steering pump (3) and install clamp securing hose in place.
6. Install serpentine drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

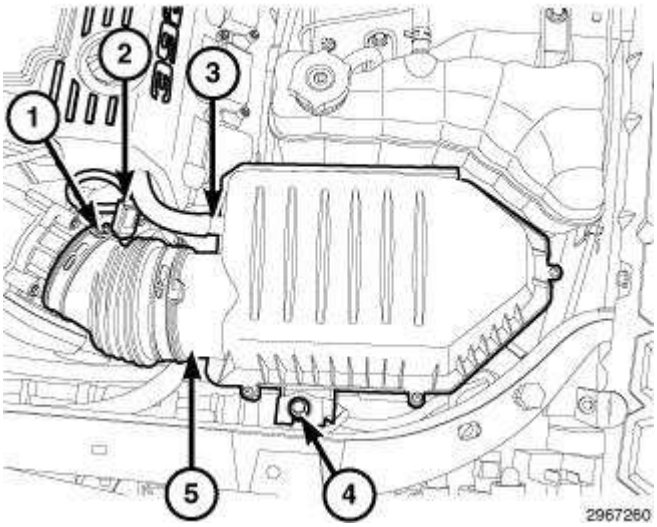

Fig. 119: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

7. While sliding the air duct onto the throttle body, lower the air cleaner housing (5) into position

and align the locating pin on the bottom of the housing.

8. Install the air cleaner housing retaining bolt (4) and tighten to 5 N.m (44 in. lbs.).
9. Install the makeup air hose (3) at the air cleaner housing.
10. Connect the intake air temperature sensor electrical connector (2).
11. Position the air duct retaining clamp (1) at the throttle body and tighten to 3 N.m (30 in. lbs.).

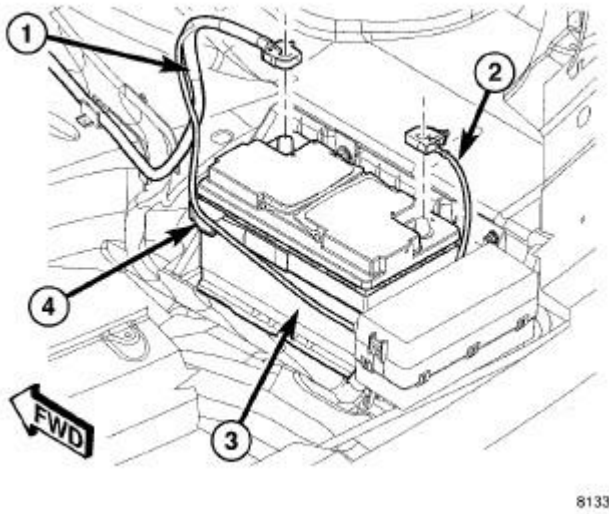

Fig. 120: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

12. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
13. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

COOLER, POWER STEERING

DESCRIPTION

DESCRIPTION

NON SRT

There is no power steering fluid cooler in the Electro Hydraulic Power Steering (EHPS) system.

SRT

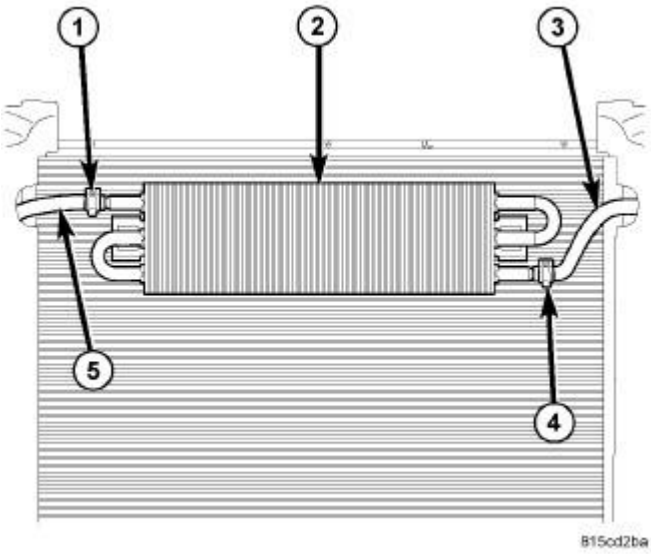

Fig. 121: SRT8 Fluid Cooler And Hoses
Courtesy of CHRYSLER GROUP, LLC

This vehicle uses a fluid-to-air type power steering fluid cooler (2) with external cooling fins. The cooler mounts to clips attached to the front of the cooling module.

REMOVAL

SRT

1. Disconnect and isolate battery negative cable from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .

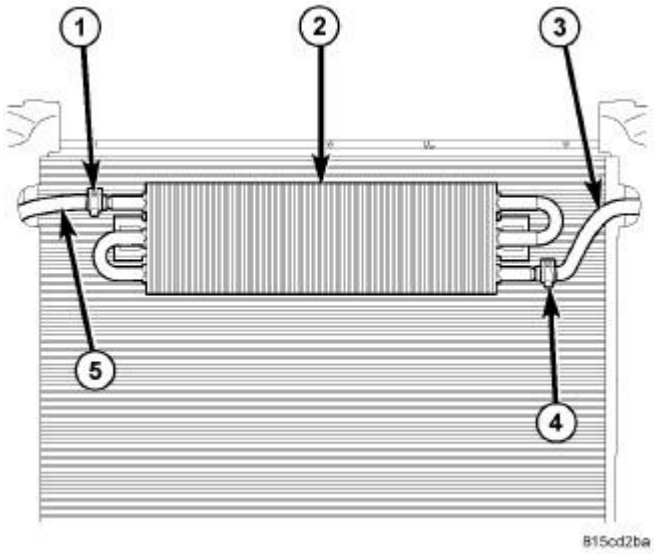

Fig. 122: SRT8 Fluid Cooler And Hoses
Courtesy of CHRYSLER GROUP, LLC

5. Remove hose clamp (1), then return hose (5) from steering gear at cooler (2).
6. Remove hose clamp (4), then return hose (3) to reservoir at cooler (2).

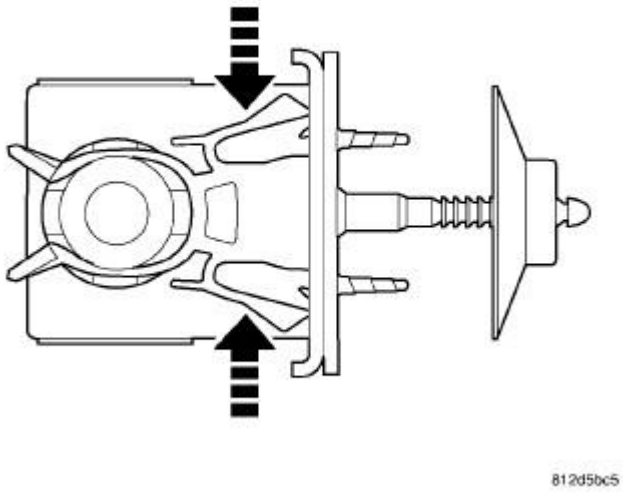

Fig. 123: Cooler Retainer Clips
Courtesy of CHRYSLER GROUP, LLC

7. Push in on cooler mounting clip tabs.
8. Remove cooler from clips mounted to cooling module.

INSTALLATION

SRT

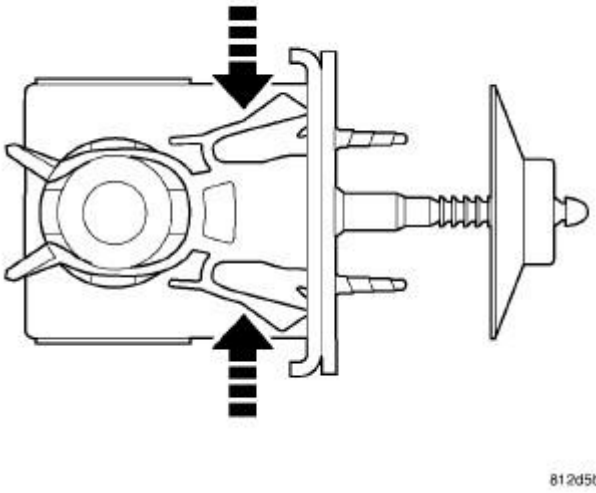

Fig. 124: Cooler Retainer Clips
Courtesy of CHRYSLER GROUP, LLC

1. Install center tube of cooler over mounting clips attached to cooling module. Push cooler past clip retaining tabs allowing it to lock into place.

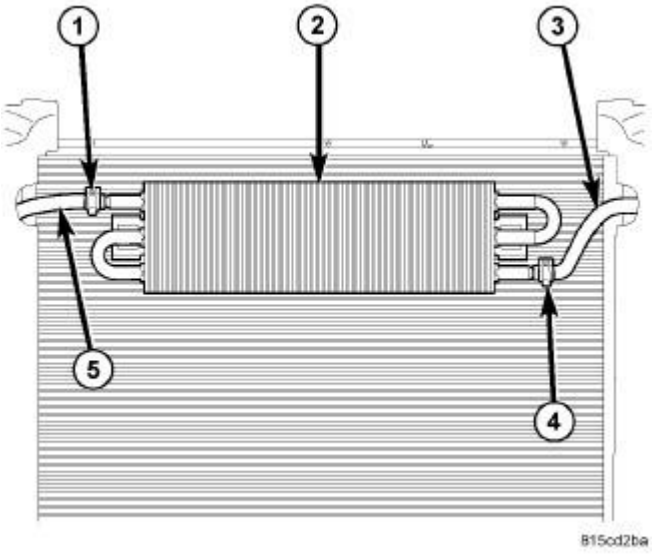

Fig. 125: SRT8 Fluid Cooler And Hoses
Courtesy of CHRYSLER GROUP, LLC

2. Slide return hose to reservoir (3) onto outlet of cooler (2). Install clamp (4) securing hose in place.
3. Slide return hose from gear (5) onto inlet of cooler (2). Install clamp (1) securing hose in place.

4. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .
5. Lower vehicle.

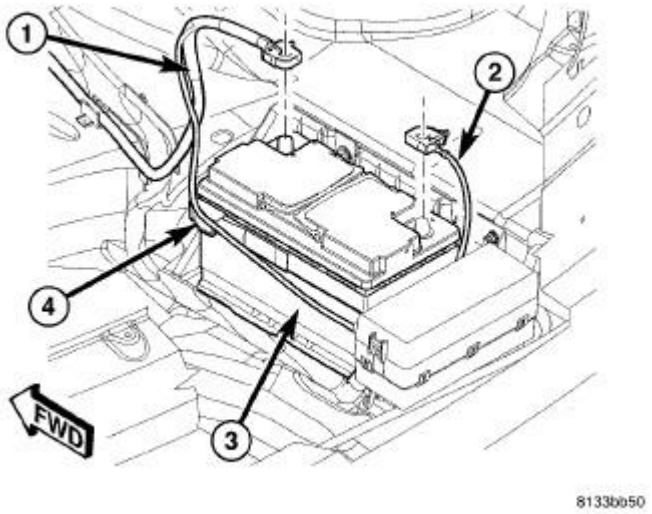

Fig. 126: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

6. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
7. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

FLUID

DESCRIPTION

DESCRIPTION

CAUTION: This vehicle features an Electro Hydraulic Power Steering (EHPS) pump which requires a different power steering fluid. Do not mix power steering fluid types. Damage may result to the power steering pump and system if any other fluid is used. The EHPS system uses fluid which meets material specification MS-11655 or equivalent.

NON SRT VEHICLES

Non-SRT vehicles are equipped with Electro Hydraulic Power Steering (EHPS) systems and require power steering fluid which meets material specification MS-11655 or equivalent.

SRT VEHICLES

The recommended fluid for the power steering system in SRT vehicles is Mopar® Power Steering fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid. Both fluids have the same material

standard specifications (MS-9602).

Mopar® ATF+4 (and Mopar® Power Steering fluid + 4), when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE

NON-SRT POWER STEERING FLUID LEVEL CHECKING

WARNING: Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.

CAUTION: This vehicle features an Electro Hydraulic Power Steering (EHPS) pump which requires a different power steering fluid. Do not mix power steering fluid types. Damage may result to the power steering pump and system if any other fluid is used. The EHPS system uses fluid which meets material specification MS-11655 or equivalent.

NOTE: Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected.

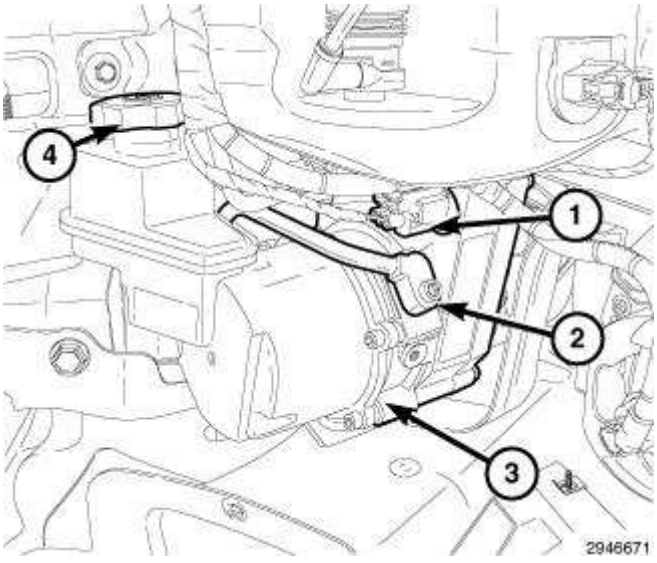

Fig. 127: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: The power steering fluid reservoir (4) is integrated with the Electro Hydraulic

Power Steering (EHPS) pump.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove right front wheel mounting nuts, then tire and wheel assembly.
3. Remove right front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
4. Ensure that the fluid is at the correct level in the power steering reservoir (4).

SRT POWER STEERING FLUID LEVEL CHECKING

WARNING: Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

NOTE: Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected.

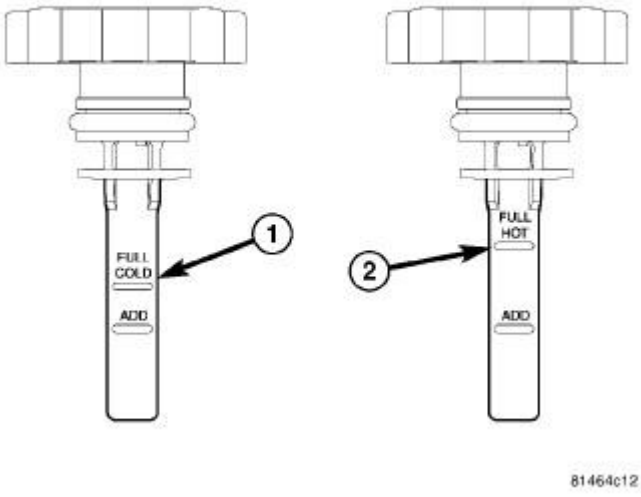

Fig. 128: Cold & Hot Sides Of Dipstick
Courtesy of CHRYSLER GROUP, LLC

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two

sides to the dipstick, one is for checking the fluid when it is cold, the other is for checking the fluid when it is hot. Before opening the power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick.

Use the COLD side of the dipstick (1) to measure when the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F). The fluid level should read between the ADD and FULL COLD lines.

Use the HOT side of the dipstick (2) to measure when the vehicle has been running and the fluid is hot. When the fluid is hot, the fluid level is allowed to read up to the FULL HOT line. **Only add fluid to the system when the vehicle is cold.**

Use only Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid in the power steering system. Do not overfill the power steering system.

HOSE, POWER STEERING, PRESSURE

REMOVAL

ALL-WHEEL-DRIVE

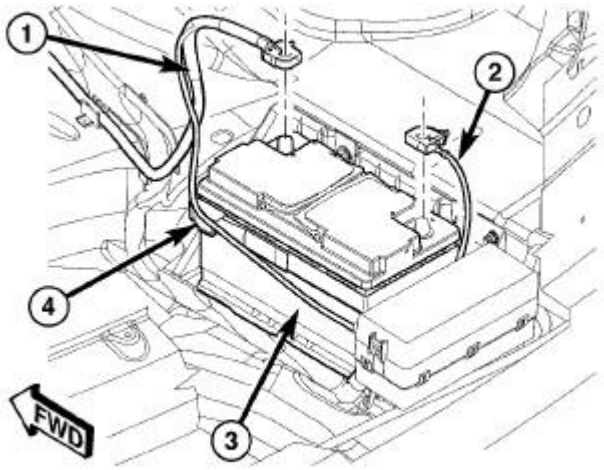

Fig. 129: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.

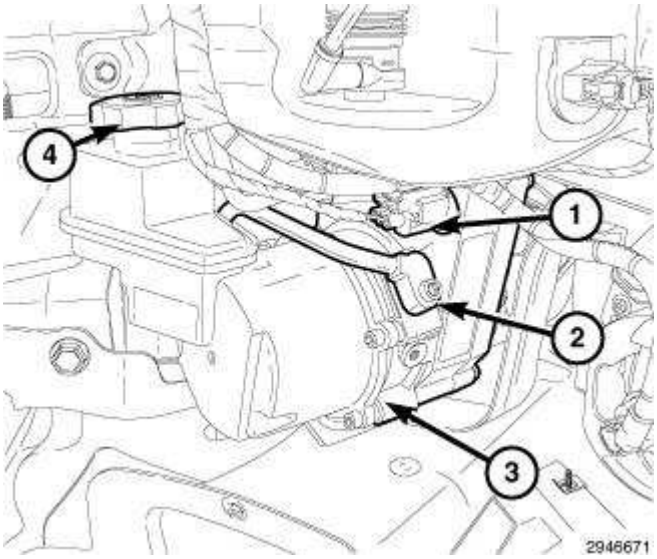

Fig. 130: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the right front wheel lug nuts, then remove the wheel and tire.
4. Remove the right front wheelhouse splash shield Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Siphon power steering fluid from pump reservoir (4).
6. Remove power steering pressure line bolt (2) and separate power steering pressure line from Electro Hydraulic Power Steering (EHPS) pump.

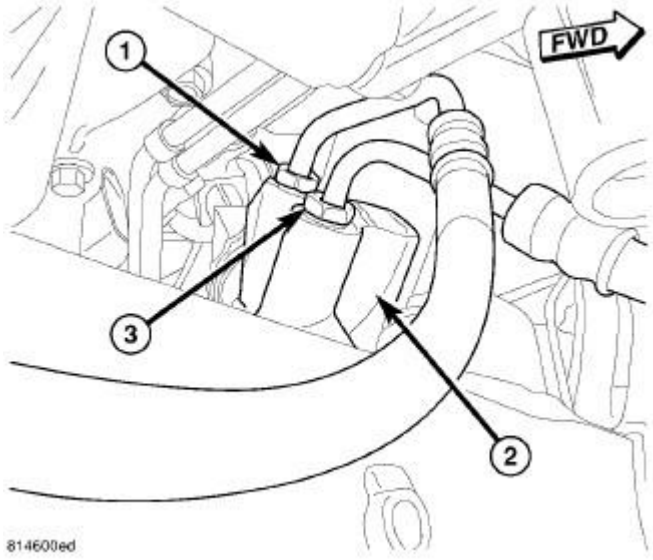

Fig. 131: Hoses AT AWD Gear
Courtesy of CHRYSLER GROUP, LLC

7. Remove the two bolts fastening the pressure hose routing clamps to the engine cradle.
8. Unthread pressure hose tube nut (3), then remove pressure hose from steering gear (2) and vehicle.

REAR-WHEEL-DRIVE

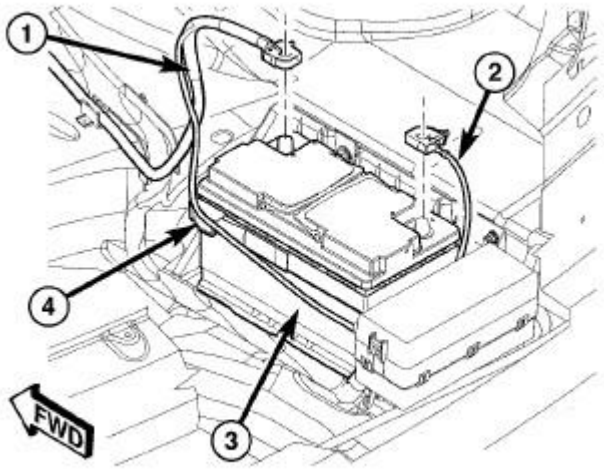

Fig. 132: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.

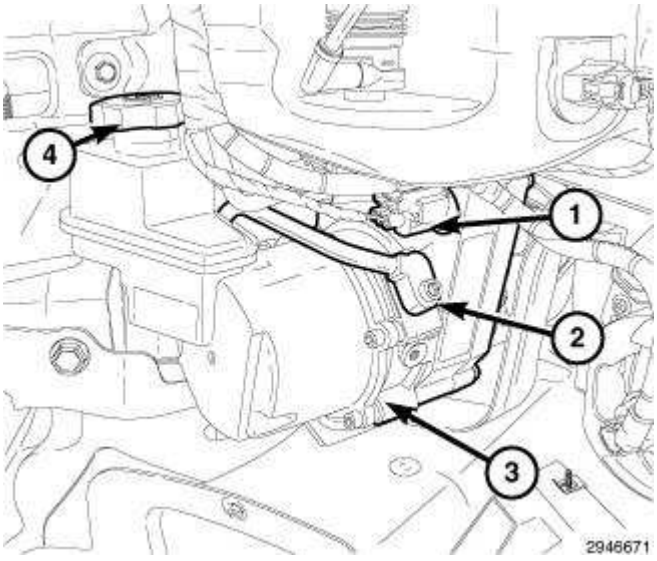

Fig. 133: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

3. Remove right front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
4. Siphon power steering fluid from pump reservoir (4).
5. Remove power steering pressure line retaining bolt (2) and separate pressure line from Electro Hydraulic Power Steering (EHPS) pump.

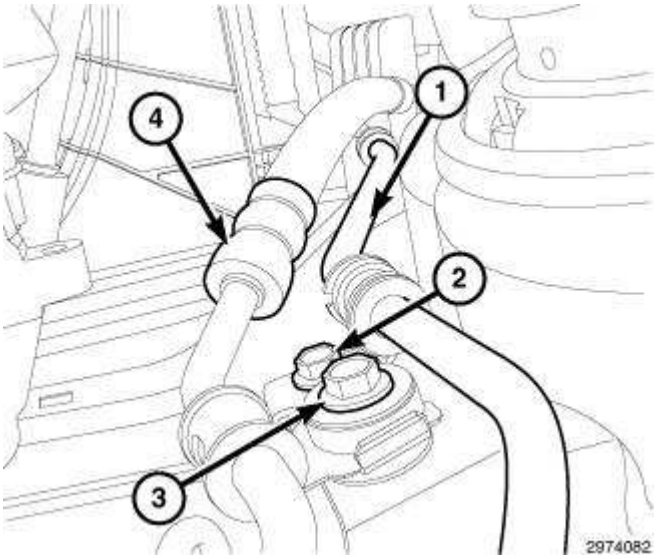

Fig. 134: Mounting Bolt & Pressure Line
Courtesy of CHRYSLER GROUP, LLC

6. Remove mounting bolt (3) and separate pressure line (4) from crossmember.

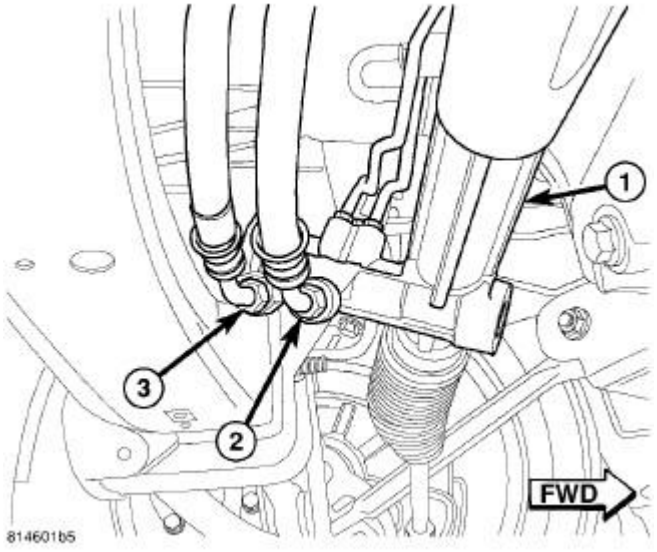

Fig. 135: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

7. Unthread pressure hose tube nut (2) from steering gear (1).
8. Remove pressure hose from vehicle.

SRT

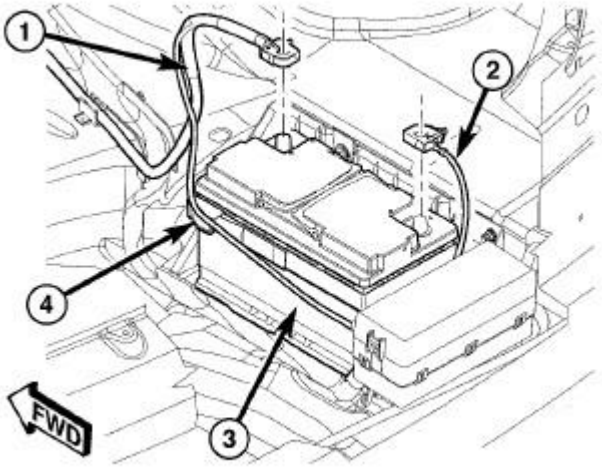

Fig. 136: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Remove air cleaner housing and inlet tube to throttle body. Refer to **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL** or **BODY, AIR CLEANER, REMOVAL, 5.7L** or **BODY, AIR CLEANER, REMOVAL** .

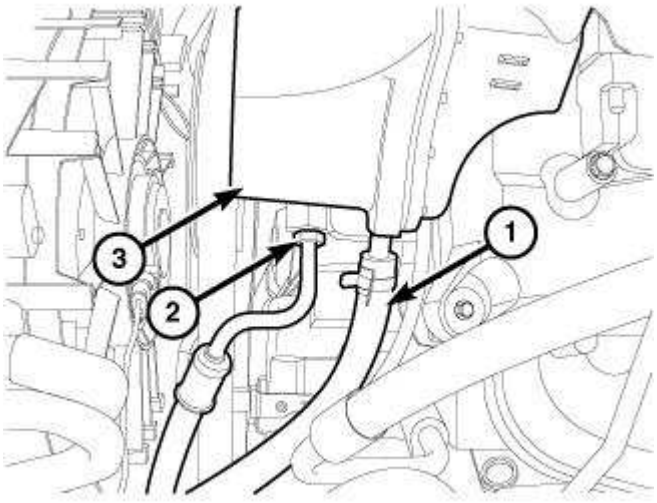

Fig. 137: Supply Hose, Pump, Remove Pressure Hose & Pump
Courtesy of CHRYSLER GROUP, LLC

4. Unthread tube nut, then remove pressure hose (2) from pump (3).
5. Raise and support vehicle. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .
6. Remove belly pan. Refer to **BELLY PAN, REMOVAL** .

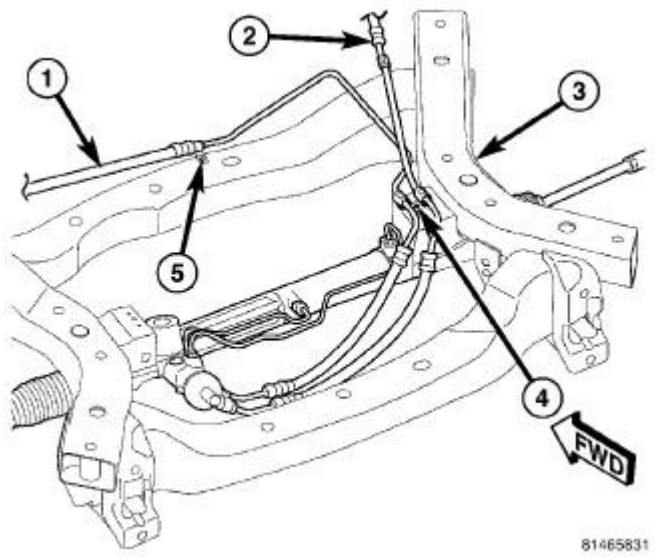

Fig. 138: Hose Routing Along Engine Cradle
Courtesy of CHRYSLER GROUP, LLC

7. Remove screw (5) securing pressure hose (1) routing clamp to front of engine cradle (3).
8. Remove screw (4) fastening routing clamps securing pressure (1) and return (2) hoses to right side of engine cradle (3).

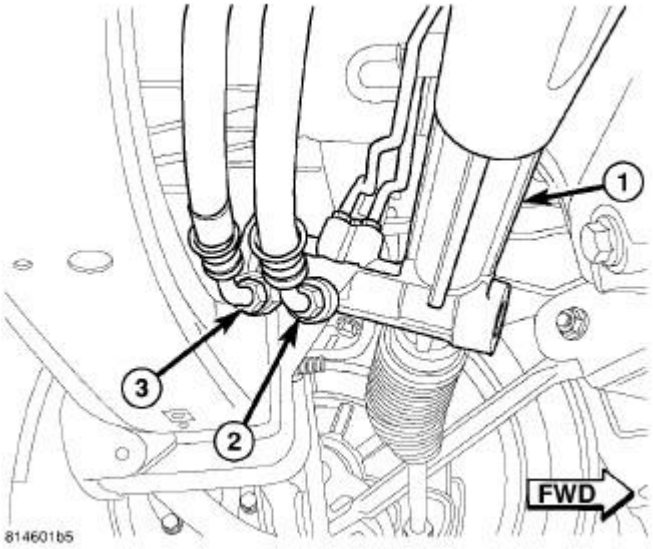

Fig. 139: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

9. Unthread pressure hose tube nut (2) from steering gear (1).
10. Remove pressure hose from vehicle.

INSTALLATION

ALL-WHEEL-DRIVE

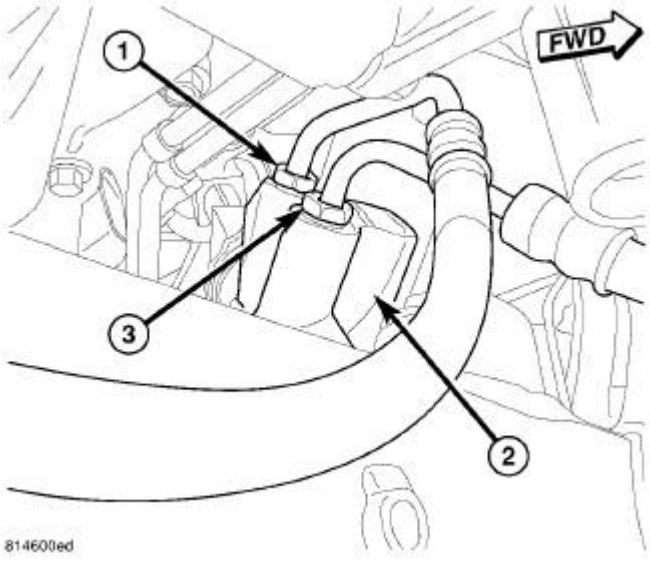

Fig. 140: Hoses AT AWD Gear
Courtesy of CHRYSLER GROUP, LLC

1. Install pressure hose in engine compartment from underneath.

NOTE: **Always use a NEW O-ring on the end of the pressure or return hose at the gear.**

2. Lubricate NEW O-ring on steering gear end of pressure hose with clean power steering fluid.
3. Insert pressure hose into steering gear (2) port and install tube nut (3). **Do not tighten tube nut at this time.**

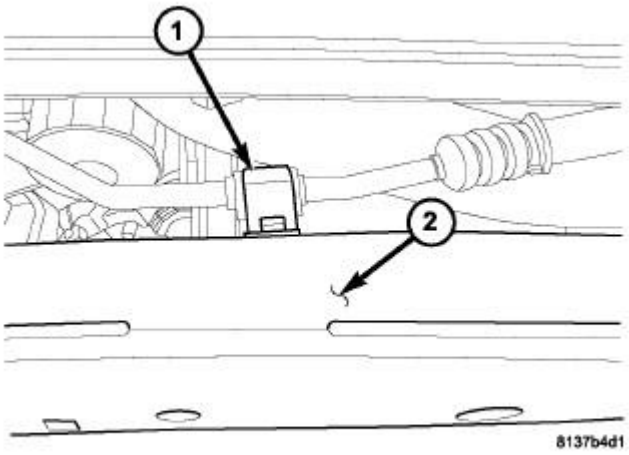

Fig. 141: Hose Mounting Bracket To Cradle
Courtesy of CHRYSLER GROUP, LLC

4. Route pressure hose along left side of engine cradle. Install screw through routing clamp and secure hose to left side of engine cradle.
5. Route pressure hose along front of engine cradle. Install screw through routing clamp (1) and secure hose to front of engine cradle (2).

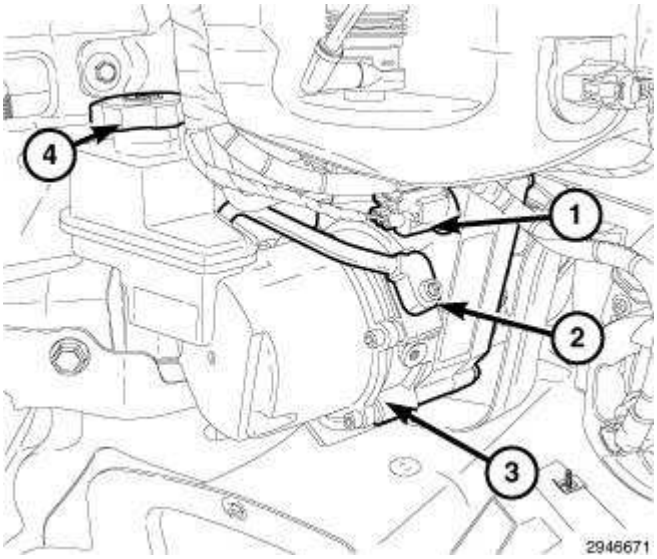

Fig. 142: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a new O-ring on the end of the pressure line.

6. Lubricate the new O-ring on the end of the pressure line with clean power steering fluid.
7. Install power steering pressure line to EHPS Pump (3).
8. Install pressure line retaining bolt (2) and tighten to 10 N.m (89 in. lbs.).

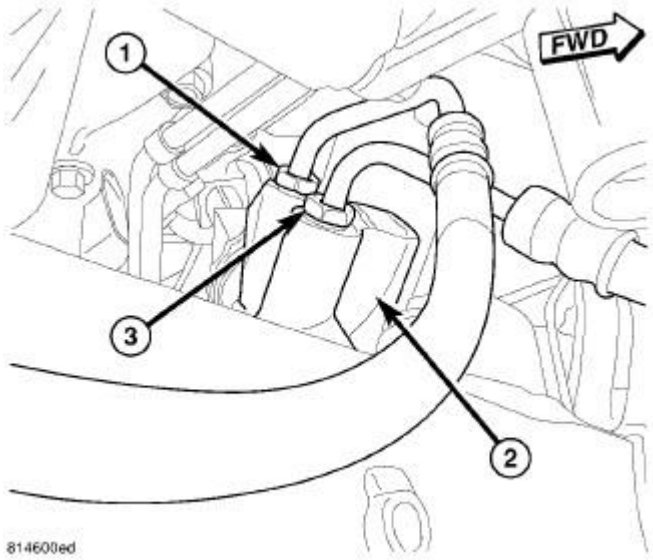

Fig. 143: Hoses AT AWD Gear
Courtesy of CHRYSLER GROUP, LLC

9. Tighten pressure (3) hose tube nut at steering gear (2) to 47 N.m (35 ft. lbs.).
10. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

11. Install right front wheel house splash shield.
12. Lower vehicle.

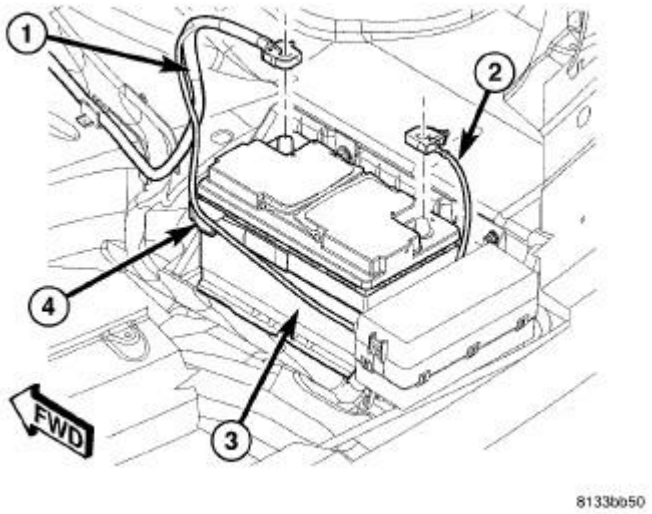

Fig. 144: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

13. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

REAR-WHEEL-DRIVE

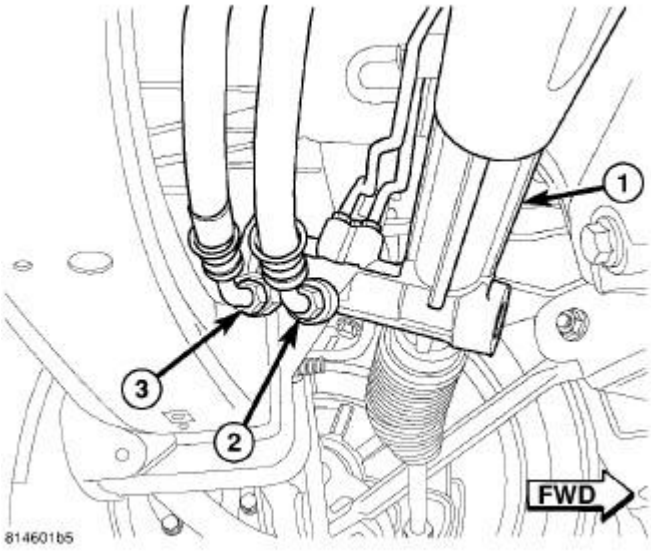

Fig. 145: Hoses AT RWD Steering Gear

NOTE: Always use a NEW O-ring on the end of the pressure hose.

1. Install pressure hose in engine compartment from underneath.
2. Lubricate NEW O-ring on steering gear end of pressure hose with clean power steering fluid.
3. Install pressure hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

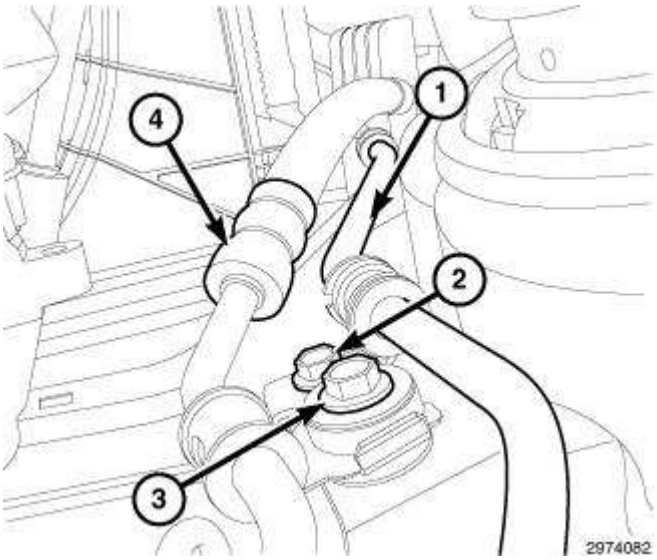

Fig. 146: Mounting Bolt & Pressure Line
Courtesy of CHRYSLER GROUP, LLC

4. Route pressure hose (4) along right side of engine cradle. Position pressure hose (4) routing clamp and install bolt (3) securing hose to the right side of engine cradle.

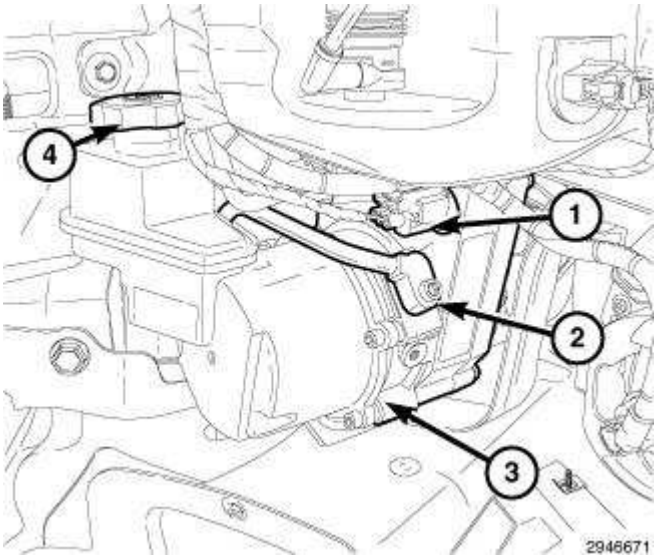

Fig. 147: Pressure Hose Retaining Bolt & (EHPS) Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a new O-ring on the end of the pressure line.

5. Lubricate the new O-ring on the end of the pressure line with clean power steering fluid.
6. Install power steering pressure line to Electro Hydraulic Power Steering (EHPS) pump (3).
7. Install pressure line retaining bolt (2) and tighten to 10 N.m (89 in. lbs.).

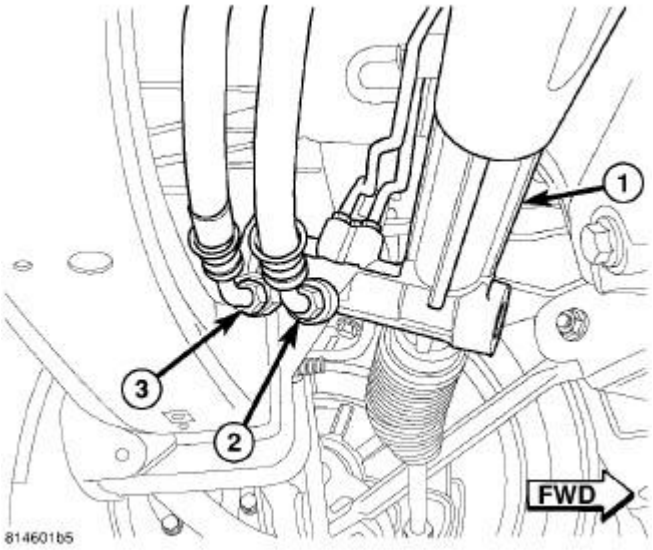

Fig. 148: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

8. Tighten pressure hose tube nut at steering gear to 47 N.m (35 ft. lbs.).
9. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.
10. Install right front wheel house splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
11. Lower vehicle.

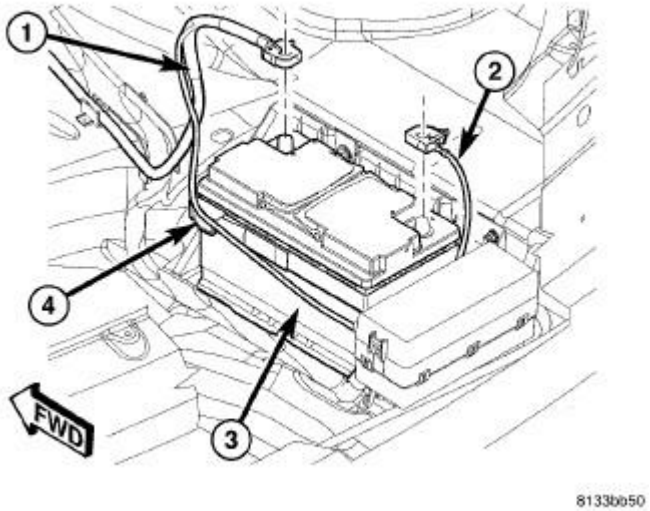

Fig. 149: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

12. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

SRT

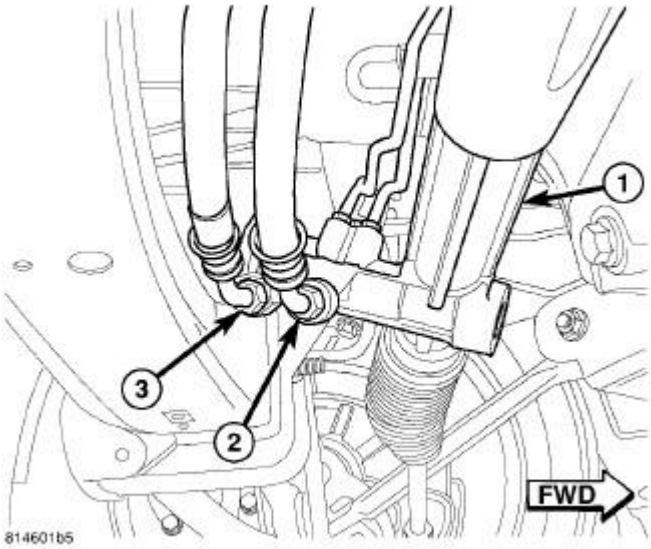

Fig. 150: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .
2. Install pressure hose in engine compartment from underneath.

NOTE: Always use a NEW O-ring on the end of the pressure hose.

3. Lubricate new O-ring on steering gear end of pressure hose with clean power steering fluid.
4. Install pressure hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

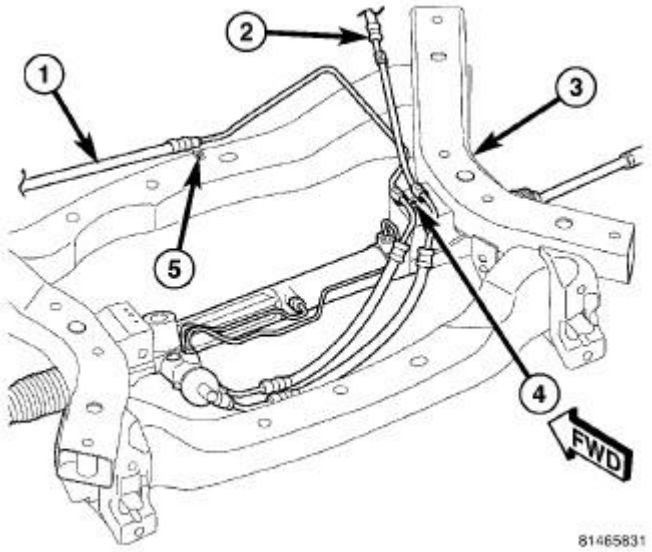

Fig. 151: Hose Routing Along Engine Cradle
Courtesy of CHRYSLER GROUP, LLC

5. Route pressure hose along right side of engine cradle. Position pressure hose (1) routing clamp over return hose (2) routing clamp, then install screw (4) securing hoses to right side of engine cradle (3).
6. Route pressure hose along front of engine cradle. Install screw (5) through routing clamp securing hose to front of engine cradle (3).

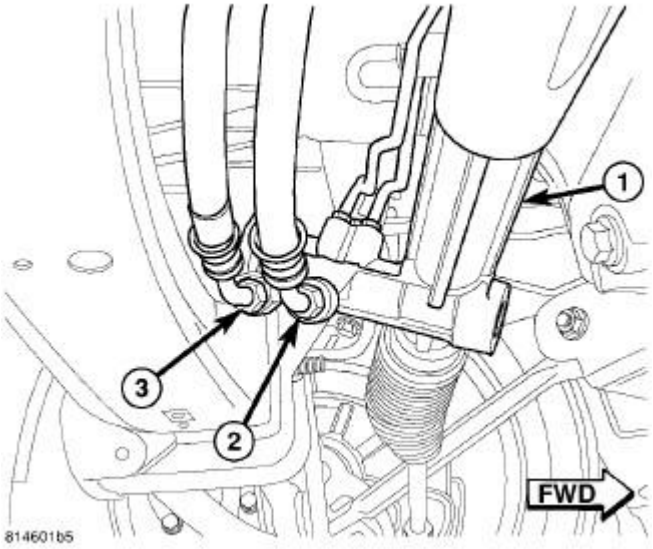

Fig. 152: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

7. Tighten pressure hose tube nut at steering gear to 47 N.m (35 ft. lbs.).
8. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .
9. Lower vehicle.

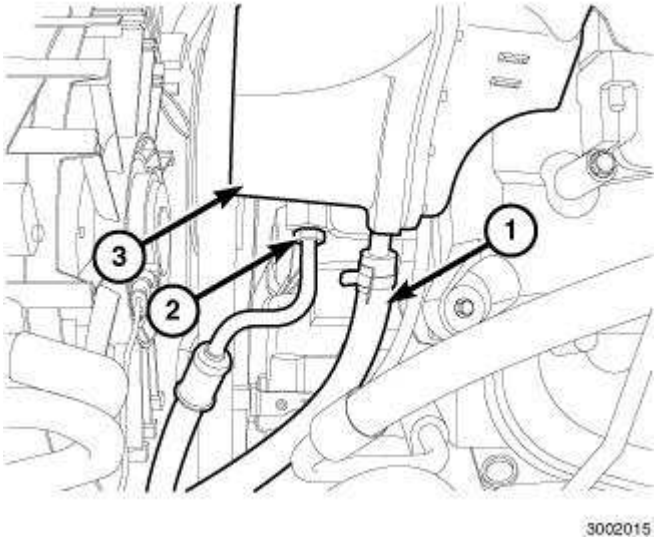

Fig. 153: Supply Hose, Pump, Remove Pressure Hose & Pump
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the end of the pressure hose.

10. Lubricate new O-ring on power steering pump end of pressure hose with clean power steering fluid.

11. Install pressure hose (2) to pump (3). Tighten pressure hose tube nut to 47 N.m (35 ft. lbs.).

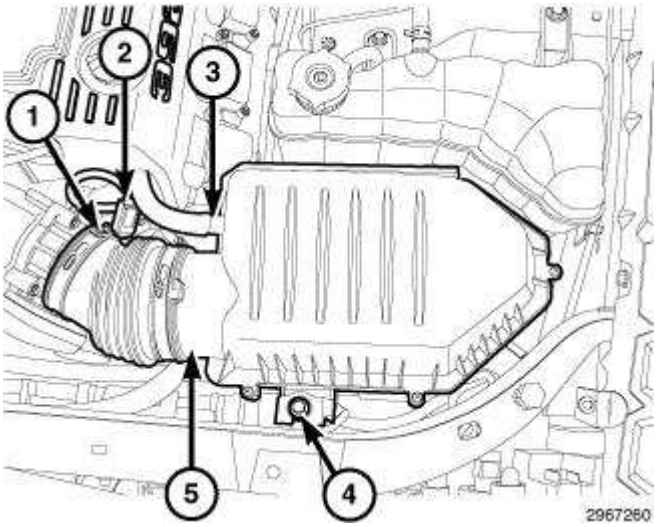

Fig. 154: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

12. While sliding the air duct onto the throttle body, lower the air cleaner housing (5) into position and align the locating pin on the bottom of the housing.
13. Install the air cleaner housing retaining bolt (4) and tighten to 5 N.m (44 in. lbs.).
14. Install the makeup air hose (3) at the air cleaner housing.
15. Connect the intake air temperature sensor electrical connector (2).
16. Position the air duct retaining clamp (1) at the throttle body and tighten to 3 N.m (30 in. lbs.).

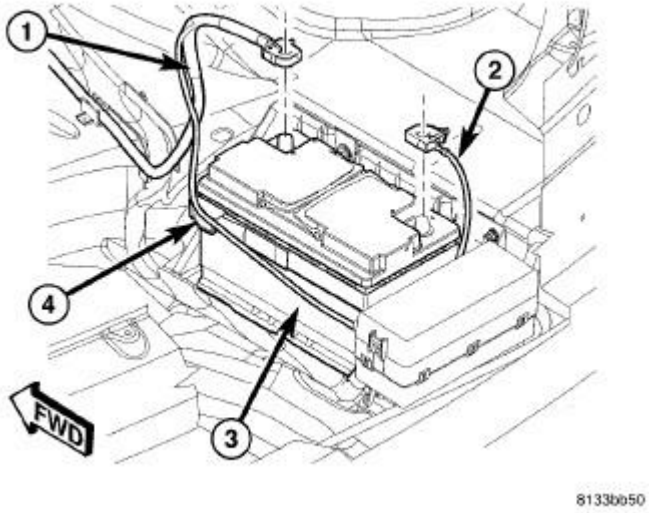

Fig. 155: Disconnecting/Connecting Battery Cables

REMOVAL

COOLER TO RESERVOIR - SRT

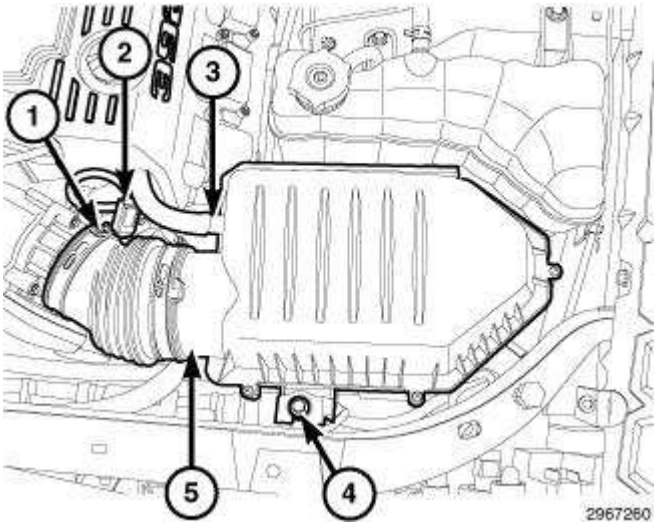

Fig. 156: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Loosen the air duct retaining clamp (1) at the throttle body.
4. Disconnect the intake air temperature sensor electrical connector (2).
5. Remove the makeup air hose (3) at the air cleaner housing.
6. Remove the air cleaner housing retaining bolt (4).
7. While lifting up the air cleaner housing (5), slide the air duct off the throttle body and remove the air cleaner housing from the vehicle.

10. Unthread return hose tube nut (3) from steering gear (1).
11. Remove return hose from vehicle.

INSTALLATION

COOLER TO RESERVOIR - SRT

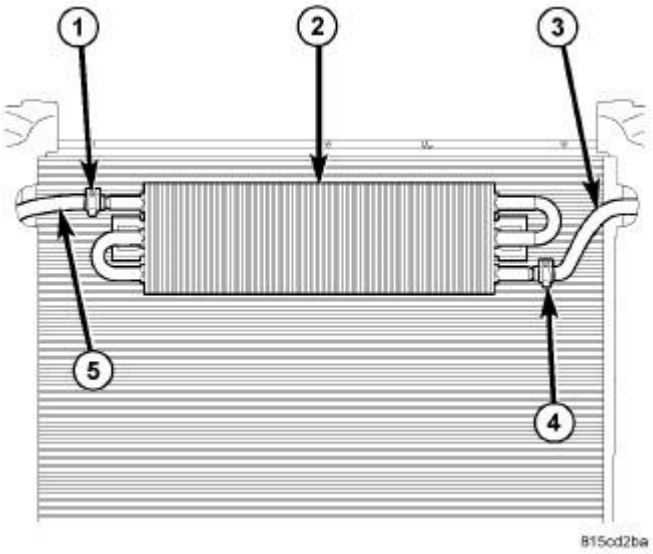

Fig. 168: SRT8 Fluid Cooler And Hoses
Courtesy of CHRYSLER GROUP, LLC

1. Slide return hose (3) onto fitting on the left side of the cooling module (2). Install clamp (4)

securing hose in place.

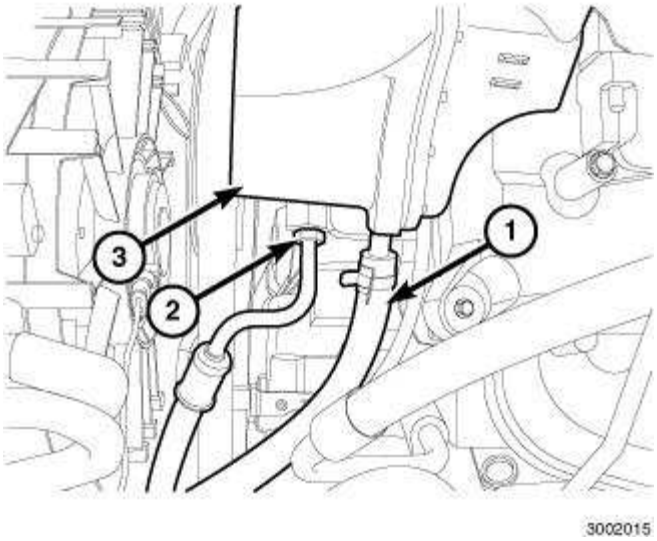

Fig. 169: Supply Hose, Pump, Remove Pressure Hose & Pump
Courtesy of CHRYSLER GROUP, LLC

2. Route hose through engine compartment.
3. Slide return hose (1) onto reservoir (3). Install clamp securing hose in place.
4. Install upper radiator closure panels.

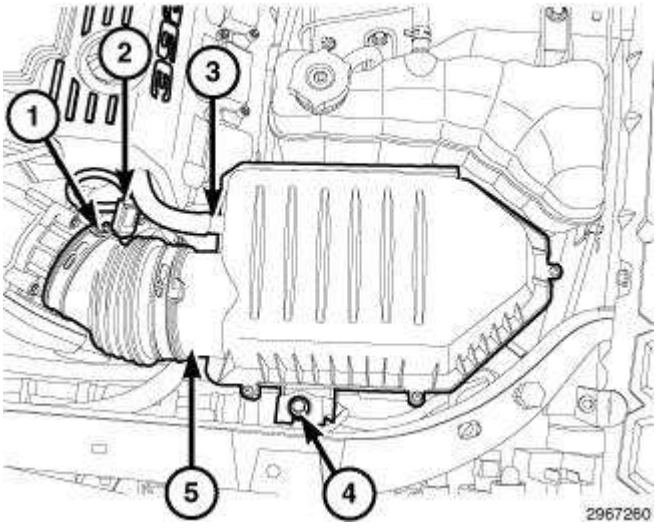

Fig. 170: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

5. While sliding the air duct onto the throttle body, lower the air cleaner housing (5) into position and align the locating pin on the bottom of the housing.
6. Install the air cleaner housing retaining bolt (4) and tighten to 5 N.m (44 in. lbs.).

7. Install the makeup air hose (3) at the air cleaner housing.
8. Connect the intake air temperature sensor electrical connector (2).
9. Position the air duct retaining clamp (1) at the throttle body and tighten to 3 N.m (30 in. lbs.).
10. Connect battery negative cable to battery post. It is important that this is performed properly.
11. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

GEAR TO COOLER - SRT

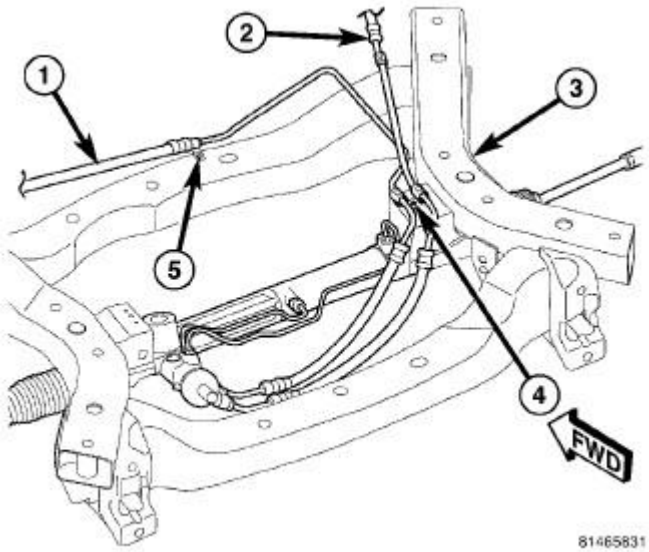

Fig. 171: Hose Routing Along Engine Cradle
Courtesy of CHRYSLER GROUP, LLC

1. Route cooler end of return hose (2) over steering gear from rear by reversing the steps used in removal.

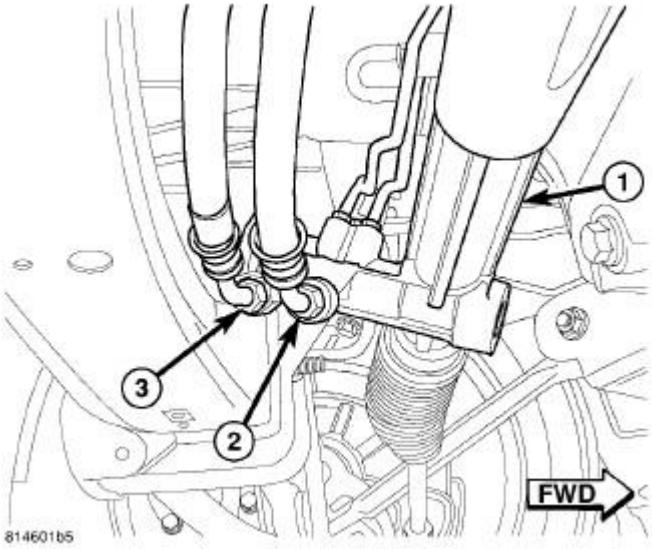

Fig. 172: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the end of the return hose at the steering gear.

2. Lubricate new O-ring on steering gear end of return hose with clean power steering fluid.
3. Lift gear end of return hose to return port on steering gear. Install return hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

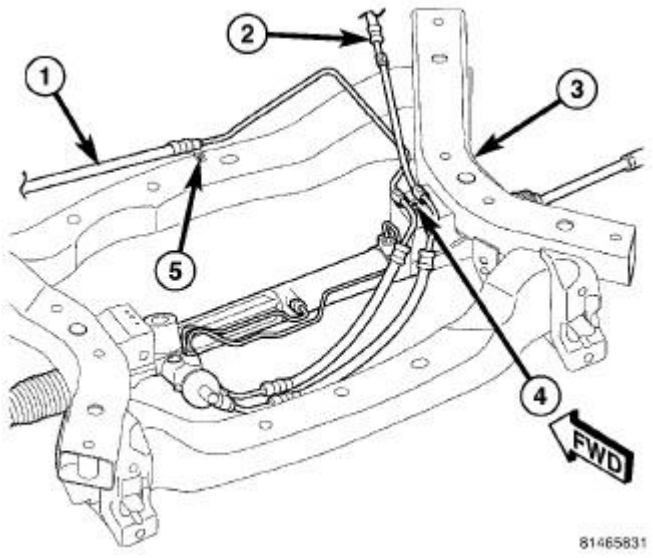

Fig. 173: Hose Routing Along Engine Cradle
Courtesy of CHRYSLER GROUP, LLC

4. Route return hose along right side of engine cradle as shown in illustration. Position pressure hose (1) routing clamp over return hose (2) routing clamp, then install screw (4) securing hoses to right side of engine cradle (3).

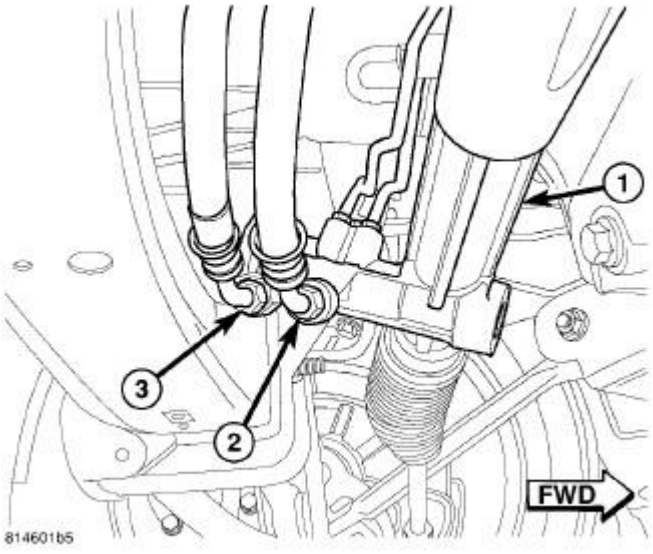

Fig. 174: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

5. Tighten return hose tube nut at steering gear to 47 N.m (35 ft. lbs.).
6. Install belly pan. Refer to **BELLY PAN, INSTALLATION** .
7. Lower vehicle.

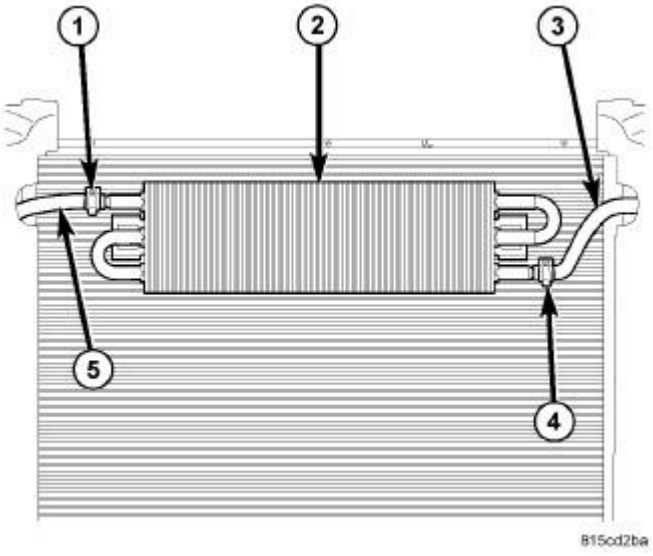

Fig. 175: SRT8 Fluid Cooler And Hoses
Courtesy of CHRYSLER GROUP, LLC

8. Slide return hose (5) onto fitting on the right side of the cooling module (2). Install clamp (1) securing hose in place.
9. Install radiator closeout panels.

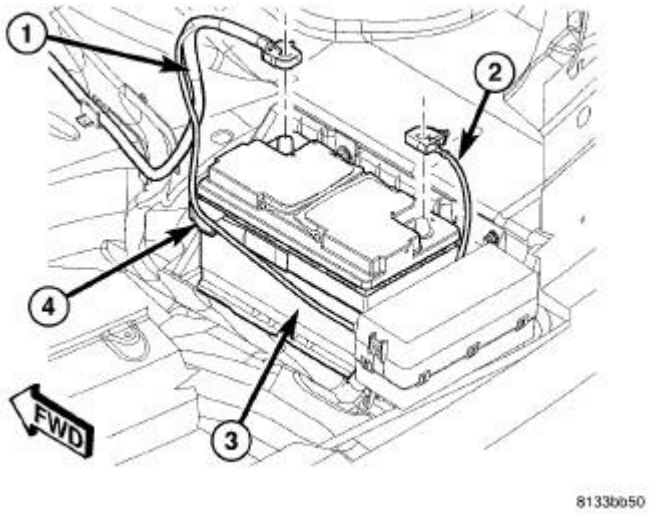

Fig. 176: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

10. Connect negative battery cable (2) to battery post. It is important that this is performed properly.
11. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

NON SRT

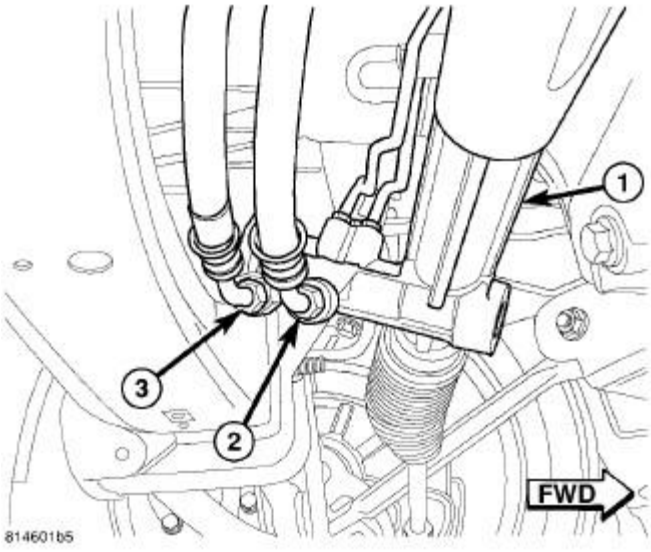

Fig. 177: Hoses AT RWD Steering Gear

Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use a NEW O-ring on the end of the return hose at the steering gear.

1. Lubricate NEW O-ring on steering gear end of return hose with clean power steering fluid.
2. Lift gear end of return hose to return port on steering gear. Install return hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

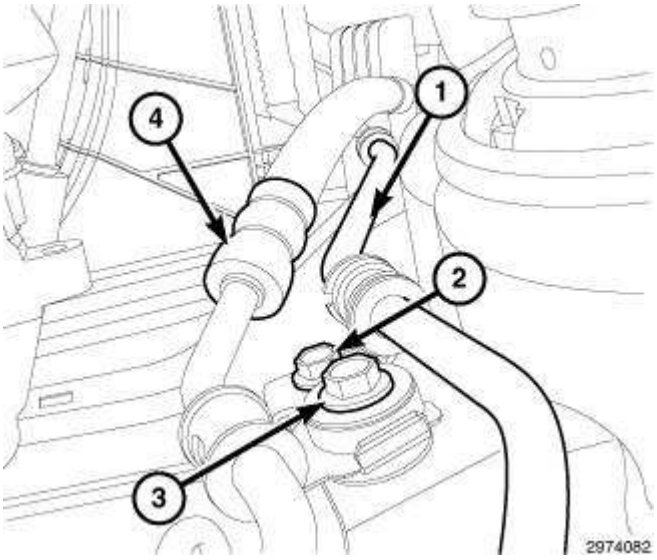

Fig. 178: Mounting Bolt & Pressure Line
Courtesy of CHRYSLER GROUP, LLC

3. Route return hose (1) along right side of engine cradle as shown in illustration and install retaining bolt (2). Tighten bolt to 19 N.m (14 ft. lbs.).

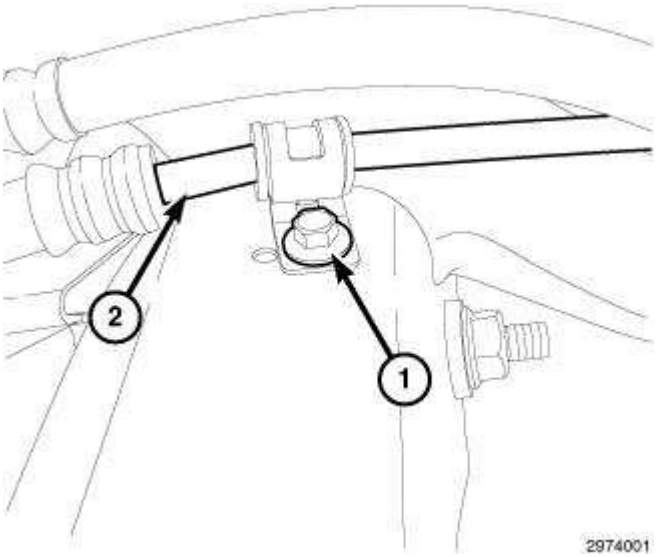

Fig. 179: Retaining Bolt & Return Line
Courtesy of CHRYSLER GROUP, LLC

4. Position return hose routing clamp, then install bolt (1) securing the return hose (2) to engine cradle. Tighten bolt to 19 N.m (14 ft. lbs.)

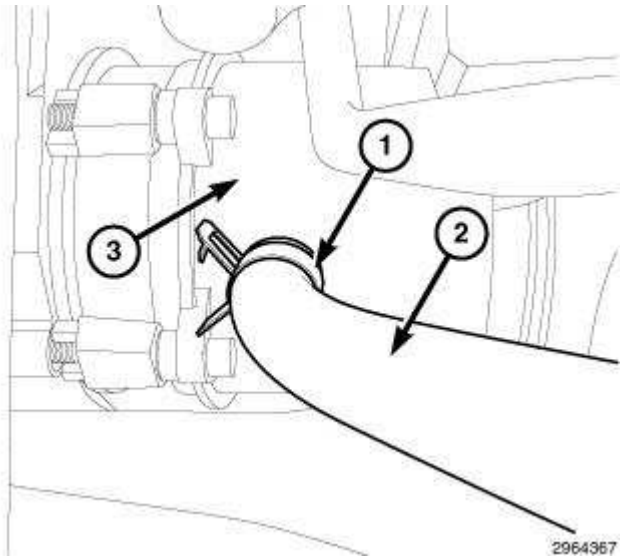

Fig. 180: Hose Clamp, Return Hose & (EHPS) Reservoir
Courtesy of CHRYSLER GROUP, LLC

5. Attach return hose (2) to Electro Hydraulic Power Steering (EHPS) pump (3), then secure retaining clamp (1) to EHPS pump.

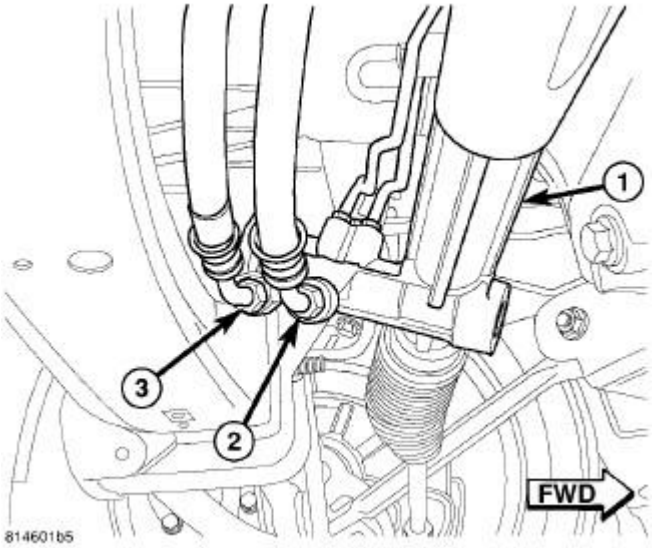

Fig. 181: Hoses AT RWD Steering Gear
Courtesy of CHRYSLER GROUP, LLC

6. Tighten return hose tube nut at steering gear to 47 N.m (35 ft. lbs.)
7. Install right front wheel house splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .

8. Lower vehicle.

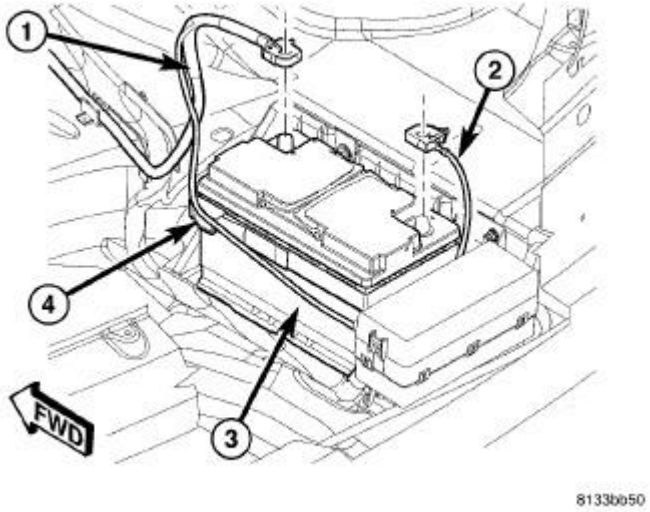

Fig. 182: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
10. Fill and bleed power steering system. Refer to **STANDARD PROCEDURE**.

PULLEY, POWER STEERING PUMP

REMOVAL

NON SRT

Hydraulic pressure for operation of the power steering gear is provided by an Electro Hydraulic Power Steering (EHPS) pump and there is no power steering pulley.

SRT

CAUTION: Do not hammer on power steering pump pulley or shaft to remove power steering pump pulley. Damage to pulley and power steering pump will occur.

CAUTION: It is very important to use Puller (special tool #9962, Puller, P/S Pulley), to remove pulley from power steering pump shaft. Use of other pullers can damage or break pulley and pump shaft.

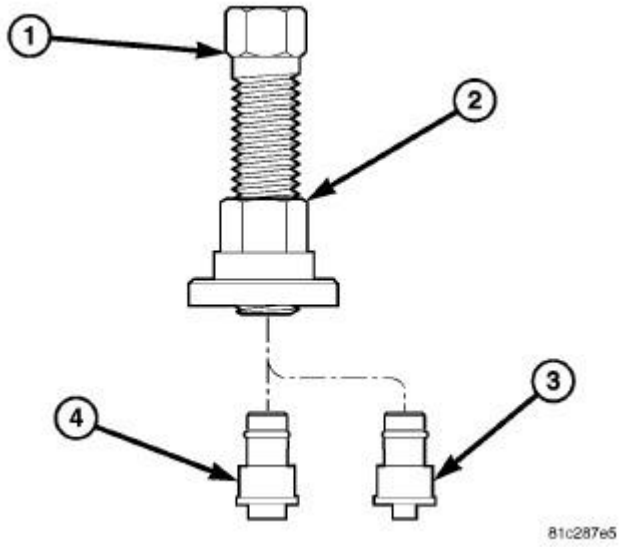

Fig. 183: Identifying Button Installation On Tool
Courtesy of CHRYSLER GROUP, LLC

1. Remove power steering pump from engine. Refer to **PUMP, REMOVAL**.
2. Coat Screw-Drive (1) with lubricant and thread into Puller Body (2).

NOTE: Two Buttons come with Puller kit ((special tool #9962-3, Button, Thrust) and (special tool #9962-4, Button, Thrust)). Be sure to use Button that best fits end of pump shaft to avoid damage to Button or pump shaft.

3. Insert Button (4) (special tool #9962-4, Button, Thrust), into end of Screw-Drive. Be sure not to misplace ball bearing that resides behind Button.

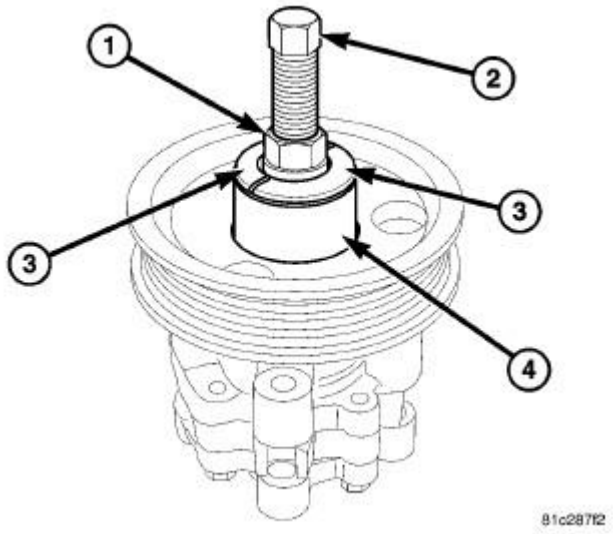

Fig. 184: Collets & Puller Body
Courtesy of CHRYSLER GROUP, LLC

4. Assemble Puller (special tool #9962, Puller, P/S Pulley), over end of pump shaft and pulley hub.
    1. Place Button on end of Screw-Drive against pump shaft.
    2. Assemble Collets (3) (special tool #9962-2, Collet, Half, Pulley Remover), surrounding Puller Body (1) and pulley hub flange, then slide the Collet Sleeve over the Collets.
    3. Hand tighten Screw-Drive (2) taking up any slack in Puller.
5. Hold Puller Body stationary while turning Screw-Drive until pulley is removed from power steering pump shaft.

NOTE: Inspect pulley. Replace if pulley is bent, cracked, or loose.

INSTALLATION

NON SRT

Hydraulic pressure for operation of the power steering gear is provided by an Electro Hydraulic Power Steering (EHPS) pump and there is no power steering pulley.

SRT

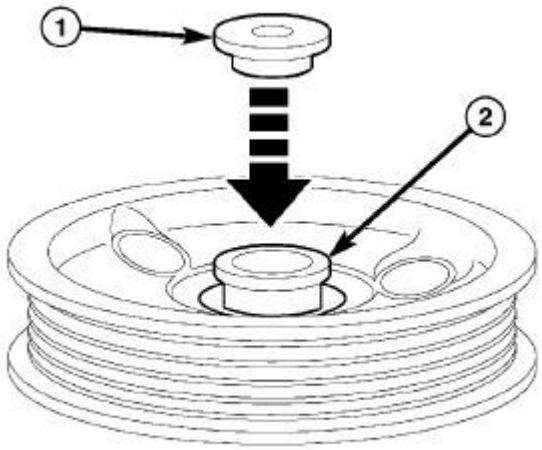

Fig. 185: Power Steering Pump Pulley & Installation Spacer
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not hammer on power steering pump pulley (2) or pump shaft to install pulley. This action will damage pulley and power steering pump.

1. Place power steering pump pulley (2) squarely on end of power steering pump shaft.

2. Place Installation Spacer (1) (special tool #6936, Spacer), on top of pump pulley (2).

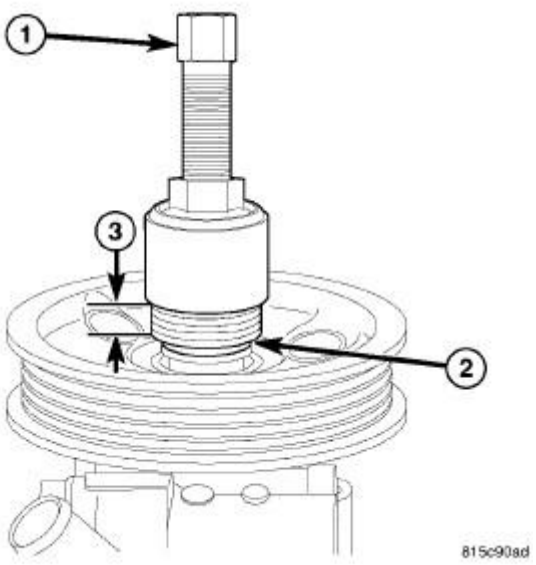

Fig. 186: Thickness, Spacer & Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Later build pumps feature a shaft with internal threads that are not as deep as earlier production, thus requiring a stack of washers, approximately 13 mm (0.5 in.) thickness (3), placed over Spacer (special tool #6936, Spacer) (2), before mounting Installer (special tool #C-4063C, Installer, P/S Pulley) (1) on the pump. To know if a replacement pump requires the stack of washers, measure the depth of the shaft hole. A later build pump will have a depth of 20 mm (0.78 in.) while an earlier build pump will have a depth of 32 mm (1.25 in.).

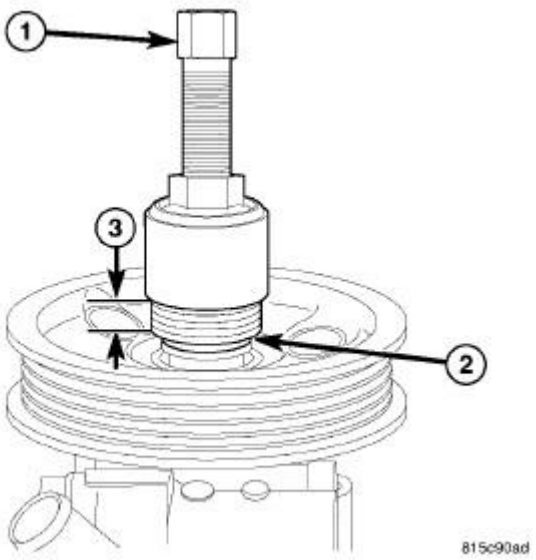

Fig. 187: Thickness, Spacer & Installer
Courtesy of CHRYSLER GROUP, LLC

3. As necessary (see above note), place a stack of washers approximately 13 mm (0.5 in.) thickness (3) over Spacer (special tool #6936, Spacer) (2).

NOTE: Installer (special tool #C-4063C, Installer, P/S Pulley), is a combination of Installer (special tool #C-4063C, Installer, P/S Pulley), and Forcing Screw (special tool #C-4063-2, Forcing Screw). It is important to use Forcing Screw (special tool #C-4063-2, Forcing Screw) when performing this procedure.

4. Thread Installer (1) (special tool #C-4063C, Installer, P/S Pulley), completely into internal threads of power steering pump shaft, then rotate Installer Nut down against washers (as necessary) and Spacer (2) on pump pulley.
5. Ensuring that special tools and pulley remain aligned with pump shaft, tighten Installer Nut, forcing pulley onto power steering pump shaft until Spacer (2) comes in contact with end of pump shaft. **When Spacer (2) is against shaft of power steering pump, Installer (1) Nut will no longer rotate.**
6. Install power steering pump on engine. Refer to **PUMP, INSTALLATION**.

RESERVOIR, POWER STEERING PUMP

REMOVAL

NON SRT

For the Electro Hydraulic Power Steering (EHPS) system, the power steering reservoir is integrated with the EHPS pump and is serviced as an assembly. Refer to **PUMP, REMOVAL**.

SRT

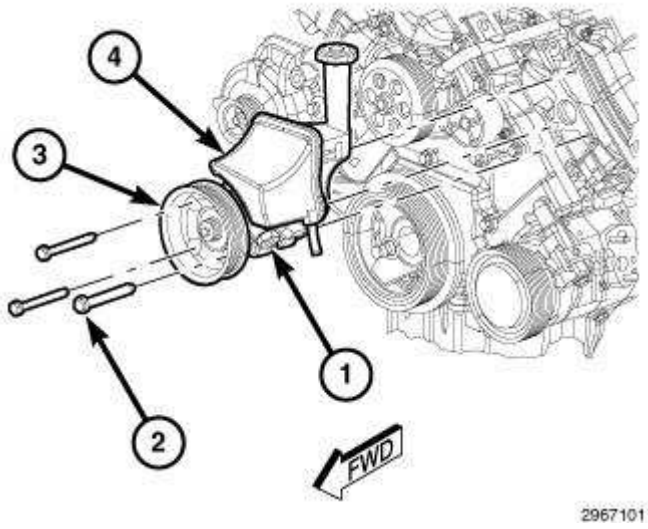

Fig. 188: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

For the SRT Power Steering System, the power steering reservoir (4) is integrated with the power steering pump (1). To remove, refer to **PUMP, REMOVAL**.

INSTALLATION

NON SRT

For the Electro Hydraulic Power Steering (EHPS) system, the power steering reservoir is integrated with the EHPS pump and is serviced as an assembly. Refer to **PUMP, INSTALLATION**.

SRT

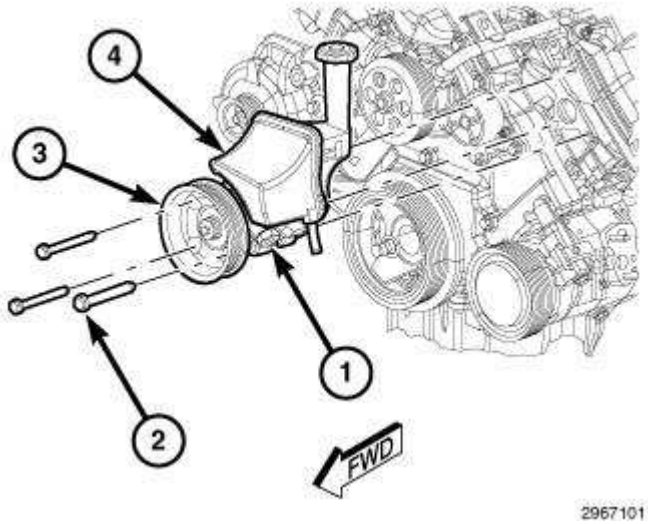

Fig. 189: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

For the SRT Power Steering System, the power steering reservoir (4) is integrated with the power steering pump (1). To install, refer to **PUMP, INSTALLATION**.

ACCESSORIES AND EQUIPMENT

Power Top/Sunroof - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

Two power operated sunroofs are available factory-installed optional equipment on this vehicle. One has a single sliding glass panel and is referred to as the Single Pane Sunroof. The other has two glass panels, one sliding and one fixed, and is referred to as the Dual Pane (also known as the CommandView®) Sunroof. The information and procedures cover only the electric motor and electronic module units and the switches used for these two sunroofs. The information covering the mechanical components of these two sunroof systems can be found in the Body article. Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

SINGLE PANE SUNROOF

The single pane power sunroof system allows the sliding glass sunroof panel over the first row seating to be opened, closed or placed in a ventilation position electrically by actuating one of three switch push buttons located in the overhead console. The electronic controls integral to the sunroof motor and module unit provide an express (also known as one-touch) feature to simplify sunroof opening and closing while driving. The electronics also provide an Excess Force Limitation (EFL) feature, which detects obstacles trapped between the glass and the opening in the vehicle roof during closing.

The sunroof glass panel tilts upward at the rear for the ventilation position, or slides downward and rearward between the outer roof panel and the headliner for the open position. The glass panel seals flush with the roof in the closed position to eliminate wind noise, and an integrated mesh wind deflector reduces wind buffeting at low speeds with the sunroof open. The sunroof also includes a manual sliding sunshade to cover the deep tinted glass panel when closed.

The major components of the single pane power sunroof system include:

- **Frame and Mechanism** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Manual Sunshade** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Motor and Module Unit** - The single pane power sunroof motor and module unit is secured near the center of the front frame member of the sunroof, between the outer roof panel and the headliner.
- **Sliding Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Switch** - The single pane power sunroof switch unit is integral to the overhead console centered in the headliner between the windshield upper header and the front of the sunroof opening.
- **Wind Deflector** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

Hard wired circuitry connects the single pane power sunroof system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are

routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the single pane power sunroof system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

DUAL PANE SUNROOF

The optional dual pane (also known as the CommandView®) sunroof has one movable deep tinted glass pane over the front row seating and one fixed deep tinted glass pane over the second row seating. This unit also features a power operated sunshade that extends over both the front and rear glass panes when closed. If one of the switch push buttons for the movable pane is actuated while the sunshade is extended over the front glass opening, the system will automatically retract the sunshade to behind the front glass opening before moving the sunroof glass pane. Therefore, the sunshade can never cover the movable glass pane opening unless the pane is in the fully closed position.

The dual pane power sunroof system allows the sliding glass sunroof panel to be opened, closed or placed in a ventilation position electrically by actuating one of three switch push buttons located in the overhead console. The electronic controls integral to the sunroof motor and module unit provide an express (also known as one-touch) feature to simplify sunroof opening and closing while driving. The electronics also provide an Excess Force Limitation (EFL) feature, which detects obstacles trapped between the glass and the opening in the vehicle roof panel during closing.

A second two push button switch in the overhead console provides separate express features for opening and closing the sunshade. The power operated sunshade electronics also provide an EFL feature, which detects obstacles trapped between the sunshade and the opening in the vehicle roof panel during closing.

The sliding sunroof glass panel tilts upward at the rear for the ventilation position, or slides downward and rearward beneath the fixed glass panel for the open position. The sliding glass panel seals flush with the roof in the closed position to eliminate wind noise, and an integrated mesh wind deflector reduces wind buffeting at low speeds with the sunroof open.

The major components of the dual pane power sunroof system include:

- **Fixed Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Frame and Mechanism** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Motor And Electronic Module Units** - The dual pane power sunroof and power sunshade motor and electronic module units are secured to each side of center on the front frame member of the sunroof, between the outer roof panel and the headliner.
- **Power Sunshade** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Sliding Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Switches** - The dual pane power sunroof and power sunshade switches are integral to the

overhead console centered in the headliner between the windshield upper header and the front of the sunroof opening.

- **Wind Deflector** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

Hard wired circuitry connects the dual pane power sunroof system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the dual pane power sunroof system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

SINGLE PANE SUNROOF

The single pane sunroof receives battery feed through a fused B(+) circuit from the Power Distribution Center (PDC). However, the on-board electronic module of the sunroof motor monitors an input on a fused ignition (run - accessory) circuit and is configured to only allow the power sunroof to be operated with the switches in the overhead console when the ignition switch is in the ON or ACCESSORY positions, or using the accessory delay feature for a timed interval after the ignition is turned to the OFF position as long as neither front door has been opened.

The electric motor and electronic module unit of the sunroof moves the sliding glass panel through the use of mechanical drive cables as well as mechanical linkages and guides. See the Body service information for additional information on these components. Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

The on-board electronic module of the power sunroof motor provides both express (also known as one touch) and manual opening and closing based upon module programming and the inputs received from the sunroof switches integral to the overhead console. The electronic module stores and recalls a sliding glass panel hard stop position, then counts the direction and number of motor rotations from that hard stop to enable the express open and close features. The hard stop must be learned by a service replacement motor and electronic module unit during an initialization procedure.

The electronic module also monitors the motor opening load through current draw, and the motor closing load through motor speed. Monitoring the motor load and speed is how the module logic is able to implement the obstacle detection (also known as Excess Force Limitation/EFL) feature. The EFL feature stops and reverses the sliding glass panel movement when an obstruction to sliding panel closing travel is encountered.

The power sunroof circuits and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods

will not prove conclusive in the diagnosis of the on-board electronic module or the power sunroof motor. If there are no mechanical issues with the power sunroof assembly and the power sunroof switches and circuitry test okay, but the motor manual and express or EFL features are still ineffective following performance of the initialization procedure, the motor and electronic module unit must be replaced.

DUAL PANE SUNROOF AND SUNSHADE

The dual pane power sunroof sliding glass panel and power sunshade motors both receive battery feed through a fused B(+) circuit from the Power Distribution Center (PDC). However, the on-board electronic module of each sunroof or sunshade motor monitors an input on a fused ignition (run - accessory) circuit and is configured to only allow the power sunroof and the power sunshade to be operated with the switches in the overhead console when the ignition switch is in the ON or ACCESSORY positions, or using the accessory delay feature for a timed interval after the ignition is turned to the OFF position as long as neither front door has been opened.

The electric motor and electronic module unit of the sunroof or sunshade moves the sliding glass panel or the sunshade through the use of mechanical drive cables as well as mechanical linkages and guides. See the Body service information for additional information on these components. Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

The on-board electronic modules integral to the power sunroof and sunshade motors provide both express (also known as one-touch) and manual opening and closing for their respective motors based upon module programming and the inputs received from the sunroof and sunshade switches integral to the overhead console. The electronic modules store and recall a sliding glass panel or a power sunshade hard stop position, then counts the direction and number of motor rotations from that hard stop to enable the express open and close features. These hard stops must be learned by a service replacement motor and electronic module unit during an initialization procedure.

In addition, the electronic modules are programmed to move only one motor at a time. The two motors communicate switch input information as well as sunroof and sunshade position information with each other through a serial bus circuit, but do not communicate with any other electronic modules in the vehicle. The electronic modules are programmed to move the sunshade out of the way into a safe mid-open position automatically before allowing the sliding glass panel to move. Likewise, if the sunshade switch is depressed to close the sunshade while the sliding glass panel is in an open position, the electronic modules are programmed to automatically close the glass panel before closing the sunshade.

The electronic modules also provide an obstacle detection (also known as Excess Force Limitation/EFL) feature for both the sliding glass panel and the sunshade. The modules each monitor motor closing load through motor speed. When an obstacle is detected due to a significant decrease in motor speed, the module will stop the motor closing motion while limiting the forces applied to the obstacle, then reverse the motor direction to allow the obstacle to be removed.

The electronic modules provide a thermal protection feature to protect the motors from abuse or overheating. If the motor is cycled enough to cause overheating, the software will allow one final closing cycle before it stops responding to further switch inputs. Once a motor has cooled sufficiently, normal operation will be automatically restored. However, the ignition switch must remain in the ON

or ACCESSORY positions so that the module remains awake long enough to monitor the cool down of the motor.

The power sunroof and sunshade circuits and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the on-board electronic modules or the power sunroof and power sunshade motors. If there are no issues with the power sunroof and sunshade mechanisms and the power sunroof or power sunshade switches and circuitry test okay, but the motor and express or EFL features are still ineffective following the initialization procedure, the motor and electronic module unit must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUNROOF SYSTEM

SINGLE PANE SUNROOF

The hard wired circuits between components related to the operation of the single pane power sunroof system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof motor. If the power sunroof switches, motors and circuitry test okay, but the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module unit must be replaced.

NOTE: **If there is no sliding sunroof panel movement when the power sunroof switch OPEN or CLOSE push button is depressed, but there is movement when the VENT push button is depressed, the sunroof module requires calibration. Complete the Single Pane Sunroof Motor And Module Initialization procedure prior to performing any further sunroof diagnosis. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.**

CONDITION	POSSIBLE CAUSES	CORRECTION
POWER SUNROOF COMPLETELY INOPERATIVE	1. Ineffective ground circuit.	1. Test and repair the open sunroof motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair the open sunroof motor feed circuit if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
AUDIBLE WHINE WHEN	1. Binding drive cable.	1. Replace the binding drive cable if

POWER SUNROOF SWITCH IS ACTUATED		required.
	2. Ineffective sunroof motor and module unit.	2. Replace the sunroof motor and module unit if required.
AUDIBLE CLICKING OR RATCHETING WHEN POWER SUNROOF SWITCH IS ACTUATED	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to **ADJUSTMENTS** or **ADJUSTMENTS** .
	2. Damaged or worn drive cable.	2. Replace the broken or worn drive cable if required.
	3. Damaged or worn motor drive gear.	3. Replace the sunroof motor and module unit if required.
POWER SUNROOF VENTS AND OPENS BUT DOES NOT CLOSE	1. Damaged or disengaged trough guide.	1. Replace or reinstall trough guide if required.
	2. Binding drive cable.	2. Replace the binding drive cable if required.
	3. Ineffective CLOSE circuit.	3. Repair the sunroof CLOSE circuit between the switch and the motor if required.
	4. Ineffective sunroof switch.	4. Test and replace the sunroof switch (overhead console assembly) if required.
	5. Ineffective sunroof motor and module unit.	5. Replace the sunroof motor and module unit if required.
POWER SUNROOF VENTS AND CLOSES BUT DOES NOT OPEN	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective OPEN circuit.	2. Repair the sunroof OPEN circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF DOES NOT VENT	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective VENT circuit.	2. Repair the sunroof VENT circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF GLASS MOVEMENT INCONSISTENT - NOT	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to **ADJUSTMENTS** or

SMOOTH AND UNIFORM		**ADJUSTMENTS** .

DUAL PANE SUNROOF AND SUNSHADE

The hard wired circuits between components related to the operation of the dual pane power sunroof and sunshade system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof or power sunshade motor. If the power sunroof or power sunshade switches, motors and circuitry test okay, but the express or Excess Force Limitation (EFL) features are still ineffective following the initialization procedures, the motor and module unit must be replaced.

TEST PREPARATION

- **Check Electrical System Voltage** - There should be at least 12.5 volts when measured at the battery terminals.
- **Ignition Switch Position** - The ignition switch should be in the ON or ACCESSORY positions with the engine not running.
- **Note Power Sunroof Responses** - Depress each of the sunroof switch push buttons one at a time and note the system responses. Try both express (short press duration) and manual (long press duration) for each push button.
- **Note Power Sunshade Responses** - Depress each of the sunshade switch push buttons one at a time and note the system responses. Try both express (short press duration) and manual (long press duration) for each push button.

Match the noted system responses to the conditions listed in the diagnostic table to determine the possible causes and corrections for the condition.

CONDITION	POSSIBLE CAUSES	CORRECTION
POWER SUNROOF OR POWER SUNSHADE COMPLETELY	1. Thermal protection feature active.	1. Let vehicle sit for two minutes with ignition switch in the ON or ACCESSORY position to allow the motor(s) to cool and the thermal protection feature to become inactive, then test again.
	2. Ineffective ground circuit.	2. Test and repair the open sunroof or sunshade motor ground circuit if required.
	3. Ineffective fused B(+) circuit.	3. Test and repair the open sunroof or sunshade motor fused B(+) circuit if required.
		4. Test and repair the open sunroof

INOPERATIVE AND UNRESPONSIVE	4. Ineffective fused ignition (run - acc) circuit. 5. Ineffective sunroof or sunshade switch return circuit. 6. Ineffective sunroof or sunshade switch. 7. Ineffective sunroof or sunshade motor and module unit.	or sunshade motor fused ignition (run - acc) circuit if required. 5. Test and repair the open sunroof or sunshade switch return circuit if required. 6. Test and replace the sunroof or sunshade switch (overhead console assembly) if required. 7. Replace the sunroof or sunshade motor and module unit if required.*
SLIGHT SUNROOF OR SUNSHADE MOVEMENT OR AUDIBLE RELAY CLICKS BUT NO COMPLETE MOVEMENT EVENTS	1. Binding drive cable or blocked cable travel path. 2. Ineffective sunroof or sunshade motor and module unit.	1. Repair the blocked cable travel path or replace the binding drive cable if required. 2. Replace the sunroof or sunshade motor and module unit if required.*
MOTOR MOVES FREELY, BUT WHEN CLOSING IT SLOWS, STOPS AND REVERSES DIRECTION	1. Obstacle detection event.	1. Refer to **NUISANCE REVERSALS** topic following this table.
MOTOR STOPS RUNNING AND WILL NOT OPEN GLASS MORE THAN 8 INCHES OR WILL NOT OPEN SUNSHADE MORE THAN 12 INCHES	1. Motor is in manufacturing mode.	1. Replace the sunroof or sunshade motor and module unit if required.*
POWER SUNROOF VENTS AND CLOSES BUT DOES NOT OPEN, OR POWER SUNSHADE CLOSES BUT DOES NOT OPEN	1. Binding drive cable. 2. Ineffective OPEN circuit. 3. Ineffective sunroof or sunshade switch. 4. Ineffective sunroof or sunshade motor and module unit.	1. Replace the binding drive cable if required. 2. Repair the sunroof or sunshade OPEN circuit between the switch and the motor if required. 3. Test and replace the sunroof or sunshade switch (overhead console assembly) if required. 4. Replace the sunroof or sunshade motor and module unit if required.*
POWER SUNROOF VENTS AND OPENS BUT DOES NOT CLOSE, OR POWER SUNSHADE OPENS BUT DOES NOT	1. Binding drive cable. 2. Ineffective CLOSE circuit. 3. Ineffective sunroof or sunshade switch.	1. Replace the binding drive cable if required. 2. Repair the sunroof or sunshade CLOSE circuit between the switch and the motor if required. 3. Test and replace the sunroof or sunshade switch (overhead console assembly) if required.

CLOSE	4. Ineffective sunroof or sunshade motor and module unit.	4. Replace the sunroof or sunshade motor and module unit if required.*
POWER SUNROOF DOES NOT VENT	1. Binding drive cable. 2. Ineffective VENT circuit. 3. Ineffective sunroof switch. 4. Ineffective sunroof motor and module unit.	1. Replace the binding drive cable if required. 2. Repair the sunroof VENT circuit between the switch and the motor if required. 3. Test and replace the sunroof switch (overhead console assembly) if required. 4. Replace the sunroof motor and module unit if required.
POWER SUNROOF GLASS OR POWER SUNSHADE MOVES ONLY WHEN SWITCH IS PRESSED AND HELD (MANUAL MODE - LOSS OF ONE-TOUCH OR EXPRESS MODE)	1. Ineffective communication between sunroof and sunshade motor and module units.	1. Refer to **MOTOR COMMUNICATIONS CHECK** topic following this table.
POWER SUNROOF GLASS OR POWER SUNSHADE MOVEMENT INCONSISTENT - NOT SMOOTH AND UNIFORM	1. Improperly adjusted sliding glass panel or sunshade.	1. Adjust the sunroof glass panel or sunshade if required. Refer to **ADJUSTMENTS** or **ADJUSTMENTS** .
*The sliding glass and sunshade motor and module units are interchangeable. Swap the motor and module units to confirm whether a new replacement motor and module is required or another issue is causing the problem.		

NUISANCE REVERSALS

A nuisance reversal describes a condition where the obstacle detection feature (also known as the Excess Force Limitation/EFL feature) reverses sunroof glass or sunshade movement to protect for an obstacle, but no obvious obstacle exists. When the motor speed decreases beyond what the module has learned during previous cycles, it is interpreted by the module as an obstacle having been encountered. However, other conditions such as low ambient temperatures or low system voltage levels can slow sunroof or sunshade operation, which may be misinterpreted by the module as an obstacle resulting in a nuisance reversal.

To test for this condition, first verify that the system voltage of the vehicle is at or above 12.5 volts. Now, carefully observe and listen while the reversal occurs as the sunroof or sunshade is closed and proceed as follows.

- If the nuisance reversals always occur at the same point in the sunroof or sunshade travel, perform the DUAL PANE SUNROOF OR SUNSHADE OBSTACLE DETECTION REVERSAL OVERRIDE procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**. This will

force the motor to try to learn the new friction level during the override closing event.

- If the nuisance reversals continue to occur at the same point in the sunroof or sunshade travel following the performance of the override procedure, note the location where the reversal occurs and inspect that area for binding parts. If any noise is noted during the reversal, identify the source of the noise. For example, if the reversal always occurs in the last 7.6 centimeters (3 inches) of sunroof travel, observe the wind deflector for binding as it is pushed downward or examine the guides in that area of travel for debris in the tracks or damage to the cable track. It may be necessary to remove the sliding glass panel, the wind deflector or the drain channel to observe the sunroof mechanism in operation in order to identify the specific source of binding.
- Improper glass adjustment and glass fit to the roof sheet metal and the fixed glass panel can cause nuisance reversals to occur. In those cases, proper adjustment of the two glass panels may resolve the problem. Refer to **ADJUSTMENTS** or **ADJUSTMENTS** .
- If the nuisance reversals only occur while driving under rough road conditions, verify there are no localized bind points in the sunroof or sunshade travel. Striking a large enough bump or driving on washboard roads could be expected to cause an occasional nuisance reversal. The software is programmed to detect rough road events and minimize them, but can't completely eliminate them without disabling the obstacle detection feature.
- If the nuisance reversals only occur as the engine is being turned OFF or during the start or stall of another electric motor in the vehicle (power window or power seat motors) then a voltage drop or high current draw event may be reducing the electrical power available to the sunroof or sunshade motor. Check for loose connections or excessive resistance in the battery and ground circuits to the sunroof and sunshade motors. The software is programmed to compensate for voltage drop or high current draw events when proper wiring and connections are functional.
- If the nuisance reversals are intermittent, cannot be tracked to any specific position and are not resolved by performing the override procedure, replacement of the motor and module unit may be necessary. However, if proper motor and module unit replacement does not resolve the problem, the mechanical cause of the binding must be found and repaired to restore proper sunroof or sunshade operation.

MOTOR COMMUNICATIONS CHECK

Sunroof and sunshade operation must be synchronized. The two motor and module units share a communication circuit. This communication circuit is not connected to any other communications circuits in the vehicle. When the sunroof and sunshade communications is active and functioning properly, the express (also known as one-touch) mode of operation for both units is enabled. When the motor and module units cannot communicate, express mode is disabled for both units and only the manual mode of operation is enabled.

To test for proper motor communications, first verify that the system voltage of the vehicle is at or above 12.5 volts. Turn the ignition switch to the ON or ACCESSORY position and try to operate the sunroof and sunshade with their respective switches, carefully noting the results. Proceed as follows.

- Both the sunroof and the sunshade operate only in manual mode. Check the communications circuit between the two motor and module units for a short or open circuit. Refer to the appropriate wiring information. Repair the communications circuit if required. If the communications circuit checks okay, one or both motor and module units may have an internal

communications failure and may need to be replaced.

- The sunroof moves in manual mode, but the sunshade does not move. Check the ground, fused B(+), fused ignition (run - acc) and switch circuits at the sunshade motor. If the circuits check okay, replace the ineffective sunshade motor and module unit.
- The sunshade moves in manual mode, but the sunroof does not move. Check the ground, fused B(+), fused ignition (run - acc) and switch circuits at the sunroof motor. If the circuits check okay, replace the ineffective sunroof motor and module unit.

MOTOR, SUNROOF

DESCRIPTION

DESCRIPTION

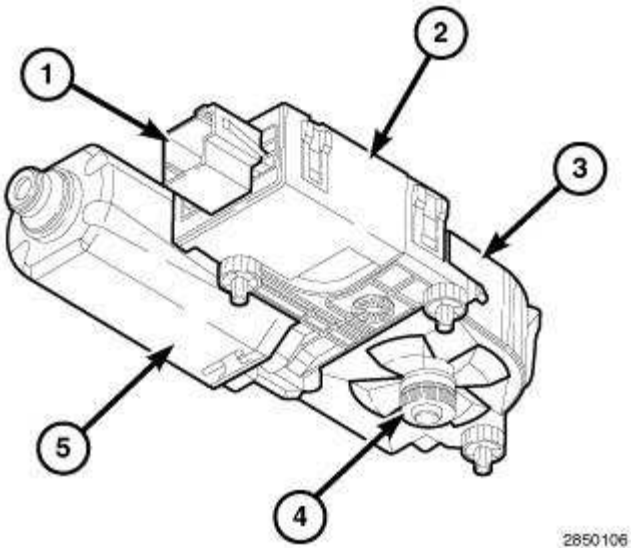

Fig. 1: Single Pane Sunroof Motor
Courtesy of CHRYSLER GROUP, LLC

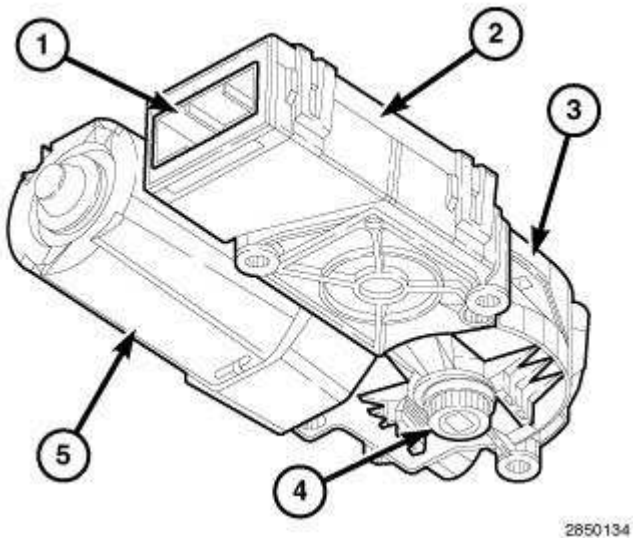

Fig. 2: Dual Pane Sunroof Or Sunshade Motor
Courtesy of CHRYSLER GROUP, LLC

The motor and electronic module units for both the single pane sunroof and the dual pane sunroof or sunshade are quite similar, but are not interchangeable. However, the dual pane sunroof and sunshade motor and module units are interchangeable and configure themselves to either sunroof or sunshade operation through a configuration pin in the sunshade connector of the sunroof wire harness. Each sunroof motor (5) is a reversible, 12-volt Direct Current (DC), permanent magnet motor with internal thermal protection.

The single panel sunroof has a single motor and electronic module unit secured by three screws near the center of the underside of the front sunroof frame member where it is concealed above the headliner. The dual pane sunroof has two motor and electronic modules, each secured by three screws to the underside of the front sunroof frame member and concealed above the headliner. The motor to the left of center operates the sliding glass mechanism, while the motor to the right of center operates the power sunshade mechanism.

Each motor is connected mechanically to the sunroof or sunshade drive gear (4) through a right angle drive, gear reduction transmission (3). Each motor also is connected electrically to an on-board electronic control unit (2) that has an integral connector receptacle (1) that connects the unit to the vehicle electrical system through a dedicated take out and connector of the sunroof wire harness.

The sunroof motor or sunshade motor and electronic module units cannot be repaired. If ineffective or damaged, the entire motor and module unit must be replaced.

OPERATION

OPERATION

The single pane and dual pane power sunroof and power sunshade motors are each completely controlled by the circuitry of their respective on-board electronic module. The module receives battery current on a fused B(+) circuit from the Totally Integrated Power Module (TIPM) and has a path to

ground at all times through a take out and eyelet terminal connector secured by a ground screw to the body sheet metal. These connections allow the module to function regardless of the ignition switch position.

However, the modules both monitor an input on a fused ignition switch output (run - accessory) circuit, and provide a source current to the sunroof and sunshade switches in the overhead console only when the ignition switch is in the ON or ACCESSORY positions, or while the accessory delay feature is active. The modules then monitor a separate input circuit for each switch position, which it uses to determine the proper outputs to the power sunroof or power sunshade motor. A positive and negative battery connection to the two motor brushes will cause the power sunroof or sunshade motor to rotate in one direction. Reversing the current through these same two brushes will cause the motor to rotate in the opposite direction.

The hard wired circuits of the power sunroof and power sunshade motors as well as those between the electronic modules and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof and power sunshade motors. If the power sunroof or power sunshade switches and the hard wired circuitry test okay, but the motor or the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module must be replaced as a unit.

STANDARD PROCEDURE

DUAL PANE SUNROOF OR SUNSHADE OVERRIDE POSITION CALIBRATION

SLIDING GLASS

The sliding glass panel motor stalls when the glass reaches the fully vented position and the electronic motor module learns that position (hard stop), then counts the number of motor rotations to know where the fully closed and fully open positions of the glass are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully vented motor stall position.

1. Be certain electrical system voltage is at or above 12.5 volts.
2. Be certain the key is in the ignition switch and the switch is in the ON position.
3. Be certain the power sunshade is open at least beyond the back of the sliding glass panel opening.
4. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel is in the fully vented position or until the motor will not drive the glass any further towards the fully vented position.
5. Open the driver side front door.
6. Turn the ignition switch to the OFF position.
7. Within 2 seconds, turn the ignition switch back to the ON position.
8. Within 2 seconds, depress and hold the VENT push button of the sunroof switch for about ten seconds. At the end of ten seconds, the motor will try to drive the sliding glass panel to the fully

vented position. Once motor stall is detected the electronic module will write that stall position to memory as the new glass position.

9. Verify sliding glass panel motor operation by cycling the glass to fully opened, fully closed, fully vented, then fully closed again.

SUNSHADE

The sunshade motor stalls when the shade reaches the fully closed position and the electronic motor module learns that position (hard stop), then counts the number of motor rotations to know where the mid-opened and fully opened positions of the shade are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully closed motor stall position.

1. Be certain electrical system voltage is at or above 12.5 volts.
2. Be certain the key is in the ignition switch and the switch is in the ON position.
3. Be certain the sliding glass panel is in the fully closed position.
4. Depress and hold the CLOSE push button of the sunshade switch until the shade is in the fully closed position or until the motor will not drive the shade any further towards the fully closed position.
5. Open the driver side front door.
6. Turn the ignition switch to the OFF position.
7. Within 2 seconds, turn the ignition switch back to the ON position.
8. Within 2 seconds, depress and hold the CLOSE push button of the sunshade switch for about ten seconds. At the end of ten seconds, the motor will try to drive the shade to the fully closed position. Once motor stall is detected, the electronic module will write that stall position to memory as the new shade position.
9. Verify sunshade motor operation by cycling the shade to mid-opened, fully opened, then fully closed again.

DUAL PANE SUNROOF OR SUNSHADE OBSTACLE DETECTION UPDATE

The obstacle detection function (also known as Excessive Force Limitation/EFL) updates the sunroof sliding glass panel and sunshade closing profiles after each successful CLOSE event as long as temperature and voltage are within a normal range. Being certain that these parameters are within range and cycling the sliding glass panel and sunshade will update the obstacle detection settings in the electronic module software.

- Be certain electrical system voltage is at or above 12.5 volts.
- Be certain vehicle is in an area that is near room temperature - 20 to 25° C (68 to 77° F).
- Be certain the key is in the ignition switch and the switch is in the ON position.
- Be certain there are no physical binds or blockages to sliding glass panel or sunshade travel.

SLIDING GLASS

1. Be certain the power sunshade is in the fully open position.

2. Depress the VENT push button of the sunroof switch so that the sliding glass panel travels to the fully vented position.
3. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
4. Depress the OPEN push button of the sunroof switch so that the sliding glass panel travels to the fully opened position.
5. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
6. Repeat Steps 2 through 5 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

SUNSHADE

1. Be certain the sunroof sliding glass is in the fully closed position.
2. Depress the OPEN push button of the sunshade switch so that the shade travels to the mid-open position.
3. Depress the OPEN push button of the sunshade switch again so that the shade travels to the fully opened position.
4. Depress the CLOSE push button of the sunshade switch so that the shade travels to the fully closed position.
5. Repeat Steps 2 through 4 for at least 5 complete sunshade panel cycles (MID-OPEN, FULL-OPEN, CLOSE).

SUNROOF MOTOR AND MODULE INITIALIZATION

SINGLE PANE SUNROOF

INITIALIZATION

A new motor is shipped uncalibrated with no vehicle cycles having been run. After installation and connection of the wire harness, the following steps must be taken to initialize the new motor and module unit.

NOTE: Verify that the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor and module unit drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor and module initialization procedure will not be properly completed.

NOTE: If at any point during the following procedure the sunroof does not respond as expected, restart the procedure at Step 1.

1. Depress and hold the CLOSE push button of the sunroof switch until the sunroof sliding glass panel moves to the fully closed hard stop and then back to the tilt (VENT) position.
2. Release the CLOSE push button of the sunroof switch, then depress and hold the CLOSE push

button again within 5 seconds.

3. As the CLOSE push button of the sunroof switch is held, the sunroof sliding glass panel will move to the fully closed position, then to the fully opened position and then fully closed again.
4. Initialization is complete. Release the sunroof switch push button.

REINITIALIZATION

The following procedure causes a previously calibrated and properly operating electronic motor module to relearn and update motor stall position and obstacle detection.

NOTE: If at any point during the following procedure the sunroof does not respond as expected, restart the procedure at Step 1.

1. Depress and hold the CLOSE push button of the sunroof switch until the sliding glass panel is fully closed.
2. Continue to hold the CLOSE push button of the sunroof switch. It will take at least 10 seconds for the initialization process to begin.
3. The sunroof sliding glass panel will move to the hard stop and then back to the tilt (VENT) position.
4. Release the CLOSE push button of the sunroof switch, then depress and hold the CLOSE push button again within 5 seconds.
5. As the CLOSE push button of the sunroof switch is held, the sunroof sliding glass panel will move to the fully closed position, then to the fully opened position and then fully closed again.
6. Initialization is complete. Release the sunroof switch push button.

DUAL PANE SUNROOF

A new motor is shipped uncalibrated with no vehicle cycles having been run. After installation and connection of the wire harness, the following steps must be taken to initialize the new motor and module unit.

NOTE: Verify that the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor and module unit drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor and module initialization procedure will not be properly completed.

SUNROOF

1. Turn the ignition switch to the ON position.
2. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel has moved to the fully vented position.
3. Be certain that the sunshade has opened to at least beyond the back of the sliding glass panel opening before finishing the sunroof motor and module initialization.
4. Depress the VENT push button of the sunroof switch and release. The sliding glass panel

should travel to the fully vented position.

5. Depress the CLOSE push button of the sunroof switch and release. The sliding glass panel should travel past the fully closed position, then reverse direction back to fully closed to set the sunroof seal.
6. Depress the OPEN push button of the sunroof switch and release. The sliding glass panel should travel to the fully opened position.
7. Depress the CLOSE push button of the sunroof switch and release. The sliding glass panel should travel to the fully closed position.
8. Repeat Steps 4 through 7 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

SUNSHADE

1. Turn the ignition switch to the ON position.
2. Depress and hold the CLOSE push button of the sunroof switch until the sliding sunshade panel has moved to the fully closed position.
3. Be certain that the sunroof sliding glass panel is in the fully closed position before finishing the sunshade motor and module initialization.
4. Depress the OPEN push button of the sunshade switch and release. The sunshade panel should travel to the mid-open position at least beyond the back of the sliding glass panel opening.
5. Depress the OPEN push button of the sunshade switch again and release. The sunshade panel should travel to the fully opened position.
6. Depress the CLOSE push button of the sunshade switch and release. The sunshade panel should travel to the fully closed position.
7. Repeat Steps 4 through 6 for at least 5 complete sunshade panel cycles (MID-OPEN, FULL-OPEN, CLOSE).

SUNROOF OR SUNSHADE OBSTACLE DETECTION REVERSAL OVERRIDE

SINGLE PANE

There are two methods for overriding the obstacle detection feature if the single pane sunroof sliding glass is unable to close due to a known blockage condition (ice, leaves, debris in track).

OVERRIDE - METHOD 1

Depress and hold the CLOSE push button of the sunroof switch during the close. The sunroof will be in override mode during the close.

OVERRIDE - METHOD 2

Once the sunroof encounters and reverses on an obstacle during express (one touch) closing three consecutive times, the sunroof will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE

Any sunroof obstacle detection override mode is exited by reaching the close position. Once the override has been exited, all normal operations will resume including the obstacle detection feature.

DUAL PANE

There are two methods for overriding the obstacle detection feature if the dual pane sunroof sliding glass panel or sunshade is unable to close due to a known blockage condition (ice, leaves, debris in track).

OVERRIDE - METHOD 1

Depress and hold the CLOSE push button of the sunroof or sunshade switch during the initial close, during the reversal and for 2 seconds after the reversal stops. If the CLOSE push button is released at any time between the initial close and the end of the 2 seconds after the reversal stops, the sunroof or sunshade will not enter override mode. Once the CLOSE push button has been held through these events, the sunroof or sunshade will be in primary override mode. All CLOSE push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in primary override mode.

OVERRIDE - METHOD 2

Once the sunroof or sunshade encounters and reverses on an obstacle during closing three consecutive times with no other sunroof or sunshade push button switches being depressed, the fourth time the CLOSE push button is depressed, the sunroof or sunshade will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE

Any sunroof or sunshade obstacle detection override mode is exited by either reaching the close position or by depressing any sunroof or sunshade switch push button except CLOSE to remove the obstacle. Once the override has been exited, all normal operations will resume including the obstacle detection feature.

REMOVAL

REMOVAL

SINGLE PANE SUNROOF

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a

new component. Failure to perform this procedure may result in damage to the vehicle, to the sunroof or in serious or fatal injuries. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

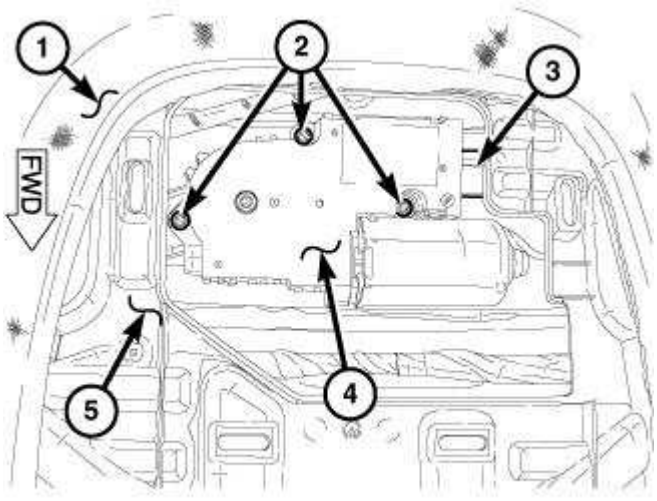

Fig. 3: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner (1). Refer to **CONSOLE, OVERHEAD, REMOVAL** .
3. Reach through the opening in the headliner bracket (5) for the overhead console to access the sunroof motor and module unit (4).
4. Remove the three screws (2) that secure the motor and module to the sunroof frame.
5. Lower the motor and module unit through the headliner bracket opening far enough to access and disconnect the sunroof wire harness connector from the motor and module connector receptacle (3).
6. Remove the sunroof motor and module unit from the vehicle.

DUAL PANE SUNROOF OR SUNSHADE

WARNING: Do not attempt to move or reposition the sunroof glass panel, the sunshade or the drive cables with the sunroof or sunshade motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Panel Calibration procedure and the Sunroof Motor And Module Initialization procedure must be completed any time a sunroof or sunshade motor and module unit is replaced with a new component. Failure to perform these procedures may result in damage to the vehicle, to the sunroof, to the sunshade or in serious or fatal injuries. Refer to

MOTOR, SUNROOF, STANDARD PROCEDURE.

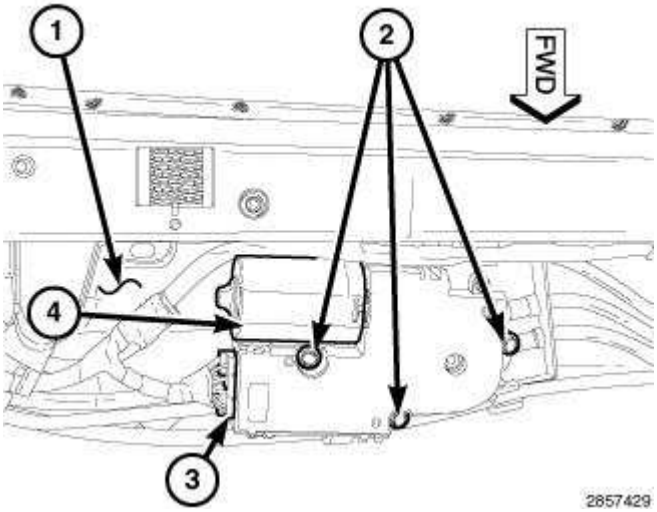

Fig. 4: Inner Roof Panel, Sunroof Wire Harness Connector, Screws & Module Unit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Lower the headliner from the inner roof panel (1). Refer to **HEADLINER, REMOVAL** .
3. Disconnect the sunroof wire harness connector (3) from the sunroof or sunshade motor and module unit (4) connector receptacle (2).
4. Remove the three screws (2) that secure the motor and module unit to the sunroof frame.
5. Remove the sunroof or sunshade motor and module unit from the vehicle.

INSTALLATION

INSTALLATION

SINGLE PANE SUNROOF

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage to the vehicle, to the sunroof or in serious or fatal injuries. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

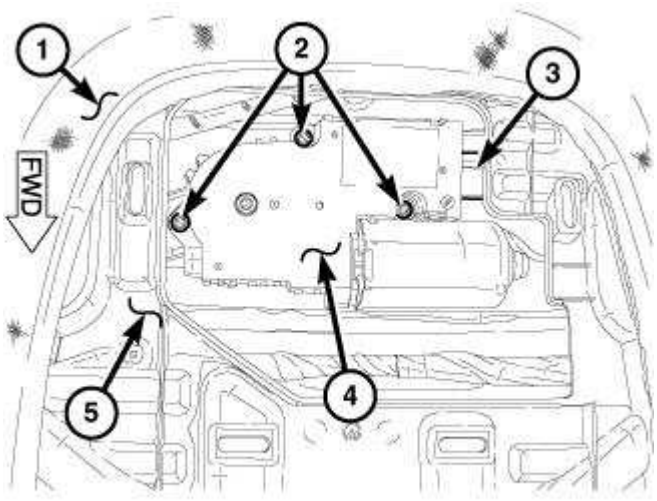

Fig. 5: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the sunroof motor and module unit (4) close enough to the headliner bracket (5) for the overhead console to access and reconnect the overhead wire harness connector to the motor and module connector receptacle (3).
2. Position the motor and module through the headliner bracket opening and onto the sunroof frame.
3. Install and tighten the three screws (2) that secure the motor and module to the sunroof frame. Tighten the screws to 4 N.m (35 in. lbs.).
4. Reinstall the overhead console onto the headliner (1). Refer to **CONSOLE, OVERHEAD, INSTALLATION** .
5. Reconnect the battery negative cable.
6. Perform the Sunroof Motor And Module Initialization procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.

DUAL PANE SUNROOF OR SUNSHADE

WARNING: Do not attempt to move or reposition the sunroof glass panel, the sunshade or the drive cables with the sunroof or sunshade motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Panel Calibration procedure and the Sunroof Motor And Module Initialization procedure must be completed any time a sunroof or sunshade motor and module unit is replaced with a new component. Failure to perform these procedures may result in damage to the vehicle, to the sunroof, to the sunshade or in serious or fatal injuries. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.

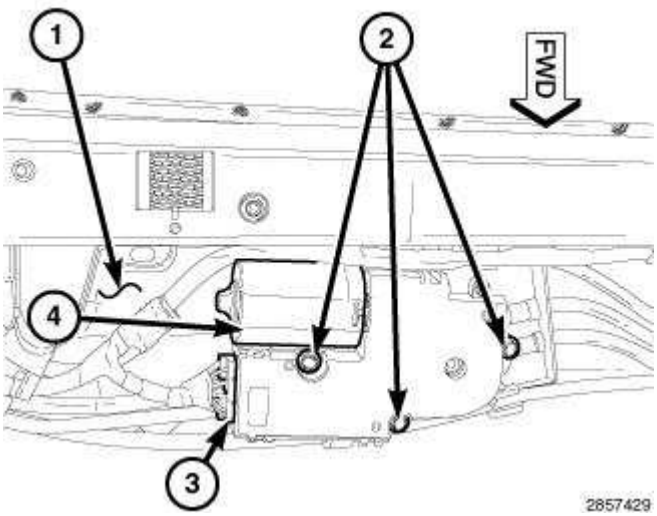

Fig. 6: Inner Roof Panel, Sunroof Wire Harness Connector, Screws & Module Unit
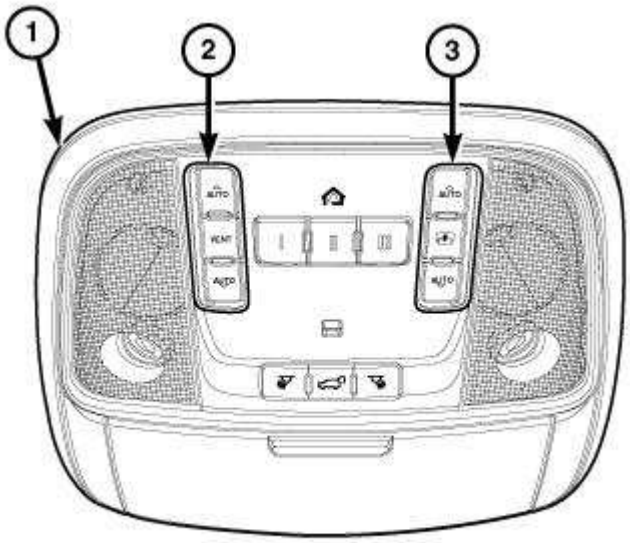
Courtesy of CHRYSLER GROUP, LLC

1. Position the sunroof or sunshade motor and module unit (4) to the sunroof frame.
2. Install and tighten the three screws (2) that secure the motor and module unit to the sunroof frame. Tighten the screws to 3.8 N.m (34 in. lbs.).
3. Reconnect the sunroof wire harness connector (3) to the motor and module unit connector receptacle.
4. Reinstall the headliner to the inner roof panel (1). Refer to **HEADLINER, INSTALLATION** .
5. Reconnect the battery negative cable.
6. If a previously initialized sunroof or sunshade motor and module unit has been reinstalled, perform the Dual Pane Sunroof Or Sunshade Override Position Calibration procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.
7. If a new sunroof or sunshade motor and module unit has been installed, perform the Sunroof Motor And Module Initialization procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION



2843875

Fig. 7: Power Sunroof Switch, Overhead Console & Power Sunshade Switch
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with a power sunroof have a power sunroof switch (2) integral to the overhead console (1) located in the headliner just forward of the sunroof opening. This switch has three momentary push buttons clearly identified by either text or icons indicating their functions. The three functions are from front-to-back: CLOSE, VENT, and OPEN. The switch push buttons also have instrument panel dimmer controlled Light Emitting Diode (LED) units that provide back lighting for visibility at night.

Vehicles with the optional dual pane (also known as CommandView®) sunroof also have a power sunshade switch (3) integral to the overhead console. This switch has two momentary push buttons that are also clearly identified by icons indicating their functions. The two functions are from front-to-back: CLOSE and OPEN. These switch push buttons are also back lit by LED units for visibility at night.

Both the power sunroof and (if equipped) the power sunshade switch are connected to the vehicle electrical system through the printed circuit board of the overhead console, which is connected to a dedicated take out and connector of the overhead wire harness. If either switch is ineffective or damaged, the entire overhead console must be replaced.

OPERATION

OPERATION

Both the power sunroof and (if equipped) the power sunshade switch are hard wired to the electronic module integral to their respective power sunroof or power sunshade motor. The electronic module provides the switch with a source current whenever the ignition switch is in the ON or ACCESSORY positions. When one of the switch push buttons is depressed, it sends a signal back to the electronic

module and the electronic module controls the motor to move the sunroof or sunshade panel to the appropriate position.

A short duration (less than 800 milliseconds) press of the switch push button is interpreted by the electronic module as an Express (also known as one touch) command, where the motor will automatically move the glass panel or sunshade to the fully open, fully closed or (sliding glass panel only) the ventilation position. A long duration (greater than 800 milliseconds) press of the push button is interpreted by the electronic module as a manual command, where the motor moves only as long as the push button is held in the depressed position. During an Express event, any new switch input will immediately stop an in-progress event which, as in the manual mode, allows the customer to stop the sliding glass panel or sunshade at any desired location.

The power sunroof and power sunshade switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUNROOF SWITCH

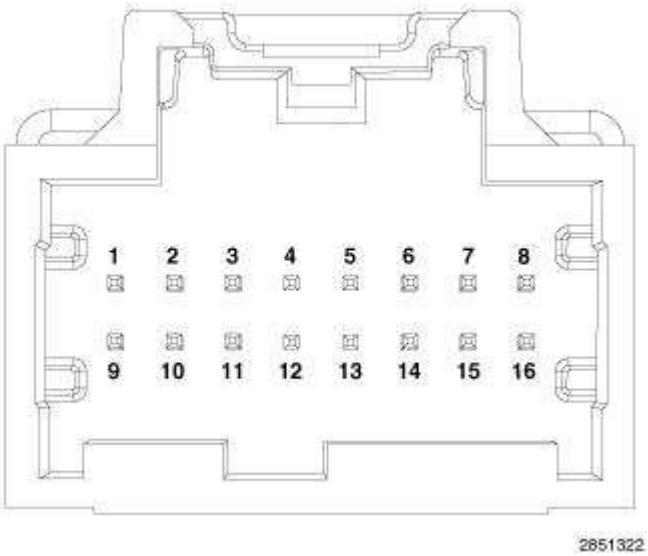


Fig. 8: Sunroof Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner. Refer to **CONSOLE, OVERHEAD, REMOVAL** .
3. Disconnect the overhead wire harness connector from the overhead console connector receptacle.
4. Using a multimeter, test the continuity between the terminals of the overhead console connector receptacle while actuating the power sunroof switch or power sunshade switch as shown in the Sunroof Switch Tests or Sunshade Switch Tests table.

SUNROOF SWITCH TESTS	
SWITCH POSITION	**CONTINUITY BETWEEN PINS**
OFF	NO CONTINUITY
OPEN	9 and 12
CLOSE	11 and 12
VENT	10 and 12

SUNSHADE SWITCH TESTS	
SWITCH POSITION	**CONTINUITY BETWEEN PINS**
OFF	NO CONTINUITY
OPEN	12 and 14
CLOSE	12 and 13

5. If either switch fails any of the tests, replace the overhead console and both switches as a unit as required.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and tire road force variation can cause vehicles to exhibit steering wheel vibration and/or seat vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as presence of wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

NOTE: If a Noise & Vibration Analyzer is available, use it to diagnosis the issue during the road test.

NOTE: If the vehicle has been sitting for an extended period of time it is recommended to drive to warm the tires. This process could eliminate flat spots that can cause vibration.

Road test vehicle on a smooth road **at and near the designated speed** where legal speed limits allow. Lightly place hands on steering wheel at the 10:00 and 2:00 positions and observe for:

- Steering wheel oscillation: clockwise/counterclockwise
- Steering wheel high frequency movement: rapid vibration up and down
- Seat high frequency movement: rapid vibration up and down

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at the designated speed; if vibration occurs or is enhanced, vibration is likely due to a brake concern.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to a powertrain concern (Refer to appropriate DIFFERENTIAL AND DRIVELINE

information).

TIRE/WHEEL BALANCE AND ROAD FORCE VARIATION

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

Balance the tire and wheel assemblies as necessary, and if wheel balance equipment is capable, also test for tire and wheel runout and road force variation following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. Refer to **STANDARD PROCEDURE**. Repeat the road test above to verify the vibration is repaired.

STANDARD PROCEDURE

TIRE AND WHEEL BALANCE

NOTE: Always verify the wheel and tire balance before removing any wheel weights. If assembly is within specification and weights are not corroded or loose, do not remove weights. The process of removing and adding weight could damage wheel protective coating.

NOTE: Balance and road force variation equipment must be calibrated and maintained per equipment manufacturer's specifications.

NOTE: If a tire sealant & inflator kit was used to temporarily repair small punctures then the tire must be removed from wheel and all the sealant must be removed with a water damped cloth before repairing & balancing the assembly.

NOTE: Some wheels may not have an outer flange. Apply adhesive weights on midplane surface to balance.

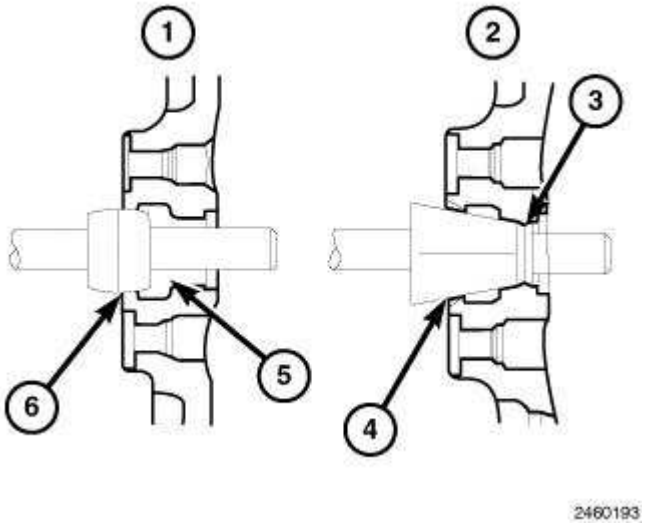

Fig. 1: Balancing Wheels Using Cone/Collet
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Balance equipment could read an incorrect balance result when measuring Chrome Clad wheels. This is caused by the equipments mounting cone/collet contacting the cladding or the cone/collet is not balanced. A dual-taper collet (1) type wheel centering tool is recommended as opposed to a high-taper cone (2) type wheel centering tool. Always use the manufacturer's recommended balance equipment.**

- **Dual-taper collet type (1)**
- **High-taper cone type (2)**
- **Possible obstruction (3)**
- **May not seat properly (4)**
- **No obstruction (5)**
- **Properly seated (6)**

NOTE: **If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.**

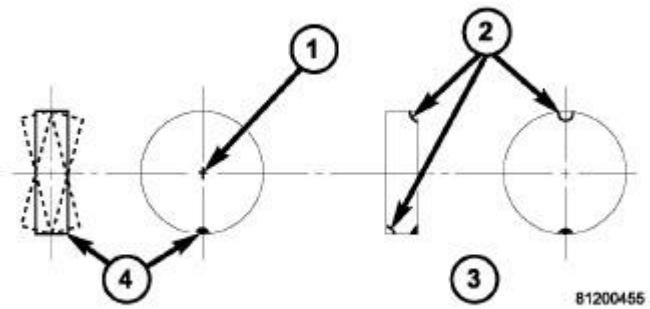

Fig. 2: Dynamic Balancing
Courtesy of CHRYSLER GROUP, LLC

For dynamic balancing (**recommended**), the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

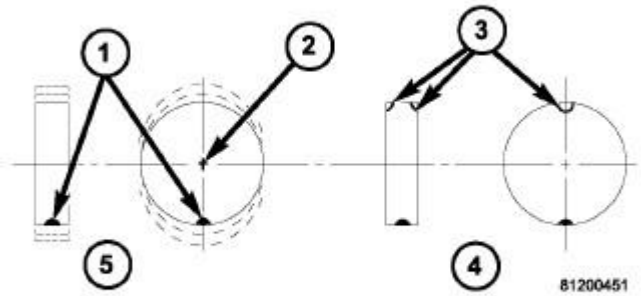

Fig. 3: Static Balancing
Courtesy of CHRYSLER GROUP, LLC

For static balancing (**not recommended**), find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

Aluminum wheels use a different type wheel weight than steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the

other should not be more than 0.125 (1/8) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning, or the wrong collet/cone may have been used.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

TIRE AND WHEEL ROTATION

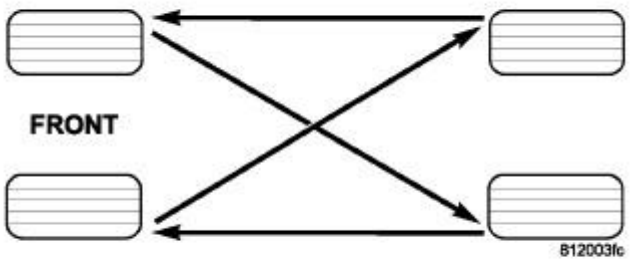

Fig. 4: Rotating Tires
Courtesy of CHRYSLER GROUP, LLC

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

REMOVAL

TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

1. Raise vehicle so tire and wheel assembly clears ground level.

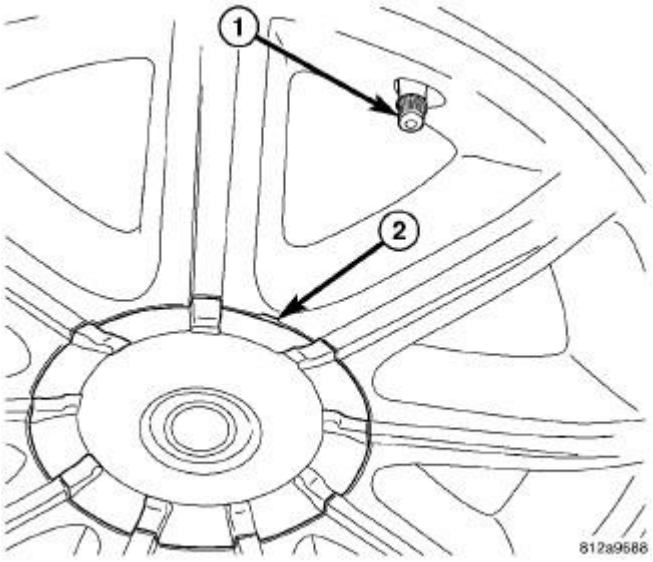

Fig. 5: Center Cap Removal Notch
Courtesy of CHRYSLER GROUP, LLC

2. If vehicle is equipped with wheel center caps covering wheel nuts, remove cap with appropriate removal tool utilizing notch formed into wheel (2) near valve stem (1). Use care not to damage wheel coating.

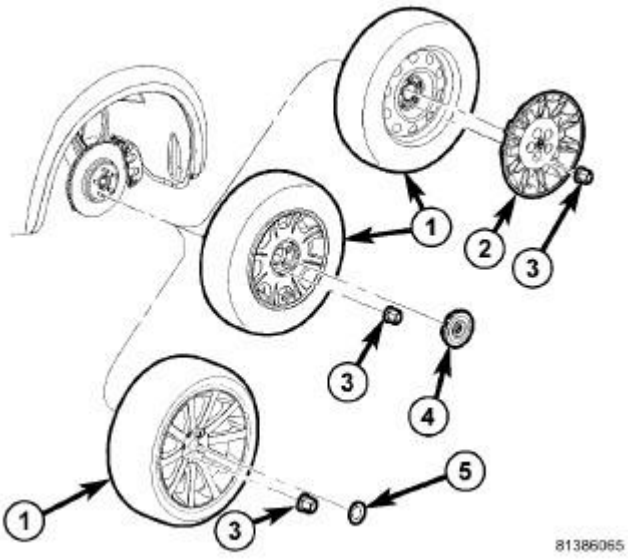

Fig. 6: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Remove five wheel mounting (lug) nuts (3) from studs.
4. Remove tire and wheel assembly (1) from hub.

TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

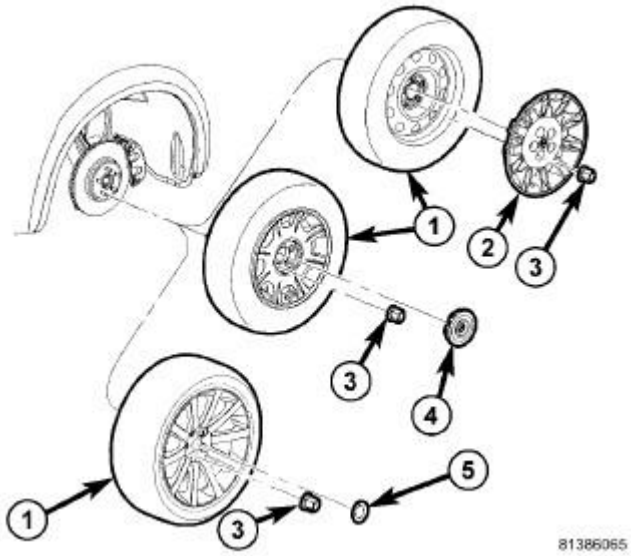

Fig. 7: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle so tire and wheel assembly clears ground level.

CAUTION: When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is attached using the wheel mounting nuts.

2. Remove five wheel mounting (lug) nuts (3) from studs.
3. Remove wheel cover (2) using care not to let tire and wheel assembly (1) fall off vehicle.
4. Remove tire and wheel assembly (1) from hub.

INSTALLATION

TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.

NOTE: Never use oil or grease on studs or wheel mounting (lug) nuts.

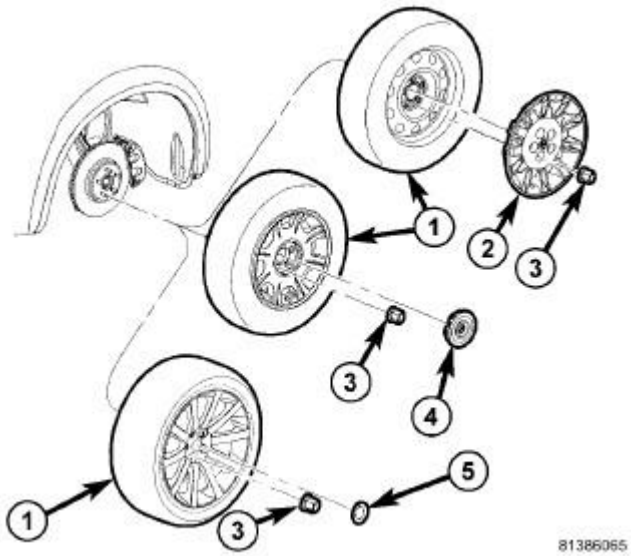

Fig. 8: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Clean wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between wheel and vehicle.
2. Position tire and wheel assembly (1) on wheel mounting studs using hub pilot as guide. Place and hold wheel flush up against mounting surface.

   NOTE: Always use the original (OEM) style wheel mounting (lug) nuts. Do not use replacement parts of lesser quality or substitute design.

3. Loosely install all five wheel mounting (lug) nuts (3).

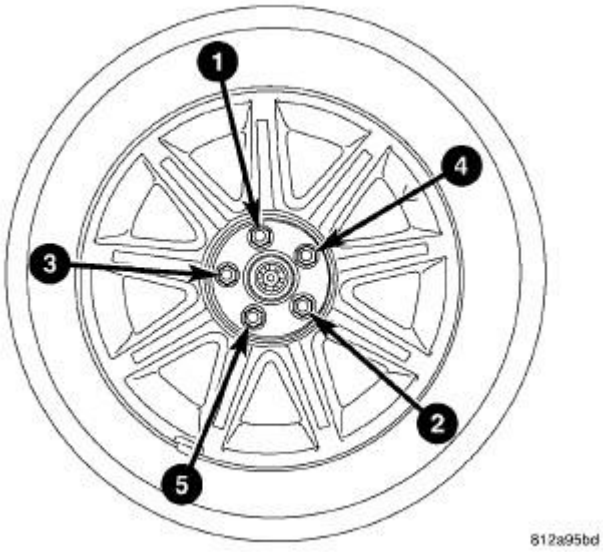

Fig. 9: Tightening Sequence - Aluminum Wheel
Courtesy of CHRYSLER GROUP, LLC

4. Lightly snug all wheel mounting nuts, then progressively tighten them in proper sequence shown in illustration. Tighten wheel mounting nuts to 150 N.m (110 ft. lbs.).

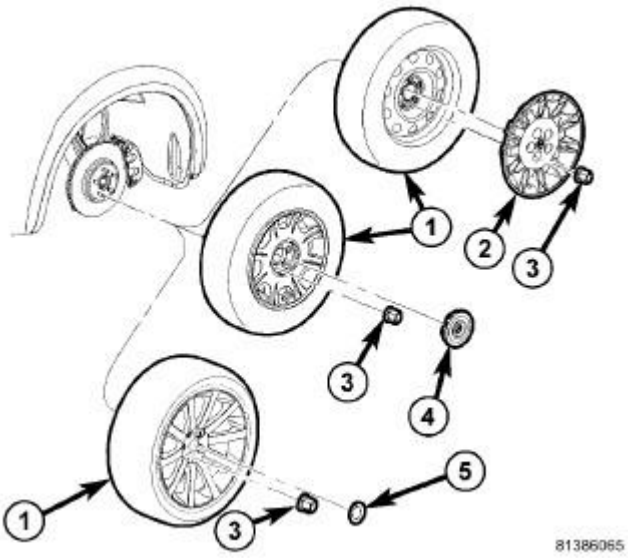

Fig. 10: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

5. If applicable, install wheel center cap (4).
6. Lower vehicle.

TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.

NOTE: Never use oil or grease on studs or wheel mounting nuts.

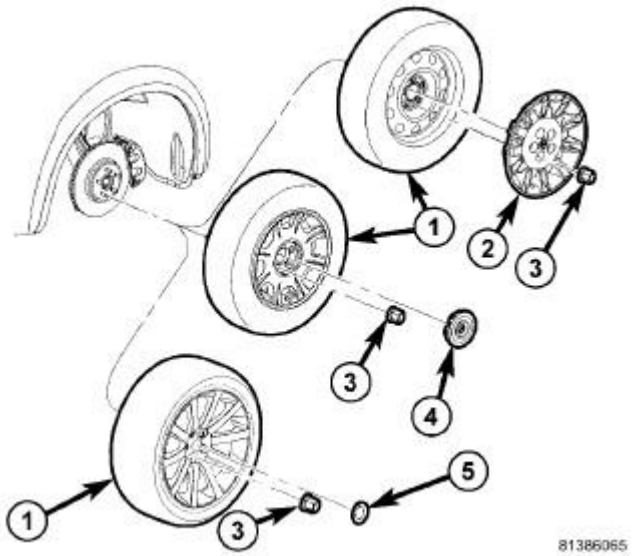

Fig. 11: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Clean wheel mounting surfaces, removing any corrosion build-up. It is important to have good metal-to-metal contact between wheel and vehicle.
2. Position tire and wheel assembly (1) on wheel mounting studs using hub pilot as guide. Place and hold wheel flush up against mounting surface.

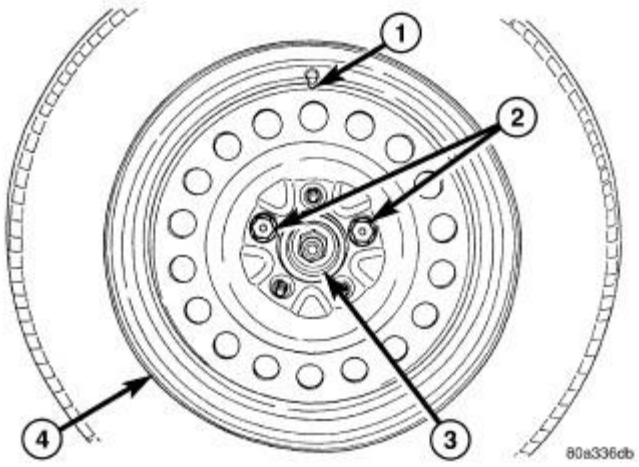

Fig. 12: Two Wheel Mounting Nuts Installed
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE STEM
2 - NUTS
3 - HUB
4 - WHEEL

NOTE: Wheel mounting nuts must be installed on the studs as shown in illustration (2) to allow proper installation of the wheel cover.

3. Using valve stem as an index placed at 12 O'clock position (1), install and **lightly tighten** two wheel mounting nuts on studs located at 2 O'clock and 10 O'clock positions as shown in illustration (2).

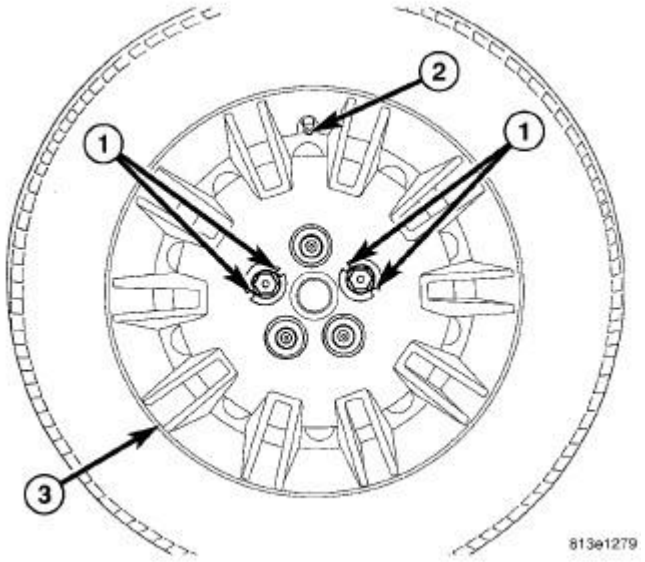

Fig. 13: Installing Cover Over Two Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Place wheel cover (3) on wheel in the following fashion:
    1. Align valve notch in wheel cover with valve stem on wheel (2).
    2. At same time, align two holes in wheel cover having retaining tabs (1) with two installed wheel nuts.
    3. Press in on center of wheel cover until wheel cover retaining tabs (1) push past and engage rear of previously installed wheel mounting nuts. This will hold wheel cover in place.

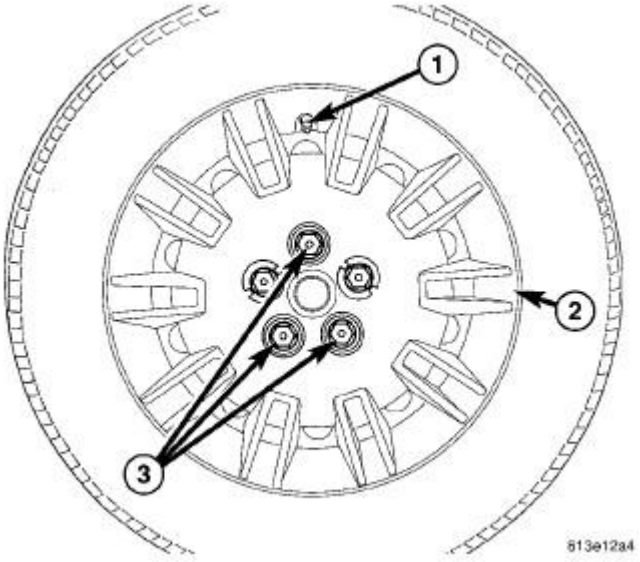

Fig. 14: Three Nuts Retaining Cover/Wheel
Courtesy of CHRYSLER GROUP, LLC

5. Install and **lightly tighten** three remaining wheel mounting nuts (3) securing wheel cover in place.

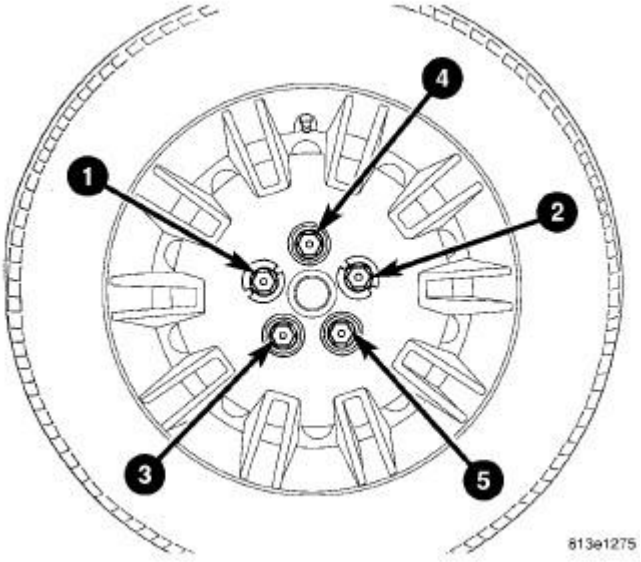

Fig. 15: Wheel Nut Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Progressively tighten all five wheel mounting nuts in proper sequence. Tighten wheel mounting nuts to 150 N.m (110 ft. lbs.).
7. Lower vehicle.

TIRE PRESSURE MONITORING

DESCRIPTION

DESCRIPTION

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored.

There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does so.

The Base TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a central receiver module (Wireless Ignition Node (WIN)), and an indicator lamp.

The receiver circuit for the TPM system is integrated into the WIN. For non-remote start vehicles, the antenna is internal to the WIN. For factory installed remote start vehicles, the antenna is external to the WIN. The WIN can also include the Remote Keyless Entry (RKE) receiver, Remote Start (if equipped) and the Sentry Key Immobilizer (SKIM) receiver. All receivers share a number of common components. The WIN decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the WIN will send a request to the module that controls the indicator lamp (and the text display if equipped with the Premium system) via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The WIN will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WIN will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WIN memory.

The WIN automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when

the vehicle has been stopped for more than 20 minutes.

The Premium TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole and a TPM module. The receiver circuit for the TPM system is mounted in the right rear wheel well. The TPM module is fixed to a metal bracket mounted to the inner wheel well located behind the splash shield. The TPM module decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the TPM module will send a request to the module that controls the indicator lamp and the text display via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The TPM module will store all warning and fault conditions, placard pressure values and low pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted once the new sensor id has been learned.

The TPM module will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication.

The TPM module automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

NOTE: A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).

NOTE: Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

OPERATION

OPERATION

BASE TIRE PRESSURE MONITORING

The tire pressure monitoring system (TPMS) is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Wireless Ignition Node (WIN). These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). For more information on sensors. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION**.

If the TPM system detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see placard table below **TPM THRESHOLD PRESSURES**), the TPM system will continuously illuminate an indicator lamp. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds, then remain on solid.

If the WIN detects a warning or fault condition at ignition key "ON" it will wait ten seconds +/- 10 % before sending the first request to illuminate the indicator lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The WIN shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "ON" and key "OFF" cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are learned by the WIN from the Front Control Module (FCM) configuration during the initial Manufacturing Plant Process, or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (see placard table below **TPM THRESHOLD PRESSURES**). The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven; this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the WIN receives a valid transmission from that sensor location.

PREMIUM TIRE PRESSURE MONITORING

The tire pressure monitoring (TPM) system is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the TPM module. These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). For more information on sensors. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION**.

If the TPM module detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see placard table below **TPM THRESHOLD PRESSURES**), a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value(s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the Low Pressure (lamp) OFF Threshold (see placard table below **TPM THRESHOLD PRESSURES**), and the TPM module receives a valid transmission from the sensor, the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System"

text message will be displayed in the instrument cluster, and the tire pressure graphic display will have "- -" in place of the pressure value. After the flash sequence, the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

If the TPM module detects a warning or fault condition at ignition key "ON" it will wait approximately ten seconds before sending the first request to illuminate the indicator lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle when a "warning" or "fault" condition is detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and reset.

The TPM module shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during the ignition key "ON" cycle. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are learned by the TPM control module using signal strength and direction of wheel rotation as received by the TPM module from each of the sensors, and updates the graphic display when necessary or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (see placard table below **TPM THRESHOLD PRESSURES**). The system will automatically update and the TPM indicator lamp will turn off once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven? this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the TPM module receives a valid transmission from that sensor location.

For both the Premium and Base TPM, the recommended "Placard Pressure", "Low-pressure Threshold" (Low Pressure ON) and "Hysteresis Pressure" values for the tires installed on the vehicle, are learned by the WIN or the TPM module from the Front Control Module (FCM) configuration during the initial Manufacturing Plant Process, or during a service procedure, as required. The WIN upon learning the placard pressure via the bus (through a matrix within the WIN software) applies the appropriate "Low Pressure Threshold" and "Hysteresis Pressure" values.

To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table. The Low Pressure OFF Threshold is defined as the Low Pressure ON Threshold plus the Hysteresis Pressure value.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPM THRESHOLD PRESSURES

NOTE: **To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver's B-Pillar, then apply the placard pressure to the following table.**

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING

When diagnosing a tire pressure issue, first check the Tire Pressure Monitoring (TPM) indicator lamp

in the instrument cluster during ignition key ON. From the OFF position, turn the key to ON and check the TPM indicator lamp to observe one of the following:

- If after 10 seconds the indicator lamp is illuminating continuously (not flashing), proceed to LOW PRESSURE below.
- If after 10 seconds the indicator lamp flashes on/off for 75 seconds, then remains on solid, there is a system fault detected. Proceed to **SYSTEM FAULT** .

LOW PRESSURE

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure. For details, refer to TIRES, STANDARD PROCEDURE.

Check air pressure as necessary in all tires using a known accurate air gauge and adjust to the specification listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original (special) valve stem cap is securely installed to keep moisture out of the sensor.

If the indicator lamp is still ON continuously, refer to the appropriate diagnostic information.

SYSTEM FAULT

If a system fault is detected, a chime will sound, and the TPM indicator (telltale) lamp will flash for 75 seconds, then remain on solid. For vehicles with the Premium TPM Systems, a "CHECK TPM SYSTEM" message will appear in the Electronic Vehicle Information Center (EVIC), followed by a graphic display. A system fault can occur by many scenarios, including the following:

- Signal interference due to electronic devices or driving next to facilities emitting the same Radio Frequencies as the TPM sensors.
- Installing some form of aftermarket window tinting that affects radio wave signals.
- Accumulation of snow or ice around the wheels or wheel housings.
- Using tire chains on the vehicle.
- Using wheels not equipped with TPM sensors.

Refer to the appropriate diagnostic information.

MODULE, TIRE PRESSURE MONITORING (TPM)

DESCRIPTION

DESCRIPTION

The TPM Module is a stand-alone receiver that is used to perform all TPM functionality in a Premium TPM System on this vehicle. The TPM is located in the right rear wheel well behind the splash shield and is mounted to the wheel house inner flange with a bracket. The TPM uses information transmitted from each of the sensors as well as the difference is the strength of the signal received to determine the location of each of the sensors. The TPM then transmits the required information directly to the CCN in order to update the lamp, chime and display as required.

OPERATION

OPERATION

The TPM receives information from each of the sensors in the form of RF signals. The information contained in each of the transmissions provides all the information necessary for the TPM to determine the pressure in each tire as well as the position of the sensor. This autolocating process only happens in the first 10 minutes of any drive cycle while traveling at speeds above 15mph (24 km/h) (The autolocating process will start again only if the vehicle has been shut off for approximately 20 minutes or longer).

REMOVAL

REMOVAL

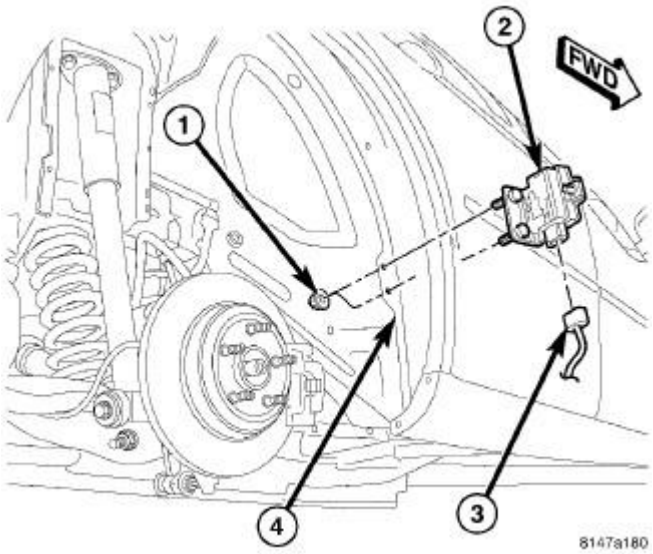

Fig. 16: Rear Transponder Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Remove wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** or **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .
2. Disconnect wiring harness connector (3) at the Tire Pressure Module (2).
3. Remove mounting nuts (1), then remove the Tire Pressure Module (2) from body seam flange (4).

INSTALLATION

INSTALLATION

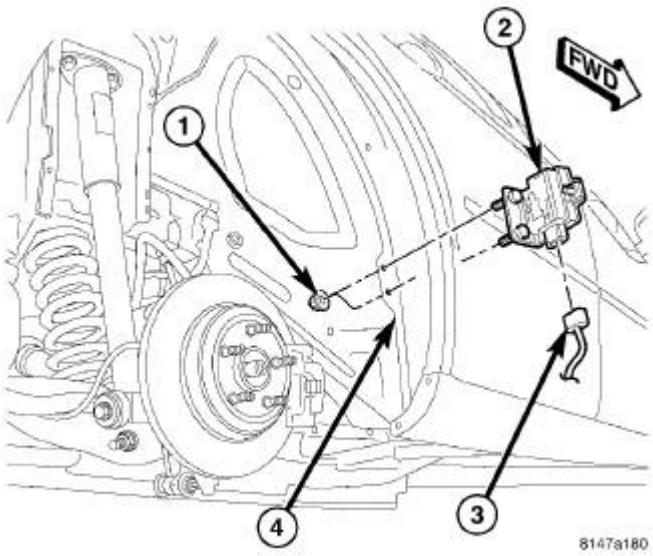

Fig. 17: Rear Transponder Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Position the Tire Pressure Module (2) on body seam flange (4) and install mounting nuts (1).
2. Connect wiring harness connector (3) at the Tire Pressure Module (2).
3. Install wheelhouse splash shield and all components removed to access it. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** or **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .
4. Perform one of the following to make the system learn the new sensor ID:
    1. Use the TPM-RKE Analyzer 9936, with the Scan Tool to program the TPM Module with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
    2. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

SENSOR, TIRE PRESSURE MONITORING (TPM)

CAUTION

CAUTION

CAUTION: The use of tire sealants is not recommended for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants may clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: It is not recommended to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DESCRIPTION

NON SRT8

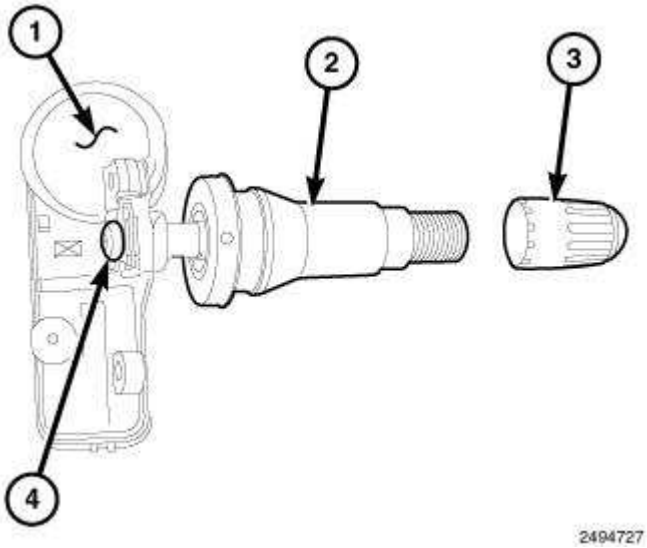

Fig. 18: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Replace the valve stem assembly and tire pressure sensor mounting screw with each tire change.**

One tire pressure sensor (1) is mounted to a valve stem (2) specifically designed for mounting the pressure sensor (1) in each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor (1) must be replaced. The TPM system operates on a 433 MHz radio frequency. The tire pressure sensor valve stem (2) looks similar to a standard valve stem with the tire mounted on the wheel. To visually identify a tire pressure sensor/valve stem, the valve stem cap (3) is longer than a standard valve stem.

NOTE: **This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.**

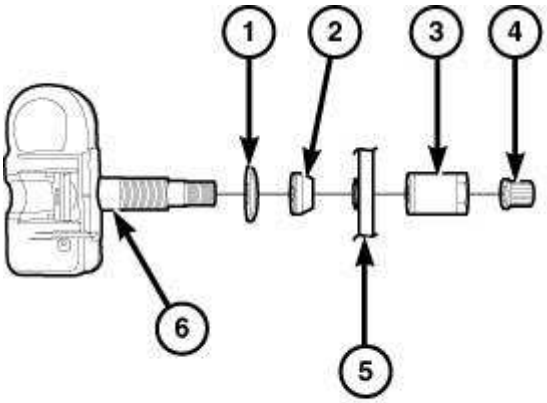
The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues.)

The serviceable components of the tire pressure sensor are:

- Tire pressure sensor (1), including all components below
- Valve stem (2), including screw (4), core, and cap (3)
- Valve stem core (not shown)
- Valve stem cap (3)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

SRT8



300313

Fig. 19: Sensor Mounting - Exploded View
Courtesy of CHRYSLER GROUP, LLC

On vehicles equipped with Tire Pressure Monitoring (TPM), one tire pressure sensor (6) is mounted to each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.

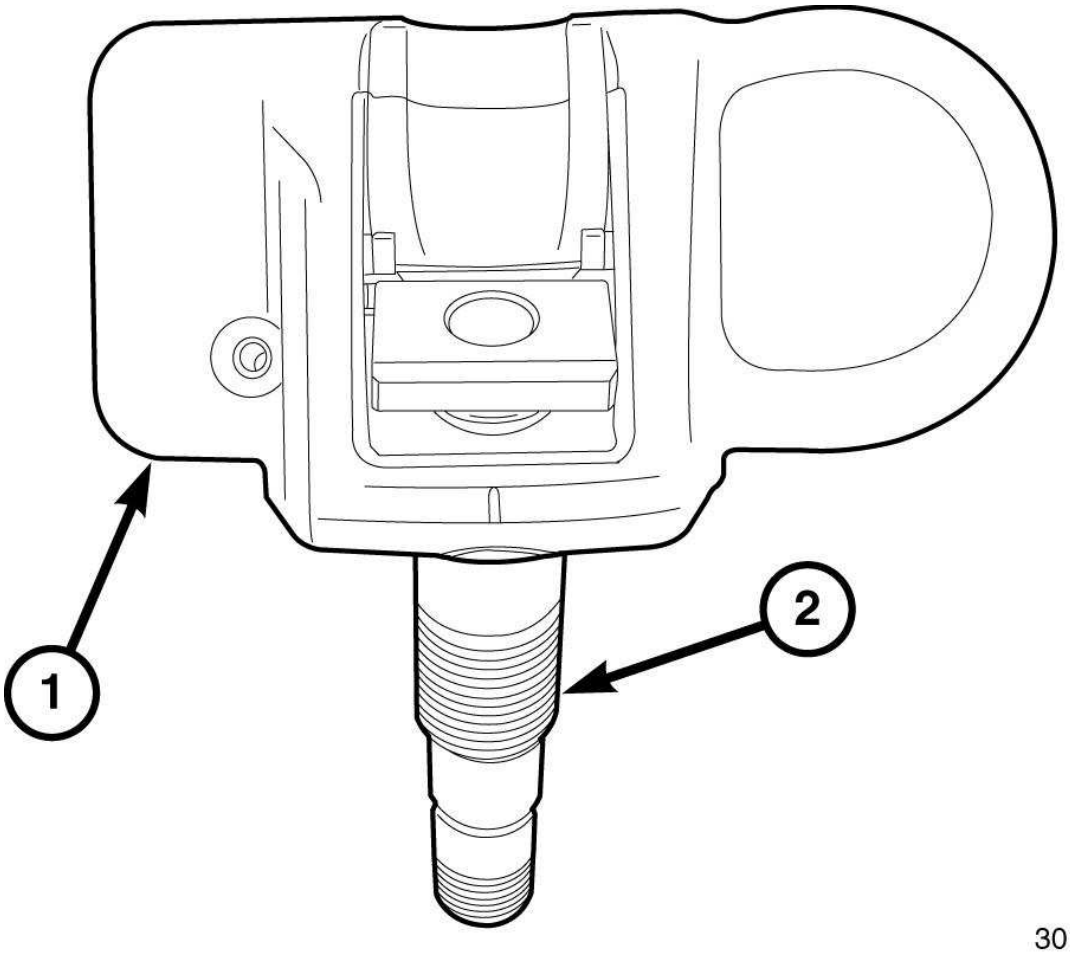


Fig. 20: Tire Pressure Monitoring Sensor
Courtesy of CHRYSLER GROUP, LLC

The TPM system operates on a 433 MHz radio frequency. The 433 MHz sensors (1) can be easily identified by the part number.

CAUTION: Although additional sensors operating at 433 MHz sensors are available and are used in other applications, they are not interchangeable. Always make sure the correct sensor is being used and be sure to replace the sensor with the correct part number.

NOTE: Once mounted inside a tire and wheel assembly you are not able to visually see

the difference between this sensor and other 315 MHz and 433 MHz sensors. At that point, the TPM/RKE Analyzer 9936, with the Scan Tool may be used to identify the sensor frequency or the tire can be dismounted allowing visual inspection of the sensor body and part number.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel (This could cause sealing and system performance issues). **Do not attempt to install a tire pressure sensor in an aftermarket wheel. If aftermarket wheels are installed and do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.**

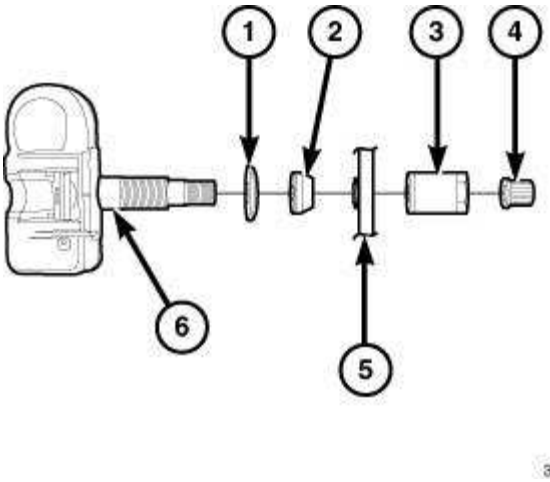

Fig. 21: Sensor Mounting - Exploded View
Courtesy of CHRYSLER GROUP, LLC

1 - METAL WASHER
2 - SEAL
3 - NUT (WITH PRESSED-IN WASHER)
4 - CAP (WITH SEAL)
5 - SECTIONAL CUTAWAY OF WHEEL
6 - TPM SENSOR

The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Seal (2) and Metal Washer (1)
- Valve Stem Cap (4)
- Valve Stem Core
- Valve Stem Nut (with pressed-in washer) (3)

NOTE: **Any time a sensor is installed on a wheel, a new Sensor-To-Wheel Seal (2), Metal Washer (1) and Valve Stem Nut (3) must be installed to ensure air tight sealing. A service kit is available.**

The valve stem caps and cores are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

OPERATION

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer. The TPM-RKE Analyzer has the ability to change the sensor mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

Each sensor's (transmitter) broadcast is uniquely coded so that the module can monitor the state of each of the sensors on the four rotating road wheels. The module can automatically learn and store the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced. The vehicle must be stationary for more then 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then

follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

REMOVAL

NON SRT8

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

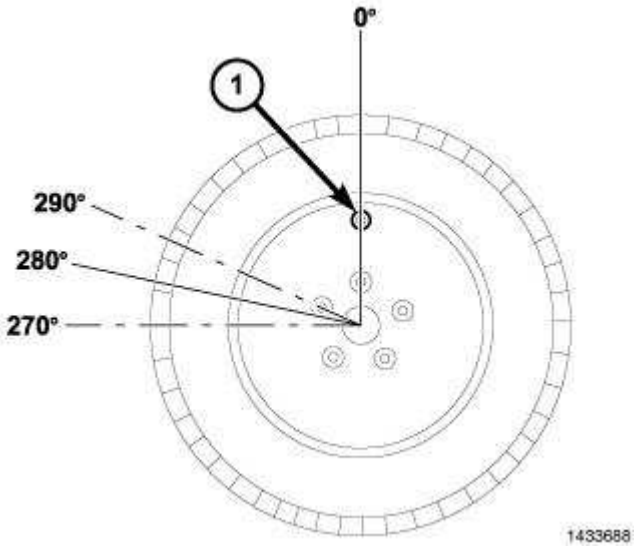

Fig. 22: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
    1. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
    2. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

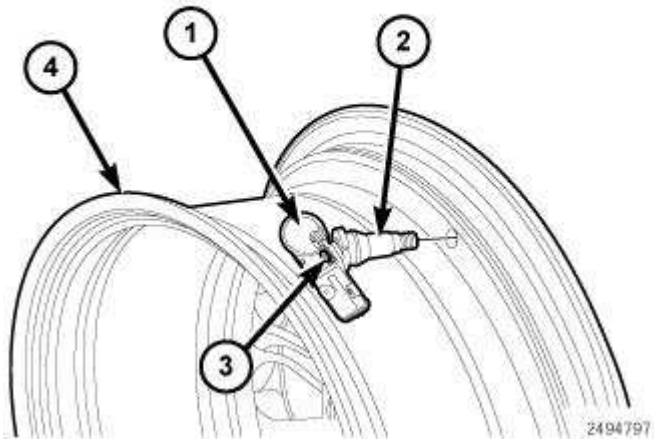

Fig. 23: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

4. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2).
5. Remove the valve stem (2) from the wheel (4).

SRT8

1. Raise and support vehicle.
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

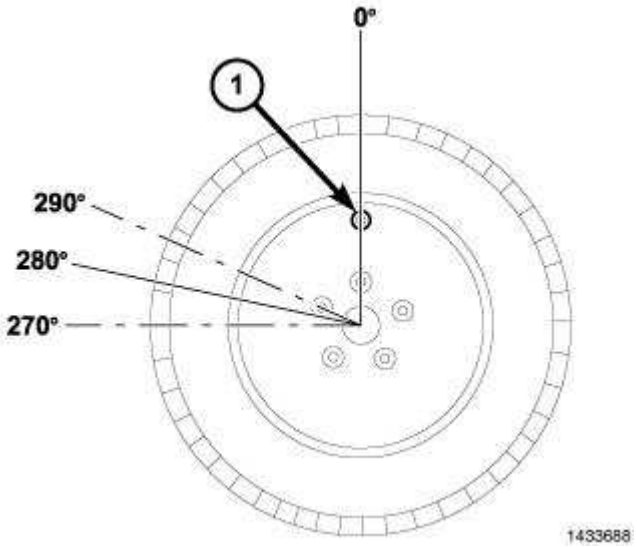

Fig. 24: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
    1. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
    2. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

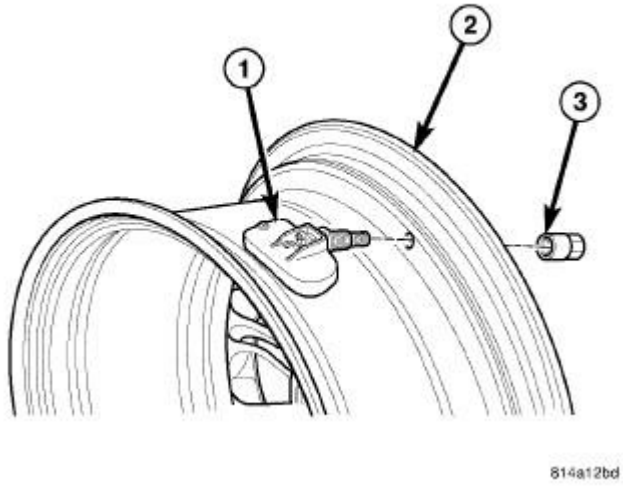

Fig. 25: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

4. Remove sensor nut (3) retaining sensor to wheel. While removing nut, hold pressure against

rear of metal valve stem to keep valve stem from pushing rearward, damaging antenna strap.

5. Remove sensor (1) from wheel (2).

INSTALLATION

NON SRT8

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.

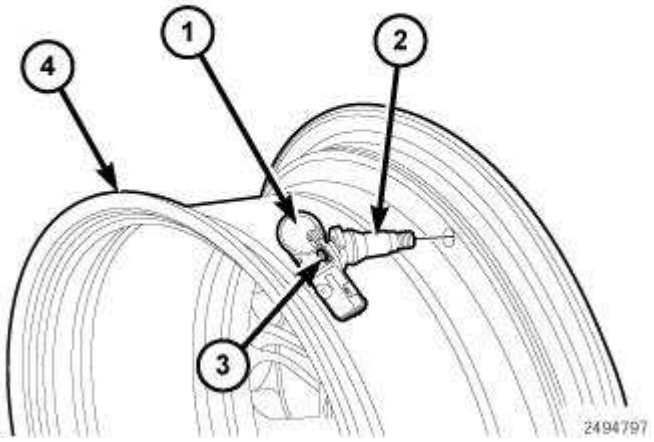

Fig. 26: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

1. Wipe area clean around sensor/valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged.

NOTE: A new valve stem is pre-lubricated for proper installation with a standard tool.

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.

2. Insert valve stem (2) through wheel (4) and pull through to seat with standard valve stem installation tool.

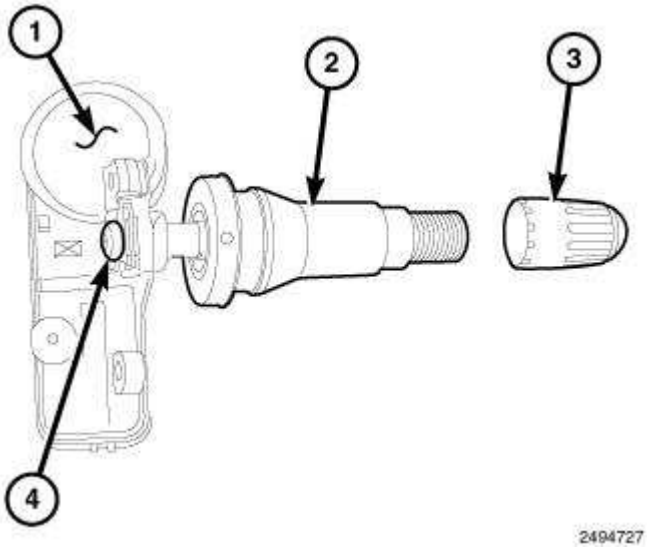

Fig. 27: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

3. If replacing the valve stem (2) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (2) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension, install the retainer screw (4) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

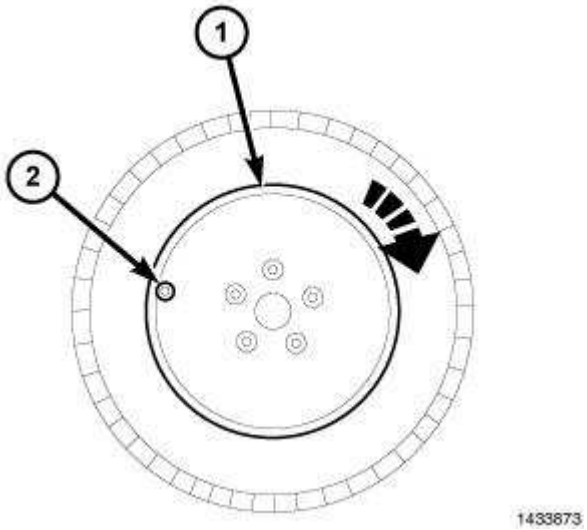

Fig. 28: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

1 - HEAD OF CHANGER LOCATED HERE
2 - VALVE STEM

1.

Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

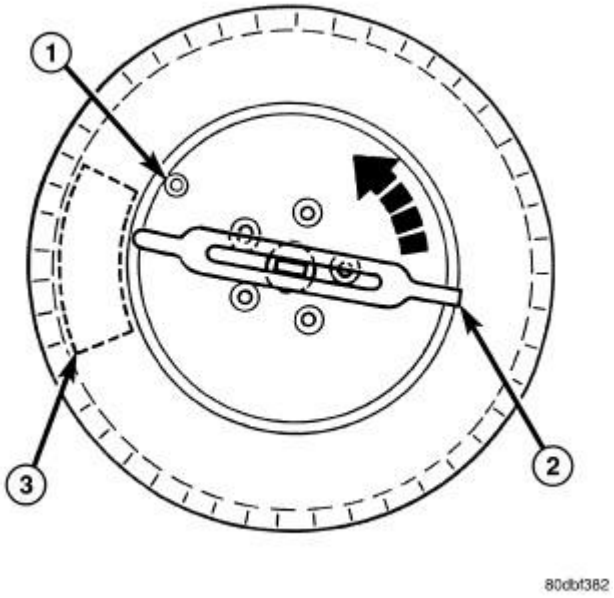

Fig. 29: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE STEM
2 - INSTALLATION END OF MOUNTING/DISMOUNTING TOOL
3 - BEAD BREAKER (KEEP CLEAR OF SENSOR)

2.

Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

5. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.

6. Install tire and wheel assembly on the vehicle.
7. Remove the support and lower the vehicle.
8. Perform one of the following to make the system learn the new sensor ID.
    1. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the Tire Pressure Module (TPM) with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
    2. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: **If a sensor cannot be trained, refer to appropriate diagnostic information.**

SRT8

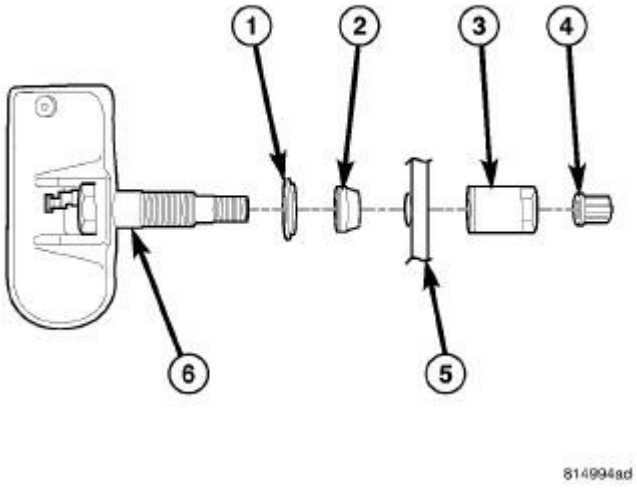

Fig. 30: Sensor Mounting - Exploded View

2 - SEAL
3 - NUT (WITH PRESSED-IN WASHER)
4 - CAP (WITH SEAL)
5 - SECTIONAL CUTAWAY OF WHEEL
6 - TPM SENSOR

NOTE: **Before reinstalling an existing tire pressure sensor, replace seal (2) and metal washer (1) at base of sensor valve stem (6) to ensure proper sealing.**

1. Wipe area clean around sensor/valve stem mounting hole in wheel (5). Make sure surface of wheel is not damaged.

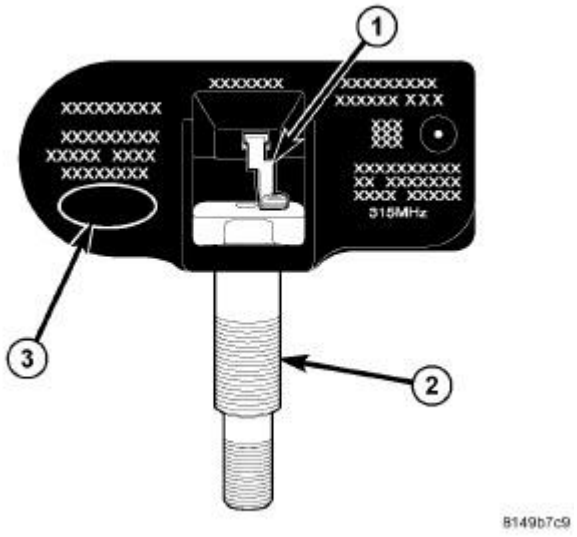

Fig. 31: Tire Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - ANTENNA STRAP
2 - VALVE STEM
3 - IDENTIFICATION INSIGNIA

CAUTION: To avoid damaging sensor antenna strap (1), if equipped, hold pressure against rear of metal valve stem (2) while sensor is inserted through wheel mounting hole and nut is installed.

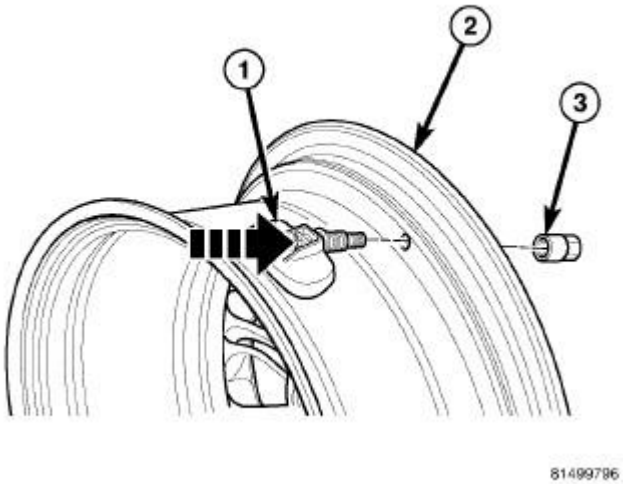

Fig. 32: Installing Sensor To Wheel
Courtesy of CHRYSLER GROUP, LLC

1 - TIRE PRESSURE SENSOR
2 - WHEEL
3 - NUT (WITH WASHER)

2. Insert sensor (1) through wheel (2) as shown in illustration keeping pressure against rear of metal valve stem (See Arrow**Fig. 32**). Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, damage may occur.
3. Install sensor nut (with pressed-in washer) (3) by hand.

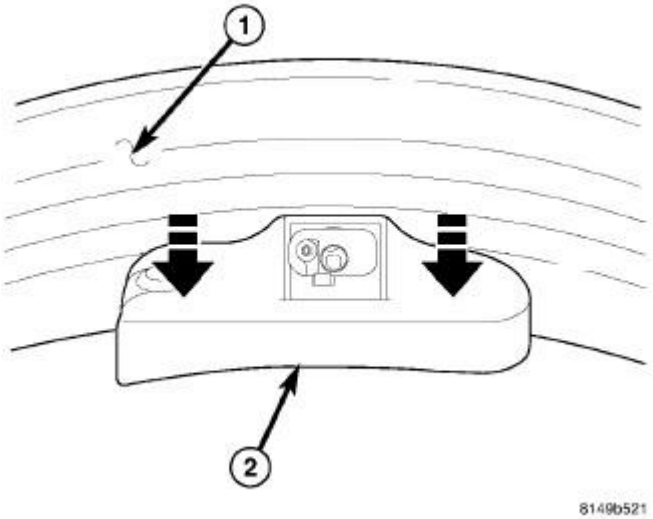

Fig. 33: Seat Sensor Against Wheel Interior

Courtesy of CHRYSLER GROUP, LLC

1 - WHEEL INTERIOR
2 - TIRE PRESSURE SENSOR

CAUTION: Over-torquing the sensor nut by as little as 12 N.m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function. However, the condition should be corrected immediately.

NOTE: Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).

4. While holding sensor in position, tighten sensor nut to 6 N.m (53 in. lbs.).
5. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

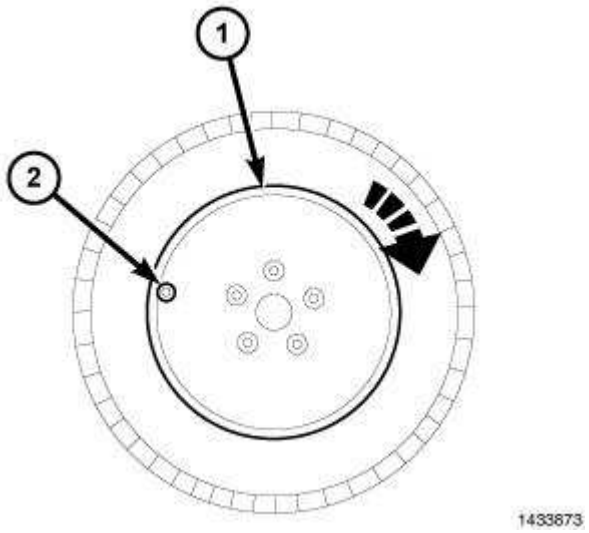

Fig. 34: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

1 - HEAD OF CHANGER LOCATED HERE
2 - VALVE STEM

1.

Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

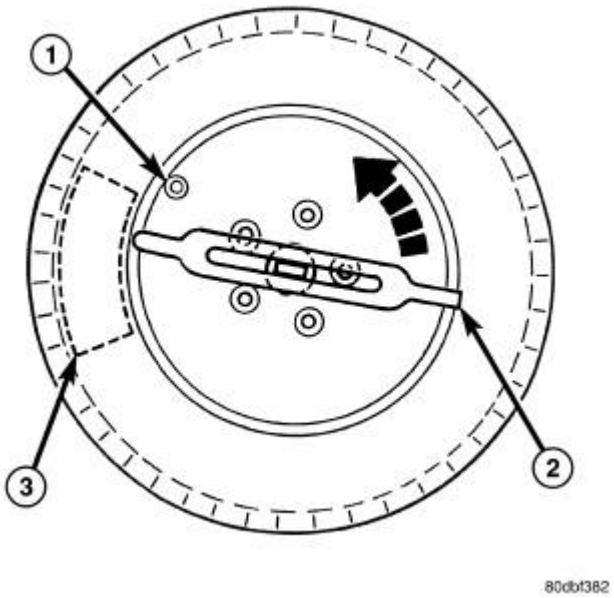

Fig. 35: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

1 - VALVE STEM
2 - INSTALLATION END OF MOUNTING/DISMOUNTING TOOL
3 - BEAD BREAKER (KEEP CLEAR OF SENSOR)

2. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

6. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
7. Install tire and wheel assembly on vehicle.
8. Remove the support and lower the vehicle.
9. Perform one of the following to make the system learn the new sensor ID.
    1. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the Tire Pressure Module (TPM) with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
    2. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h).

During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TIRES

DESCRIPTION

TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the information on Tire Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the Tire Identification chart to decipher the code. For example purposes, the tire size P225/60 R 16 97 T is used in the chart. An All Season type tire will also have either M + S, M AND S, or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall. The absence of an "XL" or "LL" marking infers a standard load tire.

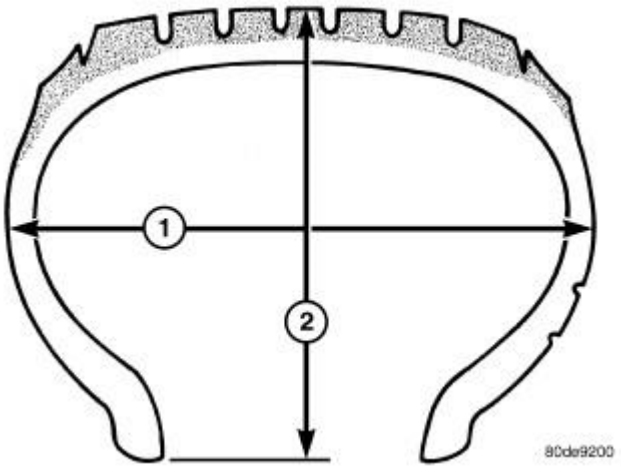

Fig. 36: Tire Aspect Ratio
Courtesy of CHRYSLER GROUP, LLC

1 - SECTIONAL WIDTH
2 - SECTIONAL HEIGHT

NOTE: **() * Height (2) ÷ Width (1) = Aspect Ratio.**

NOTE: **() ** Consult the tire manufacturer regarding any questions on tire specifications or capabilities.**

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

REPLACEMENT TIRES

WARNING: **Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.**

WARNING: In order to maintain the speed capability of the vehicle, replacement tires must have speed ratings equal to or higher than those fitted to the vehicle as original equipment. If tires with lower speed ratings are fitted, the vehicle's handling may be affected and the speed capability of the vehicle may be lowered to the maximum speed capability of the replacement tires. To avoid an accident resulting in severe or fatal injury, consult the tire manufacturer in regards to maximum speed ratings.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

A compact (temporary) spare tire and wheel assembly is standard equipment on most models of this vehicle. A full-size spare is not available on most models.

Select Export vehicles are equipped with the TIREFIT tire repair kit as standard equipment in place of a spare tire. It is to be used to repair small punctures in the tire as necessary. A compact spare tire is optional on select Export Vehicles. For additional information, refer to the Owners Manual.

The spare tire and wheel diameters and wheel offsets match those of the road wheels on the vehicle.

The compact (temporary) spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact (temporary) spare tire and wheel assembly. Refer to the Owner's Manual for complete details.

DIAGNOSIS AND TESTING

TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, refer to **DIAGNOSIS AND TESTING**. For irregular tire wear issues, refer to **TIRES, DIAGNOSIS AND TESTING**.

TIRE/VEHICLE LEAD

Refer to **WHEEL ALIGNMENT, DIAGNOSIS AND TESTING** .

TIRE WEAR PATTERNS

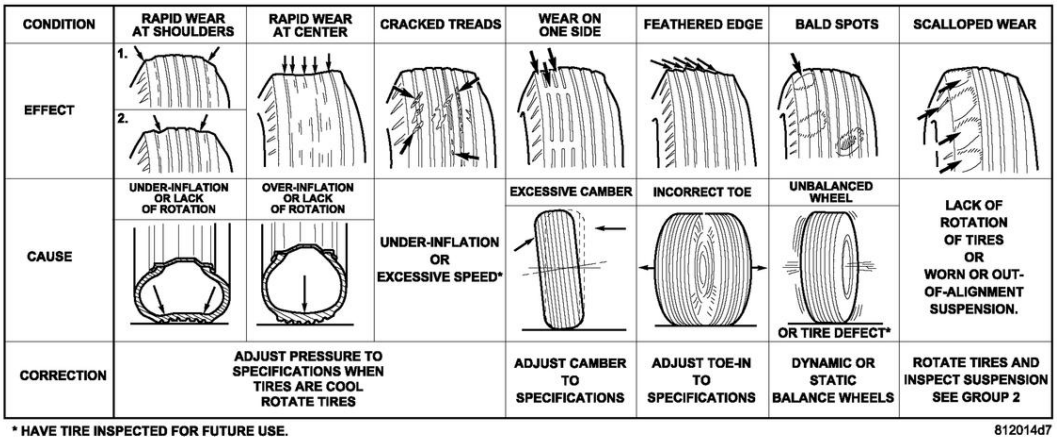

Fig. 37: Identifying Tire Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TREAD WEAR INDICATORS

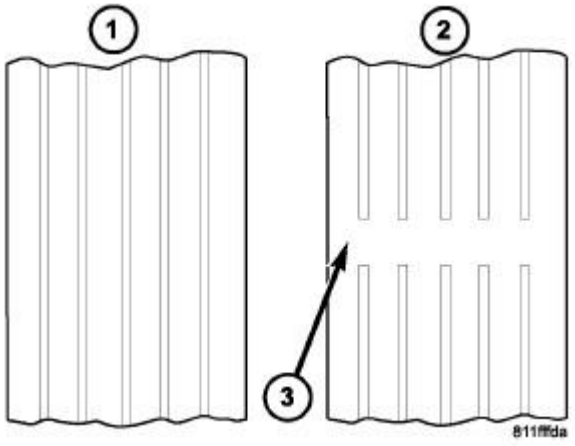

Fig. 38: Identifying Tread Wear Indicators
Courtesy of CHRYSLER GROUP, LLC

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire And Loading Information Label provided with the vehicle (usually on the driver's door opening or B-pillar).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy

- Unsatisfactory ride
- The vehicle to drift.

WARNING: Over or under inflated tires can affect vehicle handling. The tire can fail suddenly, resulting in loss of vehicle control.

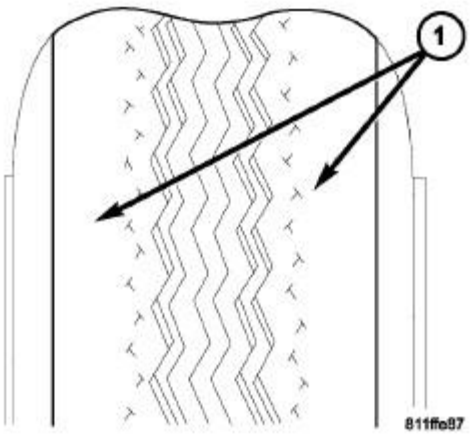

Fig. 39: Under Inflation
Courtesy of CHRYSLER GROUP, LLC

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

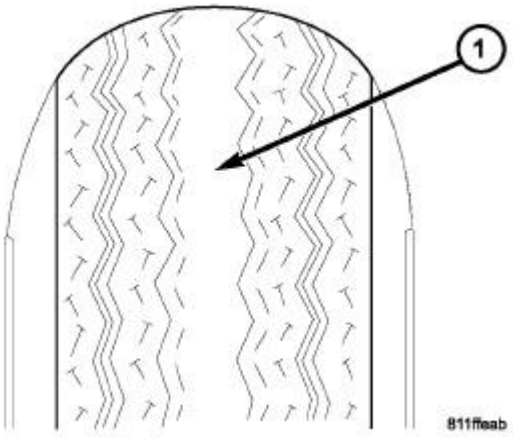

Fig. 40: Identifying Over Inflated Tire
Courtesy of CHRYSLER GROUP, LLC

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).

TIRE LEAK REPAIRING

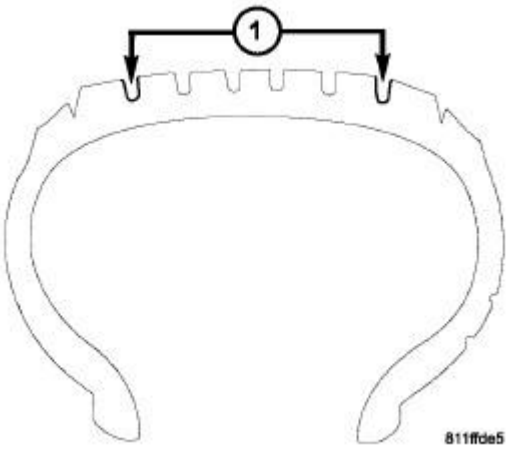

Fig. 41: Identifying Tire Repair Area
Courtesy of CHRYSLER GROUP, LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle. Refer to **INSTALLATION**.

WHEELS

DESCRIPTION

WHEEL

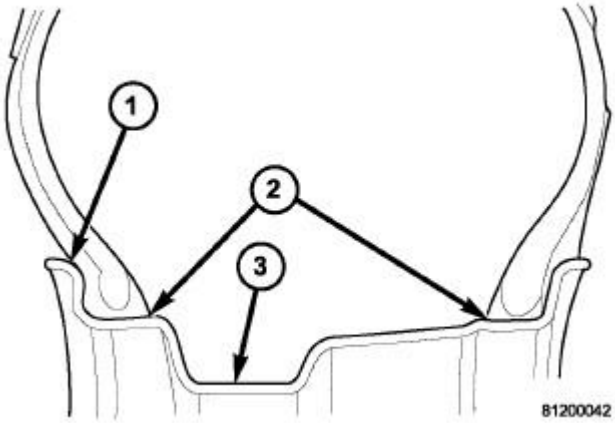

Fig. 42: Identifying Wheel/Rim Design
Courtesy of CHRYSLER GROUP, LLC

All vehicles use either steel or cast aluminum drop center wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When being installed on the wheel, initial inflation of the tire forces the tire bead over these raised sections into place.

The wheels used on All-Wheel-Drive (AWD) vehicles have a shallower dish (larger offset) than Rear-Wheel-Drive (RWD) wheels to accommodate the AWD suspension geometry and half shaft package, while maintaining the same track as RWD vehicles.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle.

WARNING: Replacement with used wheels is not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

WARNING: Chrysler LLC does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death. For clarification:

- **Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit (93 degrees Celsius).**
- **Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure.**
- **Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.**
- **Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.**

SPECIFICATIONS

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	SPECIFICATION

Wheel Mounting (Lug) Nut	150	110	-

CLEANING

CLEANING

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the "DO NOT USE" items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

STUD, WHEEL, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding. Refer to CAUTION and WARNING .

CAUTION: Wheel mounting studs MUST NOT be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove front wheel and tire assembly. Refer to **REMOVAL**.
3. Access and remove front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

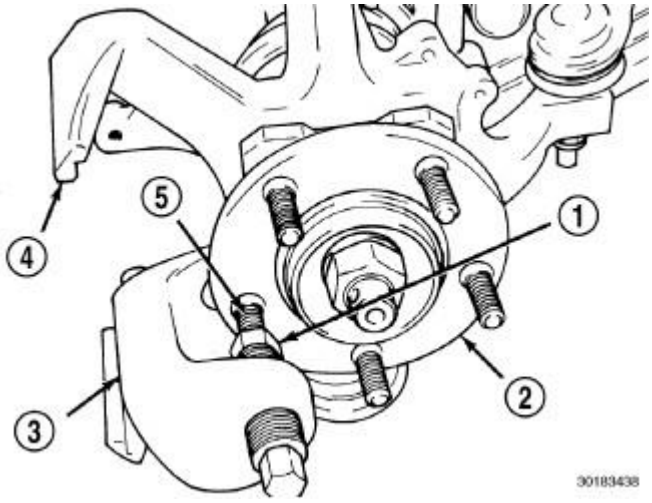

Fig. 43: Wheel Stud Removal (Typical)
Courtesy of CHRYSLER GROUP, LLC

1 - WHEEL MOUNTING (LUG) NUT
2 - HUB AND BEARING ASSEMBLY
3 - SPECIAL TOOL C-4150A
4 - STEERING KNUCKLE
5 - WHEEL STUD

4. On wheel mounting stud to be removed, install a wheel mounting (lug) nut (1) far enough so the threads on the stud are even with end of nut. Install Remover (special tool #C-4150A, Press, Ball Joint) (3), on hub and bearing flange and wheel stud (5).
5. Tighten screw on Remover, pushing wheel stud (5) out of hub flange. Once shoulder of wheel stud is past flange, remove special tool. Remove nut from stud and remove stud from hub flange.

INSTALLATION

INSTALLATION

1 - WASHERS
2 - HUB AND BEARING ASSEMBLY
3 - WHEEL MOUNTING (LUG) NUT
4 - STEERING KNUCKLE

1. Install replacement wheel stud into flange of hub and bearing from rear. Install stack of washers (1) on wheel stud, then install a standard type wheel mounting (lug) nut (3) on stud with flat side of lug nut against washers.
2. Tighten nut (3), pulling wheel stud into hub flange. Once head of stud is fully seated against rear of hub flange, remove nut and washers from stud.
3. Install brake rotor and caliper. Refer to **ROTOR, BRAKE, INSTALLATION** .
4. Install wheel and tire assembly. Refer to **INSTALLATION**.
5. Lower vehicle.
6. Road test vehicle to ensure proper operation of the brakes.

STUD, WHEEL, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding. Refer to CAUTION and WARNING .

CAUTION: Wheel mounting studs MUST NOT be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove rear wheel and tire assembly. Refer to **REMOVAL**.
3. Access and remove rear brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

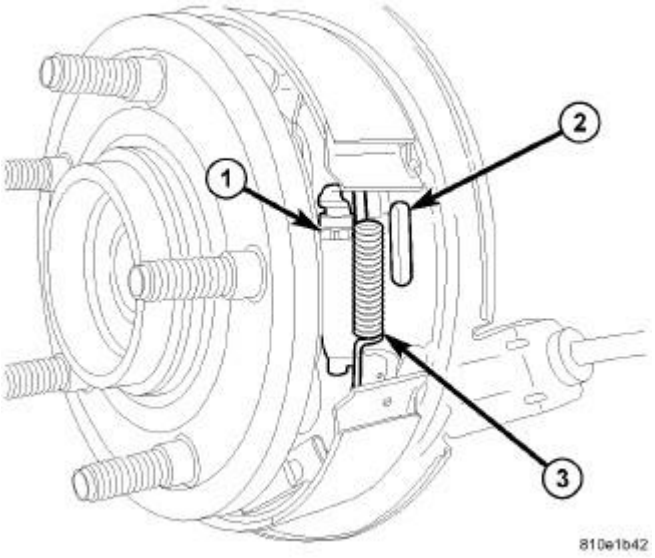

Fig. 45: Shoe Adjuster & Spring
Courtesy of CHRYSLER GROUP, LLC

1 - ADJUSTER STAR WHEEL
2 - ADJUSTER ACCESS HOLE IN SUPPORT PLATE
3 - SPRING

4. Back off shoe adjustment until adjuster (1) threads bottom.
5. Using appropriate tools, remove spring (3) at adjuster.
6. Pull upward on upper shoe near adjuster to provide enough slack to remove adjuster from shoes, then remove adjuster (1).

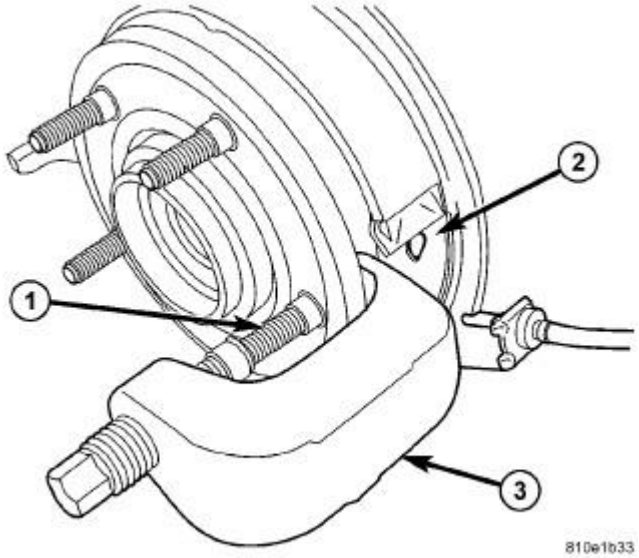

Fig. 46: Positioned For Stud Removal
Courtesy of CHRYSLER GROUP, LLC

1 - STUD
2 - OPEN AREA WHERE ADJUSTER WAS REMOVED
3 - REMOVER C-4150A

7. Install Remover (special tool #C-4150A, Press, Ball Joint) (3), on hub and bearing flange and wheel stud (1).
8. Tighten Remover forcing screw, pushing wheel stud (1) out of hub and bearing flange. Remove tool (3).
9. Remove stud from rear of hub flange. It may be necessary to rock hub flange back and forth to ease stud removal.

INSTALLATION

INSTALLATION

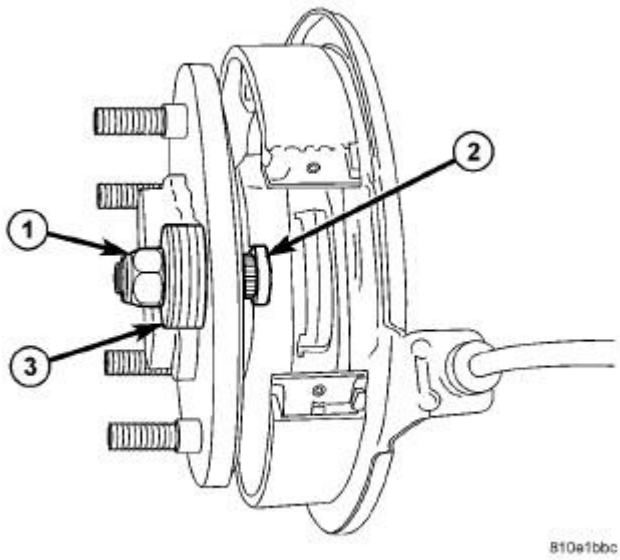

Fig. 47: Nut & Washers Installed On Stud
Courtesy of CHRYSLER GROUP, LLC

1 - STANDARD WHEEL NUT INSTALLED FLAT SIDE FIRST
2 - STUD
3 - STACK OF WASHERS

1. Install replacement wheel stud into flange of hub and bearing from rear (2). Install a stack of washers (3) (approximately 5, depending on thickness) over stud, then install a standard wheel mounting (lug) nut (1) on stud with flat side of nut against washers.
2. Tighten wheel mounting nut (1), pulling wheel stud into flange of hub and bearing. Once head of stud (2) is fully seated against rear of hub flange, remove nut and washers from wheel stud.

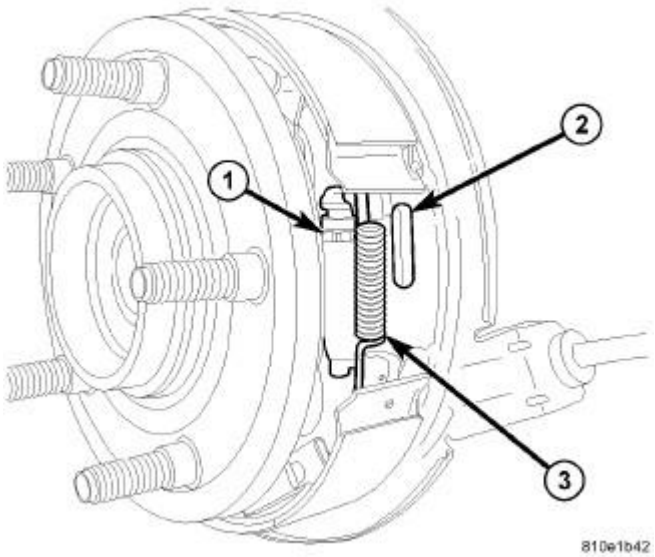

Fig. 48: Shoe Adjuster & Spring
Courtesy of CHRYSLER GROUP, LLC

1 - ADJUSTER STAR WHEEL
2 - ADJUSTER ACCESS HOLE IN SUPPORT PLATE
3 - SPRING

3. Install parking brake shoe adjuster (1) between upper and lower parking brake shoes. Position end of adjuster with star wheel upward. Once in place, slide upper shoe downward against adjuster mounting slot, taking up any slack between two pieces.
4. Using appropriate tools, install spring (3) at adjuster.

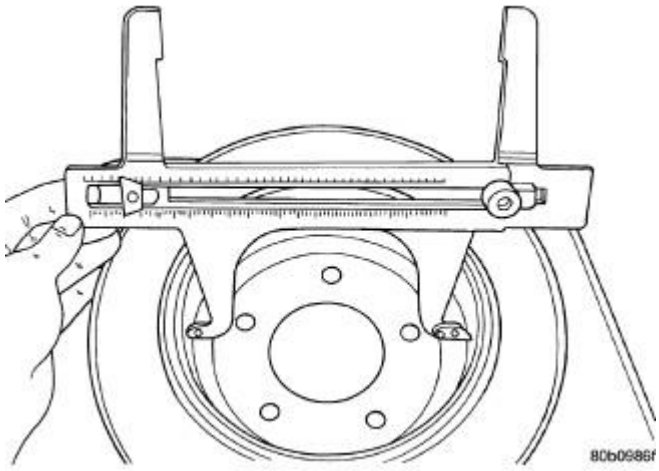

Fig. 49: Measuring Parking Brake Drum Diameter
Courtesy of CHRYSLER GROUP, LLC

NOTE: When measuring brake drum diameter, diameter should be measured in center of shoe contact surface area.

5. Using Brake Shoe Gauge (special tool #C-3919, Gauge, Brake Shoes), or equivalent, measure inside diameter of parking brake drum portion of rotor.

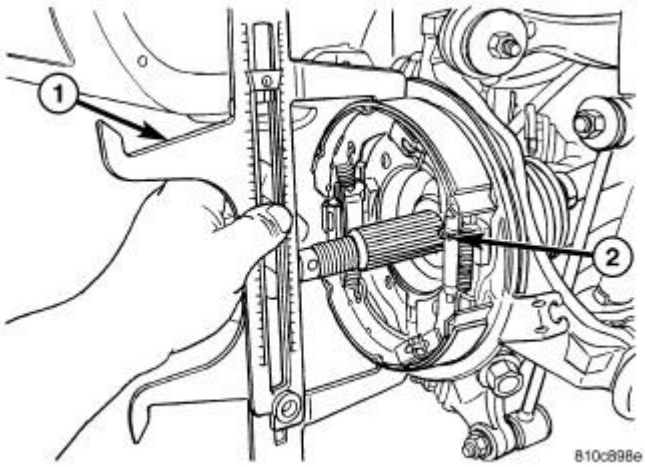

Fig. 50: Measuring Parking Brake Shoes
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE GAUGE
2 - ADJUSTER STAR WHEEL

6. Place Gauge (1) over parking brake shoes at widest point.
7. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
8. Install brake rotor and components removed to access it. Refer to **ROTOR, BRAKE, INSTALLATION** .
9. Install wheel and tire assembly. Refer to **INSTALLATION**.
10. Adjust parking brake shoes. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
11. Lower vehicle.
12. Road test vehicle to ensure proper operation of the brakes.

TIRE PRESSURE MONITOR SYSTEM

Chry - Chrysler - 300 - 2010-13

DESCRIPTION & OPERATION

NOTE: If a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. See RESET PROCEDURES.

TIRE PRESSURE MONITOR (TPM) SYSTEM

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored. There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does so.

The Base TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a central receiver module Wireless Ignition Node (WIN), and an indicator lamp.

The Premium TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a TPM module, and a receiver circuit mounted in the right rear wheel well.

The TPM module decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the WIN will send a request to the module that controls the indicator lamp (and the text display if equipped with the Premium system) via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime". The WIN will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WIN/TPM module will store all wheel sensor IDs and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WIN memory. After a sensor has been replaced, the WIN automatically learns and stores the sensor ID's while driving continuously above 15 mph (24 km/h) for 10 minutes. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

IMPORTANT: Under the following conditions, the system may not function properly:

- **The areas, facilities or devices that use similar radio wave frequencies are**

located in the vicinity of the vehicle.

- **A radio device of similar frequency is used near the vehicle.**
- **Installing some form of aftermarket window tinting that affects radio wave signals**
- **A lot of snow or ice is stuck to the vehicle, especially around the wheels or wheel housings.**
- **Using tire chains on the vehicle**
- **The battery of the sensor has been depleted (approximate 10-year life span).**
- **A spare tire is installed.**
- **A tire without tire pressure sensor is used.**
- **Wheels other than manufacturer factory wheels are used.**

TIRE PRESSURE MONITOR WARNING INDICATORS

The TPM warning light will illuminate in the instrument cluster, a "LOW TIRE" message will be displayed and a chime will sound when tire pressure is low in one or more of the four active road tires. In addition, the EVIC (if equipped) will display a "LOW TIRE" message and a graphic showing the pressure values of each tire with the low tire pressure values flashing. Once the system receives the updated tire pressures, the system will automatically update and the TPM warning light and "LOW TIRE" message will turn offupdate, the graphic display in the EVIC will stop flashing. The vehicle may need to be driven for up to 20 minutes above 15 mph (24 km/h) in order for the TPMS to receive this information.

If a system fault is detected, the TPM warning light will flash on and off for 75 seconds and then remain on solid. In addition, the EVIC (if equipped) will display a "SERVICE TPM SYSTEM" message for a minimum of five seconds and then display dashes (- -) in place of the pressure value to indicate which sensor is not being received. The system fault will also sound a chime. If the ignition switch is cycled, this sequence will repeat, providing the system fault still exists. Mounting the compact spare will also cause the system to indicate a system fault. The TPM warning light (and EVIC message) will turn off when the fault condition no longer exists.

The EVIC will also display a "SERVICE TPM SYSTEM" message for a minimum of five seconds when a system fault related to an incorrect sensor location fault is detected. In this case, the "SERVICE TPM SYSTEM" message is then followed with a graphic display with pressure values still shown. This indicates that the pressure values are still being received from the TPM sensors but they may not be located in the correct vehicle position. The system still needs to be serviced as long as the "SERVICE TPM SYSTEM" message is displayed.

RESET PROCEDURES

NOTE: **If a tire pressure sensor has been replaced, the tire pressure sensors must be retrained.**

The TPM Telltale Light will illuminate in the instrument cluster, a LOW TIRE message will be displayed and a chime will sound when tire pressure is low in one or more of the four active road tires. Iinflate each tire to the vehicles recommended pressure value. Once the system receives the updated tire pressures, the system will automatically update and the TPM Telltale Light and the LOW TIRE message will turn off. The vehicle may need to be driven for up to 20 minutes above 15 mph (24 km/h) in order for the TPMS to receive this information.

TIRE PRESSURE SENSOR RETRAINING

Using a RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the WIN/TPM module can monitor the state of each of the sensors on the 4 rotating road wheels. The WIN/TPM module automatically learns and stores the sensor's ID while driving after a sensor has been replaced. There is no formal retraining procedure necessary.

After the vehicle has remained stationary for 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

DISMOUNTING/MOUNTING PROCEDURES

CAUTION: The tire should be dismounted from the wheel using the tire changer manufacturer's instructions. Use the following information to avoid damage during the dismounting/mounting procedures.

CAUTION: The Tire Pressure Monitoring (TPM) system has been optimized for the original equipment tires and wheels. TPM system pressures have been established for the tire size equipped on the vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with TPM, as damage to the sensors may result.

NOTE: If a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. See RESET PROCEDURES.

NOTE: Wheels and tires are match-mounted at the factory. Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location to ensure that it is remounted in the original position on the wheel. For match-mounting procedures, refer to appropriate manufacturer service information.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire

pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven this is normal and there should be no adjustment for this increased pressure.

NOTE: If tires require leak-testing, a water test may be used to check for a leak around the sensor, as long as any water at the valve core is removed when procedure is completed. Water can be expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate tire as necessary. Install original valve stem cap.

TIRE PRESSURE SENSOR (EXCEPT SRT8)

CAUTION: Although additional sensors operating at 433 MHz are available and are used in other applications, they are not interchangeable. Always make sure the correct sensor is being used and be sure to replace the sensor with the correct part number.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only. If aftermarket wheels are installed, and therefore do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Sensor.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

CAUTION: DO NOT reuse sensor-to-wheel grommet. Always use a new grommet when installing a pressure sensor and properly torque the sensor nut.

Removal

1. Remove tire and wheel assembly from vehicle.
2. Dismount tire from wheel following tire changer manufacturer's instructions while paying special attention to the following to avoid damaging the pressure sensor:
    - When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire.
    - When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° +/- 10° from the valve stem, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.
3. Remove the sensor to valve stem retainer screw (4) and then remove the sensor (1) from the valve stem (2). See **Fig. 2**.
4. Remove valve stem from wheel. See **Fig. 2**.

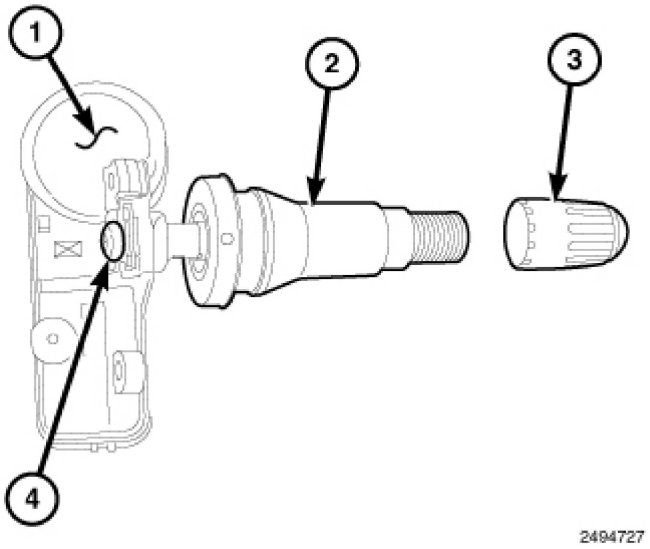

Fig. 1: Identifying Tire Pressure Sensor Components
Courtesy of CHRYSLER CORP.

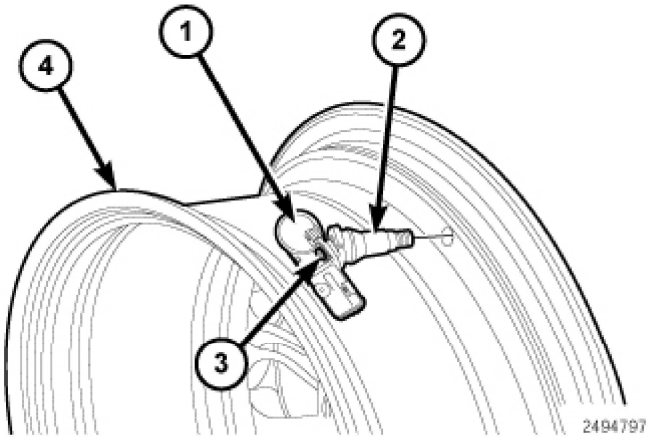

Fig. 2: Removing & Installing Tire Pressure Sensor
Courtesy of CHRYSLER CORP.

Installation

NOTE: If replacing the tire pressure sensor, a new valve stem may be pre-mounted to the sensor as an assembly. When reusing the tire pressure sensor the new valve stem may come with a mounting screw.

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.
2. Insert the new valve stem into the rim and pull through with a standard valve stem installation tool.
3. If replacing the valve stem only, verify that the flat sides of the brass extension on the bottom of the valve stem are at a 90 degree angle with the wheel. See **Fig. 1**
4. Position the pressure sensor over the brass extension.
5. Install the retainer screw and torque to 12 INCH lbs. (1.4 N.m)
6. Mount tire on wheel following tire changer manufacturer's instructions, paying special attention to the following to avoid damaging tire pressure sensor:

    - **Rotating Wheel Tire Changers**

      Once the wheel is mounted to the changer, position the sensor valve stem approximately 280° from the head of the changer in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads. See **Fig. 8**.

    - **Rotating Tool Tire Changers**

      Position the wheel on the changer so that the sensor valve stem is approximately 210° from the head of the changer in a clockwise direction from the mounting end of the tool. See **Fig. 9**. Make sure the sensor is clear of the lower bead breaker area to avoid damaging the sensor when the breaker rises. Rotate the tool in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.
7. Adjust air pressure to specification. Make sure original style valve stem cap is securely installed to keep moisture out of sensor. Install wheel and tire assembly on vehicle.
8. Drive vehicle for a minimum of 5 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

TIRE PRESSURE SENSOR (SRT8)

CAUTION: Although additional sensors operating at 433 MHz sensors are available and are used in other applications, they are not interchangeable. Always

make sure the correct sensor is being used and be sure to replace the sensor with the correct part number.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only. If aftermarket wheels are installed, and therefore do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Sensor.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

CAUTION: Any time a sensor is to be installed in a wheel, it is necessary to install a new sensor-to-wheel seal, metal washer and valve stem nut, to ensure airtight sealing. See Fig. 3.

CAUTION: DO NOT reuse sensor-to-wheel grommet. Always use a new grommet when installing a pressure sensor and properly torque the sensor nut.

Removal

1. Remove tire and wheel assembly from vehicle.
2. Dismount tire from wheel following tire changer manufacturer's instructions while paying special attention to the following to avoid damaging the pressure sensor:
   - When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire. See **Fig. 5**.
   - When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° +/- 10° from the valve stem, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads. See **Fig. 5**
3. Using a thin-walled socket, remove special nut retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem to keep valve stem from pushing rearward, which could damage antenna strap. See **Fig. 4**.

4. Remove sensor from wheel. See **Fig. 6**.

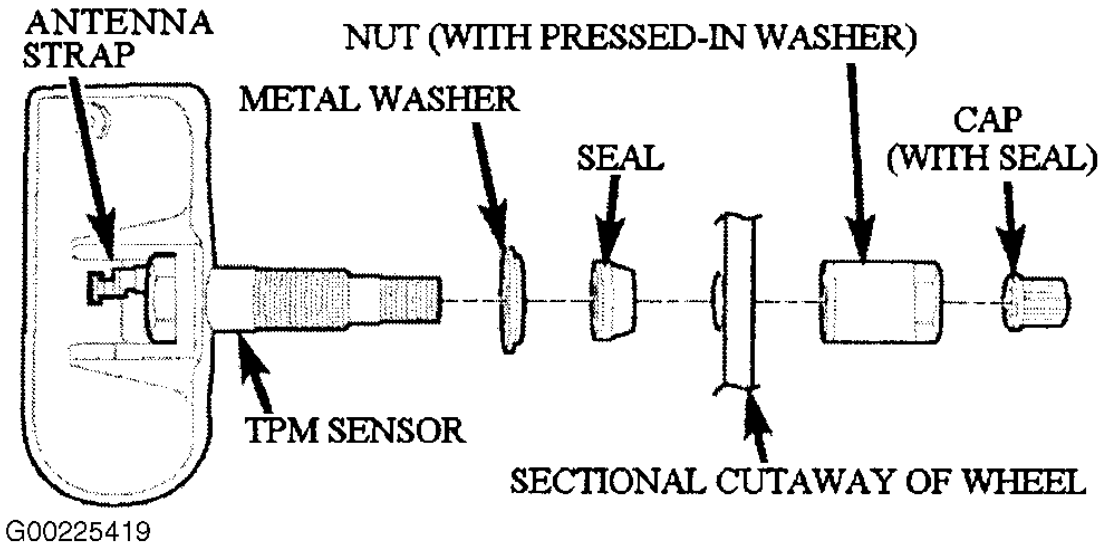

Fig. 3: Identifying Tire Pressure Sensor Components (1 Of 2)
Courtesy of CHRYSLER CORP.

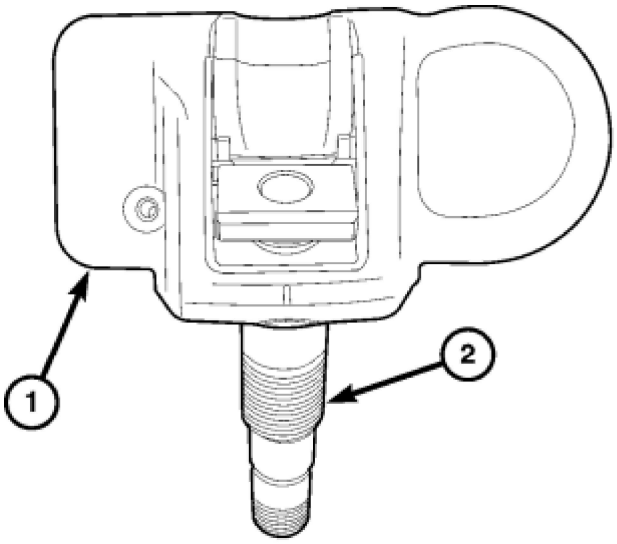

Fig. 4: Identifying Tire Pressure Sensor Components (2 Of 2)
Courtesy of CHRYSLER CORP.

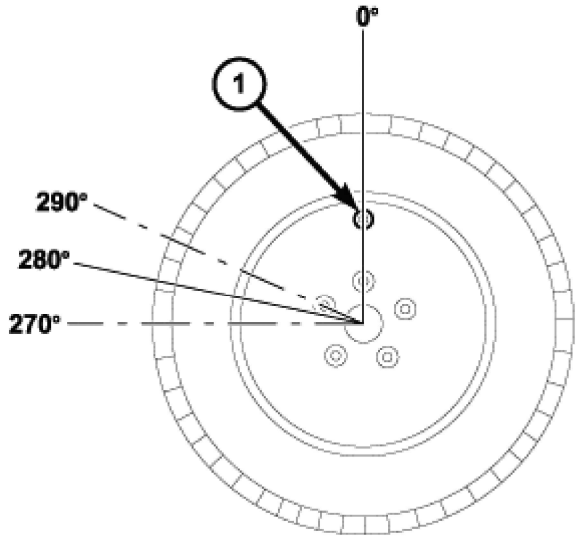

Fig. 5: Dismounting Tire With Tool
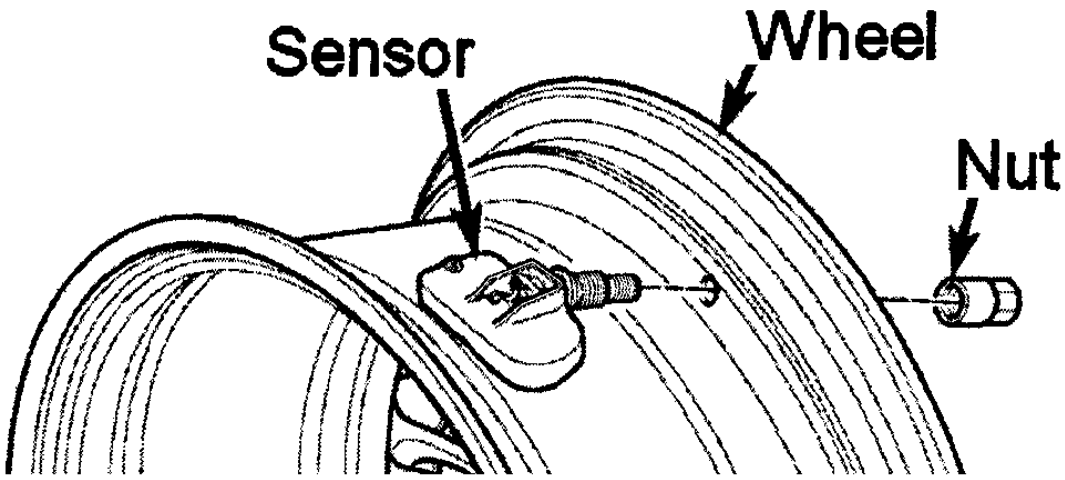
Courtesy of CHRYSLER CORP.



G00225421

Fig. 6: Removing & Installing Tire Pressure Sensor
Courtesy of CHRYSLER CORP.

Installation

NOTE: Before reinstalling an existing tire pressure sensor, replace seal and metal washer at base of valve stem to ensure proper sealing. See Fig. 3.

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.

CAUTION: To avoid damaging sensor antenna strap, hold pressure against rear of metal valve stem while sensor is inserted through wheel mounting

hole and nut is installed. See Fig. 4 and Fig. 6 .

2. Insert sensor through wheel as shown keeping pressure against rear of metal valve stem. Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, or damage may occur. Install sensor nut (with pressed-in washer) by hand. See **Fig. 6** and **Fig. 7** .

   NOTE: Before tightening sensor nut, push downward on sensor housing in an attempt to make it flush with interior contour of wheel.

3. Using a thin-walled socket, install sensor nut. While holding sensor in position, tighten sensor nut to 71 INCH lbs. (8 N.m).

   CAUTION: Over-torquing the sensor nut by as little as 106 INCH lbs. (12 N.m) may result in sensor separation from the valve stem. Under this condition, the sensor may still function; however, the condition should be corrected immediately.

4. Mount tire on wheel following tire changer manufacturer's instructions, paying special attention to the following to avoid damaging tire pressure sensor:

   - **Rotating Wheel Tire Changers**

     Once the wheel is mounted to the changer, position the sensor valve stem approximately 280° from the head of the changer in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads. See **Fig. 8**.

   - **Rotating Tool Tire Changers**

     Position the wheel on the changer so that the sensor valve stem is approximately 210° from the head of the changer in a clockwise direction from the mounting end of the tool. See **Fig. 9**. Make sure the sensor is clear of the lower bead breaker area to avoid damaging the sensor when the breaker rises. Rotate the tool in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

5. Adjust air pressure to specification. Make sure original style valve stem cap is securely installed to keep moisture out of sensor. Install wheel and tire assembly on vehicle.
6. Drive vehicle for a minimum of 5 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Component	Ft. Lbs. (N.m)
Wheel Nut	110 (150)
	INCH Lbs. (N.m)
Tire Pressure Sensor Nut	(1) 71 (8)

(1) Over-torquing the sensor nut by as little as 106 INCH lbs. (12 N.m) may result in sensor separation from the valve stem. Under this condition, the sensor may still function; however, the condition should be corrected immediately.

TRANSFER CASE

BW44-40 - Service Information - Chrysler 300

OPERATION

OPERATION

The Borg Warner 44-40 is a full time all-wheel drive transfer case with a fixed gear ratio. Depending on traction conditions, the PCM will modulate the electromagnetic clutch assembly to vary the amount of torque applied to the front axle. Torque is transmitted through the input shaft to the clutch and drive sprocket assembly, and is transferred directly to the rear propeller shaft, and to the output shaft and front propeller shaft by the drive chain. The oil pump circulates gear lube throughout the case to provide clutch cooling, and the PCM monitors the temperature of the transfer case with a temperature sensor.

ADJUSTMENTS

ADJUSTMENTS

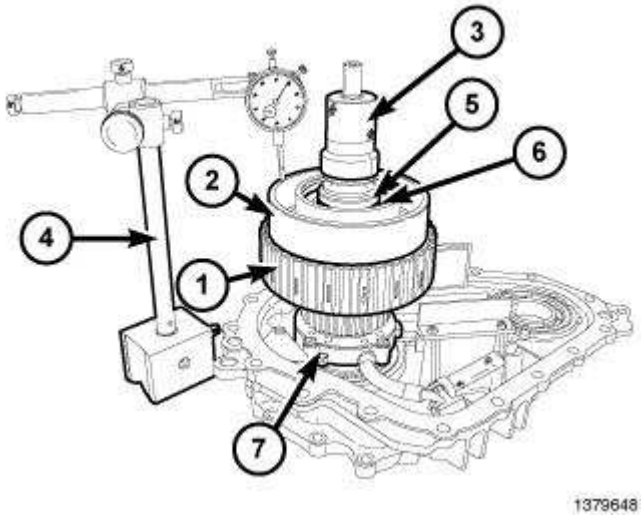

Fig. 1: Checking Clutch Clearance
Courtesy of CHRYSLER GROUP, LLC

1. Install the oil pump (7), the new clutch assembly (1), the rotor (2), the bearing (6), and the spacer (5) on the input shaft.
2. Install the clutch clearance tool (3) on the input shaft.
3. Set up a dial indicator (4) to measure the clearance between the rotor (2) and the top clutch disc inside the clutch housing (1).
4. Zero the dial indicator (4).
5. Push the rotor (2) downward evenly as close to the shaft as possible and record the highest

reading. Repeat this measurement in three more locations and calculate the average of all four measurements. This is the total amount of clutch clearance.

6. The total clutch clearance must be between 1.2 mm and 0.7 mm (0.047 in. and 0.028 in.). If the total clutch clearance is not within specifications, select a larger or smaller spacer as needed, and re-check clutch clearance.

SPECIFICATIONS

SPECIFICATIONS

TORQUE

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Case Bolts	31	23	-
Snubber Bolts	8	6	-
Oil Baffle Bolts	8	6	-

GENERAL SPECIFICATIONS

DESCRIPTION	Metric	Standard
Clutch Clearance	0.7 mm - 1.2 mm	0.028 in. - 0.047 in.
Clutch Coil Resistance @ 20° C (68° F)	2.85 - 3.15 ?	
Temperature Sensor Resistance @ 20° C (68° F)	2726 - 3603 ?	

REMOVAL

REMOVAL

1. Raise and support the vehicle.

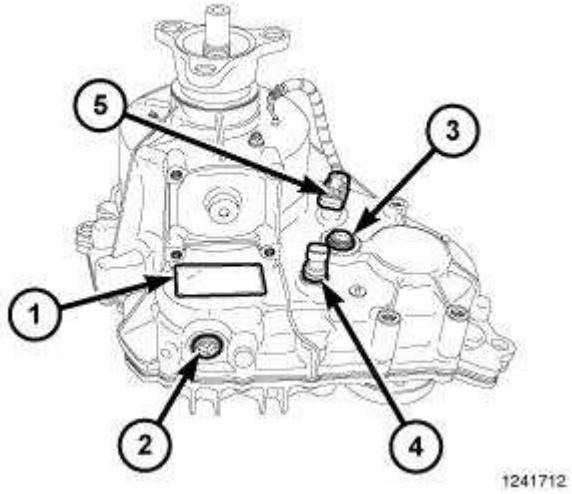

Fig. 2: Transfer Case And Drain Plug
Courtesy of CHRYSLER GROUP, LLC

2. Remove the transfer case drain plug (2) and allow the transfer case lubricant to drain into a suitable container.
3. Remove the exhaust. Refer to **MUFFLER, EXHAUST, REMOVAL** .
4. Remove the rear propeller shaft. Refer to **REMOVAL** .

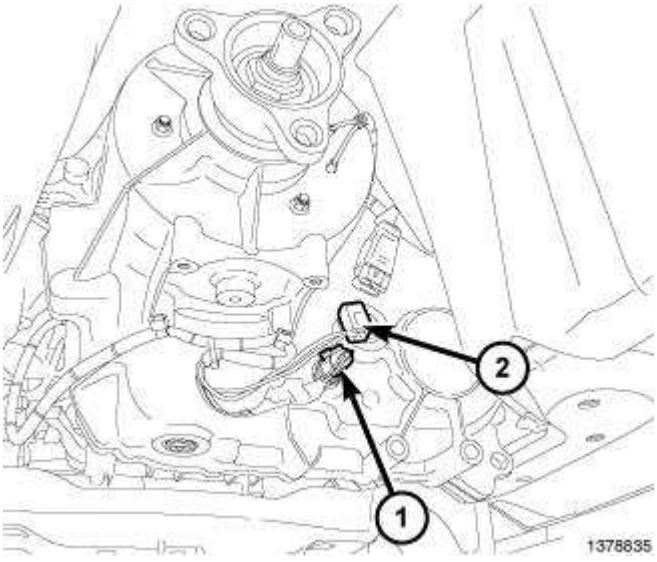

Fig. 3: Temperature Sensor Harness Connector And Clutch Coil Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the temperature sensor harness connector (1) and the clutch coil harness connector (2).
6. Raise transmission slightly with service jack to relieve load on crossmember and supports.

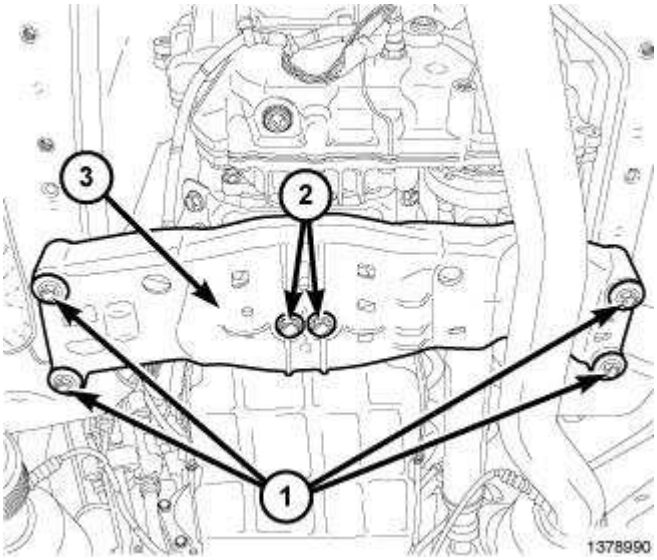

Fig. 4: Crossmember And Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (2) securing rear support and cushion to transmission crossmember (3).
8. Remove bolts attaching the crossmember (1) to frame and remove crossmember (3).
9. Remove the front propeller shaft. Refer to **REMOVAL** .

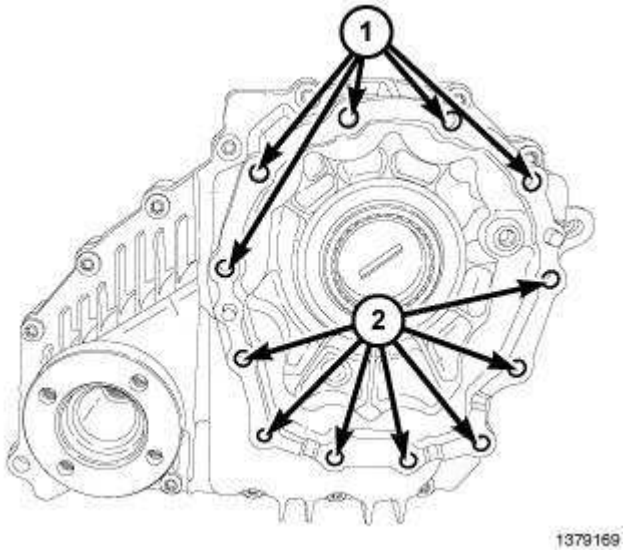

Fig. 5: Front (Transmission) Side Of PTU Case Flange
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front (transmission) side of the transfer case flange is shown in illustration for clarity.

10. Remove the lower transfer case-to-transmission bolts from the lower half of the transfer case flange (2).

11. Slightly lower the rear of the transmission to gain access to the upper transfer case to-transmission bolts.
12. Support the transfer case with a transmission jack
13. Remove the upper transfer case to transmission bolts from the upper half of the transfer case flange (1).
14. Remove the transfer case.

DISASSEMBLY

DISASSEMBLY

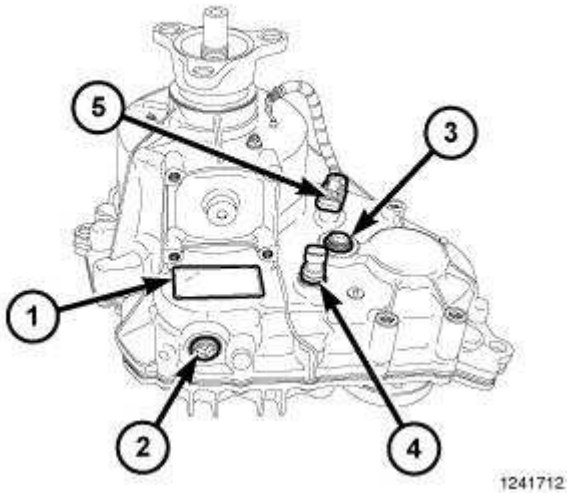

Fig. 6: Transfer Case And Drain Plug
Courtesy of CHRYSLER GROUP, LLC

NOTE: The vent hole is near the input shaft hub. If the unit is set on the mounting surface, oil will drain out through the vent.

1. Place the transfer case so that it can be drained of any remaining fluid and remove the drain plug (2).

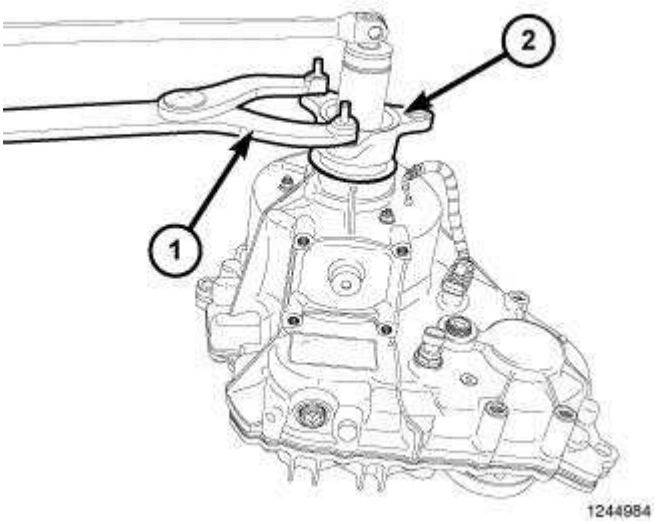

Fig. 7: Holder And Rear Output Flange
Courtesy of CHRYSLER GROUP, LLC

2. Install Holder (special tool #6958, Wrench, Spanner) (1) onto the rear output flange (2).
3. Remove the rear output flange nut.

33. Use the (special tool #9585, Remover, Bearing Cup) Bearing Race Remover (1) and (special tool #C-637, Slide Hammer, Universal) Slide Hammer (2) to remove the Output Shaft Bearing (3) from the Front Case Half (4).
34. Use the (special tool #9664, Remover, Bearing Cup) Bearing Race Remover and (special tool #C-637, Slide Hammer, Universal) Slide Hammer to remove the Input Shaft Bearing from the Front Case Half.

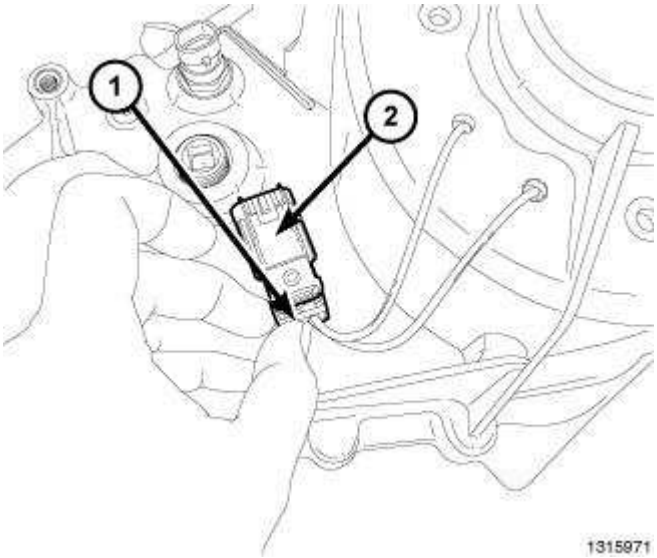

Fig. 34: Clutch Coil Harness Connector And Retainer
Courtesy of CHRYSLER GROUP, LLC

35. Remove the Tie Straps, and remove the Convoluted Sheath from the Clutch Coil Wires.
36. Remove the retainer (1) from the Clutch Coil Harness Connector (2).

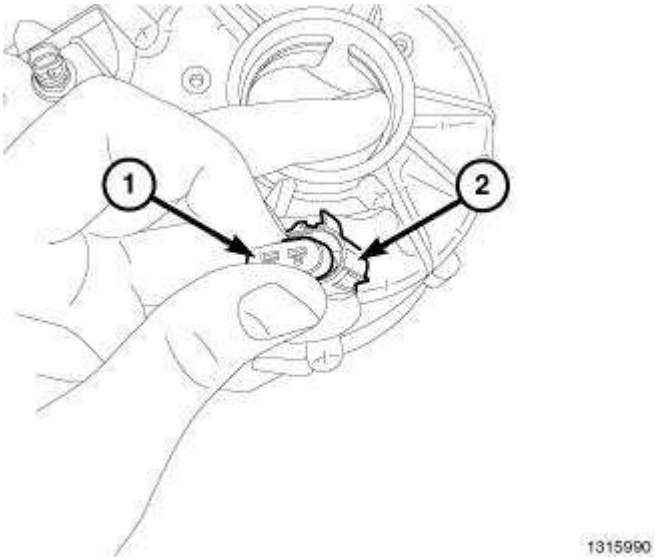

Fig. 35: Clutch Coil Harness Connector And Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The clutch coil wires are retained in the harness connector by tabs. The tabs must be released from the connector face to remove the wires from the harness connector.

37. Remove the Cover (1) from the Clutch Coil Harness Connector (2), release the tabs, and disconnect the Clutch Coil Terminal Ends from the Clutch Coil Harness Connector (2).

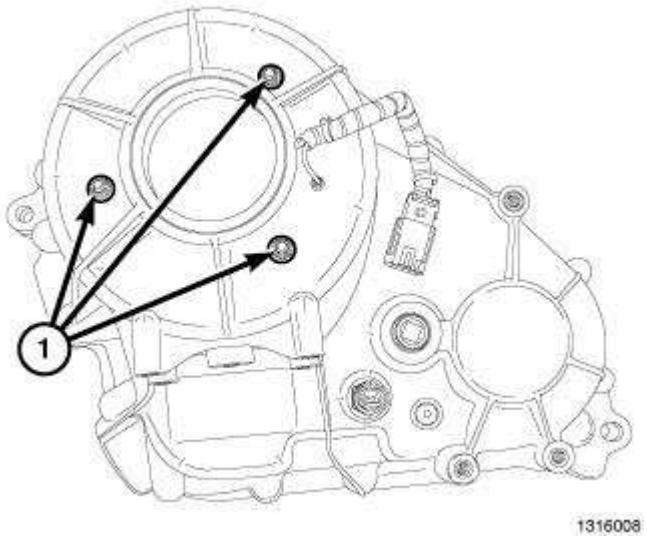

Fig. 36: Clutch Coil Retainers
Courtesy of CHRYSLER GROUP, LLC

38. Remove the Clutch Coil retainers (1).

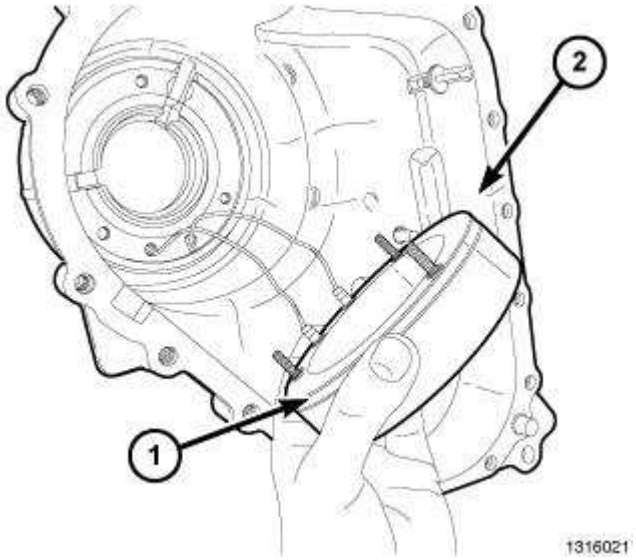

Fig. 37: Clutch Coil And Rear Case Half
Courtesy of CHRYSLER GROUP, LLC

39. Remove the Clutch Coil (1) from the Rear Case Half (2).

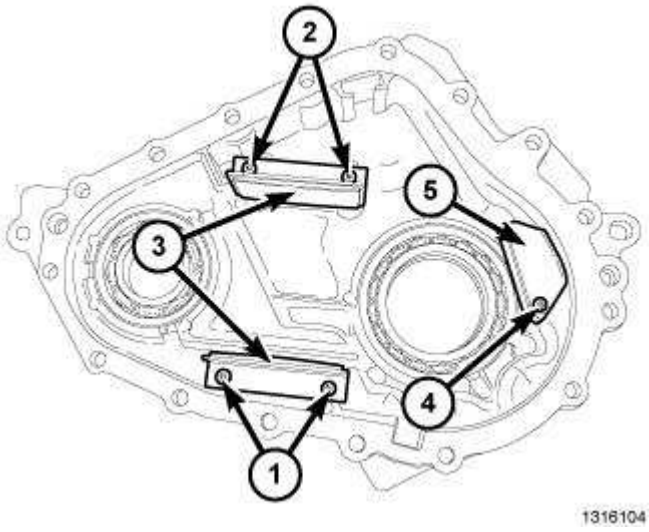

Fig. 38: Oil Baffle, Fasteners, And Snubbers
Courtesy of CHRYSLER GROUP, LLC

40. Remove the Fastener (4) and the Oil Baffle (5).
41. Remove the Fasteners (1) and (2) and the Snubbers (3).
42. Remove the input and output shaft seals from the front case half.
43. Remove the input shaft seal from the rear case half.

ASSEMBLY

ASSEMBLY

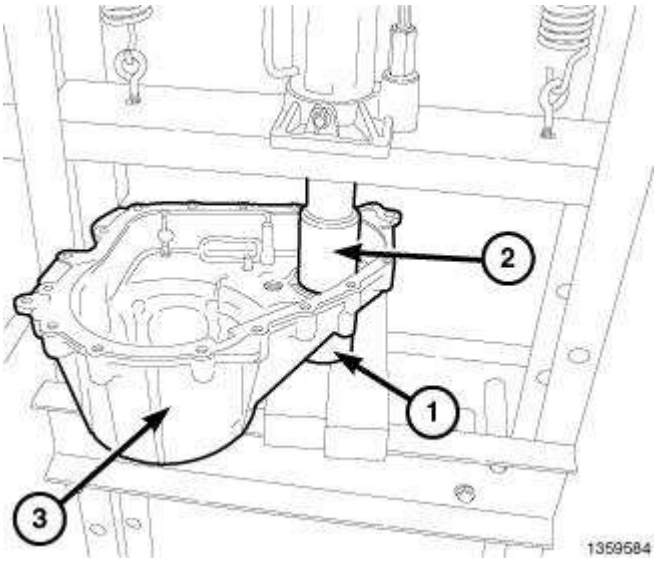

Fig. 39: Remover/Installer Rear Case Half
Courtesy of CHRYSLER GROUP, LLC

1. Check the clearance for the new clutch pack, and select a new spacer if necessary. Refer to **ADJUSTMENTS**.
2. Position the Rear Case Half (3) on an Arbor Press, and position (special tool #8835-3, Receiver, Bushing) Remover/Installer (1) to support the Rear Case Half (3) from below in the area of the Output Shaft Bearing.
3. Use the (special tool #8441-2, Cup, Receiver) Installer (2) and an Arbor Press to install the Output Shaft Bearing into the Rear Case Half (3).

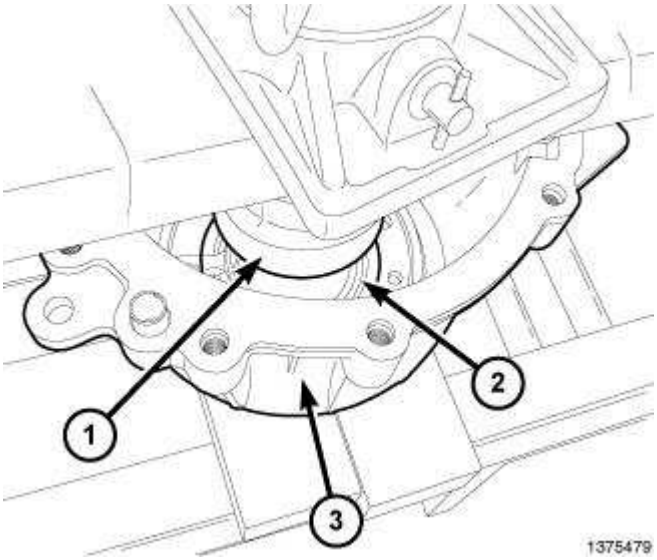

Fig. 40: Bearing Installer And an Arbor Press to install the Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

4. Use the (special tool #D-156, Installer, Bearing) Bearing Installer (1) and an Arbor Press to install the Input Shaft Bearing (2) into the rear case half (3).

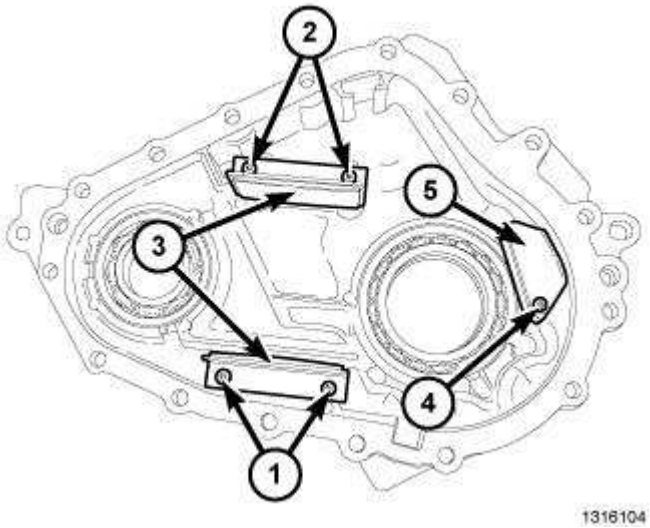

Fig. 41: Oil Baffle, Fasteners, And Snubbers
Courtesy of CHRYSLER GROUP, LLC

5. Install the Snubbers (3). Tighten the bolts (1) and (2) to 8 Nm (6 ft. lbs.).
6. Install the Oil Baffle (5). Tighten the Bolts (4) to 8 Nm (6 ft. lbs.).

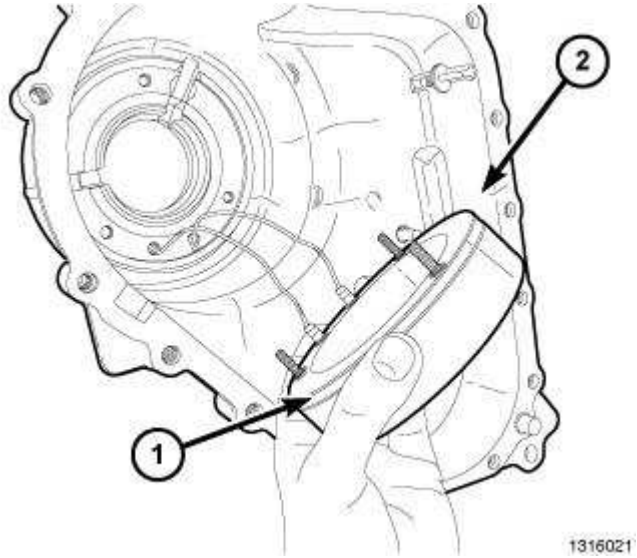

Fig. 42: Clutch Coil And Rear Case Half
Courtesy of CHRYSLER GROUP, LLC

7. Route the wires through the Rear Case Half (2) and install the Clutch Coil (1) into the Rear Case Half (2).

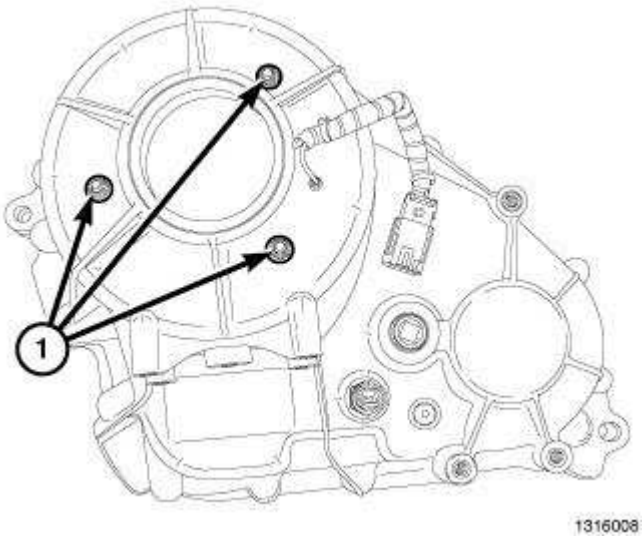

Fig. 43: Clutch Coil Retainers
Courtesy of CHRYSLER GROUP, LLC

8. Install the Clutch Coil retainers (1). Tighten to 10 Nm (7 ft. lbs.).

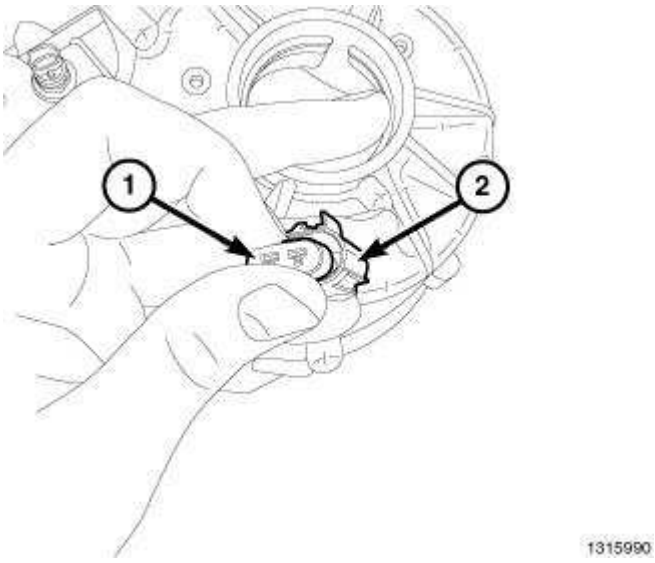

Fig. 44: Clutch Coil Harness Connector And Cover
Courtesy of CHRYSLER GROUP, LLC

9. Install Clutch Coil Wire Terminal Ends into the Clutch Coil Harness Connector (2), engage the Terminal Ends in the Tabs, then install the Cover (1).

NOTE: If the original convoluted sheath is damaged, install new convoluted sheath

10. Install the Convoluted Sheath and install new tie straps to secure it in position.

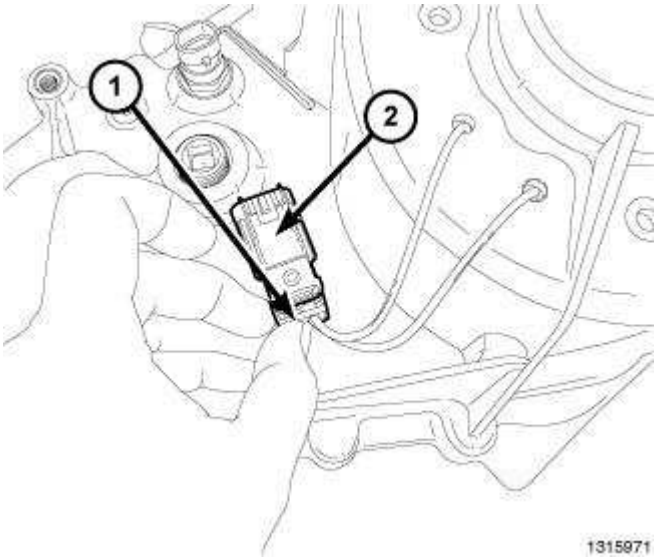

Fig. 45: Clutch Coil Harness Connector And Retainer
Courtesy of CHRYSLER GROUP, LLC

11. Install the Wire Retainer (1) on the back of the Clutch Coil Harness Connector (2).

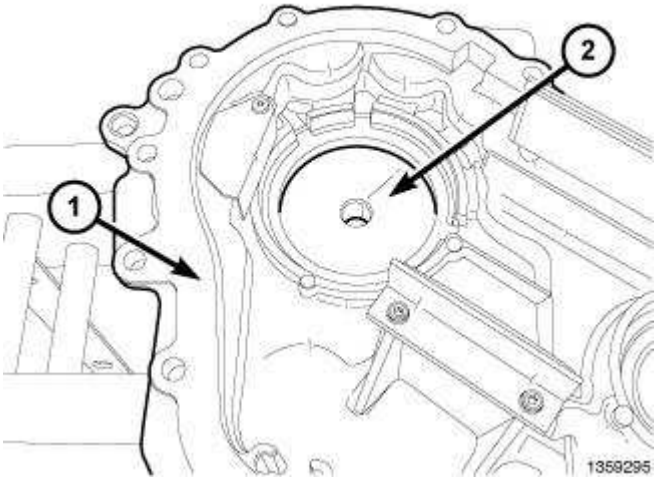

Fig. 46: Seal Installer And Front Case Half
Courtesy of CHRYSLER GROUP, LLC

12. Position the Front Case Half (1) on an Arbor Press, and position (special tool #8149, Installer, Seal) Seal Installer (2) to support the Input Shaft Seal Flange from below.

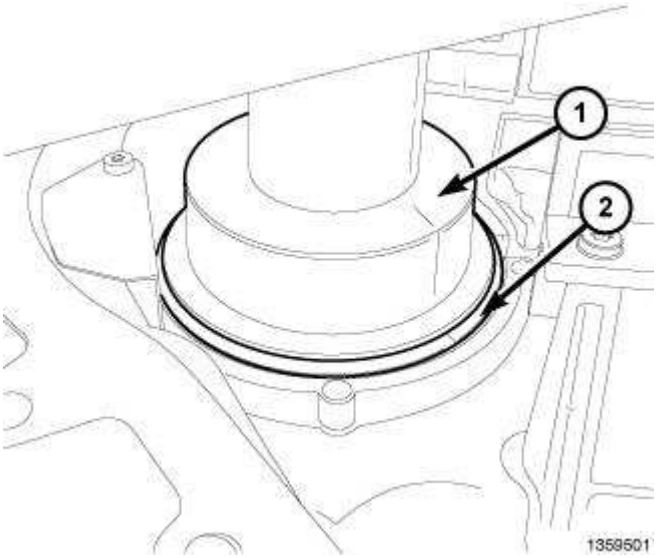

Fig. 47: Bearing Installer And Input Shaft Bearing - Front Case Half
Courtesy of CHRYSLER GROUP, LLC

13. Use (special tool #8153, Installer, Bearing Cup) Bearing Installer (1) and an Arbor Press to install the Input Shaft Bearing (2) into the Front Case Half.

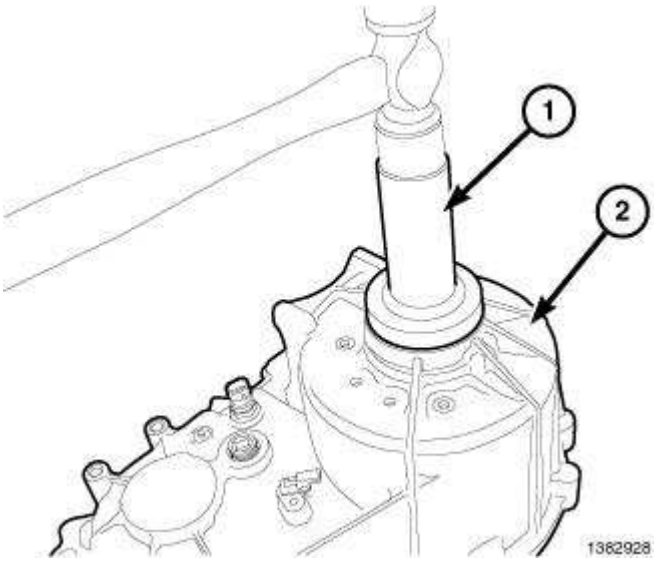

Fig. 48: Seal Installer And Rear Case Half
Courtesy of CHRYSLER GROUP, LLC

14. Use (special tool #10174, Installer, Seal, Rear Output) Seal Installer to install the rear input shaft seal into the rear case half (2).

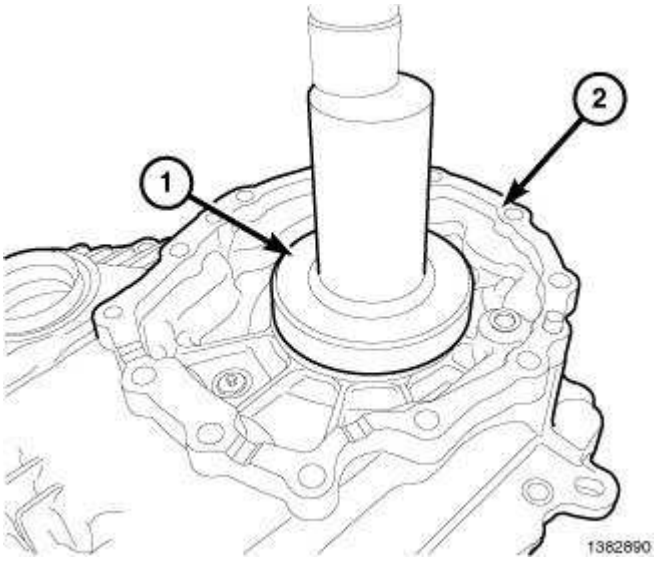

Fig. 49: Seal Installer And Front Case Half
Courtesy of CHRYSLER GROUP, LLC

15. Use (special tool #10173, Installer, Input Shaft Seal) Seal Installer (1) to install the front input shaft seal into the front case half (2).
16. Use (special tool #10174, Installer, Seal, Rear Output) Seal Installer to install the rear output shaft seal into the front case half (2).

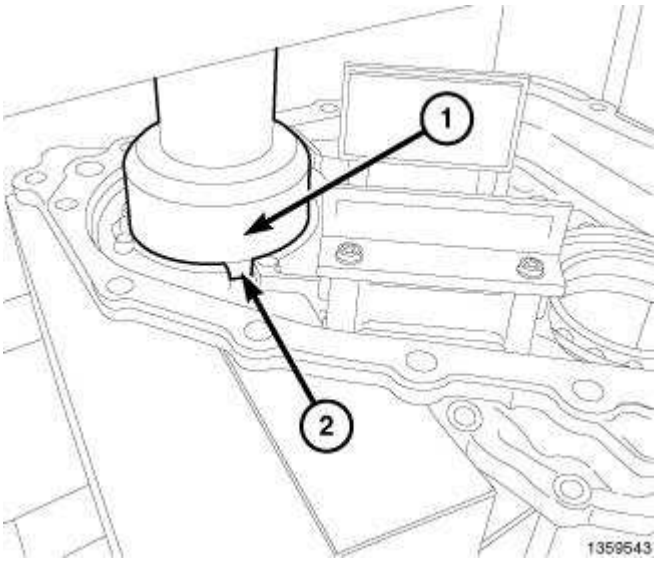

Fig. 50: Bearing Installer And Output Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

17. Use the (special tool #D-156, Installer, Bearing) Bearing Installer and an Arbor Press to install the Output Shaft Bearing into the Front Case Half.

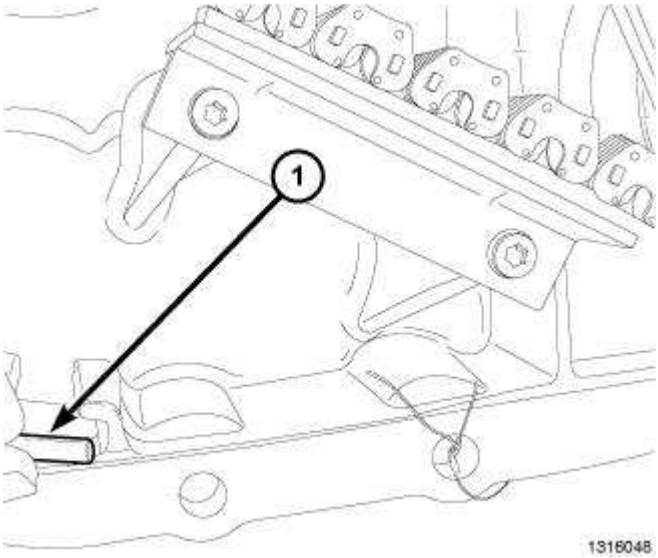

Fig. 51: Case Magnet
Courtesy of CHRYSLER GROUP, LLC

18. Install the Case Magnet (1).

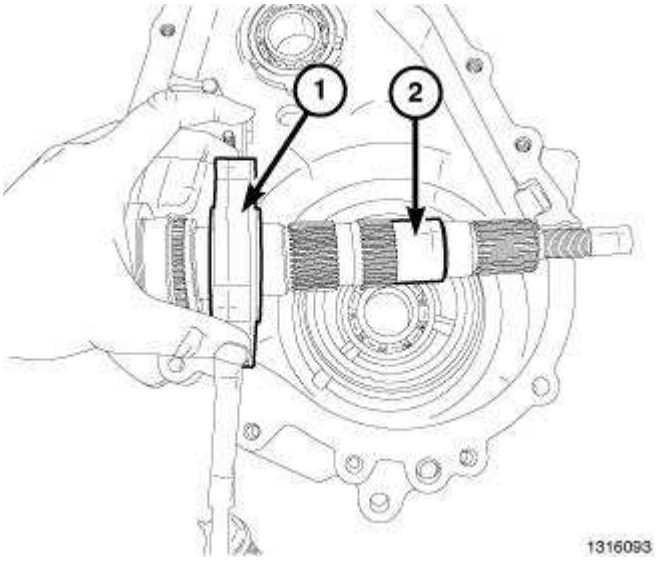

Fig. 52: Oil Pump Assembly And Input Shaft
Courtesy of CHRYSLER GROUP, LLC

19. Position the Oil Pump Assembly (1) onto the Input Shaft (2).

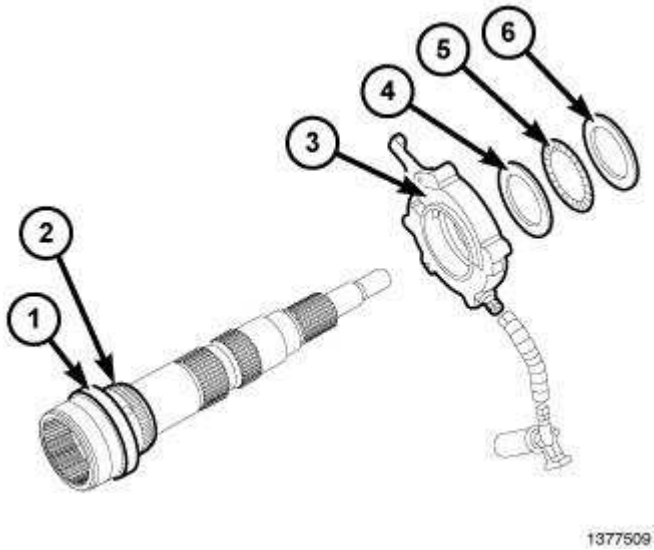

Fig. 53: Top Spacer, Bottom Spacer, Input Shaft, And Splines
Courtesy of CHRYSLER GROUP, LLC

20. Slide the Oil Pump down until it fully engages the Splines (2) on the Input Shaft (1).
21. Install the Bottom Spacer (4), the Bearing (5), and Top Spacer (6) onto the Input Shaft (1).

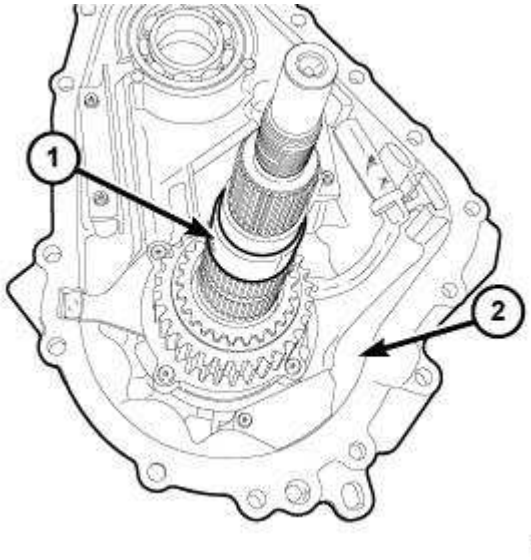

Fig. 54: Input Shaft Assembly And Front Case Half
Courtesy of CHRYSLER GROUP, LLC

22. Install the Input Shaft assembly (1) into the Front Case Half (2).

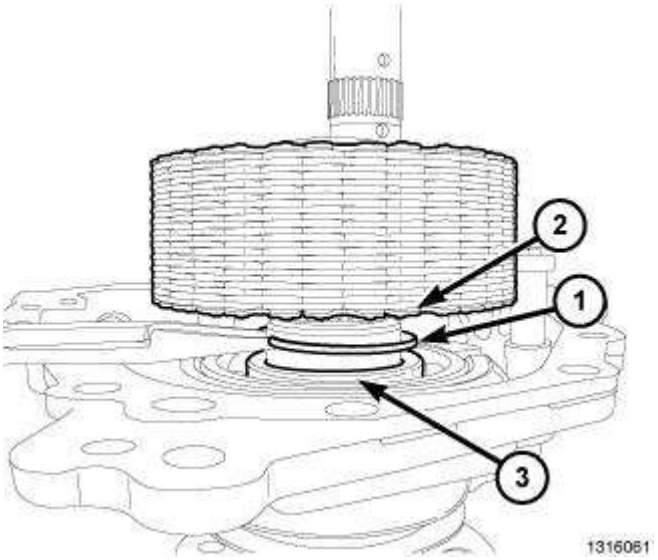

Fig. 55: Locating Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The output shaft sprocket is pressed onto the output shaft.**

NOTE: **If the Snap Ring (1) is temporarily installed too close to the top of the Output Shaft, it might not be possible to install it into the Bottom Groove on the Output Shaft after the Output Shaft Sprocket is pressed onto the Output Shaft.**

23. Temporarily install the Snap Ring (1) approximately 3 mm (0.12 in.) above the Groove (3) on the Output Shaft.
24. Install the Output Shaft Sprocket, the Drive Chain and the Drive Sprocket as an assembly.

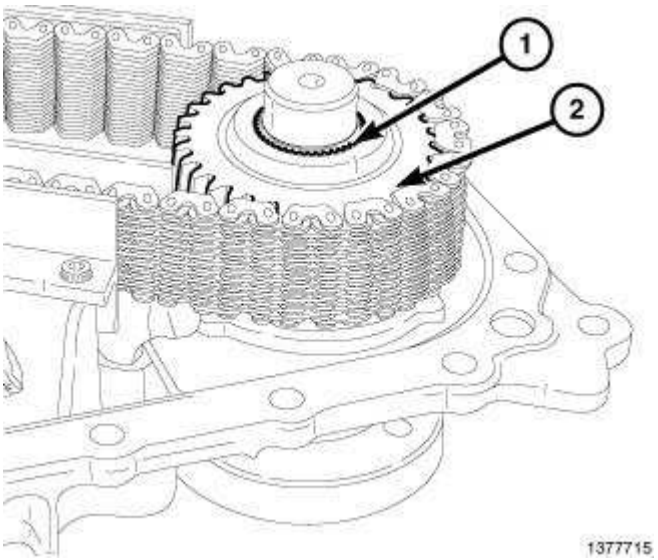

Fig. 56: Output Shaft Sprocket And Top Groove On Output Shaft

Courtesy of CHRYSLER GROUP, LLC

NOTE: When the Output Shaft Sprocket (2) is at the correct height, the Top Groove (1) on the Output Shaft will be visible.

25. Use the (special tool #8835-3, Receiver, Bushing) Installer and an arbor press to install the Output Shaft Sprocket (2) onto the Output Shaft. Press the sprocket until the Top Groove (1) on the Output Shaft is visible.

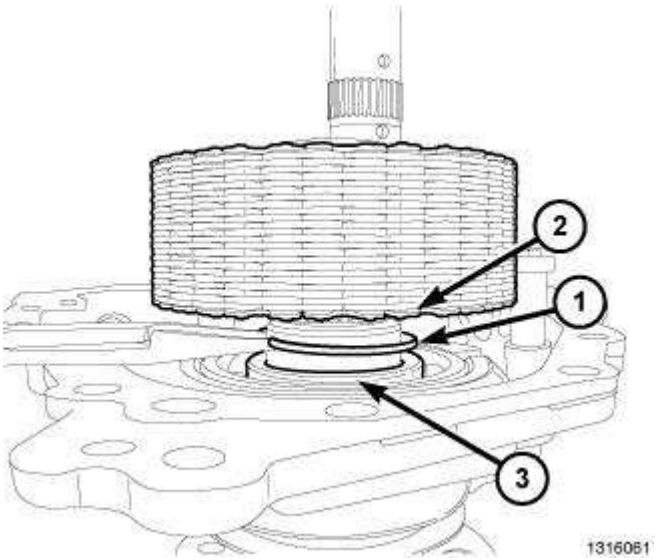

Fig. 57: Locating Snap Ring
Courtesy of CHRYSLER GROUP, LLC

26. Press the Output Shaft upward with the Output Shaft Flange, then install the Snap Ring (1) into the Groove (3) on the Output Shaft.

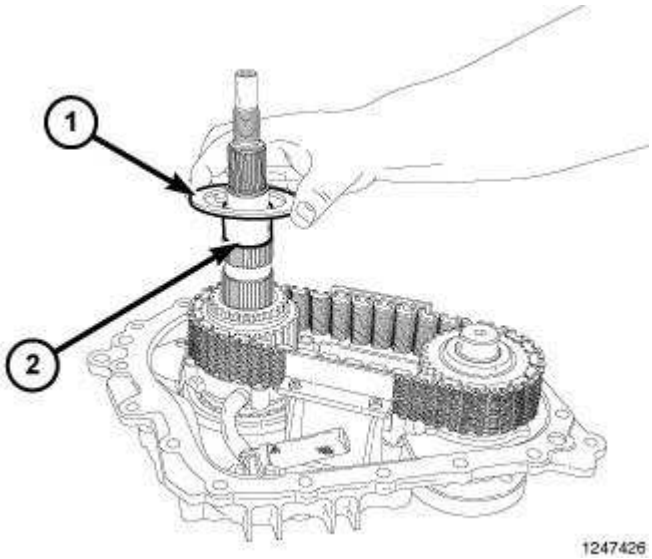

Fig. 58: Thrust Washer And Input Shaft

33. Install the bearing (1) onto the input shaft.

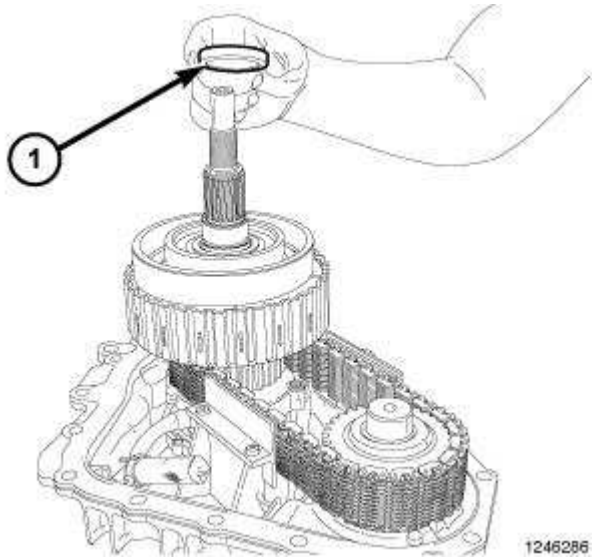

Fig. 65: Spacer
Courtesy of CHRYSLER GROUP, LLC

34. Install the spacer (1).

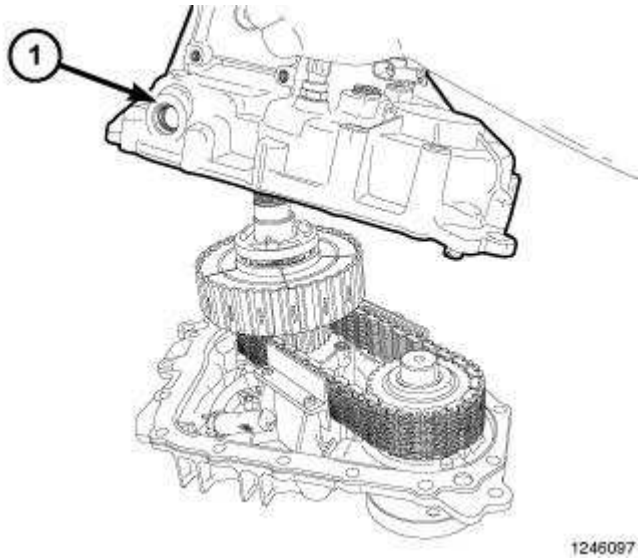

Fig. 66: Transfer Case Rear Cover
Courtesy of CHRYSLER GROUP, LLC

35. Apply a bead of Loctite® 598 HB to the front case half sealing surface.
36. Install the rear cover (1). Tighten the case bolts to 31 Nm (23 ft. lbs).

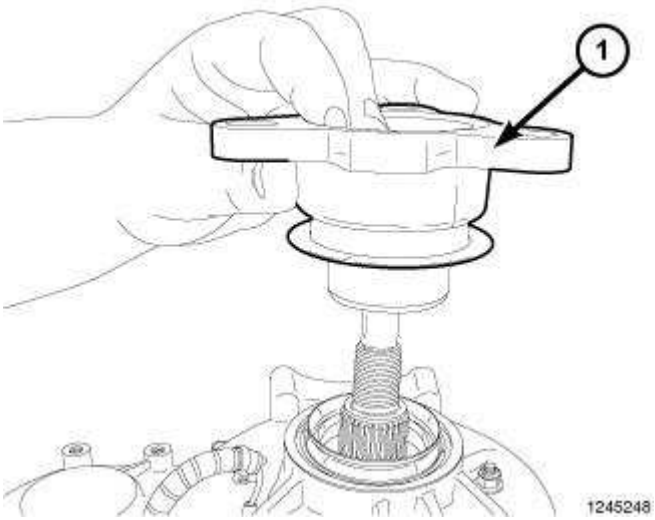

Fig. 67: Rear Output Flange
Courtesy of CHRYSLER GROUP, LLC

37. Install the rear output flange (1)

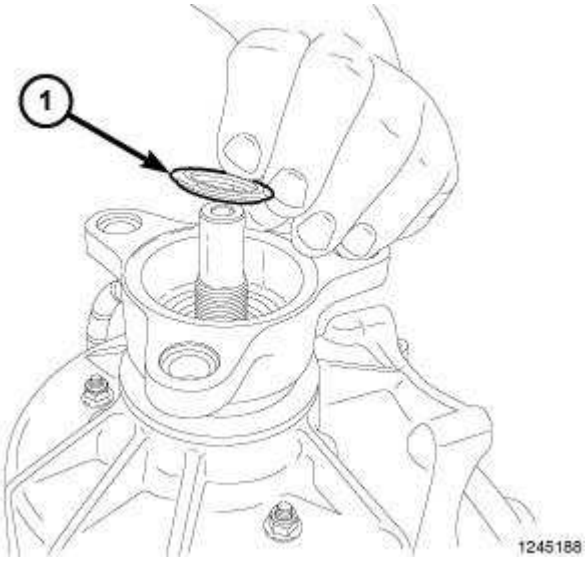

Fig. 68: Outer Rear Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

38. Install a new outer rear output shaft seal (1)

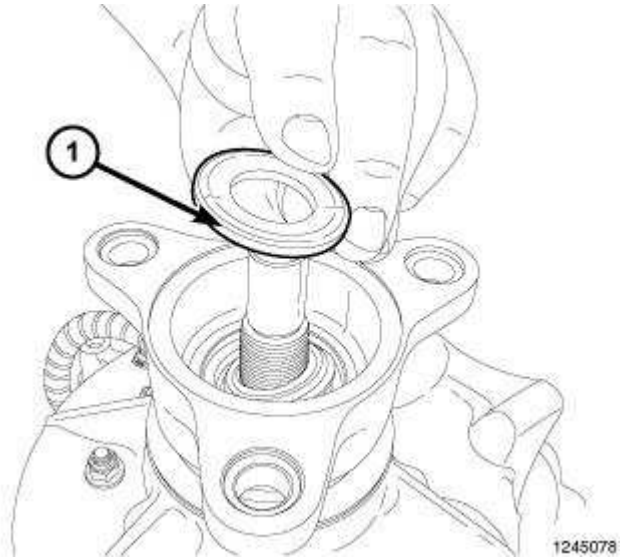

Fig. 69: Rear Output Flange Washer
Courtesy of CHRYSLER GROUP, LLC

39. Install the rear output flange washer (1)

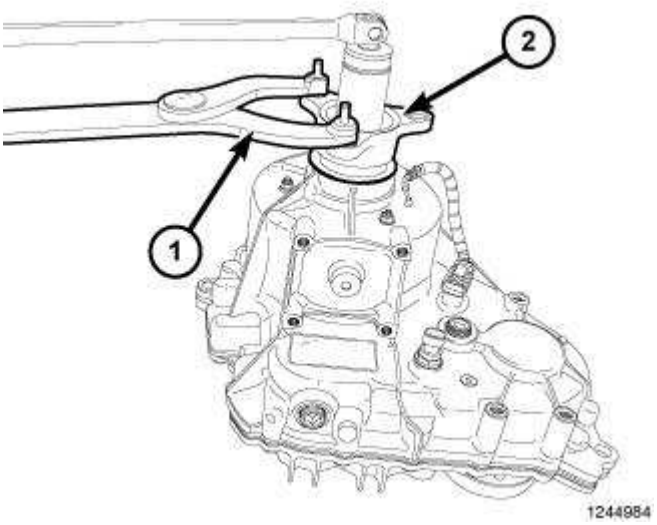

Fig. 70: Holder And Rear Output Flange
Courtesy of CHRYSLER GROUP, LLC

40. Install the rear output flange nut.
41. Install Holder (special tool #6958, Wrench, Spanner) (1) onto the rear output flange (2). Tighten the rear output flange nut to 319 Nm (235 ft. lbs.).

INSTALLATION

INSTALLATION

1. Place the transfer case on a transmission jack, and raise the transfer case up to the rear transmission flange.
2. Align the transfer case dowel pins with the holes in the rear transmission flange.

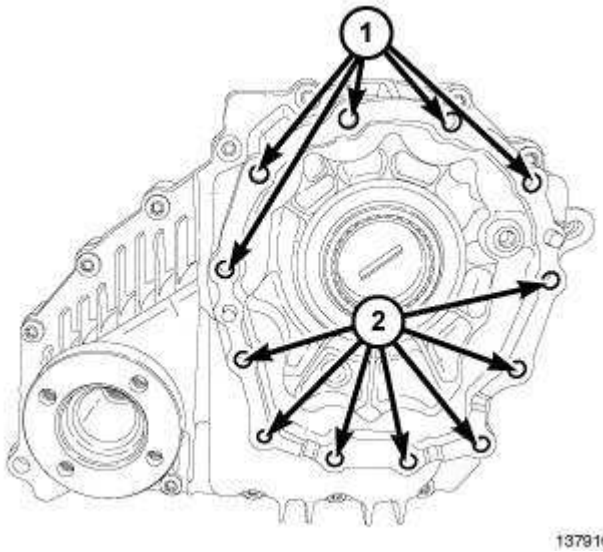

Fig. 71: Front (Transmission) Side Of PTU Case Flange
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front (transmission) side of the transfer case flange is shown in illustration for clarity.

3. Install the upper and lower transfer case to transmission bolts into the upper (1) and lower (2) halves half of the transfer case flange. Tighten the transfer case to transmission bolts to 55 Nm (41 ft. lb.).
4. Raise the transfer case and transmission up into position, and support with a suitable service jack. Remove the transmission jack.
5. Install the front propeller shaft. Refer to **INSTALLATION** .

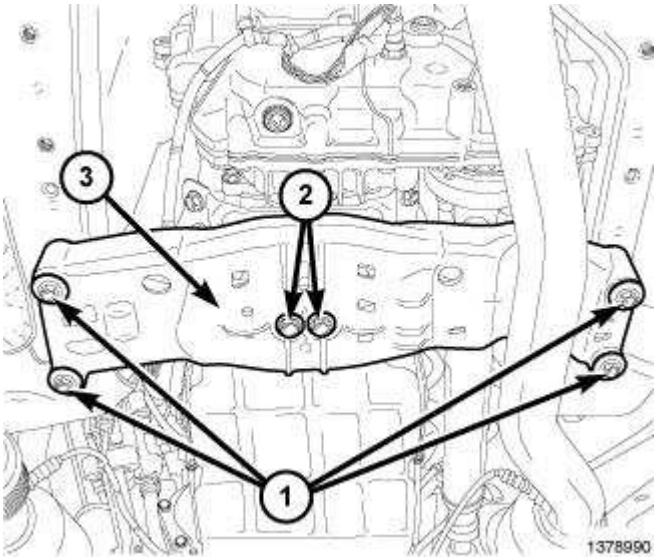

Fig. 72: Crossmember And Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the crossmember (3) and install the bolts attaching the crossmember (1) to frame.
7. Lower transmission with service jack onto crossmember and supports.
8. Install the bolts (2) securing rear support and cushion to transmission crossmember (3).

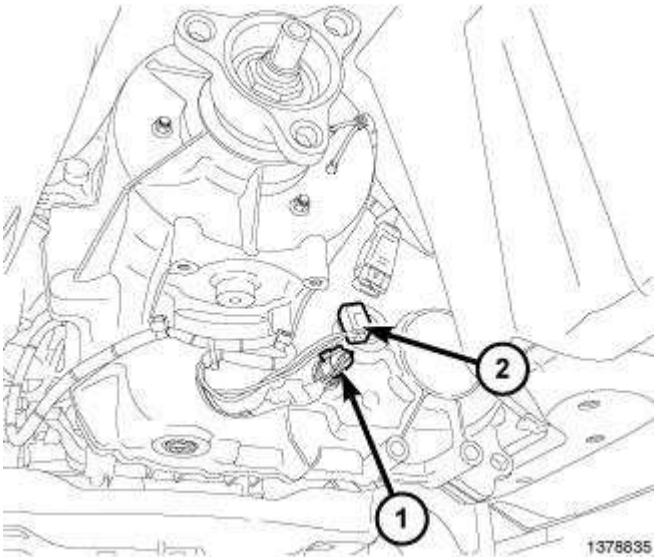

Fig. 73: Temperature Sensor Harness Connector And Clutch Coil Harness Connector
Courtesy of CHRYSLER GROUP, LLC

9. Connect the temperature sensor harness connector (1) and the clutch coil harness connector (2).
10. Install the rear propeller shaft. Refer to **INSTALLATION** .
11. Install the exhaust. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
12. If the fluid was drained, fill the transfer case with 1.0L +/- 0.5L (2.11 pint +/- 0.11pint.) of fluid.

Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

10. Remove the Tie Straps, and remove the Convoluted Sheath from the Clutch Coil Wires.
11. Remove the retainer (1) from the Clutch Coil Harness Connector (2).

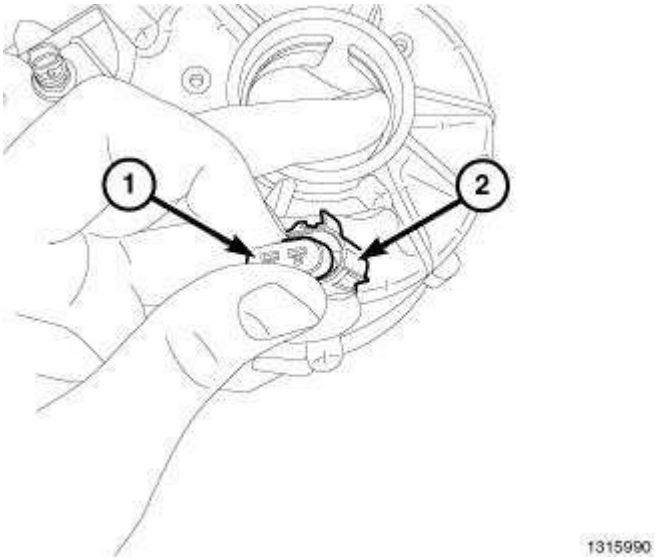

Fig. 143: Clutch Coil Harness Connector And Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: The clutch coil wires are retained in the harness connector by tabs. The tabs must be released from the connector face to remove the wires from the harness connector.

12. Remove the Cover (1) from the Clutch Coil Harness Connector (2), release the tabs, and disconnect the Clutch Coil Terminal Ends from the Clutch Coil Harness Connector (2).

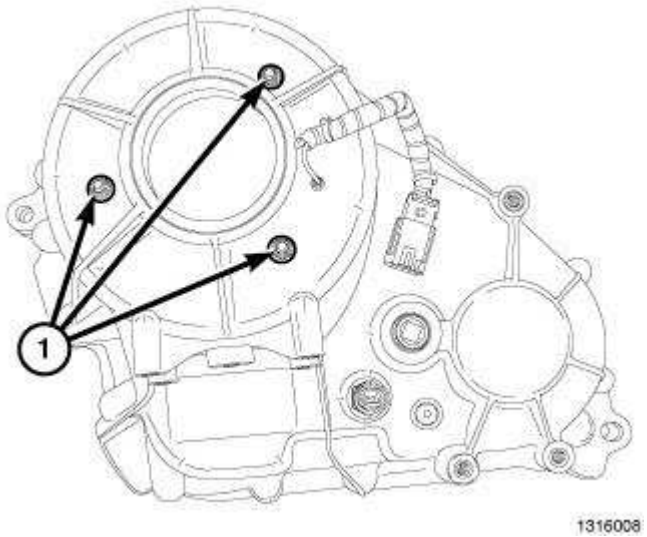

Fig. 144: Clutch Coil Retainers
Courtesy of CHRYSLER GROUP, LLC

13. Remove the Clutch Coil retainers (1).

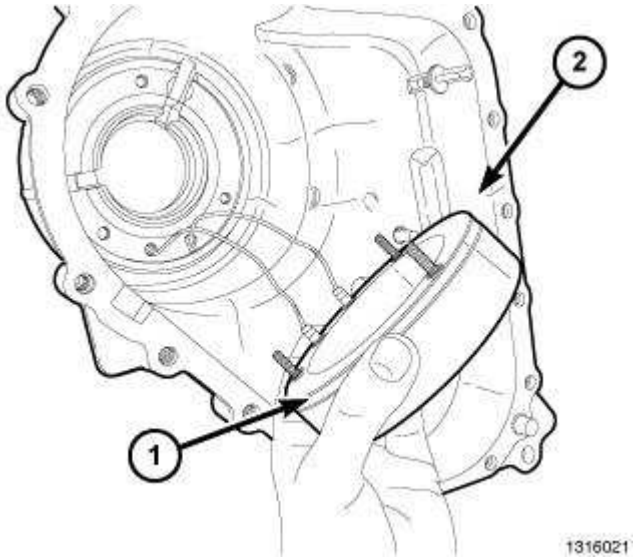

Fig. 145: Clutch Coil And Rear Case Half
Courtesy of CHRYSLER GROUP, LLC

14. Remove the Clutch Coil (1) from the Rear Case Half (2).

INSTALLATION

INSTALLATION

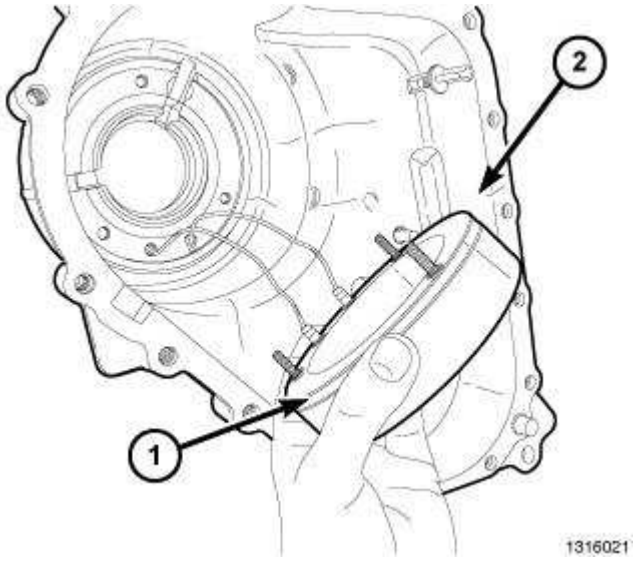

Fig. 146: Clutch Coil And Rear Case Half
Courtesy of CHRYSLER GROUP, LLC

1. Route the wires through the Rear Case Half (2) and install the Clutch Coil (1) into the Rear Case Half.

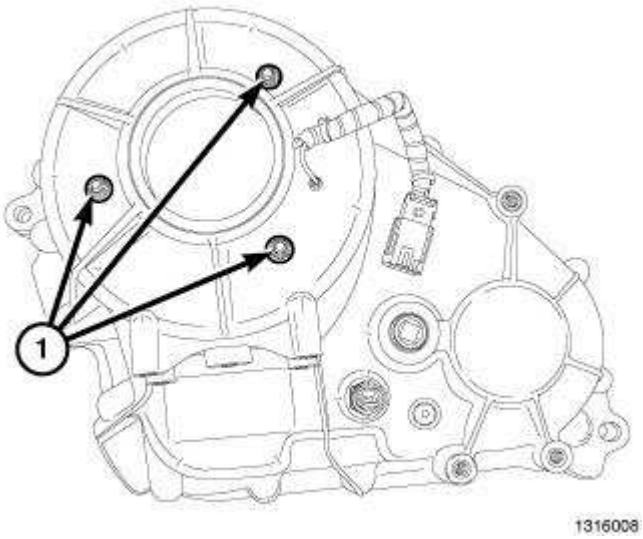

Fig. 147: Clutch Coil Retainers
Courtesy of CHRYSLER GROUP, LLC

2. Install the Clutch Coil retainers (1). Tighten to 10 Nm (7 ft. lbs.).

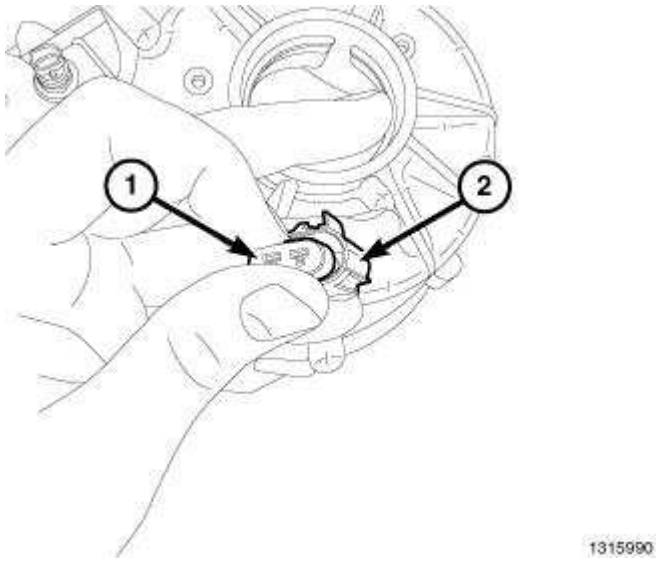

Fig. 148: Clutch Coil Harness Connector And Cover
Courtesy of CHRYSLER GROUP, LLC

3. Install Clutch Coil Wire Terminal Ends into the Clutch Coil Harness Connector (2), engage the Terminal Ends in the Tabs, then install the Cover (1).

NOTE: If the original convoluted sheath is damaged, install new convoluted sheath

4. Install the Convoluted Sheath and install new tie straps to secure it in position.

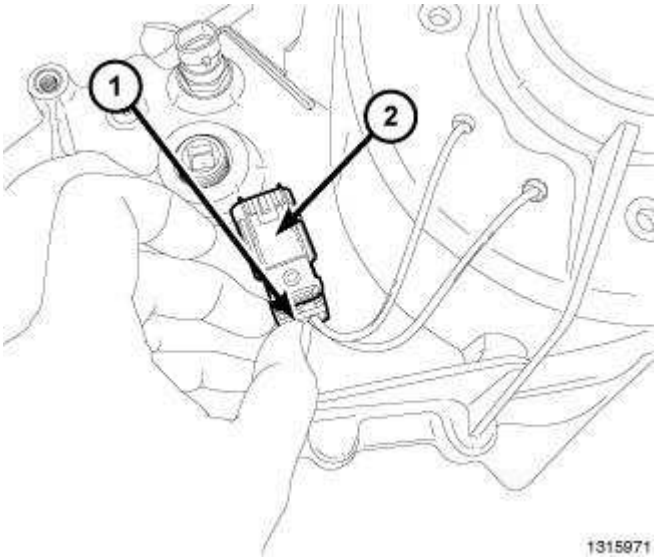

Fig. 149: Clutch Coil Harness Connector And Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Install the Wire Retainer (1) on the back of the Clutch Coil Harness Connector (2).

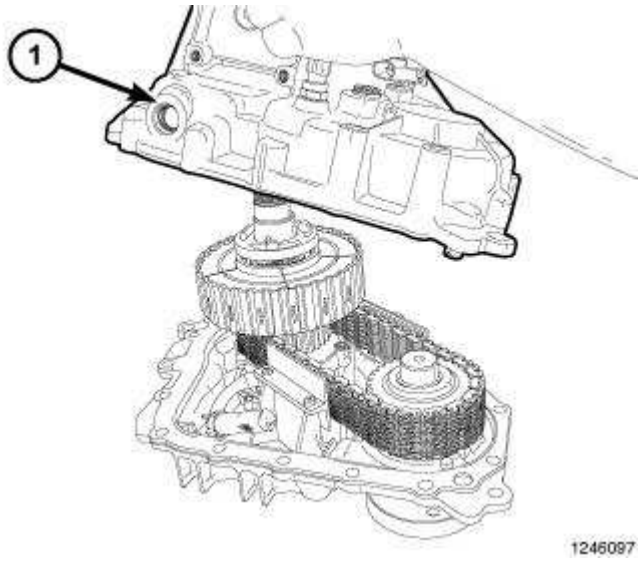

Fig. 150: Transfer Case Rear Cover
Courtesy of CHRYSLER GROUP, LLC

6. Install the rear cover (1)
7. Install the case half bolts.

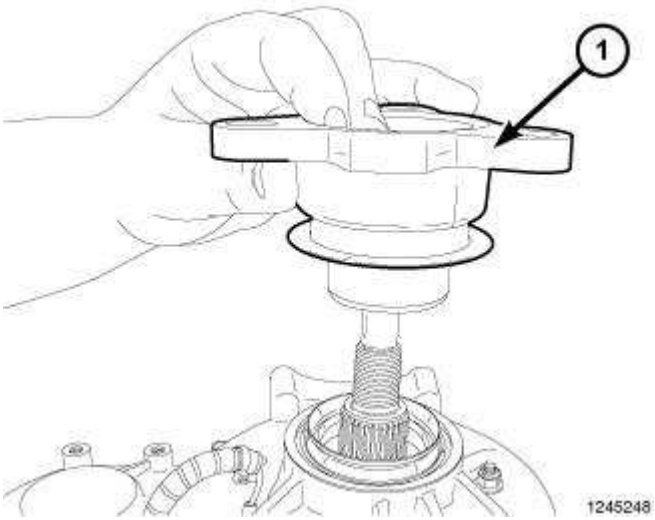

Fig. 151: Rear Output Flange
Courtesy of CHRYSLER GROUP, LLC

8. Install the rear output flange (1)

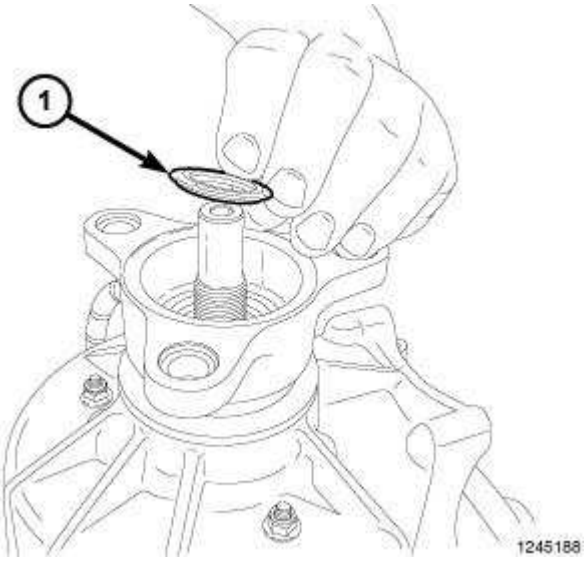

Fig. 152: Outer Rear Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

9. Install the outer rear output shaft seal (1)

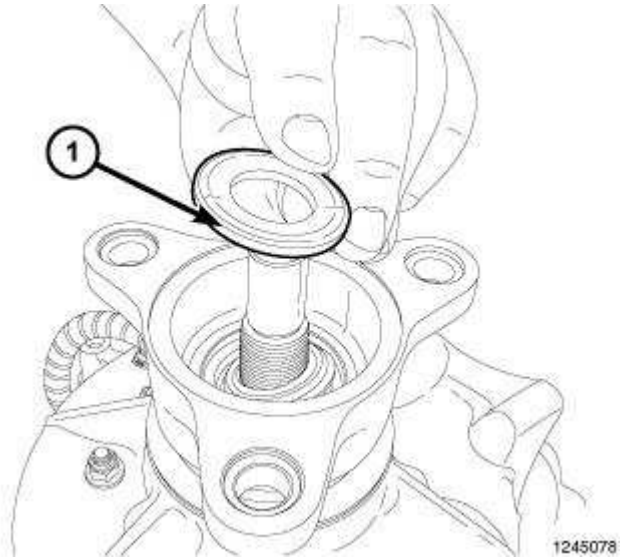

Fig. 153: Rear Output Flange Washer
Courtesy of CHRYSLER GROUP, LLC

10. Install the rear output flange washer (1)
11. Install the rear output flange nut.

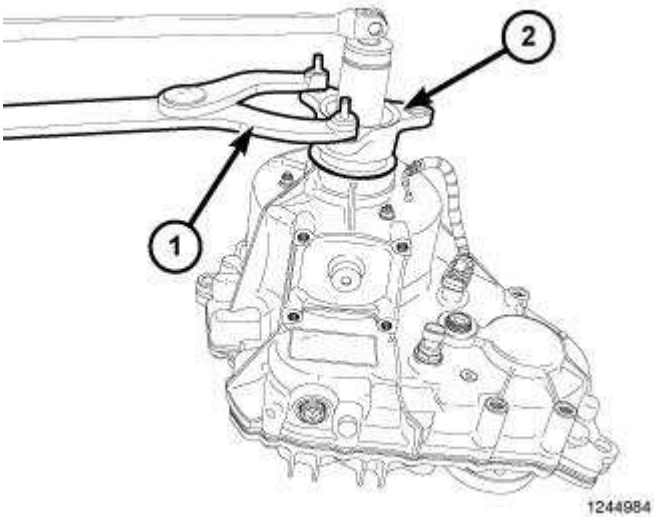

Fig. 154: Holder And Rear Output Flange
Courtesy of CHRYSLER GROUP, LLC

12. Install Holder (special tool #6958, Wrench, Spanner) (1) onto the rear output flange (2).
13. Install the transfer case, and refill it. Refer to **INSTALLATION** & **FLUID, STANDARD PROCEDURE**.

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID CHECK

1. Raise and support vehicle.

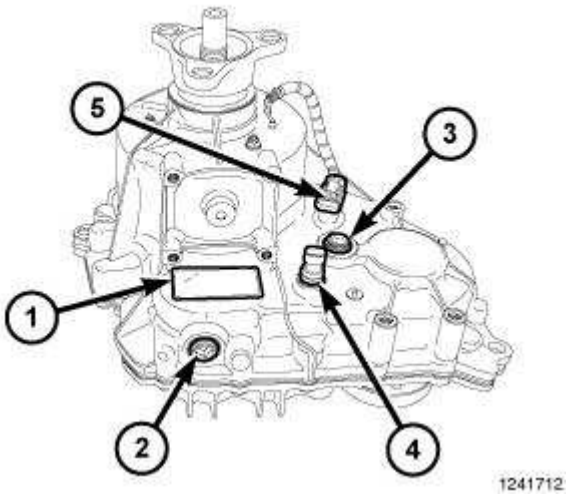

Fig. 155: Transfer Case And Drain Plug
Courtesy of CHRYSLER GROUP, LLC

2. Clean the area around the transfer case plugs (2) and (3).

NOTE: Inspect all the transfer case plug seals and replace as necessary.

3. Remove the transfer case fill plug (3).
4. Remove the transfer case drain plug (2) and allow the transfer case lubricant to drain into a suitable container.
5. When the fluid has stopped draining, install the drain plug (2) and tighten to 23 Nm (17 ft. lbs.).
6. Using the fill hole (3), fill the transfer case with 1.0 L +/- 0.05 L (2.11 pint +/- 0.11 pint) of fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
7. Install the fill plug (3) and tighten to 23 Nm (17 ft. lbs).

PUMP, TRANSMISSION OIL

REMOVAL

REMOVAL

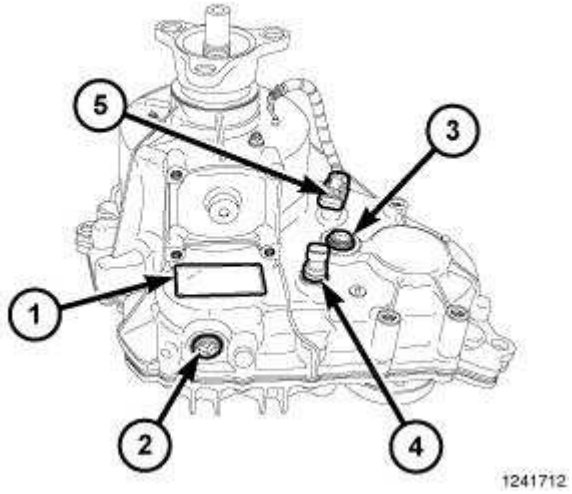

Fig. 156: Transfer Case And Drain Plug
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transfer case. Refer to **REMOVAL**.

   NOTE: The vent hole is near the input shaft hub. If the unit is set on the mounting surface, oil will drain out through the vent.

2. Place the transfer case so that it can be drained of any remaining fluid and remove the drain plug (2).

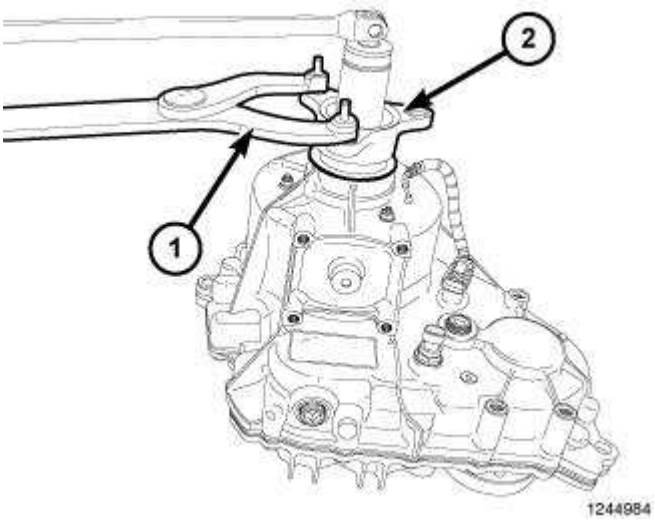

Fig. 157: Holder And Rear Output Flange
Courtesy of CHRYSLER GROUP, LLC

3. Install Holder (special tool #6958, Wrench, Spanner) (1) onto the rear output flange (2).
4. Remove the rear output flange nut.

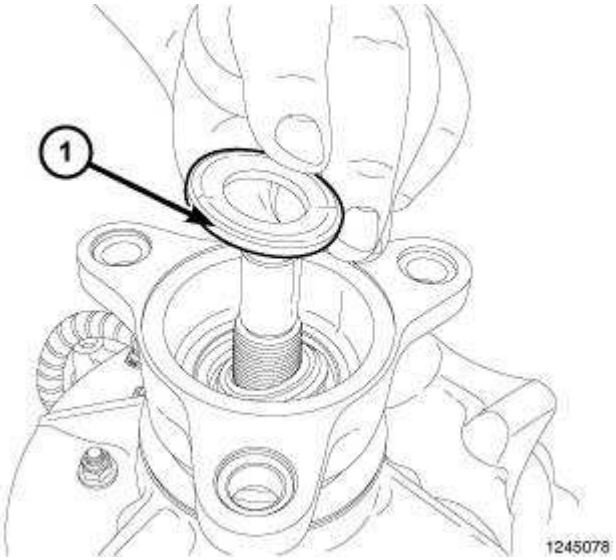

Fig. 158: Rear Output Flange Washer

20. Install the rear output flange nut.
21. Install Holder (special tool #6958, Wrench, Spanner) (1) onto the rear output flange (2). Tighten the rear output flange nut to 319 Nm (235 ft. lbs.).
22. Install the transfer case. Refer to **INSTALLATION**.

ACCESSORIES AND EQUIPMENT

Universal Transmitter - Chrysler 300

DESCRIPTION

DESCRIPTION

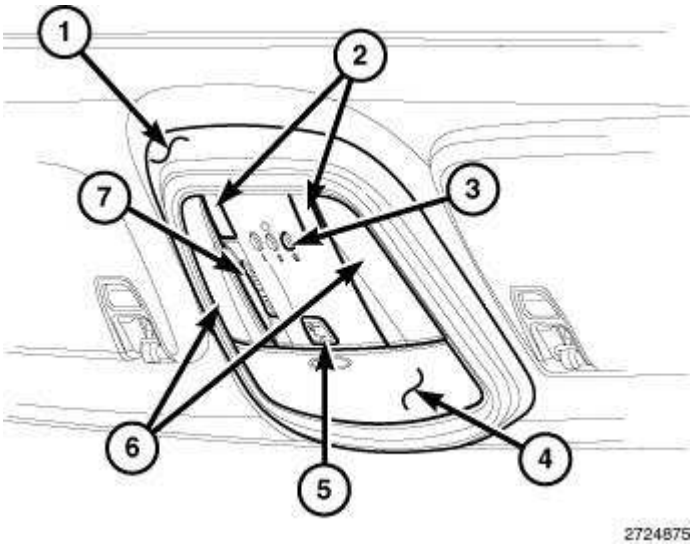

Fig. 1: View Of Overhead Console Transmitter Push Buttons
Courtesy of CHRYSLER GROUP, LLC

The HomeLink® transceiver for this vehicle is located within the overhead console (1). The only visible component of the universal transmitter are the three transmitter push buttons (3) at the front of the overhead console. The buttons are marked with one, two or three illuminated dots, respectively, for identification of each channel.

Each of the three transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 286 to 399 Megahertz (MHz) frequency range for remote operation. The transmitter is capable of operating systems using either rolling code or non-rolling code technology. The system will not transmit operating signals if the Vehicle Theft Security System is armed.

The HomeLink® transceiver cannot be repaired, and is only available for service with the overhead console. If any part of the component is inoperative or damaged, the complete overhead console assembly must be replaced. Refer to **CONSOLE, OVERHEAD, REMOVAL** .

OPERATION

OPERATION

The HomeLink® transceiver operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. For more information on the features, programming procedures and operation of the HomeLink® transceiver, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HOMELINK® TRANSCEIVER

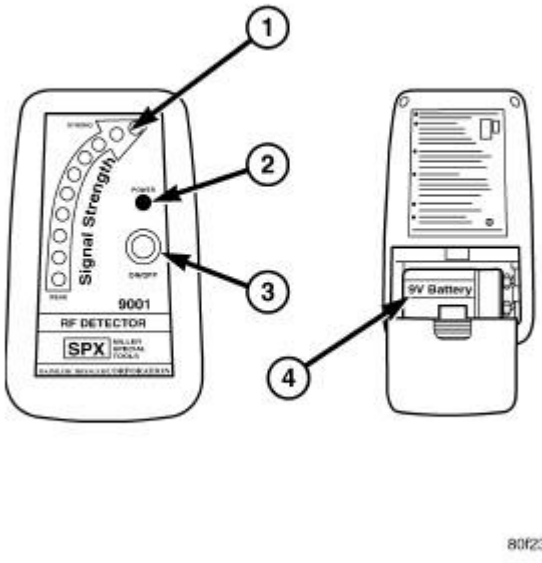

Fig. 2: Identifying Radio Frequency Detector
Courtesy of CHRYSLER GROUP, LLC

If the HomeLink® transceiver is inoperative, retrain the transceiver with a known good transmitter. Refer to **STANDARD PROCEDURE**. Test the universal transmitter operation again. If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool as described below:

1. Turn the Radio Frequency (RF) Detector ON (3). A "chirp" will sound and the green power Light Emitting Diode (LED) will light (2). If the green LED does not light, replace the battery (4).
2. Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.
3. The red signal detection LEDs (1) will light and the tool will beep if a radio signal is detected. Repeat this test for all three transmitter buttons. If the tool does not detect a radio signal for any of the three buttons, replace the inoperative HomeLink® transceiver assembly. The HomeLink® transceiver is only available for service with the overhead console. If any part of the component is inoperative or damaged, the complete overhead console assembly must be replaced.

STANDARD PROCEDURE

ERASING HOMELINK® TRANSCEIVER CODES

NOTE: Individual channels cannot be erased. Erasing the HomeLink® transceiver codes will erase ALL programmed codes.

To erase programming from all three buttons (individual buttons cannot be erased but can be reprogrammed), press and hold the two outer HomeLink® transceiver buttons until the indicator light begins to flash after about 20 seconds. Release both buttons. Do not hold for longer that 30 seconds. HomeLink® is now in the train (or learning) mode and can be programmed at any time beginning with Programming. Refer to **STANDARD PROCEDURE**.

PROGRAMMING HOMELINK® TRANSCEIVER CODES

WARNING: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Your motorized door or gate may open and close while you are training the universal transmitter if the vehicle is in range of the motorized device. Do not train the universal transmitter if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

NOTE: When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the HomeLink® transceiver for quicker training and accurate transmission of the radio-frequency signal.

NOTE: If programing the HomeLink® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.

PROGRAMMING PROCEDURE

1. Press and hold the two outer HomeLink® transceiver buttons, and release only when the indicator light begins to flash (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLink® transceiver buttons.
2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLink® transceiver buttons while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLink® transceiver button that you want to train and the hand-held transmitter button. **Do not release the buttons until step 4 has been completed.**

NOTE: **Some gate operators and garage door openers may require you to replace this Programming Step 3 with procedures noted in the "Gate Operator/Canadian Programming" information.**

4. The HomeLink® transceiver indicator light will flash slowly and then rapidly after HomeLink® successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to rapid flash.
5. Press and hold the just trained HomeLink® transceiver button and observe the indicator light. If the indicator light **stays on constantly, programming is complete** and your device should activate when the button is pressed and released.

NOTE: **To program the remaining two buttons, begin with "Programming" step 2. Do not repeat step 1.**

If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with "Programming" steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: **There are 30 seconds in which to initiate step 8.**

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® transceiver button. Repeat the **"press/hold/release"** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.

   The HomeLink® transceiver should now activate your rolling code equipped device.

NOTE: **To program the remaining two HomeLink® transceiver buttons, begin with "Programming" step 2. Do not repeat step 1.**

CANADIAN PROGRAMMING/GATE PROGRAMMING

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLink® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Programming HomeLink®**

Transceiver Codes" step 3 with the following:

NOTE: **When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.**

3. Continue to press and hold the HomeLink® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. The indicator light will flash slowly and then rapidly. Proceed with "Programming" step 4 to complete.

REPROGRAMMING HOMELINK® TRANSCEIVER CODES

WARNING: **Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Your motorized door or gate may open and close while you are training the HomeLink® transceiver if the vehicle is in range of the motorized device. Do not train the HomeLink® transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.**

NOTE: **If programing the HomeLink® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.**

PROGRAMMING PROCEDURE

To program a device to the HomeLink® transceiver using a button previously trained, follow these steps:

1. Press and hold the desired HomeLink® transceiver button. **DO NOT** release the button. The indicator light will begin to flash after 20 seconds. Without releasing the HomeLink® transceiver button, proceed to step 2.
2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLink® transceiver button while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLink® transceiver button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**

NOTE: **Some gate operators and garage door openers may require you to replace this Reprogramming Step 3 with procedures noted in the "Gate Operator/Canadian Programming" information.**

4. The HomeLink® transceiver indicator light will flash slowly and then rapidly after it successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to the rapid flash.
5. Press and hold the just trained HomeLink® transceiver button and observe the indicator light. If the indicator light **stays on constantly, reprogramming is complete** and your device should activate when the button is pressed and released.

   NOTE: If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with "Reprogramming" steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

   NOTE: There are 30 seconds in which to initiate step 8.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the reprogrammed HomeLink® transceiver button. Repeat the **"press/hold/release"** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the reprogramming.

   The HomeLink® transceiver should now activate your rolling code equipped device.

CANADIAN PROGRAMMING/GATE PROGRAMMING

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLink® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Reprogramming HomeLink® Transceiver Codes" step 3** with the following:

NOTE: When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.

3. Continue to press and hold the HomeLink® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. The indicator light will flash slowly and then rapidly. Proceed with "Programming" step 4 to complete.

CAPACITIES AND RECOMMENDED FLUIDS

DESCRIPTION

LUBRICANT RECOMMENDATIONS

SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate articles in this information for the correct application of these lubricants.

CHASSIS

Component	Fluid, Lubricant, or Genuine Part
Steering Gear AND Linkage, Ball Joints, Prop Shafts AND Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

BODY

Component	Fluid, Lubricant, and Genuine Part
Hinges:	
Door AND Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator AND Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

FLUID TYPES

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

LUBRICANTS BEARING DESIGNATIONS

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API). Refer to**Fig. 1**.
- National Lubricating Grease Institute (NLGI)

- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

9400-9

Fig. 1: Identifying American Petroleum Institute Certified Symbol
Courtesy of CHRYSLER GROUP, LLC

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

DESCRIPTION

ASSOCIATION DES CONSTRUCTEURS EUROP E ENS D' AUTOMOBILES (EUROPEAN AUTOMOBILE MANUFACTURERS ASSOCIATION) (ACEA)

For countries that use the ACEA european oil categories for service fill oils, use engine oils with the appropriate viscosity based on local ambient temperatures that meet the requirements of ACEA C3 and that are approved to MB 229.31 or MB 229.51.

AUTOMATIC TRANSMISSION FLUID

8HP45 TRANSMISSIONS

CAUTION: A unique transmission fluid has been developed for the 8HP45 transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid

see FLUIDS, LUBRICANTS AND GENUINE PARTS. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS.

NOTE: Refer to FLUIDS, LUBRICANTS AND GENUINE PARTS Service Procedures for fluid level checking procedures.

P/N 68157995AA Automatic Transmission Fluid is the recommended fluid for the **8HP45** Chrysler automatic transmissions.

FLUID ADDITIVES - WITH 8HP45

Chrysler strongly recommends against the addition of any fluids to the 8HP45 transmission other than the automatic transmission fluid listed above. **Special dyes MUST NOT BE USED in the 8HP45 transmission** .

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of Chrysler and **these additives must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

AUTOMATIC TRANSMISSIONS - WITHOUT 8HP45

NOTE: Refer to FLUIDS, LUBRICANTS AND GENUINE PARTS for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for Chrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

FLUID ADDITIVES - WITHOUT 8HP45

Chrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating,

oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of Chrysler and **these additives must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

ENGINE OIL

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

LUBRICANTS BEARING DESIGNATIONS

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Europ e ens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

9400-9

Fig. 2: Identifying American Petroleum Institute Certified Symbol

Courtesy of CHRYSLER GROUP, LLC

Use an engine oil that is API Certified. Mopar® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

SAE VISCOSITY

Vehicles with 5.7L engines equipped with Multiple Displacement System (MDS) must use SAE 5W-20 oil. Failure to do so may result in improper operation of the Multiple Displacement System (MDS). Refer to Multi Displacement System under Starting and Operating. Refer to owners manual for details. Refer to the engine oil filler cap for the recommend engine oil viscosity for each vehicle. An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-20 or 5W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range.

NOTE: **6.4L engines. For best performance and maximum protection under all types of operating conditions, the manufacturer only recommends full synthetic engine oils SAE 0W-40 that meet the American Petroleum Institute (API) categories of SM or SM/CF. meeting the requirements of Chrysler Group LLC Material Standard MS-10725.**

ACEA CATEGORIES

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

9400-9

Fig. 3: Identifying American Petroleum Institute Certified Symbol
Courtesy of CHRYSLER GROUP, LLC

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). Chrysler only recommend API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar® or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

9400-9

Fig. 4: Identifying American Petroleum Institute Certified Symbol

Courtesy of CHRYSLER GROUP, LLC

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80, 000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

ENGINE OIL - DIESEL ENGINES

> **WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.**

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

LUBRICANTS BEARING DESIGNATIONS

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)

- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Europ e ens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY GRADE

An SAE engine oil that conforms to ACEA A3/B4/C3 that is approved to MB 229.31 is recommended for all operating temperatures. This engine oil is a low ash product that improves low temperature starting and vehicle fuel economy.

DISPOSING OF USED ENGINE OIL

Care should be taken in disposing of the used engine oil from your vehicle. Used oil, indiscriminately discarded, can present a problem to the environment. Contact your local authorized dealer, service station, or governmental agency for advice on how and where used oil can be safely discarded in your area.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80, 000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

ENGINE COOLANT

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting.

If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35° F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100, 000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT) may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic. The increased temperature can result in sever engine damage. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against

freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

TRANSFER CASE

Recommended lubricant for the BW 44-40 transfer case is MOPAR ® (P/N 68049954AA) BW 44-40 Transfer Case Lubricant.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

BRAKE FLUID - EXPORT

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. If DOT 3 brake fluid is not available, brake fluid conforming to DOT 4 specifications may be used in its place. The fluids are compatible, but DOT 4 usage may require additional fluid maintenance. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle

brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

POWER STEERING FLUID

NON SRT VEHICLES

Non-SRT vehicles are equipped with Electro Hydraulic Power Steering (EHPS) systems and require power steering fluid which meets material specification MS-11655 or equivalent.

SRT VEHICLES

The recommended fluid for the power steering system for SRT vehicles is Mopar® Power Steering fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid. Both fluids have the same material standard specifications (MS-9602).

Mopar® ATF+4 (and Mopar® Power Steering fluid + 4), when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

DIESEL FUEL

Diesel fuels are available from most reputable fuel marketers. Fuel with a calculated Cetane Index of 45 or higher must be used. See your authorized dealer or distributor for further information regarding fuels availability.

In areas where diesel fuel is below the recommended quality levels (high levels of sulfur and water) it is critical to monitor the fuel filter for contamination and the "Water-In-Fuel" message in the Electronic Vehicle Information Center (EVIC). Failure to properly service the fuel system for these items can significantly reduce engine life and lead to major engine repair. More frequent service intervals of the fuel filter/water separator unit may be required under these conditions than those shown in "Maintenance Schedule A or B."

A/C REFRIGERANT

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a nontoxic, nonflammable, clear and colorless liquefied gas.

CAUTION: R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure.

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected. Refer to **DIAGNOSIS AND TESTING** .

OPERATION

OPERATION

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

SPECIFICATIONS

FLUIDS, LUBRICANTS AND GENUINE PARTS

ENGINE

Description	Type	Part Number	Capacities	
			U.S.	Metric
Cooling System				
? Engine Coolant (3.0L Diesel Engines) (1)	MOPAR® Antifreeze/Coolant 5 Year/100, 000 Mile Formula HOAT (Hybrid Organic Additive Technology)	1 Gallon - 05066386AA	12.7 Quarts	12 Liters
? Engine Coolant (3.6L Engine) (1)	MOPAR® Antifreeze/Coolant 5 Year/100, 000 Mile Formula HOAT (Hybrid Organic Additive Technology)	1 Gallon - 5066 386AA	10 Quarts	9.5 Liters
? Engine Coolant (5.7L Engine)	MOPAR® Antifreeze/Coolant 5 Year/100, 000 Mile Formula HOAT (Hybrid Organic Additive Technology)	1 Gallon - 5066 386AA	14.7 Quarts	13.9 Liters
? Engine Coolant (6.4L Engine)(1)	MOPAR® Antifreeze/Coolant 5 Year/100, 000 Mile Formula HOAT (Hybrid Organic Additive Technology)	1 Gallon - 5066 386AA	14.5 Quarts	13.7 Liters
Engine Oil with Filter				
Engine Oil (3.0L Diesel Engine)	MOBIL 1® SAE 5W-30 Low Ash Fully Synthetic oil, meeting the requirements of ACEA C3	1 Quart - 05166241AA	9.7 Quarts	9.2 Liters
Engine Oil (3.6L Engines)	MOPAR® API Certified SAE 5W-30 engine oil, meeting the requirements of Chrysler Group LLC Material Standard MS-6395.	1 Quart - 4761 838AB 1 Gallon- 4761 844AB	6 Quarts	5.6 Liters

Engine Oil (5.7L Engines)	MOPAR® API Certified SAE 5W-20 engine oil, meeting the requirements of Chrysler Group LLC Material Standard MS-6395.	1 Quart - 4761 872MA 1 Gallon - 4761 851AF	7 Quarts	6.6 Liters
Engine Oil (6.4L Engine)	MOPAR® API Certified SAE Full Synthetic engine oil 0W-40, meeting the requirements of Chrysler Group LLC Material Standard MS-10725.	1 Quart - 05037645AB	7 Quarts	6.6 Liters
Engine Oil Filter (3.0L Diesel Engine)	MOPAR® Engine Oil Filter Kit	68109834AA	N/A	N/A
Engine Oil Filter (3.6L Engines)	MOPAR® Engine Oil Filter	68079 744AA	N/A	N/A
Engine Oil Filter (5.7L and 6.4L Engines)	MOPAR® Engine Oil Filter	4884 899AB	N/A	N/A
Fuel (approximate)				
Fuel Selection (3.0L Diesel Engine)	Use good quality diesel fuel from a reputable supplier in your vehicle. The manufacturer requires that you must fuel this vehicle with Ultra Low Sulfur Highway Diesel fuel (15 ppm Sulfur maximum) and prohibits the use of Low Sulfur Highway Diesel fuel (500 ppm Sulfur maximum) to avoid damage to the emissions control system. For most year-round service, No. 2 diesel fuel meeting ASTM specification D-975 Grade S15 will provide good performance. If the vehicle is exposed to extreme cold (below 20F or -7C), or is required to operate at colder-than-normal conditions for prolonged periods, use climatized No. 2 diesel fuel or dilute the No. 2 diesel fuel with 50% No. 1 diesel fuel. This will provide better protection from fuel gelling or wax-plugging of the fuel filters. This vehicle is fully compatible with biodiesel blends up to 5% biodiesel meeting ASTM specification D-975.	N/A	19 Gallons	72 Liters
Fuel Selection (3.6L Engine)	87 Octane Acceptable - 89 Octane Recommended	N/A	19 Gallons	72 Liters
Fuel Selection (5.7L Engine)	87 Octane Acceptable - 89 Octane Recommended	N/A	19 Gallons	72 Liters
Fuel Selection (6.4L Engine)	91 Octane Only or higher	N/A	19 Gallons	72 Liters

A/C Refrigerant System				
A/C Refrigerant System	R-134a	82300101AB	1.56 Pounds	709 Grams

(1) ? System fill capacity includes heater and coolant recovery bottle filled to MAX level.

CAUTION:

Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.

SPARK PLUGS

	MS-11655			

(1) ? Limited-Slip Rear Axles require the addition of 118 ml (4 oz.) MOPAR® Limited Slip Additive.

(2) ?? If MOPAR® Brake Fluid DOT 3 is not available, then MOPAR® Brake and Clutch Fluid DOT 4 (P/N 04549625AC), is acceptable

.

(3) ??? If MOPAR® Power Steering Fluid +4 is not available, then MOPAR® ATF +4 Automatic Transmission Fluid (P/N 05166226AA), is acceptable.

(4) ????

CAUTION:

There is an Electro Hydraulic Power Steering (EHPS) pump on Non-SRT vehicles which requires a different power steering fluid. Do not mix power steering fluid types. Damage may result to the power steering pump and system if any other fluid is used. The EHPS system uses fluid which meets material specification MS-11655 or equivalent. The mechanical power steering pump systems on SRT vehicles require the use of Power Steering Fluid +4, which meets material specification MS-9602 or equivalent. Do not overfill.

CAUTION:

Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.

FUSE LOCATIONS AND TYPES

SPECIFICATIONS

SPECIFICATIONS

FRONT POWER DISTRIBUTION CENTER FUSES

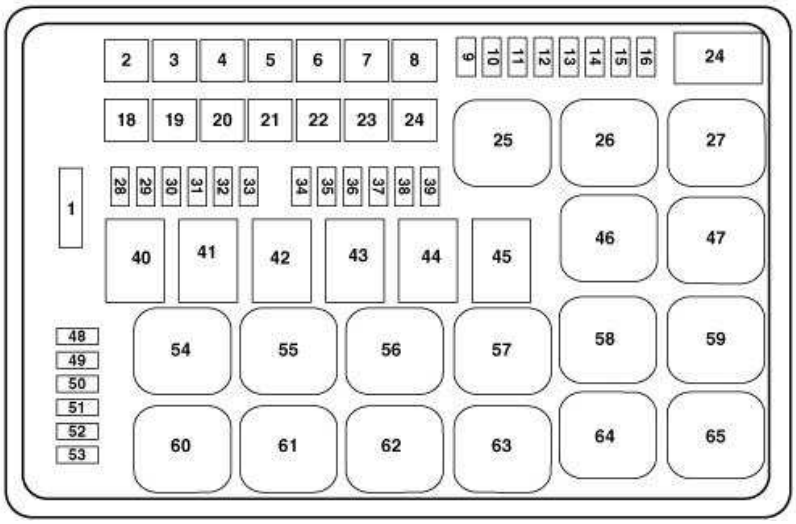

Fig. 5: Integrated Power Module (IPM)
Courtesy of CHRYSLER GROUP, LLC

The Integrated Power Module (IPM) is located in the engine compartment. This module contains fuses and relays.

CAUTION:

- **When installing the Power Distribution Center cover, it is important to ensure the cover is properly positioned and fully latched. Failure to do so may allow water to get into the Power Distribution Center, and possibly result in an electrical system failure.**
- **When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.**

HOISTING

STANDARD PROCEDURE

STANDARD PROCEDURE - HOISTING

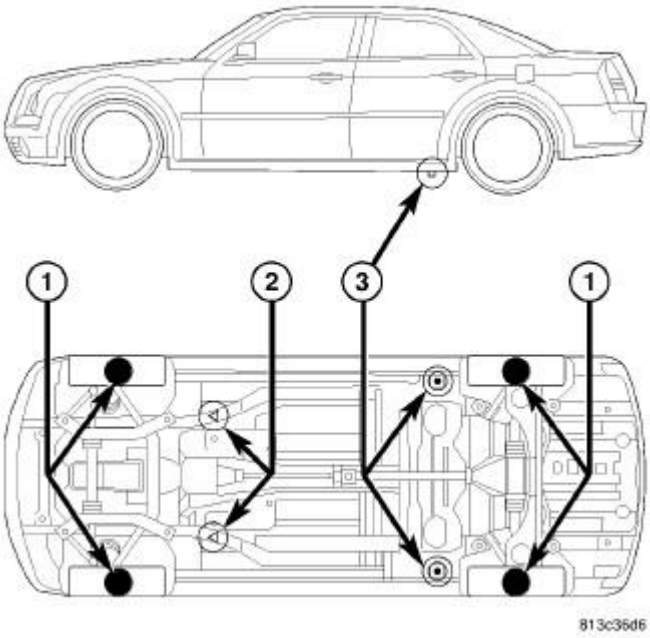

Fig. 7: Lifting Points
Courtesy of CHRYSLER GROUP, LLC

1 - DRIVE ON LIFT
2 - SAE HOISTING SYMBOLS
2 - FRAME CONTACT LIFT (SINGLE POST)
2 - CHASSIS LIFT (DUAL LIFT)
2 - OUTBOARD LIFT (DUAL LIFT)
2 - FLOOR JACK
3 - HOISTING PADS
3 - FRAME CONTACT LIFT (SINGLE POST)
3 - CHASSIS LIFT (DUAL LIFT)
3 - OUTBOARD LIFT (DUAL LIFT)
3 - FLOOR JACK

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Do not position hoisting device on any suspension component, including the front or rear suspension crossmembers. Do not hoist on the front and

rear bumpers, the lower radiator crossmember, or the front engine mount.

Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in permanent damage to the body.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands.

A floor jack or any lifting device must never be used on any part of the underbody other than the described areas.

JUMP STARTING

STANDARD PROCEDURE

STANDARD PROCEDURE - JUMP STARTING

WARNING: Review all safety precautions and warnings in the battery system service information. Refer to BATTERY, STANDARD PROCEDURE .

- **Take care to avoid the radiator cooling fan whenever the hood is raised. It can start anytime the ignition switch is ON. You can be hurt by the fan.**
- **Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transmission cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow this procedure carefully.**
- **Battery fluid is a corrosive acid solution; do not allow battery fluid to contact eyes, skin, or clothing. Don't lean over battery when attaching clamps or allow the clamps to touch each other. If acid splashes in eyes or on skin, flush contaminated area immediately with large quantities of water.**
- **A battery generates hydrogen gas, which is flammable and explosive. Keep flame or spark away from the vent holes.**
- **Do not use a booster battery or any other booster source with an output that exceeds 12 Volts.**
- **The battery in this vehicle has a vent hose that should not be disconnected and should only be replaced with a battery of the same type (vented).**

Failure to follow these instructions may result in serious or fatal injury.

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

NOTE: The battery is stored under an access cover in the trunk. Remote battery terminals are located in the engine compartment for jump starting.

TO JUMP START A DISABLED VEHICLE:

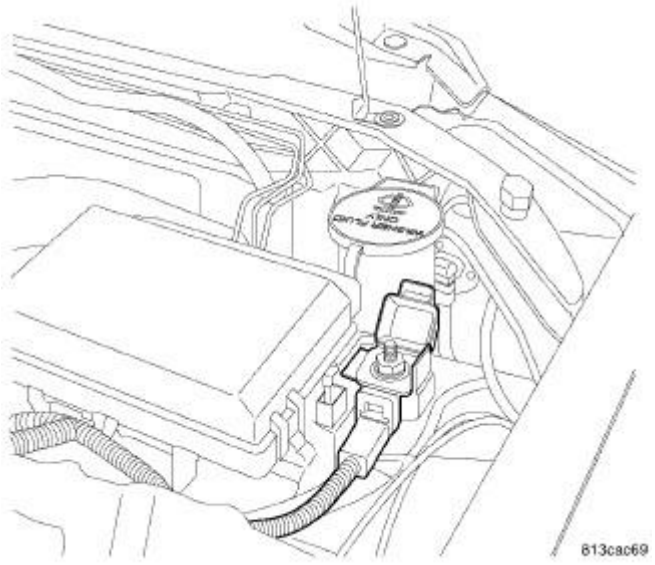

Fig. 8: Positive Jumper Start Attachment
Courtesy of CHRYSLER GROUP, LLC

1. Wear eye protection and remove any metal jewelry, such as watchbands or bracelets, that might make an inadvertent electrical contact.
2. When boost is provided by a battery in another vehicle, park that vehicle within booster cable reach, but do not allow the vehicles to touch one another.
3. Set the parking brake, place the automatic transmission in PARK, and turn the ignition switch to the LOCK position on both vehicles.
4. Turn off the heater, radio, and all unnecessary electrical loads.
5. Connect one end of the jumper cable to the remote jump-start positive battery post (+) in the engine compartment. Connect the other end of the same cable to the positive terminal of the booster battery. Refer to the following illustration for jump-starting connections.
6. Connect the other cable, first to the negative terminal of the booster battery and then to the engine ground (-) of the vehicle with the discharged battery. Make sure you have a good contact on the engine ground. Refer to the following illustration for jump-starting connections.
7. Start the engine in the vehicle that has the booster battery. Let the engine idle a few minutes. Then, start the engine in the vehicle with the discharged battery.

NOTE: if the ESP/BAS light (in the instrument cluster) remains on continuously

after starting the engine of the vehicle with the discharged battery. Refer to STANDARD PROCEDURE .

8. When removing the jumper cables, reverse the above sequence exactly. Be careful of the moving belts and fan.

WARNING:

- **You should not try to start your vehicle by pushing or towing.**
- **Do not connect the cable to the negative post of the discharged battery. The resulting electrical spark could cause the battery to explode.**
- **During cold weather when temperatures are below the freezing point, electrolyte in a discharged battery may freeze. Do not attempt jump-starting because the battery could rupture or explode. The battery temperature must be brought above the freezing point before attempting jump-start.**
- **Failure to follow these instructions may result in serious or fatal injury.**

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULES - NAFTA

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, "Change Oil" will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions, the oil change indicator message will illuminate. This means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicle's oil if it has been six months since your last oil change, even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 8, 000 miles (13, 000 km) or six months, whichever comes first.**

OIL CHANGE INDICATOR- RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.**

At Each Stop for Fuel

- Check the engine oil level.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering, and transmission, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.

- Inspect the brake hoses and lines.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

REQUIRED MAINTENANCE INTERVALS

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	**Kilometers**	**Months**	
8000	13000	6	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 8, 000 miles (13 000 km).
16000	26000	12	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 16, 000 miles (26 000 km). • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary. • Inspect exhaust system. Perform the first inspection at 16, 000 miles (26 000 km) or 12 months. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
24000	39000	18	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 24, 000 miles (39 000 km). • Inspect the CV joints. • Inspect exhaust system. • Inspect the rear axle fluid. Inspect the front axle fluid - All Wheel Drive (AWD).
32000	52000	24	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of

			irregular wear, even if it occurs before 32, 000 miles (52 000 km). • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Replace the spark plugs (5.7L Engine). • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the brake linings, replace if necessary. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Inspect the transfer case fluid - All Wheel Drive (AWD).
40000	65000	30	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 40, 000 miles (65 000 km).
48000	78000	36	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 48, 000 miles (78 000 km). • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the rear axle fluid and on models equipped with All Wheel Drive (AWD) change the front axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing.
56000	91000	42	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 56, 000

			miles (91 000 km).
64000	104000	48	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 64, 000 miles (104 000 km). • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Replace the spark plugs (5.7L Engine). • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Change the automatic transmission fluid and filter if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing (five-speed transmission only). • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing - All Wheel Drive (AWD).
72000	117000	54	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 72, 000 miles (117 000 km). • Inspect the CV joints. • Inspect exhaust system. • Inspect the rear axle fluid. Inspect the front axle fluid - All Wheel Drive (AWD).
80000	130000	60	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 80, 000 miles (130 000 km). • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Flush and replace the engine coolant if not done at 104, 000 miles (169 000 km).

			• Inspect the brake linings, replace if necessary. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
88000	143000	66	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 88, 000 miles (143 000 km).
96000	156000	72	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 96, 000 miles (156 000 km). • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Replace the spark plugs (3.6L Engine). • Replace the spark plugs (5.7L Engine). • Inspect and replace PCV valve if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the brake linings, replace if necessary. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the rear axle fluid and on models equipped with All Wheel Drive (AWD) change the front axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the transfer case fluid - All Wheel Drive (AWD).
104000	169000	78	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 104, 000 miles (169 000 km). • Flush and replace engine coolant at 104, 000 miles (169, 00 km) or 60 months (whichever occurs first).

112000	182000	84	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 112, 000 miles (182 000 km). • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
120000	195000	90	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 120, 000 miles (195 000 km). • Inspect the CV joints. • Inspect exhaust system. • Change the automatic transmission fluid and filter (five-speed transmission only). • Replace the accessory drive belt(s). • Inspect the rear axle fluid. Inspect the front axle fluid - All Wheel Drive (AWD).
128000	208000	96	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 128, 000 miles (208 000 km). • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Replace the spark plugs (5.7L Engine). • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the brake linings, replace if necessary. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing - All Wheel Drive

			(AWD).
136000	221000	102	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 136, 000 miles (221 000 km).
144000	234000	108	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 144, 000 miles (234 000 km). • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the rear axle fluid and on models equipped with All Wheel Drive (AWD) change the front axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing.
152000	247000	114	• Change the engine oil and engine oil filter. • Rotate the tires, rotate at the first sign of irregular wear, even if it occurs before 152, 000 miles (247 000 km).

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, "Change Oil" will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km). However, an earlier oil change at 3, 000 miles (5 000 km) may be required if the vehicle is operated under "Severe Duty Conditions" later in this information.

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicle's oil if it has been six months since your last oil change, even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 6, 000 miles (10 000 km) or six months, whichever comes first.**

OIL CHANGE INDICATOR- RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.

3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

At Each Stop for Fuel

- Check the engine oil level.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering, and transmission, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

REQUIRED MAINTENANCE INTERVALS

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	**Kilometers**	**Months**	
6000	10000	6	• Change the engine oil and engine oil filter. • Rotate tires.
12000	20000	12	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary.

			• Inspect the CV joints. Perform the first inspection at 12, 000 miles (20 000 km) or 12 months. • Inspect the exhaust system. Perform the first inspection at 12, 000 miles (20 000 km) or 12 months. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
18000	30000	18	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the rear axle fluid.
24000	40000	24	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
30000	50000	30	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Adjust parking brake on vehicles equipped with four-wheel disc brakes.
36000	60000	36	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary.

			• Inspect the CV joints. • Inspect the exhaust system. • Inspect the rear axle fluid. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
42000	70000	42	• Change the engine oil and engine oil filter. • Rotate tires.
48000	80000	48	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing.
54000	90000	54	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the rear axle fluid.
60000	100000	60	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the CV joints. • Inspect the exhaust system.

			• Change the automatic transmission fluid and filter if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing. • Flush and replace the engine coolant at 60 months if not done at 102, 000 miles (170 000 km). • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
66000	110000	66	• Change the engine oil and engine oil filter. • Rotate tires.
72000	120000	72	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the rear axle fluid. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
78000	130000	78	• Change the engine oil and engine oil filter. • Rotate tires.
84000	140000	84	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system.

			• Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
90000	150000	90	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Inspect and replace the PCV Valve if necessary. • Inspect the rear axle fluid. • Adjust parking brake on vehicles equipped with four-wheel disc brakes.
96000	160000	96	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the spark plugs. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing.
102000	170000	102	• Change the engine oil and engine oil filter. • Rotate tires. • Flush and replace the engine coolant if not done at 60 months.
108000	180000	108	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter.

			• Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the rear axle fluid. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
114000	190000	114	• Change the engine oil and engine oil filter. • Rotate tires.
120000	200000	120	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the automatic transmission fluid and filter.
126000	210000	126	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the rear axle fluid.
132000	220000	132	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints.

			• Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary.
138000	230000	138	• Change the engine oil and engine oil filter. • Rotate tires.
144000	240000	144	• Change the engine oil and engine oil filter. • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system. • Inspect the front suspension, tie rod ends and boot seals for cracks or leaks and all parts for damage, wear, improper looseness or end play; replace if necessary. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing.
150000	250000	150	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Adjust parking brake on vehicles equipped with four-wheel disc brakes.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

MAINTENANCE SCHEDULES - EUROPE

MAINTENANCE SCHEDULE - GASOLINE ENGINE

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, "Change Oil" will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km). However, an earlier oil change at 3, 000 miles (5, 000 km) may be required if the vehicle is operated under "Severe Duty Conditions" later in this information.

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 6 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The Oil Change Due message will display in the EVIC for five seconds after a single chime has sounded at the start of each ignition that an oil change is due. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon personal driving style.

Unless reset, this message will continue to display each time you cycle the ignition to the ON/RUN position. To turn off the message temporarily, press and release the MENU button. To reset the oil change indicator system (after performing the scheduled maintenance), perform the following procedure:

1. Without pressing the brake pedal, push the ENGINE START/STOP button and cycle the ignition to the ON/ RUN position (Do not start the engine.)
2. Fully depress the accelerator pedal, slowly, three times within 10 seconds.
3. Without pressing the brake pedal, push the ENGINE START/STOP button once to return the ignition to the OFF/LOCK position.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change**

indicator system did not reset. If necessary, repeat this procedure.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, power steering and transmission (4.7L and 5.7L only) and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

CAUTION:

- **Failure to perform the required maintenance items may result in damage to the vehicle.**

REQUIRED MAINTENANCE INTERVALS

SEVERE DUTY CONDITIONS

() ++ Change the engine oil and engine oil filter at every 3, 000 miles (5 000 km) or 3 months if using your vehicle under any of the following severe duty conditions:

- Stop and go driving.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	Kilometers	Months	

7500	12000	6	• Change the engine oil and engine oil filter.++() • Rotate tires.
15000	24000	12	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Inspect the CV joints. Perform the first inspection at 15, 000 miles (24 000 km) or 12 months. • Inspect exhaust system. Perform the first inspection at 15, 000 miles (24 000 km) or 12 months. • Inspect the rear axle fluid.
22500	36000	18	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
30000	48000	24	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • **Replace the spark plugs (5.7L Engine).** • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.
37500	60000	30	• Change the engine oil and engine oil filter.++ () • Rotate tires.
45000	72000	36	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary.

			• Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
52500	84000	42	• Change the engine oil and engine oil filter.++ () • Rotate tires.
60000	96000	48	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • **Replace the spark plugs (5.7L Engine).** • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Change the automatic transmission fluid and filter if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.
67500	108000	54	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
75000	120000	60	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Inspect the rear axle fluid.

			• Flush and replace the engine coolant at 60 months if not done at 105, 000 miles (168 000 km).
82500	132000	66	• Change the engine oil and engine oil filter.++ () • Rotate tires.
90000	144000	72	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • **Replace the spark plugs (5.7L Engine).** • **Inspect and replace PCV valve if necessary. +()** • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
97500	156000	78	• Change the engine oil and engine oil filter.++ () • Rotate tires.
105000	168000	84	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • **Replace the spark plugs (2.7L and 3.5L Engines).** • **Replace the timing belt (3.5L Engine).** • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Inspect the rear axle fluid. • Flush and replace the engine coolant.
112500	180000	90	• Change the engine oil and engine oil filter.++ () • Rotate tires.

			• Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
120000	192000	96	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • **Replace the spark plugs (5.7L Engine).** • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Change the automatic transmission fluid and filter. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid. • Replace the accessory drive belt(s) (2.7L, 3.5L, and 5.7L Engines).
127500	204000	102	• Change the engine oil and engine oil filter.++ () • Rotate tires.
135000	216000	108	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
142500	228000	114	• Change the engine oil and engine oil filter.++ () • Rotate tires.
150000	240000	120	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter.

			• **Replace the spark plugs (5.7L Engine).** • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.

() + This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

WARNING:

- **Failure to properly inspect and maintain the vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident and may result in possible serious or fatal injury.**

MAINTENANCE SCHEDULE - DIESEL ENGINE

To help have the best driving experience possible, the manufacturer has identified the specific vehicle maintenance service intervals that are required to keep the vehicle operating properly and safely.

The manufacturer recommends that these maintenance intervals be performed at your selling dealer. The technicians at your dealership know your vehicle best, and have access to factory trained information, genuine MOPAR® parts, and specially designed electronic and mechanical tools that can help prevent future costly repairs.

The maintenance intervals shown should be performed as indicated in this information.

NOTE: Under no circumstances should oil change intervals exceed 12, 500 miles (20 000 km) or 12 months, whichever comes first.

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message will flash in the EVIC display for approximately 10 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message will continue to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position (Do not start the engine).

2. Fully depress the accelerator pedal and keep it fully pressed for at least 30 seconds.
3. Press and release the brake pedal six times while holding the accelerator pedal pressed.

At Each Stop for Fuel

- Check the engine oil level about 15 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and power steering and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Inspect for the presence of water in the fuel filter/water separator unit.

CAUTION:

- **Failure to perform the required maintenance items may result in damage to the vehicle.**

Refer to the Maintenance Schedules on the following pages for the required maintenance intervals.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			**Maintenance Items**
Miles	**Kilometers**	**Months**	
6250	10000	6	• Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.
12500	20000	12	• Change the engine oil and engine oil filter. • Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.

			• Replace the air conditioning filter. • Inspect the brake linings, replace if necessary. • Inspect exhaust system. Perform the first inspection at 12, 500 miles (20 000 km) or 12 months. • Inspect the CV joints. Perform the first inspection at 12, 500 miles (20 000 km) or 12 months.
18750	30000	18	• Rotate tires. • Replace engine air cleaner filter.
25000	40000	24	• Change the engine oil and engine oil filter. • Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Replace the fuel filter/water separator unit. • Inspect the front suspension, tie rod ends and boot seals, replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect exhaust system. • Inspect the CV joints. • Adjust the parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid. Change if using your vehicle for police, taxi, fleet, or frequent trailer towing.
31250	50000	30	• Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.
37500	60000	36	• Change the engine oil and engine oil filter. • Rotate tires. • Replace engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary.
43750	70000	42	• Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter,

			and replace if necessary.
50000	80000	48	• Change the engine oil and engine oil filter. • Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Replace the fuel filter/water separator unit. • Inspect the front suspension, tie rod ends and boot seals, replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect exhaust system. • Inspect the CV joints. • Inspect the transfer case fluid. • Adjust the parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid. Change if using your vehicle for police, taxi, fleet, or frequent trailer towing.
56250	90000	54	• Rotate tires. • Replace engine air cleaner filter.
62500	100000	60	• Change the engine oil and engine oil filter. • Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary. • Change the automatic transmission fluid and filter if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing.
68750	110000	66	• Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.
75000	120000	72	• Change the engine oil and engine oil filter. • Rotate tires. • Replace engine air cleaner filter.

			• Replace the air conditioning filter. • Replace the fuel filter/water separator unit. • Inspect the front suspension, tie rod ends and boot seals, replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect exhaust system. • Inspect the CV joints. • Adjust the parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid. Change if using your vehicle for police, taxi, fleet, or frequent trailer towing.
81250	130000	78	• Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.
87500	140000	84	• Change the engine oil and engine oil filter. • Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, replace if necessary.
93750	150000	90	• Rotate tires. • Replace engine air cleaner filter.
100000	160000	96	• Change the engine oil and engine oil filter. • Rotate tires. • If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Replace the fuel filter/water separator unit. • Inspect the front suspension, tie rod ends and boot seals, replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect exhaust system. • Inspect the CV joints. • Change the automatic transmission fluid and filter.

			• Flush and replace the engine coolant (antifreeze). • Replace accessory drive belt(s). • Adjust the parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid. Change if using your vehicle for police, taxi, fleet, or frequent trailer towing.

WARNING:

- **Failure to properly inspect and maintain the vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident and may result in possible serious or fatal injury.**

MAINTENANCE SCHEDULES - MIDDLE EAST

MAINTENANCE SCHEDULE - GASOLINE ENGINE

The Scheduled Maintenance services listed in this information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km). However, an earlier oil change at 3, 000 miles (5 000 km) may be required if the vehicle is operated under "Severe Duty Conditions" later in this information.

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 6 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message will flash in the EVIC display for approximately 10 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message will continue to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position (Do not start the engine).
2. Fully depress the accelerator pedal slowly three times within 10 seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary repeat this procedure.**

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, power steering and transmission (4.7L and 5.7L only) and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

CAUTION:

- **Failure to perform the required maintenance items may result in damage to the vehicle.**

REQUIRED MAINTENANCE INTERVALS

SEVERE DUTY CONDITIONS

() ++ Change the engine oil and engine oil filter at every 3, 000 miles (5 000 km) or 3 months if using your vehicle under any of the following severe duty conditions:

- Stop and go driving.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	Kilometers	Months	
7500	12000	6	• Change the engine oil and engine oil filter.++ () • Rotate tires.
15000	24000	12	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Inspect exhaust system. Perform the first inspection at 15, 000 miles (24 000 km) or 12 months.
22500	36000	18	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the rear axle fluid.
30000	48000	24	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • Replace the spark plugs (5.7L Engine). • Replace the air conditioning filter (if equipped)

			• Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes.
37500	60000	30	• Change the engine oil and engine oil filter.++ () • Rotate tires.

142500	228000	114	• Change the engine oil and engine oil filter.++ () • Rotate tires.
150000	240000	120	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • Replace the spark plugs (5.7L Engine). • Replace the air conditioning filter (if equipped) • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes.

() + This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

WARNING:

- **Failure to properly inspect and maintain the vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident and may result in possible serious or fatal injury.**

MAINTENANCE SCHEDULES - MIDDLE EAST - SRT8

MAINTENANCE SCHEDULE - GASOLINE ENGINE - SRT8

The Scheduled Maintenance services listed in this information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km). However, an earlier oil change at 3, 000 miles (5 000 km) may be required if the vehicle is operated under "Severe Duty Conditions" later in this information.

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT**

illuminated.

- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 6 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message will flash in the EVIC display for approximately 10 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message will continue to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position (Do not start the engine).
2. Fully depress the accelerator pedal slowly three times within 10 seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary repeat this procedure.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, power steering and transmission (4.7L and 5.7L only) and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

CAUTION:

- **Failure to perform the required maintenance items may result in damage to the vehicle.**

REQUIRED MAINTENANCE INTERVALS

SEVERE DUTY CONDITIONS

() ++ Change the engine oil and engine oil filter at every 3, 000 miles (5 000 km) or 3 months if using your vehicle under any of the following severe duty conditions:

- Stop and go driving.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	**Kilometers**	**Months**	
7500	12000	6	• Change the engine oil and engine oil filter.++ () • Rotate tires.
15000	24000	12	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Inspect the CV joints. Perform the first inspection at 15, 000 miles (24 000 km) or 12 months. • Inspect exhaust system. Perform the first inspection at 15, 000 miles (24 000 km) or 12 months. • Inspect the rear axle fluid.
22500	36000	18	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Inspect the CV joints.

			• Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
30000	48000	24	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.
37500	60000	30	• Change the engine oil and engine oil filter.++ () • Rotate tires.
45000	72000	36	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
52500	84000	42	• Change the engine oil and engine oil filter.++ () • Rotate tires.
60000	96000	48	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Change the automatic transmission fluid and filter if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing.

			• Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.
67500	108000	54	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
75000	120000	60	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Inspect the rear axle fluid. • Flush and replace the engine coolant at 60 months if not done at 105, 000 miles (168 000 km).
82500	132000	66	• Change the engine oil and engine oil filter.++ () • Rotate tires.
90000	144000	72	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • **Inspect and replace PCV valve if necessary. +()** • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.

97500	156000	78	• Change the engine oil and engine oil filter.++ () • Rotate tires.
105000	168000	84	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • **Replace the spark plugs.** • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Inspect the rear axle fluid. • Flush and replace the engine coolant.
112500	180000	90	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
120000	192000	96	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Change the automatic transmission fluid and filter. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.
127500	204000	102	• Change the engine oil and engine oil filter.++ () • Rotate tires.
135000	216000	108	• Change the engine oil and engine oil filter.++ () • Rotate tires. • If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter; replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary.

			• Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing. • Inspect the CV joints. • Inspect exhaust system. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary.
142500	228000	114	• Change the engine oil and engine oil filter.++ () • Rotate tires.
150000	240000	120	• Change the engine oil and engine oil filter.++ () • Rotate tires. • Replace the engine air cleaner filter. • Replace the air conditioning filter. • Inspect the brake linings; replace if necessary. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Inspect the rear axle fluid.

() + This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

WARNING:

- **Failure to properly inspect and maintain the vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident and may result in possible serious or fatal injury.**

INSPECTION

INSPECTION

The following steps outline the dealer inspection procedure required every 5 years for vehicles covered under the terms of the Lifetime Powertrain Warranty. Refer to the appropriate warranty information for additional terms and coverages applicable to the Lifetime Powertrain Warranty.

1. Lift the vehicle on a suitable hoist.
2. Check all Powertrain components for leaks or physical damage. Note any concerns.
3. Lower the vehicle and check the level and condition of the engine oil.
4. Connect a diagnostic scan tool and check for any Diagnostic Trouble Codes (DTC).

NEW VEHICLE PREPARATION INSTRUCTIONS

STANDARD PROCEDURE

STANDARD PROCEDURE - NEW VEHICLE PREPARATION

NEW VEHICLE PREP INSTRUCTIONS	
VEHICLE READINESS	
DESCRIPTION	**ACTION**
Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days	Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days.
Install Ignition Off Draw (IOD) Fuse	Locate and install/connect Ignition Off Draw fuse or connector.
Place vehicle into Customer Mode (if no IOD fuse)	Simultaneously press the "Front Defrost" and "List/Enter" buttons and hold for five (5) seconds. The EVIC display will update once the vehicle goes into customer mode.
Inflate tire pressure to maximum side wall pressure (except heavy duty trucks)	Increase the tire pressure to maximum sidewall pressure if vehicle is going into lot storage.
Install all "Shipped Loose" items	Install all "Shipped Loose" items
Install Front License Plate Bracket (if required)	Install Front License Plate Bracket
Install Roof Rack	Install Roof Rack
Install Antenna	Install Antenna
Install Wheel Center Caps	Install Wheel Center Caps
Reset Tire Pressure Light Load Switch (if equipped)	If vehicle is going into storage and tire pressure is being set to maximum, switch the tire pressure light load setting to "maximum load" using the button on the instrument panel.
UNDERHOOD	
DESCRIPTION	**ACTION**
Hood Latch and Safety Catch - Adjust as Needed	Verify the operation of the hood release system including the inside hood release lever and the outside hood secondary safety catch. Adjust if necessary. The safety catch prevents the hood from going to the full open position until it is manually released. To test the safety catch, unlatch the hood with the interior hood release lever and attempt to raise the hood without operating the safety catch.
Battery State-of-Charge - document voltage	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service information procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
	Inspect the following for routing, loose attachments,

Loose Attachments, Routing and Clearance	connections, and clearance. Reroute and tighten as required: Brake Lines, Fuel Lines, Power Steering Hoses, Vacuum Hoses, Clutch Lines, Refrigerant Lines, Wiring, Belts.
All Fluid Levels	Refer to the owner's manual or service information for proper fluid level inspection locations.
No Fluid Leaks present	Visually inspect the underhood area to make sure absence of fluid leaks. Check clamps for tightness an full engagement.
UNDER VEHICLE	
DESCRIPTION	**ACTION**
No Fluid Leaks present	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.
Loose Attachments, Routing, Clearance, Damage	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.
ROAD TEST	
DESCRIPTION	**ACTION**
Perform Road Test, Mileage: Before _____ After _____	Record mileage before and after road test.
Engine Starts with All Keys	Start vehicle with all sets of keys.
All Warning Lights and Gauges / No DTCs	Verify all warning lights and gauges are operating properly, and no fault codes exist.
Keyless Go	Make sure vehicle starts with push button, when key is inside vehicle.
Engine Starts Only in Park & Neutral	Verify engine will only start while automatic transmission is in park or neutral.
Engine Starts Only with Clutch Depressed	Verify engine will only start when clutch is depressed on manual transmission vehicles.
Service and Parking Brakes	Apply the service brakes while the car is in motion. Be sure the brake operation is smooth and positive. Make sure the vehicle stops in a straight line and without pulling to one side. Make sure there is no shudder or vibration when braking. Make sure that the parking brake is easy to operate. Make sure the parking brake does not drag.
Brake Transmission Shift Interlock	Make sure that the vehicle will only start when the brake is depressed on vehicles with automatic transmission.
	Check for smooth shifting. Make sure shift lever

Clutch / Manual Transmission Shifting	operates easily and smoothly. Check for proper synchronization. The gears should not grind.
Automatic Transmission Shifting	Make sure that the park lock mechanism holds the vehicle. With the vehicle on a grade, put the automatic transmission in park and slowly release the service brake to check the operation of the park mechanism. Make sure the shift lever operates easily and smoothly. Check for smooth shifting. Check for proper upshifting and downshifting.
Autostick	Verify that Autostick feature allows proper shifting through the gears.
	ROAD TEST
DESCRIPTION	**ACTION**
Engine Performance - Cold	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Engine Performance - Warm	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Steering and Handling	Check that the power assist works properly. Make sure that the steering wheel does not vibrate abnormally at idle or road speed. Make sure that the steering wheel is centered when traveling in a straight line. Check that the vehicle does not drift to either side on flat road surfaces. Make sure that the vehicle does not vibrate or shake abnormally.
Noise, Vibration, Squeaks, or Rattles	Check that the vehicle is free of noise, vibrations, squeaks, or rattles. Tighten any loose fasteners.
Heater / Defrost - Front	Check the heater operation after the vehicle has reached operating temperature. Operate blower motor at all speeds. Operate the system in all modes. Check for hot air at all appropriate outlets. Check for temperature control operation.
Air Conditioning	Make sure that the A/C system cools properly. Operate blower motor at all speeds. Check for cool air at all temperature outlets. Operate the system in all modes.
Rear Heater and Air Conditioning	Check the rear heater and A/C for proper operation.
Defrost - Rear	Make sure that the electric heated rear defroster operates correctly. Turn on and feel for warmth.

Blindspot Monitoring System (if equipped)	While on road test, verify that the visual warning indicators located on the side view mirrors are operating properly when an object is within the detection zone.
Cruise Control (if equipped)	Check the "on/off" switch. Check the "set" operation. Check the "resume" function. Check the "accelerate" and "decelerate" function. Check the "cancel" button. Check the brake/clutch release function. If equipped, verify operation of Adaptive Cruise Control function.
Set Compass Variance / Calculation (if equipped)	Refer to the service information on TechCONNECT for information regarding compass setting procedures.
ROAD TEST	
DESCRIPTION	**ACTION**
Electronic Sway Bar Disconnect (if equipped)	With vehicle in four wheel drive, press the sway bar switch to activate the system. Verify that the "Sway Bar Indicator Light" is illuminated. **WARNING:** **Do not exceed 18 MPH / 29 KMPH while the front sway bar is disconnected. Failure to follow these instructions may result in possible serious or fatal injury.**
Transfer Case (if equipped)	Shift the transfer case through all ranges to make sure all shifting is smooth and operates properly.
Load Leveling Air Suspension (if equipped)	Use the terrain select switch to change the ride height during normal driving conditions. Cycle through each selection and verify proper operation of the air suspension system.
Tire Pressure Monitoring System	Verify that Tire Pressure Monitoring Indicator Light is not illuminated when tires are above minimum inflation recommendations. Make sure that indicator lamp is not flashing/chiming.
Park Assist (if equipped)	Put vehicle in reverse and slowly back up toward an object. Verify that Park Assist warning icon, lights and chimes operate properly as object is approached.
Back-Up Camera (if equipped)	Put vehicle in reverse, verify that screen provides a clear and visible image from rear of vehicle.
INTERIOR	
DESCRIPTION	**ACTION**
Visually Inspect Interior Parts for Damage, Fit, etc.	From the interior of the vehicle, open and close all doors to make sure ease of operation. Fully open and close the glove box to make sure proper operation. Fully open and close the console door to make sure proper operation. Check interior panels for proper fit and free from damage.
	Operate and visually inspect all interior lights and

All Interior Lamps and Horn	switches, including: Dome/Map lamps, and if equipped the following: vanity mirror lamps, glove box lamps, ash tray lamp, cigar lighter lamp, radio lamps, door mounted lamps, illuminated entry system. Make sure that the horn operates properly.
Rear View Mirror	Check that the rearview mirror's day/night function Is operating properly.
Front and Rear Wipers and Washers	Activate front windshield wipers, and if equipped, rear window wipers and check for proper operation at all speeds. Activate the front and if equipped, the rear washer. Check the spray pattern for proper operation and aim. Check the intermittent wipe feature for proper operation.
All interior Door Locks including Child Locks	Check all interior door locks for proper operation, including rear child safety door locks if equipped. Place in the unlocked position.
INTERIOR	
DESCRIPTION	**ACTION**
Steering Wheel Mounted Controls	Check all steering wheel controls for proper operation.
Memory Mirror / Seat	Verify the proper operation of the memory mirror and seat system.
Cigar Lighter	Check cigar lighter for proper operation.
Power Windows and Window Lock Switch	Fully open and close all power windows to make sure proper operation and sealing. Make sure that the windows operate properly at each door. Verify that window lock button is operating properly.
Power Adjustable Pedals (if equipped)	Check the adjustable pedals for proper operation by pressing the switch on the steering column.
Outside Power Mirrors	Check power mirrors for proper operation.
Heated Mirrors (if equipped)	Check power heated mirrors for proper operation.
Power Folding Mirrors (if equipped)	Check power folding mirrors for proper operation.
Seats and Seat Belts - All Adjustments	Check for correct installation and operation of seat and shoulder belts, and retractors. Check that the restraint system safety labels regarding the use of seatbelts and airbags are in place. Fully cycle the seats for proper adjustments and verify that each seat is securely mounted. Fold down and latch the rear seats. Pull forward to check that the latches operate correctly. Check for proper head restraint operation.
Convertible Top (If equipped)	Cycle the convertible top. Check and adjust alignment as required. In cold weather, allow the top to reach room temperature before cycling.
FIAT Cabrio Top (if equipped)	Cycle the convertible top. Check and adjust alignment as required. In cold weather, allow the top to reach room temperature before cycling.

Skyslider (if equipped)	Cycle the Skyslider roof. Check and adjust alignment as required.
Power Sunroof (if equipped)	Cycle sunroof. Make sure that the sunroof opens and closes easily. Verify proper operation of one touch open/close feature if equipped.
Set Clock(s)	Set all clocks to correct time. Refer to Owner's Manual for information regarding clock setting procedures.
Audio System	Turn the radio on and check reception in both AM and FM modes. Check that the CD player operates properly. Check for good sound quality from all speakers.
Satellite Radio (if equipped)	Turn on satellite radio and verify reception.
Disable Front Seat Video (if equipped)	Use the scantool to disable front seat video while vehicle not in park.
Video System (if equipped)	Test the DVD player to make sure that a DVD will load properly and display on the screen.
Satellite Streaming Video (if equipped)	Satellite Streaming Video.
Wireless Headphones / Video Remote (if equipped)	Check for proper operation of the Wireless Headphones / Video Remote.
INTERIOR	
DESCRIPTION	**ACTION**
Heated Steering Wheel (if equipped)	Verify that heated steering wheel is functioning properly.
Rear Sliding Window (if equipped)	Check for proper operation of the information or power rear sliding window.
Power Outlet(s)	Check all power outlets for proper operation.
Integrated Child Seat / Belt	Check the child restraints and child seats for proper operation.
Place tire changing instruction sheet in left rear quarter panel storage compartment (RT only)	Place tire changing instruction sheet in left rear quarter panel storage compartment (RT only).
Storage bins properly seated around the spare tire (WK only)	Verify that storage bins are properly seated.
Power folding Headrests (if equipped)	Verify proper operation of power folding third row head restraints by pressing the power folding switch located on the instrument panel switch bank.
Heated Seats (if equipped)	Check for proper operation of heated seats on all power levels, on all equipped seats.
Power Cooled Seats (if equipped)	Check for proper operation of ventilated seats on all power levels, on all equipped seats.
Heated / Cooled Cup Holders (if equipped)	Check for proper operation of the heated and cooled and cooled cupholders.
Cargo Compartment Cover (if equipped)	Check the rear cargo compartment cover is operating properly.

Vinyl Floor Covering (if equipped)	Verify properly equipped.
EXTERIOR	
DESCRIPTION	**ACTION**
Inspect Body and Paint for Damage and Fit/ Finish	Inspect the body exterior for damage, loose or missing items. During the inspection, make sure that no vehicle damage occurred from the time the vehicle was received and the beginning of the New Vehicle Preparation.
Exterior Lamps - Headlamps, Turn Signals, Hazards, Park/Tail/License Plate, Trunk Lights, etc.	Operate and visually inspect the following: Headlamps (High/Low Beams), turn signals, hazard warning flashers, parking/tail/license plate lamps, reverse/back up lamps, fog lamps, stop lamps including center mounted stop lamp, daytime running lamps (if equipped), clearance lamps, cargo bed lamps, any other lamps.
Lock and Unlock all doors with all mechanical keys	Verify all doors lock and unlock with all mechanical keys.
EXTERIOR	
DESCRIPTION	**ACTION**
Doors, Liftgate and Tailgate - Adjust Strikers as Needed	Open each door/liftgate/tailgate from the outside to check outside door handle operation. Check the door detent. Partially close all doors to check the open-door detent. Close all doors/liftgates/tailgates to check the operation of latches and strikers. Adjust strikers as required. Verify liftgate/tailgate ease of operation.
Power Liftgate - Inspect for fit and operation (if equipped)	Verify all modes of operation of the power liftgate, including operating the liftgate using the inside switches and the Remote Keyless Entry transmitter.
Power Sliding Door - Inspect for Fit and Operation (if equipped)	Verify all modes of operation of the power sliding door, including operating the sliding door using the inside switches and the Remote Keyless Entry transmitter.
Security Alarm Test (if equipped)	Lock doors using the Remote Keyless Entry Transmitter. Verify the operation of the Vehicle Security System warning lamp.
Passive Entry (if equipped)	Verify that the Keyless Enter-N-Go feature is operating properly, by grabbing the door handle of the locked vehicle, while the Remote Keyless Entry transmitter key is within 5 feet of the vehicle. The door should unlock automatically.
Remote Keyless Entry (if equipped)	Verify that doors unlock properly using all key FOBS.
Remote Start (if equipped)	Verify that engine starts with all keys when using Remote Keyless Entry Transmitter.
Top (Wrangler)	For Wrangler equipped with soft top, verify opening and closing operation. For Hard/Soft Top, verify top

	fits and is seated properly.
VEHICLE STORAGE	
DESCRIPTION	**ACTION**
Keep all protective transit film, wheel covers and films on vehicle until sold	Keep all protective transit film, wheel covers and films on vehicle until sold.
Inflate tire pressure to maximum side wall pressure	Inflate tire pressure to maximum side wall pressure (except heavy duty trucks.)
Put Vehicle into Ship Mode (if no IOD fuse)	Simultaneously press the "Front Defrost" and "List/Enter" buttons and hold for five (5) seconds. The EVIC display will update once the vehicle goes into ship mode.
Remove ignition off draw (IOD) Fuse	Remove fuse before storing vehicle to conserve battery.
FINAL DETAIL & INSPECTION	
DESCRIPTION	**ACTION**
Perform all incomplete recalls and RRTs	Perform all incomplete recalls and RRTs.
Remove interior and exterior Transportation Protective Covers	Remove exterior protective coatings/coverings from vehicle, remove interior protective covers, grease markings on door jambs, unnecessary labels, etc.
Inspect paint and body, touch up as needed	Make sure that the body is free from paint chips or scratches. Touch up any chips/scratches using thin layers of paint. Make sure that the body is free from dings and dents.
Install IOD Fuse or put vehicle into Customer Mode	Install fuse or place vehicle into customer mode prior to delivery.
Test and record battery state of charge	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service information procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Adjust tire pressures including spare to door placard	Adjust tire pressures including spare to door placard.
Reset Tire Pressure Light Load Switch (if equipped)	Reset the Tire Pressure Light Load Switch back to the "Light Load" setting using the switch on the instrument panel.
Top off Diesel Exhaust Fluid reservoir	Fill the Diesel Exhaust Fluid Reservoir located behind the cab on the driver's side of truck (clearly marked in blue) with Mopar Diesel Exhaust Fluid prior to customer delivery.
Wash and clean vehicle exterior	Wash the entire vehicle. Clean the tire sidewalls and wheel/wheel covers (use non - acidic wheel cleaner). Clean exterior/interior glass surfaces.
Clean vehicle interior	Inspect the interior trim, seats, carpeting, and moldings. Clean as necessary.

Fill Fuel Tank with specified grade	Fill fuel tank with the specified grade of fuel. Refer to owner's manual or information tag behind the fuel filler.

TOWING

STANDARD PROCEDURE

STANDARD PROCEDURE - VEHICLE TOWING

WARNINGS AND CAUTIONS

WARNING: Do not allow towing attachment devices to contact the fuel tank or lines, fuel leak can result.

Do not lift or tow vehicle by front or rear bumper.

Do not go under a lifted vehicle if not supported properly on safety stands.

Do not allow passengers to ride in a towed vehicle.

Use a safety chain that is independent from the towing attachment device. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle.

Do not secure vehicle to towing device by the use of front or rear suspension or steering components.

Remove or secure loose or protruding objects from a damaged vehicle before towing.

Refer to state and local rules and regulations before towing a vehicle.

Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

RECOMMENDED TOWING EQUIPMENT

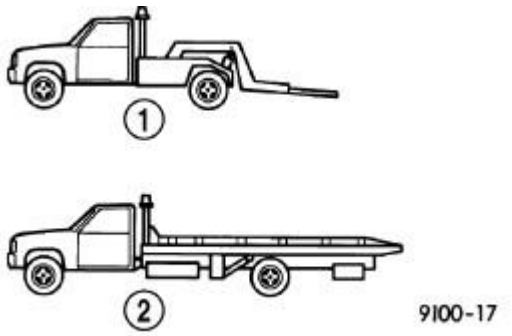

Fig. 9: Recommended Towing Devices
Courtesy of CHRYSLER GROUP, LLC

1 - WHEEL LIFT
2 - FLAT BED CARRIER

- RWD vehicles, a flat bed towing device is recommended.
- AWD vehicles, a flat bed towing device is recommended.

CAUTION:
- **Do not attempt to tow this vehicle from the front with sling type towing equipment. Damage to the front fascia and air dams will result.**
- **The only approved method of towing is with a flat bed truck.**
- **Do not tow the vehicle from the rear. Damage to the rear sheet metal, liftgate and fascia will occur.**
- **Do not push or tow this vehicle with another vehicle as damage to the bumper fascia and transmission may result.**

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

be sure the has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

If using a wheel lift towing device, the disabled vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the front end of the vehicle and lower the front end closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake rotors.

LOCKED VEHICLE TOWING

When a locked vehicle must be towed with the front wheels on the ground, use a towing dolly or flat bed hauler.

FLAT BED TOWING TIE DOWNS

CAUTION: Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

The vehicle can be tied to a flat bed device using the pair of front transportation slots on the bottom surface of the rails, behind the front wheels. The rear transportation slots are on the bottom of the left bumper extension and in the bracket extending inboard of the right bumper extension.

WITHOUT THE IGNITION KEY

Special care must be taken when the vehicle is towed with the ignition in the LOCK position. The only approved method of towing with out the ignition key is with a flat bed truck. Proper towing equipment is necessary to prevent damage to the vehicle.

TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE (FLAT TOWING WITH ALL FOUR WHEELS ON THE GROUND)

Your vehicle may be towed under the following conditions: The gear selector must be in NEUTRAL, the distance to be traveled must not exceed 48 km (30) miles, and the towing speed must not exceed 48 km/h (30 mph). Exceeding these towing limits may cause a transmission geartrain failure. If the transmission is not operative, or if the vehicle is to be towed more than 48 km (30) miles, the vehicle must be transported using a flat bed or the drive shaft disconnected at the rear axle drive flange.

TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE WITH A TOW DOLLEY

The manufacture **does not recommend** that you tow this vehicle on a tow dolley. Vehicle damage may occur.

ACCESSORIES AND EQUIPMENT

Vehicle Theft Security - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

The Vehicle Theft Security System (VTSS) is an available factory-installed option on this vehicle. The VTSS is comprised of two primary subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). The VTA is an active system that provides visual and audible responses as deterrents to and warnings of unauthorized vehicle tampering. The SKIS is a passive system that effectively immobilizes the vehicle against unauthorized operation. Following are paragraphs, which describe these subsystems of the VTSS.

Certain functions and features of the VTSS rely upon resources shared with or controlled by other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other modules that may affect VTSS operation are:

- **Body Control Module (BCM)** - The BCM is located in the interior compartment in the right kick panel. The BCM provides the VTA system logic, driver and passenger door ajar switch status, hood ajar (export) and power lock switch status. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Instrument Cluster** - The Instrument Cluster (IC) is also known as the Cab Compartment Node (CCN). The IC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. The IC provides the security indicator. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PYGMY) provides the SKIS engine control logic. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Radio Frequency Hub (RF-Hub)** - The Radio Frequency Hub (RF-Hub) provides ignition switch status by way of the Keyless Ignition Node (KIN). The RF-Hub broadcasts that message over the CAN Bus network. The Remote Start logic is contained in the RF-Hub and the Remote Start Antenna is connected directly to it. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

Except for the Sentry Key transponders integral to the FOB with Integrated Key (FOBIK) which rely upon Low Frequency (LF) communication, hard-wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SKIS components through a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

VEHICLE THEFT ALARM

The VTA is available in three different configurations for this vehicle: One configuration is designed for vehicles manufactured for sale in North America; while, the other two configurations are designed for vehicles manufactured for sale in markets outside of North America, also referred to as export markets within the context of this service information. All vehicles equipped with VTA are also equipped with the Remote Keyless Entry (RKE) system and the Sentry Key Immobilizer System (SKIS), regardless of their market destination.

The North American and export base version of the VTA system provide perimeter vehicle protection by monitoring the vehicle doors, the ignition switch, the liftgate, and the hood for vehicles built for certain markets where it is required equipment. On the premium export version it also monitors vehicle tilt and motion. If unauthorized vehicle use or tampering is detected, these systems respond by pulsing the vehicle horn. The premium export version will sound a siren. The siren is located in the left front corner on the radiator support. This produces an audible deterrent. Both of these systems will also flash certain exterior lamps which produces a visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door.
- **Hood Ajar Switch** - A hood ajar switch is located in a bracket on the right inner fender side shield of vehicles built for sale in certain export markets where it is required equipment.
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch for the liftgate in the vehicle. Refer to **LATCH, REMOVAL** .
- **Security Indicator** - A security indicator is integral to the Instrument Cluster (IC) (also known as the Cab Compartment Node/CCN). Refer to **DESCRIPTION** .

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is standard on all vehicles equipped with the Radio Frequency Hub. The SKIS provides passive vehicle protection by preventing the engine from operating unless a valid electronically encoded FOBIK is detected in the vehicle interior.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Security Indicator** - A security indicator is integral to the Instrument Cluster (IC) (also known as the Cab Compartment Node/CCN). Refer to **DESCRIPTION** .
- **Sentry Key Transponder** - The Sentry Key transponder is integral to the FOB with Integrated Key (FOBIK), which also includes an integral Remote Keyless Entry (RKE) transmitter and an integral mechanical valet key. Refer to **KEY, TRANSPONDER, DESCRIPTION**.
- **Radio Frequency Hub** - The Radio Frequency Hub (RF-Hub) is located above the headliner at the liftgate opening. The RF-Hub is hardwired to the Keyless Ignition Node (KIN). The RF-Hub performs all of the same functions performed by a Wireless Control Module (WCM) or a Wireless Ignition Node (WIN) and the Passive Entry Module used on other vehicles. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

- **Powertrain Control Module** - The Powertrain Control Module (PYGMY) provides the SKIS engine control logic. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Body Control Module (BCM)** - The BCM is located in the interior compartment in the right kick panel. The BCM provides the VTA system logic, driver and passenger door ajar switch status, hood ajar (export) and power lock switch status. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .

OPERATION

OPERATION

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are paragraphs that briefly describe the operation of each of these two subsystems.

VEHICLE THEFT ALARM

The Body Control Module (BCM) and the Radio Frequency Hub (RF-Hub) are used on this vehicle to control and integrate many of the functions and features included in the Vehicle Theft Alarm (VTA/VTS) system. In the VTA system, the BCM receives inputs indicating the status of the door ajar switches, the liftgate ajar switch, and the power lock switches. In vehicles built for certain export markets where it is required, the hood ajar switch provides a hard-wired input to the BCM. The BCM processes the information from all of these inputs and sends the appropriate electronic messages over the CAN data bus. The BCM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate. The RF-Hub sends out the ignition switch status and all the commands from the FOBIK.

The hard-wired circuits between the components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, details of wire harness routing and retention, connector pin-out information, and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Select the modules that are used with the VTA system and monitor the status of the appropriate components. Refer to the appropriate diagnostic information for any Diagnostic Trouble Codes (DTCs) procedures.

For Body Control Module DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Radio Frequency Hub DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Powertrain Control Module DTCs: Refer to appropriate diagnostic information .

Following are paragraphs that briefly describe the operation of each of the VTA features. See the

owner's manual in the vehicle glove box for arming and disarming procedures, use, and operation of the VTA.

ARMING

Passive arming of the VTA occurs when the vehicle is exited with the FOB with Integrated Key (FOBIK), the headlamps are turned OFF, and the doors are locked while they are open using the power lock switch. Active arming occurs when the LOCK button on the FOBIK is pressed to lock the vehicle. For active arming to occur, the doors, and the liftgate must be closed and the Keyless Ignition Node (KIN) must be in the OFF position when the FOBIK LOCK button or the LOCK button on the passive entry handle is pressed. The power lock switches will not function if the FOBIK is in the vehicle interior.

Pre-arming of the VTA is initiated when a door or the liftgate is open when the vehicle is locked using a power door lock switch or when the FOBIK LOCK button is pressed. Pre-arming will not occur if the FOBIK is in the vehicle interior. When the VTA is pre-armed, the arming sequence is delayed until all of the doors and the liftgate have been closed. The VTA will remain in pre-armed mode for up to 16 seconds after all doors and the liftgate have been closed.

Once the VTA begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about 16 seconds. This indicates that VTA arming is in progress. If the ignition is turned to the ON position, if a door or the liftgate is unlocked and opened by any means, or the RKE PANIC button (if equipped) is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

On vehicles equipped with the hood ajar switch, the VTA arming sequence will occur regardless of whether the hood is open or closed, but the underhood area will not be protected unless the hood is closed when the VTA arming sequence begins. Also, if the status of the hood ajar switch changes from open to closed during the 16 second arming process, the security indicator will stop flashing and the VTA arming sequence will abort. Once the arming process is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

DISARMING

Press the FOBIK UNLOCK button or with one of the valid FOBIKs located outside the vehicle and within 1.5m (5 ft.) of the drivers or passenger front door handles, grab the Passive Entry handle and enter the vehicle, then press the Start/Stop/Button (SSB) to ON (requires at least one valid FOBIK in the vehicle).

POWER-UP MODE

When the armed VTA senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode, the alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician, or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery

jump-starting is attempted. The VTA will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

ALARM

The VTA alarm output varies by the version of the VTA with which the vehicle is equipped. In all cases, the alarm provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing ON and OFF of the exterior lamps. For vehicles equipped with the North American or the export base version of the VTA, the audible output will be a pulsing of the horn. See the owner's manual in the vehicle glove box for details of the alarm output requirements of the specific market for which the vehicle was manufactured. The inputs that will trigger the alarm include the door ajar switches, the liftgate ajar switch, and in vehicles built for certain markets where required, the hood ajar switch.

TAMPER ALERT

If the VTA alarm was triggered, the VTA tamper alert feature will give the message "REMOTE START DISABLED - START VEHICLE TO RESET" in the Electronic Vehicle Information Center (EVIC) and the horn will beep three short beeps. This message will display once the vehicle is properly disarmed by unlocking the vehicle with a valid FOBIK. This message can also display if the alarm has since timed out or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine whenever any method other than a valid FOBIK is used to start the vehicle. The SKIS is considered a passive protection system, because it is always active when the ignition system is energized and it does not require any customer intervention. The SKIS uses Low Frequency (LF) communication to obtain confirmation that the FOBIK in the interior of the vehicle is valid for operating the vehicle. The microprocessor-based SKIS hardware and software also uses electronic messages to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

Two pre-programmed FOBIK transponders are provided with the vehicle from the factory. Each RF-Hub will recognize a maximum of eight FOBIK transponders. If the customer would like additional FOBIKs, other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional FOBIKs must be programmed to the RF-Hub in the vehicle in order for the system to recognize them as valid. This can be done by the dealer using a diagnostic scan tool. All FOBIKs used on that particular vehicle must be in the vehicle when programming takes place.

The RF-Hub performs a self-test of the SKIS each time the ignition is pressed to the ON position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The WIN will also send an electronic message to the instrument cluster if a fault is detected, and the instrument cluster illuminates the security indicator.

The hard-wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information for any Diagnostic Trouble Code (DTC) procedures.

For Body Control Module DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Radio Frequency Hub DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Powertrain Control Module DTCs: Refer to appropriate diagnostic information .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are the recommended procedures for diagnosis of each of these two subsystems.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

VEHICLE THEFT ALARM

The hard-wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA

system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Select the modules that are used with the VTA system and monitor the status of the appropriate components. Refer to the appropriate diagnostic information for any Diagnostic Trouble Codes (DTCs) procedures.

For Body Control Module DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Radio Frequency Hub DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Powertrain Control Module DTCs: Refer to appropriate diagnostic information .

For diagnosing an intermittent false trip of the alarm, using a scan tool select: "BCM", "System Test" and "View Last VTA Trigger Cause Data" The scan tool will display the last four "Triggers" that the Body Control Module has stored. If the alarm will not set, the scan tool can be helpful by showing the status of each component presently. Select "View VTA Enable Data" under "System Tests".

SENTRY KEY IMMOBILIZER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard-wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Select the modules that are used with the VTA system and monitor the status of the appropriate components. Refer to the appropriate diagnostic information for any Diagnostic Trouble Codes (DTCs) procedures.

For Body Control Module DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Radio Frequency Hub DTCs: Refer to **DIAGNOSIS AND TESTING** .

For Powertrain Control Module DTCs: Refer to appropriate diagnostic information .

STANDARD PROCEDURE

FOBIK PROGRAMMING

The Radio Frequency Hub (RF-Hub) may be programmed to recognize up to a total of eight FOBIKs. When replacing or adding a FOBIK, the integrated key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once an additional or new key has been cut, the RF-Hub must be programmed to recognize it as a valid FOBIK. When programming a FOBIK it may be necessary to have the vehicle PIN. Follow the instructions on the scan tool screen.

Programming

NOTE: All FOBICs that are to be used in this vehicle must remain on the front seat near the center console but behind the shifter.

NOTE: Do not put a Laptop or any wireless device (cell phone, audio device, etc.) on top of or near the center console. The RF Antenna is below the console.

1. Turn the ignition on.
2. With the scan tool select RFH.
3. Turn the ignition to the off/lock position. The ignition must be left off throughout this procedure on vehicles equipped with the RF-Hub.
4. With the scan tool select; "Misc. Functions" "Program Ignition FOBIKs".

   NOTE: When programming a FOBIK, hold it near or on the center console top.

   NOTE: When you are instructed to "Press the Unlock button" it is important that you do not hold the button. Press it One time quickly.

5. Press "Continue" and follow the instructions on the screen.

RF-HUB INITIALIZATION - EXPORT WITH COLUMN LOCK MODULE

CAUTION: On vehicles equipped with the optional export premium Vehicle Theft System, when either the Radio Frequency Hub RF-Hub) or the shaft lock module (also known as Elektrische Lenksaulen Verriegelung/ELV or Electric Steering Column Lock/ESCL) is replaced with a new unit, the existing RF-Hub or ELV/ESCL MUST also be replaced with a new unit. In other words, any time either the RF-Hub or the ELV/ESCL is replaced with a new unit, BOTH the RF-Hub and the ELV/ESCL MUST be replaced with new units, WITHOUT EXCEPTION. Following replacement of BOTH the RF-Hub and the column lock module/ELV/ESCL, the two modules MUST be initialized using diagnostic scan tool routines in the EXACT SEQUENCE that follows. Failure to follow this sequence may result in BOTH the new RF-Hub and the new ELV/ESCL being rendered unusable, requiring BOTH

units to be replaced a second time.

NOTE: Do not put a laptop or any wireless device (cell phones, audio devices etc.) near the top of the center console (the RKE antenna is located below the center console).

1. After both the RF-Hub and the ELV/ESCL have been replaced with new units, connect the diagnostic scan tool to the Data Link Connector (DLC).
2. Turn the ignition ON
3. Navigate to the RF-Hub in the ECU View of the diagnostic scan tool.
4. Turn the ignition OFF
5. Put all the FOBICs used in this vehicle on the front seat away from the console.
6. With the scan tool select: "Program ignition FOBIKs" in the Miscellaneous Functions menu and follow the instructions on the screen.

NOTE: When programming a FOBIK, have it in your hand resting on the console.

7. After all the FOBIKs have been programmed, run the "RF-Hub Replace" routine.
8. Turn the ignition on.
9. Run the ELV Replaced routine, also found under the Miscellaneous Functions menu item of the RF-Hub in the ECU View of the diagnostic scan tool.
10. Turn the ignition to the OFF position, wait 30 seconds, then cycle the ignition back to the ON/RUN position.
11. Verify that the ELV Locks the steering column when the ignition is turned off and Unlocks the steering column when the ignition is turned On.

KEY, TRANSPONDER

DESCRIPTION

DESCRIPTION

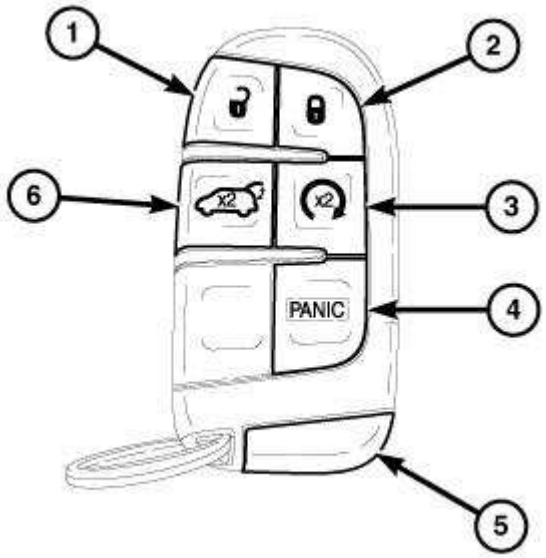

Fig. 1: FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) Transmitters
Courtesy of CHRYSLER GROUP, LLC

Vehicles are shipped from the factory with two FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitters programmed to the vehicle as standard equipment. The FOBIK circuitry is contained and protected within a molded black plastic case with a black soft rubber touch pad on the face divided into six sections. The rearward end of the FOBIK case houses a mechanical, metal, coded emergency key (5) that is released by sliding a latch button on the back of the FOBIK case.

Depending upon vehicle equipment, each FOBIK has at least three and no more than five functional resistive membrane switches located beneath the six touch pad sections. Each functional touch pad section is clearly identified by white icons or white text and icons identifying the specific function obtained by pushing that button. Domestic market vehicles also include a touch pad section on the FOBIK with the red text **PANIC** applied to it. Not counting the **PANIC** touch pad (4), the available switches include:

- **Unlock (1)**

  - Standard equipment.

- **Lock (2)** - Standard equipment.
- **Remote Start (3)** - Only for vehicles equipped with the factory-installed remote start system.
- **Liftgate/Decklid (6)** - Standard equipment.

The FOBIK RKE transmitter is the primary customer active interface for remotely operating the power lock system, the RKE system, and the remote start system components and features. However, the FOBIK also has an important passive role in each of the following vehicle systems:

- **Keyless Go System**

- **Passive Entry System**
- **Sentry Key® Theft Deterrent System**
- **Vehicle Theft Security System (VTSS)**

Other than battery replacement, the FOBIK cannot be adjusted or repaired. If damaged or ineffective, the FOBIK must be replaced with a new unit. A new and unused FOBIK unit must be properly programmed in order to function properly with the systems of the vehicle. The mechanical emergency key of the new FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Programming FOBIKs

For FOBIK Programming, refer to **STANDARD PROCEDURE** .

OPERATION

OPERATION

The FOB with Integrated Key (FOBIK) incorporates many useful functions into a single, compact unit. The transducer on the internal circuit board of the FOBIK uses low frequency Radio Frequency (RF) communication to ensure vehicle security through an electronic validation or handshake process that is performed with the Radio Frequency Hub (RF Hub) each time the engine is started.

When any one of the Remote Keyless Entry (RKE), liftgate/decklid or remote start buttons of the FOBIK is depressed, the on-board transmitter of the FOBIK generates a high frequency RF request signal that is received and validated by the RF Hub. If the RF Hub determines the RF signal was generated by a FOBIK that is valid for the vehicle, the RF Hub relays electronic request messages to the appropriate electronic modules in the vehicle over the Controller Area Network (CAN) data bus to invoke the functions or features associated with the request.

Each vehicle owner is provided with a four-digit Personal Identification Number (PIN) by the dealer at the time of vehicle purchase. This number is required along with a diagnostic scan tool for the dealer to program an additional or replacement FOBIK into the electronics of the vehicle. The emergency key included with a new additional or replacement blank FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Diagnosis of a FOBIK transmitter requires the use of a Radio Frequency Detector such as (special tool #9001, RF Detector) or (special tool #CH9936, Analyzer, TPM/RKE). Refer to the appropriate diagnostic information. Refer to **DIAGNOSIS AND TESTING** .

EMERGENCY STARTING

The integrated mechanical key of the FOBIK provides emergency access to the vehicle in case the battery in the vehicle or the transmitter becomes discharged.

In the event that the battery in the FOBIK is low or there is a Low Frequency Antenna problem:

- Hold the FOBIK with the key ring away from the Keyless Ignition Node (KIN).

- With the "Lock/Unlock" button end of the FOBIK, press the Start/Stop Button (SSB).
- Push gently to prevent scratching the KIN's surface.

Programming FOBIKs

For FOBIK Programming. Refer to **STANDARD PROCEDURE** .

MODULE, INTRUSION

DESCRIPTION

DESCRIPTION

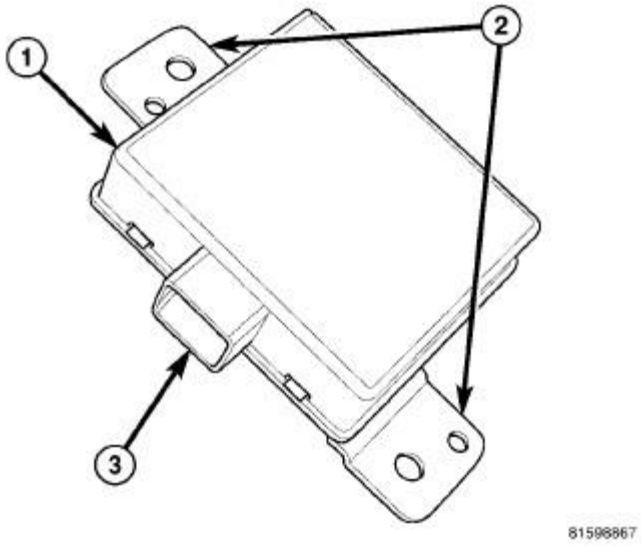

Fig. 2: Identifying Intrusion Module Components
Courtesy of CHRYSLER GROUP, LLC

An intrusion module (1) is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for certain markets, where the additional features offered by this system are required. The intrusion module is located in the passenger compartment. This unit is designed to work in conjunction with the intrusion sensor transmitter and intrusion sensor receiver to provide interior motion detection and serves as the interface between the Totally Integrated Power Module (TIPM), the Cab Compartment Node (CCN) and the alarm siren.

The intrusion module has two integral mounts (2) that are secured by nuts to two weld studs on the right quarter inner panel just behind the right rear wheel house. The module is concealed beneath the quarter inner trim panel. Concealed within the molded plastic housing is the circuitry of the module, which includes a microprocessor. The module is connected through an integral connector receptacle (3) to the vehicle electrical system by a take out and connector of the body wire harness.

The intrusion module unit cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The microprocessor in the intrusion module contains the motion detection logic circuits and controls all of the features of the premium version of the Vehicle Theft Alarm (VTA). The module uses On-Board Diagnostics (OBD) and can communicate with other modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used by the module to communicate with the Front Control Module (FCM) and the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). The module also communicates with the alarm siren over a dedicated serial bus circuit.

The intrusion module microprocessor continuously monitors inputs from the intrusion sensor transmitter and receiver as well as inputs from the EMIC and the alarm siren module. The module energizes the intrusion sensor transmitter, which transmits ultrasonic signals into the vehicle cabin through a transmit transducer, then monitors the current draw of the transmitter to detect problems with the transmitter and transmitter circuits. The module also energizes the intrusion sensor receiver, which listens to the ultrasonic signals through a receive transducer as they bounce off of objects in the vehicle interior, then monitors the current draw of the receiver for data signals and to detect problems with the receiver and receiver circuits. If an object is moving in the interior, a detection circuit in the module senses this movement through the modulation of the returning data signals from the receiver.

If movement is detected, the intrusion module sends an electronic message to the FCM over the CAN data bus to flash the exterior lighting and sends another message to the alarm siren module over the dedicated serial bus line to sound the siren. When the EMIC or FCM detect a breach in the perimeter protection through a door, liftgate, flip-up glass, or hood ajar switch input, they send an electronic message to the intrusion module and the module sends a message to the FCM to flash the exterior lighting and a message to the alarm siren module to sound the siren. The module also monitors message inputs from the alarm siren module for siren battery or siren input/output circuit tamper alerts, and siren battery condition alerts, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects. An active fault only remains for the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the module. If a fault does not recur for 50 ignition cycles, the module will automatically erase the stored DTC.

The intrusion module receives battery voltage on a fused B(+) circuit through a fuse in the Junction Block (JB), and is grounded at all times through a hard wired remote ground point. These connections allow the module to remain operational, regardless of the ignition switch position.

The hard wired circuits of the intrusion module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the intrusion module or the electronic controls or communication between modules and other devices that provide some features of the VTA. The most reliable, efficient, and accurate means to diagnose the intrusion module or the electronic controls and communication related to intrusion module operation requires the use of a diagnostic scan tool. Refer

to the appropriate diagnostic information.

REMOVAL

REMOVAL

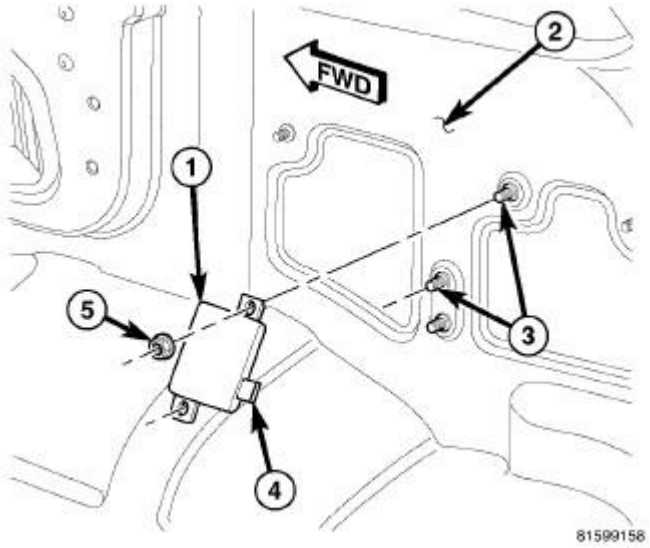

Fig. 3: Removing/Installing Intrusion Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from the inside of the right quarter inner panel (2). Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
3. Disconnect the take out of the body wire harness from the connector receptacle (4) on the rearward side of the intrusion module (1).
4. Remove the two nuts (5) that secure the module to the studs (3) on the quarter inner panel.
5. Remove the module from the studs on the quarter inner panel.

INSTALLATION

INSTALLATION

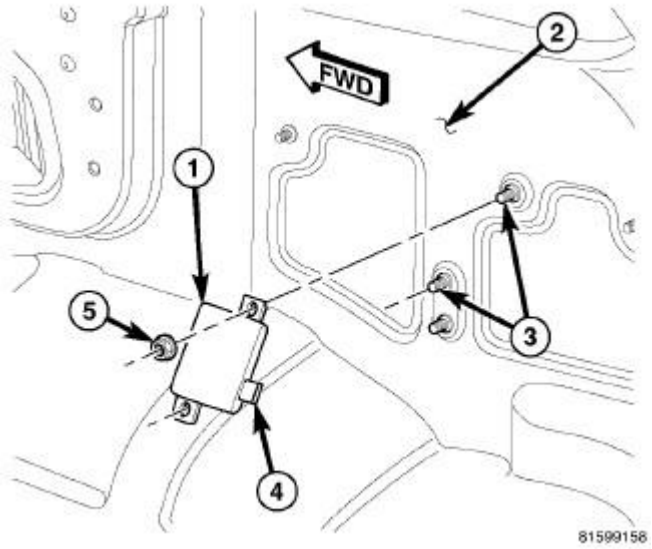

Fig. 4: Removing/Installing Intrusion Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the intrusion module (1) onto the two studs (3) on the right quarter inner panel (2).
2. Install and tighten the two nuts (5) that secure the module to the studs on the quarter inner panel. Tighten the nuts to 2 N.m (20 in. lbs.).
3. Reconnect the take out of the body wire harness to the connector receptacle (4) on the rearward side of the module.
4. Reinstall the trim onto the inside of the right quarter inner panel. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.

MODULE, SHAFT LOCK

DESCRIPTION

DESCRIPTION

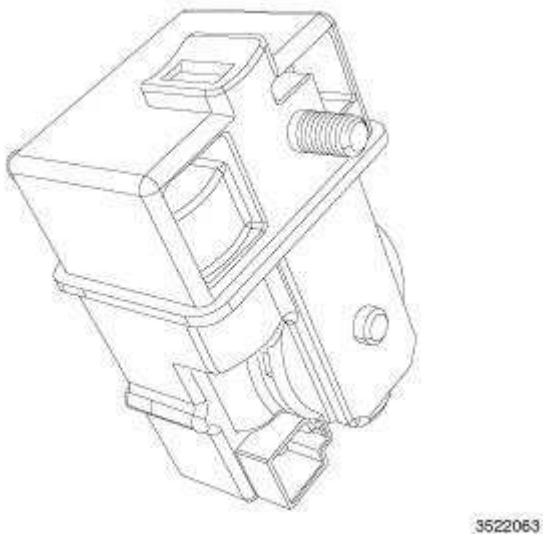

Fig. 5: Shaft Lock Module
Courtesy of CHRYSLER GROUP, LLC

A shaft lock module (1) is part of the premium version of the Sentry Key Immobilizer System (SKIS) in the Vehicle Theft Security System (VTSS). The premium version of the SKIS is only available in vehicles built for certain markets, where the additional features offered by this system are required. The shaft lock module is located in a bracket integral to the lower end of the steering column housing casting below the instrument panel. This unit is designed to work in conjunction with the Radio frequency Hub (RF-Hub), to control a locking bolt (2) that engages a machined slot in the steering shaft to prevent shaft rotation whenever the ignition is in the LOCK position. It can only be unlocked by the presence of a valid FOBIK in the vehicle and the Keyless Ignition Node (KIN) in the RUN/START position.

Concealed within the module is the electronic circuitry of the module, and a bi-directional electric motor that actuates the locking bolt. The module is connected to the vehicle electrical system through the instrument panel wire harness and the headliner harness.

The mounting provisions for the shaft lock module are designed to resist unauthorized tampering. The module cannot be removed from the steering column while the steering column is installed in the vehicle. The shaft lock module cannot be adjusted or repaired and, if ineffective or damaged, must be replaced. Whenever a shaft lock module is replaced the Radio Frequency Hub must also be replaced. To remove a shaft lock module. Refer to **MODULE, SHAFT LOCK, REMOVAL**.

OPERATION

OPERATION

The electronic circuitry within the shaft lock module contains all of the logic circuits and components to monitor and control the operation of the shaft locking bolt. The module uses a serial data bus for bi-directional communication with the Radio Frequency Hub (RF-Hub). If the module detects a problem with the positioning or operation of the locking bolt, it sends an error message to the RF-Hub. The RF-Hub then sets and stores a Diagnostic Trouble Code (DTC) and sends an electronic error

message over the Controller Area Network (CAN) data bus to other modules.

The shaft lock module continuously monitors inputs from the RF-Hub and energizes the electric motor to move the locking bolt to the locked or unlocked position based upon that input. If the RF-Hub indicates that the FOBIK present in the vehicle is invalid, the locking bolt remains in the locked position. When the RF-Hub indicates that a valid FOBIK is present in the vehicle and the Keyless Ignition Node (KIN) is in the On/Start position, the shaft lock module operates a motor to move the locking bolt to the unlocked position. However, to prevent inadvertent column locking due to a failure while the vehicle is being operated, the module cannot move the locking bolt from the unlocked position to the locked position as long as the KIN remains in the RUN/START position and other data from the RF-Hub.

The shaft lock module receives ground at all times through a hard wired remote ground point. The module receives battery voltage to operate and to move the locking bolt in the unlocked direction on a B(+) circuit, and receives battery voltage to operate the locking bolt in the locked direction only when the KIN is in the OFF position and other data from the RF-Hub allows it.

For added system security, the shaft lock module learns a unique Secret Key code from the RF-Hub over the serial data bus upon initialization. This code is stored in the memory of the module and cannot be changed. Therefore, if the RF-Hub requires service replacement, a new shaft lock module will also be required. Another security code, called a PIN, is used to gain access to the RF-Hub Secured Access Mode. The Secured Access Mode is required during service to initialize a new shaft lock module. Before replacing the shaft lock module or the RF-Hub see the "RF-Hub Replacement and Programming Order Guide" for the proper sequence. Refer to **STANDARD PROCEDURE** .

For the shaft Lock replacement procedure. Refer to **MODULE, SHAFT LOCK, REMOVAL**.

REMOVAL

MODULE UNLOCKED

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: If a NEW column lock module has been installed, a new Radio Frequency Hub (RF Hub) must also be installed.

NOTE: Before attempting service, the ignition key must be inside the vehicle near or on the center console for the entire length of the procedure.

NOTE: **Before disconnecting the battery, check that the steering wheel can rotate back and forth verifying the steering column is unlocked.**

NOTE: **When replacing any module(s) follow the "RF-Hub, BCM, PCM FOBik and ELV Replacement and Programming Order Guide" for replacement and programming order. Refer to STANDARD PROCEDURE .**

NOTE: **For additional information programming the ELV/ESCL. Refer to STANDARD PROCEDURE.**

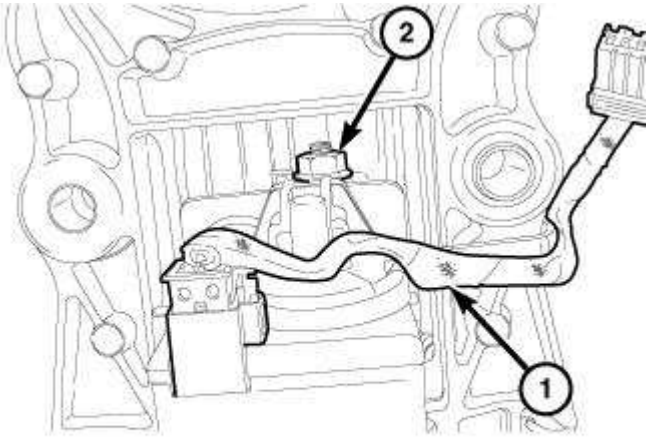

Fig. 6: Steering Column Lock Module Retainer & Steering Column Lock Module Jumper Harness
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Intelligent Battery Sensor (IBS) from the battery.
2. Remove the steering column. Refer to **COLUMN, REMOVAL** .
3. Remove the steering column lock module retainer (2).
4. Disconnect the steering column lock module jumper harness (1) from the steering column lock module.

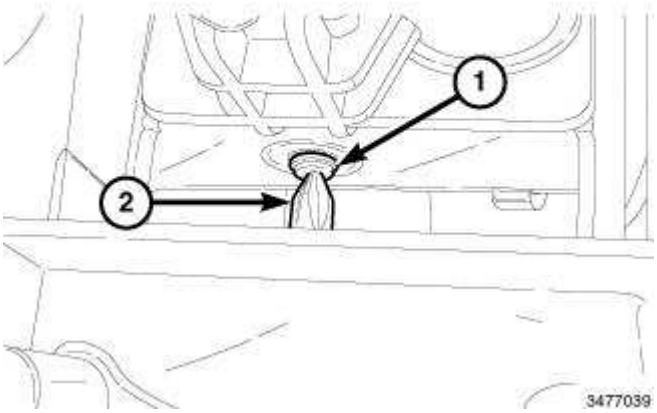

Fig. 7: Screw Driver & Threaded Stud
Courtesy of CHRYSLER GROUP, LLC

5. Using a pocket screw driver (2) or equivalent, push in the threaded stud (1) and remove the steering column lock module.

MODULE LOCKED

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Before starting this procedure refer to the MODULE/PROGRAMMING ORDER REPLACEMENT GUIDE chart for the correct order in which to replace and program the modules. Refer to STANDARD PROCEDURE .

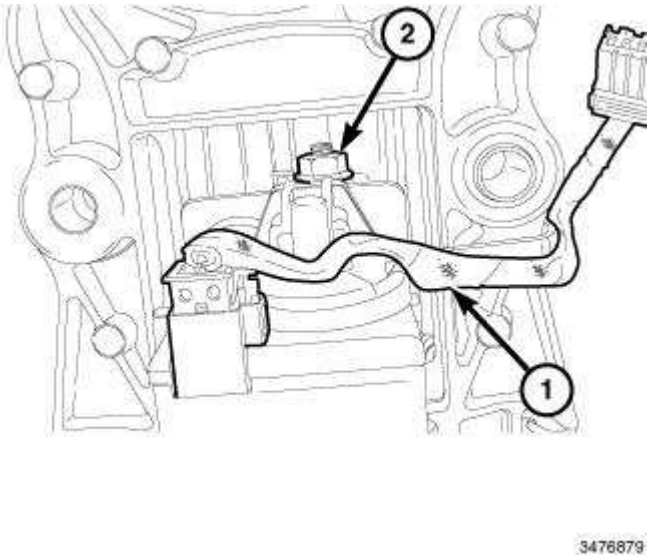

Fig. 8: Steering Column Lock Module Retainer & Steering Column Lock Module Jumper Harness
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the steering column. Refer to **COLUMN, REMOVAL** .
3. Remove the steering column lock module retainer (2).
4. Remove the steering column lock module jumper harness (1).

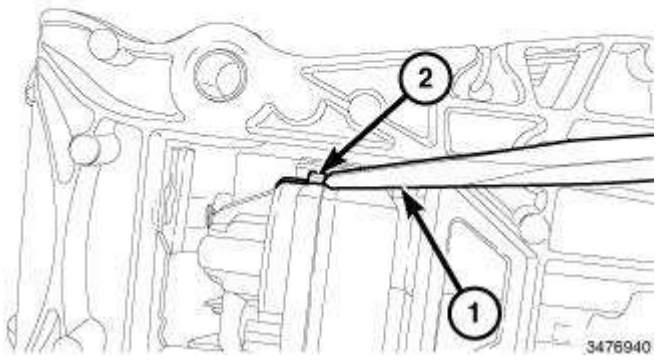

Fig. 9: Cold Chisel & Access Door
Courtesy of CHRYSLER GROUP, LLC

NOTE: When knocking the access door off it is important that you are parallel to the module to prevent damage to the internal gears.

5. Using a cold chisel (1) or equivalent knock the access door (2) off of the steering column lock module.

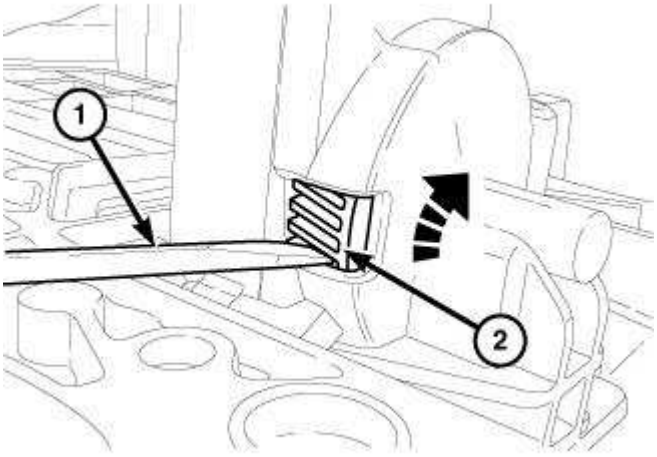

Fig. 10: Screw Driver & Rotate The Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rotate the gear until it stops.

6. Using a pocket screw driver (1) or equivalent rotate the gear (2) away from the steering column to unlock the module.

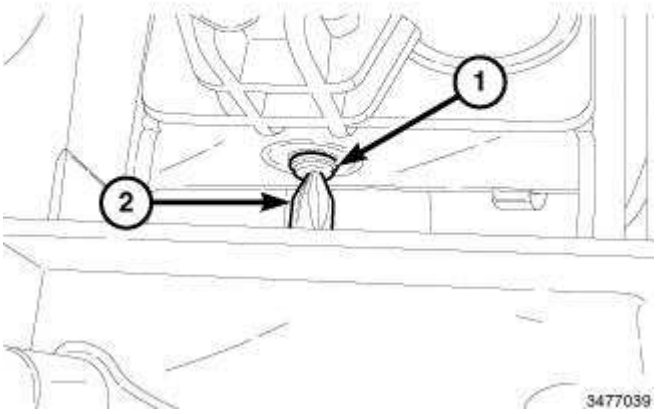

Fig. 11: Screw Driver & Threaded Stud
Courtesy of CHRYSLER GROUP, LLC

7. Using a pocket screw driver (2) or equivalent push in the threaded stud (1).

8. Remove the steering column lock module.

INSTALLATION

INSTALLATION

NOTE: Before attempting service, the ignition key must be inside the vehicle near or on the center console for the entire length of the procedure.

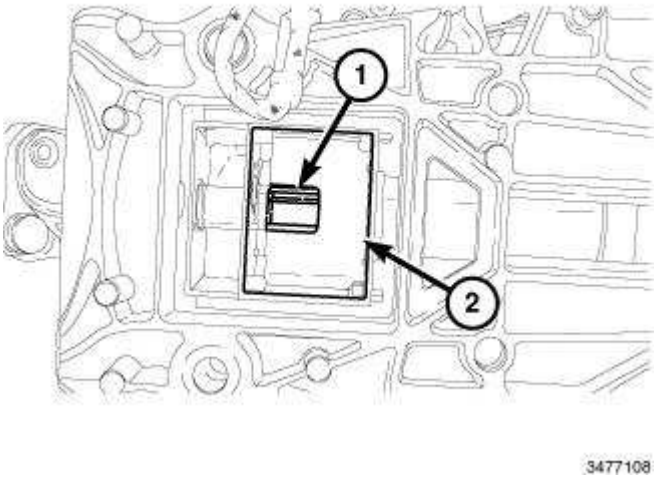

Fig. 12: Module Area & Column Lock Shaft Area
Courtesy of CHRYSLER GROUP, LLC

1. Check and remove any debris found the column lock shaft area (1).
2. Check the rest of the module area (2) for debris that will prevent the column lock module from function properly.
3. Push in the threaded stud on the steering column lock module and install the steering column lock module into the steering column.

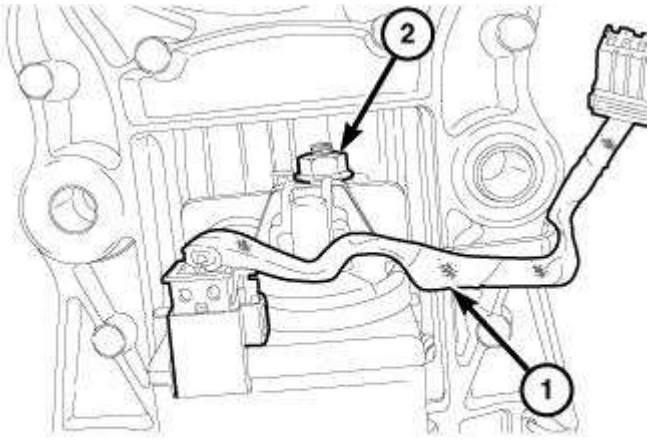

Fig. 13: Steering Column Lock Module Retainer & Steering Column Lock Module Jumper Harness
Courtesy of CHRYSLER GROUP, LLC

4. Install the steering column lock module jumper harness (1).
5. Install the steering column lock module retainer (2).

   Tighten to 6 N.m (53 in. lbs.).

6. Install the steering column. Refer to **COLUMN, INSTALLATION** .
7. Connect the negative battery cable/IBS to the battery.

NOTE: If a NEW column lock module has been installed, a new Radio Frequency Hub (RF Hub) must also be installed.

NOTE: Program the modules as described in the "RF-Hub, BCM, PCM FOBik and ELV Replacement and Programming Order Guide". Refer to STANDARD PROCEDURE .

NOTE: For additional information programming the ELV/ESCL. Refer to STANDARD PROCEDURE.

SENSOR, INTRUSION MODULE

DESCRIPTION

DESCRIPTION

The Intrusion Module, sometimes referred to as Intrusion Transceiver Module (ITM), is used on some export vehicles only. Its function is to sense any interior movement while the vehicle is parked and

secured. Besides having two exterior sensors it also has an internal sensor that senses the tilt and motion of the sensor itself. This protects against tire theft and tow away. When interior movement or module motion is detected, it will trip the Vehicle Theft Alarm (VTA) and sound the equipped siren. When tripped it will also send a CAN Bus message to the Body Control Module and the Radio Frequency Hub to actuate their respective actions such as flash the lamps and immobilize the engine etc.

The Intrusion Module is mounted in the headliner near the 2nd row overhead lamp assembly. There is one sensor in the snap plate of the second row lamp assembly, and one sensor in the snap plate of the third row lamp assembly. The sensor harness is glued to the underside of the headliner.

REMOVAL

REMOVAL

SECOND ROW INTRUSION SENSOR

1. The second row intrusion sensor is attached to the second row overhead lamp assembly and is available separately.
2. Remove the Intrusion Module. Refer to **MODULE, INTRUSION, REMOVAL**.
3. Disconnect and remove the intrusion sensor.

THIRD ROW INTRUSION SENSOR

1. Disconnect the negative battery cable.
2. Remove the third row dome lamp assembly.
3. Disconnect the intrusion sensor.
4. Remove intrusion sensor from the dome lamp bezel.

INSTALLATION

INSTALLATION

SECOND ROW INTRUSION SENSOR

The second row intrusion sensor is in the snap plate of the second row lamp assembly. Refer to **MODULE, INTRUSION, INSTALLATION**.

THIRD ROW INTRUSION SENSOR

1. Install the intrusion sensor into the dome lamp assembly.
2. Connect the intrusion sensor.
3. Install the third row dome lamp.
4. Connect the negative battery cable.

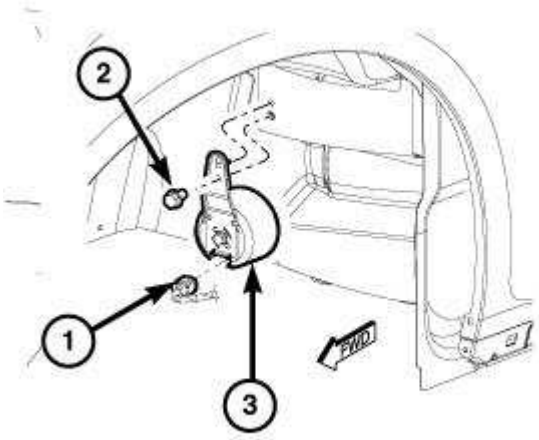
SENSOR HARNESS

1. Lower the headliner to gain access to the sensor harness which is glued to the top of the headliner. Refer to **HEADLINER, REMOVAL** .
2. Overlay the new harness near the old one and secure it with tape.
3. Cut off the old connectors but leave the old harness. It is safer to leave it because removing it may damage the headliner.
4. Raise the headliner as necessary to install and connect the sensors.
5. Finish installing the headliner. Refer to **HEADLINER, INSTALLATION** .

SIREN

REMOVAL

REMOVAL



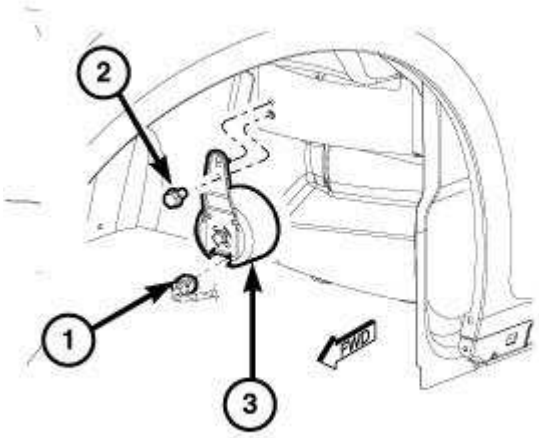
3660951

Fig. 14: Siren Electrical Connector & Siren Mounting Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the left front splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
3. Disconnect the siren electrical connector (1).
4. Remove the siren mounting retainer (2).
5. Remove the siren from the vehicle.

INSTALLATION

INSTALLATION



3660951

Fig. 15: Siren Electrical Connector & Siren Mounting Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Position the siren (3) to the vehicle.
2. Install the siren mounting retainer (2).
3. Connect the siren electrical connector (1).
4. Install the left front splash shield Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
5. Connect the negative battery cable.

ACCESSORIES AND EQUIPMENT

Power Windows - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed through a circuit breaker, only when the ignition switch is in the On position.

The power window system includes the power window switches on each door trim panel, the circuit breaker, and the power window motors inside each door. The power switches are all similar in design and function with exception of the drivers side power switch module however, they are all serviced in the same manner. The power motors are similar as well and can be serviced separately from the window regulators.

OPERATION

OPERATION

POWER WINDOW SWITCH

The power windows are controlled by a window/lock switch on the trim panel of each front door. Switches in the driver door window/lock switch allows the driver to control the passenger windows.

The power window switch for the driver side front door window has a second detent position beyond the normal Down position that provides an automatic one-touch window down feature. This feature is controlled by the window/lock switch.

The power window switches control the battery and ground feeds to the power window motors. All of the passenger door power window switches receive their battery and ground feeds through the circuitry of the window/lock switch. When the power window lockout switch is in the Lock position, the battery feed for the individual passenger door power window switches is interrupted.

POWER WINDOW MOTOR

A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals will cause the motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction.

In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads. The power window motor and gearbox assembly cannot be

adjusted or repaired. If damaged or ineffective, the entire unit must be replaced.

EXPRESS DOWN WINDOW FEATURE

This feature allows you to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the RKE transmitter and then immediately press and hold the UNLOCK button until the windows lower to the desired level or until they lower completely.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOWS

For complete circuit diagrams, refer to the appropriate wiring information.

ALL WINDOWS INOPERATIVE

1. Check the circuit breaker. If OK, go to 2. If not OK, replace the inoperative circuit breaker.
2. Disconnect and isolate the battery negative cable. Remove the window/lock switch from the driver side front door trim panel. Unplug the wire harness connector.
3. Check for continuity between the ground circuit cavity of the door module wire harness connector and a good ground. If OK, go to 4. If not OK, repair the circuit to ground as required.
4. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the window/lock switch wire harness connector. If OK, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . If not OK, repair the circuit as required.

ONE WINDOW INOPERATIVE

The window glass must be free to slide up and down for the power window motor to function properly. If the glass is not free to move up and down, the motor will overload and trip the integral circuit breaker. To determine if the glass is free, disconnect the regulator from the glass. Then slide the window up and down by hand.

There is an alternate method to check if the glass is free. Position the glass between the up and down stops. Then, shake the glass in the door. Check that the glass can be moved slightly from side to side, front to rear, and up and down. Then check that the glass is not bound tight in the tracks. If the glass is free, proceed with the diagnosis that follows. If the glass is not free, determine the cause of the condition.

If the only inoperative window is in the driver or passenger side front door and the preceding checks have not identified a problem. Refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If the problem being diagnosed involves only the Auto-down feature for the driver side front door window, but all of the power windows are operational, replace the driver's side window/lock switch. For diagnosis of the window/lock switch. Refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . For a rear power window problem proceed with the following:

1. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the power window switch unit on the door with the inoperative power window. Check for continuity between the ground circuit cavity of the power window switch wire harness connector and a good ground. There should be continuity. If OK, go to 2. If not OK, repair the open circuit to the power window and door lock master switch as required.
2. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity in the body half of the power window switch unit wire harness connector. If OK, go to 3. If not OK, repair the open circuit to the power window and door lock master switch as required.
3. Test the power window switch continuity. Refer to **SWITCH, POWER WINDOW, DIAGNOSIS AND TESTING**. If OK, go to 4. If not OK, replace the power window switch.
4. Check the continuity in each circuit between the inoperative power window switch wire harness connector cavities and the corresponding power window motor wire harness connector cavities. If OK, refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If not OK, repair the open circuit(s) as required.

NOTE: All passenger door power window switches receive their battery and ground feed for operating the passenger door power window motors through the driver side power window and lock master switch and wire harness connector.

STANDARD PROCEDURE

STANDARD PROCEDURE -

CLEAR/RELEARN

NOTE: The battery must be fully charged or the vehicle running for proper calibration of the front door module.

NOTE: The following procedure must be performed anytime the power window system has been serviced in either front door or, there is a possible concern with a door module calibration.

Express-up / Express-down possible concerns.

- Glass will not lower all the way down flush to the belt-line.
- Glass will not raise fully; wind noise / water leak.
- Glass will not raise automatically (Expess-up) after lifting the switch to the second detent and releasing.

To clear/denormalize the door module memory, perform the following procedure:

CLEAR/DENORMALIZE

CLEAR/DENORMALIZE

1. Check and repair any door module Diagnostic Trouble Code (DTC) (s) before proceeding.
2. Using a scan tool, under the miscellaneous functions menu select (Denormalize Window/Reset ECU), and follow the directions to clear/denormalize the door module memory.

To relearn/normalize the door module memory, perform the following procedure:

MOTOR, WINDOW REGULATOR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINDOW MOTOR

For complete circuit diagrams, refer to the appropriate wiring information.

1. Disconnect and isolate the battery negative cable. Remove the trim panel from the door with the inoperative power window.
2. Unplug the power window motor wire harness connector. Apply 12 volts across the motor terminals to check its operation in one direction. Reverse the connections across the motor terminals to check the operation in the other direction. If the window is in the full up or full down position, the motor will not operate in that direction by design. If OK, repair the circuits from the power window motor to the power window switch as required. If not OK, replace the inoperative motor.
3. If the motor operates in both directions, check the operation of the window glass and lift mechanism through its complete up and down travel. There should be no binding or sticking of the window glass or lift mechanism through the entire travel range. If not OK, check the window glass, tracks, and regulator for sticking, binding, or improper adjustment.

REMOVAL

REMOVAL

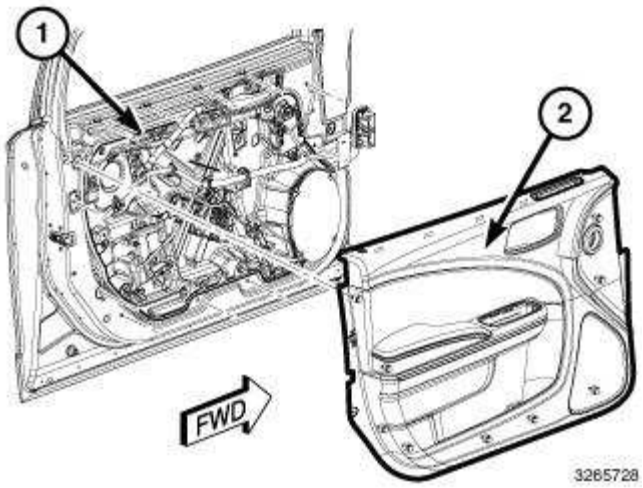

Fig. 1: Motor And Gear Assembly & Interior Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Partially raise or lower the door glass to relieve tension on motor and cables where possible. Secure the glass as necessary.
2. Disconnect and isolate the negative battery cable.
3. Remove the door interior trim panel (2). Refer to **PANEL, DOOR TRIM, REMOVAL** or **PANEL, REAR DOOR TRIM, INSTALLATION** for the appropriate procedure.

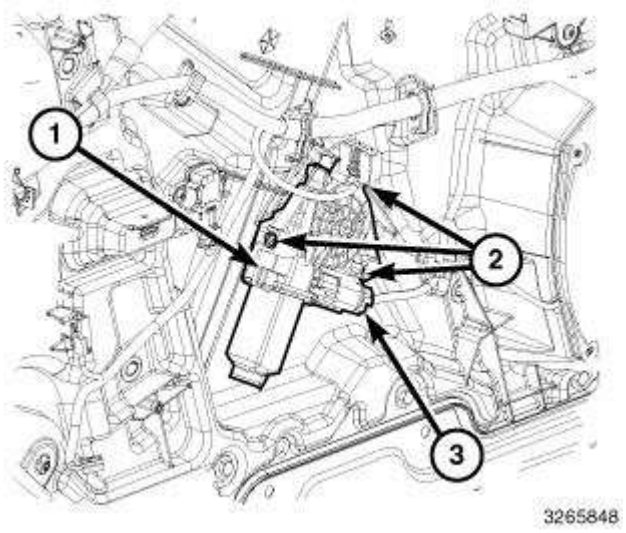

Fig. 2: Window Motor
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the power window motor electrical connector (3) from the motor electrical connector receptacle.
5. Remove the three fasteners (2) that secure the power window motor and gear assembly (1) to the carrier plate.

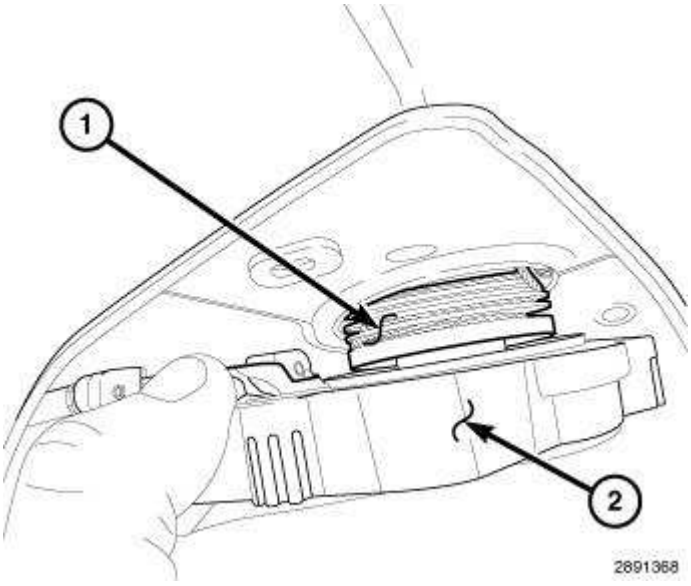

Fig. 3: Identifying Cable Drive And Motor
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable flat bladed tool, lightly pry the cable drive (1) away from the motor (2) and remove the motor and gear assembly.

INSTALLATION

INSTALLATION

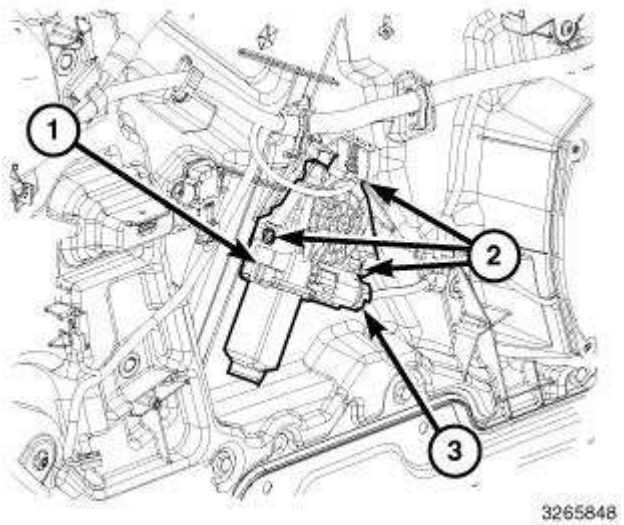

Fig. 4: Window Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The power window motor may need to actuated momentarily to line up the gear in the drive assembly with the regulator.

1. Connect the power window motor electrical connector (3) to the motor electrical connector receptacle.
2. Position the power window motor and gear assembly (1) on the carrier plate, aligning the drive gear with the regulator.
3. If necessary, temporarily connect the window switch assembly and battery to actuate the motor.
4. Install and tighten the three fasteners (2) that secure the power window motor and gear assembly to the carrier plate.

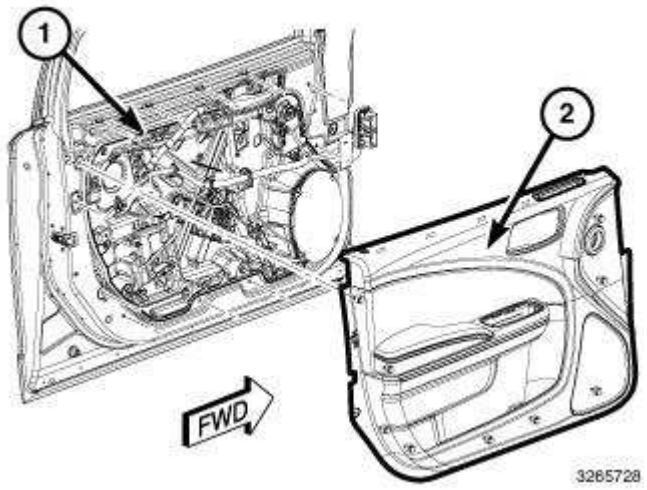

Fig. 5: Motor And Gear Assembly & Interior Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Reinstall the door interior trim panel (2), refer to **PANEL, DOOR TRIM, INSTALLATION** or **PANEL, REAR DOOR TRIM, INSTALLATION** for the appropriate procedure.
6. Connect the negative battery cable.
7. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE**.

SWITCH, POWER WINDOW

DESCRIPTION

DESCRIPTION

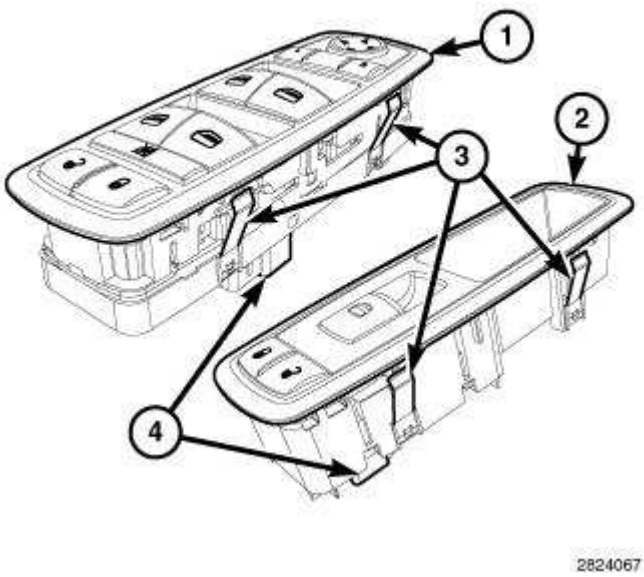

Fig. 6: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Two different modules are used: a driver side module (1), and a passenger side module (2). Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

Each switch module housing is secured within the trim panel armrest by four spring clip retainers (3), two on each side of the switch module housing. The passenger side switch module includes a small cubby bin. A connector receptacle (4) integral to the switch module housing connect the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harness.

The front door power switch modules include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - Three mirror selector switch buttons choose the power mirror to be adjusted, **R** (right), **L** (left) or a power fold position (both mirrors).
- **Power Mirror Direction Control Switch (Driver Side Switch Only)** - After a power mirror is selected, pressing down on one of the arrows on the momentary mirror direction switch will move the selected mirror in that direction for as long as it is held down until the limit of the mirror

travel is reached.

- **Power Window Lockout Switch (Driver Side Switch Only)** - A latching push-button power window lockout switch allows the vehicle operator to lock out the power window switches on each front and rear passenger door so that those windows may be operated only from the driver side front door master switches. When the lockout switch is engaged, the LED back lighting for each front and rear passenger door power window switch is extinguished.
- **Power Window Switches** - A single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for each passenger door window while the driver side switch module contains four of these power window switches, one switch dedicated to each door window. The switch tab for the driver side front door power window has a second detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. A second detent in the up direction on both front door power window switches activates the **Express-Up** feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door switch module must be replaced as a unit.

OPERATION

OPERATION

The driver side front door power switch module combines a power lock switch, a power window switch for each of the four door windows including auto-down (also known as one-touch down or express down) and express up features for both front door windows, a power window lockout switch, a power mirror selector switch, and a power mirror adjustment switch in a single unit. The passenger side power door switch module combines a power lock switch and a passenger side front door power window switch with the auto-down and express up features.

The driver side front door power switch module provides resistor multiplexed outputs to the driver door module indicating the power lock switch selection, hard wired analog outputs indicating the power mirror selector switch and adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection indicating the power window switch selections. The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating both the power lock and power window switch selections.

The hard-wired circuits between the driver side front door power switch module and the driver side door module or the rear door power window switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the door module or in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

The hard-wired circuits between the passenger side front door power switch module and the

passenger side door module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock or power window systems. The most reliable, efficient, and accurate means to diagnose the power switch module or the electronic controls and communication related to power lock or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOW SWITCH

The front door power window switches are included in the window/lock switch . Refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** .

The Light-Emitting Diode (LED) illumination lamps for all of the power window switches receive battery current through the power window circuit breaker in the junction block. If all of the LEDs are inoperative in the power window switch and the power windows are inoperative. Refer to **DIAGNOSIS AND TESTING** . If the power windows operate, but any or all of the LEDs are inoperative, the power window and lock switch units with the inoperative LED(s) must be replaced. For complete circuit diagrams, refer to the appropriate wiring information.

REMOVAL

REMOVAL

FRONT SWITCH MODULE

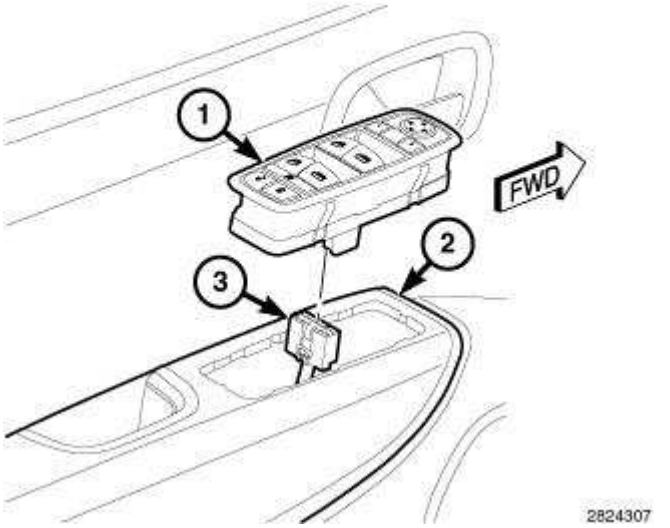

Fig. 7: Switch Module, Arm Rest & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, pry the bezel of the front door switch module (1) up and away from the front door trim panel arm rest (2) far enough to disengage the four spring steel retainers of the switch from the arm rest opening.
3. Pull the switch module away from the mounting hold of the arm rest far enough to access and disconnect the door wire harness connector (3) from the switch connector receptacle.
4. Remove the switch module from the vehicle.

REAR SWITCH ASSEMBLY

NOTE: The passenger rear window switches for this vehicle are serviced in the same manner as the front switch module.

1. Refer to1.

INSTALLATION

INSTALLATION

FRONT SWITCH MODULE

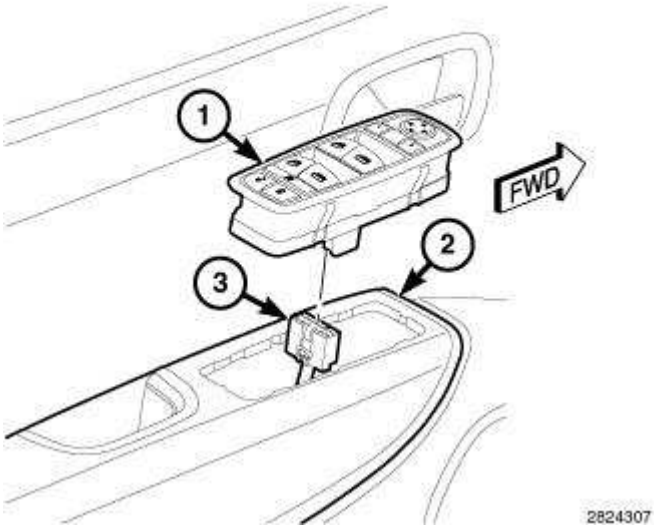

Fig. 8: Switch Module, Arm Rest & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door switch module (1) close enough to the mounting hole in the arm rest (2) of the front door trim panel to access and reconnect the front door wire harness connector (3) to the switch connector receptacle.
2. Align the switch module to the arm rest mounting hole.

3. Using hand pressure, press the switch module firmly and evenly into the mounting hole until the four spring steel retainers of the switch are fully engaged and the switch bezel is fully seated against the arm rest.
4. Connect the battery negative cable.

REAR SWITCH ASSEMBLY

NOTE: The passenger rear window switches for this vehicle are serviced in the same manner as the front switch module.

ACCESSORIES AND EQUIPMENT

Wiper System & Washer System - Service Information - Chrysler 300

DESCRIPTION

DESCRIPTION

An electrically operated intermittent wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Light Rain Sensor Module** - A Light Rain Sensor Module (LRSM) (also known as the Light Sensor Module/LSM or the Rain Sensor Module/RSM) is used on vehicles equipped with the optional automatic wiper feature. The LRSM is located on a bracket bonded to the inside surface of the windshield glass, near the inside rear view mirror mount.
- **Multi-Function Switch** - The multi-function switch is integral to the Steering Column Control Module (SCCM) along with the clockspring and the Steering Control Module (SCM) on the top of the steering column just below the steering wheel. The multi-function switch is connected to the SCM. Only the switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The multi-function switch provides all of the driver controls for the wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) along with the multi-function switch and the clockspring on the top of the steering column just below the steering wheel. The SCM is completely concealed beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower, outboard side of the washer reservoir, ahead of the right front wheel house splash shield.
- **Washer Nozzle** - Two fluidic washer nozzles with integral check valves are secured by latch features to dedicated openings in the hood panel near the base of the windshield.
- **Washer Plumbing** - The plumbing for the washer system consists of rubber hoses, hard plastic tubes and molded rubber or plastic fittings. The plumbing is routed to the dash panel from the washer reservoir along the outboard side of the right front load beam. The washer hose is routed along the right hood hinge to the hood, then across the underside of the hood panel to the washer nozzles.
- **Washer Pump/Motor** - The electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, outboard side of the washer reservoir, ahead of the right front wheel house splash shield.
- **Washer Reservoir** - The washer reservoir is concealed between the right inner fender shield and the right outer fender panel, ahead of the right front wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, can be easily accessed from

the right front corner of the engine compartment.

- **Wiper Arms And Blades** - The two wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two wiper blades are each secured to their wiper arm with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation. The left and right wiper arms and wiper blades are unique and are not interchangeable.
- **Wiper Module** - The wiper pivot shafts are the only visible components of the wiper module. The remainder of the module is concealed beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, three rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the two wiper drive links and the two wiper pivots.

Hard wired circuitry connects the wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the wiper and washer system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

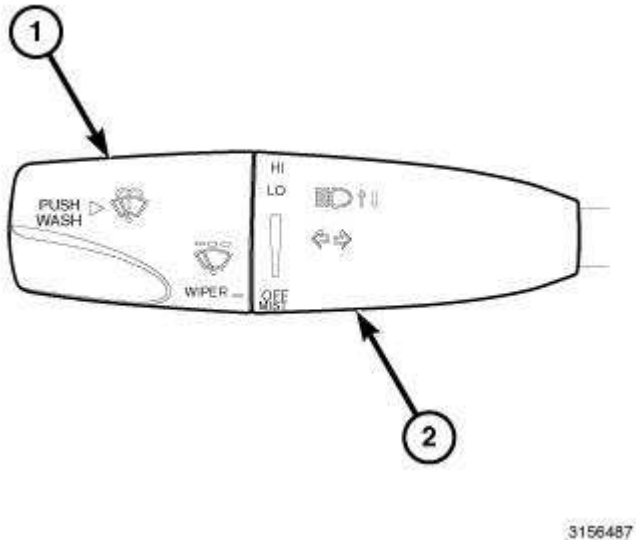

Fig. 1: Control Knob & Control Stalk
Courtesy of CHRYSLER GROUP, LLC

The wiper and washer system is designed to provide the vehicle operator with a convenient, safe and reliable means of maintaining visibility through the windshield glass. The various components of this

system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud or other minor debris from the outer surface of the windshield glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all wiper and washer system functions with the control knob (1) on the control stalk (2) of the multi-function switch that extends from the left side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the OFF, DELAY (except with the optional automatic wiper system), AUTO (with the optional automatic wiper system only), LOW or HIGH wiper system operating modes. In the DELAY mode, the control knob also allows the vehicle operator to select from one of four intermittent wipe DELAY intervals. In the AUTO mode, the control knob allows the vehicle operator to select from one of four automatic wiper sensitivity levels.

Depressing the control knob towards the steering column actuates the momentary washer system switch, which selects the WASH and WIPE-AFTER-WASH modes depending upon when and how long the switch is held closed. Rotating the control knob downward actuates another momentary switch and selects the MIST mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the control knob is released.

The multi-function switch provides hard wired analog and resistor multiplexed inputs to the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Wiper and washer system operation is completely controlled by the SCM and BCM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the ACCESSORY or ON positions. The BCM uses intelligent, high current, self-protected high side switches to control integrated wiper relays that control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The multi-function switch circuitry receives battery current and a clean ground output from the SCM, then provides analog and multiplexed inputs to the SCM to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the wiper and washer system operating modes.

AUTOMATIC WIPE MODE

If the vehicle is equipped with the optional automatic wiper system and it is enabled, when the control knob on the control stalk of the multi-function switch is moved to one of the four sensitivity positions, the SCM sends an electronic **wiper switch sensitivity** message to the BCM over the CAN data bus. The BCM, which is also a Local Interface Network (LIN) data bus master, relays the **wiper switch sensitivity** message to the Light Rain Sensor Module (LRSM) (also known as the Light Sensor Module/LSM or Rain Sensor Module/RSM), which is a LIN slave, over the LIN data bus.

The LRSM monitors an area within the wipe pattern of the windshield glass for the accumulation of moisture. Based upon internal programming and the selected sensitivity level, when sufficient moisture has accumulated the LRSM sends the appropriate electronic **wipe command** messages back to the BCM over the LIN data bus. Then the BCM operates the wiper system accordingly.

As the sensitivity level is set higher, the LRSM is more sensitive to moisture accumulation and will send **wipe commands** more frequently. The third (middle) sensitivity position of the control knob is designed to provide optimal wiper performance for most typical driving requirements. The BCM logic is also programmed to provide an immediate wipe cycle each time the control knob on the control stalk of the multi-function switch is moved from the OFF position to one of the four sensitivity positions, and another immediate wipe cycle each time the control knob is moved from a lower sensitivity position to a higher sensitivity position.

Also, if a vehicle is equipped with automatic wipers but the feature has been disabled using the customer programmable features function, when any sensitivity position is selected with the control knob the system will respond in the same manner as in the intermittent wipe mode. The automatic wiper system also has features designed to protect the mechanical components of the wiper system, and will not allow automatic wiper operation under the following conditions:

- **Low Ambient Temperature** - When the ambient temperature is below 0° C (32° F), the automatic wipers will not operate during a new ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment the current ignition cycle began, or until a vehicle speed input is detected.
- **Transmission In Neutral** - When the transmission gear selector is placed in the NEUTRAL position with the ignition switch in the ON position, the automatic wipers will not operate during the current ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment the NEUTRAL position was selected, until the vehicle speed is greater than 8 kilometers-per-hour (5 miles-per-hour) or until the transmission gear selector is moved out of the NEUTRAL position, whichever occurs first.

CONTINUOUS WIPE MODE

When the LOW position of the control knob on the control stalk of the multi-function switch is selected the SCM sends an electronic **wiper switch low** status message to the BCM over the CAN data bus. The BCM then directs battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the HIGH position of the control knob is selected the SCM sends an electronic **wiper switch high** status message to the BCM. The BCM then directs battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the OFF position of the multi-function switch control knob is selected, the SCM sends an electronic **wiper switch off** status message to the BCM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob OFF position is selected.

If the wiper blades are in the down position on the windshield when the OFF position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the BCM. The BCM then de-energizes the wiper motor and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the OFF position is selected, the park switch is an open circuit and the BCM continues running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the BCM is again closed to ground.

HEADLAMPS ON WITH WIPERS MODE

The circuitry of the BCM provides an automatic HEADLAMPS ON WITH WIPERS mode for vehicles equipped with the optional automatic headlamps. This is a customer programmable feature that can be enabled or disabled through the Electronic Vehicle Information Center (EVIC). If this feature is enabled, when the headlamp switch is in the AUTO position, the headlamps will turn ON automatically whenever the windshield wipers are turned ON; and, if the headlamps were turned ON automatically when the wipers were turned ON, they will also turn OFF automatically when the wipers are turned OFF.

If this feature is enabled in vehicles equipped with the optional automatic wiper feature, when the automatic wiper mode is selected the headlamps will turn ON automatically only after the wipers complete three automatic wipe cycles within about 30 seconds, and they will turn OFF automatically after 3 minutes elapse without any automatic wipe cycles unless ambient light conditions dictate otherwise.

INTERMITTENT WIPE MODE

The following applies to vehicles not equipped with the optional automatic wiper system, or to vehicles equipped with the automatic wiper system that have been disabled using the customer programmable features function.

When the control knob on the control stalk of the multi-function switch is moved to one of the four DELAY interval positions the SCM sends an electronic **wiper switch delay interval** status message to the BCM. Then the BCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

The BCM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the BCM to determine the proper intervals at which to energize and de-energize the wiper motor low speed brush to operate the wiper motor intermittently for one low speed cycle at a time.

The BCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature, the BCM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, the Antilock Brake System/ABS module or the Electronic Stability Control/ESC module) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

MIST WIPE MODE

When the control knob of the multi-function switch is rotated downward to the momentary MIST position, the SCM sends an electronic **wiper mist mode** status message to the BCM. The BCM then energizes the low speed brush of the wiper motor for as long as the switch is held closed, then de-energizes the motor when the state of the switch changes to open, parking the wiper blades near the base of the windshield. The BCM can operate the wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the switch is held closed.

WASH MODE

When the control knob of the multi-function switch is depressed toward the steering column to the momentary WASH position for more than about one-half second with the wiper system operating, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the switch is held closed (up to approximately 10 seconds) and to be de-energized when the control knob is released.

When the control knob is depressed to the momentary WASH position while the wiper system is operating in one of the DELAY interval (or sensitivity level with automatic wipers) positions, the washer pump/motor operation is the same. However, the BCM logic also overrides the selected delay interval or sensitivity level and operates the wiper motor in a continuous low speed mode for as long as the control knob is held in the momentary WASH position, then reverts to the selected delay interval or sensitivity level several wipe cycles after the control knob is released. If the WASH switch is held closed for more than about 10 seconds, the BCM will suspend washer pump/motor operation until the control knob is released for about 2 seconds, then cycled back to the WASH position.

WIPE-AFTER-WASH MODE

When the control knob of the multi-function switch is depressed toward the steering column to the momentary WASH position for more than about one-half second while the wiper system is not operating, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to operate the washer pump/motor and energizes the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 10 seconds). When the control knob is released, the BCM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for two or three additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

If the control knob is held inward for more than about 10 seconds, the BCM will suspend washer pump/motor operation until the knob is released for about 2 seconds and then cycled back to the

WASH position; however, the wipers will continue to operate for as long as the switch is held closed. The BCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the BCM to count the number of wipe cycles that occur after the control knob is released, and to determine the proper interval at which to de-energize the wiper motor to complete the WIPE-AFTER-WASH mode cycle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WIPER MOTOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If the wiper motor operates, but the wipers do not move on the windshield, replace the ineffective wiper motor or wiper linkage module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the wiper and washer system or the electronic controls and communication related to wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The wiper and washer switches are integral to the multi-function switch in the Steering Column Control Module (SCCM). The multi-function switch communicates with the Steering Control Module (SCM), which is also integral to the SCCM. The SCM communicates with the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Controller Area Network (CAN) data bus. Before performing any of the following tests, determine whether the other functions of the multi-function switch are operational. If other multi-function switch functions are ineffective, diagnose and repair that problem before attempting to repair the Wiper and Washer System.

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between BCM and wiper motor if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor as required.
WIPERS DO NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between BCM and wiper motor if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective wiper motor park switch.	3. Test and replace wiper motor if required.
WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS	1. Ineffective wiper motor.	1. Check amperage draw with linkage disconnected from wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor output shaft, check linkage and pivots for binding. If binding is detected, repair or replace wiper linkage module if required. If no linkage binding detected, replace the wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between BCM and wiper motor if required.

WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuits.	2. Test and repair washer pump feed circuits between BCM and washer pump if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective washer pump.	5. Test and replace open or shorted washer pump if required.

FALSE WIPES (AUTOMATIC WIPER ONLY)

False wipes are unnecessary wipes that occur when the control knob of the multi-function switch is in one of the four automatic wiper sensitivity positions and no rain or moisture is apparent within the wipe pattern on the windshield glass. Because this system is designed to operate whenever it detects moisture, if the switch is in one of the automatic wiper sensitivity positions any road spray, bug splatters, or mist from passing cars or trucks may occasionally cause the wipers to cycle. These are normal characteristics of this system and are not false wipes.

False wipes generally are the result of foreign material or flaws that interfere with the system optics. The optics for this system allow the Light Rain Sensor Module (LRSM) (also known as the Light Sensor Module/LSM or Rain Sensor Module/RSM) to precisely transmit several InfraRed (IR) light beams and precisely monitor the intensity of these beams reflected from the outer surface of the windshield glass to determine the presence of moisture. The sensitivity of this system is such that anything that distorts the focus or intensity of the IR light beams or affects the ability of the photo diodes within the LRSM to see and accurately measure these light beams can result in the LRSM logic misinterpreting the resulting input data as moisture on the windshield. The optics for this system include the lenses of the LRSM, the lens of the LRSM bracket, the adhesive pad layer that bonds the LRSM bracket to the inside of the windshield, and the windshield glass.

The following procedure should only be used if false wipe occurrences are frequent and persistent. Perform diagnosis of the wiper system, the multi-function switch, the Steering Control Module (SCM) and the LRSM using a diagnostic scan tool and the appropriate diagnostic procedures before performing the following:

NOTE: The Light Rain Sensor Module (LRSM) mounting bracket is serviced as a unit with the windshield glass. If either the bracket or the glass is ineffective or damaged, the entire LRSM bracket and windshield glass unit must be replaced.

1. Carefully inspect the outer surface of the windshield glass for physical damage, including scratches, cracks or chips in the vicinity of the LRSM mounting bracket lenses. **Scratches,**

cracks or chips in the windshield glass outside the area of the LRSM mounting bracket lenses will not cause false wipes. If OK, go to Step 2. If not OK, replace the damaged windshield.

2. From the outside of the windshield glass, carefully inspect the adhesive layer between the windshield glass and the LRSM bracket for any large voids. If an adhesive void greater than about 1 millimeter (0.04 inch) is observed, replace the flawed LRSM mounting bracket and windshield unit. If OK, go to Step 3.
3. Lightly pull the LRSM away from the windshield bracket to confirm that both sides of the spring steel LRSM mounting band are fully engaged with the mounting bracket on the inside of the windshield glass. If OK, go to Step 4. If not OK, reinstall the LRSM onto the bracket as required.
4. Remove the LRSM from the mounting bracket. Inspect the LRSM lenses and the mounting bracket lens for contamination. If OK, go to Step 5. If not OK, clean any foreign material from each of these lenses using rubbing alcohol and a lint-free cloth.
5. Carefully inspect the LRSM for any physical damage, including scratches on the LRSM lenses. If OK, go to Step 6. If not OK, replace the damaged LRSM.
6. Carefully inspect the LRSM mounting bracket for any physical damage, including scratches on the LRSM bracket lens. If not OK, replace the damaged LRSM bracket and windshield as a unit.

CLEANING

CLEANING

WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing or beading on the glass after thorough cleaning of the

squeegees and the glass, the entire wiper blade assembly must be replaced.

WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor unit from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles cannot be back-flushed due to the integral check valve mechanism. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

INSPECTION

INSPECTION

WIPER SYSTEM

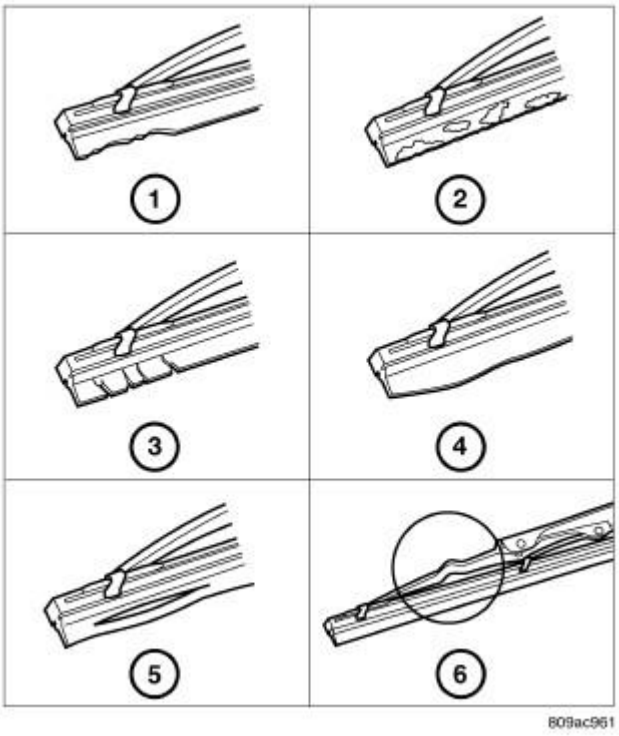

Fig. 2: Wiper Blades And Wiper Arms
Courtesy of CHRYSLER GROUP, LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4) or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or if there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from

the glass using a small fish scale. On vehicles with unequal wiper arm lengths, be certain that measurements on both arms are taken at a point an equal distance from their wiper arm hinge pins. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a significantly lower scale reading.

4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing or beading, replace the wiper blade.

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

ARM, WIPER

DESCRIPTION

DESCRIPTION

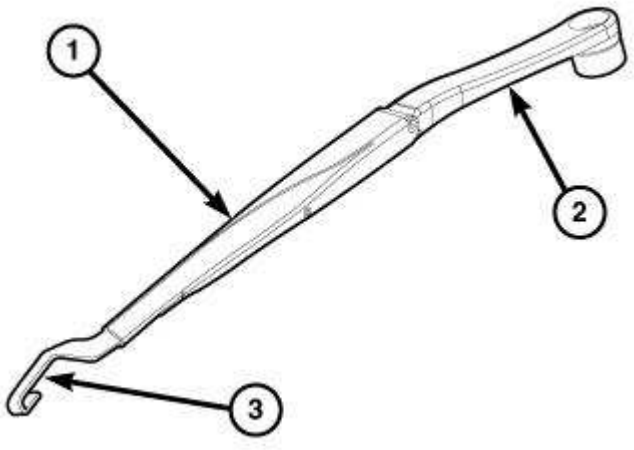

Fig. 3: Stamped Steel Channel, Aluminum Pivot End & Stamped Steel Strap

Courtesy of CHRYSLER GROUP, LLC

The wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms have a somewhat sculpted appearance that actually has a functional purpose. The sculpting is designed to reduce wind buffeting, which helps to reduce wind noise within the passenger compartment of the vehicle.

These wiper arms include an over-center hinge design that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast aluminum pivot end (2) with a large, internally tapered mounting boss at one end. A molded black plastic cap snaps over the pivot end to conceal the wiper arm retaining nut and the mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (1) hinges on and is secured with a hinge pin to the blade end of the wiper arm pivot end. One end of a stamped steel strap (3), is secured within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

Concealed within the stamped steel channel is a long tension spring which is engaged with a formed wire link hooked over a metal dowel pin that passes through the underside of the pivot end. The opposite end of the spring is hooked over another metal dowel pin that passes through the underside of the steel channel.

The driver and passenger side wiper arms are not interchangeable. These arms have a letter **D** (Driver) or **P** (Passenger) cast into the surface of the pivot end to identify their proper locations. A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

OPERATION

The wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nuts lock the wiper arms to the threaded studs of the wiper pivot shafts. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REMOVAL

REMOVAL

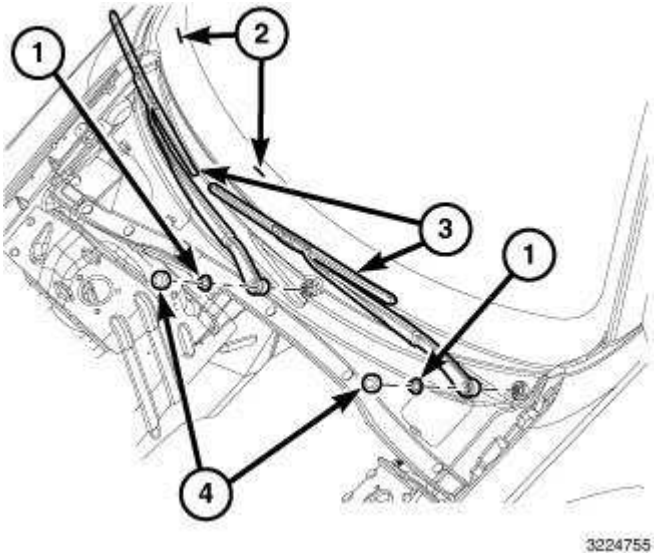

Fig. 4: Wiper Arm And Blade, Plastic Nut Cap & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Lift the wiper arm and blade (3) to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
2. Carefully pry the plastic nut cap (4) off of the nut (1) on the pivot end of the wiper arm.
3. Remove the nut that secures the wiper arm to the wiper pivot shaft.

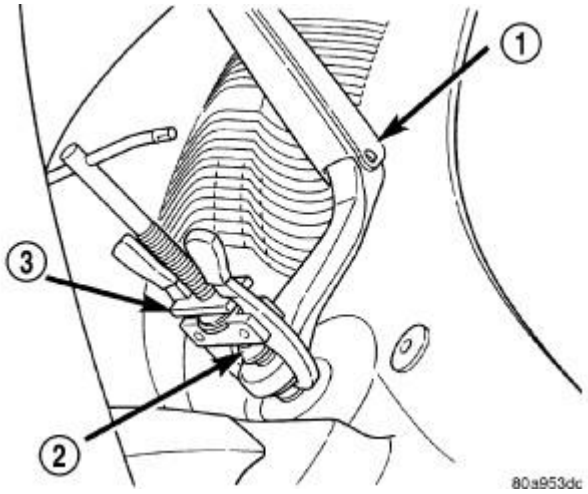

Fig. 5: Disengaging Wiper Arm From Pivot Shaft
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the wiper pivot shaft (2).
5. Remove the wiper arm pivot end from the wiper pivot shaft.

INSTALLATION

INSTALLATION

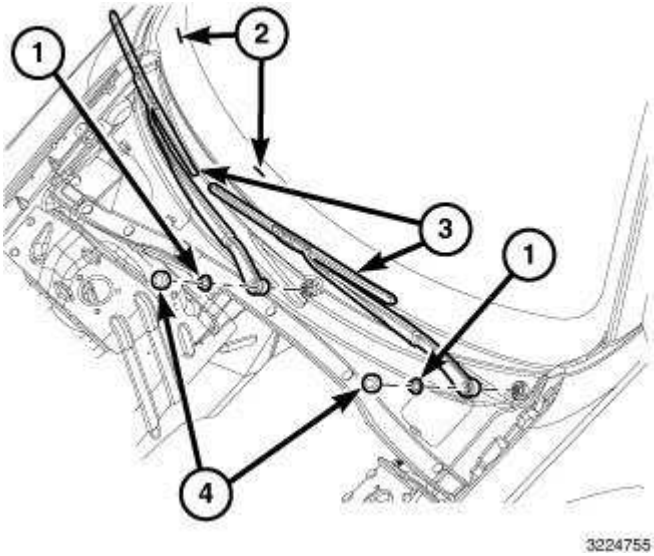

Fig. 6: Wiper Arm And Blade, Plastic Nut Cap & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the wiper motor is in the park position before attempting to install the wiper arms. Turn the ignition switch to the ON position and move the multi-function switch control knob to turn the wiper motor ON, then turn it back to the OFF position. Wait until the wiper pivot shafts stop moving, then turn the ignition switch back to the OFF position. The wiper motor is now in the park position.

NOTE: The right and left wiper arms are not interchangeable. The right wiper arm pivot end is identified with a letter P (Passenger) and the left is identified with a letter D (Driver). Be certain that each wiper arm is installed on the proper wiper pivot.

1. The wiper arm and blade (3) must be indexed to the pivot shaft with the wiper motor in the park position to be properly installed. Loosely position the wiper arm pivot end onto the wiper pivot shaft so that the wiper blade is aligned with the appropriate wiper alignment line (2), which is a mark located just below the upper margin of the lower windshield blackout area.
2. Once the wiper blade is aligned, push the pivot end of the arm down firmly and evenly over the pivot shaft until it is fully engaged.
3. Install and tighten the nut (1) that secures the wiper arm to the pivot shaft. Tighten the nut to 18 N.m (13 ft. lbs.).
4. Wet the windshield glass, then operate the wipers. Turn the wiper switch to the OFF position, then check for correct wiper blade alignment and readjust as required.
5. Reinstall the plastic nut cap (4) onto the wiper arm mounting nut.

BLADE, WIPER

DESCRIPTION

DESCRIPTION

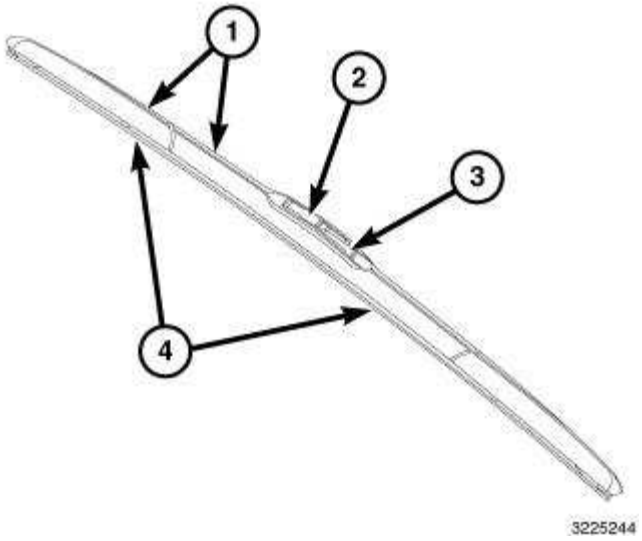

Fig. 7: Blade Covers, Integral Latch & Pivot Block
Courtesy of CHRYSLER GROUP, LLC

Each front wiper blade is secured by an integral latch (2) and an integral pivot block (3) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. These wiper blades have a somewhat sculpted appearance that actually has a functional purpose. The sculpted appearance is due to molded plastic blade covers (1) securely fastened over the bridges and links of the wiper blade. This sculpting is designed to reduce wind buffeting, which helps to reduce wind noise within the passenger compartment of the vehicle.

The wiper blade consists of the following components:

- **Blade Covers** - The molded plastic blade covers shield the wiper superstructure and elements to reduce wind buffeting.
- **Element (4)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.
- **Superstructure** - The superstructure includes several stamped steel bridges and links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

The passenger side wiper blades are 52.50 centimeters (20.67 inches) long. The driver side wiper blades are 60.00 centimeters (23.62 inches) long. They have non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If ineffective, worn, or damaged the entire wiper blade unit must be replaced.

OPERATION

OPERATION

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

REMOVAL

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

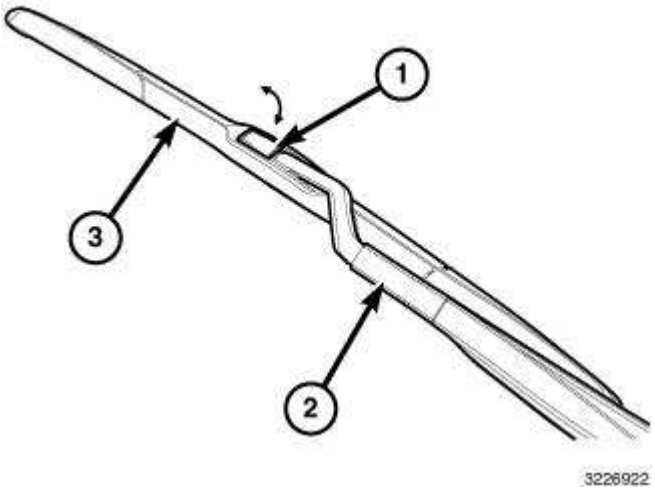

Fig. 8: Tab, Wiper Arm & Element
Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) to raise the wiper blade and element (3) off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the blade from the arm, lift or gently pry the latch release tab (1) located just in front

of the pivot block at the tip of the arm upward until it stands perpendicular to the wiper arm.

3. Rotate the lower end of the blade slightly downward (toward the wiper element and away from the wiper arm), then slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation on the end of the arm.
4. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure between the latch and the pivot block.
5. Gently lower the tip of the wiper arm onto the glass.

INSTALLATION

INSTALLATION

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

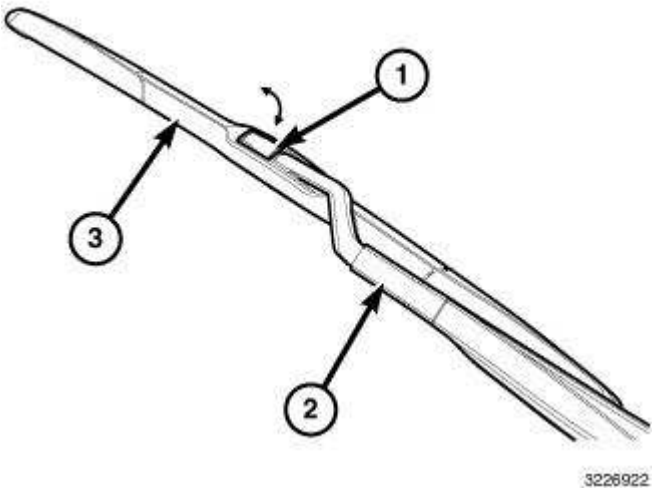

Fig. 9: Tab, Wiper Arm & Element
Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade and element unit (3) near the hook formation on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure between the latch (1) and the pivot block far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until it is fully

engaged.

5. Rotate the latch release tab down into the blade until it snaps into its locked position. Latch engagement will be accompanied by an audible click.
6. Gently lower the wiper blade and element onto the glass.

HOSES AND TUBES, WASHER

DESCRIPTION

DESCRIPTION

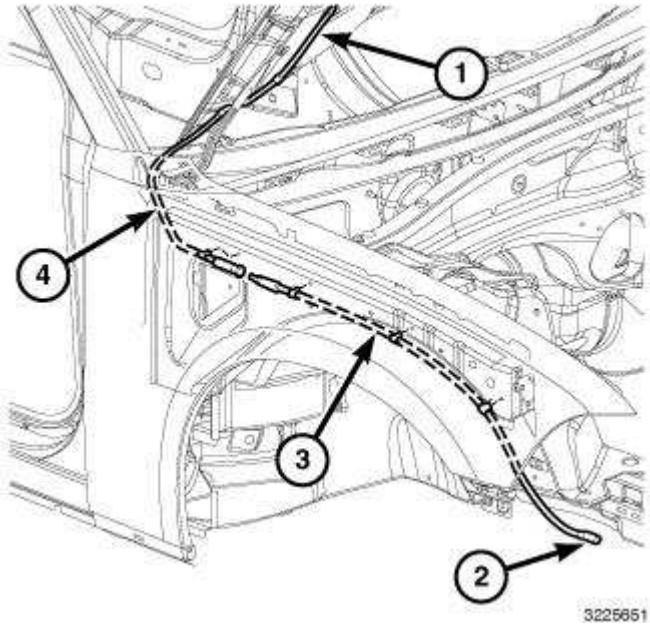

Fig. 10: Hood Panel & Front Hose
Courtesy of CHRYSLER GROUP, LLC

The washer plumbing consists of small diameter rubber hose or hard plastic tubing that is routed from the washer reservoir located on the outside of the right frame rail ahead of the right front wheel house near the right front corner of the engine compartment to the two washer nozzles mounted at the back of the hood panel. The front hose (2) is attached to the outlet nipple of the washer pump/motor unit near the bottom of the reservoir.

The front hose is routed from the washer pump to the outboard side of the right load beam. The front and rear (4) hoses are connected by a molded plastic quick-connect fitting above the wheel house. The rear hose is routed to the right side of the dash panel, then up to the right hood hinge. The rear washer hose is routed around the right hood hinge to the underside of the hood panel (1), then between the hood reinforcement and the hood silencer pad to the two washer nozzles.

Molded rubber fittings provide the connections to the nipples of the washer nozzles. Several plastic push-in type retainers secure the washer hose at regular intervals along its path from the washer

pump to the washer nozzles.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. The molded plastic and rubber washer hose fittings cannot be repaired. If these fittings are ineffective or damaged, they must be replaced.

OPERATION

OPERATION

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the washer system plumbing and fittings to the two washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp or moving parts; and, sharp bends that might pinch the hose must be avoided.

STANDARD PROCEDURE

STANDARD PROCEDURE - DISCONNECTING WASHER HOSE QUICK-CONNECT FITTINGS

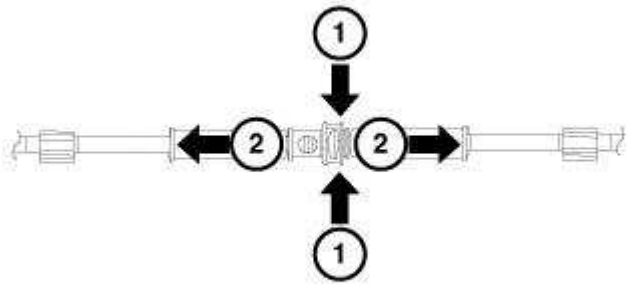

Fig. 11: Molded Plastic Quick-Connect & Washer Hose Tubes
Courtesy of CHRYSLER GROUP, LLC

A molded plastic quick-connect fitting joins the front and rear sections of the washer hose tubes. To disconnect this fitting:

1. Squeeze the two solid sides (not the open sides) of the female half of the quick-connect fitting at the outer edge.
2. While still squeezing the female half of the fitting, pull the two washer hose tubes away from each other.

LINKAGE, WIPER ARM

DESCRIPTION

DESCRIPTION

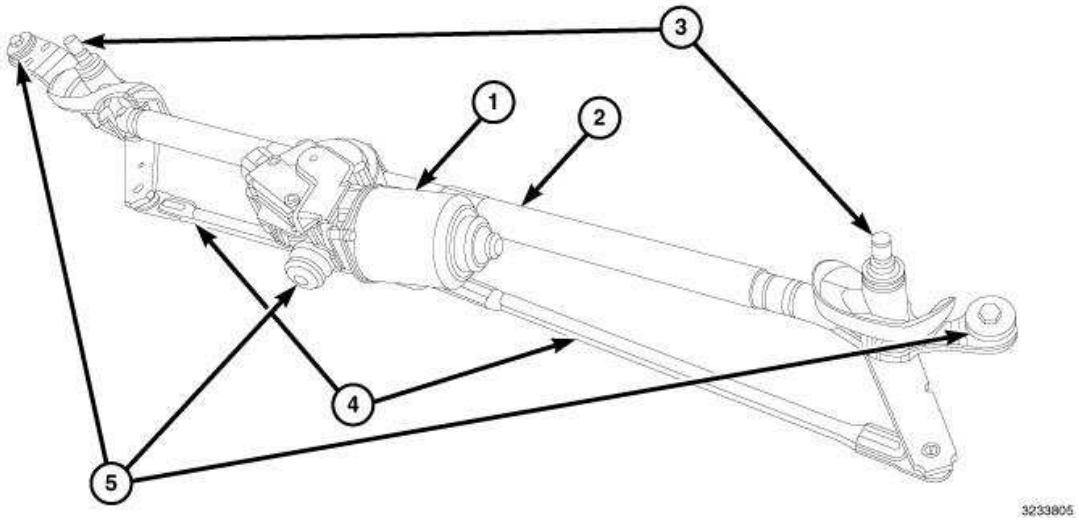

Fig. 12: Bracket, Insulators, Wiper Motor, Wiper Pivots & Steel Drive Links
Courtesy of CHRYSLER GROUP, LLC

The wiper linkage module is secured within the cowl plenum panel beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades and are the only visible components of the wiper linkage module.

The wiper linkage module consists of the following major components:

- **Bracket** - The wiper linkage module bracket (2) consists of a long tubular steel main member that has a die cast pivot bracket formation near each end where the two wiper pivots are secured. The wiper linkage module bracket is secured within the cowl plenum by two screws through two rubber insulators (5).
- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a long double ball stud secured to the drive end.
- **Linkage** - Two stamped steel drive links (4) connect the wiper motor crank arm to the two wiper pivot lever arms. The passenger side link has a plastic socket-type bushing on each end, while the driver side link has a socket-type bushing on the pivot end and a sleeve-type bushing on the crank arm end. The bushing on the pivot end of each link is snap-fit over a ball stud on the pivot lever arm. The sleeve-type bushing on the driver side link is snap fit over the inner ball formation of a double ball stud on the crank arm, then the socket-type bushing of the passenger side drive link is snapped over the outer ball formation.
- **Motor** - The wiper motor (1) is secured by a bracket integral to the motor transmission housing with two screws and nuts near the center of the wiper linkage module bracket. A knob-like rubber insulator (5) on a stud integral to the motor transmission housing is engaged in a slot in a stamped bracket on the front shock tower brace. The two-speed permanent magnet wiper motor

features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker. An integral connector receptacle connects the motor to the vehicle electrical system.

- **Pivots** - The two front wiper pivots (3) are secured to the ends of the wiper module bracket. The lever arms that extend from the bottom of the pivot shafts each have ball studs that engage the bushings of the drive links. The upper end of each pivot shaft where the wiper arms will be fastened each is tapered and serrated with a threaded stud formation at the tip.

The wiper motor and crank arm unit is available for separate service replacement. Any other component of the wiper linkage module cannot be adjusted or repaired. If any component of the module other than the motor is ineffective or damaged, the entire wiper linkage module unit must be replaced.

OPERATION

OPERATION

The wiper linkage module operation is controlled by the battery current inputs received by the wiper motor through the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned OFF, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper motor or the electronic controls or communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the wiper motor or the electronic controls and communication related to wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

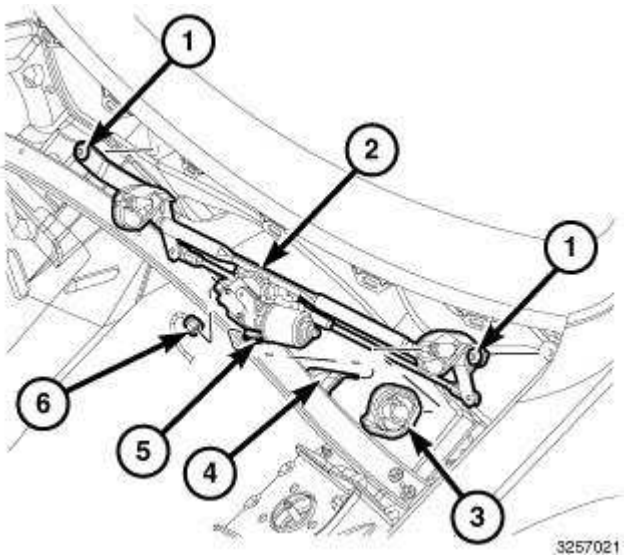

Fig. 13: Two Screws, Wiper Module, Foam Mucket, Rubber Isolator & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The wiper motor can be removed from the wiper linkage module and is serviced independently from the remainder of the wiper linkage module for this vehicle. Refer to MOTOR, WIPER, REMOVAL.

1. Disconnect and isolate the battery negative cable.
2. Remove both wiper arms from the wiper pivots. Refer to **ARM, WIPER, REMOVAL**.
3. Remove the cowl plenum cover/grille panel from over the wiper module (2). Refer to **COVER, COWL PANEL, REMOVAL** .
4. Remove the foam mucket (3) from the left wiper pivot cup.
5. Disconnect the wire harness connector (6) from the connector receptacle for the wiper motor.
6. Remove the two screws (1) that secure the module bracket to the cowl.
7. Pull the wiper linkage module toward the outboard side of the vehicle far enough to disengage the knob-like rubber isolator (5) from the slotted bracket (4) on the front shock tower brace.
8. Remove the wiper linkage module from the cowl as a unit.

INSTALLATION

INSTALLATION

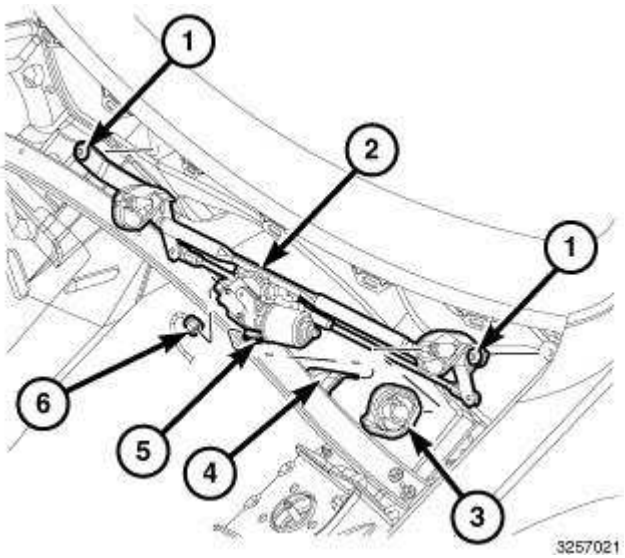

Fig. 14: Two Screws, Wiper Module, Foam Mucket, Rubber Isolator & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The wiper motor can be removed from the wiper linkage module and is serviced independently from the remainder of the wiper linkage module for this vehicle. Refer to MOTOR, WIPER, REMOVAL.

1. Position the wiper linkage module (2) to the cowl as a unit.
2. Position the knob-like rubber isolator (5) into the slotted bracket (4) on the front shock tower brace and push the module inboard far enough to seat the isolator in the bracket.
3. Starting on the outboard side, install and tighten the two screws (1) that secure the wiper linkage module to the cowl. Tighten the screws to 8 N.m (71 in. lbs.).
4. Reconnect the wire harness connector (6) to the connector receptacle for the wiper motor. Be certain connector is fully engaged and locked.
5. Reinstall the foam mucket (3) onto the left wiper pivot cup.
6. Reinstall the cowl plenum cover/grille panel over the wiper linkage module. Refer to **COVER, COWL PANEL, INSTALLATION** .
7. Reinstall both wiper arms onto the wiper pivots. Refer to **ARM, WIPER, INSTALLATION**.
8. Reconnect the battery negative cable.

MODULE, LIGHT RAIN SENSOR (LRSM)

DESCRIPTION

DESCRIPTION

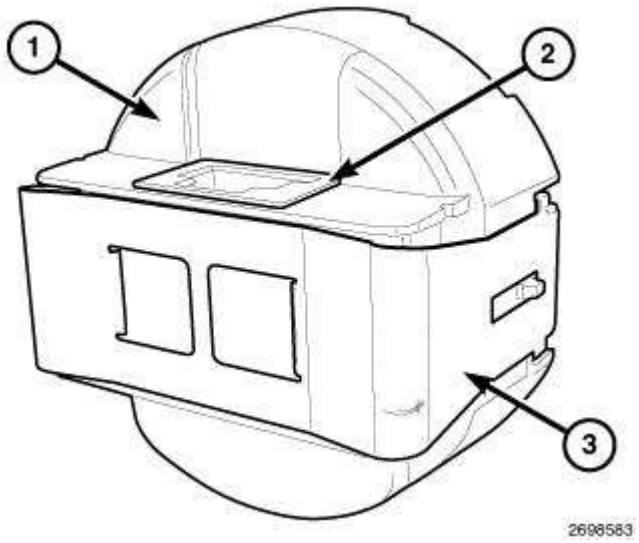

Fig. 15: Light Rain Sensor Module
Courtesy of CHRYSLER GROUP, LLC

The Light Rain Sensor Module (LRSM) (1) is the primary component of the automatic wiper system. In some vehicle applications the LRSM is also capable of performing an ambient light sensor function; and, therefore, is alternately referred to as the Light Sensor Module (LSM) or the Rain Sensor Module (RSM). The LRSM is located on the inside of the windshield just below and to the right of the inside rear view mirror mounting button. The LRSM is concealed from view within the vehicle interior by a molded plastic inside rear view mirror bracket trim cover that fits over the top of the LRSM housing and the LRSM mounting bracket, but the LRSM is visible through the windshield glass from the exterior of the vehicle.

The molded black plastic LRSM housing has an integral connector receptacle (2) at the top with provisions for up to four terminal pins. These terminal pins connect the LRSM to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness that extends from above the headliner. Openings on the windshield side of the housing are fitted with four convex clear plastic lenses. A spring steel retaining strap (3) extends forward on each side of the housing to latch the LRSM to a molded black plastic mounting bracket, which is permanently bonded to the inside of the windshield glass.

Concealed and protected within the LRSM housing is the electronic circuitry of the module, which includes two InfraRed (IR) diodes, two photocells, and a microprocessor. The LRSM is a Local Interface Network (LIN) slave and communicates over a single LIN bus circuit with the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM is a LIN master and a gateway to the Controller Area Network (CAN) data bus. The BCM controls the exchange of electronic messages back and forth between the LRSM and other electronic modules in the vehicle.

The LRSM cannot be adjusted or repaired. If ineffective or damaged, the entire module must be replaced. The LRSM mounting bracket is serviced only as a unit with the windshield glass.

OPERATION

OPERATION

The microprocessor-based Light Rain Sensor Module (LRSM) (also known as the Light Sensor Module/LSM or the Rain Sensor Module/RSM) senses moisture in the wipe pattern on the outside of the windshield glass and sends electronic messages to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Local Interface Network (LIN) data bus. The BCM relays messages back and forth between the LRSM and other electronic modules in the vehicle.

Two InfraRed (IR) diodes within the LRSM generate infrared light beams that are aimed by two of the convex optical lenses of the sensor through the windshield glass. Two additional convex optical lenses of the sensor are focused on the infrared light beams reflected back from the windshield glass and allow the two photocells within the sensor to sense changes in the intensity of these infrared light beams. When sufficient moisture accumulates within the wipe pattern on the windshield glass, less of the infrared light is reflected back and the sensor detects a change in the monitored infrared light beam intensity.

The internal programming of the LRSM then sends the appropriate electronic **wipe command** messages to the BCM over the LIN data bus. The BCM then responds by activating or deactivating the wiper system. Similarly, in some vehicle applications the photocells within the LRSM are capable of sensing ambient light levels through the windshield glass and providing electronic **light level** messages to other modules in the vehicle.

The Steering Control Module (SCM) sends electronic **wiper switch status** and **sensitivity level** messages over the CAN data bus to the BCM based upon the driver-selected settings of the control knob on the control stalk of the multi-function switch. The BCM receives electronic messages from other electronic modules in the vehicle over the CAN data bus, and the BCM relays the messages to the LRSM over the LIN bus.

The higher the selected sensitivity setting the more sensitive the LRSM is to the accumulated moisture on the windshield glass, and the more frequently the LRSM will send **wipe commands** to the BCM to operate the wiper system. The third (middle) sensitivity setting is set up for optimal operation of the automatic wipers under most typical driving conditions.

The LRSM operates on battery current received through a fused ignition switch output (run/accessory) circuit controlled by the run-accessory relay. The LRSM receives ground at all times through a take out of the body wire harness with an eyelet terminal that is secured by a ground screw to the body sheet metal. Therefore, the LRSM is operational only when the ignition switch is in the ON or ACCESSORY positions.

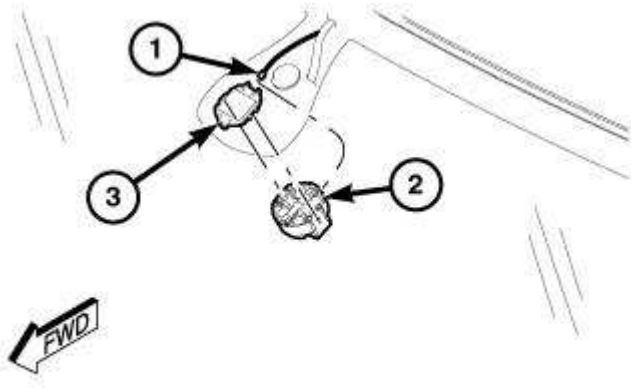
It is important to note that the default operation of the automatic wiper system is low speed continuous wipe. Therefore, if no message is received by the BCM from the LRSM for more than about five seconds when the AUTOMATIC wipe mode is selected, the wipers will default to the low speed continuous wipe operation. It is also noteworthy that the BCM must be properly configured for the automatic wipers option for the automatic wipers to function.

The hard wired circuits of the LRSM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LRSM or the electronic controls or communication

between other modules and devices that provide some features of the automatic wiper system. The most reliable, efficient, and accurate means to diagnose the LRSM or the electronic controls and communication related to LRSM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL



2726939

Fig. 16: Wire Harness Connector, LRSM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim cover from the inside rear view mirror mounting bracket. Refer to **MIRROR, REARVIEW, REMOVAL** .
3. Disconnect the wire harness connector (1) from the LRSM (2).
4. Depress one side of the spring steel retaining strap on the LRSM towards the windshield while lightly prying the end of the strap closest to the glass away from the tab of the mounting bracket (3) on the windshield. Now rotate the loose side of the LRSM away from the glass far enough to disengage the other side of the strap from the mounting bracket tab.
5. Remove the LRSM from the mounting bracket.

INSTALLATION

INSTALLATION

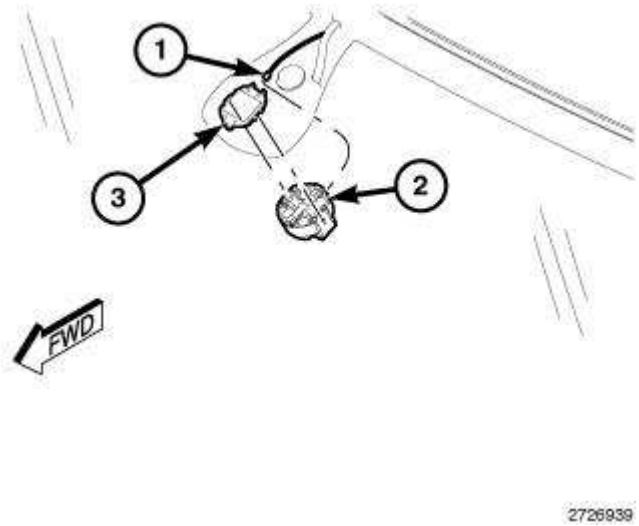


Fig. 17: Wire Harness Connector, LRSM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

CAUTION: During installation be certain not to touch or contaminate the optical lenses of the Light Rain Sensor Module (LRSM) or the glass through which the LRSM optics are focused. Contaminated optics will negatively impact LRSM performance.

1. Position the Light Rain Sensor Module (LRSM) (2) to the center of the mounting bracket (3) on the inside of the windshield near the inside rear view mirror.
2. Depress both sides of the spring steel retaining strap on the LRSM simultaneously until the hooks of the strap engage the tabs of the mounting bracket on the windshield.
3. Reconnect the wire harness connector (1) to the LRSM.
4. Reinstall the inside rear view mirror mounting bracket trim cover. Refer to **MIRROR, REARVIEW, INSTALLATION** .
5. Reconnect the battery negative cable.

MOTOR, WIPER

DESCRIPTION

DESCRIPTION

The wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, DESCRIPTION**.

OPERATION

OPERATION

The wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, OPERATION**.

REMOVAL

REMOVAL

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit MUST be replaced.

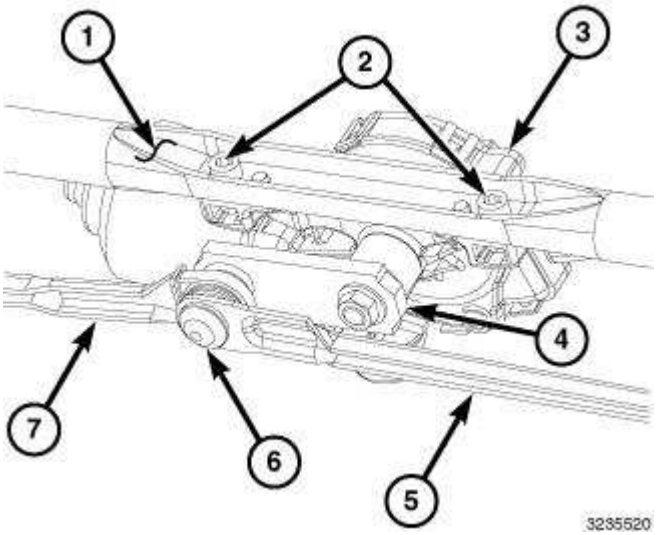

Fig. 18: Module Bracket, Two Screws, Motor, Crank Arm, Drive Link, Bushing & Wiper Drive Link
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the wiper linkage module from the vehicle and place it on a suitable work surface. Refer to **LINKAGE, WIPER ARM, REMOVAL**.
3. Disengage the socket bushing (6) of the right wiper drive link (5) from the double ball stud on the wiper motor crank arm (4) using two large screwdrivers, one on each side of the double ball stud. Pry firmly and evenly between the crank arm and the metal portion of the drive link until the socket unsnaps from the ball.

4. Disengage the sleeve bushing of the left wiper drive link (7) from the double ball stud on the wiper motor crank arm.
5. Remove the two screws (2) that secure the motor (3) bracket to the module bracket (1).
6. Remove the wiper motor and crank arm as a unit from the underside of the module bracket.

INSTALLATION

INSTALLATION

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit MUST be replaced.

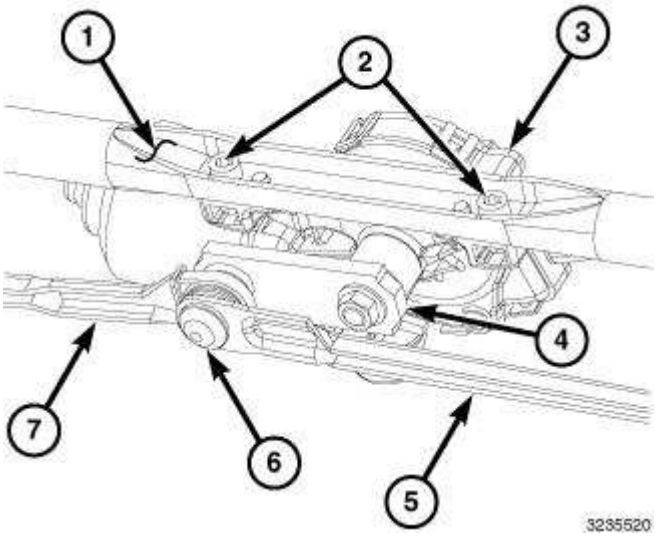

Fig. 19: Module Bracket, Two Screws, Motor, Crank Arm, Drive Link, Bushing & Wiper Drive Link
Courtesy of CHRYSLER GROUP, LLC

1. Be certain that the two nuts are positioned properly within the pockets of the wiper motor (3) bracket.
2. Position the wiper motor and crank arm as a unit to the underside of the wiper module bracket (1).

3. Install and tighten the two screws (2) into the two nuts that secure the motor bracket to the module bracket. Tighten the screws to 7.5 N.m (66 in. lbs.).
4. Position the sleeve bushing of the left wiper drive link (7) onto the double ball stud on the end of the motor crank arm (4).
5. Position the socket bushing (6) of the right wiper drive link (5) over the double ball stud on the crank arm.
6. Place a short 19 millimeter or 3/4 inch socket over the domed cap side of the socket bushing as an installation tool. Use large channel-lock pliers to firmly and evenly apply enough pressure between the back of the crank arm and the top of the socket installation tool to snap the bushing onto the ball stud. **Do not apply pressure directly to the plastic bushings.**

NOTE: Be certain to turn the ignition switch to the ON position, then turn the wiper switch ON and OFF again to cycle the wiper motor and linkage to their natural park position before reinstalling the wiper arms onto the wiper pivots.

7. Reinstall the wiper linkage module into the vehicle. Refer to **LINKAGE, WIPER ARM, INSTALLATION**.
8. Reconnect the battery negative cable.

NOZZLE, WASHER

DESCRIPTION

DESCRIPTION

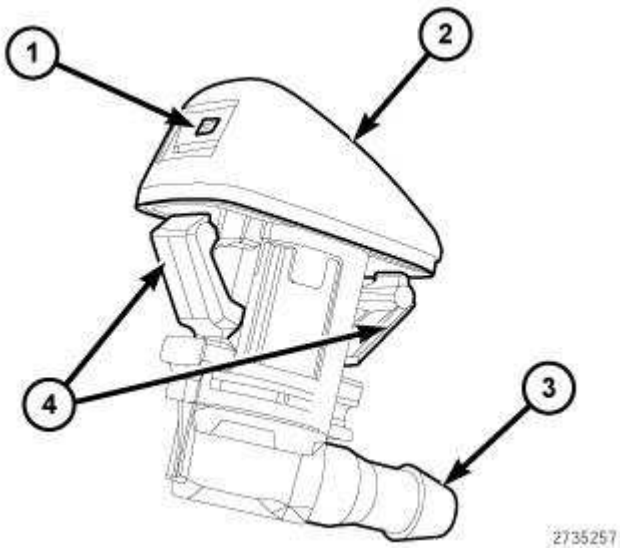

Fig. 20: Washer Nozzles, Two Integral Latches, Nozzle Orifices & Washer Plumbing Fittings
Courtesy of CHRYSLER GROUP, LLC

The fluidic washer nozzles (2) are constructed of molded plastic and include an integral check valve.

Each nozzle has two integral latches (4) that secure them in dedicated holes in the hood panel near the base of the windshield. The domed upper surface of the washer nozzle is visible on the outside of the hood panel and the nozzle orifices (1) is oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. The washer plumbing fittings (3) for the washer nozzles extend below the hood panel and are accessible from the engine compartment.

The washer nozzles cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced.

OPERATION

OPERATION

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single hose, which is attached to a barbed nipple on each washer nozzle below the hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer system is turned OFF.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REMOVAL

REMOVAL

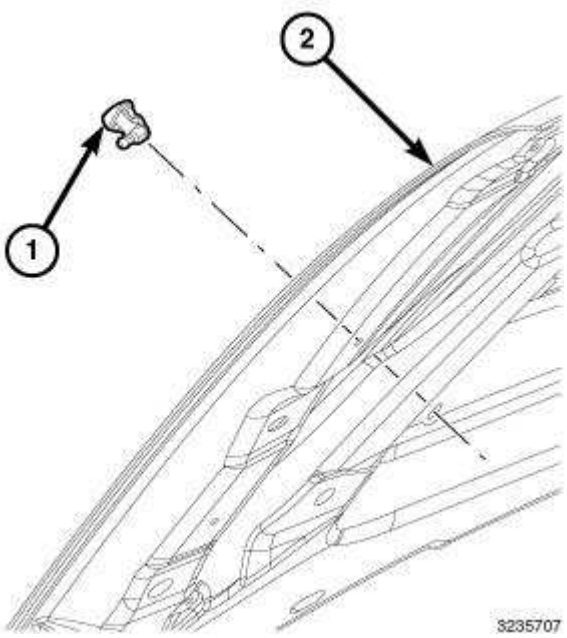

Fig. 21: Hood & Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. From the underside of the hood (2), remove the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement as necessary to access the washer nozzle (1) hose connections.
2. From the underside of the hood, disconnect the washer nozzle hose fitting from the barbed nipple of the washer nozzle.
3. From the underside of the hood, release the integral latch features of the washer nozzle and push the nozzle out through the mounting hole toward the top side of the hood.
4. Remove the washer nozzle from the top of the hood panel.

INSTALLATION

INSTALLATION

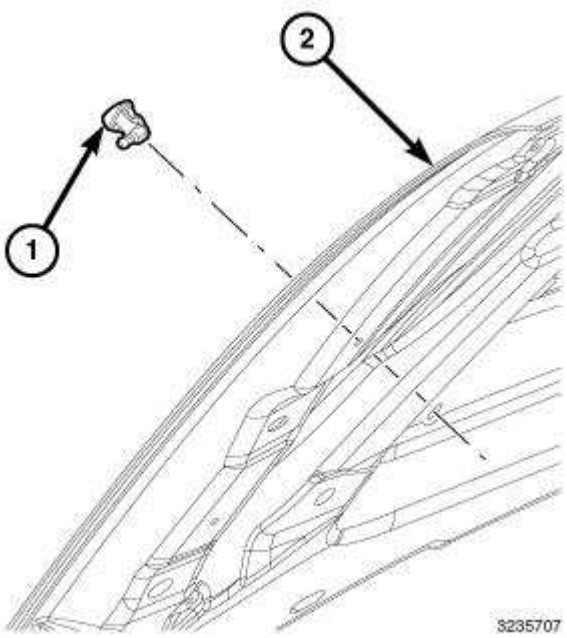

Fig. 22: Hood & Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer nozzle (1) to the mounting hole on the outside of the hood panel (2).
2. Align the anti-rotation tabs of the nozzle with the anti-rotation notches in the mounting hole.
3. Using hand pressure, push firmly and evenly on the top of the washer nozzle until the integral latch features lock into place on the underside of the hood.
4. From the underside of the hood, reconnect the washer hose fitting to the barbed nipple of the nozzle.
5. Reinstall the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement.

PUMP, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

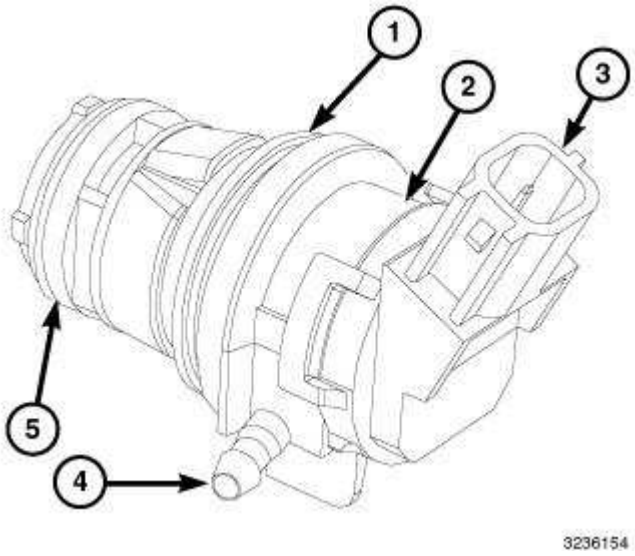

Fig. 23: Washer Pump/Motor Unit, Inlet Nipple, Grommet Seal, Barbed Outlet Nipple & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The washer pump/motor unit (2) is located in a sump area on the outboard facing side of the washer reservoir on the right frame rail, ahead of the right front wheel house. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump.

An inlet nipple (5) on the end of the pump housing passes through a rubber grommet seal (1) installed in a dedicated mounting hole in the sump area at the base of the washer reservoir. When the pump is installed in the reservoir, a barbed outlet nipple (4) on the pump housing connects the unit to the front washer hose.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. An integral connector receptacle (3) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

OPERATION

The washer pump/motor unit features a small Direct Current (DC) electric motor. The motor is connected to the vehicle electrical system through a single take out and two-cavity connector of the headlamp and dash wire harness. The motor is grounded at all times through another take out of the headlamp and dash wire harness with a single eyelet terminal connector that is secured by a screw to the body sheet metal in the engine compartment.

The Body Control Module (BCM) (also known as the Common Body Controller/CBC) controls the

washer pump/motor control circuit through a high side driver based upon electronic **washer request** messages received over the Controller Area Network (CAN) data bus from the Steering Control Module (SCM). The SCM monitors hard wired analog and multiplex inputs from the washer switch circuitry contained within the multi-function switch to determine the proper electronic messages to send.

Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. A filter screen integral to the pump inlet port prevents most debris from entering the pump housing. When the pump motor is energized, the motor spins the rotor within the washer pump. The spinning pump rotor pressurizes the washer fluid and forces it through the pump outlet nipple, the washer plumbing, and the washer nozzles onto the windshield glass.

The washer pump/motor unit and the hard wired circuits connected to the unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide many features of the wiper and washer system. The most reliable, efficient, and accurate means to diagnose the washer pump/motor unit or the electronic controls and communication related to washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

NOTE: The washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.

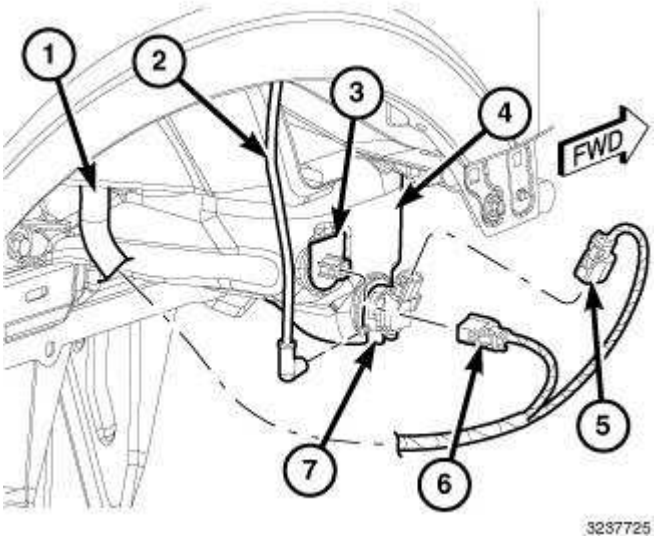

Fig. 24: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.

2. Turn the steering wheel to move the front wheels to the full right turn position.
3. Raise and support the vehicle.
4. Remove the fasteners that secure the forward end of the right front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the splash shield away from the inner fender panel and front fascia far enough to access the washer pump/motor unit (7) on the washer reservoir (4) on the outboard side of the right frame rail.
6. Disconnect the headlamp and dash wire harness (1) connector for the washer pump motor (5) from the motor connector receptacle.
7. Disconnect the washer hose (2) from the barbed outlet nipple of the washer pump and allow the washer fluid to drain into a clean container for reuse.
8. Using hand pressure, firmly grasp and pull the washer pump outward far enough to disengage the pump inlet nipple from the rubber grommet seal in the reservoir. Care must be taken not to damage the reservoir.
9. Remove the washer pump/motor unit from the washer reservoir.
10. Remove the rubber grommet seal from the washer pump mounting hole in the reservoir and discard.

INSTALLATION

INSTALLATION

NOTE: The washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.

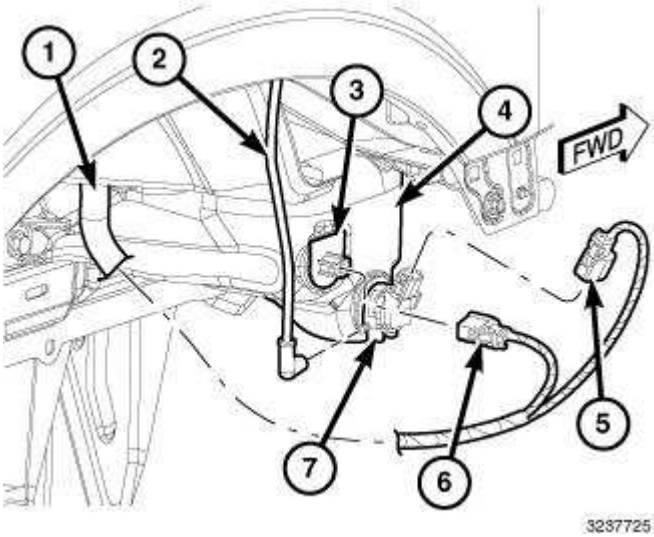

Fig. 25: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new rubber grommet seal with clean washer fluid and install it into the washer pump mounting hole in the washer reservoir (4). Always use a new rubber grommet seal on the reservoir.
2. Position the inlet nipple at the base of the pump housing of the washer pump/motor unit (7) to the rubber grommet seal in the reservoir.
3. Using hand pressure, press firmly and evenly on the washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal in the pump mounting hole of the reservoir.
4. Reconnect the washer hose (2) to the barbed outlet nipple of the washer pump.
5. Reconnect the headlamp and dash wire harness (1) connector for the washer pump/motor unit (5) to the connector receptacle on the top of the pump motor.
6. Reinstall the fasteners that secure the right front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
7. Lower the vehicle.
8. Reconnect the battery negative cable.
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

RESERVOIR, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

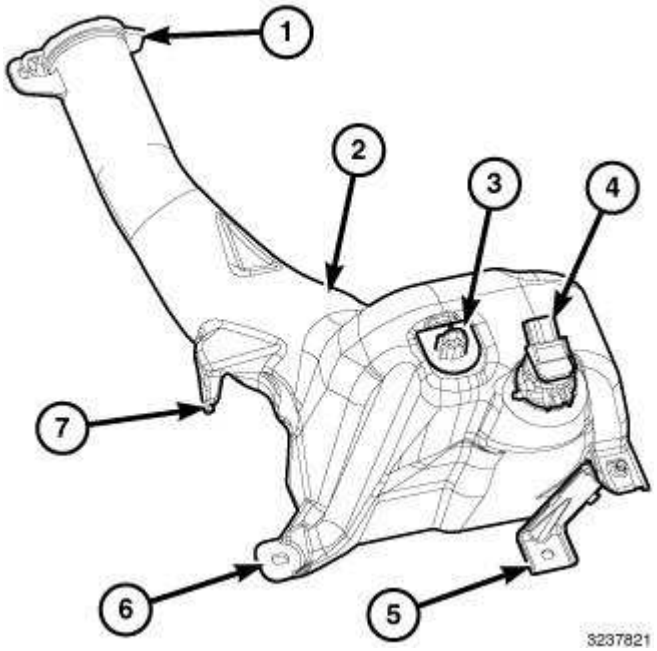

Fig. 26: Fluid Reservoir, Filler Neck And Cap Unit, Washer Pump/Motor Unit, Switch, Locating Post, Mounting Tab & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

The molded plastic washer fluid reservoir (2) is mounted on the outboard side of the right frame rail, ahead the right front wheel, where it is concealed by the right front wheel house splash shield. The only visible component of the washer reservoir is the filler neck and cap unit (1), which extends upward into the engine compartment just forward of the right strut tower. A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** and the text **Washer Fluid Only** molded into it snaps over the open end of the filler neck. The cap hinges on and is secured to a molded-in hook formation on the rear of the reservoir filler neck.

There are separate, dedicated holes on the outboard side of the reservoir provided for the washer pump/motor unit (4) and the washer fluid level switch (3). The rear inboard side of the washer reservoir has an integral locating post (7) and an integral mounting tab (6), while the front outboard corner has a mounting tab that includes a stamped steel mounting bracket (5). The rear mounting tab and front mounting bracket are secured to the frame rail by screws. The right front fender wheel house splash shield must be removed to access the washer reservoir for service.

The washer reservoir cannot be repaired and, if ineffective or damaged, it must be replaced. The washer reservoir, rubber grommet seals for the washer pump/motor unit and the washer fluid level switch as well as the filler cap are each available for individual service replacement.

OPERATION

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the washer system. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir.

The washer pump/motor unit is located in a sump area near the bottom on the outboard side of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer pump/motor unit is mounted in the lowest position in the sump. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the washer system will no longer operate.

REMOVAL

REMOVAL

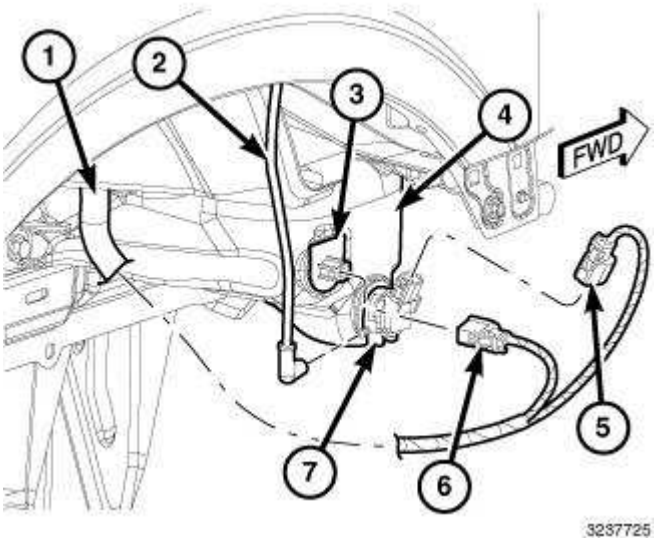

Fig. 27: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the ElectroHydraulic Power Steering (EHPS) pump from the outboard side of the right frame rail. Refer to **PUMP, REMOVAL** .
3. Disconnect the headlamp and dash wire harness (1) connector for the washer pump (5) from the washer pump motor (7) connector receptacle.
4. Disconnect the headlamp and dash wire harness connector for the washer fluid level switch (6) from the switch (3) connector receptacle.
5. Disconnect the washer hose (2) from the barbed outlet nipple of the washer pump and allow the washer fluid to drain into a clean container for reuse.

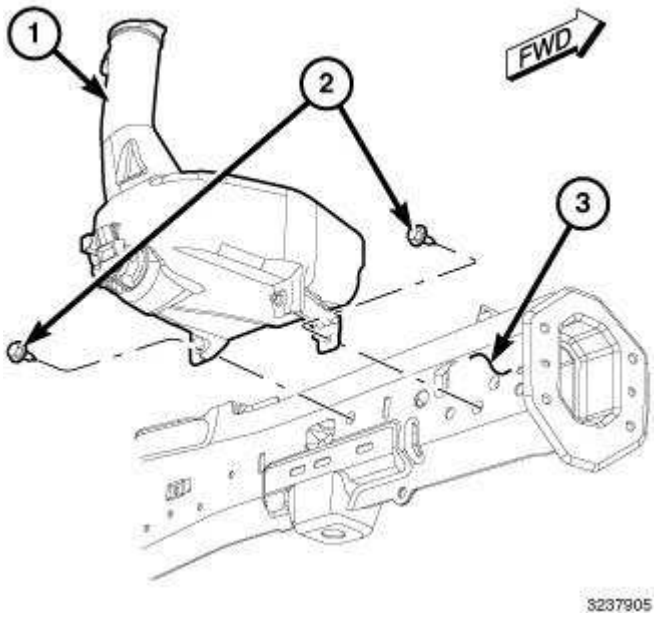

Fig. 28: Two Screws, Washer Reservoir & Right Frame Rail
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two screws (2) that secure the washer reservoir (1) to the outboard side of the right frame rail (3).
7. Lower the washer reservoir from the vehicle, rotating it as necessary for clearance.

INSTALLATION

INSTALLATION

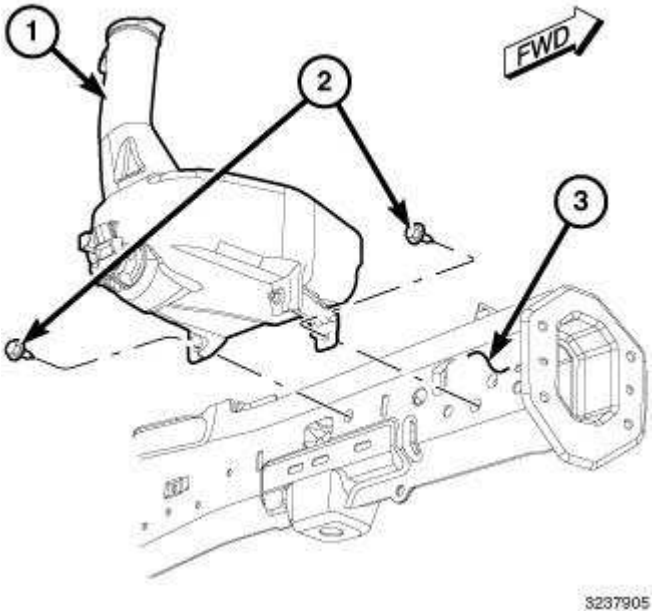

Fig. 29: Two Screws, Washer Reservoir & Right Frame Rail
Courtesy of CHRYSLER GROUP, LLC

1. Lift the washer reservoir (1) up into the vehicle and position it to the outboard side of the right frame rail (3).
2. Install and tighten the two screws (2) that secure the reservoir to the frame rail. Tighten the screws securely.

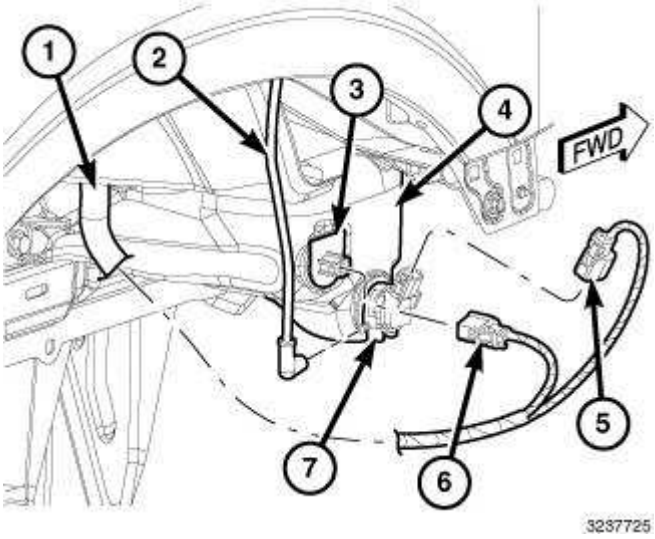

Fig. 30: Washer Pump/Motor Unit, Washer Reservoir, Dash Wire Harness, Pump Motor & Washer Hose
Courtesy of CHRYSLER GROUP, LLC

3. Reconnect the washer hose (2) to the barbed outlet nipple of the washer pump (7).
4. Reconnect the headlamp and dash wire harness (1) connector for the washer pump/motor unit (5) to the connector receptacle on the top of the pump motor.
5. Reconnect the headlamp and dash wire harness connector for the washer fluid level switch (6) to the connector receptacle for the switch (3).
6. Reinstall the ElectroHydraulic Power Steering (EHPS) pump onto the outboard side of the right frame rail. Refer to **PUMP, INSTALLATION** .
7. Reconnect the battery negative cable.
8. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

SWITCH, WASHER FLUID LEVEL

DESCRIPTION

DESCRIPTION

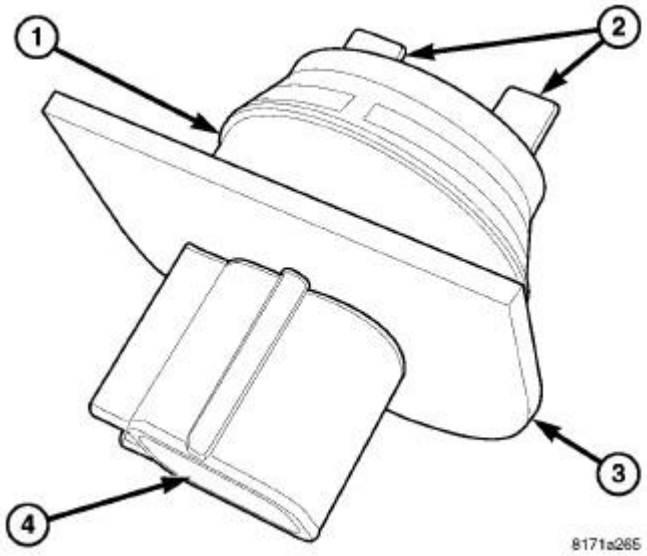

Fig. 31: Washer Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

The washer fluid level switch (3) is a two-pin conductivity sensor with no moving parts mounted on the outboard facing side of the washer reservoir on the right frame rail, ahead of the left front wheel opening. Only the molded plastic switch mounting flange and the integral connector receptacle (4) are visible when the switch is installed in the reservoir.

A short nipple formation (1) extends from the inner surface of the switch mounting flange, and a barb on the nipple is pressed through a rubber grommet seal installed in the mounting hole of the reservoir. Two over-molded pins or electrodes (2) extend from the back of the nipple formation. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The washer fluid level switch cannot be adjusted or repaired. If ineffective or damaged, the switch must be replaced.

OPERATION

OPERATION

The washer fluid level switch uses fluid conductivity to monitor the level of the washer fluid in the washer reservoir. Electricity is conducted between the two switch pins or electrodes only when they are immersed in the washer fluid, which closes the switch circuit. When the fluid level in the washer reservoir falls below the pins, electrical current cannot be conducted and the switch becomes an open circuit, which signals a low fluid condition.

In order to prevent an electrical charge from accumulating in the electrical leads of the switch, the switch receives current that is pulsed from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) located in the passenger compartment. The BCM monitors the switch return signal and is programmed to respond to three consecutive open switch readings by sending an

electronic **washer fluid indicator lamp-ON request** message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) over the Controller Area Network (CAN) data bus. The IC responds to this message by illuminating the washer fluid indicator and by sounding an audible chime tone warning.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. The switch is connected in series between a sensor return circuit and the washer fluid switch sense input to the BCM.

The washer fluid level switch and the hard wired circuits between the switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer fluid level indicator or the electronic controls or communication between other modules and devices that provide some features of the washer system. The most reliable, efficient, and accurate means to diagnose the washer fluid level indicator or the electronic controls and communication related to washer fluid level switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

NOTE: The washer fluid level switch may be removed from the washer reservoir without removing the reservoir from the vehicle.
